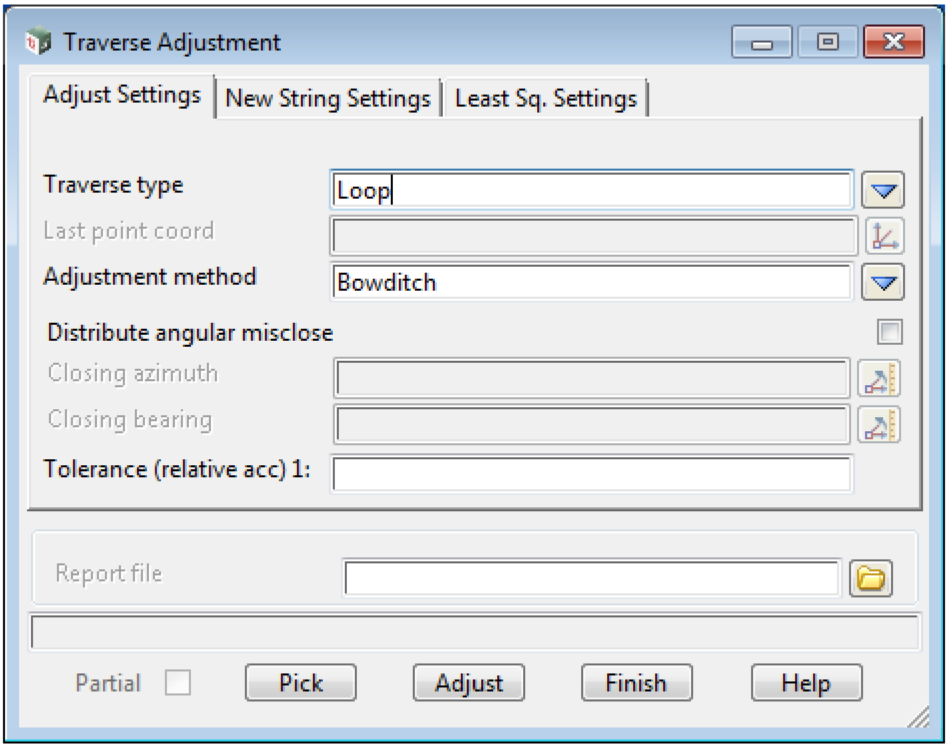
Help



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Adjust Settings tab

Traverse type	choice box	loop	loop, non-loop

the traverse can be a closed loop or a non loop.

Last point coord	xyz		

co-ordinates of the last point of the traverse. Only applicable for a non-loop traverse.

Adjustment method	choice box	transit	Transit, Bowditch, Compass, Least Square

method of adjustment.

Distribute angular misclose	tick box	unticked	

if ticked, the closing azimuth and bearing fields are enabled, allowing the entry of the values so that a calculation of an angular misclose can be made. i.e. angular misclose = closing azimuth - closing bearing.

This requires a closing observation to be recorded separately to the adjustment string chosen.

This angular misclose can be distributed around the traverse before adjustment. The distribution follows standard survey practice, calculating a misclose value per setup station and then adding this constant to every traverse leg in a accumulative manner.

*i.e. The 1st leg angle adjusted bearing = orig bearing 1st leg + 1*misclose/setup stn.*

*The 2nd leg angle adjusted bearing = orig bearing 1st leg + 2*misclose/setup stn. and so forth.*

The closing observation is not taken from the traverse string to be adjusted, but by direct entry into the closing azimuth and bearing fields.

Closing azimuth	angle box		

The closing azimuth is the bearing as calculated from the last point (known coordinate; equal to the *start point if a loop traverse) to the closing station (known coordinate or bearing).*

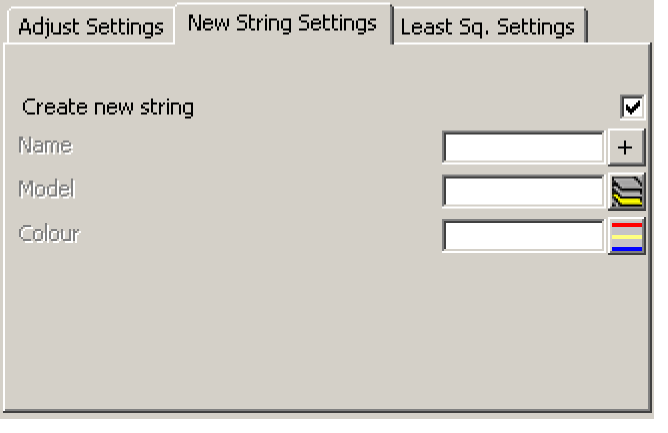
Closing bearing angle box

The closing bearing is the observation from the last traverse point to the closing station (known coordinate or bearing)

Tolerance (relative acc) 1:

The accuracy can be set which will be used to assess the misclose value before the adjustment is made. If the misclose is out of tolerance, a message box will appear notifying the user that the linear tolerance has not been met and prompting for further action. This may force the adjustment to continue or the exit of the process.

New String Settings tab



Create new string tick box tick

if ticked, a new adjusted string is created. If not tick, the selected string is adjusted.

Name name box

if non-blank, the name of the new string. If blank, the original string name is used.

Model model box available models

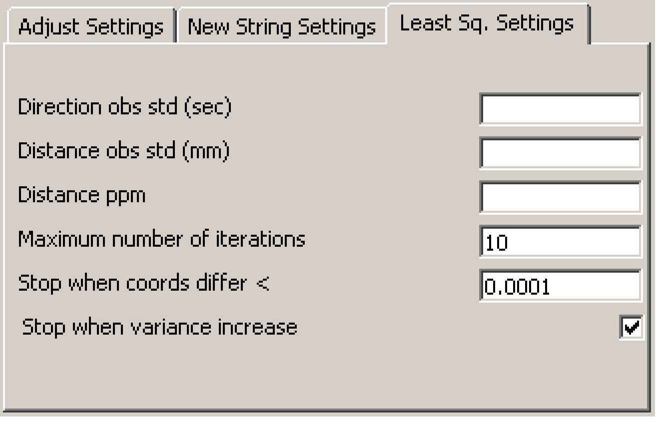
if non-blank, the model of the new string. If blank, the original string model is used.

Colour colour box available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

if the least square method is chosen the following parameters can be set in the **Least Sq. Settings** *tab. If a different method is chosen the least square parameters are shown* ***greyed out*** *indicating that they are not used in the adjustment.*

Least Sq. Settings tab



Direction obs std (sec)

standard deviation of a single angular measurement in seconds of arc.

Distance obs std (mm)

standard deviation of a single distance measurement.

Distance ppm

distance error in parts per million.

This value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations input box 10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ input box 0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

Variance increase tick box ticked

the calculation of the adjustment can stopped when the variance between successive calculations increases

The remaining values are as follows:

Report file *.rpt files

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

Partial tick box

if ticked, only part of the selected string is adjusted.

Pick button

select the string to adjust.

Adjust button

perform the adjustment.

17.9.7 Survey Adjustments Utilities

Position of option on menu: **Survey =>Adjustments =>Utilities**

The options on the **Survey Adjustment Utilities** menu are designed to get data from external sources into the Least Squares Network and Level Network formats, (.IN .LIN files respectively) for processing by 12d.

The data conversion is a multistep process as it is designed to bring in several different formats into the 12d .IN/.LIN formats.

.SOA files

The SOA files are an intermediate text file generated onboard a Leica 1200/Viva TPS/GPS instrument.

The format files to generate these files from a Leica DBX are shipped in the library directory.

- **ANG_Code_Office.FRT** is the format file used when the Station number is put in as a code
- **ANG_ID_Office.FRT** is the format file used when the Station number is put in as a Point ID

The use of format files is out of the scope of this manual and described in the Leica documentation.

The SOA file format is intermediary and not documented.

.ANG files

ANG files are a text file containing rounds of angles, they are generated by the **Leica DBX to ANG** panel or can be generated in TP-Setout or TP-Stakeout.

The format of an **.ANG** is such

```
<Backsight ID> <Backsight Height> <Station ID> <Station Height>
<Foresight ID> <Foresight Height> <Backsight bearing> <Backsight Ver-
tical angle> <Backsight slope distance> <Foresight bearing> <Fore-
sight Vertical angle> <Foresight slope distance>
```

Bearing and angles are in radians and station Ids must be quoted if they have spaces.

```
"34748A" 1.300 "34872A" 1.660 "34978B" 0.000 5.49580322 1.58360594
159.477 2.83371620 1.53209318 117.170
```

.LSF files

LSF files are a TP-Setout/ TP-Stakeout format for a least squares network adjustment.

The format consists of several sections, each section is terminated by an **END**.

The first a list of station coordinates and weighting definitions.

```
<Station name> <Easting> <Northing> <Weight> <Level> <Weight>
GB117 9808.1480 168635.6450 1000 4.0314 1000
```

A weight of 1000 means fixed, 1 completely free.

The second section is the horizontal observations.

```
<Backsight ID> <Station ID> <Foresight ID> <Backsight bearing> <Fore-
sight bearing>
KHABB KHP14 KHP13 0.0000 3.15157367
```

Bearing and angles are in radians and station Ids must be quoted if they have spaces.

The 3rd section is the horizontal distances.

```
<Station name> < Station name > < Horizontal distance>
KHABB GB117 68.909
```

The 4th section is the height difference information.

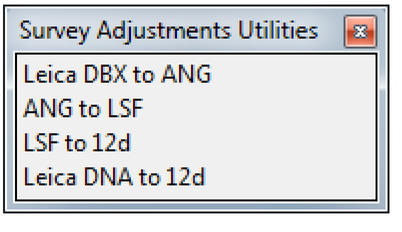
```
<Station name> < Station name > < Vertical distance>
KHABB GB117 -11.138
```

A complete sample:

```
GB117 9808.1480 168635.6450 1000 4.0314 1000
KHP17 9839.3686 168651.5200 1 18.2912 1000
KHABB 9813.0536 168704.3997 1 15.1675 1
END
GB117 KHABB KHP17 0.0000 5.74994583
KHABB KHP17 KHP16 0.0000 3.13833713
END
KHABB KHP17 59.053
KHABB GB117 68.909
KHP17 KHP16 71.045
END
KHABB KHP17 3.119
KHABB GB117 -11.138
KHP17 KHP16 3.757
END
```

The **Utilities** walk-right menu is

.

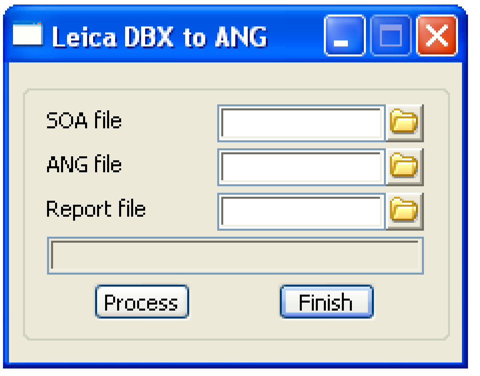


For the option Leica DBX to ANG go to 17.9.7.1 Leica DBX to ANG
ANG to LSF 17.9.7.2 ANG to LSF
LSF to 12d 17.9.7.3 LSF to 12d
Leica DNA to 12d 17.9.7.4 Leica DNA to 12d

17.9.7.1 Leica DBX to ANG

Position of option on menu: **Survey =>Adjustments =>Utilities => Leica DBX to ANG**
This option converts the **.SOA** file produced on the Leica instrument into a rounds of angles **.ANG** file.

Selecting **Leica DBX to ANG brings up the Leica DBX to ANG** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
SOA file	file box		

select the SOA file produced from a Leica DBX to process.

ANG file file box

enter the ANG to be created, if existing you will be warned it will be overwritten.

Report file file box

a report file is generated to allow scrutiny of the conversion process to detect gross errors.

if it looks as below containing details of each collated measurement, this report should be checked before further processing of the created ANG fie.

Report for conversion of "6404-CONTROL.SOA" to "QQ.ANG"

Overall stations 50
Overall measures 1816

17 meas's from SSM139008 to target PM42949
Hz: mean 49°54'55.7" std dev 0°00'03.0"
Va: mean 87°34'50.4" std dev 0°00'05.0"
Sd: mean 385.938 std dev 0.0003
TH: mean 1.784 std dev 0.0000

Process button

process the SOA file and produce the ANG file.

17.9.7.2 ANG to LSF

Position of option on menu: **Survey =>Adjustments =>Utilities => ANG to LSF**
The panel converts a round of angles **ANG file** into the **LSF** least squares network format.

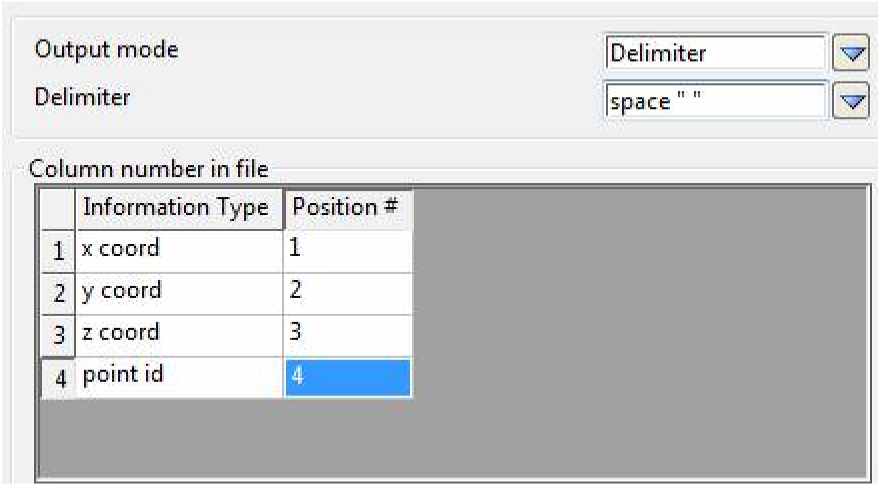
As a prerequisite to using this panel a **PTA file** of the fixed control points must be created.

The PTA format is a space delimited **<Easting> <Northing> <Level> <"ID">**

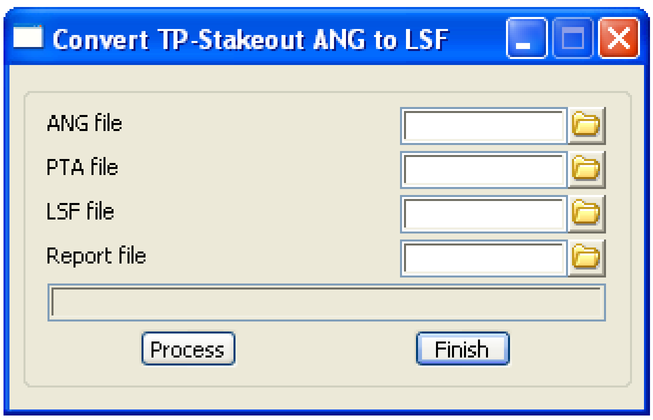
```
12343.345 234435.236 500.127 "STN1"
12654.877 234435.345 501.457 "STN2"
12456.345 234543.866 499.345 "STN3"
```

The **PTA file** can come in from **TP-Setout/TP-Stakeout** or it can be written out using the **File I/O =>Data output->x y z general** option. See 8.2.5.4 User X Y Z and Attributes Output .

Set the following fields in the xyz output for creating a **PTA** format file.



Selecting **ANG to LSF brings up the Convert TP- Stakeout ANG to LSF** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ANG file	file box		

the ANG file to be converted.

PTA file	file box		

the PTA file containing the fixed control points.

LSF file	file box		

the LSF file to be created.

Report file	file box		

a report file is generated to allow scrutiny of the conversion process to detect gross errors. It has simple statistics on the angle, distances and height differences.

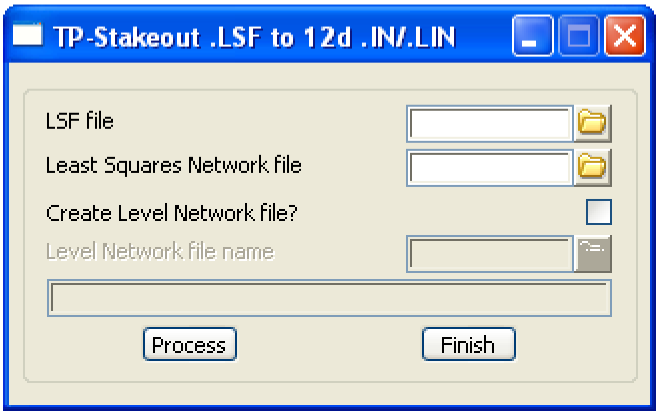
Process	button		

create a LSF file from the ANG file.

17.9.7.3 LSF to 12d

Position of option on menu: **Survey =>Adjustments =>Utilities => LSF to 12d**
This panel converts a **LSF** format file into the **12d** Least squares network and Level network file formats.

Selecting **LSF to 12d brings up the TP- Stakeout .LSF to 12d .IN/.LIN** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

LSF file file box

the LSF file to be processed.

12d Least squares network file file box

the 12d .IN file to be created.

Create Level Network file? tick box

if ticked enter the Level Network .LIN file will be created.

Level Network file name

the Level Network .LIN file to be created.

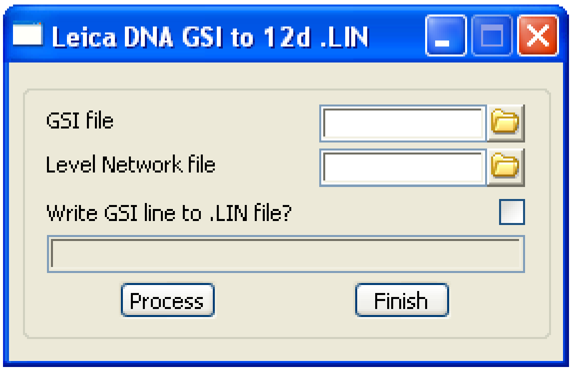
Process button

create the .IN and optional .LIN file form the LSF file.

17.9.7.4 Leica DNA to 12d

Position of option on menu: **Survey =>Adjustments =>Utilities => Leica DNA to 12d**
This panel converts a **GSI** format file from a Leica digital level into the 12d Level network file format.

Selecting **Leica DNA to 12d brings up the Leica DNA GSI to 12d .LIN** panel.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

GSI file file box

the GSI file to process

Level Network file file box

the .LIN file to create

Write GSI line to .LIN file? tick box

if ticked the raw data from the GSI file will be written as a comment line into the .LIN file.

Process button

create the level network LIN file.

17.10 Conversions

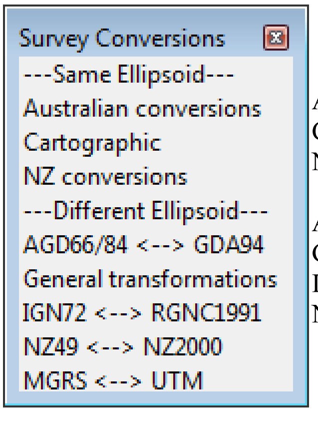
Position of menu: **Survey =>Conversions**

The **Conversions** walk-right menu contains survey transformations for converting between most projections (or longitude, latitude) including Transverse Mercator, UTM etc.conversion options.

Conversions can involve the same ellipsoid or different ellipsoid. When using different ellipsoids, either a 7-parameter transformation or NTVT2 grids can be used to convert between the ellipsoids.

The **Conversion** walk-right menu is

.



Australian conversions (eg zone to zone) fro the same datum
Cartographic conversion from one projection to another (same datum)
NZ conversions (eg circuit to circuit) for the same datum

AGD 66/84 <--> GDA94 conversions (AMG <-> MGA
General conversions with ellipsoid change
IGN72 <-->RGN1991 conversions
NZ49 <--> NZ2000 conversions

For converting between projections using the same ellipsoid:

For the option *Australian conversions*, go to 17.10.1 Australian Conversions .

Cartographic, 17.10.2 Cartographic

NZ conversions, 17.10.3 NZ Conversions

For converting between projections with different ellipsoids:

For the option *AGD66/84<-->GDA94*, go to 17.10.4 AGD66/84 <---> GDA94 .

General transformations 17.10.6 General Transformations

IGN72<->RGNC1991, 17.10.7 IGN72 <---> RGNC1991

NZ49<->NZ2000, 17.10.5 NZ49 <---> NZ2000

MGRS<->UTM, 17.10.8 MGRS <---> UTM

For more information about terminology used in these sections, see the Appendix 38 Geodetics Summary .

17.10.1 Australian Conversions

Position of option on menu: **Survey =>Conversions =>Australian conversions**

The **Australian conversions** option converts data from one form (AMG/MGA, Long Lat, Global XYZ) to another for the same common datum (AGD66/84 or GDA94). The option also allows for the conversion from one zone to another for a common datum. (e.g. from zone 54 to 55 in MGA).

For converting ISG co-ordinates in the same datum, use the option

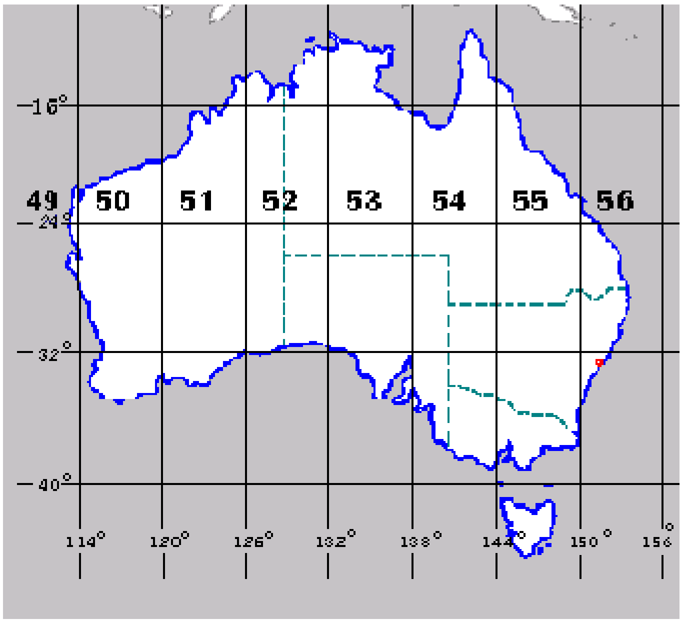
Survey =>Conversions =>Cartographic (see 17.10.2 Cartographic).

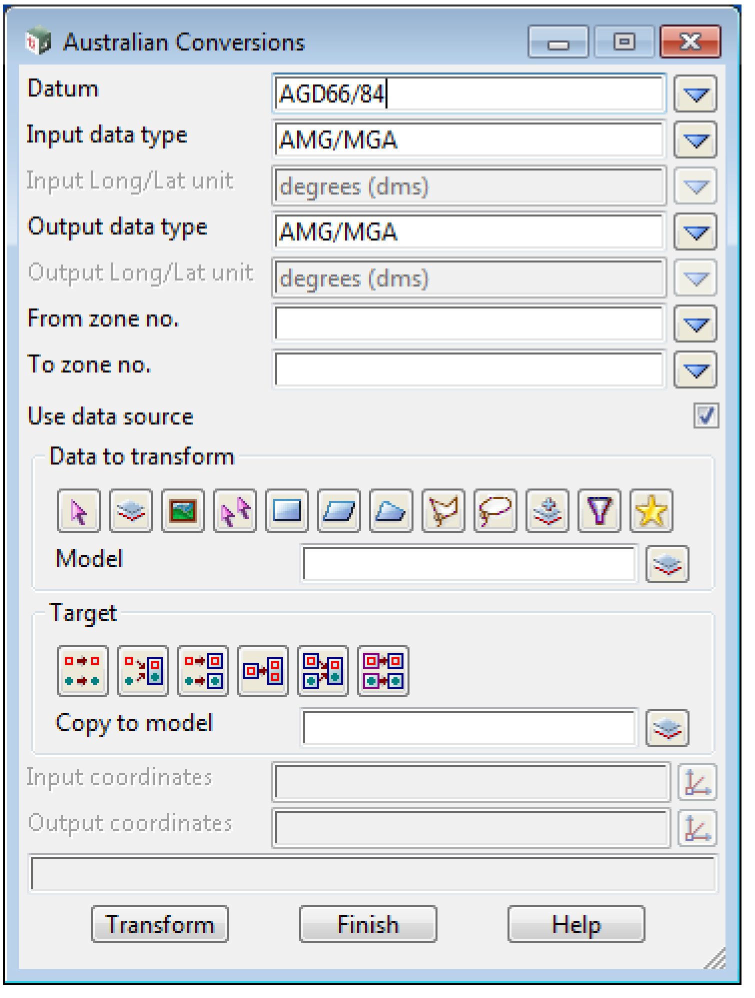
For converting between the ***different*** datums AGD66/84 and GDA94, use the option

Survey =>Conversions =>AGD66/84 <-> GDA94 (see 17.10.4 AGD66/84 <---> GDA94).

For more information, go to the section 38.5 Converting Between AMG, ISG and MGA in the Appendix 38 Geodetics Summary .

Selecting **Australian conversions** brings up the **Australian conversions** panel





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum	choice box	AGD66/84	AGD66/84, GDA94
either AGD66/84 or MGA94 is selected.			
Input data type	choice box	AMG/MGA	AMG/MGA, Long Lat Global XYZ
type of the input data type.			
Input Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees
if **Lat/Long** *was selected, the Lat-Long coords have the selected units.*			
Output data type	choice box	AMG/MGA	AMG/MGA, Long Lat Global XYZ
type of the input data type.			
Output Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees
if **Lat/Long** *was selected, the Lat-Long coords have the selected units.*			
From zone no.			49 -> 59
if **AMG/MGA** *was selected for the input data type, the AMG/MGA zone is given is this field.*			
To zone no.			49 -> 59

if **AMG/MGA** *was selected for the output data type, the AMG/MGA zone is given is this field.*

Use data source tick box tick

if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source input

if ***use data source*** *is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see* 4.19.3 Data Source

Target target

if ***use data source*** *in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see* 4.19.4 Data Target

Input coordinates XYZ box

if ***use data source*** *is not ticked, the co-ordinates in this field is transformed.*

Output coordinates XYZ box

if ***use data source*** *is not ticked, the transformed co-ordinates are displayed in this field.*

Transform button

perform the transformation.

17.10.2 Cartographic

Position of option on menu: **Survey =>Conversions =>Cartographic**

Position of option on menu: **Utilities =>A-G =>Cartographic**

The **Cartographic** option is used to transform data based on the same datum between

(a) two different cartographic projections (based on the same datum)

(b) longitude and latitude and a cartographic projection (based on the same datum)

(c) a cartographic projection and longitude and latitude (based on the same datum).

The datum, relates to the ellipsoid model used. This should be the same for both the to and from fields. i.e. a transform between data based on the ANS ellipsoid, to data based on the WGS84 ellipsoid would be incorrect.

(a) Transforming Between Two Cartographic Projections

For the first case, the data starts in one cartographic projection and is to be transformed into another cartographic projection.

This is achieved by converting the data in (x,y) co-ordinates in the original projection, to (longitude, latitude) and then converting from (longitude, latitude) to (x,y) in the new projection.

original projection → (longitude, latitude) → new projection

For example, to transform from MGA zone 50 to MGA zone 51, the original data starts in MGA zone 50, is transformed to (longitude, latitude) and then transformed from (longitude, latitude) to MGA zone 51.

Note that to make the transformation, the two cartographic projection must already be defined. That is in the example above, the two projections MGA zone 50 and MGA zone 51 must already be defined.

In 12d Model, a *Cartographic projection* is defined by the option

Project => Projections =>Create/edit

and is documented in the section 7.6.6.2 Create/Edit Projection .

The two cartographic projection definitions for the conversion are given in the **Cartographic** panel.

(b) Transform Between Longitude-Latitude and a Cartographic Projection

For the second case, the data starts in (longitude, latitude) is to be transformed into (x,y) co-ordinates in a cartographic projection.

(longitude, latitude) $\longrightarrow$ cartographic projection

For example, to transform (longitude, latitude) to MGA zone 51.

To make the transformation, the required cartographic projection must already be defined by the option

Project => Projections =>Create/edit

which is documented in the section 7.6.6.2 Create/Edit Projection .

Notes

1. In the southern hemisphere, the latitude values are **negative**. If the latitude is given as positive rather than negative, then the option **Factor** can be used to multiply the latitude by -1.
2. If the information is given in (latitude, longitude) rather than the required (longitude, latitude), then the option **Swap XY** can be used to swap the order of the co-ordinates.

(c) Transform Between a Cartographic Projection and Longitude-Latitude

For the third case, the data starts in (x,y) co-ordinates in a cartographic projection and need to be transformed to (longitude, latitude).

cartographic projection $\longrightarrow$ (longitude, latitude)

For example, to transform from MGA zone 51 to (longitude, latitude).

To make the transformation, the required cartographic projection must already be defined by the option

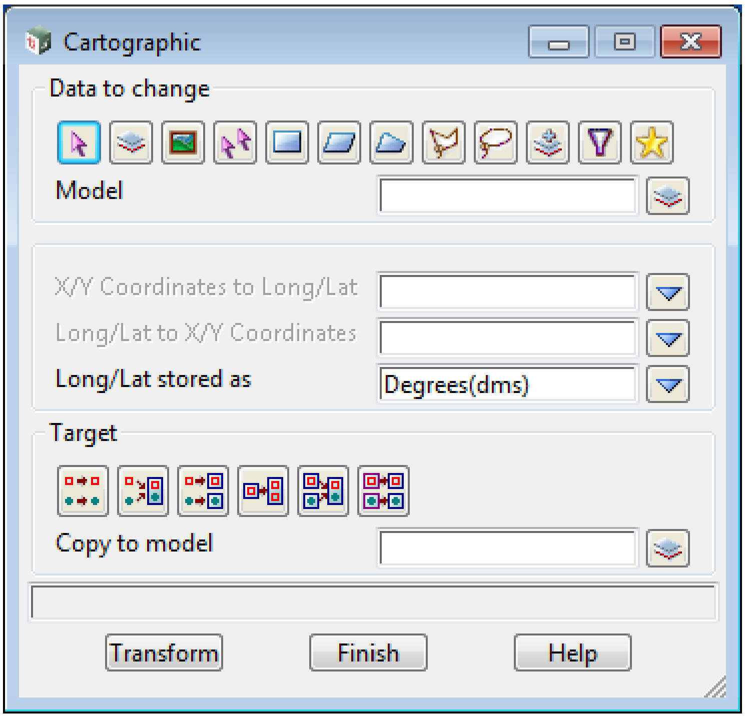
Project => Projections =>Create/edit

which is documented in the section 7.6.6.2 Create/Edit Projection .

Notes

1. In the southern hemisphere, the latitude values are **negative**. If a positive value for latitude is required, then the option **Factor** can be used to multiply the latitude by -1.
2. If the information is required to be given in (latitude, longitude) rather than the (longitude, latitude) produced by the transformation, then the option **Swap XY** can be used to swap the order of the co-ordinates.

On selecting the **Cartographic** option, the **Cartographic** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type			

data selection type - for a full description go to 4.19.3 Data Source .

Data source	input		

source of data to be processed.

X/Y Coordinates to Long/Lat		choice box	available projections

if ***non-blank****, the name of the cartographic projection to map the selected string co-ordinates into longitude-latitude values.*
If ***blank****, the initial co-ordinates are not transformed from (x,y) to (longitude, latitude). Hence the initial co-ordinates are then assumed to be in (longitude, latitude) form ready to be transformed to (x,y) by the transformation given in the* **Long/Lat to x/y coordinates** *field. Note that in the southern hemisphere, the latitude values must be given as* ***negative****.*

Long/Lat to X/Y Coordinates		choice box	available projections

if ***non-blank****, the cartographic projection to apply to the longitude-latitude values.*
If ***blank****, the co-ordinates are not transformed from (longitude, latitude) to (x,y). Hence the initial (x,y) co-ordinates are transformed to (longitude, latitude) by the transformation given in the* **x/y co-ordinates to Long/Lat** *field and then left in (longitude, latitude). Note that in the southern hemisphere, the latitude values are* ***negative****.*

Long/Lat stored as	input	degrees	radians degrees decimal degrees

format for the longitude and latitudes - either radians, degrees (in 4.17.1 HP Notation *for degrees, minutes and seconds) or decimal degrees.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target

Target info	input		

extra information required for the target.

Transform button

transform the selected strings to longitude-latitude co-ordinates using the **x/y coordinates to long/ lat (radians)** *transformation, and then project those longitude-latitude co-ordinates into the new co-ordinate system using the* **long/lat (radians) to x/y coordinates** *transformation.*

Note

The **Cartographic** option can be used to transform just *x/y coordinates* to *long/lat* or *long/lat* to *x/ y coordinates* by simply leaving the appropriate panel field blank. The units for *longitude* and *latitude* are either degrees (dms), decimal degrees or radians.

17.10.3 NZ Conversions

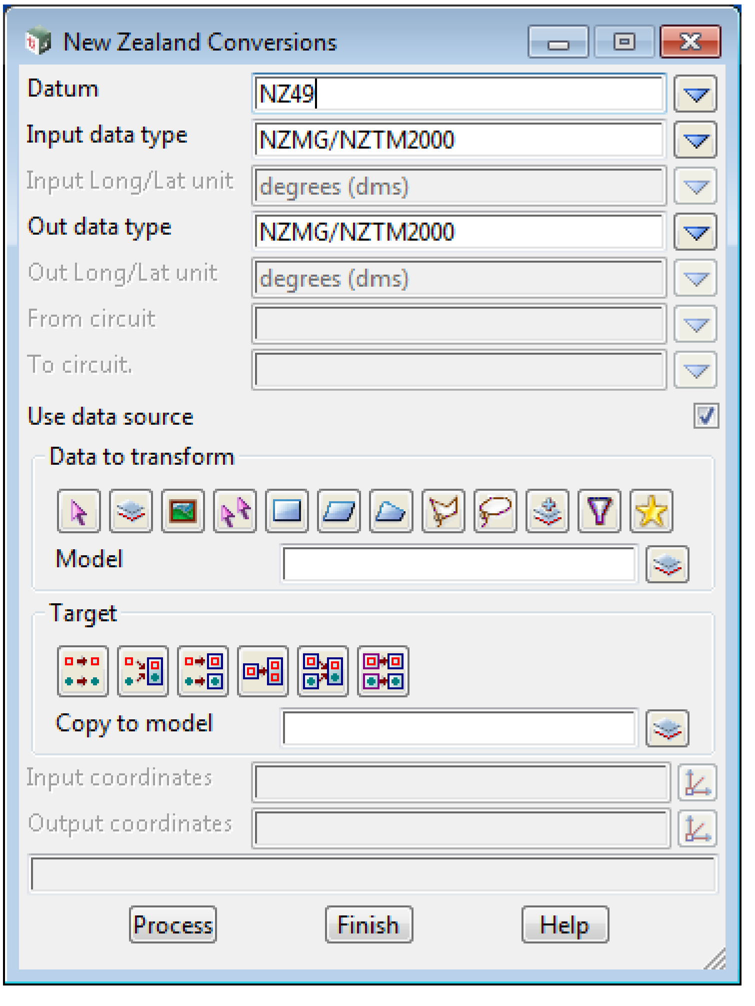
Position of option on menu: **Survey =>Conversions =>NZ conversions**

The **NZ conversions** option converts data from one form (NZMG/NZTM2000, Long Lat) to another for the same ellipsoid (i.e. datum NZ49 or NZ2000).

For converting between the ***different*** datums NZ 49 and NZ 2000, use the option

Survey =>Conversions =>NZ49 <-> NZ2000 (see 17.10.5 NZ49 <---> NZ2000).

Selecting **NZ conversions** brings up the **New Zealand Conversions** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum	choice box	NZ49	NZ49, NZ2000

either NZ49 or NZ2000 is selected.

Input data type	choice box	NZMG/NZTM2000NZMG. Circuit, Long Lat	

type of the input data type.

Input Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees

if **Lat/Long** *was selected, the Lat-Long coords have the selected units.*

Output data type	choice box	NZMG/NZTM2000NZMG. Circuit, Long Lat	

type of the input data type.

Output Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees

if **Lat/Long** *was selected, the Lat-Long coords have the selected units.*

From Circuit

if **Circuit** *was selected for the input data type, the NZ Circuit is given is this field.*

To Circuit

if **Circuit** *was selected for the output data type, the NZ Circuit is given is this field.*

Use data source	tick box	tick	

if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source type	Model		

if ***use data source*** *is ticked, the data selection type*

Data source	input		

if ***use data source*** *is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see* 4.19.3 Data Source

Target	target		

if ***use data source*** *in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see* 4.19.4 Data Target

Input coordinates	XYZ box		

if ***use data source*** *is not ticked, the co-ordinates in this field is transformed.*

Output coordinates	XYZ box		

if ***use data source*** *is not ticked, the transformed co-ordinates are displayed in this field.*

Transform	button		

perform the transformation.

17.10.4 AGD66/84 <---> GDA94

Position of option on menu: **Survey =>Conversions =>AGD66/84 <-> GDA94**

This option converts data between the two Australian Datums, AGD 66/84 and GDA 94. The transformation between the two datums can be by either a seven parameter similarity transformation for a State, or a NTv2 grid for either a State or Australia.

12d Model is GDA compliant for both the similarity transformations and NTv2 grids.

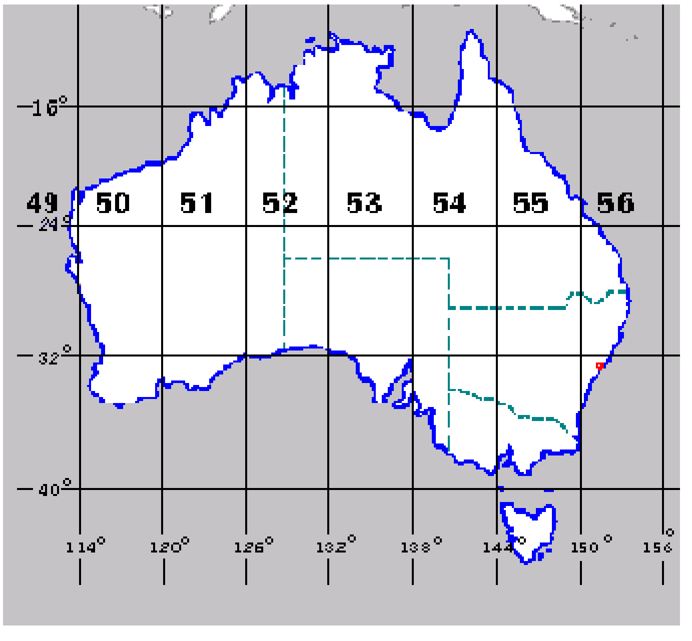
GDA

The AGD 66/84 data can be either longitude and latitude, co-ordinates in an AMG Zone or co-ordinates in an ISG Zone.

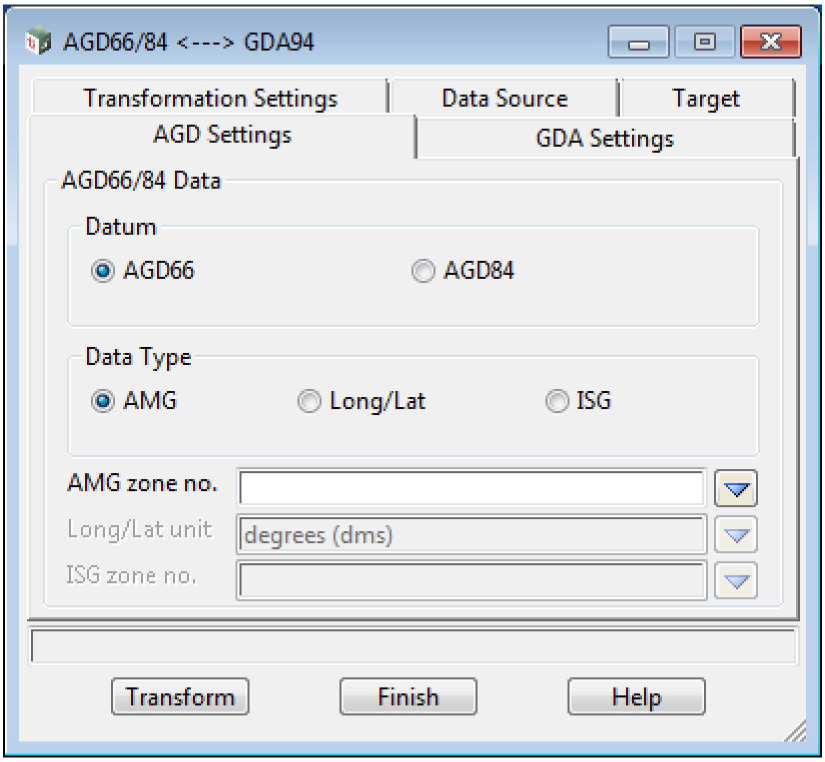
The GDA 94 data can be either longitude and latitude, Global XYZ or co-ordinates in a MGA Zone.

Hence the option will converts data from AMG 66/84 or ISG 66/84 to MGA 94 and vice-versa.

For more information, go to the section 38.5 Converting Between AMG, ISG and MGA in the Appendix 38 Geodetics Summary



Selecting agd66/84 <---> gda94 brings up the agd66/84 <---> gda94 panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

AGD Settings

AGD66 AGD84	radio button		

either AGD66 or AGD84 is selected.(AGD = Australian Geodetic datum)

AMG Lat/Long ISG	radio button		

either AMG, Lat/Long or ISG is selected.(AMG = Australian Map Grid, ISG = Integrated Survey Grid). The ISG relates to the state of New South Wales

AMG Zone no.	*choice box*		49 -> 59

if **AMG** *was selected, the AMG zone is given is this field.*

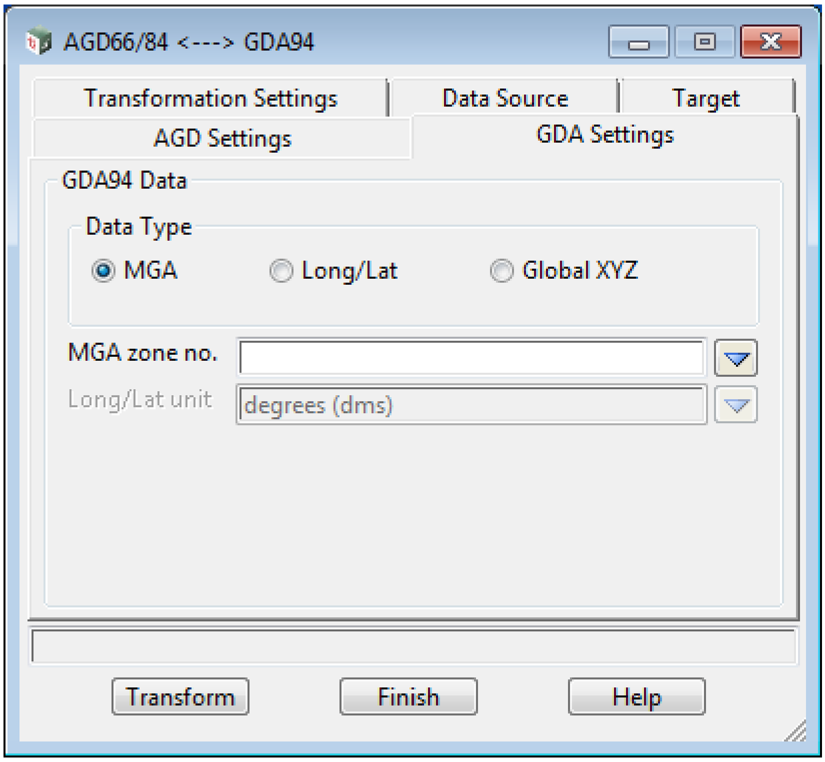
Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees

if **Lat/Long** *was selected, the Lat-Long coords have the selected units.*

ISG Zone no.	*choice box*		ISG54/2 -> ISG56/3

if **ISG** *was selected, the ISG zone is given is this field.*

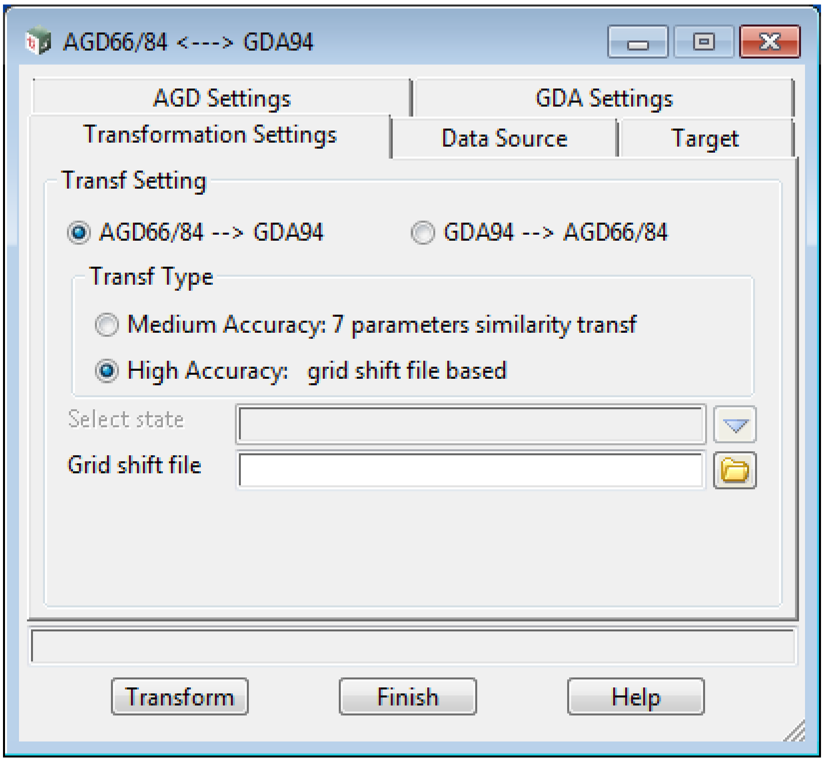
GDA Settings



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MGA Lat/Long Global XYZ radio button			
one of the three choices is selected.			
MGA Zone no.	*choice box*		49 -> 59
if **MGA** *was selected, the MGA zone is given is this field.*			
Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees
if **Lat/Long** *was selected, the Lat-Long coordinates have the selected units.*			

Transformation Settings



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

AGD66/84 --> GDA94 **GDA94 --> AGD66/84** radio button

one of the two choices is selected.

Medium accuracy radio box tick

if ticked, a seven parameter similarity transformation for the selected Australian State is used.

High accuracy radio button

if ticked, the NT V2 grid shift file is used.

Select State *choice box* ACT, NSW,TAS, VIC

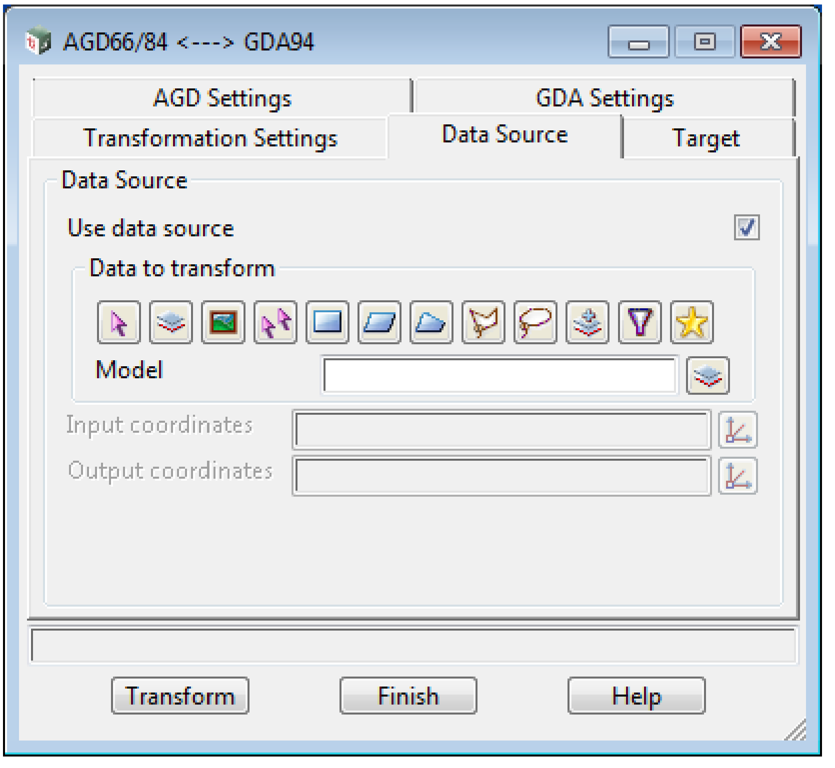
if the AGD66 datum has been selected, and the 7 parameter transformation is to be used, the seven parameter transformation parameters are different for each state. (i.e the states which adopted the AGD66 datum) By selecting the appropriate state, the corresponding values will be used.

If the AGD84 datum has been selected, the parameters used are the australian wide values and therefore the state selection is not appropriate.

Grid shift file *file box* **gsb*

for high accuracy, the NTv2 grid shift files can be used.

Data Source



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use data source	tick box	tick	

if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source input

*if **use data source** is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see* 4.19.3 Data Source

Input coordinates XYZ box

*if **use data source** is not ticked, the co-ordinates in this field is transformed.*

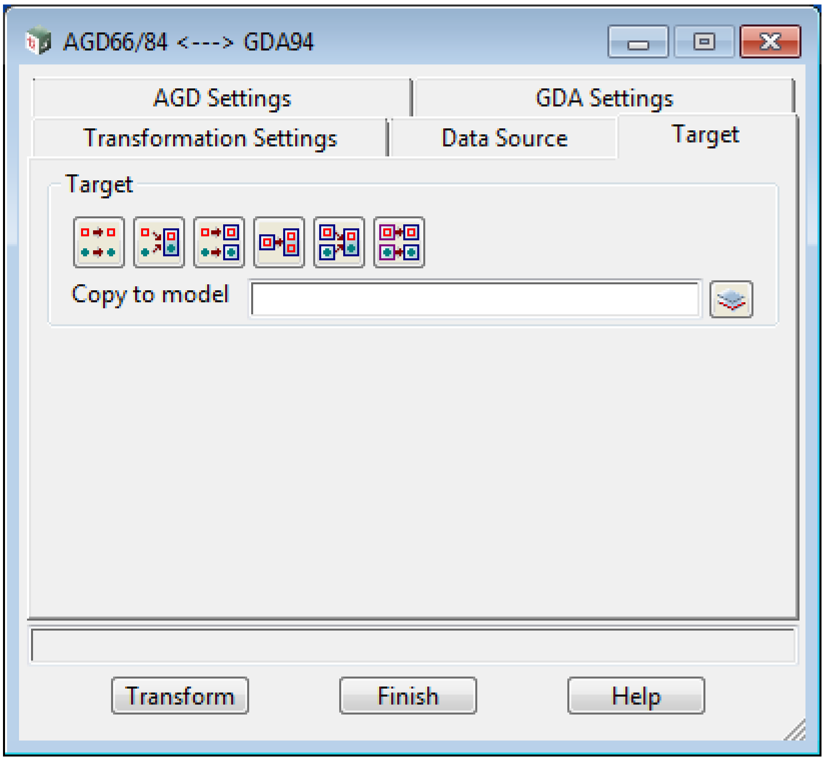
Output coordinates XYZ box

*if **use data source** is not ticked, the transformed co-ordinates are displayed in this field.*

Transform button

perform the transformation.

Target



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Target	target		

*if **use data source** in the data source is ticked, the target of the transformed data should be specified The target for the data is selected using the data target box. For more information on the data target box see* 4.19.4 Data Target

17.10.5 NZ49 <---> NZ2000

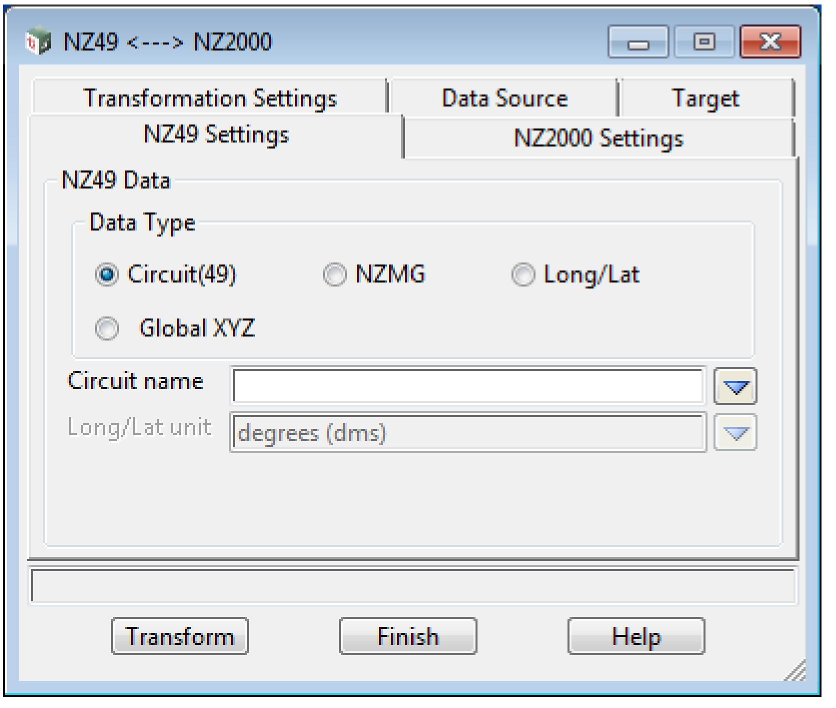
Position of option on menu: **Survey =>Conversions =>NZ49 <-> NZ2000**

This option converts data from the NZ 49 datum to the NZ 2000 datum and vice-versa.

The transformation between the two datums can be by either the NZ seven parameter similarity transformation or a NTv2 grid.

The data to be converted can be longitude and latitude, NZMG, circuits or Global XYZ.

Selecting **NZ49<---> NZ2000** brings up the **NZ49 <---> NZ2000** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

NZ 49 Settings

Circuit (49)	radio button		

if the data in the NZ49 datum is of ***circuit*** *type the circuit radio button is selected.*

NZMG	radio button		

if the data in the NZ49 datum is of NZMG type the radio button is selected.

Lat/Long	radio button		

if the data in the NZ49 datum is of Lat/Long type the radio button is selected.

Global XYZ	radio button		

if the data in the NZ49 datum is of Global XYZ type the radio button is selected.

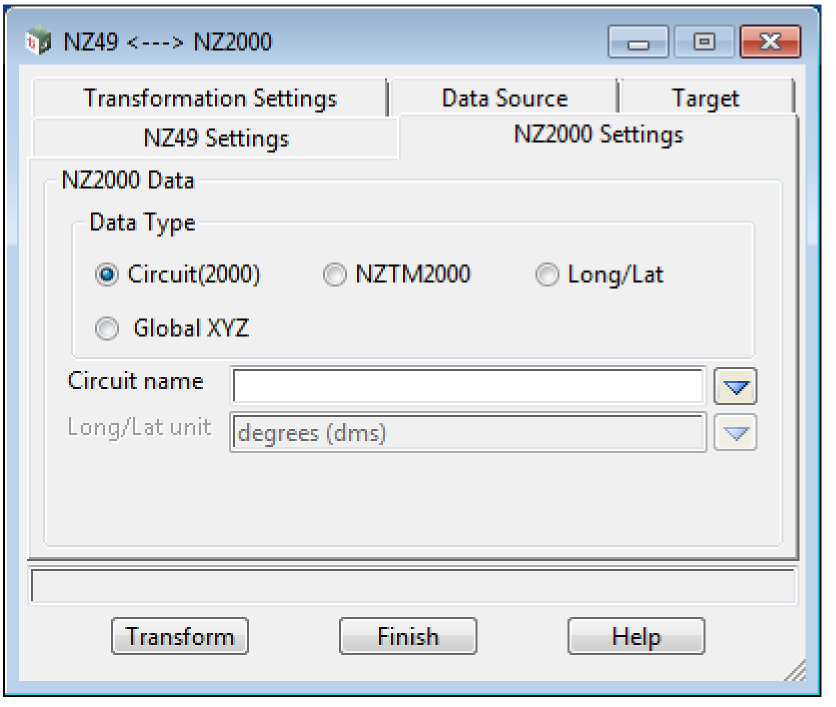
Circuit name	choice box		All NZ 1949 circuits

if **Circuit (49)** *was selected, the specific NZ Circuit should be selected.*

Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees

if **Lat/Long** *was selected, the Lat-Long coords have the selected units.*

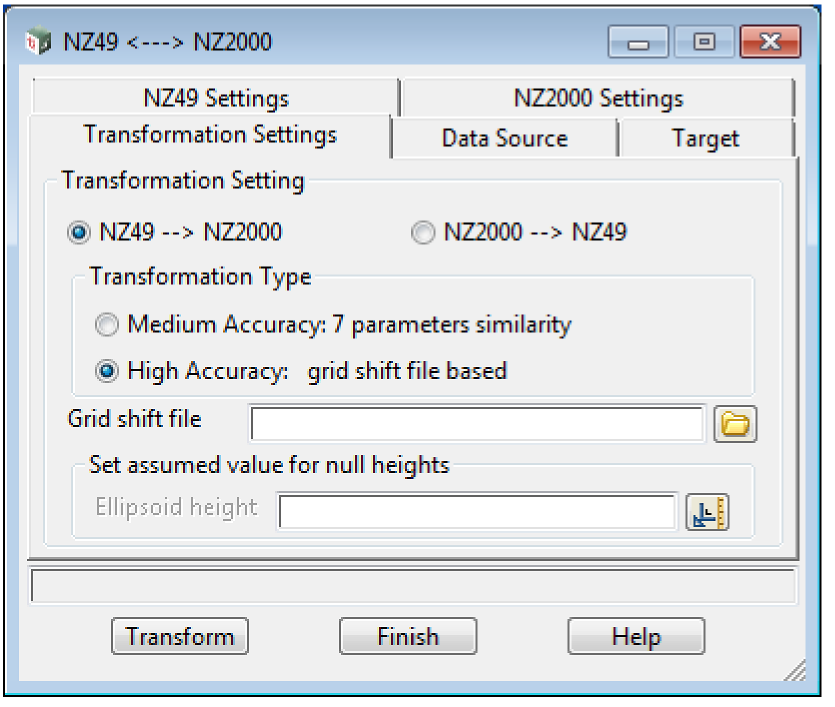
NZ 2000 Settings



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Circuit (2000)	radio button		
if the data in the NZ2000 datum is of ***circuit*** *type the circuit radio button is selected.*			
NZTM2000	radio button		
if the data in the NZ2000 datum is of NZTM2000 type the radio button is selected.			
Lat/Long	radio button		
if the data in the NZ2000 datum is of Lat/Long type the radio button is selected.			
Global XYZ	radio button		
if the data in the NZ2000 datum is of Global XYZ type the radio button is selected.			
Circuit name	choice box		All NZ 1949 circuits
if **Circuit (2000)** *was selected, the specific NZ Circuit should be selected.*			
Lat/Long unit	*choice box*	degrees	radians, degrees, decimal degrees
if **Lat/Long** *was selected, the Lat-Long coords have the selected units.*			

Transformation Settings



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

NZ49 --> NZ2000 NZ2000 --> NZ49 radio button

the direction of the transformation is specified by the selection of one of the two choices.

Medium accuracy tick box tick

if ticked, a seven parameter similarity transformation for NZ is used.

High accuracy tick box

if ticked, the NT V2 grid shift file is used.

Grid shift file *file box*

if **High accuracy** *is ticked, a NTv2 grid shift should be selected. A single file for New Zealand can be used.*

Ellipsoid Height *input box*

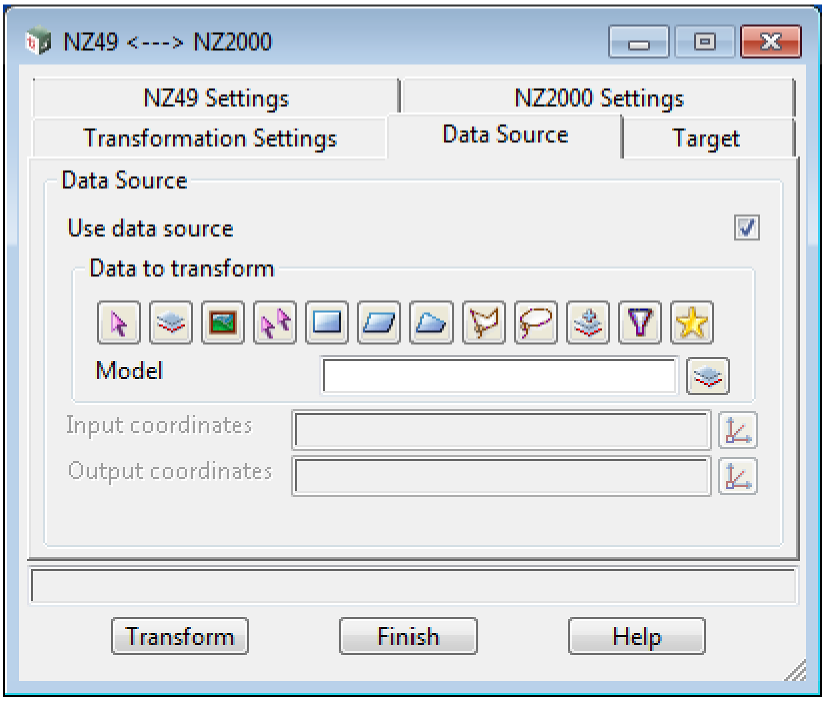
this is only required if the data to be transformed contains null values ***and*** *when*

1) The ***7 parameter similarity transformation*** *is used and/or*

2) When either the input or output types are of ***Global XYZ*** *type*

An approximate ellipsoid level needs only to be +/- 100 m from the true value for most accuracy requirements. (An error in estimation of the ellipsoid height of a few hundred metres will introduce an error in the transformed horizontal position in the order of millimetres only).

Data Source



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use data source	tick box	tick	

if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source	input		

if ***use data source*** *is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see* 4.19.3 Data Source

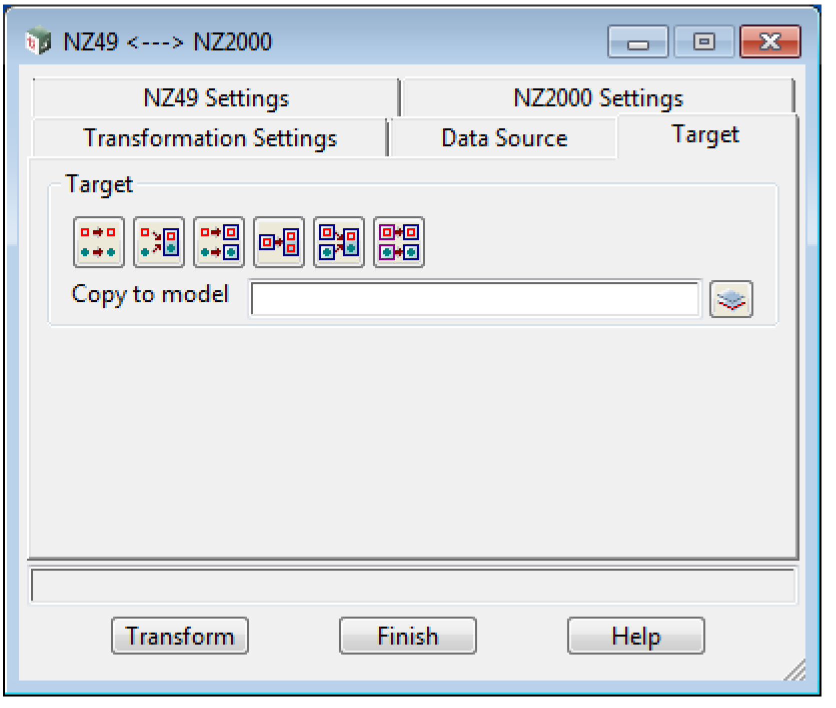
Input coordinates	XYZ box		

if ***use data source*** *is not ticked, the co-ordinates in this field is transformed.*

Output coordinates	XYZ box		

if ***use data source*** *is not ticked, the transformed co-ordinates are displayed in this field.*

Target



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Target	target		

*if **use data source** in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see* 4.19.4 Data Target

Transform	button		

perform the transformation.

17.10.6 General Transformations

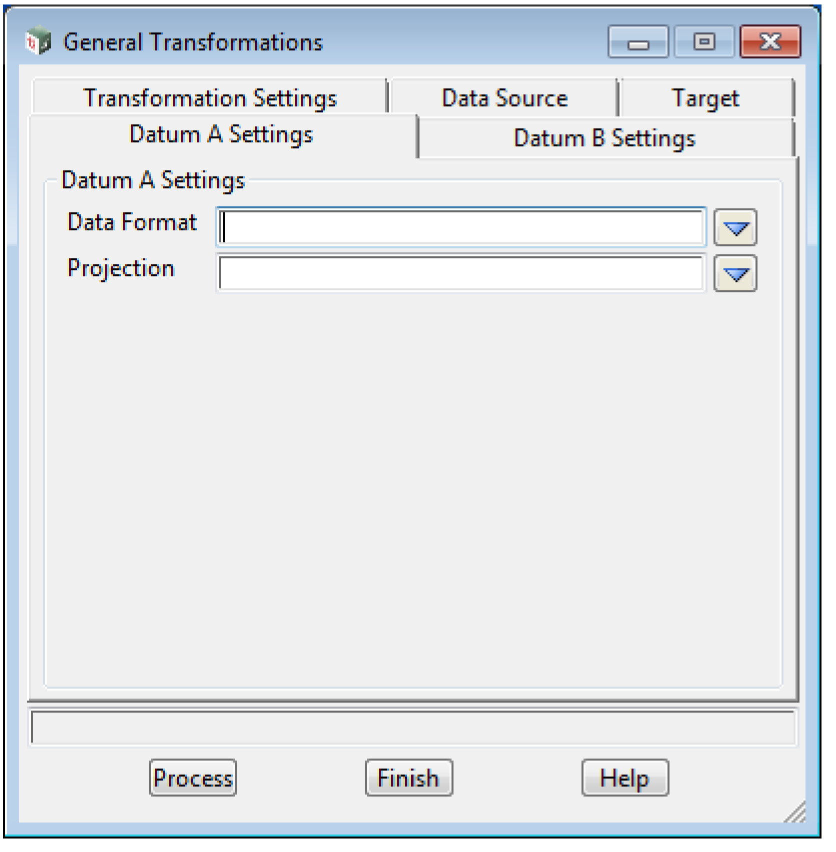
Position of option on menu: **Survey =>Conversions =>General transformations**

This option converts data between two datums (i.e. different ellipsoids).

The transformation between the two datums can be by either a seven parameter similarity transformation or a NTv2 grid.

The data to be converted can be longitude and latitude, a 12d supported projection (eg TM, UTM) or Global XYZ.

Selecting **General transformations** brings up the **General Transformations** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Datum A Settings, Datum B Settings

Data format	choice box		Global XYZ Easting Northing Long Lat - radians Long Lat - degrees (dms) Long Lat - decimal degrees

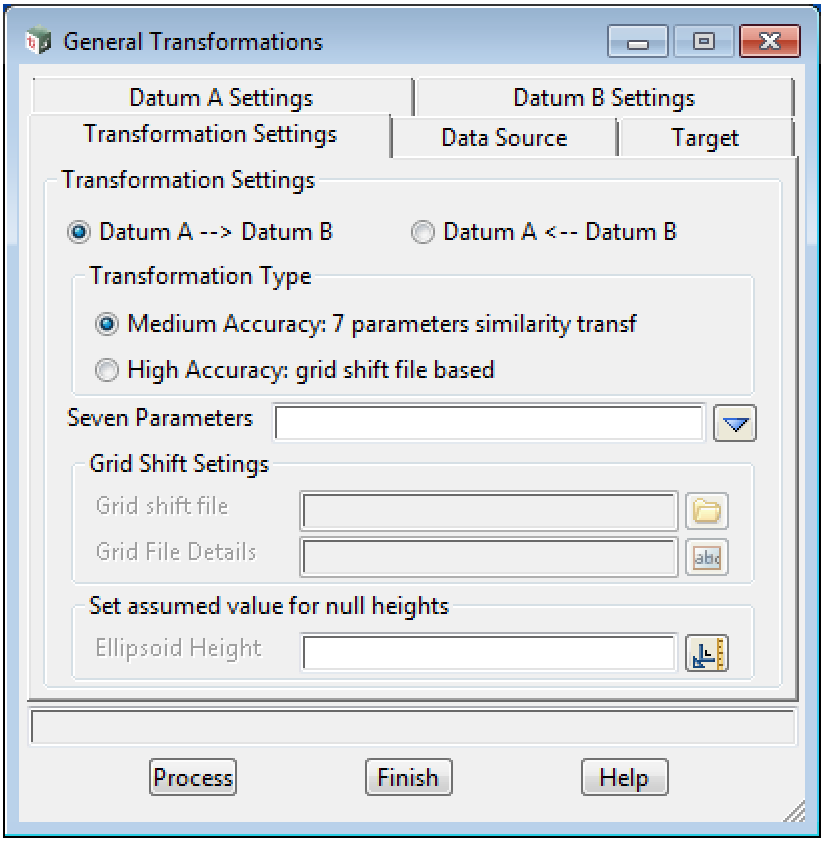
the type of data to be transformed/ transformed to.

*if **Easting, Northing**, the data is co-ordinates in the projection defined by the* **Projection** *field.*
*if **Long Lat - radians**, the data is (longitude, latitude) with the angles given in radians.*
*if **Long Lat - degrees (dms)**, the data is (long, lat) with the angles given in hp format (i.e. ddd.mmssss).*
*if **Long Lat - decimal degrees**, the data is (long, lat) with the angles given decimal degrees.*
*if **Global XYZ**, the data is in the Global XYZ system.*

Projection	projection box		defined projections

the name of the cartographic projection that the data is in.

Transformation Settings



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Datum A --> Datum B **Datum B --> Datum A** radio button

the direction of the transformation is specified by the selection of one of the two choices.

Medium accuracy tick box tick

if ticked, a seven parameter similarity transformation is used.

High accuracy tick box

if ticked, a NT V2 grid shift file is used.

Seven parameters *file box* *available 7 param definitions*

if ***Medium accuracy*** *is ticked, a seven parameter similarity transformation is selected.*

Grid shift file *file box* *available gsb files*

if ***High accuracy*** *is ticked, a NTv2 grid shift is selected.*

Ellipsoid Height *input box*

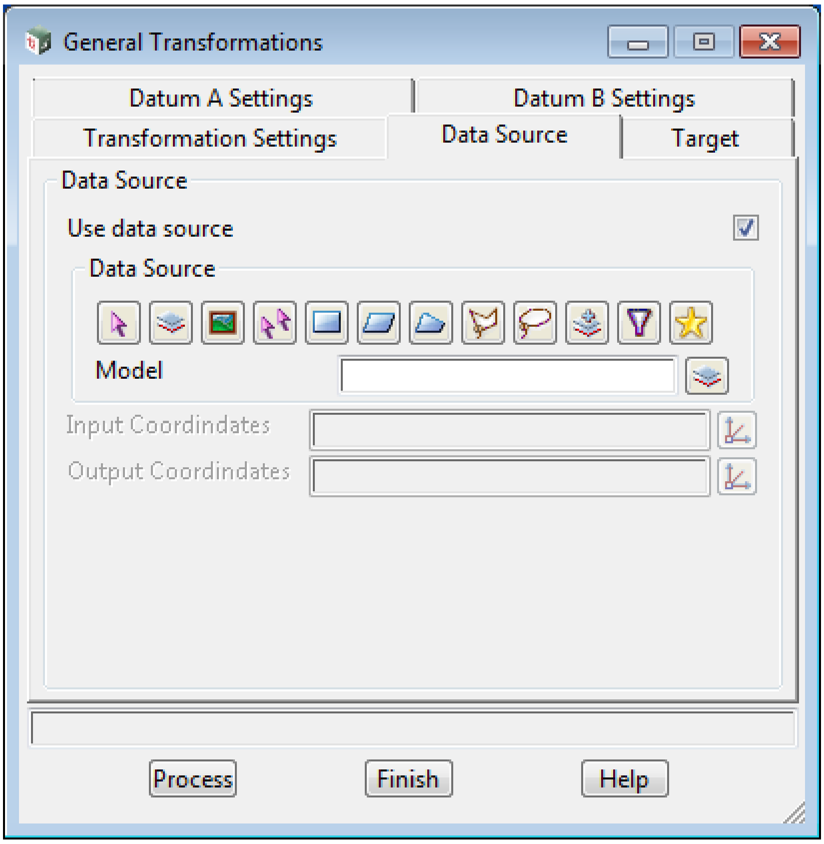
this is only required if the data to be transformed contains null values ***and*** *when*

1) The 7 ***parameter similarity transformation*** *is used and/or*

2) When either the input or output types are of ***Global XYZ*** *type*

An approximate ellipsoid level needs only to be +/- 100 m from the true value for most accuracy requirements. (An error in estimation of the ellipsoid height of a few hundred metres will introduce an error in the transformed horizontal position in the order of millimetres only).

Data Source



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use data source	tick box	tick	

if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source	input		

*if **use data source** is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see* 4.19.3 Data Source

Input coordinates	XYZ box		

*if **use data source** is not ticked, the co-ordinates in this field is transformed.*

Output coordinates	XYZ box		

*if **use data source** is not ticked, the transformed co-ordinates are displayed in this field.*

Target

Field Description Type Defaults Pop-Up

Target target

*if **use data source** in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see* 4.19.4 Data Target

Process button

perform the transformation.

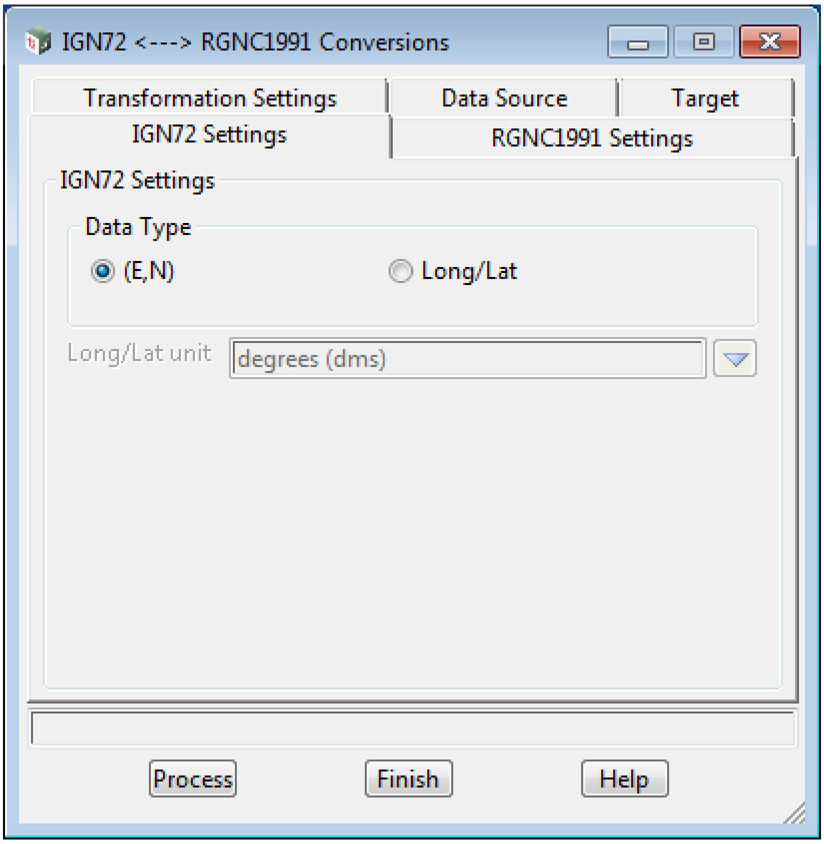
17.10.7 IGN72 <---> RGNC1991

Position of option on menu: **Survey =>Conversions =>IGN72 <->RGNC1991**

This option converts data between the old and new datums for New Caledonia.

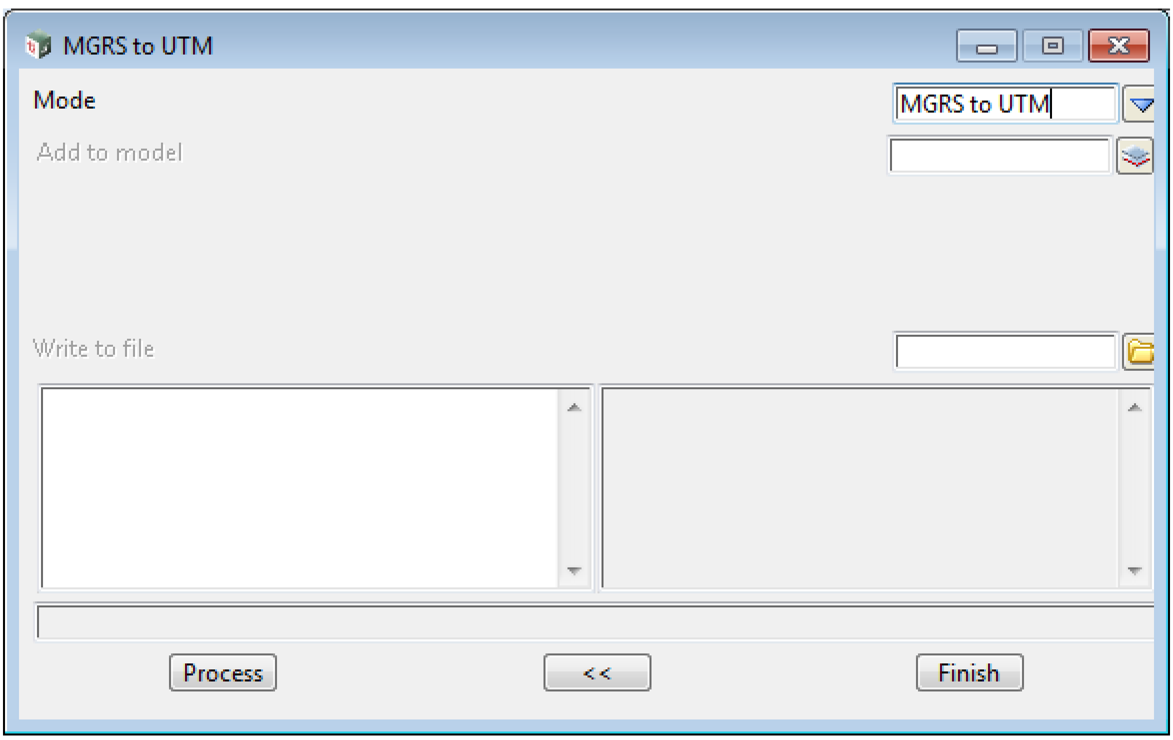
The transformation between the two datums can be by either a seven parameter similarity transformation or a NTv2 grid.

The data to be converted to/from can be (longitude, latitude) or (Easting, Northing).



17.10.8 MGRS <---> UTM

Position of option on menu: **Survey =>Conversions => MGRS<->UTM**

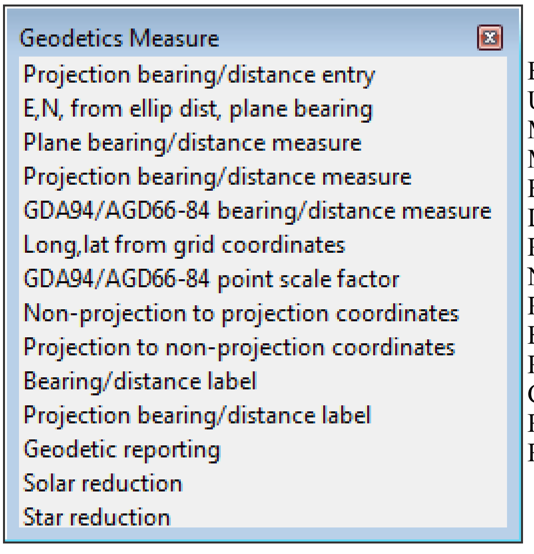


17.11 Geodetic Measures and Entry

Position of menu: **Survey =>Geodetics**

The **Geodetics** walk-right menu is

.



Bearing distance entry for a projection
Use ellipsoid dist, plane brg to create point
Measure bearing, distance, with user input for scale
Measure plane brg, ellip dist, given projection
Bearing dist between 2 pts for GDA/AGD
Long and lat from projection (grid) coords
Point scale factor at a grid point for GDA/AGD
Non-projection to projection coordinate conversion
Projection to non-projection coordinate conversion
Bearing distance label for selected string/segment
Projection brg-dist label for selected string/segment
Create a report based on projection coordinates
Reduce solar observations
Reduce star observations

For Projection bearing /distance entry, go to 17.11.1 Projection Bearing/Distance Entry
E,N calc from ellip dist, plane brg, 17.11.2 E,N from Ellipsoid Distance and Plane Bearing .
Plane bearing /distance measure, 28.6.2 Bearing and Distance
Projection bearing/distance measure, 17.11.4 Projection Bearing and Distance Measure
GDA94/AGD66-84 bearing/distance measure, 17.11.5 GDA94/AGD66-84 Bearing and Distance Measure
Long, lat from grid coordinates, 17.11.6 Longitude, Latitude from Grid Coordinates
GDA94/AGD66-84 Point scale factor, 17.11.7 GDA94/AGD66-84 Point Scale Factor
Non-projection to projection coordinates, 17.11.8 Non-Projection to Projection Coordinates
Projection to non-projection coordinates, 17.11.9 Projection to Non-Projection Coordinates
Bearing/distance label, 17.11.10 Bearing/Distance Label
Projection bearing/distance label, 17.11.11 Projection Bearing/Distance Label
Geodetic reporting, 17.11.12 Geodetic Reporting
Solar reduction, 17.11.13 Solar Reduction
Star reduction, 17.11.14 Star Reduction

For more information about terminology used in these sections, see the Appendix 38 Geodetics Summary .

17.11.1 Projection Bearing/Distance Entry

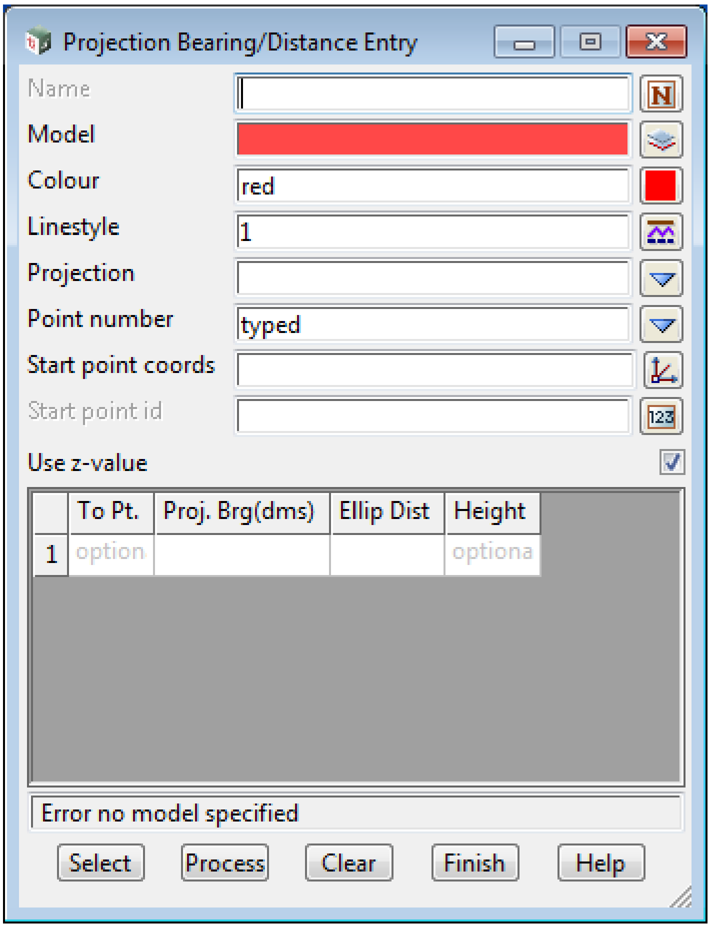
Position of option on menu: **Survey =>Geodetics =>Projection bearing/distance entry**

This section of documentation is a work in progress and will be updated in subsequent releases.

The **Projection bearing/distance entry** option allows the input of a traverse by manual input of projection bearings (the plane bearing) and ellipsoid distances or by selecting an existing string.

For each point, the projection co-ordinates are used with the projection bearing and ellipsoid distance from that point to calculate the projection co-ordinates for the new point taking the map projection into account.

Selecting **Projection bearing/distance entry** brings up the **Projection Bearing/Distance Entry** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file

this field is optional. If non-blank, the name of the new string.

Model	model box		available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour	colour box	red	available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Linestyle	input	1	available line styles

line style of the string.

Projection	input	project projection	available projections

This is the projection that is used for calculating the (Easting, Northing) values.

Point number	choice box		

Start point coords measure box

Use z- value tick box transit

*if **ticked**, the z-values for each point are entered.*
*If **no ticked** then z-values are not entered and are not displayed in the grid.*

Point id input typed none, auto increment, typed

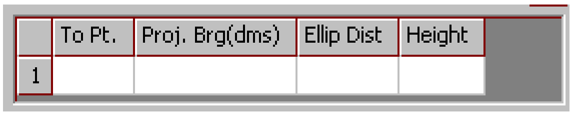
*if **none,** no point ids are entered and the grid control will not show a column for point ids.*

*If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.*

*if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.*

VALUES IN GRID grid box

The columns shown in the grid will depend on the selection of the **Use z- value** *and* **Point id** *fields.*



To Pt. input

*if **none** is selected for the* **Point id** *field, this column will not be displayed.*

*if **auto increment** is selected for the* **Point id** *field, this column will not be displayed.*

*if **typed** is selected for the* **Point id** *field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. I f a new value is typed into the To Pt. field, the next line will increment from that number.*

Proj.Brg angle box

The user should enter the projection bearing for the segment into this field. The projection bearing can be defined as the bearing resulting from plane geometry calculations between the two projection coordinates. This is sometimes called the grid bearing in some countries (e.g. New Zealand) and the plane bearing in others such as Australia as defined in the GDA technical manual (ICSM)).

Ellip Dist input box

the user should enter the ellipsoid distance. This distance is the measured horizontal distance that has been reduced onto the ellipsoid taking into account the heights above the ellipsoid at each end of the measured line. This reduction may be by the use of a height scale factor for example. Distances that are measured near mean sea level approximate the ellipsoid distance (since the MSL approximates the ellipsoid in many reference ellipsoids (eg AGD)). The amount of correction will be dependant on the length of line, the heights above the ellipsoid and the reference ellipsoid being used.

Height input box

This column will only be visible in the grid if the **Use z- value** *tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.*

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the *relevant information.*

Process button

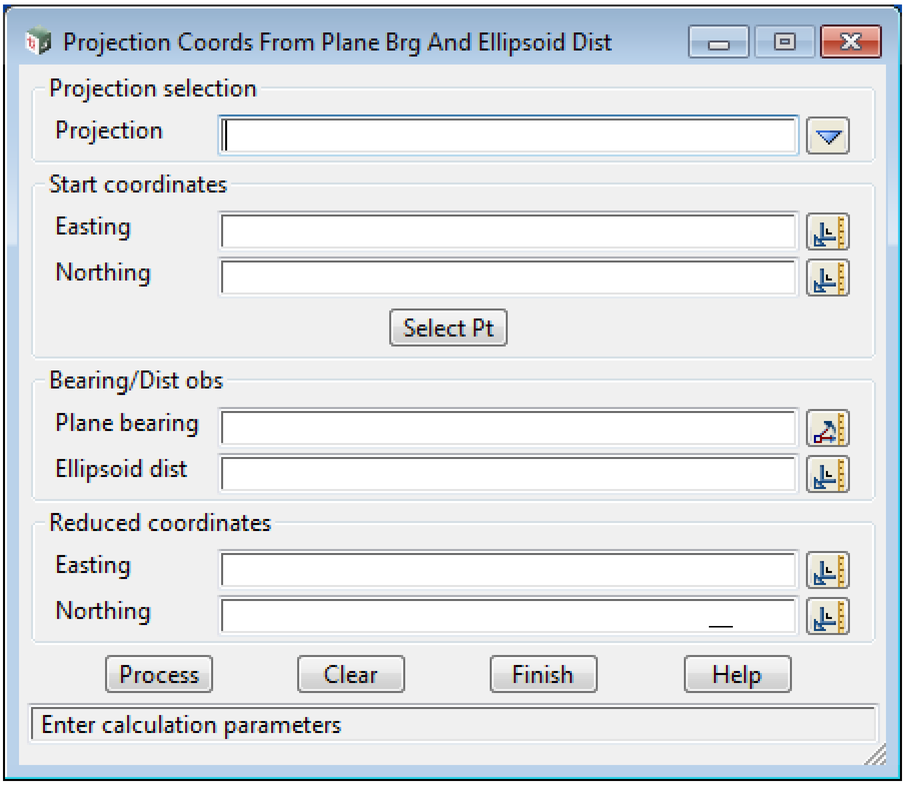
changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

17.11.2 E,N from Ellipsoid Distance and Plane Bearing

Position of option on menu: **Survey =>Geodetics =>E,N from ellip dist, plane bearing**

The **E,N calc from ellip dist, plane brg** option allows users to calculate projection coordinates given the projection, start coordinate, plane bearing and ellipsoid distance. The results are given inside the panel.

On selecting the **E,N calc from ellip dist, plane brg** option, the **Projection Coords from plane brg and ellipsoid dist** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Projection selection

Projection choice box current projection available projections

the projection of the data to be used.

Start coordinates

Easting input

the easting value of the start coordinate.

Northing input

the northing value of the start coordinate.

Select Pt button

if the point exists in a view, the coordinate can be entered by selecting the button and then on the required point. The selected points coordinates will be returned to the relevant coordinate boxes.

Bearing/Dist obs

Plane bearing input

the plane bearing (or Projection brg) of the line from the nominated start coordinate. The projection bearing can be defined as the bearing resulting from plane geometry calculations between the two projection coordinates. This is sometimes called the grid bearing in some countries (e.g. New Zealand) and the plane bearing in others (eg Australia as defined in the GDA technical manual (ICSM)).

Ellipsoid distance input

the ellipsoid distance of the line from the nominated start coordinate

Reduced coordinates

Easting input

the calculated easting value of the 2nd point.

Northing input

the calculated northing value of the 2nd point.

Buttons at bottom

Process button

perform the calculation.

Clear button

clear the input fields

17.11.3 Plane Bearing and Distance Measure

Position of option on menu: **Survey =>Geodetics =>Plane bearing/distance measure**

Measures the plane angle and plane distance between two selected points.

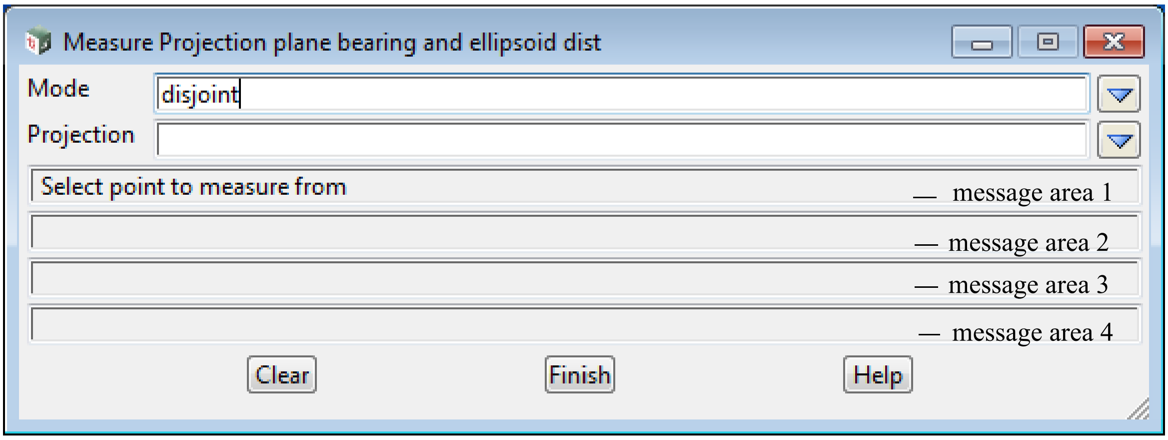
This option has already been documented in the section 28.6.2 Bearing and Distance.

17.11.4 Projection Bearing and Distance Measure

Position of option on menu: **Survey =>Geodetics =>Projection bearing/distance measure**

The **Projection bearing and dist** option allows users to measure projection plane bearing, plane distance, ellipsoid distance, arc-to chord values and a line scale factor.

On selecting the **Projection bearing and dist** option, the **Measure Projection Plane bearing and ellipsoid dist** panel is displayed.



This panel is principally used to display the distances between, and bearing of the line joining, pairs of user selected points.

message area 1: point selection comment

message area 2: dx = dy =

message area 3: plane brg = plane dist = ellipsoid dist =

message area 4: t-T fwd = t-T rev = l.s.f =

where dx is the x coordinate difference between the points, dy is the y coordinate difference between the points

plane brg is the angle measured clockwise from north and is calculated using the coordinate values (Inverse value)

plane dist is the distance calculated using the coordinate values (Inverse value)

ellipsoid dist is the ellipsoid distance calculated using the specified projection and coordinate values.

t-T fwd is the forward arc-to chord correction.

t-T rev is the reverse arc-to chord correction.

l.s.f is the line scale factor. It is calculated by plane distance/ellipsoid distance.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous

In disjoint mode, only the distance between the two points and the bearing (in degrees, minutes and seconds) of the (imaginary) line connecting the two points are displayed.

In continuous mode, after the initial reporting of the bearing/distance, the user is prompted to select the next point(2nd point). In this case the previously selected second point becomes the first point.

Projection	choice	current projection	available projections

the projection of the data to be used.

Clear	button		

when this button is selected, the selection sequence is re-initialised.

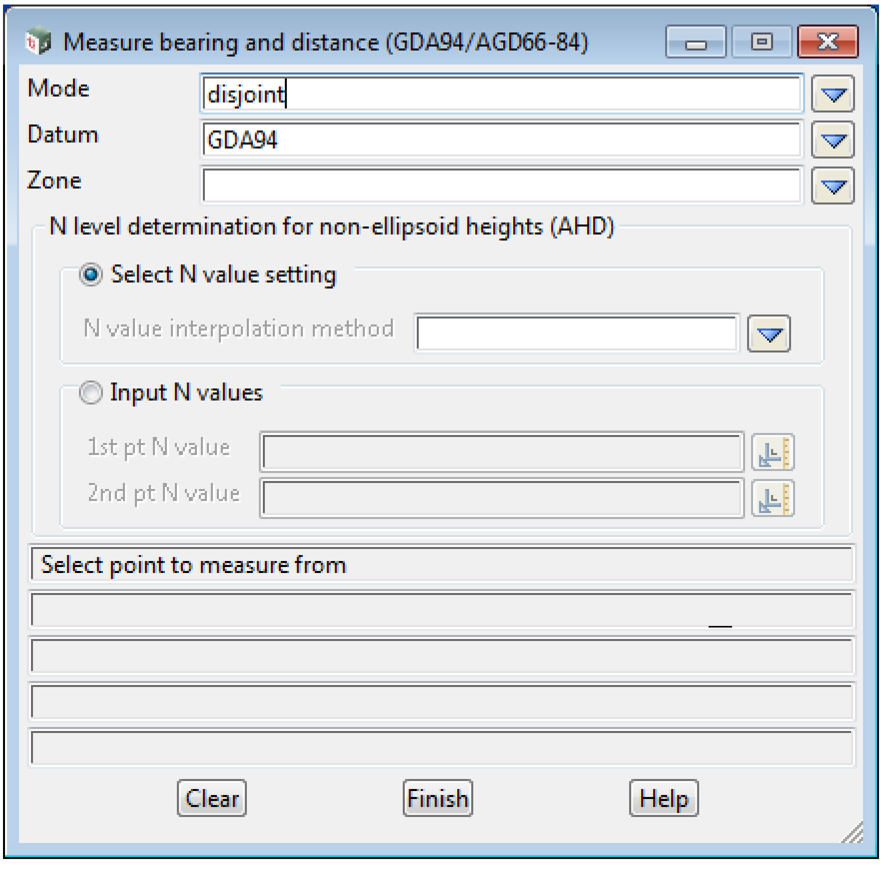
17.11.5 GDA94/AGD66-84 Bearing and Distance Measure

Position of option on menu: Survey =>Geodetics =>GDA94/AGD66-84 bearing/distance

measure

The **Bearing and distance (GDA94/AGD66-84)** is specifically for Australian use. It allows users to select two AMG/MGA coordinates and return the calculated geodetic parameters.

On selecting the **Bearing and distance (GDA94/AGD66-84)** option, the **Bearing and distance (GDA94/AGD66-84)** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous

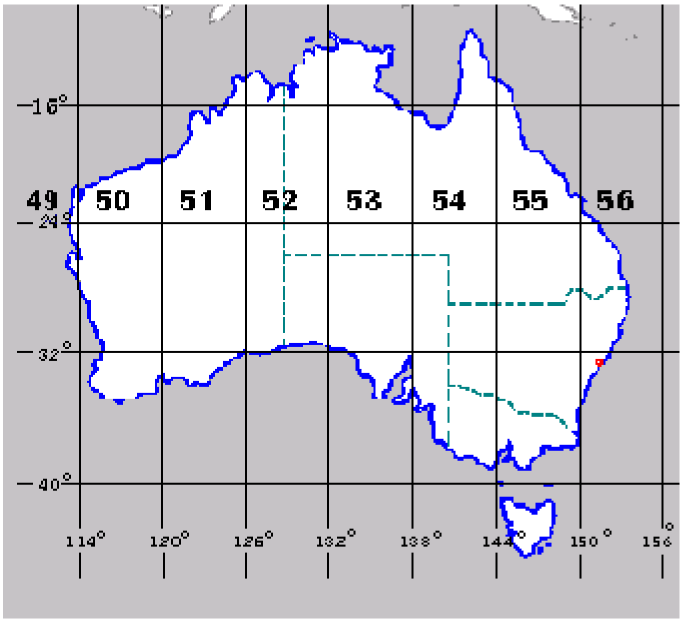
In disjoint mode, the geodetic parameters between the two points are displayed. After the first calculation, further selections must include both the first and second points.

In continuous mode, after the initial reporting of the values, the user is prompted to select the next point(2nd point). In this case the previously selected second point becomes the first point.

Field Description	Type	Defaults	Pop-Up
Datum	choice	current projection	AGD66/84 GDA94

the datum of the data to be used.

I



Zone	choice	current zone	49
			50
			51
			52
			53
			54
			55
			56
			57
			58
			59

the zone of the data to be used.

Select N value setting radio button selected

if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the **N value interpolation method** *choice box.*

Note: The ellipsoid height is required to calculate the values. However most level datums, such as AHD approximate geoid heights. Therefore, one of the selected points should at least have a non-null value and a means for computing a ellipsoid height. If one point has a valid height and the other does not, an option will be given to assume the other point has the same value.

Various options of converting non-ellipsoid geoid heights to ellipsoid are given by the* N value interpolation method *choice box or the user can enter N values for the first and second points.

N value interpolation method choice box currently set method Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are define d in the project n value settings. For more information on the n value settings see the section 7.6.7 N values

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Input N values radio button unselected

if an N value is known for the area or for the selected points, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

1st pt N value input box

if the Input N value option is chosen, an N value is entered for the first point.

2nd pt N value input box

if the Input N value option is chosen, an N value is entered for the second point.

How to Use the Panel and Panel Messages

The results are returned to the panel in the following format:

message area 1	Messages
message area 2	plane brg =, plane dist, dx =, dy =
measure area 3	grid brg =, ellipsoid dist =, line scale factor =
message area 4	Mean height factor =, (Plane dist/level terrain dist) scale factor =
measure area 5	Mean level terrain distance =

Note: Mean height factor is the factor to apply to a measured horizontal distance (usually measured at a height above or below the ellipsoid) to reduce it down to an ellipsoid distance. The other geodetic values and terminology are clearly defined in the GDA technical manual. See http://www.anzlic.org.au/icsm/gdatm/

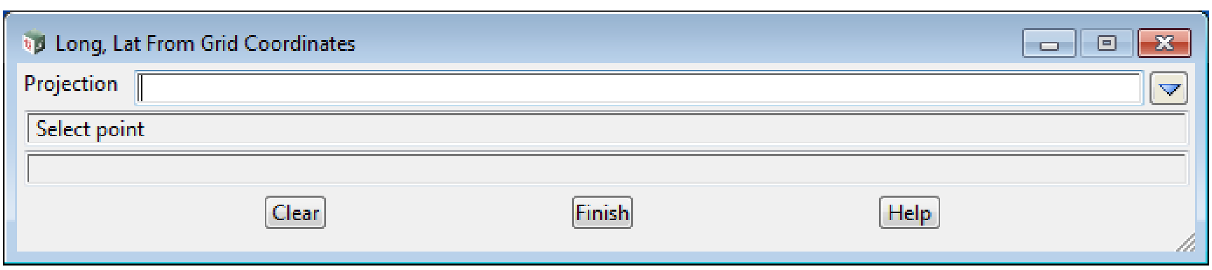
The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

17.11.6 Longitude, Latitude from Grid Coordinates

Position of option on menu: **Survey =>Geodetics =>Long, lat from grid coordinates**

The **Longitude, latitude from grid coordinates** option allows a user to calculate Longitude, latitude and convergence of a point, given a projection and selection of a grid coordinate.

On selecting the **Longitude, latitude from grid coordinates** option, the **Longitude, latitude from grid coordinates** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection	choice	current projection	available projections

the projection of the data to be used.

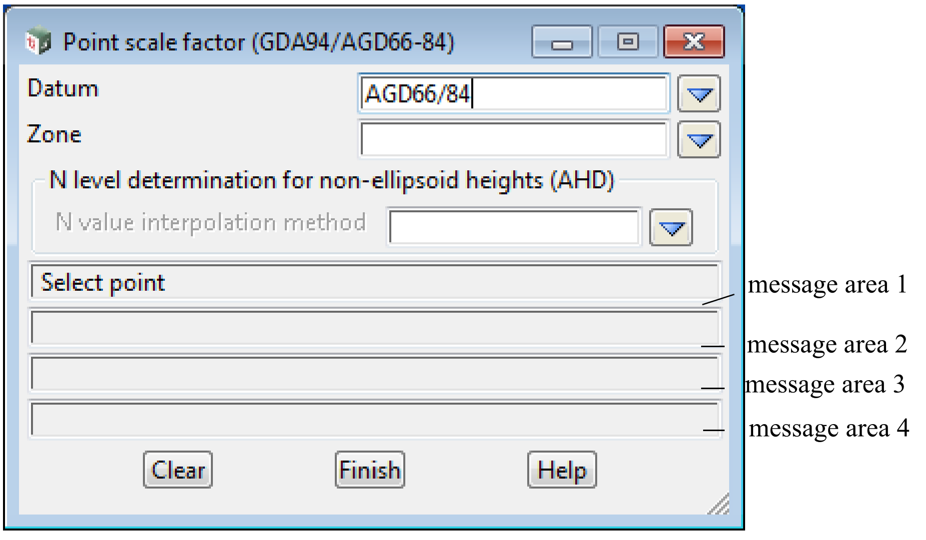
The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

17.11.7 GDA94/AGD66-84 Point Scale Factor

Position of option on menu: **Survey =>Geodetics =>GDA94/AGD66-84 point scale factor**

The **Point scale factor (GDA94/AGD66-84)** is specifically for Australian use. It allows users to select AMG/MGA coordinates and return the point scale factor and latitude and longitude of the point.

On selecting the **Point scale factor (GDA94/AGD66-84)** option, the **Point scale factor (GDA94/AGD66-84)** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum	choice	current projection	AGD66/84 GDA94

the datum of the data to be used.

Note: The ellipsoid height is required to calculate the point scale factor. However most level datums, such as the AHD approximate geoid heights. Therefore, selected points should at least have a non-null value and a means for computing a ellipsoid height. Various options of converting non-ellipsoid geoid heights to ellipsoid are given.

Select N value setting

radio button selected

if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the **N value interpolation method** ***choice box****.*

N value interpolation method choice box currently set method Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are define d in the project n value settings. For more information on the n value settings see the section 7.6.7 N values

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Input N value radio button unselected

if an N value is known for the area or for the selected point, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Enter N value input box

if the Input N value option is chosen, an N value is entered.

How to Use the Panel and Panel Messages

The results are returned to the panel in the following format:

message area 1	Messages
message area 2	Point scale = , Interpolated or entered N value = (if applicable)
measure area 3	Combined point scale/height factor =
message area 4	Longitude = Latitude =

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

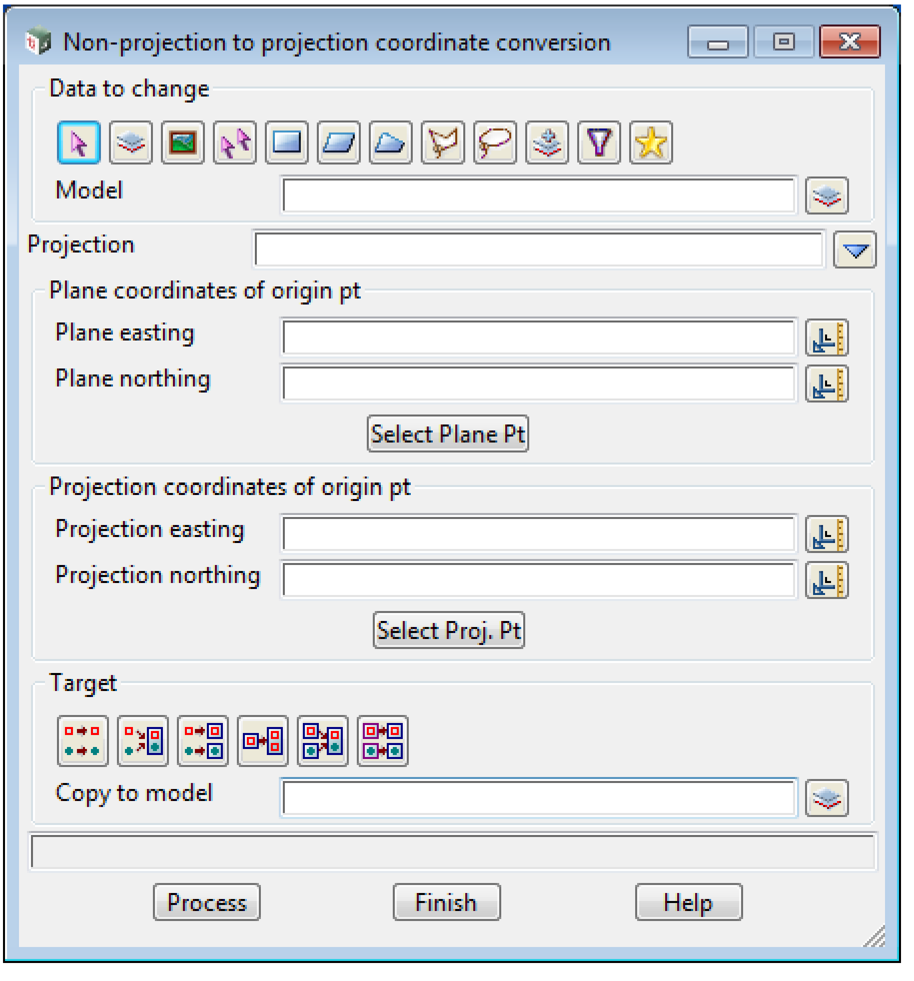
17.11.8 Non-Projection to Projection Coordinates

Position of option on menu: **Survey =>Geodetics =>Non-projection to projection coordinate conversion**

The **Non-projection to projection coordinate conversion** is for the conversion of non-projection coordinates (plane) to a specified projection system. This is done by calculating a series of vectors from an origin point. The origin coordinates in both the plane and projection are known. The plane vector is calculated between the origin and other selected points. Then using the projection coordinates of the origin and the plane vector a projection vector is calculated which allows the projection coordinates of the selected points to be calculated. **The azimuth orientation should be the same in both systems, i.e. no swing should be required.**

The process will convert the vertex of straight segments very effectively. However, care should be taken when trying to convert non-linear segments such as curves. These may have construction entities such as TP’s that no longer have the same relationship with a centre point after conversion for example. This is due to differing scale factors of points due to the projection.

On selecting the **Non-projection to projection coordinates** option, the **Non-projection to projection coordinate conversion** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to change	source box	model	

the source of objects to be converted are selected using the data source box. For more information on the data source box see 4.19.3 Data Source

Projection	projection box	current projection	available projections

the projection to which the data is to be converted to is specified in the projection box.

Plane easting	input box		

the plane easting value of the origin point.

Plane northing input box

the plane northing value of the origin point.

Select Plane Pt button

selection of the button allows the point to picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Projection easting input box

the projection easting value of the origin point.

Projection northing input box

the projection northing value of the origin point.

Select Projection Pt button

selection of the button allows the point to picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Target target

the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see 4.19.4 Data Target

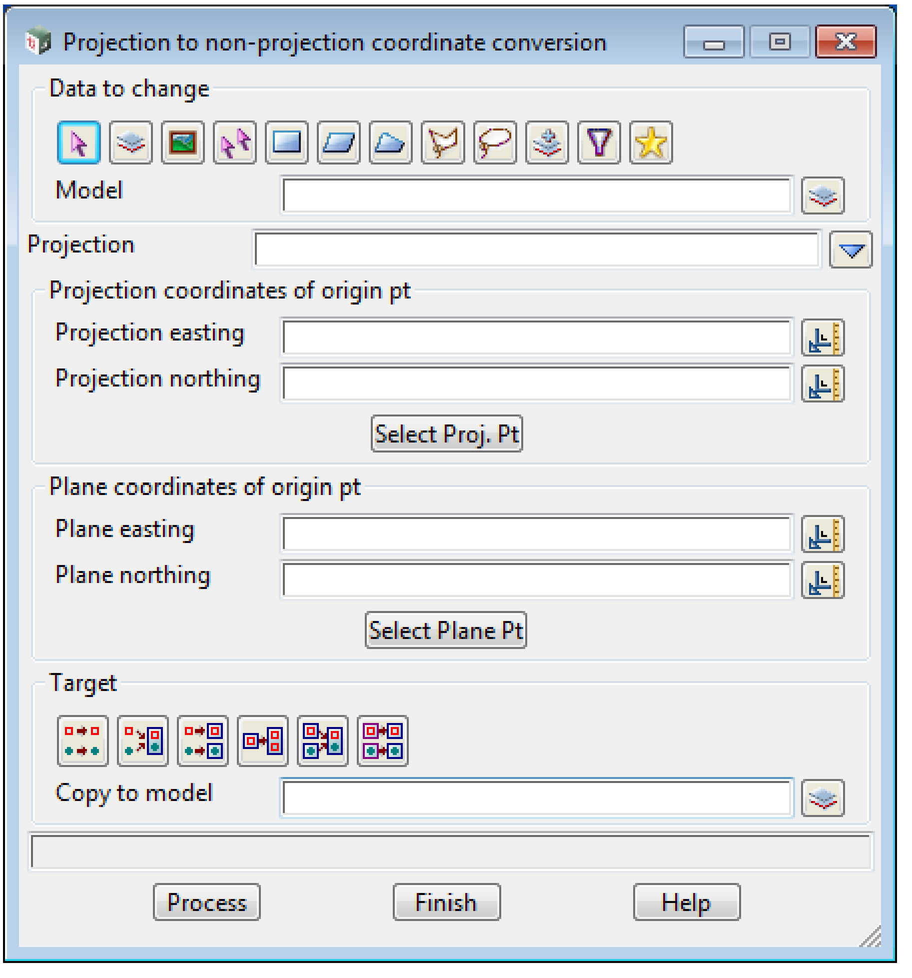
17.11.9 Projection to Non-Projection Coordinates

Position of option on menu: **Survey =>Geodetics => Projection to non-projection coordinate conversion**

The **Projection to non-projection coordinate conversion** is for the conversion of projection coordinates to plane coordinates. This is done by calculating a series of vectors from an origin point. The origin coordinates in both the plane and projection are known. The projection vector is calculated between the origin and other selected points. Then using the plane coordinates of the origin and the projection vector a plane vector is calculated which allows the projection coordinates of the selected points to be calculated. **The azimuth orientation should be the same in both systems, *i.e.* no swing should be required.**

The process will convert the vertex of straight segments very effectively. However, care should be taken when trying to convert non-linear segments such as curves. These may have construction entities such as TP's that no longer have the same relationship with a centre point after conversion for example. This is due to differing scale factors of points due to the projection.

On selecting the **Projection to non-projection coordinates** option, the **Projection to non-projection coordinate conversion** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to change	source box	model	

the source of objects to be converted are selected using the data source box. For more information on the data source box see 4.19.3 Data Source

Projection	choice box	current projection	available projections

the projection to which the data is to be converted from is specified in the projection box.

Projection easting input box

the projection easting value of the origin point.

Projection northing input box

the projection northing value of the origin point.

Select Proj. Pt button

selection of the button allows the point to picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Plane easting input box

the plane easting value of the origin point.

Plane northing input box

the plane northing value of the origin point.

Select Plane Pt button

selection of the button allows the point to picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Target target

the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see 4.19.4 Data Target.

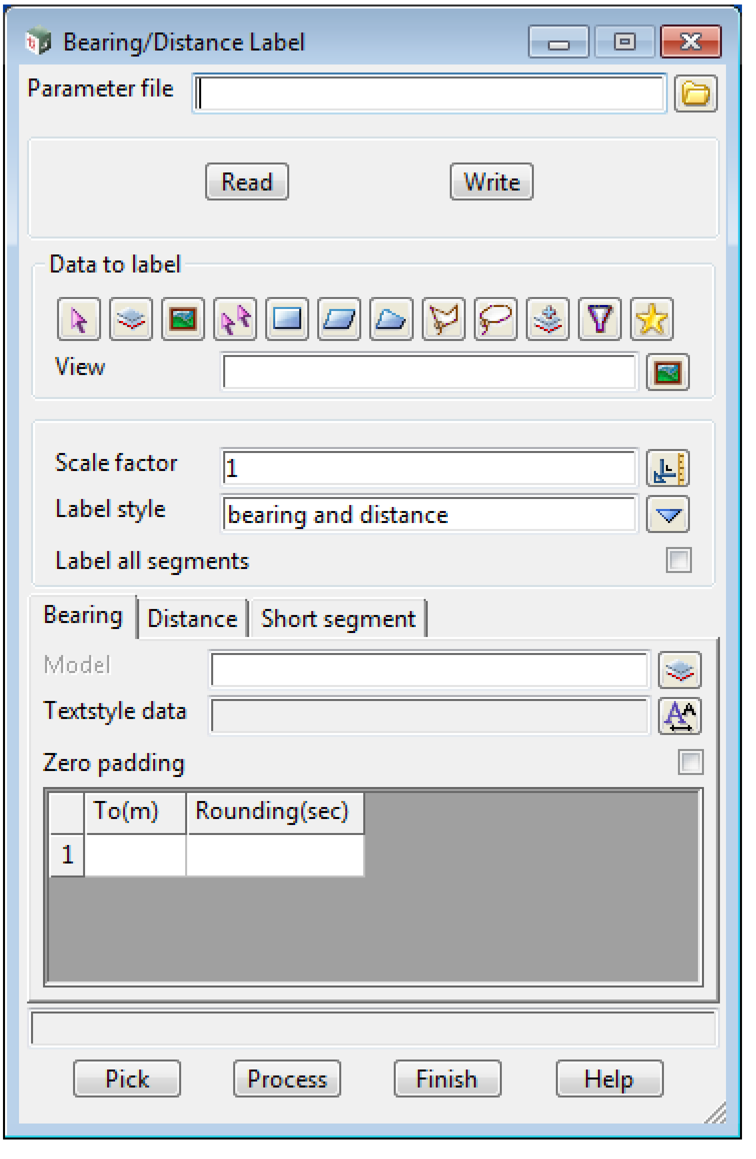
17.11.10 Bearing/Distance Label

Position of option on menu: **Survey =>Geodetics => Bearing/distance label**

The **Bearing/distance label** is for the labelling of a selected string with bearing and distance information. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees).

On selecting the **Bearing/distance label** option, the **Bearing/distance label** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameter file	file box		*.lbf files

the parameter file can be read in which will fill in the remaining values within the panel. The user can make changes and save the choices as a different file, thus enabling a library of labelling options to be created.

Read	button		

if a valid parameter file is entered into the parameter file field, the user can press the read button to load the information in the file into the panel.

Write	button		

if a valid parameter file name is entered into the parameter file field, the user can press the write button to save the edited panel information into a file so that it can be read in at a later date.

Scale factor	input box	Current Scale factor at Central meridian if set	

if a scale factor is specified, the distance values labelled will use the scale factor to compute the label distance. This scale factor will be applied to the calculated plane distance from coordinates in the following manner:

label distance = plane distance /scale factor.

Label style	choice box	bearing and distance	bearing and distance bearing distance distance bearing

the label style.

Bearing and distance equates to having the bearing and distance justification point at the same point on the midpoint of the segment (the text justification can make the bearing bottom-middle and the distance top-middle for example to show the bearing above the line and the distance below)

Bearing distance equates to having the bearing and distance justification point along side. For example, a label may be a bearing on the left and a distance on the right

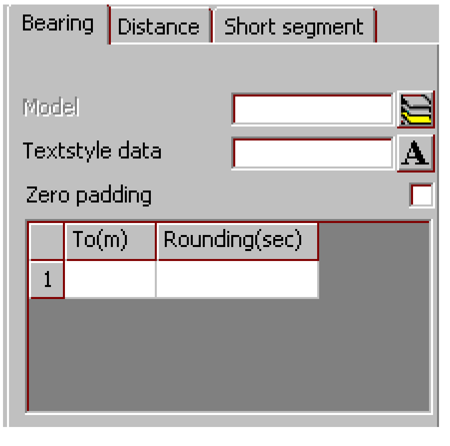
Distance bearing equates to having the distance and bearing justification point along side. For example, a label may be a distance on the left and a bearing on the right

Label all segments	tick box	unticked	

if ticked all the segments of the selected string will be labelled.

Bearing tab

the following fields are located on the bearing tab.

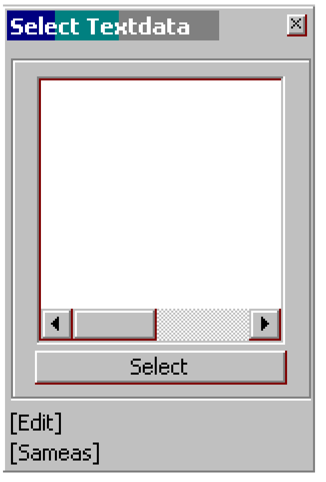


Field Description	Type	Defaults	Pop-Up
Model	model box		current models

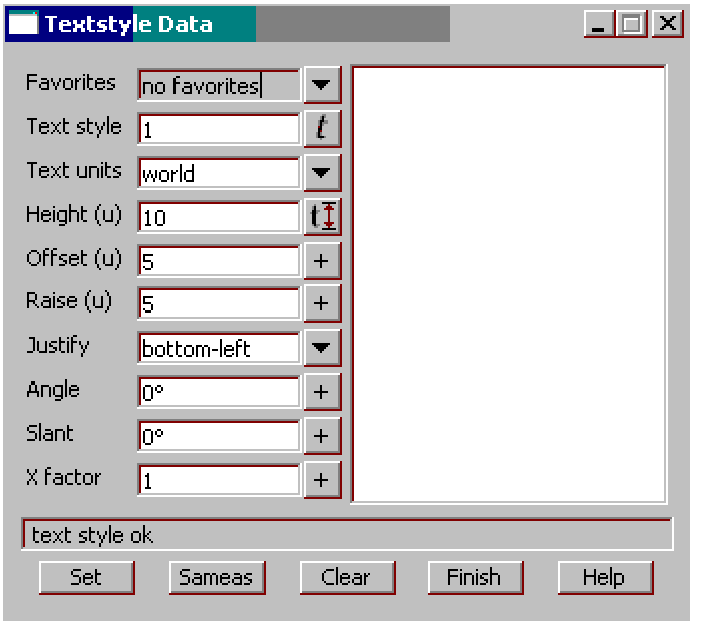
if a valid model name is specified, the bearing text will be created in that model.

Textstyle data textstyle box current textstyle names

on pressing the textstyle data button a list of available textdata predefined names read from the ***texstyles_name.4d*** *file are displayed.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the **textstyle data** *panel. This allows for definition of textstyle, units, height offset raise etc.*



The textstyle data panel enables the user to define multiple text parameters.

Zero padding tick box unticked

if ticked, the labels will have zero's inserted so that at least 2 characters exist for the minutes and second part of the label. For example, A bearing of 10^o *6' 5" would become* 10^o *06' 05" with padding.*

The values in the grid relate to the rounding of bearings for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box

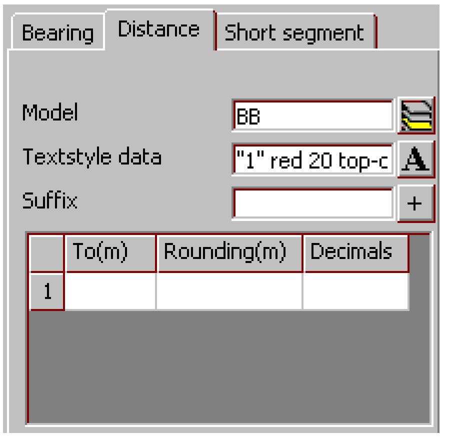
the rounding upper range limit in meters. This value together with the rounding specified, allow the bearings between certain distance ranges to be rounded to a certain value. The first line in the grid is *from 0 to the specified distance range. Any following lines in the grid use the* **To(m)** *value in the previous line for the lower limit to the* **To(m)** *value in that line.*

Rounding (sec) input box

the rounding value given relates to the distance range. Any bearing within the distance range specified will be rounded to the value in seconds. e.g for a rounding value of 60 seconds the bearing will be rounded to the nearest minute.

Distance tab

the following fields are located on the distance tab.

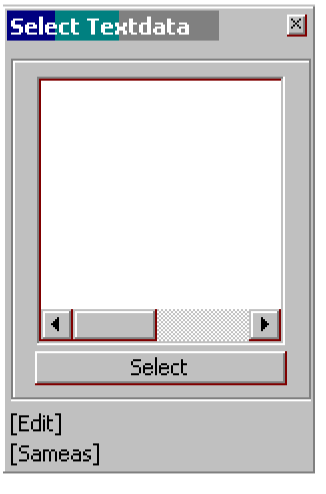


Field Description	Type	Defaults	Pop-Up
Model	model box		current models

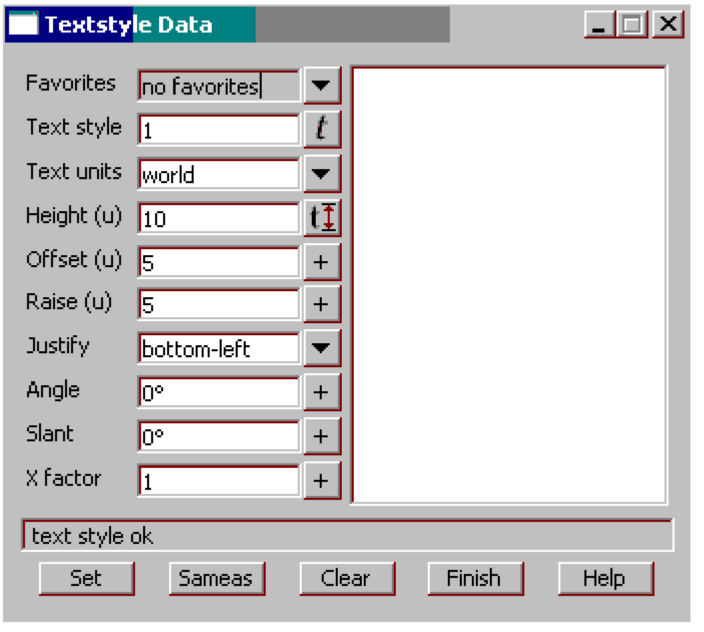
if a valid model name is specified, the distance text will be created in that model.

Textstyle data	textstyle box		current textstyle names

on pressing the textstyle data button a list of available textdata predefined names read from the ***texstyles_name.4d*** *file are displayed.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the **textstyle data** *panel. This allows for definition of textstyle, units, height offset raise etc.*



The textstyle data panel enables the user to define multiple text parameters.

Suffix input box

if entered, this suffix will be appended to the end of the distance label.

The values in the grid relate to the rounding of distances for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box

the rounding upper range limit in meters. This value together with the rounding and number of decimals specified, allow the distance to be rounded to a certain value. The first line in the grid is from 0 to the specified distance range. Any following lines in the grid use the **To(m)** *value in the previous line for the lower limit to the* **To(m)** *value in that line.*

Rounding (m) input box

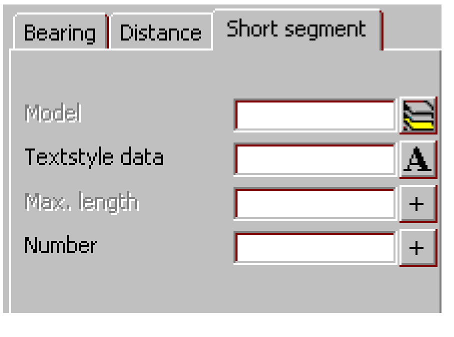
the rounding value given relates to the distance range. Any distance within the distance range specified will be rounded to the value in metres. e.g for a rounding value of 0.05 a distance of 125.261 will be rounded to a value of 125.25

Decimals input box

the number of decimal places can be specified. For a distance of 125.261, rounding of 0.05 and Decimals equal to 3, the label will be 125.250.

Short segment tab

the following fields are located on the short segment tab.

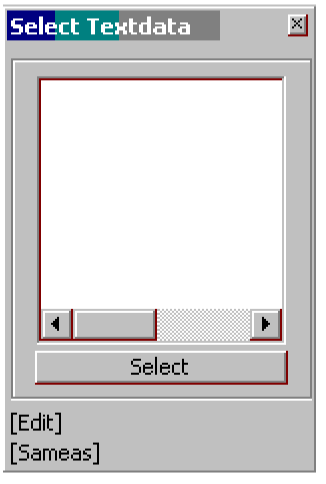


Field Description	Type	Defaults	Pop-Up
Model	model box		current models

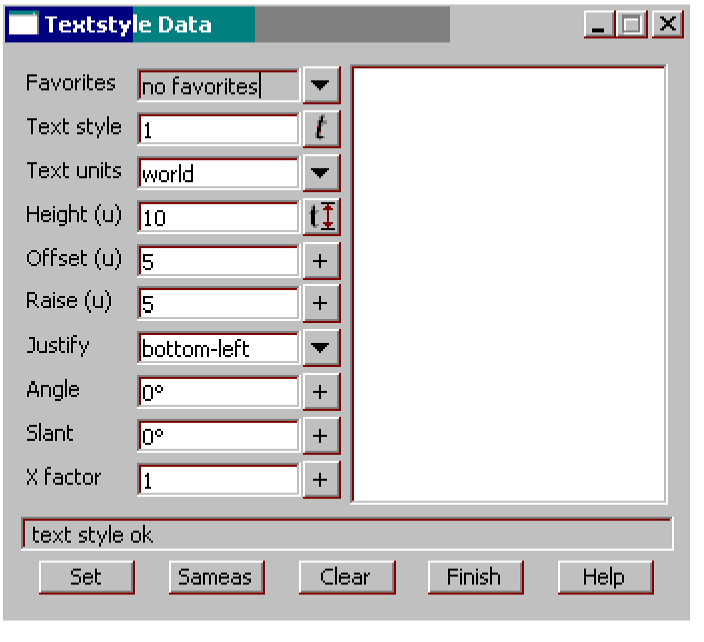
if a valid model name is specified, the short segment text will be created in that model.

Textstyle data	textstyle box		current textstyle names

*on pressing the textstyle data button a list of available textdata predefined names read from the **texstyles_name.4d** file are displayed.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Textstyle data** *panel. This allows for definition of textstyle, units, height offset raise etc.*



The textstyle data panel enables the user to define multiple text parameters.

Max. length	input box		

if entered, this value will be compared with the selected segment distance. If the selected distance is less than this distance, the short line labelling will override any bearing and distance labelling.

Number	input box		

if entered, this value will be used for the short segment text.

Pick button

on selection the user can then select a segment/line from a view with direction. The direction will give the bearing direction which is usually +/- 180 degrees different. eg a segment with a bearing of 24 degrees can be labelled with a bearing of 204 by picking in a south west direction.

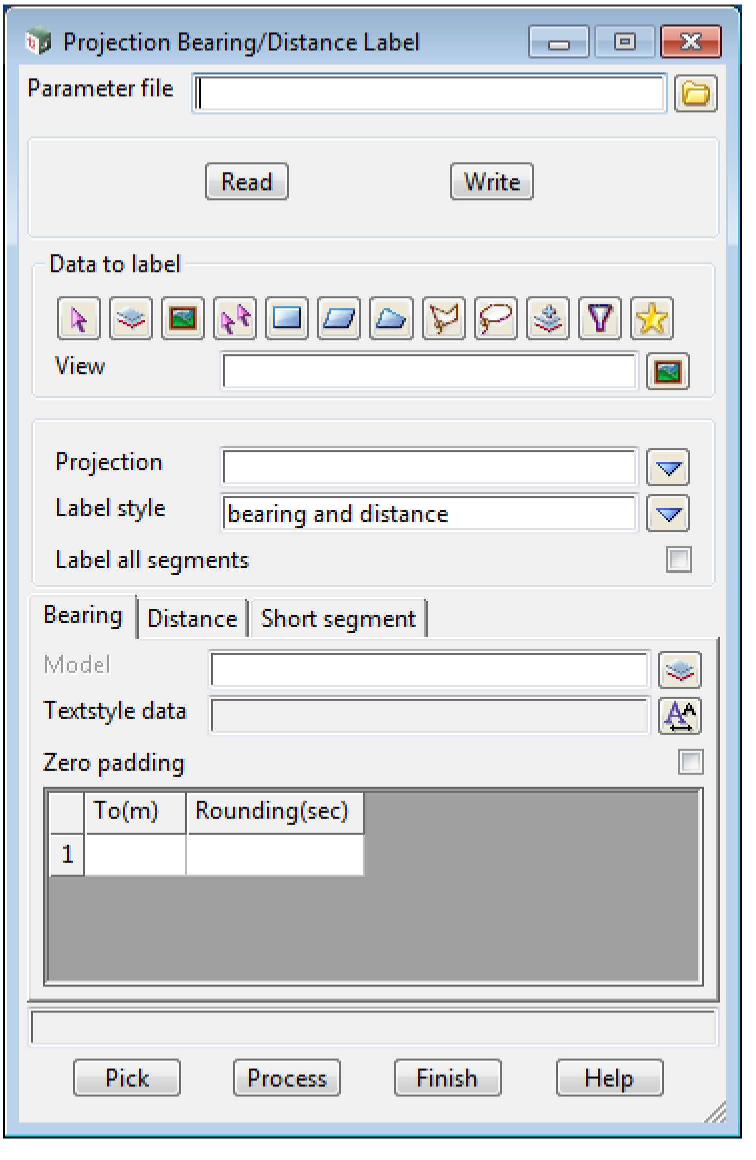
17.11.11 Projection Bearing/Distance Label

Position of option on menu: **Survey =>Geodetics => Projection bearing/distance label**

The **Projection bearing/distance label** is for the labelling of a selected string with plane bearing and ellipsoid distance information that is in terms of a selected projection. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees of actual direction).

On selecting the **Projection bearing/distance label** option, the **Projection bearing/distance label** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameter file	file box		*.lbf files

the parameter file can be read in which will fill in the remaining values within the panel. The user can make changes and save the choices as a different file, thus enabling a library of labelling options to be created.

Read	button		

if a valid parameter file is entered into the parameter file field, the user can press the read button to load the information in the file into the panel.

Write	button		

if a valid parameter file name is entered into the parameter file field, the user can press the write button to save the edited panel information into a file so that it can be read in at a later date.

Projection	choice	current projection	available projections

the projection of the data to be used for labelling.

Label style	choice box	bearing and distance	bearing and distance, bearing distance, distance bearing

the label style.

Bearing and distance equates to having the bearing and distance justification point at the same point on the midpoint of the segment (the text justification can make the bearing bottom-middle and the distance top-middle for example to show the bearing above the line and the distance below)

Bearing distance equates to having the bearing and distance justification point along side. For example, a label may be a bearing on the left and a distance on the right

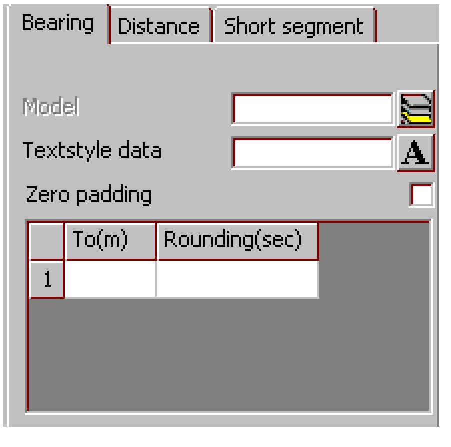
Distance bearing equates to having the distance and bearing justification point along side. For example, a label may be a distance on the left and a bearing on the right

Label all segments	tick box	unticked	

if ticked all the segments of the selected string will be labelled.

Bearing tab

the following fields are located on the bearing tab.

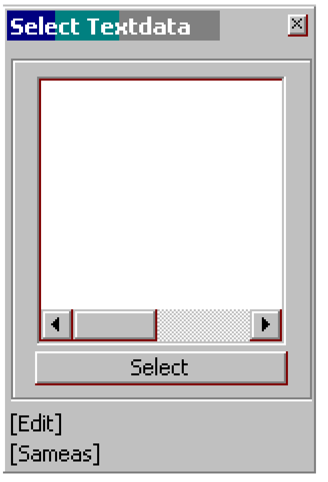


Field Description	Type	Defaults	Pop-Up
Model	model box		current models

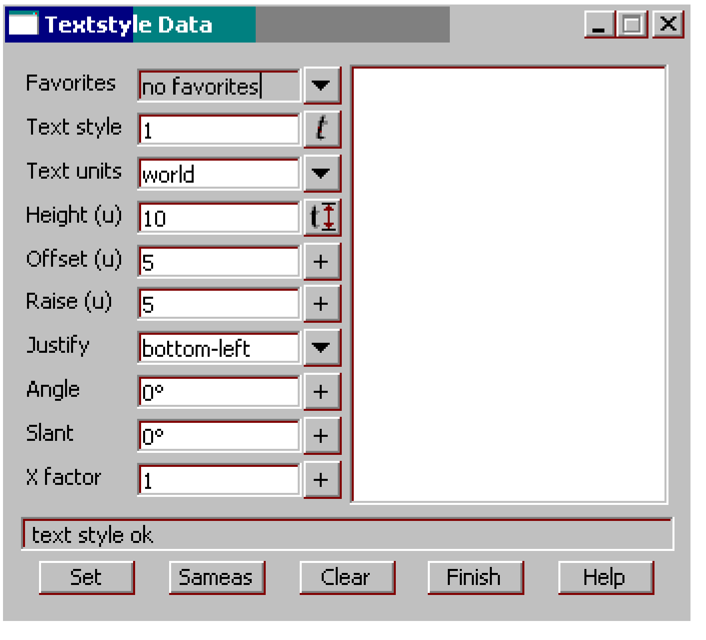
if a valid model name is specified, the bearing text will be created in that model.

Textstyle data	textstyle box		current textstyle names

on pressing the textstyle data button a list of available textdata predefined names read from the ***texstyles_name.4d*** *file are displayed.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the **textstyle data** *panel. This allows for definition of textstyle, units, height offset raise etc.*



The textstyle data panel enables the user to define multiple text parameters.

Zero padding tick box unticked

if ticked, the labels will have zero's inserted so that at least 2 characters exist for the minutes and second part of the label. For example, A bearing of 10^o *6' 5" would become* 10^o *06' 05" with padding.*

The values in the grid relate to the rounding of bearings for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box

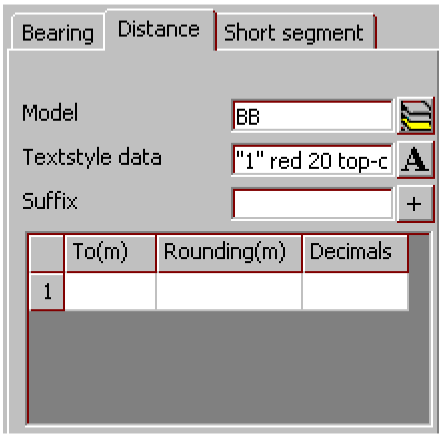
the rounding upper range limit in meters. This value together with the rounding specified, allow the bearings between certain distance ranges to be rounded to a certain value. The first line in the grid is from 0 to the specified distance range. Any following lines in the grid use the **To(m)** *value in the previous line for the lower limit to the* **To(m)** *value in that line.*

Rounding (sec) input box

the rounding value given relates to the distance range. Any bearing within the distance range specified *will be rounded to the value in seconds. e.g for a rounding value of 60 seconds the bearing will be rounded to the nearest minute.*

Distance tab

the following fields are located on the distance tab.

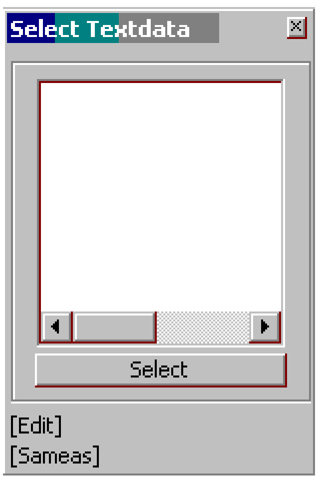


Field Description	Type	Defaults	Pop-Up
Model	model box		current models

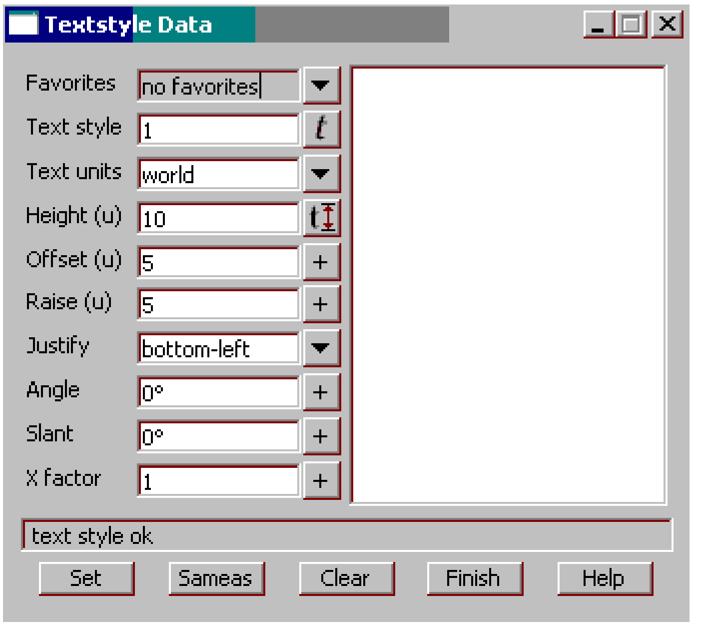
if a valid model name is specified, the distance text will be created in that model.

Field Description	Type	Defaults	Pop-Up
Textstyle data	textstyle box		current textstyle names

*on pressing the textstyle data button a list of available textdata predefined names read from the **texstyles_name.4d** file are displayed.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the **textstyle data** *panel. This allows for definition of textstyle, units, height offset raise etc.*



The textstyle data panel enables the user to define multiple text parameters.

Suffix input box

if entered, this suffix will be appended to the end of the distance label.

The values in the grid relate to the rounding of distances for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box

the rounding upper range limit in meters. This value together with the rounding and number of decimals specified, allow the distance to be rounded to a certain value. The first line in the grid is from 0 to the specified distance range. Any following lines in the grid use the **To(m)** *value in the previous line for the lower limit to the* **To(m)** *value in that line.*

Rounding (m) input box

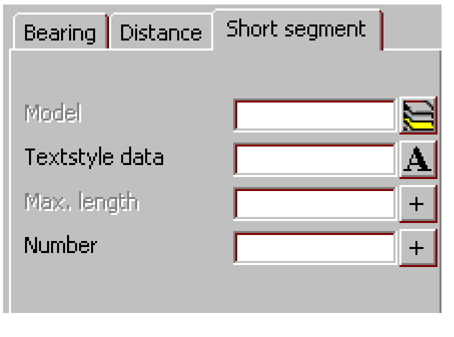
the rounding value given relates to the distance range. Any distance within the distance range specified will be rounded to the value in metres. e.g for a rounding value of 0.05 a distance of 125.261 will be rounded to a value of 125.25

Decimals input box

the number of decimal places can be specified. For a distance of 125.261, rounding of 0.05 and Decimals equal to 3, the label will be 125.250.

Short segment tab

the following fields are located on the short segment tab.

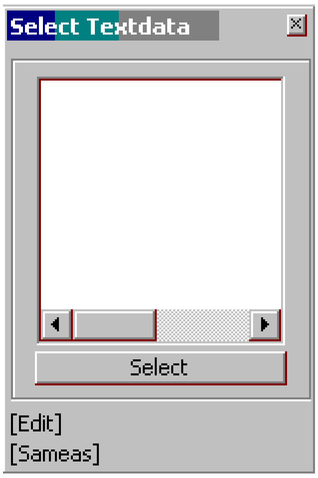


Field Description	Type	Defaults	Pop-Up
Model	model box		current models

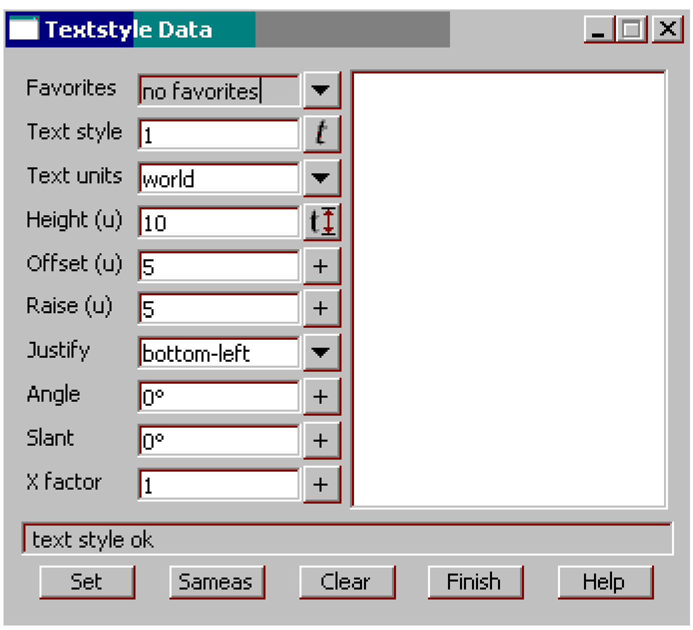
if a valid model name is specified, the short segment text will be created in that model.

Textstyle data	textstyle box		current textstyle names

on pressing the textstyle data button a list of available textdata predefined names read from the ***texstyles_name.4d*** *file are displayed.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the **textstyle data** *panel. This allows for definition of textstyle, units, height offset raise etc.*



The textstyle data panel enables the user to define multiple text parameters.

Max. length	input box		

if entered, this value will be compared with the selected segment distance. If the selected distance is less than this distance, the short line labelling will override any bearing and distance labelling.

Number	input box		

if entered, this value will be used for the short segment text.

Pick button

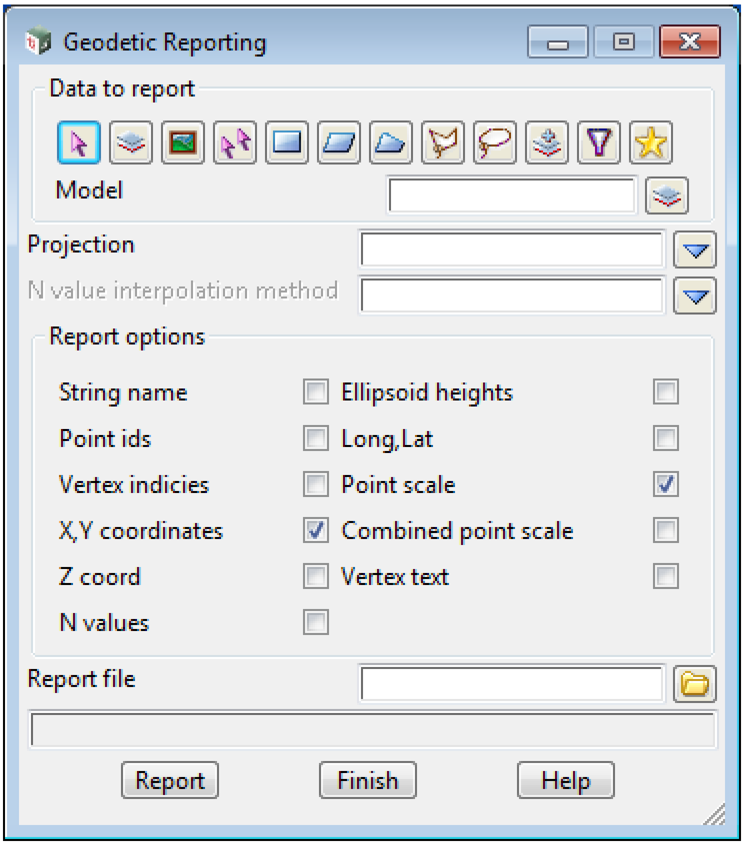
on selection the user can then select a segment/line from a view with direction. The direction will give the bearing direction which is usually +/- 180 degrees different. eg a segment with a bearing of 24 degrees can be labelled with a bearing of 204 by picking in a south west direction.

17.11.12 Geodetic Reporting

Position of option on menu: **Survey =>Geodetics => Geodetic reporting**

The **Geodetic reporting** option is for the reporting of selected data (projection coordinates) in terms of geodetic positions and variables. The user can choose from a number of different reporting options including, point scale factor, Longitude and latitude, point IDs, *etc.*

On selecting the **Geodetic reporting** option, the **Geodetic Reporting** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data to report source box model

the source of objects to be reported are selected using the data source box. For more information on the data source box see 4.19.3 Data Source *. The selected data must be in terms of the selected map projection.coordinate system.*

Projection choice current projection available projections

the projection of the data to be reported.

N value interpolation method choice box currently set method Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are define d in the project n value settings. For more information on the n value settings see the section 7.6.7 N values

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the reporting only. The original z value for the point will remain unchanged

String name tick box

if selected, any valid string names will be shown in the report.

Point IDs tick box

if selected, any valid point ids will be shown in the report.

Vertex indices tick box

if selected, vertex numbers will be shown in the report.

X,Y coordinates tick box ticked

if ticked, the coordinates of the selected data will be reported.

Z coord tick box

if selected, any valid z values will be shown in the report.

N values tick box

if ticked, the N value calculated for the given point will be reported (if valid).

Ellipsoid heights tick box

if selected, the calculated ellipsoid height will be reported. If no N values are calculated, this will be the same as the Z value.

Long, Lat tick box

if selected, the calculated longitude and latitude will be reported.

Point scale tick box ticked

if selected, the point scale for each point will be reported.

Combined point scale tick box

if selected, the combined point scale for each point will be reported. This combined scale factor is the product of the point scale factor and a height scale factor. The height scale factor is computed from the ellipsoid height of the point.

Text tick box

if selected, any valid text values will be shown in the report.

Report file input *.rpt

name of the file to report to.

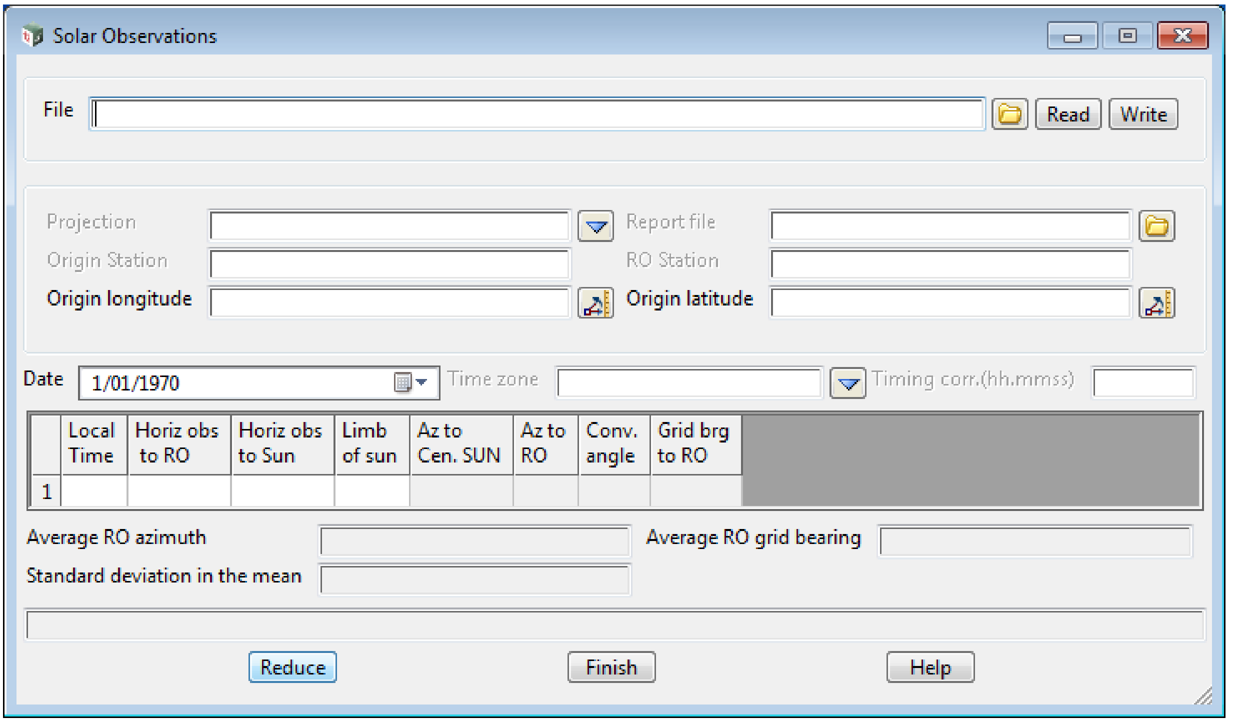
Report button

17.11.13 Solar Reduction

Position of option on menu: **Survey =>Geodetics => Solar reduction**

The **Solar reduction** option allows the reduction of observations to the sun by the hour angle method. The user can specify either limb or the centre of the sun, and a number of observations can be processed together. **The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory**. These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050

On selecting the **Solar reduction** option, the **Solar Observations** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	file box		*.ast files

a filename can be specified for reading or writing a file.

Read	button		

if a valid file exists, the file contents can be loaded into the panel.

Write	button		

if a valid name is specified and the valid values are entered into all of the fields, the user can write the input data to a file.

Projection	choice	current projection	available projections

a projection can be specified so that a grid convergence value can be computed. This value will be used to compute the grid or projection bearing to the RO. If left blank, only the True azimuth will be reported.

Report file	input		*.rpt

name of the file to report to.

Origin station	input		

name of the origin station

RO station	input		

name of the reference object station

Origin longitude	input		

the observation station's longitude should be specified in DMS format.

Origin latitude	input		

the observation station's latitude should be specified in DMS format.

Date	date box	current system date	

the date of the observations as at the observers position should be entered. This can be by direct entry *into the date field or by selecting the day, month, year from a date pop-up panel. The user can scroll through different months by selecting the arrow buttons on the pop-up date panel.*

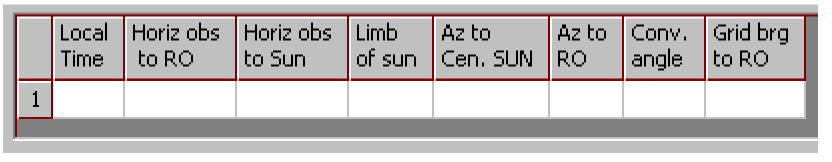
Time zone time zone box major time zones

a valid time zone for the observers position and local time should be selected from the pop-up list.

Timing corr.(hh.mmss) input

the correction to apply for any timing error including stopwatch corrections should be entered. The value should be in a hours, minutes seconds in hp format.

GRID VALUES: input



Local time input

the local time of the observation specified in 24 hour time in HMS. eg. 18.121002

Horiz obs to RO input

the horizontal angle (bearing) observed to the RO for the set of measurements. A set in this case includes a pointing to the RO and sun (at a certain time) in the same face.

Horiz obs to SUN input

the horizontal angle (bearing) observed to the Sun for the set of measurements.(The observation should not be corrected for the suns semi diameter as this is done internally by the reduction process)

If observation s are made on both faces, a separate line should be entered for each face. e.g Face 1 to RO may be 0.0000 and the face 1 to the sun may be 50.0000 which would be on the same line, then the observer may change face to face 2 and observe to the sun again followed by the RO. The face 2 observations should appear on the next line eg 180.0004 230.0110.

Limb of sun choice box Centre
Left limb
Right limb

the limb of the sun observed should be specified. This enables the suns semi diameter correction to be applied. This also allows the observations to be read in any order.

Az to cen. SUN output

the true azimuth to the sun will be displayed in this field on successful reduction of the observations.

Az to RO output

the true azimuth to the RO will be displayed in this field on successful reduction of the observations.

Conv. angle output

the convergence angle at the observation point will be displayed in this field if a valid projection is specified and there is a successful reduction of the observations.

Grid brg to RO output

the grid bearing to the RO will be displayed in this field if a valid convergence angle is calculated and there is a successful reduction of the observations. The grid bearing is calculated by:

Grid brg = True azimuth + convergence

The fields and buttons used in this panel below the grid have the following functions.

Field Description Type Defaults Pop-Up

Average RO azimuth output

if there is as successful reduction, the average RO azimuth value will be reported in this field.

Average RO grid bearing output

if there is as successful reduction, and the projection given, the average RO grid bearing value will be reported in this field.

Standard deviation in the mean output

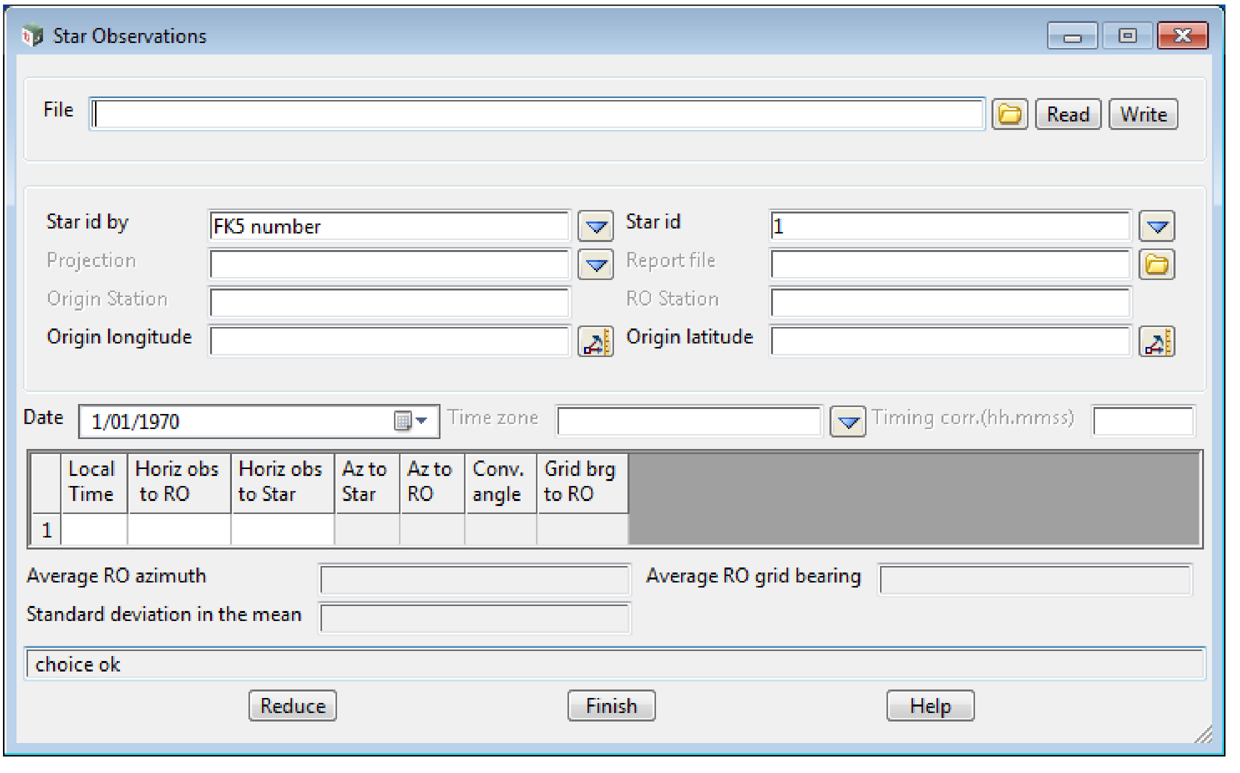
this is a statistical measure of the reduced observations.

17.11.14 Star Reduction

Position of option on menu: **Survey =>Geodetics => Star reduction**

The **Star reduction** option allows the reduction of observations to the nominated star by the hour angle method. A number of observations can be processed together. **The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory.** These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050

On selecting the **Star reduction** option, the **Star Observations** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	file box		*.ast files

a filename can be specified for reading or writing a file.

Read button

if a valid file exists, the file contents can be loaded into the panel.

Write button

if a valid name is specified and the valid values are entered into all of the fields, the user can write the input data to a file.

Star id by	button	FK5 number	General name Constellation Bayer/ Flamsteed number FK5 number SAO number

the star can be identified by a number of different means. The stars available are based on the Fifth Fundamental Catalogue(FK5) catalogue. Cross matching of id's are not possible in some instances. e.g A star may have no known general name.

The selection of an id method will force the changing of the id list so the particular star can be selected.

Star id	choice	1st star id in list	available id's for that type

the star id can be selected from the list.

Report file	input		*.rpt

name of the file to report to.

Origin station input

name of the origin station

RO station input

name of the reference object station

Origin longitude input

the observation station's longitude should be specified in DMS format.

Origin latitude input

the observation station's latitude should be specified in DMS format.

Date date box current system date

the date of the observations as at the observers position should be entered. This can be by direct entry into the date field or by selecting the day, month, year from a date pop-up panel. The user can scroll through different months by selecting the arrow buttons on the pop-up date panel.

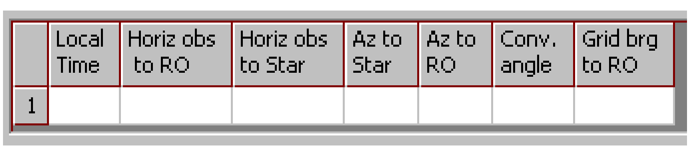
Time zone time zone box major time zones

a valid time zone for the observers position and local time should be selected from the pop-up list.

Timing corr.(hh.mmss) input

the correction to apply for any timing error including stopwatch corrections should be entered. The value should be in a hours, minutes seconds in hp format.

GRID VALUES: input



Local time input

the local time of the observation specified in 24 hour time in HMS. eg. 18.121002

Horiz obs to RO input

the horizontal angle (bearing) observed to the RO for the set of measurements. A set in this case includes a pointing to the RO and star (at a certain time) in the same face.

If observation s are made on both faces, a separate line should be entered for each face. e.g Face 1 to RO may be 0.0000 and the face 1 to the star may be 50.0000 which would be on the same line, then the observer may change face to face 2 and observe to the star again followed by the RO. The face 2 observations should appear on the next line eg 180.0004 230.0110.

Horiz obs to Star input

the horizontal angle (bearing) observed to the Star for the set of measurements.

Az to Star output

the true azimuth to the sun will be displayed in this field on successful reduction of the observations.

Az to RO output

the true azimuth to the RO will be displayed in this field on successful reduction of the observations.

Conv. angle output

the convergence angle at the observation point will be displayed in this field if a valid projection is specified and there is a successful reduction of the observations.

Grid brg to RO output

the grid bearing to the RO will be displayed in this field if a valid convergence angle is calculated and there is a successful reduction of the observations. The grid bearing is calculated by:

Grid brg = True azimuth + convergence

The fields and buttons used in this panel below the grid have the following functions.

