name of the *.ts file to store all the TSS data in. The TSS can be brought back for editing by giving this filename.

Create button
create a new traverse spreadsheet using the parameters entered in the above panel field. The appropriate editor (either for a Projection Traverse Spreadsheet or a Plane Traverse Spreadsheet panel) is then brought up for the TSS data to be entered and/or edited.

17.12.3 TSS Edit

Position of option on menu: Survey => Traverse spreadsheet => Edit

The traverse spreadsheet editor reads in an existing TSS file and loads the information into either the Projection Traverse Spreadsheet or the Plane Traverse Spreadsheet panel.

Selecting Traverse Spreadsheet Edit brings up the Edit Traverse Spreadsheet panel:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>File name</td>
<td>file box</td>
<td>*.ts files</td>
<td></td>
</tr>
</tbody>
</table>

name of the file containing the traverse spreadsheet information to be edited.

Edit button
read the information in the traverse spreadsheet file and load it into either a Projection Traverse Spreadsheet or a Plane Traverse Spreadsheet panel.

For entering/editing either a Projection TSS or Plane TT, please go to the section 17.12.3.1 Traverse Spreadsheets

17.12.3.1 Traverse Spreadsheets

The Projection and Plane TSS panels allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

The two panels are very similar and only the top section is different. The Projection Traverse Spreadsheet requires a Projection rather than a Scale factor.
For more information about terminology used in the projection option, see the Appendix 38, Geodetics Summary.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network name</td>
<td>display only</td>
<td></td>
<td>the entire spreadsheet can be given a name for identification purposes. This was defined when the TSS was created and can only be changed using the TSS Utilities option.</td>
</tr>
<tr>
<td>File name</td>
<td>display only</td>
<td></td>
<td>the file name containing the TSS information. This was defined when the TSS was created and can only be changed using the TSS Utilities option.</td>
</tr>
</tbody>
</table>

The only visible difference between the Plane and Projections Traverse Spreadsheet panel is that the Scale or Projection is given at the top of the panel. All the panel fields are the same.

Of course the calculations are different for the two types of spreadsheets. For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculated co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and 12d Model calculates the correct co-ordinate position using full projection calculations.

**Block Settings**

**Position**
- input
  - the order of a block within the spreadsheet can be specified by nominating the block position. Numbering within the list starts at 1. This parameter is used for inserting new blocks into the list. If a user nominates to insert in position 5 and there is only 2 blocks already defined, the block will be placed at the end of the list (i.e. position 3)

**Count**
- input
  - the number of blocks within the spreadsheet.

**Type**
- choice
  - traverse, radiation, radiation backsight, parcel, irregular trace, balance
  - the type of a block within the spreadsheet can be specified by nominating the block type.

The traverse block is for the entry of loop and non-loop traverses starting and ending at points with known coordinate values.

For a hanging traverse, i.e. a traverse that does not close onto a known point, the data can be entered by entering a 0 (zero) in the point id field of the grid control, as well as the end point - point id field.

The radiation block consists of a number of radiations or side shots from a point with known coordinates. This point may be defined in a previous traverse block or it may be from a known point. A valid coordinate must exist for the radiation start point for the radiation block to be used.

A radiation backsight block is the same as a radiation block except that the value set to the backsight is included. After adjustment of previous blocks, the coordinates of setup and backsight points often change. This will introduce swing errors into calculations if not accounted for. By entering the backsight value as set in the field, a comparison is made between what was set and the adjusted value. The difference is then applied to the radiations in the block to reflect the corrected angle measurements.

`XXXX - need 12d NZ documentation on TSS`

**Name**
- input
  - a spreadsheet can consist of a number of different blocks. For each block, a name can be given which can help identify a particular traverse/radiation block within the spreadsheet.

**Flag**
- input
  - the adjustment mode of the current block. The mode is either adjusted or unadjust. All blocks are set to
unadjusted on reading of a file, and the user specifies which blocks are to be adjusted.

**Prev** button
allows the navigation to the previous block in the list.

**Next** button
allows the navigation to the next block in the list.

**New** button
allows for the definition and entry of a new block in the list.

**Update** button
allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the **update** button will ensure the new value will be used in further calculations and adjustments.

**Insert** button
allows for the insertion of a block into the list in the position defined by the **Block position** entry.

**Append** button
allows for the insertion of a block at the end of the list.

**Delete** button
allows for the deletion of the currently displayed block.

**Show EN** tick box ticked
if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not be shown.

**Copy b dsc** tick box ticked
if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.

**Pick string** button
allows for the loading of the current block by selecting a string from the current view.

**Adjustment method** choice bowditch, compass, transit, least square
method of adjustment.

**Loop** tick box unticked
For loop traverses the tick box should be checked. This assumes that the start and end points are the same.

The fields in this panel define the start and end point details. If the **loop** option is chosen the end point details are assumed to be the same as the start point In this case the end point group is disabled.

**Least square tab**

**Angular std (sec)**
The standard deviation of a single angular measurement in seconds of arc.

**Linear std (mm)**
this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)

**ppm**
this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

**Iterations** input box 10
the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

**Coords differ**  
input box 0.0001  
the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

**variance increase**  
tick box ticked  
the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

**Start point**  
button/input  
the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

**N**  
input  
the start point’s northing value.

**E**  
input  
the start point’s easting value.

**Desc**  
input  
the start point’s description.

the grid control values can be entered using valid inputs into the various fields.

**To Point**. The point id of the next traverse station.

**Bearing (dms)**. The bearing of the traverse line.

**Distance**. The distance of the traverse line.

**Point Desc**. The description of the traverse point

**Easting** The easting coordinate of the traverse point. **NB**. This field is only displayed when the calc or adjust buttons are selected.

**Northing** The northing coordinate of the traverse point. **NB**. This field is only displayed when the calc or adjust buttons are selected.

The fields in end point group specify the end point parameters

**end point**  
button/input  
the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

**N**  
input  
the end point’s northing value.

**E**  
input  
the end point’s easting value.

**Desc**  
input  
the end point’s description.
the misclose line near the bottom of the panel have the following functions.

- **Bearing** input box
  - the closing bearing for the traverses.

- **Distance** input box
  - the closing distance of the traverse

- **Delta east** input box
  - the closing vector’s delta east component

- **Delta east** input box
  - the closing vector’s delta east component

- **Misclosure** input box
  - the ratio of the closing distance to the total traverse distance.

The buttons at the bottom of the panel have the following function.

- **Calc** button
  - the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list before this can be done.

- **Adjust** button
  - the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

- **Adjust All** button
  - the adjustment of all of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

- **Save** button
  - saves the current data in the panel to the TSS file (displayed in the file name box).

### 17.12.4 TSS Utilities

**Position of option on menu:**  Survey => Traverse spreadsheet => Utilities

The traverse spreadsheet utilities are used to change the file containing a TSS, change the name (TSS), change between Plane (constant scale) or Projection type.

Selecting Traverse Spreadsheet Utilities brings up the Traverse Spreadsheet Utilities panel:
17.12.5 Lot Check

Position of option on menu: Survey => Traverse spreadsheet => Lot check

The Lot check option allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. This option can be used to enter existing plan dimensions to check area calculations as well as ensuring lots are closed to prescribed limits.

Selecting Lot check brings up the Lot Check panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The scale and datum fields are the only difference between the plane and datum lot check panels.
Prev button
allows the navigation to the previous block in the list.

Next button
allows the navigation to the next block in the list.

New button
allows for the definition and entry of a new block in the list.

Update button
allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the update button will ensure the new value will be used in further calculations and adjustments.

Insert button
allows for the insertion of a block into the list in the position defined by the Block position entry.

Append button
allows for the insertion of a block at the end of the list.

Delete button
allows for the deletion of the currently displayed block.

File name input box *.ts
a file name can be defined which will allow for the reading of an existing file and for defining a new file name for reading in the future.

Read button
the read button allows for the loading of an existing file as specified by the file name box.

Write button
the write button allows for the saving of the current file as specified in the file name box.

Pick string button
allows for the loading of the current block by selecting a string from the current view.

Adjust method choice bowditch, compass, transit, least square, none
method of adjustment.

Show EN tick box ticked
if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not be shown.

Copy b dsc tick box ticked
if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.

The fields in this panel define the start and end point details. If the loop option is chosen the end point details are assumed to be the same as the start point. In this case the end point group is disabled.

Least square tab
The fields in this panel define the values to be used for least square adjustments.

Angular std (sec)
The standard deviation of a single angular measurement in seconds of arc.

Linear std (mm)
this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)
ppm

this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations

input box

10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ

input box

0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

variance increase

tick box

ticked

the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

Start point

button/input

the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

N

input

the start point’s northing value.

E

input

the start point’s easting value.

Desc

input

the start point’s description.

The grid control values can be entered using valid inputs into the various fields.

To Point. The point id of the next traverse station.

Bearing (dms). The bearing of the traverse line.

Distance. The distance of the traverse line.

Point Desc. The description of the traverse point

Easting The easting coordinate of the traverse point. NB. This field is only displayed when the calc or adjust buttons are selected.

Northing The northing coordinate of the traverse point. NB. This field is only displayed when the calc or adjust buttons are selected.

The fields in end point group specify the end point parameters

end point

button/input

the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

N

input

the end point’s northing value.

E

input

the end point’s easting value.
Desc  input
the end point’s description.

The misclose line near the bottom of the panel has the following functions:

Bearing  input box
the closing bearing for the traverses.

Distance  input box
the closing distance of the traverse

Delta east  input box
the closing vector’s delta east component

Delta east  input box
the closing vector’s delta east component

Misclosure  input box
the ratio of the closing distance to the total traverse distance.

The buttons at the bottom of the panel have the following functions:

Calc  button
the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list before this can be done.

Adjust  button
the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

Adjust All  button
the adjustment of all of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

Report  button
on selecting this button the NZ traverse spreadsheet report panel appears.

17.12.6 NZ TSS Report

Position of option on menu:  Survey =>Traverse spreadsheet =>NZ report

The NZ report option allows the user to define the report header etc. so as to produce a spreadsheet report which can be printed to a pre-printed NZ sheet.

Selecting NZ report brings up the NZ Traverse Spreadsheet Report panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input format</strong></td>

<td>tick box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*either a TSS file (*.ts) or a lot check file (*.lch) can be reported.*

*name of the TSS or lot check file.*

*either TS sheet.*

*If tick, parcel block types are included in the report.*
Traverse Title section

*Traverses of, line 2, line 3, line 4*

The title of the traverses can be entered into the *traverses of* box as well as the following *line 2, line 3* and *line 4* input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ, the number of characters should be limited to 20 characters (inclusive of space characters) for the *traverse of* line and 33 characters (inclusive of space characters) for *lines 2 to 4*.

The input into the *traverses for* line is compulsory but for *lines 2 to 4* it is optional.

Datum Information section

**NZ Circuit** choice box

*existing NZ circuits*

the circuit in which the current spreadsheet file relates to should be specified.

**Projection** choice box

*Geodetic 1949, Geodetic 2000, Old Cadastral*

the appropriate NZ geodetic datum should be selected.

**Coords in terms of section**

*these parameters are only required to be entered for the Old cadastral datum case. For other datums, the values are automatically updated.*

**Point name** input box

*the name of the origin point should be entered.*

**Northing** input box

*the nothing coordinate of the origin point should be entered.*

**Easting** input box

*the easting coordinate of the origin point should be entered.*

Other Details section

**Field book** input box

*the name of the field book used.*

**Plan no** input box

*the plan no to be created if known.*

**NZ Land District** choice box

*Existing NZ land districts*

the appropriate NZ land district should be selected.

**Report file** files box

*.*rpt files

*file name for the report.*

**Report file** button

*a report using the nominated file name is created.*

17.12.7 Standard TSS Report

**Position of option on menu:**  
Survey => Traverse spreadsheet => Standard report

The *Standard report* allows the user to define the report header etc. so as to produce a standard TSS report which can be printed, saved or edited.

Selecting *Standard report* brings up the *Standard Traverse Spreadsheet Report* panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

</table>

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up
Input format choice box *.ts *.ts, *.lch
either a TSS file (*.ts) or a lot check file (*.lch) can be reported.
Input file input box *.ts
name of the TSS or lot check file.
Print choice box TS sheet TS sheet, Calc sheet, Other
either TS sheet.
Report parcels tick box
If ticked, parcel block types are included in the report.

Traverse Title section

Job id text input box
text to use as the Job id.

Traverses of, line 2, line 3, line 4

The title of the traverses can be entered into the traverses of box as well as the following line 2, line 3 and line 4 input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ the number of characters should be limited to 20 characters (inclusive of space characters) for the traverse of line and 33 characters (inclusive of space characters) for lines 2 to 4.

The input into the traverses for line is compulsory but for lines 2 to 4 it is optional.

Surveyor id text input box
text to use as the Surveyor id.

**Computer operator**
- text input box
text to use as the Computer operator.

**Report file**
- files box
  - file name for the report.

**Report file**
- button
  - a report using the nominated file name is created.

### 17.12.8 TSS Drafting

**Position of option on menu:** Survey => Traverse spreadsheet => Drafting

The Traverse spreadsheet drafting produce models, linestyles and colours for data within the TSS.

Selecting **Drafting** brings up the **Traverse Spreadsheet Drafting** panel

![Traverse Spreadsheet Drafting Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

Draft TS sheet tick box
  if ticked,
Draft calc sheet tick box
  if ticked,
Draft other tick box
  if ticked,
Map file Map File box
  Map File to define the drafting
  *.mapfile, *.mf files
Pre*postfix for models text input box
  pre and post text to add to the model names given in the Map File
Short segment max length real input box
  maximum size for a segment to be considered a short segment. Short segments are labelled with a number and the details placed in a table.
Short segment start no. integer input box
  start number for any short segments.
Table location xyz box
  world position for the short segment table.
Process button
  process the traverse spreadsheet and create the drafting and short segment table.

17.12.9 TSS Radiation Table Drafting

Position of option on menu:  Survey => Traverse spreadsheet=> Radiation table

The Traverse spreadsheet radiation table option produces radiation tables for the radiation data in a traverse spreadsheet.

Selecting Radiation table brings up the Radiation Table Drafting panel

The fields and buttons used in this panel have the following functions.
## Traverse Spreadsheet

### 17.12.10 Landonline XML Read

**Position of menu:** Survey => Traverse spreadsheet => Landonline XML read

The Landonline XML Read option reads in data in the XML format for Landonline New Zealand.

Selecting Landonline XML read brings up the Read Landonline XML File panel.
17.12.11 Landonline XML Write

Position of menu: Survey => Traverse spreadsheet => Landonline XML write

The Landonline XML Write option writes out data in the XML format for Landonline New Zealand.

Selecting Landonline XML write brings up the Write Landonline XML File panel
Documentation is available from 12d NZ Ltd.

17.13 Conformance

Position of menu:  Survey => Conformance

The Conformance walk-right menu contains survey options for generating conformance reports and models on surveyed points representing as-built batter slopes and pavements, compared against string data representing designed batter slopes and pavements.

The Conformance walk-right menu is

For the option Batter slope report, go to Pavement report

17.13.1 Batter slope report
Conformance

**Position of option on menu:**  Survey => Conformance => Batter slope report

The **Batter slope report** option generates a conformance report on surveyed points representing an as-built batter slope, compared against string data representing a designed batter slope. In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. *within tolerance, above tolerance, below tolerance, and not tested*). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, and point error.

**Note1:** the term *point conformance* is used here to refer to a point’s distance from design (distance from the conformance line on diagram below), while the term *point error* refers to a point’s distance out of tolerance. As such, a point that is within tolerance (i.e. a conformant point) will, in general, have a non-zero conformance and a zero error, while a point that is out of tolerance (i.e. a non-conformant point) will have both a non-zero conformance and a non-zero error.

**Note2:** the point conformances and errors can be measured either vertically or perpendicular to the conformance line. It is perhaps worthwhile to note, especially in the case of the *sliding critical zone*, that the perpendicular measurements are determined from the vertical measurements, and not vice versa. That is, if the slope of the conformance line, measured from horizontal, is denoted by the angle $\alpha$, then a surveyed point $Q$, has a perpendicular conformance $Q_{cp}$, and error $Q_{ep}$, determined from the point’s vertical conformance $Q_{cv}$, and error $Q_{ev}$, via the following relationships:

\[
Q_{cp} = Q_{cv}.\cos\alpha \\
Q_{ep} = Q_{ev}.\cos\alpha
\]

**Note3:** the conformance line is the line from which all point conformances and tolerances are measured, and is always parallel to the design batter slope line. When testing a sub-grade survey, the conformance line will normally be below the design batter slope line, but when testing a completed-construction survey, the two lines should normally coincide.
Typical sections through excavation and embankment batters are shown in the diagram below, along with schematics showing how the surveyed points are tested for conformance:

- **Excavation Batter with Sliding Critical Zone**
  - Control String
  - Primary String

- **Embarkment Batter with Fixed Critical Zone**

---

Conformance Line

**Symbols**:
- $D$ = Sub-grade depth
- $C$ = Critical zone range
- $T$ = Tolerance
- $u$ = upper
- $l$ = lower
- $c$ = critical
- $m$ = main
- $p$ = perpendicular
- $v$ = vertical
- $h$ = horizontal
- $b$ = along batter
Selecting **Batter slope report** brings up the **Batter Slope Conformance Report** panel.

![Batter Slope Conformance Report panel](image)

**Batters Tab:**

The fields and buttons used in this panel have the following functions.

<table>

<tr>
<td>the Slope control string is optional (and is not shown on the diagram above). If no string is selected, the Primary string, below, will be used as the Slope control string. The line that is formed in plan, from a...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
surveyed point to the nearest point on the Slope control string, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.

**Primary string**

the string selected with this box should represent one edge of the designed batter (normally the edge closer to the road - i.e. the toe string of an excavation batter, or the crest string of an embankment batter).

*The Primary string represents the start of the Critical Zone, which continues horizontally in the direction of the Secondary string, for a distance specified in the Critical zone range field (on the Tolerances Tab).*

**Secondary string**

the string selected with this box should represent the other edge of the designed batter (normally the edge further away from the road - i.e. the interface string)

**Constraints**

**Start chainage**

the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string is selected, but a different value can be typed in.

**End chainage**

the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string is selected, but a different value can be typed in.

**Chainage bandwidth**

if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth. This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.

**Results**

**Report file**

the name of the conformance report file to be created. If no extension is given, it will be given an extension of ".rpt".

**Results model**

the name of the results model to be created. If blank, the results model is not created.

**Report**

generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

**Finish**

exits the option and closes the panel. This button can be activated regardless of which panel tab is currently active.
Tolerances Tab:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tolerance file</td>
<td>file box</td>
<td>*.tol</td>
<td></td>
</tr>
</tbody>
</table>

the name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of ".tol". The tolerance file stores the details of every field on the Tolerances Tab, the Report File Tab, and the Results Model Tab. The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.

Read button
Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write button
Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.

Sub-grade depth from design batter

Depth is measured choice box perpendicular perpendicular to batter vertical

whether the sub-grade depth is measured perpendicular to the batter or vertically (refer to parameters Dp and Dv on the diagram above)
Sub-grade depth  real box  0.0
the depth of the conformance line from the design batter (refer to parameters Dp and Dv on the
diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a
completed-construction survey, however, this value will normally be zero, and the conformance line
will coincide with the design batter slope line.

Critical zone range

<table>
<thead>
<tr>
<th>Zone is defined as</th>
<th>choice box</th>
<th>sliding</th>
<th>sliding</th>
</tr>
</thead>
</table>
| determines whether the Critical Zone is defined as sliding or fixed (refer to diagram above). For
excavation batters, the zone is normally sliding, whilst for embankment batters, it is normally fixed.

<table>
<thead>
<tr>
<th>Range is measured</th>
<th>choice box</th>
<th>vertical</th>
<th>vertical</th>
</tr>
</thead>
</table>
| determines how the size of the Critical Zone is measured (refer to parameters Cb, Cv, and Ch on the
diagram above)

<table>
<thead>
<tr>
<th>Range</th>
<th>real box</th>
</tr>
</thead>
</table>
| the size of the Critical Zone, measured in the specified direction (refer to parameters Cb, Cv, and Ch on the
diagram above). This distance must be zero or greater.

Tolerance details

<table>
<thead>
<tr>
<th>Points inside road</th>
<th>choice box</th>
<th>do not test</th>
<th>do not test</th>
</tr>
</thead>
</table>
| determines what to do with any surveyed points found inside the road. If such points are found, and this
field is set to do not test, the points will be classified as untested, and in the results model, will have
their vertex text set to INR.

Note: untested points do not appear in the conformance report.

<table>
<thead>
<tr>
<th>Tolerances measured</th>
<th>choice box</th>
<th>perpendicular</th>
<th>perpendicular to batter</th>
</tr>
</thead>
</table>
| whether the conformance tolerances are measured perpendicular to the batter or vertically (refer to
parameters T**p and T**v on the diagram above). This field also determines whether the reported
point conformances and point errors are measured perpendicularly or vertically.

Flat-to-Steep transition slope: 1v in

<table>
<thead>
<tr>
<th>real box</th>
</tr>
</thead>
</table>
| It is possible to use two different sets of batter slope tolerances, when producing the conformance
report. The Flat slope tolerance set will be used whenever the design slope is equal to the transition
slope or flatter, and the Steep slope tolerance set will be used whenever the design slope is steeper than
the transition slope. The transition slope must be specified as a positive number, and will be interpreted
as a slope in the form

1[v]: transition slope[h]. Leaving this field blank will disable the Steep slope tolerance set, ensuring
that only the Flat slope tolerance set will ever be used.

Flat slope tolerances

The following four tolerances are used if the transition slope is not specified, or whenever the
design slope is equal to the transition slope or flatter.

<table>
<thead>
<tr>
<th>1 Upper critical</th>
<th>real box</th>
</tr>
</thead>
</table>
| refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.

<table>
<thead>
<tr>
<th>2 Lower critical</th>
<th>real box</th>
</tr>
</thead>
<tbody>
<tr>
<td>refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.</td>
<td></td>
</tr>
</tbody>
</table>
3 Upper main
the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.

4 Lower main
the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.

Steep slope tolerances

The following four tolerances are used only if the transition slope is specified, and the design slope is steeper than the transition slope.

5 Upper critical
refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.

6 Lower critical
refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.

7 Upper main
the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.

8 Lower main
the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.
Report File Tab:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max lines per page</td>
<td>integer box</td>
<td>70</td>
<td></td>
</tr>
</tbody>
</table>

The maximum number of report lines that can fit on a printed page. This number is needed so that page breaks (form feed characters) can be inserted into the report file at the appropriate places. The number of lines per page will vary depending on the editor/word-processor used for printing, the desired page size and margin widths, the desired page layout (portrait or landscape), and the desired font and font size. As such, the number needs to be tuned for the user’s particular report specifications/requirements.

**Note1:** you may find that MS Notepad is not a good program for printing out the report file (Notepad doesn't seem to interpret form feed characters).

**Note2:** if Max lines per page is set to a large enough number, there will be no page breaks in the report file.

**Header information**

- **Original survey file** input box
  
  optional line of text in the report header to identify the original survey data file

- **Re-check file**
  
  optional line of text in the report header to identify the survey data file where the pavement was rechecked.
Lot number
input box
optional line of text in the report header to identify the lot number

Lot location
input box
optional line of text in the report header to identify the lot location

Lot description
input box
optional line of text in the report header to identify the lot description

Table options

Show design levels tick box off
whether to show the design levels in the column after the point levels

Note: the design levels are always vertically above or below the point levels, even if the tolerances are measured perpendicular to the design slope.

Show non-conformance errors tick box off
whether to show the point errors for non-conformant points (i.e. the distances the points are out of tolerance). If turned on, the point errors will appear in parentheses, ( =, after the conformance and tolerance details.

Show non-conformance slopes tick box off
whether to show the surveyed slopes at non-conformant points. The surveyed slope is the slope between the previous and current point in the report, within a single, offset-sorted chainage band. The slope is calculated as though the previous point lies in the same vertical plane as that of the current point’s design slope. As such, the slope is adjusted for any differences in bearing direction between the two design slopes, and for any incline in the road, as shown in the diagram, below:

If turned on, the surveyed slopes will appear in square brackets, [ =, after the conformance, tolerance and point error details.

Note: if the Chainage bandwidth on the Batters Tab is zero or blank, then the points will only be sorted by chainage, and not sub-sorted by offset within chainage bands. In this case, surveyed slopes will
show vertex ids

if ticked the vertex id of the point rather than the name of the string containing the point will be shown in the report file.

footer information

surveyor name
input box
name of the person required to sign the report (optional)

surveyor title
input box
title of the person required to sign the report (optional)

results model tab:

<table>
<thead>
<tr>
<th>field description</th>
<th>type</th>
<th>defaults</th>
<th>pop-up</th>
</tr>
</thead>
<tbody>
<tr>
<td>clean results model beforehand</td>
<td>tick box</td>

<td>z values are</td>
<td>choice box</td>
<td>levels</td>
<td>levels conformances errors</td>
</tr>
</tbody>
</table>

determines what z values to give the points generated in the results model

note: any untested points in the model will have their z values set to their original point levels,
regardless.

**Vertex text shows**

- choice box
- conformances
- levels
- conformances
- errors

**Vertex text shows** determines what values to show in the vertex text of the points generated in the results model.

*Note 1:* Any points within tolerance will have a zero error. For these points, if the vertex text is set to errors, no text will be set.

*Note 2:* Any untested points in the model will have the vertex text set to show one of four possible error codes, explaining why the point was not tested. The error codes are **NUL** (invalid z-value), **OCR** (outside chainage range), **ERR** (intersection error or similar), and **INR** (inside road).

**Vertex textstyle data**

- textdata box
- user textdata
- favourites

**Vertex textstyle data** controls the appearance of the vertex text for the points generated in the results model.

**Colours**

Separate models by colour

- tick box

If ticked, the results model will be several models, each result colour going to a separate model named with a suffix of the colour name.

**Points within tolerance**

- colour box
- green
- available colours

**Points within tolerance**

**Points above tolerance**

- colour box
- red
- available colours

**Points below tolerance**

- colour box
- cyan
- available colours

**Untested points**

- colour box
- grey
- available colours

**Colour for points within tolerance**

**Colour for points above tolerance**

**Colour for points below tolerance**

**Colour for untested points**

*Note:* Untested points do not appear in the conformance report.

**Create tin of tested results model points**

**Tin name**

- tin box
- available tins

**Tin name**

*Name of the tin to create.* If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model field (on the Batters Tab) is blank, no tin will be created.

*Note:* The tin will be created only with the set of tested points created in the Results model, and can be used to quickly display contour maps of the results. When creating the tin, an attempt is made to null any triangles outside the *shrink-wrapped* boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see Chainage bandwidth on the Batters Tab).

**Model for tin**

- model box
- available models

**Model for tin**

*Model for tin to be placed in, for viewing purposes.* If blank, the tin is not placed into a model.

**Tin colour**

- colour box
- available colours

**Tin colour**

*Colour for tin.* If blank, the tin will adopt the colour selected for Points within tolerance.
12d Field Tab:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Populate from 12dField attr's</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* if 12dField was used to pick up the points then the attributes can be used to populate the conformance panel automatically, for example the control lines and primary and secondary edge strings. On selecting the string the panel will be updated.*

17.13.2 Pavement report

**Position of option on menu:** Survey => Conformance => Pavement report

The Pavilion report option generates a conformance report on surveyed points representing the top of an as-built pavement, compared against string data representing the top of a designed pavement (level conformance), and compared against tin data representing the bottom of an as-built pavement (thickness conformance).

In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. within tolerance, above tolerance, below tolerance, and not tested). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, point error, pavement thickness and pavement thickness error.

**Note1:** the term point conformance is used here to refer to a point’s distance from design (distance from the conformance line on diagram below), while the term point error refers to a
point’s distance out of tolerance. As such, a point that is within tolerance (i.e. a *conformant point*)
will, in general, have a non-zero conformance and a zero error, while a point that is out of
tolerance (i.e. a *non-conformant point*) will have both a non-zero conformance and a non-zero
error.

**Note2:** the point conformances and errors can be measured either vertically or perpendicular to
the conformance line. The conformance line is the line from which all point conformances and
tolerances are measured, and is always parallel to the design pavement line. When testing a
sub-grade survey, the conformance line will normally be below the design pavement line, but
when testing a completed-construction survey, the two lines should normally coincide.

**Note3:** the optional pavement thickness measurements are always made vertically downwards
from the surveyed points, to the tin representing the bottom of pavement. Pavement thickness
errors will be non-zero wherever the pavement is found to be too thick or too thin. When testing
for both level conformance and thickness conformance, both tests must pass for a point to be
considered conformant.
A typical section of pavement is shown in the diagram below, along with a schematic showing how the surveyed points are tested for level conformance:

- **Outside Pavement**
- **Inside Pavement**
- **Outside Pavement**

**Slope Control String (optional)**

**Control String**

**Primary String**

**Conformance Line**

**Design Pavement**

**Above Tolerance**

**Within Tolerance**

**Below Tolerance**

**Typical Section of Pavement with Negative Edge Offsets**

- $D = \text{Sub-grade depth}$
- $P = \text{Primary edge offset}$
- $S = \text{Secondary edge offset}$
- $T = \text{Tolerance}$
- $\nu = \text{upper}$
- $l = \text{lower}$
Selecting **Pavement report** brings up the **Pavement Conformance Report** panel

**Pavement Tab:**

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data source of points</strong></td>
<td>source box</td>
<td>all points selected with this source box (whether they exist in point-string form or line-string form) will be considered as the set of surveyed points to be tested for conformance.</td>
<td></td>
</tr>
<tr>
<td><strong>Control string</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Slope control string</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Primary edge string</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Secondary edge string</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Design data</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Design data</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Constraints</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Start chainage</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Chainage bandwidth</strong></td>
<td></td>
<td>5</td>
<td></td>
</tr>
<tr>
<td><strong>Results</strong></td>
<td>string box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Report file</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Results model</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:** the data for the Point Description column in the report will be taken from the string names of the selected points. If all the string names are blank, however, the point description data in the report will show point ids representing the sequential order that the points are reported in. The results model (if generated) will always have the string names of each point set to match the reported point description.

**Design data**

- **Control string** string box
  the string selected with this box should normally represent the road centreline, and will be used to determine the chainage and offset of each surveyed point

- **Slope control string** string box
  the Slope control string is optional. If no string is selected, the Control string, above, will be used as the...
Slope control string. The line that is formed in plan, from a surveyed point to the nearest point on the slope control string, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.

**Primary string** string box
the string selected with this box should represent one edge of the designed pavement (normally the edge that is closer to the Control string)

**Secondary string** string box
the string selected with this box should represent the other edge of the designed pavement (normally the edge that is further away from the Control string).

*Note:* If the selected string is the same as the Primary string, or if no string is selected, then the pavement is defined by one string and is considered to be flat (i.e. zero cross-fall), and to have a width defined by the Primary and Secondary edge offsets (on the Tolerances Tab). This feature can be useful for identifying any surveyed points that are close to an edge line.

**Design pavement tin**
if selected this tin will be used for design levels rather than the primary and secondary strings.

**Data for thickness measurements**

**Bottom of pavement tin** tin box available tins
the Bottom of pavement tin is optional. If not selected, the pavement is not tested for thickness conformance. The tin selected with this box should represent the as-built bottom surface of the pavement currently being tested.

**Constraints**

**Start chainage** real box
the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string is selected, but a different value can be typed in.

**End chainage** real box
the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string is selected, but a different value can be typed in.

**Chainage bandwidth** real box 5.0
if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth. This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.

**Results**

**Report file** file box *.rpt
the name of the conformance report file to be created. If no extension is given, it will be given an extension of .rpt.

**Results model** model box available models
the name of the results model to be created. If blank, the results model is not created.

**Report** generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

**Finish** exits the option and closes the panel. This button can be activated regardless of which panel tab is
Tolerances Tab:

The fields and buttons have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tolerance file</td>
<td>file box</td>
<td>* .tol</td>
<td></td>
</tr>
</tbody>
</table>

The name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of .tol. The tolerance file stores the details of every field on the Tolerances Tab, the Report File Tab, and the Results Model Tab. The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.

Read button

Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write button

Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.
Depth from design pavement

Depth is measured choice box vertical perpendicular to pavement vertical

whether the sub-grade depth is measured perpendicular to the pavement or vertically (refer to parameter D on the diagram above)

Note: since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.

Depth (+ below) real box 0.0

the depth of the conformance line from the design pavement (refer to parameter D on the diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a completed-construction survey, however, this value will normally be zero, and the conformance line will coincide with the design pavement line.

Vertical tolerance details

Tolerances are measured choice box vertical perpendicular to pavement vertical

whether the conformance tolerances are measured perpendicular to the pavement or vertically (refer to parameters Tu and Tl on the diagram above). This field also determines whether the reported point conformances and point errors are measured perpendicularly or vertically.

Note: since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.

Upper tolerance real box

the upper allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter Tu on the diagram above). This value is normally zero or greater.

Lower tolerance real box

the lower allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter Tl on the diagram above). This value is normally zero or less.

Thickness tolerance details

Maximum thickness real box

the maximum allowable vertical distance that a surveyed point may be above the Bottom of pavement, in order to be conformant. If blank, there will be no upper limit to the pavement thickness.

Minimum thickness real box

the minimum allowable vertical distance that a surveyed point may be above the Bottom of pavement, in order to be conformant. If blank, there will be no lower limit to the pavement thickness.
Edges Tab:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge type</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Edge mode</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Points outside edge</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The settings for Primary edge details and Secondary edge details are the same.

Tolerance file parameters (cont).

Primary edge details /Secondary edge details

- **Edge type**
  - **left**: the string is the left hand edge of the pavement.
  - **right**: the string is the right hand edge of the pavement.
  - **join**: the string is joint between pavements.
  - **none**: the string is not used for edge checks.

- **Edge mode**
  - **test horizontally**: the edge is only tested for horizontal conformance
  - **test vertically & horizontally**: the edge is only tested for both horizontal and vertical conformance

- **Points outside edge**
  - **do not test**, **test vertically**

Determines what to do with any surveyed points found outside the pavement.
**do not test:** points outside the edge are not tested. The points will be classified as untested, and in the results model, will have their vertex text set to EDG. **Note:** untested points do not appear in the conformance report.

**test vertically:** points outside the edge are tested vertically.

**Edge extents**

Enter the range around the nominal edge in which a point is considered to be an edge check. This is relative to the 'left/right' setting for the edge, +ve is outside the pavement and -ve into the pavement.

**Edge tolerance**

Enter the tolerances from the design edge, this is relative to the 'left/right' setting for the edge, +ve is outside the pavement and -ve into the pavement.

**Report File Tab:**

![Pavement Conformance Report](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max lines per page</td>
<td>integer box</td>
<td>70</td>
<td></td>
</tr>
</tbody>
</table>

The maximum number of report lines that can fit on a printed page. This number is needed so that page breaks (form feed characters) can be inserted into the report file at the appropriate places. The number...
of lines per page will vary depending on the editor/word-processor used for printing, the desired page size and margin widths, the desired page layout (portrait or landscape), and the desired font and font size. As such, the number needs to be tuned for the user’s particular report specifications/requirements.

Note1: you may find that MS Notepad is not a good program for printing out the report file (Notepad doesn’t seem to interpret form feed characters).

Note2: if Max lines per page is set to a large enough number, there will be no page breaks in the report file.

Header information

Original survey file input box
optional line of text in the report header to identify the original survey data file

Re-check file
Optional line of text in the report header to identify the survey data file where the pavement was rechecked.

Lot number input box
optional line of text in the report header to identify the lot number

Lot location input box
optional line of text in the report header to identify the lot location

Lot description input box
optional line of text in the report header to identify the lot description

Table options

Show design levels tick box off
whether to show the design levels in the column after the point levels

Note: the design levels are always vertically above or below the point levels, even if the tolerances are measured perpendicular to the design slope.

Show non-conformance errors tick box off
whether to show the point errors and thickness errors for non-conformant points (i.e. the distances the points are out of level and thickness conformance, respectively). If turned on, the point errors will appear in parentheses, ( ), after the conformance and tolerance details, and the thickness errors will appear in parentheses, ( ), after the thickness and max/min thickness details.

Show vertex ids tick box
if ticked the vertex id of the point rather than the name of the string containing the point will be shown in the report file.

Footer information

Surveyor name input box
name of the person required to sign the report (optional)

Surveyor title input box
title of the person required to sign the report (optional)
The next tab on the panel is the Results Model Tab:

</table>

*Note:* any untested points in the model will have their z values set to their original point levels, regardless.
Vertex text shows choice box conformances levels
conformances errors thicknesses thickness errors
determines what values to show in the vertex text of the points generated in the results model

Note1: any points that pass the level conformance test will have a zero error. For these points, if the vertex text is set to errors, no text will be set. Likewise, any points that pass the thickness conformance test will have a zero thickness error. For these points, if the vertex text is set to thickness errors, no text will be set.

Note2: any untested points in the model will have the vertex text set to show one of five possible error codes, explaining why the point was not tested. The error codes are NUL (invalid z-value), OCR (outside chainage range), ERR (intersection error or similar), EDG (outside pavement edge), and NTN (bottom of pavement tin not defined at point).

Vertex textstyle data textdata box user textdata favorites
controls the appearance of the vertex text for the points generated in the results model

Colours

Separate models by colour tick box
if ticked the results model will be several models, each result colour going to a separate model named with a suffix of the colour name.

Points within tolerance colour box green available colours
colour for points within tolerance (i.e. points that pass both the level and thickness conformance tests)

Points above tolerance colour box red available colours
colour for points above tolerance (i.e. points that are above the Upper tolerance or points where the pavement is thicker than the Maximum thickness)

Points below tolerance colour box cyan available colours
colour for points below tolerance (i.e. points that are below the Lower tolerance or points where the pavement is thinner than the Minimum thickness)

Untested points colour box grey available colours
colour for untested points

Note: untested points do not appear in the conformance report.

Create tin of tested results model points

Tin name tin box available tins
name of the tin to create. If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model field (on the Pavement Tab) is blank, no tin will be created.

Note: the tin will be created only with the set of tested points created in the Results model, and (depending on what the points’ z-values are set to in the Results model) can be used to quickly display contour maps of the results, or to create a Bottom of pavement tin for the next pavement layer to be tested. When creating the tin, an attempt is made to null any triangles outside the shrink-wrapped boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see Chainage bandwidth on the Pavement Tab).

Model for tin model box available models
model for tin to be placed in, for viewing purposes. If blank, the tin is not placed into a model.

Tin colour colour box available colours
colour for tin. If blank, the tin will adopt the colour selected for Points within tolerance.
12d Field Tab:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Populate from 12dField attr's</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Populate from 12dField attr's**

if 12dField was used to pickup the points then the attributes can be used to populate the conformance panel automatically, for example the control lines and primary and secondary edge strings. On selecting the string the panel will be updated.

17.14 Extras

**Position of menu:** Survey => Extras

The Survey Extras walk-right menu contains extra survey options, some of which are still being developed.

The Survey Extras walk-right menu is
For the option Auslig AusGeoid98 *.dat -> xyz, go to 17.14.1 AusGeoid98 *.dat -> xyz

Bearing/Distance entry 17.14.2 Plane Bearing/Distance Entry
Traverse/Radiation 17.14.3 Bearing/Distance Entry for Traverse/

Radiation
Catenary measurement 17.14.4 Catenary Measurement
Create Control Station 17.14.5 Create Control Stations
Check control model 17.14.6 Check Control Model
Linear regression 17.14.7 Linear Regression
Reduction to field file 17.14.8 Survey Function to Field File
On grade 17.14.9 On Grade

17.14.1 AusGeoid98 *.dat -> xyz

Position of option on menu:  Survey => Extras => Auslig AusGeoid98 *.dat -> xyz

The Ausgeoid98 *.dat -> xyz option allows the conversion of a standard AusGeoid98 *.dat file into a XYZ format. This format can then be read into 12d. The values in the XYZ file will have the following meaning:

X value will represent the Longitude
Y value will represent the Latitude
Z value will represent the N value

Selecting Ausgeoid98 *.dat -> xyz brings up the Ausgeoid98 *.dat -> xyz panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

<td>input projection scale This value will be applied to any entered distances. i.e. final distance = entered distance * scale factor</td>
</tr>
<tr>
<td>Use z-value</td>
<td>tick box transit if ticked, the z-values for each point can be entered. If no ticked then z-values are not entered.</td>
</tr>
<tr>
<td>Point id</td>
<td>input typed none, auto increment, typed if none, no point ids are entered and the grid control will not show a column for point ids. If auto increment then the values of point ids will be incremented by a value of 1 starting from the specified Start point id. If no Start point id is specified then no point ids will be allocated. No column for point ids is shown in the grid control. if typed then the values of point ids will be incremented by a value of 1, starting from the specified Start point id. If no Start point id is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.</td>
</tr>
</tbody>
</table>

**VALUES IN GRID** grid box The columns shown in the grid will depend on the selection of the Use z-value and Point id fields.

<table>
<thead>
<tr>
<th>To Pt.</th>
<th>Bearing (dms)</th>
<th>Distance</th>
<th>Height</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**To Pt.**

if none is selected for the Point id field, this column will not be displayed.

if auto increment is selected for the Point id field, this column will not be displayed.

if typed is selected for the Point id field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.

**Bearing (dms)**

The user should enter the bearing for the segment into this field.

**Distance**

the user should enter the distance of the segment.

**Height**

This column will only be visible in the grid if the Use z-value tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.

**Select**

on pressing the select button, a user is able to pick an existing string from the current view. If a non-
traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

**Process** button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

### 17.14.3 Bearing/Distance Entry for Traverse/Radiation

**Position of option on menu:**  Survey => Extras => Traverse/Radiation

The Traverse/radiation option allows the input of a traverse or radiations by manual input of plane bearings and plane distances or by selecting an existing string.

**Bearing/Distance Traverse/Radiation Entry**

Selecting Traverse/Radiation brings up the Bearing/Distance Traverse/Radiation Entry panel

![Traverse/Radiation Entry Panel](image)

</tbody>
</table>

To Pt.

if none is selected for the Point id field, this column will not be displayed.

if auto increment is selected for the Point id field, this column will not be displayed.

if typed is selected for the Point id field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.
Bearing (dms) angle box
The user should enter the bearing for the segment into this field.

Distance input box
the user should enter the distance of the segment.

Height input box
This column will only be visible in the grid if the Use z-value tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.

Select button
on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button
changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

17.14.4 Catenary Measurement

Position of option on menu: Survey => Extras => Catenary measurement

The Catenary measurements option allows for the picking up of data in the vertical plane between two known points using only a bearing and a vertical angle. For example, picking up wires between towers where a distance measurement to the cable is not possible.

Selecting Catenary measurements brings up the Catenary Measurements panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

the colour of the created string.

**Linestyle**  
input  
1  
available linestyles  
linestyle of the created string.

**Report file**  
file box  
*.rpt files  
if non-blank, the name of the file to write the report to.
17.14.5 Create Control Stations

Position of option on menu: Survey =>Extras =>Create Control stations
Position of option on menu: Strings =>Create =>Create Control Stations

A control station (for surveying) consists of a one point string. For V6, the point name is the name of the control station. For V5 and before, the string name is used as name of the control station.

Control stations are used when reducing 12d field files in the Survey Reduction module.

The Create Control Stations options allows the user to define control stations in a given model. The option checks that the point ids are unique in the control model.

Selecting Create Control Stations brings up the Create Control Station panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>colour box</td>
<td>red</td>
<td>available colours</td>
</tr>
<tr>
<td>Style mode</td>
<td>Linestyles Only</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Style</td>
<td>input</td>
<td>1</td>
<td>available line styles</td>
</tr>
<tr>
<td>Use z-value</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Use point id as control point name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Text style data</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Use z-value tick box ticked
if ticked, the height value must be specified for all of the stations.

Use point id as control point name tick box ticked
if ticked, the point names are used as the names of the control points and the point names are checked for uniqueness.
If not ticked, the name of the string is used as the names of the control points and the string names are checked for uniqueness. This is only for compatibility in pre 12d Model V6.0.

Station name Easting Northing Height Remark
the information for stations to be created is entered into the grid. The stations are created by selecting the Process button.

If a station name is typed in and the <enter> key pressed then the Model is searched and if a control station already exists of the same name (either point name or string name depending on the Use point id as control point name flag), the co-ordinates are displayed in the grid.

The grid control values can be entered/displayed using valid inputs into the various fields.

Station name. The associated text that identifies the control point.
Easting The easting coordinate of the control point.
Northing The northing coordinate of the control point.
Height The height of the station. (Only displayed if the use z-value tickbox is selected.)
Remark The description of the control station.

Process button
After the Process button is chosen, the control stations in the grid are created. If a station of the given name already exists in the control Model, the user is asked if the co-ordinates of the station are to be updated by the values given in the grid.

Same as button
After the Same as button is chosen, another string is selected and information about it is used for the Model, Colour and Point style fields in this panel.

17.14.6 Check Control Model
Position of option on menu: Survey =>Extras =>Check Control model

The Check control model option checks that there are no points in the control model with the same point id. A report of all the points in the control models, or only those with clashing point ids, is created.
Selecting Check control model brings up the Check Control Model panel

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up
Control model model box available models
What's New in 12d Model

the model the check for unique point ids.

Report file  
file box  
*.rpt files

if non-blank, the name of the file to write the report to.

Report only duplicated point(s)  
tick box  
ticked

if ticked, only those points with duplicated point ids are reported.
If not ticked, all points in the control model are written out.

Process  
button

check the Control model for duplicated point ids.

17.14.7 Linear Regression

Position of option on menu:  Survey => Extras => Linear regression

Position of option on menu:  Strings => Utilities => Linear regression

The linear regression option will create a line, circle or arc of best fit through points on a string. The line can be constrained to go through a selected point or have a given bearing.

Selecting linear regression brings up the linear regression panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regression for</td>
<td>choice box</td>
<td>line</td>
<td>line, circle, arc</td>
</tr>
</tbody>
</table>

if line/circle/arc, the line/circle/arc of best fit through the points is created.
Constraints

if ticked, the regression line can be restrained to go through a selected point or be given a selected bearing.

Keep z-values

tick box

if ticked, the z-values of the selected string are used on the regression string.

Create new string

tick box

if ticked, a new adjusted string is created. If not ticked, the selected string is adjusted.

Constraints

Thro point

tick box

if ticked, the regression line is constrained to go through the point with co-ordinates given in the Coordinates field.

Coordinates

if thro point is ticked, the regression line is constrained to go through the point given in this field.

Fixed bearing

tick box

if ticked, the regression line is constrained to have the bearing given in the Bearing value field.

Bearing value

if thro point is ticked, the regression line is constrained to have the bearing given in this field.

Name

name box

if non-blank, the name of the new string. If blank, the original string name is used.

Model

model box available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour

colour box available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Report file

*.rpt files

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

Partial

tick box

if ticked, only part of the string is used in the regression.

Pick

button

select the string to create a regression line/circle/arc from.

Regression

button

perform the regression.

17.14.8 Survey Function to Field File

Position of option on menu: Survey => Extras => Reduction to field file

The reduction to field file option writes out the field data from a Survey function to a file in the standard 12d field file format.

Selecting reduction to field file brings up the survey reduction function export panel

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Function name | input | available Survey functions |
17.14.9 On Grade

The on grade option produces a string that is a fixed horizontal distance from a selected string with z-values produced by extrapolating the grade from two strings or from a tin.

Selecting On grade brings up the On Grade String panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

3DP Strings 17.15.4 Write TP Stakeout 3DP String Alignments to HZA/VTA 17.15.5 TP Alignment

17.15.3 Write TP Stakeout Binary Triangles (TSC Format)

**Position of option on menu:** Survey => Leica => 1100 => Triangles (TSC)

The Write TP Stakeout Binary triangles TSC option writes out a tin as a TP Stakeout binary file.

On selecting the *Triangles (TSC)* option, the **Write TP Stakeout Binary Triangles (TSC Format)** panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>

17.15.5 TP Alignment

Position of option on menu: Survey => Leica => 1100 => Alignments to HZA/VTA
This option converts alignments or super alignments into the TP-Setout/TP-Stakeout alignment format. These programs support the clothoid/natural clothoid and cubic parabola transition types. Due to restrictions in the software using these files the file names and alignment names must be
On selecting the **Alignments to HZA/VTA** option, the **TP Alignment** panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>
Suffix to lane name

A suffix will be added to the alignment name in the SDF/LDF file entry.

Process button

Create the TP-Stakeout/Setout format files, if errors are encountered during the conversion such as names > 8 characters the appropriate warnings will be displayed.

17.15.6 Leica 1200

The Leica 1200 walk-right menu collects under the one menu, options that can work with Leica 1200 instruments.

![Leica 1200 Menu](image)

For the option Strings, go to

- 17.15.7 Create Leica 1200 String Files
- 17.15.8 Create Leica 1200 String Files (Old)
- 17.15.9 Create Leica 1200 Triangle Files
- 17.15.10 Create Leica 1200 Road Files
- 17.15.11 Create Leica 1200 Tunnel Files

17.15.7 Create Leica 1200 String Files

Position of menu: Survey => Leica => 1200 => Strings

This panel creates a points and lines database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate LandXML file and then calling a Leica provided converter to create the DBX files.

Selecting Strings brings up the Create Leica 1200 String Files panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>

---

What's New in 12d Model 17
The data source to write to the DBX files

Write button
Create the Leica 1200 Strings DBX files.

17.15.8 Create Leica 1200 String Files (Old)

Position of menu: Survey => Leica => 1200 => Strings (V4)

This panel is identical to 17.15.7 Create Leica 1200 String Files but calls an older version of the Leica LandXML/DBX converter.

Selecting Strings (V4) brings up the Create Leica 1200 String Files (Old) panel

17.15.9 Create Leica 1200 Triangle Files

Position of menu: Survey => Leica => 1200 => Triangles

This panel creates a triangle database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate LandXML file and then calling a Leica provided converter to create the DBX files.

Selecting Triangles brings up the Create Leica 1200 Triangle Files panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jobname</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create database</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LeicaXML file</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Folder for DBXs</td>
<td>file</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tin</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tin Polygon selection</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Write</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Jobname**

The internal jobname seen inside the Leica software.

**Create database**

Tick box

If ticked will create the 1200 DBX.

If not ticked just the LandXML file is created.

**LeicaXML file**

The name of the Leica LandXML file to create.

**Folder for DBXs**

The folder to create the databases in.

**Tin**

The tin to write to the DBX.

**Tin Polygon selection**

Select a polygon for the region of the tin to write out.

**Write**

Create the Leica 1200 Triangle DBX files.

### 17.15.10 Create Leica 1200 Road Files

**Position of menu:** Survey => Leica => 1200 => Roads

This panel creates a roads database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate Leica LandXML file and then calling a Leica provided converter to create the DBX files.

This panel allows either a flat group of strings to be written to the DBX or multiple roads and layers in those roads dependent on the users needs.

Selecting **Roads** brings up the **Create Leica 1200 Road Files** panel.
The fields and buttons used in this panel have the following functions.

**Jobname**

*The internal jobname seen inside the Leica software.*

**File name**

*The name of the Leica LandXML file to create.*

**Transition mapping**  
*Due to the inadequate specification of transitions in the LandXML schema users must explicitly map 12d transition types to other vendors types.*

**Create database**  
*tick box  
if ticked will create the 1200 DBX,  
if not ticked just the LandXML file is created.*

**Put all stringlines in a layer**  
*tick box  
if not ticked then the strings in the model selected in the Stringlines model box in the "Simple" tab are written to the LandXML file with no layer grouping,  
if ticked there are 2 options.*
Folder for DBXs file
The folder to create the databases in.

Simple Tab
The "Simple" tab allows a centreline and model of strings to be written to a single layer in the DBX.

Alignment string string select
The centreline for the layer.

Include alignment in layer tick box
if ticked the centreline is included in the layer; is cut as part of the road surface.

Stringlines model model box
The model of strings forming the road surface/layer.

Layer name
The default layer name is the model name, this can be changed here.

Advanced Tab
The "Advanced" tab allows multiple centrelines and strings to be written to layers in the DBX.
For each alignment string there can be up to 10 layers, e.g. an entire subdivision can be uploaded by nominating the centreline for each road and adding the models for the final surface layers, boxing layers etc.

Alignment string
The centreline for the 10 optional layers.

Alignment in layer 1
If ticked the centreline is included in the 1st layer, is cut as part of the road surface.

Stringlines models 1
The model of strings forming the road surface/layer.

Layer name 1
The default layer name is the model name, this can be changed here.

To create extra roads/centrelines right click on the row number in the grid box to insert an extra row and fill out to suit.

Write button
Create the Leica 1200 Road DBX files.

17.15.11 Create Leica 1200 Tunnel Files

Position of menu: Survey => Leica => 1200 => Tunnel
This panel creates a tunnel database for use on the Leica 1200 series of TPS instruments. This is done by creating an intermediate Leica LandXML file and then calling a Leica provided converter to create the tunnel DBX files.

This panel allows a single centreline and layer to be written to a tunnel DBX, it uses some industry standard tunnel definition files (.PRO,.PRA) to define the shape of profiles and the chainages they are applied at, these files are created via a text editor or other software packages.

Selecting Tunnel brings up the Create Leica 1200 Tunnel Files panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

<tr>
<td></td>
<td>Create the tunnel DBX files.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For more information on PRO/PRA tunnel definition files please see 20.12.10 Definition of the PRO and PRA definition files.
17.15.12 Leica GradeSmart 3D

The Leica GradeSmart 3D walk-right menu collects under the one menu, options that can work with Leica GradeSmart software.

The GradeSmart options are all documented in the Leica GradeSmart manual.

Triangles to TSB

The GradeSmart options are all documented in the Leica GradeSmart manual.

17.16 Topcon

The Topcon walk-right menu collects under the one menu, options that can work with Topcon instruments.

For the option Write LN3 file go to

- 17.16.1 Create Topcon LN3 String Files
- 17.16.2 Read Topcon LN3 Strings Files
- 17.16.3 Create Topcon TN3 Triangle Files
- 17.16.4 Read Topcon TN3 Triangle Files
- 17.16.5 Create RD3 Road File
- 17.16.6 Read Topcon RD3 Road File
- 17.16.7 Create Topcon PT3 Points Files
- 17.16.8 Read Topcon PT3 Points Files

17.16.1 Create Topcon LN3 String Files

Position of menu: Survey => Topcon => write LN3 file

This panel writes strings to Topcon LN3 linework files.

Selecting write LN3 file brings up the Create Topcon LN3 String Files panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data to write</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data source type</td>

<td>file</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The LN3 file you wish to read.

Pre* postfix for models

for information please go to 4.19.2 Pre*Postfix in Panel Fields

17.16.3 Create Topcon TN3 Triangle Files

**Position of menu:** Survey => Topcon => Write TN3 file

This panel writes triangles to the Topcon TN3 triangulation files.

Selecting Write TN3 file brings up the Create Topcon TN3 Triangle Files panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The tin to write to the TN3 file.

Internal Tin name

The name of the tin you see inside the Topcon software.

**Tin Polygon selection**

Select a polygon for the region of the tin to write out.

Topcon tin file

The name of the TN3 file to create.
17.16.4 Read Topcon TN3 Triangle Files

Position of menu: Survey => Topcon => Read TN3 file
This panel reads in triangles from the Topcon TN3 triangulation files.
Selecting Read TN3 file brings up the Read Topcon TN3 Triangle Files panel.

![Read Topcon TN3 Triangle Files panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Topcon tin file</td>
<td>file</td>
<td></td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>End change for X-sections</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
RD3 Job
   The RD3 file you wish to create.

Alignment string
   The centreline of the road.

Report vertical alignment
   If ticked the vertical alignment is uploaded to the RD3 file

Report X-sections
   If ticked cross sections are uploaded to the RD3 file

X-sections model
   The model containing the cut cross section strings to upload to the RD3 file. These must have been cut normal to the nominated alignment string or the upload will fail. Start chainage for X-sections
   If non blank the start chainage to upload cross sections from.

End chainage for X-sections
   If non blank the end chainage to upload cross sections to.

17.16.6 Read Topcon RD3 Road File

Position of menu: Survey => Topcon => Read RD3 file

This panel reads in the centreline and cross sections from a Topcon RD3 road definition file. Selecting Read RD3 file brings up the Read Topcon RD3 Road File panel.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

17.17 Trimble

The Trimble walk-right menu is:

For the option **Write TTM file**, go to

- 17.17.1 Write TTM File
- 17.17.2 Trimble Link Points
- 17.17.3 Trimble Link Triangles
- 17.17.4 Trimble Link Roads
- 17.17.5 SCS900 CSV to XYZ ID Code

17.17.1 Write TTM File

Triangles from a tin (not a super tin) can be written out as a Trimble TTM file.

Note that the Trimble TTM is binary and so can not be viewed or edited.

Selecting **Write TTM file** brings up the Create Trimble TTM Triangles File panel:
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td></td>

<tr>
<td><strong>Write</strong></td>
<td>send the triangles directly to the Trimble device or write them to the given TTM file.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 17.17.4 Trimble Link Roads

This option uploads an alignment string and associated x-sections to a Trimble device, or writes the data to a specific roading file.

Selecting **Trimble Link roads** brings up the **Create Trimble Link Roads** panel:
The Trimble upload/DC file has certain limitations and criteria. These include:

1. The alignment string must exist on the X-sections. This allows us to calculate the zero pt so we can split the template into left and right.

2. The X-sections model should be representative of the alignment string, i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.

3. The alignment string cannot exist above or below the X-sections, i.e. it should be on the section as per 1.

4. The number of points on successive section templates (left and right) should be the same, i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the upload data by using the chainage range between areas where the number of points on each side of the X-sections are the same.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alignment string</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Job name</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Upload directly to Trimble device</td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
<tr>
<td>Use legacy DC Format</td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
<tr>
<td>Report vertical alignment</td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
<tr>
<td>Report X-sections</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>X-sections model</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Start chainage for X-sections</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>End chainage for X-sections</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Assume X-sections left end-segment is sideslope</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Assume X-sections right end-segment is sideslope</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Side slope tolerance (%)</td>
<td></td>
<td>0.01</td>
<td></td>
</tr>
</tbody>
</table>

*the alignment string to be uploaded/written to the file.*

*name of the Trimble job*

*if ticked, the selected data is uploaded to the Trimble device.*

*If not ticked, the data is written to a Trimble DC file with the given job name and ending in .DC*
if ticked, include vertical alignment details in the upload/file.

Report X-sections tick box not ticked
if ticked, the X-sections in X-section model will be uploaded/output to the file.

X-sections model model box
the model of X-sections to be uploaded/written to the file. This can only be filled in if Report vertical alignment and Report X-sections are ticked.

Start chainage for X-sections measure box
if non blank, only X-sections whose chainage is greater than or equal to the Start chainage for X-sections and less than or equal to the End chainage for X-sections are uploaded/written out. If blank, all X-sections that are less than or equal to the End chainage for X-sections are uploaded/written out.

End chainage for X-sections measure box
if non blank, only X-sections whose chainage is less than or equal to the End chainage for X-sections and greater than or equal to the Start chainage for X-sections are uploaded/written out. If blank, all X-sections that are greater to or equal to the Start chainage for X-sections are uploaded/written out.

Assume X-sections left end-segment is sideslope tick box ticked
if ticked, the first segment is considered to be a sideslope, and the Sideslope tolerance (%) field is enabled.

Assume X-sections right end-segment is sideslope tick box ticked
if ticked, the last segment is considered to be a sideslope, and the Sideslope tolerance (%) field is enabled.

Sideslope tolerance (%) measure box 0.01

Write button
send the data directly to the Trimble device or write it to the given DC file.

17.17.5 SCS900 CSV to XYZ ID Code
This option converts a Trimble SCS900 CSV file to an xyz file.
Selecting SCS900 CSV to XYZ ID Code brings up the Convert SCS900 CSV File panel:

The fields and buttons used in this panel have the following functions:
What's New in 12d Model 17

**SCS900 csv file**
file box

name of the SCS900 CSV file

**North/East?**
tick box
ticked

if ticked,

**Output xyz File**
file box

name of the xyz file to convert the SCS900 CSV file to

**Process**
button

convert the SCS900 file to a xyz file

17.18 Setout

**Position of menu:** Survey => Setout

The Setout walk-right menu contains options for creating points numbers and files for uploading to data recorders.

The Setout walk-right menu is .

17.18.1 Create Centre Points for Curves of Strings

**Position of option on menu:** Survey => Setout => Create centres of string curves

This option is used to create points at the centres of arcs in alignment strings, polylines, arcs or circles.

17.18.2 Create X Y Text for Centre Points of Alignments

17.18.3 Setout Lip Line

17.18.4 Create Setout Points

17.18.5 Create Setout Points Using Super String
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

</tbody>
</table>

### 17.18.2 Create X Y Text for Centre Points of Alignments

**Position of option on menu:** Survey => Setout => Create x y text of centres of HIPs

This option creates text for the x and y co-ordinates of the horizontal arcs on an alignment string.
model for the text of the x and y co-ordinates

Text size (w) input box
size of text in world units.

Text colour input box
colour of text

Pick a string button
select string to create text for.
17.18.3 Setout Lip Line

Position of option on menu:  Survey => Setout => Setout lip line

This panel is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select a lip string</td>
<td>string select</td>
<td>pick the alignment string to have bubbles created for.</td>
<td></td>
</tr>
<tr>
<td>Select point type:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>hcp</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>vcp</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Quarter point type:</td>
<td></td>
<td></td>
<td></td>

<tr>
<td>Chord</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Chainage</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Report file</td>
<td>input box</td>
<td>name of the report file.</td>
<td></td>
</tr>
<tr>
<td>Create bubbles</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model for bubbles/text</td>
<td>input box</td>
<td>model for the bubbles and text.</td>
<td></td>
</tr>
</tbody>
</table>

pick the alignment string to have bubbles created for.

if ticked, the horizontal tangent points are included.

if ticked, the vertical tangent points are included.

if ticked, the quarter points by chord distance are included.

if ticked, the quarter points by chainage distance are included.

if ticked, bubbles are created with the string name and bubble number inside.
Text size (w)  
input box  
size (in world units) for the text inside the bubble.

Colour for text  
input box  
Colour for the bubble and bubble text.

Bubble offset  
input box  
offset distance from the alignment string to place the bubble.

Process  
button  
run the option.

17.18.4 Create Setout Points

Position of option on menu:  Survey => Setout => Setout points

This panel is used to create points with numbers for use in setting out data. This option is usually run before the option to create an instrument upload file. The setout point is created as a 4d string with the point at the data point and with the point id as the text for the 4d string, with a text size of zero.

Separate text for the numbers and circles surrounding the data points and the text numbers are also created. By default, a file called "defaults.sof" is read in containing settings required for the option.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Textstyle</strong></td>
<td>input box</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td><strong>Model for setout points</strong></td>
<td>input box</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td><strong>Model for points labels</strong></td>
<td>input box</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td><strong>Individual points</strong></td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Use super strings</strong></td>
<td>tick box</td>
<td>tick</td>
<td></td>
</tr>
<tr>
<td><strong>The next number</strong></td>
<td>input box</td>
<td>1 or highest number</td>

<td>output box</td>
<td></td>
<td>data to create point ids for:</td>
</tr>
<tr>
<td><strong>Many points/strings</strong></td>
<td>tick box</td>
<td>tick</td>
<td></td>
</tr>
<tr>
<td><strong>Label</strong></td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Undo</strong></td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Default settings</strong></td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Textstyle**
- input box 1
  - textstyle for the created point ids

**Model for setout points**
- input box 0
  - model to place the setout points in

**Model for points labels**
- input box 0
  - model to place the setout point ids and circles in.

**Individual points**
- tick box
  - if ticked, the setout points are created as point strings
  - If not ticked, individual one point strings are created.

**Use super strings**
- tick box
  - if not ticked, super strings are created for the setout points. The super string point id is set to the setout point id.
  - If not ticked, 4d strings are created for the setout points strings with the 4d text as the setout point id (with text size set to zero).

**The next number**
- input box
  - 1 or highest number in model for setout points
  - next numeric point id to use for creating point ids. If a **Model for setout points** is given, the model is searched for any super strings or 4d strings with numbers as text and the **The next number** is set to one more than the highest numeric point id in the model.

**Reset**
- button
  - reset the **The next number** to the highest point in the model for setout points.

**Data to label**
- input box
  - string, model, view, point
  - type of data source.

**Model/View/String/Point to**
- output box
  - data to create point ids for.

**Many points/strings**
- tick box
  - tick
  - if ticked, the each time a string/point is selected, the string/point is processed without having to click on the **Label** button. After a string/point is processed, another string/point can then be selected.
  - If not ticked, the **Label** button must be clicked before the selected string/point is processed.

**Label**
- button
  - create setout points and circles for the selected data.

**Undo**
- button
  - undo the last setout points and s created whilst the panel has been up.

**Default settings**
- button
  - default settings for the s. These can be read in from a file.

### 17.18.5 Create Setout Points Using Super String

**Position of option on menu:** Survey => Setout => Setout points using super string

**Position of option on menu:** Road Toolbar
This option creates a super string over the top of the data selected. The super string allows point numbers. The incremental point numbers are displayed at each vertex inside a circle symbol. The setout numbers are identified on a setout model and incremented each time the panel is activated.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Create Pts</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Start Num</td>
<td>integer</td>
<td>1 (or next available number on subsequent runs of the option)</td>
<td></td>
</tr>
<tr>
<td>Pt Offset</td>
<td>real</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td>real</td>
<td>1.5</td>
<td></td>
</tr>
<tr>
<td>Alpha *</td>
<td>real</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

*Type in number and <enter> or accept default*
Offset of the setout point, typically a distance behind the back of kerb.
(This will be the setout point x,y location but the z value refers to the original string selected e.g. the kerb return)

Offset  real
Offset of the setout point text and circle, from the actual setout point.

Alpha*  text
If non-blank, Alpha point number prefix is used

Data Source  choice box  String  String, Point, Model, View

String: Allows the selection of a string (using 12d pick with direction), where the setout number is always placed on the right hand side in relation to the pick direction, perpendicular to the string.
Alignment choices: A selection panel is displayed with 3 choices:-

s  by number <divides the string into equal parts>
s  by distance <divides the string and may have a remainder>
s  by special chainage file

String to label  button

Point: Allows the selection of a point. There is no direction involved.

Point to label  button

Model and View: Allows the setout of multiple strings and points but again there is no control over the pick direction or the orientation of the setout number in relation to any string.

Model to label  model
existing model selection required

View to label  view
Existing view to be selected

Label  button
Runs the option and adds the setout model to the view from which the Data Source was selected

Undo  button
Each <Label> creation has an undo
The fields and buttons used in this panel have the following functions:

<table>

</tr>
</tbody>
</table>

*Activates the move option allowing the setout text bubble to be dynamically relocated on screen, but still remain attached to the actual setout point*
Link to Setout:

Add button
- Draws a leader line from the actual setout point to the setout text value bubble

Add All button
- Draws a leader line from the actual setout point to the setout text value bubble at all vertices on the selected setout string

Link to Setout:

Delete button
- Deletes the leader line from the actual setout point to the setout text value bubble, if it exists

Delete All button
- Deletes the leader line from the actual setout point to the setout text value bubble at all vertices on the selected setout string

Reverse Setout Numbers:

Select button
- This option reverses the numbering order only on a setout string.

Re numbering / Drape:

This option can renumber the start number used on setout data. When a string or model is selected a prompt for a new start number is displayed.

The tin to drape is used to reset the z value of the setout point. A design tin can be used, but care should be taken to have a design point in the tin, close to the setout point, as a “drop onto the tin” is used to calculate the new z value.

Data Source choice box String String, Model
- String or model are the choices

Tin to drape tin
- If non-blank, setout vertices will be draped to get new z value

Setout String button
- Select the setout string to perform the above Re number ing / Drape

Update Setout + Z Values + Grades + Tabulation:

Select button
- Setout features can be updated as the original string selected for setout (e.g. Kerb return alignment) has been stored as an attribute on the setout string. Care must be taken to re-select the original string.

Toggle Z's <> Grades:

Select button
- Setout features such as labelling Z values and grades on segments are discussed under Options tab. This option toggles the display between the two
The fields and buttons used in this panel have the following functions:

Options

Setout Type

Setout number or Z values are the choices

Setout Number:

Point size choice box
Selections are Point and Point 0.5 (refer to the size of the point shown at the setout z, y)

Draw circle around setout point tick true
Refers to the linestyle circle at each setout z, y.

Draw circle around text label tick true
Refers to the circle surrounding each setout point number text value

Circle colour colour box blue
The colour of the circle surrounding each setout point number text value

Point tolerance real
X,Y Tolerance between setout points to handle duplicate or near duplicate points

Draw link from Setout to Label tick box false

Use Highest Project Point ID integer
Search for the highest point number available in the project

Label Grade Approximations tick box false
(Grades can be labelled between setout points, but care must be taken as the z value is used from the setout points, the length from the original reference string selected. The grade is only correct if the points are on grade and or on a parabola. So the grades are reported as approximate only and for a visual check.)

Z Value:

Symbol input ZTICK
Symbol Size real 1
Decimal Places Integer 3
Prefix Text input
if non-blank text value added to text Z value. <e.g. R.L.>

Textstyle Data textstyle box
Setup text style, colour, height and width

Model for setout model box available models
Enter a model name for the setout data

Suffix for Level, Grade, Links Models
Display default values for models that may be created if you choose to draw link lines, label levels or grades. If setout model is “Setout”...then these models would default to “Setout Level” “Setout Link” “Setout Grade”
17.19 Upload

**Position of menu:** Survey => Upload

The Survey Upload walk-right menu contains survey options to upload data the most survey instruments. There are options to upload points, triangulations and road geometry.

The Survey Upload walk-right menu is

![Survey Upload Menu]

Create triangle upload file
Create points upload file
Create roads upload file
Create points upload file (new) - only for Trimble Link
Create roads upload file (new) - only for Leica XML and Trimble Link
Upload data to instrument/device

For the option Create unique coordinates, go to

- 17.19.1 Create Unique Coordinates
- 17.19.2 Create Triangle Upload File
- 17.19.3 Create Points Upload File
- 17.19.4 Create Road Upload File
- 17.19.5 Create Points Upload File (New)
- 17.19.6 Create Road Upload File (New)
- 17.19.7 Create Paveset Upload File
- 17.19.8 Survey Data Upload

17.19.1 Create Unique Coordinates

**Position of option on menu:** Survey => Upload => Create unique coordinates

This option creates points from the selected data so that there is only one point for all vertices within user defined xy and z tolerances.

Selecting Create unique coordinates brings up the Create Model of Unique Points panel.

![Create Model of Unique Points]

The fields and buttons used in this panel have the following functions:
### Data source of setout points

_data selection type - for a full description go to 4.19.3 Data Source._

### Data source

_data source of strings to create unique points from_

### Output model

_model box_

_model for the created vertices._

**xy tolerance**  
real value box  
-0.001

**z tolerance**  
real value box  
-0.001

_all vertices closer than these tolerances are considered to be the same vertex and only one point will be created for all of them._

### Process

_button_

_create the distinct points_

## 17.19.2 Create Triangle Upload File

**Position of option on menu:**  
Survey => Upload => Create triangle upload file

The [Create triangle upload file](#) option allows the creation of a triangle file based on a tin. Various file formats can be selected.

Selecting [Create triangle upload file](#) brings up the Create triangle upload file panel

![Create triangle upload file panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>input</td>
<td></td>
<td></td>
</tr>

_On clicking the write button, [12d Model](#) will write the specified file._
File type choice box
Leica DTM *.gsi
12d xyzs *.dat
Ortho 12d *.T12
Sokkia *.tri
TP Setout/Stakeout *.tsa
LandXML *.xml

file type to be produced.

For Leica DTM *.gsi format:

Job id input
job id to be included in file. (max 8 characters)
Leica output file input
name of file to be produced
Easting offset input
easting offset to be applied to data. This is important where large coordinate values are used, such as in map projections.
Northing offset input
northing offset to be applied to data. This is important where large coordinate values are used, such as in map projections.

For 12D xyzs *.dat format:

12d output file input
name of file to be produced

For Ortho 12d *.T12 format:

Ortho 12d output file input
name of file to be produced

For Sokkia *.tri format:
17.19.3 Create Points Upload File

**Position of option on menu:** Survey => Upload => Create points upload file

The **Create points upload file** option allows the creation of a file of point ids, x, y and z, for string data (super strings and 4d strings only). Various file formats can be selected.

Selecting **Create points upload file** brings up the **Create Instrument Points Upload File** panel.

Upload files for points can be created for various Leica, Geodimeter, Sokkia, Topcon, UPL, QuikDraw, Trimble XYZ formats as well as a text file of point id, x,y,z data.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instrument choices</td>
<td>choice box</td>
<td>report_xyz</td>
<td>available instruments</td>
</tr>
<tr>
<td>Output Z values</td>
<td>tick box</td>
<td></td>
<td>if ticked, z-values are output - only used for Geodimeter formats</td>
</tr>
<tr>
<td>Create new job on SDR 33</td>
<td>tick box</td>
<td></td>
<td>if ticked, create a new job on SDR33 - only used for Sokkia formats</td>
</tr>
<tr>
<td>Left justify fields</td>
<td>tick box</td>
<td></td>
<td>if ticked, each field is left justified - only used for Sokkia formats</td>
</tr>
<tr>
<td>User definable terminator</td>
<td>input box</td>
<td>&amp;</td>
<td>terminator to use - only used for Geodimeter formats.</td>
</tr>
<tr>
<td>Default char for blank name</td>
<td>input box</td>
<td>z</td>
<td>character used for blank names - only used for Geodimeter formats.</td>
</tr>
<tr>
<td>Data source of setout points</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
data selection type - for a full description go to 4.19.3 Data Source.

Data source
data source of setout points to create the upload file from.

Number of decimal places input box 3
number of decimal places for x, y and z values.

Default for null value input box -9999
value to write for null z-values.

Start point id input box
point id to start creating upload file from.

End point id input box
last point id to write to upload file.

Note: Start and End point ids may be left blank, and all point ids (whether numeric or alpha-numeric) will be written to the upload file.

Origin x/Origin y input box
If non-zero, subtract the value from the x/y value before writing out.

Upload file file box
name of the upload file to create.

Get Point Range button
pressing this button will populate the Start and End point id fields with the minimum and maximum (numeric) point ids found in the selected source data. If the selected source data contains a mix of numeric and alpha-numeric point ids, the alpha-numeric point ids are considered to have a numeric value of zero (0), but are ignored when determining the range. If the selected source data contains alpha-numeric point ids only, then the Start and End point id fields will both be set to zero (0).

Write File button
create the upload file

17.19.4 Create Road Upload File

Position of option on menu: Survey => Upload => Create roads upload file

The Create roads upload file option allows the creation of a specific roading file. Files can be created for various Leica (8 & 16 formats), Geodimeter, Sokkia, Topcon and Trimble Roading formats.

Selecting Create road upload file brings up the Create Roading Upload File panel

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instrument choices</td>
<td>choice box</td>
<td>Geodimeter Roadline 3d</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Leica Road Plus 8</td>
<td></td>
</tr>
</tbody>
</table>
For choice of **Geodimeter Roadline 3d**, go to

- **Leica Road Plus 8**
- **Leica Road Plus 16**
- **LMGS - D45**
- **Sokkia Roading - Alignment Road**
- **Sokkia Roading - String Road**
- **Topcon MS2000**
- **Topcon GTS-700 Roads**
- **Trimble Roading**

**Geodimeter Roadline 3D file**

**Position of option on menu:** Survey => Upload => Create roads upload file, Instrument choice = Geodimeter Roadline 3d

The **Geodimeter Roadline 3d** option allows the creation of a specific roading file.

Selecting **Geodimeter Roadline 3d** brings up the **Report Geodimeter Roadline 3D** panel

![Report Geodimeter Roadline 3D](image)

The Geodimeter (trimble), has certain limitations and criteria associated with the 3d file. These include:

1. Each section template (i.e. right or left) has a max number of 12 points.
2. The first and last segments of the alignment must be a straight (for both horizontal and
vertical).

3. The start and end chainages of the horizontal alignment should be the same for the vertical alignment.

4. The alignment string must exist on the xsec's. This allows the calculation of the zero pt so we can split the section into left and right templates.

5. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.

6. The alignment string cannot exist above or below the xsection. i.e. it should be on the section as per 4)

7. The number of points on consecutive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, cannot handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections is the same.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select H-Align</td>
<td>Select box</td>
<td></td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Leica road plus 8 / 16 file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Leica roadplus 8 or Leica roadplus 16

The Leica roadplus 8 and Leica roadplus 16 options allow the creation of specific Leica road files.

Selecting Leica roadplus 8 brings up the Report Leica roadplus 8 panel.
Selecting **Leica roadplus 16** brings up the **Report Leica roadplus 16** panel.

The 8 and 16 formats are different file formats for the leica range of instruments. The user should be aware of the required format for the particular instrument. Please refer to the Leica documentation for specifications.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Job id</strong></td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Select alignment</strong></td>
<td>String select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Report vertical align</strong></td>
<td>tick box</td>
<td>no</td>
<td></td>
</tr>
<tr>
<td><strong>Report cross sections</strong></td>
<td>tick box</td>
<td>no</td>
<td></td>
</tr>
<tr>
<td><strong>Cross section model</strong></td>
<td>model box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>XSec start ch</strong></td>
<td>input box</td>
<td>min alignment ch</td>
<td></td>
</tr>
<tr>
<td><strong>XSec end ch</strong></td>
<td>input box</td>
<td>max alignment ch</td>
<td></td>
</tr>
<tr>
<td><strong>Report cross section assignment</strong></td>
<td>tick box</td>
<td>no</td>
<td></td>
</tr>
<tr>
<td><strong>File name</strong></td>
<td>input box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The name given will be appended with the correct prefix eg ALN for alignment file. As Leica only takes 8 character file names, the name may be truncated.

**Write** button
write appropriate files.

LMGS - D45 file

**Position of option on menu:** Survey => Upload => Create roads upload file, Instrument choice = LMGS - D45 file

The LMGS - D45 file option allows the creation of a specific file format suitable for upload to Leica’s grader and paver control systems. The format has a number of rules that must be satisfied for correct file creation. These include:

1. There must be an equal number of points on each section
2. Points should not be closer than 5cm in both directions
3. Azimuth changes between cross section points should not be greater than 20gon (18 degrees).

Selecting LMGS - D45 file brings up the LMGS - D45 file panel

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cross section model</td>
<td>model box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>XSec start ch</td>
<td>input box</td>
<td>min alignment ch</td>
<td></td>
</tr>
<tr>
<td>XSec end ch</td>
<td>input box</td>
<td>max alignment ch</td>
<td></td>
</tr>
<tr>
<td>File name</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Write button

write appropriate file.

Sokkia Roading - Alignment Road file

**Position of option on menu:** Survey => Upload => Create roads upload file, Instrument choice = Sokkia Roading - Alignment road

The Sokkia Roading - Alignment road option allows the creation of a specific roading file.

Selecting Sokkia Roading - Alignment road brings up the SDR Roading - Alignment Road panel
The sdr33 roading file has certain limitations and criteria. These include:

1. The alignment string must exist on the xsec’s. This allows us to calculate the zero pt so we can split the template into left and right.

2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.

3. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 1).

4. The number of points on adjacent section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select H-Align</td>
<td>Select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>select valid alignment string.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Road Name</td>
<td>input box</td>
<td>Name of selected alignment string</td>
<td>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</td>
</tr>
<tr>
<td>Report vertical alignment</td>
<td>tick box</td>
<td>no</td>
<td></td>
</tr>
<tr>
<td>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Assume last XSec segment is sideslope</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
</tbody>
</table>

if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the default cut and fill slope fields are enabled.

**Default cut slope (%)**  
this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition in the file will be given the value as entered into the default cut slope field. If no value is set for the default, the cut slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.

**Default fill slope (%)**  
this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition in the file will be given the value as entered into the default fill slope field. If no value is set for the default, the fill slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.

**Cross section model**  
This will ask for the model of cross sections. These sections will be written out to the file.

**XSec start ch**  
chainage value to start writing cross sections

**XSec end ch**  
chainage value to end writing cross sections

**File name**  
the name to be used for file creation

**Write**  
write appropriate file

**Sokkia Roading - String Road file**

Position of option on menu: Survey => Upload => Create roads upload file, Instrument choice = Sokkia Roading - String road

The **Sokkia Roading - String road** option allows the creation of a specific string roading file. Selecting **Sokkia Roading - String road** brings up the **SDR Roading - String Road** panel
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

**Trimble Roading File**

**Position of option on menu:** Survey => Upload => Create roads upload file, Instrument choice = Trimble Roading

The Trimble Roading option allows the creation of a specific roading file.

Selecting Trimble Roading brings up the Report Trimble Roading panel.
The Trimble DC file has certain limitations and criteria. These include:

1. The alignment string must exist on the xsec's. This allows us to calculate the zero pt so we can split the template into left and right.

2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.

3. The alignment string cannot exist above or below the xsection. i.e. it should be on the section as per 1).

4. The number of points on successive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Select H-Align</strong></td>
<td>Select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>select valid alignment string.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Road Name</strong></td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Name of selected alignment string</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Report vertical align</strong></td>
<td>tick box</td>
<td>no</td>
<td></td>
</tr>
<tr>
<td></td>
<td>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Assume last XSec segment is sideslope</strong></td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
</tbody>
</table>
if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the
default cut and fill slope fields are enabled.

**Default cut slope (%)**  
input box

this field is optional. From the section data it is only possible to calculate either the cut or fill
sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade
is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition
in the file will be given the value as entered into the **default cut slope** field. If no value is set for the
default, the cut slope in this instance will be given a null value. The default value if entered, should be
in whole percent e.g. 50.0 for a 1v in 2h slope.

**Default fill slope (%)**  
input box

this field is optional. From the section data it is only possible to calculate either the cut or fill
sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade
is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition
in the file will be given the value as entered into the **default fill slope** field. If no value is set for the
default, the fill slope in this instance will be given a null value. The default value if entered, should be
in whole percent e.g. 50.0 for a 1v in 2h slope.

**Cross section model**  
model box

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch  
input box       min alignment ch

chainage value to start writing cross sections.

XSec end ch  
input box       max alignment ch

chainage value to end writing cross sections.

File name  
input box

the name to be used for file creation

Write  
button

write appropriate files.

---

17.19.5 Create Points Upload File (New)

**Position of option on menu:** Survey => Upload => Create points upload file (new)

The Create points upload file (new) option creates or uploads directly to a Trimble instrument a
file of point ids, x, y and z, for string data (super strings and 4d strings only).

Only Trimble file formats is supported as this stage - the option Create points upload file
(17.19.3 Create Points Upload File) is used to create files for most other instruments.

Selecting Create points upload file (new) brings up the Create Points Upload File panel.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Upload directly to Trimble device</strong></td>
<td>tick box</td>

</tbody>
</table>
17.19.6 Create Road Upload File (New)

**Position of option on menu:** Survey => Upload => Create road upload file (new)

The Create road upload file (new) option allows the creation of road files or uploads directly to a Trimble instrument and Leica using Leica XML format.

Only Trimble and Leica LandXML file formats are supported as this stage- the option Create road upload file (17.19.4 Create Road Upload File) is used to create files for most other instruments.

Selecting Create road upload file (new) brings up the Create Road Upload File panel.

![Create Road Upload File Panel](image)

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
<tr>
<td><strong>Start chainage for X-sections</strong></td>
<td>chainage value to start writing cross sections. If blank, start with first x-section.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>End chainage for X-sections</strong></td>
<td>chainage value to stop writing cross sections. If blank, end with last x-section.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Assume X-sections left end-segment is sideslope</strong></td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If ticked, left end segments are tagged as sideslopes.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Assume X-sections right end-segment is sideslope  

*If ticked, right end segments are tagged as sideslopes.*

Sideslope tolerance (%)  

*input 0.01*

Write  

*write out or upload the date.*

**Leica X-Sections LandXML**

**Position of option on menu:**  
Survey => Upload => Create roads upload file (new), File type = Leica X-Sections LandXML  

The **Leica X-Sections LandXML** options creates a file in LandXML format suitable for Leica instruments.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>File name</td>
<td>input box</td>
<td>*.*xml</td>
<td></td>
</tr>
<tr>
<td>Create database</td>
<td>tick box</td>
<td></td>
<td></td>

<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Job Name</td>
<td>input box</td>
<td>name of selected alignment string</td>
<td></td>
</tr>
<tr>
<td>Report vertical alignment</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The name of the Leica LandXML file.

If ticked, a DBX file is created.

Select valid alignment string.

Input job name. If a valid alignment is selected, the name of that alignment will be the default job name.
if ticked, vertical alignment details written to file.

**Report cross sections**  tick box
if ticked, the cross section model box will be enabled.

**X-sections model**  model box available models
model of cross sections to be written out.

**Start chainage for X-sections**
chainage value to start writing cross sections. If blank, start with first x-section.

**End chainage for X-sections**
chainage value to stop writing cross sections. If blank, end with last x-section.

**Assume X-sections left end-segment is sideslope**  tick box
If ticked, left end segments are tagged as sideslopes.

**Assume X-sections right end-segment is sideslope**  tick box
If ticked, right end segments are tagged as sideslopes.

**Write**  button
write out file.
### 17.19.7 Create Paveset Upload File

**Position of option on menu:** Survey => Create Paveset upload file

The **Paveset Output** panel produces data in a format used by Paveset machine guidance software used in laying asphalt and other materials.

Selecting **Create Paveset upload file** brings up the **Paveset Output** panel.

![Paveset Output Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data to process</strong></td>
<td>Model             </td>
<td>             </td>
<td>             </td>

<tr>
<td><strong>Abutting lane</strong></td>
<td>choice box</td>
<td>None</td>
<td>None, Left, Right</td>
</tr>
<tr>
<td><strong>Missing lanes</strong></td>
<td>choice box</td>
<td>None</td>
<td>None, Left, Right</td>
</tr>
</tbody>
</table>

**Chainage String**

The string for chainages

**Paveset file**

File to write the output data to

**Number of lanes**

The number of lanes for this paving run

**Abutting lane**

If the paving run is abutting an existing lane choose that here

**Missing lanes**

If the paving runs have missing points in some areas choose the side they are missing from here.

- **None** - the same number of points exist at each cross section, an error will occur in processing if a difference is detected.
- **Left/Right** - the output to paveset is padded on the nominated side to match the nominal number of
lanes, when processing is finished you will display a list of chainages where this occurred

X- Sect Ch tol  
input box  
0.5

The chainage variation allowed for each cross section

Design Tin  
input

The design TIN to drop the selected points against for level differences

Height from tin  
input box

The height from the design TIN
+ve = above
-ve = below

Write  
button

Process the points and write the Paveset file

17.19.8 Survey Data Upload

Position of option on menu: Survey => Upload

The upload option take data from the computer and sends it to the data collector connected to the computer's serial port.

Selecting Upload brings up the Survey Data Upload panel

![Survey Data Upload panel]

The fields and buttons used in this panel have the following functions.

This section of documentation is a work in progress and will be updated in subsequent releases.

This manual will only refer to the TPS and GPS simulators, for connection details to actual instruments refer to the supplied 12dField documentation.

![12d Field - Last Configuration](image)

Continue to next section 18.2.2 GPS Localisation or return to 18.2 12d Field.

18.2.1.1 TPS

This section of documentation is a work in progress and will be updated in subsequent releases.

For the TPS Simulator this is the only panel to enter 12dField. Press Set and you will enter 12dField proper.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instrument</td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Select the instrument you wish to use with 12dField, dependent on the instrument selected the panel flow will vary.

Surveyor

Enter the name for the surveyor using 12dField.

After selecting Set the 12d Field - Setout TPS Simulator is displayed on the screen. For more information please go to 18.2.1.4 12d Field - Setout (TPS Simulator)

Set
Enter 12dField

Continue to next section 18.2.1.2 GPS or return to 18.2 12d Field.
18.2.1.2 GPS

This section of documentation is a work in progress and will be updated in subsequent releases.

For the GPS-Simulator 2 more panels are required
Select GPS-Simulator from the choice box.

![12d Field Instrument Selection](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instrument</td>
<td>choice box</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Select the instrument you wish to use with 12dField, dependent on the instrument selected the panel flow will vary.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Surveyor</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Enter the name for the surveyor using 12dField.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Set

Brings up the Configure GPS Simulator panel.

For more information on the Configure GPS Simulator panel please go to 18.2.1.3 Configure GPS Simulator

Continue to next section 18.2.1.3 Configure GPS Simulator or return to 18.2.12d Field.

18.2.1.3 Configure GPS Simulator

This section of documentation is a work in progress and will be updated in subsequent releases.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>NMEA file</td>
<td>folder</td>
<td>*.nmea</td>
<td></td>
</tr>
</tbody>
</table>

The GPS simulator needs a NMEA file to run, this can be a file recorded from an actual instrument or constructed from within 12dField itself by 'driving' along an existing string. A default file "Default_LLQ.NMEA" is created automatically for 1st up usage.

**Overwrite time**  
if ticked the time in the NMEA string is ignored and the current computer time used instead.

**Set**  
proceed to the next panel

**Change instrument**  
go back to the instrument selection panel.

**Cancel**  
exit 12dField

Selecting **Set** displays the next **Configure GPS Simulator** panel.

---

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Base Projection</strong></td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Select the projection to use, these are located in the carto.4d file. This projection is used to convert the WGS84 lat/long/elevation into cartesian coordinates which can be used directly or have a localisation applied to them.

**Perform transformation**  
tick box  
if ticked a user defined localisation will be applied to the GPS reading.

**12dF Helmert Params**  
Select the *.TDF_HEL file containing the transformation details to apply, this file is created with the "GPS Localisation" panel in the main 12DField menu.

**Set**  
Enter 12dField

**Change instrument**  
go back to the instrument selection panel.
 Cancel  
 Exit 12dField

After selecting Set the 12d Field - Setout GPS Simulator is displayed on the screen. For more information please go to 18.2.1.5 12d Field - Setout (GPS Simulator).

Continue to next section 18.2.1.5 12d Field - Setout (GPS Simulator) or return to 18.2 12d Field.

### 18.2.1.4 12d Field - Setout (TPS Simulator)

This section of documentation is a work in progress and will be updated in subsequent releases.

The control bar has one user definable setting, in the settings panel under the general tab you can toggle on or off whether you want the current string name on the control bar, this is "Str Name on Control Bar", 12dField will need to be restarted for this setting to change.

<table>
<thead>
<tr>
<th>12d Field - Setout (TPS Simulator)</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
</tr>
</tbody>
</table>

**Names.4d**

controls the string details used by 12dField when storing a point, e.g. model/linestyle/weight etc.

**Setup**

brings up the Store Point Setup panel.

For more information on Store Point Setup panel, please go to 18.2.1.6.1 Store Point Setup.

brings up the Target Heights Panel

Show the current number of satellites and status, pressing the button brings up the GPS Status panel. In the settings panel the user defines the thresholds for GPS errors.

**Shift**

is used by 12dField panels to change buttons to add extra functionality.

Show the current measuring style, pressing brings up the GPS/TPS settings panel.

Select button for tablet PC, allow selection with a press.

**Menu**

brings up the 12d Field panels menu. For more information please go to 18.2.1.7 Options

**Exit**

Exits 12d Field.

Continue to next section 18.2.1.5 12d Field - Setout (GPS Simulator) or return to 18.2 12d Field.

### 18.2.1.5 12d Field - Setout (GPS Simulator)

This section of documentation is a work in progress and will be updated in subsequent releases.
For information on the **12d Field - GPS Status** panel please go to [18.2.1.6 12d Field - GPS Status](#). Continue to next section [18.2.1.6 12d Field - GPS Status](#) or return to [18.2 12d Field](#).

### 18.2.1.6 12d Field - GPS Status

The **12d Field - GPS Status** panel provides information about the current state of the **GPS** instrument such as fix quality and satellites used.

![12d Field - GPS Status panel](image)

**Status Tab**

The WGS84 cartesian Y of the running measurement.

**Proj'n Z**
12dF double box

The WGS84 cartesian Z of the running measurement.

Continue to next section 18.2.1.6.1 Store Point Setup, or return to 18.2 12d Field.

### 18.2.1.6.1 Store Point Setup

The 12d Field - Store Point Setup panel is called up the 1st time a user attempts to store a point to a model in a 12dField setout panel or if the user presses the **Setup** button on the 12dField control bar.

This panel must be validly completed before a point can be stored.

The panel is grouped into 4 separate areas each described below.

#### Model/string settings

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td>String</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Point/Line type</td>
<td>Line</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>Green</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Linestyle</td>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Weight</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions.

**Model/string settings**

These settings work the same as your typical 12d settings work, they control the look of the stored string in the model.

**Name**
enter the name of the string to be stored manually or from the pop up select a predefined name (from names.4d) which will also populate the other settings.

**Model**
- **model box**
  - the model to store the string in. (This model will automatically be added to your defined 12dField plan view)

**Point/Line type**
- **choice box**
  - Point, Line
  - whether the string is a point or line string.

**Colour**
- **colour box**
  - the colour of the string.

**Linestyle**
- **linestyle of the string**

**Weight**
- **the thickness of the string.**

**Same as**
- **button**
  - select an existing point/line and the fields will set to it's properties.

**Pre*postfix for models**
- if non blank the pre-postfix will be applied to the nominal model when storing the point.

**FLD backup files**

All 12dField points are stored to a FLD file as well as a model. This is done for backup reasons as every shot is stored to the FLD file on disk when a shot is taken ensuring no data should be lost in the event of an unexpected shutdown of 12d.

The 12dField files have sufficient attributes in them that they can be read directly back into 12d without going through the survey data reduction functions.

**File names from**
- Manual Entry, Populate from model name, Populate from <pre> part of pre-post, Populate from <post> part of pre-post

**Select Choice**

- **Manual entry**
- **Populate from model name**
- **Populate from <pre> part of pre-post**
- **Populate from <post> part of pre-post**

*Manual Entry - enter the name of the file in the File name box.*  
*Populate from model name - the name of the model in the model box is used as the file name.*  
*Populate from <pre> part of pre-post - the name of the file is the pre part.*  
*Populate from <post> part of pre-post - the name of the file is the post part.*

*For example a surveyor might enter a model name of "Asphalt Conformance" in the model box.*  
*They then for a pre fix enter the year month and day and their initials "20113006MG " and they select "Populate from model name" for the FLD file name.*  
*The model and field file written will be "20113006MG Asphalt Conformance"*

**FLD Settings**
Surveyor
the name of the surveyor

Description
a description of the survey (Populated from 12dF_JOB_DESCRIPTIONS.4D)

Lot number
a lot number of the survey (Populated from 12dF_JOB_LOT_NUMBERS.4D)

Category
the category of the survey (Populated from 12dF_JOB_CATEGORIES.4D)

Vertex Id settings
This choice box controls the way the id of each vertex in the string is written.

Pickup Id Type
None, Same each shot, Inc on Rec, Dec on Rec, Chainage, Chainage&Offset, Same as Setout Id

None - no vertex id is written.
Same each shot - the value in the Pickup Id box will be used for all points stored.
Inc on Rec - the value in the Pickup Id box will be used for the next point stored then incremented.
Dec on Rec - the value in the Pickup Id box will be used for the next point stored then decremented.
Chainage - the chainage of the point being stored will be used as it's vertex id.
Chainage&Offset - the chainage and offset of the point being stored will be used as it's vertex id.
Same as Setout Id - the vertex id of the point being setout will be used.

Notes on the incrementing of the Id.
The id is alphanumeric and the number of characters does not change. The increment/decrement applies to the either the numeric or alpha ending of the id, not to a combination of both.

Increment examples 1->2, 9->0, A1>A2, A9->A0, AA->AB, AZ->BA, S099->S100, S999->S000
Decrement examples 6->5, 0->9, A2>A1, A0->A9, AB->AA, AA->ZZ, S100->S099, S000->S999

Pickup Id
This is the id of the next vertex to be stored

Cancel button
if cancel is pressed the panel will close but the next time a point is stored it will open again.

Finish button
if the panel validates correctly it will close and the point will be stored. The panel will only open again if called manually from the control bar or a new setout is started.
18.2.1.7 Options

This section of documentation is a work in progress and will be updated in subsequent releases.

For the option Single String Setout, go to 18.2.1.8.1 Single String Setout
Batter Setout 18.2.1.8.2 Batter Setout
Basic Pickup 18.2.1.8.3 12d Field -Basic Pickup
Tin Setout 18.2.1.8.4 Tin Setout
Crossfall Setout 18.2.1.8.5 Crossfall Setout
Point Setout 18.2.1.8.6 Point Setout
Grid Setout 18.2.1.8.7 Grid Setout
Crown Setout 18.2.1.8.8 Crown Setout
Tunnel Definition 18.2.1.8.9 Tunnel Definition
Tunnel Setout 18.2.1.8.10 Tunnel Setout
Station Helmert 18.2.1.8.11 Station Helmert
18.2.1.8 Common Measurement Buttons

A description of the common measurement buttons on 12dField Setout panels is described below.

The measurement buttons are on a dialog as such:

The INFO and DLG buttons

These buttons do not change in behaviour between all of the different measure modes.
Displays the information panel, this panel contains extra information about the current setout that is not displayed in the standard panel, the contents of the information panel is user configurable via the text file 12dF_INFO_PAGE_CONFIG. When the information panel is active the button changes to INFO-.

DLG-
When pressed the dialog minimises to maximise the screen area, the button changes to DLG+ which when pressed will bring the panel back to full size.

Single (GPS/TPS) and Multiface (TPS only) measurement modes.
The MEAS button.

MEAS
Starts the measurement, on completion the button state changes to this

MEAS

STORE
Store the point as per the settings in the 18.2.1.6.1 Store Point Setup panel, the first store of a point brings this panel up automatically. Once stored the STORE button will be blanked out until a new measurement is taken.

The MS+ST button

MS+ST
Starts a measurement and stores the point as per the settings in the 18.2.1.6.1 Store Point Setup panel. The STORE button remains disabled.
Continuous (GPS/TPS) measurement mode

In continuous mode the MS+ST button is disabled.

**MEAS**
Start continuous measurement

**STOP**
Stop the continuous measurement, the STORE button will remain active until pressed. When the point is stored the button is disabled until a new measurement is started.

**STORE**
Store the point as per the settings in the 18.2.1.6.1 Store Point Setup panel, the button state does not change meaning the user can continue to move storing points at a single press of the button.

Averaging measurement mode (GPS only)
In averaging mode the MS+ST button is disabled.

**MEAS**
Start the averaging measurement, the details of the averaging, std deviations xy&z are displayed in the 3rd message line of the dialog.

**STOP**
Stop the averaging measurement.

**MEAS**
Start a new averaging measurement.

**STORE**
Store the point as per the settings in the 18.2.1.6.1 Store Point Setup panel.

The Chainage Buttons

The chainage buttons commonly appear as the middle row of buttons in a 12dField setout panel.
The CH+ and CH- buttons are used to quickly increment to the next chainage to be setout, the buttons are activated when the Chainage Increment field in the panel has a value other than 0.

**CH+**

When pressed the value in the Chainage Increment field is added to the current setout chainage. The value in Chainage Increment field can be +ve or -ve.

**CH-**

When pressed the value in the Chainage Increment field is subtracted from the current setout chainage. The value in Chainage Increment field can be +ve or -ve.

The CH=CURR and RESTORE buttons are used for where the user has a need to temporarily
use the current chainage for setout purposes.

**CH=CURR**

The button is activated when a measurement has been taken. When pressed the setout chainage is set to the current chainage, the **RESTORE** button is then activated and the **CH+** and **CH-** buttons disabled.

**RESTORE**

When pressed the setout chainage is set back to the chainage when **CH=CURR** was pressed and the **CH+ CH-** buttons enabled if possible.

**The Bottom Button Row**

---

**<-TAB**

changes the active tab in the setout panel to the next left.

**TAB->**
changes the active tab in the setout panel to the next right.

The 

\texttt{{<}\textsc{tab} and 	extsc{tab}>}} keys can be overwritten for special user behaviour.

Overwriting the 

\texttt{{<}\textsc{tab} and 	extsc{tab}>} keys.

The functionality of the TAB keys can be defined in "\texttt{12dF\_DLG\_USER\_KEYS.4D}".

The file allows the user to enter the text for the key and the functionality for the key to take on.

\begin{quote}
\texttt{bt\_tab\_left" P2d" tps\_position\_hz} \\
\texttt{bt\_tab\_right" P XY" tps\_position\_xy} \\
\end{quote}

The 1st field is the keyword for the button to override.

The 2nd field is the text for the button to override.

The 3rd field is the action for the button to perform, any of the 12dField hot keys defined in "\texttt{12dF\_USER\_KEYS.4D}" can be assigned.

Continue to next section \ref{sec:single-setout} or return to \ref{sec:12d-field}.

\section{Single String Setout}

The 12d Field Single String Setout panel is used when the setout point is relative both horizontally and vertically to one string, for example a traffic island or kerb and gutter.

Single string setout works by dropping a point to a nominated control string, then the setout string is cut normal to the dropped point on the control string.

When setting out the setout string is cut normal from a point at the setout chainage on the control string, then the setout offset is then applied from here to create the setout point.

\textbf{Note} the control string and the setout string could be the same string or all different, this dependant on the task being performed.

Selecting the Single String Setout option brings up the 12d Field - Single String Setout panel.
**Setout Tab**

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setout CS Raw Ch</td>
<td>12dF chainage box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>The raw, no equalities setout chainage on the control string, start chainage plus distance along string</em></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Setout Offset</td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>The offset from the setout string to setout, +ve is to the right of the string, -ve left</em></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Chainage Increment</td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>The value the setout chainage will be changed by when chainage increment/decrement is called.</em></td>
<td></td>
<td></td>

<td>12dF double box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel).</em></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Buttons**

<table>
<thead>
<tr>
<th>MEAS</th>
<th>button</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.</em></td>
<td></td>
</tr>
</tbody>
</table>
INFO+ button
Display the user configurable information panel to view extra information not available on the standard dialog.

DLG- button
Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button
Start a measurement and store it on completion.

CH + button
Increment the setout chainage by the value in the chainage increment field.

CH - button
Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button
Set the setout chainage to the chainage of the last measured point.

RESTORE button
Restore the setout chainage to the chainage prior to the "CH=CURR" button being pressed.

<-TAB button
Go to the previous tab in the dialog.

TAB-> button
Go to the next tab in the dialog.

DLG+ button
Restore a minimised panel to it's full size.

INFO- button
Close the user configurable information panel.

Nav P button
Load a saved navigation page configuration.

Sh M button
Start a measurement with a touch on the screen.

Sh M+S button
Start a measurement with a touch on the screen, store it on completion.

READ button
Load previously saved setout settings for reuse.

SAVE button
Save the current setout settings for reuse at a later date.

STOP button
Stop the measurement in process.

STORE button
Store the last measured point.
Strings Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control String</td>
<td>12dF string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Setout String</td>
<td>12dF string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Reference String</td>
<td>12dF string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Surface Shift</td>
<td>choice box</td>
<td>-0.000</td>
<td></td>
</tr>
</tbody>
</table>

Control string, the string to which the other strings are cut normal to for calculations.

Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centrelne.

Reference string, a string to which the current point is dropped normally to for information only.

A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “TDF_SURFACE_SHIFTS.4D”).
Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description    Type    Defaults    Pop-Up

Navigation Box   draw box

*The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.*

Continue to next section 18.2.1.8.2 Batter Setout or return to 18.2 12d Field.

18.2.1.8.2 Batter Setout

The 12d - Field Batter Setout panel is used to dynamically locate the intersection point of a slope defined by the cut of 2 strings and the natural surface at the user's current position.

It is designed around the user wishing to place batter rails in place for guiding the cut/fill.

**Note**, unlike other string setout routines the batter setout does not have a setout string, just the control string and the 2 design strings.

The user is able to set a shift to move the design surface up or down once the strings are cut.

There are manual modes available for setting the design slope when 2 strings are not able to be cut.

Batter setout works by dropping a point to a nominated control string, the 2 strings used to determine the slope are cut normal to the dropped point on the control string, the delta offset for the pole is dependant on the users height rather than a setout string.
Selecting the Batter Setout option brings up the **12d - Field Batter Setout** panel.

### Setout Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Setout CS Raw Ch</strong></td>
<td>12dF chainage box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Chainage Increment</strong></td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Hgt Rail over Batter</strong></td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Hgt Rail over Ground</strong></td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Compaction Factor</strong></td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*The raw, no equalities setout chainage on the control string, start chainage plus distance along string*

*The value the setout chainage will be changed by when chainage increment/decrement is called.*

*The height of the batter rail above the design batter, say 0.1 for cut and 1.0 for fill.*

*The height of the batter rail above the natural ground, typically as large as number as possible to get the rail away from the top/toe of the batter.*

*A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated the *Settings* panel.)*

### Buttons

**MEAS**  button
Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

**INFO+** button
Display the user configurable information panel to view extra information not available on the standard dialog.

**DLG-** button
Minimises the dialog so only the first 2 rows of buttons are shown.

**MS+ST** button
Start a measurement and store it on completion.

**CH +** button
Increment the setout chainage by the value in the chainage increment field.

**CH -** button
Decrement the setout chainage by the value in the chainage increment field.

**CH=CURR** button
Set the setout chainage to the chainage of the last measured point.

**RESTORE** button
Restore the setout chainage to the chainage prior to the "CH=CURR" button being pressed.

**<-TAB** button
Go to the previous tab in the dialog.

**TAB->** button
Go to the next tab in the dialog.

**STOP** button
Stop the measurement in process.

**STORE** button
Store the last measured point.

**Nav P** button
Load a saved navigation page configuration.

**Sh M** button
Start a measurement with a touch on the screen.

**Sh M+S** button
Start a measurement with a touch on the screen, store it on completion.

**READ** button
Load previously saved setout settings for reuse.

**SAVE** button
Save the current setout settings for reuse at a later date.

**DLG+** button
Restore a minimised panel to it's full size.

**INFO-** button
Close the user configurable information panel.
### Strings Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control String</td>
<td>12dF string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Hinge String</td>
<td>12dF string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2nd String</td>
<td>12dF string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Reference String</td>
<td>12dF string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Surface Offset Mode</td>
<td>choice box</td>
<td>vertical, normal</td>
<td></td>
</tr>
<tr>
<td>Surface Shift</td>
<td>choice box</td>
<td>0.000</td>
<td></td>
</tr>
</tbody>
</table>

**Control String**

*Control string, the string to which the other strings are cut normal to for calculations.*

**Hinge String**

*The hinge string is the string the batter is being cut or filled to. Slope distances etc. are given to this string.*

**2nd String**

*The other string along with the hinge string defining the batter slope.*

**Reference String**

*Reference string, a string to which the current point is dropped normally to for information only.*

**Surface Offset Mode**

*Whether the offset to the surface is normal or vertical*

- **Vertical**: The height offset is applied vertically to the design slope.
- **Normal**: The height offset is applied normal/perpendicular to the design slope.

**Surface Shift**

*A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “TDF_SURFACE_SHIFTS.4D”)*
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Batter Mode</td>
<td>choice box</td>
<td></td>
<td>Auto, Centreline, hinge &amp; slope</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Manual relative (dOS&amp;dHgt), Manual absolute (dOS&amp;RL)</td>
</tr>
<tr>
<td>Offset</td>
<td>12dF double box</td>
<td>Dependant on the 'Batter Mode' setting in use, see description of the options in 'Batter Mode'.</td>
<td></td>
</tr>
<tr>
<td>Delta Hgt/Absolute Height</td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Choose the method to generate the batter slope.

**Auto**: The batter slope is determined by cutting the hinge and secondary string.

**Centreline, hinge & slope**: The batter setout is done by cutting the hinge and applying a manually entered slope from this.

**Manual relative (dOS&dHgt)**: The user manually enters the hinge offset from the control line, the hinge height relative to the control line and the batter slope.

**Manual absolute (dOS&RL)**: The user manually enters the hinge offset from the control line, the absolute hinge height and the batter slope.

**Manual, use current slope**: The batter setout is done by cutting the hinge and applying the last measured slope.
Dependant on the 'Batter Mode' setting in use, see description of the options in 'Batter Mode'.

**Slope H/V**
12dF double box

The slope of the batter in horizontal/vertical from, e.g. 2:1

</tbody>
</table>

The fields and buttons used in this panel have the following functions.

Field Description       Type        Defaults     Pop-Up
Control String          12dF string select box
Pickup CS Raw Ch        12dF chainage box
Pickup CS Offset        12dF double box
Pickup Easting          12dF double box
Pickup Northing         12dF double box
Pickup Level            12dF double box
Pickup Id               12dF input box

The raw/non equality chainage of the current point on the control string.
The offset of the current point from the control string, +ve is right.
The measured easting.
The measured northing.
The measured level.
The Id of the measured point, the behaviour of the Id is controlled from the 18.2.1.6.1 Store Point Setup panel.

**Auto Store Dist?**

12dF double box

If non zero the distance between shots to automatically store points, the measurement mode must be continuous.

Please see 18.2.1.8 Common Measurement Buttons for information on the buttons.

Continue to next section 18.2.1.8.4 Tin Setout or return to 18.2 12d Field.

### 18.2.1.8.4 Tin Setout

The 12d Field - Tin Setout panel is used when the user needs to get design levels from a tin. The point can be dropped either vertically to the tin or 3d/normal to the tin. Selecting the Tin Setout option brings up the 12d Field - Tin Setout panel.

#### Setout Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setout TIN</td>
<td>12dF tin box</td>
<td></td>

</tr>
<tr>
<td>Compaction Factor</td>
<td>12dF double box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The TIN to use for setting out

The height diff from the setout surface/string. +ve is above.

When this is toggled on the point is dropped normal to the tin.

In the event the point cannot be dropped to triangle face it will try drop to the edge of a triangle that lies inside the 2d boundary of the tin.
A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel).

**Buttons**

**MEAS** button

Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

**INFO+** button

Display the user configurable information panel to view extra information not available on the standard dialog.

**DLG-** button

Minimises the dialog so only the first 2 rows of buttons are shown.

**MS+ST** button

Start a measurement and store it on completion.

**<-TAB** button

Go to the previous tab in the dialog.

**TAB->** button

Go to the next tab in the dialog.

**STOP** button

Stop the measurement in process.

**STORE** button

Store the last measured point.

**Nav P** button

Load a saved navigation page configuration.

**Sh M** button

Start a measurement with a touch on the screen.

**Sh M+S** button

Start a measurement with a touch on the screen, store it on completion.

**READ** button

Load previously saved setout settings for reuse.

**SAVE** button

Save the current setout settings for reuse at a later date.

**INFO-** button

Close the user configurable information panel.
Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description | Type      | Defaults | Pop-Up
---                | ---       | ---      | ---
Reference String   | 12dF string select box

Reference string, a string to which the current point is dropped normally to for information only.

Surface Shift | choice box | 0.000

A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “TDF_SURFACE_SHIFTS.4D”)

Continue to next section 18.2.1.8.5 Crossfall Setout or return to 18.2 12d Field.

18.2.1.8.5 Crossfall Setout

The 12d Field - Crossfall Setout panel is used when the user wants to generate their design height by cutting 2 strings and projecting the plane of the cuts to their position.

The user is able to set a shift to move the design surface up or down once the strings are cut.

There are manual modes available of setting the design crossfall when 2 strings are not able to be cut.

Crossfall Setout works by dropping a point to a nominated control string, then a setout string and the 2 strings used to determine the crossfall are cut normal to the dropped point on the control string.

Note the control string, the setout string and 1 of the level strings could be the same string or all different, this dependant on the task being performed.

Selecting the Crossfall Setout option brings up the 12d Field - Crossfall Setout panel.
Setout Tab

Buttons

MEAS button

*Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.*
INFO+ button
Display the user configurable information panel to view extra information not available on the standard dialog.

DLG- button
Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button
Start a measurement and store it on completion.

CH + button
Increment the setout chainage by the value in the chainage increment field.

CH - button
Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button
Set the setout chainage to the chainage of the last measured point.

RESTORE button
Restore the setout chainage to the chainage prior to the "CH=CURR" button being pressed.

<-TAB button
Go to the previous tab in the dialog.

TAB-> button
Go to the next tab in the dialog.

STORE button
Store the last measured point.

Nav P button
Load a saved navigation page configuration.

Sh M button
Start a measurement with a touch on the screen.

Sh M+S button
Start a measurement with a touch on the screen, store it on completion.

READ button
Load previously saved setout settings for reuse.

SAVE button
Save the current setout settings for reuse at a later date.

DLG+ button
Restore a minimised panel to it’s full size.

INFO- button
Close the user configurable information panel.

STOP button
Stop the measurement in process.
Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description     Type                     Defaults   Pop-Up

**Control String**  12dF string select box

*Control string, the string to which the other strings are cut normal to for calculations.*

**Setout String**  12dF string select box

*Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centreline*

**1st level string**  12dF string select box

*Level string 1, the string cut for one of the design heights.*

**2nd level string**  12dF string select box

*Level string 2, the string cut for a 2nd design height.*

**Reference String**  12dF string select box

*Reference string, a string to which the current point is dropped normally to for information only.*

**Surface Offset Mode**  choice box    Vertical, Normal

*Whether the offset to the surface is normal or vertical*

*Vertical*: The height offset is applied vertically to the design surface.

*Normal*: The height offset is applied normal/perpendicular to the design surface.

**Surface Shift**  choice box
A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “TDF_SURFACE_SHIFTS.4D”).

**Manual Tab**

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>

What's New in 12d Model

STORE button
Store the last measured point.

Nav P button
Load a saved navigation page configuration.

Sh M button
Start a measurement with a touch on the screen.

Sh M+S button
Start a measurement with a touch on the screen, store it on completion.

READ button
Load previously saved setout settings for reuse.

SAVE button
Save the current setout settings for reuse at a later date.

DLG+ button
Restore a minimised panel to its full size.

INFO- button
Close the user configurable information panel.

Strings Tab

The fields and buttons used in this panel have the following functions.
### Control String

Control string, the string to which the other strings are cut normal to for calculations.

**Type:** 12dF new select box

### Reference String

Reference string, a string to which the current point is dropped normally to for information only.

**Type:** 12dF new select box

---

#### Nav Tab

The fields and buttons used in this panel have the following functions.

- **Navigation Box**: draw box

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.
Offset Pt Tab

The Offset Point tab allows the current setout point to be offset in a defined direction and distance.

For example if the offset direction was 45° and the offset distance 5m pressing Left would move the point 5m at 315°.

If a control string is nominated then when the point is originally selected it is dropped to the control string and the bearing at this point is the default for the offset direction.

For example, to place offset pegs to a drainage pit select the road centreline and then select the pit. The bearing is that of the road, enter the offset distance and press Right or Left and the point is updated.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset Direction</td>

<tr>
<td>Right</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Forw button
Offset the point by the offset distance in the offset direction.

Back button
Offset the point by the offset distance against the offset direction.

Continue to next section 18.2.1.8.7 Grid Setout, or return to 18.2 12d Field.

18.2.1.8.7 Grid Setout

This section of documentation is a work in progress and will be updated in subsequent releases.

The 12d Field - Grid Setout panel creates a setout point at offsets from 2 strings. Most typically used in buildings where points are dimensioned off setout grids. Selecting the Grid Setout option brings up the 12d Field - Grid Setout panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.8 Crown Setout or return to 18.2 12d Field.
18.2.1.8.8 Crown Setout

The 12d Field - Crown Setout panel is effectively 2 12d Field - Crossfall Setout panels. It is typically used on rural roads when the user wants to generate design heights to both sides of the crowned road.

Crown setout works by dropping a point to a nominated control string, then the setout string and the 3 strings used to determine the crown are cut normal to the dropped point on the control string.

The user is able to set a shift to move the design surface up or down once the strings are cut.

Note the setout string and 1 of the level strings could be the same string or different, this dependant on the task being performed.

Selecting the Crown Setout option brings up the 12d Field - Crown Setout panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

</table>

**Field Description**

**Name**
The name of the tunnel, this a file with the extension `12dF_TUN_DEF`.

**Control string**
The centreline the tunnel definitions are applied to, the centreline must have valid vertical geometry for the chainage ranges in the `PRA` file.

**Tunnel Profiles**
The `PRO/PRA` files containing the tunnel definition. For more information on `PRO/PRA` tunnel definition files please see [20.12.10 Definition of the PRO and PRA definition files](#).

**Profiles Normal to CL?**
tick box
- if ticked the tunnel is calculated perpendicular/normal to the vertical alignment of the centreline resulting in a true 3d model.
- if not ticked the tunnel is calculated vertical to the vertical alignment of the centreline, this means an effective loss of clearance on steeper grades.

**Profile Chainages 3d?**
tick box
- if not ticked the chainages in the `PRA` file are taken as plan chainages.
- if ticked the chainages are interpreted as 3d, this is the plan/2d chainage of the 1st point where the horizontal and vertical geometry coincide plus the 3d length along the centreline from there.

**Read**
button
Read in a `12dField` tunnel definition file.

**Write**
button
Write to a `12dField` tunnel definition file.

**Finish**
Exit the panel.

Continue to next section [18.2.1.8.10 Tunnel Setout](#) or return to [18.2 12d Field](#).
18.2.1.8.10 Tunnel Setout

The **Tunnel Setout** option, (available in TPS only) allows the user to locate and setout points on a tunnel previously defined in the **18.2.1.8.9 Tunnel Definition** panel.

