In our example, **BCC** has two walk right menus and they both need options to run Design and Survey chains.

So in the folder **User\BCC**, the contents of **ADAC_customer_walk_right_menu.4d** are

```plaintext
Menu "ADAC BCC 4.1 Chains" {
    Button "BCC Design to ADAC 41 chain" {
        Command "chain -pvf $USER/BCC/ADAC_BCC_41.pvf $LIB/ADAC_design_base.chain"
    }
    Button "BCC Survey to ADAC 41 chain" {
        Command "chain -pvf $USER/BCC/ADAC_BCC_41.pvf $LIB/ADAC_survey_base.chain"
    }
}

Menu "ADAC BCC 4.0 Chains" {
    Button "BCC Design to ADAC 40 chain" {
        Command "chain -pvf $USER/BCC/ADAC_BCC_40.pvf $LIB/ADAC_design_base.chain"
    }
    Button "BCC Survey to ADAC 40 chain" {
        Command "chain -pvf $USER/BCC/ADAC_BCC_40.pvf $LIB/ADAC_survey_base.chain"
    }
}

**BRC** only require ADAC 4.1 but do need both Design and Survey so only one walk right menu is required but it needs an option for Design and an option for Survey on it. So the **ADAC_customer_walk_right_menu.4d** in the folder **User\BRC** is

```plaintext
Menu "ADAC BRC 4.1 Chains" {
    Button "BRC Design to ADAC 41 chain" {
        Command "chain -pvf $USER/BRC/ADAC_BRC_41.pvf $LIB/ADAC_design_base.chain"
    }
    Button "BRC Survey to ADAC 41 chain" {
        Command "chain -pvf $USER/BRC/ADAC_BRC_41.pvf $LIB/ADAC_survey_base.chain"
    }
}
```

**GCC** only require ADAC 4.1 and only need Survey so only one walk right menu is required with just the one option for Survey on it. So the **ADAC_customer_walk_right_menu.4d** in the folder **User\GCC** is

```plaintext
Menu "ADAC GCCC 4.1 Chains" {
    Button "GCC Design to ADAC 41 chain" {
        Command "chain -pvf $USER/GCC/ADAC_GCCC_41.pvf $LIB/ADAC_design_base.chain"
    }
    Button "GCC Survey to ADAC 41 chain" {
        Command "chain -pvf $USER/GCC/ADAC_GCCC_41.pvf $LIB/ADAC_survey_base.chain"
    }
}
```
(f) Finally the `ADAC_customer_user_menu.4d`'s for each of the customers needs to be included in the **ADAC User** menu

This is done by having a file in the **User** folder called `ADAC_customer_user_menu.4d`.

(Aside: Yes this is the same name as in the customer folders. If it causes confusion then we will change it. Maybe it should have an s in it `ADAC_customers_user_menu.4d`.)

This is the file that was included in the **User** menu by the

```#
#include "ADAC_customer_usr_menu.4d"
```

This file first includes all the walk right menus for the different customers on the **User ADAC** menu, and then includes the definitions of the walk right menus.

```
Menu "User Adac" {

#include "BCC\ADAC_customer_user_menu.4d"
#include "BRC\ADAC_customer_user_menu.4d"
#include "GCCC\ADAC_customer_user_menu.4d"

} #include "BCC\ADAC_customer_walkright_menu.4d"
#include "BRC\ADAC_customer_walkright_menu.4d"
#include "GCCC\ADAC_customer_walkright_menu.4d"
```

Continue to the next section 10.6.4 Setting Up ADAC Templates, or return to 10.6.3 Setting up and Running ADAC Chains from the Menus, or 10.6 Setting Up for ADAC.
10.6.4 Setting Up ADAC Templates

When creating ADAC Header using the ADAC =>Create Header, or ADAC Assets using the ADAC =>Create Asset option, Templates can be used to automatically fill in many of the values of ADAC elements.

See
10.6.4.1 ADAC Header Templates
10.6.4.2 ADAC Asset Templates

10.6.4.1 ADAC Header Templates

In most firms, many of the values in an ADAC Header would be the same for each new ADAC job.

For example, all your jobs could be in MGA zone 56, using the Horizontal Datum GDA 94 and Vertical Datum AHD. Or you always have the three surveyor names in the ADAC Header.

To prevent having to reenter this data every time you create a new ADAC Header, users can create ADAC Header Templates with information for any new ADAC Header already filled in.

When you have ADAC Header Templates, the Template field pop up in the Create ADAC Header panel lists all your ADAC Header Templates for the selected ADAC version, as a folder structure.

When the new ADAC Header is created, it will have all the values from the selected Header Template.

So for the new ADAC Header, only those values not covered by the Header Template need to be entered.

To create an ADAC Header Template, you

1. create an ADAC Header for the required ADAC version, and with the ADAC values that you want the Header Template to have
2. place it in the model ADAC Header Templates
3. in the string attributes, add a Text attribute called Template into the top level of the ADAC attribute group, with its value being the required folder structure for displaying the Header Template with the names for each folder level being separated by a forward slash (/).
For example, to have a **Header Template** called **MGA 96** and have it display in a folder called **BCC**, the value for the attribute **Template** is **BCC/MGA 96**

![String Attributes](image)

To use the **Header Templates** in another project you can either:

(a) write the model **ADAC Header Templates** out as a 12da file and read it into new ADAC projects.

(b) have the model **ADAC Header Templates** in a project and share that project into your new ADAC projects.

(c) write the models **ADAC Header Templates** and **ADAC Asset Templates** out to the 12da file **ADAC_Templates.4da** and place the file in **User_Lib**.

The option:

`ADAC =>User =>Setting up a new ADAC Project =>Read in templates from User_Lib`

...can then be used in any project to read **User_Lib\ADAC_Templates.4da** in, and hence the models **ADAC Header Templates** and **ADAC Asset Templates** into the new project.

See [10.4.9.1.3 Reading in Templates from User_Lib](#).  

Continue to the next section [10.6.4.2 ADAC Asset Templates](#), or return to [10.6.4 Setting Up ADAC Templates](#).
10.6.4.2 ADAC Asset Templates

When creating ADAC Assets by hand, there would be some the values in an ADAC Asset that would be the same each time the ADAC Asset was used in ADAC job.

For example, a Transport>RoadEdges>RoadEdge with Type Bitumen and Owner Council may be regularly required.

To prevent having to reenter this data every time you create a new ADAC Asset, users can create ADAC Asset Templates with information for any new ADAC Asset already filled in.

When you have ADAC Asset Templates, the Template field pop up in the Create ADAC Asset panel, lists all your ADAC Asset Templates for the selected ADAC version and the selected ADAC Asset, in a folder structure.

When the new ADAC Asset is created, it will have all the values from the selected Asset Template.

So for the new ADAC Asset, only those values not covered by the Asset Template need to be entered.

To create an ADAC Asset Template, you

1. create an ADAC Asset for the required ADAC version, and with the ADAC values that you want the Asset Template to have
2. place it in the model ADAC Asset Templates
3. in the string attributes, add a Text attribute called Template into the top level of the ADAC attribute group, with its value being the required folder structure for displaying the Asset Template with the names for each folder level being separated by a forward slash (/).

For example, to have an Asset Template for a Road Edge called Bitumen, and have it display in a folder called BCC, the value for the attribute Template is BCC/Bitumen
To use the Asset Templates in another project you can either:

(a) write the model ADAC Asset Templates out as a 12da file and read it into new ADAC projects.

(b) have the model ADAC Asset Templates in a project and share that project into your new ADAC projects.

(c) write the models ADAC Header Templates and ADAC Asset Templates out to the 12da file ADAC_Templates.4da and place the file in User_Lib.

The option:

ADAC => User => Setting up a new ADAC Project => Read in templates from User_Lib

can then be used in any project to read User_Lib/ADAC_Templates.4da in, and hence the models ADAC Header Templates and ADAC Asset Templates into the new project.

See 10.4.9.1.3 Reading in Templates from User_Lib.

Continue to the next section 10.6.5 Setting Up Your User Keys or return to 10.6 Setting Up for ADAC.
10.6.5 Setting Up Your User Keys

Two things you will do regularly when doing ADAC work is to bring up the ADAC menu and to bring up the **String Attributes** panel.

So in the standard *12d Model 11* installation, the function keys are assigned so that:

- Pressing **F12** brings up the **ADAC** menu.
- Pressing **F8** brings up the **Strings Attributes** panel.

If you wish to change the use of functions keys then you can define the way you want the **function keys** to work.

For example, you may want

- Press **F11** to bring up the **ADAC** menu.
- Press **F12** to bring up the **String Attributes** panel.

In *12d Model* the actions of the function keys is controlled by **userkeys.4d**. There may already be a copy in your **User** folder. If not, copy it over from the folder in **Program Files**:

```
12d\12dmodel\11.00\set_ups.
```

Then just replace the existing lines for defining **f11** and **f12** with (lines preceded by `//` are comment lines).

```
// mod for f11

f11 panel "ADAC"

// mod for f12

f12 panel "String Attributes"
```

Return to **10.6 Setting Up for ADAC**.
11 Edit

The Edit menu contains the Undo and Redo options.

Infinite Undo and Redo facilities have been implemented for many of the 12d Model options. However, because much of the power of 12d Model comes from being able to leave options hanging and editing more than one string at a time, this made the standard concept of Undo/Redo of limited benefit to 12d Model users.

Consequently, the following methodology has been adopted for Undo and Redo in 12d Model:

Independent undo and redo lists are maintained for each string being edited and these list are cleared once the editor is left.
There is also a main undo/redo list which is used for all other options that can be undone. The main undo/redo lists are cleared when the 12d Model session is exited.
Please continue to the next section Undo and Redo for Editors.
11.1 Undo and Redo for Editors

Each editor contains its own Undo/Redo option on its nd Edit menu and whilst a string is being edited, the editor maintains its own undo/redo lists.

For example, for a 2d string, the Undo/Redo option is just above the Quit option.

As each edit is made to the string, the state of the string before the edit is added to the top of the string’s undo list and the redo list is emptied.

If undo is selected from the nd edit menu, the last edit operation for that string will be undone and the undone operation added to the top of the string’s redo list.

If another undo is selected before another edit is made to the string, what is now was last operation on the string will be undone (is was the second last operation before the previous undo) and the undone operation added to the top of the string’s redo list.

If redo is selected from the nd edit menu, then the top operation on the redo list is redone, and the state of the string before the redo is added to the top of the undo list.

Hence edits for the string can be undone and redone whilst in the edit session for the string.

When the edit session is completed by selecting either quite or finish from the nd edit menu, the undo and redo lists for the edit session are deleted and the operations for the edit session can no longer be undone or redone.

Note

If more than one string is being edited at the same time, each string editor maintains its own undo/redo lists so that the undo/redo operations for the different strings do not get intertwined.

Hence if undo or redo is selected from a particular strings nd edit menu, the undo or redo applies only to the operations performed on that particular string, no matter what other nd edit options where performed on other strings.

Please continue to the next section Undo and Redo for other Options.
11.2 Undo and Redo for other Options

As well as the undo/redo lists maintained by the string editors, there is another set of undo/redo list maintained for all other options that support undo and redo. These are called the main undo and redo lists.

For a description of the undo in 12d Model, please go to the section Edit.

The undo option which controls the main undo/redo lists, is the on the Edit menu from the main menu.

If undo is selected from the undo menu, the last undoable option performed (apart from editor operation on strings) will be undone and the undone operation added to the top of the main redo list.

If another undo is selected before another undoable option is performed, what is now was last operation will be undone (is was the second last operation before the previous undo) and the undone operation added to the top of the main redo list.

If redo is selected from the undo menu, then the top operation on the main redo list is redone, and the state before the redo is added to the top of the undo list.

Hence many operations can be undone and redone.

When the 12d Model session is completed by selecting either exit from the 12d Model menu, the undo and redo lists for the session are deleted and the operations for the session can no longer be undone or redone.

For the option Undo, go to the section

For some restrictions on the Undo/Redos, please continue to the section Some Restrictions on Undo and Redo.
11.2.1 Undo

If undo is selected from the undo menu, the undo panel showing the last operation to undo is displayed.

For some restrictions on the Undo/Redos, please continue to the section Some Restrictions on Undo and Redo.
11.2.2 Redo

If redo is selected from the undo menu, the redo panel showing the last operation to redo is displayed.

For some restrictions on the Undo/Redos, please continue to the section Some Restrictions on Undo and Redo.
11.2.3 Undo List

If undo list is selected from the undo menu, a list of all the items on the undo list is displayed in the undo list panel.

![Undo List Dialogue Box]

No Undo's or Redo's

OK
11.2.4 Clear all Undos

Selecting clear all undo from the undo menu will bring up a clear all undo's/redo's yes-no panel.

If yes is selected, the main undo and redo lists will be cleared.
11.2.5 Some Restrictions on Undo and Redo

Undo and Redo are available for most of the Strings options and most of the Utilities options. Undo is available for all File=> Input options but there are no Redos for these Undos.

Undo is available for all Utilities=>Global options that use the Output option with the Mode set to one of the three copy modes. There are no Redos with these Undos.

There are no Undos for Models=>Delete and Models=>Clean.
12 View

Position of menu: View

Views are the drawing display areas in 12d Model.

The View walk-right menu contains options to list existing views and create new views. The view drawing and manipulation options are in the View menus attached to each view.

The Views walk-right menu is

- On Main menu:
  - create new views
  - turn Toolbars on/off
  - toggle Status Bar on/off

- On 12d Model menu and floating Views menu:
  - list of defined views
  - info about the data on the view
  - table of info on all models on view
  - create plan, perspective, section views
  - write out a view in raster format
  - write out view in selected raster format
  - rename a view
  - delete a view
  - save/restore list of models on view
  - transfer models between views
  - send tins/rasters to back of drawing list
  - helpful visualisation options
  - display Views User menu

For the option New, go to:

- 12.1 New
- 12.2 Toolbars
- Status Bar
- 12.3 Views
- 12.4 View Info
- 12.5 View Information Table
- 12.6 Create
- 12.7 Dump
- 12.8 Rename
- 12.9 Delete
- 12.10 Models Save/Restore
- 12.11 Models Transfer
- 12.12 Send Tins/Rasters to Back
- 12.13 Visualisation
- View Redraw Settings ALG??
12.1 New

Position of option on menu: View => New

The New walk-right menu provides options to create views of type Plan, Section, Perspective, Perspective OpenGL and Perspective Hide.

After selecting one of the options, a new view of the appropriate type with the next sequential view number is created in the Views Area.
12.2 Toolbars

**Position of option on menu:** View => Toolbars
Clicking on Toolbars brings up the Customize Toolbars panel

![Customize Toolbars panel]

Clicking the tick on/off for a given toolbar or controlbar in the Toolbars list turns the toolbar or controlbar on/off.

Status Bar

**Position of option on menu:** View => Status Bar
Toggles the Status Bar on/off.

For more information please see 4.3.8 Status Bar.

12.3 Views

**Position of option on menu:** View => Views
The Views walk-right menu provides a list of the all the views defined in this session of 12d Model.
For each view in the list, a further walk-right menu lists all the models added to that view.

![View List panel]
12.4 View Info

Position of option on menu: View => View Info

Selecting View info fires up the View information panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>input</td>
<td>available views</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>input the name of the view to get information about</td>
</tr>
<tr>
<td>Point id info</td>
<td>tick box</td>
<td>tick</td>
<td>if ticked, the Point id min and Point id max fields are shown on the panel and when the Info button is pressed, their values calculated for the data on the view. If not ticked, the Point id min and Point id max fields are not shown on the panel.</td>
</tr>
<tr>
<td>Null level info</td>
<td>tick box</td>
<td>tick</td>
<td>if ticked, the Num null vertices field is shown on the panel and when the Info button is pressed, the value calculated for the data on the view. If not ticked, the Num null vertices field is not shown on the panel.</td>
</tr>
<tr>
<td>xmin/ymin/zmin, xmax/ymax/zmax</td>
<td>output</td>
<td></td>
<td>returns the limits of all the models on the view</td>
</tr>
<tr>
<td>Point id min/max</td>
<td>output</td>
<td></td>
<td>minimum/maximum integer point id in the model</td>
</tr>
<tr>
<td>Elements</td>
<td>output</td>
<td></td>
<td>returns the number of elements in all the models on the view</td>
</tr>
<tr>
<td>Num vertices</td>
<td>output</td>
<td></td>
<td>returns the number of points in all the models on the view</td>
</tr>
<tr>
<td>Point id min</td>
<td>output</td>
<td></td>
<td>the minimum Point id for the data on the view.</td>
</tr>
<tr>
<td>Point id max</td>
<td>output</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
the maximum Point id for the data on the view.

**Num null vertices** output

returns the number of null vertices in all the models on the view

**Info** button

get the information for the view given in the view field.

**Calc Extent** button

recalculate the x, y, z bounding box for the models on the view given in the view field.

**How to Use the Panel**

The view information for the view given in the view field is retrieved and placed in the appropriate panel fields when the view name is entered into the view field from the pop-ups, or a <enter> is entered after entering the view name into the view field, or on selecting the **info** button.
12.5 View Information Table

**Position of option on menu:** View => View info table

The View information table option displays the minimum and maximum x, y and z values for every model on the view, and by double-clicking on a model name in the list, brings up a String Information Table that lists all the strings in that model (see 13.3 Model Information Table).

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the sort menu on the column header fields.

Selecting View info table fires up the View Information Table panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>view box</td>
<td>available views</td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>column</td>
<td>sort menu</td>
<td></td>
</tr>
<tr>
<td>Read only</td>
<td>column</td>
<td>sort menu</td>
<td></td>
</tr>
<tr>
<td>Loaded</td>
<td>column</td>
<td>sort menu</td>
<td></td>
</tr>
<tr>
<td>Min X, Min Y, Min Z</td>
<td>columns</td>
<td>sort menu</td>
<td></td>
</tr>
<tr>
<td>Max X, Max X, Max Z</td>
<td>columns</td>
<td>sort menu</td>
<td></td>
</tr>
</tbody>
</table>

The name of the view to list all the models for.

All the models in the view are listed in the model column.

If no, in this current opening of the project, the model has not yet been fully loaded into 12d Model.

The minimum/maximum values for the model are displayed in the columns.
Created/Updated columns dates
dates the model was first created/updated

Update button
recalculate the minimum/maximum information in the table.

Notes
1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.
12.6 Create

Position of menu: View => Create

The floating Create menu item operates in two ways.

First, if Create itself is activated (by clicking LB when Create is highlighted), the New View panel appears. The New View panel can be used to create plan, perspective and sections views.

Secondly, the Create walk-right brings up a the View Create menu. This walk-right menu has separate options for creating plan, perspective and section views.

The Main menu option View => Create will only work the second way.

The Create walk-right menu is

![Create Menu]

The New View panel obtained by clicking LB on the Create menu item and the three options on the View Create menu will now be described.

For the option New view, go to

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plan view</td>
<td>create a plan view</td>
<td>12.6.1 New View</td>
</tr>
<tr>
<td>Plan OpenGL view</td>
<td>create a plan OpenGL view</td>
<td>ALG??</td>
</tr>
<tr>
<td>Perspective view</td>
<td>create a perspective view</td>
<td>12.6.2 Plan, Perspective and Section</td>
</tr>
<tr>
<td>Perspective OpenGL view</td>
<td>create a perspective OpenGL view</td>
<td>12.6.2 Plan, Perspective and Section</td>
</tr>
<tr>
<td>Section view</td>
<td>create a section view</td>
<td>12.6.2 Plan, Perspective and Section</td>
</tr>
</tbody>
</table>
12.6.1 New View

On selecting the **Create** option, the **New View** panel is displayed.

![New View Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>View name</strong></td>
<td>name of the new view to be created.</td>
<td>view box</td>
<td>next view number</td>
<td></td>
</tr>
<tr>
<td><strong>View type</strong></td>
<td>type of the view to be created.</td>
<td>choice box</td>
<td>plan</td>
<td>plan, persp, section, persp openGL</td>
</tr>
</tbody>
</table>

*type of the view to be created. There are three types of views - plan, perspective, perspective openGL and sections views.*

**Create** button

*after selecting this button, a new view of the name and type given in the panel is created in the Views Area. The panel then disappears.*
12d Model Reference Manual

12.6.2 Plan, Perspective and Section Views

Position of option on menu: View => Create => Plan/Perspective/Perspective OpenGL/Section view

On the Plan/ Perspective/ Perspective OpenGL/ Section view option, the New Plan/ Perspective/ Perspective OpenGL/ Section view panel is displayed.

The fields and buttons used in this panels have the following functions.

Field Description      Type     Defaults     Pop-Up

View name             input     next view number

name of the new plan/perspective/section view to be created.

Create                  button

after selecting this button, the new view of the specified name is created in the Views Area. The panel then disappears.
12.7 Dump

Position of option on menu: View => Dump

This option is used to write the view out in a user selected raster format. The option is identical to the Dump option on the View System menu.

![View Dump dialog box](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>view box</td>
<td></td>
<td>available views</td>
<td>name of the view to be dumped</td>
</tr>
<tr>
<td>Include title</td>
<td>tick box</td>
<td></td>
<td></td>
<td>if ticked, include the view title area in the dump</td>
</tr>
<tr>
<td>Format</td>
<td>choice box</td>
<td>jpeg</td>
<td>bmp, gif, jpeg, jpeg 2000, png, tga</td>
<td>format of the dump of the view</td>
</tr>
<tr>
<td>File</td>
<td>file box</td>
<td></td>
<td></td>
<td>name of the file for the dump of the view</td>
</tr>
<tr>
<td>Dump</td>
<td>button</td>
<td></td>
<td></td>
<td>dump the view in the given format</td>
</tr>
</tbody>
</table>
12.8 Rename

Position of option on menu:  View => Rename

This option renames an existing view.

Selecting Rename brings up the View Rename panel:

![View Rename panel]

The fields and buttons used in this panels have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Original view name</td>
<td>view box</td>
<td>current name of the view</td>
<td>available views</td>
</tr>
<tr>
<td>New view name</td>
<td>view box</td>
<td>new name for the view</td>
<td>available views</td>
</tr>
<tr>
<td>Rename</td>
<td>button</td>
<td>rename the view</td>
<td></td>
</tr>
</tbody>
</table>
12.9 Delete

**Position of option on menu:** View => Delete

This option deletes an existing view.

Since the easiest method to delete a view is to use the [X] in the top right hand corner of the view, the Delete View option is mainly used in rare cases such as when the view is not responding due a graphics card problem.

Selecting Delete brings up the Delete View panel:

![Delete View panel]

The fields and buttons used in this panels have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>view box</td>
<td>available views</td>
<td></td>
</tr>
<tr>
<td><em>name of the view to delete</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Delete</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>delete the view</em></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### 12.10 Models Save/Restore

**Position of option on menu:** View => Models save/restore

This option is used to write out a list of models on the view and also to read in a list of models and add them to a given view.

On selecting the Models save/restore option, the View save/restore models panel is displayed.

![View (Save / Restore Models) panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Save tab</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>File name for save</td>
<td>file for model list.</td>
<td>file</td>
<td>*.vml files</td>
<td></td>
</tr>
<tr>
<td>View to save</td>
<td>view to write out list of model for.</td>
<td>view</td>
<td>available views</td>
<td></td>
</tr>
<tr>
<td>Save</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Save tab**
- *after selecting this button, the names of all the model on the view are written out to the file.*

| **Restore tab**        |                            |         |                   |                         |

**Restore tab**
- *add the models in the list just read in to the given view.*
12.11 Models Transfer

Position of option on menu: View => Models transfer

This option is used to add all the models on one view to a different view.

Selecting Models transfer brings up the Models Transfer panel:

![Models transfer panel]

The user is then asked to click in the view to get the models from (source view) and then to select the destination view where the models are to be added to.

Note - if the destination view is a new view, click on Fit first to give the new view a valid coordinate system.
12.12 Send Tins/Rasters to Back

**Position of option on menu:**  View => Send tins/rasters to back

This option is used to send tins and rasters to the back of the drawing list.
12.13 Visualisation

**Position of menu:** View => Visualisation

This is a chargeable module which uses the Perspective OpenGL view to create realistic 3d pictures using raster drapes, bitmaps and extrusions along super strings.

The Visualisation walk-right menu is

![Visualisation Menu]

- **Tin render settings**
- **Tin height render settings**
- **View height render settings**
- **Render drape**
- **Texture map edit**
- **Billboards**
- **Extrusions**
- **Meshes**
- **Timelines**

For **Tin render settings**, go to

- 12.13.1 Tin Render Settings
- 12.13.2 Tin Height Render Settings
- **Render drape**
- 12.13.3 Render Drape
- **Texture map edit**
- 12.13.4 Texture Map Edit

12.13.1 Tin Render Settings

Position of option on menu:  View => Visualisation => Tin render settings
Position of option on menu:  Tins => Edit => Render settings

For a tin added to a Perspective OpenGL view with Shade ticked on, the triangles of the tin can be displayed as solid colour or various degrees of transparency depending of the Blending value for the tin which can vary between 1 and 0. If Blending is 1 the tin is opaque and triangles display as a solid colour, and Blending of 0 means the triangles are totally transparent.

A tin can be one sided and only viewable from above, or two sided and viewable from above or below.

Rasters, such as photos, can also be associated with a tin and when the tin is displayed in a Perspective OpenGL view with the shade turned on, the rasters are draped onto the tin wherever the triangles are still the base colour.

For triangles that are not the base tin colour, textures can be applied to the triangle using a Texture mapping file where the triangle colour is the index into the mapping file.

Finally text, filled polygons, text, billboards and images in models added to any Perspective OpenGL view that the tin is on can also be attributed so that they can be draped and displayed on the tin.

All these properties are known as Tin Render Settings and are set using this option.

IMPORTANT NOTE: the Visualisation module is required for the Tin Render Settings to be used on a Perspective OpenGL view.

Selecting Tin render settings brings up the Tin Render Settings panel
The fields and buttons used in this panel have the following functions.

**Field Description** | **Type** | **Defaults** | **Pop-Up**
--- | --- | --- | ---
**Tin to apply settings** | tin box | available tins | name of the tin to apply/modify the Tin Render Settings. Any existing Tin Render Settings of the tin are loaded into the appropriate panel fields so that they can be modified.

**Blending** | input | | Blending control the level of transparency of the tin.
0 means the tin is totally transparent (and hence invisible) and 1 means that the tin is opaque (non-transparent) and can’t be seen through at all.
If blank, then the Blending value defaults to 1 and the tin is opaque (non-transparent).

**Texture mapping** | texture mapping file box | | if non blank, the name of the set of colour-to-texture mappings that is defined in the file `textures_maps.4d`. The Texture Mapping set defines for a colour, what texture from the `textures.4d` file is applied to the triangles of the tin that have been coloured this colour (and the colour in no the base tin), rather than applying any raster to those triangles.

**Two sided tins** | tick box | | if ticked, the tin is visible when viewed from both above and below. For example, the tin used for the bottom of a bridge needs to be two-sided.
If non-tick, then the tin is one sided and only shows when viewed from above.

**Drape Rasters**

**Model of rasters** | model box | available models | if not blank, the model of ortho-rectified rasters to be associated with the tin and draped onto the tin when the tin is on a Perspective OpenGL view. The raster images will only be draped onto triangles that have the base tin colour.
Raster name

if non blank, the name of an ortho-rectified raster to be associated with the tin (and hence draped onto the tin when the tin is on an Perspective OpenGL view).

Drape Names

WARNING WHEN USING DRAPE NAMES
Because draped text, billboards, images and textures can all occur at the same (x,y) value and hence have the same z-value at that point, there are certain ordering rules controlling what you see.

First the model containing the tin needs to be brought to the FRONT of the view using Perspective OpenGL View Menu: Models => Models to front.

Then textures using the tin colour and the Texture mapping file will be drawn first, draped text will be next, then draped polygons and draped images fight it out.

Plan text

if not blank, when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, all vertex text that is using a true type font are draped onto the tin.

Plan polygons

when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name then it is draped onto the tin and if the value of the attribute is zero (0) the super string is draped and coloured using the strings fill colour, or if the value is one (1), a texture is draped onto the tin and the fill colour is used as the reference to the Texture mapping file given in the Texture mapping field, to specify which texture to drape.

The Integer string attribute name and value can be set using the option View => Visualisation => Render drape (see 12.13.3 Render Drape) or by setting an Integer string attribute of the required name and value using the option Strings => Properties => Attributes (see 14.12.8 Attributes).

Plan billboards

when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name and any value, all horizontal billboards (i.e. have Vertical turned off) are draped onto the tin.

The Integer string attribute with this name can be set using the Drape name field in the option View => Visualisation => Billboards => Add/Remove (ss) (see 12.13.5.2 Add and Remove Billboard from Super String) or by setting an Integer string attribute of the required name using the option Strings => Properties => Attributes (see 14.12.8 Attributes).

Plan images

when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name and any value, all images on the super string are draped onto the tin.

The Integer string attribute of this name is set using the option Strings => Properties => Attributes (see 14.12.8 Attributes).

Set button

apply the data in the panels fields to the tin.
visualisation textures draped on tin using base tin colour and texture mapping file
textures draped on tin using triangle colour and texture mapping file
texture draped on tin within a polygon using polygon fill colour as key to texture in texture mapping file
image draped on tin
polygon draped on tin using polygon fill colour
vertex text draped on tin

textures draped on tin using base tin colour and texture mapping file
12.13.2 Tin Height Render Settings

Position of option on menu: View => Visualisation => Tin height render settings

For a tin (that is not a super tin) the Tin Height Render Setting option sets the texture map and parameters that can be stretched over the specified height range.

To see the effect, the tin must be on a Perspective OpenGL view with Shade ticked on, and you have the Visualisation module.

Notes
1. this only displays when you have the Visualisation module.
2. This option does not work for a Super Tin.

Selecting Tin height render settings brings up the Tin Height Render Settings panel:
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin to apply settings</td>

</tbody>
</table>
12.13.3 Render Drape

**Position of option on menu:**  View => Visualisation => Render drape

Selecting Render drape brings up the Change Polygon Drape panel.

![Change Polygon Drape panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data source type</strong></td>
<td>Model</td>
<td>Model</td>
<td></td>
<td></td>

<tr>
<td><strong>Data source</strong></td>
<td>source of data to be processed.</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Action</strong></td>
<td>choice box [ignore, set, clear, ignore]</td>
<td>choice box</td>
<td>ignore</td>
<td>set, clear, ignore</td>
</tr>
</tbody>
</table>

If **set**, for each selected polygon, an Integer string attribute is created with the attribute name Drape name and the value of the attribute is

- 0 if Drape mode is Colour and
- 1 if Drape mode is Colour to texture.

If **clear**, for each selected polygon the Integer string attribute with name Drape name is removed.

If **ignore**, nothing is done.

**Drape name**

name of the Integer attribute that is set for the string. The attribute name is used to identify these polygon in the View->Visualisation->Tin Render Settings 16.6.7 Render Settings (see Plan polygons in the Drape Names section)

**Drape mode**

choice box [Colour, Colour to texture]

If Colour - the fill colours of the selected polygons are used for the drape

If Colour to texture - the fill colours of the selected polygons are used to reference the texture in the Texture Mapping file
Target type
Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info
input
extra information required for the target.

Change
button
process the selected strings.
12.13.4 Texture Map Edit

Position of option on menu:  Visualisation => Texture map edit

This option edits the texture mapping file (texture_map.4d) which contains the texture map tables that can be applied to the coloured triangles of a tin in renderings.

Each texture map table must have a unique name.

On selecting the Text map edit option, the Texture Map Create/Edit/Delete panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Texture map table</td>
<td>name of the texture map table inside the texture map file.</td>
<td>colour box</td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>colour to apply the texture to.</td>
<td>available colours</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Texture name</td>
<td>texture to apply to all triangles with the specified colour</td>
<td>available textures</td>
<td></td>
<td></td>
</tr>
<tr>
<td>New</td>
<td>to create a new texture map table, click on the New button and then type the texture map table name into the Texture map table field. Then start filling in the Colour and Texture name columns.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Update</td>
<td>update the given Texture map table with the values in the Colour and Texture name columns.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Delete</td>
<td>Delete the texture map table named in the Texture map table field.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Write</td>
<td>write out the texture map information to the texture map file, texture_map.4d.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
12.13.5 Billboards

Position of menu: View => Visualisation => Billboards

The billboard options plane an image onto a rectangular billboard. This can be used to display background scenes, signs etc.

The Billboard walk-right menu is

- Create and add
- Add/Remove (ss)
- Create many
- Create Forest
- Trees/shrubs
- Create from EXIF JPEG files

For the option Create and add, go to 12.13.5.1 Create and Place Billboard.

Add/Remove (ss) 12.13.5.2 Add and Remove Billboard from Super String

Create many 12.13.5.3 12D - Billboard Signs Create
Create forest 12.13.5.4 Create Forest
Trees/shrubs 12.13.5.5 Trees/Shrubs as Faces and Billboards
Create from EXIF JPEG files 12.13.5.6 Create Billboards from EXIF JPEG Files
12.13.5.1 Create and Place Billboard

**Position of option on menu:** View => Visualisation => Billboards => Create and add

This option defines a billboard (its size and position, the image on the billboard, etc.) and adds it to a super string and can also add it to the file billboards.4d which is used by other options.

The option always creates a super string with the billboard on it, so if you just wanted to add a billboard definition to the billboards.4d file, then use this option which creates a super string with the billboard, but then delete the created super string.

On selecting the Create and add option, the Create and Place Billboards panel is displayed.

![Create and Place Billboard panel](image)

The fields and buttons used in this panels have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

| **Image file**                     | file box        |          |        |
| name of the file containing the image to place on the billboard |
| **Alpha file**                     | file box        |          |        |
| currently not supported |

Image polygon
This polygon is used to crop the image. The billboard origin (0,0) is at the centre of the image and the world size of the image is determined by the Width and Height fields below. The Image polygon must also be drawn with the same (0,0) reference and in world units.

Number of fans
The billboard can consist of multiple copies of the image rotated equally around 180 degrees of the z-axis at x=0. This is mainly used for trees so that you see a tree no matter which direction you look from.
If Number of fans = 1, then the image is used on both sides of the billboard.
If Number of fans is left blank, then the image is used on one side of the billboard and the side is given the colour specified in the Colour field on the Positioning tab.

Width
The width in world units for the billboard (before the billboard it is cropped by any Image polygon).

Height
The height in world units for the billboard (before the billboard is cropped by any Image polygon).

Positioning tab
Model
Model for the created super string with the billboard.

Coordinate
The (x,y,z) coordinate of the vertex of the super string which has the billboard placed on it.

Colour
The colour used for the back of a billboard when Number of fans is left blank. Note if number of fans is 1 or more then the same image is used on both sides of the blades of the fan.

Billboard type
If Vertical, the string is placed vertically (upright) and nothing else is needed.
If Threed, a grid for entering Factor, Rotate and Offset values is displayed and these are used to control the position of the billboard in 3d.
If Plan, the billboard is a horizontal billboard and will draw on a Plan view. A billboard must be a Plan (or Horizontal) billboard when using Drape names for Plan billboards in the Tin Render Settings panel to drape horizontal billboards onto a tin (see 12.13.1 Tin Render Settings).

Angle
The angle the billboard is rotated in the (x,y) plane. Angle is measured counterclockwise in degrees in 4.17.1 HP Notation with zero along the x-axis.

Offset x, Offset y, Offset z
x/y/z distance to place the billboard away from the super string vertex.

Buttons at Bottom
Create
Creates the super string with the billboard on it.

Write
Writes out the new billboards.4d file.
12.13.5.2 Add and Remove Billboard from Super String

Position of option on menu: View => Visualisation => Billboards => Add/Remove (ss)

Each vertex of a super string can have its own billboard.

A billboard consists of an image and a width and height.

The Add/remove from super string option places a selected billboard either in a vertical plane or as a plan image at a user given distance from each vertex of a super string. The image it at a given angle or perpendicular to a selected string. An example could be the image on a stop sign which is in the vertical plane.

Selecting Add/Remove (ss) brings up the Change Super String Billboard panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>Model</td>
<td></td>
<td></td>
</tr>
<tr>
<td>data selection type - for a full description go to 4.19.3 Data Source.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data source</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>source of data to be processed.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Action**

- choice box
- ignore
- set, clear, ignore

  *If set*, the billboard is placed at each vertex in the super string.
  *If clear*, the billboard information at each vertex is cleared.
  *If ignore*, nothing is done to the billboard information.

**Billboard**

- billboard box

  *Billboard box* to be used.

**Angle**

- angle box

  *Angle box* - angle to rotation the billboard - positive is counter clockwise. *This is ignored if Perpendicular is used.*

**Colour**

- colour box

  *Colour box* - colour for the back of the billboard.

**Offset x, Offset y, Offset z**

- x/y/z distance to place the billboard away from the super string vertex.

**Vertical**

- tick box

  *If ticked*, the string is placed vertically and nothing else is needed.
  *If not ticked*, the billboard is a horizontal billboard and will draw on a Plan view. *This is also needed when using Drape names for Plan billboards in the Tin Render Settings panel to drape horizontal billboards onto a tin (see 12.13.1 Tin Render Settings).*

**Drape name**

- input

  *If Vertical is not ticked, then this field can be modified.*
  *If not blank, an Integer string Attribute is created with this name. The Drape name is used in the Tin Render Settings panel (see 12.13.1 Tin Render Settings) for draping horizontal billboards onto a tin.*

**Perpendicular**

- string select box

  *If a string is selected, then the billboard is placed on the line going through the vertex and perpendicular to the selected string. Angle is ignored.*

**Target type**

*Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.*

**Target info**

- input

  *Extra information required for the target.*

**Change**

- button

  *Process the selected strings.*
12.13.5.3 12D - Billboard Signs Create

Position of option on menu: View => Visualisation => Billboards => Create Many

This option takes images and creates entries in the billboards.4d file. Note that it does not create a super string with a billboard on it.

The option requires that you rename your images in the appropriate format:

Name   Width (m)   Height (m)  -> space separated.

For example, "sign 20 5.jpg" creates a billboard with the name "sign" which is 20 units wide and 5 units high.

Selecting Create Many displays the 12D - Billboard Signs Create panel:

![12D - Billboard Signs Create panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>choice box</td>
<td>JPG</td>
<td>BMP, JPG, PNG, TGA, ALL</td>

<tr>
<td>Fan</td>
<td>number box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Type of image files to read in.
- Browse to a dedicated folder. File names are used to create the billboard name, width and height, e.g. sign 20 5.jpg creates a billboard with the name sign 20 units wide and 5 units high.
- The billboard group to add the selected images to.
- If not blank, the number of extra fans to add to the billboard. If blank, no extra fans will be added to the billboard.
Read button

*Loads all the images of the specified type into 12d and adds them to the Group specified in the billboards.4d file. If the Group does not exist it is created.*

Write button

*Appends the new group to the billboards.4d file. You must restart 12d load the new billboards.4d file.*
12.13.5.4 Create Forest

**Position of option on menu:** Visualisation => Billboards => Create forest

Create forest creates randomly placed trees and shrubs in a selected polygon.

The forest make up is controlled by a user defined forest file which gives the types and distribution of trees, and variation in size and spread.

Selecting Create forest displays the Create Forest panel

![Create Forest panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field/Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forest boundary polygon</td>
<td>string select</td>
<td></td>
<td></td>

<tr>
<td>Forest floor tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td>Forest file</td>
<td>file box</td>
<td>.forests files</td>
<td></td>
</tr>
<tr>
<td>Trees per hectare</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model for forest</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Model for canopy data</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
</tbody>
</table>

**Clean model (s) beforehand**  
*If ticked*, the forest and forest canopy models are cleaned before the option is run

**Run**  
*Runs the option*
12.13.5.5 Trees/Shrubs as Faces and Billboards

**Position of option on menu:** View => Visualisation => Billboards => Trees/shrubs

**Position of option on menu:** View => Visualisation => Utilities => Trees/shrubs faces

The Trees/shrubs - faces option inserts the trees and shrubs as face elements. This means that each tree may consist of hundreds or thousands of faces.

The Trees/shrubs option inserts the images of trees and shrubs as a fanned billboard. This means that each tree consists of only one point.

On selecting the Trees/shrubs option, the **3D Tree Insertion** panel is displayed and on selecting the Trees/shrubs faces option, the **3D Tree Insertion - Faces** panel is displayed.

The fields and buttons used in these panels have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Tree and Shrub tabs</strong></td>
<td></td>
<td></td>

</tr>
</tbody>
</table>
**Model**  
model box  
model to add the tree/shrub to.

**Height and Spread**  
real value  
varies  
parameters for scaling

**Single**  
radio button  
if ticked then the tree is placed at the selected position.

**Along a string**  
radio button  
if ticked then the tree is placed along a string. When the string is selected then a Tree Interval panel is brought up to specify how the trees are placed along the string.

**Select**  
button  
select the string or position for the tree.

**Process**  
button  
insert the trees/shrubs.

## Tree Interval

This panel is for specifying how often the trees/shrubs are to be inserted along the string.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interval type</td>
<td>choice box</td>
<td>by number</td>
<td>by number</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>by distance</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>by special chg file</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>by vertex</td>
</tr>
</tbody>
</table>

- **by number**: an Interval number field is displayed on the panel and the tree is inserted that many times along the string.
- **by distance**: an Interval distance field is displayed on the panel and the tree is inserted with that distance separation along the string.
- **by special chg file**: a Special chg file field is displayed on the panel and the tree is inserted along the string at the chainages given in the file.
- **by vertex**: the tree is inserted at every vertex of the string.

**Set**  
button  
set the parameters for tree interval to those in the panel.
12.13.5.6 Create Billboards from EXIF JPEG Files

Position of option on menu: View => Visualisation => Billboards => Create from EXIF JPEG Files

This option reads in JPEG files which must include EXIF and GPS information. This information is then used to create and position a billboard with the image on the billboard.

If a Projection is selected by the user, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no Projection is given, then the co-ordinates are left as lat/long.

Note: EXIF is short for Exchangeable Image File, a format that is a standard for storing interchange information in digital photography image files using JPEG compression. Almost all new digital cameras use the EXIF annotation, storing information on the image such as shutter speed, exposure compensation, F number, what metering system was used, if a flash was used, ISO number, date and time the image was taken, white balance, auxiliary lenses that were used and resolution.

Selecting Create from EXIF JPEG Files brings up the Create Billboards from JPEG Files panel.

The fields and buttons in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
JPEG files | Advanced | tick box | not ticked |
File to read | file box | available *.jpg files |
Projection | choice box |
Colour | colour box | available colours |
Add plan images | if not blank and Add plan images is not ticked, then this colour is used for the back of the billboard. If blank, the colour is white.
Add plan images tick box not ticked
   if **ticked**, plan images are created instead of billboards.

Rotate plan images tick box not ticked
   if **ticked** and **Add plan images** is ticked, the rotate value from the EXIF will be used to rotate the image.

Pixel to mm measure box
   the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the **Pixel to mm** (mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.

Model for billboards model box
   the model for the image to be inserted into.

Create button
   when all the fields have been entered, the **Create** button creates images from the selected files.
12.13.6 Extrusions

Position of menu: View => Visualisation => Extrusions

In its basic form, an extrusion is taking a cross-section and pushing it (extrude it, or sweep it) along a string to create a 3D object. For example, a circle extruded along a string creates a pipe. For more information, go to the section 12.13.7 Defining Extrudes and Extrusions.

There is a library of extrusions read in for the project, usually stored in the file extrusions.4d.

The Extrusions walk-right menu is:

For the option String along string, go to 12.13.8.1 String Extrude
Library extrude 12.13.8.2 Change Library Extrude
Roadside furniture 12.13.8.3 Roadside Furniture
Create 12.13.8.4 Create Group Extrusions
Fences 12.13.35.3 Fences
Tutorial 12.13.8.5 Tutorial to Create Group Extrusions

More information on extrudes is found in the section 12.13.7 Defining Extrudes and Extrusions.
12.13.7 Defining Extrudes and Extrusions

In its basic form, an extrusion is simply taking a cross-section and pushing it (extrude it) along a string to create a 3d object. For example, a circle extruded along a string creates a pipe.

The string that is pushed along the string is called the **extrude**.

**Note:** this is also known as a Sweep or Swept Path.

![Diagram of extrusion](image)

Only the \((x,y)\) co-ordinates of the string used as the extrude are used and that gives the shape of the cross-section with the \((0,0)\) point being the point where the string being extruded along sits.

So the \((x,y)\) co-ordinates of the extrude are being taken as \((\text{offset}, \text{height})\) in the plane perpendicular to the string being extruded along. So extrudes are normally defined around \((0,0)\) in the \((x,y)\) plane.

**Interval extrude**

The interval extrude can be seen as a series of string extrudes applied along the string at a specified interval distance. Here is an example of a 'Ring' interval extrude:
This extrude is defined by a diamond being extruded along a circle, and finally being instanced along the super string at the specified interval.
The extrusions.4d fragment defining this extrude is:

```
interval_extrude {
  name      "Vertical Ring"
  colour    true
  mirror_x  false
  interval  4.0
  factor_x  1.0
  factor_y  1.0
  factor_z  1.0
  rotate_x  0.0
  rotate_y  90.0
  rotate_z  0.0
  offset_x  0.0
  offset_y  0.0
  offset_z  0.0
}
```
at_grade false

path {

// the string that the extrude is drawn along

  name   "circle path"
  breakline line
  colour  white
  style   1
  closed  1

  data_3d { // note must be defined with x,y,z data
    0 0.0 0.0
    1 0.0 0.0
  }
  radius_data {
    0.5
    0.5
  }
  interval {
    chord_arc  0.005
    distance  -999
  }
}

data {

// the shape of the extrude

  name   "path data"
  breakline line
  colour  magenta
  style   1
  closed  1

  data_2d {
    -0.1  0.0
    0.0  0.1
    0.1  0.0
    0.0 -0.1
  }
  interval {
    chord_arc  0.001
    distance  -999
  }
}
}

TODO: define group extrude:

A group extrude is a combination of string and interval extrudes.
12.13.8 3D Transformations

This transformation consists of factor (scale), rotation, and offset (translation) for x, y, and z. Transformations are always applied in the following order:

rotate, factor, offset about the axes z, y, x

rotate z occurs in the x-y plane (plan rotation)
rotate y occurs in the x-z plane (slope rotation)
rotate x occurs in the y-z plane (super-elevation rotation)
factor z
factor y note: factors are commutative (any order is the same)
factor x
offset z
offset y note: offsets are commutative (and order is the same)
offfset x

Note that the rotations about each axis are in the local coordinate system of the object being rotated. So after each rotation, the axes are also rotated.

12.13.8.1 String Extrude

Position of option on menu: View => Visualisation => Extrude along string

The String along string option extrudes a selected super string along a super string. It can also be used to extrude a library extrude along string. But if a library extrude is to be applied to many strings, the Library Extrude option is more appropriate (12.13.8.2 Change Library Extrude).

More information on extrudes is found in the section 12.13.7 Defining Extrudes and Extrusions.

On selecting the Extrude option, the String Extrude panel is displayed.
The fields and buttons in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>String</strong></td>
<td>super string to extrude along</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Use library extrude</strong></td>
<td>if ticked, an existing extrusion is selected from the extrusion library. The extrude from the library is selected in the Extrude name field. If not ticked, the Extrude string and Scale panel fields are used.</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Extrude name</strong></td>
<td>select the name of the extrude to use from the extrude library.</td>

</tbody>
</table>
12.13.8.2 Change Library Extrude

Position of option on menu: Visualisation => Library extrude

This option can apply an extrusion from the extrusions library, extrusions.4d, to a super string, or change the extrusion applied to a super string, or remove an extrusion from a super string.

Selecting Library extrude brings up the Change Library Extrude panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>Model</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data source</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*data selection type - for a full description go to 4.19.3 Data Source.*
**Action**

Choice box: set, clear

*If clear,* all existing extrusions are removed from the selected super strings. The only other fields to be filled in is the Target.

*If set,* a library extrude is applied to the selected super strings.

**Extrude name**

Extrude box: list of extrusions

Extrude to be applied to the super strings.

**Overwrite library properties**

Tick box

*If ticked,* the placement of the extrude uses the information in the grid on the panel. If not ticked, the placement properties are taken from the extrude in the library.

**Start/end chainage**

Chainage box

Start/end chainage for applying the extrusion.

**Start/end chainage**

Chainage box

Start/end chainage for applying the extrusion. If blank, use the strings start/end.

**Chainage interval**

For an interval extrude only - interval to use for the extrude.

**Grid of X,Y,X against Factor, Rotate, Offset**

Placement information for applying the extrude.

**Use extrude colour**

Tick box

*If ticked,* the placement uses the information in the grid on the panel. If no ticked, then the string segment colour is used for the extrusion.

**Reflect extrude**

Tick box

*If ticked,* the extrude is reflected in the local y axis before it is applied.

**Replace existing extrudes**

Tick box

*If ticked,* all existing extrudes are cleared before the new one is applied.

**Target type**

Data target type - where to put the processed strings. For a full description go to 4.19.4 *Data Target*.

**Target info**

Input

Extra information required for the target.

**Change**

Button

Process the selected string
12.13.8.3 Roadside Furniture

Position of option on menu: View => Visualisation => Extrusions => Roadside furniture

This option is for inserting extruded objects that have been supplied by 12D Solutions Pty Ltd. It includes street lights, log barriers, park bench, posts and columns, walls, timber fences, guard rails, signs etc.

The list of items that can be inserted is being continuously upgraded by 12D Solutions.

Selecting Roadside furniture brings up the Roadside Furniture panel.

Clicking on the tabs brings up the information required for that piece of roadside furniture.

For all the tabs other than Park Bench, Street Light and Guard Rail, once a tab had been selected, moving the cursor over the picture brings up a special panel for the extra information required.

For example, for the Sign tab, moving the cursor over the picture brings up the Sign Details panel:
New 12D Ascii

This option is similar to the others e.g. Street Light, but allows the user to create their own features and place them in the same manner as the others on the panel.

Specifications for an ascii file:

The stem of the ascii file name, the model name in the ascii file and the stem of the bitmap name showing the picture of the object..... "MUST" be the same e.g. File: User Street Light.12da Model: User Street Light Bitmap: User Street Light.bmp

Bitmap size to be 345W x 250H pixels

Place the 12da file and the bitmap in your User_Library
12.13.8.4 Create Group Extrusions

Position of option on menu: View => Visualisation => Extrusions => Create

The Create option creates groups extrusions and saves them to the extrusions.4d file.

Selecting Create brings up the Create - Group Extrusions panel.
12.13.8.5 Tutorial to Create Group Extrusions

**Position of option on menu:**  View =>Visualisation => Extrusions =>Tutorial

The Tutorial option demonstrates how to creates groups extrusions and will also create groups extrusions.

Selecting Tutorial brings up the **Tutorial - Group Extrusions** panel.
12.13.9 Meshes

**Position of menu:** View => Visualisation => Meshes

The Meshes walk-right menu is

```
Meshes
Mesh library
Place mesh
Convert to 12dmesh
```

For the option Mesh library go to 12.13.9.1 Mesh Library

Place Mesh 12.13.9.3 Place a Mesh

Convert to 12dmesh 12.13.9.4 Convert to 12dMesh Format

12.13.9.1 Mesh Library

**Position of option on menu:** View => Visualisation => Meshes => Mesh Library

**Position of option on menu:** View => Visualisation => Timelines => Mesh Library

The Mesh Library allows you to predefine meshes and the standard transformations required to get them into a world co-ordinate system. As meshes may come from a variety of packages that use arbitrary scales, rotations or offsets, this may be necessary.

It can also be used to define anchors, to anchor a mesh to the tin. This can be useful to get your mesh to conform to a terrain, such as a vehicle running down a road.

The mesh can then be written to the mesh library file, mesh_library.4d

Selecting Mesh Library brings up the Mesh Library panel.
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library file</td>
<td>file</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>the mesh library file to read/write</em></td>
<td></td>
</tr>
<tr>
<td>Read</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>reads a mesh library file</em></td>
<td></td>
</tr>
<tr>
<td>Write</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>writes a mesh library file</em></td>
<td></td>
</tr>
<tr>
<td>+ (Add)</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>adds a new mesh</em></td>
<td></td>
</tr>
</tbody>
</table>
Folder (Create Folder)

Creates a new folder for categorising meshes

Delete

Deletes a mesh or folder

Name

the name of the current mesh

Mesh file

the mesh file, in OBJ format

General tab

<table>
<thead>
<tr>
<th>General</th>
<th>Anchors</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset X</td>
<td>Offset Y</td>
</tr>
<tr>
<td>Scale X</td>
<td>Scale Y</td>
</tr>
<tr>
<td>Rotate X</td>
<td>Rotate Y</td>
</tr>
</tbody>
</table>

Offset x

an optional offset along the x axis to apply

Offset y

an optional offset along the y axis to apply

Offset z

an optional offset along the z axis to apply

Scale x

an optional scale to apply to the x scale of the object

Scale y

an optional scale to apply to the y scale of the object

Scale z

an optional scale to apply to the z scale of the object

Rotate x

an optional rotation around the x axis

Rotate y

an optional rotation around the y axis

Rotate z

an optional rotation around the z axis

Anchors tab

The Anchors tab is used to define anchors, for anchoring a mesh to a tin. To do this, you must
define four anchors, at each corner of the mesh.

Back left

defines the co-ordinates of the back left point of the mesh

Back right

defines the co-ordinates of the back right point of the mesh

Front left

defines the co-ordinates of the front left point of the mesh

Front right

defines the co-ordinates of the front right point of the mesh

Find anchors button

As you may not know the co-ordinates, you may use the **Find Anchors** button to see a list of a number of the lowest points on the mesh. For more information see 12.13.9.2 Find Anchors

Update Preview button

updates the preview based on the transformation settings

Draw? tick box

whether or not to draw the mesh in the viewer at the bottom

Auto rotate? tick box

whether or not to automatically rotate the mesh

Auto scale? tick box

whether or not to scale the mesh based on supplied transformations

12.13.9.2 Find Anchors
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>a known anchor point</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Anchor</td>
<td>the anchor to set. You only need to set four anchors.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Set</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When you select a row, the preview on the [12.13.9.1 Mesh Library](#) will show a symbol to indicate where that co-ordinate is located.
12.13.9.3 Place a Mesh

Position of option on menu: View => Visualisation => Meshes => Place a mesh

This panel allows you to place a mesh as the vertex of a super string.

Selecting Place a mesh brings up the Place a mesh panel.

The fields and buttons used in the panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Source | choice box | | Library, File

Whether the mesh comes from the Mesh Library or a separate file

if Sources is Library:

Mesh
the name of the mesh (from the mesh library) to place

Anchor tin
an optional tin to anchor the mesh to

if Source is File:

Mesh file
the file (containing the mesh definition) to use

Model
model box

the model to place the mesh in

Coordinate
the co-ordinate to place the mesh at
Offset x
   an optional offset along the x axis to apply

Offset y
   an optional offset along the y axis to apply

Offset z
   an optional offset along the z axis to apply

Scale x
   an optional scale to apply to the x scale of the object

Scale y
   an optional scale to apply to the y scale of the object

Scale z
   an optional scale to apply to the z scale of the object

Rotate x
   an optional rotation around the x axis

Rotate y
   an optional rotation around the y axis

Rotate z
   an optional rotation around the z axis

Place button
   places the mesh
12.13.9.4 Convert to 12dMesh Format

Position of option on menu: View => Visualisation => Meshes => Convert to 12dmesh

This option converts most files in OBJ format to the 12dmesh format. Selecting Convert to 12dmesh brings up the Convert to 12dmesh format panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>

**Target timeline** choice box

the type of target timeline

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.15 Floating Eye Timeline

A **Floating Eye** allows the camera to be fixed on a known target, but the user can retain control over the position of the eye. The **Floating Eye** is a camera type. It can only be accessed by first setting the eye type of a camera to **Floating Camera**.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset x</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>an optional x offset from the target. If not set, the current x offset from the target will be used.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset y</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>an optional y offset from the target. If not set, the current y offset from the target will be used.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset z</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>an optional z offset from the target. If not set, the current y offset from the target will be used.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For all other fields and buttons please see [12.13.11 Timeline Common Fields and Buttons](#).
12.13.16 3d Object Timeline

The **3d Object Timeline** draws a 3d object on any number of views at a given time. A 3d object may include a mesh from another package, in the OBJ (Alias Wavefront) format.

Creating a **3d Object Timeline** will create two sub timelines automatically - the initial transformation and other transformations.

Initial transformations should be used to convert your mesh into world co-ordinates, as meshes may come from a number of packages with arbitrary scale, offsets or rotations.

![Edit Timeline](image)

The fields and buttons used in the panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
View Grid | the list of OpenGL perspective views to draw on | | |
Load From | choice box | From library, From file | |
Mesh file | file | | when loading from file, the mesh file to use
Anchor to tin

a tin to anchor the mesh to - useful for vehicles on terrain. Note that this will only work for a library mesh that has anchor points defined.

<table>
<thead>
<tr>
<th>Load from</th>
<th>From library</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library mesh</td>
<td></td>
</tr>
<tr>
<td>Anchor to tin</td>
<td></td>
</tr>
<tr>
<td>Enabled</td>
<td></td>
</tr>
<tr>
<td>Can toggle?</td>
<td></td>
</tr>
</tbody>
</table>

Display a 3d Object and any textures.
The object should be in the open .OBJ format.

Library mesh

this field is displayed when From Library is selected from the Load From choice box.

when loading from a library, the mesh to use

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.17 2d Symbol Timeline

This allows you to define the settings for drawing a 2d symbol on a number of plan views.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symbol</td>
<td>symbol box</td>
<td>the symbol to draw</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>colour box</td>
<td>the colour for the symbol</td>
<td></td>
</tr>
<tr>
<td>View grid</td>
<td></td>
<td>the list of plan views to draw the symbol</td>
<td></td>
</tr>
</tbody>
</table>

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.18 Linear Path Timeline

This editor defines the settings for a Linear Path Timeline. A Linear Path Timeline returns the position and direction on a string linearly, to fit the amount of time supplied.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Path string</strong></td>
<td>string select</td>
<td>the string to follow</td>
<td></td>
</tr>
<tr>
<td><strong>Start chainage</strong></td>
<td></td>
<td>the optional start chainage</td>
<td></td>
</tr>
<tr>
<td><strong>End chainage</strong></td>
<td></td>
<td>the optional end chainage</td>
<td></td>
</tr>
<tr>
<td><strong>Offset</strong></td>
<td></td>
<td>an offset from the path string</td>
<td></td>
</tr>
<tr>
<td><strong>Reverse?</strong></td>
<td>tick box</td>
<td>whether or not to reverse the direction (start at end)</td>
<td></td>
</tr>
</tbody>
</table>

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.19 Chainage Timeline

This editor allows you to define the settings for a Chainage Timeline. The Chainage Timeline follows a string or path by querying another string that defines the chainage to use at a given time. For the Chainage Timeline, the chainage string should be defined with X being time and Y being the chainage.

The Chainage Timeline will return the position and direction at the current chainage of the path string.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path string</td>
<td>the string to follow</td>
<td>string</td>
<td>select</td>
<td></td>
</tr>
<tr>
<td>Chainage string</td>
<td>the string that defines what chainage to use at what time</td>
<td>string</td>
<td>select</td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td>an offset from the path string</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in the panel have the following functions.

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.20 Fixed Position Timeline

This editor allows you to define the settings for a Fixed Position Timeline. A Fixed Position Timeline will always return the supplied position.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coordinate</td>
<td></td>
<td>null null</td>
<td></td>
</tr>
</tbody>
</table>

Coordinate
the coordinate of the fixed position

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.21 Manual Transform Timeline

This editor defines the settings for a **Manual Transform Timeline**. A manual transform is either an offset, rotation or scale on the current transformation being applied to a timeline.

![Edit Timeline Panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>choice box</td>
<td></td>
<td>Offset, Rotate, Scale</td>
</tr>
</tbody>
</table>

*the mode of transformation: offset, rotate or scale*

**Offset** defines the parameters for an offset transformation
Offset X
the optional offset to x

Relative? tick box
whether or not Offset X is a relative or absolute offset

Offset Y
the optional offset to y

Relative? tick box
whether or not Offset Y is a relative or absolute offset

Offset Z
the optional offset to z

Relative? tick box
whether or not Offset Z is a relative or absolute offset

Offset in local co-ordinates tick box
whether or not the offset should be applied before or after the transformation to local co-ordinates

Rotate defines the parameters for a rotation transformation

Rotate X
the optional rotation around the x axis

Relative? tick box
whether or not the X rotation is relative or absolute

Rotate Y
the optional rotation around the y axis

Relative? tick box
whether or not the $Y$ rotation is relative or absolute

**Rotate Z**
the optional rotation around the $z$ axis

**Relative?** tick box
whether or not the $Z$ rotation is relative or absolute

**Scale** defines the parameters for a scaling transformation

![Scale Interface]

**Scale X**
the optional $x$ scale

**Relative?** tick box
whether or not the $x$ scale is relative

**Scale Y**
the optional $y$ scale

**Relative?** tick box
whether or not the $y$ scale is relative

**Scale Z**
the optional $z$ scale

**Relative?** tick box
whether or not the $z$ scale is relative

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.22 Transformation String Timeline

The Transformation String Timeline modifies one parameter of a transformation, based on a profile string. The profile string should be created such that x is time and y is the value of the parameter.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>the parameter to update.</td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Profile string</td>
<td>the profile string to use to modify the parameter</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Use Y as Radians** tick box  
enabled when the parameter is a rotation parameter.  
if ticked, the value of Y will be considered to be radians rather than degrees.

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.23 Transform Reference Timeline

This editor defines the settings for a Transform Reference Timeline. A Transform Reference Timeline uses the transformation as supplied by another timeline. It is useful, for example, to make the target of a camera follow a vehicle, as it will return all the transformations from the reference timeline.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference mode</td>
<td>choice box</td>
<td>Timeline, View</td>
<td></td>
</tr>
</tbody>
</table>

whether to reference another timeline or a view

Timeline

the timeline to reference, if Reference mode is set to Timeline
View

the view to reference, if Reference mode is set to View

Use Parameters

defines which of the parameters to use from the transformation

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.24 Chain Event Timeline

This allows you to define the settings for a Chain Event Timeline. A Chain Event Timeline runs a chain at discrete intervals or specific times.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>choice box</td>
<td>Specific times, On interval</td>
<td></td>
</tr>
<tr>
<td>Run every (seconds)</td>
<td>if mode is set to On Interval, the interval, in seconds, between runs of the chain</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time Grid</td>
<td>if mode is set to Specific times, the list of times, in seconds, the chain should be run</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Chain file</td>
<td>file</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameter file</td>
<td>file</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
the optional parameter file to pass to the chain

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.25 Macro Event Timeline

This allows you to define the settings for a Macro Event Timeline. A Macro Event Timeline runs a macro at discrete intervals or specific times.

![Edit Timeline Panel]

The fields and buttons used in the panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mode</strong></td>
<td>choice box</td>
<td>Specific times, On interval</td>
<td></td>
</tr>
<tr>
<td><strong>Run every (seconds)</strong></td>
<td>if mode is set to <strong>On interval</strong>, the interval, in seconds, between runs of the macro</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Time Grid</strong></td>
<td>if mode is set to <strong>Specific times</strong>, the list of times, in seconds, the macro should be run</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Macro file</strong></td>
<td>file</td>
<td>the macro file to run</td>
<td></td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

At some time, either at an interval or specific times, run a macro.
Two command line arguments will be passed down to the macro.
1) The time of the event
2) The actual time the event is run
the optional arguments to pass to the macro

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.26 Overlay Timeline

This editor defines the setting for an **Overlay Timeline**. An **Overlay Timeline** draws a model as an overlay, or on a 2 dimensional plane, on top of a number of perspective views. Any children timelines will also appear in the overlay plane.

An **Overlay Timeline** is quite useful for showing diagnostic or other information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>View Grid</strong></td>
<td><em>the set of views to draw the overlay plane on</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Overlay model</strong></td>
<td><em>the model to draw as an overlay plane</em></td>
<td>model box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For all other fields and buttons please see [12.13.11 Timeline Common Fields and Buttons](#).
12.13.27 Static Text Timeline

This editor edits the settings for a **Static Text Timeline**. A **Static Text Timeline Draws** user defined text on a perspective view.

![Edit Timeline](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Grid</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the list of perspective views to draw on</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Text</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the text to draw</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Text style</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the style of the text</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Pre*Post</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>an optional pre*post to apply to the text</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.28 Text Profile String Timeline

This edits the settings for a **Text Profile String Timeline**. A **Text Profile String Timeline** displays text as defined by a profile string, at each time step in the timeline. The profile string should be created with X being time and Y being the value to display.

![Edit Timeline](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View grid</td>
<td>the list of OpenGL views to draw text on</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Text style</td>
<td>the style of the text</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Profile string</td>
<td>the profile string to use</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in the panel have the following functions.

**View grid**
- the list of OpenGL views to draw text on

**Text style**
- the style of the text

**Profile string**
- string select
Pre*Post

*an optional Pre*Post to be applied to the text*

Width

*an optional width of the text*

Precision

*an optional precision for the text - used when displaying variables of type Real*

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.29 Text Vertex String Timeline

This editor allows you to define the settings for a Text Vertex String Timeline. A Text Vertex String Timeline draws the text on the vertex of a supplied profile string at the given time. The string should be created such that X is time.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Grid</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>String</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Enabled</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Can toggle?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Text style</td>
<td>&quot;1&quot; left bottom red 10 0 1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*View Grid*

the list of OpenGL views to draw the text on

*String*

the string to draw

*Text style*
the style of the text

Pre*Post

an optional Pre*Post to be applied to the text

Width

an optional width of the text

Precision

an optional precision for the text - used when displaying variables of type Real

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.
12.13.30 Text Variable Timeline

This edits the settings for a **Text Variable Timeline**. A **Text Variable Timeline** displays text on a number of OpenGL perspective views, by specifying a variable or property of another timeline.

Each timeline publishes a number of variables or properties that can be used - such as start time, end time or other context specific items.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>View grid</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Source timeline</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Text style</strong></td>
<td>“1” left bottom red 10 0 1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Pre”Post</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Width</strong></td>
<td></td>
<td>123</td>
<td></td>
</tr>
<tr>
<td><strong>Precision</strong></td>
<td></td>
<td>123</td>
<td></td>
</tr>
<tr>
<td><strong>Enabled</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Can toggle?</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Display text, based on some variable of another timeline.</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in the panel have the following functions.

- **View grid**: the list of OpenGL views to draw the text on
- **Source timeline**
the timeline whose variable you wish to draw as text

Variable choice box
the variable to be drawn

Text style
the style of the text

Pre*Post
an optional Pre*Post to be applied to the text

Width
an optional width of the text

Precision
an optional precision for the text - used when displaying variables of type Real

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.30.1 Edit a Timeline

Position of option on menu:  View =>Visualisation =>Timelines => Edit

This panel creates a new timeline file or edits an existing one.
Selecting Edit brings up the Edit a timeline panel.

The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up
Timeline file
the file to edit or create
Create button
creates the new file
Edit button
edits an existing timeline file

12.13.30.2 Play a Timeline

Position of option on menu:  View =>Visualisation =>Timelines => Play

This panel plays a timeline file.
Selecting Play brings up the Play a timeline panel.
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>

**Timeline tab**

- **Timeline**
  - file
  - the timeline file to run

- **Start time**
  - the time at which to start playing the file

- **Time multiplier**
  - an optional multiplier (for example, setting this to 2 would run the timeline at 2x, meaning each second would take half a second to play)

- **Auto play**
  - tick box
  - whether or not to start playing the timeline when it is run

**Movie tab**

- **Create movie?**
  - tick box
  - if ticked, a movie is generated

- **Movie file**
  - file box
  - available *.avi files
  - name of the movie file

- **Record whole application**
  - tick box
  - if ticked, the whole application will be recorded, rather than just a selected view

- **View**
  - view box
  - (only if Record whole application is not ticked) the view of which to record the movie

- **Frames per second**
  - number box
  - 10
  - the number of frames per second

**Buttons at bottom**

- **Run**
  - button
  - runs the timeline
12.13.31 Timeline Playback Control Bar

The timeline playback control bar appears when a timeline is running. It offers playback controls while the timeline runs.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restart</td>
<td>Restarts the timeline</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step back</td>
<td>Steps back by the nominated time step (the input box on the right)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Play / Pause</td>
<td>Plays or pauses the playback of the timeline</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Stop</td>
<td>stops running the timeline</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step forward</td>
<td>Steps forward by the nominated time step (the input box on the right)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time multiplier</td>
<td>Sets the time multiplier. For more information on the Change Timeline Multiplier panel, please see 12.13.32 Change Timeline Multiplier</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interactive camera</td>
<td>Defines interactive cameras at runtime</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Toggle</td>
<td>Toggles timelines enabled state on or off. For more information on the Enable/ Disable Timelines panel, please see 12.13.33 Enable / Disable Timelines</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
12.13.32 Change Timeline Multiplier

This sets the current time multiplier for the timeline. For example, setting this to 2 would run the timeline at 2x, meaning each second would take half a second to play.

Clicking \( \text{X} \) on the Timeline Playback Control Bar brings up the Change timeline multiplier panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Multiplier</strong></td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Set</strong></td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

\( \text{the multiplier to apply} \)

\( \text{sets the multiplier} \)
12.13.33 Enable / Disable Timelines

This panel provides a list of the timelines currently running and allows you to enable or disable them quickly. They can only be enabled or disabled if they are set to Can toggle?. Note that if you disable a parent, all child timelines will also be disabled. The Can toggle? tick box is found on the editor for each timeline.

To disable, simply tick off the required timeline and vice versa to enable them again. Clicking on the Timeline Playback Control Bar brings up the Enable/ disable timelines panel.
12.13.34 Timeline Camera

This panel allows you to define cameras for a supplied view during run time. Clicking on the Timeline Playback Control Bar brings up the Timeline Camera panel.

![Timeline Camera Panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>the perspective view to control</td>
<td>view box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Target</td>
<td>a target timeline to reference</td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Eye Mode</td>
<td>the mode for the eye of the camera, either fixed, offset or floating</td>
<td>choice box</td>
<td>Fixed, Offset, Floating</td>
<td></td>
</tr>
</tbody>
</table>

**Fixed**

\[Position X coordinate\]
the x coordinate of the fixed eye

\[Position Y coordinate\]
the y coordinate of the fixed eye

\[Position Z coordinate\]
the z coordinate of the fixed eye

Use view eye button
loads the eye settings from the supplied view

Offset

Offset X
the x offset of the eye from the target

Offset Y
the y offset of the eye from the target

Offset Z
the z offset of the eye from the target

Floating
Float mode sets the timeline camera into a floating mode. This means the camera will be set to a fixed target, but the user will retain control over the camera. When started, the camera will start at the current offset from the target.

Set button
Creates and sets the details for the camera
**12.13.34.1 Quick Timeline Create**

**Position of option on menu:** View => Visualisation => Timelines => Quick timeline

This option creates a timeline along a selected Drive String, with the choice of a set of vehicles and/or a floating camera.

An optional Start and End chainage can be entered to limit the length of travel.

Enter a speed for the drive and an anchor tin for the four tyre anchor points of the vehicles.

The Calc Time button will calculate, in seconds, the travel time Duration at the selected speed.

Vehicles are defined as meshes and can be Grouped together under a Name and a start time (in seconds)....optional.

Upon completing your selections (Drive String, Speed, Vehicles etc).... Save the selection using the Append button, and Write the file out.

Note: More than one Drive string and set of vehicles can be selected, appended and finally all written out in the same timeline file. Depending on the location of your drive string selection and its direction, you may have to enter an offset for the vehicles, and/or tick Reverse.

Once the timeline is written, it can be played under View=>Visualisation=>Timelines=>Play

Selecting Quick timeline brings up the 12d Quick timeline create panel.
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Floating Camera</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
</tbody>
</table>

A floating camera allows you to specify the floating eye component of a camera.

The target is defined as the Drive String, but during the playing of the timeline, the eye can be moved independently by the user (e.g. using the Orbit).

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vehicles</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
</tbody>
</table>
Ticking this option on turns on appropriate fields for setting up timelines for vehicles.

**Timeline File**
- file box
- available files
  - If non-blank, entry used as timeline file name.

**Drive String**
- string select
  - If selected, string is used as timeline drive string and timeline duration can be calculated.
  - If non-blank, entry used as timeline file name.

**Start Ch**
- real
  - If non-blank, entry used as start of timeline...optional.

**End Ch**
- real
  - If non-blank, entry used as end of timeline...optional.

**View for display**
- view box
- available views
  - If non-blank, entry used to play back the timeline (an Open GL Perspective View is required).

**Speed for journey (km/h)**
- real
  - If non-blank, entry used to calculate the timeline duration in seconds.

**Anchor Tin**
- tin box
  - If non-blank, entry used as the location for the four vehicle tyre points.

**Global Options**

**Duration**
- real
  - If non-blank, entry used as timeline length (can be calculated initially via the Calc Time button).

**Loop Vehicles?**
- tick box
  - If ticked, the set of vehicles will be replayed during the timeline.

**Group Options**

**Name**
- name box
  - If non-blank, entry used for the grouping of the vehicles under that name and can be toggled off during the playing of the timeline...optional.

**Start**
- real
  - If non-blank, entry used for start time of the group (in seconds)...optional.

**Vehicle Mesh <Group Files>**

**File**
- file box
  - If non-blank, entry used for populating the grid selection of vehicle meshes.
  - Refer library for standard examples.

**Read**
- button
  - Reads in the file above and populates the vehicle grid.

**Write**
- button
  - Writes out the data currently in the vehicle grid to the file.

**Vehicle Mesh Grid:**

**Vehicle Mesh**
- Vehicle choices (can be viewed under View=>Visualisation=>Meshes=>Mesh library
**Offset**
Real

*If non-blank entry used for offset from drive string*

**Reverse**
tick box not ticked

*If ticked, vehicles will run in the opposite direction to the drive string direction.*

**Calc Time**
button

*Calculates the time of travel in seconds using the Drive String and Speed of journey.*

**Append**
button

*One or more timelines (Drive String, speed, vehicle etc) can be appended, before finally being written out to the timeline file.*

**Write**
button

*After appending, the Timeline File is written out.*
12.13.35 Utilities

Position of menu: View => Visualisation => Utilities

The Utilities walk-right menu is

- create box of clouds as background
- create sky dome of clouds as background
- change billboards on super strings
- inserting fences
- create forest
- insert houses
- create strings for line marking
- insert fences, guard rails, signs, walls etc.
- insert trees and shrubs as billboards
- insert trees and shrubs as faces
- colour within a polygon
- explode text into vectors so it can be draped onto surface
- create plan images from JPEG files which include EXIF and GPS data

For the options, see

- Clouds 12.13.35.1 Clouds
- Sky dome 12.13.35.2 Sky dome
- Billboards on strings 12.13.5.1 Create and Place Billboard
- Fences 12.13.35.3 Fences
- Forest 12.13.5.4 Create Forest
- Houses 12.13.35.4 Houses
- Line marking 12.13.35.5 Line Marking
- Line marking (New) 12.13.35.6 Line Marking (New)
- Roadside furniture 12.13.8.3 Roadside Furniture
- Trees/shrubs billboards 12.13.5.5 Trees/Shrubs as Faces and Billboards
- Trees/shrubs faces 12.13.5.5 Trees/Shrubs as Faces and Billboards
- Traffic signals 12.13.35.7 Traffic Lighting Placement

- Colour within polygon 16.8.2 Colour Within Polygon
- Explode (text) 28.9.18 Explode Text
- Head to tail faces 12.13.35.10 Head to tail faces
- Create plan images from JPEG’s 12.13.35.11 Create Plan Images from JPEG Files
12.13.35.1 Clouds

Position of option on menu: View => Visualisation => Utilities => Clouds

This option is used to create a square box around the view with the cloud image on the inside of it. From within a scene, this will then appear as a sky with clouds as the background.

On selecting the Clouds option, the Visualisation Clouds panel is displayed:

![Image of the Visualisation Clouds panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Centre of cloud square</td>
<td>xyz box</td>
<td>position select</td>
<td></td>
</tr>
<tr>
<td>Process</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*model to place the cloud square in.*

*give the x y z co-ordinates for the centre of the cloud square.*

*create the cloud square.*
12.13.35.2 Sky dome

Position of option on menu: View => Visualisation => Utilities => Sky dome

This option reads in a 12da of a triangulation and a raster image to form a dome, that represents the sky.

On selecting the Sky dome option, the Visualisation Sky Dome panel is displayed:

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sky Dome Type</td>
<td>choice box</td>
<td></td>
<td>Drop down selection available, with a preview above.</td>
</tr>
<tr>
<td>12d Sky Dome 1 (Cloud - Dark Blue)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>12d Sky Dome 2 (Cloud - Haze)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>12d Sky Dome 3 (Cloud - Light Blue)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>12d Sky Dome 4 (Cloud - Snow Mtns)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>12d Sky Dome 5 (Clear Sky)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Centre of Sky Dome</td>
<td>valid x,y,z</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Process</td>
<td>button</td>
<td></td>
<td>Read in data from Library and translate to centre coords</td>
</tr>
</tbody>
</table>

Model Format
12d Sky Dome Data  (3 dimensional data for the triangulation)
12d Sky Dome Tin  (3 dimensional triangulation)
12d Sky Dome 1 Raster  (2 dimensional raster for the triangulation)

Note:

More than one sky type can be read in and used but the selected raster is then applied to the same tin.

To view the sky dome in the OpenGL perspective view, add the 12d Sky Dome Tin model only to the view.
12.13.3.5 Fences

**Position of option on menu:**  View => Visualisation => Extrusions => Fences

This option is for extruded 12d Solutions supplied fences along strings. The list of fences is being continuously upgraded by 12d Solutions. Selecting the Fences brings up the Visualisation Fence Extrusions panel.

![Visualisation Fence Extrusions panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>Model</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data source</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Process</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Clicking on the tabs brings up the type of fence to be extruded along selected super strings.

*Data source type - for a full description go to 4.19.3 Data Source.*

source of super string to extrude fences along

apply the fence to the selected super strings
12.13.35.4 Houses

Position of option on menu: View => Visualisation => Utilities => Houses

This option is for inserting 12d Solutions supplied houses. The list of houses is being continuously upgraded by 12d Solutions. Selecting the Houses brings up the Visualisation 3D Buildings panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Centre of building</td>
<td>xyz box</td>
<td>position select</td>
<td>give the x y z co-ordinates for the centre of the base of the inserted building</td>
</tr>
<tr>
<td>Orientation</td>
<td>angle box</td>
<td>angle select</td>
<td>give the angle to orient the building</td>
</tr>
<tr>
<td>Process</td>
<td>button</td>
<td></td>
<td>insert the selected building</td>
</tr>
</tbody>
</table>

Clicking on the tabs brings up the type of house to be inserted.
12.13.35.5 Line Marking

Position of option on menu: View => Visualisation => Utilities => Line marking

This option is used to create polygon data in 3D representing the line marking on a road. The polygons can then be included in the design tin for triangulating and the "Colour Triangles Within a Polygon" option used to colour the triangles for use in shades and renderings.

The line marking polygons created by the option represents a dashed line style centred around the selected line marking string marking the position of the dashed line. The length and separation of the dashed lines are user defined and the width of the dash is defined by a width to the left and a width to the right of the line marking string.

![Line Marking Panel]

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>line marking position string</td>
<td>string select</td>
<td>select the string to define the position of the line marking on the road. The string will also provide z-values for use in creating the line marking.</td>
<td></td>
</tr>
<tr>
<td>Colour for line marking</td>
<td>input box</td>
<td>green</td>
<td>available colours</td>
</tr>
<tr>
<td>Length of the line marking</td>
<td>input box</td>
<td>9</td>
<td></td>
</tr>
<tr>
<td>Gap to next line marking</td>
<td>input box</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>Width of line marking on lhs of line</td>
<td>input box</td>
<td>0.05</td>
<td></td>
</tr>
<tr>
<td>Width of line marking on rhs of line</td>
<td>input box</td>
<td>0.05</td>
<td></td>
</tr>
<tr>
<td>Crossfall (%) on lhs of line</td>
<td>input box</td>
<td>-3</td>
<td></td>
</tr>
<tr>
<td>Crossfall (%) on rhs of line</td>
<td>input box</td>
<td>-3</td>
<td></td>
</tr>
<tr>
<td>Model for line marking polygons</td>
<td>line marking</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model for line marking centre</td>
<td>line marking ctr</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The crossfall for the part of the line marking on the left hand side of the line marking position string (so z-
values for the polygon can be calculated).

**Crossfall (%) on rhs of line** input box -3
cross fall for the part of the line marking on the right hand side of the line marking position string (so z-values for the polygon can be calculated).

**Model for line marking polygons** model box line marking available models
model for the polygons representing the line marking.

**Model for line marking centre** model box line marking ctr available models
model for a string with just the part of the line marking position string which is inside the line marking polygons.

**Create** button
run the option and create the line marking polygons.

**Undo** button
undo the last set of polygons created since the panel was up.

### 12.13.35.6 Line Marking (New)

**Position of option on menu:** View => Visualisation => Utilities => Line marking (New)

This option is made up of several parts.

1. **Create line marking polygons:**
   - The drop down menu has a list of linemarking definitions, that match the linestyles in 12d.
   - The length, gap and width values are used to create polygons along the strings selected.
   - Fill in the Linemarking model, colour and the optional tin (used to drape the polygons).

2. **Apply Extrusions Only:**
   - In this option extrusions are matched to linestyles, rather than producing individual polygons.

3. **Pavement Arrows:**
   - In this option polygons are created from the symbol definition.

Single Arrows can be placed, using the **Dynamic Orientation** button to select an x,y point on screen.

**Multiple Arrows:**

- **Arrow Edge Line Reference** "Pick with direction" along a string
- **Arrow Spacing** Distance apart
- **Arrow Offset** Relative to the directional pick
- **Arrow Start Point** If you select a right turn lane string, picking with direction towards an intersection, then the start point would be at the intersection and subsequent arrows placed at the Arrow Spacing away from the intersection.

Selecting **Line marking (New)** brings up the **Linemarking Create (Visualisation)** panel.
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

### 12.13.35.8 Colour Within Polygon

**Position of option on menu:** View => Visualisation => Utilities => Colour within polygon

This option colours triangles in a tin. It has already been documented as Tins => Colour => Colour within polygon in the section 16.8.2 Colour Within Polygon.

### 12.13.35.9 Explode Text

**Position of option on menu:** View => Visualisation => Utilities => Explode text

This option explodes text into lines and arcs. It has already been documented as Utilities => A-G => Explode text in the section 28.9.18 Explode Text.

### 12.13.35.10 Head to tail faces

**Position of option on menu:** View => Visualisation => Utilities => Head to tail faces

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Head to tail faces brings up the Head to Tail Face Strings panel.

![Head to Tail Face Strings panel](image)

### 12.13.35.11 Create Plan Images from JPEG Files

**Position of option on menu:** View => Visualisation => Utilities => Create plan images from JPEG’s

Selecting Create plan images from JPEG’s brings up the Create Plan Images from JPEG Files panel.
The fields and buttons used in the panel have the following functions.

<table>

13 Models

Position of menu:  Model

In 12d Model, models contain all the terrain and design information in the form of strings, tins and trimeshes.

The Models menu contains the options needed to create new models, rename models, report, clean models and delete models from the project.

The Models walk-right menu is

For the option Models, go to section 13.1 Models
Model info 13.2 Model Information
Model manager
Model info table 13.3 Model Information Table
String info table 13.4 String Information Table
Create
Rename
Global rename
Utilities 13.8 Utilities
Sharing 13.9 Sharing
Clean 13.10 Clean
Delete 13.11 Delete
13.1 Models

**Position of menu:**  Model => Models

The Models walk-right menu provides options to list all the models in the project, and list all the models in the project area but not added to the project (removed models).

If a model is selected from the project model list, then it is automatically loaded into the Model Information panel.

The Models walk-right menu is

![Model List](image)

- List of models in project
- List of non-project models

For Project models go to

13.1.1 Project Models

For Removed models

13.1.2 Removed Models
13.1.1 Project Models

Position of option on menu:  Model => Models => Project models

The project models walk-right menu provides a list of all the models in the project and if a model name is selected from the list, a model information panel is fired up with the selected model name already in the model field.
13.1.2 Removed Models

**Position of option on menu:**  Model => Models => Removed Models

The removed models walk-right menu provides a list of all the models in the project area that are not in the project.

They would be mainly models that were in the project but have been removed from the project but not deleted from the disk.
13.2 Model Information

Position of option on menu:  Model => Model Info
Selecting Model info fires up the Model Information panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>xmin/ymin/zmin, xmax/ymax/zmax</td>
<td>output</td>
<td></td>
<td>returns the model limits</td>
</tr>
<tr>
<td>point id min/max</td>
<td>output</td>
<td>minimum/maximum integer point id in the model</td>
<td></td>
</tr>
<tr>
<td>Elements</td>
<td>output</td>
<td></td>
<td>returns the number of elements in the model</td>
</tr>
<tr>
<td>num vertices</td>
<td>output</td>
<td></td>
<td>returns the number of vertices in the model</td>
</tr>
<tr>
<td>num null vertices</td>
<td>output</td>
<td></td>
<td>returns the number of null vertices in the model</td>
</tr>
<tr>
<td>Info</td>
<td>button</td>
<td></td>
<td>get the information for the model given in the Model field.</td>
</tr>
<tr>
<td>Calc Extent</td>
<td>button</td>
<td></td>
<td>recalculate the x, y, z bounding box for the model given in the Model field.</td>
</tr>
</tbody>
</table>

How to Use the Panel
The model information for the model given in the model field is retrieved and placed in the appropriate panel fields when the model name is entered into the model field from the pop-ups, or a <return> is entered after entering the model name into the model field, or on selecting the Info button.
13.3 Model Information Table

**Position of option on menu:**  Model => Model Info Table

The Model info table option displays the minimum and maximum x, y and z values for every model in the project in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the sort menu on the column header fields.

Selecting Model info table fires up the Model Information Table panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>column</td>
<td></td>
<td>sort menu</td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>Update</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>recalculate the minimum/maximum information in the table.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Notes
1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.
13.4 String Information Table

Position of option on menu:  Model => String info table

The String info table option displays the minimum and maximum x, y and z values for every string in a given model in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the sort menu on the column header fields.

Selecting String info table fires up the String Information Table panel.

The greyed out icons Edit, Properties, Delete only appear when a model has been selected and a row of the table selected.

![String Information Table](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

<tr>
<td>Min X, Min Y, Min Z</td>
<td>columns</td>
<td></td>
<td>sort menu</td>
</tr>
</tbody>
</table>
Max X, Max Y, Max Z

the minimum/maximum values for each string in the model are displayed in the columns

Created/Updated columns dates
date the string was first created/updated

Update button
recalculate the minimum/maximum information in the table.

When data has been read in for a model, the three icons, Edit, Properties, Delete appear

After clicking on a row in the table (and hence specifying a string), the specified string is highlighted on any plan views it is on, and the icons can be used to edit the string, bring up the string properties table or delete the string.

Notes
1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.
13.5 Create

Position of option on menu:  Model => Create

On selecting the Create option, the Create Model, and/or View panel is displayed. This panel can be used to create new models and add a model to a view.

![Create Model, and/or View panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>name of the model to be created and/or added to a model and/or view.</td>
<td>model box</td>
<td>all models</td>
<td></td>
</tr>
<tr>
<td>Add to view</td>
<td>if non-blank, the name of the view to which the model given in the model-field will be added.</td>
<td>view box</td>
<td>all views</td>
<td></td>
</tr>
<tr>
<td>Create</td>
<td>If the model given in the Model field does not exist, it will be created. If the add to view field is non-blank, then the model given in the model field will be added to the view given in the add to view field.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
13.6 Rename

Position of option on menu: Model ➔ Rename

On selecting the rename option, the Model Rename panel is displayed. This panel can be used to change the names of existing models.

![Model Rename Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Old model</td>
<td>name of the model to be renamed.</td>
<td>model box</td>
<td>all models</td>
<td></td>
</tr>
<tr>
<td>New model</td>
<td>new name for the model</td>
<td>model box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Rename button

Change the name of the model in the old model field to the name given in the new model field.
13.7 Global Rename

Position of option on menu:  Model => Global rename

Selecting the Global rename, displays the Global Model Rename panel. This panel is used to change the names of many existing models by matching according to a pattern expression or a regular expression.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Match sub strings</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>if ticked,</strong> the Search expression is used to match against part of each model name. <strong>If not ticked,</strong> the Search expression is used to match against the entire model name.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Pattern expression</td>
<td>radio button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>if set on</strong>, then Pattern expressions given in the Search and Replace fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Search</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>pattern to search for in the model names. For example &quot;* tin&quot; will select all models with a name ending with &quot; tin&quot;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Replace</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>replacement for the search pattern found in the model name. For example, &quot;tin &quot; in the Replace field, takes the matched part of the model name and adds &quot;tin &quot; to the front of it. Hence the Search pattern &quot;* tin&quot; and Replace pattern &quot;tin *&quot; finds all models with names ending in &quot; tin&quot; and renames them with the name starting with &quot;tin &quot; (and the &quot; tin&quot; at the end of the name is dropped off).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Regular expression</td>
<td>radio button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>if set on</strong>, then Regular expressions given in the Search and Replace fields are used to modify model names.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Search  input
regular expression to search for in the model names.

Replace  input
replacement for the search expression found in the model name.

Test data  grid
The Test data grid shows the effect of the Search and Replace on all the model names in the project.

The Input column shows the existing model name.
The Output column shows the name after applying the Search and Replace.
The Status column displays if there has been a match or no match.

Rename  button
change the name of all the models in the project according to the selected Search and Replace fields.
13.8 Utilities

Position of menu:  Model => Utilities

The utilities menu contains miscellaneous options involving models.

The utilities walk-right menu is

| Model Utilities | Create/edit attributes for models |
| Add             | Add removed and other project models to project |
| Copy project models | Copy model from another project |
| Remove          | Remove models from project |
| Save            | Save models to disk |
| Project models utilities | Add/removes, saves, cleans, deletes models |
| User            | |

For the option Attributes, go to  13.8.1 Attributes
    Add  13.8.2 Add
    Copy project models  13.8.3 Copy Project Models
    Remove  13.8.4 Remove
    Save  13.8.5 Save
    Project model utilities  13.8.6 Project Model Utilities
13.8.1 Attributes

Position of option on menu: Model => Utilities => Attributes

The Attributes options displays, creates and edits attributes for models.

On selecting Attributes, the Model Attributes panel is displayed.

![Model Attributes Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>model box</td>
<td>all available models</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>name of the attribute</td>
<td></td>
<td></td>
</tr>
<tr>

<td>integer, real, text</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data</td>
<td>value for the attribute</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Apply</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

set the attributes to the values in the panel and then exit the panel.

set the attributes to the values in the panel but don't exit the panel.
13.8.2 Add

Position of menu:  Model => Utilities => Add

Models can be added to the project and to views.

The model adds walk-right menu is

![Menu screenshot]

For the option Add to project go to

Add all to project  13.8.2.1 Add To Project
Add to view  13.8.2.3 Add to View

13.8.2.1 Add To Project

Position of option on menu:  Model => Utilities => Add => Add to project

The add to project option is used to add a removed model back into the project.

On selecting the add to project option, the add model to the project panel is displayed.

![Add Model to the Project screenshot]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removed model</td>
<td>input</td>
<td>removed models</td>
<td>name of the model not in the project that is to be added to the project.</td>
</tr>
<tr>
<td>Add</td>
<td>button</td>
<td></td>
<td>add the model given in the removed model field to the working project.</td>
</tr>
</tbody>
</table>

13.8.2.2 Add All To Project

Position of option on menu:  Model => Utilities => Add => Add all to Project

The add all to project option is used to add all the removed models back into the project.

On selecting the add all to project option, the add all models to project panel is displayed.

![Add All Models To Project screenshot]
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*after selecting this button, all removed models in the working project will be added to the project.*

### 13.8.2.3 Add to View

**Position of option on menu:**  Model => Utilities => Add => Add to view

On selecting the *add to view* option, the *add model to a view* panel is displayed.

![Add Model to a View Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
</tbody>
</table>

*name of the model to be added to a view.*

| Add to view       | input         | available views |                              |

*name of the view to which the model given in the model field will be added.*

| Add               | button        |                              |                              |

*add the model given in the model field to the view given by the add to view field.*
13.8.3 Copy Project Models

Position of option on menu: Model =>Utilities =>Copy Project Models

Selecting copy project models brings up the Copy Project Models panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder</td>
<td>input</td>
<td>Select folder panel</td>
<td></td>
</tr>
<tr>
<td>Project</td>
<td>input</td>
<td>projects in the folder</td>
<td></td>
</tr>
</tbody>
</table>

name of the folder that the project to get the model from, is in.

name of the project in the folder given in the folder field, that the model is to be copied from.

Once a project is selected, all the models from that project will be listed in the Original Model Name.
Add data to existing models  tick box
if ticked, if the model that the data is being read into already exists, the new data is copied into the model.

Clean data in existing models  tick box
if ticked, any existing data in the models being read into, is first cleaned out.
NOTE - If neither tick box is ticked then if the model already exists, no data is copied.

Search/Replace
section for renaming models from the selected project

Match sub strings  tick box
if ticked, the Search expression is used to match against part of each model name.
If not ticked, the Search expression is used to match against the entire model name.

Pattern expression  radio button
if set on, then Pattern expressions given in the Search and Replace fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.

Search  input
pattern to search for in the model names. For example "* tin" will select all models with a name ending with "tin ".

Replace  input
replacement for the search pattern found in the model name. For example, "tin " takes the matched part of the model name and adds " tin " to the front of it.
Hence the Search pattern "* tin" and Replace pattern "tin *" finds all models with names ending in " tin " and renames them with the name starting with "tin " (and the " tin" at the end of the name is dropped off).

Regular expression  radio button
if set on, then Regular expressions given in the Search and Replace fields are used to modify model names.

Search  input
regular expression to search for in the model names.

Replace  input
replacement for the search expression found in the model name.

Model Names Grid
The models selected by the Search and Replace expressions are shown in the Original Model Name column. Note that if the model already exists in the current project, then the cell for that model in Original Model Name column will be displayed in yellow.

Copy  tick box
if ticked, the model will be copied.
If not ticked, the model will not be copied.
Clicking RB on Copy at the top of the column brings up a menu to Clear which turns all the ticks off.

Original Model Name  column
name of the existing model in the selected project

New Model Name  column
if non-blank, the new name to be given to the copied model.
If blank, the original model name is used.
The New Model Names can be from applying the Search and Replace, or just typing them in.
<table>
<thead>
<tr>
<th>Status</th>
<th>column displays if there has been a match or no match for the search/replace for renaming models</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy</td>
<td>button copy to this project, the model given in the model field from the project given in the project field.</td>
</tr>
<tr>
<td>Refresh</td>
<td>button refresh the list of all models in the selected project</td>
</tr>
</tbody>
</table>
13.8.4 Remove

**Position of menu:** Model => Utilities => Remove

Models can be removed from the project and from views.

The model removes walk-right menu is

![Model Removes](image)

The options in the menu will now be described.

For the option Remove from project go to 13.8.4.1 Remove Model from Project
- Remove all from project 13.8.4.2 Remove All Models From Project
- Remove from view 13.8.4.3 Remove From View

### 13.8.4.1 Remove Model from Project

**Position of option on menu:** Model => Utilities => Remove => Remove from project

On selecting the remove from project option, the remove model from project panel is displayed.

![Remove Model From Project](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
</tbody>
</table>

*name of the model to be remove from the working project.*

Remove button

*after selecting this button, the model given in the model field will be removed from the working project.*

### 13.8.4.2 Remove All Models From Project

**Position of option on menu:** Model => Utilities => Remove => Remove from all projects

On selecting the remove all option, the remove all models from project panel is displayed.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove button</td>
<td></td>
<td>after selecting this button, all models in the working project will be removed. Next, all views will be refreshed. Finally, unless an error occurs, the panel will be removed.</td>
<td></td>
</tr>
</tbody>
</table>

13.8.4.3 Remove From View

Position of option on menu:    Model => Utilities => Remove => Remove from view

On selecting the remove from view option, the remove model from a view panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description      | Type       | Defaults          | Pop-Up          |
------------------------|------------|-------------------|-----------------|
Model                   | input      | available models  |                 |
                        |            | name of the model to be removed from a view. |
Remove from view        | input      | available views   |                 |
                        |            | name of the view from which the model given in the model field will be removed. |
Remove button           |            |                   |                 |
                        | remove the model given in the model field from the view given in the remove from view field. |
13.8.5 Save

Position of menu:  Model => Utilities => Save

Models can be saved on disk so that they can be used for future project work or in other projects.

The model saves walk-right menu is

![Model Saves](image)

The options in the menu will now be described.

For the option Save a model go to 13.8.5.1 Save a Model

Save all models 13.8.5.2 Save All Models

13.8.5.1 Save a Model

Position of option on menu:  Model => Utilities => Save => Save a model

On selecting the save a model option, the save model panel is displayed.

![Save Model](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

<td>Model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
</tbody>
</table>

name of the model to be saved.

Save  button

after selecting this button, the model given in the model field will be saved to disk.

13.8.5.2 Save All Models

Position of option on menu:  Model => Utilities => Save => Save all models

On selecting the save all models option, the save all models panel is displayed.

![Save All Models](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>

Utilities  Page 1693
Save button

After selecting this button, all models in the working project that have been modified since they were last saved, will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.
13.8.6 Project Model Utilities

Position of option on menu:  Model => Utilities => Project model utilities

The Project Model Utilities panels can add/remove models from the project, clean and delete models, add/remove models from views.

On selecting Project model utilities, the Project Model Utilities panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Disk Models section</strong></td>
<td>options to add removed models to the project and delete removed models</td>
<td></td>
<td></td>
</tr>
<tr>

- **Save the ticked models**
- **Remove the ticked models from the project**
- **Clean the ticked models**
- **Delete the ticked models**

refresh the model properties displayed in the panel
13.9 Sharing

**Position of menu:** Model => Sharing

Sharing allows models from a project (the server project) to be added to other projects (client projects).

Before any models can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The Sharing walk-right menu is

![Shared Models menu]

- Share: allow models in this project to be used by other projects
- Add: add a shared model from another project
- Remove: remove a model shared from another project
- Synchronize: updated models shared from other projects

For the option *Share*, go to

- 13.9.1 Share Models
- 13.9.2 Add Shared Models
- 13.9.3 Remove Shared Models
- 13.9.4 Synchronize Shared Models
13.9.1 Share Models

**Position of option on menu:**  Model => Sharing => Share

Before models in a server project can be added to client projects, the models must be made available for sharing in the server project by using the Share option.

All models that have been made available for sharing are displayed in model lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

This option also can reverse the process. That is, remove the availability of a model for sharing. If this is done then clients who have shared this model will be warned when starting up their project and/or synchronizing occurs.

Selecting Share displays the Share Project Models panel.

![Share Project Models panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pattern</td>
<td>if a pattern is typed then all the models matching the pattern will have a tick placed in the Share column. If * is typed then all models are ticked for sharing.</td>
<td>grid column</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

All the models in the project are listed in the Share Project Models panel and if a model has been tagged for Sharing, a tick will be displayed in the Share column of the grid.
tick if the model is to be made available for sharing when the Set button is pressed.

All models that have been made available for sharing are displayed in model lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

Clicking RB on Share at the top of the column brings up a menu to Toggle the ticks, Set all the ticks on, Clear to turn all the ticks off.

Model grid column
this column lists all the models in the project

Share as grid column
an optional name with which the model will be shared out to clients. Leave it blank to share under the original name.

Only show project models tick box
if ticked, only the models which originated from the current project are shown.

Set button
clicking Set marks all the models with a tick in the Tick column as being available for sharing. Those models without a tick will not be available for sharing.
13.9.2 Add Shared Models

Position of option on menu: Model => Sharing => Add

The Add option is used to add shared models from a server project, to this project (a client project).

All models that have been added as shared models are displayed in model lists in a colour defined by an environment variable. The default colour is blue.

Selecting Add displays the Add Shared Models to Project panel.

The fields and buttons used in this panel have the following functions.

Field Description | Type                   | Defaults | Pop-Up
---               | ---                    | ---      | ---
Folder            | folder box             | select folder

Folder to look for 12d Model projects. When a folder is selected, all the 12d Model projects in the
folder will be displayed in a Projects pop-up list.

Project folder box select folder

name of the 12d Model project in the folder given in the Folder field, to search for models marked for sharing. Once a project is selected, all the models marked for sharing from that project will be listed in the Original Model Name column.

Search/Replace section for renaming models from the selected project

Match sub strings tick box

if ticked, the Search expression is used to match against part of each model name.

If not ticked, the Search expression is used to match against the entire model name.

Pattern expression radio button

if set on, then Pattern expressions given in the Search and Replace fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.

Search pattern to search for in the model names. For example "* exist" will select all models with a name ending with " exist"

Replace input replacement for the search pattern found in the model name. For example, "exist " in the Replace field takes the matched part of the model name and adds " exist " to the front of it.

Hence the Search pattern "* exist" and Replace pattern "exist *" finds all models with names ending in " exist" and renames them with the name starting with "exist " (and the " exist" at the end of the name is dropped off).

Regular expression radio button

if set on, then Regular expressions given in the Search and Replace fields are used to modify model names.

Search regular expression to search for in the model names.

Replace input replacement for the search expression found in the model name.

Model Names Grid

The models available for sharing in the selected project are shown in the Original Model Name column. Any renaming by the Search and Replace expressions are shown in the New Model Name column. Note that if the model already exists in the current project, then the cell for that model in Original Model Name column will be displayed in yellow.

Add tick box

if ticked, the model will be added to this project as a shared model. If not ticked, the model will not be added to this project as a shared model.

Clicking RB on Add at the top of the column brings up a menu to Clear which turns all the ticks off.

Note - a shared model that has been previously added can only be removed by using the Model => Sharing => Remove option.

Original Model Name column

this column lists all the models in the server project available for sharing.

New Model Name column

if non-blank, the new name to be given to shared model in this project. If blank, the original model name is used.
The New Model Names can be from applying the **Search and Replace**, or by just typing them in.

**Status** output column displays if their has been a match or no match for the search/replace for renaming models.

**Add** button adds to this project (a client project) as a shared model, the ticked models given in the Original Model Name field from the project given in the **Project** field.

**Refresh** button refreshes the list of all models available for sharing in the selected server project.
13.9.3 Remove Shared Models

Position of option on menu: Model =>Sharing =>Remove

The Remove option is used to remove shared models from the project. The shared models would have been previously added to the project with the Model =>Sharing =>Add option.

Selecting Remove displays the Remove Shared Models from Project panel.

![Remove Shared Models from Project panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>DefaultsPop-Up</th>
</tr>
</thead>

</tr>
</tbody>
</table>
pattern to search for in the model names. For example "* exist" will select all models with a name ending with " exist"

**Regular expression** radio button

If set on, then **Regular** expressions given in the **Search** field are used to select shared model names.

**Search** input

Regular expression to search for in the shared model names.

**Model Names Grid**

list of all shared models added to the project.

**Remove** tick box

If ticked, the model will be removed from this project as a shared model.

If not ticked, the model will not be removed.

Clicking RB on **Remove** at the top of the column brings up a menu to **Clear** which turns all the ticks off.

**Model Name** column

this column lists all the models added as shared models from other server projects

**Share path**

this column lists the path name to the server project and the original model name in the server project

**Status** column

displays if their has been a match or no match for the Search for selecting shared models

**Remove** button

clicking **Remove** removes as shared models from this project, all the models with a tick.

**Refresh** button

clicking **Refresh** refreshes the list of all shared models previously added to the project
13.9.4 Synchronize Shared Models

Position of option on menu:  Model =>Sharing =>Synchronize

The Synchronize option is used to updated any added shared models. The shared models would have been previously added to the project with the Model =>Sharing =>Add option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section 7.6.13.4 Project Share Settings.

Selecting Synchronize displays the Synchronize Shared Models panel.

![Synchronize Shared Models Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronize</td>

</tbody>
</table>
Status will either be **Ok** or **No Longer Shared** to reflect the status of the model on that row.

**Redraw views** tick box

Whether or not to redraw all the views any of the synchronized models are on.

**Refresh** button

clicking **Refresh** refreshes the list of all shared models previously added to the project.
13.10 Clean

**Position of option on menu:**  Model => Clean

The clean option is used to delete all the strings in a model but the model itself is not deleted. The model is still attached to any views it had been added to.

To help protect the user against disasters, when a model is selected for cleaning, a yes-no pop-up menu is invoked to confirm that the user did intend cleaning out the model.

Wild cards (*) and wild characters (!) can be used to select the models to clean and then a list of selected models is displayed for confirmation.

If cleaning is confirmed, all the strings in the selected models are deleted.

Selecting Clean displays the **Clean Model** panel.

![Clean Model panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>name of the model to be cleaned out. Wild cards (*) and characters (?) can be used to give a list of models to be cleaned.</td>

<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Clean</td>
<td>after selecting this button, all strings in the model given in the model field will be deleted. A yes-no pop-up is used to confirm that cleaning is required.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
13.11 Delete

Position of menu: Model => Delete

Using the delete option, models can be deleted from disk so that they no longer can be accessed or take up disk space.

To help protect the user against disasters, when a model is selected for deletion, a yes-no pop-up menu is used to confirm that deleting the model is intended. If deletion is confirmed, the selected model is deleted from the project and the disk. For extra security, there is also a Trash Bin (see 7.6.15 Trash Bin) where models can automatically be moved to on delete before being permanently deleted from disk.

The model delete walk-right menu is

```
Model Deletes
Delete a model
Delete empty models
Delete all models
```

For the option Delete a model, go to 13.11.1 Delete a Model
Delete empty models 13.11.2 Delete Empty Models
Delete all models  13.11.3 Delete All Models
13.11.1 Delete a Model

Position of option on menu:  Model => Delete => Delete a Model

The delete a model option is used to delete a model in the working project.

Wild cards (*) and wild characters (!) can be used to select the models to delete and then a list of selected models is displayed for confirmation.

If a 12d Model trash bin is being used, the deleted models may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

Selecting Delete a model brings up the Delete Model panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

Note
For the floating menu, the Strings option has another mode of operation. Rather than moving onto the walk-right arrow, if LB is clicked when the Strings button is highlighted on the 12d Model menu, the String inquire panel is displayed on the screen. Unfortunately this does not work on the Main menu.
14.1 Create

Position of option on menu:  
Strings => Create

The Create option is used to produce new strings. If a string already exists, the Editor option is used to modify it.

The Create walk-right menu contains options to create 2d, 3d, 4d, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Note that the 2d, 3d, 4d, pipe and polyline strings are actually super strings but automatically set some of the properties of the super string. For example a 2d string is a super string with just one constant z-value. Any of these strings can be made a full super string by clicking on the Advanced Mode icon in the string editor.

Once a string has been created, it can be converted to most of the other string types using the string Convert option.

To create a new string of the same type and with similar header information as an existing string, the same as option is selected from the String Create menu.

Notes
1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

   Linestyles can be defined that drawn lines between the points even though the breakline type is point.
2. The string vertices are also called intersection points (IP’s).

The String Create walk-right menu is

The string creation process is similar for each string type and for editing strings as well.

For the option 2d, go to  
14.1.1 Create - 2d Super

For the option 3d, go to  
14.1.2 Create - 3d Super
4d  14.1.3 Create - 4d Super
Super alignment  14.1.4 Create Arcs
Arcs  14.1.4 Create Arcs
Circles  14.1.5 Create - Circles
Feature  14.1.6 Create - Feature
Pipe  14.1.7 Create - Pipe Super
Polyline  14.1.8 Create - Polyline Super
Super  14.1.9 Create - Super
Text  14.1.10 Create - Text
Ellipse  14.1.11 Create - Ellipse
Xfall and grade  20.8.11 String by Xfall and Grade
Control stations  14.1.12 Create - Control Stations
Old  14.20.1 Old
New  14.1.13 New
Same as  14.1.14 Create - Same As
14.1.1 Create - 2d Super

Position of option on menu:  Strings =>Create =>2d

A 2d super string is a super string with the restriction that it has:

(a) vertices of (x,y) co-ordinates joined by straight segments only
(b) One z-value for the entire string

That is, a 2d string consists of a series of (x,y) vertices joined only by straight segments, and all with the same z-value (height). 2d strings are often referred to as "contour strings" because contours are the most common example of a string with a constant height.

The Many strings tick-box is used when more than one string of the same type is to be created, if many strings is set to tick, when the current string creation is Finished or Quit, a new Create Super 2d String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Super 2d String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, model, colour, type, linestyle, weigh of the Create Super 2d String panel.

From 12d Model 8 onwards, the default is to create 2d super strings rather than the 2d strings used up to 12d Model 7. A 2d super string is a super string with Constant height. That is, there is only one z-value for the entire string. The advantage is using a 2d super string is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older 2d string create options are still available under Strings =>Create =>Old (go to the section 14.20.1.2 Create - 2d (pre V8))

On selecting 2d the Create Super 2d String panel is displayed.

The default values for the panel fields are taken from the CAD Controlbar (see 15.1 Controlbars)

To create a new 2d super string (a 2d super string is a super string with the constant height flag set on), the panel fields are filled in and the Create button selected.

The fields and buttons used in the Create Super 2d String panel have the following functions.
Create

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Name | input | from CAD controlbar | the name of the new string
Model | model box | from CAD controlbar | available models
name of the model that the new string is in
Colour | colour box | from CAD controlbar | available colours
the colour of the new string
Type | choice box | line | line, point
breakline type (point-line type) of the string
Linestyle | input | from CAD controlbar | available line styles
line style of the string
Weight | input | from CAD controlbar | thickness of the string
Height | input | from CAD controlbar | for a 2d super string, there is only one height (z-value) for the entire string.
Tinability | choice box | Points and segments | Points only
Points and segments
Not tinable
if Vertices and segments, all the vertices and segments of the string are set to tinable.
If Vertices only, all the vertices are set to tinable and the segments to not tinable.
If Not tinable, all the vertices or segments are set to not tinable.
Allow point ids | tick box | if ticked, the 2d super string can have point ids for each vertex.
If not ticked, the 2d super string will not have point ids. This can be reversed if point ids are required in the future.
Many strings | tick box | if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.
Create | button | After the Create button is chosen, the Edit 2d menu is displayed.
Same as | button | After the Same as button is chosen, another string is selected and information about it is used for the fields in this panel.
Finish | button | end the option, don't proceed to the edit stage.

Start Edit - 2d Super

On selecting the Create button in the Create Super 2d String panel the Edit 2d menu is placed on the screen. The Edit 2d menu for a 2d super string is
To create a new 2d super string, select the Append icon.

The Append option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's Edit 2d menu are usable.

The options in the Edit 2d menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the Edit 2d menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 2d Editor, go to the section 14.4.2 Edit 2d
14.1.2 Create - 3d Super

Position of option on menu:  Strings => Create => 3d

A 3d super string consists of a series of (x,y,z) vertices, joined only by straight segments.
The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each
string vertex, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a
special case of a 3d string where the heights at all the vertices are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is
required at each string vertex.

The Many strings tick-box is used when more than one string of the same type is to be created, If many
strings is set to tick, when the current string creation is Finished or Quit, a new Create Super 3d String
panel is placed on the screen with the same information in it as the string just created. If any of the
information needs to be modified for the new string, simply change it in the Create Super 3d String panel
fields before selecting the Create button for the new string. Hence a new string of the same type can be
created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type)
and pipe it into the name, model, colour, type, linestyle and weight of the Create Super 3d String panel.
From 12d Model 8 onwards, the default is to create 3d super strings rather than the 3d strings used up to
12d Model 7. The advantage is using a 3d super string is that all the CAD options will work for it, vertices
and segments can be assigned tinability and it can have point id’s for setout.

The older 3d string create option is still available under
Strings => Create => Old (go to the section 14.20.1.3 Create - 3d (pre V8))

On selecting the 3d option, the Create Super 3d String panel is displayed.

The default values for the panel fields are taken from the CAD Controlbar (see 15.1 Controlbars)

To create a new 3d super string, the panel fields are filled in and the Create button selected.

The fields and buttons used in the Create Super 3d String panel have the following functions.

On selecting the Create button in the Create Super 3d String panel the Edit 3d menu is placed on the screen. The Edit 3d menu for a 3d super string is