Field Description	Type	Defaults	Pop-Up

Average RO azimuth output

if there is as successful reduction, the average RO azimuth value will be reported in this field.

Average RO grid bearing output

if there is as successful reduction, and the projection given, the average RO grid bearing value will be reported in this field.

Standard deviation in the mean output

this is a statistical measure of the reduced observations.

17.12 Traverse Spreadsheet

Position of menu: **Survey =>Traverse spreadsheet**

The **Traverse Spreadsheet** options allow the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop). Traverse Spreadsheet will often be abbreviated as TSS.

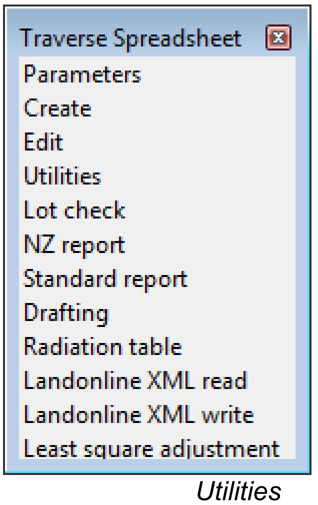
There are two types of traverse spreadsheets (TSS) - Plane and Projection.

For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculate co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and ***12d Model*** calculates the correct co-ordinate position using full projection calculations.

The **Traverse spreadsheet** walk-right menu contains the traverse spreadsheet options.

.

For the option *Parameters, go to* 17.12.1 TSS Parameters
Create 17.12.2 TSS Create
Edit 17.12.3 TSS Edit



Setting parameters for the traverse spreadsheet option

NZ traverse spreadsheet report
Standard traverse spreadsheet report
Traverse spreadsheet drafting
Creating radiation tables from a TSS
Reading LINZ XML data
Writing LINZ XML data
Least Square adjustment

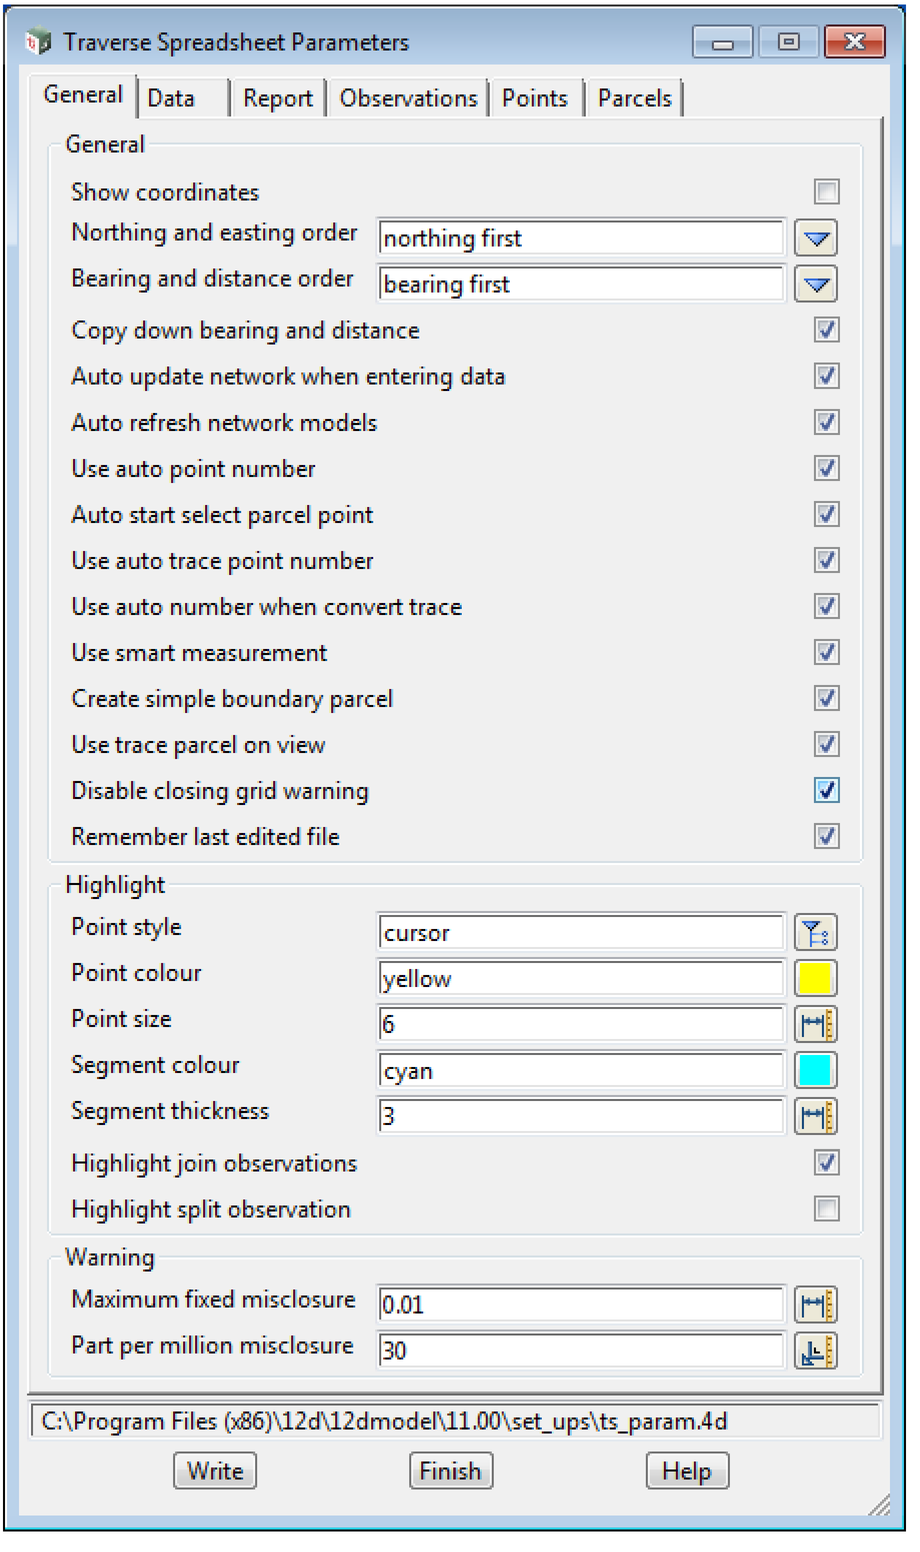
Utilities	17.12.4 TSS Utilities
Lot check	17.12.5 Lot Check
NZ report	17.12.6 NZ TSS Report
Standard report	17.12.7 Standard TSS Report
Drafting	17.12.8 TSS Drafting
Radiation table	17.12.9 TSS Radiation Table Drafting
Landonline XML read	17.12.10 Landonline XML Read
Landonline XML write	17.12.11 Landonline XML Write
Least square adjustment	

17.12.1 TSS Parameters

Position of option on menu: **Survey =>Parameters**

The **Traverse Spreadsheet Parameters** sets the parameters for defining the *look and feel* of the TSS create and edit panels, reports and drafting.

Selecting **Parameters** brings up the **Traverse Spreadsheet Parameters** panel:



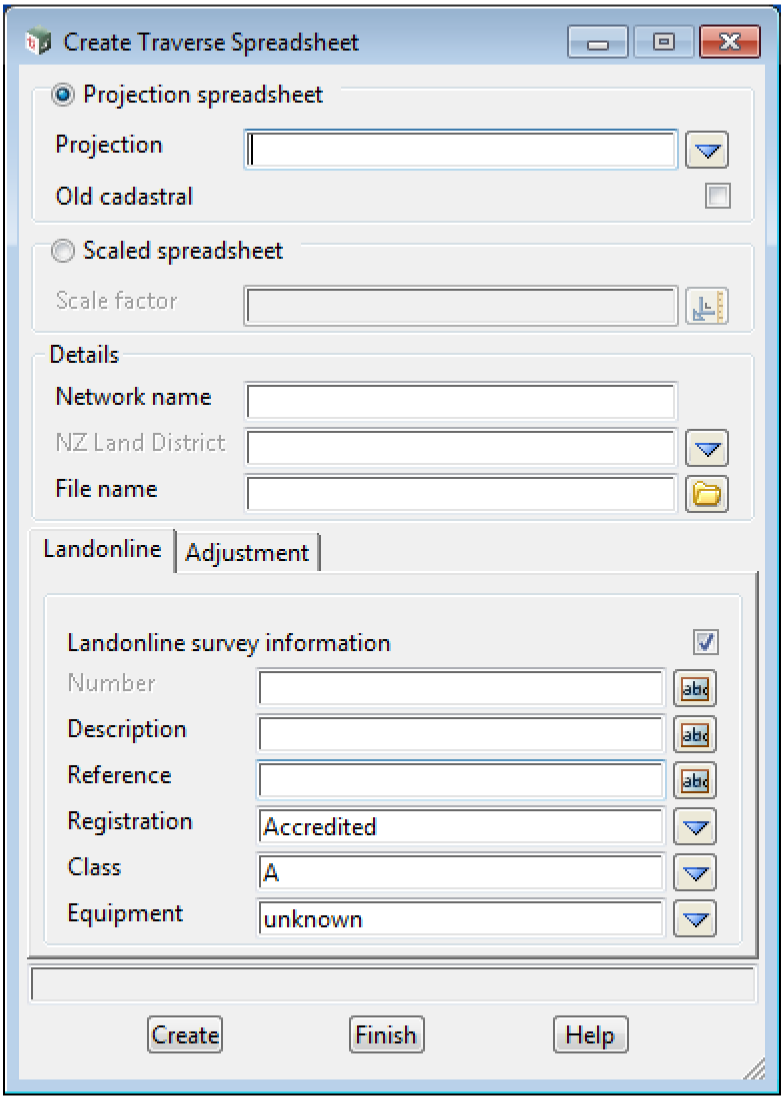
17.12.2 TSS Create

Position of option on menu: **Survey =>Traverse spreadsheet =>Create**

A traverse spreadsheet (TSS) can either use a constant scale factor or a cartographic projection to define the relationship between bearings/distances and the (x,y) co-ordinates.

The **Traverse Spreadsheet Create** option allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

Selecting Traverse Spreadsheet **Create** brings up the **Create Traverse Spreadsheet** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection spreadsheet	radio button		

if selected then the **Projection** *field must be filled in.*

Projection	projection box	first projection	project projections

the cartographic projection used in the TSS. For more information on projections go to 7.6.6 Projections *. This is a Projection TSS.*

Scaled spreadsheet	radio button		

if selected then the **Scale factor** *field must be filled in.*

Scale factor	real box		

the constant scale factor used in the TSS. This is a Plane TSS.

Details section

Spreadsheet name text box

the name for the TSS

File name text box

*name of the *.tf file to store all the TSS data in. The TSS can be brought back for editing by giving this filename.*

Create button

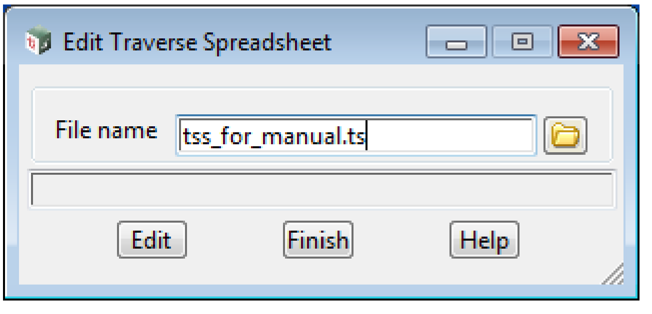
create a new traverse spreadsheet using the parameters entered in the above panel field. The appropriate editor (either for a **Projection Traverse Spreadsheet** *or a* **Plane Traverse Spreadsheet** *panel) is then brought up for the TSS data to be entered and/or edited.*

17.12.3 TSS Edit

Position of option on menu: **Survey =>Traverse spreadsheet =>Edit**

The traverse spreadsheet editor reads in an existing TSS file and loads the information into either the **Projection Traverse Spreadsheet** or the **Plane Traverse Spreadsheet** panel.

Selecting Traverse Spreadsheet **Edit** brings up the **Edit Traverse Spreadsheet** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File name	file box		*.ts files

name of the file containing the traverse spreadsheet information to be edited.

Edit button

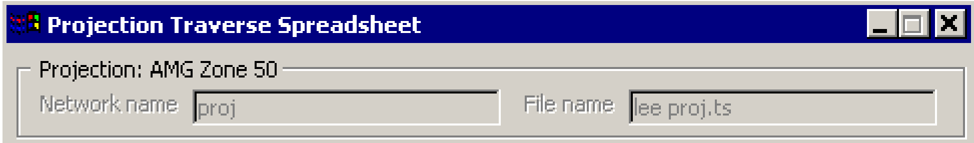
read the information in the traverse spreadsheet file and load it into either a **Projection Traverse Spreadsheet** *or a* **Plane Traverse Spreadsheet** *panel.*

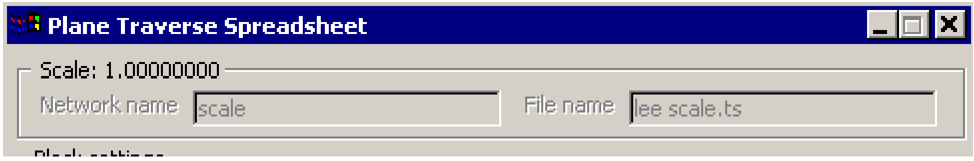
For entering/editing either a Projection TSS or Plane TT, please go to the section 17.12.3.1 Traverse Spreadsheets

17.12.3.1 Traverse Spreadsheets

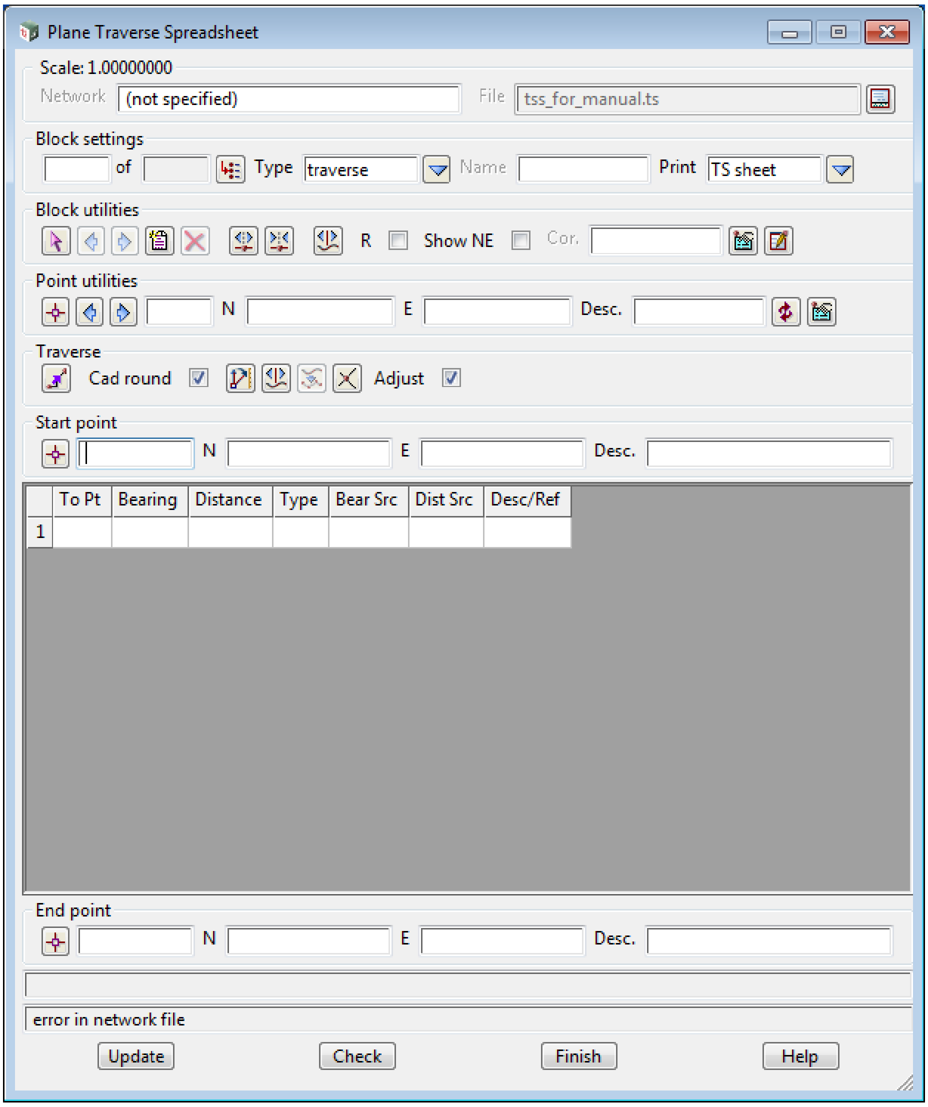
The **Projection** and **Plane TSS** panels allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

The two panels are very similar and only the top section is different. The Projection Traverse Spreadsheet requires a **Projection** rather than a **Scale factor**.





For more information about terminology used in the projection option, see the Appendix 38 Geodetics Summary .



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network name	display only		

the entire spreadsheet can be given a name for identification purposes. This was defined when the TSS was created and can only be changed using the TSS Utilities option.

File name	display only		

the file name containing the TSS information. This was defined when the TSS was created and can only be changed using the TSS Utilities option.

The only visible difference between the Plane and Projections Traverse Spreadsheet panel is that the Scale or Projection is given at the top of the panel. All the panel fields are the same.

Of course the calculations are different for the two types of spreadsheets. For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculated co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and ***12d Model*** *calculates the correct co-ordinate position using full projection calculations.*

Block Settings

Position	input		

*the order of a block within the spreadsheet can be specified by nominating the block position. Numbering within the list starts at **1**. This parameter is used for inserting new blocks into the list. If a user nominates to insert in position 5 and there is only 2 blocks already defined, the block will be placed at the end of the list (i.e. position 3)*

Count	input		

the number of blocks within the spreadsheet.

Type	choice	traverse	traverse, radiation, radiation backsight, parcel, irregular trace, balance

the type of a block within the spreadsheet can be specified by nominating the block type.

*The **traverse** block is for the entry of loop and non-loop traverses starting and ending at points with known coordinate values.*

For a hanging traverse, i.e. a traverse that does not close onto a known point, the data can be entered by entering a 0 (zero) in the point id field of the grid control, as well as the end point - point id field.

*The **radiation** block consists of a number of radiations or **side shots** from a point with known coordinates. This point may be defined in a previous traverse block or it may be from a known point. A valid coordinate must exist for the radiation start point for the radiation block to be used.*

*A **radiation backsight** block is the same a s a radiation block except that the value set to the backsight is included. After adjustment of previous blocks, the coordinates of setup and backsight points often change. This will introduce swing errors into calculations if not accounted for. By entering the backsight value as set in the field, a comparison is made between what was set and the adjusted value. The difference is then applied to the radiations in the block to reflect the corrected angle measurements.*

XXXX - need 12d NZ documentation on TSS

Name	input		

a spreadsheet can consist of a number of different blocks. For each block, a name can be given which can help identify a particular traverse/radiation block within the spreadsheet.

Flag	input		

the adjustment mode of the current block. The mode is either adjusted or unadjust. All blocks are set to *unadjusted on reading of a file, and the user specifies which blocks are to be adjusted.*

Prev button

allows the navigation to the previous block in the list.

Next button

allows the navigation to the next block in the list.

New button

allows for the definition and entry of a new block in the list.

Update button

allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the ***update*** *button will ensure the new value will be used in further calculations and adjustments*

Insert button

allows for the insertion of a block into the list in the position defined by the **Block position** entry.

Append button

allows for the insertion of a block at the end of the list.

Delete button

allows for the deletion of the currently displayed block.

Show EN tick box ticked

if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not be shown.

Copy b dsc tick box ticked

if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.

Pick string button

allows for the loading of the current block by selecting a string from the current view.

Adjustment method choice bowditch, compass, transit, least square

method of adjustment.

Loop tick box unticked

For loop traverses the tick box should be checked. This assumes that the start and end points are the same.

The fields in this panel define the start and end point details. If the **loop** option is chosen the end point details are assumed to be the same as the start point In this case the end point group is disabled.

Least square tab

Angular std (sec).

*The standard deviation of a single angular measurement in seconds of arc***.**

Linear std (mm)

this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)

ppm

this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations input box 10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ input box 0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

variance increase tick box ticked

the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

Start point button/input

the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

N input

the start point's northing value.

E input

the start point's easting value.

Desc input

the start point's description.

the grid control values can be entered using valid inputs into the various fields.

***To Point**. The point id of the next traverse station.*
***Bearing (dms)**. The bearing of the traverse line.*
***Distance**. The distance of the traverse line.*
***Point Desc.** The description of the traverse point*
***Easting** The easting coordinate of the traverse point. **NB.** This field is only displayed when the calc or adjust buttons are selected.*
***Northing** The northing coordinate of the traverse point. **NB.** This field is only displayed when the calc or adjust buttons are selected.*

The fields in end point group specify the end point parameters

end point button/input

the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

N input

the end point's northing value.

E input

the end point's easting value.

Desc input

the end point's description.

the misclose line near the bottom of the panel have the following functions.

Bearing input box

the closing bearing for the traverses.

Distance input box

the closing distance of the traverse

Delta east input box

the closing vector's delta east component

Delta east input box

the closing vector's delta east component

Misclosure input box

the ratio of the closing distance to the total traverse distance.

The buttons at the bottom of the panel have the following function.

Calc button

the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list ***before*** *this can be done.*

Adjust button

the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

Adjust All button

the adjustment of all of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

Save button

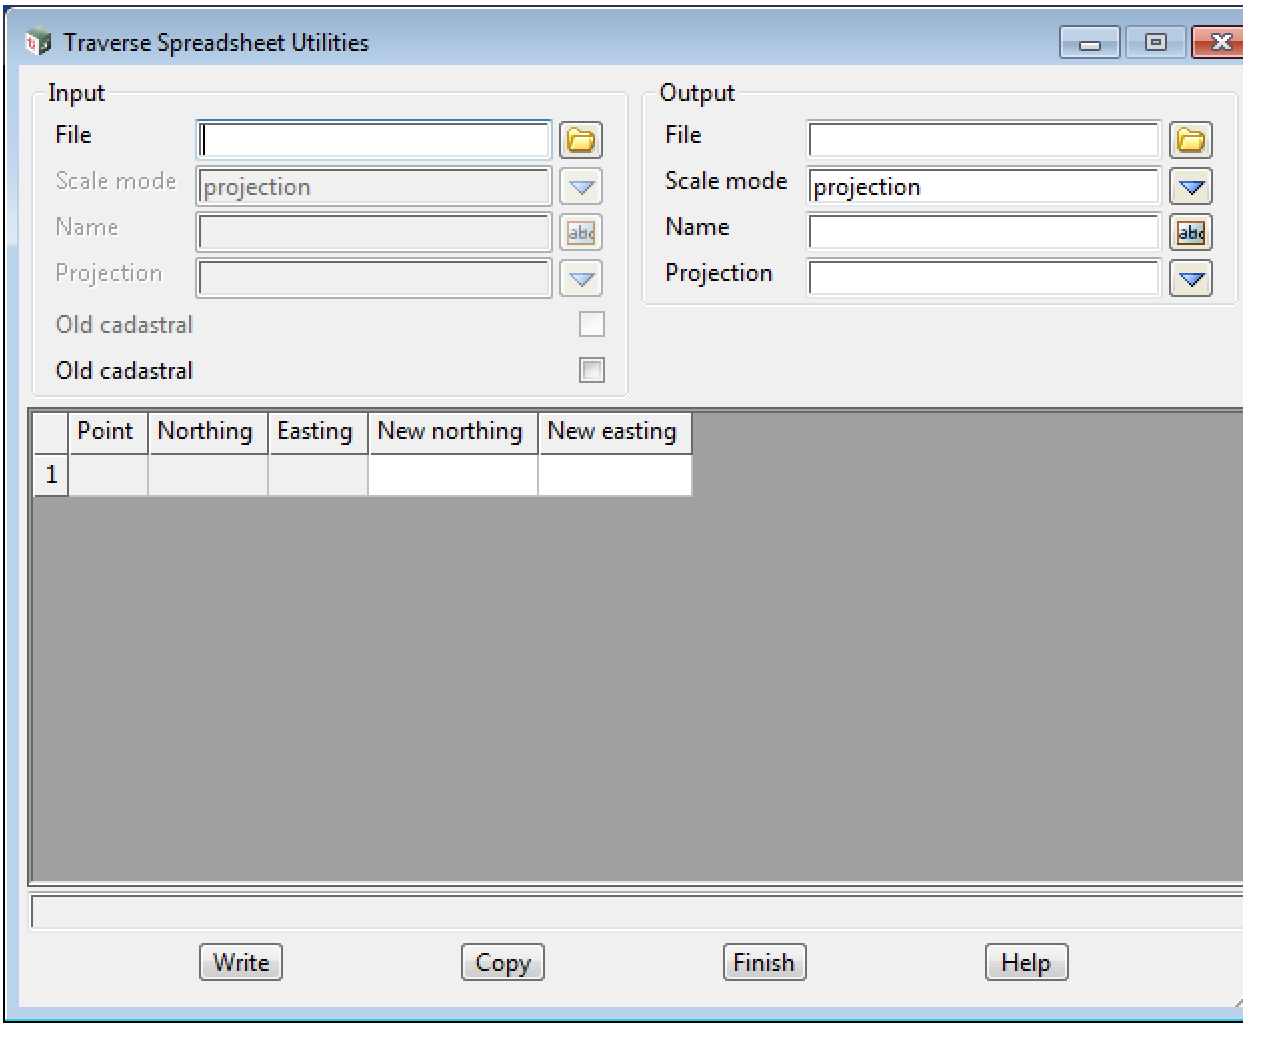
saves the current data in the panel to the TSS file (displayed in the ***file name*** *box).*

17.12.4 TSS Utilities

Position of option on menu: **Survey =>Traverse spreadsheet =>Utilities**

The traverse spreadsheet utilities are used to change the file containing a TSS, change the name (TSS), change between Plane (constant scale) or Projection type,

Selecting Traverse Spreadsheet Utilities brings up the **Traverse Spreadsheet Utilities** panel:

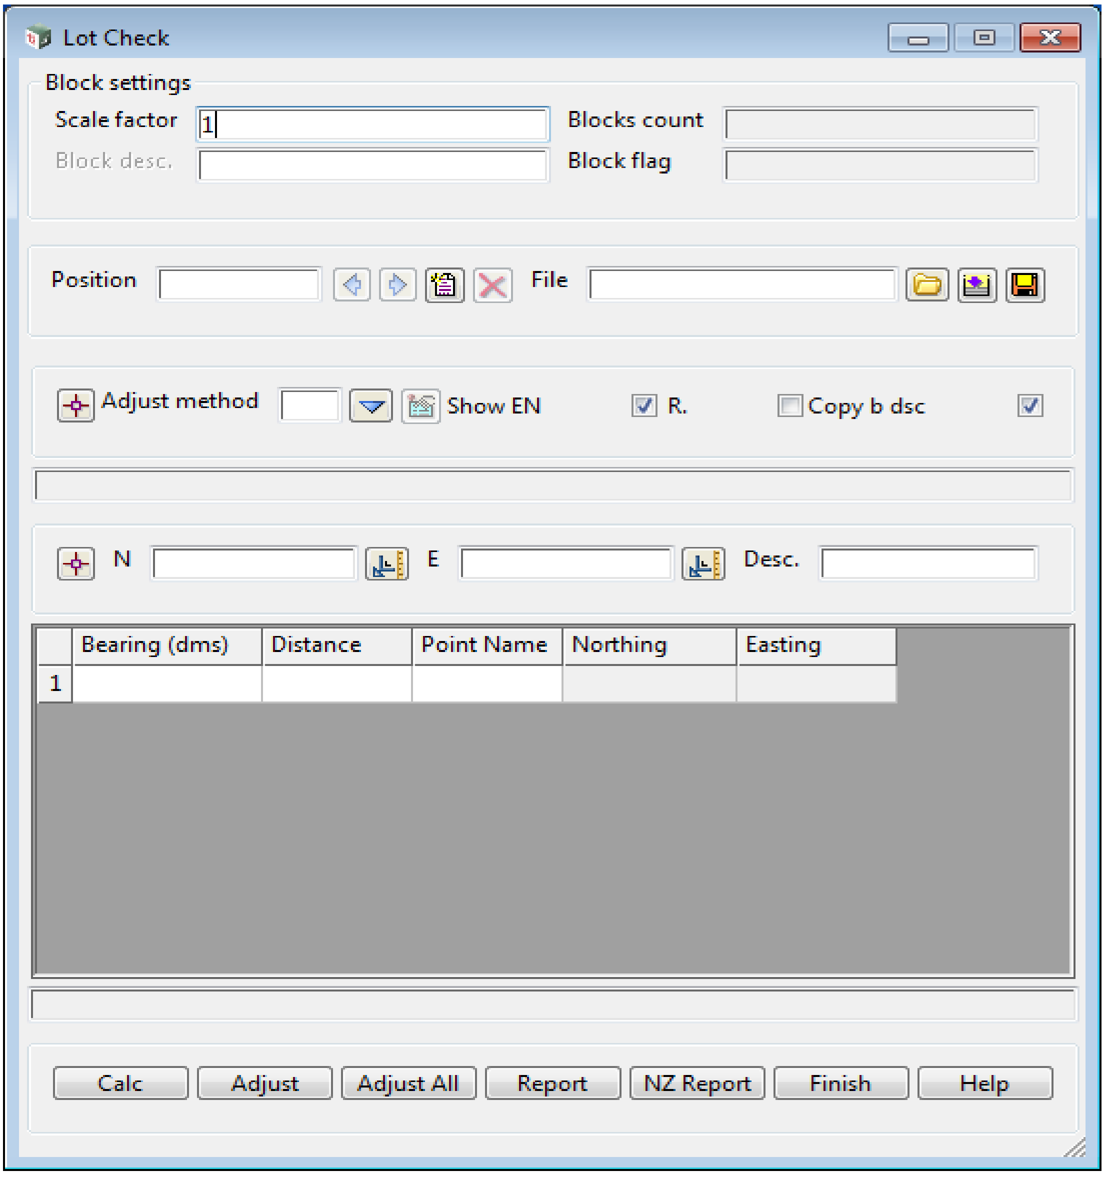


17.12.5 Lot Check

Position of option on menu: **Survey =>Traverse spreadsheet =>Lot check**

The **Lot check** option allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. This option can be used to enter existing plan dimensions to check area calculations as well as ensuring lots are closed to prescribed limits.

Selecting **Lot check** brings up the **Lot Check** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

The scale and datum fields are the only difference between the plane and datum lot check panels.

Scale factor input project scale factor

a scale factor can be defined which will be applied to any entered distances. Final distances used in calculations are derived by multiplying the entered distance by the scale factor.

Block count input

the number of blocks within the spreadsheet.

Desc. input

a spreadsheet can consist of a number of different blocks. For each block, a block description can be given which can help identify a particular traverse/radiation block within the spreadsheet.

Block flag input

the adjustment mode of the current block. The mode is either adjusted or unadjust. All blocks are set to unadjusted on reading of a file, and the user specifies which blocks are to be adjusted.

Prev button

allows the navigation to the previous block in the list.

Next button

allows the navigation to the next block in the list.

New button

allows for the definition and entry of a new block in the list.

Update button

*allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the **update** button will ensure the new value will be used in further calculations and adjustments*

Insert button

allows for the insertion of a block into the list in the position defined by the **Block position** entry.

Append button

allows for the insertion of a block at the end of the list.

Delete button

allows for the deletion of the currently displayed block.

File name input box *.ts

a file name can be defined which will allow for the reading of an existing file and for defining a new file name for reading in the future.

Read button

*the read button allows for the loading of an existing file as specified by the **file name** box.*

Write button

*the write button allows for the saving of the current file as specified in the **file name** box.*

Pick string button

allows for the loading of the current block by selecting a string from the current view.

Adjust method choice bowditch, compass, transit, least square, none

method of adjustment.

Show EN tick box ticked

if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not be shown.

Copy b dsc tick box ticked

if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.

The fields in this panel define the start and end point details. If the **loop** option is chosen the end point details are assumed to be the same as the start point In this case the end point group is disabled.

Least square tab

The fields in this panel define the values to be used for least square adjustments.

Angular std (sec).

The standard deviation of a single angular measurement in seconds of arc.

Linear std (mm)

this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)

ppm

this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations input box 10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ input box 0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

variance increase tick box ticked

the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

Start point button/input

the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

N input

the start point's northing value.

E input

the start point's easting value.

Desc input

the start point's description.

The grid control values can be entered using valid inputs into the various fields.

To Point. *The point id of the next traverse station.*
Bearing (dms). *The bearing of the traverse line.*
Distance. *The distance of the traverse line.*
Point Desc. *The description of the traverse point*
Easting *The easting coordinate of the traverse point.* ***NB.*** *This field is only displayed when the calc or adjust buttons are selected.*
Northing *The northing coordinate of the traverse point.* ***NB.*** *This field is only displayed when the calc or adjust buttons are selected.*

The fields in end point group specify the end point parameters

end point button/input

the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

N input

the end point's northing value.

E input

the end point's easting value.

Desc input

the end point's description.

The misclose line near the bottom of the panel has the following functions:

Bearing input box

the closing bearing for the traverses.

Distance input box

the closing distance of the traverse

Delta east input box

the closing vector's delta east component

Delta east input box

the closing vector's delta east component

Misclosure input box

the ratio of the closing distance to the total traverse distance.

The buttons at the bottom of the panel have the following functions:

Calc button

*the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list **before** this can be done.*

Adjust button

the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

Adjust All button

the adjustment of all of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

Report button

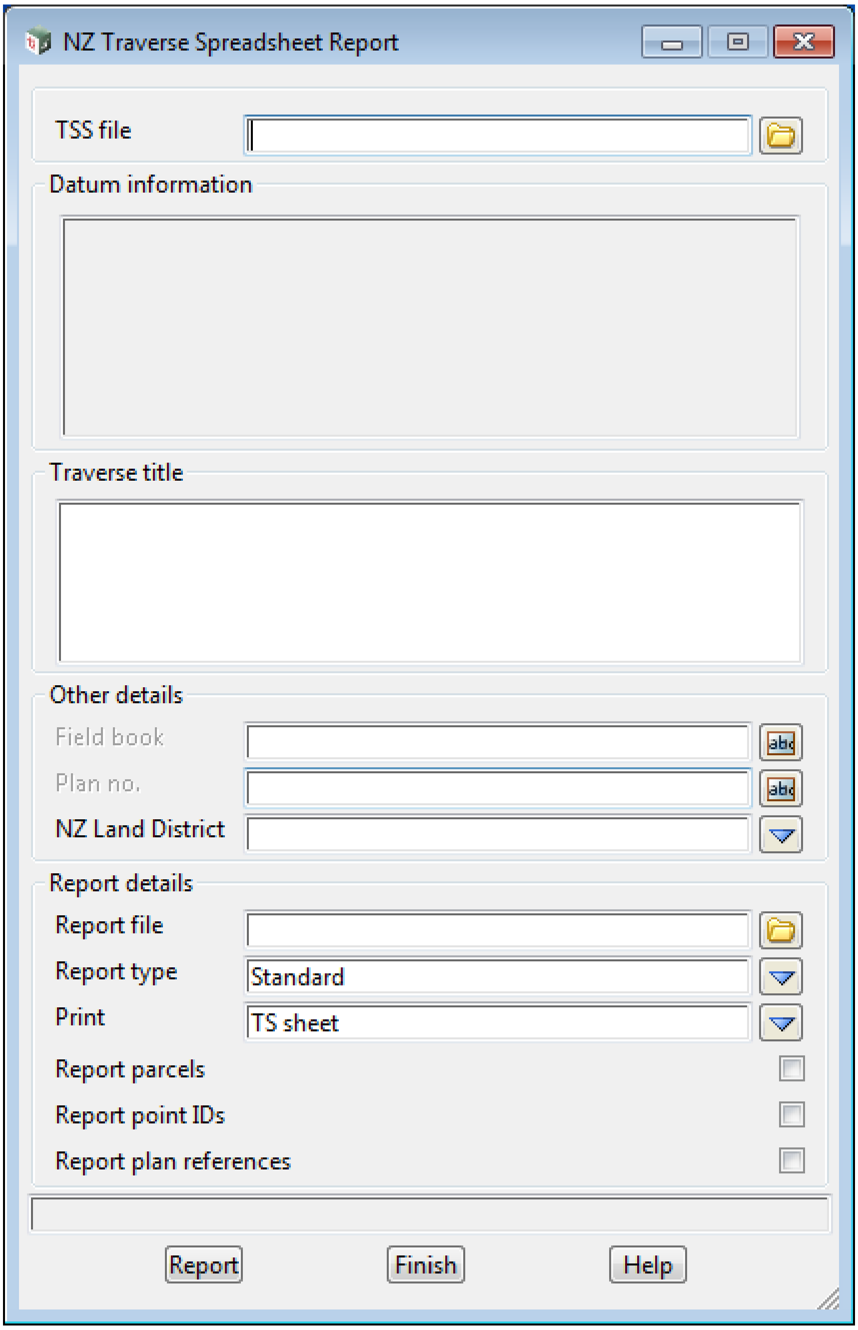
on selecting this button the NZ traverse spreadsheet report panel appears.

17.12.6 NZ TSS Report

Position of option on menu: **Survey =>Traverse spreadsheet =>NZ report**

The **NZ report** option allows the user to define the report header etc. so as to produce a spreadsheet report which can be printed to a pre-printed NZ sheet.

Selecting **NZ report** brings up the **NZ Traverse Spreadsheet Report** panel



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Input format | choice box | *.ts | *.ts, *.lch

either a TSS file (.ts) or a lot check file (*.lch) can be reported.*

Input file | input box | | *.ts

name of the TSS or lot check file.

Print | choice box | TS sheet | TS sheet, Calc sheet, Other

either TS sheet.

Report parcels | tick box

If tick, parcel block types are included in the report.

Traverse Title section

Traverses of, line 2, line 3, line 4

*The title of the traverses can be entered into the **traverses of** box as well as the following **line 2**, **line 3** and **line 4** input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ the number of characters should be limited to 20 characters (inclusive of space characters) for the **traverse of** line and 33 characters (inclusive of space characters) for **lines 2** to **4**.*

*The input into the **traverses for** line is compulsory but for **lines 2** to **4** it is optional.*

Datum Information section

NZ Circuit choice box existing NZ circuits

the circuit in which the current spreadsheet file relates to should be specified.

Projection choice box Geodetic 1949
Geodetic 2000
Old Cadastral

the appropriate NZ geodetic datum should be selected.

Coords in terms of section

these parameters are only required to be entered for the Old cadastral datum case. For other datums, the values are automatically updated.

Point name input box

the name of the origin point should be entered.

Northing input box

the nothing coordinate of the origin point should be entered.

Easting input box

the easting coordinate of the origin point should be entered.

Other Details section

Field book input box

the name of the field book used.

Plan no input box

the plan no to be created if known.

NZ Land District choice box Existing NZ land districts

the appropriate NZ land district should be selected.

Report file files box *.rpt files

file name for the report.

Report file button

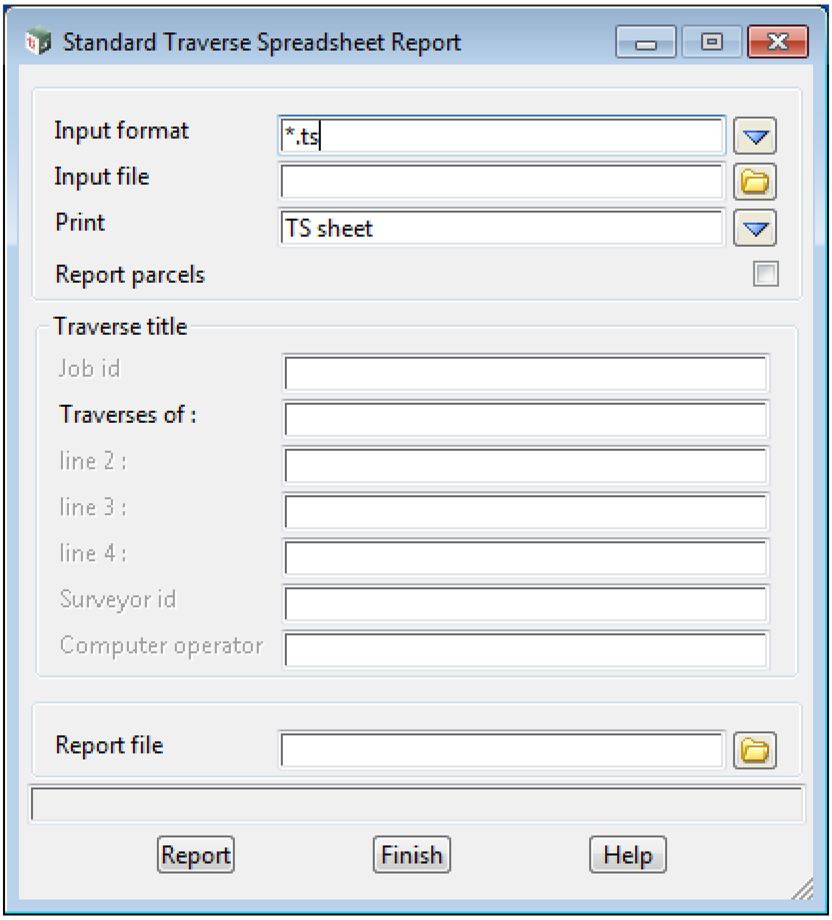
a report using the nominated file name is created.

17.12.7 Standard TSS Report

Position of option on menu: **Survey =>Traverse spreadsheet =>Standard report**

The **Standard report** allows the user to define the report header etc. so as to produce a standard TSS report which can be printed, saved or edited.

Selecting **Standard report** brings up the **Standard Traverse Spreadsheet Report** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input format	choice box	*.ts	*.ts, *.lch

either a TSS file (.ts) or a lot check file (*.lch) can be reported.*

Input file	input box		*.ts

name of the TSS or lot check file.

Print	choice box	TS sheet	TS sheet, Calc sheet, Other

either TS sheet.

Report parcels	tick box		

If ticked, parcel block types are included in the report.

Traverse Title section

Job id text input box

text to use as the Job id.

Traverses of, line 2, line 3, line 4

*The title of the traverses can be entered into the **traverses of** box as well as the following **line 2**, **line 3** and **line 4** input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ the number of characters should be limited to 20 characters (inclusive of space characters) for the **traverse of** line and 33 characters (inclusive of space characters) for **lines 2** to **4**.*

*The input into the **traverses for** line is compulsory but for **lines 2** to **4** it is optional.*

Surveyor id text input box

text to use as the Surveyor id.

Computer operator text input box

text to use as the Computer operator.

Report file files box *.rpt files

file name for the report.

Report file button

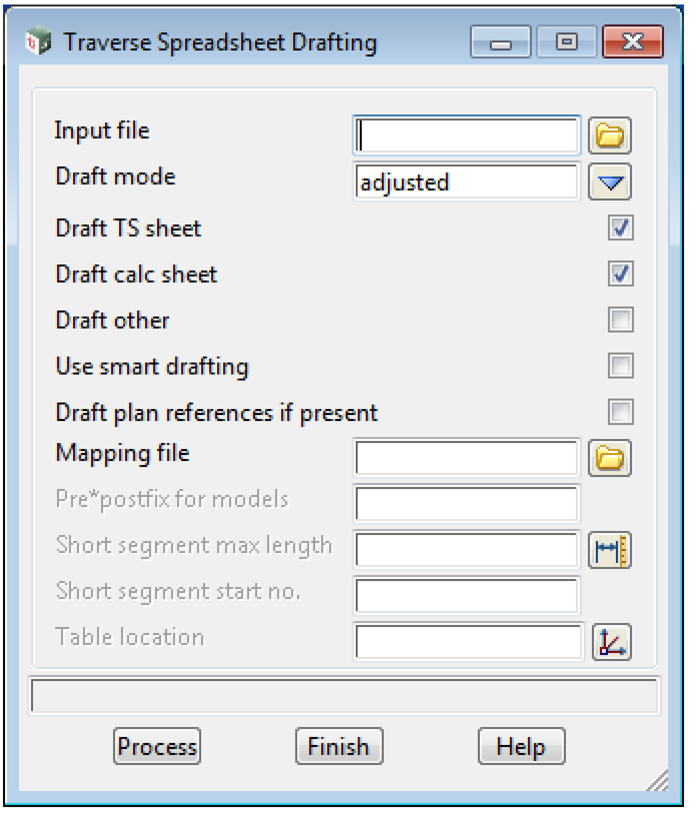
a report using the nominated file name is created.

17.12.8 TSS Drafting

Position of option on menu: **Survey => Traverse spreadsheet=> Drafting**

The Traverse spreadsheet **drafting** produce models, linestyles and colours for data within the TSS.

Selecting **Drafting** brings up the **Traverse Spreadsheet Drafting** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	file box		*.ts

name of the existing spreadsheet file to create drafting for.

Draft mode	choice box	adjusted	adjusted initial

the draft mode will determine if adjusted strings are used for drafting or if the unadjusted values (initial) values are used

Draft TS sheet tick box

if ticked,

Draft calc sheet tick box

if ticked,

Draft other tick box

if ticked,

Map file Map File box *.mapfile, *.mf files

Map File to define the drafting

Pre*postfix for models text input box

pre and post text to add to the model names given in the Map File

Short segment max length real input box

maximum size for a segment to be considered a short segment. Short segments are labelled with a number and the details placed in a table.

Short segment start no. integer input box

start number for any short segments.

Table location xyz box

world position for the short segment table.

Process button

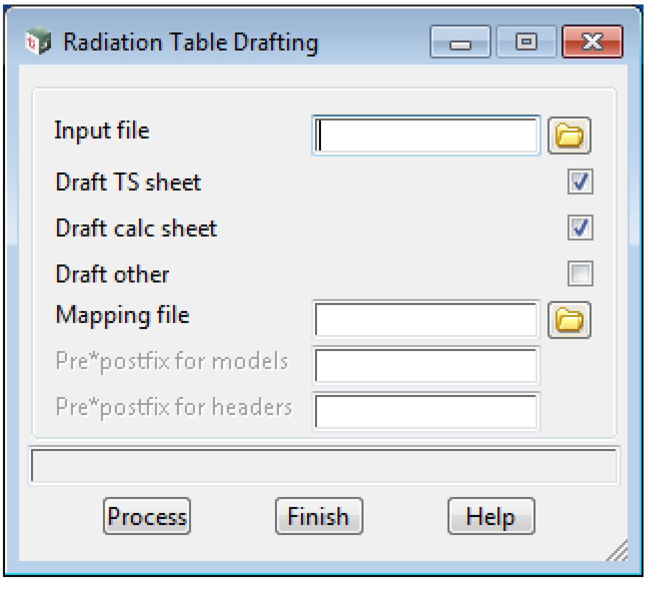
process the traverse spreadsheet and create the drafting and short segment table.

17.12.9 TSS Radiation Table Drafting

Position of option on menu: **Survey => Traverse spreadsheet=> Radiation table**

The Traverse spreadsheet **radiation table** option produces radiation tables for the radiation data in a traverse spreadsheet.

Selecting **Radiation table** brings up the **Radiation Table Drafting** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	file box		*.ts

name of the existing spreadsheet file to create radiation tables for.

Draft TS sheet tick box

if ticked,

Draft calc sheet tick box

if ticked,

Draft other tick box

if ticked,

Map File Map File box *.mapfile, *.mf files

Map File to define the drafting

Pre*postfix for models text input box

pre and post text to add to the model names given in the Map File

Pre*postfix for headers text input box

pre and post text to add to the header names for the radiation tables.

Process button

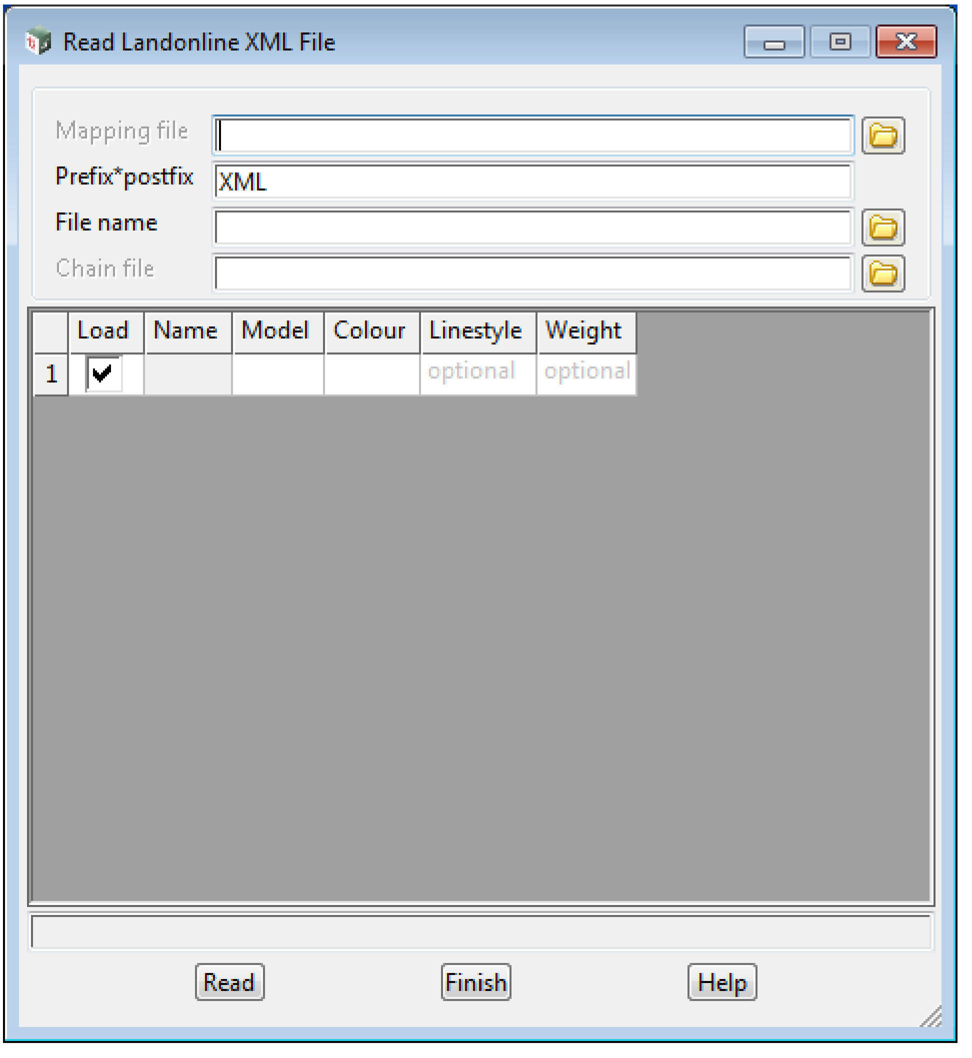
process the traverse spreadsheet and create the radiation tables.

17.12.10 Landonline XML Read

Position of menu: **Survey =>Traverse spreadsheet => Landonline XML read**

The **Landonline XML Read** option reads in data in the XML format for Landonline New Zealand.

Selecting **Landonline XML read** brings up the **Read Landonline XML File** panel



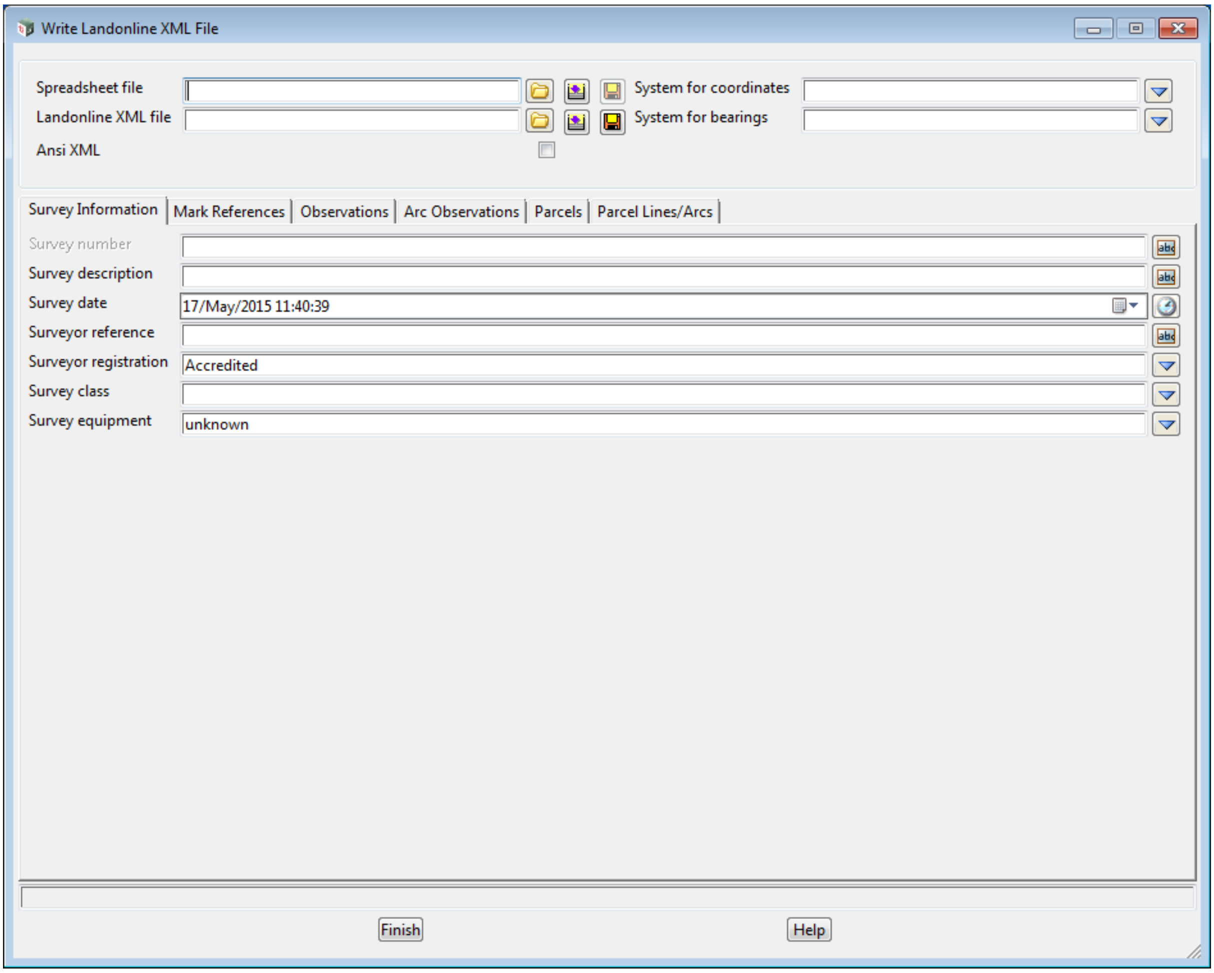
Documentation is available from *12d NZ Ltd*.

17.12.11 Landonline XML Write

Position of menu: **Survey =>Traverse spreadsheet => Landonline XML write**

The **Landonline XML Write** option writes out data in the XML format for Landonline New Zealand.

Selecting **Landonline XML write** brings up the **Write Landonline XML File** panel



Documentation is available from 12d NZ Ltd.

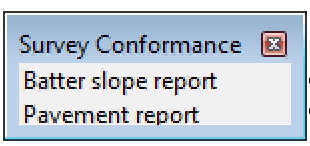
17.13 Conformance

Position of menu: **Survey =>Conformance**

The **Conformance** walk-right menu contains survey options for generating conformance reports and models on surveyed points representing as-built batter slopes and pavements, compared against string data representing designed batter slopes and pavements.

The **Conformance** walk-right menu is

.



Generate batter slope conformance report
Generate pavement conformance report

For the option *Batter slope report*, go to 17.13.1 Batter slope report
Pavement report 17.13.2 Pavement report

17.13.1 Batter slope report

Position of option on menu: Survey =>Conformance =>Batter slope report

The **Batter slope report** option generates a conformance report on surveyed points representing an as-built batter slope, compared against string data representing a designed batter slope.

In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. *within tolerance*, *above tolerance*, *below tolerance*, and *not tested*). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, and point error.

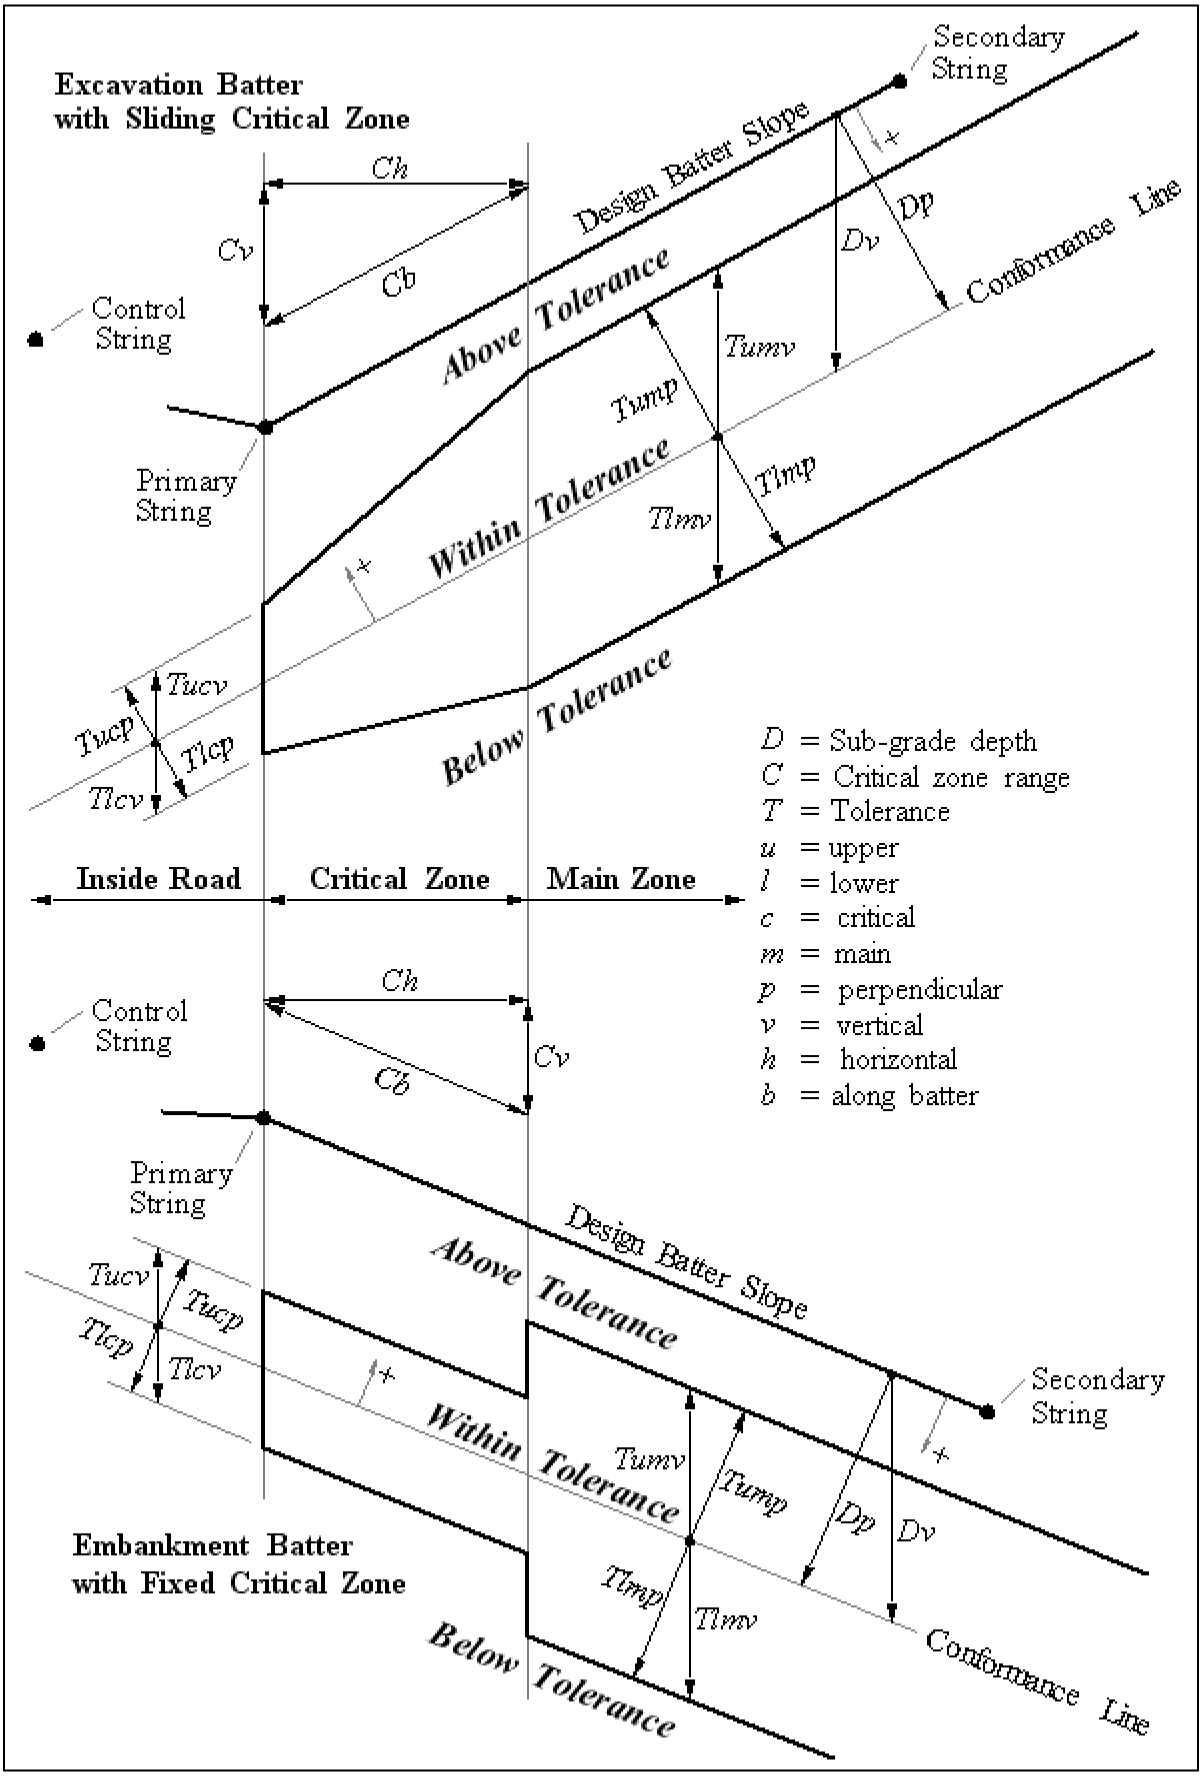
Note1: the term *point conformance* is used here to refer to a point's distance from design (distance from the conformance line on diagram below), while the term *point error* refers to a point's distance out of tolerance. As such, a point that is within tolerance (i.e. a *conformant point*) will, in general, have a non-zero conformance and a zero error, while a point that is out of tolerance (i.e. a *non-conformant point*) will have both a non-zero conformance and a non-zero error.

Note2: the point conformances and errors can be measured either vertically or perpendicular to the conformance line. It is perhaps worthwhile to note, especially in the case of the *sliding critical zone*, that the perpendicular measurements are determined from the vertical measurements, and **not** vice versa. That is, if the slope of the conformance line, measured from horizontal, is denoted by the angle *A*, then a surveyed point *Q*, has a perpendicular conformance *Qcp*, and error *Qep*, determined from the point's vertical conformance *Qcv*, and error *Qev*, via the following relationships:

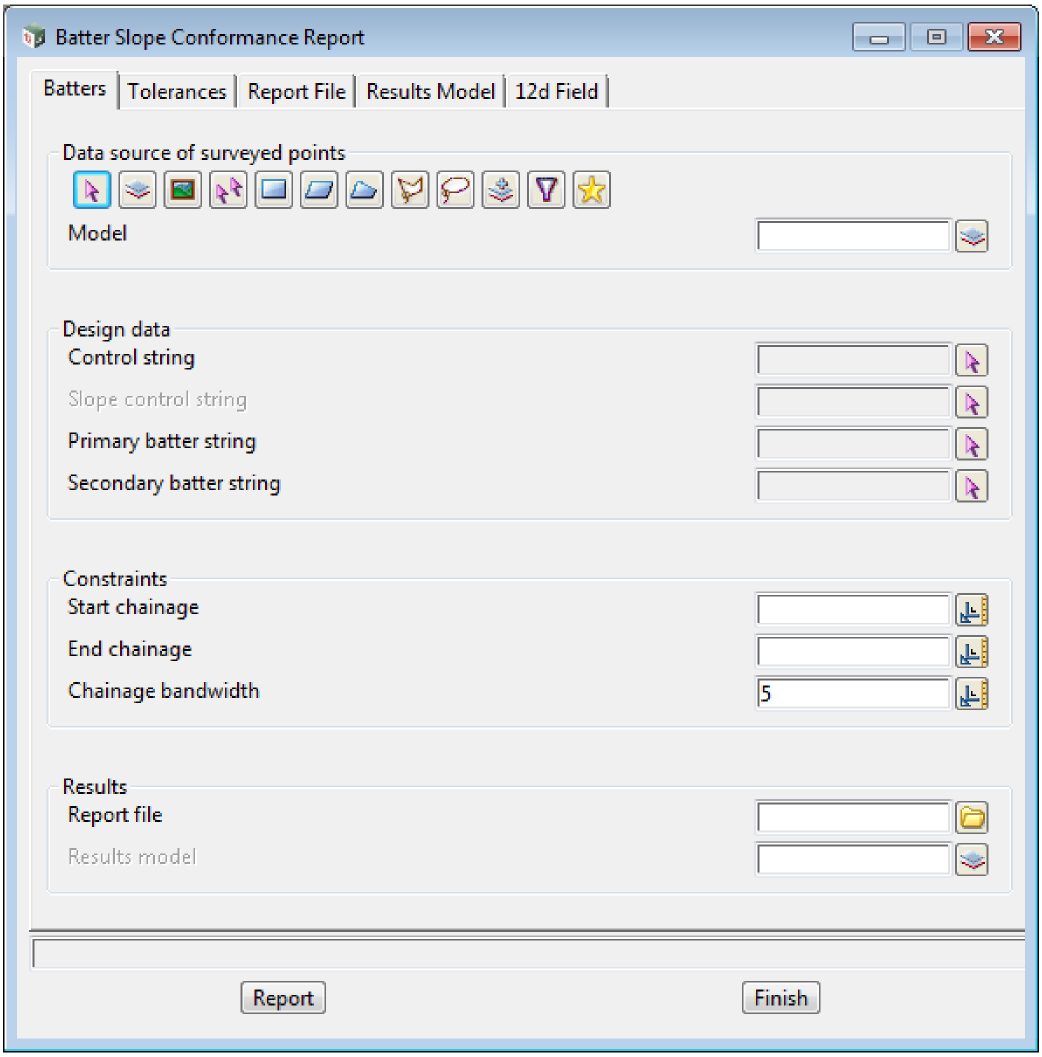
$$Qcp = Qcv.\cos A$$
$$Qep = Qev.\cos A$$

Note3: the conformance line is the line from which all point conformances and tolerances are measured, and is always parallel to the design batter slope line. When testing a sub-grade survey, the conformance line will normally be below the design batter slope line, but when testing a completed-construction survey, the two lines should normally coincide.

Typical sections through excavation and embankment batters are shown in the diagram below, along with schematics showing how the surveyed points are tested for conformance:



Selecting **Batter slope report** brings up the **Batter Slope Conformance Report** panel



Batters Tab:

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data source of points source box

all points selected with this source box (whether they exist in point-string form or line-string form) will be considered as the set of surveyed points to be tested for conformance.

Note: *the data for the* Point Description *column in the report will be taken from the string names of the selected points. If* ***all*** *the string names are blank, however, the point description data in the report will show point ids representing the sequential order that the points are reported in. The results model (if generated) will always have the string names of each point set to match the reported point description.*

Design data

Control string string box

the string selected with this box should normally represent the road centreline, and will be used to determine the chainage and offset of each surveyed point

Slope control string string box

the Slope control string *is optional (and is not shown on the diagram above). If no string is selected, the* Primary string*, below, will be used as the* Slope control string*. The line that is formed in plan, from a* *surveyed point to the nearest point on the* Slope control string*, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.*

Primary string string box

the string selected with this box should represent one edge of the designed batter (normally the edge closer to the road - i.e. the toe string of an excavation batter, or the crest string of an embankment batter).

The Primary string *represents the start of the* Critical Zone*, which continues horizontally in the direction of the* Secondary string*, for a distance specified in the* Critical zone range *field (on the* Tolerances Tab*).*

Secondary string string box

the string selected with this box should represent the other edge of the designed batter (normally the edge further away from the road - i.e. the interface string)

Constraints

Start chainage real box

the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string *is selected, but a different value can be typed in.*

End chainage real box

the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string *is selected, but a different value can be typed in.*

Chainage bandwidth real box 5.0

if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth. *This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.*

Results

Report file file box *.rpt

the name of the conformance report file to be created. If no extension is given, it will be given an extension of ".rpt".

Results model model box available models

the name of the results model to be created. If blank, the results model is not created.

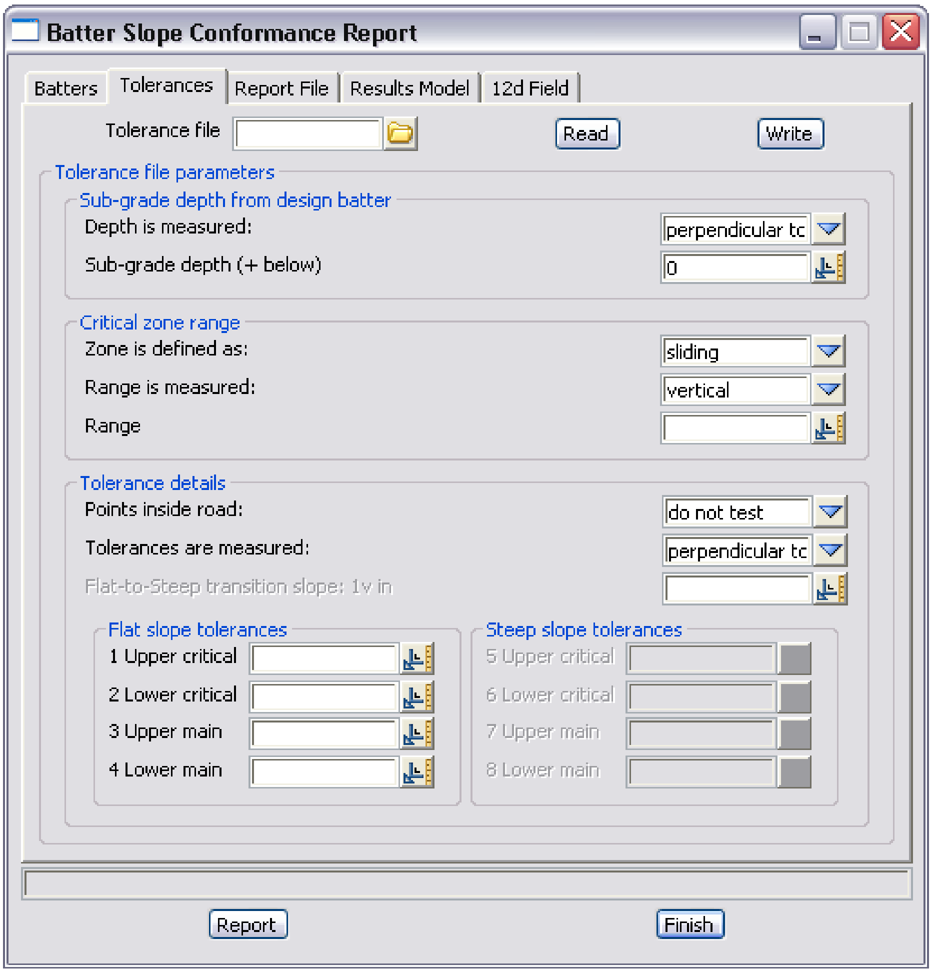
Report button

generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

Finish button

exits the option and closes the panel. This button can be activated regardless of which panel tab is currently active.

Tolerances Tab:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tolerance file	file box		*.tol

the name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of ".tol". *The tolerance file stores the details of every field on the* Tolerances Tab, *the* Report File Tab, *and the* Results Model Tab. *The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.*

Read button

Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write button

Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.

Sub-grade depth from design batter

Field Description	Type	Defaults	Pop-Up
Depth is measured	choice box	perpendicular	perpendicular to batter vertical

whether the sub-grade depth is measured perpendicular to the batter or vertically (refer to parameters Dp and Dv on the diagram above)

Sub-grade depth real box 0.0

the depth of the conformance line from the design batter (refer to parameters Dp and Dv on the diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a completed-construction survey, however, this value will normally be zero, and the conformance line will coincide with the design batter slope line.

Critical zone range

Zone is defined as choice box sliding sliding
fixed

determines whether the Critical Zone is defined as sliding *or* fixed *(refer to diagram above). For excavation batters, the zone is normally* sliding*, whilst for embankment batters, it is normally* fixed*.*

Range is measured choice box vertical along batter
vertical
horizontal

determines how the size of the Critical Zone is measured (refer to parameters Cb, Cv, and Ch on the diagram above)

Range real box

the size of the Critical Zone, measured in the specified direction (refer to parameters Cb, Cv, and Ch on the diagram above). This distance must be zero or greater.

Tolerance details

Points inside road choice box do not test do not test
test with zero tolerance
test with fixed crit. tolerance

determines what to do with any surveyed points found inside the road. If such points are found, and this field is set to **do not test***, the points will be classified as untested, and in the results model, will have their vertex text set to* **INR***.*

Note: *untested points do not appear in the conformance report.*

Tolerances measured choice box perpendicular perpendicular to batter
vertical

*whether the conformance tolerances are measured perpendicular to the batter or vertically (refer to parameters T**p and T**v on the diagram above). This field also determines whether the reported point conformances and point errors are measured perpendiculary or vertically.*

Flat-to-Steep transition slope: 1v in
real box

It is possible to use two different sets of batter slope tolerances, when producing the conformance report. The Flat slope tolerance *set will be used whenever the design slope is equal to the* transition slope *or flatter, and the* Steep slope tolerance *set will be used whenever the design slope is steeper than the* transition slope. *The* transition slope *must be specified as a positive number, and will be interpreted as a slope in the form*
1[v] : transition slope[h]. *Leaving this field blank will disable the* Steep slope tolerance *set, ensuring that only the* Flat slope tolerance *set will ever be used.*

Flat slope tolerances

The following four tolerances are used if the *transition slope* is not specified, or whenever the design slope is equal to the *transition slope* or flatter.

1 Upper critical real box

refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.

2 Lower critical real box

refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.

3 Upper main real box

the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.

4 Lower main real box

the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.

Steep slope tolerances

The following four tolerances are used only if the *transition slope* is specified, and the design slope is steeper than the *transition slope*.

5 Upper critical real box

refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.

6 Lower critical real box

refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.

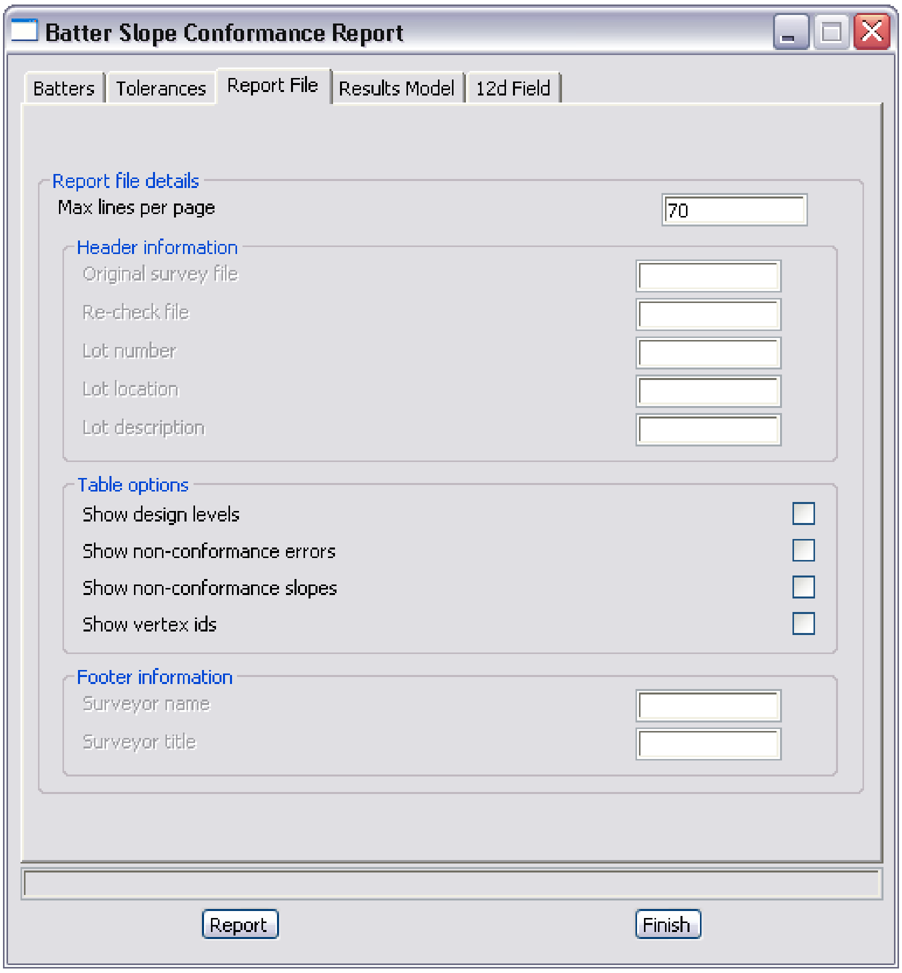
7 Upper main real box

the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.

8 Lower main real box

the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.

Report File Tab:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Max lines per page	integer box	70	

the maximum number of report lines that can fit on a printed page. This number is needed so that page breaks (form feed characters) can be inserted into the report file at the appropriate places. The number of lines per page will vary depending on the editor/word-processor used for printing, the desired page size and margin widths, the desired page layout (portrait or landscape), and the desired font and font size. As such, the number needs to be tuned for the user's particular report specifications/requirements.

Note1: *you may find that MS Notepad is not a good program for printing out the report file (Notepad doesn't seem to interpret form feed characters).*

Note2: *if* Max lines per page *is set to a large enough number, there will be no page breaks in the report file.*

Header information

Original survey file input box

optional line of text in the report header to identify the original survey data file

Re-check file

optional line of text in the report header to identify the survey data file where the pavement was rechecked.

Lot number input box

optional line of text in the report header to identify the lot number

Lot location input box

optional line of text in the report header to identify the lot location

Lot description input box

optional line of text in the report header to identify the lot description

Table options

Show design levels tick box off

whether to show the design levels *in the column after the* point levels

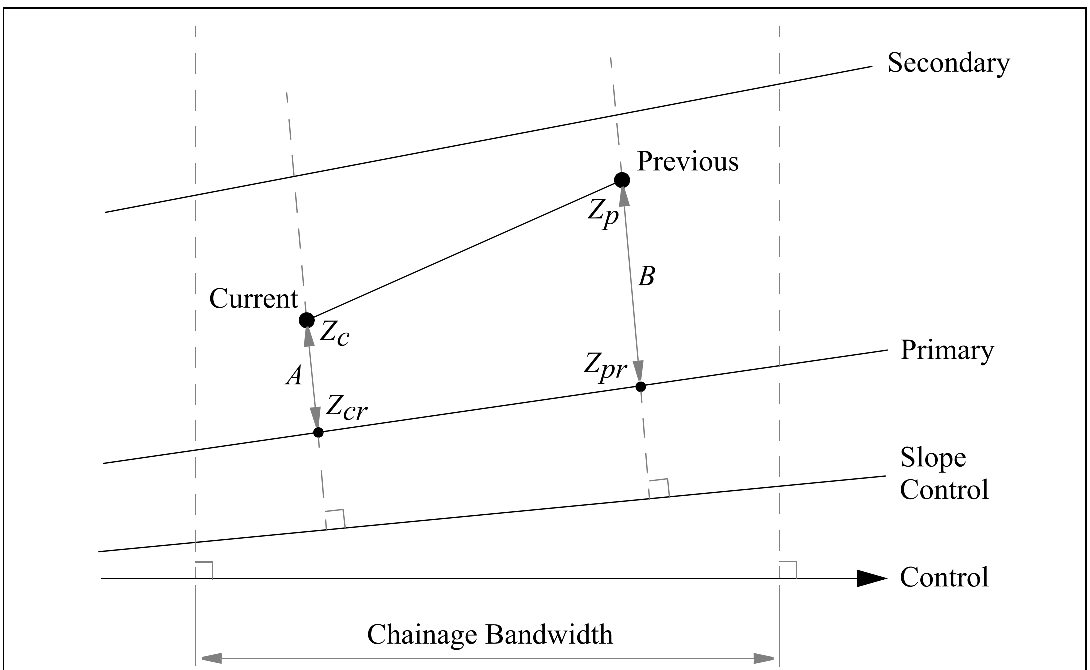
Note: *the* design levels *are always vertically above or below the* point levels*, even if the tolerances are measured perpendicular to the design slope.*

Show non-conformance errors tick box off

whether to show the point errors *for non-conformant points (i.e. the distances the points are out of tolerance). If turned on, the* point errors *will appear in parentheses, (=, after the conformance and tolerance details.*

Show non-conformance slopes tick box off

whether to show the surveyed slopes *at non-conformant points. The* surveyed slope *is the slope between the previous and current point in the report, within a single, offset-sorted chainage band. The slope is calculated as though the previous point lies in the same vertical plane as that of the current point's design slope. As such, the slope is adjusted for any differences in bearing direction between the two design slopes, and for any incline in the road, as shown in the diagram, below:*



$$\text{Surveyed Slope} = 1 \; in \left|\frac{D_h}{D_v}\right| \qquad D_h = A - B \qquad D_v = Z_c - Z_p - Z_{cr} + Z_{pr}$$

If turned on, the surveyed slopes *will appear in square brackets, [=, after the conformance, tolerance and point error details.*

Note: *if the* Chainage bandwidth *on the* Batters Tab *is zero or blank, then the points will only be sorted by chainage, and not sub-sorted by offset within chainage bands. In this case, surveyed slopes will* *never be reported.*

Show vertex ids

if ticked the vertex id of the point rather than the name of the string containing the point will be shown in the report file.

Footer information

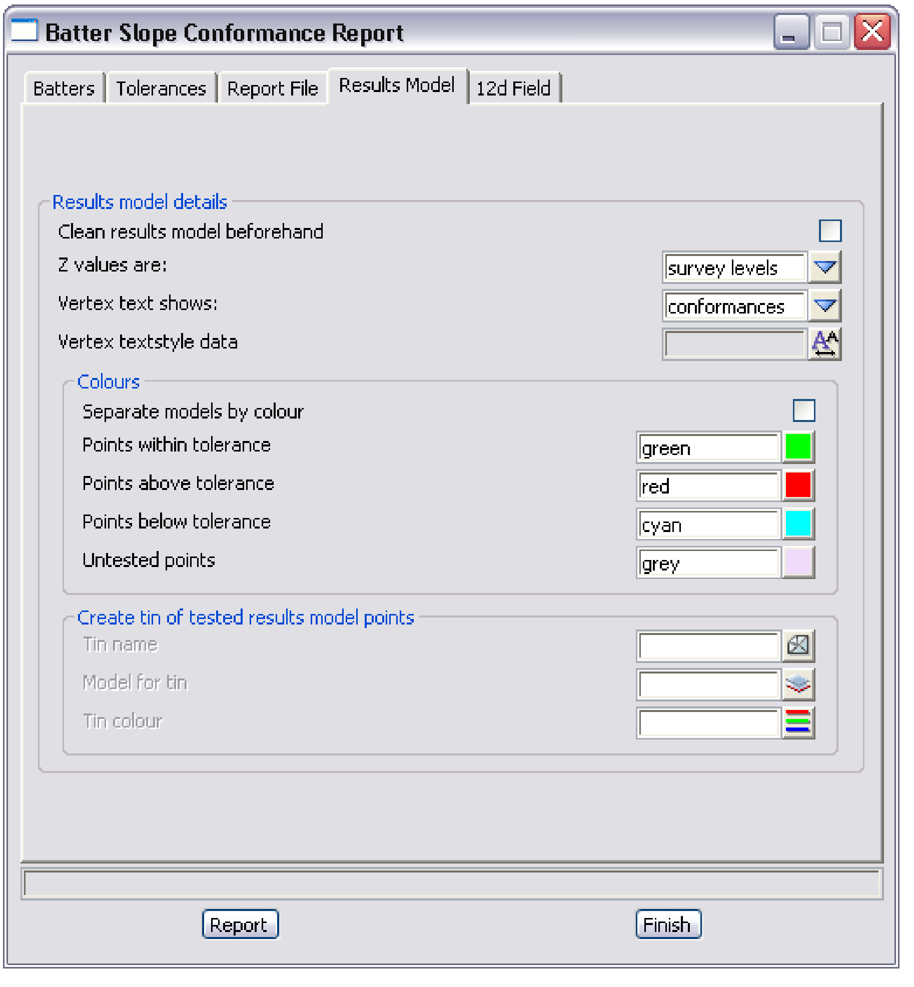
Surveyor name input box

name of the person required to sign the report (optional)

Surveyor title input box

title of the person required to sign the report (optional)

Results Model Tab:



The fields have the following functions:

Field Description	Type	Defaults	Pop-Up
Clean results model beforehand	tick box	off	
Z values are	choice box	levels	levels conformances errors

whether to clean the contents of an existing results model before re-running the option (Clean results model beforehand)

determines what z values to give the points generated in the results model (Z values are)

***Note:** any untested points in the model will have their z values set to their original point levels,* *regardless.*

Vertex text shows	choice box	conformances	levels conformances errors

determines what values to show in the vertex text of the points generated in the results model

***Note1:** any points within tolerance will have a zero error. For these points, if the vertex text is set to* **errors**, *no text will be set.*

***Note2:** any untested points in the model will have the vertex text set to show one of four possible error codes, explaining why the point was not tested. The error codes are* **NUL** *(invalid z-value),* **OCR** *(outside chainage range),* **ERR** *(intersection error or similar), and* **INR** *(inside road).*

Vertex textstyle data	textdata box		user textdata favourites

controls the appearance of the vertex text for the points generated in the results model

Colours

Separate models by colour tick box

if ticked the results model will be several models, each result colour going to a separate model named with a suffix of the colour name.

Points within tolerance	colour box	green	available colours

colour for points within tolerance

Points above tolerance	colour box	red	available colours

colour for points above tolerance

Points below tolerance	colour box	cyan	available colours

colour for points below tolerance

Untested points	colour box	grey	available colours

colour for untested points

***Note:** untested points do not appear in the conformance report.*

Create tin of tested results model points

Tin name	tin box		available tins

name of the tin to create. If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model *field (on the* Batters Tab*) is blank, no tin will be created.*

***Note:** the tin will be created only with the set of tested points created in the* Results model, *and can be used to quickly display contour maps of the results. When creating the tin, an attempt is made to null any triangles outside the **shrink-wrapped** boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see* Chainage bandwidth *on the* Batters Tab*).*

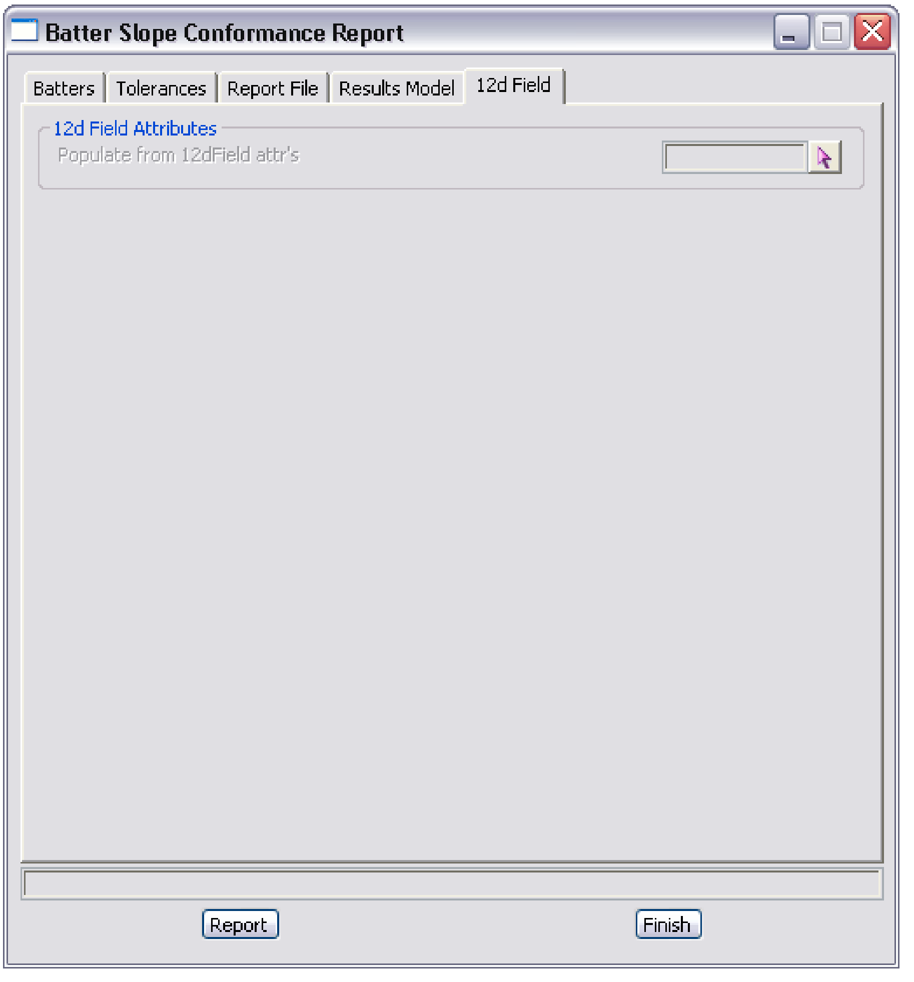
Model for tin	model box		available models

model for tin to be placed in, for viewing purposes. If blank, the tin is not placed into a model.

Tin colour	colour box		available colours

colour for tin. If blank, the tin will adopt the colour selected for Points within tolerance.

12d Field Tab:



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Populate from 12dField attr's

if 12dField was used to pickup the points then the attributes can be used to populate the conformance panel automatically, for example the control lines and primary and secondary edge strings. On selecting the string the panel will be updated.

17.13.2 Pavement report

Position of option on menu: **Survey =>Conformance =>Pavement report**

The **Pavement report** option generates a conformance report on surveyed points representing the top of an as-built pavement, compared against string data representing the top of a designed pavement (level conformance), and compared against tin data representing the bottom of an as-built pavement (thickness conformance).

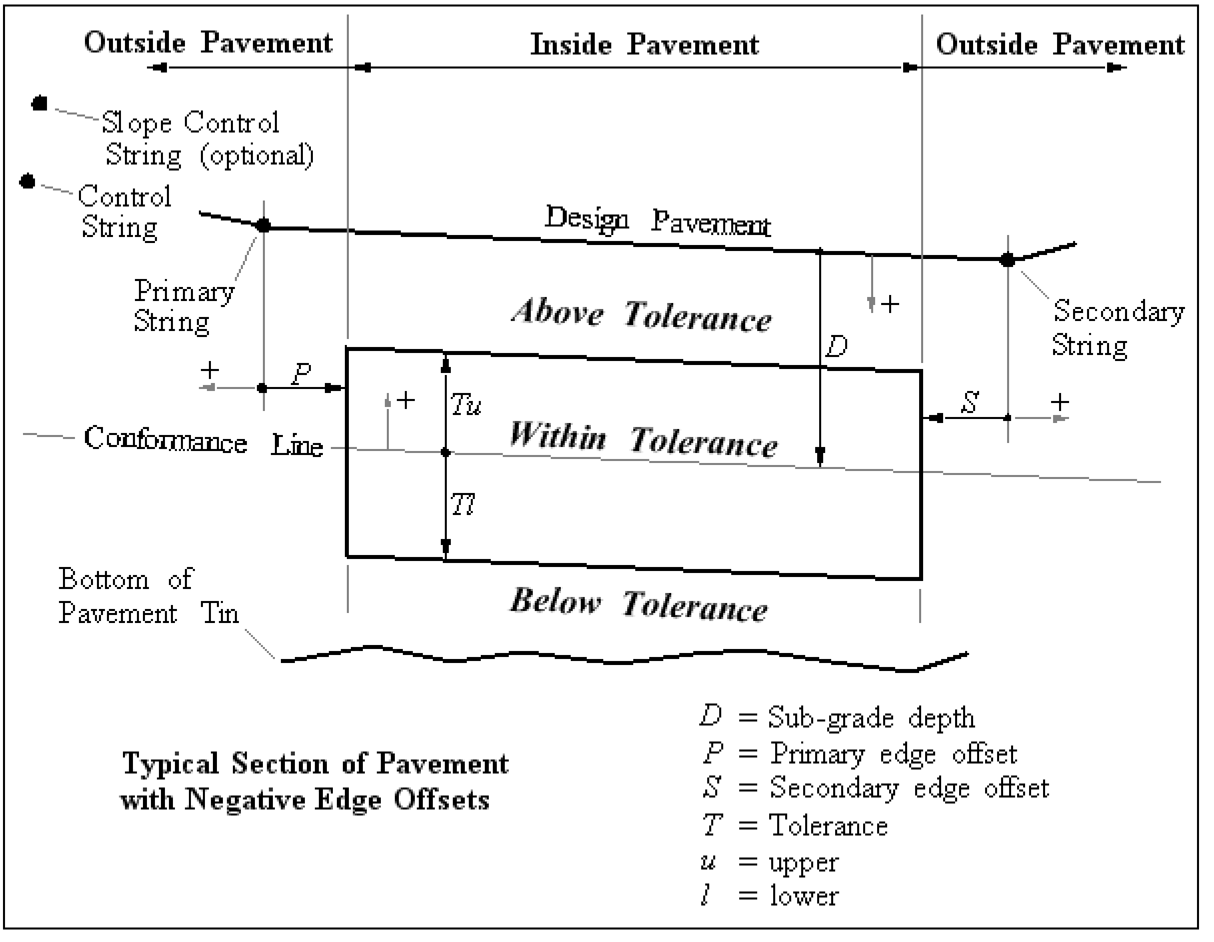
In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. *within tolerance*, *above tolerance*, *below tolerance*, and *not tested*). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, point error, pavement thickness and pavement thickness error.

Note1: the term *point conformance* is used here to refer to a point's distance from design (distance from the conformance line on diagram below), while the term *point error* refers to a point's distance out of tolerance. As such, a point that is within tolerance (i.e. a *conformant point*) will, in general, have a non-zero conformance and a zero error, while a point that is out of tolerance (i.e. a *non-conformant point*) will have both a non-zero conformance and a non-zero error.

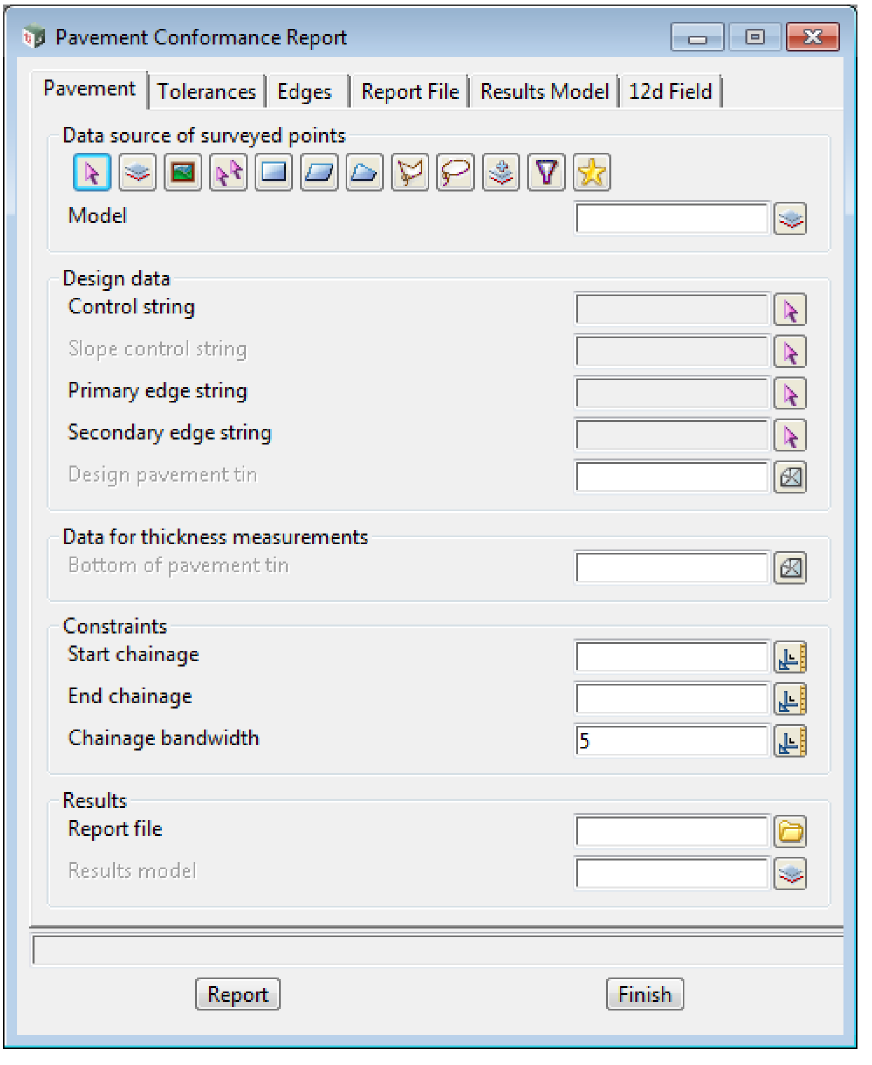
Note2: the point conformances and errors can be measured either vertically or perpendicular to the conformance line. The conformance line is the line from which all point conformances and tolerances are measured, and is always parallel to the design pavement line. When testing a sub-grade survey, the conformance line will normally be below the design pavement line, but when testing a completed-construction survey, the two lines should normally coincide.

Note3: the optional pavement thickness measurements are always made vertically downwards from the surveyed points, to the tin representing the bottom of pavement. Pavement thickness errors will be non-zero wherever the pavement is found to be too thick or too thin. When testing for both level conformance and thickness conformance, both tests must pass for a point to be considered conformant.

A typical section of pavement is shown in the diagram below, along with a schematic showing how the surveyed points are tested for level conformance:



Selecting **Pavement report** brings up the **Pavement Conformance Report** panel



Pavement Tab:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source of points	source box		

all points selected with this source box (whether they exist in point-string form or line-string form) will be considered as the set of surveyed points to be tested for conformance.

***Note:** the data for the* Point Description *column in the report will be taken from the string names of the selected points. If **all** the string names are blank, however, the point description data in the report will show point ids representing the sequential order that the points are reported in. The results model (if generated) will always have the string names of each point set to match the reported point description.*

Design data

Control string string box

the string selected with this box should normally represent the road centreline, and will be used to determine the chainage and offset of each surveyed point

Slope control string string box

the Slope control string *is optional. If no string is selected, the* Control string*, above, will be used as the*

Slope control string*. The line that is formed in plan, from a surveyed point to the nearest point on the* Slope control string*, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.*

Primary string string box

the string selected with this box should represent one edge of the designed pavement (normally the edge that is closer to the Control string*)*

Secondary string string box

the string selected with this box should represent the other edge of the designed pavement (normally the edge that is further away from the Control string*).*

Note: *If the selected string is the same as the* Primary string*, or if no string is selected, then the pavement is defined by one string and is considered to be flat (i.e. zero cross-fall), and to have a width defined by the* Primary *and* Secondary edge offsets *(on the* Tolerances Tab*). This feature can be useful for identifying any surveyed points that are close to an edge line.*

Design pavement tin

if selected this tin will be used for design levels rather than the primary and secondary strings.

Data for thickness measurements

Bottom of pavement tin tin box available tins

the Bottom of pavement tin *is optional. If not selected, the pavement is not tested for thickness conformance. The tin selected with this box should represent the as-built bottom surface of the pavement currently being tested.*

Constraints

Start chainage real box

the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string *is selected, but a different value can be typed in.*

End chainage real box

the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string *is selected, but a different value can be typed in.*

Chainage bandwidth real box 5.0

if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth*. This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.*

Results

Report file file box *.rpt

the name of the conformance report file to be created. If no extension is given, it will be given an extension of .rpt.

Results model model box available models

the name of the results model to be created. If blank, the results model is not created.

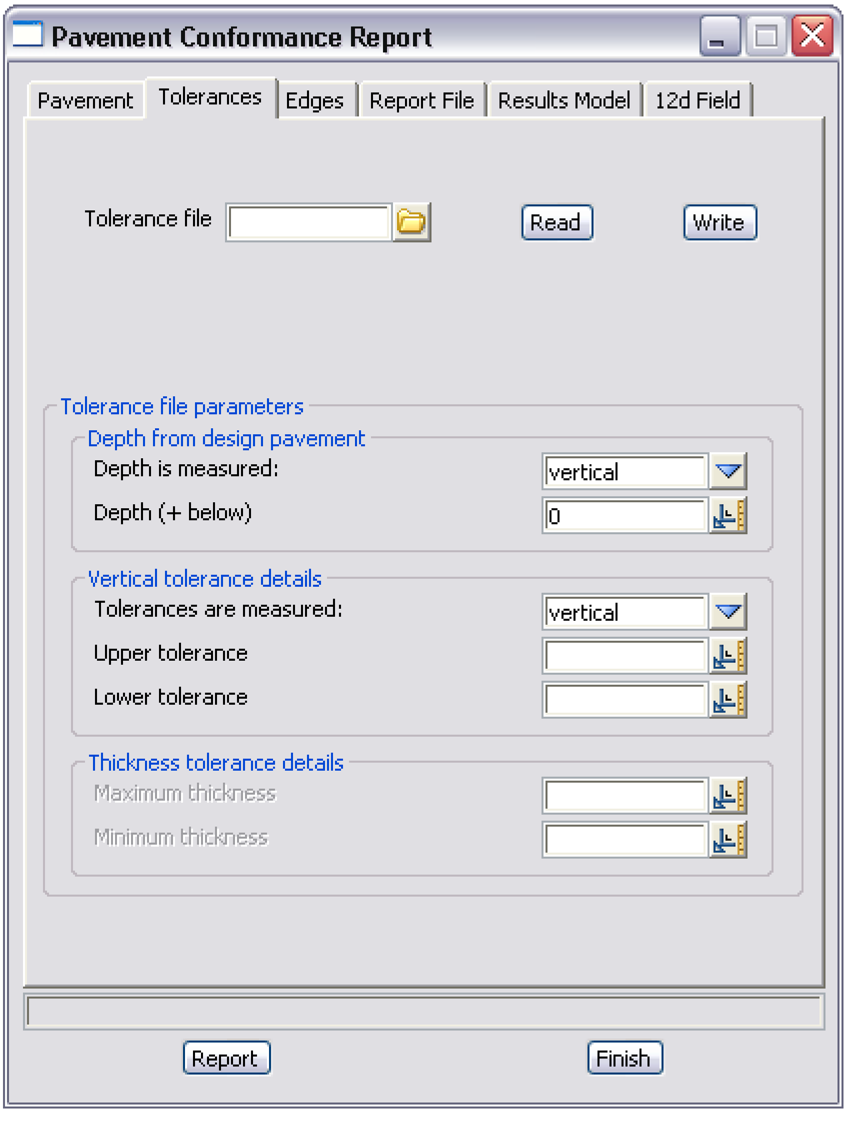
Report button

generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

Finish button

exits the option and closes the panel. This button can be activated regardless of which panel tab is *currently active.*

Tolerances Tab:



The fields and buttons have the following functions:

Field Description	Type	Defaults	Pop-Up
Tolerance file	file box		*.tol

the name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of .tol. *The tolerance file stores the details of every field on the* Tolerances Tab, *the* Report File Tab, *and the* Results Model Tab. *The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.*

Read button

Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write button

Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.

Depth from design pavement

Depth is measured choice box vertical perpendicular to pavement
vertical

whether the sub-grade depth is measured perpendicular to the pavement or vertically (refer to parameter D on the diagram above)

Note: *since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.*

Depth (+ below) real box 0.0

the depth of the conformance line from the design pavement (refer to parameter D on the diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a completed-construction survey, however, this value will normally be zero, and the conformance line will coincide with the design pavement line.

Vertical tolerance details

Tolerances are measured choice box vertical perpendicular to pavement
vertical

whether the conformance tolerances are measured perpendicular to the pavement or vertically (refer to parameters Tu and Tl on the diagram above). This field also determines whether the reported point conformances and point errors are measured perpendiculary or vertically.

Note: *since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.*

Upper tolerance real box

the upper allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter Tu on the diagram above). This value is normally zero or greater.

Lower tolerance real box

the lower allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter Tl on the diagram above). This value is normally zero or less.

Thickness tolerance details

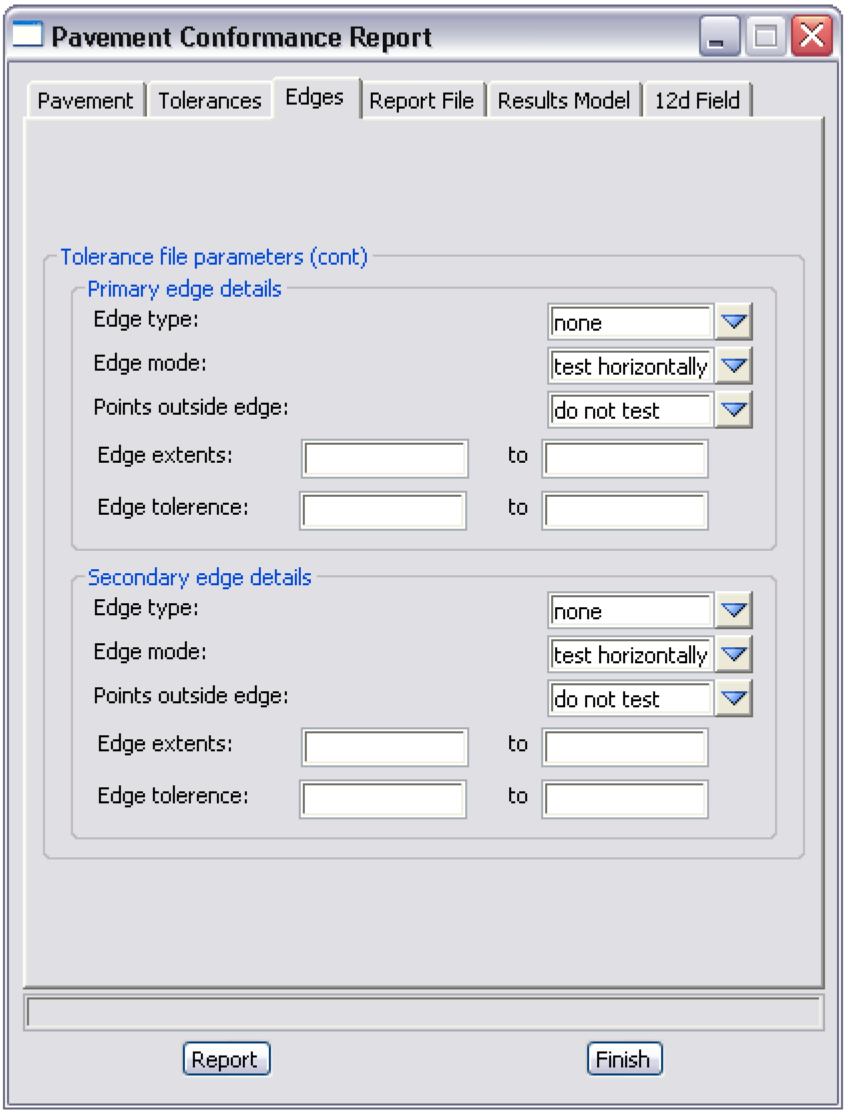
Maximum thickness real box

the maximum allowable vertical distance that a surveyed point may be above the Bottom of pavement tin*, in order to be conformant. If blank, there will be no upper limit to the pavement thickness.*

Minimum thickness real box

the minimum allowable vertical distance that a surveyed point may be above the Bottom of pavement tin*, in order to be conformant. If blank, there will be no lower limit to the pavement thickness.*

Edges Tab:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

The settings for **Primary edge details** and **Secondary edge details** are the same.

Tolerance file parameters (cont).

Primary edge details /Secondary edge details

Edge type	choice box		left, right, join, none

***left**: the string is the left hand edge of the pavement.*
***right:** the string is the right hand edge of the pavement.*
***join**: the string is joint between pavements.*
***none**: the string is not used for edge checks.*

Edge mode	choice box	test horizontally, test vertically & horizontally	

***test horizontally:** the edge is only tested for horizontal conformance*
***test vertically & horizontally:** the edge is only tested for both horizontal and vertical conformance*

Points outside edge	choice box		do not test, test vertically

Determines what to do with any surveyed points found outside the pavement.

do not test: *points outside the edge are not tested.The points will be classified as untested, and in the results model, will have their vertex text set to* EDG. ***Note:*** *untested points do not appear in the conformance report.*

test vertically*: points outside the edge are tested vertically.*

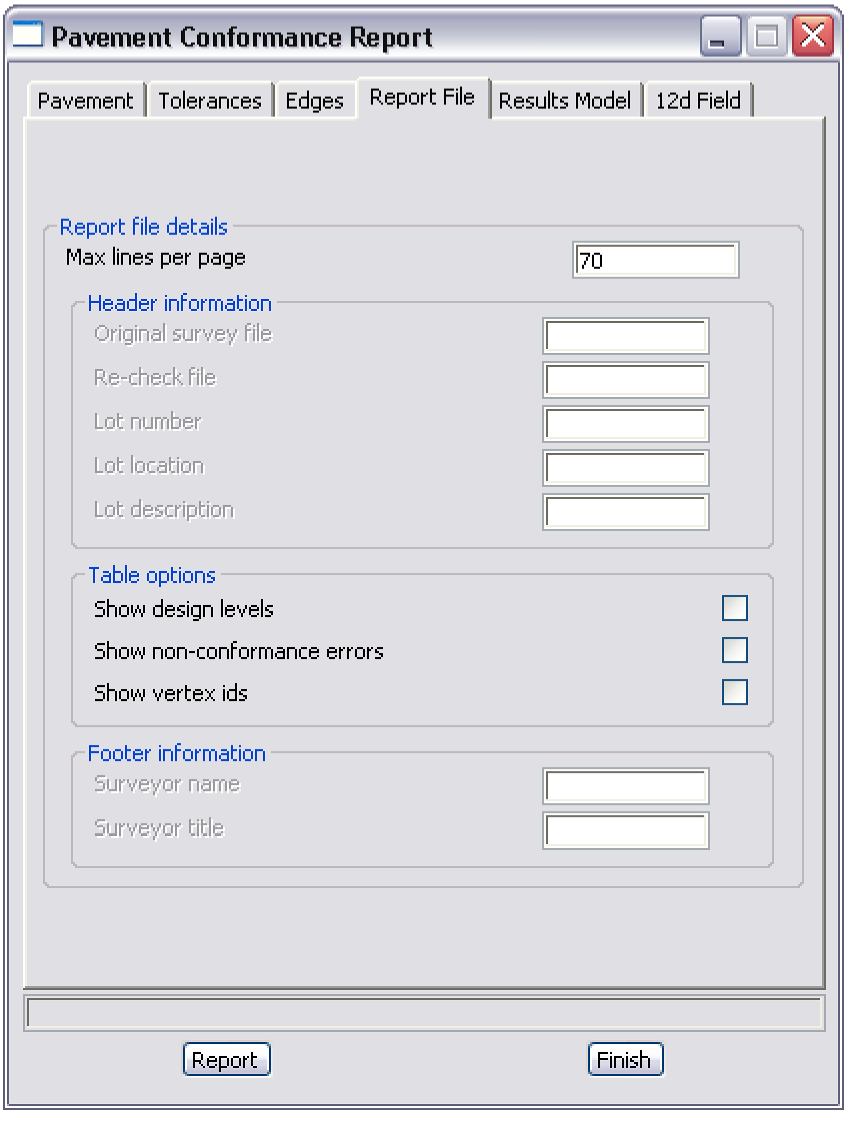
Edge extents

Enter the range around the nominal edge in which a point is considered to be an edge check. This is relative to the 'left/right' setting for the edge, +ve is outside the pavement and -ve into the pavement.

Edge tolerance

Enter the tolerances from the design edge, this is relative to the 'left/right' setting for the edge, +ve is outside the pavement and -ve into the pavement.

Report File Tab:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Max lines per page	integer box	70	

the maximum number of report lines that can fit on a printed page. This number is needed so that page breaks (form feed characters) can be inserted into the report file at the appropriate places. The number *of lines per page will vary depending on the editor/word-processor used for printing, the desired page size and margin widths, the desired page layout (portrait or landscape), and the desired font and font size. As such, the number needs to be tuned for the user's particular report specifications/requirements.*

Note1: *you may find that MS Notepad is not a good program for printing out the report file (Notepad doesn't seem to interpret form feed characters).*

Note2: *if* Max lines per page *is set to a large enough number, there will be no page breaks in the report file.*

Header information

Original survey file input box

optional line of text in the report header to identify the original survey data file

Re-check file

Optional line of text in the report header to identify the survey data file where the pavement was rechecked.

Lot number input box

optional line of text in the report header to identify the lot number

Lot location input box

optional line of text in the report header to identify the lot location

Lot description input box

optional line of text in the report header to identify the lot description

Table options

Show design levels tick box off

whether to show the design levels *in the column after the* point levels

Note: *the* design levels *are always vertically above or below the* point levels*, even if the tolerances are measured perpendicular to the design slope.*

Show non-conformance errors tick box off

whether to show the point errors *and* thickness errors *for non-conformant points (i.e. the distances the points are out of level and thickness conformance, respectively). If turned on, the* point errors *will appear in parentheses,* ( )*, after the conformance and tolerance details, and the* thickness errors *will appear in parentheses,* ( )*, after the thickness and max/min thickness details.*

Show vertex ids tick box

if ticked the vertex id of the point rather than the name of the string containing the point will be shown in the report file.

Footer information

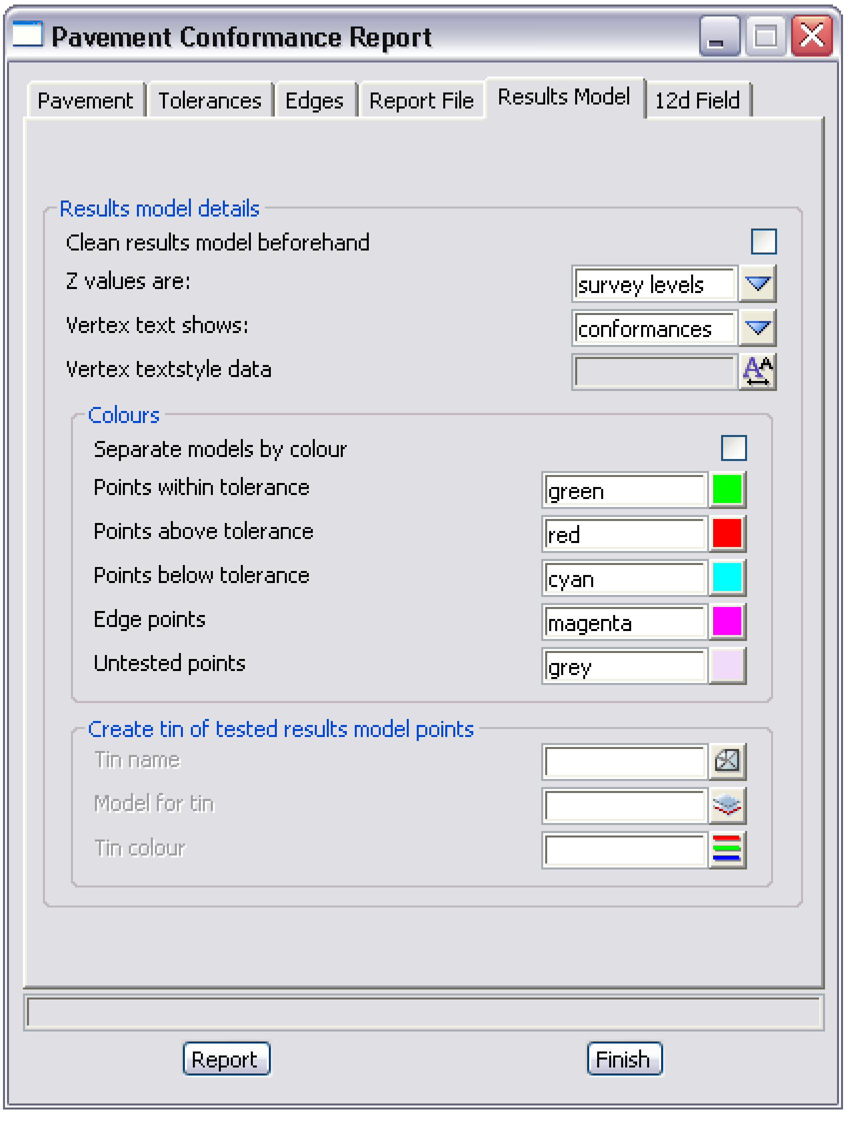
Surveyor name input box

name of the person required to sign the report (optional)

Surveyor title input box

title of the person required to sign the report (optional)

The next tab on the panel is the Results Model Tab:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Clean results model beforehand	tick box	off	

whether to clean the contents of an existing results model before re-running the option

Z values are	choice box	levels	levels conformances errors thicknesses thickness errors

determines what z values to give the points generated in the results model

Note: *any untested points in the model will have their z values set to their original point levels, regardless.*

Vertex text shows	choice box	conformances	levels conformances errors thicknesses thickness errors

determines what values to show in the vertex text of the points generated in the results model

Note1: *any points that pass the level conformance test will have a zero error. For these points, if the vertex text is set to* **errors***, no text will be set. Likewise, any points that pass the thickness conformance test will have a zero thickness error. For these points, if the vertex text is set to* **thickness errors***, no text will be set.*

Note2: *any untested points in the model will have the vertex text set to show one of five possible error codes, explaining why the point was not tested. The error codes are* **NUL** *(invalid z-value),* **OCR** *(outside chainage range),* **ERR** *(intersection error or similar),* **EDG** *(outside pavement edge), and* **NTN** *(bottom of pavement tin not defined at point).*

Vertex textstyle data	textdata box		user textdata favorites

controls the appearance of the vertex text for the points generated in the results model

Colours

Separate models by colour tick box

if ticked the results model will be several models, each result colour going to a separate model named with a suffix of the colour name.

Points within tolerance	colour box	green	available colours

colour for points within tolerance (i.e. points that pass both the level and thickness conformance tests)

Points above tolerance	colour box	red	available colours

colour for points above tolerance (i.e. points that are above the Upper tolerance *or points where the pavement is thicker than the* Maximum thickness*)*

Points below tolerance	colour box	cyan	available colours

colour for points below tolerance (i.e. points that are below the Lower tolerance *or points where the pavement is thinner than the* Minimum thickness*)*

Untested points	colour box	grey	available colours

colour for untested points

Note: *untested points do not appear in the conformance report.*

Create tin of tested results model points

Tin name	tin box		available tins

name of the tin to create. If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model *field (on the* Pavement Tab*) is blank, no tin will be created.*

Note: *the tin will be created only with the set of tested points created in the* Results model*, and (depending on what the points' z-values are set to in the* Results model*) can be used to quickly display contour maps of the results, or to create a* Bottom of pavement tin *for the next pavement layer to be tested. When creating the tin, an attempt is made to null any triangles outside the shrink-wrapped boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see* Chainage bandwidth *on the* Pavement Tab*).*

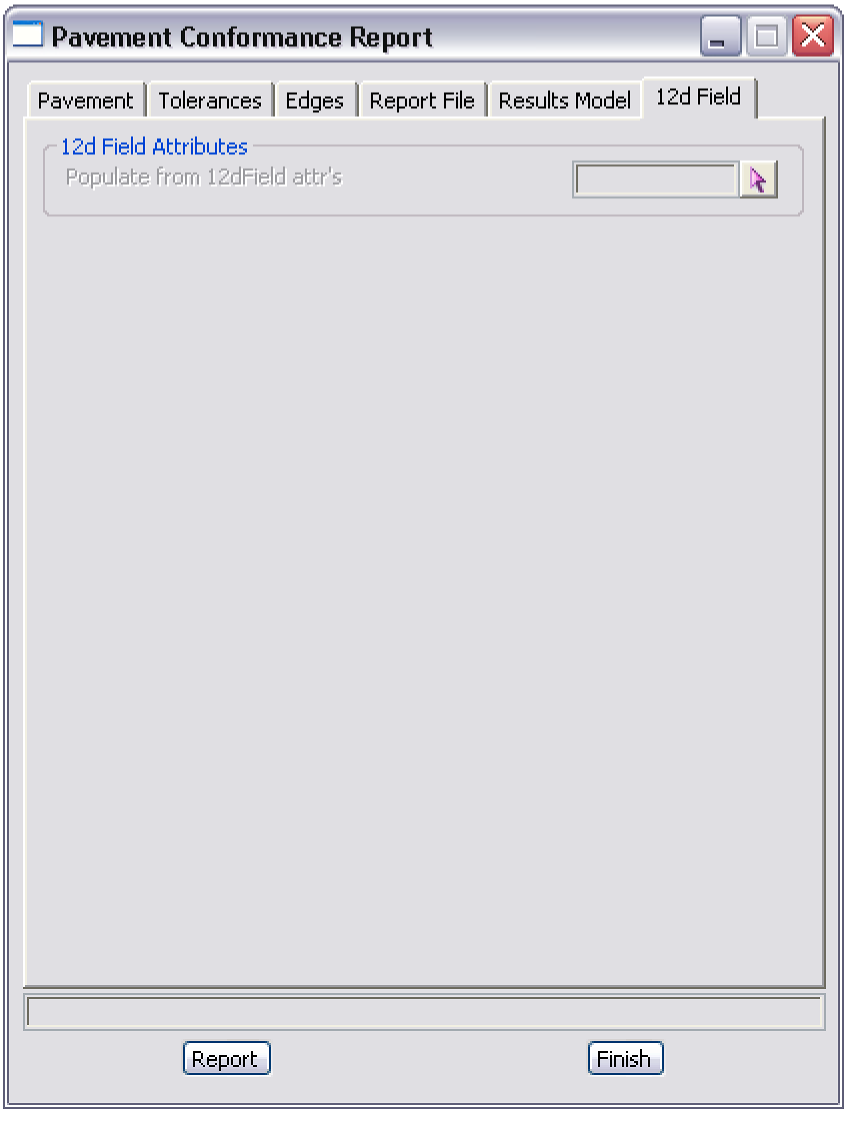
Model for tin	model box		available models

model for tin to be placed in, for viewing purposes. If blank, the tin is not placed into a model.

Tin colour	colour box		available colours

colour for tin. If blank, the tin will adopt the colour selected for Points within tolerance.

12d Field Tab:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Populate from 12dField attr's

if 12dField was used to pickup the points then the attributes can be used to populate the conformance panel automatically, for example the control lines and primary and secondary edge strings. On selecting the string the panel will be updated.

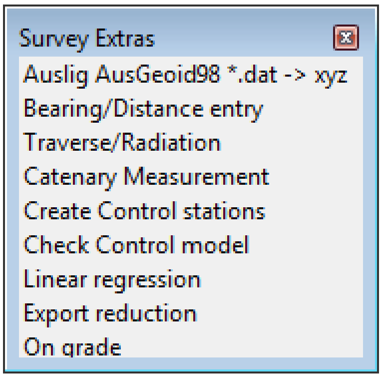
17.14 Extras

Position of menu: **Survey =>Extras**

The **Survey Extras** walk-right menu contains extra survey options, some of which are still being developed.

The **Survey Extras** walk-right menu is

.



Convert AusGeoid98 file into XYZ format
entry and edit by plane bearing and plane distance
bearing distance entry to produce traverse or radiations
create points in a vertical plane
create control stations
check unique point id in control model
Linear regression
write out a field file from a survey function
create an on-grade string

For the option *Auslig AusGeoid98 *.dat ->xyz*, go to 17.14.1 AusGeoid98 *.dat -> xyz
Bearing/Distance entry 17.14.2 Plane Bearing/Distance Entry
Traverse/Radiation 17.14.3 Bearing/Distance Entry for Traverse/ Radiation
Catenary measurement 17.14.4 Catenary Measurement
Create Control Station 17.14.5 Create Control Stations
Check control model 17.14.6 Check Control Model
Linear regression 17.14.7 Linear Regression
Reduction to field file 17.14.8 Survey Function to Field File
On grade 17.14.9 On Grade

17.14.1 AusGeoid98 *.dat -> xyz

Position of option on menu: **Survey =>Extras =>Auslig AusGeoid98 *.dat->xyz**

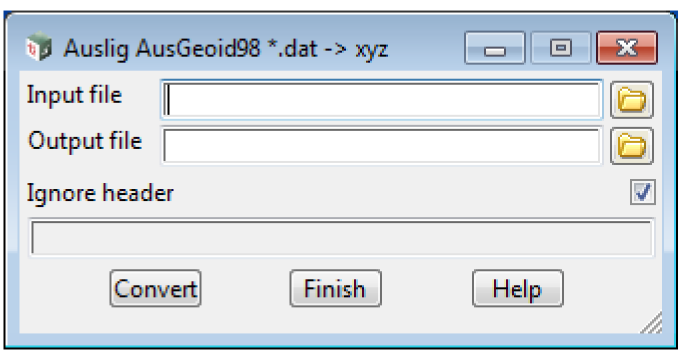
The **Ausgeoid98 *.dat -> xyz** option allows the conversion of a standard AusGeoid98 *.dat file into a XYZ format. This format can then be read into 12d. The values in the XYZ file will have the following meaning

X value will represent the Longitude

Y value will represent the Latitude

Z value will represent the N value

Selecting **Ausgeoid98 *.dat -> xyz** brings up the **Ausgeoid98 *.dat -> xyz** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	file box		*.dat

this filename of the AusGeoid file. The .dat extension is added by default.

Output file file box

this filename of the XYZ file to be produced.

Ignore header tick box ticked

*if ticked, the first line in the *.dat file is ignored (usually the header)*

Convert button

convert the file.

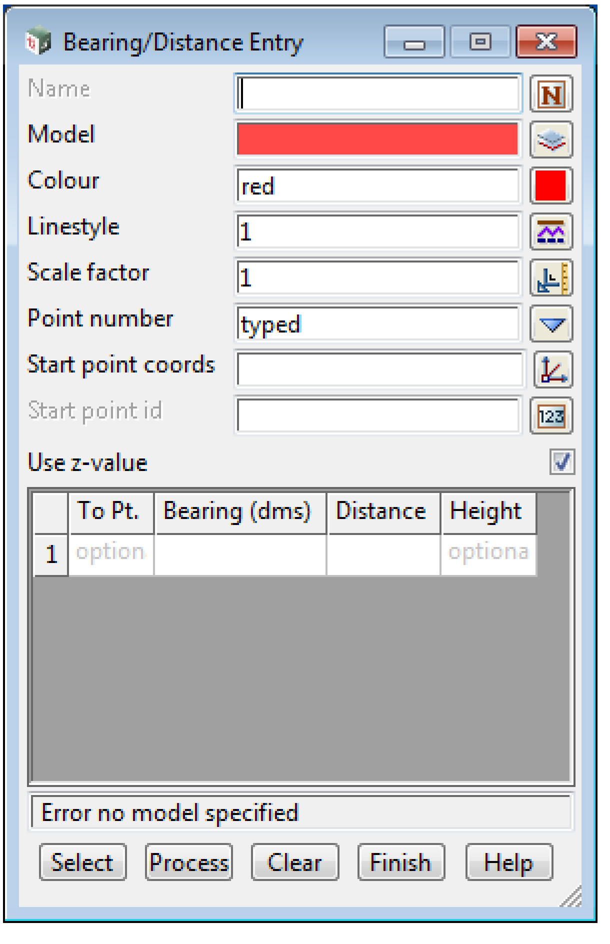
For more information about terminology used in this option, see the Appendix 38 Geodetics Summary .

17.14.2 Plane Bearing/Distance Entry

Position of option on menu: **Survey =>Extras =>Bearing/distance entry**

The **bearing/distance entry** option allows the input of a traverse by manual input of plane bearings and plane distances or by selecting an existing string.

Selecting **Bearing/distance entry** brings up the **Bearing/Distance Entry** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file

this field is optional. If non-blank, the name of the new string.

Model model box available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour colour box red available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Linestyle input 1 available line styles

line style of the string.

Scale factor input projection scale

*This value will be applied to any entered distances. i.e. final distance = entered distance * scale factor*
The scale factor could be a point scale factor, a line scale factor or a combined scale factor.
The final distance will be used for coordinate calculations.

Use z- value tick box transit

*if **ticked**, the z-values for each point can be entered.*
*If **no ticked** then z-values are not entered.*

Point id input typed none, auto increment, typed

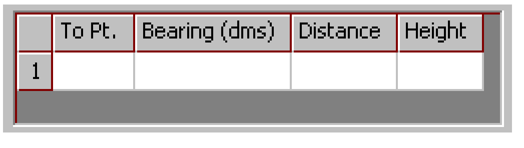
*if **none,** no point ids are entered and the grid control will not show a column for point ids.*

*If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.*

*if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.*

VALUES IN GRID grid box

The columns shown in the grid will depend on the selection of the **Use z- value** *and* **Point id** *fields.*



To Pt. input

*if **none** is selected for the* **Point id** *field, this column will not be displayed.*

*if **auto increment** is selected for the* **Point id** *field, this column will not be displayed.*

*if **typed** is selected for the* **Point id** *field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. I f a new value is typed into the To Pt. field, the next line will increment from that number.*

Bearing (dms) angle box

The user should enter the bearing for the segment into this field.

Distance input box

the user should enter the distance of the segment.

Height input box

This column will only be visible in the grid if the **Use z- value** *tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.*

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-

traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

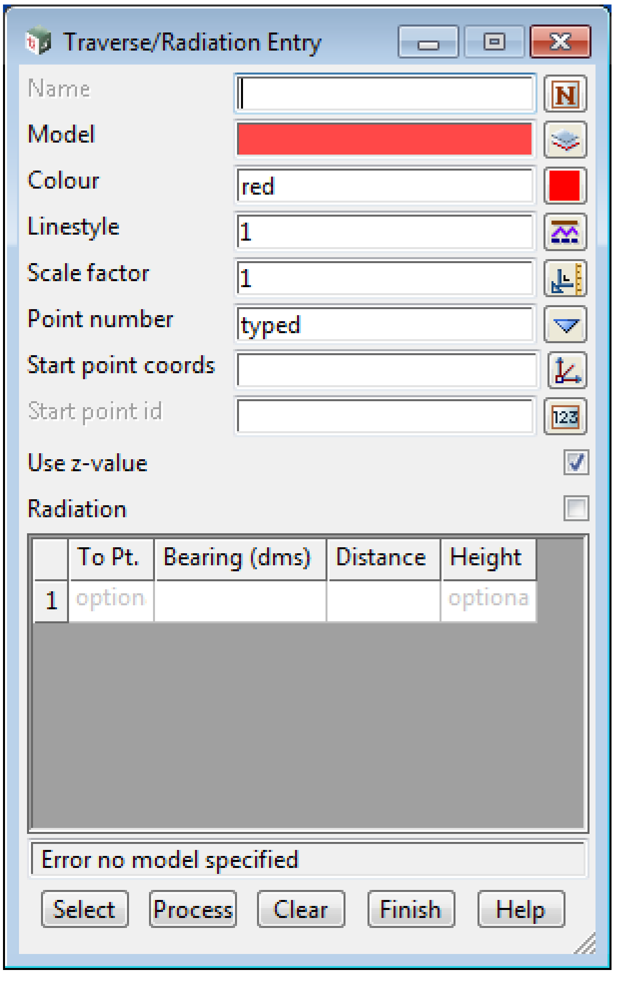
17.14.3 Bearing/Distance Entry for Traverse/Radiation

Position of option on menu: **Survey =>Extras =>Traverse/Radiation**

The **Traverse/radiation** option allows the input of a traverse or radiations by manual input of plane bearings and plane distances or by selecting an existing string.

Bearing/Distance Traverse/Radiation Entry

Selecting **Traverse/Radiation** brings up the **Bearing/Distance Traverse/Radiation Entry** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file

this field is optional. If non-blank, the name of the new string/strings.

Model	model box		available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour	colour box	red	available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Linestyle	input	1	available line styles

line style of the string.

Scale factor	input	projection scale	

*This value will be applied to any entered distances. i.e. final distance = entered distance * scale factor*
The scale factor could be a point scale factor, a line scale factor or a combined scale factor.
The final distance will be used for coordinate calculations.

Start point coords	xyz pick box		

coordinates of the first point. The bearing/distances start from this point.

Start point id	input		

if Point ids is auto increment, point id of the first point.

Point id	input	typed	none, auto increment, typed

*if **none,** no point ids are entered and the grid control will not show a column for point ids.*

*If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.*

*if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.*

Use z- value	tick box		

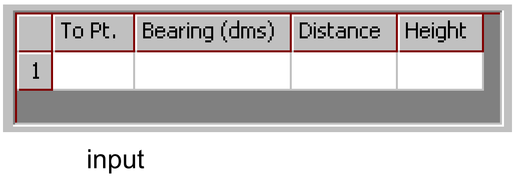
*if **ticked**, the z-values for each point can be entered.*
*If **not ticked** then z-values are not entered.*

Radiation	tick box		

*if **ticked**, the bearing distances are used to create points that are radiations from the start point.*
*If **not ticked** the bearing/distances are used to create a traverse string beginning at the start point.*

Values In Grid	grid box		

The columns shown in the grid will depend on the selection of the **Use z- value** *and* **Point id** *fields.*



To Pt.	input		

*if **none** is selected for the* **Point id** *field, this column will not be displayed.*

*if **auto increment** is selected for the* **Point id** *field, this column will not be displayed.*

*if **typed** is selected for the* **Point id** *field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. I f a new value is typed into the To Pt. field, the next line will increment from that number.*

Bearing (dms) angle box

The user should enter the bearing for the segment into this field.

Distance input box

the user should enter the distance of the segment.

Height input box

This column will only be visible in the grid if the **Use z- value** *tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.*

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

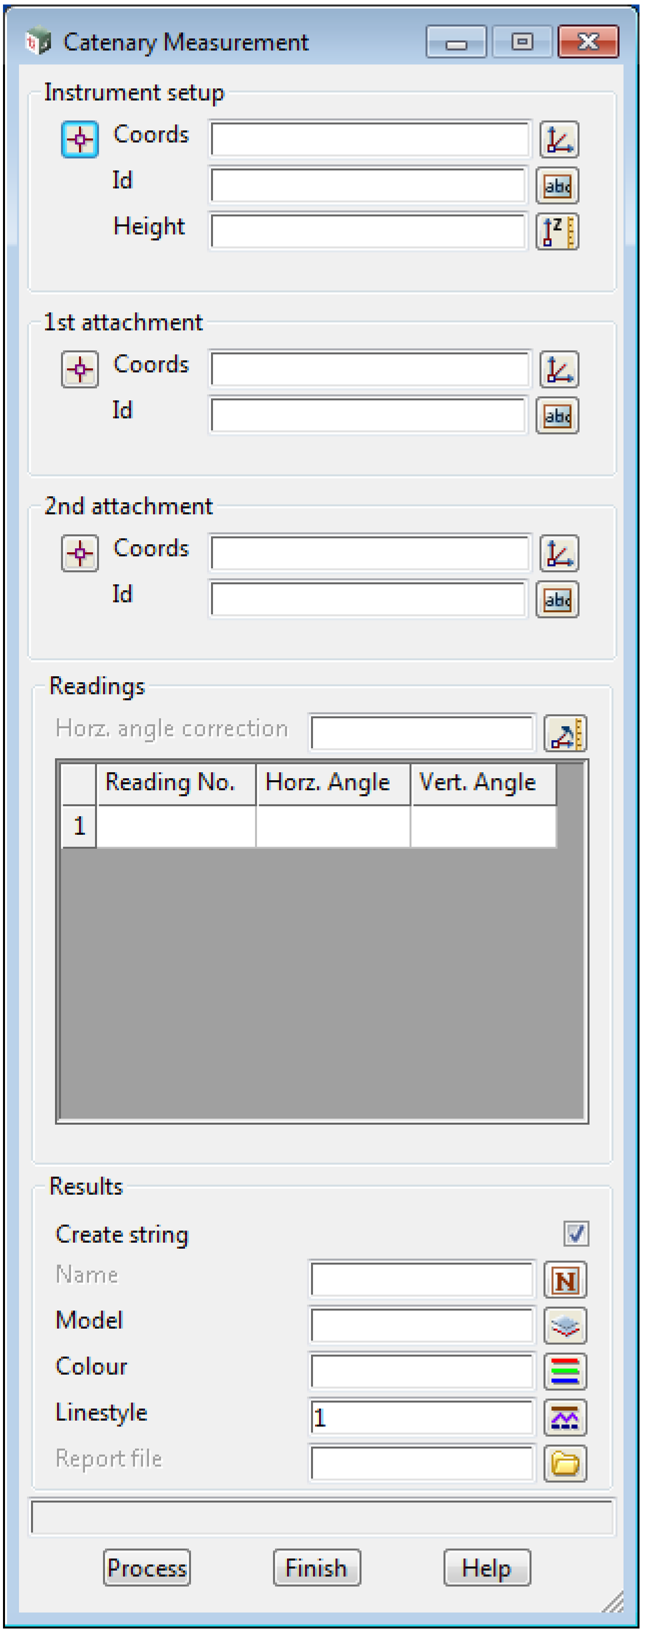
changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

17.14.4 Catenary Measurement

Position of option on menu: **Survey =>Extras =>Catenary measurement**

The **Catenary measurements** option allows for the picking up of data in the vertical plane between two known points using only a bearing and a vertical angle. For example, picking up wires between towers where a distance measurement to the cable is not possible.

Selecting **Catenary measurements** brings up the **Catenary Measurements** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Instrument setup

Coords xyz box

the xyz coordinates of the instrument.

Id input box

the vertex id (point id) of the instrument.

Height input box

the height of the instrument.

1st Attachment

Coords xyz box

the xyz coordinates of the attachment point of the cable on the first tower.

Id input box

the vertex id (point id) of the first tower.

2nd Attachment

Coords xyz box

the xyz coordinates of the attachment point of the cable on the second tower.

Id input box

the vertex id (point id) of the second tower.

Reading

Horizontal angle correction angle box

angle to be subtracted from the Horizontal Angle reading to give true bearing.

Reading No input box

number for the reading.

Horz. Angle angle box

Horizontal Angle reading. The Horizontal angle correction is subtracted from this to give the true bearing.

Vert. Angle angle box

Vertical Angle reading.

Results

Create string tick box ticked

if ticked, a string of the observed points is created.

Name input box

name of the created string.

Model model box available models

name of the model for the created string.

Colour colour box red available colours

the colour of the created string.

Linestyle input 1 available linestyles

linestyle of the created string.

Report file file box *.rpt files

if non-blank, the name of the file to write the report to.

Process button

reduce the angle readings.

17.14.5 Create Control Stations

Position of option on menu: **Survey =>Extras =>Create Control stations**

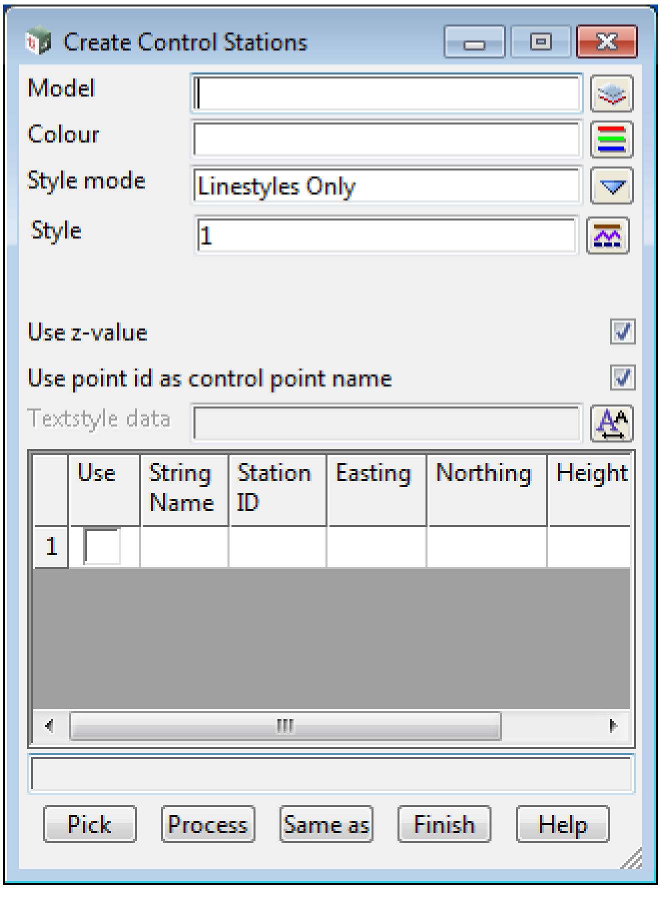
Position of option on menu: **Strings =>Create =>Create Control Stations**

A *control station* (for surveying) consists of a one point string. For V6, the *point name* is the name of the control station. For V5 and before, the *string name* is used as name of the control station.

Control stations are used when reducing 12d field files in the *Survey Reduction* module.

The **Create Control Stations** options allows the user to define control stations in a given model. The option checks that the point ids are unique in the control model.

Selecting **Create Control Stations** brings up the **Create Control Station** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	model box		available models

name of the model for the control stations.

Colour	colour box	red	available colours

the colour of the new control stations.

Line style	input	1	available line styles

line style of the control station.

Use z-value tick box ticked

if ticked, the height value must be specified for all of the stations.

Use point id as control point name tick box ticked

if ticked, the point names are used as the names of the control points and the ***point names*** *are checked for uniqueness.*
If not ticked, the name of the string is used as the names of the control points and the ***string names*** *are checked for uniqueness. This is only for compatibility in pre* **12d Model** *V6.0.*

Station name Easting Northing Height Remark

the information for stations to be created is entered into the grid. The stations are created by selecting the **Process** *button.*

If a station name is typed in and the <enter> key pressed then the Model is searched and if a control station already exists of the same name (either point name or string name depending on the ***Use point id as control point name*** *flag), the co-ordinates are displayed in the grid.*

The grid control values can be entered/displayed using valid inputs into the various fields.

***Station name**. The associated text that identifies the control point.*
***Easting** The easting coordinate of the control point.*
***Northing** The northing coordinate of the control point.*
***Height** The height of the station. (Only displayed if the use z-value tickbox is selected.)*
***Remark** The description of the control station.*

Process button

After the **Process** *button is chosen, the control stations in the grid are created. If a station of the given name already exists in the control Model, the user is asked if the co-ordinates of the station are to be updated by the values given in the grid.*

Same as button

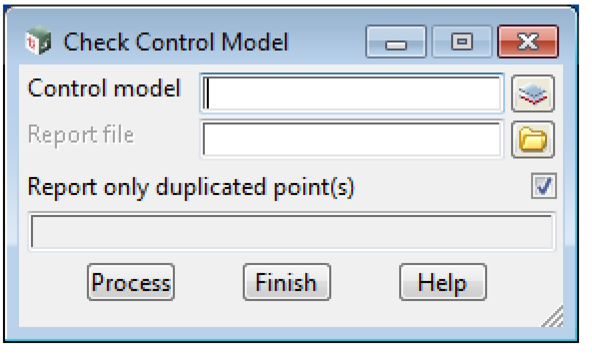
After the **Same as** *button is chosen, another string is selected and information about it is used for the Model, Colour and Point style fields in this panel.*

17.14.6 Check Control Model

Position of option on menu: **Survey =>Extras =>Check Control model**

The **Check control model** option checks that there are no points in the control model with the same point id. A report of all the points in the control models, or only those with clashing point ids, is created.

Selecting **Check control model** brings up the **Check Control Model** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control model	model box		available models

the model the check for unique point ids.

Report file file box *.rpt files

if non-blank, the name of the file to write the report to.

Report only duplicated point(s) tick box ticked

if ticked, only those points with duplicated point ids are reported.
If not ticked, all points in the control model are written out.

Process button

check the Control model for duplicated point ids.

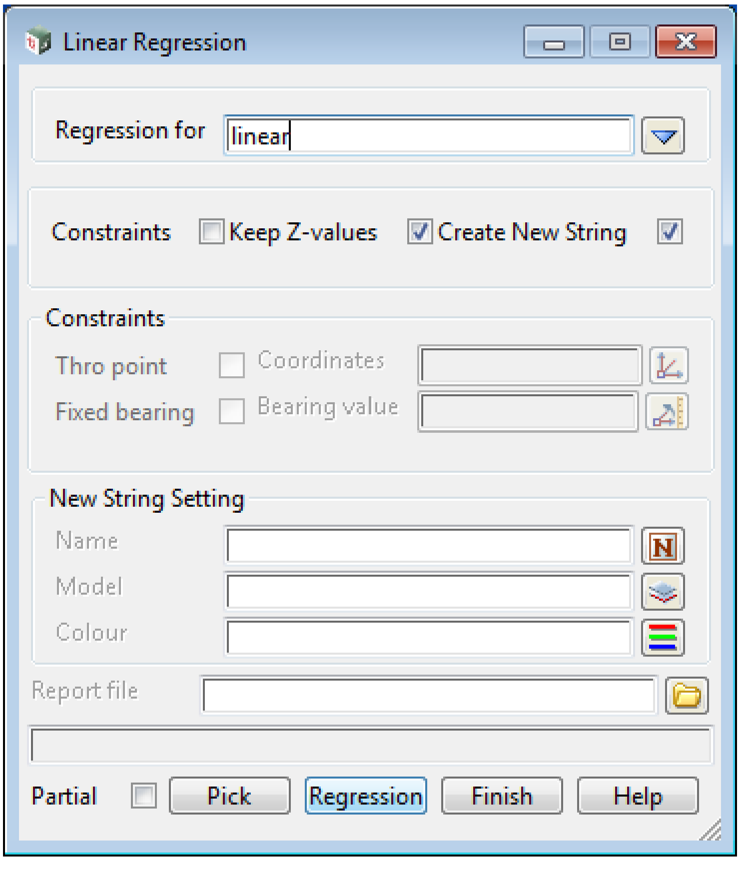
17.14.7 Linear Regression

Position of option on menu: Survey =>Extras =>Linear regression

Position of option on menu: Strings =>Utilities =>Linear regression

The linear regression option will create a line, circle or arc of best fit through points on a string. The line can be constrained to go through a selected point or have a given bearing.

Selecting **linear regression** brings up the **linear regression** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Regression for	choice box	line	line, circle, arc

if line/circle/arc, the line/circle/arc of best fit through the points is created.

Constraints	tick box		

if ticked, the regression line can be restrained to go through a selected point or be given a selected bearing.

Keep z-values	tick box	tick	

if ticked, the z-values of the selected string are used on the regression string.

Create new string	tick box	tick	

if ticked, a new adjusted string is created. If not ticked, the selected string is adjusted.

Constraints

Thro point tick box

if ticked, the regression line is constrained to go through the point with co-ordinates given in the **Coordinates** *field.*

Coordinates

if ***thro point*** *is ticked, the regression line is constrained to go through the point given in this field.*

Fixed bearing tick box

if ticked, the regression line is constrained to have the bearing given in the **Bearing value** *field.*

Bearing value

if ***thro point*** *is ticked, the regression line is constrained to have the bearing given in this field.*

Name name box

if non-blank, the name of the new string. If blank, the original string name is used.

Model model box available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour colour box available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Report file *.rpt files

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

Partial tick box

if ticked, only part of the string is used in the regression.

Pick button

select the string to create a regression line/circle/arc from.

Regression button

perform the regression.

17.14.8 Survey Function to Field File

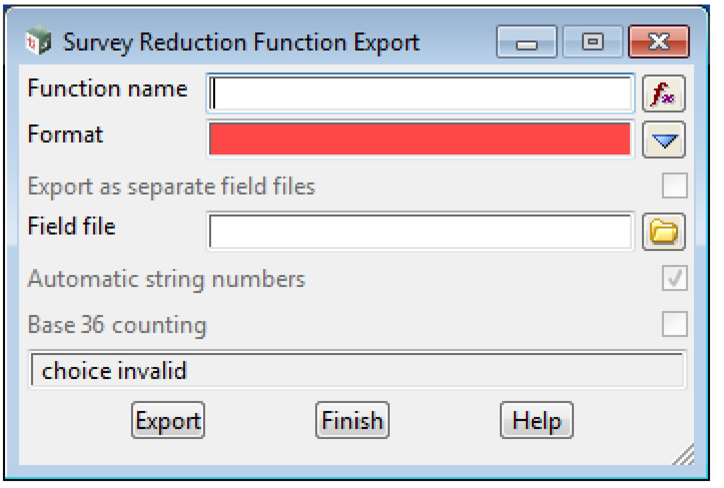
Position of option on menu: **Survey =>Extras =>Reduction to field file**

The **reduction to field file** option writes out the field data from a Survey function to a file in the standard 12d field file format.

Selecting **reduction to field file** brings up the **survey reduction function export** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input		available Survey functions



name of the 12d Survey function to write out a 12d field file for.

Field file input *.fld

name of the 12d field file to write out the Survey field data to.

Export button

create the 12d field file.

17.14.9 On Grade

Position of option on menu: **Survey =>Extras =>On grade**

Position of option on menu: **Strings =>Utilities =>On grade**

The **on grade** option produces a string that is a fixed horizontal distance from a selected string with z-values produced by extrapolating the grade from two strings or from a tin.

Selecting **On grade** brings up the **On Grade String** panel

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Primary string string select

string to produce the on grade string from

Horizontal offset input

horizontal distance to offset the on grade string from the primary string, relative to the direction of the primary/control string, +ve to the right

Vertical offset input

vertical distance to offset the on grade string from the primary string

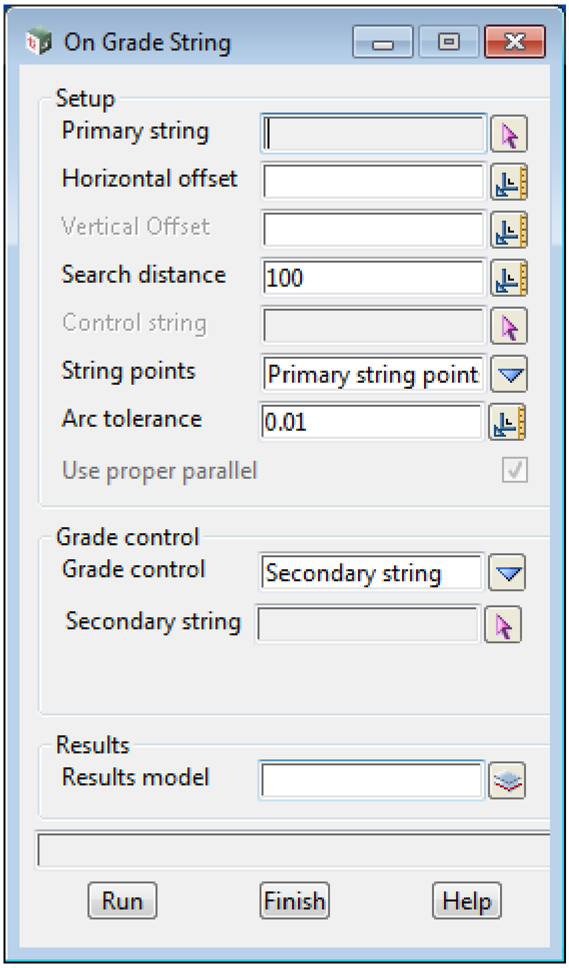
Search distance input

only string cuts inside this distance will be considered

Control string string select

*if **selected**, the horizontal distance is measured at right angles to the control string. In this case, the on-grade may not be parallel to the primary string.*
*If **not selected**, the horizontal distance is measured at right angles to the primary string.*

String points choice box Primary string points
Chainage interval
Special chainage file



*if **Primary string points**, the on-grade string has vertices on it where ever there is a vertex on the primary string. Extra points will also be include for the given arc tolerance.*

Arc tolerance input

*if **non zero**, chord to arc tolerance to use for adding additional vertices*

Use proper parallel tick box

*if **ticked**, the primary string is parallelled to from the on-grade string*

*If **Chainage interval**, vertices are created on the on-grade string corresponding to the given chainage interval along the primary/control string.*

Interval input

the chainage interval the use along the primary/control string for creating on-grade vertices.

*If **Special chainage file**, vertices are created on the on-grade string from chainages on the primary or control string, corresponding to the special chainages file.*

Special chainages file box .spc files

the chainage interval the use along the primary/control string for creating on-grade vertices.

Grade control choice box Secondary string
Tin

*if **Secondary string**, the grade to use to create z-values on the on-grade string is the grade between the secondary string and the primary string.*

Secondary string string select

the grade to use is taken from the secondary to the primary string

*If **Tin**,*

Tin tin box

the tin to use

Offset input

offset from the primary string to the point on the tin to create the grade, relative to the primary string direction, +ve to the right

Results model model box available models

the model for the created on-grade string

Run button

create the on grade string

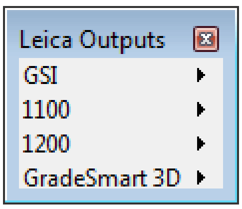
17.15 Leica

Position of menu: **Survey =>Leica**

The **Leica** walk-right menu collects options for working with Leica instruments.

The **Leica** walk-right menu is

.

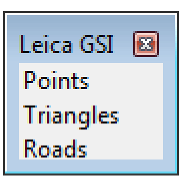


For the option *GSI*, go to [17.15.1 Leica GSI](#)
1100 [17.15.2 Leica 1100](#)
1200 [17.15.6 Leica 1200](#)
GradeSmart 3D [17.15.12 Leica GradeSmart 3D](#)

17.15.1 Leica GSI

The **Leica GSI** walk-right menu collects under the one menu, options that can work with Leica GSI format.

.

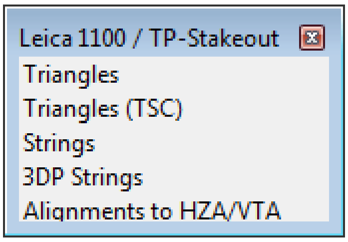


For the option *Points*, go to [17.19.3 Create Points Upload File](#)
Triangles [17.19.2 Create Triangle Upload File](#)
Roads [17.19.4 Create Road Upload File](#)

17.15.2 Leica 1100

The **Leica 1100** walk-right menu collects under the one menu, options that can work with Leica 1100 instruments.

.



For the option *Triangles*, go to 8.2.13 TP Stakeout Triangles Output

Triangles (TSC) 17.15.3 Write TP Stakeout Binary Triangles (TSC Format)

Strings 8.2.14 TP Stakeout Strings Output

3DP Strings 17.15.4 Write TP Stakeout 3DP String

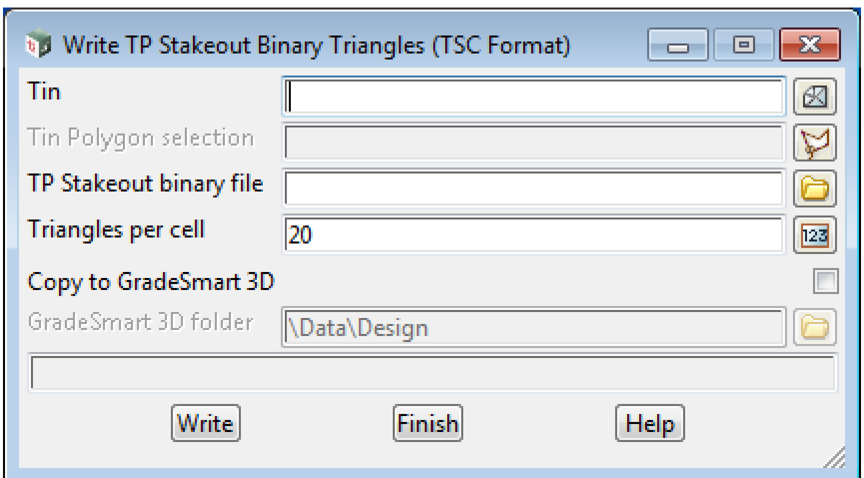
Alignments to HZA/VTA 17.15.5 TP Alignment

17.15.3 Write TP Stakeout Binary Triangles (TSC Format)

Position of option on menu: **Survey => Leica => 1100 =>Triangles (TSC)**

The Write *TP Stakeout Binary triangles TSC* option writes out a tin as a TP Stakeout binary file.

On selecting the **Triangles (TSC)** option, the **Write TP Stakeout Binary Triangles (TSC Format)** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to write out in TP Stakeout binary format.

Tin polygon selection	poly string-select		

if selected, only triangles with their centroid inside this string are written out

TP Stakeout binary file	input		*.tsc

name of the file for the triangles

Triangles per cell

a TP Stakeout parameter

Copy to GradeSmart 3D tick box

if ticked, copy file to GradeSmart folder

GradeSmart 3D folder folder box

folder for GradeSmart files

Write button

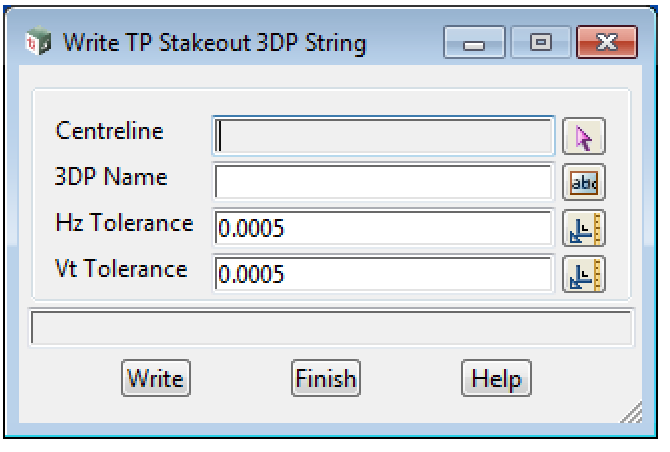
write out the tin in TP Stakeout binary format.

17.15.4 Write TP Stakeout 3DP String

Position of option on menu: **Survey => Leica => 1100 =>3DP Strings**

This panel creates a TP-Stakeout 3DP format file

Selecting **3DP Strings** brings up the **Write TP Stakeout 3DP String** panel**.**



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Centreline string select

select the super alignment or super string to convert, the string must have valid vertical geometry or an error will occur when processing.

3DP Name

the name of the 3DP file to be created, the name of the file must be <= 8 characters.

Hz Tolerance

the arc to chord tolerance of the created horizontal points.

Vt Tolerance

the arc to chord tolerance of the created vertical points.

Write button

write the 3DP file, any errors in processing the selected string will be displayed.

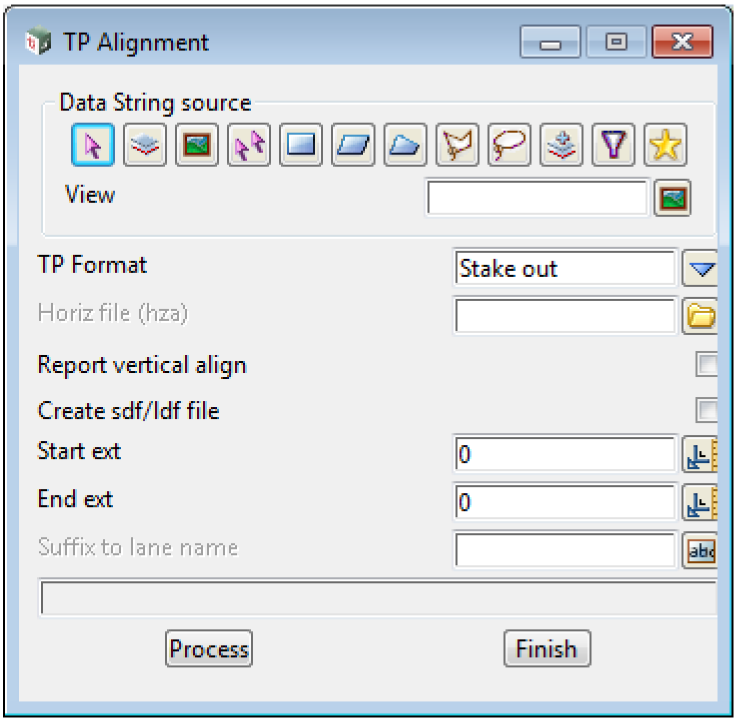
17.15.5 TP Alignment

Position of option on menu: **Survey => Leica => 1100 =>Alignments to HZA/VTA**

This option converts alignments or super alignments into the TP-Setout/TP-Stakeout alignment format. These programs support the clothoid/natural clothoid and cubic parabola transition types. Due to restrictions in the software using these files the file names and alignment names must be

<= 8 characters.