### Setout Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setout CS Raw Ch</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Setout CS 3d Ch</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>S/O Prof Ele Index</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>S/O Prof Ele %</td>
<td></td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>S/O Prof Ele Os</td>
<td></td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Chainage Increment</td>
<td></td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Setout CS Raw Ch**

*The plan chainage of the point you wish to setout. If the tunnel chainages are defined as 3d this will be read only and be updated when a 3d chainage is entered.*

**Setout CS 3d Ch**

*The 3d chainage of the point you wish to setout. If the tunnel chainages are defined as 2d this will be read only and be updated when a 2d chainage is entered.*

**S/O Prof Ele Name**

*The name of the element in the profile to setout.*

**S/O Prof Ele %**

*The percentage around the element to setout, 0% means the start of the element, 100% the end of the element.*

**S/O Prof Ele Os**

*The offset from the element to setout, +ve is to the right of the element.*

**Chainage Increment**

*12dF double box*
The value the setout chainage will be changed by when chainage increment/decrement is called.

### Strings Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Edit tunnel</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Reference String</strong></td>
<td>12dF new select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Attributes specific to tunnel setout for display on the information and navigation pages.</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>pu_tun_ele_name</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>pu_tun_ele_idx</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>pu_tun_ele_per</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**pu_tun_ele_os**

Offset from the tunnel element at the shot taken, +ve is to the right hand side.

**so_tun_ele_name**

Name of the tunnel element at the point setout.

**so_tun_ele_idx**

Index, (zero based) of the tunnel element in the profile at the point setout, 0 is the first element.

**so_tun_ele_per**

Percentage around the tunnel element at the point setout.

**so_tun_ele_os**

Offset from the tunnel element at the point setout, +ve is to the right hand side.

---

**Nav Tab**

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Navigation Box</td>
<td>draw box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.11 Station Helmert, or return to 18.2 12d Field.
18.2.1.8.11 Station Helmert

The 12d Field - Helmert Resection panel can be used to establish a station setup by taking readings to up to 6 known points.

The horizontal position is obtained by a Helmert transformation; translation, rotation and uniform scaling of the readings.

The vertical position is obtained by meaning the z values of the readings, the z value is not weighted on distance measured.

Readings can be used for either horizontal position, vertical position or both.

Selecting Station Helmert displays the 12d Field - Helmert Resection panel on the screen.

Main Tab

A point for use in the resection can either be picked from the screen or manually entered.

If picked from the screen the Id and Model boxes will be filled automatically.

If entered manually the Id must be unique in the point model.

Note in 12dField the Id always refers to the Vertex Id.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Point</td>
<td>string select box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Point Id</td>
<td>12dF input box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Select the point for the next shot to be used in the resection.
The Id/name of the target point.

**Point Model**

*model box*

The model containing the point for use in the resection.

**Smart Find On**

*tick box*

Smart find can be used when you can clearly identify one point in a resection, e.g. in a tunnel you can see multiple targets but only identify the one closest to you.

Smart find can be used after you have measured to the identified point.

If ticked on then after a reading to a station smart find will look through the points model to find one that the reading matches, both horizontally and vertically.

The horizontal and vertical tolerances can be set on the parameters tab.

Use smart find to identify all stations measured to automatically.

The surveyor can optionally store the resection point to a model if need be.

**Setup name**

*input box*

The Id of the setup to be stored.

**Setup Model**

*model box*

The model to store the setup to.

**Height Instrument**

*12dF double box*

The height of the instrument above the setup point.

**Buttons**

**MEAS**

*button*

Take a measurement to a station.

**INC ID**

*button*

Increment the point ID and make this the setout point. E.g. BOLT30 -> BOLT31

**DEC ID**

*button*

Decrement the point ID and make this the setout point. E.g. BOLT31 -> BOLT30

**Shot Count**

Number of shot used so far in the resection.

**Finish**

*button*

Leave the panel and make this the new station setup, if any of the position tolerances nominated on the parameters tab are exceeded you will get a warning box allowing you to re-enter or continue.

**Quit**

*button*

Quit the resection and restore the previous station setup.
Details Tab
The details tab displays the overall details of the current setup.
The level of detail is different for 2 and 3+ shots where redundancies in the helmert calcs are available. For 3+ shot the estimation error can be displayed.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up
Hz-Dist PPM 12dF long box
Easting double box
Northing double box
Level double box
Pos error double box
Calc'd scale factor double box
Calc'd PPM
RL Diff

Shot count
MEAS INC ID DEC ID
Finish Help Quit
No reading

The scale factor to be applied to measured horizontal distances.
The calculated easting of the station setup.
The calculated northing of the station setup.
The calculated level of the station setup.
The estimated horizontal error in the station setup.
The scale factor applied to the measurements to get the best fit.
Calc'd PPM  

*double box*

*The scale factor in ppm applied to the measurements to get the best fit.*

RL Diff  

*double box*

*The height difference range between the readings.*

---

**Coords Tab**

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Station Name</strong></td>
<td></td>
<td></td>
<td></td>

<td></td>
</tr>
<tr>
<td><strong>Use?</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Del?</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Station Name**

*The name of the station this reading refers to.*

**Apx Pos Err**

*The approximate horizontal position error of this reading calculated in conjunction with all other readings in use. A high error for this reading in comparison to others might indicate a problem with this reading.*

**Use?**  

*tick box*

*If ticked this reading will be used in the horizontal calculation. Ticking or unticking the box will trigger the recalculation of the horizontal position.*

**Del?**  

*tick box*

*If ticked a confirmation box will be displayed and the reading removed from the resection. Removal will trigger the recalculation of the horizontal position.*
Levels Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

<td>Max Hgt Diff</td>
<td>12dF double box</td>
<td>0.002</td>
<td></td>
</tr>
</tbody>
</table>

The smart find feature is ticked on by default.
The distance tolerance for a point to be used in the smart find.
The level tolerance for a point to be used in the smart find.
The maximum position error allowed, a warning will be shown if exceeded.
The maximum ppm's allowed, a warning will be shown if exceeded.
The maximum height variation allowed, a warning will be shown if exceeded.

Continue to next section 18.2.1.8.12 Station Standard, or return to 18.2 12d Field.
18.2.1.8.12 Station Standard

The 12d Field - Instrument Setup panel is used to establish a station setup over a known point. Orientation is established by measuring/sighting a backsight station. It is not necessary to set an orientation on the instrument, 12dField handles the angle difference internally.

Selecting the Station Standard option brings up the 12d Field - Instrument Setup panel.

Station Tab

The point for use in the setup can either be picked from the screen or manually entered. If picked from the screen the Id and Model boxes will be filled automatically. If entered manually the Id must be unique in the point model.

Note in 12dField the Id always refers to the Vertex Id.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Station</td>
<td>string select box</td>

</tr>
</tbody>
</table>

**General Tab**

**Turn**

**Last**

*The instrument will turn to the last position a measurement was taken at.*

**XY**

*A screen select will be activated and the instrument will turn horizontally only to the selected position.*

**XYZ**

*A screen select will be activated and the instrument will turn horizontally and vertically to the selected position.*

**Turn GPS**

*Note* these buttons are only available if a GPS instrument is selected as the secondary instrument.

**GPS xy**
The instrument will turn horizontally only to the current GPS position.

GPS xyz

The instrument will turn horizontally and vertically to the current GPS position.

Joystick Tab

LEFT

Rotate the instrument to the left as viewed from the prism back to the instrument, LEFT can be pressed twice more to increase the speed of rotation.

RIGHT

Rotate the instrument to the right as viewed from the prism back to the instrument, RIGHT can be pressed twice more to increase the speed of rotation.

UP

Rotate the Up, UP can be pressed twice more to increase the speed of rotation.

DOWN

Rotate the Down, DOWN can be pressed twice more to increase the speed of rotation.

STOP

Stop the instrument rotating.
Quick Pos Tab

The Quick Pos tab allows the user to manually rotate the instrument in the horizontal and vertical directions by preset amounts. This is sometimes easier to use to orientate the instrument correctly than the joystick controls. There are 4 user definable rotations in the horizontal directions and 3 in the vertical.

The buttons show the direction of rotation and the amount of rotation in degrees, the amount of the rotation is defined on the Quick Pos Params Tab.

When a rotation button is pressed the instrument will rotate by a specified amount and direction, all buttons are disabled until the rotation has completed.
### Quick Pos Params Tab

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick Pos Hz 1</td>
<td></td>
<td>5</td>
<td></td>

18.2.1.8.20 Reconnect

Selecting Reconnect will attempt to disconnect from the current instrument and then reconnect. This may be required when the instrument has been restarted.
18.2.2 GPS Localisation

**Position of option on menu:** Survey => Field 12d => GPS Localisation

The panel is used to create the localisation parameters used inside 12dField for reducing GPS observations into a local system.

Points collected with 12dField as raw WGS84 cartesian coordinates can be matched with local control points to calculate the parameters to convert GPS readings directly into the local system.

The 12dField localisation treats horizontal and vertical components separately. The horizontal transformation is a Helmert translation, translation, rotation and uniform scaling of the x and y axes.

The vertical translation can either be a simple z translation or be taken from a tin, the tin can be manually created outside of the panel, e.g. from AusGeoid98 or created by the panel via a plane of best fit.

The basic workflow for this panel is to observe known control points in the field with 12dField with just the ellipsoid set, e.g. MGA56.

Then use this panel to match the observed points with the control points to create the localisation.

Selecting GPS Localisation brings up the Helmert 2.5D Params panel

![Helmert 2.5D Params Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td></td>
<td></td>
<td></td>
<td>* .tdf_hel</td>
</tr>
</tbody>
</table>
The TDF_HEL file to be read in or written to. This is the file used by 12dField to localise GPS reading.

Read button
Read in the TDF_HEL file

Write button
Write out the TDF_HEL file

Geoid Tin
If selected the value of the tin at the local coordinate is added to the height of the raw GPS coordinate.

Create Local TIN tick box
If unticked and the Local Tin box is blank the points are adjusted by the straight mean z difference of the observations.
If unticked and the Local Tin box is not empty the points are adjusted by the value of the TIN at the xy location.
If ticked and the Local Tin box is not empty a plane of best fit is used to create the local TIN and the points are adjusted by the value of the TIN at the current xy location. The extent of the local TIN is 1000m outside the control used.

Local Tin
The Local Tin as described above.

Control model model box
the model containing the control points.

Obsrv’d model model box
the model containing the observed points.

Rotate (cw) measure box
At Point, Point to Point, String from Point, String to Point

The clockwise rotation parameter of the helmert transformation.

Scale measure box
At Point, Point to Point, String from Point, String to Point

The scaling parameter of the helmert transformation.

X translate measure box
At Point, Point to Point, String from Point, String to Point

The x translation of the helmert transformation.

Y translate measure box
At Point, Point to Point, String from Point, String to Point

The y translation of the helmert transformation.

Z translate measure box
At Point, Point to Point, String from Point, String to Point

The z translation of the helmert transformation, (note this is 0.0 if a local TIN is being used).

The grid
Please note changing the level of a control station to "null" means the station and corresponding observed point will not be used in the height calculations.

**Use pt**
- tick box
  - if ticked this point is used in the transformation calculations

**Use z**
- tick box
  - If unticked this point is not used to calculate the transformation height parameter.

**Control Stat Id**
- The Id of the control station, will normally match the observed Id.

**Control Easting/Northing/Level**
- the coordinate of the control station.

**Observed Easting/Northing/Level**
- the coordinate of the observed point.

**Residual Easting/Northing/Level**
- the delta of the observed point with the control point after the transformation has been applied.

**Buttons**

**Control**
- button
  - Start the selection of the control/observed point pairs. Note the environment variable PICK_ORDER_OBSERVED_FIRST_4D can be set to make the selection order 'observed' then 'control'. For ease of use 2 plan views should be used, one with the observed points and one with the control points.

**Calculate**
- button
  - Calculate the transformation and update the residuals in the grid control.

**Finish**
- button
  - Exit the panel, a warning message will appear if the transformation parameters have not yet been written to file.

Continue to next section 18.2.3 12dField Setout FLD File To Strings or return to 18.2 12d Field.
18.2.3 12dField Setout FLD File To Strings

**Position of option on menu:**  Survey => 12d Field => Setout FLD file to strings

A field file, (.FLD) created by **12dField Setout** is attributed in such a way it can be read directly into **12d Model** without going through a Survey Data Reduction function, the string data will be read in with the original name, model, colour, linestyle and weight. Field files created by **12dField Setout** from version **V9C1e** can be read in with this panel.

Selecting **Setout FLD file to strings** displays the **12dField Setout FLD File To Strings** panel.

- **File**: The 12d Field pickup codes file to edit or create.
- **Read**: Reads the pickup codes file.
- **Write**: Writes the pickup codes file.

**+ icon**: Add a new node at the current level of the highlighted node in the tree - a sibling node. You can’t add a sibling node to the top level Pickup node.
add a child to the current highlighted node in the tree.

delete the current highlighted node in the tree

moves the current highlighted node in the tree up

moves the current highlighted node down in the tree

copies to the cache the current highlighted node in the tree

pastes the cached node to the current node in the tree (if it is allowed).

Continue to next section 18.2.5.1.1 Defining Codes, or return to 18.2 12d Field.

18.2.5.1.1 Defining Codes

There are a number of different code types that can be added to your pickup codes file, depending on the structure of your tree. Each code has the following field Type, which can be used to define the type:

Type [Header]

Select Choice

Header
Footer
Features
Opcodes
Attributes
Include

For information on Header go to 18.2.5.1.1.1 Header
Footer 18.2.5.1.1.2 Footer
Features 18.2.5.1.1.4 Features
Opcodes 18.2.5.1.1.5 Opcodes
Attributes 18.2.5.1.1.6 Attributes
Include 18.2.5.1.1.3 Include
18.2.5.1.1 Header

A **Header** to be included in any macro code generation.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text field</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*the macro code to include in the header*

Continue to next section [18.2.5.1.2 Footer](#) or return to [18.2 12d Field](#).

18.2.5.1.2 Footer

A footer to be included in any macro code generation.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text field</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*the macro code to include in the footer*
18.2.5.1.1.3 Include

Defines another code file to be included.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include file</td>
<td>file</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Reload</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note that include files can be edited inline, within one editor.

18.2.5.1.1.4 Features

This code type defines a group of features

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prompt</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: The prompt name of the features group to appear in 12d Field pickup

Available Children Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
<td>18.2.5.1.1.4.1 Feature</td>

- **Prompt**
  - the cosmetic name to be displayed during 12d field pickup

- **Output**
  - the optional value to output to the pickup file - uses prompt if undefined

- **Message**
  - a message to display when picking up the code

- **Default**
  - the default value

- **Horizontal angle**
  - choice box
  - Off, On - Required, On - Optional
  - if the horizontal angle is to be captured

- **Vertical angle**
  - choice box
  - Off, On - Required, On - Optional
  - if the vertical angle is to be captured

- **Slope distance**
  - choice box
  - Off, On - Required, On - Optional
  - if the slope distance is to be captured

- **Target height**
  - choice box
  - Off, On - Required, On - Optional
  - if the target height is required
Data type choice box
            Vertex, Next Segment,
            Prev Segment, String,
            Prompt, Prompt Segment

how the attribute should be attached

Optional? tick box
            if ticked, this attribute is treated as optional
            if not ticked, this attribute must be filled out

Bundle? tick box
            if ticked, this attribute is treated as a bundle
            if not ticked, this attribute is treated as a normal attribute

Programming Tab
See 18.2.5.1.1.7 Programming.

Continue to next section 18.2.5.1.4.12 Choice Attribute, or return to 18.2 12d Field.
18.2.5.1.1.4.12 Choice Attribute

This defines an attribute attached to a feature, which requires a value to be selected from a list of choices.

The fields and buttons used in this panel have the following functions.

**Details Tab**

**Prompt**
- input: the cosmetic name to be displayed during 12d field pickup

**Output**
- input: the optional value to output to the pickup file - uses prompt if undefined

**Message**
- input: a message to display when picking up the code

**Default**
- input: the default value

**Data type**
- choice box: Vertex, Next Segment, Prev Segment, String, Prompt, Prompt Segment

**Optional?**
- tick box: if ticked, this attribute is treated as optional
  - if not ticked, this attribute must be filled out
18.2.5.1.1.5 Opcodes

This code type defines a group of opcodes.

<table>
<thead>
<tr>
<th>Type</th>
<th>Opcodes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prompt</td>
<td>Opcodes</td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions.

Field Description       Type   Defaults   Pop-Up
Prompt                   input   the cosmetic name of the opcodes group

Available children types

For information on Group go to 18.2.5.1.1.5 Group (Opcodes)
OpCode                   18.2.5.1.1.5.2 OpCode
Include                  18.2.5.1.1.3 Include

Continue to next section 18.2.5.1.1.5 Group (Opcodes) or return to 18.2 12d Field.
18.2.5.1.1.5.1 Group (Opcodes)
This code defines a group of opcodes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prompt</td>
<td>the cosmetic name of the group of opcodes</td>
<td>input</td>

18.2.5.1.1.6 Attributes

This defines a top level group of attributes.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prompt</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Available children types
For information on Group go to 18.2.5.1.1.6.1 Group (Attributes).
Attribute
Include
Continue to next section 18.2.5.1.1.6.1 Group (Attributes), or return to 18.2 12d Field.
18.2.5.1.1.6.1 Group (Attributes)

This defines a group of attributes or other groups.

<table>
<thead>
<tr>
<th>Type</th>
<th>Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prompt</td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions.

Field Description  Type  Defaults  Pop-Up

**Prompt**

*the cosmetic name for the group that will be displayed*

**Available children types**

- **Select Choice**
  - Group
  - Attribute
  - Include

For information on Group go to 18.2.5.1.1.6.1 Group (Attributes).

For information on Attribute go to 18.2.5.1.1.6.2 Attribute.

For information on Include go to 18.2.5.1.1.3 Include.

Continue to next section 18.2.5.1.1.6.2 Attribute or return to 18.2 12d Field.
Attribute

This defines an attribute that may be attached to a picked up point or string during pickup.

The fields and buttons used in this panel have the following functions.

### Details Tab

- **Prompt**
  - **Type**: input
  - **Description**: the cosmetic name to be displayed during 12d field pickup

- **Output**
  - **Type**: input
  - **Description**: the optional value to output to the pickup file - uses prompt if undefined

- **Object**
  - **Type**: input
  - **Description**: the optional value to be used to define a set of attributes - uses output if undefined

- **Message**
  - **Type**: input
  - **Description**: a message to display when picking up the code

- **Default**
  - **Type**: input
  - **Description**: the default value

### Programming Tab

See [18.2.5.1.1.7 Programming](#).

Available children types

For information on Feature go to [18.2.5.1.1.4.7 Feature Attribute](#).

- Real [18.2.5.1.1.4.8 Real Attribute](#)
- Text [18.2.5.1.1.4.9 Text Attribute](#)
- Integer [18.2.5.1.1.4.10 Integer Attribute](#)
18.2.5.1.1.7 Programming

It is possible to generate macro code for GIS post processing, for any feature or attribute. The **programming tab** is used to assist you in doing so.

See [18.2.5.5 12d Pickup Codes to Macro](#) for more information on how to generate a GIS post processing 4dm file.

To assist you, this is broken into sections: **Header Tab**, **Declaration Tab**, **Process Tab**, **Footer Tab**.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For use with attributes or opcodes, defines the variable that the data should be stored in for use later.

### Header Tab

The **Header tab** defines any header that should be output into the macro file for the current item.
The fields and buttons used in this panel have the following functions.

Field Description | Type    | Defaults | Pop-Up
---|---|---|---
**Use header?** | tick box | | |

*if ticked, the header will output to the generated file*
*if not ticked, no header will be used*

**Text field**

*the macro code to output into the GIS post processing file*

**Declaration Tab**

The **Declaration tab** defines the 'declaration' to be output into the macro, which can be used for defining variables.
### The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use declaration?</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Use declaration?**
  - If ticked, a declaration will be output to the generated file
  - If not ticked, no declaration will be output

- **Text field**
  - The macro code to output into the GIS post processing file.

### Process Tab

The **Process tab** defines the main processing part of the macro code, which could be used to process a selected feature code and associated attributes, or other items such as opcodes.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use process?</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If ticked, the process data will be output into the generated file.
If not ticked, no process data will be output.

**Text field**

The macro code to output into the GIS post processing file

**Footer Tab**

The **Footer tab** is used to define any macro code that should be added to the footer.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use footer?</strong></td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>if ticked, the footer will output to the generated file</em></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>if not ticked, no footer will be output</em></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Text field**

*The macro code to output into the GIS post processing file*

Continue to next section 18.2.5.2 Pickup Favourites, or return to 18.2 12d Field.
18.2.5.2 Pickup Favourites

**Position of option on menu:** Survey => 12d Field => 12d Field Pickup Codes => 12d Pickup Favourites

This panel is used to create and edit 12d field pickup favourites files. They contain a list of feature codes and associated information for use within 12d Field Pickup.

Selecting 12d Pickup Favourites brings up the Pickup Favourites panel.

![Image of Pickup Favourites panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Favourites file</td>
<td>file</td>
<td>file</td>
<td>*.12dfieldfavourites</td>
</tr>
<tr>

<td>button</td>
<td>loads the optional 12d field pickup codes file for use</td>
<td></td>
</tr>
</tbody>
</table>
adds a new favourite

moves a favourite up

moves a favourite down

delete a favourite

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>String number</td>
<td>Display name</td>
<td>Display image</td>
</tr>
</tbody>
</table>

**Code**

- the name of the favourite.
- If a pickup codes file has been loaded, the list of codes in the pickup codes file will be available as a choice in the browse box.
- If no pickup codes file has been loaded, nothing will appear in the browse box.

**String number**

input
the optional string number for the favourite

**Display name**

the optional cosmetic name of the favourite to display
If not specified, the favourite will display using the code name

**Display image**

the optional cosmetic image of the favourite to display
If not specified, no image will be displayed.

**Write**

button
writes the Pickup favourites to the specified file.

Continue to next section [18.2.5.3 Mapfile to 12d Pickup Codes](#), or return to [18.2 12d Field](#).
18.2.5.3 Mapfile to 12d Pickup Codes

Position of option on menu: Survey => 12d Field => 12d Field Pickup Codes => Mapfile to 12d Pickup Codes

This option is used to create a 12d Field Pickup Coding file from an existing map file. Only the following information from the Basic section of the mapfile is used:
- Key
- Model
- Comment

Selecting Mapfile to 12d Pickup Codes brings up the Mapfile to 12d Pickup Codes panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mapfile</td>

<td></td>
</tr>
</tbody>
</table>

Return to 18.2 12d Field.
The **ePlan XML Schema** is a vendor independent XML format introduced by the State Governments in Australia for the submission of Cadastral plans.

So far it has been implemented by NSW, Qld and Victoria with the other States planning to implement it in the future.

Although there are similarities between the States, there are different enumeration files for each State in the ePlan XML Schema. Also each State has its own business rules, and own methods for submitting the ePlan.XML data.

Also although the various ePlan XML's are based on Land.XML, what is a valid Land.XML file may not be a valid ePlan.XML for a particular State.

See

19.1 ePlan.XML Overview
19.2 12d Approach to ePlan XML
19.3 12d ePlan Workflow
19.4 12d ePlan Menu
19.1 ePlan.XML Overview

See

19.1.1 ePlan XML Structure

19.1.1 ePlan XML Structure

The ePlan Schema is fully described by the ePlan XSD (XML Schema Definition), which formally defines the structure and all the elements inside an ePlan XML file. That means that any ePlan.XML can be validated against the ePlan Schema XSD to see that it conforms to the Schema.

Return to 19.1 ePlan.XML Overview or 19 ePlan.
19.2 12d Approach to ePlan XML

Creating an ePlan XML file could be approached as a spreadsheet type exercise where you type the values into a document, but this is little more than a manual data collection exercise.

Continue to the next section 19.3 12d ePlan Workflow, or return to 19 ePlan.
19.3 12d ePlan Workflow

In 12d Model, the source of the data to write out to an ePlan XML is usually from either

Continue to the next section 19.4 12d ePlan Menu, or return to 19 ePlan.
19.4 12d ePlan Menu

Position on menu: Survey => Network => ePlan

See

19.4.1 Create NSW ePlan Network
19.4.1 Create NSW ePlan Network

Position of option on menu:  Survey => Network => ePlan => NSW

To create an ePlan for NSW, an ePlan network needs to be created. The data to go out as an NSW ePlan.XML file are then added to the ePlan network. Selecting NSW brings up the Create NSW ePlan Network panel:

![Create NSW ePlan Network panel]

The fields and buttons used in this panel have the following functions.

General node

Model
- model box
- the model for the ePlan network.

Name
- name box
- the name for the ePlan network.

Description
- text box
- a description for the ePlan network.

Coordinate System node

Description
- text box
- a description for the coordinate system.
Vertical datum choice box AHD
the vertical datum.

Horizontal datum choice box
the horizontal datum.

Ellipsoid name choice box
name of the ellipsoid used (if any).

Zone number text box
zone number if MGA).

General node
Style Network Style box available network styles
the style used for displaying the ePlan network.

Buttons at bottom
Create button
create an ePlan Network for NSW.

After the Create button is pressed, a new NSW ePlan is created and the Edit ES toolbar appears. For information on the Edit ES toolbar, go to 19.4.2 Edit ES for NSW ePlan Network.

Continue to the next section or return to 19.4 12d ePlan Menu or 19 ePlan.
19.4.2 Edit ES for NSW ePlan Network

Position of option on menu: Survey => Network => ePlan => Create NSW ePlan Network

If the Strings Edit is used to select an ePlan network, or after the Create button is pressed on the Create NSW ePlan Network panel and a new NSW ePlan is created, the Edit ES toolbar appears to edit the EPlan object.

19.4.2.1.1 Adding a Point

The Add a Point option adds a user selected point to the ePlan network. Selecting Add a Point options writes the message to the screen message area

<Pick point or (n)ame, (d)escription> [picks][Menu]

and a point is selected and if it is outside the tolerance distance of all existing points in the Network, it is added to the network and given the next available Point id.
19.4.2.1.2 Importing Points

The Import Points option adds a Data Source of user selected points to the ePlan network.

Selecting Import points brings up the Import Points panel.

![Import Points panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

20.1 Templates in 12d Model

In 12d Model, Templates provide a quick and easy method for defining design details along a string for use in conceptual designs and simple detailed designs, and visualisations.

For more complex urban design, intersections and roundabouts, Templates are impractical and not an efficient solution. For these cases 12d Model introduced the MTF modifiers to provide much finer control and provide all the power of string design without losing the ease of Template design in simpler cases.

Continue to the next section 20.1.1 Simple Templates.

20.1.1 Simple Templates

But in both the simple Template case, and the more powerful MTF Modifiers case, the standard civil technique to be able to examining what is happening in a 2D diagram is to look at cross sections.

Cross sections are 2D diagrams that display what a section cuts through.

The section is traditionally taken at right angles to a selected Reference string (usually an alignment string representing the centreline of a road) and the coordinates of a point in the cross section are (Offset, Height) where Offset is the plan distance along the section of a point in the section from a selected Hinge Point, and Height is the height of the point.

A 12d Model Template consists of a left hand side followed by a right hand side.

Each side is made up of a number of links with names and colours, and each link is defined by any two of the three

(a) width of the link
(b) change in z-value from the beginning of the link to the end of the link. that is, the z-value at the end of the link minus the z-value at the start of the link. This is referred to as the height of the link.
(c) xfall

and the links are connected sequentially to form a cross section.

Notice that the height is only a relative height and not a z-value.

On the left hand side, the links go from right to left. The vertex (point) at the end of the link is given the same name as the link. The far right of the left hand side is the Hinge Point. So on the left hand side, positive widths go to the left.

On the right hand side, the links go from left to right. The vertex (point) at the end of the link is given the same name as the link.
given the same name as the link. The far left of the right hand size is also the Hinge Point. So on the right hand side, positive widths go to the right.

So this definition of the Template is given in terms of **links** and each **link** is defined **relative** to the **previous link** and the left and right hand sides are positioned around a **Hinge Point**.

The **point** at the end of the link is given the **name** of the **link** and is called a **Link Point** or **Template Point**.

Hence on the left hand side of the Hinge Point, the Link Point is at the left hand end of the link. And on the right hand side of the Hinge Point, the Link point is at the right hand end of the link.

For example, a Template consisting of three links called lkerb, lshoulder and lverge on the left hand side, and three links called rkerb, rshoulder, rverge on the right hand side could look like:

![Cross Section View of a Template](image)

Continue to the next section **20.1.1.1 Design X Sections**.

**20.1.1.1 Design X Sections**

A Template is used to generate a cross section at a particular chainage on the Reference string and Hinge string by finding the point where at that chainage the section perpendicular to the **Reference string** **cuts the Hinge string** and the cut point is use as the **Hinge Point** for the Template at that chainage.

So for a simple Template with just the left kerb link on the left hand side and the right kerb link on the right hand side, applying the Template at a chainage **ch** will produce:

![Plan View of Applying the Template at Chainage ch](image)

This is termed "**applying**" the Template at the chainage **ch**. The created points in the cross section are given the same name as the Link points and joined together in the section in the same order as in the Template.
Applying the Template to the Reference and Hinge strings means that when the Template is applied at specified chainages down the Reference string.

The sections created by applying a Template are called design cross sections, or just design sections or design x sections.

In 12d Model, the design sections are stored as 4d super strings where the (x,y,z) vertices are the coordinates generated applying the Template with the vertex text being the name of the Link point.

Continue to the next section 20.1.1.2 Design Strings.

### 20.1.1.2 Design Strings

For a Link Point, for each chainage that the Template is applied there will be a point of the same name on the x section at that chainage.

These common points are joined together in chainage order (i.e. longitudinally) to form a string called the design string. The design string is given the name of the Link point that the string was created from (and hence the same name as the link). The default colour of the string is the link colour.

Polygons can also be created for each link by joining the strings created at either end of the link. The polygon is given the link colour.

So for the simple two link Template with two Template Links left kerb and right kerb:

will generate two strings left kerb and right kerb.
And for the case of the more complex six link Template

Continue to the next section 20.1.2 12d Model Templates.
20.1.2 12d Model Templates

12d Model supports Templates with

(a) an unlimited number of links that are always created (fixed links) followed by
(b) a decisions table that has special rules to decide when certain links are created
(c) an unlimited number of variable cut links and fill links
(d) a final cut/fill slope to be applied at the end of the last cut or fill template link.

Fixed Template Links

The fixed template links are applied to the selected Hinge string and are always used when applying the template regardless of whether the template points are in cut or fill. Each link is defined by two of the three variables, width, height and crossfall, and has a name and colour.

At the end of the fixed links, 12d Model checks to see if a Decisions table exists.

If a Decisions table exists, then it is used and the Decision commands processed.

If a Continue Cut/Fill command is reached in the decision command processing, then this stops the Decision command processing, and the processing moves onto the Cut, Fill and Final Cut/Fill tables.

If no Continue Cut/Fill command is reached in the decisions, then the processing stops after the decision commands are exhausted and the Cut, Fill and Final Cut/Fill tables ARE NOT USED.

If no Decisions table exists, then the Cut, Fill and Final Cut/Fill tables are used after the Fixed table.

Template Decisions

The decisions table is used for

- complicated cut and fill requirements including multiple strata, decisions based on depth below one or more strata or strings, multi-level decisions (i.e. depth decisions followed by fixed links, more depth decision etc.); and
- extended battering including repetitive battering, fixed width batters, and battering relative to a string or strata.

The decisions table is documented in the section 21.8 Full Definition of Template Decisions.

Cut and Fill Template Links and Final Cut/Fill

At the end of the fixed links, if there is no Decisions table, or if a Continue Cut Fill command is reached in the Decisions, the Cut and Fill tables are used.
(a) If the end of the last link of the fixed template/last decision is in cut, then the Cut links are used.
   There can be an unlimited number of cut links and they are used sequentially starting with the first link.

(b) If the end of the fixed template/last decision is in fill, the fill links are used.
   There can be an unlimited number of cut and fill links and they are used sequentially starting with the first link.

If the surface tin is intersected when using either the cut links or the fill links, the section is terminated at that intersection point. Otherwise, the entire link is included in the section, and next cut or fill link is then used. This is repeated until the surface is intersected or all the links in the cut or fill table have been used.

If there is still no intersection with the surface after using all of the cut or fill links, then the Final Cut/Fill table is used to try and intersect with the tin.

Note: The unlimited cut/fill links are called variable template links because at each cross section, a different number of them may be needed. Hence the number of links used varies from cross section to cross section depending on the tin above it.

**Final Cut/Fill**

If the tin has not been intersected at the end of using the Fixed links, Decisions, and Cut and Fill links, the Final Cut and Fill Slopes are used.

How to create a Template with a fixed link table, a cut and fill tables and the final cut/fill links is discussed further in the option [20.2.2 Create/Edit Templates](#). The definition of the Decision Table is given in the section [21.8 Full Definition of Template Decisions](#).

For discussion of the Template menu, continue to the next section [20.2 Templates](#) or return to [20.1 Templates in 12d Model](#).

**Note**

Around any curves, the Reference string is approximated by chords spaced at the string's chainage interval or, if it is different, the section separation interval, or extra points as determined by the horizontal and vertical chord-arc tolerances.

If the chord-to-arc distance is greater than the chord/arc tolerance given in the Apply options panels, then extra points are inserted around the curve so that the chord/arc tolerance is met.
20.2 Templates

**Position of menu:** Design => Templates

The templates walk-right menu has options to create and edit templates, copy, rename and other template utilities.

For a description of templates in 12d Model, see section 20.1 Templates in 12d Model.

The templates walk-right menu is

For the option:
- **Templates**, go to [20.2.1 Templates](#)
- **Template manager** 7.6.12.5 [Template Manager](#)
- **Create/edit** [20.2.2 Create/Edit Templates](#)
- **Copy** [20.2.3 Copy Template](#)
- **Rename** [20.2.4 Rename Template](#)
- **Utilities** [20.2.5 Template Utilities](#)
- **Delete** [20.2.6 Delete Templates](#)
20.2.1 Templates

Position of option on menu:  Design =>Templates =>Templates

The templates walk-right menu provides options to list all the templates added to the project templates) and all the templates in the project area but not in the project (removed templates).

The Templates walk-right menu is

For the options, see
Project templates 20.2.1.1 Project Templates
Removed templates 20.2.1.2 Removed Templates

20.2.1.1 Project Templates

The Project templates walk-right menu provides a list of all the templates in the project.

20.2.1.2 Removed Templates

The Removed templates walk-right menu provides a list of all the templates in the project area that have been removed from the project (using the removed from project option).

Go to the next section 20.2.2 Create/Edit Templates or return to 20.2 Templates.
20.2.2 Create/Edit Templates

Position of option on menu: Design => Templates => Create/edit

12d Model supports templates with an unlimited number of fixed links, followed by either

(a) a decisions table
and/or
(b) an unlimited number of cut and fill links and a final cut/fill slope to be applied at the end of the last template link.

To collect the different types of link information needed in the template, the Template Create/Edit panel was designed with five buttons fixed, decisions, cut, fill and final cut/fill used to bring up and display the panels for creating and editing the fixed, decisions, cut, fill and final cut/fill tables.

For a generate description of Templates in 12d Model, see 20.1 Templates in 12d Model.

Selecting Create/edit displays the Template Create/Edit panel.

The description of the fields and buttons used in the Template Create/Edit panel now follows.

The associated panels created by the buttons fixed, cut, fill, final cut/fill will be described in the next four sections and the Decisions panel will be described in the section 21.8 Full Definition of Template Decisions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template name</td>
<td>input</td>
<td>available templates</td>
<td>name of the template being created/edited. If the template already exists, then the associated panels will already contain the information for that template. The buttons fixed, decisions, cut, fill and final cut/fill can only be selected after the template name is given.</td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>Decisions</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Cut or Fill</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Final Cut/Fill</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note - the buttons can only be selected after the template name has been given in the Template name panel field.
**How to Use the Panel**

(a) A new template is created, or an existing template modified, by first entering the template name into the template field (typed or picked from the pop-up).

(b) To define or edit the fixed sections of the template, select the **Fixed** button and the **Fixed Template** panel will appear.

(c) use the **Decisions** button to define or edit the decisions table

(d) use the **Cut**, **Fill** and **Final Cut/Fill** button to define or edit the variable cut, fill or final cut/fill sections of the template respectively.

The four panels controlled by the buttons **Fixed**, **Cut**, **Fill** and **Final Cut/Fill** from the Template Create/Edit panel will now be described in detail. The **Decisions** button is described in the section **21.8 Full Definition of Template Decisions**.

Go to the next section **20.2.2.1 Fixed Template**.
20.2.2.1 Fixed Template

If the template already exists, the current fixed template links will be displayed in the panel. If the template is new, the panel will be empty.

The Fixed Template panel is

![Fixed Template Panel Image]

An unlimited number of fixed links can be defined in the grid on the panel. For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

For each link, any two of the three values of width, height and percent crossfall (xfall) can be used to defined the link. The colour and name are also defined for the link.

The name of the link is also given to point at the end of the link and also to the string created by the end of the link. The link colour is used as the string colour and when an Apply Template or Apply MTF is used, the colour of the polygon created by joining the two ends of the link. See 20.1 Templates in 12d Model.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>width of the link being defined</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Height</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the vertical distance between the end point and the start point of the link being defined.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For a fixed link, height is positive in the up direction. Hence for a fixed link, height is positive up and</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
negative down.

NOTE - if height and cross-fall are being used to go down, then define height to be negative and xfall to be negative.

X-fall % input
percent cross fall of the link being defined - units are percent grade. For xfall, positive is up and negative down.

NOTE - if height and xfall are being used to go down, then define height to be negative and xfall to be negative.

Colour colour box available colours
colour of the link being defined. If no colour is supplied, the default colour is used.

Name input
name of the link being defined - this is used as the name of the string created by the end point of the link.

OK/Apply button
OK stores the values in the fields and exits the panel. Apply stores the values but doesn’t exit the panel.

Warning - If the OK or Apply button is not selected, then no new information will be recorded.

Draw button
draws the fixed template at the bottom of the panel. Automatically does a fit.

NOTE - if height and xfall are being used to go down, then define height to be negative and xfall to be negative.

Go to the next section 20.2.2.2 Decisions Template or return to 20.2.2 Create/Edit Templates.
20.2.2.2 Decisions Template

If the template already exists, the current Decisions Template links will be displayed in the panel. If the template is new, the panel will be empty.

The Decisions Template panel is

The Decisions Template panel is documented in the section 21.8 Full Definition of Template Decisions.

Go to the next section 20.2.2.3 Variable Cut or Fill Template or return to 20.2.2 Create/Edit Templates.
20.2.2.3 Variable Cut or Fill Template

The definition of the cut or fill template links are similar to the fixed template links except the slope is given as a “one vertical in a user given horizontal value” rather than a percent crossfall. If the template already exists, the current cut (fill) template links will be displayed in the panel. If the template is new, the panel will be empty.

The Variable Cut Template panel and the Variable Fill Template panel are similar and look like

An unlimited number of links can be defined in the variable grid. For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

For each link, any two of the three values of width, height and slope can be used to define the link. The colour and name are also defined for the link.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Height</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Slope</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For cut link, height is positive in the up direction. That is, for a cut link, height is positive up and negative down.

For fill link, height is positive in the down direction. That is, for a fill link, height is positive down and negative up.

This definition for fill links of down being positive for heights may seem strange but it is to fit in with the definition of slope for fill links where a positive slope is down. This was done so that most of the entries in the Slope table did not need a negative sign in front of them.
Slope 1: input
slope of the cut link being defined. The units are “one vertical in the given horizontal value”.

Special note: the value 0 is used to designate a horizontal slope since a vertical slope is not allowed.

In the Variable Cut Template, for cut slopes, positive is up and negative down
In the Variable Fill Template, for fill slopes, positive is down and negative is up.

Important note:
This definition of slope for fill links of down being positive may seem strange but it was done so that most of the entries in the Slope table did not need a negative sign in front of them.

NOTE - in cut: if height and slope are being used to go down, then define height to be negative and slope to be negative.

In fill: if height and slope are being used to go up, then define height to be negative and slope to be negative.

Colour colour box available colours
colour of the link being defined. If no colour is supplied, the default colour is used.

Name input
name of the link being defined - this is used as the name of the string created by the end point of the link.

OK/Apply button
OK stores the values in the fields and exits the panel. Apply stores the values but doesn’t exit the panel.

Warning - If the OK or Apply button is not selected, then no new information will be recorded.

NOTE - in cut: if height and slope are being used to go down, then define height to be negative and slope to be negative.

In fill: if height and slope are being used to go up, then define height to be negative and slope to be negative.

Go to the next section 20.2.2.4 Final Cut/Fill Template or return to 20.2.2 Create/Edit Templates.
20.2.2.4 Final Cut/Fill Template

The Final Cut/Fill Template is used if the links in either the cut or fill templates are exhausted without an intersection with the tin being found.

If the Template already exists, the current final cut/fill values will be displayed in the panel. If the Template is new, the default values are displayed.

The Final Cut/Fill Template panel is

![Final Cut/Fill Template Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Final cut slope 1 v in</td>
<td>input</td>
<td>0</td>
<td>no slope, 0,1,2,3,4,5,10</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>the cut slope is used if the end of the last link in the template is in cut. That is, it is below the tin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>This value is the Cut slope for the interface calculation to be done at the end of the last link of the template. A cut slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For final cut slope, positive is up and negative down</td>
</tr>
<tr>
<td>Final fill slope 1 v in</td>
<td>input</td>
<td>0</td>
<td>no slope, 0,1,2,3,4,5,10</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>the fill slope is used if the end of the last link in the template is in fill. That is, it is above the tin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>This value is the Fill slope for the interface calculation to be done at the end of the last link of the template. A fill slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For final fill slope, positive is down and negative is up.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>This definition of fill slope being positive when going down is used so that the value in the Final fill slope 1 v in field is normally positive.</td>
</tr>
<tr>

<tr>
<td></td>
<td></td>
<td></td>
<td>OK stores the values in the fields and exits the panel. Apply stores the values but doesn’t exit the panel.</td>
</tr>
</tbody>
</table>

Warning - If the OK or Apply button is not selected, then no new information will be recorded.

Go to the next section 20.2.3 Copy Template or return to 20.2.2 Create/Edit Templates or 20.2 Templates.
20.2.3 Copy Template

Position of option on menu: Design => Templates => Copy

A copy of an existing template can be made using the Copy option. This is often useful when a new template that is similar to an existing template is needed. The existing template can be copied and the copy then edited and modified.

On selecting the Copy option, the Copy Template panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Old template</td>
<td>template box</td>
<td>available templates</td>
<td></td>
</tr>
<tr>
<td>New template</td>
<td>template box</td>
<td>available templates</td>
<td></td>
</tr>
<tr>
<td>Copy</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

After selecting this button, the template given in the Old template field will be copied and the copy given the name in the New template field.

Go to the next section 20.2.4 Rename Template or return to 20.2 Templates.
20.2.4 Rename Template

Position of option on menu: Design => Templates => Rename

On selecting the Rename option, the Template Rename panel is displayed. This panel can be used to change the names of existing templates.

![Template Rename panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Old template</td>
<td>name of the template to be renamed.</td>
<td>template box</td>
<td>available templates</td>
<td></td>
</tr>
<tr>
<td>New template</td>
<td>new name for the template</td>
<td>template box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Rename</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Change the name of the template in the **old template** field to the name given in the **new template** field.

Go to the next section 20.2.5 Template Utilities or return to 20.2 Templates.
20.2.5 Template Utilities

Position of menu: Design =>Templates =>Utilities

The Utilities menu contains miscellaneous options involving templates.

The Utilities walk-right menu is

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>add templates to project</td>
</tr>
<tr>
<td>Input</td>
<td>read in template file</td>
</tr>
<tr>
<td>Output</td>
<td>write out templates</td>
</tr>
<tr>
<td>Remove</td>
<td>remove templates from project</td>
</tr>
<tr>
<td>Save</td>
<td>save templates to disk</td>
</tr>
</tbody>
</table>

Each option will now be described.

For the options see
- Add: 20.2.5.1 Add Templates
- Input: 20.2.5.2 Input Templates
- Output: 20.2.5.3 Output Templates
- Remove: 20.2.5.4 Remove Templates
- Save: 20.2.5.5 Save Templates

20.2.5.1 Add Templates

Position of menu: Design =>Templates =>Utilities =>Add

Removed templates can be added back into the project using the options in the Add walk-right menu. The Template Adds walk-right menu is

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add to project</td>
<td>add a Template to a project</td>
</tr>
<tr>
<td>Add all to project</td>
<td>add All Templates to a Project</td>
</tr>
</tbody>
</table>

For the option Add to project, go to 20.2.5.1.1 Add a Template to a project

Add all to project 20.2.5.1.2 Add All Templates to a Project

Go to the next section 20.2.5.1 Add Templates, or return to 20.2.5 Template Utilities or 20.2 Templates.
20.2.5.1.1 Add a Template to a project

Position of option on menu: Design => Templates => Utilities => Add => Add to project

Templates in the working project area but not yet in the project can be added to the project using this option.

On selecting the Add to project option, the Add Template to the Project panel is displayed.

![Add Template to the Project panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removed template</td>
<td>removed templates box</td>
<td>removed templates</td>
<td></td>
</tr>
<tr>
<td>name of the template to be added to the project.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Add button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>add the template given in the template field to the working project.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Go to the next section 20.2.5.1.2 Add All Templates to a Project, or return to 20.2.5.1 Add Templates or 20.2.5 Template Utilities.

20.2.5.1.2 Add All Templates to a Project

Position of option on menu: Design => Templates => Utilities => Add => Add all to project

The Add all to project option is used to add all the removed templates back into the project.

On selecting the Add all to project option, the Add All Templates To Project panel is displayed.

![Add All Templates To Project panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>after selecting this button, all removed templates in the working project will be added to the project.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Return to 20.2.5.1 Add Templates or 20.2.5 Template Utilities.
20.2.5.2 Input Templates
This input option is used to read in templates from files in this special 12d Model format.
The option has already been described under File I/O=>Templates input (see 8.11.1 Templates Input).
Go to the next section 20.2.5.3 Output Templates, or return to 20.2.5 Template Utilities.

20.2.5.3 Output Templates
The output option writes out one or all templates in the 12d Model template format.
The option has already been described under File I/O=>Templates output (see 8.11.2 Templates Output).
Go to the next section 20.2.5.4 Remove Templates, or return to 20.2.5 Template Utilities.
20.2.5.4 Remove Templates

Position of menu: Design => Templates => Utilities => Remove

Templates can be removed from the project using the options in the remove walk-right menu. Removed templates are not deleted but remain in the project area and are no longer accessible in the project.

The Template Removes walk-right menu is

For the options see
- Remove from project: 20.2.5.4.1 Remove Template from Project
- Remove all from project: 20.2.5.4.2 Remove All Templates From Project

20.2.5.4.1 Remove Template from Project

Position of option on menu: Design => Templates => Utilities => Remove => Remove from project

Individual templates can be removed from the project using the Remove from project option and on selecting the option, the Remove Template From Project panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>template box</td>
<td>available templates</td>
<td></td>
</tr>
<tr>
<td>Remove</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

name of the template to be removed from the working project.

after selecting this button, the template given in the template field will be removed from the working project.

Go to the next section 20.2.5.4.2 Remove All Templates From Project, or return to 20.2.5.4 Remove Templates or 20.2.5 Template Utilities.
20.2.5.4.2 Remove All Templates From Project

Position of option on menu: Design => Templates => Utilities => Remove => Remove all from project

All templates can be removed from the project using the Remove all option and on selecting the option, the Remove All Templates From Project panel is displayed.

![Remove All Templates From Project panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove</td>
<td>button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*after selecting this button, all templates in the working project will be removed.*

Return to [20.2.5.4 Remove Templates](#) or [20.2.5 Template Utilities](#).
20.2.5.5 Save Templates

Position of menu:  Design => Templates => Utilities => Save

Templates can be saved on disk. This is done automatically by the Save option on the 12d Model but this option allows just the templates to be saved.

The Template saves walk-right menu is

For the options see
- Save a template 20.2.5.5.1 Save a Template
- Save all templates 20.2.5.5.2 Save All Templates

20.2.5.5.1 Save a Template

Position of option on menu:  Design => Templates => Utilities => Save => Save a template

On selecting the Save a template option, the Save Template panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>template box</td>
<td>available templates</td>
<td></td>
</tr>
</tbody>
</table>

- name of the template to be saved.

Save button
- after selecting this button, the template given in the template field will be saved to disk.

Go to the next section 20.2.5.5.2 Save All Templates, or return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.
20.2.5.5.2 Save All Templates

**Position of option on menu:** Design => Templates => Utilities => Save => Save all templates

On selecting the Save all templates option, the Save All Templates panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Save</strong> button</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

After selecting this button, all templates in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.
20.2.6 Delete Templates

Position of menu: Design => Templates => Delete

Using the Delete option, templates can be deleted from the project and moved to the Trash Bin, or permanently deleted from the computer disk so that they can no longer be accessed or take up disk space.

To help protect the user against disasters, when a template is selected for deletion, a Yes-No pop-up menu is used to confirm that the user did intend deleting the template.

The Template Deletes walk-right menu is

For the options see

Delete a template 20.2.6.1 Delete a Template
Delete all templates 20.2.6.2 Delete All Templates

20.2.6.1 Delete a Template

Position of option on menu: Design => Templates => Delete => Delete a template

The delete a template option is used to delete individual template from the project.

On selecting the Delete a template option, the Delete Template panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>template box</td>
<td>project templates</td>
<td></td>
</tr>
<tr>
<td>name of the template to be deleted.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Permanently delete?</td>
<td>tick box</td>
<td>if ticked, the deleted template will not go to the trash bin but will be permanently deleted from disk</td>
<td></td>
</tr>
<tr>
<td>Delete</td>
<td>button</td>
<td>after selecting this button, the template given in the template field will be deleted. A Yes-No pop-up is used to confirm that deletion is required.</td>
<td></td>
</tr>
</tbody>
</table>

Go to the next section 20.2.6.2 Delete All Templates, or return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.

20.2.6.2 Delete All Templates
Position of option on menu: Design => Templates => Delete => Delete all templates

The Delete all option will delete all templates in the working project. It does not delete templates that are in the working project area but not yet added to the project.

On selecting the Delete all option, the Delete All Templates panel is displayed.

![Delete All Templates Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Permanently delete</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

After selecting this button, a Yes-No pop-up is used to confirm that deletion is required. If it is, all templates in the project will be deleted from disk. Unless an error occurs, the panel will be removed.

If ticked, the deleted templates will not go to the trash bin but will be permanently deleted from disk.

Return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.
20.3 Apply Functions

**Position of menu:** Design => Apply

The **Apply** options are for producing design strings using **Templates** and **Modifiers** to create strings along a Reference or Reference and Hinge string - “Applying the Modifiers to a string”.

This method is used to quickly produce roads, canals, trenches, site batters etc.

When applying the modifiers and templates, design x-sections and strings are automatically produced, plus the cut and fill volumes for the design.

Creating a design in this way is the first job of the **Apply** options.

However, after applying modifiers and templates and examining the results, it is normally necessary to make changes to the Reference or Hinge strings, the modifiers and templates, or even the tin used for interfacing.

In all cases, the strings, sections and volumes created during the **Apply** are no longer valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them with new ones by re-applying the template, this is time consuming if repeated over and over again.

Hence in **12d Model**, the concept of an **Apply function** and **Recalc** was introduced.

Basically, an **Apply Function** keeps track of all the information involved in applying Modifiers and Templates, and all the strings and models created during the **Apply Template/Apply MTF**.

If either the reference or Hinge strings, the Modifiers or Templates or the Tin are changed, the Apply Functions can be re-run and all the old information automatically deleted and replaced by the updated information.

**NOTES ABOUT THE STRING CHOSEN TO APPLY MODIFIERS AND TEMPLATES TO**

1. The **Apply** options create sections and strings using a **Reference** string to define the chainage and what is meant by perpendicular at each chainage, and a **Hinge** string from where the modifiers and templates links are defined. That is, the Hinge string defines the zero offset. The Modifiers and Templates define a point name and colour for each template link.

   Cross sections can be created with point names corresponding to the template links, and strings formed by joining the same named points from consecutive cross sections.

2. If vertical geometry does not exist for the entire length of the string that the templates are being applied to (either the Hinge string, or if there is no Hinge string then the Reference string), then the modifiers and templates are only applied to the section of the string where vertical geometry exists.

3. If the horizontal or vertical geometry has overlapping tangent points at any section of the string, then the option terminates without any calculations being made.

4. Any curves will be approximated by chords spaced at chainage interval given by the **section separation** value. If the chord-to-arc distance for the chords is greater than the chord/arc tolerance given in the **Apply template/Apply MTF** panel, then extra points are inserted around the curve so that the chord/arc tolerance is met.
The **Apply** walk-right menu is

![Design Functions Menu]

Each option in this menu will now be described.

For the options:

- **Apply template**: [20.3.1 Apply Template Function](#)
- **Apply MTF**: [20.3.2 Apply MTF Function](#)
- **Apply MTF manager**: [20.3.3 Apply MTF Manager - Create/Update](#)
- **Kerb return**: [20.3.5 Kerb Return Function](#)
- **String modifiers**: [20.3.6 String Modifiers Function](#)
- **Interface**: [20.3.7 Interface Function](#)
- **Alignment/Super alignment table**: [24.16.14 Alignment & Super Alignment Table](#)  
  [24 Drafting](#)
- **Amend VG**: [20.3.8 Amend VG](#)
- **Defaults**: [20.3.1 Apply Template Function](#)
20.3.1 Apply Template Function

Position of option on menu:   Design \(\Rightarrow\) Apply \(\Rightarrow\) Apply

Selecting Apply displays the Apply Template Function panel. This panel is used to collect the information for applying a new Apply function, or to change the information for an existing Apply function.

![Apply Template Function Panel]

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Function name | | | 
Tin | | | 
Left template | | | 
Right template | | | 
LHS prefix | | | 
RHS prefix | | | 
Reference | | | 
Hinge | | | 
Start chainage | | | 
End chainage | | | 
Section separation | | | 
Report file | | | 

**Buttons at bottom**

- **Views button**
  perspective views can be defined with respect to chainages on the string. This option is described in more detail in the section 20.3.1.1 Views

- **Apply button**
  apply the template information to the selected reference and hinge strings, between the start and end chainages.
  The cut, fill and balance volumes are also calculated and written to the message area.
For the information on each **Apply Template Function** tab, go to

- **Apply Main tab**
- **Apply Models tab**
- **Apply Misc tab**
- **Apply Tin tab**
- **Apply Filter tab**
- **Apply Plot tab**

### Apply Main tab

**Function name**

function box available template functions

name of the function to define the *apply* for. If the function already exists and is picked from a pop-up or an `<enter>` is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.

**Tin**

tin box available tins
if non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the left and right template fields.
If blank, then only the fixed part of the templates are used unless a tin is specified in the decisions section of the templates.

Left/right template template box available templates
name of the template to be applied to the left/right of the string. If a template is used on the left/right, the template definitions go from the hinge string out to the left/right.

LHS/RHS prefix input
prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give the text. If post text is required, precede it by a *.

Reference string-select
the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.

Hinge string-select
the reference string defines chainage and bearing but the templates are actually applied to the hinge string. For a given chainage, a line is taken at right angles to the point of that chainage on the reference string and extended until it cuts the hinge string. The templates are applied at that point on the hinge string along the direction of the line.
If no hinge string is selected, the reference string is also the hinge string.

Start/End chainage input
the reference string start/end chainage for applying the template. If blank, the start/end chainage of the reference string is used.

Section separation input 10.0
sections are created at right angles to points on the reference string that are the section separation chainage distance apart.

Report file file box *.rpt
if not blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be appended to the file.
If blank, no report is produced.
Apply Models tab

![Apply Template Function](image)

**Model for strings**  
model box  
available models  
*if not blank, the name of the model to contain the template and interface strings. The string colour is the template link colour.*  
*If blank, the strings will not be stored.*

**Model for sections**  
model box  
available models  
*if not blank, the name of the model to contain the design sections generated by the templates.*  
*If blank, the sections will not be stored.*

**Section colour**  
colour box  
default colour  
available colours  
*the colour for the sections strings*

**Model for polygons**  
model box  
available models  
*if not blank, the name of the model to contain the polygons created for each link of the template. The polygon is given the colour of the template link.*  
*If blank, the polygons will not be stored.*

**Model for road boundary**  
model box  
available models  
*if not blank, the name of the model to contain the polygon created by joining the outside links of the road.*  
*If blank, the polygon will not be stored.*

**Difference model**  
model box  
available models  
*if not blank, the sections which are the difference between the tin sections and the template x-sections are retained and placed in the model given in this field. If blank, the sections are not kept.*
**Apply Misc tab**

![Apply Template Function](image)

- **Strip depth**
  - Input: 0
  - The stripping depth to be used on the tin before the apply is done.

- **Create arcs**
  - Choice box:
    - **Super arcs**
    - No arcs, alignment arcs, polyline arcs, super arcs

  - If no arcs, the strings are created as 3d strings with no arcs.
  - **Alignment arcs**, the strings are created as alignment strings with arcs.
  - **Polyline arcs**, the strings are created as polyline strings with arcs.
  - **Super arcs**, the strings are created as super strings with arcs.

- **Chord/arc tolerance**
  - Input: default chord/arc tolerance
  - The chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.

- **Volume correction for curves**
  - Tick box

  - If ticked, volume corrections are made when going around curves.

- **Sections as 4d**
  - Tick box: tick

  - If ticked, the section strings will be created as 4d super strings with the appropriate template string names as the vertex text at each vertex of the section. These are needed for boxing and some options on x-section plots.

- **Copy hinge**
  - Tick box: tick
if ticked, a string with points at the apply chainages is created on top of the hinge string.

Apply Tin tab

Create road tin  tick box
if ticked, the fields in this tab are used to create a road tin

Road tin  tin box available tins
name for the tin created from the design strings and sections

Colour for tin  colour box available colours
colour of the road tin

Model for tin  model box available models
model for the road tin

Create depth range polygons  tick box
if ticked, depth polygons are created

Depth range file  file box *.drf files
depth range file used when creating polygons

Model for polygons  model box available models
model for the depth polygons
Apply Filter tab

Filter cross-sections  tick box

if ticked, the fields in this tab are used to filter cross sections

Filter sections model  model box  available models

model for the filtered cross sections

Filtered sections colour  colour box  available colours

colour of the filtered cross sections

Regular filtering interval  input

regular interval to use for filtering the cross sections

Regular culling tolerance  input 0

tolerance to use when selecting a cross section

Include start sections  tick box

if ticked, a section at the start chainage is included even if the start chainage is not at a regular interval

Include end sections  tick box

if ticked, a section at the end chainage is included even if the end chainage is not at a regular interval

Include chainage equality sections  tick box

if ticked, include sections where there is a chainage equality

Include H/V tangent sections  tick box

if ticked, a sections at the horizontal/vertical tangent points are included even if they are not at a regular interval
**Include V crest/sag sections**  tick box

if ticked, a sections at the crest and sag points are included even if they are not at a regular interval

**Special chainage file**  file box  *.spc files

if non blank, a file of chainages to include sections at even if they are not a regular interval

---

**Apply Plot tab**

**Generate long section plot(s)  tick box**

if ticked, long section plots are created

**Long section PPF**  file box  *.lplotppf files

*binary ppf file to use for the long section plots*

**Plotter type**  plotter box  model  available plotters

*type of plotter to use for the long section plots*

**Plot stem**

the name to use for the plots - a number will be added when more than one page is produced

**Clean plot model(s) beforehand  tick box**

if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created

**Generate cross section plot(s)  tick box**

if ticked, cross section plots are created

**Cross section PPF**  file box  *.lplotppf files
binary ppf file to use for the cross section plots

**Plotter type**
plotter box model available plotters
type of plotter to use for the cross section plots

**Plot stem**
the name to use for the plots - a number will be added when more than one page is produced

**Clean plot model(s) beforehand**
tick box
if ticked and the plotter type is model, the plot models are cleaned before the plots are created

### 20.3.1.1 Views

This option locks perspective views to the reference string of the Apply Template/Apply MTF function.

It defines the eye and target co-ordinates for the perspective views in terms of the chainage and height above an existing reference string (as in the perspective view-ops option, string-walk) rather than entering the (x,y,z) eye and target co-ordinates.

If the string is modified, then the perspective eye and target points will also change.

Selecting Views fires up the Template Views panel.

![Template Views Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>view box</td>
<td>available views</td>
<td></td>
</tr>
<tr>
<td>Eye chainage</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Eye height</td>
<td>input</td>
<td>1.3</td>
<td></td>
</tr>
<tr>
<td>Target chainage</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Target height</td>
<td>input</td>
<td>0.3</td>
<td></td>
</tr>
</tbody>
</table>

**Add View**
button
add the view to the template function and then redraw the view using the above eye and target
parameters.

**Remove View** button

remove the view from the Apply template/Apply MTF function.
20.3.2 Apply MTF Function

The Apply MTF option is used for more complex design work such as urban, intersection and roundabout design. It includes defining different templates over different chainage ranges, modifiers for advanced control of the strings created by the Apply MTF strings, sections and trimeshes, stripping depths and boxing, a road tin and depth polygons, sights lines, tadpoles, plus long section and cross section plots.

For Apply MTF, the modifiers and templates are supplied in a file called the Modifiers and Templates File or MTF file. The definition of the MTF will follow after the description of the Apply MTF option.

Selecting Apply MTF displays the Apply MTF Function panel.

This panel can be used to create the information for applying a new template function or to modify the information for an existing template function.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>

Buttons from bottom

Views button

Perspective views can be defined with respect to chainages on the string. This option is described in more detail in the section 20.3.1.1 Views.

Apply button

Apply the modifiers and template information to the selected reference and hinge strings, between the start and end chainages.

The cut, fill and balance volumes are also calculated and written to the message area and to the Output Window.

For the information on each Apply MTF Function tab, go to

- Apply MTF Main tab
- Apply MTF Models tab
- Apply MTF Misc tab
- Apply MTF Tin tab
- Apply MTF Sight tab
- Apply MTF Filter tab
- Apply MTF Plot tab
- Apply MTF Tadpoles tab
### Apply MTF Main tab

![Apply MTF Main tab](image)

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Function name</strong></td>
<td>function box available template functions name of the function to define the Apply MTF for. If the function already exists and is picked from a pop-up or an &lt;enter&gt; is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</td>
</tr>
<tr>
<td><strong>Tin</strong></td>
<td>tin box available tins if non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the template file. If blank, then only the fixed part of the templates are used unless a tin is specified in the decisions section of the templates.</td>
</tr>
<tr>
<td><strong>MTF file</strong></td>
<td>file box available mtf’s, edit mtf name of the file containing the definitions of where and how templates are applied and modified along the string, how boxing definitions are applied, stripping depths etc. For more information on the MTF file, go to the section 21.1 The Modifiers and Templates File - MTF.</td>
</tr>
<tr>
<td><strong>V6 compatible</strong></td>
<td>tick box</td>
</tr>
</tbody>
</table>
if ticked, the template is used as it was in 12d Model version 6

LHS/RHS prefix

prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give
the text. If post text is required, precede it by a *

Reference

the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.

Hinge

the Reference string defines chainage and bearing but the zero offset for the modifiers and templates is
at the Hinge string.
For a given chainage, a line is taken at right angles to the point of that chainage on the Reference string and extended until it cuts the Hinge string. For the modifiers and templates, this point represents the zero offset. Hence the modifiers and templates are applied at that point on the Hinge string along the direction of the line.
If no Hinge string is selected, the Reference string is also used as the Hinge string.

Start/End chainage

the Reference string start/end chainage for applying the MTF to. If blank, the Start/End chainage of
the Reference string is used.

Start/End chainage

Mode

Extension ref

the Start/End chainage, Mode and Extension ref are all used to define the start/end chainage on the Reference string for applying the MTF.
If blank, the Start/End chainage of the reference string is used
For more information on Start/End Chainage Modes, see 21.2.1 MTF Hinge Modifiers

Section separation

sections are created at right angles to points on the Reference string that are the Section separation
chainage distance apart.

Report file

if not blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be automatically over written.
If blank, no report is produced.
Also if boxing is included in the MTF file definition, the volumes in the report can include not only the volumes from the stripped natural surface tin to the design, but also the interboxing layer volumes and the volumes from the last boxing layer to the design and to the stripped natural surface.
Apply MTF Models tab

The Models tab consists of a grid for defining the model for the design strings forming the road surface and design cross section, up to eight layers of boxing and models for the difference sections between the design and the natural surface.

The last boxing layer is also referred to as the Subgrade layer.

Road Surface:

Strings
if not blank, the name of the model to contain the design and interface strings. The default string colours are the template link colours but that can be overridden by a Map file.
If blank, the strings will not be stored.

Sections
if not blank, the name of the model to contain the design sections generated by the apply.
If blank, no sections are stored.

Colour
the colour for the design cross sections.
Boxing Layer 1-8:
if not blank, boxing strings and sections will be created for that layer.
The Boxing Layers are used from Boxing Layer 1 down until the first blank row.
The last boxing layer is also referred to as the subgrade layer.
For more information on boxing, see 21.6 What is Boxing?.

<table>

</tbody>
</table>
Apply MTF Misc tab

Create arcs: choice box super arcs no arcs, alignment arcs, polyline arcs, super arcs

*if no arcs*, the strings are created as 3d strings with no arcs.
*alignment arcs*, the strings are created as alignment strings with arcs
*polyline arcs*, the strings are created as polyline strings with arcs
*super arcs*, the strings are created as super strings with arcs.

Chord/arc tolerance: input default chord/arc tolerance

*the chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.*

Volume correction for curves: tick box

*if ticked, volume corrections are made when going around curves.*

Partial interfaces: tick box tick

*if ticked, an interface string is not produced when no intersection is made with the tin. The interface may then be broken into a number of interface strings.*

Chord/arc tolerance input default chord/arc tolerance
If not ticked, a yellow segment is created in the interface string when no intersection is made with the tin. Only one interface string will then be produced.

**Copy hinge** tick box tick
if ticked, a string with points at the apply chainages is created on top of the hinge string.

**Use stripping** tick box tick
if ticked, the stripping depths in the mtf file are used.

**Show detailed stripping volumes** tick box
if ticked, end area stripping volumes are written to the report file

**Calculate natural surface to design volumes** tick box tick
if ticked, end area volumes between the natural surface and the design strings are written to the report file. If stripping is used, then the cut and fill areas and volumes are calculated from the design to the stripped natural surface.

**Calculate natural surface to subgrade volume** tick box tick
if ticked, end area volumes between the natural surface to the subgrade (the last boxing layer) are written to the report file. If stripping is used, then the cut and fill areas and volumes are calculated from the last layer of boxing, to the stripped natural surface.

**Calculate road to subgrade volumes** tick box tick
if ticked, end area volumes between the design strings and the subgrade (the last boxing layer) are written to the report file.

**Calculate inter-boxing layer volumes** tick box tick
if ticked, end area volumes between each of the boxing layers are written to the report file.

**Map file** file box *.mapfile files
if non blank, the given map file is applied to all the design strings created by the Apply MTF. The map file overrides any default colours from the templates. The map file can colour strings, apply linestyles, apply hatch patterns to polygons, apply extrudes to super strings etc. For more details on the map file, see 8.8.1 Create/Edit a Map File.
Apply MTF Tin tab

The Tin tab controls the creation of a design tin and depth polygons.

- **Create road tin** (tick box)
  - If ticked, the fields in this tab are used to create a road tin

- **Road tin** (tin box)
  - Name for the tin created from the design strings and sections

- **Colour for tin** (colour box)
  - Colour of the road tin

- **Model for tin** (model box)
  - Model for the road tin

- **Create depth range polygons** (tick box)
  - If ticked, depth polygons are created

- **Depth range file** (file box)
  - Depth range file used when creating polygons
  - *.drf files
<table>
<thead>
<tr>
<th>Model for polygons</th>
<th>model box</th>
<th>available models</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>model for the depth polygons</td>
<td></td>
</tr>
</tbody>
</table>

**Extra Models grid**

extra models to be included in creating the road tin

**Extra Model**

model box in column | available models |

name of a model to include in the road tin
Apply MTF Sight tab

The Sight tab controls the reporting of sight distance lines between the reference line and a super tin formed from the natural surface tin and the design tin, and barrier lines on the reference line if it is a super alignment. For more information on sight distance calculations and for the option that will also create sight lines/no-lines and take bridge tins into consideration, go to the section 20.8.3 Stopping Distance.

Calculate sight distances tick box

If ticked, sight distance lines are created and barrier lines calculated and applied to the reference string if it is a super alignment.

Min sight distance input 100

Minimum chainage distance to use for placing the test target point.

Max sight distance input 3000

Maximum chainage distance to use for placing the test target point.

Eye height input 1.3

Height of the eye point above the picked string.
Eye offset input 1.3
offset of the eye point from the picked string.

Target height input 0.3
height of the test target point above the picked string.

Target offset input 1.3
offset of the target point from the picked string.

Calc interval input 20
chainage increment to move the eye point for the next sight distance calculation.

Trial interval input 10
chainage increment to move to test target point.

Report file file box *.rpt files
if non blank, a sight distance report is produced and written out to this file name.

Create separation/barrier lines tick box
if ticked, and the reference string is a super alignment, barrier and separation lines are created and defined in the super alignment.

Barrier distance input
Min barrier road length input
Max barrier road length input
Min between barriers input
Apply MTF Filter tab

the Filter tab controls the filtering of cross sections

Filter cross-sections    tick box
    if ticked, the fields in this tab are used to filter cross sections

Filter sections model    model box
    model for the filtered cross sections

Filtered sections colour    colour box
    available colours

Regular filtering interval    input
    regular interval to use for filtering the cross sections

Regular culling tolerance    input
    tolerance to use when selecting a cross section

Include start sections    tick box
if ticked, a section at the start chainage is included even if the start chainage is not at a regular interval

Include end sections  tick box
if ticked, a section at the end chainage is included even if the end chainage is not at a regular interval

Include H tangent sections  tick box
if ticked, a sections at the horizontal tangent points are included even if they are not at a regular interval

Include V create/sag sections tick box
if ticked, a sections at the crest and sag points are included even if they are not at a regular interval

Special chainage file  file box *.spc files
if non blank, a file of chainages to include sections at even if they are not at regular intervals
Apply MTF Plot tab

the Plot tab controls the generation of long section and cross section plots

Generate long section plot(s) tick box
if ticked, long section plots are created

Long section PPF file box *.lplotppf files
binary ppf file to use for the long section plots

Plotter type plotter box model available plotters
type of plotter to use for the long section plots

Plot stem
the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box
if ticked and the plotter type is model, the plot models are cleaned before the plots are created
Generate cross section plot(s)  tick box
if ticked, cross section plots are created

Cross section PPF  file box  *.lplotppf files
binary ppf file to use for the cross section plots

Plotter type  plotter box  model  available plotters
type of plotter to use for the cross section plots

Plot stem
the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand  tick box
if ticked and the plotter type is model, the plot models are cleaned before the plots are created
Apply MTF Tadpoles tab

The Tadpole tab controls the generation of batters ticks and tadpoles (hachure notation). For more information see the section 24.5 Create Cut/Fill Symbols.

<table>
<thead>
<tr>
<th>Create tadpoles</th>
<th>tick box</th>
</tr>
</thead>
<tbody>
<tr>
<td>if ticked, cut/fill symbols are created between given strings</td>
<td></td>

</tbody>
</table>
Apply Functions

side of the reference string to search for strings to apply symbols to.

**String 1**

`input`

*name of the point on the template to start symbol.*

**String 2**

`input`

*name of the point on the template to stop symbol.*

**Start Ch.**

`input`

*if blank, use the start chainage of the Apply MTF.*

*If non blank, the chainage to start applying this symbol to.*

**End Ch.**

`input`

*if blank, use the end chainage of the Apply MTF.*

*If non blank, the chainage to stop applying this symbol to.*

**Symbol 1**

`symbol data`

*definition of the symbol to create at the given interval, or at twice the given interval if Symbol 2 is defined*

**Symbol 1 %**

`input`

*if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol.*

*If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)*

**Symbol 2**

`symbol data`

*definition of a second symbol to create at twice the given interval*

**Symbol 2 %**

`input`

*if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol.*

*If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)*
20.3.3 Apply MTF Manager - Create/Update

Position of option on menu:  Design => Apply => Apply MTF manager

This option is part of a process to manage your Apply MTF Functions in conjunction with the Apply MTF Defaults.

The Manager is in part an extension of the model naming convention within the defaults.

All models, except ROAD SURFACE STRINGS and ROAD SURFACE SECTIONS, can be toggled on and off when creating an Apply MTF Function,

e.g.

BOXING STRINGS
BOXING SECTIONS
POLYGONS AND BOUNDARY POLYGONS
DESIGN TIN
DEPTH POLYGONS
FILTER SECTIONS
TADPOLES

The Manager also allows one project model for ROAD SURFACE STRINGS, ROAD SURFACE SECTIONS, POLYGONS AND BOUNDARY POLYGONS and TADPOLES by using a new syntax in the Apply MTF Defaults.

Selecting the Apply MTF manager option displays the Apply MTF Manager - Create / Update panel.

The fields and buttons used in this panel have the following functions.
### Chapter 20  Design

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Filter Xsects</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
</tbody>
</table>

If ticked then any empty filter xsects models will be deleted when an existing AM is updated

<table>
<thead>
<tr>
<th>Grid</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply</td>
<td>tick box</td>
<td>not ticked</td>
<td></td>
</tr>
</tbody>
</table>

Set to ticked once a SA selection string is accepted

If ticked and the **<Create/Update>** is selected, then the Apply MTF will be created or an existing one recalced

If ticked and the **<Del AMM>** button is also selected, then the Apply MTF Manager reference to that alignment will be deleted
If not ticked and the <Create/Update> is selected, then the Apply MTF will NOT be created or an existing one recalced

**Note:** It is up to the user to delete the actual Apply MTF Function and all associated data including the mtf

**Recalc using exist mtf**  tick box

This tick box is an automatic indication of whether or not a Reference Super Alignment has an Apply MTF Function already linked to it

There is no need for the user to use this box when creating or updating an Apply MTF Function

It will be unticked if the reference has no Apply MTF Function attached

In this case templates are required for Left, Right or both

It will be ticked if the reference does have one or more Apply MTF Functions attached

In this case the existing AM will be updated using the existing MTF and reflect any changes in regards to models required

**Function & mtf Pre/Suff**  input  DES*

If non-blank, entry used as a prefix or suffix in conjunction with the Apply MTF Reference Super Alignment Name

Example:

Reference SA name: MC00
Pre/Suff: DES*
Apply MTF Function Name: DES MC00

Reference SA name: MC00
Pre/Suff: * DES
Apply MTF Function Name: MC00 DES

If blank, the Apply MTF Reference Super Alignment Name is used only

Apply MTF Function Name: MC00

**Super Align Name**  input

Automatically populated, after the SA reference is selected

The Super Alignment Name entry cannot be changed as it comprises part of the Apply MTF Function name...refer above

**Append Pre/Suff to models**  tick box  not ticked

If ticked then the prefix or suffix will be combined with the SA name (refer above) and passed down to any default extensions from the Apply MTF Defaults

Refer **Design=>Apply=>Apply MTF Defaults**

Model Format for Apply MTF Defaults:

Road Surface Strings e.g.

"DESIGN" * used in conjunction with a Pre/Suff of DES * and a SA name MC00, would result in a strings model called "DES DESIGN MC00"

"* DESIGN" used in conjunction with a Pre/Suff of DES * and a SA name MC00, would result in a strings model called "DES MC00 DESIGN"

There is a new addition to the format used by the Apply MTF Manager, that allows one design
strings model. That model can be used in all Apply MTF Functions
"DESIGN &" would result in a strings model called just "DESIGN"

Note: The above format can also be used for the following Apply MTF Models:
  - Model for Cross Sections "CROSS SECTIONS &"
  - Model for Polygons "VIS POLYGONS &"
  - Model for Road Boundary "ROAD BOUNDARIES &"
  - Model for Tadpoles "TADPOLES &"

**Template LHS**
- input
  - name of the template to be applied to the left side of the reference SA

**Template RHS**
- input
  - name of the template to be applied to the right side of the reference SA

**Tin interface**
- input
  - If non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of
  - the templates given in the left and right template fields
  - If blank, then only the fixed part of the templates is used unless a tin is specified in the decisions section
  - of the templates

**Boxing**
- tick box not ticked
  - If ticked then all boxing models will be created

**Polys**
- tick box ticked
  - If ticked then both polygon models will be created

**Road Tin**
- tick box ticked
  - If ticked then road tin and model will be created

**Depth Polys**
- tick box not ticked
  - If ticked then depth polygon models will be created

**Tadpoles**
- tick box not ticked
  - If ticked then tadpole model will be created

**Filter Xsect**
- tick box not ticked
  - If ticked then filter xsection model will be created

**Buttons at Bottom**

**Create/Update**
- button
  - A validation on the panel is carried out along with a check if an Apply MTF Function being created,
  - exists or not
  - Appropriate warning messages in the output window will be displayed
  - The Apply MTF Function is created or an existing one is updated
  - If a new Apply MTF is being created, then the grid on the AMM panel is refreshed and the tick box
    <Recalc using exist mtf> is set to ticked

**Clear Grid**
- button
  - Clears the selection lines in the grid

**Sort Grid**
- button
  - Sorts the grid lines by placing lines where the <Recalc using exist mtf> box is ticked on, at the top of
the grid

Add AMM button

For clarity...clear the grid first and then select the Super Alignment you wish to add another Apply MTF Function to

Del AMM button

In order to delete (or remove) from the Apply MTF Manager any connection to a Super Alignment, then first clear the grid, select the Super alignment and UNTICK the <Apply> box

20.3.4 Defaults For Startup

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function &amp; mtf Pre/Suff</td>
<td>input</td>
<td>DES*</td>
<td></td>
</tr>
</tbody>
</table>

*If non-blank, entry used as a prefix or suffix in conjunction with the Apply MTF Reference Super Alignment Name*

Example:

Reference SA name: MC00
Pre/Suff: DES *
Apply MTF Function Name: DES MC00

Reference SA name: MC00
Pre/Suff: * DES
Apply MTF Function Name: MC00 DES

*If blank, the Apply MTF Reference Super Alignment Name is used only*
Apply MTF Function Name: MC00

Delete empty Apply MTF models

Boxing
tick box ticked
  If ticked then any empty boxing models will be deleted when an existing AM is updated

Polygon
tick box ticked
  If ticked then any empty polygon models will be deleted when an existing AM is updated

Road Tin
tick box ticked
  If ticked then any empty road tin models will be deleted when an existing AM is updated

Depth Polys
tick box ticked
  If ticked then any empty depth polys models will be deleted when an existing AM is updated

Tadpoles
tick box ticked
  If ticked then any empty tadpoles models will be deleted when an existing AM is updated

Filter Xsects
tick box ticked
  If ticked then any empty filter xsects models will be deleted when an existing AM is updated

Apply MTF Create Models

Boxing
tick box not ticked
  If ticked then all boxing models will be created

Polys
tick box ticked
  If ticked then both polygon models will be created

Road Tin
tick box ticked
  If ticked then road tin and model will be created

Depth Polys
tick box not ticked
  If ticked then depth polygon models will be created

Tadpoles
tick box not ticked
  If ticked then tadpole model will be created

Filter Xsect
tick box not ticked
  If ticked then filter xsection model will be created

Grid Width
  real 750
  If non-blank entry used as width of grid on main panel

Grid Height
  real 250
  If non-blank entry used as height of grid on main panel

Write
  button
  If selected, the defaults file (Create_Apply_Many_Manager_Panel.def) will be written out to the <.project> directory
20.3.5 Kerb Return Function

**Position of option on menu:** Design => Apply => Kerb return

The **kerb return** option is used to help create the vertical geometry for an alignment string being used as a kerb return.

The standard situation is that in the plan view, the kerb return joins two kerb lines which already have z-values.

It is then necessary to define vertical geometry for the kerb return, usually taking into consideration the z-values and incoming grades from selected strings (often the centre lines and kerb strings).

A standard first guess at the kerb return vertical geometry is known as the quarter point vertical geometry and it is defined by:

1. break the section along the kerb return into four equal pieces
2. project the incoming grade from a selected start grade string to intersect the first quarter point line
3. project back the outgoing grade from a selected end grade string to intersect the last quarter point line
4. join the two projected intersection points
5. define vertical intersection points (VIP’s) at the intersection points
6. create back to back vertical curves for the VIP’s

---

**Plan View of the Horizontal Geometry of the Kerb Return**

---

**Section View of the Quarter-Point Vertical Geometry for the Kerb Return**
The **kerb return** option creates a function which will automatically create the quarter-point vertical geometry for the kerb return and will recalculate it as required.

**Note:** the actual **direction** of the kerb is important - start grade and start height apply to the **start** of the kerb and end grade and end height apply to the **end of the kerb** where start and end are determined by the actual **direction** of the kerb (not the picking direction).

On selecting the **kerb return** option, the **apply kerb return function** panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function name</td>
<td>function box</td>
<td></td>
<td>available kerb functions</td>
</tr>
</tbody>
</table>

- **name of the function to define the apply for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.**

- **Start grade string**    string-select
  - select the string to be used for the in grade at the start of the kerb return.

- **End grade string**     string-select
  - select the string to be used for the out grade at the end of the kerb return.

- **Start height string** string-select
  - select the string to be used for the height at the start of the kerb return - this is used for the z-value at the start of the kerb return.

- **End height string**     string-select
  - select the string to be used for the height at the end of the kerb return - this is used for the z-value at the end of the kerb return.

- **Kerb return**    string-select
  - select the alignment string that is the kerb return.

- **Clear vertical geometry**    tick box
  - if ticked, the vertical geometry of the kerb return string is cleared as soon as the apply button is selected, or a recalc done.

- **Pick all**       button
if pick all is selected, the user is asked to sequentially select the four strings: the Start grade string, End grade string, Start height string and End height string. The strings are automatically assigned to the appropriate string-select panel fields.

HG button brings up the kerb return function create HG panel. This option is currently under development.

Apply button

if the kerb return has no vertical geometry (it will be automatically be deleted if the clear vertical geometry is set to tick) or the vertical geometry is the quarter-point geometry for the previous apply, then new quarter-point vertical geometry is created for the kerb return string.

Otherwise, nothing happens when the apply button is selected. That is, if the kerb return already has vertical geometry which is not the quarter-point geometry for the previous apply, and the clear vertical geometry is set to no tick, then nothing happens when the apply button is selected.

Note

The experimental Kerb Return Function Create HG panel is

![Kerb Return Function Create HG panel](image)
20.3.6 String Modifiers Function

Position of option on menu:  Design => Apply => String modifiers

The String Modifiers option is used to create vertical intersection points for an alignment string, or heights for a 2d, 3d, 4d, polyline or super string, using projection of heights from a selected string and user given cross-falls or cross-fall between two selected strings.

The String Modifier commands are actually part of an MTF file and are documented in 21 Advanced Design.

This option allows the user to run just the string_modifiers section of the mtf.

Selecting String Modifiers displays the String Modifiers Function panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function name</td>
<td>function box</td>
<td>available template functions</td>
<td>name of the function to define the apply for. If the function already exists and is picked from a pop-up or an &lt;enter&gt; is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</td>
</tr>
<tr>
<td>MTF file</td>
<td>file box</td>
<td>available mtf files</td>
<td>the name of the MTF file to use the string_modifiers section from.</td>
</tr>
<tr>
<td>Apply</td>
<td>button</td>
<td></td>
<td>apply the string modifiers section of the MTF.</td>
</tr>
</tbody>
</table>
20.3.7 Interface Function

Position of option on menu: Design => Apply => Interface

An interface string is where the design meets the natural terrain - it shows the extent of the design. The method used for calculating the interface string for a given string, tin and cut and fill slopes, is as follows:

For a point on a string, an interface point is calculated by going off at right angles to the string along a line of fixed slope until either the tin is cut or a fixed (plan) distance is travelled. The slope of the line is either the cut or fill slope depending on whether the string point is below the tin (cut point) or above the tin (fill point).

The interface string for a string is constructed by calculating the interface points at regular intervals along the string and then joining the interface points together to form the interface string.

After calculating an interface string and examining the results, it is often necessary to make changes to either the original string, the cut and fill slopes used, or even the tin used for interfacing against. The interface string and slope strings created during the interface would no longer be valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them by new ones by re-applying the interface, this is would be time consuming if repeated over and over again. The interface function has been introduced to help reduce the work involved when recalculating an interface string.

Basically, an interface function keeps track of all the information involved in creating an interface string and all the strings and models created during the interface. If either the original string, the cut and fill slope or the tin is subsequently modified, the interface functions can be re-run and all the old information automatically deleted and replaced by the updated information.

On selecting interface, the interface function panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function</td>
<td>function box</td>
<td>available interface functions</td>
<td></td>
</tr>
</tbody>
</table>
name of the function to define the interface for. If the function already exists and is picked from a popup or and an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.

**String interface**

string select box

select the string to calculate the interface from.

**Cut slope 1 v in**

input 1.0

the slope of the interface line if a point is in cut. A cut slope of one vertical to the given value of horizontal units is used. Positive is up for a cut slope. A value 0 is used to designate a horizontal line.

**Fill slope 1 v in**

input 1.0

the slope of the interface line if the point is in fill. A fill slope of one vertical to the given value of horizontal units is used. Positive is down for a fill slope. A value 0 is used for a horizontal line.

**Section separation**

input 10

the distance between the points on the selected string that interface points will be calculated from.

**Search distance**

input 100

the (plan) distance to search along the interface line to see if the tin has been intersected. If the tin has not been intersected then the z-value at the end of the interface line is taken as the interface point z-value.

**Left or right**

choice box left, right

the interface point is calculated by going out at right angles to the selected string. It is possible to go to either the left or the right depending on the value of this field.

**Use super strings**

tick box

if ticked, the interface and cut and fill slope lines are created as super strings.

**Tin**

tin box available tins

name of the tin that the interface points will be calculated against.

**Model for interface**

model box available models

name of the model to contain the calculated interface string.

**Model for slope lines**

model box available models

if not blank, name of the model to contain the lines connecting the string points with the interface points (the slope lines). If the field is blank, no slope lines are recorded. If blank, the slope lines are not created.

**Remove loops**

tick box

if tick, the strings and sections created by the Interface function are process to try an remove any loops from the strings, and create sections that don’t cross each other. That is, remove any places where a string crosses over itself, or sections cross each other.

Loops in the strings and crossing sections often occur on the inside of curves or the inside of adjacent lines.

**Interface**

button

An interface string is calculated using the selected string and the parameters defined in the panel. The interface string points are coloured red if the original string point was in cut and green if the original string point was in fill.

<esc> can be used to abort the interface option.
20.3.8 Amend VG

Position of option on menu:  Design =>Apply =>Amend VG

Amend VG is used to modify the vertical geometry of an alignment string using a variety of methods including linear interpolation cubic reverse and circular reverse interpolating or by extending crossfall between two given strings.

Selecting Amend VG, the Amend VG panel is displayed.

![Amend VG panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amend mode</td>
<td>choice box</td>
<td>linear, cubic reverse, circular reverse, VG linear, Extend Xfall</td>
<td></td>
</tr>
</tbody>
</table>

if linear, a panel to input the values for Start offset/height/crossfall %, End offset/height/crossfall % and Absolute height is displayed and filled in to define how to modifying the vertical geometry of the Amend string.

If cubic reverse, a panel to input the values for Start offset/height/crossfall %, End offset/height/crossfall % and Absolute height is displayed and filled in to define how to modifying the vertical geometry of the Amend string.

If circular reverse, no extra information is needed to define how to modifying the vertical geometry of the Amend string.

If VG linear, a panel to input the values for Start height/crossfall %, End height/crossfall % and Absolute height is displayed and filled in to define how to modifying the vertical geometry of the Amend string.

If Extend Xfall, a panel to select the two strings to extend the crossfall from is displayed and filled in to define how to modifying the vertical geometry of the Amend string.
Apply Functions

Start chainage input
chainage to start modifying the vertical geometry of a string

End chainage input
chainage to stop modifying the vertical geometry of a string

Chainage interval input 10
chainage interval to apply the vertical geometry modification

Reference string select box
select the reference string to define chainage and perpendicular. If there is no Hinge string, then z-values are only taken from the Reference string.
chainage interval to apply the vertical geometry modification

Amend string select box
select the reference string to define chainage and perpendicular. If there is no Hinge string, then z-values are only taken from the Reference string.

Hinge string select box
if selected, the string to take z-values from

Amend string select box
the string to have its vertical geometry amended
Amend button

amend the vertical geometry of the Amend string between the start and end chainages
20.3.9 Apply Defaults

The Defaults walk right menu contains options to set up defaults when first using the Apply Template Function and Apply MTF Function panels.

The two options Apply template defaults and Apply MTF defaults will now be described.

There are two files apply_defaults.4d and apply_many_defaults.4d which contain the pre or post text to be added to the name of the function to automatically create many entries in the panel fields for Apply template and Apply MTF plus default values for all the other panel fields.

After the name of a new function is typed in and <Enter> pressed, all the fields mentioned in the default files are automatically filled in using the function name and the defined pre-post text as supplied in the file, plus setting any other panel fields from default values supplied in the file. If the files are missing, no panel fields are automatically filled in.

The files can be created and edited using the Apply template defaults or Apply MTF defaults option which brings up the Apply Template Defaults or Apply Templates Defaults panels respectively.

Each of the fields in the Apply Template Defaults panel matches a field in the Apply panel and so for the documentation see 20.3.1 Apply Template Function.

Each of the fields in the Apply Templates Defaults panel matches a field in the Apply Templates Function panel and so for the documentation see 20.3.2 Apply MTF Function.
Each of the fields in the Apply Template Defaults panel matches a field in the Apply panel and so for the documentation see 20.3.1 Apply Template Function.
Each of the fields in the **Apply Templates Defaults** panel matches a field in the **Apply Templates Function** panel and so for the documentation see 20.3.2 **Apply MTF Function**.
20.4 MTF

Position of menu:  Design => MTF

In the Apply MTF option, a MTF file is used to control the application of templates, modifiers, boxing etc to the Hinge string.

The full definition for the MTF file is given in the section 21.1 The Modifiers and Templates File - MTF.

The MTF walk-right menu is

![MTF Walk-Right Menu]

Each option in this menu will now be described.

For the options, see:

- **Create**  [20.4.1 Create MTF]
- **Edit**  [20.4.2 Edit MTF]
- **Snippets**  [20.4.3 Snippets]
- **Rename**  [20.4.4 Rename MTF]
- **Apply MTF**  [20.3.2 Apply MTF Function]
- **Edit by string**  [20.4.6 Edit by String]
- **Copy MTF**  [20.4.7 Copy MTF]
- **Delete MTF**  [20.4.8 Delete MTF]
- **Create file**  [20.4.9 Create File]
- **Edit file**  [20.4.4 Rename MTF]
20.4.1 Create MTF

Position of option on menu:  Design => MTF => Create

The MTF=>Create option is used to create a new MTF file (*.mtf).
The created MTF file is written to disk and can be edited using the MTF=>Edit option.

Selecting Create displays the Create MTF File panel.

![Create MTF File Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTF file</td>
<td>name of the MTF file to create.</td>
<td>file box</td>
<td>*.mtf files</td>
<td></td>
</tr>
<tr>
<td>Seed MTF file</td>
<td>name of an MTF file to load into the new MTF file. This allows standard information to be automatically included in the new MTF file. The Seed MTF file is just a standard MTF file with the extension after the . changed to mtf_seed</td>
<td>file box</td>
<td>*.mtf_seed files</td>
<td></td>
</tr>
<tr>
<td>Centreline</td>
<td>if a centreline string is selected, it is used for selecting chainages in the MTF</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create</td>
<td>create an MTF file with name given by the MTF file panel fields.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If the file given in the MTF file field does not exist, then the MTF Edit menu is placed on the screen and is used to create and edit the MTF sections in the MTF file.
If the file already exists, then nothing will happen on selecting Create.
20.4.1.1 MTF Edit

When Create is selected from the Create MTF File panel, it brings up the MTF Edit menu which is used to create and edit the MTF sections to be saved in the MTF file.

The MTF Edit menu is described in the section 21.1 The Modifiers and Templates File - MTF.

Go to the next section 20.4.2 Edit MTF or return to 20.4 MTF.
20.4.2 Edit MTF

Position of option on menu: Design => MTF => Edit

The MTF=>Edit option is used to edit mtf files (*.mtf).

The MTF=>Edit option has two modes of operation - selecting the MTF=>Edit itself, or by activating the MTF=>Edit option's walk-right menu, folder *.mtf.

Selecting MTF=>Edit itself brings up the Edit MTF File panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTF file</td>
<td>file box</td>
<td>*.mtf files</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>name of the MTF file to edit</td>
<td></td>
</tr>
<tr>
<td>Seed MTF file</td>
<td>file box</td>
<td>*.mtf_seed files</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>for a new MTF file, the name of an MTF file to load into the new MTF file. This allows standard information to be automatically included in the new MTF file. The Seed MTF file is just a standard MTF file with the extension after the . changed to mtf_seed</td>
<td></td>
</tr>
<tr>
<td>Centreline</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if a centreline string is selected, it is used for selecting chainages in the MTF</td>
<td></td>
</tr>
<tr>
<td>Edit</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>edit the file given by MTF file panel field.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the file given in the MTF file field exists, then the MTF Edit menu is brought up to create/edit the MTF sections.</td>
<td></td>
</tr>
</tbody>
</table>

Similarly the MTF=>Edit walk-right menu provides a list all the MTF files (files ending in .mtf) in the current folder. When a MTF file is selected from the list, the Edit MTF File panel is brought up
to create/edit the MTF sections.

The MTF Edit menu is described in the section 21.1 The Modifiers and Templates File - MTF.

Go to the next section 20.4.3 Snippets or return to 20.4 MTF.
20.4.3 Snippets

See

20.4.3.1 Edit Snippet
20.4.3.2 Create Trimesh Snippet
20.4.3.3 Edit Snippet File
20.4.3.4 Compile Snippet
20.4.3.5 12d Supplied Snippets

For information on Snippets, see 21.5 Defining and Using Snippets
20.4.3.1 Edit Snippet

**Position of option on menu:** Design => MTF => Snippets => Edit snippet

Selecting **Edit snippet** brings up the **Edit Snippet** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MTF Snippets</strong></td>
<td>Tree Box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*lists all of the MTF Snippets available in the following folders:

- **Working Folder:** MTF Snippets located in the current Working Folder
- **User_Lib Folder:** MTF Snippets located in the User Library (USER_LIB_4D)
12d Library Folder: MTF Snippets located in the 12d Model Library (LIB_4D)
(C:\Program Files (x86)\12d\12dmodel\11.00\Library, or
C:\Program Files\12d\12dmodel\11.00\library depending on your setup)

Expanding Working Folder, User_Lib Folder of 12d Library Folder will list all the snippets in that
folder. For information on the snippets in 12d Library Folder, see 20.4.3.5 12d Supplied Snippets.

Clicking on a snippet name in the list displays the following information about the selected snippet:

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Snippet Input box
displays the file path and name of the selected MTF Snippet.

Copy to Clipboard Button
copies the selected MTF Snippet file path to the clipboard
This may be pasted into the Modifiers->MTF Snippet panel, or useful for creating snippets that call
other snippets.

MTF Snippet Preview Draw box
displays a preview image of the selected MTF Snippet.

Users can create their own preview images using the following guidelines:
• A preview image must have the same name as its associated MTF Snippet. For example; a snippet
  named “My_Snippet.MTFSNIPPET”, will have a preview image named “My_Snippet.jpg”,
• The preview image should have the dimensions 400 pixels wide by 300 pixels high,
• The preview image must be in jpeg (*.jpg) image format,
• The preview image must be located in either your “$USER/images” folder (USER_4D) or your
  current Working Folder.

Refresh Button
updates the MTF Snippets tree box.

When clicked, the macro will find and display all MTF Snippets in the current project Working Folder,
User Library Folder, and 12d Library Folder.

Note: To fully refresh a list, the relevant tree must also be collapsed and then re-expanded.

Snippet Info Tab

Snippet Info Text Edit Box
displays information about the currently selected MTF Snippet.

Users can display their own custom information for a snippet by using the following guidelines:
• Open the MTF Snippet in a text editor, by select Edit Snippet,
• At the top of the file, prefix your information with: // INFO

For example; if your snippet file contains:
// INFO Snippet Type: INSERT
// INFO Description: Kerb & Gutter

The Snippet Info text box will display:

Snippet Type: INSERT
Description: Kerb & Gutter
**Snippet Variables Tab**

**Snippet Variables**  
*Grid Control box*

*lists the currently selected MTF Snippet variables.*

*Each row represents a variable.*

*Column 1 - represents the variable name,*

*Column 2 - represents the variable value,*

*Column 3 - represents the variable type.*

*MTF Snippet variable types include: Number, Text*

*Only variables that define a single value are displayed (i.e.; formulas are ignored).*

*For example:*

```plaintext
#define _A 1.23  
@ def_tok A 1.23  
@ def_tok STR1 KI
```

*Users can create new variables, edit existing variables and delete existing variables.*

*Note: Creating and/or deleting a variable in the Grid Control Box does not change how that variable is used elsewhere in the snippet.*

**Save Edits**  
*button*

*open the Unsaved Changes panel to write out the Snippet Variables (Grid Control Box) to the MTF Snippet file.*

*Note: 12d Model Library snippets and User Library snippets cannot be edited via the panel. Therefore this button is disabled when these snippets are selected.*
Snippet Parameters Tab

Snippet Parameters Grid Control box
lists the currently selected MTF Snippet parameters.
Each row represents a parameter.
Column 1 - represents the parameter name,
Column 2 - represents the parameter title,
Column 3 - represents the parameter type,
Column 4 - represents the parameter value.
Parameters to be displayed in the Edit Snippet panel must be defined in the snippet_params.4d file.
Only parameters of the following types may be displayed and edited: TEXT, REAL, INTEGER
Users can create new parameters, edit existing parameters and delete existing parameters.
Note: Creating and/or deleting a parameter in the Grid Control Box does not change how that parameter is used elsewhere in the snippet.

Save Edits button
opens the Unsaved Changes panel to write out the Snippet Parameters (Grid Control Box) to the MTF Snippet file.
Note: 12d Model Library snippets and User Library snippets cannot be edited via the panel. Therefore this button is disabled when these snippets are selected.

Copy Snippet button
opens the Copy Snippet To panel and allows the user to copy the selected snippet to the current Working Folder.

Edit Snippet button
open the selected snippet in a text editor.
The default text editor is Notepad, unless a text editor is defined in the users env.4d:EDITOR_4D
Note: The text editors Multiple Instance settings will control whether snippets open for editing in the same window or create a new window.
Selecting the **Copy Snippet** button brings up the **Copy Snippet To...** panel.

```
Copy Snippet To...
```

**Source File**
- **Type**: File Box
- **Defaults**: When the Copy Snippet To panel opens, this field is auto-populated with the currently selected MTF Snippet from the MTF Snippets tree.
- **Description**: file path and name of the MTF Snippet being copied.

**Target File**
- **Type**: File Box
- **Description**: enter a new file name and path for the MTF Snippet being copied.

**Copy**
- **Type**: Button
- **Description**: when clicked the **Source File** is copied with the **Target File** path and name.

Selecting the **Save Edits** button brings up the **Unsaved Changes** panel.

```
You have unsaved changes
```

**Overwrite**
- **Type**: Button
- **Description**: writes all variables in the MTF Variables Grid Control Box to the currently selected MTF Snippet file.
- **Options**: Existing variables of the same name will be overwritten.

**Save As**
- **Type**: Button
save all variables in the MTF Variables Grid Control Box to a new MTF Snippet file.

Selecting this button brings up the Copy Snippet To panel.

**Discard** Button

all edits made to the variables in the MTF Variables Grid Control Box are discarded and the currently selected MTF Snippet file is not edited.

**Cancel** Button

closes the Unsaved Changes panel.

---

**How snippet_params.4d Works**

snippet_params.4d is a file that allows users to control the visibility of MTF Snippet Parameters in the Snippet Parameters Grid_CtrlBox.

**File Format:**

- Plain Text
- Each line should contain one MTF Snippet Parameter name. For example: LANE1
- MTF Snippet Parameter names are case sensitive
- Comments are allowed in the file, and should begin with: //

**Where should snippet_params.4d be located?**

By default the file is located in:

C:\Program Files\12d\12dmodel\11.00\set_ups

or

C:\Program Files (x86)\12d\12dmodel\11.00\set_ups

Users can copy this file to their User directory (typically C:\12d\11.00\User) or their current 12d Model project directory. The macro will find and read this file in those directories. The macros search order is:

- Search the current 12d Model project directory for Snippet_Params.4d. If found; read.
- Search the User directory for Snippet_Params.4d. If found; read.
- Search the Set_Ups directory for Snippet_Params.4d. If found; read.

Go to the next section 20.4.3.2 Create Trimesh Snippet or return to 20.4.3 Snippets.

---

**20.4.3.2 Create Trimesh Snippet**

**Position of option on menu:** Design => MTF => Snippets => Create trimesh snippet

This section of documentation is a work in progress and will be updated in subsequent releases.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Go to the next section 20.4.3.3 Edit Snippet File or return to 20.4.3 Snippets.
20.4.3.3 Edit Snippet File

Position of option on menu:  Design => MTF => Snippet => Edit snippet file

The Edit snippet file option is used to edit MTF Snippet files (*.mtfsnippet) with the text editor pointed to by the EDIT_4D environment variable.

The Edit snippet file option has two modes of operation - clicking on the option Edit snippet file itself, or by activating the MTF => Snippets => Edit snippet file option's walk-right menu, folder *.mtfsnippet.

Selecting Edit snippet file itself brings up the Edit MTF File *.mtfsnippet panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder</td>
<td>name of the folder for the .mtf snippet file.</td>
<td>folder box</td>
<td>current folder</td>
<td></td>
</tr>
<tr>
<td>File to edit</td>
<td>name of the MTF Snippet file, in Folder, to edit.</td>
<td>file box</td>
<td>*.mtfsnippet files</td>
<td></td>
</tr>
<tr>
<td>Edit</td>
<td>edit the MTF Snippet file given by the Folder and File to edit panel fields by the text editor pointed to by the EDIT_4D environment variable. If the file given in the File to edit field does not exist, then a new file is created which already has each of the section headers set up.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Similarly the Edit snippet file walk-right menu provides a list all the MTF Snippet files (files ending in .mtfsnippet) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Go to the next section 20.4.3.4 Compile Snippet or return to 20.4.3 Snippets.
20.4.3.4 Compile Snippet

Position of option on menu: Design => MTF => Snippet => Compile snippet

The Compile snippet option is used to create a compiled version of a Snippet file. This can be done to protect any intellectual property (IP) and minimise concerns people may have in developing and sharing snippets.

The compiled snippet file can not be read with a text editor. Compiling a snippet encrypts and encodes the snippet contents into a new file with an extension of mtfsnippetc (note the ‘c’ at the end, denoting a compiled snippet).

A compiled snippet can be run and used by anyone, but the snippet code itself cannot be viewed or edited. Temporary snippet files, if enabled, are not generated for compiled snippets.

Original Snippet

// INFO Example compiled snippet

Compiled Snippet
nyKgSBlhX6wGqQizY/fRFDrCf/7YReG2J34wsghywz6Ys+cfVn+Pl+crz+4c9XgNbYj+kmS14F
flh+l/bNu41RYYd4RtNvls9

Selecting Compile snippet itself brings up the Edit MTF File *.mtfsnippet panel.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up
Snippet file file box *.mtfsnippet files
name of the MTF Snippet file to compile.

Compiled file file box *.mtfsnippetc files
name of the compiled MTF Snippet file.

Compile button
compile the snippet given in the Snippet file field and write the compiled snippet out with the name given in the Compile file field.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Return to 20.4.3 Snippets or 20.4 MTF.

20.4.3.5.12 TRI_KERB_PROFILE
20.4.3.5.1 TRI_1PT_TRENCH_DES_LAY

This Snippet is used to create a trench pavement, using <Design> or <Layer> strings created in your MTF.

It is linked to the Start Link at a specified location of left, centre or right.

A depth can be specified either to another link or a set value.

The top surface of the trench is defined by a Named Grade.

The Reference string name can be used as part of the model naming convention.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTF file</td>

Continue to 20.4.3.5.9 TRI_2PT_STRUCT_FILL or return to 20.4.3.5 12d Supplied Snippets or 20.4.3 Snippets.
20.4.3.5.9 TRI_2PT_STRUCT_FILL

This Snippet is used to create typical pavement, using <Design> or <Layer> strings created in your MTF.

It is linked to the Start and End Links at a slope specified.

Slopes are for fill, so no sign is required for either slope.

The Reference string name can be used as part of the model naming convention.

The fields and buttons used in this panel have the following functions.

<table>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If ticked, rename the MTF in all functions that include it.

Rename button
rename the MTF file to the new name.

Go to the next section 20.4.5 Apply MTF or return to 20.4 MTF.
20.4.5 Apply MTF

Position of option on menu: Design => MTF => Apply MTF

The Apply MTF option is used to apply a MTF file to a selected hinge string.
The option has already been described under Design=>Apply=>Apply MTF.

For the description of Apply MTF, please go to the section 20.3.2 Apply MTF Function.

Go to the next section 20.4.6 Edit by String or return to 20.4 MTF.
20.4.6 Edit by String

**Position of option on menu:**  Design => MTF => Edit by string

The **Edit by string** option is used to edit the **MTF** by selecting a string created by the **MTF** in an **Apply MTF**.

Selecting **Edit by string** brings up the **Edit MTF/Survey Function Data** panel:

![Edit MTF/Survey Function Data panel]

After selecting the **Pick Edit** button, a string created by MTF function is selected and the MTF editor is started for the MTF.

For information on the **MTF Editor**, go to the section **20.4.1.1 MTF Edit**.

Go to the next section **20.4.7 Copy MTF** or return to **20.4 MTF**.
20.4.7 Copy MTF

Position of option on menu: Design => MTF => Copy

Selecting Copy brings up the Copy an MTF panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTF to copy</td>
<td>file box</td>
<td>*.mtf files</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>name of the MTF file to copy.</td>
<td></td>
</tr>
<tr>
<td>Target MTF</td>
<td>file box</td>
<td>*.mtf files</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>new name for the MTF file.</td>
<td></td>
</tr>
<tr>
<td>Copy all backups</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if ticked, copy all the backup files of the MTF as well.</td>
<td></td>
</tr>
<tr>
<td>Copy</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>copy the MTF file to the new name.</td>
<td></td>
</tr>
</tbody>
</table>

Go to the next section 20.4.8 Delete MTF or return to 20.4 MTF.
20.4.8 Delete MTF

Position of option on menu: Design => MTF => Delete

Selecting Delete brings up the Delete an MTF panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTF to delete</td>
<td>file box</td>
<td>* .mtf files</td>

</tr>
<tr>
<td></td>
<td>name of the MTF file to delete</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Delete all backups</td>
<td>tick box</td>
<td></td>
<td>if ticked, delete all the backup files of the MTF as well</td>
</tr>
<tr>
<td>Delete</td>
<td>button</td>
<td></td>
<td>delete the MTF file.</td>
</tr>
</tbody>
</table>

Go to the next section 20.4.9 Create File or return to 20.4 MTF.
20.4.9 Create File

Position of option on menu: Design => MTF => Create file

The MTF => Create file option is used to create a new Modifiers and Templates Files (*.mtf) with the text editor pointed to by the EDIT_4D environment variable.

The created file will already have all the section headers (key words and opening and closing brackets) in it.

Selecting Create file brings up the Create MTF File *.mtf panel.

![Create MTF File *.mtf panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder</td>
<td>folder box</td>
<td>folder box</td>
<td>current folder</td>
<td></td>
</tr>
<tr>
<td></td>
<td>name of the folder for the .mtf file.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>File to create</td>
<td>file box</td>
<td>file box</td>
<td>*.mtf files</td>
<td></td>
</tr>
<tr>
<td></td>
<td>name of the file to create. The new MTF file already has each of the section headers set up.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create</td>
<td>button</td>
<td></td>
<td></td>
<td>create an MTF file given by the Folder and File to create panel fields. If the file given in the File to edit field already exists, then an error occurs.</td>
</tr>
</tbody>
</table>

The text format for the MTF file is described in the section 21.10.1 Text Format of the MTF File.

Go to the next section 20.4.10 Edit MTF File or return to 20.4 MTF.
20.4.10 Edit MTF File

Position of option on menu: Design => MTF => Edit file

The MTF=>Edit file option is used to edit MTF files (*.mtf) with the text editor pointed to by the EDIT_4D environment variable.

The MTF=>Edit file option has two modes of operation - selecting the MTF=>Edit file itself, or by activating the MTF=>Edit file option's walk-right menu, folder *.mtf. Selecting MTF=>Edit file itself brings up the Edit a MTF File *.mtf panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder</td>
<td>name of the folder for the .mtf file.</td>
<td>folder box</td>
<td>current folder</td>
<td></td>
</tr>
<tr>
<td>File to edit</td>
<td>name of the MTF file, in Folder, to edit.</td>
<td>file box</td>
<td>*.mtf files</td>
<td></td>
</tr>
<tr>
<td>Edit</td>
<td>edit the MTF file given by the Folder and File to edit panel fields by the text editor pointed to by the EDIT_4D environment variable. If the file given in the File to edit field does not exist, then a new file is created which already has each of the section headers set up.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Similarly the MTF=>Edit file walk-right menu provides a list all the MTF files (files ending in .mtf) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

The text format for the MTF file is described in the section 21.10.1 Text Format of the MTF File.

Return to 20.4 MTF.
20.5 Boxing

Position of menu:  Design => Boxing

The Boxing walk-right menu is

In the Apply MTF option, boxing can be applied to the generated design sections by special commands in the MTF.

However, it is also possible to apply boxing as a post process to a model of x-sections as long as the x-sections were generated in the 4d super string format (this is done by both the Apply and Apply MTF options and the Cuts options - see 28.9.13 Cuts).

For more information on boxing, see 21.6 What is Boxing? and for more information on the various scenarios for generating boxing, see 21.6.2 Applying Boxing.

The rules for calculating different types of boxing are known as Boxing Definitions and Boxing Definition are created and stored in a Boxing file.

The Boxing, and the different Boxing Definitions contained within the file, are created/edited using the options Create and Edit from the Template Boxing menu.

The options Boxing many function, Boxing many and Boxing use the Boxing Definitions to generate boxing.

For the options see:

- Create definitions 20.5.1 Create Boxing Definitions
- Edit definitions 20.5.2 Edit Boxing Definitions
- Rename 20.5.3 Rename Boxing File
- Boxing many function 20.5.4 Boxing Many Function
- Boxing 20.5.5 Apply Boxing
- Boxing many 20.5.6 Apply Boxing Many
- Copy boxing 20.5.7 Copy Boxing
- Delete boxing 20.5.8 Delete a Boxing File
- Create definitions file 20.5.9 Create Definitions Text File
- Edit definitions file 20.5.4 Boxing Many Function
20.5.1 Create Boxing Definitions

Position of option on menu:  Design =>Boxing =>Create definitions

The rules for calculating different types of boxing are known as Boxing Definitions and Boxing Definition are created and stored in a Boxing file.

The Boxing=>Create definitions option is used to create a new Boxing file (*.bf), and then the Edit Boxing Definitions panel is opened for the Boxing file to create and add new Boxing Definitions. The Edit Boxing Definitions panel is then used to write the Boxing file to disk.

and can be edited using the Boxing =>Edit definitions option, or by standard text editor.

Selecting Create definitions displays the Create Boxing File panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boxing file</td>
<td>file box</td>
<td>*.bf files</td>
<td>name of the boxing file to create.</td>
</tr>
</tbody>
</table>

Create button

create a boxing file with name given by the boxing file panel fields.
If the file given in the boxing file field does not exist, then the Edit Boxing Definitions panel is placed on the screen and is used to create and edit the boxing definitions for the boxing file.
If the file already exists, then nothing will happen on selecting Create.

When Create is selected from the Create Boxing File panel, it brings up the Edit Boxing Definitions panel which is used to create and edit the boxing definitions, and to saved the boxing definitions to disk in the boxing file.

For information on the Edit Boxing Definitions panel, go to 21.7.2 Edit Boxing File.

The Edit Boxing Definitions panel is described in the section 21.7.2 Edit Boxing File.

Go to the next section 20.5.2 Edit Boxing Definitions or return to 20.5 Boxing.
20.5.2 Edit Boxing Definitions

Position of option on menu: Design => Boxing => Edit definitions

The Boxing => Edit definitions option is used to edit Boxing files (*.bf).

The Boxing => Edit definitions option has two modes of operation - selecting the Boxing => Edit definitions itself, or by activating the Boxing => Edit definitions option's walk-right menu, folder *.bf. Clicking on Boxing=>Edit definitions itself brings up the edit boxing file panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boxing file</td>
<td>input</td>
<td>* .bf</td>
<td>files</td>
</tr>
<tr>
<td></td>
<td></td>
<td>name of the boxing file to edit.</td>
<td></td>
</tr>
<tr>
<td>Edit</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

edit the file given by boxing file panel field.
If the file given in the boxing file field exists, then the Edit Boxing Definitions panel is brought up to create/edit the boxing definitions in the boxing file.

Similarly, walking right on Boxing=>Edit provides a list all the boxing files (files ending in .bf) in the current folder and when a file is selected from the list, the Edit Boxing Definitions panel is brought up for the selected boxing file.

The Edit Boxing Definitions panel is described in the section 21.7.2 Edit Boxing File.

Go to the next section 20.5.3 Rename Boxing File or return to 20.5 Boxing.
20.5.3 Rename Boxing File

Position of option on menu:  Design =>Boxing =>Rename

On selecting Rename, the Boxing Rename panel is displayed.

This panel can be used to change the names of existing boxing files.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boxing to rename</td>
<td>boxing file</td>
<td>box</td>

Cut sections, Use existing sections

if Cut section, sections are cut through the strings in the *Model to cut through* and placed in *Model for sections*.

If User existing sections, no sections are cut and the existing sections in *Model for sections* are used to apply the boxing to.

**Model to cut through**

-model box

model of strings to cut sections through

**Section separation**

-input 10

the distance along the selected centre line to generate plan section lines to be used to cut through the...
model or view.

**Left/Right cut width**  input  50

the left/right distance to go out from the centre line for creating a section to cut through the strings.

**Chord/arc tolerance**  input  default chord/arc tolerance

the chord to arc tolerance to use on the selected string for determining how many plan sections are created around horizontal curves.

**Start/End chainage**  choice box  Start (ref)/End (ref)

**Mode**  choice box  Smart Chainage modes

**Extension ref**  real box

the **Start/End chainage**, **Mode** and **Extension ref** are all used to define the start/end chainage on the selected centreline string.

The sections for the cuts are restricted to between these start and end chainage.

If blank, the **Start/End chainage** of the reference string is used

For more information on **Start/End Chainage Modes**, see [21.2.1 MTF Hinge Modifiers](#).

**Special chainages file**  file box  *.spf files

a file containing chainages, one per line, that are also used as extra chainages to create cross sections at.

**Model for sections**  model box  available models

model for the cut cross sections.

**Colour**  colour box  available colours

colour for the cut cross sections.

**Filter out single point strings**  tick box

if ticked, don’t save any sections that only have a single point in them

**Create tin for sections**  tick box

if ticked, a tin of the cross sections in **Model for sections** is created.

**Tin for sections**  tin box  available tins

name of the tin of cross sections

**Model for tin**  model box  available models

model for the cross sections tin.
Layers tab

The layers tab consists of a grid for defining up to eight layers of boxing strings and sections. The last boxing layer is also referred to as the subgrade layer.

Boxing Layer 1-8:

If the model names are non-blank, boxing strings and sections will be created for that layer.

For more information on boxing, see 21.6 What is Boxing?

Strings input

If non-blank, pre*post text to use with the function name to create the name of the model for the boxing strings for this layer.
If blank, the boxing strings will not be stored for this layer.

**Sections**

input available models

*if non-blank, pre*post text to use with the function name to create the name of the model for the boxing sections for this layer.

*If blank, the boxing sections will not be stored for this layer.*

**Colour**

colour box available colours

colour for the boxing sections for this layer

**Create subgrade tin**

tick box

*if ticked, then a tin of the subgrade strings and sections is created. Note - the subgrade is the last boxing layer.*

**Subgrade tin**

tin box available tins

*name for the subgrade tin*

**Subgrade tin model**

model box available models

*model for the subgrade tin*
Left/Right Boxing tabs

Tab for applying left boxing - gives the chainage range and boxing definitions to use for each of the eight layers of boxing

For more information on boxing, see 21.6 What is Boxing?

Layer choice box

Layer 1, Layer 2 ... Layer 8

As each layer is selected, a grid for defining the chainages and boxing definition that applies to that chainage are given in the grid. The boxing definition goes from the chainage on the row specifying the boxing file until the chainage on the next row.

Layer grid:

For each selected layer:

Chainage smart chainage box

For the selected boxing layer, the chainage to apply the boxing definition to. The boxing file starts at this chainage and goes until the chainage on the next row.

If you right click in the Chainage column in the Left/Right Boxing tabs, or select Browse (if the Browse menu comes up) then a Chainage panel comes up which has the most of the standard MTF choices for Smart Chainages.