```
model ->string_name for the 3d super string being edited
```

append or prepend an IP
delete an IP
To create a new 3d super string, select the Append icon.

The Append option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string’s Edit 3d menu are usable.

The options in the Edit 3d menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the Edit 3d menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 3d Editor, go to the section 14.4.3 Edit 3d.
14.1.3 Create - 4d Super

Position of option on menu:  Strings => Create => 4d

A 4d super string consists of a series of (x,y,z) co-ordinates joined only by straight segments, and a text label at each vertex.

Creating and editing a 4d string is very similar to a 3d string - the major difference is that a height and a text label is required at each string vertex.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to tick, when the current string creation is Finished or Quit, a new Create Super 4d String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Super 4d String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle and weight of the Create Super 4d String panel.

From 12d Model 8 onwards, the default is to create 4d super strings rather than the 4d strings used up to 12d Model 7. The advantage is using a 4d super string is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older 4d string create option is still available under

Strings => Create => Old

(Pre V8)

On selecting the 4d option, the Create Super 4d String panel is displayed.

![Create Super 4d String panel](image)

The default values for the panel fields are taken from the CAD Controlbar (see 15.1 Controlbars).

To create a new 4d super string, the panel fields are filled in and the Create button selected.

The fields and buttons used in the Create Super 4d String panel have the following functions.

end the option, don't proceed to the edit stage

Start Edit - 4d Super

On selecting the Create button in the Create Super 4d String panel the Edit 4d menu is placed on the screen. The Edit 4d menu for a 4d super string is
To create a new 4d super string, select the Append or Append + Text icon.

The Append and or Append + Text option are used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex. Append + Text also asks for text at each vertex.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

If Append + text was selected, the user will then be prompted for the text to be placed at that vertex.

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string’s Edit 4d menu are usable.

The options in the Edit 4d menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the Edit 4d menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 4d Editor, go to the section 14.4.4 Edit 4d
14.1.4 Create Arcs

Position of menu:  Strings => Create => Arcs

The Create arcs option is used to create 12d Model arcs.

A 12d Model arc consists of a radius, a centre point, and a start and end point on the arc.

The radius can be positive or negative. If the radius is positive, the arc is drawn from the start-point to the end-point in a clockwise direction. If the radius is negative, the arc is drawn from the start-point to the end-point in counter-clockwise direction.

The height at the start point and at the end point can be different. In that case, the arc is still a plan arc but the z- value varies linearly from the start point to the end point as one moves around the arc. Hence the 12d Model arc string is actually a helix with its centre-line perpendicular to the xy-plane.

For convenient 12d Model includes a variety of methods for creating arcs.

On selecting the Arcs option, the Create arcs menu is displayed giving all the different methods for creating arcs.

![Create Arcs Menu]

Each option in the Create arcs menu fires up its own special panel to collect the necessary information for defining the arc.

The mouse is used to select the special points required for the arc and circle definitions. For example, in the arc - 3 points on arc option, the three points are selected using the mouse.

Unlike the other strings created under strings=>create, the arc can be created immediately without needing any options from the arc editors.

Consequently, after an arc is defined, the create panel is not removed and is left on the screen to create another arc. Any information that needs modifying is changed in the arc panel and is used for the new create.

New arcs are created until either the panel is removed by selecting the finish or [X] button, or the create terminated by selecting cancel from the pick ops menu in which case the panel will be left on the screen. In the last case, the arc button is then used to begin a new create sequence.

Each of the methods for creating arcs will now be described.

For the option

14.1.4.1 Create - Arc

Position of option on menu:  Strings => Create => Arcs => Create Arcs

Arcs and circles are normally created using the strings=>create => arcs or strings=>create => circles menu. Please see the documentation on that option for creating arcs and circles.

This option is a special arc creator so that a menu exists if the strings=>create =>same as option is used on an arc. It creates an arc with an initial sweep angle of 360 degrees.

The Many strings tick-box is used when more than one string of the same type is to be created, if many strings is set to tick, when the current string creation is Finished or Quit, a new Create Arc String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Arc String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create Arc String panel.

After selecting the option, the Create arc string panel is displayed.

The new fields and buttons used in the create arc string panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>

</tbody>
</table>
Radius input

the radius for the arc.

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the create button is chosen, the arc edit menu and arc edit info panel are displayed.

Same as button

After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.

Note - the centre co-ordinates can either be typed into the centre panel field, or if LB is clicked on [+] for the centre panel field, the xyz ops menu comes up and the pick xyz option used to select a point as the arc centre.

Continue to the next section 14.1.4.2 Create Arc - Centre Point, Start Point and Sweep or go back to 14.1.4 Create Arcs.
Start Edit - Arc

Unlike the other string creates, on selecting the Create button the arc string is immediately created with a sweep angle of 360 degrees. The arc edit menu and arc edit info panel are also placed on the screen at the same time.

The arc edit menu and arc edit info panel for an arc string are

For full information in the Arc Editor, go to the section 14.4.5 Arc Edit

14.1.4.2 Create Arc - Centre Point, Start Point and Sweep

Position of option on menu: Strings => Create => Arcs => Centre, Start, Sweep

This option defines an arc by selecting a centre point, the start point of the arc and the sweep angle of the arc. The sweep angle is measured in the clockwise direction.

The radius is calculated by the option and is simply the distance between the centre and start points. The arc end point is also automatically calculated using the known points, radius and sweep angle.

After selecting the option, the arc - centre, start point and sweep angle panel is displayed.

To create an arc, the name, colour, model, chainage interval and sweep angle are entered into the appropriate fields and then the centre point and start point of the arc are selected with the cursor. The arc is
then created using the information provided in the panel. The new fields and buttons used in the **arc - centre, start point and sweep angle** panel have the following functions.

<table>

### 14.1.4.3 Create Arc - Centre Point, Start and End Points

**Position of option on menu:** Strings => Create => Arcs => Centre, 2 pts on arc

This option defines an arc by selecting a centre point, a start and end points for the arc and the direction (clockwise, anti-clockwise) that the arc travels in. The radius is calculated by the option and is simply the distance between the centre and start points.

It is difficult to choose the end point correctly so that it lies exactly on the arc since it only occurs when the
距离中心和选定端点之间的距离正好是圆弧的半径。

因此，选定的端点和圆弧方向用于确定从起点到“端点到中心点”线的扫掠角度。这是定义圆弧所需的足够信息。实际端点然后被计算出来，使其位于圆弧上。

在选择选项后，圆弧 - 中心、起点和终点面板显示。

要创建一个圆弧，必须将名称、颜色、模型、链距间隔和方向输入到相应的字段中，然后选择中心点、起点和终点。然后使用面板上提供的信息创建圆弧。

圆弧 - 中心、起点和终点面板中使用的字段和按钮具有以下功能。

14.1.4.4 Create Arc - Centre, Radius, Start and End Points

Position of option on menu:  Strings =>Create =>Arcs =>Centre, radius, 2pts

This option defines an arc by the user setting a radius and direction of arc and then selecting the centre, start and end points for the arc.

Since the radius is given exactly, it is difficult to choose the start and end points so that they lie exactly on the arc. This only occurs when the distance between the centre and selected start and end points is exactly the radius of the arc.

Hence, the selected start point is dropped perpendicularly onto the arc to give the real start point. Similarly, for the real end point.

After selecting the option, the **arc - radius, centre, start and end points** panel is displayed.
To create an arc, the name, colour, model, chainage interval, radius and direction are entered into the appropriate fields and then the centre point, start and end points of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The fields and buttons used in the **arc - radius, centre, start and end points** panel have the following functions.

14.1.4.5 Create Arc - Three Points on Arc

Position of option on menu: Strings =>Create =>Arcs =>3 pts on arc

This option defines an arc by selecting three points that lie on the arc.

The selected arc points are the start point, a point between the start and end point, and the end point. The three points must be selected in that order.

After selecting the option, the arc - 3 points on arc panel is displayed.

To create an arc, the name, colour, model and chainage interval are entered into the appropriate fields and then three points - start point, point between the start and end point, and the end point-which lie on the arc are selected with the cursor.

After the three points are picked, the arc is created using the information provided in the panel.
After a arc is defined, the option does not terminate. Another arc can be created by simply modifying any of the information that needs changing in the arc - 3 points on arc panel and then selecting three points on a new arc.

The fields and buttons used in the arc - 3 points on arc panel have the following functions.

Panel Messages

Next step messages sent to the screen message area when selecting the start point of the arc

<Arc start> [picks][][][menu]
<Arc start> [picks][accepts][menu]

Go back to 14.1.4 Create Arcs.
14.1.5 Create - Circles

Position of menu: Strings => Create => Circles

The create circles option is used to create 12d Model circles.

A 12d Model circle has no start and end points but is defined by a centre point and a radius. The circle has a constant height (z-value).

For convenient 12d Model includes a variety of methods for creating circles. On walking-right on the circles option, the create circles menu is displayed giving all the different methods for creating circles.

For Centre, radius, go to 14.1.5.1 Create Circle - Centre Point, Radius
Centre, pt on circle 14.1.5.2 Create Circle - Centre Point, Point on Circle
3 pts on circle 14.1.5.3 Create Circle - Three Points on Circle

Each option in the create circles menu fires up its own special panel to collect the necessary information for defining the circle.

The mouse is used to select the special points required for the circle definitions. For example, the circle - centre, radius option required the value of the radius to be entered into the circle - centre point, radius panel and the centre point is selected using the cursor.

Unlike the other strings created under strings=>create, the circles can be created immediately without needing any options from the circle editor. Consequently, after a circle is defined, the create panel is not removed and is left on the screen to create another circle. Any information that needs modifying is changed in the circle panel and is used for the new create.

New circles are created until either the panel is removed by selecting the finish or [X] button, or the create terminated by selecting cancel from the pick ops menu in which case the panel will be left on the screen. In the last case, the circle button is then used to begin a new create sequence.

Each of the methods for creating circles and arcs will now be described.

14.1.5.1 Create Circle - Centre Point, Radius

Position of option on menu: Strings => Create => Circles => Centre, radius

This option defines a circle by supplying a typed radius and selecting a centre point with the mouse

After selecting the option, the circle - centre point, radius panel is displayed.
To create a circle, the name, colour, model, chainage interval and radius are entered into the appropriate fields and the centre point selected with the cursor. The circle is then created using the information provided in the panel.

The new fields and buttons used in the **circle - centre point, radius** panel have the following functions.

Thickness of the string.
Chapter 14  Strings

Create z mode input typed snap, typed
the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.

Create z value input 0
if the z mode method is typed, then the height (z-value) of the circle is the value in the field.

Create Ch interval input 10
the chainage interval used when a chord approximation is needed for the circle.

Create Circle button
The circle button is used to begin a new create if the previous one was cancelled.

Create Same as button
After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.

How to Use the Panel to Create a Circle
(a) The panel fields are filled in with the appropriate data for use in defining the circle.
(b) The mouse is then used to select the centre point for the circle.

Messages sent to the screen message area when selecting and accepting the centre point

<Circle centre> [picks][menu]
<Circle centre> [picks][accepts][menu]

When selecting a point on the circle

<Point on circle> [picks][menu]
<Point on circle> [picks][accepts][menu]

14.1.5.3 Create Circle - Three Points on Circle
Position of option on menu:  Strings =>Create =>Circles =>3 pts on circle
This option defines a circle by selecting three points that all lie on the circle. The radius and centre point are automatically calculated by the option.

After selecting the option, the circle - 3 points on circle panel is displayed.

To create a circle, the name, colour, model and chainage interval are entered into the appropriate fields and then three points which lie on the circle are selected with the cursor. The circle is then created using the information provided in the panel.

The fields and buttons used in the circle - 3 points on circle panel have the following functions.
Create

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Name | input | the name of the new string.

Model | input | available models | name of the model that the new string is in.

Colour | input | default colour | available colours | the colour of the new string.

Style | input | 1 | available line styles | line style of the string.

Weight | input | 0 | thickness of the string.

z mode | input | typed | snap, typed | the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.

z value | input | 0 | if the z mode method is typed, then the height (z-value) of the circle is the value in the field.

Ch interval | input | 10 | the chainage interval used when a chord approximation is needed for the circle.

Circle button | The **circle** button is used to begin a new create if the previous one was cancelled.

Same as button | After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.

Panel Messages

Next step messages sent to the screen message area when selecting and accepting the 1st point

<First point on circle> [picks][menu]
<First point on circle> [picks][accepts][menu]

When selecting and accepting the second point

<Second point on circle> [picks][menu]
<Second point on circle> [picks][accepts][menu]

When selecting and accepting the third point

<Third point on circle> [picks][menu]
<Third point on circle> [picks][accepts][menu]
14.1.6 Create - Feature

Position of option on menu:  **Strings =>Create =>Feature**

A feature string consists of a centre point (x,y,z) and a user given radius.

The difference between a circle and a feature string is that for a feature string the centre point is considered to be a valid (x,y,z) point but all the points on the circumference of the feature string are null values. Feature strings can be used to represent objects such as trees.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to *tick*, when the current string creation is *Finished* or Quit, a new Create Feature String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Feature String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create Feature String panel.

After selecting the option, the Create feature string panel is displayed.

![Create Feature String Panel](image)

The new fields and buttons used in the create feature string panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>input</td>
<td>the name of the new string.</td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
<tr>

<td>input</td>
<td>default colour available colours</td>
<td></td>
</tr>
<tr>
<td>Style</td>
<td>input</td>
<td>1 available line styles</td>
<td></td>
</tr>
<tr>
<td>Weight</td>
<td>input</td>
<td>0 thickness of the string.</td>
<td></td>
</tr>
<tr>
<td>Centre</td>
<td>input</td>
<td>xyz ops menu</td>
<td></td>
</tr>
</tbody>
</table>

Co-ordinates of the centre of the feature.
Radius input

the radius for the feature.

Many strings tick
if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button
After the create button is chosen, the Feature Edit menu and Feature Edit Info panel are displayed.

Same as button
After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.

Note - the centre co-ordinates can either be typed into the centre panel field, or if LB is clicked on [+] for the centre panel field, the xyz ops menu comes up and the pick xyz option can be used from it to select a point as the arc centre.

Start Edit - Feature

Like the arc creates, on selecting the Create button the feature string is immediately created. The Feature Edit menu and feature edit info panel are also placed on the screen at the same time

The Feature Edit menu and panel for a feature string are

For full information in the Feature Editor, go to the section 14.4.7 Feature Edit
14.1.7 Create - Pipe Super

Position of option on menu:  Strings =>Create =>Pipe

A pipe super string is the same as a 3d string except that the pipe string also has a diameter hence the options for creating and editing a pipe string are almost the same as for a 3d string.

The main difference is that the pipe diameter can be modified in the Properties panel for the string.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create Super Pipe String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Super Pipe String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle style, weight, diameter and tinability fields of the Create Super Pipe String panel.

From 12d Model 8 onwards, the default is to create super pipe strings rather than the pipe strings used up to 12d Model 7. The advantage is using a pipe super string is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id’s for setout.

The older pipe string create option is still available under

Strings =>Create =>Old  (go to the section 14.20.1.5 Create - Pipe (Pre V8))

On selecting the Pipe option, the Create Super Pipe String panel is displayed.

The fields and buttons used in the Create Super Pipe String panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>input</td>
<td>from CAD controlbar</td>
<td></td>
</tr>
</tbody>
</table>

The default values for the panel fields are taken from the CAD Controlbar (see 15.1 Controlbars)

To create a new pipe super string, the panel fields are filled in and the Create button selected.

Create

---

**Start Edit - Pipe Super**

On selecting the Create button in the Create Super Pipe String panel the Edit Pipe menu is placed on the screen. The Edit Pipe menu for a pipe super string is
To create a new pipe super string, select the Append icon.

The Append option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all pipe strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit options on the string's Edit Pipe menu are usable.

The options in the Edit Pipe menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the Edit Pipe menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the Pipe Editor, go to the section 14.4.8 Edit Pipe
14.1.8 Create - Polyline Super

Position of option on menu:  Strings => Create => Polyline

A polyline string is similar to a 3d string except that it can have either straight lines or arcs joining the (x,y,z) vertices of the string. The arcs are plan arcs with possibly a different z at either end and the z values are linearly interpolated between the end points. Hence in a long section, the end vertices are joined by straight lines for both line and arc segments of the polyline.

Creating and editing a polyline string is very similar to a 3d string. The only major difference is that a radius is required at each string segment (a radius of 0 means no arc, just a straight line).

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create Super Polyline String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Super Polyline String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle style and weight fields of the Create Super Polyline String panel.

From 12d Model 8 onwards, the default is to create super polyline strings rather than the polyline strings used up to 12d Model 7. The advantage is using a super polyline string is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id’s for setout.

The older pipe string create option is still available under

Strings => Create => Old

(go to the section 14.20.1.6 Create - Polyline (Pre V8))

On selecting the Polyline option, the Create Super Polyline String panel is displayed.

The default values for the panel fields are taken from the CAD Controlbar (see 15.1 Controlbars)

To create a new polyline super string, the panel fields are filled in and the Create button selected.

The fields and buttons used in the Create Super Polyline String panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>

Start Edit - Polyline Super

On selecting the Create button in the Create Super Polyline String panel the Edit Polyline menu is placed on the screen. The Edit Polyline menu for a polyline super string is
To create a new polyline string, the user must select one of the two append options (Append or Append + radius) on the Append drop-down toolbar on the Edit Polyline toolbar. The Append option simply creates vertices which are joined by a straight segment whereas the Append + radius creates vertices with a radius for the segment.

The Append options are used to add vertices to either end of an existing string, or in the case of a new string, places the 1st vertex and then begins appending vertices to the 1st vertex.

For all polyline strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

If Append + radius was selected, the user will then be prompted for the radius of the segment being placed. The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

The options in the Edit Polyline menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the Edit Polyline menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the Polyline Editor, go to the section 14.4.9 Edit Polyline
14.1.9 Create - Super

Position of option on menu:  
Strings =>Create =>Super

A super string is a combination and generalisation of a 4d string, a pipe string and a polyline string.

A super strings consists of a series of (x,y) vertices, plus it can have either straight lines or arcs joining the 
vertices of the string.

At each vertex, the super string has:

- height
- text
- visibility
- tinability (contourability)
- point number
- symbol
- user defined attributes

For each segment, the super string has:

- plan radius
- colour
- text
- tinability (breakline)
- pipe diameter or box dimensions
- visibility
- user defined attributes

Creating and editing a super string is very similar to a polyline string in that a radius is can be given at each 
string segment (a radius of 0 means no arc, just a straight line), and also like a 4d string in that there can be 
text at each vertex. However there are many more choices about what is defined for each vertex and 
segment of the super string.

The Many strings tick-box is used when more than one string of the same type is to be created. If many 
strings is set to tick, when the current string creation is Finished or Quit, a new Create Super String panel 
is placed on the screen with the same information in it as the string just created. If any of the information 
needs to be modified for the new string, simply change it in the Create Super String panel fields before 
selecting the Create button for the new string. Hence a new string of the same type can be created without 
going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) 
and pipe it into the name, colour, model, style breakline type and height field of the Create Super String 
panel.

On selecting the Super string option, the Create Super String panel is displayed.
When the panel opens, various panel field values are taken from the ControlBars.
The information in Name, Model, Colour, Style and Tinable are taken from the CAD ControlBar,
Attributes from the Attributes ControlBar and Pipe information from the Pipe ControlBar.
If the Name icon is used in the Create Super String panel to select a name from the names.4d pop up,
then the panel fields are updated from the names.4d file.

To create a new super string, the appropriate panel fields are filled in and the Create button clicked.

The new fields and buttons used in the Create Super String panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>names.4d box</td>
<td>names.4d file</td>
<td>the name of the new string</td>
</tr>
</tbody>
</table>
Model  
model box  
available models

name of the model for the new string.

Colour  
colour box  
default colour  
available colours

the colour of the new string.

Note that each segment can have a different colour if in the Segment tab, the Segment colour choice is Varied.

Type  
choice box  
line  
line, point

breakline type (point-line type) of the string

As an overall string property:

If a string has type line, then all vertices and all segments are tinable.
If a string has type point, then all vertices are tinable but the segments are not tinable.

Note that each vertex and segment can have different tinabilities and it is controlled in the Tínable tab.

Style  
linestyle box  
1  
available line styles

line style of the new string.

Weight  
weight box  
0

thickness of the string when plotted.

String type  
choice box  
2d like, 3d like, 4d like

if not blank, the like type sets a number of the panel field settings.

Many strings  
tick box

if ticked then after the current string is finished, a new Create Super String panel is placed on the screen with all the same values for the panel fields as in the current panel.

Vertex tab

The fields for setting up what information is required for vertices.

Vertices height  
choice box  
Constant for all
Varied
No height

if Constant for all, there is only one height that is used for all vertices of the string (2d like).
If Varied, there is a different height for each vertex (3d like)
If No height, there is no height at all for the string.

if the Vertices height choice is Constant for all then the field Default height is enabled.

Default height  
real box

the one height that is used for every vertex of the string.

Text data  
choice box  
Constant for all
Varied
No text data

if Constant for all, there is one text for all the vertices of the string.
If Varied, there is different text for each vertex.
If No text data, there is no text at all for the string.

if the Text data choice is Constant for all then the fields Input text and Text style are enabled.

Input text  
text box

the one bit of text that is used for every vertex of the string.

Text style  
choice box  
Constant for all
Varied
if Constant for all, there is one textstyle that is used for all the vertices of the string.  
If Varied, there is a different textstyle for each vertex.  
If No text data, there is no textstyle at all for the string.

if the Text style choice is Constant for all then the field Textstyle data is enabled.

Textstyle data textstyle data box  
the one textstyle data that is used for every vertex of the string.

Symbol data choice box  
if Constant for all, there is one symbol that is used for all vertices of the string.  
If Varied, there is a different symbol for each vertex  
If No symbol, there is no symbols at all for the string.

if the Symbol data choice is Constant for all then the field Symbol data is enabled.

Symbol data symbol data box  
the one symbol data that is used for every vertex of the string.

Variable point id tick box  
if ticked, there is a different point id for each vertex.  
If not ticked, there are no vertex ids for any vertex of the string.

Attribute data for each vertex tick box  
if ticked, there can be attributes for each vertex.  
If not ticked, there are no attributes on any vertex.

Segment tab
The fields for setting up what information is required for segments.

Segments colour choice box  
if Constant for all, there is one colour for every segment of the string and that is the colour in the Colour field.  
If Varied, there is a different colour for each segment.

Text data choice box  
if Constant for all, there is one text for all the segments of the string.  
If Varied, there is different text for each segment.  
If No text data, there is no text at all for the string.

if the Text data choice is Constant for all then the fields Input text and Text style are enabled.

Input text text box  
the one bit of text that is used for every segment of the string.

Text style choice box  
if Constant for all, there is one textstyle that is used for all the segments of the string.
If *Varied*, there is a different textstyle for each segment.
If *No text data*, there is no textstyle at all for the string.

If the Text style choice is Constant for all then the field Textstyle data is enabled.

**Textstyle data**

*Textstyle data box*

the one textstyle data that is used for every segment of the string.

**Radius/Major**

*Tick box*

If ticked, each segment can have a radius and a major flag.
If not ticked, all segments are straight lines.

*Note:* the radius is a signed value and in the direction of travel along the arc, a negative radius means the arc bends to the left and a positive radius means the arc bends to the right. However this is still not enough to uniquely define the arc and it can be a minor major arc (turns through less than or equal to 180 degrees), or a major arc (turns through more than 180 degrees). The Major flag is 0 for a minor arc and 1 for a major arc.

**Attribute data for each segment**

*Tick box*

If ticked, there can be attributes for each segment.
If not ticked, there are no attributes on any segment.

**Tinable/Visible tab**

The fields for setting up what tinability is allowed for vertices and segments.

*Tinability* for a *vertex* is the property that the vertex is included in a tin (triangulation).
If a vertex is tinable then it is included in a tin.
If a vertex is not tinable, then it is not included in a tin.

*Tinability* for a *segment* is the property that the segment is to be included in a tin (triangulation). That is, the segment is to be a side of a triangle in a tin. Another name for a tinable segment is that it is a *breakline*. Even though a segment is tinable, it may not end up in a tin if there are crossing breaklines. Also a tinable segment can not be included in a tin if either of its end vertices are not tinable.

If a segment is tinable then if possible, it is included as the side of a triangle in a tin.
If a segment is not tinable, then it does not have to be included as a side of a triangle in a tin.

As an overall string property:

If a string has type *line*, then all vertices and all segments are tinable.
If a string has type *point*, then all vertices are tinable but the segments are not tinable.

**Vertex tinability**

*Choice box*

*Constant*
varied
not tinable

if *Constant*, there is one tinability and it is the same for all vertices in the string.
If *Varied*, each vertex can have a different tinability.
If *Not tinable*, then all vertices are not tinable.

**Segment tinability**

*Choice box*

*Constant*
varied
not tinable

if *Constant*, there is one tinability and it is the same for all segments in the string.
If *Varied*, each segment can have a different tinability.
If *Not tinable*, then all segments are not tinable.
Pipe mode tab
The fields for setting up what pipe modes are allowed for segments.
Segments can be all round for a string, or all box (culvert) for a string but can’t be a mixture of round
and box in the one string.
If a segment is round then it just needs a diameter.
If a segment is culvert (or box), it needs a width and a height.

Pipe choice
There are five choice: the string is a
- constant pipe string and has one diameter for the entire string
- a variable pipe string and can have a different diameter for each segment
- a constant culvert string and has the one width and height for each segment
- a variable culvert string and can have a different width and height for each segment
- or the string has no diameter or width and height for any segment.

Pipe mode choice box
- no round pipe or culvert
- round pipe entire string
- round pipe each segment
- culvert entire string
- culvert each segment

if no round pipe or culvert, there is no diameters, or any widths or heights for any segment.
if round pipe entire string, there is one diameter for all segments in the string.
if round pipe each segment, there is a different diameter for each segments of the string.
if culvert entire string, there is one width and a height for all segments in the string.
if culvert each segment, there is a different width and height for each segment of the string.

if the Pipe mode choice is round pipe entire string then the field Diameter is enabled.
Diameter real box
diameter to use for every segment of the string.

if the Pipe mode choice is culvert entire string then the fields Width and Height are enabled.
Width/Height real box
width/height to use for every segment of the string.

if the Pipe mode choice is NOT no round pipe or culvert then the field Justify is enabled.
Justify choice box
- Invert, centre, obvert
  If invert, the coordinates of the vertices are on the top of the pipe/culvert.
  If centre, the coordinates of the vertices are in the centre of the pipe/culvert.
  If obvert, the coordinates of the vertices are at the bottom of the pipe/culvert.

Buttons at bottom
Create button
After the create button is chosen, the super edit menu and super edit info panel are displayed.

Same as button
After the same as button is chosen, another string is selected and information about it is used for the
fields in this panel.

Start Edit - Super String
On selecting the Create button in the Create Super String panel the Super Edit menu and Super Edit Info
panels are placed on the screen.
To create a new super string, select the **Append** or **Append + radius** or **Append + text** icons.

The **Append** and **Append + text** options simply creates vertices that are joined by a straight segments. **Append + text** also asks for text at each vertex.

The **Append + radius** create vertices with a radius for the segment.

For all super strings, a cross is then drawn in each plan view that the string’s model is on, and the cross follows the cursor around the screen. If the string’s model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed. If **Append + text** was selected, the user will then be prompted for the text to be placed at the vertex.

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string’s **Super Edit** menu are usable.

The options in the **Super Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Super Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Super Editor, go to the section 14.4.10 **Edit Super**
14.1.10 Create - Text

Position of option on menu: Strings => Create => Text

A text string consists of:
(a) the text
(b) an (x,y) position for the text
(c) a text style
(d) a justification
(e) the height of the text in pixels, paper or world units
(f) the x factor and slant of the text
(g) the colour of the text
(h) the angle to write the text at

The default text style uses a non-proportional font but user defined fonts can be proportional or non-proportional.
The justification of the text with respect to text string’s (x,y) position is user specified.
The text angle is measured in a counter-clockwise direction with respect to the horizontal axis.

For more information on text definitions, go to the section 4.6 Text Definitions.

Note - deleting text

Text is deleted as a normal string with the picking point at the text string’s definition point. The relationship of the definition point and the text depends on the text offset and justification.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create Text String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Text String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create Text String panel.

On selecting the Text string option, the Create text string panel is displayed.
To create a new text string, the name, model, colour and actual text of the new string are entered into the appropriate fields, and the textstyle info such as height, offset, justification, angle are entered by clicking on the Textstyle info box. The create button is then selected.

The new fields and buttons used in the create text string panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>name of the new string</td>
<td>name box</td>

</table>

Start Edit - Text

On selecting the create button in the create text string panel the text edit menu and text edit info panel are placed on the screen.
The **text edit** menu for a text string is and the **text edit** panel is

![Text Edit Menu](image1.png)

(x,y) position of text
define the actual text
text height
text angle
bring up attribute panel
toggle edit info panel
undo/redo
quit the create
finish the text edit

To creating a new text string, the user must first select the **Position** option from the **Text edit** menu. Then after selecting a position, the text is created and displayed (if the model is on the view).

For full information in the Text Editor, go to the section 14.4.12 **Text Edit**
14.1.11 Create - Ellipse

Position of option on menu:  
Strings => Create => Ellipse

This option creates a super string of points along the ellipse defined in the panel. The frequency of points is determined by a user defined chord-to-arc tolerance.

After selecting the Ellipse option, the Create Ellipse panel is displayed.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ellipse centre</td>
<td>model select</td>
<td>centre of the ellipse</td>

<td>measure box</td>
<td>10°00'</td>
<td></td>
</tr>
<tr>
<td>Level</td>
<td>measure box</td>
<td>null</td>
<td></td>
</tr>
</tbody>
</table>

The Create Ellipse panel includes fields for specifying the ellipse's center, output model, add to view, colour, ellipse name, major axis, minor axis, major axis bearing, level, and arc-chord tolerance. Each field is described with its type, default value, and available options.

The panel allows users to define the ellipse's characteristics, including its center, axis lengths, bearing, and level, to create a string of points along the ellipse.
Arc-Chord Tol measure box 0.01
the chord to arc tolerance to use for deciding how often to create points around the ellipse

Create button
after the Create button is chosen, a string of points around the ellipse is created

Same as button
after the same as button is chosen, another string is selected and information about it is used for the fields in this panel.
14.1.12 Create - Control Stations

Position of option on menu: Strings => Create => Create Control Station

This option is documented in Survey => Extras => Create Control stations in the section 17.14.5 Create Control Stations.
14.1.13 New

Position of option on menu: Strings => Create => New

This section of documentation is a work in progress and will be updated in subsequent releases.

The New walk-right menu contains options Interface and Face.

For the option Interface, go to

Face

14.1.13.1 Interface

Position of option on menu: Strings => Create => New => Interface

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the Interface option, the Create Super Interface String panel is displayed.

The fields and buttons used in the Create Super Interface String panel have the following functions.
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>Same as</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the Create button has been pressed, the Edit Interface toolbar and Super edit Info panel appears on the screen, containing the list of available edit options for the Super Interface String.

14.1.13.2 Face

Position of option on menu: Strings => Create => New => Face

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the Face option, the Create Super Face String panel is displayed.
The fields and buttons used in the **Create Super Face String panel** have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>colour box</td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>choice box</td>
<td>line</td>
<td>point, line</td>
</tr>
<tr>
<td>Linestyle</td>
<td>input</td>
<td>from CAD controlbar</td>
<td>available line styles</td>
</tr>
<tr>
<td>Weight</td>

<td></td>
</tr>
<tr>
<td>Create</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Same as</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the Create button has been pressed, the Edit Face toolbar and Super edit Info panel appears on the screen, containing the list of available edit options for the Super Face String.
14.1.14 Create - Same As

Position of option on menu: Strings => Create => Same as

The same as option is used to create a new string of the same type and with similar header information as an existing string.

On selecting the same as create option, the create same as panel is displayed.

![Create Same As Panel]

After selecting the option, the option is already running and waiting for a string to be selected.

Once a string is selected from a view, a new create nd string panel of the same type as the selected string and with all the header information from the selected string, is displayed on the screen.

The user then proceeds as a normal create string option.

If the pick is terminated by clicking RB to get up the pick ops menu and selecting cancel from it, the option can be started again by selecting the pick & create button.
14.2 Super Alignments

Position of menu: Strings => Super alignments

The Super Alignment walk-right menu contains options to create a super alignment string, plus options to create/edit labelling and information styles, and design standards and templates.

For the option Super alignment, go to:
- 14.2.1 Create Super Alignment
- 14.2.2 Super Alignment Tools
- 14.2.3 Super Alignment Style
- 14.2.4 Super Alignment Info Styles
- 14.2.5 Design Standards
- 14.2.6 Design Templates
- 14.2.7 Import Legacy Design
14.2.1 Create Super Alignment

Position of option on menu:  Strings => Super Alignments => Super alignments

A super alignment string is defined by specifying both its horizontal and vertical geometry.

If the user does not have the Alignment Module, then the super alignment acts like the pre-V10 alignment string and consists of only horizontal and vertical intersection points consisting of leading transitions-arc-trailing transition for each horizontal intersection point, and parabolas or arcs on the intersection points for vertical geometry. The resultant elements are linked tangentially to form the horizontal and vertical geometry. The intersection points and the tangent points can be moved.

If the user has the Alignment Module then the Super Alignment includes IP constructions but also allows much more complicated parametric design.

The Horizontal Geometry of a Super Alignment is made up of parts, which may be as simple as a straight line between two points or an arc with a given centre and radius, or a horizontal intersection point with given leading and trailing transitions or the parts can be very complicated where for example the points of a line are defined by the offset intersection of the two arcs from other strings.

Often a horizontal part is not fully defined (parts are classified as fixed which are fully defined, floating which have one degree of freedom and free which have two degrees of freedom) and the extra restriction that the horizontal parts must be linked tangentially is necessary to fully defined the horizontal geometry. The horizontal geometry is then said to be solved.

Once solved, the horizontal geometry simply consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called parts, and if the horizontal geometry solves, it also contains the resultant horizontal segments.

Similarly the Vertical Geometry is made up of parts, which are made up of simple or complicated combinations of straight lines, arcs or parabolas. Again the extra restriction that the vertical parts must be linked tangentially is often necessary to fully defined the vertical geometry. The vertical geometry is then said to be solved and the solved vertical geometry simply consists of linked known segments of types lines, arcs and parabolas, and so can be drawn in a section view.

So the vertical geometry is made up of the constructive definitions called parts, and if the vertical geometry solves, it also contains the resultant vertical segments.

Important Note

The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the solved segments are displayed and any unsolved parts are displayed as red crosses.

For more information on Super Alignments and Parts, see 21.9 Placing Parts for Super Alignments.

Notes:

1. vertical geometry can only be added to an existing super alignment string. That is, to a string with some horizontal geometry.

2. for both the alignment and super alignment, the horizontal geometry is defined in a plan view and the vertical geometry in a section view.

On selecting the Super Alignment option, the Create Super Alignment panel is displayed.
To create a new super alignment string, the name, model, colour, etc. of the new string are entered into the appropriate fields for each branch on the tree on the left-hand side of the panel, and the **Create** or **Many** button selected.

For information on each branch and the buttons (Create, Many, Same as), and starting to edit after selecting the **Create** or **Many** button, go to:

- Basic > General branch
- Basic > Chainage branch
- Basic > Interval branch
- Basic > Label branch
- Basic > Transition branch
- Basic > Closure branch
- Basic > Sync branch
- Basic > IP defaults branch
- Advanced > Start branch
- Advanced > End branch
- Advanced > Design branch
- Advanced > Profiles branch
- Advanced > Equality branch
- Advanced > Chain branch (not yet implemented)
- Buttons at Bottom
- Start Edit - Super Alignment
The fields and buttons used in the **Basic > General** branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mode</th>
<th>choice box</th>
<th>start point</th>
<th>end point</th>
<th>control point</th>
<th>start part</th>
<th>end part</th>
</tr>
</thead>
</table>

If start point, the Control chainage value is applied to the start of the usable horizontal geometry.

If end point, the Control chainage value is applied to the end of the usable horizontal geometry.

If control point, a user given control point is dropped perpendicularly onto the horizontal geometry and that position is given the Control chainage value.

Control point X/Y coordinate select x, y box
coordinates of the control point

If start part, the Control chainage value is applied to the start of the first part of horizontal geometry, even if it is invisible.

If end part, the Control chainage value is applied to the end of the last part of horizontal geometry, even if it is invisible.
Basic > Interval branch

The fields and buttons used in the Basic > Interval branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>horizontal chord to arc tolerance to use for any arcs and transitions</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If blank, the default is 0.1.</td>
<td></td>
</tr>
<tr>
<td>Vertical Chainage interval</td>
<td>measure box</td>
<td></td>
<td>Point to point/String to point</td>
</tr>
<tr>
<td></td>
<td>vertical chainage interval for the string</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If blank, the default is 10.</td>
<td></td>
</tr>
<tr>
<td>Vertical Chord to arc tol</td>
<td>measure box</td>
<td></td>
<td>Point to point/String to point</td>
</tr>
<tr>
<td></td>
<td>vertical chord to arc tolerance to use for any parabolas or circular curves.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If blank, the default is 0.1.</td>
<td></td>
</tr>
</tbody>
</table>

Note: the horizontal and vertical intervals and chord to arc tolerances are used when the super alignment is approximated by straights in three dimensions.
### Basic > Label branch

![Image of Create Super Alignment panel]

The fields and buttons used in the **Basic > Label** branch of the **Create Super Alignment** panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label style</strong></td>
<td>choice box</td>
<td>default</td>
<td>available label styles</td>
</tr>
</tbody>
</table>

The super alignment style controls the way the super alignment draws and highlights on the screen.

For more information please go to the section 14.2.3 **Super Alignment Style**

- **Label Major Chainage interval** measure box
  
  major chainage interval to use for labelling

  *If blank, the default is 10.*

- **Label Minor Chainage interval** measure box
  
  minor chainage interval to use for labelling

- **Label Reference chainage interval** measure box
  
  reference value for the chainage labelling intervals

- **Label Special chainage file** file box

  file of special chainages for labelling

  *Note: the labelling of the super alignment is given by the Label style on the General tab.*

  For more information please go to the section 14.2.3 **Super Alignment Style**
Basic > Transition branch

The fields and buttons used in the Basic > Transition branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transition type</td>
<td>choice box</td>
<td>clothoid</td>
<td></td>
</tr>
</tbody>
</table>

The transition (for example clothoid) to be used for this super alignment string.

For more information see 39.2.7.5 Transitions and Spirals File.
The fields and buttons used in the Basic > Closure branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Closed string</td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
</tbody>
</table>

*If ticked, the super alignment is automatically closed*
Basic > Sync branch

The fields and buttons used in the Basic > Sync branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical sync</td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
</tbody>
</table>

*If ticked*, when the horizontal geometry is modified, an attempt is made to modify the chainage position of the vertical geometry so that it remains locked to the same parts of the horizontal geometry as before the horizontal geometry was modified.

*If not ticked*, after horizontal geometry is modified, the vertical geometry will possibly be moved in relation to the horizontal geometry because the (x,y) position for a given chainage will change.
Basic > IP defaults branch

The IP Defaults branch defines the types of HIPs and VIPs that are placed when laying down horizontal and vertical geometry.

The fields and buttons used in the Basic > IP defaults branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIP type</td>
<td>choice box</td>
<td>Curve radius</td>
<td>Curve speed/radius/length</td>
</tr>
</tbody>
</table>

The default HIP type given to any placed HIPs. The default for the panel is a Curve radius with blank Curve radius, Approach and Depart length. That is, just a HIP with no curve or transitions on it.

If Curve speed, any new HIP being created will be a Speed IP with the speed specified in the Speed field.

If the Speed field is blank, the default alignment speed is used.

If Curve radius, any new HIP being created will be a Radius IP with the radius of the arc on the HIP specified in the Curve Radius field. Optional approaching and departing transitions can also be defined in the Approach length and Depart length fields.
If the Curve Radius field is non-zero, an arc of the given value is placed on the HIP.
If the Curve Radius field is blank, the HIP won’t have an arc associated with it.
If the Approach length field is non-zero, then a leading transition of the given value is placed on the HIP. If there is a non-zero value then there must also be a non-zero Curve Radius value.
If the Depart length field is non-zero, then a trailing transition of the given value is placed on the HIP. If there is a non-zero value then there must also be a non-zero Curve Radius value.

Note - if either the Approach length or Depart length fields are non zero then there must be a non zero Curve radius.

If the HIP is defined by Curve radius, then as the HIP is moved around, the values in the Curve radius definition are held for the HIP. That is, the radius of the arc and the transition lengths are kept constant and the length of the arc is modified.

If Curve length, any new HIP being created will be a Length IP with the length specified in the Curve length field.

If the Curve length field is blank, the HIP will have an arc of length zero.
If the HIP is defined by Curve length, then as the HIP is moved around, the arc length is held for the arc on the HIP and arc radius is modified.

VIP type choice box Curve length Curve speed/radius/length
Asymmetric
The default VIP type given to any placed VIPs. The default for the panel is a Curve length with a Length of 0.

If Curve speed, any new VIP being created will be a Speed IP with the speed specified in the Speed field.

If the Speed field is blank, the default alignment speed is used.
If Curve radius, any new VIP being created will be a Radius IP with the radius specified in the Radius field.

If the Radius field is blank, the VIP won’t have an parabola/arc associated with it. The value in the Radius field can be a k-value for a parabola, an effective radius (100 x k-value) for a parabola, or the radius of an arc.

If the Kvalue tick box is ticked, a parabola is placed on the VIP and the k-value of the parabola is the value in the Radius field.

If the Circular curve tick box is ticked, an arc is placed on the VIP and the radius of the arc is the value in the Radius field.

If neither Kvalue or Circular curve is ticked, a parabola is placed on the VIP and the effective radius of the parabola is the value in the Radius field.

If the VIP is defined by Curve radius, then as the VIP is moved up or down, the values in the Curve radius definition is held for the VIP. That is, the radius or k-value will be kept constant and the length of the parabola/arc is varied.

If Curve length, any new VIP being created will be a parabolic Length IP with the length specified in the Length field.

If the Length field is 0, then just the VIP will be drawn with no parabola on it.

If the Length field is blank, the VIP will be associated with an parabola of maximum length.

If the VIP is defined by Curve length, then as the VIP is moved up or down, the length of the parabola given in the Curve Length definition is held for the VIP. That is, the length is kept constant and the radius/k-value of the parabola is varied.

If Asymmetric, any new VIP being created will have parabolas of the combined lengths of Approach length and Depart length.

If the VIP is defined by Asymmetric, then as the VIP is moved up or down, the Approach and Depart Lengths of the parabolas given in the Asymmetric definition are held for the VIP. That is, the lengths are kept constant and the radius/k-value of the parabolas are varied.
Advanced > Start branch

The Start branch defines where the usable horizontal and vertical geometry starts for the super alignment. Note that the super alignment can have more horizontal and vertical geometry than is actually used.

The fields and buttons used in the Advanced > Start branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Horizontal mode</td>
<td>choice box</td>
<td>default</td>
<td>segment</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>point</td>
</tr>
</tbody>
</table>

specifies how the start of the usable horizontal geometry is defined.

If default, the beginning of the first visible horizontal part is the start of the usable horizontal geometry.

If segment, a user selected segment of the horizontal geometry is the start of the usable horizontal geometry.

If point, a user selected position is dropped perpendicularly onto the super alignment to define the start of the usable horizontal geometry.

Start Control point X/Y coordinate select x, y box

used in the segment and point cases of the Start Horizontal mode.

Start Vertical mode choice box absolute relative chainage

specifies how the start of the usable vertical geometry is defined.

If absolute, the beginning of the first visible vertical part is the start of the usable vertical geometry.

If relative, the chainage of the start of the usable horizontal geometry is used as the start of
the usable vertical geometry. If the beginning of the defined vertical geometry is after this chainage, then the first segment is extrapolated back to the required chainage.

If chainage, a user given chainage defines the start of the usable vertical geometry.

Chainage measure box available measures
used in the chainage case of the Start Vertical mode.
Advanced > End branch

The End branch defines where the usable horizontal and vertical geometry ends for the super alignment. Note that the super alignment can have more horizontal and vertical geometry than is actually used.

The fields and buttons used in the Advanced > End branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>End Horizontal mode</td>
<td>choice box</td>
<td>default segment</td>
<td>point</td>
</tr>
<tr>
<td>End Vertical mode</td>
<td>choice box</td>
<td>absolute chainage</td>
<td>relative</td>
</tr>
</tbody>
</table>

specifies how the end of the usable horizontal geometry is defined.

If default, the end of the last visible horizontal part is the end of the usable horizontal geometry.

If segment, a user selected segment of the horizontal geometry is the end of the usable horizontal geometry.

If point, a user selected position is dropped perpendicularly onto the super alignment to define the end of the usable horizontal geometry.

End Control X/Y coordinate select x, y box used in the segment and point cases of the End Horizontal mode.

End Vertical mode choice box absolute relative chainage

specifies how the end of the usable vertical geometry is defined.

If absolute, the end of the last visible vertical part is the end of the usable vertical geometry.

If relative, the chainage of the end of the usable horizontal geometry is used as the end of the
usable vertical geometry. If the end of the defined vertical geometry is before this chainage, then the last segment is extrapolated to the required chainage.

If chainage, a user given chainage defines the end of the usable vertical geometry.

Chainage measure box available measures used in the chainage case of the End Vertical mode.
Advanced > Design branch

The Design branch is only used if a design template has been set up and is to be used for automatically inserting curves and transition curves in horizontal geometry, apply super elevation and widening, and automatically inserting vertical curves in the vertical geometry.

The fields and buttons used in the Advanced > Design branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use design standards</td>
<td>tick box</td>

No of lanes on RoC

number of lanes on the right of the centreline. The number of lanes can be zero.

Horizontal speed IP choice box minimum maximum

For Alignment speed and Curve speed HIPs.

If minimum, when an arc is automatically placed on an HIP using the design table, the arc with the smallest radius for the design speed is used.
If maximum, when an arc is automatically placed on an HIP using the design table, the arc with the largest radius for the design speed is used.

Vertical speed IP choice box minimum maximum

For Alignment speed and Speed VIPs.

If minimum, when a parabola is automatically placed on an VIP using the design table, the parabola with the smallest kvalue for the design speed is used.
If maximum, when a parabola is automatically placed on an VIP using the design table, the parabola with the largest kvalue for the design speed is used.

Speed lookup choice box ceiling floor round up round down

Different method to achieve the actual speed from the speed table.
If ceiling, then the design speed is the upper speed from the table.
If floor, then the design speed is the lower speed from the table.
If round up, the speed will be the upper speed from the table when the calculated speed is greater than or equal to the half way speed. Otherwise it will be the lower speed.
If round down, the speed will be the lower speed from the table when the calculated speed is less than or equal to the half way speed. Otherwise it will be the upper speed.

Radius lookup choice box ceiling floor round up round down interpolate

Different method to achieve the actual radius from the radius table.
If ceiling, then the design radius is the upper radius from the table.
If floor, then the design radius is the lower radius from the table.
If round up, the radius will be the upper radius from the table when the calculated radius is greater than or equal to the half way radius. Otherwise it will be the lower radius.
If round down, the radius will be the lower radius from the table when the calculated radius is less than or equal to the half way radius. Otherwise it will be the upper radius.
If interpolate, the radius is the calculated based on the specified speed.

For non speed HIPs only (that is, not Alignment speed or Curve speed HIPs).
The radius has been defined by the user and LJG?
Advanced > Profiles branch

The fields and buttons used in the Advanced > Profiles branch of the Create Super Alignment panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Chain file</strong></td>
<td>file box</td>
<td>available *.chain files</td>
<td></td>
</tr>
</tbody>
</table>

This parameter file to run every time the super alignment is resolved/recalced.

*For more information see the section 28.3 Chains in the book 28 Utilities.

Run chain after set tick box not ticked
Buttons at Bottom

Create button
when only one super alignment is to be created, click on the Create button. The Edit Super Alignment toolbar is displayed.

Many button
when more than one super alignment is to be created using the same set-up information, then click on the Many button. Edit Super Alignment toolbar is displayed.
After the editing for this string is finished, a new Create Super Alignment panel is placed on the screen with the same values for the panel fields as the string just created. Hence new super alignments can be created (by clicking on the Create or Many button) without having to go back to the String Create menu.
If no more super alignments are to be created, click on the Finish button

Same as button
after the Same as button is chosen, another string is selected and information about it is used to fill in fields for this panel
Start Edit - Super Alignment

After selecting the Create or Many button, the Super Alignment toolbar is created and placed on the screen.

The Append HIP simply creates horizontal intersection points (HIPs) that are joined by a straight segments.

For Appending HIPs, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first HIP of the string (using the appropriate snaps).

The string is then drawn from the first HIP to the cursor position, which represents the second HIP of the string. Clicking LB and accepting with MB selects the second string HIP and the process repeats for subsequent string HIPs.

Now that the string is created, all the edit option on the string’s Edit SA toolbar are usable.

The options in the Edit SA toolbar are not only used for placing the initial HIPs of the string, but for editing the super alignment once it is created. Since the Append HIP and other options in the Edit SA toolbar are identical to the options used when editing an existing string, they will be discussed in detail in the Editor section.

For full information on the Super Alignment Editor, go to the section 14.4.11 Edit Super Alignment.
14.2.2 Super Alignment Tools

Position of Menu: Strings => Super alignments => Tools

The Super Alignment Tools walk-right menu is

14.2.2.1 Super Alignment Info

Position of option on menu: Strings => Super alignments => Tools => Info

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Info displays the Super Alignment Info panel.

14.2.2.2 Super Alignment Report

Position of option on menu: Strings => Super alignments => Tools => Report

Selecting Report displays the Super Alignment Report panel.
Resolve a Super Alignment

Position of option on menu:  
Strings => Super alignments => Tools => Resolve

When a super alignment is created using computators, the super alignment is defined with references to other strings. If the referenced strings are modified, then the super alignment will not automatically reflect the changes in the referenced strings.

Resolve forces the string to be resolved using the current position and properties of any referenced strings.
Selecting Resolve displays the Resolve Super Alignment panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super alignment</td>
<td>string select</td>
<td>select a super string to resolve.</td>
<td></td>
</tr>
<tr>
<td>Resolve</td>
<td>button</td>
<td>after the Resolve button is clicked, the super alignment is resolved using the new position and properties of any referenced strings.</td>
<td></td>
</tr>
</tbody>
</table>
14.2.2.4 Dereference Super Alignments

Position of option on menu:  Strings =>Super alignments =>Tools =>Deref

When a super alignment is created using computators, the super alignment is defined with references to other strings.

Dereferencing removes the references to other strings in a super alignment, and inserts copies of the referenced string in its place. Hence a dereferenced string looks like the original string, but it no longer has links to any other strings.

The Deref option copies the original string, and dereferences the copied string.

So after running Deref there are no longer any references to other strings in the copy of the super alignment. Selecting Deref displays the Dereference Super Alignments panel.

![Dereference Super Alignments panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data to dereference</td>
<td>Model</td>
<td></td>
<td></td>

<td></td>
<td></td>
</tr>
<tr>
<td>extra information required for the Data source.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Target type</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Target info</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>extra information required for the target. Only the Copy Targets are allowed.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Process</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>after the Process button is clicked, the selected strings are copied and dereferenced.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
14.2.2.5 Reverse Super Alignment

Position of option on menu:  
**Strings => Super alignments => Tools => Reverse**

Reverse creates a copy of the selected super alignment, and then reverses the direction of the copied super alignment.

If there are any computators in the super alignment, the copy of the super alignment will be dereferenced before being reversed.

Even if the super alignment will not solve, it can still be reversed. This is useful when strings come in from other systems and have geometry (that is, horizontal and vertical segments) but won’t solve. These strings can now be reversed.

Selecting Reverse displays the **Reverse Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super alignment</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**select the super alignment to copy and reverse the direction of the copied string**

- **Geometry only**
  - tick box
  - not ticked

  *If ticked* then only the Geometry of the Super Alignment (the segments for the horizontal and the segments for the vertical) is used, and a reverse string is created by simply reversing the segments. All construction data is removed. So this will work for super alignments that have geometry but won’t solve.

  The reversed string no longer has any constructive definition but just consists of the horizontal and vertical data.

  This is useful when strings come in from other systems and have geometry (that is, horizontal and vertical segments) but won’t solve.

  *If not ticked* then the string will need to solve before it can be reversed.

  **Note 1:** This reverses and replaces the existing string so if you don’t want to lose the data in your existing string, make a copy of it first.

  **Note 2:** The horizontal segments can be straights, arcs, transitions and offset transitions. The vertical segments can be straights, arcs and parabolas.

- **Reverse**
  - button

**after the Reverse button is clicked, the direction of the copied super alignment is reversed.**
14.2.2.6 Parallel a Super Alignment

Position of option on menu:  
Strings => Super alignments => Tools => Parallel

Parallel parallels the horizontal geometry of a super alignment by a user given offset. 
Selecting Parallel displays the Parallel Super Alignment panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Super alignment</strong></td>
<td>string select</td>
<td>select a super alignment to parallel</td>

Weight

input
thickness of the string

Label style

choice box default available label styles
The super alignment style controls the way the super alignment draws and highlights on the screen. For more information please go to the section 14.2.3 Super Alignment Style

Transition type

input clothoid clothoid, cubic parabola westrail-cubic, cubic spiral natural clothoid, bloss sinusoidal, cosinusoidal sinusoidal transition (for example clothoid spiral) to be used for this super alignment string. For more information see 39.2.7.5 Transitions and Spirals File.

Chain file

file
The chain parameter file to run every time the super alignment is resolved/recalced.
For more information see the section 28.3 Chains in the book 28 Utilities

Close

tick box
if ticked, the super alignment is automatically closed.
Sync vertical geometry tick box

*If ticked*, when the horizontal geometry is modified, an attempt is made to modify the chainage position of the vertical geometry so that remains locked to the same parts of the horizontal geometry as before the horizontal geometry was modified.

*If not ticked*, after horizontal geometry is modified, the vertical will possibly be moved in relation to the horizontal geometry because the (x,y) position for a given chainage will change.

Use chainage equalities tick box

*If ticked*, chainage equalities can be defined and the automatic labelling of the string will use the equalities.

Parallel button

*After the Parallel button is clicked*, a dereferenced copy of the horizontal geometry of the super alignment is paralleled. The vertical geometry is deleted.

Same as button

*After clicking Same as and then select a string. All the picked string properties will be loaded into the panel fields.*

### 14.2.2.7 Translate Super Alignment

Position of option on menu:  
Strings => Super alignments => Tools => Translate

Translate copies the selected super alignment, and then dereferences and translates the copied string. Selecting Translate displays the Translate Super Alignment panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super alignment</td>
<td>string select</td>

<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**14.2.2.9 Scale Super Alignment**

Position of option on menu: Strings =>Super alignments =>Tools =>Scale

Scale copies the selected super alignment, and then dereferences and scales the copied string about a user defined origin.

Selecting Scale displays the Scale Super Alignment panel.
The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Super alignment</strong></td>
<td>string select</td>

if not blank, model for the split string
If blank, use the model of the selected string

Split button
after the Split button is clicked, the super alignment is copied and split at the given chainage.

### 14.2.2.11 Joining Two Super Alignments

Position of option on menu: Strings => Super alignments => Tools => Join

Join joins two super alignments at their ends to make a new super alignment.
Selecting Join displays the Join Super Alignment panel.

![Join Super Alignment Panel](image)

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super alignment</td>
<td>string select</td>

If blank, use the model of the selected string for the joined string.
Join button

*after the Join button is clicked, a new super alignments is created by joining the two super alignments*

Same as button

*after clicking Same as and then select a string. All the picked string properties will be loaded into the panel fields.*

### 14.2.2.12 Copy Vertical Geometry

**Position of option on menu:** Strings => Super alignments => Tools => Copy vertical

Copies the vertical geometry from one super alignment to another super alignment. This will not work for a super alignment with computators.

Selecting Copy vertical displays the Copy Vertical Super Alignment panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

<td></td>
</tr>
<tr>
<td>Process</td>
<td>button</td>
<td>after the Process button is clicked, the vertical geometry is copied from the original alignment to the second super alignment.</td>
<td></td>
</tr>
</tbody>
</table>

### 14.2.2.13 Convert Fixed/Floating Elements to IPs
Position of option on menu: **Strings => Super alignments => Tools => Fixed/floating to IPs**

**Fixed/floating to IPs** converts the fixed and floating elements of the horizontal and vertical geometry to horizontal and vertical intersection points joins with arcs and transitions for HIPs and parabolas or vertical arcs for VIPs.

Selecting **Fixed/floating to IPs** displays the **Fixed/floating to IPs** panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super alignment string select</td>
<td>string select</td>
<td>select a super alignment to convert</td>

<td></td>
</tr>
</tbody>
</table>

Extra panel fields when New super alignment properties is ticked.

*The tabs are the same as when Creating a Super Alignment - go to On selecting the Super Alignment option, the Create Super Alignment panel is displayed.*

*Please note that under New Super Alignment properties => General Tab Many Strings is not applicable to Fixed/Floating to IPs.*

**Convert** button

*after the Convert button is clicked, a new super alignments is created by converting all the elements to IPs*

**Same as** button

*after clicking Same as and then select a string. All the picked string properties will be loaded*
into the panel fields.

14.2.2.14 Change the Styles for Selected Super Alignments

Position of option on menu: Strings => Super alignments => Tools => Change style

Change style changes the super alignment style for all the selected super alignments. Selecting Change style displays the Change Super Alignment Style panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

**14.2.2.16 Constrain the Movement of Super Alignment Points**

Position of option on menu: Strings => Super alignments => Tools => Move settings

Move settings constrains the movement of horizontal and vertical intersection points for any super alignment being edited.

Selecting Move settings displays the **Move Super Alignment Point Settings** panel.

The buttons are radio buttons - that is, only one can be selected:
Default
allows any movement in the selected HIP or VIP point

X-axis
constrains an HIPs to only move along the x-axis. That is, the y coordinate is fixed.
Constrains a VIPs to only move along the chainage-axis. That is, the height coordinate is fixed.

Y-axis
constrains an HIPs to only move along the y-axis. That is, the x coordinate is fixed.
Constrains a VIPs to only move along the height-axis. That is, the chainage coordinate is fixed.

Fwd Tgt
constrains an HIPs to only move along the incoming straight to the HIP.
Constrains a VIPs to only move along the incoming straight to the VIP.

Bwd Tgt
constrains an HIPs to only move along the outgoing straight from the HIP.
Constrains a VIPs to only move along the outgoing straight from the VIP.

14.2.2.17 Equality Query

Position of option on menu: Strings => Super alignments => Tools => Equality query

Displays the Kpost name, offset from Kpost and Zone of the Kpost for a selected position on a super alignment.

Selecting Equality query displays the Equality From Chainage panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super alignment</td>
<td>string select</td>
<td>select the super alignment to display the Kpost name, Offset and Zone for Super alignment to display the Kpost name, Offset and Zone for</td>
<td></td>
</tr>
</tbody>
</table>
Query button

After the Query button is clicked, the vertical geometry is copied from the original alignment to the second super alignment.

14.2.2.18 Chainage Query

Position of option on menu: Strings => Super alignments => Tools => Chainage query

For a user given Kpost name, offset from Kpost and Zone, this option displays the raw chainage of that point.

Selecting Chainage query displays the Chainage From Equality panel.

![Chainage From Equality panel]

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super alignment</td>
<td>string select</td>
<td></td>
<td>select the super alignment to get the raw chainage for</td>
</tr>
<tr>
<td>Kpost name</td>
<td>name of a Kpost on the selected string</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td>offset from the Kpost</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Zone</td>
<td>Kpost zone</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Query</td>
<td>button</td>
<td></td>
<td>after the Query button is clicked, the raw chainage of the point given by the Kpost name, Offset from Kpost and Zone.</td>
</tr>
</tbody>
</table>

14.2.2.19 Reverse Calc Parts

Position of option on menu: Strings => Super alignments => Tools => Reverse calc parts

A super alignment is made up of the methods for constructing each part of the super alignment (one set for the horizontal geometry and another set for the vertical geometry), and if the methods are consistent, then they define a string of tangential segments which defines the super alignment in plan and in section.

In plan the segments can be lines, arcs or transitions. In section the segments are lines, arcs or parabolas. Normally the segments are tangential to each other.

Sometimes a super alignment is missing the construction parts and only consists of the underlying segments. Then the super alignment can not be edited since there are no methods defining the string.
The Reverse Calc Parts option takes a super alignment consisting only of segments, and tries to build construction methods for the super alignment. If it is successful, then the super alignment can then be edited.

Note - the segments should be tangential to each other but if that is not the case, the option will try and move the vertices by a user defined tolerance to find a tangential solution.

Selecting Reverse calc parts displays the Reverse Calc Parts For Super Alignment panel.

The new fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

14.2.2.20 Validate Super Alignment

Position of option on menu: Strings => Super alignments => Tools => Validate

This section of documentation is a work in progress and will be updated in subsequent releases.
Selecting Validate displays the **Super Alignment Parts Validation** panel.
14.2.3 Super Alignment Style

Position of option on menu:  Strings => Super alignments => Label styles

The super alignment label styles control the way that the super alignment draws on the screen and when it is being edited.

Selecting Super alignment style displays the Super Alignment Style Create/Edit panel.

For the tab Highlights go to  Highlights tab
For the tab Labels go to  Highlights Table
For the **Buttons at the bottom** go to [Buttons at Bottom](#).

The fields and buttons used in the **Super Alignment Style Create/Edit** panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

### Label Type Table

For each label type in the table, the Use flag is ticked if it is to be drawn, and if it is drawn, the symbol is given in the Symbol Data column, text is prefixed/postfixed as given in the Pre*Postfix column, the text used the textstyle data given in the Textstyle Data column with the number of decimal places given in the Precision column.

There are twenty four (24) types:

- unknown - when it is not any of the other horizontal critical points
- curve-spiral - the tangent point between an arc and a transition. Eg CS
- spiral-curve - the tangent point between a transition and an arc. Eg SC
tangent-curve - the tangent point between a straight line and an arc. Eg TC
curve-tangent - the tangent point between an arc and a straight line. Eg CT
tangent-spiral - the tangent point between a straight line and a transition. Eg TS
spiral-tangent - the tangent point between a transition and a straight line. Eg ST
common tangent - the tangent point between two arcs. Eg CTP
spiral-spiral - the tangent point between two transitions Eg SS
interval - the chainage label at the major interval
vert. unknown - when it is not any of the other vertical critical points
vert. tangent-curve - the tangent point between a straight grade and a vertical curve (parabola
or an arc). Eg VTC
vert. curve- tangent- - the tangent point between a vertical curve (parabola or an arc) and a
straight grade. Eg VCT
vert. common tangent - the tangent point between two vertical curves. Eg VCTP
crest - a vertical crest (local maximum) point. Eg CREST
sag - a vertical sag (local minimum) point. Eg SAG
special chainages - chainages from a special chainage file given in the Special chainage file
field in the Basic Label section of the Super Alignment Properties
horz. direction - the direction symbol of the string
minor interval - the chainage label at the minor interval
k post equality - label the k posts equations. Eg 15 Km 998 = 16 Km
internal equality - label the internal equality equation Eg 17 Km 500 = 17 Km 600
segment radius - label the radius of an arc segment Eg R 500.0
segment length - label the length of a segment Eg L 500.0
segment bearing - label the bearing of a segment in dms format Eg 125 30 20

Buttons at Bottom

Set button
clicking the Set button means that for this session, all the definitions in the panel will be used
for the style given in the Super alignment label style field. Unless the Write button is used to
write the values out to the astyles.4d file, the values will be lost when the project is exited.

Write button
clicking the Write button writes out all the values in this panel to the astyles.4d file as the style
given in the Super alignment label style field

Note
The new Super alignment label style is not used until a resolve is done on the super alignment string,
14.2.4 Super Alignment Info Styles

Position of option on menu:  Strings => Super alignments => Info style

The super alignment info styles control what information is displayed in the Super Alignment Info panel brought up by the 14.2.1 Super Alignment Info option on the SA Tools menu or toolbar.

Selecting Super alignment info displays the Super Alignment Info Styles panel.
14.2.5 Design Standards

Position of option on menu:  Strings => Super alignments => Design standards

The design standards sets up numerous standard tables for:

(a) horizontal speed (speed_standards) defines for various speeds, the use of horizontal arcs and transition curves, super elevation for various numbers of lanes.

(b) horizontal widening (widening_standards) defines the road widening for various lane widths, speeds and curve radii.

(c) horizontal small deflection (small_deflection_standards)

(d) vertical crest (crest_standards) defines for crest curves the k-values of allowed parabolas for different speeds

(e) vertical sag (sag_standards) defines for sag curves the k-values of allowed parabolas for different speeds

For each of the five types of tables, specific tables of values are set up by the user for each of the different design scenarios that the user will undertake. Each specific table is given a name, and the names must be unique within each of the five types of tables.

The tables are written to a file (design_standards.xml) which is then read in whenever a project is opened.

The tables in the design standards file are used in the option Strings => Create => Super alignments => Design templates to define Design Templates (see 14.2.6 Design Templates), and when a super alignment is created, one Design Template is selected for use with that super alignment (see the section Advanced > Design branch from 14.2.1 Create Super Alignment).

Selecting Design standards displays the Design Standards panel.
DOCO TO GO INTO DEFINITIONS OF DESIGN PARAMETERS

Ease-off
choice box
none
maximum
by length

method of transitioning between minimum and maximum super elevation.
If none, no transition is done.
If maximum, maximum back to back curves are added to the super diagram between the minimum and maximum super elevation and are used to transition the super.
If by length, the ease off distance is given by the Ease off length value.

Ease-off length
input
the length of the ease off for the transition of super elevation when the by length method is selected

Min on reverse
input
if the chainage distance between two curves of opposite sign is less than the Minimum on reverse value then the two curves are treated as reverse curves when applying the design rules.
Min on broken back input

if the chainage distance between two curves of the same sign is less than the Minimum on broken-back value then the two curves are treated as broken-back curves when applying the design rules.

Plan View

If this distance is less than Min on reverse then the two curves are treated as reverse curves

Plan View

FROM V9 DOCO

Slope type choice box planar
crowned
projected

If planar, then the design table is only applied for half of the road (from the hinge string to the end of the fixed template). The side used is given by Highside.

If crowned, then the design table is used for each side of the roads (from the left most fixed template to the hinge string, and from the hinge string to the right most fixed template).

If projected, then the design table is first applied to half of the road given by Highside (from the hinge string to the end of the fixed template). Then the grade from the Highside is projected through the hinge string and used on the other side of the road.
Super Alignments

**Highside**

choice box left edge left edge, right edge

*used if the Slope type is planar or projected to define the higher side of the road pavement.*
14.2.6 Design Templates

Position of option on menu:  Strings =>Super alignments =>Design templates

The *Design Templates* option is used to create Design Templates (each with a unique name) that have one of each of the five design table types (horizontal speed, horizontal widening, horizontal small deflection, vertical crest, vertical sag) that have been defined by the Strings =>Create =>Super alignments =>Design standards option (see 14.2.5 Design Standards), plus whether curve transitions are allowed, whether minimum or maximum curve radii are used, and reverse and broken back curve lengths.

When a super alignment is created, one *Design Template* is selected for use with that super alignment (see the section Advanced > Design branch from 14.2.1 Create Super Alignment).

Selecting Design templates displays the Design Template Editor panel.

Clicking on the + in front of Design Templates will list all the design templates that are in the design_templates.xml file currently be used in the 12d Model project.
The fields and buttons used in the Design Template Editor panel when creating a new Design Template, or when clicking on an existing Design Template, have the following functions.

<table>
<thead>

Buttons at Bottom

Write button

clicking the Write button writes out all the Design Templates defined in this panel to the design_templates.xml file.
14.2.7 Import Legacy Design

Position of option on menu:  Strings =>Super alignments =>Import legacy design

The Import legacy design option reads a 12d Model 9 Design Parameter File and converts it to a Design Template for use in 12d Model 10 or higher.

Note:

Selecting Import legacy design displays the Import Design Parameters panel.

Selecting a Design parameters file will read in the selected .design file and populate fields in the panel.
14.2.8 Define Design Parameters - from V9

Position of option on menu:  Strings => Create => Super alignments => Design parameters

This was superseded in 12d Model 10 by Design Tables and Design Templates.

The **design parameters table** defines the use arcs, transition curves, parabolas, super elevation and road widening for given design speeds. The table is used to use by a super alignment in conjunction with user supplied information given in the **Design** tab of the super alignment.

Selecting Design parameters displays the Road Design Parameters panel.

![Road Design Parameters panel image](image-url)
14.2.9 SA Element Parts Viewer

Position of option on menu: Super Alignment Toolbar => Help

This option displays and explains all the parts in both horizontal and vertical, available in the Super Alignment.

Examples from the library can be read in for editing.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Horizontal</td>
<td>choice box</td>
<td>various</td>

</tr>
</tbody>
</table>
Quick selection of Vertical parts

Read Both button
Will read in 12da examples of all the parts. Most include vertical parts that are similar to their horizontal counterparts.

A plan view is created, called "SA Examples", and a model called "12D HOR ELEMENTS" is added to the plan view.

Show Horiz tick box
If ticked, allows the explanation and viewing of all horizontal parts

Show Vert tick box
If ticked, allows the explanation and viewing of all vertical parts

Show Solutions tick box
If ticked, allows the viewing of examples that can be read in

Read button
Will read in 12da examples of Super Alignments. Most include vertical geometry.

A plan view is created, called "SA Examples", and a model in the format "12D SA EXAMPLE 1" is added to the plan view.

Previous button
Step backward through examples

Next button
Step forward through examples
14.2.10 Super to SA Element Convert

Position of option on menu: Road Toolbar

This option is used to convert super strings that may have come in from other software.

The conversion will attempt to create a Super Alignment made up in the horizontal of element parts.

The parts will mainly include at least one fixed part followed by floating parts of varying types (lines and arcs).

A label style can be set and a tin set in the vertical as a drape computator.

Note: If the original string had a geometry error (non-tangential arcs e.g.), then the resulting Super Alignment will show an error.

The error however will be easy to find as any parts prior to the error, will still show as solved.

Selecting the convert alignment option brings up the Super to SA Element Convert panel.

The fields and buttons used in the panel have the following functions.

Field Description | Type | Defaults | Pop-Up
---|---|---|---
Data source type | Model | | |
Data source | input | | |
New name | name box | select name | |

"data selection type - for a full description go to 4.19.3 Data Source."

"source of data to be processed."

"if non-blank, then the name of the selected strings will be changed to the name given in the new name"
field.

**New model**

14.3.7 Trimeshes from Tin
14.3.8 Trimeshes from Polygon
14.3.1 Create Trimesh

Position of option on menu:  Strings => Trimesh => Create trimesh

THIS OPTION IS CURRENTLY UNDER DEVELOPMENT.

The option is for creating trimeshes from 12d Model strings and a profile.

Continue to 14.3.2 Trimeshes from 12d Objects or return to 14.3 Trimesh.
14.3.2 Trimeshes from 12d Objects

This option creates trimeshes for any mesh, extrude, super string pipe or culvert, drainage/sewer string or billboard, in the selected data. The trimeshes can then be added to a section view, or cross section plots, to see that they are correctly sectioned through.

Selecting Trimeshes from 12d Objects brings up the Generate Trimeshes from 12d Objects panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

14.4 Editor

Position of option on menu: Strings => Editor

The string editor is used for modifying any of the 12d Model strings.

After selecting the editor option, the edit string panel is placed on the screen to record any error messages.

The option is already in pick mode (the pick & edit button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited. From the picked string's type, the editor is able to determine the appropriate editor and placed on the screen.

Each string type has its own edit operations which will now be discussed in detail.

Note - if the edit menu is deleted from the screen using the menu delete option, it can be raised again by clicking RB in any view.

For the option 2d, go to

3d
4d
Arcs
Circles
Feature
Edit Pipe
Edit Polyline
Super
Super Alignment
Text

For the old string options:

2d go to
3d - old
4d - old
Alignment
Pipe - old
Polyline - old

Please continue to the next section 14.4.1 Super String Edit - Common Information.
14.4.1 Super String Edit - Common Information

14.4.1.1 nd edit menu

After selecting the string to be edited, the toolbar containing the list of available edit options (the string’s Edit menu) is placed on the screen. If Display edit info is ticked on in the Default panel (Project => Management => Defaults), an information panel, (the string’s Edit info panel) is also displayed.

For example, the Edit String menu and Super Edit Info panel for a 3d super string are

Most of the options chosen from the Edit menu repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

For example, if the Delete option is selected, any number of vertices can be deleted from the chosen string without re-selecting the Delete option. For full information on the Delete option, go to the section 14.4.1.2 Delete.

To select a new edit option, simply select the option from the Edit toolbar. The current option is automatically terminated and the new option begins.
Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertices (point type) or with straight lines joining the vertices (line type). Linestyles can be defined that drawn lines between the vertices even though the breakline type is point.

2. The string vertices are called intersection points (IPs).

3. The string Super Edit Info panel will not automatically appear if Display edit info is set to off in the System Settings tab of the Project => Management => Defaults panel.

14.4.1.13 Quit
14.4.1.12 Finish
14.4.1.14 Typed input

14.4.1.2 Delete
The vertex to be deleted is picked (LB) and accepted (MB). When the vertex is accepted, it is deleted. The string, minus the deleted point, is then redrawn.

Once a vertex has been deleted, another vertex in the string can then be selected and deleted. Hence any number of vertices from the string can be deleted one after another.

The delete option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the Edit nd menu.

Typed input can be used to select a point for deletion.

Continue to the next section 14.4.1.3 Move or return to 14.4.1 Super String Edit - Common Information.

14.4.1.3 Move

The move option is for moving individual vertices (intersection points - IPs) of the string.

The move cycle consists of two steps:
(a) selecting the vertex to move
(b) selecting the new position for the vertex.

Step (a)
First the point to be moved is selected. The selected vertex will then move around the view and the string
redrawn to show the change as the cursor is moved.

message area 1 <Move>
Screen message area
<Pick vertex to move> [picks][fast][Menu

Step (b)
The current cursor position is selected as the new position for the vertex by selecting (LB) and accepting (MB). The vertex being moved is then anchored at the cursor position for the vertex, and the string redrawn.

message area 1 <Move>
Screen message area
<Pick new location of vertex> [picks][fast][menu]

Typed input can be used in either step.

Once the move cycle is completed and the vertex moved, the move option is still current and can be repeated for other vertices without having to re-select the move option.

The Move option is terminated by selecting cancel from the pick ops menu or by selecting a new Edit nd option.

Continue to the next section 14.4.1.4 Insert or return to 14.4.1 Super String Edit - Common Information.

14.4.1.4 Insert

The insert option is designed to place a new vertex in a string between two adjacent vertices (note that the inserted point does not have to be on the segment joining the two vertices).

Select the two adjacent vertices by selecting the segment joining them

New vertex added at this location

Inserting a vertex, like moving a vertex, is a two step process.

Step (a) - selecting the vertices to be on either side of the new vertex by selected the segment

The two adjacent vertices are chosen by selecting the segment connecting the two vertices. Once the segment is selected, the new vertex is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted vertex.

message area 1 <Insert >
Screen message area
<Pick position to insert vertex> [picks][fast][menu]
Step (b) - selecting the position for the new vertex
The position of the new vertex is selecting
message area 1  
Screen message area
<Insert>
<Pick new location of vertex> [picks][fast][menu]

Once the insert cycle is completed and the vertex inserted, the insert option is still current and can be repeated for other insertions without having to re-select the insert option.

The insert option is terminated by selecting Cancel from the Pick ops menu or by selecting a new option from the Edit nd menu.

Typed input can be used in either step.

Continue to the next section 14.4.1.5 Between or return to 14.4.1 Super String Edit - Common Information.

14.4.1.5 Between

The between option is similar to the insert option except that the inserted vertex does have to be on the segment joining the two vertices. To accomplish this, the cursor position is projected onto the segment to give the new vertex position.

Select the segment that the new vertex must be on

New vertex added at this location

The between option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the Edit nd menu.

Continue to the next section 14.4.1.6 Extend or return to 14.4.1 Super String Edit - Common Information.

14.4.1.6 Extend
The extend option is used to move a vertex along the line joining the vertex to its neighbouring vertex. That is, the bearing of the segment is kept constant and the vertex is moved along that segment either towards or away from its neighbouring vertex on the segment.

Pick here to extend this vertex

Pick here to extend this vertex

Extending, like moving a vertex, is a two step process.

Step (a) - selecting the segment and the vertex to be moved along that segment

The segment and the vertex to be moved are chosen in the one operation by picking (LB) and accepting (MB) at a co-ordinate point near the segment and close to the vertex to be moved along that segment.

Once the segment and vertex are selected, the new position of the selected vertex is assumed to be at the current cursor position projected along the selected segment.

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex.

Step (b) - selecting the final position for the vertex

The final position for the vertex is set to the projection of the selected cursor position onto the segment.

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The extend option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the Edit nd menu.

Typed input can be used in either step.

Note - Extend can be used on the end points of the string.

Continue to the next section 14.4.1.7 Open/Close or return to 14.4.1 Super String Edit - Common
14.4.1.7 Open/Close

Toggles a string between Open and Closed.

If the string is open (that is, the start and end vertices are not the same), selecting the Open/Close option adds a segment joining the first and last vertices of the string.

Selecting Yes if the string is open adds a segment, joining the first and last vertices of the string.

The string is now closed.

If the string is closed (that is, there is a segment from the start to the end vertices), selecting the Open/Close option removes the last segment of the string.

Continue to the next section 14.4.1.8 Properties or return to 14.4.1 Super String Edit - Common Information.
14.4.1.8 Properties

Selecting Properties brings up the **Super String Properties** panel which is used to modify the string’s header information.

What is displayed in the **Super String Properties** panel depends on the type of the super string. That is, it depends on what properties of the super string have been enabled.

For example, constant height enabled means that there is only one height for the entire super string so height appears in the **Super String Properties** panel. If variable height is enabled, there is a height for each vertex and so height does not appear in the **Super String Properties** panel.

In the **Advanced** mode, all the super string properties can be modified and so all possible super string fields are displayed in the **Super String Properties** panel.
The fields in the panels are similar to those in the Create Super String panels. The only new fields are the OK and Apply which are used in the normal way.

Continue to the next section 14.4.1.9 Info or return to 14.4.1 Super String Edit - Common Information.

14.4.1.9 Info
14.4.1.10 Undo/Redo

An undo and redo list is defined for each editor on the screen. That is, each editor has its own undo/redo lists. If an option is undone, it is added to the redo list so that it can be redone.

When the editor is exited by either Quit or Finish, the undo and redo lists are deleted and are no longer usable.

14.4.1.10.1 Undo

Undoes the last editor operation for this string and adds it to the top of the redo list.

14.4.1.10.2 Redo

Redo the last editor operation that was undone for this string. Add the undone operation to the top of the undo list.

14.4.11 ‘?’ Help

The Help button to go to the Help topic for the panel.

Continue to the next section 14.4.1.12 Finish or return to 14.4.1 Super String Edit - Common Information.

14.4.1.12 Finish

The edit process is completed and the modified string stored in the given model when the Finish option is chosen from the Edit nd menu.

After selecting the Finish option, a Yes-No-Cancel panel is displayed to confirm that the edit is to be ended. If Yes is selected, the edits will be stored.

Continue to the next section 14.4.1.13 Quit or return to 14.4.1 Super String Edit - Common Information.

14.4.1.13 Quit

Even after points are created for the new string, the create process can be aborted by selecting the Quit option from the Edit nd menu. The option then terminates and no string is created.
After selecting the **Quit** option, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be ended. If **yes** is selected, the edits will be ignored and the unedited string kept. Note that if it was a new string being created, the option terminates by Quit and no string is created.

Continue to the next section **14.4.1.14 Typed input** or return to **14.4.1 Super String Edit - Common Information**.

### 14.4.1.14 Typed input

Typed input can be used wherever a select is required to obtain a co-ordinate. For example an (x,y), (x, y, z) or (chainage, height).

To start typed input, start typing, and a special typed-input box appears on the screen.

If the focus is on a Plan or Perspective view, then an **Enter X Y Z** box comes up when you are placing horizontal geometry for an alignment or super alignment, or vertices for all other string types. If you are creating vertical geometry for an alignment or super alignment and the focus is on a Section view, then a **Enter Ch Ht** box appears.

These are also called the **XYZ typed input** box and the **Chainage Height typed input** box respectively.

An **<enter>** terminates the typed input and the entered values taken as the position of the required point. The typed-input box then disappears.

If the user wishes to abort the typed input and return to mouse input, simply select the [X] button on the typed input box or type **<enter>** with no values in the typed input box.

Continue to the next section **14.4.2 Edit 2d** or return to **14.4.1 Super String Edit - Common Information**.
14.4.2 Edit 2d

On picking a 2d string, the Edit 2d toolbar is placed on the screen. If Display edit info is ticked on in the Default panel (Project => Management => Defaults), an information panel, (the string’s Super Edit Info panel) is also displayed.

![Edit 2d toolbar and Super Edit Info panel]

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings, the panel Super Edit Info, and the options, 14.4.1.2 Delete, 14.4.1.4 Insert, 14.4.1.3 Move, 14.4.1.5 Between, 14.4.1.6 Extend, 14.4.1.7 Open/Close, 14.4.1.8 Properties, 14.4.1.9 Info, 14.4.1.10.1 Undo, 14.4.1.10.2 Redo, 14.4.1.13 Quit, 14.4.1.11 ‘?’ Help, 14.4.1.12 Finish and 14.4.1.14 Typed input.

Each Edit 2d option not mentioned in the earlier section 14.4.1 Super String Edit - Common Information will now be described.

See 14.4.2.1 2d - Append
14.4.2.2 2d - Height
14.4.2.3 2d - Height (Nav)
14.4.2.4 2d Properties

14.4.2.1 2d - Append

The append option is used to
- create the 1st vertex in a new string
- or, to append a new vertex to the end of the string
- or to prepend a new vertex to the beginning of the string.

In this option, both appending and prepending will be referred to as appending.

14.4.2.1.1 Existing 2d Strings
Appending a vertex is a two step process.

Step (a) - For an existing string - selecting the end of the string to append the vertex to. After the Append option has been selected, the end of the string to append the vertex to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point.

```
message area 1          <Append>
Screen message area
            <Pick end to append to> [picks][fast][menu]
```

Step (b) - selecting the position for the new appended vertex. The position of the new appended vertex is set to the current cursor position by picking (LB) and accepting (MB).

```
message area 1          <Append>
Screen message area
            <Pick location of vertex> [picks][fast][Menu]
```

Once a vertex has been appended to the string, the appended vertex is considered to be the selected string end and a new step (b) begins. The current cursor position indicates the new position for the next appended vertex.

Hence a series of string vertices is easily entered by first selecting the string end that the new vertices are to be appended to (step (a)) and then moving the cursor to the position of each new vertex and selecting them in turn (setup (b)).

Once the move cycle is completed and the vertex moved, the move option is still current and can be repeated for other vertices without having to re-select the move option.

The Append option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new Edit 2d option.

### 14.4.2 New 2d String

For creating a new string, the cursor is used to select the 1st vertex of the string. The option then continues as if appending to an existing 2d string where the end vertex has already been selected.

Typed input can be used in either step.

Continue to next section 14.4.2.2 2d - Height or return to 14.4.2 Edit 2d.

#### 14.4.2.2 2d - Height
After the height option is chosen, a height typed input box is displayed on the screen with the string’s current height (z value).

The height typed-input box looks like:

The height is entered into the typed-input box, terminated by <enter>. The entered value is taken as the height of the 2d string and the string redrawn with the new height. The typed-input box then disappears.

The height option automatically terminates and a new option is selected from the Edit 2d.

**Note** - all the points in a 2d string have the same height.

Continue to next section 14.4.2.3 2d - Height (Nav) or return to 14.4.2 Edit 2d.

### 14.4.2.3 2d - Height (Nav)

The height (Nav) option is used to modify the height (z value) of the 2d string. After the height (Nav) option is chosen, a Super Vertex Height panel is displayed on the screen with the string’s current height (z value).

To change the height of the selected string, enter the value into the height field and press **ok** or **apply**. The entered value is then taken as the height of the 2d string and the string redrawn with the new height.

**Note** - all the points in a 2d string have the same height.

The fields and buttons used in the Super Vertex Height panel have the following functions.
Height 

input height of vertex/string

the height used for the entire string.

OK/Apply 

button

OK sets the string with the value in the panel field and removes the panel. Apply set the string with the value in the panel field and leaves the panel on the screen.

Continue to next section 14.4.2.4 2d Properties or return to 14.4.2 Edit 2d.

14.4.2.4 2d Properties

For information on the Super String Properties panel, go to 14.4.1.8 Properties
14.4.3 Edit 3d

Position of option on menu: Strings => Editor

On picking a 3d string, the Edit 3d toolbar is placed on the screen. If Display edit info is ticked on in the Default panel (Project => Management => Defaults), an information panel, (the string’s Super Edit Info panel) is also displayed.

![Edit toolbar](image)

Each option in the Edit 3d menu will now be described.

See 14.4.3.1 3d - Append
14.4.3.2 3d - Extend and Extend ht
14.4.3.3 3d - Height
14.4.3.4 3d - Height (Nav)
14.4.3.5 3d Properties

The difference between a 2d and a 3d string is that all points in a 2d string have the same z-value, whereas for a 3d string, each point can have a different z-value.

Hence most of the options in the Edit 3d menu are similar to the Edit 2d options of the same name, and only the differences for each option will be discussed. The Edit 2d options are given in the section 14.4.2 Edit 2d

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings, the panel Super Edit Info, and the options, 14.4.1.2 Delete, 14.4.1.4 Insert, 14.4.1.3 Move, 14.4.1.5 Between, 14.4.1.6 Extend, 14.4.1.7 Open/Close, 14.4.1.8 Properties, 14.4.1.9 Info, 14.4.1.10.1 Undo, 14.4.1.10.2 Redo, 14.4.1.13 Quit, 14.4.1.11 ‘?’ Help, 14.4.1.12 Finish and 14.4.1.14 Typed input.

14.4.3.1 3d - Append
Since in most cases, it would be tiresome to ask for a height every time a vertex is added, the entry of a new height is controlled by the **height** toggle in the snaps menu. If **height** is toggled to on, then every time a vertex is placed or moved an enter height typed-input box is displayed on the screen.

The enter height typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the 3d string vertex and the string redrawn with the new height at the vertex. The typed-input box then disappears.

When the enter height box is placed on the screen, it will already have a value in it depending on the circumstances preceding the operation.

For example, if a vertex or segment was snapped to, the height at that vertex or segment will be displayed in the box.

Continue to next section 14.4.3.2 3d - Extend and Extend ht or return to 14.4.3 Edit 3d.

**14.4.3.2 3d - Extend and Extend ht**
The **Extend ht** option is similar to the **Extend** option except that the z-value of the moved vertex is modified by linearly interpolating the z-value from the original vertices at the end of the selected segment.

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend.

### 14.4.3.3 3d - Height

The **height** option is used to modify the height (z value) of any vertex in the string. After the height option is chosen, the user must select which vertex is going to have its height modified. After the vertex has been selected, a Height typed-input box is displayed on the screen with the vertex's current height (z value).

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the vertex in the 3d string and the string redrawn with the new height at that point. The typed-input box then disappears.

The **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit 3d** menu.

Continue to next section [14.4.3.4 3d - Height (Nav)] or return to [14.4.3 Edit 3d].
14.4.3.4 3d - Height (Nav)

As soon as Height (Nav) is chosen, a Super Vertex Height panel is displayed on the screen with the string's current height (z value) in the Height field.

The Super Vertex Height panel is used to set the height value for vertices.

When the Super Vertex Height panel appears on the screen, the vertex index field is the vertex index of the selected vertex, with its associated height in the Height field of the panel. To select another vertex to alter, the vertex to modify is selected by typing the vertex index into the Vertex index field or by selecting Prev or next to switch to another vertex. The selected vertex is highlighted on the string and its vertex index, and height are written to the appropriate panel fields in the Super Vertex Height panel. The values can be changed and either OK or Apply the changed value to the vertex.

Another vertex can then be selected or the Prev and Next buttons used to move to adjacent vertices.

The fields and buttons used in the Super Vertex Height panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex index</td>
<td>input selected vertex</td>
<td></td>
<td>selected vertex</td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>if a vertex is selected, then its vertex index is displayed in this field. An index can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>button move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Height</td>
<td>input height of vertex/string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>the height used for the vertex or for the entire string.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Continue to next section 14.4.3.5 3d Properties or return to 14.4.3 Edit 3d.

14.4.3.5 3d Properties
For information on the Super String Properties panel, go to 14.4.18 Properties.
14.4.4 Edit 4d

Position of option on menu:  
Strings => Editor

A 4d super string is a super string with the restriction that it has:
(a) vertices of (x,y,z) co-ordinates joined by straight segments only
(b) Text at each vertex
(c) All text has the same height, rotation, etc. So it is controlled by the one Text Style for the entire string

On picking a 4d string, the Edit 4d toolbar is placed on the screen. If Display edit info is ticked on in the Default panel (Project => Management => Defaults), an information panel, (the string’s Super Edit Info panel) is also displayed.

Only the options append, Append + Text, text, size and angle will be described in detail since all the other options are similar to the equivalent 3d string option (see the section 14.4.3 Edit 3d).

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings, the panel Super Edit Info, and the options, 14.4.1.2 Delete, 14.4.1.4 Insert, 14.4.1.3 Move, 14.4.1.5 Between, 14.4.1.6 Extend, 14.4.1.7 Open/Close, 14.4.1.8 Properties, 14.4.1.9 Info, 14.4.1.10.1 Undo, 14.4.1.10.2 Redo, 14.4.1.13 Quit, 14.4.1.11 ‘?’ Help, 14.4.1.12 Finish and 14.4.1.14 Typed input.

See 14.4.4.1 4d - Append +Text
14.4.4.2 4d - Height
14.4.4.3 4d - Height (Nav)
14.4.4.4 4d - Text (Nav)
14.4.4.5 4d - Text Info
14.4.4.6 4d Properties

14.4.4.1 4d - Append +Text
Append + text is a three step process.

Step (a) - For an existing string - selecting the end of the string to append the vertex and text to.

After the Append + text option has been selected, the end of the string to append the vertex to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point.

Step (b) - selecting the position for the new appended vertex.

The position of the new appended vertex is set to the current cursor position by picking (LB) and accepting (MB).

Step (c) - Creating a text label for the vertex.

Once the new appended vertex is set to the current cursor position a Description typed-input box is displayed on the screen.
Type the description into the typed-input box, finishing with <enter> and the typed-input box then disappears.

The appended vertex is now considered to be the selected string end and a new step (b) begins. The current cursor position indicates the new position for the next appended vertex.

Hence a series of string vertices is easily entered by first selecting the string end that the new vertices are to be appended to (step (a)) and then moving the cursor to the position of each new vertex and selecting them in turn (setup (b)).

The append option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the Edit 4d menu.

Continue to next section 14.4.4.2 4d - Height or return to 14.4.4 Edit 4d.

14.4.4.2 4d - Height

The height option is used to modify the height (z value) of any vertex in the string.

After the height option is chosen, the user selects which vertex is going to have its height modified.

After the vertex has been selected, a Height typed-input box is displayed on the screen with the vertex current height (z value).

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the vertex in the 4d string and the string redrawn with the new height at that vertex. The typed-input box then disappears.

Another vertex can then be selected for modifying its height.

The height option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the Edit 4d menu.

Continue to next section 14.4.4.3 4d - Height (Nav) or return to 14.4.4 Edit 4d.

14.4.4.3 4d - Height (Nav)

Selecting Height (Nav) brings up the Super Vertex Height panel with the height at the first vertex of the string displayed.

The Super Vertex Height panel is used to set the height value for any vertex of the string.
Any vertex can then be selected by clicking on the number icon at the end of the Vertex index panel field and selecting the required vertex, or by typing in its Vertex index and pressing <Enter>, or by using the Prev and Next buttons used to move to adjacent vertices until the required vertex is selected.

When the vertex to modify is selected, the vertex is highlighted on the string and its vertex index, and height are displayed in the appropriate panel fields in the Super Vertex Height panel. The new vertex height is stored by clicking either OK or Apply.

The fields and buttons used in the Super Vertex Height panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex index</td>
<td>input</td>
<td>selected vertex</td>
<td>if a vertex is selected, then its vertex index is displayed in this field. An index can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td>Height</td>
<td>input</td>
<td>height of vertex/string</td>
<td>the height used for the selected vertex.</td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</td>
<td></td>
</tr>
</tbody>
</table>

Continue to next section 14.4.4.4 4d - Text (Nav) or return to 14.4.4 Edit 4d.

14.4.4.4 4d - Text (Nav)

Selecting Text (Nav) brings up the Super Vertex Text panel with the text at the first vertex of the string displayed.

The Super Vertex Text panel is used to set the text for any vertex of the string.
Any vertex can then be selected by clicking on the number icon at the end of the Vertex index panel field and selecting the required vertex, or by typing in its Vertex index and pressing <Enter>, or by using the Prev and Next buttons used to move to adjacent vertices until the required vertex is selected.

When the vertex to modify is selected, the vertex is highlighted on the string and its vertex index and vertex text are displayed in the appropriate panel fields in the Super Vertex Text panel. The new vertex text is stored by clicking either OK or Apply.

The fields and buttons used in the Super Vertex Text panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex index</td>
<td>input selected vertex. If a vertex is selected, its vertex index is displayed</td>
</tr>
<tr>
<td></td>
<td>in this field. A number can also be typed in and any information in the panel</td>
</tr>
<tr>
<td></td>
<td>will then be applied to that vertex if OK or Apply is selected.</td>
</tr>
<tr>
<td>Prev</td>
<td>move to the previous vertex (predecessor). The information for the previous</td>
</tr>
<tr>
<td></td>
<td>vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>move to the next vertex (successor). The information for the next vertex is</td>
</tr>
<tr>
<td></td>
<td>displayed in the panel fields.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>values in the panel fields and removes the panel. Apply sets the vertex/</td>
</tr>
<tr>
<td></td>
<td>string with the values in the panel fields and leaves the panel on the</td>
</tr>
<tr>
<td></td>
<td>screen.</td>
</tr>
</tbody>
</table>

Continue to next section 14.4.4.5 4d - Text Info or return to 14.4.4 Edit 4d.
14.4.4.5 4d - Text Info

For a 4d super string, the size, colour, slant, offset, etc. of vertex text is all the same and is controlled by the Text Style for the 4d super string.

Selecting Text Info brings up the Super Vertex Annotate panel with the text style for the string displayed.

The fields and buttons used in the Super Vertex Annotate panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text style</td>
<td>text style box</td>
<td>string's text style</td>
<td>available text styles</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the text style string</td>
<td>This can be modified to change the values for all the text on the 4d string.</td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td>for the string being edited, OK sets the text style for the string and removes the panel. Apply sets the text style for the string and leaves the panel on the screen.</td>
<td></td>
</tr>
</tbody>
</table>

To modify any of the values of the Text Style, click on the Text style icon at the end of the Text style panel field to bring up the Select Textdata panel, and then select [Edit].
To change any of the values in the Text Style panel:

1. Modify the value in the Text Style panel and then click on Set and Finish. The panel will then close.

2. Click on Apply or OK in the Super Vertex Annotate panel.

**Modifying the Text Height**

All the text labels in the 4d string have the same height.

The height of all the text is modified by changing the Height (u) in the Text Style Info for the string (see 14.4.4.5 4d - Text Info).

**Modifying the Text Angle**

All the text labels in the 4d string are drawn rotated about their defining string point with the same rotation angle. The angle, in degrees, is measured in a counter-clockwise direction about the horizontal axis.

The angle of all the text is modified by changing the Angle in the Text Style Info for the string (see 14.4.4.5 4d - Text Info).

Continue to next section 14.4.4.6 4d Properties or return to 14.4.4 Edit 4d.

**14.4.4.6 4d Properties**
For information on the **Super String Properties** panel, go to [14.4.1.8 Properties](#).
14.4.5 Arc Edit

On picking an Arc string, the Arc Edit menu and Arc Edit Info panel are placed on the screen.

Each option in the arc edit menu will now be described.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.5.1 Height

The **Height** option is used to define the z-value at the start or end point of the arc.

The z-value at any point on the arc is an interpolation on arc length of the values at the end points. Hence, the arc is an arc in plan only - in three dimensions, it is a helix.

**Height** is a two step process.

Step (a) - selecting the start or end point of the arc

After picking **height**, the end point of the arc whose height is to be modified is selected.

message area 1 <Height of arc>

Screen message area

<Select point to change height> [picks][menu]

<Select point to change height> [picks][accepts][menu]

Step (b) - entering the new height

After the start or end point of the arc is selected, an enter value typed-input box is placed on the screen with the points current height displayed in it.

The **enter value** typed-input box looks like:

The new height for the point is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **height** option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the arc edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the height option, simply select the **restart** option from the pick ops menu and the pick ops menu will disappear leaving the **height** option still current.

Continue to next section 14.4.5.2 Typed Radius or return to 14.4.5 Arc Edit.
14.4.5.2 Typed Radius

The Typed radius option is used to modify the radius of the selected arc.

After the typed radius option is chosen, an enter value typed-input box is placed on the screen with the arc's current radius displayed in it.

The enter value typed-input box looks like:

The arc radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc and the arc is redrawn with its new radius.

The typed-input box then disappears.

The typed radius option is automatically terminated and a new option needs to be selected from the arc edit menu.

Continue to next section 14.4.5.3 Sweep Angle or return to 14.4.5 Arc Edit.

14.4.5.3 Sweep Angle

The Sweep angle option is used to modify the sweep angle of the selected arc.

After the sweep angle option is chosen, an enter value typed-input box is placed on the screen with the arc's current sweep angle displayed in it.

The enter value typed-input box looks like:

The arc sweep angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the sweep angle of the arc and the arc is redrawn with its new sweep angle.

The typed-input box then disappears.

The sweep angle option is automatically terminated and a new option needs to be selected from the arc edit menu.

Continue to next section 14.4.5.4 Chainage Interval or return to 14.4.5 Arc Edit.

14.4.5.4 Chainage Interval

The ch interval option is used to modify the chainage interval of the selected arc.

After the ch interval option is chosen, an enter value typed-input box is placed on the screen with the arc's current chainage interval displayed in it.

The enter value typed-input box looks like:

The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the arc and the arc is redrawn with its new chainage interval.

The typed-input box then disappears.

The ch interval option is automatically terminated and a new option needs to be selected from the arc edit menu.

Continue to next section 14.4.5.5 Move End or return to 14.4.5 Arc Edit.
14.4.5.5 Move End

The move end option is used to re-position either the start or the end point of the arc.

Move end is a two step process.

Step (a) - selecting the start or end point of the arc
After selecting the move end option, the end point to be move is selected.

message area 1 <Move End>
Screen message area
<Select point to move> [picks][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the end point
After selecting the end point to move, the new position for the end point is selected.

message area 1 <Move End>
Screen message area
<Select final position of point> [picks][menu]
<Select final position of point> [picks][accepts][menu]

The move end option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the arc edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the move end option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the move end option still current.

Continue to next section 14.4.5.6 Radius or return to 14.4.5 Arc Edit.

14.4.5.6 Radius

The radius option is used to change the radius of the arc by leaving the centre point alone and re-positioning a point on the arc. The new position for the point will define a new radius for the arc.

Radius is a two step process.

Step (a) - selecting the point on the arc to move
After selecting the radius option, the point on the arc to be moved is selected.

message area 1 <Radius>
Screen message area
<Select point to move> [picks][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point
After selecting the point to move, the new position for the point is selected.

message area 1 <Radius>
Screen message area
<Select final position of point> [picks][menu]
<Select final position of point> [picks][accepts][menu]

The radius option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the arc edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the radius option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the radius option still current.

Continue to next section 14.4.5.7 Move or return to 14.4.5 Arc Edit.

14.4.5.7 Move

The Move option is used to change the position of the entire arc by selecting and moving the arc centre or any point on the arc.

Move is a two step process.
Step (a) - selecting the point on the arc to move
After selecting the move option, the point on the arc to move is selected.

message area 1 <Move>
Screen message area
<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point
After selecting the point to move, the new position for the point is selected.

message area 1 <Move>
Screen message area
<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

The Move option repeats until cancelled by the user by either bringing up the Pick ops menu and selecting Cancel or by selecting a new option from the Arc edit menu.

If, after bringing up the Pick ops menu, it is decided to continue with the move option, simply select the restart option from the Pick ops menu and the Pick ops menu will disappear leaving the move option still current.

Continue to next section 14.4.5.8 Properties or return to 14.4.5 Arc Edit.

14.4.5.8 Properties

Selecting Properties brings up the Arc String Properties panel which is used to modify the string’s header information.

The fields in this panel are similar to those in the create arc string panel and the arc editor options. The only new field is

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK/Apply button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

for the string being edited, OK sets the string with the values in the panel fields and removes the panel. Apply sets the string with the values in the panel fields and leaves the panel on the screen.
14.4.6 Circle Edit

On picking a circle string, the circle edit menu and circle edit info panel are placed on the screen.

Each option in the circle edit menu will now be described.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.6.1 Height

The height option is used to define the z-value for the entire circle.

After selecting the height option, an enter value typed-input box is placed on the screen with the circles current height displayed in it.

The enter value typed-input box looks like:

The new height for the circle is entered into the typed-input box, terminated with <enter>.

The typed-input box then disappears.

The height option is automatically terminated and a new option needs to be selected from the circle edit menu.

Continue to next section 14.4.6.2 Typed Radius or return to 14.4.6 Circle Edit.

14.4.6.2 Typed Radius

The typed radius option is used to modify the radius of the selected circle.

After the typed radius option is chosen, an enter value typed-input box is placed on the screen with the circles current radius displayed in it.

The enter value typed-input box looks like:

The circle radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the circle and the circle redrawn with its new radius.

The typed-input box then disappears.
The typed radius option is automatically terminated and a new option needs to be selected from the circle edit menu.

Continue to next section 14.4.6.3 Radius or return to 14.4.6 Circle Edit.

14.4.6.3 Radius

The radius option is used to change the radius of the circle by leaving the centre point alone and re-positioning a point on the circle. The new position for the point will define a new radius for the circle.

Radius is a two step process.
Step (a) - selecting the point on the circle to move
After selecting the radius option, the point on the circle to be moved is selected.

message area 1 <Radius>
Screen message area
<Select point to move> [picks][][menu]  
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point
After selecting the point to move, the new position for the point is selected.

message area 1 <Radius>
Screen message area
<Select final position of point> [picks][][menu]  
<Select final position of point> [picks][accepts][menu]

The radius option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the circle edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the radius option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the radius option still current.

Continue to next section 14.4.6.4 Chainage Interval or return to 14.4.6 Circle Edit.

14.4.6.4 Chainage Interval

The ch interval option is used to modify the chainage interval of the selected circle.

After the ch interval option is chosen, an enter value typed-input box is placed on the screen with the circles current chainage interval displayed in it.

The enter value typed-input box looks like:

```
  Enter value
  Enter value  40
```

The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the circle.

The typed-input box then disappears.

The ch interval option is automatically terminated and a new option needs to be selected from the circle edit menu.

Continue to next section 14.4.6.5 Move or return to 14.4.6 Circle Edit.

14.4.6.5 Move

The move option is used to change the position of the entire circle by selecting and moving the circle centre or any point on the circle.

Move is a two step process.
Step (a) - selecting the point on the circle to move
After selecting the move option, the point on the circle to move is selected.

message area <Move>
Screen message area
<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point
After selecting the point to move, the new position for the point is selected.

message area 1 <Move>
Screen message area
<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

The move option repeats until cancelled by the user by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the circle edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the move option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the move option still current.

Note - the centre point of the circle can be selected and moved with the move option.

Continue to next section 14.4.6.6 Properties or return to 14.4.6 Circle Edit.

14.4.6.6 Properties
Selecting Properties brings up the Circle String Properties panel which is used to modify the string’s header information.

The fields in this panel are similar to those in the create circle string panel and the circle editor options. The only new field is

Field Description Type Defaults Pop-Up
Set button
for the circle being edited, set all the items in the circle string Properties panel to the values given in the panel.
14.4.7 Feature Edit

On picking a feature string, the Feature Edit menu and panel are placed on the screen.

Each option in the Feature Edit menu is identical to those from the circle edit menu and will not be described again. See the section 14.4.6 Circle Edit.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.
14.4.8 Edit Pipe

Position of option on menu:   Strings => Editor

On picking a pipe string, the Edit Pipe toolbar is placed on the screen. If Display edit info is ticked on in the Default panel (Project => Management => Defaults), an information panel, (the string’s Super Edit Info panel) is also displayed.

The only difference between a 3d and a pipe string is that the pipe string has a diameter. Hence most of the options in the pipe edit toolbar are similar to the Edit 3d options of the same name, and only the Properties option which includes diameter need to be discussed. See the section 14.4.3 Edit 3d for information on the Edit 3d editor.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.8.1 Pipe Justification

Selecting the Pipe icon brings up the Super Segment Pipe panel which is used to modify the string’s pipe justification.

The Justify field is used to modify the justification of the pipe string.

Note - the default pipe string has only one justification for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own justification.

Continue to next section 14.4.8.2 Super Pipe String Properties or return to 14.4.8 Edit Pipe.
14.4.8.2 Super Pipe String Properties

Selecting the Properties icon brings up the Pipe String Properties panel which is used to modify the string’s header information, the pipe diameter and the pipe justification.

![Super String Properties panel](image)

The fields in this panel are similar to those in the create pipe string panel and the 3d string editor options. The only new field is:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diameter</td>
<td>real box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The diameter field is used to modify the diameter of the pipe string.

Note - the default pipe string has only one diameter for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own diameter, or can be a box culvert rather than a pipe.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Justify</td>
<td>choice box</td>
<td>invert, centre, obvert</td>
<td></td>
</tr>
</tbody>
</table>

The Justify field is used to modify the justification of the pipe string.

Note - the default pipe string has only one justification for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own justification.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

for the string being edited, OK sets the string with the values in the panel fields and removes the panel. Apply sets the string with the values in the panel fields and leaves the panel on the screen.
14.4.9 Edit Polyline

Position of option on menu:  Strings => Editor

On picking a Polyline string, the Edit Polyline toolbar is placed on the screen. If Display edit info is ticked on in the Default panel (Project => Management => Defaults), an information panel, (the string’s Super Edit Info panel) is also displayed.

On picking a polyline string, the Polyline edit menu and Polyline edit info panel are placed on the screen.

The major difference between a polyline and a 3d string is that a polyline string can have an arc instead of a line joining adjacent string vertices. Hence most of the options in the Edit Polyline toolbar are similar to the Edit 3d options of the same name, and only the differences for each option will be discussed. See the section 14.4.3 Edit 3d for information on the 3d string editor.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

For the option Add/Remove Toolbar go to
- Change Toolbar
- Utilities Toolbar
- Vertex Toolbar
- Radius Toolbar
- Properties Toolbar
- Info Toolbar
- Undo Toolbar
- Redo Toolbar
- Help Toolbar
- Finish Toolbar

14.4.9.1 Add/Remove Toolbar

The Add/remove toolbar is

14.4.9.2 Change Toolbar
14.4.9.3 Utilities Toolbar
14.4.9.4 Radius
14.4.9.5 Properties toolbar
14.4.1 Super String Edit - Common
The Append/Prepend options allow for simply adding vertices, or adding vertices plus radii for the segments.

**Append**

For the cases when no arc is required, the Append option simply places vertices.

**Append + Radius**

If an arc radius is required for every segment of the super string, there is an Append + Radius option that asks for the radius for every segment.

If the Append + Radius option is selected, then before each vertex is appended, a Radius typed-input box is placed on the screen.

The Radius typed-input box looks like

![Radius typed-input box](image)

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A radius value of 0 is taken to mean no arc.

The height question for each point is toggled on/off in the snaps menu just as it was for a 3d string.

The Append options are terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit polyline toolbar.

Go to the next section 14.4.9.2 Change Toolbar

14.4.9.2 Change Toolbar
The Move, Insert and Between options are the same as for a 3d string.

There are two Extend options for a polyline string - Extend that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, Extend ht where the z-value of the point being extended is linearly interpolated by the extension distance.

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend. The segment to extend can be a straight or an arc segment.

14.4.9.3 Utilities Toolbar

The utilities toolbar contains a number of useful miscellaneous option for the polyline string. The menu is

Each of the new options will now be discussed.

14.4.9.3.1 Ins 3 Point Curve

The Ins 3 Pt Curve option is used to insert a curve through three adjacent vertices.
After selecting the option, the middle vertex of the three adjacent vertices is selected. When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

14.4.9.3.2 Del 3 Point Curve
The del 3 pt curve option is used to delete the curves on either side of a vertex. After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero. Hence the curves on either side of the vertex are effectively removed.

14.4.9.3.3 Open/Close
Toggles the string between being open and closed.

Go to the next section 14.4.9.4 Radius

14.4.9.4 Radius
Selecting Radius icon brings up the Super Segment Radius panel which is used to modify the radius of any arc/line joining adjacent polyline points.

- The panel displays the arc radius and bulge setting for segment 1 and the next/previous buttons can be used to display the values for any segment.
- A particular segment can be selected by clicking on the value box for the Segment index field and then picking the segment. The current arc radius and bulge for the segment are displayed.
- New values can then be entered into the panel field and the arc modified by selecting the OK or Apply button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is ticked, the larger arc is used. The default is bulge turned off.
14.4.9.5 Properties toolbar

Selecting the Properties icon brings up the Polyline String Properties toolbar which is used to modify the string’s header information.

The fields in this panel are the same as for a 3d string.
14.4.10 Edit Super

On picking a super string, the Super Edit menu and Super Edit Info panel are placed on the screen.

The super string is similar to a polyline string in that it can have an arc instead of a line joining adjacent string points. Hence most of the options in the super edit menu are similar to the polyline edit options of the same name, and only the differences for each option will be discussed.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

For the option Add/ Remove Toolbar go to

14.4.10.1 Add/Remove Toolbar
14.4.10.2 Change Toolbar
14.4.10.3 Utilities Toolbar
14.4.10.4 Vertex Toolbar
14.4.10.5 Segment Toolbar
14.4.1 Super String Edit - Common

14.4.10.1 Add/Remove Toolbar

The Add/Remove toolbar is
The **Append/Prepend** options allow for simply adding vertices, or adding a vertex plus a radius for the segment, or adding vertices and text for each vertex.

**Append**

For the cases when no arc or text is required, the Append option simply places vertices.

**Append + Radius**

If an arc radius is required for every segment of the super string, there is an Append + Radius option that asks for the radius for every segment.

If the Append + Radius option is selected, then before each vertex is appended, a radius typed-input box is placed on the screen.

The radius typed-input box looks like

![Typed Input]

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next super string vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A radius value of 0 is taken to mean *no arc*.

**Append + Text**

If text is required at every vertex of the super string, there the Append + Text option that asks for the text at every vertex.

When Append + Text is selected, then before each vertex is appended, a Description typed-input box is placed on the screen.

![Typed Input]

The text is entered into the typed-input box, terminated with <enter> and the entered text is taken as the vertex text,

The height question for each vertex is toggled on/off in the snaps menu just as it was for a polyline string.

The Append options are terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Super Edit toolbar

Go to the next section 14.4.10.2 Change Toolbar
14.4.10.2 Change Toolbar

The \textbf{Extend ht} option is used to move a vertex along the line joining the vertex to its neighbouring vertex plus the z-value is interpolated from the z-values at either end of the segment.

\textbf{Move, Insert and Between}

The \textbf{Move}, \textbf{Insert} and \textbf{Between} options are the same as for a 3d string. See \textbf{Extend and Extend Height}.

\textbf{Extend and Extend Height}

There are two \textbf{Extend} options for a super string - \textbf{Extend} that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, \textbf{Extend ht} where the z-value of the point being extended is linearly interpolated by the extension distance (either along the straight or arc segment).

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend. The segment to extend can be a straight or an arc segment.

Please continue to the next section \textbf{14.4.10.3 Utilities Toolbar}.

14.4.10.3 Utilities Toolbar
Insert 3 Point Curve

The Ins 3 Pt Curve option is used to insert a curve through three adjacent vertices. After selecting the option, the middle vertex of the three adjacent vertices is selected. When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

Delete 3 Point Curve

The del 3 pt curve option is used to delete the curves on either side of a vertex. After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero. Hence the curves on either side of the vertex are effectively removed.

Open/Close

Toggles the string between being open and closed.

Please continue to the next section 14.4.10.4 Vertex Toolbar.

14.4.10.4 Vertex Toolbar

The Vertex toolbar contains options to modify information at any vertex of the super string.

For the option Height (Nav) go to 14.4.10.4.1 Height (Nav)
  Tinfile 14.4.10.4.2 Tinfile
  Visible 14.4.10.4.3 Visible
  Point Id 14.4.10.4.4 Point Id
  Text 14.4.10.4.5 Text
  Text (Nav) 14.4.10.4.6 Text (Nav)
  Text Info 14.4.10.4.7 Text Info
  Symbols 14.4.10.4.8 Symbols
  Attributes 14.4.10.4.9 Attributes
  All vertex properties 14.4.10.4.10 All Vertex Properties

14.4.10.4.1 Height (Nav)

Selecting Height (Nav) brings up the Super Vertex Height panel which is used to set the height value for vertices.
As soon as Height (Nav) is chosen, the height information for the first vertex is shown.
A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>. Similarly the Prev and Next buttons can be used to move to adjacent vertices.

When a vertex is selected, its vertex number, height mode and height are written to the appropriate panel fields.

if any panel fields are modified, selecting either OK or Apply will store the new information for the vertex.

The fields and buttons used in the Super Vertex Height panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex index</td>
<td>number box</td>
<td>selected vertex</td>
<td></td>
<td>if a vertex is selected, then its vertex number is displayed in this field.</td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td></td>
<td>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>button</td>

<td>for the vertex being edited, OK sets the vertex with the values in the panel fields and removes the panel.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Apply sets the vertex with the values in the panel fields and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

Please continue to the next section 14.4.10.4.2 Tínable

14.4.10.4.2 Tínable

Selecting Tínable brings up the Super Vertex Tínable panel which is used to set the tinability information for vertices.
As soon as Tinable is chosen, the tinability information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>.

Similarly the Prev and Next buttons can be used to move to adjacent vertices.

When a vertex is selected, its tinability information is written to the appropriate panel fields.

If any panel fields are modified, selecting either OK or Apply will store the new information for the vertex.

The fields and buttons used in the Super Vertex Tinable panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex Index</td>
<td>Number box Selected vertex. If a vertex is selected, its vertex number is displayed in this field.</td>
</tr>
<tr>
<td>Prev</td>
<td>Button Move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>Button Move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Tinable mode</td>
<td>Choice box All vertices tinable, All vertices not tinable, Each vertex</td>
</tr>
<tr>
<td>Tinable</td>
<td>Tick box If ticked, the vertex is tinable. That is, it is included in tins. If not ticked, then the vertex is ignored when triangulating.</td>
</tr>
<tr>
<td>OK/Apply</td>
<td>Button For the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

Please continue to the next section 14.4.10.4.3 Visible
Selecting Visible brings up the Super Vertex Visible panel which is used to set the visibility flag for vertices.

As soon as Visible is chosen, the visibility information for the first vertex is shown. A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>. Similarly the Prev and Next buttons can be used to move to adjacent vertices.

When a vertex is selected, its visibility information is written to the appropriate panel fields. If any panel fields are modified, selecting either OK or Apply will store the new information for the vertex.

The fields and buttons used in the Super Vertex Visible panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex index</td>
<td>number box</td>
<td>selected vertex</td>
<td></td>
<td></td>
</tr>
<tr>
<td>if a vertex is selected, then its vertex number is displayed in this field.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Visible mode</td>
<td>choice box</td>
<td>all vertices visible</td>
<td>visibility for entire string</td>
<td>visibility for each vertex</td>
</tr>
<tr>
<td>if all vertices visible, all vertices are visible.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>if visibility for the entire string, the Visible and Visible cross setting is used for all vertices in the string.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>if visibility each vertex, then each vertex has its own Visible and Visible cross setting.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Visible</td>
<td>tick box</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>if ticked, the vertex is visible.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>if not ticked, then the vertex is invisible.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Visible cross</td>
<td>tick box</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>if ticked, when it is a point string, a cross is drawn at each vertex.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>if not ticked, when it is a point string, no cross is drawn at each vertex.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note - this is important when there is a symbol at the vertex. In that case, the vertex needs to be visible so that the symbol is drawn, but the standard cross drawn at vertices is not wanted.
OK/Apply button

For the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section 14.4.10.4.4 Point Id

14.4.10.4.4 Point Id

Selecting Point Id brings up the Super Vertex Point Id panel which is used to set the point IDs for vertices.

As soon as Point Id is chosen, the Point id information for the first vertex is shown. A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>. Similarly the Prev and Next buttons can be used to move to adjacent vertices.

When a vertex is selected, its Point id information written to the appropriate panel fields. If any panel fields are modified, selecting either OK or Apply will store the new information for the vertex.

The fields and buttons used in the Super Vertex Point Id panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex index</td>
<td>number box</td>
<td>selected vertex</td>
<td></td>
<td>if a vertex is selected, then its vertex number is displayed in this field.</td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td></td>
<td>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td></td>
<td></td>
<td>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Point id mode</td>
<td>choice box</td>
<td>no ids, each vertex</td>
<td></td>
<td>if no ids, there are no Point ids for any vertex. if each vertex, then each vertex has a Point id.</td>
</tr>
<tr>
<td>Point id</td>
<td>text box</td>
<td>point id of vertex</td>
<td></td>
<td>the point id for the vertex.</td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td></td>
<td></td>
<td>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the</td>
</tr>
</tbody>
</table>
panel. **Apply** sets the vertex/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section 14.4.10.4.5 Text

### 14.4.10.4.5 Text

As soon as **Text** is chosen, the Vertex Select is running and the message

```
<Pick vertex to set text> [Picks][Accept][Menu]
```

is displayed in the screen message area.

The vertex to have its text modified is then selected and the Description typed-input box is displayed on the screen with the current text for the vertex in it.

![Description typed-input box](image)

To modify the vertex text, type the new text into the Description typed-input box, finishing with <enter> and the vertex text is updated and the typed-input box.

Please continue to the next section 14.4.10.4.6 Text (Nav)

### 14.4.10.4.6 Text (Nav)

Selecting **Text (Nav)** brings up the **Super Vertex Text** panel which is used to set the text for vertices.

![Super Vertex Text panel](image)

As soon as **Text (Nav)** is chosen, the vertex text for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its vertex text is written to the appropriate panel fields. If any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

</tbody>
</table>

Please continue to the next section **14.4.10.4.7 Text Info**

#### 14.4.10.4.7 Text Info

Selecting **Text info** brings up the **Super Vertex Annotate** panel which is used to set the annotation styles for the text at vertices.

![Super Vertex Annotate Panel](image)

As soon as **Text info** is chosen, the text annotation information for the first vertex is shown. A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>. Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its **text annotation** information is written to the appropriate panel fields. If any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.
14.4.10.4.8 Symbols

Selecting Symbols brings up the Super Vertex Symbol panel which is used to set symbols and their display parameters at vertices.

As soon as Symbols is chosen, the symbol annotation information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>.

Similarly the Prev and Next buttons can be used to move to adjacent vertices.

When a vertex is selected, its symbol information is written to the appropriate panel fields.
if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Symbol** panel have the following functions.

**Field Description** | **Type** | **Defaults** | **Pop-Up**
--- | --- | --- | ---
Vertex index | input | selected vertex | 
*if a vertex is selected, then its vertex number is displayed in this field.*
Prev | button |  | 
*move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.*
Next | button |  | 
*move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.*
Symbol mode | input | no symbol, entire string, each vertex | 
*if no symbol, then there is no symbol at any vertex.*
*if entire string, then the same symbol and settings are used for each vertex.*
*if each vertex, then each vertex has separate symbols and settings.*
Symbol style | symbol box | 1 | available symbols
*symbol at the vertex*
Symbol rotation | angle box |  | rotation angle of the symbol (measured from the positive x-axis in the counter-clockwise direction).
Symbol size (u) | real box |  | size of the symbol (in units for the symbol).
Symbol offset x (u) | real box | 0 | distance (in units for the symbol) to offset the symbol in the x direction from its (x,y) placement position.
Symbol offset y (u) | real box | 0 | distance (in units for the symbol) to offset the symbol in the y direction from its (x,y) placement position.
Symbol colour | input | available colours | colour of the symbol if none is defined in the symbol definition
OK/Apply | button |  | for the vertex being edited, **OK** sets the vertex/string with the values in the panel fields and removes the panel. **Apply** sets the vertex/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section **14.4.10.4.9 Attributes**

### 14.4.10.4.9 Attributes

Selecting **Attributes** brings up the **Super Vertex User Attributes** panel which is used to display and edit user defined attributes at vertices of the super string.
As soon as Attribute is chosen, the attribute information for the first vertex is shown. A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>. Similarly the Prev and Next buttons can be used to move to adjacent vertices.

When a vertex is selected, its attribute information is written to the appropriate panel fields. If any panel fields are modified, selecting either OK or Apply will store the new information for the vertex.

The fields and buttons used in the Super Vertex User Attributes panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex index</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if a vertex is selected, then its vertex number is displayed in this field.</td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td>Attribute mode</td>
<td>choice box</td>
<td>no attributes, each vertex</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if no attributes, then no vertices have user attributes.</td>
<td></td>
</tr>
</tbody>
</table>
if each vertex, then each vertex can have user attributes.

Name/Type/Data Grid

Name  input  name for the user attribute. This must be unique for all attributes at this vertex.

Type  choice box  integer, real, text  type of the attribute.

Data  input  value for the attribute.

OK/Apply  button  

for the vertex being edited, OK sets the vertex with the values in the panel fields and removes the panel. Apply sets the vertex with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section 14.4.10.4.10 All Vertex Properties

14.4.10.4.10 All Vertex Properties

Selecting All properties brings up the Super Vertex Properties panel which is used to display all the properties for a vertex.

This option is also available from the Strings menu

Position of option on menu:  Strings =>Properties =>Vertex (all)
As soon as All vertex properties is chosen, the height information for the first segment is shown in the panel. Clicking on the various tabs will show the various vertex information for the first vertex.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>. Similarly the Prev and Next buttons can be used to move to adjacent vertices.

When a vertex is selected, its attribute information is written to the appropriate tabs and panel fields. If any panel fields are modified, selecting either OK or Apply will store the new information for the vertex.

The fields in each of the tabs for the Super Vertex Properties panel have already been described in the other options on the Vertex Toolbar. See 14.4.10.4 Vertex Toolbar.

For information on the Segment Toolbar, please continue to the next section 14.4.10.5 Segment Toolbar.
14.4.10.5 Segment Toolbar

The Segment toolbar contains options to modify information at any segment of the super string.

For the option Colour go to 14.4.10.5.1 Colour
Visible 14.4.10.5.2 Visible
Radius 14.4.10.5.3 Radius
Pipe 14.4.10.5.4 Pipe
Tinable 14.4.10.5.5 Tinable
Text 14.4.10.5.6 Text
Annotate 14.4.10.5.7 Annotate
Attributes 14.4.10.5.8 Attributes
All segment properties 14.4.10.5.9 All Segment Properties

14.4.10.5.1 Colour

Selecting Colour brings up the Super Segment Colour panel which is used to set the colour of the string segments.

As soon as Colour is chosen, the colour information for the first segment is shown.
A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.
Similarly the Prev and Next buttons can be used to move to adjacent segments.

When a segment is selected, its colour information is written to the appropriate panel fields.
if any panel fields are modified, selecting either OK or Apply will store the new information for the segment.
The fields and buttons used in the Super Segment Colour panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Segment index</td>
<td>number box</td>
<td>selected vertex</td>
<td>if a segment is selected, then its segment index is displayed in this field.</td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td></td>
<td>move to the next segment (successor). The information for the next new is displayed in the panel fields.</td>
</tr>
<tr>
<td>Colour mode</td>
<td>choice box</td>
<td>string colour, each segment</td>
<td>if string colour, then all the segments in the string have the same colour. If each segment, then each segment has a separate colour.</td>
</tr>
<tr>
<td>Colour</td>
<td>colour box</td>
<td>colour of segment/string</td>
<td>available colours the colour used for the segment or for the entire string.</td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td></td>
<td>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

Please continue to the next section 14.4.10.5.2 Visible

**14.4.10.5.2 Visible**

Selecting Visible brings up the Super Segment Visible panel which is used to set the visibility flag for segments.

As soon as Visible is chosen, the visibility information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the Prev and Next buttons can be used to move to adjacent segments.

When a segment is selected, its visibility information is written to the appropriate panel fields.

If any panel fields are modified, selecting either OK or Apply will store the new information for the segment.
The fields and buttons used in the **Super Segment Visible** panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Segment index</strong></td>
<td>number box</td>
<td>selected vertex</td>
<td>if a segment is selected, then its segment index is displayed in this field.</td>
</tr>
<tr>
<td><strong>Prev</strong></td>
<td>button</td>
<td>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td><strong>Next</strong></td>
<td>button</td>
<td>move to the next segment (successor). The information for the next new is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td><strong>Visible mode</strong></td>
<td>choice box</td>
<td>all segments visible, visibility for entire string, visibility for each segment</td>
<td></td>
</tr>
<tr>
<td><strong>Visible</strong></td>
<td>tick box</td>
<td>if ticked, the segment is visible. if not ticked, then the segment is invisible.</td>
<td></td>
</tr>
<tr>
<td><strong>Visible??</strong></td>
<td>tick box</td>
<td>if ticked, if not ticked.</td>
<td></td>
</tr>
<tr>
<td><strong>OK/Apply</strong></td>
<td>button</td>
<td>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</td>
<td></td>
</tr>
</tbody>
</table>

Please continue to the next section **14.4.10.5.3 Radius**

**14.4.10.5.3 Radius**

When viewed in plan, the segments of a super string can be joined by string lines or arcs. If the radius is positive, the arc is drawn from the start vertex to the end vertex of the segment in a clockwise direction. If the radius is negative, the arc is drawn from the start vertex to the end vertex on the segment in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc - one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.

A zero radius is interpreted to be a just a straight line segment with no arc.
Selecting *Radius* brings up the **Super Segment Radius** panel which is used to set the plan radius of the segment.

As soon as *Radius* is chosen, the radius information for the first segment is shown. A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the *Prev* and *Next* buttons can be used to move to adjacent segments.

When a segment is selected, its radius information is written to the appropriate panel fields. If any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Radius** panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Segment index</td>
<td>number box</td>
<td>selected vertex</td>
<td></td>
<td><em>if a segment is selected, then its segment index is displayed in this field.</em></td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td></td>
<td><em>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</em></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td></td>
<td></td>
<td><em>move to the next segment (successor). The information for the new segment is displayed in the panel fields.</em></td>
</tr>
</tbody>
</table>
| Radius mode    | choice box                                                                  | no arcs, each segment |                | *if no arcs, then no segments have a diameter (that is, they are all line segments).*
|                |                                                                             |               |                  | *If each segment, then each segment has a radius.*                       |
| Radius         | real box                                                                    | 0             |                  | *radius of the segment arc. A radius of 0 mean no arc.*                |
| Bulge          | tick box                                                                    |               |                  | *if ticked, the larger arc is used.*
|                |                                                                             |               |                  | *if not-ticked, the smaller arc is used.*                               |
| OK/Apply       | button                                                                      |               |                  | *for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.* |
14.4.10.5.4 Pipe

The segments of a super string can have either a pipe or box cross section, or none. Selecting Pipe brings up the Super Segment Pipe panel which is used to set the pipe mode and size for the string segments.

As soon as Pipe is chosen, the pipe information for the first segment is shown. A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>. Similarly the Prev and Next buttons can be used to move to adjacent segments.

When a segment is selected, its pipe information is written to the appropriate panel fields. If any panel fields are modified, selecting either OK or Apply will store the new information for the segment.

The fields and buttons used in the Super Segment Pipe panel have the following functions.
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Segment index</td>
<td>number box</td>
<td>selected vertex</td>
<td>if a segment is selected, then its segment index is displayed in this field.</td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td></td>
<td>move to the next segment (successor). The information for the new segment is displayed in the panel fields.</td>
</tr>
<tr>
<td>Pipe mode</td>
<td>choice box</td>
<td>no pipe or culvert</td>
<td>pipe entire string</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>culvert each segment</td>
</tr>
</tbody>
</table>

if no pipe or culvert, there is no pipe or culvert for the segment.
If pipe entire string, then all the segments in the string are pipes and have the same diameter.
If pipe each segment, then each segment is a pipe and can have a different diameter.
If culvert entire string, then all the segments in the string are culverts and have the same width and height.
If culvert each segment, then each segment is a culvert and can have a different width and height.

Justify choice box invert, centre, overt justification of the pipe/culvert with respect to the co-ordinates given for the vertices of the super string.

Pipe diameter real box diameter of the pipe in world units.

Culvert width real box width of the culvert section in world units.

Culvert height real box height of the culvert section in world units.

OK/Apply button for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section 14.4.10.5.5 Tinable

14.4.10.5.5 Tinable
Selecting Segment=>Tinable brings up the Super Segment Tinable panel which is used to set the tinable flag for segments.
As soon as **Tinable** is chosen, the tinability information for the first segment is shown. A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <enter>. Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its **tinability** information is written to the appropriate panel fields. If any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Tinable** panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Segment index</td>
<td>number box</td>
<td>selected vertex</td>
<td></td>
</tr>

</tbody>
</table>
for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section [14.4.10.5.7 Annotate](#)

### 14.4.10.5.7 Annotate

Selecting **Annotate** brings up the **Super Segment Annotate** panel which is used to set the annotation styles for the text at segments.

![Super Segment Annotate](image)

As soon as **Annotate** is chosen, the annotation information for the first segment is shown. A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing `<enter>`.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its annotation information is written to the appropriate panel fields. If any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Annotate** panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Segment index</strong></td>
<td>number box</td>
<td>selected vertex</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>if a segment is selected, then its segment index is displayed in this field.</em></td>
<td></td>
</tr>
<tr>
<td><strong>Prev</strong></td>

<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section 14.4.10.5.8 Attributes.

### 14.4.10.5.8 Attributes

Selecting **Attributes** brings up the **Super Segment User Attributes** panel which is used to display and edit user defined attributes at segments of the super string.

![Super Segment User Attributes Panel](image)

As soon as **Attributes** is chosen, the attributes for the first segment are shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its attribute information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment User Attributes** panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Segment index</strong></td>
<td>number box</td>
<td>selected vertex</td>
<td></td>
</tr>
</tbody>
</table>

*if a segment is selected, then its segment index is displayed in this field.*
Prev button
move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next button
move to the next segment (successor). The information for the new segment is displayed in the panel fields.

Attribute mode choice box
no attributes, each segment
if no attributes, then no segments have user attributes.
if each segment, then each segment can have user attributes.

Name/Type/Data Grid

Name input
name for the user attribute. This must be unique for all attributes at this segment.

Type choice box
integer, real, text
type of the attribute.

Data Grid grid
values for the attributes.

OK/Apply button
for the segment being edited, OK sets the segment with the values in the panel fields and removes the panel. Apply sets the segment with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section 14.4.10.5.9 All Segment Properties

14.4.10.5.9 All Segment Properties
Selecting All properties brings up the Super Segment Properties panel which is used to display all the properties of a segment.

This option is also available from the Strings menu

Position of option on menu: Strings => Properties => Segment (all)
As soon as All segment properties is chosen, the colour information for the first segment is shown. Clicking on the various tabs will show the various segment information for the first segment.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment.

When the segment to modify is selected, its segment index and all other information are written to the appropriate panel fields.

Another segment can then be selected or the Prev and Next buttons used to move to adjacent segments and display data for that segment.

After any panel fields are modified, selecting either OK or Apply will change the information for the segment.

The fields in each of the tabs for the Super Segment Properties panel have already been described in the other options on the Segment Toolbar. See 14.4.10.5 Segment Toolbar.

For information on the Properties Toolbar, please continue to the next section 14.4.10.5.10 Properties Toolbar.
14.4.10.5.10 Properties Toolbar

Selecting **Properties** brings up the **Super String Properties** panel which is used to modify the string's header information.

![Super String Properties Panel](image)

The fields in this panel are similar to those in the **Create Super String** panel and the Super String Editor options. The only new field is

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Description Type</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK/Apply button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.
14.4.11 Edit Super Alignment

On picking a super alignment, the Super Alignment Edit menu is placed on the screen.

For the option Add/ Remove toolbar go to 14.4.11.1 SA - Add/Remove IPs Toolbar
   Move/Edit toolbar 14.4.11.2 SA - Move/Edit Toolbar
   Change icon 14.4.11.3 SA - Change Icon
   Part Editors toolbar 14.4.11.4 SA - Part Editors Toolbar
   Properties toolbar 14.4.11.5 SA - Super Alignment

Properties Icon
   Undo icon 14.4.11.6 SA - Undo and Redo Icons
   Redo icon 14.4.11.6 SA - Undo and Redo Icons
   Info icon 14.4.11.7 SA - Info Icon
   Recalc icon 14.4.11.8 SA - Recalc Icon
   Error Checker icon 14.4.11.9 SA - Error Checker Icon
   Clear toolbar 14.4.11.10 SA - Clear Toolbar
   Help icon 14.4.11.11 SA - Help Icon
   Finish toolbar 14.4.11.12 SA - Finish Toolbar
14.4.11.1 SA - Add/Remove IPs Toolbar

The Add/Remove IPs toolbar is

- Append or prepend a HIP
- Append or prepend a VIP
- Insert IP
- Between IP
- Insert VIP height
- Insert VIP grade
- Intersect VIP grades
- Filter IPs
- Delete an IP

The Append operations for a super alignment string are similar to the 2d string case except that there are separate Append options for the horizontal and vertical geometry of the string.

For the option:

- Append HIP go to 14.4.11.1 SA - Append/Prepend HIP - Horizontal Geometry
- Append VIP 14.4.11.1.2 SA - Append/Prepend VIP - Vertical Geometry

The Insert IP, Between IP and Delete IP work on the horizontal geometry if used on a plan view, and if used on a section view that the super alignment is profiled on, they work on the vertical geometry.

For the option Insert IP go to 14.4.11.1.3 SA - Insert IP
- Between IP 14.4.11.1.4 SA - Between IP
- Delete IP 14.4.11.1.9 SA - Delete IP

For the option Insert VIP Height, go to 14.4.11.1.5 SA - Insert VIP Height
- Insert VIP Grade 14.4.11.1.6 SA - Insert VIP Grade
- Intersect VIP Grades 14.4.11.1.7 SA - Intersect VIP Grades
- Filter IPs 14.4.11.1.8 SA - Filter IPs
- Delete an IP 14.4.11.1.9 SA - Delete IP

14.4.11.1.1 SA - Append/Prepend HIP - Horizontal Geometry

The Append HIP option is used in a plan view to create the first horizontal intersection point (HIP) in a new super alignment string and then append further HIPs, or for an existing super alignment string to append new HIPs to the end of the string, or to new HIPs to the beginning of the string. In this option, both appending and prepending will be referred to as Appending.

14.4.11.1.1.1 Existing Super Alignment

Appending an HIP is a two step process.

Step (a) - selecting the end to Append the HIP to.

After picking Append HIP, the end of the string to append the point to is selected. Once the string end is selected, the new HIP is assumed to be at the current cursor location. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

- screen message area <Pick end to append to> [picks][fast][Menu>

Step (b) - selecting the position for the new appended HIP.
The position of the new appended HIP is set to the current cursor position by picking (LB) and accepting (MB).

Once an HIP has been appended to the string, the appended HIP is considered to be the selected string end and a new Append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position of the next appended HIP.

Hence a series of HIPS is easily entered by first selecting the string end in a plan view that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting it.

**Typed input:** r for relative, b for bearing-distance can be used in either step.

### 14.4.11.1.1.2 New Super Alignment

When the Append HIP option is selected, a cross will appear on any plan views that have the super alignment string's model on them.

The first HIP is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing super alignment string where the end HIP has already been accepted.

**Typed input:** r for relative, b for bearing-distance can be used in either step.

The Append HIP option is terminated by either pressing RB to bring up the Pick Ops menu and selecting Cancel or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Append HIP option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Append HIP option still current.

### 14.4.11.1.2 SA - Append/Prepend VIP - Vertical Geometry

The Append HIP option is used in a section view to create vertical geometry for a super alignment that must already have some horizontal geometry. The existing super alignment needs to be the primary string on the section view. That is, it is the string profiled on the section view that is going to be used to create the vertical geometry. This can be achieved by using either the VG edit or the Profile option from the section view menu.

Note: on a section view, the option Utilities => VG edit takes the selected super alignment and profiles it on the section view and also opens the SA Editor for the string.

The Append HIP option can the first vertical intersection point (VIP) in an existing super alignment string that has no vertical geometry, and then append further VIPs, or for an existing super alignment string with vertical geometry, OR appends new VIPs to the end or the beginning of the vertical geometry of the string. In this option, both appending and prepending will be referred to as Appending.

#### 14.4.11.1.2.1 Existing Vertical Geometry

Appending a VIP point is almost the same as for a HIP except that the co-ordinate system is (chainage,height) rather than (x,y) values.

Appending an VIP is a two step process.

Step (a) - selecting the end to Append the VIP to.

After picking Append VIP, the end of the vertical geometry to append the point to is selected in the section view. Once the vertical geometry end is selected, the new VIP is assumed to be at the current cursor location and as the cursor is moved, the string is redrawn reflecting the changing position of the appended VIP.

**Typed input:** r for relative, b for bearing-distance can be used in either step.
The position of the new appended VIP is set to the current cursor position by picking (LB) and accepting (MB).

Once a VIP has been appended to the string, the appended VIP is considered to be the selected vertical geometry end and a new Append cycle begins. That is, stage (a) is already set up. The current cursor position in the section view indicates the new position of the next appended VIP.

**Typed input:** `r` for relative, `g` for grade-height can be used in either step.

Hence a series of VIPs is easily entered by first selecting the vertical geometry end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting them in.

### 14.4.11.1.2.2 New Vertical Geometry

Creating the **first VIP** is similar to the first HIP.

When the **Append VIP** option is selected, a cross will appear on any section views that have the super alignment string profiled on them.

Once the first VIP is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing vertical geometry where the end point has already been accepted.

**Typed input:** `r` for relative, `g` for grade-height can be used in either step.

The **Append VIP** option is terminated by either pressing RB to bring up the Pick Ops menu and selecting Cancel or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the **Append VIP** option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the **Append VIP** option still current.

### 14.4.11.1.3 SA - Insert IP

The **Insert** option is designed to place a new HIP or VIP between two adjacent IPs.

**Insert IP** works on the horizontal or the vertical geometry depending on whether a plan or section view is used for the editing.

The inserted IP does not have to be on the line joining the two intersection points - the Between IP option is used to guarantee that the IP is on the IP-IP line.

Inserting an IP is a two step process.

**Step (a)** - selecting the IP's to be on either side of the new intersection point

The two adjacent IPs are chosen by selecting the line connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

For horizontal and vertical inserts

**Step (b)** - selecting the position for the new IP

The position of the new IP is set to the current cursor position by picking (LB) and accepting (MB).

Once the insert cycle is completed and the IP inserted, the Insert IP option is still current and can be repeated for other insertions (in either plan or section views) without having to re-select the Insert IP option.

The **Insert IP** option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.
If, after bringing up the Pick Ops menu, it is decided to continue with the Insert IP option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Insert IP option still current.

14.4.11.1.4 SA - Between IP

The Between IP option is similar to the Insert IP option (see 14.4.11.1.3 SA - Insert IP) except the inserted point does have to be on the line joining the two IPs. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP position.

The Between IP option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Between IP option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Insert IP option still current.

14.4.11.1.5 SA - Insert VIP Height

The Insert VIP Height option is used to insert a vertical intersection point (VIP) into the super alignment by clicking on the super alignment in either plan or section view to select the chainage that the VIP is to be inserted at, and then giving the height for the VIP.

So inserting the VIP is a two step process.

Step (a) - selecting the chainage for the VIP to inserted

After selecting Insert VIP Height, a chainage to insert the new VIP at is selected by picking (LB) and accepting (MB) at that position on the super alignment.

For horizontal and vertical inserts

screen message area <Select point to add VIP> [picks][fast][Menu>

Step (b) - giving the height for the new VIP

After the chainage of the new VIP is selected, a Height Typed Input box is placed on the screen with the height of the super alignment at the selected chainage already displayed.

The required value is type into the Height Typed Input box and <Enter>.

The Height Typed Input box is removed from the screen and the new VIP inserted into the super alignment.

Once the Insert VIP cycle is completed and the VIP inserted, the Insert VIP Height is still current and can be repeated for other insertions (in either plan or section views) without having to re-select the Insert VIP Height option.

The Insert VIP Height option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Insert VIP Height option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Insert VIP Height option still current.
14.4.11.1.6 SA - Insert VIP Grade

The Insert VIP Grade option inserts a vertical intersection point (VIP) at a given grade from an existing VIP. The new VIP position is given by either a distance from the picked VIP or at given chainage on the super alignment.

After selecting Insert VIP Grade, the Grade Insert VIP panel is displayed.

![Grade Insert VIP panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start VIP</td>
<td>VIP number box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Grade</td>
<td>measure x-fall box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mode</td>
<td>choice</td>
<td>distance</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>distance, chainage</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Insert</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VIP number whose (chainage, height) position is used to start the Grade Insert from. The number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the Start VIP field.

**Note**

- **Positive** is up when going in the direction of increasing chainage and negative is up when going in the direction of decreasing chainage.

If distance, the new VIP is inserted at the (chainage) distance given in the Value field from the start VIP, but with height determined by going with the given grade from the start VIP.

If chainage, the new VIP is inserted at the chainage given in the value field but with height determined by going with the given grade from the start VIP.

Insert the new VIP into the alignment string.
14.4.11.1.7 SA - Intersect VIP Grades

The Intersect VIP Grades option inserts a VIP which is given by intersecting lines of given grades from two existing VIPs in the (chainage,height) plane.

The grades are either typed in or calculated by giving another VIP that the line goes through.

After selecting the option, the Grades Intersect VIP panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Grade</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Start VIP</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mode</td>
<td>choice</td>
<td>grade, VIP #</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note for grades **positive** is up when going in the direction of increasing chainage and **negative** is up when going in the direction of decreasing chainage.

Second Grade

Start VIP

the VIP number whose (chainage,height) position is the start of a line.

The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the Start VIP field.

Mode

choice grade, VIP #

Value or End VIP

input

if mode is grade, the box is called Value and the value is a percent grade.

if mode is VIP #, the box is called End VIP and the value is the number of a VIP.

For End VIP, The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the End VIP field.

Note for grades **positive** is up when going in the direction of increasing chainage and **negative** is up when going in the direction of decreasing chainage.
Value or End VIP input

if mode is grade, the box is called Value and the value is a percent grade.
if mode is VIP #, the box is called End VIP and the value is the number of a VIP.

For End VIP, the VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the End VIP field.

Insert button

calculate in (chainage,height) space the intersection of the two lines given above and insert it as a new VIP into the super alignment.

14.4.11.1.8 SA - Filter IPs

The Filter IPs option tries to remove redundant HIPS and VIPs. That is, IP’s that are very close to one another, or extra IPs on a straight line.

The extra IPs are often created when data is loaded from a CAD package and the elements are not tangential.

The Filter IPs option terminates after it is run and then a new option needs to be selected from the Edit SA toolbar.

14.4.11.1.9 SA - Delete IP

The Delete IP option is used to delete HIPS or VIPs points from the super alignment.

After picking Delete IP, any selected IP in the string is deleted. The string, minus the deleted IP, is redrawn after each deletion.

Once an IP has been deleted, another IP in the selected string can be deleted. Hence any number of the IPs can be deleted, one after another.

A HIP is deleted if the IP is chosen from a plan view and a VIP deleted if the IP is selected from a section view.

For HIP and VIP deletes

screen message area <Pick point to delete> [picks][fast][Menu>

The Delete IP option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Delete IP option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Delete IP option still current.
14.4.11.2 SA - Move/Edit Toolbar

The Move/Edit toolbar is

- move IPs and Part definition points
- move horizontal geometry parts
- move vertical geometry parts
- extend IP
- extend by length
- Tangent Wizard
- move tangent point
- change curve
- change height
- change grade
- change grade 2

The Move IP, Move Tangent and Extend IP work on the horizontal geometry if used in a plan view and if used in a section view that the super alignment is profiled on, they work on the vertical geometry.

For the option *Move IP* go to

- Move HG parts 14.4.11.2.1 SA - Move HG Parts
- Move VG parts 14.4.11.2.3 SA - Move VG Parts
- Extend IP 14.4.11.2.5 SA - Extend IP
- Extend by length 14.4.11.2.6 SA - Extend by Length
- Tangent Wizard 14.4.11.2.7 SA - Tangent Wizard
- Move Tangent 14.4.11.2.4 SA - Move Tangent Point
- Change curve 14.4.11.2.8 SA - Change Curve
- Change height 14.4.11.2.9 SA - Change Height
- Change grade 14.4.11.2.10 SA - Change Grade
- Change grade 2 14.4.11.2.11 SA - Change Grade 2
14.4.11.2.1 SA - Move

The Move option allows the user to move

individual HIPs or Horizontal Parts definition points if the points are selected in a plan view

individual VIPs or Vertical Parts definition points if the points are selected in a section view

that the super alignment is profiled on.

The Move cycle consists of two steps:
(a) selecting the point to be moved
(b) selecting the new position for the point.

Step (a)
First the point to be moved is selected. The selected point will then move around the view as the cursor is moved. The IPs/Parts recalculate and redraw as the point is moved.

screen message area  <Pick point to move> [picks][fast][Menu>

Step (b)
The current cursor position is selected as the new position for the point by picking (LB) and accepting (MB). The point being moved is then anchored at the cursor position and the string redrawn.

screen message area  <Pick final position of point> [picks][fast][Menu>

Once the Move cycle is completed and the point moved, the Move option is still current and can be repeated for other points without having to re-select the Move option.

The Move option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Move option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Move option still current.
14.4.11.2.2 SA - Move HG Parts

Move HG Parts translates the X or the Y coordinates for a given range of Horizontal Parts in the super alignment being edited.

Clicking on the Move HG Parts icon brings up the Move Horizontal Parts panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start part</td>
<td>the number of the Part in the Horizontal Geometry to start translating in x or y. Clicking MB in the field or RB on the number icon brings up the Same as picker and a Horizontal Part from the super alignment can be selected from a plan view and the Part Number will be piped into the field.</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>End part</td>
<td>the number of the Part in the Horizontal Geometry to end the translating in x or y. Clicking MB in the field or RB on the number icon brings up the Same as picker and a Horizontal Part from the super alignment can be selected from a plan view and the Part Number will be piped into the field.</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mode</td>
<td>move x coords, move y coords if Mode is move x coords, the x coordinates of all the parts from the Start part to End part are translated by Value. if Mode is move y coords, the y coordinates of all the parts from the Start part to End part are translated by Value.</td>
<td>choice box</td>
<td>move x coords, move y coords</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>the distance to move the coordinates. Measure X or Measure Y</td>
<td>measure box</td>
<td>Measure X or Measure Y</td>
<td></td>
</tr>
</tbody>
</table>

Move   button   move the specified coordinates for the given range of Horizontal Parts.
14.4.11.2.3 SA - Move VG Parts

Move VG Parts translates the chainages or the heights for a given range of Vertical Parts in the super alignment being edited.

Clicking on the Move VG Parts icon brings up the Move Vertical Parts panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start part</td>
<td>the number of the Part in the Vertical Geometry to start translating in chainage or height. Clicking MB in the field or RB on the Number icon brings up the Same as picker and a Vertical Part from the super alignment can be selected from a section view, and the Part Number piped into the field.</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>End part</td>
<td>the number of the Part in the Vertical Geometry to end the translating in chainage or height. Clicking MB in the field or RB on the Number icon brings up the Same as picker and a Vertical Part from the super alignment can be selected from a section view and the Part Number will be piped into the field.</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mode</td>
<td>move x coords, move y coords if Mode is move chainages, the chainage coordinates of all the parts from the Start part to End part are translated by Value. if Mode is move heights, the height coordinates of all the parts from the Start part to End part are translated by Value.</td>
<td>choice box</td>
<td>move x coords, move y coords</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>Measure Chainage or Measure Z the distance to move the coordinates</td>
<td>measure box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Move</td>
<td>move the specified coordinates for the given range of Vertical Parts</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
14.4.11.2.4 SA - Move Tangent Point

The **Move Tangent** option allows the user to move

individual horizontal tangent points in a plan view if the horizontal tangent point (HTP) is part of an HiP with a curve on it but no approaching or departing transitions.

individual vertical tangent points in a section view that the super alignment is profiled on if the vertical tangent point (VTP) is part of a VIP with a parabola or curve on it.

The **Move Tangent** cycle consists of two steps:

(a) selecting the tangent point (TP) to be moved

(b) selecting the new position for the TP.

Step (a)

First the tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a horizontal tangent point is selected, the string will be redrawn with the HTP moved to the cursor position and the circular curve radius will be modified appropriately.

If a vertical tangent point is selected, the string will be redrawn with the VTP moved to the cursor position and the vertical curve modified appropriately.

screen message area <Pick tangent to extend> [picks][fast][Menu>

Step (b)

The current cursor position is selected as the new position for the point by picking (LB) and accepting (MB). The tangent being moved is then anchored at the cursor position and the string redrawn.

screen message area <Pick final position of tangent> [picks][fast][Menu>

Once the Move Tangent cycle is completed and the TP moved, the Move Tangent option is still current and can be repeated for other tangent points without having to re-select the Move Tangent option.

The Move Tangent option is terminated by selecting **Cancel** from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Move Tangent option, simply select the **Restart** option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Move Tangent option still current.
14.4.11.2.5 SA - Extend IP

The **Extend IP** option is used to move an IP along the line joining the IP to its neighbouring IP. That is, in a plan view, the bearing of the HIP-HIP line is kept constant and the intersection point is moved along that line either towards or away from its neighbouring intersection point on the HIP-HIP line.

In a section view, the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either towards or away from its neighbouring intersection point on the VIP-VIP line.

Extending, like moving an IP, is a two step process.

**Step (a) - selecting the IP-IP line and the IP to be moved along that line**

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a position near the IP-IP line and close to the intersection point to be moved along that line.

  screen message area  <Pick point to extend> [picks][fast][Menu>

Once the line and IP are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line. As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

**Step (b) - selecting the final position for the IP**

The current cursor position is selected as the new position for the IP by picking (LB) and accepting (MB). The final position for the intersection point is set to the projection of the selected cursor position onto the IP-IP line.

  screen message area  <Pick final position of point> [picks][fast][Menu>

Once the **Extend IP** is completed, the extend option is still current and can be repeated without re-selecting the **Extend IP** option.

The **Extend IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Extend IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Extend IP** option still current.

**Note** - **Extend IP** can be used on the end points of the horizontal or vertical geometry of a super alignment string.
14.4.11.2.6 SA - Extend by Length

The **Extend by length** option is used to move a horizontal IP or vertical IP by a given length along the line joining the IP to its neighbouring IP.

A horizontal IP is modified in a plan view and the bearing of the HIP-HIP line is kept constant and the intersection point is moved by a given length along that line either towards or away from its neighbouring intersection point on the HIP-HIP line.

A vertical IP is modified in a section view and the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either towards or away from its neighbouring intersection point on the VIP-VIP line.

To modify a horizontal IP, the string is edited in a plan view. To modify a vertical IP, the string is edited in a section view.

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a position near the IP-IP line and close to the intersection point to be moved along that line.