On selecting the **Alignments to HZA/VTA** option, the **TP Alignment** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data String source

Data source type

data selection type - for a full description go to 4.19.3 Data Source .

Data source model

Source of the alignment/super alignment strings to convert.

TP Format choice box Stake out Stake out, Set out

Stake out - write the data out in TP-Stakeout format.
Set out - write the data out in TP-Setout format.

Horiz file (hza) file

The HZA file to create, the name must be 8 characters or less.

Report vertical align tick box

if ticked the vertical alignment will be written to a .VTA file of the same name as the HZA file.

Create sdf/ldf file tick box

if ticked a surface/lane entry will be created for the alignments being written in the SDF/LDF file of the same name as the HZA file.

Start ext input

The start extension to all alignments being written, +ve extends before the start chainage, -ve invalidates that distance +into the alignment.

End ext input

The end extension to all alignments being written, +ve extends after the end chainage, -ve invalidates that distance back into the alignment.

Suffix to lane name

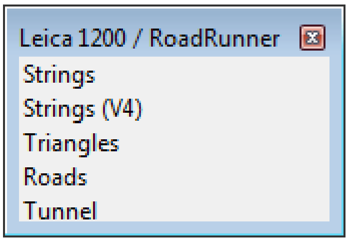
A suffix will be added to the alignment name in the SDF/LDF file entry.

Process button

Create the TP-Stakeout/Setout format files, if errors are encountered during the conversion such as names > 8 characters the appropriate warnings will be displayed.

17.15.6 Leica 1200

The **Leica 1200** walk-right menu collects under the one menu, options that can work with Leica 1200 instruments.



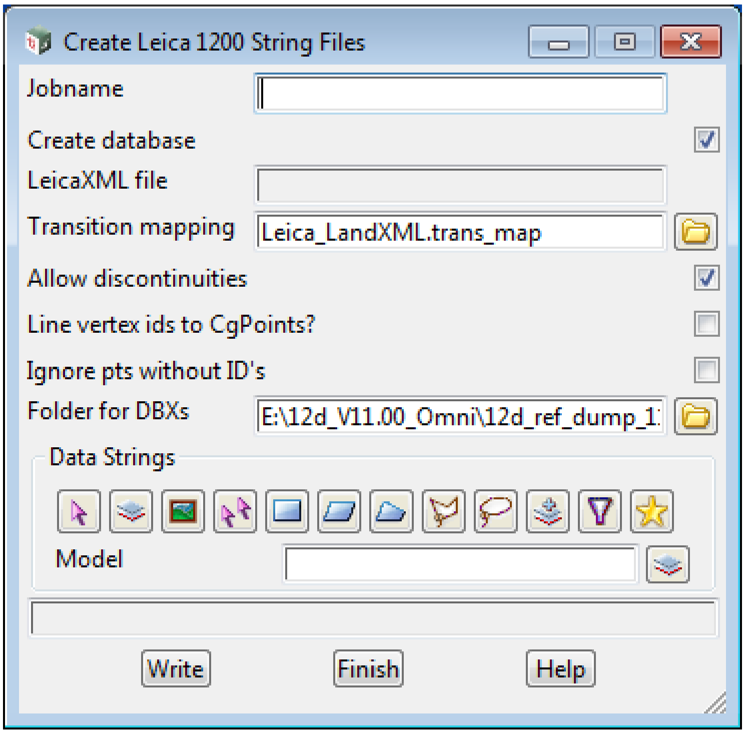
For the option *Strings*, go to [17.15.7 Create Leica 1200 String Files](#)
Strings (V4) [17.15.8 Create Leica 1200 String Files (Old)](#)
Triangles [17.15.9 Create Leica 1200 Triangle Files](#)
Roads [17.15.10 Create Leica 1200 Road Files](#)
Tunnel [17.15.11 Create Leica 1200 Tunnel Files](#)

17.15.7 Create Leica 1200 String Files

Position of menu: **Survey =>Leica => 1200 => Strings**

This panel creates a points and lines database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate LandXML file and then calling a Leica provided converter to create the DBX files.

Selecting **Strings** brings up the **Create Leica 1200 String Files** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Jobname

The internal jobname seen inside the Leica software.

Create database tick box

If ticked will create the 1200 DBX
if not ticked just the LandXML file is created.

LeicaXML file

The name of the Leica LandXML file to create.

Transition mapping file

Due to the inadequate specification of transitions in the LandXML schema users must explicitly map 12d transition types to other vendors types.

Allow discontinuities tick box

If ticked super string discontinuities will not be written to the DBX.

Line vertex ids to CgPoints? tick box

If ticked will write all of the string vertices to CgPoints as well as writing the strings as plan features.

Ignore pts without ID's tick box

If ticked, points without a Point ID will be ignored.

Folder for DBXs file

The folder to create the databases in.

Data Strings

Data source type model

data selection type - for a full description go to 4.19.3 Data Source .

Data source model

The data source to write to the DBX files

Write button

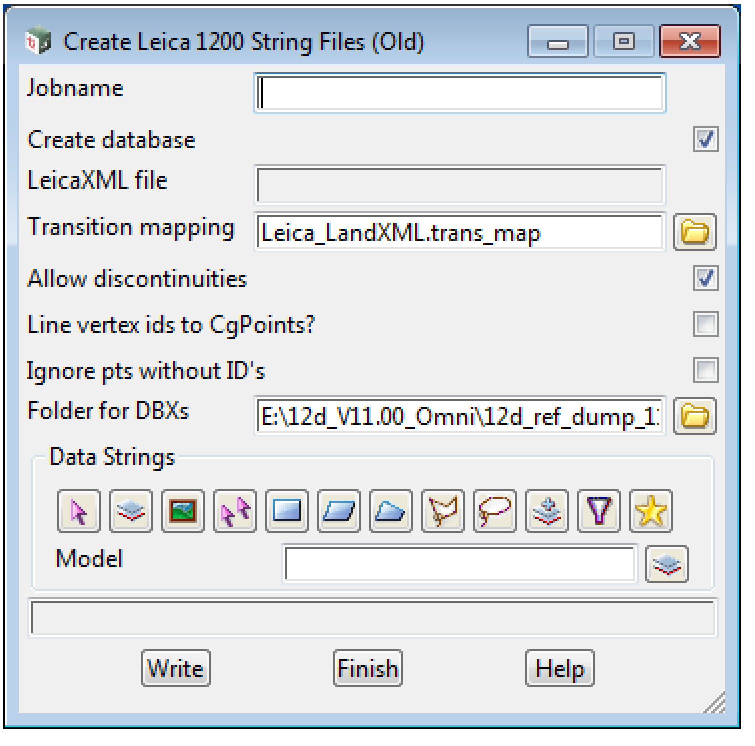
Create the Leica 1200 Strings DBX files.

17.15.8 Create Leica 1200 String Files (Old)

Position of menu: **Survey =>Leica => 1200 => Strings (V4)**

This panel is identical to 17.15.7 Create Leica 1200 String Files but calls an older version of the Leica LandXML/DBX converter.

Selecting **Strings (V4)** brings up the **Create Leica 1200 String Files (Old)** panel

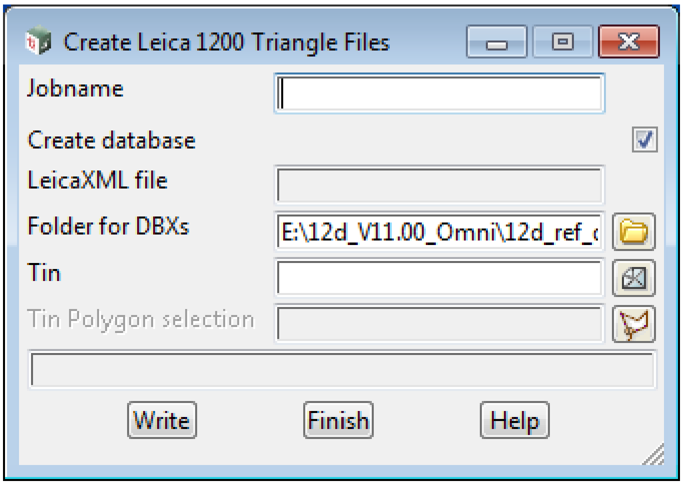


17.15.9 Create Leica 1200 Triangle Files

Position of menu: **Survey =>Leica => 1200 => Triangles**

This panel creates a triangle database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate LandXML file and then calling a Leica provided converter to create the DBX files.

Selecting **Triangles** brings up the **Create Leica 1200 Triangle Files** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Jobname

The internal jobname seen inside the Leica software.

Create database tick box

if ticked will create the 1200 DBX,
if not ticked just the LandXML file is created.

LeicaXML file

The name of the Leica LandXML file to create.

Folder for DBXs file

The folder to create the databases in.

Tin input

The tin to write to the DBX.

Tin Polygon selection

Select a polygon for the region of the tin to write out.

Write button

Create the Leica 1200 Triangle DBX files.

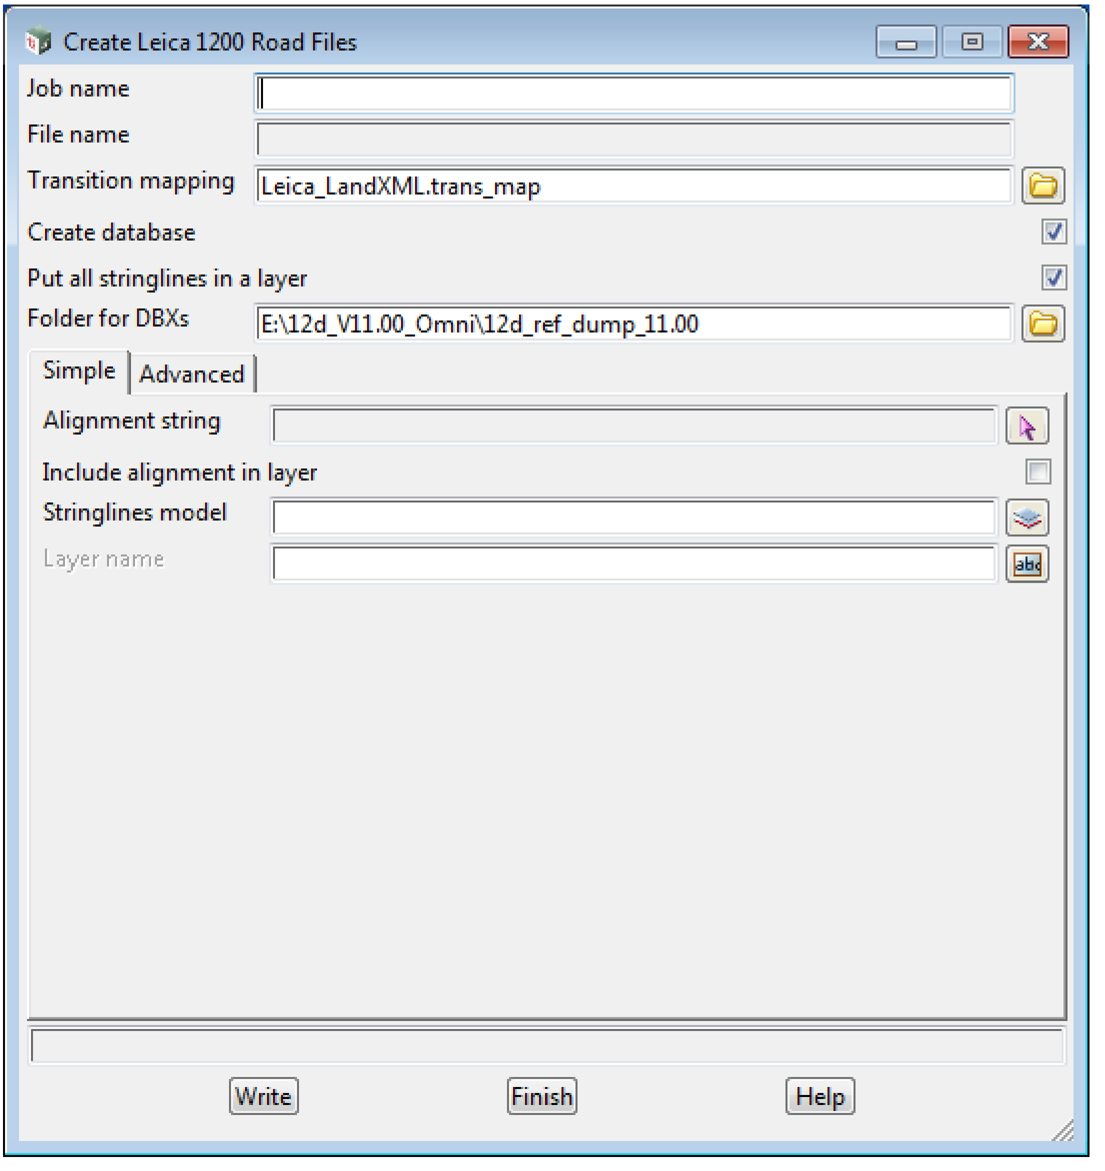
17.15.10 Create Leica 1200 Road Files

Position of menu: **Survey =>Leica => 1200 => Roads**

This panel creates a roads database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate Leica LandXML file and then calling a Leica provided converter to create the DBX files.

This panel allows either a flat group of strings to be written to the DBX or multiple roads and layers in those roads dependent on the users needs.

Selecting **Roads** brings up the **Create Leica 1200 Road Files** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Jobname

The internal jobname seen inside the Leica software.

File name

The name of the Leica LandXML file to create.

Transition mapping file

Due to the inadequate specification of transitions in the LandXML schema users must explicitly map 12d transition types to other vendors types.

Create database tick box

if ticked will create the 1200 DBX,
if not ticked just the LandXML file is created.

Put all stringlines in a layer tick box

if not ticked then the strings in the model selected in the **Stringlines model** *box in the "**Simple**" tab are written to the LandXML file with no layer grouping.*
if ticked there are 2 options.

Folder for DBXs file

The folder to create the databases in.

Simple Tab

The "**Simple**" tab allows a centreline and model of strings to be written to a single layer in the DBX.

Alignment string string select

The centreline for the layer.

Include alignment in layer tick box

if ticked the centreline is included in the layer, is cut as part of the road surface.

Stringlines model model box

The model of strings forming the road surface/layer.

Layer name

The default layer name is the model name, this can be changed here.

Advanced Tab

The "**Advanced**" tab allows multiple centrelines and strings to be written to layers in the DBX. For each alignment string there can be up to 10 layers, e.g. an entire subdivision can be uploaded by nominating the centreline for each road and adding the models for the final surface layers, boxing layers etc.

Alignment string

The centreline for the 10 optional layers.

Alignment in layer 1

If ticked the centreline is included in the 1st layer, is cut as part of the road surface.

Stringlines models 1

The model of strings forming the road surface/layer.

Layer name 1

The default layer name is the model name, this can be changed here.

For the rest of the option layer enter the model and layer name to suit.

To create extra roads/centrelines right click on the row number in the grid box to insert an extra row and fill out to suit.

Write button

Create the Leica 1200 Road DBX files.

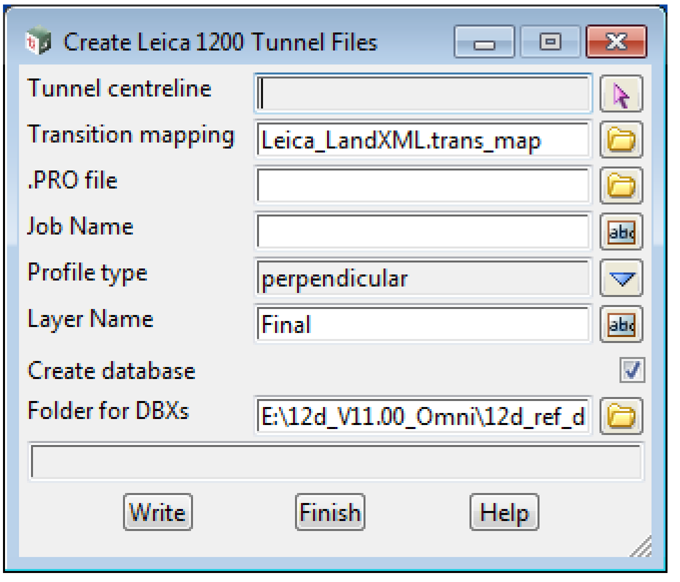
17.15.11 Create Leica 1200 Tunnel Files

Position of menu: **Survey =>Leica => 1200 =>Tunnel**

This panel creates a tunnel database for use on the Leica 1200 series of TPS instruments. This is done by creating an intermediate Leica LandXML file and then calling a Leica provided converter to create the tunnel DBX files.

This panel allows a single centreline and layer to be written to a tunnel DBX, it uses some industry standard tunnel definition files (.PRO,.PRA) to define the shape of profiles and the chainages they are applied at, these files are created via a text editor or other software packages.

Selecting **Tunnel** brings up the **Create Leica 1200 Tunnel Files** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tunnel centreline	string select		

The centreline for the tunnel.

Transition mapping file Leica_LandXML.trans_map

Due to the inadequate specification of transitions in the LandXML schema users must explicitly map 12d transition types to other vendors types.

.PRO file file

The profiles file containing the definition of the tunnel elements.

Create database

If ticked will create the 1200 tunnel DBX
if not ticked, just the Leica LandXML file is created.

Jobname

The internal jobname seen inside the Leica software.

Profile type choice box perpendicular perpendicular, vertical

perpendicular - the profiles are to be interpreted normal to the grade of the tunnel vertical alignment.
vertical - the profiles are not adjusted to the grade of the tunnel vertical alignment.

Layer name Final

The name of the tunnel DBX layer.

Create database tick box

if ticked will create the 1200 DBX
if not ticked just the LandXML file is created.

Folder for DBXs file

The folder to create the databases in.

Write button

Create the tunnel DBX files.

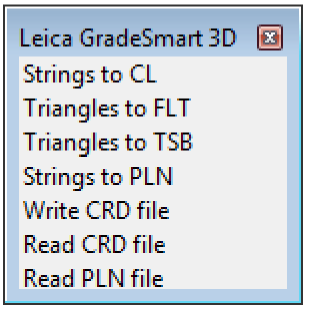
For more information on PRO/PRA tunnel definition files please see 20.12.10 Definition of the PRO and PRA definition files

17.15.12 Leica GradeSmart 3D

The **Leica GradeSmart 3D** walk-right menu collects under the one menu, options that can work with Leica GradeSmart software.

The *GradeSmart* options are all documented in the Leica GradeSmart manual.

.



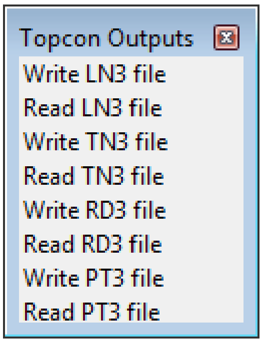
Triangles to TSB

The *GradeSmart* options are all documented in the Leica GradeSmart manual.

17.16 Topcon

The **Topcon** walk-right menu collects under the one menu, options that can work with Topcon instruments.

.



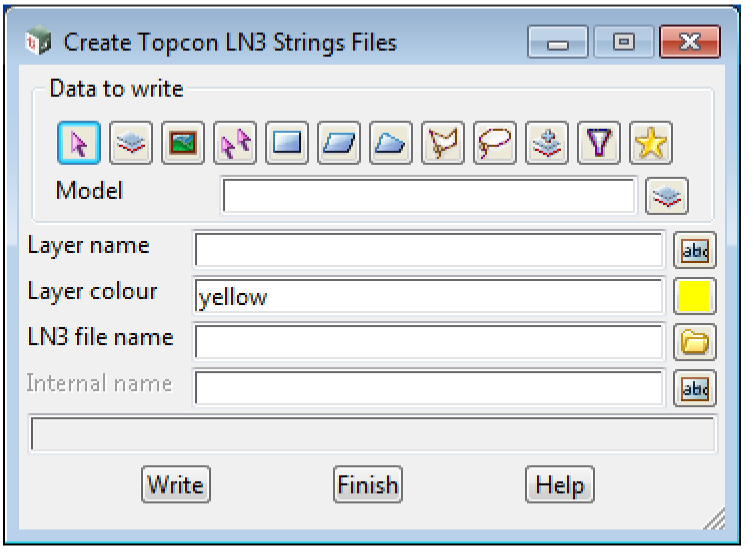
For the option *Write LN3 file* go to	17.16.1 Create Topcon LN3 String Files
Read LN3 file	17.16.2 Read Topcon LN3 Strings Files
Write TN3 file	17.16.3 Create Topcon TN3 Triangle Files
Read TN3 file	17.16.4 Read Topcon TN3 Triangle Files
Write *RD3 file*	17.16.5 Create RD3 Road File
Read RD3 file	17.16.6 Read Topcon RD3 Road File
Write *PT3 file*	17.16.7 Create Topcon PT3 Points Files
Read PT3 file	17.16.8 Read Topcon PT3 Points Files

17.16.1 Create Topcon LN3 String Files

Position of menu: **Survey =>Topcon=> write LN3 file**

This panel writes strings to Topcon LN3 linework files.

Selecting **write LN3 file** brings up the **Create Topcon LN3 String Files** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Data to write

Data source type model

data selection type - for a full description go to [4.19.3 Data Source](#) .

Data source model

The data source to write to the LN3 file.

Layer name

The name of the layer in the LN3 file.

Layer colour colour yellow

The colour of the strings in the Topcon LN3 file.
Please note that the LN3 format colour string by layer and hence individual string colours cannot be mapped to a LN3 file.

LN3 file name

The name of the LN3 file.

Internal name

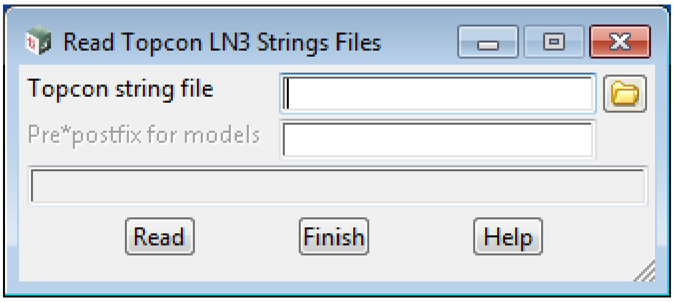
The name of the LN3 file you see inside the Topcon software.

17.16.2 Read Topcon LN3 Strings Files

Position of menu: Survey =>Topcon=> Read LN3 file

This panel reads in strings from the Topcon LN3 linework files.

Selecting **Read LN3 file** brings up the **Read Topcon LN3 String Files** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Topcon string file	file		

The LN3 file you wish to read.

Pre* postfix for models

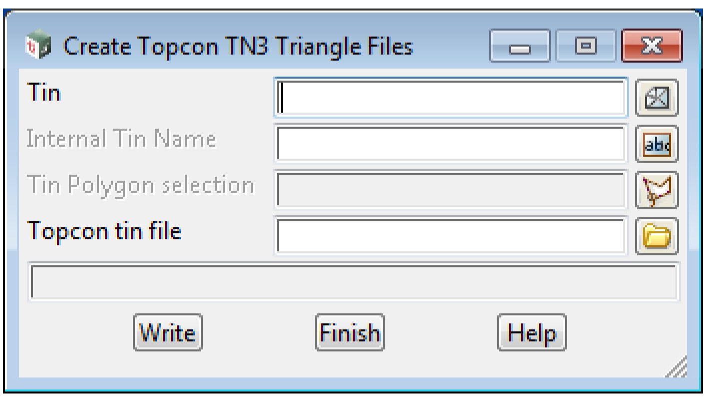
for information please go to 4.19.2 Pre*Postfix in Panel Fields

17.16.3 Create Topcon TN3 Triangle Files

Position of menu: **Survey =>Topcon=> Write TN3 file**

This panel writes triangles to the Topcon TN3 triangulation files.

Selecting **Write TN3 file** brings up the **Create Topcon TN3 Triangle Files** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		

The tin to write to the TN3 file.

Internal Tin name

The name of the tin you see inside the Topcon software.

Tin Polygon selection

Select a polygon for the region of the tin to write out.

Topcon tin file	file	

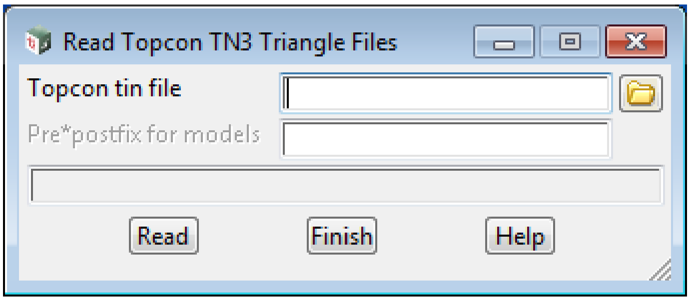
The name of the TN3 file to create.

17.16.4 Read Topcon TN3 Triangle Files

Position of menu: Survey =>Topcon=> Read TN3 file

This panel reads in triangles from the Topcon TN3 triangulation files.

Selecting **Read TN3 file** brings up the **Read Topcon TN3 Triangle Files** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Topcon tin file	file		

The TN3 file you wish to read.

Pre* postfix for models

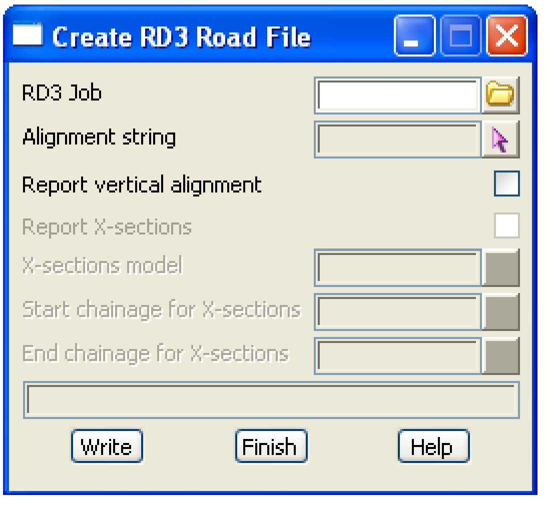
for information please go to 4.19.2 Pre*Postfix in Panel Fields

17.16.5 Create RD3 Road File

Position of menu: Survey =>Topcon=> Write RD3 file

This panel uploads the centreline and cross sections for a Topcon RD3 road definition file. The RD3 file can contain just a centreline, a centreline with vertical alignment or the full definition including cross sections.

Selecting **Write RD3 file** brings up the **Create RD3 Road File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

RD3 Job file

The RD3 file you wish to create.

Alignment string string select

The centreline of the road.

Report vertical alignment tick box

If ticked the vertical alignment is uploaded to the RD3 file

Report X-sections tick box

If ticked cross sections are uploaded to the RD3 file

X-sections model

The model containing the cut cross section strings to upload to the RD3 file. These must have been cut normal to the nominated alignment string or the upload will fail. Start chainage for X-sections
If non blank the start chainage to upload cross sections from.

End chainage for X-sections

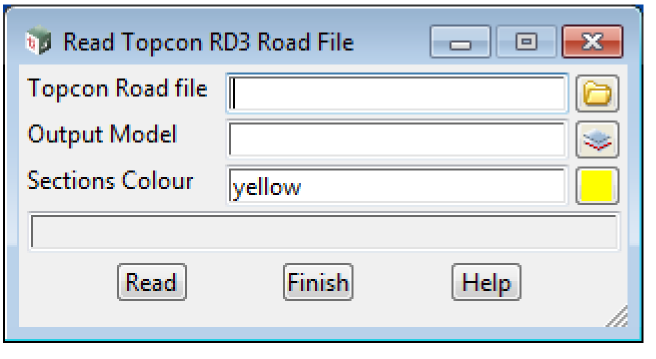
If non blank the end chainage to upload cross sections to.

17.16.6 Read Topcon RD3 Road File

Position of menu: **Survey =>Topcon=> Read RD3 file**

This panel reads in the centreline and cross sections from a Topcon RD3 road definition file.

Selecting **Read RD3 file** brings up the **Read Topcon RD3 Road File** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Topcon Road file

The RD3 file you wish to read.

Output Model model

The model for the centreline and cross sections.

Sections Colour colour box yellow

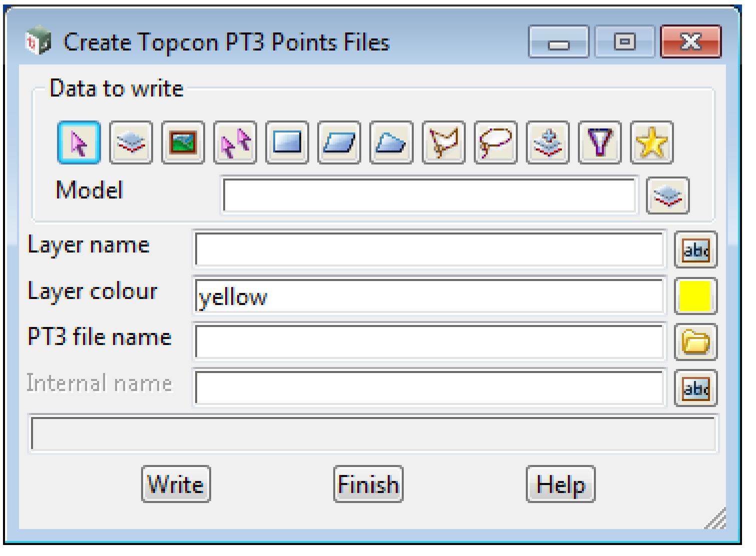
The colour for the cross section strings.

17.16.7 Create Topcon PT3 Points Files

Position of menu: **Survey =>Topcon=> Write PT3 file**

This panel writes strings to Topcon PT3 points files.

Selecting **Write PT3 file** brings up the **Create Topcon PT3 Points Files** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data to write

The data to write to the PT3 file.

Data source type

data selection type - for a full description go to 4.19.3 Data Source .

Data source model

Layer name

The name of the layer in the PT3 file.

Layer colour select colour yellow available colours

The colour of the points in the Topcon PT3 file. Please note that the PT3 format colours points by layer and hence individual point colours cannot be mapped to a PT3 file.

PT3 file name file box

The name of the PT3 file.

Internal name

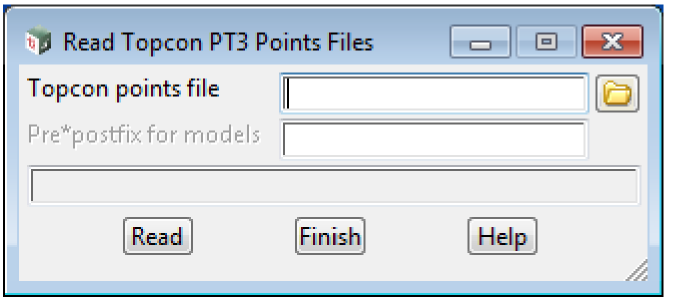
The name of the PT3 file you see inside the Topcon software.

17.16.8 Read Topcon PT3 Points Files

Position of menu: **Survey =>Topcon=> Read PT3 file**

This panel reads in points from the Topcon PT3 points files.

Selecting **Read PT3 file** brings up the **Read Topcon PT3 Points Files** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Topcon points file	file box		

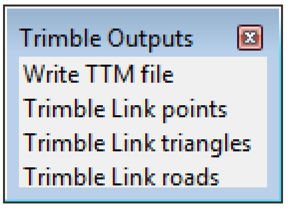
The PT3 file you wish to read.

Pre* postfix for models

for information please go to 4.19.2 Pre*Postfix in Panel Fields

17.17 Trimble

The **Trimble** walk-right menu is:



For the option *Write TTM file*, go to 17.17.1 Write TTM File

Trimble Link points 17.17.2 Trimble Link Points

Trimble Link triangles 17.17.3 Trimble Link Triangles

Trimble Link roads 17.17.4 Trimble Link Roads

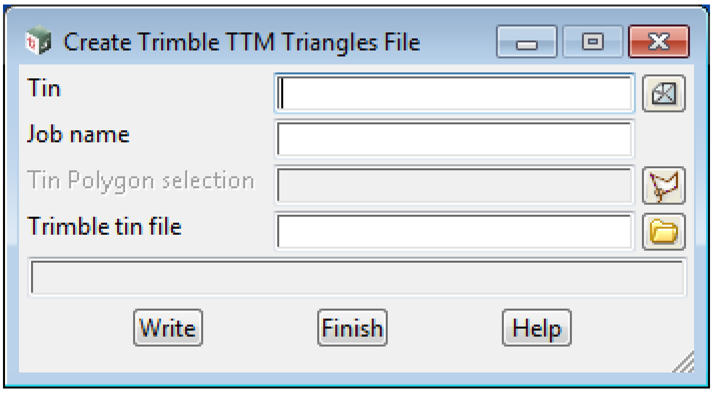
SCS900 CSV to XYZ ID Code 17.17.5 SCS900 CSV to XYZ ID Code

17.17.1 Write TTM File

Triangles from a tin (not a super tin) can be written out as a Trimble TTM file.

Note that the Trimble TTM is binary and so can not be viewed or edited.

Selecting **Write TTM file** brings up the **Create Trimble TTM Triangles File** panel:



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

the tin (not a super tin) to write out to a Trimble TTM file. A super tin can not be written out to a TTM file.

Job name text input

name of the job to write into the Trimble TTM file

Tin Polygon selection polygon box

if a string is selected, then only those triangles whose centroid is inside the polygon are written to the TTM file.

If no string is selected, then all the triangles in the tin are written to the TTM file.

Trimble tin file file box

name of the Trimble TTM file. If it is not present, ".TTM" will be automatically added to the end of the file name.

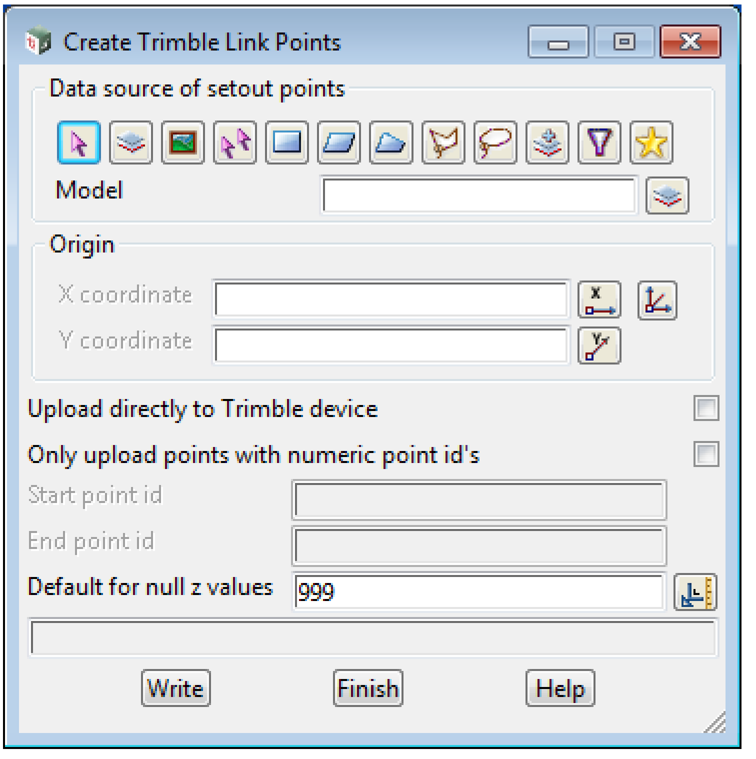
Write button

write out the triangles to the given TTM file.

17.17.2 Trimble Link Points

This option uploads selected vertices with point IDs to a Trimble device or writes the (X, Y, Z, point ID) data to a file.

Selecting **Trimble Link points** brings up the **Create Trimble Link Points** panel:



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Data source of setout points

data selection type - for a full description go to 4.19.3 Data Source .

Data source

data source of setout points to create the upload data from.

Origin X coordinate/Origin Y coordinate

If non-zero, subtract the value from the x/y value before uploading/writing out.

Upload directly to Trimble device tick box not ticked

if ticked, the selected points are uploaded to the Trimble device.
If not ticked, the data is written to a Trimble DC file with the name as the 12d Model project and ending in .DC

Only upload points with numeric point id’s tick box not ticked

if ticked, only vertices with numeric point IDs are uploaded to the Trimble device or written out.
If not ticked, all vertices (whether numeric or alpha-numeric point IDs) are uploaded to the Trimble device or written out.

Start point id input box

point ID to start creating upload data from.

End point id input box

last point ID to create upload data to.
Note: Start and End point IDs may be left blank, and all point IDs are uploaded.

Default for null z values measure box 999 *value to write for null z-values.*

Write button

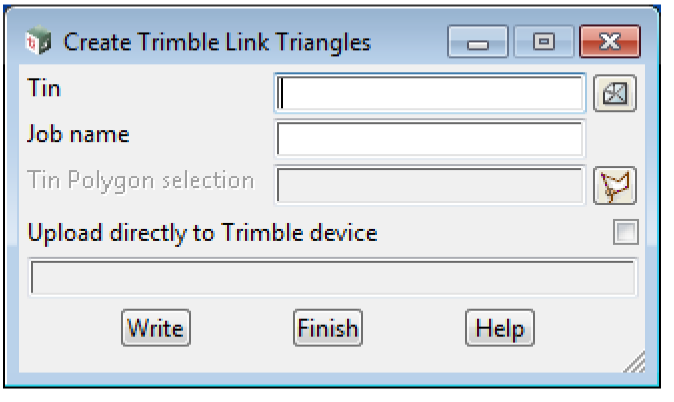
send the vertices directly to the Trimble device or write them to a DC file.

17.17.3 Trimble Link Triangles

Triangles from a tin (not a super tin) can be uploaded to a Trimble device or written out as a Trimble TTM file.

Note that the Trimble TTM is binary and so cannot be viewed or edited.

Selecting **Trimble Link triangles** brings up the **Create Trimble Link Triangles** panel:



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Tin tin box available tins

the tin (not a super tin) to either upload directly to the Trimble device or write out to a Trimble TTM file. A super tin can not be written out to a TTM file.

Job name text input

name of the Trimble job

Tin Polygon selection polygon box

if a string is selected, then only those triangles whose centroid is inside the polygon are processed. If no string is selected, then all the triangles in the tin are processed.

Upload directly to Trimble device tick box not ticked

if ticked, the selected triangles are uploaded to the Trimble device.
If not ticked, the data is written to a Trimble TTM file with the given job name and ending in .TTM

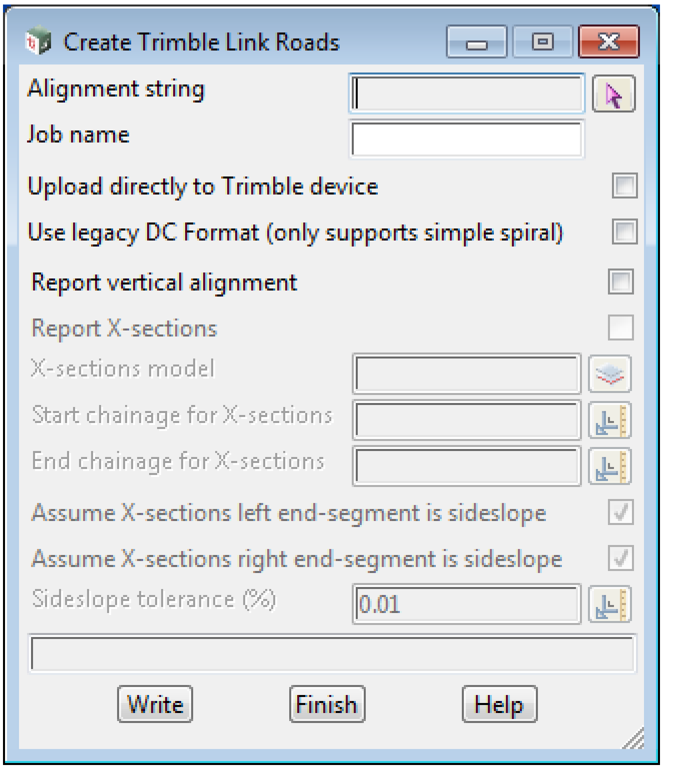
Write button

send the triangles directly to the Trimble device or write them to the given TTM file.

17.17.4 Trimble Link Roads

This option uploads an alignment string and associated x-sections to a Trimble device, or writes the data to a specific roading file.

Selecting **Trimble Link roads** brings up the **Create Trimble Link Roads** panel:



The Trimble upload/DC file has certain limitations and criteria. These include:

1. The alignment string must exist on the X-sections. This allows us to calculate the ***zero pt*** so we can split the template into left and right.
2. The X-sections model should be representative of the alignment string, *i.e.* not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
3. The alignment string cannot exist above or below the X-sections, *i.e.* it should be on the section as per 1.
4. The number of points on successive section templates (left and right) should be the same, *i.e.* if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the upload data by using the chainage range between areas where the number of points on each side of the X-sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Alignment string	input		

the alignment string to be uploaded/written to the file.

Job name	input		

name of the Trimble job

Upload directly to Trimble device	tick box	not ticked	

if ticked, the selected data is uploaded to the Trimble device.
If not ticked, the data is written to a Trimble DC file with the given job name and ending in .DC

Use legacy DC Format	tick box	not ticked	
Report vertical alignment	tick box	not ticked	

if ticked, include vertical alignment details in the upload/file.

Report X-sections tick box not ticked

if ticked, the X-sections in **X-section model** *will be uploaded/output to the file.*

X-sections model model box

the model of X-sections to be uploaded/written to the file. This can only be filled in if **Report vertical alignment** *and* **Report X-sections** *are ticked.*

Start chainage for X-sections measure box

if non blank, only X-sections whose chainage is greater than or equal to the **Start chainage for X-sections and** *less than or equal to the* **End chainage for X-sections** *are uploaded/written out.*
If blank, all X-sections that are less than or equal to the **End chainage for x-sections** *are uploaded/written out.*

End chainage for X-sections measure box

if non blank, only X-sections whose chainage is less than or equal to the **End chainage for X-sections and** *greater than or equal to the* **Start chainage for X-sections** *are uploaded/written out.*
If blank, all X-sections that are greater to or equal to the **Start chainage for X-sections** *are uploaded/written out.*

Assume X-sections left end-segment is sideslope tick box ticked

if ticked, the first segment is considered to be a sideslope, and the **Sideslope tolerance (%)** *field is enabled.*

Assume X-sections right end-segment is sideslope tick box ticked

if ticked, the last segment is considered to be a sideslope, and the **Sideslope tolerance (%)** *field is enabled.*

Sideslope tolerance (%) measure box 0.01

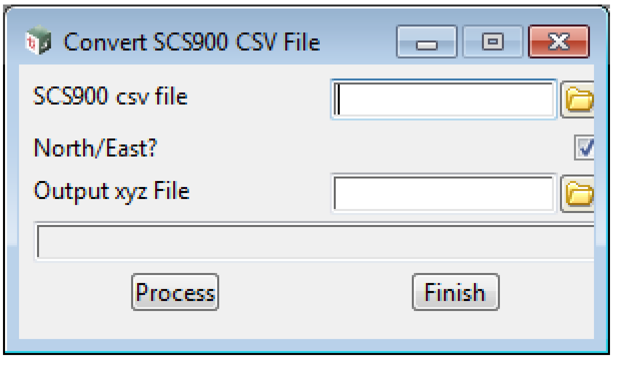
Write button

send the data directly to the Trimble device or write it to the given DC file.

17.17.5 SCS900 CSV to XYZ ID Code

This option converts a Trimble SCS900 CSV file to an xyz file.

Selecting **SCS900 CSV to XYZ ID Code** brings up the **Convert SCS900 CSV File** panel:



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

SCS900 csv file file box *.csv files

name of the SCS900 CSV file

North/East? tick box ticked

if ticked,

Output xyz File file box *.xyz files

name of the xyz file to convert the SCS900 CSV file to

Process button

convert the SCS900 file to a xyz file

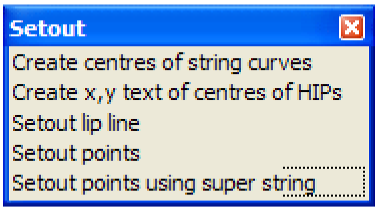
17.18 Setout

Position of menu: **Survey =>Setout**

The **Setout** walk-right menu contains options for creating points numbers and files for uploading to data recorders.

The **Setout** walk-right menu is

.



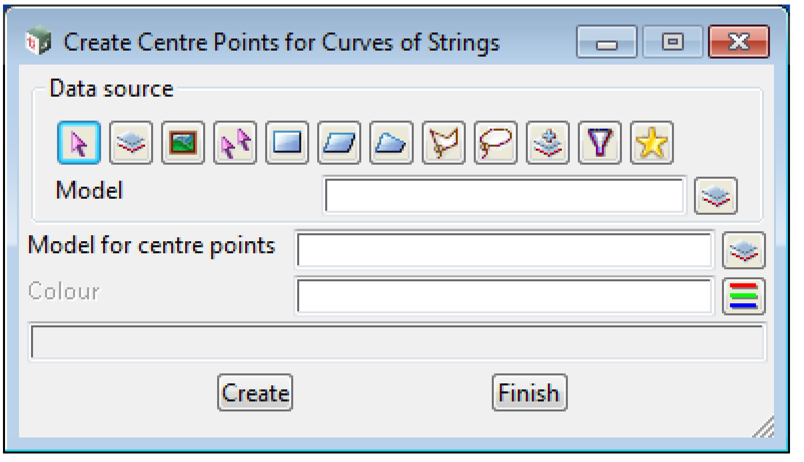
setout centres of string curves
create text at centre of HIP's
setout lip line
create setout points
create setout points using super strings

For *Create centres of string curves*, go to 17.18.1 Create Centre Points for Curves of Strings
Create x,y,z,text of centres of HIPs 17.18.2 Create X Y Text for Centre Points of Alignments
Setout lip line 17.18.3 Setout Lip Line .
Setout points 17.18.4 Create Setout Points .
Setout points using super string 17.18.5 Create Setout Points Using Super String .

17.18.1 Create Centre Points for Curves of Strings

Position of option on menu: **Survey =>Setout =>Create centres of string curves**

This option is used to create points at the centres of arcs in alignment strings, polylines, arcs or circles.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type	Model		

data selection type - for a full description go to 4.19.3 Data Source .

Data source

data source for strings to process

Model for centre points	input box		

model for the created points

Colour	colour box		available colours

colour of centre points

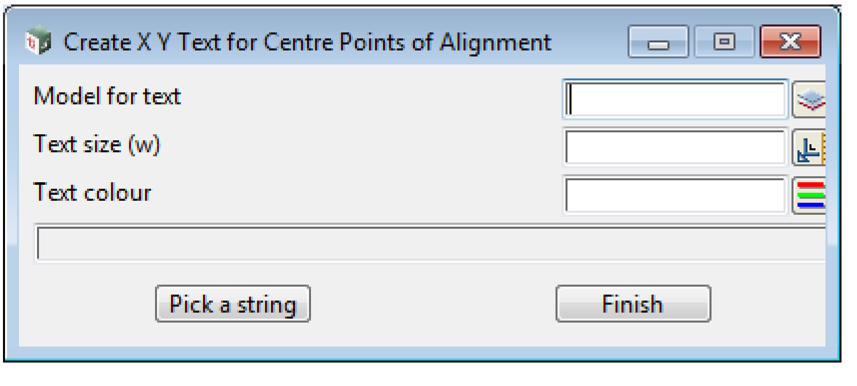
Create	button		

create the points

17.18.2 Create X Y Text for Centre Points of Alignments

Position of option on menu: **Survey =>Setout =>Create x y text of centres of HIPs**

This option creates text for the x and y co-ordinates of the horizontal arcs on an alignment string.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model for text	input box		

model for the text of the x and y co-ordinates

Text size (w) input box

size of text in world units.

Text colour input box

colour of text

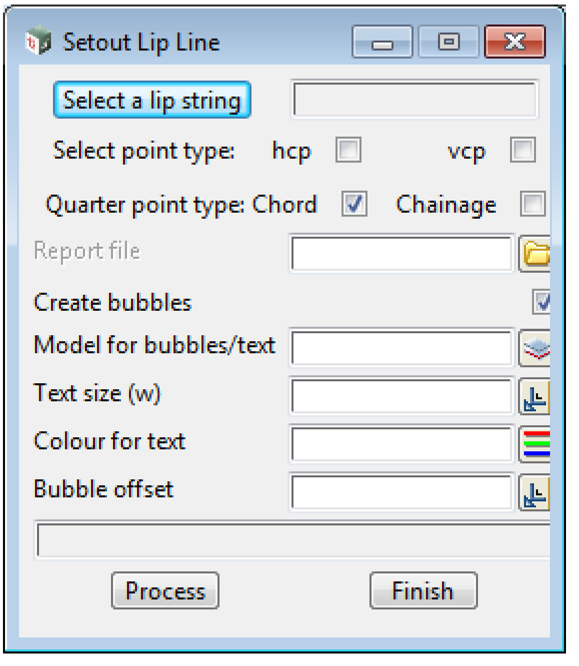
Pick a string button

select string to create text for.

17.18.3 Setout Lip Line

Position of option on menu: **Survey =>Setout =>Setout lip line**

This panel is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select a lip string	string select		

pick the alignment string to have bubbles created for.

Select point type:

hcp	tick box		

if ticked, the horizontal tangent points are included.

vcp	tick box		

if ticked, the vertical tangent points are included.

Quarter point type:

Chord	tick box	tick	

if ticked, the quarter points by chord distance are included.

Chainage	tick box		

if ticked, the quarter points by chainage distance are included.

Report file	input box		

name of the report file.

Create bubbles	tick box	tick	

if ticked, bubbles are created with the string name and bubble number inside.

Model for bubbles/text	input box		

model for the bubbles and text.

Text size (w) input box

size (in world units) for the text inside the bubble.

Colour for text input box

Colour for the bubble and bubble text.

Bubble offset input box

offset distance from the alignment string to place the bubble.

Process button

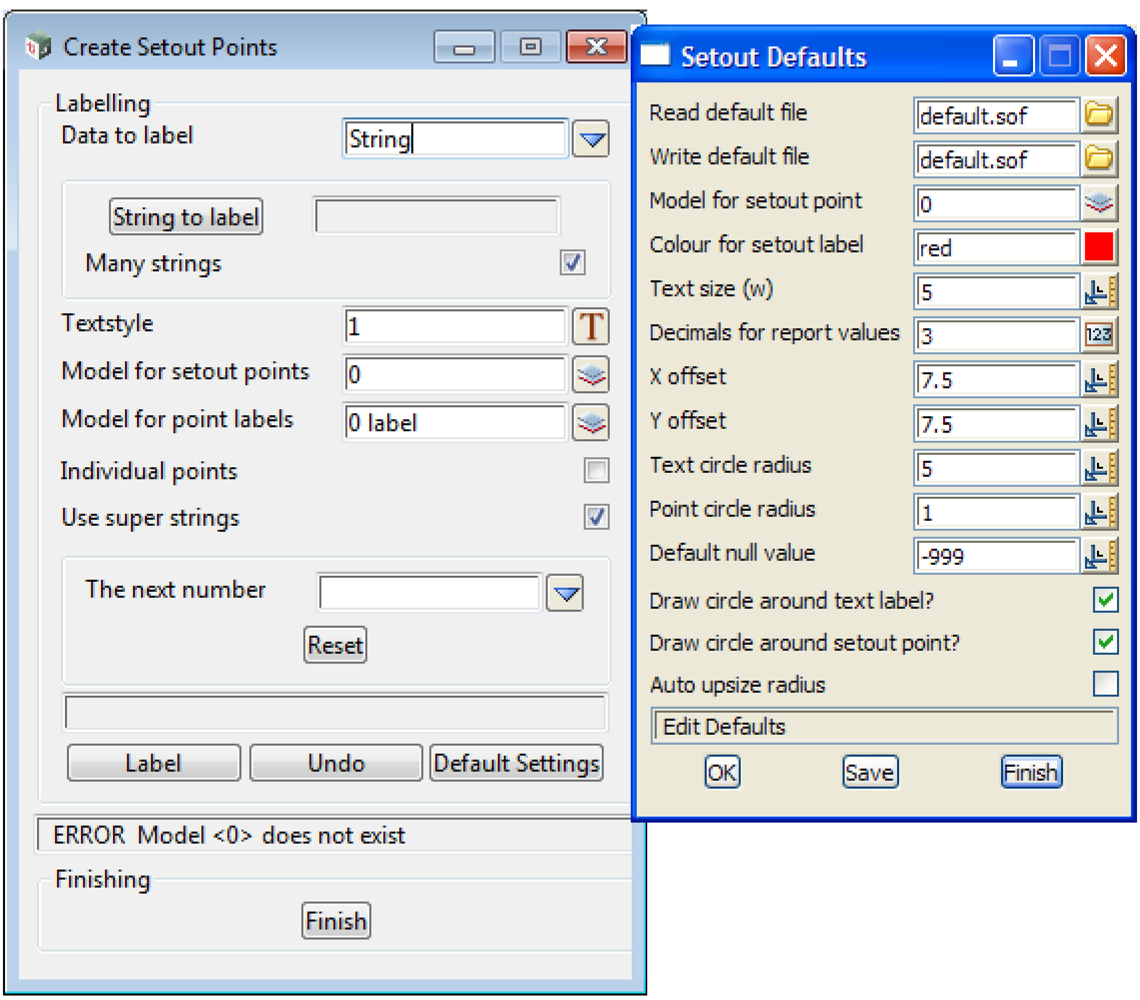
run the option.

17.18.4 Create Setout Points

Position of option on menu: **Survey =>Setout =>Setout points**

This panel is used to create points with numbers for use in setting out data. This option is usually run before the option to create an instrument upload file. The setout point is created as a 4d string with the point at the data point and with the point id as the text for the 4d string, with a text size of zero.

Separate text for the numbers and circles surrounding the data points and the text numbers are also created. By default, a file called "defaults.sof" is read in containing settings required for the option.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Textstyle	input box	1	

textstyle for the created point ids

Model for setout points	input box	0	

model to place the setout points in

Model for points labels	input box	0	

model to place the setout point ids and circles in.

Individual points	tick box		

if ticked, the setout points are created as point strings
If not ticked, individual one point strings are created.

Use super strings	tick box	tick	

if not ticked, super strings are created for the setout points. The super string point id is set to the setout point id.
If not ticked, 4d strings are created for the setout points strings with the 4d text as the setout point id (with text size set to zero).

The next number	input box	1 or highest number in model for setout points	

*next numeric point id to use for creating point ids. If a **Model for setout points** is given, the model is searched for any super strings or 4d strings with numbers as text and the **The next number** is set to one more than the highest numeric point id in the model.*

Reset	button		

*reset the **The next number** to the highest point in the model for setout points.*

Data to label	input box	string	string, model, view, point

type of data source.

Model/View/String/Point to	output box		

data to create point ids for.

Many points/strings	tick box	tick	

if ticked, the each time a string/point is selected, the string/point is processed without having to click on the **Label** *button. After a string/point is processed, another string/point can then be selected.*
If not ticked, the **Label** *button must be clicked before the selected string/point is processed.*

Label	button		

create setout points and circles for the selected data.

Undo	button		

undo the last setout points and s created whilst the panel has been up.

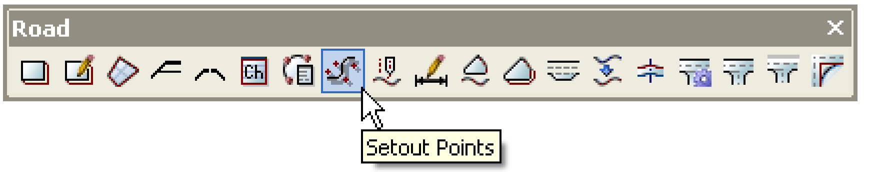
Default settings	button		

default settings for the s. These can be read in from a file.

17.18.5 Create Setout Points Using Super String

Position of option on menu: **Survey =>Setout =>Setout points using super string**

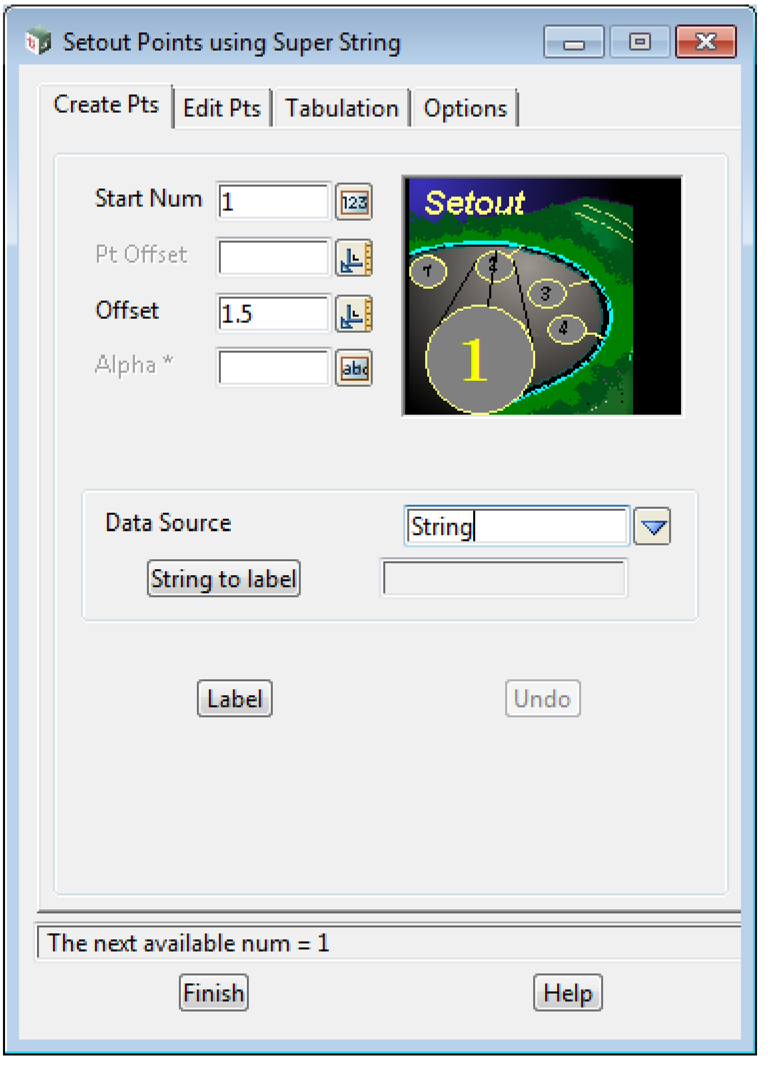
Position of option on menu: **Road Toolbar**



This option creates a super string over the top of the data selected.The super string allows point numbers. The incremental point numbers are displayed at each vertex inside a circle symbol.

The setout numbers are identified on a setout model and incremented each time the panel is activated.

.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Create Pts

Start Num integer 1 (or next available number on subsequent runs of the option)

Type in number and <enter> or accept default

Pt Offset real

Offset of the setout point, typically a distance behind the back of kerb.
(This will be the setout point x,y location but the z value refers to the original string selected e.g. the kerb return)

Offset real

Offset of the setout point text and circle, from the actual setout point.

Alpha* text

If non-blank, Alpha point number prefix is used

Data Source choice box String String, Point, Model, View

String: *Allows the selection of a string (using 12d pick with direction), where the setout number is always placed on the right hand side in relation to the pick direction, perpendicular to the string. Alignment choices: A selection panel is displayed with 3 choices:-*

- by number <divides the string into equal parts>
- by distance <divides the string and may have a remainder>
- by special chainage file

String to label button

Point: *Allows the selection of a point. There is no direction involved.*

Point to label button

Model and View*: Allows the setout of multiple strings and points but again there is no control over the pick direction or the orientation of the setout number in relation to any string.*

Model to label model

existing model selection required

View to label view

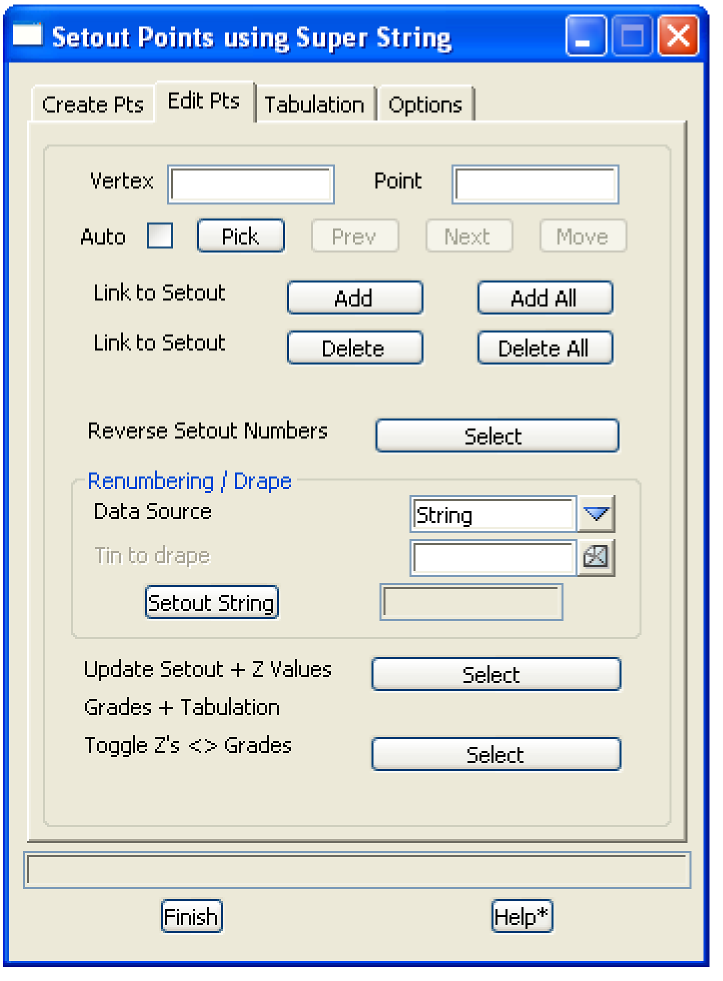
Existing view to be selected

Label button

Runs the option and adds the setout model to the view from which the Data Source was selected

Undo button

Each <Label> creation has an undo



The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up

Edit Pts

Vertex Integer

Point Integer

The Vertex and Point fields above are automatically filled in after a setout string has been picked

Auto tick box false

When ticked on, and a setout point is selected using <Pick>, then the <Move> option is automatically activated

Pick button

Select setout point to move text bubble

Prev button

Steps backward and highlights the previous point on setout string

Next button

Steps forward and highlights the next point on setout string

Move button

Activates the move option allowing the setout text bubble to be dynamically relocated on screen, but still remain attached to the actual setout point

Link to Setout:

Add button

Draws a leader line from the actual setout point to the setout text value bubble

Add All button

Draws a leader line from the actual setout point to the setout text value bubble at all vertices on the selected setout string

Link to Setout:

Delete button

Deletes the leader line from the actual setout point to the setout text value bubble, if it exists

Delete All button

Deletes the leader line from the actual setout point to the setout text value bubble at all vertices on the selected setout string

Reverse Setout Numbers:

Select button

This option reverses the numbering order only on a setout string.

Renumbering / Drape:

This option can renumber the start number used on setout data. When a string or model is selected a prompt for a new start number is displayed.

The tin to drape is used to reset the z value of the setout point. A design tin can be used, but care should be taken to have a design point in the tin, close to the setout point, as a "drop onto the tin" is used to calculate the new z value.

Data Source choice box String String, Model

String or model are the choices

Tin to drape tin

if non-blank, setout vertices will be draped to get new z value

Setout String button

*Select the setout string to perform the above **Renumbering / Drape***

Update Setout + Z Values + Grades + Tabulation:

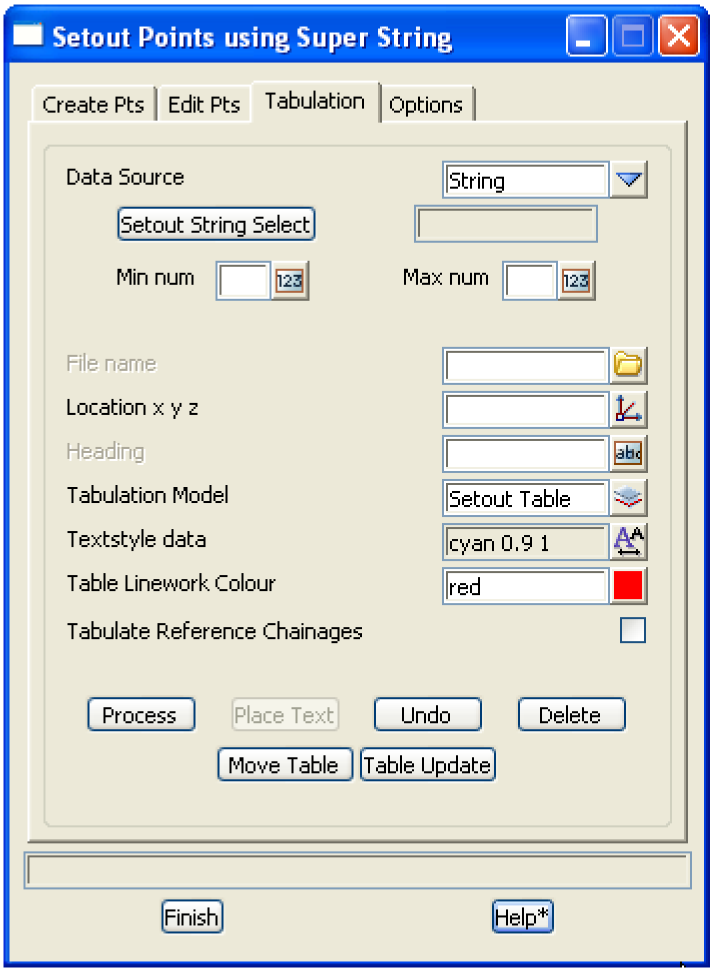
Select button

Setout features can be updated as the original string selected for setout (e.g. Kerb return alignment) has been stored as an attribute on the setout string.Care must be taken to re-select the original string.

Toggle Z's <> Grades:

Select button

Setout features such as labelling Z values and grades on segments are discussed under Options *tab. This option toggles the display between the two*



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Tabulation

Data Source — choice box — String — String, Model

String or model are the choices

Setout String Select — button

Select a setout string to tabulate

Model to Tabulate — model

Select existing setout string to tabulate

Min num — integer

Max num — integer

Fields are filled out once setout data is selected, but can be changed manually.

File name — file

If non-blank an xyz file will be created

Location xyz — xyz pick

Select on screen or enter a coord for the top left hand corner of table

Heading — Input

if non-blank entry used as heading for tabulation

Tabulation Model model available models

Enter a model name for the tabulation

Textstyle Data textstyle box select Textdata

Setup text colour, height and width

Table Linework Colour colour box available colours

Colour for any linework in tabulation

Tabulate Reference Chainages tick box false

Chainages can be displayed from the original selected string (e.g. Reference kerb return alignment) in relation to setout vertices

Process button

runs the option

Place Text button

Creates the tabulation on the tabulation model

Undo button

Undo for that operation

Delete button

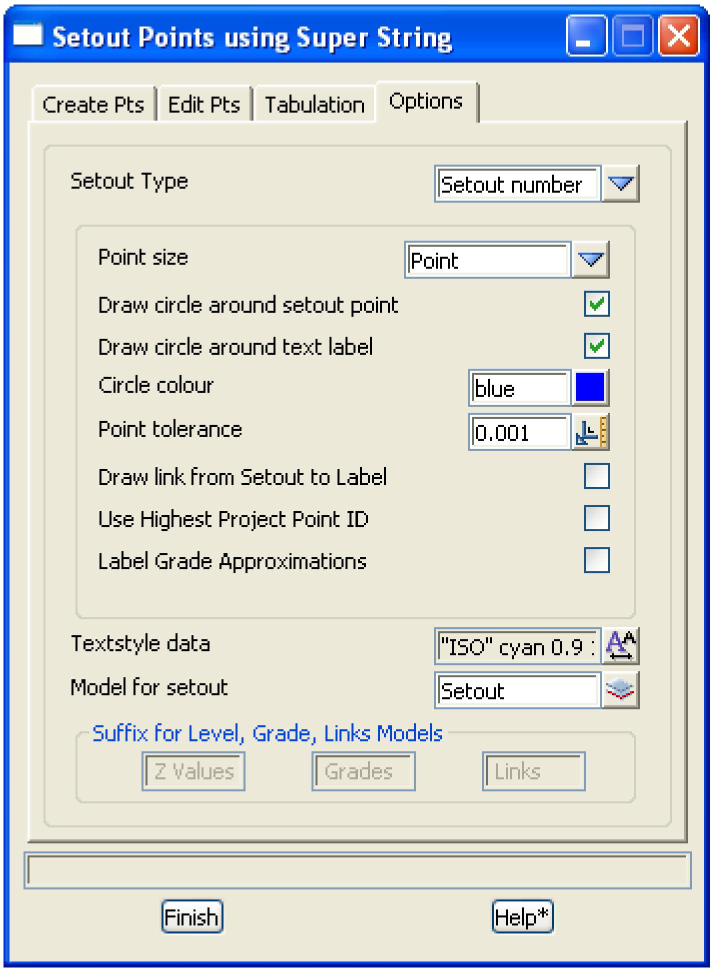
Deletes all the entities on the table selected

Move Table button

Moves the complete table on screen (select table and destination point)

Table Update button

Table can be updated if text parameters are changed or Reference Chainages is ticked on or off. Select the tabulation.



Options

Setout Type choice box Setout number Setout number, Z value

Setout number or Z values are the choices

Setout Number:

Point size choice box Point Point, Point 0.5

Selections are Point and Point 0.5 (refer to the size of the point shown at the setout z, y)

Draw circle around setout point tick true

Refers to the linestyle circle at each setout z, y.

Draw circle around text label tick true

Refers to the circle surrounding each setout point number text value

Circle colour colour box blue

The colour of the circle surrounding each setout point number text value

Point tolerance real

X,Y Tolerance between setout points to handle duplicate or near duplicate points

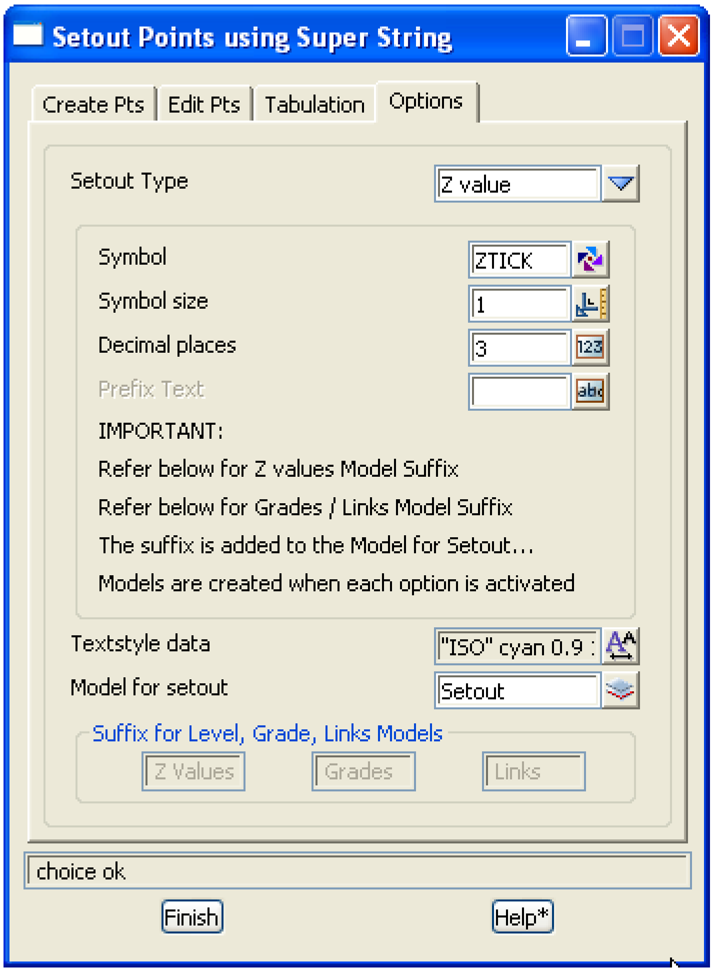
Draw link from Setout to Label tick box false

Use Highest Project Point ID integer

Search for the highest point number available in the project

Label Grade Approximations tick box false

(Grades can be labelled between setout points, but care must be taken as the z value is used from the setout points, the length from the original reference string selected.
The grade is only correct if the points are on grade and or on a parabola. So the grades are reported as approximate only and for a visual check.)



Z Value:

Symbol input ZTICK

Symbol Size real 1

Decimal Places Integer 3

Prefix Text input

if non-blank text value added to text Z value. <e.g. R.L.>

Textstyle Data textstyle box

Setup text style, colour, height and width

Model for setout model box available models

Enter a model name for the setout data

Suffix for Level, Grade, Links Models

Display default values for models that may be created if you choose to draw link lines, label levels or grades. If setout model is "Setout"....then these models would default to "Setout Level" "Setout Link" "Setout Grade"

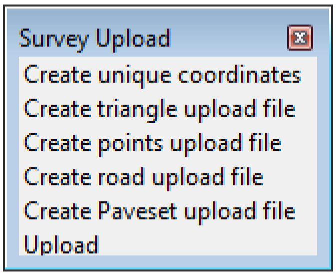
17.19 Upload

Position of menu: **Survey =>Upload**

The **Survey Upload** walk-right menu contains survey options to upload data the most survey instruments. There are options to upload points, triangulations and road geometry.

The **Survey Upload** walk-right menu is

.



Create triangle upload file
Create points upload file
Create roads upload file
Create points upload file (new) - only for *Trimble Link*
Create roads upload file (new) - only for *Leica XML* and *Trimble Link*
Upload data to instrument/device

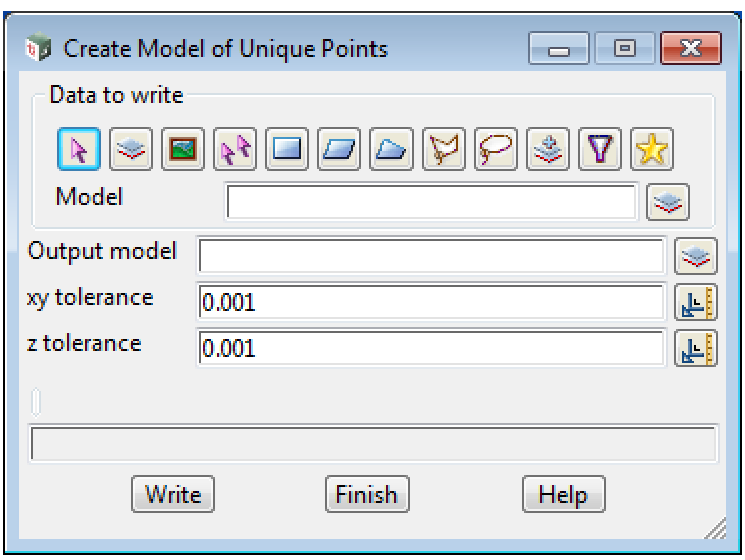
For the option *Create unique coordinates*, go to	17.19.1 Create Unique Coordinates
Create triangle upload file	17.19.2 Create Triangle Upload File
Create points upload file	17.19.3 Create Points Upload File
Create road upload file	17.19.4 Create Road Upload File
Create points upload file (new)	17.19.5 Create Points Upload File (New)
Create road upload file (new)	17.19.6 Create Road Upload File (New)
Create Paveset upload file	17.19.7 Create Paveset Upload File
Upload	17.19.8 Survey Data Upload

17.19.1 Create Unique Coordinates

Position of option on menu: **Survey =>Upload => Create unique coordinates**

This option creates points from the selected data so that there is only one point for all vertices within user defined xy and z tolerances.

Selecting **Create unique coordinates** brings up the **Create Model of Unique Points** panel.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Data source of setout points

data selection type - for a full description go to 4.19.3 Data Source.

Data source

data source of strings to create unique points from

Output model model box

model for the created vertices.

xy tolerance real value box -0.001

z tolerance real value box -0.001

all vertices closer than these tolerances are considered to be the same vertex and only one point will be created for all of them.

Process button

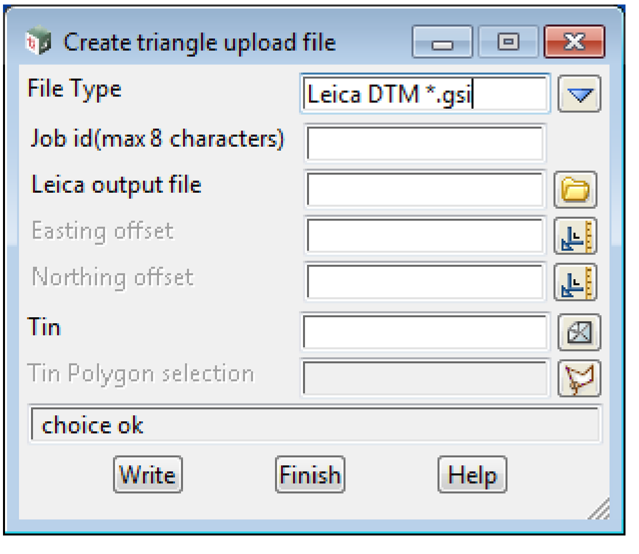
create the distinct points

17.19.2 Create Triangle Upload File

Position of option on menu: **Survey =>Upload => Create triangle upload file**

The **Create triangle upload file** option allows the creation of a triangle file based on a tin. Various file formats can be selected

Selecting **Create triangle upload file** brings up the **Create triangle upload file** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Common parameters at bottom:

Tin input

name of tin from which the triangle file will be based.

Tin polygon selection selection

allows the user to select a specific area of the tin to be exported as a triangle file.

Write button

On clicking the write button, **12d Model** *will write the specified file.*

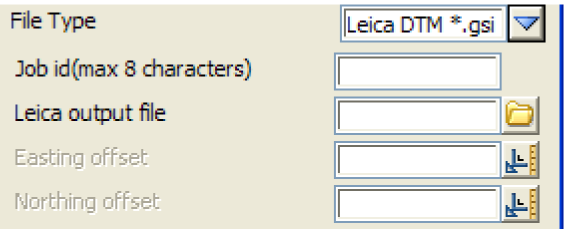
File type choice box

Leica DTM *.gsi
12d xyzs *.dat
Ortho 12d *.T12
Sokkia *.tri
TP Setout/Stakeout *.tsa
LandXML *.xml

file type to be produced.

***For* Leica DTM *.gsi format:**

.



Job id input

job id to be included in file. (max 8 characters)

Leica output file input

name of file to be produced

Easting offset input

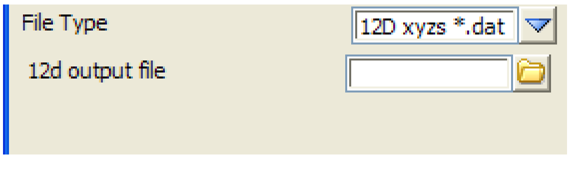
easting offset to be applied to data. This is important where large coordinate values are used, such as in map projections.

Northing offset input

northing offset to be applied to data. This is important where large coordinate values are used, such as in map projections.

***For* 12D xyzs *.dat format:**

.

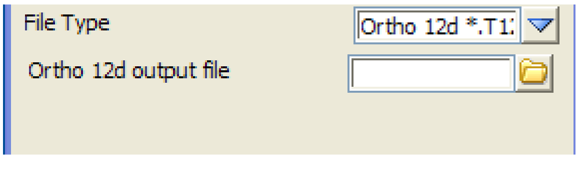


12d output file input

name of file to be produced

***For* Ortho 12d *.T12 format:**

.

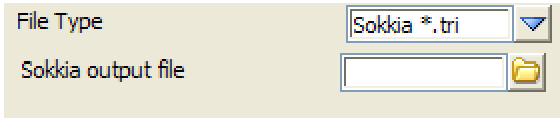


Ortho 12d output file input

name of file to be produced

***For* Sokkia *.tri format:**

.

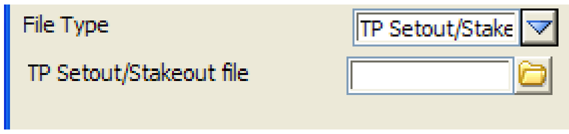


Sokkia output file input

name of file to be produced

***For* TPSetout/Stakeout *.tsa format:**

.

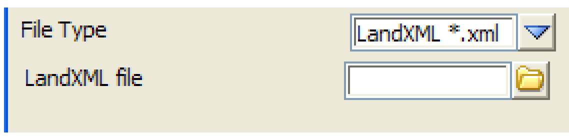


Tp Setout/Stakeout file input

name of file to be produced

***For* TPSetout/Stakeout *.tsa format:**

.



LandXML file input

name of file to be produced

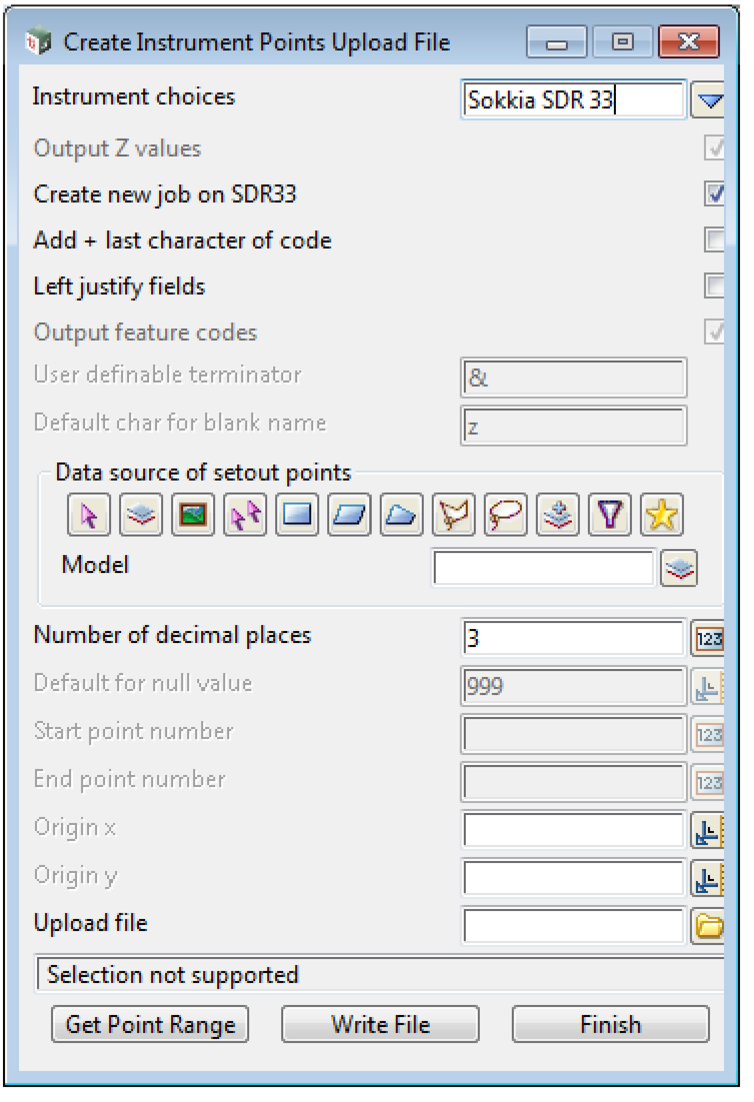
17.19.3 Create Points Upload File

Position of option on menu: **Survey =>Upload => Create points upload file**

The **Create points upload file** option allows the creation of a file of point ids, x, y and z, for string data (super strings and 4d strings only). Various file formats can be selected

Selecting **Create points upload file** brings up the **Create Instrument Points Upload File** panel.

Upload files for points can be created for various Leica, Geodimeter, Sokkia, Topcon, UPL, QuikDraw, Trimble XYZ formats as well as a text file of point id, x,y,z data.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Instrument choices	choice box	report_xyz	available instruments

type of output format

Output z values tick box

if ticked, z-values are output - only used for Geodimeter formats

Create new job on SDR 33 tick box

if ticked, create a new job on SDR33 - only used for Sokkia formats

Left justify fields tick box

if ticked, each field is left justified - only used for Sokkia formats

User definable terminator input box &

terminator to use - only used for Geodimeter formats.

Default char for blank name input box z

character used for blank names - only used for Geodimeter formats.

Data source of setout points

data selection type - for a full description go to 4.19.3 Data Source.

Data source

data source of setout points to create the upload file from.

Number of decimal places input box 3

number of decimal places for x, y and z values.

Default for null value input box -9999

value to write for null z-values.

Start point id input box

point id to start creating upload file from.

End point id input box

last point id to write to upload file.

Note: Start and End point ids may be left blank, and all point ids (whether numeric or alpha-numeric) will be written to the upload file.

Origin x/Origin y input box

If non-zero, subtract the value from the x/y value before writing out.

Upload file file box

name of the upload file to create.

Get Point Range button

pressing this button will populate the Start and End point id fields with the minimum and maximum (numeric) point ids found in the selected source data. If the selected source data contains a mix of numeric and alpha-numeric point ids, the alpha-numeric point ids are considered to have a numeric value of zero (0), but are ignored when determining the range. If the selected source data contains alpha-numeric point ids only, then the Start and End point id fields will both be set to zero (0).

Write File button

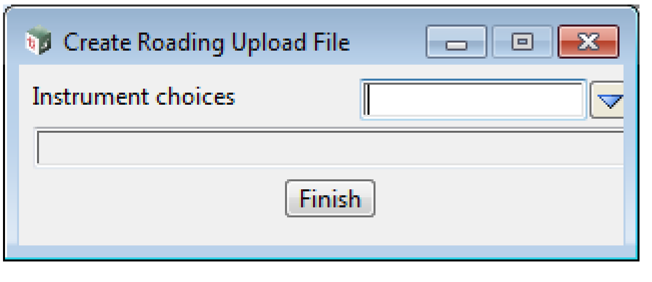
create the upload file

17.19.4 Create Road Upload File

Position of option on menu: **Survey =>Upload => Create roads upload file**

The **Create roads upload file** option allows the creation of a specific roading file. Files can be created for various Leica (8 & 16 formats), Geodimeter, Sokkia, Topcon and Trimble Roading formats.

Selecting **Create road upload file** brings up the **Create Roading Upload File** panel



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Instrument choices	choice box		Geodimeter Roadline 3d Leica Road Plus 8

Leica Road Plus 16
LMGS - D45
Sokkia Roading - Alignment Road
Sokkia Roading - String Road
Topcon MS2000
Topcon GTS-700 Roads
Trimble Roading

For choice of *Geodimeter Roadline 3d*, go to Geodimeter Roadline 3D file
Leica Road Plus 8 Leica road plus 8 / 16 file
Leica Road Plus 16 Leica road plus 8 / 16 file

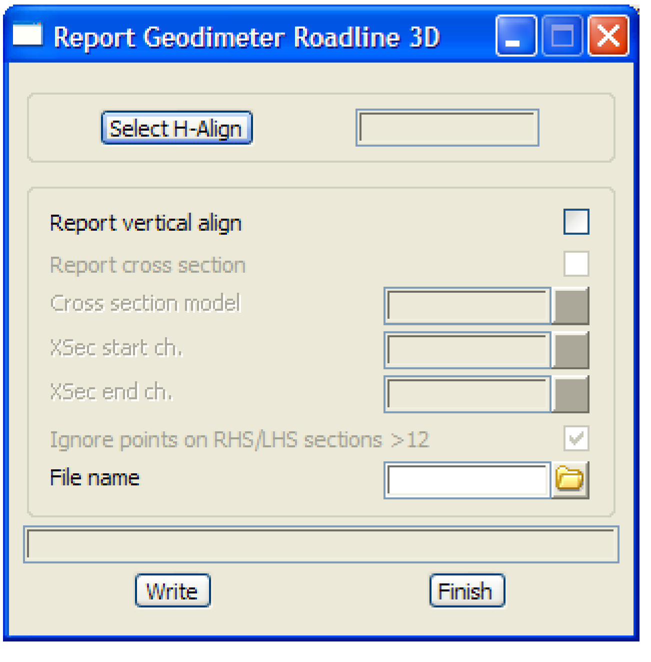
Geodimeter Roadline 3D file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Geodimeter Roadline 3d

The **Geodimeter Roadline 3d** option allows the creation of a specific roading file.

Selecting **Geodimeter Roadline 3d** brings up the **Report Geodimeter Roadline 3D** panel



The Geodimeter (trimble), has certain limitations and criteria associated with the 3d file. These include:

1. Each section template (i.e. right or left) has a max number of 12 points.
2. The first and last segments of the alignment must be a straight (for both horizontal and

vertical).

3. The start and end chainages of the horizontal alignment should be the same for the vertical alignment.
4. The alignment string must exist on the xsec's. This allows the calculation of the ***zero pt*** so we can split the section into left and right templates.
5. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
6. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 4)
7. The number of points on consecutive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, cannot handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections is the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align	Select box		

select valid alignment string.

Report vertical alignment	tick box	no	

write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.

Report cross sections	tick box	no	

if selected, the cross section model box will be enabled.

Cross section model	model box		

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch	input box	min alignment ch	

chainage value to start writing cross sections.

XSec end ch	input box	max alignment ch	

chainage value to end writing cross sections.

Ignore points on RHS/LHS sections >12 tick box ticked

if ticked, where there are more than 12 points in either the RHS or LHS template (derived from the xsection) the outlying points are ignored. e.g. if there was 14 points on the RHS template, only 12 will be written to the file with 2 pts being ignored.

File name	input box		

the name to be used for file creation

Write	button		

write appropriate files.

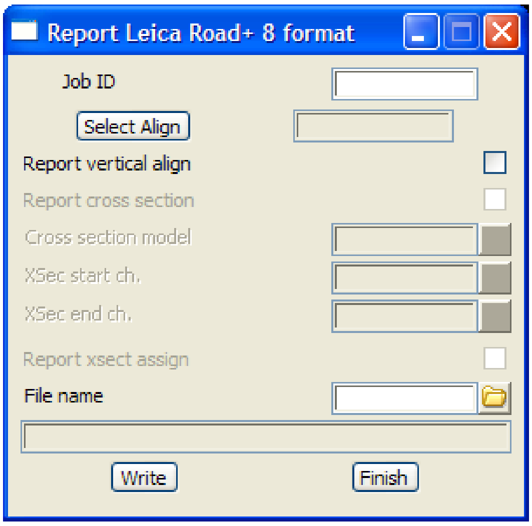
Leica road plus 8 / 16 file

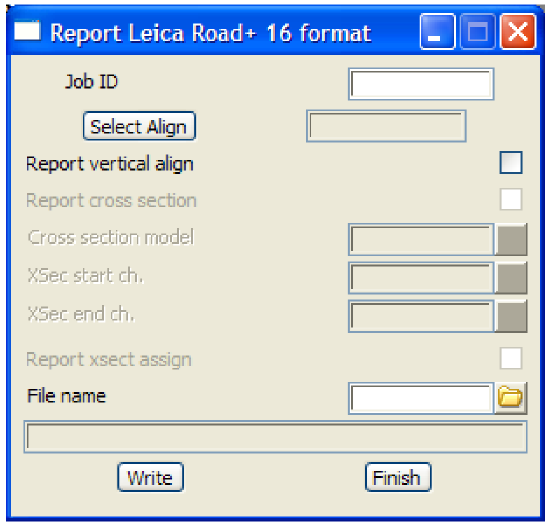
Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Leica roadplus 8 or Leica roadplus 16

The **Leica roadplus 8 and Leica roadplus 16** options allow the creation of specific Leica roading files.

Selecting **Leica roadplus 8** brings up the **Report Leica roadplus 8** panel.

Selecting **Leica roadplus 16** brings up the **Report Leica roadplus 16** panel.





The 8 and 16 formats are different file formats for the leica range of instruments. The user should be aware of the required format for the particular instrument. Please refer to the Leica documentation for specifications

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Job id	input box		

job id (max 8 characters).

Select alignment	String select box		

select valid alignment string.

Report vertical alignment	tick box	no	

*write vertical alignment details to file mode. If yes vertical alignment details written to appropriate file. i.e. (PRF*****.gsi)*

Report cross sections	tick box	no	

if selected, the cross section model box will be enabled.

Cross section model	model box		

This will ask for the model of cross sections. These sections will be written out to the appropriate file.

*i.e. (CRS*****.gsi)*

XSec start ch	input box	min alignment ch	

chainage value to start writing cross sections.

XSec end ch	input box	max alignment ch	

chainage value to end writing cross sections.

Report cross section assignment	tick box	no	

*If ticked, a cross section assignment file (STA*****.gsi) file will be made.*

File name	input box		

*the name to be used for file creation. **NB depending on what files are specified, the name given will be appended with the correct prefix eg ALN for alignment file. As Leica only takes 8 character file names, the name may be truncated.***

Write	button		

write appropriate files.

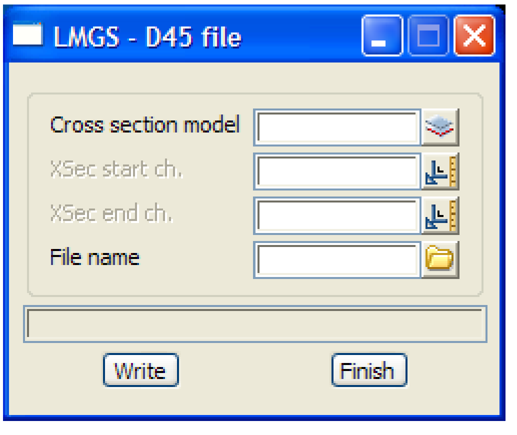
LMGS - D45 file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = LMGS - D45 file

The **LMGS - D45 file** option allows the creation of a specific file format suitable for upload to Leica'a grader and paver control systems. The format has a number of rules that must be satisfied for correct file creation. These include:

1. There must be an equal number of points on each section
2. Points should not be closer than 5cm in both directions
3. Azimuth changes between cross section points should not be greater than 20gon (18 degrees).

Selecting **LMGS - D45 file** brings up the **LMGS - D45 file** panel



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Cross section model	model box		

the model of cross sections. These sections will be written out to the file.

XSec start ch	input box	min alignment ch	

chainage value to start writing cross sections.

XSec end ch	input box	max alignment ch	

chainage value to end writing cross sections.

File name	input box		

the name to be used for the file creation. The file will automatically be given a .D45 extension.

Write	button		

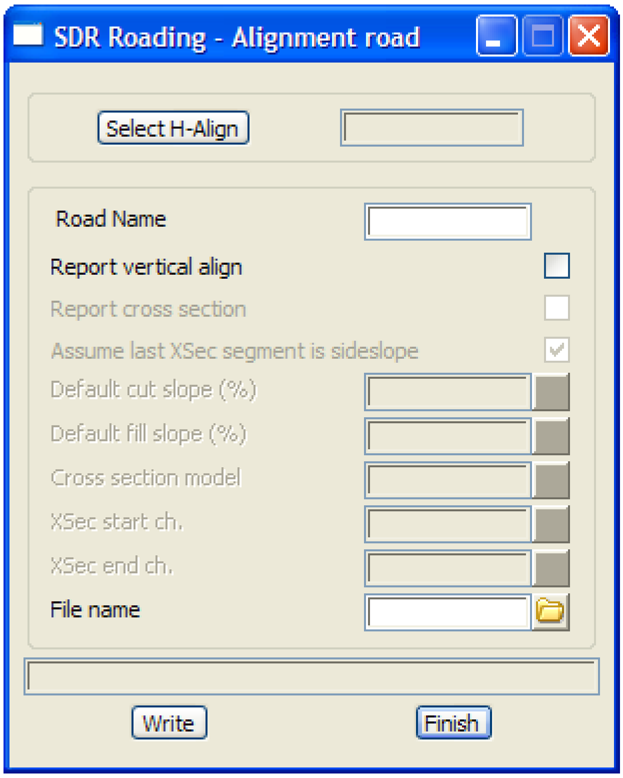
write appropriate file.

Sokkia Roading - Alignment Road file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Sokkia Roading - Alignment road

The **Sokkia Roading - Alignment road** option allows the creation of a specific roading file.

Selecting **Sokkia Roading - Alignment road** brings up the **SDR Roading - Alignment Road** panel



The sdr33 roading file has certain limitations and criteria. These include:

1. The alignment string must exist on the xsec's. This allows us to calculate the ***zero pt*** so we can split the template into left and right.
2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
3. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 1).
4. The number of points on adjacent section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align	Select box		

select valid alignment string.

Road Name	input box	Name of selected alignment string	

input road name. If a valid alignment is selected, the name of that alignment will be the default road name.

Report vertical alignment	tick box	no	

write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.

Assume last XSec segment is sideslope tick box ticked *if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the default cut and fill slope fields are enabled.*

Default cut slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition in the file will be given the value as entered into the ***default cut slope*** *field. If no value is set for the default, the cut slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Default fill slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition in the file will be given the value as entered into the ***default fill slope*** *field. If no value is set for the default, the fill slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Cross section model model box

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch input box min alignment ch

chainage value to start writing cross sections

XSec end ch input box max alignment ch

chainage value to end writing cross sections

File name input box

the name to be used for file creation

Write button

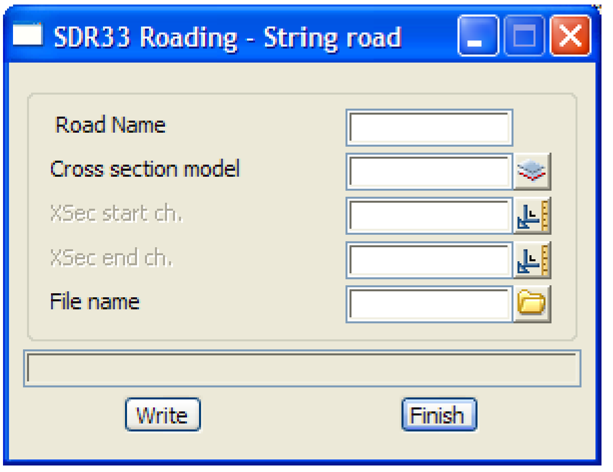
write appropriate file

Sokkia Roading - String Road file

Position of option on menu: **Survey =>Upload => Create roads upload file, Instrument choice = Sokkia Roading - String road**

The **Sokkia Roading - String road** option allows the creation of a specific string roading file.

Selecting **Sokkia Roading - String road** brings up the **SDR Roading - String Road** panel



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Road Name	input box	Name of selected alignment string	

input road name. If a valid alignment is selected, the name of that alignment will be the default road name.

Cross section model	Model box		available models

model of cross sections to write out in SDR33 string format

XSec start ch.	input box	min alignment ch	

chainage of the first cross sections to write out

XSec end ch.	input box	max alignment ch	

chainage of the last cross sections to write out

File name	file box		

the name to be used for file creation

Write	button		

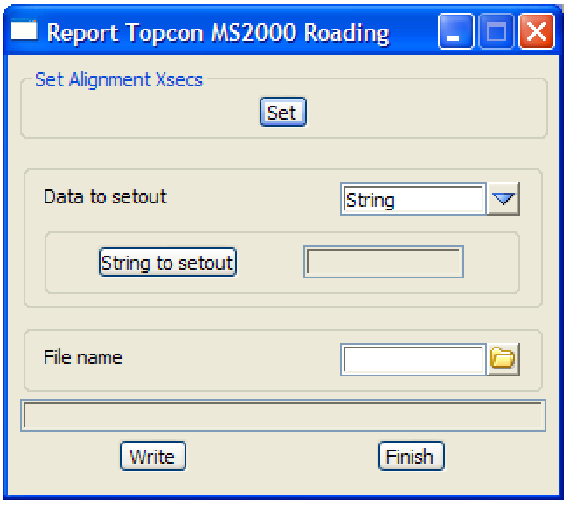
write appropriate file.

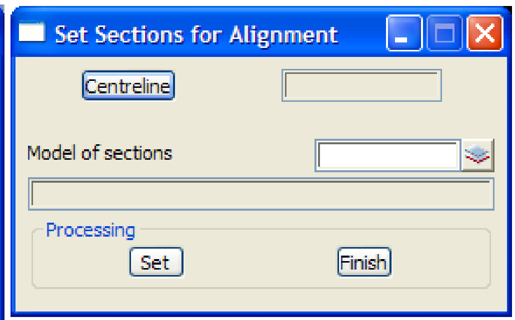
Topcon MS2000 Roading file

Position of option on menu: **Survey =>Upload => Create roads upload file, Instrument choice = Topcon MS2000**

The **Topcon MS2000** option allows the creation of a specific roading file.

Selecting **Topcon MS2000** brings up the **Report topcon MS2000 Roading** panel





The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Set	button		Set section for alignment panel

the set button will bring up the **set sections for alignment panel.** *This panel allows the user to select multiple alignment/xsection combinations for the one file. The alignment is selected (using the* **Centreline** *selection button) followed by the* **Model of sections** *for that alignment. The* **Set** *button is pressed to accept the selection. This can be repeated for a number of alignments. Finish will close the* **set sections for alignment panel** *and return to the original panel*

Data to setout	choice box	string	model view string

the data to be included in the file can be selected by choosing a valid model, view or string. Depending on which data source is selected, the appropriate selection button will appear. The user then selects the button and then the items of interest.

File name input box

the name to be used for file creation

Write button

write appropriate files.

Topcon GT700 Roading File

Position of option on menu: **Survey =>Upload => Create roads upload file, Instrument choice = Topcon GTS-700 Roads**

The **Topcon GTS-700 Roads** option allows the creation of a specific roading file.

Selecting **Topcon GTS-700 Roads** brings up the **Report Topcon GT700 Roading** panel

The fields and buttons used in this panel have the following functions:

Field Description | Type | Defaults | Pop-Up

String to setout select button

after pressing the string to setout button, the user can select a valid string. This string will be used for setting out.

Model of sections model box

the model of cross sections. These sections will be written out to the file.

File for horizontal input box

the name to be used for horizontal file creation. The file will automatically be given a .hg extension.

File for vertical input box

the name to be used for the vertical file creation. The file will automatically be given a .vg extension.

File for sections input box

the name to be used for the section file creation. The file will automatically be given a .xs extension.

Write button

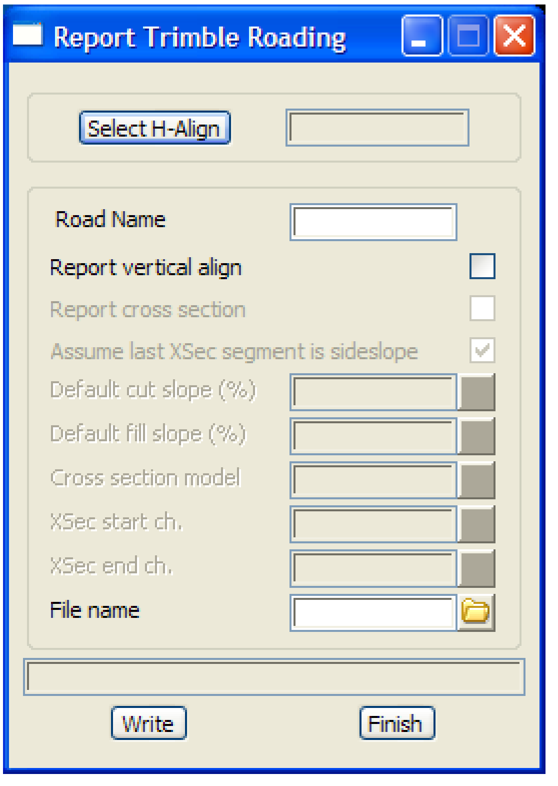
write appropriate files.

Trimble Roading File

Position of option on menu: **Survey =>Upload => Create roads upload file, Instrument choice = Trimble Roading**

The **Trimble Roading** option allows the creation of a specific roading file.

Selecting **Trimble Roading** brings up the **Report Trimble Roading** panel



The Trimble DC file has certain limitations and criteria. These include:

1. The alignment string must exist on the xsec's. This allows us to calculate the ***zero pt*** so we can split the template into left and right.
2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
3. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 1).
4. The number of points on successive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align	Select box		

select valid alignment string.

Road Name	input box	Name of selected alignment string	

input road name. If a valid alignment is selected, the name of that alignment will be the default road name.

Report vertical alignment	tick box	no	

write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.

Assume last XSec segment is sideslope tick box ticked *if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the default cut and fill slope fields are enabled.*

Default cut slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition in the file will be given the value as entered into the ***default cut slope*** *field. If no value is set for the default, the cut slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Default fill slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition in the file will be given the value as entered into the ***default fill slope*** *field. If no value is set for the default, the fill slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Cross section model model box

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch input box min alignment ch

chainage value to start writing cross sections.

XSec end ch input box max alignment ch

chainage value to end writing cross sections.

File name input box

the name to be used for file creation

Write button

write appropriate files.

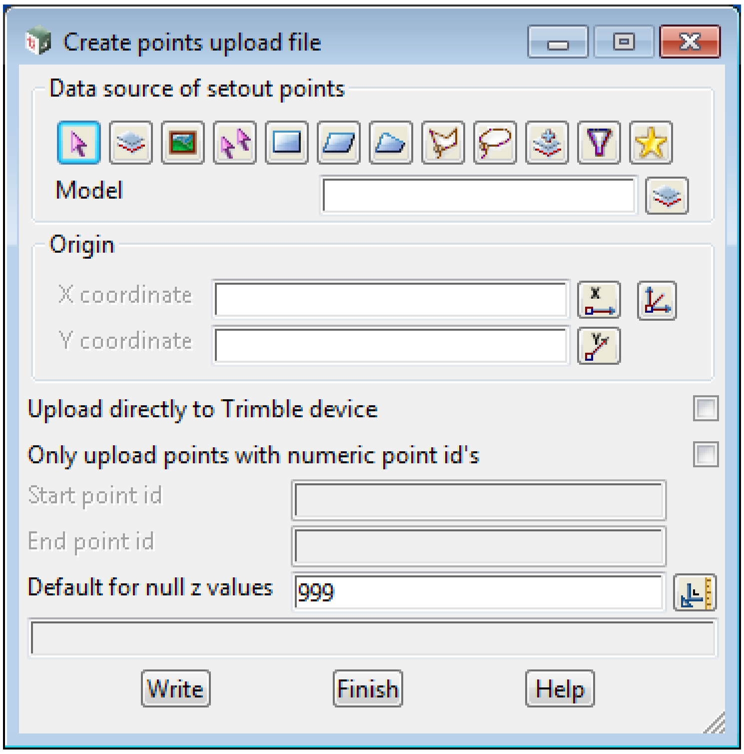
17.19.5 Create Points Upload File (New)

Position of option on menu: **Survey =>Upload => Create points upload file (new)**

The **Create points upload file (new)** option creates or uploads directly to a Trimble instrument a file of point ids, x, y and z, for string data (super strings and 4d strings only).

Only Trimble file formats is supported as this stage - the option **Create points upload file** (17.19.3 Create Points Upload File) is used to create files for most other instruments.

Selecting **Create points upload file (new)** brings up the **Create Points Upload File** panel.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Upload directly to Trimble device tick box

if ticked, the points are uploaded to the attached Trimble instrument
if not ticked, a dc file will be created.

Data source type

data selection type - for a full description go to 4.19.3 Data Source .

Data source

source of data to be processed.

Default for null value input box 999

value to write for null z-values.

Only upload points with numeric point names tick box

if ticked, only points with numeric (integer) point names are used.
if not ticked, alphanumeric point names are used.

Start point id input box

point id to start creating upload file from.

End point id input box

last point id to write to upload file.

Note: Start and End point ids may be left blank, and all point ids (whether numeric or alpha-numeric) will be written to the upload file.

Origin x/Origin y input box

If non-zero, subtract the value from the x/y value before writing out.

Upload File button

create the upload file

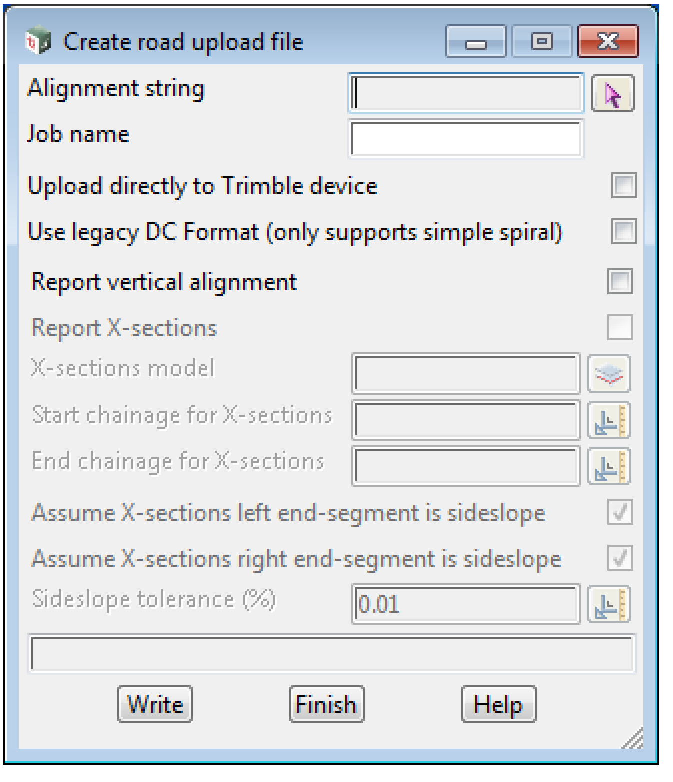
17.19.6 Create Road Upload File (New)

Position of option on menu: **Survey =>Upload => Create road upload file (new)**

The **Create road upload file (new)** option allows the creation of road files or uploads directly to a Trimble instrument and Leica using *Leica XML* format.

Only *Trimble* and *Leica LandXML* file formats are supported as this stage- the option **Create road upload file** (17.19.4 Create Road Upload File) is used to create files for most other instruments.

Selecting **Create road upload file (new)** brings up the **Create Road Upload File** panel



The fields and buttons used in this panel have the following functions:

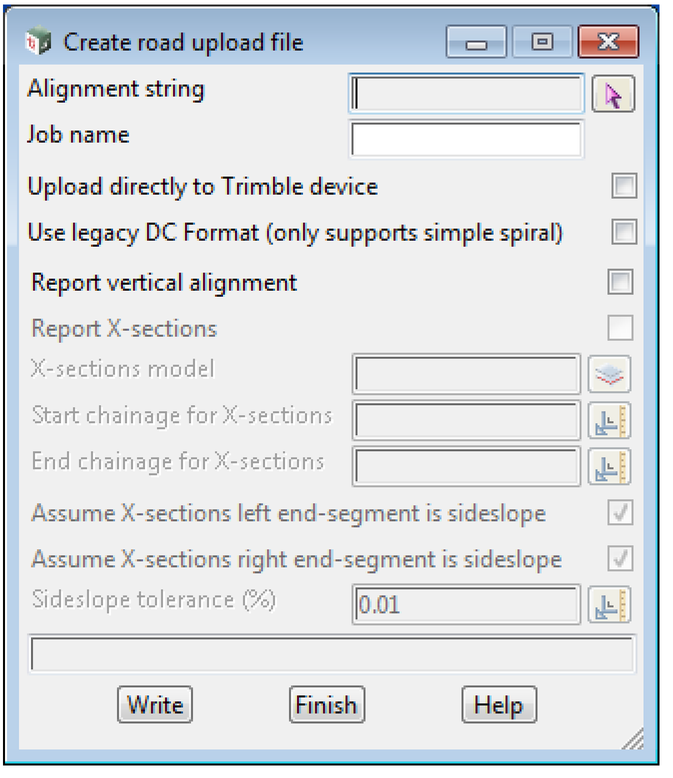
Field Description	Type	Defaults	Pop-Up
File type	choice box		Trimble Link Leica X-sections LandXML

For the choice Trimble Link, go to Trimble Link
Leica X-Sections LandXML Leica X-Sections LandXML

Trimble Link

Position of option on menu: **Survey =>Upload => Create roads upload file (new), File type = Trimble Link**

The **Trimble Link** options creates a file in Trimble dc format or uploads the date directly to the instrument using *Trimble Link*.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Alignment string String select box

select valid alignment string.

Job Name input box

the name for the Trimble job.

Upload directly to Trimble device tick box not ticked

if ticked, the points are uploaded to the attached Trimble instrument
if not ticked, a dc file will be created.

Use legacy DC format (only supports simple spiral) tick box not ticked

if ticked, the old DC format will be used.

Report vertical alignment tick box

If ticked, vertical alignment details written to file.

Report X-sections tick box

if ticked, the cross section model box will be enabled.

X- sections model model box

model of cross sections to be written out.

Start chainage for X-sections

chainage value to start writing cross sections. If blank, start with first x-section.

End chainage for X-sections

chainage value to stop writing cross sections. If blank, end with last x-section.

Assume X-sections left end-segment is sideslope tick box

If ticked, left end segments are tagged as sideslopes.

Assume X-sections right end-segment is sideslope tick box

If ticked, right end segments are tagged as sideslopes.

Sideslope tolerance (%) input 0.01

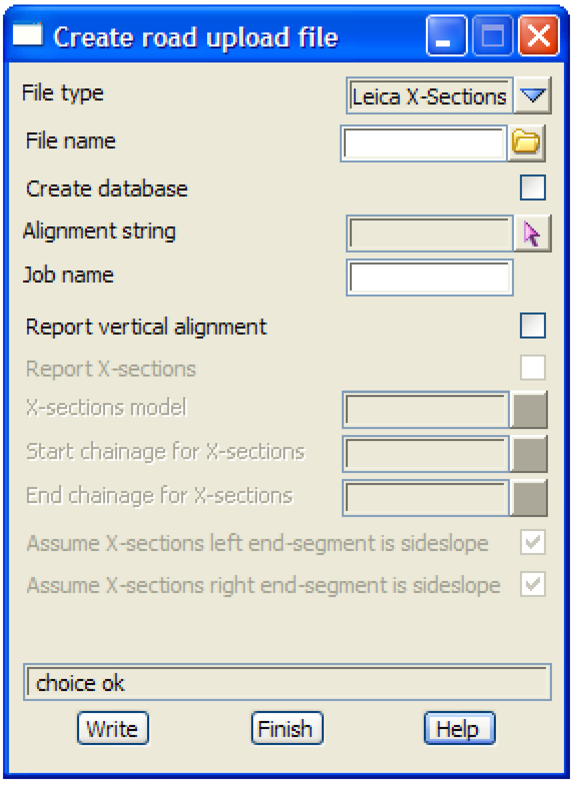
Write button

write out or upload the date.

Leica X-Sections LandXML

Position of option on menu: Survey =>Upload => Create roads upload file (new), File type = Leica X-Sections LandXML

The **Leica X-Sections LandXML** options creates a file in LandXML format suitable for *Leica* instruments



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File name	input box		*.xml

the name of the Leica LandXML file.

Create database tick box

if ticked, a DBX file is created

Alignment string string select

select valid alignment string.

Job Name input box name of selected alignment string

input job name. If a valid alignment is selected, the name of that alignment will be the default job name.

Report vertical alignment tick box

if ticked, vertical alignment details written to file.

Report cross sections tick box

if ticked, the cross section model box will be enabled.

X- sections model model box available models

model of cross sections to be written out.

Start chainage for X-sections

chainage value to start writing cross sections. If blank, start with first x-section.

End chainage for X-sections

chainage value to stop writing cross sections. If blank, end with last x-section.

Assume X-sections left end-segment is sideslope tick box

If ticked, left end segments are tagged as sideslopes.

Assume X-sections right end-segment is sideslope tick box

If ticked, right end segments are tagged as sideslopes.

Write button

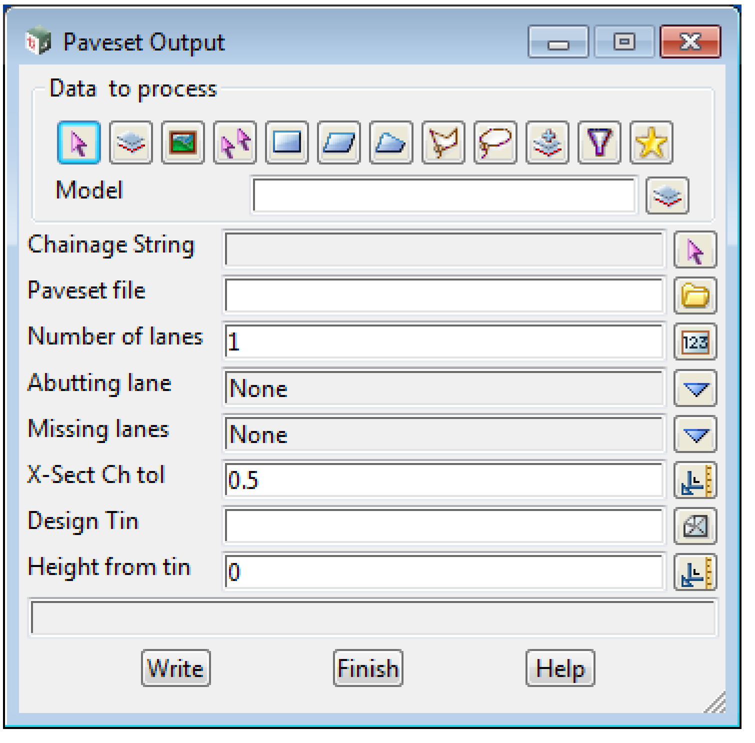
write out file.

17.19.7 Create Paveset Upload File

Position of option on menu: **Survey =>Create Paveset upload file**

The **Paveset Output** panel produces data in a format used by Paveset machine guidance software used in laying asphalt and other materials.

Selecting **Create Paveset upload file** brings up the **Paveset Output** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to process	Model		

data selection type - for a full description go to 4.19.3 Data Source .

Data source	input		

source of data to be processed.

Chainage String	string select		

The string for chainages

Paveset file	file select		

File to write the output data to

Number of lanes	number box		

The number of lanes for this paving run

Abutting lane	choice box	None	None, Left, Right

If the paving run is abutting an existing lane choose that here

Missing lanes	choice box	None	None, Left, Right

If the paving runs have missing points in some areas choose the side they are missing from here.

None *- the same number of points exist at each cross section, an error will occur in processing if a difference is detected.*

Left/Right *- the output to paveset is padded on the nominated side to match the nominal number of* *lanes, when processing is finished you will display a list of chainages where this occurred*

X- Sect Ch tol input box 0.5

The chainage variation allowed for each cross section

Design Tin input

The design TIN to drop the selected points against for level differences

Height from tin input box

The height from the design TIN
+ve = above
-ve = below

Write button

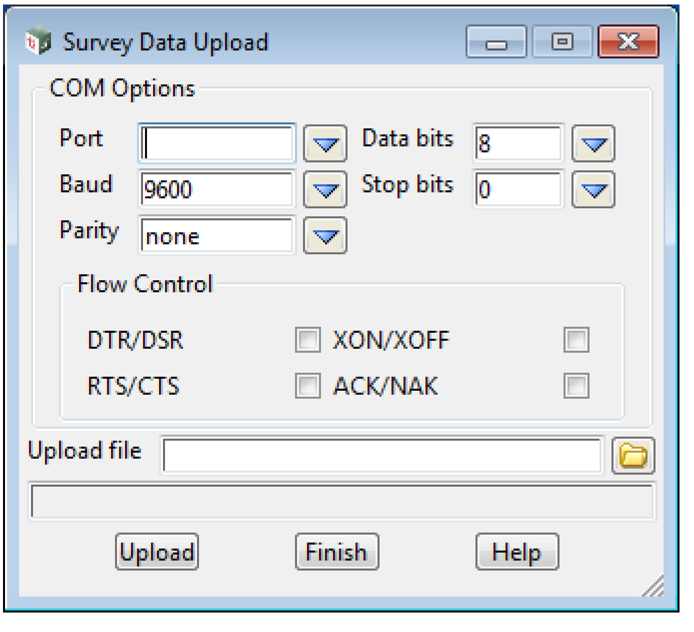
Process the points and write the Paveset file

17.19.8 Survey Data Upload

Position of option on menu: Survey =>Upload

The **upload** option take data from the computer and sends it to the data collector connected to the computer's serial port.

Selecting **Upload** brings up the **Survey Data Upload** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Port	input	from configuration file	

name of the computer serial port that the data collector is connected to. The default port is specified in the data collector configuration file.

Baud rate input from configuration file

speed of the serial port

Data bits input from configuration file

number of data bits

Stop bits input from configuration file *number of stop bits*

Parity input from configuration file

parity

DTR/DSR from configuration file

if ticked, use DTR/DSR flow control

RTS/CTS from configuration file

if ticked, use RTS/CTS flow control

XON/XOFF from configuration file

if ticked, use Xon/Xoff

ACK/NAK from configuration file

if ticked, use ACK/NAK

Field file input *.fld files

name of the 12d field file that the raw file is to be converted to. The raw file is given the same name but with the extension specified in the configuration file, e.g., ".gre".

Upload button

On clicking the upload button, ***12d Model*** *will send the specified file through the serial port and up to the data collector.*

18 12d Field

The **12d Field** allows you to take the full functionality of ***12d Model*** out into the field and control and instrument or GPS for Setout and Pickup.

\

See

18.1 12d Field Overview

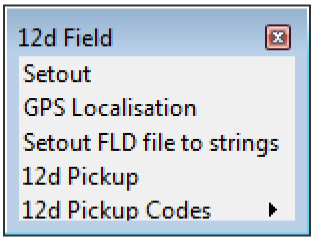
The **12d Field** module is for communicating directory with survey grade GPS units and Total Station theodolites through radio, blue tooth, Wi-Fi and cable. Survey data is displayed live on screen in conjunction with full road project design and existing surface data.

18.2 12d Field

Position of menu: **Survey =>12d Field**

The **12d Field** walk-right menu is:

.



See

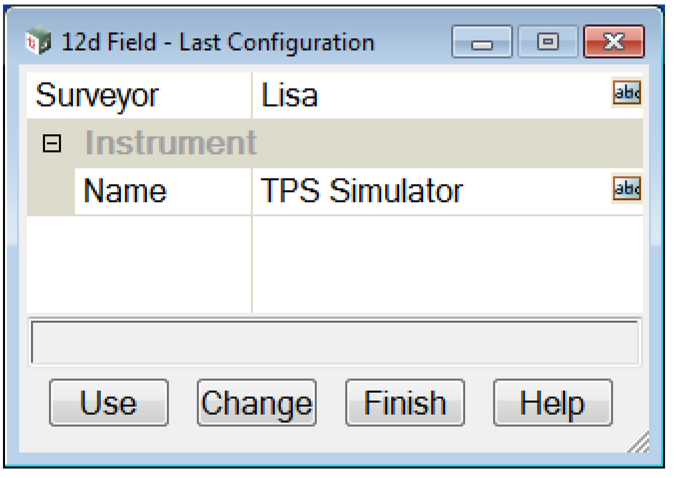
Setout, go to 18.2.1 Setout
GPS Localisation 18.2.2 GPS Localisation
Setout FLD file to strings 18.2.3 12dField Setout FLD File To Strings
12d Pickup 18.2.4 12d Pickup
12d Pickup Codes 18.2.5 12d Pickup Codes

18.2.1 Setout

Position of menu: **Survey =>12d Field=>Setout**

This section of documentation is a work in progress and will be updated in subsequent releases.

This manual will only refer to the **TPS** and **GPS simulators**, for connection details to actual instruments refer to the supplied 12dField documentation.



Continue to next section 18.2.2 GPS Localisation or return to 18.2 12d Field .

18.2.1.1 TPS

This section of documentation is a work in progress and will be updated in subsequent releases.

For the **TPS Simulator** this is the only panel to enter 12dField. Press **Set** and you will enter 12dField proper.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Instrument	choice box		

Select the instrument you wish to use with 12dField, dependent on the instrument selected the panel flow will vary.

Surveyor

Enter the name for the surveyor using 12dField.

After selecting **Set** *the* **12d Field - Setout TPS Simulator** *is displayed on the screen. For more information please go to* 18.2.1.4 12d Field - Setout (TPS Simulator)

Set

Enter 12dField

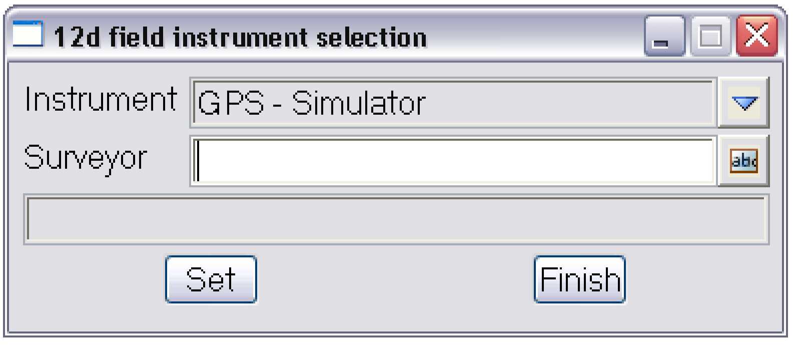
Continue to next section 18.2.1.2 GPS or return to 18.2 12d Field .

18.2.1.2 GPS

This section of documentation is a work in progress and will be updated in subsequent releases.

For the **GPS-Simulator** 2 more panels are required

Select **GPS-Simulator** from the choice box.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Instrument	choice box		

Select the instrument you wish to use with 12dField, dependent on the instrument selected the panel flow will vary.

Surveyor

Enter the name for the surveyor using 12dField.

Set

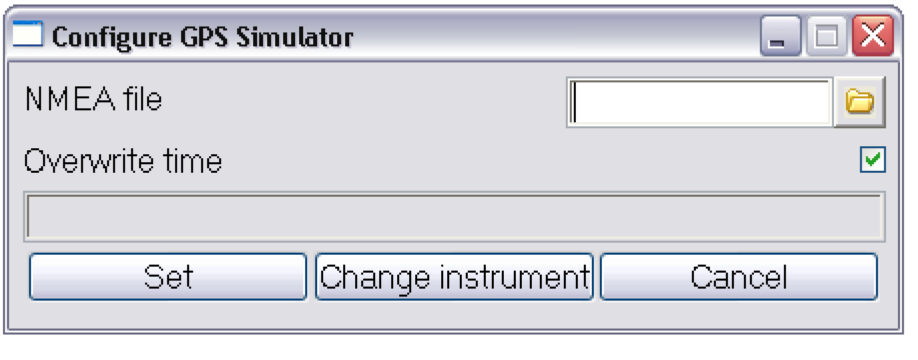
Brings up the **Configure GPS Simulator** *panel.*

For more information on the **Configure GPS Simulator** panel please go to 18.2.1.3 Configure GPS Simulator

Continue to next section 18.2.1.3 Configure GPS Simulator or return to 18.2 12d Field .

18.2.1.3 Configure GPS Simulator

This section of documentation is a work in progress and will be updated in subsequent releases.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

NMEA file folder *.nmea

The GPS simulator needs a NMEA file to run, this can be a file recorded from an actual instrument or constructed from within 12dField itself by 'driving' along an existing string. A default file "Default_LLQ.NMEA" is created automatically for 1st up usage.

Overwrite time tick box

if ticked the time in the NMEA string is ignored and the current computer time used instead.

Set button

proceed to the next panel

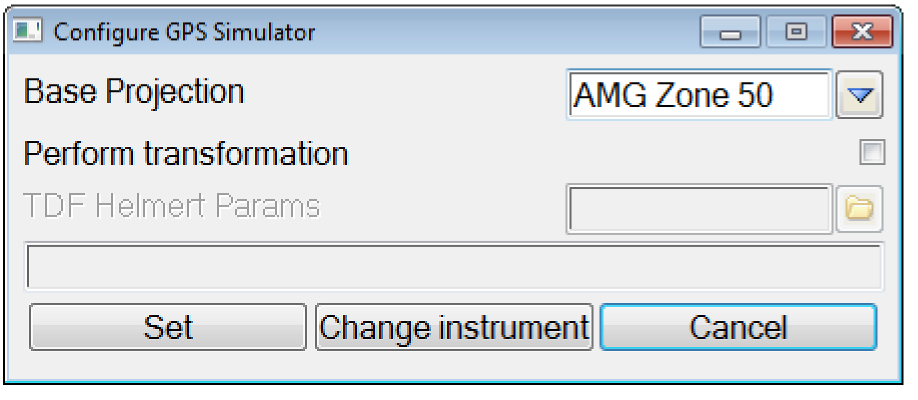
Change instrument button

go back to the instrument selection panel.

Cancel button

exit 12dField

Selecting **Set** displays the next **Configure GPS Simulator** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Base Projection choice box

Select the projection to use, these are located in the carto.4d file. This projection is used to convert the WGS84 lat/long/elevation into cartesian coordinates which can be used directly or have a localisation applied to them.

Perform transformation tick box

if ticked a user defined localisation will be applied to the GPS reading.

12dF Helmert Params

*Select the *.TDF_HEL file containing the transformation details to apply, this file is created with the "GPS Localisation" panel in the main 12DField menu.*

Set button

Enter 12dField

Change instrument button

Go back to the instrument selection panel.

Cancel button

Exit 12dField

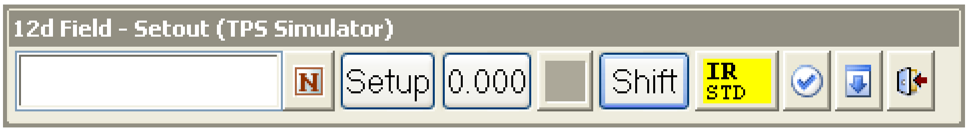
After selecting **Set** *the* **12d Field - Setout GPS Simulator** *is displayed on the screen. For more information please go to*18.2.1.5 12d Field - Setout (GPS Simulator)

Continue to next section 18.2.1.4 12d Field - Setout (TPS Simulator) or return to 18.2 12d Field .

18.2.1.4 12d Field - Setout (TPS Simulator)

This section of documentation is a work in progress and will be updated in subsequent releases.

The control bar has one user definable setting, In the settings panel under the general tab you can toggle on or off whether you want the current string name on the control bar, this is "Str Name on Control Bar", 12dField will need to be restarted for this setting to change.



Names.4d

controls the string details used by 12dField when storing a point, e.g. model/linestyle/weight etc.

Setup

brings up the **Store Point Setup** *panel*.
For more information on **Store Point Setup** *panel*, *please go to* 18.2.1.6.1 Store Point Setup

brings up the **Target Heights Panel**

Show the current number of satellites and status, pressing the button brings up the **GPS Status** *panel. In the settings panel the user defines the thresholds for* ***GPS*** *errors.*

Shift

is used by 12dField panels to change buttons to add extra functionality.

Show the current measuring style, pressing brings up the **GPS/TPS settings** *panel.*

Select button, for tablet PC, allow selection with a press.

Menu

brings up the 12d Field panels menu. For more information please go to 18.2.1.7 Options

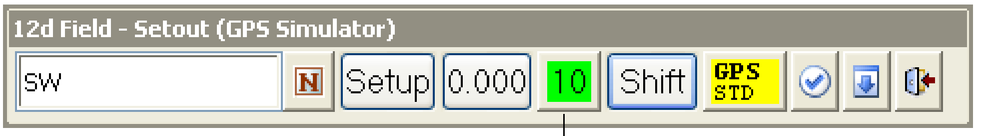
Exit

Exits 12d Field.

Continue to next section 18.2.1.5 12d Field - Setout (GPS Simulator) or return to 18.2 12d Field .

18.2.1.5 12d Field - Setout (GPS Simulator)

This section of documentation is a work in progress and will be updated in subsequent releases.



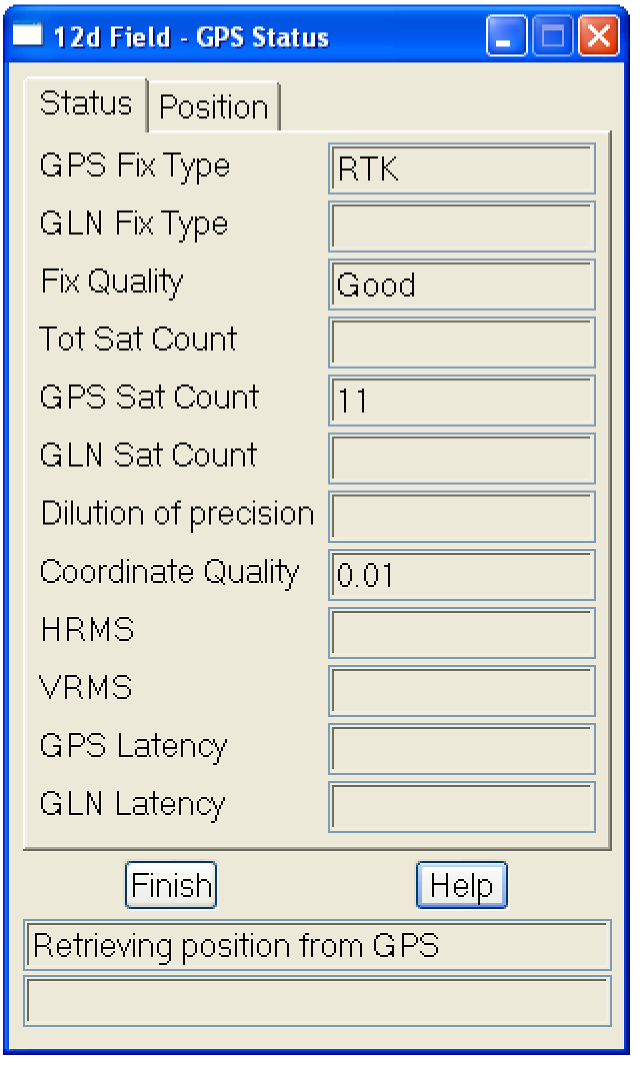
Selecting this option brings up the **12d Field - GPS Status** *panel.*

For information on the **12d Field - GPS Status** panel please go to 18.2.1.6 12d Field - GPS Status

Continue to next section 18.2.1.6 12d Field - GPS Status or return to 18.2 12d Field .

18.2.1.6 12d Field - GPS Status

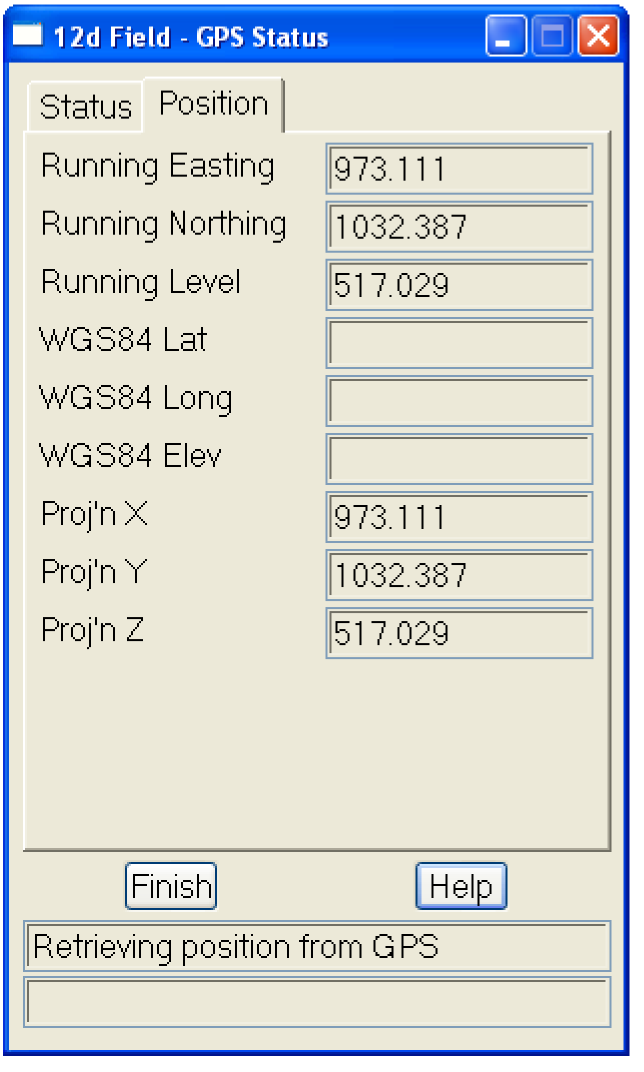
The **12d Field - GPS Status** panel provides information about the current state of the **GPS** instrument such as fix quality and satellites used.



Status Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
GPS Fix Type	12dF input box		
The current fix type of the GPS satellites, e.g RTK			
GLN Fix Type	12dF input box		
The current fix type of the Glonass satellites, e.g RTK			
Fix Quality	12dF input box		
The quality of the GPS, Good, Average, Poor no RTK			
Tot Sat Count	12dF long box		
The number of GPS & Glonass satellites			
GPS Sat Count	12dF long box		
The number of GPS satellites			
GLN Sat Count	12dF long box		
The number of Glonass satellites			
Dilution of precision	12dF double box		
The current dilution of precision			
Coordinate Quality	12dF double box		
Leica specific coordinate quality			
HRMS	12dF double box		
Horizontal Root Mean Square value			
VRMS	12dF double box		
Vertical Root Mean Square value			
GPS Latency	12dF double box		
The latency of the measurements from the GPS satellites.			
GLN Latency	12dF double box		
The latency of the measurements from the Glonass satellites.			



Position Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Running Easting 12dF double box

The current easting of the GPS.

Running Northing 12dF double box

The current northing of the GPS.

Running Level 12dF double box

The current level of the GPS.

WGS84 Lat 12dF angle box

The WGS84 latitude of the running measurement.

WGS84 Long 12dF angle box

The WGS84 longitude of the running measurement.

WGS84 Elev 1 12dF double box

The WGS84 elevation of the running measurement.

Proj'n X 12dF double box

The WGS84 cartesian X of the running measurement.

Proj'n Y 12dF double box

The WGS84 cartesian Y of the running measurement.

Proj'n Z 12dF double box

The WGS84 cartesian Z of the running measurement.

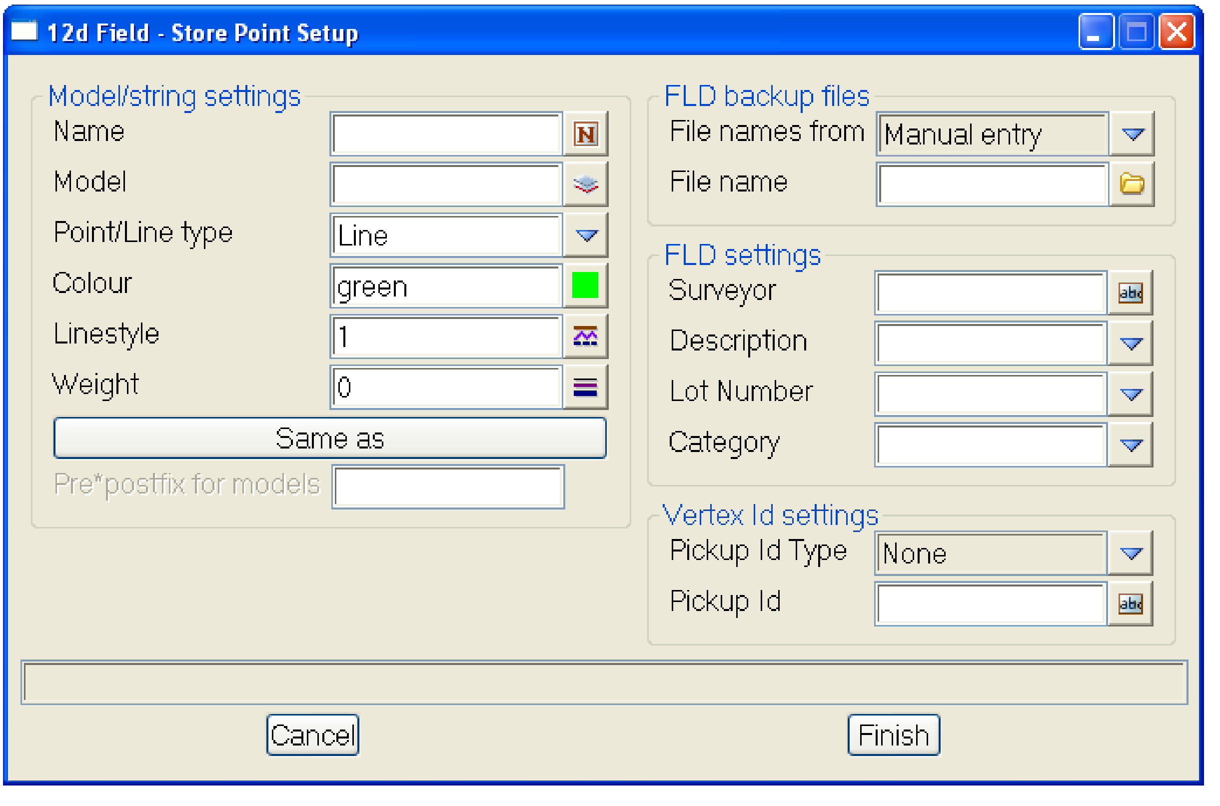
Continue to next section 18.2.1.6.1 Store Point Setup or return to 18.2 12d Field .

18.2.1.6.1 Store Point Setup

The **12d Field - Store Point Setup** panel is called up the 1st time a user attempts to store a point to a model in a 12dField setout panel or if the user presses the **Setup** button on the 12dField control bar.

This panel must be validly completed before a point can be stored.

The panel is grouped into 4 separate areas each described below.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Model/string settings

These settings work the same as your typical 12d settings work, they control the look of the stored string in the model.

Name

enter the name of the string to be stored manually or from the pop up select a predefined name (from names.4d) which will also populate the other settings.

Model model box

the model to store the string in. (This model will automatically be added to your defined 12dField plan view)

Point/Line type choice box Point, Line

whether the string is a point or line string.

Colour colour box

the colour of the string.

Linestyle

linestyle of the string

Weight

the thickness of the string.

Same as button

select an existing point/line and the fields will set to it's properties.

Pre*postfix for models

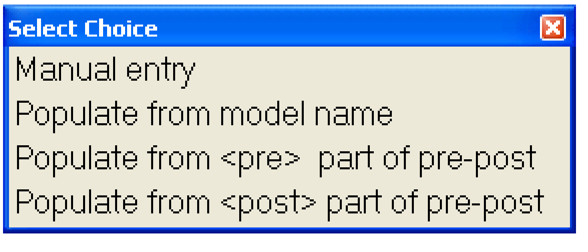
if non blank the pre-postfix will be applied to the nominal model when storing the point.

FLD backup files

All 12dField points are stored to a FLD file as well as a model. This is done for backup reasons as every shot is stored to the FLD file on disk when a shot is taken ensuring no data should be lost in the event of an unexpected shutdown of 12d.

The 12dField files have sufficient attributes in them that they can be read directly back into 12d without going through the survey data reduction functions.

File names from Manual Entry, Populate from model name, Populate from <pre> part of pre post, Populate from <post> part of pre-post



*Manual Entry - enter the name of the file in the **File name** box.*
*Populate from model name - the name of the model in the **model box** is used as the file name.*
Populate from <pre> part of pre-post - the name of the file is the pre part.
Populate from <post> part of pre-post - the name of the file is the post part.

*For example a surveyor might enter a model name of "Asphalt Conformance" in the **model box**.*
*They then for a pre fix enter the year month and day and their initials "20113006MG " and they select "**Populate from model name**" for the FLD file name.*
The model and field file written will be "20113006MG Asphalt Conformance"

FLD Settings

Surveyor

the name of the surveyor

Description

*a description of the survey (Populated from **12dF_JOB_DESCRIPTIONS.4D**)*

Lot number

*a lot number of the survey (Populated from **12dF_JOB_LOT_NUMBERS.4D**)*

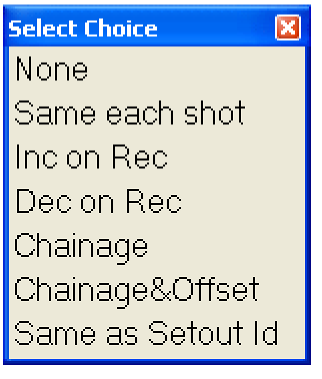
Category

*the category of the survey (Populated from **12dF_JOB_CATEGORIES.4D**)*

Vertex Id settings

This choice box controls the way the id of each vertex in the string is written.

Pickup Id Type None, Same each shot, Inc on Rec, Dec on Rec, Chainage, Chainage&Offset. Same as Setout Id



None - no vertex id is written.
*Same each shot - the value in the **Pickup Id** box will be used for all points stored.*
*Inc on Rec - the value in the **Pickup Id** box will be used for the next point stored then incremented.*
*Dec on Rec - the value in the **Pickup Id** box will be used for the next point stored then decremented.*
Chainage - the chainage of the point being stored will be used as it's vertex id.
Chainage&Offset - the chainage and offset of the point being stored will be used as it's vertex id.
Same as Setout Id - the vertex id of the point being setout will be used.

Notes on the incrementing of the Id.
The id is alphanumeric and the number of characters does not change.The increment/decrement applies to the either the numeric or alpha ending of the id, not to a combination of both.

```
Increment  examples  1->2, 9->0, A1>A2, A9->A0, AA->AB, AZ->BA,
S099->S100, S999->S000
Decrement examples 6->5, 0->9, A2>A1, A0->A9, AB->AA, AA->ZZ,
S100->S099, S000->S999
```

Pickup Id

This is the id of the next vertex to be stored

Cancel button

if cancel is pressed the panel will close but the next time a point is stored it will open again.

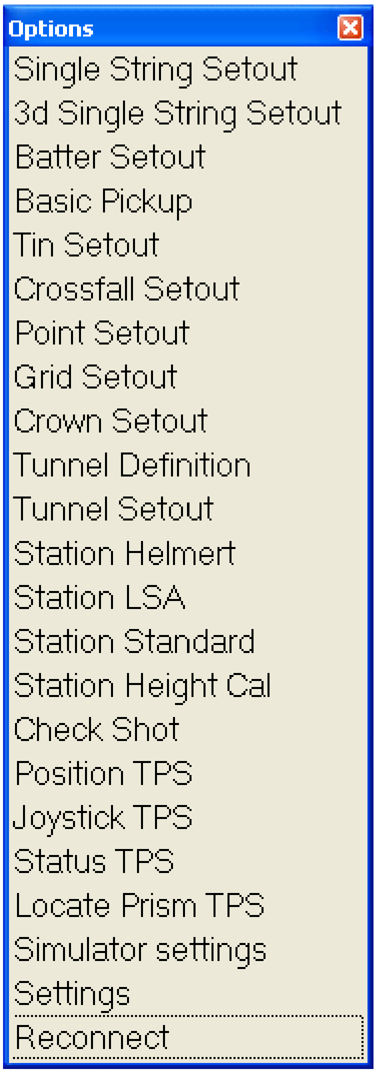
Finish button

if the panel validates correctly it will close and the point will be stored. The panel will only open again if called manually from the control bar or a new setout is started.

Continue to next section 18.2.1.7 Options or return to 18.2 12d Field .

18.2.1.7 Options

This section of documentation is a work in progress and will be updated in subsequent releases.

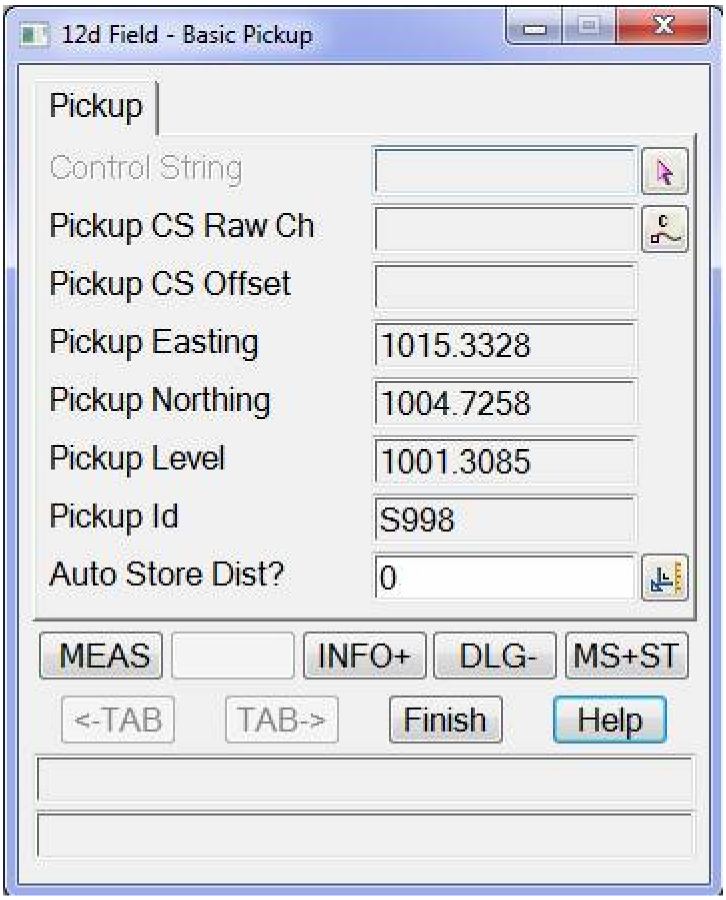


For the option *Single String Setout*, go to 18.2.1.8.1 Single String Setout
Batter Setout 18.2.1.8.2 Batter Setout
Basic Pickup 18.2.1.8.3 12d Field -Basic Pickup
Tin Setout 18.2.1.8.4 Tin Setout
Crossfall Setout 18.2.1.8.5 Crossfall Setout
Point Setout 18.2.1.8.6 Point Setout
Grid Setout 18.2.1.8.7 Grid Setout
Crown Setout 18.2.1.8.8 Crown Setout
Tunnel Definition 18.2.1.8.9 Tunnel Definition
Tunnel Setout 18.2.1.8.10 Tunnel Setout
Station Helmert 18.2.1.8.11 Station Helmert

18.2.1.8 Common Measurement Buttons

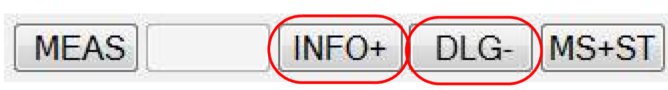
A description of the common measurement buttons on 12dField Setout panels is described below.

The measurement buttons are on a dialog as such:



The INFO and DLG buttons

These buttons do not change in behaviour between all of the different measure modes.

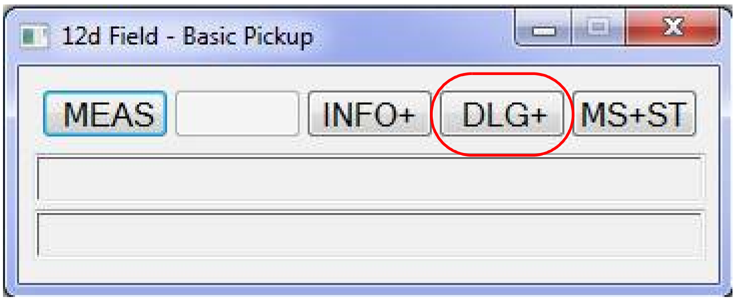


INFO+

*Displays the information panel, this panel contains extra information about the current setout that is not displayed in the standard panel, the contents of the information panel is user configurable via the text file **12dF_INFO_PAGE_CONFIG.4D**. When the information panel is active the button changes to **INFO-**.*

DLG-

*When pressed the dialog minimises to maximise the screen area, the button changes to **DLG+** which when pressed will bring the panel back to full size.*



Single (GPS/TPS) and Multiface (TPS only) measurement modes.

The **MEAS** button.

MEAS

Starts the measurement, on completion the button state changes to this

MEAS

Start another measurement.

STORE

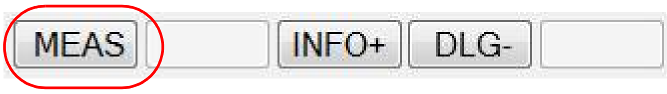
Store the point as per the settings in the 18.2.1.6.1 Store Point Setup *panel, the first store of a point brings this panel up automatically. Once stored the **STORE** button will be blanked out until a new measurement is taken.*

The **MS+ST** button

MS+ST

Starts a measurement and stores the point as per the settings in the 18.2.1.6.1 Store Point Setup *panel. The **STORE** button remains disabled.*

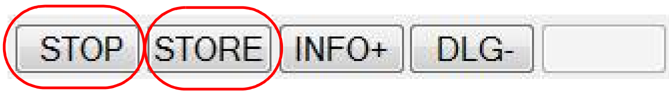
Continuous (GPS/TPS) measurement mode



In continuous mode the **MS+ST** button is disabled.

MEAS

Start continuous measurement



STOP

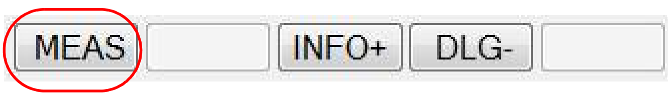
*Stop the continuous measurement, the **STORE** button will remain active until pressed. When the point is stored the button is disabled until a new measurement is started.*

STORE

Store the point as per the settings in the 18.2.1.6.1 Store Point Setup *panel, the button state does not change meaning the user can continue to move storing points at a single press of the button.*

Averaging measurement mode (GPS only)

In averaging mode the **MS+ST** button is disabled.



MEAS

Start the averaging measurement, the details of the averaging, std deviations xy&z are displayed in the 3rd message line of the dialog.

STOP

Stop the averaging measurement.

MEAS

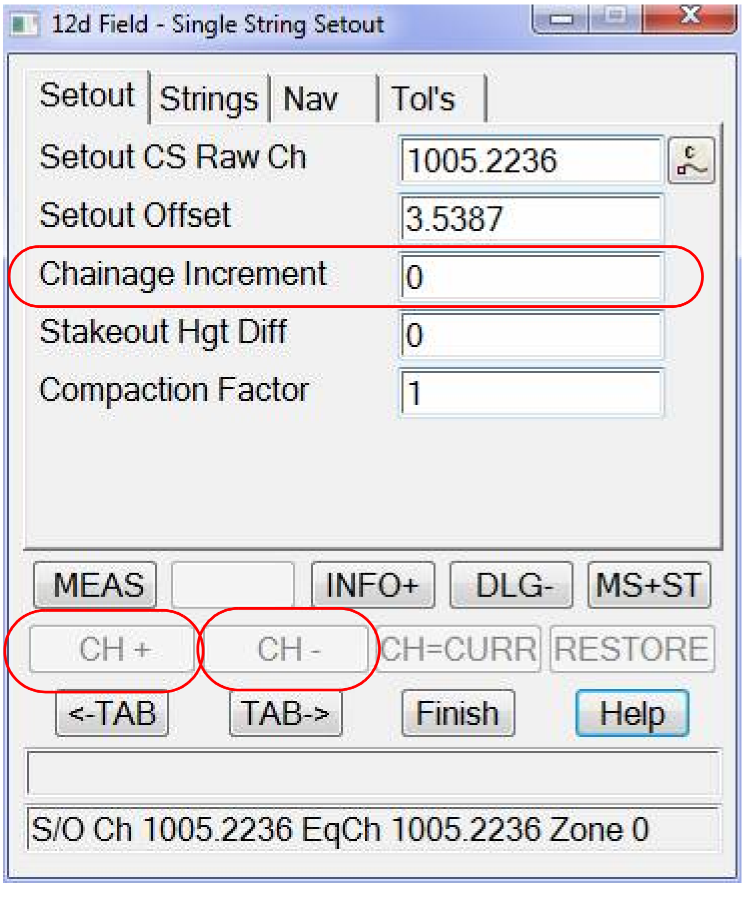
Start a new averaging measurement.

STORE

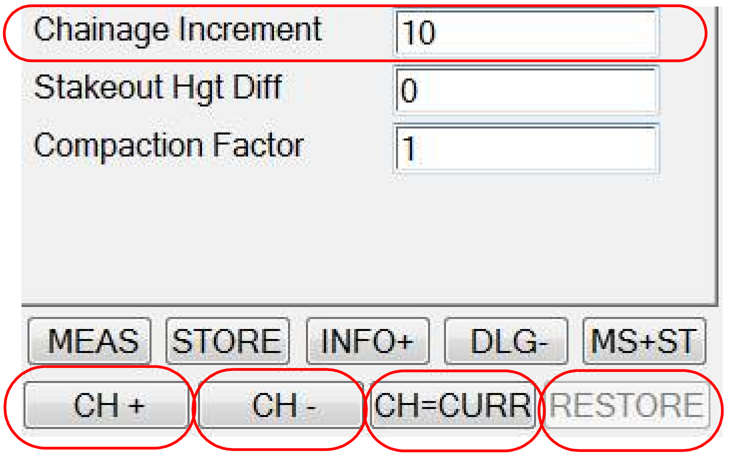
Store the point as per the settings in the 18.2.1.6.1 Store Point Setup *panel.*

The Chainage Buttons

The chainage buttons commonly appear as the middle row of buttons in a 12dField setout panel.



The **CH+** and **CH-** buttons are used to quickly increment to the next chainage to be setout, the buttons are activated when the **Chainage Increment field** in the panel has a value other than 0.



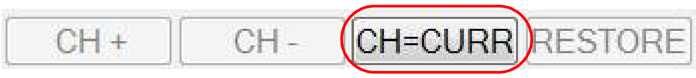
CH+

When pressed the value in the ***Chainage Increment field*** *is added to the current setout chainage. The value in* ***Chainage Increment field*** *can be +ve or -ve.*

CH-

When pressed the value in the ***Chainage Increment field*** *is subtracted from the current setout chainage. The value in* ***Chainage Increment field*** *can be +ve or -ve.*

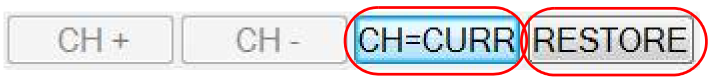
The **CH=CURR** and **RESTORE** buttons are used for where the user has a need to temporarily use the current chainage for setout purposes.



CH=CURR

The button is activated when a measurement has been taken.

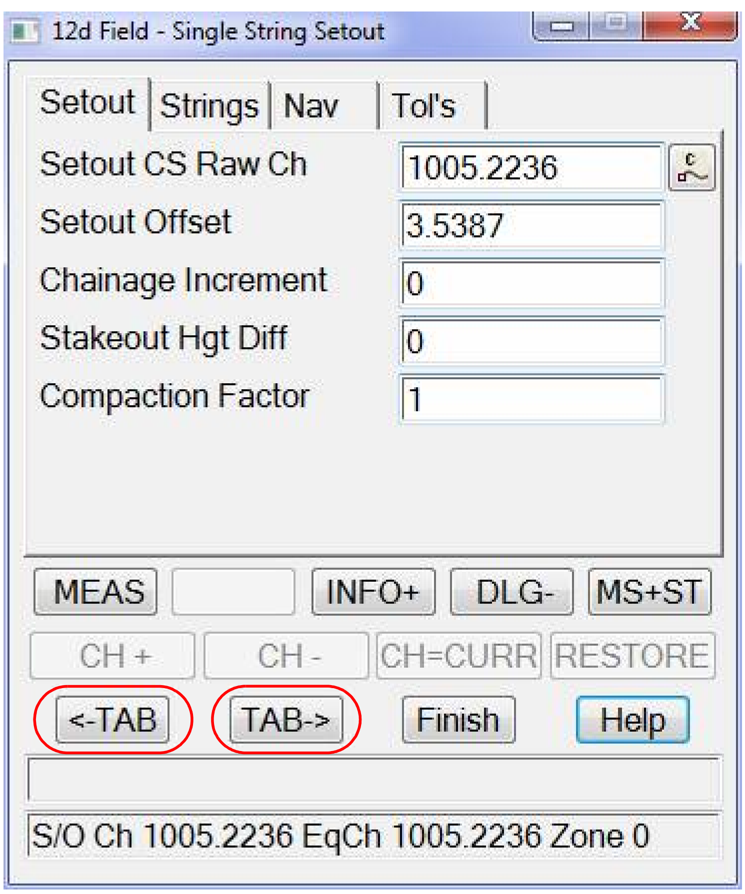
When pressed the setout chainage is set to the current chainage, the **RESTORE** *button is then activated and the* **CH+** and **CH-** *buttons disabled.*



RESTORE

*When pressed the setout chainage is set back to the chainage when **CH=CURR** was pressed and the **CH+ CH-** buttons enabled if possible.*

The Bottom Button Row



<-TAB

changes the active tab in the setout panel to the next left.