The Chainage Mode will determine what other fields are also on the panel (for example Extension ref for Mode Typed). For more information on Chainage Modes, see 21.2.1 MTF Hinge Modifiers

Boxing boxing definition box

The boxing definition to use with the given chainage range. The pop-up lists all the boxing definitions in the Boxing file

<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For more information on boxing, see 21.6 **What is Boxing?** and for more information on the various scenarios for generating boxing, see 21.6.2 **Applying Boxing**.

The text format for the Boxing file is described in the section 21.10.2 **Text Format of the Boxing File**.

Go to the next section 20.5.10 **Edit Definitions Text File** or return to 20.5 **Boxing**.
20.5.10 Edit Definitions Text File

Position of option on menu: Design => Boxing => Edit definitions file

The Boxing=>Edit definitions file option is used to edit boxing files (*.bf) with the text editor pointed to by the EDIT_4D environment variable.

The Boxing=>Edit definitions file option has two modes of operation - selecting the Boxing=>Edit definitions file itself, or by activating the Boxing=>Edit definitions file option's walk-right menu, folder *.bf.

Selecting Boxing=>Edit definitions file itself brings up the edit boxing file *.bf panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder</td>
<td>name of the folder for the .bf file.</td>
<td>input</td>
<td>current folder</td>

<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Boxing=>Edit definitions file walk-right menu provides a list all the boxing files (files ending in .bf) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

The format for the boxing file is described in the 21.10.2 Text Format of the Boxing File section.

Return to 20.5 Boxing.
20.6 Estate Lots

Position of menu:  Design => Estate/Lots

This module is currently under development.

The Estate Lots module is for creating house lots for an Estate (Subdivision).

There are options to create and edit lots by a variety of methods. Once the lots are created they can be numbered, given a lot type (see 20.6.1 Lot types) and labelled.

The labelling includes labelling the side of lots with bearing and distances, lots with areas and lot numbers.

Reports of lot areas and types can be created and lots coloured according to areas.

Finally options exist to create point numbers and reports for setting out the lots.

The Estate/Lots walk-right menu is:

![Estate/Lots Walk-right Menu]

For the options see

- **Create lots**  
  [20.6.2 Create Lots]

- **Edit lots**  
  [20.6.3 Edit Lots]

- **Filter lots**  
  [20.6.4 Filter Lots]

- **Number lots**  
  [20.6.5 Number Lots]

- **Label lots**  
  [20.6.6 Label Lots]

- **Delete lot attributes/text**  
  [20.6.7 Delete Lot Attributes and Text]

- **Setout lots**  
  [20.6.8 Setout Lots]

- **Report lots**  
  [20.6.9 Report Lots]

- **Lot utilities**  
  [20.6.10 Lot Utilities]
20.6.1 Lot types

Lots can have a type which is used in reports. The lot types are defined in a text file called lottypes.4d which is searched for in the standard library areas (see 39.3 Library, User Library, Customer Library).

For example of lottypes.4d is

- park
- road
- other
- surround
- McDonalds

20.6.2 Create Lots

Position of menu:  Design => Estate/Lots => Create lots

For the options see

- Create lots 20.6.2.1 Create Lot
- Create lots by picking point inside 20.6.2.2 Create Lot from Picking
- Create lots - polygon discovery 28.10.8 Polygon Discovery
- Create lots by picking segments 20.6.2.3 Create Lot from Picking Segments
- Create lots from polygons 20.6.2.4 Create Lot from Polygon
- Read geocomp lots file 20.6.2.5 Read Geocomp Lots File
20.6.2.1 Create Lot

Position of option on menu: Design => Estate/Lots => Create lots => Create lot

This option creates lots of a user given area using the front and back strings for a number of lots and an initial straight line edge of a lot. The final edge of the lot then needs to be determined.

The methods of creating the final edge of lot are:

(a) parallel the existing side - parallel edge. See Parallel Edge
(b) having the same bearing as a selected line - parallel pick. See Parallel Pick
(c) having a given bearing - parallel bear. See Parallel Bearing
(d) perpendicular to either the front string or the back string - perpendicular. See Perpendicular and Perpendicular Pick
(e) perpendicular to either the front string or the back string but starting from a user selected point - perpen start pt. See Perpendicular and Perpendicular Pick
(f) pivoting about a selected point - pivot pick. See Pivot Pick and Pivot Frontage
(g) pivoting about the point at minimum frontage - pivot frontage. See Pivot Pick and Pivot Frontage
(h) closing a selected string - close string. See Close String
The fields and buttons used in this panel have the following functions.

<table>

</tbody>
</table>
Pick edge  string select
    pick the straight line to form the edge of the created lot.

The front, back and edge form three sides of the lot to be created.

Method  choice box  parallel edge  parallel edge, parallel pick
    parallel bear, perpendicular, perpen start pt, pivot pick,
    pivot frontage, close string

pick the string to form the back of the created lot.

Process  button
    use the selected front, back and edged and then create the final side of the lot by the selected method.

Continue to the next section 20.6.2.1.1 Creating Lots from a Front and Back String and an Edge for a full description of each method of creating the lots.
20.6.2.1.1 Creating Lots from a Front and Back String and an Edge

Parallel Edge
This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings must be selected with direction to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The initial edge must be one straight line segment. It can not be an arc.

For Parallel Edge, the final edge is created parallel to the initial edge and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Parallel Bearing
This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings must be selected with direction to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The initial edge must be one straight line segment. It can not be an arc.

For Parallel Bear, the final edge is created with a user specified bearing and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of
the next lot.

Parallel Pick
This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings must be selected with direction to indicate which direction to move along them to form the lot. The front and back strings cannot be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The initial edge must be one straight line segment. It cannot be an arc.

For Parallel Pick, the final edge is created with the bearing of a user selected segment and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.
**Perpendicular and Perpendicular Pick**

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For **Perpendicular**, the **final edge** is constrained to be perpendicular to either the front or the back string and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

For **Perpendicular Pick**, a start point is selected on the front/back string and the **final edge** is created past the start point. This option only needs to be used when **Perpendicular** has problems finding a solution due to sharp changes of bearing along the front/back string.

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

---

**Pivot Pick and Pivot Frontage**

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For **Pivot Pick**, a position is selected on either the front or back string to be one point of the **final edge**. The other point of the final edge is determined so that the lot has the required given area (to within the area tolerance).

For **Pivot Frontage**, the pivot point is taken to be the position on the front string that is the minimum frontage distance along the front string from the initial edge.
The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

**Close String**

This method simply closes the string that is selected by the user.
20.6.2.2 Create Lot from Picking

**Position of option on menu:** Design => Estate/Lots => Create lots => Create lots by picking point inside

This option creates a lot by a picking inside a collection of strings and the lot is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot side without cutting any other segment.

On selecting the Create lot by picking point inside option, the Create Lot - Pick Point Inside panel is displayed.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

<td>available colours</td>
<td></td>
</tr>
</tbody>
</table>

Select a position that is inside the lot to be created

Creating a Lot by Picking Inside the Lot

On selecting the Create lot by picking point inside option, the Create Lot - Pick Point Inside panel is displayed.
colour for the created lot.

**Search distance**

**double box** 20

maximum distance to search from the selected point for sides of the lot

**Pick**

**string select**

pick the position to try and form a lot around.
20.6.2.3 Create Lot from Picking Segments

Position of option on menu: Design => Estate/Lots => Create lots => by picking segments

This option creates a lot by picking each segment in its order (and with direction) around the lot. Segments will be automatically extended or clipped to form the lot.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model for lot</td>
<td>model box</td>
<td>available models</td>
<td></td>
</tr>
<tr>
<td>Lot colour</td>
<td>colour box</td>
<td>available colours</td>

when a lot is selected, its lot number is displayed in this field. This can be changed and the selected lot will get the new Lot number when the Set button is selected.

when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new Lot type when the Set button is selected. See 20.6.1 Lot types.

if ticked, the lot numbers are displayed for the selected lots.

view to temporarily display the lot numbers.

select the lot to change either the lot number or the lot type.

set the lot number and the lot type of the selected lot to the values given in the Lot number and Lot type fields.
20.6.6 Label Lots

Position of menu:  Design => Estate/Lots => Label lots

After lots are numbered, text for the lot numbers and areas can be displayed.

For the option Lot labelling, go to 20.6.6.1 Create Lot Annotation.

String b/d labelling  20.6.6.2 String Bearing Distance Labelling

20.6.6.1 Create Lot Annotation

Position of option on menu:  Design => Estate/Lots => Number lots => Lot labelling

This option creates annotation of the lot numbers, lot areas, bearings of the sides and lengths of the sides.

The fields and buttons used in this panel have the following functions.
Input/Output parameters

Lot annotation file  
file of defaults for labelling the lots.

Read  
read in a given lot annotation file.

Save  
write out the current parameters to the given lot annotation file.

Save as  
write out the current parameters to a different lot annotation file.

Text parameters

Area parameters  
parameters for labelling the area of a lot.

Create area text  
if ticked, annotation for the areas is created using the Area parameters.

Lot number parameters  
parameters for labelling the lot numbers.

Create lot no. text  
if ticked, annotation for the lot numbers is created using the Lot number parameters.

Bearing parameters  
parameters for labelling the bearings of the sides of the lots.

Create bearing text  
if ticked, annotation for the lot bearings is created using the Bearing parameters.

Distance parameters  
parameters for labelling the lengths of the sides of the lots.

Create distance text  
if ticked, annotation for the lengths of the sides is created using the Distance parameters.

Short segment parameters  
parameters for specifying what is a "short Segment" and the parameters for labelling sides of the lots that are short segments.

Create short segment text  
if ticked, annotation for short segments is created using the Short segment parameters.

Data

Data source type  
data source type.

Data source  
data source for lots to be annotated.

Lot type  
user defined
of the lots selected by the data source, only lots of this type are labelled. See 20.6.1 Lot types.
**Process** button

*select all the lots given by the Data source and Lot type and create annotations according the Text parameters.*

### 20.6.6.2 String Bearing Distance Labelling

**Position of option on menu:** Design =>Estate/Lots => Label lots =>String b/d labelling

Option to label the bearing and lengths of segments of strings.

This option is described in the section [24.1 Bearing/Distance Labelling](#).
20.6.7 Delete Lot Attributes and Text

Position of option on menu: Design => Estate/Lots => Delete lot attributes/text

This option is used to remove the attributes for a lot which store the lot number, area etc. It can also delete the annotation text that has been created for the lot.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>choice box</td>
<td>lot text</td>
<td>lot text, lot attributes</td>
</tr>
<tr>
<td>Data source</td>

</tr>
</tbody>
</table>

when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new Lot type when the Set button is selected.

Data source

data source for lot to delete either the lot text or lot attributes.

Display lot numbers
tick box
if ticked, the lot numbers are displayed for the selected lots.

View to display
view box
available views
view to temporarily display the lot numbers.

Process
button
delete the selected attributes from the selected lots.
20.6.8 Setout Lots

Position of option on menu:  Design => Estate/Lots => Setout lots

Options to create unique point numbers for the vertices at the ends of each segment of the lots, and to create z-values from a given tin for the vertices of the lots.

For the option Create lot point numbers, go to 20.6.8.1 Create Lot Point Numbers

Drape points 20.6.8.2 Drape Points

20.6.8.1 Create Lot Point Numbers

Position of option on menu:  Design => Estate/Lots => Setout lots => Create lot point numbers

This option creates unique point numbers for the vertices at the ends of each segment of the lots. Duplicate vertices are only given one point number.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions.

Field Description       Type Defaults Pop-Up
Lot type                choice box user defined user defined
                         of the lots selected by the data source, only lots of this type have point numbers created. See 20.6.1 Lot types
Data source             model box available models
                         data source for lots to have point numbers created.
Model for setout points  model box available models
                         model for the set out points.
Text colour             colour box available colours
colour of the point numbers.

**Text units**
- choice box world screen, paper, world

Units for text size.

**Text size**
- double box

Size of the text for the point numbers.

**Add points to lot views**
- tick box tick

If ticked, add the model of point numbers to the views that the lots are displayed on.

**Create short segment text**
- tick box tick

If ticked, annotation for short segments is created using the Short segment parameters.

**Filter redundant points**
- tick box tick

If ticked, then if two adjacent line have the same bearing then the two segments are replaced by one segment. And if two adjacent arc segments could be the one arc, then they are replaced by one arc.

**Process**
- button

Select all the lots given by the Data source and Lot type and create annotations according the Text parameters.

### 20.6.8.2 Drape Points

**Position of option on menu:** Design => Estate/Lots => Setout lots => Drape points

Option for setting the z-value of points to the z-value from a specified tin.

![Update Z-values from Tin](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

</table>
20.6.10 Lot Utilities

Various lot options.

Position of menu: Design => Estate/Lots => Lot utilities

![Lot Utilities Menu]

For the option Colour lots by range file, go to

- 20.6.10.1 Colour Lots by Range File
- 20.6.10.2 Remove Lot Colour
- 20.6.10.3 Reverse Bearing
- 20.6.10.4 Short Line/Arc Table
- 20.6.10.5 Short Line/Arc Report
- 20.6.10.6 Short Segment Utilities

20.6.10.1 Colour Lots by Range File

Position of option on menu: Design => Estate/Lots => Lot utilities => Colour lots by range file

The option colours lots by area using a lot range file (.lrf) to define the colour for each minimum and maximum area. It also creates a table of the statistics for the area ranges.

![Lot Colour By Range File]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range file</td>
<td>file box</td>
<td>*.lrf</td>
<td>range file for colouring lots.</td>

<td>model</td>
<td></td>
<td>data source for lots to be coloured.</td>
</tr>
</tbody>
</table>
Table location position select box

position of the table.

Model for table model box available models

model for the table of statistics on the lot areas.

Text colour colour box available colours

colour of the text.

Text size (w) double box

size of the text for the table.

Process button

select all the lots given by the Data source and Lot type and colour them according to the lot range file.

20.6.10.2 Remove Lot Colour

Position of option on menu: Design => Estate/Lots => Lot utilities => Remove lot colour

The option removes the colour of all the selected lots.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

data source for lots to have their colour removed.

Process button

select all the lots given by the Data source and remove the lot colour.

20.6.10.3 Reverse Bearing

Position of option on menu: Design => Estate/Lots => Lot utilities => Reverse bearing

Option to change the value of the bearing text created by the lot labelling option by adding 180 degrees to the bearing. This is then the bearing of a line in the reversed direction to that represented by the original bearing text. The rounding for the reversed bearing is done according to the lot parameters.
The fields and buttons used in this panel have the following functions.

### Field Description

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zero padding</td>
<td>tick box</td>
<td>tick</td>
<td></td>
</tr>
</tbody>
</table>

- **Zero padding**: if ticked, if the minutes and/or seconds are zero then two zeros are written out. If not ticked, if the minutes and/or seconds are zero then they are left out.

- **Pick**: button  

  pick the bearing text that is to be modified.

---

### 20.6.10.4 Short Line/Arc Table

- **Position of option on menu**: Design => Estate/Lots => Lot utilities => Short line/arc table
- **Position of option on menu**: Drafting => Text and Tables => Short segment table

Option to create a table of all the short segments and/or short arcs.

This option is described in the section [24.16.11 Short Segments Table](#).

### 20.6.10.5 Short Line/Arc Report

- **Position of option on menu**: Design => Estate/Lots => Lot utilities => Short line/arc report
- **Position of option on menu**: Drafting => Text and Tables => Short segment report

Option to create a report of all the short segments and/or short arcs.

This option is described in the section [24.16.12 Short Segment Report](#).

### 20.6.10.6 Short Segment Utilities

- **Position of option on menu**: Design => Estate/Lots => Lot utilities => Table utilities
- **Position of option on menu**: Drafting => Text and Tables => Short segment table utilities

This panel is used to modify an existing short segments table.

This option is described in the section [24.16.13 Short Segments Table Utilities](#).
20.7 Pads

Position of menu: Design => Pads

The Pads walk-right menu is

![Pads menu screenshot]

<td>At Point, Point to Point, String from Point, String to Point</td>
<td></td>
</tr>
</tbody>
</table>
The interval along the pad string for the volume calculations.

**Search distance** measures box

At Point, Point to Point, String from Point, String to Point

The maximum search distance for intersecting the cut/fill slopes with the pad.

**Which side** choice box

left, right

Which side of the string is the outside of the pad.

**Model** model box

available models

The model for the final strings and tadpoles.

**View** view box

select view

View to add temporary strings to.

**Tolerance**

The tolerance for balancing the cut/fill for the pad.

**Balance** button

Balance the pad to within tolerance value.

**Up** button

Move pad up by translation value.

**Down** button

Move pad down by translation value.

**Finish** button

Add strings to permanent model and finish.
### 20.7.2 Dynamic Pad Interface

**Position of option on menu:** Design => Pads => Dynamic pad

This option is to create a pad by interfacing from a selected string and calculated the volume for the pad. The pad can be moved up or down and the new volumes are calculated.

The pad can also be moved in plan and the new interface and volumes are dynamically calculated.

![Dynamic Pad Interface](image)

The fields and buttons used in this panel have the following functions.

*data selection type - for a full description go to 4.19.3 Data Source*
Display button

brings up the Display Text Defaults panel

Offsets tab

Global offset input

if other offsets are not given, the distance to offset the sides of the pad from the strings used to create the pad

Offsets model model box

model for the offset lines

Offsets type choice box Segment Segment, Point to Point

if Segment, define the offset line by picking a segment.
If Point to Point, define the offset line by picking two points.

Select button

select an offset line

Creation tab

Pad level type choice box Typed input, Use tin level Use bdy/ht, Use bdy/slope

if typed input, all vertices of the pad are given the height in the Lot level field.
If use tin level, the height of each vertex of the pad is taken from the tin given in the Tin field.

If typed input:

Pad level input

the height to use for all the vertices of the pad.

If Use tin level:

Tin tin box available tins

the tin used to give heights to the vertices of the pad.

If Bdy/ht:

Height

the height to be above the selected boundary string

Reference boundary

the selected boundary string for the pad to be a given height above/below

If Use/slope:

Slope 1 in

the slope to be above the selected boundary string

Reference boundary

the selected boundary string for the pad to be a given slope above/below

Single/ Along a string radio buttons single

if single, a single pad is created from the strings surrounded the selected point.
If along a string, pads are created surrounding each vertex of selected string.

Centroid/search distance string select

if single, a point is selected and then a circle is rubber banded until a second point is selected. The pad is created from segments within the circle.

Search dist input
if along a string, then for each vertex, all segments within the distance are processed to create the pad.

Select

string select

if along a string, select the string to use. Pads are created surrounding each vertex of this string.

Process

button

run the option
20.7.4 Allotment Pad Edit

**Position of option on menu:** Design => Pads => Edit/grade pad

This option is used to grade a pad created with the previous option, Design => Pads => Create/grade pad.

Selecting Edit/grade pad brings up the Allotment Pad Edit panel.

![Allotment Pad Edit panel](image)

The fields and buttons used in this panel have the following functions.

Field Description: name of the pad/pond function. If the function already exists and is picked from a popup or and an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.

Cut slope 1 v in: the slope of the interface line if a point is in cut. A cut slope of one vertical to the given value of horizontal units is used. Positive is up for a cut slope. A value 0 is used to designate a horizontal line.

Fill slope 1 v in: the slope of the interface line if the point is in fill. A fill slope of one vertical to the given value of horizontal units is used. Positive is down for a fill slope. A value 0 is used for a horizontal line.

Section separation: the distance between the points on the selected string that interface points will be calculated from.

Existing tin surface: available tins
name of the tin to interface to.

**Pad /Pond internal model**  model box  available model
if non blank, name of the model to include as part of the interface model

**Model for interface strs**  model box  available models
name of the model to contain the calculated interface string.

**Name for pad/pond tin**  tin box  available tins
name of the tin to create from the reference string, the interface string and the pad/pond internal model

**Height increment**  input
value to vertically translate the reference string by (cleared after each process unless **Maintain height increment during processing** is ticked)

**Water level**  input
if non blank, the height of the water level

**Use overflow water level from cut interface**  tick box
if ticked, the water level to the lowest point on the cut interface is determined and used as the water level height

**View display**  view box  available views
if non blank, the view to display the results on

**Report file name**  file box  *.rpt files
if non blank, the view to display the results on

**Maintain height increment during processing**  tick box
if ticked, the reference string will be raised by the **Height increment** each time the function is processed, but only while the panel is open

**Calculate storage to existing tin surface only**  tick box
if ticked, this will calculate the storage to the **Existing tin surface from the Water level only**

**Reference string**  string select
select the string to interface from.

**Process**  button
run the function
20.8 Roads

Position of menu:  Design => Roads

The road options include road network creation options and a number of other options for creating road details.

Some of the options are currently under development.

The roads walk-right menu is

- generate components
- setup and create road network
- stopping distance calculations
- input/output to TRARR
- run TMR VPATH
- editor for creating/running TMR ARNDT
- generate data for mass haul on long section
- create traffic islands
- create guide posts to AUSTROAD standard
- lots of generating strings by Xfalls
- more roads macros

For the options see

- Components 20.9 Components
- Create roads 20.8.1 Create Roads
- Design checker 20.8.2 Design Checker
- Stopping distance 20.8.3 Stopping Distance
- Trarr 20.8.4 Trarr
- Vehicle path 20.8.5 Vehicle Path
- ARNDT editor 20.8.6 ARNDT Editor
- Mass haul 20.8.7 Mass Haul
- Traffic islands 20.8.8 Traffic Islands
- Guide post creator 20.8.10 Guide Post Placement
- String by xfall and grade 20.8.11 String by Xfall and Grade
- More 20.8.12 More Roads
20.8.1 Create Roads

Position of menu:  Design =>Roads =>Create roads

The Create roads functions allow the user to start with a model of road centrelines with vertical geometry, and unique string name.

The centrelines can then be tagged with the width of the roads, left and right turn radii for any intersections and the definitions of any culdesacs at the end of a centreline.

The Create option will then create the left and right edges of the roads, create kerb returns and any intersections and the appropriate culdesacs.

For example

Initial Network of Centrelines
Road Network After Running the Roads Option

Blow Up of an Intersection
The Create Roads walk-right menu is

Create Roads
Create roads
V10 Create roads

Create Roads
V10 Create Roads - superseded

See

Create Roads 20.8.1.1 Create Roads - Enhanced
V10 Create roads 20.8.1.2 V10 Create Roads
20.8.1.1 Create Roads - Enhanced

Position on menu: Design => Roads => Create => Create Roads - Enhanced

The Create Roads - Enhanced panel is a total rewrite of Create Roads with many new features including:

(a) Either templates or snippets can be used to define the roads, intersections and kerbs.
(b) Wherever possible computators have been used to define kerb returns and culdesacs, and Smart Start and End modes in the Apply MTFs rather than chainage values.
(c) There is now a separate template for the left and right side of the road but unlike Create Roads, there is no separate Carriageway template.
(d) There are default values for culdesacs.
(e) A kerb can be frozen without freezing the roads.
(f) Snippets can use the boxing defined in the Boxing tab or snippets can do their own boxing. But if you do both then you are on your own.
(g) Left and Right prefix to use when creating the Apply MTFs.

Selecting Create Roads - Enhanced brings up the Create Roads - Enhanced panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function</td>
<td>function box</td>
<td>available create roads</td>
<td>enhancement functions</td>
</tr>
</tbody>
</table>

**Available tabs**

- Go to Design tab
- Go to Outputs tab
- Go to Boxing tab
- Go to Tins tab
- Go to Visualisation tab
- Go to Defaults tab
- Go to Buttons at bottom

**Design tab**

**Centrelines**

- model box
- available models

The model of the centreline lines that are to be processed to create roads, intersections and culdesac. Each centreline must have a unique name and vertical geometry.

After the Centreline model is selected either from the pop-up or by entering a model name and pushing the <Enter> key, the centrelines are analysed to see if left and right kerbs are possible (centreline ending on another serenely), if a culdesac is possible (end of a centreline) etc and then all the centrelines are listed in a Property Sheet on the bottom of the panel.

The entry for each centreline is where you enter values to override the defaults for road width, kerb radius, culdesac parameters etc. This information is then stored in the function rather than as attributes on the centreline strings.

**Road grid** - list of all the centrelines

**Road**

- centreline name

**Frozen**

- tick box
if ticked, the centreline is frozen out of the automatic Create Roads process.

For a frozen centreline, when the Create Roads function is run, the Apply MTF for that centreline is deleted and re-created. However any existing Apply MTF for that centreline will be run. Kerb returns are still calculated using the lip line create by running the existing Apply MTF for the frozen centreline. Hence the mtf for a frozen centreline can be modified and the changes will not be deleted when the Create Roads function is recalced.

Natural surface tin

method of naming the kerb returns

Kerb returns model model box available models
model for all the kerb returns

Kerb returns Apply MTF strings model model box available models
model for all the strings produced by the kerb return Applies

Kerb returns Apply MTF sections model model box available models
model for all the x-sections produced by the kerb return Applies

Apply MTF map file map file box available map files
if not blank, the name of the map file to use in the created Apply MTFs

Output chain chain box available chain files
if not blank, a chain is created of all the Apply MTFs that are run by the Create Roads - Advanced panel in the order that they need to be run.

Go to the next tab Boxing tab or return to Available tabs

Boxing tab
boxing can be created for all the road and kerb return strings. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road/kerb return centrelines.
Create boxing  tick box
if ticked, boxing is applied for all the road and kerb returns. The boxing definitions must have a
common centreline name in them which will be replaced by the name of each of the road centrelines or
kerb returns.

Default boxing file  file box
*.blf files

Default boxing CL delimiter  text box
common name in each boxing definition which will be replaced by the name of each road/kerb return
centreline

Model stem for boxing strings  text box
pre*post text to use with the road/kerb return function name for boxing string models

Boxing sections  text box
pre*post text to use with the road/kerb return function name for boxing section models

Boxing kerb return sections and strings in one model  tick box
if ticked, the strings for all the kerb return Applies are place in one model rather than one model for
each kerb return. Similarly, the sections for all the kerb return Applies are placed in the one model.
If not ticked, the model names are created in the same way as for the road centrelines. That is, the
Model stem for boxing strings and sections are used with the kerb return function name and the layer
stems to produce the kerb return boxing strings and sections models.

Model name for boxing kerb strings  model box
available models
when only one model (per layer) for the box kerb strings is used - the base name for the model of kerb
strings created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.

Model name for boxing kerb sections  model box
available models
when only one model (per layer) for the box kerb sections is used - the base name for the model of kerb
sections created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.

Boxing Layer 1-8 in the grid:
if non blank, boxing strings and sections will be created for that layer.
The last boxing layer is also referred to as the subgrade layer.

Layer stem  text box
for this boxing layer, the pre*post text used when naming models for boxing sections and strings.

Road - LHS  text box
for this boxing layer, the boxing definition to use on the left hand side of road centrelines

Road - RHS  text box
for this boxing layer, the boxing definition to use on the right hand side of road centrelines

Kerb return  text box
for this boxing layer, the boxing definition to use on the kerb returns
**Intersection - LHS**
Text box

For this boxing layer, the boxing definition to use on the left hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

**Intersection - RHS**
Text box

For this boxing layer, the boxing definition to use on the right hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Go to the next tab **Tins tab** or return to **Available tabs**

if ticked, draw the triangles of a tin as solid colour on the view

Tin colour to use for cut polygons colour box available colours
colour to use for all the cut polygons

Tin colour to use for fill polygons colour box available colours
colour to use for all the fill polygons

Tin colour to use for transition polygons colour box available colours
colour to use for all the polygons in neither cut nor fill

Go to the next tab Defaults tab or return to Available tabs

Defaults tab

Roads

Road width real box 3.5 measures pop up
width to be used for the left and right side of the road if one hasn’t been defined for any centrelines

Section separation real box 5 measures pop up
chainage distance to use for the Applies created for the roads along the centrelines

Chord/Arc tolerance real box 0.01 measures pop up
chord to arc tolerance to use in the Applies for the centrelines.

Kerb returns

Kerb radius real box 5 measures pop up
radius to use for filleting between any centrelines that don’t have a left or right radius defined

Section separation real box 1 measures pop up
chainage distance to use to use for the Applies that are created for the kerb returns

Chord/Arc tolerance real box 0.001 measures pop up
chord to arc tolerance to use for the Applies that are created for the kerb returns

Culdesacs
**Bulb radius**  
real box 9 measures pop up  
radius of the bulb of the culdesac

**Bulb offset**  
real box measures pop up  
offset of the centre of the culdesac bulb from the centreline.

**Left width**  
real box 3.5 measures pop up  
width of the left hand side of the throat of the culdesac

**Right width**  
real box 3.5 measures pop up  
width of the right hand side of the throat of the culdesac

**Left radius**  
real box 15 measures pop up  
fillet radius of the curve on the left hand side going from the beginning of the culdesac to either the bulb of the culdesac, or onto the tangent between this curve and the bulb of the culdesac.

**Right radius**  
real box 15 measures pop up  
fillet radius of the curve on the right hand side going from the beginning of the culdesac to either the bulb of the culdesac, or onto the tangent between this curve and the bulb of the culdesac.

**Left tangent**  
real box measures pop up  
if non zero, there is a straight line of this length that is the tangent between the fillet curve on the left hand side at the beginning of the culdesac and the bulb of the culdesac. This can not be a negative value.

**Right tangent**  
real box measures pop up  
if non zero, there is a straight line of this length that is the tangent between the fillet curve on the right hand side at the beginning of the culdesac and the bulb of the culdesac. This can not be a negative value.

**Projection**  
real box measures pop up  
if non zero, the end of the centreline with the culdesac on it is extended by this distance. The centre of the culdesac bulb is then placed at the perpendicular distance of **Bulb offset** from the extended point.

Go to the next tab  **Buttons at bottom** or return to  **Available tabs**

**Buttons at bottom**

**Create** button  
run the option and create the road network.

Return to  **20.8.1 Create Roads**
20.8.1.2 V10 Create Roads

The Create Roads walk-right menu is

construct the roads network

file for error messages

Boxing tab

boxing can be created for all the road and kerb return strings. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road/kerb return centrelines.

Create boxing tick box

if ticked, boxing is applied for all the road and kerb returns. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road centrelines or kerb returns.

Default boxing file file box *.blf files

file of boxing file definitions

Default boxing CL delimiter input

common name in each boxing definition which will be replaced by the name of each road/kerb return centreline

Model stem for boxing strings input

pre*post text to use with the road/kerb return function name for boxing string models
Boxing sections  
input  
pre*post text to use with the road/kerb return function name for boxing section models

Boxing kerb return sections and strings in one model  
tick box  
if ticked, the strings for all the kerb return Applies are place in one model rather than one model for each kerb return. Similarly, the sections for all the kerb return Applies are placed in the one model. If not ticked, the model names are created in the same way as for the road centrelines. That is, the Model stem for boxing strings and sections are used with the kerb return function name and the layer stems to produce the kerb return boxing strings and sections models.

Model name for boxing kerb strings  
input  
when only one model (per layer) for the box kerb strings is used - the base name for the model of kerb strings created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.

Model name for boxing kerb sections  
input  
when only one model (per layer) for the box kerb sections is used - the base name for the model of kerb sections created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.

Boxing Layer 1-8 in the grid:  
if non blank, boxing strings and sections will be created for that layer. The last boxing layer is also referred to as the subgrade layer.

Layer stem  
input  
for this boxing layer, the pre*post text used when naming models for boxing sections and strings.

Road - LHS  
input  
for this boxing layer, the boxing definition to use on the left hand side of road centrelines

Road - RHS  
input  
for this boxing layer, the boxing definition to use on the right hand side of road centrelines

Kerb return  
input  
for this boxing layer, the boxing definition to use on the kerb returns

Intersection - LHS  
input  
for this boxing layer, the boxing definition to use on the left hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Intersection - RHS  
input  
for this boxing layer, the boxing definition to use on the right hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

- angle for nulling the triangles

**Nulling length**
- input
- length for nulling the triangles

**Null Seed points:**

**Seed X/Y**
- input
- X/Y coordinate of a nulling seed point

**Seed Point**
- button
- select a seed point for nulling the tins. The X and Y coordinates are written to the Seed X/Y grid

**Visualisation tab**

**Create visualisation**
- tick box
- if ticked, the road tin is processed for visualisation

**Apply texture map to tin**
- tick box
- if ticked, the texture map is applied to the road tin

**Draw road tin as solid on view**
- tick box

**Tin colour to use for cut polygons**
- colour box
- colour to use for all the cut polygons

**Tin colour to use for fill polygons**
- colour box
- colour to use for all the fill polygons

**Tin colour to use for transition polygons**
- colour box
- colour to use for all the polygons in neither cut nor fill

**Freezing tab**

**Colour for the frozen sections**
- colour box
- colour to use for the sections of frozen strings. In any view, this gives a quick way of identifying frozen roads.

**Road grid**
- list of all the centrelines

**Element**
- centreline name
- available colours

**Frozen**
- tick box
- if ticked, the centreline is frozen out of the automatic Create Roads process.

For a frozen centreline, when the **Create Roads** function is run, the Apply MTF for that centreline is deleted and re-created. However any existing Apply MTF for that centreline will be run. Kerb returns are still calculated using the lip line create by running the existing Apply MTF for the frozen centreline. Hence the mtf for a frozen centreline can be modified and the changes will not be deleted when the Create Roads function is recalced.
Note - if the two roads used to define a kerb return are both frozen, then the kerb return is automatically frozen and the kerb return is not deleted and recreated when the Create Roads function is recalced. However the existing Apply MTF for the frozen kerb return is run on each recalc.

Buttons at bottom

Create button

run the option and create the road network.

Continue to 20.8.1.2.2 Create Roads - Setup or return to 20.8.1.2 V10 Create Roads.
20.8.1.2.2 Create Roads - Setup

**Position of option on menu:**  Design => Roads => Create => Create Roads - Setup

In the **Create Roads - Setup** panel there are default values for the road width and road crossfall and turn radius.

If a different road width or crossfall, or a different left turn radius or right hand radius is required, the **Create Roads - Setup** option is used to define the different information for any centreline. **Create Roads - Setup** is also used to define culdesacs.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Road Setup tab</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Centreline</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

used to set the left and right turn radii, and the width of the road. This option is used twice to set the different radii for each end of a road by picking the centreline close to the end that is to have the left and right turn radii defined. The left and right turn radii can be different for each end of an alignment.

Road width
width of one side of the road for the selected centreline.

**LHS turn radius**

radius to use for filleting between any centrelines on the left.

**RHS turn radius**

radius to use for filleting between any centrelines on the right.

**Set button**

store the given values in the panel with the selected centreline.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Culdesac Setup tab</strong></td>

<tr>
<td>Bulb radius</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>radius of the culdesac bulb</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Bulb offset input
offset of the culdesac bulb

Right fillet input
radius of the fillet between the bulb and the right hand side of the road

Left straight input
distance between the left fillet and the bulb

Right straight input
distance between the right fillet and the bulb

Set button
store the panel values the selected centreline.

Continue to 20.8.1.2.3 Create Roads - Kreturns Convert or return to 20.8.1.2 V10 Create Roads.
20.8.1.2.3 Create Roads - Kreturns Convert

Position of option on menu: Design => Roads => Create => Kret Convert

This macro is to be used in conjunction with the Create Roads.

Once Create Roads has been run, this macro will convert all the SA kerb returns to Element method (in both horizontal and vertical).

The horizontal parts are referenced to the appropriate road centreline, using segment computators and a free arc radius.

The vertical is a combination of a fixed grade at the start and end, with a compound parabola.

The fields and buttons used in this panel have the following functions.

<table>

Field Description Type Defaults Pop-Up
Road tin  tin box  available tins
  tin of the road design

Terrain tin  tin box  available tins
  tin of the terrain

Interval  input
  interval to calculate sight lines

Start chainage
  if non blank, start chainage for producing the Trarr file.
  if blank, start at the beginning of the centreline string.

End chainage
  if non blank, end chainage for producing the Trarr file.
  if blank, go to the end of the centreline string.

Maximum sight distance  input
  maximum distance to try and calculate sight lines

Trial interval  input
  interval to move ahead to test sight distance to

Barrier distance  input
  if sight distance is less than this value then a barrier line is required

85%le speed  input
  85 percentile speed (to write to the Trarr file)

Eye height  input  1.3
  height of the eye point above the picked string

Target height  input  0.3
  height of the target point above the picked string

Model for sight lines  model box  available models
  if non blank, the sight lines are kept and placed in this model

Colour  colour box  available colours
  colour of the sight lines

Trarr file  file box  *.rpt files
  if non blank, a Trarr file of this name is produced

Centreline  string-select
  string to be used for placing the eye and target points and calculating sight distance, is selected from a view.

Polygon  string-select
  boundary polygon for the road tin

Sight  button
  calculate sight lines and write out a Trarr file
20.8.4.2 Trarr input

Position of option on menu: Design => Roads => Trarr => Trarr input

Option to read a TRARR file.

Please contact 12d Solutions Pty Ltd if you wish to use this option.

20.8.5 Vehicle Path

Position of menu:  Design =>Roads =>Vehicle Path

The vehicle path option is used to interface with the vehicle path program Vpath, written by the Queensland Department of Transport and Main Roads. Vpath can be obtained from the Queensland Department of Transport and Main Roads.

The Vpath program is fully described in its own Manual available from Queensland Department of Transport and Main Roads.

To run Vpath from within 12d Model the environment variable WINDOWS_VEHICLE_PATH_4D is set to point to the folder where the Windows Vpath executable is located.

This can be set manually or done through the Edit Environment Variables panel.

WINDOWS_VEHICLE_PATH_4D   folder-path

On selecting the Vehicle Path option, the Vehicle Path panel is displayed. If the environment variable is not set the Edit Environment Variables panel will be displayed on the screen.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

<tr>
<td><em>if ticked the collated boundary string is copied to the swept path model.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Vehicle position hatching</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
the strings tracing out the vehicle position can be hatched.

**Name**

name of the vehicle position hatching.

**Model**

model for the vehicle position hatching.

**Spacing**

spacing of the vehicle position hatching.

**Colour**

colour of the vehicle position hatching.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vis Tab</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The *Vis* tab is used to create a visualisation from the generated strings.

**Drape tin**

*the tin to drape the generated string onto to create the visualisation*

**Swept extrude**

*the extrusion to use for the swept path strings*
Steer extrude

the extrusion to use for the steering path strings

Veh pos extrude

the extrusion to use for the vehicle position strings

Run Vehicle Path button

run the Vpath program and load the results back into the models given in the panel fields.

Vehicle Path supports up to 20 IPs. A warning message will be displayed if this is exceeded and no data will be produced.

Vehicle Path only supports tangential straight/curve and curve/curve geometry. A warning message will be displayed if this criteria is not met and no data will be produced.
20.8.6 ARNDT Editor

Position of menu: Design => Roads => ARNDT Editor

This editor allows you to create or edit files for ARNDT (A Roundabout Numerical Design Tool) files. It can also interface directly with ARNDT to create geometry and generate reports.

Selecting ARNDT Editor brings up the ARNDT panel.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARNDT file</td>
<td>file</td>
<td>the ARNDT file to read or write</td>
<td></td>
</tr>
<tr>
<td>Read</td>
<td>button</td>
<td>reads the ARNDT file</td>
<td></td>
</tr>
<tr>
<td>New leg</td>
<td>button</td>
<td>creates a new leg for the roundabout</td>
<td></td>
</tr>
<tr>
<td>Delete leg</td>
<td>button</td>
<td>deletes the currently selected leg</td>
<td></td>
</tr>
<tr>
<td>Add curve</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
adds a new entry curve to the selected leg

**Delete curve** button

deletes the selected entry curve

**Write** button

writes the *ARNDT* file

**Load geometry** button

options for loading geometry via *ARNDT* and generating report files

**Central Island**

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Central island radius</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the radius of the central island</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Circulating width</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the offset from the radius of the circulating string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong># of circulating lanes</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the number of lanes circulating the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Edge type**

_the edge type for the central island (Kerbing or Edge Line)_

**Legs Node**

The **Leg node**, for each leg of the roundabout, allows you to modify parameters for that leg.

---

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approach carriageway?</td>
<td>choice box</td>
<td>yes, no</td>
<td></td>
</tr>
<tr>
<td>Departure carriageway?</td>
<td>choice box</td>
<td>yes, no</td>
<td></td>
</tr>
</tbody>
</table>

 whether or not there is an approach carriageway (yes or no)  
 whether or not there is a departure carriageway (yes or no)  

**Bearing**

_the bearing of the leg_

**Offset**

_the offset of the leg from the centre of the roundabout_
This defines the properties for the approach carriage of the leg, if there is an approach.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Approach details</strong></td>
<td></td>

<td></td>
<td></td>
</tr>
<tr>
<td><em>the type of edging for the right edge of the approach</em></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Curve details - left edge

Radius
the radius of the left edge of the approach

Edge type
the type of edging for the left edge of the approach

Leg Departure Node
This defines the properties for the departure carriageway of the leg, if there is a departure.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Departure details</td>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The width of the departure carriageway

the number of lanes in the departure carriageway
Offset to median edge
   the offset of the departure from the median

Curve details - right edge
  Radius
   the radius of the right edge of the departure
  Edge type
   the type of edging for the right edge of the departure

Curve details - left edge
  Radius
   the radius of the left edge of the departure
  Edge type
   the type of edging for the left edge of the departure

Approach Curves Node
This node defines the setting for each approach curve. New approach curves can be added to a leg by clicking the Add curve button. There are two methods for defining a curve - either by arc details or start tangent.

Approach curves are only defined by their right hand edge.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>

**Right Edge Details**

**Defined by**
choice box

*how the curve is defined*

**Curve type**
the type of curve (Reverse or Compound)

**Radius**
the radius of the right edge - only available when defined by Arc details

**Length**
the length of the right edge - only available when defined by Arc details
Tangent bearing
the bearing of the tangent to the curve - only available when defined by Start tangent details

Tangent offset
the offset of the tangent to the roundabout - only available when defined by Start tangent details

Edge type
the type of edging for the right edge (Kerbing or Edge Line)

Left Edge Details

Curve type
the type of curve. This field is read only.

Radius
the radius of the curve, if using Arc details. This field is read only.

Length
the length of the curve, if using Arc details. This field is read only.

Tangent bearing
the bearing of the tangent to the curve, if using Start tangent details. This field is read only.

Tangent offset
the offset of the tangent, if using Start tangent details. This field is read only.

Edge type
the type of edging for the right edge (Kerbing or Edge Line)

Leg Speed & Traffic Node
This node defines the speed and traffic details for each leg of the roundabout.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed environment</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Annual average daily traffic flow</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The speed environment of the carriageway

Annual average daily traffic flow

To leg 1

the average daily traffic flow (vehicles per day) leaving leg 1 and returning to leg 1

To leg 2

the average daily traffic flow (vehicles per day) leaving leg 1 and exiting via leg 2

This is repeated for each leg of the roundabout

Accident Parameters

This defines various parameters used by ARNDT for calculating risks and costs for the roundabout. These parameters are requested by the ARNDT program. Please see the ARNDT documentation for more details on these parameters.
Load Geometry / Export to ARNDT

Selecting **Load Geometry** brings up the **Export to ARNDT** panel.

This panel allows you to load geometry from **ARNDT**, based on the file you are editing, as well as optionally generating reports.

The fields and buttons used in this panel have the following functions:
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Position</strong></td>
<td></td>
<td>the x and y co-ordinate for the roundabout</td>
<td></td>

</tr>
</tbody>
</table>
20.8.7 Mass Haul

Position of menu:   Design => Roads => Mass haul

The option under Mass haul reads a volumes report and creates Mass Haul information.

The Mass haul walk-right menu is

```
Mass Haul
Mass haul analyser
Mass haul
```

mass haul analysis from volumes report
create mass haul string and report from volumes report

For Mass haul analyser, go to 20.8.7.1 Mass Haul Analyser 20.8.8.3 Mass Haul String and Report

20.8.7.1 Mass Haul Analyser

Position of option on menu:   Design => Roads => Mass haul => Mass haul analyser

The Mass Haul Analyser option calculates the mass haul along an alignment using the volume report files from various 12d functions.

To operate the option a volume report file is selected and the report file type set to match the report type. The Calculate tabulation button will then calculate the bulking factors and add the special chainage items to the tabulation. After this the Calculate Mass Haul option will push excess fill material forwards along the alignment to a matching cut item with the same accumulated balance and push excess cut material backwards along the alignment to a matching fill item.

Where the cost of Haul cost is greater than the Borrow Plus Spoil cost the option will skip that material.

The option performs this operation several times passing back over the alignment until no more haul material can be found. It then borrows and spoils the remaining material.

The macro is intended to provide an analysis methodology to the designer to enable them to quickly review where material is available in an alignment in order to optimise the alignment with respect to potential cost savings. It is also a useful tool for training in the techniques of mass haul. The final mass haul graph should be exported for detailed analysis using the Design=>Roads=>Mass haul => Mass Haul option.

Selecting the Mass haul analyser option brings up the Mass Haul Analyser panel.
Configuration Tab
This tab is used to set up the parameters to be used by the macro.

The fields and buttons used in this panel have the following functions:

Special Chainages Tab

This tab is used to add additional items to the tabulation.

The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Chainage | chainage box | the chainage that the special item is to be applied
Type | choice box | borrow, spoil, break | the type of special item to be applied
Loose Volume | | the volume of loose material in the special item
Retrieve | button | retrieve special chainages into the grid control
Store Chainages | button | save special chainages from the grid control
### Tabulation Tab

This tab displays the processed cut and fill volumes after bulking factors have been applied.
Haul Costs Tab

This tab displays the processed haul volumes after mass haul has been applied.
Borrow Items Tab

This tab displays the remaining borrow volumes after mass haul has been applied.
Spoil Items Tab

This tab displays the remaining spoil volumes after mass haul has been applied.
Mass Haul Diagram Tab

This tab displays a graph of the resulting mass haul diagram. For information on several features of the graph please go to 20.8.8.2 Graph Box Operation.
Summary Tab

This tab displays a summary of the costs calculated. These costs can be used to compare trends in the efficiency of the mass haul between different designs. The costs given are not intended to be the final cost of the mass haul as further analysis will be required however they do give an indication as to the efficiency of a design with regard to mass haul.

</tbody>
</table>

20.8.8.1 Selecting The Right Report File Type

The report file type option allows the user to use various report file types generated by 12d.

Go to

- NATURAL SURFACE TO DESIGN VOLUMES
- NATURAL SURFACE TO SUBGRADE VOLUME
- TIN-TIN VOLUME REPORT
- STRING TIN-TIN VOLUME REPORT
- TIN TO HEIGHT VOLUME REPORT
- STRING TIN TO HEIGHT VOLUME REPORT
- SECTIONS TO HEIGHT VOLUME REPORT
- SECTIONS TO SECTIONS VOLUME REPORT

Each type is selected to cause the option to look for certain key phrases in the report file at the top of each cut/fill/balance tabulation.

NATURAL SURFACE TO DESIGN VOLUMES

This choice is selected to use the natural surface to design volumes table generated by the "Apply MTF" function. This function must be run first from the Design=>Apply=>Apply MTF menu.
item.

**NATURAL SURFACE TO SUBGRADE VOLUME**

This choice is selected to use the natural surface to subgrade volumes table generated by the "Apply MTF" function. This function must be run first from the Design=>Apply=>Apply MTF menu item. In order to use this option boxing must be calculated in the Apply MTF function.

**TIN-TIN VOLUME REPORT**

This choice is selected to use the tin to tin volumes table generated by the Apply MTF function. This function must be run first from the Design=>Volumes=>End Area=>Tin to tin menu item.

**STRING TIN-TIN VOLUME REPORT**

This choice is selected to use the string tin to tin volumes table generated by the "Apply MTF" function. This function must be run first from the Design=>Volumes=>End Area=>String tin to tin menu item.

**TIN TO HEIGHT VOLUME REPORT**

This choice is selected to use the tin to height volumes table generated by the "Apply MTF" function. This function must be run first from the Design=>Volumes=>End Area=>Tin to height menu item.

**STRING TIN TO HEIGHT VOLUME REPORT**

This choice is selected to use the string tin to height volumes table generated by the "Apply MTF" function. This function must be run first from the Design=>Volumes=>End Area=>String tin to height menu item.

**SECTIONS TO HEIGHT VOLUME REPORT**

This choice is selected to use the sections to height volumes table generated by the "Apply MTF" function. This function must be run first from the Design=>Volumes=>End Area=>Sections to height menu item.

**SECTIONS TO SECTIONS VOLUME REPORT**

This choice is selected to use the sections to sections volumes table generated by the "Apply MTF" function. This function must be run first from the Design=>Volumes=>End Area=>Sections to sections menu item.

**20.8.8.2 Graph Box Operation**

Each graph box has a number of graph options available as buttons (graph buttons) at the top of the graph. To select one of the graph buttons, click LB whilst the cursor is over the button.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>This option sets the graph box to pick mode. When in this mode the graph box will show various information as the mouse hovers over a chainage in the graph.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The loose material tabulation item number, the available cut and fill within that chainage interval are shown in the message area at the bottom of the panel and the borrow, spoil and haul amounts are graphically shown in the graph highlighting the source chainage and destination chainage.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Fit button</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>This option sets the graph box to fit mode. This option will calculate the extents of the items plotted in the graph box and zoom out to show them. After the fit is complete the graph will return to pick mode.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Pan button</td>
<td></td>
<td></td>

</tr>
<tr>
<td>Horizontal Scale real box</td>
<td>1000</td>
<td></td>
<td>set the horizontal scale to be used to plot the data</td>
</tr>
</tbody>
</table>
20.8.8.3 Mass Haul String and Report

Position of option on menu: Design => Roads => Mass haul => Mass haul

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Existing volume report file</td>
<td>file box</td>
<td>*.rpt files</td>

plot the data

Finish button

closes the panel
cut/fill compaction factor for any chainages not in the compaction parameter file or if there is no file.

Apply compaction factor to choice box cut, fill

if cut, the cut volumes are multiplied by the compaction factors.
if fill, the fill volumes are divided by the compaction factors.

Model for mass haul string model box available models

model for the created mass haul string.

Colour for mass haul string colour box available colours

colour of the created mass haul string.

Report file input box

if non-blank, a mass haul volumes file is created.

Process button

run the option.

20.8.8.4 Format of the Compaction Parameter File

Format of the
// Sample cut/fill compaction parameter file - the file ending
is .mhf
// All lines starting with // are comments and blank lines are
ignored
//
// A range is specified by a start and end chainage and a compaction
factor.
// A compaction factor of 1.0 means there is no compaction.
// A compaction factor of 0.9 means that 1.0 cubic metres of cut is
equivalent
// to 0.9 cubic metres of fill due to compaction.

// format is
// Start_ch End_ch Compaction_factor
0 100 0.9
100 500 1.0
500 2000 1.1
20.8.9 Traffic Islands

**Position of menu:** File I/O => Roads => Traffic islands

The options under Traffic islands create a traffic island from three travel lines, offsets and nose radii, and also can apply a kerb profile around the island.

The Traffic islands walk-right menu is

- create a traffic island
- run a kerb profile around a traffic island

For

- Traffic island  **20.8.9.1 Create Traffic Island**
- Traffic island profile/tin  **20.8.9.2 Traffic Island Profile/Tin**
20.8.9.1 Create Traffic Island

**Position of option on menu:** Design => Roads => Traffic islands => Traffic Island

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. Drape the island onto a tin to give z-values and then apply a kerb profile to complete the island.

On selecting the traffic island option, the Island Create Splitter/Centre panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td></td>
<td>cyan</td>
<td></td>
</tr>
<tr>
<td>Create as Super Alignment</td>
<td></td>
<td>✔️</td>
<td></td>
</tr>
</tbody>
</table>

**Buttons at bottom**
Select strings select
select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.

Preview string select
draw the traffic island with the given parameters in the panel draw box.

Process button
create the alignment string

Island Create tab

Offset from travel lines input box
offset distance from the selected travel lines.

Radius at nose input box
radius of the corner of the traffic island between the selected travel lines.

Name name box available names
name of the created alignment string.

Model model box available models
model for the created alignment string.

Colour colour box available colours
colour of the created alignment string.

Create as super alignment tick box
if ticked, create the string as a super alignment.
If not ticked, create the string as an alignment.

Quick Island tab
the quick island tab produces a traffic island of fixed sides but with the given nose radii. The traffic island can be created as a super alignment that can then be easily moved around and modified.

Radius at nose input box
radius of the corner of the traffic island.

Name name box available names
name of the created alignment string.

Model model box available models
model for the created alignment string.

Colour colour box available colours
colour of the created alignment string.

Create as super alignment tick box
if ticked, create the string as a super alignment.
If not ticked, create the string as an alignment.

Position xyz select box
pick two points to indicate the direction that the island will be created.

Then click on Process to create the Traffic Island.

Kerb Profile tab
Use island alignment levels instead of Tin  

- if ticked, use the alignments own z-value instead of draping the alignment onto the tin.
- If not ticked, drape the alignment onto the tin to get z-values.

Offset kerb face/top/back  

- input box
- offset for kerb face/top/back for the selected kerb type.

Height kerb face/top/back  

- input box
- height for kerb face/top/back.

Tin  

- tin box
- triangulation to drape the traffic island strings onto.

Kerb type  

- input box
- type of kerb to apply to the reference string of the traffic island. If type User is selected from the pop-up list, a file which defines the kerb profile can be selected and used.

File  

- file box
- file to read/write the user defined kerb type to.

Read  

- button
- read the given File to define a kerb type.

Save  

- button
- save the kerb parameters to the given File.
20.8.9.2 Traffic Island Profile/Tin

Position of option on menu: Design => Roads => Traffic islands => Traffic island profile/tin

This option applies a kerb profile, either from the 12d library or from a user defined file.

The template profile is applied to a Super Alignment, creating strings, and a triangulation.

The option is saved as a function within 12d and as a function can be re-run at any time if changes occur with the Super Alignment.

Some default kerb profiles are available under Kerb on the panel.

User defined kerbs are created by entering offset, height and string names in the fields in the draw box at the top of the panel, and then saved as a User Kerb Type file (*.ukt)

User Kerb Type files can then be written out, or read in as required.

On selecting the Traffic Island profile/tin, the New Island Create Function panel is displayed.

The fields and buttons used in this panel have the following functions.
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Function name</strong></td>
<td>function</td>
<td></td>
<td>available functions</td>
</tr>
<tr>
<td>name of the Island Create function</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Model Island Strings</strong></td>
<td>model box</td>
<td></td>
<td>available models</td>
</tr>
<tr>
<td>model for the created island strings</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Model Island Tin</strong></td>
<td>model box</td>
<td></td>
<td>model for the tin of the created island</td>
</tr>
<tr>
<td>name of the Island Tin</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Colour Island Paving</strong></td>
<td>input</td>
<td>paving</td>
<td>available colours</td>
</tr>
<tr>
<td>if non-blank, then the colour is used to colour the island triangulation within innermost kerb string (D)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Colour Island Tin</strong></td>
<td>input</td>
<td>concrete</td>
<td>available colours</td>
</tr>
<tr>
<td>if non-blank, then the colour is used to colour the island triangulation between the strings defined by A and D.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In the drawing area:

**A**

A string is created which is a copy of the reference string and given this name. It is added to the **Model Island Strings** model.

**B**

Name, offset and height from the reference string, of the first string of the island. It is added to the **Model Island Strings** model. If offset and height are both zero, then the string is not created.

**C**

Name, offset and height from the reference string, of the second string of the island. It is added to the **Model Island Strings** model. If offset and height are both zero, then the string is not created.

**D**

Name, offset and height from the reference string, of the third string of the island. It is added to the **Model Island Strings** model. If offset and height are both zero, then the string is not created.
Design Details

Kerb | choice box | Barrier Type A | Barrier Type A, Barrier Type B, Mountable, Semi-Mountable, User

selected kerb type is displayed in draw box above

If Kerb is User then the File field and the Read and Save buttons are made active, and are used to read in an existing user defined Kerb type, or to create a new one.

File | file box | files ending in .ukt
name of the user kerb type file (ukt) to read in or create

Read | button
Reads in the user defined kerb definition from the ukt file given in the File field and displays the profile and Offsets and Height in the draw box at the top of the Panel

Save | button
Writes out the kerb profile information (O and H values, and string names) as a user defined kerb, into the file given in the File field.

Reference | select pick
Select the reference alignment which will have the kerb profile applied to it to create the island. “pick with direction” in a clockwise manner as the kerb profile is always on the RHS.

Process | button
runs the option which created the island string and the coloured island tin

Note:
The New Island Create Function reads in the standard kerb profiles as templates and if required, creates a template from the ukt files. The function needs these templates because an apply is used (internally) to create the Island.
20.8.10 Guide Post Placement

Position of option on menu:  Design => Roads => Guide post creator

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Guide post creator brings up the Guide Post Placement panel.

20.8.11 String by Xfall and Grade

Position of option on menu:  Design =>Roads =>String by xfall and grade

This panel is used to create strings by a variety of methods using xfall from one string, or xfalls from two strings, either using a reference string to define where the xfall is measured, or perpendicular to selected strings. Some of the methods grade the created string.

Selecting String by xfall and grade brings up the Create by Xfall and Grade panel.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xfall type</td>

Xfall type choice box

methods for creating the new string. For the definition of each choice, go to 20.8.11.1 Xfall Types

Reference string
Hinge string
Secondary string
Offset, Xfall, Grade etc

which of these fields are present, and what they are for depends on the Xfall type.

Start/End mode choice box Start (ref)/End (ref)
defines the start/end chainages for creating the string.
The Start/End modes are the same as for the MTF modifiers. For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers.

20.8.11.1.1 1 String, Offset and Xfall

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

20.8.11.1.1 1 String, Offset and Xfall

This option requires a Hinge string, an Offset and Xfall, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to Reference string and at each chainage ch between the Start mode and the End mode, a section is taken normal (perpendicular) to the Reference string and cutting the Hinge string.

A vertex of a new string is created by going out from the Hinge string along the section at the given Offset and Xfall.

Positive Offset is defined as going to the right of the Hinge string when travelling in the direction of increasing chainage on the Reference string. Offset can be positive or negative.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string and at each chainage ch, a vertex of the new string is created by going out normal (perpendicular) to the Hinge string for the given Offset and Xfall.

Positive Offset is defined as going to the right of the Hinge string when travelling in the direction of increasing chainage on the Hinge string. Offset can be positive or negative.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.
20.8.11.1.2 1 String, Offset and Height

This option requires a **Hinge string**, an **Offset** and **Height**, and an **optional Reference string**.

**Reference String Selected**

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken normal (perpendicular) to the **Reference string** and cutting the **Hinge string**.

A vertex of a new string is created by going out from the Hinge string along the section at the given **Offset** and **Height**.

Continue to the next choice [20.8.11.1.2 1 String, Offset and Height](#) or return to [20.8.11 Xfall Types](#) or [20.8.11 String by Xfall and Grade](#).
Positive Offset is defined as going to the right of the **Hinge** string when travelling in the direction of increasing chainage on the **Reference** string. Offset can be positive or negative.

**Height** is added to the height on the Hinge string. Height can be positive or negative.

For information about the sign convention for offset and xfalls, go to [20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

---

**Reference String NOT Selected**

If a **Reference** string is NOT selected then the **Start mode** and **End Mode** refer to the **Hinge** string and at each chainage ch, a vertex of a new string is created by going out **normal** (perpendicular) to the **Hinge string** for the given **Offset** and **Height**.

Positive Offset is defined as going to the right of the Hinge string when travelling in the direction of increasing chainage on the Hinge string. Offset can be positive or negative.

**Height** is added to the height on the Hinge string. Height can be positive or negative.

For information about the sign convention for offset and xfalls, go to [20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).
20.8.11.1.3 1 String, Height and Xfall

This option requires a Hinge string, a Height and Xfall, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to Reference string and at each chainage ch between the Start mode and the End mode, a section is taken normal (perpendicular) to the Reference string and cutting the Hinge string.

A vertex of a new string is created by going out from the Hinge string along the section at the given Height and Xfall.
**Height** is added to the height on the Hinge string. Height can be positive or negative. Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

---

**Reference String NOT Selected**

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string and at each chainage ch, a vertex of a new string is created by going out normal (perpendicular) to the Hinge string for the given Height and Xfall.

Height is added to the height at that chainage on the Hinge string. Height can be positive or negative.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.
20.8.11.4 2 Strings, Xfall and Normal to Reference String or Hinge String

This option requires a Hinge and a Secondary string, a Xfall, and an option Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to Reference string and at each chainage (ch) between the Start mode and the End mode, a section is taken normal (perpendicular) to the Reference string and cutting the Hinge string and the Secondary strings.

On this section, the Xfall is taken from the Hinge and Secondary strings and a vertex of a new string created where the Xfalls intersect.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to Hinge string and at each chainage (ch), a section is taken normal (perpendicular) to the Hinge string and cutting the Secondary strings.

On this section, the Xfall is taken from the Hinge and Secondary strings and a vertex of a new string created where the Xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.
Continue to the next choice 20.8.11.5 2 Strings, Xfall and Normal to Both or return to 20.8.11 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.5 2 Strings, Xfall and Normal to Both

This option requires a Hinge and a Secondary string, a Xfall, and an option Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to Reference string and at each chainage ch between the Start mode and the End mode, a section is taken normal (perpendicular) to the Reference string and cutting the Hinge string, and the Xfall is taken from the cut with the Hinge string and along the section.

This is then intersected with a section normal to the Secondary string and with the given Xfall.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string.

At each chainage ch between the Start mode and the End mode, a section is taken normal (perpendicular) to the Hinge string and the Xfall is taken along this section.

This is then intersected with a section normal to the Secondary string and with the given Xfall.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

No Reference String

Positive Xfall is in the upward direction. Xfall can be positive or negative.
Continue to the next choice 20.8.11.1.6 2 Strings, 2 Xfalls and Normal to Reference String or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.6 2 Strings, 2 Xfalls and Normal to Reference String or Hinge String

This option requires a Hinge and a Secondary string, two Xfalls, and an option Reference string.

**Reference String Selected**

If a Reference string is selected then the Start mode and End Mode refer to the Reference string and at each chainage (ch) between the Start mode and the End mode, a section is taken normal (perpendicular) to the Reference string and cutting the Hinge string and the Secondary strings.

On this section, the xfall Pri xfall is taken from the Hinge string, and xfall Sec xfall from the Secondary string, and a vertex of a new string created where the two xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to Hinge string and at each chainage (ch), a section is taken normal (perpendicular) to the Hinge string and cutting the Secondary strings.

On this section, the xfall Pri xfall is taken from the Hinge string, and xfall Sec xfall from the Secondary string, and a vertex of a new string created where the two xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

No Reference String

Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice 20.8.11.1.7 2 Strings, 2 Xfalls and Normal to Both or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.7 2 Strings, 2 Xfalls and Normal to Both

This option requires a Hinge and a Secondary string, two Xfalls, and an option Reference.
string.

**Reference String Selected**

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string, and the xfall **Pri xfall** is taken from the cut with the Hinge string and along the section.

This is then intersected with a section **normal** to the **Secondary** string and with the xfall **Sec xfall**.

The new string is formed from the intersection points.

**Note** - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to **20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade**.

---

**Reference String NOT Selected**

If a **Reference** string is NOT selected then the **Start mode** and **End Mode** refer to the **Hinge** string.

At each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Hinge string** and the xfall **Pri xfall** is taken along this section.

This is then intersected with a section **normal** to the **Secondary** string and with the xfall **Sec xfall**.

The new string is formed from the intersection points.

**Note** - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to **20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade**.
Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice 20.8.11.1.8 1 String, Start RL and Grade, Fixed Offset or return to 20.8.11 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.8 1 String, Start RL and Grade, Fixed Offset

This option requires a Hinge string, a Start RL and forward Grade, an Offset, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge string. The vertices of the created string lie on these normals.

The plan position of the created vertices are given by going out from the Hinge string along the normal section for the given Offset.

The first vertex of the created string is on the normal to the Reference string at chainage Start mode, with an offset from the Hinge string of Offset and with a height of Start RL.
The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade $\text{Grade->}$ and going through the first vertex.
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Reference String NOT Selected
If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

The plan position of the created vertices are given by going out from the Hinge string along the normal section for the given Offset.

The first vertex of the created string is on the normal to the Hinge string at chainage Start mode, with an offset from the Hinge string of Offset, and with a height of Start RL.
The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade \textit{Grade->} and going through the first vertex.
Chapter 20  Design

20.8.11.1.9 1 String, Start RL and Grade, Fixed Xfall

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.9 1 String, Start RL and Grade, Fixed Xfall or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

This option requires a Hinge string, a Start RL and forward Grade, a Xfall, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge string. The vertices of the created string lie on these normals.

The first vertex of the created string is on the normal to the Reference string and has a height.
Start RL. The offset for the first vertex is calculated and is such that the given Xfall from Hinge string will give the vertex the height Start RL.

The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade Grade-> and going through the first vertex.

The offsets for the vertices are calculated and are such that the given Xfall from Hinge string will give the vertex the correct height for that chainage.
Roads

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

The first vertex of the created string is on the normal to the Hinge string and has a height Start RL. The offset for the first vertex is calculated and is such that the given Xfall from Hinge string will give the vertex the height Start RL.
The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade \( \text{Grade}-> \) and going through the first vertex.

The offsets for the vertices are calculated and are such that the given \( X\text{fall} \) from Hinge string will give the vertex the correct height for that chainage.
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.10 1 String, End RL and Grade, Fixed Offset or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.10 1 String, End RL and Grade, Fixed Offset

This option requires a Hinge string, an End RL and backward Grade, an Offset, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge string. The vertices of the created string lie on these normals.

The plan position of the created vertices are given by going out from the Hinge string along the
normal section for the given Offset.

The last vertex of the created string is on the normal to the Reference string at chainage End mode, with an offset from the Hinge string of Offset and with a height of End RL.

### Last Vertex of Created String

- **Reference string**
- **Hinge string**
- **Plan View**
- **Section View along a Normal to the Reference String at Chainage End Mode**

The heights of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative \(<\text{Grade}\) and going through the last vertex.

### Chainage-Height Diagram for the Created String

- Chainage of created string on normal at Start mode
- Chainage of created string on normal at Reference chainage ch
- Chainage of created string on normal at End mode
- Height on the created string at the chainage on the created string which corresponds to the normal at chainage ch on the Reference string
- Line with grade negative \(<\text{Grade}\)
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

The plan position of the created vertices are given by going out from the Hinge string along the normal section for the given Offset.

The last vertex of the created string is on the normal to the Hinge string at chainage End mode, with an offset from the Hinge string of Offset and with a height of End RL.
The heights of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative \(<\text{Grade}\) and going through the last vertex.
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.11 1 String, End RL and Grade, Fixed Xfall or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.11 1 String, End RL and Grade, Fixed Xfall

This option requires a Hinge string, an End RL and backward Grade, a Xfall, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge string. The vertices of the created string lie on these normals.

The last vertex of the created string is on the normal to the Reference string and has a height...
**End RL.** The offset for the last vertex is calculated and is such that the given Xfall from Hinge string will give the vertex the height End RL.

The heights of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative $<-\text{Grade}$ and going through the last vertex.
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

**Reference String NOT Selected**

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

The last vertex of the created string is on the normal to the Hinge string and has a height End RL. The offset for the last vertex is calculated and is such that the given Xfall from Hinge string will give the vertex the height End RL.
The heights of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative $<-\text{Grade}$ and going through the last vertex.
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.12 2 Strings, Start RL & Grade, Equal Width, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

### 20.8.11.12 2 Strings, Start RL & Grade, Equal Width, Normal to Reference or Hinge String

This option requires a Hinge and a Secondary string, a Start RL and forward Grade, and an optional Reference string.

#### Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge and the Secondary strings. The vertices of the created string lie on these normals.
On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade Grade-> and going through the point (normal to Start mode, Start RL).

Reference String NOT Selected
If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.
The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade \textit{Grade->} and going through the point (normal to Start mode, Start RL).

Continue to the next choice 20.8.11.13 2 Strings, Start RL & Grade, Equal Width and Normal to Both or return to 20.8.11 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.13 2 Strings, Start RL & Grade, Equal Width and Normal to Both
This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an **optional Reference** string.

**Reference String Selected**

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

**Note** - it may not be possible to find such an intersection point.

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal to Start mode, Start RL).

**Reference String NOT Selected**
If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the Secondary string is created that intersects in plan with the section from the Hinge string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

**Note** - it may not be possible to find such an intersection point.

---

**No Reference string**

![Diagram of No Reference string](image)

The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade \( \text{Grade}\rightarrow \) and going through the point (normal to Start mode, Start RL).

---

**Chainage-Height Diagram for the Created String**

![Diagram of Chainage-Height Diagram](image)

Continue to the next choice 20.8.11.14 2 Strings, End RL & Grade, Equal Width, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

**20.8.11.14 2 Strings, End RL & Grade, Equal Width, Normal to Reference or Hinge String**
This option requires a Hinge and a Secondary string, a End RL and backward Grade, and an optional Reference string.

**Reference String Selected**

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge and the Secondary strings. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative <-Grade and going through the point (normal to End mode, End RL).
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string and cutting the Secondary string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative $<-\text{Grade}$ and going through the point (normal to End mode, End RL).
20.8.11.15 2 Strings, End RL & Grade, Equal Width and Normal to Both

This option requires a Hinge and a Secondary string, an End RL and backward Grade, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the Secondary string is created that intersects in plan with the section from the Reference string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.
The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative \(-\text{Grade}\) and going through the point (normal to End mode, End RL).

Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the Secondary string is created that intersects in plan with the section from the Hinge string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.
The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative \(-\text{Grade}\) and going through the point (normal to End mode, End RL).

Continue to the next choice 20.8.11.1.16 2 Strings, Start RL & Grade, Equal Xfall, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.16 2 Strings, Start RL & Grade, Equal Xfall, Normal to Reference or Hinge String
This option requires a Hinge and a Secondary string, a Start RL and forward Grade, and an optional Reference string.

**Reference String Selected**

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge and the Secondary strings. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade \( \text{Grade->} \) and going through the point (normal at Start mode, Start RL).

![Chainage-Height Diagram for the Created String](image)

On the section normal to the Reference string at chainage ch, the plan position of the vertex (with the calculated height) is such that the absolute value of the xfall from the Hinge string to the vertex, and the vertex to the Secondary string, is the same. This gives the plan position of the new vertex of the new string.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string and cutting the Secondary string. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade Grade-> and going through the point (normal at Start mode, Start RL).

On the section normal to the Hinge string at chainage ch, the plan position of the vertex (with the calculated height) is such that the absolute value of the xfall from the Hinge string to the vertex, and the vertex to the Secondary string, is the same. This gives the plan position of the new vertex of the new string.
Chapter 20 Design

20.8.11.1.17 2 Strings, Start RL & Grade, Equal Xfall and Normal to Both

This option requires a Hinge and a Secondary string, a Start RL and forward Grade, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge string. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade Grade-> and going through the point (normal at Start mode, Start RL).

Continue to the next choice 20.8.11.1.17 2 Strings, Start RL & Grade, Equal Xfall and Normal to Both or return to 20.8.11 Xfall Types or 20.8.11 String by Xfall and Grade.
On the section at Reference chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the normal to the Secondary string, is the same.

That is, a normal to the Secondary string is created that intersects in plan with the section from the Reference string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

**Note** - it may not be possible to find such an intersection point.

**Reference String NOT Selected**

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade Grade-> and going through the point (normal at Start mode, Start RL).
On the section at Hinge chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the normal to the Secondary string, is the same.

That is, a normal to the Secondary string is created that intersects in plan with the section from the Hinge string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.

Continue to the next choice 20.8.11.18 2 Strings, End RL & Grade, Equal Xfall, Normal to Reference or Hinge String or return to 20.8.11 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.18 2 Strings, End RL & Grade, Equal Xfall, Normal to Reference or Hinge String
This option requires a **Hinge** and a **Secondary** string, a **End RL** and backward **Grade**, and an **optional Reference** string.

The height of the vertex (of the new string) on the section at chainage \( ch \), is in (Reference string chainage, height) space, on the line with grade of negative \(<-\text{Grade}\) and going through the point (End mode, End RL).

That is,

\[
\text{"height at } ch\text{" } = \text{End RL } - \text{<Grade } * (\text{End mode } - \text{ch})/(\text{End mode } - \text{Start mode})/100
\]

On the section normal to the Reference string at chainage \( ch \), the position of the vertex with the calculated height is such that the absolute value of the xfall from the Hinge string to the vertex, and the absolute value of the xfall from the vertex to the Secondary string, are the same.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to Hinge string and at each chainage (ch), a section is taken normal (perpendicular) to the Hinge string and cutting the Secondary strings.

The height of the vertex (of the new string) on the section at chainage ch, is in (Hinge string chainage, height) space, on the line with grade of negative $<\text{Grade}$ and going through the point (End mode, End RL).

That is,

the "height at ch" = End RL - $<\text{Grade}$ * (End mode - ch)/(End mode - Start mode)/100

On the section normal to the Hinge string at chainage ch, the position of the vertex with the calculated height is such that the absolute value of the xfall from the Hinge string to the vertex, and the absolute value of the xfall from the vertex to the Secondary string, are the same.
Continue to the next choice 20.8.11.1.19 2 Strings, End RL & Grade, Equal Xfall and Normal to Both or return to 20.8.11 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.19 2 Strings, End RL & Grade, Equal Xfall and Normal to Both

This option requires a **Hinge** and a **Secondary** string, an **End RL** and backward **Grade**, and an **optional Reference** string.

Reference String Selected

If a Reference string is selected then the **Start mode** and **End Mode** refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge string. The vertices of the created string lie on these normals.

The height of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<Grade** and going through the point (normal to End mode, End RL).
On the section at Reference chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the normal to the Secondary string, is the same.

That is, a normal to the Secondary string is created that intersects in plan with the section from the Reference string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

**Note** - it may not be possible to find such an intersection point.

Reference String NOT Selected

If a Reference string is NOT selected then the **Start mode** and **End Mode** refer to the **Hinge string**, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).
On the section at Hinge chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the normal to the Secondary string, is the same.

That is, a normal to the Secondary string is created that intersects in plan with the section from the Hinge string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

**Note** - it may not be possible to find such an intersection point.

Continue to the next choice 20.8.11.1.20 2 Strings, Start Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.20 2 Strings, Start Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String
This option requires a Hinge and a Secondary string, a Start delta height and forward Grade, and an optional Reference string.

**Reference String Selected**

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge and the Secondary strings. The vertices of the created string lie on these normals.

The first vertex of the created string is on the normal to the Reference string at chainage Start mode, and its height is the height of the Hinge string on the Start mode normal, plus Start delta height.

\[
\text{height of first vertex} = \text{height of Hinge string on Start mode normal} + \text{Start delta height}
\]

The plan position of the first vertex is on the Start mode normal, and with an offset from the Hinge string such that the Xfall is equal to the xfall between the Hinge and Secondary strings, and the change of height from the Hinge string is Start delta height.

The heights of the subsequent vertices of the created string are defined in (created string...
chainage, height) space, and lie on the line with grade \textit{Grade->} and going through the first vertex.

The plan position of the vertex of the created string on the normal at Reference chainage \textit{ch} is such that it is on the line through the Hinge string with \textit{xfall} equal to the \textit{xfall between the Hinge and Secondary strings}, and having the calculated height.

Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string and cutting the Secondary string. The vertices of the created string lie on these normals.

The first vertex of the created string is on the normal to the Hinge string at chainage Start mode, and its height is the height of the Hinge string on the Start mode normal, plus Start delta...
height.

height of first vertex = height of Hinge string on Start mode normal + Start delta height

The plan position of the first vertex is on the Start mode normal, and with an offset from the Hinge string such that the Xfall is equal to the xfall between the Hinge and Secondary strings, and the change of height from the Hinge string is Start delta height.

The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade Grade-> and going through the first vertex.

The plan position of the vertex of the created string on the normal at Hinge chainage is such that it is on the line through the Hinge string with xfall equal to the xfall between the Hinge and Secondary strings, and having the calculated height.
20.8.11.1.21 2 Strings, End Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String

This option requires a Hinge and a Secondary string, an End delta height and backward Grade, and an optional Reference string.

Reference String Selected

If a Reference string is selected then the Start mode and End Mode refer to the Reference string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Reference string and cutting the Hinge and the Secondary strings. The vertices of the created string lie on these normals.

The last vertex of the created string is on the normal to the Reference string at chainage End.
mode, and its height is the height of the Hinge string on the End mode normal, plus End delta height.

height of last vertex = height of Hinge string on End mode normal + End delta height

The plan position of the last vertex is on the End mode normal, and with an offset from the Hinge string such that the Xfall is equal to the \texttt{xfall between the Hinge and Secondary strings}, and the change of height from the Hinge string is \texttt{End delta height}.

The heights of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative \texttt{<Grade} and going through the last vertex.

The plan position of the vertex of the created string on the normal at Reference chainage \texttt{ch} is such that it is on the line through the Hinge string with xfall equal to the \texttt{xfall between the Hinge and Secondary strings}, and having the calculated height.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string and cutting the Secondary string. The vertices of the created string lie on these normals.

The last vertex of the created string is on the normal to the Hinge string at chainage End mode, and its height is the height of the Hinge string on the End mode normal, plus End delta height.

height of last vertex = height of Hinge string on End mode normal + End delta height

The plan position of the last vertex is on the End mode normal, and with an offset from the Hinge string such that the Xfall is equal to the xfall between the Hinge and Secondary strings, and the change of height from the Hinge string is End delta height.
The heights of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative \(-\text{Grade}\) and going through the last vertex.

The plan position of the vertex of the created string on the normal at Hinge chainage is such that it is on the line through the Hinge string with xfall equal to the xfall between the Hinge and Secondary strings, and having the calculated height.
**20.8.11.1.22 1 String, Start RL and End RL, Fixed Xfall**

This option requires a **Hinge** string, a **Start RL** and **End RL**, a **Xfall**, and an optional **Reference** string.

**Reference String Selected**

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Reference string and has a **height**
**Start RL.** The offset for the first vertex is calculated and is such that the given Xfall from Hinge string will give the vertex the height **Start RL.**

The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL**, and ending with **End RL** on the normal at End mode.

**Chainage-Height Diagram for the Created String**

The plan position of the vertex of the created string on the normal at Reference chainage ch is constructed by going out from the hinge string with xfall equal to the Xfall, and for an offset so that the height is equal to the required height at chainage ch.
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Reference String NOT Selected
If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string. The vertices of the created string lie on these normals.

The first vertex of the created string is on the normal to the Hinge string and has a height Start RL. The offset for the first vertex is calculated and is such that the given Xfall from Hinge string will give the vertex the height Start RL.
The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with Start RL, and ending with End RL on the normal at End mode.

The plan position of the vertex of the created string on the normal at Hinge chainage ch is constructed by going out from the hinge string with xfall equal to the Xfall and for an offset so that the height is equal to the required height at chainage ch.
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.23 2 Strings, Start RL and End RL, Xfall from Secondary String, Normal to Reference or Hinge String or return to 20.8.11 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.23 2 Strings, Start RL and End RL, Xfall from Secondary String, Normal to Reference or Hinge String

This option requires a **Hinge** and a **Secondary** string, a **Start RL** and **End RL**, and an **optional Reference** string.

**Reference String Selected**

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.
The **first vertex** of the created string is on the normal to the Reference string at chainage **Start mode**, with height **Start RL**. The plan position of the first vertex is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and for the required offset so that the height is **Start RL**.

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL**, and ending with **End RL** on the normal at **End mode**.

The **plan position** of the vertex of the created string on the normal at Reference chainage **ch** is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings** at chainage **ch**, and for an offset so that the height is equal to the required height at chainage **ch**.
Reference String NOT Selected

If a Reference string is NOT selected then the Start mode and End Mode refer to the Hinge string, and at the given chainage interval between the Start mode and the End mode, sections are taken normal (perpendicular) to the Hinge string and cutting the Secondary string. The vertices of the created string lie on these normals.

The first vertex of the created string is on the normal to the Hinge string at chainage Start mode, with height Start RL. The plan position of the first vertex is constructed by going out from the hinge string with xfall equal to the xfall between the Hinge and Secondary strings, and for the required offset so that the height is Start RL.
The heights of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with Start RL, and ending with End RL on the normal at End mode.

The plan position of the vertex of the created string on the normal at Hinge chainage $ch$ is constructed by going out from the hinge string with xfall equal to the xfall between the Hinge and Secondary strings at chainage $ch$, and for an offset so that the height is equal to the required height at chainage $ch$.

Continue to the next section 20.8.12 More Roads or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.
20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade

Because of the number of different ways Create by Xfall and Grade can be used, there is a strict sign convention followed for heights, offsets and xfalls. In all cases, a positive height or delta height is up and a negative height or delta height is down.

For any string, there is a definition for the left and right of a string (see Left and Right Side of a String), and there is a definition of Offset and Xfall for just that string (see Offset and Offset Distance for a String.)

However, Create by Xfall and Grade involves not just one string, but often two or three strings, so needs a standard sign convention of Offset and Xfall.

In Create by Xfall and Grade, if a Reference string is selected, then the direction of the Reference string is paramount and the sign convention for Offset and Xfall for a Hinge and Secondary string refers back to the Reference string. See Offset and Xfall - When Controlled by a Reference String.

In Create by Xfall and Grade, if a Reference string is NOT selected, then the direction of the Hinge string is paramount and the sign convention for Offset and Xfall for the Hinge and Secondary string refer back to the Hinge string. See Offset and Xfall - No Reference String and Controlled by Hinge String.

See Height
See Left and Right Side of a String.
See Offset and Offset Distance for a String
See Xfall for a String
See Offset and Xfall - When Controlled by a Reference String
See Offset and Xfall - No Reference String and Controlled by Hinge String

Height
For any string a positive height or delta height is up and a negative height or delta height is down.

Left and Right Side of a String
For any string:
the right side of the string is defined to be to the right of the string when travelling down the string in the direction of the increasing chainage.
the left side of the string is defined to be to the left of the string when travelling down the string in the direction of the increasing chainage.

Offset and Offset Distance for a String
Offset at chainage ch on a particular string is plan distance measured normal (perpendicular) to the string, starting at zero on the string and positive when going out to the right of the string, and negative when going out to the left of the string. Offset is only a (x,y) plane distance. It does not involve z values.

The offset distance of a point (x,y,z) from a particular string is the plan distance from the point (x,y) to the position on the string calculated by dropping the point (x,y) perpendicularly in the (x,y) plane onto the string. The offset distance is positive if the point (x,y,z) is on the right of the string, and negative is the point (x,y,z) is on the left of the string.

Xfall for a String
For Xfall:
a xfall is positive when it is going up when measured in the direction of increasing positive offset. That is, it is going up when going to the right of the string.
a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset. That is, it is going down when going to the **right** of the string.

a **xfall** is **negative** when it is going up in the direction of increasing negative offset (decreasing positive offset). That is, it is going up when going to the **left** of the string.

a **xfall** is **positive** when it is going down in the direction of increasing negative offset (decreasing positive offset). That is, it is going down when going to the **left** of the string.

---

**Offset and Xfall - When Controlled by a Reference String**

**Offset**

When a Reference string is selected, the **Reference** string is used to determine the sign convention for Offset and Xfall for the Hinge and Secondary strings. Hence the direction of the Hinge and Secondary strings are not used.

When a Reference string is selected:

an **offset** is **positive** when it is going in the direction of increasing positive offset with respect to the Reference string. That is, it is moving in the direction of going to the **right** of the Reference string.
an offset is negative when it is going in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is moving in the direction of going to the left of the Reference string.

Xfall
When a Reference string is selected:

- a xfall is positive when it is going up when measured in the direction of increasing positive offset with respect to the Reference string. That is, it is going up when moving in the direction of going to the right of the Reference string.

- a xfall is negative when it is going down when measured in the direction of increasing positive offset with respect to the Reference string. That is, it is going down when moving in the direction of going to the left of the Reference string.

- a xfall is negative when it is going up when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is going up when moving in the direction of going to the left of the Reference string.

- a xfall is positive when it is going down in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is going down when moving in the direction of going to the left of the Reference string.
Offset and Xfall - No Reference String and Controlled by Hinge String

When no Reference string is selected, then the Hinge string is used to determine the sign convention for Offset and Xfall for the Hinge and Secondary strings. Hence the direction of the Secondary strings is not used.

**Offset**

When no Reference string is selected then the Hinge string is used and:

- an **offset** is **positive** when it is going in the direction of increasing positive offset with respect to the Hinge string. That is, it is moving in the direction of going to the **right** of the Hinge string.

- an **offset** is **negative** when it is going in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is moving in the direction of going to the **left** of the Hinge string.

**Xfall**

When no Reference string is selected then the Hinge string is used and:

- a **xfall** is **positive** when it is going up when measured in the direction of increasing positive offset with respect to the Hinge string. That is, it is going up when moving in the direction of going to the **right** of the Hinge string.

- a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset with respect to the Hinge string. That is, it is going down when moving in the direction of going to the **right** of the Hinge string.
a $xfall$ is negative when it is going up when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is going up when moving in the direction of going to the left of the Hinge string.

a $xfall$ is positive when it is going down when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is going down when moving in the direction of going to the left of the Hinge string.
No Reference String on Left of Hinge String

20.8.12.1 Drape Alignment

Position of option on menu:  Design => Roads => More => Drape alignment string

This option has already been documented in Tins => Drape=> Drape align.

For the option *Drape align*, please continue to the section 16.10.3 Drape Alignment (Macro).

20.8.12.2 Line Marking

Position of option on menu:  Design => Roads => More => Line marking

This option creates an alignment string for a traffic island and has already been documented as Drafting => Line marking

For more information on the option *Line marking*, please continue to the section 24.2 Line Marking.
20.8.12.3 Road Polygons

Position of option on menu: Design => Roads => More => Road polygons

This option takes a model of cross-sections and creates polygons between specified points on the cross-sections. This option is already documented under Design => X-Sections => Polygons from sections.

For more information on the option Polygons from sections, please go to the section 20.14.5 Polygons from Sections in this chapter.

20.8.12.4 Road Widening with Minimum and Maximum Crossfall

Position of option on menu: Design => Roads => More => Road widening

This option creates cross sections using the minimum and maximum cross-fall when going out from a selected reference string (usually and alignment string).

Adding these cross sections to a section view when designing the vertical geometry gives an envelope of maximum and minimum crossfall points.

The fields and buttons used in this panel have the following functions:

Model name min/max xfall  model box
  model for minimum/maximum cross fall cross sections.

Min xfall  input box  -2
  minimum cross-fall (in %)

Max xfall  input box  -5
  maximum cross-fall (in %)

Max width  input box  10
  maximum width to go out at the minimum and maximum cross falls.

Chg interval  input box  20
  chainage interval for calculating the minimum and maximum cross fall cross sections.

View to add  view box
  view to add the created cross sections to.

Reference  string select
  pick the reference string with direction for the x-sections to go out from. The cross sections are created to the right of the reference string as defined by the direction that the Reference string is picked. To get the sections on the other side, pick the reference string in the opposite direction.

Process  button
  create the minimum and maximum cross fall cross sections.

20.8.12.5 Create Roundabout

Position of option on menu:  Design => Roads => More => Roundabout

This option creates a roundabout between two alignment strings. The road widths for the two roads (the distance from the road centre line to the edge of the road) plus the roundabout radius (the distance from the centre of the roundabout to the centreline of the roundabout road), the roundabout width (added and subtracted from the roundabout width to give the inner and outer edges of the roundabout roadway - the inner and outer roundabout radii) and the fillet radius for the turning lanes.
The fields and buttons used in this panel have the following functions:

20.8.12.6 Kerb Special Chainage File

Position of option on menu: Design => Roads => More => Kerb special chainage file

This option is used to create a special chainage file for an alignment string. The method of creating the chainages is defined differently for each segment of the alignment string.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>By number</td>

<td></td>
<td></td>
</tr>
<tr>
<td>Select</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **By number**: if ticked, break the selected segment of the selected string into the number of pieces given by the **Value** field.

- **By distance**: if ticked, break the selected segment of the selected string into pieces of length given by the **Value** field.

- **Value**: the number of pieces or the chainage length to break the selected segment into.

- **Special chg file**: file to write chainages to
pick the alignment string to create chainages for. The alignment string is then drawn in the panel draw box. Each segment of the alignment string is selected by clicking MB over it in the panel draw box. The special chainages are then defined for that segment.

Add button
add the chainages given by number of length to the special chainages list

View button
view the special chainages list. The special chainages list can be edited

Write button
write the special chainages list to the special chainages file

20.8.12.7 Special Chainage File

Position of option on menu: Design => Roads => More => Special chainage file

This option is used to create a special chainage file for an alignment string.

The chainages are created for a selected reference string but can then be defined by dropping strings and/or individual points onto the reference string.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>

</table>

20.8.12.10 Kret Convert to Computators

Position of option on menu: Design => Roads => More => Kret convert to computators

This section of documentation is a work in progress and will be updated in subsequent releases.
Selecting Kret convert to computators, displays the **Computator Kreturn & Culdesac Create** panel on the screen.
20.8.12.11 Subgrade Intersect Function

Position of option on menu: Design => Roads => More => Subgrade Intersect Function

Typical Application

1. Widening job where the intersection of the design xfall from the existing road edge and the design batter is required.

2. Design strings are ESL (shoulder edge) and CEL (carriageway edge)

This panel is used to create a string that could be used in the subgrade surface of a road design, in particular road widening.

The crossfall between these strings is calculated, and applied from the hinge string, offset by the subgrade depth, to intersect with the design tin specified.

The intersecting string created is placed on the selected model.

Selecting Subgrade Intersect Function, displays the Subgrade Batter Intersection Create panel.
The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

<td>measures box</td>
<td></td>
<td>At Point, Point to Point, String from Point, String to Point</td>
</tr>
<tr>
<td></td>
<td>Enter start chainage</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**End Chainage**

Enter end chainage

**Section separation**

Distance along the reference to create points on the string created

**Side to search**

Side to search in relation to reference string

**Special chainages**

A file containing chainages, one per line, that are also used as chainages to create points on the string created

**Subgrade Depth**

Depth below the design tin (in metres)

**Copy Hinge**

If ticked, makes a copy of the hinge in the model specified.

**Copy Strs 1 2**

If ticked, makes a copy at subgrade depth of strings 1 & 2 in the model specified.

**Reference**

Selection must be Super alignment, used to calculate chainages

**Hinge string**

Selected as a start point for the subgrade (Existing bitumen or cutback strings e.g.)

**String 1**

String in the design surface, used in xfall calculations

**String 2**

String in the design surface, used in xfall calculations

**Process**

Runs the option
20.8.12.12 X Segment function

Position of option on menu: Design => Roads => More => X Segment function

This option is used for the removal of segments on design and boxing cross sections. Typically it is used where road widening has been applied to both sides of a roadway. Design sections in this case would be created using "Cuts through strings", where the two widenings are now joined.

The design may also have a small overlay on the existing roadway and boxing definitions have been defined for each side of the widening.

In each case again, the sections, especially the boxing subgrade, are joined.

The sections are converted to super strings and segments that need to be removed are defined at vertex points by name.

A point name is entered as the "First Point" and segments are defined as either left or right of that point or a second point along the section can be specified.

A "Design" section model can be entered along with multiple boxing models...Layer1, Layer2, Layer3 etc.

Selecting X Segment function, displays the Section Segment Removal panel on the screen.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function Name</td>

End Chainage real
if blank, then all the sections are used

Model Design input
existing model name of design sections

Model Layer (n) input
existing model name of boxing sections

Process button
runs the option
20.9 Components

**Position of menu:** Design => Roads => Components

**Components** are parametric road objects that can be placed on existing design strings to generate complex geometry. This includes geometry for:

- Intersections
- Roundabouts
- Exit Ramps
- Entry Ramps
- Bus Bays
- Parking Bays
- CHR Intersections
- Culdesacs
- Hammerheads

Each component has a number of parameters that may be modified before and after they are placed to meet your requirements.

Components are stored in a library. Every time you place a component, you will reference the library definition. Once it is placed, if you wish to customise only that placed instance of the component, you may detach it from the library so that changes to the component will not affect the library component and vice versa.

The Components walk-right menu is

![Components Menu](image)

For the options see
- Component library 20.9.1 Component Library
- Place component 20.9.32 Place a Component
- Edit component 20.9.34 Edit a Placed Component
- Quick place 20.9.35 Component Quick Place

For information on
- Editing Components 20.9.32.1 Editing Components
- Specific Component Types 20.9.2 Component Types
20.9.1 Component Library

Position of option on menu: Design => Roads => Components => Component library

This panel is used to define the components in your current project. Components are initially based off predefined 'base' components (see Base component). Once you add a base or template component to your library, you may customise it as you require.

Selecting Component library brings up the Component library panel.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library file</td>
<td>file box</td>
<td></td>
<td>the current component library you are editing</td>
<td>*.12dcomponentslib files</td>
</tr>
</tbody>
</table>

Insert a new component (See 20.9.1.4 New Component)

Folder icon
creates a new folder or subfolder under the Components node.
This is to allowing grouping of similar components.

Delete icon
deletes the highlighted component or folder.

Copy icon

copies the highlighted component or folder.

Paste icon

pastes the selected component or folder at the current highlighted level.

Write button

writes the components out to the given component library file.

Read button

reads in the given component library file.

20.9.1.1 Settings Node

This node defines library wide settings. Whenever you use a component from this library, these settings will apply.

![Component library](image)

20.9.1.1.1 Naming of Strings in a Component

Each string generated as part of the component can be named. They can either be set to something static or they can be dynamically generated using a number of variables as part of the name field.

The variables generally concern which side of the road the string is being created for, whether it was the approach or departure or the 'source' or 'destination'.

For example, in a left turn, the 'source' is the string a driver is leaving from and the 'destination' is the string entering.

$source_name - the name of the source string after the source string name mask is applied (see 20.9.1.1.2 Source String Name Mask)

$destination_name - the name of the destination string after the source string name mask is applied (see 20.9.1.1.2 Source String Name Mask)

$full_source_name - the full name of the source string

$full_destination_name - the full name of the destination string

$source_approach_or_departure - ‘approach’ if we are generating strings for the approach of the source string, otherwise ‘departure’
$destination_approach_or_departure - ‘approach’ if we are generating strings for the approach of the destination string, otherwise 'departure'

$source_side - the side of the road we are currently generating strings for on the source string

$destination_side - the side of the road we are currently generating strings for on the destination string

$count[1-9] - allows up to 9 counters, of the form %count1, $count2 ... $count9

Each time this counter variable is seen, it's value is incremented by 1.

20.9.1.1.2 Source String Name Mask

The source string name mask is defined in the Component Library. It allows you to extract part of a centreline string name. This is quite useful to maintain your own naming conventions.

For example, if you have a centreline named MC01 and you wish to name your left turn MK01, the part of the name that is common is 01.

If you set the source string name mask to MC*, the name used when you use the $source_name or $destination_name variables will be everything represented by the '*'. In this case, 01.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source string name mask</td>
<td>an optional field used to assist in naming individual strings created as part of a component. See 20.9.1.1.2 Source String Name Mask for more information.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Driving side</td>
<td>choice box</td>
<td>Left side</td>
<td>Left side, Right side</td>
</tr>
</tbody>
</table>

whether or not the component should be created for left or right hand side driving.

20.9.1.2 Folder Nodes

Folders can be created to group components. You can create a folder and give it whatever name you wish.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*the name of the folder*

**20.9.1.3 Components Node**

Each component node displays the name and type of the component, as well as what it will look like on a theoretical set of centreline strings. The generated geometry will change when you place it depending on the selected strings but this view gives you an idea of what it may look like.
The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up
---|---|---|---
**Name**
*the name of the component*

**Type**
*the type of the component - read only*
edits the component. For more information please see 20.9.32.1.1 Editing in the Component library - Component Editor

20.9.1.4 New Component

This panel allows you to create a new component from a base component. A base component may be from either one of your own library components, or a component shipped with 12d Model.

Selecting brings up the New component panel.

The fields and buttons used in this panel have the following functions:

Field Description        Type    Defaults    Pop-Up

**Base component**

*the component you wish your component to be based on*

This may be either a **Base Component**, as shipped by 12d, or one from your **Library**.

For information on **Component Types** please go to the section 20.9.2 Component Types

**Name**

*the name of your component, which must be unique*
Create button

creates the component and adds it to the library

20.9.2.1 Minor Intersection

An intersection component can be edited via the 20.9.1 Component Library or by editing the definition of a placed component. While an intersection is defined as a crossroad, the intersection will automatically close off any leg of the intersection that does not have valid strings.

For information on Defining an Intersection see 20.9.2.1.1 Defining an Intersection

Placing Intersections 20.9.7.1.4 Placing Intersections
20.9.2.1.1 Defining an Intersection

An intersection is broken into two roads - the **Major road** and the **Minor road**. Each road, major or minor, may have an approach (the section of the road leading in to the intersection) and the departure (the section of the road leading away from the intersection). The approach and departure for both the Major and Minor Road are defined by the same set of parameters.

For information on:
- Placement Parameters Node see [20.9.3 Placement Parameters](#)
- Carriageway Node [20.9.4 Carriageway Node](#)
- Approach / Departure => Left turn Node [20.9.5 Left Turn - Approach / Departure](#)
- Approach / Departure => Left Turn =>Kerb Return Node [20.9.6 Approach / Departure =>Left](#)
20.9.3 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.7.1.4 Placing Intersections.

20.9.4 Carriageway Node

This node defines the carriageway of the road, in terms of the number of lanes and the type of lanes.

There are two modes for defining the carriageway: **Automatic Mode** and **Manual Mode**.

**Note that regardless of the mode, you can only define a median on one side of the carriageway.**

If you place your intersection using dual carriageways, the width will be ignored.

**Automatic Mode**

**Automatic** mode does not allow you to define names for each lane of your carriageway and only allows a basic layout. It is the simplest and quickest way to define a carriageway.
The fields and buttons used in this panel have the following functions:

<table>

Width

the width of the lane

Type

the type of lane (Normal, Bike or Median)
20.9.5 Left Turn - Approach / Departure

This node defines the Left turn of an intersection. If you are in Right Side driving mode, this will be called Right Turn.

There are three types of turns currently available:
1. Stand up - for more information go to Stand Up Turn
2. Free - for more information go to Free Turn
3. High entry - for more information go to High Entry Turn

Both Stand up and Free turns allow you to define the type of kerb return being used.

Stand Up Turn

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Turn name</td>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Turn type</td>
<td>the type of turn (in this case, Stand up)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Free Turn

A **Free turn** supports an optional diverging lane, a traffic island and an optional merging island.

<table>

</tbody>
</table>

The fields and buttons used in this panel have the following functions:

**Turn Details**

**Turn name**
the name to use for created geometry

Turn type
the type of turn (in this case, Free)

Diverging Lane
Create?
whether or not to create a diverging lane

Name
an optional name to use for the diverging lane

Lane width
the width of the diverging lane

Taper length
the length of the leading taper on the diverging lane

Taper approach radius
the approach radius of the taper

Taper Departure radius
the departure radius of the taper

Parallel lane length
the length of the parallel lane of the diverging lane

Dedicated turn lane?
whether or not to create a dedicated turn lane - only available if not creating a diverging lane

Island
Island name
the name of the island string

Offset 1
the first offset of the painted island from the internal island

Offset 2
the second offset of the painted island from the internal island

Offset 3
the third offset of the painted island from the internal island

Offset 4
the fourth offset of the painted island from the internal island

Offset 5
the fifth offset of the painted island from the internal island

Offset 6
the sixth offset of the painted island from the internal island

Width
the width of the island from the kerb return
Radius 1
the first radius of the internal island

Radius 2
the second radius of the internal island

Radius 3
the third radius of the internal island

Merging Lane
Create?
whether or not to create a merging lane

Name
an optional name to use for the merging lane

Lane width
the width of the merging lane

Taper length
the length of the leading taper on the merging lane

Taper approach radius
the approach radius of the taper

Taper Departure radius
the departure radius of the taper

Parallel lane length
the length of the parallel lane of the merging lane
High Entry Turn

A High Entry Turn supports an island and optional diverging lane, as well as an optional dedicated turning lane when no diverging lane is used.

The fields and buttons used in this panel have the following functions:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>

</table>
20.9.6 Approach / Departure =>Left Turn =>Kerb Return Node

The stand up and free left turn types allow you to define the kerb return to be used. These options include 20.9.6.1 Fillet Kerb Return, 20.9.6.2 Two Centred Kerb Return and 20.9.6.3 Three Centred Kerb Return

20.9.6.1 Fillet Kerb Return

![Diagram showing Fillet Kerb Return panel]

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>

<td>15</td>
<td></td>
</tr>
</tbody>
</table>
the approach tangent for the two centred curve

20.9.6.3 Three Centred Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up
---|---|---|---
Type | the type of kerb to create (in this case, *Three Centred*) | | |
Approach radius | the approach radius of the three centred curve | | |
Intermediate radius | the intermediate radius of the three centred curve | | |
Departure radius | the departure radius of the three centred curve | | |
20.9.7 Approach / Departure =>Median / Right Turn Node

This node is used to define the median and an optional right turn for an intersection road approach or departure.

**Note that if you are using Right Side driving, then this will say Median / Left Turn.**

This node is only used if a median has been defined as part of the carriageway.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

20.9.7.1.4 Placing Intersections
When placing an intersection, there are several placement specific settings. This means they are separate from the definition but help define how the intersection is placed. These are defined when placing the component, and may be edited from the 20.9.34.1 Placed
Component Editor: Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clearance - major approach</td>
<td>15</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Clearance - minor approach</td>
<td>15</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Clearance - major departure</td>
<td>15</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Clearance - minor departure</td>

<td></td>
</tr>
<tr>
<td>Length - minor approach</td>
<td>150</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Length - minor departure</td>
<td>150</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions:

**Major left**
- the left most major road

**Minor left**
- the left most minor road

**Major right**
- the right most major road (optional)

**Minor right**
- the right most minor road (optional)

**Major right and minor right can be set when there is a dual carriageway.**

**Edit definition button**
- Selecting this button displays the Edit a Placed Component Definition panel. For more information please see 20.9.34.2 Edit a Placed Component Definition

**Clearance - major approach**
- the clearance of geometry on the approach of the major road, from the intersection

**Clearance - minor approach**
- the clearance of geometry on the approach of the minor road, from the intersection

**Clearance - major departure**
- the clearance of geometry on the departure of the major road, from the intersection

**Clearance - minor departure**
- the clearance of geometry on the departure of the minor road, from the intersection

**Length - major approach**
- the length of the geometry created for the approach of the major road
Length - minor approach
the length of the geometry created for the approach of the minor road

Length - major departure
the length of the geometry created for the departure of the major road

Length - minor departure
the length of the geometry created for the departure of the minor road

20.9.7.2 Roundabout

A Roundabout component can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.
For information on Defining a Roundabout see 20.9.7.2.1 Defining a Roundabout
Placing Roundabouts 20.9.11.7.1 Placing Roundabouts

20.9.7.2.1 Defining a Roundabout

A Roundabout is defined around two intersecting roads - the Major road and the Minor road. Each road, major or minor, may have an approach (the section of the road leading in to the roundabout) and the departure (the section of the road leading away from the roundabout).

The approach and departure for both the Major and Minor road are defined by the same
set of parameters.

For information on:

Placement Parameters Node see 20.9.8 Placement Parameters
Centre Node 20.9.9 Centre Node
Approach/ Departure Node 20.9.10 Approach / Departure Node
Approach/ Departure => Kerb Node 20.9.11 Approach / Departure => Kerb Node
20.9.8 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.11.7.1 Placing Roundabouts.
20.9.9 Centre Node

This node defines parameters for the centre of the roundabout.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Centre radius</td>
<td>the radius of the centre island of the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Circulating width</td>
<td>the width around the centre island</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Extra circulating offset</td>
<td>an additional offset to apply to throat and kerb return strings from the circulating width</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
20.9.10 Approach / Departure Node

This node defines parameters for the approach or departure of a specific Roundabout road. This node is made up of two sub parts - the **Entry** into the roundabout and the **Exit** from the roundabout. They can be configured independently.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Entry</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Entry name</td>
<td>the name to apply to the entry string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Carriageway width</td>
<td>the width of the carriageway at the entry to the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Radius</td>
<td>the radius of the entry into the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Width</td>
<td>the width of the entry throat into the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td>an offset of the entry string from the centre of the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CL offset</td>
<td>an offset of the entry from the centreline, for medians</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Reverse curve?</td>
<td>whether or not to create a reverse curve (yes or no)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Approach radius</td>
<td>the approach radius for the reverse curve</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Departure radius</td>
<td>the departure radius of the reverse curve</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Distance from rbout
the distance of the start of the reverse curve from the roundabout

RC Offset
the offset of the reverse curve from the centreline

Exit

Exit name
the name to apply to the exit string

Carriageway width
the width of the carriageway at the exit to the roundabout

Radius
the radius of the exit from the roundabout

Width
the width of the exit throat from the roundabout

CL Offset
an offset of the exit string from the centre of the roundabout
20.9.11 Approach / Departure => Kerb Node

This defines the kerb return between the entry at the approach / departure and the adjacent exit. There are several types of kerb returns available.

- Arc / Three Tangents / Arc see 20.9.11.2 Arc / Three Tangents / Arc
- Three Tangents / Locked Arc / Three Tangents see 20.9.11.3 Three Tangents / Locked Arc / Three Tangents
- Three Tangents / Arc / Three Tangents see 20.9.11.4 Three Tangents / Arc / Three Tangents
- Fillet see 20.9.11.5 Fillet
- Two Centre Curve see 20.9.11.6 Two Centre Curve
- Three Centre Curve see 20.9.11.7 Three Centre Curve

Getting the geometry right for your roundabout can be complex. The geometry is not guaranteed to solve and you may need to try another kerb return type if the current one does not suit your needs.

20.9.11.1 Common Fields

Name
the name of the kerb return

Type
the type of kerb return

20.9.11.2 Arc / Three Tangents / Arc

This creates a kerb return with an approaching arc, an arc with three tangents (to the edge of the entry throat, the circulating width and the edge of the exit throat) and a departing arc.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approach radius</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Departure radius</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Alternate solution on approach</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Alternate solution on departure</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
whether or not to attempt a different solution on the approach arc

**Alternate solution on departure**
whether or not to attempt a different solution on the departure arc

### 20.9.11.3 Three Tangents / Locked Arc / Three Tangents

This creates a kerb return with the following components:

- an arc tangential to the entry carriageway, the edge of the entry throat and the circulating width of the roundabout
- an arc with a radius locked to the radius of the circulating width
- an arc tangential to the circulating width of the roundabout, the edge of the exit throat and the exit carriageway

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate solution on approach</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Alternate solution on departure</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 20.9.11.4 Three Tangents / Arc / Three Tangents

This creates a kerb return with the following components:

- an arc tangential to the entry carriageway, the edge of the entry throat and the circulating width of the roundabout
- an arc with a user defined radius
- an arc tangential to the circulating width of the roundabout, the edge of the exit throat and the exit carriageway

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Radius</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*a user defined radius for the internal arc*
Alternate solution on approach

whether or not to attempt a different solution on the approach arc

Alternate solution on departure

whether or not to attempt a different solution on the departure arc

20.9.11.5 Fillet

This creates a kerb return as a simple fillet between the approach / departure and the adjacent carriageway.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Radius</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*the radius to use for the fillet*

20.9.11.6 Two Centre Curve

This creates a kerb return as a two centre curve.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approach radius</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Departure radius</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Approach tangent</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 20.9.11.7.1 Placing Roundabouts

A roundabout is placed at the intersection of two roads - the Major and Minor road. When placing a roundabout, there are several placement specific settings. This means they are separate from the definition but help define how the roundabout is placed.

These are defined when placing the component, and may be edited from the [20.9.34.1 Placed Component Editor](#). Some of these are also available from the [20.9.34.2 Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.
the major road of the roundabout

Minor road

the minor road of the roundabout

Component parameters

Length - major approach
the length strings to generate along the major approach

Length - major departure
the length strings to generate along the major departure

Length - minor approach
the length strings to generate along the minor approach

Length - minor departure
the length strings to generate along the minor departure

Note that setting a length to 0 will effectively close that leg of the roundabout.
20.9.11.8 Bus Bay

A Bus Bay component can be edited via the [20.9.1 Component Library](#) or by editing the definition of a placed component.

For information on Defining a Bus Bay see [20.9.11.8.1 Defining a Bus Bay](#) and Placing Bus Bays [20.9.11.8.2 Placing Bus Bays](#)

20.9.11.8.1 Defining a Bus Bay

A Bus Bay is defined as being created from a known chainage on one centreline string.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td></td>
<td></td>

<td><em>an optional offset of the bulb from the centreline</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Right tangent length</strong></td>
<td><em>an optional offset of the bulb from the centreline</em></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions:
the radius of the left fillet of the culdesac

**Right fillet radius**
the radius of the right fillet of the culdesac

**Approach width**
the width of the carriageway approaching the culdesac

**Left tangent length**
an optional length of a tangent between the left fillet and the bulb

**Right tangent length**
an optional length of a tangent between the right fillet and the bulb

### 20.9.11.9.2 Placing Culdesacs

A **Culdesac** is placed either at the start or end of a road. When placing a culdesac, there are several placement specific settings. This means they are separate from the definition but help define how the culdesac is placed.

These are defined when placing the component, and may be edited from the [20.9.34.1 Placed Component Editor](#). Some of these are also available from the [20.9.34.2 Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

```
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Centreline</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Chainage extension</td>
<td></td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Anchor</td>
<td></td>
<td>Start</td>
<td></td>
</tr>
</tbody>
</table>
```

The fields and buttons used in this panel have the following functions:

- **Centreline**
  the centreline the culdesac is created for

- **Chainage extension**
  an extension from the anchor

- **Anchor**
  where the culdesac is anchored (Start or End)
20.9.11.10 HAMMERHEAD

The HAMMERHEAD has parameters to cover most situations. For example, by modifying the parameters, the Hammerhead covers both of the cases:

Selecting

Design =>Roads =>Components =>Place component

brings up the Place a Component panel.
Clicking on the Component choice icon and selecting HAMMERHEAD puts information specific to a HAMMERHEAD on the panel.
If you select a Centreline, the Function and Model boxes are automatically filled out using a combination of the string name, the word HAMMERHEAD and a unique number amongst the HAMMERHEAD functions already in the project.

Anchor says whether the HAMMERHEAD is to go at the Start or End of the Centreline.

Click Place to create the Hammerhead component.
Clicking **Edit** definitions will first bring up a panel to let you know that editing the definition will modify the Hammerhead from the one that was in the library.

Clicking **Yes** opens the **Edit a Placed Component Definition** panel.

Clicking on the tab **Placement parameters** will show the field **Anchor** (which was set before) but can be changed to either **Start** and **End**.

Clicking on **Hammer Head** displays the general tab of parameters.
The values in the fields can be modified and the Hammerhead will dynamically change. Clicking on the spinners will increase/decrease the value by a certain amount.

All arc radius values can be zero which means that there is no arc.

A radius is negative if it is going to the left and positive if it is going to the right, when travelling on the left hand side of the road.

Clicking on **Set** stores the current values of the parameters in the function.

Clicking on **Save to library** writes the component to the library with its current values. It is then available in the library to use in the future.

The definitions of all the parameters in the panel are:
and the parameters that produced this diagram are:

- Centre leg left fillet radius
- Centre leg right fillet radius (0 in this case)
- Centre leg - length
- Centre leg - left width
- Centre leg - right width
- Left leg left fillet radius
- Left leg right fillet radius
- Left leg - left width
- Left leg - right width
- Left leg angle
- Right leg left fillet radius
- Right leg right fillet radius
- Right leg - left width
- Right leg - right width
- Right leg angle
- Right length
- Left length
- Transition radius
- Left offset
- Right offset

All arcs can have 0 radius which means no arc. A radius is negative if going to the left and positive if going to the right when travelling on the left hand side of the road parallel to the Centreline (which doesn't have to be just a straight).
Note that the Centreline does not have to be a straight. It could involve straights, arcs and transitions.

In the next example, the Hammerhead is coming off a Centreline and the Hammerhead Centre leg width value means that the Centre leg of the Hammerhead includes a straight, a curve and another straight from the Centreline.

Also note that simply changing the Left leg angle to 0 gives
20.9.11.11 Parking Bays

Parking Bays can be edited via the Component Library or by editing the definition of a placed component.

For information on Defining a Parking Bay Placing Parking Bay

20.9.11.11.1 Defining Parking Bays

Parking Bays are created along a nominated centreline string. A Parking Bays component consists of a user defined number of 'sets of bays' on the left and right side.

A set of bays can consist of one or more actual parking bays. It is defined by a number of parameters for width, length, offset and rotation, as well as several cosmetic settings.

A set of bays can either be a Standard Bay or a Separation.

Bays on the left and right side are defined in the same manner.

To add a set of bays to the left or right side, simply select either Left Bays or Right Bays and click the button

The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up
adds a bay set to the selected side

deletes the selected bay set

moves the selected bay definition up

moves the selected bay definition down

Bay Parameters

Type

the type of bay - Standard or Separation. For more information please see 20.9.12 Standard Bay and 20.9.13 Separation

</table>
20.9.13.2 Left Turn

A Left Turn is a subset of an intersection, compromising of just a Left Turn. A Left Turn can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

For information on Defining a Left Turn
   20.9.13.2.1 Defining a Left Turn

   Placing Left Turns
   20.9.15.1.1 Placing Left Turns

20.9.13.2.1 Defining a Left Turn

A Left Turn is only defined by the parameters involving the Left Turn - the type of turn and the kerb return.

For information on Placement Parameters see
   20.9.14 Placement Parameters
   20.9.15 Left Turn
   20.9.15.1 Left Turn => Kerb Return
20.9.14 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.15.1.1 Placing Left Turns.
20.9.15 Left Turn

A Left Turn is defined in the same way as the Intersection Left Turn. For more information, please see the section on the 20.9.5 Left Turn - Approach / Departure.

20.9.15.1 Left Turn => Kerb Return

A Left Turn Kerb Return is defined in the same was as the Intersection kerb return. For more information, please see the section on the 20.9.6 Approach / Departure =>Left Turn =>Kerb Return Node.

20.9.15.1.1 Placing Left Turns

Left Turns are placed at the intersection of two roads - a Major and a Minor, with an approach or departure. Like an intersection, they can also support dual carriageways. When placing a Left Turn component, there are several placement specific settings. This means they are separate from the definition but help define how the Left Turn is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.

![Alignment Parameters](AlignmentParameters.png)

  - the right most major road (optional)

- **Minor right**
  - the right most minor road (optional)

Component parameters

- **Clearance**
  - the distance from the intersection at which to start creating the median island

- **Length**
  - the length of the geometry to create
From

whether or not the median should be created on the approach or departure side of the major string

Side

the side on which the median should be bound
20.9.17.2 Entry Ramp

An Entry Ramp component creates an Entry Ramp from an overpass or other adjoining road to a freeway or other major road. It can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

For information on Defining an Entry Ramp
Placing Entry Ramps

20.9.17.2.1 Defining a Entry Ramp

An Entry Ramp is defined by the ramp itself, a shoulder, a merging lane and an optional connection.

For information on Entry Ramp node see
Placement Parameters
Shoulder node
Merging lane node
Connection node

20.9.18 Entry Ramp Node
20.9.19 Placement Parameters
20.9.20 Shoulder Node
20.9.21 Merging Lane Node
20.9.22 Connection
20.9.18 Entry Ramp Node

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name</td>
<td>source_entry_ramp</td>
<td></td>
</tr>
<tr>
<td>Radius 1</td>
<td>Radius</td>
<td>150</td>
<td></td>
</tr>
<tr>
<td>Radius 2</td>
<td>Radius</td>
<td>500</td>
<td></td>
</tr>
<tr>
<td>Nose to taper length</td>
<td>Nose</td>
<td>50</td>
<td></td>
</tr>
<tr>
<td>Internal radius</td>
<td>Internal</td>
<td>400</td>
<td></td>
</tr>
<tr>
<td>Taper length</td>
<td>Taper</td>
<td>90</td>
<td></td>
</tr>
<tr>
<td>Taper rotation 1 in</td>
<td>Taper rotation</td>
<td>50</td>
<td></td>
</tr>
<tr>
<td>Curved taper?</td>
<td>Curved taper?</td>
<td>no</td>
<td></td>
</tr>
</tbody>
</table>

- **Name**: the name of the entry ramp string
- **Radius 1**: the first radius of the entry reverse curve
- **Radius 2**: the second radius of the entry reverse curve
- **Nose to taper length**: The distance between the nose of the shoulder and the taper
- **Internal radius**: the radius of the final, internal arc
- **Taper length**: the length of the trailing taper
- **Taper rotation 1 in**: the rotation of the trailing taper
- **Curved taper?**: whether or not to use a curved taper (may be more suitable for curving centrelines)
20.9.19 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.22.2.1 Placing Entry Ramps.
20.9.20 Shoulder Node

This node defines properties for the shoulder of the Entry Ramp.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the name of the shoulder string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Nose offset from shoulder</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the offset of the island nose from the shoulder</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Nose offset from ramp</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the offset of the island nose from the ramp itself</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Nose width</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the width of the nose</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
20.9.21 Merging Lane Node

This node defines the parameters for the Merging lane.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>$source_name merging lane</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lane width</td>
<td></td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>Radius</td>
<td></td>
<td>394</td>
<td></td>
</tr>
<tr>
<td>Curve 1 radius</td>
<td></td>
<td>95</td>
<td></td>
</tr>
<tr>
<td>Parallel lane length</td>
<td></td>
<td>95</td>
<td></td>
</tr>
<tr>
<td>Curve 2 radius</td>
<td></td>
<td>100</td>
<td></td>
</tr>
<tr>
<td>Curve 2 length</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Taper length</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Name: the name of the merging lane string
- Lane width: the width of the merging lane
- Radius: the radius used to construct the merging lane
- Curve 1 radius: the radius of the first optional curve, before the parallel lane length
- Parallel lane length: the length of the parallel lane
- Curve 2 radius: the radius of the second optional curve, after the parallel lane
- Curve 2 length: the length of the second optional curve, after the parallel lane
- Taper length: the length of the taper at the end of the merging lane
20.9.22 Connection

This node defines the properties for an optional connection from the overpass / minor road. At the moment, this supports either no connection strings or a roundabout.