```
screen message area
{F}orward: pick IP to extend, (or {B}ackward)> [picks][fast][Menu]
```

Once the line and IP are selected, a **Length Typed Input** box is displayed and the required length typed into the box and <Enter> pressed.

![Typed Input](image)

The IP then moves to its new position.

**Note:** When in Forward mode, the IP moves along the selected segment. When in Backward mode, the IP moves along the segment on the other side of the selected IP.

The default is Forward. To select Backward mode, type ‘B’. To select Forward mode, type ‘F’.

Once the **Extend by length** is completed, the extend option is still current and can be repeated without re-selecting the **Extend by length** option.

The **Extend by length** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Extend by length** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Extend by length** option still current.

**Extend by length** can be used on the end points of the horizontal or vertical geometry of a super alignment string.
14.4.11.2.7 SA - Tangent Wizard

The Tangent Wizard works for a HIP defined with just an arc on it and no transitions, or a VIP with a parabola or curve defined on it.

If a suitable HIP or VIP is selected, the Tangent Wizard modifies the curve/parabola on the selected HIP/VIP so that a common curve-curve tangent point is created on at least one side of the HIP/VIP.

When the Tangent Wizard is used on HIP 3, the radius of the curve on HIP 3 is increased until the tangent point on the right is common with the tangent point on HIP 4. This happens before the tangent point on the left meets the tangent point for HIP 2.

When the Tangent Wizard run successfully, the Tangent Wizard option is still current and can be repeated without re-selecting Tangent Wizard. If an incorrect IP is selected, the Tangent Wizard terminates and an option needs to be selected from the Edit SA toolbar.

The Tangent Wizard option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Tangent Wizard option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Tangent Wizard option still current.
14.4.11.2.8 SA - Change Curve

The Change Curve option is used to change the defining value for the horizontal curve (radius or length) of a curve on a horizontal intersection point, or the defining value for the vertical curve (length, k-value or radius) on a vertical intersection point.

After selecting Change Curve:

- screen message area <Pick IP to change curve info> [picks][fast][Menu>

If an HIP is selected from a plan view, the value defining the horizontal curve (radius or length) on the HIP is displayed.

![Typed Input](image1)

The required Radius (or Length) is typed into the Typed Input box and <Enter> pressed. The HIP is given the new value and the Typed Input box is removed from the screen.

If an VIP is selected from a section view that the super alignment is profiled on, the value defining the vertical curve (length, k-value or length) on the VIP is displayed.

![Typed Input](image2)

The required Length (or k value or Length) is typed into the Typed Input box and <Enter> pressed. The VIP is given the new value and the Typed Input box is removed from the screen.

Once the curve value is changed, the Change Curve is still current and can be repeated for other IPs in the super alignment without having to re-select the Change Curve option.

The Change Curve option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Change Curve option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Change Curve option still current.
14.4.11.2.9 SA - Change Height

The Change Height option is used to change the height of an existing vertical intersection point (VIP).

After selecting Change Height, a VIP is selected from a section view that the super alignment is profiled on:

screen message area <Pick IP to change height> [picks][fast][Menu>

After the VIP is selected, a Height Typed Input box is placed on the screen with the height of the selected VIP already displayed.

The required height is typed into the Height Typed Input box and <Enter> pressed.

The Height Typed Input box is removed from the screen and the VIP is given the new height.

Once the height is changed, the Change Height is still current and can be repeated for other VIPs in the super alignment without having to re-select the Change Height option.

The Change Height option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Change Height option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Change Height option still current.
14.4.11.2.10 SA - Change Grade

The Change Grade option is used to change the grade of the line between two consecutive vertical intersection points (VIPs) by moving the VIP at the selected end of the line up or down to achieve the given grade.

Note that the chainage position of the VIP remains the same and the grade on both sides of the moved VIP change.

After selecting Change Grade, the line joining consecutive VIP is picked with direction from a section view that the super alignment is profiled on.

After the VIP is selected, a Grade Typed Input box is placed on the screen with the grade of the selected line, measured from left to right, is already displayed.

Note: going from left to right in the section view (that is, increasing chainage), positive grade is up and negative grade is down.

If the line was picked with direction going from left to right in the section view (increasing chainage), then the position of the VIP at the left end of the line is kept constant and the line is graded with the new grade and the height of the VIP at the right end of the line is modified so that it sits on the new graded line. The chainage of the VIP is kept constant. That is, the VIP just moves up or down until the new grade is reached. The Grade Typed Input box is removed from the screen.

If the line was picked with direction going from right to left in the section view (decreasing chainage), then the position of the VIP at the right end of the line is kept constant and the line is graded with the new grade and the height of the VIP at the left end of the line is modified so that it sits on the new graded line. The chainage of the VIP is kept constant. That is, the VIP just moves up or down until the new grade is reached. The Grade Typed Input box is removed from the screen.

Once the grade is changed, the Change Grade is still current and can be repeated for other lines between VIPs in the super alignment without having to re-select the Change Grade option.

The Change Grade option is terminated by selecting Cancel from the Pick Ops menu or by selecting a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Change Grade option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Change Grade option still current.
14.4.11.2.11 SA - Change Grade 2

The **Change Grade 2** option is used to change the grade of the line between two consecutive vertical intersection points (VIPs) by sliding the VIP at the selected end of the line along the VIP-VIP line on the other side of the VIP so that the grade of the other line is not modified.

Note that the chainage position of the VIP changes and only the grade on the selected line of the moved VIP changes.

After selecting **Change Grade**, the line joining consecutive VIP is picked with direction from a section view that the super alignment is profiled on

```
screen message area <Pick grade to change> [picks][fast][Menu>
```

After the VIP is selected, a **Grade** Typed Input box is placed on the screen with the grade of the selected line, measured from left to right, is already displayed.

Note: going from left to right in the section view (that is, increasing chainage), positive grade is up and negative grade is down.

If the line was picked with direction going from left to right in the section view (increasing chainage), then the position of the VIP at the left end of the line is kept constant and the line is graded with the new grade by sliding the VIP at the right end of the line along the VIP-VIP line on the other side of the VIP to keep that grade constant. So the grade on the other side of the VIP is kept constant. That is, the VIP slides up or down the other VIP-VIP line until the new grade is reached.

The **Grade** Typed Input box is removed from the screen.

If the line was picked with direction going from right to left in the section view (decreasing chainage), then the position of the VIP at the right end of the line is kept constant and the line is graded to the new grade by sliding the VIP at the left end of the line along the VIP-VIP line on the other side of the VIP to keep that grade constant. So the grade on the other side of the VIP is kept constant. That is, the VIP slides up or down the other line until the new grade is reached.

The **Grade** Typed Input box is removed from the screen.

Once the grade is changed, the **Change Grade 2** is still current and can be repeated for other lines between VIPs in the super alignment without having to re-select the **Change Grade 2** option.

The **Change Grade 2** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting
a new option from the Edit SA toolbar.

If, after bringing up the Pick Ops menu, it is decided to continue with the Change Grade 2 option, simply select the Restart option from the Pick Ops menu and the Pick Ops menu will disappear leaving the Change Grade 2 option still current.
14.4.11.3 SA - Change Icon

The Change icon is

Selecting this icon allows the user to change the radius of arcs placed by Parts.
14.4.11.4 SA - Part Editors Toolbar

The Part Editors toolbar is

- Parts editor
- HIPs editor
- VIPs editor
- Chainage equalities editor
- Custom editor
- Centreline options
- Named positions

For the option *Parts Editor*, go to

- 14.4.11.4.1 SA - Parts Editor
- 14.4.11.4.2 SA - HIPs Editor
- 14.4.11.4.3 SA - VIPs Editor
- 14.4.11.4.4 SA - Chainage Equalities Editor
- 14.4.11.4.5 SA - Custom Superelevation and Widening Editor
- 14.4.11.4.6 SA - Centreline Options
- 14.4.11.4.7 SA - Named Positions
14.4.11.4.1 SA - Parts Editor

Placing a super alignment consists of:
(a) defining the horizontal geometry consisting of lines, arcs, transitions and tapers
(b) defining the vertical geometry consisting of lines, parabolas and arcs.

A simple way to create horizontal and vertical geometry for the super alignment is by using horizontal intersection points (HIPs) with arcs and transitions (eg spirals), and vertical intersection points (VIP’s) with parabolas or arcs for placing the vertical geometry.

However the super alignment also allows for more complex construction methods to define the lines, arcs and transitions (the horizontal elements) that within 12d Model be grouped together to make up the Parts of the horizontal geometry.

For example, a horizontal line is defined to be a given parallel offset of a selected line segment from another string. Or a more complex part such Free Arc with Known Radius that consists of the three elements: an arc of a known radius plus a leading and a trailing transition.

Similarly more complex construction methods are available to define the lines, parabolas and arcs (the vertical elements) that are grouped together within 12d Model to make up the Parts of the vertical geometry.

Some of the Parts definitions have some degree of freedom in the definition of the elements in the Parts, and the sequencing and types of the Parts, plus the condition that, if possible, each element is tangential to the adjacent elements, allows 12d Model to calculate and solve for some unknowns in the Part definitions that make up the super alignment.

For example, if a Free Arc with Known Radius placed between two known lines then the tangentiality condition means that the position of the Free Arc with Known Radius (arc and two transitions) is uniquely defined as a arc and leading and trailing transitions on the intersection point of the two lines. Or just a fillet between the two lines if the two transitions have zero length.

For more information on placing parts, fixed and floating parts and solving, go to 21.9 Placing Parts for Super Alignments.

The general creating and editing of the horizontal and vertical Parts inside 12d Model is done in the Horizontal and Vertical Parts panel and this is brought up by clicking on the on the Parts Editor icon.
See 14.4.11.4.1.1 Icons on the Horizontal and Vertical Parts Panel
See 14.4.11.4.1.2 Creating and Editing a Part
See 14.4.11.4.1.3 Types of Horizontal Parts
See 14.4.11.4.1.4 Types of Vertical Parts
14.4.11.4.1.1 Icons on the Horizontal and Vertical Parts Panel

If there are any existing horizontal parts in the super alignment, then a + will appear to the left of Horizontal in the tree. Similarly if there are any existing vertical parts then a + will appear next to Vertical in the tree.

Clicking on the + next to Horizontal/Vertical will then list all the horizontal/vertical parts in order from the start of the super alignment to the end of the super alignment.

To make a Part the current Part being edited, simply Left click on the Part in the expanded list and the selected Part will be highlighted and the information about the part displayed on the right hand side of the panel.

The selected part will also highlight in any Plan views the super alignment is on if it is a Horizontal Part, or...
any Section views that the super alignment is profiled on if it is a Vertical Part.

A Part can be selected from a Plan or Section View using the Pick icon. The selected part then becomes the current Part for editing.

Clicking on the Previous icon makes the previous part in the list the current Part for editing.

Clicking on the Next icon makes the following part in the list the current Part for editing.
A new Blank Part is inserted after the current Part by clicking on the Insert icon.

The current Part can be copied by clicking on the Copy icon.

The part that the copied Part is to be inserted after is then made the current Part (by Picking, clicking on the Part in the Editor, etc.)

And clicking on the Paste icon then inserts the copied part after the current Part.
The current Part is moved one place closer to the start of the list by clicking on the Move up icon.

The current Part is moved one place down towards the bottom of the list by clicking on the Move down icon.

The current Part is deleted by clicking on the Delete icon.
14.4.11.4.1.2 Creating and Editing a Part

A new Part is created by Inserting a new Blank Part and then clicking on the Type choice box to get the list of available Parts. After choosing a Part, the information required to define the selected part is displayed on the right hand side of the Horizontal and Vertical Parts panel. The required information is filled in and then the Set button at the bottom of the panel is clicked to create the new Part.

An existing Part can be edited by selecting it to make it the current Part which will display its defining information on the right hand side of the Horizontal and Vertical Parts panel. Any required changes to the information are made and then click on the Set button at the bottom of the panel to update the Part.

An existing Part can be changed to a different type of Part by selecting it to make it the current Part, then click on the Type choice box and select the new Type for the Part from the pop-up list.

14.4.11.4.1.3 Types of Horizontal Parts

See 21.9.2.1 Horizontal IPs

See 21.9.3.10 Vertical Arcs - Free

For definitions of the horizontal and vertical elements, go to 21.9 Placing Parts for Super Alignments
14.4.11.4.2 SA - HIPs Editor

If the horizontal geometry of the super alignment consists of only HIP’s (that is, no horizontal parts) then clicking on HIPs Editor brings up the **Horizontal IP Properties** panel which lists all the HIP’s in the super alignment showing how the curves on the HIP are defined and the values for the HIP and accompanying arcs and transitions (spirals).

The **Horizontal IP Properties** panel is:

![Horizontal IP Properties Panel](image1)

Super Alignment Profiled on a Plan View

Table of HIP Information
Clicking on the row number in the table draws a green circle around the corresponding HIP in any plan views where the HIP is visible.

The Left arrow and Right arrow moves the highlighting to the previous HIP and next HIP respectively.
If Active is ticked for a row then that HIP is used in the super alignment.
If Active is not ticked for a row then that HIP is not used in the super alignment.
If Visible is ticked for a row then the curve at the HIP is used in the super alignment.
If Visible is not ticked for a row then the curve at the HIP is not used in the super alignment.
Warning: the row number will not be the same as the HIP numbers shown on a plan view if there are HIP’s that are not Active.

The **HIP type** can be modified by clicking **RB** in the **HIP Type** column for the HIP to be modified to bring up the choices for the HIP.

When the HIP Type is changed, the new information can be typed into the appropriate cells for that HIP and then the **Set** button is pressed to make the change.

Note: if the entire line is already highlighted, you will need to first click **LB** in the appropriate HIP Type cell to get focus just on that cell and then click **RB**. If a pop-up with Browse comes up, select Browse to get the HIP Type choices.
Any of the values in the other columns X Coord, Y Coord, Speed, Radius, Length, Leading, Trailing and Comment can be modified and the **Set** button pressed to use the new values (if they are appropriate for the HIP Type).

Note:
- Length is the length of the arc when the HIP Type is **Curve length**
- Speed is the design speed for the curves at the HIP Type is **Curve speed**.
- Radius is the radius of the arc when HIP Type is **Curve radius** or **Curve spiral**.
- Leading is the length of the leading transition (spiral) when HIP Type is **Curve spiral**.
- Trailing is the length of the trailing transition (spiral) when HIP Type is **Curve spiral**.

Warning: the not **Active** HIP’s are still listed in the HIP table but the labelling of the HIP’s on a plan view does not include them so in that case, the line number in the **Horizontal IP Properties** panel is not the same as the HIP number displayed on a plan view.
14.4.11.4.3 SA - VIPs Editor

If the vertical geometry of the super alignment consists of only VIPs (that is, no vertical parts) then clicking on VIPs Editor brings up the Vertical IP Properties panel which lists all the VIP’s in the super alignment showing how the parabolas, asymmetric parabolas and arcs on the VIP are defined and the values for the VIP and accompanying parabolas and arcs.

The Vertical IP Properties is:

![Vertical IP Properties](image1)

and when there is VIP information to display, looks like:

![Super Alignment Profiled on a Section View](image2)  
![Table of VIP Information](image3)

Clicking on the row number in the table draws a green circle around the corresponding HIP in any plan.
views where the HIP is visible.

The Left arrow and Right arrow moves the highlighting to the previous VIP and next VIP respectively.

If Active is ticked for a row then that VIP is used in the super alignment.
If Active is not ticked for a row then that VIP is not used in the super alignment.
If Visible is ticked for a row then the curve at the VIP is used in the super alignment.
If Visible is not ticked for a row then the curve at the VIP is not used in the super alignment.

Warning: the row number will not be the same as the VIP numbers shown on a section view if there are VIP’s that are not Active.

The VIP type can be modified by clicking RB in the VIP Type column for the VIP to be modified to bring up the choices for the VIP.

When the VIP Type is changed, the new information can be typed into the appropriate cells for that VIP and then the Set button is pressed to make the change.

Note: if the entire line is already highlighted, you will need to first click LB in the appropriate VIP Type cell to get focus just on that cell and then click RB. If a pop-up with Browse comes up, select Browse to get the HIP Type choices.

Any of the values in the other columns Chainage, Height, Speed, Radius, K Value, Length, Length2 and Comment can be modified and the Set button pressed to use the new values (if they are appropriate for the VIP Type).

Note:
Length is the length of the parabola when VIP Type is Length
Length and Length2 are the lengths for an Asymmetric parabola when VIP Type is Asymmetric
Speed is the design speed for the parabola when VIP Type is Speed.
Radius is the radius of the arc when VIP Type is Circular arc or the effective radius for a parabola when VIP Type is Radius.
K Value is the K value for the parabola when HIP Type is K value.

Warning: the not Active are still listed in the VIP table but the labelling of the VIP’s on a section view does not include them so in that case, the line number in the Vertical IP Properties panel is not the same as the VIP number displayed on a section view.
14.4.11.4.4 SA - Chainage Equalities Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

If Use chainage equality is ticked in the Advanced > Equality section of the Properties for the super alignment, then the **Chainage Equalities** panel is displayed.
14.4.11.4.5 SA - Custom Superelevation and Widening Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

If Use design standards is ticked in the Advanced > Design section of the Properties for the super alignment, then the Custom Superelevation and Widening panel is displayed.
14.4.11.4.6 SA - Centreline Options

At any time, a copy of the current horizontal or vertical geometry can be made and stored under an Option name.

So an Option is like a backup (safe copy) of the current horizontal or vertical geometry and can be restored as the super alignment geometry at a later time.

Clicking Centreline Options brings up the **Options Data** panel.

Insert

If the Horizontal/Vertical branch is highlighted and **Insert** clicked, a new Option is created under Horizontal/Vertical with the default name Horizontal/Vertical, and a copy of the current horizontal/vertical geometry of the super alignment is stored with the new option.

Name and Comment can be modified and are changed when <Enter> is pressed.
Delete
If the Horizontal/Vertical Option is highlighted and **Delete** clicked, then the Option is deleted.

Sync
If the Horizontal/Vertical Option is highlighted and **Sync** clicked, the horizontal/vertical geometry of the Option is deleted and replaced by the current horizontal/vertical geometry of the super alignment. That is, the Option geometry is taken from the super alignment.

Apply
If the Horizontal/Vertical branch is highlighted and **Apply** clicked, the horizontal/vertical geometry of the super alignment is deleted and replaced by the horizontal/vertical geometry of the Option. That is, the super alignment geometry is taken from the Option.

Swap
If the Horizontal/Vertical branch is highlighted and **Swap** clicked, the current horizontal/vertical geometry of the super alignment is replaced by the horizontal/vertical geometry of the Option and the horizontal/vertical geometry of the Option is replaced by the current horizontal/vertical geometry of the super alignment. That is, the two geometries are swapped.
14.4.11.4.7 SA - Named Positions

This section of documentation is a work in progress and will be updated in subsequent releases.
Clicking Named Positions brings up the Named Positions Data panel.
14.4.11.5 SA - Super Alignment Properties Icon

Selecting Properties displays the Super Alignment Properties panel.

The information in the Super Alignment Properties panel is the same as for the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on any branch, then the Set button must be clicked before leaving that branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See 14.2.1 Create Super Alignment for details on all the fields and values in the branches of this panel.

For information on each branch, go to:

Basic > General branch
Basic > Chainage branch
Basic > Interval branch
Basic > Label branch
Basic > General branch

The information in the Basic > General branch is the same as for the Basic > General branch of the Create Super Alignment panel. The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Basic > General branch, then the Set button must be clicked before leaving the Basic > General branch to modify the values for the string. WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Basic > General branch for details on all the fields and values in the Basic > General branch.
The information in the Basic > Chainage branch is the same as for the Basic > Chainage branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Basic > Chainage branch, then the Set button must be clicked before leaving the Basic > Chainage branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Basic > Chainage branch for details on all the fields and values in the Basic > Chainage branch.
Basic > Interval branch

The information in the Basic > Interval branch is the same as for the Basic > Interval branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Basic > Interval branch, then the Set button must be clicked before leaving the Basic > Interval branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Basic > Interval branch for details on all the fields and values in the Basic > Interval branch.
**Basic > Label branch**

The information in the Basic >Label branch is the same as for the Basic >Label branch of the **Create Super Alignment** panel.

The only difference is that the Set button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >Label branch, then the Set button must be clicked before leaving the Basic >Label branch to modify the values for the string.

**WARNING:** this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See **Basic > Label branch** for details on all the fields and values in the Basic >Label branch.
Basic > Transition branch

The information in the Basic > Transition branch is the same as for the Basic > Transition branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Basic > Transition branch, then the Set button must be clicked before leaving the Basic > Transition branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Basic > Transition branch for details on all the fields and values in the Basic > Transition branch.
Basic > Closure branch

The information in the Basic > Closure branch is the same as for the Basic > Closure branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Basic > Closure branch, then the Set button must be clicked before leaving the Basic > Closure branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Basic > Closure branch for details on all the fields and values in the Basic > Closure branch.
Basic > Sync branch

The information in the Basic > Sync branch is the same as for the Basic > Sync branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Basic > Sync branch, then the Set button must be clicked before leaving the Basic > Sync branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Basic > Sync branch for details on all the fields and values in the Basic > Sync branch.
Basic > IP defaults branch

The information in the Basic >IP defaults branch is the same as for the Basic >IP defaults branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Basic >IP defaults branch, then the Set button must be clicked before leaving the Basic >IP defaults branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Basic > IP defaults branch for details on all the fields and values in the Basic >IP defaults branch.
The information in the Advanced > Start branch is the same as for the Advanced > Start branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Advanced > Start branch, then the Set button must be clicked before leaving the Advanced > Start branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Advanced > Start branch for details on all the fields and values in the Advanced > Start branch.
Advanced > End branch

The information in the Advanced >End branch is the same as for the Advanced >End branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Advanced >End branch, then the Set button must be clicked before leaving the Advanced >End branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Advanced > End branch for details on all the fields and values in the Advanced >End branch.
Advanced > Design branch

The information in the Advanced > Design branch is the same as for the Advanced > Design branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Advanced > Design branch, then the Set button must be clicked before leaving the Advanced > Design branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Advanced > Design branch for details on all the fields and values in the Advanced > Design branch.
Advanced > Profiles branch

The information in the Advanced >Profiles branch is the same as for the Advanced >Profiles branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Advanced >Profiles branch, then the Set button must be clicked before leaving the Advanced >Profiles branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Advanced > Profiles branch for details on all the fields and values in the Advanced >Profiles branch.
Advanced > Equality branch

The information in the Advanced > Equality branch is the same as for the Advanced > Equality branch of the Create Super Alignment panel.

The only difference is that the Set button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Advanced > Equality branch, then the Set button must be clicked before leaving the Advanced > Equality branch to modify the values for the string.

WARNING: this means that you must click on Set after modifying each branch - you can’t change values on a number of branches and then click Set.

See Advanced > Equality branch for details on all the fields and values in the Advanced > Equality branch.
**Advanced > Chain branch**

The information in the Advanced > Chain branch is the same as for the Advanced > Chain branch of the Create Super Alignment panel.

The only difference is that the **Set** button only exists on the Super Alignment Properties panel and if any changes are made to the values on the Advanced > Chain branch, then the **Set** button must be clicked before leaving the Advanced > Chain branch to modify the values for the string.

**WARNING:** this means that you must click on **Set** after modifying each branch - you can’t change values on a number of branches and then click **Set**.

See [Advanced > Chain branch (not yet implemented)](#) for details on all the fields and values in the Advanced > Chain branch.
14.4.11.6 SA - Undo and Redo Icons

An Undo and Redo list is defined for each Editor open on the screen. That is, each open Editor has its own Undo/Redo lists.

As each option is performed in an open Editor, the reverse of the option is added to the Editors Undo list. Hence an option can be undone (reversed) by immediately clicking on the Undo icon.

Note: the Undo icon is.

If an option is undone, it is added to the Redo list so that it can be redone.

So clicking on the Undo icon undoes the last Editor operation for this super alignment and adds it to the top of the Redo list

Note: the Redo icon is

Clicking on the Redo icon redoes the last Editor operation that was undone for this super alignment and the undone operation is added to the top of the Undo list.

Important Note: as each option is added to an Undo or Redo list, the options already on the list are pushed down and none of the options pushed down can be undone/redone until all the options above it have been undone/redone. So both the Undo and Redo lists are last in, first out lists.

So the order in the Undo/Redo lists is important and can not be altered.

When the Editor is exited by either Quit or Finish, the undo and redo lists are deleted and are no longer usable.

14.4.11.7 SA - Info Icon

The Info icon is

and clicking on the Info icon brings up the Super Alignment Info panel (see 14.2.2.1 Super Alignment Info).
### Super Alignment Info

#### Selection
- **Style**: Default
- **Chainage**: 0
- **Dynamic**: on

#### General
- **Model**: XX
- **Name**: 
- **Style**: default
- **Length**: 3463.852

#### Position
- **Xcoord**: 65.031
- **Ycoord**: 1256.193
- **Level**: 
- **Angle**: 3.0412
- **Grade**: 

---

**Page 1978**  
*Editor*
14.4.11.8 SA - Recalc Icon

The Recalc icon is

and clicking on the Recalc icon does a *recalc* for the super alignment.

14.4.11.9 SA - Error Checker Icon

The Error Checker icon is

and clicking on the Error Checker icon brings up the **Super Alignment Checker** panel and runs the SA checking routines.

Warning: This options is still under development.
14.4.11.10 SA - Clear Toolbar

The Clear toolbar is

The Clear VG and Clear HG options are used to delete all the horizontal and/or vertical geometry points in the super alignment string.

14.4.11.10.1 SA - Clear VG

The Clear VG option removes all the vertical geometry from the string.

The Clear HG option removes all the horizontal and vertical geometry from the string.

After a Clear HG, the horizontal and vertical geometry can be re-entered using the SA Edit options.
14.4.11.11 SA - Help Icon

The Help icon is

Clicking on Help icon opens the context sensitive Help and jumps to this section.
For more information on the super alignment options, see 14.4.11 Edit Super Alignment.
14.4.11.12 SA - Finish Toolbar

The Finish toolbar is

- finish - save the SA and finish the editing session
- quit - end the editing session without saving

14.4.11.12.1 SA - Finish

When editing of the super alignment is completed, **Finish** is used to save the modifications and exit the SA Editor.

After selecting **Finish**, a **Yes-No-Cancel** panel is displayed to confirm that the edit session has ended and all the edits are to be kept. If **Yes** is selected, the edits will be stored and the SA Editor exited.

14.4.11.12.2 SA - Quit

At any time the Editing process can be aborted and all the edits thrown away by selecting the **Quit** option. That is, the super alignment is left as it was before the **Edit** was begun.

After selecting **Quit**, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be terminated. If **Yes** is selected, the edits will be ignored and the original unedited super alignment kept.

Note that if it was a new string being created, the Editor is terminated by Quit and no string is created.
14.4.12 Text Edit

On picking a text string, the text edit menu and the panel are placed on the screen.

Each option in the text edit menu will now be described.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.12.1 Position

The position option is used to place the text string for the first time and to re-position (move) an existing text string.

Position is a one step process.

After selecting the position option, the new position for the text is selected. The text is then redrawn at the new position.

Typed input can be used at any stage.

Continue to the next section 14.4.12.2 Text or return to 14.4.12 Text Edit.

14.4.12.2 Text

The text option is used to modify the text of the text string.

After the text option is chosen, an enter text typed-input box is placed on the screen with the string’s current text displayed in it.

The text is entered into the typed-input box, terminated with <enter>. The entered value is taken as the text of the text string and the string redrawn with the new text. The typed-input box then disappears.
The **text** option automatically terminates and a new option needs to be selected from the **text edit** menu.

Continue to the next section 14.4.12.3 **Text ht** or return to 14.4.12 **Text Edit**.

### 14.4.12.3 **Text ht**

The **text ht** option is used to modify the height of the text in the text string.

After the **text ht** option is chosen, an enter value typed-input box is placed on the screen with the string's current text height displayed in it.

The enter value typed-input box looks like:

![Enter value box](image)

The text height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the text in the text string and the string redrawn with the new height.

The typed-input box then disappears.

The **height** option is automatically terminated and a new option needs to be selected from the **text edit** menu.

Continue to the next section 14.4.12.4 **Angle** or return to 14.4.12 **Text Edit**.

### 14.4.12.4 **Angle**

The **angle** option is used to modify the angle that the text in the text string is drawn at.

The text angle is measured in a counter-clockwise direction with respect to the horizontal axis.

After the **angle** option is chosen, an enter angle typed-input box is placed on the screen with the string's current text angle displayed in it.

The enter angle typed-input box looks like:

![Enter angle box](image)

The text angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the angle of the text in the text string and the string redrawn with the new angle.

The typed-input box then disappears.

The **angle** option is automatically terminated and a new option needs to be selected from the **text edit** menu.

Continue to the next section 14.4.12.5 **Properties** or return to 14.4.12 **Text Edit**.

### 14.4.12.5 **Properties**

Selecting **Properties** brings up the **Text String Properties** panel which is used to modify the string’s header information.
### Field Description

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Continue to the next section [14.5 Points Edit](#) or return to [14.4.12 Text Edit](#).
14.5 Points Edit

Position of menu:  Strings => Points Edit

The points operations available in the Points edit menu are similar to the create/edit options. However, in the Points edit options, the user does not begin by picking the particular string to be edited. Instead, the required option is selected followed by the point to be modified from any string. The option can then be applied to another point on that or any other string, or another point operation chosen, and applied to any point.

If the user wants to make a large number of point edits to the one string, the editor option discussed in the last section is the easiest option to use. However, if a number of strings are going to be edited with the same operation or a selection of operations, then the points edit option is more suitable.

After selecting the Points edit option, the Points edit menu is displayed.

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Append</td>
<td>Append to a string</td>
</tr>
<tr>
<td>Between</td>
<td>Insert on the line between string points</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete a string point</td>
</tr>
<tr>
<td>Extend</td>
<td>Extend a string point</td>
</tr>
<tr>
<td>Extend Ht</td>
<td>For polyline/superstring - extend point and extrapolated height</td>
</tr>
<tr>
<td>Height</td>
<td>Change height of a point</td>
</tr>
<tr>
<td>Insert</td>
<td>Insert a point into a string</td>
</tr>
<tr>
<td>Move</td>
<td>Move a string point, or a text string</td>
</tr>
<tr>
<td>Add 3pt curve</td>
<td>For polyline/superstring - add curve through 3 points</td>
</tr>
<tr>
<td>Del 3pt curve</td>
<td>For polyline/superstring - delete adjacent curves</td>
</tr>
<tr>
<td>Vertex</td>
<td>Edit vertex data for a super string</td>
</tr>
</tbody>
</table>

Each of the options performs the same work as the option of the same name in the Edit string option. The individual options in the Points Edit menu will now be discussed in detail.

For the option Append, go to 14.5.1 Append Point

Between 14.5.2 Between Point
Delete 14.5.3 Delete Point
Extend 14.5.4 Extend Point
Extend Ht 14.5.5 Extend Height
Height 14.5.6 Height
Insert 14.5.7 Insert Point
Move 14.5.8 Move Point
Add 3pt curve 14.5.9 Add 3 Point Curve
Del 3pt curve 14.5.10 Delete 3 Point Curve
Vertex 14.5.11 Edit Vertex
14.5.1 Append Point

Position of option on menu: Strings => Points Edit => Append

The append option adds additional points to the end of a string. On selecting the Append option, an append point panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the append option, the particular end of the string to append points to is selected using the standard LB and MB pick and accept sequence.

The points to be appended are then selected. The option keeps adding points to the selected string until the pick ops menu is brought up using RB and cancel is selected.

After the append has been completed, the option repeats. That is, the user is asked to select another string to append to. This continues until finish or [X] is selected from the append point panel.
14.5.2 Between Point

Position of option on menu:  Strings => Points Edit => Between

On selecting the between option, a between point panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the between option, the particular segment to insert a point on is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the between has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until finish or [X] is selected from the between point panel.
14.5.3 Delete Point

Position of option on menu:  Strings =>Points Edit => Delete

On selecting the delete option, a delete point message panel is displayed.

![Delete Point Message Panel]

The message area of this panel informs the user of any error messages.

Once in the delete option, the particular point to delete is selected using the standard LB and MB pick and accept sequence. When the point is accepted, it is deleted.

After the delete has been completed, the option repeats. That is, the user is asked to select another point to delete (the point can be on any string). This continues until finish or [X] is selected from the delete point panel.
14.5.4 Extend Point

**Position of option on menu:** Strings => Points Edit => Extend

On selecting the **extend** option, a **extend point** panel is displayed.

![Extend Point Panel](image)

The message area of this panel informs the user of any error messages.

Once in the **extend** option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted.

After the **extend** has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until **finish** or [X] is selected from the **extend point** panel.
14.5.5 Extend Height

**Position of option on menu:** Strings => Points Edit => Extend Ht

The extend point by height option is similar to the extend option except that the z-value of the moved point is modified by linearly interpolating the z-value from the original points at the end of the selected segment. On selecting the extend by ht option, an extend point by ht panel is displayed.

![Extend Point by Ht Panel](image)

The message area of this panel informs the user of any error messages.

Once in the extend point by ht option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted. The z-value of the moved point is the linear interpolation of the selected segment.

After the extend point by ht has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until finish or [X] is selected from the extend point by ht panel.
14.5.6 Height

Position of option on menu: Strings => Points Edit => Height

On selecting the height option, a point height panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the height option, the particular point to modify the height for is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the height existing height is displayed in a height box which can be modified and accepted by typing <enter>.

After the height has been completed, the option repeats. That is, the user is asked to select another point to modify the height for (the point can be on any string). This continues until finish or [X] is selected from the point height panel.
14.5.7 Insert Point

**Position of option on menu:** Strings => Points Edit => Insert

On selecting the insert option, an insert point message panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the insert option, the particular segment to identify the two points to insert the point is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the insert has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until finish or [X] is selected from the insert point panel.
14.5.8 Move Point

Position of option on menu:  Strings => Points Edit => Move

On selecting the move option, a move point panel is displayed.

The message area of this panel informs the user of any error messages. There are similar panels for each of the other points edit options.

Once in the move option, the particular point to move is selected using the standard LB and MB pick and accept sequence. The position that the point is to be moved to is then selected and accepted.

After the move has been completed, the option repeats. That is, the user is asked to select another point to move (the point can be on any string). This continues until finish or [X] is selected from the move point panel.
14.5.9 Add 3 Point Curve

**Position of option on menu:** Strings => Points Edit => Add 3pt Curve

On selecting the add 3pt curve option, a **insert 3pt curve** panel is displayed.

![Insert 3pt Curve Panel](image)

The message area of this panel informs the user of any error messages.

Once in the add 3pt curve option, the middle point of the three points of the super string to fit a curve for, is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the curve is fitted between it and the left and right adjacent points of the super string.

After the add 3pt curve has been completed, the option repeats. That is, the user is asked to select another point to add a curve to (the point can be on any super string). This continues until finish or [X] is selected from the **insert 3pt curve** panel.
14.5.10 Delete 3 Point Curve

Position of option on menu: Strings => Points Edit => Del 3pt Curve

On selecting the del 3pt curve option, a delete 3pt curve panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the Delete 3pt curve option, a vertex from a super string is selected using the standard LB and MB pick and accept sequence and if there is curves on both sides of the vertex, the radii are removed and the vertices are joined by straight line segments.

After the Delete 3pt curve has been completed, the option repeats. That is, the user is asked to select another point on a super string to remove the curves on either side (the point can be on any super string). This continues until finish or [X] is selected from the Delete 3pt curve panel.
14.5.11 Edit Vertex

**Position of option on menu:**  Strings =>Points Edit => Vertex

The Edit Vertex option allows the quick editing of the co-ordinates, vertex id, symbol, vertex text and tinability of a selected string vertex.

The name, model, colour and linestyle, which are string properties, can also be modified however the user has the choice of modifying the string properties for the entire string, or have the option remove the selected vertex from the string and only give the string properties to the newly created one vertex string. If a vertex is removed from the string, the adjacent vertices of the removed vertex can be joined.

On selecting the **Vertex** option, a **Edit Vertex** panel is displayed.

The **Edit Vertex** option is already running and a super string vertex is selected.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>

String properties

Remove vertex from string

Join remaining strings

Name

Model

Colour

Linestyle 1
Z coordinate

Measure Z panel

the y coordinate (elevation) of the selected vertex. Change this to the required value.

Symbol

symbol box

available symbols

the symbol on the selected vertex. Change this to the required symbol.

Text

input

the text on the selected vertex. Change this to the required text.

Tinable

tick box

ticked if the selected vertex is tinable. Change if required.

String/New vertex properties

Remove vertex from string

tick box

tick if the selected vertex is to be removed from its current string.

Join remaining points

tick box

only setable if Remove vertex from string is ticked.
If ticked then the vertices on either side of the removed vertex are joined.
If not ticked then the original string will be broken into two strings when the vertex is removed.

Name

input

the name of the string containing the selected vertex. Change this to the required name.

Model

model box

available models

the model of the string containing the selected vertex. Change this to the required model.

Colour

colour box

available colours

the colour of the string containing the selected vertex. Change this to the required colour.

Linestyle

linestyle box

the linestyle of the string containing the selected vertex. Change this to the required linestyle.

Pick

button

chose Pick and then select the vertex to be edited.

Set

button

apply the values in the panel to the selected vertex. Pick is still active so that another vertex can be selected.
14.6 Strings Edit

**Position of menu:** Strings => Strings Edit

The Strings edit option contains operations to be applied, not to individual points of a string, but to entire strings.

After selecting the Strings edit option, the Strings edit menu is displayed.

The individual options in the Strings edit menu will now be discussed in detail.

For the option Change, go to 14.6.1 Change

- change string colour, type, name or model
- delete or keep part of a string
- connect the first and last points
- delete a string
- duplicate a string
- join two strings to form one string
- join many strings to form one string
- delete a string link
- disconnect the first and last points
- parallel the string
- reverse the order of string points
- split a string into two strings
- translate a string to a new position
- change the text information
- create inner and outer chords for an arc
- segment a super string
- create corner splay
14.6.1 Change

Position of option on menu:  
Strings => Strings Edit => Change

The Change option can be used to change the mode, colour, style, name and point-line type of a string. On selecting the Change option, the Change string panel is displayed.

![Change String Panel]

The Change option is already in progress and if a string is selected, the model, colour, style, name and point-line type are changed according to the fields in the change string panel. The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

</tr>
</tbody>
</table>

Please continue to the next section 14.6.2 Clip.
14.6.2 Clip

Position of option on menu: Strings => Strings Edit => Clip

The Clip option can be used to delete or keep part of a string.
On selecting the Clip option, the Clip string panel is displayed.

![Clip string panel]

After selecting the clip option, the user is asked to select the string to be clipped. The user is then asked to select two points on the string to define the section to be clipped.

Depending on the clip mode, either
(a) a new string is created from the section of the string between the two points
(b) two new strings are created by deleting the section of the string between the two points
(c) one new string is created by deleting the section of the string between the two points and then joining the two selected points.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the 1st half of the clipped string. Otherwise the values of the original string are used for the 1st half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the clipped string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to keep string, the original string is kept
trash string, the original string is moved to the trash model
delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st name</td>

internal, external, join external

if internal, a new string is created from the section of string between the two selected points.
external, two new strings are created by deleting the section of the string between the two points.
join external, one new string is created by deleting the section of the string between the two points and then joining the two selected points.

How to Use the Panel and Panel Messages

(a) Enter the new model, colour and name for the first and second parts of the clipped string.
(b) The string to be clipped is selected.
(c) The points to be used as the clipped point are then selected.
(d) The section of the string is then clipped between the selected points and depending on the clip mode, the selected string is then clipped or the clipped section kept.

Please continue to the next section 14.6.3 Close.
14.6.3 Close

Position of option on menu:  Strings => Strings Edit => Close

A closed string is simply a string whose 1st and last points are the same.

The close string option adds to the end of the string, a point that is identical to the 1st string point. This then forms a closed string.

On selecting the close option, the close string panel is displayed.

The close option is already in progress and if a string is selected, it is closed.

Please continue to the next section 14.6.4 Delete.
14.6.4 Delete

Position of option on menu:  Strings => Strings Edit => Delete

Entire strings can be deleted from the model using the Delete option.

On selecting the Delete string option, the Delete string panel is displayed.

![Delete String Panel]

The delete option is already in progress and if a string is selected (LB) and accepted (MB), it is deleted.

If the trash mode in the trash defaults panel is set to trash string, the original string is not deleted but moved to the trash model.

Please continue to the next section 14.6.5 Duplicate.
14.6.5 Duplicate

Position of option on menu:  
**Strings => Strings Edit => Duplicate**

The duplicate option is used to make a copy of the string with the option of giving the duplicate string a new model, colour and/or name.

On selecting the duplicate option, the **duplicate string** panel is displayed.

The duplicate option is already in progress and if a string is selected, then a copy of the string will be created and possibly given a new model, colour or name depending on the fields in the **duplicate string** panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>New name</td>
<td>if the new name field is blank, the duplicate string has the same name as the original string. If the new name field is non-blank, then the duplicate string is given the name in the new name field.</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>New model</td>
<td>if new model is blank, the duplicate string is placed in the same model as the original string. If the new model field is non-blank, then the duplicate string is placed in the model given in the new model field.</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>New colour</td>
<td>if the new colour field is blank, the duplicate string has the same colour as the original string. If the new colour field is non-blank, then the duplicate string is given the colour specified in the new colour field.</td>
<td>input</td>
<td>available colours</td>
<td></td>
</tr>
</tbody>
</table>

Please continue to the next section 14.6.6 Join.
14.6.6 Join

Position of option on menu:  Strings => Strings Edit => Join

The Join option is used to create a new string by joining two existing strings together. On selecting the Join option, the Join strings panel is displayed.

![Join Strings Panel]

After selecting the Join option, the user is asked to select in turn the two strings that make up the joined string.

First, the string that will become the first half of the new joined string is selected with the direction that the string will have as the first half of the new string.

Next, the string that will become the second half of the new joined string is selected with the direction that the string will have as the second half of the new string.

The end of the first selected directed string and the beginning of the second selected directed string are joined to form the new joined string.

If the model, colour and/or name panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the keep mode is set to keep string, the original strings are kept. trash string, the original strings are moved to the trash model delete string, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>New name</td>
<td>input</td>
<td>if the new name field is blank, the joined string is given the name of the first selected string. If the new name field is non-blank, the joined string is given the name in the new name field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>New model</td>
<td>input available models</td>
<td>if new model is blank, the joined string is placed in the same model as the first selected string. If the new model field is non-blank, the joined string is placed in the model given in the new model field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>New colour</td>
<td>input available colours</td>
<td>if the new colour field is blank, the joined string is given the colour of the first selected string. If the new colour field is non-blank, then the joined string is given the colour specified in the new colour field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Keep mode</td>
<td>input keep strings delete string, keep strings</td>
<td>if delete string, the selected strings selected are deleted. keep string, the selected strings are not deleted. trash string, the strings selected to be joined are moved to the trash model.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

How to Use the Panel

(a) Enter the new model, colour and name for the joined string.
(b) The 1st string is selected by picking it with the required direction.
(c) The string to be joined to the 1st selected string is selected by picking it with the required
direction.
(d) The last point of the 1st directed string and the 1st point of the second directed string are
joined to create a new string with model, colour, name as specified in the join strings panel.

Please continue to the next section 14.6.7 Join Many.
14.6.7 Join Many

Position of option on menu:  Strings => Strings Edit => Join many

The Join many option is used to create a new string by joining two or more existing strings, or parts or strings, together.

On selecting the Join many option, the Join many strings panel is displayed.

After selecting the Join many option, the user is asked to select in turn the strings that will make up the joined string. Using the partial mode, parts of strings can be joined.

First, the string that will become the first part of the new joined string is selected with the direction that the string will have as the first part of the new string.

If partial is set (tick), two points are then picked on the string and only the part of the string between the picked points is used in the join.

Next, the strings that will become the subsequent parts of the new joined string are selected in order with the direction that the strings will have in the new joined string.

Again, whenever partial is set (tick), two points are picked on the selected string and only the part of the string between the picked points is used in the join.

The end of each selected directed string (or partial string) is joined to the beginning of the subsequent selected directed string (or partial string) when forming the joined string.

If the name, model and/or colour panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the keep mode is set to keep string, the original strings are kept
trash string, the original strings are moved to the trash model
delete string, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>New name</td>
<td>if blank, the joined string is given the name of the first selected string. If non-blank, the joined string is given the name in the new name field.</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>New model</td>
<td>if blank, the joined string is placed in the same model as the first selected string. If non-blank, the joined string is placed in the model given in the new model field.</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>New colour</td>
<td>if blank, the joined string is given the colour of the first selected string. If non-blank, the joined string is given the colour specified in the new colour field.</td>
<td>input</td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td>Keep mode</td>
<td>keep strings, the selected strings are not deleted.</td>
<td>input</td>
<td>keep strings, delete strings</td>
<td></td>
</tr>
</tbody>
</table>
trash string, the strings selected to be joined are moved to the trash model.

Partial tick

if ticked, two points are then picked on the string and only the part of the string between the picked points is used in the join.

if not ticked, no extra points are required and the entire string is used.

How to Use the Panel and Panel Messages

(a) Enter the new model, colour and name for the joined string.

(b) The first string to be joined is then selected by picking the required string with the required direction, plus two points to restrict the string if partial is set on.

(c) The second and subsequent strings to be joined are then selected (or partial string if partial is set on) in order and with the required direction.

(d) The last point of each directed string is connected to the first point of the subsequent directed string to create a new joined string. The model, colour and name as specified in the join many strings panel are used for the new string.

Please continue to the next section 14.6.8 Link Clip.
14.6.8 Link Clip

Position of option on menu:  Strings \(\Rightarrow\) Strings Edit \(\Rightarrow\) Link clip

The link clip option can be used to delete the link joining two adjacent vertices of a string.

On selecting the link clip option, the link clip string panel is displayed.

After selecting the link clip option, the user selects the link of the string to be clipped. On acceptance, the selected link is deleted from the string, thus creating two new strings.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the first half of the link clipped string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the link clipped string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to keep string, the original string is kept
trash string, the original string is moved to the trash model
delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st name</td>

<td>available models</td>
<td></td>
</tr>
</tbody>
</table>

if blank, the first half of the clipped string is given the name of the original string.
If non-blank, the first half of the clipped string is given the name in the 1st name field.

if blank, the first half of the clipped string is placed in the same model as the original selected string.
If non-blank, the first half of the clipped string is placed in the model given in the 1st model field.

if blank, the first half of the clipped string is given the colour of the original string.
If non-blank, the first half of the clipped string is given the colour specified in the 1st colour field.

if blank, the second half of the clipped string is given the name of the original string.
If non-blank, the second half of the clipped string is given the name in the 2nd name field.

if blank, the second half of the clipped string is placed in the same model as the original selected string. If non-blank, the second half of the clipped string is placed in the model given in the 2nd model field.
2nd colour

input available colours
if blank, the second half of the clipped string is given the colour of the original string.
If non-blank, the second half of the clipped string is given the colour specified in the 2nd colour field.

Keep mode

input keep string delete, keep, trash string
if delete string, the string selected to be clipped is deleted.
keep string, the selected string is not deleted.
trash string, the string selected to be clipped is moved to the trash model.

Please continue to the next section 14.6.9 Open.
14.6.9 Open

Position of option on menu: Strings => Strings Edit => Open

A closed string is opened by removing the last point of the string.

On selecting the open option, the open string panel is displayed.

![Open String Panel]

The open option is already in progress and if a closed string is selected, it is opened.

Please continue to the next section 14.6.10 Parallel.
14.6.10 Parallel

Position of option on menu:  Strings => Strings Edit => Parallel

Strings, or parts of strings, can be translated perpendicularly to either the left or right using the parallel option. The z-values of the string can also be adjusted by a constant value.

The difference between a translate and a parallel is that for a straight translate, the translation vector is the same for the whole string. In a parallel, the translation is at right angles to each link of the string and hence the translation direction varies along the string.

For example, the edge of a road is a parallel of the centre-line, not a copy of the centre-line.

On selecting the parallel option, the Parallel String panel is displayed.

The user is then asked to select the string to parallel.

If partial is not set, the string is copied parallel through the distance given in the offset field.

If partial is set (tick), two points are then picked on the string and only the part of the string between the picked points is copied parallel through the distance given in the offset field.

The value in the delta ht field is then added to the z-values of the string.

The direction imposed upon the string when selecting it is used to determine what is the left and right side of the string in the parallel operation.

A positive offset parallels the string to the right with respect to the direction of picking. A negative offset parallels to the left with respect to the direction of picking.

Hence, the fields and buttons used in the parallel string panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>New name</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>If blank, the paralleled string is given the name of the original string.</em>&lt;br&gt; <em>If non-blank, the parallel string is given the name in the new name field.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>New model</td>
<td>input</td>
<td></td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>If blank, the paralleled string is placed in the same model as the original selected string.</em>&lt;br&gt; <em>If non-blank, the paralleled string is placed in the model given in the new model field.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>New colour</td>
<td>input</td>
<td></td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>If blank, the paralleled string is given the colour of the original string.</em>&lt;br&gt; <em>If non-blank, the paralleled string is given the colour specified in the new colour field.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td>input</td>
<td>distance (in world units) that the string will be copied parallel through. A positive distance denotes that the string will be paralleled to the right of the original string.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Delta ht</td>
<td>input</td>
<td>value to add to the z-values of the string.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Partial tick

If ticked, two points are then picked on the string and only the part of the string between the picked points is used in the parallel.

If no ticked, no extra points are required and the entire string is used.

How to Use the Panel

(a) Enter the new model, colour and name for the paralleled string.
(b) Enter the offset distance for the parallel - left and right is determined by picking direction.
(c) Enter the height to add to the string’s z-values in the delta ht field.
(d) The selected string (or partial string if partial is set on) is then copied parallel as required.

Please continue to the next section 14.6.11 Reverse.
14.6.11 Reverse

Position of option on menu: Strings => Strings Edit => Reverse

The reverse string option simply reverses the order of the points in a string. On selecting the reverse option, the reverse string panel is displayed.

After selecting the reverse option, the user simply picks (LB) the string that is to have its point order reversed and on acceptance (MB) of the string, the reversing takes place.

Please continue to the next section 14.6.12 Split.
14.6.12 Split

Position of option on menu: Strings => Strings Edit => Split

The Split option is used to create two new strings by splitting an existing string about a selected point on the string.

On selecting the Split option, the Split string panel is displayed.

If control point is set off, after selecting the split option, the user is asked to select the string and the selection point is also used as a split point. Hence the one point is used to select the string and as the split point.

If control point is set on, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point. Hence the string select and the split point are selected separately.

Two strings are then created by splitting the chosen string about the split point.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the first half of the split string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the split string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to keep string, the original string is kept
trash string, the original string is moved to the trash model
delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st name</td>
<td>input</td>
<td>if blank, the first half of the split string is given the name of the original string. If non-blank, the first half of the split string is given the name in the 1st name field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1st model</td>
<td>input</td>
<td>if blank, the first half of the split string is placed in the same model as the original selected string. If non-blank, the first half of the split string is placed in the model given in the 1st model field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1st colour</td>
<td>input</td>
<td>if blank, the first half of the split string is given the colour of the original string. If non-blank, then the first half of the split string is given the colour specified in the 1st colour</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
field.

**2nd name** input

*if blank, the second half of the split string is given the name of the original string.*

*If non-blank, the second half of the split string is given the name in the 2nd name field.*

**2nd model** input available models

*if blank, the second half of the split string is placed in the same model as the original selected string.*

*If non-blank, the second half of the split string is placed in the model given in the 2nd model field.*

**2nd colour** input available colours

*if blank, the second half of the split string is given the colour of the original string.*

*If non-blank, then the second half of the split string is given the colour specified in the 2nd colour field.*

**Keep mode** input keep string delete, keep, trash string

*if delete string, the string selected to be split is deleted.*

*keep string, the selected string is not deleted.*

*trash string, the string selected to be split is moved to the trash model.*

**Control pt** tick

*If ticked, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point.*

*If not ticked, the user is asked to select the string and the selection point is also used as a split point.*

**How to Use the Panel and Panel Messages**

(a) Enter the new model, colour and name for the first and second parts of the split string.

(b) If control is on, the string is selected and then the split point is selected.

   If control is off, the string is selected and the same point is to be used as the split point.

(c) The chosen string is then split about the split point and the two halves given models, colours and names as defined by the split string panel.

Please continue to the next section 14.6.13 Translate.
14.6.13 Translate

Position of option on menu: Strings => Strings Edit => Translate

Entire strings can be translated in the x,y and z directions using the translate option. The translated string can either be moved or copied to its new translated position.

The difference between a copy or a move is simply that if a string is copied, a copy of the string is translated and the original string left untouched, whereas for a move, the actual string is moved from its original position to the new translated position.

On selecting the Translate option, the Translate string panel is displayed.

![Translate String Panel]

The selected string is translated by using the cursor to select a position on the string (the before point) and then selecting the position (not necessarily on a string) that the point will be translated to (after point).

Hence the translate operation requires two positions - a before and an after point - for the translation to be defined.

The first position (the before point) is selected using the normal select procedures. The second position (the after point) depends entirely on the translate mode.

If the translate mode is set to
cursor x y z or cursor x y
the cursor is used to not only select the string point but also to indicate where it is to be moved/copied to.

typed x y z
the second point has the absolute coordinates given in the x y z field.

typed dx dy dz
the second point is defined relative to the first point by the adding the dx dy dz given in the dx dy dz field.

Selected strings will be translated until the option is finished.

The fields and buttons used in the translate panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>New name</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

if blank, the string is given the name of the original string.
If non-blank, the string is given the name in the new name field.

New model          | input | available models |

if blank, the string is placed in the same model as the original selected string.
If non-blank, the string is placed in the model given in the New model field.
**New colour**  
input available colours  
*if blank, the string is given the colour of the original string.*  
*If non-blank, then the string is given the colour specified in the new colour field.*

**Translate mode**  
input cursor xy cursor xy, cursor xyz, typed xyz, typed dx dy dz  
*see comments about translate mode in the general description of move/copy*

**x y z**  
input  
*if Translate mode is **Typed x y z** then this field appears and the position on the string where the string was selected is translated to this co-ordinate.*

**dx dy dz**  
input  
*if Translate mode is **Typed dx dy dz** then this field appears and the selected string is translated by the given dx dy dz.*

**Move/copy mode**  
input move copy, move  
*if the mode is set to move, the string is translated as defined in the panel fields and the original string is deleted. If the mode is copy, the original string is left alone.*

**How to Use the Panel and Panel Messages**

(a) Enter the new model, colour and name for the translated string.
(b) The string to be translated and its “before” point is chosen.
(c) The “after” point is chosen according to the translate mode.
(d) The selected string is then translated (moved or copied) as required.

Please continue to the next section 14.6.14 Textdata Info.
14.6.14 Textdata Info

Position of option on menu: Strings => Strings Edit => Textdata info

The Textdata info option is used to change the information about the text for a text string, super strings and text for 4d strings.

Selecting the option, the Change Textstyle Info panel:

![Change Textstyle Info Panel]

The parameters for the textstyle information are set and then any selected string is given the new textstyle parameters. If any of the parameters are left blank, then that parameter is not modified for the selected string.

To define the Textstyle info parameters, click on the text button and then the edit button.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>New textstyle info</td>

<td>textstyle information to use for the selected strings.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Change</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

selected strings will have their text modified by the parameters in the new textstyle info field.
14.6.15 Arc to Chords

Position of option on menu: Strings => Strings Edit => Arc to chords

The Arc to Chord option works on a super string and creates inside or outside chords for any arc segments in the super string.

The number of chords created can be defined by giving the number of chords required, a chord length to use for each chord, or an arc to chord tolerance.

On selecting the Arc to chords option, the Arc to Chords panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick</td>

</tr>
</tbody>
</table>
14.6.16 Segment Strings

Position of option on menu:  Strings => Strings Edit => Segment string

The Segment string option works on a super string and inserts extra points on an arc or line segment of the super string to break it into smaller arc or line segments.

The number of arcs/lines created can be controlled by specifying either
(a) the number of sub-segments required
(b) a single sub-segment length to break the start of the segment into that length
(c) a sub-segment length to break the segment into as many sub-segments of that length as possible.

On selecting the Segment strings option, the Segment String panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description  Type  Defaults  Pop-Up
Pick  button  select the super string to edit.
Previous  button  move to the previous segment of the super string.
Next  button  move to the next segment of the super string.
Method  choice box  by number  by number
          one distance  by distance
          by distance

method for creating the sub-segments.

by number - the segment is broken into No of parts equal segments
one distance - the segment is broken into two parts with the first part having the length Distance (which end will depend on the direction that the segment was selected).
by distance - the segment is broken into as many sub-segments of length Distance as possible (which end the division starts at depends on the direction that the segment was selected).

No of parts, Distance  value to use with the Method.
Current segment length  output only
  length of the currently selected segment of the super string.

Calc segment length  output only
  calculated length of the segment that will be created.

Process  button
  create sub-segments for the selected segment of the super string.
14.6.17 Corner Splays

Position of option on menu:  Strings => Strings Edit => Corner splays

The Corner splays option works on a super string and creates splays between two adjacent straight segments.

The number of chords created can be defined by giving the number of sub-segments required, one sub-segment length to beak of the segment or a sub-segment length to beak the segment into as many sub-segments as possible.

On selecting the Corner splays option, the Corner splays panel is displayed.

![Corner Splays Panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>

*if ticked, the original string is not modified and a new string is created with the corner splays. If not ticked, the original string is modified.*
Pick button

select a super string and the splays will be created.
14.6.18 Surrounding Polygon

Position of option on menu:  Strings => Strings Edit => Surrounding polygon

The Surrounding polygon option works on all the super strings on the view surrounding a selected position (point) and, if possible, creates a closed polygon from parts of the strings surrounding the selected point.

A straight line must be able to be drawn from the selected point to the lines/arcs that could be used in the surrounding strings.

This option creates a lot/polygon by a picking inside a collection of strings and the lot/polygon is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot/polygon can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot/polygon side without cutting any other segment.

![Creating a Polygon by Picking Inside the Polygon](image)

On selecting the Surrounding polygon option, the Create Polygon - Pick Point Inside panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

  *colour for the created polygon.*

Pick
  button
  *pick a position on a view and the surrounding polygon will be created from all the super strings on the view.*
14.7 Cogo

Position on menu: Strings => Cogo

Note: This option is no longer available.

The Cogo (co-ordinate geometry) options provide methods of constructing points, lines and arcs from a variety of operations such as picking, filleting, intersecting and finding tangents.

Selecting the cogo option creates the Cogo edit ops menu and the Cogo edit panel.

The options in the cogo edit ops menu all create either a point, string or arc and the cogo edit panel remains on the screen for each of the menu options and provides the string properties for any created objects.

All of the options chosen from the Cogo edits ops menu and its sub-menus repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

The name of the current selected option is displayed in the first message area of the cogo edit panel.

To select a new Cogo edits ops option, simply select the new option from the Cogo edit ops menu or sub-menus. The current option is automatically terminated and the new option begun.

An option is also terminated when either the cancel or finish button is selected in the Cogo edit panel, or finish is elected from the Cogo edit ops menu.

Each of the options in the Cogo edit ops menu will now be discussed.

For the option Create ops, go to 14.7.1 Create Ops

Intersect ops 14.7.2 Intersect Ops
Vector 14.7.3 Vector
Parallel 14.7.4 Parallel
Fillet ops 14.7.5 Fillet Ops
Fillet ops (T) 14.7.6 Fillet Ops (T)
Fillet ops (TJ) 14.7.7 Fillet Ops (TJ)
Tangent 14.7.8 Tangent

Please continue to the next section 14.7.1 Create Ops.
14.7.1 Create Ops

The Create ops walk-right menu is

Each of the options in the Create Ops menu will now be discussed.

For the option Create point, go to

14.7.1.1 Create Point
14.7.1.2 Create Line
14.7.1.3 Create Point Between Points
14.7.1.4 Locate Offset
14.7.1.5 Locate Deflection
14.7.1.6 Divide - Number
14.7.1.7 Divide - Distance
14.7.1.8 Perpendicular
14.7.1.9 Projection
14.7.1.10 Locate Chainage

14.7.1.1 Create Point

After selecting the Create point option, the user simply selects a point using the normal picking sequence.
The point will be created with name, colour and model from the cogo edit panel.

If no z-value is given in the cogo edit panel, then a null z-value is used.

If height snap is on and the point is created by snapping to an existing point or line, the z-value for the point
is taken from the snapped point or if tin snap is on, from the underlying triangulation. The snapped z-value
will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is
taken from the cogo edit panel. If no value exists in the cogo edit, an error message please specify z
value is displayed in the cogo edit message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then
disappears.

Screen message area
<<Create Point> Select position for point> [picks][menu]
14.7.1.2 Create Line

After selecting the create line option, the user simply selects two points to be the end points of the line using the normal picking sequence.

The line will be created with name, colour and model from the cogo edit panel.

If either end point is created by snapping to an existing point or line, the z-value for the point is taken from the snapped point or if tin snap is on, from the underlying triangulation. If no z-value exists, the z-value is taken from the cogo edit panel.

If height snap is on, the snapped z-value will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is taken from the cogo edit panel. If no value exists in the cogo edit, an error message please specify z value is displayed in the cogo edit message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then disappears.

Screen message area

<<Create Line>  Select 1st point on line>  [picks][][menu]
<<Create Line>  Select 2nd point on line>  [picks][][menu]

14.7.1.3 Create Point Between Points

The create point between points option allows the user to select two points to act as the end points of a line and then create a new point a user supplied given distance along that line.

After selecting the create point between points option, the user simply selects two points to act as the end points of the line using the normal picking sequence.

An enter distance from 1st point box is then displayed on the screen and the user simply enters the appropriate distance into the box, terminated with a <enter>. The box then disappears.

The point is then created with name, colour and model and z-value from the cogo edit panel.

If no z-value exists in the panel, no point is created.

Screen message area

<<Between>  Select 1st point>  [picks][][menu]
<<Between>  Select 2nd point>  [picks][][menu]
<<Between> Enter distance from 1st point  [caret][][menu] select a button

14.7.1.4 Locate Offset

The locate offset option is used to create a point at a given perpendicular offset distance from a user defined point on a selected item.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the locate offset option needs

(a) a selected item
(b) a control point
(c) a projection distance
(d) an offset distance

After selecting the locate offset option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

A distance along item box is then displayed on the screen and the user enters the appropriate distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.
Finally an offset distance box is displayed on the screen. The user enters the appropriate offset distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with name, colour, model and z-value from the cogo edit panel.

If no z-value exists in the panel, no point is created.

Screen message area

<<<Locate Offset> Select item to project along> [picks][menu]
<<<Locate Offset> Select control point> [picks][menu]
/Locate Offset> distance along item [caret][menu] select a button
/Locate Offset> offset distance [caret][menu] select a button

14.7.1.5 Locate Deflection

The locate deflection option is used to create a point at a given deflection angle and distance from a user defined point on a selected item.

The locate deflection option is very similar to the locate offset option except instead of going out perpendicular to the item, the user provides a deflection angle. Hence the locate offset is a special case of the locate deflection option when the deflection angle is ninety degrees.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the locate deflection option needs

(a) a selected item
(b) a control point
(c) a projection distance
(d) a deflection angle
(e) a deflection distance

After selecting the locate offset option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

Boxes for the distance along item, deflection angle and deflection distance are then (sequentially) displayed on the screen and the user enters the appropriate values into each box, terminated with a <enter>. The box then disappears.

A positive distance is in the picking direction of the item and a positive angle is an angle to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with name, colour, model and z-value from the cogo edit panel.

If no z-value exists in the panel, no point is created.

Screen message area

<<<Locate Deflection> Select item to project along> [picks][menu]
<<<Locate Deflection> Select control point> [picks][menu]
/<Locate Deflection> distance along item [caret][menu] select a button
/<Locate Deflection> deflection distance [caret][menu] select a button
/<Locate Deflection> deflection angle [caret][menu] select a button

14.7.1.6 Divide - Number
The divide - nos option is used to place points at positions which would divide an arc or a line into an equal number of pieces.

For example, if the option was used to show how and an arc could be divided into seven pieces, points would be placed at the six division marks. No point is placed at the start or end of the arc. Hence, the start and end points plus the division points divide the arc into the required number of divisions.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the divide - nos option, the user picks the item to divide using the normal picking sequence.

A no of divisions box is then displayed on the screen and the user enters the required number of divisions into the box, terminated with a <enter>. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the name, colour, model and z-value from the cogo edit panel.

Screen message area

<<Divide by #>  Select item to divide>  [picks][][menu]

14.7.1.7 Divide - Distance

The divide - dist option is used to place points at positions which would divide an arc or a line into pieces of a given distance.

Note - unless the arc or line is exactly divisible by the distance, the last division will be smaller than the required distance.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the divide - dist option, the user picks the item to divide using the normal picking sequence.

A distance box is then displayed on the screen and the user enters the required distance for each division into the box, terminated with a <enter>. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the name, colour, model and z-value from the cogo edit panel.

Screen message area

<<Divide by distance>  Select item to divide>  [picks][][menu]

14.7.1.8 Perpendicular

The perpend option is used to create the point which is the perpendicular projection of a selected point onto a selected line or arc.

Since the option can only drop a point onto an arc or a line, when the item is selected to project onto, only the picked line or arc sub-element of the item is used.

On selecting the perpend option, the user picks the point to drop perpendicularly.

The item to drop perpendicularly onto is then selected.

The point representing the perpendicular projection of the chosen point onto the selected item is then created. The created point has the name, colour, model and z-value from the cogo edit panel.

Screen message area

<<Perpend>  Select point to drop>  [picks][][menu]

14.7.1.9 Projection
The **projection** option is used to create a point which is given distance along a line or arc. Since the option can only project a point along an arc or a line, when the item is selected to project along, only the picked line or arc sub-element of the item is used. On selecting the **projection** option, the user picks the item to project along. A distance box is then displayed on the screen and the user enters the appropriate projection distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.

The point representing the projected point along the selected item is then created using the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

```
<<Projection>  Select item to project along>  [picks][][menu]
<Projection>  distance  [caret][][menu] select a button
```

### 14.7.1.10 Locate Chainage

The **locate chainage** option is used to create a point at a given chainage on a selected string. On selecting the **locate chainage** option, the user picks the item to locate the chainage on. A locate chainage box is then displayed on the screen and the user enters the appropriate chainage into the box, terminated with a <enter>. The box then disappears.

A point at the given chainage on the selected item is then created using the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

```
<<Locate chainage>  Select item to locate on>  [picks][][menu]
<Locate chainage>  chainage  [caret][][menu] select a button
```

Please continue to the next section **14.7.2 Intersect Ops**.
14.7.2 Intersect Ops

The **Intersection** options are for finding various intersections of lines and arcs.

Most of intersect cases can have more than one solution. For example, the intersection of a line with an arc.

To easily distinguish between the cases, **12d Model** uses the sense of direction implied when picking items to determine which case was required by the user.

The **Intersect ops** walk-right menu is

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Intersect</strong></td>
<td>Creates a point at the intersection of lines and arcs.</td>
</tr>
<tr>
<td><strong>Intersect Offset</strong></td>
<td>Intersect lines and arcs offset by a user supplied distance.</td>
</tr>
<tr>
<td><strong>Bearings Intersect</strong></td>
<td>Intersect lines and arcs using bearings.</td>
</tr>
<tr>
<td><strong>2 pts 2 dists</strong></td>
<td>Intersect two points and two distances.</td>
</tr>
</tbody>
</table>

Each of the options in the **Intersect Ops** menu will now be discussed.

For the option **Intersect**, go to

- **Create line** 14.7.1 Create Line
- **intersect offset** 14.7.2 Intersect Offset
- **Bearings intersect** 14.7.3 Bearings Intersect
- **2 pts 2 dists** 14.7.4 Two Points, Two Distances

14.7.2.1 Intersect

The **Intersect** option creates a point at the intersection of lines and arcs.

That is, it will find the intersection of

(a) a line with a line
(b) a line with an arc
or
(c) an arc with an arc

After selecting the **Intersect** option, the user simply selects the two items to intersect using the normal picking sequence.

If an intersect exists, a point is created at the intersection with name, colour, model and z-value from the **Cogo edit** panel.

If no z-value exists in the panel, no point is created.

When there is more than one possible solution, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

`<<Intersect> Select 1st item to intersect> [picks][menu]`

`<<Intersect> Select 2st item to intersect> [picks][menu]`

14.7.2.2 Intersect Offset

Like the **Intersect** option, **Intersect offset** is for creating points at the intersection of lines and arcs.

However, before the line or arc is used, it is offset by a user supplied distance.

Hence the intersection is between displaced lines and arcs.

A practical example of **intersect offset** is for finding the position of a manhole in a subdivision which
is three metres from one property line and two metres from the culdesac arc.

After selecting the intersect option, the user selects the first item to intersect using the normal picking sequence.

A 1st offset box is then displayed on the screen and the user enters the appropriate offset for the first line into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The second item to intersect is then selected and a 2nd offset box is displayed on the screen for the user to enter the offset for the second line.

If an intersect exists for the two offset items, a point is created at the intersection with name, colour, model and z-value from the cogo edit panel.

If no z-value exists in the panel, no point is created.

As in the intersect option, when more than one solutions is possible, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

<<Intersect Offset> Select 1st item to intersect> [picks][menu]
<<Intersect Offset> 1st offset [caret][menu] select a button
<<Intersect Offset> Select 2st item to intersect> [picks][menu]
<<Intersect Offset> 2nd offset [caret][menu] select a button

14.7.2.3 Bearings Intersect

The Bearings intersect option finds the intersect of the lines going through two user selected points at user supplied bearings.

Hence the option will calculate the point that is at given bearings from two selected points

After selecting the bearings intersect option, the user selects the first point using the normal picking sequence.

A bearing 1 box is then displayed on the screen and the user enters the bearing for the line through the point into the box, terminated with a <enter>. The box then disappears. The bearing is entered in degrees, minutes and seconds.

The second point is then selected and a bearing 2 box is displayed on the screen for the user to enter the bearing for the line through the second point.

The intersection of the two lines is then calculated and if it exists, a point is created at the intersection with name, colour, model and z-value from the cogo edit panel.

If no z-value exists in the panel, no point is created.

Note

The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid point for the option

Screen message area

<<Bearings Intersect> Select 1st point> [picks][menu]
<<Bearings Intersect> bearing 1 [caret][menu] select a button
<<Bearings Intersect> Select 2nd point> [picks][menu]
<<Bearings Intersect> bearing 2 [caret][menu] select a button

14.7.2.4 Two Points, Two Distances

The 2 pts 2 dists option find the point that given distances from two user selected points.

This problem is equivalent to finding the intersection of two circles centred on the points and with radii the
same as the distances.
When there is more than one solution, the solution to the right of the line joining the two points is used. (the
direction of the line is from the first point to the second point). To obtain the other solution, simply select the
points in the opposite order.

After selecting the 2 pts 2 dists option, the user selects the first point using the normal picking
sequence.

A 1st distance box is then displayed on the screen and the user enters the distance that the new point is
from the selected point into the box, terminated with a <enter>. The box then disappears.
The second point is then selected and a 2nd distance box is displayed on the screen for the user to enter
the distance to the second point.

The point that is the required distances from the two points is created with name, colour, model
and z-value from the cogo edit panel. If no z-value exists in the panel, no point is created.

Note
The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid
point for the option

Screen message area

<<Locate 2 pts 2 dists>  Select 1st point>  [picks][][menu]
<<Locate 2 pts 2 dists>  1st distance  [caret][][menu] select a button
<<Locate 2 pts 2 dists>  Select 2nd point>  [picks][][menu]
<<Locate 2 pts 2 dists>  2nd distance  [caret][][menu] select a button

Please continue to the next section 14.7.3 Vector.
14.7.3 Vector

The vector options are for creating points which are a given as at a given vector from another point. The default definition of the vector is as (bearing, distance) but other combinations such as (angle, distance), relative (x,y) and absolute (x,y) are possible using normal typed input.

The methods for creating the new points are
(a) locate - create a new point using a vector
(b) radiation - the points created are all a vector from the initial point selected
(c) traverse - the last point created becomes the next point to work from

The vector walk-right menu is

Each of the options in the Vector Ops menu will now be discussed.
For the option Traverse, go to 14.7.3.3 Traverse
Radiation  14.7.3.2 Radiation
Intersect offset  14.7.2.2 Intersect Offset
Locate  14.7.3.1 Locate

14.7.3.1 Locate

In the locate option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point. The sequence is then repeated by selecting another point and giving another vector.

After selecting the locate option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>. The box then disappears.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the name, colour, model and z-value from the cogo edit panel. If no z-value exists in the panel, the given z-value could be nonsense.

The sequence of picking a point and giving a vector is then repeated.

The option terminates when another cogo option is selected or the cancel button is selected on the cogo edit panel.

Screen message area
<<Locate>  Select point>  [picks][menu]
<Locate>  bearing distance  [caret][menu] select a button

14.7.3.2 Radiation

In the radiation option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point.

After selecting the radiation option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and
distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the name, colour, model and z-value from the cogo edit panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the new given bearing and distance from the original selected point.

The option terminates when another cogo option is selected or the cancel button is selected on the cogo edit panel.

Screen message area

<<Radiation> Select point> [picks][menu]
<<Radiation> bearing distance [caret][menu] select a button

14.7.3.3 Traverse

In the traverse option, an initial point is chosen and a vector supplied to produce a new point which is the vector away from the initial point.

The created point is then taken to be the start point for the next sequence of creating a new point by a vector.

After selecting the traverse option, the user simply selects the first point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point.

The new point is given the name, colour, model and z-value from the cogo edit panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the given bearing and distance from the last created point.

Hence, the last created point takes the place of the original selected point.

The option terminates when another cogo option is selected or the cancel button is selected on the cogo edit panel.

Screen message area

<<Traverse> Select point> [picks][menu]
<<Traverse> bearing distance [caret][menu] select a button

Please continue to the next section 14.7.4 Parallel.
14.7.4 Parallel

Items can be translated perpendicularly to either the left or right using the parallel option (also known as a copy parallel operation).

After selecting the parallel option, the user simply selects the item to paralleled using the normal picking sequence.

A offset box is then displayed on the screen and the user enters the required offset distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

A new item is then created which is a copy parallel of the selected item by the given offset distance. The new item has the name, colour and model from the cogo edit panel.

The option terminates when another cogo option is selected or the cancel button is selected on the cogo edit panel.

Screen message area

<<Parallel> Select item to parallel> [picks][][menu]
<Parallel> offset> [caret][][menu] select a button

Please continue to the next section 14.7.5 Fillet Ops.
14.7.5 Fillet Ops

The fillet options are for creating an arc between lines and arcs.

That is, it will try and fit an arc between
(a) two lines
(b) a line and an arc
or
(c) two arcs

The created arc is determined by tangents from the items it is a fillet for and another piece of information such as a radius or a start point.

Since the option can only fillet between arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the fillet.

Most fillet cases can have more than one solution. For example, the fillet of a given radius between two lines can have up to four solutions.

To easily distinguish between the cases, 12d Model uses the order of picking and the sense of direction implied when picking the items to determine which case was required by the user.

The direction is used as follow -
the arc comes off the first item in the direction that the first item is picked and lands on the second in the direction that the second item is picked.

The fillet ops walk-right menu is

Each of the options in the Fillet Ops menu will now be discussed.

For the option Item Item Radius, go to
Item Item Point
3 points

14.7.5.1 Fillet Item Item Radius

This fillet option creates an arc of a user given radius between two user selected items.

After selecting the fillet item item radius option, the user selects the first item to be used in the fillet using the normal picking sequence.
Next the second item to be used in the fillet is selected.
An enter radius box is then displayed on the screen and the user types the appropriate radius for the fillet into the box, terminated with a <enter>. The box then disappears.
A positive radius implies that the arc travels in a clockwise direction and a negative radius for an arc travelling in an anti-clockwise direction.

If a fillet exists for the two items and the radius, an fillet arc is created with name, colour, model and z-value from the cogo edit panel.
If no z-value exists in the panel, no arc is created.

Screen message area
<<Fillet by radius> Select 1st item> [picks][][menu]
14.7.5.2 Fillet Item Item Point

This fillet option creates an arc between two user selected items starting at a user defined control point. After selecting the fillet item item pt option, the user selects the first item to be used in the fillet using the normal picking sequence.

Next the second item to be used in the fillet is selected.

Finally, a point is selected to act as the starting point for the fillet. This point, called the control point, must lie on the first item selected. If the selected point doesn't lie on the first item, the selected point is projected perpendicularly onto the item and the projected point used as the control point.

If a fillet exists for the two items and the control point, a fillet arc is created with name, colour, model and z-value from the cogo edit panel.

If no z-value exists in the panel, a null z-value is used.

Screen message area

14.7.5.3 Fillet Three Points

This option creates an arc between three user selected points. After selecting the fillet 3 pts option, the user selects the three points one after another using the normal picking sequence.

The three arc points must be selected in the order

(a) the start point
(b) a point between the start and end point
(c) the end point

If an arc does exist containing the three points, it will be unique including its direction. The arc will be created with name, colour, model and z-value from the cogo edit panel.

If no z-value exists in the panel, a null z-value is used.

Screen message area

Please continue to the next section 14.7.6 Fillet Ops (T).
14.7.6 Fillet Ops (T)

The fillet (T) options are almost identical to the fillet options.

The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc.

The trimmed items are not joined to the fillet arc.

The original strings obey the trash defaults from the utilities=>defaults=>trash defaults option.

That is, if the trash mode is set to keep string, the original strings are untouched.

delete string, deleted.

trash string, moved to the trash model.

For information on the fillet options, see the section 14.7.5 Fillet Ops.

For the option Item Item Radius, please go to the section 14.7.5.1 Fillet Item Item Radius.

Item Item Point 14.7.5.2 Fillet Item Item Point.

Please continue to the next section 14.7.7 Fillet Ops (TJ).
14.7.7 Fillet Ops (TJ)

The fillet (TJ) options are the almost identical to the fillet and fillet (T) options.

The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc and the three items joined to form a new item. That is, the trimmed items are joined to the fillet arc. The original strings obey the trash defaults from the Utilities=>Defaults=>Trash defaults option. That is, if the trash mode is set to keep string, the original strings are untouched. delete string, deleted, trash string, moved to the trash model.

For information on the fillet options, see the section 14.7.5 Fillet Ops

For the option Item Item Radius, please continue to the section 14.7.5.1 Fillet Item Item Radius.

Item Item Point

Please continue to the next section 14.7.8 Tangent.
14.7.8 Tangent

The tangent option creates tangent lines between point and arcs.
That is, tangents can be defined between
(a) a point and an arc
(b) two arcs
or
(c) two points - simply a line between the two points

Since the option can only fillet between points and arcs, when an item is selected, only the
picked sub-arc of the item is used as an arc.

Most tangent cases can have more than one solution. For example, two tangents from a point to
an arc.

To easily distinguish between the cases, 12d Model uses the order of picking the items and the sense of
direction implied when picking an arc to determine which case was required by the user.

After selecting the tangent option, the user selects the first item to be used in the tangent calcula-
tions using the normal picking sequence.
Next the second item to be used is selected.
If a tangent line exists between the two items selected, a line string is created with name, colour, model and
z-value from the cogo edit panel.
If no z-value exists in the panel, a null z-value is used for the line.

Screen message area

<<Tangent>  Select 1st item>  [picks][][menu]
<<Tangent>  Select 2nd item>  [picks][][menu]
14.8 Texts Edit

**Position of menu:** Strings => Texts Edit

These options are like the Strings => Points edit options in that the options only does the one thing to a selected string. You then pick another string to do the same type of change.

For each of the Texts Edit options, press <Esc> or select Cancel from the Pick Ops menu to terminate the option. Selecting another CAD option will also terminate the option and start the new option.

Walking right on Texts edit displays the Texts edit menu

For the option Colour, go to 14.8.1 Change Text Colour
- Height 14.8.2 Change Text Height
- Style 14.8.3 Change Text Style
- Angle 14.8.4 Change Text Angle
- Justify 14.8.5 Change Text Justify
- Combine 14.8.6 Change Combine
14.8.1 Change Text Colour

Click on **Colour** and a **Colour Typed Input** box comes up

The new colour is picked from the pop up list, or typed into the box and <Enter> pressed.
The box is then removed and the following message is written to the screen message area

Pick text and its colour will be changed to that shown in the square brackets ([]). Then pick another text to change its colour.
Typing c or C brings up the **Colour Typed Input** box to select a new colour.
All subsequent selected texts will have their colour changed to this colour until either the option is terminated or a new colour is selected
To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.
14.8.2 Change Text Height

Click on **Height** and a **Height Typed Input** box comes up

![Height Typed Input Box]

The new height is typed into the box and <Enter> pressed.
The box is then removed and the following message is written to the screen message area

```
<Pick text to change (h)eight [6.00000]> [picks][fast][Menu]
```

Pick text and its height will be changed to that shown in the square brackets ([]). Then pick another text to change its height.

Typing h or H bring up the **Height Typed Input** box to select a new height.

All subsequent selected texts will have their height changed to this height until either the option is terminated or a new height is selected

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.
14.8.3 Change Text Style

Click on Style and a Style Typed Input box comes up

The new style is picked from the pop up list, or typed into the box and <Enter> pressed. The box is then removed and the following message is written to the screen message area

```
Pick text to change (s)yle[1]> [picks][fast][Menu]
```

Pick text and its style will be changed to that shown in the square brackets ([ ]). Then pick another text to change its style.

Typing s or S brings up the Style Typed Input box to select a new style.

All subsequent selected texts will have their style changed to this style until either the option is terminated or a new style is selected.

To terminate the option, press <Esc>, select Cancel from the Pick Ops menu, or select another CAD option.
14.8.4 Change Text Angle

Click on Angle and an Angle Typed Input box comes up

![Typed Input Window]

The new angle is typed into the box and <Enter> pressed. The box is then removed and the following message is written to the screen message area

```
<Pick text to change (angle [ 45° 50’ 0’’]> [picks][accepts][Menu] ""
```

Pick text and its angle will be changed to that shown in the square brackets ([]). Then pick another text to change its angle.

Typing a or A brings up the Angle Typed Input box to select a new angle.

All subsequent selected texts will have their angle changed to this angle until either the option is terminated or a new angle is selected.

To terminate the option, press <Esc>, select Cancel from the Pick Ops menu, or select another CAD option.

Note

The angle is type in in hp notation and measured counter clockwise from the positive x-axis. The box will convert the hp notation and display it in degrees, minutes and seconds. For example, 45.5 in hp notation become 45 degrees 50 minutes.
14.8.5 Change Text Justify

Click on **Justify** and a **Justify Typed Input** box comes up

![Typical Input]

The new justification is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area

```
Pick text to change [justify [bottom-left]> [picks][fast][Menu]
```

Pick text and its justification will be changed to that shown in the square brackets ([]). Then pick another text to change its justification.

Typing j or J brings up the **Justify Typed Input** box to select a new justification.

All subsequent selected texts will have their justification changed to this justification until either the option is terminated or a new justification is selected.

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.
14.8.6 Change Combine

This option allows you to change one or more of Colour, Height, Angle, Textstyle and Justification.

Selecting Combine writes the following message to the screen message area:

```
<Pick text to change (c)olour (h)eight (a)ngle (s)tyle (j)ustify> [picks][fast][Menu]
```

Type c or C and a Colour Typed Input box comes up:

![Typed Input Box]

The new colour is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area:

```
<Pick text to change (c)olour[cyan] (h)eight (a)ngle (s)tyle (j)ustify> [picks][fast][Menu]
```

This sets the colour to cyan.

Pick text and its colour will be changed to that shown in the square brackets ([cyan]). Then pick another text to change its colour.

Typing c or C when there is a colour shown between the square brackets (for example [cyan]), removes the colour from the square brackets.

If any text is picked when there is no colour in the square brackets then its colour will not be changed.

Similarly:

**Height**

**IF** there is no height in square brackets after (h)eight, typing h or H brings up the Height Typed Input box to select a new height. Entering a height and pressing <Enter> sets the new height and it will appear in square brackets after (h)eight in the message written to the screen message area.

Typing h or H when there is a height shown between the square brackets (for example [2.00]), removes the height from the square brackets.

**Angle**

**IF** there is no angle in square brackets after (a)ngle, typing a or A brings up the Angle Typed Input box to select a new angle. Entering an angle and pressing <Enter> sets the new angle and it will appear in square brackets after (a)ngle in the message written to the screen message area.

Typing a or A when there is an angle shown between the square brackets, removes the angle from the square brackets.

**Textstyle**

**IF** there is no textstyle in square brackets after (s)tyle, typing s or S brings up the Style Typed Input box to select a new textstyle. Entering a textstyle and pressing <Enter> sets the new textstyle and it will appear in square brackets after (s)tyle in the message written to the screen message area.

Typing s or S when there is a textstyle shown between the square brackets, removes the textstyle from the square brackets.

**Justification**

**IF** there is no justification in square brackets after (j)ustify, typing s or S brings up the Justify
**Typed Input** box to select a new justification. Entering a justification and pressing <Enter> sets the new justification and it will appear in square brackets after *(j)ustify* in the message written to the screen message area.

Typing *j* or *J* when there is an justification shown between the square brackets, removes the justification from the square brackets.

If any text is picked then the values of the text are changed for any that there is a value in the square brackets otherwise that value of the text is not changed.

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.
14.9 Convert

Position of option on menu:  Strings => Convert

The Convert option is used to create a new string of possibly a different string type from a chosen string. Since not all string conversion are possible, or even make sense (for example, converting a 3d string to a text string), the list of defined conversion depends on the type of the string chosen for conversion.

After selecting the string to convert, a menu containing the possible conversions is raised and the required conversion selected from it.

After the type of conversion is selected, a string Properties panel containing the attribute information for the new string is displayed and can be used to modify any properties of the new string.

After selecting the Convert option, the Convert String panel is placed on the screen.

If a new name, model or colour is required for the converted string, the new data is entered into the Convert String panel. If a change isn’t required, leave the appropriate panel field blank.

The Convert option is already in progress and if a string is selected and accepted, a menu containing all the available conversions for that particular string type is displayed.

For example, for each string type the choices are:
After selecting the conversion to be made, a new string of the selected type is created and given the model, colour and name according to the fields in the Convert String panel.

The Properties panel for the new string is also displayed and hence any of the strings properties can be modified for the new string.

The fields and buttons used in the Convert String panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>New name</td>
<td>input</td>
<td></td>

</tr>
</tbody>
</table>
14.10 Grids

Position of option on menu:  \textit{Strings} => \textit{Grids}

The Grids menu allows the user to create and edit grids.

After selecting \textit{Grids}, the \textit{Grids} menu is placed on the screen.

For the option:
\begin{itemize}
  \item Create grids 14.10.1 \textit{Create Grids}
  \item Edit grid string 14.10.2 \textit{Edit Grid String}
  \item Edit grid tin 14.10.3 \textit{Edit Grid Tin}
  \item Grid conversions 14.10.4 \textit{Grid Conversions}
  \item Shift grid string range 14.10.5 \textit{Shift Grid String Range}
  \item Shift grid tin range 14.10.6 \textit{Shift Grid Tin Range}
\end{itemize}
14.10.1 Create Grids

Position of option on menu: Strings => Grids => Create grids

Selecting Create grids brings up the Create Grid String panel

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Geometry</strong></td>

<tr>
<td>The number of cells relative to the origin in the grid’s local X axis. The sign of the number denotes whether it is to the left or right of the origin.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Min Y</td>
<td>number box</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

The diagram shows the Create Grid String panel with fields for Geometry, Angle, Cell X/Y, Range, and Create mode. Each field has its corresponding function and default values as described.

---

Grids
the number of cells relative to the origin in the grid’s local Y axis. The sign of the number denotes whether it is below or above the origin.

**Max X**

the number of cells relative to the origin in the grid’s local X axis. The sign of the number denotes whether it is to the left or right of the origin.

**Max Y**

the number of cells relative to the origin in the grid’s local Y axis. The sign of the number denotes whether it is below or above the origin.

**Create mode**

choice box  
Grid string  
Grid string, Grid tin  
the type of grid to be created.

**Grid tin name**

tin box  
enabled only if **Create mode** is set to Grid tin. The name of the grid tin to be created. The tin must not already exist.

**Colour**

colour box  
string colour for all points on the grid

**Model for grid**

model box  
name of the model in which the data is to be placed. The model will be created if it does not already exist. This field must be filled in.

**Tin for grid levels**

tin box  
opoptional information. If tin is selected, the height on each grid point is obtained from the grid. If blank, the height of each grid point is null.

**Rectangle**

button  
if selected, the origin X/Y, angle and all range values are calculated from two corners of the selected rectangle. **Note:** Cell X/Y must be defined.

**Rectangle by 3 Points**

button  
if selected, the origin X/Y, angle and all range values are calculated from three corners of the selected rectangle. The first point defines the origin, the second point defines the angle and range X values, and the third point defines the range Y values. **Note:** Cell X/Y must be defined.

**Create**

button  
creates the grid string/tin.
14.10.2 Edit Grid String

Position of option on menu: Strings => Grids => Edit grid string

Selecting Edit grid string brings up the Edit Grid String panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grid string</td>
<td>string select</td>
<td></td>
<td></td>

<td>0</td>
<td></td>
</tr>
</tbody>
</table>

The grid string panel is shown with various fields for editing grid parameters, including grid string selection, geometry settings, and range specifications.
the number of cells relative to the origin in the grid’s local Y axis. The sign of the number denotes whether it is below or above the origin.

Max X  
the number of cells relative to the origin in the grid’s local X axis. The sign of the number denotes whether it is to the left or right of the origin.

Max Y  
the number of cells relative to the origin in the grid’s local Y axis. The sign of the number denotes whether it is below or above the origin.

Colour  
string colour for all points on the grid

Tin for grid levels  
optional information. If tin is selected, the height on each grid point is obtained from the grid. If blank, the height of each grid point is null.

Rectangle  
if selected, the origin X/Y, angle and all range values are calculated from the two corners of the selected rectangle. Note: Cell X/Y must be defined.

Rectangle by 3 Points  
if selected, the origin X/Y, angle and all range values are calculated from three corners of the selected rectangle. The first point defines the origin, the second point defines the angle and range X values, and the third point defines the range Y values. Note: Cell X/Y must be defined.

Update  
updates the grid string.
14.10.3 Edit Grid Tin

Position of option on menu:  Strings => Grids => Edit grid tin

Selecting Edit grid tin brings up the Edit Grid Tin panel

Update   button
14.11 Inquire

Position of option on menu: Strings => Inquire

The inquire option is used to obtain information about a string displayed on the screen. The amount and type of information varies between string types.

On selecting the Inquire option, the String Inquire panel is displayed.

The panel is used for any special messages and to end the option.

After selecting the inquire option, the strings are selected using the normal 12d Model selecting mechanism (LB to pick a string, MB to accept a string, RB for the pick ops menu). Whenever a string is picked, the information about the picked string is displayed on the screen in the Information menu.

An example of the Information menu for an Alignment string is

For more details on the Information menu, go to the section 14.11.1 String Information

Any number of string inquiries can be made with the option by repeated use of the mouse buttons LB and MB to pick and accept strings.

The inquire option is terminated by either selecting the Cancel option from the Pick Ops menu (raised by clicking RB) or selecting Finish or [X] from the String Inquire panel.
14.11.1 String Information

Whenever a string is picked, the information about the picked string is displayed on the screen in the Information menu.

The Information menu displays different information depending on whether the string was picked in a Plan or Perspective view or in a Section view.

For a Plan or Perspective View

The details on the Information menu can include:

- model = - gives the model of the selected string
- name = -
- type = -
- colour = -
- line style = -
- pt/line = -
- # pts = -
- area = -
- length = -
- Snap type = - e.g. Line Snap, Point Snap
- x = -
- y = -
- prof ch = -
- prof z = -
- brg = -
- segment length = -
- +ve or -ve = - if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.

For a Section View

The information refers to the snapped position and string.

Information When Snapping to an Alignment on a Plan View

For a Section View
For a section view, the x-axis of the view is defined by the chainage along the string that is being profiled on the section view (the *profiled* string). The profiled string is displayed on the section view.

For any tins in models added to the section view, the sections through the tins along the profiled string are also displayed in the section view.

Finally, any parts of any strings in models added to the section view that are in the corridor defined for the section view are projected onto the section view and displayed.

The details on the Information menu can include:

- **model =** - gives the model of the selected string
- **name =** -
- **type =** - " type " " "
- **colour =** - " colour " " "
- **line style =** - " line style " " "
- **pt/line =** - " breakline type " " "
- **# pts =** - " number of points " " "
- **area =** - " area if it is a closed string "
- **length =** - " length of the string "
- **Snap type** - e.g. Line Snap, Point Snap
- **x =** - " x co-ordinate of the selected position "
- **y =** - " y co-ordinate of the selected position "
- **z =** - " z co-ordinate of the selected position "
- **prof ch =** - " chainage of the *profiled* string at the selected position "
  
  Note that this is not the chainage of the selected string unless the selected string is the profiled string.

- **prof z =** - " z-value of the *profiled* string at the profile chainage of the selected position "
  
  Note that this is not the z of the selected position unless the selected string is the profiled string.

- **brg =** - " instantaneous bearing of the selected position on the string "
- **segment length** - " length of the string segment containing the selected position "
- **+ve or -ve** - if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.

**IMPORTANT NOTES**

1. for a string selected on a section view, the " z = " value is the z co-ordinate of the selected position. The "prof z = " value is the z co-ordinate of the string profiled on the section view.

2. The "prof ch = " value is the chainage of the string profiled on the section view, not the chainage of the selected string.
The \( z = \) and \( \text{prof } z = \) are the same, and are the \( z \)-value at the primary string for the section view.

\[ z = \] is the \( z \)-value at the primary string for the section view.

\[ \text{prof } z = \] is the \( z \)-value at the primary string for the section view.
Inquire Information When Snapping to a Service String on a Section View

**Primary string for the section view**

- \( z = \) is the z-value at the snap position
- \( \text{prof } z = \) is the z-value at the primary string for the section view

Information for a Cursor Snap on a Section View

- \( \text{Cursor Snap} \)
- \( x = 42756.195 \)
- \( y = 37347.341 \)
- \( z = 195.004 \)
- \( \text{prof } ch = 198.363 \)
- \( \text{prof } z = 187.962 \)
14.12 Properties

Position of menu: Strings => Properties

The Properties walk-right menu contains options to obtain and/or modify the properties of any string displayed on the screen, or obtain and/or modify the vertices and segments of a super string. The Properties walk-right menu is

For the option:
- Multi strings, go to 14.12.1 Multi String Properties
- Single string 14.12.2 Single String
- Vertex 14.12.3 Vertex
- Vertex (all) 14.12.6 Vertex (all)
- Segment 14.12.4 Segment
- Segment (all) 14.12.5 Segment (all)
- Vertex/Segment 14.12.7 Vertex/Segment
- Attributes 14.12.8 Attributes
- Super string dimensions 14.12.9 Super Strings
14.12.1 Multi String Properties

Position of option on menu:  

**Strings =>Properties =>Multi strings**

The **Multi String Properties** panel allows you to select strings and the panel displays all the common properties of the selected strings, and the value of a property if it is the same for all the selected elements.

The value of any of these properties can then be modified and all the selected strings will have the property changed to the modified value.

Selecting **Multi strings** brings up the **Multi String Properties** panel.

![Multi String Properties Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data source selection</strong></td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
</tbody>
</table>

*If ticked*, a Data Source is displayed and used to define the strings in the Selection Set.

**Data Source**

- data source box

  *all the strings in the Data Source are selected for the Selection Set.*

*If not ticked*, **Add** and **Clear** buttons are displayed and used to defined the strings in the selection Set.

**Add**

- button
when Add is clicked, strings are selected/deselected using the Multipick method, and are added to any string already selected for the Selection Set by the Add button.

The Add button and be used any number of times and each time it adds the new selected items to the Selection Set.

Clear button

When Clear is clicked, the Selection Set is cleared. That is, there are no strings in the Selection Set.

The common properties of all the strings in the Selection Set are displayed in the Name-Value property list. If the value of a common property is the same for all the strings in the Selection Set, then the common value is displayed in the Value column for that property. Otherwise the Value column for that property is left blank.

Common Property List

the Common Property Tree displays all the common properties of the selected strings that can be modified.

The name of each common property is displayed in a row in the Name column.

For a particular common property, if all the selected strings have the same value for that common property then the common value is displayed in the Value column for the row of the common property. Otherwise the value column is blank.

If a value is modified in the Value column, then for all the strings in the Selection Set, that property is changed to the new value.

Same As, Select All and Clear Selection Buttons

these three buttons work together. Rows in the Property List can be selected (highlighted), and then the Same As button used to select a string whose properties are used to update the strings in the selection set for the highlighted common properties.

Same As button

when Same As is clicked and an string is selected, then for all the strings in the Selection Set, the values of the highlighted properties in the Common Property List are set to the values of the Same As string.

Select All button

clicking Select All highlights all the rows of properties in the Property List. If required, individual rows can then be deselected using Ctrl-LB.

Clear Property Selection button

clicking Clear Property Selection clears all the highlighted property rows.
14.12.2 Single String

Position of option on menu:  

**Strings =>Properties =>Single string**

The **Single string** option obtains and/or modify property information about any string displayed on the screen.

For example, the string's name, colour and style are string properties. Each string type has its own particular set of properties.

On selecting the **Single string** option, the **String Properties** panel is displayed.

![String Properties Panel]

The panel is only used for any special messages and to end the option.

The **String Properties** option is automatically in a pick mode and the user selects strings using the normal 12d Model picking mechanism (LB to select a string, MB to accept a string, RB for the **pick ops** menu).

Whenever a string is selected, the appropriate **Properties** panel for the string type is displayed on the screen with all the picked string's properties shown.

For example, for a 2d string, the **Properties** panel is

![2d String Properties Panel]

To modify any of the properties for the selected string, simply change the information in the appropriate panel field and select the **OK or Apply** button.

The **Properties** panel is also brought up by the **Properties** option on each string editor and the **Properties** panel have been shown for each string in the Editor section of the manual.

Please continue to the next section **14.12.3 Vertex**.
14.12.3 Vertex

Position of option on menu:  
Strings => Properties => Vertex

The Vertex option obtains and/or modify property information about the vertex of any super string displayed on the screen.

For example, the height, symbol, annotation, point no are all properties of a super string vertex.

On selecting the Vertex option, the String Vertex Properties panel is displayed.

The panel is only used for any special messages and to end the option.

The String Vertex Properties option is automatically in a pick mode and the user selects the vertex of a super string using the normal 12d Model picking mechanism. Whenever a vertex is selected, a Vertex menu showing the properties of the vertex is displayed on the screen.

To modify any of the properties for the selected vertex, simply click on the appropriate item on the Vertex menu and the appropriate panel will come up to modify the vertex property.

Please continue to the next section 14.12.4 Segment.
14.12.4 Segment

Position of option on menu: **Strings => Properties => Segment**

The Segment option obtains and/or modify property information about the segment of any super string displayed on the screen.

For example, the visibility, radius, colour, text are all properties of a super string segment.

On selecting the Segment option, the **String Segment Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The String Segment Properties option is automatically in a pick mode and the user selects the segment of a super string using the normal 12d Model picking mechanism. Whenever a segment is selected, a Segment menu showing the properties of the segment is displayed on the screen.

To modify any of the properties for the selected segment, simply click on the appropriate item on the Segment menu and the appropriate panel will come up to modify the segment property.

Please continue to the next section **14.12.7 Vertex/Segment**.
14.12.5 Segment (all)

Position of option on menu: Strings => Properties => Segment (all)

For more information please go to the section 14.4.10.5.9 All Segment Properties

For more information please go to the section 14.4.10.4.10 All Vertex Properties
Properties
Properties
14.12.7 Vertex/Segment

Position of option on menu:  **Strings => Properties => Vertex/Segment**

This option is a combination of the Vertex and Segment options already documented.

The *Vertex/Segment* option obtains and/or modify property information about the vertex or segment of any super string displayed on the screen.

On selecting the *Vertex/Segment* option, the **String Vertex/Segment Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The *String Vertex/Segment Properties* option is automatically in a pick mode and the user selects either the *vertex* or the *segment* of a super string using the normal 12d Model picking mechanism. Whenever a *vertex* or *segment* is selected, the *Vertex* or *Segment* menu showing the properties of the selected vertex or segment is displayed on the screen.
14.12.8 Attributes

Position of option on menu:  String => Properties => Attributes

The Attributes options displays, creates and edits attributes for any strings in the project.

On selecting Attributes, the String Attributes panel is displayed.

![String Attributes Panel]

The fields and buttons used in this panel have the following functions.

set/reset the chainage interval and chord/arc tolerance
set visibility flags to constant/variable or clear the flag
compress a super string
set tinability to constant/variable or clear the flag
set fill styles for the string
define symbols constant/each vertex or have no symbols
set a colour for every segment in the super string
set the height(s) of the super string
clear the super string attributes for the string, vertex and/or segment
set the Vertex IDs to sequential numbers or clears the existing vertex IDs
ss segments can have a diameter or a box cross-section
clear any segment radii
clear any segment geometry
set or clear vertex and segment text and annotations
convert strings with same start and end points to closed super strings
14.12.9.1 Chainage Interval

Position of option on menu: Strings => Properties => Super string dimensions => Chainage interval

Position of option on menu: Utilities => Super strings => Chainage interval

A super string has one chainage interval value for the entire string. If the value is non-zero, then any line segments of the string are subdivided by the chainage interval when the super string is used in triangulations.

A super string also has one arc-chord tolerance value for the entire string. If the value is non-zero, then any curved segments are subdivided by the arc-chord tolerance when used in triangulations.

The Chainage interval option can set the chainage interval value and/or the chord-to-arc tolerance value for selected super strings.

On selecting the Chainage interval option, the Change Super String Chainage Interval panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Data source type | Model | | |
Data source | input | | |

Interval tab

Action choice box ignore set, clear, ignore

If set, set the chainage intervals of the selected super strings to the value in Chainage interval.
If clear, set all the selected super strings to not use a chainage interval.
If ignore, don't modify the chainage interval of the selected super strings.
Chainage interval input
the chainage interval to use for a super string.

Chord/arc tolerance tab
Action choice box ignore set, clear, ignore
if set, set the chord/arc tolerance of the selected super strings to the value in Chord/arc tolerance.
If clear, set all the selected super strings to not use a chord/arc tolerance.
If ignore, don’t modify the chord/arc tolerance of the selected super strings.

Chord/arc tolerance input
the chord/arc tolerance to use for a super string.

Target type
Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input
extra information required for the target.

Change button
process the selected strings
14.12.9.2 Visible

Position of option on menu: Strings => Properties => Super string dimensions => Visible
Position of option on menu: Utilities => Super strings => Visible

For selected super strings, the Visible option can set the flags that determine how visibility is defined for a super string.

Segment visibility can
(a) be not setable at all for the string - it is always visible
(b) have one setting for the entire string - visible only
(c) have separate settings for each segment (and all set to visible)

Similarly, vertex visibility can
(a) be not setable at all for the string - it is always visible
(b) have one setting for the entire string - visible only
(c) have separate settings for each segment (and all set to visible).

The Visible option allows any of the above cases to be set up for the selected super strings.

On selecting the Visible option, the Change Super String Visibility panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>Model</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Data selection type - for a full description go to 4.19.3 Data Source.
Data source  
input 
source of data to be processed.

Vertex tab
Action  
choice box  
ignore  
set, clear, ignore
if set, the vertex visibility can be allowed to be a constant for all vertices in the string, or to be different for each vertex in the string.
If clear, the vertex visibility flags are removed for the string and the string vertices are always visible.
If ignore, don’t modify the visibility flags for the vertices of the string.

Apply  
choice box
if Action is set, then the Apply field is used.
If Apply is constant, the string has only one visibility flag and it applies to all vertices in the string. It is set to visible.
If Apply is variable, each vertex in the string has its own visibility flag and each flag is set to visible.

Segment tab
Action  
choice box  
ignore  
set, clear, ignore
if set, the segment visibility can be allowed to be a constant for all segments in the string, or to be different for each segment in the string.
If clear, the segment visibility are removed for the string and the string segments are always visible.
If ignore, don’t modify the visibility flags for segments of the string.

Apply  
choice box
if Action is set, then the Apply field is used.
If Apply is constant, the string has only one visibility flag and it applies to all segments in the string. It is set to visible.
If Apply is variable, each segment in the string has its own visibility flag and each flag is set to visible.

extra information required for the target.

Change  
button
process the selected strings.
14.12.9.3 Compress

Position of option on menu:  Strings => Properties => Super string dimensions => Compress
Position of option on menu:  Utilities => Super strings => Compress

The compress option removes any super string dimensions that are not needed. For example, dimensions such as radius, variable z, etc. that are not being used in the string are removed. This reduces the storage required for the super string.

On selecting the Compress option, the Compress Super String Dimensions panel is displayed.

![Compress Super String Dimensions Panel]

The fields and buttons used in the panel have the following functions.

<table>

14.12.9.4 Tinable

Position of option on menu: Strings => Properties => Super string dimensions => Tinable
Position of option on menu: Utilities => Super strings => Tinable

For selected super strings, the Tinable option can set the flags that determine how tinability is defined for a super string and can also set whether segments or vertices are tinable or not.

Segment tinability can
(a) be not setable at all for the string - it is always tinable
(b) have one setting for the entire string
(c) have separate settings for each segment.

Similarly, vertex tinability can
(a) be not setable at all for the string - it is always tinable
(b) have one setting for the entire string
(c) have separate settings for each segment.

The Tinable option allows any of the above cases to be set up for the selected super strings.

On selecting the Tinable option, the Change Super String Tinability panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Buttons at Bottom**

- **Change** button: process the selected strings

**Solid, Bitmap, Pattern, Hatch and Autocad Tabs**

Each tab defines how that type of fill is applied to the string. Zero, one or more fill types can be applied to a string. Each tab will now be described.

See

- [14.12.9.5.1 Solid Tab](#)
- [14.12.9.5.2 Bitmap Tab](#)
- [14.12.9.5.3 Pattern Tab](#)
- [14.12.9.5.4 Hatch tab](#)
- [14.12.9.5.5 Autocad tab](#)
14.12.9.5.1 Solid Tab

The fields and buttons used in the panel have the following functions.

**Action**
- choice box
- ignore
- set, clear, ignore

*If set*, this type of fill is set for the string.
*If clear*, this type of fill is turned off for the string.
*If ignore*, don’t modify this type of fill for the string.

**Same as string colour**
- tick box

*If ticked*, then for all the strings that are to have their *Solid fills* modified, the colour of the super string...
solid fill is set to be the same as the string colour.

If not ticked, the fill colour is used for the Solid fill.

Fill colour

if Same as string colour is not ticked, the Fill colour is used to fill the super string. If the super string is not closed, the fill will apply as if the super string was closed.

Blending

the blend value is used for the solid fill. This value is between 0.0 and 1.0 and controls the amount of transparency of the fill.

if blank, a blend value of 1.0 is assumed.

Continue to 14.12.9.5.2 Bitmap Tab or return to 14.12.9.5 Fills.
14.12.9.5.2 Bitmap Tab

The fields and buttons used in the panel have the following functions.

**Action**
- choice box
- ignore
- set, clear, ignore

*if set*, this type of fill is set for the string.
*if clear*, this type of fill is turned off for the string.
*if ignore*, don’t modify this type of fill for the string.

**Type**
- choice box
- device, world, paper

the units of Width, Height, Stagger, and Spacing. This means the bitmap can be drawn in either world
size, paper size (mm) or device size.

**Origin X** real box

the x co-ordinate of the origin point of the repeated pattern.

**Origin Y** real box

the y co-ordinate of the origin point of the repeated pattern.

**Angle** angle

the orientation of the bitmap pattern relative to the x axis measured in the anti-clockwise direction in dms.

**Angle relative to view** tick box

this field controls whether the Angle is relative to the x axis or to the plotting x axis.

*If ticked* and we are plotting, Angle is measured relative to the x axis of the plot rotation.

*If not ticked*, Angle is always absolute to the world x axis.

**Height** real box

the height of the bitmap in the selected units.

**File name** file box .bmp files

the bitmap file to be used for filling. Only BMP files are currently supported.

**Transparent colour** colour box Select Colour pop up

the transparency colour within the bitmap. This means any pixel of this colour within the bitmap is not drawn.

**Stagger** real box

if not blank, this field allows each alternate row of bitmaps to be staggered (or offset) by the specified value. Stagger is measured in the selected units along the x axis in the rotated system.

*If blank*, a Stagger value of 0.0 is assumed.

**Spacing X** input

the distance in the selected units along the x axis in the rotated system between each instance of the bitmap.

**Spacing Y** input

the distance in the selected units along the y axis in the rotated system between each instance of the bitmap.

**Solid colour** colour box Select Colour pop up

if not blank, when the bitmaps become too small to be legible, the super string is solid filled instead with Solid colour.

**Solid blend value** input

if not blank, and Solid Colour is specified, the solid fill is drawn with transparency. The blend value is between 0.0 and 1.0 and controls the transparency of the solid colour.

Continue to [14.12.9.5.3 Pattern Tab](#) or return to [14.12.9.5 Fills](#).
14.12.9.5.3 Pattern Tab

The fields and buttons used in the panel have the following functions.

**Action**
- choice box, ignore, set, clear, ignore
  - *if set*, this type of fill is set for the string.
  - *if clear*, this type of fill is turned off for the string.
  - *if ignore*, don’t modify this type of fill for the string.

**Pattern**
- select pattern, pop up
  - the pattern name to be applied. The patterns are defined in the patterns.4d
For more information on the 12d pattern definition go to the section 40.4 Patterns.

*If clear*, this type of fill is turned off for the string.
*If ignore*, don’t modify this type of fill for the string.
Pattern  select autocad pattern pop-up

The Autocad pattern name to be applied. These patterns are defined in the file acad.pat.

This file is an Autocad file.

Type  choice box  device, world, paper

the units of Size. This means the bitmap can be drawn in either world size, paper size (mm) or screen (device) size (pixels).

Angle  angle

the orientation of the pattern relative to the x axis measured in the anti-clockwise direction in dms.

Angle relative to view  tick box

this field controls whether the Angle is relative to the x axis or to the plotting x axis.

If ticked and we are plotting, Angle is measured relative to the x axis of the plot rotation.

If not ticked, Angle is always absolute to the world x axis.

Size  real box

the size of the pattern in the selected type.

Colour  colour box  Select Colour pop up

the colour of the pattern.

Return to 14.12.9.5 Fills.
14.12.9.6 Symbol

Position of option on menu:  Strings =>Properties =>Super string dimensions =>Symbol
Position of option on menu:  Utilities =>Super strings =>Symbol

For selected super strings, the symbols option can set the flags that determine how symbols are defined for a super string.

A super string can have no symbols, a constant symbol definition for the entire string or different symbol definitions at each vertex.

On selecting the symbol option, the Change Super String Symbols panel is displayed.

![Change Super String Symbols Panel]

The fields and buttons used in the panel have the following functions.

Field Description | Type | Defaults | Pop-Up
---|---|---|---
Data source type | Model | | |
Data source | input | | |
Action | choice box | ignore | set, clear, ignore

* If set, a symbol can be constant for all vertices in the string, or can be different for each vertex in the string.
* If clear, there are no symbols for the string.
* If ignore, don’t modify the symbol flags for the vertices of the string.
Apply

**choice box**

constant, variable

*if* Action *is set*, *then* the Apply field is used.

*If* Apply is constant, the string has only one symbol and it used for each vertices in the string.

It is set to visible.

*If* Apply is variable, each vertex in the string has its own symbol.

**Symbol**

symbol box

symbol to be used.

**Size**

size of the symbol.

**Rotation**

angle box

angle to rotation the symbol - positive is counter-clockwise.

**Colour**

colour box

colour for the symbol (if the symbol has no imbedded colours).

**Offset**

distance the centre of the symbol is from the vertex.

**Raise**

distance the centre of the symbol is raised off the line through the vertex with the given angle.

**Target type**

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

14.13 Label

Position of menu: Strings => Label

The Label menu contains options to label string chainages, create tadpoles for cut and fill, label string vertices with their x, y, z or point numbers and names.

The Label walk-right menu is

For the option Chainages, go to 14.13.1 Label Chainages
Chainages (function) 14.13.2 Chainages (function)
Cut/fill 14.13.3 Label Cut/Fill
Names 14.13.4 Label Names
Vertices 14.13.5 Label Vertices
14.13.1 Label Chainages

Position of option on menu: **Strings => Label => Chainages**

The **Label chainages** option is used to create text at regular chainages and special points on a string such as horizontal and vertical tangent points, crest and sag points and user selected points. It can also create tick marks at selected chainages.

The user has control over the label height, colour, angle, offset and the number of decimal places displayed, plus the size and colour of the tick marks.

As well as being used for labelling centre-lines, this option is used in conjunction with the sewer option to created special labels for sewer long section plots.

On selecting the **Label chainages** option, the **Label chainages on string** panel is displayed.

![Label Chainages on String](image-url)
Individual points can be labelled by selecting them after picking the Points button.

The marks button brings up the label chainages on string (marks) panel which is used to place marks at the chosen chainages.

The fields and buttons used in the label chainages on string panel have the following functions.

<table>
<thead>

</tbody>
</table>
type of labelling required.

Ch interval or n/a input
the regular interval to use for labelling points.

Ch reference input 0
the chainages to be labelled are integer multiples of the chainage interval added to the
reference chainage. For example, if the reference chainage is 23.2 and the chainage interval
10, the chainages 3.2, 13.2, 23.2, 33.2 etc. will be labelled.

Start chainage input
if non-blank, the string chainage to start labelling from.
If blank, start at the beginning of the string.

End chainage input
if non-blank, the string chainage to end the labelling at.
If blank, go to the end of the selected string.

Special chainage input
file of special chainages to create labels at.

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the strings being labelled for determining how many points are
labelled around horizontal curves.

Labels tab

Model for labels model box available models
if non-blank, labels are generated and placed in this model.
If blank, no labels are created (but tick marks may be).

Pre*postfix for labels input
the beginning and ending of the label to be given at each point. Spaces are significant. This
uses the standard 12d method of pre-text*post-text. That is, 'Ch * m' would add 'Ch ' before
the value and ' m' after the label.

Textstyle info textstyle box 1 available textstyle data
textstyle data to use when creating the labels.

# dec pl for labels input 0
number of decimal places used in the labels.

Chainages tick tick
if ticked, the chainage of each point is appended to the label stem to create the label for the
point.
If not ticked, only the label stem is used as the label.

Heights tick
if ticked, the height of each point is used in the label for the point.
If not ticked, heights are not used in the label.

Null heights tick
if ticked and the height of a point null, (null) is used in the label for the point.
If not ticked, null heights are not used in the label.

Add TC, CT, etc. tick
if ticked and labelling an alignment string, the critical point types are used in the label for the
point.
If not ticked, critical point types are not used in the label.
Marks tab

Model for marks  
input  
available models

if non-blank, tick marks are generated according to the label mode and placed in this model.
If blank, no tick marks are created.

Mode for marks  
input  
ticks centred  
ticks on lhs, ticks on rhs, ticks centred

mode for the tick marks.

Name for marks  
input  
1

name to give the tick marks (mainly used for mapping files)

Size for marks (w)  
input  
1

size in world units for the tick marks

Colour for marks  
input  
orange  
available colours

colour of the tick marks.

Points  
button

pick individual positions to label with a label stem and chainage (if the chainages field is set to tick).

Label  
button

label the selected strings as specified by the label mode, mode for marks and other fields in the panel.
14.13.2 Chainages (function)

The parameters for this panel are identical to Label Chainages on String, however instead of selecting data source for labels this option will create a function associated with a specified string.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function name</td>
<td>function box</td>
<td></td>
<td>select function</td>
</tr>
<tr>
<td>String to label</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For more information on this panel and its fields and buttons, please go to 14.13.1 Label Chainages.

Please continue to the next section 14.13.3 Label Cut/Fill.
14.13.3 Label Cut/Fill

Position of menu:  

Strings => Label => Cut/Fill

The cut/fill menu contains options to create cut and fill tick marks between selected strings. The options can generate standard tadpoles, tick marks or use user specified model as the tick symbol. For each option, a reference string is selected which defines the chainages used for labelling cut/fill. The cut/fill symbols are drawn perpendicular to the reference string.

Two strings, str1 and str2 are selected for labelling.

The tick symbols are drawn at right angles to the reference string at a user specified chainage going between the two strings, str1 and str2, from the higher string point to the lower string point (which string is higher or lower may vary along the strings). The tick symbol is repeated at the given chainage interval.

The tick symbol is drawn as a percentage of the distance from the high point to the low point between the two strings, str1 and str2 and this percentage is specified separately for the odd and even numbered ticks. The cut/fill walk-right menu is

For the option Tadpoles, go to  

Ticks  

User symbols  

From file  

14.13.3.1 Tadpoles  

14.13.3.2 Ticks  

14.13.3.3 User Symbols  

14.13.3.4 From File

14.13.3.1 Tadpoles

Position of option on menu:  

Strings => Label => Cut/Fill => Tadpoles

The Tadpoles option is used to generate tadpole symbols between two strings. On selecting the Tadpoles option, the Label tadpoles marks panel is displayed.
The fields and buttons in this panel are used as follows:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start chainage</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
  - if non-blank, the reference string chainage to start creating tadpoles from.
  - if blank, the reference string start chainage is used.
| End chainage      | input |          |        |
  - if non-blank, the reference string chainage to end the tadpoles at.
  - if blank, the reference string end chainage is used.
| Interval          | input | 10       |        |
  - the chainage interval to use for creating tadpoles.
| Maximum offset    | input | 100      |        |
  - the maximum distance to search from the reference string to find strings str1 and str2.
| Small tick%       | input | 100      |        |
  - the percentage of the distance between the two strings, str1 and str2, that is taken up by the odd numbered tadpoles.
| Large tick%       | input | 100      |        |
  - the percentage of the distance between the two strings, str1 and str2, that is taken up by the even numbered tadpole.
| Model for ticks   | input | available models |        |
  - the models for the tadpoles to placed into.
| Colour for ticks  | input | cyan | available colours |        |
  - the colour for the tadpoles.
| Ref/Str1/Str      | button |          |        |
  - the selected string is used as the reference/str1/str2 string.
14.13.3.2 Ticks

Position of option on menu:  Strings => Label => Cut/Fill => Ticks

The ticks option is used to generate ticks (straight lines) between two strings. On selecting the ticks option, the label tick marks panel is displayed.

The fields and buttons in this panel are used in exactly the same way as for the label tadpoles marks panels. The only difference is that the defaults for the small tick % and large tick % panel fields are 25 and 75 respectively.

14.13.3.3 User Symbols

Position of option on menu:  Strings => Label => Cut/Fill => User symbols

The user symbols option uses a given model, the tick symbol model, as the symbol to draw between the low and high points on the two strings. The tick symbol model is aligned so that the model origin is at the high string point and the model’s positive x-axis goes from the high string point to the low string point.

On selecting the ticks option, the label tick marks panel is displayed.

Continue to the next section 14.13.3.3 User Symbols or return to 14.13.3 Label Cut/Fill.
The fields and buttons in this panel are used in exactly the same way as for the label tadpoles marks panels except that a tick symbol model panel field is used to specify the symbol to be drawn for the cut/fill tick marks.

<table>

</table>

Continue to the next section 14.13.3.4 From File or return to 14.13.3 Label Cut/Fill.

14.13.3.4 From File

Position of option on menu: Strings => Label => Cut/Fill => From file

This is the same option as Drafting => Create cut/fill symbols

Please go to the section 14.13.3 Label Cut/Fill.
14.13.4 Label Names

Position of option on menu: Strings => Label => Names

The label names option is used to label individual strings or all the strings in a model, with their string names. The user has control over the label height, colour, and the distance between the labels. On selecting the label names option, the label string names panel is displayed.

By using the pick button, individual strings can be labelled using the values in the panel fields. The model to label field is ignored.

If the label button is selected, then all the strings in the model given by the model to label field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the label names panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>

Please continue to the next section 14.13.5 Label Vertices.
14.13.5 Label Vertices

Position of option on menu:  
Strings => Label => Vertices

The Label vertices option can be used to label the x, y, z, z no nulls, point numbers, id-pt no, name and descriptions of strings selected by the data source.

The user has control over the label height, colour, the number of decimal places, the distance between the labels, the distance the label is from the point position, and the angle to draw the label at.

On selecting the Label vertices option, the Label vertices panel is displayed.

Individual strings can be labelled by using the pick button and then selecting the strings, to be labelled using the values in the panel fields. The string model field is ignored.

If the label button is selected, then all the strings in the model given by the string model field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the label strings panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Type of labelling required - x, y, z, point number, vertex no. for each point in the string.

Name of the model containing the strings to be labelled. Not used with the pick button.
Model for labels
   input
   available models
   name of the model to place the labels in.

Num dec places
   input 0 0,1,2,3,4,5
   number of decimal places used in the x,y,z labels.

Textstyle data
   input
textstyle information.

Create mode
   input 4d 4d, text
   if 4d, the vertex labels for the one string are placed in a 4d string.
   text, the vertex labels are created as individual text strings.

Chord/arc tolerance
   input default chord/arc tolerance
   the chord to arc tolerance to use on any alignment string being labelled for determining how many
   points are labelled around horizontal curves.

Label
   button
   label all the strings in the model given in the string model field.
14.14 Rasters

Position of menu: Strings => Rasters

The Rasters menu contains options for working with rasters. The Rasters walk-right menu is

- Create a raster
- Create a raster from an ECW file
- Create a raster from a TAB file
- Create plan images from JPEGs
- Edit
- Plan to raster
- Set boundary
- Reset boundary
- ECW tools

For the option Create go to

- Create go to 14.14.1 Create a Raster
- Create from ECW's 14.14.2 Create Rasters from ECW Files
- Create from TAB's 14.14.3 Create Rasters from TAB Files
- Create plan images from JPEG’s 14.14.4 Create Plan Images from JPEG Files
- Edit 14.14.5 Edit a Raster
- Plan to raster 9.1.4.7 Create Raster from Plan View
- Set boundary 14.14.6 Set a Boundary for a Raster
- Reset boundary 14.14.7 Reset the Boundary for a Raster
- ECW tools 14.14.8 ECW Tools - Not Supported!
14.14.1 Create a Raster

Position of option on menu: **Strings => Rasters => Create**

A raster element consists of a raster image and positioning information for the raster so that it can be mapped into world units.

A raster element is added to a model just like any other string but for convenience it is suggested that no other strings are in the same model as a raster.

To help speed up drawing on a view, there is toggle for displaying/not displaying rasters on plan views.

**Raster Restrictions**

(a) The Raster file must have read/write permission

(b) Rasters are only supported on Win 2000 and above.

Selecting **Create** brings up the **Create Raster Element** panel.

![Create Raster Element Panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source Image tab</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Image format</td>
<td>choice box</td>
<td></td>
<td>BMP, DIB, GIF, ECW, JPEG, JPEG 2000, PNG, TGA, TIFF</td>
</tr>
</tbody>
</table>

*format that the original image is in. Non ECW rasters must be 24 bit colour.*

| Raster file | file box | name of the original raster image. The file must have read/write access and be 24 bit colour. |

<table>
<thead>
<tr>
<th>Source Image tab</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image format</td>
<td>choice box</td>
<td></td>
<td>BMP, DIB, GIF, ECW, JPEG, JPEG 2000, PNG, TGA, TIFF</td>
</tr>
</tbody>
</table>

*format that the original image is in. Non ECW rasters must be 24 bit colour.*

| Raster file | file box | name of the original raster image. The file must have read/write access and be 24 bit colour. |
Page
- page number of the raster when the format can contain more than one image (e.g. in a TIFF)

Null colour
- colour box available colours
- colour when there is no pixel in the raster

Temporary folder
- file box c:\temp select folder
- folder to use as a temporary storage area whilst converting the raster to the 12d raster format. The temporary folder needs to have enough free disk space to convert the largest of the rasters to bmp format.

Width/Height in pixels
- output only
- the width/height in pixels of the selected raster

Depth in bits
- output only
- display the colour depth of the source data

Projection
- output only
- display the projection of the source data if available

Location tab
- The Location tab supplies the information for positioning the raster in world units in 12d Model. Most rasters formats, other than ECW or Geotiff, do not include this information so it must be supplied by other means, either in a file or by typing in a world origin, anticlockwise rotation angle and world width and height.
**Data format** choice box Raw details Raw Details, Autocad scr file ESRI world, Geo Tiff, Mapinfo tab

*If Raw details,* the location details are typed into the World Location Details section as rotation, world origin, world width and height.

*If Autocad scr file,* the location details are taken from the scr file given in Location file. An Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom left hand corner, bottom right hand corner, top left hand corner and top right hand corner. An example of a scr file is:

```
line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695
```

*If ESRI world,* the location details are taken from the ESRI world file given in Location file. An ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.

*If Geo Tiff,* the Location details are taken from the geotiff file given in Location file panel field.

*If Mapinfo Tab,* the location details are taken from the Mapinfo tab file given in Location file.

**Location file** file box

file with the location details

**Anticlockwise rotation** angle box

the world rotation of the raster.

**X/Y co-ordinate** real box

the world x/y co-ordinate of the left hand bottom corner of the raster.

**World width/height** real box

the width/height in world units of the raster.

**Output tab**

the parameters for the created 12d raster.
Output size

An estimate of the amount of disk space the raster will use in 12d Model.

Fastest drawing speed

Only if raster is less than 24 bit depth - if selected, the raster is converted to a 24 bit image.

Minimum disk space

Only if raster is less than 24 bit depth - if selected, the raster is not converted to a 24 bit image and hence will take up less disk space. However it is converted at drawing time and so will be slower to display than a 24 bit image.

Name for raster

The name for the raster.

Model for raster

Name of the model for the raster element. Available models.

Show border

If tick then the border of the raster element is displayed.

Colour for border

The colour of the border for the raster. Default colour. Available colours.

Tin

If not blank, this tin is tagged with this raster so the raster is used for draping on the tin when the tin is used in visualisations.
**Crop tab**

This section of documentation is a work in progress and will be updated in subsequent releases.

![Crop tab interface](image)

- **Crop?** tick box
  - *if ticked,*

**Crop world origin**
- X coordinate
- Y coordinate

**Crop world size**
- Width
- Height

**Crop rect in pixels**
- Crop X px
- Crop Y px
- Width px
- Height px

- Define the crop rectangle interactively (only when rotation is zero)

- Clear crop
Create button

After the Create button is chosen, the raster element is created.
14.14.2 Create Rasters from ECW Files

Position of option on menu: Strings => Rasters => Create from ECWs

This option attaches one or more ECW files to a model. Selecting Create from ECWs brings up the Create Rasters from ECW Files panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

if ticked, the border will be visible

Transparent Blend

The degree of opacity, 1 = opaque, 0.1 = very transparent

Create  
button

after the Read button is chosen, the raster elements are created.
14.14.3 Create Rasters from TAB Files

Position of option on menu:  Strings => Rasters => Create from TAB’s

This option reads one or more rasters as define by TAB files and places them in a model. Selecting Create from TAB’s brings up the Create Rasters from TAB Files panel.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Raster name (Pre*post)</td>
<td>text input</td>
<td>if not blank, pre<em>post text to use for the name of the raster(s) from the ECW file(s) (see 4.19.2 Pre</em>Postfix in Panel Fields for information on using pre*postfix)</td>
<td></td>
</tr>
<tr>
<td>TAB files</td>
<td></td>
<td></td>

name of the file found in the folder

Size    output
file size

Model for TAB’s    input    available models
name of the model for the rasters defined by the TAB files

Mask colour    colour box    available colours
colour when there is no pixel in the raster

Colour for border    input    default colour    available colours
the colour of the border for the raster

Show border    tick    tick
if ticked then the border of the raster element is displayed

Temporary folder    file box    c:\temp select folder
folder to use as a temporary storage area whilst converting the raster to the 12d raster format.
The temporary folder needs to have enough free disk space to convert the largest of the
rasters to bmp format.

Transparent Blend
The degree of opacity, 1 = opaque, 0.1 = very transparent

Create    button
after the Read button is chosen, the raster elements are created.
14.14.4 Create Plan Images from JPEG Files

Position of option on menu: **Strings => Rasters => Create plan images from JPEG’s**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Create plan images from JPEG’s brings up the **Create Plan Images from JPEG Files** panel.

![Create Plan Images from JPEG Files panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>File to read</strong></td>
<td>file box</td>
<td>*.jpg files</td>
<td></td>
</tr>
<tr>

<td>measure box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Model for images</strong></td>
<td>model box</td>
<td></td>
<td>available models</td>
</tr>
</tbody>
</table>

*name of the JPEG file to attach to the model*

*if ticked, the File To Read field is replaced by a grid to allow multiple JPEG files to be read in, is opened. A wild card is used to select all the files to be read in.*
14.14.5 Edit a Raster

The `Edit` option modifies the properties of any raster displayed in a 12d Model view. Selecting `Edit` brings up the `Edit Raster Element` panel.

![Edit Raster Element panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source Image tab</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Original raster file</td>
<td>output</td>
<td></td>
<td></td>
</tr>
<tr>
<td>file that the raster originally came from</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Null colour</td>
<td>colour box</td>
<td>available colours</td>
<td>colour when there is no pixel in the raster</td>
</tr>
<tr>
<td>Width/Height in pixels</td>
<td>output only</td>
<td></td>
<td>the width/height in pixels of the selected raster</td>
</tr>
<tr>
<td>Depth in bits</td>
<td>output only</td>
<td></td>
<td>display the colour depth of the raster</td>
</tr>
<tr>
<td>Projection</td>
<td>output only</td>
<td></td>
<td>display the original projection of the raster (if available)</td>
</tr>
<tr>
<td><strong>Location tab</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When the raster is selected, the raw details for the raster (or ECW details) are displayed. The location details can then be modified and hence how the raster is positioned in world units in 12d Model is modified.
Rasters

Data format

- choice box
- Raw details
- Raw Details, Autocad scr file
- ESRI world, Geo Tiff,
  Mapinfo tab

**if Raw details**, the location details are typed into the World Location Details section as rotation,
world origin, world width and height.

**if Autocad scr file**, the location details are taken from the scr file given in Location file. An
Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom
left hand corner, bottom right hand corner, top left hand corner and top right hand corner. An
example of a scr file is:

```
line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695
```

**if ESRI world**, the location details are taken from the ESCRI world file given in Location file. An
ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin.
For use with 12d, the row and column rotations must be the same and yscale = - xscale.

**if Geo Tiff**, the Location details are taken from the geotiff file given in Location file panel field.

**if Mapinfo Tab**, the location details are taken the Mapinfo tab file given in Location file.

NOTE: A raster is **deleted** by using the string *Delete* option. The raster is selected for deleting by
picking on the border of the raster.
14.14.6 Set a Boundary for a Raster

Position of option on menu: Strings => Rasters => Set boundary

The **Set boundary** option defines a boundary polygon for the raster. Only the parts of the raster inside the boundary polygon are displayed. The boundary polygon can have holes.

Selecting **Set boundary** brings up the **Raster Set Boundary String** panel.

![Raster Set Boundary String Panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

14.14.8 ECW Tools - Not Supported!

Position of option on menu: Strings => Rasters => ECW tools

Selecting ECW tools brings up the ECW tools - Not Supported! menu.

This section of documentation is a work in progress and will be updated in subsequent releases.

For the option Change ECW's projection go to
14.14.8.1 Change ECWs Projection
Translate ECWs
14.14.8.2 Translate ECWs

14.14.8.1 Change ECWs Projection

Position of option on menu: Strings => Rasters => ECW tools => Change ECW’s Projection

Selecting Change ECW’s Projection brings up the Change Projection for ECW Files - Not Supported panel.

This section of documentation is a work in progress and will be updated in subsequent releases.

14.14.8.2 Translate ECWs

Position of option on menu: Strings => Rasters => ECW tools => Translate ECW’s

Selecting Translate ECW’s brings up the Translate ECW Files - Not Supported panel.

This section of documentation is a work in progress and will be updated in subsequent releases.
14.15 Point Clouds

Position of menu:  Strings => Point clouds

The Point clouds walk-right menu is

For the options go to:

14.15.1 Categories
14.15.2 Delete Points
14.15.3 Cartographic Transform
14.15.4 Limiting Cloud Drawing on View
14.15.5 Point Cloud Pinning
14.15.1 Categories

Position of menu:  Strings => Point clouds => Categories

For the options go to:

14.15.1.1 Set LAS Categories
14.15.1.2 Global Set LAS Categories
14.15.1.3 Setting Point Cloud Categories by TIN
14.15.1.4 Setting LAS File Categories by TIN
14.15.1.5 Copying Point Cloud Files by Categories
14.15.1.6 Copying LAS Files by Categories
14.15.1.1 Set LAS Categories

Position of option on menu: Strings => Point clouds => Categories => LAS Categories

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting LAS Categories fires up the Set LAS Categories panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
14.16 WMS

Position of option on menu:  **File I/O => WMS**  
Position of option on menu:  **Strings => WMS**

The WMS walk-right menu containing these options is:

For the option **Create** go to  
- 8.6.21.1 Download from a WMS
- 8.6.21.2 WMS Wizard

For the option **Create (Wizard)** go to  
- 8.6.21.2 WMS Wizard

For the option **Edit** go to  
- 8.6.22.1 Edit a WMS Image

For the option **Delete** go to  
- 8.6.22.2 Delete a WMS Image
14.17 Utilities

Position of menu: Strings => Utilities

The Utilities menu contains miscellaneous options involving strings.

The Utilities walk-right menu is

- Set string chainage at a point
- Calculate depth string, report offset & xfall
- Fit lines and arcs
- Remove loops from strings
- Create strings from labelled sections
- Create section from projecting points onto a line

For the option Chainage go to

- Depth string 14.17.2 Depth String
- Linear regression 17.14.7 Linear Regression
- Loop removal 14.17.4 Loop Removal
- Strings from sections 14.17.5 Strings from Sections
- Sections from points 20.14.9 Sections from Points
- Developments 14.17.6 Developments
- On grade 14.17.7 On Grade
- Old editor 14.17.8 Old Editor
14.17.1 Chainage

Position of option on menu: Strings => Utilities => Chainage

The chainage menu option allows the user to specify the start chainage for a string by specifying what the chainage will be at a selected point on the string. The string's start chainage is then adjusted so that the point has the given chainage.

Selecting chainage fires up the chainage at point on string panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Old chainage</td>
<td>output</td>
<td></td>
<td></td>
</tr>
<tr>
<td>New chainage</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Set button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Old chainage reports the initial chainage of the dropped point.

New chainage the new chainage for the dropped point.

Pick two objects to pick - pick the string to modify the chainage at a point and then pick a point which will be dropped onto the selected string to give the point that will have its chainage modified. The existing chainage on the string of the dropped point is then written to the old chainage panel field.

Set on selecting set, the start chainage is modified so that the chainage at the picked point is the value in the new chainage field. The old chainage field is then updated with the new chainage.

Please continue to the next section 14.17.2 Depth String.
14.17.2 Depth String

Position of option on menu:  Strings => Utilities => Depth string

The depth string option calculates the horizontal and vertical offsets and the cross-fall between two strings and then creates and/or reports on the string.

A reference string is selected which is used to define chainages. Lines perpendicular to the reference string are taken at regular chainages and intersected (in plan) with the first and second strings. The horizontal and vertical offsets and the cross-fall between the two strings are calculated at the intersection points.

On selecting the Depth string option, the Depth string panel is displayed.

![Depth String Panel]

The fields and buttons in this panel are used as follows:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

<td>if non-blank, the file for the offset and cross-fall report</td>
</tr>
</tbody>
</table>
Ref/1st/2nd button

select the reference/first/second string.

Report button

calculate a depth string and produce an offset and cross-fall report on it.

Please continue to the next section 14.17.3 Linear Regression.
14.17.3 Linear Regression

Position of option on menu: Strings => Utilities => Linear regression
Position of option on menu: Survey => Extras => Linear regression
This option is documented in 17.14.7 Linear Regression.
Please continue to the next section 14.17.4 Loop Removal.
14.17.4 Loop Removal

Position of option on menu:  Strings => Utilities => Loop removal

The loop removal option tries to remove loops from strings by adding points where the string self intersects and removing the loops at those points. The level of the added points are the mean of the self intersect points.

Selecting loop removal fires up the loop removal panel.

![Loop Removal Panel]

The fields and buttons used in this panel have the following functions.

Please continue to the next section 14.17.5 Strings from Sections.
14.17.5 Strings from Sections

Position of option on menu:  Strings => Utilities => Strings from sections

The strings from sections option creates strings by joining the common named points on successive 4d strings (usually generated as sections). This option is documented under Design => X-Sections => Strings from Sections.

Please go to the section 20.14.8 Strings from Sections.
14.17.6 Developments

Position of menu:  **Strings => Utilities => Developments**

Some of the options under **string utilities** are still under development, or are being phased out (Cogo (trial)) and won’t be documented or released until future versions of **12d Model**. The current options on the **Developments** menu are
14.17.7 On Grade

Position of option on menu: Survey => Extras => On grade
Position of option on menu: Strings => Utilities => On grade
For Information on this option please go to 17.14.9 On Grade in the section 17.14 Extras
14.17.8 Old Editor

Position of option on menu: Strings => Utilities => Old Editor

This section of documentation is a work in progress and will be updated in subsequent releases. Selecting Old editor brings up the Edit String Old panel.

![Edit String Old Panel](image_url)
14.18 User

Position of option on menu: Strings => User

The walk-right menu Strings => User has extra macro options. These could be from 12d Solutions or users. The User Strings walk-right menu is

![User Strings menu]

For the option Attribute Editor, go to

- Get length in 3d  
- Head to tail closest points  
- Name strings using text strings  
- Remove tinability  
- Scale text values  
- Scale string names  
- Set string names by number  
- Set string properties  
- Sum length of all strings view/model  
- Super string audit  
- Super string dimension occurrences  
- Super string to v3.2 strings  
- Translate string in section view

Edit the top 10 attributes
Calculates 3d length

For the option Attribute Editor, go to

- 14.18.1 Attribute Editor
- 29.3.14 Length in 3d
- 29.3.15 XXX Head to Tail Closest Points
- 29.3.21 XXX Name Section Strings by Picking Text
- 29.3.26 XXX Remove Tinability
- 29.3.28 XXX Scale Text Values
- 29.3.29 XXX Scale String Names
- 29.3.30 XXX Set String Names by Number
- 29.3.31 XXX String Operations
- 29.3.36 Total Length of Strings
- 29.3.37 XXX Super String Dimension Occurrences
- 29.3.37 XXX Super String Dimension Occurrences
- 29.3.38 XXX Transform V4 to V3.2
- 29.3.39 XXX Section Move
14.18.1 Attribute Editor

On selecting the Attribute editor, the Top 10 Attribute Editor panel is displayed.

This option displays ten (10) attributes of type string, vertex or segment for a selected string. This option was written before the Strings => Properties => Attributes editor existed and was mainly used for editing drainage data. For more documentation, go to 23.10.2 Attribute Editor.

Most of the detailed catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d or edited inside 12d using this panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>pick string</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>First Select Pick to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>string-pit-pipe</td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>All catchment data is stored with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select Pit. A circle will be drawn around the pit selected. Next and Prev will now move you from pit to pit.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>attribute name</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Select the drop down icon and then select the Attribute Name from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3 top 10 attributes lists are maintained (pit, pipe and string). The attributes that you can select from are all of the attributes that exist on all of the strings in the model. If the attribute does not exist for the string/pit/pipe that you are displaying the data field will display Not found.
**type**  
choice box  

*for existing attributes this will display Text, Real or Integer.*  
*When defining a new attribute select the type of data to be stored in the attribute*

**data**  
input box  

*the data stored in the attribute is displayed/edited/created in this field.*

**< prev**  
button

**next =>**  
button  

*move to next string in the model pit on the string pipe on the string*

**process**  
button  

*updates the attributes displayed in the dialogue.*

**Notes:**

First select Pick to select the string that contains the user attributes. All catchment data is stored with the pits in drainage strings. The strings will be highlighted in white when they are selected.  
To access the pit attributes LB this field then select Pit. A circle will be drawn around the pit selected.  
LB the Attribute Name field and then select from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in. They may not be defined for the string you are editing. If the string does not have that attribute defined not found will be displayed in the Data field.  
To change the value for the attribute enter the new value in the data field. If the attribute does not exist, deleting the not found text and adding data will create it. The following message will be displayed whenever you are creating a new attribute.  

For more documentation on setting the attributes for this option, go to 23.10.2 Attribute Editor
14.19 Delete

Position of option on menu: Strings => Delete

Entire strings can be deleted from 12d Model using the delete option.

Any number of strings can be deleted by successively selecting the strings.

On selecting the delete string option, the strings delete panel is displayed.

Field Description       Type       Defaults       Pop-Up
Pick & Delete           button     any selected strings are deleted.

The cycle is terminated by clicking RB to raise the pick ops menu and selecting cancel from it.
14.20 Old String Create and Editors
14.20.1 Old

Position of option on menu: Strings => Create => Old

These old options are the string creation options that were available before 12d Model 8 was released. The Create option is used to produce new strings. If a string already exists, the Editor option is used to modify it.

The Create walk-right menu contains options to create 2d, 3d, 4d, alignment, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Once a string has been created, it can be converted to most of the other string types using the string Convert option.

To create a new string of the same type and with similar header information as an existing string, the same as option is selected from the String Create menu.

Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

Linetyles can be defined that drawn lines between the points even though the breakline type is point.

2. The string vertices are also called intersection points (IP's).

The String Create Old walk-right menu is

The string creation process is similar for each string type and for editing strings as well.

For the option Alignments, go to 14.20.1.1 Alignments

<table>
<thead>
<tr>
<th>String Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>2d</td>
<td>14.20.1.2 Create - 2d (pre V8)</td>

</tr>
</tbody>
</table>

14.20.1.1 Alignments

Position of menu: Strings => Create => Old => Alignments

The Alignment walk-right menu contains options to create an alignment string, plus quick methods of creating an alignment string with horizontal geometry already created for culdesacs, circles and fillets.
For the option Alignment, go to 14.20.1.1.1 Create - Alignment, Culdesac 14.20.1.1.2 Create - Culdesac, 3 centre curve 14.20.1.1.3 Create - Three centre curve, Circle 14.20.1.1.4 Create - Circle, Fillet 14.20.1.1.5 Create - Fillet, Traffic island 20.8.9.1 Create Traffic Island, Traffic island profile/tin 20.8.9.2 Traffic Island Profile/Tin.

14.20.1.1.1 Create - Alignment
Position of option on menu: Strings => Create => Old => Alignments => Alignment

An alignment string is defined by specifying both its horizontal and vertical geometry. The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points) with circular curves and transition spirals applied to the intersection points. Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points (called vertical intersection points) and either parabolic or circular curves applied to the vertical intersection points.

The horizontal geometry is defined in a plan view and the vertical geometry in a section view. Alignment strings are often referred to as "centre-line strings" because road centre-lines are common examples of alignment strings.

Note vertical geometry can only be added to an existing string.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create Alignment String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Alignment String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create Alignment String panel.

On selecting the Alignment string option, the Create Alignment String panel is displayed.
To create a new alignment string, the name, model, colour, style and transition spiral type of the new string are entered into the appropriate fields and the Create button selected.

The new fields and buttons used in the Create Alignment String panel have the following functions.

<table>
<thead>
<tr>

</table>
displayed.

**Same as** button

*After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.*

### 14.20.1.1.1 Alignment Edit

Selecting the create button in the create alignment string panel the alignment edit menu and alignment edit info panel are placed on the screen.

The Alignment edit menu and Alignment edit info panel for an alignment string are

![Alignment Edit Menu and Alignment Edit Info Panel](image)

To begin creating an alignment string, the user must select the Append=>HIPs option from the Alignment Edit menu and start placing points in a plan view.

To create a new alignment string, select the Append => HIPs option from the Alignment Edit menu.

The Append =>HIPs option is used to add horizontal intersection points to either end of an existing alignment string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all alignment strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's Alignment Edit menu are usable.

The options in the Alignment Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the Alignment edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information on the Alignment Editor, go to the section 14.20.2 Alignment Edit.
### 14.20.1.1.2 Create - Culdesac

**Position of option on menu:**  Strings => Create => Old => Alignments => Culdesac

Create an alignment string for a culdesac for user defined road widths, culdesac radius and offset. No vertical geometry is defined.

On selecting the **Culdesac** option, the **Culdesac Alignment Creation** panel is displayed.

<table>
<thead>
<tr>
<th>Field Description</th>

14.20.1.1.4 Create - Circle

Position of option on menu:  Strings =>Create =>Old =>Alignments =>Circle

Create an alignment string for a circle with a user radius and selected centre or with a dynamic mode set, selected centre and interactively positioned circumference.

On selecting the curve option, the circle alignment construction panel is displayed.

The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Radius</td>
<td>input box</td>

<tr>
<td>Name/Model/Colour/Style</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
name/model/colour/style of the created alignment string.

Dynamic tick box

if not ticked, then the Centre pick x,y and radius fields are used to define the circle.

if ticked, then the Pick button is used to select the centre and then the cursor is taken to be on the circle to dynamically define the radius.

Pick button

pick the circle centre when in dynamic mode.

Process button

create the alignment string.

Undo button

undo the last alignment string created whilst the panel has been active.
14.20.1.1.5 Create - Fillet

Position of option on menu:  Strings =>Create =>Old =>Alignments =>Fillet

Create an alignment string for a fillet with a for user radius and selected in and out strings.

On selecting the fillet option, the fillet alignment construction panel is displayed.

![Fillet Alignment Construction Panel](image)

The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select 1</td>
<td>string select</td>
<td></td>

<tr>
<td>Process</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
create the alignment string.

Undo button

undo the last alignment string created whilst the panel has been active.
14.20.1.1.6 Create - Traffic Island

Position of option on menu:  Strings =>Create =>Old =>Alignments =>Traffic Island

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. No vertical geometry is defined.

On selecting the traffic island option, the traffic island alignment creation panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset from travel lines</td>

</tr>
</tbody>
</table>
Name/Model/Colour/Style  input box
    name/model/colour/style of the created alignment string.

Select  strings select
    select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.

Preview  string select
    draw the traffic island with the given parameters in the panel draw box.

Process  button
    create the alignment string

Undo  button
    undo the last alignment string created whilst the panel has been active.
14.20.1.2 Create - 2d (pre V8)

Position of option on menu:  Strings =>Create =>Old =>2d

A 2d string consists of a series of (x,y) vertices all with the same z-value (height). 2d strings are often referred to as “contour strings” because contours are the most common example of a string with a constant height.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create 2d String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create 2d String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create 2d String panel.

From 12d Model 8 onwards, the default is to create 2d super strings rather than the 2d strings used up to 12d Model 7. A 2d super string is a super string with Constant height. That is, there is only one z-value for the entire string. The advantage is using a 2d super string is that all the CAD options will work for it and it can be given point id’s for setout.

On selecting the 2d string option, the create 2d string panel is displayed.

![Create 2d String Panel]

The default values for the panel fields are taken from the CAD Controlbar (see 15.1 Controlbars).

To create a new 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the Create button selected.

The new fields and buttons used in the create 2d string panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the name of the new string.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>input</td>
<td></td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td></td>
<td>name of the model that the new string is in.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

### 14.20.1.2.1 2d Edit for New String

On selecting the **Create** button in the **Create 2d String** panel the **2d edit** menu and **2d Edit Info** panel are placed on the screen.

The **2d edit** menu for a 2d string is

*append or prepend an IP*

*move an IP*

*insert an IP*

*insert IP on line joining IPs*

*delete an IP*

*extend an IP*

*modify the string's z-value*

*open a closed string*

*close a string*

*bring up Properties panel*

*toggle edit info panel*

*undo/redo*

*quit the create*

*finish the 2d create*

To create a new 2d string, select the **Append** option from the **2d Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the 2nd vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.
Now that the string is created, all the edit option on the string’s 2d Edit menu are usable.

The options in the 2d Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the 2d Edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 2d Editor, go to the section 14.20.3 2d Edit - Old
14.20.1.3 Create - 3d (pre V8)

Position of option on menu:  Strings => Create => Old => 3d

A 3d string consists of a series of (x,y,z) points.

The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each string point, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a special case of a 3d string where the heights at all the points are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is required at each string point.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create 3d String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create 3d String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create 3d String panel.

On selecting the 3d string option, the create 3d string panel is displayed.

![Create 3d String Panel](image)

To create a new 3d string, the name, colour, model and point-line type of the new string are entered into the appropriate fields and the create button selected.

To create a new 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the Create button selected.

The new fields and buttons used in the create 3d string panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

14.20.1.3.1 3d Edit

Selecting the create button in the create 3d string panel the 3d edit menu and 3d edit info panel are placed on the screen.

The 3d edit menu and panel for a 3d string are

![3d Edit Menu](image)

To create the new 3d string, select the Append option from the 3d Edit menu.

The Append option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string’s 3d Edit menu are usable.

The options in the 3d Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the 3d edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the
string Editor section.
For full information in the 3d Editor, go to the section 14.20.4 3d Edit - Old
14.20.1.4 Create - 4d (Pre V8)

Position of option on menu:  Strings =>Create =>4d

A 4d string consists of a series of (x,y,z) points and a text label at each point.

Creating and editing a 4d string is very similar to a 3d string.- the major difference is that a height and a text label is required at each string point.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create 4d String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create 4d String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create 4d String panel.

On selecting the 4d string option, the create 4d string panel is displayed.

To create a new 4d string, the name, colour, model, point-line type, text size and units, offset, justification and angle for the new string are entered into the appropriate fields and the create button selected.

The new fields and buttons used in the create 4d string panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>

14.20.1.4.1 4d Edit

Selecting the create button in the create 4d string panel the 4d edit menu and 4d edit info panel are placed on the screen.

The 4d edit menu and panel for a 4d string are

To create a new 4d string, the user must select one of the two Append options on the Append walk-right of the 4d Edit menu which has options to simply create points or to create points and text at the points.

The Append and Append + text options are used to add points and text (in a plan view) to either end of an existing string, or in the case of a new string, places the 1st point and text and then begins appending points and text to the 1st point.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

If Append + text was selected, the user will then be prompted for the text to be placed at that points.

The string and text is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.
Now that the string is created, all the edit option on the string's 4d Edit menu are usable.

The options in the 4d Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the 4d edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the 4d Editor, go to the section 14.20.5 4d Edit - Old
14.20.1.5 Create - Pipe (Pre V8)

Position of option on menu: Strings => Create => Old => Pipe

A pipe string is the same as a 3d string except that the pipe string also has a diameter hence the options for creating and editing a pipe string are almost the same as for a 3d string.

The main difference is that there are no options to open and close a pipe string and there is an additional option for modifying the pipe diameter.

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create Pipe String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Pipe String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create Pipe String panel.

On selecting the Pipe string option, the Create Pipe String panel is displayed.

To create a new pipe string, the name, colour, model, point-line type and diameter of the new string are entered into the appropriate fields and the create button selected.

The new fields and buttons used in the create pipe string panel have the following functions.

<table>
<thead>
<tr>

### 14.20.1.5.1 Pipe Edit

On selecting the **Create** button in the **Create Pipe String** panel the **Pipe Edit** menu and **Pipe Edit info** panel are placed on the screen.

The **Pipe Edit** menu and panel for a pipe string are

To create a new pipe string, select the **Append** option from the **Pipe Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all pipe strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string’s **Pipe Edit** menu are usable.

The options in the **Pipe Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Pipe Edit** menu
are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.
For full information in the Pipe Editor, go to the section 14.20.6 Pipe Edit - Old.
14.20.1.6 Create - Polyline (Pre V8)

Position of option on menu:  Strings => Create => Old => Polyline

A polyline string is similar to a 3d string except that it can have either straight lines or arcs joining the (x,y,z) points of the string. The arcs are plan arcs with possibly a different z at either end and the z values are linearly interpolated between the end points. Hence in a long section, the end points are joined by a straight lines for both line and arc segments of the polyline.

Creating and editing a polyline string is very similar to a 3d string. The only major difference is that a radius is required at each string segment (a radius of 0 means no arc, just a straight line).

The Many strings tick-box is used when more than one string of the same type is to be created. If many strings is set to tick, when the current string creation is Finished or Quit, a new Create Polyline String panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the Create Polyline String panel fields before selecting the Create button for the new string. Hence a new string of the same type can be created without going back to the Create menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the Create Polyline String panel.

On selecting the polyline string option, the create polyline string panel is displayed.

To create a new polyline string, the name, colour, model, point-line type and linestyle of the new string are entered into the appropriate fields and the create button selected.

The new fields and buttons used in the create pipe string panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>input</td>
<td></td>
<td>the name of the new string.</td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>input</td>
<td></td>
<td>name of the model that the new string is in.</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>input</td>
<td>default colour</td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td>Style</td>
<td>input</td>
<td>1</td>
<td>available line styles</td>
<td></td>
</tr>
<tr>
<td>Weight</td>
<td>input</td>
<td>0</td>
<td>thickness of the string.</td>
<td></td>
</tr>
</tbody>
</table>
Many strings tick
if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button
After the create button is chosen, the polyline edit menu and polyline edit info panel are displayed.

Same as button
After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.

14.20.1.6.1 Polyline Edit

Selecting the create button in the create polyline string panel the polyline edit menu and polyline edit info panels are placed on the screen.

To create a new polyline string, the user must select one of the two append options (Append or Append + radius) on the Append walk-right of the Polyline Edit menu. The which Append option to simply creates points which are joined by a straight segment whereas the Append + radius create points with a radius for the segment.

The Append options are used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all polyline strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

If Append + radius was selected, the user will then be prompted for the radius of the segment being placed.

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's Polyline Edit menu are usable.

The options in the Polyline Edit menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the Append and other options in the Polyline Edit menu are identical to the options used when editing an existing string, they will be discussed in detail in the string Editor section.

For full information in the Polyline Editor, go to the section 14.20.7 Polyline Edit - Old
14.20.2 Alignment Edit

Position of option on menu: Strings => Editor

An alignment string is defined by specifying the horizontal and vertical geometry as separate operations. The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points, HIP’s) and circular curves and transitions (e.g. clothoid spiral) applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points called vertical intersection points (VIP’s) and parabolic or circular curves applied to the vertical intersection points.

The horizontal geometry is defined in a plan view and the vertical geometry in a section view. Hence the alignment string editor can edit information for the string on both plan and section views.

Since a section view is only defined in relation to a specific string (called the primary string for the section view), the vertical geometry of the picked string can only be edited in a section view if the string is the primary string for that section view. That is, the string can only be edited on a section view if the string being edited is profiled on that section view.

On selecting an alignment string, the alignment edit menu and the alignment edit info are placed on the screen.

Most of the options are applicable to either horizontal or vertical geometry. The meaning of the option depends on whether the string is being edited in a plan or a section view. Hence the description of the option will often need to be split into its separate action on horizontal or vertical geometry.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

Each option will now be discussed in detail.

Go to 14.20.2.1 Alignment Append
14.20.2.1 Alignment Append

The append operation for an alignment string is similar to the 3d string case except that there are separate append options for the horizontal and vertical geometry of the string.

The append walk-right is

![Append Walk-right](image)

14.20.2.1.1 Append HIPs - Horizontal Geometry

The append=>HIPs option in a plan view is used to create the 1st horizontal point in a new alignment string, to append a new horizontal intersect point to the end of the string or to prepend a new horizontal intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

#### 14.20.2.1.1.1 Existing Alignment String

Appending a point is a two step process.

- **Step (a) - selecting the end to append the point to.**
  
  After picking append=>HIPs, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point.

  - **message area 1** <Append Points>
  - **message area 2** IP point number, x, y, z co-ords of IP
  - **message area 3** bearing-in, bearing out, bearing difference for an IP
  - **message area 4** select final position - after pick

  Screen message area
  
  <Select string end to append to> [picks][menu]
  <Select final position of point> [picks][accepts][menu]

- **Step (b) - selecting the position for the new appended point.**
  
  A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

  - **message area 1** <Append Points>
  - **message area 2** IP point number, x, y, z co-ords of IP
  - **message area 3** bearing-in, bearing out, bearing difference for closest IP
  - **message area 4** select final position - before pick

  Screen message area
  
  <Select final position of point> [picks][menu]
  <Select final position of point> [picks][accepts][menu]

Once an intersection point has been appended to the string, the appended intersection point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is
already set up. The current cursor position indicates the new position of the next appended intersection point.

Hence a series of string points is easily entered by first selecting the string end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting them in turn.

**Typed input** can be used in either step.

The **append** option is terminated by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **alignment edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the append option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the append option still current.

### 14.20.2.1.1.2 New Alignment String

When the **append=>HIPs** option is selected, a cross will appear on any plan views that have the alignment string’s model on them.

The first horizontal intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing alignment string where the end point has already been accepted.

### 14.20.2.1.2 Append VIPs - Vertical Geometry

The **append=>VIPs** option is used to create and edit the vertical geometry of the picked string if the string is a primary string on any section view. This can be achieved by using either the **VG edit** or the **profile** option from the section view **view=>utilities** menu.

Vertical geometry can only be defined for a string with existing horizontal geometry.

On a section view, **Append=>VIPs** is used to create the first vertical intersection point in an existing string, to append a new vertical intersect point to the end of the string or to prepend a new vertical intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

#### 14.20.2.1.2.1 Existing Vertical Geometry

Appending a vertical point is the same as for a horizontal intersection point except that the co-ordinate system is (chainage,height) rather than (x,y) values and the information messages displayed in the **alignment edit info** panel show chainage, height and percentage grade rather than x,y,z and bearings.

For example -

<table>
<thead>
<tr>
<th>Message Area</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>area 1</td>
<td><strong>&lt;Append Points&gt;</strong></td>
</tr>
<tr>
<td>area 2</td>
<td>VIP point number, chainage,height of VIP</td>
</tr>
<tr>
<td>area 3</td>
<td>curve length, %grade-in, %grade-out, grade difference for an VIP</td>
</tr>
<tr>
<td>area 4</td>
<td>edit finished - before pick select final position - after pick</td>
</tr>
</tbody>
</table>

#### 14.20.2.1.2.2 New Vertical Geometry

Creating the **1st vertical intersection point** (VIP) in a string is similar to the **1st horizontal IP**.

When the **append=>VIPs** option is selected, a cross will appear on any section views that have the alignment string profiled on them.

The 1st vertical intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing vertical geometry where the end point has already been accepted.

**Typed input** can be used at any stage of the append.

See the next section **14.20.2.2 Alignment Move** or return to **14.20.2 Alignment Edit**.

### 14.20.2.2 Alignment Move
The **move** option allows the user to move

(a) individual horizontal intersection points (HIPs)

(b) individual tangent points (HTPs) if there is no transition on the HIP.

(c) individual vertical intersection points or tangent points (VIPs or VTPs).

**move** acts on the horizontal geometry if the point to move is selected in a plan view, or the vertical geometry if the point to move is selected in a section view.

### 14.20.2.2.1 Move - Horizontal Geometry

The **move** option in a plan view is for moving individual horizontal intersection points (HIP’s) or horizontal tangent points (HTPs) of the string.

The move cycle consists of two steps:

(a) selecting the point to be moved

(b) selecting the new position for the point.
Step (a)

First the horizontal intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a horizontal intersection point is selected, the string will be redrawn with the intersection point moved to the cursor position and the circular curve radius and transition lengths left constant.

A horizontal tangent point only occurs on a line connecting two adjacent horizontal intersection points (the HIP-HIP line). Hence, a horizontal tangent point can only move along its HIP-HIP line. Moving a horizontal tangent point actually means that the radius of the circular curve at the tangent point is modified so that the new position of the point is still a tangent point on the HIP-HIP line for the new circular curve.

To guarantee that the new position for the tangent point is on the HIP-HIP line, the cursor position is automatically projected perpendicularly onto the HIP-HIP line to give the new tangent point.

Step (b)

The current cursor position (or its projection for a HTP) is selected as the new position for the point by picking (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the HIP (or at the projected point for a HTP), and the string redrawn.

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.

14.20.2.2.2 Move - Vertical Geometry

The move option is used in a section view to move individual vertical intersection points (VIP’s) or vertical tangent points (VTP’s).

The move cycle consists of two steps:

(a) selecting the point to be moved

(b) selecting the new position for the point.

Step (a)

First the vertical intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a vertical intersection point (VIP) is selected, the string will be redrawn with the vertical intersection point moved to the cursor position and the parabolic curve length or the circular curve radius left constant.

A vertical tangent point (VTP) only occurs on a line connecting two adjacent vertical intersection points (the VIP-VIP line). Hence, a vertical tangent point can only move along its VIP-VIP line. Moving a vertical tangent point actually means that the length of the parabolic curve at the vertical tangent point is modified so that the new position of the point is still a vertical tangent point on the VIP-VIP line for the new parabolic curve.

To guarantee that the new position for the vertical tangent point is on the VIP-VIP line, the cursor position is automatically projected perpendicularly onto the VIP-VIP line to give the new vertical tangent point.
Step (b)

The current cursor position (or its projection for a VTP) is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for an VIP (or at the projected point for a VTP), and the string redrawn.

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.

The move option is terminated by selecting cancel from the pick ops menu or by selecting a new alignment edit option.

See the next section 14.20.2.3 Alignment Insert or return to 14.20.2 Alignment Edit.

14.20.2.3 Alignment Insert

The insert option is designed to place a new intersection point in a string between two adjacent intersection points. The inserted point does not have to be on the line joining the two intersection points - the between option is used to guarantee that the IP is on the IP-IP line.

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP’s to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the line connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

Like the move option, the insert works on the horizontal or the vertical geometry depending on whether a plan or section view is used to select the connecting line.

For horizontal inserts

```
message area 1  <Insert Point>
message area 2  IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3  bearing-in, bearing out, bearing difference for the inserted IP
message area 4  select final position - after pick
Screen message area
  <Select line to insert on> [picks][][][menu]
  <Select line to insert on> [picks][accepts][menu]
```

For vertical inserts

```
message area 1  <Insert Point>
message area 2  VIP point number, Ch, Ht co-ords of VIP
message area 3  VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4  select final position - after pick
Screen message area
  <Select line to insert on> [picks][][][menu]
```
Step (b) - selecting the position for the new intersection point

The position of the new intersection point is set to the current cursor position by picking (LB) and accepting (MB).

**horizontal**

Message area 1: <Insert Point>
Message area 2: IP point number, x, y co-ords of IP, radius, start spiral, end spiral
Message area 3: bearing-in, bearing out, bearing difference for the inserted IP
Message area 4: select final position - before pick, edit finished - after pick

**vertical**

Message area 1: <Insert Point>
Message area 2: VIP point number, Ch, Ht co-ords of VIP
Message area 3: VC length, %grade-in, %grade-out, grade diff for the moved VIP
Message area 4: select final position - before pick, edit finished - after pick

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the insert option.

The insert option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

Typed input can be used in either step.

See the next section 14.20.2.4 Alignment Between or return to 14.20.2 Alignment Edit.

**14.20.2.4 Alignment Between**

The between option is similar to the insert option except the inserted point does have to be on the line joining the two intersection points. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP point position.

The between option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

See the next section 14.20.2.5 Alignment Delete or return to 14.20.2 Alignment Edit.

**14.20.2.5 Alignment Delete**

The delete option is used to delete intersection points from the string.

After picking the delete option, any selected intersection point in the string is deleted. The string, minus the deleted point, is redrawn after each deletion.

Once an intersection point has been deleted, another intersection point in the selected string can selected for deletion. Hence any number of the string points can be deleted one after another.

A horizontal intersection point is deleted if the point is chosen from a plan view and a vertical intersection point deleted if the point is selected from a vertical view.

For horizontal deletes

Message area 1: <Delete Points>
Message area 2: IP point number, x, y co-ords of IP, radius, start spiral, end spiral
Message area 3: bearing-in, bearing out, bearing difference for the inserted IP

Screen message area

<Select point to delete> [picks][menu]
<Select point to delete> [picks][accepts][menu]
For vertical deletes

message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP

Screen message area

<Select point to delete> [picks][menu]
<Select point to delete> [picks][accepts][menu]

The delete option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

Typed input can be used to select a point for deletion.

See the next section 14.20.2.6 Alignment Extend or return to 14.20.2 Alignment Edit.

14.20.2.6 Alignment Extend

The extend option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, in a plan view, the bearing of the HIP-HIP line is kept constant and the intersection point is moved along that line either towards or away from its neighbouring intersection point on the HIP-HIP line.

In a section view, the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either towards or away from its neighbouring intersection point on the VIP-VIP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a co-ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and IP are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line. As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

For horizontal extends

message area 1 <Extend Point>
message area 2 IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3 bearing-in, bearing out, bearing difference for the inserted IP
message area 4 select final position - after pick

Screen message area

<Select line to extend> [picks][menu]
<Select line to extend> [picks][accepts][menu]

For vertical extends

message area 1 <Extend Point>
message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 select final position - after pick

Screen message area

<Select line to extend> [picks][menu]
<Select line to extend> [picks][accepts][menu]

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the current cursor position onto the IP-IP line.

horizontal -

message area 1 <Extend Points>
message area 2 IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3 bearing-in, bearing out, bearing difference for the inserted IP
message area 4 select final position - before pick, edit finished- after pick
Screen message area
   <Select final position of point> [picks][menu]
   <Select final position of point> [picks][accepts][menu]

vertical

message area 1     <Extend Points>
message area 2     VIP point number, Ch, Ht co-ords of VIP
message area 3     VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4     select final position - before pick, edit finished- after pick

Screen message area
   <Select final position of point> [picks][menu]
   <Select final position of point> [picks][accepts][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The extend option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the alignment edit menu.

Typed input can be used in either step.

Note - Extend can be used on the end points of the string.

See the next section 14.20.2.7 Alignment Height or return to 14.20.2 Alignment Edit.

14.20.2.7 Alignment Height

The height option is used to insert and/or modify the height of a vertical intersection point in a plan view, or to modify the height of a vertical intersection point in a section view.

Hence the height option is unique - it only affects the vertical geometry of the string but can be used in a plan or section view.

The height walk-right is

14.20.2.7.1 By Plan - Height in a Plan View

In a plan view, the height=>by plan option is used to create a vertical intersection point of a given height, or modify the height of an existing vertical point, at a selected plan position on the string.

After the height option is chosen, the user selects a position on the string in a plan view. The use of point and line snap will important for selecting the correct position.

If a vertical intersection point already exists at the chainage of the selected position, it will be selected for modification. Otherwise a new vertical intersection point will be inserted into the vertical geometry at the chainage of the selected position.

A new height typed-input box is then displayed on the screen with the vertical intersection point's current height (z value).

The new height typed-input box looks like:

[Diagram of new height typed-input box]

The height is entered into the typed-input box, terminated with <Enter>. The entered value is taken as the new height of the vertical intersection point in the alignment.

The typed-input box then disappears.
14.20.2.7.2 By Section - Height in a Section View

In a section view, the `height=>by section` option can only be used to modify the height of an existing vertical intersection point.

After the `height` option is chosen, the user selects the vertical intersection point that will have its height modified from a section view. After selecting the VIP, a new `height` typed-input box is displayed on the screen with the point's current height (z value).

The new `height` typed-input box looks like:

```
New height
New height 0.1717
```

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new height of the vertical intersection point in the alignment string and the string redrawn with the new height at that point.

The typed-input box then disappears.

For either `height=>by plan` or `height=>by section`, the `height` option is terminated on selecting `cancel` from the `pick ops` menu or by selecting a new option from the `alignment edit` menu.

See the next section 14.20.2.8 Alignment Curves or return to 14.20.2 Alignment Edit.

14.20.2.8 Alignment Curves

The `Curves` option allows the user to

(a) add a circular curve of a specified radius or curve length to a horizontal intersection point
(b) add start and end transition (eg spiral) to an intersection point with and existing circular curve
(c) add a circular curve of a specified radius or curve length to a vertical intersection point

The `Curves` walk-right menu is

```
Curves
Radius
Length
Spiral
Reverse
Properties
```

The `radius` option is used to create or modify the radius of a circular curve at a horizontal or vertical intersection point. `radius` acts on the horizontal geometry if the point is selected in a plan view, or the vertical geometry if the point is selected in a section view.

Similarly the `length` option is used to set a circular curve by giving its total curve length rather than the radius. `length` acts on the horizontal geometry if the point is selected in a plan view, or the vertical geometry if the point is selected in a section view.

The `spiral` option is for adding transitions to a horizontal intersection point with a curve already on it.

14.20.2.8.1 Radius

In a plan view, the `radius` option is used to add a circular curve to an intersection point with no curve or to modify the radius of the circular curve if one already exists.

In a section view, the `radius` option is used to add a circular curve to an intersection point with no curve or to modify the radius of a circular curve if one already exists.

Radius is a two step process.
Step (a) - selecting the intersection point
First the intersection point whose curve is to be modified is selected.

For horizontal radius
- message area 1: <Radius>
- message area 2: IP point number, x, y co-ords of IP, radius, start spiral, end spiral
- message area 3: bearing-in, bearing out, bearing difference for the inserted IP

For vertical radius
- message area 1: <Radius>
- message area 2: VIP point number, Ch, Ht co-ords of VIP
- message area 3: radius, %grade-in, %grade-out, grade diff for the moved VIP
- message area 4: enter value - before value entered edit finished - after value entered

Screen message area
- <Select point to change radius> [picks][menu]
- <Select point to change radius> [picks][accepts][menu]

Step (b) - entering the new radius
After an intersection point is chosen, a new radius typed-input box is displayed on the screen with either the intersection point's current curve radius or, if no curve exists, zero.

The new radius typed-input box looks like:

![New radius input box]

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the curve at that intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing curve is to be removed from an intersection point, enter the value zero into the new radius typed-input box.

horizontal
- message area 1: <Radius>
- message area 2: IP point number, x, y co-ords of IP, radius, start spiral, end spiral
- message area 3: bearing-in, bearing out, bearing diff for the inserted IP
- message area 4: enter value - before value entered edit finished - after value entered

vertical
- message area 1: <Radius>
- message area 2: VIP point number, Ch, Ht co-ords of VIP
- message area 3: radius, %grade-in, %grade-out, grade diff for the moved VIP
- message area 4: enter value - before value entered edit finished - after value entered

Like most of the other alignment edit options, after a radius has been modified the option is still current and another intersection point can be chosen to have its curve radius modified.

The radius option is terminated by selecting a different alignment edit option.

14.20.2.8.2 Length

Although the circular curve on an intersection point is stored as a radius, it is possible to define the radius indirectly by giving the total curve length by using the length option.

The option works in plan or section views.

To use length, first select the intersection point to add a new circular curve to, or to modify the existing curve.

A new length typed-input box is then displayed on the screen with either the current curve length, or if no curve exists, zero.
The new length typed-input box looks like:

![New length box]

The total curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new curve length. The typed-input box then disappears.

If an existing circular curve is to be removed, zero is entered into the new length typed-input box.

Like most of the other alignment edit options, after the length has been modified the option is still current and another IP can be chosen to have its curve modified.

The length option is terminated by selecting a different alignment edit option.

**WARNING** - when length is used, the equivalent radius is computed and stored with the curve. If the IP is moved, the radius is kept constant and the total curve length is modified.

### 14.20.2.8.3 Spiral

In a plan view, the spiral option is used to add a start or end transitions (eg spirals) to a curve on an intersection point, or to modify an existing transition. Spiral does not work on a section view.

After picking spiral, select the end of the curve to add a new transition to, or the existing transition to be modified. A new length typed-input box is displayed on the screen with either the current transition length, or zero if no transition exists.

The new length typed-input box looks like:

![New length box]

The transition length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new transition length. The typed-input box then disappears.

If an existing transition is to be removed, zero is entered into the new length typed-input box.

Like most of the other alignment edit options, after the spiral has been modified the option is still current and another curve can be chosen to have its transitions modified.

The spiral option is terminated by selecting a different alignment edit option.

### 14.20.2.8.4 Reverse

12d Model normally creates a curve on the side of the IP that has the smallest angle. The sign of the radius (positive or negative) is automatically determined by 12d Model.

The Reverse option creates a circular curve that is the part left over from the standard curve.

On selecting Reverse, the Reverse IP panel is displayed.

![Reverse IP panel]

The HIP is chosen by either typing in the HIP number in the IP number field, or by clicking on the 123 button and then selecting the HIP.
To change the curve from reversed/not reversed, simply tick on/off the Reversed tick box and then click on Set.

See the next section 14.20.2.9 Alignment Parabolas or return to 14.20.2 Alignment Edit.

14.20.2.9 Alignment Parabolas

The parabolas option is for adding, removing or modifying parabolic curves to the vertical geometry. It allows the user to

(a) add a parabolic curve of a given curve length to a vertical intersection point
(b) add a parabolic curve of a given effective radius to a vertical intersection point

The parabolas walk-right menu is

![](image)

The radius option is used to set a parabolic curve of given effective radius to a vertical intersection point.

The length option is used to set a parabolic curve of a given curve length to a vertical intersection point.

**Note** - the option only works on the vertical geometry if the VIP is selected in a section view. Points cannot be selected in any other view.

14.20.2.9.1 Radius

In a section view, the radius option is used to add a parabolic curve to an intersection point with no curve or to modify the radius of the parabolic curve if one already exists.

**Radius** is a two step process.

**Step (a) - selecting the intersection point**

First the intersection point whose parabola is to be modified is selected.

message area 1 <Radius>
message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 enter value- after pick
Screen message area

<Select point to change radius> [picks][][menu]
<Select point to change radius> [picks][accepts][menu]

**Step (b) - entering the new radius**

After an intersection point is chosen, a new radius typed-input box is displayed on the screen with either the intersection point's current parabolic radius or, if no parabola exists, the last value entered into the radius typed-input box.

The new radius typed-input box looks like:

![New radius input box](image)

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the parabola at that intersection point and the string redrawn with the new parabola. The typed-input box then disappears.

If an existing parabola is to be removed from an intersection point, enter the value zero into the radius typed-input box.
Like most of the other alignment edit options, after the radius has been modified the option is still current and another intersection point can be chosen to have its parabolic radius modified.

The radius option is terminated by selecting a different alignment edit option.

**WARNING** - when radius is used, the equivalent parabolic length is computed and stored with the curve. If the VIP is moved, the parabolic length is kept constant and the effective radius is modified.

### 14.20.2.9.2 Length

The length option is used to add a parabolic curve to a vertical intersection point with no curve or to modify the length of the parabolic curve if one already exists.

Adding or modifying curve length is a two step process.

**Step (a) - selecting the vertical intersection point**

First the vertical intersection point whose parabola is to be modified is selected.

**Step (b) - entering the new curve length**

After a VIP is selected, a new length typed-input box is displayed on the screen with the point's current parabolic curve length.

The new length typed-input box looks like

The curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the length of the parabolic curve at that vertical intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing parabola is to be removed from a vertical intersection point, enter the value zero into the curve length typed-input box.

Like most of the other alignment edit options, after the parabolic curve length has been modified the option is still current and another vertical intersection point can be chosen to have its parabola modified.

The length option is terminated by selecting a different alignment edit option.

See the next section **14.20.2.10 Alignment Utilities** or return to **14.20.2 Alignment Edit**.

### 14.20.2.10 Alignment Utilities
The Utilities walk-right menu contains a number of useful miscellaneous option for the alignment string. The menu is

The Utilities walk-right menu contains a number of useful miscellaneous option for the alignment string. The menu is

Each of the options will now be discussed.

14.20.2.10.1 Move VIPs

The Move VIPs option is for moving a range of vertical intersection points (VIPs) by a chainage or an elevation increment.

After selecting the option, the Move VIPs panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start VIP No.</td>
<td>the VIP number of the 1st VIP in the range to be moved. If blank, then 1.</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>End VIP No.</td>
<td>the VIP number of the last VIP in the range to be moved. If blank, then the last VIP.</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mode</td>
<td>if move chainage, the chainage of all the points in the specified range are incremented by the given value. If move hts, the heights (elevations) of all the points in the specified range are incremented by the given value.</td>
<td>input</td>
<td>move chainage</td>
<td>move hts</td>
</tr>
<tr>
<td>Value</td>
<td>value to increment either the chainage or the height for all the VIPs in the specified range.</td>
<td>input</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
**Move** button
move the VIPs in the range given by the start and end ip field by the chainage or height given in the value field.

**14.20.2.10.2 Sort VIPs**
The sort VIPs option is for sorting VIP's into increasing chainage order. After selecting the option, the sort VIPs panel is displayed.

![Sort VIPs panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start VIP No.</td>
<td>input</td>
<td>if not blank, the VIP number of the 1st VIP in the range to be sorted. If blank, then 1.</td>
<td></td>
</tr>
<tr>
<td>End VIP No.</td>
<td>input</td>
<td>the VIP number of the last VIP in the range to be sorted. If blank, then the last VIP.</td>
<td></td>
</tr>
<tr>
<td>Sort</td>
<td>button</td>
<td>sort the VIPs in the range given by the start and end ip field into chainage order.</td>
<td></td>
</tr>
</tbody>
</table>

**14.20.2.10.3 Chainage Insert**
The chainage insert option inserts a vertical intersection point (VIP) at a given chainage and height. After selecting the option, the chainage insert VIP panel is displayed.

![Chainage Insert VIP panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ch ht</td>
<td>input</td>
<td>the chainage and height of the VIP to insert - separate values by spaces.</td>
<td></td>
</tr>
<tr>
<td>Insert</td>
<td>button</td>
<td>insert the VIP point given in the Ch ht field into the alignment string.</td>
<td></td>
</tr>
</tbody>
</table>
14.20.2.10.4 Grade Insert

The grade insert option inserts a VIP at a given grade from an existing VIP. The new VIP position is given by either a distance from the picked VIP or at given chainage.

After selecting the option, the grade insert VIP panel is displayed.

![Grade Insert VIP panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start VIP #</td>
<td>the VIP number whose position is used to start the grade insert from.</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Grade</td>
<td>percent grade to be used.</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mode</td>
<td>choice distance distance, chainage</td>
<td>choice</td>
<td>distance</td>
<td>chainage</td>
</tr>
<tr>
<td></td>
<td>if distance, the new VIP is inserted at the given grade and distance (given in the value field) from the start VIP.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>if chainage, the new VIP is inserted at the chainage (given in the value field but having the given grade from the start VIP.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Insert</td>
<td>button insert the new VIP into the alignment string.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

14.20.2.10.5 Grades Intersect

The grades intersect option inserts a VIP which is given by intersecting lines of given grades from two existing VIPs. The grades are either typed in or calculated by giving another VIP that the line goes through.

After selecting the option, the Grades Intersect VIPs panel is displayed.

![Grades Intersect VIPs panel](image)

The fields and buttons used in the panel have the following functions.
Field Description | Type       | Defaults | Pop-Up
Start VIP #       | input      | the VIP number which is used in defining a line.

Mode              | choice     | grade    | grade, VIP #
If grade, the field value is a percent grade and a line is defined as going through the start VIP and with the given grade.
If VIP #, the field value is the number of a VIP and a line is defined as going through the start VIP and this VIP.

Note for grades positive is up when going in the direction of increasing chainage and negative is up when going in the direction of decreasing chainage.

Value              | input      |
If mode is grade, value is a percent grade.
If mode is VIP #, value is the number of a VIP.

Insert             | button     |
Calculate the point which is the intersection of the two lines and insert it as a new VIP into the alignment string.

14.20.2.10.6 Interval
Each alignment string has a chainage interval that is used to define regular points along the string. The chainage interval is used for approximation the alignment in operations such as triangulating and applying templates to an alignment string.

After selecting the option, an enter value typed-input box is displayed on the screen with the string's current chainage interval placed in it.

The new chainage interval is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The interval option terminates after use.

14.20.2.10.7 Start Chainage
Each alignment string has a start chainage which can be positive, negative or zero.

After selecting the option, an enter value typed-input box is displayed on the screen with the string's current start chainage in it.

The new start chainage is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

When a new start chainage is entered, the vertical intersection points are automatically moved so that they retain their same relative chainage with respect to the start point on the alignment.

The start chainage option terminates after use.

14.20.2.10.8 Regenerate
If the horizontal geometry of an alignment string is modified, then the profile through any triangulations would also change. Hence, if the alignment string being edited was profiled on any section views, then the profile would be need to be recalculated after any horizontal geometry changes.

On selecting the regenerate option, any section view that has the alignment string being edited as its primary string (that is, as the string defining the chainage for the section view) is automatically re-profiled.

Hence the regenerate option is equivalent to running the regenerate option for each section view with the edited alignment string as its primary string.

14.20.2.10.9 Validate
When constructing horizontal and vertical geometry, it is possible to end up with invalid constructs such as overlapping tangent points.

On selecting the validate option, the alignment string will be checked for:

**horizontal geometry checks**
- at least two horizontal intersection points
- no co-incident horizontal intersection points
- no overlapping horizontal tangent points

**vertical geometry checks**
- at least two vertical intersection points
- no co-incident vertical intersection points
- no overlapping vertical tangent point
- vertical intersection points chainages are in ascending order

If any errors occur, an errors menu is placed on the screen.

![Errors Menu](image)

The errors menu remains on the screen and only disappears when either the [X] is picked or one of the error messages is picked with LB.

**Note** - the validate option is automatically run when the edit is finished.

### 14.20.2.10.10 Clear VG and Clear HG

The Clear VG and Clear HG options are used to delete all the horizontal and/or vertical intersection points in the string.

The Clear VG option removes all the vertical geometry from the string.

The Clear HG option removes all the horizontal and vertical geometry from the string.

After a Clear, the horizontal or vertical geometry can be re-entered using the edit options.

### 14.20.2.10.11 Properties

Selecting Properties brings up the Alignment String Properties panel which is used to modify the string’s header information.
The fields in this panel are similar to those in the **Create Alignment String** panel and the alignment string editor options. The only new field is

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Draw ips</strong></td>
<td>tick</td>
<td>tick</td>
<td></td>
</tr>
</tbody>
</table>

*If ticked*, the horizontal and vertical intersection points are drawn on plan and section views. *If not ticked*, the ips are not drawn on the plan and section views.

**OK/Apply** button

For the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.

See the next section 14.20.2.11 Finish or return to 14.20.2 Alignment Edit.

### 14.20.2.11 Finish

The **Finish** option is used to terminate the alignment string edits. After selecting the **Finish** option, the string is checked for overlapping horizontal or vertical tangent points and any errors reported.
14.20.3 2d Edit - Old

Position of option on menu:  **Strings => Editor**

On picking a 2d string, the **2d edit** menu and the **2d edit info** panel are placed on the screen.

See the earlier section **14.4.1 Super String Edit - Common Information** for general information about editing strings.

Each option in the **2d edit** menu will now be described.

### 14.20.3.1 Append

The **append** option is used to create the 1st point in a new string, to append a new intersect point to the end of the string or to prepend a new intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

#### 14.20.3.1.1 Existing 2d Strings

Appending a point is a two step process.

**Step (a) - selecting the end to append the point to.**

After the **append** option has been selected, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point.

- **message area 1** <Append Points>
- **message area 2** IP point number, x, y, z co-ords of IP
- **message area 3** bearing-in, bearing out, bearing difference for an IP
- **message area 4** select final position- after pick

Screen message area

- <Select string end to append to> [picks][menu]
- <Select string end to append to> [picks][accepts][menu]

**Step (b) - selecting the position for the new appended point.**

A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

- **message area 1** <Append Points>
- **message area 2** IP point number, x, y, z co-ords of IP
- **message area 3** bearing-in, bearing out, bearing difference for closest IP
- **message area 4** select final position- before pick
Once a point has been appended to the string, the appended point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position for the next appended point.

Hence a series of string points is easily entered by first selecting the string end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point and selecting them in turn.

**Typed input** can be used in either step.

The append option is terminated by either bringing up the pick ops menu and selecting cancel or by selecting a new option from the 2d edit menu.

If, after bringing up the pick ops menu, it is decided to continue with the append option, simply select the restart option from the pick ops menu and the pick ops menu will disappear leaving the append option still current.

### 14.20.3.1.2 New 2d String

For creating a new string, the cursor is used to select the 1st point of the string. The option then continues as if appending to an existing 2d string where the end point has already been selected.

See the next section **14.20.3.2 Move** or return to **14.20.3 2d Edit - Old**.

#### 14.20.3.2 Move

The move option is for moving individual points (intersection points - IP's) of the string.

The move cycle consists of two steps:

(a) selecting the point to be moved

(b) selecting the new position for the point.

**Step (a)**

First the point to be moved is selected. The selected point will then move around the view and the string redrewn to show the change as the cursor is moved.

- message area 1: <Move Point>
- message area 2: IP point number, x, y, z co-ords of IP
- message area 3: bearing-in, bearing out, bearing difference for the closest IP
- message area 4: select final position- after pick

**Screen message area**

- <Select point to move> [picks][][menu]
- <Select point to move> [picks][accepts][menu]

**Step (b)**

The current cursor position is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the IP, and the string redrawn.

- message area 1: <Move Point>
- message area 2: IP point number, x, y, z co-ords of IP
- message area 3: bearing-in, bearing out, bearing difference for the moved IP
- message area 4: select final position- before pick, edit finished- after pick

**Screen message area**

- <Select final position of point> [picks][][menu]
- <Select final position of point> [picks][accepts][menu]

**Typed input** can be used in either step.

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.
The move option is terminated by selecting cancel from the pick ops menu or by selecting a new 2d edit option.

See the next section 14.20.3.3 Insert or return to 14.20.3 2d Edit - Old.

14.20.3.3 Insert

The Insert option is designed to place a new intersection point in a string between two adjacent intersection points (note that the inserted point does not have to be on the line joining the two intersection points).

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the line connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

Step (b) - selecting the position for the new intersection point

The position of the new intersection point is selecting

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the insert option.

The insert option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the 2d edit menu.

Typed input can be used in either step.

See the next section 14.20.3.4 Between or return to 14.20.3 2d Edit - Old.

14.20.3.4 Between

The between option is similar to the insert option except that the inserted point does have to be on the line joining the two intersection points. To accomplish this, the cursor position is projected onto the IP-IP line to give the new IP point position.

The between option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the 2d edit menu.

See the next section 14.20.3.5 Delete or return to 14.20.3 2d Edit - Old.

14.20.3.5 Delete

The delete option is used to delete selected intersection points from the string.

The point to be deleted is picked (LB) and accepted (MB). When the point is accepted, it is deleted. The
string, minus the deleted point, is then redrawn.

Once a point has been deleted, another point in the string can then be selected and deleted. Hence any number of points from the string can be deleted one after another.

message area 1 <Delete Points>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for closest IP
message area 5 Screen message area
  <Select point to delete> [picks][menu]
  <Select point to delete> [picks][accepts][menu]

The delete option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the 2d edit menu.

Typed input can be used to select a point for deletion.

See the next section 14.20.3.6 Extend or return to 14.20.3 2d Edit - Old.

14.20.3.6 Extend

The extend option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, the bearing of the IP-IP line is kept constant and the intersection point is moved along that line either towards or away from its neighbouring intersection point on the IP-IP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by picking (LB) and accepting (MB) a co-ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and intersection point (IP) are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line.

As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

message area 1 <Extend Point>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for closest IP
message area 4 select final position- after pick
Screen message area
  <Select line to extend> [picks][menu]
  <Select line to extend> [picks][accepts][menu]

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the selected cursor position onto the IP-IP line.

message area 1 <Extend Points>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for closest IP
message area 4 select final position - before pick, edit finished - after pick
Screen message area
  <Select final position of point> [picks][menu]
  <Select final position of point> [picks][accepts][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The extend option is terminated by selecting cancel from the pick ops menu or by selecting a new
option from the 2d edit menu.

**Typed input** can be used in either step.

**Note** - Extend can be used on the end points of the string.

See the next section 14.20.3.7 Height or return to 14.20.3 2d Edit - Old.

14.20.3.7 Height

The height option is used to modify the height (z value) of the 2d string.

After the height option is chosen, an enter value typed-input box is displayed on the screen with the string's current height (z value).

The enter value typed-input box looks like:

```
<table>
<thead>
<tr>
<th>Enter value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter value</td>
</tr>
</tbody>
</table>
```

The height is entered into the typed-input box, terminated by <enter>. The entered value is taken as the height of the 2d string and the string redrawn with the new height. The typed-input box then disappears.

The height option automatically terminates and a new option is selected from the 2d edit.

**Note** - all the points in a 2d string have the same height.

See the next section 14.20.3.8 Open or return to 14.20.3 2d Edit - Old.

14.20.3.8 Open

If the string is closed (that is, the end points have the same x and y values), selecting the open option removes the last point of the string.

If the string is not closed, the open option does nothing.

See the next section 14.20.3.9 Close or return to 14.20.3 2d Edit - Old.

14.20.3.9 Close

Selecting the close option adds a point to the end of the string with the same co-ordinate values as the 1st point in the string.

See the next section 14.20.3.10 Properties or return to 14.20.3 2d Edit - Old.

14.20.3.10 Properties

Selecting Properties brings up the 2d String Properties panel which is used to modify the string's header information.
The fields in this panel are similar to those in the **Create 2d String** panel and the 2d string editor options. The only new field is:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Set</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*for the 2d string being edited, set all the items in the 2d String Properties panel to the values given in the panel.*
14.20.4 3d Edit - Old

Position of option on menu:  Strings => Editor

On picking a 3d string, the 3d edit menu and 3d edit info panel are placed on the screen.

The difference between a 2d and a 3d string is that all points in a 2d string have the same z-value, whereas for a 3d string, each point can have a different z-value.

Hence most of the options in the 3d edit menu are similar to the 2d edit options of the same name, and only the differences for each option will be discussed. The 2d Edit options are given in the section 14.4.2 Edit 2d.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.4.1 Append

The Append operation for a 3d string is similar to that for a 2d string except that a height (z-value) is required for each new point.

Since in most cases, it would be tiresome to ask for a height every time a point is added, the entry of a new height is controlled by the height toggle in the snaps menu. If height is toggled to on, then every time a point is placed or moved an enter height typed-input box is displayed on the screen.

The enter height typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the 3d string point and the string redrawn with the new height at the point. The typed-input box then disappears.

When the enter height box is placed on the screen, it will already have a value in it depending on the circumstances preceding the operation.

For example, if a point or line was snapped to, the height at that point or line will be displayed in the box.

See the next section 14.20.3.7 Height or return to 14.20.4 3d Edit - Old.

14.20.4.2 Height

The height option is used to modify the height (z value) of any point in the string.
After the height option is chosen, the user must select which point is going to have its height modified. After the point has been selected, an New height typed-input box is displayed on the screen with the point’s current height (z value).

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the point in the 3d string and the string redrawn with the new height at that point. The typed-input box then disappears.

The height option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the 3d edit menu.

See the next section 14.20.3.10 Properties or return to 14.20.4 3d Edit - Old.

### 14.20.4.3 Properties

Selecting Properties brings up the 3d String Properties panel which is used to modify the string’s header information.

![3d String Properties panel](image)

The fields in this panel are similar to those in the create 3d string panel and the 3dd string editor options. The only new field is

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK/Apply button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the 3d string with the values in the panel fields and leaves the panel on the screen.
14.20.5 4d Edit - Old

Position of option on menu: Strings => Editor
On picking a 4d string, the 4d edit menu and 4d edit info panel are placed on the screen.

Only the options append, text, size and angle will be described in detail since all the other options are similar to the equivalent 3d string option (see the section 14.4.3 Edit 3d).

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.5.1 Append

The append operation for a 4d string is similar to the 3d string case except that a height and an optional text label is required for each new point.

Since in many cases a text label is not required at every point of a 4d string, there is an append option that asks for text at every point and another that does not ask.

The 4d append walk-right is

The height question for each point is toggled on or off in the snaps menu just as it was for a 3d string.

The append option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the 4d edit menu.

See the next section 14.20.5.2 Text or return to 14.20.5 4d Edit - Old.

14.20.5.2 Text

The text option is used to modify the text label of any point in the 4d string.

After the text option is chosen, the user must select which point is going to have its text label modified. Once the point has been selected, an enter text typed-input box is displayed on the screen with the point's current text label placed in it.

The new text label is entered into the typed-input box, terminated with <enter>. The entered value is taken as the text label of the point in the 4d string and the string redrawn with the new text at that point. The typed-
input box then disappears.

The text option is terminated on selecting cancel from the pick ops menu or by selecting a new option from the 4d edit menu.

See the next section 14.20.5.3 Text ht or return to 14.20.5 4d Edit - Old.

14.20.5.3 Text ht

All the text labels in the 4d string have the same height (given in pixel or world units). The text ht option is used to modify this text label height.

After selecting the option, an enter value typed-input box is displayed on the screen with the string's current text label height placed in it.

The new text label height is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text label height for all the points in the 4d string and the string redrawn using the new height. The typed-input box then disappears.

The text ht option automatically terminates after use.

See the next section 14.20.5.4 Angle or return to 14.20.5 4d Edit - Old.

14.20.5.4 Angle

All the text labels in the 4d string are drawn rotated about their defining string point with the same rotation angle. The angle, in degrees, is measured in a counter-clockwise direction about the horizontal axis.

The angle option is used to modify the text rotation angle.

After selecting the option, an enter value typed-input box is displayed on the screen with the string's current text rotation angle placed in it.

The new text rotation angle is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text rotation angle for all the points in the 4d string and the string redrawn using the new angle. The typed-input box then disappears.

The angle option automatically terminates after use.

See the next section 14.20.5.5 Utilities or return to 14.20.5 4d Edit - Old.

14.20.5.5 Utilities

Position of option on menu: Strings => Editor

The 4d utilities walk-right is

14.20.5.5.1 Properties

Selecting Properties brings up the 4d String Properties panel which is used to modify the string's header information.
The fields in this panel are similar to those in the `create 4d string` panel and the 4d string editor options. The only new field is

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK/Apply button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.
14.20.6 Pipe Edit - Old

On picking a pipe string, the pipe edit menu and panel are placed on the screen.

The only difference between a 3d and a pipe string is that the pipe string has a diameter. Hence most of the options in the pipe edit menu are similar to the 3d edit options of the same name, and only the diameter and Properties options need to be discussed. See the section 14.4.3 Edit 3d for information on the 3d string editor.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.6.1 Diameter

The diameter option is used to modify the diameter of the pipe string. After the diameter option is chosen, an enter value typed-input box is displayed on the screen with the string's current diameter.

The enter value typed-input box looks like:

```
<table>
<thead>
<tr>
<th>Enter value</th>
</tr>
</thead>
</table>
```

The diameter is entered into the typed-input box, terminated with <enter>. The entered value is taken as the diameter of the pipe string. The typed-input box then disappears.

The diameter option automatically terminates and a new option is selected from the pipe edit menu.

**Note** - the pipe string has only one diameter for the entire string.

See the next section 14.20.6.2 Properties or return to 14.20.6 Pipe Edit - Old.

14.20.6.2 Properties

Selecting Properties brings up the Pipe String Properties panel which is used to modify the string's header information.
The fields in this panel are similar to those in the **create pipe string** panel and the 3d string editor options. The only new field is

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK/Apply button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.
14.20.7 Polyline Edit - Old

On picking a polyline string, the polyline edit menu and polyline edit info panel are placed on the screen.

The major difference between a polyline and a 3d string is that a polyline string can have an arc instead of a line joining adjacent string points. Hence most of the options in the polyline edit menu are similar to the 3d edit options of the same name, and only the differences for each option will be discussed. See the section 14.4.3 Edit 3d for information on the 3d string editor.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.7.1 Append

The append operation for a polyline string is similar to the 3d string case except that an arc radius can be given for each new line segment.

Since in many cases an arc radius is not required at every segment of a polyline string, there is an append option that asks for the radius at every point and another that does not ask.

The append walk-right is

If the append + radius option selected, then before each point is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next polyline string point and the arc will be drawn correctly as the cursor is moved to the next point.

A radius value of 0 is taken to mean no arc.

The height question for each point is toggled on/off in the snaps menu just as it was for a 3d string.
The `append` option is terminated on selecting `cancel` from the `pick ops` menu or by selecting a new option from the `polyline edit` menu.

See the next section 14.20.7.2 Extend or return to 14.20.7 Polyline Edit - Old.

### 14.20.7.2 Extend

There are two `extend` options for a polyline string - `extend=>extend` that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, `extend=>extend ht` where the z-value of the point being extended is linearly interpolated by the extension distance.

The `Extend` walk-right is

![Polyline Edit Options](image)

#### 14.20.7.2.1 Extend

`extend=>extend` that is identical to the 3d string case where the z-value of the point being extended is kept constant.

#### 14.20.7.2.2 Extend by ht

`extend=>extend ht` not only moves the point but also linearly interpolates the z-value of the point being extended.

See the next section 14.20.7.3 Radius or return to 14.20.7 Polyline Edit - Old.

### 14.20.7.3 Radius

Selecting `radius` brings up the `change radius` panel which is used to modify the radius of any arc/line joining adjacent polyline points.

![Change Radius Panel](image)

After selecting the `radius` option, the user selects the arc/straight to be modified and the current arc radius and bulge setting will be displayed in the `change radius` panel.

New values can then be entered and the arc modified by selecting the `set` button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc: one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.
14.20.7.4 Utilities

The Utilities walk-right menu contains a number of useful miscellaneous option for the polyline string. The menu is

Each of the new options will now be discussed.

14.20.7.4.1 Ins 3 Pt Curve

The Ins 3 Pt Curve option is used to insert a curve through three adjacent polyline points. After selecting the option, the middle IP of the three adjacent polyline points is selected. When the IP is accepted, the radius required to fit a curve through the IP and the two adjacent IP’s is calculated, and this radius is then applied to the segments joining the adjacent IP’s.

14.20.7.4.2 Del 3 Pt Curve

The del 3 pt curve option is used to delete the curves on either side of a polyline point. After selecting the option, an IP is selected and when the IP is accepted, the radii of the segments on either side are set to zero. Hence the curves on either side of the IP are effectively removed.

14.20.7.4.3 Properties

Selecting Properties brings up the Polyline String Properties panel which is used to modify the string’s header information.

See the next section 14.20.7.4 Utilities or return to 14.20.7 Polyline Edit - Old.
The fields in this panel are similar to those in the create polyline string panel and the polyline string editor options. The only new field is:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK/Apply button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.
14.20.8 Super Edit - Old

On picking a super string, the **Super Edit** menu and **Super Edit Info** panel are placed on the screen.

The super string is similar to a polyline string in that it can have an arc instead of a line joining adjacent string points. Hence most of the options in the **super edit** menu are similar to the **polyline edit** options of the same name, and only the differences for each option will be discussed.

See the earlier section 14.4.1 **Super String Edit - Common Information** for general information about editing strings.

14.20.8.1 Append

The **Append** operation for a super is the same as the polyline case and an arc radius can be given for each new line segment.

Since in many cases an arc radius is not required at every segment of a super string, there is an append option that asks for the radius at every point and another that does not ask.

The **Append** walk-right is

If the **Append + Radius** option selected, then before each vertex is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next super string vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A radius value of 0 is taken to mean no arc.

The height question for each vertex is toggled on/off in the snaps menu just as it was for a polyline string.

The **Append** option is terminated on selecting **Cancel** from the **Pick Ops** menu or by selecting a new
option from the Super Edit menu

See the next section 14.20.8.2 Extend or return to 14.20.8 Super Edit - Old.

14.20.8.2 Extend

There are two extend options for a polyline string - Extend=>Extend that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, Extend=>Extend Ht where the z-value of the point being extended is linearly interpolated by the extension distance.

The Extend walk-right is

14.20.8.2.1 Extend

Extend=>Extend that is identical to the 3d string case where the z-value of the point being extended is kept constant.

14.20.8.2.2 Extend by Ht

Extend=>Extend Ht not only moves the point but also linearly interpolates the z-value of the point being extended.

See the next section 14.20.8.3 Vertex or return to 14.20.8 Super Edit - Old.

14.20.8.3 Vertex

The Vertex menu contains options to modify information at any vertex of the super string.

The Vertex walk-right is

14.20.8.3.1 Height

Selecting Vertex=>Height brings up the Super Vertex Height panel which is used to set the height value for vertices.
As soon as Height is chosen, a <Select vertex> [Picks][[Menu] message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its vertex number, height mode and height are written to the appropriate panel fields. The values and modes can be changed and either OK or Apply selected to change the values of the vertex.

Another vertex can then be selected or the Prev and Next buttons used to move to adjacent vertices.

The fields and buttons used in the Super Vertex Height panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input</td>
<td>selected vertex</td>
<td>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Height mode | input                                | no z, entire string, each vertex | if no z, there is no z value for the vertex.  
if entire string, then the string has the same z value for each vertex.  
if each vertex, then each vertex has a separate z value. |
| Height      | input                                | height of vertex/string | the height used for the vertex or for the entire string. |
| OK/Apply    | button                               | for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen. |

14.20.8.3.2 Tinable

Selecting Vertex=>Tinable brings up the Super Vertex Tinable panel which is used to set the tinable flag for vertices.
As soon as Tinable is chosen, a <Select vertex> [Picks] [Menu] message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its vertex number and tinable flag are displayed in the panel. The tinable flag can be changed and either OK or Apply selected to change the tinable flag of the vertex.

Another vertex can then be selected or the Prev and Next buttons used to move to adjacent vertices.

The fields and buttons used in the Super Vertex Tinable panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
</tr>
</tbody>
</table>

  * if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.

<table>
<thead>
<tr>
<th>Prev button</th>
<th>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Next button</td>
<td>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Tinable tick</th>
<th>if ticked, the vertex is included in tins. if not ticked, then the vertex is ignored when triangulating.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK/Apply button</td>
<td>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

14.20.8.3.3 Visible

Selecting Vertex=>Visible brings up the Super Vertex Visible panel which is used to set the visibility flag for vertices.
As soon as Visible is chosen, a <Select vertex> [Picks][Menu] message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its vertex number and visibility flag are displayed in the panel. The visibility flag can be changed and either OK or Apply selected to change the visibility flag of the vertex.

Another vertex can then be selected or the Prev and Next buttons used to move to adjacent vertices.

The fields and buttons used in the Super Vertex Visible panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
</tr>
<tr>
<td>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
<td></td>
</tr>
<tr>
<td>Visible</td>
<td>tick</td>
<td></td>
<td></td>
</tr>
<tr>
<td>if ticked, the vertex is visible.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>if not ticked, then the vertex is invisible.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

14.20.8.3.4 Point no

Selecting Vertex=>Point no brings up the Super Vertex Point Number panel which is used to set the point numbers for vertices.
As soon as Point no is chosen, a <Select vertex> [Picks][Menu] message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its vertex number and point number are displayed in the panel. The point number can be changed and either OK or Apply selected to change the point number of the vertex. Another vertex can then be selected or the Prev and Next buttons used to move to adjacent vertices.

The fields and buttons used in the Super Vertex Visible panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Point no.</td>
<td>input</td>
<td>point no of vertex</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the point number used for the vertex.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

14.20.8.3.5 Text

Selecting Vertex=>Text brings up the Super Vertex Text panel which is used to set the text for vertices.
As soon as Text is chosen, a <Select vertex> [Picks][][Menu] message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its vertex number, text mode and text are written to the appropriate panel fields. The values and modes can be changed and either OK or Apply selected to change the values of the vertex.

Another vertex can then be selected or the Prev and Next buttons used to move to adjacent vertices.

The fields and buttons used in the Super Vertex Text panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input selected vertex if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</td>
</tr>
<tr>
<td>Prev</td>
<td>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
</tr>
<tr>
<td>Text mode</td>
<td>input no text, entire string, each vertex if no text, there is no text for the vertex. if entire string, then the string has the same text for each vertex. if each vertex, then each vertex has a separate text value.</td>
</tr>
<tr>
<td>Text</td>
<td>input text of vertex/string the text used for the vertex or for the entire string.</td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

14.20.8.3.6 Text Info

Selecting Vertex=>Text info brings up the Super Vertex Annotate panel which is used to set the annotation styles for the text at vertices.
As soon as `Text info` is chosen, a `<Select vertex> [Picks][][Menu]` message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its `vertex number`, `annotate mode` and `annotation information` are written to the appropriate panel fields. The values and modes can be changed and either `OK` or `Apply` selected to change the values of the vertex.

Another vertex can then be selected or the `Prev` and `Next` buttons used to move to adjacent vertices.

The fields and buttons used in the `Super Vertex Annotate` panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
</tr>
<tr>
<td>Annotate mode</td>
<td>input</td>
<td>no annotation, entire string, each vertex</td>
<td></td>
</tr>
<tr>
<td>Text style</td>
<td>input</td>
<td>1</td>
<td>available text styles</td>
</tr>
<tr>

<td>input</td>
<td>pixels</td>
<td>pixels, world</td>
</tr>
<tr>
<td>Height (u)</td>
<td>input</td>
<td>height of the text (in text units).</td>
<td></td>
</tr>
<tr>
<td>X factor</td>
<td>input</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Offset (u)</td>
<td>input</td>
<td>0</td>
<td>distance (in text units) to offset the text from its (x,y) placement position.</td>
</tr>
</tbody>
</table>
Raise (u)  input  0  
\text{distance (in text units) to raise the text above the line for its (x,y) placement position.}

Justify  input  bottom-left  bot-left/cent/right, mid-left/cent/right  top-left/cent/right  
\text{text justification (about the offset position).}

Angle  input  
\text{angle of the text.}

Slant  input  0  
\text{slant, in degrees, of the text.}

Colour  input  available colours  
\text{colour of the text.}

OK/Apply button  
\text{for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.}

14.20.8.3.7 Symbol Info

Selecting Vertex=>Symbol info brings up the Super Vertex Symbol panel which is used to set symbols and their display parameters at vertices.

As soon as Symbol info is chosen, a <Select vertex> [Picks][][Menu] message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its vertex number, symbol mode and symbol information are written to the appropriate panel fields. The values and modes can be changed and either OK or Apply selected to change the values for the vertex.

Another vertex can then be selected or the Prev and Next buttons used to move to adjacent vertices.

The fields and buttons used in the Super Vertex Symbol panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
</tr>
</tbody>
</table>

\text{if a vertex is selected, then its vertex number is displayed in this field. A number can also be}
typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.

Prev button
move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button
move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Symbol mode input
no symbol, entire string, each vertex
if no symbol, then there is no symbol at the vertex.
if entire string, then the same symbol and settings are used for each vertex.
if each vertex, then each vertex has separate symbols and settings.

Symbol style input 1 available line styles
line style for the symbol at the vertex.

Symbol rotation input
rotation angle of the symbol.

Symbol size (u) input
size of the symbol (in xxx units).

Symbol offset (u) input 0
distance (in xxx units) to offset the symbol from its (x,y) placement position.

Symbol raise (u) input 0
distance (in xxx units) to raise the symbol above the line for its (x,y) placement position.

Symbol colour input available colours
colour of the symbol if none is defined in the symbol definition

OK/Apply button
for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.

14.20.8.3.8 Attributes
Selecting Vertex=>Attributes brings up the Super Vertex User Attributes panel which is used to display and edit user defined attributes at vertices of the super string.
The Prev and Next buttons are used to cycle through and display the attributes for each vertex in the super string in the Name/Type/Data grid.

The data in the Name/Type/Data grid can be deleted, modified or added to and then updated for the vertex using the OK or Apply button.

The fields and buttons used in the Super Vertex User Attributes panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertex no.</td>
<td>input selected vertex when the option starts, the user attributes for the first vertex is displayed. The Next and Prev buttons will move onto other vertices. Also a number can be typed into the field and any information in the panel will then be applied to that vertex if OK or Apply is selected. Typing &lt;Enter&gt; after entering a number will go to that vertex number and display the attributes.</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Attribute mode         | choice box                                                                  | choice box   | no attributes, each vertex | if no attributes, then no vertices have user attributes. if each vertex, then each vertex can have user attributes.
### Name/Type/Data Grid

**Name**

input

name for the user attribute. This must be unique for all attributes at this vertex.

**Type**

choice box

integer, real, text

**Data**

input

value for the attribute.

**OK/Apply**

button

for the vertex being edited, OK sets the vertex with the values in the panel fields and removes the panel. Apply sets the vertex with the values in the panel fields and leaves the panel on the screen.

### 14.20.8.3.9 Vertex - All above

Selecting Vertex => All above brings up the Super Vertex Properties panel which is used to display all the properties for a vertex.

This option is also available from the Strings menu.

**Position of option on menu:**

Strings => Properties => Vertex (all)

As soon as All above is chosen, a <Select vertex> [Picks][][Menu] message is written to the Status Bar and vertices can be selected.
When the vertex to modify is selected, its vertex number and all other information are written to the appropriate panel fields. The values and modes can be changed and either OK or Apply selected to change the values for the vertex.

The fields in the Super Vertex Properties panel have already been described in the other Vertex options and so will not be described again.

Please continue to the next section 14.4.10.5 Segment Toolbar.

14.20.8.4 Segment

The Segment menu contains options to modify information at any segment of the super string.

The Segment walk-right is

![Segment Walk-right](image)

14.20.8.4.1 Colour

Selecting Segment=>Colour brings up the Super Segment Colour panel which is used to set the colour of the string segments.

![Super Segment Colour Panel](image)

As soon as Colour is chosen, a <Select segment> [Picks][[Menu] message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its segment number, colour mode and colour are written to the appropriate panel fields. The values and modes can be changed and either OK or Apply selected to change the values of the segment.

Another segment can then be selected or the Prev and Next buttons used to move to adjacent segments. The appropriate segment highlights when the Prev and Next buttons are used.

The fields and buttons used in the Super Segment Colour panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Segment no.</td>
<td>input</td>
<td>selected vertex</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or...*
Apply is selected.

Prev button
move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button
move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Colour mode input
string colour, each segment
if no z, there is no z value for the vertex.
if string colour, then all the segments in the string have the same colour.
if each segment, then each segment has a separate colour.

Colour input
colour of segment/string
available colours
the colour used for the segment or for the entire string.

OK/Apply button
for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.

14.20.8.4.2 Tinable
Selecting Segment=>Tinable brings up the Super Segment Tinable panel which is used to set the tinable flag for segments.

As soon as Tinable is chosen, a <Select segment> [Picks][[Menu]] message is written to the Status Bar and vertices can be selected.

When the segment to modify is selected, its segment number and tinable flag are displayed in the panel. The tinable flag can be changed and either OK or Apply selected to change the tinable flag of the segment. Another segment can then be selected or the Prev and Next buttons used to move to adjacent segments.

The fields and buttons used in the Super Segment Tinable panel have the following functions.

Field Description Type Defaults Pop-Up
Segment no. input selected segment
if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.

Prev button
move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.
Next button
move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Tinable tick
if ticked, the triangulation process tries to preserve the segment as a side of a triangle in the tin.

OK/Apply button
for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.

14.20.8.4.3 Diameter
The segments of a super string can have either a pipe or box cross section, or none. Selecting Segment=>Diameter brings up the Super Segment Pipe panel which is used to set the pipe mode and size for the string segments.

As soon as Diameter is chosen, a <Select segment> [Picks][][Menu] message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its segment number, pipe mode and information are written to the appropriate panel fields and the Super Segment Pipe panel will change depending on whether it was a pip or box cross-section for the string.

After any panel fields are modified, selecting either OK or Apply will change the pipe information for the segment.
Another segment can then be selected or the Prev and Next buttons used to move to adjacent segments. The appropriate segment highlights when the Prev and Next buttons are used.

The fields and buttons used in the Super Segment Pipe panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Segment no.</td>
<td>Type input selected vertex if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</td>
</tr>
<tr>
<td>Prev</td>
<td>button move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</td>
</tr>
<tr>
<td>Next</td>
<td>button move to the next segment (successor). The information for the next segment is displayed in the panel fields.</td>
</tr>
<tr>
<td>Pipe mode</td>
<td>input no pipe or box pipe entire string pipe each segment box entire string box each segment</td>
</tr>
<tr>
<td>Justify</td>
<td>input invert, centre, overt justification of the pipe/box with respect to the co-ordinates given for the vertices of the super string. rotation angle of the symbol.</td>
</tr>
<tr>
<td>Pipe diameter</td>
<td>input diameter of the pipe in world units.</td>
</tr>
<tr>
<td>Box width</td>
<td>input width of the box section in world units.</td>
</tr>
<tr>
<td>Box height</td>
<td>input height of the box section in world units.</td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

14.20.8.4.4 Radius

When viewed in plan, the segments of a super string can be joined by string lines or arcs. If the radius is positive, the arc is drawn from the start vertex to the end vertex of the segment in a clockwise direction. If the radius is negative, the arc is drawn from the start vertex to the end vertex on the segment in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.

A zero radius is interpreted to be a just a straight line segment with no arc.

Selecting Segment=>Radius brings up the Super Segment Radius panel which is used to set the plan radius of the segment.
As soon as \texttt{Radius} is chosen, a <Select segment> [Picks][][Menu] message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its segment number, radius and bulge are written to the appropriate panel fields. The values and modes can be changed and either \texttt{OK} or \texttt{Apply} selected to change the values of the segment.

Another segment can then be selected or the \texttt{Prev} and \texttt{Next} buttons used to move to adjacent segments. The appropriate segment highlights when the \texttt{Prev} and \texttt{Next} buttons are used.

The fields and buttons used in the \textbf{Super Segment Radius} panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

<td>\textit{if not-ticked, the smaller arc is used.}</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Bulge input 0
radius of the segment arc. A radius of 0 mean no arc.

OK/Apply button
for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.

14.20.8.4.5 Text
Selecting Segment=>Text brings up the Super Segment Text panel which is used to set the text for segments.

As soon as Text is chosen, a <Select segment> [Picks][][Menu] message is written to the Status Bar and vertices can be selected.

When the segment to modify is selected, its segment number, text mode and text are written to the appropriate panel fields. The values and modes can be changed and either OK or Apply selected to change the values of the segment.

Another segment can then be selected or the Prev and Next buttons used to move to adjacent segments.

The fields and buttons used in the Super Segment Text panel have the following functions.

<table>
<thead>
<tr>

</table>
OK/Apply button

for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

### 14.20.8.4.7 Visible

Selecting **Segment=>Visible** brings up the **Super Segment Visible** panel which is used to set the visibility flag for segments.

As soon as **Visible** is chosen, a `<Select segment> [Picks][][Menu]` message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its **segment number** and **visibility flag** are displayed in the panel. The visibility flag can be changed and either **OK** or **Apply** selected to change the visibility flag of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Visible** panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Segment no.</strong></td>
<td>input</td>
<td></td>
<td>selected vertex</td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if <strong>OK</strong> or <strong>Apply</strong> is selected.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Prev</strong></td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</em></td>
<td></td>

<td><em>for the segment being edited, <strong>OK</strong> sets the segment/string with the values in the panel fields and removes the panel. <strong>Apply</strong> sets the segment/string with the values in the panel fields and leaves the panel on the screen.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 14.20.8.4.8 Attributes

Selecting **Segment=>Attributes** brings up the **Super Segment User Attributes** panel which is used to...
display and edit user defined attributes at segments of the super string.

The Prev and Next buttons are used to cycle through and display the attributes for each segment in the super string in the Name/Type/Data grid.

The data in the Name/Type/Data grid can be deleted, modified or added to and then updated for the segment using the OK or Apply button.

The fields and buttons used in the Super Segment User Attributes panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Segment no.</td>

</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>choice box</td>
<td>integer, real, text</td>
</tr>
<tr>
<td>Data</td>
<td>input</td>
<td>value for the attribute.</td>
</tr>
</tbody>
</table>

**OK/Apply button**

For the segment being edited, **OK** sets the segment with the values in the panel fields and removes the panel. **Apply** sets the segment with the values in the panel fields and leaves the panel on the screen.

**14.20.8.4.9 Segment - All above**

Selecting Segment=>All above brings up the Super Segment Properties panel which is used to display all the properties of a segment.

This option is also available from the Strings menu

**Position of option on menu:** Strings =>Properties =>Segment (all)

As soon as All above is chosen, a <Select segment> [Picks][Menu] message is written to the Status Bar
and segments can be selected. When the segment to modify is selected, its segment number and all other information are written to the appropriate panel fields. The values and modes can be changed and either OK or Apply selected to change the values for the segment.

The fields in the Super Segment Properties panel have already been described in the other Segment options and so will not be described again.

See the next section 14.20.8.5 Utilities or return to 14.20.8 Super Edit - Old.

### 14.20.8.5 Utilities

The Utilities walk-right menu contains a number of useful miscellaneous options for the super string. The menu is

![Super Utilities](image)

Each of the new options will now be discussed.

#### 14.20.8.5.1 Ins 3 Pt Curve

The Ins 3 Pt Curve option is used to insert a curve through three adjacent super string vertices. After selecting the option, the middle vertex of the three adjacent super string vertices is selected. When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

#### 14.20.8.5.2 Del 3 Pt Curve

The del 3 pt curve option is used to delete the curves on either side of a super string vertex. After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero. Hence the curves on either side of the vertex are effectively removed.

#### 14.20.8.5.3 Open

If the string is closed, selecting the open option removes the segment between the 1st and last vertex of the super string. If the string is not closed, the open option does nothing.

#### 14.20.8.5.4 Close

Selecting the close option adds a segment between the 1st and the last vertices of the super string. Note that unlike other strings, no extra vertices are added.

#### 14.20.8.5.5 Properties

Selecting Properties brings up the Super String Properties panel which is used to modify the string’s header information.
The fields in this panel are similar to those in the **Create Super String** panel and the Super String Editor options. The only new field is

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OK/Apply</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*
15 CAD

In 12d Model there are CAD options which are available under both the CAD menu and flyouts on the CAD Toolbar which by default, is on the left hand side of the 12d Model screen.

The CAD options create and edit strings using a variety of methods and are fully described in the section 15.2 CAD Options.

The strings created by the CAD menu or CAD toolbars use values in the three controlbars (Cad Controlbar, Symbol Controlbar, and Text Controlbar) to define string attributes such as name, model and colour.

So the controlbars will be described in full in the section 15.1 Controlbars before the CAD options.

For basic information on toolbars and ControlBars, see the section 4.3.5 Toolbars and Controlbars.

The CAD options create various elements using a number of methods. These options make use of Tool bars and Control bars. Tool bars just have icons on them but Control bars have icons and also controls such as a model box on them. The method groupings are shown on the toolbars (e.g. Points, Lines).

For details on each of the walk rights menus on the CAD menu, go to the section 15.2 CAD Options.

For details on the Controlbars go to the section 15.1 Controlbars.
15.1 Controlbars

This default position of the ControlBars is on the top left hand side of the screen under the main menu.

See

15.1.1 CAD Controlbar
15.1.2 Symbol Controlbar
15.1.3 Text Controlbar
15.1.4 Pipe Controlbar
15.1.5 Attributes Controlbar
15.1.6 Search Bar
15.1.1 CAD Controlbar

The fields and buttons used in CAD controlbar have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>name box</td>
<td>name of string</td>
<td>names.4d names</td>
<td></td>
</tr>
<tr>
<td>model box</td>
<td>model icon button</td>
<td>existing models</td>
<td></td>
</tr>
<tr>
<td>colour box</td>
<td>colour icon button</td>
<td>standard 12d colours</td>
<td></td>
</tr>
<tr>
<td>input</td>
<td>input measures</td>
<td>height measures</td>
<td>menu</td>

<tr>
<td>linetype box</td>
<td>linestyle icon button</td>
<td>valid linestyles</td>
<td></td>
</tr>
<tr>
<td>weight box</td>
<td>weight icon button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>tinability box</td>
<td>tinability icon</td>
<td>no, yes, points</td>
<td>button</td>
</tr>
</tbody>
</table>

name of string. If a valid name already exists in names.4d, the + button can be used to bring up a choice box of available names. On selection of a valid name, the rest of the values in the control bar will be filled out. e.g. colour, linetype etc.

this field can be recognised by the model icon button on the right hand side of the field. The user can select an existing model by selecting the model icon. If a new model is to be used, the user simply types the model name into the field.

colour box can be recognised by the colour icon button on the right hand side of the field. The user can select a 12d standard colour model by selecting the colour icon.

this field allows a height or z value to be assigned to the created elements. If a valid value exists, this value will be applied to the created element. This is regardless if the z value was specified in an XYZ box. If blank, the null value is used. If no value is specified, the level will be interpolated where possible. A value of null can be entered into the height field as well so that created vertices will be given a null height value.

linetype box can be recognised by the linestyle icon button on the right hand side of the field. The user can select a valid linestyle by selecting the linestyle icon.

weight box can be recognised by the weight icon button on the right hand side of the field. The user can type in the required weight (millimetres on the plot). If blank, no weight is assigned.

the choices in this field set the tinability for the string. If no, no vertices or segments in the string are tinable. If yes, all vertices and segments in the string are tinable. If point, all vertices in the string are tinable but not the segments.

button the eye dropper allows the user to select an existing element which will define the cad control bar values.

Continue to the next section 15.1.2 Symbol Controlbar or return to 15.1 Controlbars.
## 15.1.2 Symbol Controlbar

![Symbol Controlbar](image)

The fields and buttons used in Symbol controlbar have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>The symbols data box allows a symbols favourite to be selected and fill the other boxes. The symbols data box will be described after the other controls.</td>
<td>symbols box</td>
<td>valid symbols</td>
<td></td>
</tr>
<tr>
<td>this field can be recognised by the symbol icon button on the right hand side of the field. The user can select a valid symbol by selecting the symbol icon.</td>
<td>input</td>
<td>size measures menu</td>
<td></td>
</tr>
<tr>
<td>this field gives the size of the created symbols. If a valid value exists, this value will be applied to the created symbol.</td>
<td>input</td>
<td>angle measures menu</td>
<td></td>
</tr>
<tr>
<td>this field gives the angle of the created symbols. If a valid value exists, this value will be applied to the created symbol.</td>
<td>Symbols data box</td>
<td>on pressing the button a list of available symbols data predefined names read from the <code>symbols_names.4d</code> file are displayed. If a symbols data is selected, the values are used for the other Symbol Controlbar fields.</td>
<td></td>
</tr>
</tbody>
</table>

If no names exist, the user can edit the current settings by selecting the edit button and bring up the Symbols Information panel. This allows for definition of symbol colour, sized, rotation, offset and raise.
Continue to the next section 15.1.3 Text Controlbar or return to 15.1 Controlbars.
15.1.3 Text Controlbar

Text can occur as a text string, or on vertices and segments of a super string.

Each type of text has a vertex (these are displayed when Vertices are toggle on in a plan view), a justification point, a rotation, an offset and raise value.

The vertex and justification point only coincide if the offset and raise values are both zero. What parts of the text on a super string vertex or segment that can be independently modified depends on the settings for the super string.

For the CAD text options, the created elements will have attributes as defined by the Text Controlbar. The default position of the Text Controlbar is in top middle of the screen under the main menu.

The Text Controlbar is

The operation of the Textstyle data box is as follows:

Textstyle data box

on pressing the button a list of available textdata predefined names read from the texstyle_names.4d file are displayed.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the
**Textstyle Data** panel. This allows for definition of textstyle, units, height offset raise etc.

Continue to the next section 15.1.4 Pipe Controlbar or return to 15.1 Controlbars.
15.1.4 Pipe Controlbar

The Pipe ControlBar is used to set the Pipe dimension when a super string is create with CAD. The Pipe ControlBar can set the entire super string to be a round pipe or a box culvert pipe.

There is a **Pipe ControlBar** and it is used to make a round or culvert string whenever a new string is created by the CAD options.

When a new string is created with the CAD options and the value in the **Shape** field of the Pipe ControlBar is **Diameter** or **Culvert**, then the **Justify**, **Size 1** and **Size 2** fields from the Pipe ControlBar are given to the created string.

To clear **all** the fields in the Pipe ControlBar, clear the **Pipe Shape** field and press <Enter>. This clears all the other fields of the Pipe ControlBar.

**Note**

The *Names.4d* now has a **Pipe** section so that the Pipe ControlBar can be automatically filled in when a name is selected in the CAD ControlBar that is in the Pipe section. See 7.9.1.6 Pipe Node in 7.9.1 Name Mappings - Names.4d File.

Continue to the next section 15.1.5 Attributes Controlbar or return to 15.1 Controlbars.
15.1.5 Attributes Controlbar

There is a **Attributes ControlBar** and it is used to apply **string** attributes whenever a new super string is created by the CAD options, the attributes in the Attributes ControlBar are given to the string as string attributes.

![Attributes ControlBar](image)

When a new string is created with the CAD options, the string is given the attributes in the **Attributes ControlBar** as string attributes.

**Note**

The *Names.4d* now has an **Attribute Data** section so that the **Attributes ControlBar** can be automatically filled in when a name is selected in the **CAD ControlBar** that is in the **Attributes** section. See [7.9.1.7 Attributes Data Node](#) in 7.9.1 Name Mappings - *Names.4d* File.

Continue to the next section [15.1.6 Search Bar](#) or return to [15.1 Controlbars](#).
15.1.6 Search Bar

The Search Bar allows quick access to any option in 12d Model.

By simply typing text into the Search Bar, the option searches for matches of the typed text amongst the full path names of all the options on the menus, and then lists the menu items and the position of the menu that contains the menu item.

For example, typing in `volu` will bring up the list shown below.

Double clicking on an item in the list brings up the panel for that item.

Note that case is ignored when searching for matches.

Return to 15.1 Controlbars.
15.2 CAD Options

Position of option on menu: CAD

The CAD options are available from the CAD menu or from the CAD toolbar. The CAD toolbar is a flyout toolbar.

The CAD walk-right menu is

![CAD Walk-Right Menu]

and the CAD Toolbar is

![CAD Toolbar]

The string creation process is similar for each string type and for editing strings as well. On selecting the appropriate option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For the options see

15.3 CAD Dimension

**Position of option on menu:**  CAD => Dimension

Various types of Dimensions can be created with the Dimension options.

Each type of Dimension remembers the items it was created from (Association). In most cases when the items are modified, the Dimensions and the associated values on the Dimension dynamically change. See [15.3.1 Dimension Association](#).

For information about the meaning of the linear dimension commands Linear, Horizontal, Vertical, Aligned, Rotated, Horizontal segment, Vertical segment, Aligned segment and Rotated segment see [15.3.6 Linear Dimension Commands](#).

For more information on each of the dimension commands, see

**Create same as** - create new dimension of same type as selected dimension [15.3.5 Dimension - Create Same As](#)

**Linear** - various 2D distances. See [15.3.6.1 Linear](#)

**Angle 2 lines** - angle between two selected lines. See [15.3.14 Angle 2 Lines](#)

---

**Special Linear - Two Points Defines the Extent**
- delta x - i.e. Rotation of 0. Two points defines the extents.
- delta y - i.e. Rotation of 90. Two points define the extent Rotation given by 2 pts. Two points define the extent User given rotation. Two points define the extent.

**Special Linear - Segment Defines the Extent**
- delta x - i.e. Rotation of 0. Segment defines the extents.
- delta y - i.e. Rotation of 90. Segment defines the extent Rotation given by segment. Segment defines the extent User given rotation. Segment defines the extent.

various options to work with dimensions.
Angle 3 points - angle between two lines defined by 3 points. See 15.3.15 Angle 3 points
Angle Arc - angle subtended by existing arc or a segment with a radius. See 15.3.16 Angle Arc
Length - the 2D length of selected segments See 15.3.7 Length
Drop segment - point dropped onto segment. See 15.3.8 Drop Segment
Drop string - point dropped onto a string. See 15.3.8 Drop Segment
Area - area of selected strings. See 15.3.10 Area
Radius - radius of a selected arc. See 15.3.13 Radius
Diameter - diameter of an arc 15.3.12 Diameter.
Jogged radius - radius of a selected arc with jog. See 15.3.11 Jogged radius
Arc Length - Arc by Centre, 2 Points - length of an arc with arc defined by selecting a centre and two points on the arc. See 15.3.17 Arc Length by Centre, 2 Points

Horizontal - the horizontal distance (delta x) between two selected points. See 15.3.6.3 Horizontal
Vertical - the vertical distance (delta y) between two selected points. See 15.3.6.4 Vertical
Aligned - 2D distance between two selected points. See 15.3.6.2 Aligned
Rotated - the 2D between a selected point and another selected point dropped onto the line going through the first point with a user given angle. See 15.3.6.5 Rotated

Horizontal segment - the horizontal distance (delta x) between the end vertices of selected segments. See 15.3.6.7 Horizontal Segment
Vertical segment - the vertical distance (delta y) between the vertical points of the selected segment. See 15.3.6.8 Vertical Segment
Aligned segment - the 2D distance between the end vertices of selected segments. See 15.3.6.6 Aligned Segment
Rotated segment - the 2D between the first vertex of a selected segment and the end vertex of the segment dropped onto the line going through the first vertex with a user given angle. See 15.3.6.9 Rotated Segment

Utilities - various dimension utilities. See 15.3.18 Dimension Utilities
15.3.1 Dimension Association

When *dimensions* are created, the dimension can remember the items that were used to create them (*Association*).

In most cases when items are moved, the dimensions associated with the items dynamically change.

In cases where it is not automatic, there is a **Recalc** and **Recalc all** for dimensions and leaders. In the dimension options, typing **a** or **A** toggles Association **ON** and **OFF**.
15.3.2 Continuous Mode

For all the Linear dimension options except Aligned, there is a Continuous mode.

When Continues mode is on, all the dimensions lines are on the same line as the dimension line of the first dimension done in the sequence.
In the dimension options which support Continuous, typing c or C toggles Continuous ON and OFF.
15.3.3 Baseline Mode

For all the dimension options *Horizontal, Vertical and Rotated*, there is a **Baseline** mode. When **Baseline** mode is **ON**, the distances are all measured from the first picked point, the first dimension line goes through the picked dimension point, and for each subsequent dimension line, the distance is measured from the first point, and the dimension line is moved a give distance offset to the previous dimension line so that the dimension lines for not overlap.

In the dimension options which support **Baseline**, (b)aseline appears in the message in the screen message area:

Typing b or B toggles **Baseline ON** and **OFF** and when **Baseline** is toggle **ON** for the first time, the *Dimension lines distance Typed Input* box is place on the screen.

The new distance is typed into the box and <Enter> pressed.

Whenever **Baseline** is toggled **ON**, (d)istance appears in the message in the screen message area:

Typing d or D toggles brings up the *Dimension lines distance Typed Input* box and a new distance can be entered.

Whenever **Baseline** is **ON**, **Continuous** is turned **OFF**.
Rotated Baseline ON

Positive baseline distance

First point

Rotation

Second point

Fourth point

Point that all the dimension lines go through

Vertical Baseline ON

Positive baseline distance

First point

First point

Point that all the dimension lines go through

Fifth point

Fifth point

Negative baseline distance

First point
15.3.4 Zero Offset Mode

For some dimension options there is a **Zero Offset** mode.

When **Zero Offset** mode is ON, then the user is not asked to select a dimension point.

The dimension line is automatically placed on the line between the two points.

When **Zero Offset** is available, typing *z* or *Z* toggles **Zero offset ON and OFF**.
15.3.5 Dimension - Create Same As

Create same as creates a new Dimension of the same type as a selected Dimension.

Step 1.
Select Create same as and the following message is written to the screen message area:

```
<Pick dimension> [picks][fast][Menu]
```

Step 2. Select an existing Dimension
When an existing Dimension is selected, a new create Dimension of the same Dimension type as the selected Dimension, is started.
15.3.6 Linear Dimension Commands

The **Linear Dimension** commands measure the **2D (plan) distance between two points**. The two points to measure between define a line and that line has a **Rotation** angle with respect to the x-axis (Rotation is measured in an anticlockwise direction from the positive x-axis).

![Diagram of Linear Dimension](image)

Note that the two points may be selected individually or can be the end points of a selected segment (if the segment is an arc or a transition, only the end points of the segment are used).

Because most drawings to be dimensioned are very regular and often drawn so that the major line work is parallel to the x and y axes, it is an advantage to have special forms of the **Linear Dimension** so that the intent is clearer and less information has to be provided by the user.

The **special Linear Dimensions** are best classified by their **Rotation** angle.

(a) **Horizontal - rotation angle of 0**

This is the difference between the two x coordinates of the points or segment (delta x).

The Rotation is known (0) so once the first point is selected, the software automatically drops the second point onto the line with Rotation 0 that goes through the first point and uses the x value from the dropped point.

- **Horizontal and selecting two points.** See 15.3.6.3 Horizontal
- **Horizontal and selecting a segment.** See 15.3.6.7 Horizontal Segment

(b) **Vertical - rotation angle of 90**

This is the difference between the two y coordinates (delta y).

The Rotation is known (90) so once the first point is selected, the software automatically drops the second point onto the line with Rotation 90 that goes through the first point and uses the y value from the dropped point.

- **Vertical and selecting two points.** See 15.3.6.4 Vertical
- **Vertical and selecting a segment.** See 15.3.6.8 Vertical Segment

(c) **Rotated - a user given rotation value.**

The Rotation is known so once the first point is selected, the software automatically drops the second point onto the line with the given Rotation that goes through the first point and uses the dropped point to measure the 2D distance to.

- **Rotated and selecting two points.** See 15.3.6.5 Rotated
- **Rotated and selecting a segment.** See 15.3.6.9 Rotated Segment

(d) **Aligned - rotation defined by selecting two points or a segment**
This is a more general case where the two points have to accurately selected and are used to defined the Rotation. This is the only case when the Rotation is not known before selecting anything.

**Aligned** and selecting two points.  
See [15.3.6.2 Aligned](#)

**Aligned** and selecting a segment  
See [15.3.6.6 Aligned Segment](#)

Hence in 12d Model there are eight separate commands for defining a Linear dimension with a special rotation, and **one general Linear command** that covers all eight Linear command.

See  
**Linear** - all eight cases.  
See [15.3.6.1 Linear](#)
15.3.6.1 Linear

The Linear option allows the use any of the eight modes of defining a Linear dimension. The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See [15.3.1 Dimension Association](#).
- **c** or **C** toggles Continuous **ON** and **OFF**. See [15.3.2 Continuous Mode](#).
- **t** or **T** brings up the dimension text format. See [15.5 Text Format for Dimensions and Leaders](#).
- **s** or **S** brings up the dimension style list. [15.3.18.2 Dimension Styles](#).

**Step 1.**
Select Linear and the following message is written to the screen message area.

**Step 2. Settings**
Typed one characters commands are now required and the first ones to set are those that don’t actually start a dimension but are set ups - **n**, **a**, **c**, **s**.

Some of the commands, **n**, **a**, **c**, **s**

- **n** or **N** toggles between picking two points or picking a segment.
- **a** or **A** toggles association **ON** and **OFF**.
- **c** or **C** toggles continuous **ON** and **OFF**.
- **s** or **S** brings up the dimension style list.

**Step 3. Dimension Commands**
The dimension commands are **horizontal**, **vertical**, **aligned** or **rotated** and the current active dimension command has square brackets around it.

- **h** makes **horizontal** the active dimension command.
- **v** makes **vertical** the active dimension command.
- **l** makes **aligned** the active dimension command.
- **r** makes **rotated** the active dimension command.

Note - When **rotated** is the active dimension command, the current value for the rotation angle is displayed in the message area.

Whenever the angle is displayed, typing **g** or **G** will bring up a **Typed Input** box to change the rotation angle.

**Step 4. Creating a Dimension - picking first point or a segment.**
What type of linear dimension is to be created has been set (h, v, l, r). Whether it requires two points or a segment **has** been set.
Whether it will be associated or not, or continuous or not has been set.

Depending on the point/segment mode, the start of the message indicates whether picking a point or picking a segment is required. So now pick the first point or a segment.

How the Linear option operates is now identical to one of eight specialised linear dimension options so it will not be documented now but done in each of the specialised cases.

If Horizontal and point, see 15.3.6.3 Horizontal
If Horizontal and segment, see 15.3.6.7 Horizontal Segment

If Vertical and point, see 15.3.6.4 Vertical
If Vertical and segment, see 15.3.6.8 Vertical Segment

If Aligned and point, see 15.3.6.2 Aligned
If Aligned and segment, see 15.3.6.6 Aligned Segment

With Rotated, the angle is already set so you won’t be asked for that again.
If Rotated and point, see 15.3.6.5 Rotated
If Rotated and segment, see 15.3.6.9 Rotated Segment

Step 5.

After the dimension has been created, the Linear option then starts again. That is, goes back to Step 1. You can continue with the current dimension type or switch to another dimension type by clicking on h, v, l or r (or H, V, L or R).

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.6.2 Aligned

**Aligned** labels the 2D distance between two selected points.

The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
- **t** or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
- **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles
- **z** or **Z** toggles Zero Offset mode **ON** and **OFF**. See 15.3.4 Zero Offset Mode

**Step 1. Pick the start point**

Select **Aligned** and the following message is written to the screen message area:

```
<Pick start point| (a)s sociative (s)ty le|default| forma(t) [(z)ero offset OFF] > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected start point.

**Step 2. Pick the end point**

The following message is written to the screen message area:

```
<Pick end point| [a]ssociative > [picks][fast][Menu]
```

If Association is **ON** then the end of dimension is associated with the selected end point.

The **2D distance** is calculated between these two points.

**Step 3. Pick the point that the dimension line will go through (dimension point)**

The following message is written to the screen message area:

```
<Pick dimension point> [picks][fast][Menu]
```

The dimension line is then drawn parallel to the line between the two selected points and going through the dimension point.

The **Aligned** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.6.3 Horizontal

Horizontal labels the horizontal distance (delta x) between two selected points. The dimension is added to the model given in the CAD toolbar.

a or A toggles Association ON and OFF. See 15.3.1 Dimension Association
c or C toggles Continuous ON and OFF. See 15.3.2 Continuous Mode
t or T brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or S brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1. Pick the start point

Select Horizontal and the following message is written to the screen message area

< [Pick start point] [(continuous OFF)] [(baseline OFF)] [(a)sociative (style) [default] format(t) > [picks][fast][Menu]

If Association is ON then the start of the dimension is associated with the selected first point.

Step 2. Pick the end point

The following message is written to the screen message area.

< [Pick end point] [(a)sociative] [picks][fast][Menu]

If Association is ON then the end of dimension is associated with the selected end point.

The horizontal distance (delta x) is calculated between these two points.

Step 3. Pick the point that the dimension line will go through (dimension point)

The following message is then written to the left hand side of the screen message area.

< [Pick dimension point] [picks][fast][Menu]

The horizontal dimension line is then drawn parallel to the x-axis going through the dimension point.

Step 4.1

If Continuous is OFF

The Horizontal option then starts again. That is, goes back to Step 1.
If Continuous is ON

If Continuous is ON then you are asked to pick another end point and another Horizontal dimension is created with the start of the horizontal dimension being the previous dimension end, and the dimension point is the same as the previous dimension point.

This repeats until Continuous is toggle OFF and then the next selected end point is the last horizontal dimension in the sequence.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.6.4 Vertical

**Vertical** labels the vertical distance (delta y) between two selected points.

The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See **15.3.1 Dimension Association**
- **c** or **C** toggles Continuous **ON** and **OFF**. See **15.3.2 Continuous Mode**
- **t** or **T** brings up the dimension text format. See **15.5 Text Format for Dimensions and Leaders**
- **s** or **S** brings up the dimension style list. **15.3.18.2 Dimension Styles**

**Step 1. Pick the start point**

Select **Vertical** and the following message is written to the screen message area:

```
```

If Association is **ON** then the start of the dimension is associated with the selected first point.

**Step 2. Pick the end point**

The following message is written to the screen message area:

```
<Pick end point> [a]ssociative > [p]icks [f]ast [m]enu
```

If Association is **ON** then the end of dimension is associated with the selected end point. The vertical length (delta y) is calculated between these two points.

**Step 3. Pick the point that the dimension line will go through (dimension point)**

The following message is then written to the left hand side of the screen message area.

```
<Pick dimension point> [p]icks [f]ast [m]enu
```

The vertical dimension line is then drawn parallel to the y-axis going through the dimension point.

**Step 4.1**

If Continuous is **OFF**

The **Vertical** option then starts again. That is, goes back to **Step 1**.
If Continuous is **ON**

If Continuous is ON then you are asked to pick another end point and another Vertical dimension is created with the start of the vertical dimension being the previous dimension end, and the dimension point is the same as the previous dimension point.

This repeats until Continuous is toggle **OFF** and then the next selected end point is the last vertical dimension in the sequence.

For information on how the dimension object appears, see [15.3.18.2 Dimension Styles](#).
15.3.6.5 Rotated

**Rotated** labels the **2D distance** between the first selected point and the second selected point **dropped** onto the line with a user given angle (Rotation) and going through the first selected point.

The dimension is added to the model given in the CAD toolbar.

- a or A toggles Association **ON** and **OFF**. See **15.3.1 Dimension Association**
- c or C toggles Continuous **ON** and **OFF**. See **15.3.2 Continuous Mode**
- t or T brings up the dimension text format. See **15.5 Text Format for Dimensions and Leaders**
- s or S brings up the dimension style list. **15.3.18.2 Dimension Styles**

**Step 1. Pick the start point**

Select **Rotated** and the following message is written to the screen message area:

```
<Pick start point] [(c)ontinuous OFF] [(b)aseline OFF] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected first point.

**Step 2. Pick the end point**

The following message is written to the screen message area:

```
[Pick end point] (a)ssociative > [picks][fast][Menu]
```

If Association is **ON** then the end of dimension is associated with the selected end point.

**Step 3. Type in the Rotation value**

The following message is written to the screen message area:

```
Typed Input
Rotation 10°
```

The Rotation is in degrees in hp notation and is measured in an anticlockwise direction from the positive x axis.

**Type in the Rotation value and <Enter>**

When in **Continuous** mode the Rotation is only asked for when placing the first **Rotated** dimensions otherwise it is asked for each time.

**Note:** for the **Linear** command, the **Rotation** value is not asked for because it will have already been set.

**Step 4. Pick the point that the dimension line will go through (dimension point)**

The following message is then written to the left hand side of the screen message area:

```
<Pick dimension point>] [picks][fast][Menu]
```

The **2D (plan) distance** is calculated between the first selected point and the second selected point dropped onto the line going through the first selected and with the user given angle (Rotation).

The dimension line is then drawn with the angle of the dimension line equal to the entered Rotation.

**Step 5.1**

If Continuous is **OFF**
The Rotated option then starts again. That is, goes back to Step 1.

If Continuous is ON

If Continuous is ON then you are asked to pick another end point and another Rotated dimension is created with the start of the Rotated dimension being the previous dimension end, and the dimension point is the same as the previous dimension point.

The 2D (plan) distance is calculated between the previous dropped selected point and the new selected point dropped onto the line with the user given angle (Rotation) going through the first selected point.

This repeats until Continuous is toggle OFF and then the next selected end point is the last Rotated dimension in the sequence.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.6.6 Aligned Segment

Aligned segment labels the 2D distance between the start and end vertices of a selected segment. The segment can be straight, arc or a transition.

The dimension is added to the model given in the CAD toolbar.

Note that this is not the same as the length of a segment for an arc, a transition or offset transition.

a or A toggles Association ON and OFF. See 15.3.1 Dimension Association

t or T brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders

s or S brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1. Pick the segment

Select Aligned segment and the following message is written to the screen message area

<Pick segment> [a]ssociative [s]tyle[default] forma(t) > [picks][fast][Menu]

If Association is ON then the dimension is associated with the selected segment.

The 2D distance is calculated between the start and end vertices of the selected segment.

Step 2. Pick the point that the dimension line will go through (dimension point)

The following message is then written to the left hand side of the screen message area.

<Pick dimension point> [picks][fast][Menu]

The dimension line is then drawn parallel to the line from the start to the end vertices of the segment and going through the dimension point.

The Aligned segment option then starts again. That is, goes back to Step 1.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.6.7 Horizontal Segment

**Horizontal segment** labels the horizontal distance (delta x) between the start and end vertices of a selected segment. The segment can be straight, arc or a transition.

The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
- **c** or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
- **t** or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
- **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1. Pick the segment**

Select Horizontal segment and the following message is written to the screen message area

```
<Pick segment> [a]ssociative [s]tyle[default] form(t) [(c)ontinuous OFF] > [picks][fast][Menu]
```

If Association is **ON** then the dimension is associated with the selected segment.

The horizontal distance (delta x) is calculated between the start and end vertices of the selected segment.

**Step 2. Pick the point that the dimension line will go through (dimension point)**

The following message is then written to the screen message area.

```
<Pick dimension point> [picks][fast][Menu]
```

The horizontal dimension line is then drawn parallel to the x-axis going through the dimension point.

**Step 3.**

- If Continuous is **OFF**
  
  The Horizontal segment option then starts again. That is, goes back to **Step 1**.

![Continuous OFF example](image)

If Continuous is **ON**

If Continuous is **ON** then you are asked to pick another segment and another Horizontal segment dimension is created for the next segment and the dimension point is the same as the previous dimension point.

This repeats until Continuous is toggle **OFF** and then the next selected segment is the last horizontal dimension in the sequence.
For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.6.8 Vertical Segment

**Vertical segment** labels the vertical distance (delta y) between end vertices of a selected segment. The segment can be straight, arc or a transition.

The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
- **c** or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
- **t** or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
- **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1. Pick the segment**

Select Vertical segment and the following message is written to the screen message area

```
<Pick segment> (a)ssociative (s)tyledefault form(a) [(c)ontinuous ON OFF] > [picks][fast][Menu]
```

If Association is **ON** then the dimension is associated with the selected segment.

The vertical distance (delta y) is calculated between the start and end vertices of the selected segment.

**Step 2. Pick the point that the dimension line will go through (dimension point)**

The following message is then written to the screen message area.

```
<Pick dimension point> [picks][fast][Menu]
```

The vertical dimension line is then drawn parallel to the y-axis going through the dimension point.

**Step 3.**

- If Continuous is **OFF**
  
  The **Vertical segment** option then starts again. That is, goes back to **Step 1**.

- If Continuous is **ON**

  If Continuous is **ON** then you are asked to pick another segment and another Vertical segment dimension is created for the next segment and the dimension point is the same as the previous dimension point.

  This repeats until Continuous is toggle **OFF** and then the next selected segment is the last vertical dimension in the sequence.
For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.6.9 Rotated Segment

Rotated segment labels the 2D distance between the start vertex of a segment, and the end vertex of the segment dropped onto the line with a user given angle (Rotation) and going through the first vertex.

The dimension is added to the model given in the CAD toolbar.

a or A toggles Association ON and OFF. See 15.3.1 Dimension Association
c or C toggles Continuous ON and OFF. See 15.3.2 Continuous Mode
t or T brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or S brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.
Select Rotated segment and the following message is written to the screen message area

Pick segment] (a)ssociative (s)tye[default] (f)ormat[i] [(c)ontinuous OFF] an(g)e[10°] > [picks][fast][Menu]

If Association is ON then the dimension is associated with the selected segment.

Step 2. Type g to Change the Rotation Value

If the Rotation is to be changed, type g or G and the Rotation Typed Input box is then displayed.

Type in the Rotation value and press <Enter>.
The Rotation is in degrees in hp notation and is measured in an anticlockwise direction from the positive x axis.

Step 3. Pick the segment
The following message is written to the screen message area.

Pick segment] (a)ssociative (s)tye[default] (f)ormat[i] [(c)ontinuous OFF] an(g)e[10°] > [picks][fast][Menu]

If Association is ON then the dimension is associated with the selected segment.

Step 4. Pick the point that the dimension line will go through (dimension point)
The following message is then written to the screen message area.

Pick dimension point> [picks][fast][Menu]

The 2D (plan) distance is calculated between the start of the segment and the end of the segment dropped onto the line with the user given angle (Rotation) going through the start of the selected segment.
The dimension line is then drawn with the angle of the dimension line equal to the entered Rotation.

Step 5.
If Continuous is OFF
The Rotated option then starts again. That is, goes back to Step 1.
If Continuous is **ON**

If Continuous is ON then you are asked to pick another segment. The Rotation angle can also be changed.

![Diagram showing CAD Dimension process](image)

When another segment is selected, the start and end vertices are dropped onto the line with the user given angle (Rotation) going through the current dimension point.

The **2D (plan) distance** is calculated between the dropped ends of the segment.

This repeats until Continuous is toggle **OFF** and then the next selected segment is the last **Rotated segment** dimension in the sequence.

The **Rotated segment** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see [15.3.18.2 Dimension Styles](#).
15.3.7 Length

**Length** labels the **2D length** of a selected **segment**. The segment may be a straight, arc, transition or offset transition.

The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles association **ON** and **OFF**. See 15.3.1 Dimension Association
- **c** or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
- **o** or **O** toggles offset **ON** and **OFF**. See An Important Note about the Offset Toggle
- **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1. Pick the segment**

Select **Length** and the following message is written to the screen message area:

```
<Pick segment> (a)ssociative (s) style[default] forma(t) [(o)ffset ON] [(c)ontinuous OFF] > [picks][fast][Menu]
```

If **association** is **ON** then the dimension is associated with the selected segment.

**Note:** Continuous mode is only available if **offset** is **ON**.

The 2D length of the selected segment is calculated.

**Step 2. Pick the dimension point**

The following message is then written to the screen message area.