TAB->

changes the active tab in the setout panel to the next right.

The **<-TAB** and **TAB->** keys can be overwritten for special user behaviour.

Overwriting the **<-TAB** and **TAB->** keys.

The functionality of the TAB keys can be defined in "**12dF_DLG_USER_KEYS.4D**".

The file allows the user to enter the text for the key and the functionality for the key to take on.

"bt_tab_left" "P2d" "tps_position_hz"

"bt_tab_right" "P XY" "tps_position_xy"

The 1st field is the keyword for the button to override.

The 2nd field is the text for the button to override.

The 3rd field is the action for the button to perform, any of the 12dField hot keys defined in "**12dF_USER_KEYS.4D**" can be assigned.

Continue to next section 18.2.1.8.1 Single String Setout or return to 18.2 12d Field .

18.2.1.8.1 Single String Setout

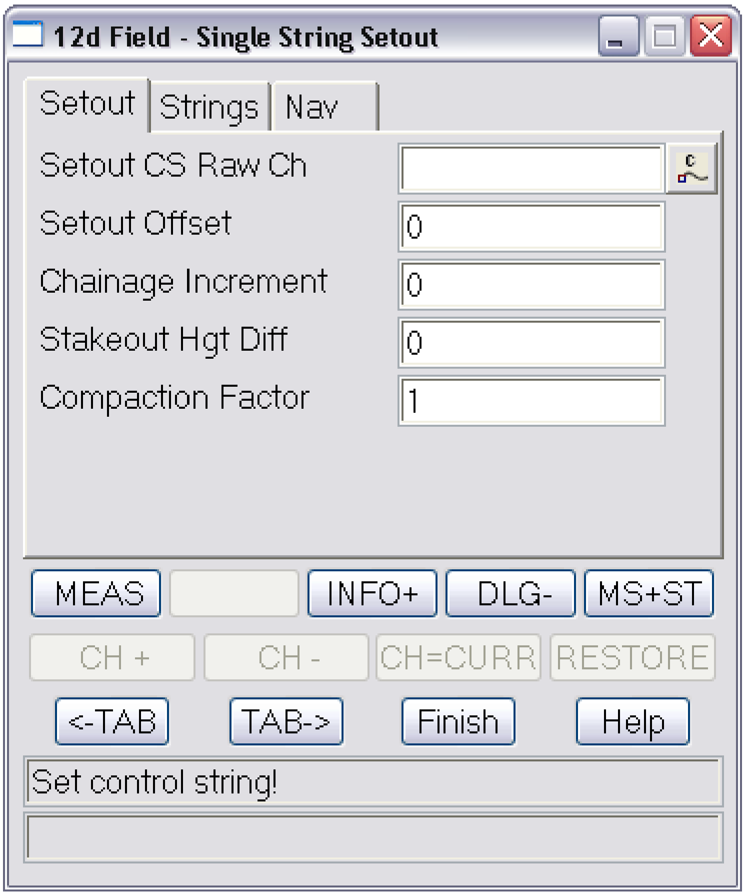
The **12d Field Single String Setout** panel is used when the setout point is relative both horizontally and vertically to one string, for example a traffic island or kerb and gutter.

Single string setout works by dropping a point to a nominated control string, then the setout string is cut normal to the dropped point on the control string.

When setting out the setout string is cut normal from a point at the setout chainage on the control string, then the setout offset is then applied from here to create the setout point.

Note the control string and the setout string could be the same string or all different, this dependant on the task being performed.

Selecting the **Single String Setout** option brings up the **12d Field - Single String Setout** panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Setout CS Raw Ch 12dF chainage box

The raw, no equalities setout chainage on the control string, start chainage plus distance along string

Setout Offset 12dF double box

The offset from the setout string to setout, +ve is to the right of the string, -ve left

Chainage Increment 12dF double box

The value the setout chainage will be changed by when chainage increment/decrement is called.

Stakeout Hgt Diff 12dF double box

The height diff from the setout surface/string. +ve is above.

Compaction Factor 12dF double box

A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel).

Buttons

MEAS button

Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog.

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

CH + button

Increment the setout chainage by the value in the chainage increment field.

CH - button

Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button

Set the setout chainage to the chainage of the last measured point.

RESTORE button

*Restore the setout chainage to the chainage prior to the "**CH=CURR**" button being pressed.*

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

DLG+ button

Restore a minimised panel to it's full size.

INFO- button

Close the user configurable information panel.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

Start a measurement with a touch on the screen, store it on completion.

READ button

Load previously saved setout settings for reuse.

SAVE button

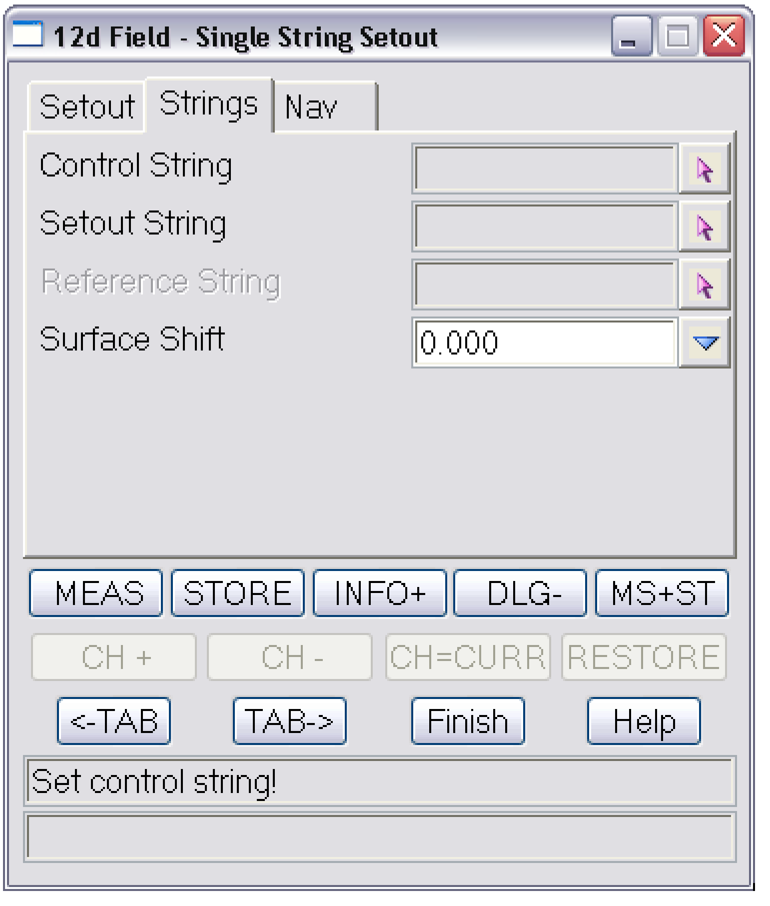
Save the current setout settings for reuse at a later date.

STOP button

Stop the measurement in process.

STORE button

Store the last measured point.



Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control String	12dF string select box		

Control string, the string to which the other strings are cut normal to for calculations.

Setout String	12dF string select box		

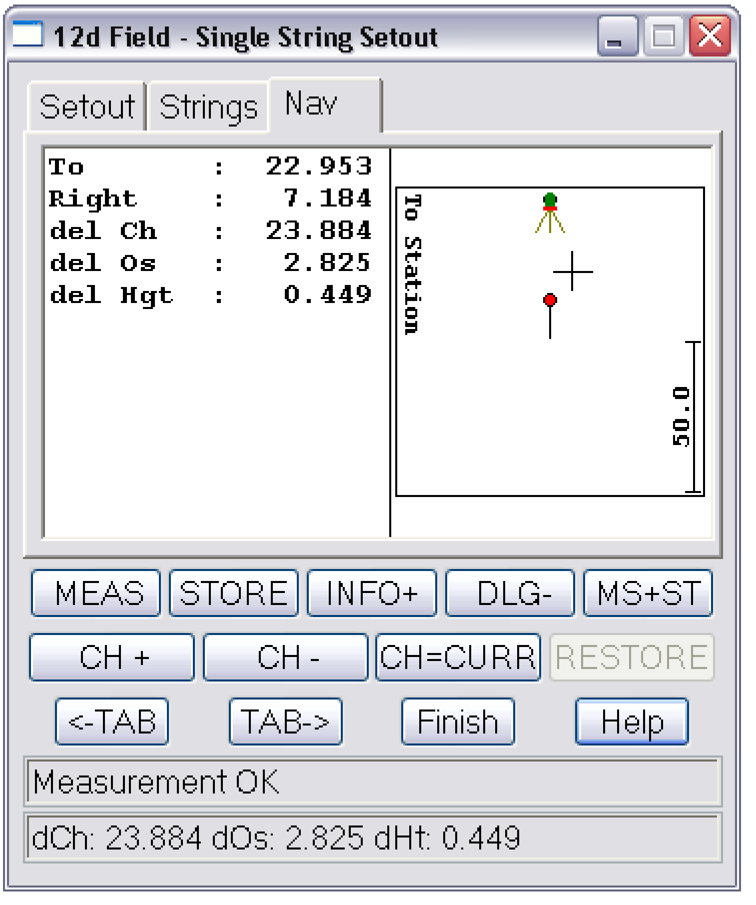
Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centreline

Reference String	12dF string select box		

Reference string, a string to which the current point is dropped normally to for information only.

Surface Shift	choice box		-0.0000

*A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in "**TDF_SURFACE_SHIFTS.4D**")*



Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Navigation Box		draw box	

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.2 Batter Setout or return to 18.2 12d Field .

18.2.1.8.2 Batter Setout

The **12d - Field Batter Setout** panel is used to dynamically locate the intersection point of a slope defined by the cut of 2 strings and the natural surface at the users current position.

It is designed around the user wishing to place batter rails in place for guiding the cut/fill.

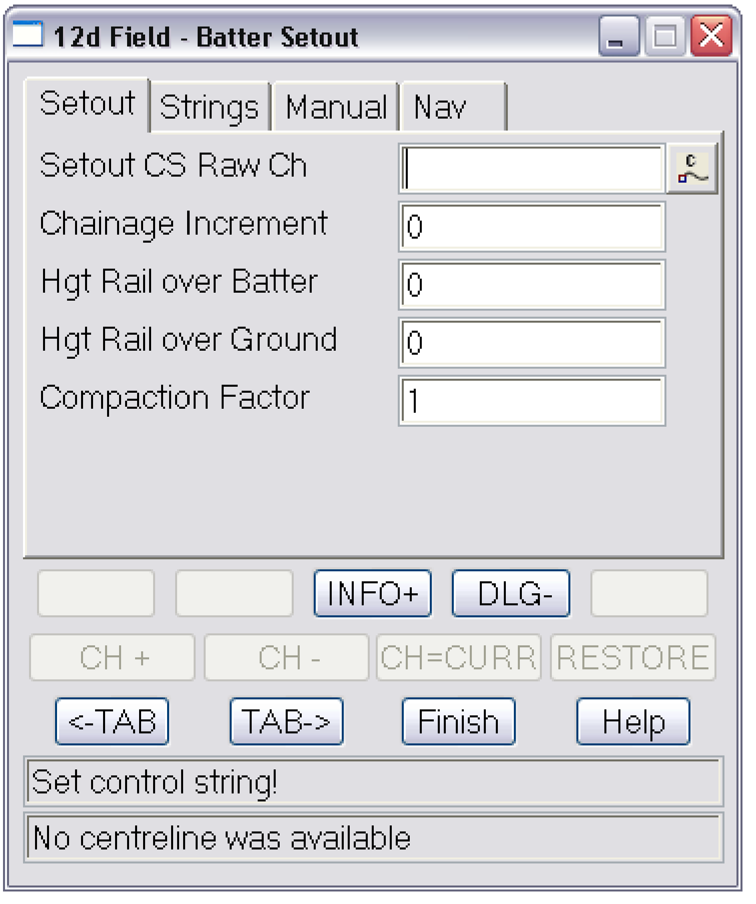
Note, unlike other string setout routines the batter setout does not have a setout string, just the control string and the 2 design strings.

The user is able to set a shift to move the design surface up or down once the strings are cut.

There are manual modes available for setting the design slope when 2 strings are not able to be cut.

Batter setout works by dropping a point to a nominated control string, the 2 strings used to determine the slope are cut normal to the dropped point on the control string, the delta offset for the pole is dependant on the users height rather than a setout string.

Selecting the **Batter Setout** option brings up the **12d - Field Batter Setout** panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Setout CS Raw Ch	12dF chainage box		

The raw, no equalities setout chainage on the control string, start chainage plus distance along string

Chainage Increment 12dF double box

The value the setout chainage will be changed by when chainage increment/decrement is called.

Hgt Rail over Batter 12dF double box

The height of the batter rail above the design batter, say 0.1 for cut and 1.0 for fill.

Hgt Rail over Ground 12dF double box

The height of the batter rail above the natural ground, typically as large as number as possible to get the rail away from the top/toe of the batter.

Compaction Factor 12dF double box

A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated the **Settings** *panel.)*

Buttons

MEAS button

*Start a measurement, the behaviour is determined by the **TPS/GPS** measurement setting set from the control bar.*

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

CH + button

Increment the setout chainage by the value in the chainage increment field.

CH - button

Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button

Set the setout chainage to the chainage of the last measured point.

RESTORE button

*Restore the setout chainage to the chainage prior to the **"CH=CURR"** button being pressed.*

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

STOP button

Stop the measurement in process.

STORE button

Store the last measured point.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

Start a measurement with a touch on the screen, store it on completion.

READ button

Load previously saved setout settings for reuse.

SAVE button

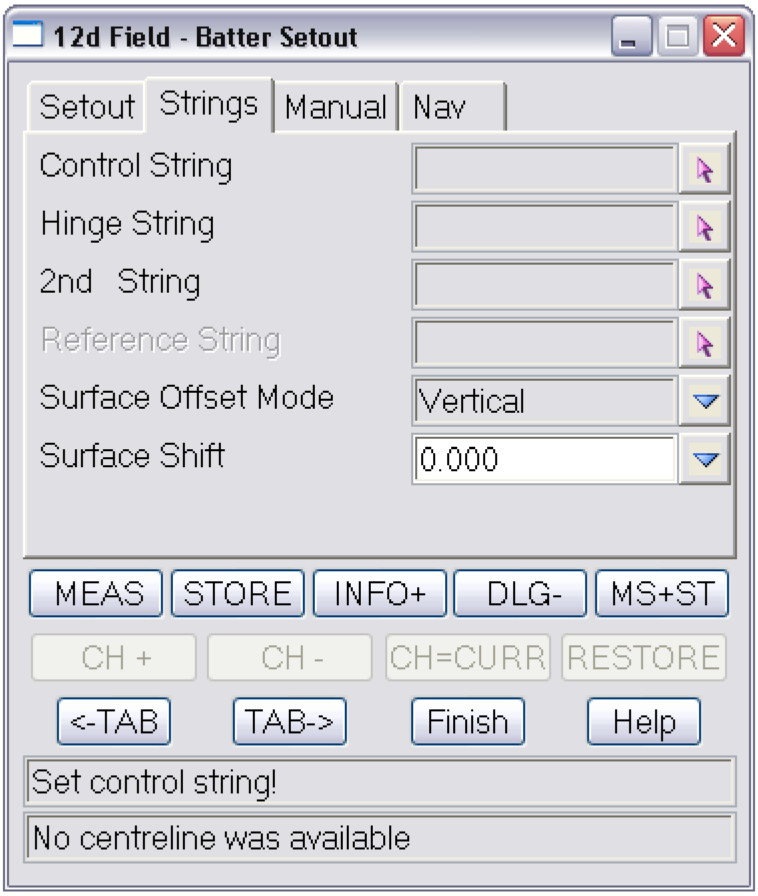
Save the current setout settings for reuse at a later date.

DLG+ button

Restore a minimised panel to it's full size.

INFO- button

Close the user configurable information panel.



Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control String	12dF string select box		

Control string, the string to which the other strings are cut normal to for calculations.

Hinge String	12dF string select box		

The hinge string is the string the batter is being cut or filled to. Slope distances etc. are given to this string.

2nd String	12dF string select box		

The other string along with the hinge string defining the batter slope.

Reference String	12dF string select box		

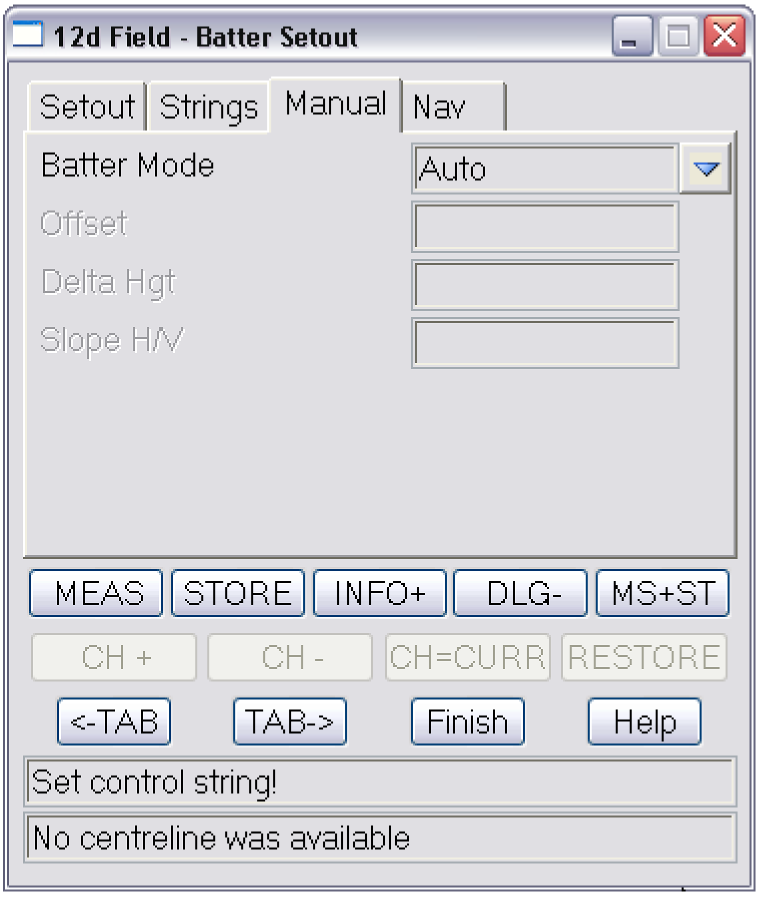
Reference string, a string to which the current point is dropped normally to for information only.

Surface Offset Mode	choice box		vertical, normal

Whether the offset to the surface is normal or vertical
Vertical: *The height offset is applied vertically to the design slope.*
Normal: *The height offset is applied normal/perpendicular to the design slope.*

Surface Shift	choice box		0.000

*A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in "**TDF_SURFACE_SHIFTS.4D**")*



Manual Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Batter Mode	choice box		Auto Centreline, hinge & slope Manual relative (dOS&dHgt), Manual absolute (dOS&RL) Manual, use current slope

Choose the method to generate the batter slope.

***Auto:** The batter slope is determined by cutting the hinge and secondary string.*

***Centreline, hinge & slope:** The batter setout is done by cutting the hinge and applying a manually entered slope from this.*

***Manual relative (dOS&dHgt):** The user manually enters the hinge offset from the control line, the hinge height relative to the control line and the batter slope.*

***Manual absolute (dOS&RL)**: The user manually enters the hinge offset from the control line, the absolute hinge height and the batter slope.*

***Manual, use current slope**: The batter setout is done by cutting the hinge and applying the last measured slope.*

Offset 12dF double box

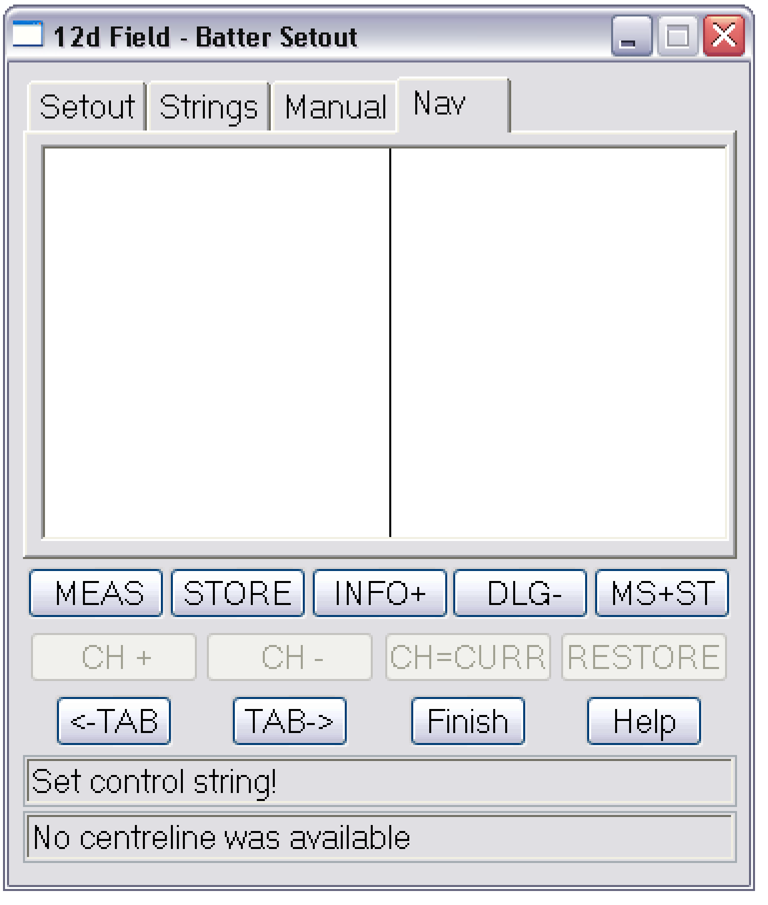
*Dependant on the '**Batter Mode**' setting in use, see description of the options in '**Batter Mode**'.*

Delta Hgt/Absolute Height 12dF double box

*Dependant on the '**Batter Mode**' setting in use, see description of the options in '**Batter Mode**'.*

Slope H/V 12dF double box

The slope of the batter in horizontal/vertical from, e.g. 2:1



Nav Tab

The fields and buttons used in this panel have the following functions.

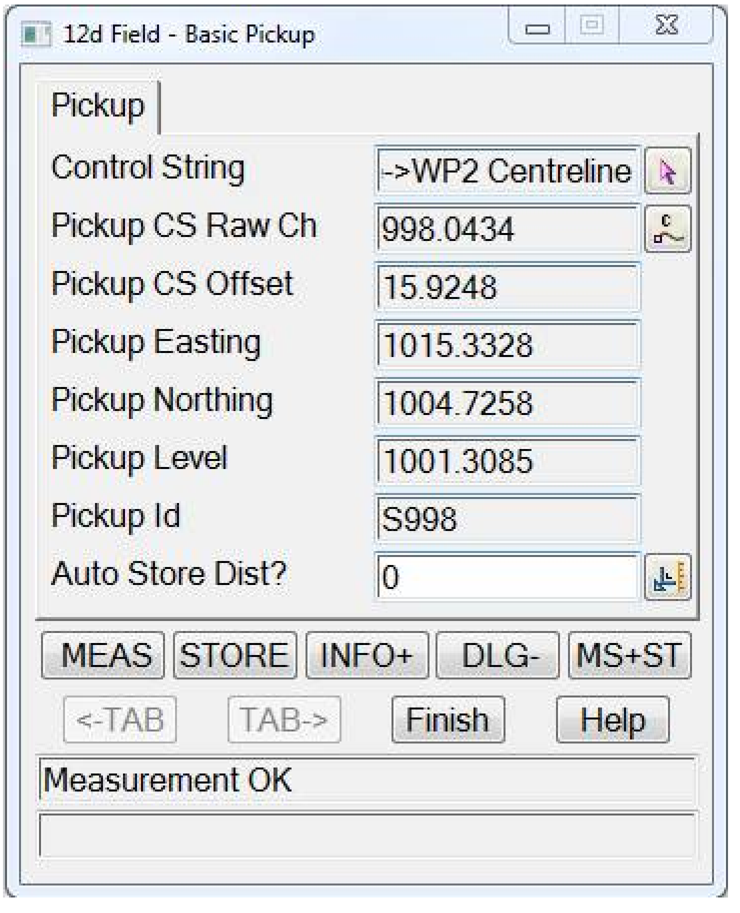
Field Description	Type	Defaults	Pop-Up
Navigation Box	draw box		

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.3 12d Field -Basic Pickup or return to 18.2 12d Field .

18.2.1.8.3 12d Field -Basic Pickup

The **12d Field - Basic Pickup** panel enables the user to pickup and store points. Basic Pickup is only for points and simple lines, it has no edit facilities, recalculations for target height corrections etc.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Control String 12dF string select box

If selected the chainage and offset of the current point on this string will be displayed.

Pickup CS Raw Ch 12dF chainage box

The raw/non equality chainage of the current point on the control string.

Pickup CS Offset 12dF double box

The offset of the current point from the control string, +ve is right

Pickup Easting 12dF double box

The measured easting.

Pickup Northing 12dF double box

The measured northing.

Pickup Level 12dF double box

The measured level.

Pickup Id 12dF input box

The Id of the measured point, the behaviour of the Id is controlled from the 18.2.1.6.1 Store Point Setup *panel.*

Auto Store Dist? 12dF double box

If non zero the distance between shots to automatically store points, the measurement mode must be continuous.

Please see 18.2.1.8 Common Measurement Buttons for information on the buttons.

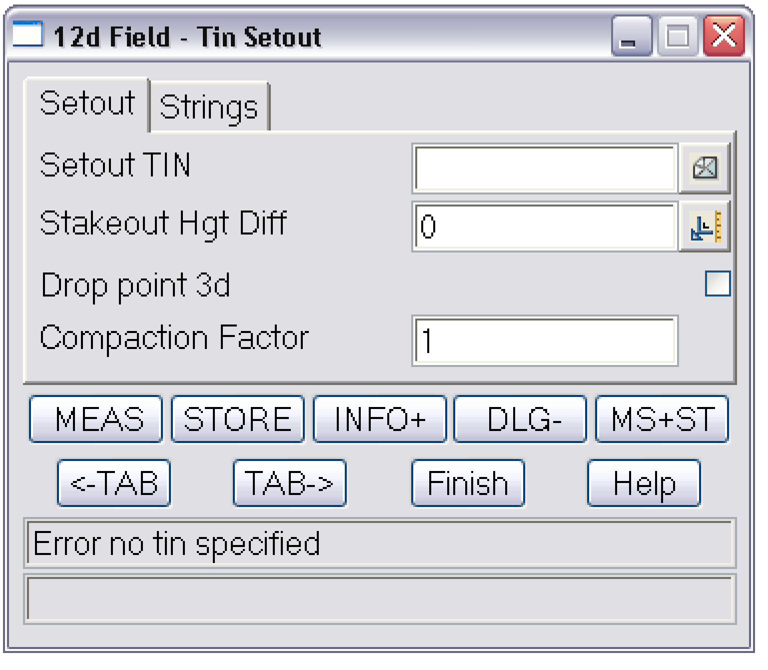
Continue to next section 18.2.1.8.4 Tin Setout or return to 18.2 12d Field .

18.2.1.8.4 Tin Setout

The **12d Field - Tin Setout** panel is used when the user needs to get design levels from a tin.

The point can be dropped either vertically to the tin or 3d/normal to the tin.

Selecting the **Tin Setout** option brings up the **12d Field - Tin Setout** panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Setout TIN	12dF tin box		

The TIN to use for setting out

Stakeout Hgt Diff 12dF double box

The height diff from the setout surface/string. +ve is above.

Drop point 3d named tick box

When this is toggled on the point is dropped normal to the tin.

In the event the point cannot be dropped to triangle face it will try drop to the edge of a triangle that lies inside the 2d boundary of the tin.

Compaction Factor 12dF double box

A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel).

Buttons

MEAS button

Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

STOP button

Stop the measurement in process.

STORE button

Store the last measured point.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

Start a measurement with a touch on the screen, store it on completion.

READ button

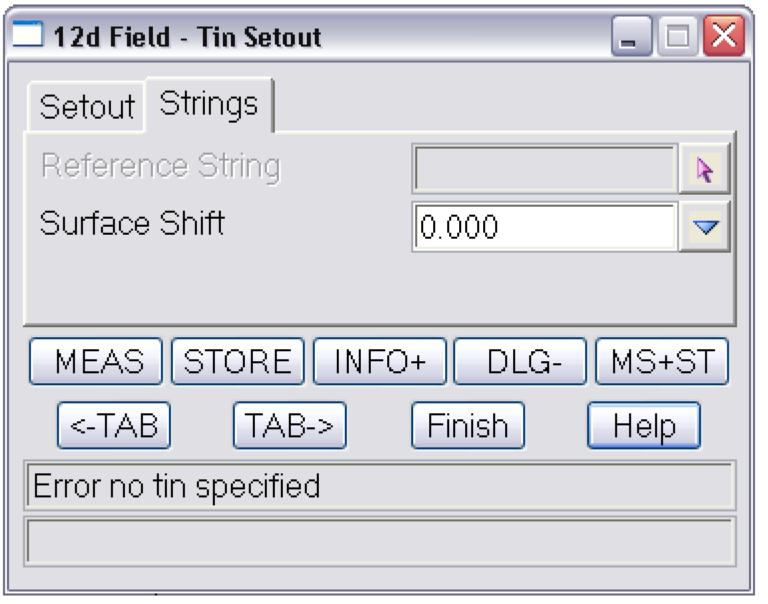
Load previously saved setout settings for reuse.

SAVE button

Save the current setout settings for reuse at a later date.

INFO- button

Close the user configurable information panel.



Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Reference String	12dF string select box		

Reference string, a string to which the current point is dropped normally to for information only.

Surface Shift	choice box		0.000

*A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in "**TDF_SURFACE_SHIFTS.4D**")*

Continue to next section 18.2.1.8.5 Crossfall Setout or return to 18.2 12d Field .

18.2.1.8.5 Crossfall Setout

The **12d Field** - **Crossfall Setout** panel is used when the user wants to generate their design height by cutting 2 strings and projecting the plane of the cuts to their position.

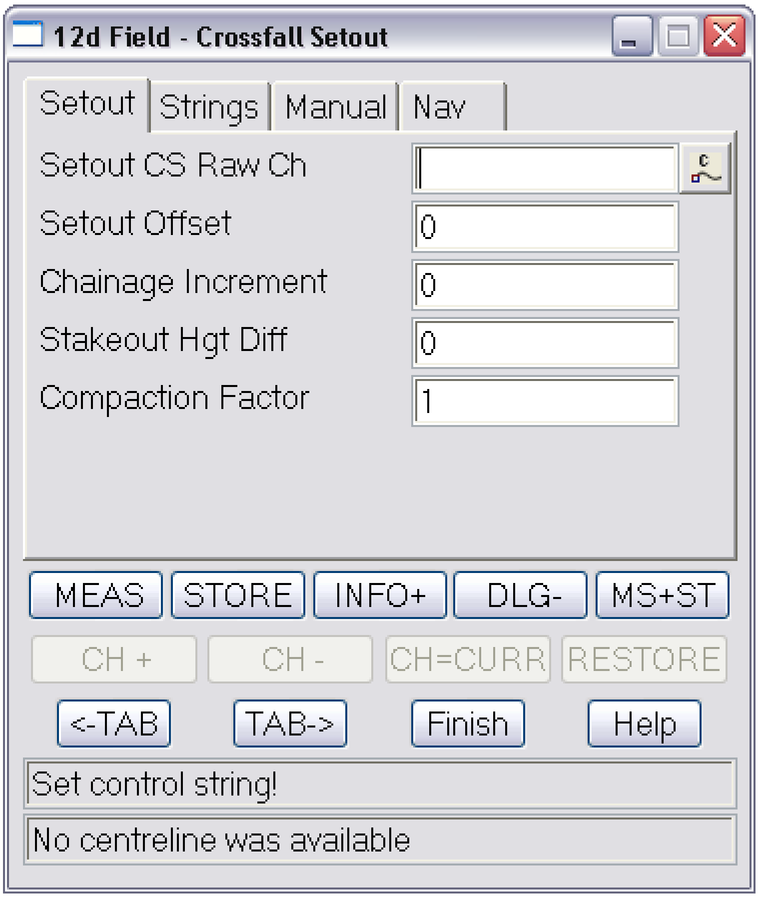
The user is able to set a shift to move the design surface up or down once the strings are cut.

There are manual modes available of setting the design crossfall when 2 strings are not able to be cut.

Crossfall Setout works by dropping a point to a nominated control string, then a setout string and the 2 strings used to determine the crossfall are cut normal to the dropped point on the control string.

Note the control string, the setout string and 1 of the level strings could be the same string or all different, this dependant on the task being performed.

Selecting the **Crossfall Setout** option brings up the **12d Field** - **Crossfall Setout** panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Setout CS Raw Ch	12dF chainage box		

The raw, no equalities setout chainage on the control string, start chainage plus distance along string

Setout Offset 12dF double box

The offset from the setout string to setout, +ve is to the right of the string, -ve left

Chainage Increment 12dF double box

Chainage Increment

Stakeout Hgt Diff 12dF double box

The height diff from the setout surface/string. +ve is above.

Compaction Factor 12dF double box

*A **Compaction Factor** applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel).*

Buttons

MEAS button

Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

CH + button

Increment the setout chainage by the value in the chainage increment field.

CH - button

Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button

Set the setout chainage to the chainage of the last measured point.

RESTORE button

*Restore the setout chainage to the chainage prior to the "**CH=CURR**" button being pressed.*

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

STORE button

Store the last measured point.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

Start a measurement with a touch on the screen, store it on completion.

READ button

Load previously saved setout settings for reuse.

SAVE button

Save the current setout settings for reuse at a later date.

DLG+ button

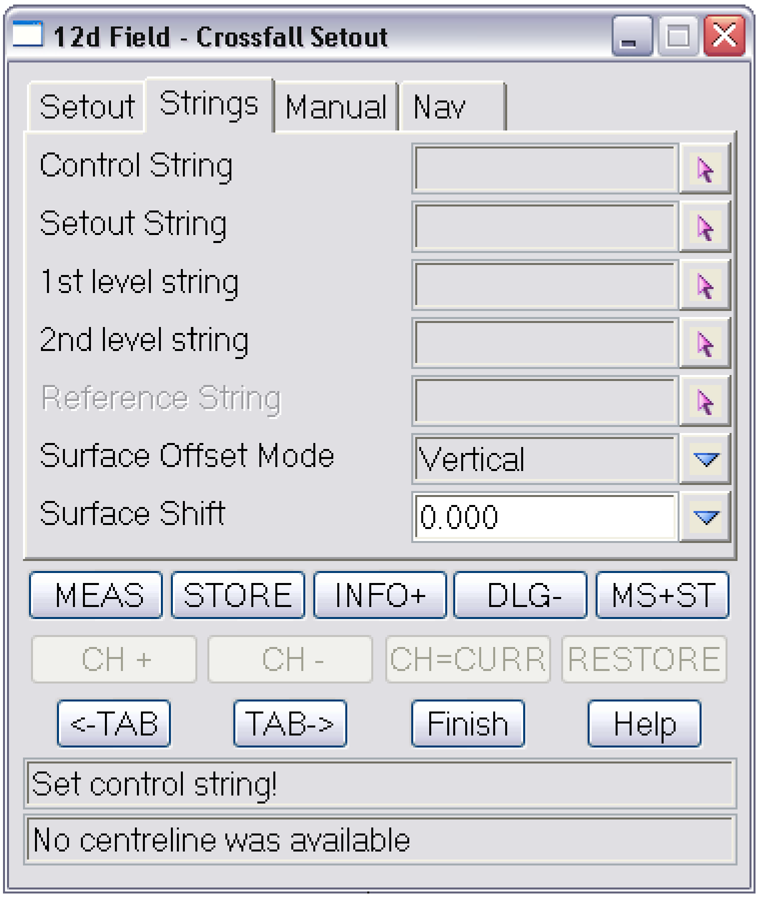
Restore a minimised panel to it's full size.

INFO- button

Close the user configurable information panel.

STOP button

Stop the measurement in process.



Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Control String | 12dF string select box

Control string, the string to which the other strings are cut normal to for calculations.

Setout String | 12dF string select box

Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centreline

1st level string | 12dF string select box

Level string 1, the string cut for one of the design heights.

2nd level string | 12dF string select box

Level string 2, the string cut for a 2nd design height.

Reference String | 12dF string select box

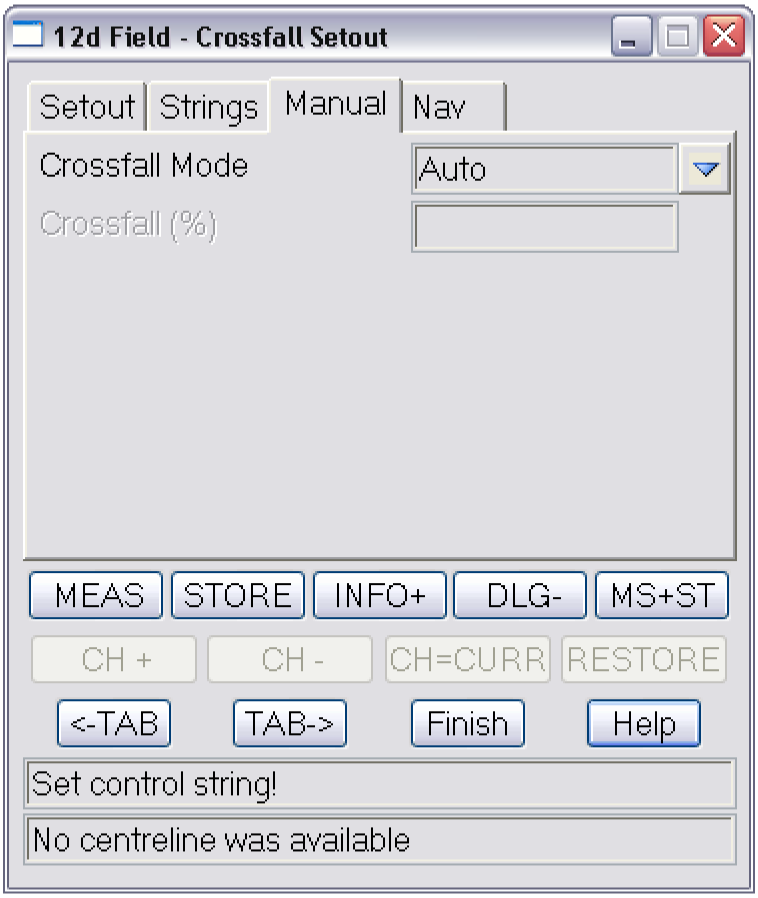
Reference string, a string to which the current point is dropped normally to for information only.

Surface Offset Mode | choice box | Vertical, Normal

Whether the offset to the surface is normal or vertical
***Vertical**: The height offset is applied vertically to the design surface.*
***Normal**: The height offset is applied normal/perpendicular to the design surface.*

Surface Shift | choice box

*A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in "**TDF_SURFACE_SHIFTS.4D**").*



Manual Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Crossfall Mode	choice box		Auto, Centreline, string & x-fall, Manual, use current x-fall

The method used to generate the design crossfall

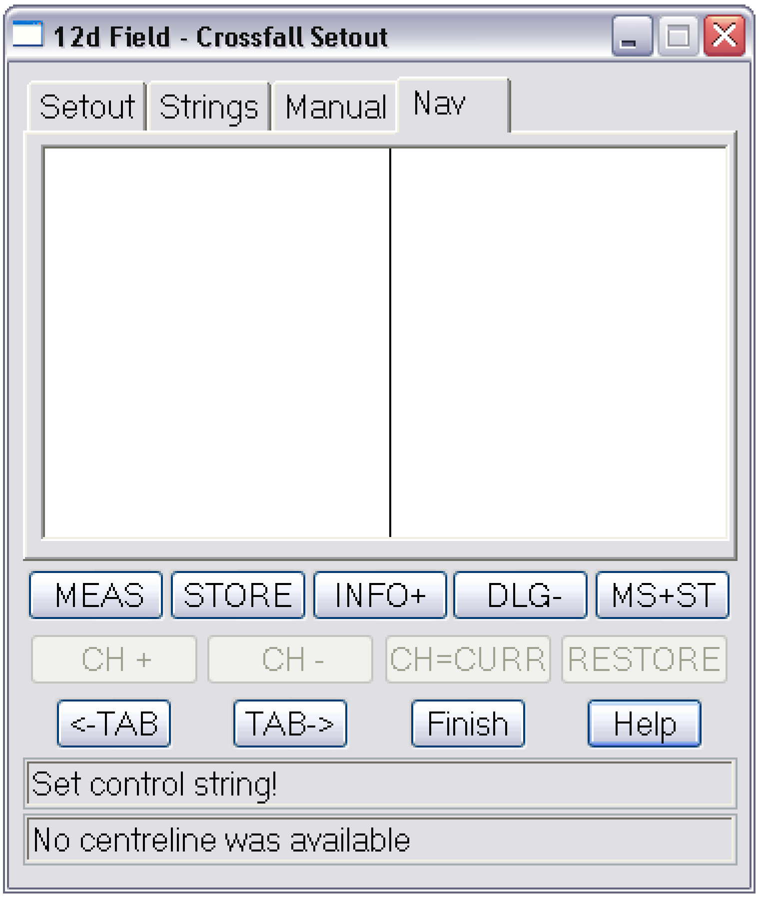
Auto: *The crossfall is calculated by cutting the 1st and 2nd strings.*

Centreline, string & x-fall: *The crossfall is entered manually, only the 1st string is cut and the crossfall projected from this.*

Manual, use current x-fall: *The crossfall is entered manually defaulting to last calculated crossfall, only the 1st string is cut and the crossfall projected from this.*

Crossfall (%)	12dF double box		

The manual crossfall entered by the user in the crossfall setout routine



Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Navigation Box	draw box		

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.6 Point Setout or return to 18.2 12d Field .

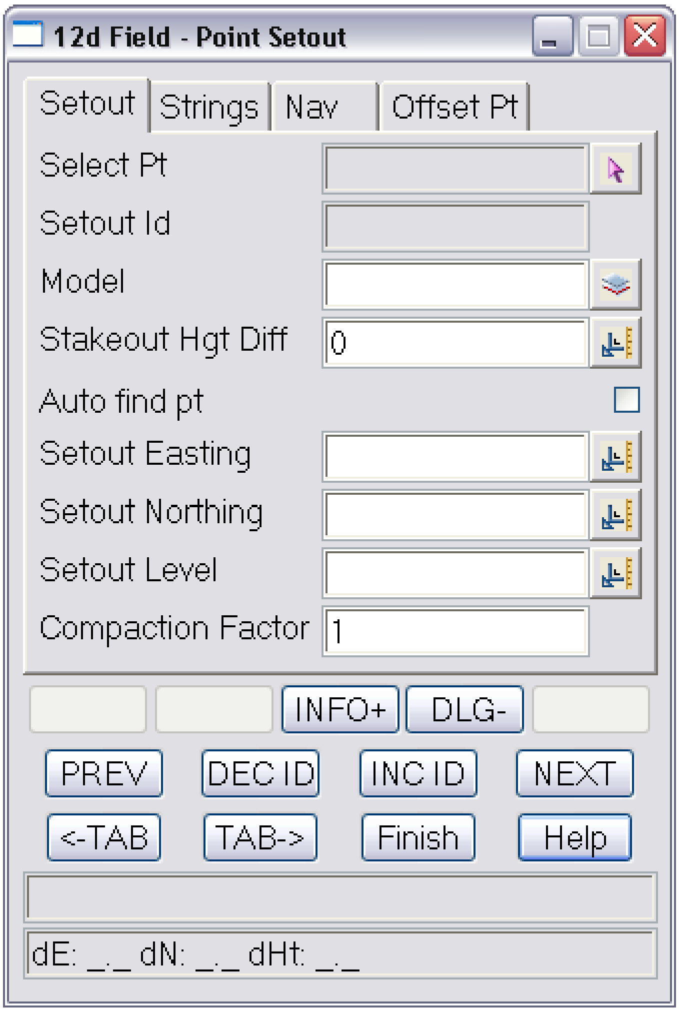
18.2.1.8.6 Point Setout

The **12d Field - Point Setout** panel enables the user to setout individual points, optionally referenced to a control string.

The point can be either selected from a view, be found automatically or be manually entered.

The panel also allows the offsetting of the point by a defined bearing and distance.

Selecting the **Point Setout** option brings up the **12d Field - Point Setout** panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Point Selection

The point can be picked from a view, in this case the Id and Model boxes will be automatically filled out.

The point id can be manually changed but in this case must be unique in the model.

If auto find is on the point will be set to the closest point in the setout model to the current position in the field

Select Pt 12dF new select box

Select the point to setout, will update the Point Id and Model boxes

Setout Id 12dF input box

The id/name of the setout point.

Model model box

The model containing the setout point.

Stakeout Hgt Diff 12dF double box

The height diff from the setout surface/string. +ve is above.

Auto find pt named tick box

Auto find pt

Setout Easting, Setout Northing, Setout Level

The coordinate boxes are only added to the panel if ticked on under survey in the settings panel.

Setout Easting 12dF double box

The easting to setout.

Setout Northing 12dF double box

The northing to setout.

Setout Level 12dF double box

The height to setout.

Compaction Factor 12dF double box

A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel.)

Buttons

MEAS button

Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

NEXT button

Make the setout point the next point in the current string.

PREV button

Make the setout point the previous point in the current string.

INC ID button

Increment the point ID and make this the setout point. E.g. BOLT30 -> BOLT31

DEC ID button

Decrement the point ID and make this the setout point. E.g. BOLT31 -> BOLT30

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

STOP button

Stop the measurement in process.

STORE button

Store the last measured point.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

Start a measurement with a touch on the screen, store it on completion.

READ button

Load previously saved setout settings for reuse.

SAVE button

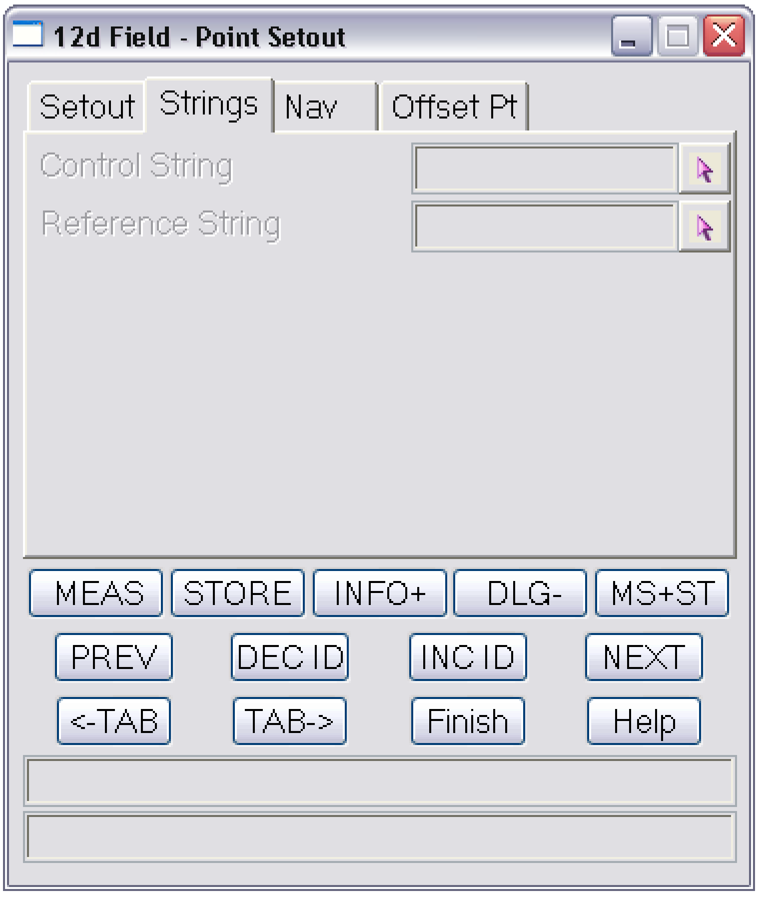
Save the current setout settings for reuse at a later date.

DLG+ button

Restore a minimised panel to it's full size.

INFO- button

Close the user configurable information panel.



Strings Tab

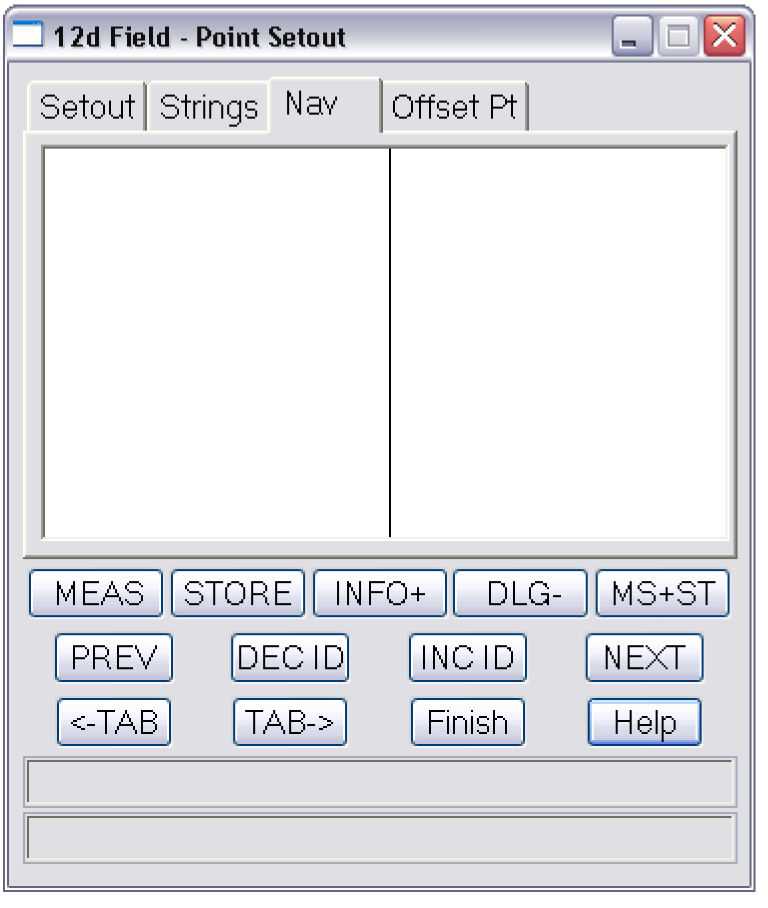
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control String	12dF new select box		

Control string, the string to which the other strings are cut normal to for calculations.

Reference String	12dF new select box		

Reference string, a string to which the current point is dropped normally to for information only.

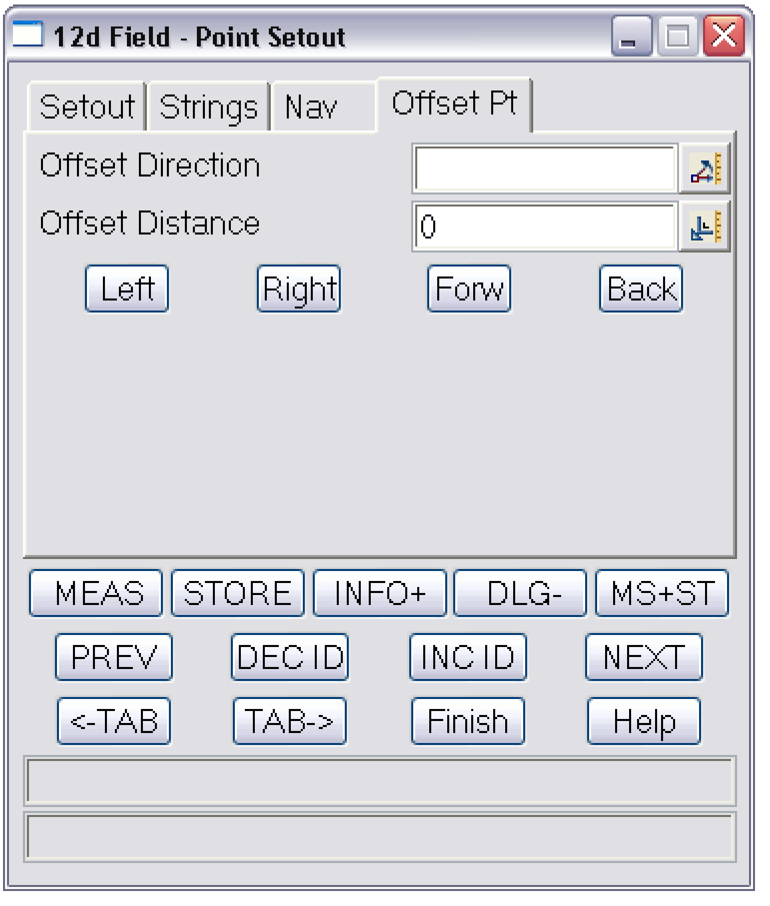


Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Navigation Box	draw box		

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.



Offset Pt Tab

The **Offset Point** tab allows the current setout point to be offset in a defined direction and distance.

For example if the offset direction was 45° and the offset distance 5m pressing Left would move the point 5m at 315°.

If a control string is nominated then when the point is originally selected it is dropped to the control string and the bearing at this point is the default for the offset direction.

For example, to place offset pegs to a drainage pit select the road centreline and then select the pit. The bearing is that of the road, enter the offset distance and press Right or Left and the point is updated.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Offset Direction	12dF angle box		

Direction to offset base point in.

Offset Distance	12dF double box		

Distance to offset base point by.

Left	button		

Offset the point by the offset distance to the left of the offset direction.

Right	button		

Offset the point by the offset distance to the right of the offset direction.

Forw button

Offset the point by the offset distance in the offset direction.

Back button

Offset the point by the offset distance against the offset direction.

Continue to next section 18.2.1.8.7 Grid Setout or return to 18.2 12d Field .

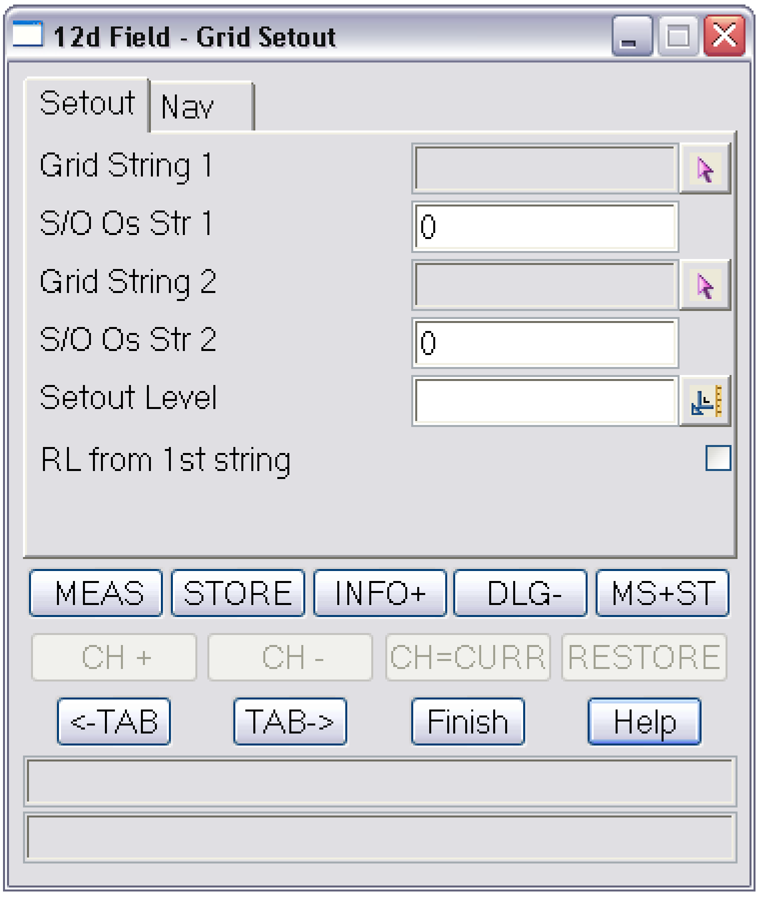
18.2.1.8.7 Grid Setout

This section of documentation is a work in progress and will be updated in subsequent releases.

The **12d Field - Grid Setout** panel creates a setout point at offsets from 2 strings.

Most typically used in buildings where points are dimensioned off setout grids

Selecting the **Grid Setout** option brings up the **12d Field - Grid Setout** panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Grid String 1 12dF new select box

The first string for grid setout

S/O Os Str 1 12dF double box

The setout offset from the first string

Grid String 2 12dF new select box

The second string for grid setout

S/O Os Str 2 12dF double box

The setout offset from the second string

Setout Level 12dF double box

The height to setout.

RL from 1st string tick box

If ticked then the level of the 1st string selected will be the setout level

Buttons

MEAS button

Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

CH + button

increment the setout chainage by the value in the chainage increment field.

CH - button

Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button

Set the setout chainage to the chainage of the last measured point.

RESTORE button

*Restore the setout chainage to the chainage prior to the "**CH=CURR**" button being pressed.*

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

STOP button

Stop the measurement in process.

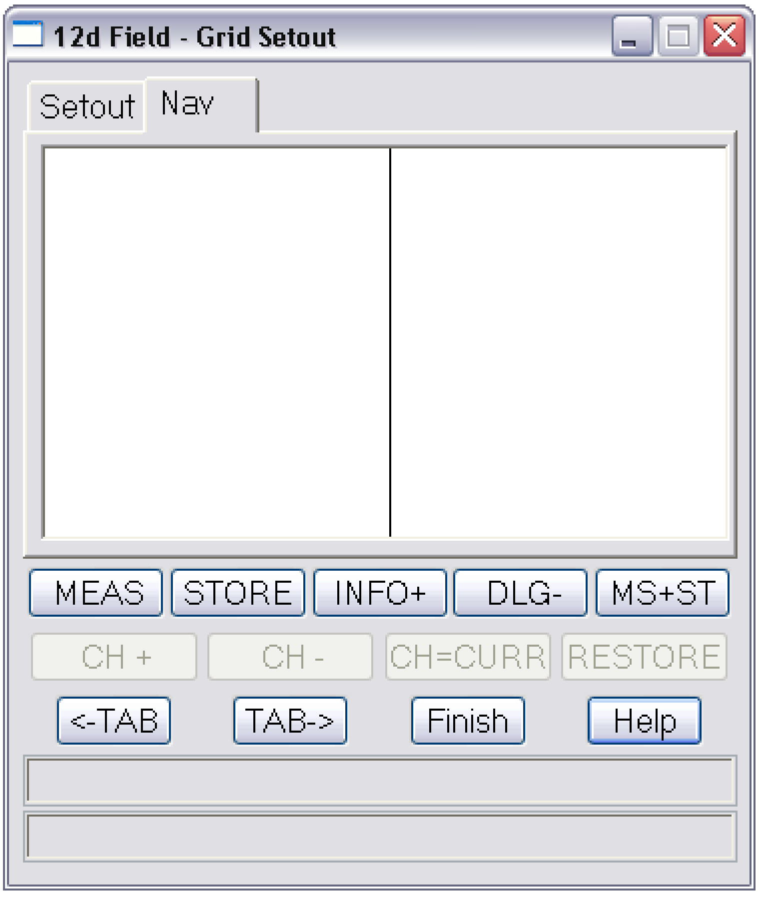
INFO- button

Close the user configurable information panel.



Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Navigation Box draw box

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.8 Crown Setout or return to 18.2 12d Field .

18.2.1.8.8 Crown Setout

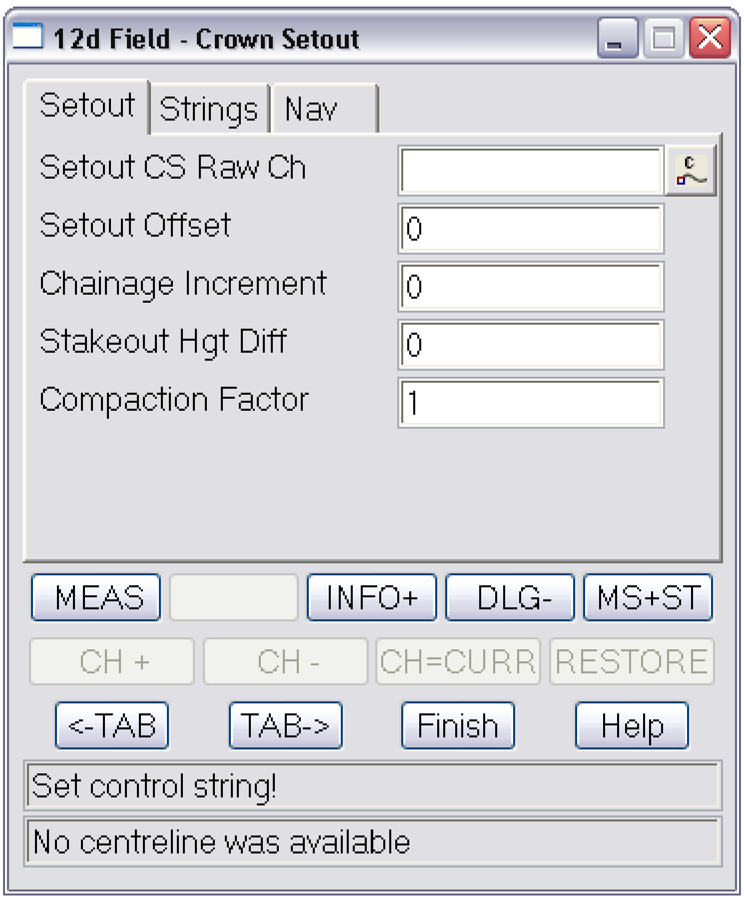
The **12d Field - Crown Setout** panel is effectively 2 **12d Field - Crossfall Setout** panels. It is typically used on rural roads when the user wants to generate design heights to both sides of the crowned road.

Crown setout works by dropping a point to a nominated control string, then the setout string and the 3 strings used to determine the crown are cut normal to the dropped point on the control string.

The user is able to set a shift to move the design surface up or down once the strings are cut.

Note the setout string and 1 of the level strings could be the same string or different, this dependant on the task being performed.

Selecting the **Crown Setout** option brings up the **12d Field - Crown Setout** panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Setout CS Raw Ch	12dF chainage box		

The raw, no equalities setout chainage on the control string, start chainage plus distance along string

Setout Offset	12dF double box		

The offset from the setout string to setout, +ve is to the right of the string, -ve left

Chainage Increment	12dF double box		

The value the setout chainage will be changed by when chainage increment/decrement is called.

Stakeout Hgt Diff 12dF double box

The height diff from the setout surface/string. +ve is above.

Compaction Factor 12dF double box

A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel.)

Buttons

MEAS button

*Start a measurement, the behaviour is determined by the **TPS/GPS** measurement setting set from the control bar.*

Start a measurement and store it on completion.

CH + button

Increment the setout chainage by the value in the chainage increment field.

CH - button

Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button

Set the setout chainage to the chainage of the last measured point.

RESTORE button

*Restore the setout chainage to the chainage prior to the "**CH=CURR**" button being pressed.*

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

STOP button

Stop the measurement in process.

STORE button

Store the last measured point.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

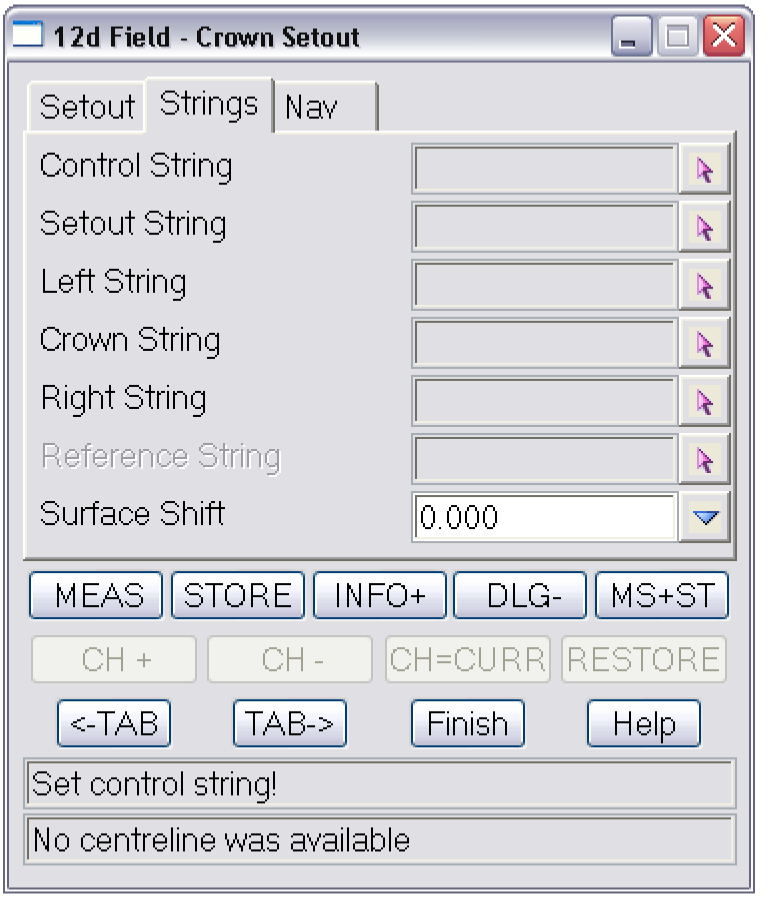
Start a measurement with a touch on the screen, store it on completion.

READ button

Load previously saved setout settings for reuse.

SAVE button

Save the current setout settings for reuse at a later date.



Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Control String 12dF new select box

Control string, the string to which the other strings are cut normal to for calculations.

Setout String 12dF new select box

Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centreline

1st Level String 12dF new select box

Level string 1, a string cut for one of the design heights.

Crown String 12dF new select box

Crown string, the middle string for design heights in crown setout

2nd Level String 12dF new select box

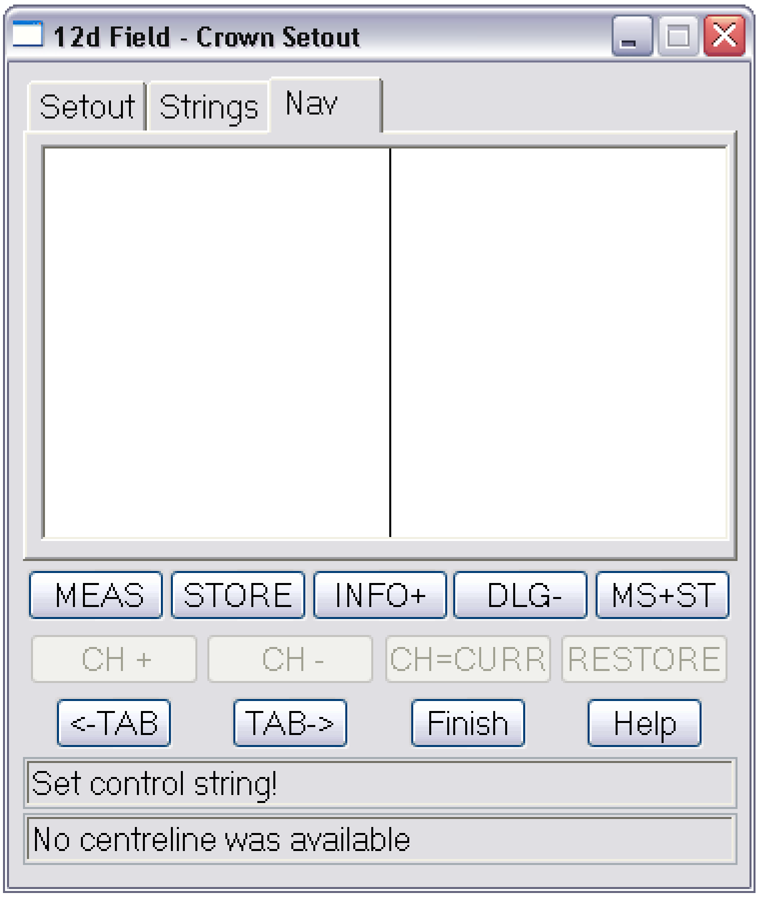
Level string 2, the string cut for a 2nd design height.

Reference String 12dF new select box

Reference string, a string to which the current point is dropped normally to for information only.

Surface Shift choice box 0.0000

*A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in "**TDF_SURFACE_SHIFTS.4D**")*



Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Navigation Box draw box

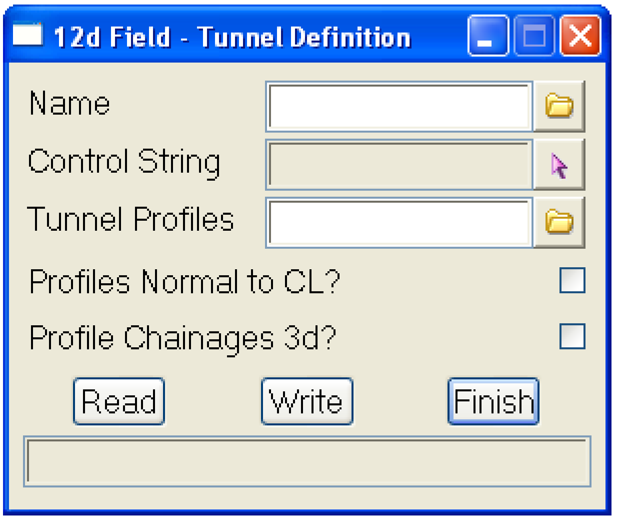
The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.9 Tunnel Definition or return to 18.2 12d Field .

18.2.1.8.9 Tunnel Definition

The **Tunnel Definition** panel combines a centreline, the **PRO/PRA** tunnel definition files and information on how the profiles are applied to the centreline into a single file for use by the **Tunnel Setout** panel.

For more information on **PRO/PRA** tunnel definition files please see 20.12.10 Definition of the PRO and PRA definition files



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Name

*The name of the tunnel, this a file with the extension **12dF_TUN_DEF.***

Control string

*The centreline the tunnel definitions are applied to, the centreline must have valid vertical geometry for the chainage ranges in the **PRA** file.*

Tunnel Profiles

*The **PRO/PRA** files containing the tunnel definition. For more information on **PRO/PRA** tunnel definition files please see* 20.12.10 Definition of the PRO and PRA definition files

Profiles Normal to CL? tick box

if ticked the tunnel is calculated perpendicular/normal to the vertical alignment of the centreline resulting in a true 3d model.

if not ticked the tunnel is calculated vertical to the vertical alignment of the centreline, this means an effective loss of clearance on steeper grades.

Profile Chainages 3d? tick box

*if not ticked the chainages in the **PRA** file are taken as plan chainages.*

if ticked the chainages are interpreted as 3d, this is the plan/2d chainage of the 1st point where the horizontal and vertical geometry coincide plus the 3d length along the centreline from there.

Read button

Read in a 12dField tunnel definition file.

Write button

Write to a 12dField tunnel definition file.

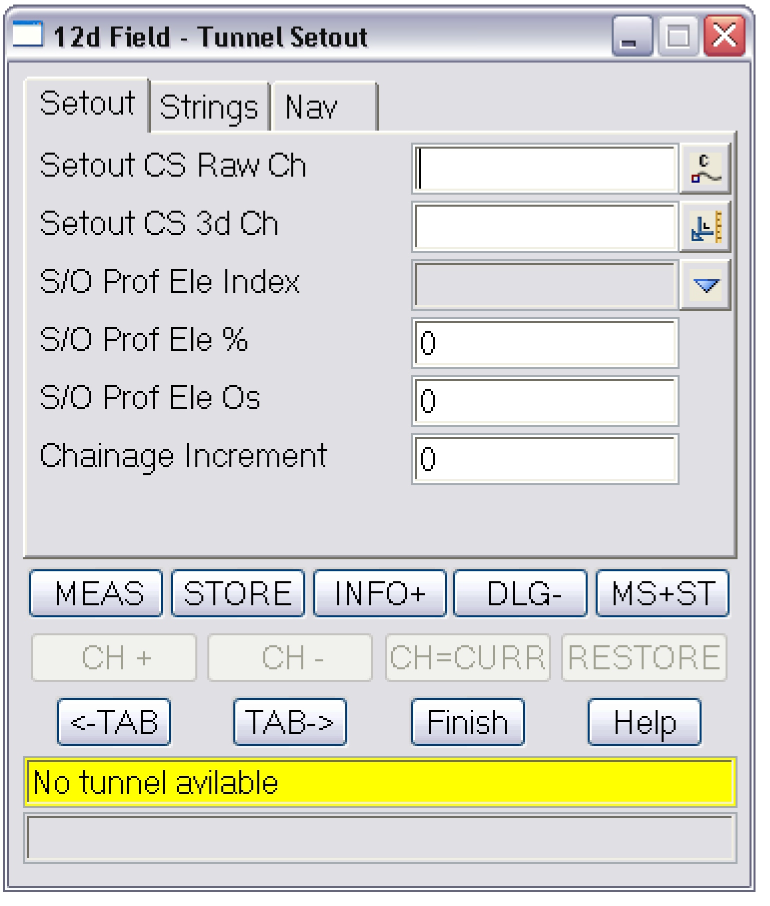
Finish

Exit the panel.

Continue to next section 18.2.1.8.10 Tunnel Setout or return to 18.2 12d Field .

18.2.1.8.10 Tunnel Setout

The **Tunnel Setout** option, (available in TPS only) allows the user to locate and setout points on a tunnel previously defined in the 18.2.1.8.9 Tunnel Definition panel.



Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Setout CS Raw Ch

The plan chainage of the point you wish to setout. If the tunnel chainages are defined as 3d this will be read only and be updated when a 3d chainage is entered.

Setout CS 3d Ch

The 3d chainage of the point you wish to setout. If the tunnel chainages are defined as 2d this will be read only and be updated when a 2d chainage is entered.

S/O Prof Ele Name

The name of the element in the profile to setout.

S/O Prof Ele %

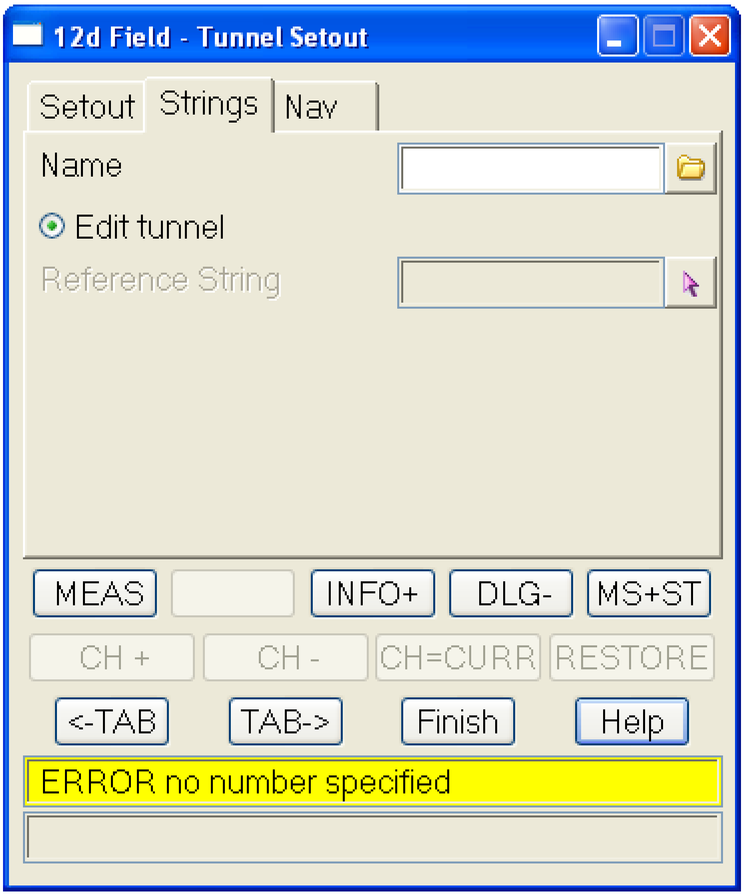
The percentage around the element to setout, 0% means the start of the element, 100% the end of the element.

S/O Prof Ele Os

The offset from the element to setout, +ve is to the right of the element.

Chainage Increment 12dF double box

The value the setout chainage will be changed by when chainage increment/decrement is called.



Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Name

Select the tunnel to setout.

Edit tunnel

If pressed will open up the 18.2.1.8.9 Tunnel Definition *panel with the currently defined tunnel, on closure of the* ***Tunnel Definition*** *panel the definition will be read in again.*

Reference String 12dF new select box

Reference string, a string to which the current point is dropped normally to for information only.

Attributes specific to tunnel setout for display on the information and navigation pages.

pu_tun_ele_name

Name of the tunnel element at the shot taken

pu_tun_ele_idx

Index, (zero based) of the tunnel element in the profile at the shot taken, 0 is the first element

pu_tun_ele_per

Percentage around the tunnel element at the shot taken.

pu_tun_ele_os

Offset from the tunnel element at the shot taken, +ve is to the right hand side.

so_tun_ele_name

Name of the tunnel element at the point setout

so_tun_ele_idx

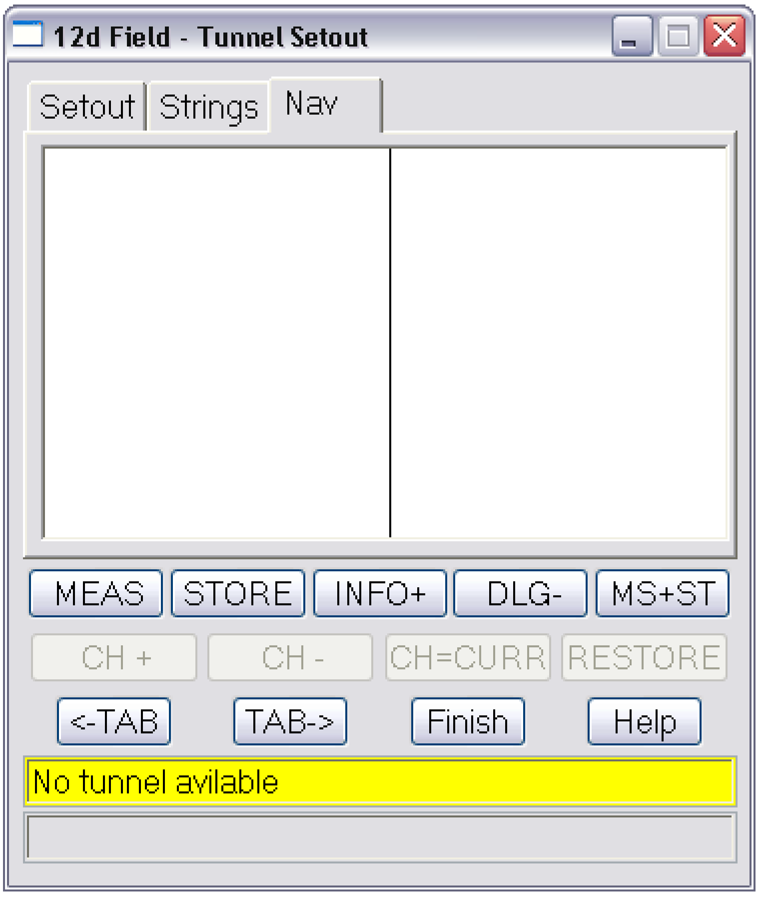
Index, (zero based) of the tunnel element in the profile at the point setout, 0 is the first element

so_tun_ele_per

Percentage around the tunnel element at the point setout.

so_tun_ele_os

Offset from the tunnel element at the point setout, +ve is to the right hand side.



Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Navigation Box	draw box		

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Continue to next section 18.2.1.8.11 Station Helmert or return to 18.2 12d Field .

18.2.1.8.11 Station Helmert

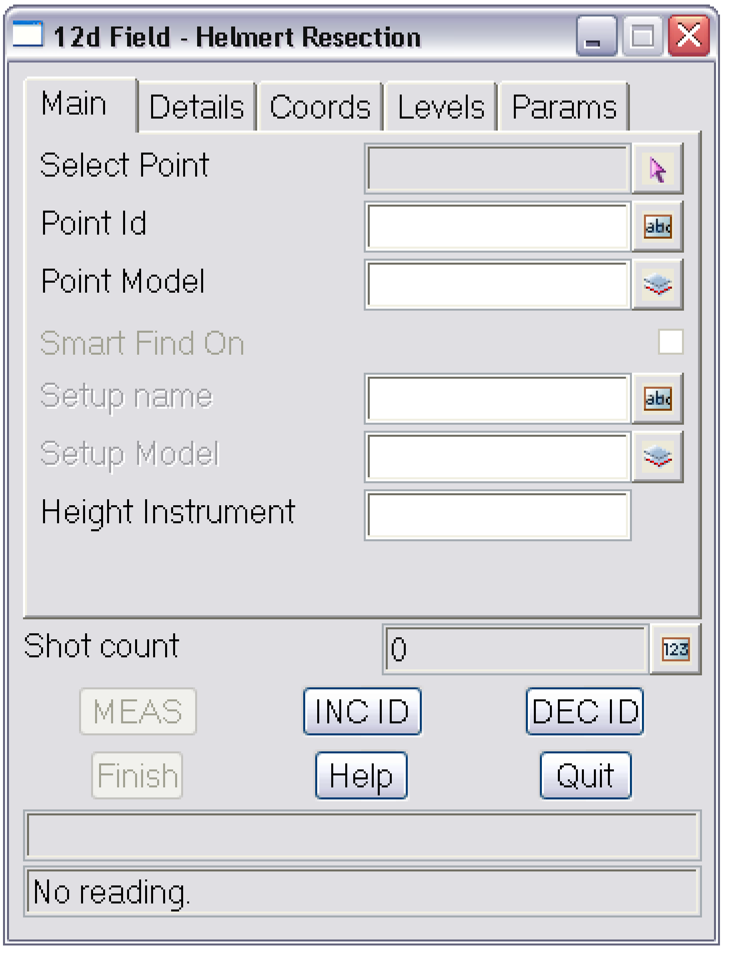
The **12d Field - Helmert Resection** panel can be used to establish a station setup by taking readings to up to 6 known points.

The horizontal position is obtained by a Helmert transformation; translation, rotation and uniform scaling of the readings.

The vertical position is obtained by meaning the z values of the readings, the z value is not weighted on distance measured.

Readings can be used for either horizontal position, vertical position or both.

Selecting **Station Helmert** displays the **12d Field - Helmert Resection** panel on the screen.



Main Tab

A point for use in the resection can either be picked from the screen or manually entered.

If picked from the screen the Id and Model boxes will be filled automatically.

If entered manually the Id must be unique in the point model.

Note in 12dField the Id always refers to the Vertex Id.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select Point	string select box		

Select the point for the next shot to be used in the resection

Point Id	12dF input box		

The Id/name of the target point.

Point Model model box

The model containing the point for use in the resection.

Smart Find On tick box

Smart find can be used when you can clearly identify one point in a resection, e.g. in a tunnel you can see multiple targets but only identify the one closest to you.
Smart find can be used after you have measured to the identified point.

If ticked on then after a reading to a station smart find will look through the points model to find one that the reading matches, both horizontally and vertically.

The horizontal and vertical tolerances can be set on the parameters tab.

Use smart find to identify all stations measured to automatically.

The surveyor can optionally store the resection point to a model if need be.

Setup name input box

The Id of the setup to be stored.

Setup Model model box

The model to store the setup to.

Height Instrument 12dF double box

The height of the instrument above the setup point.

Buttons

MEAS button

Take a measurement to a station.

INC ID button

Increment the point ID and make this the setout point. E.g. BOLT30 -> BOLT31

DEC ID button

Decrement the point ID and make this the setout point. E.g. BOLT31 -> BOLT30

Shot Count

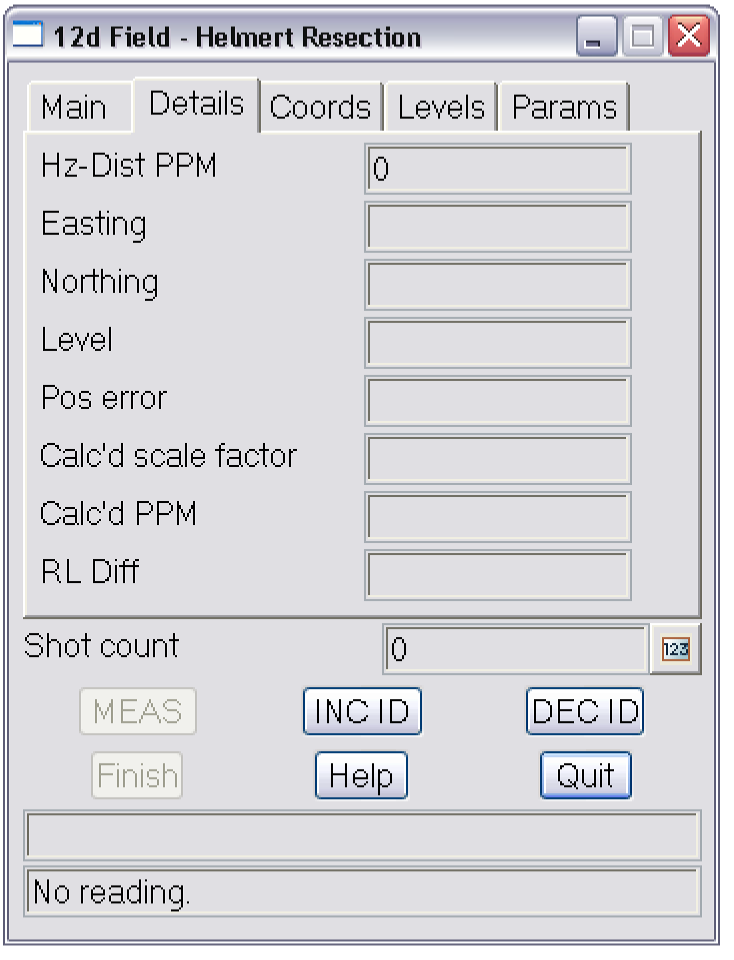
Number of shot used so far in the resection.

Finish button

Leave the panel and make this the new station setup, if any of the position tolerances nominated on the parameters tab are exceeded you will get a warning box allowing you to re-enter or continue.

Quit button

Quit the resection and restore the previous station setup.



Details Tab

The details tab displays the overall details of the current setup.

The level of detail is different for 2 and 3+ shots where redundancies in the helmert calcs are available. For 3+ shot the estimation error can be displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Hz-Dist PPM	12dF long box		

The scale factor to be applied to measured horizontal distances.

Easting	double box		

The calculated easting of the station setup.

Northing	double box		

The calculated northing of the station setup.

Level	double box		

The calculated level of the station setup.

Pos error	double box		

The estimated horizontal error in the station setup.

Calc'd scale factor	double box		

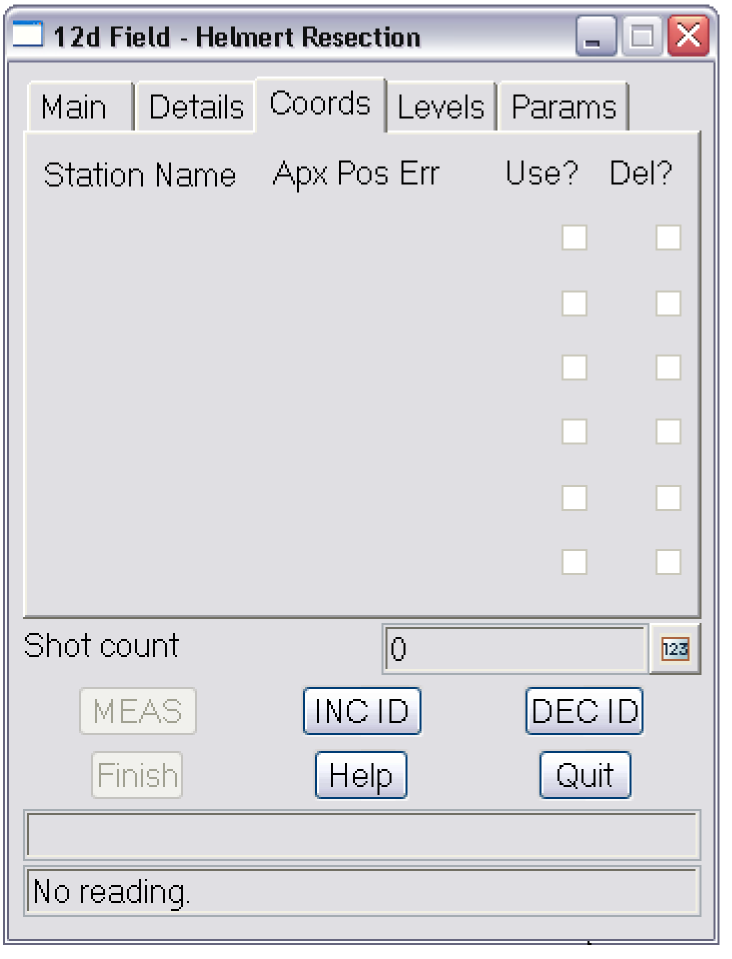
The scale factor applied to the measurements to get the best fit.

Calc'd PPM double box

The scale factor in ppm applied to the measurements to get the best fit.

RL Diff double box

The height difference range between the readings.



Coords Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Station Name

The name of the station this reading refers to.

Apx Pos Err

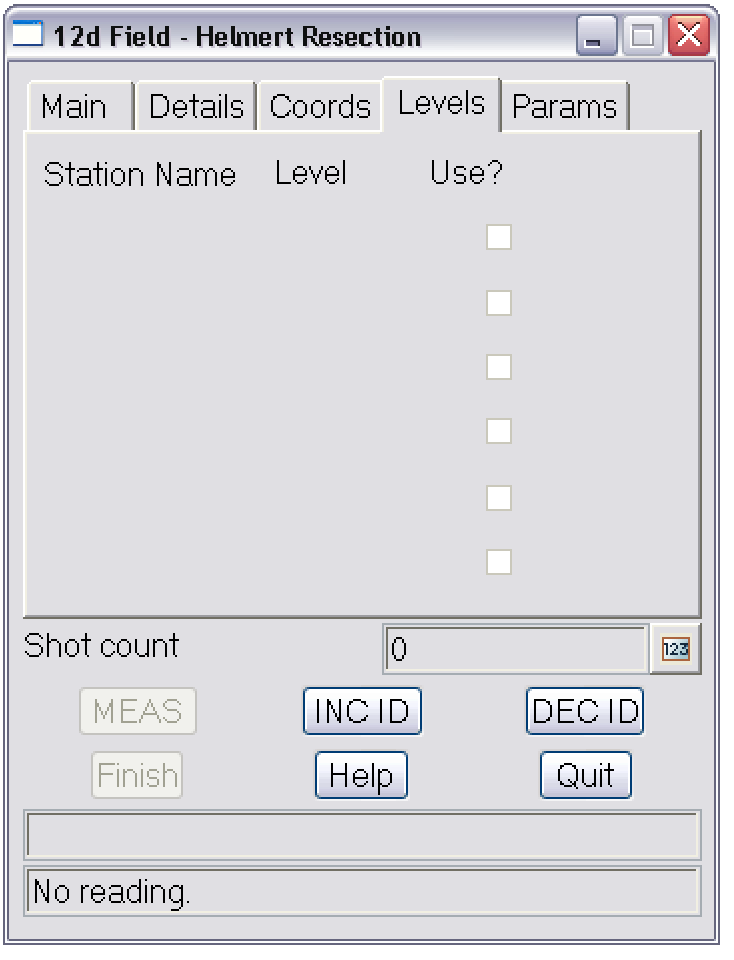
The approximate horizontal position error of this reading calculated in conjunction with all other readings in use. A high error for this reading in comparison to others might indicate a problem with this reading.

Use? tick box

if ticked this reading will be used in the horizontal calculation. Ticking or unticking the box will trigger the recalculation of the horizontal position.

Del? tick box

If ticked a confirmation box will be displayed and the reading removed from the resection. Removal will trigger the recalculation of the horizontal position.



Levels Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Station Name

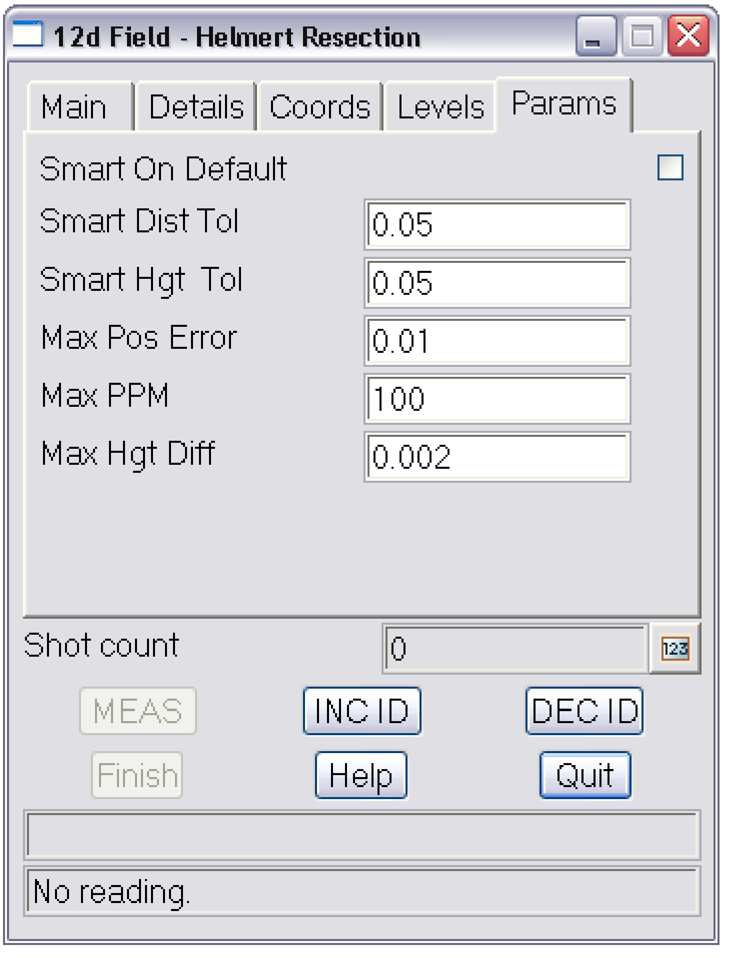
The name of the station this reading refers to.

Level

The level of the station calculated by this reading. A large difference for this reading in comparison to others might indicate a problem with this reading.

Use? tick box

If ticked this reading will be used in the vertical calculation. Ticking or unticking the box will trigger the recalculation of the vertical position.



Params Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Smart On Default tick box

The smart find feature is ticked on by default

Smart Dist Tol 12dF double box

The distance tolerance for a point to be used in the smart find

Smart Hgt Tol 12dF double box

The level tolerance for a point to be used in the smart find

Max Pos Error 12dF double box

The maximum position error allowed, a warning will be shown if exceeded.

Max PPM 12dF double box

The maximum ppm's allowed, a warning will be shown if exceeded.

Max Hgt Diff 12dF double box

The maximum height variation allowed, a warning will be shown if exceeded.

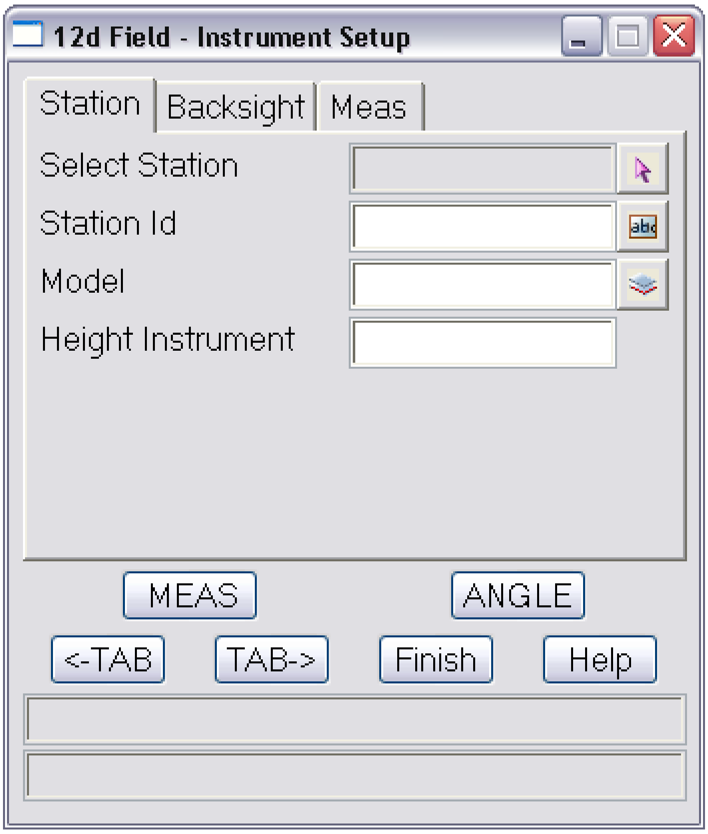
Continue to next section 18.2.1.8.12 Station Standard or return to 18.2 12d Field .

18.2.1.8.12 Station Standard

The **12d Field - Instrument Setup** panel is used to establish a station setup over a known point.

Orientation is established by measuring/sighting a backsight station. It is not necessary to set an orientation on the instrument, 12dField handles the angle difference internally.

Selecting the **Station Standard** option brings up the **12d Field - Instrument Setup** panel.



Station Tab

The point for use in the setup can either be picked from the screen or manually entered.

If picked from the screen the Id and Model boxes will be filled automatically.

If entered manually the Id must be unique in the point model.

Note in 12dField the Id always refers to the Vertex Id.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select Station	string select box		

Select the control station you are setting up over.

Station Id	12dF input box		

The Id/name of the instrument setup.

Model	model box		

The model containing the instrument station.

Height Instrument	12dF double box		

The height of the instrument above the setup point.

Buttons

MEAS button

Start a full measurement, distance and angles.

ANGLE button

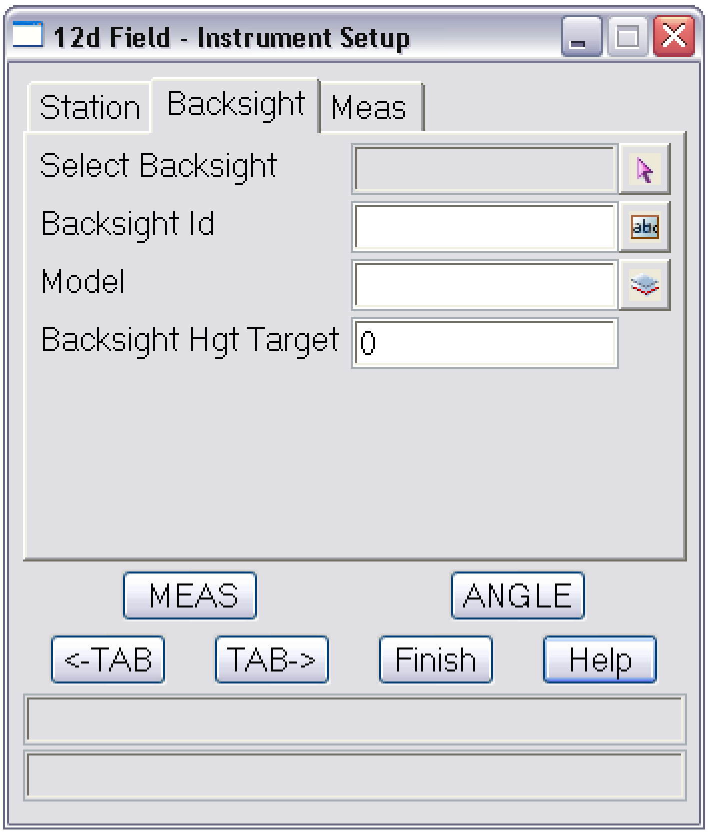
Start a horizontal/vertical angular measurement, no distance.

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.



Backsight Tab

The backsight for use in the setup can either be picked from the screen or manually entered.

If picked from the screen the Id and Model boxes will be filled automatically.

If entered manually the Id must be unique in the point model.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Select Backsight string select box

Select the point to be used for the backsight.

Backsight Id 12dF input box

The Id/name of the backsight point.

Backsight Hgt Target 12dF double box

The height of the backsight target above the backsight point.

Meas Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

BkSt Diff Horz Dist 12dF double box

Measured difference in horizontal distance to the backsight point.

BkSt Diff Meas East 12dF double box

Measured difference in easting to the backsight point.

BkSt Diff Meas North 12dF double box

Measured difference in northing to the backsight point.

BkSt Diff Meas Hgt 12dF double box

Measured difference in height to the backsight point.

Bearing Swing 12dF angle box

A bearing swing applied to the instrument reading to get the correct grid bearing.

Max Diff Horz Dist 12dF double box

Difference in horizontal distance that brings up a warning message.

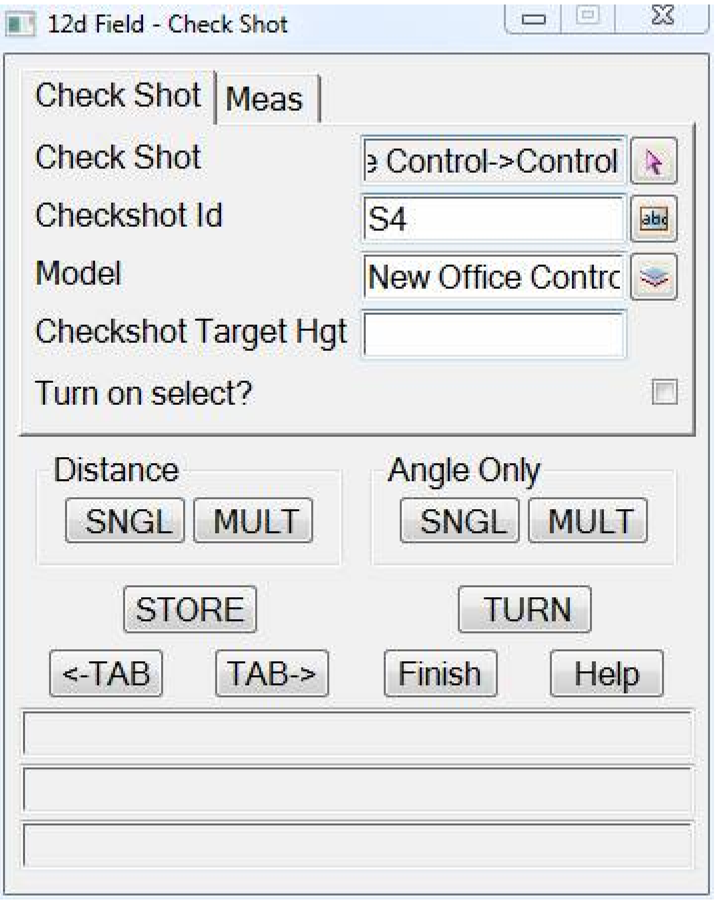
Max Diff Meas Hgt 12dF double box

Difference in height that brings up a warning message.

Continue to next section 18.2.1.8.13 Check Shot or return to 18.2 12d Field .

18.2.1.8.13 Check Shot

The **12d Field - Check Shot** panel allows a measurement to a known point to check the validity of the current setup. The measurement can be a full measurement or angle only.



Check Shot Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Check Shot	string select box		

select a point for the check shot measurement

Checkshot Id

the vertex id of the selected point, this can be populated from the select or manually entered.

Model	model box		

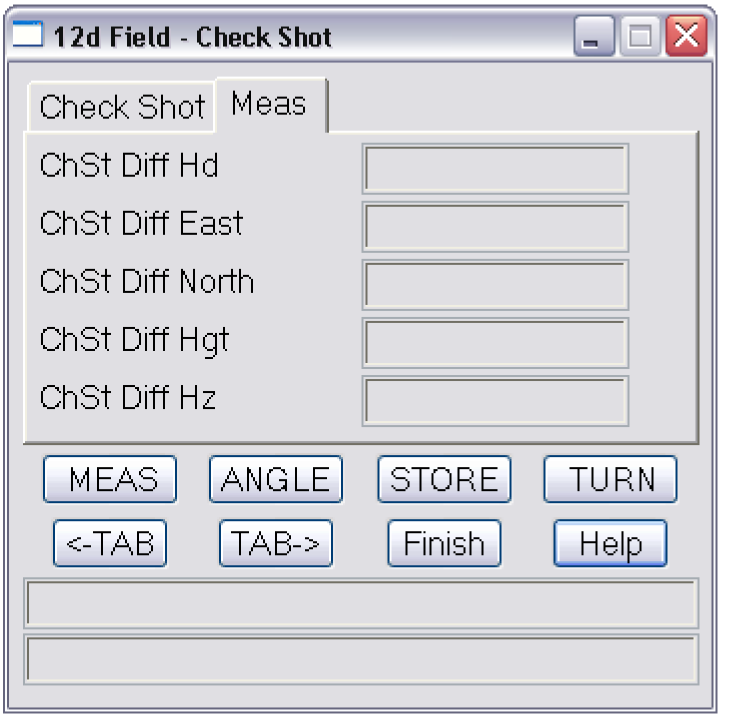
the model containing the checkshot point.

Checkshot Target Hgt

the height of target for the checkshot.

Turn on select?	tick box		

if ticked on selecting a checkshot point the instrument will rotate automatically to that point.



Meas Tab

Once a measurement is completed the focus will change to the **Meas** tab.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

ChSt Diff Hd

the difference in horizontal distance to the checkshot point, actual - observed

ChSt Diff East

the difference in eastings to the checkshot point, actual - observed

ChSt Diff North

the difference in northings to the checkshot point, actual - observed

ChSt Diff Hgt

the difference in level to the checkshot point, actual - observed

ChSt Diff Hz

the difference in horizontal angle to the checkshot point, actual - observed

Buttons

Distance

SNGL button

Take a single distance measurement to the checkshot dependent on the current TPS measurement settings

MULT button

Take a multiface distance measurement to the checkshot dependent on the current TPS measurement settings

Angle Only

SNGL button

Take a single angular measurement to the checkshot dependent on the current TPS measurement settings

MULT button

Take a multiface angular measurement to the checkshot dependent on the current TPS measurement settings

STORE button

Write the measurement to the checkshot to the current field file (.FLD), this does not store the reading to a model.

TURN button

rotate the instrument to the selected checkshot point.

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

Continue to next section 18.2.1.8.14 Position TPS or return to 18.2 12d Field .

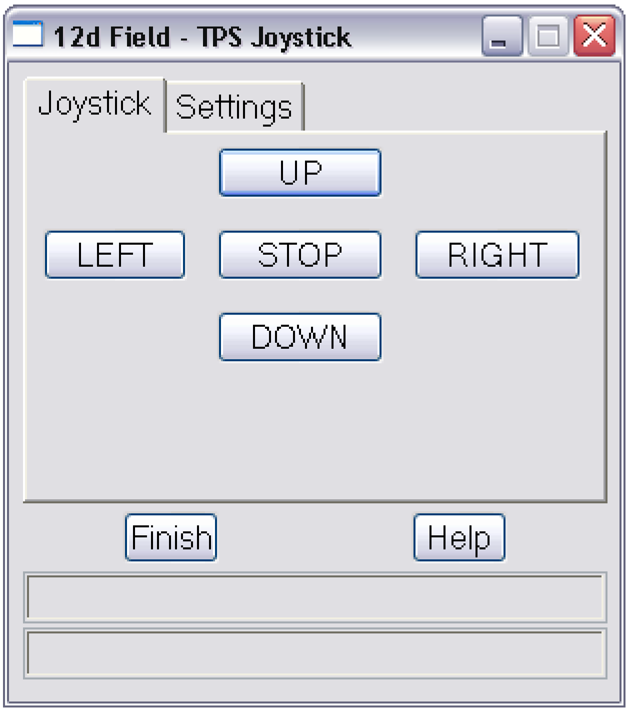
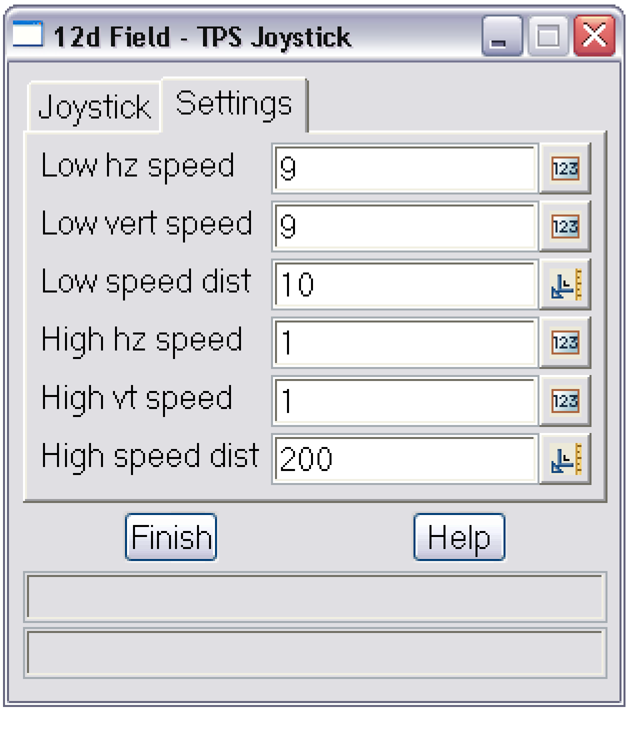
18.2.1.8.15 Joystick TPS

This section of documentation is a work in progress and will be updated in subsequent releases.

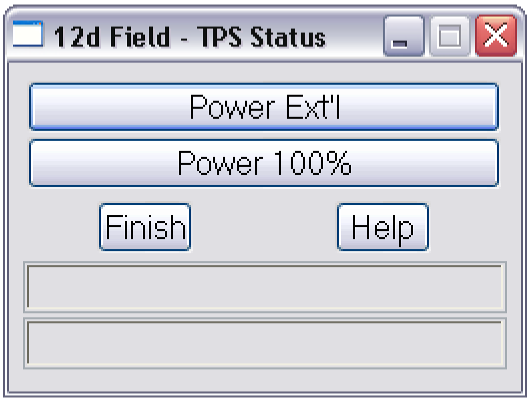




Continue to next section 18.2.1.8.16 Status TPS or return to 18.2 12d Field .

18.2.1.8.16 Status TPS

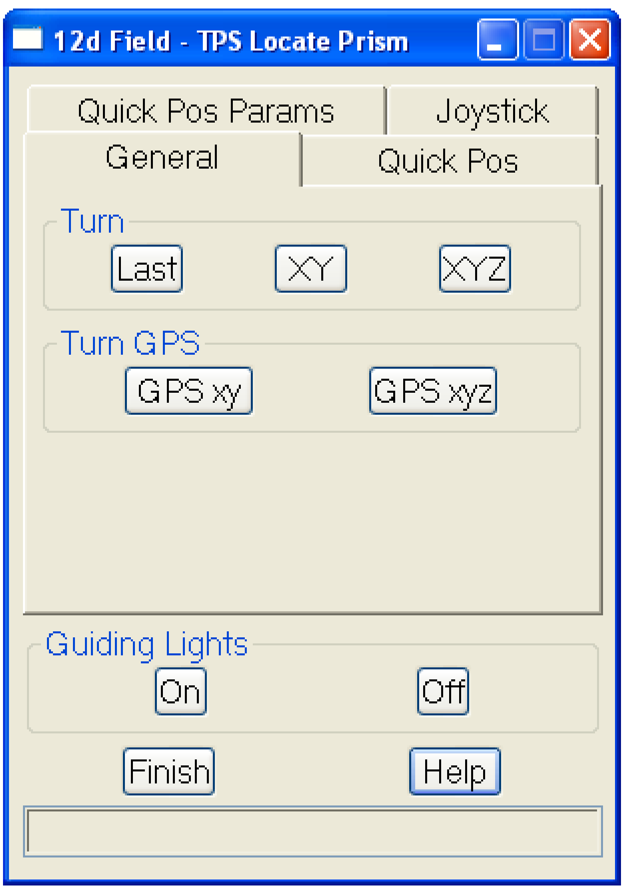
This section of documentation is a work in progress and will be updated in subsequent releases.



Continue to next section 18.2.1.8.17 Locate Prism TPS or return to 18.2 12d Field .

18.2.1.8.17 Locate Prism TPS

The **12d Field - TPS Locate Prism** panel is an aid to remotely position the TPS to the current prism location.



Common fields and buttons

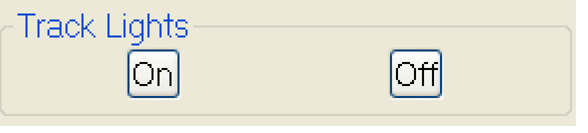
The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

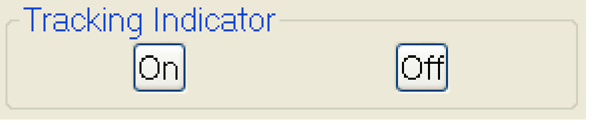
Guiding lights

The guiding lights button group is available if the TPS in use has guide lights. The naming of the guiding lights group depends on the primary instrument.

Trimble SPSx30



Topcon 9000



Leica 1200

On

Activate the instruments guiding lights.

On

Deactivate the instruments guiding lights.

General Tab

Turn

Last

The instrument will turn to the last position a measurement was taken at.

XY

A screen select will be activated and the instrument will turn horizontally only to the selected position.

XYZ

A screen select will be activated and the instrument will turn horizontally and vertically to the selected position.

Turn GPS

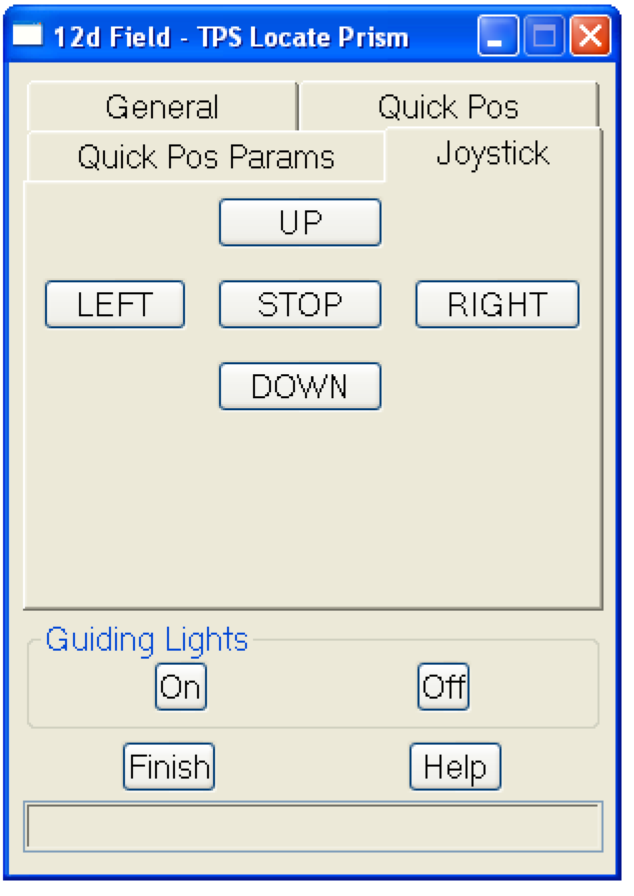
Note these buttons are only available if a GPS instrument is selected as the secondary instrument.

GPS xy

The instrument will turn horizontally only to the current GPS position.

GPS xyz

The instrument will turn horizontally and vertically to the current GPS position.



Joystick Tab

LEFT

Rotate the instrument to the left as viewed from the prism back to the instrument, ***LEFT*** *can be pressed twice more to increase the speed of rotation.*

RIGHT

Rotate the instrument to the right as viewed from the prism back to the instrument, ***RIGHT*** *can be pressed twice more to increase the speed of rotation.*

UP

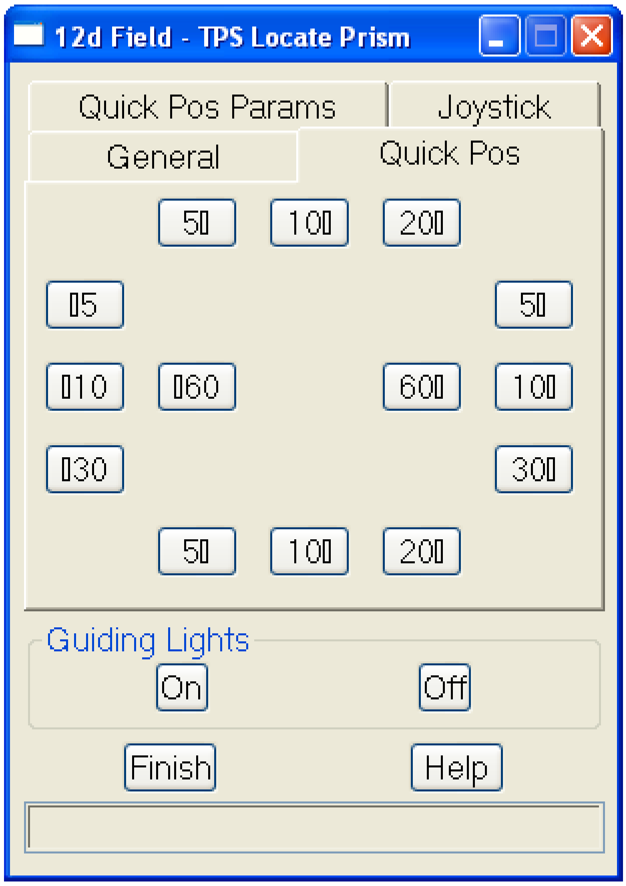
Rotate the Up, ***UP*** *can be pressed twice more to increase the speed of rotation.*

DOWN

Rotate the Down, ***DOWN*** *can be pressed twice more to increase the speed of rotation.*

STOP

Stop the instrument rotating.

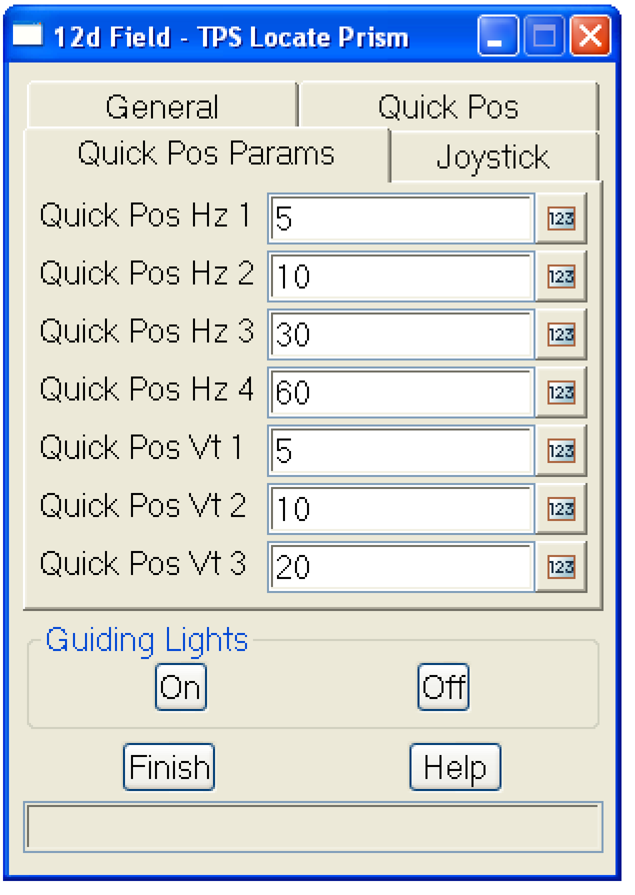


Quick Pos Tab

The **Quick Pos** tab allows the user to manually rotate the instrument in the horizontal and vertical directions by preset amounts.This is sometimes easier to use to orientate the instrument correctly than the joystick controls. There are 4 user definable rotations in the horizontal directions and 3 in the vertical.

The buttons show the direction of rotation and the amount of rotation in degrees, the amount of the rotation is defined on the Quick Pos Params Tab .

When a rotation button is pressed the instrument will rotate by a specified amount and direction, all buttons are disabled until the rotation has completed



Quick Pos Params Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

The **Quick Pos Params** define the rotation available in the Quick Pos Tab .

Quick Pos Hz 1

*the amount of rotation in degrees for the top button in the horizontal groups for **Quick Pos***

Quick Pos Hz 2

*the amount of rotation in degrees for the outer middle button in the horizontal groups for **Quick Pos***

Quick Pos Hz 3

*the amount of rotation in degrees for the lower button in the horizontal groups for **Quick Pos***

Quick Pos Hz 4

*the amount of rotation in degrees for the inner middle button in the horizontal groups for **Quick Pos***

Quick Pos Vt 1

*the amount of rotation in degrees for the left button in the vertical groups for **Quick Pos***

Quick Pos Vt 2

*the amount of rotation in degrees for the middle button in the vertical groups for **Quick Pos***

Quick Pos Vt 3

*the amount of rotation in degrees for the right button in the vertical groups for **Quick Pos***

Continue to next section 18.2.1.8.20 Reconnect or return to 18.2 12d Field .

18.2.1.8.20 Reconnect

Selecting **Reconnect** will attempt to disconnect from the current instrument and then reconnect. This may be required when the instrument has been restarted.

18.2.2 GPS Localisation

Position of option on menu: **Survey =>Field 12d=>GPS Localisation**

The panel is used to create the localisation parameters used inside 12dField for reducing GPS observations into a local system.

Points collected with 12dField as raw WGS84 cartesian coordinates can be matched with local control points to calculate the parameters to convert GPS readings directly into the local system.

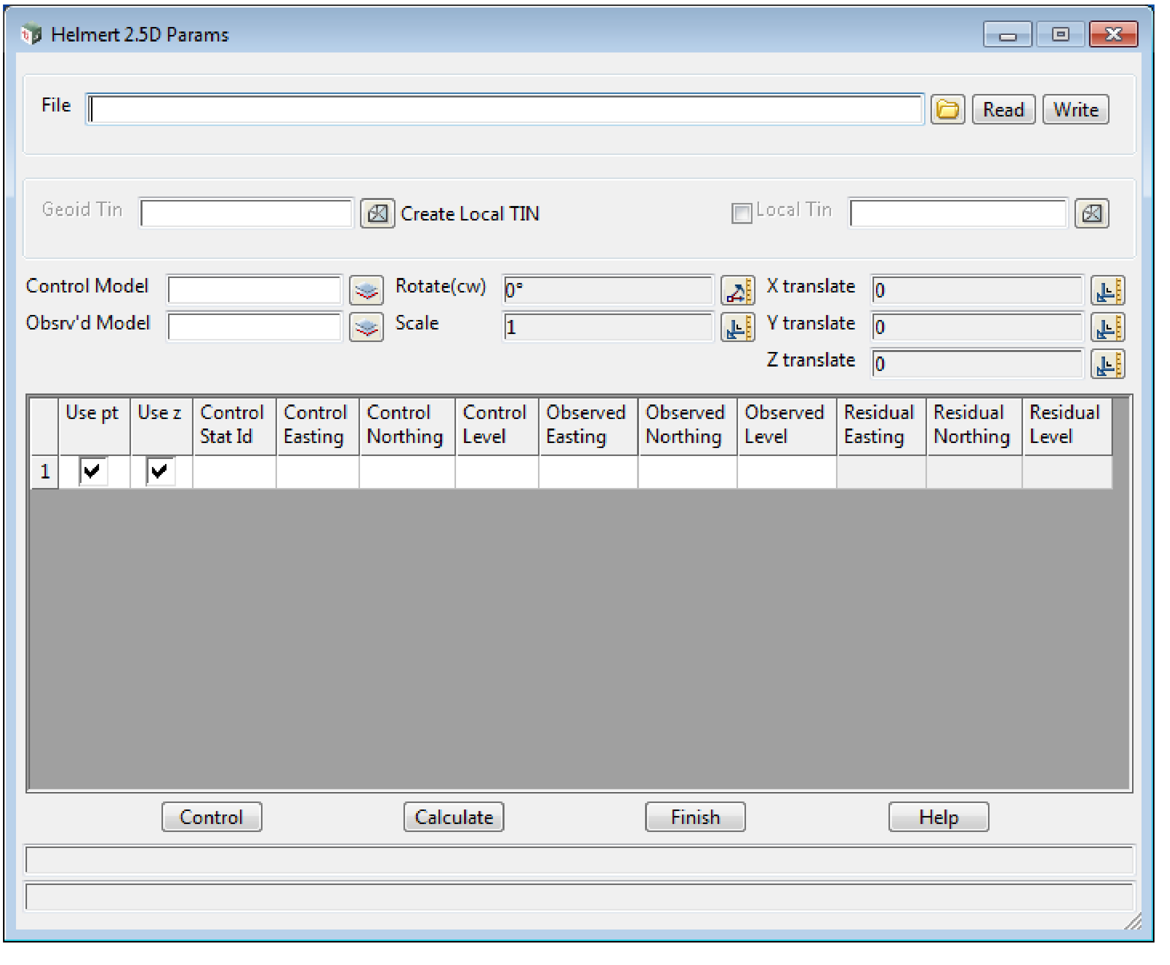
The 12dField localisation treats horizontal and vertical components separately. The horizontal transformation is a Helmert translation, translation, rotation and uniform scaling of the x and y axes.

The vertical translation can either be a simple z translation or be taken from a tin, the tin can be manually created outside of the panel, e.g. from AusGeoid98 or created by the panel via a plane of best fit.

The basic workflow for this panel is to observe known control points in the field with 12dField with just the ellipsoid set, e.g. MGA56.

Then use this panel to match the observed points with the control points to create the localisation.

Selecting **GPS Localisation** brings up the **Helmert 2.5D Params** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File			*.tdf_hel

The TDF_HEL file to be read in or written to. This is the file used by 12dField to localise GPS reading.

Read button

Read in the TDF_HEL file

Write button

Write out the TDF_HEL file

Geoid Tin

If selected the value of the tin at the local coordinate is added to the height of the raw GPS coordinate.

Create Local TIN tick box

*If unticked and the **Local Tin** box is blank the points are adjusted by the straight mean z difference of the observations.*
*If unticked and the **Local Tin** box is not empty the points are adjusted by the value of the TIN at the xy location.*

*If ticked and the **Local Tin** box is not empty a plane of best fit is used to create the local TIN and the points are adjusted by the value of the TIN at the current xy location. The extent of the local TIN is 1000m outside the control used.*

Local Tin

*The **Local Tin** as described above.*

Control model model box

the model containing the control points.

Obsrv'd model model box

the model containing the observed points.

Rotate (cw) measure box At Point, Point to Point, String from Point, String to Point

The clockwise rotation parameter of the helmert transformation.

Scale measure box At Point, Point to Point, String from Point, String to Point

The scaling parameter of the helmert transformation.

X translate measure box At Point, Point to Point, String from Point, String to Point

The x translation of the helmert transformation.

Y translate measure box At Point, Point to Point, String from Point, String to Point

The y translation of the helmert transformation.

Z translate measure box At Point, Point to Point, String from Point, String to Point

The z translation of the helmert transformation, (note this is 0.0 if a local TIN is being used).

The grid

Please note changing the level of a control station to "null" means the station and corresponding observed point will not be used in the height calculations.

Use pt tick box

if ticked this point is used in the transformation calculations

Use z tick box

If unticked this point is not used to calculate the transformation height parameter.

Control Stat Id

The Id of the control station, will normally match the observed Id.

Control Easting/Northing/Level

the coordinate of the control station.

Observed Easting/Northing/Level

the coordinate of the observed point.

Residual Easting/Northing/Level

the delta of the observed point with the control point after the transformation has been applied.

Buttons

Control button

Start the selection of the control/observed point pairs. Note the environment variable PICK_ORDER_OBSERVED_FIRST_4D can be set to make the selection order 'observed' then 'control'. For ease of use 2 plan views should be used, one with the observed points and one with the control points.

Calculate button

Calculate the transformation and update the residuals in the grid control.

Finish button

Exit the panel, a warning message will appear if the transformation parameters have not yet been written to file.

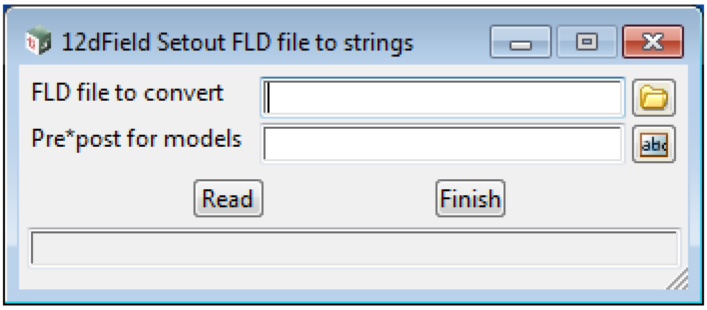
Continue to next section 18.2.3 12dField Setout FLD File To Strings or return to 18.2 12d Field .

18.2.3 12dField Setout FLD File To Strings

Position of option on menu: **Survey =>12d Field =>Setout FLD file to strings**

A field file, (**.FLD**) created by **12dField Setout** is attributed in such a way it can be read directly into ***12d Model*** without going through a Survey Data Reduction function, the string data will be read in with the original name, model, colour, linestyle and weight. Field files created by **12dField Setout** from version **V9C1e** can be read in with this panel.

Selecting **Setout FLD file to strings** displays the**12dField Setout FLD File To Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
FLD file to convert	file		

the field file to be read in.

Pre*post for models

For more information please go to the section 4.19.2 Pre*Postfix in Panel Fields

Read	button		

the FLD file will be read in, if a point in the field file is not correctly attributed a message will be displayed in the output window and no point will be created.

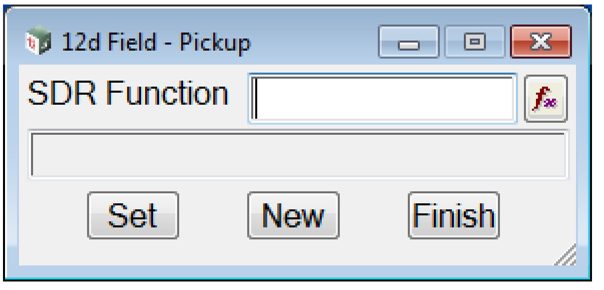
Continue to next section 18.2.4 12d Pickup or return to 18.2 12d Field .

18.2.4 12d Pickup

Position of option on menu: **Survey =>12d Field =>12d Pickup**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **12d Pickup** brings up the **12d Field - Pickup** panel



The fields and buttons used in this panel have the following functions.

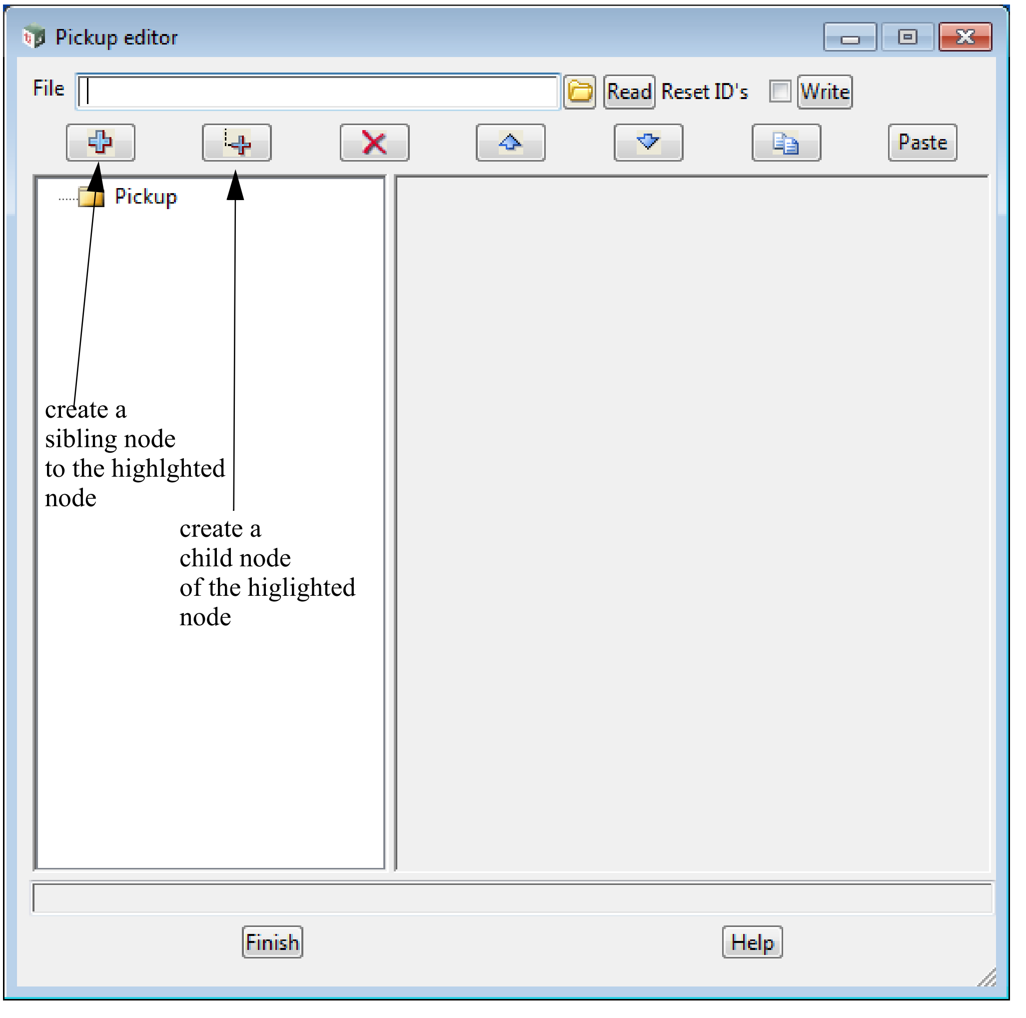
18.2.5.1 Pickup Editor

Position of option on menu: **Survey =>12d Field =>12d Field Pickup Codes =>12d Pickup Codes Editor**

The **Pickup Editor** panel allows you to define and edit feature codes to be used in **12d Field Pickup**.

Selecting **12d Pickup Codes Editor** brings up the **Pickup Editor** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

File

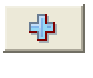
the 12d Field pickup codes file to edit or create

Read

reads the pickup codes file

Write

writes the pickup codes file



add a new node at the current level of the highlighted node in the tree - a sibling node. You can't add a sibling node to the top level ***Pickup*** *node.*

add a child to the current highlighted node in the tree.

delete the current highlighted node in the tree

moves the current highlighted node in the tree up

moves the current highlighted node down in the tree

copies to the cache the current highlighted node in the tree

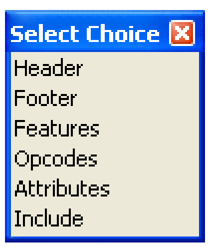
pastes the cached node to the current node in the tree (if it is allowed).

Continue to next section 18.2.5.1.1 Defining Codes or return to 18.2 12d Field .

18.2.5.1.1 Defining Codes

There are a number of different code types that can be added to your pickup codes file, depending on the structure of your tree.

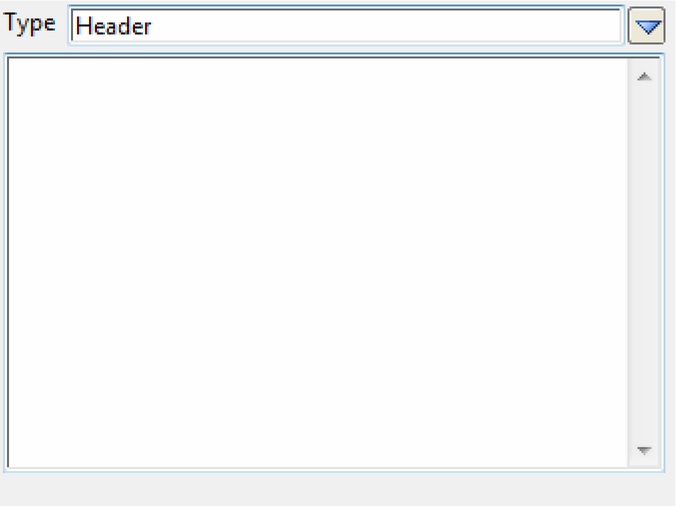
Each code has the following field **Type,** which can be used to define the type:



For information on Header go to 18.2.5.1.1.1 Header
Footer 18.2.5.1.1.2 Footer
Features 18.2.5.1.1.4 Features
Opcodes 18.2.5.1.1.5 Opcodes
Attributes 18.2.5.1.1.6 Attributes
Include 18.2.5.1.1.3 Include

18.2.5.1.1.1 Header

A **Header** to be included in any macro code generation.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

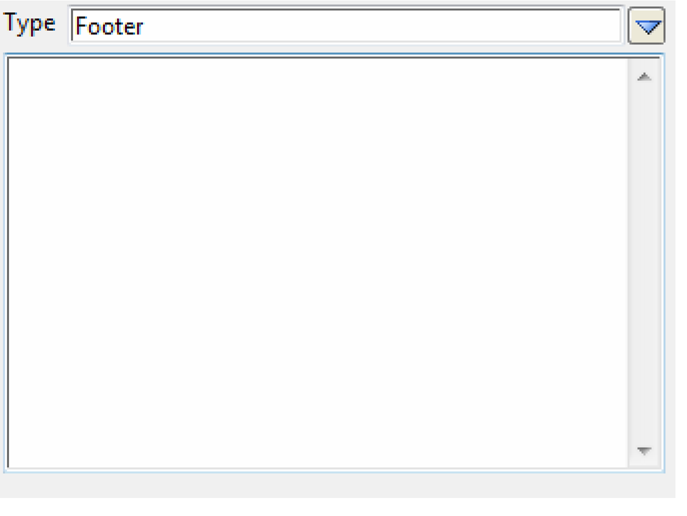
Text field

the macro code to include in the header

Continue to next section 18.2.5.1.1.2 Footer or return to 18.2 12d Field .

18.2.5.1.1.2 Footer

A footer to be included in any macro code generation.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

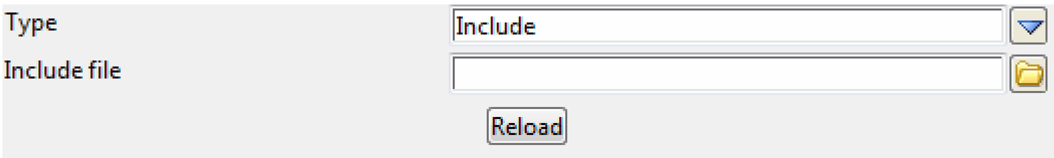
Text field

the macro code to include in the footer

Continue to next section 18.2.5.1.1.3 Include or return to 18.2 12d Field .

18.2.5.1.1.3 Include

Defines another code file to be included.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Include file	file		

the include file

Field Description	Type	Defaults	Pop-Up
Reload	button		

reloads the include file

Note that **include files** can be edited inline, within one editor.

Continue to next section 18.2.5.1.1.4 Features or return to 18.2 12d Field .

18.2.5.1.1.4 Features

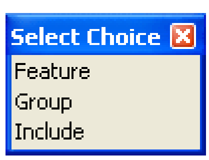
This code type defines a group of features

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		

the prompt name of the features group to appear in 12d Field pickup

Available Children Types



Feature 18.2.5.1.1.4.1 Feature
Group 18.2.5.1.1.4.2 Group (Features)
Include 18.2.5.1.1.3 Include

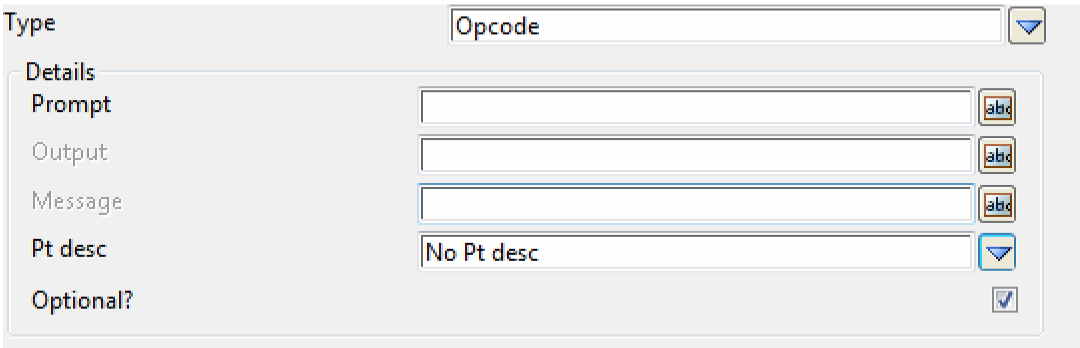
Item

the value for a choice

Continue to next section 18.2.5.1.1.4.6 Opcode Attribute or return to 18.2 12d Field .

18.2.5.1.1.4.6Opcode Attribute

This defines an attribute attached to a feature, which requires the entry of an opcode.



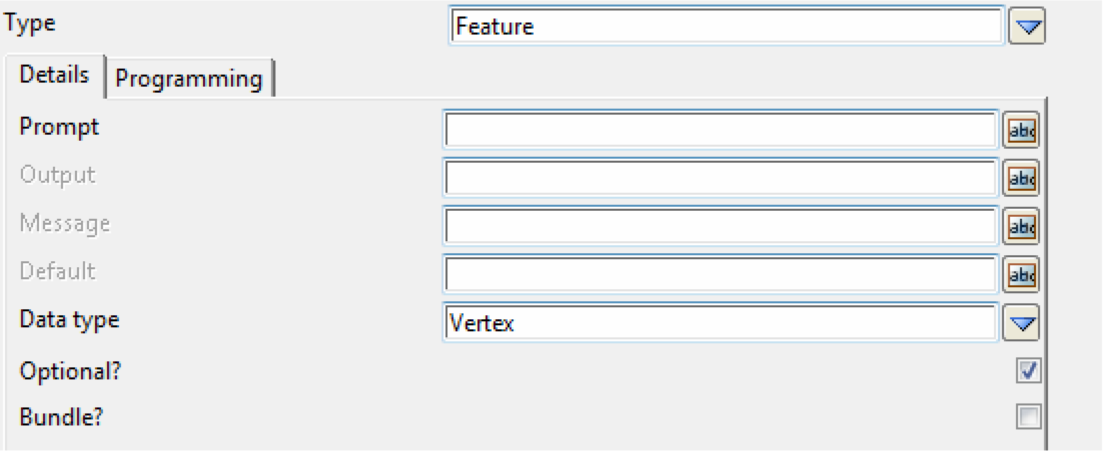
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		
the cosmetic name for the opcode			
Output	input		
the optional output for the opcode - defaults to prompt if not defined			
Message	input		
an optional message to display when entering the opcode value			
Pt desc	choice box		No pt desc, Pt desc, Null pt desc
the point description			
Optional	tick box		
if ticked, this opcode attribute is optional *if not ticked, this opcode attribute must be entered in the field*			

Continue to next section 18.2.5.1.1.4.7 Feature Attribute or return to 18.2 12d Field .

18.2.5.1.1.4.7Feature Attribute

This defines an attribute attached to a feature, which requires the entry of another feature.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Details Tab

Prompt input

the cosmetic name to be displayed during 12d field pickup

Output input

the optional value to output to the pickup file - uses prompt if undefined

Message input

a message to display when picking up the code

Default input

the default value

Data type choice box — Vertex, Next Segment, Prev Segment, String, Prompt, Prompt Segment

how the attribute should be attached

Optional? tick box

if ticked, this attribute is treated as optional
if not ticked, this attribute must be filled out

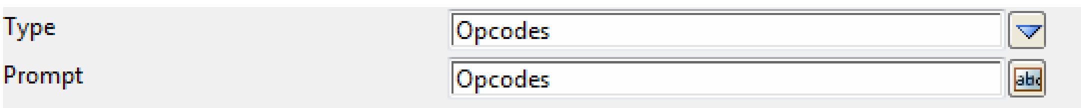
Continue to next section 18.2.5.1.1.5 Opcodes or return to 18.2 12d Field .

18.2.5.1.1.5 Opcodes

This code type defines a group of opcodes.

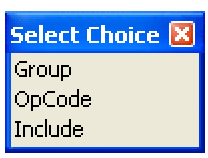


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		

the cosmetic name of the opcodes group

Available children types

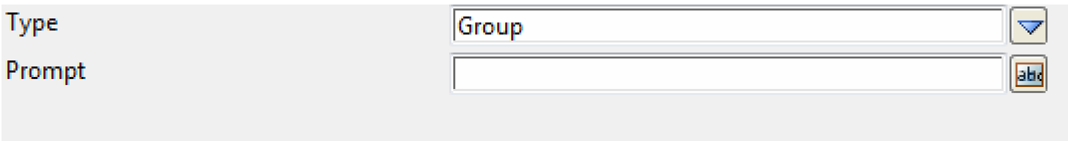


For information on Group go to 18.2.5.1.1.5.1 Group (Opcodes)
OpCode 18.2.5.1.1.5.2 OpCode
Include 18.2.5.1.1.3 Include

Continue to next section 18.2.5.1.1.5.1 Group (Opcodes) or return to 18.2 12d Field .

18.2.5.1.1.5.1Group (Opcodes)

This code defines a group of opcodes

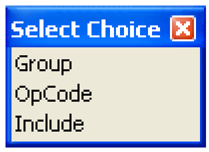


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		

the cosmetic name of the group of opcodes

Available children types

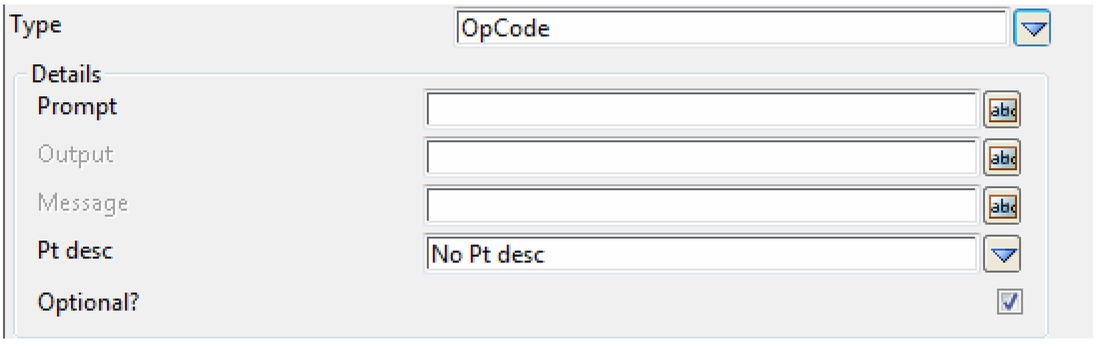


For information on Group go to	18.2.5.1.1.5.1 Group (Opcodes)
OpCode	18.2.5.1.1.5.2 OpCode
Include	18.2.5.1.1.3 Include

Continue to next section 18.2.5.1.1.5.2 OpCode or return to 18.2 12d Field .

18.2.5.1.1.5.2OpCode

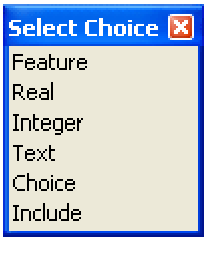
This defines a custom opcode that can be attached to the running pickup function or a picked up feature.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		
the cosmetic name to be displayed during 12d field pickup			
Output	input		
the optional value to output to the pickup file - uses prompt if undefined			
Message	input		
a message to display when entering the opcode			
Pt desc	choice box		No pt desc, Pt desc, Null pt desc
the point description			
Optional?	tick box		
if ticked, this opcode is treated as optional *if not ticked, it is required*			

Available children types



For information on Feature go to 18.2.5.1.1.5.3 Feature Attribute (OpCode)
Real 18.2.5.1.1.5.4 Real Attribute (OpCode)
Integer 18.2.5.1.1.5.5 Integer Attribute (OpCode)

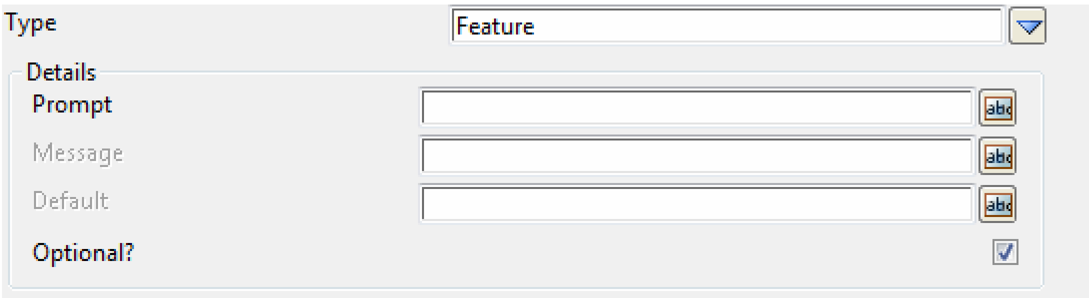
18.2.5.1.1.5.3Feature Attribute (OpCode)

This defines an attribute attached to an opcode, which requires the entry of a feature.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		

the cosmetic name to be displayed during 12d field pickup

Message	input		

a message to display when entering the opcode attribute

Default	input		

the default value for the attribute

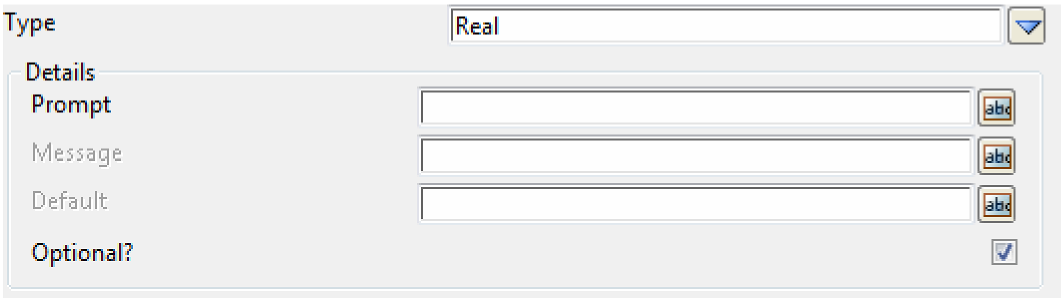
Optional?	tick box		

if ticked, this attribute is treated as optional
if not ticked, it is required

Continue to next section 18.2.5.1.1.5.4 Real Attribute (OpCode) or return to 18.2 12d Field .

18.2.5.1.1.5.4Real Attribute (OpCode)

This defines an attribute attached to an opcode, which requires the entry of a real value.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		

the cosmetic name to be displayed during 12d field pickup

Message	input		

a message to display when entering the opcode attribute

Default	input		

the default value for the attribute

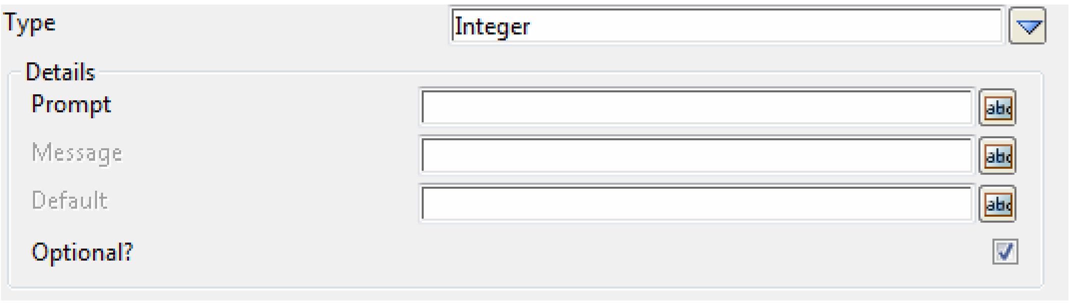
Optional?	tick box		

if ticked, this attribute is treated as optional
if not ticked, it is required

Continue to next section 18.2.5.1.1.5.5 Integer Attribute (OpCode) or return to 18.2 12d Field .

18.2.5.1.1.5.5Integer Attribute (OpCode)

This defines an attribute attached to an opcode, which requires the entry of an integer value.



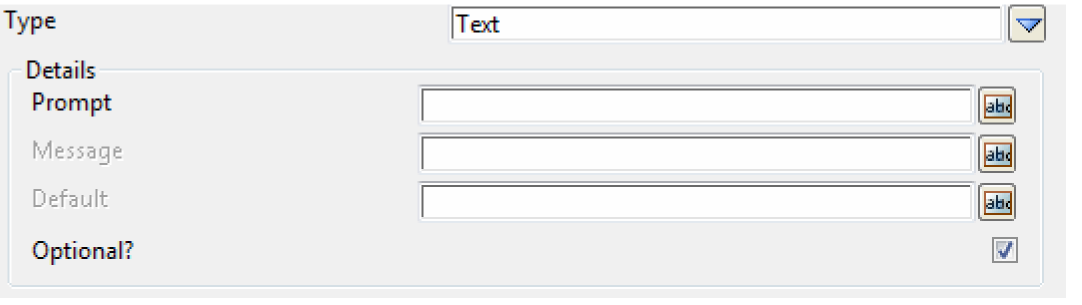
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		
the cosmetic name to be displayed during 12d field pickup			
Message	input		
a message to display when entering the opcode attribute			
Default	input		
the default value for the attribute			
Optional?	tick box		
if ticked, this attribute is treated as optional *if not ticked, it is required*			

Continue to next section 18.2.5.1.1.5.6 Text Attribute (OpCode) or return to 18.2 12d Field .

18.2.5.1.1.5.6Text Attribute (OpCode)

This defines an attribute attached to an opcode, which requires the entry of a text value.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		

the cosmetic name to be displayed during 12d field pickup

Message	input		

a message to display when entering the opcode attribute

Default	input		

the default value for the attribute

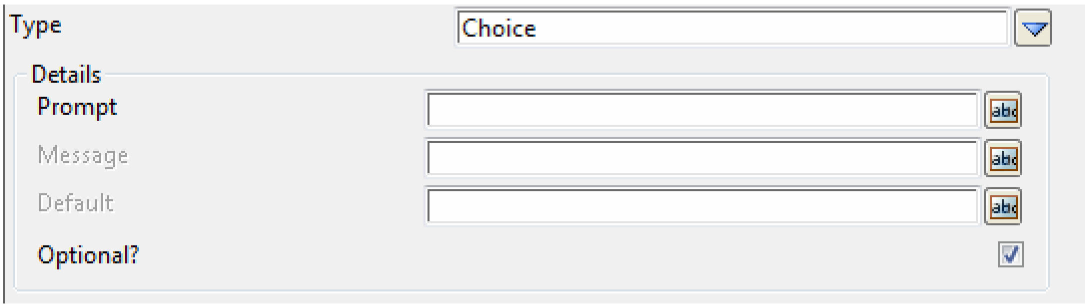
Optional?	tick box		

if ticked, this attribute is treated as optional
if not ticked, it is required

Continue to next section 18.2.5.1.1.5.7 Choice Attribute (OpCode) or return to 18.2 12d Field .

18.2.5.1.1.5.7Choice Attribute (OpCode)

This defines an attribute attached to an opcode, which requires the entry of a value selected from a choice.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Prompt input

the cosmetic name to be displayed during 12d field pickup

Message input

a message to display when entering the opcode attribute

Default input

the default value for the attribute

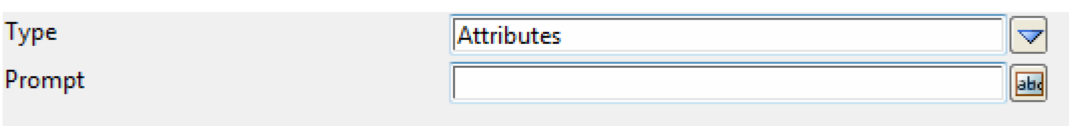
Optional? tick box

if ticked, this attribute is treated as optional
if not ticked, it is required

Continue to next section 18.2.5.1.1.6 Attributes or return to 18.2 12d Field .

18.2.5.1.1.6 Attributes

This defines a top level group of attributes.



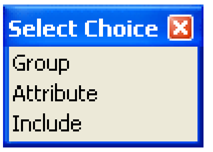
The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Prompt input

the cosmetic name for the group of attributes.

Available children types

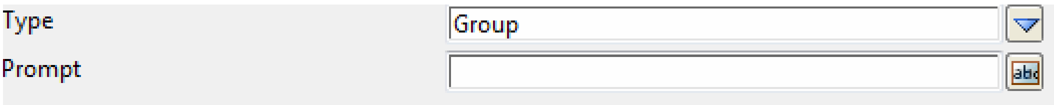


For information on Group go to 18.2.5.1.1.6.1 Group (Attributes)
Attribute 18.2.5.1.1.6.2 Attribute
Include 18.2.5.1.1.3 Include

Continue to next section 18.2.5.1.1.6.1 Group (Attributes) or return to 18.2 12d Field .

18.2.5.1.1.6.1Group (Attributes)

This defines a group of attributes or other groups.

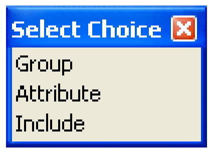


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prompt	input		

the cosmetic name for the group that will be displayed

Available children types

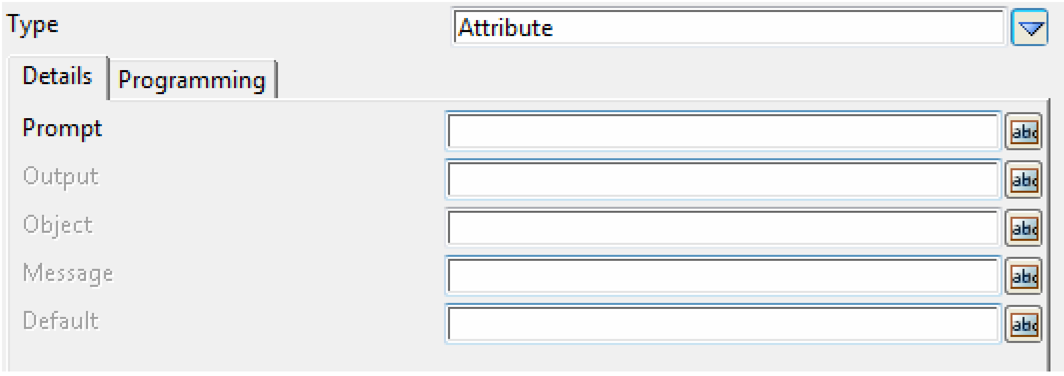


For information on Group go to 18.2.5.1.1.6.1 Group (Attributes)
Attribute 18.2.5.1.1.6.2 Attribute
Include 18.2.5.1.1.3 Include

Continue to next section 18.2.5.1.1.6.2 Attribute or return to 18.2 12d Field .

18.2.5.1.1.6.2Attribute

This defines an attribute that may be attached to a picked up point or string during pickup.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Details Tab

Prompt input

the cosmetic name to be displayed during 12d field pickup

Output input

the optional value to output to the pickup file - uses prompt if undefined

Object input

the optional value to be used to define a set of attributes - uses output if undefined

Message input

a message to display when picking up the code

Default input

the default value

Programming Tab

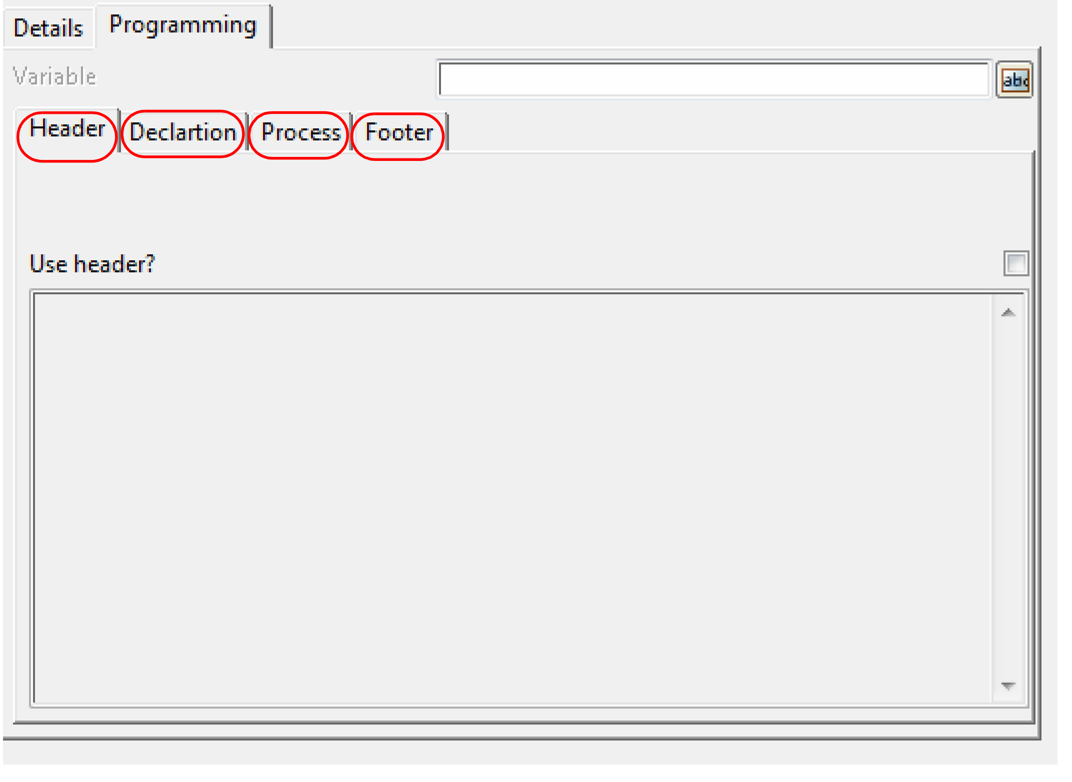
Continue to next section 18.2.5.1.1.7 Programming or return to 18.2 12d Field .