Mode

the mode of the connection (either 20.9.22.1 Roundabout Mode or 20.9.22.2 No Strings Mode)

20.9.22.1 Roundabout Mode

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the offset from the intersection, along the minor road, that the connection should be created</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Roundabout radius</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the radius of the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Circulating width</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the circulating width of the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

20.9.22.2 No Strings Mode

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>the offset from the intersection, along the minor road, that the connection should be created</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Width</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>how far away from the minor road the entry ramp should start</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

20.9.22.2.1 Placing Entry Ramps
Entry Ramps are placed at the intersection of two roads - a major freeway and a minor adjoining or overpass road. When placing an Entry Ramp, there are several placement specific settings. This means they are separate from the definition but help define how the Entry Ramp is placed. These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major road</td>
<td></td>
<td>EXAMPLE 7-&gt;MCCI</td>
<td></td>
</tr>
<tr>
<td>Entry road</td>
<td></td>
<td>EXAMPLE 7-&gt;MCA1</td>
<td></td>
</tr>
<tr>
<td>Carriageway width</td>
<td></td>
<td>3.5</td>
<td></td>
</tr>
<tr>
<td>Distance from interchange</td>
<td></td>
<td>580</td>
<td></td>
</tr>
<tr>
<td>Approach/Departure</td>
<td></td>
<td>Approach</td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Major road | | EXAMPLE 7->MCCI | |
Entry road | | EXAMPLE 7->MCA1 | |
Carriageway width | | 3.5 | |
Distance from interchange | | 580 | |
Approach/Departure | | Approach | |

Edit definition button

Selecting this button displays the Edit a Placed Component Definition panel. For more information please see 20.9.34.2 Edit a Placed Component Definition

Carriageway width

the width of the freeway carriageway

Distance from interchange

the distance of the end of the entry ramp from the interchange

Approach/Departure

whether the entry ramp is bound to the approach or departure of the freeway / major road

20.9.22.3 Exit Ramp

An Exit Ramp component creates an Exit Ramp from a freeway or other major road to an overpass or other adjoining road. It can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

For more information on Defining an Exit Ramp see 20.9.22.3.1 Defining an Exit Ramp Placing an Exit Ramp 20.9.27.1.1 Placing Exit Ramps
20.9.22.3.1 Defining an Exit Ramp

An **Exit Ramp** is defined by the ramp itself, a shoulder, a diverging lane and an optional connection.

For information on the Exit Ramp Node see
- 20.9.23 Exit Ramp Node
- 20.9.24 Placement Parameters
- 20.9.25 Shoulder Node
- 20.9.26 Diverging Lane Node
- 20.9.27 Connection Node
20.9.23 Exit Ramp Node

This node defines the ramp itself.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal String</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>the name of the string to create</td>
<td>Internal</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Taper length</td>
<td>the length of the ramp taper</td>
<td></td>
<td>140</td>
<td></td>
</tr>
<tr>
<td>Radius 1</td>
<td>the first radius of a reverse curve</td>
<td></td>
<td>300</td>
<td></td>
</tr>
<tr>
<td>Length 1</td>
<td>the first length of a reverse curve</td>
<td></td>
<td>140</td>
<td></td>
</tr>
<tr>
<td>Radius 2</td>
<td>the second radius of a reverse curve</td>
<td></td>
<td>120</td>
<td></td>
</tr>
<tr>
<td>Length 2</td>
<td>the second length of a reverse curve</td>
<td></td>
<td>75</td>
<td></td>
</tr>
<tr>
<td>Dual lane ramp</td>
<td></td>
<td></td>
<td>no</td>
<td></td>
</tr>
<tr>
<td>Taper length</td>
<td>the taper length on the dual lane exit ramp</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Internal String

Name
the name of the string to create

Taper length
the length of the ramp taper

Radius 1
the first radius of a reverse curve

Length 1
the first length of a reverse curve

Radius 2
the second radius of a reverse curve

Length 2
the second length of a reverse curve

Dual Lane Ramp

Dual lane
whether or not this is a dual lane exit ramp

Taper length
the taper length on the dual lane exit ramp
20.9.24 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.27.1.1 Placing Exit Ramps.
20.9.25 Shoulder Node

This node defines the shoulder part of the exit ramp.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the name of the created shoulder string</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Shoulder length</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the length of the shoulder</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Nose radius</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the radius of the nose of the exit ramp island</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Nose offset from shoulder</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the offset of the island nose from the shoulder</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Nose offset from ramp</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the offset of the island nose from the ramp</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
20.9.26 Diverging Lane Node

This node defines the details for the diverging lane of the exit ramp.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>the name of the created string of the diverging lane</td>
</tr>
<tr>
<td>App. taper length</td>
<td>the length of approaching taper</td>
</tr>
<tr>
<td>Lane width</td>
<td>the width of the diverging lane</td>
</tr>
<tr>
<td>Lane length</td>
<td>the length of the diverging lane</td>
</tr>
<tr>
<td>Radius</td>
<td>the radius for the diverging lane</td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td>Name</td>
<td></td>
</tr>
<tr>
<td>App. taper length</td>
<td></td>
<td>15</td>
<td></td>
</tr>
<tr>
<td>Lane width</td>
<td></td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>Lane length</td>
<td></td>
<td>165</td>
<td></td>
</tr>
<tr>
<td>Radius</td>
<td></td>
<td>1500</td>
<td></td>
</tr>
</tbody>
</table>
20.9.27 Connection Node

The connection node defines how the Exit Ramp connects to the adjoining road or overpass. There are two types of connection currently; either no visible connection or a Roundabout (see 20.9.27.1 Roundabout Connection).

20.9.27.1 Roundabout Connection

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset</td>
<td>the offset of the roundabout from the major road</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Roundabout radius</td>
<td>the radius of the centre of the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Circulating width</td>
<td>the circulating width around the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Connecting radius</td>
<td>the radius of an arc connecting the exit ramp to the roundabout</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

20.9.27.1.1 Placing Exit Ramps

Exit Ramps are placed at the intersection of two roads - a major freeway and a minor adjoining or overpass road. When placing an Exit Ramp, there are several placement specific settings. This means they are separate from the definition but help define how the Exit Ramp is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.
The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major road</td>
<td>the freeway or major road to exit from</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Exit road</td>
<td>the road the ramp leads to</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Carriageway width</td>
<td>the width of the major road</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Distance from interchange</td>
<td>the distance from the interchange that the exit ramp should start</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Approach / Departure</td>
<td>whether the exit ramp is bound to the approach or departure of the major road</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 20.9.27.2 CHR Intersection

A **CHR** or **Channelised Rural Intersection** creates an intersection between two roads, typically in a T-Junction configuration. It can be edited via the [20.9.1 Component Library](#) or by editing the definition of a placed component.

For information on Predefined Values Node see [20.9.28 Predefined Values Node](#), [20.9.29 Major Road Node](#), [20.9.30 Major Road => Kerb Return Node](#), [20.9.31 Minor Road Node](#), [20.9.31.3.1 Placing CHR Intersections](#).
20.9.28 Predefined Values Node

The Predefined Values node is used to populate the details of the CHR based on one of a set of predefined speeds and a supplied lane width.
20.9.29 Major Road Node

This defines the details for the major road.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kerb name</td>
<td>the name of the kerb string to create</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lane width</td>
<td>the width of the carriageway</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Short CHR?</td>
<td>whether or not to create a short CHR</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Turn name</td>
<td>the name of the right turn string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Storage length</td>
<td>the storage length of the right turn</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Deceleration length</td>
<td>the deceleration length of the right turn</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lane width</td>
<td>the width of the right turn lane</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Leading Taper

Approach radius
the approach radius of the leading taper

Departure radius
the departure radius of the leading taper

Taper length
the length of the leading taper

Trailing Taper

Approach radius
the approach radius of the trailing taper

Departure radius
the departure radius of the trailing taper

Taper length
the length of the trailing taper

Islands

Approach radius
the approach radius of the islands

Departure radius
the departure radius of the islands

Taper length
the taper length for the islands

Leading island name
the name of the leading island of the CHR

Trailing island name
the name of the trailing island of the CHR
20.9.30 Major Road => Kerb Return Node

There are several different kerb return types available:

- Fillet 20.9.30.1 Fillet Kerb Return
- Two Centred 20.9.30.2 Two Centred Kerb Return
- Three Centred 20.9.30.3 Three Centred Kerb Return

20.9.30.1 Fillet Kerb Return

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>

<td><em>the departure radius of the three centred curve</em></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
20.9.31.3.1 Placing CHR Intersections

CHR Intersections are placed at the intersection of two roads - a major road and a minor road. Each road can be optionally defined with a second carriageway. When placing a CHR intersection, there are several placement specific settings. This means they are separate from the definition but help define how the CHR is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major left</td>
<td>the left most major road</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Minor left</td>
<td>the left most minor road</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Major right</td>
<td>the right most major road (optional)</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Minor right</td>
<td>the right most minor road (optional)</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Major right and Minor right</td>
<td>can be set when there is a dual carriageway.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The fields and buttons used in this panel have the following functions:

- **Lateral offset**
  
  *an offset of the CHR intersection from the major left control line. This is useful when the control line is not the centreline.*
20.9.32 Place a Component

Position of option on menu: Design => Roads => Components => Place component

The Place a component panel allows you to place a component from your library.

The placement specific parameters required will depend on which component you are attempting to place.

Each component is created as a function, which means you can easily recalc after you change the strings to which it is attached or make it part of a chain.

Please note that there are two types of parameters involved in defining a component:

1. Component Specific – meaning how the geometry is generated. These are edited via the library or by editing the definition of a placed component.

2. Placement Specific – how the component is placed. These are edited when placing a component on the Place a component panel or on Editing a Placed Component.

Selecting Place component brings up the Place a component panel.

The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Common Fields
Function function
    the function to create

Library file file
    the library file to read components from

Component choice box
    the component to place

Pre*Post an optional pre*post to apply to generated strings

Model model box
    the model to create the component strings in

Place button
    places the components

For more information on the placement specific parameters required for each component, see the section on the specific component type (see 20.9.2 Component Types).
20.9.32.1 Editing Components

Components may be edited either in the library or directly from a placed component.

For information on Editing in the Component library go to 20.9.32.1.1 Editing in the Component library - Component Editor

For information on Editing a Placed Component go to 20.9.33.1 Editing a Placed Component

20.9.32.1.1 Editing in the Component library - Component Editor

Design => Roads => Components => Component library => Component Node => Edit button

To edit in the Component Library, select your component and then select the edit button, this brings up the Component Editor panel.

The Component Editor panel changes depending on the component, so for specific information on parameters, please see the section on that component type (see 20.9.2 Component Types). The following example shows editing an intersection component.
The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Component name | | the name of the component | |
Preview button | | shows a preview of the component with theoretical centreline strings. For more information please go to 20.9.33 Component Viewer | |
Set button | | sets the component in the library | |
20.9.33 Component Viewer

The Component viewer, which is updated as you make changes to your library component, gives you an idea of what your component may look like when it is placed. The following example shows a standard intersection.

Selecting the Preview button on the Component Editor panel displays the Component viewer panel.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration</td>
<td>choice box</td>
<td>Crossroads, T Junction</td>
<td></td>
</tr>
</tbody>
</table>

this field allows you to change what strings are generated to show you how the component will change based on different centrelines.

Options include: Crossroads and T-Junction

Note that this does not affect the component in anyway – this is only for previewing purposes.

20.9.33.1 Editing a Placed Component

You may edit a placed component, either by changing the placement specific parameters or by changing the definition itself.

A placed component may be edited by using the Functions => Editor (Utilities => Functions => Editor) or by using the Edit Component option on the Components menu (Design => Roads => Components => Edit Component).

As when placing the component, the placement specific parameters will vary based on the type
of component.
For more information on Edit a Placed Component please see 20.9.34 Edit a Placed Component.
20.9.34 Edit a Placed Component

**Position of menu:**  Design => Roads => Components => Edit Component

The Edit a Placed Component panel, edits an existing component by its function.

![Edit a Placed Component panel](image)

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Please note that Library and Component will be read only if you have opted to detach the component from the library.

**Edit Definition** button

*allows you to edit the definition of the placed component, which will detach it from the library. After you do this, any changes to the library component will not affect your component. For more information please see 20.9.34.2 Edit a Placed Component Definition*

For information on the placement specific parameters, please see the section for that component.
(see 20.9.2 Component Types).

**Output Model**

model box

*the model the geometry will be generated into*

**Pre*Post**

an optional pre*post

**Set**

button

Sets the details

### 20.9.34.2 Edit a Placed Component Definition

To edit the definition of a placed component, you must edit the function (Utilities => Functions =>Editor or Design =>Roads =>Components => Edit Component) and then select 'Edit Definition' on the 20.9.34.1 Placed Component Editor panel.

The following example shows the intersection editor. For details on the component specific parameters, see the section on that component type (see 20.9.2 Component Types).

As you edit the component, your changes will be reflected on the component strings.

If you do not wish to keep the changes, simply press 'Finish' without pressing 'Set'.

---

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
</table>
Component name

the name of the component

Set button

sets the component specific parameters

Save to library button

allows you to save your component definition back into your library. This is useful after you have made changes which you wish to reuse in other components. For more information please see 20.9.34.3

20.9.34.3 Save to Library

This panel allows you to save an edited definition back in to your library.

The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Library file

the library file to save to

Component

the name of the component you are saving

The panel displays a list of all the folders in your library. Select which folder you wish to save it into.

Save button

saves the component into your library
20.9.35 Component Quick Place

Position of option on menu:  Design =>Roads =>Components => Quick place

The Component quick place toolbar is an easy way to quickly drop components on to existing strings.

Simply start the toolbar, pick your component and hover your mouse over where you would like the component created. If the placement point is correct, a preview of the component will be drawn on your view.

Once you have picked the position correctly, hitting C on your keyboard will create the component.

You can then press E to edit the component.

The fields and buttons used in this panel have the following functions:

20.10 Sight Lines

Position of menu: Design => Sight lines
Utilities => H-Z => Sight lines

A Sight Line is a lines of sight emanate from an eye point and continuing until it is stopped by an object.

In 12d Model Sight lines are stopped by the items:

(i) A Tin (tin or super tin)
(ii) Bridge tins
(iii) Super stings that are round pipes or rectangular pipes
(iv) Drainage strings
(v) Billboards
(vi) Extrusions down a super string
(vii) Trimeshes
(viii) Meshes

The sight line calculations are used in various forms in all the options on the Sight Lines menu.

See

20.10.2 Sight Distance Enhanced
20.10.3 Viewshed All
20.10.4 Shadow Analysis
20.10.5 Sun in Driver Eyes
20.10.6 Sun Exposure
20.10.7 Sight Distance - Tin Only
20.10.8 Viewshed - Tin Only
20.10.9 Dynamic Viewshed - Tin Only
20.10.1 Sight Lines

Position of option on menu:  
Design => Sight lines => Sight distance enhanced  
Utilities => H-Z => Sight lines => Sight distance enhanced  

An **eye point** can see a **target point** if a straight line can be drawn from the eye point to the target point and the line is not stopped by any obstruction along the way.

If the target point can be seen from the eye point then it is **visible** to the eye point. If not, then it is **invisible** to the eye point.

Note that this is a reciprocal relationship - if **you** can see the **target point** then the **target point** can see **you**.

In **12d Model** the items that can stop an eye from seeing a target point are:

(a) A Tin (tin or super tin)  
   This is the ground surface. If in a plan view, the eye is on the tin then in z-value it must be above the tin.  
   For some options the eye can be off the Tin.  
   In some options, the tin can contain null regions.

(b) Bridge tins  
   A Bridge Tin is a tin where the underside of the tin is used in the visibility calculations.  
   These tins can be used to model some obstructions.

(c) Obstructions.  
   These are Objects in models that can stop a ray emanating from the eye point. Valid obstructions are  
   (i) Super stings that are round pipes or rectangular pipes  
   (ii) Drainage strings  
   (iii) Billboards  
   (iv) Extrusions  
   (v) Trimeshes  
   (vi) Meshes

A **Sight Line** is a line emanating from an eye point and continuing until it is stopped by one of the above items.

In **12d Model**, visibility/invisibility/sight line calculations are used in various forms in all the options on the **Sight Line** menu.

![Sight Lines menu]

**Sight distance options** - determining for each chainage down a road, how far ahead you can see.
Viewshed options - determining all the points that can be seen from a given eye position.

Shadow analysis - determining what shadows are created by objects.

Sun in drivers eyes - determining when the sun is in a drivers eyes.

Sun exposure - determining when the sun comes in a given window.
20.10.2 Sight Distance Enhanced

Position of option on menu:  
**Design =>Sight lines =>Sight distance enhanced**  
**Utilities =>H-Z =>Sight lines =>Sight distance enhanced**  

For a string (Super Alignment etc), the *sight distance enhanced* option calculates the maximum distance that can be seen from an eye point on the tin to a target point further along the string.  

A string and (optionally) an eye point offset and height, and a target offset and height define the direction of the sight lines.  

Tins, Bridge Tins and Obstructions are supplied for the sight line calculations.  

To calculate the sight distances, *12d Model* positions the *eye point* at the given *start chainage* on the selected string, and then goes out perpendicularly for the *distance eye offset*. That position is dropped onto the tin, and finally raises it by the given *eye height*.  

From the *eye point*, a target point is placed at a chainage distance equal to the given *minimum sight distance* along the string. The target point is offset by the given *target offset*, then dropped onto the tin and finally raised by the given *target height*.  

The *target point* is then tested for visibility from the eye point, against the given tin. That is, a test is made to see if the *target point can be seen from the eye point*, against the surface given by the tin.  

If the target point is visible, it is moved a given chainage distance *trial interval* further along the string and the visibility test redone.  

The process is repeated until either the target point is invisible, or the target point is the given *maximum sight distance* (in chainage) away from the eye point.  

A line joining the eye and *final target point position* is created and placed in the *model for sight lines*. The *chainage* distance between the eye and the final target point is placed as a text string in the *model for sight text*, positioned at the eye point.  

The eye point is then moved the given chainage distance *interval* along the string, and the process repeated until the eye point is past the given *end chainage*.  

The eye point is then placed at the *end chainage* and the negative of the *trial interval* and *interval* values used to calculate sight distance for the reverse direction along the string.  

It is also possible to use a speed, reaction time and deceleration coefficient to calculate a minimum distance.  

Selecting *Sight distance enhanced* brings up the *Advanced Sight Distance* panel.
The fields and buttons used in this panel have the following functions.

**Field Description**  
**Type**  
**Defaults**  
**Pop-Up**

**Tin**  
tin box  
available tins  
*name of the tin to use as the surface for testing visibility.*

**Report type**  
choice box  
type of report file to be produced (only if **Report file** has a file name in it)

**Report file**  
file box  
depends on Report type  
*if not blank, a report of the type selected in **Report type** is produced and written out to this file name.*

**Centreline tab**

**Centreline**  
string-select  
the string to be used for calculating the chainage position for the eye and target points, is selected from a view.

**Interval**  
real box  
100  
measures pop-up  
*once the sight distance is calculated for the eye at a chainage, the eye chainage is incremented by this amount the sight distance calculation repeated.*

**Start/end chainage**  
real box  
the sight distance is calculated for points on the selected string covering the chainage range given by the start and end chainage fields. If the **start/end chainage** is blank, the start/end chainage of the selected string is used.
Trial interval  real box  10  measures pop-up

If the target point is visible, it is then moved along by this chainage increment and the sight test repeated.

There are also values under the Safe Limit tab that can be used in the sight distance calculations instead of the fixed Minimum sight distance.

If Calculate min distance is ticked, then the values on the Safe Limit tab can be entered and are used to calculate a minimum sight distance.

Calculate min distance  tick box

If ticked then the minimum sight distance is calculated from the values in the Safe Limit tab which allows for a Speed, Reaction time and a Deceleration coefficient.

If not ticked then the constant Minimum sight distance is used.

Minimum sight distance  real box  100  measures pop-up

If Calculate min distance is not ticked, then this is the minimum chainage distance from the eye point to place the test target point. The first test of a target is made at this minimum chainage distance from the eye chainage.

Maximum sight distance  real box  3000  measures pop-up

Maximum chainage distance to use for placing the test target point. The testing stops if the test target position goes over this chainage distance. In this case, the sight distance will be the maximum sight distance.

Safe Limit tab

Speed (km/hr)  real box  60  measures pop-up

speed that the vehicle is travelling.

Reaction time (s)  real box  2  measures pop-up

time in seconds for the driver to react.

Deceleration coefficient (m/s²)  real box  0.36  measures pop-up

the Deceleration coefficient in metres per second per second.

Eye tab

the eye position is determined by finding the chainage along the selected string, going out perpendicularly for the given eye offset (negative to the left, positive to the right), dropping that position onto the given tin, and then adding the eye height to the height on the tin. Hence the eye point is always the eye height above the tin.

Height  real box  1.3

height of the eye point above the given tin.

Offset  real box  -0.5

offset of the eye point from the picked string.

Target tab

the target position is determined by finding the chainage along the selected string, going out perpendicularly for the given target offset (negative to the left, positive to the right), dropping that position onto the given tin, and then adding the target height to the height on the tin. Hence the target point is always the target height above the tin.
Height real box 0.3

height of the target point above the given tin

Offset real box -0.5

offset of the target point from the picked string.

Bridge Tins tab

A Bridge Tin is a tin where the underside of the tin is used in the visibility calculations.

Tins grid of tins available tins

the underside of these tins are used in the visibility calculations. These tins can be used to model some obstructions.

Forward tab

Do calcs tick box

if ticked, do the calculations for the forward direction. That is, from the start of the string and in increasing string chainage.

Sight lines model box available models

if not blank, the name of the model to contain the sight lines.
If blank, the sight lines are not created.

Clean models first tick box not ticked

if ticked, the models of results are cleaned out before the option runs.

Good colour colour box default colour available colours

when the minimum sight distance is achieved, sight lines are created in the good colour

Bad colour colour box default colour available colours

when the minimum sight distance is not achieved, sight lines are created in the Bad colour

Sight text model box available models

if non-blank, the name of the model to contain the sight distance text.
If blank, the sight distance text is not created.

Sight text info text info

drawing information for the sight text.

Reverse tab

Do calcs tick box

if ticked, do the calcs for the reverse direction. That is, from the end of the sting and going in reverse string chainage direction.

Sight lines model box available models

if not blank, the name of the model to contain the sight lines when going down the string in the reverse direction. Note that the eye and target offsets are then applied in the reverse direction of the string.
If blank, the sight lines are not created.

Clean models first tick box not ticked
if ticked, the models of results are cleaned out before the option runs.

**Good colour**
- colour box
- default colour
- available colours
  
  when the minimum sight distance is achieved, sight lines are created in the good colour

**Bad colour**
- colour box
- default colour
- available colours
  
  when the minimum sight distance is not achieved, sight lines are created in the Bad colour

**Sight text**
- model box
- available models
  
  if non-blank, the name of the model to contain the sight distance text.
  
  If blank, the sight distance text is not created.

**Sight text info**
- text info
  
  definition of the sight text.

**Obstructions tab**

all the 3d objects in the data source that can be used as obstructions, are used. For a list of valid obstructions, see **20.10.1 Sight Lines**.

**Data source type**
- Model
  
  data selection type - XX

**Data source for obstructions**

source of data to look through for elements to use as obstructions.

**Sight button**
- button
  
  clicking this button runs the operation.

In the report, the definition for safe distance is

\[
reaction\_distance = reaction\_time \times speed\_value / 3.6
\]
\[
safe\_distance = reaction\_distance + speed\_value \times speed\_value / (254 \times (deceleration\_coefficient + grade \times change\_deceleration\_per\_grade))
\]

where

**reaction\_time** is in seconds

**speed\_value** is the Operating speed in km/h

**deceleration\_coefficient** is the coefficient of deceleration (longitudinal friction factor)

**grade** is longitudinal grade (a percentage), with sign + for upgrades and - for downgrades.

**change\_deceleration\_per\_grade** is

**Note:** 3.6 is the conversion from km/h to m/s
20.10.3 Viewshed All

Position of option on menu: Design => Sight lines => Viewshed all
Utilities => H-Z => Sight lines => Viewshed all

This panel is used to calculate the points, on or above a tin, that are visible and invisible from a user selected eye position. That is, it is calculating the sight lines from an eye point.

This is equivalent to calculating the points that can, or can not, see a selected eye point.

Bridge Tins and Obstructions are used in the sight line calculations. For a list of valid obstructions, see 20.10.1 Sight Lines

The calculations are made along rays emanating from the eye point from a minimum plan distance to a maximum plan distance from the eye point. The rays are created at regular angular steps from a start angle to an end angle.

The eye point can be off the tin and there can be null triangles in the tin.

Selecting Viewshed all displays the Advanced Viewshed panel.

```
<table>
<thead>
<tr>
<th>Settings tab</th>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
```

The fields and buttons used in this panel have the following functions.

- **Tin**: name of the tin to be used for the viewshed analysis.
- **Height of target above tin**: the distance that the target is above the tin. This can be positive or negative.
- **Start angle**: the angle to begin taking sight rays emanating from the eye point. Measured in a counter clockwise direction from the positive x-axis.
End angle angle box 359.30
the angle to stop taking sight rays emanating from the eye point. Measured in a counter clockwise
direction from the positive x-axis.

Step angle angle box 5
the angle between successive sight rays emanating from the eye point.

Minimum distance real box
if not blank, the minimum distance from the eye point along the sight ray to begin recording visible/
invisible points.
If blank, the minimum distance is zero.

Maximum distance real box
the maximum distance from the eye point along the sight ray to record visible/invisible points.
If blank, the entire tin is considered.

Clean models first tick box
if ticked, the models of results are cleaned out before the option runs.

Eye tab
Eye XYZ input/output xyz ops menu
X/Y/Z coordinate
the XYZ co-ordinates of the eye point.
Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

Note - the z-value must be above the surface of the tin at the (x,y) eye position minus the target height.
So the eye can not be below the tin by more than the target height, or even the target height below the
tin.

Results tab
More tick box
if ticked, ask for name, model, linestyle, weight.
If not ticked, only ask for model.

Name name box names in names.4d
the name for the visible/invisible sight strings.

Model model box available models
the model for the visible/invisible sight strings.

Linestyle linestyle box available linestyles
the linestyle for the visible/invisible sight strings.

Weight weight box
thickness of the string when plotted

Colour of visible bits colour box default line colour
if not blank, the colour for the visible parts of the rays.
If blank, the visible parts are not created.

Colour of invisible bits colour box default point colour
if not blank, the colour for the invisible parts of the rays.
If blank, the invisible parts are not created.

Separate strings tick box

If ticked, the visible and invisible sections are separate strings.

If not ticked, the visible and invisible sections are combined into one super string.

Rays tab

Visible Rays

The visible rays are the lines from the eye point to the point on the tin where the target goes from being visible to invisible.

If Colour of visible bits is not blank then this is the colour used for these rays.

If Colour of visible bits is blank then the colour is the default line colour.

The ray will be coloured where it is over invisible targets with the colour for the invisible bits (this can happen in undulating country).

More tick box

If ticked, ask for name, model, linestyle, weight.

If not ticked, only ask for model.

Name name box names in names.4d

the name for the visible ray strings.

Model model box available models

If not blank, the model for the visible ray strings.

If blank, don’t create the visible ray strings

Linestyle linestyle box available linestyles

the linestyle for the visible ray strings.

Weight weight box

thickness of the visible ray strings when plotted

Invisible Rays

The invisible rays are the lines from the eye point to the point on the tin where the target goes from being invisible to visible.

If Colour of invisible bits is not blank then this is the colour used for these rays.

If Colour of invisible bits is blank then the colour is the default point colour.

The ray comes from the eye and is coloured with the Colour of visible bits to the change over from visible to invisible and then coloured with the Colour of invisible bits to where the ray ends (the change over visible to invisible).

More tick box

If ticked, ask for name, model, linestyle, weight.

If not ticked, only ask for model.

Name name box names in names.4d

the name for the invisible ray strings.

Model model box available models
if **not blank**, the model for the invisible ray strings.
If **blank**, don’t create the invisible ray strings

**Linestyle**
linestyle box
available linestyles

the linestyle for the invisible ray strings.

**Weight**

*A Bridge Tin* is a tin where the underside of the tin is used in the visibility calculations.

**Tins**
grid of tins
available tins

the underside of these tins are used in the visibility calculations. These tins can be used to model some obstructions.

---

**Obstructions tab**

the following elements can also obstruct the view line.

(i) super strings with round or rectangular sections.
(ii) bill boards
(iii) extrusions along a string

**Data source type**
Model

data selection type - XX

**Data source for obstructions**

source of data to look through for elements to use as obstructions.

**Viewshed**
button

On selecting this button, the lines of sight emanating from the eye XYZ point are calculated.
20.10.4 Shadow Analysis

Position of option on menu: Design => Sight lines => Shadow analysis
Utilities => H-Z => Sight lines => Shadow analysis

This option is under development.

The Shadow Analysis option is similar to the Viewshed option except that the sun is used as the eye position. This means that the visible areas are those in sunlight and the invisible areas are those in the shade (in shadows).

Selecting Shadow analysis displays the Shadow Analysis panel.

![Shadow Analysis Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

*name of the tin to be used for the shadow analysis.*

*the perpendicular distance between the result lines.*

Selecting Shadow analysis displays the Shadow Analysis panel.
Clean models first    tick box    not ticked

if ticked, the models of results are cleaned out before the option runs.

Sun Angle tab

Use Angle XY and Angle Z    tick box    not ticked

this controls whether Angle XY and Angle Z are typed in and used to specify the position of the sun, or if the sun position (and hence Angle XY and Angle Z) are calculated by giving the date and time of day, and either the (Easting, Northing) or the longitude and latitude of a point in the middle of the data.

If ticked, the user specifies the position of the sun with respect to the data by giving Angle XY and Angle Z (see below for their definitions). This method if used when the data is in an arbitrary coordinate system so there is no way to calculate the position of the sun from the data.

If not ticked, then the data needs to be in a Projection and the angle to the sun is calculated by giving the date and time, and either the (x,y) coordinate, or the longitude and latitude and of a point in the data.

So if Use Angle XY and Angle Z for sun position is not ticked:

Date

the sun position is calculated for this date and time.
Time zone  
choice box

used to define the time zone for the time and date.

**Projection the data is in**  
projection box

the data to do Shadow Analysis on must be in this projection.

**Use Easting (X) Northing (Y) coordinates**  
tick box  
not ticked

if **ticked**, the \((x,y)\) coordinates of a point in the middle of the data is given. Using the Projection, the longitude and latitude can be calculated for this point. **Note** - because the data is in a projection, then the \((x,y)\) coordinates are often referred to as Eastings and Northings.

If **not ticked**, the latitude and longitude of a point in the middle of the data is given. Using the Projection, the \((x,y)\) position of the point can be calculated.

If **Use Easting (X) Northing (Y) coordinates** is **ticked**:

**X/Y/Z coordinate**  
real box  
measure box

the \(x,y\) and \(z\) coordinates for a typical point in the data can be typed in or a point can be selected using the Point select and the values for \(x, y,\) an \(dz\) will be written to these fields.

The \(z\) coordinate will also be written to the **Height** field.

If **Use Easting (X) Northing (Y) coordinates** is **not ticked**:

**Longitude/Latitude**  
angle box  
measure box

the longitude and latitude for a typical point in the data is typed in.

**Height**  
measure box

the height of a typical point on the ground.

If **Use Easting (X) Northing (Y) coordinates** is **ticked**:

**Angle XY**  
angle box  
0

the angle of the sun in the \(XY\) plane measured in a counter clockwise direction from the positive \(x\) axis. It is dms in HP notation.

**Angle Z**  
angle box  
15

the angle of the sun in the vertical plane, measured from the horizontal plane with positive angle going up (Elevation angle?). It is dms in HP notation.

**Results tab**

**More**  
tick box

if ticked, ask for name, model, linestyle, weight.

If not ticked, only ask for model.

**Name**  
nname box  
names in names.4d

the name for the sunshine (visible)/shade (invisible) sight strings.

**Model**  
model box  
available models

the model for the sunshine (visible)/shade (invisible) sight strings.

**Linestyle**  
linestyle box  
available linestyles

the linestyle for the sunshine (visible)/shade (invisible) sight strings.

**Weight**  
weight box

thickness of the sunshine (visible)/shade (invisible) sight strings when plotted
Colour of bits in sunshine  colour box  default line colour
if not blank, the colour for the parts in sunshine. These are the visible parts of the view lines.
If blank, the sunshine parts are not created.

Colour of bits in shade bits  colour box  default point colour
if not blank, the colour for the parts in the shade (in shadows). These are the invisible parts of the view lines.
If blank, the shade parts are not created.

Separate strings  tick box
if ticked, the sunshine (visible) and shade (invisible) sections are separate strings.
If not ticked, the sunshine (visible) and shade (invisible) sections are combined into one multicoloured string.

Bridge Tins tab
A Bridge Tin is a tin where the underside of the tin is used in the visibility calculations.
Tins  grid of tins  available tins
the underside of these tins are used in the visibility calculations. These tins can be used to model some obstructions.

Obstructions tab
the following elements can also obstruct the line from the sun.
(i) super strings with round or rectangular sections.
(ii) bill boards
(iii) extrusions along a string

Data source type  Model
data selection type - XX

Data source for obstructions
source of data to look through for elements to use as obstructions.

Process  button
On selecting this button, the lines of sight emanating from the sun are calculated.

<Esc> can be used to terminate the option during the processing.
20.10.5 Sun in Driver Eyes

Position of option on menu:  Design => Sight lines => Sun in driver eyes
Utilities => H-Z => Sight lines => Sun in driver eyes

This option is under development.

Selecting Sun in driver eyes displays the Sun in the Driver Eyes panel.

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up
--- | --- | --- | ---
Tin | tin box | available tins | name of the tin to be used for the analysis.
20.10.6 Sun Exposure

Position of option on menu:  
Design => Sight lines => Sun exposure  
Utilities => H-Z => Sight lines => Sun exposure

This option is under development.

Selecting Sun exposure displays the Sun Exposure panel.

The fields and buttons used in this panel have the following functions.

Main tab

Point position
20.10.7 Sight Distance - Tin Only

Position of option on menu:
- Design => Sight lines => Sight distance - tin only
- Utilities => H-Z => Sight lines => Sight distance - tin only

For a string (Super Alignment etc), the sight distance option calculates the maximum distance along the road that can be seen from an eye point.

The calculations are done in the same manner as for the Advanced Sight Distance except that there is only a Tin and Bridge Tins. There are no Obstructions (see 20.10.2 Sight Distance Enhanced).

Selecting Sight distance - tin only brings up the Sight Distance panel.

![Sight Distance Panel]

The fields and buttons used in this panel have the following functions.

<td></td>
</tr>
<tr>
<td></td>
<td>once the sight distance is calculated for the eye at a chainage, the eye chainage is incremented by this amount the sight distance calculation repeated.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Start/end chainage</td>
<td>input</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
the sight distance is calculated for points on the selected string covering the chainage range given by the start and end chainage fields. If the start/end chainage is blank, the start/end chainage of the selected string is used.

Trial interval  
input 10
if the target point is visible, it is then moved along by this chainage increment and the sight test repeated.

Minimum sight distance  
input 100
minimum chainage distance from the eye point to place the test target point. The first test of a target is made at this minimum chainage distance from the eye chainage.

Maximum sight distance  
input 3000
maximum chainage distance to use for placing the test target point. The testing stops if the test target position goes over this chainage distance. In this case, the sight distance will be the maximum sight distance.

Eye tab
the eye position is determined by finding the chainage along the selected string, going out perpendicularly for the given eye offset (negative to the left, positive to the right), dropping that position onto the given tin, and then adding the eye height to the height on the tin. Hence the eye point is always the eye height above the tin.

Height  
input 1.3
height of the eye point above the given tin.

Offset  
input -0.5
offset of the eye point from the picked string.
Target tab

the target position is determined by finding the chainage along the selected string, going out perpendicularly for the given target offset (negative to the left, positive to the right), dropping that position onto the given tin, and then adding the target height to the height on the tin. Hence the target point is always the target height above the tin.

Height input 0.3
height of the target point above the given tin

Offset input -0.5
offset of the target point from the picked string.
Bridge Tins tab

Tin  grid  available tins

name of the tins to use as vertical obstructions when testing visibility.

Forward Direction tab

Do calcs  tick box
if ticked, do the calcs for the forward direction

**Sight lines**
- model box
- available models

If non-blank, the name of the model to contain the sight lines.
If blank, the sight lines are not created.

if non-blank, the name of the model to contain the sight distance text. If blank, the sight distance text is not created.

Sight text info

text info

definition of the sight text.

Sight button

sight lines and text will be calculated for the given string and tin, and placed in the sight line and text models.
20.10.8 Viewshed - Tin Only

Position of option on menu:  
**Design** => **Sight lines** => **Viewshed - tin only**  
**Utilities** => **H-Z** => **Sight lines** => **Viewshed - tin only**

This panel is used to calculate the points that are visible and invisible from a user selected eye position. This is equivalent to calculating the points that can or cannot see a selected point.

The calculations are made along rays emanating from the eye point from a minimum to a maximum distance from the eye point. The rays are created at regular angular steps from a start angle to an end angle.

The calculations are done in the same manner as for the Advanced Viewshed except that there is only a Tin. There are no Bridge Tins or Obstructions (see [20.10.3 Viewshed All](#)).

Selecting Viewshed displays the Tin Viewshed panel.

![Tin Viewshed Panel](image)

The fields and buttons used in this panel have the following functions.

*name of the tin to be used for the viewshed analysis.*

*the angle to begin taking sight rays emanating from the eye point.*

*the angle to stop taking sight rays emanating from the eye point.*

*the angle between successive sight rays emanating from the eye point.*
the maximum distance from the eye point along the sight ray to record visible/invisible points. If blank, the entire tin is considered.

Clean model first  tick box
if ticked, the models of results are cleaned out before the option runs.

Eye tab

Eye XYZ  input/output  xz op menu

X/Y/Z coordinate
the XYZ co-ordinates of the eye point.
Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

Note - the z-value is normally above the surface of the tin and should not be on the tin.

Results tab

More  tick box
if ticked, ask for name, model, linestyle, weight.
if not ticked, only ask for model.

Name  input
name for the created strings

Model  model box  available models
the model for the visible/invisible sight strings.

Linestyle  linestyle box  linestyle for the created strings

Weight  weight box  weight for the created strings

Colour of visible bits  colour box  default line colour
if not blank, the colour for the visible parts of the rays.
If blank, the visible parts are not created.

Colour of invisible bits  colour box  default point colour
if not blank, the colour for the invisible parts of the rays.
If blank, the invisible parts are not created.

Separate strings  tick box
if ticked, the visible and invisible sections are separate strings.
If not ticked, the visible and invisible sections are combined into one super string.

Rays tab

Visible Rays
the visible rays are the lines from the eye point to the point on the tin where the terrain goes from being visible to invisible.

If Colour of visible bits is not blank then this is the colour used for these rays.
If Colour of visible bits is blank then the colour is the default line colour.
The ray will be coloured where it is over invisible terrain with the colour for the invisible bits (this happens in undulating country. That is where there are valleys).

More

tick box
if ticked, ask for name, model, linestyle, weight.
if not ticked, only ask for model.

Name

input
name for the created strings

Model

model box
available models
if not blank, the model for the visible ray strings.
If blank, don’t create the visible ray strings

Linestyle

linestyle box
linestyle for the created strings

Weight

weight box
weight for the created strings

Invisible Rays
the invisible rays are the lines from the eye point to the point on the tin where the terrain goes from being invisible to visible.

If Colour of invisible bits is not blank then this is the colour used for these rays.
If Colour of invisible bits is blank then the colour is the default point colour.

The ray comes from the eye and is coloured with the Colour of visible bits to the change over from visible to invisible and then coloured with the Colour of invisible bits to where the ray ends (the change over visible to invisible).

More

tick box
if ticked, ask for name, model, linestyle, weight.
if not ticked, only ask for model.

Name

input
name for the created strings

Model

model box
available models
if not blank, the model for the invisible ray strings.
If blank, don’t create the invisible ray strings

Linestyle

linestyle box
linestyle for the created strings

Weight

weight box
weight for the created strings

Viewshed

button
On selecting this button, the lines of sight emanating from the eye XYZ point are calculated.
20.10.9 Dynamic Viewshed - Tin Only

Position of option on menu: Design => Sight lines => Viewshed dynamic - tin only
Utilities => H-Z => Sight lines => Viewshed dynamic - tin only

Dynamic viewshed is used to calculate and display on a section view, the points that are visible and invisible from a user selected eye position to a user selected target position.

The target point can be dynamically moved and the sight line is automatically recalculated and displayed on the section view.

The calculations are done in the same manner as for the Advanced Viewshed except that there is only a Tin. There are no Bridge Tins or Obstructions (see 20.10.3 Viewshed All).

Selecting Viewshed dynamic displays the Viewshed Dynamic panel.

![Viewshed Dynamic Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field/Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section view</td>
<td>view box</td>

<td></td>
</tr>
<tr>
<td>Colour of invisible bits</td>
<td>colour box</td>
<td>default point colour</td>
<td></td>
</tr>
<tr>
<td>Start XYZ</td>
<td>input/output</td>
<td>xyz ops menu</td>
<td></td>
</tr>
</tbody>
</table>
X/Y/Z coordinate
the XYZ co-ordinates of the start of the line to determine viewshed for.
Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

End XY input/output xyz ops menu
X/Y coordinate
the XY co-ordinates of the end of the line to determine viewshed for.
Each co-ordinate can be individual entered or the point pick icon used to select an existing point.
No Z is required.

Dynamic tick box
if ticked and the Start/End points button is used, once the Start point is selected, the viewshed analysis is carried out from the start point to the cursor position which represents the end point. The results are displayed in the section view.

Start/End points button
if picked, an start point is selected and then the height displayed in an enter height input box. If required, a new height can be typed into the enter height box. After typing an <enter> into the input box, the box is removed from the screen and the x, y and height is piped into the Start XYZ panel field.
The cursor is then used to select the End point.
If Dynamic is ticked, as the Cursor position is moved, the viewshed is carried out to the new cursor position and the results displayed in the section view.

Profile button
Selecting this button calculates the line of sight from the start to the end position.
20.11 Track

Position of menu: Design => Track => Help

The Track options have their own Help system which is brought up by clicking on Help on the Track menu, or clicking Help on each of the Track panels.
20.12 Tunnels and Structures

Position of menu: Design => Tunnel-Structures

In Version 11.0, the creation of tunnel profiles and the generation of a tunnel or structure has been enhanced from Version 10.0 to make the process easier.

Tunnels and structures are defined by a number of profiles, each of which must have the same number of named vertices, and these profiles are applied along a centreline (alignment). New profiles are generated at user given chainages along the tunnel/structure centreline, and any profile generated between two defined profiles is the linear interpolation by chainage of the two defined profiles.

The defined tunnel profiles and how they are applied down a string are specified in the Create/Edit Tunnel File panel, and this information is stored in a Tunnel Definition File (ending in .12d_Tunnel).

The Tunnel Definition File is used in other options such as Create Tunnel which generates the profile and longitudinal strings, and trimesh, for the tunnel, Conform Tunnel for tunnel conformance, and in 12d Field for setting out tunnels.

Note: a Trimesh can be generated for a tunnel by the Create Tunnel panel.

The Tunnel menu is:

See

20.12.1 Creating/Editing a Tunnel Definition File
20.12.2 Create Tunnel

20.12.4 Conform Tunnel
20.12.5 Conform Plot Tunnel
20.12.6 Plot Settings
20.12.7 Trimesh from Tunnel Points
20.12.1 Creating/Editing a Tunnel Definition File

Position of option on menu: Design => Tunnel-Structures => Create/edit tunnel file

The Create/Edit Tunnel File panel is used to define the tunnel definition file which records:

(a) the profiles used to define the tunnel
(b) the tunnel centreline (the tunnel reference string) that the tunnel profiles are applied to
(c) whether the tunnel profiles are applied perpendicular (i.e. normal) or vertically to the tunnel centreline
(d) whether 2d or 3d chainages are used in the tunnel definitions.
(e) the chainages where the profiles are applied, and optional height, grade and rotation changes when the profiles are applied along the tunnel centreline.

Note: Tunnel profiles and longitudinal strings can be generated perpendicular (i.e. normal) to the defined centreline resulting in a true 3d representation of the tunnel.

One restriction is that a tunnel cannot be completely vertical - there must be some chainage difference in the vertical alignment. But given that a chainage difference as small as 0.01mm can be used then this restriction is rarely a problem.

Selecting Create/edit tunnel file brings up the Create/Edit Tunnel File panel.
Top Section

**Tunnel definition**

- tunnel file box
- available 12d_tunnel files

The tunnel file to contain all the definitions for the tunnel. That is, the tunnel centreline, the tunnel profiles and which profiles and how often they are applied along the centreline of the tunnel.

**Read**

- read in the file given in the **Tunnel definition** field.

**Write**

- write out all the values in the panel to the file giving in the **Tunnel definition** field.

**Export (PRO/PRA)**

- button

Write out the appropriate values in the panel as a PRO and PRA file.

*Note: PRO and PRA are files use in TP Setout and TP Stakeout. See 20.12.10 Definition of the PRO and PRA definition files.*
General tab

Tunnel centreline

the centreline that the tunnel definitions are applied to. The centreline must have valid vertical geometry for all the chainage ranges used in the Assignments, Offsets Heights and Rotations tabs.

Profile type

choice box perpendicular, vertical

if perpendicular, the tunnel profiles are applied perpendicularly (i.e. normal) to the vertical alignment of the centreline. That is, perpendicular to the tangent vector to the centreline at that chainage. This results in a true 3d model.

If vertical, the tunnel is calculated vertical to the vertical alignment of the centreline. This may mean an effective loss of clearance on steeper grades.

Chainage type

choice box 2d, 3d

if 2d, the chainages in the tunnel definitions are taken as plan chainages.

if 3d, are interpreted as 3d. That is, it is the plan/2d chainage of the 1st point where the horizontal and vertical geometry coincide, plus the 3d length along the centreline from there.

Manage Profiles tab

A tunnel can contain any number of defined profiles that are used to linearly extrapolate between. The Manage Profile tab lets you create a new profile:

(a) using an existing profile as a seed profile and the new profile is given a copy of the seed profile’s geometry. The profile geometry is then edited using the Profiles tab.

or

(b) create a new profile that has no geometry and the geometry is entered using the Profiles tab.

Seed profile

profiles box available profiles in this tunnel definitions file

if not blank, it must be a profile in this tunnel definitions file and it is used as a Seed profile for the new profile being created.

New name

text box

name for the new profile being created. The new name must be unique amongst the profiles in this tunnel definitions file.

Create

button

create a new profile with the geometry being a copy of the geometry of the Seed profile.

Delete profile

profiles box available profiles in this tunnel definitions file

the profile in this tunnel definitions file to delete.

Delete

button

delete the profile given in the Delete profile field.

Profile to rename

profiles box available profiles in this tunnel definitions file

the profile in this tunnel definitions file to be renamed.

New name

text box
new name for the profile. The new name must be unique amongst the profiles in this tunnel definitions file.

**Rename** button
rename the profile given in the **Profile to rename** field to the name given in the **New name** field.

**Import profile** profiles box available profiles in this tunnel definitions file
the profile in this tunnel definitions file to delete.

**Delete** button
delete the profile given in the **Delete profile** field.

**Profiles tab**
A tunnel can contain any number of defined profiles that are used to linearly extrapolate between. The **Profile** tab lets you create new profiles, pick existing profiles to edit and graphically display the shape of the profile for you.

**Current Profile** choice box list of profiles in the current tunnel
Select the profile you wish to create or edit. If the selected profile already has vertices defined, they will be displayed in the grid, and the shape drawn in the area under the grid.

**Set** button
Records the contents of the current grid as the profile given in the **Current profile** field. **Set** must be pressed before moving to another profile or the contents of the current grid will be lost.

**Profile grid**

**Name** text box
the name of the vertex of the profile. It must be unique to this profile.

**Offset** real box
the offset of the vertex from the centreline. Positive offset is to the right of the centreline, negative offset is to the left of the centreline.

**Height** real box
the height difference of the vertex from the centreline. Positive height is above the centreline, negative height is below the centreline.

**Radius** real box
the radius of the segment from this named vertex to the next named vertex. A positive radius is a right handed or clockwise curve with respect to the order of the vertices in the grid. Zero (0) means that there is no radius and there is a straight line between this vertex and the next named vertex. There must always be a value for the radius.
Assignments tab

This grid is used to define where the defined profiles are assigned on the centreline. For a row in the grid, the named profile starts at the chainage in that row. For any chainage between this chainage and the chainage on the next row of the grid, a profile is generated by interpolating by chainage between the named profile on this row and the named profile on the next row.

The same profile can be used any number of times in the Assignment grid. The chainages in the Assignments grid must be in ascending order.

Set button

Records the contents of the Assignments grid. Set must be pressed before moving to another tab or the contents of the current grid will be lost.

Assignments grid

Chainage real cell

The chainage where the named profile begins. For any chainage between this chainage and the one on the next row, a profile is generated by interpolated by chainage between this profile and the one on the next row of the grid.

Name profiles cell available profiles

The name of the profile to start at this chainage.

Offsets/Heights/Rotations tab

A profile can be adjusted by applying an offset, a (delta) height and a rotation. The Offsets/Heights/Rotations grid is used to define the offset/height/grade or angle applied to a profile.
The offset/height/grade or angle on a row of the grid starts at the chainage in that row. For any chainage between the chainage of this row and the chainage of the next row, an offset/height/grade or angle for the profile at the chainage is calculated by interpolating between the offset/height/grade or angle of the profile in this row and the offset/height/grade or angle on the following row of the grid. The chainages in the Offsets/Heights/Rotations grid must be in ascending order.

Notes:
1. the height is a delta height. That is, it is added to the height of the profile.
2. the rotation in a row can be given as either a Percent Grade (positive is up) or an Angle (dms in hp notation and is measure in counterclockwise from the offset axis). The percent grade or angle will be referred to as the rotation.

Set button
Records the contents of the Offsets/Heights/Rotations grid. Set must be pressed before moving to another tab or the contents of the current grid will be lost.

Offsets/Heights/Rotations grid

Chainage real cell
The chainage to start applying the offset/height/rotation.
For any chainage between this chainage and the one on the next row of the grid, an offset/height/rotation is generated by interpolated by chainage between this offset/height/rotation and the one in the next row of the grid.

Offset/Height/Grade or Angle real cell
the offset/height/grade or angle to start at this chainage.
For any chainage between this chainage and the one on the next row, an offset/height/rotation is calculated by interpolated by chainage between this offset/height/rotation and the one on the next row of the grid.

Type choice cell
None, Linear, Cubic, Rev C, Biquadratic
the type of interpolation used for the offset/height/rotation at chainage between the chainage of this row and the chainage on the next row.
None: no interpolation is done and the offset/height/rotation at this chainage is used. If there is a different offset/height/rotation on the next row then there will be a problem and you need to insert another row after this row with a chainage slightly less than the chainage on the next row. The offset/height/rotation of the inserted row needs to be the same as this row and the Type should be Linear.
Linear: offset/height/rotation is linearly interpolated by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.
Cubic: offset/height/rotation is interpolated as a cubic by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.
Rev C: offset/height/rotation is interpolated as a reverse cubic by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.
Biquadratic: offset/height/rotation is interpolated as a back to back quadratics by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.
20.12.2 Create Tunnel

Position of option on menu: Design => Tunnel-Structures => Create tunnel

The Create Tunnel panel is used to generate the strings defining the shape of the tunnel - the profile and longitudinal strings, and the trimesh, for the tunnel.

The tunnel is defined in a Tunnel File that has been created in the Create/Edit Tunnel File panel.

Selecting Create Tunnel brings up the Create Tunnel panel.

![Create Tunnel panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>

</tbody>
</table>

The tunnel file containing all the definitions for the tunnel. That is, the tunnel centreline, the tunnel profiles and which profiles and how often they are applied along the centreline of the tunnel.

*if not blank*, a string of the tunnel profile is created at each chainage point along the tunnel centreline and stored in this model.

*If blank*, no strings of the tunnel profiles are created.

*if not blank*, strings are created by joining common vertices of the profiles along the tunnel centreline and stored in this model.

*If blank*, no longitudinal strings are created.
Colour of strings

- colour box
- available colours

colour of the profiles and longitudinal strings.

Model for trimesh

- model box

If not blank, a trimesh is created for the tunnel and placed in this model.
If blank, no trimesh is created.

Colour of trimesh

- colour box
- available colours

colour of the trimesh.

Mesh, form end caps?

- tick box

If ticked, the trimesh includes a mesh over each end of the tunnel. This creates a closed trimesh. A volume is calculated and reported in a String inquire on a closed trimesh.
If not ticked, the trimesh ends are left open. A volume is NOT reported in a String inquire on an open trimesh.

Colour of endcap

- colour box
- available colours

colour of the endcap.

Clean models?

- tick box

If ticked, the profile and longitudinal strings, and trimesh models are cleaned before the new strings and trimesh are created.

Start/End 2d control chainage

- real box

the Start/End 2d chainage on the centreline to create the trimesh, longitudinal strings and profile strings for.

Chainage Inc

- real box

the chainage increment to create the sections and vertices of the strings at. Whether the chainage is 2d or 3d is defined in the Tunnel Definition File.

Profile Straight/Arc Inc%

- real box

this defines how often vertices are generated around the tunnel profiles between the vertices of the tunnel profile, and hence how may vertices are created in the sections, how many longitudinal strings and the density of triangles in the trimesh.
The value is a percentage to the length of the tunnel profile and for each tunnel section, vertices are generated at each of the defining vertices of the tunnel profile, and then at the Profile Straight/Arc Inc% distance between adjacent defining vertices of the tunnel profile.
Hence the Profile Straight/Arc Inc% options control the accuracy of the shapes generated for the tunnel - straights and arcs are detected, and defined values assigned accordingly.

Note - the values Profile Straight/Arc Inc% give a good approximation to the number of vertices are created on each section but there may be a few more because all the defining vertices of the profile as in the sections. So if Profile Straight/Arc Inc% is 5 then there will be approximately 20 vertices on each section.

Create

- button

create the tunnel profile strings, longitudinal strings, and trimesh.
20.12.3 Create Combined Tunnel

Position of option on menu: Design => Tunnel-Structures => Create combined tunnel

CURRENTLY A WORK IN PROGRESS

The Create Combined Tunnel panel is used to

The tunnel is defined in a Tunnel File that has been created in the Create/Edit Tunnel File panel.

Selecting Create combined tunnel brings up the Create Combined Tunnel panel

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

![Trimesh from Tunnel Points panel](image)
a triangle in a trimesh has an **outside edge** if that edge of the triangle has no adjacent triangle in the trimesh. A triangle in the trimesh with an outside edge is called an **outside triangle**.

Any outside triangle in the created trimesh whose angle of its normal is greater than the angle of the normal to the tunnel (at the first vertex of the triangle), is greater than **Null angle param** will be nulled. This is useful for cleaning up the end caps, and edge triangles that deviate too much from the direction along the length of the tunnel.

**Null profile length**

real box

a triangle in a trimesh has an **outside edge** if that edge of the triangle has no adjacent triangle in the trimesh. A triangle in the trimesh with an outside edge is called an **outside triangle**.

Any outside triangle in the created trimesh whose difference in the profile distance of the two ends of the edge dropped onto the profile around the tunnel, is greater than **Null profile length**, will be nulled. This should not be needed too often because **Null chainage diff** and **Null angle param** would generally do the job. Also if there is a radical change in profile across this mesh face then this nulling may not work as intended.

**Colour for trimesh**

colour box

available colours

colour of the trimesh.

**Clean trimesh model?**

tick box

if ticked the model for the trimesh is cleaned before the new trimesh is created.

**Create**

button

create the trimesh from the points.

</thead>
<tbody>
<tr>
<td>Read</td>
<td>button</td>
</tr>
</tbody>
</table>
read in a data file of settings for the panel

**Write** button
write out a data file of the settings in the panel

**Buttons at bottom of panel**

**Overlay** button
run the overlay.

**Setup**

**Radio buttons**
radio buttons to define how cross sections for existing road are produced

**From Tin** radio button
if selected, the road x-sections are created by taking sections though a tin. The following fields are displayed

**Tin** tin box available tins
sections are created through this tin to represent the existing road

**Separation** input
chainage distance between cross sections

**Left/Right extension** input
Left/Right distance to define the limits of the cross sections

**Model for tin x-sections** model box available models
model for the created cross sections

**From Cuts** radio button
if selected, the road x-sections are created by taking cuts through strings. The following fields are displayed

**Strings model** model box available models
sections are created by taking cuts through the strings in this model

**Separation** input
chainage distance between cross sections

**Model for cuts** model box available models
model for the created cross sections

**From X-sections** radio button
if selected, the road x-sections already exist. The following fields are displayed

**X-sections model** model box available models
existing model of x-sections to use for the road

**Overlay mode** choice box Normal Normal, Use Crossfalls Only
Use Reference Z Values and Crossfalls only

if Normal, at each section the left/right z-value is calculated so that the left/right crossfall and minimum overlay is obeyed. The z-value for the section is the maximum of the calculated z-values for the left and right.

If User Crossfalls only, the crossfalls from the Left and Right Setups tabs are used and no minimum
overlay applied.

If Reference Z values and Crossfalls only, no overlay calculations are performed and the crossfalls in the Left and Rights Setups tabs are applied to the actual z-values on the reference string.

Reference string  string select box
select the string for the centreline of the road

Ignore reference z values in calculations  tick box
if not ticked, when the z-value is calculated at each section obeying just the minimum overlay criteria then use the maximum of the and the calculated z-value and the reference z-value at that section.

If ticked, use the calculated z-value at each section.

Start chainage  input
chainage to start the overlay calculations

End chainage  input
chainage to end the overlay calculations

Special chainages  file box
special chainage file to define additional cross sections for overlay processing

Left/Right Setup tab
setup for the left/right side sections

Radio buttons
radio buttons to define how cross sections for existing road are produced

By offset  radio button
if selected, the width of the left/right cross sections is given in the Offset field

Offset  input
left/right offset distance to define the edge of the left/right section

By String  radio button
if selected, the width of the left/right cross section is defined by a selected Edge string minus the Cut Back/Extension value. The following fields are displayed

Edge string  string select
select the left/right edge string

Cut Back/Extension  input
value to subtract from the distance to the edge string to define the left/right section

When By String is selected, the Chainage-Minimum X-Fall grid can also be automatically filled in by using the crossfall between the Road Crown and the Edge String.

Road crown  string select
select the road crown the use for calculating the cross fall to the Edge string

Only critical points  tick box
if ticked, the crossfall between the Road crown and the Edge string is only calculated at the tangent points of the Reference string.

If not ticked, the crossfall between the Road crown and the Edge string is calculated at the regular
interval given by Xfall Load Interval and also at the tangent points of the Reference string.

**Xfall load interval**  
input  
regular interval to calculate crossfall

**Load Xfalls from Strings**  
button  
when selected, the Chainage-Minimum X-Fall grid is automatically filled in by using the crossfall between the Road Crown and the Edge String

**By name**  
radio button  
if selected, the width of the left/right cross section is defined by the name of a given string minus the Cut Back/Extension value. The following fields are displayed

**Name**  
name of the string to select as the left/right edge string

**Cut Back/Extension**  
input  
value to subtract from the distance to the edge string to define the left/right section

**Default Xfall**  
input  
if non blank, the default crossfall to use for the left/right cross section.

If blank, the Chainage-Minimum X-fall grid is used.

**Chainage- Minimum Xfall grid**  
this grid is only used if the Default Xfall is blank

**Chainage**  
input  
chainage to use the Min xfall

**Min X-fall**  
input  
minimum X-fall to use at that chainage

**Min. Depth tab**  
there can be one minimum depth value for the entire job or the minimum depth can vary between chainages

**Default depth**  
input  
if non blank, the default minimum depth to use for the left and right cross section.

If blank, the Chainage-Minimum Depth grid is used.

**Chainage- Minimum Depth grid**  
this grid is only used if the Default depth is blank

**Chainage**  
input  
chainage to start the minimum depth

**Min Depth**  
input  
minimum depth to start at this chainage and either go to the next chainage or if there is a Min Depth 2, interpolate to Min Depth 2 from this chainage to the next chainage

**Min Depth 2**  
input  
minimum depth to end with at the next chainage

**Results tab**
Transfer Z-values to reference string  tick box

if ticked, the calculated z-values are used to update the z-values on the reference string

Clean models before overlay  tick box

if ticked, the models of results are cleaned before the overlay option is run

Model for overlay x-sections  model box

model for the created overlay x-sections

Model for overlay strings  model box

model for the created overlay strings

Colour  colour box

colour for the created overlay strings

Model for xfall strings  model box

if non blank, left and right strings with z-value equal to the left/right crossfall are created and placed in this model

Model for min/max points  model box

if non blank, points for the minimum and the maximum of the calculated z-values for the left and right sections are created and placed in this model

X-sections depth range file  file box

available depth range files

a depth range file used for colouring x-sections by the depth between the overlay and the road tin

Overlay report  file box

*.rpt files

report on the overlay

Volumes report  file box

*.rpt files

volumes of overlay report

Write volumes as CSV  tick box

if ticked, the volume report is written as a CSV file (for Excel)

Overlay Tin tab

the Overlay Tin tab controls the creation of an overlay tin and depth polygons

Create overlay tin  tick box

if ticked, the fields in this tab are used to create an overlay tin

Tin name  tin box

available tins

name for the tin created from the overlay strings and sections

Tin colour  colour box

available colours

colour of the overlay tin

Model for tin  model box

model for the overlay tin

Create depth polygons  tick box

if ticked, depth polygons are created between the road tin and the overlay tin

Depth range file  file box

*.drf files

depth range file used when creating polygons

Model for depth polygons  model box

available models

Overlay
model for the depth polygons

**Scarification tab**

The *Scarification* tab controls any scarification to be applied to the road sections before calculating overlays.

**Perform scarification** tick box
- If ticked, scarification is performed on the road sections before overlay is calculated.

**Model for scarified x-sections** model box available models
- If *non blank*, road x-sections after scarification are created and placed in this model.

**Colour** colour box available colours
- Colour of the scarified sections.

**Clean scarification x-sections model** tick box
- If ticked, clean the model of scarified sections before running calculations.

**Default scarification depth** input
- If *non blank*, the default scarification depth to use for road cross section.
- If *blank*, the *Overlay-Depth* grid is used.

**Chainage- Minimum Depth grid**
- This grid is only used if the *Default scarification depth* is *blank*.

  **Chainage** input
  - Chainage to start the scarification depth.

  **Depth** input
  - Scarification depth to start at this chainage and either go to the next chainage or if there is a *Depth 2*, interpolate to Min Depth 2 from this chainage to the next chainage.

  **Depth 2** input
  - Scarification depth to end with at the next chainage.

**Plots tab**

**Generate long section plots** tick box
- If ticked, long section plots are created.

**Long section PPF** file box *.lplotppf files
- Binary ppf file to use for the long section plots.

**Plot type** plotter box model available plotters
- Type of plotter to use for the long section plots.

**Plot stem**
- The name to use for the plots - a number will be added when more than one page is produced.

**Clean plot model beforehand** tick box
- If ticked and the *plot type* is *model*, the plot models are cleaned before the plots are created.

**Generate cross section plots** tick box
- If ticked, cross section plots are created.
Cross section PPF  file box  *.lplotppf files

binary pff file to use for the cross section plots

Plotter type  plotter box  model  available plotters

type of plotter to use for the cross section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand  tick box

if ticked and the plotter type is model, the plot models are cleaned before the plots are created
20.14 X-Sections

Position of menu: Design => X-Sections

Cross sections can be created in a variety of ways including:

(a) sections through triangulations created with the options in the menu Tins => Sections.
(b) sections generated by cutting through strings with the options Utilities => A-G => Cuts.
(c) design sections generated from options on the menu Design = Apply
(d) sections generated by the end area volumes options Design => Volumes => End area

The x-sections menu contains options to read cross-sections in from a file and for working with cross sections in a variety of way.

Walking right on X-Sections bring up the X-Sections menu:

For Colour X-Sections by XFall range go to
- Colour Sections by XFall range
- Construction tables
- Cut/fill polygons from sections
- Name cross sections by chainage

Chainage:
- Polygons from sections
- Read x-section file
- Sort cross-section mode
- Strings from sections
- X-section filter

Chainages:
- X-sections along a string
- X-sections from cuts thru strings
- X-sections from points

Report X-section CivilCAD/Moss/QLD MR format

Page 4156
20.14.1 Colour Sections by XFall Range

Position of option on menu: Design => X-Sections => Colour X-Sections by Xfall range
Utilities => A-G => Colour X-Sections by Xfall range

This panel will colour the segments of a set of x-sections, based on their x-fall.

Selecting Colour X-Sections by Xfall range displays the Colour Sections by XFall Range panel.

![Colour Sections by XFall Range Panel]

run the option and only create the left polygons.

Create right  
button

run the option and only create the right polygons.

Undo  
button

undo the last set of polygons created whilst the panel has been up.

Finish  
button

end the option and remove the panel. The undo capability for the polygons is terminated.
20.14.4 Name Cross Sections by Chainage

Position of option on menu: Design => X-Sections => Name cross sections by chainage

This option names cross-sections with the chainage from a selected string.

Note that the chainage from the string that the cross section comes from is in the name of the cross section so this option effectively gives the chainage to the cross section.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cross sections source</td>
<td>choice box</td>
<td>model</td>

</tr>
<tr>
<td>Pick centreline string</td>
<td>output box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Process</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Field Description: type of data source.

Model/String/View of x-sections: source of the cross section data.

Number of decimals: number of decimal places to use in the chainage label.

Scale factor: factor to multiply the chainage by before creating the label.

Prefix: prefix for the chainage value - for cross-section options to work, this should be sect or design.

Pick centreline string: select the string that is used to find a chainage for the cross sections.

Process: run the option.
20.14.5 Polygons from Sections

Position of option on menu: Design => X-Sections => Polygons from sections

Option to take a model of cross-sections and create polygons between specified points on the cross-sections.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model that contains the cross sections</td>
<td>model box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name of first/last point for LHS polygons</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name of first/last point for RHS polygons</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Model/colour for polygons</td>
<td>input box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Create button
create polygons between the first and last points on the left and right side of the cross-sections.

Undo button
undo the last set of polygons created whilst the panel was up.
### 20.14.6 Read X-Section Data

**Position of option on menu:** Design => X-Sections => Read x-section file

This option is used to read in cross section data from a file and convert it to x-section strings (4d strings).

The data in the file is only centre-line chainage values, offset, heights and text (Code) so an alignment string needs to be selected to give an (x,y) position for the centre-line chainage and a direction (at right angles to the alignment string at the chainage) to convert the (offset, height) values into (x,y,z) points on a string.

**NOTE** - after reading in the x-section data and hence creating 4d strings, the Design => X-Sections => Strings from sections option can be run to create 3d strings by joining points with the same Code from adjacent x-sections. The created 3d strings are given the string name of the Code that they joined.

Selecting Read x-section file brings up the **Read X-Section Data** panel:

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>File format</td>
<td>Format of the x-section data in the file.</td>
<td>input box</td>
<td><strong>12d Model</strong></td>
<td>12d Model, Alg, Moss, Chainage/Offset/Height/Text</td>
</tr>
</tbody>
</table>

#### 12d Model Format

The 12d Model format is a simple text file format with the text CH followed by one or more spaces and then the alignment chainage (centre line chainage) of the x-section, and then on the following lines, the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then the text (Code) for that point on the x-section. The x-section continues until the next Ch line. For example, the following defines two x-sections at chainage 10 and 20 respectively.

```
ch 10
  -3  5  A
0 6  "Second label"
  4  7  C
ch 20
  -3.5  5.5  A
```
Note that if the Code includes a space, then it must be enclosed in quotes. For example "Second label". Also the Code is not optional - if there is no code, put "".

Chainage/Offset/Height/Text Format

The Chainage/Offset/Height/Text format is a very simple text file format with each line containing the alignment chainage (centre line chainage) for the x-section followed by one or more spaces and then on the same line the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then optionally, the text (Code) for that point on the x-section. The x-section continues until the alignment chainage changes. For example, the following defines two x-sections at chainage 10 and 20 respectively.

10  -3  5  A
10   0  6  "Second label"
10   4  7  C
20  -3.5  5.5  A
20   0  6  D
20   4.5  7.5  E

Note that if the Code includes a space, then it must be enclosed in quotes. For example "Second label". Also the Code is optional (whereas it was compulsory for the 12d Model format).

Moss (MX) Format

Please refer to Moss (MX) documentation or ask the group who supplied the data.

Alg Format

Not documented.

X-section file input box
file of x-section data.

String names on line 4 tick box
ONLY used for the ALG format which is not documented

Select al string string select
select the string that is used to define the (x,y) position of the zero offset of the x-section and also the bearing for the x-section.

Model for x-secs model box available models
model for the created x-sections

Process button
read the file and create the x-sections

Undo button
undo the last set of x-sections created since the panel has been active
20.14.7 Sort X-Sections in a Model

Position of option on menu: Design => X-Sections => Sort cross section model

This option is used to sort cross sections in a model so that they are in the order of the chainages embedded in the cross section name.

Selecting Sort cross section model brings up the Sort X-Sections in a Model panel:

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model of x-sections</td>
<td>model box</td>
<td>available models</td>
<td>model containing the cross sections to be sorted into chainage order.</td>
</tr>
<tr>
<td>Sort</td>
<td>button</td>
<td>run the option.</td>
<td></td>
</tr>
</tbody>
</table>
20.14.8 Strings from Sections

Position of option on menu:  Design => X-Sections => Strings from sections

The strings from sections option creates strings by joining the common named points on successive 4d strings (usually generated as sections).

Selecting strings from sections fires up the strings from sections panel.

Selecting strings from sections fires up the strings from sections panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model of sections</td>

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>try and join points with the same name from successive sections to form strings.</td>
<td></td>
</tr>
</tbody>
</table>
20.14.9 Sections from Points

Position of option on menu: Design => X-Sections => X-sections from points

The X-sections from points option creates a cross section by first defining a section line and then dropping all selected points in a user-defined offset distance from the section line, onto the section line.

(a) The z-value for the dropped point is the same as for the original point.
(b) The Point number (Vertex id) of the dropped point is the Point number (Vertex id) of the original point.
(c) The Vertex text of the dropped is the code (string name) of the original point.

The user specifies the start chainage for the created section and the value for the "centreline chainage" of the section.

Selecting Sections from points fires up the Sections from points panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data source type</strong></td>
<td>data source type.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Data source</strong></td>
<td>data source for points to create sections from.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Point mode</strong></td>
<td>choice box</td>
<td>2 points</td>
<td></td>
<td>2 points, 1 point and bearing point on centreline</td>
</tr>
</tbody>
</table>

If **2 points**, then the Start point and End point are selected. The section goes through the two points.

If **1 point and bearing**, then the Start point is selected and a **Bearing** given. The section goes through the start point with the given bearing.

If **point on centreline**, then a **Centreline** is selected and a **point on the centreline** selected. The section goes through the selected point on the centreline and is perpendicular to the selected centreline at the selected point.
If Point mode is **2 points**:

- **Start point** string select
- **End point** string select

If Point mode is **1 point and bearing**:

- **Start point** string select
- **Bearing** angle box

If Point mode is **point on centreline**

- **Centreline** string select

- **Process** button

  *create a cross section from the selected points.*
20.14.10 X Section Filter (Sections at Even Chainages)

**Position of option on menu:** Design => X-Sections => X-section filter

This panel selects user specified cross-sections from a model of cross-sections and copies them into another model. The cross sections must already exist - no new cross-sections are created. It is a function so can be recalced when the cross-section model is changed.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Function name</strong></td>
<td>string</td>
<td></td>

<td><em>chainage interval to select cross sections. Sections are selected which are multiples of the filter chainage interval.</em></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Design/Existing sections</strong></td>
<td>radio button</td>
<td>design sections</td>
<td></td>
</tr>
</tbody>
</table>
cross sections are 3d strings with the name

    Design and the chainage of the cross-section (usually created by an Apply),

or    Sect and the chainage of the cross-section (usually created by Tins =>Section =>X section)

If Design sections is selected, then sections starting with the name Design are selected.
If Existing sections is selected, then sections starting with the name Sect are selected.

Include TC_CT sections    tick box
    if ticked, include cross sections at tangent points from the reference string.

Include start/end section    tick box
    include a cross section at the start/end chainage of the reference string

TC_CT tolerance +/-    input box
    if non-zero, then regular cross sections (i.e. those selected by the filter chainage interval) are not
    included if they are closer than the given tolerance distance to a tangent point.

Special chainage file    input box
    include cross sections with chainages given in the given special chainage file.

Reference    output box
    select reference string to use for the filter options requiring tangent points and start/end chainages.

Process    button
    copy the specified cross-sections to the Filtered Model.

20.14.10.1 X-Sections Along a String

Settlement 20.16.2 Settlement
20.16.1 Culverts from File

Position of option on menu: Design => More => Culverts from file
This option is currently under development.
20.16.2 Settlement

Position of option on menu:  Design => More => Settlement

This option uses a tin of settlement values to adjust the z-values of strings.

The idea behind the option is that a number of string may have been surveyed as well as a number of control points. At a later date, the z-value at the control points is again measured and there is a major difference in the two z-value at each control point due to say settlement (subsidence) of the ground.

A tin of the difference of the z-values at each control point is called the settlement tin. The tin is not normally a constant value because differential settlement usually occurs. That is, the settlement is different at each point over the surface.

The Settlement option can adjust all the z-values of the selected data by the amount in the settlement tin.

It can be applied to just to the vertices of the strings (mode relative points), or to the vertices and the segments of the strings (mode relative string). In relative string mode, where ever a segment crosses a triangle of the settlement tin, a new vertex is inserted into the string (with initial z-value interpolated from the adjacent string vertices) and the settlement tin value applied to the new vertex.

The settlement tin values can be added to, or subtracted from, the string values.

One interesting use of the Settlement option is when the settlement tin is constructed from the depths from the surface to a rock or soil strata (as given from bore hole logs).

The surface of the rock could be constructed by simply calculating the height of the rock at each bore hole and triangulating the heights. The original surface would have no affect on such a rock surface.

However by applying the Settlement option to the ground data, using the depths as the settlement tin, and then triangulating the resultant strings to give the rock surface, undulations in the ground data will also be reflected in the rock surface. This is what usually happens when the earth is folded and both surfaces fold in a similar manner.

The Settlement option can also be used without creating a tin of the difference of the z-values at each control point. A tin can simply be created from the new z-values of the control points.

In absolute points mode, each vertex of the strings are given the z-value from the tin. This is the same as draping just the vertices of strings onto a tin (see 16.10.1 Drape).

In absolute string mode, not only do the string vertices take their z-values from the tin, but where ever a segment crosses a triangle of the tin, a new vertex is inserted into the string and the z-value for the new vertex is taken from the tin. This is the same as a draping the strings onto the tin (see 16.10.1 Drape).
The fields and buttons used in this panel have the following functions.

*Data selection type* - for a full description go to 4.19.3 Data Source.

**Data source**

source of data to be processed.

**Settlement tin**

tin of values (settlement values) to be used to reduce/increase the z-values of strings by.

**Settlement on**

if Settlement on is:

- **relative points** then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point.

- **relative string** then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which then has the settlement value applied to it (the initial z-value for the inserted point is interpolated from its adjacent points in the string).

- **absolute points** then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point.

- **absolute string** then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which is given the settlement value at that point.

**Apply tin values by**

if "add tin values", then the tin values are added to the string values.
If "subtract tin values", then the tin values are subtracted from the string values.

**Prefix for models**
- prefix to apply to the name of each model in the data source to create new models for the processed data.

**Process button**
- adjust the heights of the selected data.

20.17.2.1 New Island Create (Function)

Position of option on menu:  Design => Roads => More => New Island Create (Function)

This option applies a kerb profile, either from the 12d library or from a user defined file.

The template profile is applied to a Super Alignment, creating strings, and a triangulation.

The option is saved as a function within 12d and as a function can be re-run at any time if changes occur with the Super Alignment.

Some default kerb profiles are available under Kerb on the panel.

User defined kerbs are created by entering offset, height and string names in the fields in the draw box at the top of the panel, and then saved as a User Kerb Type file (*.ukt)

User Kerb Type files can then be written out, or read in as required.

On selecting the New Island Create (Function) option, the New Island Create (Function) panel is displayed.
The fields and buttons used in this panel have the following functions.

<table>
<thead>

Process button
create the traffic island strings and tin.

Undo button
undo the last traffic island created whilst the option was running.
20.17.2.3 Create Mass Haul String and Report

**Position of option on menu:** Design => Roads => More => Mass haul

This option has been replaced by 20.8.8.3 Mass Haul String and Report.

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.

The fields and buttons used in this panel have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

21.1.2.3 New Value Usage
21.1 The Modifiers and Templates File - MTF

_12d Model_ uses templates as a quick and easy method for defining design details along a string, and in the _Apply MTF_ option, modifiers are introduced to handle the most complex design details such as sophisticated urban design including intersections and roundabouts.

_12d Model_ uses templates as a quick and easy method for defining design details along a string. So for simple work, the Design=>Apply=>Apply option cuts a left and right template into a surface to produce a design. For information on how Templates are defined in _12d Model_, see 20.1 Templates in _12d Model_.

For more sophisticated design such as highways and complex urban design, intersections and roundabouts, templates are impractical and not an efficient solution. For these cases _12d Model_ uses _MTF modifiers_ to provide much finer control and provide all the power of string design without losing the ease of template design for simpler cases.

The Design =>Apply =>Apply MTF option uses a _Modifiers and Templates File_ or _MTF_ file applied to a Reference and Hinge string to tackle complex tasks and:

(a) run Hinge modifiers to adjust the Hinge string

(b) Insert Templates

(c) run Modifiers to adjust any links in the inserted templates, or create new links without needing a Template, and then make adjustments to these links.

(d) generate Sections, Boxing and Strings

(a) defined shapes and produce _trimeshes_ to give a solid representation of the road components.

For more definitions of these items used in MTF’s, see 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes.

**Note** - the _Alignment_ module is required to use the _Apply MTF_ option.

The _MTF_ file used in an _Apply MTF_ is created and edited _interactively_ from within _12d Model_. An _MTF_ can be created using the Create MTF panel (Design =>MTF =>Create) and edited using the MTF Edit menu.
Alternatively an MTF can be created and edited from within the Apply MTF option itself by:

once the Apply MTF option has been selected and the Apply MTF Function panel is on the screen, simply enter the name of the mtf file into the MTF file field and click on the Folder icon to bring up the pop-up menu and select Open from the pop-up.

If the MTF does not exist, then the Create MTF panel (with the MTF file name already filled in) is placed on the screen and the user simply selects the Create button. If the MTF file does exist, then it is loaded into the MTF Edit menu.

For full documentation on the MTF Edit menu, see 21.2 MTF Edit.

Note - although the MTF file can be edited with a text editor that supports unicode, it is easy to get the syntax wrong and create an invalid MTF file. So it is always best to use the interactive editor, MTF Edit.

For some special definitions and information required for Modifiers and Templates, see

21.1.1 MTF Links, Points, Sections, Strings and Trimeshes

See

- 21.1.1.1 MTF Links, Points and Strings
- 21.1.1.2 MTF Links and Layers
- 21.1.1.3 MTF Shapes and Trimeshes
21.1.1.1 MTF Links, Points and Strings

A Modifiers and Template File (MTF), like a Template, is defined in terms of the links which go together to make up an MTF section.

As for a 12d Template, an MTF Section consists of a left hand side ending at the Hinge Point, followed by a right hand side.

Each side if made up of a number of MTF links and each link is defined by any two of the three
(a) width of the link
(b) change in z-value from the beginning of the link to the end of the link. that is, the z-value at the end of the link minus the z-value at the start of the link. This is referred to as the height of the link.
(c) xfall or slope
and the links are connected sequentially to form a cross section.

Notice that the height is only a relative height and not a z-value.

On the left hand side, the MTF links go from right to left. The vertex (point) at the end of the link is given the same name as the link. The far right of the left hand side is the Hinge Point. So on the left hand side, positive widths go to the left.

On the right hand side, the MTF links go from left to right. The vertex (point) at the end of the link is given the same name as the link. The far left of the right hand size is also the Hinge Point. So on the right hand side, positive widths go to the right.

Note that this definition of the MTF Section is given in terms of MTF links and each MTF Link is defined by a relative width and relative height to the previous link, and the left and right hand sides are positioned around a Hinge Point.

A width from the Hinge point and a height above the Hinge point can be calculated for each MTF Link point by accumulating the widths and heights of all the links from the Hinge point to the this link, and including this link. These values of the width and height for the Link Point are referred to as the width relative to the Hinge Point and height relative to the Hinge Point. Or sometimes absolute width (or absolute offset) and absolute height for short.

Note that this use of the word absolute must not to be confused with the absolute value of a number (which is always positive).

Similarly for the Left Hand Side of a MTF Section except that the diagram goes to the left of the Hinge Point and positive widths are measure as going to the left.

Also if the \((x,y,z)\) coordinates are known for the Hinge point and the plan angle that the

Cross Section View of the Right Hand Side of a MTF Section

Start of rkerb
link called rkerb
end of rkerb - rkerb point
height of rkerb
width of rkerb
height of rshoulder (-ve in this case)
width of rshoulder
height of rshoulder relative to the Hinge Point (-ve in this case)
Hinge Point
section makes through the Hinge point, then the \((x,y,z)\) coordinates for each Link point can be calculated by accumulating all the relative widths and heights and applying them along the section line.

Each MTF link has a name and colour and it is best for all the links in an MTF section to have unique names.

The point at the end of the MTF link is given the name of the link and is called a MTF Link Point, or an Link Point or MTF Point for short.

So on the left hand side of the Hinge Point, the MTF Link Point is at the left hand end of the link and on the right hand side of the Hinge Point, the MTF Link Point is at the right hand end of the link.

When the MTF is Applied to a Reference and a Hinge String, MTF links and points are created at each chainage, and it is also known, whether or not, the same MTF link and point exists at the next chainage.

So applying the MTF defines not only each MTF link and but also how each link point is connected longitudinally along the Reference and Hinge strings to form a string, or more than one string if there are some chainages where the link point does not exist.

The longitudinal strings (MTF strings) created by a link point are given the same name and colour as the link point.

As an example, the MTF with one link called left kerb and one link on the right called right kerb applied down the a Reference and Hinge String with produce two strings called left kerb and right kerb:
For brevity, when there is no confusion, the longitudinal MTF strings created by the MTF are often just called e **strings**.

Unlike the simpler Apply Template, the **Apply MTF** option does not automatically create strings for all the **MTF points** but allows the user to specify which strings are created. See [21.2.2.5.2 Create Strings](#).

Continue to the next section [21.1.1.2 MTF Links and Layers](#) or return to [21.1.1 MTF Links, Points, Sections, Strings and Trimeshes](#).
21.1.1.2 MTF Links and Layers

As well as having a name, each MTF Link also has a unique Layer. The default Layer is Design.

Layers are simply a way of grouping certain links together so that they can be referred to as one thing. For example, the default Layer Design is usually where all the links go that make up the Design.

When a MTF Link is created, the Layer is given at the same time as the link name and colour and most MTF commands work for any Layer.

A MTF Link of name link_name in the layer layer_name is denoted by:

layer_name << link_name when link_name is a left side link.

layer_name >> link_name when link_name is a a right side link.

layer_name => link_name when the side for link_name has not yet been evaluated (this can happen in general Snippet code that can work when inserted in the Left or Right Modifiers panel.)

In the Apply MTF Function, strings or sections are only automatically created for the layer Design.

For other Layers, strings are created using the MTF command Create Strings. See 21.2.2.5.2 Create Strings.

Continue to the next section 21.1.1.3 MTF Shapes and Trimeshes or return to 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes
21.1.1.3 MTF Shapes and Trimeshes

A **Shape** is made up of a group of **MTF link points** that in profile are joined together in a specific order. Each **MTF link point** can come from any **Layer**.

A Shape can be open or closed.

So shapes are similar to cross sections except a shape can go back under or over itself, and can be closed.

When and **MTF** is Applied to a Defence and Hinge string (**Apply MTF Function**), the Shape will be defined at chainages along the Reference string and Hinge string, and the MTF Link Points of the Shape can generate MTF strings for the Shape.

A **Trimesh** can be constructed from the MTF sections and MTF strings generated by applying the Shape along the Reference and Hinge string. See 4.5.5 **Trimeshes**.

So the **Trimesh of a Shape** can be thought of as a profile swept (extruded) along the Reference and Hinge string. But remember that at any chainage, the **MTF** can change the positions of each MTF point so the profile of the Shape can change from chainage to chainage.

There is a **MTF** option to creates a Trimesh of a **Shape** and its **trimesh**. See 21.2.2.5.1 Create **Shapes**

Continue to the section 21.1.2 Calculating Link Values or return to 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes.
21.1.2 Calculating Link Values

See

21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions
21.1.2.2 Modify X, Hold Y in MTF Modifiers
21.1.2.3 New Value Usage

21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions

For most of the MTF Modifier commands and the MTF Absolute command, the command modifies the current value of the link of one for one of Width, Height, Xfall or Slope, and uses (holds) the current value of the link of another one of Width, Height, Xfall or Slope.

Together, the modified value and the held value defines the new values for the link.

It doesn't matter which two of width, height and xfall or slope were originally used to define the link, the option will internally convert the definition to what is required to be modified and held.

For example the link may be originally defined by xfall and height but the link Modifier type could be Modify Width, Hold Xfall or Modify Xfall, Hold Width.

Even though the existing link is not defined by width, for each required chainage, the xfall and height values of the existing link uniquely define a width at that chainage. And it is this calculated width that is then modified by Modify Width, Hold Xfall or used (held) by a Modify Xfall, Hold Width.

So no matter how the link is originally defined, any one of width, height or xfall/slope can be calculated and modified or held by the option.

Continue to the section 21.1.2.2 Modify X, Hold Y in MTF Modifiers or return to 21.1.2 Calculating Link Values.
21.1.2.2 Modify X, Hold Y in MTF Modifiers

A link in an MTF is initially defined by two out of three of width, height and xfall/slope because **only two** are needed to uniquely define the link. Any values not used in the link definition can be calculated from the defining values so any of the values width, height, xfall and slope for the link are always known. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

In an Apply MTF, there are MTF Modifiers such as the Modify link command that act on the link and **modifier** one or some times two of the values defining the link.

One of the most common methods to modify the definition of a link is that one of the link values **is not modified** and keeps the same value (it is **held**) and another value is **modified** until a given condition is satisfied.

That is, for the link:

(a) **one** of Width, Height or Xfall **keeps its existing value** (i.e. **holds** its existing value).

and

(b) a **different one** of Width, Height or Xfall **is modified** and takes the value needed to satisfy a given condition.

This is summarised as

Hold X, Modify Y

or

Modify Y, Hold X

For example, for the To String modifier

Modify Width, Hold Height.

(a) the **Height keeps its existing value** for the link (i.e. **holds** its existing value).

and

(b) the **Width is modified** to be the value that puts the end of the link directly under a given string.

(see 21.2.2.2.10 Fixed Link - To String)

With the To String modifier, if the string is moved, the **Width** will also change to keep the end of the link under the string.
21.1.2.3 New Value Usage

New value usage has the choices:

(a) Add to the current value of the link

If Add to the current value of the link, the value of the parameter width/height/xfall/slope at each chainage is added to the current value for the parameter. For compactness, in a grid, this will be displayed in an Absolute column with Absolute not ticked or no.

and

(b) Replace the current value of the link.

If Replace the current value of the link, the value of the parameter width/height/xfall/slope at each chainage replaces the current value for the parameter. For compactness, In a grid, this will be shown in an Absolute column with Absolute ticked or yes.

The different is best understood by running a Modifier command on a simple one Link job and then modifying the Width with the two values of New value usage.

First insert a link called la with a width of 3.8.

Then add a Modify a Modify Link command to Modify the Width with a constant width of 2, and New value usage with the value Add to the current value of the link (also denoted as Absolute off).

The Width is then 5.8.
Now change the value of **New value usage** to *Replace the current value of the link* (i.e. *Absolute on*).

The **Width** is then 2.

So a **New value usage** of *Add to the current value of the link* (i.e. *Absolute off*) adds to the current value of the link and you may not even know what the final width of the link is until the MTF is run.

Whereas a **New value usage** of *Replace the current value of the link* (i.e. *Absolute on*) resets the value to a given value. So at that point in the MTF, you know exactly what the value of Width is.

Note that there may be more **Width** commands further down in the MTF command list that may change the value of **Width** again so the final **Width** will only be definitely be known when the entire MTF is processed.

Continue to the section 21.2 MTF Edit or return to 21.1.2 Calculating Link Values.
21.2 MTF Edit

For general information about the MTF (Modifiers and Template File) see 21.1 The Modifiers and Templates File - MTF.

The MTF Edit menu is

```
MTF Edit
Road1.mtf
Hinge
Modify left
Modify right
Boxing
Recalc
Auto recalc
More
Settings
Save
```

For documentation on the options see:

- **Hinge** [21.2.1 MTF Hinge Modifiers]
- **Modify left** [21.2.2 Left and Right MTF Modifiers]
- **Modify right** [21.2.2 Left and Right MTF Modifiers]
- **Boxing** [21.2.3 MTF Boxing]
- **Recalc** [21.2.4 MTF Recalc]
- **Auto recalc** [21.2.5 MTF Auto Recalc]
- **More** [21.2.6 MTF More]
- **Settings** [21.2.7 MTF Settings]
- **Save** [21.2.8 MTF Save]

Please continue to the next section [21.2.1 MTF Hinge Modifiers] or return to [21.2 MTF Edit].
21.2.1 MTF Hinge Modifiers

The hinge string is selected using the Hinge panel field in the Apply MTF Function panel. Hinge modifiers are used to modify the position of the point on the hinge string (the Hinge point) that is considered the zero offset and Height point when applying the Templates and Modifier commands. See 20.1 Templates in 12d Model.

Selecting Hinge from the MTF Edit menu brings up the Hinge Modifiers panel.

The Hinge Modifiers panel consists of a grid with of rows (or lines) with commands in them, and an OK or Apply button to record the results.

Hinge Modifier Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

The commands in the Hinge Modifier grid are processed sequentially from the top to the bottom of the grid.

When the Grid Row is Empty

If the row of the grid is empty, clicking LB in the empty row will bring up the Create menu which contains all the available hinge commands. Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the Create menu.
Selecting a menu item will bring up an associated panel which displays the information required for the hinge command. When the panel is filled in and OK or Apply selected, the panel information is written out to the row of the grid and is known as a hinge command. For information on each of the Hinge Commands, see 21.2.1.1 Create Hinge Commands.

When the Grid Row is Not Empty

If the row of the grid is not empty (and hence filled with a hinge command) then clicking LB in the cell:

(a) **Type** will bring up the associated panel for the hinge command.
   
   For information on each of the Hinge Commands, see 21.2.1.1 Create Hinge Commands.

(b) **Start chainage** cell brings up the Smart Start Chainage panel

   The Start Chainage Mode will determine what other fields are also on the panel (for example Extension ref for Mode Start of reference string. For more information on Chainage Modes, see 21.2.1 MTF Hinge Modifiers

(c) **End Chainage** cell brings up the Smart End Chainage panel
The End Chainage Mode will determine what other fields are also on the panel (for example Extension ref for Mode End of reference string. For more information on Chainage Modes, see 21.2.1 MTF Hinge Modifiers.

(d) Interval will allow a real value to be typed into the cell

Note that the Interval column will not appear in the grid if Show interval column? is not ticked in the MTF Settings. See 21.2.7.8 MTF Setting Show Interval Column.

(e) Extra Start, Extra End or Active will toggle the tick/not ticked

Note that the Extra start and Extra end columns will not appear in the grid if Show extra start/end column? is not ticked in the MTF Settings. See 21.2.7.6 MTF Setting Show Extra Start/End column.

(f) Comment will allow text to be typed into the cell

Note that clicking in the Type, Start chainage, End chainage, Interval, Extra Start, Extra End, Active and Comment cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.

Buttons at Bottom

OK button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply button

Apply stores the values in the grid and leaves the panel on the screen.

If Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, a recalc of the associated Apply Many for the MTF is done.

Autopan on/off button

when clicked to say Autopan is on then if the chainage range is not in the view that the Reference string is on then the view will be panned so that it is on the view.

Highlight button

clicking the Highlight button brings up the Highlight Modifiers panel.
Continue to the next section 21.2.1.1 Create Hinge Commands.
21.2.1.1 Create Hinge Commands

The commands in the Hinge Modifiers grid are processed sequentially from top to bottom. The Hinge Modifier commands are selected from the Create menu that is displayed when clicking in a cell in the Type column of the Hinge Modifiers panel.

For a description of the options, see

- **Offset** [21.2.1.2 Offset]
- **Height** [21.2.1.3 Height]
- **Offset to string** [21.2.1.4 Offset to String]
- **Height to string** [21.2.1.5 Height to String]
- **Coord to string** [21.2.1.6 Coord to String]
- **Height to tin** [21.2.1.7 Height to Tin]
- **No hinge** [21.2.1.8 No Hinge]
- **Comment** [21.2.1.9 Comment]
- **Region** [21.2.1.10 Region]
21.2.1.2 Offset

The offset hinge modifier will move the hinge point a given offset distance (perpendicular to the reference string) from its current plan position. A positive offset is to the right of the hinge string and a negative offset to the left.

![Plan View](image)

Selecting Offset brings up the Hinge Offset panel

![Hinge Offset Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start chainage</td>
<td></td>
<td></td>

</tr>
</tbody>
</table>

Start chainage, End chainage, Interval
defines the start/end chainages for modifying the offset of the hinge string.

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Start/End offset  
start/end offset.
Absolute  tick box  tick
if ticked, the offset is set to the values given in the **start** and **end value** fields.
if not ticked, the values given in the **start** and **end value** fields are added to the existing offsets.

Cubic  tick box
if ticked, the offset is varied as a reverse cubic between the start and end chainages.
if not ticked, the offset is varied linearly between the start and end chainages.

Active, Comment, Extra start, Extra end, OK, Apply
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Go to the next section 21.2.1.3 Height or return to 21.2.1 MTF Hinge Modifiers
21.2.1.3 Height

The **Height** modifier linearly varies the height of the hinge point between the given chainages.

Selecting **Height** brings up the **Hinge Height** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start chainage, End chainage, Interval</td>

*Start chainage, End chainage, Interval*

defines the start/end chainages for modifying the height of the hinge string.

for information on these panel fields, see [21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels](#).

*Start/End height*

start/end height.

*Extra start/end*

if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.

*Absolute*

if **ticked**, the height is set to the values given in the **start** and **end value** fields.

if **not ticked**, the values given in the **start** and **end value** fields are added to the existing heights.

*Cubic*

if **ticked**, the height is varied as a reverse cubic between the start and end chainages.

if **not ticked**, the height is varied linearly between the start and end chainages.

*Active, Comment, Extra start, Extra end, OK, Apply*

for information on these panel fields, see [21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels](#).
Modifier Panels.

Go to the next section 21.2.1.4 Offset to String or return to 21.2.1 MTF Hinge Modifiers.
21.2.1.4 Offset to String

The **Offset to string** hinge modifier makes the offset of the hinge point the same as the offset of a selected string.

Selecting **Offset to string** brings up the **Hinge Offset to String** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start chainage, End chainage, Interval</td>
<td>defines the start/end chainages for modifying the offset of the hinge string.</td>

<tr>
<td></td>
<td>For information on these panel fields, see <a href="#">21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels</a>.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>When the <strong>Start mode</strong> is <strong>Start (ref)</strong>, or <strong>Typed</strong> and the chainage is <strong>blank</strong>, the modification begins at the low dropped chainage of the selected string.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>When the <strong>End mode</strong> is <strong>End (ref)</strong>, or <strong>Typed</strong> and the chainage is <strong>blank</strong>, the modification ends at the high dropped chainage of the selected string.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>string-select</td>
<td>select string to use for defining offset from hinge.</td>
<td></td>
</tr>
<tr>
<td>Active, Comment, Extra start, Extra end, OK, Apply</td>
<td>for information on these panel fields, see <a href="#">21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels</a>.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Go to the next section [21.2.1.5 Height to String](#) or return to [21.2.1 MTF Hinge Modifiers](#).
21.2.1.5 Height to String

The **Height to string** hinge modifier makes the height of the hinge point the same as the height of a selected string.

Selecting **Height to string** brings up the **Hinge Height to String** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Start chainage, End chainage, Interval</strong></td>
<td>defines the start/end chainages for modifying the height of the hinge string.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>String</strong></td>
<td>select string to use for defining height of hinge.</td>
<td>string-select</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Active, Comment, Extra start, Extra end, OK, Apply</strong></td>
<td>for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Go to the next section 21.2.1.6 **Coord to String** or return to 21.2.1 **MTF Hinge Modifiers**
21.2.1.6 Coord to String

The **Coord** hinge modifier is used to replace the x, y and z position of the hinge point by the x, y and z position of another 12d Model string.

Hence **Coord** replaces the hinge string by another string between the given chainages.

Selecting **Coord to String** brings up the **Hinge Coord to String** panel.

![Hinge Coord to String panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start chainage, End chainage, Interval</td>
<td>defines the start/end chainages for modifying the coordinates of the hinge string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>select string to use for defining the coordinates of the hinge string</td>
<td>string-select</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

When the **Start mode** is **Start (ref)**, or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.

When the **End mode** is **End (ref)**, or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.

Go to the next section 21.2.1.7 Height to Tin or return to 21.2.1 MTF Hinge Modifiers.
21.2.1.7 Height to Tin

The **Height to tin** hinge modifier makes the height of the hinge point the same as the height of a tin at the same (x,y) location as the hinge point.

Selecting **Height to tin** brings up the **Hinge Height to Tin** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start chainage, End chainage, Interval</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>defines the start/end chainages for modifying the height of the hinge string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tin</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>tin box</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>tin to use for z-values. At each vertex of the hinge string in he chainage range, set the z-value to be the tin z-value at the same (x,y) position as the vertex.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Active, Comment, Extra start, Extra end, OK, Apply</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Go to the next section 21.2.8 No Hinge or return to 21.2.1 MTF Hinge Modifiers.
21.2.1.8 No Hinge

The **No hinge** modifier is used to **stop** the hinge string (and hence the apply) between given chainages. This will leave a gap in the strings created by the apply between the given chainages.

Selecting **No hinge** brings up the **No Hinge** panel

![](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Start chainage, End chainage, Interval</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>defines the start/end chainages for stopping the hinge string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>for information on these panel fields, see <a href="#">21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels</a></td>

<td>text box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*If not blank, this is a secondary name, often a shorter name, that is used in the Region pop up rather than using the Region description.*

*If blank, then when the grid is saved, the Bookmark name is set to be the same as the Region description.*

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collapse</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*If ticked, all the commands in the grid until the next Region command are collapsed into this Region command.*

*If not ticked, the commands in the grid until the next Region command are not collapsed.*
OK, Apply

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

There are Regions, Previous Region and Next Region icons at the right hand side of the Hinge Modifiers panel that use this created Region. For information on using these icons and information on Regions in a grid, see 4.19.6 Grids in Panels.

Go to the next section 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels or return to 21.2.1 MTF Hinge Modifiers.
21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels

Most of the Hinge Modifier panels have the following common panels fields and buttons.

**Start/End chainage**  smart chainage box  Start (ref)/End (ref)

defines the start/end chainages for use in the Modifier.
For more information on Start/End Chainages and Modes, see 21.4 Smart Chainages.

**Interval**  real box

*if not blank*, the interval to use to create cross sections and strings over the given chainage range.
*If blank*, the interval given by any MTF Edit => Interval commands, and/or the Section separation value from the Apply MTF panel, is used.

**Extra start**  tick box  tick

*if ticked*, add an extra x-section a distance Extra start/value millimetres before the start chainage. See 21.2.7.4 MTF Setting Show Extra Start/End and 21.2.7.5 MTF Setting Extra Start/End value.

**Extra end**  tick box  tick

*if ticked*, add an extra x-section a distance Extra start/value millimetres before the end chainage. See 21.2.7.4 MTF Setting Show Extra Start/End and 21.2.7.5 MTF Setting Extra Start/End value.

**Comment**  text box

comment to add to the Comment column for the row of the grid.

**Active**  yes/no choice box

*if yes*, use this modifier.
*If no*, don’t use this modifier.

**OK**  button

**OK** stores the values in the fields and removes the panel BUT no recalc is done.

**Apply**  button
Apply stores the values and leaves the panel on the screen.

Go to the next section 21.2.2 Left and Right MTF Modifiers or return to 21.2.1 MTF Hinge Modifiers.
21.2.2 Left and Right MTF Modifiers

In its simplest form, the MTF (Modifiers and Templates File) defines what templates are used on either side of the hinge string, where the templates stop and start with linear interpolation between two templates over a chainage range.

For more complex work, MTF Modifiers are used to modify the strings defined by the templates, and even totally replace the use of templates and insert links and modify the inserted links and generate sections, strings and trimeshes.

Just as templates are defined on the left and the right side, there are left and right MTF Modifiers for working on the links on the left or right side of the Hinge string.

Most of the MTF Modifiers have a common methodology:

(a) an existing link from a template (referenced by its name from the template definition), or a new link that is created by an MTF Insert, can be removed or modified between given start and end chainages on the reference string.

(b) values defining a link are modified over a given start and end chainage. How the values are modified depends on the particular modifier command.

Note: regardless of how the link is originally defined (for example by width and xfall), any of the values width, height, xfall and slope then exist and can be modified. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

(c) more than one MTF modifier may exist for a link at a given chainage hence the order of the MTF modifiers is important.

Modify left option brings up the Left MTF Modifiers panel which is used to create and edit modifiers to use on the left hand side of the Hinge string.

Similarly the Modify right option brings up the Right MTF Modifiers panel which is used to create and edit modifiers on the right hand side of the Hinge string.
The Left/Right MTF Modifiers panel consists of a grid with rows (or lines) with Commands in them, and an OK or Apply button to record the results.

**Left/Right MTF Modifier Grid**

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

The commands in the Hinge Modifier grid are processed sequentially from the top to the bottom of the grid.

**When the Grid Row is Empty**

If the row of the grid is empty, clicking LB in the empty row will bring up the Create menu which contains all the available MTF Modifier commands. Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the Create menu.

Selecting a menu item will bring up an associated panel which displays the information required for the MTF Modifier command. When the panel is filled in and OK or Apply selected, the panel information is written out to the row of the grid and is known as a MTF modifier command or modifier command for short. For information on each of the Hinge Commands, see 21.2.2.1 Create MTF Commands.

**When the Grid Row is Not Empty**

If the row of the grid is not empty (and hence filled with a modifier command) then clicking LB in the cell:

(a) Type will bring up the associated panel for the modifier command.

For information on each of the Hinge Commands, see 21.2.2.1 Create MTF Commands.

(b) Start chainage cell brings up the Smart Start Chainage panel
The Start Chainage Mode will determine what other fields are also on the panel (for example Extension ref for Mode Start of reference string). For more information on Chainage Modes, see 21.2.1 MTF Hinge Modifiers

(c) End Chainage cell brings up the Smart End Chainage panel

The End Chainage Mode will determine what other fields are also on the panel (for example Extension ref for Mode End of reference string). For more information on Chainage Modes, see 21.2.1 MTF Hinge Modifiers

(d) Interval will allow a real value to be typed into the cell

Note that the Interval column will not appear in the grid if Show interval column? is not ticked in the MTF Settings. See 21.2.7.8 MTF Setting Show Interval Column

(e) Extra Start, Extra End or Active will toggle the tick/not ticked

Note that the Extra start and Extra end columns will not appear in the grid if Show extra start/end column? is not ticked in the MTF Settings. See 21.2.7.6 MTF Setting Show Extra Start/End column.

(f) Comment will allow text to be typed into the cell
Note that clicking in the Type, Start chainage, End chainage, Interval, Extra Start, Extra End, Active and Comment cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.

Buttons at Bottom

OK button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply button

Apply stores the values in the grid and leaves the panel on the screen.

If Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, a recalc of the associated Apply Many for the MTF is done.

Autopan on/off button

when clicked to say Autopan is on then if the chainage range is not in the view that the Reference string is on then the view will be panned so that it is on the view. See 21.2.2.2 Fixed Link Modifiers.

Highlight button

clicking the Highlight button brings up the Highlight Modifiers panel.

See 21.2.2.1.6 Highlight Button

Each of the Create commands will be described in the following sections.

The Create commands for the left side modifiers and the right side modifiers work in the same way so the modifiers will only be described the once.

Continue to the next section 21.2.2.1 Create MTF Commands.
21.2.2.1 Create MTF Commands

![Create MTF Commands]

modify fixed section
modify the cut, fill, final cut/fill of a template
define interval values, aliases etc
create shapes, strings, tins and trimeshes
insert snippets
turn on debugging
pause the MTF
add a comment row
define a region in the grid

When brought up from **Modifiers left**, the **Create** options work on the **links** are on the **left hand side** of the **Hinge string**. And on the left, the links are placed from right to left so the **start of a left side link** is at the **right hand end of the link**. See 21.1.1.1 MTF Links, Points and Strings.

When brought up from **Modifiers right**, the **Create** options work on the **links** are on the **right hand side** of the **Hinge string**. And on the right, the links are placed from left to right so the **start of a right side link** is at the **left hand end of the link**. See 21.1.1.1 MTF Links, Points and Strings.

For the options see

- **Fixed** 21.2.2.2 Fixed Link Modifiers
- **Template** 21.2.2.3 Template Modifiers
- **Interval** 21.2.2.4 Interval
- **Create** 21.2.2.5 MTF Create
- **Snippet** 21.2.2.6 Snippet
- **Debug** 21.2.2.7 Debug
- **Pause** 21.2.2.8 Pause
- **Comment** 21.2.2.9 Comment
- **Region** 21.2.2.10 Region

For general information about the MTF Commands, see

21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels
21.2.2.1.2 Link or Link(s)
21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels
21.2.2.1.4 Alias for MTF Modifiers
21.2.2.1.5 Autopan Button
21.2.2.1.6 Highlight Button
21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels

Most of the Modifier panels have the following common panels fields.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alias</td>
<td>text box</td>
<td>if not blank</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>a text name that can be used to refer to for this row in the grid.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The Alias is a reference to this command in the Left/Right MTF Modifiers grid that can be referred to by Smart Chainages used in the Left/Right MTF Modifiers commands in the grid.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>See 21.2.2.1.4 Alias for MTF Modifiers.</td>
<td></td>
</tr>
<tr>
<td>Start/End chainage</td>
<td>smart chainage box</td>
<td>Start (ref)/End (ref)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>defines the start/end chainages for use in the Modifier.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information on Start/End Chainages and Modes, see 21.4 Smart Chainages.</td>
<td></td>
</tr>
<tr>
<td>Interval</td>
<td>real box</td>
<td>if not blank</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the interval to use to create cross sections and strings over the given chainage range.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If blank, the interval given by any MTF Edit =&gt; Interval commands, and/or the Section separation value from the Apply MTF panel, is used.</td>
<td></td>
</tr>
<tr>
<td>Extra start</td>
<td>tick box</td>
<td>if ticked</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>add an extra x-section a distance Extra start/value millimetres before the start chainage. See 21.2.7.4 MTF Setting Show Extra Start/End and 21.2.7.5 MTF Setting Extra Start/End value.</td>
<td></td>
</tr>
<tr>
<td>Extra end</td>
<td>tick box</td>
<td>if ticked</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>add an extra x-section a distance Extra start/value millimetres before the end chainage. See 21.2.7.4 MTF Setting Show Extra Start/End and 21.2.7.5 MTF Setting Extra Start/End value.</td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td>text box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>comment to add to the Comment column for the row of the grid.</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>tick box</td>
<td>if ticked</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>use this modifier.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If not ticked, don't use this modifier.</td>
<td></td>
</tr>
<tr>
<td>OK</td>
<td>button</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>OK stores the values in the fields and removes the panel BUT no recalc is done.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Apply</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Apply stores the values and leaves the panel on the screen.

If the MTF is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, a recalc of the associated Apply MTF for the MTF is done.

Go to the next section 21.2.2.1.2 Link or Link(s) or return to 21.2.2.1 Create MTF Commands.
21.2.2.1.2 Link or Link(s)

Some **Modifier** panels allow more than one link name to be specified.

If only one Link is allowed, then the panel field will be **Link**.

If more than one Link is allowed, then the panel field will be **Link(s)**.

When multiple Links are allowed, each Link name is separated by one or more spaces. If the Link name contains a space then it must be surrounded by double quotes. For example "name with a space".

When an MTF panel that allows multiple Link names is edited, all the Link names will be displayed surrounded by double quotes. This applies even if there is only one Link name in the field.

Go to the next section **21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels** or return to **21.2.2.1 Create MTF Commands**
21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels

When creating a link, the Modifier panels have the following common panels fields. The fields and buttons have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>width of the link.</td>
<td>real box</td>
<td>measure menu</td>
<td></td>
</tr>
<tr>
<td>Height</td>
<td>the z-value of the end of the link minus the z-value of the start of the link. That is, the delta z for the link.</td>
<td>real box</td>
<td>measure menu</td>
<td></td>
</tr>
<tr>
<td>xfall</td>
<td>the crossfall of the link.</td>
<td>real box</td>
<td>measure menu</td>
<td></td>
</tr>
</tbody>
</table>

The diagram illustrates the Cross Section View of a Template, showing the xfall on left and right.

Go to the next section 21.2.2.1.4 Alias for MTF Modifiers or return to 21.2.1 Create MTF Commands.
21.2.2.1.4 Alias for MTF Modifiers

For each Left/Right Modifiers Command, there is an optional text field called **Alias**.

An **Alias** can be used to uniquely refer to a particular command in the Left or Right MTF Modifiers grid independently of its row number.

Most MTF Commands have an **Alias** field and if it is filled in then the value will be the **Alias** for that row.

There is also a special command **Chainage Alias** that defines an **Alias** for that row and those Start and End Chainages. See 21.2.2.4.1 **Chainage Alias**.

Apart from defining an **Alias** and associated **Start** and **End** Chainages for that row, **Chainage Alias** has no other effect.

Once an **Alias** exists, it can be used in the two Smart Chainage modes, **Relative to Alias Start** and **Relative to Alias End**. See 21.4.19 **Relative to Alias Start** and 21.4.20 **Relative to Alias End**.

If an **Alias** is given for a command in the Left MTF Modifiers panel then it must be unique amongst all the Aliases for the Left MTF Modifiers commands.

Similarly if an **Alias** is given for a command in the Right MTF Modifiers panel then it must be unique amongst all the Aliases for the Right MTF Modifiers commands.

Go to the next section 21.2.2.1.5 **Autopan Button** or return to 21.2.2.1 **Create MTF Commands**
21.2.2.1.5 Autopan Button

The Autopan button is at the button of the Left/Right MTF Modifiers panels and clicking on the button will toggle between the on/off states.

The Autopan button is used in conjunction with clicking LB in the Type, Start chainage and End Chainage columns.

For all plan views that the Reference string for the MTF is on, and all section views where the Reference string is profiled, clicking in the grid on the Left/Right MTF Modifiers panels will have the following effect:

(a) If LB is clicked on the number in the grid of a command then the entire line in the grid highlights, and highlight arrows are placed at the Start and End chainage of the command.

(b) If LB is clicked in the Start chainage column of a command, then that cell of the grid highlights, and

   If Autopan is on then the plan and/or section views will pan so that the Start chainage highlight arrow shows on the views.

Important Note: the scale and the centre point of the views are not changed so if the Start/End chainage is not visible on the view, then the highlight arrow for the Start/End will not appear.
If **Autopan is off** then the Start chainage highlight arrow occurs but the view does not change. So the Start chainage highlight arrow will only show if the Start chainage is already visible on the plan and/or section views.

(c) If LB is clicked in the **End chainage** column of a command, then that cell of the grid highlights, and

If **Autopan is on** then the plan and/or section views will pan so that the End chainage highlight arrow shows on the views.

If **Autopan is off** then the End chainage highlight arrow occurs but the view does not change. So the End chainage highlight arrow will only show if the End chainage is already visible on the plan and/or section views.
(d) if LB is clicked in the **Type** column of a command, then that cell of the grid highlights, and

If **Autopan is on** then the plan and/or section views will do a fit about the Start chainage and End chainage so that both the Start chainage highlight arrow and the End chainage highlight arrow are visible in the plan and/or section views.

If **Autopan is off** then the plan and/or section views do not change. The Start chainage highlight arrow and the End chainage highlight arrow are turned on but they will only be visible if the Start chainage and/or End chainage are already visible on the views.
reference string If **Autopan is on** is showing AND the **Reference string** for the MTF is on a plan view:

(a) whenever you click on **Type** column in the grid for a command that does not involve the entire string, the scale and centre of the view is modified so that the **Start** and **End** chainage extents of the command are displayed in the plan view (with the addition of an extra percentage that is set in env.4d)

(b) whenever you click on **Start chainage** column of a command that does not involve the entire string, the scale and centre of the view is modified so that the **Start** and **End** chainage extents of the command are displayed in the plan view (with the addition of an extra percentage that is set in env.4d)

Go to the next section [21.2.2.1.6 Highlight Button](#) or return to [21.2.2.1 Create MTF Commands](#)
21.2.2.1.6 Highlight Button

Highlight button

clicking the Highlight button brings up the Highlight Modifiers panel.

Return to 21.2 MTF Edit.
21.2.2.2 Fixed Link Modifiers

The Fixed walk-right brings up the Fixed menu with options to insert and modify the fixed links.

For

- Insert: 21.2.2.2.1 Fixed Link - Insert
- Remove: 21.2.2.2.2 Fixed Link - Remove
- Trim: 21.2.2.2.3 Fixed - Trim
- Modify link: 21.2.2.2.4 Fixed - Modify Link
- Rename: 21.2.2.2.5 Fixed Link - Rename Link
- Absolute: 21.2.2.2.6 Fixed Link - Absolute to a Base Link
- Parallel: 21.2.2.2.7 Fixed Link - Parallel
- Decisions: 21.2.2.2.8 Fixed Link - Decisions
- from link: 21.2.2.2.9 Fixed Link - From link
- to string: 21.2.2.2.10 Fixed Link - To String
- to tin: 21.2.2.2.11 Fixed Link - To Tin
- to RL: 21.2.2.2.12 Fixed - To RL
- to 2 heights: 21.2.2.2.13 Fixed - to 2 Heights
- to 2 strings: 21.2.2.2.14 Fixed - by 2 strings
- Interface to tin: 21.2.2.2.15 Fixed - Interface to Tin
- Boxing: 21.2.2.2.16 Fixed - Boxing
21.2.2.2.1 Fixed Link - Insert

The Fixed Insert walk-right brings up the Fixed Insert menu with options to insert fixed links, insert a fixed part of a template, and insert a full template.

For

- **Insert**  
  - 21.2.2.2.1.1 Insert a Fixed Link
- **Insert absolute**  
  - 21.2.2.2.1.2 Insert a Fixed Link Absolute
- **Insert at string**  
  - 21.2.2.2.1.3 Insert a Fixed Link at a String
- **Insert fixed template**  
  - 21.2.2.2.1.4 Insert Fixed Links from a Template
- **Insert full template**  
  - 21.2.2.2.1.5 Insert Full Template
- **Insert xfall intersect**  
  - 21.2.2.2.1.6 Fixed Link - Insert Xfall Intersect
21.2.2.1.1 Insert a Fixed Link

Fixed links can be inserted by specifying either width and height, width and xfall, or height and xfall, where width/height/xfall are measured from the last fixed link before this link.

**Note** - height is not a z-value (RL) but the difference in z-values between the start and the end of the link.

It doesn’t matter which of the two is used to define the link, the third (plus slope) can be calculated. See 21.2 MTF Edit.

So the link can be modified by varying the width, xfall, height or slope.

Selecting **Insert** brings up the **Fixed - Insert** panel

![Fixed - Insert panel](image.png)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>available Layers</td>
<td>Layer for the new link. For information on Layers, see 21.1.1.2 MTF Links and Layers.</td>
</tr>
<tr>
<td>Link</td>
<td>text box</td>
<td></td>
<td>name for the new link.</td>
</tr>
<tr>
<td>Colour</td>
<td>colour box</td>
<td>available colours</td>
<td>colour of the link being created.</td>
</tr>
<tr>
<td>Width /Height/Xfall</td>
<td>real box</td>
<td>measures menu</td>
<td>width/height/crossfall of the link being created - only use two of the three.</td>
</tr>
</tbody>
</table>

For more information on these panel fields, see 21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels.
**Before** choice box select name menu

*if not blank*, the name of the link to insert the new link before.