```
<Pick dimension point> [picks][fast][Menu]
```

The dimension line is then drawn parallel to the segment and going through the dimension point.

If **offset** is **ON** then the distance between the dimension point and the segment (the offset distance) is remembered with the dimension.

If **offset** is **OFF** then the dimension point itself is remembered with the dimension.
Step 3.1

If **Continuous** is **OFF**:  

The **Length** option then starts again. That is, goes back to **Step 1**.

**Continuous** is **ON** (and for that **Offset** must also be **ON**):

If **Continuous** is **ON** then you are asked to pick another segment and another Length dimension is created for the next segment. The distance the dimension line is from the segment (offset distance) is the same as it was for the previous segment.

This repeats until **Continuous** is toggle **OFF** and then the next selected segment is the last Length dimension in the sequence.

The **Length** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see [15.3.18.2 Dimension Styles](#).
An Important Note about the Offset Toggle

When the dimension line is first drawn, the difference between Offset ON and Offset OFF is not apparent.

But when you move a vertex and the associated Length dimensions go with it, the difference is move obvious.

For the Length dimensions that are created with Offset ON, the original offsets are maintained. So the new dimension lines will be the same parallel distance from the segments as when they were originally dimensioned.

For the Length dimensions that are created with Offset OFF, the original dimensions points are maintained. So the new dimension lines will go through the original dimension points and so their parallel distance from the segments will be totally different from before.
CAD Dimension

Length dimension placed with Offset OFF

When the vertex is moved the dimension lines still go through the original dimension points

when the vertex is moved the offsets are NOT maintained

Length dimension placed with Offset ON

When the vertex is moved the offsets are maintained

when the vertex is moved the offsets are maintained
15.3.8 Drop Segment

**Drop segment** labels the 2D distance between a selected point, and the point is dropped perpendicularly onto a selected base segment.

If the base segment is a line then the drop may occur on the extended segment.

If the base segment is an arc then it will drop to the outside or inside of the visible part of the arc.

If the base segment is a circle then the drop will go to the inside or outside of the circle depending on whether the point is inside or outside the circle.

The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See [15.3.1 Dimension Association](#)
- **t** or **T** brings up the dimension text format. See [15.5 Text Format for Dimensions and Leaders](#)
- **s** or **S** brings up the dimension style list. See [15.3.18.2 Dimension Styles](#)
- **z** or **Z** toggles **Zero Offset** mode **ON** and **OFF**. See [15.3.4 Zero Offset Mode](#)

Step 1.
Select **Drop segment** and the following message is written to the screen message area:

```
Pick start point.
```

If Association is **ON** then the start of the dimension is associated with the selected start point.

Step 2.
The following message is written to the screen message area asking for a segment to be selected. The segment can be a straight, an arc, a transition or an offset transition:

```
Pick base segment.
```

Pick the segment.
If Association is **ON** then the end of the dimension is associated with the selected segment.
The picked point is dropped perpendicularly onto the selected segment (or the extended line segment) and the 2D distance is calculated between these two points.

Step 3.
If **Zero Offset** is **OFF**, the following message is then written to the screen message area.

```
Pick dimension point.
```

Pick the point that the dimension line will go through (dimension point).
The dimension line is then drawn parallel to the line between the selected point and the selected point dropped perpendicularly onto the selected segment, and going through the dimension point.

If **Zero Offset** is **ON**, then no dimension point is picked because the dimension point is taken to be on the line joining the picked point and the dropped point.

For both cases of **Zero Offset**, the **Drop segment** option then starts again. That is, goes back to Step 1.
For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

**Note on Automatic Recalculation of Drop Segment Dimension When the Point or Segment Moves**

When **Association** in turned **ON**, the picked point and the picked base segment are associated...
with the *Drop segment* dimension. So if either the picked point or the picked base segment is moved, the drop dimensions automatically recalcs.

Also note that the drop onto the base segment may involve the extended base segment because the drop point may not be between the end points of the selected base segment.
15.3.9 Drop String

**Drop string** labels the 2D distance between a selected point and the point dropped onto a selected base string.

By Dropped onto a string we mean that the point is first checked to see that it can be dropped perpendicularly onto a segment of the selected string (not an extended segment), or if there is no segment that the point can drop perpendicularly onto then it will drop onto the **nearest vertex** of the string.

If the base string is an arc then it will drop to the outside or inside of the visible part of the arc.

If the base string is a circle then the drop will go to the inside or outside of the circle depending on whether the point is inside or outside the circle.

Hence **Drop string** will always end on the base string.

The dimension is added to the model given in the CAD toolbar.

*a* or **A** toggles Association **ON** and **OFF**. See **15.3.1 Dimension Association**

*t* or **T** brings up the dimension text format. See **15.5 Text Format for Dimensions and Leaders**

*s* or **S** brings up the dimension style list. **15.3.18.2 Dimension Styles**

**Step 1. Pick the start point**

Select **Drop string** and the following message is written to the screen message area:

```
<Pick start point] (a)ssociative (s)tye[default] forma(t) > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected start point.

**Step 2. Pick the base string**

The following message is written to the screen message area asking for a base string to be selected.

```
< (a)ssociative Pick base string> [picks][fast][Menu]
```

If Association is **ON** then the end of the dimension is associated with the selected base string.

The picked point is dropped onto the selected base string and the 2D distance is calculated between these two points.

The dimension line is then drawn between the selected point and the selected point dropped onto the selected base string.

The **Drop string** option then starts again. That is, goes back to **Step 1**.
15.3.10 Area

*Area* labels the plan area of a selected string.

The dimension is added to the model given in the CAD toolbar.

- `a` or `A` toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
- `t` or `T` brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
- `s` or `S` brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1. Pick the polygon to dimension**

Select *Area* and the following message is written to the screen message area:

```
<Pick polygon> [a]ssociative (s)tyLe[default] forma(t) > [picks][fast][Menu]
```

If Association is **ON** then the dimension is associated with the polygon.

If the selected string is not closed, the area is calculated for the polygon formed by joining the first and last vertices of the string.

The plan area is calculated for the polygon and placed inside the polygon.

The **Area** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.11 Jogged radius

This option has not yet been completed
- radius of a selected arc with jog
  
  Pick an arc or a segment with a radius.
  Then pick the start point of the jog and then the dimension point.
  
  A dimension line is draw with a start symbol at the start and then a job between the dimension point and the start point of the jog.
  
  The dimension is added to the model given in the CAD toolbar.
15.3.12 Diameter

This option has not yet been completed

**Diameter** labels the diameter of an arc or a segment with a non zero radius.

The dimension is added to the model given in the CAD toolbar.

\( \text{a or A} \) toggles Association ON and OFF. See 15.3.1 Dimension Association

\( \text{t or T} \) brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders

\( \text{s or S} \) brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1.**

Select Diameter and the following message is written to the screen message area

\(<[(A)ssociation ON] \text{Pick arc or choose (s)style[diags - yes fixed len dim line] > [picks][fast][Menu]}\>

**Pick the arc or segment with non zero radius.**

If Association is ON then the dimension is associated with the selected arc or segment.

The segment must have a radius. That is, it can’t be a line segment.

The diameter is calculated for the arc or segment.

**Step 2.**

The following message is then written to the left hand side of the screen message area.

\(<\text{Pick dimension point} > \text{[picks][fast][Menu]}\>

\( \text{t or T} \) brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders

**Pick the point that the dimension line will go through (dimension point).**

The dimension line is then drawn from the centre of the arc and through the dimension point and onto the arc. The text is placed at the dimension point.

If the dimension point is outside the arc, the dimension line continues through the arc.
The **Diameter** option then starts again. That is, goes back to Step 1.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.13 Radius

This option has not yet been completed

Radius of an arc or of a segment with a radius.

The dimension is added to the model given in the CAD toolbar.
15.3.14 Angle 2 Lines

**Angle 2 lines** labels the angle between two selected lines.

To define this dimension, the intersection point of the two extended lines divides the extended lines into two sides and the plane into four regions.

![Diagram of Angle 2 Lines](image)

Although the lines can only be initially picked by the non extended part of the lines, the dimension can go between any of the halves of the extended lines.

The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
- **t** or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
- **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1.** Pick the side to start the dimension from

Select **Angle 2 lines** and the following message is written to the screen message area

```
< [Pick start side] (a)ssociative (style[default] format(t) > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected start line.

**Step 2.** Pick the side to end the dimension on

The following message is written to the screen message area.

```
< [Pick end side] (a)ssociative > [picks][fast][Menu]
```

If Association is **ON** then the end of dimension is associated with the selected end line.

**Step 3.**

The following message is then written to the left hand side of the screen message area.

```
< Pick dimension point or reverse (d)irection (s)tart (e)nd line extension > [picks][fast][Menu]
```

As you move your cursor between the four regions, you will see the dimension line display as if the cursor was the selected dimension point.
s or S takes the other end of the first line to start the dimension on.
e or E takes the other end of the second line to end the dimension on.
d or D toggles between a clockwise and counter clockwise angle for the dimension arc.
t or T can be typed to change the text format. See 15.5 Text Format for Dimensions and Leaders.
Pick the point that the dimension line will go through (dimension point).
The dimension line is then drawn from the start side to the end side and going through the dimension point.

The Angle 2 lines option then starts again. That is, goes back to Step 1.
For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.15 Angle 3 points

**Angle 3 points** labels the angle between two temporary lines defined by 3 points. That is, it labels the angle between two lines that are constructed from the three points.

The first point is the start of the first line, the second point is the end of the first line and the start of the second line and the third point in the end of the second line.

The dimension is added to the model given in the CAD toolbar.

![Diagram of Angle 3 points]

- **a** or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
- **t** or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders.
- **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1.** Pick the first point of the first line

Select **Angle 3 points** and the following message is written to the screen message area.

```
<Pick start point> (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected point.

**Step 2.** Pick the second point that is the end of the first line and the start of the second line

The following message is written to the screen message area.

```
<Pick vertex point> (a)ssociative > [picks][fast][Menu]
```

If Association is **ON** then the vertex of the dimension is associated with the selected point.

**Step 3.** Pick the third point that is the end of the second line

The following message is written to the screen message area.

```
<Pick end point> (a)ssociative [(d)irection counter-clockwise] > [picks][fast][Menu]
```

If Association is **ON** then the end of the dimension is associated with the selected point.

**Step 4.** Pick the point that the dimension arc will go through (dimension point)

The following message is then written to the screen message area.

```
<Pick dimension point> [(d)irection clockwise] > [picks][fast][Menu]
```

As you move your cursor you see how large the line of dimensions arc will be.

- **d** or **D** toggles between a counter-clockwise and clockwise angle for the dimension arc.
When the dimension point is selected, the dimension arc is drawn from the start side to the end side and going through the dimension point.

The **Angle 3 points** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see [15.3.18.2 Dimension Styles](#).
15.3.16 Angle Arc

Angle arc labels the angle subtended by an existing arc, or of a segment with a radius. The dimension is added to the model given in the CAD toolbar.

- **a** or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
- **t** or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
- **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

**Step 1. Pick the arc of arc segment to dimension**

Select Angle arc and the following message is written to the screen message area:

```plaintext
[pick segment] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]
```

If Association is **ON** then the dimension is associated with the polygon. The angle of the arc can then be calculated.

**Step 2. Pick the point that the dimension arc will go through (dimension point)**

The following message is then written to the left hand side of the screen message area:

```plaintext
<pick dimension point> [picks][fast][Menu]
```

The dimension arc is then drawn parallel to the arc or segment and goes through the dimension point.

The **Angle arc** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.17 Arc Length by Centre, 2 Points

**NOT currently on the menu.**

**Arc** labels the length of an arc where the arc is temporarily defined by picking a centre point and two points on the arc.

Pick a position that will be centre point of the arc, and then the position that will be the first point of arc. This defines the centre, radius and start point of the arc.

A third position is then selected and it is dropped onto the arc defined by the first two points to give the end of the arc. This fully defines a temporary arc.

![Diagram of arc with points labeled](image)

**a** or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association. **t** or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders. **s** or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles.

**Step 1.**

Select Arc and the following message is written to the screen message area:

```
Pick the position to be the centre point of the arc
```

If Association is **ON** then the start of the dimension is associated with the selected point.

**Step 2.**

The following message is written to the screen message area:

```
Pick the second point is the start of the arc
```

If Association is **ON** then the vertex of the dimension is associated with the selected point.

**Step 3.**

The following message is written to the screen message area:

```
Pick the third point that is the end of the arc.
```

If Association is **ON** then the end of the dimension is associated with the selected point.

**d** or **D** toggles between a counter-clockwise and clockwise angle for the dimension arc.
Step 4.

The following message is then written to the left hand side of the screen message area.

```
<Pick dimension point> [(direction clockwise) > [picks][fast][Menu]]
```

As you move your cursor you see how large the line of dimensions arc will be.

d or D toggles between a counter-clockwise and clockwise angle for the dimension arc.

Pick the point that the dimension arc will go through (dimension point).

The dimension arc is then drawn from the start side to the end side and going through the dimension point and labelled with the subtended angle.

The Arc option then starts again. That is, goes back to Step 1.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.
15.3.18 Dimension Utilities

Position of menu: Cad => Dimension => Utilities

The Dimension Utilities menu is:

See
15.3.18.1 Dimension Edit
15.3.18.2 Dimension Styles
Recalc - select a dimension to recalc.
Recalc all - recalcs all dimensions.
Delete - select a dimension to delete.
15.3.18.3 Change Style of Dimension
15.3.18.4 Change Text Format
15.3.18.5 Create Many Segment Lengths
15.3.18.1 Dimension Edit

Picking an existing Dimension will bring up the Dimension editor.

In the Dimension editor, grip points relevant to the type of dimension will be displayed.

If there is no Association because either the Association is OFF, or Association is ON but there is nothing currently associated with the dimension, then you won’t get a grip point to move the entire dimension because the dimension is locked to its associated items.

A list of typed options is also displayed in the screen message area.

<Pick grip point or change (T)ext or (D)uble angle or (S)ty/e/d(e)gs or (D)eg or (D)elete or create (n)ew> [picks][fast][Menu]

Picking and accepting a grip point will move the grip point and when it is placed again, the association is recalced and the new value for the dimension displayed.
For the typed options, typing

**t or T** changes the dimension text format. See [15.5 Text Format for Dimensions and Leaders](#).
**o or O** changes the angle of the extension lines. The angle is measured in a counter clockwise direction and for horizontal dimensions it is measured from the positive y axis, vertical dimensions it is measured from the positive x axis and for aligned dimensions it is the measured from the perpendicular to the two points defining the dimension.
**s or S** changes the dimension style
**j or J** allows one jog to be inserted in a linear dimension
**d or D** deletes the dimension
**n or N** pick a new dimension to edit.

Also

Typing `<Esc>` will exit the editing of the current *dimension* and ask for a new drafting element (Leader or Dimension) to be selected for editing.

Similarly clicking RB and selecting **Cancel** from the **Pick Ops** menu will exit the editing of the current *dimension* and ask for a new drafting element (Leader or Dimension) to be selected for editing.

When back in the Drafting Editor, typing `<Esc>` or clicking RB and selecting **Cancel** from the **Pick Ops** menu, will exit the Drafting Editor.
15.3.18.2 Dimension Styles

Position of option on menu: CAD => Dimension => Styles

When you click on the option an Edit dimension_styles.xml panel is brought up and the panel shows the standard areas for looking for the table_styles.XML files - Working folder, Customer (User), User, Set Ups and Other.

For information about where how to find and create dimension_styles.xml files, see 15.7 Style XML Files for Dimensions, Leaders & Tables.

Once a dimension_styles.xml file has been opened, the Dimension Styles panel is displayed.

See 15.3.18.2.1 Dimension Styles - Name Node
15.3.18.2.2 Dimension Styles - Start Symbol Node
15.3.18.2.3 Dimension Styles - End Symbol Node
15.3.18.2.4 Dimension Styles - Text style Node
### 15.3.18.2.1 Dimension Styles - Name Node

This is on the right hand side of the panel when you click on the **Dimension style** name.

- **Do not clip dimension line for text** is **yes** or **Textstyle Type** is not **world** then these are not used.
- **Do not clip dimension line for text** is **no** and **Textstyle Type** is **world**, then these are used.

These settings are not currently used.
Fixed length dimension line = no
length of extension line not used

dimension line
dimension line colour
dimension line linestyle
dimension line line-weight

number of decimals for length

extension beyond dimension line

enable start extension line
start extension line linestyle
extension line colour
extension line line-weight

extension line offset from origin

end extension line

Fixed length dimension line = yes
extension line offset from origin not used

extension beyond dimension line

length of extension line
If **Don't clip dimension line for text** is set to **no**, or the **Type** from the **Textstyle** tab is not **world**, then the following are not used.

- Use box around text
- Use rounded box
- Text box colour
- Text box linestyle

The following items that are at the bottom of the tab have not yet been implemented.

- Dimension line extension size
- Baseline spacing
- Enable start dimension line
- Enable end dimension line
- Dimension line break
- Length symbol style
- Text fit
- Text offset
- Number of decimals for volumes
- Angle format style
15.3.18.2.2 Dimension Styles - Start Symbol Node

This is on the right hand side of the panel when you click on the Start symbol node.

<table>
<thead>
<tr>
<th>Style</th>
<th>Arrow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colour</td>
<td>red</td>
</tr>

</tr>
<tr>
<td>Rotation</td>
<td>45</td>
</tr>
<tr>
<td>Offset</td>
<td>0.2</td>
</tr>
<tr>
<td>Raise</td>
<td>0.5</td>
</tr>
</tbody>
</table>

For the Start symbol, the origin of the symbol is displaced from the start of the dimension line by the Offset and Raise values.

With a Rotation value of zero, the symbol is given the same rotation as the dimension line.

For a non zero Rotation, the value is added to the angle of the dimension line.
15.3.18.2.3 Dimension Styles - End Symbol Node

This is on the right hand side of the panel when you click on the End symbol node.

For the End symbol, the origin of the symbol is displaced from the end of the dimension line by the Offset and Raise values.

With a Rotation value of zero, the symbol is given the angle of the dimension line plus 180 degrees.

For a non zero Rotation, the value plus 180 degrees is added to the angle of the dimension line.

The addition of 180 degrees for the angle of the end symbol is so that the same symbol can be used for the start and the end of the dimension line.
15.3.18.2.4 Dimension Styles - Text style Node

This is on the right hand side of the panel when you click on the Text style node.

</table>

This is expected to be modified shortly so that it uses a Textstyle Data and all the features from Textstyle Data are automatically available. For the moment with paper text, only Whiteout is supported.

When the Textstyle Data is implemented, it can have its own Border type but there is no linestyle for the border in Textstyle Data. The only way to get a border with a linestyle is to use World text and set the border parameters in the General tab (15.3.18.2.1 Dimension Styles - Name Node).

If Type is not world, then Don't clip dimension line for text is set to no and these items from the General tab are not used.

- Use box around text
- Use rounded box
- Text box colour
- Text box linestyle

See 15.3.18.2.1 Dimension Styles - Name Node
15.3.18.3 Change Style of Dimension

Click on Change style of dimension and the following message is written to the screen message area:

```
<Pick drafting element to apply (s)ty[le][diags no clip]> [picks][fast][Menu]
```

Pick a dimension and its style will be changed to that shown in the square brackets ([ ]). Then pick another dimension to change its style.

Typing s or S brings up the Style Typed Input box to select a new dimension style.

The new style is picked from the pop up list, or typed into the box and <Enter> pressed. The box is then removed and the message again written to the screen message area.

All subsequent selected dimensions will have their styles changed to this new style until either the option is terminated or a new dimension style is selected.

To terminate the option, press <Esc>, select Cancel from the Pick Ops menu, or select another CAD option.
15.3.18.4 Change Text Format

The Change text format option is used to change the text format for Dimensions or Leaders.

Click on Change text format and a Typed Input box comes up

![Typed Input Dialog Box]

and whilst you are in the Typed Input box the following message is written to the screen message area.

The new text format is typed into the Typed Input box and OK clicked.

The following message is written to the screen message area

Pick a Dimension or Leader and its text format will be changed to that shown in the square brackets ([]). Then pick another Dimension or Leader to change its text format.

Typing t or T will bring the Typed Input box to type in a a new text format. See 15.5 Text Format for Dimensions and Leaders.

All subsequent selected Dimensions or Leaders will have their text formats changed to this new text format until either the option is terminated or a new text format is selected.

To terminate the option, press <Esc>, select Cancel from the Pick Ops menu, or select another CAD option.

15.4 CAD Leader

Position of option on menu:  CAD => Leader

Various types of Leaders can be created with the Leader options

Apart from the Trimesh Volume and Trimesh area leaders, each type of Leader can remember the items it was created from (Association). In most cases when the items are modified, the Leader and the associated values from the items dynamically change. See 15.4.1 Leader Association

All of the Leaders on the menu except for Trimesh Volume and Trimesh Area are also special cases of the Information Leader. That is, when in the Information Leader option, all but the Trimesh Leaders can be selected as types of the Information Leader.

For more information on each of the Leader options and menus, see

Create same as - create new information leader of same type as selected Information leader

Text - simple leader that only displays text. See 15.4.4 Text Leader

Information Leader - leader with many choices of values. See 15.4.5 Information Leader
Label - a case of Information Leader that displays text. See 15.4.5.1 Label
Area - 2D area of a selected string. See 15.4.5.2 Area
String length - 2D length of a selected string. See 15.4.5.3 String Length
String length 3d - 3D length of a selected string. See 15.4.5.4 String Length 3D
Segment length - 2D length of a selected segment. See 15.4.5.5 Segment Length
Segment length 3d - 3D length of a selected segment. See 15.4.5.6 Segment Length 3D
Bearing - bearing of a selected string. See 15.4.5.7 Segment Bearing
Bearing & segment length - bearing at string pick point and length of the segment. See 15.4.5.8 Bearing & Segment Length
Radius - radius of a selected string. See 15.4.5.9 Segment Radius
String name - name of a selected string. See 15.4.5.10 String name
Vertex text - vertex text of a selected vertex. See 15.4.5.11 Vertex Text
Segment text - segment text of a selected segment. See 15.4.5.12 Segment Text
Vertex XYZ - (x,y,z) coordinates of a vertex. See 15.4.5.13 Vertex XYZ
Vertex XY - (x,y) coordinates of a vertex. See 15.4.5.14 Vertex XY
String XYZ - (x,y,z) coordinates of a position on a string. See 15.4.5.15 String XYZ
String XY - (x,y) coordinates of a position on a string. See 15.4.5.16 String XY
String Z - z coordinates (level) of a position on a string. See 15.4.5.17 String Z
Tin Z - z value of tin at a selected (x,y) position. See 15.4.5.18 Tin Z
Tin depth - depth from a string position to a tin. See 15.4.5.19 Tin Depth
Grade % - grade in percent at a point on a string. See 15.4.5.20 Grade (%)
Grade 1 in - grade as 1 in (ie slope) at a point on a string. See 15.4.5.21 Grade 1 in - Slope
Centroid XY - (x,y) coordinates of selected string. See 15.4.5.22 Centroid XY
Centre XY - (x,y) coordinates of medial centre of selected string. See 15.4.5.23 Medial Centre XY
Trimesh volume - volume of a closed trimesh. See 15.4.5.24 Trimesh Volume
Trimesh area - surface area of one side of a trimesh. See 15.4.5.25 Trimesh Surface Area
Utilities - various leader utilities. See 15.4.6 Leader Utilities
15.4.1 Leader Association

When leaders are created, the leader can remember the items that were used to create them (Association).

In most cases when items are moved, the leaders associated with the items dynamically change.

In cases where it is not automatic, there is a Recalc and Recalc all for leaders and dimensions.

In the leader options, typing a or A toggles Association ON and OFF.
15.4.2 Hook Angle

Typing h or H allows you to change the **Hook Angle** and brings up the **Hook angle Typed Input** box.

![Hook angle Typed Input](image)

The new hook angle is typed into the box and **<Enter>** pressed.

The units for hook angle are degrees entered in hp notation, and are measure in a counter clockwise direction from the positive x-axis.
15.4.3 Leader - Create Same As

Create same as creates a new Leader of the same type as a selected Leader.

Step 1.
Select Create same as and the following message is written to the screen message area

\[ \text{<Pick leader>} \ [\text{picks}][\text{fast}][\text{Menu}] \]

Step 2. Select an existing Leader
When an existing Leader is selected, a new create Leader of the same Leader type as the selected Leader, is started.
15.4.4 Text Leader

This is simplest type of Leader and only creates a leader with user defined text.

**Text Leader** creates a leader line from a selected point (the arrow point) to a selected hook point, with user given text drawn at the end of the leader line.

a or A toggles Association **ON** and **OFF**. See [15.4.1 Leader Association](#)

s or S brings up the leader style list. [15.4.6.2 Leader Styles](#)

h or H brings up the Hook Angle [15.4.2 Hook Angle](#)

**Step 1.** Pick the arrow point (the point to start the Leader from)

Select Leader and the following message is written to the screen message area

```
<[Pick arrow point] (a)ssociative (s)tytle[A] (h)ook-angle[0°] > [picks][fast][
```

If Association is **ON** then the start of the Leader is associated with the selected arrow point.

**Step 2.** Pick the hook point

The following message is written to the screen message area.

```
<Pick hook point> [picks][fast][Menu]
```

If Association is **ON** then the hook point of the leader is associated with the selected hook point.

**Step 3.**

The text **Typed Input** box then comes up for the text for the leader to be typed into.

![Typed Input](image)

Whilst you are in the **Typed Input** box the following message is written to the screen message area.

```
Enter Text [Caret][Same as][Menu] select a button
```

The text for the Leader is typed into the **Typed Input** box and **OK** clicked.

The **Leader** is then created with the current hook angle.

The **Leader** option then starts again. That is, goes back to **Step 1**.
For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5 Information Leader

Information Leader creates a leader line from a selected point (the arrow point) to a selected hook point, with a user selected choice of what information is shown at the end of the leader line.

When Information Leader is selected, the following message is written to the screen message area.

Typing t or T brings up the Information Leader Type Typed Input box which has a choice pop up for selecting what information is drawn at the end of the leader.

After a selection is made, the message changes to indicate the current type of Information Leader being created. For example, for the choice Area.

For more information on each of the types for Information Leader see
Label - simple leader that only displays text. See 15.4.5.1 Label
Area - 2D area of a selected string. See 15.4.5.2 Area
String length - 2D length of a selected string. See 15.4.5.3 String Length
String length 3d - 3D length of a selected string. See 15.4.5.4 String Length 3D
Segment length - 2D length of a selected segment. See 15.4.5.5 Segment Length
Segment length 3d - 3D length of a selected segment. See 15.4.5.6 Segment Length 3D
Bearing - bearing of a selected string. See 15.4.5.7 Segment Bearing
Bearing & segment length - bearing at string pick point and length of the segment. See 15.4.5.8 Bearing & Segment Length
Radius - radius of a selected string. See 15.4.5.9 Segment Radius
String name - name of a selected string. See 15.4.5.10 String name
Vertex text - vertex text of a selected vertex. See 15.4.5.11 Vertex Text
Segment text - segment text of a selected segment. See 15.4.5.12 Segment Text
Vertex XYZ - (x,y,z) coordinates of a vertex. See 15.4.5.13 Vertex XYZ
Vertex XY - (x,y) coordinates of a vertex. See 15.4.5.14 Vertex XY
String XYZ - (x,y,z) coordinates of a position on a string. See 15.4.5.15 String XYZ
String XY - (x,y) coordinates of a position on a string See 15.4.5.16 String XY
String Z - z coordinates (level) of a position on a string See 15.4.5.17 String Z
Tin Z - z value of tin at a selected (x,y) position. See 15.4.5.18 Tin Z
Tin depth - depth from a string position to a tin. See 15.4.5.19 Tin Depth
Grade % - grade in percent at a point on a string. See 15.4.5.20 Grade (%)
Grade 1 in - grade as 1 in (ie slope) at a point on a string. See 15.4.5.21 Grade 1 in - Slope
Centroid XY - (x,y) coordinates of selected string. See 15.4.5.22 Centroid XY
Centre XY - (x,y) coordinates of medial centre of selected string. See 15.4.5.23 Medial Centre XY
15.4.5.1 Label

**Information Leader** choice **Label** displays in the leader box, user given text.

**Label** creates a leader line from a selected point (the pick point) to a selected hook point, with the given text drawn at the end of the leader line.

The leader is added to the model given in the CAD toolbar.

**Note:** Unlike the **Text Leader** which is also used for placing text and brings up a Typed Input box for entering multiline text (see **15.4.4 Text Leader**), **Label** is a single line format which needs new line characters if a new line is needed.

The case for using **Label** instead of the **Text** leader is when you have the same text to place multiple times. The **customise (t)ext** command uses the last specified text, and also remembers the last twelve of them.

**Step 1.** Pick the point to start the Leader from

Select **Leader** and the following message is written to the screen message area:

< (t)ype[Label] Pick arrow location (a)ssociative (s)tytle[Arial|Border] (h)ook-angle[0°] > [picks][fast][Menu]

- **a** or **A** toggles Association ON and OFF. See **15.4.1 Leader Association**
- **t** or **T** changes the type of Information Leader. See **15.4.5 Information Leader**
- **s** or **S** brings up the leader style list. **15.4.6.2 Leader Styles**
- **h** or **H** brings up the Hook Angle **15.4.2 Hook Angle**

If Association is ON then the start of the Leader is associated with the selected pick point.

**Step 2.** Pick the hook point

The following message is written to the screen message area:

<Pick hook point or customise (t)ext> [picks][fast][Menu]

- **t** or **T** brings up the leader text format. See **15.5 Text Format for Dimensions and Leaders**.

Unlike the **Text Leader** which brings up a Typed Input box for entering multiline text (see **15.4.4 Text Leader**), this is a single line format which needs new line characters if a new line is needed.

When the hook point is selected, the **Leader** is created.

The **Label Information Leader** then starts again. That is, it goes back to **Step 1**.

For information on how the Leader object appears, see **15.4.6.2 Leader Styles**.
15.4.5.2 Area

**Information Leader** choice **Area** displays in the leader box, the 2D (plan) area of a selected string. If the selected string is not closed, the area is calculated for the polygon formed by joining the first and the last vertices.

A leader line is drawn from either selected position on a string (string pick point) or the string centre, to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the area is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1.** Pick the string to label with its 2D (plan) area

When **Area** is the choice, the following message is written to the screen message area:

```
< (t)ype[Area] Pick string (a)ssociative (s)tytle[Arial Border] (h)ook-angle[0°] fixed-a(r)row> [picks][fast][Menu]
```

- a or A toggles Association ON and OFF. See 15.4.1 Leader Association
- t or T changes the type of Information Leader. See 15.4.5 Information Leader
- s or S brings up the leader style list. 15.4.6.2 Leader Styles
- h or H brings up the Hook Angle 15.4.2 Hook Angle
- r or R toggles between the arrow starting at the pick point (**free arrow**) or at the polygon centre (**fixed arrow**)

If Association is **ON** then the start of the Leader is associated with the string pick point or the polygon centre (depending on r).

**Step 2.** Pick the hook point

The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The **Information Leader** is then created.

The **Area Information Leader** then starts again. That is, it goes back to **Step 1**.
Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.3 String Length

Information Leader choice String length displays in the leader box, the 2D (plan) length of a selected string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the string length is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1. Pick the string to label with its 2D length

When String Length is the choice, the following message is written to the screen message area:

```
< (type[Length]) Pick string (a)ssoicate (s)ty[le[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or A toggles Association ON and OFF. See 15.4.1 Leader Association

t or T changes the type of Information Leader. See 15.4.5 Information Leader

s or S brings up the leader style list. 15.4.6.2 Leader Styles

h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the string pick point.

Step 2. Pick the hook point

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created.

The String Length Information Leader then starts again. That is, it goes back to Step 1.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6 Leader Styles.
15.4.5.4 String Length 3D

**Information Leader** choice **String length 3D** displays in the leader box, the 3D length of a selected string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the length is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the string to label with its 3D length**

When **String length 3d** is the choice, the following message is written to the screen message area:

```
< (t)ype[String Length 3d] Pick string (a)sociative (s)tye[Arial Border] (h)ook-angle(0*) > [picks][fast][Menu]
```

a or A toggles Association ON and OFF. See 15.4.1 Leader Association

t or T changes the type of Information Leader. See 15.4.5 Information Leader

s or S brings up the leader style list. 15.4.5.2 Leader Styles

h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the string pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```
< (t)ype[Pick hook point or customise (t)ext] > [picks][fast][Menu]
```

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.2 Leader Styles.
15.4.5.5 Segment Length

Information Leader choice Segment length displays in the leader box, the 2D (plan) length of a selected segment.

A leader line is drawn from a selected position on a segment (segment pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the segment length is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1. Pick the segment to label with its 2D length

When Segment Length is the choice, the following message is written to the screen message area:

```
< (t)ype[Segment Length] Pick segment (a)ssociative (s)tytle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or A toggles Association ON and OFF. See 15.4.1 Leader Association.

t or T changes the type of Information Leader. See 15.4.5 Information Leader.

s or S brings up the leader style list. 15.4.6.2 Leader Styles.

h or H brings up the Hook Angle 15.4.2 Hook Angle.

If Association is ON then the start of the Leader is associated with the segment pick point.

Step 2. Pick the hook point

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created.

The Segment Length Information Leader then starts again. That is, it goes back to Step 1.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.6 Segment Length 3D

**Information Leader** choice **Segment length 3d** displays in the leader box, the 3D length of a selected segment.

A leader line is drawn from the pick position on a selected segment (segment pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the 3d length of the segment is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1.** Pick the segment to label with its 3D length

When **Segment Length 3d** is the choice, the following message is written to the screen message area:

```
< (t)ype[Segment Length 3d] Pick segment (a)ssociative (s)ty[le[Arial Bold]] (h)ook-angle[0°] > [picks][fast][Menu]
```

- **a** or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
- **t** or **T** changes the type of Information Leader. See 15.4.5 Information Leader
- **s** or **S** brings up the leader style list. 15.4.6.2 Leader Styles
- **h** or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the segment pick point.

**Step 2.** Pick the hook point

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- **t** or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The **Information Leader** is then created.

The **Segment Length 3D Information Leader** then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.7 Segment Bearing

**Information Leader** choice **Segment Bearing** displays in the leader box, the bearing of a selected position on string (string pick point).

A leader line is drawn from the string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the bearing at the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the segment to label with its bearing**

When **Segment Bearing** is the choice, the following message is written to the screen message area:

```
< (t)ype[Segment Bearing] Pick point on segment (a)ssociative (s)tyl[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or A toggles Association ON and OFF. See **15.4.1 Leader Association**

t or T changes the type of Information Leader. See **15.4.5 Information Leader**

s or S brings up the leader style list. **15.4.6.2 Leader Styles**

h or H brings up the Hook Angle **15.4.2 Hook Angle**

If Association is **ON** then the start of the Leader is associated with the string pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or T brings up the leader text format. See **15.5 Text Format for Dimensions and Leaders**.

The **Information Leader** is then created.

The **Segment Bearing Information Leader** then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see **15.4.6.2 Leader Styles**.
15.4.5.8 Bearing & Segment Length

**Information Leader** choice Bearing & segment length displays in the leader box, the bearing at the string pick point and the length of the segment it is on.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the bearing and length of the pick point and segment is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the string to label with its bearing & length**

When **Segment Length & Bearing** is the choice, the following message is written to the screen message area:

```
< (t)type[Segment Length Bearing] Pick point on segment (a)ssociative (s)tyle[Ariel Border] (h)ook angle[0°] > [picks][fast][Menu]
```

- a or A toggles Association ON and OFF. See 15.4.1 Leader Association
- t or T changes the type of Information Leader. See 15.4.5 Information Leader
- s or S brings up the leader style list. 15.4.6.2 Leader Styles
- h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the segment pick point.

**Step 2. Pick the hook point.**

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The **Information Leader** is then created.

The **Segment Length & Bearing Information Leader** then starts again. That is, it goes back to Step 1.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.9 Segment Radius

**Information Leader** choice **Segment Radius** displays in the leader box the radius of a selected segment. If the segment is a straight then the radius is displayed as 0. If the segment is a transition, then the displayed radius is the radius of the transition at the picked position.

A leader line is drawn from a string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the radius of the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the segment to label with its radius**

When **Segment Radius** is the choice, the following message is written to the screen message area:

```plaintext
<:type[Segment Radius] Pick point on segment (a)ssociative (s)tyle[Ariel Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

- **a** or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
- **t** or **T** changes the type of Information Leader. See 15.4.5 Information Leader
- **s** or **S** brings up the leader style list. 15.4.6.2 Leader Styles
- **h** or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```plaintext
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- **t** or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created.

The **Segment Radius Information Leader** then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.
For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.10 String name

Information Leader choice String name displays in the leader box, the name of a selected string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the name of the string is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1. Pick the string to label with its name

When String Name is the choice, the following message is written to the screen message area:

< (type) [String Name] Pick string (a)ssociative (s)tyles (A)rial (B)order (h)ook-angle [0°] > [picks] [fast] [Menu]

a or A toggles Association ON and OFF. See 15.4.1 Leader Association

t or T changes the type of Information Leader. See 15.4.5 Information Leader

s or S brings up the leader style list. 15.4.6.2 Leader Styles

h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the segment pick point.

Step 2. Pick the hook point

The following message is written to the screen message area:

<Pick hook point or customise (t)ext > [picks] [fast] [Menu]

t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created.

The String Name Information Leader then starts again. That is, it goes back to Step 1.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.11 Vertex Text

**Information Leader** choice **Vertex text** displays in the leader box, the vertex text of a selected string vertex.

A leader line is drawn from a selected vertex on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the vertex text for the selected vertex of the string is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the string vertex to label with its vertex text**

When **Vertex Text** is the choice, the following message is written to the screen message area:

```
< (t)ype[Vertex Text] Pick vertex (a)ssociative (s)tye[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

- **a** or **A** toggles Association **ON** and **OFF**. See **15.4.1 Leader Association**
- **t** or **T** changes the type of Information Leader. See **15.4.5 Information Leader**
- **s** or **S** brings up the leader style list. **15.4.6.2 Leader Styles**
- **h** or **H** brings up the Hook Angle **15.4.2 Hook Angle**

If Association is **ON** then the start of the Leader is associated with the segment pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext > [picks][fast][Menu]
```

- **t** or **T** brings up the leader text format. See **15.5 Text Format for Dimensions and Leaders**.

The **Information Leader** is then created.

The **Vertex Text Information Leader** then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see **15.4.6.2 Leader Styles**.
15.4.5.12 Segment Text

Information Leader choice Segment text displays in the leader box, the segment text of a selected string segment.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the segment text for the selected segment of the string is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1. Pick the string segment to label with its segment text

When Segment Text is the choice, the following message is written to the screen message area:

```
< (t)ype[Segment Text] Pick segment (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

- a or A toggles Association ON and OFF. See 15.4.1 Leader Association
- t or T changes the type of Information Leader. See 15.4.5 Information Leader
- s or S brings up the leader style list. 15.4.6.2 Leader Styles
- h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the segment pick point.

Step 2. Pick the hook point

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created.

The Segment Text Information Leader then starts again. That is, it goes back to Step 1.

---

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.13 Vertex XYZ

**Information Leader** choice Vertex XYZ displays in the leader box, the x, y and z coordinates of a selected vertex.

A leader line is drawn from a selected vertex on a string to a selected hook point, and then to the end of the hook itself.

Using the text format, the x, y and z coordinates of a selected vertex are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the vertex to label with its x, y and z coordinates**

When Vertex XYZ is the choice, the following message is written to the screen message area:

```
< (t)ype[Vertex XYZ] Pick vert (a)ssociative (s)tyles[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or A toggles Association ON and OFF. See 15.4.1 Leader Association

T or T changes the type of Information Leader. See 15.4.5 Information Leader

s or S brings up the leader style list. 15.4.6.2 Leader Styles

h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the vertex.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created.

The Vertex XYZ Information Leader then starts again. That is, it goes back to Step 1.

---

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.14 Vertex XY

**Information Leader** choice **Vertex XY** displays in the leader box, the x and y coordinates of a selected vertex.

A leader line is drawn from a selected vertex on a string to a selected hook point, and then to the end of the hook itself.

Using the text format, the x and y coordinates of a selected vertex are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the vertex to label with its x and y coordinates**

When **Vertex XY** is the choice, the following message is written to the screen message area:

< (t)ype[Vertex XY] Pick vertex [a]ssociative [s]tyle[A]rial Border] [h]ook-angle[0°] > [picks][fast][Menu]

- **a** or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
- **t** or **T** changes the type of Information Leader. See 15.4.5 Information Leader
- **s** or **S** brings up the leader style list. 15.4.6.2 Leader Styles
- **h** or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the vertex.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

<Pick hook point or customise (t)ext> [picks][fast][Menu]

- **t** or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The **Information Leader** is then created.

The **Vertex XY Information Leader** then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.15 String XYZ

Information Leader choice String XYZ displays in the leader box, the x, y and z coordinates of any selected position on a string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the x, y and z coordinates of the selected string position are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the string position to label with its x, y and z coordinates**

When String XYZ is the choice, the following message is written to the screen message area:

```
< (t)ype[String XYZ] Pick point (a)ssociative (s)tytle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

- a or A toggles Association ON and OFF. See 15.4.1 Leader Association
- t or T changes the type of Information Leader. See 15.4.5 Information Leader
- s or S brings up the leader style list. 15.4.6.2 Leader Styles
- h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the string pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created. The String XYZ Information Leader then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.16 String XY

**Information Leader** choice **String XY** displays in the leader box, the x and y coordinates of any selected position on a string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the x and y coordinates of the selected string position are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the string position to label with its x and y coordinates**

When **String XY** is the choice, the following message is written to the screen message area:

```plaintext
< (t)ype[String XY] Pick point (a)ssociative (s)tyle[Arial Border] [h]ook-angle[0°] > [picks][fast][Menu]
```

- **a** or **A** toggles Association ON and OFF. See [15.4.1 Leader Association](#).
- **t** or **T** changes the type of Information Leader. See [15.4.5 Information Leader](#).
- **s** or **S** brings up the leader style list. [15.4.6.2 Leader Styles](#).
- **h** or **H** brings up the Hook Angle [15.4.2 Hook Angle](#).

If Association is **ON** then the start of the Leader is associated with the string pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```plaintext
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- **t** or **T** brings up the leader text format. See [15.5 Text Format for Dimensions and Leaders](#).

The **Information Leader** is then created.

The **String XY Information Leader** then starts again. That is, it goes back to **Step 1**.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see [15.4.6.2 Leader Styles](#).
15.4.5.17 String Z

**Information Leader** choice String Z displays in the leader box, the z coordinate (level) of any selected position on a string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the z coordinate (level) of the selected string position are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the string position to label with level (z coordinate)**

When String Z is the choice, the following message is written to the screen message area:

```
< (t)ype[String Z] Pick point (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

- a or A toggles Association ON and OFF. See 15.4.1 Leader Association
- t or T changes the type of Information Leader. See 15.4.5 Information Leader
- s or S brings up the leader style list. 15.4.6.2 Leader Styles
- h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the string pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Information Leader is then created.

The String Z Information Leader then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.18 Tin Z

**Information Leader** choice Tin Z displays in the leader box, the z value (level) from the tin at the (x,y) coordinates of a selected position.

A leader line is drawn from the selected position (pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the level from the tin is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1.** Pick the position that is to be labelled with the level (z value) from the tin

When Tin Z is the choice, and if it is the first time the Tin z option has been used in this session, then the Tin Typed Input box is placed on the screen.

![Tin Typed Input](image)

The tin to take the levels from is picked from the pop up list, or typed into the box and <Enter> pressed. The box is then removed.

The following message is written to the screen message area.

< (t)yp[Tin Z] Pick point on tin (a)ssociative (s)style[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]

a or A toggles Association ON and OFF. See 15.4.1 Leader Association
t or T changes the type of Information Leader. See 15.4.5 Information Leader
s or S brings up the leader style list. 15.4.6.2 Leader Styles
h or H brings up the Hook Angle 15.4.2 Hook Angle
i or I brings up the Tin Typed Input box to select a new tin.

If Association is ON then the start of the Leader is associated with the pick point

**Step 2.**

The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

**Pick the hook point.**

The Information Leader is then created.

The Tin Z Information Leader then starts again. That is, it goes back to Step 1.
Note - the tin itself does not have to be on any view.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.19 Tin Depth

**Information Leader** choice **Tin Depth** displays in the leader box, the depth at a selected position on a string to a tin.

A leader line is drawn from the selected string position (pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the depth from the pick point to the tin is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1.** Pick the point that is to be labelled with its depth to the tin

When **Tin Depth** is the choice, and if it is the first time the **Tin z** option has been used in this session, then the **Tin Typed Input** box is placed on the screen.

![Tin Typed Input](image)

The tin to take the levels from is picked from the pop up list, or typed into the box and `<Enter>` pressed. The box is then removed.

The following message is written to the screen message area.

`<Type[Tin Depth] Pick point on tin (a)ssociative (s)tytle(A)rial Border (h)ook-angl[e]0°] > [picks3][fast][Menu]`

- `a` or `A` toggles Association **ON** and **OFF**. See [15.4.1 Leader Association](#).
- `t` or `T` changes the type of Information Leader. See [15.4.5 Information Leader](#).
- `s` or `S` brings up the leader style list. See [15.4.6.2 Leader Styles](#).
- `h` or `H` brings up the Hook Angle. See [15.4.2 Hook Angle](#).
- `i` or `I` brings up the **Tin Typed Input** box to select a new tin.

If Association is **ON** then the start of the Leader is associated with the pick point.

**Step 2.** Pick the hook point

The following message is written to the screen message area.

`<Pick hook point or customise (t)ext> [picks3][fast][Menu]`

- `t` or `T` brings up the leader text format. See [15.5 Text Format for Dimensions and Leaders](#).

The **Information Leader** is then created.

The **Tin Depth Information Leader** then starts again. That is, it goes back to **Step 1**.

---

**Note** - the tin itself does not have to be on any view.

**Note on Position of Leader Box With Respect to the Hook Point**
As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.20 Grade (%)

**Information Leader** choice **Grade (%)** displays in the leader box, the percent grade of a selected position on string (string pick point). 

A leader line is drawn from the string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the percent grade at the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1.** Pick the position on a string to label with per cent grade 

When **Grade per cent** is the choice, the following message is written to the screen message area

```
< (t)ype[Grade %] Pick point on string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

- a or A toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
- t or T changes the type of **Information Leader**. See 15.4.5 Information Leader
- s or S brings up the leader style list. 15.4.6.2 Leader Styles
- h or H brings up the Hook Angle 15.4.2 Hook Angle

If Association is ON then the start of the Leader is associated with the string pick point.

**Step 2.** Pick the hook point 

The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The **Information Leader** is then created.

The **Grade per cent Information Leader** then starts again. That is, it goes back to **Step 1**.

---

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.21 Grade 1 in - Slope

**Information Leader** choice Grade 1 in displays in the leader box, the grade as a 1 in (slope) of a selected position on string (string pick point).

A leader line is drawn from the string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the grade as a 1 in (slope) at the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the position on a string to label with its grade as 1:in (slope)**

When **Grade 1 in** is the choice, the following message is written to the screen message area:

```
< (t)ype[Grade 1 In] Pick point on string (a)ssociative (s)tytle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

- **a** or **A** toggles Association **ON** and **OFF**. See [15.4.1 Leader Association](#).
- **t** or **T** changes the type of Information Leader. See [15.4.5 Information Leader](#).
- **s** or **S** brings up the leader style list. [15.4.6.2 Leader Styles](#).
- **h** or **H** brings up the Hook Angle [15.4.2 Hook Angle](#).

If Association is **ON** then the start of the Leader is associated with the string pick point.

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```
Pick hook point or customise (t)ext > [picks][fast][Menu]
```

- **t** or **T** brings up the leader text format. See [15.5 Text Format for Dimensions and Leaders](#).

The **Information Leader** is then created.

The **Grade 1 in Information Leader** then starts again. That is, it goes back to **Step 1**.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see [15.4.6.2 Leader Styles](#).
15.4.5.22 Centroid XY

**Information Leader** choice **Centroid XY** displays in the leader box, the (x,y) coordinates of the centroid of a selected string. If the string is not a closed string (a polygon) then it is temporarily closed for calculating the Centroid. Note that the centroid may be outside the closed string - for a point that is inside the string, see **15.4.5.23 Medial Centre XY**.

A string is selected (string pick point) and a position for the hook and leader line is drawn from either the string pick point or the centroid of the string, to a selected hook point, and then to the end of the hook itself.

Using the text format, the (x,y) coordinates of the centroid of the selected string are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1.** Pick the string to label with the (x,y) coordinates of its centroid

When **Centroid XY** is the choice, the following message is written to the screen message area:

```
< {type}[Centroid XY] Pick string (a)ssociative (c) style[Arial Bold] (h)ook-angle[0°] fixed-a(r)row> [picks][fast][Menu]
```

- a or A toggles Association **ON** and **OFF**. See **15.4.1 Leader Association**
- t or T changes the type of Information Leader. See **15.4.5 Information Leader**
- s or S brings up the leader style list. **15.4.6.2 Leader Styles**
- h or H brings up the Hook Angle **15.4.2 Hook Angle**
- r or R toggles between the arrow starting at the pick point (**free arrow**) or at the polygon centre (**fixed arrow**)

If Association is **ON** then the start of the Leader is associated with the pick point or the centroid of the string.

**Step 2.** Pick the hook point

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- t or T brings up the leader text format. See **15.5 Text Format for Dimensions and Leaders**.

The **Information Leader** is then created.

The **Centroid XY Information Leader** then starts again. That is, it goes back to **Step 1**.
Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the centroid of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the centroid of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.23 Medial Centre XY

**Information Leader** choice **Centre XY** displays in the leader box, the \((x,y)\) coordinates of the medial axis centre of a selected string. If the string is not a closed string (polygon) then it is temporarily closed for calculating the Medial centre.

**Note** - the Medial centre is a pointed calculated by 12d to use as the “centre” of a polygon and unlike a centroid, it is always inside the polygon. **WARNING** - this currently does not take arcs into consideration.

A string is selected (string pick point) and a position for the hook and leader line is drawn from either the string pick point or the medial axis centre of the string, to a selected hook point, and then to the end of the hook itself.

Using the text format, the \((x,y)\) coordinates of the medial centre of the selected string are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1.** Pick the string to label with the \((x,y)\) coordinates of its (medial) centre

When **Centre XY** is the choice, the following message is written to the screen message area:

```
(t)ype[Centroid XY] Pick string (a)ssociate (t)yle[Arial Border] (h)ook-angle[0°] fixed-arrow [picks][fast][Menu]
```

- **a** or **A** toggles Association ON and OFF. See 15.4.1 Leader Association
- **t** or **T** changes the type of Information Leader. See 15.4.5 Information Leader
- **s** or **S** brings up the leader style list. 15.4.6.2 Leader Styles
- **h** or **H** brings up the Hook Angle 15.4.2 Hook Angle
- **r** or **R** toggles between the arrow starting at the pick point (**free arrow**) or at the polygon centre (**fixed arrow**)

If Association is **ON** then the start of the Leader is associated with the centre of the string.

**Step 2.** Pick the hook point

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

- **t** or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The **Information Leader** is then created.

The **Centre XY Information Leader** then starts again. That is, it goes back to **Step 1**.
Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the medial centre of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the medial centre of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.24 Trimesh Volume

The Leader choice Trimesh volume displays in the leader box, the volume of a selected closed trimesh.

A trimesh is selected (trimesh pick point) and a position for the hook and leader line is drawn from the trimesh pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the volume of the selected trimesh is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1. Pick the trimesh to label with its volume

When Trimesh Volume is the choice, the following message is written to the screen message area:

```
<Pick trimesh (s)style[default] (h)ook-angle[0°] > [picks][fast][Menu]
```

s or S brings up the leader style list. 15.4.6.2 Leader Styles

h or H brings up the Hook Angle 15.4.2 Hook Angle

Step 2. Pick the hook point

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext [picks][fast][Menu]
```

t or T brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The Trimesh Volume Leader is then created.

The Trimesh Volume Leader then starts again. That is, it goes back to Step 1.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the medial centre of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the medial centre of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.
15.4.5.25 Trimesh Surface Area

The Leader choice Trimesh area displays in the leader box, the surface area of a selected trimesh.

A trimesh is selected (trimesh pick point) and a position for the hook and leader line is drawn from the trimesh pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the volume of the selected trimesh is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

**Step 1. Pick the trimesh to label with its surface area**

When Trimesh area is the choice, the following message is written to the screen message area:

```
<Pick trimesh (s)style[default] (h)ook-angle[0°] > [picks][fsst][Menu]
```

s or S brings up the leader style list. [15.4.6.2 Leader Styles](#)

h or H brings up the Hook Angle [15.4.2 Hook Angle](#)

**Step 2. Pick the hook point**

The following message is written to the screen message area:

```
<Pick hook point or customise (t)ext> [picks][fsst][Menu]
```

t or T brings up the leader text format. See [15.5 Text Format for Dimensions and Leaders](#)

The Trimesh Area Leader is then created.

The Trimesh Area Leader then starts again. That is, it goes back to Step 1.

**Note on Position of Leader Box With Respect to the Hook Point**

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the medial centre of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the medial centre of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see [15.4.6.2 Leader Styles](#).
15.4.6 Leader Utilities

Position of menu: Cad => Leader => Utilities

The Leader Utilities menu is:

![Leader Utilities menu]

- **Edit**
- **Styles**
- **Recalc**
- **Recalc all**
- **Delete**
- **Change info**
- **Change style**
- **Change text format**
- **Rotate text**
- **Rotate text many**

**See**

15.4.6.1 Leader Edit
15.4.6.2 Leader Styles

**Recalc** - select a leader to recalc.

**Recalc all** - recalcs all leaders.

**Delete** - select a leader to delete.

15.4.6.3 Change Style of Leader
15.4.18.4 Change Text Format (same option for Dimensions and Leaders)
15.4.6.1 Leader Edit

Picking an existing Leader will bring up the Leader editor and the grip points for the pick point and the hook point are displayed.

If there is no Association because either the Association is OFF, or Association is ON but there is nothing currently associated with the leader, then you won’t get a grip point to move the entire leader because the leader is locked to its associated items.

A list of typed options is also displayed in the screen message area.

Picking and accepting a grip point will move the grip point and when it is placed again, the association is recalced and the new value for the leader displayed.

For the typed options, typing

- **t** or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.
- **s** or **S** brings up the leader style list. 15.4.6.2 Leader Styles
- **f** or **F** to flip the side that the hook goes to.
- **d** or **D** deletes the leader
- **n** or **N** pick a new leader to edit.
Also

Pressing <Esc> will exit the editing of the current leader and ask for a new drafting element (Leader or Dimension) to be selected for editing.

Similarly clicking RB and selecting Cancel from the Pick Ops menu will exit the editing of the current leader and ask for a new drafting element (Leader or Dimension) to be selected for editing.

When back in the Drafting Editor, pressing <Esc> or clicking RB and selecting Cancel from the Pick Ops menu, will exit the Drafting Editor
15.4.6.2 Leader Styles

Position of option on menu: CAD => Leader => Styles

When you click on the option an Edit leader_styles.xml panel is brought up and the panel shows the standard areas for looking for the leader_styles.XML files - Working folder, Customer (User), User, Set Ups and Other.

For information about where how to find and create dimension_styles.xml files, see 15.7 Style XML Files for Dimensions, Leaders & Tables.

Once a leader_styles.xml file has been opened, the Leader Styles panel is displayed.

See 15.4.6.2.1 Leader Styles - Name Node
15.4.6.2.2 Leader Styles - Arrow Symbol Node
15.4.6.2.3 Leader Styles - Hook Symbol Tab
15.4.6.2.4 Leader Styles - Textstyle Node
15.4.6.2.1 Leader Styles - Name Node

This is on the right hand side of the panel when you click on the Leader style name.

<tr>
<td>Colour</td>
<td>green</td>
</tr>
<tr>
<td>Linestyle</td>
<td>THIN</td>
</tr>
<tr>
<td>Lineweight</td>
<td>1</td>
</tr>
<tr>
<td>Use arrow</td>
<td>yes</td>
</tr>
<tr>
<td>Use hook</td>
<td>yes</td>
</tr>
<tr>
<td>Hook length</td>
<td>0.5</td>
</tr>
<tr>
<td>Use box around text</td>
<td>yes</td>
</tr>
<tr>
<td>Use rounded box</td>
<td>yes</td>
</tr>
<tr>
<td>Text box colour</td>
<td>orange</td>
</tr>
<tr>
<td>Text box linestyle</td>
<td>1</td>
</tr>
<tr>
<td>Text box lineweight</td>
<td>0</td>
</tr>
<tr>
<td>Number of decimals for length</td>
<td>3</td>
</tr>
<tr>
<td>Number of decimals for area</td>
<td>2</td>
</tr>
</tbody>
</table>

- **Hook length** has same units as Textstyle. So if the Textstyle is paper, then **Hook length** is in millimetres.

- **Use hook is yes**
- **Use arrow is yes**
- **Number of decimals for length**

If the **Type** from the Textstyle tab is not world, then the following are not used.

- Use text box - should be **Use box around text** like dimension.
Text box rounded - should be *Use rounded box like dimension*?.
Text box colour
Text box linestyle
Text box line weight

The following items that are at the bottom of the tab have not yet been implemented.

- Hook angle
- Use dynamic size
- Number of decimals for volumes
- Angle format style
15.4.6.2.2 Leader Styles - Arrow Symbol Node

This is on the right hand side of the panel when you click on the Arrow symbol node.

<table>
<thead>
<tr>
<th>Style</th>
<th>Arrow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colour</td>
<td>red</td>
</tr>
<tr>
<td>Size</td>
<td>0.5</td>
</tr>
<tr>
<td>Rotation</td>
<td>45</td>
</tr>
<tr>
<td>Offset</td>
<td>0.2</td>
</tr>
<tr>
<td>Raise</td>
<td>0.5</td>
</tr>
</tbody>
</table>

The origin of the symbol is displaced from the start of the leader line by the Offset and Raise values.

With a Rotation value of zero, the symbol is given the same rotation as the leader line.

For a non zero Rotation, the value is added to the angle of the leader line.
15.4.6.2.3 Leader Styles - Hook Symbol Tab

Not implemented at this stage.

<table>
<thead>
<tr>
<th>Style</th>
<th>ARROW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colour</td>
<td>yellow</td>
</tr>
<tr>
<td>Size</td>
<td>0.5</td>
</tr>
<tr>
<td>Rotation</td>
<td>45</td>
</tr>
<tr>
<td>Offset</td>
<td>0.2</td>
</tr>
<tr>
<td>Raise</td>
<td>0.5</td>
</tr>
</tbody>
</table>
### 15.4.6.2.4 Leader Styles - Textstyle Node

This is on the right hand side of the panel when you click on the **Textstyle** node.

<table>
<thead>
<tr>
<th>Textstyle</th>
<th>Arial</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>paper</td>
</tr>
<tr>
<td>Size</td>
<td>0.2</td>
</tr>
<tr>
<td>Angle</td>
<td>0°</td>
</tr>
<tr>
<td>X-factor</td>
<td>1</td>
</tr>
<tr>
<td>Slant</td>
<td>0</td>
</tr>
<tr>
<td>Offset</td>
<td>0</td>
</tr>
<tr>
<td>Raise</td>
<td>0</td>
</tr>
<tr>
<td>Colour</td>
<td>cyan</td>
</tr>
<tr>
<td>Whiteout</td>
<td>no colour</td>
</tr>
<tr>
<td>Border</td>
<td>no colour</td>
</tr>
</tbody>
</table>

**Border type**

- **Justify**: bottom-left
- **TTF Underline**: no
- **TTF Strikeout**: no
- **TTF Italic**: no
- **TTF Outline**: no
- **TTF Weight**: 400

This is expected to be modified shortly so that it uses a **Textstyle Data** and all the features from **Textstyle Data** are automatically available. For the moment with paper text, only **Whiteout** is supported.

When the **Textstyle Data** is implemented, it can have its own **Border type** but there is no linestyle for the border in **Textstyle Data**. The only way to get a border with a linestyle is to use World text and set the border parameters in the **General** tab (15.4.6.2.1 Leader Styles - Name Node).

If **Type** is not **world**, then **Don’t clip dimension line for text** is set to **no** and these items from the General tab are not used.

- Use box around text
- Use rounded box
- Text box colour
- Text box linestyle

See 15.4.6.2.1 Leader Styles - Name Node
15.4.6.3 Change Style of Leader

Click on **Change style of style** and the following message is written to the screen message area:

```
<Pick drafting element to apply {style[(diags no clip)] [picks][fast][Menu]>
```

Pick a leader and its style will be changed to that shown in the square brackets ([[]]). Then pick another leader to change its style.

Typing **s** or **S** brings up the **Style Typed Input** box to select a new leaders style.

![Style Typed Input](image)

The new style is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the message again written to the screen message area.

All subsequent selected leaders will have their styles changed to this new style until either the option is terminated or a new leader style is selected.

To terminate the option, press **Esc**, select **Cancel** from the **Pick Ops** menu, or select another CAD option.
15.5 Text Format for Dimensions and Leaders

For Dimensions and Leaders, there is one, and sometimes more than one, value that is to be displayed in the Dimension or Leader as text. For example, the length of a segment or the x and y coordinates of a point.

The user rarely want to display all the different dimensions and leader values in the same way. For example, some values may be displayed in metres, others in millimetres. Or you may want to display both metres and yards.

In 12d Model, there are special Text Formats to allow the user to tailor how the values of the Dimensions and Leaders are displayed.

So a Text Format is used to describe how a single value for a dimension or leader is displayed. In general is has the form

\[ \text{pre_text} \text{Expression} \text{post_text} \]

where Expression can be either

(a) a set of angle brackets enclosing a value_format which describes how the value is modified and how many decimal places are used in the final text display of the value

\[ <\text{value_format}> \]

(b) an expression involving an IF statement (known as a dynamic text format)

The full structure of the Text Format, the value_format and dynamic text format is described in the following sections:

15.5.1 Angle Brackets <>
15.5.2 Pre and Post Text
15.5.3 Units Factor
15.5.4 Round Off
15.5.5 Number of Decimals
15.5.6 Dynamic Text Format
15.5.7 Multiple Text Formats
15.5.8 Typing t or T to Change the Text Format
15.5.9 Defaults File for Text Formats
15.5.1 Angle Brackets <>

In the Text Formats, angle brackets <> are used to indicate the position of the value of the Dimension or Leader.

There can be special value formatting instructions inside the angle brackets to indicate if and how the value is to be modified, and how many decimals to use when finally displayed as text.

<value_format>

What is available for value_format will be described in the following sections.

In some cases, the angle brackets may not appear at all in the Text Format and then the text does not include the actual value itself.

If the Dimension or Leader has only one value, then just <> is required.

If the Dimension or Leader has more than one value, then extra commands are needed to indicate which value is being talked about in the Text Format.

<x> is used for the x value of a coordinate
<y> is used for the y value of a coordinate
<z> is used for the z value of a coordinate
15.5.2 Pre and Post Text

The text displayed for a dimension or leader value can have user defined *pre* and *post* text around the value and that is indicated by the expression

\[ \text{pre_text} < \text{value_format} > \text{post_text} \]

where *pre_text* is written before the dimension or leader value, *post_text* is written after the value.

Typing `\n` into *pre_text* or *post_text* will be interpreted as a new line.

The angle brackets `<>` indicate where you want the value in relation to the *pre_text* and *post_text*. The angle brackets may even be missing.

For example, to show just the word “varies”, use the following with no angle brackets.

```
varies
```

15.5.3 Units Factor

The value to be displayed can be multiplied by a *units_factor*. The units_factor is written inside the angle brackets `<>`. That is

\[ <\text{units_factor}> \]

So the expression

\[ \text{pre_text} < \text{units_factor} > \text{post_text} \]

means that *pre_text* is written before the dimension or leader value, *post_text* is written after the value, `<>` indicates that you want the value and the value is multiplied by the *units_factor* before being displayed.

If *units_factor* is left blank then it is defaulted to 1.

If `<units_factor>` is left out, then there is no value in the dimension or leader text but you still get the *pre_text* and *post_text*.

**Note**

`pre_text<units_factor>post_text` is considered to be one block of text. So raise, offset, justification etc apply to the whole block, not to the *pre_text* or *post_text* individually.

As an example of `pre_text<units_factor>post_text`, you can show millimetres instead of metres by using:

```
<1000>
```

or, if you want the text “mm” after the value

```
<1000> mm
```
15.5.4 Round Off

Inside the angle brackets <>, the type of Rounding Off can be specified by a key character O (down), M (middle) or U (up) followed immediately (with no spaces) by the \textit{rounding}\_unit.  

- **Orounding\_unit** means to round down to the closest \textit{rounding}\_unit.
- **Mrounding\_unit** means to round to the closest \textit{rounding}\_unit.
- **Urounding\_unit** means to round up to the closest \textit{rounding}\_unit.

For example:

- **O1** means that 10.2 would round down to 10.
- **O0.1** means that 10.2 would round down to 10.2
- **D0.25** means that 10.2 would round up to 10.
- **U0.25** means that 10.2 would round up to 10.25
- **M0.25** means that 10.2 would round up to 10.25 rather than down to 10.

\textbf{Note:} the \textit{units}\_factor is applied first and then the Round Off.

15.5.5 Number of Decimals

Inside the angle brackets <>, you can give the number of decimal places to use when writing out the real value by using the key character D followed immediately (with no spaces) by the \textit{number of decimal places}.

- **Dn** where n is the number of decimal places.

\textit{pre\_text}<\textit{units}\_factorDn>\textit{post\_text}

The \textit{units}\_factor is applied first and then the number of decimal places used on the resulting value.

For example

- **<1000D1>**

says to multiply the real by 1000 and only use one decimal place in the text for the value.

\textbf{Note:} the \textit{units}\_factor is applied first, followed by the Round Off, and finally the \textit{number of decimal places} used in the text to display the resulting value.

So **<100D2U0.25>** is the same as **<100U0.25D2>** - multiply by 100, round Up using the \textit{rounding}\_unit of 0.25, and then writing the result with two decimal places.
15.5.6 Dynamic Text Format

It is also possible to change the format for a value depending on the size of the value by using an Expression with an IF test instead of the simple angle brackets < >.

The Expression has key words _IF_, _THEN_, _ELSE_ and _ELSEIF_ and can be

\[ \text{IF op1 comparison_value_1 THEN single_value_format_1 ELSEIF op2 comparison_value_2 THEN single_value_format_2 ELSEIF op3 comparison_value_3 THEN single_value_format_3 ... ELSE single_value_format_n} \]

where op1 and op2 are one of

- \( \text{=} \) for equals
- \( \text{>} \) for greater than
- \( \geq \) for greater than or equal to
- \( \text{<} \) for less than
- \( \leq \) for less than or equal to

and

single_value_format_n is a Text Format for a single value and not an Expression.

The comparison is always being made between the dimension/leader value and the comparison_value so we have left out the dimension/leader value.

That is, _IF_>comparison_value means if (dimension value is greater than comparison_value).

For example if you wanted to display kilometres to three decimal place, for anything greater than or equal to 1,000, metres to three decimal places for values greater or equal to 1, otherwise millimetres with no decimal places, then use

\[ \text{IF}_>=1000 \text{ THEN } <0.001D3 \text{ km } \text{ELSE}_>=1 \text{ THEN } <D3 \text{ m } \text{ELSE}_=<1000D0 \text{ mm} \]

Important Notes

1. The Dynamic Text Format always evaluates to only one piece of text.
2. The underscore is part of _IF_, _THEN_, _ELSEIF_ and _ELSE_.
3. _IF_ \text{ op} comparison_value must be followed by a _THEN_ single_value_format.
4. _ELSEIF_ \text{ op} comparison_value must be followed by a _THEN_ single_value_format.
5. It is compulsory to have an _ELSE_ at the end of the Expression.
6. An Expression is only for < > values and not <x>, <y> etc.

15.5.7 Multiple Text Formats

You can have just the one Text Format or multiple text formats in the dimension or leader.

That is, you can have

\[ \text{pre_text}<value_format_1><text_1><value_format_2>...<text_n><value_format_n} \]

where \text{pre_text} is written before the value with value_format_1, \text{text_n} is written after the n'th < > and the value in the n'th < > has the format value_format_n.

For example, to show metres and International feet, use

\[ <m \text{ or } <3.28083895> \text{ ft} \]

or to show metres and US Survey feet, use

\[ <m \text{ or } <3.28083333> \text{ ft} \]
15.5.8 Typing t or T to Change the Text Format

When using many of the **Dimension** or **Leader** commands, a list of typed options is often displayed in the screen message area and this may include **forma(t)** or **customise (t)ext**.

**example for Dimensions**

```
<Pick start point> (a)sso(ciate (s)ty(le[default] forma(t) [(z)ero off] [ OFF] > [picks][fast][Menu]
```

**for Information Leaders**

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

When this is the case, typing **t** or **T** is for changing the Text Format for the dimension or leader. The default value is the last one used.

After typing **t** or **T**, the **Format Typed Input** box is displayed showing the current text format of the selected dimension or leader.

![Format Typed Input](image)

Clicking on the Choice icon will bring up a list of **Text Formats** for the type of **dimension** or **leader** being worked on. This includes the **last six** used which is useful when using the same format multiple times. See **15.5.9 Defaults File for Text Formats**.

The new **Text Format** is picked from the pop up list, or typed into the box and **<Enter>** pressed. The **Format Typed Input** box is then removed.
15.5.9 Defaults File for Text Formats

There is an XML file called `draft_texts.xml` which contains up to fifteen text formats for each Dimension type, and up to fifteen text formats for each type of Information Leader.

When you type t or T after seeing (t)ext included in the message in the screen message area, a Format Typed Input box is placed on the screen. The pop on the box up brings up a list of up to fifteen entries which come from the appropriate section of the `draft_texts.xml` file for the dimension or leader type being created or edited.

The first six of the fifteen in the pop up are the last six ones used in the current session of 12d Model, and the rest come from the `drafts_texts.xml` file.

So in a new session, all the entries in the pop up come from the `drafts_texts.xml` file. Each time one is selected from the list, or a new text format typed in, the selected or typed in text format is placed on the top of the list. If there is already six new entries on the top of the list, the sixth one is deleted and the first five are shuffled down.

As each of the six new entries are added to the top of the list, the bottom six that have come from the `draft_texts.xml` file are dropped off the list.

The `draft_texts.xml` file is read each time you open a 12d Model project.
15.5.9.1 An Excerpt from a draft_text.xml File

The draft_text.xml file consists of a <meta_data> block at the top and then a <drafting> block with <Leader_Text> and <Dimension_Text> sections.

Note that because < and > are part of the XML syntax, in an XML file, less than (<) is written as \&lt; and greater than (>) is written as \&gt;.

An example of part of the Dimension_Text and Leader_Text sections of the drafts_texts.xml file, which includes the Aligned_Type dimension text formats for the first three entries in the pop up list.

An excerpt from a draft_text.xml file:

```xml
<Dimension_Text>
  <Aligned_Type0>len &lt;&gt; m</Aligned_Type0>
  <Angular_Type0>&lt;&gt;</Angular_Type0>
  <Arc_Ang_Type0>&lt;&gt;</Arc_Ang_Type0>
  <Aligned_Type1>_IF_&lt;0.3048_THEN_&lt;39.37007874&gt; in_ELSE_&lt;3.280839895&gt; ft</Aligned_Type1>
  <Angular_Type1>&lt;&gt;</Angular_Type1>
  <Arc_Ang_Type1>&lt;&gt;</Arc_Ang_Type1>
  <Aligned_Type2>&lt;100&gt; cm</Aligned_Type2>
</Dimension_Text>

<Leader_Text>
  <Unknown_Type0>sadfsdfa\nLine2</Unknown_Type0>
  <Area_Type0>Area &lt;&gt;</Area_Type0>
  <String_Length_3d_Type0>Length 3d &lt;&gt;m</String_Length_3d_Type0>
  <Unknown_Type1>sadfsdfa</Unknown_Type1>
  <Area_Type1>Area &lt;&gt;</Area_Type1>
  <String_Length_3d_Type1>Length 3d &lt;&gt;m</String_Length_3d_Type1>
  <Unknown_Type2>sadf</Unknown_Type2>
  <Area_Type2>Area &lt;&gt;</Area_Type2>
  <String_Length_3d_Type2>Length 3d &lt;&gt;m</String_Length_3d_Type2>
</Leader_Text>
```
15.6 CAD Table

Position of option on menu: CAD => Table

The CAD Table options create and edit tables.

A user table can be created but also tables from super alignments or CSV files that can automatically update with changes in the super alignment or CSV file.

See

15.6.1 Create Table
15.6.2 Create Table from a Super Alignment
15.6.3 Create Table from a CSV File
15.6.4 Table Edit
15.6.5 Table Styles

Recalc - select a table to recalc.
Recalc all - recalcs all tables.
Delete - select a table to delete.

15.6.6 Table to CSV
15.6.1 Create Table

Position of option on menu: CAD => Table => Create

Important Note - all the text in a table will be treated as World Units.

Selecting Create brings up the Create Table panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>name box</td>
<td>available names</td>
<td></td>
</tr>

</tr>
<tr>
<td>Location</td>
<td>x y box</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Rotation</td>
<td>angle box</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

The name for the table. This must not be blank.
the model for the table.
the table style to use for this table.
If ticked, the table automatically resizes the column widths and heights to fit the text into the columns.
If not ticked, the table will not resize the column widths and heights to fit the text into the column.
the (x,y) coordinates of the top left hand corner of the table.
the rotation of the table - entered in hp notation. It is measured in a counter clockwise direction from the positive x axis.
Use title tick box ticked
if ticked, the table has a title as the first row and it only consists of one column which goes from the left side of the table to the right side of the table. The textstyle information for text in the title is given in the Title style node of the Drafting Styles for Tables.
If not ticked, the table does not have a title at the top.

Use header tick box ticked
if ticked, each column has as its first entry a header. The textstyle information for text in the row of headers is given in the Header style node of the Drafting Styles for Tables.
If not ticked, the table does not have a title at the top.

Number of rows integer box
the number of rows in the table.

Number of columns integer box
the number of columns in the table.

Column width real box
if Auto sizing is no, the width of each column.

Row height real box
if Auto sizing is no, the height of each column.

Buttons at bottom
Create button
create the table with the properties in this panel at the location given in Location.

Continue to the next section 15.6.2 Create Table from a Super Alignment or return to 15.6 CAD Table.
15.6.2 Create Table from a Super Alignment

Position of option on menu: CAD => Table => Super alignment

This table option is for creating a table of information about a selected super alignment. The table is associated with the super alignment so that the table can be updated when the super alignment is modified.

Important Note - all the text in a table will be treated as World Units.

Selecting Super alignment brings up the Create Super Alignment Reference Table panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>name box</td>
<td>available names</td>
<td></td>
</tr>
<tr>

<tr>
<td>Model for table</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the model for the table.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Style  

table style box  

available table styles  

the table style to use for this table.

Super alignment  

string select box  

select the super alignment to provide the information to generate the table.

Chainage interval  

real box  

the interval to use if reporting information at chainage intervals down the super alignment.

Chainage reference  

real box  

the intervals for reporting are incremented about the Chainage reference value.

Start/End chainage  

choice box  

if not blank, the chainage to use for the Start/End chainages reported in the table.

If blank, the Start/End chainage of the super alignment is used.

Table format  

choice box  

if horizontal ips, the table has information about the horizontal IP’s for the super alignment, and includes columns for the horizontal IP number, the x, y, z coordinates of the HIP and the radius of any arc on the HIP.

If horizontal segments, the table has information on the vertices at the beginning of each segment along the horizontal geometry for the super alignment, and includes columns for the type of the segment that starts at that vertex, the x, y, z (level) coordinates of the vertex, the bearing of the segment coming into and leaving the vertex, and the radius of the segment coming into and leaving the vertex.

If horizontal tangents, if vertical ips, the table has information about the vertical IP’s for the super alignment, and includes columns for the vertical IP number, the chainage of the VIP and the height of the VIP.

If vertical segments, the table has information on the vertices at the beginning of each segment along the vertical geometry of the super alignment, and includes columns for the type of the segment that starts at that vertex, the chainage and z (level) coordinates of the vertex, the grade of the segment coming into and leaving the vertex, and the type of the segment coming into and leaving the vertex.

Page number  

integer box  

Auto sizing  

tick box  

not ticked  

if ticked, the table automatically resizes the column widths and heights to fit the text into the columns.

If not ticked, the table will not resize the column widths and heights to fit the text into the column.

Location  

x y box  

0  

the (x,y) coordinates of the top left hand corner of the table.

Rotation  

angle box  

0  

the rotation of the table - entered in hp notation. It is measured in a counter clockwise direction from the positive x axis.

Use title  

tick box  

ticked  

if ticked, the table has a title as the first row and it only consists of one column which goes from the left side of the table to the right side of the table. The textstyle information for text in the title is given in the Title style node of the Drafting Styles for Tables.
If not ticked, the table does not have a title at the top.

**Use header**

Tick box: ticked

If ticked, each column has as its first entry a header. The textstyle information for text in the row of headers is given in the **Header style** node of the Drafting Styles for Tables.

If not ticked, the table does not have a title at the top.

**Number of rows**

Integer box

The number of rows in the table.

Not used - the Table format and super alignment determines how many rows there are.

**Number of columns**

Integer box

The number of columns in the table.

Not used - the Table format and super alignment determines how many columns there are.

**Column width**

Real box

If Auto sizing is no, the width of each column.

**Row height**

Real box

If Auto sizing is no, the height of each column.

### Buttons at bottom

**Create**

Button

Create the table with the properties in this panel at the location given in **Location**.

Continue to the next section [15.6.3 Create Table from a CSV File](#) or return to [15.6 CAD Table](#).
15.6.3 Create Table from a CSV File

This table option is for creating a table of information from the information in a CSV file. The table is associated with the CSV file so that the table can be updated when the CSV file is modified.

**Important Note** - all the text in a table will be treated as World Units.

Selecting CSV file brings up the Create CSV File Reference Table panel.

![Create CSV File Reference Table Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>name box</td>
<td>available names</td>
<td>the name for the table. This must not be blank.</td>
</tr>
<tr>
<td>Model for table</td>
<td>model box</td>
<td>available models</td>
<td>the model for the table.</td>
</tr>
<tr>
<td>Style</td>
<td>table style box</td>
<td>available table styles</td>
<td>the table style to use for this table.</td>
</tr>
<tr>
<td>CSV source file</td>
<td>file box</td>
<td>name of the CSV file to associate with the table.</td>
<td></td>
</tr>
<tr>
<td>Column separator</td>
<td>choice box</td>
<td>comma, semicolon, tab</td>
<td>if comma, in the CSV file a comma (,) is used to separate the information for each column.</td>
</tr>
</tbody>
</table>
If *semicolon*, in the CSV file a semicolon (\( ; \)) is used the separate the information for each column.  
If *tab*, in the CSV file a tab is used the separate the information for each column.

### Auto sizing
- **tick box**
- **not ticked**
  - If **ticked**, the table automatically resizes the column widths and heights to fit the text into the columns.
  - If **not ticked**, the table will not resize the column widths and heights to fit the text into the column.

### Location
- **x y box**
- **0**
  - the (x,y) coordinates of the *top left hand corner* of the table.

### Rotation
- **angle box**
- **0**
  - the rotation of the table - entered in *hp* notation. It is measured in a counter clockwise direction from the positive x axis.

### Use title
- **tick box**
  - if **ticked** then the first line of the CSV file is taken as the titles for each column in the table. The textstyle information for text in the title is given in the *Title style* node of the Drafting Styles for Tables.
  - If **not ticked**, the table does not have a title.

### Use header
- **tick box**
  - if **ticked** then the next line of the CSV file is taken to be the Headers for each column of the table. The textstyle information for text in the row of headers is given in the *Header style* node of the Drafting Styles for Tables.
  - If **not ticked**, the table does not have a header.

### Number of rows
- **integer box**
  - the number of rows in the table.
  - Not used - the Table format and super alignment determines how many rows there are.

### Number of columns
- **integer box**
  - the number of columns in the table.
  - Not used - the Table format and super alignment determines how many columns there are.

### Column width
- **real box**
  - if **Auto sizing is no**, the width of each column.

### Row height
- **real box**
  - if **Auto sizing is no**, the height of each column.

### Buttons at bottom
- **Create**
  - button
  - create the table with the properties in this panel at the location given in *Location*.

### Important Notes
1. When a *Recalc* is done, the CSV file is reread and the information in the table updated.
2. *Auto size* in the table Properties must be ticked on for the new table to be automatically resized.
3. If you don't want the CSV file to be reread on a *Recalc*, you need to set *Type* back to *no reference* in the Table Association panel.

Continue to the next section [15.6.4 Table Edit](#) or return to [15.6 CAD Table](#).
15.6.4 Table Edit

Picking an existing table will bring up the Table editor, and at the same time the grip points and points are displayed on the plan views that the table is on (see 15.6.4.1 Move).

Important Note - all the text in a table will be treated as World Units.

See

15.6.4.1 Move
15.6.4.2 Column and Row Edits
15.6.4.3 Text and Values Edit
15.6.4.4.1 Fit All
15.6.4.5 Recalc
15.6.4.6 Properties and Associations
15.6.4.7 Content
15.6.4.1 Move

When the **Table Editor** is running, the grips points are displayed on any plan view that the table is on.

The use a grip point, you must first click on the **Move** icon on the **Table Editor** toolbar and then click and accept on the **grip** that you wish to use.

Continue to the next section **15.6.4.2 Column and Row Edits** or return to **15.6.1 Create Table** or to **15.6 CAD Table**.
15.6.4.2 Column and RowEdits

15.6.4.2.1 Insert Row
15.6.4.2.2 Insert Column
15.6.4.2.3 Delete Row
15.6.4.2.4 Delete Column
15.6.4.2.5 Resize Row
15.6.4.2.6 Resize Column
15.6.4.2.1 Insert Row

Click on the **Insert row** icon and the following message will appear in the screen message area.

```
<select row to insert (a)bove, (b)elow or a(l)p(end) [picks][fast][Menu]
```

Then move over the table until the row you want to insert a row above or below highlights.

Press **a** or **A** to insert above, or **b** or **B** to insert below, the highlighted row.

Continue to the next section 15.6.4.2.2 Insert Column or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.2.2 Insert Column

Click on the **Insert column** icon and the following message will appear in the screen message area.

```
<select column to insert (l)eft, (r)ight or a[p]pend> [picks][fast][Menu]
```

Then move over the table until the column you want to insert a column either to the left or right of highlights.

Press **I** or **L**, to insert to the left, or **r** or **R** to insert to the right, of the highlighted column.

Continue to the next section **15.6.4.2.3 Delete Row** or return to **15.6.4.2 Column and Row Edits** or **15.6.1 Create Table** or **15.6 CAD Table**.
15.6.4.2.3 Delete Row
Click on the Delete row icon and the following message will appear in the screen message area.

Then move over the table until the row you want to delete highlights

Press d or D, or pick and accept, to delete the highlighted row.

Continue to the next section 15.6.4.2.4 Delete Column or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.2.4 Delete Column
Click on the Delete column icon and the following message will appear in the screen message area.

Then move over the table until the column you want to delete highlights

Press d or D, or pick and accept, to delete the highlighted column.

Continue to the next section 15.6.4.2.5 Resize Row or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.2.5 Resize Row

Click on the **Resize row** icon and the following message will appear in the screen message area.

```
<select row to re(size) [picks][fast][Menu]
```

Then move over the table until the row you want to resize highlights.

![Image of a table with a resize icon highlighted](image)

Press `s` or `S`, or pick and accept, and the **Resize Typed Input** box will appear with the current size of the row in it.

![Image of the Resize Typed Input box](image)

Type the new size into the box and then press <Enter>. The box will disappear and the row given the new size value.

Continue to the next section 15.6.4.2.6 Resize Column or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.2.6 Resize Column

Click on the **Resize column** icon and the following message will appear in the screen message area.

```
<select column to re(s)ize> [picks][fast][Menu]
```

Then move over the table until the column you want to resize highlights.

Press `s` or `S`, or pick and accept, and the **Resize Typed Input** box will appear with the current size of the selected column in it.

Type the new size into the box and then press <Enter>. The box will disappear and the column given the new size value.

Return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.3 Text and Values Edit

create & edit all types of values
create and edit text
create and edit reals
create and edit numbers

See
15.6.4.3.1 Value Create and Edit
15.6.4.3.2 Text Create and Edit
15.6.4.3.3 Real Create and Edit
15.6.4.3.3 Real Create and Edit
15.6.4.3.1 Value Create and Edit

For an empty cell, Value can create either a text, number or real value.

If used on a non empty cell, the cell contents are displayed in a Typed input box or type Text, Number of Real depending on the type of the cell contents.

Click on the Value icon and the following message appears in the screen message area.

<select cell to edit (t)ext (n)umber (r)eal> [picks][fast][Menu]

Move over the table until the cell you want to edit or create a value, highlights.

If the cell is empty,

Type t or T, or pick and accept inside the cell, and the Enter text Typed Input box will appear.

Type n or N, and the Enter number Typed Input box will appear.

Type r or R, and the Enter real Typed Input box will appear.

Type the new text, number or real into the box and press <Enter>. 
The box will disappear and the new text, number or real placed in the cell, and the cell given the appropriate type.

Note: If the type is Real then the actual typed in value is kept in the cell BUT it is displayed with the number of decimal places given in the Table style.

If the cell is not empty, then the cell value is displayed in a Typed Input box of the same type as the cell contents.

Type the new Text, Number or Real into the Typed Input box and press <Enter>. The box will disappear and the new value placed in the cell.

Note: If the type is Real then the actual typed in value is kept in the cell BUT it is displayed with the number of decimal places given in the Table style.

Continue to the next section 15.6.4.3.2 Text Create and Edit or return to 15.6.4.3 Text and Values Edit or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.3.2 Text Create and Edit

**Important Note** - all the text in a table will be treated as World Units.

For an empty cell, **Text** creates and displays one or more lines of text.

If used on a non-empty cell, the cell contents are displayed in a Text box, and when saved, is written into the cell as a **Text** type.

Click on the **Text** icon and the following message will appear in the screen message area.

```
<select cell to edit (t)ext> [picks][fast][Menu]
```

Move over the table until the cell you want to edit or create a Text, highlights.

Type **t** or **T**, or pick and accept inside the cell, and the *Enter text* **Typed Input** box will appear.

If the cell was empty then nothing is in the *Enter text* box but if the cell is not empty, the contents of the cell are displayed as text.

Type the new text into the *Enter text* box and press <Enter>.

The box will disappear and the new text placed in the cell, and the cell given type **Text**.

Continue to the next section 15.6.4.3.3 Real Create and Edit or return to 15.6.4.3 Text and Values Edit or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.3.3 Real Create and Edit

For an empty cell, Real creates and displays a real with the number of decimal places used in the display is taken from the Table style.

If used on a non empty cell, the cell contents are converted into a real and displayed in a Real box for editing, and when saved, is written into the cell as a Real type.

If the cell contains text that can’t be converted to a real then the Real box is left empty.

Click on the Real icon and the following message will appear in the screen message area.

```
<select cell to edit > [real][picks][accepts][Menu] Cu
```

Move over the table until the cell you want to edit or create a Number, highlights.

Type r or R, or pick and accept inside the cell, and the Enter real Typed Input box will appear.

If the cell was empty then nothing is in the Enter real box but if the cell is not empty, the contents of the cell are displayed a Real, or nothing if the contents can’t convert to a real.

Type the new real into the Enter real box and press <Enter>.

The box will disappear and the new real placed in the cell and displayed with the number of decimal places given in the Table style. The cell given type Real.

Note: If the type is Real then the actual typed in value is kept in the cell BUT it is displayed with the number of decimal places given in the Table style.

Continue to the next section 15.6.4.3.4 Number Create and Edit or return to 15.6.4.3 Text and Values Edit or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.3.4 Number Create and Edit

For an empty cell, **Number** creates and displays a number (a positive or negative integer).

If used on a non-empty cell, the cell contents are converted into a number and displayed in a number box for editing, and when saved, is written into the cell as a **Number** type.

It the cell contains text that can’t be converted to a number then the Number box is left empty.

Click on the **Number** icon and the following message will appear in the screen message area.

```
<select cell to edit (n)umber> [picks][fast][Menu]
```

Move over the table until the cell you want to edit or create a Number, highlights.

![Cell selection and number creation diagram]

Type `n` or `N`, or pick and accept inside the cell, and the **Enter number** **Typed Input** box will appear.

If the cell was empty then nothing is in the **Enter number** box but if the cell is not empty, the contents of the cell are displayed a Number, or nothing if the contents can’t convert to a number.

![Typed Input dialog]

Type the new number into the **Enter number** box and press <Enter>.

The box will disappear and the new number placed in the cell, and the cell given type **Number**.

Return to **15.6.3 Text and Values Edit** or **15.6.1 Create Table** or **15.6 CAD Table**.
15.6.4.4 Fit

See  
15.6.4.4.1 Fit All  
15.6.4.4.2 Fit Row  
15.6.4.4.3 Fit Column  
15.6.4.4.4 Fit Cell

15.6.4.4.1 Fit All

Fit goes though each cell and resizes it both vertically and horizontally so that the text fits inside the cell.

It then looks at each row and makes all the cells in the same row as high as the highest one in the row.

It then looks at each column and makes all the cells in the same column as wide as the widest one in the column.

Fit runs even if Auto sizing is set to no.

Continue to the next section 15.6.4.4.2 Fit Row or return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.4.2 Fit Row

Fit row goes though each cell in the selected row to find the maximum height required to fit the text vertically in the cell, and then makes the height of the row the maximum of all the heights required for each cell. That is, it makes the row high enough to fit the text vertically in every cell in the row.

Click on the Fit row icon and the following message will appear in the screen message area.

Then move over the table until the row you want to fit highlights.

Accepting makes the row high enough to fit any text in the row.

Fit row runs even if Auto sizing is set to no.

Continue to the next section 15.6.4.4.3 Fit Column or return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.4.3 Fit Column

Fit column goes though each cell in the selected column to find the maximum width required to fit the text horizontally in the cell, and then makes the width of the column the maximum of all the widths required for each cell. That is, it makes the column wide enough to fit the text horizontally in every cell in the column.

Click on the Fit column icon and the following message will appear in the screen message area.

Then move over the table until the column you want to fit highlights.

Accepting makes the column wide enough to fit any text in the column.

Fit row runs even if Auto sizing is set to no.

Continue to the next section 15.6.4.4.4 Fit Cell or return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.4 Fit Cell

Fit cell increases the row height enough to fit the text vertically in the cell and also increases the column width enough to fit the text horizontally in the cell. That is, it makes the row and column wide enough to fit the text in the selected cell.

Note that the row height and column width will not be decreased, only increased.

Click on the Fit cell icon and the following message will appear in the screen message area:

\[ \text{<select cell to fit> [picks][fast][Menu]} \]

Then move over the table until the cell you want to fit highlights.

Accepting makes the column wide enough to fit any text in the column.

Fit cell runs if Auto sizing is set to no.

Return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.5 Recalc

Sometime when the object is associated with the Table is modified, the Table does not update.

Recalc forces an update of all the information connected with the Association object.

Return to 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.6 Properties and Associations

See
15.6.4.6.1 Properties
15.6.4.6.2 Table Association

15.6.4.6.1 Properties
Click on the Properties icon and the Table Properties panel comes up with the values for the current table in it.

Change values in the panel and then click Set for them to become the tables new values.

Continue to the next section 15.6.4.6.2 Table Association or return to 15.6.4.6 Properties and Associations or 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.6.2 Table Association

Click on the Association icon and the Table Association panel comes up.
If there is no Association for the table, one can be added with this option.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>choice box</td>
<td>no reference, super alignment</td>
<td>csv file</td>
</tr>
</tbody>
</table>

*If no reference*, then the table is not associated with anything.
*If super alignment*, read in and associate a CSV file with the table. See 15.6.4.6.2.1 Associate a Super Alignment
*If CSV file*, read in and associate a CSV file with the table. See 15.6.4.6.2.2 Associate a CSV File

Set button
set the association for the table.

See
15.6.4.6.2.1 Associate a Super Alignment
15.6.4.6.2.2 Associate a CSV File

Return to 15.6.1 Create Table or 15.6 CAD Table.
15.6.4.6.2.1 Associate a Super Alignment

Choice *super alignment* is selected when a super alignment is to be associated with the table. When *super alignment* is selected, the panel changes to display fields to enter information about the super alignment and how it is to be associated with the table.

For information about the fields in this panel, see 15.6.2 Create Table from a Super Alignment
15.6.4.6.2.2 Associate a CSV File

Choice CSV file is selected when a CSV file is to be associated with the table. When CSV file is selected, the panel changes to display fields to enter for information about the CSV file and how it is to be associated with the table.

For information about the fields in this panel, see 15.6.3 Create Table from a CSV File
15.6.4.7 Content

Click on the Content icon and the Table Content Edit panel comes up with the values for the current table in it.

In the panel you can edit the values in each cell, add new values, add or delete rows or move rows up or down.

Finally click Save for the contents of the panel to become the new values in the table.

Return to 15.6.1 Create Table or 15.6 CAD Table.
15.6.5 Table Styles

Position of option on menu: CAD => Table => Styles

Important Note - all the text in a table will be treated as World Units.

When you click on the option an Edit table_styles.xml panel is brought up and the panel shows the standard areas for looking for the table_styles.XML files - Working folder, Customer (User), User, Set Ups and Other.

For information about where how to find and create table_styles.xml files, see 15.7 Style XML Files for Dimensions, Leaders & Tables.

Once a table_styles.xml has been opened, the Table Styles panel is displayed.
For the description of each of the nodes, see

15.6.5.1 Table Styles - Name Node
15.6.5.2 Table Styles - Title Style Node
15.6.5.3 Table Styles - Header Style Node
15.6.5.4 Table Styles - Data Style Node
15.6.5.1 Table Styles - Name Node

This is on the right hand side of the panel when you click on the Table Styles name.

<table>
<thead>
<tr>
<th>Name</th>
<th>dl</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>test table style</td>
</tr>
</tbody>
</table>

Name text box
name of the table style.

Description text box
description of the table style.

Continue to the next section 15.6.5.3.1 Table Styles - Header Style > Text Style Node or return to 15.6.5 Table Styles or 15.6.1 Create Table or 15.6 CAD Table.
15.6.5.2 Table Styles - Title Style Node

This is on the right hand side of the panel when you click on the **Title style** node.

<table>
<thead>
<tr>
<th><strong>Cell linestyle</strong></th>
<th>linestyle box</th>
<th>available linestyles</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cell line colour</strong></td>
<td>colour box</td>
<td>available colours</td>
</tr>
<tr>
<td><strong>Cell line weight</strong></td>
<td>real box</td>
<td>weight of the line work drawn around the title row.</td>
</tr>
<tr>
<td><strong>Fill colour</strong></td>
<td>colour box</td>
<td>available colours</td>
</tr>
<tr>
<td><strong>Fill blend</strong></td>
<td>real box</td>
<td>blend for the fill colour for the title row.</td>
</tr>
</tbody>
</table>

To control the **text** in the Title row, see [15.6.5.3.1 Table Styles - Header Style >Text Style Node](#).
15.6.5.2.1 Table Styles - Title Style > Text Style Node

**Important Note** - all the text in a table will be treated as World Units.

This is on the RHS of the panel when you click on the **Table style > Title style > Text style** node.

If **Use title** is **yes** in the tables **Properties** then this node controls the drawing of the text in the Title at the top of the table.

These are the standard settings for defining text. See [4.6 Text Definitions](#).

Continue to the next section [15.6.5.3 Table Styles - Header Style Node](#) or return to [15.6.5 Table Styles](#) or [15.6.1 Create Table](#) or [15.6 CAD Table](#).
15.6.5.3 Table Styles - Header Style Node

This is on the RHS of the panel when you click on the **Header style** node.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cell linestyle</td>
<td>linestyle box available linestyles linestyles for drawing the line work around the header row in the table.</td>
</tr>
<tr>
<td>Cell line colour</td>
<td>text box colour of the line work drawn around the header row.</td>
</tr>
<tr>
<td>Cell line weight</td>
<td>real box weight of the line work drawn around the header row.</td>
</tr>
<tr>
<td>Fill colour</td>
<td>colour box available colours colour to fill the header row cells.</td>
</tr>
<tr>
<td>Fill blend</td>
<td>real box blend for the fill colour for the header row cells.</td>
</tr>
</tbody>
</table>

To control **text** in the Header row, see [15.6.5.3.1 Table Styles - Header Style >Text Style Node](#).
15.6.5.3.1 Table Styles - Header Style >Text Style Node

**Important Note** - all the text in a table will be treated as World Units.

This is on the RHS of the panel when you click on the **Header style >Text style** node.

If **Use header** is **yes** in the tables **Properties** then this node controls the drawing of the text in the **Header** at the top of each column in the table.

Here is the table:

<table>
<thead>
<tr>
<th>Textstyle</th>
<th>Arial</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>world</td>
</tr>
<tr>
<td>Size</td>
<td>0.5</td>
</tr>
<tr>
<td>Angle</td>
<td>0°00'</td>
</tr>
<tr>
<td>X-factor</td>
<td>1.0</td>
</tr>
<tr>
<td>Slant</td>
<td>0°00'</td>
</tr>
<tr>
<td>Offset</td>
<td>0.0</td>
</tr>
<tr>
<td>Raise</td>
<td>0.0</td>
</tr>
<tr>
<td>Colour</td>
<td>green</td>
</tr>
<tr>
<td>Whitespace</td>
<td></td>
</tr>
<tr>
<td>Border</td>
<td></td>
</tr>
<tr>
<td>Border type</td>
<td></td>
</tr>
<tr>

<td>no</td>
</tr>
<tr>
<td>TTF Italic</td>
<td>no</td>
</tr>
<tr>
<td>TTF Outline</td>
<td>no</td>
</tr>
<tr>
<td>TTF Weight</td>
<td>400.0</td>
</tr>
</tbody>
</table>

These are the standard setting for defining text. See [4.6 Text Definitions](#).

Continue to the next section [15.6.5.4 Table Styles - Data Style Node](#) or return to [15.6.5 Table Styles](#) or [15.6.1 Create Table](#) or [15.6 CAD Table](#).
15.6.5.4 Table Styles - Data Style Node

This is on the RHS of the panel when you click on the **Data style** node.

<table>
<thead>
<tr>
<th><strong>Cell linestyle</strong></th>
<th>linestyle box</th>
<th>available linestyles</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><em>linestyle for drawing the line work around the data rows in the table.</em></td>
</tr>
<tr>
<td><strong>Cell line colour</strong></td>
<td>text box</td>
<td>colour of the line work drawn around the data rows.</td>
</tr>
<tr>
<td><strong>Cell line weight</strong></td>
<td>real box</td>
<td>weight of the line work drawn around the data rows.</td>
</tr>
<tr>
<td><strong>Fill colour</strong></td>
<td>colour box</td>
<td>available colours</td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>colour to fill the data row cells.</em></td>
</tr>
<tr>
<td><strong>Fill blend</strong></td>
<td>real box</td>
<td>blend for the fill colour for the data row cells.</td>
</tr>
</tbody>
</table>

To control the text in the Data rows, see [15.6.5.3.1 Table Styles - Header Style >Text Style Node](#).
15.6.5.4.1 Table Styles - Data Style > Text Style Node

**Important Note** - all the text in a table will be treated as World Units.

This is on the RHS of the panel when you click on the **Data style > Text style** node.

This node controls the drawing of the text in the **Data** rows in the table.

<table>
<thead>
<tr>
<th>Textstyle</th>
<th>Arial</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>world</td>
</tr>
<tr>
<td>Size</td>
<td>0.5</td>
</tr>
<tr>
<td>Angle</td>
<td>0°00'</td>
</tr>
<tr>
<td>X-Factor</td>
<td>1.0</td>
</tr>
<tr>
<td>Slant</td>
<td>0°00'</td>
</tr>
<tr>
<td>Offset</td>
<td>0.0</td>
</tr>
<tr>

<td>TTF Strikout</td>
<td>no</td>
</tr>
<tr>
<td>TTF Italic</td>
<td>no</td>
</tr>
<tr>
<td>TTF Outline</td>
<td>no</td>
</tr>
<tr>
<td>TTF Weight</td>
<td>400.0</td>
</tr>
</tbody>
</table>

These are the standard settings for defining text. See [4.6 Text Definitions](#).

Return to [15.6.5 Table Styles](#) or [15.6.1 Create Table](#) or [15.6 CAD Table](#).
15.6.6 Table to CSV

**Position of option on menu:** CAD => Table => Table to csv

This option creates a CSV file for a table that is associated with a CSV file.

Selecting the Table to csv brings up the Write Table Contents to CSV File panel.

![Write Table Contents to CSV File panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output file</strong></td>
<td>file box</td>
<td>*.csv files</td>
<td><em>name of the CSV file to write to the table out to.</em></td>
</tr>
<tr>
<td><strong>Use title</strong></td>
<td>tick box</td>
<td></td>
<td><em>if ticked, the first line of the CSV file is the title of the table.</em></td>
</tr>
<tr>
<td><strong>Use header</strong></td>
<td>tick box</td>
<td></td>
<td><em>if ticked, the next line of the CSV file is the Headers for each column of the table.</em></td>
</tr>
<tr>
<td><strong>Column separator</strong></td>
<td>choice box</td>
<td>commas</td>
<td>comma, semicolon, tab <em>the column separator used when writing out the CSV file.</em></td>
</tr>
<tr>
<td><strong>Select table</strong></td>
<td>button</td>
<td></td>
<td><em>select the table AND then write out the contents of the table to a CSV file.</em></td>
</tr>
</tbody>
</table>

Return to 15.6 CAD Table.
15.7 Style XML Files for Dimensions, Leaders & Tables

There are XML files to define the styles used for Dimensions, Leaders and Tables:

(a) for Dimensions, the file is *dimensions_styles.xml*

(b) for Leaders, the file is *leader_styles.xml*.

(c) for Tables, the file is *table_styles.xml*.

These XML files are all Set Up files like *colours.4d* and folders are searched in a specific order to find the files.

However, unlike *colours.4d*, it doesn't matter if the styles xml file is found in one folder, the search continues and all the folders that contain the file are found.

And, again unlike *colours.4d*, the styles used are the merger of all the found files.

The search order is still important because if the same name exists in more than one file in the found folders, the first occurrence in the files in the search order is the one that is used.

For example, if you had a dimensions style called *d1* in the file *dimensions_styles.xml* in your working folder, and one called *d1* in the file *dimensions_styles.xml* in Programs files\12d\12dmodel\11.0\set_ups, then the *d1* is your working folder is the one that will be used and seen in any dimensions styles pop ups in *12d Model*.

See

*15.7.1 Create & Editing Dimensions, Leader & Table Styles*
15.7.1 Create & Editing Dimensions, Leader & Table Styles

Position of option on menu:  CAD =>Dimension =>Styles  
Position of option on menu:  CAD =>Leader =>Styles  
Position of option on menu:  CAD =>Table =>Styles

When you click on the options, a **Edit Styles** panel is brought up for the appropriate style and it shows the standard areas for looking for the Styles XML files - Working folder, Customer (User), User, Set Ups and Other - and displays whether the appropriate xml file:

(a) exists and available for editing (Edit)  
If the xml file exists in the folder and you have access to edit it, then the folder name is written in the panel and [Edit] is written on the right hand side of the line.

(b) does not exist but can be created (Create) by the editor  
If the xml file does not exist in the folder and you have access to create it, then the folder name is written in the panel and [Create] is written on the right hand side of the line.  
In this case a new file is created and written out to the given folder.

(c) is in a folder that has no access for editing and so can only be viewed (View)  
If there is no access the folder to create/edit the file, then the folder name is written in the panel and [View] is written on the right hand side of the line. Although the styles can’t be edited, they can be copied.  
This usually applies to the Set Ups folder which normally needs Admin privileges to write to.

(d) is in Customer (User).  
This only appears if a Customer User area has been defined.

(e) is defined separately by the user and then Other is displayed.  
In this case, the full path name of the XML file is given by the user.

See  
15.7.1.1 [Create] for Dimension, Leader and Table Styles  
15.7.1.2 [Edit] for Dimension, Leader and Table Styles
15.7.1.1 [Create] for Dimension, Leader and Table Styles

When [Create] is shown, a new xml file can be created in that folder.

Click on the line with [Create] and the Editor for that Style starts up with a **style group header** but no styles in it.

All the other style files that are found are listed in the **Includes** section displayed at the bottom of the tree.

The included files can not be edited whilst create/editing this file BUT you can copy items from them and paste them into items in this file.

New styles can now be created (see 15.7.1.2.1 Creating New Styles) and a new XML created by clicking on the **Write** button.

Creating and editing of styles is the same as for [Edit] and so is documented in that section. See 15.7.1.2 [Edit] for Dimension, Leader and Table Styles.

**Write** - writes out the information in the panel to the files name given in **Current file**.
15.7.1.2 [Edit] for Dimension, Leader and Table Styles

When [Edit] is shown, an xml file already exists and can be edited.

Click on the line with [Edit] and the Editor for that Style starts up with all the existing styles in that file displayed.

After completing any editing, the XML is saved by clicking on the Write button.

As in the [Create] case, all the other appropriate files that are found are listed in the Includes section are displayed at the bottom of the tree (see 15.7.1.1 [Create] for Dimension, Leader and Table Styles).

The included files can not be edited whilst create/editing this file BUT you and copy items from them and paste them into items in this file.

For editing in the panel, see

15.7.1.2.1 Creating New Styles
15.7.1.2.2 Copy and Paste
15.7.1.2.3 Deleting a Style
15.7.1.2.4 Duplicating a Style
15.7.1.2.5 Editing a Style
15.7.1.2.1 Creating New Styles

To create a new style from scratch when there are no styles already, highlight the style group header (Dimension styles, Leader styles or Table styles) and click on the Add Child icon.

Note - the Add Child icon adds a node as a subnode of the highlighted node.

To create a new style from scratch when some styles already exist, you can highlight the style name (name of the style or Dimension style, Leader style or Table style if it has not been given a name) and click on the Add (Add Sibling) icon.

The Add icon adds a new item at the same level (a sibling) as the highlighted item and that is why a style must already exist so that one can be selected.

In both cases a new style is created with no name and so the general style name (Dimension style, Leader style or Table style) is written in the style list until the style is given a name.

Once the style is given a name then that name will appear in the tree.
Once the new style is created then it can be edited by going into each field of the style and making changes.

**Quicker Methods for Creating New Styles**

When you click on a node to edit that section of the tree, you can not leave the edited node until all the required values are filled in. Similarly you won’t be able to save the style unless all the required values are filled in. And this may involve filling in a lot of values.

So rather than starting from scratch, it is often easier to use **Duplicate** (15.7.1.2.4 Duplicating a Style) if there are already existing styles in the file, or **Copy and Paste** (15.7.1.2.2 Copy and Paste).

**Copy** and **Paste** is particularly useful when there are no styles in the file you are creating styles but there are styles in the other files listed in the **Includes** node. Although these styles can’t be edited, they can be copied.

Continue to the next section 15.7.1.2.2 Copy and Paste or return to 15.7.1.2 [Edit] for Dimension, Leader and Table Styles or 15.7 Style XML Files for Dimensions, Leaders & Tables.
15.7.1.2.2 Copy and Paste

Rather than creating a new style from scratch, it is often easier to use Copy and Paste to create a copy of an existing style, and then edit the copied style.

Although there may be no styles in the folder you are creating styles for, there will usually be some styles in the XML file in Set Ups that can be copied.

In the tree in the Editor, click on the + in front of Set Ups to expand the tree and then click on the item in the tree that you want to copy. Then click on the Copy icon.

Next click on and highlight the style header (Dimension styles, Leader styles or Table styles) and click on Paste. The style will then appear under the style header with the same name as the original style. The copied style can then be edited.

NOTE: If the name of the copied style is not changed then this new style will be used instead of the one in Set Ups.

Continue to the next section 15.7.1.2.3 Deleting a Style or return to 15.7.1.2 [Edit] for Dimension, Leader and Table Styles or 15.7 Style XML Files for Dimensions, Leaders & Tables.
15.7.1.2.3 Deleting a Style

To delete a style, simply click on and highlight the style name, and then click on the Delete icon.

15.7.1.2.4 Duplicating a Style

To duplicate a style, simply click on and highlight the style name, and then click on the Duplicate icon.

A copy of the style, with exactly the same name, is created and added to the end of the list of styles.

The name of the style needs to be changed and any other edits done that are required.

Continue to the next section 15.7.1.2.5 Editing a Style or return to 15.7.1.2 [Edit] for Dimension, Leader and Table Styles or 15.7 Style XML Files for Dimensions, Leaders & Tables.
15.7.1.2.5 Editing a Style

To edit a style, you click on the style name, or expand the style and click on any of the sub nodes, and all the values for that node will be displayed on the right hand side of the panel.

The panel fields on the right hand side of the panel have the same icons as in other 12d Model panels and the standard pop ups are all available. For example, text, colour and choice icons.

When clicking to go to another node, all the fields currently on the right hand side are validated and if there are any problems, the first line with an error is coloured red and an Editor error box is displayed.

If Yes is selected, then all the invalid field values are discarded, the Editor error panel removed, and the data for the new selected node displayed on the right hand side of the panel.

If No is selected, then the right hand side of the panel does not change and can undergo further edits.

Return to 15.7 Style XML Files for Dimensions, Leaders & Tables.
15.8 CAD Multipick

Position of option on menu: CAD => Multipick

This section of documentation is a work in progress and will be updated in subsequent releases.

The Cad Multipick walk-right menu is

![Cad Multipick Menu]

For selecting the data, see 15.8.1 Selecting with Multipick

For the options, see

- Copy 15.8.2 CAD Multipick Copy
- Move 15.8.3 CAD Multipick Move
- Rotate 15.8.4 CAD Multipick Rotate
- Array 15.8.5 CAD Multipick Array
- Mirror 15.8.6 CAD Multipick Mirror
- Mirror X 15.8.7 CAD Multipick Mirror X
- Mirror Y 15.8.8 CAD Multipick Mirror Y
- Scale 15.8.10 CAD Multipick Scale
- Scale Dynamic 15.8.11 CAD Multipick Scale Dynamic
15.8.1 Selecting with Multipick

Upon selecting any of the Multipick options from the CAD Multipick menu

![CAD Multipick Menu]

the Screen Message Area prompts are shown for selecting selection options.

![Screen Message Area]

The default option is <m> for multipick select.

For <m> go to

- Multipick
- Single
- All
- Clear
- Inverse
- Rectangle
- Lasso

Multipick

For <m>, strings are selected by clicking LB on the string, but unlike a normal select, the string is not accepted. After LB is clicked, the string is highlighted and circles placed at the string vertices to indicate that the string is part of the Multipick set.

![Multipick Selection]

Another string is added to the Multipick set by clicking LB on the new string and again not accepting. This string will also be drawn with circles at each of its vertices to indicate that it is part of the Multipick set.
A string is removed from a *Multipick set* by simply clicking LB on the string (and not accepting). The string is then deselected and the circles are removed from the vertices of the string to indicate that it is no longer part of the *Multipick set*.

When all the required strings of the *Multipick set* have been selected, the Multipick selection is terminated by clicking MB (accepting).

The selected strings in the *Multipick set* are then passed on to the CAD Multipick option for processing. For example, if the Multipick was part of *Multipick Copy*, then after Accepting, the *Copy* part of the *Multipick Copy* takes over.

Once the Multipick option (*e.g.* *Multipick Copy*) is completed, the *Multipick set* is cleared and the Multipick CAD option begins again, and the process of building up a new *Multipick set* begins again for that same option.

To terminate the *Multipick option*, simply press <Esc>.

**Note:**

Because LB is used to keep adding new strings to the *Multipick set*, it can’t be used for the normal cycling through a selection set when more than one string satisfies the picking tolerance. So when more than one string satisfies the picking criteria a *Select which string?* panel is placed on the screen with the list of strings satisfying the LB picking criteria.

If the string is already in the *Multipick set*, there will be a tick in the Use? column.
Clicking on a line in the grid highlights the string.

And clicking in the **Use?** column to make a **tick** will add the string to the **Multipick set** and place circles on each of its vertices, or **turning off a tick** will deselect the string from the **Multipick set** and remove the circles from each of its vertices.

Clicking on the **Finish** button or **X** terminates that LB selection.
Single
<s> places the option back into the mode of selecting a single string. That is, Multipick is not used.

All
<a> will add all the strings in the models on the current view to the Multipick set. Note that the strings do not have to be visible on the view to be selected by <a>.

Clear
<c> will clear the current Multipick set. That is, all selected strings are deselected.

Inverse
<i> will take the inverse of the current Multipick set. That is, all strings in the models on the current view that are currently in the Multipick set are deselected, and all strings in the models on the current view that are not in the Multipick set are added to the Multipick set. Note that the strings do not have to be visible on the view to be selected/deselected by <i>. 
Rectangle

\(<r>\) requires the user to create a rectangle and all strings totally enclosed by that rectangle will be added to the Multipick set if they are not already in the Multipick set, or deselected if they are already in the Multipick set.

After pressing \(<r>\), the first corner of the rectangle is selected by pressing and holding down LB, and the cursor is then dragged to the second corner of the rectangle and LB released.

The strings totally enclosed by the rectangle are then added to/removed from the Multipick set.

Lasso

\(<l>\) requires the user to create a lasso, and all strings enclosed by or crossing the lasso will be added to the Multipick set if they are not in the Multipick set, or deselected if they are already in the Multipick set.

After pressing \(<l>\), the lasso start point is selected by pressing and holding down LB and the cursor is then dragged to trace out the lasso. LB is then released to stop adding to the lasso.
MB is pressed and released to accept the lasso. If LB is pressed down before accepting the lasso, further points are added to the lasso until LB is released.

The strings totally enclosed by, or crossing, the lasso are then added/removed from the Multipick set.
15.8.2 CAD Multipick Copy

For selecting the data, see 15.8.1 Selecting with Multipick.

After data has been selected, a base point is selected and the Copy part of the option is the same as the 15.20.2 CAD Copy command.
15.8.3 CAD Multipick Move

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Move part of the option is the same as the 15.20.1 CAD Move command.
15.8.4 CAD Multipick Rotate

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Rotate part of the option is the same as the 15.20.4 CAD Rotate command.
15.8.5 CAD Multipick Array

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Array part of the option is the same as the 15.20.3 CAD Array command.
15.8.6 CAD Multipick Mirror

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Mirror part of the option is the same as the 15.20.5 CAD Mirror command.
15.8.7 CAD Multipick Mirror X

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Mirror X part of the option is the same as the 15.20.6 CAD Mirror X Axis command.
15.8.8 CAD Multipick Mirror Y

For selecting the data, see 15.8.1 Selecting with Multipick.

After data has been selected, a base point is selected and the Mirror Y part of the option is the same as the 15.20.7 CAD Mirror Y Axis command.
15.8.9 Scale About an Origin

A number of options use the concept of **Scaling** about an **Origin**.

To scale a point about an Origin by a given scale factor, the point is moved along the line joining the point to the origin so that

\[
\text{distance between the scaled point and the origin} = \text{scale factor} \times \text{distance from point to origin}
\]

A **string** is scaled about an origin by a given scale factor by scaling each vertex in the string about the origin by the scale factor.
If the Scale Factor is greater than one, then the scaled string is enlarged and is on the same side of the origin as the original string but further from the origin than the original string.

If the Scale Factor is less than one but greater than zero, then the scaled string is reduced and is between the origin and the original string.

If the Scale Factor is negative then the scaled string is on the opposite side of the origin to the original string.

A Scale Factor of zero would put all the vertices of the string on top of the origin.
15.8.10 CAD Multipick Scale

For selecting the data, see 15.8.1 Selecting with Multipick

For the definition of scaling about an origin, see 15.8.9 Scale About an Origin

After data has been selected, an Origin point is selected and the Scale part of the option is the same as the 15.20.8 CAD Scale command.
15.8.11 CAD Multipick Scale Dynamic

For selecting the data, see 15.8.1 Selecting with Multipick
For the definition of scaling about an origin, see 15.8.9 Scale About an Origin

After data has been selected, an Origin point and Start Scale position is selected and the Scale Dynamic part of the option is then similar to the 15.20.9 CAD Scale Dynamic command.
15.9 CAD Point

Position of option on menu: CAD => Point
The Point walk-right menu is

Menu of Options to Create New One Point Strings
- at a user selected position
- at middle of a selected segment
- at the centre point of an arc
- at the IP of a selected arc or transition segment
- at the middle of the two selected points
- at the position of a chainage along a selected string
- a given bearing and distance from a selected position
- at the offset position of a point on a selected string
- at the offset position of a chainage along a selected string
- a given distance at right angles to a selected string
dropped perpendicularly onto a selected string
- a given distance at a given angle to a selected string
- projected a chainage distance along a selected string
distance between two selected positions
distance between two selected positions with interpolated z
- many points at given bearings and distances from a selected position
- points which divide selected seg into a number of equal segs
- points which divide selected seg into segs of given length
- points which divide selected string into a number of equal pieces
- points which divide selected string into pieces of given length
- creates new points for each vertex of a string

For the option Point, go to
- 15.9.1 Point
- 15.9.2 Mid Segment
- 15.9.3 Centre
- 15.9.4 IP
- 15.9.5 Mid point
- 15.9.6 Chainage
- 15.9.7 Bearing and distance
- 15.9.8 Offset
- 15.9.9 Chainage offset
- 15.9.10 Chainage offset extended
- 15.9.11 Deflection
- 15.9.12 Drop Perpendicular
- 15.9.13 Angle
- 15.9.14 Projection

15.9.1 Point

**Position of option on menu:** CAD => Point => Point

or by selection of appropriate icon from the toolbar.

This option creates a single vertex (point) string.

On selecting Point, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height, etc. are defined in the Cad Control Bar.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. **NOTE:** The z value will default to the value entered into the Cad Control Bar whether or not it is specified in the XYZ box. If no height value exists in the Cad Control Bar then a value will be interpolated if possible, otherwise a null value will be assigned.
15.9.2 Mid Segment

Position of option on menu: CAD =>Point =>Mid segment

or by selection of appropriate icon from the toolbar.

This option creates a point in the middle of a selected line or arc segment.

On selecting Mid segment, the user is prompted to select a segment and a vertex is created at the mid point of the segment. The model, colour, height, etc. are defined in the Cad Control Bar.
15.9.3 Centre

**Position of option on menu:** CAD =>Point =>Centre

or by selection of appropriate icon from the toolbar.

This option creates a point at the centre of a selected arc or circle.

On selecting Centre the user is prompted to select an arc and a vertex is created at the centre of the arc. The model, colour, height, etc. are defined in the **Cad Control Bar**.
15.9.4 IP

Position of option on menu: CAD => Point => IP
or by selection of appropriate icon from the toolbar.

This option creates a point at the IP of a selected arc or transition segment. That is, it creates a point at the intersection of the tangent from the start of the segment and the tangent at the end of the segment. Picking a straight segment will give an error.

On selecting IP the user is prompted to select an arc or transition segment and a new point is created at the IP of the selected segment. The model, colour, height, etc. are defined in the Cad Control Bar.
15.9.5 Mid point

Position of option on menu: CAD => Point => Mid point
or by selection of appropriate icon from the toolbar.

This option creates a point in the middle of two selected positions.

On selecting Mid point, the user is prompted to select the first position and then the second position. A vertex is created at the mid point of the two selected positions. The model, colour, height, etc. are defined in the Cad Control Bar.
15.9.6 Chainage

**Position of option on menu:** CAD => Point => Chainage

or by selection of appropriate icon from the toolbar.

This option creates a new point at the position of a user specified chainage of an existing string.

On selecting Chainage, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The user selects a valid string (left mouse button) and accepts that string (Middle mouse button or <Enter>.

**STEP 2:**

The user enters a chainage value where a point should be placed followed by the <Enter> key. This chainage is with respect to the selected string.
**STEP 3:**

A new one point string is created at the positioned on the string at the given chainage.

To create another point, the user is prompted for the string as per **STEP 1**.
15.9.7 Bearing and distance

Position of option on menu: CAD => Point => Bearing and distance
or by selection of appropriate icon from the toolbar.

This option calculates a point string that is located a given bearing and distance from a start position.

On selecting Bearing and distance, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A start position is selected and accepted.

**STEP 2:**
A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

**Note:** The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.
This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**
A distance is selected and accepted with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the distance entry box. The value is entered into the input box followed by the Enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the
user wants to see what the current value of the distance is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.
STEP 4:
A point string is created using the information supplied. By entry into the input boxes:

Or by using the perpendicular/tangential tools:
15.9.8 Offset

Position of option on menu: CAD => Point => Offset
or by selection of appropriate icon from the toolbar.

This option creates a one point string that is located by reference to a string, a control point, a
chainage distance along the string from the control point and an offset to the selected string.

After selection and acceptance of a string, a control point is selected and accepted. This point is
dropped perpendicular onto the string. The distance along the string is measured from this
dropped point. Positive distances are in the direction that the string was picked. Finally a offset to
the string can be specified for the placement of the new point string.

On selecting Offset, the user is prompted for the relevant data in the screen message box located
at the bottom left hand corner of the 12d Model application window.

STEP 1:
The user selects and accepts a string with direction. This defines what side the offset applies to.

STEP 2:
The user picks and accepts a control point to be dropped onto the selected string.
STEP 3:
A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.

STEP 4:
An offset relative to the selected string (and direction) is specified in the input box followed by the enter key.
STEP 5:
A point string is created using the information supplied.
15.9.9 Chainage offset

This option creates a one point string that is located perpendicular to the reference string with a defined offset.

**STEP 1:**
The user selects the reference string with direction.

**STEP 2:**
The user specifies a chainage on the reference string.

**STEP 3:**
The user specifies an offset distance from the reference string.
A one point string is created using the information supplied.
15.9.10 Chainage offset extended

Is similar to chainage offset except the specified chainage can be extended beyond the start and end chainages of the selected string.
15.9.11 Deflection

Position of option on menu:  CAD =>Point =>Deflection
or by selection of appropriate icon from the toolbar.

This option creates a one point string that is located by reference to a string, a control point, a
distance along the string from the control point, a deflection angle and deflection distance.

After selection of a string, a control point is selected. This point is dropped perpendicular onto the
string. A distance along the string can be entered to move the measure point. Positive distances
are in the direction that the string was picked. A deflection angle is specified which is a clockwise
angle from the measure point. The deflection distance is the distance from the measure point to
the point which is to be created.

On selecting Deflection, the user is prompted for the relevant data in the screen message box
located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The user selects and accepts a string with direction.

**STEP 2:**
The user picks and accepts a control point to be dropped onto the selected string.
STEP 3:
A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the enter key.

STEP 4:
A deflection angle is specified. This angle is clockwise, relative to the direction of the string selection pick. The value is entered into the input box followed by the enter key.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.
STEP 5:
A deflection distance is supplied. Positive is in the direction of the string selection pick. The value is entered into the input box followed by the enter key.

STEP 6:
A point string is created using the information supplied.
15.9.12 Drop Perpendicular

Position of option on menu: CAD => Point => Drop perpendicular
or by selection of appropriate icon from the toolbar.

This option creates a one point string by dropping from a user selected position perpendicularly onto a user selected string.

On selecting Drop perpendicular, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The user selects a string and accepts (with direction) to have the point dropped onto.

STEP 2:

The user picks and accepts a position to drop onto the nominated string.
STEP 3:
A point string is created at the perpendicular drop point.
15.9.13 Angle

This option creates a one point string that is located by projecting a selected position back to a string by a specified angle.

**STEP 1:**
User selects and accepts a string to have the point projected onto.

**STEP 2:**
User specifies an angle for the projection.

**STEP 3:**
User selects a position on the screen to be projected back to the string.

**STEP 4:**
A one point string is created, which form the nominated angle with the selected position on **STEP 3**.
15.9.14 Projection

Position of option on menu: CAD => Point => Projection
or by selection of appropriate icon from the toolbar.

This option creates a one point string that is located by firstly dropping a point onto a string and then giving a distance along the string from the dropped point.

On selecting Projection, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The user selects and accepts a string (with direction) to have the point dropped onto

![Diagram of CAD projection step 1](image1.png)

**STEP 2:**
The user picks and accepts a position to drop onto the nominated string

![Diagram of CAD projection step 2](image2.png)
STEP 3:
The user is prompted for the distance along the string. Positive distances are in the direction that
the string was picked. A value is entered into the input box followed by the enter key.

STEP 4:
The point string is created the nominated distance along the string from the dropped point.
15.9.15 Between Points

Position of option on menu: CAD => Point => Between points
or by selection of appropriate icon from the toolbar.

This option creates a one point string that is on the line between two selected positions and a given distance from the first point.

On selecting Between points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).

**STEP 2:**

The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.
STEP 3:
A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

STEP 4:
A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.
15.9.16 Between points 3d

**Position of option on menu:** CAD => Point => Between points 3d

or by selection of appropriate icon from the toolbar.

This option creates a one point string that is on the line between two selected positions and a given distance from the first point. The z-value of the string is interpolated from the two selected positions.

On selecting Between points 3d, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).

**STEP 2:**

The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.
STEP 3:
A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

STEP 4:
A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.
15.9.17 Radiation

**Position of option on menu:**  CAD => Point => Radiation
or by selection of appropriate icon from the toolbar.

This option creates a series of one point strings that are located by given bearings and distances from a chosen start position.

On selecting Radiation, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**  
A start position is selected and accepted.

**STEP 2:**  
A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

**Note:** The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.
This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the D key (dynamic
value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.
**STEP 4:**
A point string is created using the information supplied.

**STEP 5**
The next bearing and distance is prompted for as per step 3 and 4. Consequent points are created from the original start point selected.
15.9.18 Divide segment by number

Position of option on menu:  CAD =>Point =>Divide segment by number
or by selection of appropriate icon from the toolbar.

This option creates one point strings which will break up a super string segment into equal pieces based on a user given number of intervals. The first and last points are not created since they are taken to be the end points of the selected segment. So for five intervals, four new one point strings are created. The option works for line or arc segments of a super string.

NOTES:
1. No vertices are inserted into the selected super string - the option Strings =>Strings edits =>Segment strings does that.
2. This option is for super strings only.

On selecting Divide segment by number, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A super string segment is selected and accepted.

STEP 2:
The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.
**STEP 3:**

Given the above information, the new points are created.
15.9.19 Divide segment by chainage length

Position of option on menu: CAD => Point => Divide segment by chainage length
or by selection of appropriate icon from the toolbar.

This option creates one point strings which will break up a super string segment into pieces based on a user given chainage length. The process starts from the 1st point of the segment and continues until no more pieces can be created without going past the last point of the segment (the last piece may not be the correct length). This option works for line or arc segments of a super string.

NOTES:
1. No vertices are inserted into the selected super string - the option Strings => Strings edits => Segment strings does that.
2. This option is for super strings only.

On selecting Divide segment by chainage length, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A super string segment is selected and accepted.

STEP 2:
The user is prompted for the chainage distance. The value is entered into the input box followed by the enter key.
STEP 3:
Given the above information, the new points are created.
15.9.20 Divide string by number

**Position of option on menu:**  CAD => Point => Divide string by number

or by selection of appropriate icon from the toolbar.

This option creates one point strings which will break up a super string into equal pieces based on a user given number of divisions. The first and last points are not created since they are taken to be the end points of the selected string. So for five intervals, four new one point strings are created.

**NOTES:**

1. No vertices are inserted into the selected super string - the option Strings => Strings edits => Segment strings does that.
2. This option is for super strings only.

On selecting **Divide string by number**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

**STEP 1:**
A super string is selected and accepted.

**STEP 2:**
The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.

**STEP 3:**
Given the above information, the new points are created.
15.9.21 Divide string by chainage length

Position of option on menu: CAD => Point => Divide string by chainage length
or by selection of appropriate icon from the toolbar.

This option creates one point strings which will break up a super string into pieces based on a user given chainage length. The process starts from the 1st vertex of the strings and continues until no more pieces can be created without going past the last vertex of the string (the last piece may not be the correct length).

NOTES:
1. No vertices are inserted into the selected super string - the option Strings => Strings edits => Segment strings does that.
2. This option is for super strings only.

On selecting Divide string by chainage length, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A super string is selected and accepted.

STEP 2:
The user is prompted for the chainage distance. The value is entered into the input box followed by the <Enter> key.

STEP 3:
Given the above information, the new points are created.
15.9.22 String IPs

**Position of option on menu:** CAD => Point => String IPs

This option creates a separate point at each vertex of a selected string.

On selecting String IPs the user is prompted to select a string and a new point (a one vertex super string) is created for each vertex on the selected string. The model, colour, height, etc. for the new points are defined in the **Cad Control Bar**.
15.10 CAD Intersection

Position of option on menu:  CAD => Intersection

The Intersection walk-right menu is

Menu of Options to Create One Point Strings by Intersections
by intersecting two selected segments
by intersecting two offset selected segments
by given bearings from two selected positions
create a point with given distances from two selected positions
by selecting posn and bearing and another selected posn and dist

For the option 2 segments, go to  15.10.1 2 segments
2 offset segments  15.10.2 2 offset segments
2 points and 2 bearings  15.10.3 2 points and 2 bearings
2 points and 2 distances  15.10.4 2 points and 2 distances
2 points with bearing and distance  15.10.5 2 points with bearing and distance

distance
15.10.1 2 segments

Position of option on menu: CAD => Intersection => 2 segments
or by selection of appropriate icon from the toolbar.

This option creates a point at the intersection of the projections of two line or arc segments. On selecting 2 segments, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The 1st segment is selected and accepted.

STEP 2:
The 2nd segment is selected and accepted.

STEP 3:
A point is created at the intersection of the two segments (if a solution exists). Note that the 2nd segment in this case has been projected to enable a solution to be calculated.
15.10.2 2 offset segments

Position of option on menu:  CAD =>Intersection=> 2 offset segments
or by selection of appropriate icon from the toolbar.

This option creates a point at the intersection of the offsets of two selected segments.

On selecting 2 offset segments, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st segment is selected and accepted with direction. This sets the positive direction of the offset to the right of the direction of pick.

**STEP 2:**

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.

**STEP 3:**

The 2nd segment is selected with direction and accepted. This sets the positive direction of the offset to the right of the direction of pick.
STEP 4:
The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.

STEP 5:
A point is created at the intersection of the projected lines offset to the segments (if a solution exists).
15.10.3 2 points and 2 bearings

**Position of option on menu:**  
CAD => Intersection => 2 points and 2 bearings

or by selection of appropriate icon from the toolbar.

This option creates a point by using two points and two bearings.

On selecting **2 points and 2 bearings**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

**STEP 1:**
The 1st point is selected and accepted.

**STEP 2:**
A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

**Note:** The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.
This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

**STEP 3:**

The 2nd point to create the point from is selected and accepted.

**STEP 4:**

A bearing from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

**STEP 5:**

The point is created if there is a valid solution.
15.10.4 2 points and 2 distances

Position of option on menu: CAD =>Intersection=>2 points and 2 distances
or by selection of appropriate icon from the toolbar.

This option creates a point using two points and two distances.

On selecting 2 points and 2 distances, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The 1st point is selected and accepted.

**STEP 2:**
A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user
selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**
The 2nd point to create the point from is selected.

**STEP 4:**
A distance from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

**STEP 5:**
As there is two solutions, the user can select the correct one depending on the method of
construction. This can be done by the direct entry of distances or by use of the mouse.

1. Distance entry. After the entry of the 1st distance, the 2nd point is selected. Following the selection of the 2nd point, the 2nd radius is shown (rubber banding). The user can select one of the two solutions by choosing with a LB mouse click over the approximate position of the required solution. The solution chosen is the closest solution to the selected point. The final radius can then be entered via the keyboard by simply starting typing which brings up the radius entry panel automatically. This panel can also be activated by pressing the space bar.

2. Use of the mouse. The 1st point is selected and the radius entered by using the mouse or by direct entry from the keyboard. The 2nd point is then selected and the 2nd radius is displayed (rubber banding). A solution can be chosen by selecting with a LB mouse click over the required solution. The final solution will be the closest one to the selection. MB to accept the intersection and create the point.

**STEP 6:**
The point is created if there is a valid solution.
15.10.5 2 points with bearing and distance

Position of option on menu:  CAD =>Intersection=>2 points with bearing and distance
or by selection of appropriate icon from the toolbar.

This option creates a point from a given point and a bearing, and a second point and a distance.
On selecting 2 points with bearing and distance, the user is prompted for the relevant data in the
screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The 1st point is selected and accepted.

STEP 2:
A bearing from the 1st point to create the point is given either by selection with the mouse or by
typing a value. To type a value, simply start typing and the input box for the bearing will appear.
Alternatively you can press the space bar to bring up the input box. The value is entered into the
input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the
user wants to see what the current value of the bearing is, simply press the D key (dynamic
value). This puts the value into the input box where it can be accepted to create the point or the
input box can be closed and the rubber banding (graphically changing) of the line continued.

Note: The Page up and page down keys can be used when the input angle box comes up
to add or subtract intervals of 90 degrees.
This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:
The 2nd point to create the point from is selected and accepted.

STEP 4:
A distance from the 2nd point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.
perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

A line is drawn between the two possible solutions.

**STEP 5:**

As there is two solutions, the user can select the correct one with the mouse.
15.11 CAD Line

**Position of option on menu:**  CAD => Line

The Line walk-right menu is

<table>
<thead>
<tr>
<th>Menu of Options to Create Strings</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a two vertex (point) super string</td>
</tr>
<tr>
<td>create tangent to two selected items (vertices and/or arcs)</td>
</tr>
<tr>
<td>create a many vertex super string</td>
</tr>
<tr>
<td>create a two points string perpendicular to a reference string</td>
</tr>
<tr>
<td>create many vertex super string by bearing distances from previous vertex</td>
</tr>
<tr>
<td>append to a super string using bearing distance entry</td>
</tr>
<tr>
<td>modify the bear/distance of a selected segment</td>
</tr>
<tr>
<td>create string with vertices a dist along and dist offset to a line</td>
</tr>
<tr>
<td>create string with vertices a dist along and dist offset absolute to a line</td>
</tr>
</tbody>
</table>

For the option 2 points, go to 15.11.1 2 Points
Tangent 15.11.2 Tangent
Line string 15.11.3 Line string
Perpendicular 15.11.4 Perpendicular
Traverse 15.11.5 Traverse
Traverse append 15.11.6 Traverse append
Traverse edit 15.11.7 Traverse edit
Tape baseline 15.11.8 Tape baseline
Tape baseline absolute 15.11.9 Tape baseline absolute
15.11.1 2 Points

Position of option on menu: CAD =>Line =>2 points
or by selection of appropriate icon from the toolbar.

This option creates two vertex super strings with a line between the two vertices.

On selecting 2 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height etc. are defined in the Cad Control Bar.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel. NOTE: The z value will default to the value entered into the Cad Control Bar whether or not it is specified in the XYZ box. If no height value exists in the Cad Control Bar

The 2nd point is selected in the same way as the 1st point. The line is created after successful selection and acceptance of the 2nd point. The option remains current so that a number of lines can be created.
15.11.2 Tangent

Position of option on menu:  CAD => Line => Tangent
or by selection of appropriate icon from the toolbar.

This option creates the tangential line between two elements.

NOTE: This option is for super strings only. When selecting an arc or circle, the selection must be a line snap with direction. If a point is selected on the arc/circle the line will be drawn between the selected points and not the tangent.

On selecting Tangent, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A start position of the reference line is selected and accepted.

![Diagram of Tangent Step 1](image)

STEP 2:
The user selects and accepts the arc/circle segment with direction. The direction is required because there are two possible solutions. In this case, the direction was anti clockwise.

![Diagram of Tangent Step 2](image)

STEP 3:
After accepting the segment, a line is drawn from the 1st selected point to the tangent point. Note that in this example, the arc is produced around so that a solution can be found.

![Diagram of Tangent Step 3](image)
15.11.3 Line string

Position of option on menu:  CAD =>Line =>Line string
or by selection of appropriate icon from the toolbar.
This option creates a string of many points.
On selecting Line string, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The position of each vertex of the string is selected and accepted in order from the first to the last vertex.
15.11.4 Perpendicular

This option creates a string by selecting a reference string and a reference point the create a line from the reference point perpendicular to the reference string.

On selecting Perpendicular, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A reference string is selected and accepted.

**STEP 2:**
A line is drawn from the current mouse position perpendicular to the reference string

**STEP 3:**
After the final position is accepted, a line string is created which start from the selected position and perpendicular to the reference string.
15.11.5 Traverse

**Position of option on menu:** CAD => Line => Traverse

or by selection of appropriate icon from the toolbar.

This option creates a string by giving the bearing and distance of each vertex from the previous vertex. The position of the first vertex is the start of the string and then the bearing and distance is given to define the position of the next vertex. The created vertex then becomes the position to take the next bearing and distance from.

On selecting Traverse, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A start position is selected and accepted. This becomes the first vertex of the string.

**STEP 2:**

A line is drawn from the vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

**Note:** The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.
This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.
The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.
STEPS 4-5:
The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.
15.11.6 Traverse append

**Position of option on menu:** CAD => Line => Traverse append

or by selection of appropriate icon from the toolbar.

This option adds vertices to the end of a super string by giving the bearing and distance of each vertex from the previous vertex. When a string is selected, the end of the string becomes the position that the bearing distance is taken from. The created vertex then become the position to take the next bearing and distance from.

On selecting Traverse append, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A string to append vertices to is selected and accepted. The end of this string becomes the position to define the first bearing distance from.

**STEP 2:**

A line is drawn from the last vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

**Note:** The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.
STEP 3:

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user
selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

**STEPS 4-5:**

The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.
15.11.7 Traverse edit

Position of option on menu: CAD => Line => Traverse edit

or by selection of appropriate icon from the toolbar. 🔄

This option changes the bearing and length of a selected line segment of a super string.

On selecting Traverse edit, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A line segment of a string is selected and accepted. This segment is the one to have its bearing distance redefined.

**STEP 2:**

A **Bearing** and then the **Distance** typed input boxes are presented with the current values for the line segment displayed. After new values are entered (or just <enter> if the original value is to be maintained) then the new bearing and distance values are applied to the start vertex of the segment to produce a new end vertex. The rest of the string keeps the same bearing/distances are in the original string.

**Note:** The Page up and page down keys can be used when the input bearing box comes up to add or subtract intervals of 90 degrees.
15.11.8 Tape baseline

Position of option on menu: CAD =>Line =>Tape baseline
or by selection of appropriate icon from the toolbar.

This option creates a line string by entering distances between points and the offset distance to a user defined reference line string.

On selecting Tape baseline, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A start position of the reference line is selected and accepted.

*Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.*

**STEP 2:**
The interception point for the reference line is selected and accepted.

**STEP 3:**
After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the first point, the distance entered is relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

*Note: The distance is always relative to the previously entered vertex (positive is from start point to intercept point along the reference line).*
STEP 4:
After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

Note: The offset distance is always relative to the reference line (negative is to the left).

STEP 5:
Steps 3 and 4 should be repeated until the required number of vertices have been created in the line string.

STEP 6:
The option can be terminated by click on the close button on the Input box, followed by the Esc key.
15.11.9 Tape baseline absolute

Position of option on menu: CAD =>Line =>Tape baseline absolute

or by selection of appropriate icon from the toolbar.

This option creates a line string by entering distances from the start point and the offset distance to a user defined reference line string.

On selecting Tape baseline absolute, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A start position of the reference line is selected and accepted.

Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.

STEP 2:
The interception point for the reference line is selected and accepted.

STEP 3:
After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the absolute option, all distances entered are relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

Note: For the absolute option, distances are always relative to the start point of the reference line (positive is from start point to intercept point along the reference line).
STEP 4:
After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

Note: The offset distance is always relative to the reference line (negative is to the left).

STEP 5:
Steps 3 and 4 should be repeated until the required number of vertices have been created in the line string.

STEP 6:
The option can be terminated by click on the close button on the Input box, followed by the Esc key.
15.12 CAD Circle

**Position of option on menu:**  
CAD => Circle

The Circle walk-right menu is

- from 3 selected points
- tangential to 3 tangents (including points)
- tangential to 3 directed tangents (including points)
- known radius and tangential to 2 tangents
- known radius and tangential to 2 directed tangents
- from 2 points on diameter
- through 2 points and known radius
- through point with known radius and a bearing at point
- centre position and specified radius
- centre position and point on circle

For the option 3 points, go to

- 3 tangents
- 3 directed tangents
- 2 tangents and radius
- 2 directed tangents and radius
- 2 points
- 2 points and radius
- Point, radius and bearing
- Centre and radius
- Centre and point
- Centre and circumference

15.12.1 3 Points
15.12.2 3 tangents
15.12.3 3 directed tangents
15.12.4 2 tangents and radius
15.12.5 2 directed tangents and radius
15.12.6 2 points
15.12.7 2 point and radius
15.12.8 Point, radius and bearing
15.12.9 Centre and radius
15.12.10 Centre and point
15.12.11 Centre and circumference
15.12.1 3 Points

Position of option on menu:  CAD =>Circle =>3 points
or by selection of appropriate icon from the toolbar.

This option creates the circle through three selected points.

On selecting 3 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:
The 2nd point is selected and accepted.

After the 2nd point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.

STEP 3:
The 3rd point is selected and accepted.
STEP 4:
A circle is constructed through the three selected points
15.12.2 3 tangents

**Position of option on menu:**  CAD =>Circle=>3 tangents
or by selection of appropriate icon from the toolbar.

This option creates a circle that is tangential to three selected segments.

On selecting 3 tangents, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

**STEP 2:**
The 2nd tangent is selected and accepted.

**STEP 3:**
The 3rd tangent is selected and accepted.

**STEP 4:**
A circle is constructed that touches each of the three selected tangents.
15.12.3 3 directed tangents

**Position of option on menu:**  CAD => Circle => 3 directed tangents

or by selection of appropriate icon from the toolbar.

This option creates a circle that is tangential to three selected segments. The segments are selected in order and with direction and the circle is to the right of the direction of the selected segments.

On selecting 3 directed tangents the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

Select and accept the 1st tangent.

**Note:** For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent with direction. For further notes on picking tangents with direction, see Picking with Direction.

**Note:** The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

**STEP 4:**
If a solution exists, a circle is constructed using the given information.
15.12.4 2 tangents and radius

Position of option on menu:  CAD =>Circles=>2 tangents and radius
or by selection of appropriate icon from the toolbar.

This option creates a circle with a given radius that is tangential to two selecting segments.

On selecting 2 tangents and radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Select the 1st tangent with the mouse (Left Button) and accept it (Middle Button).

**STEP 2:**
Select the 2nd tangent and accept it.

**STEP 3:**
After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the radius by measuring existing elements.

**STEP 4:**
If a solution exists, a circle is fitted touching the two selected tangents using the given radius.
15.12.5 2 directed tangents and radius

Position of option on menu:  CAD =>Circle=>2 directed tangents and radius
or by selection of appropriate icon from the toolbar.

This option creates a circle with a given radius that is tangential to two selected segments that
are picked with direction.

On selecting 2 directed tangents and radius, the user is prompted for the relevant data in the screen
message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The circle will be
constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting
the tangent with direction. For further notes on picking tangents with direction, see Picking with
Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

---

STEP 2:
The 2nd tangent is selected and accepted.

---

STEP 3:
After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the
Input box and press the Enter key. The browse button on the Input box can be used to
define the arc radius by measuring existing elements.

---

STEP 4:
If a solution exists, a circle is constructed using the given information.
15.12.6 2 points

**Position of option on menu:**  CAD => Circle => 2 points
or by selection of appropriate icon from the toolbar.

This option creates a circle by selecting two points that define the diameter of the circle.

On selecting 2 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor (cursor position taken as the other end of a diameter). This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected and accepted.

**STEP 3:**

The circle is constructed through the two selected points. The two points define the diameter.
15.12.7 2 point and radius

**Position of option on menu:** CAD => Circle => 2 point and radius

or by selection of appropriate icon from the toolbar.

This option creates a circle of a given radius that goes through two selected points.

On selecting 2 point and radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected and accepted.

**STEP 3:**

After the 2nd point is accepted, the Radius Input box will appear. The radius value is entered into the input box followed by the enter key.
STEP 4:
If a solution exists, the circle is fitted through the two selected points using the given radius.
15.12.8 Point, radius and bearing

**Position of option on menu:** CAD => Circle => Point, radius and bearing or by selection of appropriate icon from the toolbar.

This option creates a circle of a given radius, a selected point on the circle and the bearing of the tangent to the circle at that point.

On selecting **Point, radius and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

**STEP 2:**

After the 1st point is accepted, the **Enter radius** input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

After the radius has been entered, the **Enter bearing** input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

**Note:** The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.
STEP 4:
If a solution exists, a circle is fitted from the given bearing at the selected point using the selected radius.
15.12.9 Centre and radius

Position of option on menu: CAD =>Circle =>Centre and radius
or by selection of appropriate icon from the toolbar.

This option creates a circle of a given radius and a selected centre point.

On selecting Centre and radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

The circle is constructed through the centre point using the specified radius.
15.12.10 Centre and point

Position of option on menu: CAD =>Circle =>Centre and point
or by selection of appropriate icon from the toolbar.

This option creates a circle by selecting a centre point and then using the cursor to select a second point that is on the circle.

On selecting Centre and point, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the point into the Input box and press the enter key.

STEP 3:

A circle is constructed using the two points defined by the user.
CAD Circle
15.12.11 Centre and circumference

Position of option on menu: CAD =>Circle=>Centre and circumference
or by selection of appropriate icon from the toolbar.

This option creates a circle by selecting the centre point and giving a circumference value.

On selecting Centre and circumference, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

![Image of circle creation](image1)

**STEP 2:**

After the centre point is accepted, the Circumference Input box will appear. Type the circumference length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

![Image of circumference input](image2)

**STEP 3:**

A circle is constructed using the centre point and the given circumference.

![Image of constructed circle](image3)
15.13 CAD Arc

**Position of option on menu:** CAD => Arc

The arc options creates *super string arcs*, not arc strings. The options Strings => Create => Arc create arc strings.

The Arc walk-right menu is

- 3 points
- 3 tangents
- 3 directed tangents
- 2 tangents and radius
- 2 directed tangents and radius
- 2 points and radius
- 2 points and arc length
- 2 points and end bearing
- Centre and end points
- Centre, radius and end points
- Centre, start point and sweep angle
- Start point, radius and bearing
- Start point, radius and chord
- Start point, radius, chord length and bearing
- Fillet
- Fillet by start point

from 3 selected points
tangential to 3 tangents (including points)
tangential to 3 directed tangents (including points)
known radius and tangential to 2 tangents
known radius and tangential to 2 directed tangents
through 2 points and known radius
2 points and known arc length
2 points and known bearing at first point
centre and end points
centre, radius and end points
centre, start point and sweep angle
through point with known radius and a bearing at point
start point, radius and chord length
start point, radius and chord length and bearing
fillet between 2 segments and given radius
fillet between 2 segments with selected start point
For the option 3 points, go to

- 3 tangents
- 3 directed tangents
- 2 tangents and radius
- 2 directed tangents and radius
- 2 points and radius
- 2 points and arc length
- 2 points and end bearing
- Centre and end points
- Centre, radius and end points
- Centre, start point and sweep angle
- Start point, radius and bearing
- Start point, radius and chord
- Start point, radius, chord length and bearing
- Centre and end points
- Centre, radius and end points
- Centre, start point and sweep angle
- Start point, radius, and bearing
- Start point, radius and chord
- Start point, radius, chord length and bearing
- Centre, end points
- Centre, radius and end points
- Centre, start point and sweep angle
- Start point, radius, and bearing
- Start point, radius and chord
- Start point, radius, chord length and bearing
- Centre, end points
- Centre, radius and end points
- Centre, start point and sweep angle
- Start point, radius, and bearing
- Start point, radius and chord
- Start point, radius, chord length and bearing
- Centre, end points
- Centre, radius and end points
- Centre, start point and sweep angle
- Start point, radius, and bearing
- Start point, radius and chord
- Start point, radius, chord length and bearing

Fillet
- 15.13.15 Fillet
- 15.13.16 Fillet by start point
15.13.1 3 points

Position of option on menu: CAD =>Arc =>3 points

or by selection of appropriate icon from the toolbar.

This option creates the arc through three selected points and the first and third points are the
start and end of the arc.

On selecting 3 points, the user is prompted for the relevant data in the screen message box
located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point
with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter
the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ
Input box. Type the coordinates into the XYZ Input box and press the Enter key.

**STEP 2:**
The 2nd point is selected and accepted.

After the 2nd point is accepted an arc will be displayed ‘rubber banding’ to the various solutions
according to the position of the cursor. This will continue until the 3rd point is selected and
accepted.

**STEP 3:**
The 3rd point is selected and accepted.

**STEP 4:**
An arc is constructed through the three selected points.
15.13.2 3 tangents

Position of option on menu: CAD =>Arc =>3 tangents
or by selection of appropriate icon from the toolbar.

This option creates an arc that is tangential to three selected segments. The first and third segments are the start and end of the arc.

On selecting 3 tangents, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

STEP 2:
The 2nd tangent is selected and accepted.

STEP 3:
The 3rd tangent is selected and accepted.

STEP 4:
The arc is constructed touching the three selected tangents.
15.13.3 3 directed tangents

Position of option on menu:  
CAD =>Arc =>3 directed tangents
or by selection of appropriate icon from the toolbar.

This option creates an arc that is tangential to three selected segments. The segments are
selected in order and with direction and the arc is to the right of the direction of the selected
segments. The first and third segments are the start and end of the arc.

On selecting 3 directed tangents, the user is prompted for the relevant data in the screen message
box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be
constructed to the right of the tangent. A user may reverse the direction of the tangent by
selecting a tangent with direction. For further notes on picking tangents with direction, see
Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:
The 2nd tangent is selected and accepted.

STEP 3:
The 3rd tangent is selected and accepted.

STEP 4:
If a solution exists, an arc is constructed using the given information.
15.13.4 2 tangents and radius

Position of option on menu:  CAD =>Arc => 2 tangents and radius
or by selection of appropriate icon from the toolbar.

This option creates an arc with a given radius that is tangential to two selecting segments. This is the same as a fillet.

On selecting 2 tangents and radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

STEP 2:
The 2nd tangent is selected and accepted.

STEP 3:
After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:
If a solution exists, the arc is fitted through the two selected tangents using the given radius.
15.13.5 2 directed tangents and radius

**Position of option on menu:** CAD => Arc => 2 directed tangents and radius

or by selection of appropriate icon from the toolbar.

This option creates an arc with a given radius that is tangential to two selected segments that are picked with direction.

On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

**STEP 1:**

Select and accept the 1st tangent.

**Note:** For this option the direction of the selected tangents is important. The arc will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see **Picking with Direction**.

**Note:** The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 4:**
If a solution exists, the arc is fitted through the two selected tangents using the given radius.
15.13.6 2 points and radius

Position of option on menu: CAD =>Arc =>2 points and radius
or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius that starts and ends on two selected points.

On selecting 2 points and radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**
After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**
The 2nd point is selected and accepted.

**STEP 4:**
If a solution exists, an arc is constructed using the given information.
15.13.7 2 points and arc length

Position of option on menu:  CAD => Arc => 2 points and arc length
or by selection of appropriate icon from the toolbar

This option creates an arc of a given arc length that starts and ends on two selected points.
On selecting 2 points and arc length, the user is prompted for the relevant data in the screen
message box located at the bottom left hand corner of the 12d Model application window.

STEP 1: 12d

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point
with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter
the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ
Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the start point is accepted, the Arc length Input box will appear. Type the arc length value
into the Input box and press the enter key. The browse button on the Input box can be used
to define the arc length by measuring existing elements.

STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.
15.13.8 2 points and end bearing

Position of option on menu:  
CAD => Arc => 2 points and end bearing  
or by selection of appropriate icon from the toolbar.

This option creates an arc that starts and end on two selected points and has a given bearing of 
the tangent at the end point (the end bearing).

On selecting 2 points and end bearing, the user is prompted for the relevant data in the screen 
message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point 
with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter 
the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ 
Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:
The 2nd point is selected and accepted.

STEP 3:
After the 2nd point is accepted, the Enter bearing input box will appear. Type the bearing into the 
Input box and press the enter key. The browse button on the input box can be used to define 
the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Enter Bearing input box 
comes up to add or subtract intervals of 90 degrees.

STEP 4:
If a solution exists, the arc is fitted through the two selected points with the end point of the given bearing.
15.13.9 Centre and end points

Position of option on menu:  CAD => Arc => Centre and end points
or by selection of appropriate icon from the toolbar.

This option creates an arc by selecting in order, the centre point and the start and end points. The radius of the arc is the distance between the centre and the start point.

On selecting Centre and end points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

STEP 2:
Select and accept the start point. This point defines the radius and the start of the arc.

STEP 3:
The end point of the arc is specified.

STEP 4:
The arc is constructed using the given information.
15.13.10 Centre, radius and end points

**Position of option on menu:**  CAD => Arc => Centre, radius and end points

or by selection of appropriate icon from the toolbar.

This option allows the creation of an arc given a centre point, radius, start and end points.

This option creates an arc of a given radius by selecting in the centre point and the start and end positions.

On selecting Centre, radius and end points the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

**STEP 2:**

A radius value is selected with the mouse or entered in via the keyboard. To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the Enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.

**STEP 3:**

A start point defines the start of the sweep angle to define where to start the arc. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.
STEP 4:
The end point of the arc is specified. The start and end points define the sweep angle to define the arc. The rubber banding of the arc will use the cursor position as the end position until a end point is selected and accepted. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The end point does not have to be on the arc itself. It is used to define the sweep angle.

STEP 5:
The arc is constructed using the given information.
15.13.11 Centre, start point and sweep angle

**Position of option on menu:**  CAD =>Arc =>Centre, start point and sweep angle

or by selection of appropriate icon from the toolbar.

This option creates an arc by selecting a centre point and a start points and giving a sweep angle. The radius of the arc is the distance between the centre and start point.

On selecting Centre, start point and sweep angle, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. This point defines the radius as well as the start point of the arc. To specify the 2nd point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 3:**

After the 2nd point is accepted, the **Sweep Angle** input box will appear. Type the sweep angle value into the input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

**Note:** The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.
STEP 4:
The arc is created using the information supplied.
15.13.12 Start point, radius and bearing

**Position of option on menu:**  
CAD => Arc => Start point, radius and bearing  
or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius, starting at a selected point and bearing of the tangent at the start point and going for a given arc length.

On selecting the *Start point, radius and bearing* option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**
After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**
After the radius has been entered, the *Arc Length* Input box will appear. Type the arc length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.

**STEP 4:**
After the arc length is accepted, the Bearing Input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

**Note:** The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

**STEP5:**
The arc is created with the given information.
15.13.13 Start point, radius and chord

Position of option on menu:  CAD => Arc => Start point, radius and chord
or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius, starting from a selected point and with a given chord bearing at the start point and a given arc length.

On selecting Start point, radius and chord, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

After the arc radius is entered, the Arc Length Input box will appear. Type the arc length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.

**STEP 4:**
After the arc length is entered, the **Chord Bearing** Input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

**Note:** The Page Up and Page Down keys can be used when the Chord Bearing Input box comes up to add or subtract intervals of 90 degrees.

---

**STEP 5:**
An arc is created with the given information.

---

![Typed Input](image)
15.13.14 Start point, radius, chord length and bearing

Position of option on menu: CAD =>Arc =>Start point, radius, chord length and bearing
or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius, starting from a selected point, with a given bearing of the tangent at the start point and a given chord length from the start point.

On selecting Start point, radius, chord length and bearing, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:
After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:
After the radius has been entered, the Chord Length Input box will appear. Type the chord length into the Input box and press the enter key. The browse button on the Input box can be used to define the chord length by measuring existing elements.
After the chord length has been entered, the Bearing Input box will appear. Type the bearing of the start tangent into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

**Note:** The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

**STEP 5:**
The arc is created with the given information.
15.13.15 Fillet

Position of option on menu: CAD => Arc => Fillet
or by selection of appropriate icon from the toolbar.

This option creates an arc given a fillet radius
On selecting Fillet, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown, the direction was in a north-east direction.

STEP 2:
The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a south-east direction.

STEP 3:
After the 2nd segment is accepted, the Arc Radius Input box will appear. Type the radius of the fillet in the Input box (positive radius for curves curving to the right) and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:
The fillet arc is placed between the selected segments.
15.13.16 Fillet by start point

**Position of option on menu:** CAD => Arc => Fillet by start point

or by selection of appropriate icon from the toolbar.

This option creates an arc that is a fillet between two selected sections and with a selected fillet start point (which will be a tangent point of the created arc).

On selecting Fillet by start point, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a north-east direction.

**STEP 2:**

The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a south-east direction.

**STEP 3:**

The tangent start point of the fillet is selected and accepted.

**STEP 4:**

The fillet arc is placed between the selected segments.
15.14 CAD Polygon

Position of option on menu: CAD =>Polygon

The Cad polygon walk-right menu is

- Rectangle from 2 points
- Rectangle with width and height
- Rectangle from 3 points
- Parallelogram
- Polygon inscribed
- Polygon circumscribed
- Polygon free hand
- Boundary polygon

For the option Rectangle from 2 points, go to

- Rectangle with width and height
- Rectangle from 3 points
- Parallelogram
- Polygon inscribed
- Polygon circumscribed

For the option Parallelogram, go to

- Polygon free hand
- Boundary polygon

For the option Polygon circumscribed, go to

- Polygon free hand
- Boundary polygon

For the option Polygon inscribed, go to

- Polygon free hand
- Boundary polygon

For the option Rectangle from 2 points, go to

- Rectangle with width and height
- Rectangle from 3 points
- Parallelogram
- Polygon inscribed
- Polygon circumscribed

For the option Rectangle from 3 points, go to

- Rectangle with width and height
- Parallelogram
- Polygon inscribed
- Polygon circumscribed

For the option Parallelogram, go to

- Polygon free hand
- Boundary polygon

For the option Polygon inscribed, go to

- Polygon free hand
- Boundary polygon

For the option Polygon circumscribed, go to

- Polygon free hand
- Boundary polygon

For the option Polygon free hand, go to

- Boundary polygon
15.14.1 Rectangle from 2 points

**Position of option on menu:** CAD =>Polygon =>Rectangle from 2 Points
or by selection of appropriate icon from the toolbar.

This option creates a rectangle parallel to the x and y axis by selecting two diagonal corners of the rectangle.

On selecting **Rectangle from 2 Points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a rectangle will be displayed ‘rubber banding’ to form a rectangle with the first point and the cursor position being diagonal corners. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The following message is displayed in the screen message box:

```
<N> Pick opposite corner or (r)adius, (c)hamfer, (l)ength > [pick] [fast] [Menu]
```

If filleted corners are required, type *r* and enter the **corner radius**.

If chamfered corners are required, type *c* and enter the **chamfer length**.

If a fillet or chamfer has been selected, type *n* to turn it off.

**STEP 3:**

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.
STEP 4:
The rectangle is created with the given information.
15.14.2 Rectangle with width and height

Position of option on menu: CAD => Polygon => Rectangle with width and height

or by selection of appropriate icon from the toolbar.

This option creates a rectangle parallel to the x and y axis by selecting a start point and giving the width and height of the rectangle.

On selecting Rectangle with width and height, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

This point defines the bottom left point of the rectangle.

After the start point is accepted, the width will be displayed ‘rubber banding’ to right of the start point (positive distance). The width is equal to the distance from the start point to the position of the cursor. This will continue until the width is selected and accepted.

**STEP 2:**

The width is selected with the mouse or entered in via the keyboard. To specify the width with the mouse, a point must be selected and accepted. To enter the width with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

A negative distance (to the left of the 1st point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button to select a distance, then place a minus "-" sign in front of the distance value.

After the width is accepted, the width of the rectangle is confirmed and the height will be displayed ‘rubber banding’ upwards on the screen. The height is equal to the distance from the found width point to the position of the cursor. The rectangle will be created once the height is selected and accepted.

**STEP 3:**

The height is selected with the mouse or entered in via the keyboard. To specify the height with
the mouse, a point must be selected and accepted. To enter the height with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

A negative distance (below of the 2nd point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button to select a distance, then place a minus "-" sign in front of the distance value.

**STEP 4:**

The rectangle is created with the given information.
15.14.3 Rectangle from 3 points

**Position of option on menu:**  CAD => Polygon => Rectangle from 3 points or by selection of appropriate icon from the toolbar.

This option creates a rectangle by selecting three points. The first and second point define the base of the rectangle, which can be at any angle, and the third point is on the opposite side of the rectangle. The rectangle can be filleted or chamfered.

On selecting Rectangle from 3 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted, the base of the rectangle will be displayed ‘rubber banding’ on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the rectangle is confirmed and the height will be displayed ‘rubber banding’ on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The rectangle will be created once the height is selected and accepted.

**STEP 3:**

The following message is displayed in the screen message box:
If filleted corners are required, type r and enter the corner radius.

If chamfered corners are required, type c and enter the chamfer length.

If a fillet or chamfer has been selected, type n to turn it off.

**STEP 4:**
The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

**STEP 5:**
The rectangle is created with the given information.
15.14.4 Parallelogram

**Position of option on menu:**  
CAD => Polygon => Parallelogram  
or by selection of appropriate icon from the toolbar.

This option creates a parallelogram by selecting three points. The first and second point define the base of the parallelogram, which can be at any angle, and the third point is the end point of the opposite side of the parallelogram.

On selecting Parallelogram, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted, the baseline of the rectangle will be displayed ‘rubber banding’ on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the parallelogram is confirmed and the height will be displayed ‘rubber banding’ on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The parallelogram will be created once the height is selected and accepted.

**STEP 3:**

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.
STEP 4:
The parallelogram is created with the given information.
15.14.5 Polygon inscribed (in a circle)

Position of option on menu:  CAD =>Polygon =>polygon inscribed
or by selection of appropriate icon from the toolbar.

This option creates a polygon with a user defined number of sides on the inside of a circle.
The polygon is constructed inside a circle, thus each corner of the polygon touches the
 circumference of the circle defined by the user. Conversely using the Polygon circumscribed option,
the midpoint of each side of the polygon touches the circumference of the circle creating a
polygon outside the circle.

On selecting polygon inscribed, the user is prompted for the relevant data in the screen message
box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The centre point is selected with the mouse or entered in via the keyboard. To specify the centre
point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To
enter the centre point with the keyboard, simply start typing or press the space bar to bring up the
XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired
number of sides for the polygon into the Input box and press the enter key.

After the number of sides have been selected, the polygon will be displayed ‘rubber banding’ on
the screen. The polygon will be created once the radius is selected and accepted.

STEP 3:

Before a polygon can be created inside the circle, its radius must be defined by the user. To
specify the radius with the mouse, a point must be selected and accepted. To enter the point with
the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the
coordinates into the XYZ Input box and press the enter key.

Note: One of the polygon's corners will be located on the point selected to defined the
circle's radius
**STEP 4:**
A polygon is created inside a circle with a radius defined by the user.
15.14.6 Polygon Circumscribed About a Circle

**Position of option on menu:** CAD =>Polygon =>Polygon circumscribed

or by selection of appropriate icon from the toolbar.

This option creates a polygon with a user defined number of sides on the outside a circle. The polygon is constructed outside a circle, thus the midpoint of each side of the polygon touches the circumference of the circle defined by the user. Conversely using the **Polygon inscribed** option, each corner of the polygon touches the circumference of the circle creating a polygon inside the circle.

On selecting **Polygon circumscribed**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The centre point is selected with the mouse or entered in via the keyboard. To specify the centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired number of sides for the polygon into the Input box and press the enter key.

After the number of sides have been selected, the polygon will be displayed ‘rubber banding’ on the screen. The polygon will be created once the radius is selected and accepted.

**STEP 3:**

Before a polygon can be created outside the circle, its radius must be defined by the user. To specify the radius with the mouse, a point must be selected and accepted. To enter the point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**Note:** One midpoint of the polygon’s side will be located on the point selected to defined the circle’s radius.
STEP 4:
A polygon is created outside the circle with a radius defined by the user.
15.14.7 Free Hand Polygon

**Position of option on menu:**  CAD => Polygon => Polygon free hand
or by selection of appropriate icon from the toolbar.

This option creates a closed polygon from selected vertices.

On selecting **Polygon free hand**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Pick and accept the position to form the vertices of the polygon. As each vertex is accepted, the polygon is automatically closed.

**STEP 2:**
The polygon is finished by pressing the <Esc> key.
15.14.8 Create Boundary Polygon

**Position of option on menu:** CAD => Polygon => Boundary polygon

**or by selection of appropriate icon from the toolbar.**

This option tries to form a boundary from a selected set of segments.

On selecting **Boundary polygon**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d *Model* application window.

**STEP 1:**
Pick a position inside the lines, arcs and strings to form a bounding polygon from.

**STEP 2:**
A circle is then drawn centred on the selected position with circumference going through the position of the cursor. Drag the cursor out until it encloses all the data to be used to create the closest bounding polygon around the centre.

**STEP 3:**
On accepting the circle position, an attempt is made to create the inner polygon using all the strings inside the circle.
15.15 CAD Text

Position of option on menu: CAD => Text
Position of option on menu: Various toolbars

Text can occur as a text string, on vertices and segments of a super string or on vertices of a 4d string. But the display position of text is not as straightforward as simply placing a point. For more information about text, go to the section 4.6 Text Definitions.

The Text walk-right menu is

- edit text string using typed commands and grips
- create text string using typed commands and grips
- delete text
- label perpendicular offset distance
- menu of individual Text options

For the option Edit, go to
- 15.15.2 Edit Text
- 15.15.1 Create Text
- 15.15.20 Text Delete
- 15.15.18 Label Perpendicular Offset
- 15.15.3 CAD Text Commands
15.15.1 Create Text

**Position of option on menu:** CAD => Text => Create

or by selection of appropriate icon from the toolbar.

For information about text and its definitions, go to the section 4.6 Text Definitions.

**12d Model** has two CAD text options Create and Edit. However both of these run the same option which starts up in different modes - Create is in the mode to create text as straight text, or text on a super string vertex or on a super string segment and Edit which edits existing text.

Once either CAD text option is started it is possible to change between the Create and Edit modes at any time.

The Create option creates text strings, text at super string vertices and text on super string segments, and then displays a list key commands in the screen message area, and grips on screen, to quickly allow editing of the text, text size, colour, rotation, style, angle, raise, justification point etc.

After selecting the option, the **Pick position** message is displayed in the screen message area.

To go from Create to Edit mode, type e - go to To Go from Create to Edit Mode - Typing e

To create a text string, type c - go to Creating a Text String - Typing c

To create vertex text, type v - go to Creating Text at a Super String Vertex- Typing v

To create segment text, type s - go to Creating Text at a Super String Segment- Typing s

Creating a Text String - Typing c

After typing c, the **Pick position** message is again displayed in the screen message area and the position of the text is then selected with the cursor.

When the position is accepted an **Enter text** typed input box is then displayed on the screen.

The text is typed into the box and the <enter> key pressed.

The text vertex and text justification point is placed at that position and the direction of the text is parallel to the x-axis. The angle and raise are both zero and the text justification is (left x, bottom y).
When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.14 Text Grips.

For the new text, the style and height are taken from the Text controlbar and the model and colour from the CAD controlbar (see 15.1 Controlbars, 15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar).

After the text is created, a list of typed options is then displayed in the screen message area.

C is the default if nothing is typed.

Creating Text at a Super String Vertex- Typing v

After typing v, the Pick vertex message is displayed in the screen message area and the vertex of the super string to place the text at is then selected with the cursor.

When the vertex is accepted an Enter text typed input box is then displayed on the screen.
The text is typed into the box and the <enter> key pressed.

The text justification point is placed at the selected string vertex and the direction of the text is parallel to the x-axis. The angle and raise are both zero and the text justification is (left x, bottom y).

When the text is displayed, grips for quick editing of size, rotation, moving of the justification point and string vertex are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.14 Text Grips.

For the new text, the style and height are taken from the Text controlbar and colour from the CAD controlbar (see 15.1 Controlbars, 15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar). The created text will be part of the super string so no model is required.

After the vertex text is created, a list of typed options is then displayed in the screen message area.

If m is typed, the rest of the options are shown

These option are the same as when editing existing text, and will be described in detail in the section 15.15.2 Edit Text.
Creating Text at a Super String Segment- Typing s

After typing **s**, the **Pick segment** message is displayed in the screen message area and the segment of the super string to place the text on is then selected with the cursor.

When the segment is accepted an **Enter text** typed input box is then displayed on the screen.

The text is typed into the box and the <enter> key pressed.

The text justification point is placed at the centre of the segment and the direction of the text is parallel to the segment. The angle and raise are both zero and the text justification is (left x, bottom y).

When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.14 **Text Grips**.

For the new text, the style and height are taken from the **Text controlbar** and colour from the **CAD controlbar** (see 15.1 **Controlbars**, 15.1.2 **Symbol Controlbar** and 15.1.1 **CAD Controlbar**). The created text will be part of the super string so no model is required.

After the segment text is created, a list of typed options is then displayed in the screen message
and if \( m \) is typed, the rest of the options are shown:

```
< [S] Pick grip point or (c)clour, (s)yle, (c)ontent, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore... > [picks][fast][Menu]
```

These option are the same as when editing existing text, and will be described in detail in the section 15.15.2 Edit Text.

**To Go from Create to Edit Mode - Typing e**

After typing \( e \), the **Pick text** message is displayed in the screen message area.

```
< [Pick text] (e)dit, (c)reate, (v)ertex, (s)egment > [picks][fast][Menu]
```

This is the same as when selecting the Edit option from the CAD Text toolbar and will be described in detail in the section 15.15.2 Edit Text.
15.15.2 Edit Text

Position of option on menu:  CAD => Text => Edit

or by selection of appropriate icon from the toolbar.

For information about text and its definitions, go to the section 4.6 Text Definitions.

12d Model has two CAD text options Create and Edit. However both of these run the same option which starts up in different modes - Create is in the mode to create text as straight text, or text on a super string vertex or on a super string segment and Edit which edits existing text.

Once either CAD text option is started it is possible to change between the Create and Edit modes at any time.

The Edit option edits text as either text strings, text at super string vertices or text on super string segments.

After typing e, the Pick text message is displayed in the screen message area

```
< [Pick text] (e)dit, (c)reate, (v)ertex, (s)egment > [ picks ][ fast ][ Menu ]
```

and text either as a text string, or text on a super string vertex or segment, is then selected by the mouse for editing.

The selected text with the text edit grips is shown on screen, and a list of available typed commands in the screen message area to quickly allow editing of the text, text size, colour, rotation, style, angle, raise, justification point, vertex, etc.

Options displayed after selecting text

```
< [ ] > Grip point or (v)ertex, (c)olour, (s)cale, (o)ffset, (h)eight, (w)idth, (i)mage, (r)otate, (j)ustify, (n)ext, (p)rev, (f)ill, (b)ack, no auto[ p ]an > [ picks ][ fast ][ Menu ]
```

and by typing m

```
< [ ] > Item or (a)ngle, (j)ustify, (y)justification, (d)efault, (n)ext, (p)rev, (f)ill, (b)ack, no auto[ p ]an > [ picks ][ fast ][ Menu ]
```

Output: Window

---

Options displayed after selecting text:

- Grip point or (v)ertex
- (c)olour
- (s)cale
- (o)ffset
- (h)eight
- (w)idth
- (i)mage
- (r)otate
- (j)ustify
- (n)ext
- (p)rev
- (f)ill
- (b)ack
- no auto[ p ]an

Output: Window
To change the text colour, type `c` - go to Change Text Colour - Typing c
To change the text style, type `s` - go to Change Text Style - Typing s
To change the actual text, type `t` or press space bar - go to Change Text - Pressing space bar or Typing t
To change the text height, type `h` - go to Change Text Height - Typing h
To change the text width factor, type `w` - go to Change Text Width Factor - Typing w
To create/edit a new text, type `n` - go to Create/Edit New Text - Typing n
To end the create/edit option, type `f` - go to Finish the Create/Edit - Typing f
To show the other line of options, type **m** - go to _Show Other Line of Options - Typing m_

To change the text offset, type **o** - go to _Change Text Offset - Typing o_
To change the text raise, type **r** - go to _Change Text Raise - Typing r_
To change the text angle, type **a** - go to _Change Text Angle - Typing a_
To change the text x justification, type **x** - go to _Change Text X Justification - Typing x_
To change the text y justification, type **y** - go to _Change Text Y Justification - Typing y_
To reset some text values to their defaults, type **d** - go to _Reset Text Parameters to Defaults - Typing d_
To change focus to the next text, press **->** - go to _Change Focus to the Next Text in String - Pressing right arrow key (->)_
To change focus to the previous text, press **<-** - go to _Change Focus to the Previous Text in String - Pressing left arrow key (<-)_
To show the other line of options, type **m** - go to _Show Other Line of Options - Typing m_
To toggle vertex lock on and off, type **l** - go to _Toggle Lock - Typing l_
To toggle autopan on and off, type **p** - go to _Toggle Autopan - Typing p_

**Change Text Colour - Typing c**

After typing **c**, a Colour *Typed input* box appears with the current text colour displayed.

![12d Model](image)

The new colour for the text is typed into the Colour input box followed by the <enter> key, or by selecting a colour from the *Select Colour* box which is brought up by clicking B1 on the colour button.

**Change Text Style - Typing s**

After typing **s**, a Style *Typed input* box appears with the current text style displayed.
The new style for the text is typed into the Style input box followed by the <enter> key, or by selecting a style from the Select Text Style box which is brought up by clicking B1 on the style button.

Change Text - Pressing space bar or Typing t
After typing t or pressing the space bar, an Enter Text Typed input box appears with the current text in it.

The new text is typed into the Enter Text input box followed by the <enter> key.

Change Text Height - Typing h
After typing h, a Size Typed input box appears with the current text height in it.
The new height is typed into the Size input box followed by the <enter> key.

**Note** - Many arithmetic expressions are supported in the Size typed input box (e.g. 10+27). See the section 4.19.1 Expressions in Panel Fields.

**Change Text Width Factor - Typing w**

After typing w, a X-Factor Typed input box appears with the current width (x-factor) in it.

The new width (x-factor) is typed into the X-factor input box followed by the <enter> key.

**Note** - Many arithmetic expressions are supported in the X-factor typed input box (e.g. 0.5*2.2). See the section 4.19.1 Expressions in Panel Fields.

**Create/Edit New Text - Typing n**

If the option was in Edit mode and n is typed, a new Edit is started (e mode). The **Pick text** message is displayed in the screen message area and another text is selected to edit.

Or a **new** text can be created by typing C, V or S. See the section 15.15.1 Create Text for more information on C, V and S.

If the option was in Create mode and n is typed, a new Create is started in the C mode. The
*Pick position* message is displayed in the screen message area and a new text is created.

Or a new segment or vertex text can be created by typing *v* or *S* or the Edit mode can be entered by typing *e*. See the section 15.15.1 *Create Text* for more information on *c*, *v* and *S*.

**Change Text Offset - Typing o**

After typing *o*, an Offset Typed input box appears with the current text offset in it.

The new offset is typed into the Offset input box followed by the <enter> key. The text justification point will be offset by the new amount.

Note - Many arithmetic expressions are supported in the Offset typed input box (e.g. 10+27).

For information about text and the definition of offset, go to the section 4.6 *Text Definitions*.

**Change Text Raise - Typing r**

After typing *r*, a Raise Typed input box appears with the current text raise in it.

Segment text - offset = 20
The new raise is typed into the Raise input box followed by the <enter> key. The text justification point will be raised by the new amount.

For information about text and the definition of raise, go to the section 4.6 Text Definitions. Note - Many arithmetic expressions are supported in the Raise typed input box (e.g. 10+27). See the section 4.19.1 Expressions in Panel Fields.

Change Text Angle - Typing a

After typing a, a Rotation Typed input box appears with the current text angle in it.

The new angle is typed into the Rotation input box followed by the <enter> key.
The direction of the text point will be rotated by the new amount.

For information about text and the definition of angle, go to the section 4.6 Text Definitions.

**Note** - Some arithmetic expressions are supported in the Rotation typed input box (e.g. 10+90). See the section 4.19.1.2 Expressions in Bearing, Angle Panel Fields for what is allowed in angle/bearing panel fields.

**Change Text X Justification - Typing x**

After typing x, a Justify X Typed input box appears with the current text x justification in it.

The new x justification for the text is typed into the Justify X input box followed by the <enter> key, or by selecting a justification from the Select Choice box which is brought up by clicking B1 on the choice button.

For information about text and the definition of justification, go to the section 4.6 Text Definitions.
Change Text Y Justification - Typing y

After typing y, a Justify Y Typed input box appears with the current text y justification in it.

The new y justification for the text is typed into the Justify Y input box followed by the <enter> key, or by selecting a justification from the Select Choice box which is brought up by clicking B1 on the choice button.

For information about text and the definition of justification, go to the section 4.6 Text Definitions.

Reset Text Parameters to Defaults - Typing d

After typing d, some of the text parameters are set back to their default values.

That is for a:

Text String, Vertex Text and Segment Text:
- Text style is set to the Text style in the Cad Text Controlbar
- Colour is reset to the colour in the Cad Controlbar
- Size is set to the size in the Cad Text Controlbar
- Angle is set to 0
- Offset is set to 0
- Raise is set to 0
- X Factor is set to 1
- X Justification is set to left
- Y Justification is set to bottom
- Model stays the same

For information about text definitions, go to the section 4.6 Text Definitions.
Change Focus to the Next Text in String - Pressing right arrow key (->)
For vertex text on a super string, pressing ->, moves the focus of the edit commands to the vertex text on the next vertex of the super string. If the text is on the last vertex, pressing -> does nothing.
For segment text on a super string, pressing ->, moves the focus of the edit commands to the segment text on the next segment of the super string. If the text is on the last segment, pressing -> does nothing.

For information about text definitions, go to the section 4.6 Text Definitions.

Change Focus to the Previous Text in String - Pressing left arrow key (<-)
When editing vertex text on a super string, pressing <-, moves the focus of the edit commands to the vertex text on the previous vertex of the super string. If the text is on the first vertex, pressing <-> does nothing. If Autopan is on, the selected vertex text is made the centre of the active plan view.
When editing segment text on a super string, pressing <->, moves the focus of the edit commands to the segment text on the previous segment of the super string. If the text is on the first segment, pressing <-> does nothing. If Autopan is on, the selected segment text is made the centre of the active plan view.

For information about text definitions, go to the section 4.6 Text Definitions.

Toggle Lock - Typing l
Typing l toggles locking the vertex on and off.
When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.
When the screen message area reads (l) lock (l)ock, this means that vertex lock is off (unlocked) and typing l locks it.
When the screen message area reads un(l) lock, un(l)ock, this means that the vertex is locked and typing l unlocks it.

For information about the vertex text grip, go to the section 4.14 Text Grips.
For information about text definitions, go to the section 4.6 Text Definitions.

Toggle Autopan - Typing p
Typing p toggles autopan on and off.
When editing vertex text on a super string and Autopan is on, pressing -> or <-, moves the focus of the edit commands to the vertex text on the next/previous vertex of the super string, and the selected vertex text is made the centre of the active plan view.
When editing segment text on a super string and Autopan is on, pressing -> or <-, moves the focus of the edit commands to the vertex text on the next/previous segment of the super string, and the selected segment text is made the centre of the active plan view.
When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.
When the screen message area reads `auto(p)an`, this means that autopan is off and typing `p` turns autopan on.

When the screen message area reads `no auto(p)an`, this means that autopan is on and typing `p` turns it off.

For information about text definitions, go to the section 4.6 Text Definitions.

**Show Other Line of Options - Typing m**

There are too many Edit options to fit onto one line of the screen message and two lines of options are required. Typing `m` toggles between the two lines of options.

Finish the Create/Edit - Typing f

Typing `f` exits the create/edit text option.
15.15.3 CAD Text Commands

The *Cad Text Commands* do just one text modification at a time but once one selected text has been modified, another text can then be selected to have the same type of modification. So the CAD Text Commands perform the same modification on progressively selected texts whereas the CAD Text Create and CAD Text Edit options perform any of the modifications on the one selected text.

The *Cad text commands* walk-right menu is

```
Menu of Individual Options to Create and Manipulate Text
earlier version of CAD Text Edit - edit text using grips
earlier version of CAD Text Create - create text string and edit using grips
create text string at a selected position
create text at a user selected super string vertex
create text at a user selected super string segment
rotate text about its vertex
rotate text about its justification points (which may be offset from the vertex
move text by its vertex
move text by its justification point (the vertex does not move)
change the height of text
change the characters of the text
change the style of text
change the colour of text
reset the text justification point so that it is on top of the vertex posn
label perpendicular offset distance
menu to make most of the above changes to one selected text
delete text
```

For the option *Simple edit*, go to

- 15.15.4 Simple Text Edit
- 15.15.5 Simple Text Create
- 15.15.6 Text Create
- 15.15.7 Create Text on Vertex of Super String
- 15.15.8 Text Create on Segment of Super Strings
- 15.15.9 Rotate Text around Vertex
- 15.15.10 Rotate Text about the Justification Point
- 15.15.11 Move the Text Vertex Point
- 15.15.12 Move the Text Justification Point
- 15.15.13 Height of Text
- 15.15.14 Change Text
- 15.15.15 Style of Text
- 15.15.16 Text Colour
- 15.15.17 Reset Text Justification Point
- 15.15.18 Label Perpendicular Offset
- 15.15.19 All Text Edits
- 15.15.20 Text Delete
15.15.4 Simple Text Edit

Position of option on menu: CAD => Text => Commands => Simple edit or by selection of appropriate icon from the toolbar.

This option edits text strings, and text on super string vertices or segments, using grips to quickly define the mode of editing (sizing, rotating or moving the justification point).

On selecting Simple edit, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

When the text to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.

Size Grip (diamond):

If the Size grip is selected, the text size is dynamically adjusted by moving the cursor. The size of the text is displayed as part of the Enter height prompt in the message area.

The text size is set when a position is accepted.

An exact text size can be entered by hitting the <space bar> or by starting to type a size. This brings up the Enter distance typed input box. The size is typed in and the <enter> key pressed.

To return to dynamic sizing without entering a distance, simply select the X on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically sized, the current size of the text can be displayed by pressing the d key which brings up the Enter distance typed input box with the current text size in it.
The size can be modified and the value used by pressing the <enter> key. To return to dynamic sizing without entering a distance, simply select the X on the top of the input box.

**Rotate Grip (circle):**

If the **Rotate grip** is selected, the text bearing is dynamically adjusted by moving the cursor. The bearing of the text is displayed as part of the *Enter bearing* prompt in the message area. The text bearing is set when a position is accepted.

An **exact** bearing can be entered by hitting the <space bar> or by starting to type a bearing. This brings up the *Enter bearing* typed input box. The **bearing** is typed in and the <enter> key pressed.

To return to dynamic rotating without entering a bearing, simply select the X on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically rotated, the **current** bearing of the text can be displayed by pressing the d key which brings up the *Enter bearing* typed input box with the current text bearing in it.

The **bearing** can be modified and the value used by pressing the <enter> key. To return to dynamic rotation without entering a bearing, simply select the X on the top of the input box.

**Justification Grip (square):**

If the **Justification grip** is selected, the text justification point is dynamically adjusted by moving the cursor. The (x,y) position of the text is displayed in the message area. The text justification point is set when a position is accepted.
An exact coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the Enter X Y Z typed input box. The x and y coordinates are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the X on the top of the input box. The box will disappear and dynamic moving will resume.
15.15.5 Simple Text Create

Position of option on menu: CAD => Text => Simple create or by selection of appropriate icon from the toolbar.

This option creates text strings and then displays grips to quickly allow editing of text size, rotation and justification point.

The text style and height are taken from the Text controlbar and the model and colour from the CAD controlbar (see 15.1 Controlbars, 15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar).

The text will be placed with the vertex and justification point at the selected position.

After defining one piece of text, the option restarts so that another of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Simple create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

An insertion point for the text is selected and accepted and an Enter text typed input box is then displayed on the screen.

The text is typed into the box and the <enter> key pressed.

The text will be placed with the vertex and justification point at the selected position and using values such as colour, model, text height and text style given in the CAD controlbar and Text controlbar (See 15.1 Controlbars).

When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 15.15.5 Simple Text Create.
15.15.6 Text Create

**Position of option on menu:** CAD => Text => Create
or by selection of appropriate icon from the toolbar.

This option creates text strings at a selected insertion point (a cursor snap is valid).
After defining one piece of text, the option restarts so that another piece of text can be defined.
Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
An insertion point is selected and accepted. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel.

**STEP 2:**
The actual text is entered into the text input box followed by the enter key.

**STEP 3:**
The text is created using the specified settings.
15.15.7 Create Text on Vertex of Super String

**Position of option on menu:** CAD => Text => Create v or by selection of appropriate icon from the toolbar.

This option creates text at a vertex of a super string. One piece of text is allowed per super string vertex, so if this option is used on existing vertex text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel.

**STEP 2:**
The actual text is entered into the text input box followed by the Enter key.

**STEP 3:**
The text is created using the specified settings. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.15.8 Text Create on Segment of Super Strings

**Position of option on menu:**  
CAD => Text => Create s

or by selection of appropriate icon from the toolbar.

This option creates text at the mid point of a selected super string segment. One piece of text is allowed per super string segment, so if this option is used on existing segment text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

On selecting Create s, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A super string segment is selected and accepted. The line snap is forced on so that a segment can be selected. The text will be placed relative to the insertion point which is the midpoint of the segment given other parameters such as justification, as defined in the textstyle data panel.

**STEP 2:**

The actual text is entered into the text input box followed by the Enter key.

**STEP 3:**

The text is created using the specified settings. Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
mid text
15.15.9 Rotate Text around Vertex

**Position of option on menu:** CAD => Text => Rotate v

or by selection of appropriate icon from the toolbar. ⬤

This option rotates text about its vertex. This applies to text strings, super string segment or vertex text and 4d string vertex text. For super string segment text, the vertex is taken to be the mid point of the segment.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

On selecting Rotate v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

A text string to be rotated is selected and accepted.

**STEP 2:**

The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an input box followed by the enter key. To bring up the input box start typing or press the space bar. The value is entered into the input box followed by the enter key.

**Note:** The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the angle continued.

**Note:** The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.
This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**
The text is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
15.15.10 Rotate Text about the Justification Point

**Position of option on menu:**  CAD => Text => Rotate j

or by selection of appropriate icon from the toolbar.

This option rotates text about its justification point. Note that the vertex point and the justification point do not coincide when either the raise or offset for the text is not zero.

**Note:** The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

On selecting **Rotate j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The text to be rotated is selected and accepted.

**STEP 2:**

The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

**Note:** The Page up and page down keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a
solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**
The text is rotated to the specified bearing.
Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
15.15.11 Move the Text Justification Point

**Position of option on menu:** CAD => Text => Move j
or by selection of appropriate icon from the toolbar.

This option moves the text justification point, and hence the text with it.

On selecting Move j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The text to be moved is selected and accepted.

**STEP 2:**
The new position for the text is selected and accepted.

**STEP 3:**
The text is moved to the new position.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
15.15.12 Move the Text Vertex Point

Position of option on menu:  CAD => Text => Move v
or by selection of appropriate icon from the toolbar.

This option moves the vertex that vertex text is attached to, and hence moves the text with it. The option works for text strings, vertex text for super strings and 4d string but will not work for segment text where there is no actual vertex at the mid segment position where the segment text is initially placed.

On selecting Move v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The vertex text to be moved is selected and accepted.

**STEP 2:**
The new position for the vertex and the text is selected and accepted.

**STEP 3:**
The vertex and the vertex text is moved to the new position.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
15.15.13 Height of Text

**Position of option on menu:** CAD => Text => Height

or by selection of appropriate icon from the toolbar.

This option changes the height of text.

On selecting Height, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

**STEP 1:**

The text of which the height is to be changed is selected and accepted.

**STEP 2:**

A height for the text is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

**STEP 3:**

The text height is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the
option.
15.15.14 Change Text

Position of option on menu: CAD => Text => Text
or by selection of appropriate icon from the toolbar.

This option edits the characters of selected text.
On selecting Text, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The text to be changed is selected and accepted.

STEP 2:
The new text is entered into the text input box followed by the Enter key.

STEP 3:
The text is changed.
Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
new text
15.15.15 Style of Text

Position of option on menu: CAD => Text => Style
or by selection of appropriate icon from the toolbar. 
This option changes the textstyle of selected text.

On selecting Style, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The text to be changed is selected and accepted.

STEP 2:
The new textstyle is selected from the style pop-up list.

STEP 3:
The textstyle is changed.
Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
15.15.16 Text Colour

**Position of option on menu:**  
CAD => Text => Colour

or by selection of appropriate icon from the toolbar.

This option changes the colour of selected text.

On selecting Colour, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The text to be changed is selected and accepted.

**STEP 2:**

The new colour for the text is entered into the text input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.

**STEP 3:**

The text colour is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
15.15.17 Reset Text Justification Point

Position of option on menu:  

```
CAD => Text => Reset j
```

or by selection of appropriate icon from the toolbar.

This option resets the text justification point back to being the same as the vertex for vertex text, and to the segment mid point for segment text. That is, the offset and raise for the selected text are both set to zero.

On selecting `Reset j`, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The text to be changed is selected and accepted.

**STEP 2:**
A warning message is shown giving the user the option of resetting the justification point or not.

**STEP 3:**
The text is reset if accepted.
15.15.18 Label Perpendicular Offset

Position of option on menu: CAD => Text => Label perp. Offset
or by selection of appropriate icon from the toolbar.

This option creates a perpendicular line from a selected segment to a selected position, and creates text with the value of the perpendicular distance between the segment and the selected position, on the line.

On selecting Label perp. Offset, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
A string is selected and accepted.
After the string is accepted a perpendicular line will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until a 2nd point is selected and accepted.

STEP 2:
Select a 2nd point and accept it.

STEP 3:
A perpendicular line is constructed between the accepted string and point. The length value of this line will be displayed in text. This text can be modified or changed using the other CAD Text options.

STEP 4:
After the labelled perpendicular line is constructed, another perpendicular rubber banding line will be displayed. This will continue until the option is terminated (via the Esc key).
To create another labelled perpendicular line, select another point and accept it.

**STEP 5:**
Another labelled perpendicular line is constructed. Another perpendicular *rubber banding* line will be displayed. This will continue until the option is terminated (via the Esc key).
15.15.19 All Text Edits

Position of option on menu: CAD => Text => All
or by selection of appropriate icon from the toolbar.

This option positions text using a menu made up of most of text edits already described.
On selecting All, the user is prompted for the relevant data in the screen message box located at
the bottom left hand corner of the 12d Model application window.

STEP 1:
The text to be changed is selected and accepted.

STEP 2:
After the selection and acceptance of a piece of text, the positioning menu is shown. This also
allows various other text editing functions such as colour, height and text.

STEP 3:
The user can select the appropriate option from the menu and make the changes. The menu
remains active allowing a number of operations to be made in succession.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the
option.
15.15.20 Text Delete

Position of option on menu: CAD => Text => Delete or by selection of appropriate icon from the toolbar.

This option deletes selected text.

On selecting Delete, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The text to be deleted is selected and accepted.

**STEP 2:**
The selected text is deleted.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.
15.16 CAD Symbol

Position of option on menu: CAD => Symbol
Position of option on menu: Various toolbars

12d Model symbols are world styles at a vertex of a super string. The symbol is attached to a vertex (these are displayed when Vertices are toggle on in a plan view) and has a justification point, a rotation, a delta x and a delta y. The vertex and justification point only coincide if the delta x and delta y values are both zero.

In some symbol options, the symbol type, size and angle are defined by the Symbol Controlbar and model and colour from the CAD Controlbar (for more information, go to the section 15.1.2 Symbol Controlbar).

The symbols are defined in the symbols.4d file.

For more information on the control bars, go to the sections 15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar.

The Cad Symbol walk-right menu is

Menu of Options to Create and Manipulate Symbols
edit symbols using grips
create symbols and edit using grips
delete a symbol

For the option Edit, go to 15.16.2 Edit Symbol
Create 15.16.1 Create Symbol
Delete 15.16.3 Symbol Delete
Commands 15.16.3.1 Cad Symbol Commands
15.16.1 Create Symbol

**Position of option on menu:** CAD => Symbol => Create
or by selection of appropriate icon from the toolbar.

For information about Symbol and its definitions, go to the section 4.7 Symbol Definitions.

**12d Model** has two CAD symbol options Create and Edit. However both of these run the same option which starts up in different modes - Create is in the mode to create symbols on a super string vertex and Edit which edits existing symbols.

Once either CAD symbol option is started it is possible to change between the Create and Edit modes at any time.

The **Create** option creates a new super string with a symbol on the vertex, or create a symbol on an existing super string vertex which does not already have a symbol, and then displays a list key commands in the screen message area, and grips on screen, to quickly allow editing of the symbol type, size, colour, rotation, angle, x and y offset etc.

After selecting the option, the **Pick position** message is displayed in the screen message area.

To go from Create to Edit mode, type **e** - go to **To Go from Create to Edit Mode - Typing e**
To create a symbol and a new super string, type **c** - go to **Creating a Symbol - Typing c**
To create vertex symbol, type **v** - go to **Creating Text at a Super String Vertex - Typing v**

**Creating a Symbol - Typing c**

After typing **c**, the **Pick position** message is again displayed in the screen message area and the position of the symbol is then selected with the cursor.

When the position is accepted a new one vertex super string is created with the symbol on it.

The super string vertex and symbol justification point is placed at that position. The x and y offset both zero.

When the symbol is displayed, grips for quick editing of height, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.15 Symbol Grips.

For the new symbol, the symbol name, height and angle are taken from the **Symbol controlbar**
and the model and colour from the **CAD controlbar** (see [15.1 Controlbars, 15.1.2 Symbol Controlbar](#) and [15.1.1 CAD Controlbar](#)).

After the symbol is created, a list of typed options is then displayed in the screen message area.

and if **m** is typed, the rest of the options are shown

These option are the same as when editing existing symbols, and will be described in detail in the section [15.16.2 Edit Symbol](#).

**Creating a Symbol at a Super String Vertex- Typing v**

After typing **v**, the **Pick grip point** message is displayed in the screen message area and the vertex of the super string to place the symbol on is then selected with the cursor.

The symbol and symbol justification point are placed at that vertex. The x and y offset both zero.

When the symbol is displayed, grips for quick editing of size, rotation, moving of the justification point and string vertex are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section [4.15 Symbol Grips](#).

For the new symbol, the symbol name, height and angle are taken from the **Symbol controlbar** and colour from the **CAD controlbar** (see [15.1 Controlbars, 15.1.2 Symbol Controlbar](#) and [15.1.1 CAD Controlbar](#)). The created symbol will be part of the super string so no model is required.
After the vertex symbol is created, a list of typed options is then displayed in the screen message area.

\[
\text{<[Y] Pick grip point or (j)ustification, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> \text{[picks][fast][Menu]}}
\]

and if \text{m} is typed, the rest of the options are shown

\[
\text{<[Y] offset (x), offset (y), rot(ation), (d)efault, (m)ore... (l)ock, no auto(pan), <previous, - >next> [picks][fast][Menu]}
\]

These option are the same as when editing existing symbols, and will be described in detail in the section 15.16.2 Edit Symbol.

To Go from Create to Edit Mode - Typing e

After typing \text{e}, the \text{Pick Symbol} message is displayed in the screen message area.

\[
\text{<[Pick symbol](e)dit, (c)reate, (v)ertex> [picks][fast][Menu]}
\]

This is the same as when selecting the Edit option from the CAD Symbol toolbar and will be described in detail in the section 15.16.2 Edit Symbol.
15.16.2 Edit Symbol

Position of option on menu:  CAD => Symbol => Edit
or by selection of appropriate icon from the toolbar.

For information about Symbol and its definitions, go to the section 4.7 Symbol Definitions.

12d Model has two CAD symbol options Create and Edit. However both of these run the same option which starts up in different modes - Create is in the mode to create a new symbol, or a symbol on a super string vertex and Edit which edits existing symbols.

Once either CAD symbol option is started it is possible to change between the Create and Edit modes at any time.

After typing e, the Pick symbol message is displayed in the screen message area

```plaintext
<[Pick symbol](e)dit, (c)reate, (v)ertex> [picks][fast][Menu]
```

and a symbol s then selected by the mouse for editing.

The selected symbol with the symbol edit grips is shown on screen, and a list of available typed commands in the screen message area to quickly allow editing of the symbol name, symbol size, colour, rotation, angle, x and y offset, justification point, vertex, etc.

Options displayed after selecting symbol

```plaintext
<[J]Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

and by typing m

```plaintext
<[J] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore...,[l]ocal, [n]o auto[pt]an> [picks][fast][Menu]
```

To change the symbol colour, type c - go to Change Symbol Colour - Typing c
To change the symbol name, type **s** - go to **Change Symbol Name - Typing s**
To change the symbol height, type **h** - go to **Change Symbol Height - Typing h**
To create/edit a new symbol, type **n** - go to **Create/Edit a New Symbol - Typing n**
To end the create/edit option, type **f** - go to **Finish the Create/Edit - Typing f**
To show the other line of options, type **m** - go to **Show Other Line of Options - Typing m**

To change the x offset, type **x** - go to **Change Offset x - Typing x**
To change the y offset, type **y** - go to **Change Offset y - Typing y**
To change the symbol angle, type **a** - go to **Change Symbol rotation - Typing a**
To reset some symbol values to their defaults, type **d** - go to **Reset Symbol Parameters to Defaults - Typing d**
To show the other line of options, type **m** - go to **Show Other Line of Options - Typing m**
To toggle vertex lock on and off, type **l** - go to **Toggle Lock - Typing l**
To toggle autopan on and off, type **p** - go to **Toggle Autopan - Typing p**
To change focus to the next symbol press **-&gt;** - go to **Change Focus to the Next Vertex in String - Pressing right arrow key (&gt;)**
To change focus to the previous symbol, press **&lt;-** - go to **Change Focus to the Previous Vertex in String - Pressing left arrow key (&lt;)**

**Change Symbol Colour - Typing c**
After typing **c**, a Colour **Typed input** box appears on the screen.

![Typed Input Box](image)

The new colour for the symbol is typed into the Typed input box followed by the &lt;enter&gt; key, or
by selecting a colour from the Select Colour box which is brought up by clicking on the colour button.

If the symbol has an existing colour, other then the default colour, typing C will display the Typed Input box with the current colour displayed.

Change Symbol Name - Typing s

After typing s, a Symbol Typed input box appears with the current symbol style displayed.
The new style for the symbol is typed into the Style input box followed by the <Enter> key, or by selecting a style from the Select Symbol box which is brought up by clicking on the style button.
Change Symbol Height - Typing h

After typing h, a Size Typed input box appears with the current symbol height in it.

The new height is typed into the Size Typed input box followed by the <Enter> key.

**Note** - Many arithmetic expressions are supported in the Size typed input box (e.g. 10+27). See the section 4.19.1 Expressions in Panel Fields.

Create/Edit a New Symbol - Typing n

If the option was in Edit mode and n is typed, a new Edit is started (e mode). The Pick symbol message is displayed in the screen message area and another symbol is selected to edit.

Or a new symbol can be created by typing c or v. See the section 15.16.1 Create Symbol for more information on c and v.

If the option was in Create mode and n is typed, a new Create is started in the c mode. The Pick position message is displayed in the screen message area and a new symbol is created.

Or a new vertex symbol can be created by typing v, or the Edit mode can be entered by typing e. See the section 15.16.1 Create Symbol for more information on c and v.

Change Offset x - Typing x

After typing x, an Offset x Typed input box appears with the current symbol x offset in it.
The new offset \( x \) is typed into the Offset \( x \) input box followed by the <Enter> key. The symbol justification point will be offset \( x \) by the new amount.

For information about Symbol and the definition of offset, go to the section 4.7 Symbol Definitions.

**Note** - Many arithmetic expressions are supported in the Offset typed input box (e.g. 10+27). See the section 4.19.1 Expressions in Panel Fields.

**Change Offset y - Typing y**

After typing \( o \), an Offset \( y \) **Typed input** box appears with the current symbol offset in it.
The new offset is typed into the Offset y **Typed Input** box followed by the <Enter> key. The symbol justification point will be offset y by the new amount.

For information about symbol and the definition of **offset**, go to the section 4.7 Symbol Definitions.
**Note** - Many arithmetic expressions are supported in the **Offset** typed input box (e.g. 10+27). See the section 4.19.1 **Expressions in Panel Fields**.

**Change Symbol rotation - Typing a**

After typing **a**, a Rotation **Typed input** box appears with the current symbol angle in it.

![Symbol rotation diagram]

**Symbol - angle rotation = 0**

The new angle is typed into the Rotation **Typed input** box followed by the <Enter> key. The direction of the symbol point will be rotated by the new amount.
For information about symbol and the definition of **angle rotation**, go to the section 4.7 Symbol Definitions.

**Note** - Some arithmetic expressions are supported in the Rotation typed input box (e.g. 10+90). See the section 4.19.1.2 Expressions in Bearing, Angle Panel Fields for what is allowed in angle/bearing panel fields.

**Reset Symbol Parameters to Defaults - Typing d**

After typing **d**, some of the symbol parameters are set back to their default values. That is:

- Symbol type is set to the symbol in the Cad Symbol Controlbar
- Height is set to the height in the Cad Symbol Controlbar
- Angle is set to the angle in the Cad Symbol Controlbar
- Model is left as it is
- Colour is rest to the string colour.
The default symbol type, height and angle are defined by the Symbol Controlbar and model and colour from the CAD Controlbar (for more information, go to the section 15.1.2 Symbol Controlbar).

For information about Symbol definitions, go to the section 4.7 Symbol Definitions.

**Change Focus to the Next Vertex in String - Pressing right arrow key (->)**

For vertex symbol on a super string, pressing ->, moves the focus of the edit commands to the vertex symbol on the next vertex of the super string. If the symbol is on the last vertex, pressing -> does nothing.

For information about symbol definitions, go to the section 4.7 Symbol Definitions.

**Change Focus to the Previous Vertex in String - Pressing left arrow key (<-)**

When editing vertex symbol on a super string, pressing <-, moves the focus of the edit commands to the vertex symbol on the previous vertex of the super string. If the symbol is on the first vertex, pressing < does nothing. If Autopan is on, the selected vertex symbol is made the centre of the active plan view.

For information about symbol definitions, go to the section 4.7 Symbol Definitions.

**Toggle Lock - Typing l**

Typing l toggles locking the vertex on and off.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads (l) lock (lock), this means that vertex lock is off (unlocked) and typing l locks it.

When the screen message area reads un(l) lock (unlock), this means that the vertex is locked and typing l unlocks it.

For information about the vertex symbol grip, go to the section 4.15 Symbol Grips.

For information about symbol definitions, go to the section 4.7 Symbol Definitions.

**Toggle Autopan - Typing p**

Typing p toggles autopan on and off.

When editing vertex symbol on a super string and Autopan is on, pressing -> or <-, moves the focus of the edit commands to the vertex symbol on the next/previous vertex of the super string, and the selected vertex symbol is made the centre of the active plan view.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads auto(p)an (autopan), this means that autopan is off and typing p turns autopan on.

When the screen message area reads no auto(p)an (no autopan), this means that autopan is on and typing p turns it off.
For information about symbol definitions, go to the section 4.7 Symbol Definitions.

**Show Other Line of Options - Typing m**

There are too many Edit options to fit onto one line of the screen message and two lines of options are required. Typing m toggles between the two lines of options.

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (n)eight, (n)ew, (f)inish, (m)ore... > [picks][fast][Menu]

<[J] offset (x), offset (y), rot(at)ion, (d)efault, (m)ore... , (l)ock, no auto(pan) > [picks][fast][Menu]
```

**Finish the Create/Edit - Typing f**

Typing f exits the create/edit symbol option.
15.16.3 Symbol Delete

Position of option on menu: CAD => Symbol => Delete
or by selection of appropriate icon from the toolbar.

This option deletes symbols.

On selecting Delete, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The Symbol to be deleted is selected and accepted.

**STEP 2:**
The selected Symbol is deleted.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

15.16.3.1 Cad Symbol Commands

Position of option on menu: CAD => Symbol => Commands

The Cad Symbol Commands walk-right menu is
Menu of Options to Create and Manipulate Symbols

- edit symbols using grips
- create symbols and edit using grips
- create a symbol at a selected position - a one point string is created
- create a symbol at a user selected super string vertex
- rotate symbol about its justification pt (which may be offset from the vertex)
- move symbol by its vertex
- move symbol by its justification point (the vertex does not move)
- change the height of a symbol
- change the symbol
- change the colour of a symbol
- reset the symbol justification point so that it is on top of the vertex posn

For the option *Simple edit*, go to

- 15.16.4 Simple Symbol Edit
- 15.16.5 Simple Symbol Create
- 15.16.6 Create Symbol
- 15.16.7 Create Symbol at the Vertex of a Super String
- 15.16.8 Rotate Symbol about the Justification Point
- 15.16.10 Move the Symbol Vertex Point
- 15.16.9 Move the Symbol Justification Point
- 15.16.11 Height of Symbol
- 15.16.12 Change Symbol
- 15.16.13 Symbol Colour
- 15.16.14 Reset the Symbol Justification Point
- 15.16.15 All Symbol Edits
- 15.16.3 Symbol Delete
15.16.4 Simple Symbol Edit

Position of option on menu: CAD => Symbol => Commands => Simple edit
or by selection of appropriate icon from the toolbar.

This option edits symbols using grips to quickly define the mode of editing (sizing, rotating or moving the justification point).

On selecting Simple edit, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
When the symbol to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.

Size Grip (diamond):
If the Size grip is selected, the symbol size is dynamically adjusted by moving the cursor. The size of the symbol is displayed as part of the Enter height prompt in the message area.

The symbol size is set when a position is accepted.

An exact symbol size can be entered by hitting the <space bar> or by starting to type a size. This brings up the Enter distance typed input box. The size is typed in and the <enter> key pressed.

To return to dynamic sizing without entering a distance, simply select the X on the top of the input box. The box will disappear and dynamic sizing will resume.
If the symbol is being dynamically sized, the *current* size of the symbol can be displayed by pressing the d key which brings up the **Enter distance** typed input box with the current dynamic symbol size in it.

![Typed Input](image)

The size can be modified and the value used by pressing the <Enter> key.

To return to dynamic sizing without entering a distance, simply select the X on the top of the input box.

**Rotate Grip (circle):**

If the **Rotate grip** is selected, the symbol bearing is dynamically adjusted by moving the cursor. The bearing of the symbol is displayed as part of the **Enter bearing** prompt in the message area.

The symbol bearing is set when a position is accepted.

![Rotate Grip](image)

An *exact* bearing can be entered by hitting the <space bar> or by starting to type a bearing. This brings up the **Enter bearing** typed input box. The bearing is typed in and the <Enter> key pressed.

![Typed Input](image)

To return to dynamic rotating without entering a bearing, simply select the X on the top of the input box. The box will disappear and dynamic sizing will resume.

If the symbol is being dynamically rotated, the *current* bearing of the symbol can be displayed by pressing the d key which brings up the **Enter bearing** typed input box with the *current* symbol bearing in it.

![Typed Input](image)

The bearing can be modified and the value used by pressing the <Enter> key.

To return to dynamic rotation without entering a bearing, simply select the X on the top of the input box.

**Justification Grip (square):**

If the **Justification grip** is selected, the symbol justification point is dynamically adjusted by moving the cursor. The (x,y) position of the symbol is displayed in the message area.

The symbol justification point is set when a position is accepted.
An exact coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the Enter X Y Z typed input box. The x and y coordinates are typed in, separated by a space, and the <Enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the X on the top of the input box. The box will disappear and dynamic moving will resume.
15.16.5 Simple Symbol Create

Position of option on menu: CAD => Symbol => Commands => Simple create or by selection of appropriate icon from the toolbar.

This option creates symbols and then displays grips to allow quick editing of symbol size, rotation and justification point.

The symbol and symbol height and symbol angle are taken from the Symbol controlbar (See 15.1 Controlbars) and the model and colour (if the symbol does not have an inbuilt colour) from the CAD controlbar (see 15.1 Controlbars, 15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar).

The symbol will be placed with the vertex and justification point at the selected position.

After defining one symbol, the option restarts so that another symbol can be defined. Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

On selecting Simple create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

An insertion point for the symbol is selected and accepted, the symbol is displayed on the screen.

*Warning* - if no symbol appears, then there is probably no symbol selected in the Symbol controlbar.

When the symbol is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 15.16.4 Simple Symbol Edit.
15.16.6 Create Symbol

**Position of option on menu:** CAD => Symbol => Commands => Create

or by selection of appropriate icon from the toolbar.

This option creates a symbol (as a one vertex super string) at a selected point (a cursor snap is valid).

After defining a symbol, the option restarts so that another symbol can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
An insertion point is selected and accepted. A one vertex super string is created and the symbol placed at that vertex. The symbol is placed relative to the insertion point given in the symbol definition (See symbols.4d file).

**STEP 2:**
The symbol style (name) is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu.

**STEP 3:**
A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.
STEP 4:
The symbol is created together with a point super string at the selected point.
15.16.7 Create Symbol at the Vertex of a Super String

Position of option on menu:   CAD => Symbol => Commands => Create v
or by selection of appropriate icon from the toolbar.

This option creates a symbol at a vertex of a super string. One symbol is allowed per super string vertex, so if this option is used on existing vertex symbol, the existing value is displayed in the symbol input box.

After defining a symbol, the option restarts so that another symbol can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The Symbol will be placed relative to the insertion point given other parameters such as justification, as defined in the symbol definition.

STEP 2:

The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu.
STEP 3:

A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.
STEP 4:
The symbol is created at the vertex of the super string.
15.16.8 Rotate Symbol about the Justification Point

Position of option on menu:  CAD => Symbol => Commands => Rotate j
or by selection of appropriate icon from the toolbar.

This option rotates a symbol about its justification point. The vertex point and the justification point often do not coincide. This occurs when non zero value is specified for either the x or y offset.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing symbol by that amount, rather it will reposition the symbol at that bearing.

On selecting Rotate j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The Symbol to be rotated is selected and accepted.

STEP 2:

The rotation bearing (the final bearing of the symbol) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.

STEP 3:

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.
The Symbol is rotated to the specified bearing.
Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.16.9 Move the Symbol Justification Point

**Position of option on menu:** CAD => Symbol => Commands => Move j

or by selection of appropriate icon from the toolbar.

This option moves a symbol by moving its justification point.

On selecting Move j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The Symbol to be moved is selected and accepted.

**STEP 2:**
The new position for the Symbol is selected and accepted.

**STEP 3:**
The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.16.10 Move the Symbol Vertex Point

**Position of option on menu:** CAD => Symbol => Commands => Move V

or by selection of appropriate icon from the toolbar.

This option moves a symbol by moving the vertex that the symbol is attached to. Hence the symbol and the justification point for the symbol will move.

On selecting Move V, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The Symbol to be moved is selected and accepted.

**STEP 2:**
The new position for the vertex of the Symbol is selected and accepted.

**STEP 3:**
The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.16.11 Height of Symbol

Position of option on menu: CAD => Symbol => Commands => Height
or by selection of appropriate icon from the toolbar.

This option changes the height of a symbol.

On selecting Height, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The Symbol of which the height is to be changed is selected and accepted.

STEP 2:
A height for the Symbol is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the D key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing P for perpendicular or T for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:
The Symbol height is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.16.12 Change Symbol

**Position of option on menu:** CAD => Symbol => Commands => Symbol

or by selection of appropriate icon from the toolbar.

This option changes the actual symbol defined at a super string vertex.

On selecting **Symbol**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

**STEP 1:**

The Symbol to be changed is selected and accepted.

**STEP 2:**

The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu.

**STEP 3:**

The Symbol is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.16.13 Symbol Colour

Position of option on menu:  CAD =>Symbol =>Commands=>Colour

or by selection of appropriate icon from the toolbar.

This option changes the default colour of a symbol.

Important Note: if the symbol has inbuilt colours, changing the default colour will not change the symbols displayed colours. For this case, the definition of the symbol itself will need to be changed.

On selecting Colour, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The symbol to have the default colour changed is selected and accepted.

STEP 2:
The new colour for the Symbol is entered into the Symbol input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.

STEP 3:
The Symbol colour is changed.
Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.16.14 Reset the Symbol Justification Point

**Position of option on menu:** CAD => Symbol => Commands => Reset j

or by selection of appropriate icon from the toolbar.

This option resets justification point of a selected symbol. That is, the x and y offsets for the justification point are set to zero.

On selecting Reset j, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The Symbol to be changed is selected and accepted.

**STEP 2:**
A warning message is shown giving the user the option of resetting the justification point or not.

**STEP 3:**
The symbol is reset if accepted.
15.16.15 All Symbol Edits

Position of option on menu: CAD => Symbol => Commands => All
or by selection of appropriate icon from the toolbar.

This option allows a number of symbol editing options to be done in succession using a menu made up of many of the options defined above.

On selecting All, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The Symbol to be changed is selected and accepted.

STEP 2:
After the selection and acceptance of a symbol, the positioning menu is shown. This also allows various other symbol editing functions such as colour, height and rotate.

STEP 3:
The user can select the appropriate option from the menu and make the changes. The menu remains active allowing a number of operations to be made in succession.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.17 CAD Hole

**Position of option on menu:**  CAD => Hole

The Cad Hole walk-right menu is

![Cad Hole menu](image)

For the option *Add*, go to

*Remove*

15.17.1 Add Holes
15.17.2 Remove Holes
15.17.1 Add Holes

**Position of option on menu:**  CAD => Hole => Add

or by selection of appropriate icon from the toolbar.

This option adds holes to a polygon.

On selecting **Add holes**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

First select the parent string. That is the polygon that is to have holes added to it.

**STEP 2:**

Then select the polygons that are to be the holes in the parent polygon (the child strings).

The selection of holes is terminated by pressing the `<esc>` key.

It is easier to see the result by colour filling the parent polygon.
15.17.2 Remove Holes

Position of option on menu:  CAD => Hole => Remove
or by selection of appropriate icon from the toolbar.

This option removes all holes from a polygon with holes.

On selecting Remove holes, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Select the parent string. That is the polygon that contains holes.

**STEP 2:**
On selecting and accepting the string, all holes are removed from the string. Super strings are created for each of the hole boundaries.
15.18 CAD Fill

Position of option on menu: CAD => Fill

The Fill walk-right menu is

For the option Solid, go to

Solid many

15.18.1 Solid Fill
15.18.2 Solid Fill Many Strings
15.18.1 Solid Fill

Position of option on menu:  
CAD => Fill => Solid 
or by selection of appropriate icon from the toolbar.

This option fills a super string with a user defined colour and blend.

On selecting Solid Fill, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

Select and accept a string.

If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn't closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

**Note:** If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.

**STEP 2:**

After the string is accepted, the Fill Colour Input box will appear. Type the name of the required colour into the Input box and press the enter key. The browse button on the Input box can be used to define the blend by measuring existing elements.

**STEP 3:**

After the colour is accepted, the Blend Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1 (totally transparent) must be selected.
**STEP 4:**
The selected super string is then filled.

![Blend 0 and Blend 1](image)
15.18.2 Solid Fill Many Strings

Position of option on menu: CAD => Fill => Solid many
or by selection of appropriate icon from the toolbar.

This option fills many selected super strings with the same user defined colour and blend.

On selecting Solid fill many, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
After selecting the option, the Fill Colour Input box is displayed.

Type the name of the required colour into the Input box and press the enter key. The browse button on the Input box can be used to define the blend by measuring existing elements.

**STEP 2:**
After the colour is accepted, the Blend Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1 (totally transparent) must be selected.

**STEP 3:**
Select and accept a string and the string is coloured filled.

The selected super string is then filled.
Then select and accept the next string to fill and the same colour and blend is used to colour fill the next string.

If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn’t closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

**Note:** If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.
15.19 CAD Image

Position of option on menu: CAD => Image

The Cad Image walk-right menu is

For the option Move, go to
- Rotate
- Scale
- Change width
- Change height
- Insert
- Insert JPEG(s)
- Insert many
- Delete

15.19.1 Move Image
15.19.2 Rotate Image
15.19.3 Scale Image
15.19.4 Change Width
15.19.5 Change Height
15.19.6 Insert Image
15.19.7 Insert JPEG(s)
15.19.8 Insert Many
15.19.9 Delete Image
## 15.19.1 Move Image

**Position of option on menu:** CAD => Image => Move

or by selection of appropriate icon from the toolbar.

This option moves an inserted image by modifying the x and y offset for the image. The vertex that the image is attached to does not move.

On selecting Move Image, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

Select the vertex that the image is attached to.

**Note:** The position of the image is defined relative to the vertex. To select the image, the vertex that the image is attached to must be selected. The image itself can not be picked.

**STEP 2:**

After a vertex of an image is accepted, an outline of the image is displayed and moves with the position of the cursor. This will continue until the new position is selected and accepted.

Select the new position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

**STEP 3:**

The image is then displayed at its new position.
Note: The **CAD Move Image** option only moves the image offset relative to the vertex. Use the option **CAD Move** to move the vertex (and the corresponding image moves with it).
15.19.2 Rotate Image

Position of option on menu: CAD => Image => Rotate

or by selection of appropriate icon from the toolbar.

This option rotates an image around its justification point.

On selecting Rotate Image, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Select the vertex that the image is attached to.

Note: The position of the image is defined relative to the vertex. To select the image, the vertex that the image is attached to must be selected. The image itself can not be picked.

STEP 2:
After the vertex of an image is accepted, an outline of the image is displayed. The outline is rotated dynamically as the position of the cursor changes. This will continue until a final position is selected and accepted.

Select the new rotated position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:
The rotated image is then displayed.
15.19.3 Scale Image

**Position of option on menu:** CAD => Image => Scale

or by selection of appropriate icon from the toolbar.

This option changes the size of an image.

On selecting **Scale Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Select the **vertex** that the image is attached to.

**Note:** The position of the image is defined relative to the **vertex**. To select the image, the **vertex** that the image is attached to must be selected. The image itself can not be picked.

**STEP 2:**
After the vertex of an image is accepted, an outline of the image is displayed. The size of the outline is determined by the position of the cursor. Both the height and the width of the image increase/decrease in the same ratio so that the image is not distorted.

Select the new size as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

**STEP 3:**
The scaled image is then displayed.
15.19.4 Change Width

**Position of option on menu:** CAD => Image => Change width

or by selection of appropriate icon from the toolbar.

This option is user to increase or decrease the width of an image. The height of the image is not changed so the images will be stretched.

On selecting *Width Image*, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

**STEP 1:**
Select the *vertex* that the image is attached to.

**Note:** The position of the image is defined *relative to the vertex*. To select the image, the *vertex* that the image is attached to *must be selected*. The image itself can not be picked.

![Diagram showing selection of vertex](image)

**STEP 2:**
After the vertex of an image is accepted, the outline of the image is displayed. The width of the outline is determined by the position of the cursor. Whilst the height remains constant, the width of the outline increases and decreases dynamically as the position of the cursor changes.

![Diagram showing outline change](image)

Select the new width as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

**STEP 3:**
The image with the new width is then displayed.
15.19.5 Change Height

**Position of option on menu:**  
CAD => Image => Change height

or by selection of appropriate icon from the toolbar.

This option allows the user to increase or decrease the height of an image. The width of the image is not changed so the images will be stretched.

On selecting **Height Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

**STEP 1:**
Select the **vertex** that the image is attached to.

**Note:** The position of the image is defined relative to the vertex. To select the image, the vertex that the image is attached to **must be selected**. The image itself can not be picked.

**STEP 2:**

After the vertex of an image is accepted, the outline of the image is displayed. The height of the outline is determined by the position of the cursor. Whilst the width remains constant, the height of the outline increases and decreases dynamically as the position of the cursor changes.

Select the new height as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

**STEP 3:**
The image with the new height is then displayed.
15.19.6 Insert Image

Position of option on menu: CAD => Image => Insert or by selection of appropriate icon from the toolbar.

This option takes a user selected image file and creates a super string vertex with the image inserted at that vertex.

If the file type is JPEG and it includes the EXIF and GPS information, the information is loaded into attributes for the image.

On selecting Insert, the Cad Insert Plan Image panel is displayed.

![Cad Insert Plan Image panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>input box</td>
<td></td>
<td>BMP, DIB, ECW, GIF, JPEG</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>JPEG 2000, PNG, TGA</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>TIFF, 12D</td>
</tr>
</tbody>
</table>

select the type of image file to insert. If the file type is JPEG and it includes the EXIF and GPS information, the information is loaded into attributes for the image and they can be examined by clicking '+' next to the Attributes field.

Image file input box

Select the image filename to be inserted into the project.

X/Y co-ordinate XY Pick button
select the x/y co-ordinate for origin (bottom left corner) of the image.

Origin X coordinate input box
enter the x coordinate for the bottom left of the image.

Origin Y coordinate input box
enter the y coordinate for the bottom left of the image.

Pixel to mm input box
the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the Pixel to mm (mm being millimetres) value to give width and height size in world unit.
(metres) which is needed when inserting the image.

**Attributes**

*when JPEG is selected for the Format and the JPEG file includes the EXIF and GPS information, the information is loaded into attributes for the image. The attributes can be looked at by clicking on the ‘+’.*

**Model for image input box**

*select the model for the image to be inserted into.*

**Insert button**

*when all the fields have been entered, the Insert button creates an image from the selected file.*
15.19.7 Insert JPEG(s)

This option is for reading in JPEG files which must include EXIF and GPS information. This information is then used to position the image.

If a Projection is selected by the user, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no Projection is given, then the co-ordinates are left as lat/long.

On selecting Insert JPEG(s), the Cad Insert JPEG Plan Images panel is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

15.19.9 Delete Image

Position of option on menu:  CAD => Image => Delete
or by selection of appropriate icon from the toolbar.

This option deletes an image.

On selecting Delete Image, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Select the vertex that the image is attached to.

Note: The position of the image is defined relative to the vertex. To select the image, the vertex that the image is attached to must be selected. The image itself can not be picked.

STEP 2:
When the selected image is accepted, it is then deleted.

Note that the vertex that the image was attached to is not deleted.
15.20 CAD Modify

**Position of option on menu:** CAD => Modify

The Modify walk-right menu is

![Modify Walk-Right Menu](image)

For the option *Move*, go to
- [15.20.1 CAD Move](#)
- [15.20.2 CAD Copy](#)
- [15.20.3 CAD Array](#)
- [15.20.4 CAD Rotate](#)
- [15.20.5 CAD Mirror](#)
- [15.20.6 CAD Mirror X Axis](#)
- [15.20.7 CAD Mirror Y Axis](#)
- [15.20.8 CAD Scale](#)
- [15.20.9 CAD Scale Dynamic](#)
15.20.1 CAD Move

Position of option on menu: CAD => Modify => Move
or by selection of appropriate icon from the toolbar.

This option moves a selected string.

On selecting Move, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For CAD Multipick Move, go straight to Step 2.

**STEP 1:**
A super string or circle is picked.

**STEP 2:**
A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

**NOTE:** If the <Spacebar> or any other key is pressed, an Enter X Y Z typed input box is displayed on the screen.

X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the Enter X Y Z box from the screen. If values are not going to be typed in, clicking X on the top right-hand corner of the Enter X Y Z box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

**Note:** The base position is not required to lie on the string itself.

**STEP 3:**
A final cursor position is selected which defines a distance and direction from the base position to the final position.

**STEP 4:**
On accepting the final position, the selected super string is moved by the determined distance and direction.
15.20.2 CAD Copy

Position of option on menu: CAD =>Modify =>Copy
or by selection of appropriate icon from the toolbar.

This option copies a super string.

On selecting Copy, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For CAD Multipick Copy, go straight to Step 2.

**STEP 1:**
Select a super string.

**STEP 2:**
A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

**NOTE:** If the <Spacebar> or any other key is pressed, an Enter X Y Z typed input box is displayed on the screen.

X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the Enter X Y Z box from the screen. If values are not going to be typed in, clicking on X on the top right-hand corner of the Enter X Y Z box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

**Note:** The base position is not required to lie on the string itself.

**STEP 3:**
A final cursor position is selected which defines a distance and direction from the base position to the final position.
STEP 4:
On accepting the final position, a copy of the selected super string is moved by the determined distance and direction.
15.20.3 CAD Array

Position of option on menu: CAD => Modify => Array
or by selection of appropriate icon from the toolbar.

This option copies a super string a number of times. The Multipick Array option works in the same way once the Multipick set is selected.

On selecting Array, either the Cad Array panel (for CAD Array) or the CAD Multi Array panel (for CAD Multipick Array) is displayed.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows</td>
<td>Input box</td>
<td>number of rows</td>
<td></td>
</tr>
<tr>
<td>Columns</td>
<td>Input box</td>
<td>number of columns</td>
<td></td>
</tr>
<tr>
<td>Row offset</td>
<td>Input box</td>
<td>distance between the rows</td>
<td></td>
</tr>
<tr>
<td>Column offset</td>
<td>Input box</td>
<td>distance between the columns</td>
<td></td>
</tr>
<tr>
<td>Rotation</td>
<td>angle box</td>
<td>the angle to use for the rows and columns of copies</td>
<td></td>
</tr>
<tr>
<td>Pick</td>
<td>button</td>
<td>pick the super string to copy and when it is accepted the super string is copied</td>
<td></td>
</tr>
</tbody>
</table>

**STEPS:**
Fill in the fields in the Cad Array panel, click Pick and select the super string to copy.
15.20.4 CAD Rotate

**Position of option on menu:**  CAD => Modify => Rotate

This option rotates a super string.

On selecting Rotate, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For CAD Multipick Rotate, go straight to Step 2.

**STEP 1:**
Select the super string to rotate.

**STEP 2:**
A base position is picked and then an outline of the selected string is drawn and rotated around the base position with the cursor, plus a line will be drawn from the base position to the current cursor position.

**NOTE:** If the <Spacebar> or any other key is pressed, an Enter X Y Z typed input box is displayed on the screen.

X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the Enter X Y Z box from the screen. If values are not going to be typed in, clicking on X on the top right-hand corner of the Enter X Y Z box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

**Note:** The base position is not required to lie on the string itself.

When the line has an angle of 0 degrees (bearing of 90 degrees), the outline will be on top of the selected string (i.e. there is no rotation). As the line rotates around the base position, the outline rotates around the base position. This rotation will continue until the final point is selected and accepted.

**NOTE:** If the <Spacebar> or any other key is pressed, an Enter Angle Typed Input box is displayed on the screen.
An angle (measured counter-clockwise from the positive X-axis and in 4.17.1 HP Notation) can be typed in and <Enter> will accept the value and remove the Typed Input box from the screen. If a value is not going to be typed in, clicking on X on the top right-hand corner of the Typed Input box removes the box from the screen and the option returns to selecting the rotation by moving the cursor.

**STEP 3:**

A final cursor position is selected which defines the rotation about the base position.

On accepting the final position, or after an angle has been entered, the selected string is rotated around the base position through the defined angle.
15.20.5 CAD Mirror

**Position of option on menu:** CAD => Modify => Mirror

or by selection of appropriate icon from the toolbar.

This option creates a mirrored image of a selected string.

On selecting Mirror, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For CAD Multipick Mirror, go straight to Step 2.

**STEP 1:**
Select a super string to mirror.

**STEP 2:**
Select the 1st point of the mirror axis.

The 1st point is selected with the mouse or entered via the keyboard. To enter a point with the keyboard, simply start typing or press the space bar to bring up the X Y Z Input box. Type the coordinates into the XYZ Input box and press the <Enter> key.

After the 1st point is accepted a line will be drawn from the 1st point to the position of the cursor. This line forms the mirroring axis. The outline of the reflected image will be dynamically displayed according to the changing cursor position.

**STEP 3:**
Select and accept the 2nd point of the mirror axis.

**STEP 4:**
For CAD Mirror, after the base point is accepted, the Delete Source String box will appear.

Select Yes if you want the original super string to be deleted when the new mirrored string is constructed.

Select No if you want the original super string to remain when the new mirrored string is constructed.
STEP 5:
The selected super string will be mirrored using the information given.

Delete the source string
Don’t delete the source string

For **CAD Multipick Mirror**, the original strings are always deleted.
15.20.6 CAD Mirror X Axis

Position of option on menu: CAD => Modify => Mirror X axis
or by selection of appropriate icon from the toolbar.

This option mirrors a string through the X axis.

On selecting Mirror X Axis, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For CAD Multipick Mirror X axis, go straight to Step 2.

**STEP 1**: Picking a string

Select a super string to mirror through the X axis.

**STEP 2**: 

After the string is accepted the position of the cursor on the Y axis determines the position of the mirror (which runs parallel to the X axis). As the cursor moves along the Y axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.

Select the final Y-position of the mirror X-axis.

The final position is selected with the mouse or entered via the keyboard. To enter a base point with the keyboard, simply start typing or press the <Spacebar> to bring up the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

**STEP 3**: 

For CAD Mirror X axis, after the final position is accepted, a Delete Source String box will appear.

Select Yes if you want the original super string to be deleted when the new mirrored string is constructed.

Select No if you want the original super string to remain when the new mirrored string is constructed.
STEP 4:
The selected super string will be mirrored using the information given.

For **CAD Multipick Mirror X axis**, the original strings are always deleted.
15.20.7 CAD Mirror Y Axis

Position of option on menu:  CAD => Modify => Mirror Y Axis
or by selection of appropriate icon from the toolbar.

This option mirrors a string through the Y axis.

On selecting Mirror Y Axis, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For CAD Multipick Mirror Y Axis, go straight to Step 2.

STEP 1:
Select a super string to mirror through the Y axis.

STEP 2:
After the string is accepted the position of the cursor on the X axis determines the position of the mirror (which runs parallel to the Y axis). As the cursor moves along the X axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.

Select the final X-position of the mirror Y-axis.

The final position is selected with the mouse or entered via the keyboard. To enter a base point with the keyboard, simply start typing or press the <Spacebar> to bring up the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

STEP 3:
After the final position is accepted, a Delete Source String box will appear.

Select Yes if you want the original super string to be deleted when the new mirrored string is constructed.

Select No if you want the original super string to remain when the new mirrored string is constructed.
STEP 4:
The selected super string will be mirrored using the information given.

Delete the source string  Don’t delete the source string
15.20.8 CAD Scale

**Position of option on menu:**  CAD => Modify => Scale

or by selection of appropriate icon from the toolbar.

This option increases or decreases the size of a string by a given scale about a user selected origin. Go to 15.8.9 Scale About an Origin for the definition of scaling.

On selecting Scale, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For **CAD Multipick Scale**, go straight to Step 2.

**STEP 1:**

Select a super string to scale.

**STEP 2:**

After a string is accepted, the Scale Typed Input box will appear. Type the desired scale factor into the input box and press the <Enter> key. The browse button on the Input box can be used to define the scale by measuring existing elements.

Note: the Scale/Scale Factor can be positive or negative.

**STEP 3:**

After a scale value has been entered the user is required to select the position of the origin.

An origin position can be selected with the mouse or entered via the keyboard.

To enter an origin position with the keyboard, simply start typing or press the space bar to bring up the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

If the position of the origin is given by the cursor, the position of the scaled highlighted string moves dynamically as the position of the origin changes as the cursor moves. The final selected origin position establishes the location of the scaled string relative to the original selected string.

The dimensions of the highlighted string are defined by the Scale value.

For example, if you selected a scale of 2, the distance between the cursor and a point on the highlighted string would be double the distance between the cursor and the corresponding point on the original super string.
STEP 4:
After the final position has been accepted, the original string will be removed and the newly scaled highlighted string constructed.
15.20.9 CAD Scale Dynamic

Position of option on menu:  CAD =>Modify =>Scale Dynamic
or by selection of appropriate icon from the toolbar.

This option dynamically increases or decreases the size of a string.
This option dynamically increases or decreases the size of a string about a user selected origin
by selecting a point to define the scale factor. Go to 15.8.9 Scale About an Origin for the
definition of scaling.

On selecting Scale Dynamic, the user is prompted for the relevant data in the screen message box
located at the bottom left hand corner of the 12d Model application window.

For CAD Multipick Scale Dynamic, go straight to Step 2.

**STEP 1:**
Select a super string to scale.

**STEP 2:**
An Origin point is required to be defined. An Origin point can be selected with the mouse or
entered in via the keyboard.

To enter an Origin point with the keyboard, simply start typing or press the space bar to bring up
the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

To enter the origin by the cursor, simply select and accept the required origin position.

**STEP 3:**
For CAD Scale Dynamic:

After an Origin point has been accepted, the cursor then defines the Projection point.

**Note:** the Projection Point is the cursor position dropped perpendicularly onto the line from
the origin through the original point selected on the string.

The scale factor is taken to be the ratio of the distance from the projection point to the origin
and the distance from the original point selected on the string to the origin.

That is,

Scale factor = (the distance from the projection point to the origin) divided by (the distance
from the original point selected on the string to the origin)
The highlighted string is projected from the Origin point to the Projection point (which is being defined by the cursor).

For **CAD Multipick Scale Dynamic**:

After an Origin point has been accepted, a Start Scale Position is selected.

After that the cursor then dynamically defines the End Scale position.

For Multipick, the Projection Point is the End Scale position dropped perpendicularly onto the line from the origin through the Start Scale position.

The scale factor is taken to be the ratio of the distance from the Projection Point to the origin and the distance from the Start Scale position to the origin.

That is,

\[\text{Scale factor} = \frac{\text{the distance from the Projection Point to the origin}}{\text{the distance from the Start Scale position to the origin}}\]

The highlighted strings are projected from the Origin point using the scale factor dynamically defined by the cursor (and hence the Projection point).
Hence for both the CAD Scale Dynamic and the CAD Multipick Scale Dynamic, the size and position of the highlighted string will move dynamically as the position of the Projection point moves with the cursor.

The highlighted string will increase in size if the cursor moves the Projection point further from the Origin than the original string point/Start Scale position, or decrease in size if the cursor moves the Projection point closer to the Origin than the original string point/Start Scale position. This will continue until a Projection point is accepted.

**STEP 4:**

After the Projection point has been accepted, the new scaled strings are created and the original strings deleted.
15.21 CAD Vertex

Position of option on menu: CAD => Vertex

This section of documentation is a work in progress and will be updated in subsequent releases.

The Cad Vertex walk-right menu is

Menu of Options to Move Vertices

move a vertex
move a vertex and modify its height
move a vertex along its segment - keep the same height
move a vertex along its segment - interpolate/extrapolate the height
move a vertex by a given chainage distance along a segment - keep height
move a vertex a given chainage dist along a segment - extrapolate height
append a vertex to an existing string
create a vertex on the segment joining two adjacent vertices of a string
insert a vertex between two adjacent vertices of a string
edit the height of a vertex
edit the point (vertex) ID

These options allow the editing of vertices on super strings.

For the option Move, go to 15.21.1 Move a Vertex while Keeping its Height
Move 3d 15.21.2 Move a Vertex and Modify its Height
Extend 15.21.3 Extend a Vertex while Keeping its Height
Extend 3d 15.21.4 Extend Segment and Extrapolating Heights
Extend by length 15.21.5 Extend Segment by Length and Keeping
Extend by length 3d 15.21.6 Extend Segment by Length and Extrapolating
Append 15.21.7 Append a Vertex
Between 15.21.8 New Vertex on a Segment (Between Two
<table>

</tbody>
</table>
15.21.1 Move a Vertex while Keeping its Height

Position of option on menu:  CAD => Vertex => Move
or by selection of appropriate icon from the toolbar.

This option moves the vertex of a super string. The height of the vertex is not modified.

On selecting Move, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A vertex on a super string is selected and accepted.

**STEP 2:**
The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the Enter XYZ box. This box is brought up by simply typing a value or by pressing the space bar.

**STEP 3:**
The selected vertex is moved to the new position.
15.21.2 Move a Vertex and Modify its Height

**Position of option on menu:** CAD => Vertex => Move 3d or by selection of appropriate icon from the toolbar.

This option moves the vertex of a super string and the height of the vertex is taken from the height of the final selected position.

On selecting **Move 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

**STEP 1:**
A vertex on a super string is selected and accepted.

**STEP 2:**
The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

**STEP 3:**
The selected vertex is moved to the new position and takes on the height of the string it is snapped to, or the Z value entered into the **Enter XYZ** box.
15.21.3 Extend a Vertex while Keeping its Height

**Position of option on menu:** CAD => Vertex => Extend
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is not modified.

On selecting Extend, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

**STEP 2:**
As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

**STEP 3:**
The selected vertex is moved to the new position. The height of the vertex is not changed.
the vertex height is unchanged
15.21.4 Extend Segment and Extrapolating Heights

**Position of option on menu:** CAD => Vertex => Extend 3d or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is extrapolated.

On selecting Extend 3d, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Most vertices are on two segments so it is necessary to indicate which segment is to be extended. This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

**STEP 2:**
As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

The point selected is moved to the cursor position in a rubber banding fashion. The final position of the point is selected and accepted. Alternatively, the user can enter the final coordinate value of the moved point by the Enter XYZ box. This box can be brought into view by simply typing a value or by pressing the space bar.

**STEP 3:**
The selected vertex is moved to the new position. The height of the vertex has been extrapolated.
from the heights at either end of the original segment.

The vertex height has been extrapolated from the height at the ends of the original segment (3 and 1).
15.21.5 Extend Segment by Length and Keeping Height

**Position of option on menu:** CAD => Vertex => Extend by length
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is not modified.

On selecting **Extend by length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

**STEP 2:**
The user enters the distance to extend the segment. This value is positive in the direction that the string was created.

**STEP 3:**
The point selected is moved to the new position and the string topology maintained.
the vertex height is unchanged
15.21.6 Extend Segment by Length and Extrapolating Heights

Position of option on menu: CAD => Vertex => Extend by length 3d
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is extrapolated modified.

On selecting Extend by length 3d, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting not the vertex, but by selecting on the segment that is to be extended, close to the vertex to be moved.

STEP 2:
The user enters the length value for which the point is to be extended by. This value is positive in the direction that the string was created.

STEP 3:
The point selected is moved to the new position and the height adjusted according to the grade of the extended segment.
the vertex height has been extrapolated from the height at the ends of the original segment (3 and 1)
15.21.7 Append a Vertex

**Position of option on menu:**  CAD => Vertex => Append

or by selection of appropriate icon from the toolbar. This option adds vertices to an existing super string.

On selecting **Append**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

Select a string by picking near the end of the string that vertices are to be added to (added to the beginning of the string - prepend, or added to the end of the string - append).

**STEP 2:**

After the string is accepted, a line is drawn from the end of the string to the current cursor position.

Select the position for the new vertex.

**STEP 3:**

After the new vertex is accepted, a line is drawn from that vertex to the current cursor position. That is, the process of adding points is repeated.

**STEP 4:**

This step should be repeated until the required number of vertices has been added.
STEP 5:

STEP 6:
After the required number of vertices have been added, the option is terminated for this string by pressing the <Esc> key.
15.21.8 New Vertex on a Segment (Between Two Vertices)

Position of option on menu: CAD => Vertex => Between
or by selection of appropriate icon from the toolbar.

This option adds a vertex to a string but it is constrained to be on an existing segment of the string. The height of the vertex is interpolated from the heights at the end of the segment.

On selecting *Between*, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

Select the string on the segment of the string that is to have a vertex added to it. The new vertex will be constrained to be on the segment.

**STEP 2:**

After the segment is accepted, a perpendicular line is drawn from the selected segment of the string to the position of the cursor.

**STEP 3:**

A position is selected with the mouse or typed in via the keyboard and the new vertex is created by *dropping* the position perpendicularly onto the segment.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the *Enter XYZ* Input box. Type the coordinates into the XYZ Input box and press the enter key.
15.21.9 Insert a Vertex

Position of option on menu: CAD => Vertex => Insert
or by selection of appropriate icon from the toolbar. 

This option inserts a vertex into a string between two adjacent vertices but it is constrained to be on the existing segment joining the vertices. The height of the vertex is taken from the final selected position.

On selecting Insert, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Select the string on the segment of the string that is to have a vertex added to it. The new vertex is *not* constrained to be on the segment.

**STEP 2:**
After a string is accepted, two lines will be drawn from the cursor position to either end of the selected segment.

**STEP 3:**
A final position is selected with the mouse or typed in via the keyboard and the new vertex is created at the final position.

Once the new vertex is created the original segment is no longer drawn.

**Note** - to enter via the keyboard, simply start typing or press the space bar to bring up the Enter XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.
15.21.10 Change Height of a Vertex

Position of option on menu: CAD => Vertex => Edit height or by selection of appropriate icon from the toolbar.

This option changes the height (z value) of a vertex.

On selecting Edit height, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

To see the effects of this option, use the Toggle menu to toggle on Z values. The height of each vertex (z value) is then displayed on the plan view so any modification to the height will be visible.

**STEP 2:**

Select a vertex with either the mouse or via the keyboard.

**Note** - to enter via the keyboard, simply start typing or press the space bar to bring up the Enter XYZ Input box. Type the coordinates into the Enter XYZ Input box and press the <Enter> key.

**STEP 3:**

After a point is accepted, the Height input box will appear with the current height displayed in it.

Type the new height (z value) of the vertex into the Height input box and press the <Enter> key. The browse button on the Input box can also be used to define the point's height.
STEP 4:

The height (z value) of selected point will have changed to the new value.
If z values have been turned on, the new value will be displayed in the view.
15.21.11 Edit ID

Position of option on menu: CAD => Vertex => Edit ID or by selection of appropriate icon from the toolbar.

This option changes the point id of the vertex of a super string.

On selecting Edit ID, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

To see the effects of this option, use the Toggle menu to toggle on Point id's. The Point id of each vertex is then displayed on the plan view so any modification to the point id will be visible.

STEP 2:

Select a vertex with either the mouse or via the keyboard.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the Enter XYZ Input box. Type the coordinates into the Enter XYZ Input box and press the Enter key.

STEP 3:

After the vertex is accepted, the Point ID input box will appear. Type the point id into the input box and press the Enter key.
STEP 4:
The point id of selected vertex is changed to the new value. If Point id’s have been turned on, the new value will be displayed in the view.
15.22 CAD Segment

Position of option on menu: CAD => Segment

The Cad Segment walk-right menu is

For the option Colour, go to 15.22.1 Colour
Radius 15.22.2 Radius
Insert 3-points curve 15.22.3 Insert 3-points curve
Remove 3-points curve 15.22.4 Remove 3-points curve
15.22.1 Colour

Position of option on menu: CAD => Cad Segment => Colour
or by selection of appropriate icon from the toolbar.
This option changes the colour of a selected segment.

On selecting Segment colour, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Select the segment of the super string that is to have a colour change.

**STEP 2:**
After the segment is accepted, the Colour Input box will appear. Type the desired colour into the Input box and press the enter key. Alternatively you can select a colour from a list by clicking the browse button on the Input box.

**STEP 3:**
The colour of the selected segment is drawn in the new colour.
15.22.2 Radius

Position of option on menu:  CAD => Cad Segment => Radius
or by selection of appropriate icon from the toolbar.
This option changes the radius of a segment.

On selecting Segment radius, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Select the segment of the super string that is to have a change of radius.

STEP 2:
After the segment is accepted, the Radius box will appear. Type the desired radius into the Input box and press the enter key. The browse button on the Input box can be used to define the radius by measuring existing elements.

STEP 3:
The selected segment is then drawn with the new radius.
15.22.3 Insert 3-points curve

Position of option on menu: CAD => Cad Segment => Insert 3-points curve
or by selection of appropriate icon from the toolbar.

This option allows the creation of a 3 point curve using 2 existing segments.

On selecting Insert 3pt curve, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

Select a vertex of a super string a vertex with a segment on either side, or segment of a super string.

If a vertex is selected, that vertex will be the middle vertex of the constructed 3 point curve. If a segment is selected, the closest vertex will become the middle vertex of the 3 point curve.

**STEP 2:**

After the vertex or segment is selected and accepted, an arc is through the three vertices is calculated and its radius used for the tow segments on either side of the vertex.
15.22.4 Remove 3-points curve

Position of option on menu:  CAD => Cad Segment => Remove 3-points curve
or by selection of appropriate icon from the toolbar.
This option removes the arcs from either side of a selected vertex. If a segment is selected, the closest vertex is used and the arcs removed from either side of the vertex.

On selecting Remove 3pt curve, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Select a vertex of a super string with arcs on one or two sides of the vertex.

STEP 2:
After the vertex is selected and accepted, arc on either side will removed (the radius is set to zero). Two line segments are then drawn.
15.23 CAD Edit Strings

Position of option on menu:  CAD => String
These options are currently under development.

The Cad String walk-right menu is

Menu of Options to Edit Strings
- close a string
- open a string
- reverse the direction of a string
- copy a string
- parallel a string
- trim a string back to a selected string
- extend a string until it cuts a selected string
- extend a string by a typed chainage length
- clip a string and keep the outer strings
- clip a string and keep the internal string
- deletes the selected link from the string (making two strings)
- split a string
- splits two strings where they first intersect each other
- join two strings
- join many strings
- fillet and join
- string parallel and more
- trace over parts of strings to form a new string

For the option Close, go to:
- 15.23.1 Close String
- 15.23.2 Open String
- 15.23.3 Reverse a String
- 15.23.4 Copy a String
- 15.23.5 Parallel a String
- 15.23.6 Trim a String
- 15.23.7 Extend a String
- 15.23.8 Extend String by Chainage

For the option Open:
- 15.23.9 Clip String
- 15.23.10 Delete an Internal Section of a

For the option Reverse:
- 15.23.11 Delete a Segment

For the option Copy:
- 15.23.12 Split String

For the option Parallel:
- 15.23.13 Split Crossing Strings

For the option Trim:
- 15.23.14 Join String

For the option Extend:
- 15.23.15 Join String Many

For the option Extend by chainage length:
- 15.23.16 Join Fillet

For the option Clip:
- 15.23.17 Offset

For the option Trace:
- 15.23.18 Trace
15.23.1 Close String

Position of option on menu: CAD => String => Close
or by selection of appropriate icon from the toolbar.

This option closes an open string.

On selecting Close, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
An open string is selected and accepted.

STEP 2:
The string is closed

After closing of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.23.2 Open String

Position of option on menu: CAD => String => Open
or by selection of appropriate icon from the toolbar.

This option opens a closed string.
On selecting Open, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A closed string is selected and accepted.

**STEP 2:**
The string is opened by deleting the last segment of the closed string.

*Note* - this may not be where the string was selected.

After opening of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.23.3 Reverse a String

Position of option on menu: CAD => String => Reverse
or by selection of appropriate icon from the toolbar.

This option reverses the direction of a string.

On selecting Reverse, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A string is selected and accepted.

**STEP 2:**
The string is reversed.

After reversing of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.
15.23.4 Copy a String

**Position of option on menu:** CAD => String => Copy

or by selection of appropriate icon from the toolbar.

This option copies a string. The copied strings takes its attributes from the Cad Control Bar. Copy is particularly helpful in backing up strings.

On selecting Copy, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
A string is selected and accepted. The copied string will take on the values in the control bar at the time of accepting.

**STEP 2:**
A copy of the original string will be saved into the model **bu hse string**.
15.23.5 Parallel a String

Position of option on menu: CAD => String => Parallel
or by selection of appropriate icon from the toolbar.

This option parallel a string by a given to a selected string.
Note that if there are arcs in the string, the string can not be paralleled by a distance that would collapse the arcs.

On selecting Parallel, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The string to parallel is picked with direction. The direction determines what it means to parallel to the right or left of the string.

STEP 2:
The parallel option can be applied to all of the selected string or only part of the string.
After the string is selected, a panel is displayed asking if only part of the string is to be paralleled. If only part of the string is to be paralleled (i.e. yes selected) the user picks the start and end positions of where the string is to be paralleled. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values. If the whole string is to be paralleled the user should select no.

STEP 3:
The user is prompted for the parallel distance. Positive distance is to the right of the selected
string. Negative to the left.

STEP 4:
The user is prompted for the offset height. This height value will be added to the selected string values to produce the heights for the paralleled string.

STEP 5:
The paralleled string is then generated using the supplied information.
15.23.6 Trim a String

Position of option on menu:  CAD => String => Trim
or by selection of appropriate icon from the toolbar.

This option trims a string to another nominated cutting string.

On selecting Trim, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The cutting string which will be used to define the trim extent is selected and accepted.

**STEP 2:**
The string to trim is selected. The position of the pick relative to the cutting string will dictate which part of the string will be trimmed. In this case, the selection is above the cutting string and so the trim will be of the top part of the string.

**STEP 3:**
The string is trimmed.
15.23.7 Extend a String

Position of option on menu:    CAD =>String=>Extend
or by selection of appropriate icon from the toolbar.

This option extends a string to another nominated string.

On selecting Extend, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The string to extend to is selected and accepted.

**STEP 2:**
The string to extend to is selected and accepted.

**STEP 3:**
The string is extended.
15.23.8 Extend String by Chainage Length

Position of option on menu: CAD => String => Extend by chainage length
or by selection of appropriate icon from the toolbar.

This option extends a string by a given chainage value.

On selecting Extend by chainage length, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The string to extend is selected and accepted.

STEP 2:
The chainage length to extend the string is entered into the Length input Box. Positive is in the direction of the string. Negative in the opposite direction of the string.

STEP 3:
The string is extended by the given chainage amount.
15.23.9 Clip String

Position of option on menu: CAD => String => Clip
or by selection of appropriate icon from the toolbar.

This option deletes part of a string.

On selecting Clip, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The string to be clipped is selected and accepted.

**STEP 2:**
The first and second positions defining what part of the string is to remain are selected and accepted.
The positions do not have to be at vertices but can be anywhere on segments

**STEP 3:**
The string is clipped.
15.23.10 Delete an Internal Section of a String

Position of option on menu: CAD => String => Clip internal

or by selection of appropriate icon from the toolbar.

This option deletes an internal part of a string and leaves the two end sections.

On selecting Clip internal, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The string to be clipped is selected and accepted.

**STEP 2:**
The first and second position defining what part of the string is to remain is selected and accepted. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values.

The first and second positions defining what part of the string is to be deleted are selected and accepted.

The positions do not have to be at vertices but can be anywhere on the segments.

**STEP 3:**
The part of the string between the two selected clip points is deleted leaving two strings.
15.23.11 Delete a Segment

Position of option on menu: CAD => String => Link clip

or by selection of appropriate icon from the toolbar.

This option deletes a segment from a string.

On selecting Link clip, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
The segment to be deleted is selected and accepted.

STEP 2:
The selected segment is deleted.

Note - unless the selected string was a closed string, two strings are produced.
15.23.12 Split String

Position of option on menu: CAD => String => Split

or by selection of appropriate icon from the toolbar.

This option splits one string into two strings at a given split position.

On selecting split, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The string to be split is selected and accepted.

**STEP 2:**
The split position is selected and accepted.

**STEP 3:**
The split is made at the position selected. If no vertex exists at that position, a vertex is created.
15.23.13 Split Crossing Strings

**Position of option on menu:** CAD => String => Cross split

*or by selection of appropriate icon from the toolbar.*

This option splits two crossing strings at the position of their crossing.

If there are multiple intersections between the two strings, then it splits the strings at the intersection that is the shortest distance to a pick position.

On selecting **Cross split**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

**STEP 1:**
Pick the first string.

**STEP 2:**
Pick the second string.

**STEP 3:**
The two strings are then split where the strings crossed (at the intersection that is the shortest distance to a pick position). This will create four strings.
four strings created

added vertex
15.23.14 Join String

Position of option on menu:  CAD => String => Join
or by selection of appropriate icon from the toolbar.

This option joins two super strings together at their end points.

There are four possible ways of joining the strings and the required case is determined by picking the strings with direction.

On selecting the Join option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
Select and accept a super string with direction.

For notes on picking strings with direction, see Picking with Direction.

Note: Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:
Select and accept another super string with direction.

STEP 3:
The head of the first string (as determined by the picking direction) is then joined to the tail of the second string (as determined by the picking direction).

After the strings are joined, the vertex indices will change since the order of the vertices in the string is now different.

The colour of the constructed line is adopted from first selected super string. The colour of the second string will remain unchanged.

Note: The constructed line and selected strings are stored in the model of the first selected string.
15.23.15 Join String Many

**Position of option on menu:** CAD => String => Join many

or by selection of appropriate icon from the toolbar.

This option joins many strings together. Picking with direction is used to specify which ends of the strings are joined.

On selecting the **Join many** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
Pick a super string *with direction*.

For notes on picking strings with direction, see Picking with Direction.

**Note:** The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**
Select and accept another super string, again picking *with direction*.

**STEP 3:**
The head of the first string is then joined to the tail of the second string. What is the head or tail of the strings is determined by the picking direction.

After the strings are joined, the vertex indices to reflect the new order of the vertices in the string. The colour of the constructed segment will be the same as that of the first selected super string. The colour of the second string will remain unchanged.

**Note:** The constructed segment and selected strings are stored in the model which contains the 1st selected string.
STEP 4:
The *Join Many* option joins extra strings to the already selected (and joined) strings. The user may continue selecting additional strings to join together by select and accept additional super strings by picking with direction.

This option can be terminated by the user with the **Esc** key.

**Note:** Each further construction line adopts the same colour as the 1st selected string. Both the constructed line and selected strings are stored in the model which contains the first selected string.
15.23.16 Join Fillet

Position of option on menu: CAD => String => Join fillet
or by selection of appropriate icon from the toolbar.

This option fillets, trims and joins strings.

There are eight possible ways of filleting the strings and the required case is determined by picking the strings with direction and by the sign of the radius.

On selecting the **Join strings** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

Pick a super string *with direction*.

For notes on picking strings with direction, see **Picking with Direction**.

**Note:** The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

Select and accept another super string, again picking *with direction*.

**STEP 3:**

After the second super string is accepted, the **Radius** input box will appear. Type the *fillet radius* into the input box and press the Enter key. The browse button on the input box can be used to define the fillet radius by measurement of existing elements.

**Note:** A positive fillet radius value will curve to the right, whereas a negative fillet radius will curve to the left.
A fillet arc with the radius is constructed and joined to the two strings and the ends of the two strings are automatically trimmed back to the arc.

The vertex indices will change to accommodate the new vertices in the string. The colour of the constructed line and 2nd selected string adopts the colour of the 1st selected super string. 

**Note:** The constructed arc and selected strings are stored in the model of the first selected string.
15.23.17 Offset

Position of option on menu: CAD => String => Offset
or by selection of appropriate icon from the toolbar.

This option allows the user to create "parallel" strings, i.e. creating a string that is offset by a
given distance from a selected string.

There are five possible ways of offsetting the strings as well as options for offsetting full strings or
partial strings.

The string to offset is selected by picking with direction, and the offset distance is negative to
offset to the left of the pick direction and positive to offset to the right of the pick direction.

On selecting the Offset option, the user is prompted for the relevant data in the screen message
box located at the bottom left hand corner of the 12d Model application window.

e.g.

<N> or 

The letters in the square brackets indicate which offset modes are currently selected.

For example, [N][J] at the front indicates that (n)ormal and (j)oin are the selected options.

For the option N for (n)ormal, go to

Typing N for (n)ormal
Typing P for (p)artial
Typing J for (j)oin
Typing I for (i)ntersect
Typing F for (f)illet
Typing D for (d)ual
Typing C for (c)lip

Typing N for (n)ormal

Typing N or n for (n)ormal causes the whole string to be offset.

Note - the other choice is Partial when only part of a string is offset.

When N is typed, the first character in the square brackets changes to [N].

Continue to the next mode Typing P for (p)artial or to the beginning of the Offset documentation
15.23.17 Offset.
Typing J for (j)oin

For Join, each segment of the selected string is offset by the given distance and the end points of adjacent offset segments are joined together.

So when J or j is typed, the second character in the square brackets changes to [J] and the string to offset is then selected by picking with direction.

After the string is selected, the Offset distance typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking X on the top right corner of the Offset distance typed input box.

Continue to the next mode Typing I for (i)ntersect or to the beginning of the Offset documentation 15.23.17 Offset.
Typing I for (i)ntersect

For **Intersect**, each segment of the selected string is offset by the given distance and the ends of adjacent offset segments are extended or contracted so that they intersect.

![Intersect offset in cyan](image)

**Offset Intersect with Offset Distance of -10**

So when I or i is typed, the second character in the square brackets changes to [I] and the string to offset is then selected by picking with direction.

< ![Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip]?>[picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

![Offset distance typed input box](image)

**NOTE**: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking X on the top right corner of the **Offset distance** typed input box.

Continue to the next mode **Typing F for (f)illet** or to the beginning of the Offset documentation 15.23.17 Offset.
Typing F for (f)illet

For Fillet, each segment of the selected string is offset by the given distance and the ends of adjacent offset segments are extended or contracted so they intersect. If the change of direction between adjacent segments is greater than 180 degrees, an arc is used instead of an intersect of the two segments.

So when F or f is typed, the second character in the square brackets changes to [F] and the string to offset is then selected by picking with direction.

After the string is selected, the Offset distance typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking X on the top right corner of the Offset distance typed input box.

Continue to the next mode Typing D for (d)ual or to the beginning of the Offset documentation 15.23.17 Offset.
Typing D for (d)ual

For **Dual**, construction strings are created by offset fillets to both the left and right with the given offset distance.

**Construction Strings for Offset Dual with Offset Distance of 10**

Then the **Offset Dual** is created for the given offset distance but the created string does not cut either of the two left and right offset construction strings.
More than one string may be created by the **Dual** option.

So when D or d is typed, the second character in the square brackets changes to [D] and the string to offset is then selected by picking with direction.