18.2.5.1.1.7 Programming

It is possible to generate macro code for GIS post processing, for any feature or attribute. The **programming tab** is used to assist you in doing so.

See 18.2.5.5 12d Pickup Codes to Macro for more information on how to generate a GIS post processing 4dm file.

To assist you, this is broken into sections: Header Tab , Declaration Tab , Process Tab , Footer Tab .



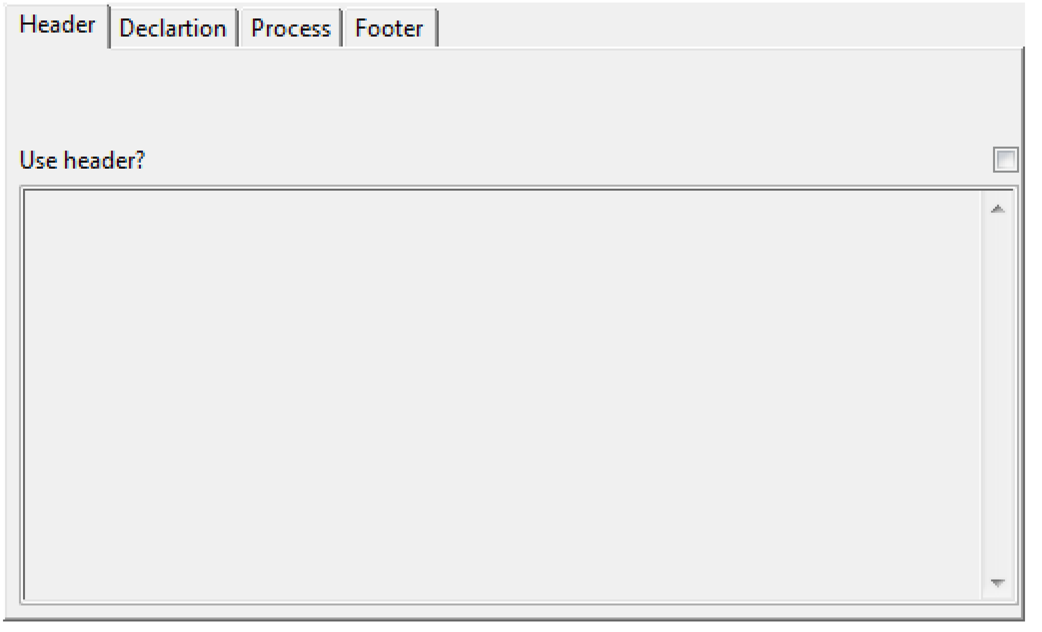
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Variable	input		

For use with attributes or opcodes, defines the variable that the data should be stored in for use later.

Header Tab

The **Header tab** defines any header that should be output into the macro file for the current item.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use header?	tick box		

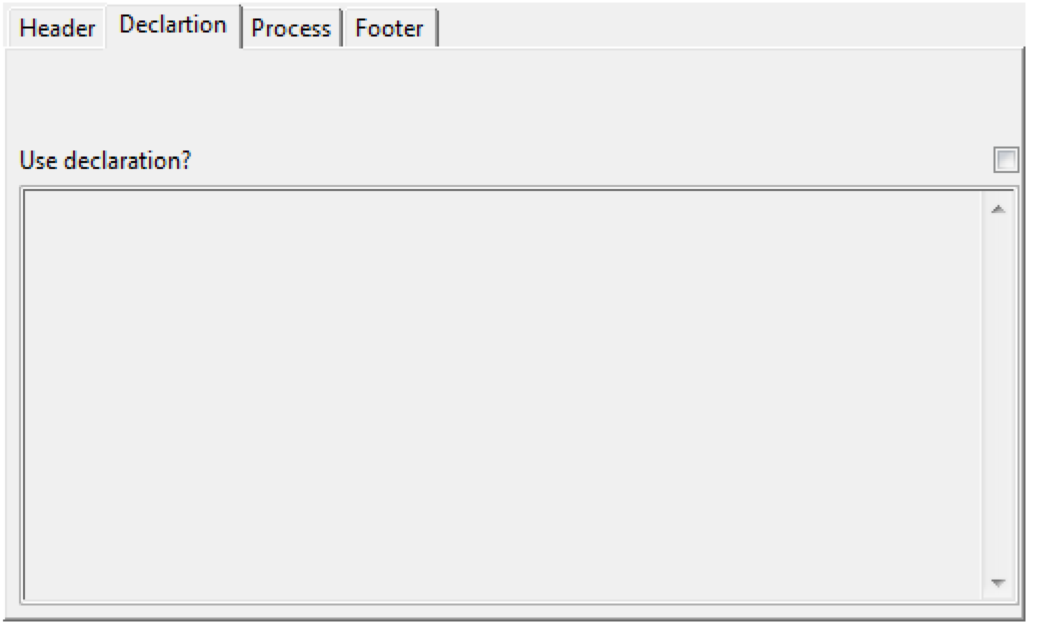
if ticked, the header will output to the generated file
if not ticked, no header will be used

Text field

the macro code to output into the GIS post processing file

Declaration Tab

The **Declaration tab** defines the 'declaration' to be output into the macro, which can be used for defining variables.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use declaration?	tick box		

if ticked, a declaration will be output to the generated file
if not ticked, no declaration will be output

Text field

the macro code to output into the GIS post processing file.

Process Tab

The **Process tab** defines the main processing part of the macro code, which could be used to process a selected feature code and associated attributes, or other items such as opcodes.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use process?	tick box		

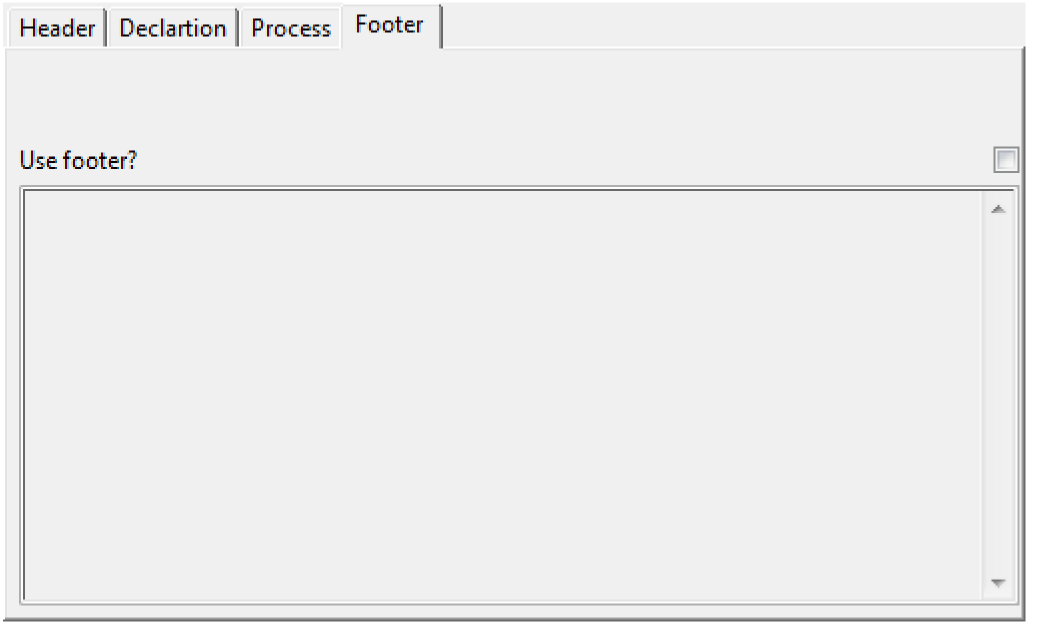
if ticked, the process data will be output into the generated file
if not ticked, no process data will be output.

Text field

the macro code to output into the GIS post processing file

Footer Tab

The **Footer tab** is used to define any macro code that should be added to the footer.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use footer?	tick box		

if ticked, the footer will output to the generated file
if not ticked, no footer will be output

Text field

the macro code to output into the GIS post processing file

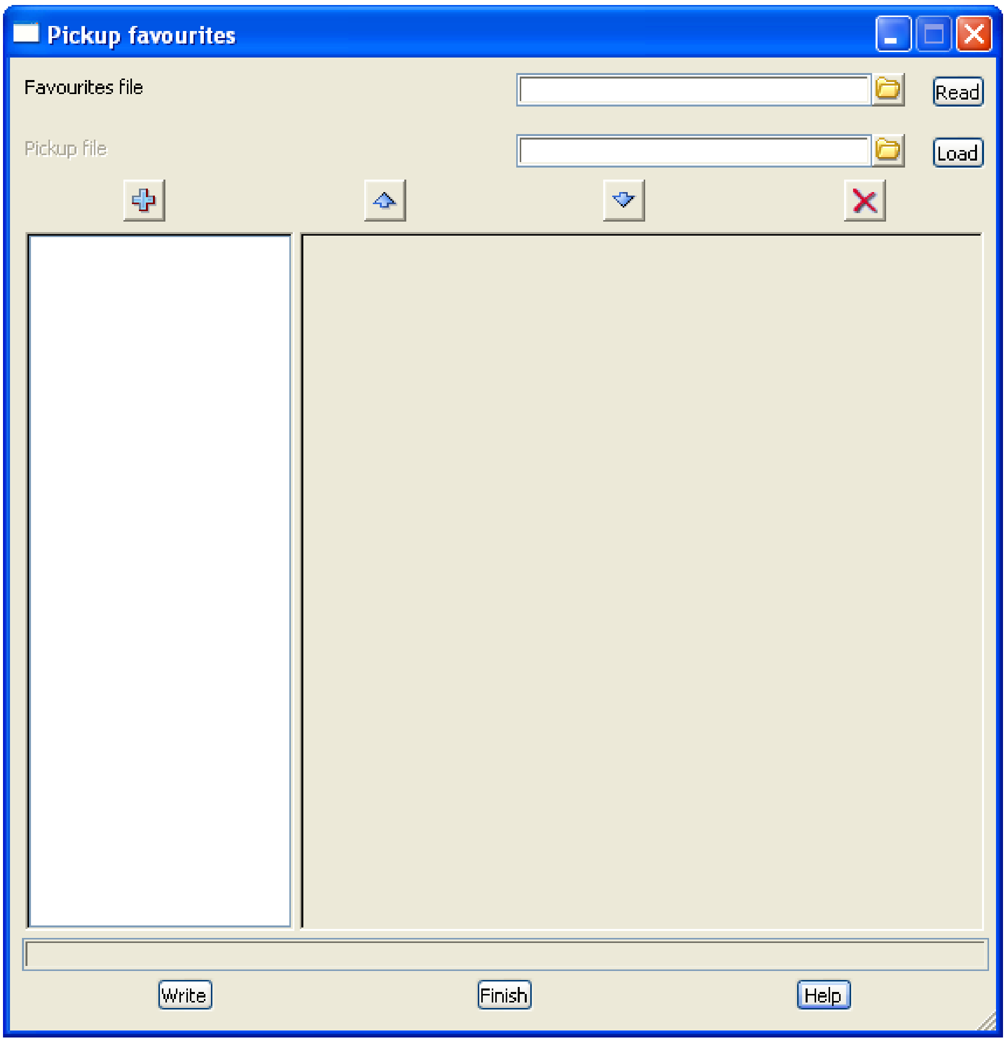
Continue to next section 18.2.5.2 Pickup Favourites or return to 18.2 12d Field .

18.2.5.2 Pickup Favourites

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => 12d Pickup Favourites

This panel is used to create and edit 12d field pickup favourites files. They contain a list of feature codes and associated information for use within **12d Field Pickup**.

Selecting **12d Pickup Favourites** brings up the **Pickup Favourites** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Favourites file	file		*.12dfieldfavourites

the favourites file to create or edit

Read	button		

reads the favourites file, if it exists

Pickup file	file		*.12dfieldcodes

the optional 12d field pickup codes file to use as the source of feature codes available as favourites.

Load	button		

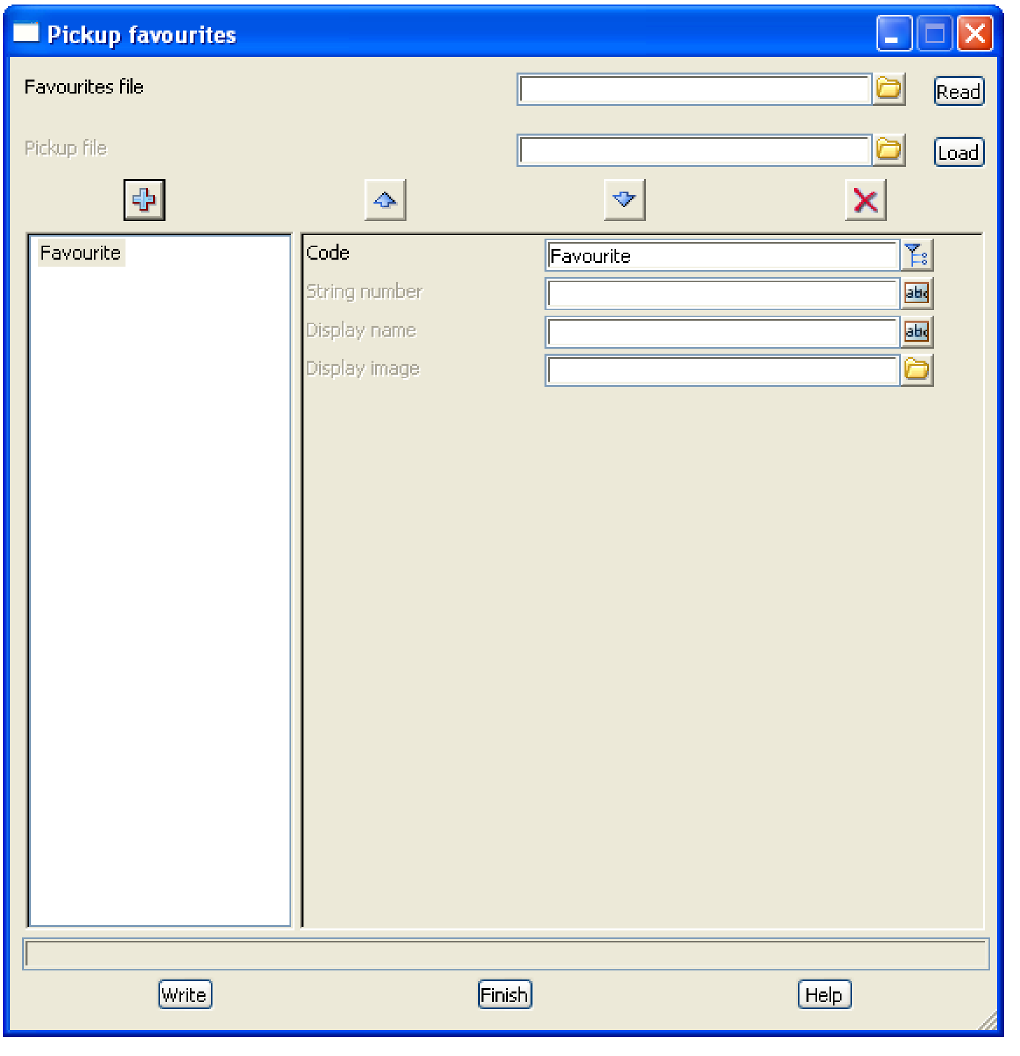
loads the optional 12d field pickup codes file for use

adds a new favourite

moves a favourite up

moves a favourite down

delete a favourite



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Code

the name of the favourite.
if a pickup codes file has been loaded, the list of codes in the pickup codes file will be available as a choice in the browse box.
if no pickup codes file has been loaded, nothing will appear in the browse box.

String number input

the optional string number for the favourite

Display name input

the optional cosmetic name of the favourite to display
If not specified, the favourite will display using the code name

Display image file

the optional cosmetic image of the favourite to display
If not specified, no image will be displayed.

Write button

writes the Pickup favourites to the specified file.

Continue to next section 18.2.5.3 Mapfile to 12d Pickup Codes or return to 18.2 12d Field .

18.2.5.3 Mapfile to 12d Pickup Codes

Position of option on menu: **Survey =>12d Field =>12d Field Pickup Codes => Mapfile to 12d Pickup Codes**

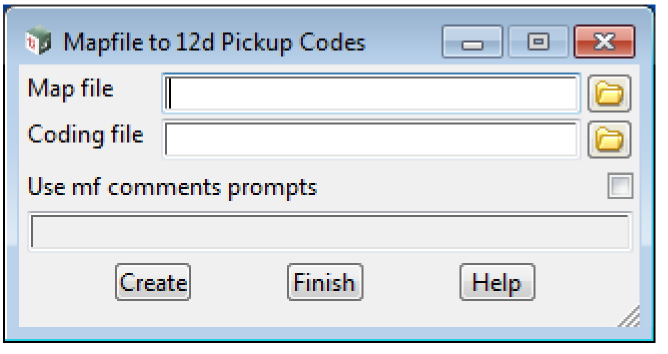
This option is used to create a 12d Field Pickup Coding file from an existing map file. Only the following information from the Basic section of the mapfile is used

Key

Model

Comment

Selecting **Mapfile to 12d Pickup Codes** brings up the **Mapfile to 12d Pickup Codes** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mapfile	file		*.mapfile *.mf

name of the 12d mapfile to convert from.

Field Description	Type	Defaults	Pop-Up
Coding file	file		*.12dfieldcodes

name of the coding file to convert to.

Use mf comments prompts tick box

if ticked, the Comment field is used as the display prompt that the user sees when selecting the current feature code.
If not ticked, the Key field is used as the display prompt.

Create button

convert the file.

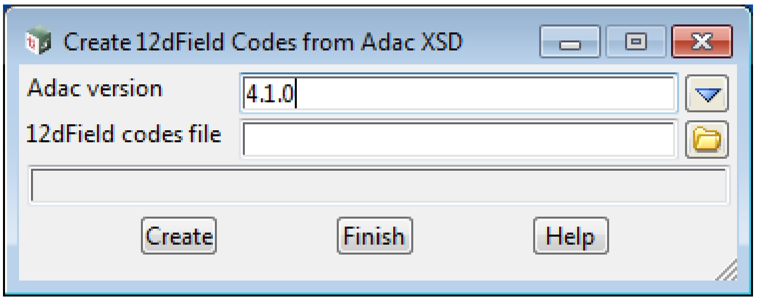
Continue to next section 18.2.5.4 ADAC XSD to 12d Pickup Codes or return to 18.2 12d Field .

18.2.5.4 ADAC XSD to 12d Pickup Codes

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => ADAC XSD to 12d Pickup Codes

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **ADAC XSD to 12d Pickup Codes** brings up the **Create 12d Field Codes from ADAC XSD** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ADAC Version	choice box		
the version of ADAC being used			
12dField codes file	file box		
Create	button		

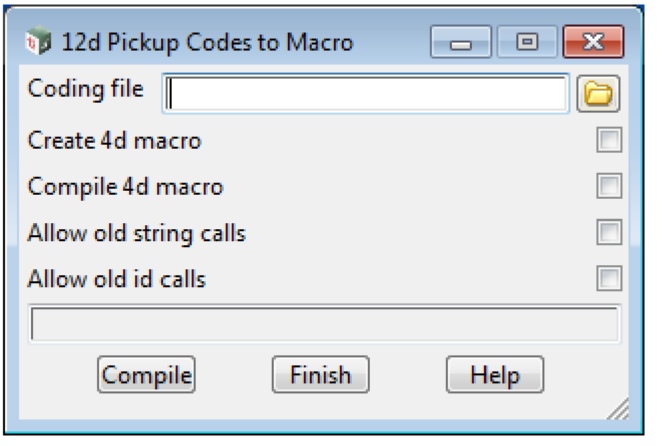
Continue to next section 18.2.5.5 12d Pickup Codes to Macro or return to 18.2 12d Field .

18.2.5.5 12d Pickup Codes to Macro

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => 12d Pickup Codes to 4dm

This panel generates a macro based on any programming defined in a 12d Field pickup codes file. It will create a new file of the same name as the 12d Field pickup codes file, with the extension 4dm

Selecting **12d Pickup Codes to 4dm** brings up the **12d Pickup Codes to Macro** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Coding file	file		*.12dfieldcodes

the 12d Field Pickup codes file to read

Create 4d macro tick box

if ticked, it creates the 4dm file from the 12d Field Pickup codes file programming.

Compile 4d macro tick box

if ticked, the created 4dm file will be compiled into a 4do file
if not ticked, no compilation will take place

Allow old string calls tick box

if ticked, old string calls will be allowed by the compiler.
if not ticked, old string calls will not be allowed by the compiler.

Allow old id calls tick box

if ticked, old id calls will be allowed by the compiler.
if not ticked, old id calls will not be allowed by the compiler.

Compile button

creates and/or compiles the 12d Field Pickup codes file into a macro

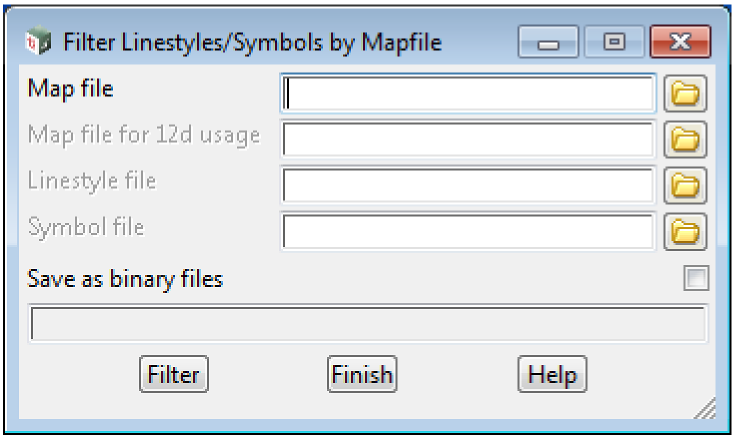
Continue to next section 18.2.5.6 Filter Linestyles/Symbols via Mapfile or return to 18.2 12d Field .

18.2.5.6 Filter Linestyles/Symbols via Mapfile

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => Filter linestyles/symbols via mapfile

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Filter linestyles/symbols via mapfile** brings up the **Filter Linestyles/Symbols by Mapfile** panel



The fields and buttons used in this panel have the following functions.

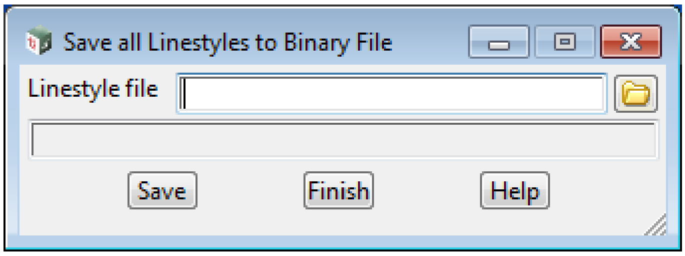
Field Description	Type	Defaults	Pop-Up
Map file	file box		available map files
Map file for 12d usage	file box		available map files
Linestyle file	file box		
Symbol file	file box		
Save as binary files	tick box	not ticked	
Filter	button		

Continue to next section 18.2.5.7 Save Binary Linestyles or return to 18.2 12d Field .

18.2.5.7 Save Binary Linestyles

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => Save binary linestyles

Selecting **Save binary linestyles** brings up the **Save all Linestyles to Binary File** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Linestyle file	file box		available *.4d files

the name of the binary form of the linestyle file

Save	button		

saves the linestyle data as a binary file.

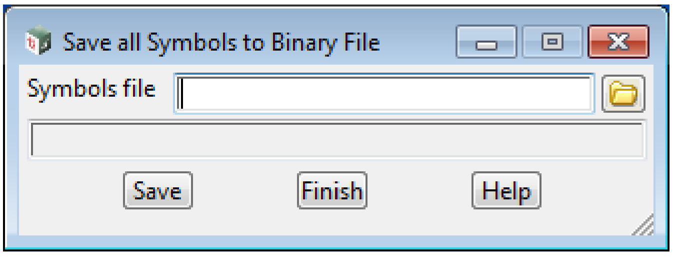
Continue to next section 18.2.5.8 Save Binary Symbols or return to 18.2 12d Field .

18.2.5.8 Save Binary Symbols

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => Save binary symbols

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Save binary symbols** brings up the **Save all Symbols to Binary File** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Symbols file	file box		available *.4d files
Save	button		

Return to 18.2 12d Field .

19 ePlan

The **ePlan XML Schema** is a vendor independent XML format introduced by the State Governments in Australia for the submission of Cadastral plans.

So far it has been implemented by NSW, Qld and Victoria with the other States planning to implment it in the fuutre.

Although there are similarities between the States, there are different enumeration files for each State in the ePlan XML Schema. Also each State has its own business rules, and own methods for submitting the ePlan.XML data.

Also althought the various ePlan XML’s are based on Land.XML, what is a valid Land.XML file may not be a valid ePlan.XML for a particular State.

See

19.1 ePlan.XML Overview
19.2 12d Approach to ePlan XML
19.3 12d ePlan Workflow
19.4 12d ePlan Menu

19.1 ePlan.XML Overview

See

19.1.1 ePlan XML Structure

19.1.1 ePlan XML Structure

The ePlan Schema is fully described by the *ePlan XSD* (**X**ML **S**chema **D**efinition), which formally defines the structure and all the elements inside an ePlan XML file. That means that any ePlan.XML can be **validated** against the ePlan Schema XSD to see that it conforms to the Schema.

Return to 19.1 ePlan.XML Overview or 19 ePlan .

19.2 12d Approach to ePlan XML

Creating an ePlan XML file could be approached as a spreadsheet type exercise where you type the values into a document, but this is little more than a manual data collection exercise.

Continue to the next section 19.3 12d ePlan Workflow or return to 19 ePlan .

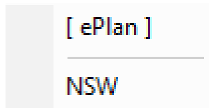
19.3 12d ePlan Workflow

In ***12d Model***, the **source** of the data to write out to an ePlan XML is usually from either

Continue to the next section 19.4 12d ePlan Menu or return to 19 ePlan .

19.4 12d ePlan Menu

Position on menu: **Survey =>Network =>ePlan**



See

19.4.1 Create NSW ePlan Network

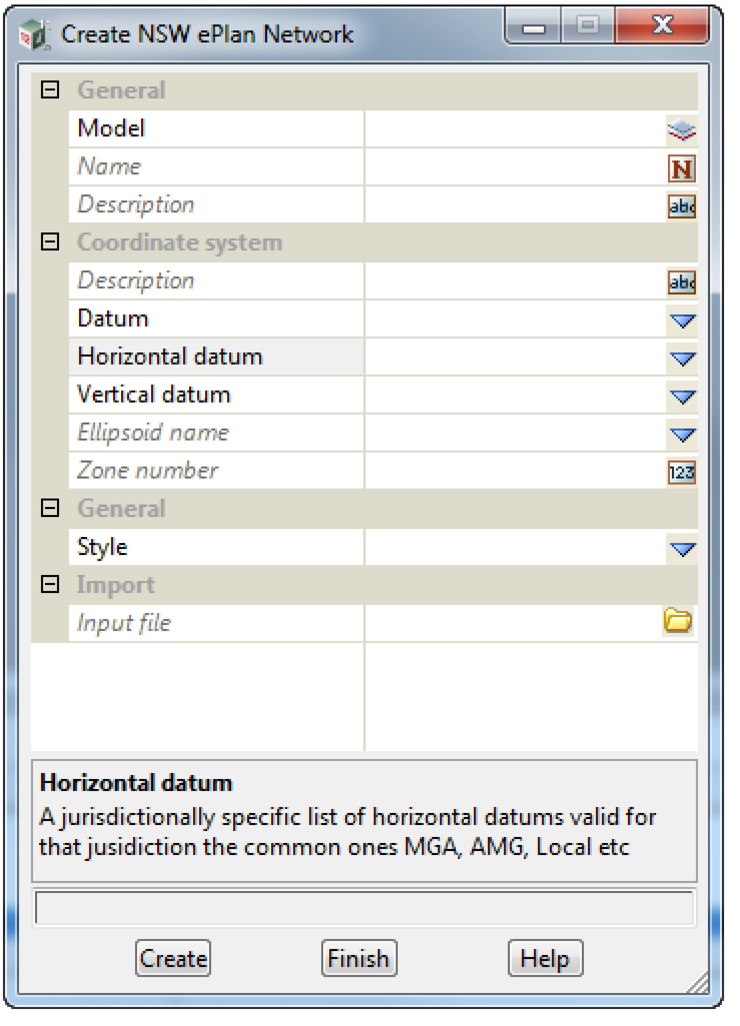
19.4.1 Create NSW ePlan Network

Position of option on menu: **Survey =>Network =>ePlan =>NSW**

To create an ePlan for NSW, an ePlan network needs to be created.

The data to go out as an NSW ePlan.XML file are then added to the ePlan network.

Selecting **NSW** brings up the **Create NSW ePlan Network** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

General node

Model — model box — Pop-Up: available models

the model for the ePlan network.

Name — name box

the name for the ePlan network.

Description — text box

a description for the ePlan network.

Coordindate System node

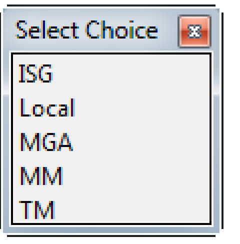
Description — text box

a description for the coordinate system.

Vertical datum choice box AHD

the vertical datum.

Horizontal datum choice box



the horizontal datum.

Ellipsoid name choice box

name of the ellipsoid used (if any).

Zone number text box

zone number if MGA).

General node

Style Network Style box available network styles

the style used for desplaying the ePlan network.

Buttons at bottom

Create button

create an ePlan Network for NSW.

After the **Create** button is pressed, a new NSW ePlan is created and the **Edit ES** toolbar appears. For information on the **Edit ES** toolbar, go to 19.4.2 Edit ES for NSW ePlan Network.

Continue to the next section or return to 19.4 12d ePlan Menu or 19 ePlan.

19.4.2 Edit ES for NSW ePlan Network

Position of option on menu: **Survey =>Network =>ePlan =>Create NSW ePlan Network**

If the Strings Edit is used to seelct an ePlan network, or after the **Create** button is pressed on the **Create NSW ePlan Network** panel and a new NSW ePlan is created, the **Edit ES** toolbar appears to edit the EPlan object.

19.4.2.1.5 Editing Monuments

19.4.2.1.1 Adding a Point

The **Add a Point** option adds a user selected point to the ePlan network.

Selecting **Add a Point** options writes the message to the screen message area

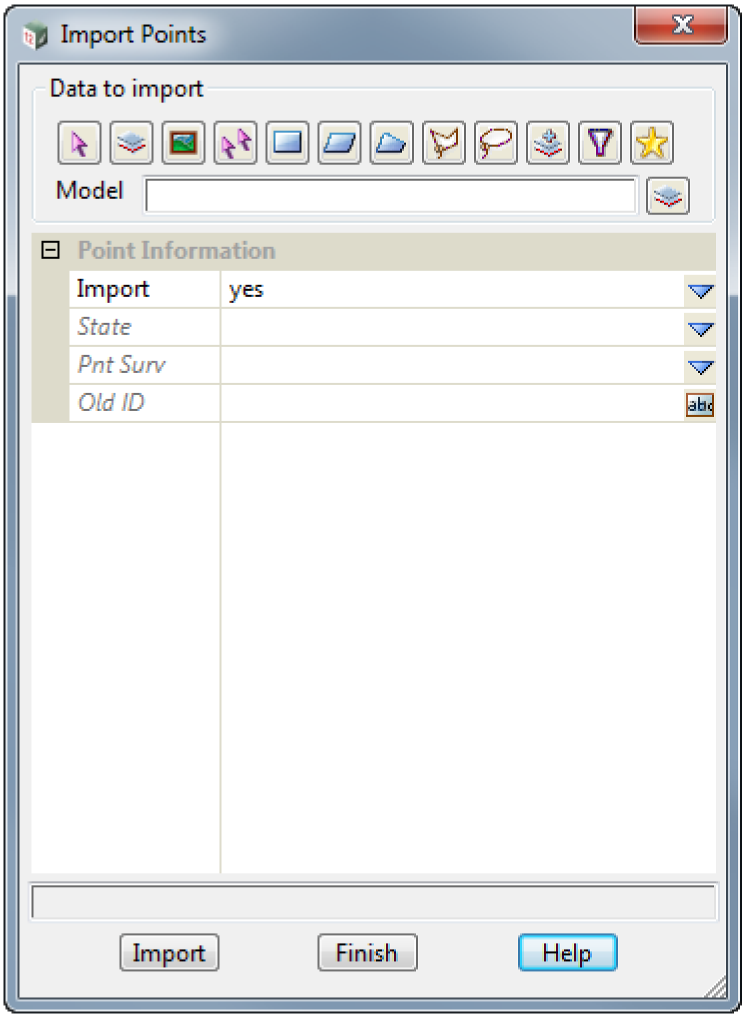
<Pick point or (n)ame, (d)escription> [picks][][Menu]

and a point is selected and if it is outside the tolerance distance of all existing points in the Network, it is added to the network and given the next available **Point id**.

19.4.2.1.2 Importing Points

The **Import Points** option adds a Data Source of user selected points to the ePlan network.

Selecting **Import points** brings up the **Import Points** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source

data source for vertices to add to the Network.

Point Information

Import	choice box		yes, no

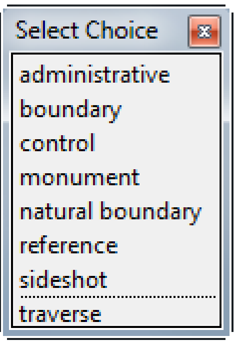
*if **yes**, the selected data is procssed for adding to the network.*

*If **no**.*

State	choice box		existing, proposed

whether the selected vertices are existing survey points or proposed points.

Pnt Surv choice box



the type of the selected vertices.

Old ID input

the Point Id that the CG point used to have. This can be modified.

Import button

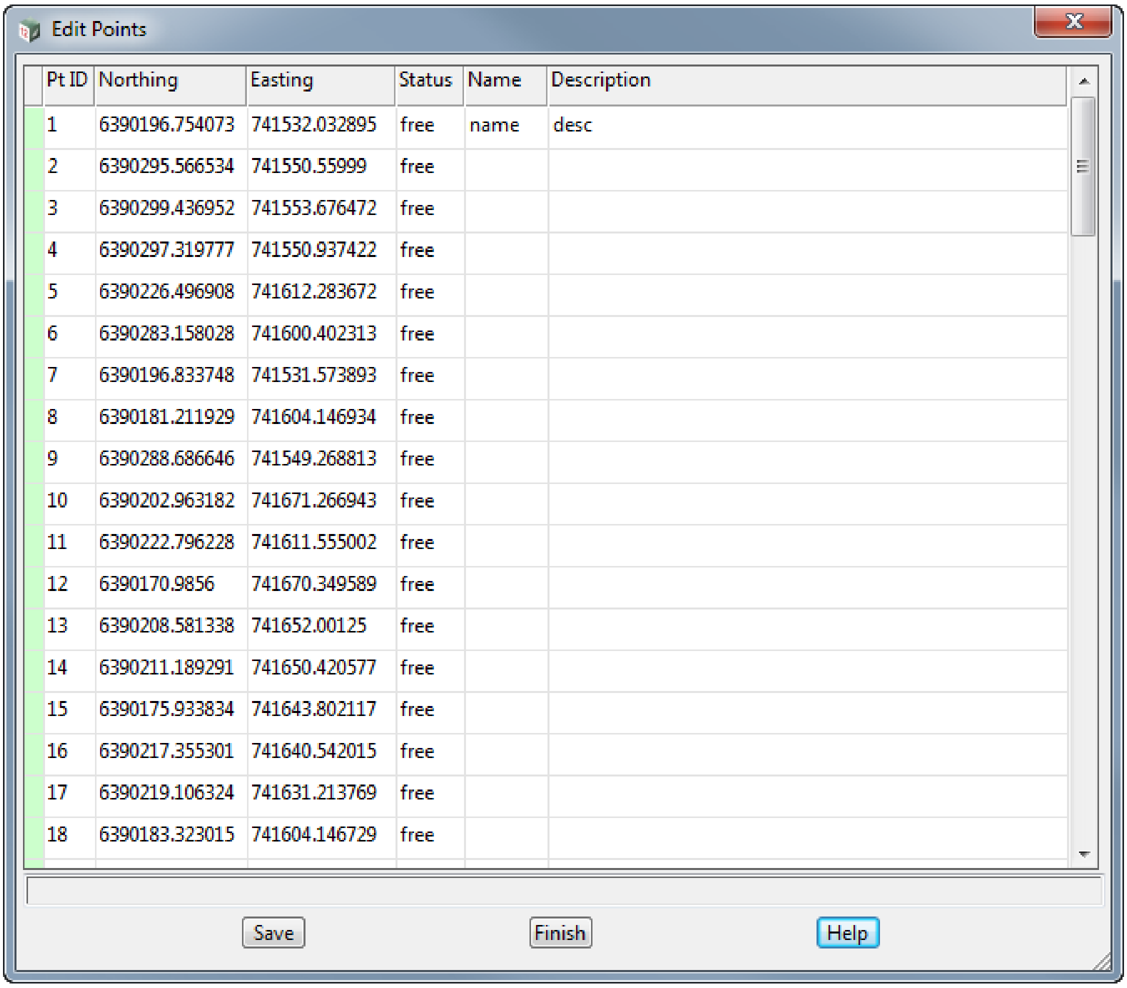
when pressed the selected vertices will be processed. Each vertex is checked in turn and if the vertex is outside the tolerance distance of all the existing point in the Network, it is added to the network and given the next available Point id.

19.4.2.1.3 Editing Points

Selecting **Edit points** brings up the **Edit Points** panel which displays in tabular form all the existing points in the Network.

For each Point it displays the Point ID, Northing, Easting, Status, Name and Description.

Clicking on a line in the grid will highlight and autopan to the point for that line on any plan views that has the Network on them.



Pt ID	Northing	Easting	Status	Name	Description
1	6390196.754073	741532.032895	free	name	desc
2	6390295.566534	741550.55999	free		
3	6390299.436952	741553.676472	free		
4	6390297.319777	741550.937422	free		
5	6390226.496908	741612.283672	free		
6	6390283.158028	741600.402313	free		
7	6390196.833748	741531.573893	free		
8	6390181.211929	741604.146934	free		
9	6390288.686646	741549.268813	free

18	6390183.323015	741604.146729	free		

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Pt ID display only

unique Point id of the poiont in the Network. This can not be modified.

Northing real box

the Northing of the point with the Point id. This can be edited.

Easting choice box fixed, free

the Easting of the point with the Point id. This can be edited.

Status

the Status is used is a Least Squares Adjustment (LSA).

*If **fixed**, the coordinates of the point will be held constant in a LSA.*

*If **free** then the coordinates of the point will be held modified in a LSA.*

Name

the name of the point. This can be edited.

Description

the description of the point. This can be edited.

Save button

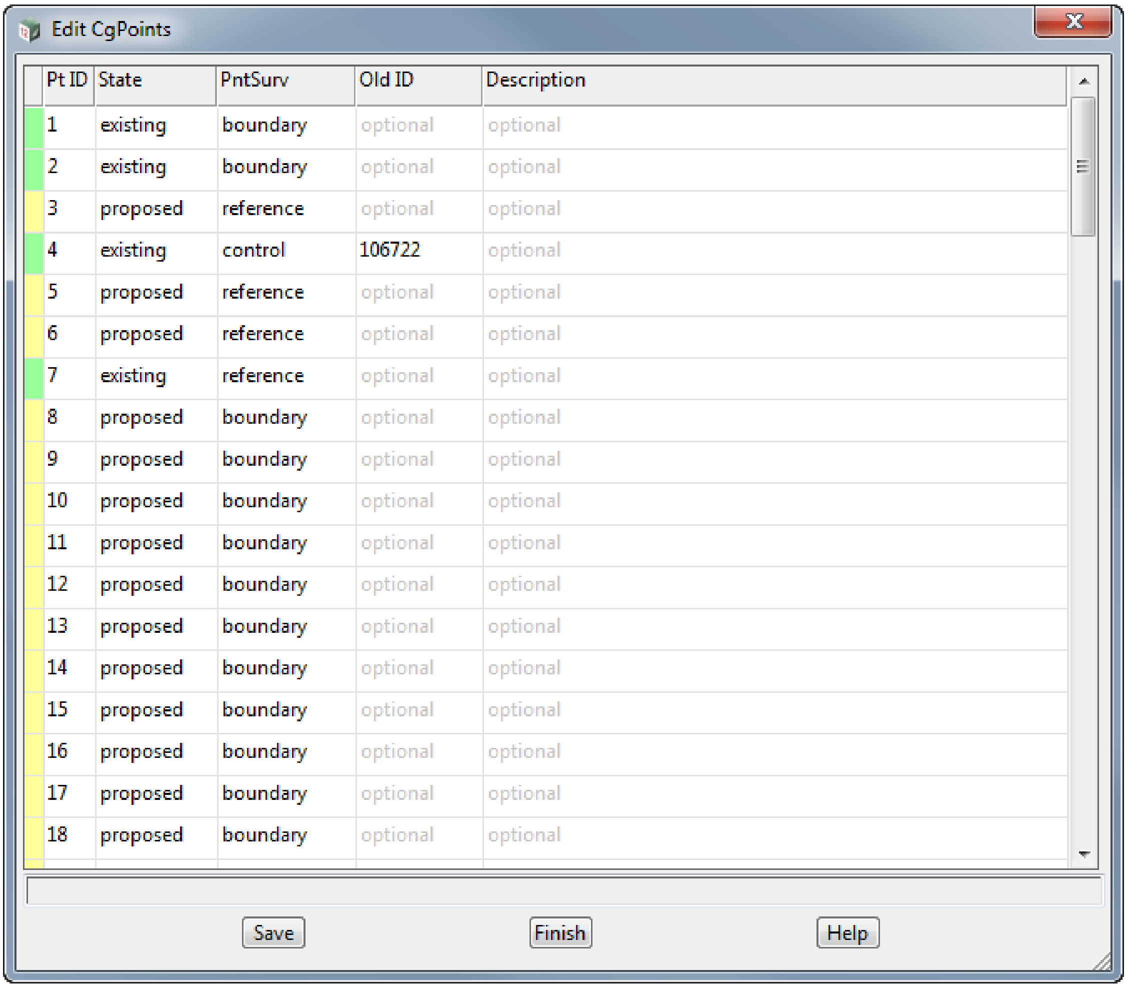
save the data in the panel to the Network object.

19.4.2.1.4 Editing CG Points

Selecting **Edit cgPoints** brings up the **Edit CgPoints** panel which displays in tabular form all the existing CG points in the Network.

For each CG point it displays the Point ID, State, PntSurv, Old ID and Description.

Clicking on a line in the grid will highlight and autopan to the CG point for that line on any plan views that has the Network on them.



Pt ID	State	PntSurv	Old ID	Description
1	existing	boundary	optional	optional
2	existing	boundary	optional	optional
3	proposed	reference	optional	optional
4	existing	control	106722	optional
5	proposed	reference	optional	optional
6	proposed	reference	optional	optional
7	existing	reference	optional	optional
8	proposed	boundary	optional	optional
9	proposed	boundary	optional	optional
10	proposed	boundary	optional	optional
11	proposed	boundary	optional	optional

14	proposed	boundary	optional	optional
15	proposed	boundary	optional	optional
16	proposed	boundary	optional	optional
17	proposed	boundary	optional	optional
18	proposed	boundary	optional	optional

The fields and buttons used in this panel have the following functions.

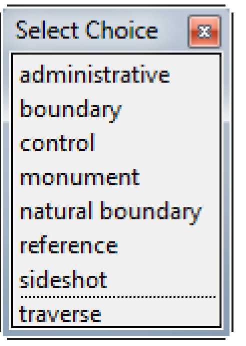
Field Description	Type	Defaults	Pop-Up
Pt ID	display only		

unique Point ID of the CG point in the Network. This can be not be modified

State	choice box		existing, proposed

whether the selected CG point are existing survey points or proposed points.

Pnt Surv choice box



the type of the selected CG point. This can be modified.

Old ID input

the Point Id that the CG point used to have. This can be modified.

Description

the description of the CG point. This can be edited.

Save button

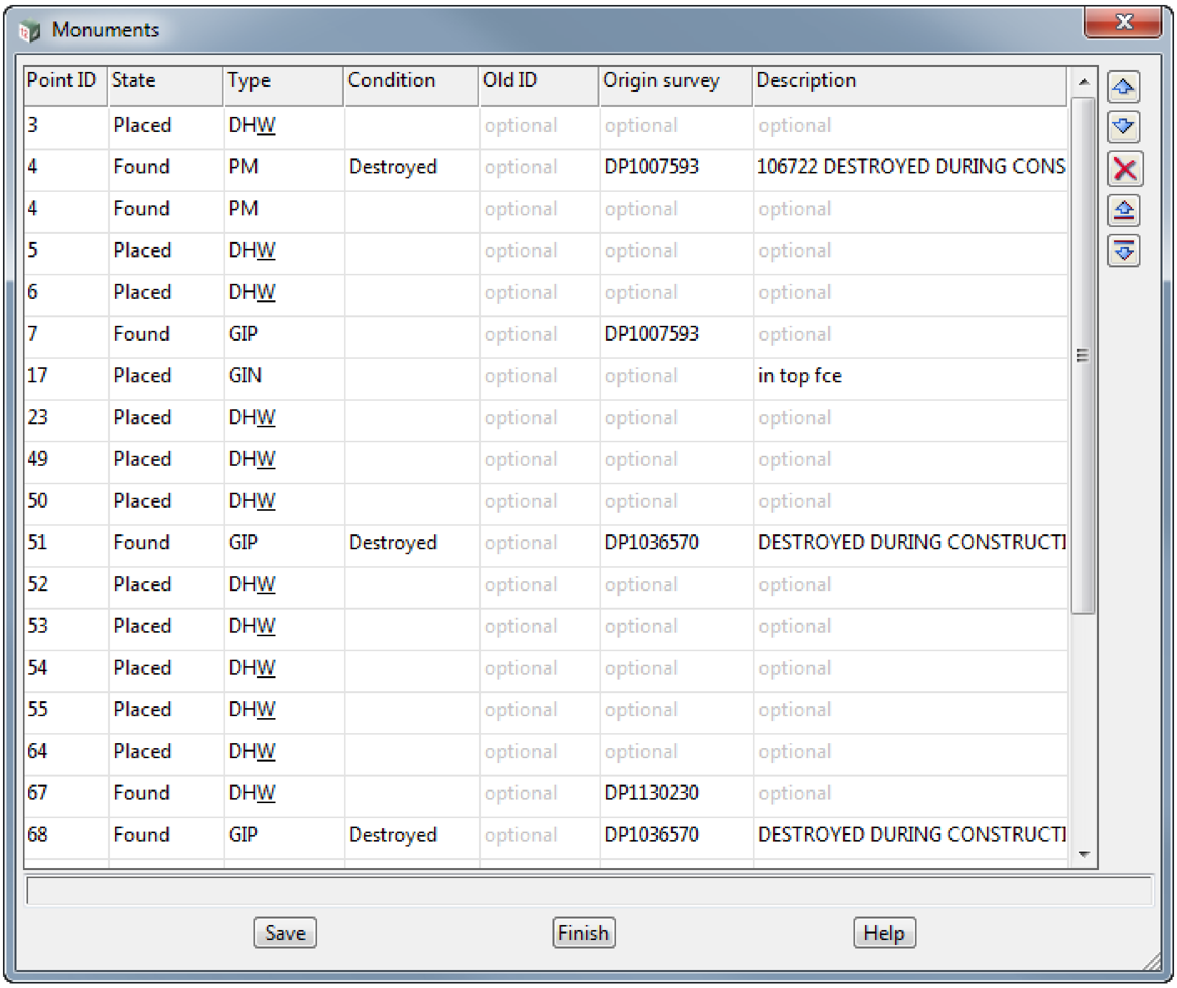
save the data in the panel to the Network object.

19.4.2.1.5 Editing Monuments

Selecting **Edit monuments** brings up the **Monuments** panel which displays in tabular form all the existing Monument points in the Network.

For each Monument Point it displays its Point ID, Type, Condition, Old ID, Origin Survey and Description.

Clicking on a line in the grid will highlight and autopan to the Monument point for that line on any plan views that has the Network on them.



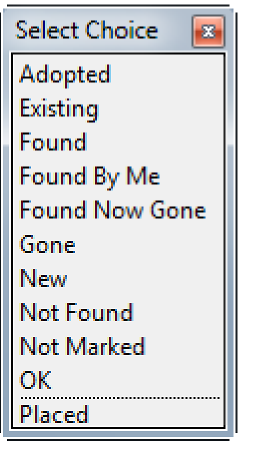
The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Pt ID display only

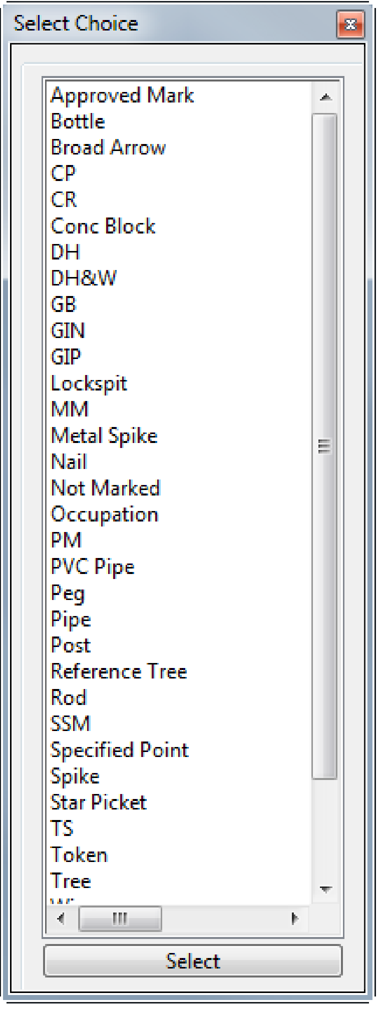
unique Point id of the Monument point in the Network. This can be not be modified.

State choice box



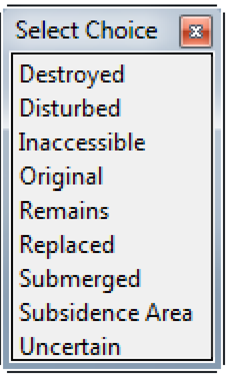
the State of the selected Monument point. This can be modified.

Type choice box



the Type of the selected Monument point. This can be modified.

Condition choice box



the Condition of the selected Monument point (which may be left blank). This can be modified.

Old ID input

the Point Id that the Monument point used to have. This can be modified.

Origin Survey

the Origin Survey for the Monument point. This can be edited.

Description

the description of the Monument point. This can be edited.

Save button

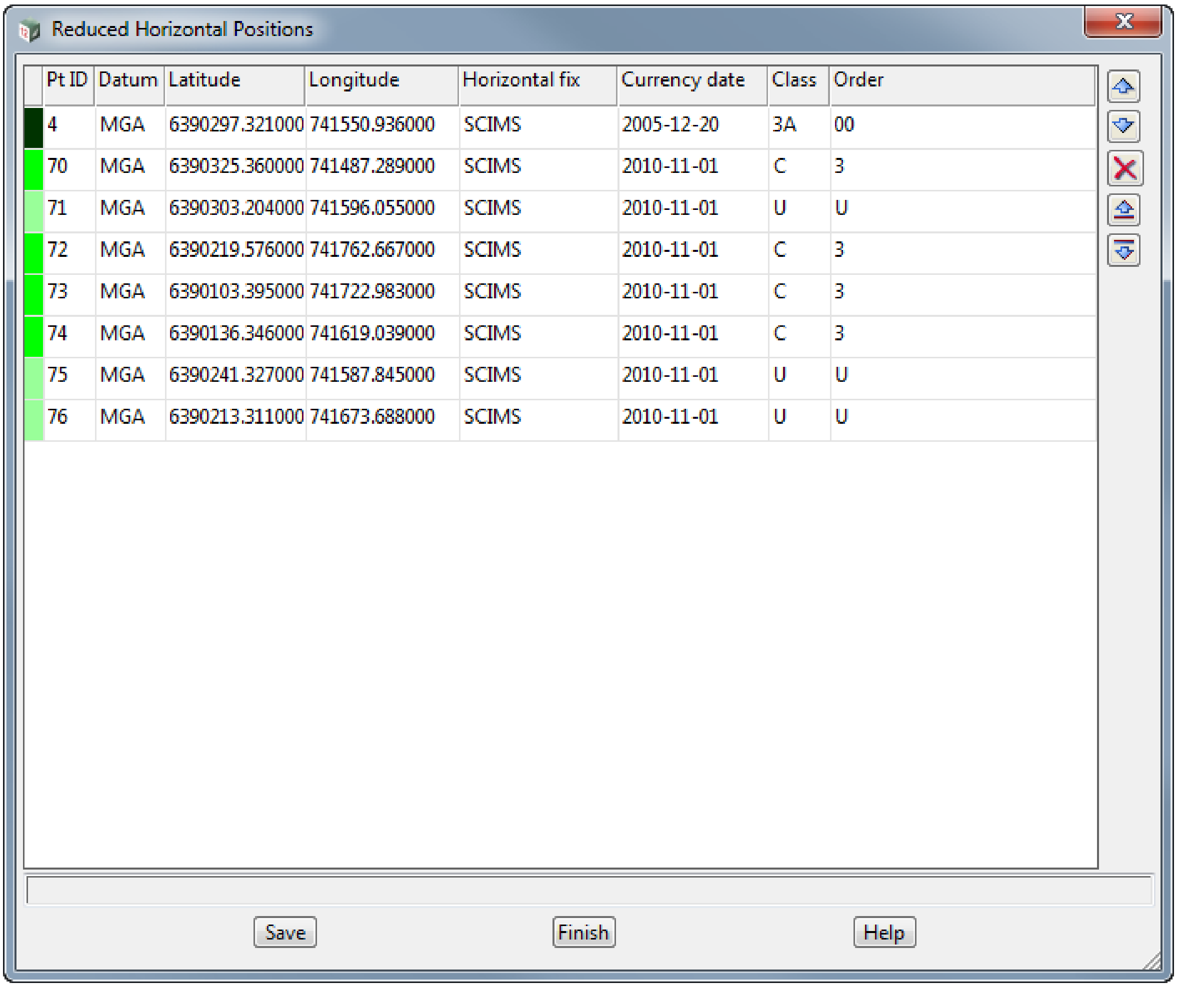
save the data in the panel to the Network object.

19.4.2.1.6 Editing Reduced Horizontal Positions

Selecting **Edit reduced horizontal positions** brings up the **Reduced Horizontal Positions** panel which displays in tabular form all the CG Points in the Network that have **PntSurv** equal to **Control** (the Control points).

For each Control Point it displays the Datum, Latitude (actually Northing) Longitude (actually Easting), Horizontal fix, Currency Date, Class and Order

Clicking on a line in the grid will highlight and autopan to the Control Point for that line on any plan views that has the Network on them.

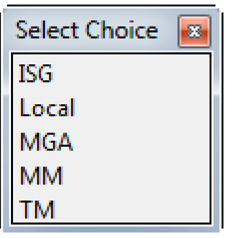


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pt ID	display only		

unique Point id of the Monument point in the Network. This can be not be modified.

Datum choice box



the horizontal datum that the coordinates for the Control Point is in.

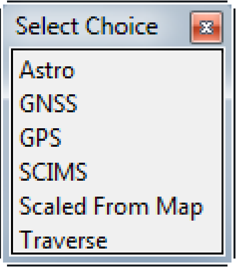
Latitude

the Northing for the Control Point (in the XML file is is stored in the Latitude field).

Longitude

the Easting for the Control Point (in the XML file is is stored in the Longitude field).

Horizontal fix choice box

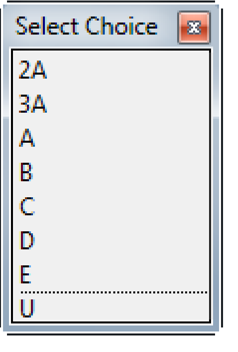


the horizontal fix for the Control Point.

Currency date

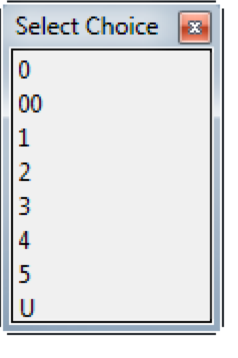
the date that the Control Point coordinates are current.

Class choice box



the class of the Control Point.

Order choice box



the order of the Control Point.

Save button

save the data in the panel to the Network object.

19.4.2.2.2 Importing Observations

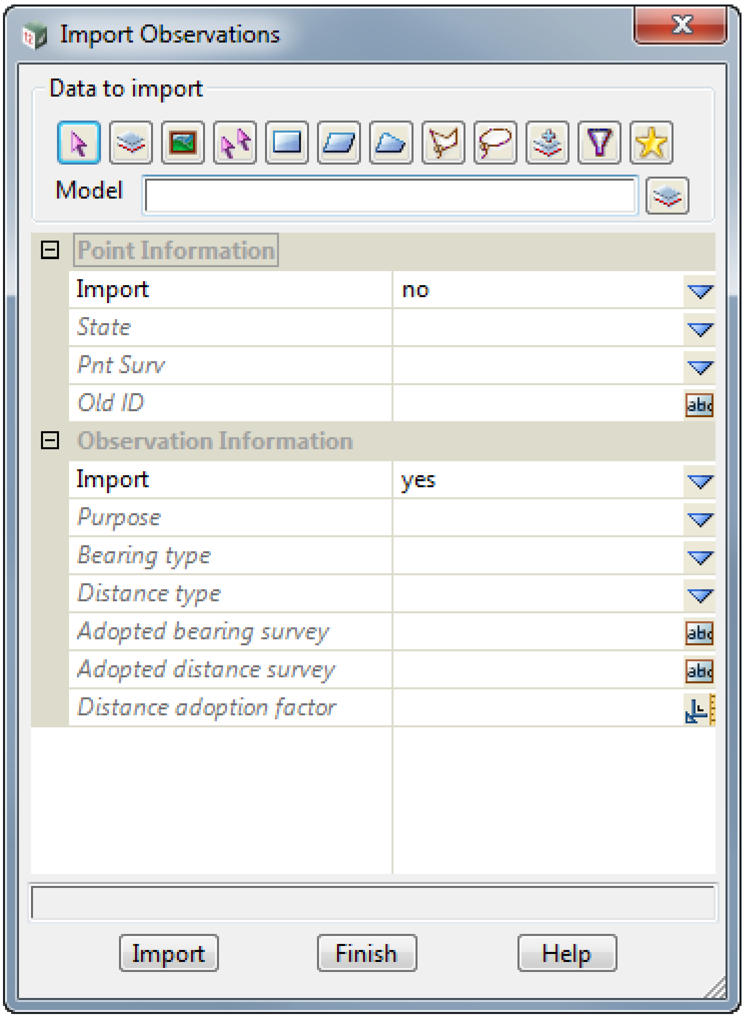
Selecting **Import observations** brings up the **Import Observations** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source

data source for segments to add to the Network as observations.

Point Information

Import	choice box		yes, no

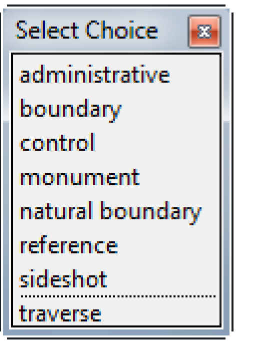
*if **yes,** the selected data is procssed for adding to the network.*

*If **no**.*

State	choice box		existing, proposed

whether the selected observations (segments) are existing survey observations or proposed observations.

Pnt Surv choice box



the type of the selected observations.

Old ID input

the Observation Id that the observation used to have.

Observation Information

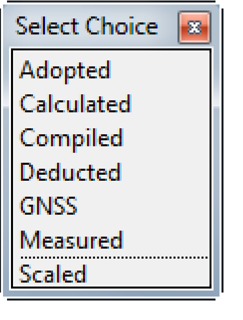
Import choice box yes, no

*if **yes,** the selected data is procssed for adding to the network.*

*If **no**.*

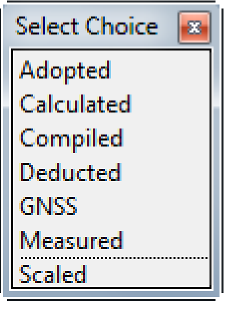
Purpose choice box Boundary, Connection, Road

Bearing type choice box



how the bearing was obtained.

Distance type choice box



how the distance was obtained.

Adopted bearing survey text box

Adopted distance survey text box

Distance adoption factor measure box

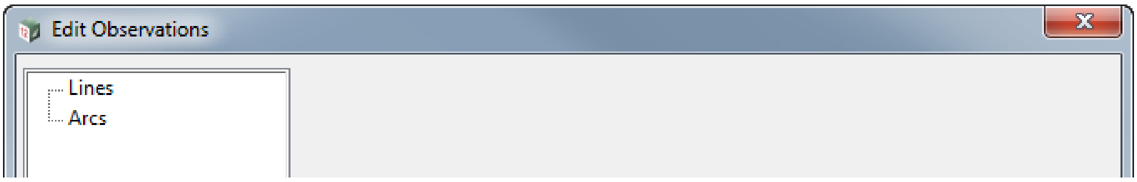
Import button

when pressed the selected segments will be processed. Each segment is checked in turn and if the vertex is outside the tolerance distance of all the existing point in the Network, it is added to the network and given the next available Point id.

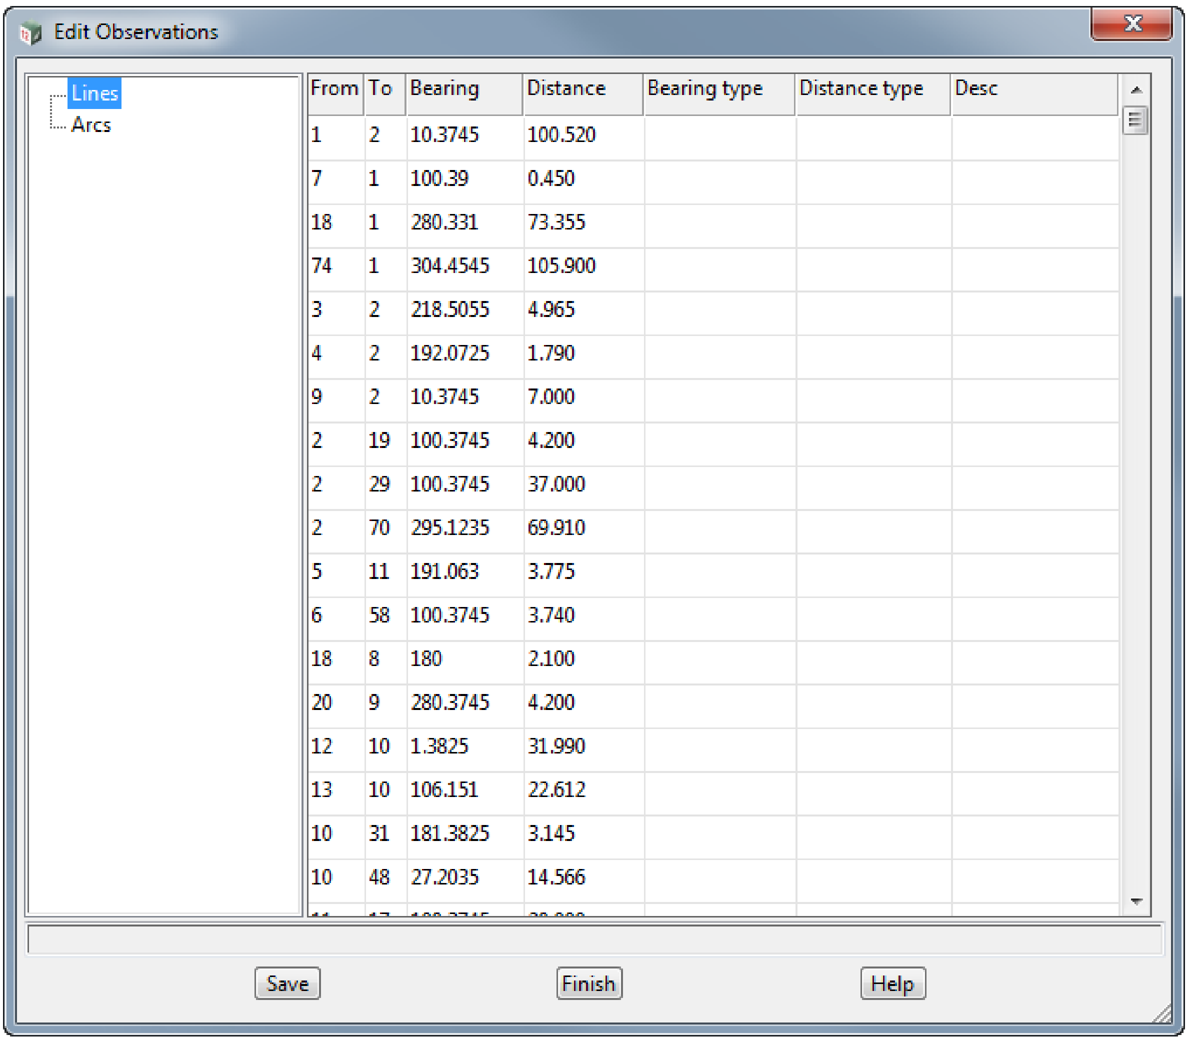
19.4.2.2.3 Editing Observations

Selecting **Edit observations** brings up the **Edit Observations** panel.

Selecting **Edit points** brings up the **Edit Points** panel which displays in tabular form all the existing Lines and Arcs in the Network.



Clicking on the **Lines** node brings up the table of information for each observation of a line.



From	To	Bearing	Distance	Bearing type	Distance type	Desc
1	2	10.3745	100.520			
7	1	100.39	0.450			
18	1	280.331	73.355			
74	1	304.4545	105.900			
3	2	218.5055	4.965			
4	2	192.0725	1.790			
9	2	10.3745	7.000			
2	19	100.3745	4.200			
2	29	100.3745	37.000			
2	70	295.1235	69.910			
5	11	191.063	3.775			
6	58	100.3745	3.740			
18	8	180	2.100			
20	9	280.3745	4.200			
12	10	1.3825	31.990

20.1 Templates in 12d Model

In ***12d Model***, Templates provide a quick and easy method for defining design details along a string for use in conceptual designs and simple detailed designs, and visualisations.

For more complex urban design, intersections and roundabouts, Templates are impractical and not an efficient solution. For these cases ***12d Model*** introduced the ***MTF modifiers*** to provide much finer control and provide all the power of string design without losing the ease of Template design in simpler cases.

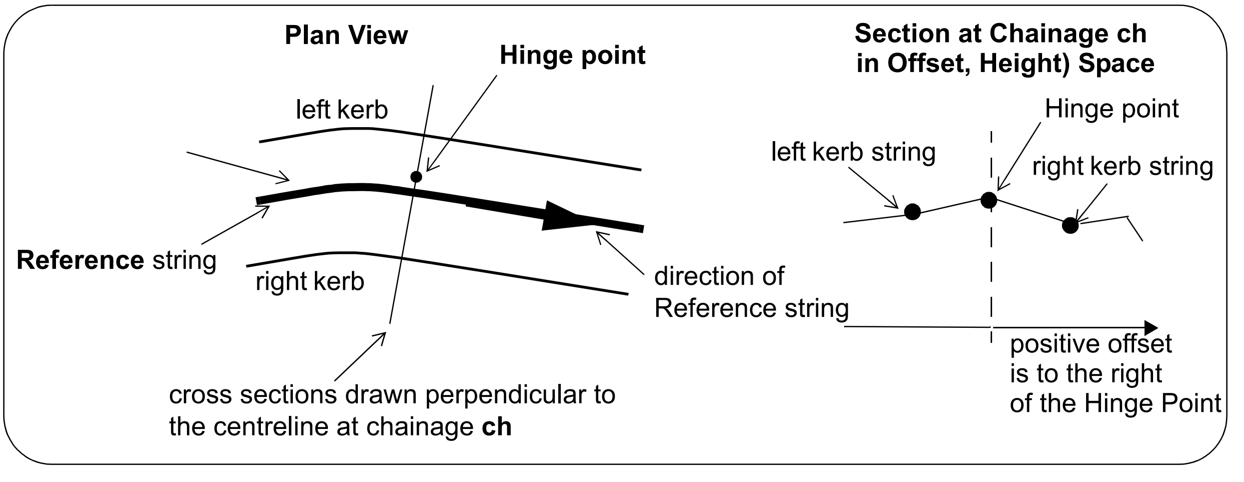
Continue to the next section 20.1.1 Simple Templates.

20.1.1 Simple Templates

But in both the simple **Template** case, and the more powerful **MTF Modifiers** case, the standard civil technique to be able to examining what is happening in a 2D diagram is to look at **cross sections**.

Cross sections are 2D diagrams that display what a section cuts through.

The section is traditionally taken at right angles to a selected **Reference string** (usually an alignment string representing the centreline of a road) and the coordinates of a point in the cross section are (Offset, Height) where Offset is the plan distance along the section of a point in the section from a selected **Hinge Point**, and Height is the height of the point.



A ***12d Model*** **Template** consists of a **left hand side** followed by a **right hand side**.

Each side is made up of a number of **links** with **names** and **colours**, and each link is defined by any two of the three

(a) width of the link

(b) change in z-value from the beginning of the link to the end of the link. that is, the z-value at the end of the link minus the z-value at the start of the link. This is referred to as the **height** of the link.

(c) xfall

and the links are connected sequentially to form a cross section.

Notice that the height is only a **relative** height and **not** a z-value.

On the **left hand side**, the links go from right to left.The vertex (point) at the end of the link is given the same name as the link. The far right of the left hand side is the Hinge Point. So on the left hand side, positive widths go to the left.

On the **right hand side**, the links go from left to right. The vertex (point) at the end of the link is given the same name as the link. The far left of the right hand size is also the Hinge Point. So on the right hand side, positive widths go to the right

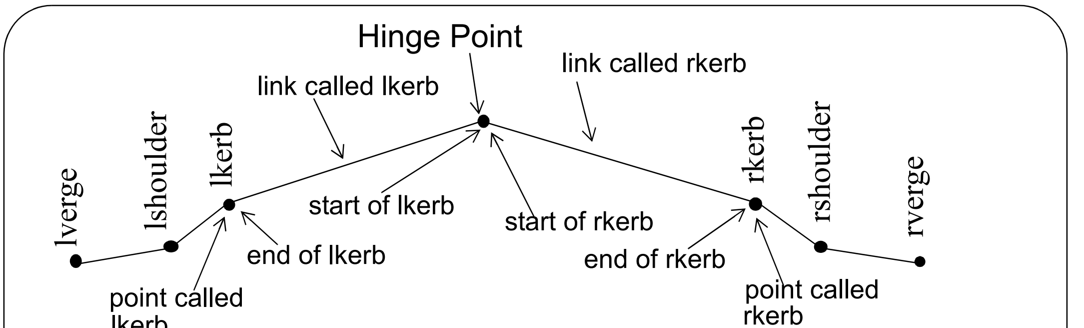
So this definition of the Template is given in terms of **links** and each **link** is defined **relative** to the **previous link** and the left and right hand sides are positioned around a **Hinge Point**.

The **point** at the **end** of the link is given the **name** of the **link** and is called a **Link Point** or **Template Point**.

Hence on the left hand side of the Hinge Point, the Link Point is at the left hand end of the link.

And on the right hand side of the Hinge Point, the Link point is at the right hand end of the link.

For example, a Template consisting of three links called lkerb, lshoulder and lverge on the left hand side, and three links called rkerb, rshoulder, rverge on the right hand side could look like:



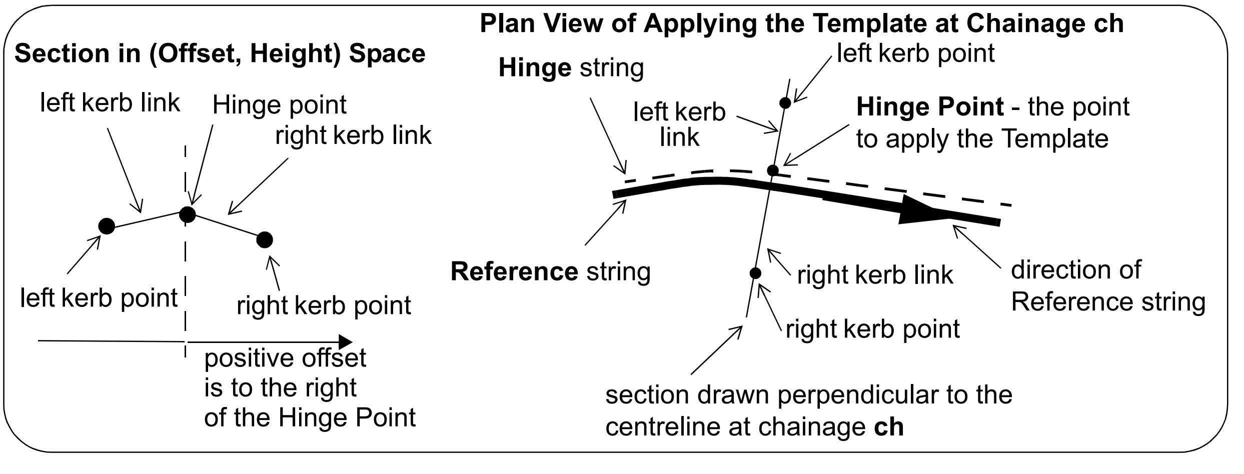
Cross Section View of a Template

Continue to the next section 20.1.1.1 Design X Sections.

20.1.1.1 Design X Sections

A Template is used to generate a cross section at a particular chainage on the Reference string and Hinge string by finding the point where at that chainage the section perpendicular to the **Reference** string **cuts the Hinge string** and the cut point is use as the **Hinge Point** for the Template at that chainage.

So for a simple Template with just the left kerb link on the left hand side and the right kerb link on the right hand side, applying the Template at a chainage **ch** will produce:



This is termed "**applying**" the Template at the chainage **ch**. The created points in the cross section are given the same name as the Link points and joined together in the section in the same order as in the Template

Applying the **Template** to the Reference and Hinge strings means that when the Template is applied at specified chainages down the Reference string.

The sections created by applying a Template are called **design cross sections**, or just **design sections** or **design x sections.**

In ***12d Model***, the design sections are stored as 4d super strings where the (x,y,z) vertices are the coordinates generated applying the Template with the vertex text being the name of the Link point.

Continue to the next section 20.1.1.2 Design Strings.

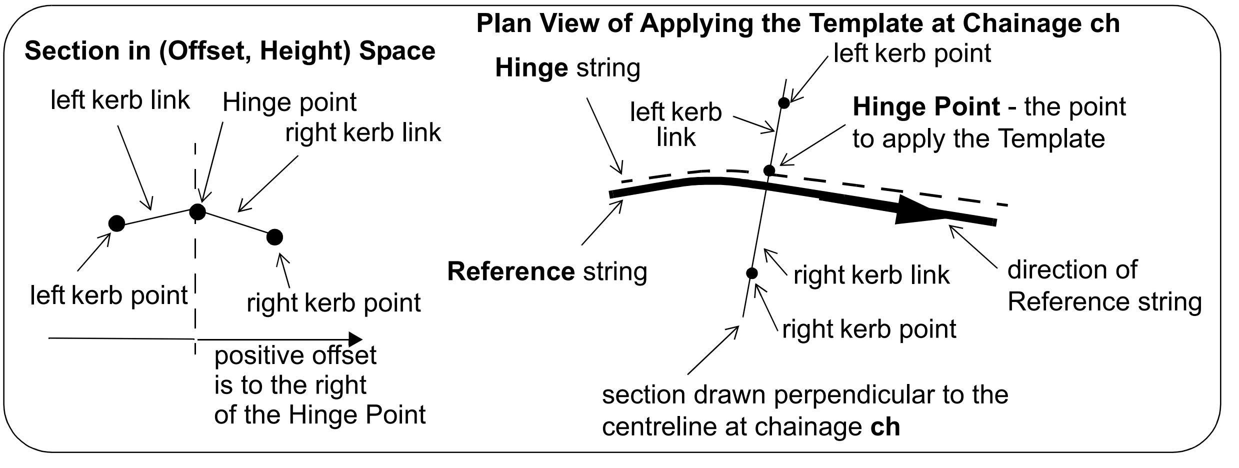
20.1.1.2 Design Strings

For a **Link Point**, for each chainage that the Template is applied there will be a point of the same name on the x section at that chainage.

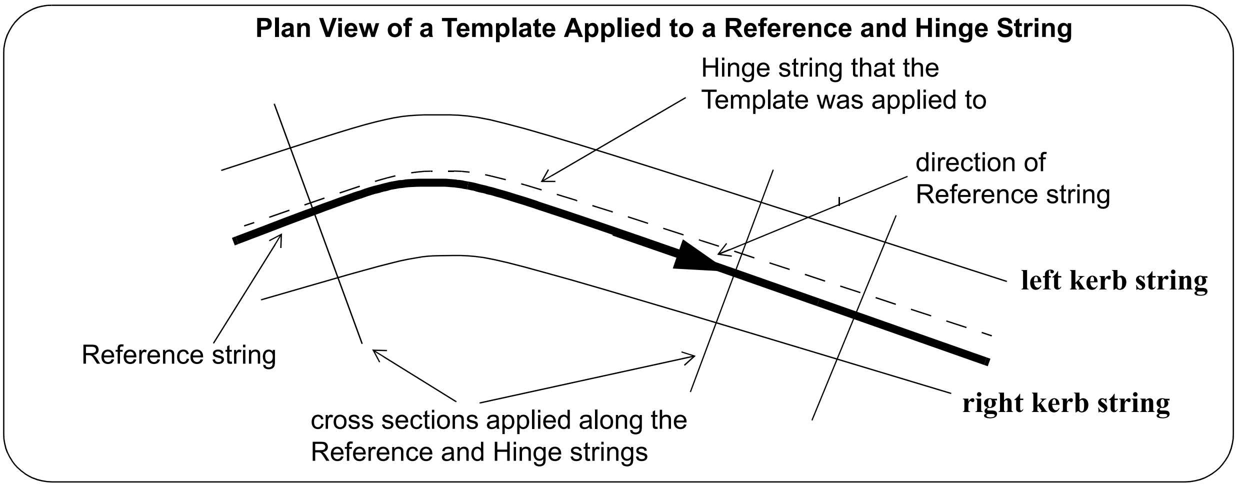
These common points are joined together in chainage order (i.e. longitudinally) to form a ***string*** called the **design string**. The design string is given the **name** of the **Link point** that the string was created from (and hence the same name as the **link**).The default colour of the string is the link colour.

Polygons can also be created for each link by joining the strings created at either end of the link. The polygon is given the link colour.

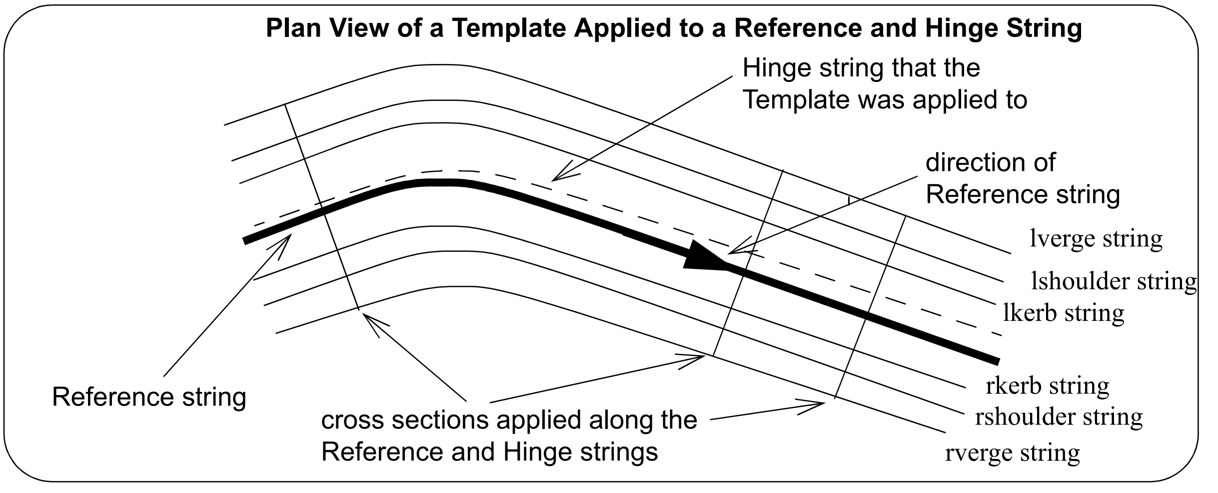
So for the simple two link Template with two **Template Links** *left kerb* and *right kerb:*



will generate two strings *left kerb* and *right kerb*.



And for the case of the more complex six link Template



Continue to the next section 20.1.2 12d Model Templates.

20.1.2 12d Model Templates

12d Model supports Templates with

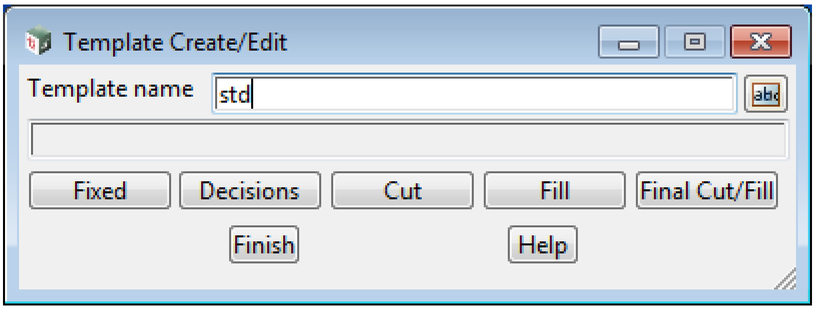
(a) an unlimited number of links that are always created (**fixed links**)

followed by

(b) a decisions table that has special rules to decide when certain links are created

(c) an unlimited number of variable cut links and fill links

(d) a final cut/fill slope to be applied at the end of the last cut or fill template link.



Fixed Template Links

The **fixed template links** are applied to the selected Hinge string and are always used when applying The template regardless of whether the template points are in cut or fill. Each link is defined by two of the three variables, width, height and crossfall, and has a name and colour.

At the end of the fixed links,***12d Model*** checks to see if a **Decisions** table exists.

If a **Decisions** table exists, then it is used and the Decision commands processed.

If a ***Continue Cut/Fill*** command is reached in the decision command processing, then this stops the Decision command processing, and the processing moves onto the **Cut**, **Fill** and **Final Cut/Fill** tables.

If no ***Continue Cut/Fill*** command is reached in the decisions, then the processing stops after the decision commands are exhausted and the **Cut**, **Fill** and **Final Cut/Fill** tables ***ARE NOT USED***.

If **no Decisions** table exists, then the **Cut**, **Fill** and **Final Cut/Fill** tables are used after the **Fixed** table.

Template Decisions

The decisions table is used for

- complicated cut and fill requirements including multiple strata, decisions based on depth below one or more strata or strings, multi-level decisions (i.e. depth decisions followed by fixed links, more depth decision etc.); and
- extended battering including repetitive battering, fixed width batters, and battering relative to a string or strata.

The **decisions** table is documented in the section 21.8 Full Definition of Template Decisions.

Cut and Fill Template Links and Final Cut/Fill

At the end of the fixed links, if there is **no** Decisions table, or if a *Continue Cut Fill* command is reached in the Decisions, the **Cut** and **Fill** tables are used.

(a) If the end of the last link of the fixed template/last decision is in cut, then the Cut links are used.

There can be an unlimited number of cut links and they are used sequentially starting with the first link.

(b) If the end of the fixed template/last decision is in fill, the fill links are used.

There can be an unlimited number of cut and fill links and they are used sequentially starting with the first link.

If the surface tin is intersected when using either the cut links or the fill links, the section is terminated at that intersection point. Otherwise, the entire link is included in the section, and next cut or fill link is then used. This is repeated until the surface is intersected or all the links in the cut or fill table have been used.

If there is still no intersection with the surface after using all of the cut or fill links, then the **Final Cut/Fill** table is used to try and intersect with the tin.

Note: The unlimited cut/fill links are called **variable** template links because at each cross section, a different number of them may be needed. Hence the number of links used varies from cross section to cross section depending on the tin above it.

Final Cut/Fill

If the tin has not been intersected at the end of using the Fixed links, Decisions, and Cut and Fill links, the Final Cut and Fill Slopes are used.

How to create a Template with a fixed link table, a cut and fill tables and the final cut/fill links is discussed further in the option 20.2.2 Create/Edit Templates. The definition of the **Decision Table** is given in the section 21.8 Full Definition of Template Decisions.

For discussion of the Template menu, continue to the next section 20.2 Templates or return to 20.1 Templates in 12d Model.

Note

Around any curves, the Reference string is approximated by chords spaced at the string's chainage interval or, if it is different, the **section separation** interval, or extra points as determined by the horizontal and vertical chord-arc tolerances.

If the chord-to-arc distance is greater than the chord/arc tolerance given in the **Apply** options panels, then extra points are inserted around the curve so that the chord/arc tolerance is met.

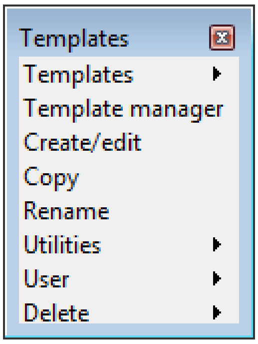
20.2 Templates

Position of menu: **Design =>Templates**

The **templates** walk-right menu has options to create and edit templates, copy, rename and other template utilities.

For a description of templates in ***12d Model***, see section 20.1 Templates in 12d Model.

The **templates** walk- right menu is



list of templates
look settings for templates
create/edit a design template
copy an existing template
rename a template
various template utilities
user defined menu
delete templates from disk

For the option:

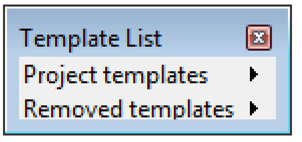
Templates, go to	20.2.1 Templates
Template manager	7.6.12.5 Template Manager
Create/edit	20.2.2 Create/Edit Templates
Copy	20.2.3 Copy Template
Rename	20.2.4 Rename Template
Utilities	20.2.5 Template Utilities
Delete	20.2.6 Delete Templates

20.2.1 Templates

Position of option on menu: **Design =>Templates =>Templates**

The **templates** walk-right menu provides options to list all the templates added to the project templates) and all the templates in the project area but not in the project (removed templates).

The **Templates** walk- right menu is



For the options, see

*Project templates*20.2.1.1 Project Templates

Removed templates20.2.1.2 Removed Templates

20.2.1.1 Project Templates

The **Project templates** walk-right menu provides a list of all the templates in the project.

20.2.1.2 Removed Templates

The **Removed templates** walk-right menu provides a list of all the templates in the project area that have been removed from the project (using the **removed from project** option).

Go to the next section 20.2.2 Create/Edit Templates or return to 20.2 Templates.

20.2.2 Create/Edit Templates

Position of option on menu: **Design =>Templates =>Create/edit**

12d Model supports templates with an unlimited number of fixed links, followed by either

(a) a decisions table

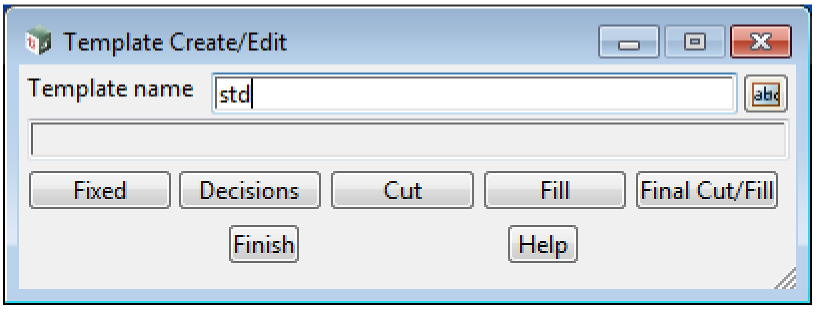
and/or

(b) an unlimited number of cut and fill links and a final cut/fill slope the be applied at the end of the last template link.

To collect the different types of link information needed in the template, the **Template Create/Edit** panel was designed with five buttons **fixed**, **decisions, cut**, **fill** and **final cut/fill** used to bring up and display the panels for creating and editing the fixed, decisions, cut, fill and final cut/fill tables.

For a generate description of Templates in ***12d Model***, see 20.1 Templates in 12d Model.

Selecting **Create/edit** displays the **Template Create/Edit** panel.



The description of the fields and buttons used in the **Template Create/Edit** panel now follows.

The associated panels created by the buttons fixed, cut, fill, final cut/fill will be described in the next four sections and the **Decisions** panel will be described in the section 21.8 Full Definition of Template Decisions.

Field Description	Type	Defaults	Pop-Up
Template name	input		available templates

name of the template being created/edited. If the template already exists, then the associated panels will already contain the information for that template. The buttons fixed, decisions, cut, fill and final cut/fill can only be selected after the **template name** *is given.*

Fixed button

On selecting this button, the **fixed template** *panel is displayed. See* 20.2.2.1 Fixed Template.

Decisions button

On selecting this button, the **Decisions Template** *panel is displayed.*

For the complete definition of decisions, please go to the section 21.8 Full Definition of Template Decisions.

Cut or **Fill** button

The **variable cut** *or* **fill template** *panel is displayed on selecting this button. See* 20.2.2.3 Variable Cut or Fill Template.

Final Cut/Fill button

The **final cut/fill template** *panel is displayed on selecting this button. See* 20.2.2.4 Final Cut/Fill Template.

Note - the buttons can only be selected after the template name has been given in the **Template name** panel field.

How to Use the Panel

(a) A new template is created, or an existing template modified, by first entering the template name into the template field (typed or picked from the pop-up).

(b) To define or edit the fixed sections of the template, select the **Fixed** button and the **Fixed Template** panel will appear.

(c) use the **Decisions** button to define or edit the decisions table

(d) use the **Cut**, **Fill** and **Final Cut/Fill** button to define or edit the variable cut, fill or final cut/fill sections of the template respectively.

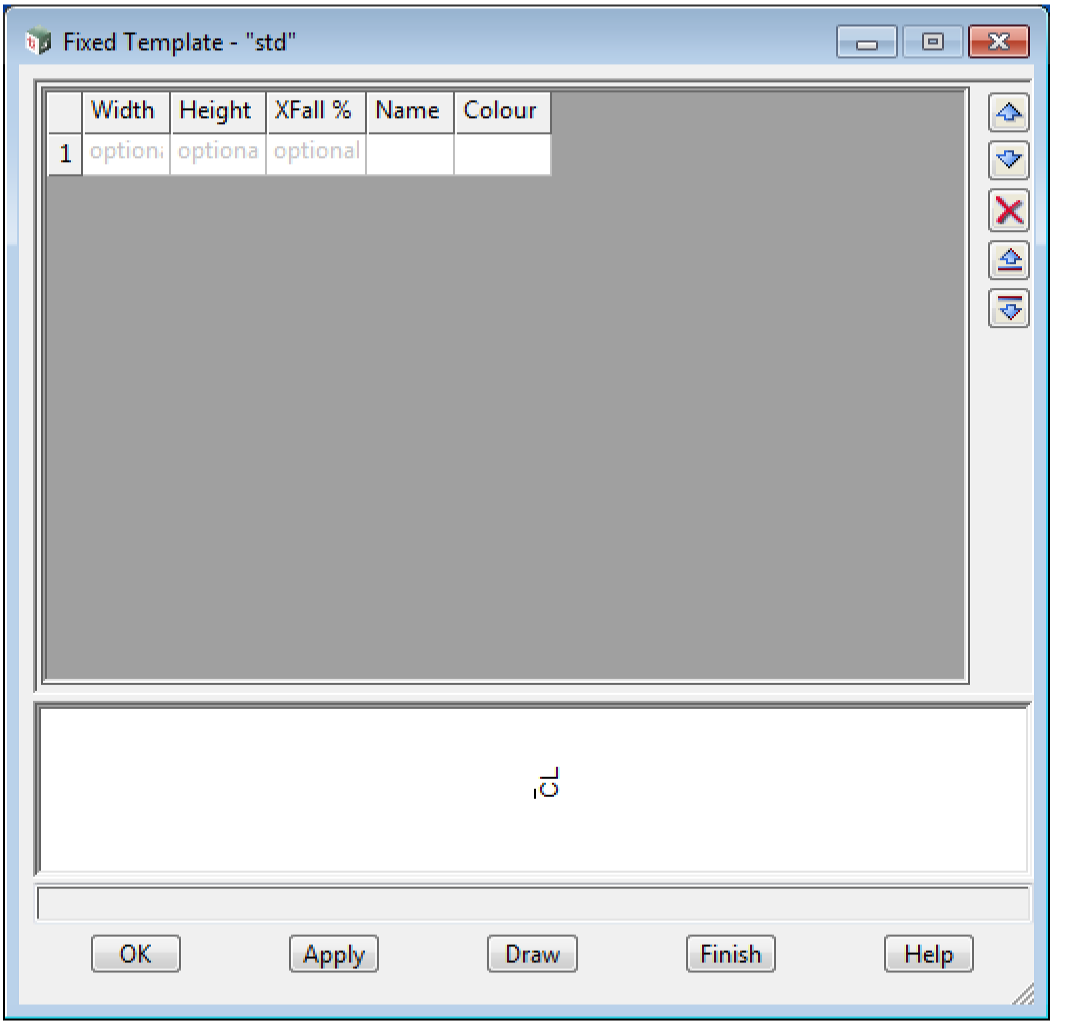
The four panels controlled by the buttons **Fixed**, **Cut**, **Fill** and **Final Cut/Fill** from the **Template Create/Edit** panel will now be described in detail. The **Decisions** button is described in the section 21.8 Full Definition of Template Decisions.

Go to the next section 20.2.2.1 Fixed Template.

20.2.2.1 Fixed Template

If the template already exists, the current fixed template links will be displayed in the panel. If the template is new, the panel will be empty.

The **Fixed Template** panel is



An unlimited number of fixed links can be defined in the grid on the panel. For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

For each link, any two of the three values of width, height and percent crossfall (xfall) can be used to defined the link. The colour and name are also defined for the link.

The name of the link is also given to point at the end of the link and also to the string created by the end of the link. The link colour is used as the string colour and when an **Apply Template** or **Apply MTF** is used, the colour of the polygon created by joining the two ends of the link. See 20.1 Templates in 12d Model.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Width	input		

width of the link being defined

Height	input		

the vertical distance between the end point and the start point of the link being defined.
*For a **fixed** link, height is **positive** in the **up** direction. Hence for a fixed link, height is positive up and*

negative down.

NOTE - if height and cross-fall are being used to go down, then define height to be negative and xfall to be negative.

X-fall % input

*percent cross fall of the link being defined - units are percent grade. For **xfall**, **positive** is **up** and negative down.*

NOTE - if height and xfall are being used to go down, then define height to be negative and xfall to be negative.

Colour colour box available colours

colour of the link being defined. If no colour is supplied, the default colour is used.

Name input

name of the link being defined - this is used as the name of the string created by the end point of the link.

OK/Apply button

OK *stores the values in the fields and exits the panel.* **Apply** *stores the values but doesn't exit the panel.*

***Warning** - If the* **OK** or **Apply** *button is **not** selected, then **no** new information will be recorded.*

Draw button

draws the fixed template at the bottom of the panel. Automatically does a fit.

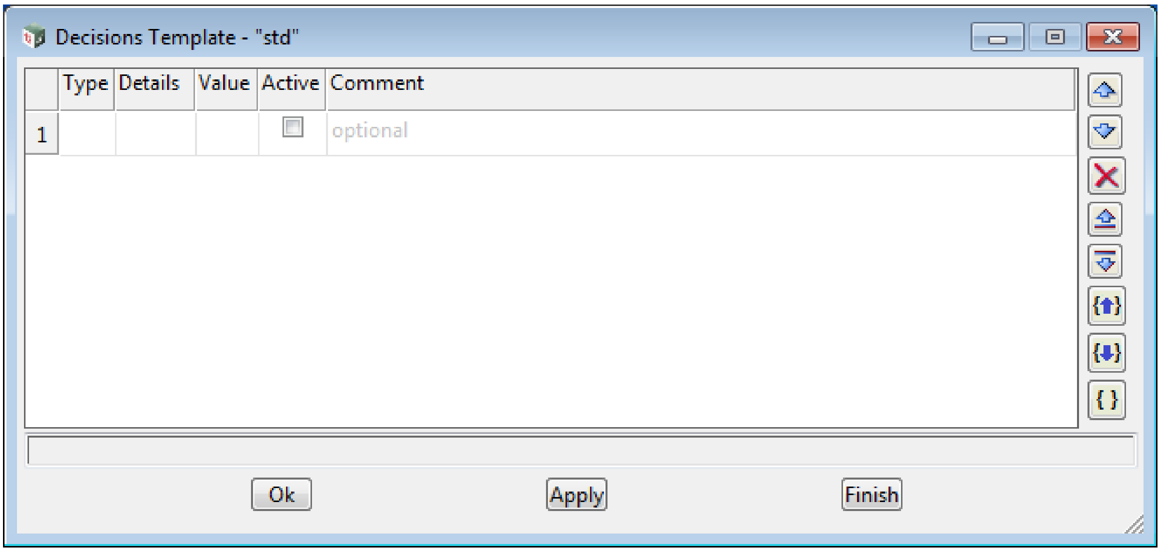
NOTE - if height and xfall are being used to go down, then define height to be negative and xfall to be negative.

Go to the next section 20.2.2.2 Decisions Template or return to 20.2.2 Create/Edit Templates.

20.2.2.2 Decisions Template

If the template already exists, the current Decisions Template links will be displayed in the panel. If the template is new, the panel will be empty.

The **Decisions Template** panel is



The **Decisions Template** panel is documented in the section 21.8 Full Definition of Template Decisions.

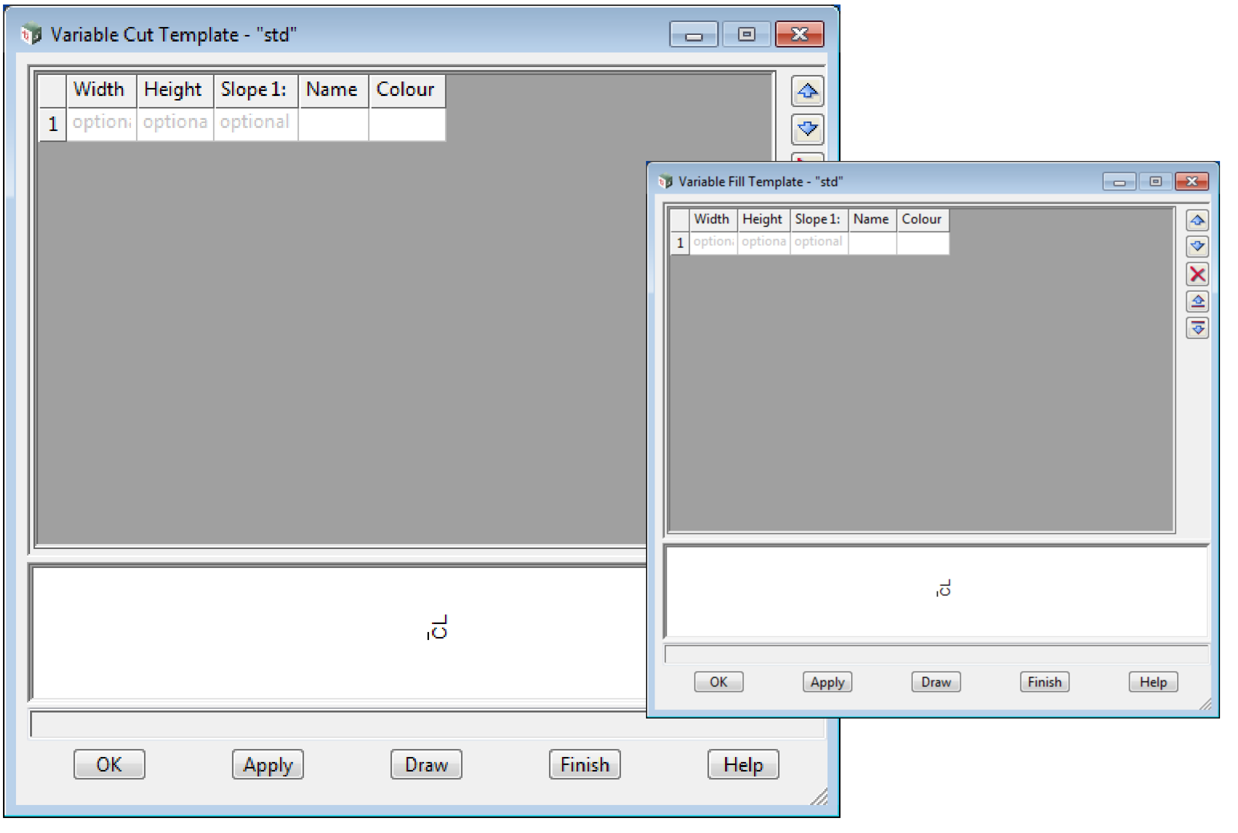
Go to the next section 20.2.2.3 Variable Cut or Fill Template or return to 20.2.2 Create/Edit Templates.

20.2.2.3 Variable Cut or Fill Template

The definition of the cut or fill template links are similar to the fixed template links except the **slope** is given as a “one vertical in a user given horizontal value” rather than a percent crossfall.

If the template already exists, the current cut (fill) template links will be displayed in the panel. If the template is new, the panel will be empty.

The **Variable Cut Template** panel and the **Variable Fill Template** panel are similar and look like



An unlimited number of links can be defined in the variable grid.For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

For each link, any two of the three values of width, height and slope can be used to define the link. The colour and name are also defined for the link.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Width	input		

width of the link being defined

Height	input		

the vertical distance between the end point and the start point of the link being defined.

Important note:

*For **cut** link, **height** is **positive** in the **up** direction. That is, for a cut link, height is positive up and negative down.*

*For **fill** link, **height** is **positive** in the **down** direction. That is, for a fill link, height is positive down and negative up.*

This definition for fill links of down being positive for heights may seem strange but it is to fit in with the definition of slope for fill links where a positive slope is down. This was done so that most of the entries in the Slope table did not need a negative sign in front of them.

Slope 1: input

slope of the cut link being defined. The units are "one vertical in the given horizontal value".

Special note*: the value* ***0*** *is used to* ***designate*** *a* ***horizontal*** *slope since a vertical slope is not allowed.*

In the Variable Cut Template, for ***cut slopes****,* ***positive is up*** *and negative down*
In the Variable Fill Template, for ***fill slopes****,* ***positive is down*** *and negative is up.*

In a Variable **Cut** Template, **positive slope** is **up** and **positive height** is **up**.

In a Variable **Fill** Template, **positive slope** is **down** and **positive height** is **down**.

Important note:
This definition of slope for fill links of down being positive may seem strange but it was done so that most of the entries in the Slope table did not need a negative sign in front of them.

NOTE -in cut: *if height and slope are being used to go down, then define height to be negative* ***and*** *slope to be negative.*

In fill: *if height and slope are being used to go up, then define height to be negative* ***and*** *slope to be negative.*

Colour colour box available colours

colour of the link being defined. If no colour is supplied, the default colour is used.

Name input

name of the link being defined - this is used as the name of the string created by the end point of the link.

OK/Apply button

OK *stores the values in the fields and exits the panel.* **Apply** *stores the values but doesn't exit the panel.*

Warning - If the **OK** or **Apply** button is **not** selected, then **no** new information will be recorded**.**

NOTE -in cut: if height and slope are being used to go down, then define height to be negative and slope to be negative.
In fill: if height and slope are being used to go up, then define height to be negative and slope to be negative.

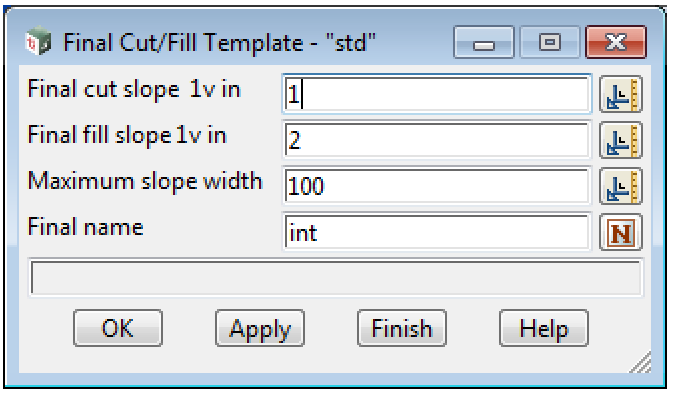
Go to the next section 20.2.2.4 Final Cut/Fill Template or return to 20.2.2 Create/Edit Templates.

20.2.2.4 Final Cut/Fill Template

The Final Cut/Fill Template is used if the links in either the cut or fill templates are exhausted without an intersection with the tin being found.

If the Template already exists, the current final cut/fill values will be displayed in the panel. If the Template is new, the default values are displayed.

The **Final Cut/Fill Template** panel is



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Final cut slope 1 v in	input	0	no slope, 0,1,2,3,4,5,10

the cut slope is used if the end of the last link in the template is in cut. That is, it is below the tin.

*This value is the Cut slope for the interface calculation to be done at the end of the last link of the template. A cut slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a **horizontal** slope - vertical slopes are not allowed.*

*For **final cut slope**, **positive is up** and negative down*

Field Description	Type	Defaults	Pop-Up
Final fill slope 1 v in	input	0	no slope, 0,1,2,3,4,5,10

the fill slope is used if the end of the last link in the template is in fill. That is, it is above the tin.

*This value is the Fill slope for the interface calculation to be done at the end of the last link of the template. A fill slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a **horizontal** slope - vertical slopes are not allowed.*

*For **final fill slope**, **positive is down** and negative is up.*
This definition of fill slope being positive when going down is used so that the value in the **Final fill slope 1 v in** *field is normally positive.*

Field Description	Type	Defaults	Pop-Up
Maximum slope width	input	100	

the maximum width for the final slope.

Field Description	Type	Defaults	Pop-Up
Final name	input	int	

name for the string created by this link (normally this string lies on the tin - the interface string).

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

OK *stores the values in the fields and exits the panel.* **Apply** *stores the values but doesn't exit the panel.*

Warning - If the **OK** or **Apply** button is **not** selected, then **no** new information will be recorded**.**

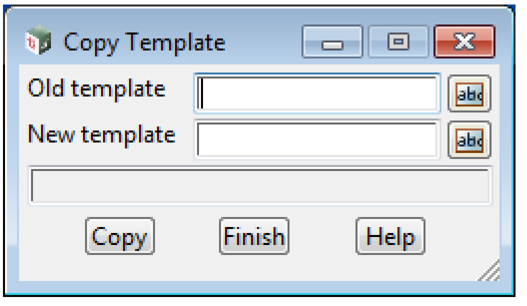
Go to the next section [20.2.3 Copy Template] or return to [20.2.2 Create/Edit Templates] or [20.2 Templates].

20.2.3 Copy Template

Position of option on menu: **Design =>Templates =>Copy**

A copy of an existing template can be made using the **Copy** option. This is often useful when a new template that is similar to an existing template is needed. The existing template can be copied and the copy then edited and modified.

On selecting the **Copy** option, the **Copy Template** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old template	template box		available templates

name of the template to be copied.

New template	template box		available templates

name of the template copy.

Copy	button		

after selecting this button, the template given in the **Old template** *field will be copied and the copy given the name in the* **New template** *field.*

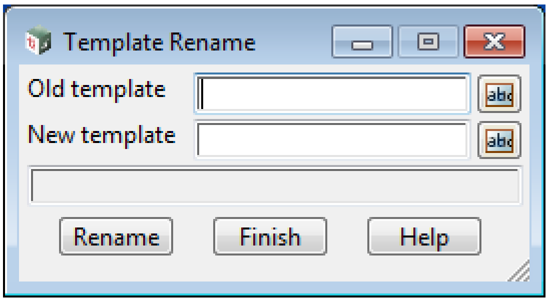
Go to the next section 20.2.4 Rename Template or return to 20.2 Templates.

20.2.4 Rename Template

Position of option on menu: **Design =>Templates =>Rename**

On selecting the **Rename** option, the **Template Rename** panel is displayed.

This panel can be used to change the names of existing templates



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old template	template box		available templates

name of the template to be renamed.

New template	template box		

new name for the template

Rename	button		

Change the name of the template in the **old template** *field to the name given in the* **new template** *field.*

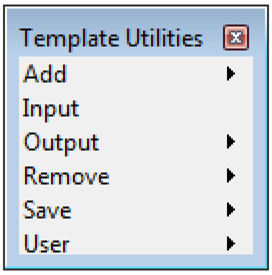
Go to the next section 20.2.5 Template Utilities or return to 20.2 Templates.

20.2.5 Template Utilities

Position of menu: **Design =>Templates =>Utilities**

The **Utilities** menu contains miscellaneous options involving templates.

The **Utilities** walk-right menu is



add templates to project
read in template file
write out templates
remove templates from project
save templates to disk

Each option will now be described.

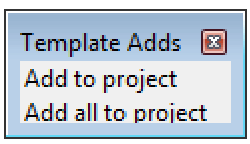
For the options see

Add	20.2.5.1 Add Templates
Input	20.2.5.2 Input Templates
Output	20.2.5.3 Output Templates
Remove	20.2.5.4 Remove Templates
Save	20.2.5.5 Save Templates

20.2.5.1 Add Templates

Position of menu: **Design =>Templates =>Utilities =>Add**

Removed templates can be added back into the project using the options in the **Add** walk-right menu. The **Template Adds** walk-right menu is



For the option *Add to project*, go to 20.2.5.1.1 Add a Template to a project
Add all to project 20.2.5.1.2 Add All Templates to a Project

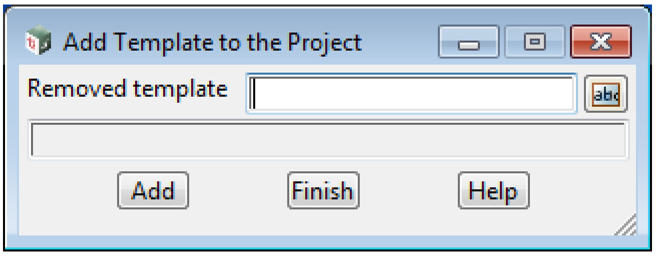
Go to the next section 20.2.5.1 Add Templates, or return to 20.2.5 Template Utilities or 20.2 Templates.

20.2.5.1.1 Add a Template to a project

Position of option on menu: **Design =>Templates =>Utilities =>Add =>Add to project**

Templates in the working project area but not yet in the project can be added to the project using this option.

On selecting the **Add to project** option, the **Add Template to the Project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed template	removed templates box		removed templates

name of the template to be added to the project.

Add	button		

add the template given in the **template** *field to the working project.*

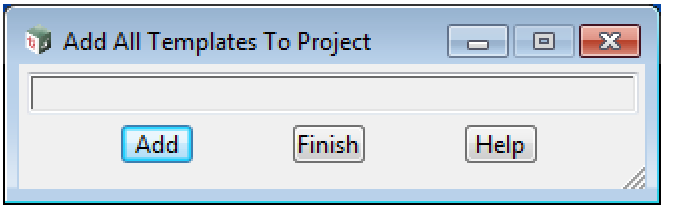
Go to the next section 20.2.5.1.2 Add All Templates to a Project, or return to 20.2.5.1 Add Templates or 20.2.5 Template Utilities.

20.2.5.1.2 Add All Templates to a Project

Position of option on menu: **Design =>Templates =>Utilities =>Add =>Add all to project**

The **Add all to project** option is used to add all the removed templates back into the project.

On selecting the **Add all to project** option, the **Add All Templates To Project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Add	button		

after selecting this button, all removed templates in the working project will be added to the project.

Return to 20.2.5.1 Add Templates or 20.2.5 Template Utilities.

20.2.5.2 Input Templates

This **input** option is used to read in templates from files in this special ***12d Model*** format.

The option has already been described under **File I/O=>Templates input** (see 8.11.1 Templates Input)

Go to the next section 20.2.5.3 Output Templates, or return to 20.2.5 Template Utilities.

20.2.5.3 Output Templates

The **output** option writes out one or all templates in the ***12d Model*** template format.

The option has already been described under **File I/O=>Templates output (**see 8.11.2 Templates Output).

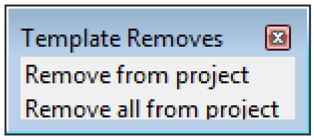
Go to the next section 20.2.5.4 Remove Templates, or return to 20.2.5 Template Utilities.

20.2.5.4 Remove Templates

Position of menu: **Design =>Templates =>Utilities =>Remove**

Templates can be removed from the project using the options in the remove walk-right menu. Removed templates are not deleted but remain in the project area and are no longer accessible in the project.

The **Template Removes** walk-right menu is



For the options see

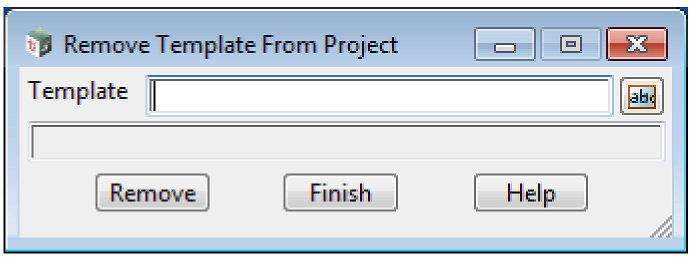
Remove from project 20.2.5.4.1 Remove Template from Project

Remove all from project 20.2.5.4.2 Remove All Templates From Project

20.2.5.4.1 Remove Template from Project

Position of option on menu: **Design =>Templates =>Utilities =>Remove => Remove from project**

Individual templates can be removed from the project using the **Remove from project** option and on selecting the option, the **Remove Template From Project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		available templates

name of the template to be removed from the working project.

Remove	button		

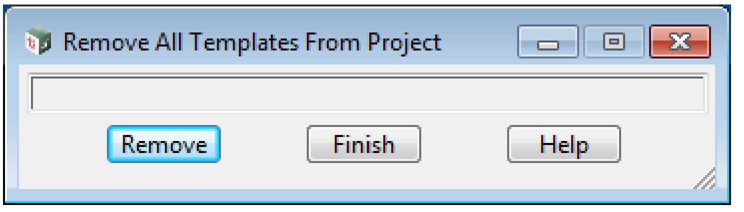
after selecting this button, the template given in the template field will be removed from the working project.

Go to the next section 20.2.5.4.2 Remove All Templates From Project, or return to 20.2.5.4 Remove Templates or 20.2.5 Template Utilities.

20.2.5.4.2 Remove All Templates From Project

Position of option on menu: **Design =>Templates =>Utilities =>Remove => Remove all from project**

All templates can be removed from the project using the **Remove all** option and on selecting the option, the **Remove All Templates From Project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Remove	button		

after selecting this button, all templates in the working project will be removed.

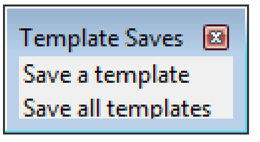
Return to 20.2.5.4 Remove Templates or 20.2.5 Template Utilities.

20.2.5.5 Save Templates

Position of menu: **Design =>Templates =>Utilities =>Save**

Templates can be saved on disk. This is done automatically by the **Save** option on the ***12d Model*** but this option allows just the templates to be saved.

The **Template saves** walk-right menu is



For the options see

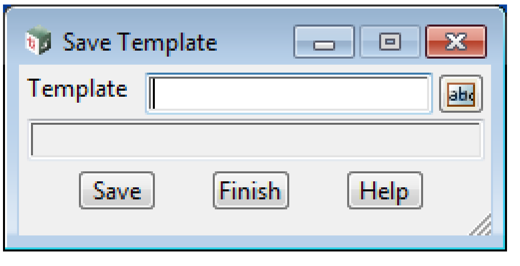
*Save a template*20.2.5.5.1 Save a Template

Save all templates20.2.5.5.2 Save All Templates

20.2.5.5.1 Save a Template

Position of option on menu: **Design =>Templates =>Utilities =>Save =>Save a template**

On selecting the **Save a template** option, the **Save Template** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		available templates

name of the template to be saved.

Save	button		

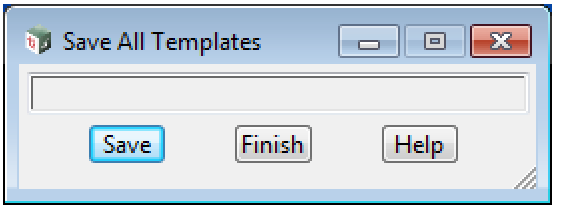
after selecting this button, the template given in the template field will be saved to disk.

Go to the next section 20.2.5.5.2 Save All Templates, or return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.

20.2.5.5.2 Save All Templates

Position of option on menu: **Design =>Templates =>Utilities =>Save =>Save all templates**

On selecting the **Save all templates** option, the **Save All Templates** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

after selecting this button, all templates in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.

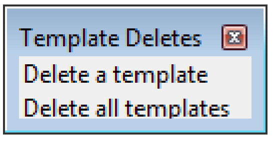
20.2.6 Delete Templates

Position of menu: **Design =>Templates =>Delete**

Using the **Delete** option, templates can be deleted from the project and moved to the Trash Bin, or permanently deleted from the computer disk so that they can no longer be accessed or take up disk space.

To help protect the user against disasters, when a template is selected for deletion, a **Yes-No** pop-up menu is used to confirm that the user did intend deleting the template.

The **Template Deletes** walk-right menu is



For the options see

*Delete a template*20.2.6.1 Delete a Template

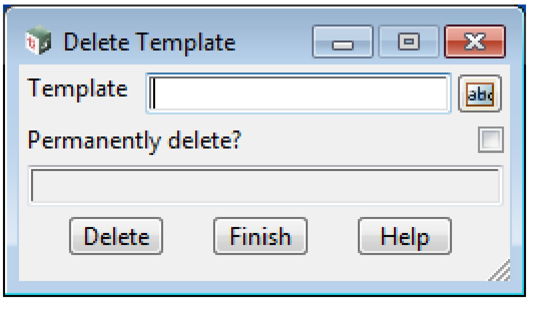
*Delete all templates*20.2.6.2 Delete All Templates

20.2.6.1 Delete a Template

Position of option on menu: **Design =>Templates =>Delete =>Delete a template**

The **delete a template** option is used to delete individual template from the project.

On selecting the **Delete a template** option, the **Delete Template** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		project templates

name of the template to be deleted.

Permanently delete?	tick box		

if ticked, the deleted template will not go to the trash bin but will be permanently deleted from disk

Delete	button		

after selecting this button, the template given in the template field will be deleted. A **Yes-No** *pop-up is used to confirm that deletion is required.*

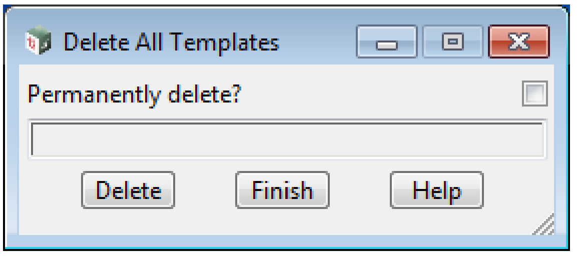
Go to the next section 20.2.6.2 Delete All Templates, or return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.

20.2.6.2 Delete All Templates

Position of option on menu: **Design =>Templates =>Delete =>Delete all templates**

The **Delete all** option will delete all templates in the working project. It does not delete templates that are in the working project area but not yet added to the project.

On selecting the **Delete all** option, the **Delete All Templates** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete	button		

after selecting this button, a **Yes-No** *pop-up is used to confirm that deletion is required. If it is, all templates in the project will be deleted from disk. Unless an error occurs, the panel will be removed.*

Permanently delete tick box

if ticked, the deleted templates will not go to the trash bin but will be permanently deleted from disk.

Return to 20.2.5.5 Save Templates or 20.2.5 Template Utilities.

20.3 Apply Functions

Position of menu: **Design =>Apply**

The **Apply** options are for producing design strings using **Templates** and **Modifiers** to create strings along a Reference or Reference and Hinge string - “Applying the Modifiers to a string”.

This method is used to quickly produce roads, canals, trenches, site batters etc.

When applying the modifiers and templates, design x-sections and strings are automatically produced, plus the cut and fill volumes for the design.

Creating a design in this way is the first job of the **Apply** options.

However, after applying modifiers and templates and examining the results, it is normally necessary to make changes to the Reference or Hinge strings, the modifiers and templates, or even the tin used for interfacing.

In all cases, the strings, sections and volumes created during the **Apply** are no longer valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them with new ones by re-applying the template, this is time consuming if repeated over and over again.

Hence in ***12d Model***, the concept of an **Apply function** and **Recalc** was introduced.

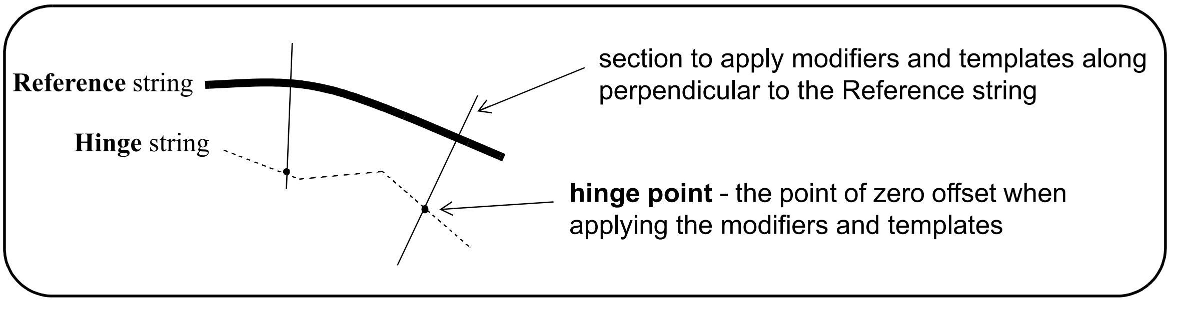
Basically, an **Apply Function** keeps track of all the information involved in applying Modifiers and Templates, and all the strings and models created during the **Apply Template/Apply MTF**.

If either the reference or Hinge strings, the Modifiers or Templates or the Tin are changed, the Apply Functions can be re-run and all the old information automatically deleted and replaced by the updated information.

NOTES ABOUT THE STRING CHOSEN TO APPLY MODIFIERS AND TEMPLATES TO

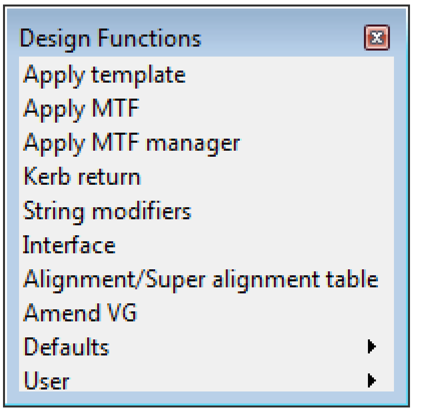
1. The **Apply** options create sections and strings using a **Reference** string to define the chainage and what is meant by perpendicular at each chainage, and a **Hinge** string from where the modifiers and templates links are defined. That is, the Hinge string defines the zero offset. The Modifiers and Templates define a point name and colour for each template link.

   Cross sections can be created with point names corresponding to the template links, and strings formed by joining the same named points from consecutive cross sections.



2. If vertical geometry does not exist for the entire length of the string that the templates are being applied to (either the Hinge string, or if there is no Hinge string then the Reference string), then the modifiers and templates are only applied to the section of the string where vertical geometry exists.
3. If the horizontal or vertical geometry has overlapping tangent points at any section of the string, then the option terminates without any calculations being made.
4. Any curves will be approximated by chords spaced at chainage interval given by the **section separation** value. If the chord-to-arc distance for the chords is greater than the chord/arc tolerance given in the **Apply template/Apply MTF** panel, then extra points are inserted around the curve so that the chord/arc tolerance is met.

The **Apply** walk-right menu is



Each option in this menu will now be described.

For the options:

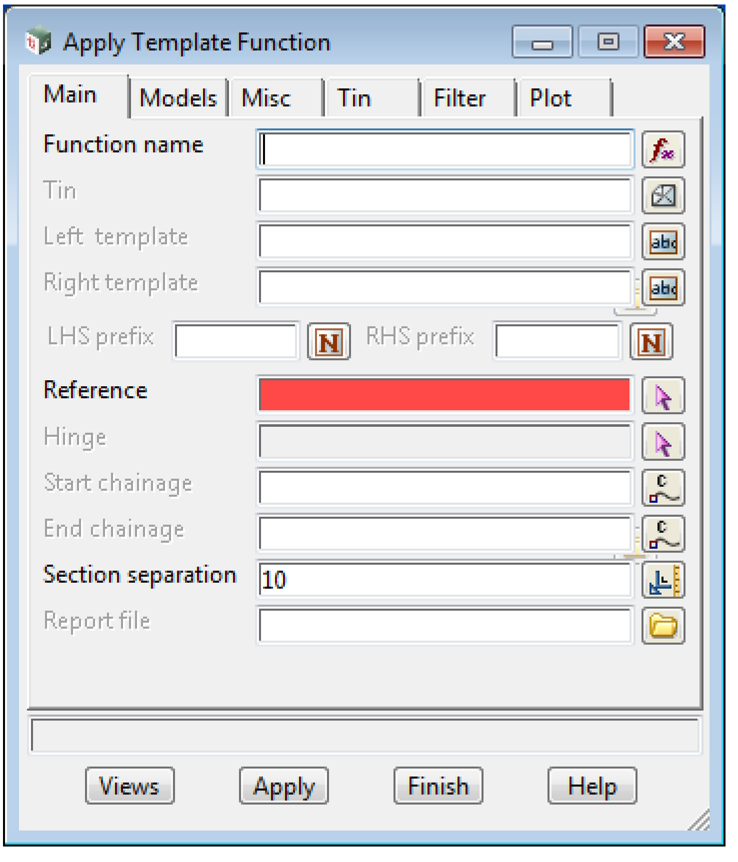
Apply template	20.3.1 Apply Template Function
Apply MTF	20.3.2 Apply MTF Function
Apply MTF manager	20.3.3 Apply MTF Manager - Create/Update
Kerb return	20.3.5 Kerb Return Function
String modifiers	20.3.6 String Modifiers Function
Interface	20.3.7 Interface Function
Alignment/Super alignment table	24.16.14 Alignment & Super Alignment Table 24 Drafting
Amend VG	20.3.8 Amend VG
Defaults	20.3.1 Apply Template Function

20.3.1 Apply Template Function

Position of option on menu: **Design =>Apply =>Apply**

Selecting **Apply** displays the **Apply Template Function** panel.

This panel is used to collect the information for applying a new Apply function, or to change the information for an existing Apply function.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Buttons at bottom

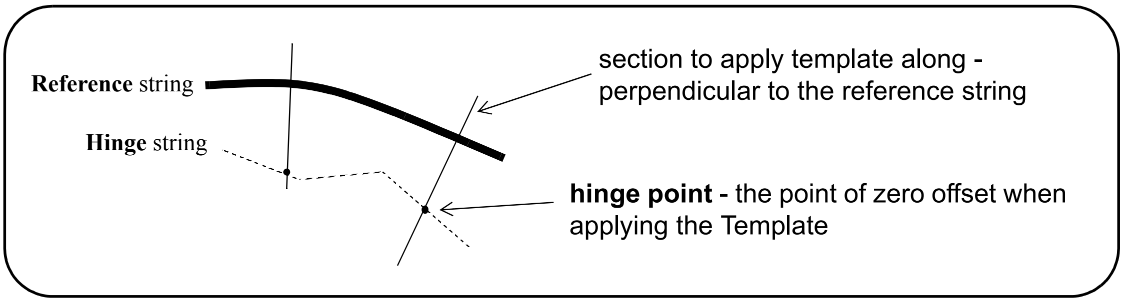
Views button

perspective views can be defined with respect to chainages on the string. This option is described in more detail in the section 20.3.1.1 Views

Apply button

apply the template information to the selected reference and hinge strings, between the start and end chainages.

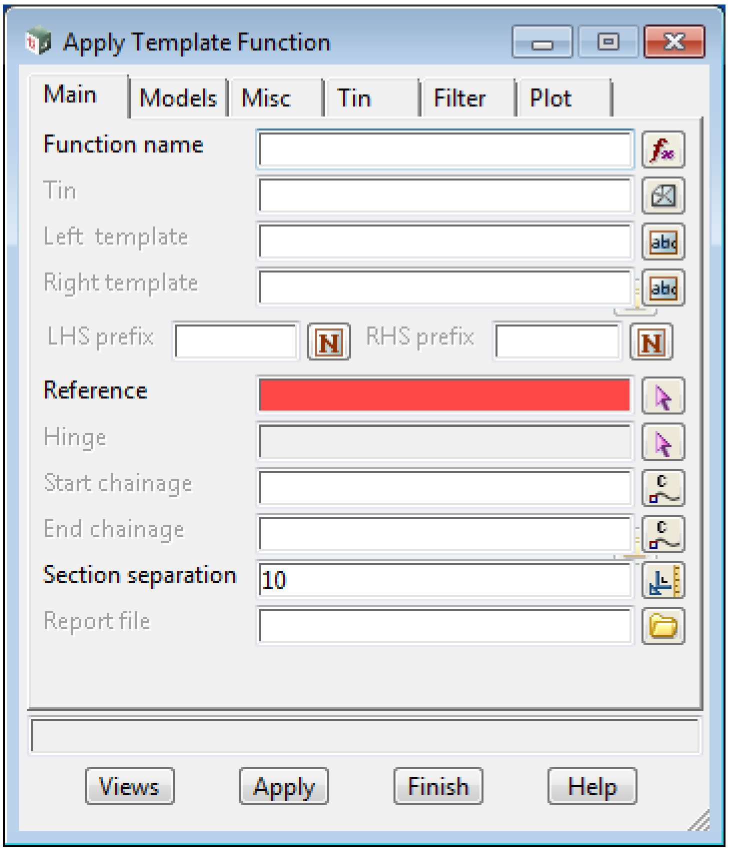
The cut, fill and balance volumes are also calculated and written to the message area.



For the information on each **Apply Template Function** tab, go to

[Apply Main tab]
[Apply Models tab]
[Apply Misc tab]
[Apply Tin tab]
[Apply Filter tab]
[Apply Plot tab]

Apply Main tab



Function name function box available template functions

name of the function to define the **apply** *for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.*

Tin tin box available tins

if non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the **left** *and* **right template** *fields.*
If blank, then only the fixed part of the templates are used unless a tin is specified in the ***decisions*** *section of the templates.*

Left/right template template box available templates

name of the template to be applied to the left/right of the string. If a template is used on the left/right, the template definitions go from the hinge string out to the left/right.

LHS/RHS prefix input

*prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give the text. If post text is required, precede it by a *.*

Reference string-select

the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.

Hinge string-select

the reference string defines chainage and bearing but the templates are actually applied to the hinge string. For a given chainage, a line is taken at right angles to the point of that chainage on the reference string and extended until it cuts the hinge string. The templates are applied at that point on the hinge string along the direction of the line.
If no hinge string is selected, the reference string is also the hinge string.

Start/End chainage input

the reference string start/end chainage for applying the template. If blank, the **start/end chainage** *of the reference string is used.*

Section separation input 10.0

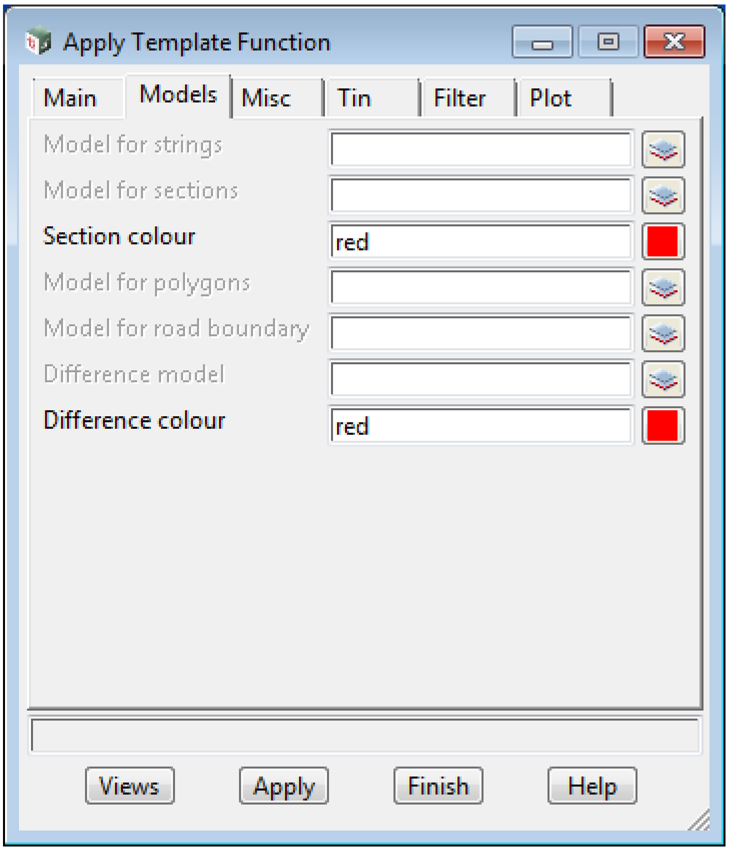
sections are created at right angles to points on the reference string that are the **section separation** *chainage distance apart.*

Report file file box *.rpt

if not blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be appended to the file.

If blank, no report is produced.

Apply Models tab



Model for strings model box available models

if not blank, the name of the model to contain the template and interface strings. The string colour is the template link colour.

If blank, the strings will not be stored.

Model for sections model box available models

if not blank, the name of the model to contain the design sections generated by the templates.
If blank, the sections will not be stored.

Section colour colour box default colour available colours

the colour for the sections strings

Model for polygons model box available models

if not blank, the name of the model to contain the polygons created for each link of the template. The polygon is given the colour of the template link.

If blank, the polygons will not be stored.

Model for road boundary model box available models

if not blank, the name of the model to contain the polygon created by joining the outside links of the road.

If blank, the polygon will not be stored.

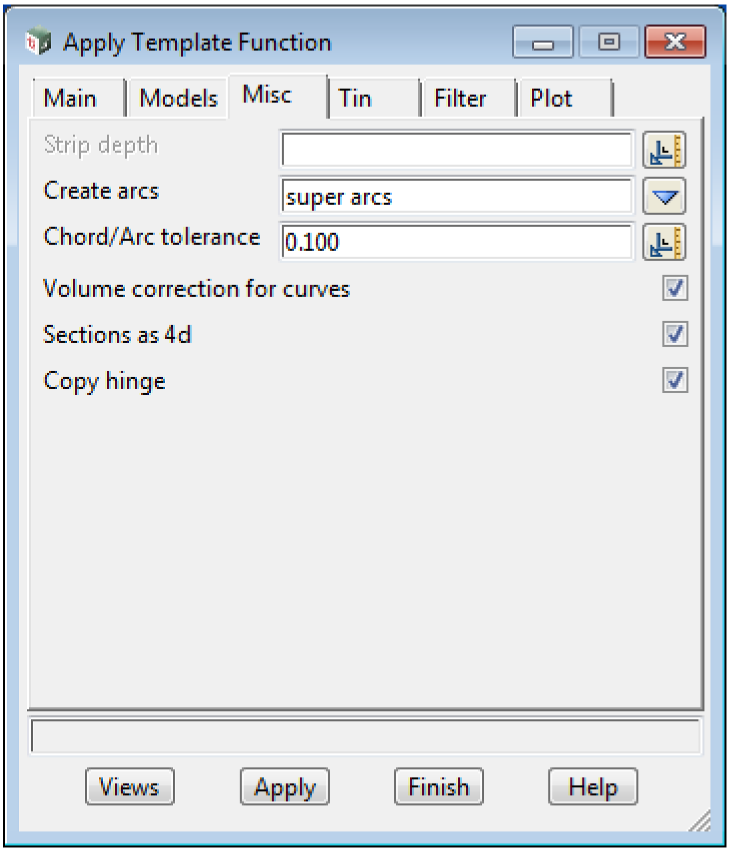
Difference model model box available models

if not blank, the sections which are the difference between the tin sections and the template x-sections are retained and placed in the model given in this field. If blank, the sections are not kept.

Difference colour colour box available colours

colour for the difference sections strings

Apply Misc tab



Strip depth input 0

the stripping depth to be used on the tin before the apply is done.

Create arcs choice box super arcs no arcs, alignment arcs, polyline arcs, super arcs

*if **no arcs**, the strings are created as 3d strings with no arcs.*
***alignment arcs**, the strings are created as alignment strings with arcs*
***polyline arcs**, the strings are created as polyline strings with arcs.*
***super arcs**, the strings are created as super strings with arcs.*

Chord/arc tolerance input default chord/arc tolerance

the chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

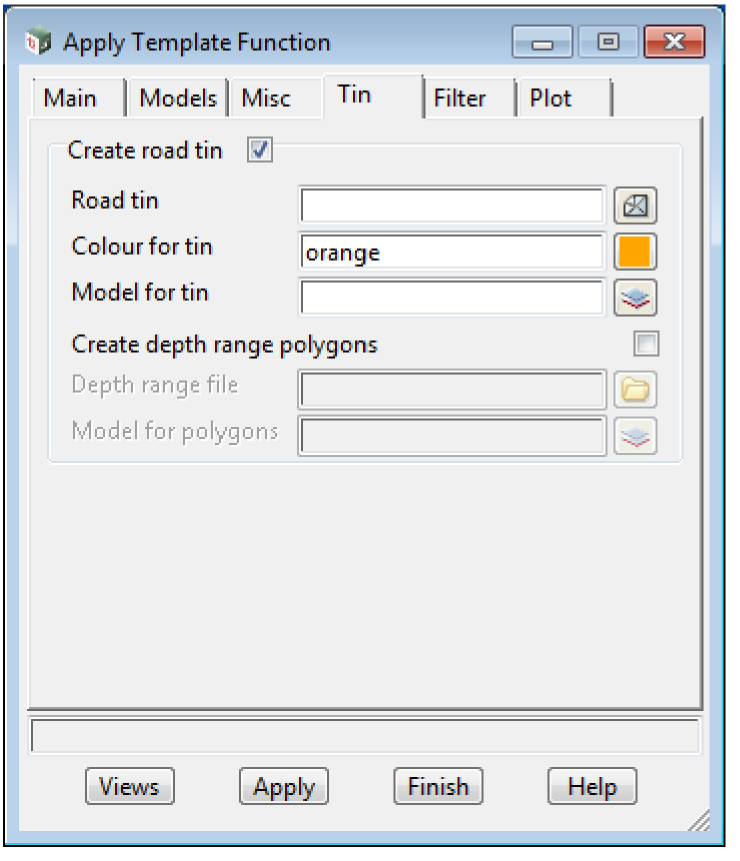
Sections as 4d tick box tick

if ticked, the section strings will be created as 4d super strings with the appropriate template string names as the vertex text at each vertex of the section. These are needed for boxing and some options on x-section plots.

Copy hinge tick box tick

if ticked, a string with points at the apply chainages is created on top of the hinge string.

Apply Tin tab



Create road tin tick box

if ticked, the fields in this tab are used to create a road tin

Road tin tin box available tins

name for the tin created from the design strings and sections

Colour for tin colour box available colours

colour of the road tin

Model for tin model box available models

model for the road tin

Create depth range polygons tick box

*if **ticked**, depth polygons are created*

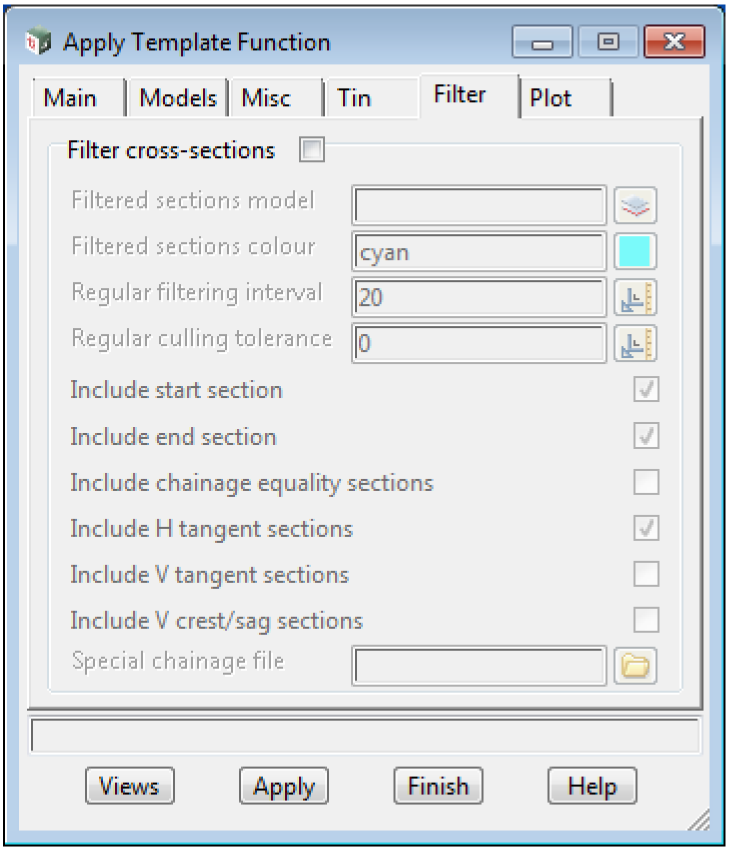
Depth range file file box *.drf files

depth range file used when creating polygons

Model for polygons model box available models

model for the depth polygons

Apply Filter tab



Filter cross-sections tick box

if ticked, the fields in this tab are used to filter cross sections

Filter sections model model box available models

model for the filtered cross sections

Filtered sections colour colour box available colours

colour of the filtered cross sections

Regular filtering interval input

regular interval to use for filtering the cross sections

Regular culling tolerance input 0

tolerance to use when selecting a cross section

Include start sections tick box

if ticked, a section at the start chainage is included even if the start chainage is not at a regular interval

Include end sections tick box

if ticked, a section at the end chainage is included even if the end chainage is not at a regular interval

Include chainage equality sections tick box

if ticked, include sections where there is a chainage equality

Include H/V tangent sections tick box

if ticked, a sections at the horizontal/vertical tangent points are included even if they are not at a regular interval

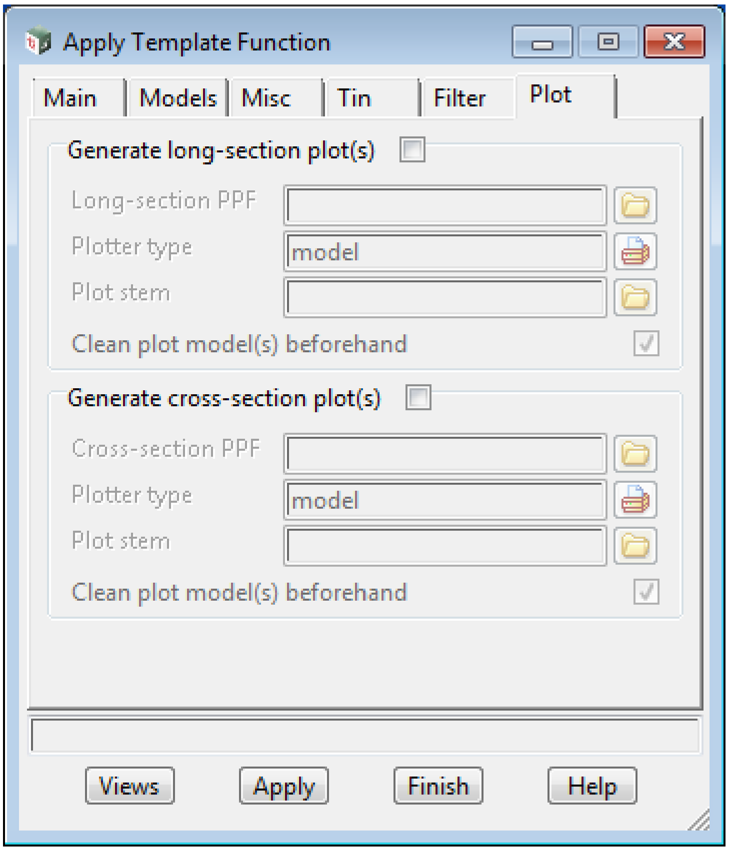
Include V crest/sag sections tick box

if ticked, a sections at the crest and sag points are included even if they are not at a regular interval

Special chainage file file box *.spc files

if non blank, a file of chainages to include sections at even if they are not a regular interval

Apply Plot tab



Generate long section plot(s) tick box

if ticked, long section plots are created

Long section PPF file box *.lplotppf files

binary ppf file to use for the long section plots

Plotter type plotter box model available plotters

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

*if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created*

Generate cross section plot(s) tick box

if ticked, cross section plots are created

Cross section PPF file box *.lplotppf files *binary ppf file to use for the cross section plots*

Plotter type plotter box model available plotters

type of plotter to use for the cross section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

*if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created*

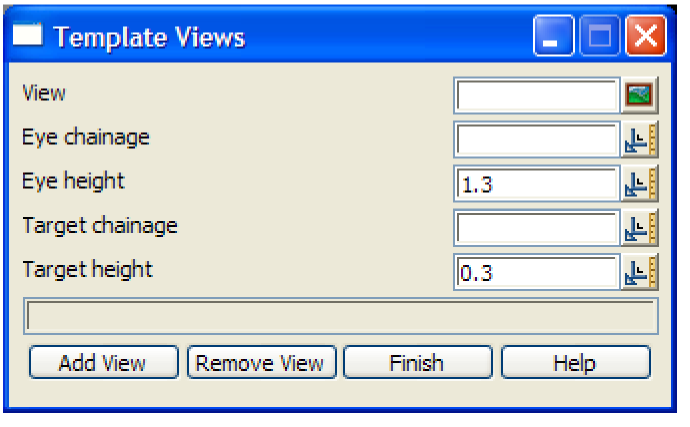
20.3.1.1 Views

This option locks perspective views to the reference string of the **Apply Template/Apply MTF** function,

It defines the eye and target co-ordinates for the perspective views in terms of the chainage and height above an existing reference string (as in the perspective view-ops option, string-walk) rather than entering the (x,y,z) eye and target co-ordinates.

If the string is modified, then the perspective eye and target points will also change.

Selecting **Views** fires up the **Template Views** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box		available views

the perspective view to define the eye and target points for.

Eye chainage input

the string chainage of the eye viewing point.

Eye height input 1.3

height of the eye viewing point above the string.

Target chainage input

the string chainage the target viewing point.

Target height input 0.3

height of the target viewing point above the string.

Add View button

add the view to the template function and then redraw the view using the above eye and target *parameters.*

Remove View button

remove the view from the Apply template/Apply MTF function.

20.3.2 Apply MTF Function

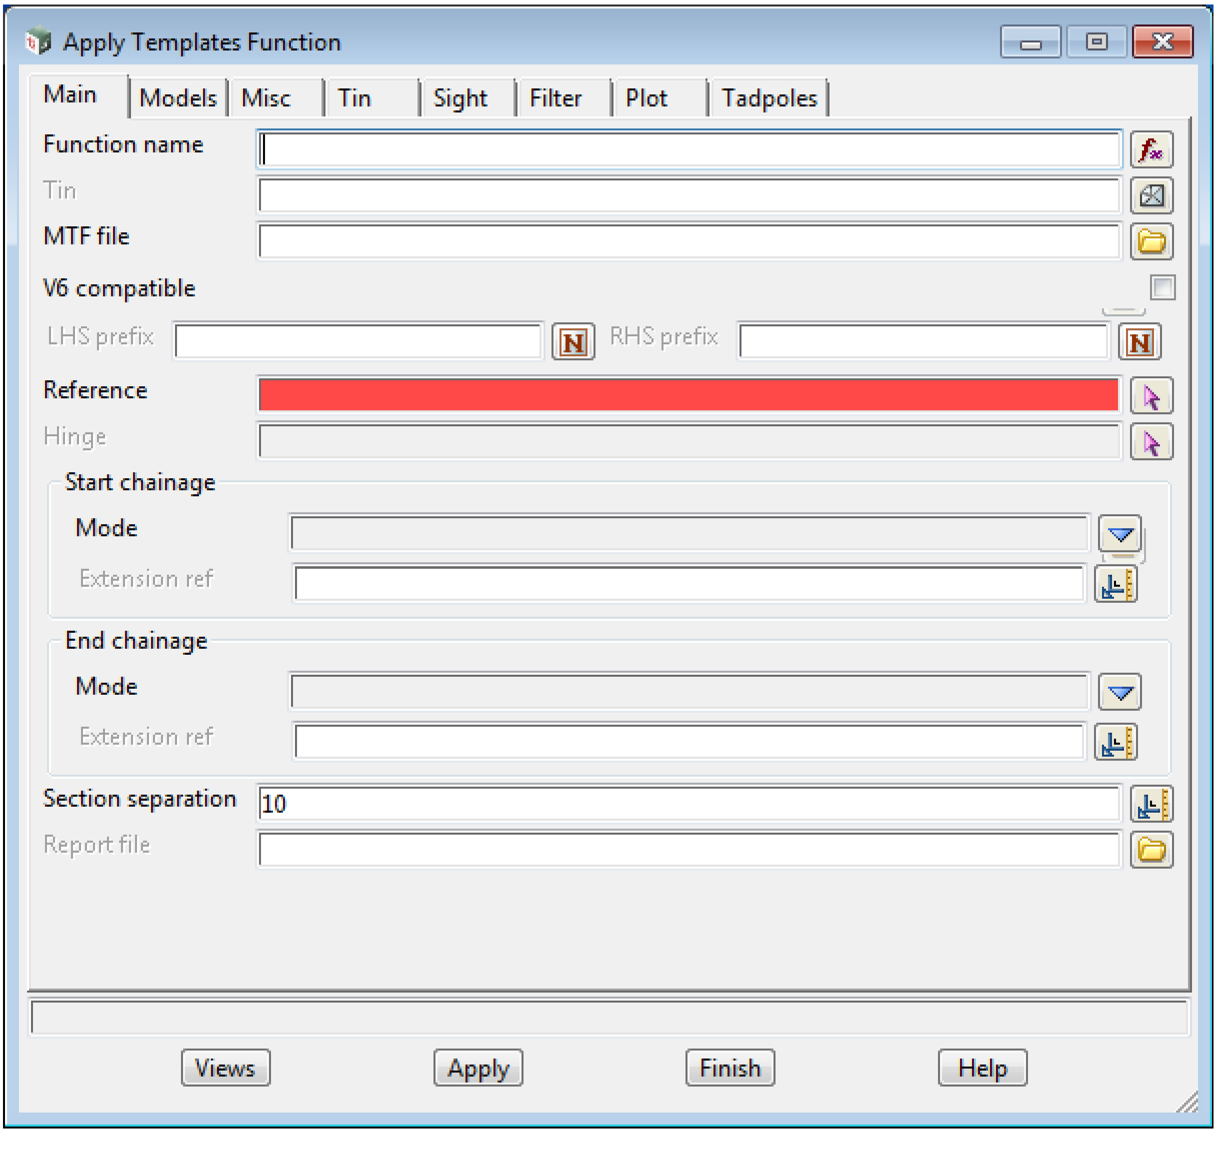
Position of option on menu: **Design =>Apply =>Apply MTF**

The **Apply MTF** option is used for more complex design work such as urban, intersection and roundabout design.

It includes defining different templates over different chainage ranges, modifiers for advanced control of the strings created by the **Apply MTF** strings, sections and trimeshes, stripping depths and boxing, a road tin and depth polygons, sights lines, tadpoles, plus long section and cross section plots.

For **Apply MTF**, the modifiers and templates are supplied in a file called the **Modifiers and Templates File** or ***MTF*** file. The definition of the ***MTF*** will follow after the description of the **Apply MTF** option.

Selecting **Apply MTF** displays the **Apply MTF Function** panel.



This panel can be used to create the information for applying a new template function or to modify the information for an existing template function.

Field Description Type Defaults Pop-Up

Buttons from bottom

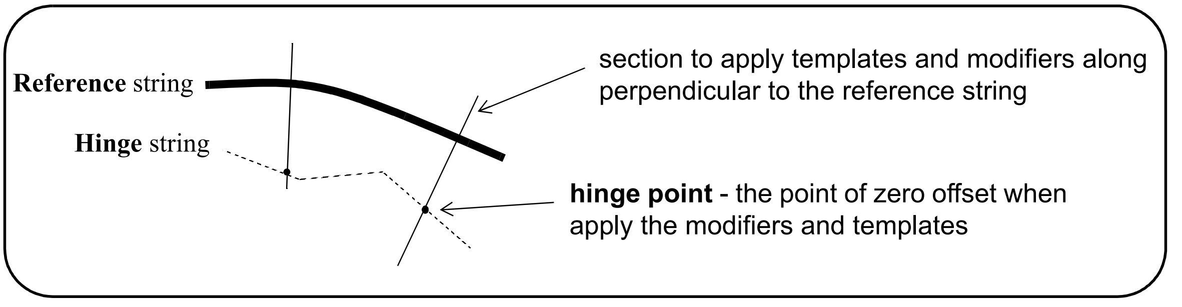
Views button

perspective views can be defined with respect to chainages on the string. This option is described in more detail in the section 20.3.1.1 Views.

Apply button

apply the modifiers and template information to the selected reference and hinge strings, between the start and end chainages.

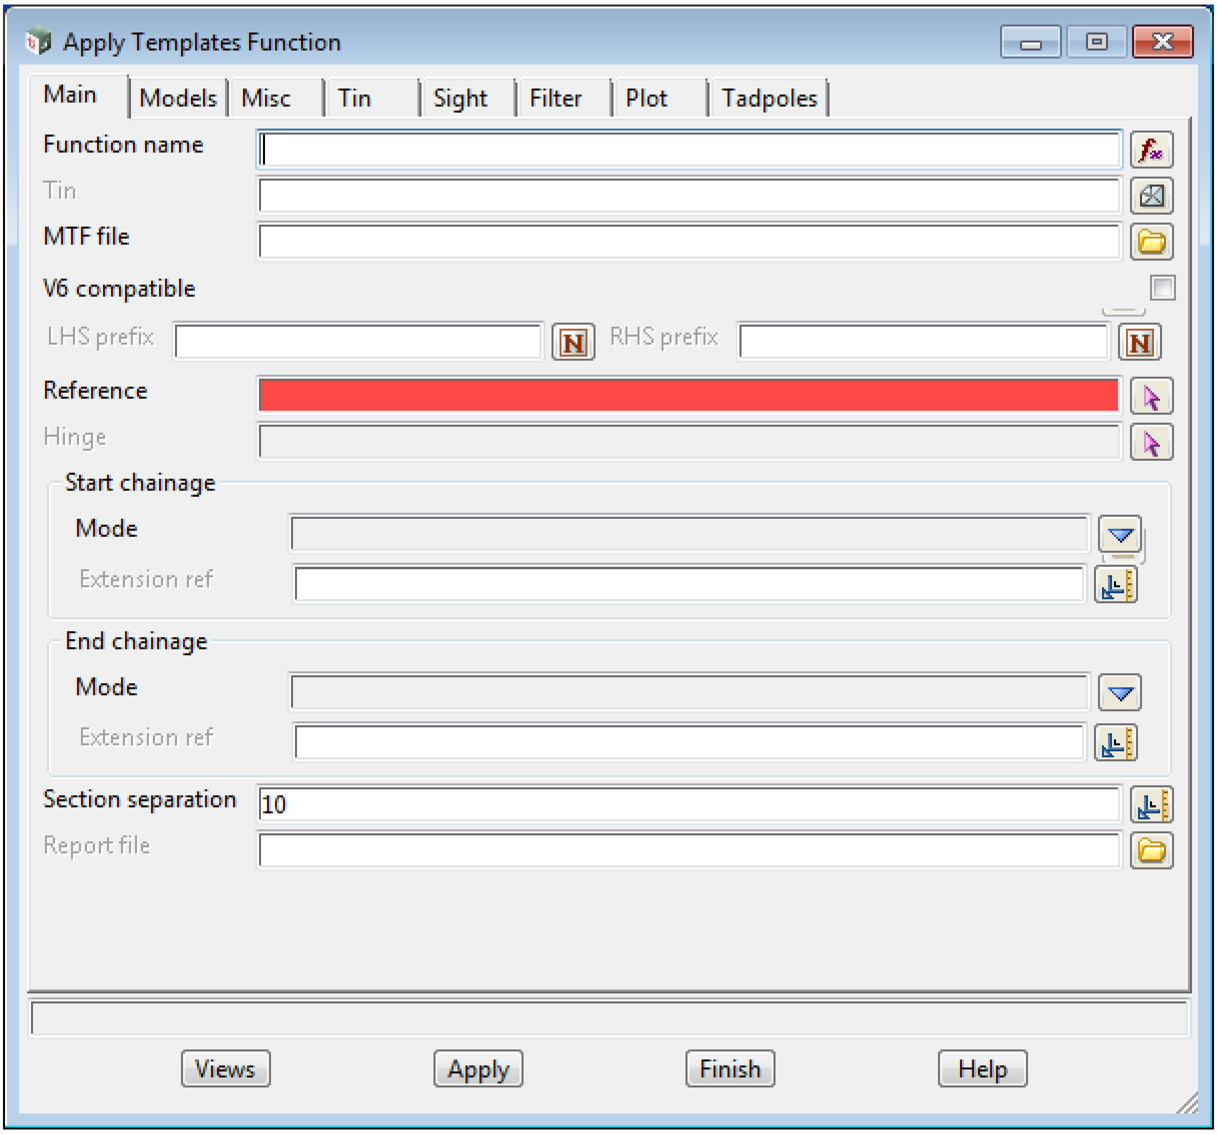
The cut, fill and balance volumes are also calculated and written to the message area and to the Output Window.



For the information on each **Apply MTF Function** tab, go to

- Apply MTF Main tab
- Apply MTF Models tab
- Apply MTF Misc tab
- Apply MTF Tin tab
- Apply MTF Sight tab
- Apply MTF Filter tab
- Apply MTF Plot tab
- Apply MTF Tadpoles tab

Apply MTF Main tab



Function name function box available template functions

name of the function to define the **Apply MTF** *for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.*

Tin tin box available tins

if non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the template file.
If blank, then only the fixed part of the templates are used unless a tin is specified in the ***decisions*** *section of the templates.*

MTF file file box available mtf's, edit mtf

name of the file containing the definitions of where and how templates are applied and modified along the string, how boxing definitions are applied, stripping depths etc.
For more information on the MTF file, go to the section 21.1 The Modifiers and Templates File - MTF.

V6 compatible tick box

if ticked, the template is used as it was in **12d Model** *version 6*

LHS/RHS prefix input

*prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give the text. If post text is required, precede it by a *.*

Reference string-select

the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.

Hinge string-select

the Reference string defines chainage and bearing but the zero offset for the modifiers and templates is at the Hinge string.

For a given chainage, a line is taken at right angles to the point of that chainage on the Reference string and extended until it cuts the Hinge string. For the modifiers and templates, this point represents the zero offset. Hence the modifiers and templates are applied at that point on the Hinge string along the direction of the line.

If no Hinge string is selected, the Reference string is also used as the Hinge string.