*If blank and After is blank*, the link is appended to the end of the fixed part of the template.

**After** choice box select name menu

*if Before is not blank, After is ignored.*

*If not blank and Before is blank, the name of the link to insert the new link after.*

*If blank and Before is blank, Before is used.*

**Note:** One of Before or After must be *blank*. If they are both blank then Before takes precedence over After.

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages for inserting the new link

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.*

**Comment, Extra start, Extra End, Active, OK, Apply**

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.*

Go to the next section 21.2.2.1.2 Insert a Fixed Link Absolute or return to 21.2.2.1 Fixed Link - Insert.
21.2.2.1.2 Insert a Fixed Link Absolute

Fixed links can be inserted by specifying either width and height, width and xfall, or height and xfall, where the width/height/xfall are measured from a Base link, or a combination of a Base link and a Grade link.

The new inserted link must end up outside any previous links.

Note - height is not a z-value (RL) but a delta height.

Selecting Insert absolute brings up the Fixed - Insert Absolute panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>available Layers</td>
<td></td>
</tr>
<tr>
<td>Link name</td>
<td>names box</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>colour box</td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td>Width /height/xfall</td>
<td>input</td>
<td>measures menu</td>
<td></td>
</tr>
</tbody>
</table>

Layer for the new link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Note: the new inserted link must end up outside any previous links.

If a Grade link is given, only the combinations width and crossfall, or width and height, are allowed.
If there is no Grade link, any two of the three can be used.

**Base link, Grade link**

If Grade link is blank:

any combination of two of width, height and xfall can be used to define the new link.

if Base link is non blank, then it is the name of the link to take the width/height/xfall from.

If Base link is blank, then the option acts as a normal Insert and the width/height/xfall are taken from the last fixed link before this insert.

If Grade link is not blank:

only the combinations width and crossfall, or width and height, are allowed.

**Width:**

if Base link is non blank, then it is the name of the link to take the width from.

If Base link is blank, then the width is from the last fixed link before this insert.

**Xfall or Height**

If xfall is given, then the xfall is applied from the Grade link.

If height is given, then the height is added to the height of the Grade link.

**Note:** the new inserted link must end up outside any previous links.

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages for inserting the new link

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Go to the next section [21.2.2.1.3 Insert a Fixed Link at a String](#) or return to [21.2.2.1 Fixed Link - Insert](#).
21.2.2.2.1.3 Insert a Fixed Link at a String

The **Insert at string** modifier copies an existing string between the two given chainages and inserts it as a link of the template.

The **Insert at string** copies an existing string between the two given chainages and inserts it as a link of the template. The created link can also be given an offset and depth from the string.

Hence the end of the new link is constructed so that it is a given plan distance **Stop short** from the **string**, and stops at the depth **Strip below the string**.

---

**Section View**

![Diagram showing the Insert at String link defined by the String, Stop short and Strip (depth).](image)

**Fixed - At String link defined by the String, Stop short and Strip (depth).**

Selecting **Insert at string** brings up the **Fixed - Modify Insert at String** panel.

---

The new fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Link name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Select string</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Side to search</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Strip</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Stop short</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Start chainage</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>End chainage</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
New link type choice box Width and Xfall, Width and Height, Height and Xfall states how the link is to be defined.

Layer layer box available Layers Layer for the new link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name names box select name menu name for the new link.

Colour colour box available colours colour for the new link

Strip real box measures menu the new link is constructed so that its end is Strip below the selected string.
Strip is a depth and is positive in the downward direction It can be positive or negative.

Stop short real box measures menu the new link is constructed so that its end is the plan distance Stop short of the selected string.
When the command is a Left Modifier, positive plan distance is measured from the Hinge string as zero and then going out to the left.
When the command is a Right Modifier, positive plan distance is measured from the Hinge string as zero and then going out to the right.
Stop short can be positive or negative.

Alias, Start Chainage, End Chainage, Interval defines the start/end chainages for inserting the new link
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Select string string select box select the string to copy as a link

Side to search choice box Left side, Right side, Both sides side to search to find the string.

Comment, Extra start, Extra End, Active For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.1.4 Insert Fixed Links from a Template or return to 21.2.2.2.1 Fixed Link - Insert.
21.2.2.1.4 Insert Fixed Links from a Template

The **Insert fixed template** modifier inserts all the fixed links from an existing Template. Selecting **Insert fixed template** brings up the **Insert Fixed Template** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>

<td>defines the start/end chainages for inserting the new fixed links</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
For information on these panel fields, see 21.2.2.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply
For information on these panel fields, see 21.2.2.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.1.5 Insert Full Template or return to 21.2.2.1 Fixed Link - Insert.
21.2.2.2.1.5 Insert Full Template

The Insert Full Template *inserts* all the fixed links from a selected template after the existing fixed links *AND also replaces* the decision, cut, fill and final cut/fill links of the existing template with those from the selected template.

So the option *leaves* the existing fixed links from the template but *removes the existing* decision, cut, fill and final cut/fill links in the template.

Selecting Insert Full Template brings up the Fixed - Insert Full Template panel

![Fixed - Insert Full Template Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>

</tbody>
</table>
Go to the next section 21.2.2.1.6 Fixed Link - Insert Xfall Intersect or return to 21.2.2.1 Fixed Link - Insert.
21.2.2.2.1.6 Fixed Link - Insert Xfall Intersect

The Xfall insert modifier inserts a new link.

And the new link is created by coming off the last link of the fixed template before the **Insert Xfall Intersect** command, and going out from that last fixed link in a variety of ways and meeting a selected string.

For example, over the chainage range, a given xfall is taken from the last link and the selected string, and the new link is the intersection of the two xfalls.

The different methods for creating the new link are:

- **Same xfall, normal ref**
- **Same xfall, normal both**
- **Diff xfalls, normal ref**
- **Diff xfalls, normal both**

and for the definitions go to [21.2.2.1.6.1 Fixed - Calculating the New Link for each Type](#).

Selecting **Insert xfall intersect** brings up the **Fixed - Xfall Intersect** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>

**choice box**

For the types of ways to create the new link, go to [21.2.2.1.6.1 Fixed - Calculating the New Link for each Type](#).

**Xfall, Xfall hinge, Xfall sec etc**

which of these fields are present, and what they are for, depends on **Type**.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Return to [21.2.2.1 Fixed Link - Insert](#).

### 21.2.2.1.6.1 Fixed - Calculating the New Link for each Type

for the definitions of the calculations for each choice go to [Same Xfall and Normal to Reference String](#), [Same Xfall and Normal to Reference String and to Other String](#), [Two Xfalls and Normal to Reference String](#), [Two Xfalls and Normal to Reference String and to Other String](#)

**Same Xfall and Normal to Reference String**
This option requires a Xfall.

The **Start mode** and **End Mode** refer to **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the Table Drain command**, and the **Other string**.

On this section, the given xfall **Xfall** is taken from the last fixed link, and the xfall of **negative Xfall** from **Other string**, and a vertex of the new link created where the xfalls intersect.

For information about the sign convention for offset and xfalls, go to [20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

---

### Same Xfall and Normal to Reference String and to Other String

This option requires a Xfall.

The **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string**.
string and cutting the last fixed link before the Table Drain command, and the xfall Xfall is taken from the cut with the last fixed link and along the section.

This is then intersected with a section normal to the Other string and with the xfall negative Xfall.

The new link is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Two Xfalls and Normal to Reference String

This option requires to xfalls: Xfall fixed link and Xfall other.

The Start mode and End Mode refer to Reference string and at each chainage (ch) between the Start mode and the End mode, a section is taken normal (perpendicular) to the Reference string and cutting the last fixed link before the Table Drain command, and the Other string.

On this section, the given xfall Xfall fixed link is taken from the last fixed link, and the xfall of Xfall other from Other string, and a vertex of the new link created where the xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.
Two Xfalls and Normal to Reference String and to Other String

This option requires to xfalls: Xfall fixed link and Xfall other.

The Start mode and End Mode refer to Reference string and at each chainage ch between the Start mode and the End mode, a section is taken normal (perpendicular) to the Reference string and cutting the last fixed link before the Table Drain command, and the xfall Xfall fixed link is taken from the cut with the last fixed link and along the section.

This is then intersected with a section normal to the Other string and with the xfall Xfall other. The new link is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.
Continue to the next section 21.2.2.2 Fixed Link - Remove or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.
21.2.2.2.2 Fixed Link - Remove

The fixed Remove walk-right brings up the fixed Remove menu with options to remove links.

![Fixed Remove menu]

To go straight to the documentation on each of the options on the Fixed modifier menu:

See

- **Remove**  
  - [21.2.2.2.1 Remove a Fixed link](#)
- **Remove absolute**  
  - [21.2.2.2.2 Remove a Fixed link - Absolute](#)
- **Leave fixed/remove number**  
  - [21.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links](#)
- **Leave fixed/remove named**  
  - [21.2.2.2.4 Fixed Link - Remove All But Fixed & Remove Named Fixed Links](#)
- **Leave fixed/remove from name**  
  - [21.2.2.2.5 Fixed Link - Remove All But Fixed & Remove Fixed Links from a Named Link](#)
- **Remove layers**  
  - [21.2.2.2.6 Fixed Link - Remove Layer](#)
21.2.2.2.1 Remove a Fixed link

The **Remove** option deletes fixed links between given chainages.

Because the link is no longer there, any following links will then be relative to the link before the deleted link.

Note that there is also a **Remove Absolute** option that deletes a link but leave the absolute position of the other links undisturbed. See **21.2.2.2.2 Remove a Fixed link - Absolute**.

Selecting **Remove** brings up the **Fixed - Remove** panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>available Layers</td>
<td></td>
</tr>
<tr>
<td>Link(s)</td>
<td>name box</td>
<td>select name menu</td>
<td></td>
</tr>
</tbody>
</table>

Layer to remove the link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

name of the links to remove. See 21.2.2.1.2 Link or Link(s).

Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages for removing the given fixed links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.2 Remove a Fixed link - Absolute or return to 21.2.2.2 Fixed Link - Remove.
21.2.2.2.2 Remove a Fixed link - Absolute

The **Remove Absolute** option deletes fixed links between given chainages whilst leaving the absolute position of the other links undisturbed.

Selecting **Remove absolute** brings up the **Fixed - Remove Absolute** panel.

The fields and buttons used in this panel have the following functions.
<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>available Layers</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><em>Layer to remove the link. For information on Layers, see 21.1.1.2 MTF Links and Layers.</em></td>
</tr>
<tr>
<td>Link(s)</td>
<td>name box</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><em>name of the links to remove. See 21.2.2.1.2 Link or Link(s).</em></td>
</tr>
</tbody>
</table>

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages for removing the given fixed links.

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.*

**Comment, Extra start, Extra End, Active, OK, Apply**

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.*

Go to the next section 21.2.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links or return to 21.2.2.2 Fixed Link - Remove.
21.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links

The **Only Fixed** option removes any of the variable cut and fill, final cut/fill links and decisions that have been defined up to this point in the modifiers grid.

Also starting from the outermost fixed link, it can also removed one or more of the remaining fixed links.

Selecting **Only Fixed** brings up the **Only Fixed** panel.

![Only Fixed Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alias, Start Chainage, End Chainage, Interval</td>
<td>defines the start/end chainages to remove the cut, fill and final cut/fill links, and some fixed links.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.*

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>No. links to remove</td>
<td>integer box</td>
<td>0</td>
<td>if <strong>greater than zero</strong>, then starting from the outside link of the fixed links, this number of fixed links are removed. If the number is larger than the number of fixed links, then it removes all the fixed links. So a large number will remove all the links - fixed, cut, fill and final cut/fill. If <strong>zero</strong> then no fixed links are removed. If <strong>less than zero</strong>, then starting from the first link of the fixed links, this number of fixed links are kept and the outer fixed links are removed. If the number is larger than the number of fixed links, then it</td>
</tr>
</tbody>
</table>
removes all the fixed links. So a large number will remove all the links - fixed, cut, fill and final cut/fill.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Go to the next section [21.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links](#) or return to [21.2.2.2 Fixed Link - Remove](#).
21.2.2.2.4 Fixed Link - Remove All But Fixed & Remove Named Fixed Links

The **Only Fixed Named** option removes any of the variable cut and fill, final cut/fill links and decisions that have been defined up to this point in the modifiers grid.

It also removes a list of fixed links from the remaining fixed links.

Selecting **Only Fixed Named** brings up the **Only Fixed Named** panel.

![Only Fixed Named Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

<tr>
<td><strong>Layer</strong></td>
<td>layer box</td>
<td>available Layers</td>
<td></td>
</tr>
<tr>
<td><strong>Wild card</strong></td>
<td>text box</td>
<td>text including wild cards (*) and wild characters () that the link names are matched against.</td>
<td></td>
</tr>
<tr>
<td><strong>Link name</strong></td>
<td>name box</td>
<td>names.4d list</td>
<td>name of the fixed link in the layer to start removing links from/to.</td>
</tr>
</tbody>
</table>

*link names that match **Wildcard** are removed from the layers listed in the grid. For information on Layers, see 21.1.1.2 MTF Links and Layers.*
Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages to remove the links from layers.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.2 Fixed Link - Remove.
21.2.2.2.3 Fixed - Trim

The Trim walk-right brings up the Trim menu with options to perform various trimming operations.

See

- **Intersect tin** [21.2.2.2.3.1 Intersect Tin]
- **Trim links to tin** [21.2.2.2.3.2 Trim Links to Tin]
- **Trim sections to string** [21.2.2.2.3.3 Trim Sections to String]
- **Trim links to string** [21.2.2.2.3.4 Trim Links to String]
- **Trim overlapping sections** [21.2.2.2.3.5 Trim Overlapping Sections]
21.2.2.2.3.1 Intersect Tin

This option finds the intersection points of the link Link within the given vertical tolerance Intersect z tol of the stripped Tin and creates extra section at nominated chainage distances from the intersection chainages.

Extra sections are then created at the reference chainages

Reference chainage of intersection of link with (tin - Strip) + Section 1 dist
Reference chainage of intersection of link with (tin - Strip) + Section 2 dist
Reference chainage of intersection of link with (tin - Strip) + Section 3 dist
Reference chainage of intersection of link with (tin - Strip) + Section 4 dist

Selecting Intersect tin brings up the Fixed - Link Intersect Tin panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>Layer of the link to cut with the stripped tin. For information on Layers, see 21.1.1.2 MTF Links and Layers.</td>
<td>layer box</td>
<td>available Layers</td>
<td></td>
</tr>
<tr>
<td>Link</td>
<td>name of the link to cut with the stripped tin. See 21.2.2.1.2 Link or Link(s).</td>
<td>name box</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td>Tin</td>
<td>name of the tin to use as the stepped tin to find the intersections with the link Link.</td>
<td>tin box</td>
<td>available tins</td>
<td></td>
</tr>
<tr>
<td>Strip</td>
<td>the depth to vertically drop the tin before calculating intersections. This is then referred to as the stripped tin.</td>
<td>real box</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Section 1, 2, 3, 4 dist</td>
<td>real box</td>
<td>if not blank, this value is added to the reference chainages of the intersection of the link with the stripped tin, and new sections are created at this new chainage. The value can be positive, negative and zero.</td>
<td>real box</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Notes</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1. There may be more than one reference string chainage where the link intersects the stripped tin.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2. A section is only produced at the intersections of the link with the stripped tin if one of Section i dist is zero.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Intersect z tol real box 0.0001

the intersection of the link with the stripped tin can occur within this vertical distance of the striped tin.

Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages for trimming the given fixed link against the tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.3.2 Trim Links to Tin or return to 21.2.2.2.3 Fixed - Trim.
21.2.2.2.3.2 Trim Links to Tin

Selecting Trim links to tin brings up the Fixed - Trim Links to Tin panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>available Layers</td>

<td>name box</td>
<td>select name menu</td>
<td>name of the link to trim against the tin. See 21.2.2.1.2 Link or Link(s).</td>
</tr>
</tbody>
</table>

Alias, Start Chainage, End Chainage, Interval

 defines the start/end chainages for trimming the given fixed link against the tin. For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.3.4 Trim Links to String or return to 21.2.2.3 Fixed - Trim.
21.2.2.3.4 Trim Links to String

This option trims links before a selected string, or after a selected string, or between two selected strings.

**Important Note:**

This option only trims the strings that are created from the links. It does NOT trim the sections. So it is a process that is performed after the sections and strings are first generated and it is only performed on the strings.

Selecting Trim links to string brings up the Fixed - Trim Links to String panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>available Layers</td>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Go to the next section 21.2.2.3.5 Trim Overlapping Sections or return to 21.2.2.3 Fixed - Trim.
21.2.2.3.5 Trim Overlapping Sections

The Trim Overlapping Sections option takes a Layer and modifies the internally calculated sections so that the sections do not overlay each other.

Any strings that are generated for that Layer will come from those modified internal sections and so will also not cross over themselves.

So any triangulation using those strings should not need any further cleanups to produce a fairly accurate tin. Certainly the tin should be accurate enough for any earthworks.

For the Design Layer, both sections and strings can be created and using the Trim Overlapping Sections option will produce results such as the example below.

Selecting Trim overlapping sections brings up the Fixed - Trim Overlapping Sections panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>available Layers</td>
<td></td>
</tr>
</tbody>
</table>

name of the Layer to modify the internally calculated sections so that the sections do not overlay each other. Any strings that are generated for that Layer after this process will come from the modified internal sections and so will also not cross over themselves.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages for trimming the given fixed link against the tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.2.3 Fixed - Trim.
21.2.2.2.4 Fixed - Modify Link

The **Fixed => Link** option can modify the width, height, xfall or slope of any Fixed link.

At a given chainage, it doesn't matter which of the two values from width, height or xfall were used to defined a Fixed link, all of the values width, height, xfall and slope can be then calculated. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions

So for a Fixed Link, the **Link** option allows to user to chose which one of width, height, xfall or slope to modify and how to modify it, and which of width, height, xfall or slope is held to be the current value for the Fixed link.

Notes

1. The combination Modify xfall and Hold slope makes no sense because xfall and slope measure exactly the same thing.
2. There is an important difference between Modify Xfall and Modify Slope.
   - **Modify Xfall** linearly interpolates the xfall between the Start Chainage and the End Chainage where xfall is the percentage of the proportion of metres vertically to metres horizontally.
   - **Modify Slope** linearly interpolates the slope between the Start Chainage and the End Chainage where slope is the ratio between one unit vertically to a number of units horizontally (1 in).

Selecting **Link** brings up the **Fixed - Modify Link** panel.

![Fixed - Modify Link panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>

</table>
Links and Layers

Link(s) name box names.4d pop-up

the name of the links in Layer to modify the width/height/xfall/slope using the method given in Modifier type, between the chainages given by Start chainage and End chainage. See 21.2.2.1.2 Link or Link(s).

When describing how the Link option works, this link is referred to as the Current link and the values of width, height, xfall and slope for the Current Link as the Current or Existing Values.

Modifier type choice box

modify Width and take Height from current link
modify Width and take Xfall from current link
modify Height and take Width from current link
modify Height and take Xfall from current link
modify Xfall and take Width from current link
modify Xfall and take Height from current link
modify Slope and take Width from current link
modify Slope and take Height from current link

A fixed link can be modified in any of the Modify type ways regardless of how the link was originally defined in terms of width, height, xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

The Modify width/height/xfall/slope is the part of the current link that is modified from its current value by the method given by Modifier type.

How the width/height/xfall/slope is modified depends on the choice made in the Type field described below.

The Hold width/height/xfall is the part of the current link that is held at its current value for the link.

New value usage choice box

Add to the current value of the link, Replace the current value of the link

if Add to the current value of the link, the value of the parameter width/height/xfall/slope at each chainage is added to the current value for the parameter. For compactness, in a grid, this will be displayed in an Absolute column with Absolute not ticked or no.

if Replace the current value of the link, the value of the parameter width/height/xfall/slope at each chainage replaces the current value for the parameter. For compactness, In a grid, this will be shown in an Absolute column with Absolute ticked or yes.

See 21.1.2.3 New Value Usage.

Type choice box

the choices for Type depends on the choice selected for Modifier type.
When **Modify type** is **Modify Width** the choices for **Type** are

For a description of the choices of **Type** when **Modifier type** is **Modify Width**, see 21.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall"

For a description of the choices of **Type** when **Modifier type** is **Modify Height**, see 21.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall"

For a description of the choices of **Type** when **Modifier type** is **Modify Xfall**, see 21.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height"

For a description of the choices of **Type** when **Modifier type** is **Modify Slope**, see 21.2.2.4.4 Type for Modifier Types "Modify Slope, Hold Width/Height"

Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages for modifying the new link

For information on these panel fields, see 21.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.1.1 Common Fields and Buttons on MTF Modifier Panels.
21.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall"

The choices for **Type** when **Modify type** is:

(a) **Modify Width, Hold Height**

or

(b) **Modify Width, Hold Xfall**

are

- use a given width for the chainage range
- interpolate between a given start width and a given end width
- interpolate between the current start width and a given end width
- interpolate between a given start width and the current end width
- use the current start width for the chainage range
- use the current start width for the chainage range
- interpolate between the current start width and the current end width
- use a parabola from the current start width
- use a parabola that goes through the current end width
- use an arc from the current start width
- use an arc that goes through the current end width
- use a cubic between the current start and end widths
- use a compound parabola between the current start and end widths
- use reverse curves between the current start and end widths
- use a sinusoidal curve between the current start and end widths
- use a straight line between the current start and end widths

For the description of each **Type** see

- 21.2.2.2.4.1.1 Width
- 21.2.2.2.4.1.2 Width -> Width
- 21.2.2.2.4.1.3 Pos -> Width

- 21.2.2.2.4.1.11 < Circular
- 21.2.2.2.4.1.12 Cubic
- 21.2.2.2.4.1.13 Pos-> Pos: Straight line
21.2.2.2.4.1.1 Width
Use a Given Width from the Start Chainage to the End Chainage

At each chainage ch between the Start chainage and End chainage, the width is that given in the Width panel field. That is, the width has the constant value of Width.

Go to the next section 21.2.2.2.4.1.2 Width -> Width or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.2 Width -> Width
Interpolate Between a Given Start Width and a Given End Width

At each chainage ch between the Start chainage and End chainage, the width is linearly interpolated by chainage between the given Start width and the End width.

Go to the next section 21.2.2.2.4.1.3 Pos -> Width or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.3 Pos -> Width
Interpolate Between the Existing Start Width & a Given End width

At each chainage ch between the Start chainage and End chainage, the width is linearly interpolated by chainage between the width at the Start chainage and the given width Width at the End chainage.

This allows you to use the width at the End chainage without knowing what the actual value of the width is.

Go to the next section 21.2.2.2.4.1.4 Width -> Pos or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link
21.2.2.4.1.4 Width -> Pos
Interpolate Between a Given Start Width & the Existing End Width

At each chainage ch between the Start chainage and End chainage, the width is linearly interpolated by chainage between the given width Width at the Start chainage and the width at the End chainage.

This allows you to use the width at the Start chainage without knowing what the actual value of the width is.

Go to the next section 21.2.2.4.1.5 or return to 21.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.4 Fixed - Modify Link

21.2.2.4.1.5 Pos ->
Use the Current Start Width for the Entire Chainage Range

At each chainage ch between the Start chainage and End chainage, the width is that at the Start chainage. That is, the width has the constant value of what it is at the Start chainage.

This allows you to use the width at the Start chainage without knowing what the actual value of the width is.

Go to the next section 21.2.2.4.1.6 or return to 21.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.4 Fixed - Modify Link

21.2.2.4.1.6 <- Pos
Use the Current End Width for the Entire Chainage Range

At each chainage ch between the Start chainage and End chainage, the width is that at the End chainage. That is, the width has the constant value of what it is at the End chainage.

This allows you to use the width at the End chainage without knowing what the actual value of the width is.

Go to the next section 21.2.2.4.1.7 or return to 21.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.4 Fixed - Modify Link

21.2.2.4.1.7 Pos-> Pos:
Interpolate Between the Existing Start Width and the Existing End Widths

At each chainage ch between the Start chainage and End chainage, the width is linearly interpolated by chainage between the width at the Start chainage and the width at the End chainage.

This allows you to use the widths at the Start chainage and the End chainage without knowing what the actual value of the widths are.

Go to the next section 21.2.2.4.1.8 Parabola -> or return to 21.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.4 Fixed - Modify Link

21.2.2.4.1.8 Parabola ->
Calculation of Width for Type Parabola ->

This option is still under development

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a parabola **a*X*X** with its origin at (**Start mode + S Ext, Start width**) and going through (**End mode + E Ext, End width**).

---

![Chainage-Width Diagram for Type Parabola](image)

Go to the next section [21.2.2.4.1.9 <- Parabola](#) or return to [21.2.2.4.1 Type for Modifier](#) Types "Modify Width, Hold Height/Xfall" or [21.2.2.4 Fixed - Modify Link](#)

---

21.2.2.4.1.9 <- Parabola

Calculation of Width for Type <- Parabola

This option is still under development

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a parabola **a*X*X** with its origin at (**End mode + E Ext, End width**) and going through (**Start mode + S Ext, Start width**).
21.2.2.4.1.10 Circular->

**Calculation of Width for Type Circular->**

*This option is still under development*

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a circle with its horizontal turning point at (**Start mode + S Ext, Start width**) and going through (**End mode + E Ext, End width**).
21.2.2.2.4.1.11 <-Circular

Calculation of Width for Type <-Circular

This option is still under development

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode** plus **S Ext**, and the **End width** is the width at chainage **End mode** plus **E Ext**.

Between the start position (**Start mode** + **S Ext**, **Start width**), and the end position (**End mode** + **E Ext**, **End width**), the width varies as a **circle** with its horizontal turning point at (**End mode** + **E Ext**, **End width**) and going through (**Start mode** + **S Ext**, **Start width**).
21.2.2.4.1.12 Cubic

Calculation of Width for Type Cubic

This option is still under development

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode** plus **S Ext**, and **End width** is the width at chainage **End mode** plus **E Ext**.

Between the start position (**Start mode** + **S Ext**, **Start width**), and the end position (**End mode** + **E Ext**, **End width**), the width varies as a cubic going through (**Start mode** + **S Ext**, **Start width**) and (**End mode** + **E Ext**, **End width**).

21.2.2.4.1.13 Pos-> Pos: Straight line

Use a Straight Line Between the Existing Start & End Widths

At each chainage ch between the **Start chainage** and **End chainage**, the width is calculated so that it is on a straight line in plan between the width at the **Start chainage** and the width at the **End chainage**.

This allows you to join the widths at the **Start chainage** and the **End chainage** by a plan straight line without knowing what the actual value of the widths are.
21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall"

The choices for Type when Modify type is:

(a) Modify Height, Hold Width

or

(b) Modify Height, Hold Xfall

are

- use a given height for chainage range
- interpolate between a given start height and a given end height
- interpolate between the current start height and a given end height
- interpolate between a given start height and the current end height
- keep the current start height for the chainage range
- use the current end height for the chainage range
- interpolate between the current start height and the current end height
- use a parabola from the current start height
- use a parabola that goes through the current end height
- use an arc from the current start height
- use an arc that goes through the current end height
- use a cubic that goes through the current start and end heights
- use reverse curves between the current start and end heights
- use a sinusoidal curve between the current start and end heights

For the description of each Type see

- 21.2.2.2.4.2.1 Height
- 21.2.2.2.4.2.2 Height -> Height
- 21.2.2.2.4.2.3 Pos -> Height
- 21.2.2.2.4.2.4 Height -> Pos

- 21.2.2.2.4.2.11 <-Circular
- 21.2.2.2.4.2.12 Cubic
21.2.2.4.2.1 Height
Use a Given Height from the Start Chainage to the End Chainage

At each chainage ch between the Start chainage and End chainage, the width is that given in the Height panel field. That is, the height has the constant value of Height.

Go to the next section 21.2.2.4.2.2 Height -> Height or return to 21.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.4.2 Fixed - Modify Link

21.2.2.4.2.2 Height -> Height
Interpolate Between a Given Start Height and a Given End Height

At each chainage ch between the Start chainage and End chainage, the height is linearly interpolated by chainage between the given Start height and the End height.

Go to the next section 21.2.2.4.2.3 Pos -> Height or return to 21.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.4.2 Fixed - Modify Link

21.2.2.4.2.3 Pos -> Height
Interpolate Between the Existing Start Height & a Given End Height

At each chainage ch between the Start chainage and End chainage, the height is linearly interpolated by chainage between the height at the Start chainage and the given height Height at the End chainage.

This allows you to use the height at the End chainage without knowing what the actual value of the height is.

Go to the next section 21.2.2.4.2.4 Height -> Pos or return to 21.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.4.2 Fixed - Modify Link
21.2.2.4.2.4 Height -> Pos
Interpolate Between a Given Start Height & the Existing End Height

At each chainage ch between the Start chainage and End chainage, the height is linearly interpolated by chainage between the given height Height at the Start chainage and the height at the End chainage.
This allows you to use the height at the Start chainage without knowing what the actual value of the height is.

Go to the next section 21.2.2.4.2.5 Pos -> or return to 21.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.4 Fixed - Modify Link

21.2.2.4.2.5 Pos ->
Use the Current Start Height for the Entire Chainage Range
At each chainage ch between the Start chainage and End chainage, the height is that at the Start chainage. That is, the height has the constant value of what it is at the Start chainage.
This allows you to use the height at the Start chainage without knowing what the actual value of the height is.

Go to the next section 21.2.2.4.2.6 <- Pos or return to 21.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.4 Fixed - Modify Link

21.2.2.4.2.6 <- Pos
Use the Current End Height for the Entire Chainage Range
At each chainage ch between the Start chainage and End chainage, the height is that at the End chainage. That is, the height has the constant value of what it is at the End chainage.
This allows you to use the height at the End chainage without knowing what the actual value of the height is.

Go to the next section 21.2.2.4.2.7 Pos-> Pos: or return to 21.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.4 Fixed - Modify Link

21.2.2.4.2.7 Pos-> Pos:
Interpolate Between the Existing Start and End Heights
At each chainage ch between the Start chainage and End chainage, the height is linearly interpolated by chainage between the height at the Start chainage and the height at the End chainage.
This allows you to use the heights at the Start chainage and the End chainage without knowing what the actual value of the heights are.

21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height"

The choices for Type when Modify type is:

(a) Modify Xfall, Hold Width

or

(b) Modify Xfall, Hold Height

are

- use a given xfall for chainage range
- interpolate between a given start xfall and a given end xfall
- interpolate between the current start xfall and a given end xfall
- interpolate between a given start xfall and the current end xfall
- keep the current start xfall for the chainage range
- use the current end xfall for the chainage range
- interpolate between the current start xfall and the current end xfall
- use a parabola from the current start xfall
- use a parabola that goes through the current end xfall
- use an arc from the current start xfall
- use an arc that goes through the current end xfall
- use a cubic between the current start and end xfalls
- use a compound parabola between the current start and end xfalls
- use reverse curves between the current start and end xfalls
- use a sinusoidal curve between the current start and end xfalls

For the description of each Type see

21.2.2.2.4.3.1 Xfall

21.2.2.2.4.3.11 <-Circular
21.2.2.2.4.3.12 Cubic
21.2.2.4.3.1 Xfall

Keep a Given Xfall

At each chainage ch between the Start chainage and End chainage, the width is that given in the Xfall panel field. That is, the Xfall has the constant value of Xfall.

Go to the next section 21.2.2.2.4.3.2 Xfall -> Xfall or return to 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.4.3.2 Xfall -> Xfall

Interpolate Between a Given Start and End Xfall

At each chainage ch between the Start chainage and End chainage, the Xfall is linearly interpolated by chainage between the given Start Xfall and the End Xfall.

Go to the next section 21.2.2.2.4.3.3 Pos -> Xfall or return to 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.4.3.3 Pos -> Xfall

Interpolate Between Existing Start Xfall & Given End Xfall

At each chainage ch between the Start chainage and End chainage, the Xfall is linearly interpolated by chainage between the Xfall at the Start chainage and the given Xfall Xfall at the End chainage. This allows you to use the Xfall at the End chainage without knowing what the actual value of the Xfall is.

Go to the next section 21.2.2.2.4.3.4 Xfall -> Pos or return to 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height" or 21.2.2.2.4 Fixed - Modify Link
21.2.2.2.4.3.4 Xfall -> Pos
Interpolate Between a Given Start Xfall & an Existing End Xfall

At each chainage ch between the **Start chainage** and **End chainage**, the Xfall is linearly interpolated by chainage between the given Xfall Xfall at the **Start chainage** and the Xfall at the **End chainage**.

This allows you to use the Xfall at the **Start chainage** without knowing what the actual value of the Xfall is.

Go to the next section 21.2.2.2.4.5 Pos -> or return to 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.3.5 Pos ->
Keep the Same Xfall as at the Start Chainage

At each chainage ch between the **Start chainage** and **End chainage**, the Xfall is that at the **Start chainage**. That is, the Xfall has the constant value of what it is at the **Start chainage**.

This allows you to use the Xfall at the **Start chainage** without knowing what the actual value of the Xfall is.

Go to the next section 21.2.2.2.4.6 <- Pos or return to 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.3.6 <- Pos
Keep the Same Xfall as at the End chainage

At each chainage ch between the **Start chainage** and **End chainage**, the Xfall is that at the **End chainage**. That is, the Xfall has the constant value of what it is at the **End chainage**.

This allows you to use the Xfall at the **End chainage** without knowing what the actual value of the Xfall is.

Go to the next section 21.2.2.2.4.7 Pos-> Pos: or return to 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.3.7 Pos-> Pos:
Interpolate Between Existing Xfalls at Start & End Chainages

At each chainage ch between the **Start chainage** and **End chainage**, the Xfall is linearly interpolated by chainage between the Xfall at the **Start chainage** and the Xfall at the **End chainage**.

This allows you to use the Xfalls at the **Start chainage** and the **End chainage** without knowing what the actual value of the heights are.

Go to the next section 21.2.2.2.4.8 Parabola -> or return to 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.4 Type for Modifier Types "Modify Slope, Hold Width/Height"

The choices for Type when Modify type is:

(a) **Modify Slope, Hold Width**

or

(b) **Modify Slope, Hold Height**

are

- use a given slope for chainage range
- interpolate between a given start slope and a given end slope
- use a parabola from the current start slope
- use a parabola that goes through the current end slope
- use an arc from the current start slope
- use an arc that goes through the current end slope
- use a cubic between the current start and end slope
- use a compound parabola between the current start and end slope
- use reverse curves between the current start and end slopes
- use a sinusoidal curve between the current start and end slopes

21.2.2.6 Fixed Link - Absolute to a Base Link

For an existing link, the **Absolute** option has most of the methods available in **Modify link** for defining either the width, height or xfall of the link, but the values are then measured from a given **Base link** rather than from the previous link.

For example, over the chainage range, the **width from the Base link** can be set to a constant, be interpolated linearly between two widths, or have the width follow a parabolic, circular curve or cubic shape.

So **Absolute** is almost identical to **Modify Link** but values are measured from a given **Base Link** rather than the previous link (see 21.2.2.2.4 **Fixed - Modify Link**). But there is some additional parameters for controlling the values.

Selecting the **Absolute** brings up the **Fixed - Modify Absolute** panel.

21.2.2.2.6.1 For Modifier Types Modify Width, Hold Height or Xfall

Go to Applying the Calculated Widths
Go to Calculating the Widths for each Type

Applying the Calculated Widths

When

For Modifier Types Modify Width, Hold Height or Xfall

Start width input measures menu

width at (Start mode + S Ext)

Start width can be positive or negative. See diagram after Offset

S Ext and E Ext have no effect for Type Width.

End width input measures menu

width at (End mode + E Ext)

End width can be positive or negative. See diagram after Offset

End width does not exist for Type Width.

S Ext/E Ext input measures menu

Start/End extension to add to the Start/end mode chainage. S Ext/E Ext can be positive or negative.

See diagram after Offset

Offset input measures menu

Final offset to be added to the width calculated at each point. Offset can be positive or negative.

For a chainage ch between the Start mode and the End mode, a width is calculated at chainage ch and that width goes out from the Base Link perpendicular to the Centreline.

The definition for calculating the width is best described in a Chainage-Width diagram. That is, in a plot with Centreline chainage as the x-axis, and Width at that chainage as the y-axis. This is similar to a long section plot where centreline chainage is the x-axis and height is the y-axis.

Then for a point A at chainage ch on the centreline, the Width calculated at chainage ch in the Chainage-Width diagram is used for the Width measured from the Base link corresponding to the section Modify Width Maintain Height, to the Centreline at chainage ch.

For the Modify Width commands, the method defining the widths may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the widths are calculated, a width Offset can be applied to all the widths.

Although the definition for calculating the widths in the chainage-width diagram may involve points outside the Start mode/End mode chainage range, the calculated widths are only applied
to the centreline between the **Start mode** chainage and the End mode chainage. Please examine the diagrams below to help understand the process.

**Relationship Between Chainage-Width Diagram and Centreline**

The link is modified between Start and End Chainage. The **S Ext** and **E Ext** are only used in the way the width is defined sections are perpendicular to the centreline.

**Calculating the Widths for each Type**

For **Type Width, Width->Width**, go to [Calculation of Width for Types Width, Width -> Width](#)

For **Type Parabola->**, go to [Calculation of Width for Type Parabola ->](#)

For **Type Circular->**, go to [Calculation of Width for Type Circular->](#)
For **Type** <-Parabola, go to  [Calculation of Width for Type <- Parabola](#)
For **Type** <-Circular, go to  [Calculation of Width for Type <-Circular](#)
For **Type** Cubic, go to  [Calculation of Width for Type Cubic](#)

### Calculation of Width for Types Width, Width -> Width

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode** plus S Ext, and **End width** is the width at chainage **End mode** plus E Ext.

The width is *linearly* interpolated between the **Start width** and the **End width**, plus the given **Offset** in the chainage-width diagram.

That is, the rate change of width per unit chainage is

\[
\text{rate of width change} = \frac{\text{End Width} - \text{Start Width}}{\text{End mode} + \text{E Ext} - \text{Start mode} - \text{S Ext}}
\]

and the width at chainage \( ch \) is

\[
(\text{Start Width} + \text{Offset}) + (ch - \text{Start Mode chainage} - \text{S Ext}) \times \text{rate of width change}
\]

These widths and the **Offset** are then used for the link being modified as the width that the link is *from the Base Link* when measured along the section perpendicular to the centreline. See _._

The Height/Xfall is maintained as that originally defined in the selected link.

### Calculation of Width for Type Parabola ->

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode** plus S Ext, and **End width** is the width at chainage **End mode** plus E Ext.

Between the start position (**Start mode** + S Ext, **Start width**), and the end position (**End mode** + E Ext, **End width**), the width varies as a parabola \( a \times X^2 \times X \) with its origin at (**Start mode** + S Ext, **Start width**) and going through (**End mode** + E Ext, **End width**).
These widths and the Offset are then used for the link being modified as the width that the link is from the Base Link when measured along the section perpendicular to the centreline. See .

The Height/Xfall is maintained as that originally defined in the selected link.

**Calculation of Width for Type Circular->**

In the chainage-width diagram, the *Start width* is the width at chainage *Start mode plus S Ext*, and *End width* is the width at chainage *End mode plus E Ext*.

Between the start position (*Start mode + S Ext, Start width*), and the end position (*End mode + E Ext, End width*), the width varies as a circle with its horizontal turning point at (*Start mode + S Ext, Start width*) and going through (*End mode + E Ext, End width*).
These widths and the offset are then used for the link being modified as the width that the link is from the Base Link when measured along the section perpendicular to the centreline. See _

The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type <- Parabola

In the chainage-width diagram, the Start width is the width at chainage Start mode plus S Ext, and End width is the width at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start width), and the end position (End mode + E Ext, End width), the width varies as a parabola a\*X\*X with its origin at (End mode + E Ext, End width) and going through (Start mode + S Ext, Start width).

Calculation of Width for Type <- Circular

In the chainage-width diagram, the Start width is the width at chainage Start mode plus S Ext, and End width is the width at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start width), and the end position (End mode + E Ext, End width), the width varies as a circle with its horizontal turning point at (End mode + E Ext, End width) and going through (Start mode + S Ext, Start width).
These widths and the Offset are then used for the link being modified as the width that the link is from the Base Link when measured along the section perpendicular to the centreline. See .

The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type Cubic

In the chainage-width diagram, the Start width is the width at chainage Start mode plus S Ext, and End width is the width at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start width), and the end position (End mode + E Ext, End width), the width varies as a cubic going through (Start mode + S Ext, Start width) and (End mode + E Ext, End width).
These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See _

*The Height/Xfall is maintained as that originally defined in the selected link._
21.2.2.2.6.2 For Modifier Types "Modify Height Maintain Width/Xfall"

Go to Applying the Calculated Heights

Go to Calculating the Heights for each Type

Applying the Calculated Heights

Start height input measures menu

height at (Start mode + S Ext)

Start height can be positive or negative. See diagram after Height Offset

S Ext and E Ext have no effect for Type Height.

End width input measures menu

height at (End mode + E Ext)

End height can be positive or negative. See diagram after Height Offset

End height does not exist for Type Height.

S Ext/E Ext input measures menu

Start/End extension to add to the Start/end mode chainage. S Ext/E Ext can be positive or negative.

See diagram after Offset

Height offset input measures menu

Final height to be added to the height calculated at each point. Height offset can be positive or negative.

For a chainage \( ch \) between the Start mode and the End mode, a height is calculated for at \( ch \) chainage and that height is used for the link that goes out from the Base Link perpendicular to the Centreline.

The definition for calculating the height is best described in a Chainage-Height diagram. That is, in a plot with Centreline chainage as the \( x \)-axis, and Height at that chainage as the \( y \)-axis. This is similar to a long section plot.

Then for a point \( A \) at a chainage \( ch \) on the centreline, the Height calculated at chainage \( ch \) in the Chainage-Height diagram is used for the Height measured from the Base link corresponding at the Centreline at chainage \( ch \).

For the Modify Height commands, the method defining the heights may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the heights are calculated, Height offset is added to all the heights.
Although the definition for calculating the heights in the chainage-height diagram may involve points outside the Start mode/End mode chainage range, the calculated heights are **only applied** to the centreline **between** the **Start mode** chainage and the End mode chainage.

### Calculating the Heights for each Type

For **Type Height, Height->Height**, go to [Calculation of Height for Types Height, Height -> Height](#).

For **Type Parabola->**, go to [Calculations for Type Parabola ->](#).

For **Type Circular->**, go to [Calculations for Type Circular->](#).

For **Type <-Parabola**, go to [Calculations for Type <- Parabola](#).

For **Type <-Circular**, go to [Calculations for Type <-Circular](#).

For **Type Cubic**, go to [Calculations for Type Cubic](#).

### Calculation of Height for Types Height, Height -> Height

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext.**, and the **End height** is the height at chainage **End mode plus E Ext.**

The height is linearly interpolated between the **Start height** and the **End height**, plus the given **Height offset** in the chainage-width diagram.

That is, the rate change of height per unit chainage is

\[
\text{rate of height change} = \frac{(\text{End height} - \text{Start height})}{(\text{End mode} + \text{E Ext} - \text{Start mode} - \text{S Ext})}
\]

and the height at chainage **ch** is

\[
\text{Height} = \text{Start height} + \text{rate of height change} \times (\text{ch} - \text{Start mode})
\]
These heights and the Height offset are then used for the link being modified as the height that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type Parabola ->

In the chainage-height diagram, the Start height is the height at chainage Start mode plus S Ext, and End height is the height at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start height), and the end position (End mode + E Ext, End height), the height varies as a parabola \(a \times X^2\) with its origin at (Start mode + S Ext, Start height) and going through (End mode + E Ext, End height).

These heights and the Height offset are then used for the link being modified as the height that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.
Calculations for Type Circular->

In the chainage-height diagram, the Start height is the height at chainage Start mode plus S Ext, and End height is the height at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start height), and the end position (End mode + E Ext, End height), the height varies as a circle with its horizontal turning point at (Start mode + S Ext, Start height) and going through (End mode + E Ext, End height).

These heights and the Height offset are then used for the link being modified as the width that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type <- Parabola

In the chainage-height diagram, the Start height is the height at chainage Start mode plus S Ext, and End height is the height at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start height), and the end position (End mode + E Ext, End height), the height varies as a parabola a*X*X with its origin at (End mode + E Ext, End height) and going through (Start mode + S Ext, Start height).
These heights and the Height offset are then used for the link being modified as the width that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type <-Circular

In the chainage-height diagram, the Start height is the height at chainage Start mode plus S Ext, and End height is the height at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start height), and the end position (End mode + E Ext, End height), the height varies as a circle with its horizontal turning point at (End mode + E Ext, End height) and going through (Start mode + S Ext, Start height).
These heights and the **Height offset** are then used for the link being modified as the height that the link is from the **Base Link** when measured along the section perpendicular to the centreline.

The **Width/Xfall** is maintained as that originally defined in the selected link.

**Calculations for Type Cubic**

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext.** and the **End height** is the height at chainage **End mode plus E Ext.**

Between the start position (**Start mode + S Ext, Start height**), and the end position (**End mode + E Ext, End height**), the height varies as a cubic going through (**Start mode + S Ext, Start height**) and (**End mode + E Ext, End height**).
These heights and the Height offset are then used for the link being modified as the height that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.

End xfall does not exist for Type Xfall.

S Ext/E Ext input measures menu
Start/End extension to add to the Start/end mode chainage. S Ext/E Ext can be positive or negative.

See diagram after Offset

Height offset input measures menu
Final height offset to be added to the height calculated at each point. Height offset can be positive or negative.

For a chainage ch between the Start mode and the End mode, a xfall is calculated at ch chainage and that xfall is used for the link that goes out from the Base Link perpendicular to the Centreline.

The definition for calculating the xfalls is best described in a Chainage-Xfall diagram. That is, in a plot with Centreline chainage as the x-axis, and Xfall at that chainage as the y-axis. This is similar to a super elevation diagram where chainage is the x-axis and xfall is the y-axis.

Then for a point A at a chainage ch on the centreline, the Xfall calculated at chainage ch in the Chainage-Xfall diagram is used for the Xfall measured from the Base link corresponding at chainage ch.

For the Modify Xfall commands, the method defining the xfalls may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the xfalls and height/widths are applied to the link, a Height offset is added to all the heights.

Although the definition for calculating the xfalls in the chainage-xfall diagram may involve points
outside the Start mode/End mode chainage range, the calculated xfalls are only applied to the centreline between the Start mode chainage and the End mode chainage.

Calculating the Xfall for each Type

For Type Xfall, Xfall->Xfall, go to Calculations of Xfalls for Types Xfall, Xfall -> Xfall
For Type Parabola->, go to Calculations for Type Parabola ->
For Type Circular->, go to Calculations for Type Circular->
For Type <-Parabola, go to Calculations for Type <- Parabola
For Type <-Circular, go to Calculations for Type <-Circular
For Type Cubic, go to Calculations for Type Cubic

Calculations of Xfalls for Types Xfall, Xfall -> Xfall

In the chainage-xfall diagram, the Start xfall is the xfall at chainage Start mode plus S Ext, and End xfall is the xfall at chainage End mode plus E Ext.

The xfall is linearly interpolated between the Start xfall and the End xfall, plus the given Xfall offset in the chainage-width diagram.

That is, the rate change of xfall per unit chainage is

rate of xfall change = (End xfall - Start xfall)/(End mode + E Ext - Start mode - S Ext)

and the xfall at chainage ch is

(Start xfall + Xfall offset) + (ch - Start Mode chainage - S Ex) * rate of xfall change
These xfalls and the Height offset are then used for the link being modified as the xfall that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

Calculations for Type Parabola ->

In the chainage-xfall diagram, the Start xfall is the xfall at chainage Start mode plus S Ext, and End xfall is the xfall at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start xfall), and the end position (End mode + E Ext, End xfall), the xfall varies as a parabola \( a \times X \times X \) with its origin at (Start mode + S Ext, Start xfall) and going through (End mode + E Ext, End xfall).

These xfalls and the Height offset are then used for the link being modified as the xfall that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

Calculations for Type Circular->
In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage **Start mode plus S Ext**, and **End xfall** is the xfall at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start xfall**), and the end position (**End mode + E Ext, End xfall**), the xfall varies as a **circle** with its horizontal turning point at (**Start mode + S Ext, Start xfall**) and going through (**End mode + E Ext, End xfall**).

![Diagram](image)

These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

**Calculations for Type <- Parabola**

In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage **Start mode plus S Ext**, and **End xfall** is the xfall at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start xfall**), and the end position (**End mode + E Ext, End xfall**), the xfall varies as a **parabola** $a \cdot X \cdot X$ with its origin at (**End mode + E Ext, End xfall**) and going through (**Start mode + S Ext, Start xfall**).
These xfalls and the Height offset are then used for the link being modified as the xfall that the link is from the Base Link when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

**Calculations for Type <-Circular**

In the chainage-xfall diagram, the Start xfall is the xfall at chainage Start mode plus S Ext, and End xfall is the xfall at chainage End mode plus E Ext.

Between the start position (Start mode + S Ext, Start xfall), and the end position (End mode + E Ext, End xfall), the xfall varies as a circle with its horizontal turning point at (End mode + E Ext, End xfall) and going through (Start mode + S Ext, Start xfall).
These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is from the *Base Link* when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

**Calculations for Type Cubic**

In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage *Start mode plus S Ext*, and **End xfall** is the xfall at chainage *End mode plus E Ext*.

Between the start position (*Start mode + S Ext, Start xfall*), and the end position (*End mode + E Ext, End xfall*), the xfall varies as a **cubic** going through (*Start mode + S Ext, Start xfall*) and (*End mode + E Ext, End xfall*).
These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

Continue to the next section [21.2.2.7 Fixed Link- Parallel](#) or return to [21.2.2 Fixed Link Modifiers](#) or [21.2.2 Left and Right MTF Modifiers](#).
21.2.2.2.7 Fixed Link- Parallel

The Parallel walk-right brings up the fixed Parallel menu with options to adjust all the links between specified fixed links and make them parallel offsets of a given link, of a selected string.

To go straight to the documentation on each of the options on the Fixed modifier menu:

See

- **Parallel string**  
  21.2.2.2.7.1 Fixed Link - Parallel Links to String
- **Parallel link**  
  21.2.2.2.7.2 Fixed Link - Parallel Links to Link
21.2.2.7.1 Fixed Link - Parallel Links to String

The **Parallel string** option takes all the fixed links between two nominated link names (inclusive) and adjusts them so that the specified widths, cross falls and heights of the links are used **perpendicular** to a **selected string** rather than measured perpendicular to the reference string.

If sections and strings are created in the **Apply MTF**, then vertices are still created on the section and on the strings **perpendicular** to the reference string.

Selecting *Parallel* brings up the **Fixed - Parallel to String** panel.
The fields and buttons used in this panel have the following functions.

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages to parallel the links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.
Continue to the next section 21.2.2.8 Fixed Link - Decisions or return to 21.2.2 Fixed Link Modifiers or 21.2 Left and Right MTF Modifiers.
21.2.2.2.8 Fixed Link - Decisions

The Decisions walk-right brings up the Fixed Decisions menu with options to make decisions on tests such as being able to batter into a tin, or how deep you are under a tin. There are labels and gotos to build complex tests.

See

Switch side 21.2.2.2.8.1 Fixed Decisions - Switch Sides
Goto 21.2.2.2.8.2 Fixed Decisions - Goto
Label 21.2.2.2.8.3 Fixed Decisions - Label
Then 21.2.2.2.8.4 Fixed Decisions - Then
End then 21.2.2.2.8.5 Fixed Decisions - End Then
Batter 21.2.2.2.8.6 Fixed Decisions - Batter
Batter test 21.2.2.2.8.7 Fixed Decisions - Batter Test
String exists 21.2.2.2.8.8 Fixed Decisions - String Exists
Above string height 21.2.2.2.8.9 Fixed Decisions - Above String Height
Link exists 21.2.2.2.8.10 Fixed Decisions - Link Exists
Above link height 21.2.2.2.8.11 Fixed Decisions - Above Link Height
Tin 21.2.2.2.8.12 Fixed Decisions - Tin
Polygon 21.2.2.2.8.13 Fixed Decisions - Polygon
21.2.2.2.8.1 Fixed Decisions - Switch Sides

The **Switch Sides** command transfers processing to the other side of the **Modifiers**.

That is, if a **Switch Sides** command is processed in a **Left MTF Modifiers** grid, then processing stops at that point in the **Left MTF Modifiers** grid, and processing is transferred to the **Right MTF Modifiers** grid. In the **Right MTF Modifiers** grid it from the row where the last **Switch Sides** command was executed in the **Right MTF Modifiers** grid, or if that hasn’t occurred before, processing starts at the top row of the **Right MTF Modifiers** grid.

And similarly if a **Switch Sides** command is processed in a **Right MTF Modifiers** grid

So processing can switch a number of times between the two sides.

Selecting **Switch sides** brings up the **Switch Sides** panel.

![Switch Sides Panel](image)

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages where the **Switch Sides** command is.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.2 Fixed Decisions - Goto or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.8.2 Fixed Decisions - Goto

**Goto** will transfer control to the row of the Left/Right MTF Modifiers grid with the label **Goto label**. Selecting **Goto** brings up the panel **Modify Decision Goto**.

**Goto label**
- Text box
- Transfer processing to the row of the Left/Right MTF Modifiers grid with this label.

**Alias, Start Chainage, End Chainage, Interval**
- Defines the start/end chainages where the GOTO command exists.
- For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

**Comment, Extra start, Extra End, Active, OK, Apply**
- For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Go to the next section [21.2.2.8.3 Fixed Decisions - Label](#) or return to [21.2.2.8 Fixed Link - Decisions](#).
21.2.2.8.3 Fixed Decisions - Label

The **Label** option creates a row in the **Left/Right MTF Modifiers** grid with the label **Label**. Selecting **Label** brings up the panel **Modify Decision Label**

![Modify Decision Label panel](image)

- **Label** text box: *name of the label that goes with this row of the Left/Right MTF Modifiers grid.*
- **Alias, Start Chainage, End Chainage, Interval**: *the Label exists when the chainage is between the Start and End chainages.*
  
  *For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).*

- **Comment, Extra start, Extra End, Active, OK, Apply**: *For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).*

Go to the next section [21.2.2.8.4 Fixed Decisions - Then](#) or return to [21.2.2.8 Fixed Link - Decisions](#).
21.2.2.8.4 Fixed Decisions - Then

The **Then** Command works in conjunction with an **End Then** command, and they both work with any one of the **Decision** commands that has a **test** and a **Goto Label** that is executed when the test succeeds (e.g. Batter Decision, String Exist, Tin).

The **Then** and the **End Then** must have the value for the **Label** field to be the same as the **GoTo Label** in a Test command.

If such an **Then-End Then** block exists for a Test command, then whenever the **GoTo Label** is executed for the Test command then processing is transferred to the **Then** command and continues from there.

However if processing reaches a **Then** command by any mean other than from a Test command, then all the commands are ignored until the **End Then** command is reached.

So a **Then-End Then** block is ignored except by a Test command with a matching **GoTo Label**.

**Notes**

1. More than one Test command can use the same **Then-End Then** block.
2. Jumping into the middle of a **Then-End Then** block should not be done and will have unpredictable consequences.

Selecting Then brings up the **Modify Decision Then** panel

---

**Label** text box

name of the label that is the same as its matching **End Then** command, and matches the **Goto Label** of any Test command that wants to use the **Then-End Then** block.

**Alias, Start Chainage, End Chainage, Interval**

the Then exists when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.5 Fixed Decisions - End Then or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.8.5 Fixed Decisions - End Then

MTF_Edit_Modify_Decision_End_Then

The End Then goes with a matching Then command. For a description of how the Then-End Then commands are used, see 21.2.2.8.4 Fixed Decisions - Then.

Selecting End then brings up the panel Modify Decision End Then

Label

text box

name of the label that is the same as its matching Then command, and matches the Goto Label of any Test command that wants to use the Then-End Then block.

Alias, Start Chainage, End Chainage, Interval

the End Then exists when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.6 Fixed Decisions - Batter or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.8.6 Fixed Decisions - Batter

The Batter option is used to construct a new link which stops if it comes within
(a) a Strip depth of a Tin
(b) an Offset distance from a Tin.
(c) a Strip depth of a Tin calculated at a given Offset from the link.

If the link does stop, control is transferred via a Goto label, otherwise control continues onto the next row in the Left/Right MTF Modifiers grid.

The maximum length of the batter link is defined by specifying values for two of the three fields Width, Height and Slope. The Width, Height and Slope values of the created link may be different if the link stops because of one of the conditions (a), (b) or (c).

Notes
1. cases (a) and (b) are just special cases of (c)
2. strip and offset can be used to stop the link to allow for a fixed structure (such as a drain) to be inserted so that it ends up on the tin.
The batter link ends if the tin is cut at the strip depth calculated at the offset distance from the link. The end of the link is created at the cut point. The test is true.

Case (c)

The batter link is defined by any two of width, height and slope and stops if it meets the tin at the strip depth calculated at the given offset distance from the link.

Failure of the batter

The batter link does not cut at the strip depth below the tin, calculated at the offset distance from the link. The end of the link is defined by the width, height and slope. The test is false.

The batter link defined by any two of width, height and slope and fails to meet the tin at the strip depth calculated at the given offset distance from the link.

Selecting Batter brings up the Modify Decision Batter panel.
The fields and buttons used in this panel have the following functions.

<table>

When test is | choice box | false | true, false
--- | --- | --- | ---

if When test is has the value true, and the test is true (i.e. the batter link comes within the depth Strip and offset Offset of the tin) then go to the label Goto label. Otherwise proceed to the next row.

If When test is has the value false, and the test is false then go to the label Goto label. Otherwise proceed to the next row.

Goto label | text box
--- | ---

used with When test is.

Note that there may be a Then-End Then block that matches the GoTo Label. For a description of a Then-End Then block and how it works, see 21.2.2.8.4 Fixed Decisions - Then.

Alias, Start Chainage, End Chainage, Interval

the batter is performed when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.7 Fixed Decisions - Batter Test or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.8.7 Fixed Decisions - Batter Test

The Batter test option tests if a user defined link comes within

(a) a Strip depth of a Tin
(b) an Offset distance from a Tin.
(c) a Strip depth of a Tin calculated at a given Offset from the link.

The test link is defined by specifying values for two of the three fields Width, Height and Slope.

Notes

1. The tests are the same as in 21.2.2.8.6 Fixed Decisions - Batter but no link is created.
   That is, The batter test is used to test if a batter will stop/not stop without creating a batter link.

2. Cases (a) and (b) are just special cases of (c)

For diagrams describing the tests, see 21.2.2.8.6 Fixed Decisions - Batter.

Selecting Batter test brings up the Modify Decision Batter Test panel

<table>
<thead>
<tr>
<th>Field Description</th>

Alias, Start Chainage, End Chainage, Interval
   the test is performed when the chainage is between the Start and End chainages.  
   For information on these panel fields, see 21.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply  
   For information on these panel fields, see 21.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.9 Fixed Decisions - Above String Height or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.2.8.9 Fixed Decisions - Above String Height

The option tests if a line of a given grade (grade line) defined from the end of a Base link passes a given height difference above a selected string.

The grade line passes through the grade point which is a given Base link offset and Base link height difference from the end of the given link.

The height is tested at a given string offset from the selected string.

The line of grade Base link grade must pass above this point for Base > String to be true.

So this case is true

The line of grade Base link grade must pass above this point for Base > String to be true.

So both these cases are false

Selecting Above string height brings up the Modify Decision Above String Height panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base layer</td>
<td>layer box</td>
<td>Design available layers</td>
<td></td>
</tr>
<tr>
<td>name of the layer that the link to test for is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Base link</td>
<td>link box</td>
<td>name of the link in Base layer to test if the line of grade going from the link is a delta height above a selected string.</td>
<td></td>
</tr>
<tr>
<td>Base link offset</td>
<td>real box</td>
<td>option &quot;sided&quot; offset distance from the end of the link Base link that the line of grade Base link grade goes through (the grade point).</td>
<td></td>
</tr>
<tr>
<td>Base link height diff</td>
<td>real box</td>
<td>the value to add to the height of the end of the link Base link that the line of grade Base link grade goes through (the grade point).</td>
<td></td>
</tr>
<tr>
<td>Base link grade</td>
<td>real box</td>
<td>percentage grade of a line through the grade point that is tested to see if it passed within a given offset and height difference of the selected string.</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>string select</td>
<td>the string to test.</td>
<td></td>
</tr>
<tr>
<td>String side</td>
<td>choice box</td>

<td></td>
</tr>
<tr>
<td>if left, only the left side of the reference string is searched for the selected string.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>If right, only the right side of the reference string is searched for the selected string.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
If both, the left and the right side of the reference string is searched for the selected string.

**String offset**

real box

optional "absolute" offset distance from the string of the point that is tested for the grade link going above.

**String height diff**

real box

optional height difference added to the height of the string. This total height is used at the String offset point to give the point that is tested for the grade link going above.

**When Base > String is**

choice box false true false

if When Base > String has the value true, and the test is true then go to the label Goto label. Otherwise proceed to the next row.

If When Base > String has the value false, and the test is false then go to the label Goto label. Otherwise proceed to the next row.

**Goto label**

text box

used with When Base > String is.

Note that there may be a Then-End Then block that matches the GoTo Label. For a description of a Then-End Then block and how it words, see 21.2.2.2.8.4 Fixed Decisions - Then.

**Alias, Start Chainage, End Chainage, Interval**

the test is performed when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.10 Fixed Decisions - Link Exists or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.8.10 Fixed Decisions - Link Exists

This option tests to see if a given link exists.

**Note** that a link is only looked for on the side that the Link Exists command being processed is in.

Selecting **Link** brings up the panel **Modify Decision Link Exists**

![Modify Decision Link Exists Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

*Name of the layer that the base link to test for is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.*

*Name of the base link in Base layer to test if the line of grade going from the base link is a delta height above a selected Link.*

*Option “sided” offset distance from the end of the link Base link that the line of grade Base link grade goes through (the grade point).*

*The value to add to the height of the end of the link Base link that the line of grade Base link grade goes through (the grade point).*

*Percentage grade of a line through the grade point that is tested to see if it passed above a given offset and height difference of a selected Link.*

*Name of the layer that the link to test that the grade line is above, is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.*

*Name of the link in Layer to test if the line of grade going from the base link is a delta height above it.*
Link offset real box
optional "absolute" offset distance from the end of Link of the point that is tested for the grade link going above.

Link height diff real box
optional height difference added to the height of the end of Link. This total height is used at the Link offset point to give the point that is tested for the grade link going above.

When Base >String is choice box false true, false
if When Base >Link has the value true, and the test is true then go to the label Goto label. Otherwise proceed to the next row.

If When Base > Link has the value false, and the test is false then go to the label Goto label. Otherwise proceed to the next row.

Goto label text box
used with When Base > Link is.
Note that there may be a Then-End Then block that matches the GoTo Label. For a description of a Then-End Then block and how it works, see 21.2.2.8.4 Fixed Decisions - Then.

Alias, Start Chainage, End Chainage, Interval
the test is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.12 Fixed Decisions - Tin or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.8.12 Fixed Decisions - Tin

Selecting Tin brings up the Modify Decision Tin panel which tests to see if the depth from the end of the given Link in a given Layer, offset by the amount given in the Offset field, is between the two values given in the Minimum depth and Maximum depth fields where the depths are taken from the stripped Tin (that is, the Tin dropped by the Strip value).

If the depth is between the values, then control is transferred to the row of the Modifiers grid with the label given by the Goto label field. Otherwise, control passes to the next row of the Modifiers grid.

Offset, Minimum depth and Maximum depth can be positive or negative.

This is a test and does not create a link.

Selecting Tin brings up the panel Modify Decision Tin.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>Tin box available tins</td>

</tr>
</tbody>
</table>

The tin to calculate the depth to.

The depth to drop the tin before testing.

Name of the layer that the link to test is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Name of link in Layer to test against the tin.

The depth is calculated at an offset distance of offset from the end of the previous link.

If the depth is between the Minimum depth and the Maximum depth, then the test is true, otherwise the test is false.

See the description of the Minimum depth field.

If When test is has the value true, and the test is true (i.e. the depth is between the minimum and maximum depths) then go to the label Goto label. Otherwise proceed to the next row.
If When test is has the value `false`, and the test is `false` (i.e. the depth is not between the minimum and maximum depths) then go to the label `Goto label`. Otherwise proceed to the next row.

**Goto label**

*used with When test is.*

Note that there may be a `Then-End Then` block that matches the `GoTo Label`. For a description of a `Then-End Then` block and how it words, see 21.2.2.8.4 Fixed Decisions - Then.

**Alias, Start Chainage, End Chainage, Interval**

the test is performed when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.8.13 Fixed Decisions - Polygon or return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.8.13 Fixed Decisions - Polygon

This options tests to see if the (x,y) coordinates of a link is inside a user selected polygon. Selecting Polygon brings up the panel Modify Decision Polygon.

![Modify Decision Polygon Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>

<tr>
<td></td>
<td></td>
<td></td>
<td>If When test is has the value false, and the test is false (i.e. the end of the given link is not inside the polygon) then go to the label Goto label. Otherwise proceed to the next row.</td>
</tr>
</tbody>
</table>
Goto label text box

used with When test is.

Note that there may be a Then-End Then block that matches the GoTo Label. For a description of a Then-End Then block and how it works, see 21.2.2.8.4 Fixed Decisions - Then.

Alias, Start Chainage, End Chainage, Interval

the test is performed when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.8 Fixed Link - Decisions.
21.2.2.2.9 Fixed Link - From link

For a given link (the current link), the from Link option takes one of Width, Height or Xfall from a selected link whilst holding one to be what it is defined as by the current link. That is, for the current link:
(a) one of its existing Width, Height or Xfall is modified by taking its value from a selected link and
(b) a different one of Width, Height or Xfall keeps its existing value (i.e. holds its existing value).

Selecting the From link brings up the Fixed - Modify from Link panel.

![Fixed - Modify from Link panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>Design</td>
<td>available layers</td>
</tr>
<tr>
<td></td>
<td>name of the layer that the link to be modified is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Link(s)</td>
<td>name box</td>
<td>names.4d pop-up</td>
<td>the name of the links in the Layer to modify the width/height/xfall/slope using the method given in Modifier type, between the chainages given by Start mode and End mode. See 21.2.2.1.2 Link or Link(s).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each of the links is processed as the current link.
A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions

The Modify Width/Height/Xfall is the part of the current link that is modified and the new values are taken from a selected link.

The Hold Width/Height/Xfall is the part of the current link that is kept (held) at its current value.

So for Modifier type:

**Modify Width, Hold Height** - the Width is taken from the link From link name that is in the layer From layer and zone From zone, and the Height is kept as it is.

**Modify Width, Hold Xfall** - the Width is taken from the link From link name that is in the layer From layer and zone From zone, and the Xfall is kept as it is.

**Modify Height, Hold Width** - the Height is taken from the link From link name that is in the layer From layer and zone From zone, and the Width is kept as it is.

**Modify Height, Hold Xfall** - the Height is taken from the link From link name that is in the layer From layer and zone From zone, and the Xfall is kept as it is.

**Modify Xfall, Hold Width** - the Xfall is taken from the link From link name that is in the layer From layer and zone From zone, and the Width is kept as it is.

**Modify Xfall, Hold Height** - the Xfall is taken from the link From link name that is in the layer From layer and zone From zone, and the Height is kept as it is.

**From layer** layer box
name of the layer of the link to take values from.

**From Link name** name box
the name of the link in the From Layer and From Zone to get the Width, Height or Xfall from.

**From zone** choice box
the fixed, cut or fill zone that the From link name link is in.

**Alias, Start Chainage, End Chainage, Interval**
defines the start/end chainages for the link to be modified.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.10 Fixed Link - To String or return to 21.2.2.2 Fixed Link Modifiers or 21.2 Left and Right MTF Modifiers.
21.2.2.2.10 Fixed Link - To String

For a given link, (the current link), the to string option takes one of Width, Height or Xfall as the value you get by going from the start point of the current link to another selected string.

That is, for the current link:

(a) one of its existing Width, Height or Xfall is modified by taking its value the vector going from the start of the current link to another selected string.

and

(b) a different one of Width, Height or Xfall keeps its existing value (i.e. holds its existing value).

Selecting the To string brings up the Fixed - Modify All to String panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>Design</td>
<td>available layers</td>
</tr>
</tbody>
</table>

name of the layer that the link to be modified is in (the current link).
For information on Layers, see 21.1.1.2 MTF Links and Layers.

<table>
<thead>
<tr>
<th>Link name</th>
<th>name box</th>
<th>names.4d pop-up</th>
<th></th>
</tr>
</thead>
</table>

the name of the link in the Layer to modify the width/height/xfall/slope using the method given in Modifier type, between the chainages given by Start mode and End mode.
This is the current link.

<table>
<thead>
<tr>
<th>Select string</th>
<th>string-select</th>
<th></th>
</tr>
</thead>
</table>

select string to use for defining width/height/xfall for the link.
Side to search choice box
left side
left side, right side, both sides
side of the hinge string to start searching to find the string to define width/height/xfall.

Modifier type choice box

modify Width, hold Height to be its current value
modify Width, hold Xfall to be its current value
modify Height, hold Width to be its current value
modify Height, hold Xfall to be its current value
modify Xfall, hold Width to be its current value
modify Xfall, hold Height to be its current value
modify Width, Height and Xfall to get onto the selected string

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

The **Modify Width/Height/Xfall** is the part of the current link that is modified and the new values are taken from a selected link.

The **Hold Width/Height/Xfall** is the part of the current link that is kept (held) at its current value.

So for **Modifier type**:

**Modify Width, Hold Height** see 21.2.2.10.1 Fixed - to String: Modifier Types Modify Width, Hold Height/Xfall

**Modify Width, Hold Xfall** see 21.2.2.10.1 Fixed - to String: Modifier Types Modify Width, Hold Height/Xfall

For **Modify Height, Hold Width** see 21.2.2.10.2 Fixed - to String: Modifier Types Modify Height, Hold Width/Xfall

For **Modify Height, Hold Xfall** see 21.2.2.10.2 Fixed - to String: Modifier Types Modify Height, Hold Width/Xfall

For **Modify Xfall, Hold Width** see 21.2.2.10.3 Fixed - to String: Modifier Types Modify Xfall, Hold Width/Height

For **Modify Xfall, Hold Height** see 21.2.2.10.3 Fixed - to String: Modifier Types Modify Xfall, Hold Width/Height

**For Modify Width, Height and Xfall**, see 21.2.2.10.4 Fixed - to String: Modifier Type Modify Width, Height and Xfall

**Alias, Start Chainage, End Change, Interval**
defines the start/end chainages for the link to be modified.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.11 Fixed Link - To Tin or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.
21.2.2.10.1 Fixed - to String: Modifier Types Modify Width, Hold Height/Xfall

For a fixed link Modify Width calculates the width of the link as the width from the start point of the link, to the selected string.

For Modify Width, Hold Height the height is taken from the current link.

For Modify Width, Hold Xfall the xfall is taken from the current link.
21.2.2.10.2 Fixed - to String: Modifier Types Modify Height, Hold Width/Xfall

For a fixed link Modify Height calculates the height of the link as the difference in the height at the start point of the link, and the height at the selected string.

For Modify Height, Hold Width the width is taken from the current link.

For Modify Height, Hold Xfall the xfall is taken from the current link.
21.2.2.10.3 Fixed - to String: Modifier Types Modify Xfall, Hold Width/Height

For a fixed link **Modify Xfall** calculates the **xfall** of the link as the **xfall** from the start point of the link to the **selected string**.

For **Modify Xfall, Hold Width** the **width** is taken from the current link.

For **Modify Xfall, Hold Height** the **height** is taken from the link.
21.2.2.2.10.4 Fixed - to String: Modifier Type Modify Width, Height and Xfall

For a fixed link Modify Width, Height and Xfall calculates the required width, height and/or xfall that the link needs to get from the start point of the link to the selected string.

To use the option you must first have a link defined but there is a command Fixed => Insert => Insert at string which creates a link and also places it on a selected string. See 21.2.2.2.1.3 Insert a Fixed Link at a String.
21.2.2.2.11 Fixed Link - To Tin

For a given link, (the current link), the to tin option takes one of Width, Height or Xfall as the value you need so that the end of the link is at the point that is a given number of intersection with a given tin.

That is, for the current link:

(a) one of Width, Height or Xfall keeps its existing value (i.e. holds its existing value).

and

(b) a different one of Width, Height or Xfall is modified so that the end of the link is at the point that is a given number of intersection with the given tin.

Note that the tin does not have to be the same tin as used in the Apply MTF function that is using the MTF.

Selecting the To tin brings up the Fixed - Link to Tin panel.

![Fixed - Link to Tin Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>name of the layer that the link to be modified is in.</td>
<td>layer box</td>
<td>Design</td>
<td>available layers</td>
</tr>
<tr>
<td>Link(s)</td>
<td>name box</td>
<td>names.4d</td>
<td>pop-up</td>
<td></td>
</tr>
<tr>
<td>Modifier type</td>
<td>the name of the links in the Layer to modify the width/height/xfall/slope using the method given in Modifier type, between the chainages given by Start mode and End mode.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For information on Layers, see 21.1.1.2 MTF Links and Layers.
Tin

The tin to use for defining the width/height/xfall/slope by getting a point of intersection with the tin.

To intersect no.

An integer box to specify how many times the current link intersects the tin. If not blank, the number of intersections with the tin is used. If the number is 1, the first intersection is used. If the number is 2, the second intersection is used. If the number is greater than 2, the last intersection is used.

Modifier type

A choice box to select the type of modification. Possible options include:
- Modify Width and take Height from current link
- Modify Width and take Xfall from current link
- Modify Height and take Width from current link
- Modify Height and take Xfall from current link
- Modify Xfall and take Width from current link
- Modify Xfall and take Height from current link
- Modify Slope and take Width from current link
- Modify Slope and take Height from current link

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

The Modify Width/Height/Xfall is the part of the current link that is modified and the new values are obtained by getting an intersection with the tin.

The Hold Width/Height/Xfall is the part of the current link that is kept (held) at its current value.

So for Modifier type:

Modify Width, Hold Height see 21.2.2.11.1 Fixed - to Tin: Modifier Types Modify Width, Hold Height/Xfall

Modify Width, Hold Xfall see 21.2.2.11.1 Fixed - to Tin: Modifier Types Modify Width, Hold Height/Xfall

For Modify Height, Hold Width see 21.2.2.11.2 Fixed - to Tin: Modifier Types Modify Height, Hold Width/Xfall

For Modify Height, Hold Xfall see 21.2.2.11.2 Fixed - to Tin: Modifier Types Modify Height, Hold Width/Xfall

For Modify Xfall, Hold Width see 21.2.2.11.3 Fixed - to Tin: Modifier Types Modify Xfall, Hold Width/Height

For Modify Xfall, Hold Height see 21.2.2.11.3 Fixed - to Tin: Modifier Types Modify Xfall, Hold Width/Height

For Modify Slope, Hold Width see 21.2.2.11.4 Fixed - to Tin: Modifier Types Modify Slope, Hold Width/Height

For Modify Slope, Hold Height see 21.2.2.11.4 Fixed - to Tin: Modifier Types Modify Slope, Hold Width/Height

Alias, Start Chainage, End Chainage, Interval

 Defines the start and end chainages that the link is modified between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.
Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

21.2.2.11.1 Fixed - to Tin: Modifier Types Modify Width, Hold Height/Xfall

For a fixed link **Modify Width** calculates the **width** of the link so that it intersects the tin at the number of intersects equal to **To intersect no**.

For **Modify Width, Hold Height** the **height** is taken from the current link.

---

### Section View

**Given link height**

- given tin
- end of fixed link is on the tin
- start of fixed link
- calculate width

**Modify Width to Intersect the tin and Hold Height**

- Given the height (delta) of the link, the width is calculated so that the link ends on the given number of intersects with the tin.

---

For **Modify Width, Hold Xfall** the **xfall** is taken from the current link.

### Section View

**Given link xfall/slope**

- given tin
- end of fixed link is on the tin
- start of fixed link
- calculate width

**Modify Width to Intersect the tin and Hold Xfall**

- Given the xfall of the link, the width is calculated so that the link ends on the given number of intersects with the tin.
21.2.2.11.2 Fixed - to Tin: Modifier Types Modify Height, Hold Width/Xfall

For a fixed link **Modify Height** calculates the **height** of the link so that it intersects the tin at the number of intersects equal to **To intersect no.**

For **Modify Height, Hold Width** the **width** is taken from the current link.

![Diagram](image-url)

For **Modify Height, Hold Xfall** the **xfall** is taken from the current link.
21.2.2.2.11.3 Fixed - to Tin: Modifier Types Modify Xfall, Hold Width/Height

For a fixed link Modify Xfall calculates the xfall of the link so that it intersects the tin at the number of intersects equal to To intersect no.

For Modify Xfall, Hold Width the width is taken from the current link.

For Modify Xfall, Hold Height the height is taken from current the link.
21.2.2.11.4 Fixed - to Tin: Modifier Types Modify Slope, Hold Width/Height

For a fixed link Modify Slope calculates the slope of the link so that it intersects the tin at the number of intersects equal to To intersect no.

For Modify Slope, Hold Width the width is taken from the current link.

For Modify Slope, Hold Height the height is taken from the current link.
21.2.2.2.12 Fixed - To RL

For a given link (the current link), the **to RL** option **takes** (holds) **one** of Width, Height or Xfall as it currently is, and then modifies a different one of Width, Height or Xfall to get to a given RL.

That is, for the current link:

(a) one of Width, Height or Xfall **keeps its existing value** (i.e. **holds its existing value**).

and

(b) a different one of Width, Height or Xfall **is modified** to the value that is needed to get to a given RL (elevation).

Selecting the **To RL** brings up the **Fixed - Link to RL** panel.

The fields and buttons used in this panel have the following functions.

Modifier type choice box

modify Width and take Xfall from current link
modify Height and take Width from current link
modify Height and take Xfall from current link
modify Xfall and take Width from current link

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

The Hold Width/Height/Xfall is the part of the current link that is kept (held) at its current value.

The Modify Width/Height/Xfall is the part of the current link that is then modified and the new values are obtained by getting to a given RL.

So for Modifier type:
Modify Width, Hold Xfall see 21.2.2.12.1 Fixed - to RL: Modifier Type Modify Width, Hold Xfall
For Modify Height, Hold Width see 21.2.2.12.2 Fixed - to RL: Modifier Types Modify Height, Hold Width/Xfall
For Modify Height, Hold Xfall see 21.2.2.12.2 Fixed - to RL: Modifier Types Modify Height, Hold Width/Xfall
For Modify Xfall, Hold Width see 21.2.2.12.3 Fixed - to RL: Modifier Type Modify Xfall, Hold Width

Alias, Start Chainage, End Chainage, Interval
defines the start and end chainages that the link is modified between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.13 Fixed - to 2 Heights or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.
21.2.2.2.12.1 Fixed - to RL: Modifier Type Modify Width, Hold Xfall

For a fixed link Modify Width calculates the width of the link required for link to end at the given RL.

For Modify Width, Hold Xfall the xfall is taken from the current link.
21.2.2.12.2 Fixed - to RL: Modifier Types Modify Height, Hold Width/Xfall

For a fixed link, Modify Height calculates the height of the link as the difference in the height at the start point of the link, and the given RL.

For Modify Height, Hold Width the width is taken from the current link.

For Modify Height, Hold Xfall the xfall is taken from the current link.
21.2.2.12.3 Fixed - to RL: Modifier Type Modify Xfall, Hold Width

For a fixed link Modify Xfall calculates the xfall of the link as the xfall from the start point of the link to the **given RL**.

For **Modify Xfall, Hold Width** the *width* is taken from the current link.

![Section View Diagram]

- **Given RL**
  - Start of fixed link
  - Calculate link xfall
  - Given link width
  - Modify Xfall to get to RL and Hold Width

- **End of fixed link**
  - End of fixed link is at the given RL (level)
  - Given the width of the link, the xfall is calculated so that the link ends at the elevation RL.
21.2.2.13 Fixed - to 2 Heights

MTF_Edit_Modify_Fixed__to_2_Heights: For an existing link, the to 2 heights option has a number of methods for defining the height and interpolation occurs over the length of the modified string and not over the length of the reference string (the chainage range).

To options also includes coming back from an RL at the end chainage and using that to define the RL at the start chainage.

For example, over the chainage range, the height can be interpolated between two given RL's.

The modifier to RL (21.2.2.12 Fixed - To RL mod has a constant RL whereas for to 2 heights, the RL at each chainage is calculated by a formula.

Selecting to 2 heights brings up the Fixed - to 2 Heights panel
The fields and buttons used in this panel have the following functions.

</table>

The option to 2 heights defines the Height of the selected string so to completely define the link, only the Width or the Xfall is needed.

For the choice Modify Height, Hold Width, the Width is kept for the link (hold) and the Height is calculated by the method given by Type.

For the choice Modify Height, Hold Xfall, the Xfall is kept for the link (hold) and the Height is calculated by the method given by Type.
Type choice box

The Height for the current link is calculated by the method given by Type.

For the calculation of Height for each type, go to 21.2.2.13.1 Fixed - Calculating the Heights for each Type.

Alias, Start Chainage, End Chainage, Interval
defines the start and end chainages that the link is modified between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.14 Fixed - by 2 strings or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.
21.2.2.13.1 Fixed - Calculating the Heights for each Type

for the definitions of the calculations for each choice go to

21.2.2.13.1.1 RL: stay at a given RL
21.2.2.13.1.2 RL -> RL: interpolate between two given RL's
21.2.2.13.1.6 RL -> Pos: interpolate between a given start RL & the calculated end height
21.2.2.13.1.7 Pos -> RL: interpolate between the calculated start height and a given RL at the end
21.2.2.13.1.3 Pos ->: all points have the same height as the start point
21.2.2.13.1.4 <- Pos: all points have the same height as the end point
21.2.2.13.1.5 Pos-> Pos: interpolate between the calculated start and end heights

21.2.2.13.1.8 RL Grade ->: start with a given Start RL and continue on the line at grade
Grade->
21.2.2.13.1.9 <- RL Grade: all points are on a line with given grade and going through End RL
21.2.2.13.1.10 Pos Grade ->: start with the calculated height and continue at a given grade
21.2.2.13.1.11 <- Pos Grade: all points are on a line of given grade and going through the end point
21.2.2.13.1.12 Pos-> Pos: Tangential Compound Parabolas
21.2.2.13.1.13 Pos-> Pos: Tangential Cubic
21.2.2.13.1.1 RL: stay at a given RL

At the vertex of the link on the normal at each chainage \( ch \) between the Start mode and End Mode, the height at \( ch \) is that given in the RL panel field.

Hence the height is the same for all modified vertices between the Start mode and the End mode.

The modifiers with Type RL work the same as the modifier to RL with the RL being the given RL (see 21.2.2.12 Fixed - To RL).

21.2.2.13.1.2 RL -> RL: interpolate between two given RL’s

At each chainage \( ch \) between the Start mode and End Mode, the vertex of the modified string is on the perpendicular to the Reference string at chainage \( ch \).

The height at of the vertex on the perpendicular to Reference chainage \( ch \), is the linear interpolation of height with respect to the string being modified, between the given Start RL and the End RL.

![Chainage-Height Diagram for Type RL->RL](image)
21.2.2.2.13.1.3 Pos ->: all points have the same height as the start point

Let \textit{Start RL} be the actual height calculated at the vertex of the string at the perpendicular to \textit{Start mode} when all the modifiers before this modifier are applied.

Then for all vertices on the perpendiculars between \textit{Start mode} and \textit{End Mode}, the height of the vertex equal to \textit{Start RL}.

21.2.2.2.13.1.4 <- Pos: all points have the same height as the end point

Let \textit{End RL} be the actual height calculated at the vertex of the string at the perpendicular (normal) to \textit{End mode} when all the modifiers before this modifier are applied.

Then for all vertices on the normals between the \textit{Start mode} and \textit{End Mode}, the height of the vertex is equal to \textit{End RL}.

21.2.2.2.13.1.5 Pos-> Pos: interpolate between the calculated start and end heights
First let Start RL be the actual height calculated at the vertex of the string at the normal to Start mode when all the modifiers before this modifier are applied.

Let End RL be the actual height calculated at the vertex of the string at the normal to End mode when all the modifiers before this modifier are applied.

Then for each vertex on the normals between Start mode and End Mode, the height of the vertex is the linear interpolation with respect to modified string chainage between the Start RL and the End RL.
21.2.2.13.1.6 RL -> Pos: interpolate between a given start RL & the calculated end height

The height at the vertex on the normal at **Start mode** is the given **Start RL**.

And **End RL** is the actual height calculated at the vertex on the modified string at the normal at **End mode** when all the modifiers before this modifier are applied.

Then at each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation *with respect to modified string chainage* between the **Start RL** and the **End RL**.

Hence for the modifiers of **Type RL -> Pos**, the calculations at chainage ch are the same as the modifiers **Width/Height/Xfall to RL** with the RL being the interpolated RL at chainage ch (see **Fixed Link - Modify Width, Height or Xfall to Get to an RL**).
21.2.2.13.1.7 Pos -> RL: interpolate between the calculated start height and a given RL at the end

**Start RL** is the actual height calculated at the vertex on the normal at **Start mode** when all the modifiers before this modifier are applied. The height at the vertex on the normal at **End mode** is the given **End RL**. Then at each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation **with respect to modified string chainage** between the **Start RL** and the **End RL**.
21.2.2.13.1.8 RL Grade ->: start with a given Start RL and continue on the line at grade Grade->

The height at the vertex on the normal at Start mode is the Start RL.
For each normal between the Start mode and the End Mode, the height of the vertex is on the line with grade Grade-> with respect to the modified string, and going through the point (normal at Start mode, Start RL).

**Important Note:** Grade is calculated using increasing Reference chainages.
21.2.2.13.1.9 <- RL Grade: all points are on a line with given grade and going through End RL.

The height on the vertex at **End mode** is **End RL**.

For each normal between the **Start mode** and the **End Mode**, the height of the vertex is on the line with grade of negative **<-Grade** with respect to the modified string chainage, and going through the point (normal at End mode, End RL).

**Important Note**: **<-Grade** is calculated using decreasing **Alignment chainages**. So in a diagram with increasing chainage, the grade is negative **<-Grade**.
21.2.2.2.13.1.10 Pos Grade ->: start with the calculated height and continue at a given grade

Let **Start RL** be the actual height calculated at the vertex on the normal at **Start mode** when all the modifiers before this modifier are applied.

Then the height of each vertex on each normal between the **Start mode** and the **End Mode** is on the line with grade **Grade->** with respect to the modified string chainage, and going through the point (normal at Start mode, Start RL).

**Important Note:** **Grade->** is calculated using **increasing Alignment chainages.**
21.2.2.13.1.11 <- Pos Grade: all points are on a line of given grade and going through the end point

Let End RL be the actual height on the vertex on the normal at End mode when all the modifiers before this modifier are applied.

Then the height of each vertex on the normals between the Start mode and the End Mode is on the line with grade of negative <-Grade with respect to the modified string chainage, and going through the point (normal at End mode, End RL).

Important Note: <-Grade is calculated using decreasing Alignment chainages and the heights at the points along the string being modified. So in a diagram with increasing chainage, the grade is negative <-Grade.

21.2.2.13.1.12 Pos-> Pos: Tangential Compound Parabolas

Let Start RL be the actual height calculated at the vertex of the string at the perpendicular to Start mode when all the modifiers before this modifier are applied.

Let End RL be the actual height calculated at the vertex of the string at the perpendicular to End mode when all the modifiers before this modifier are applied.

Then for each vertex on the perpendiculars between Start mode and End Mode, the height of the vertex is on the curve of tangential compound parabolas (in chainage-height space) between the Start RL and the End RL.

21.2.2.13.1.13 Pos-> Pos: Tangential Cubic

Let Start RL be the actual height calculated at the vertex of the string at the perpendicular to Start mode when all the modifiers before this modifier are applied.

Let End RL be the actual height calculated at the vertex of the string at the perpendicular to End mode when all the modifiers before this modifier are applied.

Then for each vertex on the perpendiculars between Start mode and End Mode, the height of the vertex is on the curve of tangential cubic (in chainage-height space) between the Start RL and the End RL.
21.2.2.2.14 Fixed - by 2 strings

The by 2 strings option calculates one of the width, height and xfall or slope from two given strings. That is, for the current link:

(a) one of Width, Height or Xfall keeps its existing value (i.e. holds its existing value).

and

(b) a different one of Width, Height or Xfall is modified and its value is taken form the differences of two selected strings.

Selecting the by 2 strings brings up the Fixed - Modify by 2 Strings panel.

The fields and buttons used in this panel have the following functions.

21.2.2.2.14.1 Fixed - by 2 Strings: Modifier Types Modify Width, Hold Height/ Xfall

For a fixed link **Modify Width** sets the width of the link to be the width between the two selected strings.

For **Modify Width, Hold Height** the height from the current link is kept.

For **Modify Width, Hold Xfall**, the xfall from the current link is kept.
21.2.2.14.2 Fixed - by 2 Strings: Modifier Types Modify Height, Hold Width/ Xfall

For a fixed link **Modify Height** sets the **height** of the link to be the height between the two selected strings.

For **Modify Height, Hold Width** the **width** from the current link is kept.

For **Modify Height, Hold Xfall** the **xfall** from the current link is kept.
21.2.2.2.14.3 Fixed - by 2 Strings: Modifier Types Modify Xfall, Hold Width/Height

For a fixed link **Modify Xfall** sets the xfall of the link to be the xfall between the two selected strings.

For **Modify Xfall, Hold Width** the width from the current link is kept.

For **Modify Xfall, Hold Height** the height from the current link is kept.
21.2.2.2.15 Fixed - Interface to Tin

The Fixed $\Rightarrow$ Interface to string option interfaces from the given link to a given tin dropped by a strip depth.

Selecting the Interface to tin brings up the Fixed - Interface to tin panel.

![Fixed - Interface to Tin panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>Design</td>
<td>available layers</td>
</tr>
<tr>
<td>Base name</td>
<td>name box</td>
<td>names.4d pop-up</td>
<td></td>
</tr>
</tbody>
</table>

Name of the layer that the link to interface off is in.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

The name of the link in the layer Layer to interface (batter) off.
That is, a line is taken from the end of the Base Link with either Final cut slope or Final fill slope, and extended until it cuts the stripped tin.

Final cut slope 1 v in real box 0 no slope, 0,1,2,3,4,5,10
The cut slope is used if the Base link is in cut. That is, it is below the tin.

The cut slope is the slope for the interface calculation to be done when the Base link is in cut. The batter continues at the cut slope until it hits the Tin dropped by the Strip depth, or until it reaches the Maximum slope width.

A cut slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed.

For final cut slope, positive is up and negative down
Final fill slope 1 v in real box 0 no slope, 0,1,2,3,4,5,10

the fill slope is used if the Base link is in cut. That is, it is above the tin.

The fill slope is the slope to be used in the interface calculation when the Base link is in fill. The batter continues at the fill slope until it hits the Tin dropped by the Strip depth, or until it reaches the Maximum slope width.

A fill slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed.

For final fill slope, positive is down and negative is up.

This definition of fill slope being positive when going down is used so that the value in the Final fill slope 1 v in field is normally positive.

Maximum slope width real box 100

the maximum width for the final slope. It hasn’t reached the tin by this distance then it stops.

Strip real box 0

the depth to vertically drop the tin before interfacing.

Tin tin box available tins

name of the tin to interface to.

Layer layer box Design available layers

name of the layer that the created link is added to.

Interface name name box

name for the link created by this link by battering.

Hence the end of string lies on the stripped tin. The string formed from the end of this link is called the interface string.

Alias, Start Chainage, End Chainage, Interval
defines the start/end chainages to calculate interface

Go to the next section 21.2.2.16.3 Boxing - Named Grade Triple or return to 21.2.2.16 Fixed - Boxing or 21.2.2.2 Fixed Link Modifiers.
21.2.2.2.16.3 Boxing - Named Grade Triple

Selecting Named grade triple brings up the panel Fixed - Modify Named Grade Triple

![Fixed - Modify Named Grade Triple panel](image)

**Alias, Start Chainage, End Chainage, Interval**

defines the start and end chainages that the modifier exists between.

For information on these panel fields, see 21.2.2.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.16.4 Boxing - Insert Intersect or return to 21.2.2.16 Fixed - Boxing or 21.2.2.16 Fixed Link Modifiers.
21.2.2.16.4 Boxing - Insert Intersect

Selecting Insert intersect brings up the panel Fixed - Insert Intersect

![Fixed - Insert Intersect Panel](image)

**Alias, Start Chainage, End Chainage, Interval**

defines the start and end chainages that the modifier exists between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.16.5 Boxing - Insert Xfall Pt or return to 21.2.2.16 Fixed - Boxing or 21.2.2.2 Fixed Link Modifiers.
21.2.2.2.16.5 Boxing - Insert Xfall Pt

Selecting **Insert xfall pt** brings up the panel **Fixed - Insert Xfall Point**

![Fixed - Insert Xfall Point panel](image)

**Alias, Start Chainage, End Chainage, Interval**

defines the start and end chainages that the modifier exists between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.16.6 Boxing - Copy Layer or return to 21.2.2.16 Fixed - Boxing or 21.2.2 Fixed Link Modifiers.
21.2.2.16.6 Boxing - Copy Layer

The Copy layer command copies the Link Points from part of one layer to another layer, with an optional value Height diff added to the copied points.

That is, the Copy layer command copies vertices from part of a selected Layer (from the vertex at the end of a Start link to the vertex at the end of an End link) and copies the vertices to a given Layer, with an optional value Height diff added to the copied vertices.

The option works by

(a) Calculating for each of the vertices from the vertex at the end of the Start link to the vertex at the end of the End link, the offset and height from the Hinge Point (the beginning of the layer).

That is, calculate an offset and delta height from the Hinge Point rather than just relative to the previous link.

(b) Adding the value Height diff to each of the height of each vertex.

(c) Inserting the vertices into the To Layer using the calculated offsets and heights from the Hinge Point for each vertex.

Hence if no links already exist in the To Layer for the calculated offset range of the copied vertices, then the cross sectional shape of the copied links is maintained.

However if links already exist in the To Layer for the calculated offset range of the copied vertices, then the existing and copied vertices are merged together. The merging occurs by simply ordering the vertices by increasing offset and then joining adjacent vertices together. The cross sectional shape of the copied links may not be maintained.

Note that the start vertex of the Start link is not copied. This is normally not a problem unless you are trying to copy the first vertex of the first Link. To do this with the Copy layer command, you would need to add a new link with a width and height of zero at the beginning of the string. This new link would then be used as the Start link.

Selecting Copy layer brings up the panel Fixed - Copy Layer
The fields and buttons used in this panel have the following functions.

<table>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Alias, Start Chainage, End Chainage, Interval**

defines the start and end chainages to copy layer points.

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF*
Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.2.16 Fixed - Boxing or 21.2.2.2 Fixed Link Modifiers.
21.2.2.3 Template Modifiers

Each 12d Template is made up of the sections Fixed, Decisions, Cut, Fill and Final Cut/Fill. See 20.1 Templates in 12d Model.

The options in the MTF Template menu are for working with the Decisions, Cut, Fill and Final Cut/Fill sections of inserted Templates.

The Template walk-right brings up the Template menu.

For

- Change decision: 21.2.2.3.1 Change Decision
- Cut: 21.2.2.3.2 Cut Link Modifiers
- Cut: 21.2.2.3.3 Fill Link Modifiers
- Final: 21.2.2.3.4 Final Modifiers
21.2.2.3.1 Change Decision

If a 12d Template has a **Decisions** section then the **Decisions** section is used before the **Cut**, **Fill** and **Final Cut/Fill** sections.

For an **Apply MTF**, a Template specified for a chainage range in the **Templates** section of the MTF (see [21.2.6.1 MTF Templates]) is called the **original** template for that chainage range.

Using the **Change Decision** modifier, for a given chainage range it is possible to **override** the **Decisions** section from the original Template and:

(a) use the **Decisions** section **from another** Template instead of the **Decisions** section of the original Template.

or

(b) use the cut, fill and final cut/fill sections of the original template **instead** of the **Decisions** section of the original template.

So the **Change Decision** option can be used to substitute a **Decisions** section from a different Template, or just **turn off** the **Decisions** section of the original Template.

In either case, the **Fixed** section of the **original** Template is **still used**.

Selecting **Change decision** brings up the **Decision - Change** panel

![Decision - Change panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision template</td>
<td>input</td>
<td>available templates</td>
<td></td>
</tr>
</tbody>
</table>

*If non-blank, this is the Template whose Decisions section is used over the given chainage range.*

*If blank, the Cut, Fill and Final Cut/Fill sections of the original Template are used over the chainage range instead of the Decision section of the original Template.*
Note that if the new Template has no decisions, then the Cut and Fill section of the original Template is used instead of the Decisions section of the original Template. That is, it is equivalent to leaving the Decisions Template field blank.

Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages to changes/stop the Template Decisions.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.3 Template Modifiers.
21.2.2.3.2 Cut Link Modifiers

The Cut walk-right brings up the Cut menu with options to modify the cut links of the template.

See

- Insert 21.2.2.3.2.1 Cut Link - Insert
- Insert cut template 21.3.0.1 Insert Cut Links from a Template
- Remove 21.3.0.2 Cut Link - Remove
- Width/Height 21.3.0.3 Cut Link - Modifier Width or Height
- Slope 21.3.0.4 Cut Link - Modify Slope
- from link 21.3.0.5 Cut Link - from Link
- to string 21.3.0.6 Cut Link - to String
- to tin 21.3.0.7 Cut Link - to Tin
- to 2 heights 21.3.0.8 Cut Link - to Two Heights
- by 2 strings 21.3.0.9 Cut Link - to 2 Strings21.3.0.9 Cut Link - to 2 Strings
21.2.3.2.1 Cut Link - Insert

Cut links can be created by the `cut Insert` command by specifying either the *width and height*, *width and slope* or *height and slope* for the link.

Selecting `Insert` brings up the `Cut - Insert` panel.

![Cut - Insert panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>Layer for the new link to go into.</td>
<td>choice box</td>
<td>available Layers</td>
<td></td>
</tr>
<tr>
<td>Link name</td>
<td>name of the cut link to create in the Layer.</td>
<td>input</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>colour of the link being created.</td>
<td>input</td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td>Width /height/slope</td>
<td>width/ height/slope of the link being created - only use two of the three.</td>
<td>input</td>
<td>measures menu</td>
<td></td>
</tr>
<tr>
<td>Before</td>
<td>if not blank, the name of the link in the Layer to insert the new link before.</td>
<td>choice box</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td>After</td>
<td>if Before is not blank, After is ignored.</td>
<td>choice box</td>
<td>select name menu</td>
<td></td>
</tr>
</tbody>
</table>

For information on Layers, see 21.1.1.2 MTF Links and Layers.
If not blank and Before is blank, the name of the link in the layer to insert the new link after.
If blank and Before is blank, Before is used.

Note: Only one of Before or After can not be blank. If they are both blank then Before takes precedence over After.

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages to changes/stop the Template Decisions.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.
21.2.2.3.3 Fill Link Modifiers

The Fill walk-right brings up the Fill menu with options to modify the fill links of the template.

![Fill menu](image)

**See**

- **Insert**
  - [21.2.2.3.1 Fill Link - Insert](#)
- **Insert fill template**
  - [21.3.0.10 Insert Fill Links from a Template](#)
- **Remove**
  - [21.3.0.11 Fill Link - Remove](#)
- **Width/Height**
  - [21.3.0.12 Fill Link - Modify Width or Height](#)
- **Slope**
  - [21.3.0.13 Fill Link - Modify Slope](#)
- **from link**
  - [21.3.0.14 Fill Link - from Link](#)
- **to string**

  - [21.3.0.16 Fill Link - to Tin](#)
- **to 2 heights**
  - [21.3.0.17 Fill Link - to Two Heights](#)
- **by 2 strings**
  - [21.3.0.18 Fill Link - to Two Strings](#)
21.2.2.3.3.1 Fill Link - Insert

Fill links can be created by the fill insert modifier and by specifying either the width and height, width and slope or height and slope.

Selecting Insert brings up the Fill - Insert panel

![Fill - Insert Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>choice box</td>
<td>available Layers</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Layer for the new link to go into.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>For information on Layers, see 21.1.1.2 MTF Links and Layers.</td>
<td></td>
</tr>
<tr>
<td>Link name</td>
<td>input</td>
<td>select name menu</td>

<tr>
<td></td>
<td></td>
<td>name of the fill link to create in the given Layer.</td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td>input</td>
<td>available colours</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>colour of the link being created.</td>
<td></td>
</tr>
<tr>
<td>Width /height/slope</td>
<td>input</td>
<td>measures menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>width/ height/slope of the link being created - only use two of the three.</td>
<td></td>
</tr>
<tr>
<td>Before</td>
<td>choice box</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if not blank, the name of the link in the Layer to insert the new link before.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If blank and After is blank, the link is appended to the end of the fixed part of the template.</td>
<td></td>
</tr>
<tr>
<td>After</td>
<td>choice box</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if Before is not blank, After is ignored.</td>
<td></td>
</tr>
</tbody>
</table>
If not blank and Before is blank, the name of the link in the layer to insert the new link after. If blank and Before is blank, Before is used.

Note: Only one of Before or After can not be blank. If they are both blank then Before takes precedence over After.

Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages to changes/stop the Template Decisions.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.
21.2.2.3.4 Final Modifiers

The Final walk-right brings up the Final menu with options to modify the final cut and fill links of the template.

See

- **Width**: 21.2.2.3.4.1 Final Link - Width
- **Cut slope**: 21.2.2.3.4.2 Final Link - Cut or Final Fill Slope
- **Fill slope**: 21.2.2.3.4.2 Final Link - Cut or Final Fill Slope
- **No cut slope**: 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope
- **No fill slope**: 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope
- **No cut/fill slope**: 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope
- **Change tin**: 21.2.2.3.4.4 Change Final Tin
- **Final link name**: 21.2.2.3.4.5 Change Final Link Name
21.2.2.3.4.1 Final Link - Width

The final Width modifier varies the Maximum slope width of the final link of the template.

Selecting Width brings up the Final - Width panel.

![Final - Width panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>name of the layer that the link to modify is in.</td>
<td>layer box</td>
<td>Design</td>
<td>available layers</td>
</tr>
<tr>

<tr>
<td>Cubic</td>
<td>if ticked, the width is varied as a reverse cubic between the start and end chainages.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>if not ticked, the width is varied linearly between the start and end chainages.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For information on Layers, see 21.1.1.2 MTF Links and Layers.
Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages to modify the maximum width of the final link.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.3.4.2 Final Link - Cut or Final Fill Slope or return to 21.2.2.3.4 Final Modifiers.
21.2.2.3.4.2 Final Link - Cut or Final Fill Slope

The final Cut slope modifier varies the cut slope of the final link of the template and the final Fill slope modifier varies the fill slope of the final link of the template.

Selecting the Cut slope or Fill slope options brings up the Final - Cut Slope and Final - Fill Slope panels respectively.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer</td>
<td>layer box</td>
<td>Design</td>
<td>available layers</td>
</tr>
</tbody>
</table>

  name of the layer that the link to modify is in.

  For information on Layers, see 21.1.1.2 MTF Links and Layers.

| Link name               | link box   | select name menu |

  name of the final link to modify.

| Start slope             | input      | measures menu |

  slope at the Start chainage for the Final cut/fill slope 1v in of the final link of the template.

| End slope               | input      | measures menu |

  slope at the End chainage for the Final cut/fill slope 1v in of the final link of the template.

  Important note: For a cut link, positive slope is up. For a fill link, positive slope is down.

| Cubic                   | tick box   | |
if tinked, the slope is varied as a reverse cubic between the start and end chainages.

Rotate tick box

if tinned, the slope is varied linearly with respect to the angle, between the start and end chainages.

Note -

Only one of cubic and rotate can be set to tinned.
If both are set to not tinned, then the slope is varied linearly with respect to slope between the start and end chainages (the default).

Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages to modify the final slope.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope or return to 21.2.2.3.4 Final Modifiers.
21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope

The final link can be stopped altogether or only stopped when it is in cut or only stopped when it is in fill.

The **No cut slope** modifier stops the final link when it is in *cut*, the **No fill slope** modifier stops the final link when it is in *fill* and the **No cut/fill fill slope** modifier stops the final link in any situation.

Selecting **No cut slope**, **No fill slope** or **No cut/fill slope** brings up the **Final - No Cut**, **Final - No Fill** or **Final - No Cut/Fill** panels respectively.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Continue to the next section 21.2.3.4.4 Change Final Tin or return to 21.2.3.4 Final Modifiers.
21.2.2.3.4.4 Change Final Tin

The **Change tin** modifier changes the tin that the final cut and fill slopes batter to.

Note that the default tin is the tin from the Apply MTF.

Selecting **Change tin** brings up the **Change Final Tin** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>available tins</td>
<td>name of the tin for the final cut and fill links to batter to.</td>
</tr>
</tbody>
</table>

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages to change the tin that the final link to batters to.

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Continue to the next section [21.2.2.3.4.4 Change Final Tin](#) or return to [21.2.2.3.4 Final Modifiers](#).
21.2.2.3.4.5 Change Final Link Name
NOTE: THIS OPTION HAS NOT BEEN IMPLEMENTED.

The **Final Link Name** modifier changes the name of the interface string.

Selecting **Final link name** brings up the **Final - Link Name** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Link name</strong></td>
<td>name box</td>
<td>available names</td>
<td>current name of the interface string.</td>
</tr>
<tr>
<td><strong>New name</strong></td>
<td>name box</td>
<td>available names</td>
<td>new name of the interface string.</td>
</tr>
</tbody>
</table>

Return to [21.2.3.4 Final Modifiers](#).
21.2.2.4 Interval

The Create walk-right brings up the Interval menu.

For

- **Alias**: 21.2.2.4.1 Chainage Alias
- **Interval**: 21.2.2.4.2 Change Interval
- **Interval relative**: 21.2.2.4.3 Change Interval Relative
- **Interval String TPs**: 21.2.2.4.4 Interval String Tangent Points
- **Intersection links/string**: 21.2.2.4.5 Intersect Links with String
21.2.2.4.1 Chainage Alias

The **Alias** option creates a row in the grid with a given **Alias** name. The **Alias** is then available to be used by **Smart Chainages**.

For the new information on **Smart Chainage**, see [21.4 Smart Chainages](#).

Selecting **Alias** brings up the panel **Chainage Alias**

![Chainage Alias Panel](image)

**Alias** text box

*a text name that can be used to refer to the row in the grid for this command.*

See [21.2.1.4 Alias for MTF Modifiers](#).

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages to define an **Alias** for this row.

For information on these panel fields, see [21.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see [21.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Go to the next section [21.2.4.2 Change Interval](#) or return to [21.2.4 Interval](#).
21.2.2.4.2 Change Interval

The **Interval** option changes the interval between the MTF sections over the given chainage range.

The sections are at the chainages that are integer multiples of the interval, and less than or equal to the start chainage and less than the end chainage. That is, the chainage values are referenced about zero and inside the start/end range.

For example, if the interval is 10 and the start chainage is -13 and the end chainage is 24 then there will be sections as

-10, 0, 10 and 20

The default value used for Interval is the **Separation distance** in the **Apply MTF** panel.

Selecting **Interval** brings up the **Change Interval** panel.

The fields and buttons used in this panel have the following functions.

<table>

</table>

The **Interval** input

If **non blank**, the interval to use to create extra cross sections and strings over the given chainage range.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).
Modifier Panels.

Go to the next section 21.2.2.4.3 Change Interval Relative or return to 21.2.2.4 Interval.
21.2.2.4.3 Change Interval Relative

The Interval Relative option changes the interval between the MTF sections over the given chainage range but instead of being referenced about zero, the chainages are reference about the start chainage.

That is, the sections are at the chainages that are the start chainage plus integer multiples of the interval, and less than or equal to the start chainage and less than the end chainage. That is, the chainage values are referenced about the start chainage and inside the start/end range.

For example, if the interval is 10 and the start chainage is -13 and the end chainage is 24 then there will be sections as

-13, -3, 7 and 17

Selecting Interval relative brings up the Change Interval Relative panel

![Change Interval Relative panel](image)

**Alias, Start Chainage, End Chainage**

defines the start and end chainages to change the interval between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Interval** input

if non blank, the interval to use to create extra cross sections and strings over the given chainage range. The values for chainage are referenced about the Start chainage.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.4.4 Interval String Tangent Points or return to 21.2.2.4 Interval.
21.2.2.4.4 Interval String Tangent Points

The **Interval String TPs** option drops the tangents points of a selected string onto the reference string and includes the dropped points as extra chainages where sections are generated. Selecting **Interval string TPs** brings up the **Interval String Tangent Points** panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>String</strong></td>
<td>string select</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*the string to select whose tangent points are dropped onto the reference string and if any of the dropped points are in the start and end chainage range then sections are generated at those dropped chainages.*

**Alias, Start Chainage, End Chainage, Interval**

defines the start and end chainages to drop tangent points.

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.*

**Comment, Extra start, Extra End, Active, OK, Apply**

*For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.*

Continue to next section **21.2.4.5 Intersect Links with String** or return to **21.2.4 Interval**.
21.2.2.4.5 Intersect Links with String

The intersection links/string option

Selecting intersection links/string brings up the Fixed - Intersect Links with String panel

![Fixed - Intersect Links with String panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>String</strong></td>
<td>string select</td>
<td>the string to select whose tangent points are dropped onto the reference string and if any of the dropped points are in the start and end chainage range then sections are generated at those dropped chainages.</td>
<td></td>
</tr>
<tr>
<td><strong>Alias, Start Chainage, End Chainage, Interval</strong></td>
<td></td>
<td>defines the start and end chainages to drop tangent points.</td>
<td></td>
</tr>
<tr>
<td><strong>Comment, Extra start, Extra End, Active, OK, Apply</strong></td>
<td></td>
<td>For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.</td>
<td></td>
</tr>
</tbody>
</table>

Return to 21.2.2.4 Interval.
21.2.2.5 MTF Create

The Create walk-right brings up the Create menu with options to create Shapes, Strings and Tins from selected MTF points.

For
- Shapes: 21.2.2.5.1 Create Shapes
- Strings: 21.2.2.5.2 Create Strings
- Tins: 21.2.2.5.3 Create Tin
21.2.2.5.1 Create Shapes

The **Shapes** option creates a shape from nominated MTF Points, and optionally strings and trimeshes.

For information on MTF Points, Strings, Shapes and Trimeshes, see [21.1.1 MTF Links, Points, Sections, Strings and Trimeshes](#).

Selecting **Shape** brings up the panel **Modify Create Shape**

![Modify Create Shape panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Shape</strong></td>
<td>text box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*name for the new shape*

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Colour</strong></td>
<td>colour box</td>
<td></td>
<td>available colours</td>
</tr>
</tbody>
</table>
colour of the shape.

**Strings model**

- Model box
- Available models

If **not blank**, strings are created for the MTF point listed in the Shape grid and added to this model. The strings have the same name and colour as the MTF points.

If **blank**, strings are not created.

**Trimesh model**

- Model box
- Available models

If **not blank**, a trimesh is created for the shape and added to this model.

If **blank**, trimeshes are not created.

**Regular**

- Tick box

If **ticked**, the shape will only be formed when all of the nominated strings exist. E.g. it will form multiple shapes if strings come and go along the length of the apply.

If **not ticked**.

**Closed**

- Tick box

If **ticked**, the shape is closed off. That is, the last MTF point in the list is joined to the first MTF point.

If **not ticked**, the shape is not closed off.

**Shape Grid**

- Layer box
- Available Layers

  layer to take the MTF point from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

- Side choice box
  - Left, Right

  side of the template to take the MTF point from.

- Links L/JG? text box

  the name of the MTF point from the layer **Layer** and side **Side**.

The shape profile is constructed from the shape grid defines by joining each MTF point to the next MTF point in the list. See 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes

If **Closed** is ticked, the last MTF point in the list is joined to the first MTF point.

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages to create the shape.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

For example, the list of MTF points

![MTF Grid Example](image)

creates a shape at each chainage by joining the four MTF points in the order down the list, and
then closes the shape by joining the fourth MTF point to the first MTF point.

Go to the next section 21.2.2.5.2 Create Strings or return to 21.2.2.5 MTF Create.
21.2.2.5.2 Create Strings

The **Strings** option creates longitudinal strings for nominated MTF points and places them in a given model.

One application of the **Strings** option is to create a model of strings for a given Layer instead of the **Boxing Layers** in the **Models** tab of the **Apply MTF Function**.

**Note**: Strings and sections are automatically created for all the MTF points in the default Layer **Design**.

For information on MTF Points, Strings, Shapes and Trimeshes, see **21.1.1 MTF Links, Points, Sections, Strings and Trimeshes**.

Selecting **Strings** brings up the panel **Modify Create Strings**

![Modify Create Strings panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Strings model</strong></td>
<td>model box</td>
<td>available models</td>
<td>the strings that created for the nominated points are placed in this model.</td>
</tr>
</tbody>
</table>

MTF Edit
**Selection type** specifies where to get all the names of points created at any section in the Start and End chainage range.

For any **Selection type** other than **Selection of links from all layers**, the points then have to match the **Wildcard** and then strings are created with the name and colour of the point, and placed in the **Strings model**.

- **If All points in a layer**, all points in the layer given in **Layer**.
- **If All LHS points in a layer**, all points in the layer given in **Layer** that are on the left hand side.
- **If All RHS points in a layer**, all points in the layer given in **Layer** that are on the right hand side.
- **If All points in all layers**, all points in the all layers.
- **If All LHS points in all layers**, all points in the all layers that are on the left hand side.
- **If All RHS points in all layers**, all points in the all layers that are on the right hand side.

**Layer** layer box available Layers used when **Selection type** is All points in a layer, All LHS points in a layer, or All RHS points in a layer. For information on Layers, see 21.1.1.2 MTF Links and Layers.

**Wildcard** text box used for all **Selection type**’s except Selection of points for all layers.

text including wild cards * and wild characters ?.

If **blank**, all points from **Selection type** have strings created for them

If **not blank**, any names of points from the **Selection type** that match the **Wildcard** have strings created for them with the same name and colour as the point.

**If Selection of points for all layers**, then a grid is used to nominate the points to be selected. The points do no have to be from the same layer:

**Selection Grid**
### Layer
- **Layer** layer box available Layers
  - layer to take the point from. For information on Layers, see [21.1.2 MTF Links and Layers](#).

### Side
- **Side** choice box Left, Right
  - side of the template to use to take the point.

### Points
- **Points** text box
  - the name of the point from the layer **Layer** and side **Side**.

For any of the points in the table, strings are created and placed in the **Strings model**.

**Alias, Start Chainage, End Chainage, Interval**
- defines the start and end chainages to create strings between.

*For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).*

**Comment, Extra start, Extra End, Active, OK, Apply**
- For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Go to the next section [21.2.5.3 Create Tin](#) or return to [21.2.5 MTF Create](#).
21.2.2.5.3 Create Tin

The **Tins** option creates a tin from selected MTF strings.

For information on MTF Points, Strings, Shapes and Trimeshes, see [21.1.1 MTF Links, Points, Sections, Strings and Trimeshes](#).

Selecting **Tins** brings up the panel **Modify Create Tin**

![Modify Create Tin dialog](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Tin</strong></td>
<td>tin box</td>
<td>the name for the created tin.</td>
<td></td>
</tr>
<tr>
<td><strong>Colour for tin</strong></td>
<td>colour box</td>
<td>the colour of the created tin.</td>
<td></td>
</tr>
<tr>
<td><strong>Model for tin</strong></td>
<td>model box</td>
<td>the created tin is added to this model.</td>
<td></td>
</tr>
</tbody>
</table>
Selection type specifies where to get all the MTF points in sections in the Start and End chainage range, and create the strings that are used in the triangulation.

For any Selection type other than Selection of links from all layers, the points have to match the Wildcard. Then strings are created and used in the triangulation.

If All LHS strings in a layer, then all points in the layer given in Layer that are on the left hand side and satisfy Wildcard are used to create strings, and the strings are used in the triangulation.

If All RHS strings in a layer, then all points in the layer given in Layer that are on the right hand side and satisfy Wildcard are used to create strings, and the strings are used in the triangulation.

Layer layer box available Layers

The Layer to take MTF points from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Wildcard text box

used for all Selection type's except Selection of points for all layers.

Text including wild cards * and wild characters ?.

If blank, all points from Selection type have strings created for them, and the strings are used in the triangulation.

If not blank, any names of points from the Selection type that match the Wildcard have strings created for them and the strings are used in the triangulation.

If Selection of points for all layers, then a grid is used to nominate the points to be selected. The points do no have to be from the same layer.

Selection Grid

Layer layer box available Layers

layer to take the point from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Side choice box Left, Right

side of the template to use to take the point.

Points text box
the name of the point from the layer **Layer** and side **Side**.

For any of the points in the table, strings are created and placed in the **Strings model**.

**Alias, Start Chainage, End Chainge, Interval**

defines the start and end chainages to create a tin.