```
<N>[D] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]
```

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

**NOTE**: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking X on the top right corner of the **Offset distance** typed input box.

**NOTE**: Running the Dual offset command twice, one with an offset and then again with the negative of the offset (-offset)

Continue to the next mode **Typing C for (c)lip** or to the beginning of the Offset documentation 15.23.17 Offset.
Typing C for (c)lip

For Clip, construction strings are created as for the Dual option by offsetting the selected string to both the left and right by the given offset distance as an offset fillet and a buffer zone defined by the construction strings and end caps with radius equal to the offset distance at each end of the selected string.

Then the Offset Clip is created for the given offset distance, but it does not cut the buffer zone for the selected string.
More than one string may be created by the **Clip** option.
So a Clip is like the Dual option except everything is removed from the buffer zone.

So when `C` or `c` is typed, the second character in the square brackets changes to `[C]` and the string to offset is then selected by picking with direction.

```
[N][C] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip > [picks][fast][Menu]
```

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the `<Enter>` key.

**NOTE**: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the `<Esc>` key or by clicking `X` on the top right corner of the **Offset distance** typed input box.

**NOTE**: Running the Clip offset command twice, one with an offset and then again with the negative of the offset (-offset)

Continue to the first mode  **Typing N for (n)ormal** or to the beginning of the Offset documentation 15.23.17 Offset.
Typing P for (p)artial

Selecting P for (p)artial allows for a part of the string to be offset. When P or p is typed, the first character in the square brackets changes to [P].

* e.g. *

< [P][I] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (o)val, (c)lip> [picks][fast][Menu]

After P is typed, the two positions on the string are selected to indicate the subsection of the string that is to be offset.

**STEP 1:**
Pick your first position. This does not have to be on the string to offset because it will be dropped perpendicular onto the string to give the first point of the partial offset.

![Diagram showing step 1](image1)

**STEP 2:**
Pick your second position. This does not have to be on the string to offset because it will be dropped perpendicular onto the string to give the second point of the partial offset.

![Diagram showing step 2](image2)

**STEP 3:**
After accepting the second position, the part of the string between the two dropped positions is offset.

![Diagram showing step 3](image3)
After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking X on the top right corner of the Offset distance typed input box.

Continue to the next mode Typing J for (j)oin or to the beginning of the Offset documentation 15.23.17 Offset.
15.23.18 Trace

Position of option on menu: CAD => String => Trace

or by selection of appropriate icon from the toolbar.

This option allows the user to create a new string by
(a) creating points as in a normal string
and/or
(b) selecting parts of existing string to copy and make part of the new string (i.e. tracing over part of an existing string)
and/or
(c) closing the new string

On selecting the Trace option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model screen message area at the bottom of the window.

e.g.

```
<[P] Pick point to append or (t)race, (c)lose> [picks][fast][Menu]
```

The letter in the square brackets indicate which trace mode is currently selected.

For example, [T] at the front indicates that (t)race mode is selected

For the option P for (p)ick go to

- Typing N for (n)ormal
- Typing P for (p)artial
- Typing C for (c)lose
- Typing J for (j)oin

Typing P for (p)ick

Typing P or p for pick means that new vertices of the string will be created in the normal way for a string editor, and the created vertices are appended to the end of the new string being created.

When P or p is typed, the first character in the square bracket changes to [P].

e.g.

```
<[P] Pick point to append or (t)race, (c)lose> [picks][fast][Menu]
```

Points are then created for the new string by the normal pick and accept.

The option is terminated by pressing the <Esc> key.

Continue to the next mode. Typing T for (t)race or to the beginning of the Trace documentation 15.23.18 Trace.
Typing T for (t)race

For Trace, an part of an existing string is selected to copy and make part of the new string. That is, part of an existing string is traced over to form part of the new string.

When T or t is typed, the second character in the square brackets changes to [T]

\[\text{[T] Select start point to trace or (p)ick, (c)lose} [\text{picks}][\text{fast}][\text{Menu}]\]

and the string to trace over is then selected by picking the string at the start position of the section of the string to trace over.

The cursor is then moved along the string in the direction of the trace. Vertices on the traced section are displayed as diamonds and a non-vertex start on the string of the trace is shown as a circle.

The final position of the trace on the string is then selected and the traced portion is copied to the string being created.
Another string can then be selected to trace over, or P or C typed to change modes.

The option is terminated by pressing the <Esc> key.

Continue to the next mode. Typing C for (c)lose or to the beginning of the Trace documentation 15.23.18 Trace.

**Typing C for (c)lose**

Typing C or c will Close the string and ends the creation of the new string.

A new Trace option then begins.

The option is terminated by pressing the <Esc> key.

Go to the beginning of the Trace documentation 15.23.18 Trace.
15.24 CAD Edit

For the option *Paste*, please go to
- Copy rectangle
- Copy many

*15.24.1 Paste*

*15.24.2 12d Copy Rectangle*

*15.24.3 12d Copy Many*
15.24.1 Paste

Paste the 12da data from the clipboard into the current view in 12d.
15.24.2 12d Copy Rectangle

In the chosen view select the first point and then drag the cursor to visualise your desired rectangle. When the second point is accepted, the data inside the rectangle is copied to the clipboard in 12da format, ready for pasting into an open 12d project. The data is copied into models of the same model names as the original data.
15.24.3 12d Copy Many

Data is copied to the clipboard by selecting data from the Data to Copy field and then selecting Copy.

On selecting the Copy many option, a Cad 12d Copy panel is displayed.

![Cad 12d Copy Panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data to Copy</td>
<td>data selection type - for a full description go to 4.19.3 Data Source.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>model box</td>
<td>select the data from the specified model.</td>
<td></td>
</tr>
<tr>
<td>Copy</td>
<td>button</td>
<td>Copies the selected data to the clipboard in 12da format.</td>
<td></td>
</tr>
</tbody>
</table>
15.25 CAD Delete

Position of option on menu: CAD => Delete

The Cad Delete walk-right menu is

Menu of Options to Delete Vertices, Segments and Strings
- delete a vertex
- delete a segment
- delete a string

For the option Vertex, go to 15.25.1 Delete Vertices
For the option Segment, go to 15.25.2 Delete Segments
For the option String, go to 15.25.3 Delete Strings
15.25.1 Delete Vertices

Position of option on menu:  CAD =>Delete =>Points
or by selection of appropriate icon from the toolbar.

This option deletes vertices of super strings.

On selecting Points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The vertex to be deleted is selected and accepted (This must be a super string).

**STEP 2:**
The vertex point is deleted and the string redrawn.
15.25.2 Delete Segments

Position of option on menu: CAD =>Delete =>Segments

or by selection of appropriate icon from the toolbar.

This option deletes segments of super strings.

On selecting Segments, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**

The segment to be deleted is selected and accepted.

**STEP 2:**

The segment is deleted leaving two separate strings in this case.
15.25.3 Delete Strings

Position of option on menu: CAD => Delete => Strings 
or by selection of appropriate icon from the toolbar.

This option deletes selected strings. The string type does not specifically have to be a super string.

On selecting Strings, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

**STEP 1:**
The string to be deleted is selected and accepted.

**STEP 2:**
The string is deleted.
15.25.4 Delete Selection of Strings

Position of option on menu: CAD =>Delete =>Selection
or by selection of appropriate icon from the toolbar.

This option allows the deleting of selected objects specified in a source box. For help on this option see 28.9.14 Delete.

On selecting the Delete option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.
15.26 Cad Acad

Position of option on menu: CAD => Acad

The Cad Acad walk-right menu is

For the option Paste, go to
- Copy rectangle
- Copy many
- Paste parameters
- Copy parameters

[Image: Cad Acad menu]

For the option Copy rectangle, go to 15.26.2 Copy rectangle
For the option Copy many, go to 15.26.3 Copy many
For the option Paste parameters, go to 15.26.4 Paste parameters
For the option Copy parameters, go to 15.26.5 Copy parameters
15.26.1 Paste

Pastes the Dwg/Dxf data from the clipboard into the current view in 12d.
15.26.2 Copy rectangle

In the chosen view select the first point and then drag the cursor to visualise your desired rectangle. When the second point is accepted, the data inside the rectangle is copied to the clipboard for pasting.
15.26.3 Copy many

Data is copied to the clipboard by selecting data from the Data to Copy field and then selecting Copy.
Selecting the Copy many option, brings up the Cad Acad Copy panel.

![Cad Acad Copy Panel]

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data to Copy</td>
<td>data selection type - for a full description go to 4.19.3 Data Source.</td>
<td></td>

<td>Copies the selected data to the clipboard.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
15.26.4 Paste parameters

The parameters for this panel are the same as parameters in the Read DWG/DXF Data panel. Selecting Paste parameters brings up the Acad Paste Parameters panel:

For more information please go to 8.1.10 DWG/DXF Input.
15.26.5 Copy parameters

The parameters for this panel are the same as parameters in the Write DWG/DXF file for panel. Selecting Copy parameters brings up the Acad Copy Parameters panel:
For more information please go to 8.2.7 Output DWG/DFX/DXB Files.
15.27 CAD Regression

Position of option on menu:  CAD => Regression

This section of documentation is a work in progress and will be updated in subsequent releases.

The Cad Regression walk-right menu is

For the option Line, go to 15.27.1 Line
Arc 15.27.2 Arc
General 15.27.3 General
15.27.1 Line

This section of documentation is a work in progress and will be updated in subsequent releases.
15.27.2 Arc

This section of documentation is a work in progress and will be updated in subsequent releases.
15.27.3 General

This section of documentation is a work in progress and will be updated in subsequent releases.
16 Tins

Position of menu: Tins

A Tin (triangulated irregular network) is an accurate method of representing 2.5D surfaces, especially those described by ground points or design strings. See 4.5.4 Tins.

12d Model uses tins in most operations involving surfaces. For example, contouring, interfacing and volume calculations.

Unlike strings, tins can be in more than one model, or even no model at all. However, to be displayed in a view or used for profiling on a section view, tins need to be in at least one model. It is suggested that each tin be in its own model called “tin tin_name”. This makes it easy to know the model a tin is in, and also to see which models contain tins and obtain lists of all tins.

The Triangles walk-right menu is

Each of these options will now be discussed.

For the option Tins, go to

</table>

- _input the name of the tin to get information on_
- _returns the tin x, y, z limits_
- _returns the number of points in the tin_
- _returns the number of triangles in the tin_
- _get the information for the tin given in the Tin field._
- _recalculate the x, y, z bounding box for the tin given in the model field._

**How to Use the Panel**

The information for the tin given in the Tin field is retrieved and placed in the appropriate panel fields when the tin name is piped into the Tin field from the pop-ups, or an <enter> is entered after typing the tin name into the Tin field, or on selecting the info button.
16.3 Check Breaklines, Duplicate Vertices, Identicals

Position of option on menu: 
- Tins => Check breaklines
- Utilities => A-G => Check/clash => Check breaklines

The Check breaklines option is used to test whether any of the line segments from any line strings in a model or view intersect (cross) the line segments from any other string in the model/view. This includes self intersections of strings.

The option also checks for any points with the same x and y coordinates (same plan position) but different z-values, and for totally duplicated strings (identicals).

Intelligent log lines are written to the output window for showing any crossing breaklines, duplicate vertices, etc.

Selecting Check breaklines displays the Check Breaklines, Duplicate Vertices and Identical Strings for panel.

![Check Breaklines, Duplicate Vertices and Identical Strings for Panel](image)

The fields and buttons in the panel have the following functions.
Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
**Data set 1**

*if Data set 2 is ticked off*, then all the selected strings in Data set 1 are checked against all the other selected strings from Data set 1.

*If Data set 2 is ticked on*, then all the selected strings in Data set 1 are checked against all the selected strings in Data set 2, **BUT** the strings in Data set 1 are not checked against each other and the strings in Data set 2 are not checked against each other.

**Data set 1 source type** | Model | data selection type - for a full description go to 4.19.3 Data Source.

**Data set 1 source** | input | data to be processed.

**Data set 2**

*if Data set 2 is ticked off*, then all the selected strings in Data set 1 are checked against all the other selected strings from Data set 1.

*If Data set 2 is ticked on*, then all the selected strings in Data set 1 are checked against all the selected strings in Data set 2, **BUT** the strings in Data set 1 are not checked against each other and the strings in Data set 2 are not checked against each other.

**Data set 2 source type** | Model | data selection type - for a full description go to 4.19.3 Data Source.

**Data set 2 source** | input | data to be processed.

**Intersecting strings with valid heights** | model box | available models

*if non-blank, check for any crossing line segments and place either a copy of the crossing segments into the model given in this field or a diamond depending on the state of Simple crosses.*

**Duplicate vertices of different heights** | model box | available models

*if non-blank, copies of any strings that are completely duplicated are placed in the model given in this field and circles are placed in this model at any duplicate points that aren’t from an entire string.*

**Identical strings in all details** | model box | available models

*if non-blank, the duplicates of any strings are moved to model given in this field. That is, if any strings are identical in all ways, then the second and subsequent identical strings are moved to the this model. This is especially for the case when a second copy of some data has been supplied.*

**Self check strings** | tick box | tick

*if ticked, a string is not check against itself for crossing breaklines etc.*

*If not ticked, a string is not checked against itself for crossing breaklines. This speeds up processing.*

**Colour for intersections** | colour box | available colours

*colour for the copies of the crossing segments.*

**Clean models beforehand** | tick box | tick

*if ticked, the models for intersecting string, duplicate points, identicals are cleaned before the option is run.*

**Report type** | choice box | 12d Report Format, original xml

*if 12d Report Format, the xml format is converted to the 12d Report Format for check breaklines*

*if original xml, report is in xml format*

**Report file** | file box | if non-blank, a report file of this name is created giving details of all the crossing breaklines and...
duplicate plan points with different z-values.

**Simple crosses**

Tick box

If ticked, create diamonds at the position where strings cross, otherwise create a string in the shape of a cross with parts of the crossing strings.

**Check**

After selecting the check button, all the strings in the model/view are tested for any crossing line segments or duplicate points. If requested, a report is generated.

<esc> can be used to abort the checking option.
16.4 Check Breaklines - Old

**Position of option on menu:** Utilities => Old => Check breaklines

The check breakline option is used to test whether any of the line segments from any line strings in a model or view intersect (cross) the line segments from any other string in the model/view. This includes self intersections of strings.

The option also checks for any points with the same x and y co-ordinates (same plan position) but different z-values, and for totally duplicated strings.

On selecting Check breaklines option and then the appropriate Data Source in the panel, the Check Breaklines for panel is displayed.

The fields and buttons in the panel have the following functions.

<table>
<thead>
<tr>

<td>create a triangulate function</td>
<td>16.5.3 Function</td>
</tr>
<tr>
<td>Quick tin</td>
<td>create a quick tin of selected strings</td>
<td>16.5.4 Quick Tin</td>
</tr>
</tbody>
</table>

For the option *Triangulate data*, go to 16.5.1 Triangulate Data
For the option *Supertin*, go to 16.5.2 Create Super Tin™
For the option *Function*, go to 16.5.3 Function
For the option *Quick tin*, go to 16.5.4 Quick Tin
16.5.1 Triangulate Data

**Position of option on menu:**   Tins =>Create =>Triangulate data

For simple jobs, the data to triangulate is all in the one model. However, it often occurs that the data one needs to triangulate is not in one model but is in the models displayed on a particular view.

The **Triangulate data source** option allows you to either select the data to triangulate from a single model, a list of models or to use the data points from all the models attached to a particular view, rather than the data from a particular model.

In each case, the models used in creating the triangulation are recorded so that the models can be easily retriangulated if any of the data changes.

Selecting **Triangulate data** displays the **Triangulate a Data Source** panel.

![Triangulate a Data Source panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>* colour to draw the triangles whenever they are displayed in a view. This is called the base tin colour. It is possible to change the colour of individual triangles so they are different to base tin colour.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **Triangulate** button does the triangulation.

The **Finish** button finishes the triangulation process.

The **Help** button provides help on the panel.

---

*Note: Image and table content adapted for readability.*
Tin style input 1 available line styles
line style used for drawing sections through the tin on the section view.

Model for tin input available models
if non-blank, the created tin will be added to the model given in this field.
if blank, the name tin new_tin_name will be placed in the field when the triangulate button is selected.

Preserve strings tick box tick
if ticked, all strings with breakline type line or segment type tinable will be preserved as sides of triangles. Otherwise, all line strings or segments of type tinable will be treated as point strings for the triangulation.

Remove bubbles tick box
if ticked, post-processing occurs to try and stop all the points of a triangle coming from the same string. This helps prevents triangles with all three points coming from the one contour string and hence forming a flat triangle.

Weed tin tick box
if ticked, all duplicate points all removed from the tin database. This helps to reduce the size of the tin files if there was a large amount of duplicate data. This flag is automatically set to tick for triangle data.

Triangle data tick box
if ticked, then it is assumed the original data was triangles and 12d will ensure that the triangles produced by the triangulation exactly match (including null regions) the original triangle data. Weed tin is automatically set to tick if face data is set to tick.

Cell method tick box
if ticked, try to create the triangles in cells - an alternate method of ordering the data which is often faster when the data comes in lines rather than randomly.

Colour by triangle data tick box
if ticked and Triangle data is ticked, the colour of each triangle in the created tin is made the same as the triangle from the triangle data.

Create many tick box
if ticked, once the tin has been triangulated, the panel will stay up so you can create another tin. If not ticked, after the tin has been created, the panel is replaced by a Retriangulate Tin panel so if there are any mods to be made, no time is wasted in needed to select the panel.

Data tab

Data source type Model
data selection type - for a full description go to 4.19.3 Data Source.
For this option, only data types involving models can be used - model, view, model list and the models from a favourite.

Data source input
source of data is to be triangulated - only Model or View allowed for this option.

Data polygon string-select
if a string is selected as a data polygon, only string points that are inside the data polygon are used in the triangulation.
If no string is selected, then all the points in all the model/view are used in the triangulation.

Nulling tab

Apply nulling tick box
if ticked, null the resultant tin using Angle, Length, Combined angle and Combined length.

**Angle**

angle box 5

if a triangle has an external side (that is not a breakline) with an angle on it less than **Angle**, then the triangle is nulled. The default value works most of the time.

*If blank then no triangles are nulled by this test.*

**Length**

real value 100

if a triangle has an external side (that is not a breakline) greater than **Length**, the triangle is nulled.

*If blank then no triangles are nulled by this test.*

**Combined angle**

angle box 60

**Combined length**

real box 20

For the Combined case, a triangle is nulled if it:

- has an external side (that is not a breakline) and the sum of the two angles on it is less than **Combined angle** (the default value works most of the time)

  *and*

- has an external side (that is not a breakline) whose length is greater than **Combined length**. A suggested value is one third to one half of Length.

*If either Combined angle or Combined length is blank, then no triangles are nulled by this test.*

**Null polygon**

string-select

if a string is selected as a null polygon, any triangle whose centroid is outside the null polygon is automatically nulled.

**Button at bottom**

**Triangulate**

button

Triangulate the model/view given in the **model/view to triangulate** field. The created tin will be stored with the name given in the **new tin name** field. The tin will be the colour given in the tin colour field. If the **model/view for tin** field is non-blank, the created tin will be added to the model given in that field - if the model does not exist, it will be created.

**Panel Messages**

Progress messages - sent to the panel message area

- no of points in model/view = no. of points
- no. points pts no. break lines break lines
- no. points pts no. of secs s no. pts/s no. dup
- break lines finished. time taken = secs

Completion message - sent to the panel message area

- average no of pts per sec = no.

<esc> can be used to abort the triangulation option.
16.5.2 Create Super Tin™

**Position of option on menu:**  Tins => Create => Supertin

The Super Tin™ option is designed to create a super triangulation from other triangulations.

With Super Tins, existing triangulations can be combined to form the equivalent of a merged triangulation without having to completely re-build a merged model and retriangulating it.

This means there are less steps in creating a Super Tin merged triangulation so a lot less time is required and there is less opportunity for errors. Also, if any of the component triangulations of the Super Tin are modified, then the Super Tin is also instantly modified.

The Super Tin is defined by a list of triangulations in increasing number order. Wherever two triangulations overlap, the triangulation of higher number takes precedence and is used to defined z-values and sections.

Hence, for any (x,y) point, the z-value on the Super Tin is defined to be the z-value from the triangulation of the highest number which is under the (x,y) point.

A section through a Super Tin is made up of the sections through the tin of highest number at each point along the section and so may involve more than one tin.

All Super Tins support Sections, Apply MTFs, Site Lines and volumes by end area calculations.

For a Super Tin, there is also an **Exact calculations flag** and if this is set to on, extra calculations are done when creating a Super Tin (and every time a tin included in a Super Tin is modified) so that the Super Tin can be used for Exact Volumes and Visualisation.

So Super Tins with the **Exact calculations** flag set support sections, Apply MTFs, site lines, and volumes by end area methods, as well as volumes by exact methods, and can also be used in visualisations.

**Note** - the reason that **Exact calculations** may be turned off is that for some tins, it may add significant processing time whenever a tin in the Super Tin is changed. So if that is slowing down your project and you don’t need exact volumes or visualisations all the time, turn off **Exact calculations** for the Super Tin. **Exact calculations** can always be turned back on when you need them.

Selecting **Supertin** brings up the Create Super Tin panel.
The fields and buttons used in this panel have the following functions.

<td>name of the tin to be included in the Super Tin. The order is critical since the higher number tins take precedence over the lower number tins. There can be up to 127 tins in a Super Tin.</td>
<td>Tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>replace, subtract</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Replace

where ever this tin exists, use it instead of any tins of a lower number in the Tin column of the grid.

Subtract

where ever this tin exists, all parts of the tins of a lower number in the Tin column, are removed. So where ever the tin exists, it creates holes in all the tins of a lower number.

An example would be a tin that is the position of many gully pits. Using this tin in subtract mode will punch holes in all the tins of a lower number in the Tin column. So in effect, it does a nulling that also nulls parts of triangles from the tins of a lower number.

Active

if yes, the tin is included in the Super Tin.
If no, the tin is not included in the Super Tin. So the tin can be taken out of the Super Tin without having to remove it from the Tin list.

Create button

create a Super Tin from the tins in the Tins to include table. The created Super Tin will be stored with the name given in the New tin name field.

If there are no errors in creating the Super Tin, the panel then turns into a 16.6.2 Edit Super Tin panel to allow any other edits to be made before finishing.
16.5.3 Function

**Position of option on menu:**  Tins -> Create -> Function

The function option is used to construct a function which when recalced, will run a retriangulate on the tin. Since a function name can be given when a tin is first created, this option is rarely needed.

Selecting function displays the Retriangulate Function panel.

![Retriangulate Function panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function name</td>
<td>input</td>
<td>available functions</td>
<td></td>
</tr>
<tr>
<td>Tin</td>
<td>input</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td>Create/Set</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Function name**
  the name to give to the retriangulate function.

- **Tin**
  name of the tin to be retriangulated when the function is recalced.

- **Create/Set**
  create or modify the retriangulate function.
16.5.4 Quick Tin

**Position of option on menu:**  Tins => Create => Quick tin

The Quick tin option create a temporary tin from strings selected in a data source, and restricted to a user selected rectangular window. Contours of a user given increment can also be generated. Each time the option is run, is creates a tin called 12d Quick Tin in the model 12d Quick Tin so the tin is over written each time the option is run.

Selecting Quick tin displays the Quick Triangulation Selection panel.

![Quick Triangulation Selection panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>Model</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data source</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Colour of tin</td>
<td>colour box</td>
<td>available colours</td>
<td>the colour or the tin, and any contours.</td>
</tr>
<tr>
<td>Tin contour increment</td>
<td>real value box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Window</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Data source type**: Model
- **Data source**: input
- **Colour of tin**: colour box
- **Tin contour increment**: real value box
- **Window**: button

After clicking on Window, two corners to define a window are selected in a view. The tin for the selected data restricted to the Window is then created with the name 12d Quick Tin, added to the model 12d Quick Tin, and then the model added to the view that the Window was defined. Tin contours is also turned off for the view.
16.6 Edit

Position of menu: Tins => Edit

Once a tin is created, it can be edited in a variety of ways. The Edit walk-right menu is

- edit a tin definition and retriangulate
- edit Super Tin definitions
- recalculate a Super Tin
- modify a retriangulate function
- retriangulate an existing tin
- set tin style
- settings for rendering V6.1
- add breakline
- swap triangle edges

For the option Tin, go to

- 16.6.1 Edit a Tin
- 16.6.2 Edit Super Tin
- 16.6.3 Recalc Super Tin
- 16.6.4 Edit Tin Function
- 16.6.5 Retriangulate
- 16.6.6 Style
- 16.6.7 Render Settings
- 16.6.8 Add Breaklines
- 16.6.9 Flip Triangles
16.6.1 Edit a Tin

**Position of option on menu:**  Tins \(\Rightarrow\) Edit \(\Rightarrow\) Tin

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The Edit \(\Rightarrow\) Tin option can be used to modify the models and setting used to define the tin and then recreate the tin from the new models and settings.

Selecting Edit \(\Rightarrow\) Tin displays the **Retriangulate Tin** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Weed tin</td>
<td>if ticked, all duplicate points all removed from the tin database.</td>
<td>tick box</td>
<td>original setting</td>
<td></td>
</tr>
</tbody>
</table>

[Diagram of the Retriangulate Tin panel]
Triangle data

Triangle data tick box original setting

If ticked, only triangles in the tin that are under the centroid of a string representing a triangle in the model/view are considered valid, all others are set to null. That is, any triangles not under the centroid of a string from the model/view will be set to null. This is extremely useful when the original string data represents triangles and it will ensure that the triangles produced by the triangulation will exactly match, including null regions, the original triangle data. Weed tin is automatically set to tick if face data is set to tick.

Cell method

Cell method tick box original setting

If ticked, try to create the triangles in cells - an alternate method of ordering the data for use when the triangulation takes too long by the non-cell method.

Data tab

Model List models in the tin

List of models used to create the original tins. The models and the order can be modified.

Data polygon string-select original data polygon

If a string is selected as a data polygon, only string points that are inside the data polygon are used in the triangulation.

If no string is selected, then all the points in all the models are used in the triangulation.

Nulling tab

Apply nulling tick box original setting

If ticked, null the resultant tin using Angle, Length, Combined angle and Combined length.

Angle angle box original setting

If a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time.

If blank then no triangles are nulled by this test.

Length real value original setting

If a triangle has an external side (that is not a breakline) greater than Length, the triangle is nulled.

If blank then no triangles are nulled by this test.

Combined angle angle box original setting

Combined length real box original setting

For the Combined case, a triangle is nulled if it:

has an external side (that is not a breakline) and the sum of the two angles on it is less than Combined angle (the default value works most of the time)

and

has an external side (that is not a breakline) whose length is greater than Combined length. A suggested value is one third to one half of Length.

If either Combined angle or Combined length is blank, then no triangles are nulled by this test.

Null polygon string-select original null polygon

If a string is selected as a null polygon, any triangle whose centroid is outside the null polygon is automatically nulled.

Retriangulate button

The original tin is deleted and the data in the models to include table used to create a new triangulation which is given the original tin name. The settings in this panel are used for the retriangulation.
16.6.2 Edit Super Tin

**Position of option on menu:**  
Tins => Edit => Supertin

When a Super Tin is created, the tins and settings used to create the Super Tin are recorded. The Edit=>Supertin option modifies the tins and setting used to define the Super Tin.

On selecting the edit=>supertin option, the edit super tin panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>

<td></td>
</tr>
</tbody>
</table>
Mode

Replace

where ever this tin exists, use it instead of any tins of a lower number in the Tin column of the grid.

Subtract

where ever this tin exists, all parts of the tins of a lower number in the Tin column, are removed. So where ever the tin exists, it creates holes in all the tins of a lower number.

An example would be a tin that is the position of many gully pits. Using this tin in subtract mode will punch holes in all the tins of a lower number in the Tin column. So in effect, it does a nulling that also Nulls parts of triangles from the tins of a lower number.

Active

if yes, the tin is included in the Super Tin.

If no, the tin is not included in the Super Tin. So the tin can be taken out of the Super Tin without having to remove it from the Tin list.

Update button

update the Super Tin definition with the information in the above panel fields.
16.6.3 Recalc Super Tin

**Position of option on menu:**  
Tins => Edit => Recalc super tin

This option gets a super tin that has **Exact calculations** ticked on, to recalculate itself.

That is, the super tin updates all the interfaces with its component tins if there were any changes to the component tins.

The option can be used in a Chain.

Selecting **Edit** => **Recalc super tin** displays the **Super Tin Recalc** panel.

![Super Tin Recalc Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Super tin</strong></td>
<td>super tin box</td>
<td>existing Super Tins</td>
<td></td>
</tr>
<tr>
<td><strong>Force recalc</strong></td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*name of the Super Tin to be recalculated.*

If ticked and **Exact calculations** is ticked on for the super tin, a recalc of the super tin is done.

If not ticked and **Exact calculations** is ticked on for the super tin, a recalc of the super tin is only done if the super tin believes it is necessary.

If **Exact calculations** is not ticked on for the super tin, then no recalc occurs.

**Recalc** button

recalculates the super tin.
16.6.4 Edit Tin Function

**Position of option on menu:** Tins => Edit => Function

The edit => function option is used to edit a tin function.

On selecting the function option, the **retriangulate function** panel is displayed which is the same as for the option Tins => Create => Function (see 16.5.3 Function).
16.6.5 Retriangulate

**Position of option on menu:** Tins => Edit => Retriangulate

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The *retriangulate* option is used to recreate the tin from the same models and settings.

The *retriangulate* menu item operates two ways.

(a) The *retriangulate* walk-right brings up the *tins* menu which is a list of all the existing tins.

   By choosing one of the tins from the *tins* menu, the tin is retriangulated.

(b) If *retriangulate* itself is activated (by clicking LB when *retriangulate* is highlighted), the *retriangulate tin* panel appears. The *retriangulate tin* panel can be used to modify the tin definition and retriangulate the tin.
16.6.6 Style

Position of option on menu:  Tins => Edit => Style

When a tin is created, it is given a linestyle (the tin linestyle) which is used for drawing the tin whenever it is profiled on a section view or plotted in long and cross section plots.

The style option is used to modify the tin linestyle.

On selecting the style option, the tin linestyle panel is displayed.

![Tin Linestyle Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Set</td>
<td>button</td>
<td></td>
<td>set the tin linestyle to that given in the style panel field.</td>
</tr>
</tbody>
</table>

name of the tin to modify the linestyle of:

linestyle for the tin.
16.6.7 Render Settings

**Position of option on menu:**  Tins => Edit => Render settings

**Position of option on menu:**  Tins => Visualisation => Tin render settings

This option sets blending, texture mappings, raster draping, one/two sides, draping of polygons, text, billboards and images for triangles in a tin. It has already been documented as

Tins => Visualisation => Tin render settings

in the section 12.13.1 Tin Render Settings.

**IMPORTANT NOTE:**  the Visualisation module is required for the Tin Render Settings to be used on a Perspective OpenGL view.
16.6.8 Add Breaklines

**Position of option on menu:**  Tins => Edit => Add breaklines

This option allows extra breaklines joining existing vertices in the tin to be created. The new breaklines can be added to a model so that the results can be reproduced on a retriangulation. Selecting Add breakline displays the Add Breaklines panel.

![Add Breaklines Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>name of the tin to add a breakline to.</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td>Model for breaklines</td>
<td>if non-blank, then as breaklines are created with this option, then the breakline is automatically added to this model so that the breakline modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).</td>
<td>model box</td>
<td>1</td>
<td>available models</td>
</tr>
<tr>
<td>Breakline</td>
<td>add a breakline by clicking near the two vertices of the tin that are to be connected by a breakline (cursor snap will do). As each breakline is added, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### 16.6.9 Flip Triangles

**Position of option on menu:**  
Tins => Edit => Flip triangles

This option works on a triangle side and if it is possible, it finds the two triangles with this common side, removes the common side and replaces it with a new common side which joins the non common triangle points in the original triangle. Note that this can’t be done when the new side goes outside the two triangles.

A new breaklines can also be automatically added to a model so that the results can be reproduced on a retriangulation.

Selecting Flip triangles displays the Flip Triangles panel.

![Flip Triangles Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
</tbody>
</table>

name of the tin to add a breakline to.

| Model for breaklines       | model box | 1 | available models |

if non-blank, then as triangles are selected and flipped, then breaklines are automatically added to this model so that the flip modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).

| Flip                       | button    |

flip a triangle by clicking near the common edge (cursor snap will do). As each flip is done, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.
16.7 Boundary

**Position of option on menu:** Tins => Boundary

The **Boundary** option is used to construct the boundary strings for a tin, i.e. the strings going around the edges between the null and non-null triangles in the tin.

If the tin has holes (internal null regions), then there will be more than one boundary string created.

Often the boundary strings is used as a first step in creating a polygon to be used to null out further triangles not required in the tin.

Selecting **Boundary** displays the **Create Boundaries for Tin** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Tin</strong></td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td><strong>Model for boundaries</strong></td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td><strong>Create super string(s)</strong></td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
<tr>
<td><strong>Solid fill string(s)</strong></td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
<tr>
<td><strong>Boundaries draped</strong></td>

<td>ticked</td>
<td></td>
</tr>
<tr>
<td><strong>Boundary colour</strong></td>
<td>input</td>
<td>cyan</td>
<td>available colours</td>
</tr>
<tr>
<td><strong>Attach to tin</strong></td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
</tbody>
</table>

The **Tin** box (name of the tin (not a super tin) to calculate the boundary strings for).

The **Model for boundaries** box (the model to place the boundary strings in).

If **ticked**, the boundary strings are super strings.

If **not ticked**, the boundary strings are 3d strings.

If **ticked**, each of the boundaries is solid filled with the tin colour.

If **ticked**, the points of the boundary have the z-values from the tin.

If **not ticked**, the z-value is set to 1.

The **Boundary colour** box (the colour for the boundary strings).

If **ticked**, the boundaries are remembered with the tin and when you have the 250M version of
12d Model and have Model Density turned on, if the density is such that the tin would only be drawn as a red rectangle, the boundaries are drawn instead of the red rectangle.

Create button

create the boundary polygons for the tin.
16.8 Colour

**Position of menu:** Tins => Colour

When a tin is created, all the triangles have the same colour (called the tin’s base colour). This is the colour given by the user when creating the tin with the **Triangulate a Data Source** panel. The base colour can be changed at any time using the colour of tin option.

However, it often necessary to colour specific triangles in some other colour than the base colour. The option Colour within polygon is designed to do just that.

When the Triangles menu is torn off the main menu, the Colour menu item on it operates in two ways:

First, clicking on Colour without walking right brings up the Colour of Tin panel (see the next section). Secondly, the Colour walk-right brings up the Tin Colouring menu.

The Tin Colouring walk-right menu is

For the option Colour of tin, go to
- Colour within polygon
- Reset
- Tin height colour
- Tins depths colour
- Aspect colouring
- Slope colouring

For the option Colour within polygon, go to
- Colour within polygon
- Reset
- Tin height colour
- Tins depths colour
- Aspect colouring
- Slope colouring

For the option Reset, go to
- Reset

For the option Tin height colour, go to
- Tin height colour

For the option Tins depths colour, go to
- Tins depths colour

For the option Aspect colouring, go to
- Aspect colouring

For the option Slope colouring, go to
- Slope colouring

For the option Colour of Tin, go to
- 16.8.1 Colour of Tin

For the option Colour Within Polygon, go to
- 16.8.2 Colour Within Polygon

For the option Reset, go to
- 16.8.3 Reset

For the option Tin Height Colour, go to
- 16.8.4 Tin Height Colour

For the option Tins Depths Colour, go to
- 16.8.5 Tins Depths Colour

For the option Aspect Colouring, go to
- 16.8.6 Aspect Colouring

For the option Slope Colouring, go to
- 16.8.7 SlopeColouring
16.8.1 Colour of Tin

**Position of option on menu:**  Tins => Colour => Colour of tin

A tin is given a base colour when it is originally constructed. The colour of tin option allows the user to change the base colour of the tin.

On selecting the Colour of tin option, the Tin Colour panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>

<td>default tin colour</td>
<td>available colours</td>
</tr>
<tr>
<td>Colour button</td>
<td>button</td>
<td>colour all the base triangles with the colour given in the Colour field.</td>
<td></td>
</tr>
</tbody>
</table>

name of the tin to have its base colour modified. The tin must exist in 12d Model. When the tin name is entered, the existing colour of the tin is displayed in the Colour panel field.

the new base colour for the tin given.
16.8.2 Colour Within Polygon

Position of option on menu:  Tins => Colour => colour within polygon

Although a tin is given a base colour when constructed, it is useful to be able to change the
colour of selected triangles. For example, in a design tin with a road and terrain, the road and the
terrain could be displayed in different colours. This is particularly effective in shades.

The colour within polygon option allows the user to colour all the triangles whose centroids lie
inside (or outside) a selected polygon, or for all the polygons in a given model, with either a user
specified colour or the colour of each polygon. If a model of polygons is used, the polygons are
processed in the order that they occur in the model. The option can be applied any number of
times to a tin.

On selecting the colour within polygon option, the colour triangles by polygons panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>

<tr>
<td></td>
<td>if Use polygons colour is not set to tick, this is the colour to set all the triangles within/out a polygon to.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Poly mode choice inside inside, outside

mode to select whether the triangles with centroids inside or outside the selected polygons are to be coloured.

Use a polygon tick box

if ticked, then individual polygons are selected and the tin coloured within them.

Colour on accept of polygon tick box

if ticked, then the colouring is done as soon as a polygon is accepted.

Polygon polygon select string pop-up

this is used to
(a) select an individual string to use as a polygon for colouring
(b) dynamically define a rectangle to use as a polygon for colouring
(c) dynamically define a parallelogram to use as a polygon for colouring
(d) dynamically define a lasso to use as a polygon for colouring
(e) edit a string already selected with the polygon select
(f) get information on a string already selected with the polygon select
(g) delete a string already selected with the polygon select
(h) clear any selection already made by the polygon select
(i) toggle on/off the checks made the string selected by the polygon select

Use a model of polygons tick box

if ticked, then all the polygons in the given model are used for colouring.

Model model box available models

model of polygons which are used for selecting triangles to be coloured. Colour happens when the Colour button is selected.

Colour button

for a model of polygons, each string in the Model of polygons is used to colour the triangles in the tin given in the tin field. If Colour on accept of polygon is off, colour within the selected string.
16.8.3 Reset

**Position of option on menu:**  Tins => Colour => Reset

The reset option is used to change all the non base-coloured triangles in a tin back to the base colour.

On selecting the reset option, the reset colour of triangles panel is displayed.

![Reset Colour of Triangles Panel](image)

The fields and buttons used in this panel have the following functions.

16.8.4 Tin Height Colour

**Position of option on menu:**  Tins => Colour => Tin height colour

The tin height colour option is used to calculate height bands for the tin and colour a view and/or create faces for the height bands. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated heights and colours are given in a user supplied height range file. A plan view can be temporarily coloured on the height basis using the range file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the height range file, see 8.9.6 Height Range File.

Selecting Tin height colour displays the Colour Height Range for Tin panel

![Colour Height Range for Tin panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

On selecting this button, the heights of the triangles of the tin within the selected bounding polygon are...
calculated.

<esc> can be used to terminate the option during height calculations.
16.8.5 Tins Depths Colour

**Position of option on menu:**  Tins => Colour => Tin depths colour

The **Tins depths colour** option calculates colour bands for the **depths** between two tins, and colours a view and/or create faces. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the common portions of the tins are used.

The calculated depths and colours are given in a user supplied depth range file. A plan view can be temporarily coloured on the depth basis using the **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the depth range file, see [8.9.4 Depth Range File](#).

On selecting the **Tins depths colour** option, the **Colour Depth Range for Tins** panel is displayed.

![Colour Depth Range for Tins](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

</tbody>
</table>

*name of the original/new tin to colour depths between. Cut is when the new tin is below the original tin.*

the user supplied depth range file is used to give the colour ranges for depths. See [8.9.4 Depth Range File](#).

**Plan view to paint**

*if non-blank, the given plan view will be painted according to the range colours given in the range file.*

**Model for faces**

*if non-blank, faces will be created with colours according to the range colours given in the range file.*

**Clean faces model beforehand**

*if tick, the model of faces is cleaned out before the option runs.*

**Poly**

*if selected, this string is used as the bounding polygon for the depth calculations.*

**Colour**

*colour the depths between the tins within the selected bounding polygon.*
<esc> can be used to terminate the option during depth calculations.
16.8.6 Aspect Colouring

Position of option on menu: Tins => Colour => Aspect colouring

The aspect colouring option is used to colour the triangles according to the aspect (direction) of the triangles in the tin. An aspect range file is used to define the colour ranges. Note that the actual colours of the triangles are changed - not a face model produced.

For more information on the aspect range file, see 8.9.5 Aspect Range File.

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the Aspect colouring option, the Aspect Analysis Colour panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td>Range file</td>
<td>aspect range file box</td>
<td>*.arf</td>
<td></td>
</tr>
<tr>
<td>Aspect</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

On selecting this button, the aspects of the triangles of the tin are calculated and the triangle coloured according to the range file.

<esc> can be used to terminate the option during aspect calculations.
16.8.7 Slope Colouring

**Position of option on menu:** Tins => Colour => Slope colouring

The **Slope colouring** option is used to colour the triangles in the tin according to the slope of the triangles. A slope range file is used to define the colour ranges.

Note that the actual colours of the triangles are changed - not a face model produced.

For more information on the slope range file, see [4.24 Defaults](#).

The values can be percent cross fall, “1v in” slope or degrees (in 12d Model dms format).

The `range_colour` is used to colour all triangles in the tin satisfying the range.

On selecting the **Slope colouring** option, the **Slope Analysis Colour** panel is displayed.

![Slope Analysis Colour Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>Name of the tin for which the slope of the triangles will be calculated and then the tin coloured.</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td>Range file</td>
<td>The user supplied range file is used to give the colour ranges for slopes to use to colour the triangles. See <a href="#">4.24 Defaults</a>.</td>
<td>slope range file</td>

<td></td>
</tr>
<tr>
<td>Slope type</td>
<td>The units used for slope in the range file.</td>
<td>input</td>
<td>percent cross fall</td>
<td>percent cross fall, degrees, 1v in</td>
</tr>
</tbody>
</table>

On selecting this button, the slopes of the triangles of the tin are calculated and coloured according to the slope range file.

<esc> can be used to terminate the option during aspect calculations.
16.9 Contour

**Position of menu:** Tins => Contour

The Tin Contours walk-right menu is

- create, smooth and label contours
- create depth contours and also label and smooth them
- change colour/model
- colour contours using a height range file
- create contours
- create depth contours
- label contours
- smooth contours

For the option **Contour, smooth and label**, go to
- 16.9.2 Contour, Smooth and Label
- 16.9.3 Depth Contour, Smooth and Label Function
- 16.9.4 Change Contours
- 16.9.5 Colour
- 16.9.6 Contour
- 16.9.7 Depth Contours
- 16.9.8 Label Contours
- 16.9.9 Smooth

For information on creating contours, go to the section 16.9.1 Creating, Smoothing and Labelling Contours.
16.9.1 Creating, Smoothing and Labelling Contours

Creating Contours

Contours (or level lines) for a surface are the strings of constant height. Contours are often produced on maps and labelled with the height of the contours.

A 12d Model tin represents a surface in three dimensions and there is an option in 12d Model for producing the contours for the tin.

For a triangle in three dimensions, a string of constant height is actually a straight line across the triangle and the contour lines of different heights for a triangle are parallel lines.

Because triangles in a tin have common sides, a contour of a given height for one triangle will connect to the contour of the same height in an adjacent triangle.

So the contour lines on adjacent triangles join up to form continuous contour strings, each segment of which is straight across a triangle.

The contours for a tin lie on the surface of the tin.

The options to create contours in 12d Model has five parameters to define which contours are calculated. They are the

- minimum contour value
- maximum contour value
- contour increment
- contour reference
- bold increment

The elevation range over which the contours are to be produced is defined by the minimum and maximum contour values. If the minimum (maximum) value is not specified, the tin minimum (maximum) z-value is used.

The increment between successive contours is given by the contour increment.
For example, if contours are required every two metres from 100.0 metres to 200.0 metres, the parameters needed are

- contour minimum = 100.0
- contour maximum = 200.0
- contour increment = 2.0

This would be sufficient information to produce the contours 100.0, 102.0, 104.0... 198.0, 200.0.

However, 12d Model also provides a parameter to allow the following contours to be produced 101.0, 103.0, 105.0 .... 197.0, 199.0

For this and similar cases, the contour reference value is used.

When a contour reference value is specified, all the contour increments are taken from the contour reference value.

In the first example, the contour reference value is the default value of 0.0. In the second example, the contour reference value is 1.0.

If major (or bold or index) contours are required, the major contour increment is given a non-zero value. Major contours will be drawn at the integer multiples of the major increment instead of the standard contours.

For information on labelling contours, go to the section Labelling Contours.
For information on smoothing contours, go to the section Smoothing Contours.

Smoothing Contours

If the triangles in a tin, or sections of a tin, are large then the contours for that section of the tin may appear angular. Consequently some people like to smooth the contours to take out the angularity.

Be careful of smoothing because smoothing of contours produces strings that no longer sit on the triangulation.

12d Model smooths contours by apply a smoothing algorithm to each of the contour strings that were produced from the triangulation.

Two smoothing algorithms are available

(a) Preserve string points - this method ensures that the smoothed contour goes through all the vertices from the original contour string.
(b) Don’t preserve string points - this method does not have to include the vertices from the original contours in the smoothed contour.

For information on creating contours, go to the section Creating Contours.
For information on labelling contours, go to the section Labelling Contours.

Labelling Contours

12d Model labels contours by placing text labels at user controlled distances along the contour string.

The position and frequency of the contour labels along a contour string is controlled by two parameters, the start distance and the separation distance.

The first contour label is placed at a chainage distance of start distance from the beginning on the contour and the labels are repeated at a chainage distance of separation distance from the
previous contour label.

There is also a parameter to specify that contours are to be labelled at the start and the end regardless of the *start distance* and *separation distance*.

The number of decimal places used for the contour label is also user specified.

**12d Model** has seven methods for positioning the contour labels. They are the

(a) above line contour direction

> contour labels are created with the text parallel to the contours line and in the same direction as the contour string. The text is raised slightly above the contour string.

(b) above line read from below

> contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is raised slightly above the contour string.

(c) centre line read from below

> contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is centred on the contour string so the contour string goes through the text.
(d) line removal & centred line read from below

Contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.

(e) above line facing up hill

Contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that it faces uphill. The text is raised slightly above the contour string.

(f) centre line facing up hill

Contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that it faces uphill. The text is centred on the contour string so the contour string goes through the text.
(g) line removal & centred line facing up hill

Contour labels are created with the text parallel to the contour line. The text is orientated so that if it faces uphill. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.

For information on creating contours, go to the section Creating Contours.
For information on smoothing contours, go to the section Smoothing Contours.
16.9.2 Contour, Smooth and Label

Position of option on menu:  Tins => Contour => Contour, smooth and label

One method of visualizing tin data is with contours. In 12d Model, contour strings can be produced over any user defined elevation range and at any interval.

This option creates contours and can also smooth and label them. It is a function and so if a function is re-run it will remove any data from its last run.

For more information on contouring, smoothing and labelling in 12d Model, go to the section Creating Contours.

Selecting Contour, smooth and label displays the Contour, Smooth and Label panel.

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up
Function name | function box | available contour fns | name of the contour, smooth and label function.
Tin to contour | input | available tins | name of the tin to be contoured.

Contours tab

Model for contours | model box | available models | name of the model to place the contours in.
Contour increment | input | 1.0 | increment between contoured values.
Contour

Name
input
if non-blank, name to give the contour strings.

Colour
input cyan available colours
colour of the contours

Linestyle
input 1 available linestyles
linestyles for the contour strings.

Weight
input
if non-blank, weight to give the contour strings.

Smooth contours
tick box
if ticked, the contours are smoothed.

Preserve string points
tick box
if ticked, then the smoothed string goes through the original vertices of the non-smoothed contour strings.
If not ticked, then the smoothed strings do not have to include the vertices from the non-smoothed contours.

Major Contours tab

Create major contours
tick box
if ticked, then major contours can be given a different name, colour, style, weight and model.

Model for major contours
model box available models
if non blank, the name of the model to place the major contours in. If blank, the same model is used as for the ordinary contours.

Major contour increment
input 5.0
increment for the major contours.
If blank or zero, then no bold contours are drawn. If non-zero, it must be an integer multiple of the contour increment.

Name
input
if non-blank, name to give the major contour strings. If blank, the same name is used as for the ordinary contours.

Colour
input off yellow available colours
colour of the major contours. If blank, the same colour is used as for the ordinary contours.

Linestyle
input 1 available linestyles
if non blank, linestyles for the major contour strings. If blank, the same linestyle is used as for the ordinary contours.

Weight
input
if non-blank, weight to give the major contour strings. If blank, the same weight is used as for the ordinary contours.

Range tab

Contour minimum
input
minimum value of the z range to be contoured. If blank, the tin's minimum z-value is used.

Contour maximum
input
maximum value of the z range to be contoured. If blank, the tin's maximum z-value is used.

Contour reference
input 0
reference value for the contour increments.

Colour by range  
tick box

* if ticked, then the contours are coloured according to a height range file rather than bold colour. See 8.9.6 Height Range File.  

Height range file  
height range file box  *.hrf

* the range file used to colour the contours.

Interpolate colours  
tick box

* if ticked, the colour of the contour will be interpolated between the colour for the range and the colour for the next range in the height range file.

If not ticked, all contours in the same range in the height range file will have the same colour

Colour text labels  
tick box

* if ticked, then any contour height text is also coloured the same colour as the contour.

Labels tab

Label contours  
tick box

* if ticked, then the contours are labelled.

Label major contours only  
tick box

* if ticked, then only the major contours are labelled.

Model for labels  
model box  available models

* if non blank, the name of the model to place the contour labels in. If blank, the same model is used as for the contours.

if non blank then instead of using the start distance and separation parameters to define where the contour labels are placed, the Model of label lines is used. In this case, a label is created where ever s string in the Model of label lines cuts a contour.

Label start and end  

if ticked, the start and end of the contours are labelled regardless of the values of start distance and separation.

Button at bottom

Calculate  

generate, smooth and label the depth contours between the two tins
16.9.4 Change Contours

**Position of option on menu:** Tins => Contour => Change

The Change option is for changing the model and/or colour of contours with a given height interval.

The main purpose of the option is to separate contours to be used as index contours from other contours. For example, when contours are supplied by a third party and all the contours are in the same model with the same colour, change contour colour can move contours to be used as index contours to a different model and give them a different colour.

For this option the selection process for a Data source is extended.

After the data is selected as defined by the Data source, the two extra parameters, `interval` and `reference`, are used to further specify which contours are to be moved and/or coloured.

Only contour strings whose heights satisfy

\[ \text{height} = \text{reference} + \text{integer} \times \text{interval} \]

are selected.

For example, if the contours 5, 10, 15 etc. are required, the reference and interval would be

`reference = 0`
`interval = 5`

However, to modify the contours 6, 11, 16 etc., the required parameters are

`reference = 1`
`interval = 5`

Selecting Change displays the Change Contours panel.

The fields and buttons used in the panel have the following functions.

reference value for the contour increments.

Contour button
contour the tin given in the tin field and place the contours in the model given in the model field. The contour range, contour increment and bold contour increment are used to specify which contours are calculated.

Panel Messages

Progress messages - sent to the panel message area
start contouring
contouring level z-value

Completion message - sent to the panel message area
finished contouring - no. contours

<esc> can be used to abort the calculation of contours.
16.9.7 Depth Contours

**Position of option on menu:**  
Tins => Contour => Depth contours

The *depth contours* option finds the contours lines for the difference between two tins. That is, it calculates the isopachs between the two tins.

Selecting *Depth contours* displays the **Depth Contours** panel.

![Depth Contours panel]

The fields and buttons used in this panel have the following functions.

<table>

- If **2d**, the created strings are 2d strings with a z-value equal to the depth.
- If **3d original**, the depth strings are draped over the original tin to form 3d strings.
- If **3d new**, the depth strings are draped over the new tin to form 3d strings.

**Calculate**

- calculate the depth contours between two tins given in the panel fields. The resulting strings are added to the model given in the **Model for depth strings** field.
16.9.8 Label Contours

**Position of option on menu:**  
Tins ➞ Contour ➞ Label

The **label contours** option can be used to label individual contour (2d) strings, or all the contour strings in a model.

The user has control over the label size, colour, number of decimal places, the distance between the labels and the distance to the first label on a string (start distance).

Note - this option cannot label fast contours. Contours strings must already exist or be generated using Tins ➞ Contour ➞ Contour, Smooth and Label Or Tins ➞ Contour ➞ Contour

For more information on labelling contours, go to the section [Labelling Contours](#).

On selecting the **label contours** option, the **label contours** panel is displayed.

![Label Contours Panel](image)

When the **Label** button is selected, all the contour strings given by the data source field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the **label contours** panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

</tr>
</tbody>
</table>
above line facing uphill
centred line facing uphill
line removal & centred facing uphill

in all cases, contour labels are created and added to the model Model for contours.

For information on each of the methods of labelling contours, go to the section Labelling Contours.

Original tin  tin box  available tins
only needed for the "facing uphill" methods - name of the tin used to generate the contours. This is needed to calculate which direction is uphill.

Num dec places  input  1  0,1,2,3,4,5
number of decimal places used in the contour label.

Textstyle data  textstyle data box  1  textstyle favourites
textstyle information to use for the contour labels.

Start dist (w)  input  0
chainage distance to the first label on the string - world units

Separation (w)  input  250
chainage interval between the labels - world units

Pick  button
if a number of individual contour strings need to be labelled, the pick button is used. After pick is chosen, any strings selected are then labelled using the information in the panel fields. After labelling one string, another pick and label cycle automatically begins.

The cycle is terminated by clicking RB to raise the pick ops menu and selecting cancel from it.

Label  button
label all the contour strings selected by the "Data to label" data source.
16.9.9 Smooth

**Position of option on menu:**  Tins => Contour => Smooth

The smooth options are used to add extra points into a contour string (2d strings) to make a smoother string.

For more information on labelling contours, go to the section [Smoothing Contours](#).

Selecting Smooth displays the Smooth Contours in panel.

  - If not ticked, the smoothed contour may deviate from the original string points.

- **Pass other strings**
  - Tick box
  - If ticked, any non-contour string is copied and added to the smoothed strings model.

- **Smooth**
  - Button
  - Smooth the selected contour (2d) strings.
16.10 Drape

**Position of menu:** Tins => Drape

The **drape** option sections along a string and creates a new 3d-string which sits over the original string in plan view (with line approximations for arcs and spirals) but with z-values taken from a triangulated surface (a tin).

The drape alignment option takes an alignment string and creates a new alignment string with the identical horizontal geometry and vertical intersection points with z-values taken from a tin.

The **tin drape** walk-right menu is

For the option **Drape**, go to

- **16.10.1 Drape**
- **16.10.2 Drape Alignment**
- **16.10.3 Drape Alignment (Macro)**
- **16.10.4 Heights for Tin Boundary or Drape Using Closest**

The options in the tin contours menu will now be discussed.
16.10.1 Drape

**Position of option on menu:**  Tins => Drape

The drape operation is simply sectioning along a string.

Draping is a very useful method for attaching a z-value for strings defined in plan only. For example, cadastral information often has only (x,y) co-ordinates. The drape operation could be used to apply z-values to the cadastral information, for example, z-values from the natural surface tin. The draped cadastral information would then sit on the natural surface and could be used effectively in perspective views as well as plan views to delineate properties etc.

The draped strings can also have a z-offset applied so that the draped strings are a constant distance above or below the tin.

Instead of simply producing a section along a string, drape can also be used to produce a face for every segment of the string by draping the segment onto the tin and forming a face by perpendicularly connecting the end points of the segment and the draped segment. For example, if the strings represented the tops of buildings, the created faces would be the sides of the buildings down to the terrain.

On selecting Drape, the Drape panel is displayed.

![Drape panel](image)

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>

- available tins
  - name of the tin to drape the strings over.

**Drape mode**
- choice box
  - Normal
  - Normal, Vertices only
  - If **Normal**, the section through the tin is created.
  - If **Vertices only**, only the z-value from the tin is calculated at the vertices of the strings.

**Z offset**
- real value box
  - If non-blank, the z-value of all the draped strings is increased by this value.

**Produce faces**
- tick-box
  - If **ticked**, drape each segment of the string to form faces.
  - If **not ticked**, simply drape the string onto the tin.

**Keep source linestyles**
- tick box
  - If **ticked**, the linestyles of the draped strings are the same as the original string that was draped.

**Target type**
- Data target type - where to put the processed strings. For a full description go to [4.19.4 Data Target](#).

**Target info**
- input
  - models where the draped strings are placed.

**Drape**
- button
  - drape the strings selected by the "data to drape" data source over the tin given in the tin field.

Note: if faces rather than sections are to be produced, tick on the **produce faces**.

<esc> can be used to abort the drape option.
16.10.2 Drape Alignment

The Drape alignment operation takes an alignment/super alignment string and creates a new alignment/super alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

The draped alignments can also have a z-offset applied so that the draped alignments are a constant distance above or below the tin.

On selecting Alignment, the Drape Alignment Many panel is displayed.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>

  create new alignment/super alignment strings with the same horizontal geometry as the selected strings
  and the z-value for VIP points taken from the given tin.
16.10.3 Drape Alignment (Macro)

**Position of option on menu:**  
Tins => Drape => Alignment (macro)

This is the Drape => Alignment option from V7C1f. It has now been superseded.

The Drape alignment (macro) operation takes an alignment string and creates a new alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

On selecting Alignment (macro), the drape alignment panel is displayed.

![Drape Alignment Panel]

model for the draped string.

Colour for string  colour box
Colour for the draped string.

Process  button
create a new alignment string with the same horizontal geometry as the selected string and the z-value for VIP points taken from the given tin.
16.10.4 Heights for Tin Boundary or Drape Using Closest Tin Node

**Position of option on menu:**  
Tins => Drape => Heights for boundary

This option takes strings and for each vertex of each string, replaces the z-value by the z-value at the same (x,y) position from a given tin, or if there is no tin at the (x,y) position, takes the z-value from the closest non-null tin node to the (x,y) position.

The option is useful for taking a tin boundary with no z-values and creating z-values for each vertex from the tin.

Since V8 the option Tins => Boundary option has a Boundaries draped flag which performs the same calculations as this option.

On selecting Heights from boundary, the Update Z-values from Tin panel is displayed.

![Drape or Closest Tin Node](image)

16.11.1.2 Aspect Analysis 2 and 2 (new)

16.11.1.1 Aspect Analysis

**Position of option on menu:**  
Tins => Tin analysis => Aspect => Aspect Analysis

This panel is used to calculate the aspect or direction that the triangles of a tin face. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated aspects can be produced and reported over user supplied bearing ranges. Similarly, a plan view can be temporarily coloured on an aspect basis using the same range file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the aspect range file, see 8.9.5 Aspect Range File.

For each range in the file, the plan and slope areas of the triangles in the bearing range will be reported on, and the range_colour can be used to colour all areas on a plan view satisfying the range.

On selecting the aspect analysis option, the Aspect Analysis panel is displayed.

![Aspect Analysis Panel](image)

</table>

The fields and buttons used in this panel have the following functions.
Tin
name of the tin for which the aspects of the triangles will be calculated.

Range file
aspect range file box *.arf
the user supplied range file is used to split up the aspect report and define the range colours used for
painting a plan view. See 8.9.5 Aspect Range File.

Plan view to paint
view box available views
if non-blank, the given plan view will be painted according to the range colours given in the range file.

Model for faces
model box available models
if non-blank, faces will be created with colours according to the range colours given in the range file.
The z-value for a face is the line number in the range file of the range that the face satisfies.

Clean faces model beforehand
tick box
if ticked, the model of faces is cleaned out before the option runs.

Report file
file box *.rpt
name of the file to contain the aspect report. If the file already exists, the report will be appended to the
file. If no name is given, no report is produced.

Poly
string-select
if selected, this string is used as the bounding polygon for the aspect calculations.

Aspect
button
the aspects of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during aspect calculations.

16.11.1.1 Example of an Aspect Range File

// aspect range file
// format: lower_bearing upper_bearing colour_for_range
0  45  red     // colour red the triangles with bearing greater than 0 and less than or equal to 45
45  90  green  // colour green the triangles with bearing > 45, and <= 90
90 123.30 "dark green" // colour dark green triangles with bearing > 90 and <=1 to 123 deg 30'

16.11.2 Aspect Analysis 2 and 2 (new)

Position of option on menu: Tins => Tin analysis => Aspect => Aspect Analysis 2
Position of option on menu: Tins => Tin analysis => Aspect => Aspect Analysis 2 (new)
As with the aspect analysis option, the aspect analysis 2 option is used to calculate the aspect or
direction that the triangles in the tin face.
However, this option can also create the strings that bound the triangles in the same aspect
range. The aspect analysis 2 (new) option is the same as aspect analysis 2 except the boundary
polygons have slightly different names.
One restriction for this option is that the calculations can not be restricted to be within a polygon
and the entire tin is used.
For more information on the aspect range file, see 8.9.5 Aspect Range File.
For each range in the file, the boundary strings for areas of common range can be created and
also coloured faces that can be displayed on any plan view.
On selecting the Aspect analysis 2 option, the Aspect Analysis 2 panel is displayed.

The fields and buttons used in this panel have the following functions.

The tin slope options calculate and report on the slopes of the triangles. The tin slope walk-right menu is

![Tin Slope Menu]

The options in this menu will now be discussed.

For the option Slope analysis, go to

- Slope analysis 2: [16.11.2.2 Slope Analysis 2 and 2 (new)]
- Slope analysis 2 (new): [16.11.2.2 Slope Analysis 2 and 2 (new)]
- Slope analysis (flag): [16.11.2.3 Slope Analysis - Flag Slopes]
16.11.2.1 Slope Analysis

Position of option on menu:  Tins => Tin analysis => Slope => Slope analysis

This panel is used to calculate the slopes of triangles in the tin. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated slopes can be produced and reported over user supplied slope ranges. Similarly, a plan view can be temporarily coloured on a slope basis using the same range file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the slope range file, see 4.24 Defaults.

The slopes in the file can be percent cross fall, “1v in” slope or degrees (in 12d Model dms format) but they must all be of the same type in the file.

Note - if 1v in is used, the range is converted to:

\[
\text{smaller_slope_as_percent_cross_fall} < \text{slope} \leq \text{larger_slope_as_percent_crossfall}
\]

For each range in the file, the plan and slope areas of the triangles in the range will be reported on, and the range_colour used to colour all areas on a plan view satisfying the range.

On selecting the Slope analysis option, the Slope Analysis panel is displayed.

![Slope Analysis Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

</table>
if non-blank, the given plan view will be painted according to the range colours given in the range file.

**Clean faces model beforehand**  tick box

if ticked, the model of faces is cleaned out before the option runs.

**Model for faces**  model box  available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

The z-value for a face is the line number in the range file of the range that the face satisfies.

**Report file**  file box  *.rpt

name of the file to contain the slope report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

**Poly**  string-select

if selected, this string is used as the bounding polygon for the slope calculations.

**Slope**  button

On selecting this button, the slopes of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during slope calculations.

### 16.11.2.1.1 Example of a Slope Range File

```plaintext
// slope range file in percent cross fall
// format:  lower_slope  upper_slope  colour_for_range
0 5    red     // colour red the triangles with slope greater than 0% and less than
// or equal to 5% x-fall
5 10   green   // colour green the triangles with slope > 5%, and <= 10% x-fall
10 300  "dark green"  // colour dark green triangles with slope greater than 10%
// and less than or equal to 300% x-fall

// slope range file in 1v in slopes
// format:  lower_slope  upper_slope  colour_for_range
0 20   red     // colour red the triangles with slope greater than flat and
// or equal to 1:20
20 10   green   // colour green the triangles with slope between 1:20 and equal to 1:10
10 1    blue    // colour blue triangles with slope between 1:10 and equal to 1:1
```
16.11.2.2 Slope Analysis 2 and 2 (new)

Position of option on menu: Tins => Tin analysis => Slope => Slope analysis 2

Position of option on menu: Tins => Tin analysis => Slope => Slope analysis 2 (new)

As with the Slope analysis option, the slope analysis 2 option is used to calculate the slope of triangles in the tin. However, this option can also create the strings that bound the triangles in the same slope range.

The slope analysis 2 (new) option is the same as Slope analysis 2 except the boundary polygons have slightly different names.

One restriction for this option is that the calculations can not be restricted to be within a polygon and the entire tin is used.

The range file for Slope analysis 2 has the same format as for Slope analysis.

For more information on the slope range file, see 4.24 Defaults.

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the slope analysis 2 option, the Slope Analysis 2 new panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>
**Model for boundaries** input available models

if non-blank, for each range of slopes in the range file, boundary strings will be created for regions of common slope. The boundary strings are given the name "slope boundaries" plus the number of the entry in the range file. Many of the boundaries will exist twice since they are the upper boundary for one range and the lower boundary for the next range but they will have a different colour and name. For slope analysis 2 (new), the boundary name also has the addition of "face" and a number to more clearly differentiate the boundaries of the same range.

**Boundaries as faces** tick box

if ticked, output the regions of common slope as faces.

**Boundaries draped** tick box

if ticked, the z-values for the boundary are taken from the tin.

If not ticked, the z-value for a boundary is the line number in the range file of the range that the boundary satisfies.

**Boundary colour** input cyan available colours

not used - was the colour for the slope boundaries.

**Slope** button

On selecting this button, the slopes of the triangles of the tin are calculated and the appropriate boundaries and faces created.

<esc> can be used to terminate the option during slope calculations.
16.11.2.3 Slope Analysis - Flag Slopes

**Position of option on menu:** Tins => Tin analysis => Slope => Slope analysis (flag)

This panel analyses the slope of triangles in a tin and reports on triangles that fall within the supplied range file.

For more information on the slope range file, see 4.24 **Defaults**.

The results are listed in the results box.

Selecting a result line will pan the last selected view to display that triangle, as well as highlighting it on screen.

Selecting Slope analysis (flag) displays the **Slope Analysis - Flag Slopes** panel on the screen.

16.11.6 Flow Arrows

**Position of option on menu:** Tins => Tin analysis => Flow arrows

The flow arrows option draws arrows indicating the flow direction across triangles in a tin.

The flow arrows can be drawn for selected points, for all the triangles within a polygon, or if no polygon is selected, for all triangles in the tin.

The arrows are drawn at the centroid of the triangle and have a fixed user given length.

On selecting the *flow arrows* option, the *flow arrows* panel is displayed.

![Flow Arrows Panel](image.png)

16.12 Inquire

**Position of menu:** Tins => Inquire

The inquire options are used to display at the current cursor position the height (z-value) on a tin, the colour of the triangle, the depth from a fixed height to a tin, and the depth between two tins.

Once the user specifies which tin or tins are to be analysed, then as the cursor moves around in any plan view, the triangles below the cursor are examined and the appropriate information displayed.

The tin inquire walk-right menu is

```
Tin Inquire
Aspect
Colour
Depth from height
Depth from string
Depth between tins
Height
Slope
Drop onto tin in 3d
Drop tin to tin in 3d
Tins on a view
User
```

display aspect of triangles

16.12.4 Depth from String

**Position of option on menu:**  Tins => Inquire => Depth from string

The **depth from string** option calculates and displays the difference between the z-value of a tin and the height of a selected string at the current plan or section view cursor position projected back onto the selected string.

The obvert (top of the string) value is also known as the cover above a string to a tin.

Selecting **Depth from string** displays the **Depth From String to Tin Inquire** panel.

The fields and buttons used in this panel have the following functions.

<table>

</tr>
</tbody>
</table>
16.12.8 Tin Drop Point 3d

**Position of option on menu:**  Tins =>Inquire =>Drop onto tin in 3d

The Drop onto tin in 3d option takes a cursor position and a user defined height of the point and drops perpendicularly onto the closest triangle.

Selecting Drop onto tin in 3d displays the Tin Drop Point 3d panel.

The Tin Drop Point 3d panel allows you to drop a point perpendicularly onto a tin. The fields in the panel and their functions are as follows:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>3d tin</td>
<td>tin box</td>
<td>available tins</td>
<td>name of the tin to drop the point perpendicularly onto. This cannot be a Super Tin.</td>
</tr>
<tr>
<td>Height of point</td>
<td>real value</td>
<td></td>
<td>the height to use at the (x,y) cursor position.</td>
</tr>
<tr>
<td>Drop coordinates</td>
<td></td>
<td></td>
<td>X, Y, Z coordinate of the point dropped perpendicularly to the tin from the (x,y) cursor position and height from Height of point field</td>
</tr>
<tr>
<td>3d drop diff</td>
<td>real</td>
<td></td>
<td>the perpendicular distance to the tin. positive if the point being dropped is above the tin negative if the point being dropped is below the tin</td>
</tr>
<tr>
<td>Drop triangle</td>
<td>number box</td>
<td></td>
<td>the number of the triangle the point was dropped to.</td>
</tr>
</tbody>
</table>
16.12.9 Tin Tin Drop Point 3d

**Position of option on menu:**  
Tins => Inquire => Drop tin to tin in 3d

The **Tin Tin Drop Point 3d** panel allows the 3d, (perpendicular) height difference between 2 tins to be displayed at any position. Once both tins are selected and a valid 3d drop can occur the difference is displayed and the triangle dropped to highlighted.

Selecting **Drop tin to tin in 3d** brings up the **Tin Tin Drop Point 3d** panel.

![Tin Tin Drop Point 3d Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>3d Tin</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>the tin to drop the point to perpendicularly in 3d, this tin cannot be a Super Tin.</em></td>
<td></td>
</tr>
<tr>
<td>Height tin</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>the tin to get a z value for the current position to use in the 3d drop, this tin can be a Super Tin.</em></td>
<td></td>
</tr>
<tr>

<tr>
<td>3d drop diff</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>the 3d, (perpendicular) difference between the 2 tins, a positive value means the 3d Tin is below the Height tin at the current position, a negative value the 3d Tin is above the Height tin.</em></td>
<td></td>
</tr>
<tr>
<td>Drop triangle</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>the index of the triangle dropped to in the 3d Tin.</em></td>
<td></td>
</tr>
</tbody>
</table>
16.12.10 Tins on View Inquire

**Position of option on menu:**  Tins => Inquire => Tins on a view

As the cursor is moved over any plan view, the Tins on a view option lists all the tins and super tins on that view, and at the (x,y) location of the cursor, dynamically displays the z-value of each tin or super tin at that (x,y) location, and the colour, slope and aspect of the triangle from the tins or super tins currently under the cursor.

For a super tin, it also displays the name of the tin being used from the super tin at that cursor location.

Selecting Tins on a view brings up the Tins on View Inquire panel.

The fields and buttons used in the this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin output when the cursor is over a plan view, the Tin column list all the tins and super tins in the view. When the cursor is actually over a tin or super tin, on the row in the grid for that tin or super tin, the height of the tin or super tin at the cursor (x,y) location, and the colour, slope and aspect of the triangle under the cursor is displayed in the rest of the columns of the grid. If it is a super tin and the cursor is over the super tine, then the name of the super tin is given and then a &quot;/&quot; and then the name of the tin from the super tin that is being used to give the height, colour, slope and aspect. For example, in the Tin column the name &quot;combined/final&quot; means that the tin the cursor is over is a super tin called &quot;combined&quot; and it is using the tin called &quot;final&quot; from the super tin &quot;combined&quot; at that location.</td>
<td>Height output when in a plan view and the cursor is actually over the tin given in the Tin column, this is the height</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
from the tin/super tin at the cursor location.

**Colour/Slope/Aspect** output

when in a plan view and the cursor is actually over the tin or super tin given in the Tin column, this is the colour/slope/aspect of the triangle from the tin or super tin at that cursor location.
16.13 Null

Position of menu:  Tins => Null

The triangulation process forms triangles throughout the convex polygon enclosing the data set. This means that triangles may cross regions where there is very little data and may produce strange results in the ill-defined regions.

In 12d Model, it is possible to make triangles invisible (called nulling triangles) so that they are not used in any options.

Note - nulled triangles are not deleted and can be made visible again at any time.

The Null walk-right menu is

- set a polygon to include/exclude all triangles inside the polygon
- null triangles outside a polygon
- reset all null triangles
- null triangles by length of sides
- null triangles by length of sides and angle
- null by angle and length starting at a seed point
- null/reset triangle under the centroid of strings
- null triangles that are crossed by strings
- pick triangles to null/reset
- null/reset triangles inside/outside polygons

The three options in the tin colouring menu will now be discussed.

For the options Include/exclude, go to

- Include/Exclude Boundaries
- Null
- Reset
- by length
- by angle/length
- by angle/length (seed)
- by centroids
- by string
- by points
- by polygons
- Null by Length
- Null by Angle and Length
- Null by Angle and Length (Seed)
- Null by Centroids
- Null by Strings
- Null by Points
- Null by polygons
16.13.1 Include/Exclude Boundaries

**Position of option on menu:** Tins => Null => Include/excludes

The Include/exclude option is used to tag a polygon that is part of the data set for a Tin so that all the triangles inside the polygon are either set to null or non-null.

On selecting the Include/exclude option, the Tin Include/Exclude Boundaries panel is displayed.

![Tin Include/Exclude Boundaries Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boundary mode</td>
<td>choice box</td>
<td>none</td>
<td>none, include, exclude</td>
</tr>
</tbody>
</table>

*Boundary mode*

- **mode to set the polygon to.**
  - If `exclude`, then any triangles inside the polygon are set to null.
  - If `include`, then any triangles inside the polygon are reset so that they aren’t null.
  - If `none`, then the polygon is not used for automatically nulling/resetting triangles.

**Pick**

- `button`
  - select the polygon to define a boundary mode for.

**Set**

- `button`
  - set the boundary mode for the selected polygon.
16.13.2 Null

**Position of option on menu:** Tins => Null => Null

The null option is used to null any triangle whose centroid is outside a user selected polygon. Selecting Null displays the Null Triangles Outside Polygon panel.

![Null Triangles Outside Polygon panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td><strong>Null on accept of polygon</strong></td>
<td>tick box</td>
<td></td>
<td>If ticked, the triangles will be nulled as soon as the string is accepted.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If not ticked, the triangles will not be nulled until the Set button is selected.</td>
</tr>
<tr>
<td><strong>Polygon</strong></td>
<td>polygon select</td>
<td></td>
<td>The string to be used as the polygon is selected after choosing this button. If Null on accept of polygon is set, then the polygon is processed immediately.</td>
</tr>
<tr>
<td><strong>Set</strong></td>
<td>button</td>
<td></td>
<td>Process the selected string. Any triangle whose centroid is outside the selected boundary polygon is set to null.</td>
</tr>
</tbody>
</table>

Null
16.13.3 Reset

Position of option on menu: Tins => Null => Reset

The reset option is used to change all the nulled triangles in a tin back to the visible triangles. Selecting reset displays the Null Triangles Reset panel.

![Null Triangles Reset Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td></td>
<td>available tins</td>
<td></td>
</tr>
</tbody>
</table>

*name of the tin to have any nulled triangles reset to being visible triangles.*

Reset button

*the reset button resets all null triangles in the tin to the base colour.*
16.13.4 Null by Length

**Position of option on menu:** Tins => Null => by length

The **null by length** option is used to null any triangle with a side of length greater than a user specified length.

Warning - this option will null out *internal* triangles. The next option, Null by angle/length will only null triangles on the outer shell.

On selecting the **by length** option, the **null triangles by length of side** panel is displayed.

![Null Triangles by Length of Side Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td>Length</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*name of the tin to null triangles in.*

*length to check triangle sides against.*

*after selecting the *set* button, the tin will be processed and any triangle with a side of length greater than the value given in the *length* panel field, will be nulled.*
16.13.5 Null by Angle and Length

Position of option on menu: Tins => Null => by angle/length

The null by angle/length option is a more powerful nulling option which tries to remove most of the external triangles that one expects should be removed. For example, for a T-intersection, all the long, thin outer triangles should be removed. The option has two sets of tests - one to remove long thin triangles and the other which uses a combined test to remove squat triangles.

Unlike the null by length option, null by angle/length only works on triangles which have an outer null triangle on one or two sides (it does not work on internal holes). These triangles are called external triangles and sides with an outer null triangle on them are called external sides.

The null by angle and length option does not remove triangles whose external side is a breakline. Hence, as expected, breaklines will stop the nulling process.

Note that null by angle and length keeps processing the remaining non-nulled triangles until no more can be nulled or are stopped by breaklines. Hence the nulling works inwards as outer triangles are nulled revealing new external triangles to be tested. The nulling process is like peeling off layers of an onion.

Important note - the setting for this option are stored by the triangulation and the option is automatically re-run if the triangulation is re-run. To turn off the tests, just set the panel fields to blank.

Warning - this option should be the first nulling option used because all null triangles are first reset to valid triangles before this option is applied.

On selecting the null by angle/length option, the Null Triangles by Angle and Length panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin to null</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
</tbody>
</table>

name of the tin to have triangles nulled. If this option has been previously run on the tin, the previous panel values are written into the panel fields.

<table>
<thead>
<tr>
<th>Angle</th>
<th>angle box</th>
<th>5</th>
</tr>
</thead>
</table>

if a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time.

If blank then no triangles are nulled by this test.
if a triangle has an external side (that is not a breakline) greater than Length, the triangle is nulled.
If blank then no triangles are nulled by this test.

For the Combined case, a triangle is nulled if it:
has an external side (that is not a breakline) and the sum of the two angles on it is less than Combined angle (the default value works most of the time)
and
has an external side (that is not a breakline) whose length is greater than Combined length. A suggested value is one third to one half of Length.

If either Combined angle or Combined length is blank, then no triangles are nulled by this test.

after selecting the Null button, all nulled triangles are reset to be valid triangles and the tin then processed and triangles nulled.
16.13.6 Null by Angle and Length (Seed)

Position of option on menu: Tins => Null => by angle/length (seed)

The null by angle/length (seed) option is similar to the powerful null by angle/length option (see 16.13.5 Null by Angle and Length) except it has the additional start point.

That is, a start triangle is selected by the cursor and the nulling starts from the triangle under the cursor.

The null by angle/length (seed) option then starts nulling triangles from the start triangle using the angle/length parameters until stopped by breaklines.

Hence the nulling works outwards from the start triangle revealing new triangles to be tested until stopped by breaklines.

This option is particularly useful for nulling internal areas of a tin.

Selecting null by angle/length (seed) displays the Null Triangles by Angle and Length from Point panel.

![Null Triangles by Angle and Length from Point](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin to null</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>name of the tin to have triangles nulled. If this option has been previously run on the tin, the previous panel values are written into the panel fields.</td>
<td></td>
</tr>
<tr>
<td>Point to null from</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the X/Y co-ordinates of a position to start nulling from.</td>
<td></td>
</tr>
<tr>
<td>Angle</td>
<td>angle box</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time. If blank then no triangles are nulled by this test.</td>
<td></td>
</tr>
<tr>
<td>Length</td>
<td>input</td>
<td>100</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if a triangle has an external side (that is not a breakline) greater than Length, the triangle is nulled.</td>
<td></td>
</tr>
</tbody>
</table>
If blank then no triangles are nulled by this test.

<table>
<thead>
<tr>
<th>Combined angle</th>
<th>input</th>
<th>60</th>
</tr>
</thead>
<tbody>
<tr>
<td>Combined length</td>
<td>input</td>
<td>20</td>
</tr>
</tbody>
</table>

For the Combined case, a triangle is nulled if it:

- has an external side (that is not a breakline) and the sum of the two angles on it is less than Combined angle (the default value works most of the time)
- has an external side (that is not a breakline) whose length is greater than Combined length. A suggested value is one third to one half of Length.

If either Combined angle or Combined length is blank, then no triangles are nulled by this test.

Null button

After selecting the Null button, the triangle under the (X,Y) position is determined and null processing starts from that triangle.
16.13.7 Null by Centroids

Position of option on menu: Tins => Null => by centroids

null by centroids is used to null/reset any triangle that lies under the centroid of a string. On selecting the by centroids option, the null triangles by centroids of strings panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

<td>Reset, Null</td>
</tr>
<tr>
<td>Set button</td>
<td>after selecting the set button, the tin will be processed and any triangle under the centroid of a string will be set according to the null mode panel field.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
16.13.8 Null by Strings

**Position of option on menu:**  
Tins => Null => by strings

The null by strings option is used to null any triangle that is cut by a string.  
On selecting the by strings option, the null triangles by strings panel is displayed.

![Null Triangles by Strings panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>if ticked, the triangles will be nulled as soon as the string is accepted.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>If not ticked, the triangles will not be nulled until the Set button is selected.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>string select</td>
<td>existing string</td>
<td>string pop-up</td>
<td></td>
</tr>
</tbody>
</table>
if string, a string will be selected and used to null any triangle that the string passes through.

If line, a temporary two point line is drawn and used to null any triangle that the line passes through.

If polyline, a temporary polyline is drawn and used to null any triangle that the string passes through.

If closed polyline, a temporary closed polyline is drawn and used to null any triangle that the string passes through.

Use a model of strings radio button

if set, a model of strings is used and a triangle is nulled if it is cut by any one of the strings.

Model model box available models
model of strings to cut the triangles.

Set button

after selecting the set button, the tin will be processed and any triangle that is cut by a string from the Model, or a selected string for the User a string case, will be nulled.
16.13.9 Null by Points

**Position of option on menu:**  Tins => Null => by points

The **null by points** null or reset any triangle that the user clicks LB whilst over the triangle in a plan view.

On selecting the **by points** option, the **null triangles by points** panel is displayed.

![Null Triangles by Points panel](image)

The fields and buttons used in this panel have the following functions.

*if null, any triangles under a cursor pick will be nulled.*

*reset, any nulled triangles under a cursor pick will be turned back on.*

**Pick**

*any triangle under the cursor select will be processing according to the null mode panel field.*
16.13.10 Null by polygons

Position of option on menu:  Tins => Null => by polygons

The null by polygons option is used to null/reset any triangles that are inside or outside a user selected polygon, or model of polygons.

If a string is selected to use and it is not closed, then a polygon is formed by joining the first and the last points of the string.

On selecting the by polygons option, the null triangles by polygons panel is displayed.

![Null Triangles By Polygons Panel]

The fields and buttons used in this panel have the following functions.

16.14.2 Copy

**Position of option on menu:** Tins => Utilities => Copy

A copy of an existing tin can be made using the copy option.

A Super Tin can also be copied and what is created is a new super tin with a new name but with exactly the same tins making it up as the original tin.

On selecting copy, the tin copy panel is displayed.

![Tin Copy Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>

</tbody>
</table>
16.14.4 Create Tin Faces

**Position of option on menu:**  
Tins => Utilities => Create tin faces

This option creates a separate face for each triangle in a tin.

Selecting Create tin faces displays the Create Tin Faces panel.

![Create Tin Faces panel](image.png)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>

<td>polygon select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Face colour</td>
<td>colour box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Solid fill ?</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Blend (0 ... 1)</td>
<td>real value</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Output model</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
</tbody>
</table>

**Tin**

Name of the tin to have faces created for each triangle.

**Tin polygon**

If selected, faces are created for triangles whose centroid is inside the selected polygon.

**Face colour**

If blank, the tin triangle colour is used for the face colour. If not blank, this colour is used for all faces.

**Solid fill ?**

If ticked, the faces are solid filled with a blend value.

**Blend (0 ... 1)**

The value of blending is between 0 and 1.

0 means the face is totally transparent (and hence invisible) and 1 means that the face is opaque (non-translucent) and can’t be seen through at all.

If blank, then the value is taken as 1 and the polygon is opaque (non-translucent).

**Output model**

Model for the faces

**Process**

Create faces for selected triangles.
16.14.5 Grid DTM

**Position of option on menu:** Tins => Utilities => Grid

The grid option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Also see the [16.14.7 DEMs](#) options for creating a file of a regular grid to different formats (Arc View, Quantm, Sokkia).

On selecting the Grid option, the Regular Grid of Tin panel is displayed.

![Regular Grid of Tin panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

*if a polygon is selected, then the spot heights will be restricted to within the polygon.*  
*If no polygon is selected, the spot heights will be calculated over the entire tin.*

**Grid**  
button  

*calculate the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.*
16.14.6 Rotated Grid

**Position of option on menu:**  Tins => Utilities => Rotated Grid

This panel is used to create a grid of points with z-values from a given tin. The grid can be rotated and a polygon can be used to restrict the created points. A report of grid points can also be calculated in either simple x y z (one point per line) form or if no polygon is used, in a format accepted by Quantm (formerly Align 3d).

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin to drape on to</td>
<td>tin box</td>

<td></td>
</tr>
<tr>
<td>Bearing of grid</td>
<td>bearing box</td>
<td>Bearing of the side of the grid.</td>
<td></td>
</tr>
</tbody>
</table>
Grid X increment input box

The grid is made up of points of integer multiple of “Delta X” in the X direction.

Grid Y increment input box

The grid is made up of points of integer multiple of “Delta Y” in the Y direction.

Keep grid null value points tick box

If ticked, the “Output null value” is written out for any null z-values.

Report file type radio button align 3d/xyz xyz

If xyz – the grid is written out as x y z with one point per line. The “Output null value” is used for any null z-values in the grid.

If align 3d – the grid is written out in a format suitable for align 3d (Quantm). The “Output null value” is used for any null z-values in the grid.

Output null value input box -9999

The z-value to write out if any grid z-value is null.

Output file name file box *.rpt files

Name of the output file for the grid data.

Process button

Run the option

Undo button

Undo the last grid created whilst the panel is up.
16.14.7 DEMs

**Position of menu:** Tins => Utilities => DEMs
**Position of menu:** File I/O => Data output => DEMs

DEMS (Digital Elevation Models) can be created from a tin. DEMS are only regular arrays of z-values, rather than the random values and break lines supported by Tins.

Unfortunately there is not just one formats for DEMs.

The DEMS walk-right menu is

![Tin DEMs menu](image)

For the option *Arc View*, go to
- 16.14.7.1 Write Arc View DEM
- 16.14.7.2 Write Arc View DEM (Actual, Min, Max, Av)
- 16.14.7.4 Sokkia
- 16.14.7.3 Quantm
16.14.7.1 Write Arc View DEM

**Position of option on menu:**  Tins => Utilities => DEMs => Arc View

**Position of menu:**  File I/O => Data output => DEMs => Arc View

The Arc View option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values and writes out the data in the Arc View DEM format.

On selecting the Arc View option, the **Write Arc View DEM** panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

maximum x/y values to calculate spot heights for.

size of the delta x and delta y - cell is a square.

value to use when writing null z-values out to the file.

the file name for the spot height values in Arc View DEM format.

calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.
16.14.7.2 Write Arc View DEM (Actual, Min, Max, Av)

Position of option on menu:  Tins => Utilities => DEMs => Arc View Act/Min/Max/Av

Position of menu:  File I/O => Data output => DEMs => Arc View Act/Min/Max/Av

The Arc View Act/Min/Max/Av option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values, and also the minimum, maximum and average values for the cell. The data is written out in the Arc View DEM format.

On selecting the Arc View Act/Min/Max/Av option, the Write Arc View DEM (Act/Min/Max/Av) panel is displayed.

![Write Arc View DEM (Act/Min/Max/Av) panel]

The fields and buttons used in this panel have the following functions.

<table>

calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.
16.14.7.3 Quantm

**Position of option on menu:**  Tins => Utilities => DEMs => Quantm

**Position of menu:**  File I/O => Data output => DEMs => Quantm

The Quantm option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Actual point strings and/or a file of heights at the points in Quantm (formerly Align 3D) format can be generated. For Quantm no polygon should be used and if there is no z-value (no tin) at a point, then a null z-value is written to the output file.

On selecting the Quantm option, the Write Quantm DEM panel is displayed.

![Write Quantm DEM panel](image)

The fields and buttons used in this panel have the following functions.

16.14.8 Remove

**Position of menu:**  Tins => Utilities => Remove

Tins can be removed from models and from the project. Remove tins are not deleted but simply taken off the tin list in the project. Removed tins are left in the project area and can be added in again using the add option.

The tin removes walk-right menu is

- Remove from project
- Remove all from project
- Remove from model

The options in the menu will now be described.

For the option Remove from project, go to

- Remove all from project
- Remove from model

16.14.14 Weed

**Position of option on menu:**  Tins =>Utilities =>Weed

When a tin is created, a copy of all the points and lines used in creating the tin is saved with the tin, including any duplicate points and lines.

The *weed* option will remove all the duplicate points and lines from the tin database.

On selecting the *Weed* option, the *tin weed* panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>

16.14.15 Z Differences from Tins

Position of option on menu:  Tins => Utilities => Z diffs from tins

This option takes a data source and for each point in the data source, creates a new point whose z-value is the difference in z-values from two given tins at the plan position of the data source point.

On selecting the Z diffs from Tins option, the Create Z-Values from Tin Differences panel is displayed.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

      - model, string, view
  - **Data source**: input
  - **Original tin**
    - name of the tin to get the z-value from
  - **New tin**
    - name of the tin to get the z-value from
  - **Model for tin differences**
    - model to place the strings containing the z values with the difference between the tins
  - **Process**
    - for all strings in the data source, calculate the difference in the z-values from the two tins at the string vertices
16.14.16 Z Differences from String to Tin

**Position of option on menu:**  Tins =>Utilities =>Z diffs from string to tin

This option takes a data source and for each string in the data source, creates a plan copy of the string and for each vertex in the new string, the z-value at a vertex is the difference in z-values from the original string vertex and the z-value of the tin at the (x,y) position of the vertex.

On selecting the Z diffs from string to tin option, the Create Z-Values from String to Tin Differences panel is displayed.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data source type</strong></td>

<td>model box</td>
<td>available models</td>
<td></td>
</tr>
</tbody>
</table>

- **Process** button
  - for all strings in the data source, calculate the difference in the z-values from the string to the tin.
16.14.17 Grid of Min / Max of Tins

Position of option on menu:  
Tins =>Utilities => Min/ Max of Tins

This option takes one to three tins and creates a regular grid of points where the z-value at each point is the minimum of the tins at that point.

Selecting Min/ Max of Tins brings up the Grid of Min / Max of Tins panel.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin 1, Tin 2, Tin 3</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if non blank, this tin is used to use in the calculation to find the minimum of the tins at each grid point.</td>
<td></td>
</tr>
<tr>
<td>Calculate tins min, max</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>when pressed, the minimum and maximum x and y values for the union of the three tins is calculated and the values written to the Grid xmin, ymin, Grid xmax, ymax fields.</td>
<td></td>
</tr>
<tr>
<td>Grid xmin, ymin</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the minimum x value, then one or more spaces, and then the minimum y values, to be used for creating the grid.</td>
<td></td>
</tr>
<tr>
<td>Grid xmax, ymax</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the maximum x value, then one or more spaces, and then the maximum y values, to be used for creating the grid.</td>
<td></td>
</tr>
<tr>
<td>x grid size</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the x coordinates for the grid points are created starting at the Grid xmin and then incremented by &quot;x grid size&quot; for as long as the x value is less than or equal to Grid xmax</td>
<td></td>
</tr>
<tr>
<td>y grid size</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the y coordinates for the grid points are created starting at the Grid ymin and then incremented by &quot;y grid size&quot; for as long as the y value is less than or equal to Grid ymax</td>
<td></td>
</tr>
</tbody>
</table>
grid size" for as long as the y value is less than or equal to Grid ymax

Calculate minimum: tick box ticked

If ticked, then grid points are created with the z-value being the minimum of tins Tin1, Tin 2, Tin3.

If not ticked, then grid points are created with the z-value being the maximum of tins Tin1, Tin 2, Tin3.

File to write results to: File

name of the file to write the grid points out to. The format of the file is x, y and z, separated by spaces and with one point per line. The "File to write results to" must be non-blank.

No decimals for output: input 3

number of decimal places to use for the x, y and z values

Process: button

when this button is pressed, the grid of either the tin minimums or maximums is created and written to the file
16.15 Sections

**Position of menu:** Tins => Sections

The triangles => sections menu contains options involving sections through the tin.

The sections walk-right menu is

```
Tin Sections
Long section
Mesh
Polygon sections
X sections
```

- section along a string
- create sets of sections through tin at right angles
- limit sections to a polygon
- x-sections along a string

For the option **Long section**, go to [16.15.1 Long Sections](#).

Mesh, [16.15.2 Mesh](#)

**Polygon sections** [16.15.3 Polygon Sections](#)

**X-sections** [16.15.4 X-Sections](#)
16.15.1 Long Sections

**Position of option on menu:**  
Tins => Sections => Long Section

The long section option calculates the section through a tin along a particular string. This option is rarely used because tins are automatically profiled through on the section view and in long section and x-section plots.

On selecting the **long section** option, the **long section along a string** panel is displayed.

![Long Section along a String Panel]

The fields and buttons used in this panel have the following functions.

</tbody>
</table>
16.15.2 Mesh

**Position of option on menu:**  
Tins => Sections => Mesh

A 12d Model mesh is simply a series of lines cutting through the tin (sections) at a given angle and spacing, and at right angles to the given angle with the same spacing.

A mesh is an effective method of visualizing a triangulation when displayed in a perspective view and for hidden views.

On selecting the mesh option, the mesh over tin panel is displayed.

![Mesh Over Tin Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

One set of sections are calculated along straight lines at the angle given by the angle field and at a separation given by the dist field and the second set at right angles to the first set.</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
<esc> can be used to abort the mesh option.
16.15.3 Polygon Sections

**Position of option on menu:**  Tins => Sections => Polygon sections

In the **polygon sections** option, sections are calculated for a series of parallel lines covering the polygon, or if no polygon is given, the tin. The angle of the parallel lines and the distance between them are set by the user.

This option provides a quick method for producing a one directional set of sections covering a polygonal region on a tin.

On selecting the **polygon sections** option, the **sections within a polygon** panel is displayed.

![Sections Within a Polygon](image)

The fields and buttons used in this panel have the following functions.

<table>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Sections within the polygon selected by poly** will be calculated along parallel straight lines at the angle given by the **angle** field and at a separation given by the **dist** field. The sections are made against the tin given by the Tin field. The sections colour is that given in the **colour** field and the section strings
are placed in the model given in the model field.
16.15.4 X-Sections

**Position of option on menu:** Tins => Sections => X Sections

The X-sections (cross sections) option calculates cross sections at a given interval along a string.

On selecting the x-section option, the **x-sections along a string** panel is displayed.

![X-Sections Along a String panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

*select the string to calculate the x-sections along.*

**Section**  
button

*calculate the x-sections along the string selected by the pick button, against the tin given in the tin field. The resulting x-section strings are added to the model given in the model for x-sections field.*
16.16 Sharing

**Position of menu:**  Tins => Sharing

Sharing allows tins from a project (the server project) to be added to other projects (client projects).

Before any tins can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The **Sharing** walk-right menu is