Start/End chainage input

the Reference string start/end chainage for applying the MTF to. If blank, the **Start/End chainage** *of the Reference string is used.*

Start/End chainage choice box Start (ref)/End (ref)
Mode choice box Smart Chainge modes
Extension ref real box

the **Start/End chainage***,* **Mode** *and* **Extension ref** *are all used to define the start/end chainage on the Reference string for applying the MTF.*

If blank, the **Start/End chainage** *of the reference string is used*

For more information on Start/End Chainage Modes, see 21.2.1 MTF Hinge Modifiers

Section separation input 10.0

sections are created at right angles to points on the Reference string that are the **Section separation** *chainage distance apart.*

Report file input *.rpt

if not blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be automatically over written.

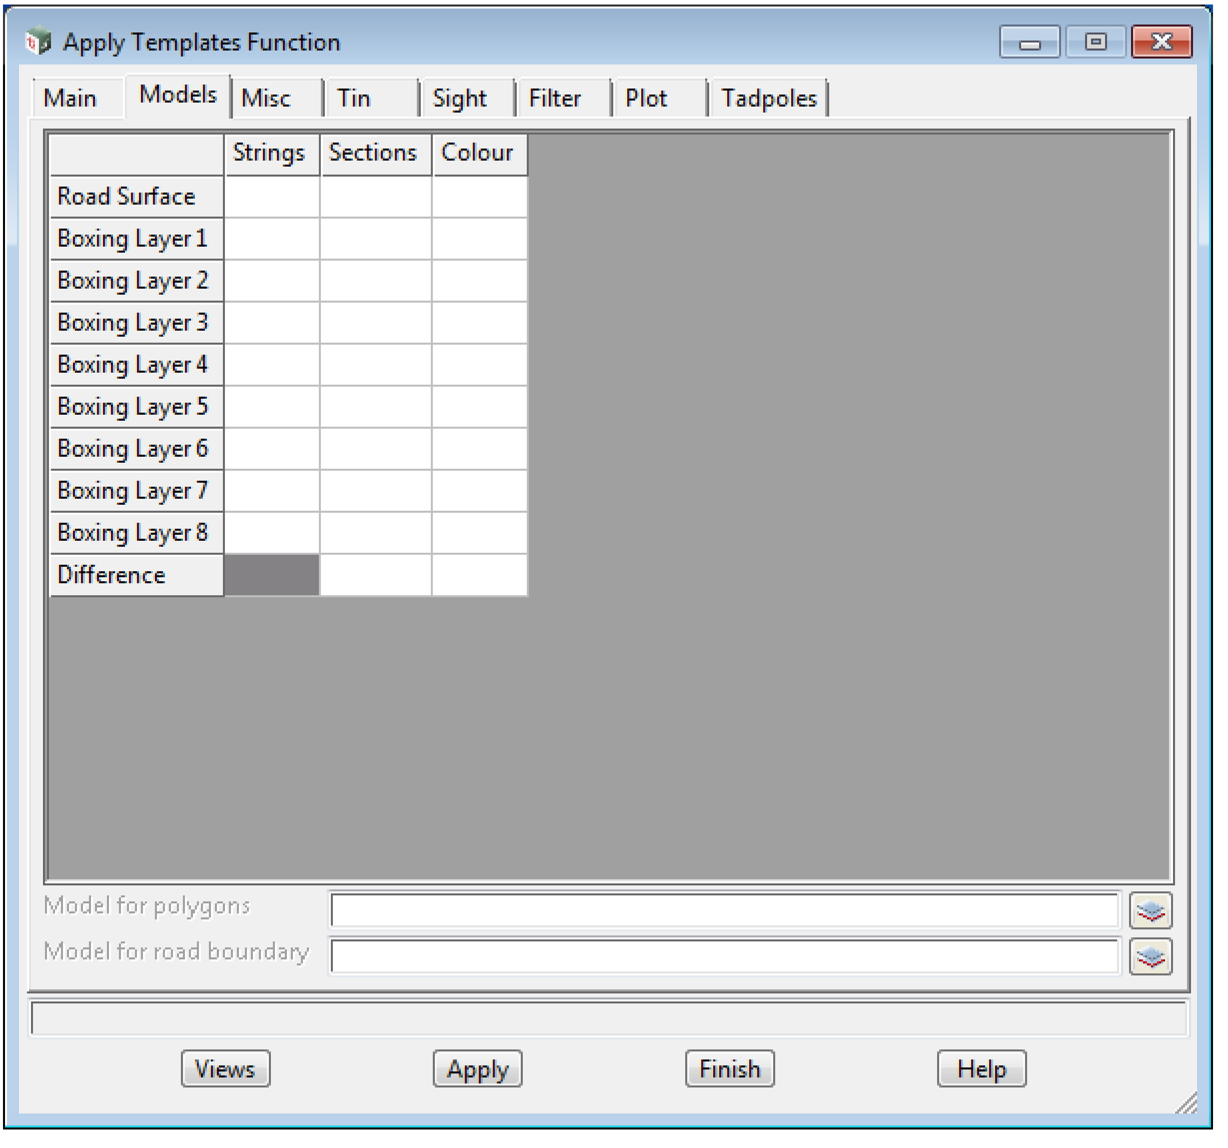
If blank, no report is produced.

Also if boxing is included in the MTF file definition, the volumes in the report can include not only the volumes from the stripped natural surface tin to the design, but also the interboxing layer volumes and the volumes from the last boxing layer to the design and to the stripped natural surface.

Apply MTF Models tab

the Models tab consists of a grid for defining the model for the design strings forming the road surface and design cross section, up to eight layers of boxing and models for the difference sections between the design and the natural surface.

The last boxing layer is also referred to as the ***Subgrade*** *layer.*



Road Surface:

Strings model box available models

if not blank, the name of the model to contain the design and interface strings. The default string colours are the template link colours but that can be overridden by a Map file.

If blank, the strings will not be stored.

Sections model box available models

if not blank, the name of the model to contain the design sections generated by the apply.

If blank, no sections are stored.

Colour colour box available colours

the colour for the design cross sections.

Boxing Layer 1-8:

if not blank, boxing strings and sections will be created for that layer.

*The Boxing Layers are used from **Boxing Layer 1** down until the first blank row.*

*The last boxing layer is also referred to as the **subgrade** layer.*

For more information on boxing, see 21.6 What is Boxing?.

Strings model box available models

if not blank, the name of the model to contain the boxing strings for this layer.

If blank, the strings will not be stored.

Sections model box available models

if not blank, the name of the model to contain the boxing sections generated by the templates and boxing rules. If blank, the sections will not be stored.

Colour colour box available colours

colour for the boxing sections for this layer

Difference

Sections model box available models

if not blank, the sections which are the difference between the tin sections and the template x-sections are retained and placed in the model given in this field.

If blank, the sections are not kept.

Colour colour box available colours

colour for the difference sections strings

Model for polygons model box available models

if not blank, the name of the model to contain the polygons created for each link of the template. The polygon is given the colour of the template link.

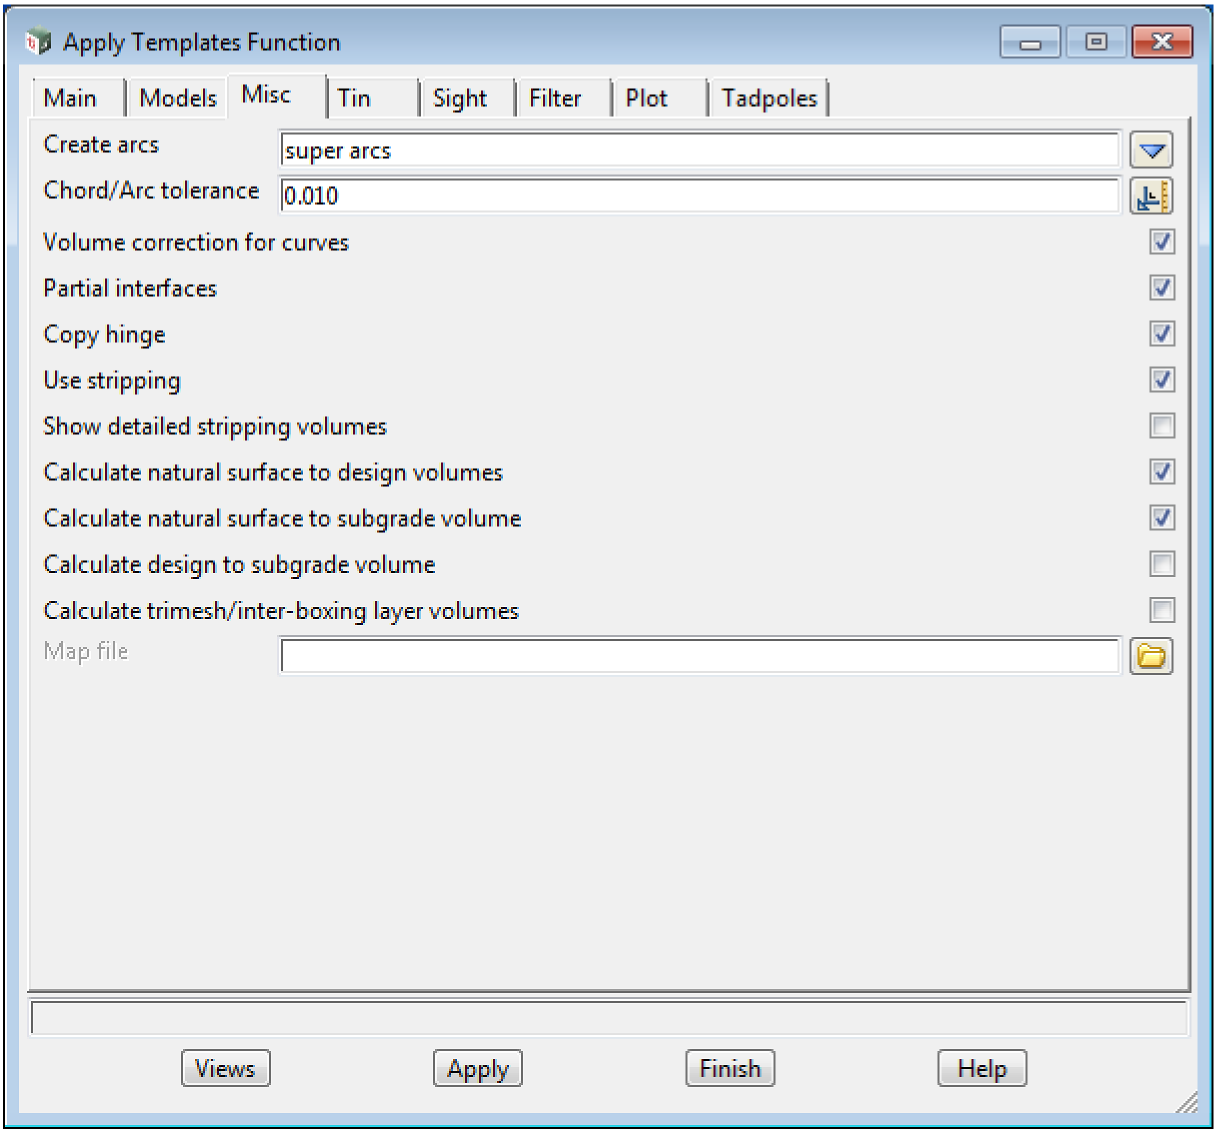
If blank, the polygons will not be stored.

Model for road boundary model box available models

if not blank, the name of the model to contain the polygon created by joining the outside links of the road.

If blank, the polygon will not be stored.

Apply MTF Misc tab



Create arcs choice box super arcs no arcs, alignment arcs, polyline arcs, super arcs

*if **no arcs**, the strings are created as 3d strings with no arcs.*
***alignment arcs**, the strings are created as alignment strings with arcs*
***polyline arcs**, the strings are created as polyline strings with arcs.*
***super arcs**, the strings are created as super strings with arcs.*

Chord/arc tolerance input default chord/arc tolerance

the chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

Partial interfaces tick box tick

if ticked, an interface string is not produced when no intersection is made with the tin. The interface may then be broken into a number of interface strings.

If not ticked, a yellow segment is created in the interface string when no intersection is made with the tin. Only one interface string will then be produced.

Copy hinge tick box tick

if ticked, a string with points at the apply chainages is created on top of the hinge string.

Use stripping tick box tick

if ticked, the stripping depths in the mtf file are used.

Show detailed stripping volumes tick box

if ticked, end area stripping volumes are written to the report file

Calculate natural surface to design volumes tick box tick

if ticked, end area volumes between the natural surface and the design strings are written to the report file. If stripping is used, then the cut and fill areas and volumes are calculated from the design to the stripped natural surface.

Calculate natural surface to subgrade volume tick box tick

if ticked, end area volumes between the natural surface to the subgrade (the last boxing layer) are written to the report file. If stripping is used, then the cut and fill areas and volumes are calculated from the last layer of boxing, to the stripped natural surface.

Calculate road to subgrade volumes tick box tick

if ticked, end area volumes between the design strings and the subgrade (the last boxing layer) are written to the report file.

Calculate inter-boxing layer volumes tick box tick

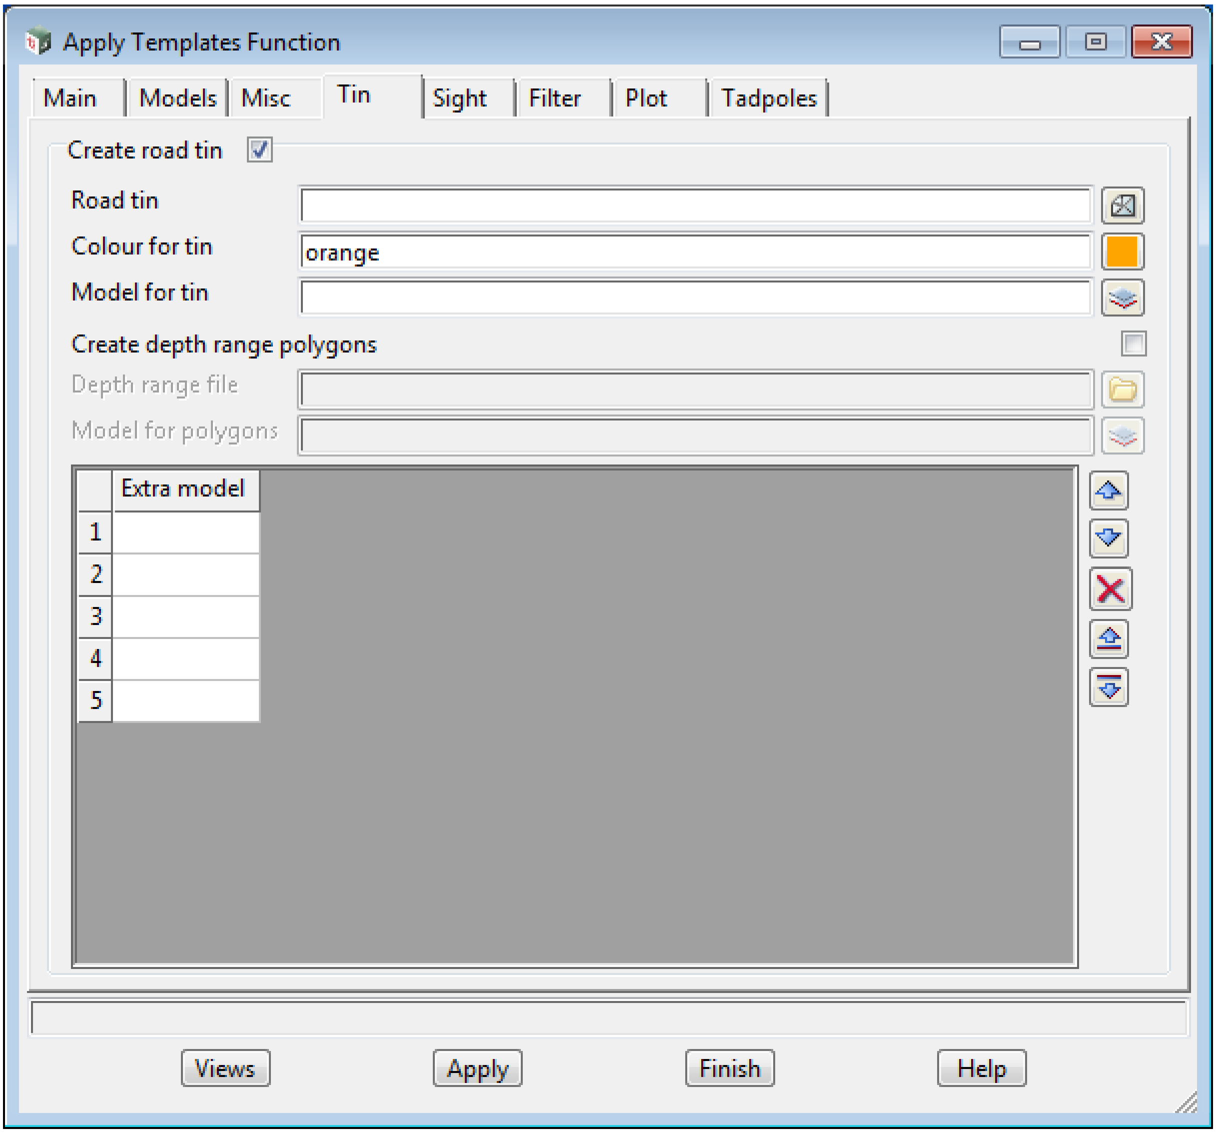
if ticked, end area volumes between each of the boxing layers are written to the report file.

Map file file box *.mapfile files

if ***non blank****, the given map file is applied to all the design strings created by the* ***Apply MTF.*** *The map file overrides any default colours from the templates. The map file can colour strings, apply linestyles, apply hatch patterns to polygons, apply extrudes to super strings etc. For more details on the map file, see* 8.8.1 Create/Edit a Map File.

Apply MTF Tin tab

the ***Tin*** *tab controls the creation of a design tin and depth polygons*



Create road tin tick box

if ticked, the fields in this tab are used to create a road tin

Road tin tin box available tins

name for the tin created from the design strings and sections

Colour for tin colour box available colours

colour of the road tin

Model for tin model box available models

model for the road tin

Create depth range polygons tick box

if ticked, depth polygons are created

Depth range file file box *.drf files

depth range file used when creating polygons

Model for polygons	model box	available models

model for the depth polygons

Extra Models grid

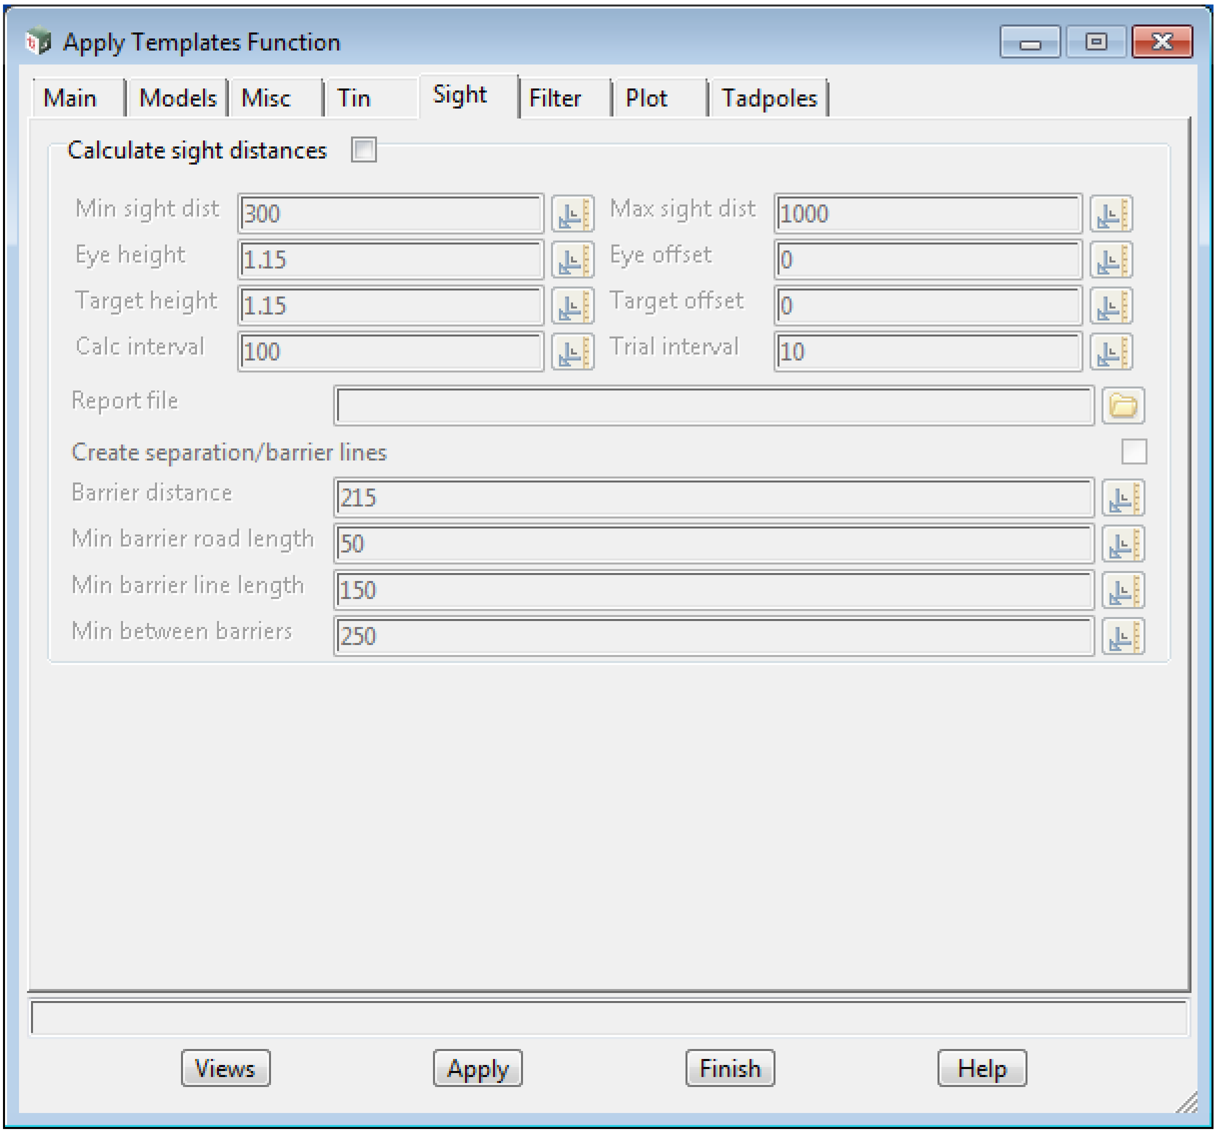
extra models to be included in creating the road tin

Extra Model	model box in column	available models

name of a model to include in the road tin

Apply MTF Sight tab

*the **Sight** tab controls the reporting of sight distance lines between the reference line and a super tin formed from the natural surface tin and the design tin, and barrier lines on the reference line if it is a super alignment. For more information on sight distance calculations and for the option that will also create sight lines/no-lines and take bridge tins into consideration, go to the section* 20.8.3 Stopping Distance.



Calculate sight distance tick box

if ticked, sight distance lines are created and barrier lines calculated and applied to the reference string if it is a super alignment.

Min sight distance input 100

minimum chainage distance to use for placing the test target point.

Max sight distance input 3000

maximum chainage distance to use for placing the test target point.

Eye height input 1.3

height of the eye point above the picked string

Eye offset input 1.3

offset of the eye point from the picked string.

Target height input 0.3

height of the test target point above the picked string

Target offset input 1.3

offset of the target point from the picked string.

Calc interval input 20

chainage increment to move the eye point for the next sight distance calculation.

Trial interval input 10

chainage increment to move to test target point.

Report file file box *.rpt files

if non blank, a sight distance report is produced and written out to this file name.

Create separation/barrier lines tick box

if ticked, and the reference string is a super alignment, barrier and separation lines are created and defined in the super alignment.

Barrier distance input

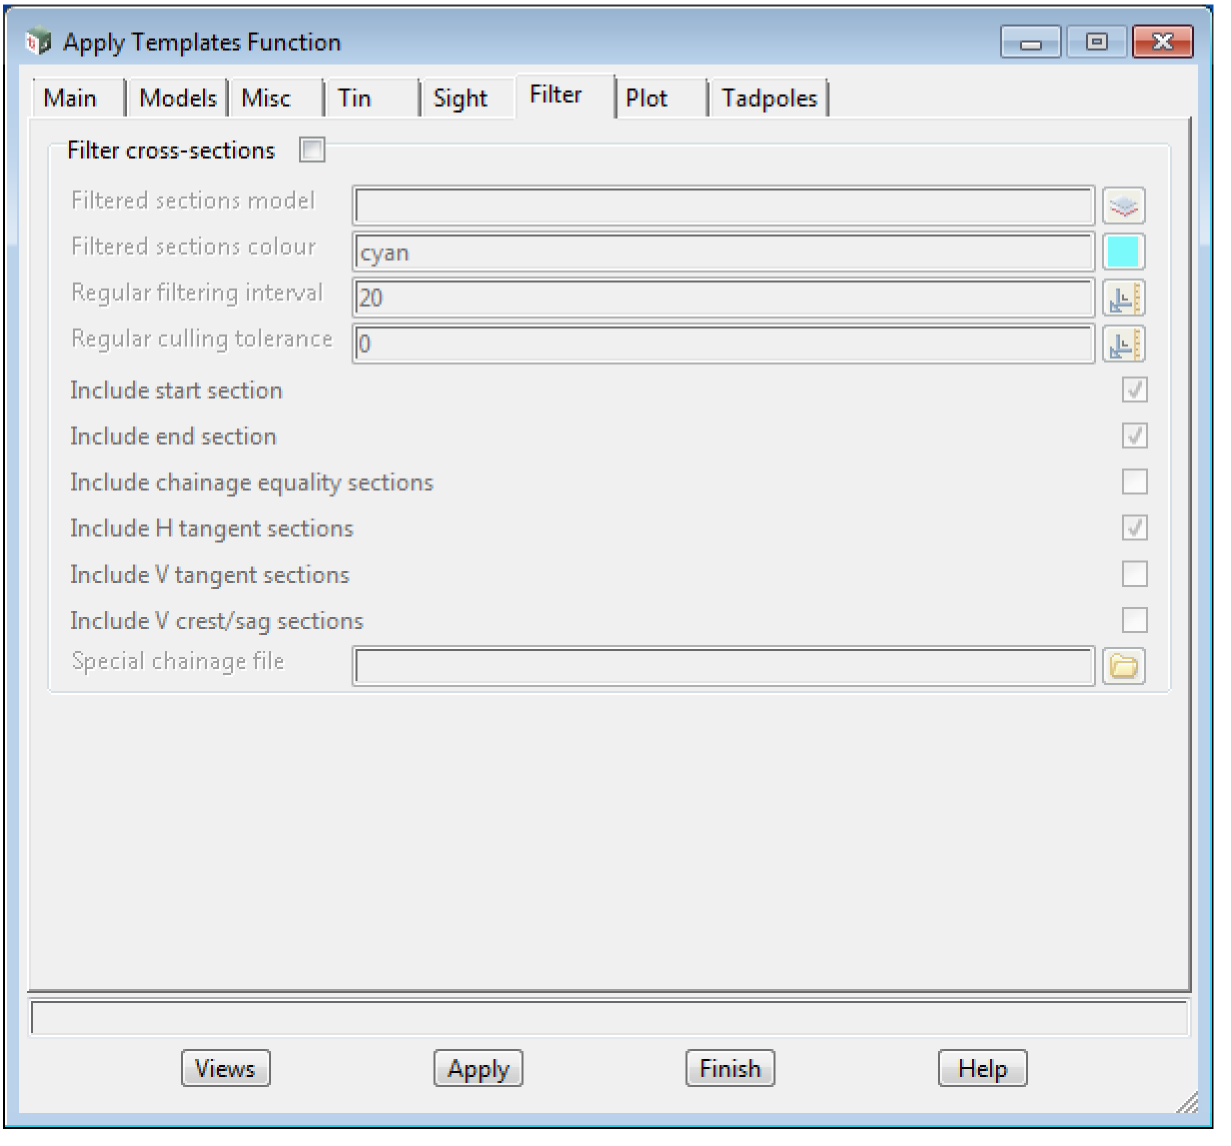
Min barrier road length input

Max barrier road length input

Min between barriers input

Apply MTF Filter tab

*the **Filter** tab controls the filtering of cross sections*



Filter cross-sections tick box

if ticked, the fields in this tab are used to filter cross sections

Filter sections model model box available models

model for the filtered cross sections

Filtered sections colour colour box available colours

colour of the filtered cross sections

Regular filtering interval input

regular interval to use for filtering the cross sections

Regular culling tolerance input 0

tolerance to use when selecting a cross section

Include start sections tick box

if ticked, a section at the start chainage is included even if the start chainage is not at a regular interval

Include end sections tick box

if ticked, a section at the end chainage is included even if the end chainage is not at a regular interval

Include H tangent sections tick box

if ticked, a sections at the horizontal tangent points are included even if they are not at a regular interval

Include V create/sag sections tick box

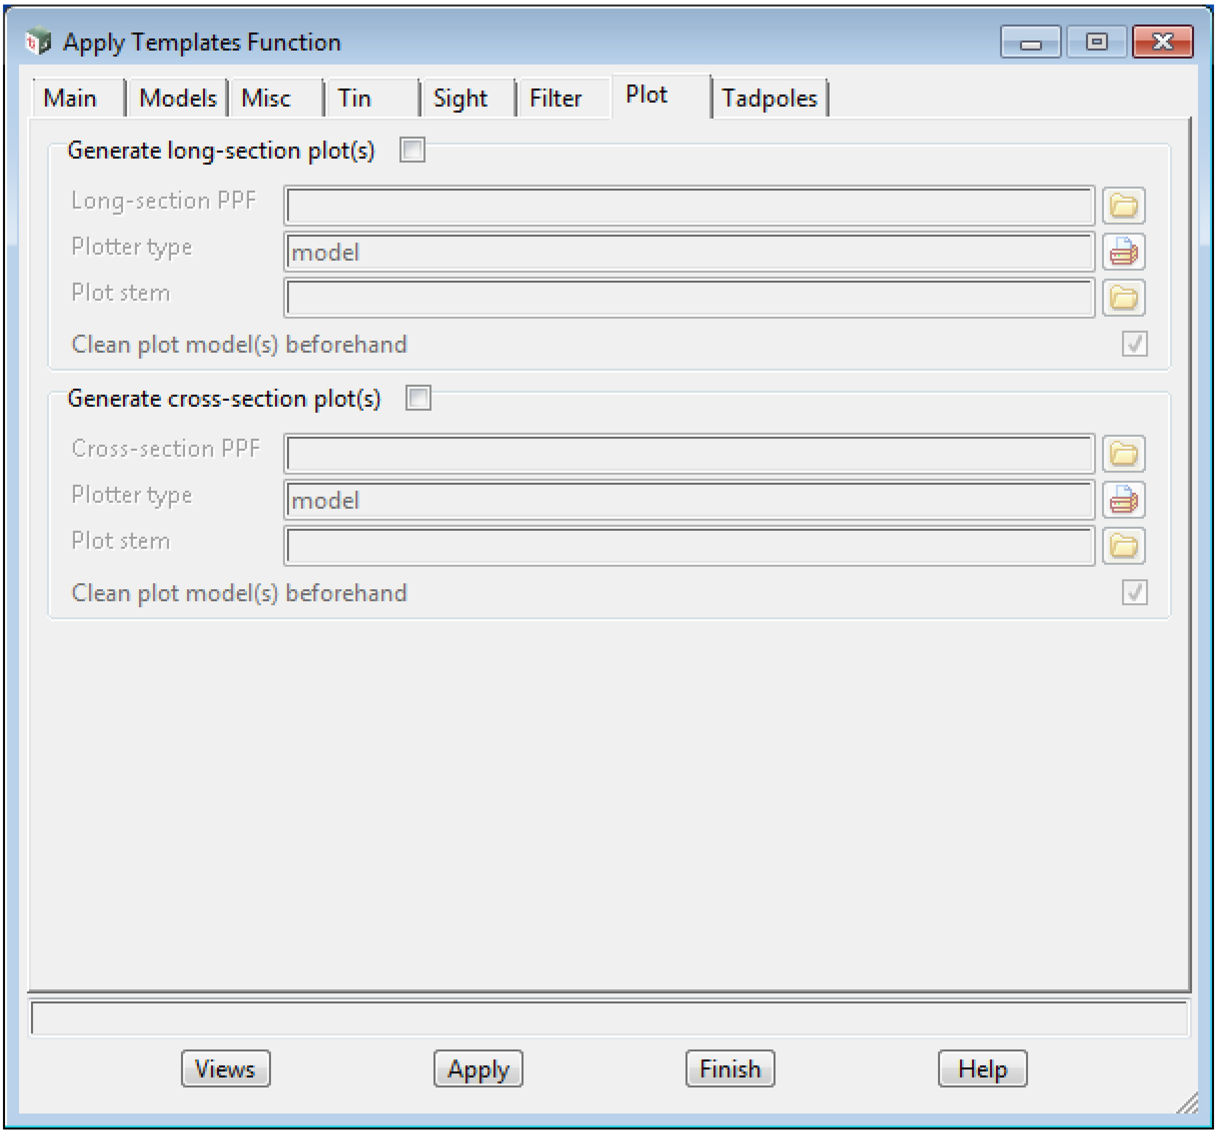
if ticked, a sections at the crest and sag points are included even if they are not at a regular interval

Special chainage file file box *.spc files

if non blank, a file of chainages to include sections at even if they are not at regular intervals

Apply MTF Plot tab

*the **Plot** tab controls the generation of long section and cross section plots*



Generate long section plot(s) tick box

if ticked, long section plots are created

Long section PPF file box *.lplotppf files

binary ppf file to use for the long section plots

Plotter type plotter box model available plotters

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

*if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created*

Generate cross section plot(s) tick box

if ticked, cross section plots are created

Cross section PPF file box *.lplotppf files

binary ppf file to use for the cross section plots

Plotter type plotter box model available plotters

type of plotter to use for the cross section plots

Plot stem

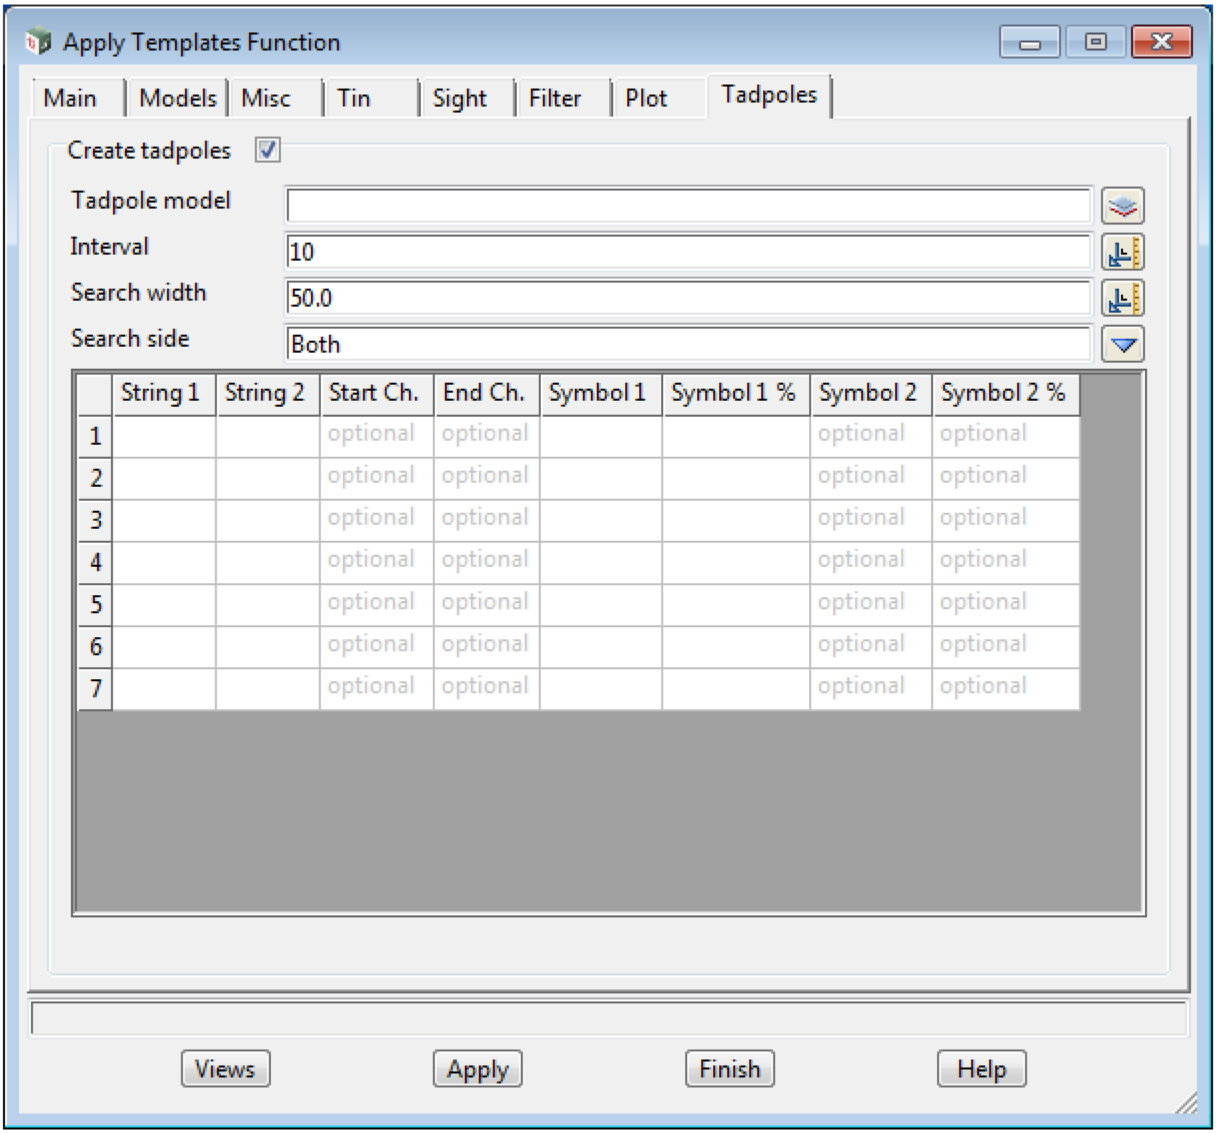
the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

*if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created*

Apply MTF Tadpoles tab

the ***Tadpole*** *tab controls the generation of batters ticks and tadpoles (hachure notation). For more information see the section* 24.5 Create Cut/Fill Symbols.



Create tadpoles tick box

if ticked, cut/fill symbols are created between given strings

Tadpole model model box available models

model for the created cut-fill symbols

Interval input 10

chainage distance between the symbols

Search width input 50

maximum distance to search to cut the strings for creating symbols. This is important for cases such as a bend in a road where multiple sets of string may then exist even when only searching out on one side of the road

Search side choice box both both, left side only right side only *side of the reference string to search for strings to apply symbols to.*

String 1 input

name of the point on the template to start symbol.

String 2 input

name of the point on the template to stop symbol.

Start Ch. input

if blank, use the start chainage of the Apply MTF.

If non blank, the chainage to start applying this symbol to.

End Ch. input

if blank, use the end chainage of the Apply MTF.

If non blank, the chainage to stop applying this symbol to.

Symbol 1 symbol data

definition of the symbol to create at the given interval, or at twice the given interval if **Symbol 2** *is defined*

Symbol 1 % input

if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol.

If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)

Symbol 2 symbol data

definition of a second symbol to create at twice the given interval

Symbol 2 % input

if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol.

If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)

20.3.3 Apply MTF Manager - Create/Update

Position of option on menu: **Design =>Apply =>Apply MTF manager**

This option is part of a process to manage your Apply MTF Functions in conjunction with the Apply MTF Defaults.

The Manager is in part an extension of the model naming convention within the defaults.

All models, except ROAD SURFACE STRINGS and ROAD SURFACE SECTIONS, can be toggled on and off when creating an Apply MTF Function,

e.g.

BOXING STRINGS

BOXING SECTIONS

POLYGONS AND BOUNDARY POLYGONS

DESIGN TIN

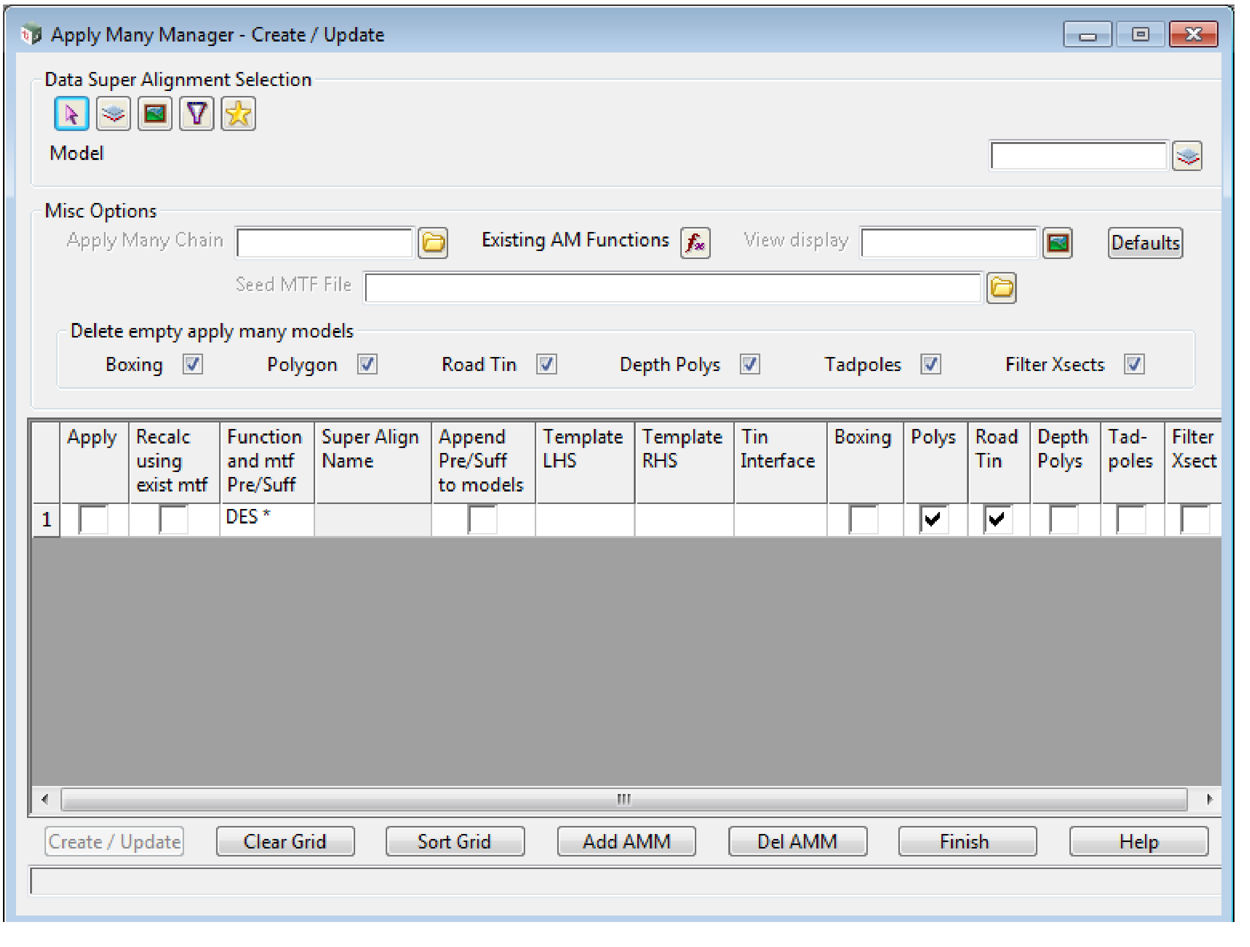
DEPTH POLYGONS

FILTER SECTIONS

TADPOLES

The Manager also allows one project model for ROAD SURFACE STRINGS, ROAD SURFACE SECTIONS, POLYGONS AND BOUNDARY POLYGONS and TADPOLES by using a new syntax in the Apply MTF Defaults.

Selecting the **Apply MTF manager** option displays the **Apply MTF Manager - Create / Update** panel.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Data source type

data selection type - for a full description go to 4.19.3 Data Source.

Misc Options

Apply MTF Chain file box available *.chain files

If non-blank entry used as chain file of all the Apply MTF Functions that are created at the time of process...optional

Existing AM Functions function box available functions

This option will give you a list of all the existing AM Functions in the project, as a quick reference when creating new ones

View Display view box available views

If non-blank entry used as view onto which design strings and sections models will be automatically added, for ease of viewing...optional

Defaults button

*If selected a separate panel will appear that allows you to set up defaults that relate to how the main panel appears. Selecting **Defaults** brings up the **Defaults for startup** panel. For more information on the **Defaults for startup** panel, go to* 20.3.4 Defaults For Startup

Seed MTF File file box

If non-blank, entry used as a seed from which any default names for the application of future Superelevation/Widening will be set

Delete empty Apply MTF models

Boxing tick box ticked

If ticked then any empty boxing models will be deleted when an existing AM is updated

Polygon tick box ticked

If ticked then any empty polygon models will be deleted when an existing AM is updated

Road Tin tick box ticked

If ticked then any empty road tin models will be deleted when an existing AM is updated

Depth Polys tick box ticked

If ticked then any empty depth polys models will be deleted when an existing AM is updated

Tadpoles tick box ticked

If ticked then any empty tadpoles models will be deleted when an existing AM is updated

Filter Xsects tick box ticked

If ticked then any empty filter xsects models will be deleted when an existing AM is updated

Grid

Apply tick box not ticked

Set to ticked once a SA selection string is accepted

*If ticked and the **<Create/Update>** is selected, then the Apply MTF will be created or an existing one recalced*

*If ticked and the **<Del AMM>** button is also selected, then the Apply MTF Manager reference to that alignment will be deleted*

*If not ticked and the **<Create/Update>** is selected, then the Apply MTF will NOT be created or an existing one recalced*

Note: It is up to the user to delete the actual Apply MTF Function and all associated data including the mtf

Recalc using exist mtf tick box

This tick box is an automatic indication of whether or not a Reference Super Alignment has an Apply MTF Function already linked to it

There is no need for the user to use this box when creating or updating an Apply MTF Function

It will be unticked if the reference has no Apply MTF Function attached

In this case templates are required for Left, Right or both

It will be ticked if the reference does have one or more Apply MTF Functions attached

In this case the existing AM will be updated using the existing MTF and reflect any changes in regards to models required

Function & mtf Pre/Suff input DES*

If non-blank, entry used as a prefix or suffix in conjunction with the Apply MTF Reference Super Alignment Name

Example:

Reference SA name:	MC00
Pre/Suff:	DES*
Apply MTF Function Name:	DES MC00
Reference SA name:	MC00
Pre/Suff:	* DES
Apply MTF Function Name:	MC00 DES

If blank, the Apply MTF Reference Super Alignment Name is used only

Apply MTF Function Name: MC00

Super Align Name input

Automatically populated, after the SA reference is selected

The Super Alignment Name entry cannot be changed as it comprises part of the Apply MTF Function name....refer above

Append Pre/Suff to models tick box not ticked

If ticked then the prefix or suffix will be combined with the SA name (refer above) and passed down to any default extensions from the Apply MTF Defaults

*refer **Design=>Apply=>Apply MTF Defaults***

Model Format for Apply MTF Defaults:

Road Surface Strings e.g.

"DESIGN *" used in conjunction with a Pre/Suff of DES * and a SA name MC00, would result in a strings model called "DES DESIGN MC00"

"* DESIGN" used in conjunction with a Pre/Suff of DES * and a SA name MC00, would result in a strings model called "DES MC00 DESIGN"

There is a new addition to the format used by the Apply MTF Manager, that allows one design strings model. That model can be used in all Apply MTF Functions

"DESIGN &" would result in a strings model called just "DESIGN"

Note: The above format can also be used for the following Apply MTF Models:

Model for Cross Sections	"CROSS SECTIONS &"
Model for Polygons	"VIS POLYGONS &"
Model for Road Boundary	"ROAD BOUNDARIES &"
Model for Tadpoles	"TADPOLES &"

Template LHS input

name of the template to be applied to the left side of the reference SA

Template RHS input

name of the template to be applied to the right side of the reference SA

Tin interface input

If non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the left and right template fields

If blank, then only the fixed part of the templates is used unless a tin is specified in the decisions section of the templates

Boxing tick box not ticked

If ticked then all boxing models will be created

Polys tick box ticked

If ticked then both polygon models will be created

Road Tin tick box ticked

If ticked then road tin and model will be created

Depth Polys tick box not ticked

If ticked then depth polygon models will be created

Tadpoles tick box not ticked

If ticked then tadpole model will be created

Filter Xsect tick box not ticked

If ticked then filter xsection model will be created

Buttons at Bottom

Create/Update button

A validation on the panel is carried out along with a check if an Apply MTF Function being created, exists or not

Appropriate warning messages in the output window will be displayed

The Apply MTF Function is created or an existing one is updated

If a new Apply MTF is being created, then the grid on the AMM panel is refreshed and the tick box <Recalc using exist mtf> is set to ticked

Clear Grid button

Clears the selection lines in the grid

Sort Grid button

Sorts the grid lines by placing lines where the <Recalc using exist mtf> box is ticked on, at the top of *the grid*

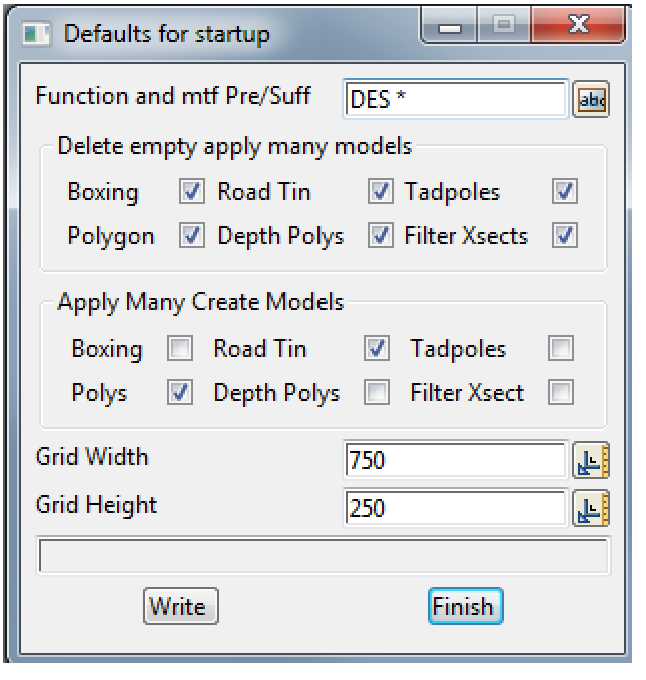
Add AMM button

For clarity...clear the grid first and then select the Super Alignment you wish to add another Apply MTF Function to

Del AMM button

In order to delete (or remove) from the Apply MTF Manager any connection to a Super Alignment, then first clear the grid, select the Super alignment and UNTICK the <Apply> box

20.3.4 Defaults For Startup



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function & mtf Pre/Suff	input	DES*	

If non-blank, entry used as a prefix or suffix in conjunction with the Apply MTF Reference Super Alignment Name

Example:

Reference SA name:	MC00
Pre/Suff:	DES*
Apply MTF Function Name:	DES MC00

Reference SA name:	MC00
Pre/Suff:	* DES
Apply MTF Function Name:	MC00 DES

If blank, the Apply MTF Reference Super Alignment Name is used only

Apply MTF Function Name: MC00

Delete empty Apply MTF models

Boxing tick box ticked

If ticked then any empty boxing models will be deleted when an existing AM is updated

Polygon tick box ticked

If ticked then any empty polygon models will be deleted when an existing AM is updated

Road Tin tick box ticked

If ticked then any empty road tin models will be deleted when an existing AM is updated

Depth Polys tick box ticked

If ticked then any empty depth polys models will be deleted when an existing AM is updated

Tadpoles tick box ticked

If ticked then any empty tadpoles models will be deleted when an existing AM is updated

Filter Xsects tick box ticked

If ticked then any empty filter xsects models will be deleted when an existing AM is updated

Apply MTF Create Models

Boxing tick box not ticked

If ticked then all boxing models will be created

Polys tick box ticked

If ticked then both polygon models will be created

Road Tin tick box ticked

If ticked then road tin and model will be created

Depth Polys tick box not ticked

If ticked then depth polygon models will be created

Tadpoles tick box not ticked

If ticked then tadpole model will be created

Filter Xsect tick box not ticked

If ticked then filter xsection model will be created

Grid Width real 750

If non-blank entry used as width of grid on main panel

Grid Height real 250

If non-blank entry used as height of grid on main panel

Write button

If selected, the defaults file (Create_Apply_Many_Manager_Panel.def) will be written out to the <.project> directory

20.3.5 Kerb Return Function

Position of option on menu: **Design =>Apply =>Kerb return**

The **kerb return** option is used to help create the vertical geometry for an alignment string being used as a kerb return.

The standard situation is that in the plan view, the kerb return joins two kerb lines which already have z-values.

It is then necessary to define vertical geometry for the kerb return, usually taking into consideration the z-values and incoming grades from selected strings (often the centre lines and kerb strings).

A standard first guess at the kerb return vertical geometry is known as the quarter point vertical geometry and it is defined by

(a) break the section along the kerb return into four equal pieces

(b) project the incoming grade from a selected start grade string to intersect the first quarter point line

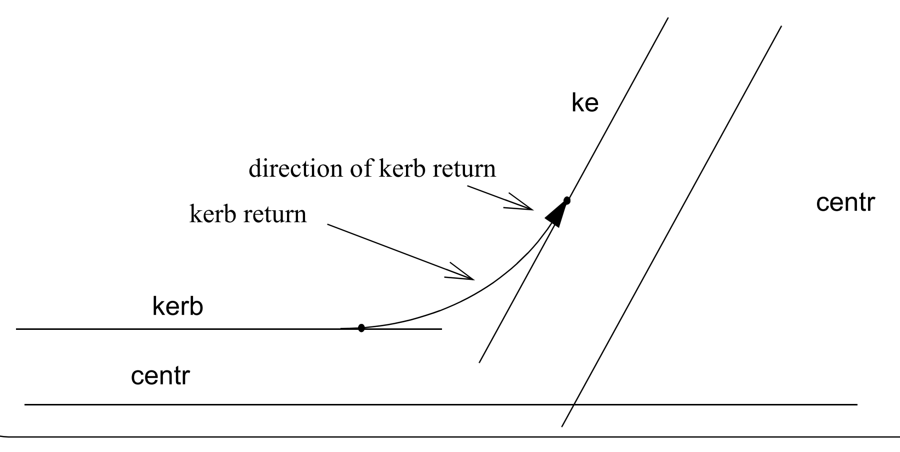
(c) project back the outgoing grade from a selected end grade string to intersect the last quarter point line

(d) join the two projected intersection points

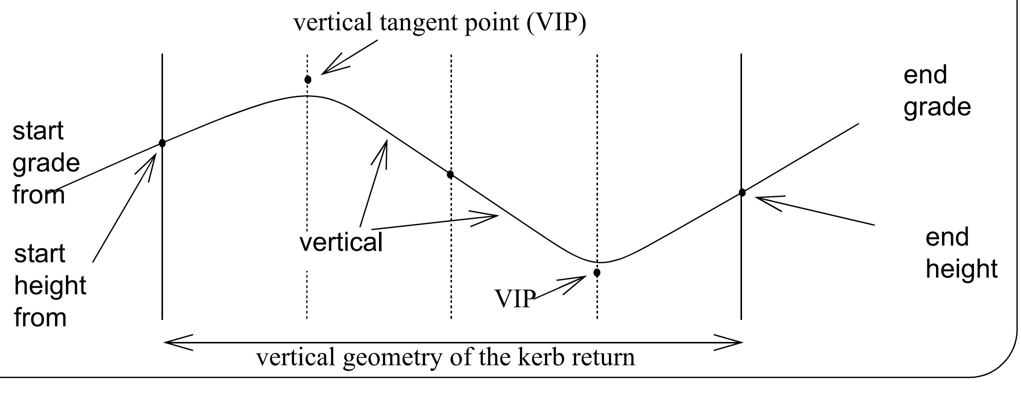
(e) define vertical intersection points (VIP's) at the intersection points

(f) create back to back vertical curves for the VIP's

Plan View of the Horizontal Geometry of the Kerb Return



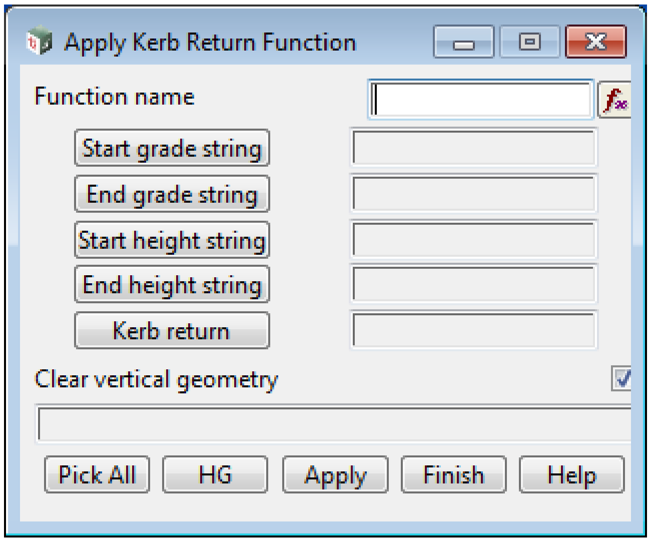
Section View of the Quarter-Point Vertical Geometry for the Kerb Return



The **kerb return** option creates a function which will automatically create the quarter-point vertical geometry for the kerb return and will recalculate it as required.

Note: the actual **direction** of the kerb is important - start grade and start height apply to the **start** of the kerb and end grade and end height apply to the **end of the kerb** where start and end are determined by the **actual direction** of the kerb (**not** the **picking direction**).

On selecting the **kerb return** option, the **apply kerb return function** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		available kerb functions

*name of the function to define the **apply** for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.*

Start grade string string-select

select the string to be used for the in grade at the start of the kerb return.

End grade string string-select

select the string to be used for the out grade at the end of the kerb return.

Start height string string-select

select the string to be used for the height at the start of the kerb return - this is used for the z-value at the start of the kerb return.

End height string string-select

select the string to be used for the height at the end of the kerb return - this is used for the z-value at the end of the kerb return.

Kerb return string-select

select the alignment string that is the kerb return.

Clear vertical geometry tick box

if ticked, the vertical geometry of the kerb return string is cleared as soon as the **apply** *button is selected, or a recalc done.*

Pick all button

if **pick all** *is selected, the user is asked to sequentially select the four strings: the Start grade string, End grade string, Start height string and End height string. The strings are automatically assigned to the appropriate string-select panel fields.*

HG button

brings up the **kerb return function create HG** *panel. This option is currently under development.*

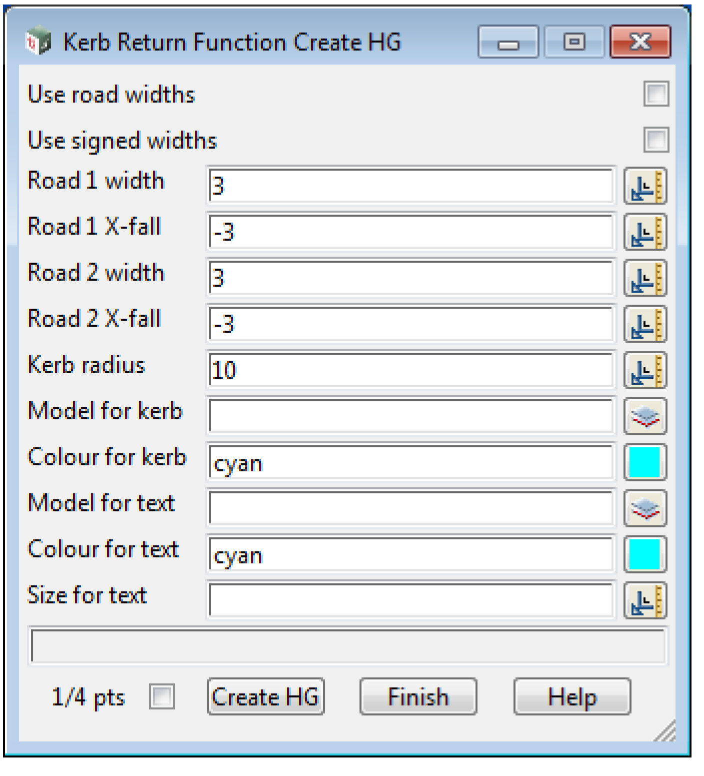
Apply button

if the kerb return has no vertical geometry (it will be automatically be deleted if the **clear vertical geometry** *is set to* ***tick****) or the vertical geometry is the quarter-point geometry for the previous apply, then new quarter-point vertical geometry is created for the kerb return string.*

Otherwize, nothing happens when the **apply** *button is selected. That is, if the kerb return already has vertical geometry which is not the quarter-point geometry for the previous apply, and the* **clear vertical geometry** *is set to* ***no tick****, then* ***nothing happens*** *when the* **apply** *button is selected.*

Note

The experimental **Kerb Return Function Create HG** panel is



20.3.6 String Modifiers Function

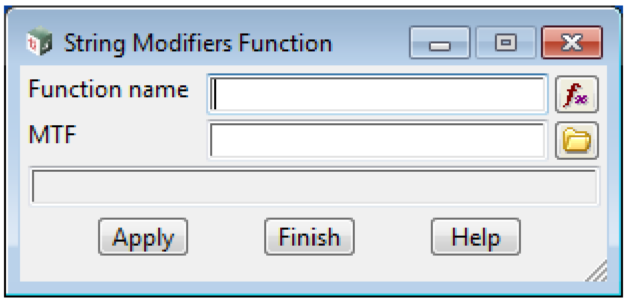
Position of option on menu: **Design =>Apply =>String modifiers**

The **String Modifiers** option is used to create vertical intersection points for an alignment string, or heights for a 2d, 3d, 4d, polyline or super string, using projection of heights from a selected string and user given cross-falls or cross-fall between two selected strings.

The **String Modifier** commands are actually part of an MTF file and are documented in 21 Advanced Design.

This option allows the user to run just the ***string_modifiers*** section of the ***mtf***.

Selecting **String Modifiers** displays the **String Modifiers Function** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		available template functions

name of the function to define the **apply** *for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.*

Field Description	Type	Defaults	Pop-Up
MTF file	file box		available mtf files

the name of the MTF file to use the string_modifiers section from.

Field Description	Type	Defaults	Pop-Up
Apply	button		

apply the string modifiers section of the MTF.

20.3.7 Interface Function

Position of option on menu: **Design =>Apply =>Interface**

An **interface** string is where the design meets the natural terrain - it shows the **extent** of the design. The method used for calculating the **interface string** for a given string, tin and cut and fill slopes, is as follows:

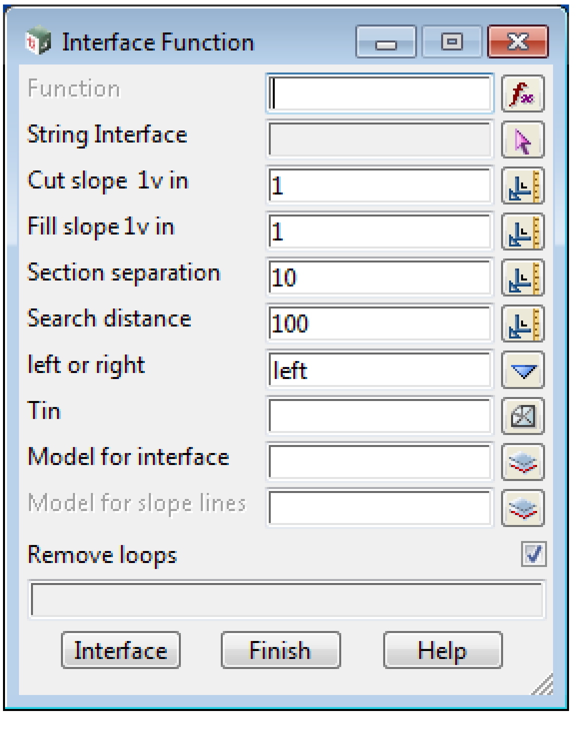
> For a point on a string, an interface point is calculated by going off at right angles to the string along a line of fixed slope until either the tin is cut or a fixed (plan) distance is travelled. The slope of the line is either the cut or fill slope depending on whether the string point is below the tin (cut point) or above the tin (fill point).
>
> The interface string for a string is constructed by calculating the interface points at regular intervals along the string and then joining the interface points together to form the interface string.

After calculating an interface string and examining the results, it is often necessary to make changes to either the original string, the cut and fill slopes used, or even the tin used for interfacing against. The interface string and slope strings created during the **interface** would no longer be valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them by new ones by re-applying the interface, this is would be time consuming if repeated over and over again. The **interface function** has been introduced to help reduce the work involved when re-calculating an interface string.

Basically, an **interface function** keeps track of all the information involved in creating an interface string and all the strings and models created during the **interface.** If either the original string, the cut and fill slope or the tin is subsequently modified, the interface functions can be re-run and all the old information automatically deleted and replaced by the updated information.

On selecting **interface**, the **interface function** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box		available interface functions

name of the function to define the **interface** *for. If the function already exists and is picked from a popup or and an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.*

String interface string select box

select the string to calculate the interface from.

Cut slope 1 v in input 1.0

the slope of the interface line if a point is in cut. A cut slope of one vertical to the given value of horizontal units is used. Positive is ***up*** *for a cut slope. A value 0 is used to designate a horizontal line.*

Fill slope 1 v in input 1.0

the slope of the interface line if the point is in fill. A fill slope of one vertical to the given value of horizontal units is used. Positive is ***down*** *for a fill slope. A value 0 is used for a horizontal line.*

Section separation input 10

the distance between the points on the selected string that interface points will be calculated from.

Search distance input 100

the (plan) distance to search along the interface line to see if the tin has been intersected. If the tin has not been intersected then the z-value at the end of the interface line is taken as the interface point z-value.

Left or right choice box left left, right

the interface point is calculated by going out at right angles to the selected string. It is possible to go to either the left or the right depending on the value of this field.

Use super strings tick box

if ticked, the interface and cut and fill slope lines are created as super strings.

Tin tin box available tins

name of the tin that the interface points will be calculated against.

Model for interface model box available models

name of the model to contain the calculated interface string.

Model for slope lines model box available models

if not blank, name of the model to contain the lines connecting the string points with the interface points (the slope lines). If the field is blank, no slope lines are recorded.
If blank, the slope lines are not created.

Remove loops tick box tick

if tick, the strings and sections created by the Interface function are process to try an remove any loops from the strings, and create sections that don't cross each other. That is, remove any places where a string crosses over itself, or sections cross each other.

Loops in the strings and crossing sections often occur on the inside of curves or the inside of adjacent lines.

Interface button

An interface string is calculated using the selected string and the parameters defined in the panel. The interface string points are coloured red if the original string point was in cut and green if the original string point was in fill.

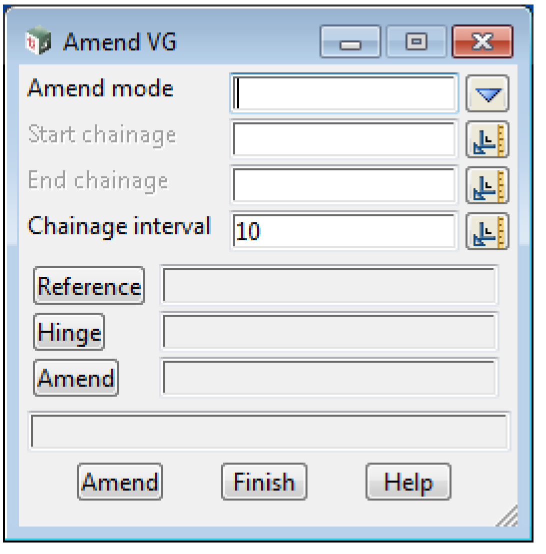
<esc> can be used to abort the interface option.

20.3.8 Amend VG

Position of option on menu: **Design =>Apply =>Amend VG**

Amend VG is used to modify the vertical geometry of an alignment string using a variety of methods including linear interpolation cubic reverse and circular reverse interpolating or by extending crossfall between two given strings.

Selecting **Amend VG**, the **Amend VG** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Amend mode	choice box		linear, cubic reverse, circular reverse, VG linear, Extend Xfall

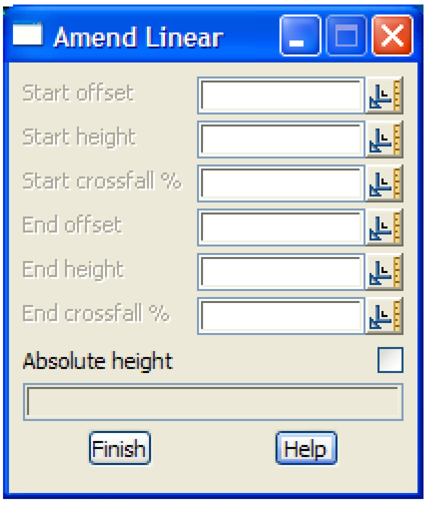
*if **linear**, a panel to input the values for **Start offset/height/crossfall %, End offset/height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

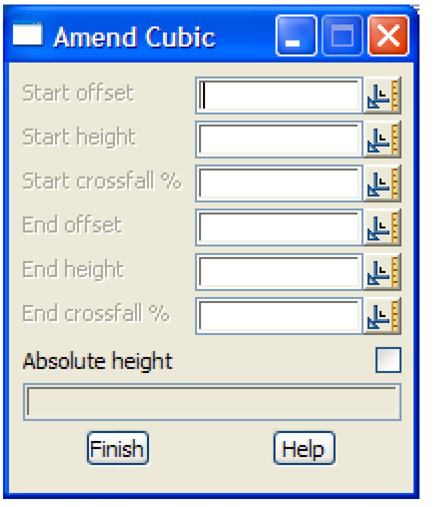
*If **cubic reverse**, a panel to input the values for **Start offset/height/crossfall %, End offset/height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

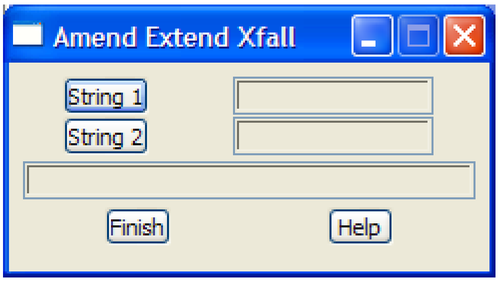
*If **circular reverse**, no extra information is needed to define how to modifying the vertical geometry of the **Amend** string*

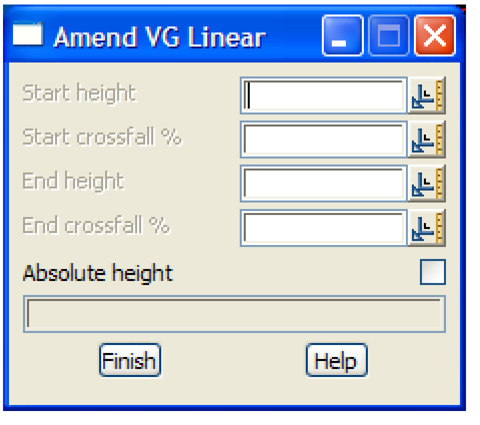
*If **VG linear**, a panel to input the values for **Start height/crossfall %, End height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

*If **Extend Xfall**, a panel to select the two strings to extend the crossfall from is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*









Start chainage input

chainage to start modifying the vertical geometry of a string

End chainage input

chainage to stop modifying the vertical geometry of a string

Chainage interval input 10

chainage interval to apply the vertical geometry modification

Reference string select box

select the reference string to define chainage and perpendicular. If there is no ***Hinge*** *string, then z-values are only taken from the Reference string.*

chainage interval to apply the vertical geometry modification

Amend string select box

select the reference string to define chainage and perpendicular. If there is no ***Hinge*** *string, then z-values are only taken from the Reference string.*

Hinge string select box

if selected, the string to take z-values from

Amend string select box

the string to have its vertical geometry amended

Amend button

amend the vertical geometry of the Amend string between the start and end chainages

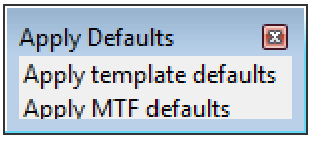
20.3.9 Apply Defaults

Position of menu: **Design =>Apply =>Defaults**

Position of option on menu: **Design =>Apply =>Defaults =>Apply template defaults**

Design =>Apply =>Defaults =>Apply MTF defaults

The **Defaults** walk right menu contains options to set up defaults when first using the **Apply Template Function** and **Apply MTF Function** panels.



The two options **Apply template defaults** and **Apply MTF defaults** will now be described.

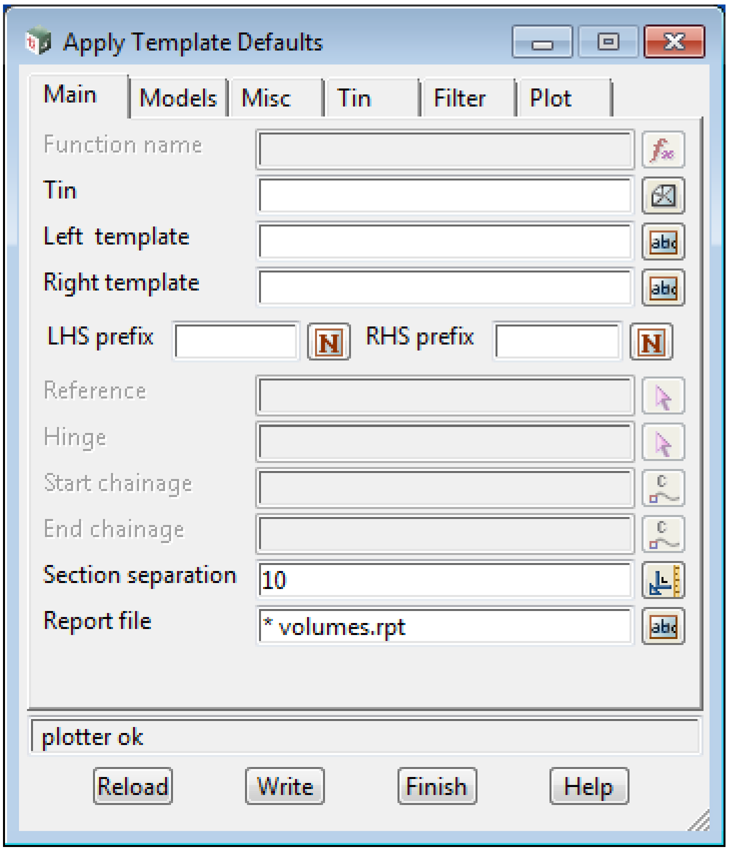
There are two files *apply_defaults.4d* and *apply_many_defaults.4d* which contain the ***pre*** or ***post*** *text* to be added to the name of the function to automatically create many entries in the panel fields for *Apply template* and *Apply MTF* plus default values for all the other panel fields.

After the name of a new function is typed in and <Enter> pressed, all the fields mentioned in the default files are automatically filled in using the function name and the defined ***pre-post text*** as supplied in the file, plus setting any other panel fields from default values supplied in the file. If the files are missing, no panel fields are automatically filled in.

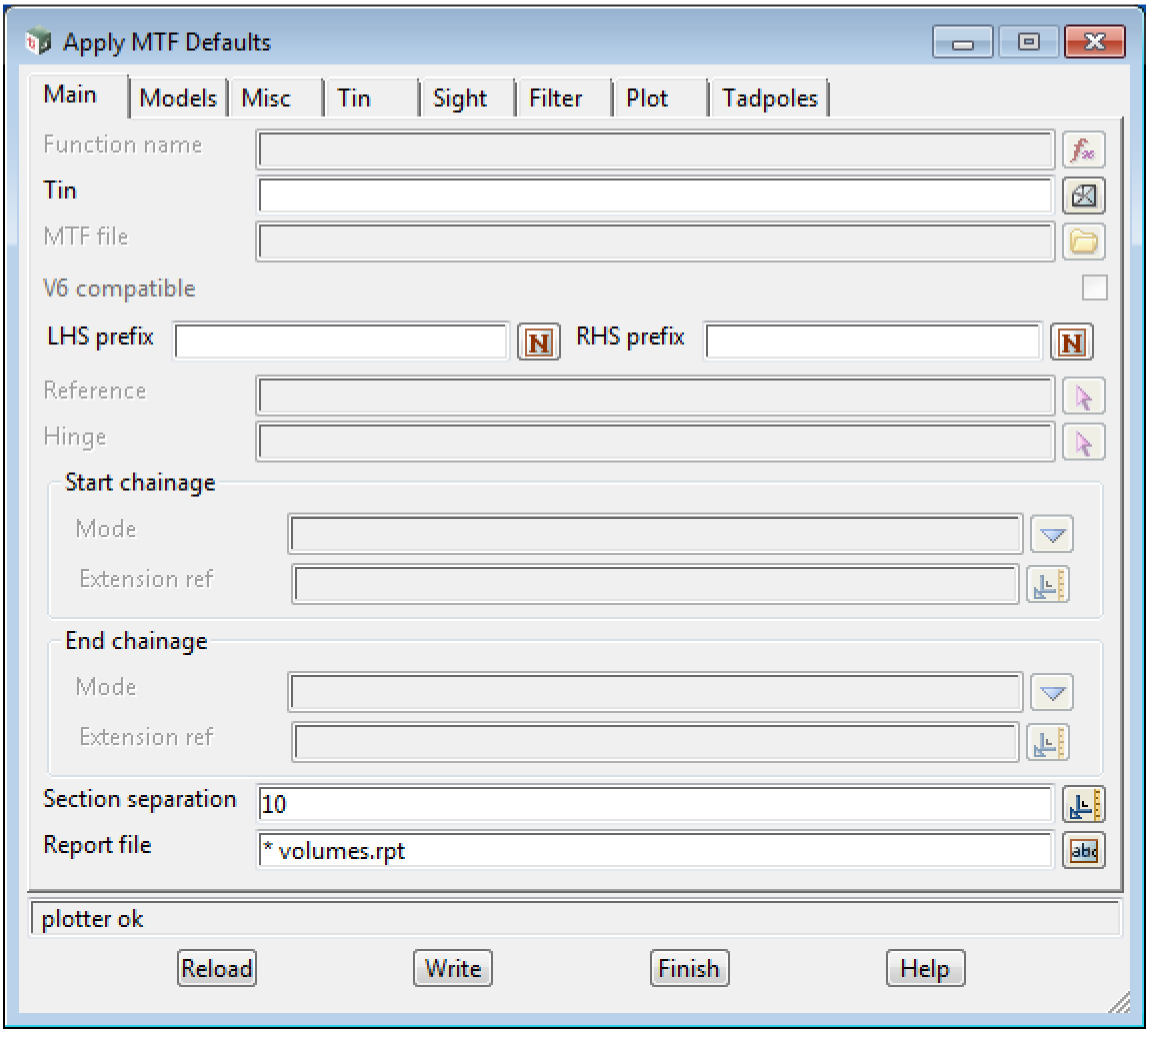
The files can be created and edited using the **Apply template defaults** or **Apply MTF defaults** option which brings up the **Apply Template Defaults** or **Apply Templates Defaults** panels respectively.

Each of the fields in the **Apply Template Defaults** panel matches a field in the **Apply** panel and so for the documentation see 20.3.1 Apply Template Function.

Each of the fields in the **Apply Templates Defaults** panel matches a field in the **Apply Templates Function** panel and so for the documentation see 20.3.2 Apply MTF Function.



Each of the fields in the **Apply Template Defaults** panel matches a field in the **Apply** panel and so for the documentation see 20.3.1 Apply Template Function.



Each of the fields in the **Apply Templates Defaults** panel matches a field in the **Apply Templates Function** panel and so for the documentation see 20.3.2 Apply MTF Function.

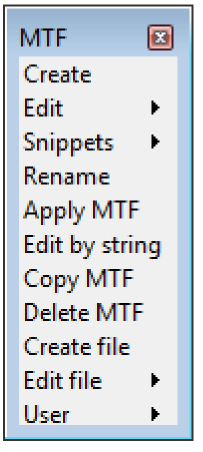
20.4 MTF

Position of menu: **Design =>MTF**

In the **Apply MTF** option, a **MTF file** is used to control the application of templates, modifiers, boxing etc to the Hinge string.

The full definition for the MTF file is given in the section 21.1 The Modifiers and Templates File - MTF.

The **MTF** walk-right menu is



Each option in this menu will now be described.

For the options, see:

Create	20.4.1 Create MTF
Edit	20.4.2 Edit MTF
Snippets	20.4.3 Snippets
Rename	20.4.4 Rename MTF
Apply MTF	20.3.2 Apply MTF Function
Edit by string	20.4.6 Edit by String
Copy MTF	20.4.7 Copy MTF
Delete MTF	20.4.8 Delete MTF
Create file	20.4.9 Create File
Edit file	20.4.4 Rename MTF

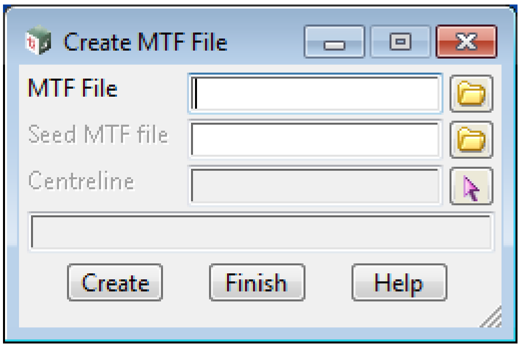
20.4.1 Create MTF

Position of option on menu: **Design =>MTF =>Create**

The **MTF=>Create** option is used to create a new MTF file (*.mtf).

The created MTF file is written to disk and can be edited using the **MTF=>Edit** option.

Selecting **Create** displays the **Create MTF File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF file	file box		*.mtf files

name of the MTF file to create.

Seed MTF file	file box		*.mtf_seed files

name of an MTF file to load into the new MTF file. This allows standard information to be automatically included in the new MTF file. The Seed MTF file is just a standard MTF file with the extension after the . changed to mtf_seed

Centreline	string select		

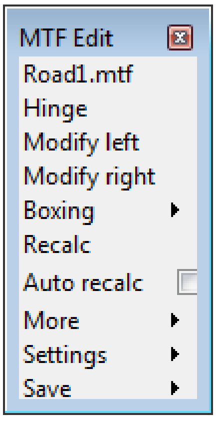
if a centreline string is selected, it is used for selecting chainages in the MTF

Create	button		

create an MTF file with name given by the **MTF file** *panel fields.*
If the file given in the **MTF file** *field does not exist, then the* **MTF Edit** *menu is placed on the screen and is used to created and edit the MTF sections in the MTF file.*
If the file already exists, then nothing will happen on selecting **Create**.

20.4.1.1 MTF Edit

When **Create** is selected from the **Create MTF File** panel, it brings up the **MTF Edit** menu which is used to create and edit the MTF sections to be saved in the MTF file.



The **MTF Edit** menu is described in the section 21.1 The Modifiers and Templates File - MTF.

Go to the next section 20.4.2 Edit MTF or return to 20.4 MTF.

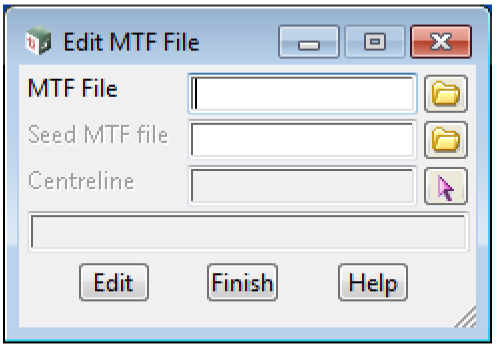
20.4.2 Edit MTF

Position of option on menu: **Design =>MTF =>Edit**

The **MTF=>Edit** option is used to edit mtf files (*.mtf).

The **MTF=>Edit** option has two modes of operation - selecting the **MTF=>Edit** itself, or by activating the **MTF=>Edit** option's walk-right menu, **folder *.mtf**.

Selecting **MTF=>Edit** itself brings up the **Edit MTF File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF file	file box		*.mtf files

name of the MTF file to edit

Seed MTF file	file box		*.mtf_seed files

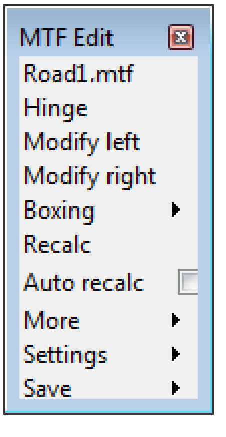
for a new MTF file, the name of an MTF file to load into the new MTF file. This allows standard information to be automatically included in the new MTF file. The Seed MTF file is just a standard MTF file with the extension after the . changed to mtf_seed

Centreline	string select		

if a centreline string is selected, it is used for selecting chainages in the MTF

Edit	button		

edit the file given by **MTF file** *panel field.*
If the file given in the **MTF file** *field exists, then the* **MTF Edit** *menu is brought up to create/edit the MTF sections.*



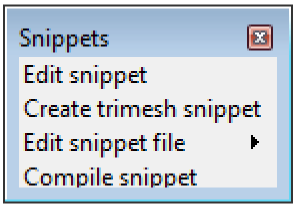
Similarly the **MTF=>Edit** walk-right menu provides a list all the MTF files (files ending in .mtf) in the current folder. When a MTF file is selected from the list, the **Edit MTF File** panel is brought up to create/edit the MTF sections.

The **MTF Edit** menu is described in the section 21.1 The Modifiers and Templates File - MTF.

Go to the next section 20.4.3 Snippets or return to 20.4 MTF.

20.4.3 Snippets

‘



See

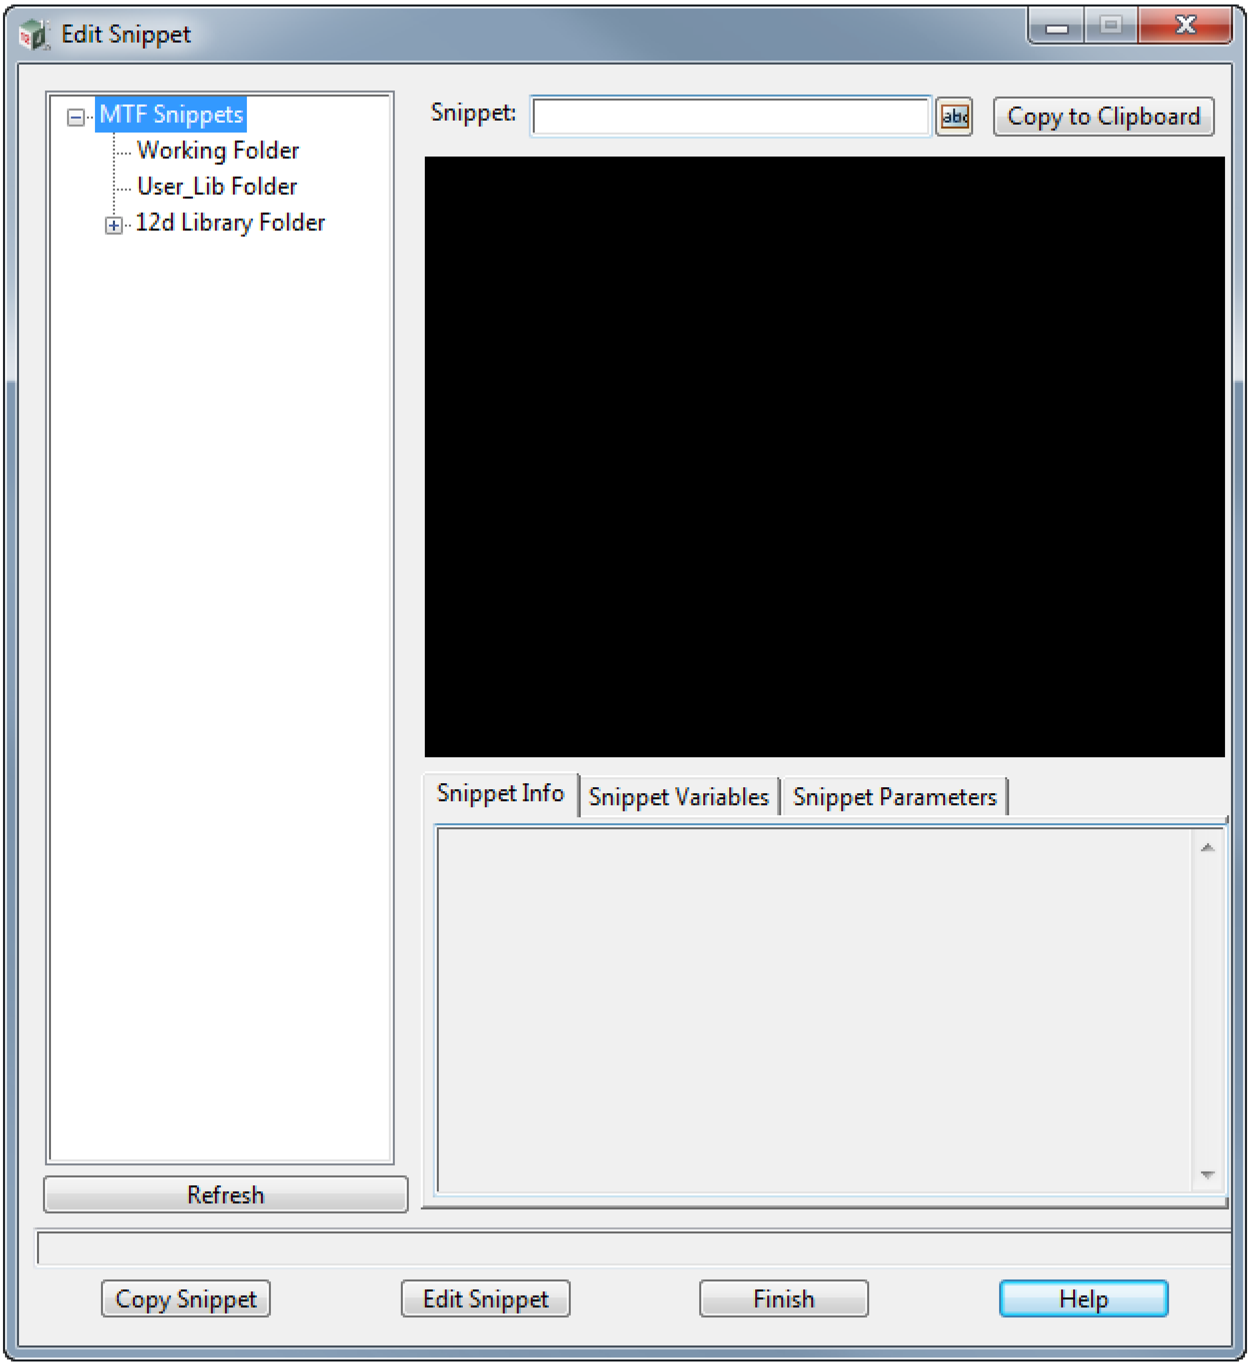
20.4.3.1 Edit Snippet
20.4.3.2 Create Trimesh Snippet
20.4.3.3 Edit Snippet File
20.4.3.4 Compile Snippet
20.4.3.5 12d Supplied Snippets

For information on Snippets, see 21.5 Defining and Using Snippets

20.4.3.1 Edit Snippet

Position of option on menu: **Design =>MTF =>Snippets =>Edit snippet**

Selecting **Edit snippet** brings up the **Edit Snippet** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF Snippets	Tree Box		

lists all of the MTF Snippets available in the following folders:

Working Folder: MTF Snippets located in the current Working Folder
User_Lib Folder: MTF Snippets located in the User Library (USER_LIB_4D)

12d Library Folder: MTF Snippets located in the 12d Model Library (LIB_4D)
(C:\Program Files (x86)\12d\12dmodel\11.00\Library, or
C:\Program Files\12d\12dmodel\11.00\library depending on your setup)

Expanding Working Folder, User_Lib Folder of 12d Library Folder will list all the snippets in that folder. For information on the snippets in 12d Library Folder, see 20.4.3.5 12d Supplied Snippets.

Clicking on a snippet name in the list displays the following information about the selected snippet:

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Snippet Input box

displays the file path and name of the selected MTF Snippet.

Copy to Clipboard Button

copies the selected MTF Snippet file path to the clipboard

This may be pasted into the **Modifiers->MTF Snippet** *panel, or useful for creating snippets that call other snippets.*

MTF Snippet Preview Draw box

displays a preview image of the selected MTF Snippet.

Users can create their own preview images using the following guidelines:

- *A preview image must have the same name as its associated MTF Snippet. For example; a snippet named "My_Snippet.MTFSNIPPET", will have a preview image named "My_Snippet.jpg",*
- *The preview image should have the dimensions 400 pixels wide by 300 pixels high,*
- *The preview image must be in jpeg (*.jpg) image format,*
- *The preview image must be located in either your "$USER/images" folder (USER_4D) or your current Working Folder.*

Refresh Button

updates the MTF Snippets tree box.

When clicked, the macro will find and display all MTF Snippets in the current project Working Folder, User Library Folder, and 12d Library Folder.

Note: To fully refresh a list, the relevant tree must also be collapsed and then re-expanded.

Snippet Info Tab

Snippet Info Text Edit Box

displays information about the currently selected MTF Snippet.

Users can display their own custom information for a snippet by using the following guidelines:

- *Open the MTF Snippet in a text editor, by select Edit Snippet,*
- *At the top of the file, prefix your information with:* // INFO

For example; if your snippet file contains:

// INFO Snippet Type: INSERT

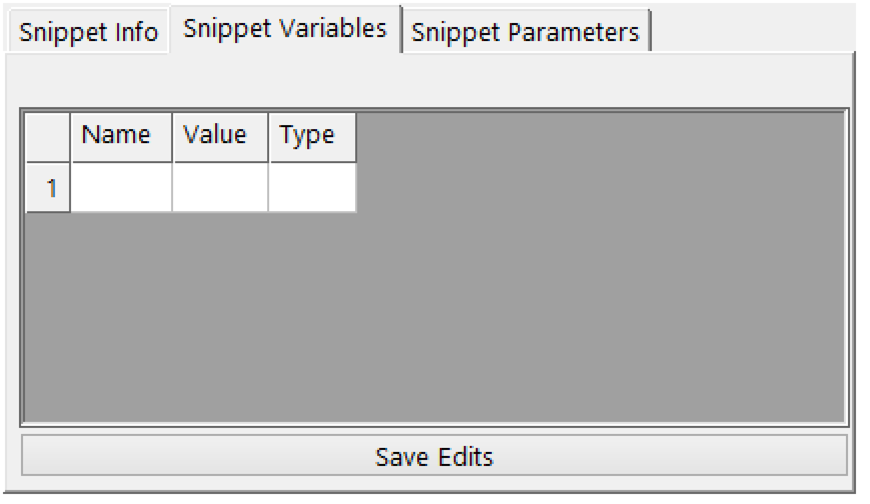
// INFO Description: Kerb & Gutter

The ***Snippet Info*** *text box will display:*

Snippet Type: INSERT

Description: Kerb & Gutter

Snippet Variables Tab



Snippet Variables Grid Control box

lists the currently selected MTF Snippet variables.

Each row represents a variable.

Column 1 - represents the variable name,

Column 2 - represents the variable value,

Column 3 - represents the variable type.

MTF Snippet variable types include: Number, Text

Only variables that define a single value are displayed (i.e.; formulas are ignored).

For example:

#define	*_A*	*1.23*
@ def_tok	*A*	*1.23*
@ def_tok	*STR1*	*KI*

Users can create new variables, edit existing variables and delete existing variables.

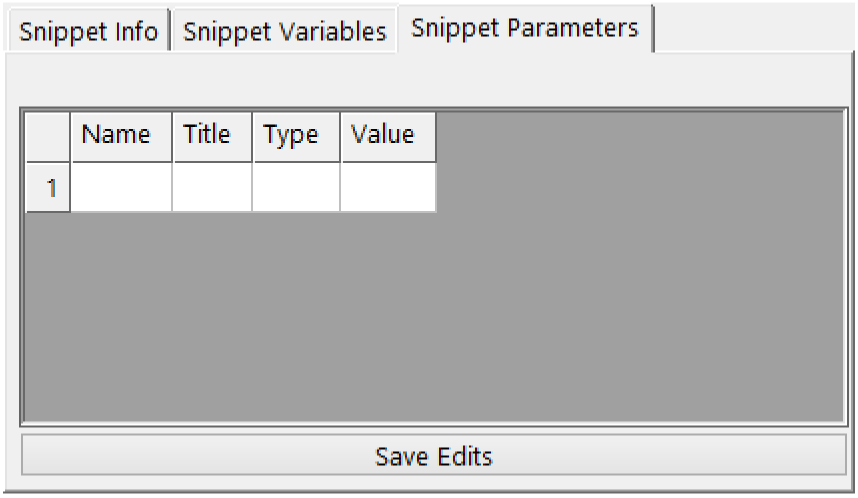
Note: Creating and/or deleting a variable in the Grid Control Box does not change how that variable is used elsewhere in the snippet.

Save Edits button

open the ***Unsaved Changes*** *panel to write out the* ***Snippet Variables*** *(Grid Control Box) to the MTF Snippet file.*

Note: 12d Model Library snippets and User Library snippets cannot be edited via the panel. Therefore this button is disabled when these snippets are selected.

Snippet Parameters Tab



Snippet Parameters Grid Control box

lists the currently selected MTF Snippet parameters.

Each row represents a parameter.

Column 1 - represents the parameter name,

Column 2 - represents the parameter title,

Column 3 - represents the parameter type,

Column 4 - represents the parameter value.

Parameters to be displayed in the Edit Snippet panel must be defined in the snippet_params.4d *file.*

Only parameters of the following types may be displayed and edited: TEXT, REAL, INTEGER

Users can create new parameters, edit existing parameters and delete existing parameters.

Note: Creating and/or deleting a parameter in the Grid Control Box does not change how that parameter is used elsewhere in the snippet.

Save Edits button

opens the ***Unsaved Changes*** *panel to write out the* ***Snippet Parameters*** *(Grid Control Box) to the MTF Snippet file.*

Note: 12d Model Library snippets and User Library snippets cannot be edited via the panel. Therefore this button is disabled when these snippets are selected.

Copy Snippet button

opens the ***Copy Snippet To*** *panel and allows the user to copy the selected snippet to the current Working Folder.*

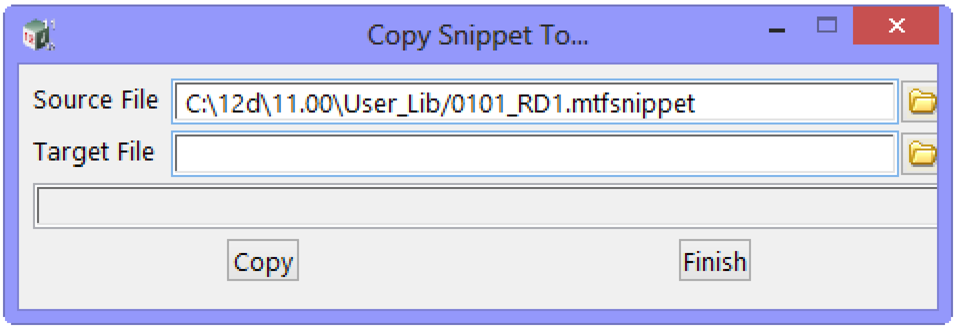
Edit Snippet button

open the selected snippet in a text editor.

*The default text editor is Notepad, unless a text editor is defined in the users env.4d:*EDITOR_4D

Note: The text editors Multiple Instance settings will control whether snippets open for editing in the same window or create a new window.

Selecting the **Copy Snippet** button brings up the **Copy Snippet To...** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Source File File Box

file path and name of the MTF Snippet being copied.

*When the **Copy Snippet To** panel opens, this field is auto-populated with the currently selected MTF Snippet from the MTF Snippets tree.*

Target File File Box

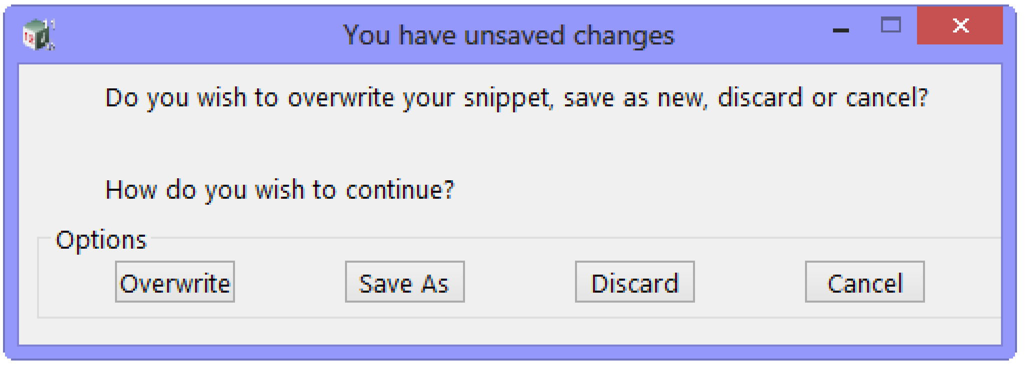
enter a new file name and path for the MTF Snippet being copied.

Entering a file name with no path will copy the MTF Snippet to the current Working Folder.

Copy Button

*when clicked the **Source File** is copied with the **Target File** path and name.*

Selecting the **Save Edits** button brings up the **Unsaved Changes** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Overwrite Button

*writes all variables in the **MTF Variables** Grid Control Box to the currently selected MTF Snippet file.*

Existing variables of the same name will be overwritten.

Save As Button

*save all variables in the **MTF Variables** Grid Control Box to a new MTF Snippet file.*

*Selecting this button brings up the **Copy Snippet To** panel.*

Discard Button

*all edits made to the variables in the **MTF Variables** Grid Control Box are discarded and the currently selected MTF Snippet file is not edited.*

Cancel Button

*closes the **Unsaved Changes** panel.*

How snippet_params.4d Works

snippet_params.4d is a file that allows users to control the visibility of MTF Snippet Parameters in the Snippet Parameters Grid_CtrlBox.

File Format:

- *Plain Text*
- *Each line should contain one MTF Snippet Parameter name. For example: LANE1*
- *MTF Snippet Parameter names are case sensitive*
- *Comments are allowed in the file, and should begin with: //*

Where should snippet_params.4d be located?

By default the file is located in:

C:\Program Files\12d\12dmodel\11.00\set_ups

or

C:\Program Files (x86)\12d\12dmodel\11.00\set_ups

Users can copy this file to their User directory (typically C:\12d\11.00\User) or their current ***12d Model*** project directory. The macro will find and read this file in those directories. The macros search order is:

- *Search the current 12d Model project directory for Snippet_Params.4d. If found; read.*
- *Search the User directory for Snippet_Params.4d. If found; read.*
- *Search the Set_Ups directory for Snippet_Params.4d. If found; read.*

Go to the next section 20.4.3.2 Create Trimesh Snippet or return to 20.4.3 Snippets.

20.4.3.2 Create Trimesh Snippet

Position of option on menu: **Design =>MTF =>Snippets =>Create trimesh snippet**

This section of documentation is a work in progress and will be updated in subsequent releases.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Go to the next section 20.4.3.3 Edit Snippet File or return to 20.4.3 Snippets.

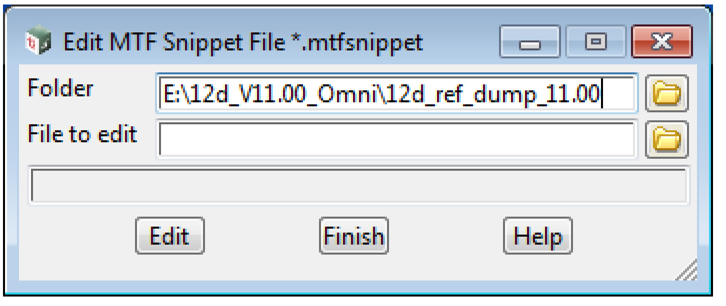
20.4.3.3 Edit Snippet File

Position of option on menu: **Design =>MTF =>Snippet =>Edit snippet file**

The **Edit snippet file** option is used to edit MTF Snippet files (*.mtfsnippet) with the text editor pointed to by the EDIT_4D environment variable.

The **Edit snippet file** option has two modes of operation - clicking on the option **Edit snippet file** itself, or by activating the **MTF =>Snippets =>Edit snippet file** option's walk-right menu, **folder *.mtfsnippet**.

Selecting **Edit snippet file** itself brings up the **Edit MTF File *.mtfsnippet** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box	current folder	

name of the folder for the .mtf snippet file.

File to edit	file box		*.mtfsnippet files

name of the MTF Snippet file, in Folder*, to edit.*

Edit	button		

edit the MTF Snippet file given by the Folder *and* File to edit *panel fields by the text editor pointed to by the* EDIT_4D *environment variable. If the file given in the* File to edit *field does not exist, then a new file is created which already has each of the section headers set up.*

Similarly the **Edit snippet file** walk-right menu provides a list all the MTF Snippet files (files ending in .mtfsnippet) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Go to the next section 20.4.3.4 Compile Snippet or return to 20.4.3 Snippets.

20.4.3.4 Compile Snippet

Position of option on menu: **Design =>MTF =>Snippet =>Compile snippet**

The **Compile snippet** option is used to create a compiled version of a Snippet file.

This can be done to protect any intellectual property (IP) and minimise concerns people may have in developing and sharing snippets.

The compiled snippet file can **not** be read with a text editor.

Compiling a snippet encrypts and encodes the snippet contents into a new file with an extension of **mtfsnippetc** (note the 'c' at the end, denoting a compiled snippet).

A compiled snippet can be run and used by anyone, but the snippet code itself cannot be viewed or edited.

Temporary snippet files, if enabled, are not generated for compiled snippets.

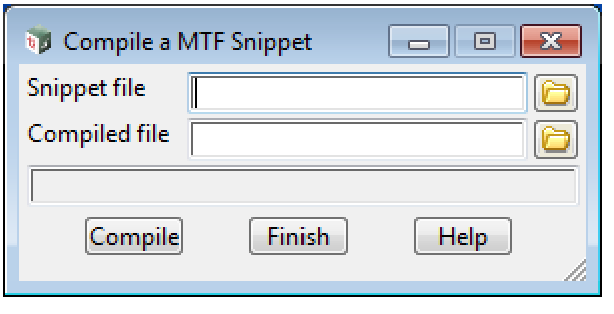
Original Snippet

// INFO Example compiled snippet

Compiled Snippet

nyKgSBlhX6wGqQizY/fRfDcT/YReG2J34wsghywz6Ys+cfVn+Pi+crz/4c9XgNbYI+kmS14F
fIh+l/bNu41RYyD4RtNvIiS9

Selecting **Compile snippet** itself brings up the **Edit MTF File *.mtfsnippet** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Snippet file	file box		*.mtfsnippet files

name of the MTF Snippet file to compile.

Compiled file	file box		*.mtfsnippetc files

name of the compiled MTF Snippet file.

Compile	button		

compile the snippet given in the **Snippet file** *field and write the compiled snippet out with the name given in the* **Compile file** *field.*

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Return to 20.4.3 Snippets or 20.4 MTF.

20.4.3.5 12d Supplied Snippets

See

20.4.3.5.1 TRI_1PT_TRENCH_DES_LAY

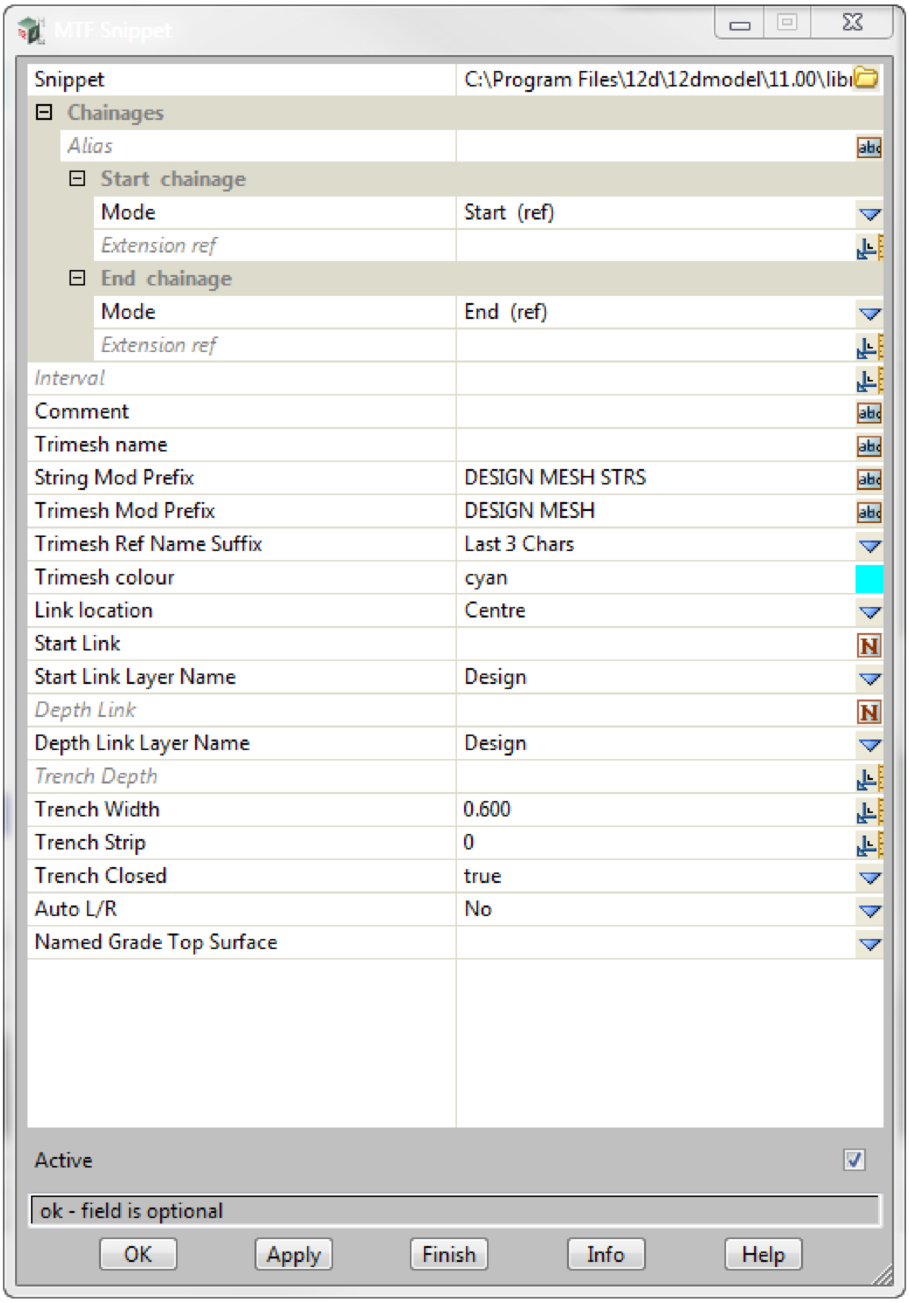
This Snippet is used to create a trench pavement, using <Design> or <Layer> strings created in your MTF.

It is linked to the Start Link at a specified location of left, centre or right.

A depth can be specified either to another link or a set value.

The top surface of the trench is defined by a Named Grade.

The Reference string name can be used as part of the model naming convention.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF file	file box		*.mtf files

name of the MTF file to create.

Snippet	snippet box	*.mtfsnippet,	*.mtfsnippetc files

snippet to run.

Alias, Start Chainage, End Chainage, Interval

defines the start and end chainages to apply a snippet.

For information on these panel fields, see 17.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

for information on these panel fields, see 17.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Trimesh Name	input		

trimesh name that is used in model names below

String Mod Prefix	input		DESIGN MESH STRS
Trimesh Mod Prefix	input		DESIGN MESH
Trimesh Ref Name Suffix	choice box	Last 3 Chars	All Chars
			Last Char
			Last 2 Chars
			Last 3 Chars
			Last 4 Chars
			None

(Model syntax: String Mod Prefix   Trimesh Name   Trimesh Ref Name Suffix)

Trimesh Colour	colour box	cyan	various
Link Location	choice box	Centre	Centre
			LHS
			RHS
Start Link	name		
Start Link Layer Name	choice box	Design	various
Depth Link	name		
Depth Link Layer Name	choice box	Design	various

(Another link can be used to control the depth of the trench.

It is optional so if not set then the following Trench depth is used)

Trench Depth	real		

(This is optional so if not set then the Depth Link above is used)

Trench Width	real		0.6
Trench Strip	real		0

(Allows a strip depth measured from the top of the trench)

Trench Closed	choice box	true	true / false
Auto L/R	choice box	No	Yes / No

if set to <No> then the Start and End Links remain unchanged.

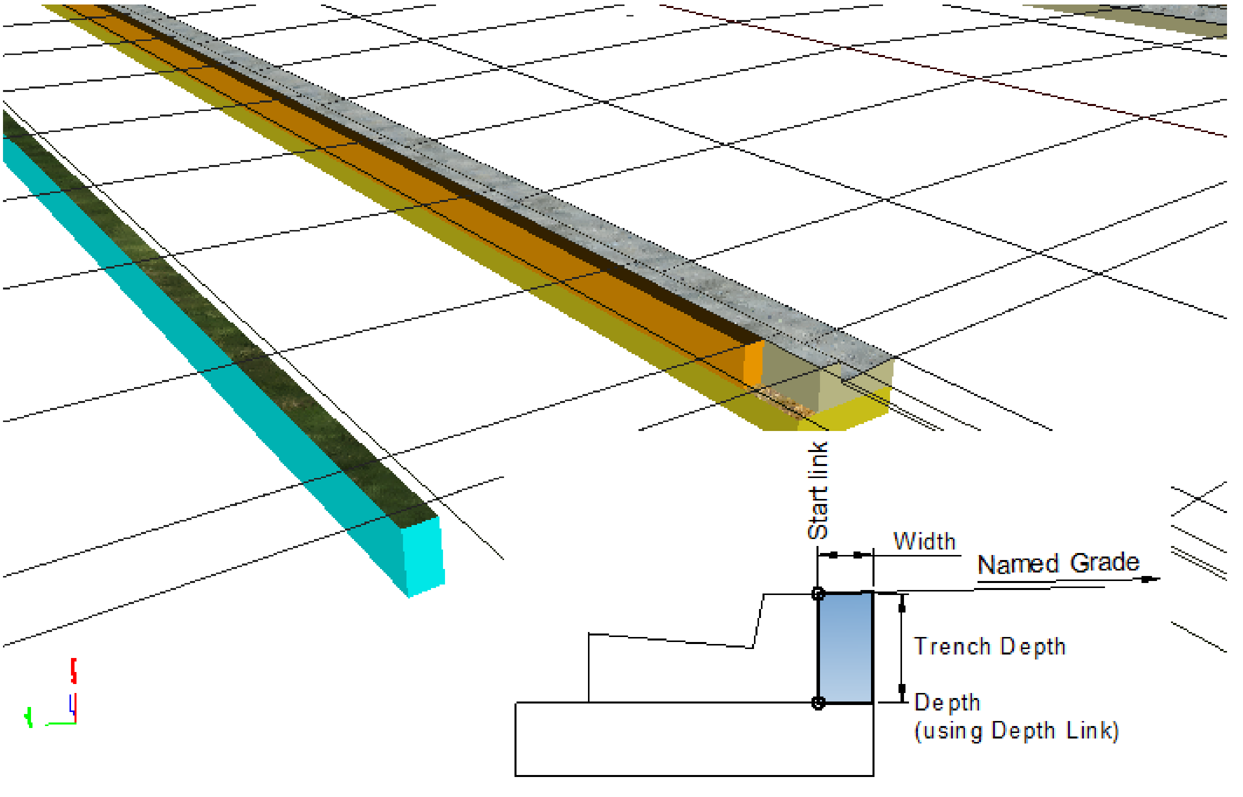
If set to <Yes> then the Start and End Links need the suffix for L/R removed.

*e.g. Any <Design> string names like **ESL** would need the <L> removed*

*e.g. Any <Layer> string names like **PVBALRO1** would need the <LRO1> removed*

Named Grade Top Surface choice box

(The top of the trench will follow this grade while the bottom of the trench is horizontal)



For more information on snippets, see 21.5 Defining and Using Snippets.

Continue to 20.4.3.5.2 TRI_1PT_TRENCH_EXT_STRS or return to 20.4.3.5 12d Supplied Snippets or 20.4.3 Snippets.

20.4.3.5.2 TRI_1PT_TRENCH_EXT_STRS

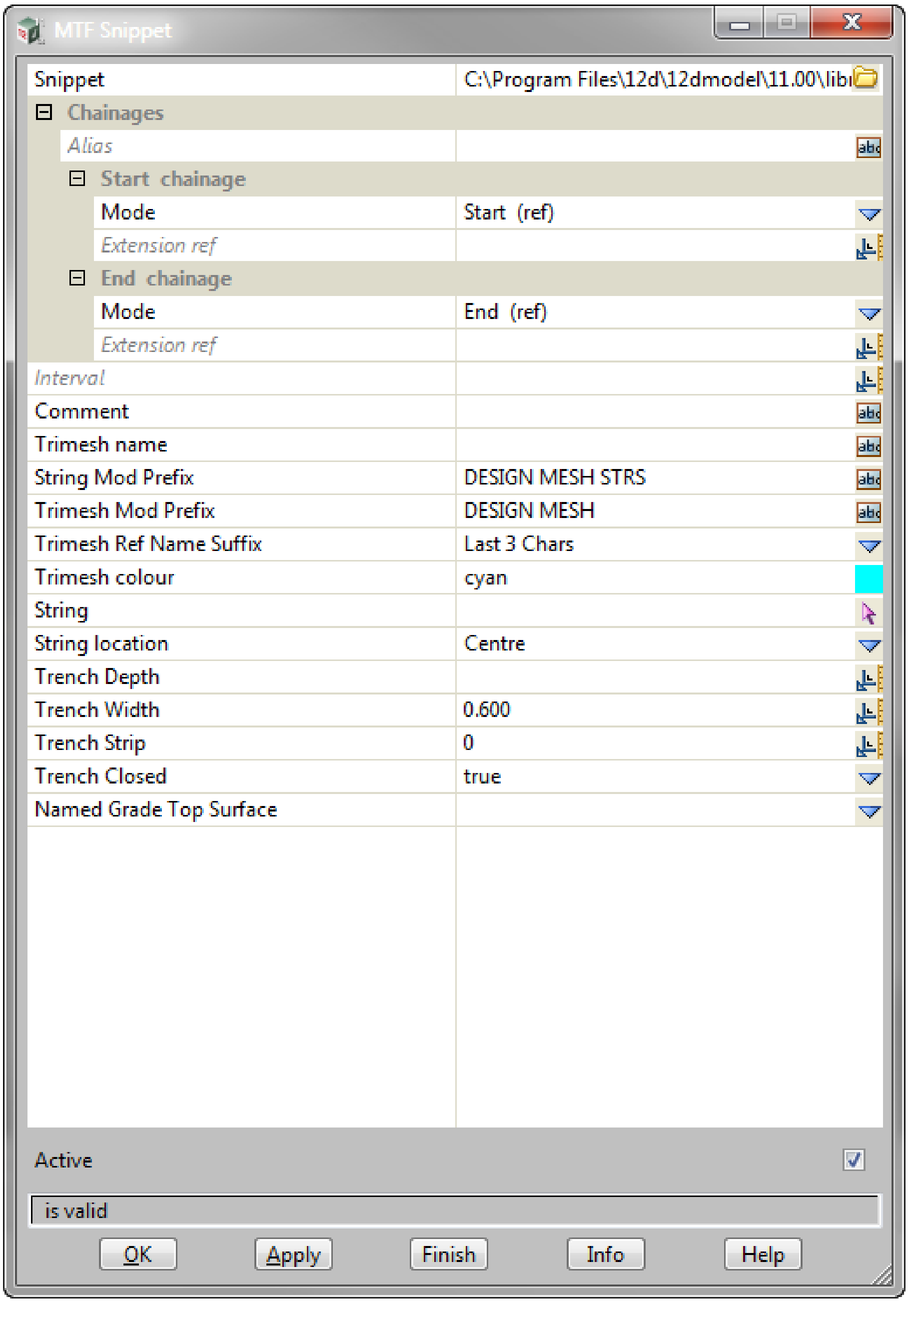
This Snippet is used to create a trench pavement, using External strings NOT created in your MTF.

It is linked to the Start Link at a specified location of left, centre or right.

A depth can be specified either to another link or a set value.

The top surface of the trench is defined by a Named Grade

The Reference string name can be used as part of the model naming convention.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Snippet	snippet box	*.mtfsnippet,	*.mtfsnippetc files

snippet to run.

Alias, Start Chainage, End Chainage, Interval

defines the start and end chainages to apply a snippet.

For information on these panel fields, see 17.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 17.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

If set to <No> then the Start and End Links remain unchanged.

If set to <Yes> then the Start and End Links need the suffix for L/R removed.

e.g Any <Design> string names like ***ESL*** *would need the <L> removed*

e.g Any <Layer> string names like ***PVBALRO1*** *would need the <LRO1> removed*

Create Named Grades choice box No Yes / No

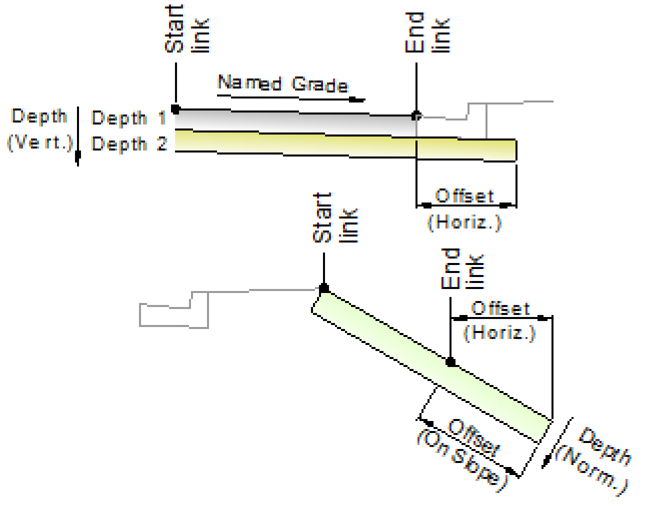
if set to <Yes> then a Named Grade in the format <Start Link Name _ End Link Name> is created for use in the MTF by other modifiers

Named Grades are Parallel? choice box No Yes / No

(This is a decision by the user in case the three links form one grade.

If ***No*** *then the middle point is calculated as an intersection of two grades, using "Depth 1" & "Depth 3".*

If ***Yes*** *then the middle point is calculated from the Second Link at the "Depth 1")*



For more information on snippets, see 21.5 Defining and Using Snippets.

Continue to 20.4.3.5.11 TRI_3PT_PAV_EXT_STRS or return to 20.4.3.5 12d Supplied Snippets or 20.4.3 Snippets.

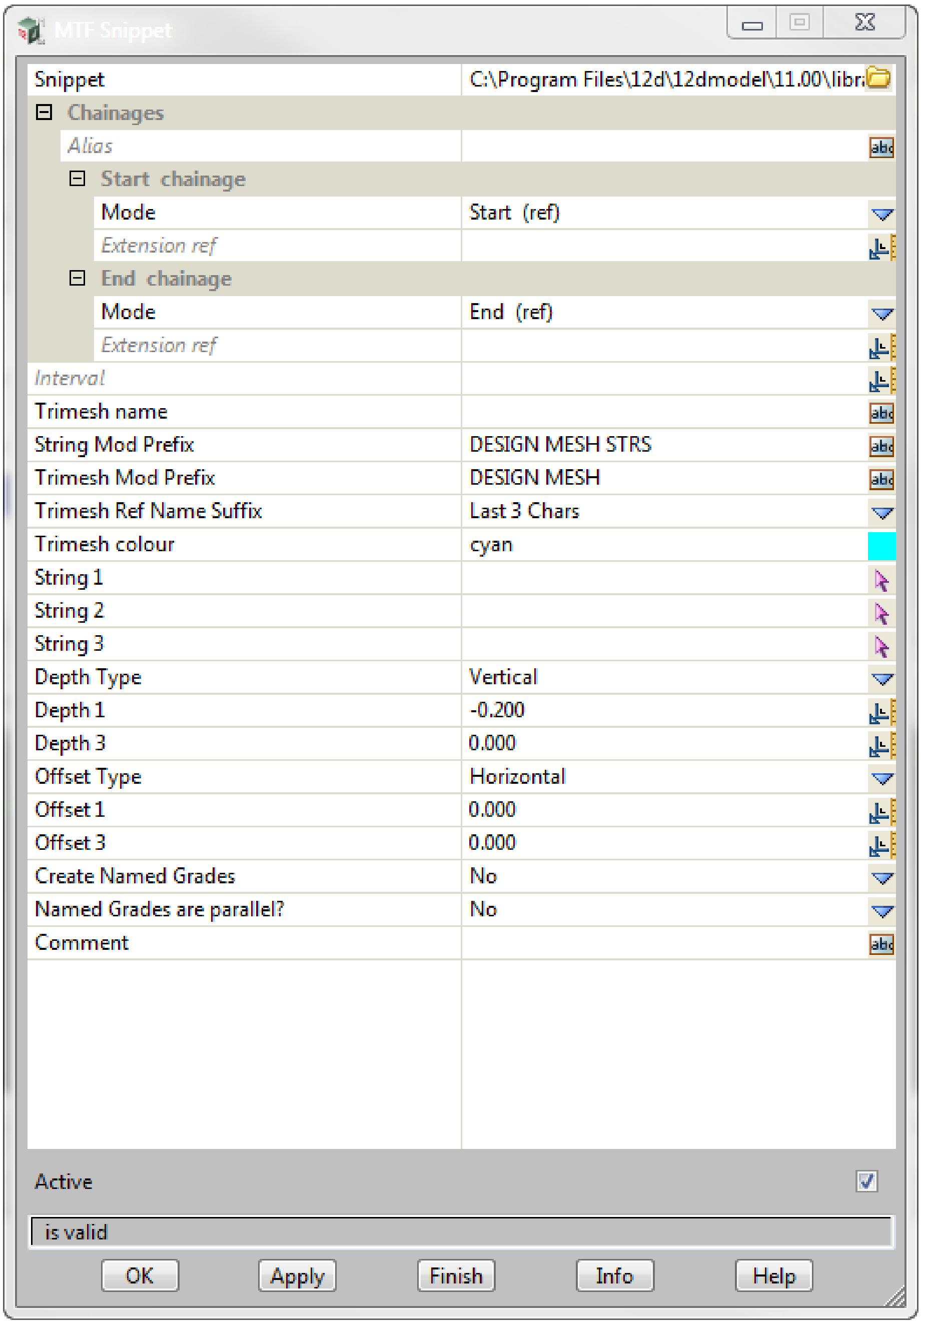
20.4.3.5.11 TRI_3PT_PAV_EXT_STRS

This Snippet is used to create typical pavement, using External strings NOT created in your MTF

It is linked to the three strings at depths specified.

Offsets from these links can be set and measured Horizontally or down the slope created from the links.

The Reference string name can be used as part of the model naming convention.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Snippet	snippet box	*.mtfsnippet,	*.mtfsnippetc files

snippet to run.

Alias, Start Chainage, End Chainage, Interval

defines the start and end chainages to apply a snippet.

For information on these panel fields, see 17.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, Extra start, Extra End, Active, OK, Apply

For information on these panel fields, see 17.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

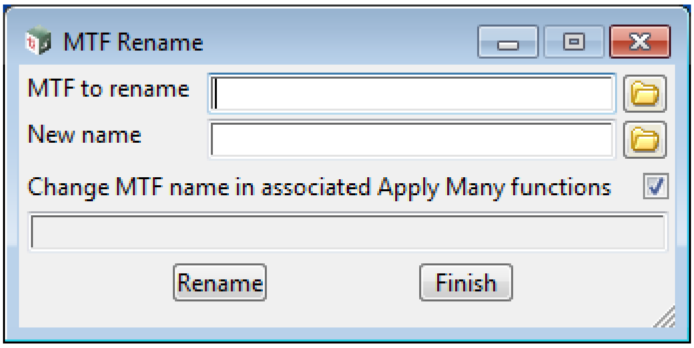
Return to 20.4.3.5 12d Supplied Snippets or 20.4.3 Snippets.

20.4.4 Rename MTF

Position of option on menu: **Design =>MTF =>Rename**

Selecting **Rename** brings up the **MTF Rename** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to rename	file box		*.mtf files

name of the MTF file to rename

New name	file box		*.mtf files

new name for the MTF file

Change MTF name is associated Apply MTF functions tick box

if ticked, rename the MTF in all functions that include it

Rename button

rename the MTF file to the new name.

Go to the next section 20.4.5 Apply MTF or return to 20.4 MTF.

20.4.5 Apply MTF

Position of option on menu: **Design =>MTF =>Apply MTF**

The **Apply MTF** option is used to apply a MTF file to a selected hinge string.

The option has already been described under **Design=>Apply=>Apply MTF.**

For the description of *Apply MTF*, please go to the section 20.3.2 Apply MTF Function.

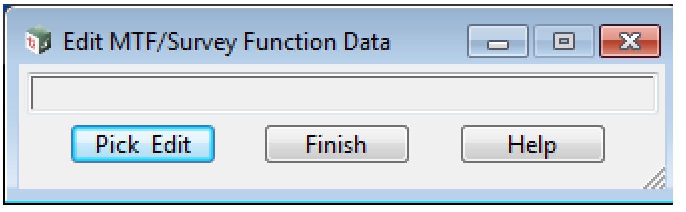
Go to the next section 20.4.6 Edit by String or return to 20.4 MTF.

20.4.6 Edit by String

Position of option on menu: **Design =>MTF =>Edit by string**

The **Edit by string** option is used to edit the ***MTF*** by selecting a string created by the *MTF* in an ***Apply MTF***.

Selecting **Edit by string** brings up the **Edit MTF/Survey Function Data** panel:



After selecting the **Pick Edit** button, a string created by MTF function is selected and the MTF editor is started for the MTF.

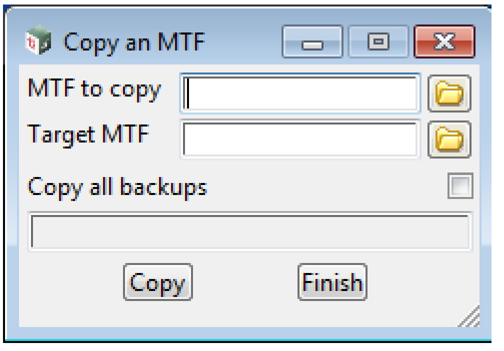
For information on the *MTF Editor*, go to the section 20.4.1.1 MTF Edit.

Go to the next section 20.4.7 Copy MTF or return to 20.4 MTF.

20.4.7 Copy MTF

Position of option on menu: **Design =>MTF =>Copy**

Selecting **Copy** brings up the **Copy an MTF** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to copy	file box		*.mtf files
name of the MTF file to copy.			
Target MTF	file box		*.mtf files
new name for the MTF file.			
Copy all backups	tick box		
if ticked, copy all the backup files of the MTF as well.			
Copy	button		
copy the MTF file to the new name.			

Go to the next section 20.4.8 Delete MTF or return to 20.4 MTF.

20.4.8 Delete MTF

Position of option on menu: **Design =>MTF =>Delete**

Selecting **Delete** brings up the **Delete an MTF** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to delete	file box		*.mtf files

name of the MTF file to delete

Field Description	Type	Defaults	Pop-Up
Delete all backups	tick box		

if ticked, delete all the backup files of the MTF as well

Field Description	Type	Defaults	Pop-Up
Delete	button		

delete the MTF file.

Go to the next section 20.4.9 Create File or return to 20.4 MTF.

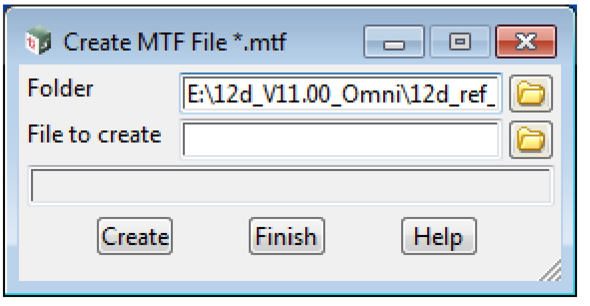
20.4.9 Create File

Position of option on menu: **Design =>MTF =>Create file**

The **MTF=>Create file** option is used to create a new ***Modifiers and Templates Files*** (*.mtf) with the text editor pointed to by the EDIT_4D environment variable.

The created file will already have all the section headers (key words and opening and closing brackets) in it.

Selecting **Create file** brings up the **Create MTF File *.mtf** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box	current folder	

name of the folder for the .mtf file.

File to create	file box		*.mtf files

name of the file to create. The new MTF file already has each of the section headers set up.

Create	button		

create an MTF file given by the **Folder** *and* **File to create** *panel fields. If the file given in the* **File to edit** *field already exists, then an error occurs.*

The text format for the MTF file is described in the section 21.10.1 Text Format of the MTF File.

Go to the next section 20.4.10 Edit MTF File or return to 20.4 MTF.

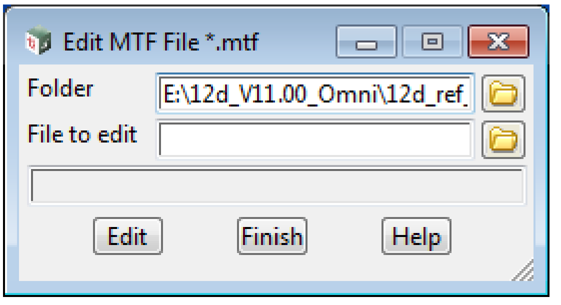
20.4.10 Edit MTF File

Position of option on menu: **Design =>MTF =>Edit file**

The **MTF=>Edit file** option is used to edit MTF files (*.mtf) with the text editor pointed to by the EDIT_4D environment variable.

The **MTF=>Edit file** option has two modes of operation - selecting the **MTF=>Edit file** itself, or by activating the **MTF=>Edit file** option's walk-right menu, **folder *.mtf**.

Selecting **MTF=>Edit file** itself brings up the **Edit a MTF File *.mtf** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box	current folder	

name of the folder for the .mtf file.

File to edit	file box		*.mtf files

name of the MTF file, in **Folder***, to edit.*

Edit	button

edit the MTF file given by the **Folder** *and* **File to edit** *panel fields by the text editor pointed to by the* EDIT_4D *environment variable. If the file given in the* **File to edit** *field does not exist, then a new file is created which already has each of the section headers set up.*

Similarly the **MTF=>Edit file** walk-right menu provides a list all the MTF files (files ending in .mtf) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

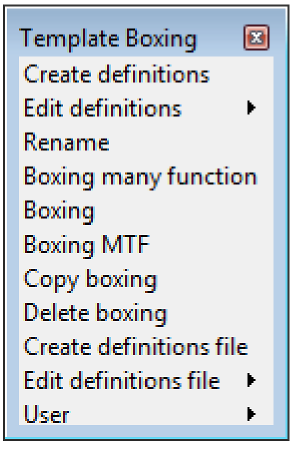
The text format for the MTF file is described in the section 21.10.1 Text Format of the MTF File.

Return to 20.4 MTF.

20.5 Boxing

Position of menu: **Design =>Boxing**

The **Boxing** walk-right menu is



In the **Apply MTF** option, **boxing** can be applied to the generated design sections by special commands in the **MTF**.

However, it is also possible to apply boxing as a post process to a model of x-sections as long as the x-sections were generated in the 4d super string format (this is done by both the Apply and Apply MTF options and the Cuts options - see 28.9.13 Cuts).

For more information on boxing, see 21.6 What is Boxing? and for more information on the various scenarios for generating boxing, see 21.6.2 Applying Boxing.

The rules for calculating different types of boxing are known as **Boxing Definitions** and *Boxing Definition* are created and stored in a **Boxing** file.

The **Boxing**, and the different **Boxing Definitions** contained within the file, are created/edited using the options **Create** and **Edit** from the **Template Boxing** menu.

The options **Boxing many function**, **Boxing many** and **Boxing** use the *Boxing Definitions* to generate boxing.

For the options see:

Create definitions	20.5.1 Create Boxing Definitions
Edit definitions	20.5.2 Edit Boxing Definitions
Rename	20.5.3 Rename Boxing File
Boxing many function	20.5.4 Boxing Many Function
Boxing	20.5.5 Apply Boxing
Boxing many	20.5.6 Apply Boxing Many
Copy boxing	20.5.7 Copy Boxing
Delete boxing	20.5.8 Delete a Boxing File
Create definitions file	20.5.9 Create Definitions Text File
Edit definitions file	20.5.4 Boxing Many Function

20.5.1 Create Boxing Definitions

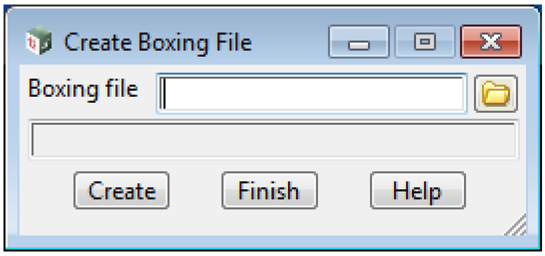
Position of option on menu: **Design =>Boxing =>Create definitions**

The rules for calculating different types of boxing are known as **Boxing Definitions** and *Boxing Definition* are created and stored in a **Boxing** file.

The **Boxing=>Create definitions** option is used to create a new **Boxing** file (*.bf), and then the **Edit Boxing Definitions** panel is opened for the **Boxing** file to create and add new *Boxing Definitions.* The **Edit Boxing Definitions** panel is then used to write the **Boxing** file to disk.

and can be edited using the **Boxing =>Edit definitions** option, or by standard text editor.

Selecting **Create definitions** displays the **Create Boxing File** panel.



The fields and buttons used in this panel have the following functions.

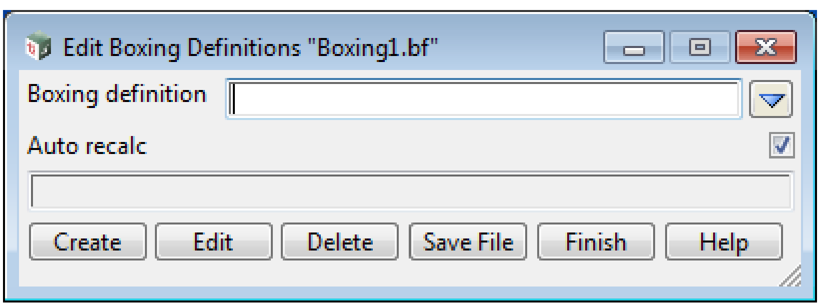
Field Description	Type	Defaults	Pop-Up
Boxing file	file box		*.bf files

name of the boxing file to create.

Create	button		

create a boxing file with name given by the **boxing file** *panel fields.*
If the file given in the **boxing file** *field does not exist, then the* **Edit Boxing Definitions** *panel is placed on the screen and is used to created and edit the boxing definitions for the boxing file.*
If the file already exists, then nothing will happen on selecting **Create**.

When **Create** is selected from the **Create Boxing File** panel, it brings up the **Edit Boxing Definitions** panel which is used to create and edit the boxing definitions, and to saved the boxing definitions to disk in the boxing file.



For information on the **Edit Boxing Definitions** panel, go to 21.7.2 Edit Boxing File.

The **Edit Boxing Definitions** panel is described in the section 21.7.2 Edit Boxing File.

Go to the next section 20.5.2 Edit Boxing Definitions or return to 20.5 Boxing.

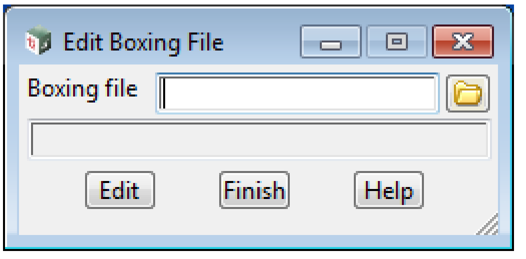
20.5.2 Edit Boxing Definitions

Position of option on menu: **Design =>Boxing =>Edit definitions**

The **Boxing =>Edit definitions** option is used to edit *Boxing* files (*.bf).

The **Boxing =>Edit definitions** option has two modes of operation - selecting the **Boxing =>Edit definitions** itself, or by activating the **Boxing =>Edit definitions** option's walk-right menu, **folder *.bf**.

Clicking on **Boxing=>Edit definitions** itself brings up the **edit boxing file** panel.



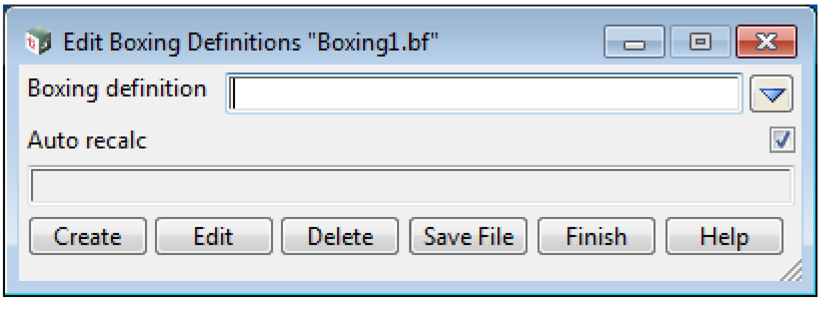
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file	input		*.bf files

name of the boxing file to edit.

Edit	button		

edit the file given by **boxing file** *panel field.*
If the file given in the **boxing file** *field exists, then the* **Edit Boxing Definitions** *panel is brought up to create/edit the boxing definitions in the boxing file.*



Similarly, walking right on **Boxing=>Edit** provides a list all the boxing files (files ending in .bf) in the current folder and when a file is selected from the list, the **Edit Boxing Definitions** panel is brought up for the selected boxing file.

The **Edit Boxing Definitions** panel is described in the section 21.7.2 Edit Boxing File.

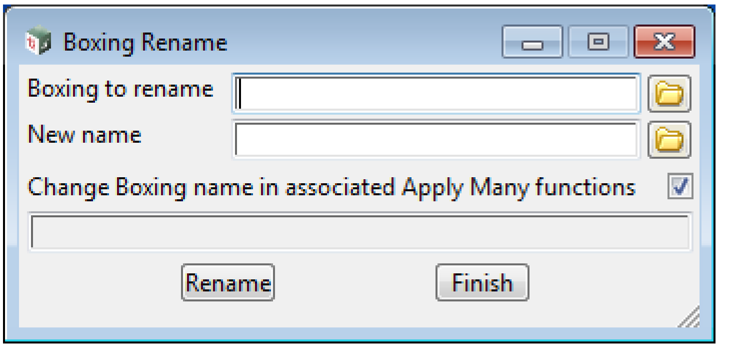
Go to the next section 20.5.3 Rename Boxing File or return to 20.5 Boxing.

20.5.3 Rename Boxing File

Position of option on menu: **Design =>Boxing =>Rename**

On selecting **Rename**, the **Boxing Rename** panel is displayed.

This panel can be used to change the names of existing boxing files.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing to rename	boxing file box		*.bf files

name of the boxing file to be renamed.

New name	boxing file box		*.bf files

new name for the boxing file

Change Boxing name in associated Apply MTF functions tick box

if ticked, rename the bf file in all the Apply MTF functions that include it.

Rename button

Change the name of the boxing file in the **Boxing to rename** *field to the name given in the* **New name** *field.*

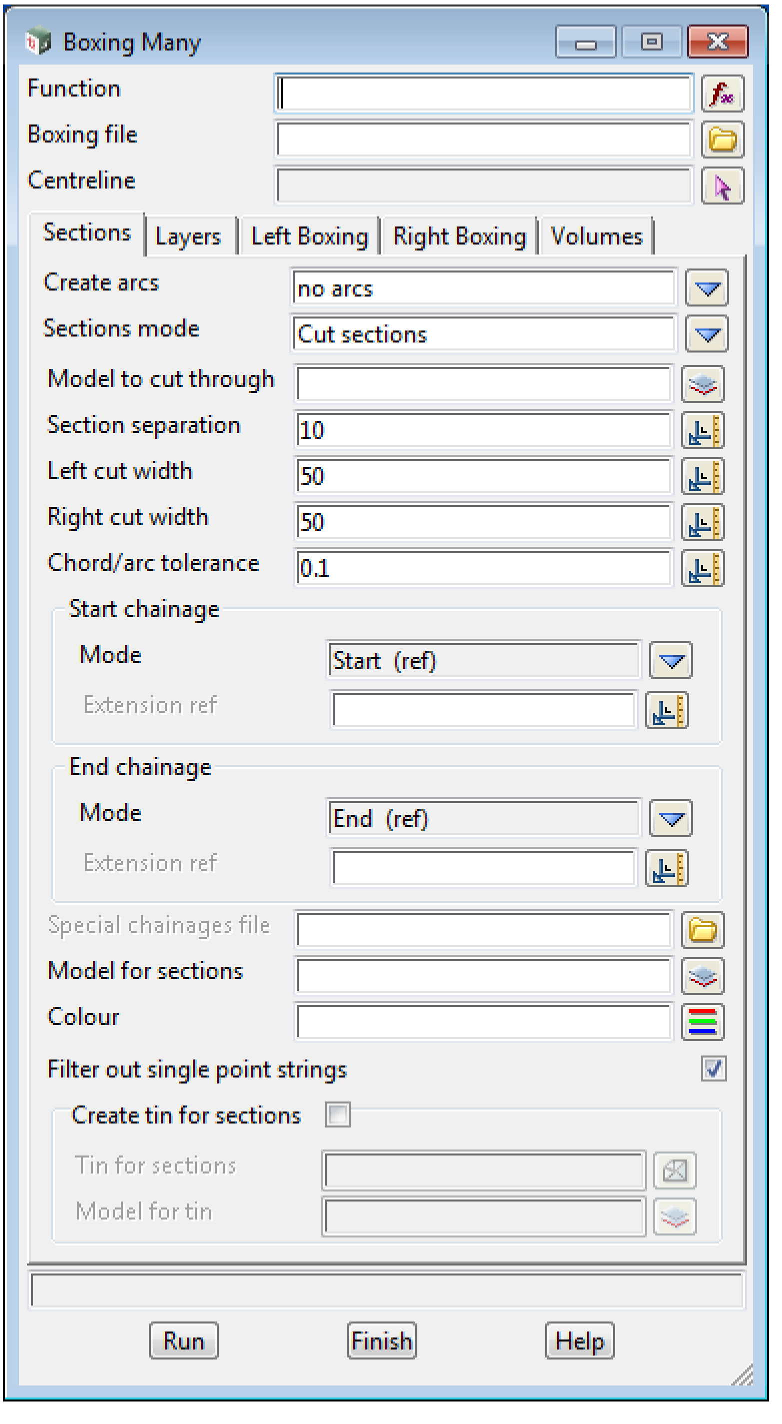
Go to the next section 20.5.4 Boxing Many Function or return to 20.5 Boxing.

20.5.4 Boxing Many Function

Position of option on menu: **Design =>Boxing =>Boxing many function**

This option is used to cut strings to create sections and then apply up to eight layers of boxing to the cut sections.

Selecting **Boxing many function** displays the **Boxing Many** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box		available boxing functions

name of the Boxing function

Boxing file file box *.bf files

the Boxing file that contains the Boxing Definition that are be applied to the cut sections

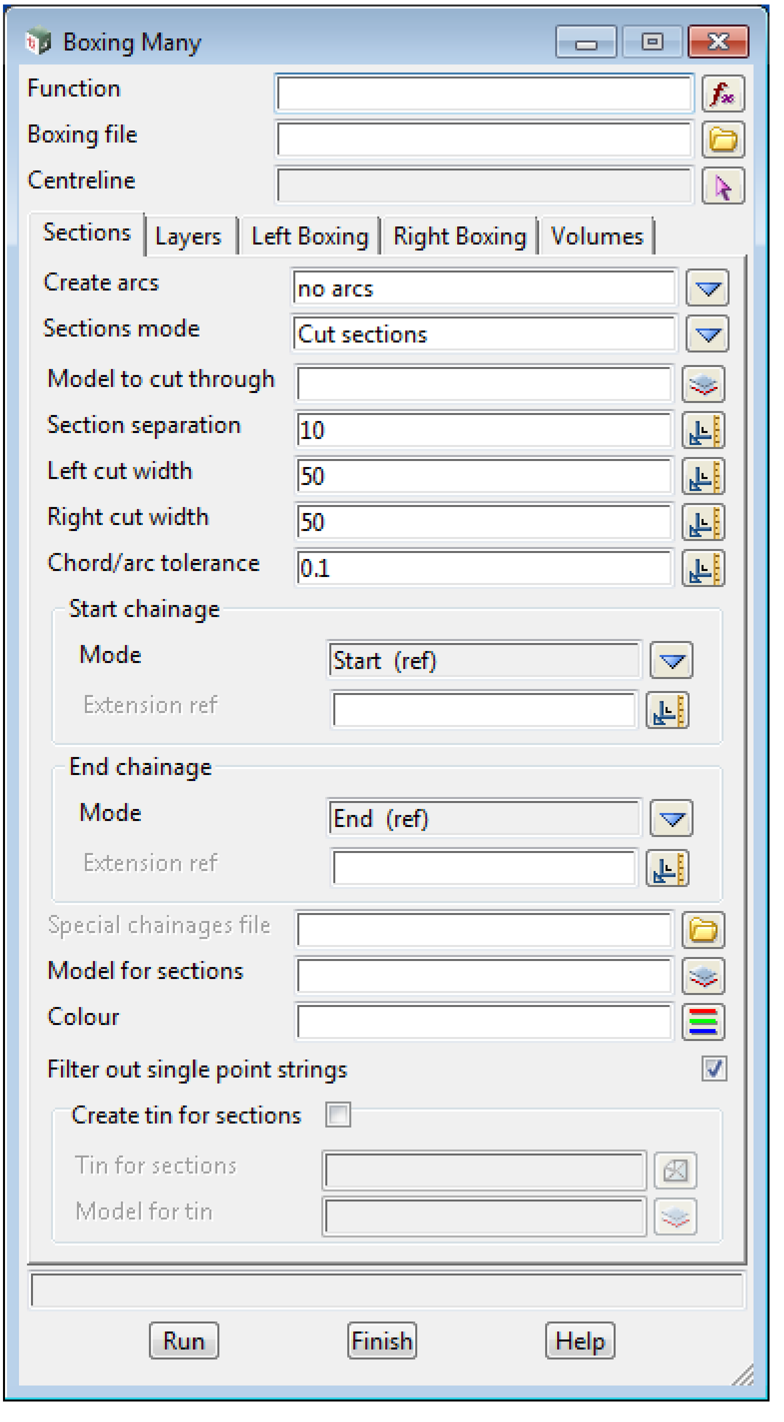
Centreline string select

string to use for chainage, and perpendicular, for cutting cross sections to apply the boxing to

For the information on each **Boxing Many** tab, go to

Sections tab
Layers tab
Left/Right Boxing tabs
Volumes tab

Sections tab



Sections mode choice box Cut sections, Use existing sections

if Cut section, sections are cut through the strings in the **Model to cut through** *and placed in* **Model for sections.**

If User existing sections, no sections are cut and the existing sections in **Model for sections** *are used to apply the boxing to.*

Model to cut through model box available models

model of strings to cut sections through

Section separation input 10

the distance along the selected centre line to generate plan section lines to be used to cut through the *model or view.*

Left/Right cut width input 50

the left/right distance to go out from the centre line for creating a section to cut through the strings.

Chord/arc tolerance input default chord/arc tolerance

the chord to arc tolerance to use on the selected string for determining how many plan sections are created around horizontal curves.

Start/End chainage choice box Start (ref)/End (ref)
Mode choice box Smart Chainge modes
Extension ref real box

the **Start/End chainage***,* **Mode** *and* **Extension ref** *are all used to define the start/end chainage on the selected centreline string.*
The sections for the cuts are restricted to between these start and end chainage.
If blank, the **Start/End chainage** *of the reference string is used*

For more information on Start/End Chainage Modes, see 21.2.1 MTF Hinge Modifiers

Special chainages file file box *.spf files

a file containing chainages, one per line, that are also used as extra chainages to create cross sections at.

Model for sections model box available models

model for the cut cross sections.

Colour colour box available colours

colour for the cut cross sections.

Filter out single point strings tick box

if ticked, don't save any sections that only have a single point in them

Create tin for sections tick box

if ticked, a tin of the cross sections in **Model for sections** *is created.*

Tin for sections tin box available tins

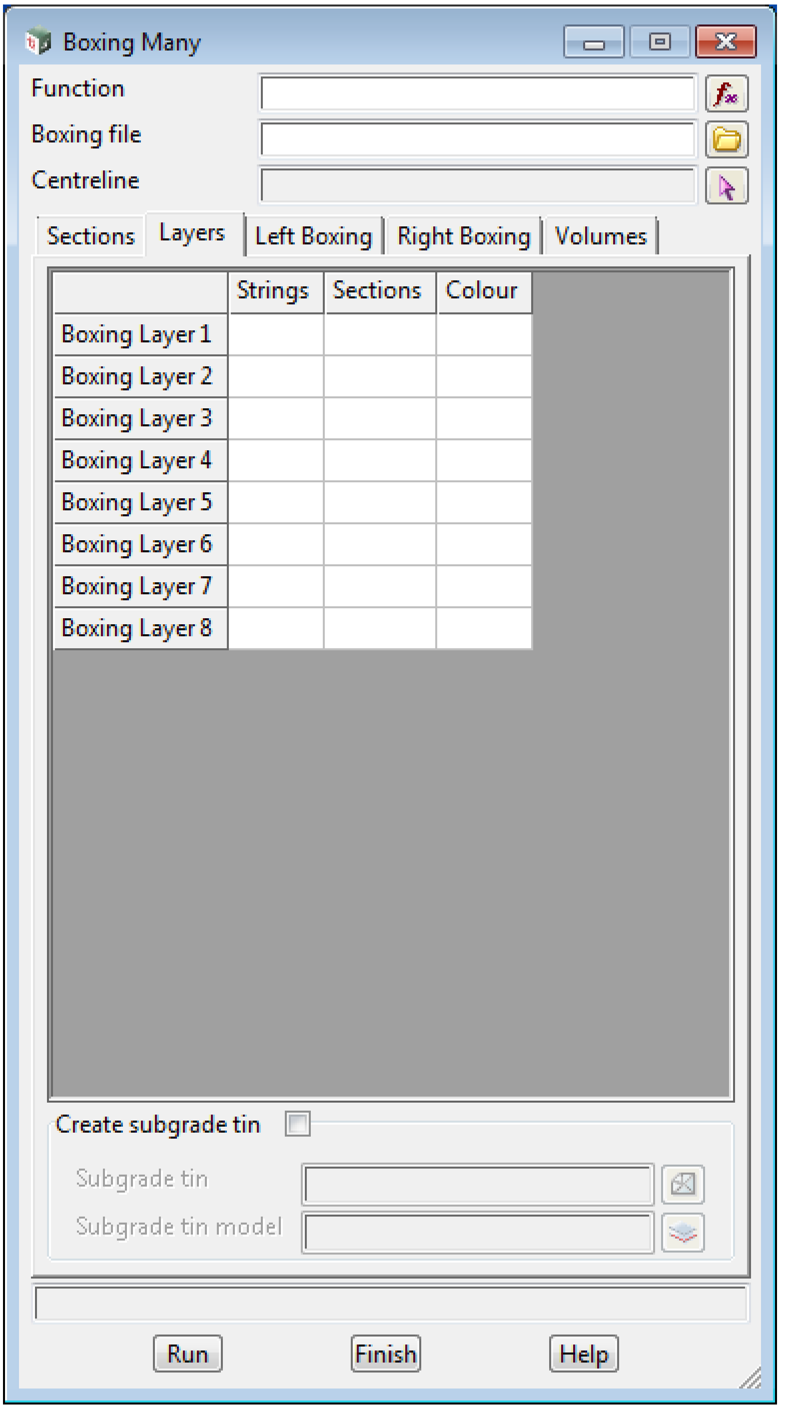
name of the tin of cross sections

Model for tin model box available models

model for the cross sections tin.

Layers tab

the layers tab consists of a grid for defining up to eight layers of boxing strings and sections. The last boxing layer is also referred to as the ***subgrade*** *layer.*



Boxing Layer 1-8:

if the model names are non blank, boxing strings and sections will be created for that layer.

For more information on boxing, see 21.6 What is Boxing?.

Strings input

*if non-blank, pre*post text to use with the function name to create the name of the model for the boxing strings for this layer.*

If blank, the boxing strings will not be stored for this layer.

Sections	input	available models

*if non-blank, pre*post text to use with the function name to create the name of the model for the boxing sections for this layer.*

If blank, the boxing sections will not be stored for this layer.

Colour	colour box	available colours

colour for the boxing sections for this layer

Create subgrade tin	tick box	

if ticked, then a tin of the subgrade strings and sections is created. Note - the subgrade is the last boxing layer.

Subgrade tin	tin box	available tins

name for the subgrade tin

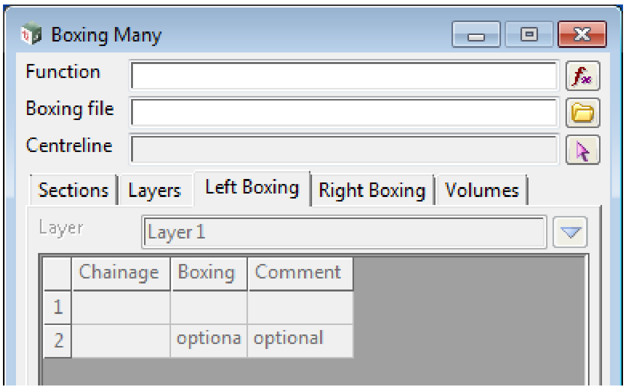
Subgrade tin model	model box	available models

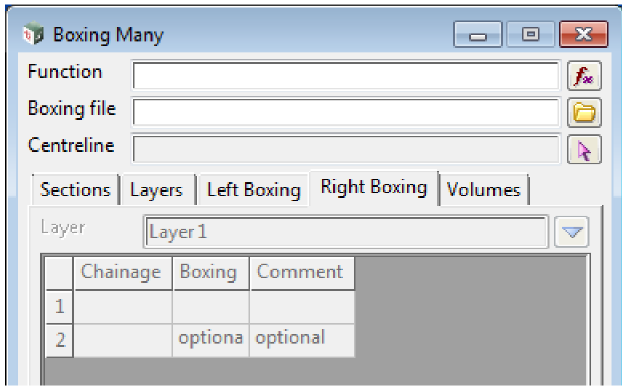
model for the subgrade tin

Left/Right Boxing tabs

tab for applying left boxing - gives the chainage range and boxing definitions to use for each of the eight layers of boxing

For more information on boxing, see 21.6 What is Boxing?.





Layer	choice box	Layer 1, Layer 2 ... Layer 8

as each layer is selected, a grid for defining the chainages and boxing definition that applies to that chainage are given in the grid. The boxing definition goes form the chainge on the row specifying the boxing file until the chainge on the new row.

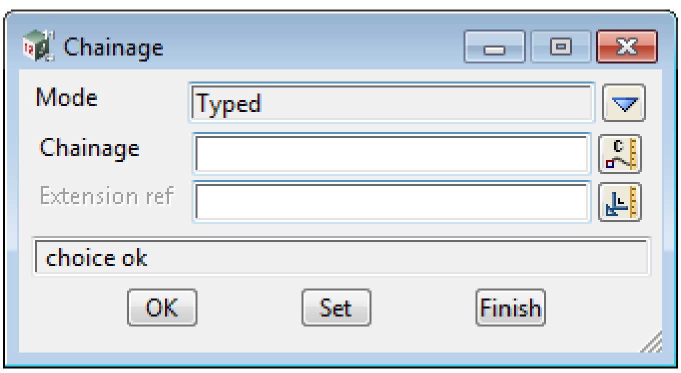
Layer grid:

For each selected layer:

Chainage smart chainge box

For the selected boxing layer, the chainage to apply the boxing definition to. The boxing file starts at this chainge and goes until the chainage on the next row.