*For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).*

**Comment, Extra start, Extra End, Active, OK, Apply**

*For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).*

Return to [21.2.2.5 MTF Create](#).
21.2.2.6 Snippet

Clicking on Snippet brings up the MTF Snippet panel which is used to insert snippets.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Snippet</td>
<td>snippet box</td>
<td>*.mtfsnippet, *.mtfsnippetc files</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If information on the snippets shipped by 12d Solutions and available from [Lib] in the Folder pop up, see 20.4.3.5 12d Supplied Snippets.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

**Alias, Start Chainage, End Chainage, Interval**

defines the start and end chainages to apply a snippet.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

For more information on the inserting and use of snippets, please go to the section 21.5 Defining and Using Snippets.

Go to the next section 21.2.2.7 Debug or return to 21.2.2.1 Create MTF Commands.
21.2.2.7 Debug

Clicking on Debug brings up the Layers Debug panel which is used to create debug information when you are having problems with your MTF, especially with Snippets.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug model prefix</td>
<td>text box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Debug models are created with the name of this prefix followed by the chainage.

Alias, Start Chainage, End Chainage, Interval

defines the start/end chainages to create debug models and file.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra end, Active, OK, Apply

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

What the Panel Does

For each chainage, a model is created with the name Debug model prefix followed by the chainage value. In the model all the link in all the layers are drawn with the offset as the x-value and height as the y-value so that the model can be looked at on a Plan View.

A report file is also created at the start chainage and it contains information debugging such as the snippets used and the values of the parameters in the snippets.

The Report has the name Debug model prefix followed by the chainage value with the decimal point replaced by an underscore, with 12D_APPLY_MTF_DEBUG_DUMP as the file extension.
For example, Lee Road debug 0_000.12D APPLY MTF DEBUG DUMP

Go to the next section 21.2.2.8 Pause or return to 21.2.2.1 Create MTF Commands.
21.2.2.8 Pause

Clicking on Pause brings up the MTF Pause Process panel which is used to enable/disable the processing of all the MTF commands in the given chainage range.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pause</td>
<td>choice box</td>
<td>Stop processing, Start processing, Stop processing</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*If End processing, then for a given chainage ch in the chainage range, all commands after this command will NOT be processed until a MTF Pause Process panel with Process set to Start processing (and whose chainage range includes this chainage ch) is met.*

*If Start processing, then for a given chainage ch in the chainage range, all commands after this command will be processed until a MTF Pause Process panel with Process set to End processing (and whose chainage range includes this chainage ch), is met.*

**Alias, Start Chainage, End Chainage, Interval**

defines the start/end chainages to use the Pause command.

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

**Comment, Extra start, Extra End, Active, OK, Apply**

For information on these panel fields, see [21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels](#).

Go to the next section [21.2.2.9 Comment](#) or return to [21.2.2.1 Create MTF Commands](#).
21.2.2.9 Comment

Selecting Comment turns the line of the Template Modifier into a field that a comment can be typed into.

Typing will then enter a comment into this line and the entire line contains just the comment.

Go to the next section 21.2.10 Region or return to 21.2.1 Create MTF Commands.
21.2.2.10 Region

The Region option inserts a Region command into the grid.
Selecting Region brings up the Modify Region panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region description</td>
<td>text box</td>
<td>name for the Region.</td>
<td></td>
</tr>
<tr>
<td>Bookmark name</td>
<td>text box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>if not blank, this is a secondary name, often a shorter name, that is used in the Region pop up rather than using the Region description.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If blank, then when the grid is saved, the Bookmark name is set to be the same as the Region description.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Collapse</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>if ticked, all the commands in the grid until the next Region command are collapsed into this Region command.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If not ticked, the commands in the grid until the next Region command are not collapsed.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK, Apply</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>for information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

There are Regions, Previous Region and Next Region icons at the right hand side of the Left/Right Modifiers panel that use this created Region. For information on using these icons and information on Regions in a grid, see 4.19.6 Grids in Panels.

Return to 21.2.2.1 Create MTF Commands.
21.2.3 MTF Boxing

In the MTF, up to eight (8) layers of boxing can be defined. For each boxing layer, the boxing can be defined by
(a) the Left boxing only
(b) the Right boxing only
(c) the Left and Right boxing.

For cases (a) and (b), the Left boxing or the Right boxing defines the boxing across the entire design section and then only one of Left boxing or Right boxing is needed.

For case (c) where both Left and Right boxing are defined for a design section, then the last point of the left boxing is automatically connected to the first point of the right boxing.

Warning for case (c), the Left boxing must end before the Right boxing begins. If there is an overlap, the Right boxing will be pushed to the end of the Left boxing.

Note - no interpolation or modifiers exist for boxing.

For a general discussion of Boxing, go to the section 21.6 What is Boxing?, for the scenarios of applying Boxing, including but not restricted to the MTF, go to the section 21.6.2 Applying Boxing, and in particular 21.6.2.1 Scenario 1 - Design Generated by One Apply MTF.

When boxing is used in the Apply MTF, the cut and fill areas and volumes are also calculated for all the inter-boxing layers. The last layer defined is also referred to as the subgrade layer and volumes are also given for the natural surface to the subgrade, and the design to the subgrade.

The Boxing walk-right in the MTF Edit menu brings up the Boxing menu with options to specify the file supplying the boxing definitions and options to apply the definitions to the Left and Right side of the design sections.

For the option
File 21.2.3.1 MTF Boxing File
Left/Right side 21.2.3.2 Left Side and Right Side Boxing
Left/Right side for each layer 21.2.3.2 Left Side and Right Side Boxing

Each of the options from this menu will now described.
21.2.3.1 MTF Boxing File

Selecting File from the Boxing menu brings up the Boxing File panel for defining the file of Boxing Definitions to be used in this Apply MTF.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boxing file</td>
<td>input</td>
<td>*.bf files</td>
<td>name of the Boxing file containing the Boxing Definitions to be used for the MTF.</td>
</tr>
<tr>
<td>Comment</td>
<td>column header</td>
<td></td>
<td>comment to add to the end of the line. In the text mtf file, the comment will be preceded by //.</td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td></td>
<td>OK stores the values in the fields and removes the panel.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Apply stores the values and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

The full definition of all the boxing command used in a Boxing Definition is given in the section 21.7 Full Definition of Boxing.

Please continue to the next section 21.2.3.2 Left Side and Right Side Boxing.
21.2.3.2 Left Side and Right Side Boxing

The panels brought up by selecting Left side or Right side from the Boxing menu brings up the Left Side Boxing and Right Side Boxing panels respectively. By default, this is for the first layer of boxing.

The Left Side Boxing and Right Side Boxing panels define for each boxing layer, what Boxing Definitions (from the boxing file) are applied, in what chainage ranges, along the reference string.

For the definition of boxing, go to the section 21.7 Full Definition of Boxing.

The panels are brought up by selecting Left side or Right side for Layer 2 to Layer 8 from the Boxing menu and then selecting the Layer number in the Layer choice box. Similar panels exist for Left and Right, and for each selected layer, and so won’t be documented separately.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left/Right Boxing Grid</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Chainage</td>
<td>smart chainage box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>chainage to start applying the Boxing Definition given in the Boxing column. The Boxing Definition goes until the chainage on the next row of the Grid.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you right click in the Chainage column or select Browse if the Browse menu comes up, then a Chainage panel comes up which has the most of the standard MTF choices for Smart Chainages. See 21.2.1 MTF Hinge Modifiers.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Boxing</td>
<td>boxing definition box</td>
<td>available boxing definitions</td>
<td></td>
</tr>
<tr>
<td></td>
<td>name of the Boxing Definition to apply from this chainage to the chainage in the next row of the Grid.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td>text box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>comment for this row of the grid.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Buttons at Bottom
**OK/Apply** button

**OK** stores the values in the fields and removes the panel.

**Apply** stores the values and leaves the panel on the screen.

Please continue to the next section **21.2.4 MTF Recalc**.
21.2.4 MTF Recalc

If Recalc is clicked, the Apply MTF associated with the MTF is recalced.

Please continue to the next section 21.2.5 MTF Auto Recalc.

21.2.5 MTF Auto Recalc

If Auto recalc is ticked, then whenever the Apply button is clicked on any of the panels for the Modifiers - Left Side Modifiers or Modifiers - Right Side or Boxing Definitions used in the Boxing, then a recalc of the associated Apply MTF for the MTF is done.

Please continue to the next section 21.2.6 MTF More.
21.2.6 MTF More

Position of menu:  Design => MTF => More

The More walk-right menu has options to apply and interpolate between templates, shift chainages by a delta value, use special chainage values and files and apply Strings modifiers.

The More walk-right menu is

![More menu]

For the options see:

- Templates  [21.2.6.1 MTF Templates]
- Shift  [21.2.6.2 MTF Shift]
- Specials  [21.2.6.3 MTF Special Chainages]
- Strings  [21.2.6.4 MTF String Modifiers]
- Hinge widening treatment  [21.2.6.6 MTF Hinge Widening Treatment]
- Loops  [21.2.6.7 MTF Remove Loops]
- Stripping  [21.2.6.8 MTF Stripping]
- Super/Widening  [21.2.6.9 MTF Super/Widening]
21.2.6.1 MTF Templates

The Templates walk-right brings up the Templates menu and selecting the Left side or Right side option brings up the Left Side Templates or Right Side Templates panels respectively which are used to specify which templates are used, and over what chainage range, for the Left and Right sides.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Templates Grid</td>
<td>For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.</td>
<td>smart chainage box</td>
<td>list of chainages for applying templates on the left/right hand side of the hinge string.</td>
<td></td>
</tr>
<tr>
<td>Chainage</td>
<td>smart chainage box</td>
<td>list of chainages for applying templates on the left/right hand side of the hinge string.</td>
<td>If you right click in the Chainage column or select Browse if the Browse menu comes up, then a Chainage panel comes up which has the most of the standard MTF choices for Smart Chainages. See 21.2.1 MTF Hinge Modifiers.</td>
<td></td>
</tr>
<tr>
<td>Template 1</td>
<td>template box</td>
<td>available templates</td>
<td>template to start applying at the chainage on the same row. If template 2 is blank, then template 1 is applied until the next chainage in the chainage column.</td>
<td></td>
</tr>
<tr>
<td>Template 2</td>
<td>template box</td>
<td>available templates</td>
<td>template to linearly interpolate to and finish with at the next chainage in the chainage column. In the file, the two templates will be separated by a comma.</td>
<td></td>
</tr>
</tbody>
</table>

Note - template 2 must have the same number of fixed and variable links as template 1 otherwise a gap
of the section separation length will be left between the end of template 1 and the start of template 2.

**Comment**

Continue to the next section [21.2.6.2 MTF Shift](#) or return to [21.2.6.2 MTF Shift 21.6 MTF More](#).
21.2.6.2 MTF Shift

In an MTF, most modifiers are defined in terms of chainage on the reference string. For example, the width modifier is defined to apply between a given start and end chainage on the reference string.

If the horizontal geometry of the reference string is modified, the reference chainages in the MTF that are defined by the Smart Chainage mode Typed will be incorrect.

Shift can help correct the Typed chainages in the MTF file when modifications are made to the reference string horizontal geometry after the MTF has been defined.

For the MTF and all special chainage files referred to in the mtf that are only typed values, Shift adds a delta chainage (the shift distance) to chainages within a user specified range.

However depending on the type of modifications made to the reference string, shift may have to be applied a number of times over a number of different chainage ranges. And apart from a simple change of start chainage, there may be chainages that can not be corrected with Shift.

Before using Shift, it is necessary to know how the reference string has changed from its original position so to use shift it is advantageous to make a copy of the reference string before any changes are made.

Examples Using Shift:

1. If only the start chainage of the reference string was modified, shift would be applied to the mtf for the entire original reference string and end chainages, with a shift distance equal to the difference between the new and the old start chainages for the reference string. For this case the horizontal geometry has not changed, just the chainages.

2. If the radius of a horizontal curve is changed in the middle of the reference string, all chainages from the beginning of the string up to point where the horizontal geometry starts to change would stay the same. At some point after the modified curve, the horizontal geometry of the string is unchanged and for this section of the mtf, a shift distance equal to the difference between the new and the old chainages of a non-modified point.

In all areas where the horizontal geometry has been modified, the chainages in the mtf would have to be carefully examined to see what changes are required.

Warning: Shift option is very powerful but is also very dangerous. Where ever possible, Smart Chainage modes other than Typed should be used.

Selecting Shift brings up the Shift Chainages panel.
The fields and buttons used in this panel have the following functions.

<table>

*OK stores the values in the fields and removes the panel.*

*Apply stores the values and leaves the panel on the screen.*

Continue to the next section 21.2.6.4 MTF String Modifiers or return to 21.2.6.3 MTF Special Chainages or 21.2.6 MTF More.
21.2.6.4 MTF String Modifiers

For information on how the String Modifiers in the MTF editor work, see 21.2.6.3 Description of String Modifiers in MTF.

Selecting Strings from the MTF Edit menu brings up the String Modifiers panel.

The String Modifiers panel consists of a grid with of rows (or lines) with commands in them, and an OK or Apply button to record the results.

String Modifier Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

The commands in the String Modifier grid are processed sequentially from the top to the bottom of the grid.

When the Grid Row is Empty

If the row of the grid is empty, clicking LB in the empty row will bring up the Create menu which contains all the available string modifier commands. Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the Create menu.

Selecting a menu item will bring up an associated panel which displays the information required for the hinge command. When the panel is filled in and OK or Apply selected, the panel information is written out to the row of the grid and is known as a hinge command. For information on each of the Hinge Commands, see 21.2.6.5 String Modifiers Commands.

When the Grid Row is Not Empty

If the row of the grid is not empty (and hence filled with a string modifier command) then clicking LB in the cell:

(a) Type will bring up the associated panel for the string modifier command.

For information on each of the Hinge Commands, see 21.2.6.5 String Modifiers Commands.

(b) Start chainage cell brings up the Smart Start Chainage panel
The **Start Chainage Mode** will determine what other fields are also on the panel (for example Extension ref for Mode **Start of reference string**. For more information on Chainage Modes, see 21.4 Smart Chainages.

(c) **End Chainage cell brings up the Smart End Chainage panel**

The **End Chainage Mode** will determine what other fields are also on the panel (for example Extension ref for Mode **End of reference string**. For more information on Chainage Modes, see 21.4 Smart Chainages.

(d) **Interval** will allow a real value to be typed into the cell

Note that the Interval column will not appear in the grid if Show interval column? is not ticked in the MTF Settings. See 21.2.7.8 MTF Setting Show Interval Column
(e) **Active** will toggle the *tick/not ticked*

(f) **Comment** will allow text to be typed into the cell

**Note** that clicking in the **Type, Start chainage, End chainage, Interval, Extra Start, Extra End, Active** and **Comment** cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.

**Buttons at Bottom**

**OK** button

**OK** stores the values in the fields and removes the panel BUT no **recalc** is done.

**Apply** button

**Apply** stores the values in the grid and leaves the panel on the screen.

*If Auto recalc is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.*

**Autopan on/off** button

*when clicked to say **Autopan is on** then if the chainage range is not in the view that the Reference string is on then the view will be panned so that it is on the view.*

**Highlight** button

*clicking the **Highlight** button brings up the **Highlight Modifiers** panel.*

Continue to the next section 21.2.6.5 **String Modifiers Commands**, or return to 21.2.6 **MTF More**
21.2.6.5 String Modifiers Commands

The commands in the String Modifiers grid are processed sequentially from top to bottom. The String Modifier commands are selected from the Create menu that is displayed when clicking in a cell in the Type column of the String Modifiers panel.

The Create menu is

modify by xfall and height
modify by 2-strings

For a description of the options, see

Height 21.2.6.5.1 Height
Height 2x 21.2.6.5.2 Height 2X
21.2.6.5.1 Height

The *height* the Height string modifier calculates for the amend point is given by:

(a) if the absolute flag is not set, the height of the hinge point, otherwise zero.

plus

(b) the interpolated height for the user given heights at the start and end chainages

plus

(c) the interpolated height for the user given cross falls at the start and end chainage.

That is, if the absolute flag is not set:

\[
\text{new height} = \text{hinge height} + (\text{interpolated height}) + (\text{interpolated xfall}) \times (\text{offset distance})
\]

If the absolute flag is set:

\[
\text{new height} = (\text{interpolated height}) + (\text{interpolated xfall}) \times (\text{offset distance})
\]

Selecting Height brings up the String Modify by Xfall Height panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amend string</td>
<td>string-select</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
select string to have heights amended.

Reference string  string-select
select reference string.

Hinge string  string-select
select hinge string.

Start/End chainage  smart chainage box
start/end chainage on the reference string for applying the modifier. See 21.2.1 MTF Hinge Modifiers

Interval  input
if non blank, the chainage separation to apply the modifier.
If blank, the Section separation value from the Apply MTF panel is used.

Start/End xfall  input  measures menu
start/end crossfall for the modifier.

Start/End height  input  measures menu
start/end height for modifier.

Absolute height  tick box
if ticked, the calculated height does not include the hinge height.
if not ticked, the calculated height includes the hinge height.

Comment  input
comment for this command line

Active  tick box  tick
if ticked, use this modifier.
if not ticked, don’t use this modifier.

OK/Apply  button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

For more information on how the String Modifiers in the MTF editor work, please go to the section 21.2.6.5.3 Description of String Modifiers in MTF.

Continue to the next section 21.2.6.5.2 Height 2X or return to 21.2.6.4 MTF String Modifiers or 21.2.6 MTF More.
21.2.6.5.2 Height 2X

The *height* the Height 2x string modifier calculates for the amend point is given by:

(a) the height of the hinge point

plus

(b) the offset distance multiplied by the cross fall between two user selected strings.

\[ \text{new height} = \text{hinge height} + \ (\text{xfall between string 1 and string 2}) \times \text{(offset distance)} \]

Selecting **Height 2x** brings up the **String Modify by 2 Strings** panel

![String Modify by 2 Strings](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Amend string</strong></td>
<td>string-select</td>
<td></td>
<td></td>
</tr>

<td></td>
</tr>
</tbody>
</table>
if non blank, the chainage separation to apply the modifier.
If blank, the Section separation value from the Apply MTF panel is used.

Crossfall string 1  string-select
select first string to define crossfall by.

Crossfall string 2  string-select
select second string to define crossfall by.

Comment  input
comment for this command line.

Active  tick box  tick
if ticked, use this modifier.
if not ticked, don’t use this modifier.

OK/Apply  button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

For more information on how the String Modifiers in the MTF editor work, please go to the section 21.2.6.5.3 Description of String Modifiers in MTF.

Continue to 21.2.6.6 MTF Hinge Widening Treatment or return to 21.2.6.4 MTF String Modifiers or 21.2.6 MTF More.
21.2.6.5.3 Description of String Modifiers in MTF

Unlike the other MTF options, the string modifier options modify the heights on an existing string called the amend string.

Like the apply options, a reference string is used to define chainage and what is perpendicular at each chainage. A hinge string is used to define offsets and heights. If no hinge string is selected, the reference string is also used as the hinge string.

For a given chainage on the reference string (chainage point), a line perpendicular to the reference string is constructed to cut through the hinge string and the amend string (the cut points are called the hinge point and the amend point).

Horizontal offset is defined as the offset value from the hinge point, and the height of the amend point is a modification of the height at the hinge point.

The string modifier options create and/or modify the heights of the amend points on the amend string.

The height of the amend point is derived from the hinge point by starting with the height of the hinge point and applying a crossfall to it across the offset distance from the hinge string to the amend string.

The cross fall can be defined by either:
(a) giving the cross fall
or
(b) using the cross fall between two user selected strings.

For the string options, the length of the string being modified is restricted by giving a start and end reference chainage. A chainage interval can also be specified to define extra reference chainage points to use between the start and end chainages.

How and where the amend string is modified depends on the type of string and whether the chainage interval is blank (null) or not.
What Points are Modified

For 3d, 4d, polyline and super strings:

If the chainage interval is not blank:

(a) The start and end chainage points are projected from the reference string and inserted into the amend string. The heights of the inserted points are defined by the string modifier command.

(b) The chainage points at the given chainage interval are also projected from the reference string and inserted into the amend string. The heights of the inserted points are defined by the string modifier command.

(c) Finally, the vertices of the amend string are dropped perpendicularly back onto the hinge and reference string and then those points used to modify the heights of the same vertices of the amend string.

If the chainage interval is blank:

(a) The start and end chainage points are projected from the reference string and inserted into the amend string. The heights of the inserted points are defined by the string modifier command.

(b) The vertices of the amend string are dropped perpendicularly back onto the hinge and reference string and then those points used to modify the heights of the same vertices of the amend string.

For Alignment strings:

If the chainage interval is not blank:

(a) All the vertical geometry is removed between the start and end chainages. That is, the vertical intersection points (VIP’s) and their associated vertical curves are removed.

(b) The start and end chainage points are projected from the reference string and vertical intersection points (VIP’s) inserted into the amend string. The height of the inserted VIP points are defined by the string modifier command.

If the chainage interval is blank:

(a) The start and end chainage points are projected from the reference string and vertical intersection points (VIP’s) inserted into the amend string. The heights of the inserted VIP points are defined by the string modifier command.

(b) The vertical intersection points (VIP’s) of the amend string are dropped perpendicularly back onto the hinge and reference strings and then those points used to modify the heights of the same VIP’s of the amend string. The vertical curves for the VIP’s are not changed.

Return to 21.2.6.4 MTF String Modifiers or 21.2.1 MTF Hinge Modifiers
21.2.6.6 MTF Hinge Widening Treatment

The **Hinge Widening Treatment** specified in the **Hinge Widening Treatment** panel.

![Hinge Widening Treatment panel]

The choices are:

- **None**
- **Horizontal only**
- **Horizontal & Vertical**

**OK** - selecting **OK** sets the **Treatment**.

Continue to the next section [21.2.6.7 MTF Remove Loops](#) or return to [21.2.6 MTF More](#).
21.2.6.7 MTF Remove Loops

The Loops options tries to remove loops in nominated strings generated by the Apply MTF.

**Important Note** - the sections generated from the Apply MTF will not be modified and will still intersect each other. In that case, the sections can be generated after the *Apply MTF* by cutting through strings. See [28.9.13.2 Cuts by Centreline](#).

Selecting **Loops** from the menu displays the **Remove loops** panel.

### Name column header

_names of the strings to process to try and remove any loops from. The names can include wild cards (*) and wild characters (!)._
21.2.6.8 MTF Stripping

A fixed stripping depth can be specified in the **Apply** option whilst the **Apply MTF** option allows for stripping depths that can **vary along the design**.

If a **non-zero stripping depth** exists at a chainage, the **cut** and **fill** calculations are done with respect to the section through the tin **dropped in height** by the stripping depth.

However, the **design strings** are generated by battering into the **unstripped** surface, and the stripping volume is the volume between the stripped and unstripped surface for the design.

Striping depths are defined for chainages along the reference string and can be linearly interpolated between chainages.

**NOTE**: Cut and fill areas and volumes are adjusted for the stripping depths. The total stripping volume is given at the end of the volumes report.

Selecting the **Stripping** option on the **MTF edit** menu brings up the **Stripping Changes** panel.

![Stripping Changes Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

<td>21.2.6.9.5 Right Widths</td>
</tr>
<tr>
<td>Right widths</td>
<td></td>
</tr>
</tbody>
</table>
21.2.6.9.1 Enable Super/Widening Names

For 12d Model Version 8, super elevation/widening from the super alignment was applied to strings in the fixed section of the template that were defined by crossfall.

For 12d Model 9, this method was replaced by being able to define by string name, which strings have super elevation and/or widening applied to them.

For backward compatibility, this option allows the user to either use string names, or to revert to the cross fall method used in version 8. The default is to use string names.

Selecting Enable super/widening names from the menu displays the Auto Super/Widening panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable names</td>
<td>tick box</td>
<td>tick</td>
<td></td>
</tr>
</tbody>
</table>

If not ticked, the super elevation/widening in the super string is applied to the string from the fixed template that are defined by crossfall.

Continue to the next section 21.2.6.9.2 Left Super or return to 21.2.6.9 MTF Super/Widening or return to 21.2.6 MTF More.
21.2.6.9.2 Left Super

This table defines the strings that have the left super elevation from the super alignment applied to them.

Selecting **Left Super** from the menu displays the **Left Side Super Crossfall Strings** panel.

*comment to be recorded.*

Return to [21.2.6.9 MTF Super/Widening](#) or [21.2.6 MTF More](#)
21.2.7 MTF Settings

Position of menu:   Design => MTF => Settings

The Settings walk-right menu is

- set the name of Design Layer
- set the default chainage type
- set the shape formation toggle
- set whether the Extra start and Extra end tick boxes are shown
- set the distance for placing extra sections before the start & end chainages
- set whether to show Extra start and Extra end columns
- set whether to show Absolute column
- set whether to show Interval column
- set the name of the link for the hinge string
- set the distance to search along a section when trying to find strings used in any of the MTF commands

For the options see:

- Design layer name  21.2.7.1 MTF Setting Design layer name
- Design chainage type  21.2.7.2 MTF Setting Default Chainage Type
- Shape formation toggle  21.2.7.3 MTF Setting Shape Formation Toggle
- Show extra start/end?  21.2.7.4 MTF Setting Show Extra Start/End
- Extra start/end value  21.2.7.5 MTF Setting Extra Start/End value
- Show start/end column?  21.2.7.6 MTF Setting Show Extra Start/End column
- Show absolute column?  21.2.7.7 MTF Setting Show Absolute Column
- Show interval column?  21.2.7.8 MTF Setting Show Interval Column
- Hinge link name  21.2.7.9 MTF Setting Hinge Link Name
- Width  21.2.7.10 MTF Width
21.2.7.1 MTF Setting Design layer name

In 12d Model, the MTF Modifiers can produce any number of named layers but there is one special layer referred to as the Design Layer, that is used to produce design x sections, design strings, the road tin, etc.

Any MTF points in the Design Layer will automatically generate points on the design x sections, and design strings will be generated without them having to be done by the Create =>Strings MTF Modifier command.

The name of the special Design Layer can be changed by clicking on Design layer name to bring up the Design Layer Name panel.

Design layer name - the name used for the special Design Layer.

OK - selecting OK sets the default name for the design layer.

Continue to the next section 21.2.7.2 MTF Setting Default Chainage Type or return to 21.2.7 MTF Settings.

21.2.7.2 MTF Setting Default Chainage Type

The Default Chainage Type panel specifies the default Smart Chainage Mode to use in the MTF Modifier commands in this MTF file.

The choices are:

None - no Smart Chainage choice is used as the default.
Typed - Typed is the default for Smart Chainages.
Extents reference string - the start of the reference string is used for Start modes and the end of the reference string is used for End modes.
Named part on reference string - named part on reference string is the default for Smart Chainages.
Named position on reference string - named position on reference string is the default for Smart Chainages.

OK - selecting OK sets the given Chainage type as the default.

Continue to the next section 21.2.7.3 MTF Setting Shape Formation Toggle or return to 21.2.7 MTF Settings.
21.2.7.3 MTF Setting Shape Formation Toggle

Creating shapes and strings can be a time consuming process so it is possible to set modes for if it occurs or not.

The choices are:

**Don't form shapes or strings** - don't create shapes or strings that are referred to in the Create => Shapes and Create => Strings MTF Modifier commands.

**Form shapes or strings** - generated the shapes and strings as specified in the Create => Shapes and Create => Strings MTF Modifier commands.

**Form shapes, not strings** - generated the shapes as specified in the Create => Shapes MTF Modifier command but do not generated the strings referred to in the Create => Strings MTF Modifier command.

**Form strings, not shapes** - generated the strings as specified in the Create => Strings MTF Modifier command but do not generated the shapes referred to in the Create => Shapes MTF Modifier command.

**OK** - selecting OK sets the given Shape Formation Type.

Continue to the next section 21.2.7.4 MTF Setting Show Extra Start/End or return to 21.2.7 MTF Settings.

21.2.7.4 MTF Setting Show Extra Start/End

With MTF Modifier commands, a command applies from the start chainage and finished just before the end chainage. This is to prevent a doubling up in the definitions for the chainage between the end of one command and the beginning of the following command.

To make values change correctly between the MTF definitions at the start and end chainages, for most MTF Modifier commands there are Extra start and Extra end tick boxes.

If Extra start is ticked on and the command is not the first, a section is created Extra start/end value before the Start chainage of the command. Because the definition for this extra section is given by the previous command. This ensures that the previous command applies to almost to the this Start chainage.

If Extra end is ticked on, a section is created Extra start/end value before the End chainage of the command. The definition of this extra section is given by the current command. This ensures that the current command applies almost to the end, especially when it is the last command and there is no next Start chainage.

For most situations, the Extra start and Extra end tick boxes for an MTF Modifier Command can be left ticked on and the default is to have them both ticked on.

If Show Extra start/end? is ticked, the Extra start and Extra end tick boxes are shown on the MTF Modifier command panels.

If Show Extra start/end? is not ticked, the Extra start and Extra end tick boxes are not shown on the MTF Modifier command panels.
Notes:
1. The display of the Extra start and Extra end columns in the Left/Right MTF Modifiers panel is controlled by the 21.2.7.6 MTF Setting Show Extra Start/End column.
2. The Extra start/end value is set by 21.2.7.5 MTF Setting Extra Start/End value.

Continue to the next section 21.2.7.5 MTF Setting Extra Start/End value or return to 21.2.7 MTF Settings.

21.2.7.5 MTF Setting Extra Start/End value

For 12d Model itself, the Extra start/end value does not need to be changed but when writing out sections that are to be loaded into some software products, the sections sometimes can’t be closer than a fixed value in the other software. In that case modifying the Extra start/end value will allow you to get over that restriction.

Extra start/end value - the distance to use for placing extra sections before the start and end chainages.
OK - selecting OK sets the Extra start/end value.

Continue to the next section 21.2.7.6 MTF Setting Show Extra Start/End column or return to 21.2.7 MTF Settings.

21.2.7.6 MTF Setting Show Extra Start/End column

If Show extra start/end column? is ticked, the Extra Start and Extra Start columns are shown in the Left/Right MTF Modifiers panel.
If Show extra start/end column? is not ticked the Extra Start and Extra Start columns are not shown in the Left/Right MTF Modifiers panel.
Note that the Extra start/Extra end tick boxes appearing in the MTF Modifier Commands is controlled by the 21.2.7.4 MTF Setting Show Extra Start/End.

21.2.7.7 MTF Setting Show Absolute Column

The Absolute column is a condensed way of displaying the value of the New value usage Absolute field in the MTF command Modify Link.
If Show absolute? is ticked, the Absolute column is shown in the Left/Right MTF Modifiers panel.
If Show absolute column? the Absolute column is not shown in the Left/Right MTF Modifiers panel.
Note that in both cases, the New value usage field (which the Absolute column represents) is shown in the MTF Modifier Link command panels.
For an example of New value usage and Absolute, see 21.1.2.3 New Value Usage.
21.2.7.8 MTF Setting Show Interval Column

If **Show interval column?** is **ticked**, the **Interval column** is shown in the **Left/Right MTF Modifiers** panel.

If **Show interval column?** the **Interval column** is **not** shown in the **Left/Right MTF Modifiers** panel.

Note that in both cases, the **Interval field** is shown on the **MTF Modifier command** panels.

Continue to the next section 21.2.7.9 **MTF Setting Hinge Link Name** or return to 21.2.7 MTF Settings.

21.2.7.9 MTF Setting Hinge Link Name

The name of the link for the Hinge string can now be given a user defined name.

**Hinge name** - the name used for the hinge link.

**OK** - selecting OK sets the **Hinge name**.

Continue to the next section 21.2.7.10 **MTF Width** or return to 21.2.7 MTF Settings.
21.2.7.10 MTF Width

A **section width** is used to limit the distance to search along a section when trying to find strings used in any of the MTF commands.

Selecting **Width** from the MTF edit men brings up the **Section Width** panel for setting the width.

![Section Width Panel](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section width</td>
<td>A perpendicular offset from the Hinge string. It is used to limit the search distance for strings when performing MTF modifier commands.</td>
<td>input</td>
<td>10000</td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td>A comment to add to the end of the line. In the file, the comment will be preceded by //..</td>
<td>column header</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OK/Apply</td>
<td><strong>OK</strong> stores the values in the fields and removes the panel. <strong>Apply</strong> stores the values and leaves the panel on the screen.</td>
<td>button</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Return to **21.2.7 MTF Settings**.
21.2.8 MTF Save

Clicking **Save** on the **MTF Edit** menu (without walking right) saves the MTF file.

Clicking on the options on the walk right menu will:

- **If** **Save** is clicked, the MTF is saved to disk and the **MTF Edit** panel is left on the screen.
- **If** **Quit** is clicked, the MTF is **not** saved to disk and the **MTF Edit** panel is closed.
- **If** **Save & Finish** is clicked, the MTF is **s**aved to disk and the **MTF Edit** panel then closed.

Return to **21.1 The Modifiers and Templates File - MTF**.
21.3 Options Not Yet Re-documented for V11

V11 introduced the concept of Layers and also removed the restriction that links could only be modified by the two of the three width, height, xfall or slope, that they were defined by. These options have not yet been documented for the V11 changes.

21.3.0.1 Insert Cut Links from a Template

All the cut links from an existing template can be inserted by the Insert cut template command. Selecting Insert cut template brings up the Insert Cut Template panel.

![Insert Cut Template](image)

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>template box</td>
<td>select template menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>the name of the template to take the cut links from.</td>
<td></td>
</tr>
<tr>
<td>Before</td>
<td>input</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if non-blank, the cut links from the selected template are inserted before the given link.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If blank, the cut links from the selected template are appended to the end of the existing cut links.</td>
<td></td>
</tr>
<tr>
<td>Start/End mode</td>
<td>choice box</td>
<td>Start (ref)/End (ref)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>defines the start/end chainages for inserting the new template links.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers</td>
<td></td>
</tr>
<tr>
<td>Interval</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if non blank, the interval to use to create cross sections and strings over the given chainage range.</td>
<td></td>
</tr>
</tbody>
</table>
If blank, the Section separation value from the Apply MTF panel is used.

Extra start/end tick box

if ticked, add an extra x-section 0.1 mm before the start/end chainage.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box

if ticked, use this modifier.
if not ticked, don’t use this modifier.

OK/Apply button

OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.2 Cut Link - Remove or return to 21.3.0.1 Insert Cut Links from a Template

21.3.0.2 Cut Link - Remove

Cut links can be deleted between given chainages by using the Cut Remove command.
Selecting Remove brings up the Cut - Remove panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link name</td>
<td>input</td>
<td>defaults</td>
<td>select name menu</td>
</tr>
</tbody>
</table>
Start/End mode choice box Start (ref)/End (ref) defines the start/end chainages for removing the cut link. For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers.

Interval input
if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply MTF panel is used.

Extra start/end tick box
if ticked, add an extra x-section 0.1 mm before the start/end chainage.

Comment input
comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box
if ticked, use this modifier.
if not ticked, don’t use this modifier.

OK/Apply button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.3 Cut Link - Modifier Width or Height or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.3 Cut Link - Modifier Width or Height
The cut width modifier is used to modify the width of variable cut links originally defined by width. That is, links defined by width and slope or width and height.

Similarly the cut height modifier is used to modify the height of variable cut links originally defined by height. That is, links defined by height and width or height and slope.

Selecting Width or Height brings up the Cut - Width and Cut - Height panels respectively.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link name</td>
<td>input</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>name of the link to modify.</td>
<td></td>
</tr>
<tr>
<td>Start/End mode</td>
<td>choice box</td>
<td>Start (ref)/End (ref)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>defines the start/end chainages for modifying the links. For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers</td>
<td></td>
</tr>
<tr>
<td>Interval</td>
<td>input</td>
<td>measures menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply MTF panel is used.</td>
<td></td>
</tr>
<tr>
<td>Start/End width/height</td>
<td>input</td>
<td>measures menu</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>start/end width/height for modifying the link.</td>
<td></td>
</tr>
<tr>
<td>Extra start/end</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</td>
<td></td>
</tr>
<tr>
<td>Absolute</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>if ticked, the width/height is set to the values given in the start and end value fields. If not ticked, the values given in the start and end value fields are added to the existing widths/heights.</td>
<td></td>
</tr>
<tr>
<td>Cubic</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
if ticked, the width/height is varied as a reverse cubic between the start and end chainages.
if not ticked, the width/height is varied linearly between the start and end chainages.

Comment input
comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick
if ticked, use this modifier.
if not ticked, don’t use this modifier.

OK/Apply button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.4 Cut Link - Modify Slope or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.4 Cut Link - Modify Slope
The cut slope modifier is used to modify the slope of variable cut links originally defined by slope. That is, links defined by slope and width or slope and height.

Selecting Slope brings up the Cut - Slope panel

The fields and buttons used in this panel have the following functions.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link name</td>
<td>input</td>
<td>select name menu</td>
<td></td>
</tr>
<tr>
<td>Start/End mode</td>
<td>choice box</td>
<td>Start (ref)/End (ref)</td>
<td></td>
</tr>
<tr>
<td>Interval</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Start/End slope</td>
<td>input</td>
<td>measures menu</td>
<td></td>
</tr>
<tr>
<td>Extra start/end</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Absolute</td>
<td>tick box</td>
<td>tick</td>
<td></td>
</tr>
<tr>
<td>Cubic</td>

<td></td>
<td></td>
</tr>
<tr>
<td>Rotate</td>
<td>tick box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td>input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>tick box</td>
<td>tick</td>
<td></td>
</tr>
<tr>
<td>OK/Apply</td>
<td>button</td>
<td>OK stores the values in the fields and removes the panel.</td>
<td>Apply stores the values and leaves the panel on the screen.</td>
</tr>
</tbody>
</table>

- **Link name**: Name of the link to modify.
- **Start/End mode**: Defines the start/end chainages for modifying the link. For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers.
- **Interval**: If non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply MTF panel is used.
- **Start/End slope**: Measures menu start/end slope for modifying the link.
- **Extra start/end**: If ticked, add an extra x-section 0.1 mm before the start/end chainage.
- **Absolute**: If ticked, the slope is set to the values given in the start and end slope fields. If not ticked, the slopes given in the start and end value fields are added to the existing slopes.
- **Cubic**: Only none or one of Cubic and Rotate can be set to tick. The default is none - that is, neither is ticked and in the default case, the slope is varied linearly with respect to slope between the start and end chainages.
- **Rotate**: If ticked, the slope is varied linearly with respect to the angle, between the start and end chainages.
- **Comment**: Comment to add to the end of the line. In the file, the comment will be preceded by //.
- **Active**: If ticked, use this modifier. If not ticked, don't use this modifier.

### 21.3.0.5 Cut Link - from Link

The Cut from link walk-right brings up the Cut from Link menu with options to take the width, height or slope from another link.
Cut Width, Height or Slope from a Link

The **Width from link** modifier is used to modify the width of cut links originally defined by width to be the same width as another link. That is, the width of the link is a copy of the width of another link.

The **Height from link** modifier is used to modify the height of cut links originally defined by height to be the same height as another link. That is, the height of the link is a copy of the height of another link.

The **Slope from link** modifier is used to modify the slope of cut links originally defined by slope to be the same slope as another link. That is, the slope of the link is a copy of the slope of another link. The link to copy slope from can be defined in terms of slope or cross fall. If the link to copy is defined by cross fall, then the slope is calculated to match the cross fall.

Selecting **width from link**, **height from link** or **slope from link** brings up the **Cut - Width from Link**, **Cut Height - from Link** and **Cut - Slope from Link** panels respectively.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link name</td>
<td>input</td>
<td>select name menu</td>
<td>name of the link to modify.</td>
</tr>
<tr>
<td>Start/End mode</td>
<td>choice box</td>
<td>Start (ref)/End (ref)</td>
<td>defines the start/end chainages for modifying the link. For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers</td>
</tr>
<tr>
<td>Interval</td>
<td>input</td>
<td></td>
<td>If non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply MTF panel is used.</td>
</tr>
<tr>
<td>From link name</td>
<td>input</td>
<td>select name menu</td>
<td>template link to take width/height/slope from.</td>
</tr>
<tr>

<td>fixed</td>
<td>fixed, cut, fill</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>zone that the template link to take width/height/slope from, comes from.</td>
</tr>
<tr>
<td>Extra start/end</td>
<td>tick box</td>
<td></td>
<td>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</td>
</tr>
<tr>
<td>Comment</td>
<td>input</td>
<td></td>
<td>comment to add to the end of the line. In the file, the comment will be preceded by //.</td>
</tr>
<tr>
<td>Active</td>
<td>tick box</td>
<td>tick</td>
<td>if ticked, use this modifier.</td>
</tr>
</tbody>
</table>
if not ticked, don’t use this modifier.

OK/Apply button
- OK stores the values in the fields and removes the panel.
- Apply stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.6 Cut Link - to String or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.6 Cut Link - to String

The Cut to string walk-right brings up the Cut to String menu with options to take the width, height or slope by going to another string.

For To string, go to
- Cut Link - Modify To String
- Cut Link - Calculate Width, Height or Slope to a String

Cut Link - Modify To String

For any cut link, To string calculates the width, height and/or slope of the link needed to get from the start point of the link to the to the selected string.

However if the tin in the Apply MTF is cut before reaching the string, the cut link stops at the Apply MTF tin.

Selecting To string bring up the Cut - to String panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link name</td>
<td>input</td>
<td>select name menu</td>
<td>name of the link to modify:</td>
</tr>
<tr>
<td>Start/End mode</td>
<td>choice box</td>
<td>Start (ref)/End (ref)</td>
<td>defines the start/end chainages for modifying the link. For more information on Start/End mode, see <a href="#">21.2.1 MTF Hinge Modifiers</a> except for this option:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>When the <strong>Start mode</strong> is <strong>Start (ref)</strong>, or <strong>Typed</strong> and the chainage is <strong>blank</strong>, the modification begins at the low dropped chainage of the selected string.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>When the <strong>End mode</strong> is <strong>End (ref)</strong>, or <strong>Typed</strong> and the chainage is <strong>blank</strong>, the modification ends at the high dropped chainage of the selected string.</td>
</tr>
<tr>
<td>Interval</td>
<td>input</td>
<td></td>
<td>If <strong>non blank</strong>, the interval to use to create cross sections and strings over the given chainage range. If <strong>blank</strong>, the <strong>Section separation</strong> value from the <strong>Apply MTF</strong> panel is used.</td>
</tr>
<tr>
<td>String</td>
<td>string-select</td>
<td></td>
<td>select string to use for defining width/height/crossfall for the link.</td>
</tr>
<tr>
<td>Side to search</td>
<td>input</td>
<td>left side, right side, both sides</td>
<td>side of the hinge string to start searching to find the string to define width/height/crossfall.</td>
</tr>
<tr>
<td>Extra start/end</td>
<td>tick box</td>
<td></td>
<td>If <strong>ticked</strong>, add an extra x-section 0.1 mm before the start/end chainage.</td>
</tr>
</tbody>
</table>
| Comment           | input    |          | comment to add to the end of the line. In the file, the comment will be preceded by //.
**Chapter 21  Advanced Design**

**Options Not Yet Re-documented for V11**

Active tick box tick

if **ticked**, use this modifier.

if **not ticked**, don’t use this modifier.

OK/Apply button

**OK** stores the values in the fields and removes the panel.

**Apply** stores the values and leaves the panel on the screen.

**Cut Link - Calculate Width, Height or Slope to a String**

**Width to String:**

For a cut link defined by width and height or width and slope, Cut Width to string calculates the **width** of the link as the width from the start point of the link, to the **to the selected string**. The slope or height is taken from the link. The option will give an error for a link defined by height and slope.

However if the tin in the Apply MTF is cut before reaching the string, the cut link stops at the **Apply MTF tin**.

**Height to String:**

For a cut link defined by height and width or height and slope, Cut Height to string calculates the **height** of the link as the difference in the height at the start point of the link, and the height at the **selected string**. The slope or width is taken from the link. The option will give an error for a link defined by width and slope.

However if the tin in the Apply MTF is cut before reaching the string, the cut link stops at the **Apply MTF tin**.
Xfall to String:

For a cut link defined by slope and width or slope and height, Cut Slope to string calculates the slope of the link as the slope from the start point of the link to the selected string. The width or height is taken from the link. The option will give an error for a link defined by width and height.

However if the tin in the Apply MTF is cut before reaching the string, the cut link stops at the Apply MTF tin.
Options Not Yet Re-documented for V11

Note:
Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example, for a modifier defined by *width* and *slope*, using *width to string* and a *slope to string* with the same string will place the end of the link on that string.

But the To string option will do the same thing in one command. See **Cut Link - Modify To String**.

Selecting *Width to string*, *Height to string* or *Slope to string* brings up the **Cut - Width to String**, **Cut - Height to String** and **Cut - Slope to String** panels respectively.

![Cut - Width to String](image)
![Cut - Height to String](image)
The fields and buttons used in this panel have the following functions.

Active
tick box tick

if ticked, use this modifier.
if not ticked, don’t use this modifier.

OK/Apply
button

OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.7 Cut Link - to Tin or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.7 Cut Link - to Tin

The Cut to tin walk-right brings up the Cut to Tin menu with options to calculate the width, height or slope to get to a given tin (which doesn’t have to be the Apply MTF tin).

For Width/Height/Tin to tin, go to the next section Cut Link - Modify Width, Height or Xfall to Sit on User Tin

Cut Link - Modify Width, Height or Xfall to Sit on User Tin

Width to Tin

For a cut link defined by width and height or width and slope, Width to tin calculates the width of the link as the width required so that the link will sit on the user given tin at the height/slope given in the link. The option gives an error for a link defined by height and slope.

Link - width and height - width calculated from the tin and given height (delta)
**Height to Tin**

For a cut link defined by *height and width* or *height and slope*, the **Height to tin** calculates the *height* of the link as the difference in the height of the start point of the link, and the height that is required so that the link will sit on the user tin at the *width/slope* given in the link. The option gives an error for a link defined by *width and xfall*.

**Slope to Tin**

For a cut link defined by *slope and width* or *slope and height*, the **Slope to tin** calculates the *slope* of the link as the *slope* required so that the link will sit on the user tin at the *width/height* given in the link. The option gives an error for a link defined by *width and height*. 
Selecting Width to tin, Height to tin, or Slope to tin brings up the Cut - Width to Tin, Cut - Height to Tin and Cut - Slope to Tin panels respectively.
Options Not Yet Re-documented for V11

*button*

**OK** stores the values in the fields and removes the panel.

**Apply** stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.8 Cut Link - to Two Heights or return to 21.3.0.1 Insert Cut Links from a Template.

### 21.3.0.8 Cut Link - to Two Heights

For an existing link, the **to 2 heights** option has a number of methods for **defining the height** from the start mode chainage to the end mode chainage. For example, over the chainage range, the height can be interpolated between two given RL’s.

However if the Apply MTF tin is cut before reaching the end of the modified link, the **cut link stops at the tin.**
Note: the **2 Strings** modifiers work with two points in a **section**. See [21.3.0.9 Cut Link - to 2 Strings](#).

Selecting a **2 heights** brings up the **Cut - to 2 Heights** panel.
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Modifier type</td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **Maintain** Slope/Width is the part of the new definition of the selected link that is taken from the selected **Link name**. See **Cut - Maintaining Width or Slope**.

The **Height** for the selected link is calculated by the method given by **Type**.

**Start/End mode**

choice box

Start (ref)/End (ref)

defines the start/end chainages for modifying the link.

For more information on **Start/End mode**, see **21.2.1 MTF Hinge Modifiers**.

**Interval**

input

if **non blank**, the interval to use to create cross sections and strings over the given chainage range.
If blank, the Section separation value from the Apply MTF panel is used.

**Type** choice box

![Select Choice](image)

For the calculation of height for each type, go to **Cut - Calculating the Heights for each Type**

**Extra start/end** tick box

*if ticked*, add an extra x-section 0.1 mm before the start/end chainage.

**Comment** input

*comment to add to the end of the line. In the file, the comment will be preceded by /*.*

**Active** tick box

*if ticked*, use this modifier.

*if not ticked*, don’t use this modifier.

**OK/Apply** button

**OK** stores the values in the fields and removes the panel.

**Apply** stores the values and leaves the panel on the screen.

**Cut - Maintaining Width or Slope**

The option **to 2 heights** defines the **height** of the selected string so to completely define the link, only the width or the slope is needed.

So from the selected link only the width or the xfall is used (maintained) - the height is calculated by the **to 2 heights** option.

If the selected link is defined by width and height, then at any chainage a slope can be calculated from the width and height at that chainage.

**Section View**

[Diagram showing the relationship between width, height, and slope]

For links defined by width and height, the slope at each chainage is uniquely defined.
If the selected link is defined by *slope and height*, then at any chainage a *width* can be calculated from the slope and height at that chainage.

For links defined by slope and height, the *width* at each chainage is uniquely defined.

Hence it doesn’t matter if the selected link is defined by *width and slope*, *width and height*, or *slope and height*, at each chainage a *width and slope* are uniquely defined.

So no matter how the selected link is defined, at any chainage, a unique width or a slope is known and it is that *Width* or *Slope* can be maintained by the **to 2 heights** option.

So the choices for the option are:

**Select Choice**
- Modify Height, Hold Width
- Modify Height, Hold Xfall

Continue to the next section **21.3.0.9 Cut Link - to 2 Strings** or return to **21.3.0.8 Cut Link - to Two Heights**, **21.3.0.1 Insert Cut Links from a Template**.

**Cut - Calculating the Heights for each Type**

**Select Choice**
- RL
- RL -> RL
- RL Grade ->
- < RL Grade
- Pos ->
- < Pos
- Pos -> Pos
- Pos Grade ->
- < Pos Grade
- RL -> Pos
- Pos -> RL

**Important Note**: Grade is calculated using *increasing Alignment chainages* and the *heights at the points* along the string being modifies. When going around a curve this will not be exactly the same as the grade along the string being modified.

The definitions of the calculations for each choice are the same as for the Fixed links. See **21.2.2.13.1 Fixed - Calculating the Heights for each Type**.

Continue to the next section **21.3.0.9 Cut Link - to 2 Strings** or return to **21.3.0.8 Cut Link - to Two Heights**, **21.3.0.1 Insert Cut Links from a Template**.
21.3.0.9 Cut Link - to 2 Strings

The Cut to 2 strings walk-right brings up the Cut to 2 Strings menu with options to calculate the width, height or slope from two given strings.

For Width/Height/Slope to 2 Strings, go to the next section Cut Link - Width, Height or Slope Between Two Strings.

Cut Link - Width, Height or Slope Between Two Strings

Width Between Two Strings

For a cut link defined by width and height or width and slope, Width to 2 strings sets the width for a link to be the width between two existing 12d Model strings.

However if the Apply MTF tin is cut before reaching the string, the cut link stops at the tin.

The option will give an error for a link defined by height and slope.

Height Between Two Strings

For a cut link defined by height and width or height and slope, Height to 2 strings sets the height for...
the link to be the **height between two** existing **12d Model** strings,

However if the Apply MTF tin is cut before reaching the string, the **cut link stops at the tin**.

The option will give an error for a link defined by **width** and **slope**.

Slope Between Two Strings

For a cut link defined by **slope** and **width** or **slope** and **height**, **Slope to 2 strings** sets the **slope** for the link to be the **slope between two** existing **12d Model** strings,

However if the Apply MTF tin is cut before reaching the string, the **cut link stops at the tin**.

The option will give an error for a link defined by **width** and **height**.
Modify Slope to be that between Two Strings - for Link defined by Xfall and Height

Selecting the width to 2 strings, height to 2 strings or slope to 2 strings option brings up the Cut - Width to 2 Strings, Cut - Height to 2 Strings and Cut - Slope to 2 String panels respectively.

</tbody>
</table>

- **start/end slope for modifying the template link.**

**Important Note** - for a fill link, a **positive** slope is down.
Extra start/end tick box
if ticked, add an extra x-section 0.1 mm before the start/end chainage.

Absolute tick box tick
if ticked, the slope is set to the values given in the start and end slope fields.
if not ticked, the values given in the start and end slope fields are added to the existing slopes.

Cubic and Rotate tick boxes:
Only none or one of Cubic and Rotate can be set to tick.
The default is none - that is, neither is ticked and in the default case, the slope is varied linearly with respect to slope between the start and end chainages.

Cubic tick box
if ticked, the slope is varied as a reverse cubic between the start and end chainages.

Rotate tick box
if ticked, the slope is varied linearly with respect to the angle, between the start and end chainages.

Comment input
comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick
if ticked, use this modifier.
if not ticked, don’t use this modifier.

OK/Apply button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.14 Fill Link - from Link or return to 21.3.0.10 Insert Fill Links from a Template.
21.3.0.14 Fill Link - from Link

The Fill from link walk-right brings up the Fill from Link menu with options to take the width, height or slope from another link.

For Width/Height/Slope from link, go to the next section Fill Link - Take Width, Height or Slope from another Link

Fill Link - Take Width, Height or Slope from another Link

The Width from link modifier is used to modify the width of fill links originally defined by width to be the same width as another link (width and height or width and slope). That is, the width of the link is a copy of the width of another link.

The Height from link modifier is used to modify the height of fill links originally defined by height to be the same height as another link (height and width or height and slope). That is, the height of the link is a copy of the height of another link.

The Slope from link modifier is used to modify the slope of fill links originally defined by slope to be the same slope as another link (slope and width or slope and height). That is, the slope of the link is a copy of the slope of another link. The link to copy slope from can be defined in terms of slope or cross fall. If the link to copy is defined by cross fall, then the slope is calculated to match the cross fall.

Selecting the width from link, height from link or slope from link option brings up the Fill - Width from Link, Fill - Height from Link and Fill - Slope from Link panels respectively.

if ticked, use this modifier.

if not ticked, don’t use this modifier.

OK/Apply

button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

**Fill Link - Calculate Width, Height or Slope to a String**

**Width to String:**

For a fill link defined by *width* and *height* or *width* and *slope*, **Fill Width to string** calculates the width of the link as the width from the start point of the link, to the to the **selected string**. The slope or *height* is taken from the link. The option will give an error for a link defined by *height* and *slope*.

However if the tin in the Apply MTF is cut before reaching the string, the **fill link stops at the Apply MTF tin**.

**Height to String:**

For a fill link defined by *height* and *width* or *height* and *slope*, **Fill Height to string** calculates the height of the link as the difference in the height at the start point of the link, and the height at the **selected string**. The slope or *width* is taken from the link. The option will give an error for a link defined by *width* and *slope*.

However if the tin in the Apply MTF is cut before reaching the string, the **fill link stops at the Apply MTF tin**.
Slope to String:
For a fill link defined by slope and width or slope and height, Fill Slope to string calculates the slope of the link as the slope from the start point of the link to the selected string. The width or height is taken from the link. The option will give an error for a link defined by width and height.

However if the tin in the Apply MTF is cut before reaching the string, the fill link stops at the Apply MTF tin.
Note:

Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example, for a modifier defined by width and slope, using width to string and a slope to string with the same string will place the end of the link on that string.

But the To string option will do the same thing in one command. See Cut Link - Modify To String.

Selecting the width to string, height to string or slope to string option brings up the Fill - Width to String, Fill - Height to String and Fill - Slope to String panels respectively.

Continue to the next section 21.3.0.16 Fill Link - to Tin or return to 21.3.0.10 Insert Fill Links from a Template.

21.3.0.16 Fill Link - to Tin

The Fill to Tin walk-right brings up the Fill to Tin menu with options to calculate the width, height or slope to get to a given tin (which doesn’t have to be the Apply MTF tin).

For Width/Height/Tin to tin, go to the next section Fill Link - Modify Width, Height or Xfall to Sit on User Tin.

Fill Link - Modify Width, Height or Xfall to Sit on User Tin

Width to Tin

For a fill link defined by width and height or width and slope, Width to Tin calculates the width of the link as the width required so that the link will sit on the user given tin at the height/slope given in the link. The option gives an error for a link defined by height and slope.

Given the height (delta) of the link, the end position being on the tin determines the end of the link. The width is then known.
Options Not Yet Re-documented for V11

### Height to Tin

For a fill link defined by height and width or height and slope, the **Height to tin** calculates the height of the link as the difference in the height of the start point of the link, and the height that is required so that the link will sit on the user tin at the **width/slope given in the link**. The option gives an error for a link defined by width and xfall.

**Important Note** - for a Fill link, positive height and slopes are down.

### Slope to Tin

Given the slope of the link, the end position being on the tin determines the end of the link. The **height (delta)** is then known.
For a fill link defined by slope and width or slope and height, Slope to tin calculates the slope of the link as the slope required so that the link will sit on the user tin at the width/height given in the link. The option gives an error for a link defined by width and height.

Selecting Width to tin, Height to tin, or Slope to tin brings up the Fill - Width to Tin, Fill - Height to Tin and Fill - Slope to Tin panels respectively.

Continue to the next section 21.3.0.17 Fill Link - to Two Heights or return to 21.3.0.10 Insert Fill Links from a Template.
21.3.0.17 Fill Link - to Two Heights

For an existing link, the **to 2 heights** option has a number of methods for **defining the height** from the start mode chainage to the end mode chainage. For example, over the chainage range, the height can be interpolated between two given RL’s.

However if the Apply MTF tin is cut before reaching the end of the modified link, the **fill link stops at the tin**.

**Note:** the **2 Strings** modifiers work with two points in a **section**. See 21.3.0.18 Fill Link - to Two Strings.

Selecting **2 heights** brings up the Fill - to 2 Heights panel
The fields and buttons used in this panel have the following functions.

  - comment to add to the end of the line. In the file, the comment will be preceded by //.

**Active**
- tick box
  - if **ticked**, use this modifier.
  - if **not ticked**, don’t use this modifier.

**OK/Apply**
- button
  - **OK** stores the values in the fields and removes the panel.
  - **Apply** stores the values and leaves the panel on the screen.

**Fill - Maintaining Width or Slope**

The option **to 2 heights** defines the **height** of the selected string so to completely define the link, only the width or the slope is needed.

So from the selected link only the **width** or the xfall is used (maintained) - the height is calculated by the **to 2 heights** option.

If the selected link is defined by **width and height**, then at any chainage a **slope** can be calculated from the width and height at that chainage.

Important note - for a **fill link**, for slope and heights, **positive is down**.

**Section View**
- width defined
- **slope calculated**
- height defined (+ve for a fill link)

For links defined by width and height, the **slope** at each chainage is uniquely defined.
If the selected link is defined by *slope and height*, then at any chainage a *width* can be calculated from the slope and height at that chainage.

For links defined by slope and height, the *width* at each chainage is uniquely defined.

Hence it doesn't matter if the selected link is defined by *width and slope*, *width and height*, or *slope and height*, at each chainage a *width and slope* are uniquely defined.

So no matter how the selected link is defined, at any chainage, a unique width or a slope is known and it is that *Width* or *Slope* can be maintained by the *to 2 heights* option.

So the choices for the option are:

```
Select Choice
Modify Height, Hold Width
Modify Height, Hold Xfall
```

Continue to the next section 21.3.0.18 Fill Link - to Two Strings or return to 21.3.0.17 Fill Link - to Two Heights, 21.3.0.10 Insert Fill Links from a Template.

**Fill - Calculating the Heights for each Type**

```
Select Choice
RL
RL -> RL
RL Grade ->
<- RL Grade
Pos ->
<- Pos
Pos -> Pos
Pos Grade ->
<- Pos Grade
RL -> Pos
Pos -> RL
```

**Important Note:** Grade is calculated using *increasing Alignment chainages* and the *heights at the points* along the string being modifies. When going around a curve this will not be exactly the same as the grade along the string being modified.

The definitions of the calculations for each choice are the same as for the Fixed links. See 21.2.2.2.13.1 Fixed - Calculating the Heights for each Type.

Continue to the next section 21.3.0.18 Fill Link - to Two Strings or return to 21.3.0.17 Fill Link - to Two Heights, 21.3.0.10 Insert Fill Links from a Template.
21.3.0.18 Fill Link - to Two Strings

The Fill to 2 strings walk-right brings up the Fill to 2 Strings menu with options to calculate the width, height or slope from two given strings.

For Width/Height/Slope to 2 Strings, go to the next section Fill Link - Width, Height or Slope Between Two Strings.

Fill Link - Width, Height or Slope Between Two Strings

Width Between Two Strings

For a fill link defined by width and height or width and slope, Width to 2 strings sets the width for a link to be the width between two existing 12d Model strings, however if the Apply MTF tin is cut before reaching the string, the fill link stops at the tin. The option will give an error for a link defined by height and slope.

Height Between Two Strings
For a fill link defined by height and width or height and slope, Height to 2 strings sets the height for the link to be the height between two existing 12d Model strings. However if the Apply MTF tin is cut before reaching the string, the fill link stops at the tin. The option will give an error for a link defined by width and slope.

Slope Between Two Strings

For a cut link defined by slope and width or slope and height, Slope to 2 strings sets the slope for the link to be the slope between two existing 12d Model strings. However if the Apply MTF tin is cut before reaching the string, the cut link stops at the tin. The option will give an error for a link defined by width and height.
Selecting the width to 2 strings, height to 2 strings or slope to 2 strings option brings up the Fill - Width to 2 Strings, Fill - Height to 2 Strings and Fill - Slope to 2 String panels respectively.
The fields and buttons used in this panel have the following functions.

Continue to the next section 21.4 Smart Chainages or return to 21.3.0.10 Insert Fill Links from a Template.
21.4 Smart Chainages

Many options in 12d Model require a chainage value from another string, usually referred to as a reference string.

For example, in the Apply MTF and in all the left and right side modifiers in an MTF, there are start and end chainages where the chainage values refer to chainages on the reference string.

The traditional method of typing in a chainage value is supported but 12d Model supports numerous other methods, called smart chainages, that calculate the chainage in various ways from the reference string geometry and from other strings.

The power of smart chainages is that when things move around, the smart chainages often don’t have to be typed in again, but automatically recalculate themselves for the new situation. Hence the chainage values do not have to be revisited every time there is a change in geometry or for simple changes like modifying the start chainage of the reference string.

The ultimate goal is to be totally free of typed fixed chainages and to produce a chainage free design.

For panel fields and grids that allow smart chainages, instead of just a chainage field, there is also a Mode field with a pop up of all the smart chainages available for that field.

There is a Modes, Start Mode and/or End Mode depending on whether there is just a chainage value or the panel has start and end chainages and hence both a Start Mode and an End Mode.
What choices are available for Mode, Start Mode and End Mode depends on the option that the smart chainage is in.

Finally most smart chainages also have an Extension field that is added to the chainage value calculated by the Mode.

For example, if the Mode was End of reference string and the Extension value was -50 then the final smart chainage will be at chainage 50 before the end of the reference string, no matter what the actual end chainage is for the reference string. See 21.4.1 Extension Value.

21.4.1 Extension Value

For chainages given by Start mode, End mode or Mode, there is an Extension ref field in the Chainage panel and the Extension ref value is added to the reference chainage calculated by the Smart Chainage.

For example, if the Mode was End of reference string and the Extension value was -50 then the final smart chainage will be at chainage 50 before the end of the reference string no matter what the actual end chainage is for the reference string.

In the cases when the Mode uses another string as well as the reference string, there is a String and Extension other field for the other string as well as an Extension ref field for the reference string.

For example, for the Mode Start of other string, there is a Extension other and an Extension ref.

![Smart Chainage Panel](image)

To get the final chainage, the value of Extension other is added to the Start chainage of the string selected in String (the other string). This point on the other string is then dropped onto the Reference string.

The value of Extension ref is then added to the chainage of the dropped point onto the Reference string, to give the final chainage used.

**Notes**

Extension other and Extension ref can be positive or negative.

Continue to the next section 21.4.2 Typed or return to 21.2.1 MTF Hinge Modifiers.
21.4.2 Typed

Selecting **Typed** adds a *Chainage* and an *Extension ref* field.

A reference string chainage is typed into the *Chainage* field and the value in the *Extension ref* field is then **added** to this value to give the chainage used as the **final chainage**.

If the *Chainage* is left blank then the **start/end chainage of the reference string** is used as the *Chainage* value.

Continue to the next section 21.4.3 **Start of Reference String** or return to 21.2.1 **MTF Hinge Modifiers**.

21.4.3 Start of Reference String

Selecting **Start of reference string** adds an *Extension ref* field.

The value in the *Extension ref* field is **added** to the **start chainage of the reference string** to give the chainage used as the **final chainage**.

Continue to the next section 21.4.4 **End of Reference String** or return to 21.2.1 **MTF Hinge Modifiers**.

21.4.4 End of Reference String

Selecting **End of reference string** adds an *Extension ref* field.

The value in the *Extension ref* field is **added** to the **end chainage of the reference string** to give the chainage used as the **final chainage**.

Continue to the next section 21.4.5 **Start of Other String** or return to 21.2.1 **MTF Hinge Modifiers**.
21.4.5 Start of Other String

Selecting Start of other string adds String, Extension other and Extension ref fields.

The String field is to select a string referred to as the Other string.

To get the final chainage, the value of Extension other is added to the Start chainage of the Other string. This point on the other string is dropped onto the Reference string.

The value of Extension ref is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the final chainage used.

Continue to the next section 21.4.6 End of Other String or return to 21.2.1 MTF Hinge Modifiers.
21.4.6 End of Other String

Selecting End of other string adds String, Extension other and Extension ref fields.

The String field is to select a string referred to as the Other string.

To get the final chainage, the value of Extension other is added to the End chainage of the Other string. This point on the other string is dropped onto the Reference string.

The value of Extension ref is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the final chainage used.

Continue to the next section 21.4.7 Lowest Dropped Chainage of Other String or return to 21.2.1 MTF Hinge Modifiers.
21.4.7 Lowest Dropped Chainage of Other String

Selecting Lowest dropped chainage of other string adds String, Extension other and Extension ref fields.

The String field is to select a string referred to as the Other string.

The start and end of the Other string are dropped onto the Reference string and the lower of the reference chainages of the two dropped ends.

How is Extension other used?

To get the final chainage, the value of Extension other is added to the Start chainage of the Other string. This point on the other string is dropped onto the Reference string.

The value of Extension ref is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the final chainage used.

Continue to the next section 21.4.8 Highest Dropped Chainage of Other String or return to 21.2.1 MTF Hinge Modifiers.
21.4.8 Highest Dropped Chainage of Other String

Selecting lowest dropped chainage of other string adds *String*, *Extension other* and *Extension ref* fields.

<table>
<thead>
<tr>
<th>Start chainage</th>
<th>End chainage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Mode</td>
</tr>
<tr>
<td><em>String</em></td>
<td><em>String</em></td>
</tr>
<tr>
<td><em>Extension other</em></td>
<td><em>Extension other</em></td>
</tr>
<tr>
<td><em>Extension ref</em></td>
<td><em>Extension ref</em></td>
</tr>
</tbody>
</table>

The *String* field is to select a string referred to as the *Other* string.

The *start* and *end* of the *Other* string are dropped onto the Reference string and the higher of the reference chainage of the two dropped end??.

How is *Extension other* used??

To get the final chainage, the value of *Extension other* is added to the *Start chainage of the Other string*. This point on the *other* string is dropped onto the Reference string.

The value of *Extension ref* is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

Start of Other String

Point of *Extension other* from the start of Other

Point dropped onto Reference string

Start of Reference String

Final chainage on Reference String

Continue to the next section 21.4.9 Named Part on Reference String or return to 21.2.1 MTF Hinge Modifiers.
21.4.9 Named Part on Reference String

Selecting Named part on reference string adds the Part and Extension ref fields.

<table>
<thead>
<tr>
<th>Start chainage</th>
<th>End chainage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Mode</td>
</tr>
<tr>
<td>Part</td>
<td>Part</td>
</tr>
<tr>
<td>Extension ref</td>
<td>Extension ref</td>
</tr>
</tbody>
</table>

The syntax for the required **Named Part** on the **Reference** string can be typed into the **Part** field. Or clicking LB or RB on the + for **Part** brings up the **Named Part Builder** for the reference string and this can be used to create the **Part text** for the section of a named part of the reference string that is required. Pressing **Set** then puts this value into the **Part** field.

![Named Part Builder](image)

The value in the **Extension ref** field is added to the reference chainage calculated for the selected named part to give the chainage used as the **final chainage**.

**Important Note**

The **Named Parts** fields access the **Vertical named parts** as well as the **Horizontal named Parts** of a Super Alignment and the **Part name** pop up list both the horizontal and vertical named parts. The **Modes** cannot distinguish between the names for horizontal and vertical named parts so the horizontal names are given priority. So if a vertical part has the same names as a horizontal part then the vertical name will not be shown in the **Part name** list.

Continue to the next section **21.4.10 Named Part on Other String** or return to **21.2.1 MTF Hinge Modifiers**.
21.4.10 Named Part on Other String

Selecting Named part on other string adds the String, Part, Extension other and Extension ref fields.

The String field is to select a string referred to as the Other string.

The syntax for the required Named Part on the Other string can be typed into the Part field. Or clicking LB or RB on the + for Part brings up the Named Part Builder for the Other string and this can be used to create the Part text for the section of a named part of the Other string that is required. Pressing Set then puts this value into the Part field.

The value in the Extension ref field is added to the reference chainage calculated for the selected named part to give the chainage used as the final chainage.

Important Note
The Named Parts fields access the Vertical named parts as well as the Horizontal named Parts of a Super Alignment and the Part name pop up list both the horizontal and vertical named parts.

The Modes cannot distinguish between the names for horizontal and vertical named parts so the horizontal names are given priority. So if a vertical named part has the same names as a horizontal named part then the vertical name will not be shown in the Part name list.

Continue to the next section 21.4.11 Named Position on Reference String or return to 21.2.1 MTF Hinge Modifiers.
21.4.11 Named Position on Reference String

Selecting Named position on reference string adds the Position and Extension ref fields.

A Named Position for the Reference string can be typed into the Position field, or selected from the Position pop up which brings up the list of all Named Positions for the Reference string.

The value in the Extension ref field is added to the reference chainage calculated for the selected named position to give the chainage used as the final chainage.

Important Note

The Named Position fields access the Vertical named positions as well as the Horizontal named positions of a Super Alignment and the Position pop up list both the horizontal and vertical named positions.

The Modes cannot distinguish between the names for horizontal and vertical named positions so the horizontal names are given priority. So if a vertical named part position has the same name as a horizontal named position then the vertical name will not be shown in the Named Position list.

Continue to the next section 21.4.12 Named Position on Other String or return to 21.2.1 MTF Hinge Modifiers.
21.4.12 Named Position on Other String

Selecting Named position on other string adds the String, Position, Extension other and Extension ref fields.

The String field is to select a string referred to as the Other string.

A Named Position for the Other string can be typed into the Position field, or selected from the Position pop up which brings up the list of all Named Positions for the Other string.

The value in the Extension ref field is added to the reference chainage calculated for the selected named part to give the chainage used as the final chainage.

Important Note

The Named Position fields access the Vertical named positions as well as the Horizontal named positions of a Super Alignment and the Position pop up list both the horizontal and vertical named positions.

The Modes cannot distinguish between the names for horizontal and vertical named positions so the horizontal names are given priority. So if a vertical named part position has the same name as a horizontal named position then the vertical name will not be shown in the Named Position list.

Continue to the next section 21.4.13 Cut Reference with Other String or return to 21.2.1 MTF Hinge Modifiers.
21.4.13 Cut Reference with Other String

Selecting Cut reference with other string adds the String and Extension ref fields.

The String field is to select a string referred to as the Other string.

The point on the Reference string where the Other string cuts the Reference string is first calculated.

The value in the Extension ref field is added to the reference chainage calculated for the cut point to give the chainage used as the final chainage.

Note - if the other string does not cut the reference string, or cuts it in more than one place, then the Mode is invalid and an error message is generated.

Continue to the next section 21.4.14 Intersection of Two Strings or return to 21.2.1 MTF Hinge Modifiers.
21.4.14 Intersection of Two Strings

Selecting Intersection of 2 strings adds the String 1, String 2 and Extension ref fields.

Two strings are selected with the String 1 and String 2 fields.

The value in the Extension ref field is added to the reference chainage calculated for the cut point to give the chainage used as the final chainage.

The intersection point of the two selected strings is calculated and dropped onto the Reference string.

The value in the Extension ref field is added to the reference chainage of the dropped intersection point to give the chainage used as the final chainage.

Continue to the next section 21.4.17 Relative to Self End or return to 21.2.1 MTF Hinge Modifiers.
21.4.15 Lowest Dropped Chainage of Modifier String

The Smart Chainage **Lowest dropped chainage of modifier string** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Lowest dropped chainage of modifier string** adds **Extension other** and **Extension ref** fields.

The **start** and **end** of the **Modifier** string are dropped onto the Reference string and the lower of the reference chainages of the two dropped ends.

**How is Extension other used?**

To get the final chainage, the value of **Extension other** is added to the **Start chainage of the Other string**. This point on the **other** string is dropped onto the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

Continue to the next section 21.4.16 Highest Dropped Chainage of Modifier String or return to 21.2.1 MTF Hinge Modifiers.
21.4.16 Highest Dropped Chainage of Modifier String

The Smart Chainage **Lowest dropped chainage of modifier string** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Lowest dropped chainage of modifier string** adds **Extension other** and **Extension ref** fields.

![_screenshot](image.png)

The *start* and *end* of the **Modifier** string are dropped onto the Reference string and the lower of the reference chainages of the two dropped ends??.

How is **Extension other** used??

To get the final chainage, the value of **Extension other** is added to the **Start chainage of the Other string**. This point on the *other* string is dropped **onto** the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

![Diagram](diagram.png)

Continue to the next section **21.4.17 Relative to Self End** or return to **21.2.1 MTF Hinge Modifiers**.
21.4.17 Relative to Self End

The Smart Chainage **Relative to self end** is only available in the Apply MTF Left and Right Modifiers. This Mode is only available for a Start Chainage.

Selecting **Relative to Self End** adds an **Extension ref** field.

The value in the **Extension ref** field is added to the **end chainage of the current MTF command** to give the chainage used as the **final chainage**.

This Mode is useful when the **end chainage** of the current MTF command is known and you want the start chainage of the same command to be relative to the known **end chainage** of the same command.

Continue to the next section 21.4.18 **Relative to Self Start** or return to 21.2.1 **MTF Hinge Modifiers**.

21.4.18 Relative to Self Start

The Smart Chainage **Relative to self start** is only available in the Apply MTF Left and Right Modifiers. This Mode is only available for an End Chainage.

Selecting **Relative to Self Start** adds an **Extension ref** field.

The value in the **Extension ref** field is added to the **start chainage of the current MTF command** to give the chainage used as the **final chainage**.

This Mode is useful when the **start chainage** of the current MTF command is known and you want the end chainage of the same command to be relative to the known **start chainage** of the same command.

Continue to the next section 21.4.19 **Relative to Alias Start** or return to 21.2.1 **MTF Hinge Modifiers**.
21.4.19 Relative to Alias Start

The Smart Chainage **Relative to alias start** is only available in the Apply MTF Left and Right Modifiers.

Selecting Relative to alias start adds Alias and Extension ref fields.

An **Alias** from the current MTF can be typed into the Alias field, or selected from the Alias pop up which brings up the list of all Aliases in the current MTF.

The value in the Extension ref field is **added** to the **start chainage** of the selected Alias to give the chainage used as the **final chainage**.

This Mode is useful when you want the start/end chainage to be relative to the start chainage of the command in the current MTF with the given Alias.

Continue to the next section 21.4.20 Relative to Alias End or return to 21.2.1 MTF Hinge Modifiers.

21.4.20 Relative to Alias End

The Smart Chainage **Relative to alias end** is only available in the Apply MTF Left and Right Modifiers.

Selecting Relative to alias end adds Alias and Extension ref fields.

An **Alias** from the current MTF can be typed into the Alias field, or selected from the Alias pop up which brings up the list of all Aliases in the current MTF.

The value in the Extension ref field is **added** to the **end chainage** of the selected Alias to give the chainage used as the **final chainage**.

This Mode is useful when you want the start/end chainage to be relative to the end chainage of the command in the current MTF with the given Alias.

Continue to the next section 21.4.21 Relative to Previous Start or return to 21.2.1 MTF Hinge Modifiers.
21.4.21 Relative to Previous Start

The Smart Chainage **Relative to previous start** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Relative to previous start** adds **Rows back** and **Extension ref** fields.

Rows back gives the number of rows in the current MTF to go back to get the **Start chainage** from. Rows back must be greater or equal to one.

The value in the **Extension ref** field is added to the **start chainage of the selected row** to give the chainage used as the **final chainage**.

This Mode is useful when you want the start/end chainage to be relative to the start chainage of an earlier command that is a known number of rows back in the current MTF.

Continue to the next section 21.4.22 Relative to Previous End or return to 21.2.1 MTF Hinge Modifiers.

21.4.22 Relative to Previous End

The Smart Chainage **Relative to previous end** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Relative to previous end** adds **Rows back** and **Extension ref** fields.

Rows back gives the number of rows in the current MTF to go back to get the **End chainage** from. Rows back must be greater or equal to one.

The value in the **Extension ref** field is added to the **end chainage of the selected row** to give the chainage used as the **final chainage**.

This Mode is useful when you want the start/end chainage to be relative to the end chainage of an earlier command that is a known number of rows back in the current MTF.

Continue to the next section 21.4.23 Snippet Cut Reference with Model of Strings or return to 21.2.1 MTF Hinge Modifiers.
21.4.23 Snippet Cut Reference with Model of Strings

The Smart Chainage **Snippet cut ref with model of strings** is only available with the Snippet option in the Apply MTF Left and Right Modifier.

This Mode takes a model of strings and the Snippet is applied where each string in the model cuts the Reference string.

Selecting Snippet cut ref with model of strings adds the Model, Wildcard and Extension other fields.

- **Model**
  - model box
  - the model of strings that is used for the snipped to be applied to where each of the strings cuts the Reference string.

- **Wildcard**
  - text box
  - if not blank, only those strings in the model Model that satisfy Wildcard are used.
    - If blank, all the strings in the model Model are used.

For each string, the point on the Reference string where the string cuts the Reference string is first calculated.

The value in the Extension ref field is added to the reference chainage calculated for the cut point to give the chainage used as the final chainage.

---

**For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.**

Continue to the next section 21.4.24 Snippet Placed to Model of Strings or return to 21.2.1 MTF Hinge Modifiers.
21.4.24 Snippet Placed to Model of Strings

The Smart Chainage Snippet placed to model of strings is only available with the Snippet option in the Apply MTF Left and Right Modifier.

This Mode takes a model of strings and the Snippet and for each string in the model, the end points of the string are dropped onto the Reference string and the Snippet is run with the Start chainage taken as the smaller of the two dropped chainages and the End chainage of the snippet taken as the larger of the two dropped chainages.

Selecting Snippet cut ref with model of string adds the Model, Wildcard and Extension other fields.

![Snippet settings](image)

- **Model**: model box available models
  - the model of strings that the Snippped is applied to using the start and end of each string dropped onto the Reference string as the Start and End chainages for the Snippet.

- **Wildcard**: text box
  - if not blank, only those strings in the model Model that satisfy Wildcard are used.
  - If blank, all the strings in the model Model are used.

For each string, the start and the end of the string are dropped onto the Reference string and the dropped chainages and used as the Start and End chainages of the Snippet.

![Snippet diagram](image)

For more information on the inserting and use of snippets, see [21.5 Defining and Using Snippets](#).

Continue to the next section [21.4.25 Drop Point to Reference String](#) or return to [21.2.1 MTF Hinge Modifiers](#).
21.4.25 Drop Point to Reference String

Selecting Drop point to reference string adds X coordinate, Y coordinate and Extension ref fields.

X coordinate and Y coordinate are the coordinate of the point to drop onto the Reference string to give a reference chainage.

The value in Extension ref is added to the dropped chainage to give the chainage used as the final chainage.

This Mode is useful when you know the coordinates of a point and you want the start/end chainage to be relative to the chainage of the dropped point.

Continue to the next section 21.4.26 Drop Point to Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.26 Drop Point to Other String

Selecting Drop point to other string adds String, X coordinate, Y coordinate, Extension other and Extension ref fields.

The String field is to select a string referred to as the Other string.

X coordinate and Y coordinate are the coordinate of the point to drop onto the Other string to give a chainage on the Other string.

The value in Extension other is added to the dropped chainage on the Other string and the point at this chainage is then dropped onto the Reference string.

The value in Extension ref is then added to the chainage of the point dropped onto the Reference string to give the chainage used as the final chainage.

Return to 21.2.1 MTF Hinge Modifiers.

21.5.1 What are MTF Snippets?

A snippet is a collection of many single MTF modifiers that can be inserted as a group into an MTF file.

However unlike an MTF file or an insert in an MTF, values to be used inside the snippet can be passed down to the snippet via parameters whose values are specified each time the snippet is placed.

So, snippets enable things such as driveway laybacks, kerb transitions, earthworks flares etc. to be a single entry in a MTF file thus reducing the size of the MTF file and enhancing it's readability.

Setting up a snippet is the same complexity as creating MTF items but once a snippet is created, it can be reused over and over again.

Snippets can also be used to hide complex modifiers from novice users.

Go to the next section 21.5.2 Creating a Snippet or back to 21.5 Defining and Using Snippets.
21.5.2 Creating a Snippet

There is currently no snippet Create/Editor in 12d Model so for the moment snippets must be manually created as a text file. Snippet text files have the extension MTFSNIPPET. Note that this is case insensitive. That is, each letter can be in upper or lower case.

Luckily the format for each snippet command is almost identical to the normal modifier commands as written out to the left_side_modifier or right_side_modifier sections of the MTF file when viewed as a text file. The snippet commands differ slightly in that they can contain variables and parameters that can be substituted when the snippet is run.

So the easiest way to create a snippet file is to create a normal MTF inside 12d Model with the modifiers to be included and used in the snippet. Once these modifier commands are in the MTF, they can be copied directly from the Modifiers grid in a snippet compatible format.

To do so, select one or more rows of modifiers in the grid. Then right-click on one of the row header to bring up the modifiers grid context menu and select Copy (snippet paste). This will copy the selected commands to the Windows clipboard.

Now that the desired modifier commands have been copied to the clipboard, you can create a new text document in your preferred text editor and paste the commands into the new document. A snippet, at its simplest, can simply be these same modifier commands in a snippet file. However, the real power and flexibility of snippets comes from using the more advanced functionality discussed in the following sections.

It is also worth noting that the snippet commands can be created manually, rather than by copy and paste, by typing the required snippet and modifier commands directly into a text file. Note, however, that the syntax and format of the snippet and modifiers must be correct or you will get errors when the snippet is inserted or run.

How to construct the additional information in the snippet file, and how a snippet works, will be explained in the following sections.

Go to the next section 21.5.3 An Example of a Snippet or back to 21.5 Defining and Using Snippets.
21.5.3 An Example of a Snippet

The following is an example of a snippet called KERB_SA_DW places a layback at a driveway. It will be used as the example in describing the workings of a snippet.

// PARAMETER WIDTH REAL "Layback width" 0.6
// PARAMETER DEPTH REAL "Layback depth" -0.04

// drop into DW

insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
insert "SAI" "grey" 0.5 $DEPTH unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
insert "SAT" "grey" 0.03 0.15 unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
insert "SAB" "grey" 0.18 0 unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end

// push out links
width "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.03 $WIDTH absolute extra_start extra_end
width "SAB" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.18 0.0 absolute extra_start extra_end
height "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.15 0.2 absolute extra_start extra_end
height "SAB" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0 0 absolute extra_start extra_end

// DW to -0.5
insert "SKL" "grey" 0.001 0 unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end
insert "SKI" "grey" 0.5 $DEPTH unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end
insert "SKB" "grey" $WIDTH 0.2 unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end

//back out -0.5 to end
insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 absolute extra_start extra_end
insert "SAI" "grey" 0.5 $DEPTH unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
insert "SAT" "grey" 0.03 0.15 unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
insert "SAB" "grey" 0.18 0 unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 absolute extra_start extra_end

// push out links
width "SAT" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 $WIDTH 0.03
Note: each line of the snippet is wrapping around because of the limited width of this document. Each line should be like:

// drop into DW
insert "SAL" *grey* 0.001 0 unknown named_position "MODIFIER_START" 0 named_position *MODIFIER_START* 0.5 absolute extra_start extra_end

But that would be impossible to read.

Go to the next section 21.5.4 Editing a Snippet File or back to 21.5 Defining and Using Snippets.
21.5.4 Editing a Snippet File

The option

\textit{Design =>MTF =>Edit snippets}

will list the local snippets files and if one is selected, opens it in the text editor.

Go to the next section \textit{21.5.5 How To Select a Snippet in an MTF} or back to \textit{21.5 Defining and Using Snippets}. 
21.5.5 How To Select a Snippet in an MTF

From the grid in the Right MTF Modifiers or Left MTF Modifiers panel, bring up the Create menu and select Snippet. This will display the MTF Snippet panel and clicking on the folder icon in the Snippet field brings up the choice of snippets to use.

A snippet is then selected from the snippet pop-up list.

Selecting a snippet can modify the fields on the MTF Snippet panel. The Start and End modes may or may not be enabled, and there may be extra field on the panel, with or without values in them.

For example, selecting the KERB_SA_DW snippet modifies the MTF Snippet panel and there are two extra panel fields - Layback width with the value 0.6 and Layback height with the value -0.4. Selecting the KERB_SA_DW_CENT snippet adds the extra panel fields but also disables the End mode.
If a Start mode or End mode is missing from the snippet, then the corresponding field will be left blank in the Start chainage/End chainage columns in the Left or Right Templates Modifiers panel. And the snippet name appears in the Type column under the text MTF Snippet.

A snippet with no End mode has Not used in the End chainage column.

How snippets control the Start and End modes is documented in the next section 21.5.7 Start and End Modes for a Snippet and how the extra panel fields are created is discussed in the
sections 21.5.8.2 Snippet Parameter of Type REAL, 21.5.8.6 Snippet Parameter of Type CHOICE and 21.5.8.8 Snippet Parameter of Type TICK.

Go to the next section 21.5.6 Comments in Snippets or back to 21.5 Defining and Using Snippets.
21.5.6 Comments in Snippets

Snippets support the same commenting syntax as MTF files, which has two forms:

1. **A Line Comment**
   
   All characters from a double forward-slash `//` until the end of that line are ignored.
   However, if the first word after the line comment character is PARAMETER, INFO or DISPLAY then the line will be interpreted as a special command by 12d.

   ```
   // PARAMETER this will not be interpreted as a normal line comment
   // This is a normal line comment
   @ def_tok WIDTH 3.5    // This is also a line comment
   ```

2. **A Block Comment**

   All characters between a starting `/*` and a terminating `*/` are ignored.

   ```
   /* This comment can
cover several lines
until we get to the terminating */
   ```

Continue to the next section 21.5.7 Start and End Modes for a Snippet or return to 21.5 Defining and Using Snippets.
21.5.7 Start and End Modes for a Snippet

The Start and End modes on the MTF Snippet panel calculate a position on the Reference string just like any other MTF modifier but how the values are specified inside the snippet file is slightly different to a standard MTF modifier.

Also unlike other MTF modifiers, some snippets only require one of the Start mode and End mode and if that is the case, the mode not required will be greyed out so that it can't be filled in.

The lines in the snippet file are similar to the normal MTF modifiers when "named position" has been selected for the Start and End modes. However the value of the "named position" in the text command needs to be replaced by either MODIFIER_START or MODIFIER_END followed by a real number.

So for example, the "named_position" "name" "extension" in a MTF command is replaced by

"named_position" MODIFIER_START snippet_extension

If a MODIFIER_START exists somewhere in the snippet then Start mode is enabled on the MTF Snipped panel.

If a MODIFIER_END exists somewhere in the snippet then End mode is enabled on the MTF Snipped panel.

Finally when a snippet runs, the chainage is calculated for the Start mode/End mode fields in the MTF Snippet panel and passed down to the snippet and where ever MODIFIER_START/MODIFIER_END appears, the passed chainage value PLUS the additional snippet_extension for each occurrence of the MODIFIER_START/MODIFIER_END is used as the chainage for that part of the snippet.

The following example for the KERB_SA_DW snippet shows how the snippet determines when a Start mode and/or End mode is needed, and how the extra snippet_extension is used.

```
// drop into DW
insert "SAL" "grey" 0.001 0  unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
...
// DW to -0.5
insert "SKL" "grey" 0.001 0  unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end
...
// back out to -0.5 to end
insert "SAL" "grey" 0.001 0  unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
```

These lines in the KERB_SA_DW snippet a lip of kerb through a driveway layback. It starts off as an SA style kerb, the layback is an SK style and then back to the SA style.

1. Looking at the first line: - the SA->SK transition:

```
insert "SAL" "grey" 0.001 0  unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
```
In this line, the "named_position" "MODIFIER_START" 0 replaces the standard chainage command in that position in the text modifier.

"named_position" "MODIFIER_START" - this tells the snippet to have a Start mode on the MTF Snippet panel. The calculated chainage for the Start mode field on the MTF Snippet panel is then passed to the snippet to be used as the chainage (plus the snippet_extension) in that "named_position" MODIFIER_START position in the modifier command.

0 - the value after MODIFIER_START is an additional value to add to the chainage calculated in from the Start mode in the MTF Snippet panel and passed down to the snippet.

So "named_position" "MODIFIER_START" 0 is replaced by the chainage defined by the Start mode of the MTF Snippet panel.

Similarly the "named_position" "MODIFIER_START" 0.5 replaces the standard chainage command in that position in the modifier and evaluates to being chainage defined by the Start mode of the MTF Snippet panel plus 0.5.

So this snippet line inserts a link from the chainage value passed in from the Start mode on the MTF Snippet panel, to 0.5 after the chainage value passed in from the Start mode on the MTF Snippet panel.

2. Looking at the second line: - SK Layback:

```
insert "SKL" "grey" 0.001 0 unknown named_position "MODIFIER_START" 0.5 named_position "MODIFIER_END" -0.5 absolute extra_start extra_end
```

The difference to the previous line is that this line has the keywords MODIFIER_START and MODIFIER_END after "named_position" commands.

"named_position" "MODIFIER_END" - this tells the snippet to have a End mode on the MTF Snippet panel. The calculated chainage for the End mode field on the MTF Snippet panel is then passed to the snippet to be used as the chainage (plus the snippet_extension) in that "named_position" MODIFIER_END position in the modifier command.

-0.5 - the value after MODIFIER_END is an additional value to add to the chainage calculated in from the End mode in the MTF Snippet panel and passed down to the snippet.

So this snippet line inserts a link from 0.5 past the chainage value passed from Start mode in the MTF Snippet panel through to 0.5 before the chainage value passed in from End mode in the MTF Snippet panel.

3. Looking at the third line: - SK ->SA transition:

```
insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 absolute extra_start extra_end
```

So this snippet line inserts a link from 0.5 before the chainage value passed to the snippet from the Start mode in the MTF Snippet panel, to the chainage value passed to the snippet from the Start mode in the MTF Snippet panel.

Go to the next section 21.5.8 Snippet Parameters and Commands or back to 21.5 Defining and Using Snippets.
21.5.8 Snippet Parameters and Commands

A powerful feature of snippets is that parameters (fields presented to and populated by the user) can be defined and used throughout the snippet file.

To pass values for the parameters through to the snippet, each parameter is displayed as the appropriate panel Field in the MTF Snippet panel, with the label (descriptive text) for the panel field defined in the snippet. For example, a Real box panel field for a real parameter and a Model box panel field for a model parameter.

The user enters the value into the field on the MTF Snippet panel. This entered value is then passed through to the snippet during processing.

**Note** - Even if a parameter is defined in a snippet, it will only appear in the MTF Snippet panel if the parameter is actually used in the snippet.

**WARNING** - once a snippet with parameters has been saved in a MTF file, the parameters for the snippet are saved *in the MTF file*. Then when the Apply MTF is run, the parameters and their values are read in from the MTF file and passed into the current snippet file.

Hence if the snippet file has been modified and parameter definitions added, modified or removed since the snippet was originally place in the MTF, these modifications of parameters will be ignored until the snippet panel is reopened in the MTF editor which forces the snippet file to be parsed again and the changes to the parameter definitions are then recognised.

For the syntax of each available parameter types and commands, see

- 21.5.8.2 Snippet Parameter of Type REAL
- 21.5.8.3 Snippet Parameter of Type INTEGER
- 21.5.8.4 Snippet Parameter of Type TEXT
- 21.5.8.5 Snippet Parameter of Type SELECT
- 21.5.8.6 Snippet Parameter of Type CHOICE
- 21.5.8.7 Snippet Parameter of Type CHOICE2
- 21.5.8.8 Snippet Parameter of Type TICK
- 21.5.8.9 Snippet Parameter of Type COLOUR
- 21.5.8.10 Snippet Parameter of Type NAME
- 21.5.8.11 Snippet Parameters for Models
- 21.5.8.12 Snippet Parameters for Tins
- 21.5.8.13 Snippet Parameter of Type LAYER
- 21.5.8.14 Snippet Parameter of Type NAMED_GRADE
- 21.5.8.15 Snippet Command INFO
- 21.5.8.16 Snippet Command DISPLAY
- 21.5.8.17 Snippet Command INCREMENT
- 21.5.8.18 Optional Parameters in Snippets
21.5.8.1 Common Definitions for Snippet Parameters

The general syntax for a snippet parameter is:

```
//  PARAMETER  param_name  param_type  param_desc  param_default  other_values
```

where

```
//  PARAMETER  param_name
```

This signifies that it is a parameter definition. Note that there must be at least one space after
the // and before the word PARAMETER.

param_name

This is the name to use for the parameter. Where ever the parameter is to be used in the
snippet, put ${param_name}. The characters of the parameter name can only be alphanumeric (upper and lower case) and underscores, and the name cannot contain spaces. The name doesn’t have quotes around it. The parameter names are not case sensitive so two
names only differing by case are considered to be identical. The parameters names must
be unique in a snippet.

param_desc  param_default

param_desc

This description is written in the MTF Snippet panel for the field to enter values for this
parameter. The description can include spaces and if it does then the description must be
enclose in double quotes (").

param_default

This value is optional.

But if it exists then this value is displayed as the value in the field for the parameter on the
MTF Snippet panel. If the default value is text and it contains any spaces then the text must
be enclosed in double quotes (").

Important Note:

There will only be a panel field in the MTF Snippet panel for the parameter param_name if the
parameter is used in the snippet.
21.5.8.2 Snippet Parameter of Type REAL

If a floating point number (a real number) is required then the REAL parameter type is used. A Snippet Parameter of type REAL inserts a Real box panel field into the MTF Snippet panel. The user can type a real number into the panel field which is then passed down to the snippet.

The syntax for type REAL is:

```
// PARAMETER param_name REAL param_descr param_default_value
```

where

```
// PARAMETER param_name
```

This defines a parameter of the given name. See `// PARAMETER param_name` for what is allowed as the parameter name.

REAL - the parameter type.

desc param_def

The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See `param_descr param_default`.

The following lines from the KERB_SA_DW snippet define two REAL parameters WIDTH and DEPTH and the values for the parameters are then used inside the snippet commands by writing $WIDTH and $DEPTH.

```
// PARAMETER WIDTH REAL "Layback width" 0.6
// PARAMETER DEPTH REAL "Layback depth" -0.04
// drop into DW
...
// push out links
width "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.03 $(WIDTH) absolute extra_start extra_end
...
```

Real panels field are in MTF Snippet panel because of the parameters WIDTH and DEPTH in the snippet

Description provided by the parameter definition in the snippet

Default value provided by the parameter definition in the snippet

**Important Note:**
The Real panel field for a REAL parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.3 Snippet Parameter of Type INTEGER or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.3 Snippet Parameter of Type INTEGER

If a whole number (an integer) is required then the INTEGER parameter type is used. A Snippet Parameter of type INTEGER inserts an Integer box panel field into the MTF Snippet panel. The user can type an integer into the panel field and it is then passed down to the snippet.

The syntax for type INTEGER is:

// PARAMETER param_name INTEGER param_desc param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

INTEGER - the parameter type.

param_desc param_default

The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_desc param_default.

Important Note:
The Integer panel field for a INTEGER parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.4 Snippet Parameter of Type TEXT or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.4 Snippet Parameter of Type TEXT

If text is required then the TEXT parameter type is used.

A Snippet Parameter of type TEXT inserts an Text box panel field into the MTF Snippet panel. The user can type text into the panel field and it is then passed down to the snippet.

The syntax for type TEXT is:

```
// PARAMETER param_name TEXT param_desc param_default
```

where

```
// PARAMETER param_name
```

This defines a parameter of the given name. See `// PARAMETER param_name` for what is allowed as the parameter name.

```
TEXT - the parameter type.
```

```
param_desc param_default
```

The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See `param descr param default`.

*Note for the TEXT type, the $parameter should be enclosed in the double quotes character in the modifier line.*

**Important Note:**
The Text panel field for a TEXT parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.5 Snippet Parameter of Type SELECT or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.5 Snippet Parameter of Type SELECT

If a string is to be selected then the SELECT parameter type is used. A Snippet Parameter of type SELECT inserts a String Select box panel field into the MTF Snippet panel. Using the Select box, a user can pick a string and it is then passed down to the snippet.

The syntax for type SELECT is:

```plaintext
// PARAMETER param_name SELECT param_desc param_default
```

where

// PARAMETER param_name
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

SELECT - the parameter type.

param_desc param_default
The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_descr param_default.

Here the parameter name is BB_STRING, its type is SELECT and so a Select box appears in the MTF Snippet panel with the panel field text Base string. The substitution point in the modifier is "$BB_STRING".

Important Note:
The String Select panel field for a SELECT parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continued to the next section 21.5.8.6 Snippet Parameter of Type CHOICE or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.6 Snippet Parameter of Type CHOICE

If the user is to select from a list of choices and the text of the choice is to be passed through to the snippet, then the CHOICE parameter type is used.

The Snippet Parameter of type CHOICE inserts a Choice box panel field into the MTF Snippet panel.

The format also defines the list of text to be displayed in the pop-up of choices and when a choice is selected, the text that is displayed is passed back to the snippet.

The syntax for type CHOICE is:

```
// PARAMETER param_name CHOICE param_desc choice_1 choice_2 ... choice_n
```

where

// PARAMETER param_name
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

CHOICE - the parameter type.

param_desc  - this description is written to the MTF Snippet panel for the field to enter values for this parameter. The description can include spaces and if it does then the description must be enclose in double quotes (").

choice_1 choice_2 ... choice_n - the choices that will be displayed in the parameter pop-up in the MTF Snippet panel.

Important Note:
The Choice panel field for a CHOICE parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.7 Snippet Parameter of Type CHOICE2 or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.7 Snippet Parameter of Type CHOICE2

If the user is to select from a list of choices, but different text than what appears on the choice list is to be passed through to the snippet, then the CHOICE2 parameter type is used.

The Snippet Parameter of type CHOICE2 inserts a Choice box panel field into the MTF Snippet panel.

The format also defines the list of text to be displayed in the pop-up of choices for each text that is displayed, a parameter value that is passed back to the snippet if that choice is selected.

The syntax for type CHOICE2 is:

```
// PARAMETER par_name CHOICE2 par_desc par_def par_1 desc_1 par_2 desc_2 ... par_n desc_n
```

where

```
// PARAMETER param_name
```

This defines a parameter of the given name. See `// PARAMETER param_name` for what is allowed as the parameter name.

CHOICE2 - the parameter type.

par_desc - this description is written in the MTF Snippet panel for the field to enter values for this parameter. The description can include spaces and if it does then the description must be enclose in double quotes (").

par_def - this value is optional but if it exists then this value is displayed as the value in the field for the parameter on the MTF Snippet panel. If the default value is text and it contains any spaces then the text must be enclosed in double quotes (").

par_i desc_i are pairs of parameters and description to go in the Choice box pop up. The description desc_i is displayed in the Choice pop up and if that description is selected, the parameter par_i is returned to the Snippet instead of the description.

For example

```
// PARAMETER CH CHOICE2 "Speed" S100 S80 "80 km/h" S100 "100 km/h"
```

This means that the text you have the default parameter, in this case S100, and then pairs of parameters and descriptions, S80 "80 km/h" etc.

**Important Note:**

The Choice panel field for a CHOICE2 parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.
Continue to the next section 21.5.8.8 Snippet Parameter of Type TICK or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.8 Snippet Parameter of Type TICK

If a true of false choice is required then the **TICK** parameter type is used.

The Snippet Parameter of type **TICK** inserts a Tick box panel field into the **MTF Snippet** panel.

The user can set the tick to off or on.

The syntax for type **TICK** is:

```plaintext
// PARAMETER param_name TICK param_desc param_default
```

where

```
// PARAMETER param_name
```

This defines a parameter of the given name. See // **PARAMETER param_name** for what is allowed as the parameter name.

**TICK** - the parameter type.

**param_desc** param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See **param_desc param_default**.

The value **param_default** is optional but if it exists then it must be 1 or a 0.

- If 1, the tick box come up set to tick/on.
- If 0, the tick box come up set to not ticked/off.

Note that in the above example, the value of the Tick box parameter TI ($TI), is used in a #define to set the value for _E (see 21.5.18 Major Warning - You Will be Caught by This).

**Important Note:**
The Tick panel field for a **TICK** parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section **21.5.8.9 Snippet Parameter of Type COLOUR** or return to **21.5.8 Snippet Parameters and Commands** or **21.5 Defining and Using Snippets**.
21.5.8.9 Snippet Parameter of Type COLOUR

If a colour is required then the COLOUR parameter type is used.

The Snippet Parameter of type COLOUR inserts a Colour box panel field into the MTF Snippet panel.

The user can type a colour name or colour number into the panel field, or select a colour from the pop-up of available colours in the project.

The syntax for type COLOUR is:

```
// PARAMETER param_name COLOUR param_desc param_default
```

where

```
// PARAMETER param_name
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.
```

```
COLOUR - the parameter type.
```

```
param_desc  param_default
The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_desc  param_default.
```

```
```

Important Note:
The Colour panel field for a COLOUR parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.10 Snippet Parameter of Type NAME or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.10 Snippet Parameter of Type NAME

If a name of a string is required then the NAME parameter type is used.

The Snippet Parameter of type NAME inserts a Name box panel field into the MTF Snippet panel. The user can type a string name into the panel field, or select a name from the pop-up of names that are taken from the names.4d file.

The syntax for type NAME is:

```
// PARAMETER  param_name  NAME  param_descr  param_default
```

where

```
// PARAMETER  param_name
```

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

NAME - the parameter type.

```
param_desc  param_default
```

The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_desc param_default.

**Important Note:**
The String Name panel field for a NAME parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.11 Snippet Parameters for Models or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.11 Snippet Parameters for Models

There are three different Snippet parameter types for creating a Model box in the MTF Snippet panel. Which parameter is used depends on what is required to happen if the model exists or does not exist.

(a) use MODEL_CREATE when it doesn’t matter if the selected model exists or doesn’t exist.
   See 21.5.8.11.1 Snippet Parameters of Type MODEL_CREATE
(b) use MODEL_MUST_EXIST when the selected model must already exist.
   See 21.5.8.11.2 Snippet Parameter of Type MODEL_MUST_EXIST
(c) use MODEL_MUST_NOT_EXIST when the model must not already exist.
   21.5.8.11.3 Snippet Parameter Type MODEL_MUST_NOT_EXIST

Or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.11.1 Snippet Parameters of Type MODEL_CREATE

The Snippet Parameter of type **MODEL_CREATE** inserts a Model box panel field into the MTF Snippet panel.

The user can type a model name into the panel field, or select a model from the pop-up of models for the Model box.

If the model does not exist when the snippet is run, then a new model is created.

The syntax for type **MODEL_CREATE** is:

```
// PARAMETER  param_name  MODEL_CREATE  param_desc  param_default
```

where

// PARAMETER  param_name
This defines a parameter of the given name. See // PARAMETER  param_name for what is allowed as the parameter name.

**MODEL_CREATE** - the parameter type.

param_desc  param_default
The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param descr param default.

---

Important Note:
The Model panel field for a MODEL_CREATE parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.11.2 Snippet Parameter of Type MODEL_MUST_EXIST or return to 21.5.8.11 Snippet Parameters for Models or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.11.2 Snippet Parameter of Type MODEL_MUST_EXIST

The Snippet Parameter of type **MODEL_MUST_EXIST** inserts a Model box panel field into the MTF Snippet panel.

The user can type a model name into the panel field, or select a model from the pop-up of models for the Model box.

If the model does not exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type **MODEL_MUST_EXIST** is:

```plaintext
// PARAMETER param_name MODEL_MUST_EXIST param_desc param_default
```

where

// PARAMETER param_name
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

MODEL_MUST_EXIST - the parameter type.

param_desc param_default
The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_desc param_default.

---

// PARAMETER TM MODEL_MUST_EXIST "Trimesh model" "Tri RSK 0201"
create_strings "selection" "KSA<<LK" "KSA<<lK" "KSA<<Tk" "KSA<<K" start_ref 0 final_ref 0
  "no_colour" "" "$TM" absolute extra_start extra_end

... 

Model box panel field is in the MTF Snippet panel because of the parameter TM of type MODEL_MUST_EXIST

Pop-up of models because the parameter type is MODEL_MUST_EXIST

Description provided by the parameter definition in the snippet

Error message if the model does not exist

---

**Important Note:**
The Model panel field for a MODEL_MUST_EXIST parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.11.3 Snippet Parameter Type MODEL_MUST_NOT_EXIST or return to 21.5.8.11 Snippet Parameters for Models or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.11.3 Snippet Parameter Type MODEL_MUST_NOT_EXIST

The Snippet Parameter of type **MODEL_MUST_NOT_EXIST** inserts a Model box panel field into the **MTF Snippet** panel.

The user can type a model name into the panel field, or select a model from the pop-up of models for the Model box.

If the model **does** exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type **MODEL_MUST_NOT_EXIST** is:

```
// PARAMETER param_name MODEL_MUST_NOT_EXIST param_desc param_default
```

where

```
// PARAMETER param_name
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.
MODEL_MUST_NOT_EXIST - the parameter type.
param_desc param_default
The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_desc param_default.
```

---

```
// PARAMETER TM MODEL_MUST_NOT_EXIST "Trimesh model" "Tri RSK 0201"
create_strings "selection" "KSA<<LK" "KSA<<IK" "KSA<<TK" "KSA<<BK" start_ref 0 final_ref 0
"no_colour" "" "$TM" absolute extra_start extra_end
...
```

Model box panel field is in the **MTF Snippet** panel because of the parameter **TM** of type **MODEL_MUST_NOT_EXIST**.

Pop-up of models because the parameter type is **MODEL_MUST_NOT_EXIST**.

Description provided by the parameter definition in the snippet.

Error message if the model already exists.

---

**Important Note:**

The Model panel field for a **MODEL_MUST_NOT_EXIST** parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.12 Snippet Parameters for Tins or return to 21.5.8.11 Snippet Parameters for Models or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.12 Snippet Parameters for Tins

There are three different Snippet parameter types for creating a Tin box in the MTF Snippet panel. Which parameter is used depends on what is required to be done if the tin exists or does not exit.

(a) use TIN_CREATE when it doesn’t matter if the selected tin exists or doesn’t exist. See 21.5.8.12.1 Snippet Parameter Type TIN_CREATE

(b) use TIN_MUST_EXIST when the selected model must already exist. See 21.5.8.12.2 Snippet Parameter Type TIN_MUST_EXIST

(c) use TIN_MUST_NOT_EXIST when the model must not already exit. 21.5.8.12.3 Snippet Parameter Type TIN_MUST_NOT_EXIST

Or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.12.1 Snippet Parameter Type TIN_CREATE

The Snippet Parameter of type TIN_CREATE inserts a Tin box panel field into the MTF Snippet panel.

The user can type a tin name into the panel field, or select a tin from the pop-up of tins for the Tin box.

If the tin does not exist when the snippet is run, then a new tin is created.

The syntax for type TIN_CREATE is:

```
// PARAMETER  param_name  TIN_CREATE  param_desc  param_default
```

where

```
// PARAMETER  param_name
```

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

TIN_CREATE - the parameter type.

```
param_desc  param_default
```

The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param descr param default.

---

Important Note:

The Tin panel field for a TIN_CREATE parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.12.2 Snippet Parameter Type TIN_MUST_EXIST or return to 21.5.8.12 Snippet Parameters for Tins or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.12.2 Snippet Parameter Type TIN_MUST_EXIST

The Snippet Parameter of type TIN_MUST_EXIST inserts a Tin box panel field into the MTF Snippet panel.

The user can type a tin name into the panel field, or select a tin from the pop-up of tins for the Tin box.

If the tin does not exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type TIN_MUST_EXIST is:

```
// PARAMETER param_name TIN_MUST_EXIST param_desc param_default
```

where

```
// PARAMETER param_name
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.
```

TIN_MUST_EXIST - the parameter type.

```
param_desc param_default
The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_desc param_default.
```

Important Note:

The Tin panel field for a TIN_MUST_EXIST parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.12.3 Snippet Parameter Type TIN_MUST_NOT_EXIST or return to 21.5.8.12 Snippet Parameters for Tins or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.12.3 Snippet Parameter Type TIN_MUST_NOT_EXIST

The Snippet Parameter of type TIN_MUST_NOT_EXIST inserts a Tin box panel field into the MTF Snippet panel.

The user can type a tin name into the panel field, or select a tin from the pop-up of tins for the Model box.

If the tin does exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type TIN_MUST_NOT_EXIST is:

```
// PARAMETER param_name  TIN_MUST_NOT_EXIST  param_desc  param_default
```

where

```
// PARAMETER  param_name
This defines a parameter of the given name. See // PARAMETER  param_name for what is allowed as the parameter name.

TIN_MUST_NOT_EXIST - the parameter type.

param_desc  param_default
The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_desc  param_default.
```

Important Note:
The Tin panel field for a TIN_MUST_NOT_EXIST parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.13 Snippet Parameter of Type LAYER or return to 21.5.8.12 Snippet Parameters for Tins or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.13 Snippet Parameter of Type LAYER

If a layer for links is required then the LAYER parameter type is used.

A Snippet Parameter of type LAYER inserts an Layer box panel field into the MTF Snippet panel. The user can type a layer name into the panel field or select a layer name from the pop-up of layers previously defined. The Layer name is then passed down to the snippet.

The syntax for type LAYER is:

```plaintext
// PARAMETER  param_name  LAYER  param_desc  param_default_value
```

where

// PARAMETER  param_name
This defines a parameter of the given name. See // PARAMETER  param_name for what is allowed as the parameter name.

LAYER - the parameter type.

param_desc  param_default
The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See param_desc  param_default.

The value param_default is optional. But if it exists then if the default layer value does not already exist, it will be added to the choice list of Layer names.

Important Note:
The Layer panel field for a LAYER parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.14 Snippet Parameter of Type NAMED_GRADE or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.14 Snippet Parameter of Type NAMED_GRADE

If a named grade definition is required then the NAMED_GRADE parameter type is used.

A Snippet Parameter of type NAMED_GRADE inserts an Named Grade box panel field into the MTF Snippet panel.

The user can type a named grade into the panel field or select a named grade from the pop-up of named grades previously defined. The Named Grade is then passed down to the snippet.

The syntax for type NAMED_GRADE is:
// PARAMETER param_name NAMED_GRADE param_description param_default_value

where

// PARAMETER  param_name

This defines a parameter of the given name. See // PARAMETER  param_name for what is allowed as the parameter name.

NAMED_GRADE - the parameter type.

param_desc  param_default

The description for the field in the MTF Snippet panel and an optional default value that is entered as the value in the field. See  param_desc  param_default.

Important Note:
The Named Grade panel field for a NAMED_GRADE parameter will only appear in the MTF Snippet panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.15 Snippet Command INFO or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
21.5.8.15 Snippet Command INFO

There is an Info button on the MTF Snippet panel and when clicked, all the lines of the snippet file that start with "// INFO" are displayed in Snippet Description pop up.

The syntax for INFO is:

```
// INFO  text_to_display
```

where

- `// INFO` is at the beginning of the line and defines the command INFO. Note that there must be one or more spaces between the // and INFO.
- `text_to_display` is a line of text that is to be displayed in the Snippet Description pop up when the Info button is clicked on the MTF Snippet panel. The text is taken from one space after the word INFO and to the end of the line.

For example, in the Snippet code:

```
// PARAMETER     CLR     COLOUR        "Colour"        "red"
// PARAMETER     LN        TEXT              "Link"            ""
// INFO ----------------------
// INFO   Lee's Test Snippet
// INFO ----------------------
insert "Design=>$(LN)" $CLR 0.0 0.0 unknown $(SCH) 0 $(ECH) 0 absolute extra_start extra_end
```

Click on Info and the Snippet Description pop-up displays all the INFO lines in the Snippet.

Continue to the next section 21.5.8.16 Snippet Command DISPLAY or return to 21.5 Defining and Using Snippets.
21.5.8.16 Snippet Command DISPLAY

The **parameter description** and the **current value** that the parameter has can be displayed in the **Detail** and **Value** columns of the **MTF Modifiers** panel by using the **DISPLAY** command in the snippet.

The syntax for **DISPLAY** is:

```plaintext
// DISPLAY  param_name
```

where

```plaintext
//  DISPLAY
```

this is at the beginning of the line and defines the command DISPLAY. Note that there must be one or more spaces between the `//` and `DISPLAY`.

```plaintext
param_name
```

this is the name of the parameters to have its description and current value displayed in the **MTF Modifiers** panel.

When the **OK** or **Apply** button is clicked on the **MTF Snippets** panel, the **description** of the parameter **param_name** is displayed in the **Details** column of the **MTF Modifiers** panel and the **current value** of the parameter **param_name** is displayed in the **Value** column of the **MTF Modifiers** panel.

For example, in the Snippet code:

```plaintext
// PARAMETER CLR COLOUR "Colour" "red"
// PARAMETER LN TEXT "Link" ""
// DISPLAY CLR
// DISPLAY LN
```

insert "Design=>$(LN)" $CLR 0.0 0.0 unknown $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
Continue to the next section 21.5.15.3 Temporary MTF Snippet File or return to 21.5 Defining and Using Snippets.
21.5.8.17 Snippet Command INCREMENT

There is an **INCREMENT** command to increment a snippet parameter by a given increment step. The increment step can be negative for a decrement.

The intended use is for TEXT parameters but it will actually work for any type of parameter but probably in an unexpected way.

How a parameter is incremented depends on the value of the parameter when it is interpreted as text. We will refer to the value of the parameter as text, as `value_text`.

For example, for an INTEGER, the value_text could be "13", for a TEXT it could be "STN003", for a REAL, it could be "23.45" and for a COLOUR, it could be "red". Obviously it usually doesn’t make sense to increment some parameters like REAL or COLOUR but it can be done.

The INCREMENT command only increments either a

(a) a group of digits at the end of the text. That is each character is one of "0" to "9". The number of digits to increment is fixed (the length of the group).

or

(b) a group of letters at the end of the text. That is, each characters is one of "a" to "z". The number of letters to increment is fixed (the length of the group). Upper and lower case letters are considered to be the same thing.

Note that INCREMENT does not increment a mixture of digits and letters.

For the `value_text`, the group of characters at the end of the value_text that will be incremented is determined by looking at the last character of the value_text and

(a) if the last character is a digit then it will be a digit group.

The rest of `value_text` is then searched from right to left until a letter is found. So all the digits at the end of the value_text make up a digit group of a fixed length.

For example, for "STN001" the group is digit group of length 3 ("001").

For "ST2N02", the group is a digit group of length 2 ("02").

For "002", the group is a digit group of length 3 ("002").

The digit group increments by the increment step but it will always keep the same number of digits. So if the incremented digit group would need an extra digit then that extra leading digit is dropped. So the number wraps around.

For example, incrementing "568" by 1 will eventually reach "999" and the next increment will give you "000".

(b) if the last character is an letter (i.e. one of a to z) then it will be a letter group.

The rest of `value_text` is then searched from right to left until a digit is found. So all the letters at the end of value_text make up a letter group of a fixed length.

For example, for "123ABC" the group is an letter group of length 3 ("ABC").

"incrementing a letter" means that you take the letters position in the alphabet and add the increment step to it to give you the position of the new incremented letter. For example, c is the third letter and increment it by two give the fifth letter which is e. When you have a letter group then you work in base 26. For example, incrementing AZ by 1 gives you BA.

As in the case for a digit group, the letter group increments by the increment step but it will always keep the same number of letters. So if the incremented digit group would need an extra letter then that extra leading letter is dropped.

For example, incrementing "TUV" by 1 will eventually reach "ZZZ" and the next increment will give you "AAA".
The syntax for **INCREMENT** is:

```
// INCREMENT  param_name  increment_step
```

where

**// INCREMENT**

this is at the beginning of the line and defines the command INCREMENT. Note that there must be one or more spaces between the `//` and INCREMENT.

**param_name**

the name of the parameter to increment.

**increment_step**

this is the amount the increment the group of digits or letters. The increment step can be negative for a decrement.

As an example,

```
// PARAMETER  STRING_ID  TEXT  "String number"  1
// INCREMENT  STRING_ID  1
```

Continue to the next section [21.5.8.18 Optional Parameters in Snippets](#) or return to [21.5 Defining and Using Snippets](#).
21.5.8.18 Optional Parameters in Snippets

Parameters can be set to be optional so that when they are displayed in the MTF Snippet panel and there is no value in the panel field, the Description is greyed out.

A parameters is made optional by adding **OPTIONAL** as the last word on the parameter line.

A default value for the parameter can still be passed in but in that case the Description in the MTF Snippet panel field will not be greyed out when it is first displayed because there is a value in it.