```
Shared Tins ✓
Share
Add
Remove
Synchronize
```

- **Share** allow tins in this project to used by other projects
- **Add** add a shared tin from another project
- **Remove** remove a tin shared from another project
- **Synchronize** updated tins shared from other projects

For the option **Share**, go to  
16.16.1 Share Tins

For the option **Add**, go to  
16.16.2 Add Shared Tins

For the option **Remove**, go to  
16.16.3 Remove Shared Tins

For the option **Synchronize**, go to  
16.16.4 Synchronize Shared Tins
16.16.1 Share Tins

**Position of option on menu:** Tins => Sharing => Share

Before tins in a server project can be added to client projects, the tins must be made available for sharing in the server project by using the Share option.

All tins that have been made available for sharing are displayed in tin lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

This option also can reverse the process. That is, remove the availability of a tin for sharing. If this is done then clients who have shared this tin will be warned when starting up their project and/or synchronizing occurs.

Selecting Share displays the **Share Project Tins** panel.

The fields and buttons used in this panel have the following functions.
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>

All the models in the project are listed in the **Share Project Tins** panel and if a tin has been tagged for Sharing, a ticked will be displayed in the **Share** column of the grid.

**Pattern**

If a pattern is typed then all the tins matching the pattern will have a tick placed in the **Share** column. If * is typed then all tins are ticked for sharing.

**Share**

tick if the tin is to be made available for sharing when the **Set** button is pressed.

All tins that have been made available for sharing are displayed in tin lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

Clicking RB on **Share** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.

**Tin**

this column lists all the tins in the project

**Share as**

an optional name with which the tin will be shared out to clients. Leave it blank to share under the original name.

**Only show project tins**

tick box

if ticked, only tins originating from the current project are shown.

**Set**

button

clicking **Set** marks all the tins with a tick in the **Tick** column as being available for sharing. Those tins without a tick will not be available for sharing.
16.16.2 Add Shared Tins

**Position of option on menu:**  Tins =>Sharing =>Add

The Add option is used to add shared tins from a server project, to this project (a client project). All tins that have been added as shared tins are displayed in tin lists in a colour defined by an environment variable. The default colour is blue.

Selecting Add displays the Add Shared Tins to Project panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder</td>
<td>folder box</td>
<td>select folder</td>
<td></td>
</tr>
</tbody>
</table>

*folder to look for 12d Model projects. When a folder is selected, all the 12d Model projects in the folder will be displayed in a Projects pop-up list.*
name of the **12d Model** project in the folder given in the **Folder** field, to search for tins marked for sharing. Once a project is selected, all the tins marked for sharing from that project will be listed in the *Original Tin Name* column.

**Search/Replace**

section for renaming tins from the selected server project

**Match sub strings**

**tick box**

*If ticked*, the **Search** expression is used to match against part of each tin name.

*If not ticked*, the **Search** expression is used to match against the entire tin name.

**Pattern expression**

**radio button**

*If set on, then Pattern expressions given in the **Search** and **Replace** fields are used to modify tin names. Pattern expressions include the standard wild card * and wild character !.

**Search**

*pattern to search for in the tin names. For example "* exist" will select all tins with a name ending with " exist"

**Replace**

*replacement for the search pattern found in the tin name. For example, "exist " in the Replace field, takes the matched part of the tin name and adds "exist " to the front of it.

*Hence the Search pattern "* exist" and Replace pattern "*" finds all tin with names ending in " exist" and renames them with the name starting with "exist " (and the " exist" at the end of the name is dropped off).

**Regular expression**

**radio button**

*If set on, then Regular expressions given in the **Search** and **Replace** fields are used to modify tin names.

**Search**

*regular expression to search for in the tin names.

**Replace**

*replacement for the search expression found in the tin name.

**Tin Names Grid**

The tins available for sharing in the selected project are shown in the *Original Tin Name* column. Any renaming by the Search and Replace expressions are shown in the *New Tin Name* column. Note that if the tin already exists in the current project, then the cell for that model in *Original Tin Name* column will be displayed in yellow.

**Add**

*tick boxes in grid column

*If ticked*, the tin will be added to the project when the **Add** button is pressed.

*If not ticked*, the tin will not be added to this project as a shared tin.

*Clicking RB on Add at the top of the column brings up a menu to Clear which turns all the ticks off.

*Note - a shared tin that has been previously added can only be removed by using the Tins => Sharing => Remove option.*

**Original Tin Name**

*column

*this column lists all the tins in the server project that are available for adding to this client project.

**New Tin Name**

*column

*if non blank*, the name to use instead of the Original Tin Name when the tin is added to the project.
If blank, the Original Tin Name is used for the tin when it is added to the project.

The New Tin Names can be from applying the **Search and Replace**, or by just typing them in.

**Model for Tin**

<table>
<thead>
<tr>
<th>Grid column</th>
<th>if non blank, the model name to use in the client project for this tin added to the project</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If blank, the model name is the same as that in the server project.</td>
</tr>
</tbody>
</table>

**Status**

<table>
<thead>
<tr>
<th>Output column</th>
<th>displays if their has been a match or no match for the search/replace for renaming tins</th>
</tr>
</thead>
</table>

**Add**

*add to this project (a client project) as a shared tin, the ticked tins given in the Original Tin Name field from the project given in the **Project** field, and add them to the model in the Model for Tin field.*

**Refresh**

*clicking Refresh refreshes the list of all tins available for sharing in the selected **12d Model** project (server project).*
16.16.3 Remove Shared Tins

**Position of option on menu:**  
Tins => Sharing => Remove

The **Remove** option is used to remove shared tins from the project. The shared tins would have been previously added to the project with the Tins => Sharing => Add option.

Selecting **Remove** displays the **Remove Shared Tins from Project** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>

Sharing

pattern to search for in the tin names. For example "* exist" will select all tins with a name ending with " exist"

Regular expression radio button
if set on, then Regular expressions given in the Search field are used to select shared tin names.

Search input
regular expression to search for in the shared tin names.

Tin Names Grid
list of all shared tins added to the project.

Remove tick boxes in grid column
if ticked, the tin will be removed from this project as a shared tin when the Remove button is pressed.
Clicking RB on Remove at the top of the column brings up a menu to Toggle the ticks, Set all the ticks on, Clear to turn all the ticks off.

Tin Name grid column
this column lists all the tins in this project added as shared tins from other server projects

Share path
this column lists the path name to the server project and the original tin name in the server project

Status grid column
displays if their has been a match or no match for the Search for selecting shared tins

Remove button
clicking Remove removes as shared tins form this project, all the tins with a tick.

Refresh button
clicking Refresh refreshes the list of all shared tins previously added to the project
16.16.4 Synchronize Shared Tins

**Position of option on menu:**  Tins => Sharing => Syncronize

The **Synchronize** option is used to updated any added shared tins. The shared tins would have been previously added to the project with the Tins => Sharing => Add option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section 7.6.13.4 Project Share Settings.

Selecting Synchronize displays the **Synchronize Shared Tins** panel.

![Synchronize Shared Tins panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Synchronize</strong></td>
<td>tick boxes in grid column</td>

<td><strong>Type</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Redraw views tick box

Whether or not to redraw all the views any of the synchronized tins are on.

Refresh button

clicking Refresh refreshes the list of all shared tins previously added to the project
16.17 Delete

**Position of menu:**  Tins ➞ Delete

The delete option is used to delete tins from the project and from the computer disk so that they no longer can be accessed or take up disk space.

To help protect against disasters, a yes-no pop-up menu is used to confirm that the user did intend deleting the tin. If deletion is confirmed, the selected tin is removed from the project (if its in the project) and deleted from the disk.

If a 12d Model trash bin is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

The tin Deletes walk-right menu is

For the option *Delete a tin*, go to 16.17.1 Delete a Tin

For the option *Delete all tins*, go to 16.17.2 Delete All Tins
16.17.1 Delete a Tin

**Position of option on menu:**   Tins => Delete => Delete a tin

The delete a tin option can be used to delete a tin in the project.

If a 12d Model trash bin is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

On selecting the delete a tin option, the delete tin panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>input</td>
<td>project tins</td>
<td></td>
</tr>
</tbody>
</table>

- *name of the tin to be deleted from the computer disk.*

- **Delete tin models if empty**   tick box

  if ticked then the models containing the tin are also deleted if they are empty after the tin is deleted.

- **Permanently delete**   tick box

  if tick, the deleted tins will not go to the trash bin but will be permanently deleted from disk.

- **Delete**   button

  after selecting this button, the tin given in the tin field will be deleted from the computer disk. A **yes-no** pop-up is used to confirm that deletion is required.
16.17.2 Delete All Tins

**Position of option on menu:** Tins => Delete => Delete all tins

The delete all option will delete all tins in the working project. It does not delete tins that are in the working project area but not yet added to the project.

If a 12d Model trash bin is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

On selecting the delete all option, the delete all tins panel is displayed.

![Delete All Tins Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete tin models if empty</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Permanently delete</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Delete</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Delete tin models if empty** tick box
  - if ticked then the models containing the tins are also deleted if they are empty after the tins are deleted.

- **Permanently delete** tick box
  - if ticked, the deleted tins will not go to the trash bin but will be permanently deleted from disk.

- **Delete** button
  - after selecting this button, a yes-no pop-up is used to confirm that deletion is required. If it is, all tins in the working project will be deleted from disk. Unless an error occurs, the panel will be removed.
17 Survey

Position of menu: Survey

The Survey walk-right menu is laid out to reflect the normal sequence of operations when handling field survey data.

The description of the options on the Survey menu assumes that the reader is familiar with surveying, the 12d Model method of field coding for their particular data collector, data collector definitions and the 12d Model field file.

A description of the 12d Model field coding and data collector definitions is given in the Appendix 36 12d Survey Guide.

17.2 Network
17.3 Setup
17.4 Download Raw
17.5 Convert Raw
17.6 Create Survey Function
17.7 Edit Survey Function

17.17 Trimble
17.18 Setout
17.19 Upload
17.20 TP Stakeout/Setout
17.1 12d Field

**Position of menu:**  Survey => 12d Field

The 12d Field module is for communicating directory with survey grade GPS units and Total Station theodolites through radio, blue tooth, Wi-Fi and cable. Survey data is displayed live on screen in conjunction with full road project design and existing surface data.

Because of its specialist nature, the documentation of the 12d Field module is in a separate chapter and also in the 12d Field Training manual.

The 12d Field walk-right menu is:

![12d Field Menu]

See 18 12d Field.- this is a separate chapter on 12d Field.
17.2 Network

Position of option on menu:  Survey => Network
Selecting Network brings up the Network menu

See

17.2.1 Creating a Least-Square Network
17.2.2 ePlan - this refers to a separate chapter on ePlan.
17.2.1 Creating a Least-Square Network

**Position of menu:** Survey => Network => Least-square

Selecting **Least-square** brings up the Create Least-square Network panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

</table>
17.2.2 ePlan

Position of menu:  Survey => Network => ePlan

See 19 ePlan... this is a separate chapter on ePlan.
17.3 Setup

Position of option on menu:  Survey => Setup
Selecting Setup brings up the Survey data setup panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data collector</td>
<td>input</td>
<td>available data collectors</td>
<td></td>
</tr>
</tbody>
</table>

name of the data collector definition used to define how to read and interpret the raw survey data file. The list of available data collectors definitions is given in the file pointed to by the environment variable DATA_COLLECTORS_4D.

A data collector definition can be created/edited by
(a) clicking on the choice button at the end of the Data collector panel field and selecting [Edit] at the bottom of the pop-up list of defined data collectors to bring up the Survey.4d Edit/Create panel.

(b) using Project=>Browse=>Survey data collectors the create/edit the Survey.4d file. Please see the 36.9 Data Collector Definitions of Appendix 36 12d Survey Guide for more information on setting up a data collector definition.

Station prefix input
if non-blank, the prefix to be used for any text given for new instrument stations.

Set button
store the selected data collector as being the currently selected one.

Note: Selecting [Edit] at the bottom of the pop-up list of data collectors will bring up the Survey.4d Create/Edit panel.
17.4 Download Raw

Position of option on menu: Survey => Download raw

The download raw option will read data from the data collector connected to the computer’s serial port, save it in a file (the raw data file) and once the download is completed, automatically convert the raw data file into a 12d field file using the currently defined data collector.

Hence the download option downloads data from the data recorder and creates a data collector raw file and an equivalent 12d field file.

For more detailed information on the survey reduction process in 12d Model, go to the Appendix 3.6 12d Survey Guide.

Selecting Download raw brings up the Survey Data Download panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>input</td>

<td>tick</td>
<td>from configuration file</td>
<td></td>
</tr>
</tbody>
</table>

![Survey Data Download panel](image.png)
if ticked, use RTS/CTS flow control

**XON/XOFF**

- tick from configuration file

if ticked, use Xon/Xoff

**ACK/NAK**

- tick from configuration file

if ticked, use ACK/NAK

**12d Field file**

- input *.fld files
  
  name of the 12d field file that the raw file is to be converted to. The raw file is given the same name but with the extension specified in the configuration file, e.g., "*.gre".

**Download**

- button

  On clicking the download button, the software will read a data stream from the serial port and store the raw data into a file. The extension of this file, will be specified in the configuration file. The name will be the same as the field file, with any "*.fld" removed.

  On completion of the download, the raw data file is automatically converted to a 12d field file of name given in the field file field.
17.5 Convert Raw

Position of option on menu:  Survey => Convert raw

The convert raw option is used to convert an existing raw data file of the type given by the data collector setup, into a 12d field file.

The raw data file may have been previously downloaded by 12d Model or obtained via another mechanism.

For more detailed information on the survey reduction process in 12d Model, go to the Appendix 36 12d Survey Guide.

Selecting Convert raw brings up the Survey Data Convert Raw panel.

![Survey Data Convert Raw panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>convert the raw data given in the raw file field into the 12d field file format and save it in the file given in the field file field.</td>
<td></td>
</tr>
</tbody>
</table>
17.6 Create Survey Function

Position of menu: Survey => Create

The create walk-right menu contains options to create a 12d Model Survey function from either a 12d field file or from scratch using Survey Reduction edit commands.

Basically, a Survey function keeps track of the field data, the information involved in the survey reduction and all the strings and models created by the Survey function. The field data for the Survey function can be edited and the reduction re-run and all the old reduced strings automatically deleted and replaced by the updated reduced strings.

For more detailed information on the survey reduction process in 12d Model, go to the Appendix 36 12d Survey Guide.

The field data can be read in from a 12d field file using the Field file option, or the Typed entry option can be used to enter all the data by hand.

The create walk-right menu is:

For the option Field file, go to 17.6.1 Field File
Typed entry 17.6.2 Typed Entry
17.6.1 Field File

Position of option on menu: Survey => Create => Field file

The field file option creates a Survey function from a 12d field file.

For more detailed information on the survey reduction process in 12d Model, go to the Appendix 36 12d Survey Guide.

Selecting field file brings up the survey data reduction function panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function name</td>
<td>input</td>
<td>available Survey functions</td>
<td>name of the 12d Survey function. If the Survey function exists, then it is loaded into the panel. If the Survey function does not exist, then a new Survey function is created.</td>
</tr>
<tr>
<td>Default model</td>
<td>input</td>
<td>available models</td>
<td>if a feature code is not found in the map file, or no map file is selected, the strings and points of that feature code will be placed in the default model. The colour used will be the default line or point colour for 12d Model. The default model field is compulsory. Check measurements will be always placed in the default model if a check model is not given (on the Advanced tab).</td>
</tr>
</tbody>
</table>
Report file input *.rpt
if non-blank, a log of the reduction steps, including new instrument stations, new target heights, scale factors, backsights and check measurements is created. Any errors are also logged.

Button at Bottom

Reduce button
On clicking the reduce button, the software converts the field measurements in the selected 12d field file, using coordinates from the control model if necessary, and produces super strings. The super strings will be assigned names and models using the name library and map file.

For descriptions of each of the tabs on the panel, go to:
- Field Files tab
- Map File tab
- Libraries tab
- Advanced tab
- Traverse tab
- Geodetics tab
- Others tab
- Attachments tab

Field Files tab
list of field files to read in
Create Survey Function

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field file</td>
<td>input</td>
<td></td>
<td>*.fld files</td>
</tr>
</tbody>
</table>

*name of the 12d field file to be read into the function as its initial field data, and then reduced. The field data in the Survey function can be edited either by command or graphically.*

| Attachment wildcards    | input   |          | not yet used    |

*not yet used*
Map File tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map file</td>
<td>input</td>
<td>*.mf files</td>
<td></td>
</tr>
</tbody>
</table>

*If non-blank, the map file is used to map feature codes to string names, models, colours, line styles, etc. In general, strings will be created as line strings by assigning a non-zero string number in the field, and strings will be created as point strings by assigning a zero string number in the field. This behaviour may be overridden with field codes 92, 93 and 94.*

<table>
<thead>
<tr>
<th>Pre*postfix for models</th>
<th>input</th>
<th>available models</th>
<th></th>
</tr>
</thead>
</table>

*The pre*postfix for models text is applied to all model names in the map file.*

| Use pt/line mapping        | tick   |                 |             |

*If ticked and a Map File is used, the column in the map file that specifies the point/line type of the string is be used to set the point/line type of the string. If not ticked and a Map File is used, the column is ignored (not used for setting point/line type of the string).*
Libraries tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name library</td>
<td>input</td>
<td>*.nl files</td>
<td></td>
</tr>
</tbody>
</table>

If non-blank, the **name library** can be used to automatically create vertex text for the string if no vertex text is given in the field. A name library file contains two columns separated by one or more spaces. The text in the first column is matched against the feature code (wild cards * and ? can be used). The second column contains the vertex text to use if a match occurs. Note that if vertex text is given in the field then it is used instead of the text in the name library.

Pre-super strings: if non-blank, the **name library** will be used to automatically create 4d strings and to assign text to 4d strings. Name library files will contain two columns. The first column in the name library will be matched against the feature code. Note that if a match is found, a 4d string is always created, as opposed to another string type. The second column will contain the text for the 4d string.

| Attribute library | input    | *.al files|        |

If non-blank, the **attribute library** is used to give names to any unnamed attributes. The first word of each line in the file is the code to define the attribute for (can include wild cards) and the next n words are the names for each unnamed attribute in order. If the attribute library is mission, then the unnamed attributes will be given the names **unnamed attribute i** for i=1, ....
### Advanced tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Heights model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Check model</td>
<td>input</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Curvature/refraction correction</td>
<td>tick box</td>
<td>tick</td>
<td></td>
</tr>
<tr>
<td>Job swing</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Control model**: If not blank, name of the model containing instrument and backsight stations that can be referenced during the reduction. The name of the string is taken as the station name and if the string contains more than one point, the first point in the string is used for the coordinates of the station.

- **Heights model**: In not blank, name of the model containing points that are used for the heights of points during reduction. The points in the heights model have the point id of required point and a height which is used whenever that point id is found in the reduction. The (x,y) co-ordinates of the point are ignored.

- **Check model**: If non-blank, then all check shots will go to this model. If blank then check shots go to the default model.

- **Curvature/refraction correction**: If ticked, during the reduction, each EDM tacheometry measurement (field code 7) has a correction for earth curvature and refraction applied to the measurement.

- **Job swing**: If non-blank, then the job is swung through this value. The rotation is in a clockwise direction and the
value is in hp dms format.

**Use GIS post processing** tick box  
if ticked, run the given 12d macro to process attribute blocks

**Join strings across field files** tick box  
if ticked, points with the same code and string number will be included in the same string in any of the field files. The order that the points are placed in the string is the order of the field files in the Field File tab.  
if not ticked, any strings will terminate at the end of a field file. Even if the string has the same name and string number is any following field file, a new string is started in the following field files.

**Use coordinate commands (opcode 2)** tick box  
if ticked,

**Allow backsights with Azimuth to calc coordinate** tick box  
If ticked, for backsight commands that reference unknown backsight points, and the backsight has the horizontal angle, vertical angle, slope distance, and Azimuth defined, the backsight point will be created from that information.  
This option was only included to allow reduction from legacy external formats, and should not be used as it is not good survey practise.

**Traverse tab**

The fields and buttons used in this panel have the following functions.
**Field Description** | **Type** | **Defaults** | **Pop-Up**
---|---|---|---
**Do traverse calcs** | tick box | not tick |  
*if ticked*, the traverse coded points are placed into a network model, and an adjustment done at the time of reduction.

**Traverse code** | input |  
*if valid, this code will be used to identify traverse data. This will effectively be the same as stringing features in the field except the user has the option of isolating the model, adjusting the strings etc.*

E.g. TL. The reduction function will look at the field file and extract any observations involving field codes with the TL code. Only backsights and measurements with the point name field populated will be processed.

*Each traverse will have a separate string number. i.e. The main traverse with a feature code/string number of e.g. TL7 and a side traverse having a feature code/string number of e.g. TL3. Note the string numbers do not have to be in any particular order. The reduction will determine the order on which the separate traverses will be processed (by dependencies).*

See [36.6 Traverse coding](#) in Appendix [36 12d Survey Guide](#).

**Adjustment method** | choice | bowditch, compass, transit, least square, none |  
*method of adjustment. The adjustment will be made to the extracted traverse strings from known point to known point. If a traverse string goes through a number of known points (known coordinates), the adjustment will made from known point to known point rather than the first known to the last known point.*

**Network model** | model box |  
*if non blank, any valid traverse strings are placed in this model*
Geodetics tab

<td></td>
<td>If ticked, when a check measurement is processed a panel is displayed showing the calculated (x,y,z)</td>
</tr>
</tbody>
</table>
What's New in 12d Model

for the check measurement.

**Backsight prompt mode**  choice box  prompt, assume yes  assume no

*If prompt*, then the backsight panel is brought up in a command has not been answered adequately previously or if something has changed that warrants a redisplay of the panel.

*If assume yes*, then *yes* is assumes for all the backsights and the panel is not brought up.

*If assume no*, then *no* is assumes for all the backsights and the panel is not brought up.

**Attachments tab**

![Survey Data Reduction Function](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Wildcard(s)</strong></td>
<td>space delimited list of wildcards for attaching files to shots. For example, photo images taken in the field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Tolerance (seconds)</strong></td>
<td>input</td>
<td>600</td>
<td></td>
</tr>
</tbody>
</table>

*The shot must be taken first and then any files with time less than this number of seconds after the shot, but before any subsequent shots, are attached to the shot.*
Photos to plan images  tick box
if ticked, 12d plan images are created for any attached image in jpeg, tiff, bmp or png format

During the reduction, the coordinates of a point may need to be supplied. This occurs when:
- an undefined point is named as the new instrument point (field code 3)
- backsight measurements are made to an undefined point (field code 4)
- check measurements are made to an undefined point (field code 6)

In this situation, a **define station coordinate** panel will pop up:

![Define Station Coordinate Panel](image)

The coordinates may be typed in, or selected from existing strings. The station may also be added to a model to allow it to be used as a station later.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Station name</td>
<td>output</td>
<td></td>

</tr>
<tr>
<td></td>
<td><strong>on selecting ok, the coordinates entered in the station xyz field are used as the station co-ordinates</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
and if the add to model field is not blank, a 4d string created.

**Edit** button

on selecting Edit, the next new instrument station entry is shown which allows the station number and associated fields to be edited.

**Cancel** button

the cancel button will remove the panel and terminate the reduction.

If the Backsight prompt mode is set on, then at each backsight measurement, the bearing datum difference panel is displayed.

If **yes** button is selected, the bearing datum difference is applied to this horizontal circle reading.

If **yes to all** button is selected, the bearing datum difference is applied to all subsequent horizontal circle readings.

The **cancel** button terminates the reduction.

If **no** is selected, this horizontal circle reading is treated as actual bearing.

If **no to all** is selected, all the horizontal circle reading are treated as actual bearings.

This facility allows the horizontal circle to have any orientation during data capture.

At each check measurement, the check measurement panel is displayed giving information about the measurement, the point it was a check measurement for and the differences between the two.
If the Continue button is selected, the reduction continues.
The Cancel button terminates the reduction.

17.6.2 Typed Entry

Position of option on menu: Survey => Create => Typed entry

The Typed entry option creates a Survey function from scratch using the edit commands.

For more detailed information on the survey reduction process in 12d Model, go to the Appendix 36 12d Survey Guide.

Selecting Typed entry brings up the survey Data Typed Entry Function panel.
17.7 Edit Survey Function

Position of menu: Survey => Edit => Edit Reduction

The Edit walk-right menu is

- edit 12d Survey function
- edit field data for a 12d Survey function
- edit 12d Survey function by selecting a string
- point code correction
- re-order points
- graphically selected field edits for individual shots
- graphically selected field edits for strings
- insert and/or modify target heights

The fields and buttons are identical to those in the Survey Data Reduction Function panel in the previous section 17.6.1 Field File.
The Edit reduction walk-right menu contains options to create a 12d Model Survey function from either a 12d field file or from scratch using Survey Reduction edit commands.

Basically, a Survey function keeps track of all the information involved in the survey data reduction and all the strings and models created by the Survey function. The Survey function can be re-run and all the old information automatically deleted and replaced by the updated information.

Once the Survey function is created, it then reduces the data according to the information supplied and stored with the Survey function. As with other 12d Model functions, the Survey function information can be modified and the function recalculated.

Many errors in a raw data file are only detected after the reduction has taken place. These are then corrected and the function recalculated to re-reduce the data.

Some of the types of problems that regularly occur during electronic field surveys are:

- Instrument height incorrectly entered
- Target height incorrectly entered
- Change of target height not entered
- Backsight station incorrectly named
- Instrument station incorrectly named
- Feature code and string number errors

The 12d Survey edits allow for all commands in the field data to be modified and new commands added. Selection for some edits can be done graphically (for example incorrect target height) and others through interactive editing of the Survey field data. In all cases, once the edit is completed, the effect is immediately calculated and displayed.

For more detailed information on the survey reduction process in 12d Model, go to the Appendix 36 12d Survey Guide.

Each option will now be described in detail.

For the option Function, please go to

- 17.7.1 Function
- 17.7.2 Field Data
- 17.7.3 Field Data by String
- 17.7.4 Coding
- 17.7.7 Order
- 17.7.8 SDR Point Edits
- 17.7.9 SDR Strings Edit
- 17.7.10 Target Height

### 17.7.1 Function

**Position of option on menu:** Survey => Edit => Function

The function option is used to edit the set-up panel values for a Survey function.

**Note** - to edit the field data rather than the set-up panel, the Field data option is used.

Selecting Function brings up the Survey Data Reduction Function panel (which is the same panel used to create the function in the Survey => Create => Field file option).
A Survey function is selected for editing by choosing the survey function from the **Function name** pop-up list which loads up the panel information for that function.

The panel information is then modified and the new values stored and used by selecting the **Reduce** button. This recalcs the function which re-reduces the data using the new panel fields.

For more information on the fields in the panel, go to the section **17.7 Edit Survey Function**.

For information on the **Survey Field Data Editor**, go to the section **17.7.5 Survey Field Data Editor**.

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix **36 12d Survey Guide**.

Please continue to the next section **17.7.2 Field Data**.

### 17.7.2 Field Data

**Position of option on menu:** Survey => Edit => Field data

The **field data** option is used to edit the **field data** from a Survey function. As the changes are made, the field data is automatically reduced to reflect the changes.
Selecting **Field data** brings up the **Edit Survey Field Data** panel:

![Edit Survey Field Data panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Function name</strong></td>
<td>function box</td>
<td>all survey functions</td>
<td><em>name of the Survey function to have the field data modified.</em></td>
</tr>
</tbody>
</table>

**Edit**

Clicking **edit** will start the Survey Field Data Editor for the given Survey function. This will be documented in the section **Survey Field Data Editor**.

For information on the **Survey Field Data Editor**, go to the section [17.7.5 Survey Field Data Editor](#).

Please continue to the next section [17.7.3 Field Data by String](#).

### 17.7.3 Field Data by String

**Position of option on menu:**  
Survey =>Edit =>Field data by string

The **Field data by string** option is used to edit the **field data** by selecting a string created from a Survey function.

Selecting **Field data by string** brings up the **Edit MTF/Survey Function Data** panel:

![Edit MTF/Survey Function Data panel](image)

After selecting the **Pick Edit** button, a string created by Survey function is selected and the Survey Field Data Editor is started for the given Survey function.

For information on the **Survey Field Data Editor**, go to the section [17.7.5 Survey Field Data Editor](#).

Please continue to the next section [17.7.4 Coding](#).

### 17.7.4 Coding

**Position of menu:**  
Survey =>Edit =>Coding

The **coding** options are used to modify the feature code and/or string number of selected points. The 12d field file is automatically updated.

The **coding** walk-right menu is
Each option will now be described in detail.

For the option Change, go to 17.7.4.1 Change
Quick change 17.7.4.2 Quick Change
Quick multi-code 17.7.4.3 Quick Multi Coding

17.7.4.1 Change

Position of option on menu: Survey => Edit => Coding => Change

Change is used to modify a points feature code and/or string number. When a point is selected, its point id, station name and target height are displayed as well as feature code and string number.

If either the feature code or string number is then modified in the panel, selecting the set button will give the selected point the new values for feature code and/or string number.

Selecting Change brings up the SDR Change Code/String panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Point id</td>
<td>display only</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Station name</td>
<td>display only</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.

move to the previous point in the string.

move to the next point in the string.

point id of the selected point.
What's New in 12d Model 17

17.7.4.2 Quick Change

Position of option on menu: Survey => Edit => Coding => Quick change

The quick change option is for more advanced users wishing to modify the same feature code and/or string number for many points.

The new feature code and/or string number is entered into the panel and whenever a point is selected and accepted, it is given the new feature code and/or string number. The picking of points continues until the picking is cancelled from the pick ops menu.

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up |
--- | --- | --- | --- |
Feature code | input/output | if not blank, when a point is accepted its feature code is changed to the value in this field. |
String number | input | if not blank, when a point is accepted its string number is changed to the value in this field. |
Same as | button | |

Please continue to the next section 17.7.4.2 Quick Change.
after selecting **same as**, a point is selected and its feature code and string number are piped into the panel fields.

**Pick button**

*selecting pick* starts the picking sequence and any accepted point will have its feature code and/or string number modified if the corresponding panel field is not blank. The pick is terminated by selecting **cancel** from the **pick ops** menu.

Please continue to the next section **17.7.4.3 Quick Multi Coding**.

17.7.4.3 Quick Multi Coding

**Position of option on menu:**  
Survey =>Edit =>Coding =>Quick multi-code

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pick button</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*after selecting Pick, pick the vertex that you want to multi-code, and then pick a string and the code and string number from the string will be added to the selected vertex as a multi-code.*

The sequence start again and continues until the pick is terminated by selecting **Cancel** from the **Pick ops** menu.

Please continue to the next section **17.7.5 Survey Field Data Editor**.

17.7.5 Survey Field Data Editor

The **Survey Field Data Editor** is used to interactively edit the field data of a **Survey** function. All the commands in the field data can be modified or deleted, or new commands added. When changes are made, the field data is automatically re-reduced so the effects can be immediately checked.

If the Editor is opened using the **Survey=>Create=>Typed Entry** option the editor will appear blank.
For information on using things inside the panel, go to 17.7.5.1 Using the Survey Field Data Panel.

For information on the field commands, go to 17.7.6 List of Field Data Commands and Panels.

For information on the icons and buttons on the panel:

- **Insert** go to Insert and Batch Add button
- **Delete** Delete
- **Go to** Goto
- **Find** Find
- **Find/Replace** Find/Replace
- **Find by Pick** Find by Pick
- **Toggle** Toggle
- **Make backsight** Make Measurement into a Backsight
- **Make check measurement** Make Measurement into a Check Measurement
- **Change to measurement** Make into a Measurement
- **Autopan** Autopan
- **Batch add** Insert and Batch Add button

### 17.7.5.1 Using the Survey Field Data Panel

#### 17.7.5.1.1 Colour Coding of the Field Data

Normally data has been loaded into the Survey function by a raw data file being downloaded.
from a data collector, converted to a 12d field file and then loaded into a Survey function.

When 12d Model converts the raw file to a 12d field file, all the raw data can be included in the 12d field file as comments.

All comments lines are displayed in green.

Each line (or lines if necessary) of raw data is converted into one or more equivalent 12d field file commands. These field file commands are placed straight after the commented line containing the raw data lines so it is easy to see what the raw data was converted to.

The original 12d field commands converted form the raw data are displayed in black.

If a field command has been inserted, it is coloured in blue. If a comment has been inserted, it will still be displayed in green but the word : added will be appended to the end of the comment.

If a field command has been modified, it is displayed in magenta.

If an original command has been deleted, the original command is left in the file but it has a large red cross placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply deleting the command again.

17.7.5.1.2 Modifying the Field Data

To modify an existing command in the field data, double click on the line to be modified and the appropriate panel for the line of field data is displayed. The data in the panel can then be modified and stored by selecting either the OK or Apply buttons. The colour of the line of modified field data is then magenta.

For example, double clicking on target height command in the field file brings up the Target Height panel with the values loaded into the appropriate panel field. The data in the panel can be modified and saved by clicking OK.
17.7.5.1.3 Deleting Field Data

To delete a line from the field data, simply highlight the data by clicking in the line and then delete key on the keyboard or select the delete icon from the top of the panel. If the line was an original command, a red cross is placed.

If an original command has been deleted, the original command is left in the file but it has a large red cross placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleting command and pressing the delete icon or delete key again.

If an inserted command has been deleted, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the delete key on the keyboard or select the delete icon from the top of the panel. Similarly to undelete multiple commands.

For information on the field commands, go to 17.7.6 List of Field Data Commands and Panels.
For information on the icons and buttons on the Survey Field Data panel, go to 17.7.5.2 Icons and Buttons on the Survey Field Data Editing Panel.
Selecting either the icon or the **Batch Add** button, displays the **New Field Data Command** panel.

![New Field Data Command Panel](image)

By clicking on the **Command** choice box selector, a full list of field commands is displayed and the required command is selected from the list.

Clicking **Create** then brings up the panel for the selected command type. The description of the field data commands panels is given in the section [17.7.6 List of Field Data Commands and Panels](#).

Alternatively, if the **12d Field Data Op Code** is known, this can be entered into the choice box instead of selecting from the list. For example, to enter a **Measurement EDM** field data command, the number 7 can be inserted in the choice box field.

When using **Batch Add**, once a command is selected, it will remain as a default for subsequent entries until another type is chosen. This allows a number of the same command to be quickly entered such as in the case of **Measurement EDM** by entering data into the appropriate fields and continuing to press <enter> through the default choices.

For a more detailed explanation on each of the fields within the panels and the appropriate field **12d Field File Op Codes** see the section [36.10.4 Full Description of 12d Field File Op Codes](#).

For a summary of just the field file op codes, see the section [36.10.5 Summary of 12d Field File Op Codes](#).

### Delete

To delete a line from the field data, highlight the data by clicking in the line and then either use the **Delete** key on the keyboard or select the **Delete** icon from the top of the panel.

If an original command has been deleted, the original command is left in the file but has a large red cross placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleted command and pressing the **Delete** icon or **Delete** key again.

If an inserted command has been deleted, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the **Delete** key on the keyboard or the **Delete** icon from the top of the panel. Similarly to undelete multiple commands.

### Goto

Selecting the **Goto** icon brings up the **Field Data Goto** panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Line number</td>
<td>Goto</td>
<td>button</td>
<td></td>
</tr>
</tbody>
</table>

*Line number to go to*

*Goto* button: go to the given line number

### Find

Selecting **Find** brings up the **Field Data Find** panel.

Each of the tabs sets the panel for the required data.

- **Named**: find given code, string number, point id etc.
- **Numbers**: find numbers between given minimum and maximum.
- **State**: find a field command in a given modification state (added, changed, deleted, field)
- **Text**: find text containing given text.
- **Type**: find a field command of a given type. For example "New String".

The up/down radio button define which direction to search in the field data.
Find/Replace

Selecting the Find/replace icon brings up the Field Data Find/Replace panel.

![Field Data Find/Replace Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Old</td>
<td>Code</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>String number</td>
<td></td>
<td></td>
</tr>
<tr>
<td>New</td>
<td>Code</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>String number</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The user specifies the old and new Code and old and new String number fields, and the search and replace is done using those parameters.

The Up/Down radio button define which direction to search in the field data.

Find by Pick

After selecting Find by pick, the user selects a point created by the Survey function and the field data editor will scroll to the line of the field data that created the point.

Toggle

The toggle button allows commented information to be shown/ not shown. Simply press the Toggle icon to move from one state to another.

Make Measurement into a Backsight

The Make Backsight icon is visible when a measurement line has been selected (highlighted) in the field data.
When the measurement line is highlighted, clicking on the Make Backsight icon brings up the Backsight panel with the highlighted measurement details filled in.
The **Azimuth** and **Backsight point** fields are filled in and the **OK** or **Apply** button selected.
The original measurement will then be shown as deleted and a new Backsight record created.

Make Measurement into a Check Measurement

The **Make Check Measurement** icon is only visible when a **measurement** or **backsight** line has been selected (highlighted) in the field data.

When the measurement line is highlighted, clicking on the **Make Check Measurement** icon brings up the **Check Measurement** panel with the details from the highlighted measurement filled in.
The **Check point** is then filled in and the **OK** or **Apply** button selected. The original measurement will then be shown as deleted and a new **Check measurement** record created.

**Note** - if the **Check point** does not exist, a **Define Station Coordinate** panel is displayed for the user to enter the coordinates for the **Check point**.
Make into a Measurement

The Make into a Measurement icon is visible when a backsight or check measurement line has been selected (highlighted) in the field data.

When the measurement line is highlighted, clicking on the Make Measurement icon brings up the EDM Measurement panel with the highlighted backsight or check measurement details filled in.
The **String number** field may need to be filled in and the **OK** or **Apply** button selected. The original **backsight** or **check measurement** will then be shown as deleted and a new **Measurement** record created.
Ticked on - when a line is selected (highlighted) in the survey data editor panel, if the point is not visible in a plan view that the model for the data is on, the view is modified so that the selected point is at the centre of the view (keeping the same scale for the view).

Please continue to the next section 17.7.6 List of Field Data Commands and Panels.

17.7.6 List of Field Data Commands and Panels

Panel buttons

The buttons that appear on the bottom of the panels used in this section have the following functions.

OK
Changes field data and closes the panel

Apply
Changes the field data but keeps the panel in view

Reset
If the record was an original field record (i.e. the command was not inserted manually) pressing the reset button will revert the record back to the original values.

Help and Finish
standard 12d buttons.

Existing point search

Some commands such as Backsight, New instrument and Check allow the user to enter existing point names (i.e. backsight point, Setup point and Check point) or in the case of measurements from a data collector, both point name and point ids.

The difference between point names and point ids is that point names are usually specified by the user and should be a unique identifier for a point, whilst for that same physical point a number of measurements (and hence point ids) may be assigned (usually by the data collector). This may be particularly true of control station measurements where measurements are made to a given point name but each measurement is given a different point id by the data collector.

In most instances, a measurement to a point has a point id (from the data collector) and 12d automatically gives it the same point name as it is rare to measure a non-control point more than once (the point name can be over ridden by the user).

The names allow the reduction routine to search for the details of that point (eg coordinates). The order in which this searching takes place is as follows:

First search the Control model (if it exists):

1. A search is made of the control model for a string whose name is the same as the specified point name. If a string is found, the first point of the string is used for the (x,y,z) co-ordinates.

2. A search is made of the control model for a vertex of a string whose point id is the same as the specified point name. If a vertex is found its (x,y,z) co-ordinates are used.

3. If only a point id was specified, a search is made of the control model for a vertex of a string whose point id is the same as the specified point id. If a vertex is found its (x,y,z) co-ordinates are used.

Next search the already entered directly entered co-ordinates (DEC) in the field file:

4. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose point name is the same as the specified point name. If a
DEC is found, its (x,y,z) co-ordinates are used.

5. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose point id is the same as the specified point name. If a DEC is found, its (x,y,z) co-ordinates are used.

6. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose point id is the same as the specified point id. If a DEC is found, its (x,y,z) co-ordinates are used.

Next search the previous measurements in the field file:

7. A search is made of previous measurements in the field file for a measurement whose point name is the same as the specified point name. If a measurement is found, its (x,y,z) co-ordinates are used.

8. A search is made of previous measurements in the field file for a measurement whose point id is the same as the specified point name. If a measurement is found, its (x,y,z) co-ordinates are used.

9. A search is made of previous measurements in the field file for a measurement whose point id is the same as the specified point id. If a measurement is found, its (x,y,z) co-ordinates are used.

Finally

10. If no match is found, the user will be prompted for the details of the previously undefined point. The user is asked to type in the (x,y,z) co-ordinates in the Define Station coordinate panel. If a model is specified in the Add to model field of the panel, then a new one point super string is created with the name point name, and as the vertex text for the point, the Station label prefix field value followed by point name.

Field Data commands

The list of field commands in the pop-up from Insert or Batch Add are:

For a summary of the field file op codes see the section 36.10.5 Summary of 12d Field File Op Codes.

For details on each option in the pop-up:
Arc fitting end (opcode 62), go to Arc Fitting (opcodes 17, 60, 61, 62)
Arc fitting start (opcode 61) Arc Fitting (opcodes 17, 60, 61, 62)
Arc through last 3 points (opcode 17) Arc Fitting (opcodes 17, 60, 61, 62)
Arc through next 3 points (opcode 60) Arc Fitting (opcodes 17, 60, 61, 62)
Attachment (opcode 126) Attachment (opcode 126)
Attribute for next segment (Measurement) (opcode 122) Measurement Attributes (Opcode 120 to 123)
Attribute for next segment (integer) (opcode 74) Attributes (opcode 68 to 79)
Attribute for next segment (real) (opcode 75) Attributes (opcode 68 to 79)
Attribute for next segment (text) (opcode 76) Attributes (opcode 68 to 79)
Attribute for previous segment (measurement) (opcode 123) Measurement Attributes (Opcode 120 to 123)
Attribute for previous segment (integer) opcode 77 Attributes (opcode 68 to 79)
Attribute for previous segment (real) opcode 78 Attributes (opcode 68 to 79)
Attribute for previous segment (text) opcode 79 Attributes (opcode 68 to 79)
Attribute for string (measurement) (opcode 120) Measurement Attributes (Opcode 120 to 123)
Attribute for string (integer) (opcode 68) Attributes (opcode 68 to 79)
Attribute for string (real) (opcode 69) Attributes (opcode 68 to 79)
Attribute for string (text) (opcode 70) Attributes (opcode 68 to 79)
Attribute for vertex (measurement) (opcode 121) Measurement Attributes (Opcode 120 to 123)

**Arc Fitting (opcodes 17, 60, 61, 62)**

Fitting arcs through measurements.

See [36.3.9 Arcs Through Points](#), in Appendix [36 12d Survey Guide](#).
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>choice box</td>
<td></td>
<td>Arc through last 3 points (opcode 17)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Arc through next 3 points (opcode 60)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Arc fitting start (opcode 61)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Arc fitting end (opcode 62)</td>
</tr>
</tbody>
</table>

For *Arc through last 3 pts*

- Named point is not used.

If no feature code, string number, named point or point id is given, then the current measurement point and the two previous points with the same feature code and string number as the current measurement point, are joined by an arc. If there is less than three such points, no arc is fitted.

If the feature code and string number exist, the last three previous measurement points of the same
feature code and string number are joined by an arc. If the current measurement point has that feature
code and string number, then it is the third of the three points used. If there is less than three points, no
arc is fitted.
If a point id exists, then the feature code and string number are taken from the previous measurement
point with that point id. That point and two measurement points previous to the predefined point of
the same feature code and string number, are joined by an arc. If there is less than three points, no arc
is fitted.

for Arc through next 3 pts

Named point is not used.
If no feature code, string number, named point or point id is given, an arc is inserted through the
current measurement point and the next two measured points with the same feature code and string
number as the current measurement point. If there is less than three points, no arc is fitted.
If a feature code, string number or point id exists, then either the feature code and/or string number
and/or the point id section of the point description can be used.
If the feature code or string number exist, a search is made for a previously defined measurement with
the same feature code or string number. An arc is inserted through this previous measurement and the
next two measured points following this previous measurement with the same feature code and string
number. If the current point has that feature code and string number, then it is the first of the three
points. If there is less than three points, no arc fitted.
If the point id exists, then the feature code and string number are taken from the previous
measurement point with that point id, and an arc is inserted through that point and the next two
measurement points with the same feature code and string number. If there is less than three points,
no arc is fitted.

for Start arc fitting

Named point is not used.
If no feature code, string number, named point or point id is given, arcs are inserted through the
following sets of measurement points with the same feature code and string number as the current
measurement point. The current measurement point is the first of the points.
The arcs are fitted as follows - the first arc is fitted through points one, two and three, the next arc
through points three, four and five etc. If the current point has that feature code and string number,
then it is the first of the points. If there is less than three points, then no arc is fitted.
If the feature code and string number exist, a search is made for a previously defined measurement with
the same feature code or string number. An arc is inserted through the following measured points
with the same feature code and string number as given. If the current point has that feature code and
string number, then it is the first of the points.
If the point id exists, then the feature code and string number are taken from the previous
measurement point with that point id, and arcs are inserted through that point and the following
measured points with the same feature code and string number.

for End arc fitting

Named point is not used.
If no feature code, string number, named point or point id is given, the fitting of arcs through the
current string is stopped. The current measurement point is the last of the points used in the arc fitting.
If the feature code and string number exist, then the fitting of arcs through the points of the previous
string with the same feature code and string number is stopped. If the current measurement point has
that feature code and string number, then it is the last point used in the arc fitting.
If the point id from the point description exists, then the point with that point id is the last point used
in the arc fitting.
If 12d Model encounters an End Arcs (62) but no Start Arcs through sets of three points (61)
command for the string, then a Start Arcs through sets of three points (61) is assumed to apply at the
beginning of the string and hence arc fitting will be applied to the entire string.

**Code**

*feature code. See the description of the panel field Arc mode for usage*

**String number**

*string number. See the description of the panel field Arc mode for usage*

**Named point**

*not used*

**Point id**

*point id. See the description of the panel field Arc mode for usage*

**Comment**

*comment for the command within the field file.*

**OK, Apply, Reset, Finish, Help**  See the description for the panel buttons in the section Panel buttons.

**Attachment (opcode 126)**

Attach a file to the measurement.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td></td>
<td></td>
<td>Attribute for previous segment (text) (opcode 79)</td>
</tr>
</tbody>
</table>

for **String** (integer)
Add an user defined integer attribute to the current string.

for **String** (real)
Add a real (floating point) user defined attribute to the current string.

for **String** (text)
Add a text user defined attribute to the current string.

for **Vertex** (integer)
Add an integer user defined attribute to the current measurement point.

for **Vertex** (real)
Add a real (floating point) user defined attribute to the current measurement point.

for **Vertex** (text)
Add a text user defined attribute to the current measurement point.

for **Next segment** (integer)
Add an integer user defined attribute to the next segment from the current measurement point.

\textit{for Next segment (real)}

Add a real (floating point) user defined attribute to the next segment from the current measurement point.

\textit{for Next segment (text)}

Add a text user defined attribute to the next segment from the current measurement point.

\textit{for Previous segment (integer)}

Add an integer user defined attribute to the previous segment for the current measurement point.

\textit{for Previous segment (real)}

Add a real (floating point) user defined attribute to the previous segment for the current measurement point.

\textit{for Previous segment (text)}

Add a text user defined attribute to the previous segment for the current measurement point.

\textbf{Name}  
\textit{The name of the attribute.}

\textbf{Value}  
\textit{The attribute data in the form specified by the mode.}

\textbf{Time surveyed}  
\textit{time when the command (op code) was created}

\textbf{Comment}  
\textit{comment for the command within the field file.}

\textbf{OK, Apply, Reset, Finish, Help}  
See the description for the panel buttons in the section \textit{Panel buttons}.

\textbf{Attribute Set (opcode 124 and 125)}

This section of documentation is a work in progress and will be updated in subsequent releases.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute set start (opcode 124)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Attribute set end (opcode 125)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Backsight (opcode 4)**

Denote the measurement as a backsight measurement.

Individual backsight measurements can be entered, or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement, the backsight command should be entered twice, with the appropriate values entered into the panel each time.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Horizontal angle</strong></td>
<td>the horizontal angle to the backsight in dd.mmss format.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Vertical angle</strong></td>
<td>the vertical angle to the backsight in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Slope distance</strong></td>
<td>the slope distance to the measurement to the backsight. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td>the azimuth to the backsight in dd.mmss format. This allows backsights to be specified by azimuth only. In the case of a differing azimuth and horizontal angle, a swing will be computed by the subtraction of the azimuth value and the horizontal angle.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Code</strong></td>
<td>the feature code of the measurement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>String number</strong></td>
<td>the string number of the measurement.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Backsight point

point name of the backsight point. This can be an integer, real, text or alphanumeric. For a more
detailed description of how the reduction finds/uses the appropriate point see the section Existing
point search.

Point id

point id of the backsight point. This can be an integer, real, text or alphanumeric. For a more detailed
description of how the reduction finds/uses the appropriate point see the section Existing point
search. If a new backsight entry is inserted into the file, this field will be non-editable since only the
backsight point is required.

Attribute

Time surveyed
time when the command (op code) was created

Comment
comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons.

Backsight Reference (opcode 50)

Specify an angle (measured positive, clockwise from north) to swing the following measurements
by.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bearing swing</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time surveyed</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The direction of the swing is positive in the clockwise direction.

Time surveyed
time when the command (op code) was created
Comment

Comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons.

Buildings (opcodes 110, 111)

Create a building face.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td></td>
<td></td>
<td></td>
</tr>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time Surveyed</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**for Building end**

If no name exists, the current building face observation set is finished (including the current measurement point).

**for Buildings start**

Start recording a building face with the given name. If name is non-blank, then the default building face is defined by the feature code and string number.

The following measurements until a Finish code (111), are stored as the building face. There is no limit to the number of points in a building face.

Name

Name has the meaning as outlined above in Building end/start definition.

Time surveyed

Time when the command (op code) was created

Comment

Insert a comment within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons.
Check Coordinate (opcode 14)

This section of documentation is a work in progress and will be updated in subsequent releases

![Check Coordinate dialog box]

Check Measurement (opcode 6)

Denote the measurement as a check measurement.

Individual check measurements can be entered, or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement the check command should be entered twice, with the appropriate values entered into the panel each time.
The fields and buttons used in this panel have the following functions.

<table>
<thead>

</tbody>
</table>

Point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.
Attribute

Time surveyed

time when the command (op code) was created

Comment

insert a comment within the field file.

OK, Apply, Reset, Finish, Help  See the description for the panel buttons in the section  Panel buttons.

Height Or Depth (opcode 28)

Note - this option  does not alter heights. It just adds a text comment of the given value.

![Height or Depth Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>value is converted to text and added to the string name as specified in the description fields.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Code, String number, Named point

Named point is not used.

If no feature code, string number, named point or point id is given, the value is added to all string names with the same code and string number as the current measurement. This applies to the entire field file.

If the feature code and string number exist, then the value is added to all string names with the same code and string number. This applies to the entire field file.

If the point id exists, then the value is added to all string names with the same code and string number as the point defined by the point id. This applies to the entire field file.

Time surveyed

time when the command (op code) was created
Comment

*insert a comment within the field file.*

**OK, Apply, Reset, Finish, Help** See the description for the panel buttons in the section [Panel buttons](#).

**Job Data (opcode 1)**

Enter text to be added as header information

![Job Data Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data</strong></td>
<td>extra text to be added as header information</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Time Surveyed</strong></td>
<td>time when the command (op code) was created</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Comment</strong></td>
<td>insert a comment within the field file.</td>
<td></td>
<td></td>

</tbody>
</table>

**Distance correction (opcode 127)**

This section of documentation is a work in progress and will be updated in subsequent releases.
Distances (opcode 49)

This section of documentation is a work in progress and will be updated in subsequent releases.

Error (opcode -1)

Enter text to be added as error information.

If the field file was reduced from a raw data collector file, any records that can't be parsed correctly will be made into an error comment.
The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
**Data** | extra text to be added as error information. If the field file was reduced from a raw data collector file, any records that can’t be parsed correctly will have an error comment.  
**Time surveyed** | time when the command (op code) was created  
**Comment** | insert a comment within the field file.  
**OK, Apply, Reset, Finish, Help** | See the description for the panel buttons in the section [Panel buttons](#)  

**End File (opcode 99)**

Command to stop the processing of the 12d field file at this line.  
This is useful for debugging errors.
Time surveyed

*time when the command (op code) was created*

Comment

*Stop processing the 12d field file at this line. Useful for debugging errors.*

**OK, Apply, Reset, Finish, Help**  See the description for the panel buttons in the section [Panel buttons](#).

**Invisible (opcodes 107, 108, 109)**

Make segments or vertices invisible.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>choice box</td>
<td>Invisible previous segment (opcode 107)</td>
<td>Invisible next segment (opcode 108)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Invisible point (opcode 109)</td>
</tr>
</tbody>
</table>

**for Make the previous segment invisible**

If no *description* is given, the previous segment containing the current measurement point is set to invisible.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that *point id* as an end point, is set to invisible.

**for Make the next segment invisible**

If no *description* is given, the next segment containing the current measurement point as a starting point is set to invisible. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that *point id* as a start point, is set to invisible.

**for Make a point invisible**

If no *description* is given, the current measurement point is set to invisible. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.
If the feature code and string number exist, then the last point of the previous string with that feature code and string number is set to invisible.

If the point id exists, then the point with that point id is set to invisible.

**Code**
the feature code of the nominated point.

**String number**
the string number of the nominated point.

**Named point**
point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#).

**Point id**
point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

**Time surveyed**
time when the command (op code) was created

**Comment**
comment for the command within the field file.

[**OK, Apply, Reset, Finish, Help**](#) See the description for the panel buttons in the section [Panel buttons](#).

---

**Strings Join (opcodes 21 to 24)**
Join two strings together.

See [36.3.8 Joining Strings](#) in Appendix 36 12d Survey Guide .
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>choice box</td>
<td>Join last points of strings (opcode 21)</td>
<td>Join first to last point of strings (opcode 22)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Join first points of strings (opcode 23)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Join last to first point of strings (opcode 24)</td>
</tr>
<tr>
<td>Code</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>String number 1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>String number 2</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**for Join last points of strings**

In the final reduction, the last point of the string with the given feature code and string_number_1 is joined to the last point of the string with given feature code and string_number_2. The created string has the given feature code (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

**for Join first to last point of strings**

In the final reduction, the first point of the string with the given feature code and string_number_1 is joined to the last point of the string with given feature code and string_number_2. The created string has the given feature code (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

**for Join first points of strings**

In the final reduction, the first point of the string with the given feature code and string number 1 is joined to the first point of the string with given feature code and string number 2. The created string has the given feature code (no string number is needed since it is the final reduction when the string numbers are then dropped).

**for Join last to first point of strings**

In the final reduction, the last point of the string with the given feature code and string_number_1 is joined to the first point of the string with given feature code and string_number_2. The created string has the given feature code (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

**Code**

*the feature code of the strings to be joined*

**String number 1**

*the string number of the first string*

**String number 2**
the string number of the second string

**Time surveyed**

*time when the command (op code) was created*

**Comment**

*insert a comment within the field file.*

**OK, Apply, Reset, Finish, Help**  See the description for the panel buttons in the section [Panel buttons](#).
EDM Measurement (opcode 7)

Store a measurement given by Horizontal angle, Vertical angle and Slope distance. Individual measurements can be entered or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement the command should be entered twice, with the appropriate values entered into the panel each time.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Horizontal angle</td>
<td>the horizontal angle to the point in dd.mmss format.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Vertical angle</td>
<td>the vertical angle to the point in dd.mmss format. If the value is in the range 0-180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Slope distance</td>
<td>the slope distance to the measurement to the point. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Code</td>
<td>the feature code of the measurement.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>String number</td>
<td>the string number of the measurement.</td>

Comment
comment for the command within the field file.

OK, Apply, Reset, Finish, Help  See the description for the panel buttons in the section Panel buttons.

Multiple Coding (opcode 16)
Record a new point at the same position as the current measurement point but with possibly a different feature code and string number.
A new point is created at the same position as the current measurement point but with the specified feature code and string number.

The point id and text are recorded as the point id and text for that vertex of the super string.

If a point name exists, then it is a named measurement and a 4d point string of name point name is created and mapped using the Map File. The 4d text is the station prefix followed by point name. The point name is added to the internal list of named points for searching for co-ordinates.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

Comment
comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons.

Tinable (opcodes 38, 39, 40)
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>choice box</td>
<td>Non tinable previous segment (opcode 39)</td>
<td>Non tinable next segment (opcode 38)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Non tinable point (opcode 40)</td>
</tr>
</tbody>
</table>

**for Make the previous segment non-tinable**

If no *description* is given, the previous segment containing the current measurement point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as an end point, is set to non-tinable.

**for Make the next segment non-tinable**

If no *description* is given, the next segment containing the current measurement point as a starting point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as a start point, is set to non-tinable.

**for Make a point not tinable**

If no *description* is given, the current measurement point is set to not tinable. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.
If the feature code and string number exist, then the last point of the previous string with that feature code and string number is set to not tinable.

If the point id exists, then the point with that point id is set to not tinable.

**Offset Measurement (opcodes 42, 43, 44)**

It is not always possible to measure a point directly but it may be possible to measure a point nearby and then measure an offset to adjust the measured point by and so produce the coordinates of the required point.
See 36.3.2 Offsets in Appendix 36 12d Survey Guide.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td></td>
<td></td>
<td>Offset radial (opcode 42)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Offset tangential (opcode 43)</td>
</tr>
</tbody>
</table>

Offset radial (opcode 42)
Offset tangential (opcode 43)
for Radial

The radial offset is used to adjust the position of the specified point by a plan distance from the specified points original position, along the plan line joining the current station to the specified point. A positive offset is away from the station, negative is toward the station.

If no point description is given, the offset is used to adjust the position of the current measured point.

If a point description exists, then either the feature code and string number or the point id section of the point description can be used.

If the feature code and string number exist, then the last point of the previous string with that feature code and string number is adjusted.

If the point id exists, then the point with that point id is adjusted.

for Tangential

The tangential offset is used to adjust the position of the specified point by a plan distance from the specified points original position, at rights angles to the plan line joining the current station to the specified point. A negative offset is to the left (looking from the station), and positive is to the right (looking from the station).

If no point description is given, the offset is used to adjust the position of the current measured point.

If a point description exists, then either the feature code and string number or the point id section of the point description can be used.

If the feature code and string number exist, then the last point of the previous string with that feature code and string number is adjusted.

If the point id exists, then the point with that point id is adjusted.

for Height

If the height of the specified point is not null, then the height offset adjusts the height of the point. A positive offset adds to the height, a negative offset reduces the height.

If no point description is given, the offset is used to adjust the position of the current measured point.

If a point description exists, then either the feature code and string number or the point id section of the point description can be used.

If the feature code and string number exist, then the last point of the previous string with that feature code and string number is adjusted.

If the point id exists, then the point with that point id is adjusted.

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help  See the description for the panel buttons in the section Panel buttons.

PPM Correction (opcode 131)

This section of documentation is a work in progress and will be updated in subsequent releases.
Pipe Justification (opcodes 80, 81, 82)

Specify what type of pipe justification point that the current measurement is.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td></td>
<td></td>
<td>Pipe invert (opcode 80)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Pipe axial (opcode 81)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Pipe obvert (opcode 82)</td>
</tr>
</tbody>
</table>

**for Pipe invert (opcode 80)**

If no point description is given, the current measurement point is on the invert (bottom) of a pipe. This is the default for measurements to points on pipe strings. If the point is not part of a pipe string, it is ignored.

If the feature code and string number exist, the last point of the previous string with the same feature code and string number as given in point description is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

If the point id exists, then the point with that point id is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

**for Pipe axial (opcode 81)**

If no point description is given, the current measurement point is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the feature code and string number exist, the last point of the previous string with the same feature code and string number as given in point description is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the point id exists, then the point with that point id is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

**for Pipe obvert (opcode 82)**

If no point description is given, the current measurement point is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the feature code and string number exist, the last point of the previous string with the same feature code and string number as given in point description is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the point id exists, then the point with that point id is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.
Code
the feature code of the measurement.

String number
the string number of the measurement.

Named point
point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search.

Point id
point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

Time surveyed
time when the command (op code) was created

Comment
comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons.

Remove Height (opcode 30)
Set the height of a measurement to null.

If no point description is given, the height of the current measurement point is set to null.
If the feature code and string number exist, then the height of the last point of the previous string with that feature code and string number is set to null.
If the point id exists, then the height of the point with that point id is set to null.

The fields and buttons used in this panel have the following functions.
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

</table>

**Resection Start (opcode 128)**

This option is under development.
OK, Apply, Reset, Finish, Help  See the description for the panel buttons in the section Panel buttons.

Resection end (opcode 129)

This option is under development.
OK, Apply, Reset, Finish, Help  See the description for the panel buttons in the section Panel buttons.

Scale Factor (opcode 9)
Specify the scale factor for subsequent measurements.

![Scale Factor panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scale factor</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Scale factor**
the scale factor to be applied to subsequent distance measurements. It is applied by multiplying raw distances by the scale factor to give the corrected distance.

**Time surveyed**
time when the command (op code) was created

**Comment**
comment for the command within the field file.

**OK, Apply, Reset, Finish, Help**  See the description for the panel buttons in the section Panel buttons.

Shaping (opcodes 83 to 86)
See 36.5 Shape field coding in Appendix 36 12d Survey Guide.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>choice box</td>
<td></td>
<td>Shape end (opcode 84)</td>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Shape extrude (opcode 86)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Shape parallel (opcode 85)</td>
</tr>
</tbody>
</table>
for Shape end
Stops using the current shape or stops recording a shape.

for Shape record
Start recording a shape with the shape name. If Shape_name is not blank, then the default field Shape is defined by the feature_code and string_number of the following measurements until a shape end co. There is no limit to the number of points in a shape.

for Shape extrude
extrude the current shape along the specified super string.

for Shape parallel
parallel the current shape along the specified super string. This creates a number of strings to represent each feature code of the shape record. In the case of shapes which contain curves, a number of strings will be created according to an arc/chord tolerance.

Name
the name of the shape.

Time surveyed
time when the command (op code) was created

Comment
comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons.

String Close (opcode 20)
Close a string.
See 36.3.4 Close String in Appendix 36 12d Survey Guide.

If no point description is given, the current string is closed.
If the feature code and string number from the point description exist, the last previous string with that feature code and string number is closed.
If the point id from the point description exists, then the string containing that point id will be closed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>

<td>comment for the command within the field file.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**OK, Apply, Reset, Finish, Help**  
See the description for the panel buttons in the section Panel buttons.

**String End (opcode 48)**

Stop a string.
If no Description exists, the current string is terminated (including the current measurement point).

If Code (feature code) and String number exist, then the last point of the previous string with that feature code and string number becomes the last point of that string.

If Point id exists, then the previous string containing the point with that point id is terminated after the point id point.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>

**Code**

the feature code of the measurement.

**String number**

the string number of the measurement.

**Named point**

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search.

**Point id**

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

**Time surveyed**

time when the command (op code) was created

**Comment**

comment for the command within the field file.

**OK, Apply, Reset, Finish, Help**  See the description for the panel buttons in the section Panel buttons.

**Rectangle (opcode 45)**

Create a parallelogram (squashed rectangle) from three points.

See 36.3.5 Rectangle in Appendix 36 12d Survey Guide.
If no Description is given, the current measurement point and the two previous points from the current string are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If the feature code and string number exist, the last three points with that feature code and string number are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If the point id exists, then the feature code and string number of the point with that point id are used and processed as above. Note that the point with the point id is not necessarily used.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>
Rectangle By 2 Points (opcode 37)

Create a rectangle from two points and a given offset.

See 36.3.6 Rectangle by 2 Points, in Appendix 36 12d Survey Guide.

The rectangle is defined by two points (reference side) and an offset.

- If a positive offset value is given, two points will be created to the right of the reference side.
- If a negative offset value is given, two points will be created to the left of the reference side.
- If no Description is given, the two new points will be joined to the given points in a closed rectangular string, and will have the same feature code as the points given.
- If the feature code and string number exist, then a search is made for the last occurrence of two points with the same feature code and string number. If found, then these points are used to define the reference side of the rectangle.
- If the point id exists, then a search is made for the last occurrence of two points with the same feature code and string number as the point given by the point id. If found, then these points are used to define the reference side of the rectangle.
- Two consecutive rectangles are unable to be defined side by side. In other words if the two points given are part of string of greater than two vertices, the command will only work for sets of two points that are exclusively defined. i.e. For a 5 point string, a rectangle can be defined by points 1 and 2, and 4 and 5.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
the feature code of the measurement.

**String number**
the string number of the measurement.

**Named point**
point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#).

**Point id**
point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

**Time surveyed**
time when the command (op code) was created

**Comment**
comment for the command within the field file.

**OK, Apply, Reset, Finish, Help** See the description for the panel buttons in the section [Panel buttons](#).

**String Reverse (opcode 19)**
Reverse the direction of a string.

If no *point description* is given, the current string is reversed.

If the *feature code* and *string number* from the *point description* exist, the last previous string with that *feature code* and *string number* is reversed.

If the *point id* from the *point description* exists, then the string containing that point id will be reversed.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>the feature code of the measurement.</td>

</tr>
<tr>
<td>OK, Apply, Reset, Finish, Help</td>
<td>See the description for the panel buttons in the section Panel buttons.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

String Start (opcode 47)

Start a new string.

See 36.3.3 Start New String in Appendix 36d Survey Guide.

If no Description is given, the current string is terminated (without including the current measurement point) and the current measurement point becomes the first point of a new string.
with the same feature code and string number.

If the feature code and string number exist, then the last point of the previous string with that feature code and string number becomes the first point of a new string with the same feature code and string number.

If the point id exists, then the previous string containing the point with that point id is terminated before the point id point, and the point becomes the first point of a new string with the same feature code and string number.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>the feature code of the measurement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>String number</td>
<td>the string number of the measurement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Named point</td>
<td>point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Point id</td>
<td>point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.</td>
<td></td>

</tbody>
</table>

OK, Apply, Reset, Finish, Help  See the description for the panel buttons in the section Panel buttons.

Breakline String (String tinable (opcode 46))

Make a string a breakline (i.e. all vertices and segments are tinable) or not a breakline.
The **point description** is used to select a string and the **mode** is used to specify if the string is a breakline or not.

If no **point description** is given, the current string is selected.

If the **feature code** and **string number** exist, the last string with that **feature code** and **string number** is selected.

If the **point id** exists, then the string containing the point with that point id is selected.

If no **mode** is given, the selected string is set as a point string (that is, not a breakline).

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breakline mode</td>
<td></td>
<td></td>
<td>not a breakline</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>breakline</td>
</tr>
</tbody>
</table>

**for Not a breakline**

the selected string is set to a point string and hence is not a breakline (however the points are tinable).

**for Breakline**

the selected string is set to a line string (all vertices and segments are tinable) and is therefore a breakline.

**Code**

the feature code of the measurement.

**String number**

the string number of the measurement.

**Named point**

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#).
Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help  See the description for the panel buttons in the section Panel buttons.

String Type (opcodes 92, 93, 94)

Specify the string to be a 2d, 3d or 4d string.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>choice box</td>
<td>String type 2d</td>
<td>String type 2d (opcode 92)</td>

<tr>
<td></td>
<td></td>
<td></td>
<td>String type 3d (opcode 93)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>String type 4d (opcode 94)</td>
</tr>
</tbody>
</table>

- if 2d - the string has one height for the entire string
- if 3d - the string can have different heights at each vertex
- if 4d - the string can have different heights and text at each vertex

**Code**
- the feature code of the measurement.

**String number**
- the string number of the measurement.

**Named point**
- point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#).

**Point id**
- point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

**Time surveyed**
- time when the command (op code) was created

**Comment**
- comment for the command within the field file.

**OK, Apply, Reset, Finish, Help**
- See the description for the panel buttons in the section [Panel buttons](#).
Culvert (opcode 96)

Specify the string to be a culvert and give the culvert width and height.

Culvert strings are always line strings and are stored with the justification of the majority of the string points. Individual culvert points are picked up either top (obvert), centre (axial) or bottom (invert) of the culvert using op codes 80, 81 and 82.

If no point_description is given, the current string is created as a culvert string with the given width and height.

If a point_description exists, then either the feature code and string number or the point id section of the point_description can be used.

If the feature code and string number exist, the last string with the same feature code and string number is created as a culvert with the given width and height.

If the point id exists, then the string containing that point id is created as a culvert string with the given width and height.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td></td>
<td></td>
<td></td>

comment for the command within the field file

OK, Apply, Reset, Finish, Help

See the description for the panel buttons in the section Panel buttons.
Pipe Diameter (opcode 95)
Specify the string to be a pipe and give the pipe diameter.

Pipe strings are always line strings and are stored with the justification of the majority of the string points. Individual pipe points are picked up either top (obvert), centre (axial) or bottom (invert) of the pipe using op codes 80, 81 and 82.

If no `point_description` is given, the current string is created as a pipe string with the given diameter.

If a `point_description` exists, then either the `feature code` and `string number` or the `point id` section of the `point_description` can be used.

If the `feature code` and `string number` exist, the last string with the same `feature code` and `string number` is created as a pipe with the given diameter.

If the `point id` exists, then the string containing that point id is created as a pipe string with the given diameter.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diameter</td>

</table>

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons.

Templating (opcodes 51 to 59)
Record and use field templates when picking up string.
See 36.4 Field Templates, in Appendix 36 12d Survey Guide.

For Template start (opcode 51), go to

- Template start
- Template end (opcode 52)
- Template pause (opcode 53)
- Template continue (opcode 54)
- Template record (opcode 55)
- Template skip (opcode 56)
- Template insert (opcode 58)
- Template delete (opcode 57)
- Template change (opcode 59)

Template start

Selecting Template start (opcode 51) brings up the Templating panel with the Command field set to Template start.

Template start starts using the field template given in the field Name.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Text box</td>
<td>Template start</td>
<td>Template start (opcode 51)</td>
</tr>
<tr>
<td>Name</td>
<td>Text box</td>
<td></td>
<td>Template end (opcode 52)</td>
</tr>
<tr>

<td>choice box</td>
<td>Forward template</td>
<td>Template pause (opcode 53)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template continue (opcode 54)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template record (opcode 55)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If zigzag is forward template, then the field template is used as a forward template. See 36.4.1 Forward Direction, in Appendix 36 12d Survey Guide.

If zigzag is reverse template, then the field template is used as a reverse template. See 36.4.2 Reverse Direction, in Appendix 36 12d Survey Guide.
**start on zig**, then the field template is used as a zig_zag template and is used in the forward definition direction first (that is starts on a zig). See 36.4.3 Zig-Zag in Appendix 36 12d Survey Guide.

**start on zag**, then the template is used as a zig_zag template and is used in the reverse direction first (that is, starts on a zag). See 36.4.3 Zig-Zag in Appendix 36 12d Survey Guide.

If zigzag is blank, or anything other than forward, reverse, or start on zag then the field template is used as a zig-zag template starting on a zig.

**Time surveyed**

time when the command (op code) was created

**Comment**

comment for the command within the field file.

**OK, Apply, Reset, Finish, Help** See the description for the panel buttons in the section Panel buttons.

**Template end**

Selecting Template end (opcode 52) brings up the Templating panel with the Command field set to Template end.

Template end stops using the current field template, or stops recording a field template.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td></td>
<td>Template end</td>
<td></td>
</tr>
<tr>
<td>Time surveyed</td>
<td></td>
<td>time when the command (op code) was created</td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td></td>
<td>comment for the command within the field file</td>
<td></td>
</tr>
</tbody>
</table>
Template pause

Selecting Template pause (opcode 53) brings up the Templating panel with the Command field set to Template pause.

Pause using the current field template or defining a field template, until a continue field template (54) or a finish field template (52) code is given.

![Templating Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Template pause</td>
<td>Template start (opcode 51)</td>
<td>Template end (opcode 52)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Template pause (opcode 53)</td>
<td>Template pause (opcode 53)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Template continue (opcode 54)</td>
<td>Template record (opcode 55)</td>
</tr>
</tbody>
</table>

**Time surveyed**

*time when the command (op code) was created*

**Comment**

*comment for the command within the field file.*

Template continue

Selecting Template continue (opcode 54) brings up the Templating panel with the Command field set to Template continue.

Continue using or defining the current field template, which has been stopped by a Template pause (opcode 53). The Continue command only needs to be given once and applies to all following measurements until another Pause or Finish command is given.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Template continue</td>
<td>Template start (opcode 51)</td>
<td>Template end (opcode 52)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template pause (opcode 53)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template continue (opcode 54)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template record (opcode 55)</td>
</tr>
</tbody>
</table>

**Time surveyed**  
_time when the command (op code) was created_

**Comment**  
_comment for the command within the field file._

**OK, Apply, Reset, Finish, Help**  
See the description for the panel buttons in the section [Panel buttons](#).

**Template record**  
Selecting Template record (opcode 55) brings up the Templatining panel with the Command field set to Template record

_Templating record_ stores the _feature code_ and _string number_ of the following measurements as a field template until a Finish code (52) is given.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Template record</td>
<td></td>
<td>Template start (opcode 51)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template end (opcode 52)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template pause (opcode 53)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template continue (opcode 54)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Template record (opcode 55)</td>
</tr>
</tbody>
</table>

**Name**

name of the template being created

Start recording a field template with the name **Name**. If **Name** is blank, then it is the default field template that is defined.

The feature code and string number of the following measurements are stored as the field template until a Finish code (52) is given. There is no limit to the number of feature code and string number pairs that can be stored in a field template.

**Time surveyed**

time when the command (opcode) was created

**Comment**

comment for the command within the field file.

**OK, Apply, Reset, Finish, Help**

See the description for the panel buttons in the section **Panel buttons**

**Template skip**

Selecting **Template skip (opcode 56)** brings up the **Template Skip** panel.

This panel allows the user to skip picking up one or more points (feature code and string number pairs) from the field template currently being used. The next measurement takes the **feature code** and **string number** from the next point after the skipped points, from the field template definition.

See **36.4.4 Skipping Field Template Points** in Appendix **36 12d Survey Guide**
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Points to skip</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the number of points (feature code and string number pairs) of the template to skip. If Points to skip is blank or zero, then only one point is skipped otherwise Points to skip points are skipped.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Skip forever</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>if ticked, the given number of feature code and string number pairs are not used from then on. If not ticked, only skip for this one used of the template.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time surveyed</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>time when the command (op code) was created</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>comment for the command within the field file.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK, Apply, Reset, Finish, Help</td>
<td>See the description for the panel buttons in the section</td>
<td>Panel buttons</td>
<td></td>
</tr>
</tbody>
</table>

Template insert

Selecting Template insert (opcode 58) brings up the Templating panel.

This option allows the user to insert new point definitions into the template. These may be new points or to add a multiple code to an existing point in the template.

See 36.4.5 Insert Template Points or Insert Multiple Codes in Appendix 36 12d Survey Guide.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature code</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>String number</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Multiple code</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Insert special</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time surveyed</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Feature code**
- Feature code to be inserted (as a new point or a multiple code) with the string number, into the template.

**String number**
- String number to be inserted (as a new point or a multiple code) with the feature code, into the template.

**Multiple code**
- If ticked off (the default), a new point is inserted into the template with the Feature code and String number given in the panel.
- If ticked on, no new point is inserted but the current template point will be made a multiple coded point with the Feature code and String number given in the panel. The multiple coding will be used each time the template point is used.

**Insert special**
- If ticked on, the point will be added to the current template being picked up (that is, to the end of the template).
- If not ticked, the point will be added to the next template being picked up (that is, to the beginning of the template).

**Time surveyed**
- Time when the command (op code) was created

**Comment**
- Comment for the command within the field file.

**OK, Apply, Reset, Finish, Help**
- See the description for the panel buttons in the section Panel buttons.

**Template delete**
Selecting Template delete (opcode 57) brings up the Templating panel.
- Allows the user to delete one or more points on the template. Picking up will use the updated template definition.
See 36.4.6 Delete Template Points in Appendix 36. 12d Survey Guide.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of points</td>
<td>type</td>
<td>defaults</td>
<td>pop-up</td>
</tr>
</tbody>
</table>

**Number of points**  
number of points to delete from the template. Any further use of the template will use the updated template definition.

**Time surveyed**  
time when the command (op code) was created

**Comment**  
comment for the command within the field file.

**OK, Apply, Reset, Finish, Help**  
See the description for the panel buttons in the section Panel buttons.

**Template change**  
Selecting Template change (opcode 59) brings up the Templating panel.
The fields and buttons used in this panel have the following functions.

**Field Description**
- **Time surveyed**: time when the command (op code) was created
- **Comment**: comment for the command within the field file.

**Additional Text For Point (opcode 41)**
Add extra text to any existing text for the current measurement.
Data

The given text in **Data** is added to the end of any existing text for the current measurement point.

Time surveyed

*time when the command (op code) was created*

Comment

*comment for the command within the field file.*

**OK, Apply, Reset, Finish, Help**  
See the description for the panel buttons in the section **Panel** buttons.

Vertical Circle Correction (opcode 15)

The given value (in decimal degrees) is **subtracted** from the vertical circle value in subsequent measurements.

![Vertical Circle](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical circle</td>
<td></td>

</tr>
</tbody>
</table>

**OK, Apply, Reset, Finish, Help**  
See the description for the panel buttons in the section **Panel** buttons.
17.7.7 Order

Position of menu: Survey => Edit => Order

This option is still under development.

The order option re-orders points in a string.

The Order walk-right menu is:

- by points
- by CL
- Auto order
- Remove

For information on by points please go to 17.7.7.1 By Points

by CL

Auto order

Remove

17.7.7.1 By Points

Position of option on menu: Survey => Edit => Order => by points

This option is still under development.

17.7.7.2 By CL

Position of option on menu: Survey => Edit => Order => by CL

This option is still under development.
17.7.7.3 Auto Order

Position of option on menu: Survey => Edit => Order => Auto order
This option is still under development.

17.7.7.4 Remove Order

Position of option on menu: Survey => Edit => Order => Remove
This option is still under development.

17.7.8 SDR Point Edits

Position of menu: Survey => Edit => Points
The Points walk-right menu contains options that work on individual points (vertices).

Note - a point may be individual point (one vertex strings) or a vertex of a string.
The Points walk-right menu is:
For the option **Additional text**, go to

- **Attachment**: 17.7.8.1 Additional Text, 17.7.8.2 Attach a File
- **Arc next 3 points**: 17.7.8.3 Arc Through Next Three Points
- **Arc last 3 points**: 17.7.8.4 Arc Through Last Three Points
- **Arc fitting start**: 17.7.8.5 Start Arc Fitting
- **Arc fitting end**: 17.7.8.6 End Arc Fitting
- **Circle feature**: 17.7.8.7 Create a Feature String
- **Invisible**: 17.7.8.8 Make a Vertex Invisible
- **Invisible last seg**: 17.7.8.9 Make the Previous Segment Invisible
- **Invisible next seg**: 17.7.8.10 Make the Next Segment Invisible
- **Non tinable**: 17.7.8.11 Make a Vertex Non Tinable
- **Non tinable last seg**: 17.7.8.12 Make the Previous Segment Non Tinable
- **Non tinable next seg**: 17.7.8.13 Make the Next Segment Non Tinable
- **Pipe invert**: 17.7.8.14 Make a Vertex an Invert Level of a Pipe
- **Pipe axial**: 17.7.8.15 Make a Vertex an Axial Level of a Pipe
- **Pipe obvert**: 17.7.8.16 Make a Vertex an Obvert Level of a Pipe
- **Rectangle last 3 points**: 17.7.8.17 Make a Parallelogram from the Last Three Points
- **Rectangle last 2 points**: 17.7.8.18 Make a Rectangle from the Last Two Points
- **Remove point**: 17.7.8.19 Delete a Vertex
- **Remove height**: 17.7.8.20 Set a Vertex Height to Null

### 17.7.8.1 Additional Text

**Position of option on menu:** Survey => Edit => Points => Additional text
Additional text adds text to selected vertices. The user selects the vertex to add text to, and then types in the text.

Selecting Additional text brings up the SDR Additional Text panel:

![SDR Additional Text](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, an Additional text typed input panel is displayed to type the text into. A Text code is then inserted into the 12d field file.

The option continues until the Finish button is selected.

If the pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.2 Attach a File

Position of option on menu: Survey => Edit => Points => Attachment

Attachment adds files to selected vertices. The user selects the vertex to add an attachment to, and then enters the name of the file to attach.

Selecting Attachment brings up the SDR Attachment panel:

![SDR Attachment](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, an Attachment file name typed input panel is displayed to enter the file name into. An Attachment field code is then inserted into the 12d field file.

The option continues until the Finish button is selected.

If the pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.
17.7.8.3 Arc Through Next Three Points

**Position of option on menu:**  Survey => Edit => Points => Arc next 3 points

**Arc next 3 points** adds an arc through the selected vertex and the next two vertices of the same string.

Selecting **Arc next 3 points** brings up the SDR Arc Next 3 Points panel:

![SDR Arc Next 3 Points panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the next two vertices of the same string by inserting an **Arc through next 3 points** field code.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

17.7.8.4 Arc Through Last Three Points

**Position of option on menu:**  Survey => Edit => Points => Arc last 3 points

**Arc last 3 points** adds an arc through the selected vertex and the previous two vertices of the same string.

Selecting **Arc last 3 points** brings up the SDR Arc Last 3 Points panel:

![SDR Arc Last 3 Points panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the previous two vertices of the same string by inserting an **Arc through last 3 points** field code.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the
17.7.8.5 Start Arc Fitting

Position of option on menu:  Survey => Edit => Points => Arc fitting start

Arc fitting start starts arc fitting through from the selected vertex until the end of the string or an stop arc fitting field code is encountered for that string.

Selecting Arc fitting start brings up the SDR Arc Fitting Start panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, arc fitting is started at the selected vertex by inserting an Arc fitting start field code.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.6 End Arc Fitting

Position of option on menu:  Survey => Edit => Points => Arc fitting end

Arc fitting end ends any arc fitting for that string at the selected vertex.

Selecting Arc fitting end brings up the SDR Arc Fitting End panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, any arc fitting for the string is stopped at the selected vertex by inserting an Arc fitting end field code.
The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.7 Create a Feature String

Position of option on menu: Survey => Edit => Points => Circle feature

Circle feature creates a feature string of a given radius at the selected vertex.

Selecting Circle feature brings up the SDR Feature panel:

![SDR Feature panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, an Feature radius typed input panel is displayed to type the radius into. A Feature code is then inserted into the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.8 Make a Vertex Invisible

Position of option on menu: Survey => Edit => Points => Invisible

Invisible turns the selected vertex invisible.

Even if the segments on either side of the invisible vertex are tagged as visible, the segments cannot be drawn because the start/end point of the segment is invisible.

Selecting Invisible brings up the SDR Invisible Point panel:

![SDR Invisible Point panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>
Pick button

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, the vertex is turned invisible by inserting an Invisible Point code into the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.9 Make the Previous Segment Invisible

Position of option on menu: Survey =>Edit =>Points =>Invisible previous segment

Invisible previous segment turns the segment ending on the selected vertex invisible. The vertex itself is not invisible.

Selecting Invisible previous segment brings up the SDR Invisible Previous Segment panel:

![SDR Invisible Previous Segment panel]

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Pick button | | | |

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, the segment ending on the vertex is turned invisible by inserting an Invisible Previous Segment code into the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.10 Make the Next Segment Invisible

Position of option on menu: Survey =>Edit =>Points =>Invisible next segment

Invisible next segment turns the segment starting on the selected vertex invisible. The vertex itself is not invisible.

Selecting Invisible next segment brings up the SDR Invisible Next Segment panel:
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, the segment starting on the vertex is turned invisible by inserting an **Invisible Next Segment** code into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

17.7.8.11 Make a Vertex Non Tinable

**Position of option on menu:**  Survey => Edit => Points => Non tinable

**Non tinable** sets the selected vertex to be non tinable (that is, the vertex is not included in any triangulation).

Even if the segments on either side of the non tinable vertex are tinable, the segments can not be included in any triangulation because the start/end point of the segment is non tinable.

Selecting **Non tinable** brings up the SDR **Non Tinable Point** panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, the vertex is set to non tinable (that is, the vertex is not included in any triangulations) by inserting a **Non tinable point** code into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.
17.7.8.12 Make the Previous Segment Non Tinnable

**Position of option on menu:** Survey => Edit => Points => Non tinable previous segment

**Non tinable previous segment** sets the segment ending on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations). The vertex itself can be tinable.

Selecting **Non tinable previous segment** brings up the **SDR Non Tinable Previous Segment** panel:

![SDR Non Tinable Previous Segment Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pick</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, the segment ending on the vertex is set to non tinable by inserting a **Non tinable previous segment** code into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

17.7.8.13 Make the Next Segment Non Tinnable

**Position of option on menu:** Survey => Edit => Points => Non tinable next segment

**Non tinable next segment** sets the segment starting on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations). The vertex itself can be tinable.

Selecting **Non tinable next segment** brings up the **SDR Non Tinable Next Segment** panel:

![SDR Non Tinable Next Segment Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pick</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, the segment starting on the vertex is set to non tinable by inserting an **Non tinable next segment** code into the 12d field file.
17.7.8.14 Make a Vertex an Invert Level of a Pipe

Position of option on menu:  Survey => Edit => Points => Pipe invert

Pipe invert sets the z-value of the selected vertex to be used as an invert level (pipe top) when the vertex is in a pipe string.

Selecting Pipe invert brings up the SDR Pipe Invert Justification panel:

```
The option then repeats and continues until the Finish button is selected.
If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.
```

17.7.8.15 Make a Vertex an Axial Level of a Pipe

Position of option on menu:  Survey => Edit => Points => Pipe axial

Pipe axial sets the z-value of the selected vertex to be used as an axial level (pipe centre) when the vertex is in a pipe string.

Selecting Pipe axial brings up the SDR Pipe Axial Justification panel:

```
The option then repeats and continues until the Finish button is selected.
If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.
```
As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, the vertex is set to be an axial level (centre of the pipe) for any pipe string it is in by inserting a Pipe axial code into the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.16 Make a Vertex an Obvert Level of a Pipe

Position of option on menu: Survey => Edit => Points => Pipe obvert

Pipe obvert sets the z-value of the selected vertex to be used as an obvert level (bottom of pipe) when the vertex is in a pipe string.

Selecting Pipe obvert brings up the SDR Pipe Obvert Justification panel:

![SDR Pipe Obvert Justification Panel]

The fields and buttons used in this panel have the following functions.

As soon as the option is selected, the Pick is active and vertices can be selected.

Each time a vertex is picked and accepted, the vertex is set to be an obvert level (bottom of the pipe) for any pipe string it is in by inserting a Pipe obvert code into the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.17 Make a Parallelogram from the Last Three Points

Position of option on menu: Survey => Edit => Points => Rectangle last 3 points

Rectangle last 3 points creates a parallelogram (squashed rectangle) from the selected vertex and the previous two vertices in the same string.

Selecting Rectangle last 3 points brings up the SDR Rectangle panel:
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** button is active and vertices can be selected.

Each time a vertex is picked and accepted, a parallelogram (squashed rectangle) is created using the selected vertex and the previous two vertices of the same string (three vertices in total) and creating a fourth vertex to form the parallelogram of four vertices. The three vertices are removed from the original string and any following vertices are used in a new string.

A *String rectangle* code is inserted into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

### 17.7.8.18 Make a Rectangle from the Last Two Points

**Position of option on menu:** Survey => Edit => Points => Rectangle last 2 points

**Rectangle last 2 points** creates a rectangle from the selected vertex and the previous vertex in the same string, and a width supplied by the user.

The rectangle is formed by using the two vertices as the base of the rectangle and using the given width as the length of the other side of the rectangle. Two new vertices are created to from the rectangle.

Selecting **Rectangle last 2 points** brings up the **SDR Rectangle by 2 Points** panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** button is active and vertices can be selected.

Each time a vertex is picked and accepted, a *Rectangle width* type input box is displayed and filled in.

The rectangle is formed by using the two vertices as the base of the rectangle and using the given width as the length of the other side of the rectangle. Two new vertices are created to from the rectangle.

The two vertices are removed from the original string and any following vertices are used in a new string.
A string rectangle by 2 points code is inserted into the 12d field file.
The option then repeats and continues until the Finish button is selected.
If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.19 Delete a Vertex

Position of option on menu: Survey => Edit => Points => Remove point

Remove point deleted the selected vertex.
The adjacent vertices in the string containing the deleted vertex will then be joined together.
Selecting Remove point brings up the SDR Delete Point panel:

![SDR Delete Point panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and vertices can be selected.
Each time a vertex is picked and accepted, the vertex deleted from the field file.
The option then repeats and continues until the Finish button is selected.
If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.8.20 Set a Vertex Height to Null

Position of option on menu: Survey => Edit => Points => Remove height

Remove height sets the height of the selected vertex to null.
Selecting Remove height brings up the SDR Remove Height panel:

![SDR Remove Height panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and vertices can be selected.
Each time a vertex is picked and accepted, the height of the selected vertex is set to null by inserting a Remove height code into the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.9 SDR Strings Edit

Position of menu: Survey => Edit => Stringing

The Stringing walk-right menu contains options that work on strings rather than individual points. The Stringing walk-right menu is:

For the option New string, go to

End string
Close
Join
Reverse
2d string
3d string
4d string
Pipe string
Culvert string
Assign string numbers

Feature Code

Reverse
2d string
3d string
4d string
Pipe string
Culvert string
Assign string numbers

17.7.9.1 New String

Position of option on menu: Survey => Edit => Stringing => New string

New string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With new string, the user selects the incorrect link and a new string command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting New string brings up the SDR Start New String panel:
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pick</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and string links can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time a string segment is picked and accepted, a string start command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.9.2 End String

**Position of option on menu:** Survey =>Edit =>Stringing =>End string

End string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With end string, the user selects the incorrect link and a **end string** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting End string brings up the SDR End String panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pick</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and string links can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time a string segment is picked and accepted, an string end command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.
17.7.9.3 Close String

Position of option on menu: Survey => Edit => Stringing => Close

With Close, the user selects any part of the string to be closed and a close string command is inserted into the 12d field file.

Selecting Close brings up the SDR Close String panel:

![SDR Close String Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick button is active and string can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time a string is picked and accepted, a string close command is inserted in the 12d field file which closes the selected string.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.9.4 Join Two Strings of Same Feature Code

Position of option on menu: Survey => Edit => Stringing => Join

With Join, the two strings of the same name (code) are selected with direction and the strings are joined by inserting the appropriate join string command in the 12d field file.

Selecting Join brings up the SDR Join Strings panel:

![SDR Join Strings Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick button is active and string can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time two strings of the same name (code) are picked with direction, the appropriate join string field code (Join first points of strings, Join first to last point of strings, Join last points of strings, Join last to first point of strings) is inserted into the 12d field file.

The option then repeats and continues until the Finish button is selected.
If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.9.5 Reverse String Direction

Position of option on menu: Survey => Edit => Stringing => Reverse

With Reverse, the selected strings is reversed by inserting the **String reverse** command into the 12d field file.

Selecting Reverse brings up the SDR Reverse String panel:

![SDR Reverse String Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and string can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time a string is selected, a **String reverse** field code is inserted into the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.9.6 Make a 2d String

Position of option on menu: Survey => Edit => Stringing => 2d string

With 2d string the user selects any vertex of a string and a **string type 2d** command is then inserted into the 12d field file.

Selecting 2d string brings up the SDR String Type 2d panel:

![SDR String Type 2d Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and string can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.
Each time a string is picked and accepted, a **String type 2d** command is inserted in the 12d field file. The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

### 17.7.9.7 Make a 3d String

**Position of option on menu:** Survey => Edit => Stringing => 3d string

With **3d string** the user selects any vertex of a string and a **string type 3d** command is then inserted into the 12d field file.

Selecting **3d string** brings up the SDR String Type 3d panel:

![SDR String Type 3d Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pick</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.

Each time a string is picked and accepted, a **String type 3d** command is inserted in the 12d field file. The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the Pick Ops menu, the **Pick** button can be used to restart the option.

### 17.7.9.8 Make a 4d String

**Position of option on menu:** Survey => Edit => Stringing => 4d string

With **4d string** the user selects any vertex of a string and a **string type 4d** command is then inserted into the 12d field file.

Selecting **4d string** brings up the SDR String Type 4d panel:

![SDR String Type 4d Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>
Pick button

As soon as the option is selected, the Pick is active and string can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time a string is picked and accepted, a String type 4d command is inserted in the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

### 17.7.9.9 Make a Pipe String

Position of option on menu: Survey => Edit => Stringing => Pipe string

With Pipe string, the user selects any vertex of a string, gives a pipe diameter and then a string type pipe command is inserted into the 12d field file.

Selecting Pipe string brings up the SDR Pipe Diameter panel:

![SDR Pipe Diameter Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick is active and string can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time a string is picked and accepted, a Pipe diameter text input is displayed and after a value is typed in, a String type pipe command is inserted in the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

### 17.7.9.10 Make a Culvert String

Position of option on menu: Survey => Edit => Stringing => Culvert string

With Culvert string, the user selects any vertex of a string, gives a culvert width and height and then a string type culvert command is inserted into the 12d field file.

Selecting Culvert string brings up the SDR Culvert panel:

![SDR Culvert Panel](image)
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As soon as the option is selected, the Pick button is active and string can be selected. If the pick is cancelled for some reason, the Pick button can be used to restart the option.

Each time a string is picked and accepted, Culvert width and Culvert height text inputs are displayed and after values are typed in, a String type culvert command is inserted in the 12d field file.

The option then repeats and continues until the Finish button is selected.

If the Pick is cancelled by hitting the <Esc> key or selecting Cancel from the Pick Ops menu, the Pick button can be used to restart the option.

17.7.9.11 Assign String Numbers

Position of option on menu: Survey => Edit => Stringing => Assign string numbers

Assign string numbers

Selecting Assign string numbers brings up the Assign Survey Field Data String Numbers panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function name</td>
<td>function box</td>
<td>SDR functions</td>
<td></td>
</tr>
</tbody>
</table>

name of the SRD function to give string numbers to.

Start string number

string number to start numbering at.

Assign button

17.7.10 Target Height

Position of menu: Survey => Edit => Target height

The Target height option is used to correct target height errors. This includes giving an incorrect value for a target height or forgetting to change the target height.

The Target height walk-right menu is
Each option will now be described in detail.

17.7.10.1 Insert Target Height

Position of option on menu: Survey => Edit => Target height => Insert

The insert option inserts a new target height command into the 12d field file at a user selected point. The user can choose whether the new target height only applied for that one point or for all following points until a new target height is set.

Selecting insert brings up the insert target height panel:

![Insert Target Height Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target height</td>
<td>input/output</td>
<td></td>
<td></td>
</tr>
<tr>
<td>when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if set is selected, the target height is modified and all affected points updated.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Just one point  
tick  
if ticked, the new target height only applied for that one point and then reverts pack to the previous target height.  
if not tick, the new target height applies for all following points until a new target height is set.

Pick  
button  
pick the point to insert a new target height.

Set  
button  
selecting set inserts the new target height command into the 12d field file.

17.7.10.2 Change Target Height

Position of option on menu: Survey => Edit => Target height => Change

The Change option changes an existing target height to a new value.

Selecting Change brings up the change target height panel:
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick</td>
<td>button</td>
<td></td>
<td>select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.</td>
</tr>
<tr>
<td>Prev</td>
<td>button</td>
<td></td>
<td>move to the previous point in the string.</td>
</tr>
<tr>
<td>Next</td>
<td>button</td>
<td></td>
<td>move to the next point in the string.</td>
</tr>
<tr>
<td>Station name</td>
<td>display only</td>
<td></td>
<td>name of the station that the point was surveyed from.</td>
</tr>
<tr>
<td>Point ID</td>
<td>display only</td>
<td></td>
<td>point ID of the selected point.</td>
</tr>
<tr>
<td>Target height</td>
<td>input/output</td>
<td></td>
<td>when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if set is selected, the target height is modified and all affected points updated.</td>
</tr>
<tr>
<td>Pick</td>
<td>button</td>
<td></td>
<td>pick the point to change the target height.</td>
</tr>
<tr>
<td>Set</td>
<td>button</td>
<td></td>
<td>selecting set changes the target height command in the 12d field file and updates affected points.</td>
</tr>
<tr>
<td>Reset</td>
<td>button</td>
<td></td>
<td>reset undoes the changes.</td>
</tr>
</tbody>
</table>

17.8 Report

Position of option on menu: Survey =>Report

Report produces a report on the field data from a Survey function.

Selecting report brings up the survey reduction report panel

The fields and buttons used in this panel have the following functions.
### 17.9 Adjustments

**Position of menu:** Survey => Adjustments

The Adjustments walk-right menu is

```
Survey Adjustments
2D Helmert (Advanced)
3D Helmert
Least squares network
Level network
Height adjustment
Traverse adjustment
Traverse Adjustment (new)
Utilities
Network adjustment data
Network adjustment
Network adjustment report
```

For 2D Helmert (Advanced), go to 28.10.4.1 2D Helmert (Advanced).
- For 3D Helmert, see 28.10.4.2 3D Helmert.
- Least squares network: 17.9.3 Least Squares Network
- Level network: 17.9.4 Level Network
- Height adjustment: 17.9.5 Height Adjustment
- Traverse Adjustment: 17.9.6 Traverse Adjustment
- Traverse Adjustment (new): 17.9.6 Traverse Adjustment
- Utilities: 17.9.7 Survey Adjustments Utilities
17.9.1 2D Helmert (Advanced)

Position of option on menu: Survey => Adjustments => 2D Helmert (Advanced)

A 2D Helmert transformation is a two dimensional linear transformation consisting of a scaling, rotation and a 2D-translation (shift) of data. Hence there are four parameters to be specified. The 2D Helmert (Advanced) option calculated and applied a Helmert transformation, and also allows the user to fix the scale for the transformation.

For information on the 2D Helmert transformation, please go to the section 28.9.1 Coordinate Transformations - Helmert and Affine.

The 2D Helmert (Advanced) panel is documented in the section 28.10.4.1 2D Helmert (Advanced).

17.9.2 3D Helmert

Position of option on menu: Survey => Adjustments => 3D Helmert

A 3D Helmert transformation is a three dimensional linear transformation consisting of a scaling, three rotations, and a 3D-translation (shift) of data. Hence there are 7 parameters to be specified.

For information on the 3D Helmert transformation, please go to the section 28.9.1 Coordinate Transformations - Helmert and Affine.

The 3D Helmert panel is documented in the section 28.10.4.2 3D Helmert.

17.9.3 Least Squares Network

Position of option on menu: Survey => Adjustments => Least squares network

The Least square network option performs a least square adjustment on a set of observations that can be manually entered into predefined grid box columns or by reading an existing input file. These observations can be of the form of distances, angles, azimuths or a combination of these.

Selecting Least squares network brings up the Least Squares Horizontal Network Adjustment panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input file</td>
<td>input box</td>
<td>* .in</td>
<td></td>
</tr>
</tbody>
</table>

A pre-existing .in input file can be specified. For the format of the .in file, go to [Format of the LSA .in File](#).

**Read**

button

On selection of the read button, if a valid .in input file has been specified, the relevant parameters will be read into the grid controls.
Distance tab

The fields and buttons used in this tab have the following functions.

**Field Description** | **Type** | **Defaults** | **Pop-Up**
--- | --- | --- | ---
S(in mm) | input box | standard deviation of a single distance measurement in mm. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

- ppm button

- parts per million error. If entered the value will be used for all lines in the grid. This eliminates the need to put the ppm on each line.

- the grid control values can be entered using valid inputs into the various fields:
  - **Use** - if ticked, the row is used in the adjustment. If *not ticked* then the row is ignored
  - **From** point id which represents the point from which the distance was read
  - **To** point id which represents the point to which the distance was read
  - **Distance** (horizontal) with all corrections having been made except for that of scale.
  - S(in mm) - if not blank, the standard deviation to use for this single distance measurement in millimetres. If blank, the default value in the panel field S(in mm) is used.
  - ppm - if not blank, the parts per million (ppm) error to use for this single distance measurement. If blank, the default value in the panel field Pmm is used.

Angle tab

The fields and buttons used in this tab have the following functions.

**Field Description** | **Type** | **Defaults** | **Pop-Up**
--- | --- | --- | ---
S(in sec) | input box | standard deviation for a single angle measurement in seconds of arc. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

- the grid control values can be entered using valid inputs into the various fields. Angle input must be in the form of degrees minutes and seconds in 4.17.1 HP Notation (e.g. 12.1055)

- **Use** - if ticked, the row is used in the adjustment. If *not ticked* then the row is ignored
**Backsight** - the backsight point id is entered.

**Instrument** - the point id of the instrument or observation station is entered.

**Foresight** - the point id of the foresight station is entered into the **Foresight** column.

**Angle (dms)** - the angle defined by the clockwise measurement from the backsight to foresight station as observed from the instrument station. Valid ranges of 0 - 360 degrees.

**S (in second)** - if non blank, the standard deviation of the angular measurement in seconds of arc to use for this single angle measurement. If blank, the default value in the panel field **S (in sec)** is used.

### Azimuth tab

<table>
<thead>
<tr>
<th>Distance</th>
<th>Angle</th>
<th>Azimuth</th>
<th>Fixed</th>
<th>Initial</th>
<th>Draw</th>
<th>Output</th>
<th>Control Model</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>S (in sec)</strong></td>
<td>Input box</td>
<td>standard deviation for a single azimuth measurement in seconds of arc. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in this tab have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>S (in sec)</strong></td>
<td>Input box</td>
<td>standard deviation for a single azimuth measurement in seconds of arc. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.</td>
<td></td>
</tr>
</tbody>
</table>

Use - if ticked, the row is used in the adjustment. If not ticked then the row is ignored.

From - the instrument station point id should be entered.

To - the point id of the observed station is entered.

**Azimuth** - the true azimuth to the observed point is entered. Azimuth input should be in the form of degrees minutes and seconds (e.g. 12.1055) Valid ranges of 0 - 360 degrees.

**S (in second)** - if non blank, the standard deviation of the azimuth in seconds of arc to use for this single angle measurement. If blank, the default value in the panel field **S (in sec)** is used.

### Fixed tab

<table>
<thead>
<tr>
<th>Distance</th>
<th>Angle</th>
<th>Azimuth</th>
<th>Fixed</th>
<th>Initial</th>
<th>Draw</th>
<th>Output</th>
<th>Control Model</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use</strong></td>
<td><strong>Point name</strong></td>
<td><strong>X coord</strong></td>
<td><strong>Y coord</strong></td>
<td><strong>Z coord</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

the grid control values can be entered using valid inputs into the various fields.

Use - if ticked, the row is used in the adjustment. If not ticked then the row is ignored.

Point name - the point id of the fixed stations

X coord - the fixed x coordinate value is entered

Y coord - the fixed y coordinate value is entered

Z coord - the fixed z coordinate value is entered

### Initial tab

**12d Model** will try and calculate initial position for each point from the entered measurement but for
some points this is not possible and then the user must enter an initial position.

<table>
<thead>
<tr>
<th>Use</th>
<th>Point name</th>
<th>X coord</th>
<th>Y coord</th>
<th>Z coord</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

the grid control values can be entered using valid inputs into the various fields.

**Use** - if tick, the row is used in the adjustment. If not ticked then the row is ignored

**Point name** - the point id of a free or floating station should be entered.

**X coord** - the initial x coordinate estimate is entered.

**Y coord** - the initial y coordinate estimate is entered.

**Z coord** - the initial z coordinate estimate is entered.

**NB. It is very important that the initial values are approximately equal to the true values. A solution will still be generated for rubbish values.**

**Draw tab**

<table>
<thead>
<tr>
<th>Name</th>
<th>Model</th>

</tr>
</tbody>
</table>

the following values can be entered to enable the production of a user defined plot of the adjustment.

**Field Description** | **Type** | **Defaults** | **Pop-Up**
---|---|---|---
**Name** | name box | defined names from names.4d file |  |
**Model** | model box | available models |  |
**Colour** | colour box | red | available colours | |
**Fixed station style** | input | Station | available line styles |  |
**Fixed station size** | input | 1 | size of symbol in world units |  |
**Fixed station colour** | colour box | green | available colours |  |
Scale for error ellipses  input  1000
this value will be applied to any error ellipses to enable an exaggerated view of the ellipse geometry

Symbol for given init points  input  1 available line styles
line style of the given initial point symbols

Symbol for calc init points  input  1 available line styles
line style of the calculated initial point symbols

Clear draw model beforehand  tick box
if ticked, the draw model will be cleaned before the new strings are created

Output tab

The fields in this panel define the output parameters.

Field Description Type Defaults Pop-Up

Output file  input box *.in
if non blank, an output file is produced that can be read in the future.

Report file  input box *.rpt
if non blank, a report file of this name is creating giving the calculation specific parameters and result.

No. decimal places for output  input box 5
the number of decimal place to use in the report

Report standard error ellipse  tick box ticked
if ticked, error ellipses for each new point are created

Control Model tab

Model  model box
a new model or an existing model containing some control points an be entered.

If a new model, the calculated points will placed into that control model.
If an existing model, if there is a point in the model with the same point id as a point being calculated,
then that rather than a new point being created, the coordinates of the existing point can be updated
after the reduction is complete (depends on the Update existing controls points tick box).

Colour  model box
colour used for control station symbol
**What's New in 12d Model**

**Adjustments**

**Style**
linestyle box
style for control stations.

**Update existing control points**
tick box ticked
if ticked, any existing coordinate positions from the adjustment will be updated in the given control model.

**Update**
button
if pressed, the updating of changed level values in the given control model will be carried out.

The remaining fields refer to those located below the grid control

<table>
<thead>
<tr>
<th>Scale factor</th>
<th>0.9996</th>
</tr>
</thead>
<tbody>
<tr>

<td>✓</td>
</tr>
</tbody>
</table>

**Scale factor**
in input box project central meridian scale factor
a scale factor can be defined which will be applied to any entered distances. Final distances used in calculations are derived by multiplying the entered distance by the scale factor.

**Add calculated initial values**
tick box tick
if this box is checked, then the initial values will be included in the report

**Maximum number of iterations**
in input box 10
the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations

**Stop when coords differ...**
in input box 0.0001
the calculation of the adjustment is stopped when the difference between successive calculations meet the defined tolerance

**Stop when the variance increases**
tick box tick
if ticked, the calculation of the adjustment is stopped when the variance between successive calculations increases

**Process**
button
run the adjustment
Format of the LSA .in File

The data in each line of the .in file is space delimited. That is, each piece of data on the line is separated by one or more spaces.

**Line 1:**
The layout of the data on the first line is as follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Description</th>
<th>Variable</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Number of distance observations</td>
<td>N-Dist</td>
<td>Integer</td>
</tr>
<tr>
<td>2</td>
<td>Number of angle observations</td>
<td>N-Ang</td>
<td>Integer</td>
</tr>
<tr>
<td>3</td>
<td>Number of true azimuth observations</td>
<td>N-Azi</td>
<td>Integer</td>
</tr>
<tr>
<td>4</td>
<td>Number of control (fixed) stations</td>
<td>N-Fix</td>
<td>Integer</td>
</tr>
<tr>
<td>5</td>
<td>Number of stations (including control stations)</td>
<td>N-Stn</td>
<td>Integer</td>
</tr>
<tr>
<td>6</td>
<td>Distance standard deviation (positive if used)</td>
<td>D-Std</td>
<td>Double</td>
</tr>
<tr>
<td>7</td>
<td>Distance part per million (non-negative if used)</td>
<td>D-Ppm</td>
<td>Double</td>
</tr>
<tr>
<td>8</td>
<td>Angle standard deviation (positive if used)</td>
<td>A-Std</td>
<td>Double</td>
</tr>
<tr>
<td>9</td>
<td>Azimuth standard deviation (positive if used)</td>
<td>Z-Std</td>
<td>Double</td>
</tr>
<tr>
<td>10</td>
<td>Scale factor</td>
<td></td>
<td>Double</td>
</tr>
</tbody>
</table>

*Note: D-Std, is in millimetres, A-Std and Z-Std are in seconds.*

**Example:**

63 71 0 16 35 5.00000 5.00000 15.00000 5.00000 1.00000

**Next N-Stn lines:**
The next *N-Fix* lines are control station records, followed by (*N-Stn - N-Fix*) station records.
The layout of the line of a station record is as follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Flag (1 if the station is used, otherwise 0)</td>
<td>Integer</td>
</tr>
<tr>
<td>2</td>
<td>Point number</td>
<td>Text</td>
</tr>
<tr>
<td>3</td>
<td>X-coord</td>
<td>Double</td>
</tr>
<tr>
<td>4</td>
<td>Y-coord</td>
<td>Double</td>
</tr>
</tbody>
</table>

**Example:**

1 9338 3889.23700 5341.54800

....

0 9712a 4007.45700 5168.68700

....

**Next N-Dist lines**
The next *N-Dist* lines are distance observation records.
The layout of the line of a distance observation record is as follows:
Note: * Part per million is different to D-Ppm by a factor of 1000. That is, if you want a ppm value of 5, the number in the file should be 0.005

Example:
```
1 9542 9702 100.20200 0.00300 0.00200
1 9542 9703 142.98200 -1.00000 -1.00000
0 9700 9506 72.10700 -1.00000 -1.00000
....
```

Next N-Ang lines

The next N-Ang lines are angle observation records. The layout of the line of a angle observation record is as follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Flag (1 if the observation is used, otherwise 0)</td>
<td>Integer</td>
</tr>
<tr>
<td>2</td>
<td>Start point number</td>
<td>Text</td>
</tr>
<tr>
<td>3</td>
<td>End point number</td>
<td>Text</td>
</tr>
<tr>
<td>4</td>
<td>Distance</td>
<td>Double</td>
</tr>
<tr>
<td>5</td>
<td>Standard deviation (in meter, negative if not used)</td>
<td>Double</td>
</tr>
<tr>
<td>6</td>
<td>Part per million*</td>
<td>Double</td>
</tr>
</tbody>
</table>

Example:
```
1 9542 9702 100.20200 0.00300 0.00200
1 9542 9703 142.98200 -1.00000 -1.00000
0 9700 9506 72.10700 -1.00000 -1.00000
....
```

Next N-Azi lines

The next N-Azi lines are true azimuth observation records. The layout of the line of a true azimuth observation record is as follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Flag (1 if the observation is used, otherwise 0)</td>
<td>Integer</td>
</tr>
<tr>
<td>2</td>
<td>Backsight point number</td>
<td>Text</td>
</tr>
<tr>
<td>3</td>
<td>Instrument point number</td>
<td>Text</td>
</tr>
<tr>
<td>4</td>
<td>Foresight point number</td>
<td>Text</td>
</tr>
<tr>
<td>5</td>
<td>Degree</td>
<td>Integer</td>
</tr>
<tr>
<td>6</td>
<td>Minute</td>
<td>Integer</td>
</tr>
<tr>
<td>7</td>
<td>Second</td>
<td>Double</td>
</tr>
<tr>
<td>8</td>
<td>Standard deviation (in mm, negative if not used)</td>
<td>Double</td>
</tr>
</tbody>
</table>

Example:
```
1 19206 9506 9701 174 29 20.00000 -1000.00000
....
```
17.9.4 Level Network

Position of option on menu: Survey => Adjustments => Level network

The level network option performs a least square adjustment on a set of level observations that can be manually entered into predefined grid box columns or by reading an existing input file.

Selecting Level network brings up the Adjustment of Level Nets panel

<table>
<thead>
<tr>
<th>Position</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Flag (1 if the observation is used, otherwise 0)</td>
<td>Integer</td>
</tr>
<tr>
<td>2</td>
<td>Backsight point number</td>

<td>*.rpt files</td>
</tr>
</tbody>
</table>
a report using the nominated file name is created.

**No. decimal places for output**, input box 5

the number of decimal places for the new levels can be defined.

**Observation tab**

![Observation tab image](image)

the grid control values can be entered using valid inputs into the various fields:

- **From** point id which represents the first point of the level difference
- **To** point id which represents the second point to which the level difference refers
- **Difference** the difference between the levels defined by the **From** point and the **To** point, i.e. the difference = (to point) level - (from point) level
Benchmark tab

- The grid control values can be entered using valid inputs into the various fields.
- **Station.** The point id of a fixed level station should be entered.
- **Level.** The corresponding level value of the fixed station.
Unknown tab

The grid control values can be entered using valid inputs into the various fields.

Station. The point id of any free or floating level stations should be entered.
Level. The corresponding approximate level value of free or floating level station.

A report using the nominated file name is created.
Control Model tab

Model

model box

an existing control model can be entered so that changes to level values can be updated.

Update existing control points tick box ticked

if ticked, any new level values from the adjustment will be updated in the given control model.

Update button

if pressed, the updating of changed level values in the given control model will be carried out.

17.9.5 Height Adjustment

Position of option on menu: Survey =>Adjustments =>Height adjustment

The Height adjustment option adjusts the selected data using either a constant z value, a plane defined by parameters, a plane defined by points (least square fit) or a tin of height differences. Selecting Height adjustment brings up the Height Adjustment panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>file box</td>
<td></td>
<td>*.haf files</td>

<tr>
<td>Data to adjust</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- *a filename can be specified for reading or writing a file.*
- *if a valid file exists, the file contents can be loaded into the panel.*
- *if a valid name is specified, the user can write the input data to a file.*
- *the source of the data to be adjusted is selected using the data source box. For more information on the data source box see 4.19.3 Data Source.*
Adjustments

**Adjustment method**

<table>
<thead>
<tr>
<th>Adjustment method</th>
<th>choice box</th>
<th>Constant</th>
<th>Constant</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The adjustment method should be selected from the list. A description of each method is given below.

**Report file**

*.rpt files

A report using the nominated file name is created.

**Target**

The target for the adjusted data should be specified. For more information on how to use a data target box see the section 4.19.4 Data Target.

**Transform**

Perform the transformation.

**Constant adjustment method**

**Corr constant**

The value to be added to the selected data. This method is the same as a translation in the z values only.

**Plane parameters adjustment method**

**Corr constant**

The value to be added to the selected data.

**Corr per unit N**

The z value correction per unit nothing.

**Corr per unit E**

The z value correction per unit easting.

**Origin point**

String select [same as]

The name of the string of the origin pt.
North coord input box
the northing value of the origin point.

East coord input box
the easting value of the origin point.

**Plane by points adjustment method**

The grid control values can be entered to build up the benchmark points from which the plane will be fitted to.

**Use pt**. the point (benchmark point) can be included in the derivation of the parameters by selecting the **Use pt** option. If the point is not to be included, then uncheck the box.

**Point**. The point id of the benchmark

**Northing**. The northing value of the benchmark

**Easting**. The Easting value of the benchmark

**Current_Ht**. The current level value of the benchmark

**Correct_Ht**. The correct height in the adjusted level plane.

**Adjusted_Ht**. This field shows the adjusted height after the adjustment is performed.

**Residual**. This field shows the difference between the correct height and the adjusted height. This value is shown after the adjustment is performed.

The **Add pt** button used in this panel can be used to add points into the grid control from selecting points from a current view. After the button is selected, consequent selection and acceptance of points from the view will add the value into the grid. The **Correct_Ht** parameter will then have to be filled out by the user.
The Calculate button can be used to calculate the adjustment parameters and residuals so that they can be inspected before the adjustment is made.

**Difference tin adjustment method**

The fields used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Difference tin</td>
<td>tin box</td>
<td>available tins</td>

</tr>
<tr>
<td>Add difference tin values</td>
<td>radio button</td>
<td>if the button Add difference tin values is checked the interpolated value from the difference tin will be added to the existing levels of the adjusted points.</td>
<td></td>
</tr>
<tr>
<td>Subtract difference tin values</td>
<td>radio button</td>
<td>if the button Subtract difference tin values is checked the interpolated value from the difference tin will be subtracted from the existing levels of the adjusted points.</td>
<td></td>
</tr>
</tbody>
</table>

if *Constant, a given value is subtracted from each z-value*

- **Corr constant**
  the value to be subtracted from all z-values

- **Origin points**
  the value to be added to all z-values

if *Plan parameters, a 3d-plane is defined and the z-value of the plane subtracted from any points*

- **Corr constant**
  *z-correction at the original point*

- **Corr per unit N**
  *z-correction per unit is the North (y) direction about the origin point*

- **Corr per unit E**
  *z-correction per unit is the East (x) direction*

- **Origin point**
  2d select box
  *pick box for selected a pint to use for North and East coordinates about the origin point*

- **North coordinate**
- **East coordinate**
if Constant, a given value is subtracted from each z-value

Corr constant
the value to be subtracted from all z-values

Origin points
the value to be added to all z-values

if Plan by points a 3d-plane is fitted using least squares adjustment to selecting points. The z-value of the plane is then subtracted from any points.

Corr constant
z-correction at the original point

Corr per unit N
z-correction per unit is the North (y) direction about the origin point

Corr per unit E
z-correction per unit is the East (x) direction

Origin point
2d select box
pick box for selecting a point to use for North and East coordinates about the origin point

North coordinate
East coordinate

if Difference tin, the z-value from a triangulation is added/subtracted from any points

Difference tin
tin box
available tins
tin of values to be added/subtracted from the z-values of points

Add difference tin values radio button
if on, the values of the tin are added to the selected points

Subtract difference tin values radio button
if on, the values of the tin are subtracted to the selected points

17.9.6 Traverse Adjustment

Position of option on menu: Survey => Adjustments => Traverse adjustment

The Traverse adjustment option performs a Bowditch, Transit, Compass or Least Square adjustment on a selected string. The adjustment can be for a closed string (loop) or an open string (non-loop).

Selecting Traverse adjustment brings up the Traverse Adjustment panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<td>tick box</td>
<td>unticked</td>
<td></td>
</tr>
<tr>
<td>if ticked, the closing azimuth and bearing fields are enabled, allowing the entry of the values so that a calculation of an angular misclose can be made. i.e. angular misclose = closing azimuth - closing bearing.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>This requires a closing observation to be recorded separately to the adjustment string chosen.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>This angular misclose can be distributed around the traverse before adjustment. The distribution follows standard survey practice, calculating a misclose value per setup station and then adding this constant to every traverse leg in a accumulative manner.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>i.e. The 1st leg angle adjusted bearing = orig bearing 1st leg + 1*misclose/setup stn.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The 2nd leg angle adjusted bearing = orig bearing 1st leg + 2*misclose/setup stn. and so forth.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The closing observation is not taken from the traverse string to be adjusted, but by direct entry into the closing azimuth and bearing fields.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Closing azimuth</td>
<td>angle box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| The closing azimuth is the bearing as calculated from the last point (known coordinate; equal to the
start point if a loop traverse) to the closing station (known coordinate or bearing).

**Closing bearing**

angle box

The closing bearing is the observation from the last traverse point to the closing station (known coordinate or bearing)

**Tolerance (relative acc) 1:**

The accuracy can be set which will be used to assess the misclose value before the adjustment is made. If the misclose is out of tolerance, a message box will appear notifying the user that the linear tolerance has not been met and prompting for further action. This may force the adjustment to continue or the exit of the process.

### New String Settings tab

<table>
<thead>
<tr>
<th>Adjust Settings</th>
<th>New String Settings</th>
<th>Least Sq. Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create new string</td>
<td>tick box</td>
<td>tick</td>

<td>name box</td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>model box</td>
<td>available models</td>
</tr>
<tr>
<td>Colour</td>
<td>colour box</td>
<td>available colours</td>
</tr>
</tbody>
</table>

*Create new string* tick box tick

If ticked, a new adjusted string is created. If not tick, the selected string is adjusted.

*Name* name box

If non-blank, the name of the new string. If blank, the original string name is used.

*Model* model box available models

If non-blank, the model of the new string. If blank, the original string model is used.

*Colour* colour box available colours

If non-blank, the colour of the new string. If blank, the original string colour is used.

If the least square method is chosen the following parameters can be set in the **Least Sq. Settings** tab. If a different method is chosen the least square parameters are shown **greyed out** indicating that they are not used in the adjustment.
Least Sq. Settings tab

```
<table>
<thead>
<tr>
<th>Adjust Settings</th>
<th>New String Settings</th>
<th>Least Sq. Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction obs std (sec)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Distance obs std (mm)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Distance ppm</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Maximum number of iterations</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>Stop when coords differ &lt;</td>
<td>0.0001</td>
<td></td>
</tr>
<tr>
<td>Stop when variance increase</td>
<td>tick box</td>
<td>ticked</td>
</tr>
</tbody>
</table>
```

**Direction obs std (sec)**

standard deviation of a single angular measurement in seconds of arc.

**Distance obs std (mm)**

standard deviation of a single distance measurement.

**Distance ppm**

distance error in parts per million.

*This value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)*

**Iterations**

input box 10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

**Coords differ**

input box 0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

**Variance increase**

tick box ticked

the calculation of the adjustment can stopped when the variance between successive calculations increases.

The remaining values are as follows:

**Report file**

*.rpt files

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

**Partial**

tick box

if ticked, only part of the selected string is adjusted.

**Pick**

button

select the string to adjust.

**Adjust**

button

perform the adjustment.

17.9.7 Survey Adjustments Utilities

Position of option on menu: Survey => Adjustments => Utilities
The options on the Survey Adjustment Utilities menu are designed to get data from external sources into the Least Squares Network and Level Network formats, (.IN/.LIN files respectively) for processing by 12d.

The data conversion is a multistep process as it is designed to bring in several different formats into the 12d .IN/.LIN formats.

.SOA files

The SOA files are an intermediate text file generated onboard a Leica 1200/Viva TPS/GPS instrument.

The format files to generate these files from a Leica DBX are shipped in the library directory.

- **ANG_Code_Office.FRT** is the format file used when the Station number is put in as a code
- **ANG_ID_Office.FRT** is the format file used when the Station number is put in as a Point ID

The use of format files is out of the scope of this manual and described in the Leica documentation.

The SOA file format is intermediary and not documented.

.ANG files

ANG files are a text file containing rounds of angles, they are generated by the Leica DBX to ANG panel or can be generated in TP-Setout or TP-Stakeout.

The format of an .ANG is such

```
<Backsight ID> <Backsight Height> <Station ID> <Station Height>
<Foresight ID> <Foresight Height> <Backsight bearing> <Backsight Vertical angle> <Backsight slope distance> <Foresight bearing> <Foresight Vertical angle> <Foresight slope distance>
```

Bearing and angles are in radians and station Ids must be quoted if they have spaces.

```
"34748A" 1.300 "34872A" 1.660 "34978B" 0.000 5.49580322 1.58360594 159.477 2.83371620 1.53209318 117.170
```

.LSF files

LSF files are a TP-Setout/TP-Stakeout format for a least squares network adjustment.

The format consists of several sections, each section is terminated by an END.

The first a list of station coordinates and weighting definitions.

```
<Station name> <Easting> <Northing> <Weight> <Level> <Weight>
GB117 9808.1480 168635.6450 1000 4.0314 1000
```

A weight of 1000 means fixed, 1 completely free.

The second section is the horizontal observations.

```
<Backsight ID> <Station ID> <Foresight ID> <Backsight bearing> <Foresight bearing>
KHABB KHP14 KHP13 0.0000 3.15157367
```
Bearing and angles are in radians and station IDs must be quoted if they have spaces.

The 3rd section is the horizontal distances.

<Station name> < Station name > < Horizontal distance>
KHABB GB117 68.909

The 4th section is the height difference information.

<Station name> < Station name > < Vertical distance>
KHABB GB117 -11.138

17.9.7.2 ANG to LSF

Position of option on menu: Survey => Adjustments => Utilities => ANG to LSF

The panel converts a round of angles ANG file into the LSF least squares network format.

As a prerequisite to using this panel a PTA file of the fixed control points must be created.

The PTA format is a space delimited <Easting> <Northing> <Level> <"ID"> format.

12343.345 234435.236 500.127 "STN1"
12654.877 234435.345 501.457 "STN2"
12456.345 234543.866 499.345 "STN3"

The PTA file can come in from TP-Setout/TP-Stakeout or it can be written out using the File I/O => Data output => x y z general option. See 8.2.5.4 User X Y Z and Attributes Output.
Set the following fields in the xyz output for creating a PTA format file.

<table>
<thead>
<tr>

- **GSI file**: the GSI file to process
- **Level Network file**: the .LIN file to create
- **Write GSI line to .LIN file?**: tick box
  - if ticked the raw data from the GSI file will be written as a comment line into the .LIN file.
- **Process**: button
  - create the level network LIN file.

### 17.10 Conversions

**Position of menu:** Survey => Conversions

The Conversions walk-right menu contains survey transformations for converting between most projections (or longitude, latitude) including Transverse Mercator, UTM etc. conversion options.

Conversions can involve the same ellipsoid or different ellipsoids. When using different ellipsoids, either a 7-parameter transformation or NTVT2 grids can be used to convert between the ellipsoids.

The Conversion walk-right menu is

![Survey Conversions]

For converting between projections using the same ellipsoid:

- For the option **Australian conversions**, go to [17.10.1 Australian Conversions](#).
- Cartographic, [17.10.2 Cartographic](#).
- NZ conversions, [17.10.3 NZ Conversions](#).

For converting between projections with different ellipsoids:

- For the option **AGD66/84 <--> GDA94**, go to [17.10.4 AGD66/84 <--> GDA94](#).
- General transformations, [17.10.6 General Transformations](#).
- **IGN72 <--> RGN1991**, [17.10.7 IGN72 <--> RGN1991](#).
- **NZ49 <--> NZ2000**, [17.10.5 NZ49 <--> NZ2000](#).
- MGRS <--> UTM, [17.10.8 MGRS <--> UTM](#).
For more information about terminology used in these sections, see the Appendix [38 Geodetics Summary].

17.10.1 Australian Conversions

Position of option on menu:  Survey => Conversions => Australian conversions

The Australian conversions option converts data from one form (AMG/MGA, Long Lat, Global XYZ) to another for the same common datum (AGD66/84 or GDA94). The option also allows for the conversion from one zone to another for a common datum. (e.g. from zone 54 to 55 in MGA).

For converting ISG co-ordinates in the same datum, use the option  
Survey => Conversions => Cartographic (see [17.10.2 Cartographic]).

For converting between the different datums AGD66/84 and GDA94, use the option  
Survey => Conversions => AGD66/84 <-> GDA94 (see [17.10.4 AGD66/84 <-> GDA94]).

For more information, go to the section [38.5 Converting Between AMG, ISG and MGA] in the Appendix [38 Geodetics Summary].

Selecting Australian conversions brings up the Australian conversions panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

<td></td>
<td>49 -&gt; 59</td>
<td></td>
</tr>
</tbody>
</table>
if AMG/MGA was selected for the output data type, the AMG/MGA zone is given in this field.

Use data source tick box if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source input

if use data source is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see 4.19.3 Data Source.

Target target

if use data source in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see 4.19.4 Data Target.

Input coordinates XYZ box

if use data source is not ticked, the coordinates in this field is transformed.

Output coordinates XYZ box

if use data source is not ticked, the transformed co-ordinates are displayed in this field.

Transform button perform the transformation.

17.10.2 Cartographic

Position of option on menu: Survey => Conversions => Cartographic

Position of option on menu: Utilities => A-G => Cartographic

The Cartographic option is used to transform data based on the same datum between

(a) two different cartographic projections (based on the same datum)

(b) longitude and latitude and a cartographic projection (based on the same datum)

(c) a cartographic projection and longitude and latitude (based on the same datum).

The datum, relates to the ellipsoid model used. This should be the same for both the to and from fields. i.e. a transform between data based on the ANS ellipsoid, to data based on the WGS84 ellipsoid would be incorrect.

(a) Transforming Between Two Cartographic Projections

For the first case, the data starts in one cartographic projection and is to be transformed into another cartographic projection.

This is achieved by converting the data in (x,y) co-ordinates in the original projection, to (longitude, latitude) and then converting from (longitude, latitude) to (x,y) in the new projection.

original projection ————> (longitude, latitude) ————> new projection

For example, to transform from MGA zone 50 to MGA zone 51, the original data starts in MGA zone 50, is transformed to (longitude, latitude) and then transformed from (longitude, latitude) to MGA zone 51.

Note that to make the transformation, the two cartographic projection must already be defined, That is in the example above, the two projections MGA zone 50 and MGA zone 51 must already be defined.

In 12d Model, a Cartographic projection is defined by the option
and is documented in the section 7.6.6.2 Create/Edit Projection.

The two cartographic projection definitions for the conversion are given in the Cartographic panel.

(b) Transform Between Longitude-Latitude and a Cartographic Projection

For the second case, the data starts in (longitude, latitude) is to be transformed into (x,y) co-
ordinates in a cartographic projection.

\[(\text{longitude, latitude}) \quad \mapsto \quad \text{cartographic projection}\]

For example, to transform (longitude, latitude) to MGA zone 51.

To make the transformation, the required cartographic projection must already be defined by the option

\[\text{Project} \Rightarrow \text{Projections} \Rightarrow \text{Create/edit}\]

which is documented in the section 7.6.6.2 Create/Edit Projection.

Notes
1. In the southern hemisphere, the latitude values are negative. If the latitude is given as positive rather than negative, then the option Factor can be used to multiply the latitude by -1.
2. If the information is given in (latitude, longitude) rather than the required (longitude, latitude), then the option Swap XY can be used to swap the order of the co-ordinates.

(c) Transform Between a Cartographic Projection and Longitude-Latitude

For the third case, the data starts in (x,y) co-ordinates in a cartographic projection and need to be transformed to (longitude, latitude).

\[(\text{cartographic projection}) \quad \mapsto \quad (\text{longitude, latitude})\]

For example, to transform from MGA zone 51 to (longitude, latitude).

To make the transformation, the required cartographic projection must already be defined by the option

\[\text{Project} \Rightarrow \text{Projections} \Rightarrow \text{Create/edit}\]

which is documented in the section 7.6.6.2 Create/Edit Projection.

Notes
1. In the southern hemisphere, the latitude values are negative. If a positive value for latitude is required, then the option Factor can be used to multiply the latitude by -1.
2. If the information is required to be given in (latitude, longitude) rather than the (longitude, latitude) produced by the transformation, then the option Swap XY can be used to swap the order of the co-ordinates.

On selecting the Cartographic option, the Cartographic panel is displayed.
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>data selection type</td>
<td>non-blank</td>
<td>for a full description go to 4.19.3 Data Source.</td>
</tr>
<tr>
<td>Data source</td>
<td>input</td>
<td></td>
<td>source of data to be processed.</td>
</tr>
</tbody>
</table>
| X/Y Coordinates to Long/Lat               | choice box      | available projections | if non-blank, the name of the cartographic projection to map the selected string co-ordinates into longitude-latitude values.  
If blank, the initial co-ordinates are not transformed from (x,y) to (longitude, latitude). Hence the initial co-ordinates are then assumed to be in (longitude, latitude) form ready to be transformed to (x,y) by the transformation given in the Long/Lat to x/y coordinates field. Note that in the southern hemisphere, the latitude values must be given as negative. |
| Long/Lat to X/Y Coordinates               | choice box      | available projections | if non-blank, the cartographic projection to apply the longitude-latitude values.  
If blank, the co-ordinates are not transformed from (longitude, latitude) to (x,y). Hence the initial (x,y) co-ordinates are transformed to (longitude, latitude) by the transformation given in the x/y coordinates to Long/Lat field and then left in (longitude, latitude). Note that in the southern hemisphere, the latitude values are negative. |
| Long/Lat stored as                         | input           | degrees  | radians, degrees, decimal degrees |
| Target type                                |                 |          | Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target |
| Target info                               |                 | input    | |

Format for the longitude and latitudes - either radians, degrees (in 4.17.1 HP Notation for degrees, minutes and seconds) or decimal degrees.
extra information required for the target.

**Transform button**

Transform the selected strings to longitude-latitude co-ordinates using the **x/y coordinates to long/lat (radians)** transformation, and then project those longitude-latitude co-ordinates into the new co-ordinate system using the **long/lat (radians) to x/y coordinates** transformation.

**Note**

The **Cartographic** option can be used to transform just **x/y coordinates** to **long/lat** or **long/lat** to **x/y coordinates** by simply leaving the appropriate panel field blank. The units for **longitude** and **latitude** are either degrees (dms), decimal degrees or radians.

### 17.10.3 NZ Conversions

**Position of option on menu:** Survey => Conversions => NZ conversions

The **NZ conversions** option converts data from one form (NZMG/NZTM2000, Long Lat) to another for the same ellipsoid (i.e. datum NZ49 or NZ2000).

For converting between the **different** datums NZ 49 and NZ 2000, use the option Survey => Conversions => NZ49 <-> NZ2000 (see 17.10.5 NZ49 <-> NZ2000).

Selecting **NZ conversions** brings up the **New Zealand Conversions** panel.
The fields and buttons used in this panel have the following functions.

**17.10.4 AGD66/84 <---> GDA94**

Position of option on menu: Survey => Conversions => AGD66/84 <---> GDA94

This option converts data between the two Australian Datums, AGD 66/84 and GDA 94. The transformation between the two datums can be by either a seven parameter similarity transformation for a State, or a NTv2 grid for either a State or Australia.
**12d Model** is GDA compliant for both the similarity transformations and NTv2 grids.

The AGD 66/84 data can be either longitude and latitude, co-ordinates in an AMG Zone or co-ordinates in an ISG Zone.

The GDA 94 data can be either longitude and latitude, Global XYZ or co-ordinates in a MGA Zone.

Hence the option will converts data from AMG 66/84 or ISG 66/84 to MGA 94 and vice-versa.

For more information, go to the section **38.5 Converting Between AMG, ISG and MGA** in the Appendix **38 Geodetics Summary**.

Selecting agd66/84 $\iff$ gda94 brings up the agd66/84 $\iff$ gda94 panel.
The fields and buttons used in this panel have the following functions.

![AGD66/84 to GDA94 conversion panel](image-url)

The AGD66/84 and GDA94 panels allow for the conversion of geodetic and map grid coordinates. The AGD66 and AGD84 are Australian Geodetic datums, while AMG represents the Australian Map Grid. The ISG grid is used in New South Wales. The panels provide options for selecting the appropriate settings and units for the conversion process.
### GDA Settings

![GDA Settings Panel](Image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>MGA  Lat/Long  Global XYZ radio button</td>
<td>one of the three choices is selected.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MGA Zone no.</td>
<td>choice box</td>
<td>49 -&gt; 59</td>
<td></td>
</tr>
<tr>
<td>Lat/Long unit</td>
<td>choice box</td>
<td>degrees</td>
<td>radians, degrees, decimal degrees</td>
</tr>
</tbody>
</table>

*If MGA was selected, the MGA zone is given in this field.*

*If Lat/Long was selected, the Lat-Long coordinates have the selected units.*
Transformation Settings

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGD66/84 --&gt; GDA94</td>
<td>radio button</td>
<td>one of the two choices is selected.</td>
<td></td>
</tr>
<tr>
<td>Medium accuracy</td>
<td>radio box</td>
<td>tick</td>
<td></td>
</tr>
<tr>
<td>High accuracy</td>
<td>radio button</td>
<td>if ticked, the NT V2 grid shift file is used.</td>
<td></td>
</tr>
<tr>
<td>Select State</td>
<td>choice box</td>
<td>ACT, NSW, TAS, VIC</td>
<td></td>
</tr>
<tr>
<td>Grid shift file</td>
<td>file box</td>
<td>*gsb</td>
<td></td>
</tr>
</tbody>
</table>

If the AGD66 datum has been selected, and the 7 parameter transformation is to be used, the seven parameter transformation parameters are different for each state. (i.e the states which adopted the AGD66 datum). By selecting the appropriate state, the corresponding values will be used.

If the AGD84 datum has been selected, the parameters used are the Australian wide values and therefore the state selection is not appropriate.

For high accuracy, the NTv2 grid shift files can be used.
Data Source

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

*if use data source in the data source is ticked, the target of the transformed data should be specified*

The target for the data is selected using the data target box. For more information on the data target box see 4.19.4 Data Target.

17.10.5 NZ49 <---> NZ2000

**Position of option on menu:** Survey => Conversions => NZ49 <--- NZ2000

This option converts data from the NZ 49 datum to the NZ 2000 datum and vice-versa.

The transformation between the two datums can be by either the NZ seven parameter similarity transformation or a NTv2 grid.

The data to be converted can be longitude and latitude, NZMG, circuits or Global XYZ.

Selecting NZ49 <--- NZ2000 brings up the NZ49 <--- NZ2000 panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

</table>

For more information about terminology used in these sections, see the Appendix 38 Geodetics Summary.

## 17.11.1 Projection Bearing/Distance Entry

**Position of option on menu:** Survey => Geodetics => Projection bearing/distance entry

This section of documentation is a work in progress and will be updated in subsequent releases.
The **Projection bearing/distance entry** option allows the input of a traverse by manual input of projection bearings (the plane bearing) and ellipsoid distances or by selecting an existing string. For each point, the projection co-ordinates are used with the projection bearing and ellipsoid distance from that point to calculate the projection co-ordinates for the new point taking the map projection into account.

Selecting **Projection bearing/distance entry** brings up the **Projection Bearing/Distance Entry** panel.

![Projection Bearing/Distance Entry GUI](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>name box</td>
<td>defined names from names.4d file</td>

</tbody>
</table>

*This field is optional. If non-blank, the name of the new string.*

*If non-blank, the model of the new string. If blank, the original string model is used.*

*If non-blank, the colour of the new string. If blank, the original string colour is used.*

*Line style of the string.*

*This is the projection that is used for calculating the (Easting, Northing) values.*
Start point coords measure box
Use z-value tick box transit

if ticked, the z-values for each point are entered.
If no ticked then z-values are not entered and are not displayed in the grid.

Point id input typed none, auto increment, typed

if none, no point ids are entered and the grid control will not show a column for point ids.
If auto increment then the values of point ids will be incremented by a value of 1 starting from the specified Start point id. If no Start point id is specified then no point ids will be allocated. No column for point ids is shown in the grid control.

if typed then the values of point ids will be incremented by a value of 1, starting from the specified Start point id. If no Start point id is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.

VALUES IN GRID grid box
The columns shown in the grid will depend on the selection of the Use z-value and Point id fields.

To Pt. input

if none is selected for the Point id field, this column will not be displayed.

if auto increment is selected for the Point id field, this column will not be displayed.

if typed is selected for the Point id field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.

Proj.Brg angle box
The user should enter the projection bearing for the segment into this field. The projection bearing can be defined as the bearing resulting from plane geometry calculations between the two projection coordinates. This is sometimes called the grid bearing in some countries (e.g. New Zealand) and the plane bearing in others such as Australia as defined in the GDA technical manual (ICSM).

Ellip Dist input box
the user should enter the ellipsoid distance. This distance is the measured horizontal distance that has been reduced onto the ellipsoid taking into account the heights above the ellipsoid at each end of the measured line. This reduction may be by the use of a height scale factor for example. Distances that are measured near mean sea level approximate the ellipsoid distance (since the MSL approximates the ellipsoid in many reference ellipsoids (e.g AGD)). The amount of correction will be dependant on the length of line, the heights above the ellipsoid and the reference ellipsoid being used.

Height input box
This column will only be visible in the grid if the Use z-value tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.

Select button
on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the
relevant information.

**Process** button changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

### 17.11.2 E,N from Ellipsoid Distance and Plane Bearing

**Position of option on menu:** Survey => Geodetics => E,N from ellip dist, plane bearing

The E,N calc from ellip dist, plane brg option allows users to calculate projection coordinates given the projection, start coordinate, plane bearing and ellipsoid distance. The results are given inside the panel.

On selecting the E,N calc from ellip dist, plane brg option, the **Projection Coords from plane brg and ellipsoid dist** panel is displayed.

![Projection Coords From Plane Brg And Ellipsoid Dist](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

the projection of the data to be used.

**Start coordinates**

- **Easting**
- **Northing**

the easting value of the start coordinate.

the northing value of the start coordinate.
Select Pt button

if the point exists in a view, the coordinate can be entered by selecting the button and then on the required point. The selected points coordinates will be returned to the relevant coordinate boxes.

**Bearing/Dist obs**

**Plane bearing** input

the plane bearing (or Projection brg) of the line from the nominated start coordinate. The projection bearing can be defined as the bearing resulting from plane geometry calculations between the two projection coordinates. This is sometimes called the grid bearing in some countries (e.g. New Zealand) and the plane bearing in others (e.g Australia as defined in the GDA technical manual (ICSM)).

**Ellipsoid distance** input

the ellipsoid distance of the line from the nominated start coordinate

**Reduced coordinates**

**Easting** input

the calculated easting value of the 2nd point.

**Northing** input

the calculated northing value of the 2nd point.

**Buttons at bottom**

**Process** button

perform the calculation.

**Clear** button

clear the input fields

---

**17.11.3 Plane Bearing and Distance Measure**

**Position of option on menu:** Survey => Geodetics => Plane bearing/distance measure

Measures the plane angle and plane distance between two selected points.

This option has already been documented in the section 28.6.2 Bearing and Distance.

**17.11.4 Projection Bearing and Distance Measure**

**Position of option on menu:** Survey => Geodetics => Projection bearing/distance measure

The **Projection bearing and dist** option allows users to measure projection plane bearing, plane distance, ellipsoid distance, arc-to chord values and a line scale factor.

On selecting the **Projection bearing and dist** option, the Measure Projection Plane bearing and ellipsoid dist panel is displayed.
This panel is principally used to display the distances between, and bearing of the line joining, pairs of user selected points.

- **message area 1**: point selection comment
- **message area 2**: \(dx = dy =\)
- **message area 3**: plane brg = plane dist = ellipsoid dist =
- **message area 4**: t-T fwd = t-T rev = l.s.f =

where \(dx\) is the \(x\) coordinate difference between the points, \(dy\) is the \(y\) coordinate difference between the points.

plane brg is the angle measured clockwise from north and is calculated using the coordinate values (Inverse value).

plane dist is the distance calculated using the coordinate values (Inverse value).

ellipsoid dist is the ellipsoid distance calculated using the specified projection and coordinate values.

\(t-T\) fwd is the forward arc-to chord correction.

\(t-T\) rev is the reverse arc-to chord correction.

l.s.f is the line scale factor. It is calculated by plane distance/ellipsoid distance.

The fields and buttons used in this panel have the following functions.

17.11.5 GDA94/AGD66-84 Bearing and Distance Measure

Position of option on menu: Survey => Geodetics => GDA94/AGD66-84 bearing/distance
measure
The Bearing and distance (GDA94/AGD66-84) is specifically for Australian use. It allows users to select two AMG/MGA coordinates and return the calculated geodetic parameters.

On selecting the Bearing and distance (GDA94/AGD66-84) option, the Bearing and distance (GDA94/AGD66-84) panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>input</td>
<td>disjoint</td>
<td>disjoint, continuous</td>
</tr>
</tbody>
</table>

In disjoint mode, the geodetic parameters between the two points are displayed. After the first calculation, further selections must include both the first and second points.

In continuous mode, after the initial reporting of the values, the user is prompted to select the next point (2nd point). In this case, the previously selected second point becomes the first point.

Datum choice current projection AGD66/84 GDA94

the datum of the data to be used.
Select N value setting  radio button selected  

if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the N value interpolation method choice box.

Note: The ellipsoid height is required to calculate the values. However most level datums, such as AHD approximate geoid heights. Therefore, one of the selected points should at least have a non-null value and a means for computing a ellipsoid height. If one point has a valid height and the other does not, an option will be given to assume the other point has the same value.

Various options of converting non-ellipsoid geoid heights to ellipsoid are given by the N value interpolation method choice box or the user can enter N values for the first and second points.

N value interpolation method  choice box  currently set method Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are defined in the project n value settings. For more information on the n value settings see the section 7.6.7 N values.

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged.

the zone of the data to be used.
Input N values radio button unselected
if an N value is known for the area or for the selected points, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

1st pt N value input box
if the Input N value option is chosen, an N value is entered for the first point.

2nd pt N value input box
if the Input N value option is chosen, an N value is entered for the second point.

How to Use the Panel and Panel Messages
The results are returned to the panel in the following format:
message area 1 Messages
message area 2 plane brg =, plane dist, dx =, dy =
measure area 3 grid brg =, ellipsoid dist =, line scale factor =
message area 4 Mean height factor =, (Plane dist/level terrain dist) scale factor =
measure area 5 Mean level terrain distance =

Note: Mean height factor is the factor to apply to a measured horizontal distance (usually measured at a height above or below the ellipsoid) to reduce it down to an ellipsoid distance. The other geodetic values and terminology are clearly defined in the GDA technical manual. See http://www.anzlic.org.au/icsm/gdatm/

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The clear button resets the message areas.

17.11.6 Longitude, Latitude from Grid Coordinates

Position of option on menu: Survey =>Geodetics =>Long, lat from grid coordinates
The Longitude, latitude from grid coordinates option allows a user to calculate Longitude, latitude and convergence of a point, given a projection and selection of a grid coordinate.

On selecting the Longitude, latitude from grid coordinates option, the Longitude, latitude from grid coordinates panel is displayed.

The fields and buttons used in this panel have the following functions.
Field Description Type Defaults Pop-Up
Projection choice current projection available projections
the projection of the data to be used.

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The clear button resets the message areas.

17.11.7 GDA94/AGD66-84 Point Scale Factor
Position of option on menu: Survey => Geodetics => GDA94/AGD66-84 point scale factor

The Point scale factor (GDA94/AGD66-84) is specifically for Australian use. It allows users to select AMG/MGA coordinates and return the point scale factor and latitude and longitude of the point.

On selecting the Point scale factor (GDA94/AGD66-84) option, the Point scale factor (GDA94/AGD66-84) panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

the zone of the data to be used.

Note: The ellipsoid height is required to calculate the point scale factor. However most level datums, such as the AHD approximate geoid heights. Therefore, selected points should at least have a non-null value and a means for computing a ellipsoid height. Various options of converting non-ellipsoid geoid heights to ellipsoid are given.

Select N value setting
- radio button selected if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the **N value interpolation method** choice box.

N value interpolation method choice box currently set method Available n value methods the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are defined in the project n value settings. For more information on the n value settings see the section 7.6.7 N values.

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged.

Input N value radio button unselected if an N value is known for the area or for the selected point, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged.

Enter N value input box if the Input N value option is chosen, an N value is entered.

How to Use the Panel and Panel Messages
The results are returned to the panel in the following format:
- message area 1 Messages
- message area 2 Point scale = , Interpolated or entered N value = (if applicable)
- measure area 3 Combined point scale/height factor =
- message area 4 Longitude = Latitude =

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

17.11.8 Non-Projection to Projection Coordinates

Position of option on menu: Survey => Geodetics => Non-projection to projection coordinate conversion

The **Non-projection to projection coordinate conversion** is for the conversion of non-
projection coordinates (plane) to a specified projection system. This is done by calculating a series of vectors from an origin point. The origin coordinates in both the plane and projection are known. The plane vector is calculated between the origin and other selected points. Then using the projection coordinates of the origin and the plane vector a projection vector is calculated which allows the projection coordinates of the selected points to be calculated. The azimuth orientation should be the same in both systems, i.e. no swing should be required.

The process will convert the vertex of straight segments very effectively. However, care should be taken when trying to convert non-linear segments such as curves. These may have construction entities such as TP’s that no longer have the same relationship with a centre point after conversion for example. This is due to differing scale factors of points due to the projection.

On selecting the **Non-projection to projection coordinates** option, the **Non-projection to projection coordinate conversion** panel is displayed.

Target target
the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see 4.19.4 Data Target.

17.11.10 Bearing/Distance Label

Position of option on menu: Survey => Geodetics => Bearing/distance label

The Bearing/distance label is for the labelling of a selected string with bearing and distance information. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees).

On selecting the Bearing/distance label option, the Bearing/distance label panel is displayed.

![Bearing/Distance Label Panel]

The fields and buttons used in this panel have the following functions.
**Parameter file**

- **Type:** file box
- **Defaults:** *.lbf files

The parameter file can be read in which will fill in the remaining values within the panel. The user can make changes and save the choices as a different file, thus enabling a library of labelling options to be created.

**Read button**

If a valid parameter file is entered into the parameter file field, the user can press the read button to load the information in the file into the panel.

**Write button**

If a valid parameter file name is entered into the parameter file field, the user can press the write button to save the edited panel information into a file so that it can be read in at a later date.

**Scale factor**

- **Type:** input box
- **Defaults:** Current Scale factor at Central meridian if set

If a scale factor is specified, the distance values labelled will use the scale factor to compute the label distance. This scale factor will be applied to the calculated plane distance from coordinates in the following manner:

\[
\text{label distance} = \frac{\text{plane distance}}{\text{scale factor}}.
\]

**Label style**

- **Type:** choice box
- **Defaults:** bearing and distance

Bearing and distance equates to having the bearing and distance justification point at the same point on the midpoint of the segment (the text justification can make the bearing bottom-middle and the distance top-middle for example to show the bearing above the line and the distance below).

Bearing distance equates to having the bearing and distance justification point along side. For example, a label may be a bearing on the left and a distance on the right.

Distance bearing equates to having the distance and bearing justification point along side. For example, a label may be a distance on the left and a bearing on the right.

**Label all segments**

- **Type:** tick box
- **Defaults:** unticked

If ticked all the segments of the selected string will be labelled.

### Bearing tab

The following fields are located on the bearing tab:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>model box</td>
<td>current models</td>
<td></td>
</tr>
</tbody>
</table>
if a valid model name is specified, the bearing text will be created in that model.

Textstyle data

Textstyle data

on pressing the textstyle data button a list of available textdata predefined names read from the `textstyles_name.4d` file are displayed.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the textstyle data panel. This allows for definition of textstyle, units, height offset raise etc.

The textstyle data panel enables the user to define multiple text parameters.

Zero padding

if ticked, the labels will have zero's inserted so that at least 2 characters exist for the minutes and second part of the label. For example, A bearing of 10° 6’ 5” would become 10° 06’ 05” with padding.

The values in the grid relate to the rounding of bearings for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m)

the rounding upper range limit in meters. This value together with the rounding specified, allow the bearings between certain distance ranges to be rounded to a certain value. The first line in the grid is
from 0 to the specified distance range. Any following lines in the grid use the To(m) value in the
previous line for the lower limit to the To(m) value in that line.

**Rounding (sec) input box**

the rounding value given relates to the distance range. Any bearing within the distance range specified
will be rounded to the value in seconds. e.g for a rounding value of 60 seconds the bearing will be
rounded to the nearest minute.

**Distance tab**

the following fields are located on the distance tab.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>model box</td>
<td>current models</td>
<td></td>

</tr>
<tr>
<td>To(m)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Rounding(m)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Decimals</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If no names exist, the user can edit the current settings by selecting the edit button and bring up the textstyle data panel. This allows for definition of textstyle, units, height offset raise etc.
The textstyle data panel enables the user to define multiple text parameters.

**Suffix**
- **input box**
  - if entered, this suffix will be appended to the end of the distance label.

The values in the grid relate to the rounding of distances for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

**To(m)**
- **input box**
  - the rounding upper range limit in meters. This value together with the rounding and number of decimals specified, allow the distance to be rounded to a certain value. The first line in the grid is from 0 to the specified distance range. Any following lines in the grid use the **To(m)** value in the previous line for the lower limit to the **To(m)** value in that line.

**Rounding (m)**
- **input box**
  - the rounding value given relates to the distance range. Any distance within the distance range specified will be rounded to the value in metres. e.g for a rounding value of 0.05 a distance of 125.261 will be rounded to a value of 125.25

**Decimals**
- **input box**
  - the number of decimal places can be specified. For a distance of 125.261, rounding of 0.05 and Decimals equal to 3, the label will be 125.250.

**Short segment tab**
- the following fields are located on the short segment tab.
What’s New in 12d Model

Geodetic Measures and Entry

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Model</strong></td>

</tr>
<tr>
<td></td>
<td></td>
<td><em>on pressing the textstyle data button a list of available textdata predefined names read from the texstyles_name.4d file are displayed.</em></td>
<td></td>
</tr>
</tbody>
</table>

If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Textstyle data** panel. This allows for definition of textstyle, units, height offset raise etc.

The textstyle data panel enables the user to define multiple text parameters.

**Max. length**

*input box*

*if entered, this value will be compared with the selected segment distance. If the selected distance is less than this distance, the short line labelling will override any bearing and distance labelling.*

**Number**

*input box*

*if entered, this value will be used for the short segment text.*
Pick button

on selection the user can then select a segment/line from a view with direction. The direction will give the bearing direction which is usually +/- 180 degrees different. eg a segment with a bearing of 24 degrees can be labelled with a bearing of 204 by picking in a south west direction.

17.11.11 Projection Bearing/Distance Label

Position of option on menu: Survey => Geodetics => Projection bearing/distance label

The Projection bearing/distance label is for the labelling of a selected string with plane bearing and ellipsoid distance information that is in terms of a selected projection. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees of actual direction).

On selecting the Projection bearing/distance label option, the Projection bearing/distance label panel is displayed.

The fields and buttons used in this panel have the following functions.

if selected, any valid z values will be shown in the report.

N values tick box
if ticked, the N value calculated for the given point will be reported (if valid).

Ellipsoid heights tick box
if selected, the calculated ellipsoid height will be reported. If no N values are calculated, this will be the same as the Z value.

Long, Lat tick box
if selected, the calculated longitude and latitude will be reported.

Point scale tick box ticked
if selected, the point scale for each point will be reported.

Combined point scale tick box
if selected, the combined point scale for each point will be reported. This combined scale factor is the product of the point scale factor and a height scale factor. The height scale factor is computed from the ellipsoid height of the point.

Text tick box
if selected, any valid text values will be shown in the report.

Report file input *.rpt
name of the file to report to.

Report button

17.11.13 Solar Reduction

Position of option on menu: Survey => Geodetics => Solar reduction

The Solar reduction option allows the reduction of observations to the sun by the hour angle method. The user can specify either limb or the centre of the sun, and a number of observations can be processed together. The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory. These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050.

On selecting the Solar reduction option, the Solar Observations panel is displayed.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>file box</td>
<td>* .ast files</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Read button</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td>name of the origin station</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RO station</td>
<td>input</td>
<td>name of the reference object station</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Origin longitude</td>
<td>input</td>
<td>the observation station's longitude should be specified in DMS format.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Origin latitude</td>
<td>input</td>
<td>the observation station's latitude should be specified in DMS format.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Date</td>
<td>date box</td>
<td>current system date</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If a valid file exists, the file contents can be loaded into the panel.

If a valid name is specified and the valid values are entered into all of the fields, the user can write the input data to a file.

A projection can be specified so that a grid convergence value can be computed. This value will be used to compute the grid or projection bearing to the RO. If left blank, only the True azimuth will be reported.

The date of the observations as at the observers position should be entered. This can be by direct entry.
into the date field or by selecting the day, month, year from a date pop-up panel. The user can scroll through different months by selecting the arrow buttons on the pop-up date panel.

**Time zone**
- **time zone box**
- **major time zones**

A valid time zone for the observer's position and local time should be selected from the pop-up list.

**Timing corr. (hh:mm:ss)**
- **input**

The correction to apply for any timing error including stopwatch corrections should be entered. The value should be in hours, minutes, seconds in **hh:mm:ss** format.

**GRID VALUES:**
- **input**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local time</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the local time of the observation specified in 24 hour time in HMS. eg. 18.121002</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Horiz obs to RO</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the horizontal angle (bearing) observed to the RO for the set of measurements. A set in this case includes a pointing to the RO and sun (at a certain time) in the same face.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Horiz obs to SUN</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the horizontal angle (bearing) observed to the Sun for the set of measurements. (The observation should not be corrected for the sun's semi diameter as this is done internally by the reduction process)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If observations are made on both faces, a separate line should be entered for each face. E.g., Face 1 to RO may be 0.0000 and the face 1 to the sun may be 50.0000 which would be on the same line, then the observer may change face to face 2 and observe to the sun again followed by the RO. The face 2 observations should appear on the next line e.g. 180.0004 230.0110.

| Limb of sun             | choice box  | Centre        | Left limb | Right limb |
|                        |             |               |          |           |
| the limb of the sun observed should be specified. This enables the sun's semi diameter correction to be applied. This also allows the observations to be read in any order. |

| Az to cen. SUN          | output      |               |          |          |
| the true azimuth to the sun will be displayed in this field on successful reduction of the observations. |

| Az to RO                | output      |               |          |          |
| the true azimuth to the RO will be displayed in this field on successful reduction of the observations. |

| Conv. angle             | output      |               |          |          |
| the convergence angle at the observation point will be displayed in this field if a valid projection is specified and there is a successful reduction of the observations. |

| Grid brg to RO          | output      |               |          |          |
| the grid bearing to the RO will be displayed in this field if a valid convergence angle is calculated and there is a successful reduction of the observations. The grid bearing is calculated by: |

**Grid brg = True azimuth + convergence**

The fields and buttons used in this panel below the grid have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average RO azimuth</td>
<td>output</td>
<td></td>
<td></td>
</tr>
<tr>
<td>if there is a successful reduction, the average RO azimuth value will be reported in this field.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Average RO grid bearing output
if there is a successful reduction, and the projection given, the average RO grid bearing value will be reported in this field.

Standard deviation in the mean output
this is a statistical measure of the reduced observations.

17.11.14 Star Reduction

Position of option on menu: Survey => Geodetics => Star reduction

The **Star reduction** option allows the reduction of observations to the nominated star by the hour angle method. A number of observations can be processed together. **The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory.** These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050

On selecting the **Star reduction** option, the **Star Observations** panel is displayed.

</table>

---

*a filename can be specified for reading or writing a file.*

*if a valid file exists, the file contents can be loaded into the panel.*

*if a valid name is specified and the valid values are entered into all of the fields, the user can write the input data to a file.*
the star can be identified by a number of different means. The stars available are based on the Fifth Fundamental Catalogue (FK5) catalogue. Cross matching of id's are not possible in some instances. e.g. A star may have no known general name.

The selection of an id method will force the changing of the id list so the particular star can be selected.

Star id choice
1st star id in list available id's for that type
the star id can be selected from the list.

Report file input *.rpt
name of the file to report to.

Origin station input
name of the origin station

RO station input
name of the reference object station

Origin longitude input
the observation station's longitude should be specified in DMS format.

Origin latitude input
the observation station's latitude should be specified in DMS format.

Date date box current system date
the date of the observations as at the observers position should be entered. This can be by direct entry into the date field or by selecting the day, month, year from a date pop-up panel. The user can scroll through different months by selecting the arrow buttons on the pop-up date panel.

Time zone time zone box major time zones
a valid time zone for the observers position and local time should be selected from the pop-up list.

Timing corr. (hh.mmss) input
the correction to apply for any timing error including stopwatch corrections should be entered. The value should be in a hours, minutes seconds in h/m/s format.

GRID VALUES:

<table>
<thead>
<tr>
<th>Local Time</th>
<th>Horiz obs to RO</th>
<th>Horiz obs to Star</th>
<th>Az to Star</th>
<th>Az to RO</th>
<th>Conv. angle</th>
<th>Grid brg to RO</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Local time input
the local time of the observation specified in 24 hour time in HMS, eg. 18.121002

Horiz obs to RO input
the horizontal angle (bearing) observed to the RO for the set of measurements. A set in this case includes a pointing to the RO and star (at a certain time) in the same face.

If observations are made on both faces, a separate line should be entered for each face. e.g. Face 1 to RO may be 0.0000 and the face 1 to the star may be 50.0000 which would be on the same line, then the observer may change face to face 2 and observe to the star again followed by the RO. The face 2 observations should appear on the next line eg 180.0004 230.0110.
Horiz obs to Star input
the horizontal angle (bearing) observed to the Star for the set of measurements.

Az to Star output
the true azimuth to the sun will be displayed in this field on successful reduction of the observations.

Az to RO output
the true azimuth to the RO will be displayed in this field on successful reduction of the observations.

Conv. angle output
the convergence angle at the observation point will be displayed in this field if a valid projection is specified and there is a successful reduction of the observations.

Grid brg to RO output
the grid bearing to the RO will be displayed in this field if a valid convergence angle is calculated and there is a successful reduction of the observations. The grid bearing is calculated by:

Grid brg = True azimuth + convergence

The fields and buttons used in this panel below the grid have the following functions.

Field Description Type Defaults Pop-Up

**Average RO azimuth** output if there is as successful reduction, the average RO azimuth value will be reported in this field.

**Average RO grid bearing** output if there is as successful reduction, and the projection given, the average RO grid bearing value will be reported in this field.

**Standard deviation in the mean** output this is a statistical measure of the reduced observations.

---

### 17.12 Traverse Spreadsheet

**Position of menu:** Survey => Traverse spreadsheet

The **Traverse Spreadsheet** options allow the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop). Traverse Spreadsheet will often be abbreviated as TSS.

There are two types of traverse spreadsheets (TSS) - Plane and Projection.

For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculate co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and **12d Model** calculates the correct co-ordinate position using full projection calculations.

The **Traverse spreadsheet** walk-right menu contains the traverse spreadsheet options.

For the option **Parameters**, go to 17.12.1 TSS Parameters
Create 17.12.2 TSS Create
Edit 17.12.3 TSS Edit

---
17.12.1 TSS Parameters

**Position of option on menu:**  
Survey => Parameters

The Traverse Spreadsheet Parameters sets the parameters for defining the look and feel of the TSS create and edit panels, reports and drafting.

Selecting Parameters brings up the Traverse Spreadsheet Parameters panel:
17.12.2 TSS Create

**Position of option on menu:** Survey => Traverse spreadsheet => Create

A traverse spreadsheet (TSS) can either use a constant scale factor or a cartographic projection to define the relationship between bearings/distances and the (x,y) co-ordinates.
The Traverse Spreadsheet Create option allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

Selecting Traverse Spreadsheet Create brings up the Create Traverse Spreadsheet panel:

![Create Traverse Spreadsheet Panel]

The fields and buttons used in this panel have the following functions.

<table>