*If you right click in the **Chainage** column in the **Left/Right Boxing** tabs, or select **Browse** if the Browse menu comes up) then a* **Chainage** *panel comes up which has the most of the standard MTF choices for **Smart Chainages**.*



The **Chainage Mode** *will determine what other fields are also on the panel (for example* **Extension ref** *for* **Mode** ***Typed****). For more information on Chainage Modes, see* 21.2.1 MTF Hinge Modifiers

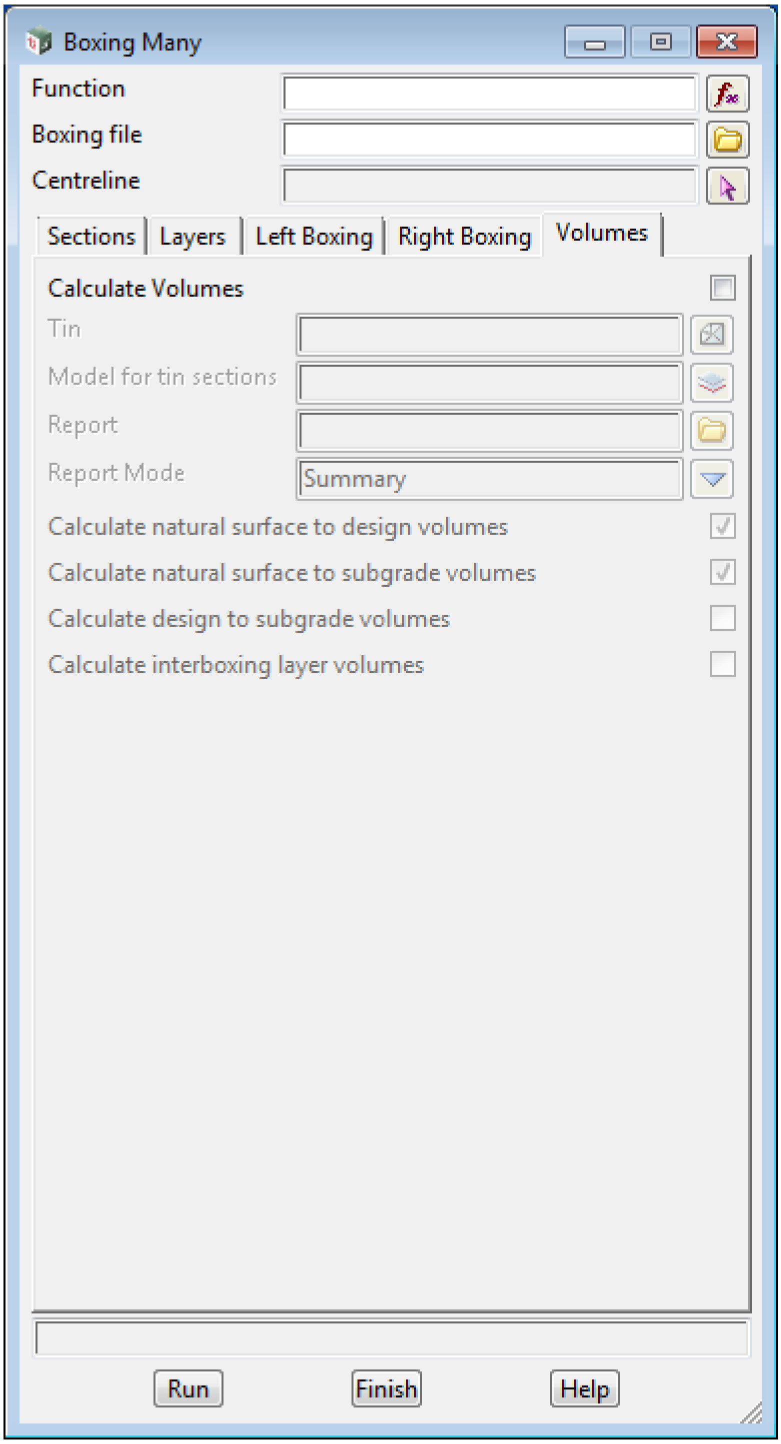
Boxing	boxing definition box	boxing definitions

*the boxing definition to use with the given chainage range. The pop-up lists all the boxing definitions in the **Boxing file***

Comment

record a comment

Volumes tab



Calculate volumes tick box

if ticked, then end area volumes are created

Tin tin box available tins

name of the natural surface tin - required if volumes to the natural surface are calculated

Model for tin sections model box available models

if non blank, model to put the natural surface sections into

Report file file box *.rpt

if non-blank, the name of the file to contain the volume report. If the file already exists, the report will be appended to the file.

If blank, no report is produced.

Report mode choice box Summary, Full

*if **Summary**, the report only contains the final volumes.*

*If **Full**, the report contains sections by section areas and volumes as well as the summary of volumes.*

Calculate natural surface to design volumes tick box tick

if ticked, end area volumes between the natural surface and the design strings are written to the report file

Calculate natural surface to subgrade volume tick box tick

if ticked, end area volumes between the natural surface to the subgrade (the last boxing layer) are written to the report file

Calculate design to subgrade volumes tick box tick

if ticked, end area volumes between the design strings and the subgrade (the last boxing layer) are written to the report file.

Calculate inter-boxing layer volumes tick box tick

if ticked, end area volumes between each of the boxing layers are written to the report file.

Run button

run the option

For more information on boxing, see 21.6 What is Boxing? and for more information on the various scenarios for generating boxing, see 21.6.2 Applying Boxing.

Go to the next section 20.5.5 Apply Boxing or return to 20.5 Boxing.

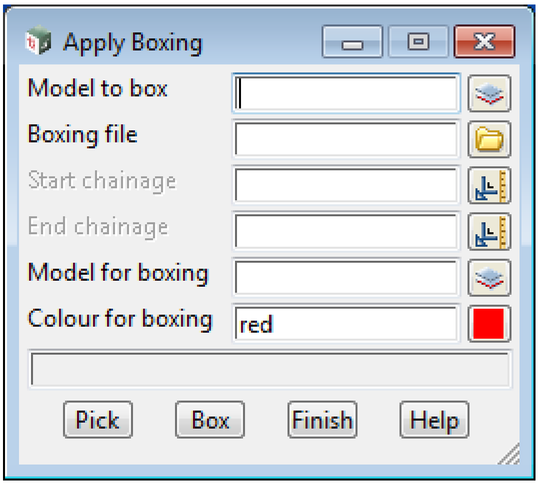
20.5.5 Apply Boxing

Position of option on menu: **Design =>Boxing =>Boxing**

Selecting **boxing** displays the **apply boxing** pane.

This panel is used to create boxing sections by applying the first **Boxing Definition** in a *Boxing* file, to a selected 4d super string or model of sections created as 4d super strings. Only the one *Boxing Definition* is used for all of the sections.

The **Apply Boxing** panel is



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model to box	model box		available models

model of sections (in 4d string format) to apply the boxing definition to.

Boxing file	file box		*.bf files

name of the file containing the boxing definition to be applied to the sections in the **model to box**.

Start/End chainage	input		

the start/end string chainage for applying boxing. If blank, then the **start/end chainage** *is taken to be the chainage at the beginning/end of the picked string.*

Model for boxing	model box		available models

model for the created boxing x-sections

Colour for boxing	colour box		available colours

colour for the boxing x-sections

Pick	button		

after picking the **Pick** *button, any selected strings will have the boxing applied to them.*

Box	button		

apply the first Boxing Definition given in the **Boxing file** *to the sections in the* **model to box** *that are between the given* **Start chainage** *and* **End chainage**.

For more information on boxing, see 21.6 What is Boxing? and for more information on the various scenarios for generating boxing, see 21.6.2 Applying Boxing.

Go to the next section 20.5.6 Apply Boxing Many or return to 20.5 Boxing.

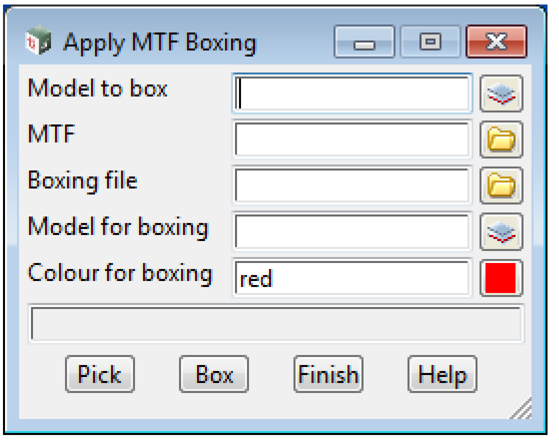
20.5.6 Apply Boxing Many

Position of option on menu: **Design =>Boxing =>Boxing many**

This panel can be used to create boxing sections by applying the **Boxing Definitions** as specified in an MTF file. to a selected 4d super string or to a model of sections.

If an individual 4d super string is picked, the option uses the Boxing defined for the chainage where the section 4d string was created.

Selecting **Boxing Many** displays the **Apply Many Boxing** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model to box	model box		available models

model of sections (in 4d string format) to apply the boxing definition to.

MTF file	file box		*.mtf files

name of the MTF file which contains the application of the Boxing Definitions to the sections given in the **Model to box** *panel field.*

If **Boxing file** *is* ***blank****, use the Boxing file given in the MTF file.*

If **Boxing file** *is* ***non-blank****, then all the Boxing Definitions referred to in the* **MTF file** *are taken from the* **Boxing file.**

Boxing file	file box		*.bf files

If ***non-blank****, then all the Boxing Definitions referred to in the* **MTF file** *are taken from the* **Boxing file***. That is, the Boxing file given in the MTF file is NOT used for the Boxing Definitions.*

If ***blank****, use the Boxing file given in the MTF file.*

Model for boxing	model box		available models

model for the created boxing x-sections

Colour for boxing	colour box		available colours

colour for the generated boxing x-sections

Pick	button		

after picking the **Pick** *button, any selected strings will have the boxing applied to them.*

Box	button		

apply the boxing as given by the **MTF file***, using the boxing definitions is the* **Boxing file***, to the 4d sections in the* **Model for boxing field***. The new boxing sections are added to the* **Model for boxing**.

For more information on boxing, see 21.6 What is Boxing? and for more information on the various scenarios for generating boxing, see 21.6.2 Applying Boxing.

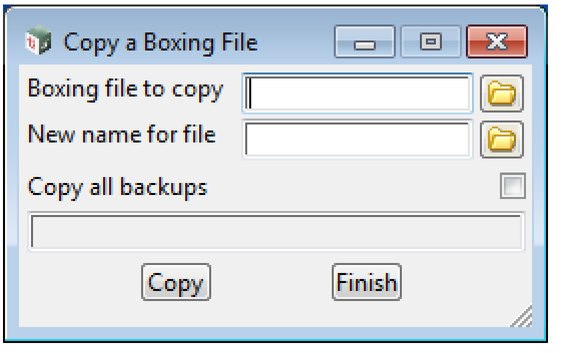
Go to the next section 20.5.7 Copy Boxing or return to 20.5 Boxing.

20.5.7 Copy Boxing

Position of option on menu: **Design =>Boxing =>Copy**

A copy of an existing boxing file can be made using the **Copy** option. This is often useful when a new boxing file that is similar to an existing boxing file is needed. The existing boxing file can be copied, and the copy then edited and modified.

On selecting **Copy** the **Copy a Boxing File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file to copy	boxing file box		*.bf files

name of the boxing file to be copied.

New name for file	boxing file box		*.bf files

name of the new boxing file.

Copy all backups tick box

if ticked, copy all the backup files of the boxing file as well.

Copy button

after selecting this button, the boxing file given in the **Boxing file to copy** *field will be copied and the copy given the name in the* **New name for file** *field.*

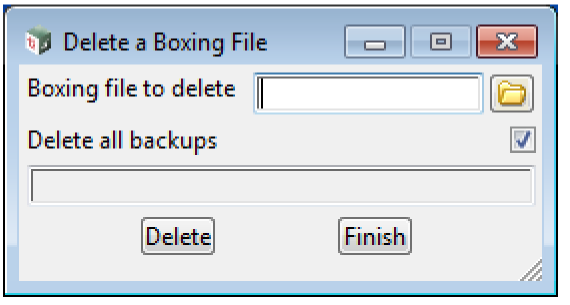
Go to the next section 20.5.8 Delete a Boxing File or return to 20.5 Boxing.

20.5.8 Delete a Boxing File

Position of option on menu: **Design =>Boxing =>Delete**

The **Delete a template** deletes boxing files from the project.

Selecting **Delete a**, displays the **Delete Template** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file to delete	boxing file box		*.bf files

name of the boxing file to delete.

Delete all backups	tick box		

if ticked, the boxing file and all its backups files will be deleted.

Delete	button		

after selecting this button, the boxing file given in the Boxing file to delete field will be deleted.

Go to the next section 20.5.9 Create Definitions Text File or return to 20.5 Boxing.

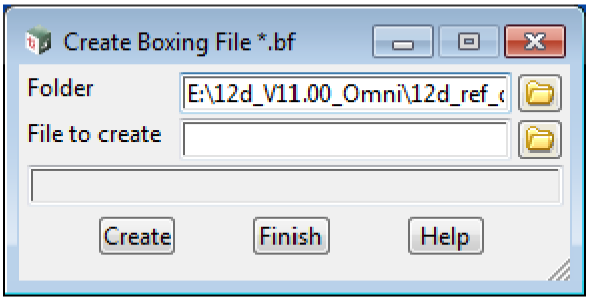
20.5.9 Create Definitions Text File

Position of option on menu: **Design =>Boxing =>Create definitions file**

The **Boxing=>Create definition file** option is used to create a new **Boxing** file (*.bf) with the text editor pointed to by the EDIT_4D environment variable.

The created text file will already have a section header set up for a boxing called “1”(key word and opening and closing brackets).

Selecting **Create definitions file** brings up the **create boxing file *.bf** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box	current folder	

name of the folder for the .bf file.

File to create	file box		*.bf files

name of the file to create.

Create	button		

create a Boxing file given by the **folder** *and* **file to create** *panel fields. If the file given in the* **file to edit** *field does not exist, then a new file is created which already has a section header set up.*

For more information on boxing, see 21.6 What is Boxing? and for more information on the various scenarios for generating boxing, see 21.6.2 Applying Boxing.

The text format for the *Boxing* file is described in the section 21.10.2 Text Format of the Boxing File.

Go to the next section 20.5.10 Edit Definitions Text File or return to 20.5 Boxing.

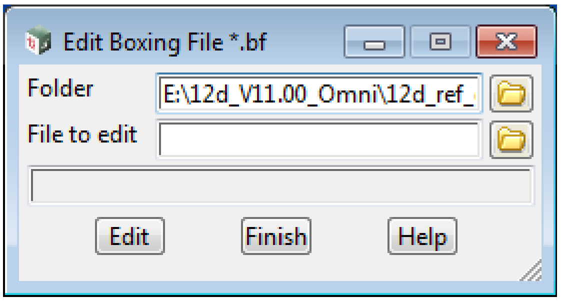
20.5.10 Edit Definitions Text File

Position of option on menu: **Design =>Boxing =>Edit definitions file**

The **Boxing=>Edit definitions file** option is used to edit boxing files (*.bf) with the text editor pointed to by the EDIT_4D environment variable.

The **Boxing=>Edit definitions file** option has two modes of operation - selecting the **Boxing=>Edit definitions file** itself, or by activating the **Boxing=>Edit definitions file** option's walk-right menu, **folder *.bf**.

Selecting **Boxing=>Edit definitions file** itself brings up the **edit boxing file *.bf** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	input	current folder	

name of the folder for the .bf file.

File to edit	input		*.bf files

name of the file, in **folder***, to edit.*

Edit	button		

edit the file given by the **folder** *and* **file to edit** *panel fields. If the file given in the* **file to edit** *field does not exist, then a new file is created which already has a section header set up.*

The **Boxing=>Edit definitions file** walk-right menu provides a list all the boxing files (files ending in .bf) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

The format for the boxing file is described in the 21.10.2 Text Format of the Boxing File section.

Return to 20.5 Boxing.

20.6 Estate Lots

Position of menu: **Design =>Estate/Lots**

This module is currently under development.

The Estate Lots module is for creating house lots for an Estate (Subdivision).

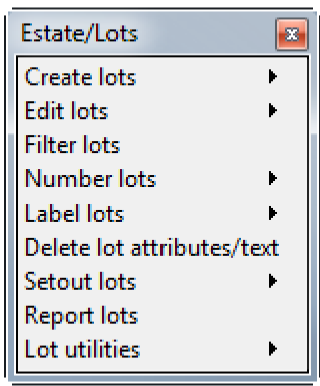
There are options to create and edit lots by a variety of methods. Once the lots are created they can be numbered, given a lot type (see 20.6.1 Lot types) and labelled.

The labelling includes labelling the side of lots with bearing and distances, lots with areas and lot numbers.

Reports of lot areas and types can be created and lots coloured according to areas.

Finally options exist to create point numbers and reports for setting out the lots.

The **Estate/Lots** walk-right menu is:



For the options see

Create lots	20.6.2 Create Lots
Edit lots	20.6.3 Edit Lots
Filter lots	20.6.4 Filter Lots
Number lots	20.6.5 Number Lots
Label lots	20.6.6 Label Lots
Delete lot attributes/text	20.6.7 Delete Lot Attributes and Text
Setout lots	20.6.8 Setout Lots
Report lots	20.6.9 Report Lots
Lot utilities	20.6.10 Lot Utilities

20.6.1 Lot types

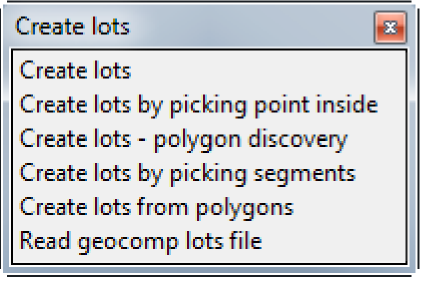
Lots can have a ***type*** which is used in reports. The lot types are defined in a text file called *lottypes.4d* which is searched for in the standard library areas (see 39.3 Library, User Library, Customer Library).

For example of lottypes.4d is

park
road
other
surround
McDonalds

20.6.2 Create Lots

Position of menu: **Design =>Estate/Lots => Create lots**



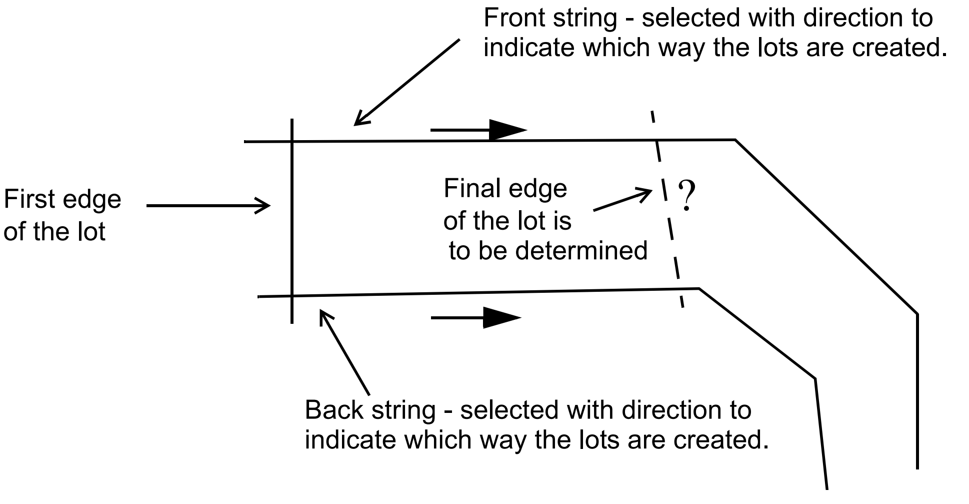
For the options see

Create lots	20.6.2.1 Create Lot
Create lots by picking point inside	20.6.2.2 Create Lot from Picking
Create lots- polygon discovery	28.10.8 Polygon Discovery
Create lots by picking segments	20.6.2.3 Create Lot from Picking Segments
Create lots from polygons	20.6.2.4 Create Lot from Polygon
Read geocomp lots file	20.6.2.5 Read Geocomp Lots File

20.6.2.1 Create Lot

Position of option on menu: **Design =>Estate/Lots => Create lots =>Create lot**

This option creates lots of a user given area using the front and back strings for a number of lots and an initial ***straight line edge*** of a lot. The final edge of the lot then needs to be determined.



The methods of creating the final edge of lot are:

(a) parallel the existing side - *parallel edge.* See Parallel Edge

(b) having the same bearing as a selected line - *parallel pick.* See Parallel Pick

(c) having a given bearing - *parallel bear*. See Parallel Bearing

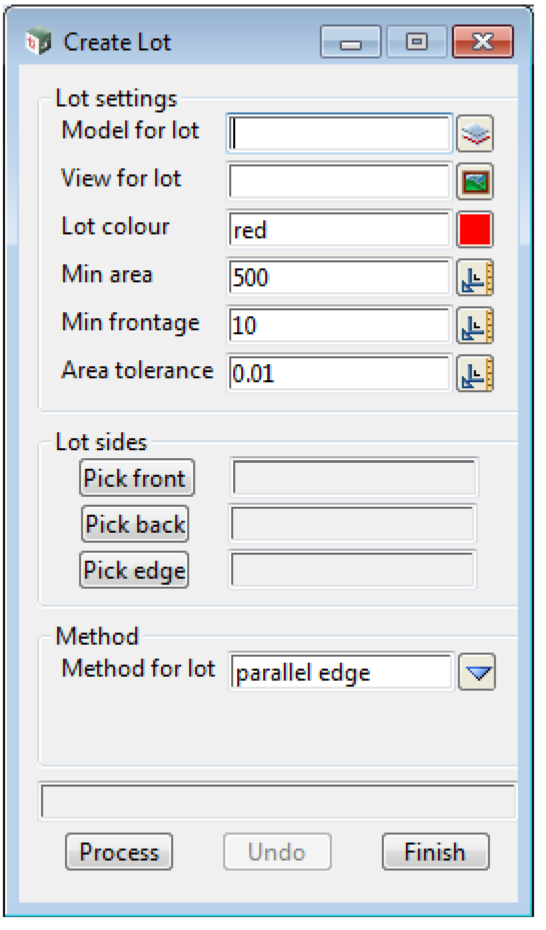
(d) perpendicular to either the front string or the back string - *perpendicular.* See Perpendicular and Perpendicular Pick

(e) perpendicular to either the front string or the back string but starting from a user selected point - *perpen start pt.* See Perpendicular and Perpendicular PickSee Perpendicular and Perpendicular Pick

(f) pivoting about a selected point - *pivot pick.* See Pivot Pick and Pivot Frontage

(g) pivoting about the point at minimum frontage - *pivot frontage.* See Pivot Pick and Pivot Frontage

(h) closing a selected string - *close string.* See Close String



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for lot	model box		available models

model for the created lot.

View for lot	view box		available views

view to add model of created lot to.

Lot colour	colour box		available colours

colour for the created lot.

Min area double box

required area of the created lot.

Min frontage input box

required minimum frontage of the created lot.

Area tolerance double box

lot to be created can be within this tolerance of the minimum area.required area of the created lot.

Pick front string select

pick the string to form the front of the created lot.

Pick back string select

pick the string to form the back of the created lot.

Pick edge	string select		

*pick the **straight** line to form the edge of the created lot.*

The front, back and edge form three sides of the lot to be created.

Method	choice box	parallel edge	parallel edge, parallel pick parallel bear, perpendicular, perpen start pt, pivot pick, pivot frontage, close string

pick the string to form the back of the created lot.

Process	button		

use the selected front, back and edged and then create the final side of the lot by the selected method.

Continue to the next section 20.6.2.1.1 Creating Lots from a Front and Back String and an Edge for a full description of each method of creating the lots.

20.6.2.1.1 Creating Lots from a Front and Back String and an Edge

Parallel Edge

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

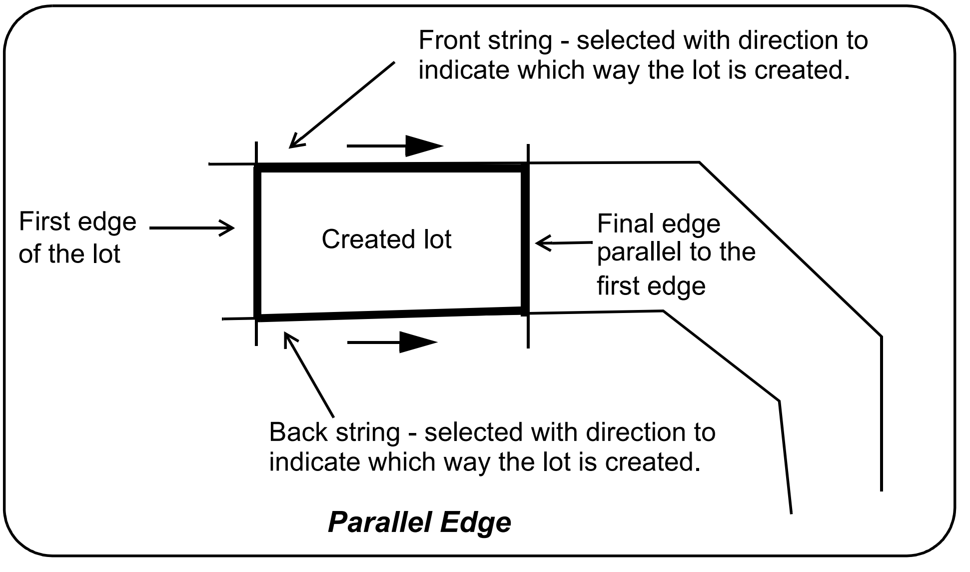
The front and back strings ***must*** be selected ***with direction*** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The ***initial edge*** must be ***one straight line segment***. It can not be an arc.

For *Parallel Edge*, the ***final edge*** is created parallel to the initial edge and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.



Parallel Bearing

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

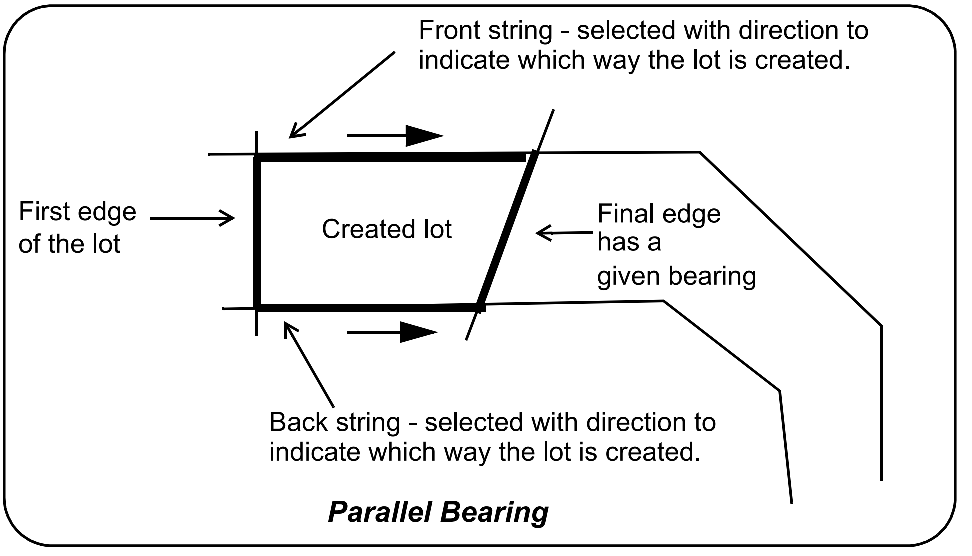
The front and back strings ***must*** be selected ***with direction*** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The ***initial edge*** must be ***one straight line segment***. It can not be an arc.

For *Parallel Bear*, the ***final edge*** is created with a user specified bearing and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.



Parallel Pick

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

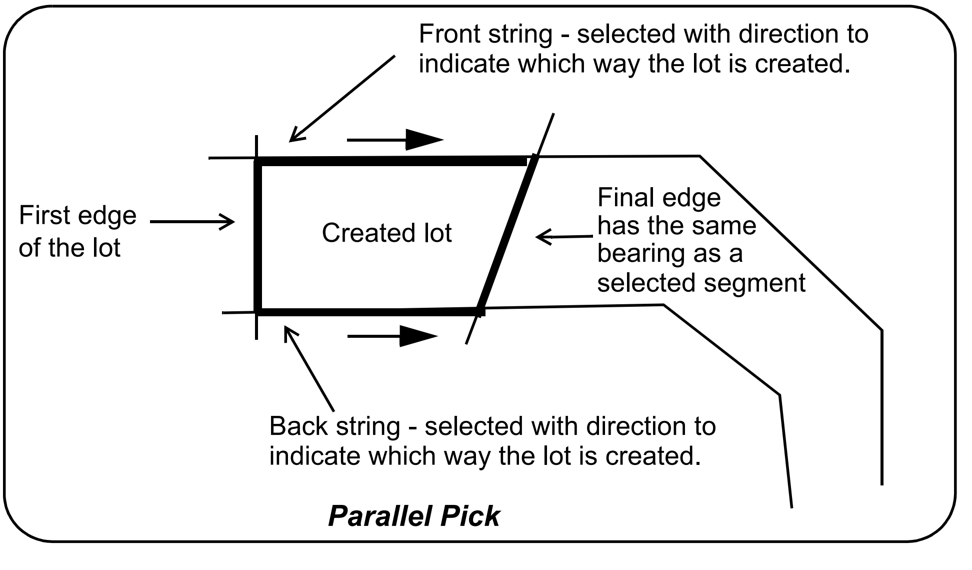
The front and back strings ***must*** be selected ***with direction*** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The ***initial edge*** must be ***one straight line segment***. It can not be an arc.

For *Parallel Pick*, the ***final edge*** is created with the bearing of a user selected segment and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.



Perpendicular and Perpendicular Pick

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings ***must*** be selected ***with direction*** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

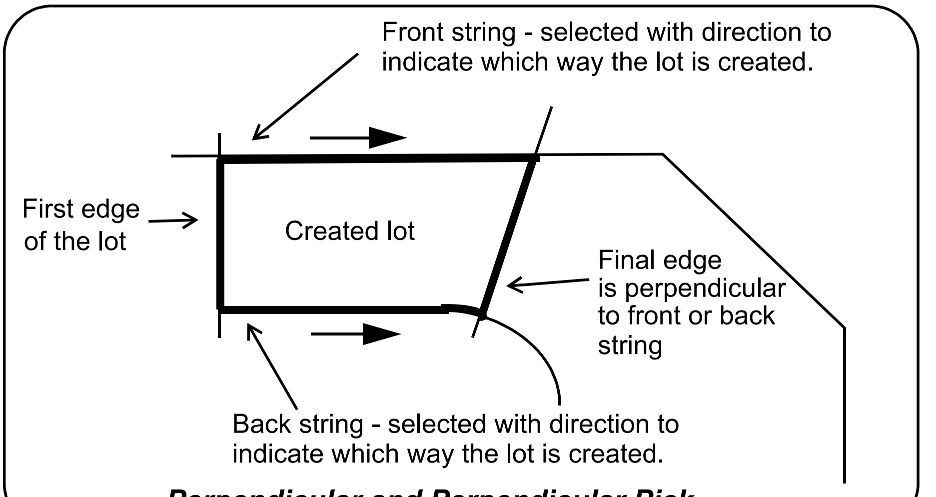
The initial edge must cut or be very close to cutting the front and back strings. The ***initial edge*** must be ***one straight line segment***. It can not be an arc.

For *Perpendicular*, the ***final edge*** is constrained to be perpendicular to either the front or the back string and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

For *Perpendicular Pick*, a start point is selected on the front/back string and the ***final edge*** is created past the start point. This option only needs to be used when *Perpendicular* has problems finding a solution due to sharp changes of bearing along the front/back string.

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.



Perpendicular and Perpendicular Pick

Pivot Pick and Pivot Frontage

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings ***must*** be selected ***with direction*** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

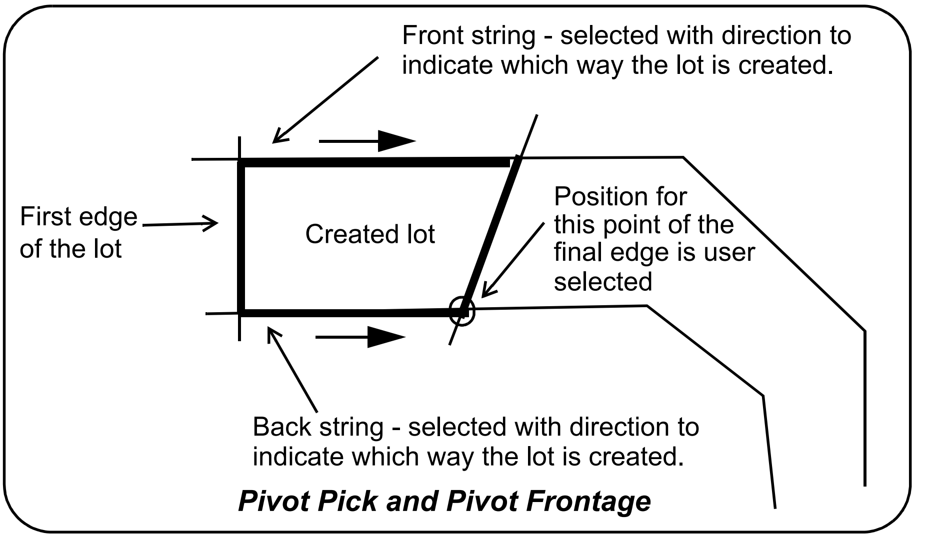
The initial edge must cut or be very close to cutting the front and back strings. The ***initial edge*** must be ***one straight line segment***. It can not be an arc.

For *Pivot Pick*, a position is selected on either the front or back string to be one point of the ***final edge***. The other point of the final edge is determined so that the lot has the required given area (to within the area tolerance).

For *Pivot Frontage*, the pivot point is taken to be the position on the front string that is the minimum frontage distance along the front string from the initial edge.

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.



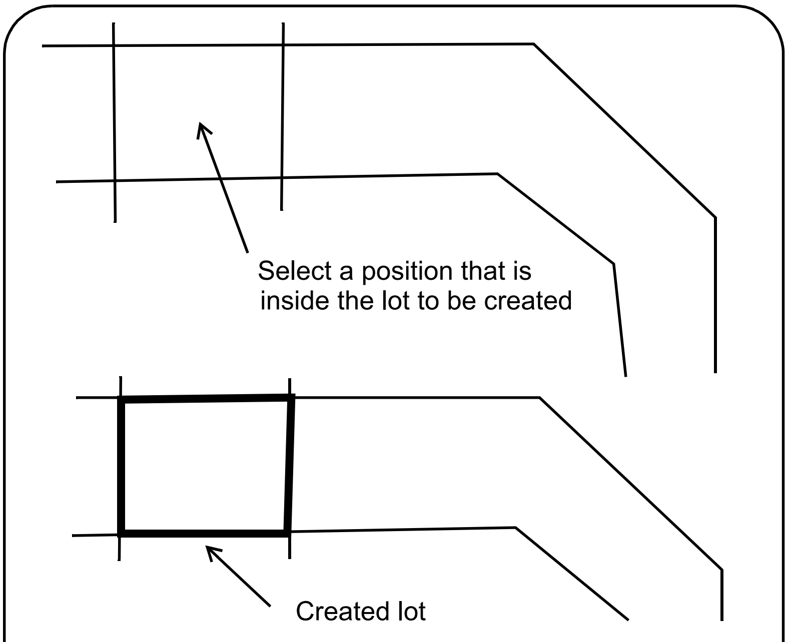
Close String

This method simply closes the string that is selected by the user.

20.6.2.2 Create Lot from Picking

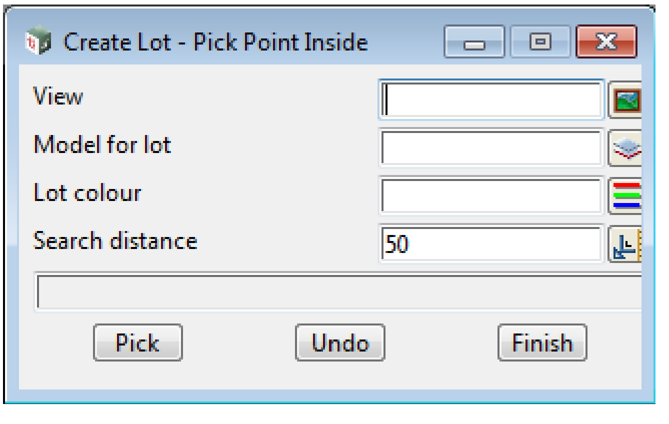
Position of option on menu: **Design =>Estate/Lots => Create lots =>Create lots by picking point inside**

This option creates a lot by a picking inside a collection of strings and the lot is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot side without cutting any other segment.



Creating a Lot by Picking Inside the Lot

On selecting the **Create lot by picking point inside** option, the **Create Lot - Pick Point Inside** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box		available views

view to add model of created lot to.

Field Description	Type	Defaults	Pop-Up
Model for lot	model box		available models

model for the created lot.

Field Description	Type	Defaults	Pop-Up
Lot colour	colour box		available colours

colour for the created lot.

Search distance double box 20

maximum distance to search from the selected point for sides of the lot

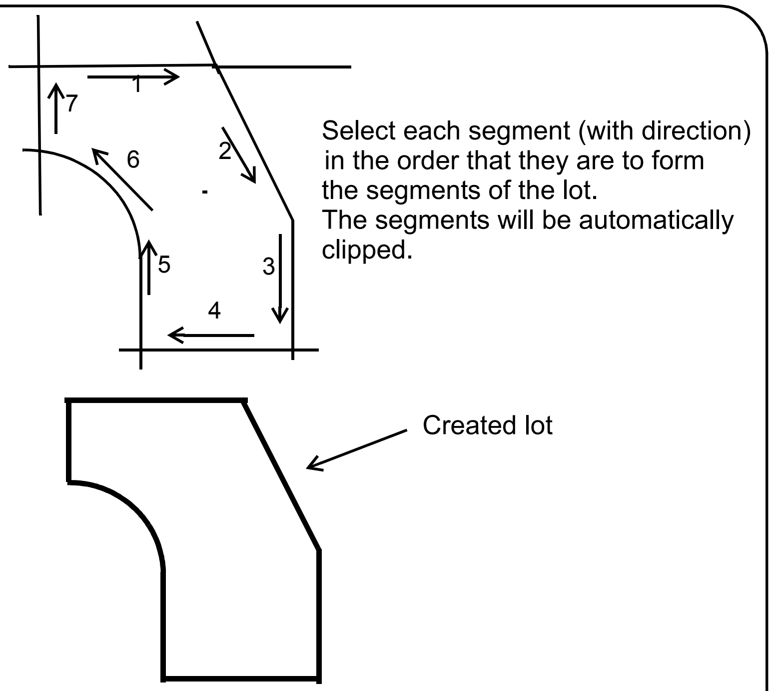
Pick string select

pick the position to try and form a lot around.

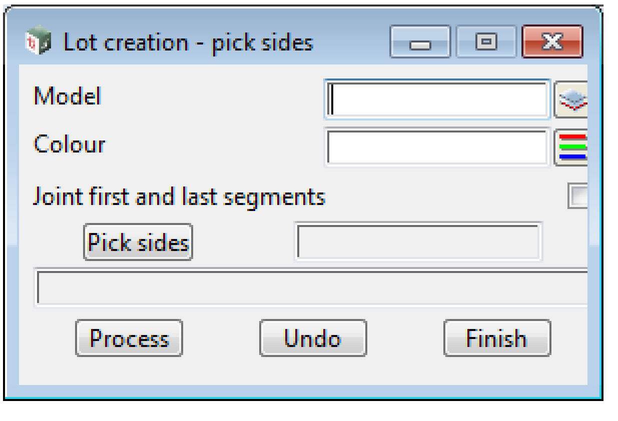
20.6.2.3 Create Lot from Picking Segments

Position of option on menu: **Design =>Estate/Lots => Create lots =>by picking segments**

This option creates a lot by a picking each segment in its order (and with direction) around the lot. Segments will be automatically extended or clipped to form the lot.



Creating a Lot by Picking the Lot Segments



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for lot	model box		available models

model for the created lot.

Lot colour	colour box		available colours

colour for the created lot.

Join first and last segment	tick box		

if ticked, join the end of the last selected segment to the start of the first selected segment to form the *final side of the lot.*

Pick sides string select

pick, with direction, the segments to be joined together to form the sides of the lot.

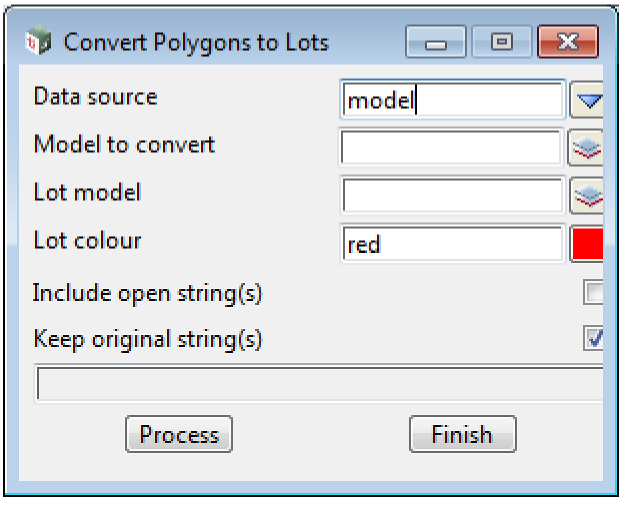
Process button

create the lot from the selected segments.

20.6.2.4 Create Lot from Polygon

Position of option on menu: **Design =>Estate/Lots =>Create lots =>Lots from polygons**

This option converts strings to a lot. The strings can be open.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type			
Data source			
Model for lot	model box		available models
Lot model	model box		available models
Lot colour	colour box		available colours
Include open strings	tick box		
Process	button		

Data source type

data source type.

Data source

data source for strings to convert to lots.

Model for lot model box available models

model for the created lot.

Lot model model box available models

model for the created lots.

Lot colour colour box available colours

colour for the created lots.

Include open strings tick box

if ticked, open strings are used to from lots by making then closed strings. If not ticked, open strings are ignored.

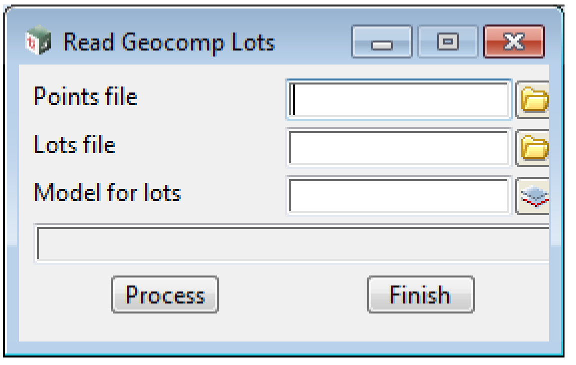
Process button

create lots from the selected strings.

20.6.2.5 Read Geocomp Lots File

Position of option on menu: **Design =>Estate/Lots => Create lots =>Read geocomp lots file**

This option reads a Geocomp lots file and creates ***12d Model*** lots.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Points file			*.pts files

name of the Geocomp points file.

Lots file			*.pts files

name of the Geocomp lots file - is uses points from the given Geocomp points file.

Model for lot	model box		available models

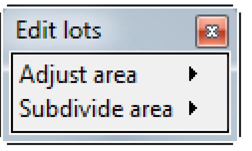
model for the created lot.

Process	button		

read in the given Geocomp points and lots file and created ***12d Model*** *lots.*

20.6.3 Edit Lots

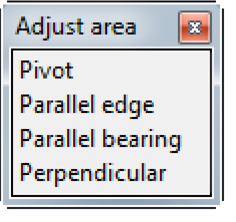
Position of menu: **Design =>Estate/Lots =>Edit lots**



For the option *Adjust area*, go to 20.6.3.1 Adjust Area
Subdivide area 20.6.3.2 Subdivide Area

20.6.3.1 Adjust Area

Position of menu: **Design =>Estate/Lots =>Edit lots =>Adjust area**



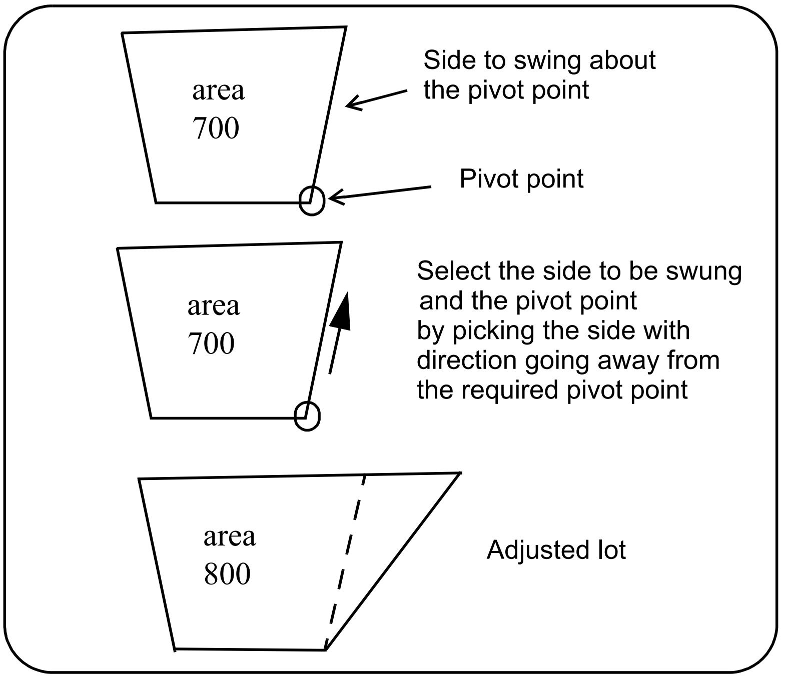
For the options see

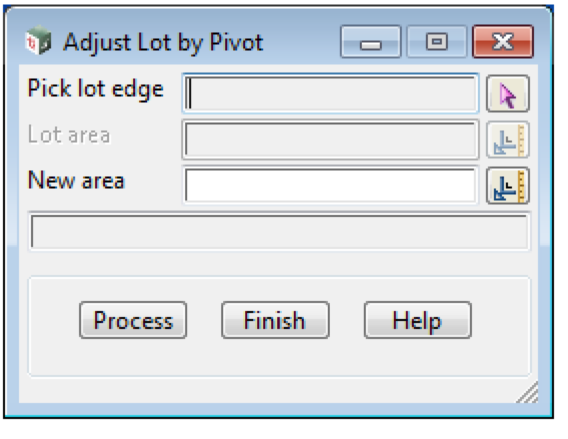
Pivot	20.6.3.1.1 Adjust Lot by Pivot
Parallel edge	20.6.3.1.2 Adjust Lot by Parallel Edge
Parallel bearing	20.6.3.1.3 Adjust Lot by Parallel Bearing
Perpendicular	20.6.3.1.4 Adjust Lot by Perpendicular

20.6.3.1.1 Adjust Lot by Pivot

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Adjust area =>Pivot**

This option adjusts the size of a lot by pivoting one side about one of its end points until the lot area has a new given area.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		

pick the lot to adjust by picking a side of the lot with direction. The start of the selected side will be the pivot point.

Lot area	output box		

area of the selected lot.

New area	input box		

required area of the adjusted lot. The area can be larger or smaller than the existing lot area.

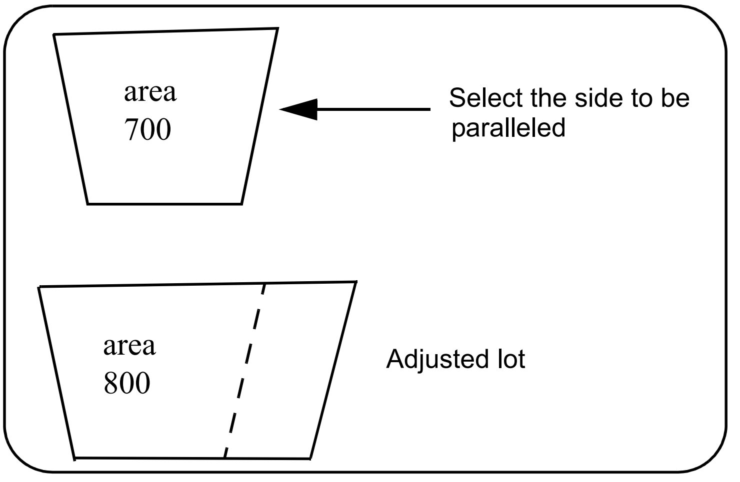
Process	button		

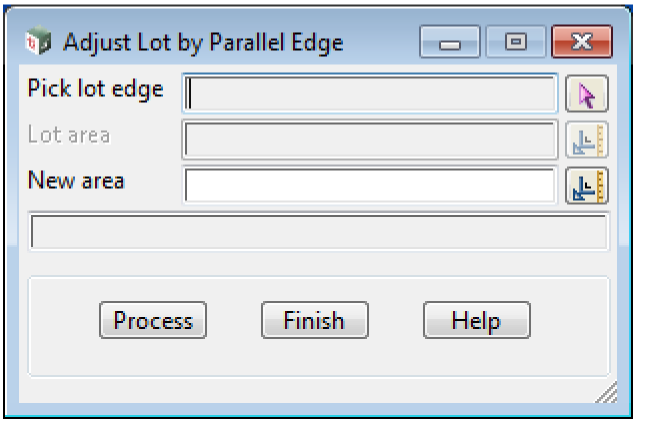
adjust the lot by pivoting the side.

20.6.3.1.2 Adjust Lot by Parallel Edge

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Adjust area =>Parallel edge**

This option adjusts the size of a lot by moving a side parallel to itself until the lot area has a new given area.





The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Pick lot edge string select

pick the lot to adjust by picking the edge of the lot that is to be paralleled.

Lot area output box

area of the selected lot.

New area input box

required area of the adjusted lot. The area can be larger or smaller than the existing lot area.

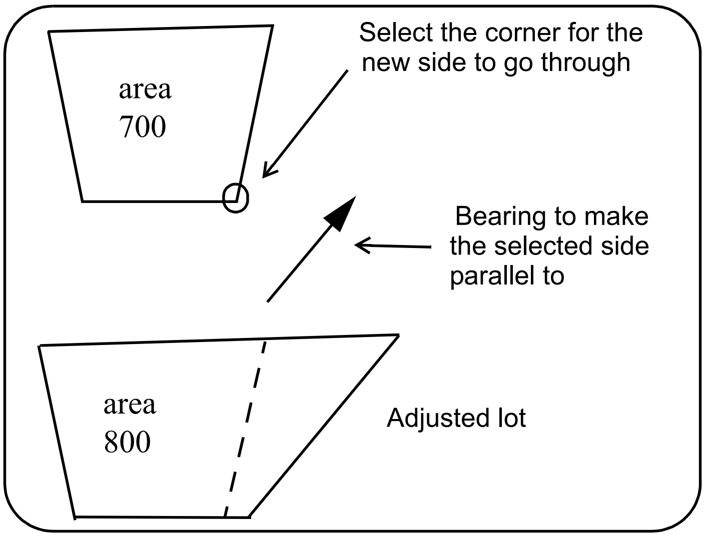
Process button

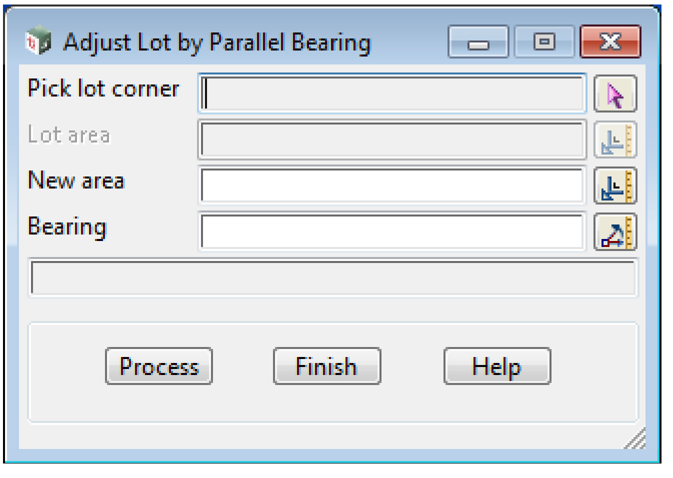
adjust the lot by paralleling the selected edge.

20.6.3.1.3 Adjust Lot by Parallel Bearing

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Adjust area =>Parallel bearing**

This option adjusts the size of a lot by moving a side parallel to a given bearing until the lot area has a new given area.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot corner	string select		

pick the lot to adjust by picking the corner of the lot that the side goes through and has the given bearing.

Lot area	output box		

area of the selected lot.

New area	input box		

required area of the adjusted lot. The area can be larger or smaller than the existing lot area.

Bearing	bearing box		

the bearing used for the selected edge.

Process	button		

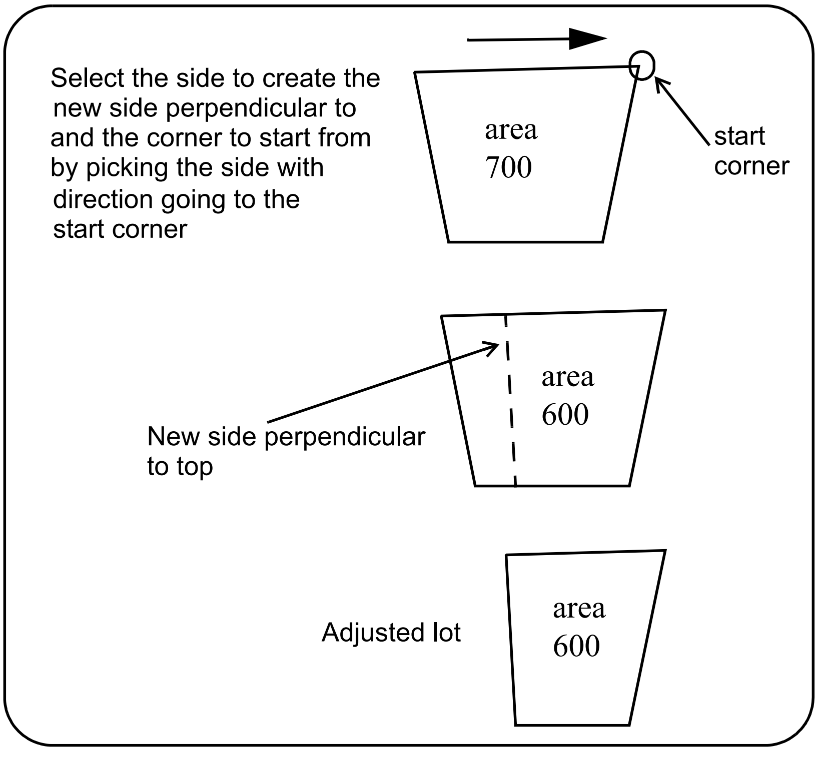
adjust the lot by paralleling the selected edge with the given bearing.

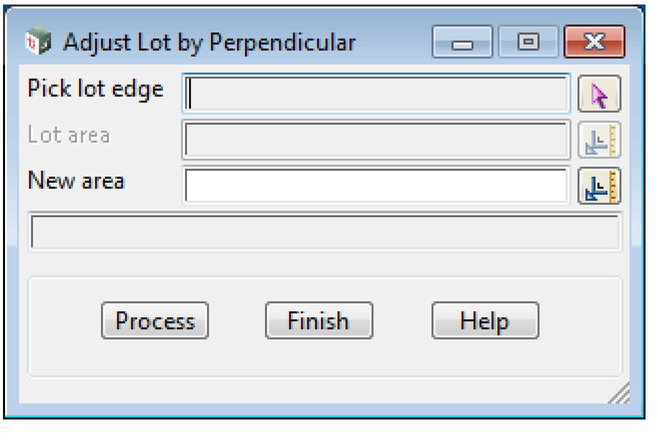
20.6.3.1.4 Adjust Lot by Perpendicular

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Adjust area =>Perpendicular**

This option adjusts the size of a lot by creating a new side perpendicular to a selected side and then moving the new side until the created lot area has a given area.

Note -the new area must be less than the original area.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		

pick the side of the lot that a new side will created perpendicular to

Lot area	output box		

area of the selected lot.

New area	input box		

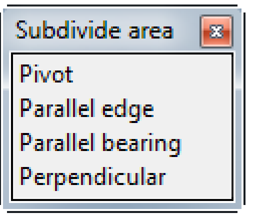
required area of the adjusted lot. The area must be smaller than the existing lot area.

Process button

adjust the lot by moving the side whilst keeping it perpendicular to another side.

20.6.3.2 Subdivide Area

Position of menu: **Design =>Estate/Lots =>Edit lots =>Subdivide area**



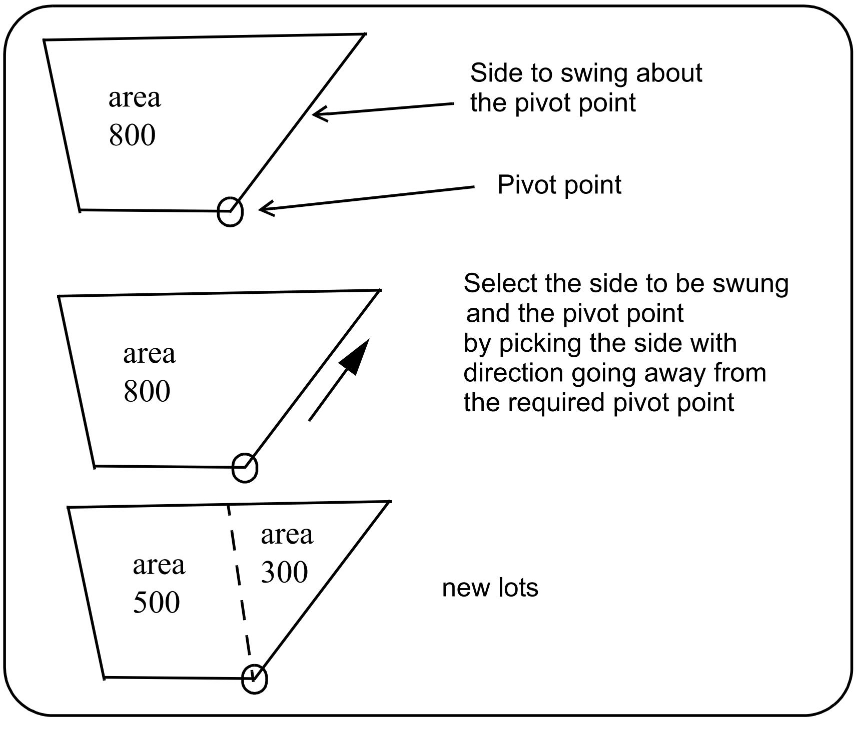
For the options see

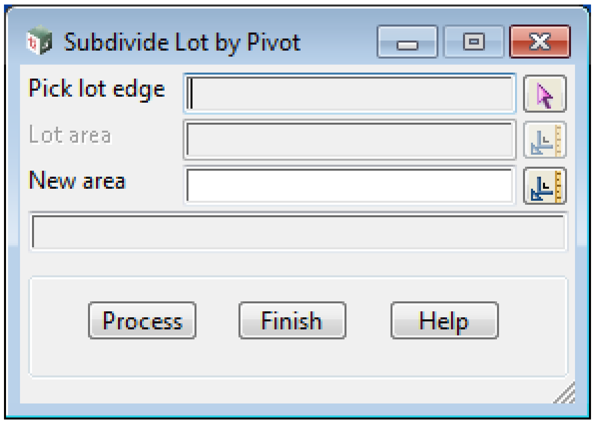
Pivot 20.6.3.2.1 Subdivide Lot by Pivot
Parallel edge 20.6.3.2.2 Subdivide Lot by Parallel Edge
Parallel bearing 20.6.3.2.3 Subdivide Lot by Parallel Bearing
Perpendicular 20.6.3.2.4 Subdivide Lot by Perpendicular

20.6.3.2.1 Subdivide Lot by Pivot

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Subdivide area =>Pivot**

This option reduces the size of a lot by pivoting one side about one of its end points until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot	string select		

pick the lot to adjust by picking a side of the lot with direction. The start of the selected side will be the pivot point.

Lot area	output box		

area of the selected lot.

New area	input box		

required area of the adjusted lot. The area must be smaller than the existing lot area.

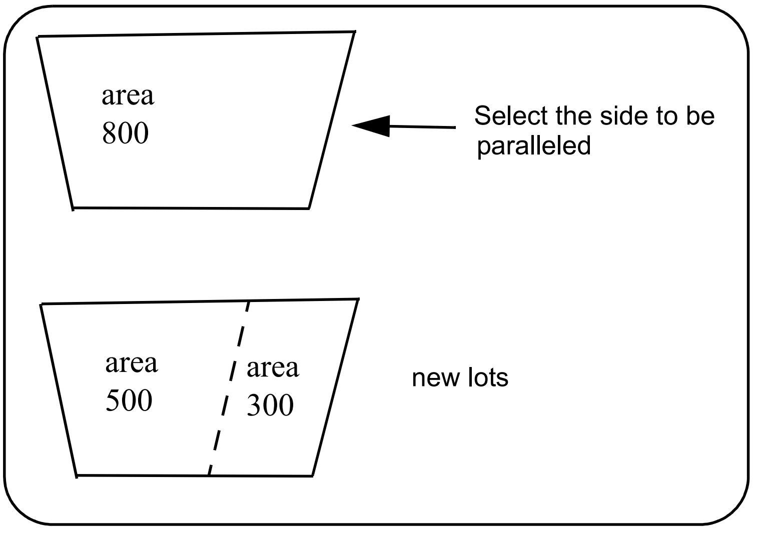
Process	button		

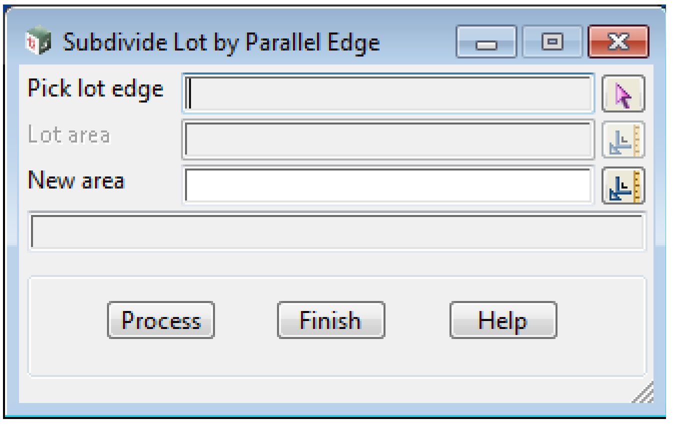
adjust the lot by pivoting the side. A second lot is created from the remainder of the original lot.

20.6.3.2.2 Subdivide Lot by Parallel Edge

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Subdivide area =>Parallel edge**

This option adjusts the size of a lot by moving a side parallel to itself until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		

pick the lot to adjust by picking the edge of the lot that is to be paralleled.

Lot area	output box		

area of the selected lot.

New area	input box		

required area of the adjusted lot. The area must be than the existing lot area.

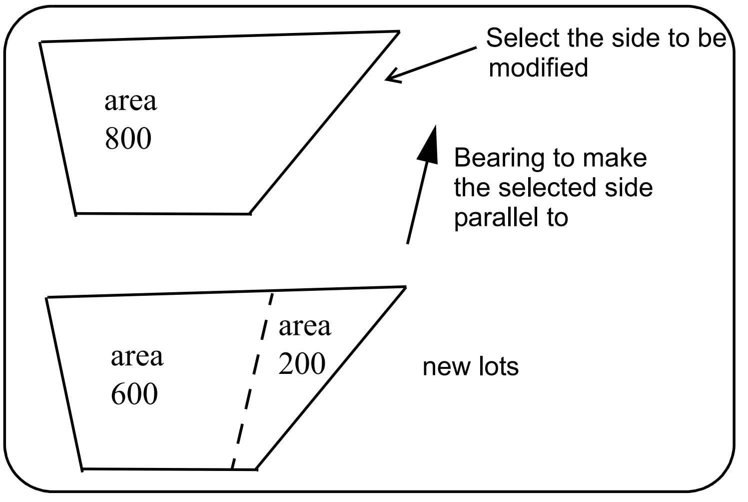
Process	button		

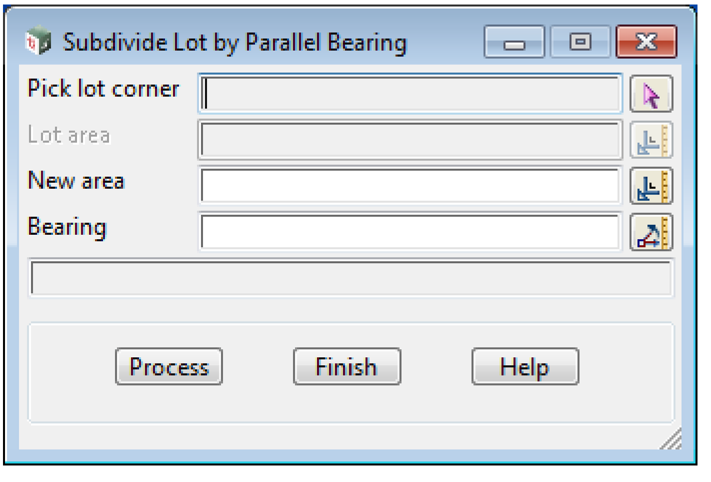
adjust the lot by paralleling the selected edge. A second lot is created from the remainder of the original lot.

20.6.3.2.3 Subdivide Lot by Parallel Bearing

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Subdivide area =>Parallel bearing**

This option adjusts the size of a lot by moving a side parallel to a given bearing until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot corner	string select		

pick the lot to adjust by picking the edge of the lot that is to be paralleled.

Lot area	output box		

area of the selected lot.

New area	input box		

required area of the adjusted lot. The area must be smaller than the existing lot area.

Bearing	bearing box		

the bearing used for the selected edge.

Process	button		

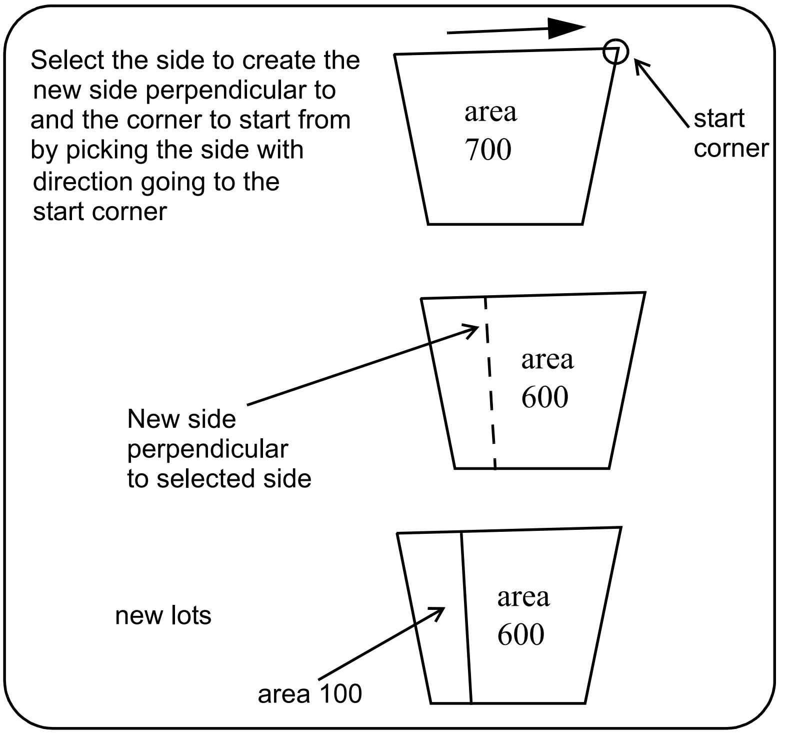
adjust the lot by paralleling the selected edge with the given bearing. A second lot is created from the remainder of the original lot.

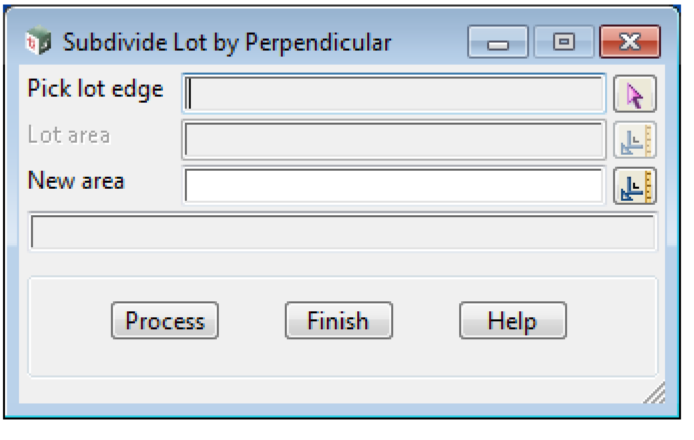
20.6.3.2.4 Subdivide Lot by Perpendicular

Position of option on menu: **Design =>Estate/Lots =>Edit lots =>Subdivide area =>Perpendicular**

This option adjusts the size of a lot by creating a new side perpendicular to a selected side and then moving the new side until the created lot area has a given smaller area. A second lot is created from the remainder of the original lot.

Note -the new area must be less than the original area.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		

pick the side of the lot that a new side will created perpendicular to

Lot area	output box		

area of the selected lot.

New area	input box		

required area of the adjusted lot. The area must be smaller than the existing lot area.

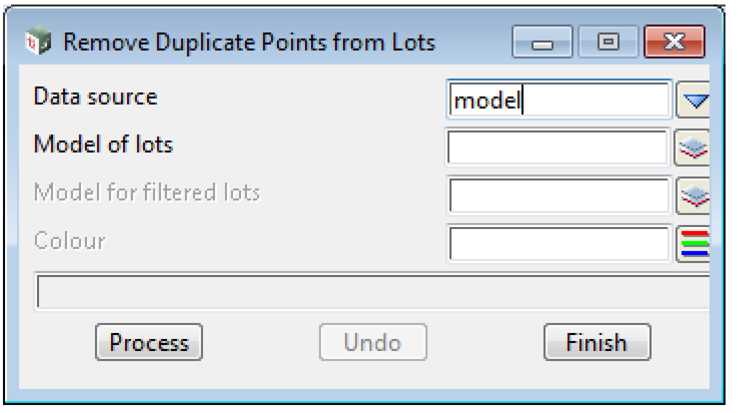
Process button

adjust the lot by moving a side whilst keeping it perpendicular to another side. A second lot is created from the remainder of the original lot.

20.6.4 Filter Lots

Position of option on menu: **Design =>Estate/Lots => Filter lots**

This option is used to remove adjacent duplicate points from lots.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Data source type

data source type.

Data source

data source for strings to convert to lots.

Model for filtered lots model box available models

model for the filtered lots.

Colour colour box available colours

if non-blank, the filtered lots are given this colour.

Otherwise a filtered lot has the same colour as the non-filtered lot.

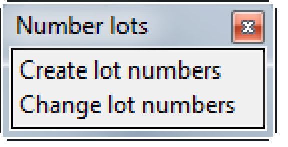
Process button

filter the selected lots.

20.6.5 Number Lots

Position of menu: **Design =>Estate/Lots => Number lots**

After lots are created, they are then numbered. The lot numbers are stored with the lot



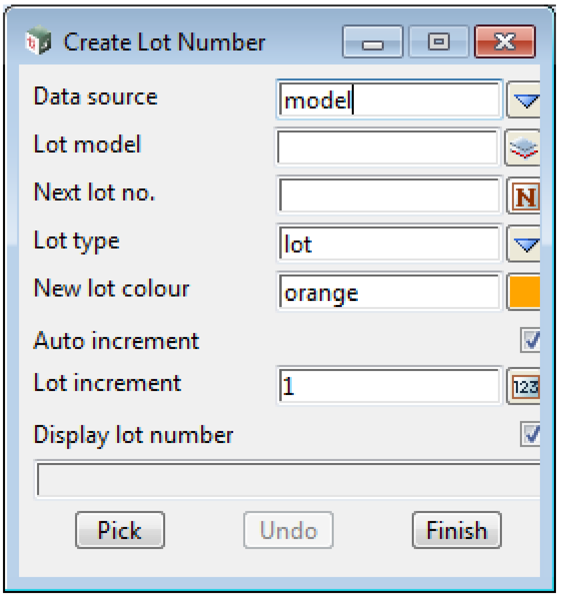
For the option *Create lot numbers*, go to 20.6.5.1 Create Lot Numbers.

Change lot numbers 20.6.5.2 Change Lot Numbers

20.6.5.1 Create Lot Numbers

Position of option on menu: **Design =>Estate/Lots => Number lots =>Create lot numbers**

This option creates lot numbers.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Data source

data source for lots that have been numbered. A new lot number cannot be the same as an existing one in the data source.

Next lot no.

the number to give the next lot that is numbered.

Lot type choice box user defined user defined

type of the lot. The choices are defined by the user in the file. See 20.6.1 Lot types

New lot colour colour box available colours

colour to created the numbered lot. This is done so that numbered and non-numbered lots can be easily distinguished.

Auto increment tick box tick

if ticked, the **Next lot no.** *is incremented after the lot is numbered.*

Lot increment integer box 1

amount to increment the **Next lot no** *if the* **Auto increment** *flag is tick.*

Display lot numbers tick box tick

if ticked, the lot number is temporarily displayed. Permanent lot numbers are created using the Label Lots options.

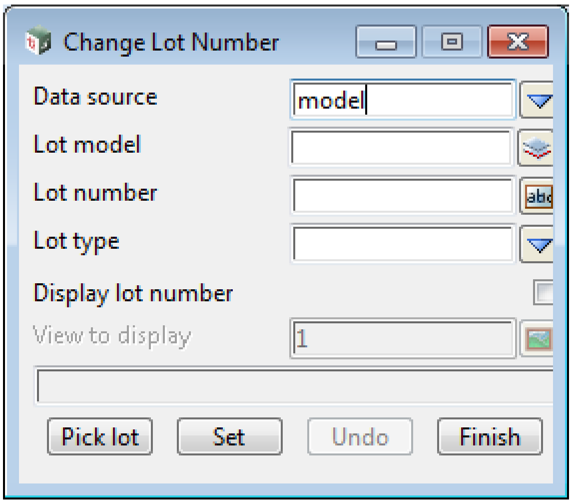
Pick string select

pick the lot the be numbered. After accepting the lot, it is given the **Next lot no.**

20.6.5.2 Change Lot Numbers

Position of option on menu: **Design =>Estate/Lots => Number lots =>Change lot numbers**

This option changes the lot numbers stored with the lot.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lot number	text box	number of selected lot	

when a lot is selected, its lot number is displayed in this field. This can be changed and the selected lot will get the new **Lot number** *when the* **Set** *button is selected.*

Lot type	choice box	type of selected lot	

when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new **Lot type** *when the* **Set** *button is selected. See* 20.6.1 Lot types.

Display lot numbers	tick box		

if ticked, the lot numbers are displayed for the selected lots.

View to display	view box		available views

view to temporarily display the lot numbers.

Pick lot	button		

select the lot to change either the lot number or the lot type.

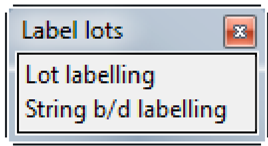
Set	button		

set the lot number and the lot type of the selected lot to the values given in the **Lot number** *and* **Lot type** *fields.*

20.6.6 Label Lots

Position of menu: **Design =>Estate/Lots => Label lots**

After lots are numbered, text for the lot numbers and areas can be displayed.

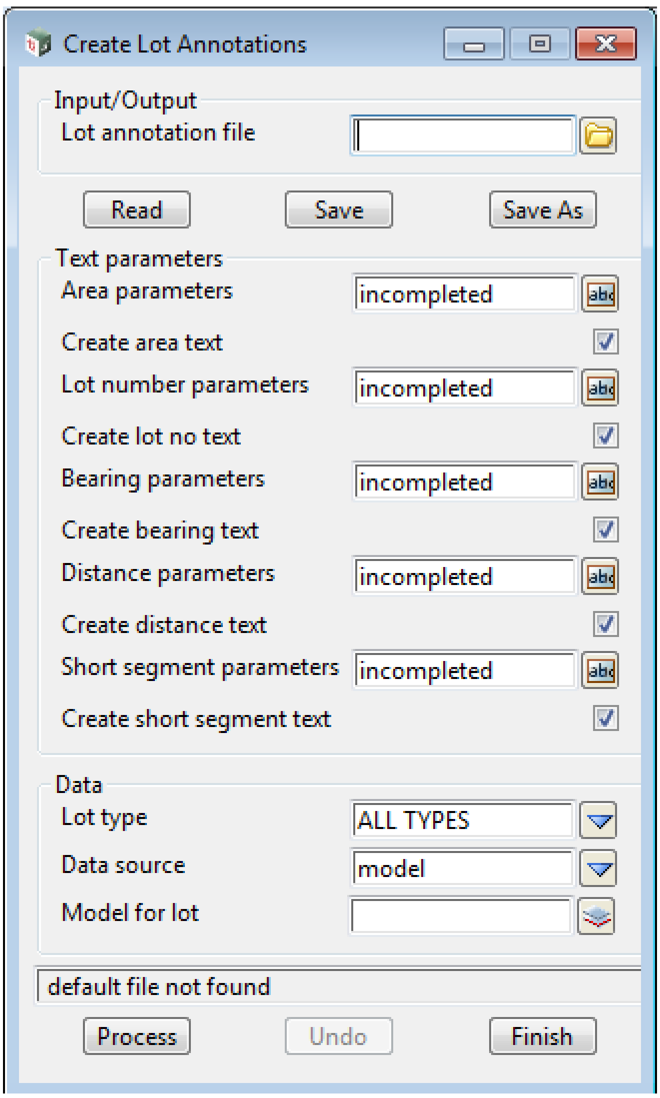


For the option *Lot labelling*, go to 20.6.6.1 Create Lot Annotation.
String b/d labelling 20.6.6.2 String Bearing Distance Labelling

20.6.6.1 Create Lot Annotation

Position of option on menu: **Design =>Estate/Lots => Number lots =>Lot labelling**

This option creates annotation of the lot numbers, lot areas, bearings of the sides and lengths of the sides.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Input/Output parameters

Lot annotation file *.laf files

file of defaults for labelling the lots.

Read button

read in a given lot annotation file.

Save button

write out the current parameters to the given lot annotation file.

Save as button

write out the current parameters to a different lot annotation file.

Text parameters

Area parameters

parameters for labelling the area of a lot.

Create area text tick box tick

if ticked, annotation for the areas is created using the **Area parameters**.

Lot number parameters

parameters for labelling the lot numbers.

Create lot no. text tick box tick

if ticked, annotation for the lot numbers is created using the **Lot number parameters**.

Bearing parameters

parameters for labelling the bearings of the sides of the lots.

Create bearing text tick box tick

if ticked, annotation for the lot bearings is created using the **Bearing parameters**.

Distance parameters

parameters for labelling the lengths of the sides of the lots.

Create distance text tick box tick

if ticked, annotation for the lengths of the sides is created using the **Distance parameters**.

Short segment parameters

parameters for specifying what is a "short Segment" and the parameters for labelling sides of the lots that are short segments.

Create short segment text tick box tick

if ticked, annotation for short segments is created using the **Short segment parameters**.

Data

Data source type

data source type.

Data source

data source for lots to be annotated.

Lot type choice box user defined user defined

of the lots selected by the data source, only lots of this type are labelled. See 20.6.1 Lot types.

Process button

select all the lots given by the **Data source** *and* **Lot type** *and create annotations according the* **Text parameters**.

20.6.6.2 String Bearing Distance Labelling

Position of option on menu: **Design =>Estate/Lots => Label lots =>String b/d labelling**

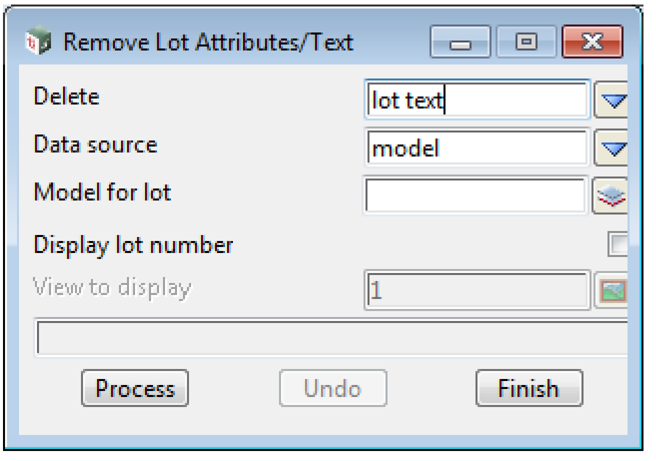
Option to label the bearing and lengths of segments of strings.

This option is described in the section 24.1 Bearing/Distance Labelling

20.6.7 Delete Lot Attributes and Text

Position of option on menu: **Design =>Estate/Lots => Delete lot attributes/text**

This option is used to remove the attributes for a lot which store the lot number, area etc. It can also delete the annotation text that has been created for the lot.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete	choice box	lot text	lot text, lot attributes

when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new **Lot type** *when the* **Set** *button is selected.*

Data source

data source for lot to delete either the lot text or lot attributes.

Display lot numbers	tick box		

if ticked, the lot numbers are displayed for the selected lots.

View to display	view box		available views

view to temporarily display the lot numbers.

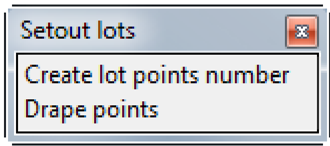
Process	button		

delete the selected attributes from the selected lots.

20.6.8 Setout Lots

Position of option on menu: **Design =>Estate/Lots => Setout lots**

Options to create unique point numbers for the vertices at the ends of each segment of the lots, and to create z-values from a given tin for the vertices of the lots.

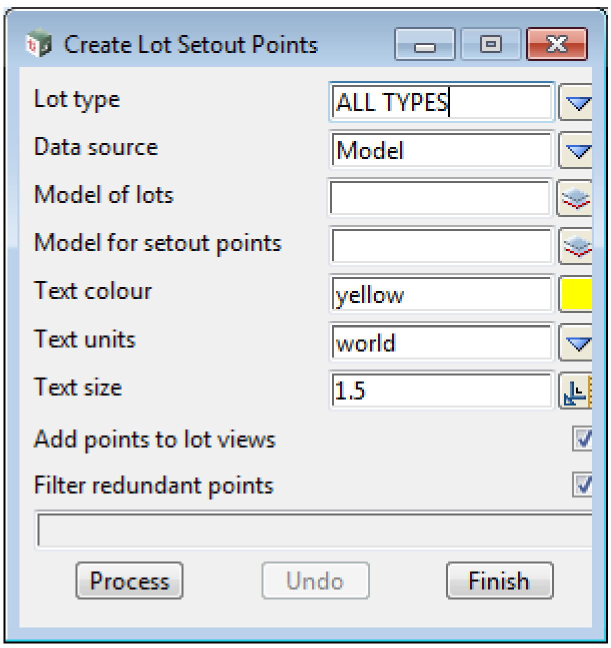


For the option *Create lot point numbers*, go to 20.6.8.1 Create Lot Point Numbers
Drape points 20.6.8.2 Drape Points

20.6.8.1 Create Lot Point Numbers

Position of option on menu: **Design =>Estate/Lots => Setout lots =>Create lot points numbers**

This option creates unique point numbers for the vertices at the ends of each segment of the lots. Duplicate vertices are only given one point number.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lot type	choice box	user defined	user defined

of the lots selected by the data source, only lots of this type have point numbers created. See 20.6.1 Lot types

Data source

data source for lots to have point numbers created.

Model for setout points	model box		available models

model for the set out points.

Text colour	colour box		available colours

colour of the point numbers.

Text units	choice box	world	screen, paper, world

units for text size.

Text size double box

Size of the text for the point numbers.

Add points to lot views tick box tick

if ticked, add the model of point numbers to the views that the lots are displayed on.

Create short segment text tick box tick

if ticked, annotation for short segments is created using the **Short segment parameters**.

Filter redundant points tick box tick

if ticked, then if two adjacent line have the same bearing then the two segments are replaced by one segment. And if two adjacent arc segments could be the one arc, then they are replaced by one arc.

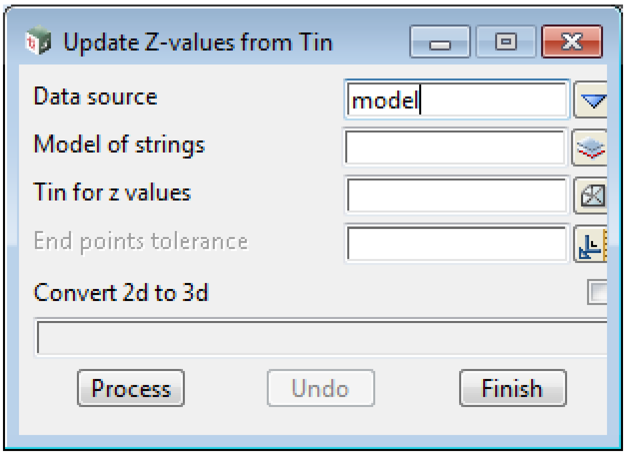
Process button

select all the lots given by the **Data source** *and* **Lot type** *and create annotations according the* **Text parameters**.

20.6.8.2 Drape Points

Position of option on menu: **Design =>Estate/Lots => Setout lots =>Drape points**

Option for setting the z-value of points to the z-value from a specified tin.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source	choice box		model, view, string

type of the data source

Model of strings / View of strings / Pick a String

source of the data

Tin for z values tin box

The tin to take the z values for the vertices from

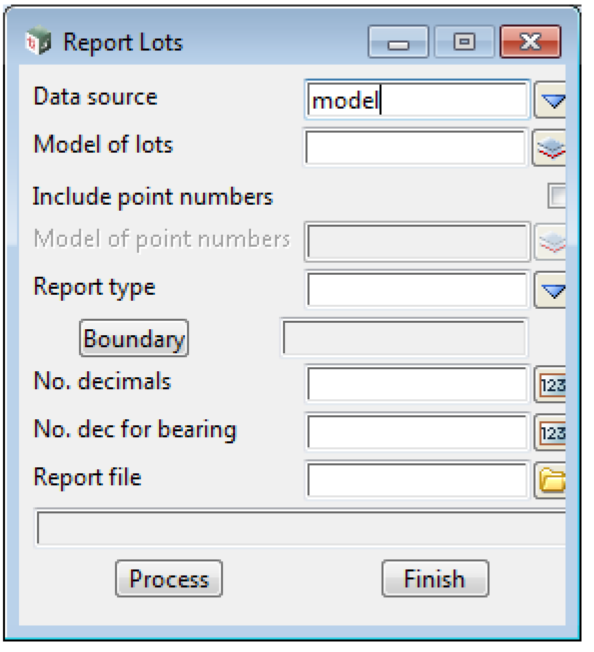
End points tolerance input

Convert 2d to 3d tick box

if ticked, 2d strings will be converted to 3d strings which have a different z value from the tin for each vertex.
if not ticked the 2d string takes its z value from the tin at the first vertex

20.6.9 Report Lots

Position of option on menu: **Design =>Estate/Lots => Report lots**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source			

data source for lots to be reported.

Include point numbers	tick box		

if ticked, include the point number for each vertex around the lot.

Model of point numbers	model box		available models

model of the point numbers for the vertices of the lots.

Report type	choice box		sort by type, sort by number sort by area, setout

type of report for the selected lots.

Boundary	string select	optional	

if selected, the boundary string for the lots.If selected then the area of the boundary string is calculated and the total area of the lots compared to the area of the boundary string.

No. decimals	integer box		

Number of decimal places for co-ordinates and lengths in the report.

No. dec for bearings	integer box		

Number of decimal places for bearings in the report.

Report file	file box		

Name of the file for the report.

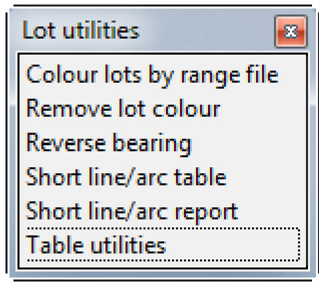
Process	button		

Create the report.

20.6.10 Lot Utilities

Various lot options.

Position of menu: **Design =>Estate/Lots => Lot utilities**

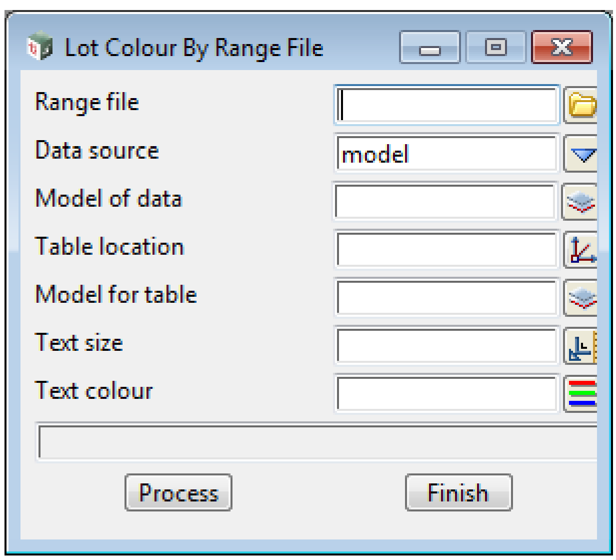


For the option *Colour lots by range file*, go to	20.6.10.1 Colour Lots by Range File
Remove lot colour	20.6.10.2 Remove Lot Colour
Reverse bearing	20.6.10.3 Reverse Bearing
Short line/arc table	20.6.10.4 Short Line/Arc Table
Short line/arc report	20.6.10.5 Short Line/Arc Report
Table utilities	20.6.10.6 Short Segment Utilities

20.6.10.1 Colour Lots by Range File

Position of option on menu: **Design =>Estate/Lots => Lot utilities =>Colour lots by range file**

The option colours lots by area using a lot range file (.lrf) to define the colour for each minimum and maximum area. It also creates a table of the statistics for the area ranges.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Range file	file box		*.lrf

range file for colouring lots.

Data source

data source for lots to be coloured.

Table location position select box

position of the table.

Model for table model box available models

model for the table of statistics on the lot areas.

Text colour colour box available colours

colour of the text.

Text size (w) double box

size of the text for the table.

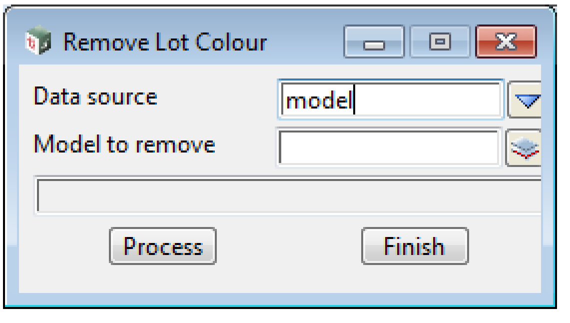
Process button

select all the lots given by the **Data source** *and* **Lot type** *and colour them according to the lot range file.*

20.6.10.2 Remove Lot Colour

Position of option on menu: **Design =>Estate/Lots => Lot utilities =>Remove lot colour**

The option removes the colour of all the selected lots.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data source

data source for lots to have their colour removed.

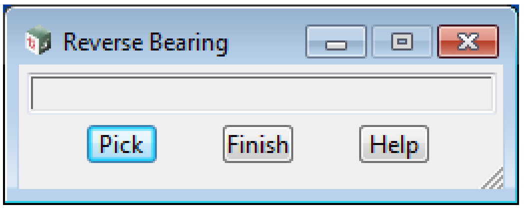
Process button

select all the lots given by the **Data source** *and remove the lot colour.*

20.6.10.3 Reverse Bearing

Position of option on menu: **Design =>Estate/Lots => Lot utilities =>Reverse bearing**

Option to change the value of the bearing text created by the lot labelling option by adding 180 degrees to the bearing.This is then the bearing of a line in the reversed direction to that represented by the original bearing text. The rounding for the reversed bearing is done according to the lot parameters.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Zero padding	tick box	tick	

if ticked, if the minutes and/or seconds are zero then two zeros are written out. If not ticked, if the minutes and/or seconds are zero then they are left out.

Pick	button		

pick the bearing text that is to be modified.

20.6.10.4 Short Line/Arc Table

Position of option on menu: **Design =>Estate/Lots => Lot utilities =>Short line/arc table**

Position of option on menu: **Drafting =>Text and Tables =>Short segment table**

Option to create a table of all the short segments and/or short arcs.

This option is described in the section 24.16.11 Short Segments Table

20.6.10.5 Short Line/Arc Report

Position of option on menu: **Design =>Estate/Lots => Lot utilities =>Short line/arc report**

Position of option on menu: **Drafting =>Text and Tables =>Short segment report**

Option to create a report of all the short segments and/or short arcs.

This option is described in the section 24.16.12 Short Segment Report

20.6.10.6 Short Segment Utilities

Position of option on menu: **Design =>Estate/Lots => Lot utilities =>Table utilities**

Position of option on menu: **Drafting =>Text and Tables =>Short segment table utilities**

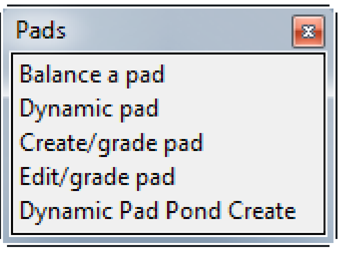
This panel is used modify an existing short segments table.

This option is described in the section 24.16.13 Short Segments Table Utilities

20.7 Pads

Position of menu: **Design =>Pads**

The **Pads** walk-right menu is



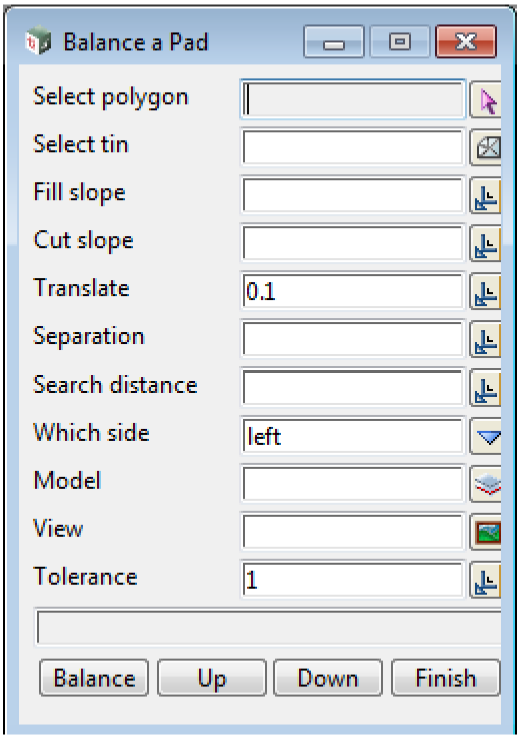
For the options see

Balance a pad	20.7.1 Balance a Pad
Dynamic pad	20.7.2 Dynamic Pad Interface
Create/grade pad	20.7.3 Allotment Pad Create
Edit/grade pad	20.7.4 Allotment Pad Edit
Dynamic Pad Pond Create	20.7.5 Dynamic Pad/Pond Interface

20.7.1 Balance a Pad

Position of option on menu: **Design =>Pads =>Balance a pad**

This option takes a pad formed by a string and user given slopes and batters from the pad to a given tin. The pad is moved up or down until a balance is found.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select polygon	string select		

The string defining the pad

Select tin	tin select		

The tin to interface the pad to

Fill slope	measures box		At Point, Point to Point, String from Point, String to Point)

The fill slope for the pad

Cut slope	measures box		At Point, Point to Point, String from Point, String to Point)

The cut slope for the pad

Translate	measures box	0.1	At Point, Point to Point, String from Point, String to Point)

The value for translating the pad up and down with the 'Up' and 'Down' keys.

Separation	measures box		At Point, Point to Point, String from Point, String

			to Point)

The interval along the pad string for the volume calculations.

Search distance	measures box		At Point, Point to Point, String from Point, String to Point)

The maximum search distance for intersecting the cut/fill slopes with the pad.

Which side	choice box	left	left, right

Which side of the string is the outside of the pad.

Model	model box		available models

The model for the final strings and tadpoles.

View	view box		select view

View to add temporary strings to.

Tolerance

The tolerance for balancing the cut/fill for the pad.

Balance button

Balance the pad to within tolerance value.

Up button

Move pad up by translation value.

Down button

Move pad down by translation value.

Finish button

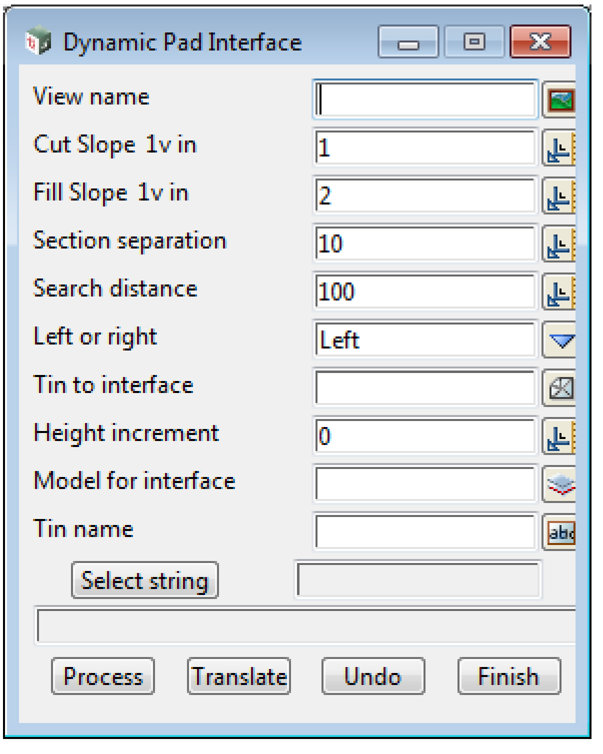
Add strings to permanent model and finish.

20.7.2 Dynamic Pad Interface

Position of option on menu: **Design =>Pads =>Dynamic pad**

This option is to create a pad by interfacing from a selected string and calculated the volume for the pad. The pad can be moved up or down and the new volumes are calculated.

The pad can also be moved in plan and the new interface and volumes are dynamically calculated.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View name	view box		

name of the view to display the pad interface strings.

Cut slope 1v in		1	

cut slope for interfacing.

Fill slope 1v in		2	

fill slope for interfacing.

Section separation		10	

interval to calculate cut and fill batters.

Search distance		100	

distance for the batter to search to find intersection with the triangles.

Left or right	choice box	left	left, right

batter to the left or right of the selected string.

Tin to interface	tin box		

tin to batter to.

Height increment		0	

when process is selected, the pad height is adjusted by the value in this panel field and the new *interface and volumes are calculated.*

Select string select

select string to batter from

Process button

adjust the height of the pad by the Height increment and recalculate the new interface and volumes.

Translate

when selected the pad will move to the cursor position and dynamically calculate the interface and volumes.

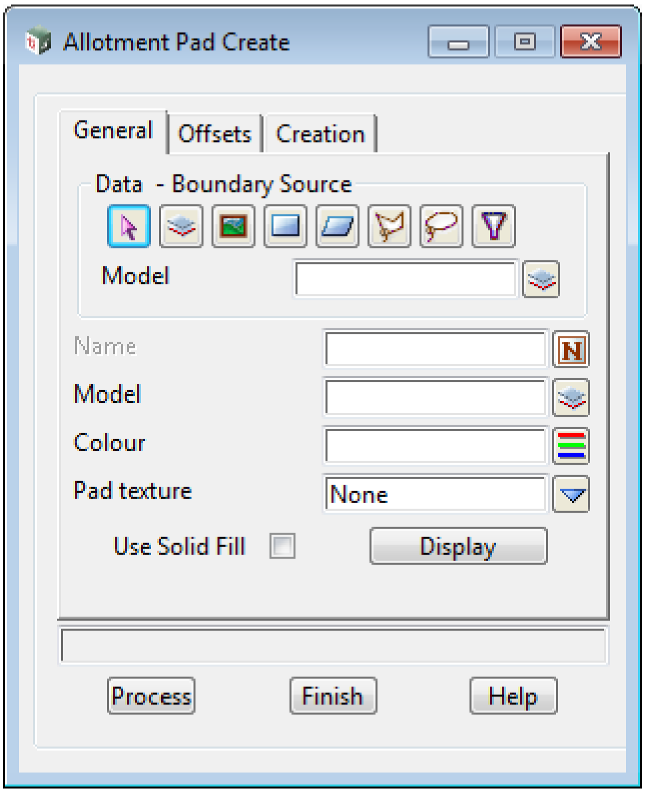
Reset button

reset the pad height to its original value.

20.7.3 Allotment Pad Create

Position of option on menu: **Design =>Pads =>Create/grade pad**

This option and the next **Design =>Pads =>Edit/grade pad** are used to create a pad from surrounding lines, grade the created pad and edit pads already created with this option.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

General tab

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source

Data source input

source of data is used to create a pad.

Name input

the name of the new pad.

Model model box available models

name of the model that the new pad is in.

Colour colour box default colour available colours

the colour of the new pad.

Pad texture choice box None None, some textures

the colour of the new pad.

Use solid fill tick box

if ticked, solid fill the pad

Display button

brings up the **Display Text Defaults** *panel*

Offsets tab

Global offset input

if other offsets are not given, the distance to offset the sides of the pad from the strings used to create the pad

Offsets model model box

model for the offset lines

Offsets type choice box Segment Segment, Point to Point

*if **Segment**, define the offset line by picking a segment.*
*If **Point to Point**, define the offset line by picking two points.*

Select button

select an offset line

Creation tab

Pad level type choice box Typed input, Use tin level Use bdy/ht, Use bdy/slope

*if **typed input**, all vertices of the pad are given the height in the* **Lot level** *field.*
*If **use tin level**, the height of each vertex of the pad is taken from the tin given in the* **Tin** *field.*

If **typed input:**

Pad level input

the height to use for all the vertices of the pad.

If **Use tin level:**

Tin tin box available tins

the tin used to give heights to the vertices of the pad.

If **Bdy/ht:**

Height

the height to be above the selected boundary string

Reference boundary

the selected boundary string for the pad to be a given height above/below

If **Use/slope:**

Slope 1 in

the slope to be above the selected boundary string

Reference boundary

the selected boundary string for the pad to be a given slope above/below

Single/ Along a string radio buttons single

*if **single**, a single pad is created from the strings surrounded the selected point.*
*If **along a string**, pads are created surrounding each vertex of selected string.*

Centroid/search distance string select

*if **single,** a point is selected and then a circle is rubber banded until a second point is selected. The pad is created from segments within the circle.*

Search dist input

*if **along a string,** then for each vertex, all segments within the distance are processed to create the pad.*

Select string select

*if **along a string,** select the string to use. Pads are created surrounding each vertex of this string.*

Process button

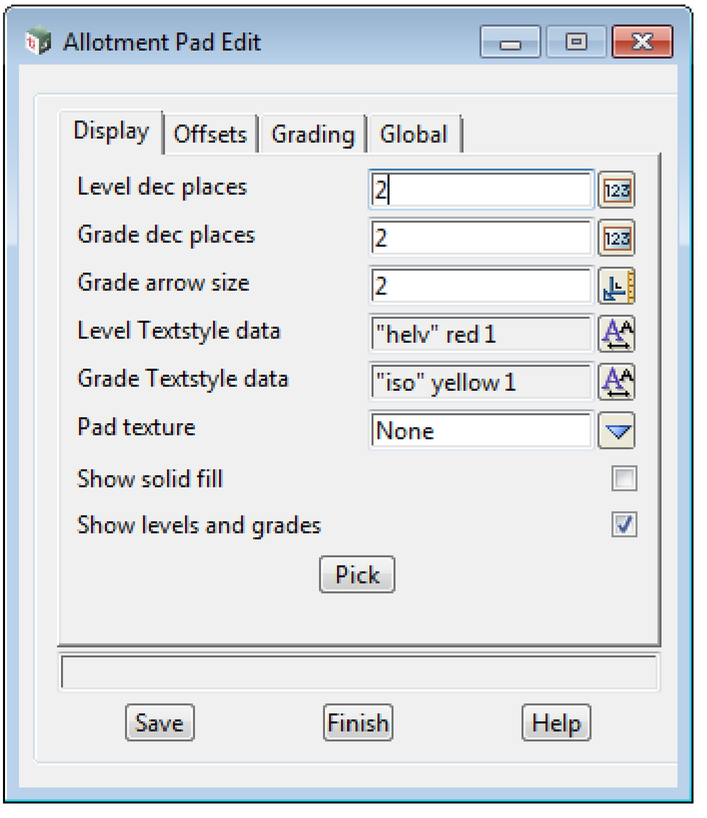
run the option

20.7.4 Allotment Pad Edit

Position of option on menu: **Design =>Pads =>Edit/grade pad**

This option is used to grade a pad created with the previous option, **Design =>Pads =>Create/grade pad.**

Selecting **Edit/grade pad** brings up the **Allotment Pad Edit** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Display tab

Level dec places input

the number of decimal places used to display the height (level) of the pad vertices.

Grade dec places input

the number of decimal places used to display the grade of the pad sides.

Grade arrow size input

size of the grade arrows

Level textstyle data textstyle data box

the textstyle data used for the displaying the level (height).

Grade textstyle data textstyle data box

the textstyle data used for the displaying the grade.

Pad texture choice box None None, some textures

the colour of the new pad.

Show solid fill tick box

if ticked, solid fill the pad

Show levels and grades tick box

if ticked, turn on the level and grades

Pick button

select the pad to edit

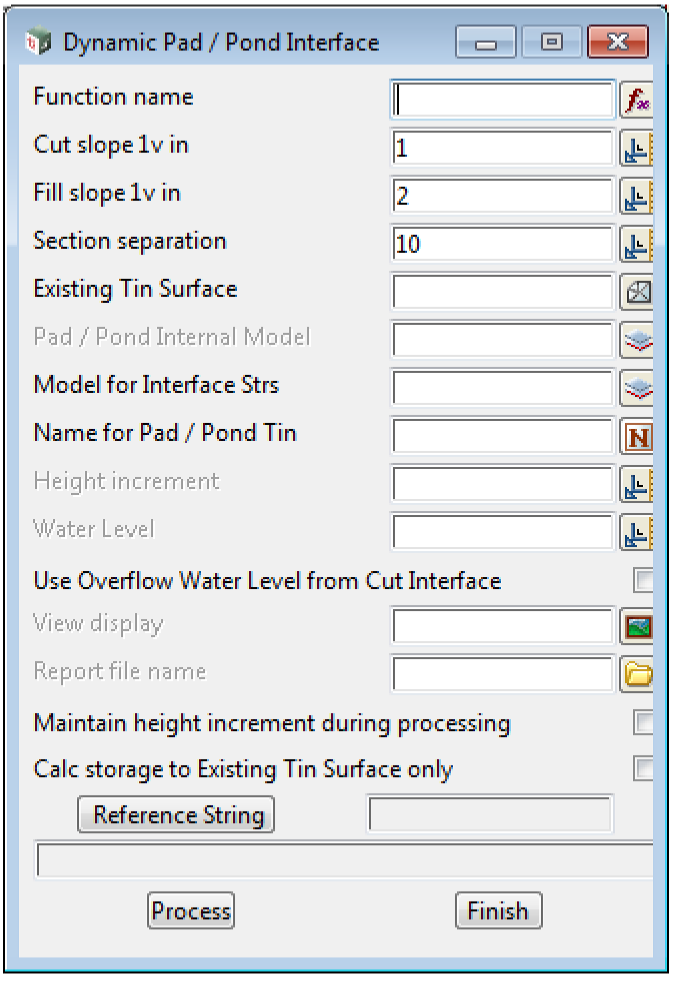
Data source input

source of data is used to create a pad.

20.7.5 Dynamic Pad/Pond Interface

Position of option on menu: **Design =>Pads =>Dynamic Pad Pond Create**

This option is used to interface from a string to a tin plus it can have an included pond model.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		available functions

name of the pad/pond function. If the function already exists and is picked from a popup or and an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields

Cut slope 1 v in	input	1.0	

*the slope of the interface line if a point is in cut. A cut slope of one vertical to the given value of horizontal units is used. Positive is **up** for a cut slope. A value 0 is used to designate a horizontal line.*

Fill slope 1 v in	input	1.0	

*the slope of the interface line if the point is in fill. A fill slope of one vertical to the given value of horizontal units is used. Positive is **down** for a fill slope. A value 0 is used for a horizontal line.*

Section separation	input	10	

the distance between the points on the selected string that interface points will be calculated from.

Existing tin surface	tin box		available tins

name of the tin to interface to.

Pad /Pond internal model model box available model

if non blank, name of the model to include as part of the interface model

Model for interface strs model box available models

name of the model to contain the calculated interface string.

Name for pad/pond tin tin box available tins

name of the tin to create from the reference string, the interface string and the pad/pond internal model

Height increment input

value to vertically translate the reference string by (cleared after each process unless **Maintain height increment during processing** *is ticked)*

Water level input

if non blank, the height of the water level

Use overflow water level from cut interface tick box

if ticked, the water level to the lowest point on the cut interface is determined and used as the water level height

View display view box available views

if non blank, the view to display the results on

Report file name file box *.rpt files

if non blank, the view to display the results on

Maintain height increment during processing tick box

if ticked, the reference string will be raised by the **Height increment** *each time the function is processed, but only while the panel is open*

Calculate storage to existing tin surface only tick box

if ticked, this will calculate the storage to the **Existing tin surface** *from the* **Water level** *only*

Reference string string select

select the string to interface from.

Process button

run the function

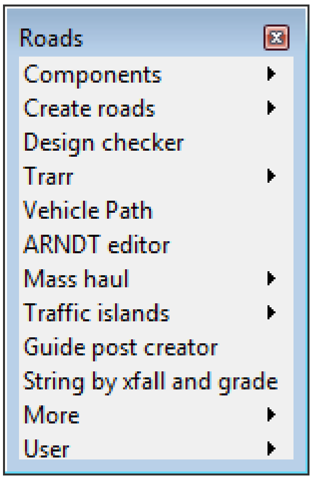
20.8 Roads

Position of menu: **Design =>Roads**

The road options include road network creation options and a number of other options for creating road details.

Some of the options are currently under development.

The **roads** walk-right menu is



generate components
setup and create road network

stopping distance calculations
input/output to TRARR
run TMR VPATH
editor for creating/running TMR ARNDT
generate data for mass haul on long section
create traffic islands
create guide posts to AUSTROAD standard
lots of generating strings by Xfalls
more roads macros

For the options see

Components	20.9 Components
Create roads	20.8.1 Create Roads
Design checker	20.8.2 Design Checker
Stopping distance	20.8.3 Stopping Distance

Guide post creator	20.8.10 Guide Post Placement
String by xfall and grade	20.8.11 String by Xfall and Grade
More	20.8.12 More Roads

20.8.1 Create Roads

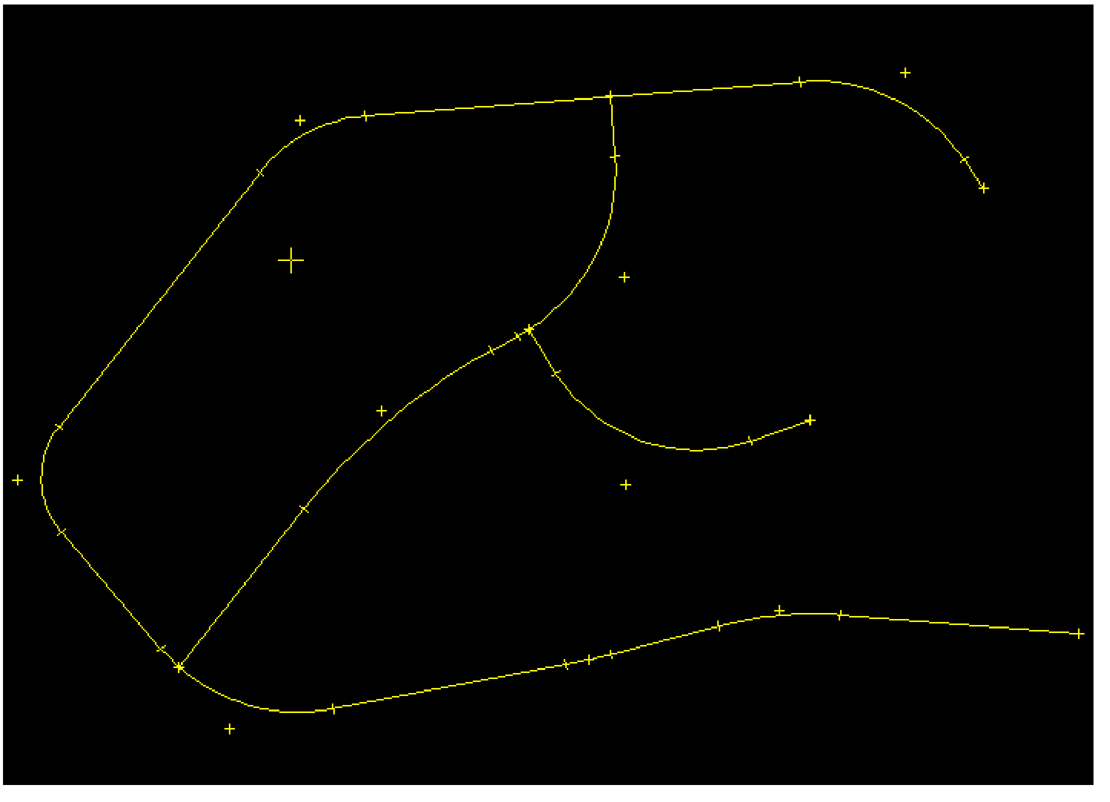
Position of menu: **Design =>Roads =>Create roads**

The **Create roads** functions allow the user to start with a model of road centrelines with vertical geometry, and unique string name.

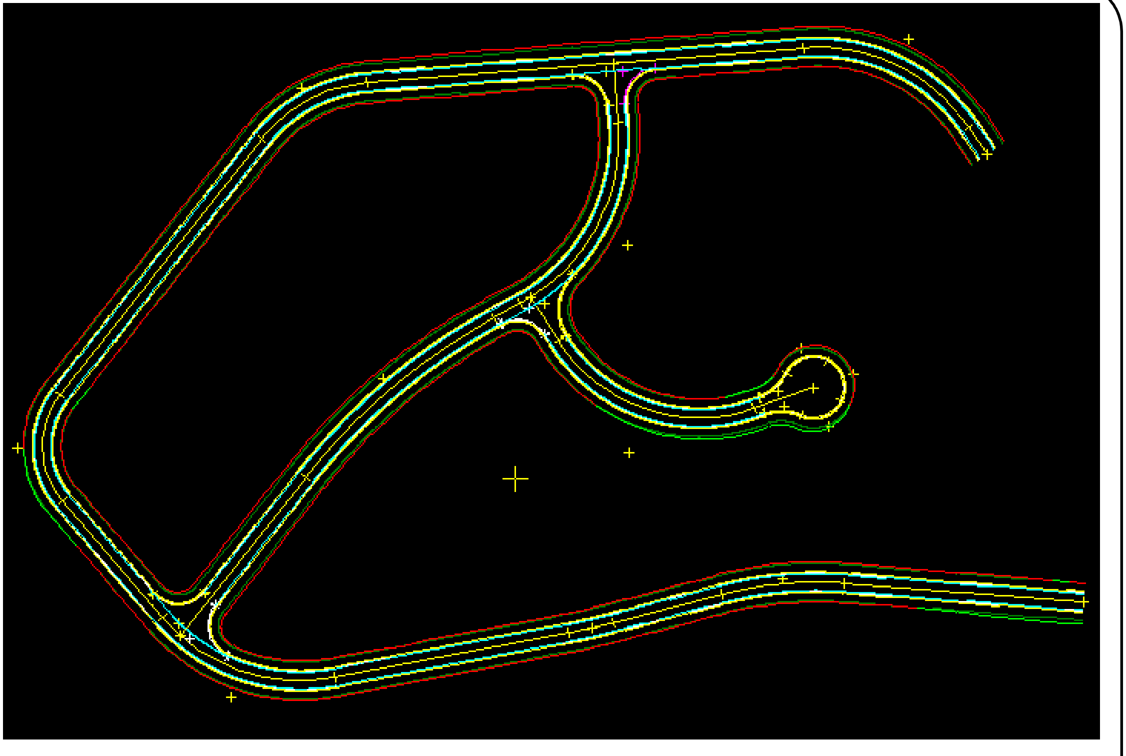
The centrelines can then be tagged with the width of the roads, left and right turn radii for any intersections and the definitions of any culdesacs at the end of a centreline.

The **Create** option will then create the left and right edges of the roads, create kerb returns and any intersections and the appropriate culdesacs.

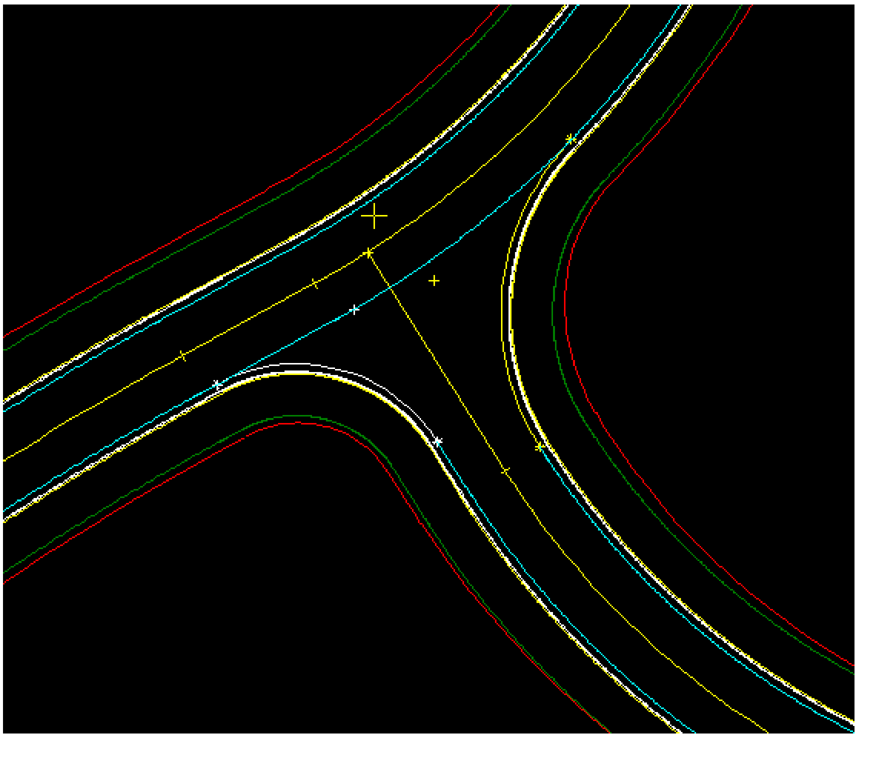
For example



Initial Network of Centrelines

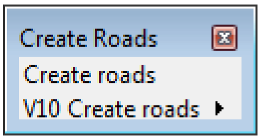


Road Network After Running the Roads Option



Blow Up of an Intersection

The **Create Roads** walk-right menu is



Create Roads
V10 Create Roads - superseded

See

Create Roads	20.8.1.1 Create Roads - Enhanced
V10 Create roads	20.8.1.2 V10 Create Roads

20.8.1.1 Create Roads - Enhanced

Position on menu: **Design =>Roads =>Create =>Create Roads - Enhanced**

The **Create Roads - Enhanced** panel is a total rewrite of ***Create Roads*** with many new features including:

(a) Either *templates* **or** snippets can be used to define the roads, intersections and kerbs.

(b) Wherever possible computators have been used to define kerb returns and culdesacs, and Smart Start and End modes in the Apply MTFs rather than chainage values.

(c) There is now a separate template for the left and right side of the road but unlike **Create Roads**, there is no separate Carriageway template.

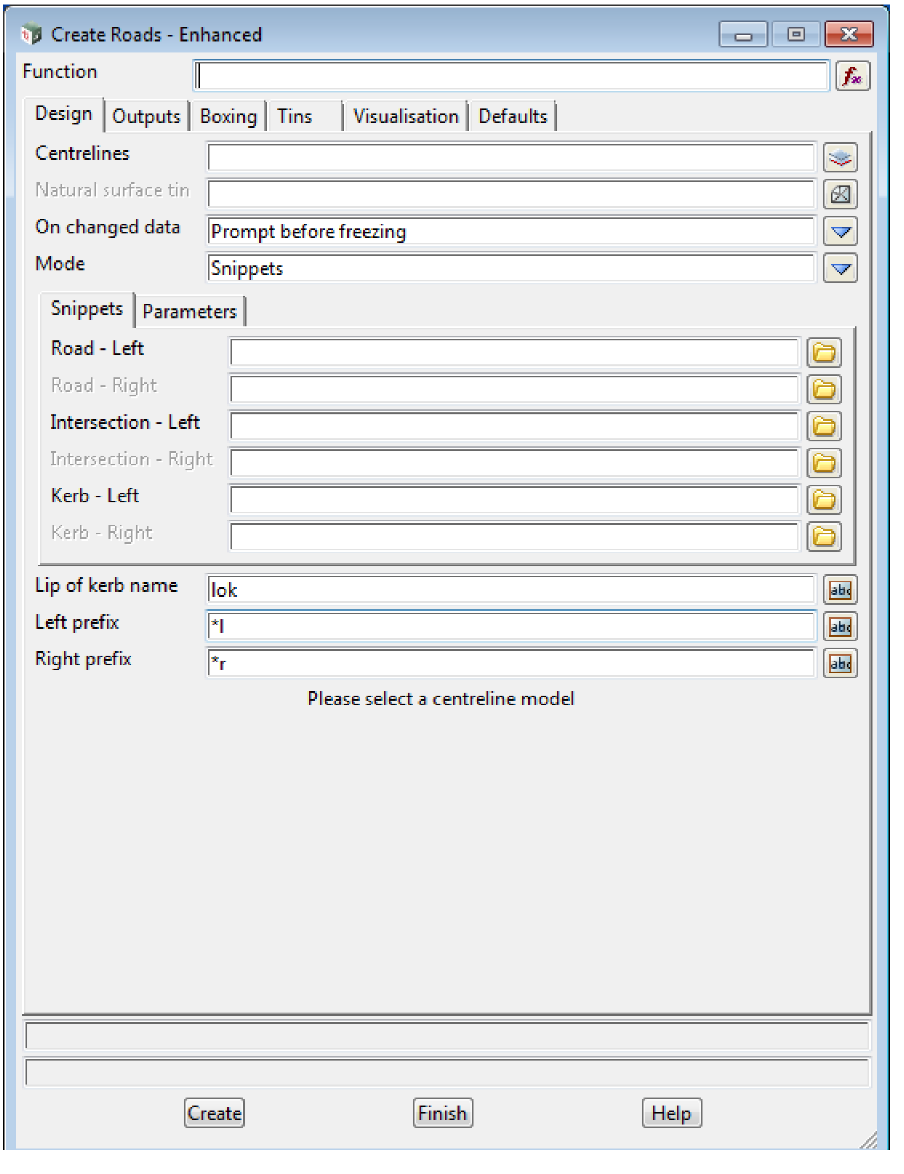
(d) There are default values for culdesacs.

(e) A kerb can be frozen without freezing the roads.

(f) Snippets can use the boxing defined in the **Boxing** tab or snippets can do their own boxing. But if you do both then you are on your own.

(g) Left and Right prefix to use when creating the Apply MTFs.

Selecting **Create Roads - Enhanced** brings up the **Create Roads - Enhanced** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box		available create roads enhancement functions

name of the create roads advanced function

Available tabs

Go to Design tab
Go to Outputs tab
Go to Boxing tab
Go to Tins tab
Go to Visualisation tab
Go to Defaults tab
Go to Buttons at bottom

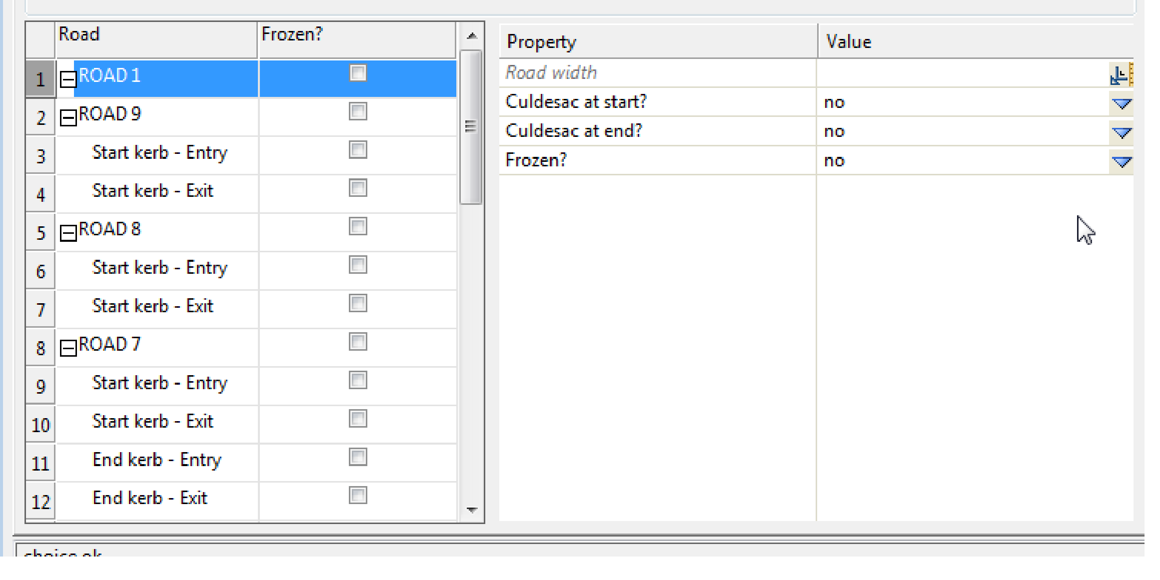
Design tab

Centrelines	model box		available models

model of the centreline lines that are to be processed to create roads, intersections and culdesac. Each centreline must have a unique name and vertical geometry.

After the Centreline model is selected either from the pop-up or by entering a model name and pushing the <Enter> key, the centrelines are analysed to see if left and right kerbs are possible (centreline ending on another serenely), if a culdesac is possible (end of a centreline) etc and then all the centrelines are listed in a Property Sheet on the bottom of the panel.

The entry for each centreline is where you enter values to override the defaults for road width, kerb radius, culdesac parameters etc. This information is then stored ***in the function*** *rather than as attributes on the centreline strings.*



Road grid - list of all the centrelines

Road

centreline name

Frozen	tick box		

if ticked, the centreline is frozen out of the automatic Create Roads process.

*For a frozen centreline, when the **Create Roads** function is run, the Apply MTF for that centreline is deleted and re-created. However any existing Apply MTF for that centreline will be run. Kerb returns are still calculated using the lip line create by running the existing Apply MTF for the frozen centreline. Hence the mtf for a frozen centreline can be modified and the changes will **not** be deleted when the Create Roads function is recalced.*

Natural surface tin	**tin box**	**available tins**

*if **not blank**, the tin to use as the natural surface for battering in the Applies.*
*If **blank**, no battering is done.*

On changed data	choice box	Prompt before freezing Always freeze Always ignore

*if **Prompt before freezing**,*
*If **Always freeze**,*

Go to the next tab Boxing tab *or return to* Available tabs

Boxing tab

boxing can be created for all the road and kerb return strings. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road/kerb return centrelines.

Create boxing tick box

if ticked, boxing is applied for all the road and kerb returns. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road centrelines or kerb returns.

Default boxing file file box *.blf files

file of boxing file definitions

Default boxing CL delimiter text box

common name in each boxing definition which will be replaced by the name of each road/kerb return centreline

Model stem for boxing strings text box

*pre*post text to use with the road/kerb return function name for boxing string models*

Boxing sections text box

*pre*post text to use with the road/kerb return function name for boxing section models*

Boxing kerb return sections and strings in one model tick box

if ticked, the strings for all the kerb return Applies are place in one model rather than one model for each kerb return. Similarly, the sections for all the kerb return Applies are placed in the one model. If not ticked, the model names are created in the same way as for the road centrelines. That is, the Model stem for boxing strings and sections are used with the kerb return function name and the layer stems to produce the kerb return boxing strings and sections models.

Model name for boxing kerb strings model box available models

*when only one model (per layer) for the box kerb strings is used - the base name for the model of kerb strings created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Model name for boxing kerb sections model box available models

*when only one model (per layer) for the box kerb sections is used - the base name for the model of kerb sections created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Boxing Layer 1-8 in the grid:

if non blank, boxing strings and sections will be created for that layer.

The last boxing layer is also referred to as the ***subgrade*** *layer.*

Layer stem text box

*for this boxing layer, the pre*post text used when naming models for boxing sections and strings.*

Road - LHS text box

for this boxing layer, the boxing definition to use on the left hand side of road centrelines

Road - RHS text box

for this boxing layer, the boxing definition to use on the right hand side of road centrelines

Kerb return text box

for this boxing layer, the boxing definition to use on the kerb returns

Intersection - LHS text box

for this boxing layer, the boxing definition to use on the left hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Intersection - RHS text box

for this boxing layer, the boxing definition to use on the right hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Create tin tick box

if ticked, create a tin for all the roads, kerb returns and culdesacs

Road tin tin box available tins

name for the tin created from the all the strings and sections

Road tin model model box available models

model for the Road tin

Road tin colour colour box available colours

colour of the road tin

Subgrade tin tin box available tins

if non blank, a subgrade tin of this name is created

Subgrade tin model model box available models

model for the Subgrade tin

Subgrade tin colour colour box available colours

colour of the subgrade tin

Nulling angle real box measures pop up

angle for nulling the triangles

Nulling length real box measures pop up

length for nulling the triangles

Nulling Seed points

Seed points are used for nulling triangles in the tins

Seed X/Y two column rid

X/Y coordinate of a nulling seed points.

Add button

after clicking on ***Add****, a seed point is selected from a view and the (X,Y) coordinates are written to the Seed X/Y grid.*

Remove button

*clicking on **Remove** will delete the highlighted row from the Seed X/Y point grid.*

Go to the next tab Visualisation tab *or return to* Available tabs

Visualisation tab

Create visualisation tick box

if ticked, the road tin is processed for visualisation

Apply texture map to tin tick box

if ticked, the texture map is applied to the road tin

Draw road tin as solid on view tick box

if ticked, draw the triangles of a tin as solid colour on the view

Tin colour to use for cut polygons colour box available colours

colour to use for all the cut polygons

Tin colour to use for fill polygons colour box available colours

colour to use for all the fill polygons

Tin colour to use for transition polygons colour box available colours

colour to use for all the polygons in neither cut nor fill

Go to the next tab Defaults tab *or return to* Available tabs

Defaults tab

Roads

Road width real box 3.5 measures pop up

width to be used for the left and right side of the road if one hasn't been defined for any centrelines

Section separation real box 5 measures pop up

chainage distance to use for the Applies created for the roads along the centrelines

Chord/Arc tolerance real box 0.01 measures pop up

chord to arc tolerance to use in the Applies for the centrelines.

Kerb returns

Kerb radius real box 5 measures pop up

radius to use for filleting between any centrelines that don't have a left or right radius defined

Section separation real box 1 measures pop up

chainage distance to use to use for the Applies that are created for the kerb returns

Chord/Arc tolerance real box 0.001 measures pop up

chord to arc tolerance to use for the Applies that are created for the kerb returns

Culdesacs

Bulb radius	real box	9	measures pop up

radius of the bulb of the culdesac

Bulb offset	real box		measures pop up

offset of the centre of the culdesac bulb from the centreline.

Left width	real box	3.5	measures pop up

width of the left hand side of the throat of the culdesac

Right width	real box	3.5	measures pop up

width of the right hand side of the throat of the culdesac

Left radius	real box	15	measures pop up

fillet radius of the curve on the left hand side going from the beginning of the culdesac to either the bulb of the culdesac, or onto the tangent between this curve and the bulb of the culdesac.

Right radius	real box	15	measures pop up

fillet radius of the curve on the right hand side going from the beginning of the culdesac to either the bulb of the culdesac, or onto the tangent between this curve and the bulb of the culdesac.

Left tangent	real box		measures pop up

if non zero, there is a straight line of this length that is the tangent between the fillet curve on the left hand side at the beginning of the culdesac and the bulb of the culdesac. This can not be a negative value.

Right tangent	real box		measures pop up

if non zero, there is a straight line of this length that is the tangent between the fillet curve on the right hand side at the beginning of the culdesac and the bulb of the culdesac. This can not be a negative value.

Projection	real box		measures pop up

*if non zero, the end of the centreline with the culdesac on it is extended by this distance. The centre of the culdesac bulb is then placed at the perpendicular distance of **Bulb offset** from the extended point.*

Go to the next tab Buttons at bottom *or return to* Available tabs

Buttons at bottom

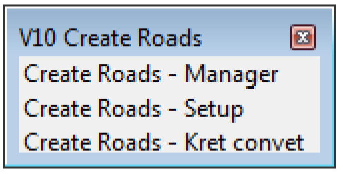
Create	button

run the option and create the road network.

Return to 20.8.1 Create Roads

20.8.1.2 V10 Create Roads

The Create **Roads** walk-right menu is



construct the roads network
setups for road network
convert kerb returns

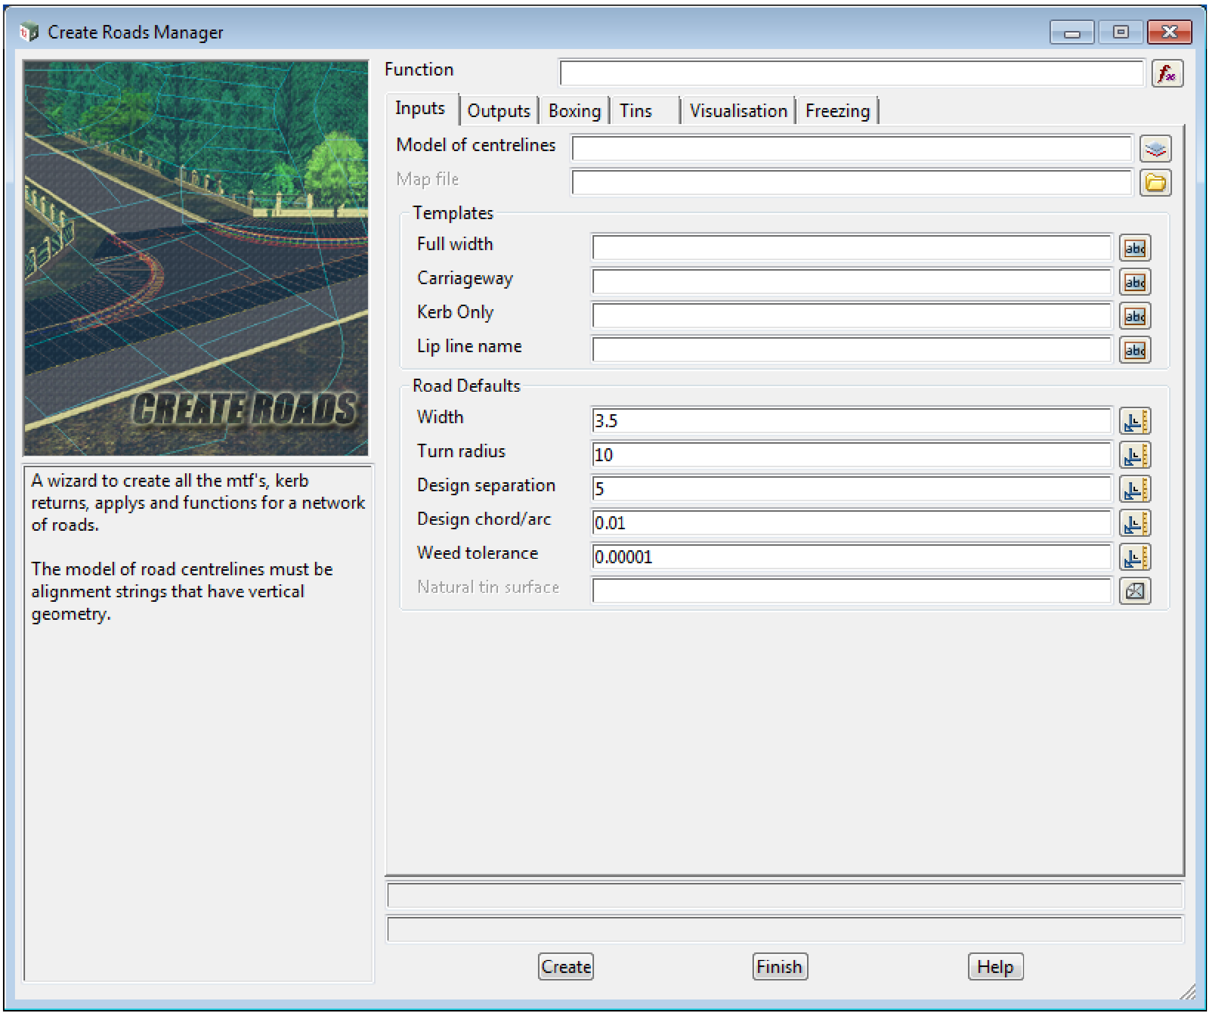
For the options see

Create Roads - Manager, go to 20.8.1.2.1 Create Roads - Manager
Create Roads - Setup 20.8.1.2.2 Create Roads - Setup
Create Roads - Kret convert 20.8.1.2.3 Create Roads - Kreturns Convert

20.8.1.2.1 Create Roads - Manager

Position of option on menu: **Design =>Roads =>Create =>Create Roads - Manager**

This option takes all the centrelines in a model and uses road widths and left and right turn radii to form roads on each centreline.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box		available roads functions

name of the create roads function

Input tab

Model of centrelines	model box		available models

model of the centreline lines that are to processed to create roads, intersections and culdesac. Each centreline must have a unique name and vertical geometry

Templates

Full width	template box		available templates

template with one fixed link and then cut and fill definitions to use for creating the roads. If a centreline has a road width defined, then the template is modified to use those values. The cut/fill section of the template are used to batter as normal.

Carriageway template box available templates

a template with only a fixed part to the end of the carriageway which is applied across any intersections - going from the chainage of the start of the kerb return on one side of the intersection to the chainage at the end of kerb return on the other side of the intersection.

Kerb only template box available templates

a template with no carriageway part. It is applied to any kerb returns

Lip line name

name of the lip line that must exist in each of the full width template and the road template. The kerb returns are created from the lip line on each road and the start height and grades are taken from the lip lines.

Road Defaults

Width

width of the road to be used if one hasn't been defined for any centrelines

Turn radius

radius to use for filleting between any centrelines that don't have a left or right radius defined

Design separation

chainage distance to use in the Applies for creating the roads along the centrelines

Default chord/arc

chord to arc tolerance to use on curves

Natural surface tin **tin box** **available tins**

if non blank, the tin to use as the natural surface for battering in the Applies.
If blank, no battering is done.

Output tab

Model stems

Road strings input

*pre*post text to use with the function name in the created Applies for the design string models for each centreline*

Road sections input

*pre*post text to use with the function name and the created Applies for the design cross section models for each centreline*

Polygons choice box One model One model, No Polygons Model for Centreline

*if **One model**, all the polygons created by the applies are place in one model.*
*If **Model for Centreline**, different models are created for the polygons in each apply.*
*If **No Polygons**, no polygons are created by the applies.*

Model model box available models

*when **One model**, model for all the polygons created by the Applies.*

Road polygons input

*pre*post text to use with the function name in the created Applies for polygon models for each centreline*

Kerb Returns

Turn separation

chord/arc tolerance for use in the kerb return Applies

Turn chord/arc

chord to arc tolerance to use on kerb return

Model for kerb returns model box available models

model for all the kerb returns

Naming choice box Follow Road Names - LHS driving
Follow Road Names - RHS driving
Use Numbers
Use Letters

method of naming the kerb returns

Just create kerb returns tick box

if ticked, only create the kerb returns. Usually only run at the beginning to see if the kerbs look correct.

Just create kerb returns tick box

if ticked, only create the kerb returns. Usually only run at the beginning to see if the kerbs look correct.

Kerb return strings and sections in one model tick box

if ticked, then all the kerb return strings and sections are place in the one model. The model names are given in the next two fields.

Model for kerb return strings model box available models

model for all the kerb return strings

Model for kerb return sections model box available models

model for all the kerb return sections

Delete frozen Apply MTF functions tick box

if ticked, the Apply MTF functions are deleted for all the frozen roads. Normally not used

View for models view box available views

if non blank, view to add all the created models onto.

Error report file box *.rpt files

file for error messages

Boxing tab

boxing can be created for all the road and kerb return strings. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road/kerb return centrelines.

Create boxing tick box

if ticked, boxing is applied for all the road and kerb returns. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road centrelines or kerb returns.

Default boxing file file box *.blf files

file of boxing file definitions

Default boxing CL delimiter input

common name in each boxing definition which will be replaced by the name of each road/kerb return centreline

Model stem for boxing strings input

*pre*post text to use with the road/kerb return function name for boxing string models*

Boxing sections input

*pre*post text to use with the road/kerb return function name for boxing section models*

Boxing kerb return sections and strings in one model tick box

if ticked, the strings for all the kerb return Applies are place in one model rather than one model for each kerb return. Similarly, the sections for all the kerb return Applies are placed in the one model. If not ticked, the model names are created in the same way as for the road centrelines. That is, the Model stem for boxing strings and sections are used with the kerb return function name and the layer stems to produce the kerb return boxing strings and sections models.

Model name for boxing kerb strings input

*when only one model (per layer) for the box kerb strings is used - the base name for the model of kerb strings created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Model name for boxing kerb sections input

*when only one model (per layer) for the box kerb sections is used - the base name for the model of kerb sections created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Boxing Layer 1-8 in the grid:

if non blank, boxing strings and sections will be created for that layer.

The last boxing layer is also referred to as the ***subgrade*** *layer.*

Layer stem input

*for this boxing layer, the pre*post text used when naming models for boxing sections and strings.*

Road - LHS input

for this boxing layer, the boxing definition to use on the left hand side of road centrelines

Road - RHS input

for this boxing layer, the boxing definition to use on the right hand side of road centrelines

Kerb return input

for this boxing layer, the boxing definition to use on the kerb returns

Intersection - LHS input

for this boxing layer, the boxing definition to use on the left hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Intersection - RHS input

for this boxing layer, the boxing definition to use on the right hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Tins tab

Create tin tick box

if ticked, create a tin for all the roads, kerb returns and culdesacs

Road tin tin box available tins

name for the tin created from the all the strings and sections

Road tin colour colour box available colours

colour of the road tin

Subgrade tin tin box available tins

if non blank, a subgrade tin of this name is created

Subgrade tin colour colour box available colours

colour of the subgrade tin

Nulling angle input

angle for nulling the triangles

Nulling length input

length for nulling the triangles

Null Seed points:

Seed X/Y input

X/Y coordinate of a nulling seed point

Seed Point button

select a seed point for nulling the tins. The X and Y coordinates are written to the Seed X/Y grid

Visualisation tab

Create visualisation tick box

if ticked, the road tin is processed for visualisation

Apply texture map to tin tick box

if ticked, the texture map is applied to the road tin

Draw road tin as solid on view tick box

Tin colour to use for cut polygons colour box available colours

colour to use for all the cut polygons

Tin colour to use for fill polygons colour box available colours

colour to use for all the fill polygons

Tin colour to use for transition polygons colour box available colours

colour to use for all the polygons in neither cut nor fill

Freezing tab

Colour for the frozen sections colour box available colours

colour to use for the sections of frozen strings. In any view, this gives a quick way of identifying frozen roads.

Road grid - list of all the centrelines

Element available colours

centreline name

Frozen tick box

if ticked, the centreline is frozen out of the automatic Create Roads process.

*For a frozen centreline, when the **Create Roads** function is run, the Apply MTF for that centreline is deleted and re-created. However any existing Apply MTF for that centreline will be run. Kerb returns are still calculated using the lip line create by running the existing Apply MTF for the frozen centreline. Hence the mtf for a frozen centreline can be modified and the changes will **not** be deleted when the Create Roads function is recalced.*

Note - if the two roads used to define a kerb return are both frozen, then the kerb return is automatically frozen and the kerb return is not deleted and recreated when the Create Roads function is recalced. However the existing Apply MTF for the frozen kerb return is run on each recalc.

Buttons at bottom

Create button

run the option and create the road network.

Continue to 20.8.1.2.2 Create Roads - Setup or return to 20.8.1.2 V10 Create Roads.

20.8.1.2.2 Create Roads - Setup

Position of option on menu: **Design =>Roads =>Create =>Create Roads - Setup**

In the **Create Roads - Setup** panel there are default values for the road width and road crossfall and turn radius.

If a different road width or crossfall, or a different left turn radius or right hand radius is required, the **Create Roads - Setup** option is used to define the different information for any centreline. **Create Roads - Setup** is also used to define culdesacs.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Road Setup tab

Centreline string select

used to set the left and right turn radii, and the width of the road. This option is used twice to set the different radii for each end of a road by picking the centreline close to the end that is to have the left and right turn radii defined. The left and right turn radii can be different for each end of an alignment.

Road width

width of one side of the road for the selected centreline.

LHS turn radius

radius to use for filleting between any centrelines on the left.

RHS turn radius

radius to use for filleting between any centrelines on the right.

Set button

store the given values in the panel with the selected centreline.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Culdesac Setup tab

Left fillet input

radius of the fillet between the road and the bulb on the left hand side

Bulb radius input

radius of the culdesac bulb

Bulb offset input

offset of the culdesac bulb

Right fillet input

radius of the fillet between the bulb and the right had side of the road

Left straight input

distance between the left fillet and the bulb

Right straight input

distance between the right fillet and the bulb

Set button

store the panel values the selected centreline.

Continue to 20.8.1.2.3 Create Roads - Kreturns Convert or return to 20.8.1.2 V10 Create Roads.

20.8.1.2.3 Create Roads - Kreturns Convert

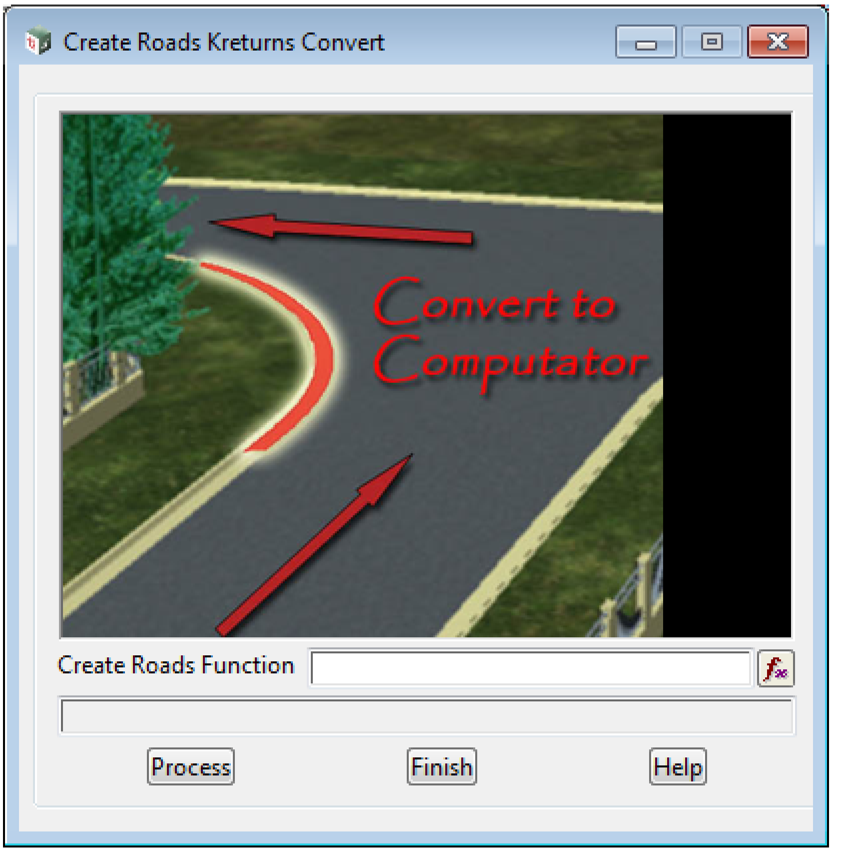
Position of option on menu: **Design =>Roads =>Create =>Kret Convert**

This macro is to be used in conjunction with the **Create Roads.**

Once **Create Roads** has been run, this macro will convert all the SA kerb returns to Element method (in both horizontal and vertical).

The horizontal parts are referenced to the appropriate road centreline, using segment computators and a free arc radius.

The vertical is a combination of a fixed grade at the start and end, with a compound parabola.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Create Roads Function	function		select function
select function from list			
Process	Button		
runs the option			

Return to 20.8.1.2 V10 Create Roads.

20.8.2 Design Checker

Position of option on menu: **Design =>Roads =>Design checker**

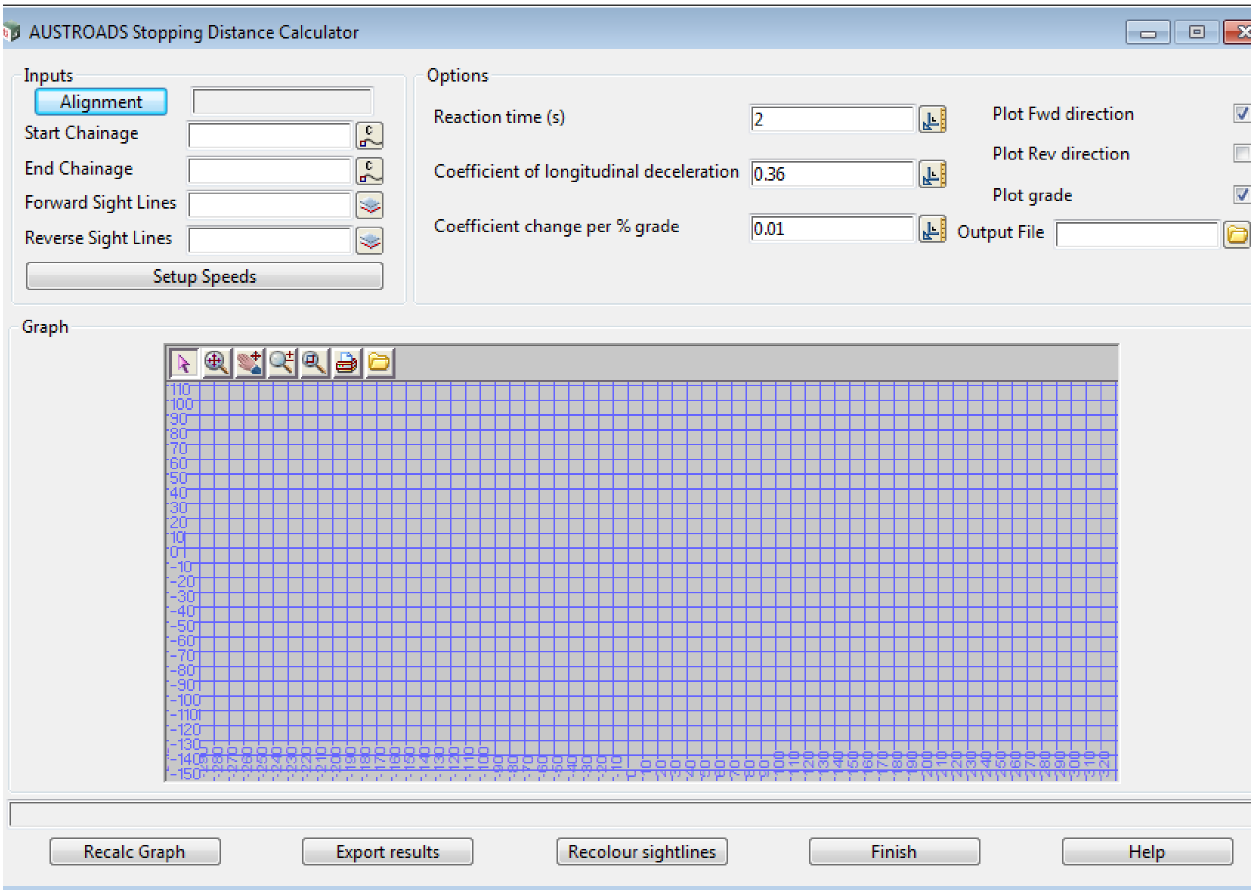
This option is still under development.

Selecting **Design checker** displays the **Design Checker** panel.

20.8.3 Stopping Distance

Position of option on menu: Design =>Roads =>Stopping distance

This section of documentation is a work in progress and will be updated in subsequent releases.

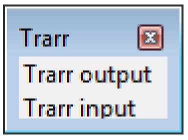


20.8.4 Trarr

Position of menu: **Design => Roads =>Trarr**

The option under **Trarr** read and write Design TRARR files.

The **Trarr** walk-right menu is



write out a Trarr file
read in a Trarr file

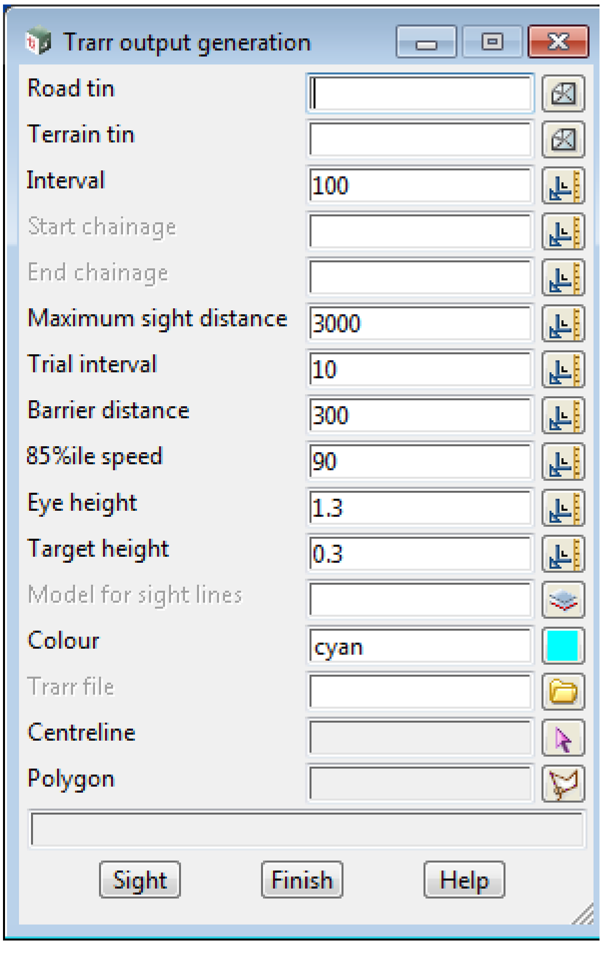
For *Trarr output*, go to 20.8.4.1 Trarr Output
Trarr input 20.8.4.2 Trarr input

20.8.4.1 Trarr Output

Position of option on menu: **Design =>Roads =>Trarr =>Trarr output**

Options to create a file for use with TRARR.

Please contact 12d Solutions Pty Ltd if you wish to use this option.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Road tin	tin box		available tins

tin of the road design

Terrain tin	tin box		available tins

tin of the terrain

Interval input

interval to calculate sight lines

Start chainage

*if **non blank**, start chainage for producing the Trarr file.*
*if **blank**, start at the beginning of the centreline string.*

End chainage

*if **non blank**, end chainage for producing the Trarr file.*
*if **blank**, go to the end of the centreline string.*

Maximum sight distance input

maximum distance to try and calculate sight lines

Trial interval input

interval to move ahead to test sight distance to

Barrier distance input

if sight distance is less than this value then a barrier line is required

85%le speed input

85 percentile speed (to write to the Trarr file)

Eye height input 1.3

height of the eye point above the picked string

Target height input 0.3

height of the target point above the picked string

Model for sight lines	model box		available models

if non blank, the sight lines are kept and placed in this model

Colour	colour box		available colours

colour of the sight lines

Trarr file	file box		*.rpt files

if non blank, a Trarr file of this name is produced

Centreline string-select

string to be used for placing the eye and target points and calculating sight distance, is selected from a view.

Polygon string-select

boundary polygon for the road tin

Sight button

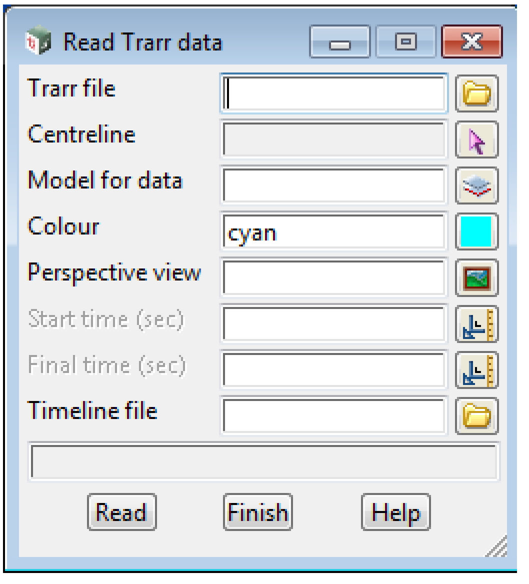
calculate sight lines and write out a Trarr file

20.8.4.2 Trarr input

Position of option on menu: **Design =>Roads =>Trarr =>Trarr input**

Option to read a TRARR file.

Please contact 12d Solutions Pty Ltd if you wish to use this option.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

20.8.5 Vehicle Path

Position of menu: **Design =>Roads =>Vehicle Path**

The **vehicle path** option is used to interface with the vehicle path program **Vpath**, written by the Queensland Department of Transport and Main Roads.**Vpath** can be obtained from the Queensland Department of Transport and Main Roads.

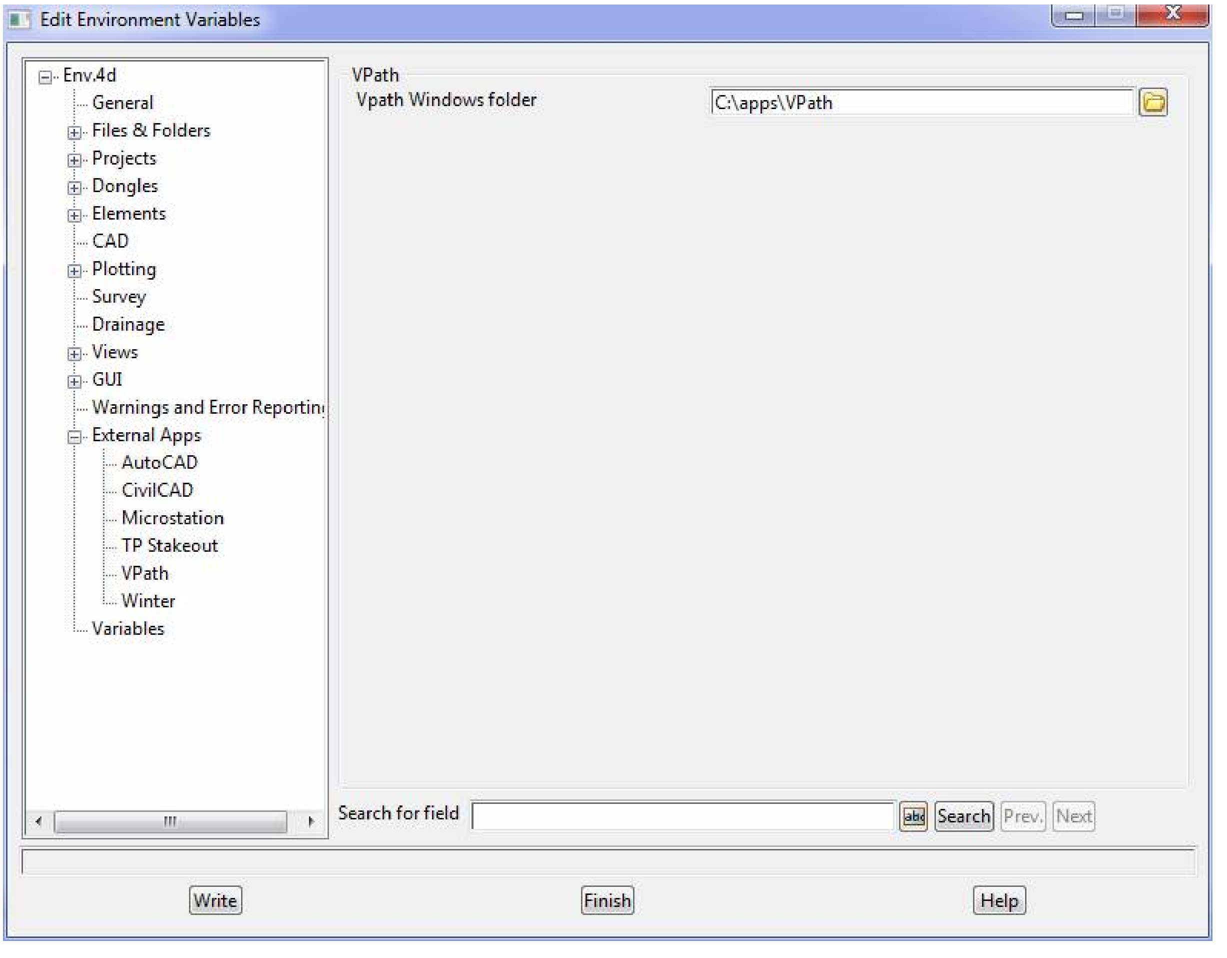
The **Vpath** program is fully described in its own Manual available from Queensland Department of Transport and Main Roads.