For example, in the Snippet code:

```plaintext
// PARAMETER CLR COLOUR "Colour" OPTIONAL
// PARAMETER LN TEXT "Link" "ES" OPTIONAL
// DISPLAY CLR
// DISPLAY LN
insert "Design=>$(LN)" $CLR 0.0 0.0 unknown $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

The `Colour` is optional and the default value has been omitted. The `Link` is optional but because there is a value in it, the word `Link` is not greyed out.

**WARNING**

Be careful when making a parameter optional because the MTF may then have errors.

For example in the above example, if the `Colour` is not filled in then there will be an error in the MTF because the command

```plaintext
insert "Design=>$(LN)" $CLR 0.0 0.0 unknown $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

will not be valid if CLR is blank and hence not there.

Continue to the next section 21.5.9 Automatic Parameters in Snippets or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.
### 21.5.9 Automatic Parameters in Snippets

In addition to the ability to create and define your own parameters in snippets, *12d Model* has a range of predefined parameters that are automatically created and calculated.

Automatic parameters allow for the use of values that are important to the snippet, but that you do not necessarily want to prompt the user to complete.

For example, string naming that is dependent on whether it is applied in the left side or right side modifiers. Rather than making the user select the correct left/right side value as a parameter, an automatic parameter can be used instead. In this way, automatic parameters can greatly simplify snippets and make them more portable.

Automatic parameters are fixed by the system and are identified by starting with an underscore, e.g. `$_AUTO_LR` or `$_AUTO_RS`.

All automatic parameter names are reserved in 12d. To ensure future compatibility, user-defined parameters should not start with an underscore.

Currently, the following automatic parameters are defined:

- `AUTO_LR`
- `SCH`
- `ECH`
- `CL_REF`, `CL_REF1`, `CLREF2`
- `CL_REF3`, `CL_REF4`
- `NULL`
- `AUTO_0I`, `AUTO_1J`, ..., `AUTO_9R`, `AUTO_AS`, `AUTO_BT`, ..., `AUTO_HZ`
- `AUTO_05`, `AUTO_16`, `AUTO_27`, ..., `AUTO_49`, `AUTO_AN`, `AUTO_BO`, ..., `AUTO_MZ`
- `INS_05`, `INS_LR`, `INS_0I`
- `INS_SIDE_05`
- `SIDE_FX`
- `AUTO_LAYER_LR`
- `APPLY_TIN`
- `APPLY_DESIGN_MODEL`
- `HINGE`
- `SIDE`
- `SILENT_NG`
- `PROJECT_ATTRIBUTE`
21.5.9.1 _AUTO_LR

Depending on the side from which the snippet is called this parameter will insert the value L if it is called from the left side modifiers and R if it is called from the right side modifiers.

<table>
<thead>
<tr>
<th>Insert Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;KLIP$_AUTO_LR&quot;&quot; &quot;red&quot; 5 unknown -2 $_SCH 0 $_ECH 0 absolute extra_start extra_end</td>
<td></td>
</tr>
</tbody>
</table>

Continue to 21.5.9.2 _SCH or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.2 _SCH

Will insert named_position MODIFIER_START.
This is typically used to insert the start chainage mode that has been passed to the snippet.
Note that this parameter does not include the extension value.

<table>
<thead>
<tr>
<th>Insert Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;KLIP&quot; &quot;red&quot; 5 unknown -2 $_SCH 0 $_ECH 0 absolute extra_start extra_end</td>
<td></td>
</tr>
</tbody>
</table>

Continue to 21.5.9.3 _ECH or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.3 _ECH

Will insert named_position MODIFIER_END.
This is typically used to insert the end chainage mode that has been passed to the snippet.
Note that this parameter does not include the extension value.

<table>
<thead>
<tr>
<th>Insert Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;KLIP&quot; &quot;red&quot; 5 unknown -2 $_SCH 0 $_ECH 0 absolute extra_start extra_end</td>
<td></td>
</tr>
</tbody>
</table>

Continue to 21.5.9.4 _CL_REF or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.4 _CL_REF

This will insert the entire name of the Reference string from the Apply many function.
For example, if the reference string name is RSR01, $_CL_REF will insert RSR01

Continue to 21.5.9.5 _CL_REF1 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.5 _CL_REF1

This will insert the last character of the name of the Reference string from the Apply many function.
For example, if the reference string name is RSR01, $_CL_REF1 will insert 1.

Continue to 21.5.9.6 _CL_REF2 or return to 21.5.9 Automatic Parameters in Snippets.
21.5.9.6 _CL_REF2
This will insert the last two characters of the name of the Reference string from the Apply many function.
For example, if the reference string name is RSR01, $(_CL_REF1) will insert 01.
Continue to 21.5.9.7 _CL_REF3 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.7 _CL_REF3
This will insert the last three characters of the name of the Reference string from the Apply many function.
For example, if the reference string name is RSR01, $(_CL_REF1) will insert R01.
Continue to 21.5.9.8 _CL_REF4 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.8 _CL_REF4
This will insert the last four characters of the name of the Reference string from the Apply many function.
For example, if the reference string name is RSR01, $(_CL_REF1) will insert SR01.
Continue to 21.5.9.9 _NULL or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.9 _NULL
The current MTF syntax includes the use of $null for various values. In snippets, this would be interpreted as a parameter or token null.
Therefore, in snippets, if you would still like to include $null in MTF commands, they need to be replaced with this automatic parameter.
An example of MTF modifier syntax - note the present of $null values:

<table>
<thead>
<tr>
<th>named_grade</th>
<th>&quot;TEST&quot;</th>
<th>start_ref</th>
<th>0</th>
<th>final_ref</th>
<th>0</th>
<th>&quot;links&quot;</th>
<th>&quot;Design=&gt;CLIN&quot;</th>
<th>&quot;Design=&gt;EDGE&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>$null</td>
<td>$null</td>
<td>$null</td>
<td></td>
<td>$null</td>
<td></td>
<td>&quot;&quot;</td>
<td>absolute</td>
<td>extra_start</td>
</tr>
<tr>
<td>extra_end</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The MTF snippet syntax for it - where $null has been replaced with $(_NULL):

<table>
<thead>
<tr>
<th>named_grade</th>
<th>&quot;TEST&quot;</th>
<th>$(_SCH)</th>
<th>0</th>
<th>$(_ECH)</th>
<th>0</th>
<th>&quot;links&quot;</th>
<th>&quot;Design=&gt;CLIN&quot;</th>
<th>&quot;Design=&gt;EDGE&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(_NULL)</td>
<td>$(_NULL)</td>
<td>$(_NULL)</td>
<td></td>
<td>$(_NULL)</td>
<td></td>
<td>&quot;&quot;</td>
<td>absolute</td>
<td>extra_start</td>
</tr>
<tr>
<td>extra_end</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Continue to 21.5.9.10 _AUTO_0I, _AUTO_1J, …, _AUTO_9R, _AUTO_AS, _AUTO_BT, …, _AUTO_HZ or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.10 _AUTO_0I, _AUTO_1J, …, _AUTO_9R, _AUTO_AS, _AUTO_BT, …, _AUTO_HZ
This is a set of 18 different, but related, automatic parameters to assist with string naming conventions for multiple occurrences.
These automatic parameters follow the MOSS/MX naming convention for multiple occurrences:
**Defining and Using Snippets**

Left side is 0 to 9, A to H. Right side is I to Z.

So, for the 1\textsuperscript{st} occurrence of a string, you would use the \_AUTO\_0I parameter.

For the 2\textsuperscript{nd} occurrence of the string, you would use the \_AUTO\_1J parameter, and so on until for the 18\textsuperscript{th} occurrence you would use the \_AUTO\_HZ parameter.

12d will automatically insert either 0/I, 1/J, 2/K ... H/Z depending on whether the snippet is called on the left or right side of the modifiers.

Hence the names of the automatic parameter \_AUTO\_0I include the 0I to indicate that it substitutes 0 when on the Left and I when on the right.

```
insert "LANE$(_AUTO_0I)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
insert "LANE$(_AUTO_1J)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
insert "LANE$(_AUTO_2K)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

Continue to 21.5.9.11 _AUTO_05, _AUTO_16, _AUTO_27, ... _AUTO_49, _AUTO_AN, _AUTO_BO, ... _AUTO_MZ or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.11 _AUTO_05, _AUTO_16, _AUTO_27, ... _AUTO_49, _AUTO_AN, _AUTO_BO, ... _AUTO_MZ

This is a set of 18 different, but related, automatic parameters to assist with string naming conventions for multiple occurrences.

These automatic parameters follow a similar, but alternative naming convention to the MOSS/MX for multiple occurrences:

```
Side | Occurrence
--- | ---
Left | 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18
    | 0 1 2 3 4 A B C D E F G H I J K L M
Right| 5 6 7 8 9 N O P Q R S T U V W X Y Z
```

Left side is 0 to 9, A to H. Right side is I to Z.

So, for the 1\textsuperscript{st} occurrence of a string, you would use the \_AUTO_05 parameter.

For the 2\textsuperscript{nd} occurrence of the string, you would use the \_AUTO_16 parameter, and so on until for the 18\textsuperscript{th} occurrence you would use the \_AUTO_MZ parameter.

12d will automatically insert either 0/5, 1/6, 2/7 ... M/Z depending on whether the snippet is called on the left or right side of the modifiers.

Hence the names of the automatic parameter \_AUTO_05 include the 05 to indicate that it substitutes 0 when on the Left and 5 when on the right.
21.5.9.12 _INS_05, _INS_LR, _INS_0I

This is used as a normal TEXT parameter, which accepts a single character indicating the side. Different automatic parameters are used depending on the character expected.

- _INS_05 will insert 0 to 4 for left side, 5 to 9 for right side
- _INS_LR will insert L for left side, R for right side
- _INS_0I will insert 0 to 9 or A to H for left side, I to Z for right side

Once set-up, the _INS_?? automatic parameter is used to set the _SIDE_FX automatic parameter (see 21.5.9.14 _SIDE_FX).

Note that, as with any other parameter, in order for the _INS_05 / _INS_LR / _INS_0I parameter to appear in the MTF Snippet panel, it must be used at least once elsewhere in the snippet. This can be done in a token definition, directive, or expression.

Continue to 21.5.9.13 _INS_SIDE_05 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.13 _INS_SIDE_05

This is similar to _INS_05 / _INS_0I / _INS_LR, but without the need to define it as a parameter. The _INS_SIDE_05 takes a single character.

The value of _INS_SIDE_05 is used to determine the value for the _SIDE_FX automatic parameter.

- _INS_SIDE_05 will be 0 to 4 for left side, 5 to 9 for right side

The _INS_SIDE_05 is unique as an automatic parameter, since its value can be set. In this way, it behaves more like a Directive (See 21.5.12 Snippet Directives).

To set the value of the _INS_SIDE_05 automatic parameter

```plaintext
$(_INS_SIDE_05)<value>
```

,value> should be a parameter.

The _INS_SIDE_05 should not be used anywhere else in snippets, including user_message commands, except to define its value.
// PARAMETER LINK1 TEXT "Attach to link" "EDGE0R"

// Set the _INS_SIDE_05 auto parameter to the 5th character of the LINK1 parameter
$(_INS_SIDE_05)$(LINK1[5:5])

user_message "_SIDE_FX = $(_SIDE_FX) " // Display the current value of _SIDE_FX

insert "Design$(_SIDE_FX)KLIP0R" "red" 2 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute

Continue to 21.5.9.14 _SIDE_FX or return to 21.5.9 Automatic Parameters in Snippets.
21.5.9.14 _SIDE_FX

This will insert the link side indicator <\:< for link on left side, or >> for link on right side, depending on the most recent use of _INS_*.

That is, if the last state of _INS_* corresponds to the left side, _SIDE_FX will insert <\:< to indicate insertion to the left.

If the last state of _INS_* corresponds to the right side, _SIDE_FX will insert >> to indicate insertion to the right. Hence if

\[
\begin{align*}
_INS_05 = 0 \text{ to } 4, \text{ then } & _SIDE_FX = <\:< \\
_INS_05 = 5 \text{ to } 9, \text{ then } & _SIDE_FX = >> \\
_INS_LR = L, \text{ then } & _SIDE_FX = <\:< \\
_INS_LR = R, \text{ then } & _SIDE_FX = >> \\
_INS_0I = 0 \text{ to } 9, A \text{ to } H, \text{ then } & _SIDE_FX = <\:< \\
_INS_0I = I \text{ to } Z, \text{ then } & _SIDE_FX = >> \\
_INS_SID_05 = 0 \text{ to } 4, \text{ then } & _SIDE_FX = <\:< \\
_INS_SID_05 = 5 \text{ to } 9, \text{ then } & _SIDE_FX = >>
\end{align*}
\]

Note that in order for the _SIDE_FX parameter to be set, the corresponding parameter _INS_* must also have been set, given a value (0 to 9, A to Z) and used somewhere in the snippet.

For this reason, if not using the _INS_05 directly, it is necessary to reference it in a temporary parameter, token or expression.
Defining and Using Snippets

The _SIDE_FX allows links to be inserted on any side of the reference, regardless of the side calling the snippet. For example, a snippet on the right side could insert a link on the left side.

Once the _SIDE_FX value is used in the snippet, its value will remain the same until re-defined by any of the _INS_05 / _INS_LR / _INS_0I / _INS_SIDE_05 automatic parameters.

21.5.9.15 _AUTO_LAYER_LR

Depending on which side the snippet is called from, will insert the value layer_left if called from the left side modifiers and layer_right if called from the right side modifiers.

This is typically used for the Create String modifier commands.

The _SIDE_FX allows links to be inserted on any side of the reference, regardless of the side calling the snippet. For example, a snippet on the right side could insert a link on the left side.

Once the _SIDE_FX value is used in the snippet, its value will remain the same until re-defined by any of the _INS_05 / _INS_LR / _INS_0I / _INS_SIDE_05 automatic parameters.

Continue to 21.5.9.15 _AUTO_LAYER_LR or return to 21.5.9 Automatic Parameters in Snippets.
21.5.9.16 _APPLY_TIN
This will insert the name of the tin from the Apply MTF function

```
interface_tin "Design=>INT" $(_SCH) 0 $(_ECH) 0 "Design=>" "$(_APPLY_TIN)" 1 2 100 0  
"red" "green" 0 0 absolute extra_start extra_end
```

Continue to 21.5.9.17 _APPLY_DESIGN_MODEL or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.17 _APPLY_DESIGN_MODEL
This will insert the name of the Road Surface Strings model entered in the Models tab of the Apply MTF function panel.

```
create_strings "$(AUTO_LAYER_LR)" "Design=>" *** $(_SCH) 0 $(_ECH) 0 "no_colour" ***  
"$(APPLY_DESIGN_MODEL)" absolute extra_start extra_end
```

Continue to 21.5.9.18 _HINGE or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.18 _HINGE
This will insert the name of the hinge string.
Since the user can define a custom hinge name (the default is HINGE), this is needed to ensure portability and compatibility with different users and setups.

```
named_grade "CWAY" $(_SCH) 0 $(_ECH) 0 "links" "Design=>HING" "Design=>EDGE"  
$null $null $null $null *** absolute extra_start extra_end
```

Continue to 21.5.9.19 _SIDE or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.19 _SIDE
Depending on which side the snippet is called from, will insert the value -1 if called from the left side modifiers and +1 if called from the right side modifiers.

Continue to 21.5.9.20 _SILENT_NG or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.20 _SILENT_NG
This will insert _SILENT_NAMED_GRADE.
When inserted in front of a named grade, the named grade will not appear in any Named Grade choice boxes.
This is typically used for temporary or construction named grades in snippets that you do not wish the end user to see in the GUI.

Continue to 21.5.9.21 _PROJECT_ATTRIBUTE or return to 21.5.9 Automatic Parameters in Snippets.
21.5.9.21 _PROJECT_ATTRIBUTE

This will insert a project attribute from the current 12d project.

The particular attribute to be inserted is specified between square brackets [ ] and follows the standard convention of attribute paths in 12d Model.

```
user_message "$_PROJECT_ATTRIBUTE[ProjectDetails/ProjectNumber/Value]"
```

This will insert the value of the ProjectNumber entered in the Project Details panel (if ProjectNumber is defined).

Continue to 21.5.9.22 Substrings of parameters or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.22 Substrings of parameters

Although there are some preset automatic parameters for extracting a few characters from a string, e.g. _CL_REF3, it is possible to extract a substring of all User parameters, and the one special auto parameter case, _CL_REF.

This is done with the following syntax:

```
param[start:end]
```

- **param** is the parameter or token name
- **start** is the character start position (the first character is at position 1). It must be an integer greater than or equal to 1.
- **end** is the character end position (the first character is at position 1). It must be an integer greater than or equal to the start position.

For the value of the selected *param*, only the text from *start* to *end* will be inserted.

Both **start** and **end** are compulsory. The colon is also compulsory.

If **end** is greater than the length of the complete param value, an end position equal to the string length will be used. That is, everything from the start up to the end of the string will be returned.

**start** must be less than **end**.

Substrings are currently supported on all user parameters. Automatic parameters and tokens are not supported.

For example,

If $(_TEXT_PARAM)$ has the value **Some text**

then

- $(TEXT_PARAM[1:3])$ is **Som**
- $(TEXT_PARAM[4:7])$ is **et**
- $(TEXT_PARAM[1:20])$ is **Some text**
- $(TEXT_PARAM[5:9])$(TEXT_PARAM[1:4]) is **textSome**

For the special auto parameter case, an example is:

```
$(CL_REF[2:6])
```

Continue to the next section 21.5.10 Arithmetic in Snippets or return to 21.5.9 Automatic Parameters in Snippets or 21.5 Defining and Using Snippets.
21.5.10 Arithmetic in Snippets

Arithmetic expressions can be used for any of the real values in the lines of a snippet file as long as special rules are obeyed.

1. If a real value is replaced by an expression then the expression must be surrounded by round brackets. That is "(" and ")".

2. If the arithmetic operators plus +, minus -, multiplication * and division / are used then there must be a space on both sides of them.

   For example, \((T_L) - (P_L)\) and \((0.0 - (D_L) / 2.0) - 0.5\)

   Note that the negative of a number has the negative sign hard up against the number with no space in-between. For example -0.5

**WARNING** - a future interactive Snippet editor may not be able to support arithmetic in snippets. Those snippets with arithmetic will still need to be modified using a text editor.

An example of some lines from a snippet file using an arithmetic expression is:

```
// RTA Type F Half Kerb to SA transition

// PARAMETER TL REAL "Transition Length" 5.5
// PARAMETER PL REAL "Part Length" 1.340

// insert the links for the 'F' to 'short F' transition

insert "1" "grey" 0.001 0.000 unknown named_position "MODIFIER_START" 0.0 named_position "MODIFIER_START" ($(TL) - (PL)) absolute extra_start extra_end

insert "2" "grey" 0.499 -0.040 unknown named_position "MODIFIER_START" 0.0 named_position "MODIFIER_START" ($(TL) - (PL)) absolute extra_start extra_end

... 
```

Continue to the next section 21.5.11 Trig and Maths Function Capabilities in Snippets or return to 21.5 Defining and Using Snippets.
21.5.11 Trig and Maths Function Capabilities in Snippets

There is now some trig and maths capability in the MTF snippet grammar.

The trig functions supported are:
- sin(x), cos(x), tan(x) - trig functions
- asin(x), acos(x), atan(x) - the inverse trig functions
- square(x) - return x\(^2\)
- sqrt(x)
- fabs(x) - returns the absolute value of its x.
- ceil(x) - the ceil functions return a floating-point value that represents the smallest integer that is greater than or equal to x.
- floor(x) - the floor functions return a floating-point value that represents the largest integer that is less than or equal to x.
- log(x) - the log functions return the natural logarithm (base e) of x if successful.
- exp(x) - the exp function returns the exponential value of the floating-point parameter, x, if successful. That is, the result is e to the power x, where e is the base of the natural logarithm.
- cube(x) - return x\(^3\)
- pow(x,y) - returns the value of x to the power y.
- fmod(x,y) - returns the floating-point remainder of x / y

pi, halfpi, twopi - so you don't have to keep typing the values in

The trig functions etc then allows calculations in a snippet like

```
// Swept angle of 2nd radius.

@def_tok A2 "(asin(($(D2) - $(R1) + $(DEL_R1_R2) * cos($(A1))) / $(R2)) - $(A1) + halfpi)
```

**Note** - Mathematical formulae in snippets should always be quoted to prevent concatenation and unexpected results.

Continue to the next section 21.5.12.1.1 #define in Snippets - Do Not Use or return to 21.5 Defining and Using Snippets.
21.5.12 Snippet Directives

Or return to 21.5 Defining and Using Snippets.
21.5.12.1 Deprecated C Preprocessor from V10

When Snippets were first introduced in 12d Model 10, the C preprocessor syntax (e.g. `#define` or `#if / #else / #endif`) was used to increase the power of snippets by performing conditional tests and evaluations on the final MTF file containing the snippet.

The C preprocessor is used throughout 12d Model (e.g. setup files) but once you progress from simple uses, it can be very confusing for users to fully understand.

Due to the complexity and limitations of using the C preprocessor, a new preprocessor has been created in 12d Model 11 specifically for Snippets. Snippets in 12d Model 11 can still use the C preprocessor style of directives and such snippets will still run in 12d Model 11. However, the use of the older style of directives has been superseded (deprecated) in 12d Model 11 and users are encouraged to only use the special Snippet Directives.

Continue to 21.5.12.1.1 #define in Snippets - Do Not Use or return to 21.5.12 Snippet Directives.
21.5.12.1.1 #define in Snippets - Do Not Use

**IMPORTANT WARNING**

From 12d Model 11 onwards, `#define` has been replaced by `@def_tok` directive and #define should not be used.

It is only documented here in case you are working on an old Snippet and need to know what the command does.

`#define` can be used in a snippet file to define parameters for use inside the snippet file.

**WARNING** - a future interactive Snippet editor may not be able to support `#define`. Those snippets with `#define` will still need to be modified using a text editor.

The `#define` is placed at the beginning of a line, followed by one or more spaces and then the define_name to be used, and then one or more spaces and the expression that the define_name stands for.

```
#define define_name define_expression
```

Then the define_name can be used instead of the define_expression anywhere else in the snippet file following the `#define`.

**Note** - snippet parameters can be used in the define_expression as long as the definition of the parameter occurs before the `#define`.

For example

```
// PARAMETER DL REAL "Drive length"  3.0
// PARAMETER WD REAL "Layback width"  0.6
// PARAMETER DP REAL "Layback depth" -0.04

#define _DR1 (0.0 - ($DL / 2.0) - 0.5)
#define _DR2 (0.0 - ($DL / 2.0) )
#define _DR3 ( ($DL / 2.0) )
#define _DR4 ( ($DL / 2.0) + 0.5)

// drop into DW
insert "SAL" "grey" 0.001 0.000 unknown named_position "MODIFIER_START" _DR1 named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAI" "grey" 0.499 $DP unknown named_position "MODIFIER_START" _DR1 named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAT" "grey" 0.030 0.150 unknown named_position "MODIFIER_START" _DR1 named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAB" "grey" 0.180 0.000 unknown named_position "MODIFIER_START" _DR1 named_position "MODIFIER_START" _DR2 absolute extra_start extra_end

...
21.5.12.2 Snippet Directives for V11 Onwards

The syntax for a Snippet Directive starts with a @, then a space, followed by the directive and any additional arguments.

```plaintext
@ <directive> <argument> [<argument>... <argument>]
```

- `<directive>` - name of the directive.
- `<argument>` - any required arguments for the directive. The number and type of these arguments will depend on the directive.

```plaintext
@ if_val_eq "$(KT)" "SM"
// Do something in here
@end if
```

For information on all the snippet directives, see the sections

- 21.5.12.3 Flow control.
- 21.5.12.4 Abbreviations.
- 21.5.12.5 Comparisons of Data Types.
- 21.5.12.6 Tokens and Tokens vs Tokens.
- 21.5.12.7 Tokens vs Strings.
- 21.5.12.8 Tokens vs Doubles.
- 21.5.12.9 Tokens vs Integers.
- 21.5.12.10 Values Defined and Value vs Value.
- 21.5.12.11 Values vs Strings.
- 21.5.12.12 Values vs Doubles.
- 21.5.12.13 Values vs Integers.
- 21.5.12.10 Values Defined and Value vs Value.

Or return to 21.5.12 Snippet Directives or 21.5 Defining and Using Snippets.
21.5.12.3 Flow control

In a snippet, the normal processing flow is that each snippet command is processed in the order in which they are encountered. It is possible, however, to change the order in which such commands are processed or even to totally skip commands. These are done through flow control directives in the snippets.

See

- 21.5.12.3.1 Conditional flow control
- 21.5.12.3.2 Transferring Flow Control

Or return to 21.5.12 Snippet Directives or 21.5 Defining and Using Snippets.
21.5.12.3.1 Conditional flow control

Snippet commands can be processed or ignored based on the result of a test. This is known as a conditional test.

Snippet directives based on conditional statements (i.e., testing whether a statement is true or false) are generally of the form `if/else/end if`.

```plaintext
@ if...
@ end_if

OR

@ if...
@ else
@ end_if
```

When the `if` condition is **true**, commands will be processed until the `else` or `end_if` directive is found.

When the `if` condition is **false**, commands will be ignored until the `else` or `end_if` directive is found.

When the `if` condition is **false** and an `else` directive is found the commands following the `else` until the `end_if` will be processed.

An `end_if` directive must always be present.

An `else` directive cannot exist without a preceding `if` directive.

There is no `else_if` directive.

```plaintext
@ if...
// When the if condition is true, the commands in this section,
// until the else or end_if will be processed.
@ else
// When the if condition is false, the commands in this section,
// until the end_if will be processed
@ end_if
```

**Embedding if** directives within other conditional directives (if or else), i.e., nested ifs, are **not** allowed.

Continue to 21.5.12.3.2 Transferring Flow Control or return to 21.5.12.3 Flow control or 21.5.12 Snippet Directives.
21.5.12.3.2 Transferring Flow Control

In addition to the conditional flow control, it is possible within snippets to transfer processing to an entirely different and disconnected section of the snippet. These transfers (jumps) are performed by the `goto` and `label` directives.

See

21.5.12.3.2.1 Goto - transfer processing to a given location.
21.5.12.3.2.2 Label - mark a location for goto

Or return to 21.5 Defining and Using Snippets.

21.5.12.3.2.1 Goto - transfer processing to a given location

The `goto` directive transfers processing to a corresponding `label` directive within the snippet. The syntax is:

```plaintext
@ goto <label>
```

- `<label>` - is the name of the label to which control will be transferred. One and only one label should be specified.

The `goto` directive must be defined with a corresponding `label` directive.

- **Control** can only be transferred **forwards** in a file (i.e. further down the contents of the file); control **cannot** be passed **backwards**.

- The corresponding `label` should **not** be inside a conditional flow group, `if/else/end_if`.

// PARAMETER KT TEXT "Kerb type" OPTIONAL

```plaintext
@ def_tok EXTRAS "absolute extra_start extra_end"

@ if_val_neq "$(KT)" "SA Kerb"
  @ goto fred
  user_message "Should not get here." $(SCH) 0 $(ECH) 0 $(EXTRAS)
  @ end_if

user_message "Should not get here." $(SCH) 0 $(ECH) 0 $(EXTRAS)

@ label fred
user_message "Should get here." $(SCH) 0 $(ECH) 0 $(EXTRAS)
```

Continue to 21.5.12.3.2.2 Label - mark a location for goto or return to 21.5.12.3.1 Conditional flow control or 21.5.12.3 Flow control or 21.5.12 Snippet Directives.
21.5.12.3.2.2 Label - mark a location for goto

The label directive is used in conjunction with a goto directive to indicate a position within the snippet.

The syntax is:

```
@ label <label>
```

`<label>` - is the name of this label. A label should normally be paired with a corresponding goto directive, though it is not compulsory. A label can exist without a goto.

The label must be placed after the goto directive to which it corresponds. Control can only be transferred forwards in a file (i.e. further down the contents of the file); control cannot be passed backwards.

The label directive should not be placed inside a conditional flow group, if/else/end_if.

The label does not have to be unique within the file and multiple pairs of goto/labels are permitted. Note, however, that goto will simply jump to the first/next found matching label.

```
@ goto end_earthowrks
@ label end_earthowrks
.
@ goto end_earthowrks
@ label end_earthowrks
```

Continue to 21.5.12.4 Abbreviations or return to 21.5.12.3.1 Conditional flow control or 21.5.12.3 Flow control or 21.5.12 Snippet Directives.
21.5.12.4 Abbreviations

When reading or writing snippet directives, it is useful to know and remember the abbreviations below.

if - conditional test
def - define a token
tok - token
val - value
str - string (i.e. text)
int - integer
dbl - double
tol - tolerance
eq - equal
neq - not equal
gt - greater than
lt - less than
ge - greater than or equal to
le - less than or equal to
in_range - within a range of values defined by lower and upper bounds
nin_range - not within (i.e. outside) a range of values defined by lower and upper bounds

These abbreviations can be used to determine the appropriate directive to use or interpret and understand directives in use.

For example, the if_val_le_dbl_tol, is a conditional directive (if) to test if a value (val) is less than or equal to (le) any of double values (dbl) with a user-specified tolerance (tol).

Continue to 21.5.12.5 Comparisons of Data Types or return to 21.5.12 Snippet Directives.
21.5.12.5 Comparisons of Data Types

There are two basic types of comparison used in snippets.

(a) The first is character-based and is typically used on strings of text.

In a character-based comparison of two values, the first character from one string is compared against the first character from the other string. If both characters are equal, processing continues to the next character in each string.

Character comparisons in snippets are not case sensitive.

(b) The second type of comparison is numeric and is typically used on numbers both integers and doubles.

In a numerical-based comparison of two values, each value is first converted into a double. If the value cannot be converted to a number, then an error is usually generated.

Assuming both values in a numerical comparison are valid numbers (or can be converted as such), the numbers are then compared in standard mathematical fashion.
Both double and integer numbers can be used in directive comparisons for doubles (contain `dbl` abbreviation). However, only integer numbers can be used in directive comparisons for integers (contain `int` abbreviation). Doubles will not be converted or truncated to integers in such cases, but instead produce an error.

Continue to 21.5.12.6 Tokens and Tokens vs Tokens or return to 21.5.12 Snippet Directives.
21.5.12.6 Tokens and Tokens vs Tokens

The following Snippet Directives define tokens, check whether tokens are defined and compare tokens with other tokens.

See

- 21.5.12.6.1 def_tok
- 21.5.12.6.2 if_tok
- 21.5.12.6.3 if_ntok
- 21.5.12.6.4 if_tok_notok
- 21.5.12.6.5 if_two_toks
- 21.5.12.6.6 if_two_toks_eq
- 21.5.12.6.7 if_all_toks
- 21.5.12.6.8 if_nall_toks
- 21.5.12.6.9 if_tok_eq_tok
- 21.5.12.6.10 if_tok_neq_tok
- 21.5.12.6.11 def_tok_minus
- 21.5.12.6.12 def_tok_minus_inc

Or return to 21.5 Defining and Using Snippets.
21.5.12.6.1 def_tok

The `def_tok` directive defines a token that can have an optional value.

The syntax is:

```plaintext
@ def_tok <token> ["<string>... "<string>"
```

- `<token>` - this is the name of the token.
  - Wherever the token is to be used in the snippet, put `$<token>`
  - Note that in the older V10 syntax, this was $token.
  - The characters of the token name can only be alphanumeric (upper and lower case) and underscores but the name **cannot contain spaces**.
  - The **token names** are not case sensitive.
    - So two names differing only by case are considered to be identical. That is, **THIS**, **This**, **this** and **tHis** are all considered identical by 12d Model.
  - Tokens are treated similarly to parameters, so any name must be unique within a snippet for all parameters and tokens.

- `<string>` - one or more optional strings of character (text).
  - Any string with spaces must be enclosed in quotes.
  - Multiple strings are concatenated.
  - The string can contain other tokens, though any tokens must have previously been defined.
  - The string can also contain mathematical expressions.
  - The snippet preprocessor will preserve any white space within quoted strings.
  - However, multiple strings or values will be concatenated without any white space.
  - If a string has spaces that need to be retained, enclose the string in quotes.

Tokens are used and substituted in the same way as parameters, e.g. `$<TOKEN>`.

```
@ def_tok TOK           //defines a token TOK with no value
@ def_tok TOK A         //defines a token TOK with the value "A"
@ def_tok TOK "A B"     //defines a token TOK with the value "A B"
@ def_tok TOK A B       //defines a token TOK with the value "AB", concatenates
@ def_tok TOK A B "C D" //defines a token TOK with the value "ABC D", concatenates
@ def_tok TOK $(KT)     //defines a token TOK with the value of the substituted parameter
```

Continue to 21.5.12.6.2 if_tok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.6.2 if_tok

The if_tok directive tests whether any of the given tokens are defined.

The syntax is:

```
@ if_tok <token> [<token>... <token>]
// Commands to be processed when statement is true
@ end_if
```

*<token>* - the name of the token to test.

At least one token must be specified, however, multiple tokens can be included.

Multiple tokens should be separated by whitespace.

If any of the tokens are defined, the statement is true.

If none of the tokens are defined, the statement is false.

Multiple tokens are handled as if joined by logical OR statements.

**NOTE:** This directive simply tests whether the token is defined and not whether the value is valid or blank.

```
@ def_tok "T1"
@ def_tok "T2"

@ if_tok "T1"
    user_message "Found token T1"
@ end_if

@ if_tok "T1" "T2"
    user_message "Found token T1 or T2"
@ end_if

@ if_tok "T2"
    user_message "Found token T2"
@ end_if
```

See also:

21.5.12.6.3 if_ntok - for logically opposite directive
21.5.12.6.7 if_all_toks - for testing if all tokens are defined

Continue to 21.5.12.6.3 if_ntok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.6.3 if_ntok

The if_ntok directive tests whether particular tokens are undefined.

The syntax is:

```plaintext
@ if_ntok <token> [<token>...] // Commands to be processed when statement is true @ end_if
```

- `<token>` - the name of the token to test.
  
  At least one token must be specified, however, multiple tokens can be included.
  
  Multiple tokens should be separated by whitespace.
  
  If none of the tokens are defined, the statement is true and the snippet commands until the next end_if directive are processed.
  
  If any of the tokens are defined, the statement is false and the entire block of commands (until the next end_if directive) are skipped.

  Multiple tokens are handled as if joined by logical OR statements.

  **NOTE:** This directive simply tests whether the token is defined and not whether the value is valid or blank.

```plaintext
@ def_tok T1
@ def_tok T2

@ if_ntok T1
  user_message "Didn't find token T1"
@ end_if

@ if_ntok T1 T2
  user_message "Didn't find token T1 or T2"
@ end_if

@ if_ntok T2
  user_message "Didn't find token T2"
@ end_if
```

See also:

- **21.5.12.6.2 if_tok** - logically opposite directive
- **21.5.12.6.8 if_nall_toks** - for testing if all tokens are undefined

Continue to **21.5.12.6.4 if_tok_ntok** or return to **21.5.12.6 Tokens and Tokens vs Tokens** or **21.5.12 Snippet Directives**.
21.5.12.6.4 if_tok_ntok

The if_tok_ntok directive tests if any token in one set is defined and if any token in another set is not defined.

The syntax is:

```
@ if_tok_ntok <token> [ <token> ] ; [ <token> ] [ <token> ]
```

- `<token>` - the name of the token to test.

At least one token in each set must be specified, however, multiple tokens can be included.

Multiple tokens should be separated by whitespace.

Two sets of tokens are separated by a semi-colon, which must be included.

Tokens in the first set, between the if_tok_ntok and the semi-colon, are tested to see if they are defined. Tokens in the second set, between the semi-colon and end, are tested to see if they are not defined.

If any of the tokens in the first set are defined and any of the tokens in the second set are undefined, the statement is true.

If none of the tokens in the first set are defined or if all of the tokens in the second set are defined, the statement is false.

Note that both sets must be true for the overall statement to be true. If either set is false, then the overall statement will be false.

```
Continue to 21.5.12.6.5 if_two_toks or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.6.5 if_two_toks

The `if_two_toks` directive tests the result of a logical comparison of if two tokens are defined. The syntax is:

```
@ if_two_toks <token1> <op> <token2>
// Commands to be processed when statement is true
@ end_if
```

- `<token1>` - the name of the token to test. Must be only one token
- `<op>` - the logical operator to use for the two tokens. This can be `&&` for logical AND or `||` for logical OR
- `<token2>` - the name of the token to test. Must be only one token.

The conditional result of this directive is dependent on the two tokens and the logical operator. The combination of possible values and their results are in the table below.

<table>
<thead>
<tr>
<th>token1</th>
<th>op</th>
<th>token2</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>defined</td>
<td>&amp;&amp;</td>
<td>defined</td>
<td>true</td>
</tr>
<tr>

@ def_tok T1
@ def_tok T2
// Token T3 is not defined

@ if_two_toks T1 && T2
    user_message "Tokens T1 and T2 are both defined"
@ end_if

@ if_two_toks T1 || T2
    user_message "Token T1 or T2 is defined"
@ end_if

@ if_two_toks T1 && T3
    user_message "Token T1 and T3 are both defined" // This shouldn't be shown
    @ else
        user_message "Token T1 and T3 are not both defined" // This should be shown
    @ end_if

@ if_two_toks T1 || T3
    user_message "Token T1 or T3 is defined"
@ end_if

See also:
21.5.12.6.6 if_two_toks_eq - for logical comparison against values

Continue to 21.5.12.6.6 if_two_toks_eq or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.6.6 if_two_toks_eq

The if_two_toks_eq directive tests the result of a two tests of tokens against corresponding values.

The syntax is:

```
@ if_two_toks_eq <token1> <value1> <op> <token2> <value2>
// Commands to be processed when statement is true
@ end_if
```

- `<token1>` - the name of the first token to test. Must be only one token.
- `<value1>` - the value to compare against token1.
- `<op>` - the logical operator to use for the two tokens.
  - This can be `&&` for logical AND or `||` for logical OR
- `<token2>` - the name of the second token to test. Must be only one token.
- `<value2>` - the value to compare against token2.

When evaluating the statement, token1 is compared against value1 and token2 is compared against value2. The results of both comparisons are then combined using the logical operator, `op`, and evaluated to set the final result of the if_two_toks_eq directive.

<table>
<thead>
<tr>
<th>token1</th>
<th>value1</th>
<th>op</th>
<th>token2</th>
<th>value2</th>
<th>Overall Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>A</td>

<td>false</td>
<td>D</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>A</td>
<td>A</td>
<td>true</td>
<td>B</td>
<td>D</td>
<td>true</td>
</tr>
<tr>
<td>A</td>
<td>C</td>
<td>false</td>
<td>B</td>
<td>D</td>
<td>true</td>
</tr>
<tr>
<td>A</td>
<td>C</td>
<td>false</td>
<td>B</td>
<td>D</td>
<td>false</td>
</tr>
</tbody>
</table>

```
@ def_tok TOK_A "alpha"
@ def_tok TOK_B "bravo"

@ if_two_toks_eq TOK_A "alpha" || TOK_B "bravo"
  user_message "TOK_A = alpha or TOK_B = bravo"
@ end_if

@ if_two_toks_eq TOK_A "charlie" && TOK_B "bravo"
  user_message "TOK_A = charlie and TOK_B = bravo" // This should not be output
  @ else
    user_message "TOK_A != charlie or TOK_B != bravo" // This should be output
  @ end_if
```
21.5.12.6.7 if_all_toks

The `if_all_toks` directive tests whether all given tokens are defined. The syntax is:

```plaintext
@if_all_toks <token> [<token>... <token>]
// Commands to be processed when statement is true
@end_if
```

- `<token>` - the name of the token to test.
  - At least one token must be specified, however, multiple tokens can be included.
  - Multiple tokens should be separated by whitespace.
  - If all of the tokens are defined, the statement is true.
  - If any of the tokens are undefined, the statement is false.
  - Multiple tokens are handled as if joined by logical AND statements.

**NOTE:** This directive simply tests whether the token is defined and not whether the value is valid or blank.

```plaintext
@def_tok T1
@def_tok T2
@def_tok T3
@if_all_toks T1
  user_message "Found token T1"
@end_if
@if_all_toks T1 T2
  user_message "Found token T1 and T2"
@end_if
@if_all_toks T1 T2 T3
  user_message "Found token T1, T2 and T3"
@end_if
```

21.5.12.6.8 if_nall_toks

The **if_nall_toks** directive tests whether all of the given tokens are undefined.

The syntax is:

```plaintext
@ if_nall_toks <token> [<token>... <token>]
// Commands to be processed when statement is true
@ end_if
```

- **<token>** - the name of the token to test.
  - At least one token must be specified, however, multiple tokens can be included. Multiple tokens should be separated by whitespace.
  - If all of the tokens are undefined, the statement is true.
  - If any of the tokens are defined, the statement is false.
  - Multiple tokens are handled as if joined by logical AND statements.

**NOTE:** This directive simply tests whether the token is defined and not whether the value is valid or blank.

```plaintext
@ def_tok T1
@ def_tok T2
@ def_tok T3

@ if_nall_toks T1
  user_message "Didn't find token T1"
@ end_if

@ if_nall_toks T1 T2
  user_message "Didn't find tokens T1 or T2"
@ end_if

@ if_nall_toks T1 T2 T3
  user_message "Didn't find tokens T1, T2 or T3"
@ end_if
```

- 21.5.12.6.7 if_all_toks - logically opposite directive
- 21.5.12.6.3 if_ntok - testing if any given tokens are undefined

Continue to 21.5.12.6.9 if_tok_eq_tok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.6.9 if_tok_eq_tok

The **if_tok_eq_tok** directive tests whether a token is equal to another token.

The syntax is:

```plaintext
@ if_tok_eq_tok <token1> <token2>
// Commands to be processed when statement is true
@ end_if
```

*<token1>* - the first token to be compared.

*<token2>* - the second token to be compared.

*token1* and *token2* are compared using a character comparison (i.e. text-based, not numeric).

- If the token1 and token2 values are equal, the statement is true.
- If the token1 and token2 values do not match, the statement is false.
- If either or both token1 or token2 are undefined, the statement is false.

```plaintext
@ def_tok TOK1 "alpha"
@ def_tok TOK2 "bravo"

@ if_tok_eq TOK1 TOK2
    user_message "Tokens 1 and 2 are equal"
@ else
    user_message "Tokens 1 and 2 are not equal or undefined"
@ end_if
```

See also:

Continue to **21.5.12.6.10 if_tok_neq_tok** or return to **21.5.12.6 Tokens and Tokens vs Tokens** or **21.5.12 Snippet Directives**.
21.5.12.6.10 if_tok_neq_tok

The if_tok_neq_tok directive tests whether a token is not equal to another token.

The syntax is:

```plaintext
@ if_tok_neq_tok <token1> <token2>
// Commands to be processed when statement is true
@ end_if
```

- `<token1>` - the first token to be compared.
- `<token2>` - the second token to be compared.

`Token1` and `token2` are compared using a character comparison (i.e. text-based, not numeric).
If `token1` and `token2` values do not match, the statement is true.
If `token1` and `token2` values match, the statement is false.
If either `token1` or `token2` is undefined, an error message is produced and the statement is evaluated as true.

```plaintext
@ def_tok TOK1 "alpha"
@ def_tok TOK2 "bravo"

@ if_tok_neq_tok TOK1 TOK2
    user_message "Tokens 1 and 2 are not equal"
  @ else
    user_message "Tokens 1 and 2 are equal"
@ end_if
```

- if_tok_neq_int - comparison against integer

Continue to 21.5.12.6.11 def_tok_minus or return to 21.5.12 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.6.11 def_tok_minus

The **def_tok_minus** directive defines a token as the result of a single digit or character subtracted from another.

The syntax is:

```
@ def_tok_minus <token> <value1> <value2>
```

- `<token>` - the name of the token to define.
- `<value1>` - a single integer or character or parameter that evaluates to such
- `<value2>` - a single integer or character or parameter that evaluates to such

The value of token is taken as the result of subtracting value2 from value1.

To determine the value of `<token>`, **value1** and **value2** are converted to their equivalent numerical ASCII character code (e.g. 0 = 48, 9 = 57, A = 65, Z = 90, a = 97, z = 122).

The ASCII character code for value2 is subtracted from the ASCII character code for value1. The result is set as the value of `<token>`.

**Example with integers:**

Raw snippet values: `<value1> = 5, <value2> = 2`
Equivalent ASCII character codes: `<value1> = 53, <value2> = 50`
Token value = 53 - 50 = 3

**Example with letters:**

Raw snippet values: `<value1> = D, <value2> = B`
Equivalent ASCII character codes: `<value1> = 68, <value2> = 66`
Token value = 68 - 66 = 2

For single-digit integers, this is the same as the basic arithmetic on the integers.

For single-digit integers, this is the same as the basic arithmetic on the integers.

For this reason, it is recommended that `<value1>` and `<value2>` are of the same type and case. That is, both values are:

- **integers (0-9)**
- **upper-case single letters (A-Z); or**
- **lower-case single letters (a-z).**

Mixing value types - e.g. integer and letter - will likely result in unexpected behaviour.

It is possible for `<value1>` or `<value2>` to contain parameters, e.g. "$\{(WIDTH)\}$", so long as the parameters evaluate to a single digit or character.

It is not possible to use tokens in either `<value1>` or `<value2>` due to the order in which snippets are processed and tokens substituted. For more information see [21.5.14 Order of Snippet Processing](#).

If value1 or value2 is not a single character, an error message will be produced.
Defining and Using Snippets

TIP - To ensure value1 and value2 are single characters, use the substring functionality to only use the first character.

// PARAMETER LANE1 INTEGER "Start lane" 5
// PARAMETER LANE2 INTEGER "End lane" 2

// ASCII character codes:
// 5 = 53
// 2 = 50

@ def_tok_minus NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = 5, LANE2 = C, NUM_LANES = 53 - 50 = 3
user_message "Number of lanes between start and end = $(NUM_LANES)"

// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "F"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "C"

// ASCII character codes:
// F = 70
// C = 67

@ def_tok_minus NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = F and LANE2 = C, NUM_LANES = 70 - 67 = 3
user_message "Number of lanes between start and end = $(NUM_LANES)"

// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "FAST"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "CAR"

// Using substring functionality to only use the 1st character of each parameter
@ def_tok_minus NUM_LANES $(LANE1[1:1]) $(LANE2[1:1])
user_message "Number of lanes between start and end = $(NUM_LANES)"

Continue to 21.5.12.6.12 def_tok_minus_inc or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.6.12 def_tok_minus_inc

The **def_tok_minus_inc** defines a token with the result of a single digit or single-character subtracted from another, plus one.

That is, it is similar to **def_tok_minus**, but the result is one more than the equivalent def_tok_minus value (i.e. it is an inclusive subtraction).

The syntax is:

```
@ def_tok_minus_inc <token> <value1> <value2>
```

- `<token>` - the name of the token to define.
- `<value1>` - a single integer or character or parameter that evaluates to such
- `<value2>` - a single integer or character or parameter that evaluates to such

The value of token is taken as the result of subtracting value2 from value1 then adding one.

To determine the value of `<token>`, value1 and value2 are converted to their equivalent numerical ASCII character code (e.g. 0 = 48, 9 = 57, A = 65, Z = 90, a = 97, z = 122).

The ASCII character code for value2 is subtracted from the ASCII character code for value1 and one (1) is added. The result is set as the value of `<token>`.

**Example with integers:**

Raw snippet values:  
<value1> = 5, <value2> = 2  
Equivalent ASCII character codes:<value1> = 53, <value2> = 50  
Token value = 53 - 50 + 1 = 4

**Example with letters:**

Raw snippet values:  
<value1> = D, <value2> = B  
Equivalent ASCII character codes:<value1> = 68, <value2> = 66  
Token value = 68 - 66 + 1 = 3

For single-character integers, this is the same as the basic arithmetic on the integers.

For this reason, it is recommended that `<value1>` and `<value2>` are of the same type and case.

That is, both values are:

- integers (0-9)
- upper-case single letters (A-Z); or
- lower-case single letters (a-z).

Mixing value types - e.g. integer and letter - will likely result in unexpected behaviour.

It is possible for `<value1>` or `<value2>` to contain parameters, e.g. "$(WIDTH)"", so long as the parameters evaluate to a single character.

It is not possible to use tokens in either `<value1>` or `<value2>` due to the order in which snippets are processed and tokens substituted. For more information see 21.5.14 **Order of Snippet Processing**.

If value1 or value2 is not a single character, an error message will be produced.
Defining and Using Snippets

TIP - To ensure value1 and value2 are single characters, use the substring functionality to only use the first character.

```plaintext
// PARAMETER LANE1 INTEGER "Start lane" 5
// PARAMETER LANE2 INTEGER "End lane" 2

// ASCII character codes:
// 5 = 53
// 2 = 50

@ def_tok_minus_inc NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = 5, LANE2 = C, NUM_LANES = 53 - 50 + 1 = 4
user_message "Number of lanes between start and end (inclusive) = $(NUM_LANES)"

// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "F"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "C"

// ASCII character codes:
// F = 70
// C = 67

@ def_tok_minus NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = F and LANE2 = C, NUM_LANES = 70 - 67 + 1 = 4
user_message "Number of lanes between start and end (inclusive) = $(NUM_LANES)"

// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "FAST"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "CAR"

// Using substring functionality to only use the 1st character of each parameter
@ def_tok_minus NUM_LANES $(LANE1[1:1]) $(LANE2[1:1])
user_message "Number of lanes between start and end (inclusive) = $(NUM_LANES)"
```

Continue to 21.5.12.7 Tokens vs Strings or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.
21.5.12.7 Tokens vs Strings

The following directives compare a token value against given strings.

See

21.5.12.7.1 if_tok_eq_str
21.5.12.7.2 if_tok_neq_str

21.5.12.7.1 if_tok_eq_str

The if_tok_eq_str directive tests if a token's value is equal to any given strings.

The syntax is:

```
@ if_tok_eq_str <token> <string> [<string> ...
// Commands to be processed if statement is true
@end_if
```

- `<token>` - the name of the token to compare.
- `<string>` - the string to compare against the value of token.

At least one string must be specified; however, multiple strings can be included.

Multiple strings should be separated by whitespace. Strings should be enclosed in quotes.

If the value of token is equal to any of the strings, the statement is true.

If the value of token is not equal to any of the strings (i.e. the token value is equal to none of the given strings), the statement is false.

Multiple strings are handled as if joined by logical OR statements.

```
@ def_tok A_TOKEN "a token"
@ def_tok B_TOKEN "b token"

@ if_tok_eq_str A_TOKEN "a token" "b token" // must equal one of the list, should pass
    user_message "if_tok_eq_str = TRUE , A = a token OR b token"
@ else
    user_message "if_tok_eq_str = FALSE , A != x token OR y token"
@end_if
```

Continue to 21.5.12.7.2 if_tok_neq_str or return to 21.5.12 Tokens vs Strings or 21.5.12 Snippet Directives.
21.5.12.7.2 if_tok_neq_str

The if_tok_neq_str directive tests if a token is **not equal** to any of the given **strings**.

The syntax is:

```plaintext
@ if_tok_neq_str <token> <string> [ '<string>'... '<string>' ]
// Commands to be processed if statement is true
@ end_if
```

**<token>** - the name of the token to compare.

**<string>** - the string to compare against the value of token.

At least one string must be specified, however, multiple strings can be included. Multiple strings should be separated by whitespace. Strings should be enclosed in quotes.

If the value of token is not equal to any of the strings, the statement is true.
If the value of token is equal to any of the string values, the statement is false.

Multiple strings are handled as if joined by logical OR statements.

```plaintext
@ def_tok A_TOKEN "a token"
@ def_tok B_TOKEN "b token"

@ if_tok_eq_str A_TOKEN "a token" "b token" // must equal one of the list, should pass
  user_message "if_tok_eq_str = TRUE , A = a token OR b token"

@ if tok_eq_str A_TOKEN "x token" "y token" // must equal one of the list, should fail
@ else
  user_message "if_tok_eq_str = FALSE , A != x token OR y token"
@ end_if
```

Continue to [21.5.12.8 Tokens vs Doubles](#) or return to [21.5.12 Tokens vs Strings](#) or [21.5.12 Snippet Directives](#).
21.5.12.8 Tokens vs Doubles

The following directives compare a token value against given doubles.

In these directives, `<double>` can be either a real number or an evaluation of a previously defined token. For example $(T49)$.

See

21.5.12.8.1 if tok_eq_dbl
21.5.12.8.2 if tok_eq_dbl_tol
21.5.12.8.3 if tok_neq_dbl
21.5.12.8.4 if tok_neq_dbl_tol
21.5.12.8.5 if tok_lt_dbl
21.5.12.8.6 if tok_lt_dbl_tol
21.5.12.8.7 if tok_le_dbl
21.5.12.8.8 if tok_le_dbl_tol
21.5.12.8.9 if tok_gt_dbl
21.5.12.8.10 if tok_gt_dbl_tol
21.5.12.8.11 if tok_ge_dbl
21.5.12.8.12 if tok_ge_dbl_tol
21.5.12.8.13 if tok_gt_dbl
21.5.12.8.14 if tok_gt_dbl_tol
21.5.12.8.15 if tok_ge_dbl
21.5.12.8.16 if tok_ge_dbl_tol
21.5.12.8.17 if tok_in_range_dbl
21.5.12.8.18 if tok_in_range_dbl_tol
21.5.12.8.19 if tok_nin_range_dbl
21.5.12.8.20 if tok_nin_range_dbl_tol

Or return to 21.5 Defining and Using Snippets.
21.5.12.8.1 if_tok_eq_dbl

The **if_tok_eq_dbl** directive tests if a token's value is **equal** to any given **double** values, within a fixed tolerance of 1.0\times10^{-6} (i.e. 1.0E-6).

The syntax is:

```plaintext
@ if_tok_eq_dbl <token> <double> [<double>... <double> ]
// Commands processed if statement is true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token.
  
  **double** can be a real number or the evaluation of a token eg $(T49)$.

At least one double value must be specified, however, multiple double values can be included.

Multiple double values should be separated by whitespace.

If the value of token is equal to any of the doubles within the tolerance, the statement is true.

If the value of token is not equal to any of the doubles within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple double values are handled as if joined by logical OR statements.

```plaintext
@ def_tok WIDTH 3.5

@ if_tok_eq_dbl WIDTH 3.0 3.5 4.0
  user_message "WIDTH is equal to 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to **21.5.12.8.2 if_tok_eq_dbl_tol** or return to **21.5.12 Tokens vs Doubles** or **21.5.12 Snippet Directives**.
21.5.12.8.2 if_tok_eq_dbl_tol

The *if_tok_eq_dbl_tol* directive tests if a token's value is equal to any given double value, within a given tolerance.

The syntax is:

```verbatim
@ if_tok_eq_dbl_tol <token> <double> [<double> ... <double>] <tolerance>
// Commands processed if statement is true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token.
  - At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace.
  - Double values should not be quoted.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison.
  - This value must be specified and must be the last value.

If the value of token is equal to any of the doubles within the tolerance, the statement is true.
If the value of token is not equal to any of the doubles within the tolerance, the statement is false.
If the token is undefined, the snippet will produce an error.
Multiple double values are handled as if joined by logical OR statements.

```verbatim
@ def_tok WIDTH 3.5

@ if_tok_eq_dbl_tol WIDTH 3.5 0.1
  user_message "WIDTH is equal to 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.3 if_tok_neq_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.3 if_tok_neq_dbl

The if_tok_neq_dbl directive tests if a token's value is not equal to any of the given doubles, within a fixed tolerance of 1.0x10^-6 \((i.e. \text{1.0E-6})\).

The syntax is:

\[
\text{@ if_tok_neq_dbl } <\text{token}> <\text{double}> \[<\text{double}>... <\text{double}>] \\
// Commands processed if statement is true \\
\text{@ end_if}
\]

\(<\text{token}>\) - the name of the token to test.
\(<\text{double}>\) - the double value to compare against the value of token.

At least one double value must be specified, however, multiple double values can be included.

Multiple double values should be separated by whitespace.

Double values should not be quoted.

If the value of token is not equal to any of the doubles within the tolerance, the statement is true.
If the value of token is equal to any of the doubles within the tolerance, the statement is false.
If the token is undefined, the snippet will produce an error.

Multiple double values are handled as if joined by logical OR statements.

\[
\text{@ def_tok WIDTH 3.5} \\
\text{@ if_tok_neq_dbl WIDTH 3.0} \\
\text{\quad user_message } "\text{WIDTH is not equal to 3.0 within a tolerance of 1e-6}" \\
\text{@ end_if}
\]

Continue to 21.5.12.8.4 if_tok_neq_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.4 if_tok_neq_dbl_tol

The if_tok_neq_dbl_tol directive tests if a token's value is not equal to any given double values, within a given tolerance.

The syntax is:

```plaintext
@if_tok_neq_dbl_tol <token> <double> [... <double>] <tolerance>
// Commands processed if statement is true
@end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token.
  At least one double value must be specified, however, multiple double values can be included.
  Multiple double values should be separated by whitespace.
  Double values should not be quoted.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison.
  This value must be specified and must be the last value.

If the value of token is not equal to any of the double values within the tolerance, the statement is true.
If the value of token is equal to any of the double values within the tolerance, the statement is false.
If the token is undefined, the snippet will produce an error.
Multiple double values are handled as if joined by logical OR statements.

```plaintext
@ def_tok WIDTH 3.5

@if_tok_neq_dbl_tol WIDTH 3.0 0.1
  user_message "WIDTH is not equal to 3.0 within a tolerance of 0.1"
@end_if
```

Continue to 21.5.12.8.5 if_tok_lt_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.5 if_tok_lt_dbl

The **if_tok_lt_dbl** directive tests if a token is less than any given doubles, within a fixed tolerance of 1.0 x 10^-6 (1.0E-6).

The syntax is:

```plaintext
@ if_tok_lt_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is less than any of the double values within the tolerance, the statement is true.

If the token value is not less than any of the double values within the tolerance (i.e. the token value is greater than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

---

```plaintext
@ def_tok WIDTH 3.5

@ if_tok_lt_dbl WIDTH 4.0
  user_message "WIDTH is less than 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.6 if_tok_lt_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.6 if_tok_lt_dbl_tol

The **if_tok_lt_dbl_tol** directive tests if a token is less than any given doubles, within a given tolerance. The comparison is numerical.

The syntax is:

```plaintext
@ if_tok_lt_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

- **<token>** - the name of the token to test.
- **<double>** - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.
- **<tolerance>** - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is less than any of the double values within the tolerance, the statement is true.

If the token value is not less than any of the double values within the tolerance (i.e. the token is greater than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```plaintext
@ def_tok WIDTH 3.5
@ if_tok_lt_dbl_tol WIDTH 4.0 0.1
  user_message "WIDTH is less than 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.7 if_tok_le_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.7 if_tok_le_db1

The if_tok_le_db1 directive tests if a token is less than or equal to any given doubles, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_tok_le_db1 <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is less than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not less than or equal to any of the double values within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

@ def_tok WIDTH 3.5

@ if_tok_le_db1 WIDTH 3.5
  user_message "WIDTH is less than or equal to 3.5 within a tolerance of 1e-6"
@ end_if

@ if_tok_le_db1 WIDTH 3.5 4.0
  user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if

Continue to 21.5.12.8.8 if_tok_le_db1_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.8 if_tok_le_dbl_tol

The if_tok_le_dbl_tol directive tests if a token is less than or equal to any given double values, within a given tolerance.

The syntax is:

```bash
@ if_tok_le_dbl_tol <token> <double> [<double>]... <tolerance>
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is less than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not less than or equal to any of the double values within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```bash
@ def_tok WIDTH 3.5
@ if_tok_le_dbl_tol WIDTH 3.5 0.1
    user_message "WIDTH is less than or equal to 3.5 within a tolerance of 0.1"
@ end_if
@ if_tok_le_dbl_tol WIDTH 3.5 4.0 0.1
    user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.9 if_tok_gt_dbl or return to 21.5.12 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.9 if_tok_gt_dbl

The **if_tok_gt_dbl** directive tests if a token is greater than any given doubles, within a fixed tolerance of 1.0 x 10^-6 (1.0E-6).

The syntax is:

```
@ if_tok_gt_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is greater than any of the double values within the tolerance, the statement is true.

If the token value is not greater than any of the double values within the tolerance (i.e. the token value is less than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_gt_dbl WIDTH 3.0
    user_message "WIDTH is greater than 3.0 within a tolerance of 1e-6"
@ end_if

@ if_tok_gt_dbl WIDTH 3.0 4.0
    user_message "WIDTH is greater than 3.0 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to **21.5.12.8.10 if_tok_gt_dbl_tol** or return to **21.5.12 Tokens vs Doubles** or **21.5.12 Snippet Directives**.
21.5.12.8.10 if_tok_gt_dbl_tol

The `if_tok_gt_dbl_tol` directive tests if a token is greater than any given double values, within a given tolerance.

The syntax is:

```
@ if_tok_gt_dbl_tol <token> <double> [ <double>... <double> ] <tolerance>
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token.
  - At least one double value must be specified, however, multiple double values can be included.
  - Multiple double values should be separated by whitespace.
  - Double values should not be quoted.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is greater than any of the double values within the tolerance, the statement is true.

If the token value is not greater than any of the double values within the tolerance (i.e. the token is less than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_gt_dbl_tol WIDTH 3.0 0.1
  user_message "WIDTH is greater than 3.5 within a tolerance of 0.1"
@ end_if

@ if_tok_gt_dbl_tol WIDTH 3.0 3.5
  user_message "WIDTH is greater than 3.0 or 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.11 if_tok_ge_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.11 if_tok_ge_dbl

The if_tok_ge_dbl directive tests if a token is greater than or equal to any given double values, within a fixed tolerance of 1.0 x 10^-6 (1.0E-6).

```plaintext
@ if_tok_ge_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is greater than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not greater than or equal to any of the double values within the tolerance (i.e. the token value is less than all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```plaintext
@ def_tok WIDTH 3.5

@ if_tok_le_dbl WIDTH 3.5
  user_message "WIDTH is less than or equal to 3.5 within a tolerance of 1e-6"
@ end_if
@ if_tok_le_dbl WIDTH 3.5 4.0
  user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.12 if_tok_le_dbl_tol or return to 21.5.12 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.12 if_tok_le_dbl_tol

The *if_tok_le_dbl_tol* directive tests if a token is less than or equal to any given double values, within a given tolerance.

The syntax is:

```plaintext
@ if_tok_le_dbl_tol <token> <double> [<double> ... <double>] <tolerance>
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is less than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not less than or equal to any of the double values within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```plaintext
@ def_tok WIDTH 3.5

@ if_tok_le_dbl_tol WIDTH 3.5 0.1
    user_message "WIDTH is less than or equal to 3.5 within a tolerance of 0.1"
@ end_if

@ if_tok_le_dbl_tol WIDTH 3.5 4.0 0.1
    user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.13 *if_tok_gt_dbl* or return to 21.5.12 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.13 if_tok_gt_dbl

The if_tok_gt_dbl directive tests if a token is greater than any given doubles, within a fixed tolerance of 1.0 x 10^-6 (1.0E-6).

The syntax is:

```
@ if_tok_gt_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is greater than any of the double values within the tolerance, the statement is true.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```verbatim
@ def_tok WIDTH 3.5

@ if_tok_gt_dbl_tol WIDTH 3.0 0.1
  user_message "WIDTH is greater than 3.5 within a tolerance of 0.1"
@ end_if

@ if_tok_gt_dbl_tol WIDTH 3.0 3.5
  user_message "WIDTH is greater than 3.0 or 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.15 if_tok_ge_dbl or return to 21.5.12 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.15 if_tok_ge_dbl

The if_tok_ge_dbl directive tests if a token is greater than or equal to any given double values, within a fixed tolerance of 1.0 x 10^{-6} (1.0E-6).

The syntax is:

```
@ if_tok_ge_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is greater than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not greater than or equal to any of the double values within the tolerance (i.e. the token value is less than all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_ge_dbl WIDTH 3.5
user_message "WIDTH is greater than or equal to 3.5 within a tolerance of 1e-6"
@ end_if

@ if_tok_ge_dbl WIDTH 3.5 4.0
user_message "WIDTH is greater than or equal to 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.16 if_tok_ge_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.16 if_tok_ge_dbl_tol

The `if_tok_ge_dbl_tol` directive tests if a token is greater than or equal to any given double values, within a given tolerance.

The syntax is:

```plaintext
@if_tok_ge_dbl_tol <token> <double> [ <double> ... <double> ] <tolerance>
// Commands processed if true
@end_if
```

- `<token>` - the name of the token to test.
- `<double>` - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is greater than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not greater than or equal to any of the double values within the tolerance (i.e. the token value is less than all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```plaintext
@ def_tok WIDTH 3.5

@ if_tok_ge_dbl_tol WIDTH 3.5 0.1
    user_message "WIDTH is greater than or equal to 3.5 within a tolerance of 0.1"
    @ end_if

@ if_tok_ge_dbl_tol WIDTH 3.5 4.0
    user_message "WIDTH is greater than or equal to 3.5 or 4.0 within a tolerance of 0.1"
    @ end_if
```

Continue to 21.5.12.8.17 if_tok_in_range_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.17 if_tok_in_range_db1

The `if_tok_in_range_db1` directive tests if a token is between two double values, within a fixed tolerance of $1.0 \times 10^{-6}$ ($1.0E-6$).

The syntax is:

```plaintext
@ if_tok_in_range_db1 <token> <lower> <upper>
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to test.
- `<lower>` - the double representing the lower bound of the range to check against the token. This value must be specified.
- `<upper>` - the double representing the upper bound of the range to check against the token. This value must be specified.

If the token value is within the range from lower to upper within the tolerance, the statement is true.

If the token is not defined or is outside the range from lower to upper within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

```plaintext
@ def_tok WIDTH 3.5
@ if_tok_in_range_db1 WIDTH 3.0 4.0
  user_message "WIDTH is within range 3.0 to 4.0 within a tolerance of 1e-6"
@ else
  user_message "WIDTH is outside range 3.0 to 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.18 if_tok_in_range_db1_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.18 if_tok_in_range_dbl_tol

The **if_tok_in_range_dbl** directive tests if a token is between two double values, within a given tolerance.

The syntax is:

```plaintext
@ if_tok_in_range_dbl <token> <lower> <upper> <tolerance>
// Commands processed if true
@ end_if
```

- **<token>** - the name of the token to compare.
- **<lower>** - the double value representing the lower bound of the range to check against the token. This value must be specified.
- **<upper>** - the double value representing the upper bound of the range to check against the token. This value must be specified.
- **<tolerance>** - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is within the range from lower to upper within the tolerance, the statement is true.

If the token is outside the range from lower to upper within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

```plaintext
@ def_tok WIDTH 3.5
@ if_tok_in_range_dbl_tol WIDTH 3.0 4.0 0.1
  user_message "WIDTH is within range 3.0 to 4.0 within a tolerance of 0.1"
@ else
  user_message "WIDTH is outside range 3.0 to 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to **21.5.12.8.19 if_tok_nin_range_dbl** or return to **21.5.12.8 Tokens vs Doubles** or **21.5.12 Snippet Directives**.
21.5.12.8.19 if_tok_nin_range_dbl

The `if_tok_nin_range_dbl` directive tests if a token is not between two double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```plaintext
@ if_tok_nin_range_dbl <token> <lower> <upper>
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to compare.
- `<lower>` - the double value representing the lower bound of the range to check against the token. This value must be specified.
- `<upper>` - the double value representing the upper bound of the range to check against the token. This value must be specified.

If the token value is within the range from lower to upper within the tolerance, the statement is true.
If the token is outside the range from lower to upper within the tolerance, the statement is false.
If the token is undefined, the snippet will produce an error.

```plaintext
@ def_tok WIDTH 4.0

@ if_tok_nin_range WIDTH 3.0 3.5
    user_message "WIDTH is not within range 3.0 to 3.5 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.20 if_tok_nin_range_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.
21.5.12.8.20 if_tok_nin_range_dbl_tol

The **if_tok_nin_range_dbl_tol** directive tests if a token is between two double values, within a given tolerance.

The syntax is:

```
@ if_tok_nin_range_dbl <token> <lower> <upper> <tolerance>
// Commands processed if true
@ end_if
```

- **<token>** - the name of the token to compare.
- **<lower>** - the double value representing the lower bound of the range to check against the token. This value must be specified.
- **<upper>** - the double value representing the upper bound of the range to check against the token. This value must be specified.
- **<tolerance>** - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is not within the range from lower to upper within the tolerance, the statement is true.

If the token is within the range from lower to upper within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

```
@ def_tok WIDTH 4.0

@ if_tok_nin_range_dbl_tol WIDTH 3.0 3.5 0.1
    user_message "WIDTH is not within the range 3.0 to 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to [21.5.12.9 Tokens vs Integers](#) or return to [21.5.12.8 Tokens vs Doubles](#) or [21.5.12 Snippet Directives](#).
21.5.12.9 Tokens vs Integers

The following directives compare a token value against given integers.

See

- \texttt{if\_tok\_eq\_int}
- \texttt{if\_tok\_neq\_int}
- \texttt{if\_tok\_lt\_int}
- \texttt{if\_tok\_le\_int}
- \texttt{if\_tok\_gt\_int}
- \texttt{if\_tok\_ge\_int}

Or return to \texttt{21.5 Defining and Using Snippets}. 
21.5.12.9.1 if_tok_eq_int

The if_tok_eq_int directive tests if a token equals any of the given integers.

The syntax is:

```plaintext
@ if_tok_eq_int <token> <integer> [integer]... <integer>
// Commands to be processed if true
@ end_if
```

- `<token>` - the name of the token to compare.
- `<integer>` - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value is equal to any of the integers, the statement is true.
If the token value is not equal to any of the integers, the statement is false.
If the token is undefined, the snippet will produce an error.
Multiple integers are handled as if joined by logical OR statements.

```plaintext
@ def_tok NUM_LANES 2
@ if_tok_eq_int NUM_LANES 2
    user_message "NUM_LANES equals 2"
@ end_if
@ if_tok_eq_int NUM_LANES 2 3 4
    user_message "NUM_LANES equals 2, 3 or 4"
@ end_if
```

See also:
- if_tok_neq_int - logically opposite directive
- if_tok_eq_dbl - for comparison with doubles
- if_val_eq_int - for testing of values rather than tokens

Continue to 21.5.12.9.2 if_tok_neq_int or return to 21.5.12 Tokens vs Integers or 21.5.12 Snippet Directives.
21.5.12.9.2 if_tok_neq_int

The if_tok_neq_int directive tests if a token does not equal any of the integers.

The syntax is:

```plaintext
@ if_tok_neq_int <token> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

- `<token>` - the name of the token to compare.
- `<integer>` - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value does not equal any of the integers, the statement is true.
If the token value equals any of the integers, the statement is false.
If the token is undefined, the snippet will produce an error.
Multiple integers are handled as if joined by logical OR statements.

```plaintext
@ def_tok NUM_LANES 2
@ if_tok_neq_int NUM_LANES 2
  user_message "NUM_LANES is not equal to 2"
@ end_if
@ if_tok_neq_int NUM_LANES 2 3 4
  user_message "NUM_LANES equal to 2, 3 or 4"
@ end_if
```

21.5.12.9.3 if_tok_lt_int

The **if_tok_lt_int** directive tests if a token is less than any given integers. The comparison is numerical.

The syntax is:

```plaintext
@ if_tok_lt_int <token> <integer> [<integer>... <integer>]
// Commands processed if true
@ end_if
```

- **<token>** - the name of the token to compare.
- **<integer>** - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value is less than any of the integers, the statement is true.
If the token value is not less than any of the integers (i.e. the token value is greater than or equal to all integer values), the statement is false.
If the token is undefined, the snippet will produce an error.

Multiple integers are handled as if joined by logical OR statements.

```plaintext
@ def_tok NUM_LANES 2

@ if_tok_lt_int NUM_LANES 3
  user_message "NUM_LANES is less than 3"
@ end_if

@ if_tok_lt_int NUM_LANES 2 3 4
  user_message "NUM_LANES is less than 2, 3 or 4"
@ end_if
```

See also:
- **if_tok_le_int** - for less than or equal to comparison against integers
- **if_tok_gt_int** - for greater than comparison against integers
- **if_tok_ge_int** - for greater than or equal to comparison against integers
- **if_tok_lt_dbl** - for comparison against doubles
- **if_val_lt_int** - for testing of values rather than tokens

Continue to 21.5.12.9.4 if_tok_le_int or return to 21.5.12.9 Tokens vs Integers or 21.5.12 Snippet Directives.
21.5.12.9.4 if_tok_le_int

The if_tok_le_int directive tests if a token is less than or equal to any given integers. The comparison is numerical.

The syntax is:

```plaintext
@ if_tok_le_int <token> <integer> [<integer>... <integer>]
// Commands processed if true
@ end_if
```

- `<token>` - the name of the token to compare.
- `<integer>` - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value is less than or equal to any of the integers, the statement is true.
If the token value is not less than or equal to any of the integers (i.e. the token value is greater than all integer values), the statement is false.
If the token is undefined, the snippet will produce an error.
Multiple integers are handled as if joined by logical OR statements.

```plaintext
@ def_tok NUM_LANES 2

@ if_tok_le_int NUM_LANES 2
  user_message "NUM_LANES is less than or equal to 2"
@ end_if

@ if_tok_le_int NUM_LANES 2 3 4
  user_message "NUM_LANES is less than or equal to 2, 3 or 4"
@ end_if
```

Continue to 21.5.12.9.5 if_tok_gt_int or return to 21.5.12.9 Tokens vs Integers or 21.5.12 Snippet Directives.
21.5.12.9.5 \texttt{if\_tok\_gt\_int}

The \texttt{if\_tok\_gt\_int} directive tests if a token is greater than any given integers. The comparison is numerical.

The syntax is:

\begin{verbatim}
@ if_tok_gt_int <token> <integer> [<integer>... <integer>]
// Commands processed if true
@ end_if
\end{verbatim}

\texttt{<token>} - the name of the token to compare.

\texttt{<integer>} - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value is greater than any of the integers, the statement is true.

If the token value is not greater than any of the integers (i.e. the token value is less than or equal to all integer values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple integers are handled as if joined by logical OR statements.

\begin{verbatim}

\end{itemize}

Continue to 21.5.12.9.6 \texttt{if\_tok\_ge\_int} or return to 21.5.12.9 Tokens vs Integers or 21.5.12 Snippet Directives.
21.5.12.9.6 if\_tok\_ge\_int

The \texttt{if\_tok\_ge\_int} directive tests if a token is greater than or equal to any given integers.

The syntax is:

\begin{verbatim}
@ if\_tok\_ge\_int <token> <integer> [... <integer>]
// Commands processed if true
@end\_if
\end{verbatim}

\texttt{<token>} - the name of the token to compare.

\texttt{<integer>} - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value is greater than or equal to any of the integers, the statement is true.

If the token value is not greater than or equal to any of the integers (\textit{i.e.} the token value is less than all integer values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple integers are handled as if joined by logical OR statements.

\begin{verbatim}
@ def\_tok NUM\_LANES 2
@ if\_tok\_ge\_int NUM\_LANES 2
  user\_message \textquotedblleft NUM\_LANES is greater than or equal to 2\textquotedblright
@ end\_if

@ if\_tok\_ge\_int NUM\_LANES 2 3 4
  user\_message \textquotedblleft NUM\_LANES is greater than or equal to 2, 3 or 4\textquotedblright
@ end\_if
\end{verbatim}

See also:

- \texttt{if\_tok\_lt\_int} - for less than comparison against integers
- \texttt{if\_tok\_gt\_int} - for greater than comparison against integers
- \texttt{if\_tok\_le\_int} - for less than or equal to comparison against integers
- \texttt{if\_tok\_ge\_dbl} - for comparison against doubles
- \texttt{if\_val\_ge\_int} - for testing of values rather than tokens

Continue to 21.5.12.10 Values Defined and Value vs Value or return to 21.5.12.9 Tokens vs Integers or 21.5.12 Snippet Directives.
21.5.12.10 Values Defined and Value vs Value

The following directives test whether values are empty and compare values with other values. Values can be parameter values (i.e. substituted) or raw values (i.e. in the file).

Note: these directives should not be used with tokens. The order in which parameters, directives and tokens are processed and substituted (see section 21.5.14 Order of Snippet Processing) will likely result in unexpected results.

See

21.5.12.10.1 if_val
21.5.12.10.2 if_nval
21.5.12.10.3 if_all_vals
21.5.12.10.4 if_nall_vals

Or return to 21.5 Defining and Using Snippets.
21.5.12.10.1 if_val

The if_val directive tests if any of the given values are empty.

The syntax is:

```plaintext
@ if_val <value> [<value>... <value>]
// Commands processed if statement is true
@ end_if
```

- `<value>` - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.
- If any of the values are not empty, the statement is true.
- If all of the values are empty, the statement is false.
- Multiple values are handled as if joined by logical OR statements.
- NOTE: This directive simply tests whether the value is defined and exists and not whether the value is valid or blank.

```plaintext
// PARAMETER PA TEXT "PA" OPTIONAL
// PARAMETER PB TEXT "PB" OPTIONAL
// PARAMETER PC TEXT "PC" OPTIONAL

@ if_val "$(PA)"
user_message "Found PA"
@ end_if

@ if_val "$(PA)" "$(PB)"
user_message "Found PA or PB"
@ end_if

@ if_val "$(PA)" "$(PB)" "$(PC)"
user_message "Found PA or PB or PC"
@ end_if
```

Continue to 21.5.12.10.2 if_nval or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippet Directives.
21.5.12.10.2 if_nval

The if_nval directive tests if any of the given values are empty.

The syntax is:

```
@ if_nval <value> [<value>... <value>]
// Commands processed if statement is true
@ end_if
```

- The `if_nval` directive tests if any of the given values are empty.
- The syntax is: `<value>` - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.
- If any of the values are empty, the statement is true.
- If none of the values are empty, the statement is false.
- Multiple values are handled as if joined by logical OR statements.

```
// PARAMETER PA TEXT "PA" OPTIONAL
// PARAMETER PB TEXT "PB" OPTIONAL
// PARAMETER PC TEXT "PC" OPTIONAL

@ if_nval "$(PA)"
user_message "Not found PA"
@ end_if

@ if_nval "$(PA)" "$(PB)"
user_message "Not found PA and PB"
@ end_if

@ if_nval "$(PA)" "$(PB)" "$(PC)"
user_message "Not found PA, PB and PC"
@ end_if
```

Continue to 21.5.12.10.3 if_all_vals or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippet Directives.
21.5.12.10.3 if_all_vals

The **if_all_vals** directive tests whether all given values are not empty.

The syntax is:

```
@ if_all_vals <value> [... <value>]
// Commands to be processed when statement is true
@ end_if
```

**<value>** - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.

If all of the values are not empty, the statement is true.

If any of the values are empty, the statement is false.

Multiple values are handled as if joined by logical AND statements.

```
@ if_all_vals "$(PA)"
  user_message "PA exists"
@ end_if

@ if_all_vals "$(PA)" "$(PB)"
  user_message "PA and PB both exist!"
@ end_if

@ if_all_vals "$(PA)" "$(PB)" "$(PC)"
  user_message "PA, PB and PC all exist!"
@ else
  user_message "One of PA, PB or PC does not exist"
@ end_if
```

Continue to 21.5.12.10.4 if_nall_vals or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippet Directives.
21.5.12.10.4 if_nall_vals

The **if_nall_vals** directive tests if all of the given values are empty.

The syntax is:

```plaintext
@ if_nall_vals <value> [<value>... <value>]
// Commands to be processed when statement is true
@ end_if
```

- `<value>` - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.
- If all of the values are empty, the statement is true.
- If any of the values are not empty, the statement is false.
- Multiple values are handled as if joined by logical AND statements.

```plaintext
@ if_nall_vals "$(PA)"
user_message "PA does not exist."
@ end_if

@ if_nall_vals "$(PA)" "$(PB)"
user_message "PA and PB do not exist.!
@ end_if

@ if_nall_vals "$(PA)" "$(PB)" "$(PC)"
user_message "PA,PB and PC do not exist."
@ end_if
```

Continue to 21.5.12.11 Values vs Strings or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippel Directives.
21.5.12.11 Values vs Strings

The following directives compare a value against given strings. Comparison is character-based and not numerical (e.g. "1" does not equal "1.0" or "01").

See

21.5.12.11.1 if_val_eq_str
21.5.12.11.2 if_val_neq_str

Or return to 21.5 Defining and Using Snippets.

21.5.12.11.1 if_val_eq_str

The if_val_eq_str directive tests if a value is equal to any of the given strings.
The syntax is:

```
@if_val_eq_str <value> <string> [ <string> ... <string> ]
// Commands processed if statement is true
@end if
```

- `<value>` - is the value to compare. One and only one value must be specified.
- `<string>` - is the string to compare against the value. At least one string must be specified, however, multiple strings can be included. Multiple strings should be separated by whitespace.

Strings or values containing whitespace should be enclosed in quotation marks.
If the value is equal to any of the strings, the statement is true.
If the value is not equal to any of the string values, the statement is false.
Multiple strings are handled as if joined by logical OR statements.

```
// PARAMETER KT TEXT "Kerb type" "SA"

@if_val_eq_str "$\{KT\}" "SA"
  user_message "Kerb type is equal to SA"
@end if

@if_val_eq_str "$\{KT\}" "SA" "SM"
  user_message "Kerb type is equal to either SA or SM"
@end if
```

Continue to 21.5.12.11.2 if_val_neq_str or return to 21.5.12.11 Values vs Strings or 21.5.12 Snippet Directives.
21.5.12.11.2 if_val_neq_str

The \texttt{if\_val\_neq\_str} directive tests if a value is not equal to any of the given strings.

The syntax is:

\begin{verbatim}
@if_val_neq_str <value> <string> [... <string>]
// Commands processed if statement is true
@end if
\end{verbatim}

\begin{itemize}
  \item \texttt{<value>} - is the value to compare. One and only one value must be specified.
  \item \texttt{<string>} - is the string to compare against the value. At least one string must be specified, however, multiple strings can be included. Multiple strings should be separated by whitespace.
  \item Strings or values containing whitespace should be enclosed in quotation marks.
  \item If the value is not equal to any of the strings, the statement is true.
  \item If the value is not equal to none of the strings (\textit{i.e.} it is equal to all strings), the statement is false.
  \item Multiple strings are handled as if joined by logical OR statements.
\end{itemize}

\begin{verbatim}
// PARAMETER KT TEXT "Kerb type" "SB"
@if_val_neq_str "$(KT)" "SA"
  user_message "Kerb type is not equal to SA"
@end if
@if_val_neq_str "$(KT)" "SA" "SM"
  user_message "Kerb type is not equal to either SA or SM"
@end if
\end{verbatim}

Continue to 21.5.12.12 \texttt{Values vs Doubles} or return to 21.5.12.11 \texttt{Values vs Strings} or 21.5.12 \texttt{Snippet Directives}.
21.5.12.12 Values vs Doubles

The following directives compare a token value against given doubles. Comparison is numerical.

See

21.5.12.12.1 if_val_eq_dbl
21.5.12.12.2 if_val_eq_dbl_tol
21.5.12.12.3 if_val_neq_dbl
21.5.12.12.4 if_val_neq_dbl_tol
21.5.12.12.5 if_val_lt_dbl
21.5.12.12.6 if_val_lt_dbl_tol
21.5.12.12.7 if_val_le_dbl
21.5.12.12.8 if_val_le_dbl_tol
21.5.12.12.9 if_val_gt_dbl
21.5.12.12.10 if_val_gt_dbl_tol
21.5.12.12.11 if_val_ge_dbl
21.5.12.12.12 if_val_ge_dbl_tol
21.5.12.12.13 if_val_in_range_dbl
21.5.12.12.14 if_val_in_range_dbl_tol
21.5.12.12.15 if_val_nin_range_dbl
21.5.12.12.16 if_val_nin_range_dbl_tol

Or return to 21.5 Defining and Using Snippets.
21.5.12.12.1 if_val_eq_dbl

The if_val_eq_dbl directive tests if a value is equal to any of the given double values, with a fixed tolerance of 1.0 x 10^-6 (1.0E-6).

The syntax is:

```
@ if_val_eq_dbl <value> <double> [ <double> ... <double> ]
// Commands processed if statement is true
@ end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value – integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

Values containing whitespace should be enclosed in quotation marks.
If the value is equal to any of the doubles within the tolerance, the statement is true.
If the value is not equal to any of the doubles within the tolerance, the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.
Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5
@ if_val_eq_dbl $\{(WIDTH)\} 3.5
  user_message "WIDTH is equal to 3.5 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.2 if_val_eq_dbl_tol or return to 21.5.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.2 if_val_eq_dbl_tol

The if_val_eq_dbl_tol directive tests if a value is equal to any given double value, within a given tolerance.

The syntax is:

```plaintext
@if_val_eq_dbl_tol <value> <double> [... <double>] <tolerance>
// Commands processed if statement is true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value—integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is equal to any of the double values within the tolerance, the statement is true.
If the value is not equal to any of the double values within the tolerance, the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.
Multiple double values are handled as if joined by logical OR statements.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 3.5
@if_val_eq_dbl_tol $(WIDTH) 3.5 0.1
  user_message "WIDTH is equal to 3.5 within a tolerance of 0.1"
@end_if
```

Continue to 21.5.12.12.3 if_val_neq_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.3 if_val_neq_dbl

The \texttt{if\_val\_neq\_dbl} directive tests if a value is not equal to any of the given doubles, with a fixed tolerance of 1.0 \times 10^{-6} (1.0E-6).

The syntax is:

\begin{verbatim}
@ if_val_neq_dbl <value> <double> [ <double> ... <double> ]
// Commands processed if statement is true
@ end_if
\end{verbatim}

- \texttt{<value>} - the value to compare. The value should evaluate to a numeric value - integer or double.
- \texttt{<double>} - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is not equal to any of the doubles within the tolerance, the statement is true.
If the value is equal to all of the doubles within the tolerance, the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.
Multiple doubles are handled as if joined by logical OR statements.

\begin{verbatim}
// PARAMETER WIDTH REAL "Lane width" 3.5
@ if_val_neq_dbl $(WIDTH) 3.0
  user_message "WIDTH is not equal to 3.0 within a tolerance of 1e-6"
@ end_if
\end{verbatim}

Continue to 21.5.12.12.4 \texttt{if\_val\_neq\_dbl\_tol} or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.4 if_val_neq_dbl_tol

The `if_val_neq_dbl_tol` directive tests if a value is not equal to any given doubles, within a given tolerance.

The syntax is:

```plaintext
@if_val_neq_dbl_tol <value> <double> [ <double> ... <double> ] <tolerance>
// Commands processed if statement is true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value- integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is not equal to any of the doubles within the tolerance, the statement is true.
If the value is equal to all of the doubles within the tolerance, the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.
Multiple double values are handled as if joined by logical OR statements.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 3.5
@if_val_neq_dbl_tol $(WIDTH) 3.0 0.1
    user_message "WIDTH is not equal to 3.0 within a tolerance of 0.1"
@end_if
```

Continue to 21.5.12.12.5 if_val_lt_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.5 if_val_lt_dbl

The if_val_lt_dbl directive tests if a value is less than any of the given double values within a fixed tolerance of 1.0 \times 10^{-6} (1.0E-6).

The syntax is:

```plaintext
@if_val_lt_dbl <value> <double> [<double>... <double>]
// Commands processed if true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

  If the value is less than any of the doubles within the tolerance, the statement is true.
  If the value is not less than any of the doubles within the tolerance (i.e. the value is greater than or equal to all doubles), the statement is false.
  If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 3.5
@if_val_lt_dbl $(WIDTH) 4.0
  user_message "WIDTH is less than 4.0 within a tolerance of 1e-6"
@end_if

@if_val_lt_dbl $(WIDTH) 3.0 3.5 4.0
  user_message "WIDTH is less than 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@end_if
```

Continue to 21.5.12.12.6 if_val_lt_dbl_tol or return to 21.5.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.6 if_val_lt_dbl_tol

The if_val_lt_dbl_tol directive tests if a value is less than any given double values, within a given tolerance.

The syntax is:

```plaintext
@if_val_lt_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is less than any of the doubles within the tolerance, the statement is true.
If the value is not less than any of the doubles within the tolerance (i.e. the value is greater than or equal to all doubles), the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 3.5
@if_val_lt_dbl_tol $(WIDTH) 4.0 0.1
  user_message "WIDTH is less than 4.0 within a tolerance of 0.1"
@end_if
@if_val_lt_dbl_tol $(WIDTH) 3.0 3.5 4.0 0.1
  user_message "WIDTH is less than 3.0, 3.5 or 4.0 within a tolerance of 0.1"
@end_if
```

Continue to 21.5.12.12.7 if_val_le_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.7 if_val_le_dbl

The if_val_le_dbl directive tests if a value is less than or equal to any of the given double values within a fixed tolerance of 1.0 x 10^-6 (1.0E-6).

The syntax is:

```plaintext
@if_val_le_dbl <value> <double> [<double>... <double>]
// Commands processed if true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is less than or equal to any of the doubles within the tolerance, the statement is true.
If the value is not less than or equal to any of the doubles within the tolerance (i.e. the value is greater than all doubles), the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.
Multiple doubles are handled as if joined by logical OR statements.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 3.5
@if_val_le_dbl $(WIDTH) 3.5
    user_message "WIDTH is less than or equal to 3.5 within a tolerance of 1e-6"
@end_if

@if_val_le_dbl $(WIDTH) 3.0 3.5 4.0
    user_message "WIDTH is less than or equal to 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@end_if
```

Continue to 21.5.12.12.8 if_val_le_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.8 if_val_le_dbl_tol

The if_val_le_dbl_tol directive tests if a value is less than or equal to any given doubles, within a given tolerance.

The syntax is:

```plaintext
@if tok_le_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is less than or equal to any of the doubles within the tolerance, the statement is true.
If the value is not less than or equal to any of the doubles within the tolerance (i.e. the value is greater than all of the doubles), the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.
Multiple doubles are handled as if joined by logical OR statements.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 3.5
@if val_le_dbl_tol $(WIDTH) 3.5 0.1
    user_message "WIDTH is less than or equal to 3.5 within a tolerance of 0.1"
@end_if
@if val_le_dbl_tol $(WIDTH) 3.0 3.5 4.0 0.1
    user_message "WIDTH is less than or equal to 3.0, 3.5 or 4.0 within a tolerance of 0.1"
@end_if
```

21.5.12.9 if_val_gt dbl

The `if_val_gt dbl` directive tests if a value is greater than any of the given doubles, within a fixed tolerance of 1.0 x 10^-6 (1.0E-6).

The syntax is:

```bash
@if_val_gt dbl <value> <double> [<double>... <double>]
// Commands processed if true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is greater than any of the doubles within the tolerance, the statement is true.
If the value is not greater than any of the doubles within the tolerance (i.e. the value is less than or equal to all doubles), the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.
Multiple doubles are handled as if joined by logical OR statements.

```bash
// PARAMETER WIDTH REAL "Lane width" 3.5
@if_val_gt dbl $(WIDTH) 3.0
    user_message "WIDTH is greater than 3.5 within a tolerance of 1e-6"
@end_if
@if_val_gt dbl $(WIDTH) 3.0 3.5 4.0
    user_message "WIDTH is greater than 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@end_if
```

Continue to 21.5.12.8 if_val_le_dbl_tol or return to 21.5.12.8 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.10 if_val_gt_dbl_tol

The `if_val_gt_dbl_tol` directive tests if a value is greater than any given double values, within a given tolerance.

The syntax is:

```
@ if_val_gt_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is greater than any of the doubles within the tolerance, the statement is true.

If the value is not greater than any of the doubles within the tolerance (i.e. the value is less than or equal to all doubles), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_gt_dbl_tol $(WIDTH) 3.0 0.1
  user_message "WIDTH is greater than 3.0 within a tolerance of 0.1"
@ end_if

@ if_val_gt_dbl_tol $(WIDTH) 3.0 3.5 4.0 0.1
  user_message "WIDTH is greater than 3.0, 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.11 if_val_ge_dbl or return to 21.5.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.11 if_val_ge_dbl

The *if_val_ge_dbl* directive tests if a value is greater than or equal to any of the given double values, within a fixed tolerance of $1.0 \times 10^{-6}$ ($1.0 \text{E-6}$).

The syntax is:

```plaintext
@ if_val_ge_dbl <value> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

*<value>* - the value to compare. The value should evaluate to a numeric value - integer or double.

*<double>* - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is greater than or equal to any of the doubles within the tolerance, the statement is true.

If the value is not greater than or equal to any of the doubles within the tolerance (*i.e.* the value is less than all of the double values), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_ge_dbl $(WIDTH) 3.5
    user_message "WIDTH is greater than or equal to 3.5 within a tolerance of 1e-6"
@ end_if

@ if_val_gt_dbl $(WIDTH) 3.0 3.5 4.0
    user_message "WIDTH is greater than or equal to 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12 if_val_ge_dbl_tol or return to 21.5.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12 if_val_ge_dbl_tol

The `if_val_ge_dbl_tol` directive tests if a value is greater than or equal to any given double values, within a given tolerance.

The syntax is:

```
@ if_val_ge_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<double>` - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is greater than or equal to any of the double within the tolerance, the statement is true.

If the value is not greater than or equal to any of the doubles within the tolerance (i.e. the value is less than all doubles), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5
@ if_val_ge_dbl_tol $(WIDTH) 3.0 0.1
  user_message "WIDTH is greater than or equal to 3.0 within a tolerance of 0.1"
@ end_if

@ if_val_ge_dbl_tol $(WIDTH) 3.0 3.5 4.0 0.1
  user_message "WIDTH is greater than or equal to 3.0, 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.13 if_val_in_range_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.13 if_val_in_range_dbl

The `if_val_in_range_dbl` directive tests if a value exists and is between two double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_val_in_range_dbl <value> <lower> <upper>
// Commands processed if true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value—integer or double.
- `<lower>` - the double representing the lower bound of the range to check against value. This value must be specified.
- `<upper>` - the double representing the upper bound of the range to check against value. This value must be specified.

If the value is within the range from lower to upper within the tolerance, the statement is true. If the value is not within the range from lower to upper within the tolerance, the statement is false. If the value or any doubles do not evaluate to a valid number, an error is produced.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_in_range_dbl $(WIDTH) 3.0 4.0
   user_message "WIDTH is between 3.0 and 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.14 if_val_in_range_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.14 if_val_in_range_dbl_tol

The if_val_in_range_dbl_tol directive tests if a value exists and is between two doubles, within a given tolerance.

The syntax is:

```
@if_val_in_range_dbl_tol <value> <lower> <upper> <tolerance>
// Commands processed if true
@end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value- integer or double.
- `<lower>` - the double value representing the lower bound of the range to check against value. This value must be specified.
- `<upper>` - the double value representing the upper bound of the range to check against value. This value must be specified.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is within the range from lower to upper within the tolerance, the statement is true.
If the value is not within the range from lower to upper within the tolerance, the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.

```
// PARAMETER WIDTH REAL "Lane width" 3.5
@if_val_in_range_dbl_tol $(WIDTH) 3.0 4.0 0.1
  user_message "WIDTH is between 3.0 and 4.0 within a tolerance of 0.1"
@end_if
```

Continue to 21.5.12.12.15 if_val_nin_range_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.12.15 if_val_nin_range_dbl

The `if_val_nin_range_dbl` directive tests if a value exists and is not between two double values, within a given tolerance.

The syntax is:

```plaintext
@ if_val_nin_range_dbl <value> <lower> <upper>
// Commands processed if true
@ end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value- integer or double.
- `<lower>` - the double representing the lower bound of the range to check against value. This value must be specified.
- `<upper>` - the double representing the upper bound of the range to check against value. This value must be specified.

If the value is not within the range from lower to upper within the tolerance, the statement is true. If the value is within the range from lower to upper within the tolerance, the statement is false. If the value or any doubles do not evaluate to a valid number, an error is produced.

```plaintext
// PARAMETER WIDTH REAL "Lane width" 4.0
@ if_val_nin_range_dbl $(WIDTH) 3.0 3.5
    user_message "WIDTH is outside the range 3.0 to 3.5 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.16 if_val_nin_range_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.
21.5.12.16 if_val_nin_range_dbl_tol

The **if_val_nin_range_dbl_tol** directive tests if a value exists and is not between two double values, within a given tolerance.

The syntax is:

```plaintext
@ if_val_nin_range_dbl_tol <value> <lower> <upper> <tolerance>
// Commands processed if true
@ end_if
```

- `<value>` - the value to compare. The value should evaluate to a numeric value - integer or double.
- `<lower>` - the double representing the lower bound of the range to check against value. This value must be specified.
- `<upper>` - the double representing the upper bound of the range to check against value. This value must be specified.
- `<tolerance>` - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is not within the range from lower to upper within the tolerance, the statement is true.
If the value is within the range from lower to upper within the tolerance, the statement is false.
If the value or any doubles do not evaluate to a valid number, an error is produced.

```plaintext
@ if_val_nin_range_dbl_tol $(WIDTH) 3.0 3.5 0.1
  user_message "WIDTH is outside the range 3.0 to 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to **21.5.12.13 Values vs Integers** or return to **21.5.12.12 Values vs Doubles** or **21.5.12 Snippet Directives**.
21.5.12.13 Values vs Integers

The following directives compare a value against given integers.

See

21.5.12.13.1 if_val_eq_int
21.5.12.13.2 if_val_neq_int
21.5.12.13.3 if_val_eq_all_ints
21.5.12.13.4 if_val_neq_all_ints
21.5.12.13.5 if_val_lt_int
21.5.12.13.6 if_val_le_int
21.5.12.13.7 if_val_gt_int
21.5.12.13.8 if_val_ge_int
21.5.12.13.9 if_val_lt_all_ints
21.5.12.13.10 if_val_le_all_ints
21.5.12.13.11 if_val_gt_all_ints
21.5.12.13.12 if_val_ge_all_ints

Or return to 21.5 Defining and Using Snippets.

21.5.12.13.1 if_val_eq_int

The if_val_eq_int directive tests if a value equals any of the given integers.

The syntax is:

```plaintext
@if_val_eq_int <value> <integer> [... <integer>]
// Commands to be processed if true
@end_if
```

- `<value>` - the value to test. The value should evaluate to a valid integer.
- `<integer>` - the integer to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is equal to any of the integers, the statement is true.
If the value is not equal to any of the integers, the statement is false.
If the value or any integers do not evaluate to a valid integer, an error is produced.
Multiple integers are handled as if joined by logical OR statements.

```plaintext
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2
@if_val_eq_int $(NUM_LANES) 2
  user_message "NUM_LANES is equal to 2"
@end_if
```

Continue to 21.5.12.13.2 if_val_neq_int or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.12.13.2 if_val_neq_int

The `if_val_neq_int` directive tests if a value is not equal to any of the integers. The syntax is:

```
@ if_val_neq_int <value> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

`<value>` - the value to test. The value should evaluate to a valid integer.

`<integer>` - the integer value to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is not equal to any of the integers, the statement is true.
If the value is equal to all of the integers, the statement is false.
If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical OR statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2
@ if_val_neq_int $(NUM_LANES) 3
  user_message "NUM_LANES is not equal to 3"
@ end_if
```

Continue to 21.5.12.13.3 if_val_eq_all_ints or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.12.13.3 if_val_eq_all_ints
The if_val_eq_all_ints directive tests if a value is equal to all of the given integers.
The syntax is:

```
@ if_val_eq_all_ints <value> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

- `<value>` - the value to test. The value should evaluate to a valid integer.
- `<integer>` - the integer to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is equal to all of the integers, the statement is true.
If the value is not equal to all of the integers, the statement is false.
If the value or any integers do not evaluate to a valid integer, an error is produced.
Multiple integers are handled as if joined by logical AND statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_eq_all_ints $(NUM_LANES) 2
    user_message "NUM_LANES is equal to 2"
@ end_if

@ if_val_eq_all_ints $(NUM_LANES) 2 3 4
    user_message "NUM_LANES is equal to 2, 3 and 4" // This should never be true
@ end_if
```

Continue to 21.5.12.13.4 if_val_neq_all_ints or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.12.13.4 if_val_neq_all_ints

The *if_val_neq_all_ints* directive tests if a value is not equal to all of the given integers.
The syntax is:

```
@ if_val_neq_all_ints <value> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

- `<value>` - the value to test. The value should evaluate to a valid integer.
- `<integer>` - the integer to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is not equal to all of the integer values, the statement is true.
If the value is equal to any of the integer values, the statement is false.
If the value or any integers do not evaluate to a valid integer, an error is produced.
Multiple integers are handled as if joined by logical AND statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_neq_all_ints $(NUM_LANES) 3 4 5
  user_message "NUM_LANES is not equal to 3, 4 AND 5"
@ end_if
```

Continue to 21.5.12.13.5 if_val_lt_int or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.12.13.5 if_val_lt_int

The **if_val_lt_int** directive tests if a value is less than any given integers.

The syntax is:

```plaintext
@ if_val_lt_int <value> <integer> [<integer>... <integer>]
// Commands processed if true
@ end_if
```

- `<value>` - the value to test. The value should evaluate to a valid integer.
- `<integer>` - the integer value to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is less than any of the integers, the statement is true.

If the value is not less than any of the integers (*i.e.* the value is greater than or equal to all integer values), the statement is false.

If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical OR statements.

```plaintext
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_lt_int $(NUM_LANES) 3 4
  user_message "NUM_LANES is less than 3 or 4"
@ end_if
```

See also:

- if_tok_lt_int - for testing of tokens rather than values

Continue to 21.5.12.13.6 if_val_le_int or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.12.13.6 if_val_le_int

The `if_val_le_int` directive tests if a value is less than or equal to any given integers.

The syntax is:

```verbatim
@if_val_le_int <value> <integer> [<integer>... <integer>]
// Commands processed if true
@end_if
```

- `<value>` - the value to test. The value should evaluate to a valid integer.
- `<integer>` - the integer value to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is less than or equal to any of the integers, the statement is true.
If the value is not less than or equal to any of the integers (i.e. the value is greater than all integer values), the statement is false.
If the value or any integers do not evaluate to a valid integer, an error is produced.
Multiple integers are handled as if joined by logical OR statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2
@if_val_le_int $(NUM_LANES) 3 4
 user_message "NUM_LANES is less than or equal to 3 or 4"
@end_if
```

See also:
- `if_val_lt_int` - for less than comparison against integers
- `if_val_gt_int` - for greater than comparison against integers
- `if_val_ge_int` - for greater than or equal to comparison against integers
- `if_val_le_dbl` - for comparison against doubles
- `if_tok_le_int` - for testing of tokens rather than values

Continue to 21.5.12.13.7 if_val_gt_int or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.12.13.7 if_val_gt_int

The `if_val_gt_int` directive tests if a value is greater than any given integers.

The syntax is:

```
@ if_val_gt_int <value> <integer> [<integer> ... <integer>]
// Commands processed if true
@ end_if
```

- `<value>` - the value to test. The value should evaluate to a valid integer.
- `<integer>` - the integer to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is greater than any of the integers, the statement is true.
If the value is not greater than any of the integers (i.e. the value is less than or equal to all integer values), the statement is false.
If the value or any integers do not evaluate to a valid integer, an error is produced.
Multiple integers are handled as if joined by logical OR statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 5
@ if_val_gt_int $(NUM_LANES) 3 4
  user_message "NUM_LANES is greater than 3 or 4"
@ end_if
```

See also:
- `if_val_le_int` - for less than or equal to comparison against integers

- `if_val_gt_dbl` - for comparison against doubles
- `if_tok_gt_int` - for testing of tokens rather than values

Continue to 21.5.12.13.8 if_val_ge_int or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.12.13.8 if_val_ge_int

The **if_val_ge_int** directive tests if a value is greater than or equal to any given integers.

The syntax is:

```plaintext
@if_val_ge_int <value> <integer> [<integer>... <integer>]
// Commands processed if true
@end_if
```

- `<value>` - the value to test. The value should evaluate to a valid integer.
- `<integer>` - the integer value to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is greater than or equal to any of the integers, the statement is true.
If the value is not greater than or equal to any of the integers *(i.e. the value is less than all integer values)*, the statement is false.
If the value or any integers do not evaluate to a valid integer, an error is produced.
Multiple integers are handled as if joined by logical OR statements.

```plaintext
//@ if_val_ge_int $(NUM_LANES) 3 4
user_message "NUM_LANES is greater than or equal to 3 or 4"
@end_if
```

- **if_val_lt_all_ints** - for less than comparison against integers
- **if_val_gt_all_ints** - for greater than comparison against integers
- **if_val_le_all_ints** - for less than or equal to comparison against integers
- **if_val_ge_int** - for comparison against any integers

Continue to 21.5.13 Snippet Variables or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.
21.5.13 Snippet Variables

In 12d Model snippets, it is possible to define variables whose values are calculated from the design model. For example, we can capture the offset or width of a link as a variable. This allows snippets to be more flexible and work with normal modifier commands that can alter the position of links.

See
21.5.13.1 Defining Link Variables
21.5.13.2 Defining General Variables
21.5.13.3 Snippet Helper Functions
21.5.13.4 Using Variables in Other Variables
21.5.13.5 Using Variables in Commands

Or return to 21.5 Defining and Using Snippets.

21.5.13.1 Defining Link Variables

The first necessary step in using snippet link variables is to define them. It is assumed that there are already some existing links in the design - not necessarily in the snippet or even output to a model. Defining a link variable allows 12d to identify which particular links need to be measured and calculated.

The syntax to define a link variable is:

```
<link_variable> <link_name> <chg_range> <alias>
```

<link_name> is the shorthand in MTF code for picking the desired link from the model. Refer to Sect. 19.1.1.2 of the 12d Help for more info.

<chg_range> is the chainage range for this variable, typically the standard range for the entire snippet: $(_SCH) 0 $(_ECH) 0

(alias) is the name for this particular link_variable. We will be able to refer to this link_variable elsewhere in our snippet by this name.

A link_variable is tied to a particular link in the MTF model. It is simply an alias to a particular link in our design.

So, for example, if we have a link called KLIP on the Design layer that we want to refer to, we would do this:

```
link_variable "Design=>KLIP" $(_SCH) 0 $(_ECH) 0 "LINK1"
```

"Design=>KLIP" is the link "KLIP" from the "Design" layer. The side (left/right) will be automatically selected depending on which side this snippet is applied.

$(_SCH) 0 $(_ECH) 0 is the standard snippet text defining the chainage range

"LINK1" is our custom alias for this particular link.

Continue to 21.5.13.2 Defining General Variables or return to 21.5.13 Snippet Variables.
21.5.13.2 Defining General Variables

In addition to link variables, which are specifically tied to a particular link in the model, it is possible to define general variables for intermediate calculations or storage of values. These are done with the generic variable command.

The general variable command has the syntax:

```
variable <name> <chg_range> <value>
```

- `<name>` is the name for this variable and must be in quotes, e.g. "VAR1"
- `<chg_range>` is the chainage range for this variable, typically the standard range for the entire snippet: $(_SCH)$ 0 $(_ECH)$ 0
- `<value>` is the value for this variable, which can include other variables, directives and formulae.

For example:

```
// PARAMETER WIDTH REAL "Road width" 3.5
variable "HALF_W" $(_SCH)$ 0 $(_ECH)$ 0 "($(WIDTH) / 2)"
```

So, if the WIDTH parameter had a value of 3.5, the resulting variable HALF_W would have a calculated value of 3.5 / 2 = 1.75. This value is calculated at run-time and at every section to which this snippet applies.

Continue to 21.5.13.3 Snippet Helper Functions or return to 21.5.13 Snippet Variables
21.5.13.3 Snippet Helper Functions

Snippets often require the calculation of various values and measurements. For example, the current offset of a link from the centreline or the height difference between two links.

These measurements and values could be used for performing conditional tests or simply as the basis for other parts of the snippet.

To this end, there are various helper functions available within snippets. 12d will automatically calculate the relevant value at every applicable section every time it is run. These can, therefore, also be used within variable commands.

```
link_variable "Design=>KLIP" $(_SCH) 0 $(_ECH) 0 "LINK1"
variable "HALF_W" $(_SCH) 0 $(_ECH) 0 "(link_width(LINK1) / 2)"
```

In this example, the value of the variable "HALF_W" is calculated from the width of the link_variable with the alias "LINK1" divided by 2. This way, if another modifier or snippet modified the link, we could still use it within our snippet without the user needing to manually enter any width manually.

The list of available helper functions is:

- `link_width(XX)` - the width of the link XX relative to the previous link
- `link_height(XX)` - the height of the link XX relative to the previous link
- `link_grade(XX)` - the grade of the link XX in y/x (not in %) relative to the previous link
- `rel_offset(XX)` - the unsigned offset of the link XX, typically +ve for LHS and RHS
- `abs_offset(XX)` - the signed offset of the link XX, typically -ve for LHS and +ve for RHS
- `abs_height(XX)` - the signed height difference from the hinge of the link XX, -ve lower, +ve higher
- `abs_level(XX)` - the level of the link XX, equal to (hinge level + height difference)
- `x_coord(XX)` - the X ordinate of the link XX
- `y_coord(XX)` - the Y ordinate of the link XX
- `apply_tin_height(XX)` - the height of the Apply MTF tin at the given link XX
- `other_tin_height(LINK;TIN)` - to capture the height of any tin (TIN) at a link (LINK) (note the semicolon separating the captured link and the tin name).
- `named_grade(NG)` - Capture signed grade (m/m) of a named grade, NG
- `named_grade_hdsd_fact(NG)` - For named grade, NG, the factor to multiply a horizontal distance by to get a slope distance.
- `named_grade_sdhd_fact(NG)` - For named grade, NG, the factor to multiply a slope distance by to get a horizontal distance.
- `named_grade_zdsd_fact(NG)` - For named grade, NG, the factor to multiply a height difference by to get a slope distance.
- `named_grade_zdzd_fact(NG)` - For named grade, NG, the factor to multiply a slope distance by to get a height difference.
- `named_grade_hdzd_fact(NG)` - For named grade, NG, the factor to multiply a horizontal distance...
by to get a height difference.

named_grade_zdhfd_fact(NG) - For named grade, NG, the factor to multiply a height difference by to get a horizontal distance.

More helper functions may be added in the future.

Continue to 21.5.13.4 Using Variables in Other Variables or return to 21.5.13 Snippet Variables

21.5.13.4 Using Variables in Other Variables

Once variables have been defined, they can be used and substituted into other variables.

To do so, wherever you would like to insert the variable, use the syntax:

```
variable(name)
```

Where variable is the keyword and name is the name of the variable to be substituted.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 1
// PARAMETER LANE_WIDTH REAL "Lane width" 3.5
// PARAMETER XFALL "Crossfall %" -3

variable "W0" $(_SCH) 0 $(_ECH) 0 "($(LANE_WIDTH) * $(NUM_LANES))"
variable "H0" $(_SCH) 0 $(_ECH) 0 "(variable(W0) * $(XFALL) / 100)"
```

Continue to 21.5.13.5 Using Variables in Commands or return to 21.5.13 Snippet Variables
21.5.13.5 Using Variables in Commands

Once variables have been defined, they can be used in a selection of modifier commands. To do so, wherever you would like to insert the variable, use the syntax:

```
variable <name>
```

Where variable is a keyword and name is the name of the variable to be substituted.

For example:

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 1
// PARAMETER LANE_WIDTH REAL "Lane width" 3.5

variable "W0" $(_SCH) 0 $(_ECH) 0 "($(_LANE_WIDTH) * $(_NUM_LANES))"

insert "Design=>EDGE" "red" variable W0 unknown -3.0 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

Note that an MTF modifier commands must be specifically written to support the use of variables. Currently, the MTF modifier commands and their values that support variables are:

- Modify_Decision_Batter: width, height, slope
- Modify_Decision_Batter_Test: width, height, slope
- Modify_XFall_Point: m_offset, m_height1
- Modify_Insert_Absolute: width, height, slope
- Modify_Insert_Link: width, height, slope
- Modify Link All
- Modify_All_To_2_RL

More may be added in the future.

Continue to 21.5.14 Order of Snippet Processing or return to 21.5.13 Snippet Variables.
21.5.14 Order of Snippet Processing

When a snippet is used in 12d Model, it is as part of an MTF.

Each Snippet referred to in the MTF is in its own file, and each snippet file goes through set steps to calculate and substitute values in the snippet, before it is used in the MTF file.

It is important to understand each step in the processing of a snippet file, and the order of the steps, to ensure that snippet runs as you expect it to.

See

- Step 1. Initial Loading of the Snippet File
- Step 2. Parameters from the MTF Snippet Panel Are Substituted
- Step 3. Snippet Directives Executed
- Step 4. Token Values Substituted
- Step 5. Snippet Inserted into MTF
- Step 6. C Preprocessor Run as Part of MTF processing

Or return to 21.5 Defining and Using Snippets.
Step 1. Initial Loading of the Snippet File

The snippet file is read and loaded into memory.
All comments and blank lines are removed.
An example of a snippet file that we will use at each step is:

```plaintext
// PARAMETER FRUIT TEXT "Enter a fruit"
@ def_tok FRUIT_TOKEN "$(FRUIT)"
@ if_val_eq_str "$(FRUIT)" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered $(FRUIT), I wanted an apple!"
@end_if
@ if_val_eq_str "$(FRUIT_TOKEN)" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
@end_if
```

Warning - this may not do what you first think it will as we will see shortly.

Continue to Step 2, Parameters from the MTF Snippet Panel Are Substituted or return to 21.5.14 Order of Snippet Processing
Step 2. Parameters from the MTF Snippet Panel Are Substituted

In the next step on the snippet file, any values of parameters that are specified in the MTF Snippet panel are substituted.

That is, all instances of parameter variables, e.g. $TOK or $(TOK), are replaced with the value that was selected by the user in the MTF Snippet panel.

Automatic parameters (e.g. $_SCH)) are also substituted.

If a parameter cannot be substituted, for example, it has not been defined, it is left as-is in the temporary MTF file and an error to the user will be produced.

As an example of the parameter substitution, if in the snippet given in Step 1, the user entered a value of apple (or accepted the default value) for the Enter a fruit parameter field on the MTF Snippet panel, then after the Parameter Substitution for FRUIT, the snippet would then look like:

```
@ def_tok FRUIT_TOKEN "apple"
@ if_val_eq_str "apple" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered apple, I wanted an apple!"
@ end_if
@ if_val_eq_str "$(FRUIT_TOKEN)" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
@ end_if
```

Continue to Step 3. Snippet Directives Executed or return to 21.5.14 Order of Snippet Processing
**Step 3. Snippet Directives Executed**

In the next pass of the snippet file, any snippet directives are parsed and executed. At this point, no parameters (or automatic parameters) exist, because they have all been substituted in the previous processing step.

So the snippet started in *Step 1*, will now look like:

```plaintext
user_message "Correct, you entered apple!"
user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
```

Notice that the flow-control previously present has been evaluated and only the applicable commands (in this case, user_message commands) remain.

**How did we get the second line?**

The second conditional test directive:

```plaintext
@ if_val_eq_str "$"(FRUIT_TOKEN)" "apple"
```

has evaluated to *false*, because in *if_val_eq_str* the value "$"(FRUIT_TOKEN)" is being treated as the raw text string $(FRUIT_TOKEN) which is not equal to *apple*.

Hence the corresponding *else* block of commands is used and we get the line

```plaintext
user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
```

is left in the snippet. Which is probably not what you wanted.

In this particular case, the snippet author would have been better off using the *@ if_tok_eq_str* directive instead of the *@ if_val_eq_str* directive.

```plaintext
@ if_tok_eq_str FRUIT_TOKEN "apple"
    user_message "Correct, you entered apple!"
@ else
    user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
@ end_if
```

The conditional test directive:

```plaintext
@ if_tok_eq_str FRUIT_TOKEN "apple"
```

will evaluated to *true*, because FRUIT_TOKEN is *apple* and we then get the line in the snippet:

```plaintext
user_message "Correct, you entered apple!"
```

Continue to *Step 4. Token Values Substituted* or return to 21.5.14 Order of Snippet Processing
**Step 4. Token Values Substituted**

In the next processing stage of the snippet, tokens have their values substituted, in a similar manner to that in which parameters were substituted in the earlier step.

At this point, this is simply a replacement of tokens in the snippet file, $TOKEN or $(TOKEN), with their value.

There is no flow control at this point, since it has already been performed in the previous step.

So the snippet started in Step 1, will now look like:

```plaintext
user_message "Correct, you entered apple!"
user_message "You entered apple, I wanted an apple!"
```

Note that each line containing tokens is processed as many times as necessary until no further tokens remain to be substituted. This allows token values to contain other tokens.

```plaintext
@ def_tok TOK1 1.0
@ def_tok TOK2 2.0
@ def_tok TOK3 "($TOK1 + $TOK2)" // TOK3
will eventually equal 3.0
```

Although the substitution of parameters and tokens is similar, it is important to understand they occur at separate stages of the snippet processing.

After Step 4, the temporary MTF snippet file is generated (.temp_mtf).

All intelligence, formulae and user input have been removed in the temporary MTF snippet file.

Continue to [Step 5, Snippet Inserted into MTF](#) or return to [21.5.14 Order of Snippet Processing](#)
Step 5. Snippet Inserted into MTF
At this stage, whatever remains of the snippet is inserted into the MTF File. No further processing is done by the 12d Snippet Preprocessor.

However, note, that the older C preprocessor- the one the handles #define, #ifdef, etc.- has not yet been run.

Continue to Step 6. C Preprocessor Run as Part of MTF processing or return to 21.5.14 Order of Snippet Processing

Step 6. C Preprocessor Run as Part of MTF processing
In the next pass, the C preprocessor- i.e. the one handling #define, #if, etc.- is used on the entire MTF, which now includes the interpreted and processed snippets.

Any parts of any snippets still using the older C preprocessor directives (#define, #if, etc) will be processed at this stage as part of the overall MTF. At this point there is no concept of a snippet as a separate entity- all snippet results have already been inserted into the MTF.

Note
Because of the power and predictability of the Snippet Directives, they should always be used instead of any C Preprocessor commands.

For more information on the substitutions and C preprocessor directives supported in the MTF, refer to the 12d Model Help section 21.10.1.16 Substitutions in the Modifiers and Templates File.

Return to 21.5.14 Order of Snippet Processing or 21.5 Defining and Using Snippets, or continue to 21.5.15 Debugging Snippets.
21.5.15 Debugging Snippets

See

21.5.15.1 Print Messages and Log Lines to the Output Window
21.5.15.2 Intermediate Parsing Results
21.5.15.3 Temporary MTF Snippet File

Or return to 21.5 Defining and Using Snippets.
21.5.15.1 Print Messages and Log Lines to the Output Window

To help with writing and debugging snippets, V11 provides the ability to write messages to the Output Window. These are done via special snippet commands `user_message_print`, `user_message_log` and `user_message` with the syntax:

(a) `user_message_print`

```
user_message_print text_msg "variable" "var_name" st_ch extra_st end_ch extra_end
"variable" - optional.
"var_name" is the name of a variable.
"variable" is optional but if it exists then "var_name" must also exist.
```

```
st_ch extra_st end_ch extra_end - optional
  st_ch is a chainage
  extra_st is added to st_ch to give the start chainage
  end_ch is a chainage
  extra_end is added to end_ch to give the end chainage
```

Print the text `text_msg` to the Output Window and then print the value of the variable `var_name` to the Output Window.

The messages are produced for every section in the chainage range given by the start chainage and the end chainage.

If the start and end chainage modes are omitted, they are taken to be from the start to the end of the reference string.

```
user_message_print "Value of REL_OFFSET: " "variable" "REL_OFFSET" $(_SCH) 0 $(_ECH) 0
```

For every section between the start and the end chainage, this will print the text "Value of REL_OFFSET " followed by the value of the variable REL_OFFSET to the Output Window.

(b) `user_message_log`, `user_message`

```
user_message_log text_msg "variable" "var_name" st_ch extra_st end_ch extra_end
user_message text_msg "variable" "var_name" st_ch extra_st end_ch extra_end
"variable" - optional.
"var_name" is the name of a variable.
"variable" is optional but if it exists then "var_name" must also exist.
```

```
st_ch extra_st end_ch extra_end - optional
  st_ch is a chainage
  extra_st is added to st_ch to give the start chainage
  end_ch is a chainage
  extra_end is added to end_ch to give the end chainage
```

Create a log line in the Output Window of the text `text_msg` followed by the value of the variable `var_name`.

The log lines are produced for every section in the chainage range given by the start chainage and the end chainage.

If the start and end chainage modes are omitted, they are taken to be from the start to the end of the reference string.
user_message_log "Value of REL_OFFSET: " "variable" "REL_OFFSET" $(SCH) 0 $(ECH) 0
For every section between the start and the end chainage, a log line will be created in the Output Window with the text "Value of REL_OFFSET " followed by the value of the variable REL_OFFSET

TIP: If you only want one message, rather than a message for every section, use:
$(SCH) 0 $(SCH) 0.0001

user_message_print "This will only print once!" $(SCH) 0 $(SCH) 0.0001

Continue to the next section 21.5.15.2 Intermediate Parsing Results or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.
21.5.15.2 Intermediate Parsing Results

As explained in the section Order of Snippet Processing, any MTF Snippet file is processed in several rounds, with each round of the process performing various parsing, evaluation and substitution steps. To assist with debugging and understanding the manner in which snippets are processed by 12d Model, there is an additional snippet instruction that can be used.

```plaintext
// OUTPUT_PARSING_STAGES <filename>
```

For example:

```plaintext
// OUTPUT_PARSING_STAGES "dump.txt"
```

With this instruction present in a snippet, 12d will write a detailed log of the snippet at each stage of processing to the given file. The contents of the file are updated/overwritten on each recalc of the Apply MTF function.

For compiled snippets, even if this instruction is present, no output will be produced.

Continue to the next section 21.5.15.3 Temporary MTF Snippet File or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.
21.5.15.3 Temporary MTF Snippet File

To assist with the development and debugging of MTF snippets, there are a number of environment variables to control the naming of, and stop the deletion of, the temporary MTF file that is created after the Snippet Directives are evaluated and the snippet parameters have been substituted (see Snippet Directives).

At the point of the temporary MTF snippet file being created (.mtfsnippet.temp_mtf), all intelligence has been removed from the output. All formulae, variables, directives and fixed decisions have been removed and only the raw modifier commands remain.

(a) Don't Delete Snippet Temp File

MTF_SNIPPET_TEMP_FILE_USE_SNIPPET_NAME_KEEP_4D 1/0

If enabled (non zero), the temporary MTF file that is generated when MTF snippets are processed and parsed will not be deleted. Each run of the Apply MTF function will create or update the contents of a file containing the snippet after processing. The file will be created in the current project's working directory.

(b) Snippet Temp File Use Snippet Name

MTF_SNIPPET_TEMP_FILE_USE_SNIPPET_NAME_4D 1/0

If enabled (non zero), the temporary snippet file generated when MTF snippets are processed will be given the name of the snippet file with the extension ".temp_mtf".

For example, if the snippet file is called "INSERT_KERB.mtfsnippet" then, by default and when enabled, the temporary snippet file produced will be "INSERT_KERB.mtfsnippet.temp_mtf".

This env variable enables the user to have this consistently named temporary file open in an editor and it can then be refreshed each time a snippet is run.

(c) Snippet Temp File Custom Extension

MTF_SNIPPET_TEMP_FILE_EXTENSION_4D Extension_text

If Extension_text is not blank, the temporary snippet file generated when MTF snippets have been processed will have the extension Extension_text rather than the default extension of "temp_mtf".

(d) Unique Snippet Temp File Name

MTF_SNIPPET_TEMP_FILE_UNIQUE_4D 1/0

If enabled (non zero), a temporary snippet file will be generated for each MTF Snippet instance in the corresponding MTF. To better relate the temporary snippet file with the actual instance in the MTF, this setting will produce a temporary snippet file for every inserted snippet and be named like so:

<Snippet_File> - <MTF> <side> <modifier_number>.<extension>

For example,

CP.mtfsnippet - RSCR01.mtf Left No. 7.temp_mtf

Corresponds to the CP.mtfsnippet file inserted in the left side modifiers of RSCR01.mtf file as modifier number 7.

These environment variables are defined in the MTF & Boxing > MTF General section of the env.4d Editor which is brought up by selecting Project => Management => env.4d. See MTF.
& Boxing > MTF General in 7 Project.

Continue to the next section 21.5.16 Compiling Snippets or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.
21.5.16 Compiling Snippets

It is possible to compile a snippet via the option

Design => MTF => Snippet => Compile snippet

This can be done to protect any intellectual property (IP) and minimise concerns people may have in developing and sharing snippets.

Compiling a snippet encrypts and encodes the snippet contents into a new file with an extension of `mtfsnippet.c` (note the 'c' at the end, denoting a compiled snippet).

A compiled snippet can be run and used by anyone, but the snippet code itself cannot be viewed or edited.

Temporary snippet files, if enabled, are not generated for compiled snippets.

Continue to the next section 21.5.17 Tips and Tricks or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.
21.5.17 Tips and Tricks

- When creating snippets, create the MTF modifier commands first and then copy and paste into a snippet. This helps ensure the format and syntax of the modifier commands is correct.
- Use comments liberally to document your snippet. This makes it easier for you and anyone else to see and understand your thought processes, reasoning and logic within the snippet, making it easier to debug and modify.
- Define tokens for commonly-used values to make code more readable and portable.

```plaintext
@ def_tok ABS "absolute"
@ def_tok ES "extra_start"
@ def_tok EE "extra_end"
@ def_tok ASE "$(ABS) $(ES) $(EE)"
Insert "LINK" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 $(ASE)
```

- When writing or testing snippets, output messages using user_message commands with values of parameters, variables and tokens to check correct calculation of values. These can be commented out or removed before finalising your snippet.
- The user_message commands will, by default, output a message for every applicable Apply MTF section. To cut down on the number of repetitive messages, specify a start and end chainage.

```plaintext
// PARAMETER WIDTH REAL "Link width" 1.0
@ def_tok MSG_CH "$(SCH) 0 $(SCH) 0.0001" // Define a token for easier readability
user_message "Link width = $(WIDTH) $(MSG_CH)" // Only output one message
```

- For all directives, there is a space between the @ and the name of the directive!
- For expressions and formula, use parentheses as much as needed. If in doubt, add more and double-check the results
- Parameter names should not contain spaces and should not start with an underscore.
- Token names should not contain spaces and should not start with an underscore.
- It is recommended that token names only contain alphanumeric characters and underscores.
- Parameter names and token names must be unique within the snippet file!
- Use the new V11 syntax, where possible! The V10 syntax- e.g. #define, $VAL - is deprecated and only supported for backwards-compatibility.

Continue to the next section 21.5.18 Major Warning - You Will be Caught by This or return to 21.5 Defining and Using Snippets.
21.5.18 Major Warning - You Will be Caught by This

**WARNING** - once a snippet with parameters has been saved in a MTF file, the parameters for the snippet are saved *in the MTF file*. Then when the Apply MTF is run, the parameters and their values are read in from the MTF file and passed into the current snippet file.

Hence if the snippet file has been modified and parameter definitions added, modified or removed since the snippet was originally place in the MTF, these modifications of parameters will be *ignored* until the snippet panel is reopened in the MTF editor which forces the snippet file to be parsed again and the changes to the parameter definitions are then recognised.

Note that when the Apply MTF for the MTF is run, the MTF used the *current* snippet file so if the snippet file has been modified since the snippet was placed in the MTF, the *modified* snippet file will be used (apart from any new parameter definitions and defaults)

Return to [21.5 Defining and Using Snippets](#).
21.6 What is Boxing?

A design is represented in 3d as a collection of strings. The design can also be approximated as a series of sections perpendicular to the centreline at various chainages. These are known as design cross section, or design sections.

See

- 21.6.1 Representing Cross Sections in 12d Model
- 21.6.2 Applying Boxing
- 21.6.2 Applying Boxing
- 21.7 Full Definition of Boxing

Go to the next section 21.6.1 Representing Cross Sections in 12d Model
21.6.1 Representing Cross Sections in 12d Model

In 12d Model, cross sections, are represented as 4d super strings. A 4d super string has an (x,y,z) coordinate for each vertex, PLUS text at each vertex. Hence, there are four bits of information, an (x,y,z,text) value, for each vertex.

Cross sections are generated in 12d Model by options such as
(a) cuts through strings along a centreline (see 28.9.13.2 Cuts by Centreline)
(b) the functions Apply MTF (see 20.3.2 Apply MTF Function) or Apply (see 20.3.1 Apply Template Function)
(c) the Boxing Many Function (see 20.5.4 Boxing Many Function)

For these cross sections, the text at each vertex of the 4d super string (vertex/point text), is the name of the string that the section cuts through at that vertex.

Also when the cross sections are generated by these options, the start chainage of the 4d string is set so that the chainages along the 4d string are the same as the offset of the vertices from the centreline used when generating the sections.

Boxing Layers
A Boxing Layer is simply another surface, usually modelling a construction material layer, under (or above) the design. The Boxing Layer is represented by strings, and also as a series of sections at the same chainages as the design sections.
Boxing Layers are normally defined in terms of the named vertices across the design section, offsets from the centreline, in terms of other boxing layers already specified, or in relationships to other strings.

When boxing is generated in the Apply MTF or the Boxing Many Function, there can be up to eight (8) layers of boxing and the last layer defined is referred to as the subgrade layer.

In 12d Model there are special commands called Boxing Commands that are be used to build a boxing layer.

A series of 12d Model boxing commands are grouped together as a Boxing Definition and when a Boxing Definition is applied to a cross section, it generates a boxing section. That is, it generates a section that is part of a particular Boxing Layer.

Each Boxing Definition is given a name, and is stored in a Boxing file. The names of the Boxing Definitions must be unique within the Boxing file.

How the Boxing file and Boxing Definitions are applied in 12d Model is described in the next section 21.6.2 Applying Boxing, and this is followed by the full definition of 12d Model boxing and the 12d Model boxing commands in the sections starting with 21.7 Full Definition of Boxing.
21.6.2 Applying Boxing

For any 12d Model project there are a number of different data creation scenarios and the appropriate method to use to generate boxing depends on how the data has been created, or is available, inside 12d Model.

See 21.6.2.1 Scenario 1 - Design Generated by One Apply MTF
See 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design
See 21.6.2.3 Scenario 3 - Design Provided as Strings Only
See 21.6.2.4 Scenario 4 - Design Sections Already Exist
21.6.2.1 Scenario 1 - Design Generated by One Apply MTF

If a design is generated by just one Apply MTF function, then up to eight (8) layers of boxing can also be generated at the same time by the Apply MTF function.

In the Apply MTF option, the MTF, controls which Boxing file is used, and how the various Boxing Definitions from that file are used to create each layer of boxing.

In the MTF Edit menu, the Boxing File option specifies which Boxing file of Boxing Definitions is used.

For each boxing layer, the boxing can be defined by
(a) the Left boxing only
(b) the Right boxing only
or
(c) the Left and Right boxing.

For cases (a) and (b), the Left boxing or the Right boxing defines the boxing across the entire design section and then only Left boxing or Right boxing is needed.

For case (c) where both Left and Right boxing are used to define the boxing across the design section, the last point of the Left boxing is automatically connected to the first point of the Right boxing.

Warning for case (c), the Left boxing must end before the Right boxing begins. If there is an overlap, the Right boxing will be pushed to the end of the Left boxing.

Note - no interpolation or modifiers exist for boxing.

For each layer, the Left side/Right side specifies what Boxing Definition to use over what chainage range.
What is Boxing?

See 21.1 The Modifiers and Templates File - MTF and 21.4 Smart Chainages.

Go to the next section 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design or back to 21.6.2 Applying Boxing.
21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design

In more complex designs, a number of separate Apply MTF's may be needed, and even some strings hand crafted, to produce the final design. Hence the design is only fully represented by a collection of strings.

In this situation, design sections are produced as a post process using Cuts through strings by either

Utilities => A-G => Cuts => by centreline

which can cut through a Data Source of strings (see 28.9.13.2 Cuts by Centreline), or by

Design => Boxing => Boxing many (function)

which can only cut through one model of strings (see 20.5.4 Boxing Many Function).

Note - the design sections produced by both options are 4d super strings where the text at each vertex of the super string is the name of the string cut to create that vertex of the super string.

The methods described in 21.6.2.4 Scenario 4 - Design Sections Already Exist are then used to generate boxing from the created design sections.

Go to the next section 21.6.2.3 Scenario 3 - Design Provided as Strings Only or back to 21.6.2 Applying Boxing.
21.6.2.3 Scenario 3 - Design Provided as Strings Only

Sometimes you only have the strings defining the design (the design strings).

This case is similar to 21.6.2.3 Scenario 3 - Design Provided as Strings Only and design sections are produced as 4d super string from the design strings using Cuts through strings by either

Utilities =>A-G =>Cuts =>by centreline

which can cut through a Data Source of strings (see 28.9.13.2 Cuts by Centreline), or by

Design =>Boxing =>Boxing many (function)

which can only cut through one model of strings (see 20.5.4 Boxing Many Function).

The methods described in 21.6.2.4 Scenario 4 - Design Sections Already Exist are then used to generate boxing from the created design sections.

Go to the next section 21.6.2.4 Scenario 4 - Design Sections Already Exist or back to 21.6.2 Applying Boxing.
21.6.2.4 Scenario 4 - Design Sections Already Exist

There is the case where you already have the design sections as 4d super strings.

The design sections may have been created by an earlier Apply MTF or Apply run, or generated by cuts through strings as in 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design or 21.6.2.3 Scenario 3 - Design Provided as Strings Only, or simply provided.

Boxing can then be generated from the **design sections** using the options:

(a) **Design => Boxing => Boxing many function**

The **Boxing Many Function** can generate up to eight layers of boxing, as well as
Chapter 21 Advanced Design

calculating volumes. See 20.5.4 Boxing Many Function.

Note that the Boxing Many Function can also create the cuts through a model of strings to create the design sections and so can be used to cover 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design, 21.6.2.3 Scenario 3 - Design Provided as Strings Only and 21.6.2.4 Scenario 4 - Design Sections Already Exist in the one function.

(b) Design =>Boxing =>Boxing many

A simplified version of the Boxing Many Function.

For Boxing Many, an MTF is used to define the application of the Boxing Definitions, and the Boxing file containing the Boxing Definitions is either that defined in the MTF or a different Boxing file. See 20.5.6 Apply Boxing Many.

The boxing can be applied to a model of sections, or just a single selected section.

(c) Design =>Boxing =>Boxing

An even more simplified version of the Boxing Many Function.

The Boxing option can only apply one Boxing Definition to all the design sections in a model. See 20.5.5 Apply Boxing.

Note - in the case when only 4d super string are provided, the option Design =>X-Sections =>Strings from sections can be used to generate design strings from these sections (see 20.14.8 Strings from Sections).

Go to the next section 21.7 Full Definition of Boxing or back to 21.6 What is Boxing? or 21.6.2 Applying Boxing.
21.7 Full Definition of Boxing

In 12d Model there are special commands called Boxing Commands that are be used to build up a boxing layer.

A series of 12d Model boxing commands are grouped together as a Boxing Definition and when a Boxing Definition is applied to a cross section, it generates a boxing section. That is, it generates a section that is part of a particular Boxing Layer.

Each Boxing Definition (the rules for calculating a specific type of boxing) is given a name, and is stored in a Boxing file (with a file name ending in .bf).

Any number of Boxing Definitions can be placed in the one Boxing file as long as each Boxing Definition in the Boxing file has a unique name.

Note that the same name of a Boxing Definition can appear in more than one Boxing file and even through they have the same name, the Boxing Definition in a different Boxing file can be completely different.

Please continue to the next section 21.7.1 Terminology Used in Boxing Commands
21.7.1 Terminology Used in Boxing Commands

The 12d Model Boxing Commands work on a cross section, which is a 4d super string (see 21.6.1 Representing Cross Sections in 12d Model).

A Boxing Definition is a group of boxing commands and the boxing commands work from left to right across the cross section to produce a boxing section.

Most of the boxing commands apply from the offset specified at the beginning of that command (Start Offset for the command) to the start offset of the next boxing command (like chainages and templates in the MTF). That is, the start offset of a boxing command is the End Offset for the previous boxing command.

So most boxing commands go from the Start Offset in the command to the Start Offset in the next boxing command.

An offset, such as the Start Offset, can be defined as:
(a) a fixed Centreline offset value (e.g. 10.5)
(b) specified relative to a vertex name on a design cross section, or any boxing section (at the section chainage) in a Boxing Layer already created.
(c) specified relative to a selected string that cuts the design cross section, or a specified Boxing Layer, in plan.

The offset represents a plan position on the cross section (a plan point on the cross section) which may or may not be the plan position of a vertex on the cross section.

The terminology used to specify such an offset is relative offset to a vertex or a string.
Note - if not all the vertex names and strings mentioned in a Boxing Definition are present in the cross section at the centreline chainage, then no boxing section is produced for that centreline chainage.

Hence

1. an offset relative to a vertex name (relative vertex offset) is defined to be the offset at a given named vertex on the design section, or a boxing section previously created, plus a given offset value.

   That is
   
   take the offset at the 4d vertex called "vertex name" and add "offset value" to it. The offset value can be positive of negative.

   If the "vertex name" is blank, then the "offset value" is taken to be the actual offset on the 4d super string.

   Hence the offset can be specified as either an actual offset value or given relative to the name of a vertex on the super string (relative offset).

   For convenience, in both cases the offset will be denoted by relative vertex offset.

2. an offset relative to string (relative string offset) is defined to be the offset on the cross section where the string cuts the section in plan, plus a given offset value.

   That is
   
   take the offset at the plan cut of the section and the string and add "offset value" to it. The offset value can be positive of negative.

A major advantage of defining boxing in terms of vertex names and strings is that whenever the vertices or strings are modified using MTF modifiers, or string edits, the boxing across the section is also automatically modified on a recalc.

A Boxing Definition may be used in either a Left Boxing or Right Boxing in an MTF, or in a Boxing Many Function option, however unlike the case for MTF modifiers, the Boxing Definition is applied to the vertex names going from left to right regardless of whether the Boxing Definition is used on the left or the right. So it is possible to create the entire boxing with just the Left Boxing or Right Boxing. If both are used, the end of the Left Boxing is joined to the start of the Right Boxing.

Warning

For a Boxing Definition to work, any cross section vertex names referred to in the Boxing Definition must be unique for that cross section. Similarly any strings cut must have unique names.

In the Apply MTF and Apply, the LHS prefix and RHS prefix panel files can be used to give vertices on cross sections different names even when the same Template is used on the left and
the right side of the centreline.

Boxing sections are generated by the Apply MTF, Boxing Many Function, Boxing Many and Boxing options, but boxing strings are only generated by the Apply MTF and Boxing Many Function. For the other cases, the option Strings=>Utilities=>Strings from sections can be used to create boxing strings from the boxing sections.

Vertical Walls

If a Boxing Definition creates two different height values at the one offset (i.e. a wall), then an extra offset point is automatically inserted into the boxing section (at offset 0.1 mm from the first vertex) so that no vertices in the created boxing section are on top of each other.

So in effect a vertical wall is created.

And since no vertices are created that are directly above each other, the boxing sections can be triangulated.

Please continue to the next section 21.7.2 Edit Boxing File or return to 21.7.1 Terminology Used in Boxing Commands.
21.7.2 Edit Boxing File

The option

   Design => Boxing => Create

creates a Boxing file which contains Boxing Definitions, and then brings up the Edit Boxing Definitions panel to create the actual Boxing Definitions (rules) to save in the Boxing file.

Similarly selecting a Boxing file from the walk-right list of

   Design => Boxing => Edit

also brings up the Edit Boxing Definitions panel to create/edit boxing definitions from the selected Boxing file.

The Edit Boxing Definitions panel is

![Edit Boxing Definitions panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boxing definition</td>
<td>input</td>
<td>boxing definitions in file</td>
<td></td>
</tr>
</tbody>
</table>

name of the Boxing Definition (in the current boxing file) to create or edit. Each Boxing Definition must have a unique name in the Boxing file.

Create button

create a Boxing Definition with name given by the Boxing definition panel field

If the Boxing Definition given in the Boxing definition field does not exist, then the Boxing Rules panel is placed on the screen and is used to created the new Boxing Definition for the Boxing file (see 21.7.2.1 Boxing Rules Panel).

If the Boxing Definition already exists, then nothing will happen when clicking on Create.

Edit button

edit an existing Boxing Definition with name given in the Boxing definition panel field

If the Boxing Definition given in the Boxing definition file exists, then the Boxing Rules panel is placed on the screen and is used to edit the existing Boxing Definition (see 21.7.2.1 Boxing Rules Panel).

If the Boxing Definition does not exist, then nothing happens when clicking on Edit.

Delete button

delete the existing Boxing Definition with the name given in the Boxing definition panel field

A Yes-No panel confirms the deletion.

Save file button

save the Boxing file with the Boxing Definitions to disk.

For more information on how Boxing works in 12d Model, go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.1 Boxing Rules Panel or return to 21.7.2 Edit Boxing File.
21.7.2.1 Boxing Rules Panel

Selecting the Create or Edit button on the Edit Boxing Definitions panel brings up the Boxing Rules panel which is used to build up/edit the nominated Boxing Definition from the Boxing Commands.

The Boxing Rules panel consists of:

(a) a **Boxing Rules** grid with rows (or lines) with commands in them

   The commands for the Boxing Rules grid are fully described in the section 21.7.2.2 Commands for Boxing Rules Grid.

   For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

(b) **Left Side Interface** and **Right Side Interface** areas

   See the following document ion on fields and buttons for this panel

(c) **Copy from start of section** and **Copy to end of section** tick boxes

   See the following document ion on fields and buttons for this panel

(d) an **OK** or **Apply** button to record the results.

   See the following document ion on fields and buttons for this panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Boxing Rules Grid</strong></td>
<td>commands for defining the Boxing Definition.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The commands will be described in the section 21.7.2.2 Commands for Boxing Rules Grid.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Left Side Interface**

**Type**

choice box

![Select Choice](image)

**If No interface:**

nothing is done

**If Xfall:**

<table>
<thead>
<tr>
<th>Xfall</th>
<th>real box</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>if non-zero, a batter with the given xfall is applied going to the left from the first point of the boxing, and goes until it intersects the design section. The intersection point is added as the first point in the boxing. If no intersection is made, nothing is added to the boxing. A positive xfall is up and negative xfall down.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**If Slope:**

<table>
<thead>
<tr>
<th>Slope</th>
<th>real box</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>if non-zero, a batter with the given slope is applied going to the left of the first point of the boxing, and goes until it intersects the design section. The intersection point is added as the first point in the boxing. If no intersection is made, nothing is added to the boxing. A positive slope is up and negative slope down.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**If Xfall from point:**

<table>
<thead>
<tr>
<th>Set point</th>
<th>button</th>
</tr>
</thead>
<tbody>
<tr>
<td>clicking on Set point brings up the Boxing LHS Xfall panel which allows the battering xfall to be defined in more complex ways. This is described in the section 21.7.2.17 Boxing Left Side Interface Xfall from Point.</td>
<td></td>
</tr>
</tbody>
</table>

**Copy from start of section**

<table>
<thead>
<tr>
<th>tick box</th>
</tr>
</thead>
<tbody>
<tr>
<td>if ticked, then the part of the design section from the start of the design section to the offset that is the start of the boxing section, is copied and made the beginning of the boxing section.</td>
</tr>
</tbody>
</table>

Hence the Copy from start of section tick is used to begin the boxing section with the start of the design section to make a full width left side boxing section.

| If not ticked, nothing is done |

**Right Side Interface**
If No interface:
nothing is done

If Xfall:

Xfall

if non-blank, a batter with the given xfall is applied to the last point of the boxing and goes until it intersects the design section. The intersection point is added as the last point in the boxing. If no intersection is made, nothing is added to the boxing. A xfall slope is up and negative xfall down.

If Slope:

Slope

if non-blank, a batter with the given slope is applied to the last point of the boxing and goes until it intersects the design section. The intersection point is added as the last point in the boxing. If no intersection is made, nothing is added to the boxing. A positive slope is up and negative slope down.

If Xfall from point:

Set point

clicking on Set point brings up the Boxing RHS Xfall panel which allows the battering xfall to be defined in more complex ways. This is described in the section 21.7.2.2.18 Boxing Right Side Interface Xfall from Point.

Copy to end of section

tick box

if ticked, then the part of the design section from the offset of the last boxing vertex to the last vertex on the design section, is copied and made the end of the boxing section.

Hence the RHS copy flag is used to continue the boxing section from the last boxing point, with the design section to the end of the design section to make a full width right side boxing section.

If not ticked, nothing is done.

Buttons at Bottom

OK

button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply

button

Apply stores the values and leaves the panel on the screen.

If the Boxing Definition is being used in an Apply MTF MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.

Notes
1. When a Boxing Definition is applied on the Left side in the MTF of an **Apply MTF**, or the Left side in a **Boxing Many Function**, any **Right Side Interface** and **Copy to end of section** is ignored. Similarly, when a Boxing Definition is applied on the right side the MTF of an **Apply MTF**, or the Right side in a **Boxing Many Function**, any **Left Side Interface** and **Copy from start of section** is ignored.

Hence a boxing definition can have all of **Left Side Interface**, **Copy from start of section** and **Right Side Interface**, **Copy to end of section** but which set is used depends on whether the boxing definition is used on the Left or the Right.

In **Apply MTF’s** and **Boxing Many Functions**, if only the Left side boxing or only the Right side boxing exists, then the boxing for the entire design section can be created by just the Left/Right side boxing and then all of the **Left Side Interface** and the **Right Side Interface** is used.

For more information on how Boxing works in **12d Model**, please go to the section **21.6 What is Boxing?**
21.7.2.2 Commands for Boxing Rules Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

If the row of the grid is empty, clicking LB in the empty row will bring up the Create menu which contains all the available boxing commands. Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the Create Rule menu.

Selecting a menu item will bring up an associated panel which displays the information required for the boxing command.

When the panel is filled in and OK or Apply selected, the panel information is written out to the command line in the correct format for that boxing command.

If the row of the grid is not empty (and hence filled with a command) clicking LB in the Type column will bring up the associated panel for the boxing command. Note this may involve two clicks - one to highlight the Type column in a row and the second click to bring up the panel to edit that Command.
The information in the panel can be changed and if OK or Apply is selected, the modified panel information is written out to the row a a command line.

Each of the panels created by selecting a command from the Create menu, will now be described.

For

- **Copy**, go to 21.7.2.2.1 Boxing Copy
- **Vertex** 21.7.2.2.2 Boxing Vertex
- **Vertex (Adv)** 21.7.2.2.3 Boxing Vertex Advanced
- **X-fall** 21.7.2.2.4 Boxing Xfall - line through a point with a given crossfall
- **X-fall 1** 21.7.2.2.5 Boxing Xfall 1 - line through a point with a crossfall taken from a point
- **Line** 21.7.2.2.6 Boxing Line - line through two points
- **Intersect** 21.7.2.2.7 Boxing Intersect - Intersection of Two Lines
- **Intersect (Adv)** 21.7.2.2.8 Boxing Intersect Advanced
- **Xfall pt** 21.7.2.2.9 Boxing Xfall Point
- **Drop (kerb)** 21.7.2.2.10 Boxing Drop
- **Decision** 21.7.2.2.11 Boxing Decision
- **Label** 21.7.2.2.12 Boxing Label
- **Goto** 21.7.2.2.13 Boxing Goto
- **Comment** 21.7.2.2.14 Boxing Comment
- **Extend tin** 21.7.2.2.15 Boxing Extend Tin
- **End** 21.7.2.2.16 Boxing End

The text file format of all the Boxing Commands in the Boxing file is given in the section 21.10.2 Text Format of the Boxing File.

Go to the next section 21.7.2.2.1 Boxing Copy or return to 21.7.2.2 Commands for Boxing Rules Grid.
21.7.2.2.1 Boxing Copy

The Copy command copies part of the selected Layer from the Start Offset defined for the Copy command, to the Start Offset of the next boxing command.

The present slope of each segment is kept but the height of each segment is adjusted by a constant value provided by user.

Note: The height adjustment may be zero so that part of the selected Layer is copied as is.

Selecting Copy brings up the Boxing Copy panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Offset</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Text</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer</td>
<td>None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Copy from layer</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer</td>
<td>None</td>
<td></td>
<td></td>

<tr>
<td>Height</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>New name</td>
<td>pre*post</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Select Offset defines where the Copy commands starts from.

If the 3d cut of string is used (Cut of string), the Z-Diff is used with Height in determining how far the
Layer is copied.

**Type**

*choice box*

---

For the documentation on the methods of defining the **Start Offset** except for **Last created**, see 21.7.2.3 Defining Relative Offset for Boxing Commands

**If Last created:**

the Copy command starts at the Start Offset but for the boxing commands Intersect and Intersect Adv, the offset position for the vertex is calculated by intersection and its actual value may not be known.

So for **Last created**, the offset is the offset of the last vertex of the selected **Layer**.

**Offset**

*real box*

0

offset to add to the offset of the last vertex. **Offset** can be positive or negative but the final Start Offset must still be on **Layer**.

---

**Copy from layer**

**Layer**

*choice box*

---

**Height**

*real box*

0

If **Start Offset Type** is NOT: **Cut of string**:

Height is added to the z-values of the part of the section of the Copy from layer **Layer** being copied to give the z-values of the boxing. For example, if Height is -0.3, the part of the Copy from layer **Layer** being copied is dropped by 0.3

If **Start Offset Type** is: **Cut of string**:

At the plan cut of the string and the START OFFSET **Layer**, **Z-Diff** (the difference of the z-values between the string and START OFFSET **Layer**) is calculated and **Height** added to it. This combined value is added to the z-values of the part of the COPY FROM LAYER **Layer** being copied, to give the z-values of the boxing
New name

**Pre*post** text input

When part of a section is copied for the boxing, the vertices of the boxing are given names from either the vertices of the section, or the selected strings that are used in limiting the section, or a unique number not related to vertices or strings.

These constructed boxing vertex names are then modified by the text given in the *Pre*post field.

The text before the * is prepended to the vertex names, and the text after the * is postpended to the vertex names.

**Active** tick box

*If ticked*, use this Boxing Command.

*If not ticked*, don’t use this Boxing Command.

**OK** button

*OK* stores the values in the fields and removes the panel BUT no *recalc* is done.

**Apply** button

*Apply* stores the values and leaves the panel on the screen.

*If the Boxing Definition* is being used in an *Apply MTF* and *Auto recalc* is ticked in the MTF, then whenever the *Apply* button is clicked, then a *recalc* of the associated *Apply MTF* for the MTF is done.

*If the Boxing Definition* is being used in a *Boxing Many Function* then whenever the *Apply* button is clicked, a *recalc* of the *Boxing Many Function* is done.

For the typed formats of the *Copy* and *Copy with height adjustment* commands created by this panel, see 21.10.2.1 Text Format - Boxing Copy and 21.10.2.2 Text Format - Boxing Copy with Height Adjustment.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.2 Boxing Vertex or return to 21.7.2.2 Commands for Boxing Rules Grid.

**Copy** diagrams for more methods of defining *Offsets*:

Copy Option - Start Offset and Copy from Layer are the same Layer
21.7.2.2 Boxing Vertex

The **Vertex** command inserts into the boxing section, one or two new vertices that are at the same **Start Offset**. So **Vertex** can be used to quickly create a vertical wall at a given **Start Offset**.

**Note** - to allow the boxing sections and strings to triangulate, *12d Model* increases the offset of the second vertex by ten thousandth of a unit.

![Section View](image)

Selecting **Vertex** brings up the **Boxing Vertex**

![Boxing Vertex](image)

The fields and buttons used in this panel have the following functions.

**Start Offset**

*Layer to use with **Offset** to defined the Start Offset where the one or two vertices are created.*
Type

choice box

For the documentation on the methods of defining the Start Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands

New vertices

Height 1

real box

If Start Offset Type is NOT: Cut of string:

Height 1 is added to the z-value of the Layer at the Start Offset to give the z-values of the new boxing vertex. For example, if Height 1 is -0.3, the vertex is dropped by 0.3 from Layer.

If Start Offset Type is: Cut of string:

At the plan cut of the string and Layer, Z-Diff (the difference of the z-values between the string and the Layer) is calculated and Height 1 added to it. This combined z-difference is added to z-value of the Layer at the Start Offset to give the z-value of the new boxing vertex.

Name 1

cname box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height using Type and Height 1.

If blank, a vertex is created with a default name.

Height 2

real box

If Start Offset Type is NOT: Cut of string:

Height 2 is added to the z-value of the Layer at the Start Offset to give the z-values of the new boxing vertex. For example, if Height 2 is -0.5, the vertex is dropped by 0.5 from Layer.

If Start Offset Type is: Cut of string:

At the plan cut of the string and Layer, Z-Diff (the difference of z-values between the string and the Layer) is calculated and Height 2 added to it. This combined z-difference is added to z-value of the Layer at the Start Offset to give the z-value of the new boxing vertex.

Name 2

cname box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height using Type and Height 2.

If blank, no vertex is created.

Note - to allow the boxing sections and strings to triangulate, if two vertices are created, 12d Model actually increases the offset of the second vertex by ten thousandth of a unit.

Active
tick box

if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.

OK
button
**OK** stores the values in the fields and removes the panel BUT no **recalc** is done.

**Apply** button

**Apply** stores the values and leaves the panel on the screen.

If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.

If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.

For the typed format of the **Vertex** command created by this panel, see [21.10.2.3 Text Format - Boxing Vertex](#).

For more information on how Boxing works in **12d Model**, please go to the section [21.6 What is Boxing?](#).

Go to the next section [21.7.2.2.3 Boxing Vertex Advanced](#) or return to [21.7.2.2 Commands for Boxing Rules Grid](#).

<td><strong>None</strong></td>
<td></td>
</tr>
</tbody>
</table>
Type  

choice box

For the documentation on the methods of defining the Start Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands.

Xfall from  

choice box  

Left, Right

When Hgt type is Normal:

if Left, the xfall to measure the distance NORMAL to is taken from the segment of the Start Offset layer that is slightly to the left of the Start Offset.

if Right, the xfall to measure the distance NORMAL to is taken from the segment of the Start Offset layer that is slightly to the right of the Start Offset.

When Hgt type is Vertical, Xfall from is not used.

New Vertices

Hgt type  

choice box  

Vertical, Normal

When Hgt type is Normal, the distance is measured NORMAL to a segment.

If Xfall from is Left, the xfall to measure the distance NORMAL to is taken from the segment of the Start Offset layer that is slightly to the left of the Start Offset.

If Xfall from is Right, the xfall to measure the distance NORMAL to is taken from the segment of the Start Offset layer that is slightly to the right of the Start Offset.

When Hgt type is Vertical, the distance is measured in the vertical plane and Xfall from is not used.

Name 1  

name box

if non blank, a vertex is created on the boxing section with this name and the appropriate position using Type, Xfall from, Hgt type and Height 1.

If blank, a vertex is created with a default name.

Height 1  

real box

If Start Offset Type is NOT: Cut of string:

If Hgt type is Normal, the distance Height 1 is taken from the point on the Layer at the Start Offset, and going out NORMAL to the segment specified by Start Offset and Xfall from.
If Hgt type is Vertical, the distance Height 1 is taken from the point on the Layer at the Start Offset, and going vertically. For example, if Height 1 is -0.5, the vertex is dropped by 0.5 from Layer.

If Start Offset Type is: Cut of string:

??

Name 2 name box

If blank, no vertex is created.

Height 2 real box

If Start Offset Type is NOT: Cut of string:

If Hgt type is Normal, the distance Height 2 is taken from the point on the Layer at the Start Offset, and going out NORMAL to the segment specified by Start Offset and Xfall from.

If Hgt type is Vertical, the distance Height 2 is taken from the point on the Layer at the Start Offset, and going vertically. For example, if Height 2 is -0.5, the vertex is dropped by 0.5 from Layer.

Active tick box

if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.

OK button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply button

Apply stores the values and leaves the panel on the screen.

If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.
If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **reca**l of the **Boxing Many Function** is done.

**Important Notes**

1. the boxing vertices must be created from left to right so be careful that vertex Name 2 is no created to the left of vertex of Name 1. If it is then it will be move to be slightly to the right of vertex Name 1.

2. to allow the boxing sections and strings to triangulate, if two vertices are created that are on top of each other, **12d Model** actually increases the offset of the second vertex by ten thousandth of a unit.

For more information on how Boxing works in **12d Model**, please go to the section **21.6 What is Boxing?**.

Go to the next section **21.7.2.2.4 Boxing Xfall - line through a point with a given crossfall** or return to **21.7.2.2 Commands for Boxing Rules Grid**.
21.7.2.2.4 Boxing Xfall - line through a point with a given crossfall

The Xfall command creates a link from the Start Offset to the Start Offset on the next boxing command, with a

(a) user given cross fall (Xfall)

(b) start height given by projecting the line with a given xfall and going through a given control point, through to the Start Offset,

Selecting Xfall brings up the Boxing Xfall panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Offset</td>
<td>choice</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Start Offset**

Start Offset defines the offset where the new line starts from.

*For the Xfall command, the 3d cut of string is not needed. Only 2d cut of string is required.*

<table>
<thead>
<tr>
<th>Type</th>
<th>choice box</th>
</tr>
</thead>
</table>

*For the documentation on the methods of defining the Start Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands.*

**Control**

the definition of the Control Point that the line goes through.

<table>
<thead>
<tr>
<th>Layer</th>
<th>choice box</th>
</tr>
</thead>
</table>

Layer to use with Control Offset to define the offset of the Control Point.

<table>
<thead>
<tr>
<th>Type</th>
<th>choice box</th>
</tr>
</thead>
</table>

*If Vertex on section:*

<table>
<thead>
<tr>
<th>Name</th>
<th>name box</th>
</tr>
</thead>
</table>

name of the vertex on the Control Layer to use with Offset to defined the Control Offset. And used with Height to define the height of the Control Point

<table>
<thead>
<tr>
<th>Offset</th>
<th>real box</th>
<th>0</th>
</tr>
</thead>
</table>

this value is added to the offset of the vertex given in the Name field to define the Control Offset. Offset can be positive or negative as long as the final Control Offset is still on the Control Layer.

<table>
<thead>
<tr>
<th>Height</th>
<th>real box</th>
<th>0</th>
</tr>
</thead>
</table>
Height is added to the z-value of the Control Layer at the Control Offset to give the height of the Control Point.

**If Offset from centreline:**

- **Offset**
  - real box
  - 0
  - an actual offset from centreline (actually just the chainage of the section) which is used as the Control Offset. Offset can be positive or negative as long as the Control Point is still on the Control Layer.

- **Height**
  - real box
  - 0
  - Height is added to the z-value of the Control Layer at the Control Offset to give the height of the Control Point.

**If 2d cut of string, height from section:**

- **String**
  - string select
  - the selected string needs to cut the Control Layer in plan wherever the boxing is being applied.

The Control Offset is the offset of the plan cut of the selected string with the Control Layer, plus the Offset value. Offset can be positive or negative as long as the final Control Offset is still on the Control Layer.

- **Offset**
  - real box
  - 0
  - offset to add to the offset of the plan cut of the Control Layer with the selected string to give the Start Offset. Offset can be positive or negative but the final Control Offset must still be on the Control Layer.

- **Height**
  - real box
  - 0
  - Height is added to the z-value of the Control Layer at the Control Offset to give the height of the Control Point.

**If Cut of string:**

- **String**
  - string select
  - the selected string needs to cut the Control Layer in plan wherever the boxing is being applied.

The Control Offset is the offset of the plan cut of the selected string with the Control Layer, plus the Offset value. Offset can be positive or negative but the final position must still be on the section.

- **Offset**
  - real box
  - 0
  - offset to add to the offset of the plan cut of the section with the selected string to give the Control Offset. Offset can be positive or negative but the final Control Offset must still be on the section.

- **Height**
  - real box
  - 0
  - At the plan cut of the string and the Control Layer, the difference of the z-values between the string and the Control Layer is calculated and Height added to it. This combined value is added to the z-values on the Control Layer to give the z-value of the Control Point.

- **Xfall**
  - input
  - 0
  - xfall of the line going through the Control Point.

**New vertices**

- **Name 1**
  - name box
  - if non blank, the vertex created at the Start Offset is given this name
  - If blank, the vertex created at the Start Offset is given a default name.

- **Name 2**
  - name box
if non blank, the vertex created at the End Offset (the Start Offset of the next command) is given this name.

If blank, the vertex created at the End Offset is given a default name.

Active tick box

if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.

OK button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply button

Apply stores the values and leaves the panel on the screen.

If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.

For the typed formats of the Xfall command created by this panel, see 21.10.2.5 Text Format - Boxing Xfall.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.5 Boxing Xfall 1 - line through a point with a crossfall taken from a point or return to 21.7.2.2 Commands for Boxing Rules Grid.

Xfall diagrams for more methods of defining Offsets:
Full Definition of Boxing
21.7.2.2.5 Boxing Xfall 1 - line through a point with a crossfall taken from a point

The **Xfall 1** command creates a link from the Start Offset, to the Start Offset on the next boxing command, with

(a) a Xfall which is the xfall at a given offset plus an additional xfall Delta

(b) a start height given by projecting to the Start Offset, the line with the specified Xfall and going through a given Control Point.

**Note** - the difference between the boxing commands **Xfall** and **Xfall 1** is that in the command **Xfall**, the user supplies the value of the xfall whereas in the command **Xfall 1**, the xfall is taken from a link on the Xfall Layer.

Selecting **Xfall 1** brings up the **Boxing Xfall 1** panel.

**Start offset**

*Start Offset defines the offset where the new line starts from.*

*For the Xfall 1 command, the 3d cut of string is not needed. Only 2d cut of string is required.*

**Type**

choice box

*For the documentation on the methods of defining the Start Offset, see [21.7.2.3 Defining Relative Offset for Boxing Commands](#)*
Control
the definition of the Control Point for the line to go through.

Layer choice box

Layer to use with Control Offset to define the offset of the Control Point.

Type choice box

If Vertex on section:
Name name box
name of the vertex on the Control Layer to use with Offset to define the Control Offset. And used with Height to define the height of the Control Point
Offset real box 0
this value is added to the offset of the vertex given in the Name field to define the Control Offset. Offset can be positive or negative as long as the final Control Offset is still on the Control Layer.
Height real box 0
Height is added to the z-value of the Control Layer at the Control Offset to give the height of the Control Point.

If Offset from centreline:
Offset real box 0
an actual offset from centreline (actually just the chainage of the section) which is used as the Control Offset. Offset can be positive or negative as long as the Control Point is still on the Control Layer.
Height real box 0
Height is added to the z-value of the Control Layer at the Control Offset to give the height of the Control Point.

If 2d cut of string, height from section:
String string select
the selected string needs to cut the Control Layer in plan wherever the boxing is being applied.
The Control Offset is the offset of the plan cut of the selected string with the Control Layer, plus the Offset value. Offset can be positive or negative as long as the final Control Offset is still on the Control Layer.

**Offset**

real box 0

offset to add to the offset of the plan cut of the Control Layer with the selected string to give the Start Offset. Offset can be positive or negative but the final Control Offset must still be on the Control Layer.

**Height**

real box 0

Height is added to the z-value of the Control Layer at the Control Offset to give the height of the Control Point.

*If Cut of string:*

**String**

string select

the selected string needs to cut the Control Layer in plan wherever the boxing is being applied.

The Control Offset is the offset of the plan cut of the selected string with the Control Layer, plus the Offset value. Offset can be positive or negative but the final position must still be on the Control Layer.

**Offset**

real box 0

offset to add to the offset of the plan cut of the section with the selected string to give the Control Offset. Offset can be positive or negative but the final Control Offset must still be on the section.

**Height**

real box 0

At the plan cut of the string and the Control Layer, the difference of the z-values between the string and the Control Layer is calculated and Height added to it. This combined value is added to the z-values on the Control Layer, to give the z-value of the Control Point.

**Xfall**

the xfall of the line going through the Control Point is:

*the xfall of the Xfall Layer at Xfall Offset, plus the value Delta.*

**Layer**

choice box

Layer to use with Offset to defined the Xfall
Type choice box

If Vertex on section:

Name name box

name of the vertex on Xfall Layer to use with Offset to define the Xfall Offset.

Offset real box

this value is added to the offset of the vertex given in the Name field to define the Xfall Offset. Offset can be positive or negative as long as the final Xfall Offset is still on the Xfall Layer.

Delta real box

the Xfall of the line is the xfall of the Xfall Layer at Xfall Offset plus Delta

If Offset from centreline:

Offset real box

an actual offset from centreline (actually just the chainage of the section) which is used as the Xfall Offset. Offset can be positive or negative as long as it is still on the Xfall Layer.

Delta real box

the Xfall of the line is the xfall of the segment of Xfall Layer at Xfall Offset plus Delta

If 2d cut of string:

String string select

the selected string needs to cut the Xfall Layer in plan wherever the boxing is being applied.

The Xfall Offset is the offset of the plan cut of the selected string with the Xfall Layer, plus the Offset value. Offset can be positive or negative but the final position Xfall Offset must still be on the Xfall Layer

Offset real box

offset to add to the offset of the plan cut of the Xfall Layer with the selected string to give the Xfall Offset. Offset can be positive or negative but the final Xfall Offset must still be on the Xfall Layer.

Delta real box

the Xfall of the line is the xfall of the segment of Xfall Layer at Xfall Offset plus Delta.

New vertices

Name 1 name box

if non blank, the vertex created at the Start Offset is given this name

If blank, the vertex created at the Start Offset is given a default name.

Name 2 name box

if non blank, the vertex created at the End Offset (the Start Offset of the next command) is given this name

If blank, the vertex created at the End Offset is given a default name.
Active tick box

if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.

OK button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply button

Apply stores the values and leaves the panel on the screen.

If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.

For the typed format of the xfall1 command created by this panel, see 21.10.2.6 Text Format - Boxing Xfall1.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

**Full Definition of Boxing**
21.7.2.2.6 Boxing Line - line through two points

The Line command creates a line from the Start Offset to the Start Offset of the next boxing command, with a
(a) slope given by two points
(b) start height given by projecting to the Start Offset, the line through the two points.

The first point defining the line has the offset **Point 1 Offset** which may be given in terms of a Vertex, or Cut with a string, and a height given by the height of a selected Layer, or at the Cut string, plus a given **Height**.

The second point defining the line has the offset **Point 2 Offset** which may be given in terms of a Vertex, or Cut with a string, and a height given by the height of a selected Layer, or at the Cut string, plus a given **Height**.

Selecting Line brings up the Boxing Line panel.
The fields and buttons used in this panel have the following functions.

**Start offset**

Start Offset defines the offset where the new line starts from.

For the Line command, the 3d cut of string is not needed. Only 2d cut of string is required.

**Type**

choice box

For the documentation on the methods of defining the Start Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands
Point 1
the definition of the first point that the line goes through.

Type choice box

For the documentation on the methods of defining the Point 1 Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands

If Vertex on section:
Height real box 0
Height is added to the z-value on the Layer at the Point 1 Offset to give the height of Point 1.

If Offset from centreline:
Height real box 0
Height is added to the z-value on the Layer at the Point 1 Offset to give the height of Point 1.

If 2d cut of string, height from section:
Height real box 0
Height is added to the z-value on the Layer at the Point 1 Offset to give the height of Point 1.

If Cut of string:
Height real box 0
Height is added to the z-value of the cut string to give the z-value of Point 1.

Point 2
the definition of the second point that the line goes through.

Type choice box

For the documentation on the methods of defining the Point 2 Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands

If Vertex on section:
Height real box 0
Height is added to the z-value on the Layer at the Point 2 Offset to give the height of Point 2.

If Offset from centreline:
Height real box 0
Height is added to the z-value of the Layer at the Point 2 Offset to give the height of Point 2.

If 2d cut of string, height from section:

Height real box 0

Height is added to the z-value on the Layer at the Point 2 Offset to give the height of Point 2.

If Cut of string:

Height real box 0

Height is added to the z-value of the cut string to give the z-value of Point 2.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.

For the typed formats of the Line command created by this panel, see 21.10.2.4 Text Format - Boxing Line.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.7 Boxing Intersect - Intersection of Two Lines or return to 21.7.2.2 Commands for Boxing Rules Grid.

Line diagrams for more methods of defining Offsets:
Full Definition of Boxing
21.7.2.2.7 Boxing Intersect - Intersection of Two Lines

The Intersect command creates a vertex on the boxing section that is the intersection of two lines.

The first line goes through Point 1 where the offset for Point 1 is the offset of a vertex from a Layer, and the height at Point 1 is the height on the vertex plus of a given Height. The xfall of the line is taken from the Layer segment to either the Left or Right of the selected vertex.

The second line goes through Point 2 where the offset for Point 2 is a relative offset to a vertex or a selected string, and the height at Point 2 is either the height on the Layer section plus a given Height, or the height at the cut string, with the addition of a given Height. The Xfall of the line is taken from the Layer segment to either the Left or Right of the relative offset of Point 2.

A new boxing vertex is created at the intersection of the two lines.

Selecting Intersect brings up the Boxing Intersect panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>

</tbody>
</table>
Xfall from choice box Left, Right

if Left, the xfall for the line is taken from the segment that is a little left of the selected vertex.

If Right, the xfall for the line is taken from the segment that is a little right of the selected vertex.

Point 2

the definition of the point that the second line goes through.

Layer choice box Design, Layer 1 ... Layer 8

Layer to select the vertex from to define the offset of the point the second line goes through.

Type choice box

If Vertex on section:

Name name box

name of the vertex on the cross section to use with Offset to defined the Point 2 Offset. And used with Height to define the height of the Point 2.

Offset real box 0

this value is added to the offset of the vertex given in the Name field to define the Point 2 Offset. Offset can be positive or negative as long as the final Point 2 Offset is still on the section.

Height real box 0

Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

If Offset from centreline:

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Point 2 Offset. Offset can be positive or negative as long as the Point 2 Offset is still on the section.

Height real box 0

Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

If 2d cut of string, height from section:

String string select

the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the Offset value. Offset can be positive or negative as long as the final Point 2 Offset is still on the section.

Offset real box 0

this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. Offset can be positive or negative but the final Point 2 Offset must still be on the section.

Height real box 0

Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.
If Cut of string:

String  string select
the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the Offset value. Offset can be positive or negative but the final position must still be on the section.

Offset  real box  0
this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. Offset can be positive or negative but the final Point 2 Offset must still be on the section.

Height  real box  0
Height is added to the z-value of the cut string to give the z-value of Point 2.

Point 2 Xfall
the definition of xfall of the second line

Layer  choice box  Design, Layer 1 ... Layer 8
Layer to select the vertex from to define the offset of the point the second line goes through.

Xfall from  choice box  Left, Right
if Left, the xfall of the second line is taken from the segment that is a little to the left of the relative offset.

If Right, the xfall of the second line is taken from the segment that is a little to the right of the relative offset

New vertex
a new vertex is created at the intersection of the two lines

Name  name box
the vertex created at the intersection of the two lines is given this name

Active  tick box
if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.

OK  button
OK stores the values in the fields and removes the panel BUT no recal is done.

Apply  button
Apply stores the values and leaves the panel on the screen.

If the Boxing Definition is being used in an Apply MTF and Auto recal is ticked in the MTF, then whenever the Apply button is clicked, then a recal of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recal of the Boxing Many Function is done.

For the typed format of the intersect command created by this panel, see 21.10.2.7 Text Format.
- Boxing Intersect.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.8 Boxing Intersect Advanced or return to 21.7.2.2 Commands for Boxing Rules Grid.

Intersect diagrams for more methods of defining Offsets:
21.7.2.2.8 Boxing Intersect Advanced

The **Intersect Advanced** command is similar to the **Intersect** command where a vertex on the boxing section is the intersection of two lines. The major difference is that the distance of the lines from vertices etc can be measured NORMAL to a segment, not just a vertical distance (See 21.7.2.2.7 Boxing Intersect - Intersection of Two Lines).

Selecting **Intersect (Adv)** brings up the **Boxing Intersect (Adv)** panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>

![Boxing Intersect (Adv) panel](image)
If Vertex on section:

**Name**

name box

name of the vertex on **Layer** to use with **Type**, **Xfall from**, **Height type** and **Height** to define the offset and height for point that the first line goes through

**Height type**

choice box **Vertical, Normal**

*When Height type is Normal, the distance is measured NORMAL to a segment.*

*If Xfall from is Left, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the left of Name.*

*If Xfall from is Right, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the right of Name.*

*When Height type is Vertical, the distance is measured in the vertical plane and Xfall from is not used. For example, if Height is -0.5, the vertex is dropped by 0.5 from Layer.*

**Height**

real box

depending on **Height type**, Height is added to added vertically or normally to give the z-value of the point the first line goes through.

**Xfall from**

choice box **Left, Right**

if Left, the xfall for the line is taken from the segment that is a little left of the selected vertex.

If Right, the xfall for the line is taken from the segment that is a little right of the selected vertex

**Point 2**

the definition of the point that the second line goes through.

**Layer**

choice box **Design, Layer 1 ... Layer 8**

Layer to select in defining the offset of the point the second line goes through. The point can be normal to a segment left or right of the relative offset from Layer.

**Type**

choice box

If Vertex on section:

**Name**

name box
name of the vertex on the cross section to use with Offset to defined the Point 2 Offset. And used with Height type and Height to define the height of Point 2.

**Offset**

real box 0

this value is added to the offset of the vertex given in the Name field to define the Point 2 Offset. Offset can be positive or negative as long as the final Point 2 Offset is still on the section.

**If Offset from centreline:**

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Point 2 Offset. Offset can be positive or negative as long as the Point 2 Offset is still on the section.

**If 2d cut of string, height from section:**

String string select

the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the Offset value. Offset can be positive or negative as long as the final Point 2 Offset is still on the section.

Offset real box 0

this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. Offset can be positive or negative but the final Point 2 Offset must still be on the section.

**If Cut of string:**

String string select

the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the Offset value. Offset can be positive or negative but the final position must still be on the section.

Offset real box 0

this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. Offset can be positive or negative but the final Point 2 Offset must still be on the section.

**Height type**

choice box Vertical, Normal

When Height type is Normal, the distance is measured NORMAL to a segment.

If Xfall from is Left, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the left of the Point 2 offset.

If Xfall from is Right, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the right of the Point 2 offset.

When Height type is Vertical, the distance is measured in the vertical plane and Xfall from is not used. For example, if Height is -0.5, the vertex is dropped by 0.5 from Layer

Height real box 0

depending on Height type, Height is added vertically or normally to give the z-value of the point the second line goes through.
Point 2 Xfall

the definition of xfall of the second line. The xfall comes from the segment in the elected Layer slightly to the left or right of the Point 2 offset

Layer choice box

Design, Layer 1 ... Layer 8

Layer to select the xfall from for the second line.

Xfall from choice box

if Left, the xfall of the second line is taken from the segment that is a little to the left of Point 2 Offset.

If Right, the xfall of the second line is taken from the segment that is a little to the right of Point 2 Offset.

If Manual, the xfall is taken from the Xfall field.

If Left Max, the xfall on the left side of Point 2 will never exceed the value in the Xfall field. If the xfall is greater than the value in Xfall field then the xfall takes the value in the Xfall field.

If Right Max, the xfall on the right side of Point 2 will never exceed the value in the Xfall field. If the xfall is greater than the value in Xfall field then the xfall takes the value in the Xfall field.

If Left Min, the xfall on the left side of Point 2 will never be less than the value in the Xfall field. If the xfall is less than the value in Xfall field then the xfall takes the value in the Xfall field.

If Right Min, the xfall on the right side of Point 2 will never be less than the value in the Xfall field. If the xfall is less than the value in Xfall field then the xfall takes the value in the Xfall field.

For example, to force a crown in the subgrade no matter what the super elevation of the road is, you would use Left Min on the left hand side of the road and Right Max on the right side of the road.

Intersection Type

the definition of xfall of the second line. The xfall comes from the segment in the elected Layer slightly to the left or right of the Point 2 offset
Full Definition of Boxing

**Type**

button
*Apply stores the values and leaves the panel on the screen.*

*If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.*

*If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.*
For the typed format of the `intersect Advanced` command created by this panel, see 21.10.2.7 Text Format - Boxing Intersect.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.9 Boxing Xfall Point or return to 21.7.2.2 Commands for Boxing Rules Grid.

*Intersect Adv* diagrams for more methods of defining *Offsets*:
Chapter 21  Advanced Design

Full Definition of Boxing

Page 4799
21.7.2.2.9 Boxing Xfall Point

The Xfall Pt command is similar to the Vertex command in that it inserts one or two new vertices at the given Start Offset.

However, instead of adjusting the height from the z-value of the Layer, the Xfall Pt command extrapolates from the z-value of the selected Layer or 2d cut with a selected string (depending on Type) using the Xfall at the Xfall Offset given in the Xfall Pt command.

Like Vertex, Xfall Pt can be used to quickly create a vertical wall of two vertices.

Note - to allow the boxing sections and strings to triangulate, 12d Model increases the offset of the second vertex by ten thousandth of a unit.

Selecting Xfall pt brings up the Boxing Xfall Pt panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

**Start offset**

Start Offset defines the vertex, plan cut or cut string to define where the grade line start goes through, and then the Offset defines where the line is projected to and creates the one or two new vertices.

**Layer - after Type**

Layer to use with Type to select the point the line goes through, and for how far.

**Type**

If Vertex on section:

Name

name box

name of the vertex on the given Layer that the line will go through. The line will have xfall given in the Xfall section. Offset is added to the offset of the vertex to defined the Start Offset, and the line is extended thought the vertex to Start Offset.

Height 1/Height 2 are then used with the projected point to define the heights of the new boxing
vertices.

**Offset**

```
real box 0
```

This value is added to the offset of the vertex given in the **Name** field to define the **Start Offset**. **Offset** can be positive or negative as long as the final **Start Offset** is still on the section.

**Height 1/Height 2**

```
real box 0
```

**Height 1/Height 2** is added to the z-value of the line that is extended to **Start Offset** to give the z-values of the new boxing vertices.

If **Offset from centreline**:

```
real box 0
```

An actual offset from centreline (actually just the chainage of the section) which is used as the **Start Offset**. **Offset** can be positive or negative as long as it is still on the section.

If **Offset from centreline is used**, the **Xfall** section is not used.

**Height 1/Height 2**

```
real box 0
```

**Height 1/Height 2** is added to the z-value of the section at the **Start Offset**, to give the z-values of the new boxing vertices. For example, if Height is -0.3, the vertex is dropped by 0.3.

If **2d Cut of string, height from section**:

**String**

```
string select
```

The **Start Offset** is the offset of the plan cut of the selected string with the section from **Layer**, plus the **Offset** value.

The **plan cut** on the section from **Layer** is used as the position to take a line through with xfall given at the Xfall Offset defined in the Xfall section. This goes through the **plan cut** on **Layer** and is extended through to the z-value at **Start Offset**.

**Height 1/Height 2** are then added to the z-value at **Start Offset** to define the heights of the new boxing vertices.

The selected string needs to cut the sections from **Layer** in plan wherever the boxing is being applied.

```
real box 0
```

Offset to add to the offset of the plan cut of the section from **Layer** with the selected string to give the **Start Offset**. **Offset** can be positive or negative but the final **Start Offset** must still be on **Layer**.

**Height 1/Height 2**

```
real box 0
```

**Height 1/Height 2** is used with the z-value of the extended line at the **Start Offset** to give the z-value of the new boxing vertices.

If **Cut of string**:

**String**

```
string select
```

The **Start Offset** is the offset of the **plan cut** of the selected string with the section from **Layer**, plus the **Offset** value. **Offset** can be positive or negative but the final position must still be on the section.

The line goes through the **3d cut** with the xfall given at the Xfall Offset defined in the Xfall section. This line goes through the **3d cut** point and is extended to **Start Offset** to give a z-value.

**Height 1/Height 2** are then added to the projected point to define the heights of the new boxing vertices.

The selected string needs to cut the sections in plan wherever the boxing is being applied.
Chapter 21  Advanced Design

Full Definition of Boxing

Offset  
real box  
0

offset to add to the offset of the plan cut of the section with the selected string to give the Start Offset. Offset can be positive or negative but the final Start Offset must still be on the section.

Height 1/Height 2  
real box  
0

Height 1/Height 2 is used with the z-value of the extended line at the Start Offset to give the z-value of the new boxing vertices.

Xfall

the definition of the offset that Xfall is taken from.

Type  
choice box

For the documentation on the methods of defining the Xfall Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands.

The xfall is taken from the point on the section in Layer with offset Xfall Offset.

Name 1  
name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height.

If blank, no vertex is created.

Height 1  
real box

Height 1 to used in the calculation height of the new boxing vertex

Name 2  
name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height.

If blank, no vertex is created.

Height 2  
real box

Height 2 to used in the calculation height of the new boxing vertex

Note - to allow the boxing sections and strings to triangulate, if two vertices are created, 12d Model actually increases the offset of the second vertex by ten thousandth of a unit.

Active  
tick box

if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.

OK  
button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply  
button

Apply stores the values and leaves the panel on the screen.
If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.

If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.

For the typed format of the **Xfall Point** command created by this panel, see [21.10.2.8 Text Format - Boxing Xfall Point](#).

For more information on how Boxing works in **12d Model**, please go to the section [21.6 What is Boxing?](#).

Go to the next section [21.7.2.10 Boxing Drop](#) or return to [21.7.2.2 Commands for Boxing Rules Grid](#).
21.7.2.2.10 Boxing Drop

The **Drop** command is a quick way of creating three vertices, the first two on a line of given Xfall, and the third vertically above the second vertex.

If the **End Offset** is before the **Start Offset** then the **Drop** is done in reverse. That is, the line still goes through the Start vertex but it then goes to the left.

Selecting **Drop (kerb)** brings up the **Boxing Drop** panel.
The fields and buttons used in this panel have the following functions.

</tbody>
</table>

The first vertex is created with offset Start Offset and z-value determined by Start Offset Type and Height.

For the documentation on the methods of defining the Start Offset except for Last created, see 21.7.2.3 Defining Relative Offset for Boxing Commands

If Start Offset Type is NOT: Cut of string:
the height of the fist vertex is $Height$ added to the z-values of the selected Layer at Start Offset. For example, if Height is -0.3, the first vertex is 0.3 below the Layer at Start Offset.

If Start Offset Type is: Cut of string:

At the plan cut of the string and the START OFFSET Layer, $Z$-Diff (the difference of the z-values between the string and START OFFSET Layer) is calculated and $Height$ added to it. This combined value is added to the z-value of Layer at the Start Offset to give the z-values of the first vertex.

Xfall to end

Xfall real box

A line is created going through the first vertex (the Start vertex) with the xfall given in the Xfall field. Positive Xfall is up and negative Xfall is down.

End offset

The second vertex lies on the line through the first vertex when it is extrapolated to End Offset.

The third vertex is created with offset End Offset and z-value determined by End Offset Type and Height.

Type choice box

For the documentation on the methods of defining the Start Offset except for Last created, see 21.7.2.3 Defining Relative Offset for Boxing Commands.

Height real box 0

If End Offset Type is NOT: Cut of string:

the height of the last vertex is $Height$ added to the z-value of the selected Layer at End Offset. For example, if Height is -0.1, the third vertex is 0.1 below the Layer at End Offset.

If End Offset Type is: Cut of string:

At the plan cut of the string and the END OFFSET Layer, $Z$-Diff (the difference of the z-values between the string and END OFFSET Layer) is calculated and $Height$ added to it. This combined value is added to the z-value of Layer at the End Offset to give the z-values of the third vertex.

IMPORTANT NOTE: if the End Offset is before the Start Offset then the line from the first vertex is reversed and goes to the left rather than the right. The use of Offset inside the Start Offset and End Offset sections is also reversed so that a positive offset goes to the left.

New Vertices

Start name box

If Start is non blank then it is the name of the first vertex, otherwise a default name is used.

Xfall name box

If Xfall is non blank then it is the name of the second vertex, otherwise a default name is used.
Full Definition of Boxing

End name box

*If End is non blank then it is the name of the third vertex, otherwise a default name is used.*

Active tick box

*if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.*

OK button

*OK stores the values in the fields and removes the panel BUT no recalc is done.*

Apply button

*Apply stores the values and leaves the panel on the screen.

If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.*

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.11 Boxing Decision or return to 21.7.2.2 Commands for Boxing Rules Grid.
21.7.2.2.11 Boxing Decision

A Test is specified and depending on the result, processing of the boxing commands is sent to a specified **Label** in the **Boxing Definition** where processing then continues from the next command after the Label, or no jump is made and processing continues to the next boxing command in the **Boxing Definition**.

Selecting **Decision** brings up the **Boxing Decision** panel

![Boxing Decision panel](image)

**Type** choice box

-determines the type of test to be made.

*If Type* is **Test offset**:

**Test Offset**
Layer - after Type

Layer to use with Type to defined the test.

Type

If Vertex on section:

the test is satisfied if the Test Offset defined by Layer, Name and Offset is still on Layer.

Name

name of the vertex on Layer to use with Offset to defined the Test Offset. If it is not a name of a vertex then the test is not satisfied.

Offset

this value is added to the offset of the vertex given in the Name field to define the Test Offset. Offset can be positive or negative.

If Offset from centreline:

the test is satisfied if the Offset is on Layer.

Offset

an actual offset from centreline (actually just the chainage on Layer) which is used as the Test Offset. Offset can be positive or negative.

If 2d Cut of string, height from section:

the test is satisfied if the selected string cuts Layer in plan and the Test Offset given by the plan cut plus Offset is still on Layer.

String

the selected string needs to cut the sections of Layer in plan wherever the boxing decision is being applied.

The Test Offset is the offset of the plan cut of the selected string with Layer, plus the Offset value.

Offset

offset to add to the offset of the plan cut of the selected string to give the Test Offset. Offset can be positive or negative but the final Test Offset must still be on Layer.
End of definition for **Type** equal to **Test offset**.

*If Type is Above Tin or Below Tin:*

**Above/Below Tin decision**

**Layer - Below Type** choice box

Layer to use with **Type** to defined the height for the test.

**Type** choice box

*If Vertex on section:*

the test is satisfied if the **height** on the section at **Test Offset** defined by **Layer**, **Name** and **Offset** is **ABOVE/BELOW** the sum of the value given in the field **Tin height offset** and the height of the tin given in the field **Tin** at **Test Offset**.

**Name** name box

name of the vertex on **Layer** to use with **Offset** to defined the **Test Offset**. If it is not a name of a vertex then the test is not satisfied.

**Offset** real box 0

this value is added to the offset of the vertex given in the **Name** field to define the **Test Offset**. **Offset** can be positive or negative.

*If Offset from centreline:*

the test is satisfied if the height of the section at **Offset** is **ABOVE/BELOW** the sum of the value given in the field **Tin height offset** and the height of the tin given in the field **Tin** at **Test Offset**.

**Offset** real box 0

an actual offset from centreline (actually just the chainage on **Layer**) which is used as the **Test Offset**. **Offset** can be positive or negative.

*If 2d Cut of string, height from section:*

the test is satisfied if the selected string cuts **Layer** in plan and the **height** of the section at **Test Offset** given by the plan cut plus **Offset** is **ABOVE/BELOW** the sum of the value given in the field **Tin height offset** and the height of the tin given in the field **Tin** at **Test Offset**.
String string select
the selected string needs to cut the sections of Layer in plan wherever the boxing decision is being applied.

The Test Offset is the offset of the plan cut of the selected string with Layer plus the Offset value.

Offset real box 0
offset to add to the offset of the plan cut of the section from Layer with the selected string to give the Test Offset. Offset can be positive or negative but the final Test Offset must still be on Layer.

If Cut of string:
the selected string can not have only null z-values.

The test is satisfied if the selected string cuts Layer in plan and the height on the cut string at Test Offset given by the plan cut plus Offset is ABOVE/BELOW the sum of the value given in the field Tin height offset and the height of the tin given in the field Tin at Test Offset.

String string select
the selected string needs to cut the sections of Layer in plan wherever the boxing decision is being applied.

The Test Offset is the offset of the plan cut of the selected string with Layer plus the Offset value.

Offset real box 0
offset to add to the offset of the plan cut of the section from Layer with the selected string to give the Test Offset. Offset can be positive or negative but the final Test Offset must still be on Layer.

End of definition for Type equal to Above Tin or Below Tin.

Goto label text box
the name of the Label in the Boxing Definition to pass control to.

When test is choice box True, False
if True, then the Goto is done if the test is satisfied.
If False, then the Goto is done test is not satisfied.
If the Goto is not done, then control passes to the next boxing command in the Boxing Definition.

Active tick box
if ticked, use this Boxing Command.
If not ticked, don’t use this Boxing Command.

OK button
OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply button
Apply stores the values and leaves the panel on the screen.
If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.
If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is
clicked, a recal of the Boxing Many Function is done.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.12 Boxing Label or return to 21.7.2.2 Commands for Boxing Rules Grid.
21.7.2.2.12 Boxing Label

Selecting Label brings up the Boxing Label panel which is used to define a label for this line in the Boxing Definition, and control can be passed to via a Goto or a Decision boxing command.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goto Label</td>
<td>input</td>
<td>name of the label for this line in the Boxing Definition.</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>tick box</td>
<td>if ticked, use this Boxing Command. If not ticked, don’t use this Boxing Command.</td>
<td></td>
</tr>
<tr>
<td>OK</td>
<td>button</td>
<td>OK stores the values in the fields and removes the panel BUT no recalc is done.</td>
<td></td>
</tr>
<tr>
<td>Apply</td>
<td>button</td>
<td>Apply stores the values and leaves the panel on the screen.</td>
<td></td>
</tr>
</tbody>
</table>

If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?

Go to the next section 21.7.2.13 Boxing Goto or return to 21.7.2.2 Commands for Boxing Rules Grid.
21.7.2.2.13 Boxing Goto

Selecting Goto brings up the Boxing Goto panel which is used to transfer control to the line in the Boxing Definition with the Label given in the Goto label field of the panel.

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goto label</strong></td>
<td>input</td>
<td>name of the Label in the Boxing Definition to transfer control to.</td>
<td></td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>tick box</td>
<td>if ticked, use this Boxing Command. If not ticked, don’t use this Boxing Command.</td>
<td></td>
</tr>
<tr>
<td><strong>OK</strong></td>
<td>button</td>
<td><strong>OK</strong> stores the values in the fields and removes the panel BUT no recalc is done.</td>
<td></td>
</tr>
<tr>
<td><strong>Apply</strong></td>
<td>button</td>
<td><strong>Apply</strong> stores the values and leaves the panel on the screen.</td>
<td></td>
</tr>
</tbody>
</table>

If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the **Apply** button is clicked, then a recalc of the associated **Apply MTF** for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the **Apply** button is clicked, a recalc of the Boxing Many Function is done.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?

Go to the next section 21.7.2.2.14 Boxing Comment or return to 21.7.2.2 Commands for Boxing Rules Grid.
21.7.2.2.14 Boxing Comment

Selecting Comment brings up the Boxing Comment panel and the panel is used to insert a comment as a line of the Boxing Definition. Comments are not processed when running the boxing commands.

![Boxing Comment Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comment</td>
<td>input</td>
<td>user comment - for information purposes only</td>
<td></td>
</tr>
<tr>
<td>OK</td>
<td>button</td>
<td>OK stores the values in the fields and removes the panel BUT no recal is done.</td>
<td></td>
</tr>
<tr>
<td>Apply</td>
<td>button</td>
<td>Apply stores the values and leaves the panel on the screen.</td>
<td></td>
</tr>
</tbody>
</table>

If the Boxing Definition is being used in an Apply MTF and Auto recal is ticked in the MTF, then whenever the Apply button is clicked, then a recal of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recal of the Boxing Many Function is done.

For more information on how Boxing works in 12d Model, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.15 Boxing Extend Tin or return to 21.7.2.2 Commands for Boxing Rules Grid.
21.7.2.2.15 Boxing Extend Tin

The Extend to Tin option is used to extend the link containing the last two vertices (or the first two vertices) already created in the boxing layer until it hits the selected Stripped Tin.

Selecting Extend Tin brings up the Boxing Extend Tin panel.

The boxing link is extended to cut the stripped tin

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extend to</td>
<td>choice box</td>
<td>Left, Right</td>
<td></td>
</tr>
</tbody>
</table>

- **Extend to**
  - If Right, then the link through the last two boxing vertices is extended until it intersects the stripped tin. The last vertex is then moved to the intersection point. Other boxing commands can then follow.
  - If Left, then the link through the first two boxing vertices is extended until it intersects the stripped tin. The first vertex is then moved to the intersection point. Note that this is moving the first vertex of the boxing defined so far. The "Copy from start of section" with the Left Side Interface will add vertices before this vertex.

  **Note** - there must be at least two vertices in the boxing before this command can be used.

- If the extend fails, then no vertex is moved and an error message is written to the output window and the boxing processing terminated at that chainage.

<table>
<thead>
<tr>
<th>Tin</th>
<th>tin box</th>
<th>available tins</th>
</tr>
</thead>
</table>

  - the tin, dropped by the Strip depth, to batter to.

<table>
<thead>
<tr>
<th>Strip depth</th>
<th>input</th>
</tr>
</thead>
</table>
distance below the tin to stop at.

**Active**

*If ticked*, use this Boxing Command.  
*If not ticked*, don’t use this Boxing Command.

**OK**

*OK* stores the values in the fields and removes the panel but no *recalc* is done.

**Apply**

*Apply* stores the values and leaves the panel on the screen.

*If the Boxing Definition* is being used in an *Apply MTF* and *Auto recalc* is ticked in the MTF, then whenever the *Apply* button is clicked, then a *recalc* of the associated *Apply MTF* for the MTF is done.

*If the Boxing Definition* is being used in a *Boxing Many Function* then whenever the *Apply* button is clicked, a *recalc* of the *Boxing Many Function* is done.

For more information on how Boxing works in **12d Model**, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.16 Boxing End or return to 21.7.2.2 Commands for Boxing Rules Grid.
21.7.2.2.16 Boxing End

Most Boxing commands go from the Start Offset defined with the command, to the Start Offset of the next Boxing command.

However sometimes a Boxing command needs to be stopped before the Start Offset of the next Boxing command.

The End command can be used to provide a "Start Offset" to act as the finishing position for the previous boxing command. So the End command simply terminates the previous Boxing command.

Apart from supplying the End Offset for the previous command, End is a "no operation" command.

Other Boxing commands can then follow the End command.

Selecting End brings up the Boxing End panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>choice box</td>
<td>-----------</td>
<td>--------</td>
</tr>
<tr>
<td>The Relative Offset defined becomes the End Offset for the previous command.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the documentation on the methods of defining the Relative Offset see 21.7.2.3 Defining Relative Offset for Boxing Commands.

OK button

OK stores the values in the fields and removes the panel BUT no recalc is done.

Apply button

Apply stores the values and leaves the panel on the screen.

If the Boxing Definition is being used in an Apply MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply MTF for the MTF is done.

If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is
clicked, a \texttt{recalc} of the \textit{Boxing Many Function} is done.

For the typed format of the \texttt{End} command created by this panel, see \texttt{21.10.2.9 Text Format - Boxing End}.

For more information on how Boxing works in \textit{12d Model}, please go to the section \texttt{21.4 Smart Chainages}.

Return to \texttt{21.7.2.2 Commands for Boxing Rules Grid}. 
21.7.2.2.17 Boxing Left Side Interface Xfall from Point

The **Xfall from Point** command creates a line from the left hand end of the boxing already defined and then batters to the *left* at a specified xfall until it intersects the design surface. The xfall of the batter is defined as

(a) the xfall on the section at a given section offset
(b) the xfall on the section at a *relative vertex offset*
(c) the xfall on the section at a *relative string offset*

plus in each case:

an additional xfall value Delta.

If the design surface is not intersected by the batter, then no extra line is created.

Xfall is percent cross-fall and a positive xfall is up and negative xfall is down.

**Note** that the **Xfall from Point** creates a line at the *beginning* of the boxing created by running all the boxing commands in the boxing grid. So it is applied *after* all the other boxing commands have been run.

If **Copy from start of section** is ticked, then the part of the design section from the start of the design section to the offset that is the start of the boxing section, is copied and made the beginning of the boxing section.

On the **Boxing Rules** panel, selecting the **Set Point** button when the **Left Side Interface** Type is **Xfall from Point** brings up the **Boxing LHS Xfall** panel

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xfall for &quot;std&quot;</td>
<td>Vertex</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer</td>
<td>None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Delta</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Layer - after Type choice box

Layer of sections to use with Type.

Type choice box

If Vertex on section:

Name name box

name of the vertex on Layer to use with Offset to define the section offset to take the Xfall value from

Offset real box

this value is added to the offset of the vertex given in the Name field to define the section offset to take the Xfall value from. Offset can be positive or negative as long as the final section offset is still on the section from Layer.

If Offset from centreline:

Offset real box

an actual offset from centreline (actually just the chainage of the section) which is used as the section from Layer offset to take the Xfall value from. Offset can be positive or negative as long as it is still on the section from Layer.

If 2d cut of string:

String string select

the selected string needs to cut the sections from Layer in plan wherever the boxing is being applied.

The section offset to take the Xfall value from is the offset of the plan cut of the selected string with the section from Layer, plus the Offset value. Offset can be positive or negative but the final section offset must still be on the section from Layer.

Offset real box

offset to add to the offset of the plan cut of the section from Layer with the selected string to give the section offset to take the Xfall value from. Offset can be positive or negative but the final section offset must still be on the section from Layer.

Delta input 0
add the value Delta to the xfall taken from the section from Layer.

OK/Apply button

OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

For the typed format of the left_xfall command created by this panel, see 21.10.2.13 Text Format - Boxing Left_Xfall, for left_slope see 21.10.2.14 Text Format - Boxing Left_slope and left_copy see 21.10.2.15 Text Format - Boxing Left_copy.

For more information on how Boxing works in 12d Model, please go to the section 21.4 Smart Chainages.

Go to the next section 21.7.2.2.18 Boxing Right Side Interface Xfall from Point or return to 21.7.2 Edit Boxing File.
21.7.2.2.18 Boxing Right Side Interface Xfall from Point

The **Xfall from Point** command creates a line from the right hand end of the boxing already defined and then batters to the **right** at a specified xfall until it intersects the design surface. The xfall of the batter is defined as

(a) the xfall on the section at a given section offset
(b) the xfall on the section at a relative vertex offset
(c) the xfall on the section at a relative string offset

plus in each case:

- an additional xfall value *Delta*.

If the design surface is not intersected by the batter, then no extra line is created. xfall is percent cross-fall and a positive xfall is up and negative xfall is down.

**Note** that the **Xfall from Point** creates a line at the **end** of the boxing created by running all the boxing commands in the boxing grid. So it is applied **after** all the other boxing commands have been run.

If **Copy to end of section** is ticked, then the part of the design section from the offset of the last boxing vertex to the last vertex on the design section, is copied and made the end of the boxing section.

On the **Boxing Rules** panel, selecting the **Set Point** button when the **Right Side Interface** Type is **Xfall from Point** brings up the **Boxing RHS Xfall** panel
The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer - after Type</td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Layer of sections to use with Type.*

Type choice box

*If Vertex on section:*

Name name box

name of the vertex on the section from Layer to use with Offset to define the section offset to take the Xfall value from

Offset real box

this value is added to the offset of the vertex given in the Name field to define the section from Layer offset to take the Xfall value from. Offset can be positive or negative as long as the final section offset is still on the section from Layer.

*If Offset from centreline:*

Offset real box

an actual offset from centreline (actually just the chainage of the section) which is used as the section from Layer offset to take the Xfall value from. Offset can be positive or negative as long as it is still on the section from Layer.

*If 2d cut of string:*

String string select

the selected string needs to cut the sections from Layer in plan wherever the boxing is being applied.

The section offset to take the Xfall value from is the offset of the plan cut of the selected string with the section from Layer, plus the Offset value. Offset can be positive or negative but the final section offset must still be on the section from Layer.

Offset real box

offset to add to the offset of the plan cut of the section from Layer with the selected string to give the section offset to take the Xfall value from. Offset can be positive or negative but the final section offset must still be on the section from Layer.
Delta input 0

add the value Delta to the xfall taken from the section from Layer.

OK/Apply button

OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

For the typed format of the right_xfall command created by this panel, see 21.10.2.10 Text Format - Boxing Right_Xfall, for right_slope see 21.10.2.11 Text Format - Boxing Right_slope and right_copy see 21.10.2.12 Text Format - Boxing Right_copy.

For more information on how Boxing works in 12d Model, please go to the section 21.4 Smart Chainages.

Go to the next section 21.7.2.19 Boxing Definitions Examples or return to 21.7.2 Edit Boxing File.

  right_copy 1
}

For more information on how Boxing works in 12d Model, please go to the section 21.4 Smart Chainages or to the section 21.6.2 Applying Boxing.
21.7.2.3 Defining Relative Offset for Boxing Commands

Most boxing commands use **Relative Offsets** to define offset positions across Design or Boxing Layers. For example, the **Start Offset** is a relative offset and is used in most boxing commands to specify where the boxing command starts.

There are a number of ways the **Relative Offset** can be defined:

(a) **Offset from centreline**

Relative to an actual Offset for the Design or Boxing Layer - relative offset

Adding a given value to an actual Offset of the given Layer.

(b) **Vertex on section**

Relative to a vertex on the Design or Boxing Layer - relative vertex offset

The offset of the given vertex is calculated and then a user given value added to it to give the **relative vertex offset**.

(c) **2d cut of string**

Relative to **2d cut** of a selected string with a given Layer.

First calculate the offset on the selected Layer of the plan cut of a selected string (2d cut). A user given value is then added to it to give the **relative 2d offset**.
(d) Cut of string

Relative to 3d cut of a selected string

This is actually the same in offset value as the 2d cut of a selected string but some boxing commands also take the 3d cut of the selected string and use the height difference of the cut of the string and the height on the Layer elsewhere in the command. This is referred to as the Z-Diff of the 3d cut.

Note that some strings only have a horizontal (plan) definition and have no z-values at all. In that case, there is no 3d cut but there can be a 2d cut (plan cut). For example, a string with only null heights or a Super Alignment with no vertical geometry.

So for the case where Relative Offset is the Start Offset:
On a Boxing Command panel, the fields and buttons where a Relative Offset is required have the following functions:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relative Offset (e.g. Start Offset, Xfall Offset etc)</td>
<td>choice box</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Layer - after Type

![Select Choice](image)
Layer to use with Offset to defined the Relative Offset.

Type  
choice box

If Vertex on section:

this is the Relative (Vertex) Offset

Name  
name box

name of the vertex on the Layer to use with Offset to define the Start Offset.

Offset  
real box

this value is added to the offset of the vertex given in the Name field to define the Relative Offset. Offset can be positive or negative as long as the final Start Offset is still on Layer.

If Offset from centreline:

this is the Relative (Centreline) Offset

Offset  
real box

an actual offset from centreline (actually just the chainage of the section). Offset can be positive or negative as long as it is still on Layer.

If 2d cut of string:

this is the Relative (2d Cut) Offset
**String**

string select

the selected string needs to cut the **Layer** in plan wherever the boxing is being applied.

**Offset**

real box

the Relative Offset is the offset of the plan cut of the selected string with the **Layer**, plus the **Offset** value. **Offset** can be positive or negative but the final position **Relative Offset** must still be on **Layer**.

*If Cut of string:*

this is the Relative (3d Cut) **Offset**

**String**

string select

the selected string needs to cut the sections of the selected **Layer** in plan wherever the boxing is being applied.

**Offset**

real box

0

The Relative Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** value. **Offset** can be positive or negative but the final position must still be on **Layer**.

**Z-Diff** is the difference between the z-value of the cut string, and the z-value on the **Layer** at the same plan position as the cut with the string. The use of **Z-Diff** depends on the boxing command.
21.8 Full Definition of Template Decisions

12d Model supports templates with an unlimited number of fixed links which are in the Fixed table of the Temple definition and they are processed first.

At the end of the fixed links, 12d Model checks to see if a Decisions table exists.

If a Decisions table exists, then it is used and the Decision commands processed.

If a Continue Cut/Fill command is reached in the decision command processing, then this stops the Decision command processing, and the processing moves onto the Cut, Fill and Final Cut/Fill tables.

If no Continue Cut/Fill command is reached in the decisions, then the processing stops after the decision commands are exhausted and the Cut, Fill and Final Cut/Fill tables ARE NOT USED.

If no Decisions table exists, then the Cut, Fill and Final Cut/Fill tables are used after the Fixed table.

Templates are created and edited using the Templates=>Create/edit option which brings up the Template Create/Edit panel.

The description of the fields and the buttons Fixed, Cut, Fill, Final Cut/Fill in this panel are given in the section 20.2.1 Templates.

Selecting Decisions on the Template Create/Edit panel brings up the Decisions Template panel:

The Decisions Template panel consists of a grid with of rows (or lines) with commands in them, and an OK or Apply button to record the results.
Decisions Templates Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

The commands in the Decisions Template grid form a simple language where the commands are processed sequentially unless control is passed to a labelled line from where sequential processing continues, or the processing is terminated by an end command. For a description of all the Decisions Template Commands, see 21.8.1 Decisions Template Commands.

When the Grid Row is Empty

If the row of the grid is empty, clicking LB in the empty row will bring up the Create Rule menu which contains all the available decisions commands. Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the Create Rule menu.

Selecting a menu item will bring up an associated panel which displays the information required for the Decisions Template command. When the panel is filled in and OK or Apply selected, the panel information is written out to the row of the grid and is known as a decisions template command.

When the Grid Row is Not Empty

If the row of the grid is not empty (and hence filled with a Decisions Template command) then clicking LB in the cell:

(a) Type will bring up the associated panel for the Decisions Template command.

For a description of all the Decisions Template Commands, see 21.8.1 Decisions Template Commands.
(b) **Active** will toggle the **tick/not ticked**

(c) **Comment** will allow text to be typed into the cell

**Note** that clicking in the **Type**, **Start chainage**, **End chainage**, **Interval**, **Extra Start**, **Extra End**, **Active** and **Comment** cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.

**Buttons at Bottom**

**OK** button

**OK** stores the values in the fields and removes the panel.

**Apply** button

**Apply** stores the values in the grid and leaves the panel on the screen.

If the template is written out using **File I/O=>Templates output** or **Templates=>Utilities=>Output**, the Decisions Template commands will be written out in the order that they are displayed in the grid.

Please continue to the next section [21.8.1 Decisions Template Commands](#).
21.8.1 Decisions Template Commands

The **commands** in the **Decisions Template** grid form a simple language where the commands are processed sequentially unless control is passed to a labelled line from where sequential processing continues, or the processing is terminated by an **end** command.

The Decisions Template Commands can:

(a) create a fixed link - **fixed xfall** and **fixed slope**

(b) create a link of fixed width but with a slope automatically selected so that the link reaches a given tin in the width - **tin width**

(c) create a link that goes within an offset of a given string **string offset**

(d) test for being between two depths below a tin, and transfer control if true - **tin decision**

(e) test that a link would get within a given depth from a tin at a given offset, and transfer control if true - **batter decision**

(f) create a link of set slope that batters to a depth below a tin at a given offset - **batter**

(g) create a label which can have processing passed to - **label**

(h) transfer processing to a given label - **goto**

(i) end the processing of commands - **end**

The **Decisions Commands** are selected from the **Create Rule** menu that is displayed when clicking in a cell in the **Type** column of the **Decisions Template** panel.

The **Create Rule** menu is

![Create Rule Menu]

fixed width and xfall
fixed width and slope
fixed width, up to a tin
go to an offset from a string
test depth below a tin
test if a batter cuts a tin
batter to a tin
create a label
goto a label
undo links
stop processing decisions, and continue with the cut/fill tables
add comment line
create a region row
terminate the decisions

For a description of each command, see

- **Fixed xfall**  [21.8.2 Template Decisions - Fixed Xfall]
- **Fixed slope**  [21.8.3 Template Decisions - Fixed Slope]
- **Tin width**  [21.8.4 Template Decisions - Tin Width]
- **String offset**  [21.8.5 Template Decisions - String Offset]
- **Tin decision**  [21.8.6 Template Decisions - Tin Decision]
- **Batter decision**  [21.8.7 Template Decisions - Batter Decision]
- **Batter**  [21.8.8 Template Decisions - Batter]
- **Label**  [21.8.9 Template Decisions - Label]
- **Goto**  [21.8.10 Template Decisions - Goto]
- **Undo links**  [21.8.11 Template Decisions - Undo]
Continue cut fill  21.8.12 Template Decisions - Continue Cut Fill
Comment  21.8.13 Template Decisions - Comment
Region  21.8.14 Template Decisions - Region
End  21.8.15 Template Decisions - End

For examples of a using decisions, go to the section 21.8.17 Decisions Examples.

Please continue to the next section 21.8.2 Template Decisions - Fixed Xfall.
21.8.2 Template Decisions - Fixed Xfall

Selecting Fixed xfall brings up the Fixed Xfall panel which is used to constructed the command for a fixed link with the possibility of using cross fall (xfall). The fixed link is defined by specifying values for two of the three fields width, height and x-fall.

Note - if defining a slope rather than a xfall is required, use Fixed Slope (see 21.8.3 Template Decisions - Fixed Slope).

The format of the Fixed Xfall command in the panel is

```
Fixed Xfall Width value Height value XFall value Name text Colour colour // comment
```

where only two of the three commands Width, Height and Xfall are used.

The format of the command typed into the template file is

```
Fixed_Xfall width_value height_value xfall_value name colour // comment
```

where one of width_value, height_value or xfall_value is the key word unknown.

The panel brought up when Fixed xfall is selected from the Create Rule menu is:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
</tbody>
</table>
the width for the link.

**Height**  
the height for the link.

**Xfall %**  
the x-fall, in percent cross-fall, of the link. Positive is up and negative down.

**Name**  
the name to be used for the created point and string.

**Colour**  
the colour to be used for the created string

cyan  
available colours

**Comment, Active, OK and Apply**  
For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.3 Template Decisions - Fixed Slope or return to 21.8 Full Definition of Template Decisions.
21.8.3 Template Decisions - Fixed Slope

Selecting Fixed slope brings up the Fixed Slope panel which is used to constructed a fixed link. The fixed link is defined by specifying values for two of the three fields width, height and slope.

Note - if defining a cross fall (xfall) rather than a slope is required, use Fixed Xfall (see 21.8.2 Template Decisions - Fixed Xfall).

The format of the Fixed Slope command in the panel is

\[ \text{Fixed Slope Width value Height value Slope value Name text Colour colour // comment} \]

where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

\[ \text{Fixed_Slope width_value height_value slope_value name colour // comment} \]

where one of width_value, height_value or slope_value is the key word unknown.

The panel brought up when Fixed slope is selected from the Create Rule menu is:

![Fixed Slope Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>input</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

the width for the link.
Height

input

the height for the link.

Slope 1v in

input

the slope, in 1v in, of the link. Positive is up and negative down.

Name

input

the name to be used for the created point and string.

Colour

input cyan available colours

the colour to be used for the created string

Comment, Active, OK and Apply

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.4 Template Decisions - Tin Width or return to 21.8 Full Definition of Template Decisions.
21.8.4 Template Decisions - Tin Width

Selecting Tin width brings up the Tin Width panel which is used to construct a link which has a *given width* and stops at the depth *strip* below the tin. Control then passes to the next line of the table.

*strip* can be positive (end point is below the tin) or negative (end point is above the tin).

The format of the Tin Width command in the panel is

```
Tin Width tin_name Strip value Width value Name text Colour colour // comment
```

The format of the command typed into the template file is

```
Tin_Width tin_name strip_value width_value name colour // comment
```

The panel brought up when Tin width is selected from the Create Rule menu is:

![Tin Width Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>input</td>
<td></td>
<td>available tins</td>
</tr>
<tr>
<td>Strip</td>
<td>input</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
distance below the tin to stop at (strip depth). **strip** can be positive (point is below the tin) or negative (point is above the tin).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Width</strong></td>
<td>input width of the link</td>
<td>1</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>input the name to be used for the created point and string.</td>
<td></td>
</tr>
<tr>
<td><strong>Colour</strong></td>
<td>input cyan available colours</td>
<td>cyan</td>
</tr>
</tbody>
</table>

**Comment, Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.5 Template Decisions - String Offset or return to 21.8 Full Definition of Template Decisions.
21.8.5 Template Decisions - String Offset

Selecting String offset brings up the String Offset panel which is used to construct a link which goes to a given offset from string and stops at the depth strip below the string. Control then passes to the next line of the table.

offset and strip can be positive or negative.

The format of the command typed into the template file is

```
String_Offset string_name strip_value offset_value name text Colour colour // comment
```

The panel brought up when String offset is selected from the Create Rule menu is:

![String Offset Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>string to go to</td>
<td>string select</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Strip</td>
<td>input</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
distance below the string to stop at.

**Offset**

offset from the string to stop at.

---

**Name**

the name to be used for the created point and string.

---

**Colour**

the colour to be used for the created string

---

**Comment, Active, OK and Apply**

For information on these panel fields, see [21.8.16 Common Fields in Template Decisions Panels](#).

Continue to the next section [21.8.6 Template Decisions - Tin Decision](#) or return to [21.8 Full Definition of Template Decisions](#).
21.8.6 Template Decisions - Tin Decision

Selecting Tin decision brings up the Tin Decision panel which tests to see if the depth from the end of the previous link, offset by the amount given in the offset field, is between the two values given in the minimum depth and maximum depth fields. If the depth is between the values, then control is transferred to the line with the label given by the goto field. Otherwise, control passes to the next line of the table.

offset, minimum and maximum depth can be positive or negative.

The format of the Tin Decision command in the panel is

**Tin Decision** tin_name Offset value Min value Max value Goto label // comment

The format of the command typed into the template file is

**Tin_Decision** tin_name offset_value min_value max_value goto_label // comment

The panel brought up when Tin decision is selected from the Create Rule menu is:

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td></td>
<td>available tins</td>
</tr>
<tr>
<td>Offset</td>
<td>input</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

The tin to calculate the depth to.

the depth is calculate at an offset distance of offset from the end of the previous link.
Minimum depth  input  0

if the depth is between the minimum and maximum depth, then control is passed to the line with the
label given in the goto field, otherwise control passes onto the next line of the table.

Maximum depth  input  1000

see previous field.

Goto  input

label to go to if the depth is between the minimum and maximum depths.

Comment, Active, OK and Apply

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.7 Template Decisions - Batter Decision or return to 21.8 Full
Definition of Template Decisions.
21.8.7 Template Decisions - Batter Decision

Selecting Batter decision brings up the Batter Decision panel which is used to test whether a given link comes within:

(a) a strip depth of a tin
(b) an offset distance from a tin.
(c) a strip depth of a tin calculated at a given offset from the link.

If the test is satisfied, then control is transferred via a goto, otherwise control continues onto the next line in the table.

The test link is defined by specifying values for two of the three fields width, height and slope.

Notes
1. no link is created, just the test is performed
2. cases (a) and (b) are just special cases of (c)
3. the batter decision is mainly used to test if a batter will stop without performing the batter.

---

**Case (a)**

The batter link ends if the tin is cut at the strip depth below the tin.

The goto is performed.

batter link defined by any two of width, height and slope and the test is meeting the tin at the strip depth.

---

**Case (b)**

The batter link ends if the tin is cut at the offset distance from the link.

The goto is performed.

batter link defined by any two of width, height and slope and the test is meeting the tin at the offset distance.
The batter link ends if the tin is cut at the strip depth calculated at the offset distance from the link.

The **goto** is performed.

The batter link does **not** cut at the strip depth below the tin, calculated at the offset distance from the link.

The **goto** is **not** performed and control goes to the next line.

The format of the Batter Decision command in the panel is

```
Batter Decision  tin_name  Strip  value  Offset  value  Width  value  Height  value  Slope  value  Goto  label  //  comment
```

where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

```
Batter_Decision  tin_name  strip_value  offset_value  width_value  height_value  slope_value  goto_label  //  comment
```

where one of `width_value`, `height_value` or `slope_value` is the key word `unknown`
The panel brought up when **Batter decision** is selected from the **Create Rule** menu is:

![Batter Decision Panel]

The fields and buttons used in this panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Default</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tin</td>
<td>tin box</td>
<td>default tins available tins</td>
<td></td>
</tr>
<tr>

<td>input</td>
<td>the slope, in 1v in, of the link. Positive is up and negative down.</td>
<td></td>
</tr>
<tr>
<td>Goto</td>
<td>input</td>
<td>label to goto if the test link comes within the strip depth of the tin at the given offset distance.</td>
<td></td>
</tr>
</tbody>
</table>

**Comment, Active, OK and Apply**

For information on these panel fields, see [21.8.16 Common Fields in Template Decisions Panels](#).

Continue to the next section [21.8.8 Template Decisions - Batter](#) or return to [21.8 Full Definition of Template Decisions](#).
21.8.8 Template Decisions - Batter

Selecting Batter brings up the Batter panel which is used to construct a link which stops if it comes within:

(a) a strip depth of a tin
(b) an offset distance from a tin.
(c) a strip depth of a tin calculated at a given offset from the link.

If the link does stop, control is transferred via a goto, otherwise control continues onto the next line in the table.

The batter link is defined by specifying values for two of the three fields width, height and slope.

Notes
1. cases (a) and (b) are just special cases of (c)
2. strip and offset can be used to stop the link to allow for a fixed structure (such as a drain) to be inserted so that it ends up on the tin.

---

**Case (a)**

The batter link ends if the tin is cut at the strip depth below the tin.

A point is created at the cut point with name and colour given in the batter command.

The goto is performed.

batter link defined by any two of width, height and slope and stops if it meets the tin at the strip depth.

---

**Case (b)**

The batter link ends if the tin is cut at the offset distance from the tin.

A point is created at the cut point with name and colour given in the batter command.

The goto is performed.

batter link defined by any two of width, height and slope and stops if it meets the tin at the offset distance.
The batter link ends if the tin is cut at the **strip** depth calculated at the **offset** distance from the link.

A point is created at the cut point with **name** and **colour** given in the batter command.

The **goto** is performed.

---

The batter link does **not** cut at the strip depth below the tin, calculated at the offset distance from the link.

A point is created at the end of the batter link with **name** and **colour** given in the batter command.

The **goto** is **not** performed and control goes to the next line.

---

The format of the Batter command in the panel is

```
Batter tin_name Strip value Width value Height value Slope value Name text
   Colour colour Goto label // comment
```

where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

```
Batter tin_name strip_value width_value height_value slope_value
   name colour goto_label // comment
```

where one of width_value, height_value or slope_value is the key word **unknown**
The panel brought up when Batter is selected from the Create Rule menu is:

![Batter Panel]

The fields and buttons used in this panel have the following functions.

21.9 Placing Parts for Super Alignments

Placing a super alignment consists of:

(a) defining the horizontal geometry which ultimately consisting of lines, arcs, transitions and tapers
(b) defining the vertical geometry which ultimately consisting of lines, parabolas and arcs.

A simple way to create horizontal and vertical geometry for the super alignment is by using horizontal intersection points (HIPs) with arcs and transitions (eg spirals), and vertical intersection points (VIPs) with parabolas or arcs for placing the vertical geometry.

However the super alignment also allows for more complex construction methods to define the lines, arcs and transitions (the horizontal elements) that within 12d Model are be grouped together to make up the Parts of the horizontal geometry.

For example, a horizontal line can be defined to be a given parallel offset of a selected line segment from another string. Or an arc of a known radius going through a point of another string and having a a leading and a trailing transition.

Similarly complex construction methods are available to define the lines, parabolas and arcs (the vertical elements) that are grouped together within 12d Model to make up the vertical geometry.

So for a super alignment, the Horizontal Geometry is made up of horizontal parts, which may be as simple as a straight line between two points or an arc with a given centre and radius, or a horizontal intersection point with given leading and trailing transitions, or the horizontal parts can be very complicated where for example the points of a line are defined by the offset intersection of the two arcs from other strings.

Similarly for a super alignment, the Vertical Geometry is made up of vertical parts.

The definition of parts that are not fully defined are classified as being

(a) fixed if the part is fully defined
(b) floating if the part has one degree of freedom. That is, one unknown is still to be determined.
(c) free if the part has two degrees of freedom. That is, two unknowns are still to be determined.

When the parts definitions have some degree of freedom, the extra restriction that the horizontal parts must be linked tangentially is imposed to try and fully defined the horizontal geometry.

If, with tangentiality, 12d Model can fully determine the horizontal geometry then the horizontal geometry is said to solve. For more information, see 21.9.1 Fixed, Floating and Free, and Solving.

Once it solves, the horizontal geometry consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called parts, and if the horizontal geometry solves, it also contains the resultant horizontal segments.

For example, if a Free Arc with Known Radius (an arc with known radius and leading and trailing transitions of known lengths) is placed between two known lines then the tangentiality condition means that the position of the Free Arc with Known Radius (arc and two transitions) is uniquely defined as a arc and leading and trailing transitions on the intersection point of the two lines. Or just a fillet between the two lines if the two transitions have zero length.

Similarly the Vertical Geometry is made up of parts, which are made up of simple or complicated combinations of straight lines, arcs or a parabolas. Again the extra restriction that the vertical parts must be linked tangentially is often necessary to fully defined the vertical geometry. The vertical geometry is then said to be solved and the solved vertical geometry simply consists of
linked known segments of types lines, arcs and parabolas, and so can be drawn in a section view.
So the vertical geometry is made up of the constructive definitions called parts, and if the vertical geometry solves, it also contains the resultant vertical segments.

Important Note
The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the segments of the solved parts are displayed and any unsolved parts are displayed as red crosses.

See 21.9.1 Fixed, Floating and Free, and Solving
See 21.9.2 Types of Horizontal Parts
See 21.9.3 Types of Vertical Parts
See 21.9.4 Definitions of Super Alignment Horizontal Parts
See 21.9.5 Definitions of Super Alignment Vertical Parts
For the documentation of the options on the Edit SA toolbar, see 14.4.11 Edit Super Alignment.
21.9.1 Fixed, Floating and Free, and Solving

The definition of fixed and floating part has to do with how many unknowns, or degrees of freedom, exist for a part.

**Fixed parts**, as the names suggests, are totally fixed in position, radius etc.

**Floating parts** have one unknown, or one degree of freedom. Solving for that one unknown will then totally determine the part.

**Free parts** have two unknowns, or two degree of freedom. Solving for both unknowns then totally determines the part.

The most common examples for the major parts used in the horizontal and vertical geometry are:

### Horizontal Geometry

**Fixed line** - its position in space is totally defined

(a) line given by two points on the line

(b) line given by one point on the line and a bearing

**Floating lines - one unknown**

(a) line going through one known point. The bearing of the line is unknown

(b) line of a given bearing. A point that the line goes through is needed to fix it.

This unknown as the names suggests, are totally fixed in position, radius etc.

**Free lines - a totally unconstrained line**

**Fixed arc** - the arcs position in space and radius is totally defined

(a) arc given by centre and radius

(b) arc defined by three points on the arc

(c) arc defined by centre and two points on the arc

**Floating arc - one unknown**

(a) arc partially defined by one point on the arc and a radius.

(b) two points on an arc.

This unknown as the names suggests, are totally fixed in position, radius etc.

**Free arc - two unknowns**

(a) only the radius of the arc is known

(b) only one point on the arc is known

(c) only the arc length is known

### Vertical Geometry

**Fixed line** - its position and shape in (chainage, height) is totally defined

(a) line given by two points on the line

(b) line given by one point on the line and a grade

**Floating lines - one unknown**

(a) line going through one known point. The grade of the line is unknown

(b) line of a given grade. A point that the line goes through is needed to fix it.

**Free lines - a totally unconstrained line**
Fixed parabola - the parabolas position in (chainage, height) space is totally defined
(a) parabola given by three points on the parabola
(b) parabola defined by its apex and effective signed radius

Floating parabola - one unknown
(a) one point on the parabola and K value are known
(b) two points on an parabola are known.

Free parabola - two unknowns
(a) only the K value of the arc is known
(b) only one point on the parabola is known
(c) only the length of the parabola is known

Fixed arc - the arcs position in (chainage, height) and radius is totally defined
(a) arc given by centre and radius
(b) arc defined by three points on the arc
(c) arc defined by centre and two points on the arc

Floating arc - one unknown
(a) arc partially defined by one point on the arc and a radius.
(b) two points on an arc.

This unknown as the names suggests, are totally fixed in position, radius etc.

Free arc - two unknowns
(a) only the radius of the arc is known
(b) only one point on the arc is known
(c) only the arc length is known

Solving
The horizontal and vertical geometry of a super alignment is made up of a series of Horizontal and Vertical Parts where the sequencing and types of the Parts, plus the condition that, if possible, each Part is tangential to the adjacent elements, allows 12d Model to calculate and solve for all the unknowns in the Part definitions and totally define the super alignment.

The order and the whether adjacent parts are Fixed, Floating or Free is very important as only certain combinations will satisfy the tangentiality conditions and hence solve to give a super alignment.

If, with tangentiality, 12d Model can fully determine the horizontal or vertical geometry then the horizontal or vertical geometry is said to solve.

Once it solves, the horizontal geometry consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called parts, and if the horizontal geometry solves, it also contains the resultant horizontal segments.

Similarly the vertical geometry is made up of the constructive definitions called parts, and if the vertical geometry solves, it also contains the resultant vertical segments.

The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the solved segments are displayed and any unsolved parts are displayed as red crosses.

See 21.9.4.4 Horizontal Transitions
See 21.9.4.5 Horizontal Computators

21.9.4.1 Horizontal IPs

See HIP: Speed
See HIP: Radius
See HIP: Arc Length

21.9.4.1.1 HIP: Speed

A horizontal intersection point (HIP) is created and the sizes of the arc and transition curves for the HIP come from the Design Template of the super alignment.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use</td>
<td>if ticked, then the Part is used in the horizontal geometry. If not ticked, the Part is not used in the horizontal geometry.</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
<tr>
<td>Visible</td>
<td>if ticked, then the Part is drawn in the horizontal geometry. If not ticked, the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>if not blank, then the Part is given this name. If blank then the Part has no name.</td>
<td>text box</td>
<td>blank</td>
<td></td>
</tr>
</tbody>
</table>

Note: If the part has a name, then a ! is placed after the type of the part in the Horizontal Parts list.
Type choice box types of horizontal parts
the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab
the geometrical information defining the Part

X coordinate, Y coordinate
the (x,y) coordinates for the HIP can be typed in, or selected using the X, Y or XY icons.

Speed
If Speed is not bank, then that is the speed used when looking up the Design Template for the HIP
If Speed is left bank, then the Design Speed for the super alignment in used when looking up the Design Template.

Comment tab
the text type into the text box is stored as a comment for the Part.

Note: If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.

Set button
the Set button must be clicked for the information for this Part to be used.

Same As button
after clicking the Same As button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.
**HIP: Radius:**
A horizontal intersection point (HIP) is created and the sizes of the arc and transition curves for the HIP are given.

**Same As Button**
Use the **Same As** button to select an existing HIP from the screen.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

**Geometry tab**

the geometrical information defining the Part

**X coordinate, Y coordinate**

the (x, y) coordinates for the HIP can be typed in, or selected using the X, Y or XY icons.

**Curve radius**

if not blank, the radius used for the arc on the HIP.

*If blank then no arc is used on the HIP.*
**Note:** if the **Curve radius** is blank then the **Leading transition** and **Trailing transition** must also be blank. That is, there is **no arc or transitions** on the HIP.

**Leading transition**
- If not blank, then it is the length of the leading transition on the HIP. This can only be non zero if the **Curve radius** is also non zero.
- If blank then there is no leading transition on the HIP.

**Leading transition**
- If not blank, then it is the length of the trailing transition on the HIP. This can only be non zero if the **Curve radius** is also non zero.
- If blank then no trailing transition on the HIP.

**Comment tab**
- The text typed into the text box is stored as a comment for the Part.

**Note:** If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.

**Set** button
- The **Set** button must be clicked for the information for this Part to be used.

**Same As** button
- After clicking the **Same As** button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.
**HIP: Arc Length**
A horizontal intersection point (HIP) is created with an arc of a given arc length.

![Horizontal panel](image)

**Same As Button**
Use the Same As button to select an existing HIP from the screen.

  *the (x,y) coordinates for the HIP can be typed in, or selected using the X, Y or XY icons.*

- **Curve length**
  *the length used for the arc on the HIP. This field can not be left blank.*
  *If zero then no arc is used on the HIP.*

**Comment tab**
the text typed into the text box is stored as a comment for the Part.

*Note: If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.*

**Set button**
the Set button must be clicked for the information for this Part to be used.
Same As button

After clicking the **Same As** button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.
21.9.4.2 Horizontal Lines

See Fixed Line: Two Points
See Fixed Line: Point & Direction
See Floating Line: Through a Point:
See Floating Line: Known Direction
See Floating Line: Known End and Nominal Length
See Free Line: No Constraints

Fixed Line: Two Points
The Fixed Line is a given offset from a line that passes through two known points.

Offset:
-ve to the left of the line from start to end points
+ve to the right

Same As Button:
Use the Same As button to select an existing line segment from the screen

The fields and buttons used in the panel have the following functions.

</tr>
</tbody>
</table>
Attach to choice box previous part, next part

the Part that the Floating Line is made tangential to. If there is a transition, it is at this end of the Floating line.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.

Set button

the Set button must be clicked for the information for this Part to be used.

Same As button

after clicking the Same As button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.
Floating line: Known End and Nominal Length

The Floating Line has a known nominal length and is attached tangentially to the end of previous part or the beginning of the next part.

Example:
Extends from the end of a previous fixed arc for a given length

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use</td>
<td>tick box if ticked, then the Part is used in the horizontal geometry. If not ticked, the Part is not used in the horizontal geometry.</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
<tr>
<td>Visible</td>
<td>tick box if ticked, then the Part is drawn in the horizontal geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</td>
<td>tick box</td>
<td>ticked</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>text box if not blank, then the Part is given this name. If blank then the Part has no name.</td>
<td>text box</td>
<td>blank</td>
<td></td>
</tr>
</tbody>
</table>

Note: If the part has a name, then a ! is placed after the type of the part in the Horizontal Parts list.

Type choice box types of horizontal parts
the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab
the geometrical information defining the Part

Length measure box available measures
the nominal length of the Floating Line

Rotation (cw) measure box available measures
if non zero then the bearing of the line is decreased by Rotation degrees (and is no longer tangential). The transition, if it exists, is still tangential to the Attach to part. See diagram at the end of this panel description.

Transition length measure box available measures
if non zero, a transition curve of this length is at the end of the Part that Attach to specifies. So if the Floating Line is Attach to the Previous Part, then the Previous Part comes first, then the transition and then the line. If the Floating Line is Attach to the Next Part, then the line comes first and then the transition, and the Next Part.
If blank, no transition curve is used

Attach to choice box previous part, next part

the Part that the Floating Line is attached to, and made tangential to. If there is a transition, it is at this end of the Floating line.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.

Set button

the Set button must be clicked for the information for this Part to be used.

Same As button

not used for this Part

Two Examples of Floating Lines with Rotation = 0
Two Examples of Floating Lines with Rotation = 45 degrees
**Free Line: No Constraints**

The **Free Line** is not constrained. It is determined by having to be tangential to the Parts at either end of the Line.

**Example:**
Free line is a tangent from a previous fixed arc to the following fixed arc.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>

Placing Parts for Super Alignments

Radius

measure box

the radius of the arc. This can be typed in or selected using the Measure Radius pop-up.

Direction

measure box

the direction of the tangent of the point on the arc as a bearing can be typed in using Notation (dd.mmssss) or selected using the measure box.

Offset

measure box

offset of the Fixed Arc from the arc defined above by Point, Radius, and Direction (bearing) at Point. Positive offset is to the right of the arc going in the direction of the arc. Negative offset is to the left of the arc going in the direction of the arc.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.

Set button

the Set button must be clicked for the information for this Part to be used.

Same As button

after clicking the Same As button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.

Known Point

Bearing of tangent at Point of 60 degrees
Floating Arc: Known Radius and Passes through a Known Point

The Floating Arc passes through a known point and has a known radius. It may not always be possible for the Floating Arc to actually solve.

For example in the case where it follows a fixed line, if the perpendicular distance between the known point and the line is greater than the given radius, then there is no solution.

**Example:**
The Floating Arc may become fully defined when it is attached to a previous fixed line

**Radius:**
- ve to the left of the direction
+ ve to the right of the direction

**Same As Button:**
Use the Same As button to select an existing arc from the screen

button
the Set button must be clicked for the information for this Part to be used.

Same As
button
after clicking the Same As button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.
Floating Arc: Known Point and Tangent Direction at the Point

The Floating Arc passes through a known point and has a known direction for the tangent to the arc at the known point.

It may not always be possible for the Floating Arc to actually solve.

For example in the case where it follows a fixed line, if the perpendicular distance between the known point and the line is greater than the given radius, then there is no solution.

**Example:**
The Floating Arc may become fully defined when it is attached to a previous fixed line

**Radius:**
-ve to the left of direction  
+ve to the right of the direction

**Same As Button:**
Use the Same As button to select an existing arc from the screen

The fields and buttons used in the panel have the following functions.

<table>

Apex Chainage, Height
the (chainage,height) coordinates for the apex of the parabola can be typed in, or selected using the C, Z or CZ icons.

Radius
available measures
the effective radius of the parabola (this is 100 times the K value). Positive radius for a sag point (minimum) and a Negative radius for a crest point (maximum).
Relative start measure box available measures
the chainage distance, relative to the given apex, to start the parabola at. A negative value is to the left of the apex, and a positive value is to the right of the apex.

Relative end measure box available measures	he chainage distance, relative to the given apex, to end the parabola at. A negative value is to the left of the apex, and a positive value is to the right of the apex.

Comment tab
the text typed into the text box is stored as a comment for the Part.

Note: If a comment exists, a # is placed after the type of the part in the Vertical Parts list.

---

Floating Asymmetric Parabola with Leading Length = 100 and Trailing Length = 50
Free Compound Parabola: Two Parabolas with Optional Total Parabolic Length
This Free Parabola has two parabolas with a given total length and a ratio of the division between the two parabolas. There is an option total length of the two parabolas.

With a given Total Length, a straight between the two parabolas may need to be automatically inserted to get a solution.

Being tangential to the parts on either side fully determines the two parabolas and any necessary straight. The grades on the previous and next parts also determine if the parabolas are crest or sag parabolas.

It is not always possible for the Free Parabola to solve.

The fields and buttons used in the panel have the following functions.

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Type</th>
<th>Defaults</th>
<th>Pop-Up</th>
</tr>
</thead>

Floating Arc: Known Point and Radius
The Floating Arc passes through a known point and has a known radius. Being tangential to a previous or next part is needed to fully determine the Floating Arc.

It is not always be possible for the Floating Arc to solve.

For example in the case where it follows a fixed line, if the perpendicular distance between the known point and the line is greater than the given radius, then there is no solution.

Example
Floating Arc going through a known point and with radius of 100.