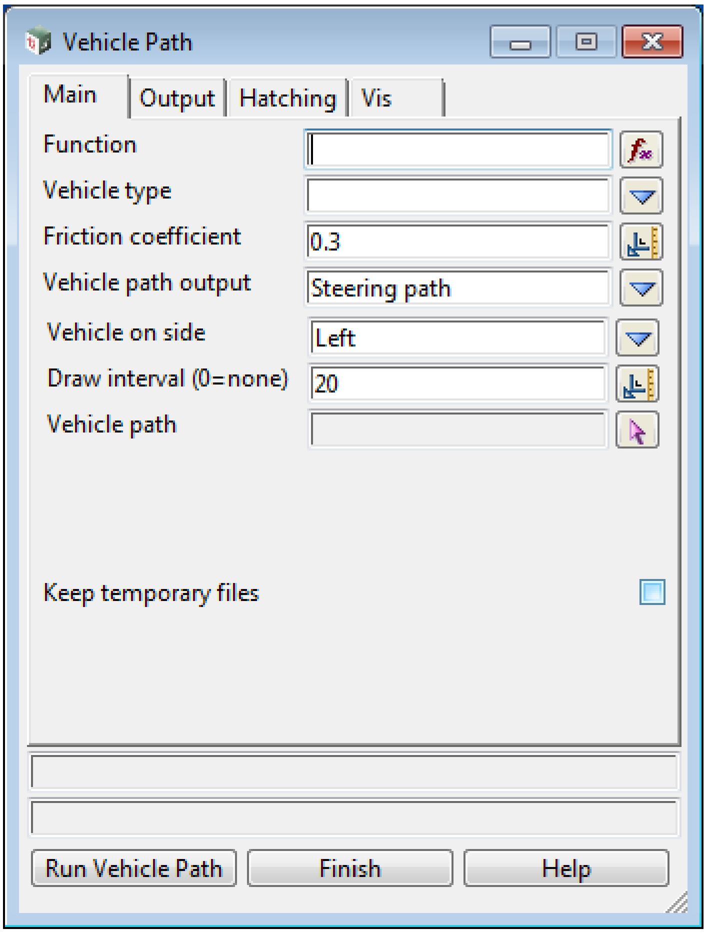
To run **Vpath** from within 12d Model the environment variable **WINDOWS_VEHICLE_PATH_4D** is set to point to the folder where the Windows **Vpath** executable is located.

This can be set manually or done through the Edit Environment Variables panel.

WINDOWS_VEHICLE_PATH_4D *folder-path*

On selecting the **Vehicle Path** option, the **Vehicle Path** panel is displayed. If the environment variable is not set the **Edit Environment Variables** panel will be displayed on the screen.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Main Tab

Function function box

*name of the **Steering Path** function. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields*

Vehicle type choice box

the vehicle type used for generating the swept path. This is populated from first the vehicles.std and then the vehicles.cus files located in the defined vehicle path directory.

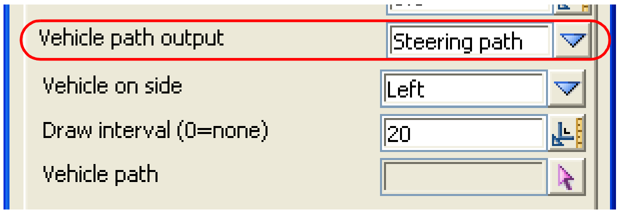
Friction coefficient input

the coefficient of friction to be used for the vehicle.

Vehicle Path Output choice box Steering path, Turning Template

Steering path: the swept path of the vehicle is generated along the selected super alignment/alignment string.

Turning Template: the swept path of the vehicle is generated through 180° at a nominated radius



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Steering path options

Vehicle on side choice box — Pop-Up: Left, Right

the side of the vehicle that the selecting steering path represents

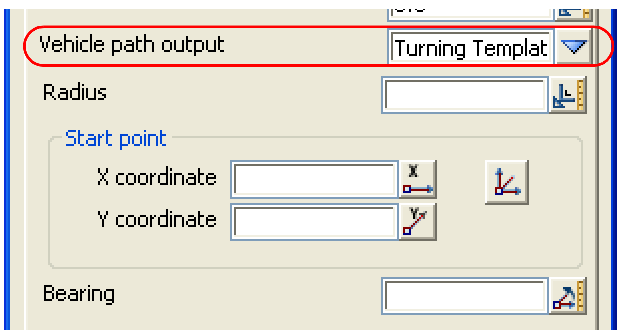
Draw interval (0=none) input

if non-zero, the position of the vehicle on the steering path is, draw the position at this interval

Vehicle Path string select

select the string for generating the swept path.
The string must be a super alignment or alignment string, consecutive straights and transitions curves are not allowed and there can be no more than 20 arcs in the string.

Turning Template Options



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Radius input

enter the radius of the turning template, positive defines a clockwise turn, negative is anti-clockwise.

Start point input

select the coordinates of the start point of the turning template.

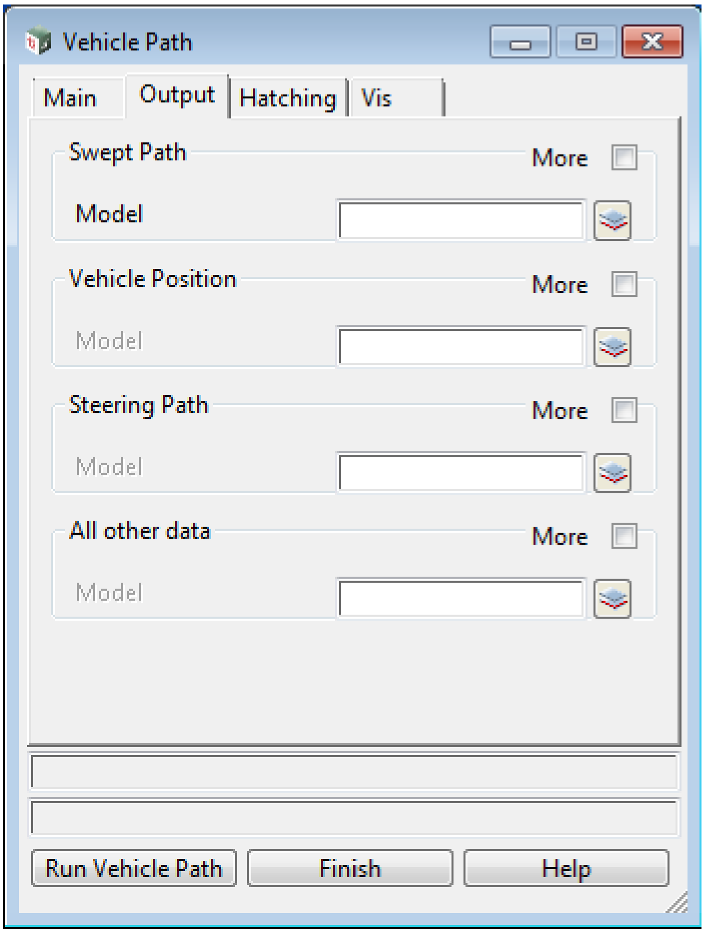
Bearing input

enter the bearing of the start point of the turning template.

Common options

Keep temporary files tick box

*if ticked the input file for **Vpath** and the **dxf** file produced by **Vpath** are kept in the **Vpath** directory.*



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Output Tab

Swept Path

the model for the swept path generated by the extremities of the vehicle

Vehicle Position

if non-blank, the strings tracing out the vehicle position at the nominated interval are placed in this model

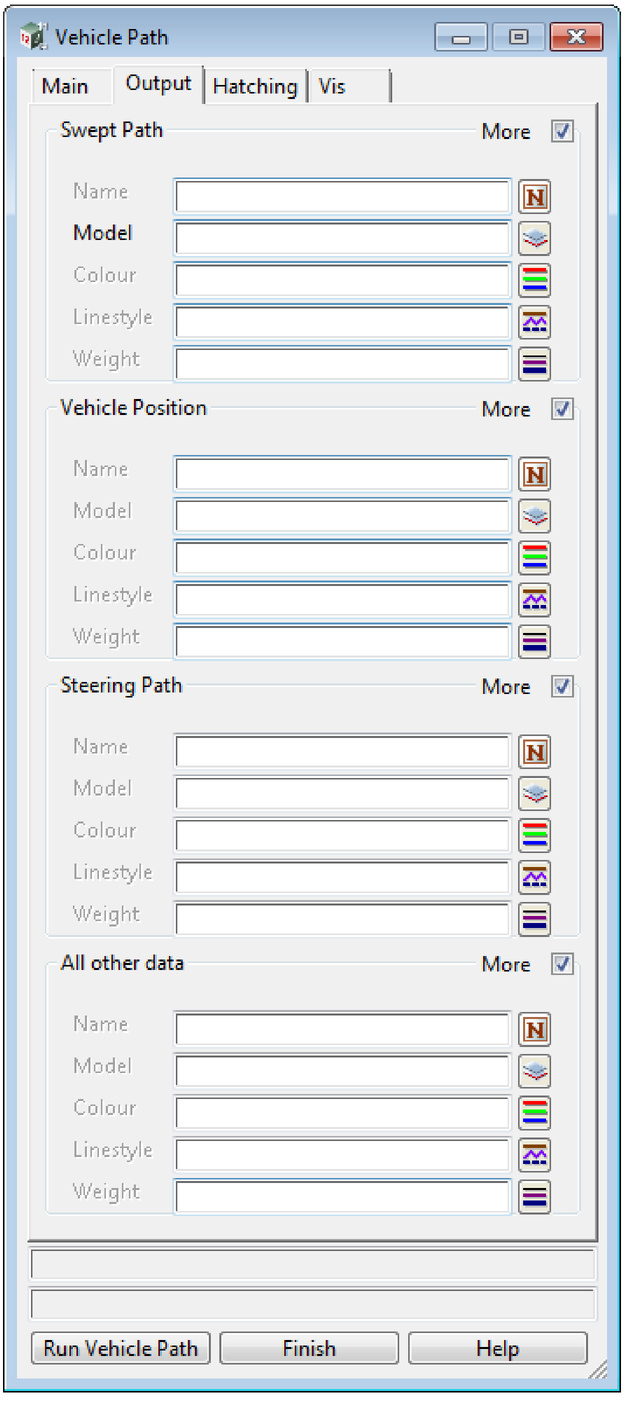
Steering Path

if non-blank, the steering path including the marking of the tangent points and centres of each circular curve are created and placed in this model

All other data

*if non blank all other data produced by **Vpath** including a table of parameters used is placed in this model.*

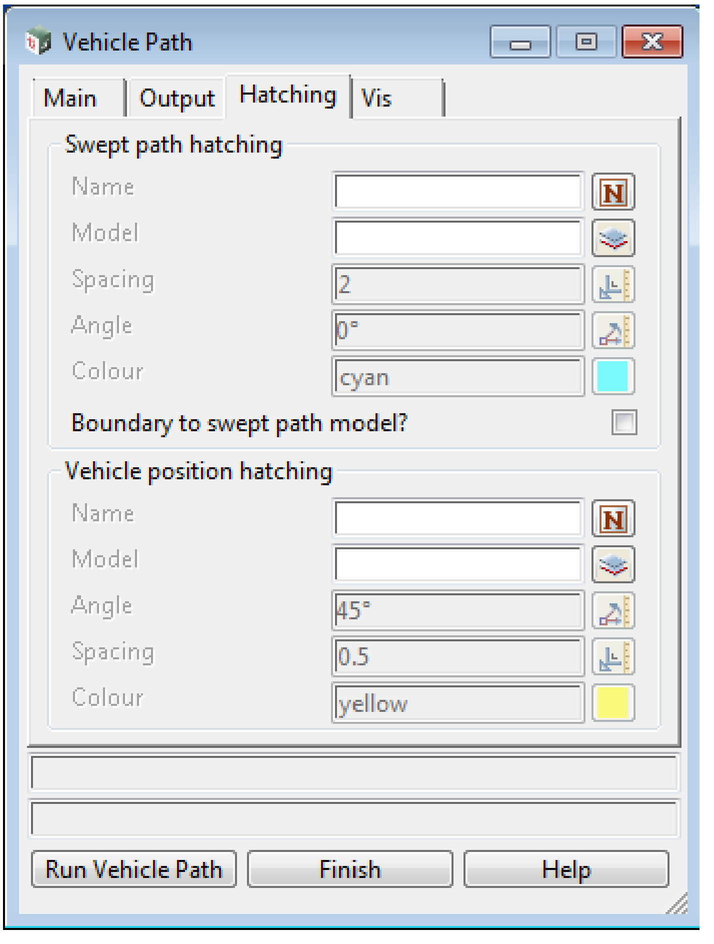
If the **More** tick box is ticked the following fields are displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

With the **More** enabled the **Name**, **Model**, **Colour**, **Linestyle** and **Weight** can be entered for each option.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Hatching Tab

Swept path hatching

The swept path of the vehicle can be hatched, the swept path strings generated by **Vpath** are collated into a single boundary string to produce the hatching.

Warning, this operation can take some time on longer alignments.

Name

name of the swept path hatching.

Model

model for the swept path hatching.

Spacing

spacing of the swept path hatching.

Colour

colour of the swept path hatching.

Boundary to swept path model? tick box

if ticked the collated boundary string is copied to the swept path model.

Vehicle position hatching

the strings tracing out the vehicle position can be hatched.

Name

name of the vehicle position hatching.

Model

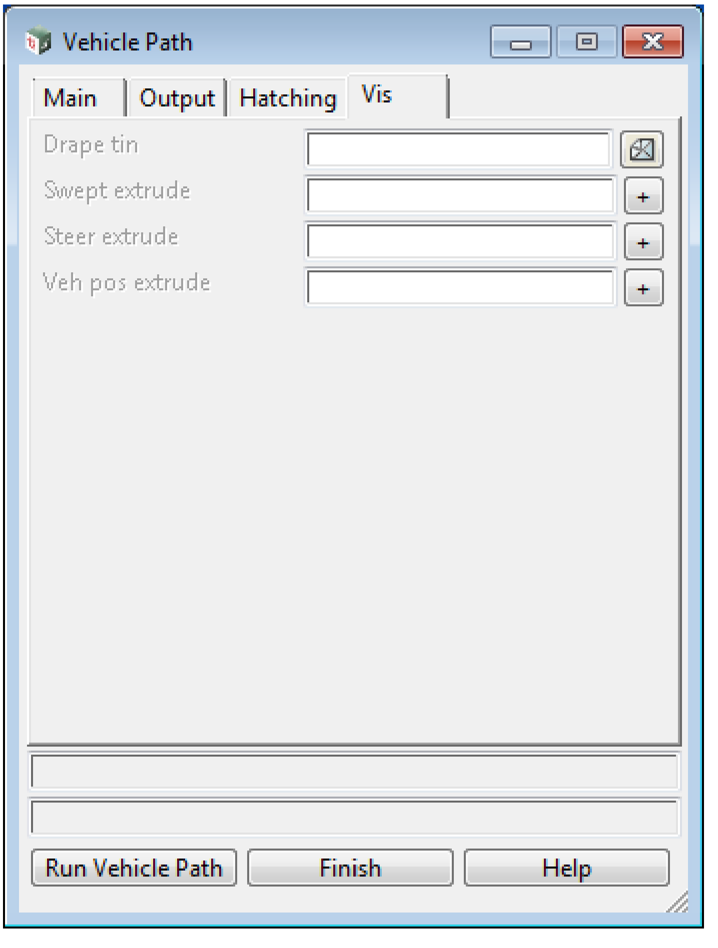
model for the vehicle position hatching.

Spacing

spacing of the vehicle position hatching.

Colour

colour of the vehicle position hatching.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Vis Tab

The **Vis** tab is used to create a visualisation from the generated strings.

Drape tin

the tin to drape the generated string onto to create the visualisation

Swept extrude

the extrusion to use for the swept path strings

Steer extrude

the extrusion to use for the steering path strings

Veh pos extrude

the extrusion to use for the vehicle position strings

Run Vehicle Path button

*run the **Vpath** program and load the results back into the models given in the panel fields.*

***Vehicle Path** supports up to 20 IPs. A warning message will be displayed if this is exceeded and no data will be produced.*

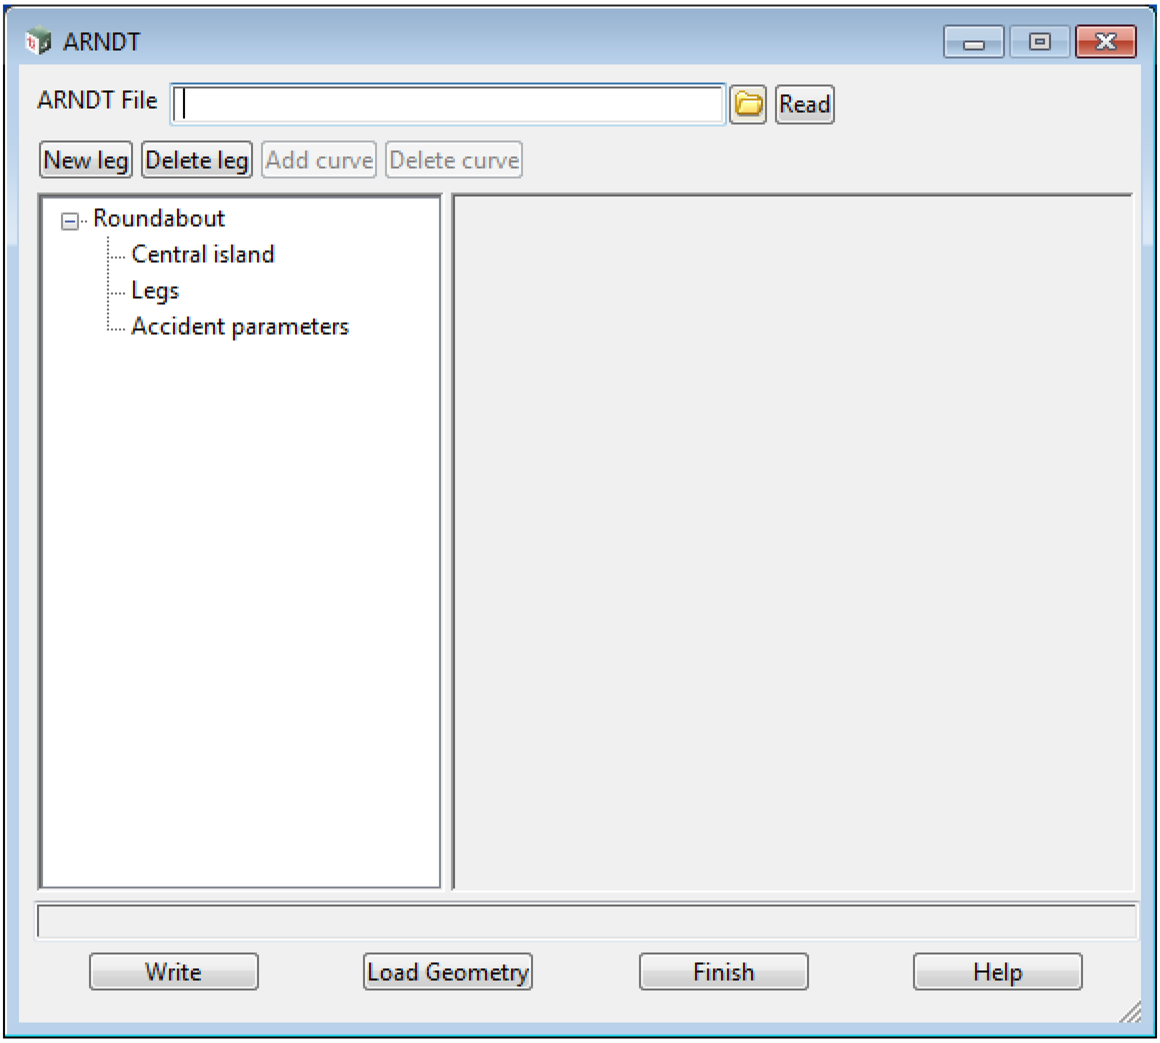
***Vehicle Path** only supports tangential straight/curve and curve/curve geometry. A warning message will be displayed if this criteria is not met and no data will be produced.*

20.8.6 ARNDT Editor

Position of menu: **Design =>Roads =>ARNDT Editor**

This editor allows you to create or edit files for **ARNDT** (**A Roundabout Numerical Design Tool**) files. It can also interface directly with **ARNDT** to create geometry and generate reports.

Selecting **ARNDT Editor** brings up the **ARNDT** panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
ARNDT file	file		

*the **ARNDT** file to read or write*

Read	button		

*reads the **ARNDT** file*

New leg	button		

creates a new leg for the roundabout

Delete leg	button		

deletes the currently selected leg

Add curve	button		

adds a new entry curve to the selected leg

Delete curve button

deletes the selected entry curve

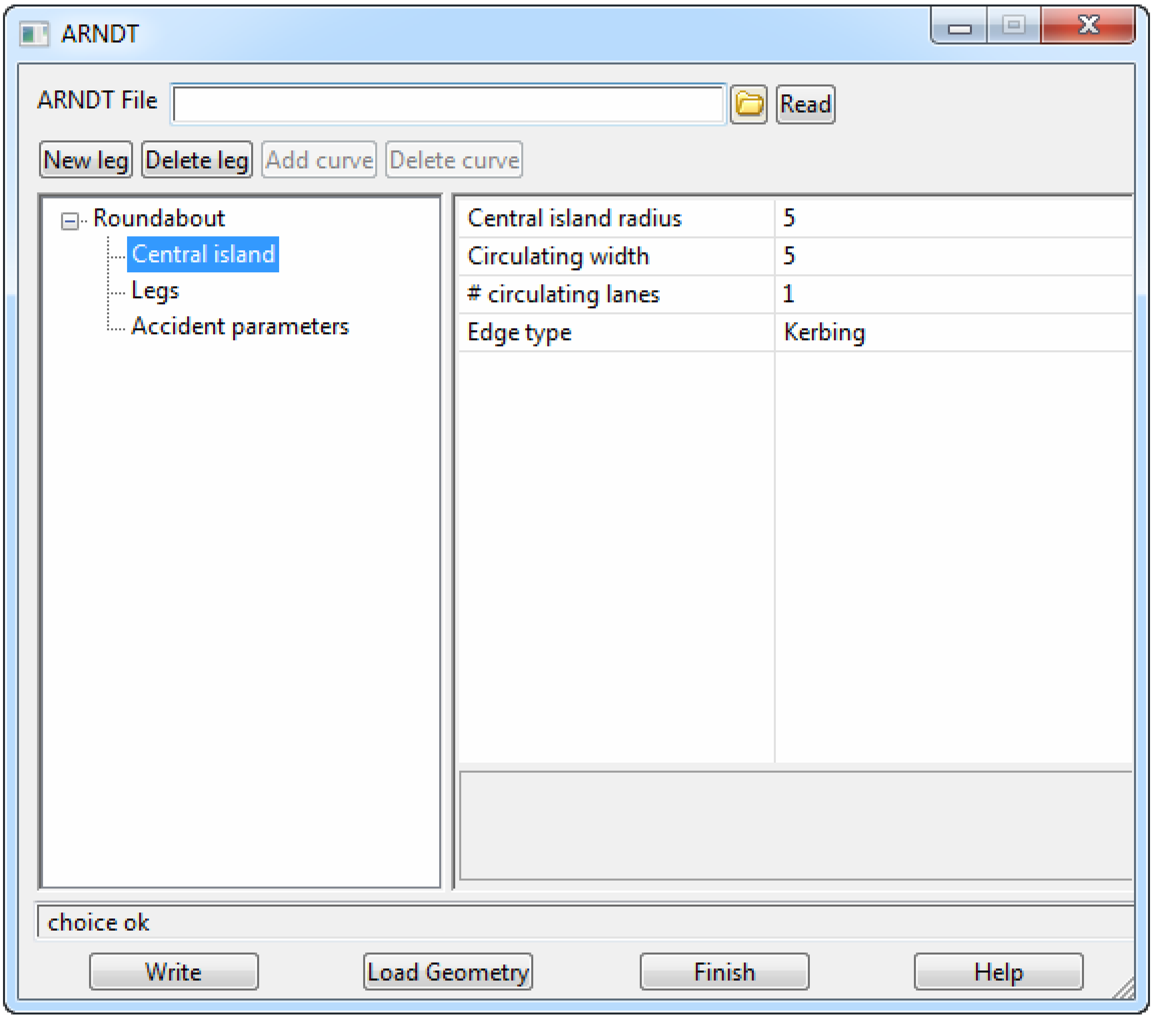
Write button

*writes the **ARNDT** file*

Load geometry button

*options for loading geometry via **ARNDT** and generating report files*

Central Island



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Central island radius

the radius of the central island

Circulating width

the offset from the radius of the circulating string

# of circulating lanes

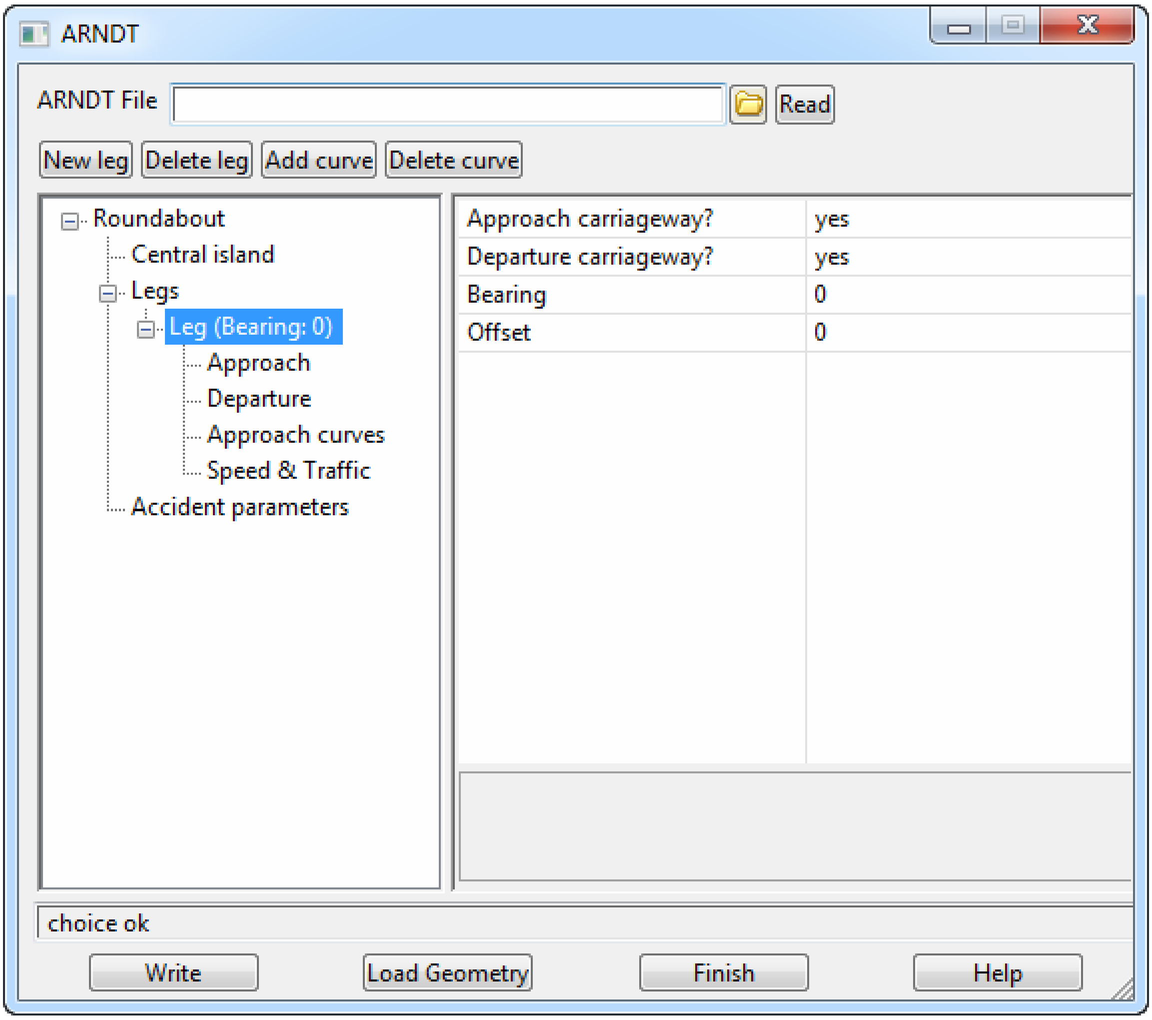
the number of lanes circulating the roundabout

Edge type

the edge type for the central island (Kerbing or Edge Line)

Legs Node

The **Leg node**, for each leg of the roundabout, allows you to modify parameters for that leg.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Approach carriageway?	choice box		yes, no

whether or not there is an approach carriageway (yes or no)

Departure carriageway?	choice box		yes, no

whether or not there is a departure carriageway (yes or no)

Bearing

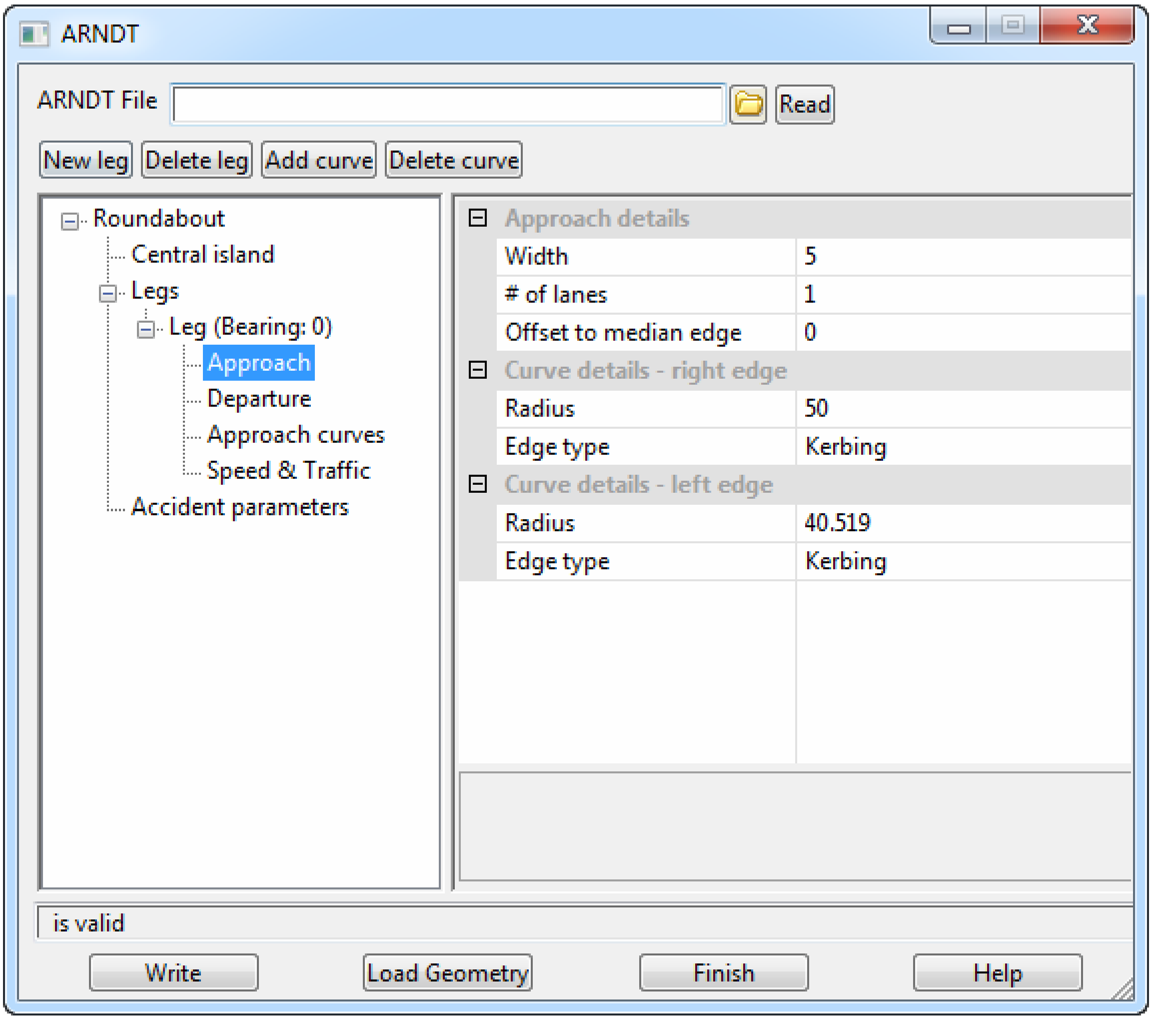
the bearing of the leg

Offset

the offset of the leg from the centre of the roundabout

Leg Approach Node

This defines the properties for the approach carriage of the leg, if there is an approach.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Approach details

Width

the width of the approach carriageway

of lanes

the number of lanes in the approach carriageway

Offset to median edge

the offset of the approach from the median

Curve details - right edge

Radius

the radius of the right edge of the approach

Edge type

the type of edging for the right edge of the approach

Curve details - left edge

Radius

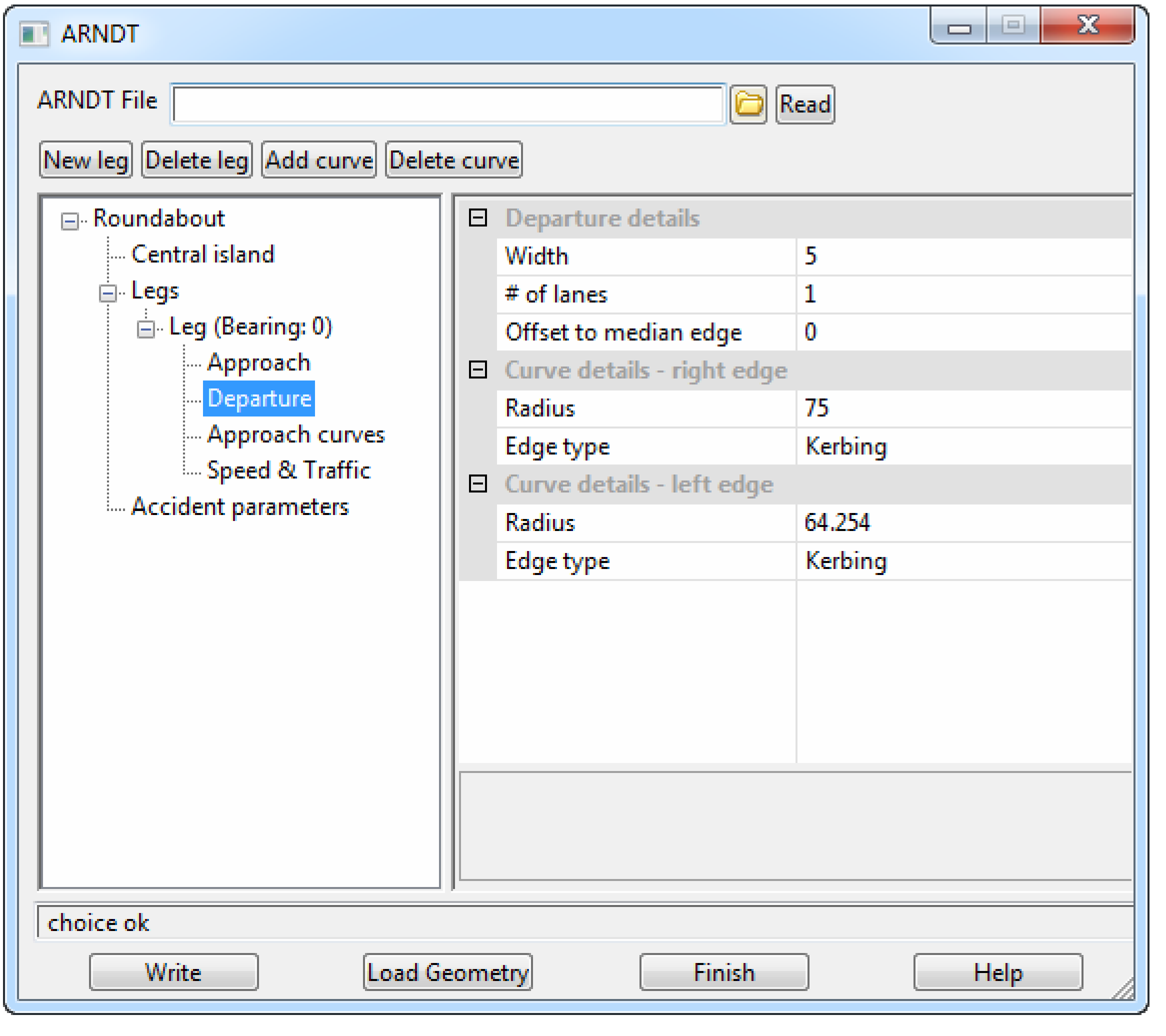
the radius of the left edge of the approach

Edge type

the type of edging for the left edge of the approach

Leg Departure Node

This defines the properties for the departure carriage of the leg, if there is a departure.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Departure details

Width

the width of the departure carriageway

of lanes

the number of lanes in the departure carriageway

Offset to median edge

the offset of the departure from the median

Curve details - right edge

Radius

the radius of the right edge of the departure

Edge type

the type of edging for the right edge of the departure

Curve details - left edge

Radius

the radius of the left edge of the departure

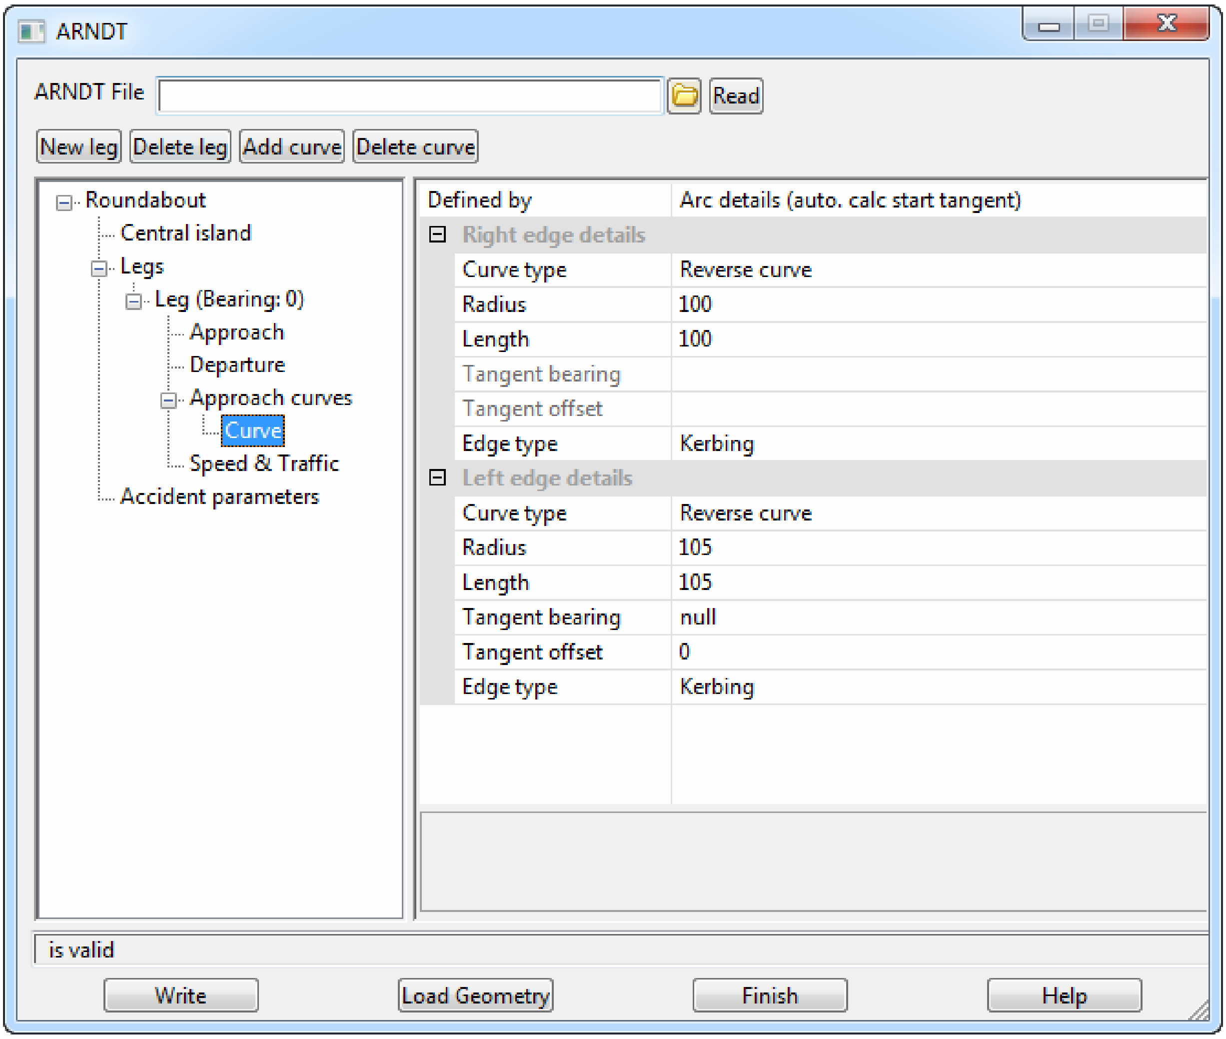
Edge type

the type of edging for the left edge of the departure

Approach Curves Node

This node defines the setting for each approach curve. New approach curves can be added to a leg by clicking the **Add curve** button. There are two methods for defining a curve - either by arc details or start tangent.

Approach curves are only defined by their right hand edge.

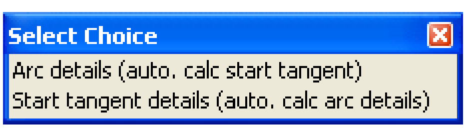


The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Right Edge Details

Defined by choice box



how the curve is defined

Curve type

the type of curve (Reverse or Compound)

Radius

*the radius of the right edge - only available when defined by **Arc details***

Length

*the length of the right edge - only available when defined by **Arc details***

Tangent bearing

*the bearing of the tangent to the curve - only available when defined by **Start tangent details***

Tangent offset

*the offset of the tangent to the roundabout - only available when defined by **Start tangent details***

Edge type

the type of edging for the right edge (Kerbing or Edge Line)

Left Edge Details

Curve type

the type of curve. This field is read only.

Radius

*the radius of the curve, if using **Arc details**. This field is read only.*

Length

*the length of the curve, if using **Arc details**. This field is read only.*

Tangent bearing

*the bearing of the tangent to the curve, if using **Start tangent details**. This field is read only.*

Tangent offset

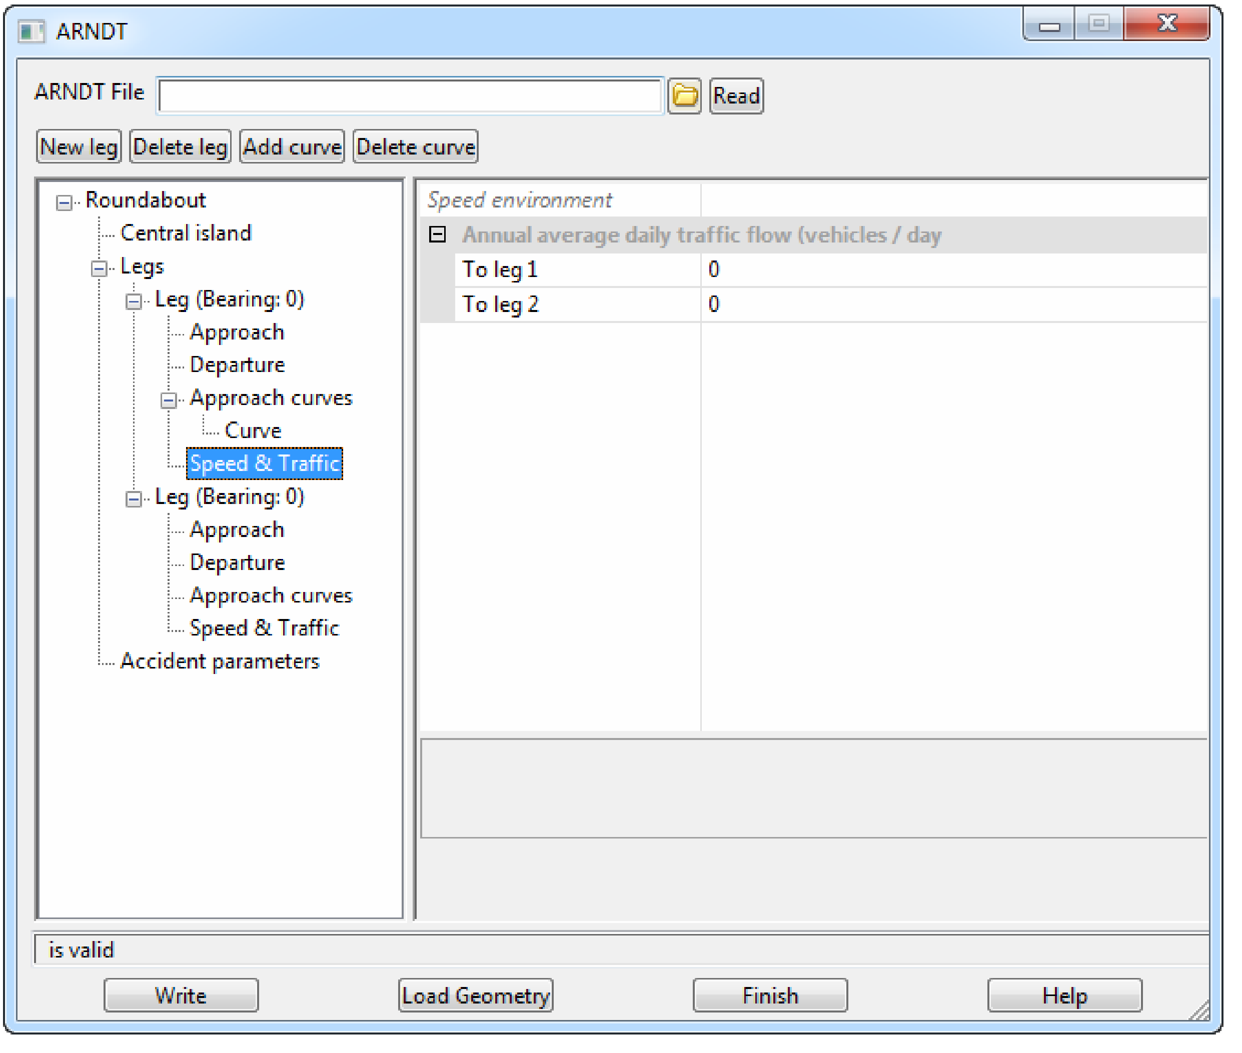
*the offset of the tangent, if using **Start tangent details**. This field is read only.*

Edge type

the type of edging for the right edge (Kerbing or Edge Line)

Leg Speed & Traffic Node

This node defines the speed and traffic details for each leg of the roundabout.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Speed environment

the speed environment of the carriageway

Annual average daily traffic flow

To leg 1

the average daily traffic flow (vehicles per day) leaving leg 1 and returning to leg 1

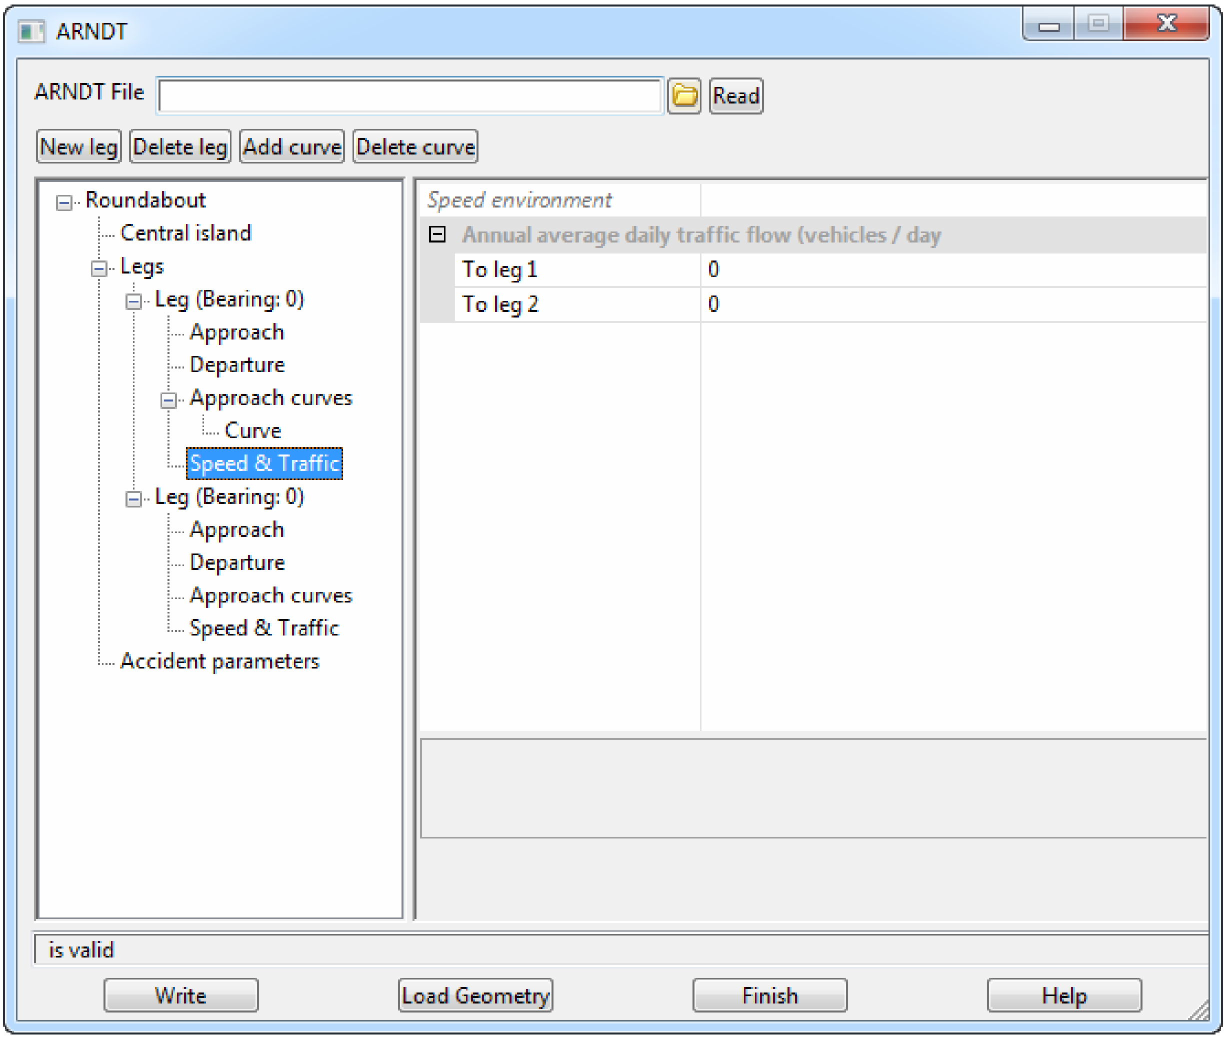
To leg 2

the average daily traffic flow (vehicles per day) leaving leg 1 and exiting via leg 2

This is repeated for each leg of the roundabout

Accident Parameters

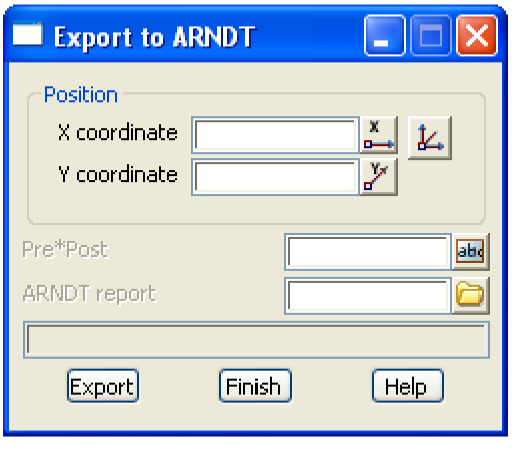
This defines various parameters used by **ARNDT** for calculating risks and costs for the roundabout. These parameters are requested by the **ARNDT** program. Please see the **ARNDT** documentation for more details on these parameters.



Load Geometry / Export to ARNDT

Selecting **Load Geometry**  brings up the **Export to ARNDT** panel.

This panel allows you to load geometry from **ARNDT**, based on the file you are editing, as well as optionally generating reports.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Position

the x and y co-ordinate for the roundabout

Pre*Post

*an optional pre*post applied to any strings read back from **ARNDT***

ARNDT report

*an optional report file of details generated by **ARNDT***

Export

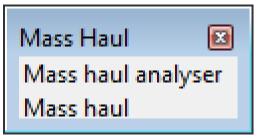
*Exports the current roundabout details to **ARNDT**, imports the results generated by **ARNDT.** Results will include geometry at the nominated position, and a report if specified.*

20.8.7 Mass Haul

Position of menu: **Design =>Roads =>Mass haul**

The option under **Mass haul** reads a volumes report and creates Mass Haul information.

The **Mass haul** walk-right menu is



mass haul analysis from volumes report
create mass haul string and report from volumes report

For *Mass haul analyser*, go to 20.8.7.1 Mass Haul Analyser
Mass haul 20.8.8.3 Mass Haul String and Report

20.8.7.1 Mass Haul Analyser

Position of option on menu: **Design =>Roads =>Mass haul =>Mass haul analyser**

The **Mass Haul Analyser** option calculates the mass haul along an alignment using the volume report files from various 12d functions.

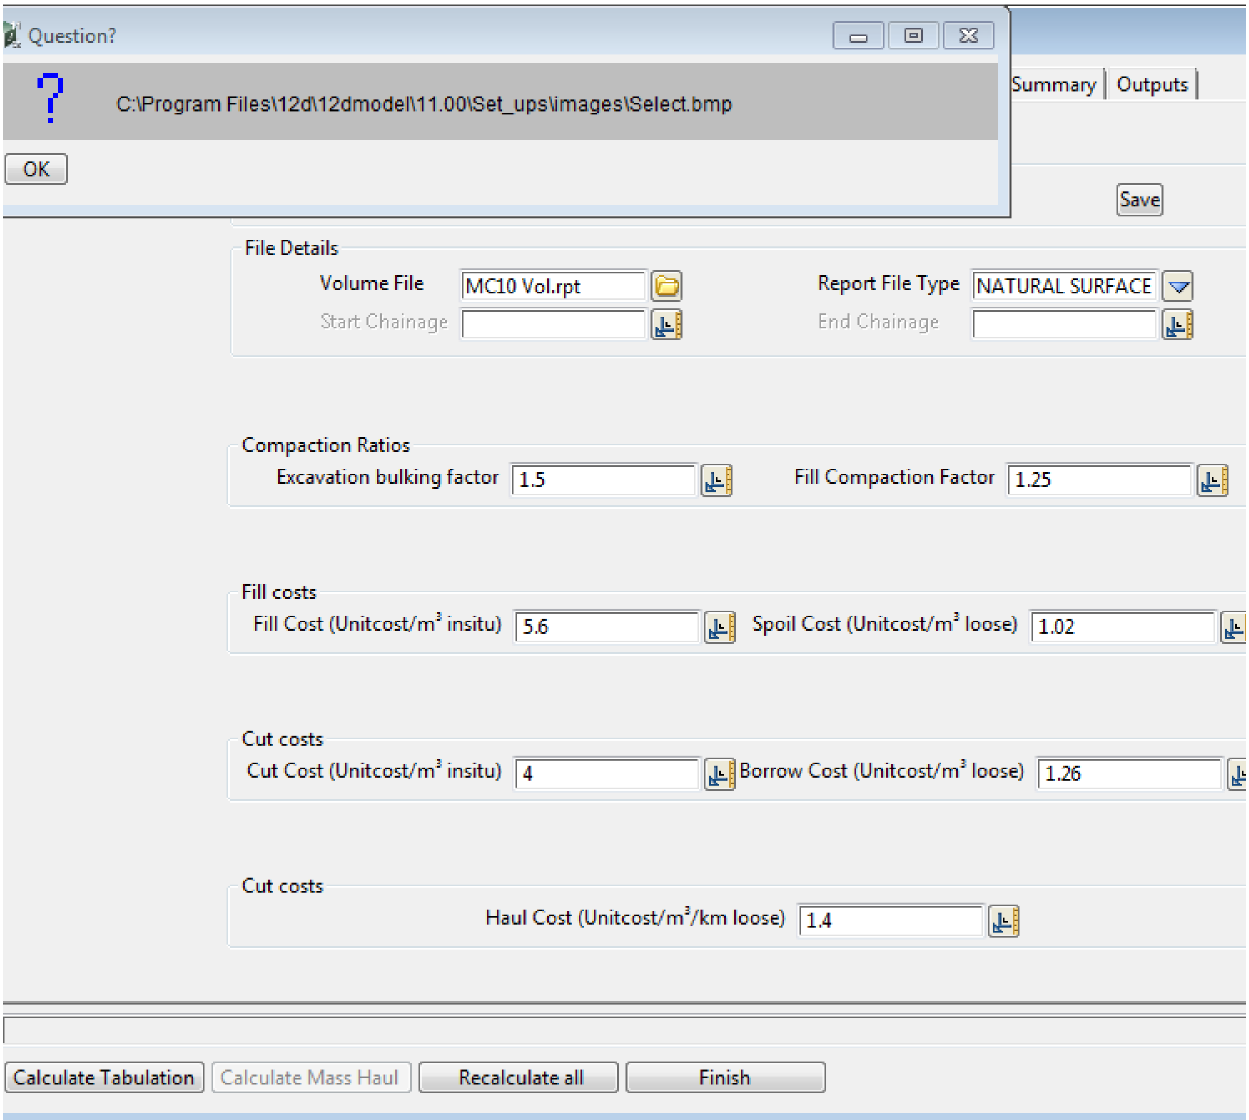
To operate the option a volume report file is selected and the report file type set to match the report type.The **Calculate tabulation** button will then calculate the bulking factors and add the special chainage items to the tabulation. After this the **Calculate Mass Haul** option will push excess fill material forwards along the alignment to a matching cut item with the same accumulated balance and push excess cut material backwards along the alignment to a matching fill item.

Where the cost of Haul cost is greater than the Borrow Plus Spoil cost the option will skip that material.

The option performs this operation several times passing back over the alignment until no more haul material can be found. It then borrows and spoils the remaining material.

The macro is intended to provide an analysis methodology to the designer to enable them to quickly review where material is available in an alignment in order to optimise the alignment with respect to potential cost savings. It is also a useful tool for training in the techniques of mass haul. The final mass haul graph should be exported for detailed analysis using the **Design=>Roads=>Mass haul =>Mass Haul** option.

Selecting the **Mass haul analyser** option brings up the **Mass Haul Analyser** panel.



Configuration Tab

This tab is used to set up the parameters to be used by the macro.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Parameter File	file		*.mhp files

name of the file containing the previously used settings for the fields in the panel.

Read Button	button		

read the parameter file in

Write button	button		

write the setting in the panel out to a parameter file.

Volume File	file		*.rpt files

input file generated from another 12d option

Report File Type	choice box	NATURAL SURFACE TO DESIGN VOLUMES see 20.8.8.1 Selecting The Right Report	

File Type

the report file type to be used as an input to the macro

Excavation bulking factor real box 1.5

bulking factor ratio between loose excavated material and insitu compacted material.
number greater than one indicates loose material is bulkier than insitu material.
defaults are arbitrary and must be selected by the user

Fill compaction factor real box 1.25

compaction factor ratio between loose excavated material and insitu compacted material.
number greater than one indicates loose material is bulkier than insitu material.
defaults are arbitrary and must be selected by the user

Fill Cost real box 5.6

cost per cubic metre to place and compact material.
defaults are arbitrary and must be selected by the user

Spoil cost real box 1.02

cost per cubic metre to dispose of excess material (including haul costs) defaults are arbitrary and must be selected by the user

Cut cost real box 4

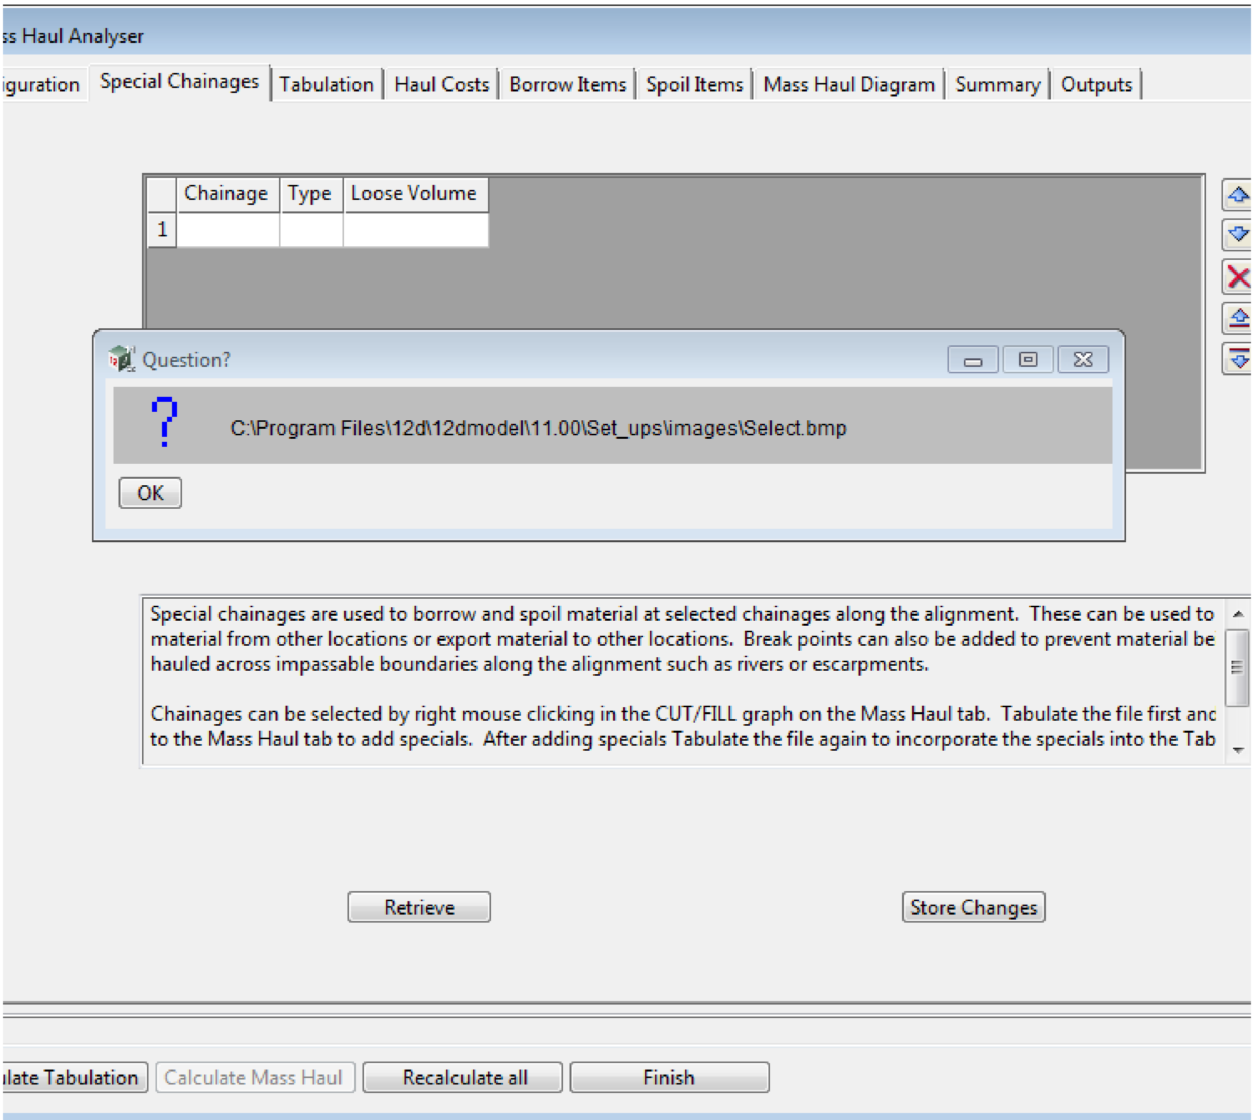
cost per cubic metre to excavate material.
defaults are arbitrary and must be selected by the user

Borrow cost real box 1.26

cost per cubic metre to import additional material (including delivery costs) defaults are arbitrary and must be selected by the user

Haul cost real box 1.4

cost per cubic metre to haul material one kilometre.
defaults are arbitrary and must be selected by the user



Special Chainages Tab

This tab is used to add additional items to the tabulation.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Chainage	chainage box		

the chainage that the special item is to be applied

Type	choice box		borrow, spoil, break

the type of special item to be applied

Loose Volume

the volume of loose material in the special item

Retrieve button

retrieve special chainages into the grid control

Store Chainages button

save special chainages from the grid control

	Chainage	Type	Insitu Cut Vol.	Insitu Fill Vol.	Loose cut 2 fill	Req'd loose fill	Excess loose Cu
1	0.0000	Fill	15.5260	18.8820	23.2890	0.3135

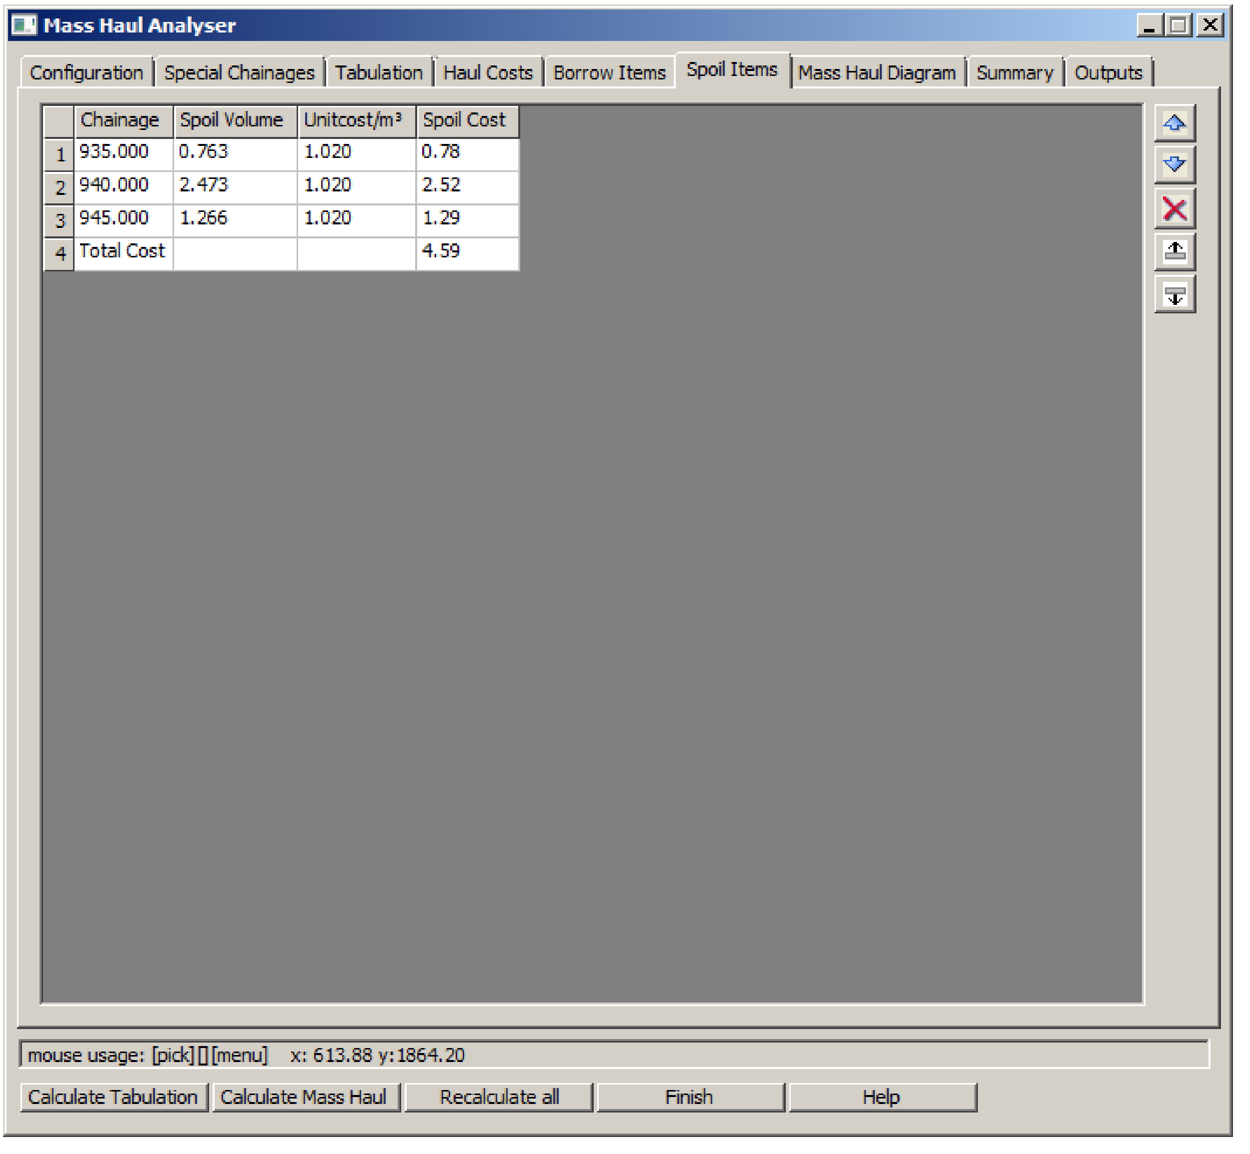
25	765.000	486.964	1.26	613.57
26	770.000	413.896	1.26	521.51

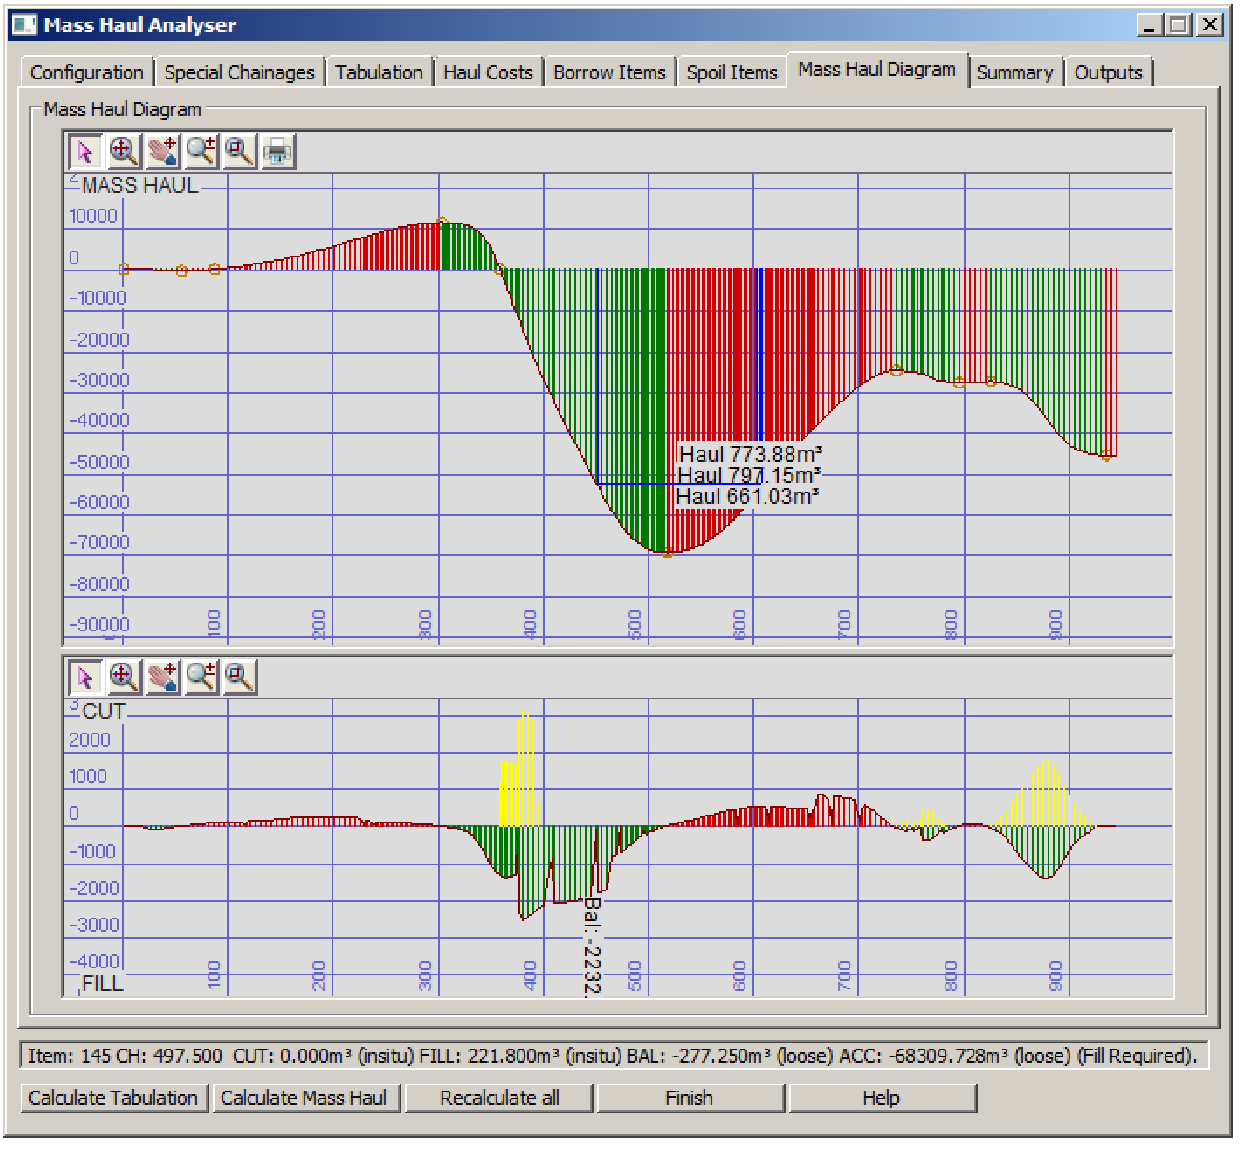
Borrow Items Tab

This tab displays the remaining borrow volumes after mass haul has been applied.



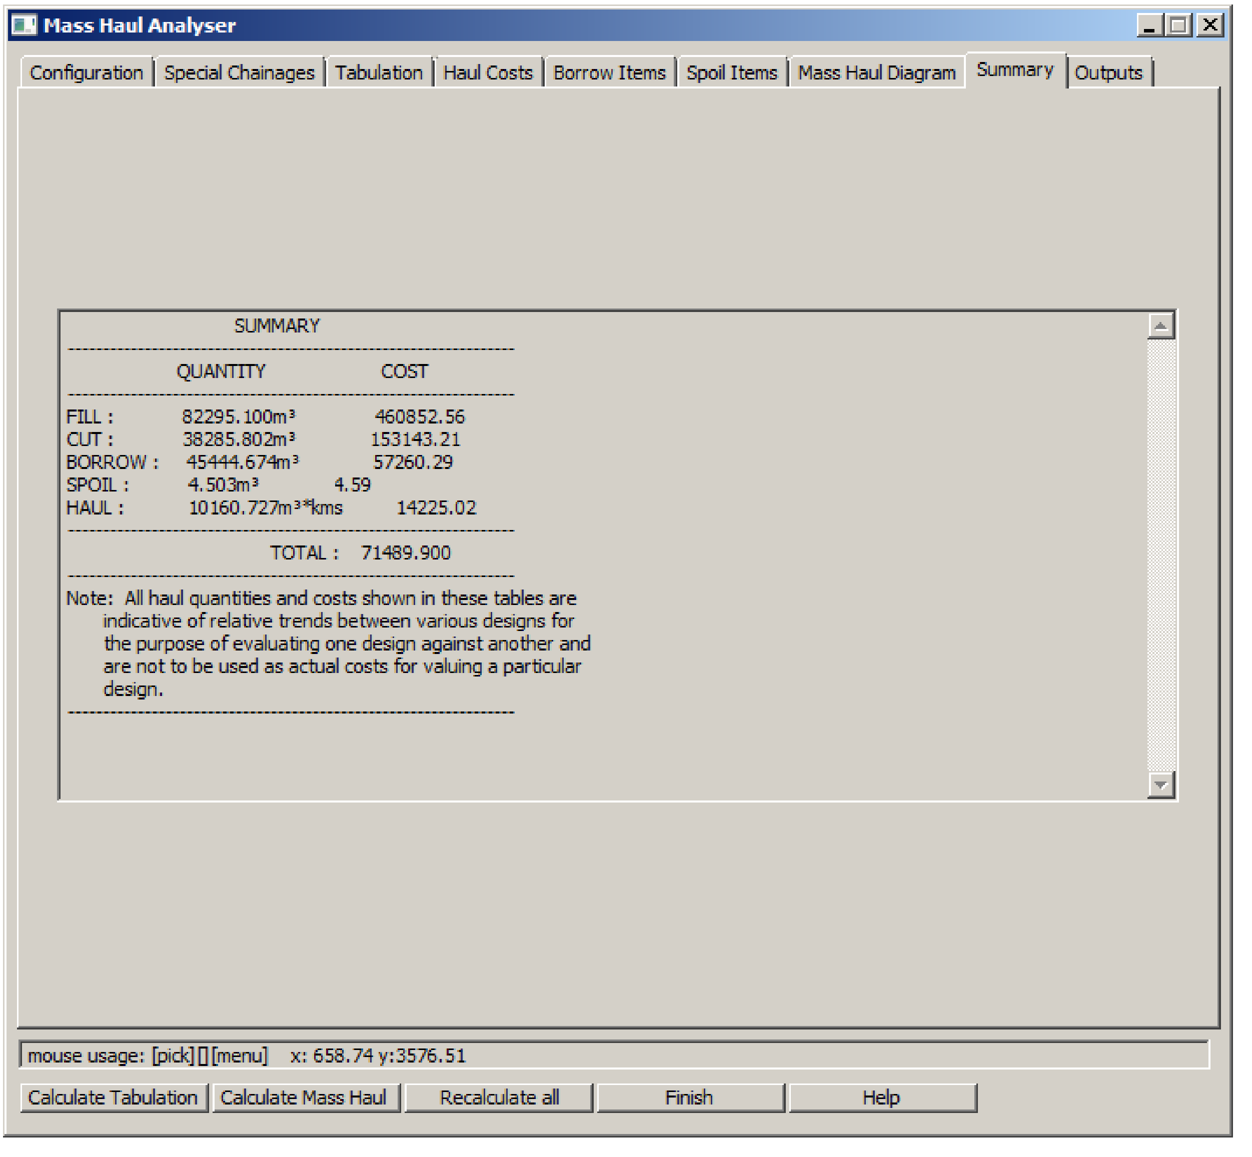
Spoil Items Tab

This tab displays the remaining spoil volumes after mass haul has been applied



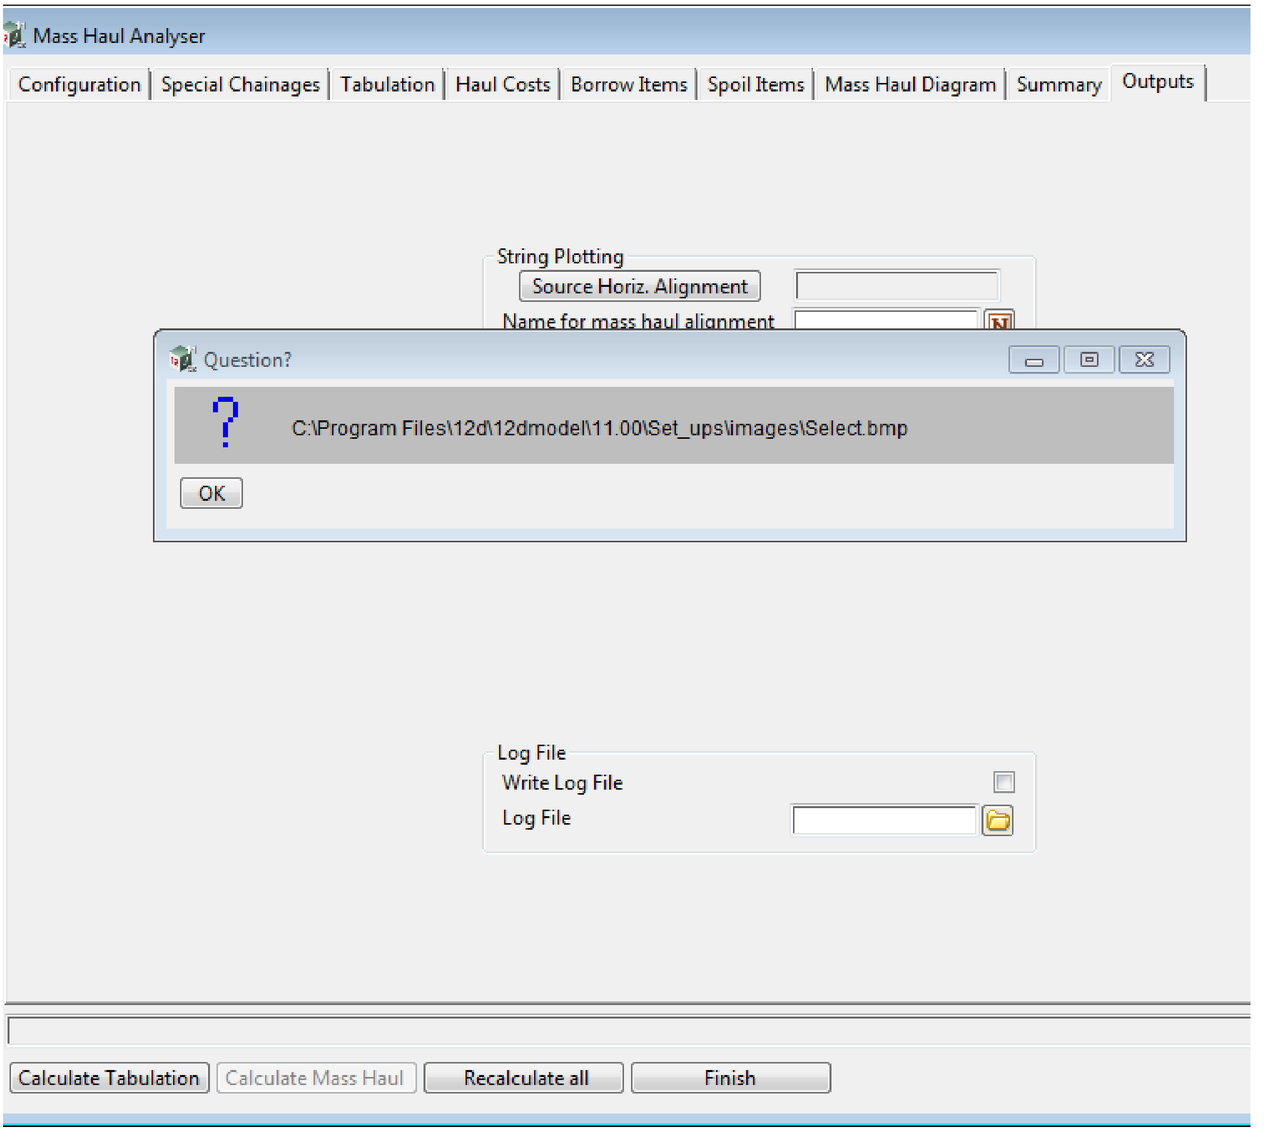
Mass Haul Diagram Tab

This tab displays a graph of the resulting mass haul diagram. For information on several features of the graph please go to 20.8.8.2 Graph Box Operation.



Summary Tab

This tab displays a summary of the costs calculated. These costs can be used to compare trends in the efficiency of the mass haul between different designs. The costs given are not intended to be the final cost of the mass haul as further analysis will be required however they do give an indication as to the efficiency of a design with regard to mass haul.



Outputs Tab

This tab can be used to export data from the option

The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Source Horiz. Alignment select string

selects the seed alignment that will be used for the horizontal alignment of the mass haul string

Name for mass haul alignment name box

sets the name of the plotted mass haul string

Model for mass haul alignment model box

sets the model of the plotted mass haul string

Colour for mass haul alignment colour box red

sets the colour of the plotted mass haul string

Plot Mass Haul Alignment button

duplicates the seed alignment and stores the mass haul accumulated volume balances as chainage *height points in that alignment*

Write log file tick box

choose this option to export a log file

Log file file box

the calculations generated by the mass haul option are stored in this log file

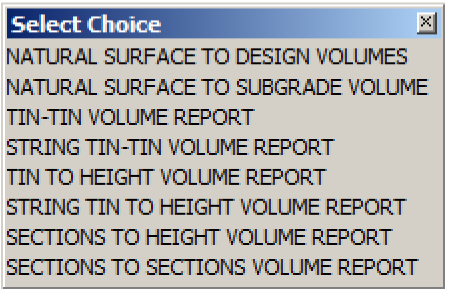
20.8.8 Common Buttons

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Calculate Tabulation	button		
recalculate tabulation			
Calculate Mass Haul	button		
recalculate mass haul			
Recalculate all	button		
recalculate both tabulation and mass haul			
Finish	button		
closes the panel			
Help	button		
displays this help			

20.8.8.1 Selecting The Right Report File Type

The report file type option allows the user to use various report file types generated by 12d.



Each type is selected to cause the option to look for certain key phrases in the report file at the top of each cut/fill/balance tabulation.

Go to NATURAL SURFACE TO DESIGN VOLUMES
NATURAL SURFACE TO SUBGRADE VOLUME
TIN-TIN VOLUME REPORT
STRING TIN-TIN VOLUME REPORT
TIN TO HEIGHT VOLUME REPORT
STRING TIN TO HEIGHT VOLUME REPORT
SECTIONS TO HEIGHT VOLUME REPORT
SECTIONS TO SECTIONS VOLUME REPORT

NATURAL SURFACE TO DESIGN VOLUMES

This choice is selected to use the natural surface to design volumes table generated by the "Apply MTF" function. This function must be run first from the **Design=>Apply=>Apply MTF** menu item.

NATURAL SURFACE TO SUBGRADE VOLUME

This choice is selected to use the natural surface to subgrade volumes table generated by the "Apply MTF" function. This function must be run first from the **Design=>Apply=>Apply MTF** menu item. In order to use this option boxing must be calculated in the Apply MTF function.

TIN-TIN VOLUME REPORT

This choice is selected to use the tin to tin volumes table generated by the Apply MTF function. This function must be run first from the **Design=>Volumes=>End Area=>Tin to tin** menu item.

STRING TIN-TIN VOLUME REPORT

This choice is selected to use the string tin to tin volumes table generated by the "Apply MTF" function. This function must be run first from the **Design=>Volumes=>End Area=>String tin to tin** menu item.

TIN TO HEIGHT VOLUME REPORT

This choice is selected to use the tin to height volumes table generated by the "Apply MTF" function. This function must be run first from the **Design=>Volumes=>End Area=>Tin to height** menu item.

STRING TIN TO HEIGHT VOLUME REPORT

This choice is selected to use the string tin to height volumes table generated by the "Apply MTF" function. This function must be run first from the **Design=>Volumes=>End Area=>String tin to height** menu item.

SECTIONS TO HEIGHT VOLUME REPORT

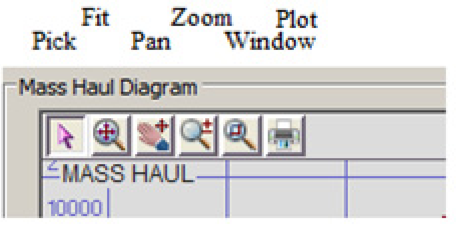
This choice is selected to use the sections to height volumes table generated by the "Apply MTF" function. This function must be run first from the **Design=>Volumes=>End Area=>Sections to height** menu item.

SECTIONS TO SECTIONS VOLUME REPORT

This choice is selected to use the sections to sections volumes table generated by the "Apply MTF" function. This function must be run first from the **Design=>Volumes=>End Area=>Sections to sections** menu item.

20.8.8.2 Graph Box Operation

Each graph box has a number of graph options available as buttons (graph buttons) at the top of the graph. To select one of the graph buttons, click LB whilst the cursor is over the button.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Pick	button		

This option sets the graph box to pick mode. When in this mode the graph box will show various information as the mouse hovers over a chainage in the graph.

The loose material tabulation item number, the available cut and fill within that chainage interval are shown in the message area at the bottom of the panel and the borrow, spoil and haul amounts are graphically shown in the graph highlighting the source chainage and destination chainage.

Fit button

This option sets the graph box to fit mode. This option will calculate the extents of the items plotted in the graph box and zoom out to show them. After the fit is complete the graph will return to pick mode.

Pan button

This option sets the graph box to panning mode. Click once to commence panning, then move the mouse and click a second time to stop panning.

Zoom button

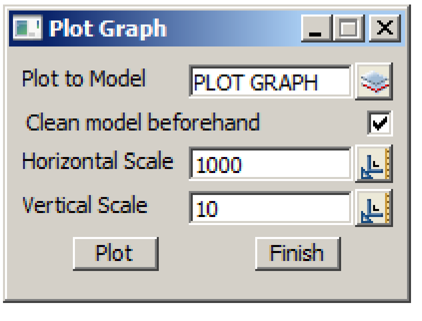
This option sets the graph box to zoom mode. Click once to commence zooming, then move the mouse and click a second time to stop zooming. Moving the mouse left and right will reduce and increase the X scale factor and moving the mouse down and up will reduce or increase the Y scale factor.

Window button

This option sets the graph box to window mode. Click once to select the first corner of a window and click a second time to select the second corner. After the window is complete the graph will return to pick mode.

Plot button

This option enables the contents of the graph box to be plotted to a **12d Model**.
Click on the button and the ***Plot Graph*** *panel is displayed.*



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Plot to Model	model box	PLOT GRAPH	all available models

the name of the model to be created/used

Clean model beforehand check box off

deletes any existing data from the plot model

Horizontal Scale real box 1000

set the horizontal scale to be used to plot the data

Vertical Scale real box 10

set the vertical scale to be used to plot the data

Plot button

plot the data

Finish button

closes the panel

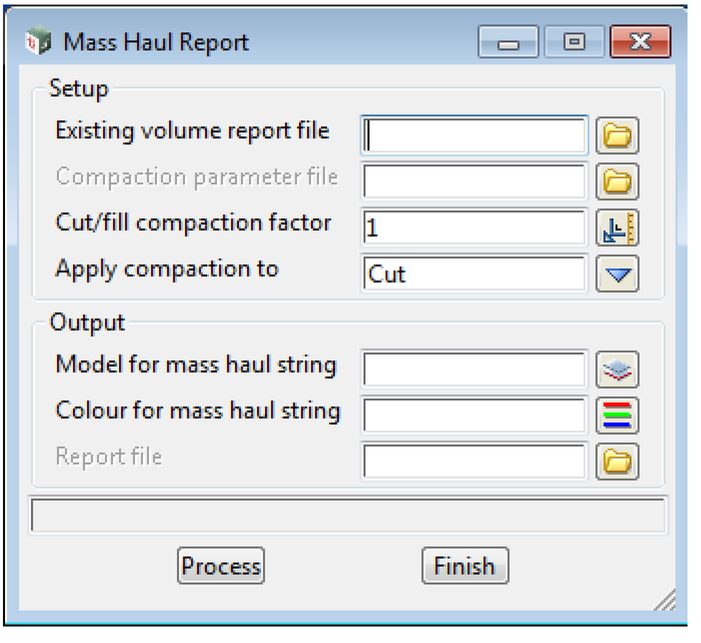
20.8.8.3 Mass Haul String and Report

Position of option on menu: **Design =>Roads =>Mass haul =>Mass haul**

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Existing volume report file file box *.rpt files

name of the existing volumes report.

Compaction parameter file input *.mhf files

file containing compaction factors to be used. See 20.8.8.4 Format of the Compaction Parameter File.

Cut/fill compaction factor input 1

cut/fill compaction factor for any chainages not in the compaction parameter file or if there is no file.

Apply compaction factor to choice box cut cut, fill

*if **cut**, the cut volumes are multiplied by the compaction factors.*
*If **fill**, the fill volumes are divided by the compaction factors.*

Model for mass haul string model box available models

model for the created mass haul string.

Colour for mass haul string colour box available colours

colour of the created mass haul string.

Report file input box

if non-blank, a mass haul volumes file is created.

Process button

run the option.

20.8.8.4 Format of the Compaction Parameter File

```
Format of the
// Sample cut/fill compaction parameter file - the file ending
is .mhf
// All lines starting with // are comments and blank lines are
ignored
//
// A range is specified by a start and end chainage and a compaction
factor.
// A compaction factor of 1.0 means there is no compaction.
// A compaction factor of 0.9 means that 1.0 cubic metres of cut is
equivalent
// to 0.9 cubic metres of fill due to compaction.

// format is
// Start_ch    End_ch   Compaction_factor

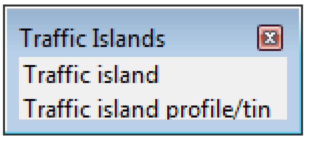
       0         100        0.9
      100        500        1.0
      500        2000       1.1
```

20.8.9 Traffic Islands

Position of menu: **File I/O =>Roads =>Traffic islands**

The options under **Traffic islands** create a traffic island from three travel lines, offsets and nose radii, and also can apply a kerb profile around the island.

The **Traffic islands** walk-right menu is



create a traffic island

run a kerb profile around a traffic island

For

Traffic island 20.8.9.1 Create Traffic Island

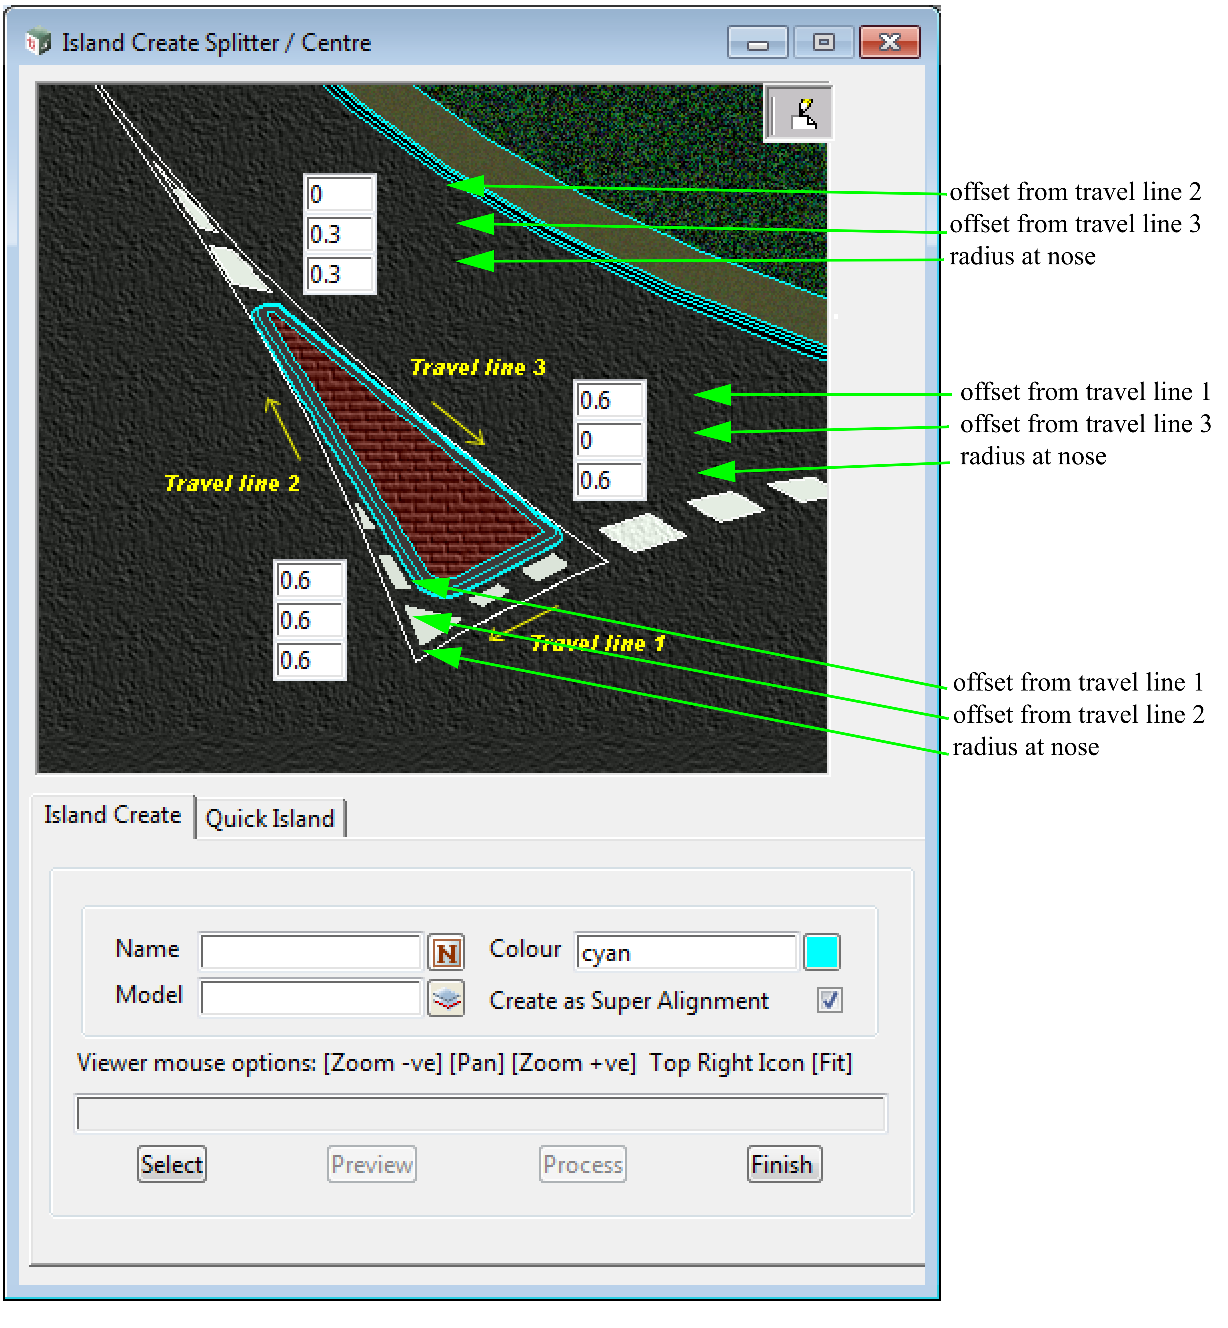
Traffic island profile/tin 20.8.9.2 Traffic Island Profile/Tin

20.8.9.1 Create Traffic Island

Position of option on menu: **Design =>Roads =>Traffic islands =>Traffic Island**

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. Drape the island onto a tin to give is z-values and then apply a kerb profile to complete the island.

On selecting the **traffic island** option, the **Island Create Splitter/Centre** panel is displayed.



The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Buttons at bottom

Select strings select

select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.

Preview string select

draw the traffic island with the given parameters in the panel draw box.

Process button

create the alignment string

Island Create tab

Offset from travel lines input box

offset distance from the selected travel lines.

Radius at nose input box

radius of the corner of the traffic island between the selected travel lines

Name name box available names

name of the created alignment string.

Model model box available models

model for the created alignment string.

Colour colour box available colours

colour of the created alignment string.

Create as super alignment tick box

if ticked, create the string as a super alignment.
If not ticked, create the string as an alignment.

Quick Island tab

the quick island tab produces a traffic island of fixed sides but with the given nose radii. The traffic island can be created as a super alignment that can then be easily moved around and modified.

Radius at nose input box

radius of the corner of the traffic island

Name name box available names

name of the created alignment string

Model model box available models

model for the created alignment string

Colour colour box available colours

colour of the created alignment string

Create as super alignment tick box

if ticked, create the string as a super alignment.
If not ticked, create the string as an alignment.

Position xyz select box

pick two points to indicate the direction that the island will be created.

Then click on **Process** *to create the Traffic Island.*

Kerb Profile tab

Use island alignment levels instead of Tin tick box

if ticked, use the alignments own z-value instead of draping the alignment onto the tin. If not ticked, drape the alignment onto the tin to get z-values.

Offset kerb face/top/back input box

offset for kerb face/top/back for the selected kerb type.

Height kerb face/top/back input box

height for kerb face/top/back.

Tin tin box available tins

triangulation to drape the traffic island strings onto.

Kerb type input box

type of kerb to apply to the reference string of the traffic island. If type **User** *is selected from the pop-up list, a file which defines the kerb profile can be selected and used.*

File file box *.ukt files

file to read/write the user defined kerb type to.

Read button

read the given **File** *to define a kerb type.*

Save button

save the kerb parameters to the given **File**.

20.8.9.2 Traffic Island Profile/Tin

Position of option on menu: **Design =>Roads =>Traffic islands =>Traffic island profile/tin**

This option applies a kerb profile, either from the **12d** library or from a user defined file.

The template profile is applied to a Super Alignment, creating strings, and a triangulation.

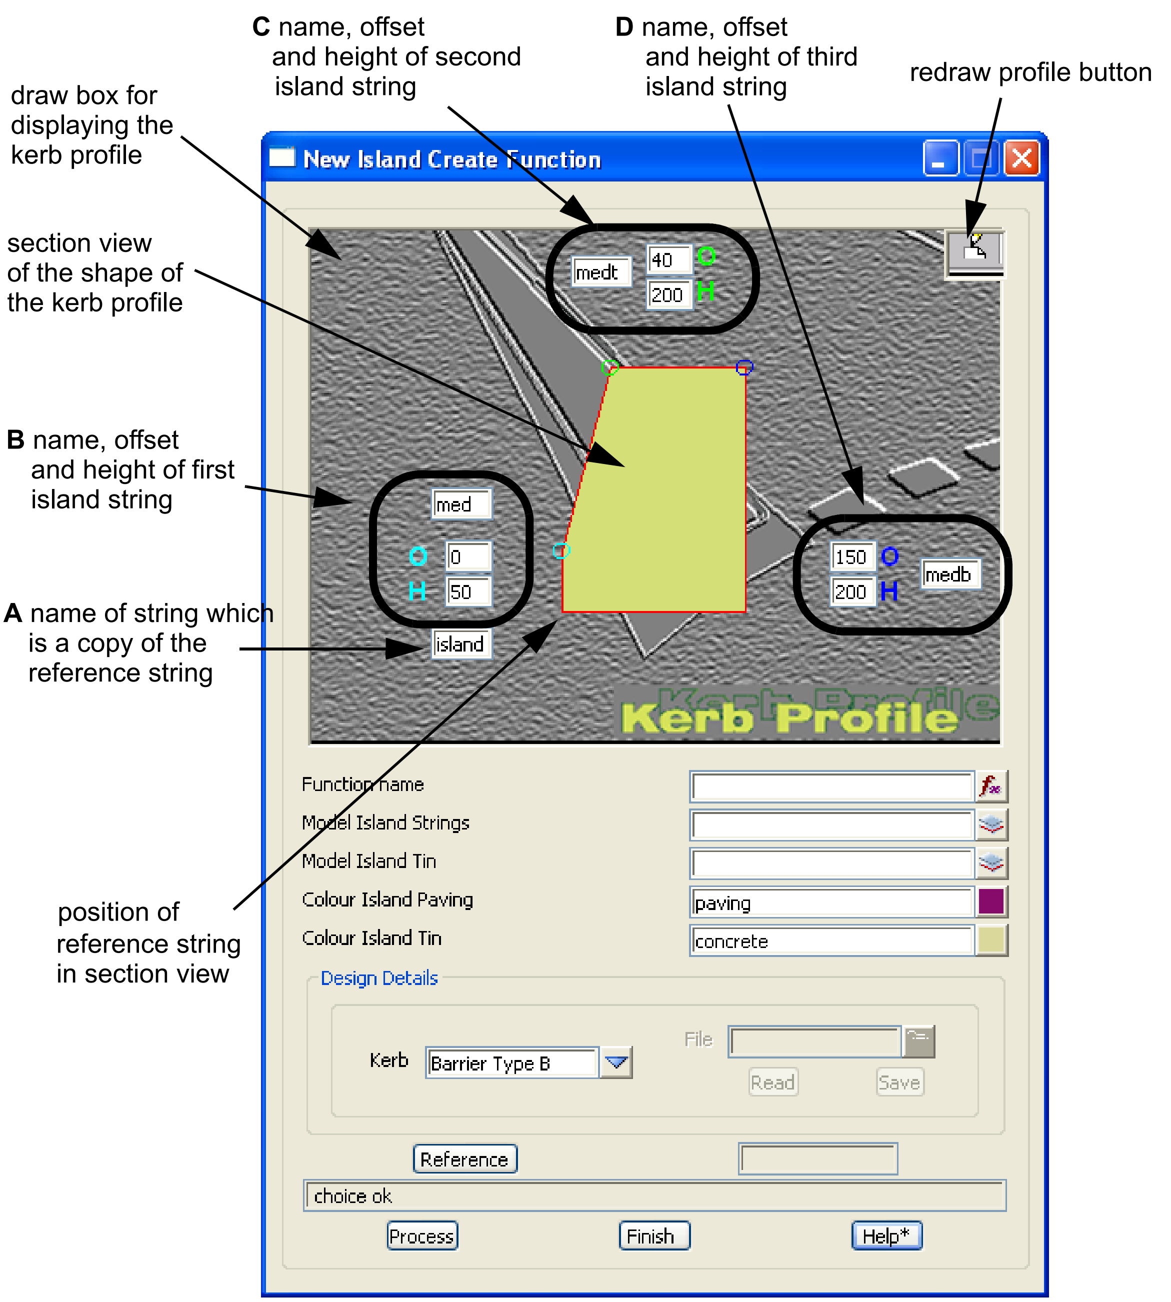
The option is saved as a function within **12d** and as a function can be re-run at any time if changes occur with the Super Alignment.

Some default kerb profiles are available under **Kerb** on the panel.

User defined kerbs are created by entering offset, height and string names in the fields in the draw box at the top of the panel, and then saved as a User Kerb Type file (*.ukt)

User Kerb Type files can then be written out, or read in as required.

On selecting the **Traffic Island profile/tin**, the **New Island Create Function** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Function name	function		available functions

name of the Island Create function

Model Island Strings	model box		available models

model for the created island strings

Model Island Tin	model box		

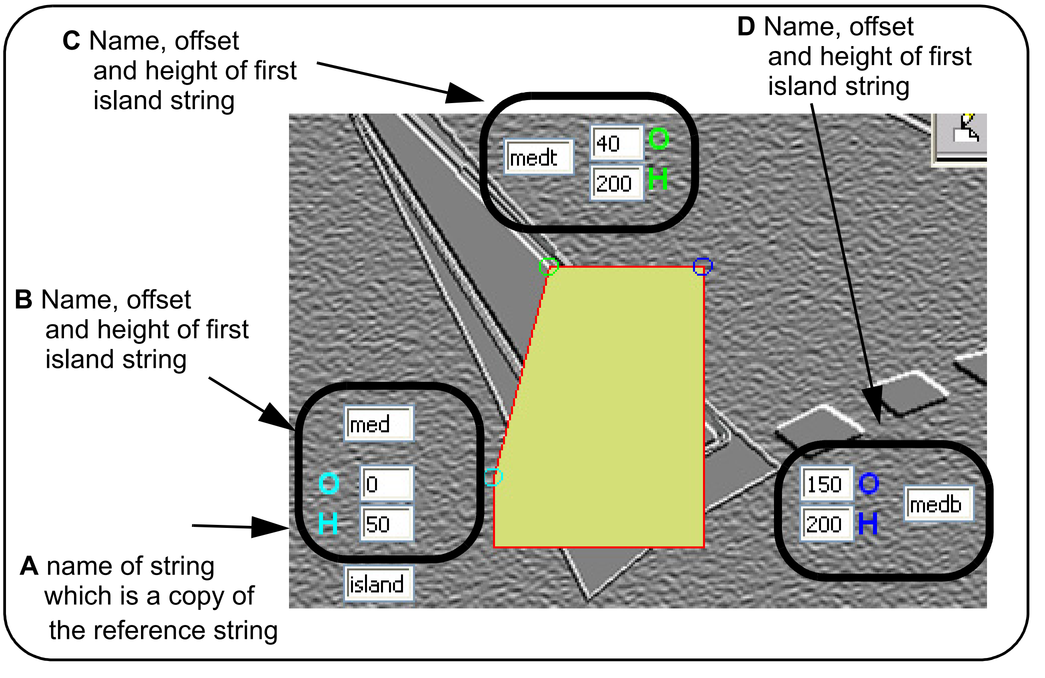
model for the tin of the created island

Colour Island Paving	input	paving	available colours

*if non-blank, then the colour is used to colour the island triangulation within innermost kerb string (**D**)*

Colour Island Tin	input	concrete	available colours

*if non-blank, then the colour is the colour is used to colour the island triangulation between the strings defined by **A** and **D**.*



In the drawing area:

A

a string is created which is a copy of the reference string and given this name. It is added to the **Model Island Strings** *model.*

B

name, offset and height from the reference string, of the first string of the island. It is added to the **Model Island Strings** *model. If offset and height are both zero, then the string is not created.*

C

name, offset and height from the reference string, of the second string of the island. It is added to the **Model Island Strings** *model. If offset and height are both zero, then the string is not created.*

D

name, offset and height from the reference string, of the third string of the island. It is added to the **Model Island Strings** *model. If offset and height are both zero, then the string is not created.*

Design Details

Kerb	choice box	Barrier Type A	Barrier Type A, Barrier Type B, Mountable, Semi - Mountable, User

selected kerb type is displayed in draw box above

If **Kerb** *is* ***User*** *then the* **File** *field and the* **Read** *and* **Save** *buttons are made active, and are used to read in an existing user defined Kerb type, or to create a new one.*

File	file box	files ending in.ukt

name of the user kerb type file (ukt) to read in or create

Read button

Reads in the user defined kerb definition from the ukt file given in the **File** *field and displays the profile and Offsets and Height in the draw box at the top of the Panel*

Save button

Writes out the kerb profile information (O and H values, and string names) as a user defined kerb, into the file given in the **File** *field.*

Reference select pick

Select the reference alignment which will have the kerb profile applied to it to create the island.“pick with direction" in a clockwise manner as the kerb profile is always on the RHS.

Process button

runs the option which created the island string and the coloured island tin

Note:

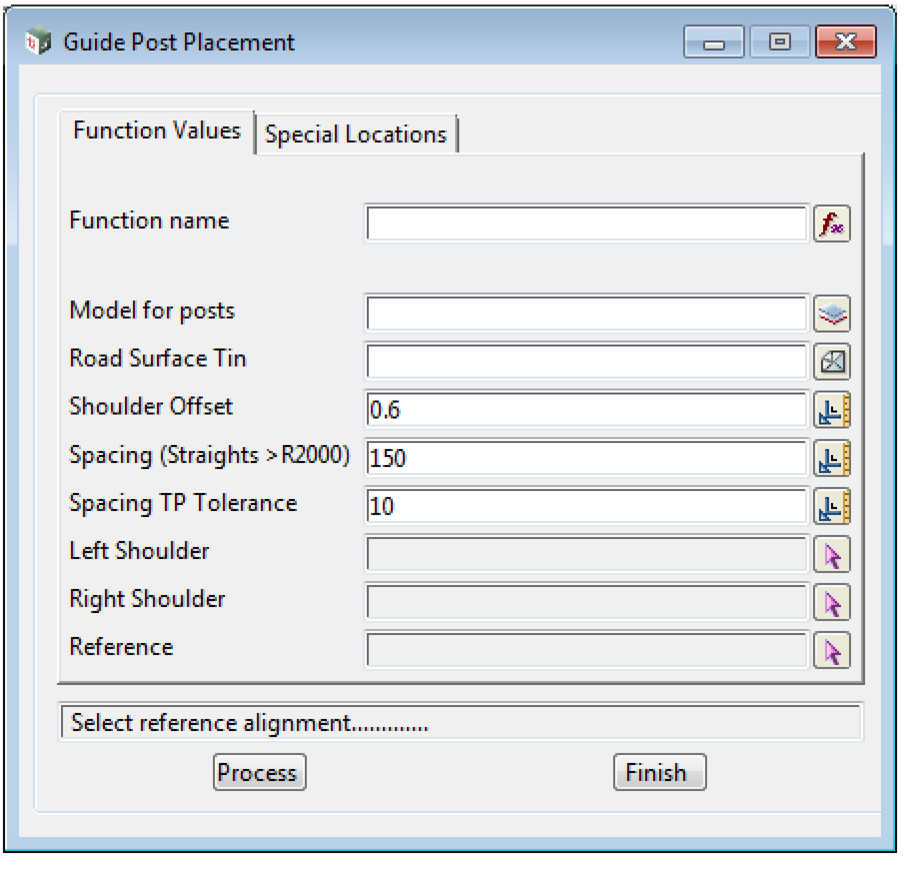
The New Island Create Function reads in the standard kerb profiles as templates and if required, creates a template from the ukt files. The function needs these templates because an apply is used (internally) to create the Island.

20.8.10 Guide Post Placement

Position of option on menu: **Design =>Roads =>Guide post creator**

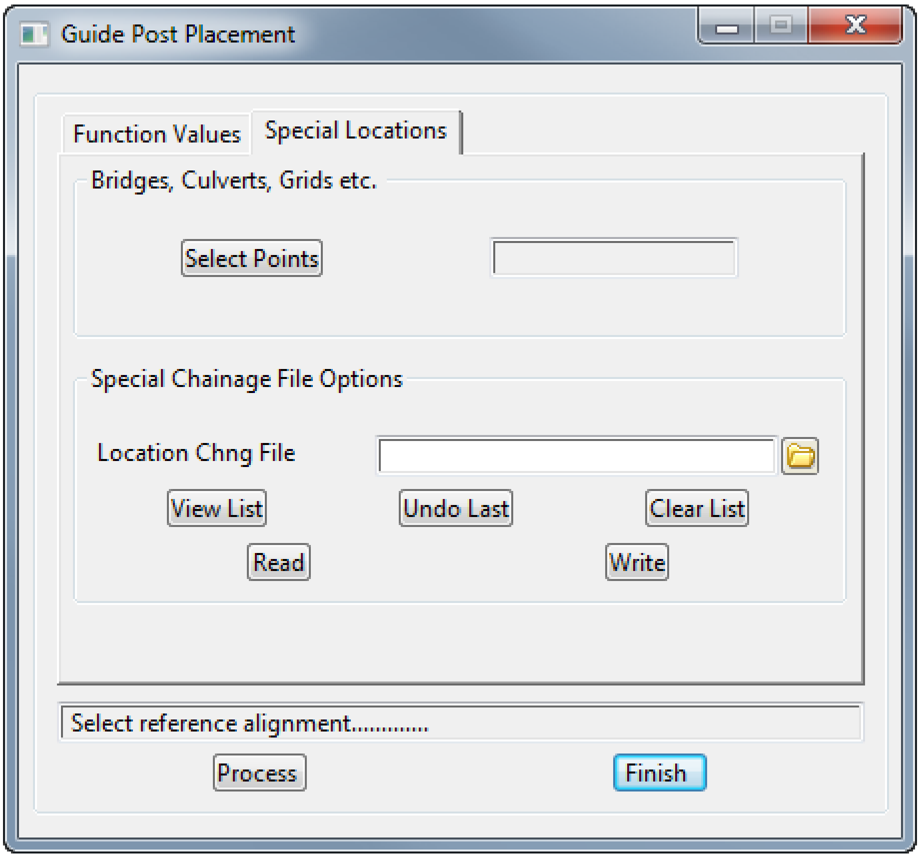
This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Guide post creator** brings up the **Guide Post Placement** panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Function Values tab			
Function name	function box		available functions
Model for posts	model box		available models
Road Surface Tin	tin box		available tins
Shoulder Offset		0.6	
Spacing (Straights >R2000)		150	
Spacing TP Tolerance		10	
Left Shoulder	choice box		
Right Shoulder	choice box		
Reference	choice box		
Process	button		



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Special Locations tab			
Bridges, Culverts, Grids etc.			
Select Points	button		
Special Chainage File Options			
Location Chng File	file		
View List	button

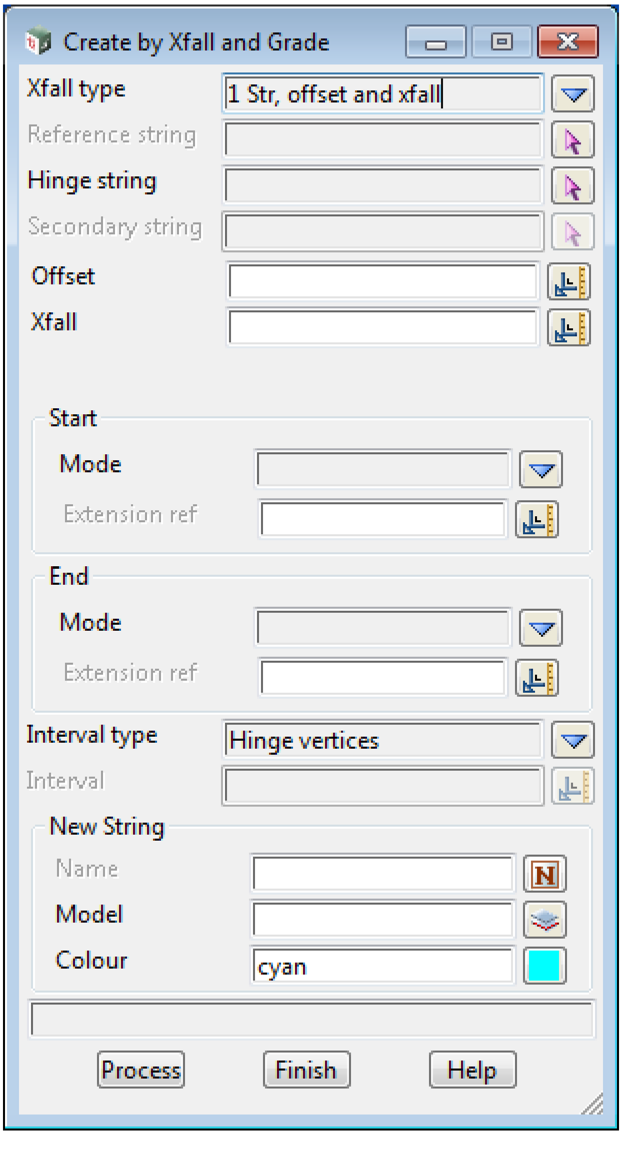
Write	button		
Process	button		

20.8.11 String by Xfall and Grade

Position of option on menu: **Design =>Roads =>String by xfall and grade**

This panel is used to create strings by a variety of methods using xfall from one string, or xfalls from two strings, either using a reference string to define where the xfall is measured, or perpendicular to selected strings. Some of the methods grade the created string.

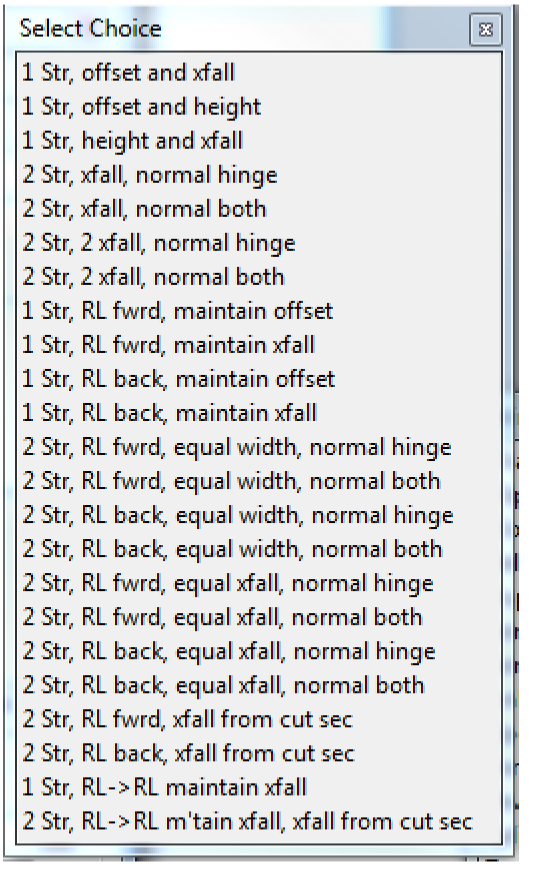
Selecting **String by xfall and grade** brings up the **Create by Xfall and Grade** panel.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Xfall type choice box



methods for creating the new string. For the definition of each choice, go to 20.8.11.1 Xfall Types

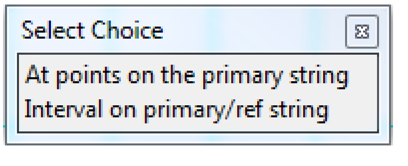
Reference string
Hinge string
Secondary string
Offset, Xfall, Grade etc

which of these fields are present, and what they are for depends on the **Xfall type**.

Start/End mode choice box Start (ref)/End (ref)

defines the start/end chainages for creating the string.
The Start/End modes are the same as for the MTF modifiers. For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers**.**

Interval type choice box



At vertices on the Hinge string -

Interval on Hinge/ref string -

String name name box names.4d list

the name to use for the created string.

Model for string model box available models

the created string is placed in this mode

String colour colour box green available colours

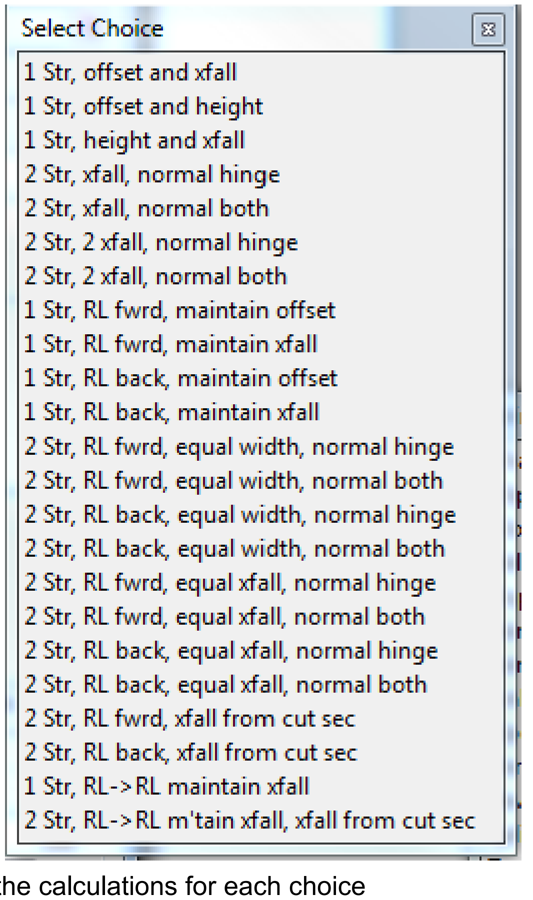
the colour of the created string

Process button

run the option.

Continue to the next section 20.8.11.1 Xfall Types.

20.8.11.1 Xfall Types

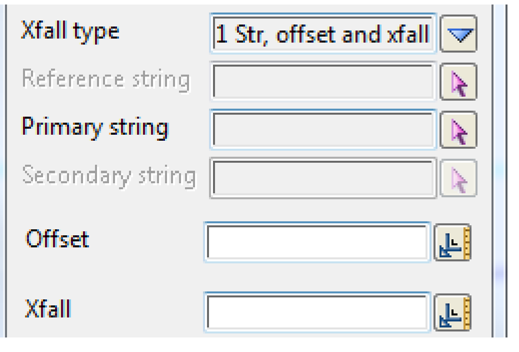


for the definitions of the calculations for each choice

1 Str, offset and xfall go to 20.8.11.1.1 1 String, Offset and Xfall
1 Str, offset and height 20.8.11.1.2 1 String, Offset and Height
1 Str, height and xfall 20.8.11.1.3 1 String, Height and Xfall
2 Str, xfall, normal hinge 20.8.11.1.4 2 Strings, Xfall and Normal to Reference String or Hinge String
2 Str, xfall, normal both 20.8.11.1.5 2 Strings, Xfall and Normal to Both
2 Str, 2 xfall, normal hinge 20.8.11.1.6 2 Strings, 2 Xfalls and Normal to Reference String or Hinge String
2 Str, 2 xfall, normal both 20.8.11.1.7 2 Strings, 2 Xfalls and Normal to Both
1 Str, RL fwrd, maintain offset 20.8.11.1.8 1 String, Start RL and Grade, Fixed Offset
1 Str, RL fwrd, maintain xfall 20.8.11.1.9 1 String, Start RL and Grade, Fixed Xfall
1 Str, RL back maintain offset 20.8.11.1.10 1 String, End RL and Grade, Fixed Offset
1 Str, RL back, maintain xfall 20.8.11.1.11 1 String, End RL and Grade, Fixed Xfall
2 Str, RL fwrd, equal width, normal hinge 20.8.11.1.12 2 Strings, Start RL & Grade, Equal Width, Normal to Reference or Hinge String
2 Str, RL fwrd, equal width, normal both 20.8.11.1.13 2 Strings, Start RL & Grade, Equal Width

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

20.8.11.1.1 1 String, Offset and Xfall



This option requires a **Hinge** string, an **Offset** and **Xfall**, and an **optional Reference** string.

Reference String Selected

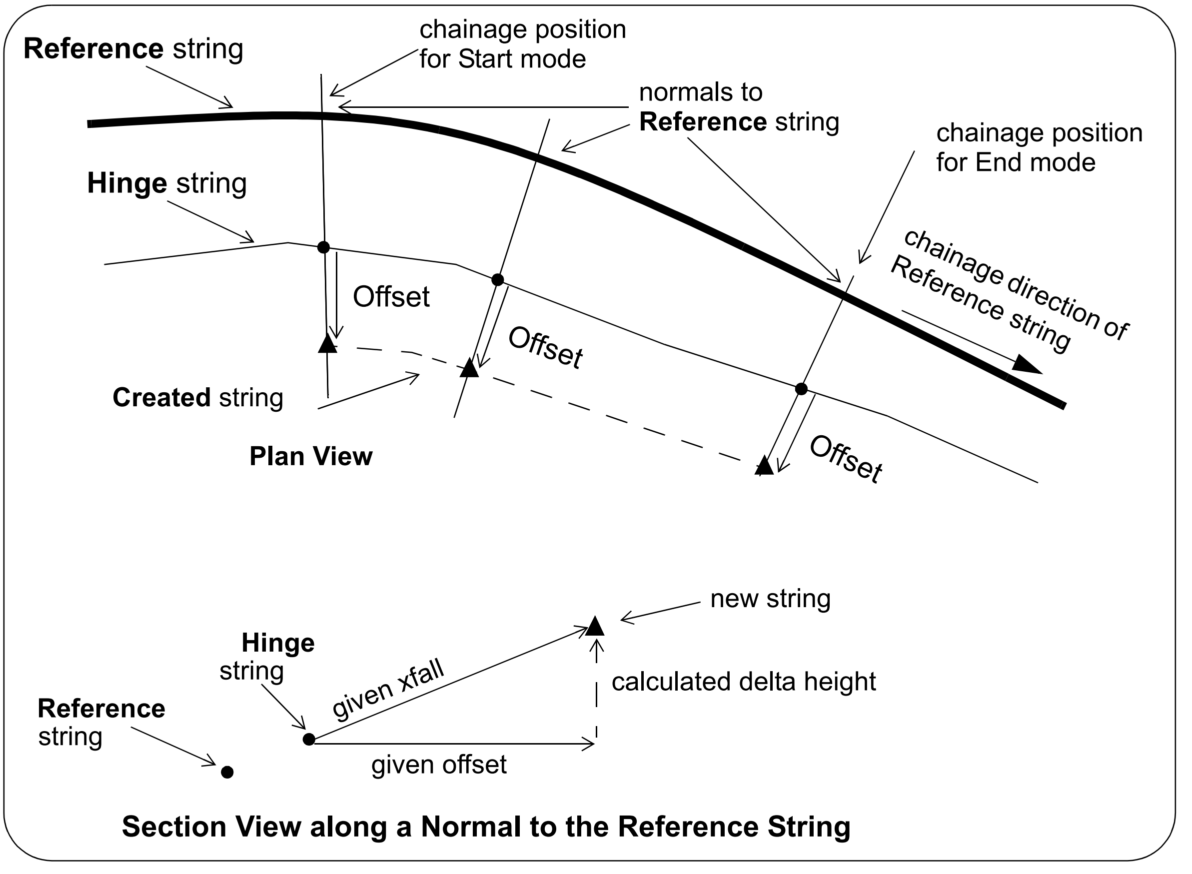
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string.

A vertex of a new string is created by going out from the Hinge string along the section at the given **Offset** and **Xfall**.

Positive Offset is defined as going to the right of the **Hinge** string when travelling in the direction of **increasing chainage on the Reference** string. Offset can be positive or negative.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



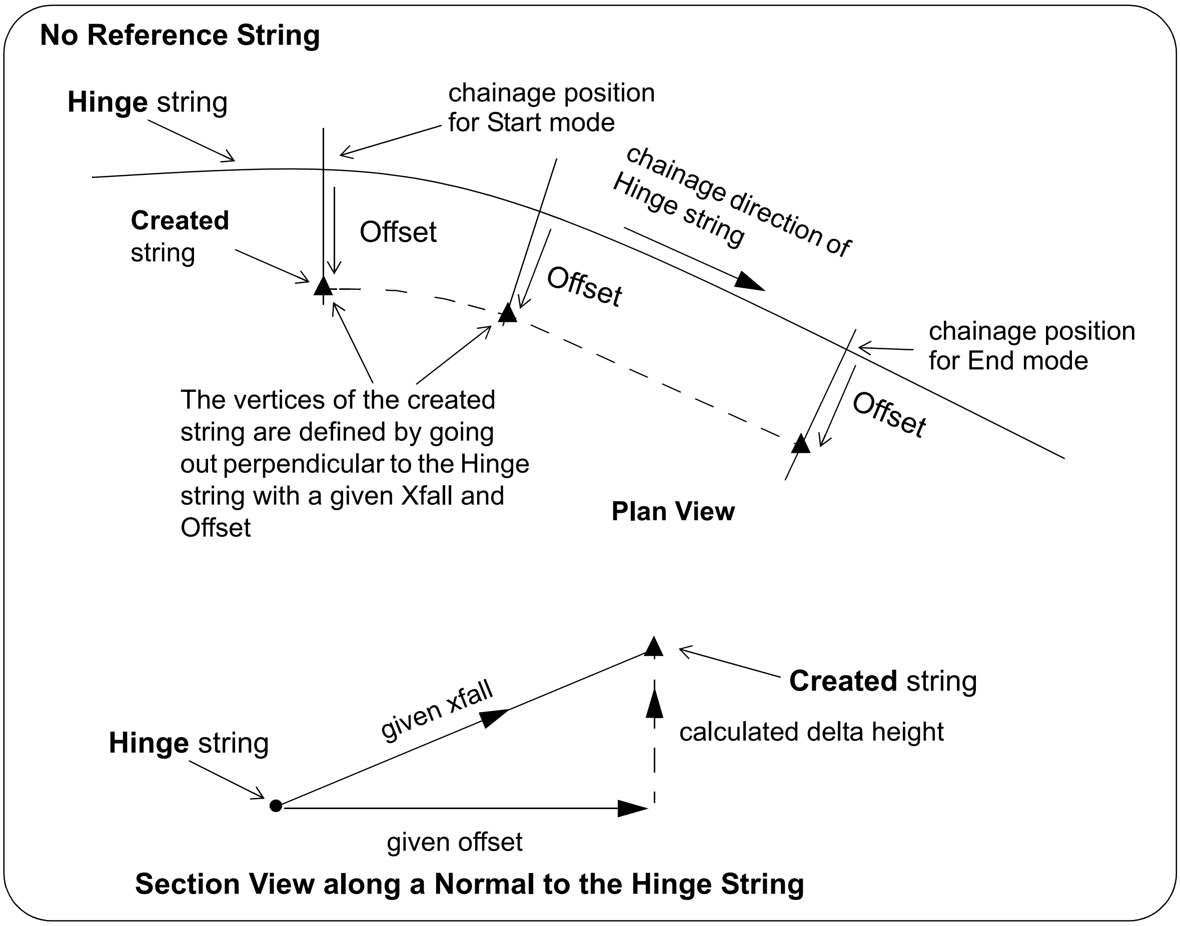
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string and at each chainage ch, a vertex of the new string is created by going out **normal** (perpendicular) to the **Hinge string** for the given **Offset** and **Xfall**.

Positive Offset is defined as going to the right of the Hinge string when travelling in the direction of increasing chainage on the Hinge string. Offset can be positive or negative.

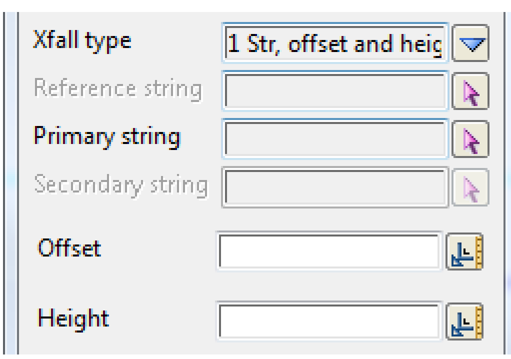
Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Continue to the next choice 20.8.11.1.2 1 String, Offset and Height or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.2 1 String, Offset and Height



This option requires a **Hinge** string, an **Offset** and **Height**, and an **optional Reference** string.

Reference String Selected

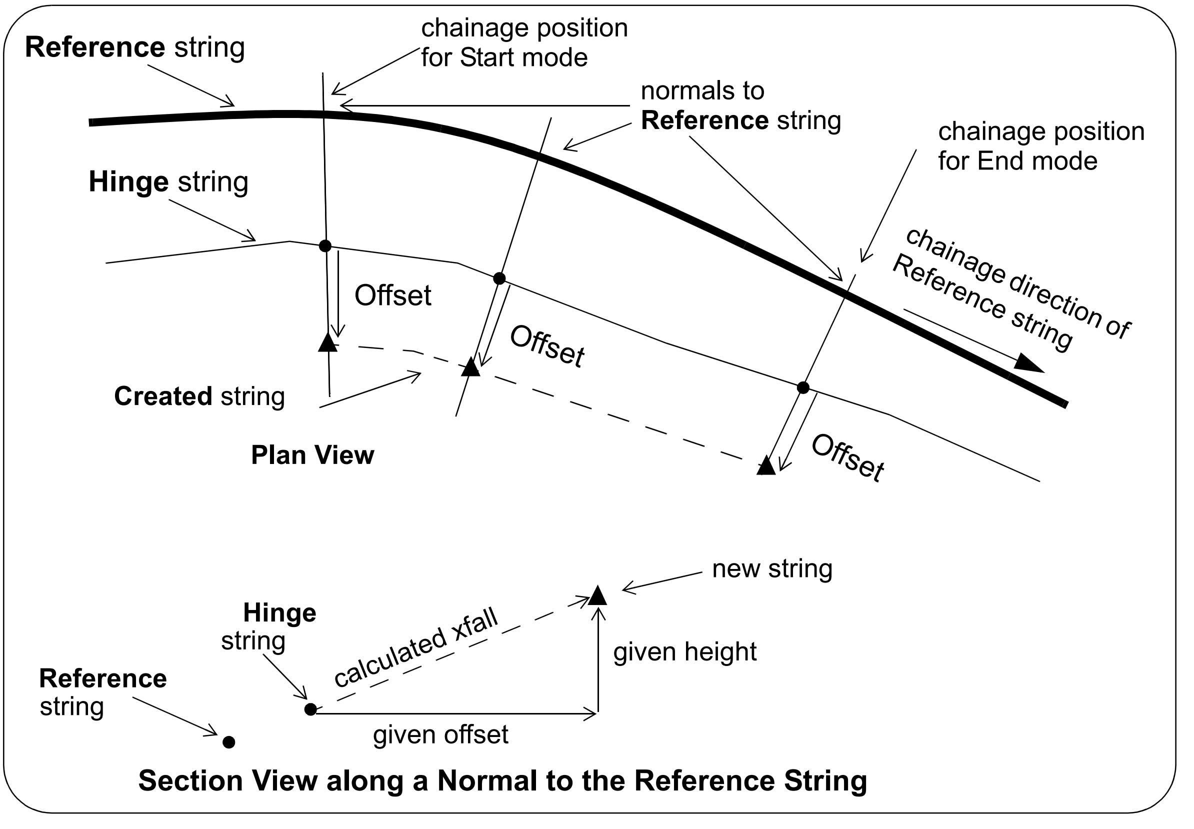
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string.

A vertex of a new string is created by going out from the Hinge string along the section at the given **Offset** and **Height**.

Positive Offset is defined as going to the right of the **Hinge** string when travelling in the direction of **increasing chainage on the Reference** string. Offset can be positive or negative.

Height is **added** to the height on the Hinge string. Height can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



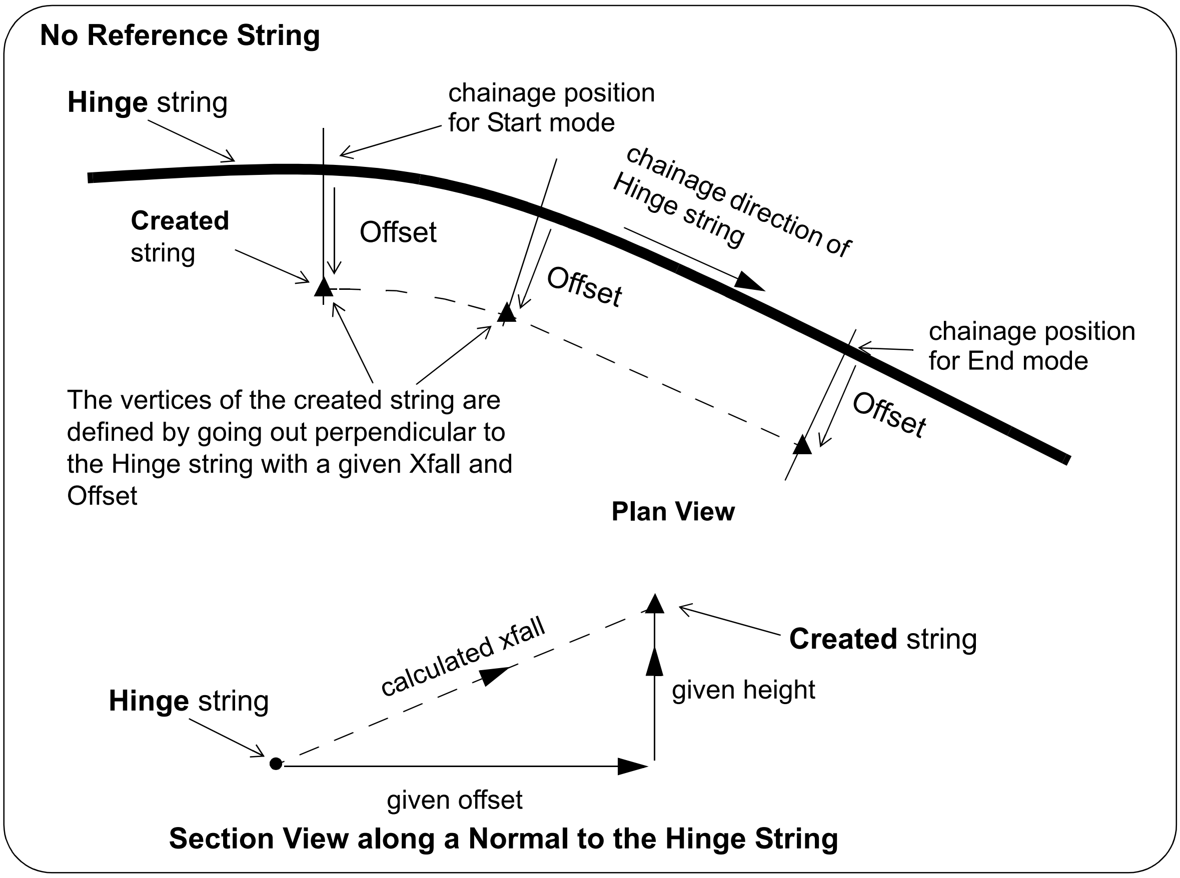
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string and at each chainage ch, a vertex of a new string is created by going out **normal** (perpendicular) to the **Hinge string** for the given **Offset** and **Height**.

Positive Offset is defined as going to the right of the Hinge string when travelling in the direction of increasing chainage on the Hinge string. Offset can be positive or negative.

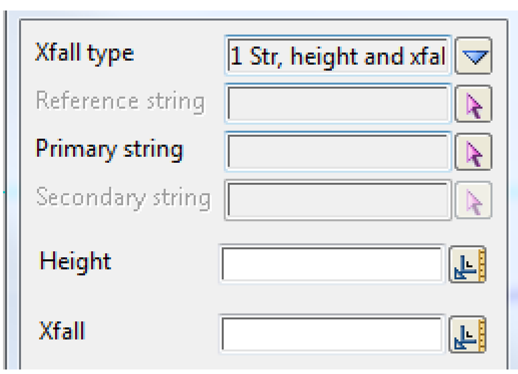
Height is **added** to the height on the Hinge string. Height can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Continue to the next choice 20.8.11.1.3 1 String, Height and Xfall or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.3 1 String, Height and Xfall



This option requires a **Hinge** string, a **Height** and **Xfall**, and an **optional Reference** string.

Reference String Selected

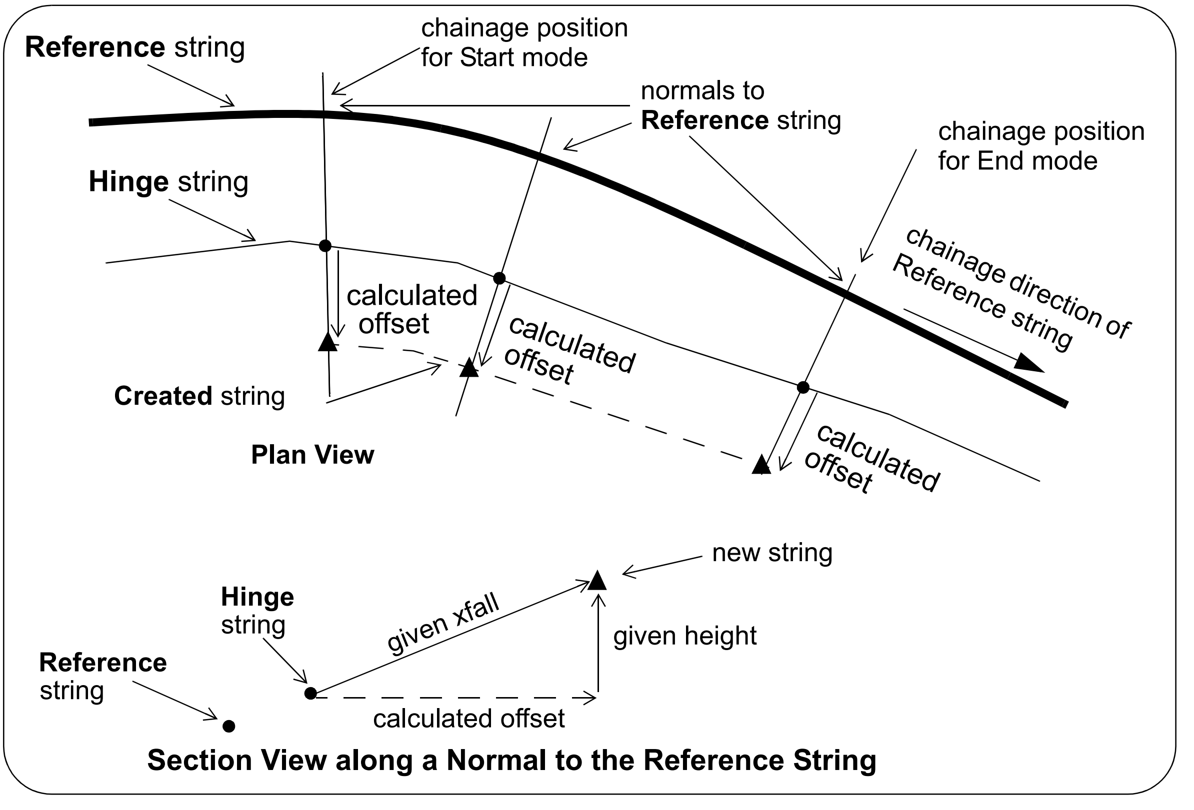
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string.

A vertex of a new string is created by going out from the Hinge string along the section at the given **Height** and **Xfall**.

Height is **added** to the height on the Hinge string. Height can be positive or negative.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



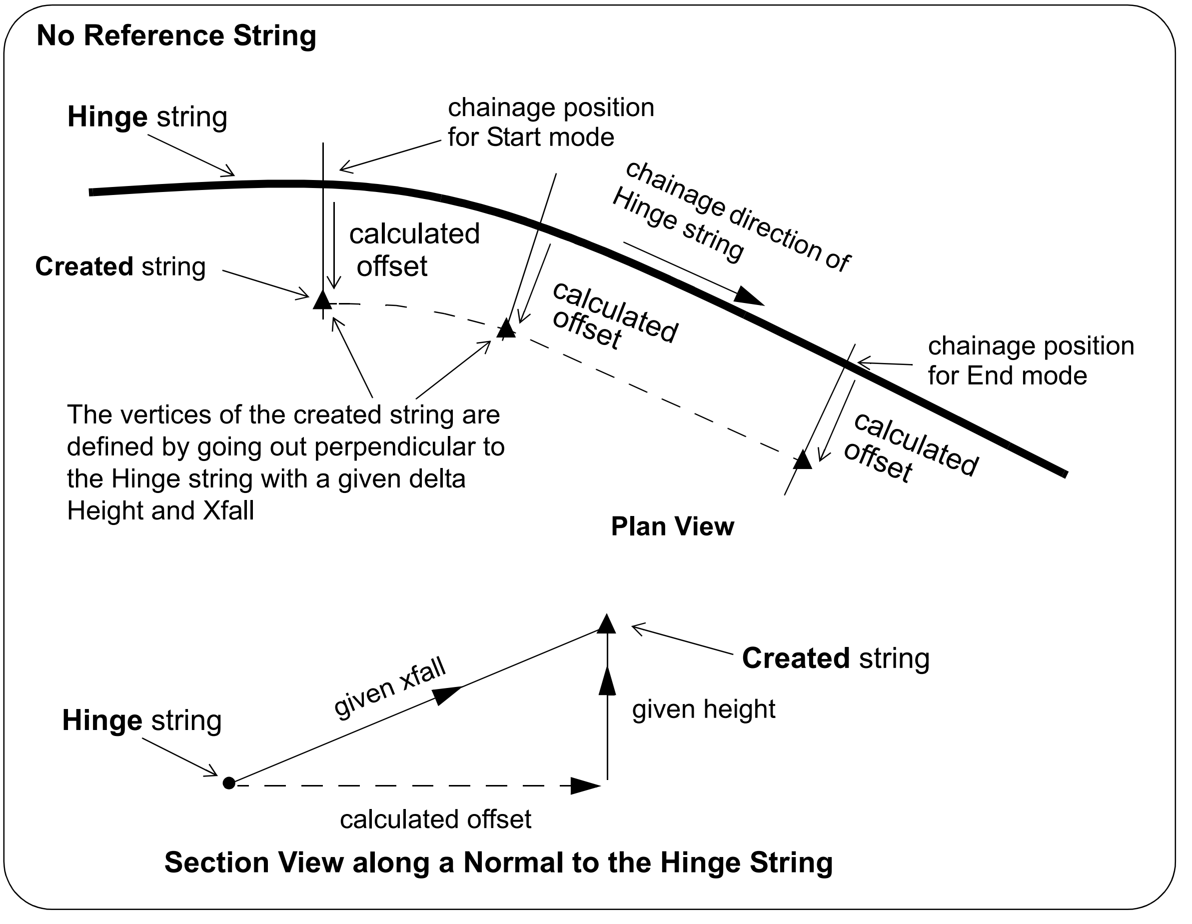
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string and at each chainage ch, a vertex of a new string is created by going out **normal** (perpendicular) to the **Hinge string** for the given **Height** and **Xfall**.

Height is **added** to the height at that chainage on the Hinge string. Height can be positive or negative.

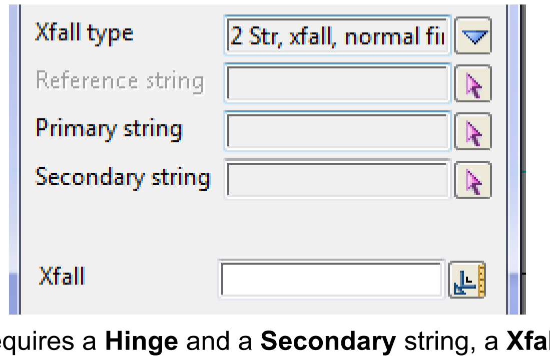
Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Continue to the next choice 20.8.11.1.4 2 Strings, Xfall and Normal to Reference String or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.4 2 Strings, Xfall and Normal to Reference String or Hinge String



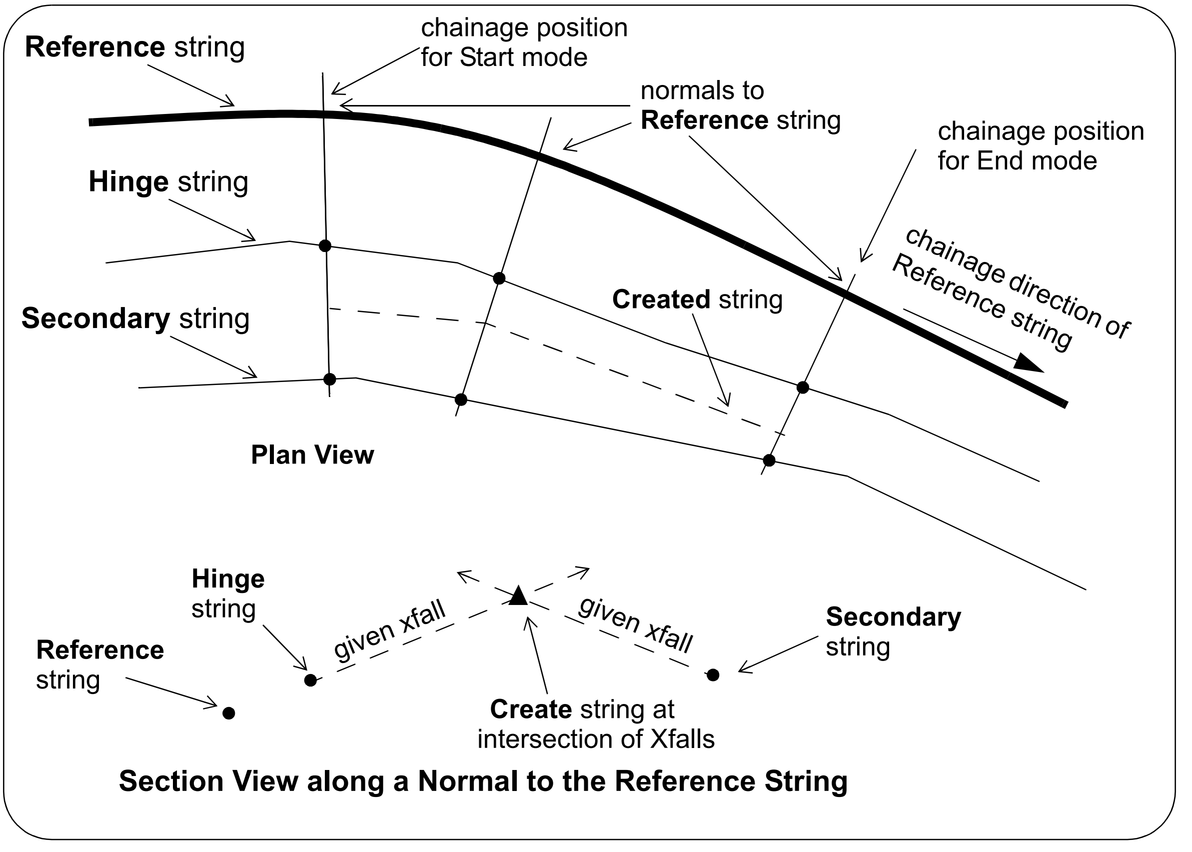
This option requires a **Hinge** and a **Secondary** string, a **Xfall**, and an **option Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string and the **Secondary** strings.

On this section, the **Xfall** is taken from the Hinge and Secondary strings and a vertex of a new string created where the Xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

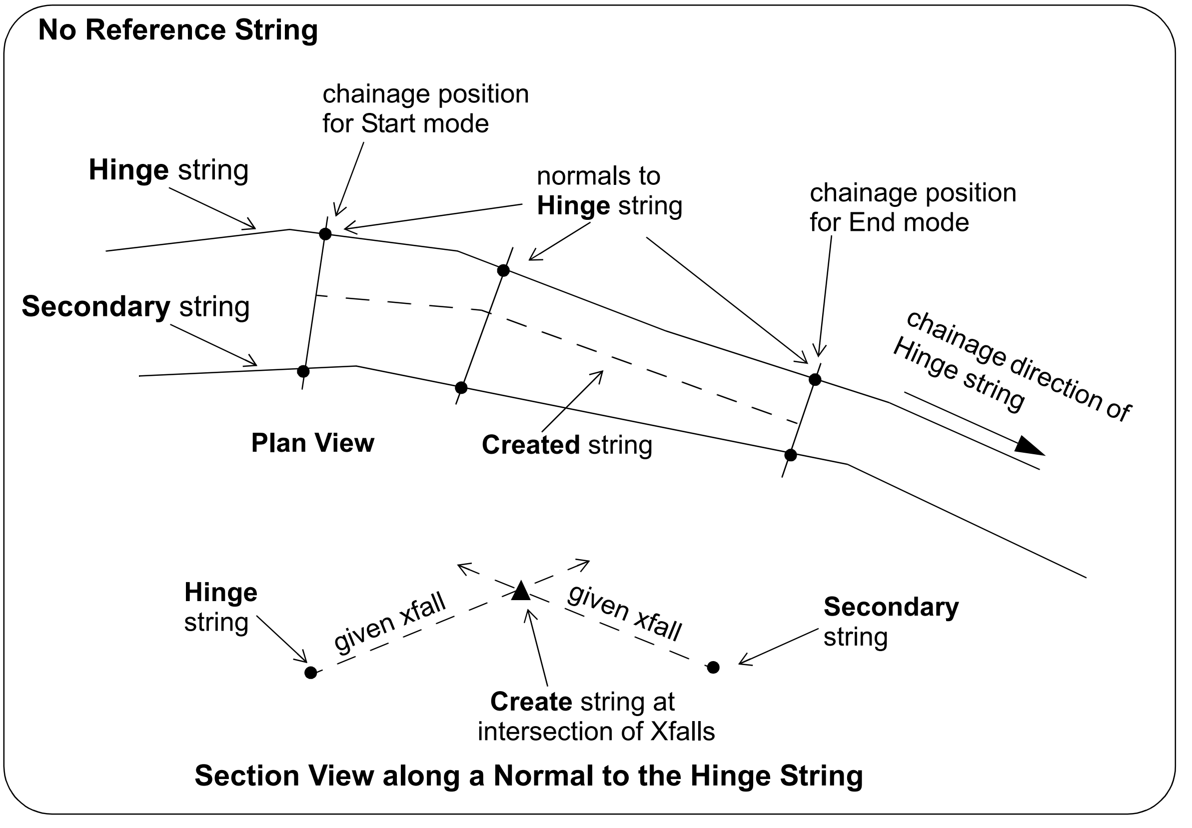


Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to **Hinge** string and at each chainage (ch), a section is taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** strings.

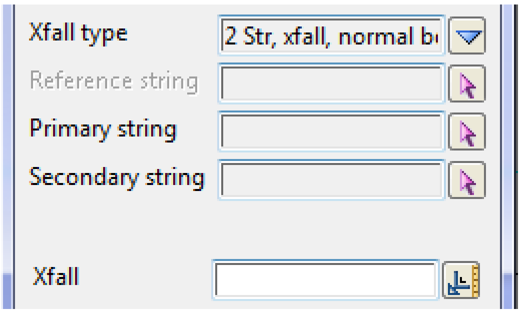
On this section, the **Xfall** is taken from the Hinge and Secondary strings and a vertex of a new string created where the Xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Continue to the next choice 20.8.11.1.5 2 Strings, Xfall and Normal to Both or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.5 2 Strings, Xfall and Normal to Both



This option requires a **Hinge** and a **Secondary** string, a **Xfall**, and an **option Reference** string.

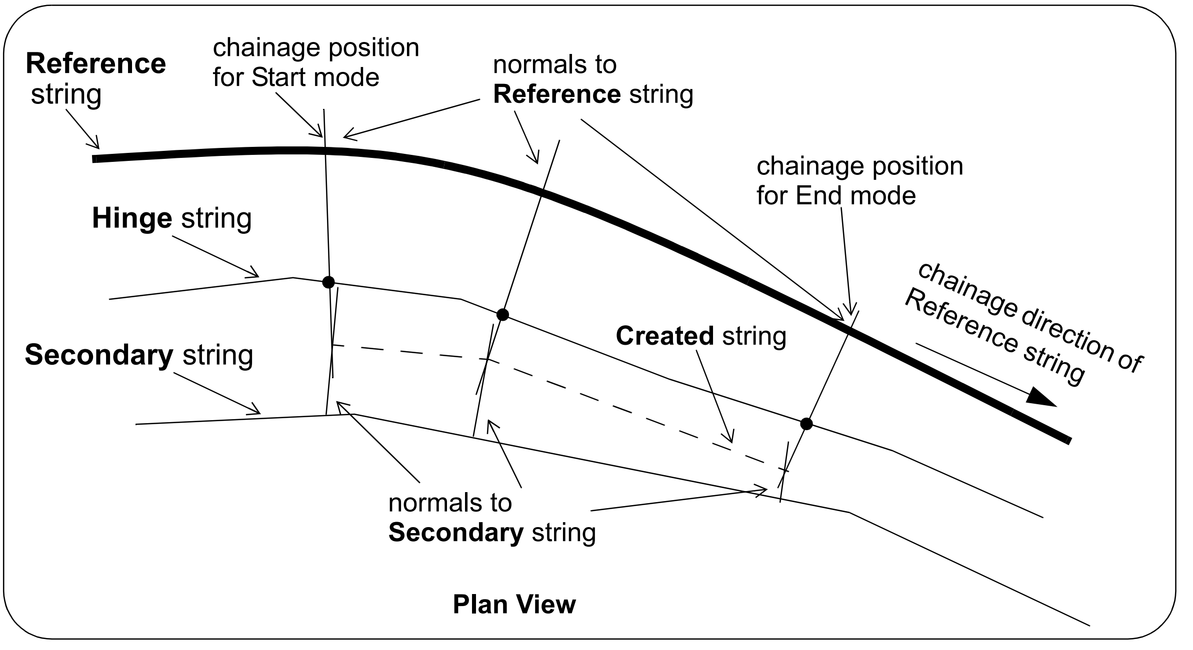
Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string, and the **Xfall** is taken from the cut with the Hinge string and along the section.

This is then intersected with a section **normal** to the **Secondary** string and with the given **Xfall**.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.



Reference String NOT Selected

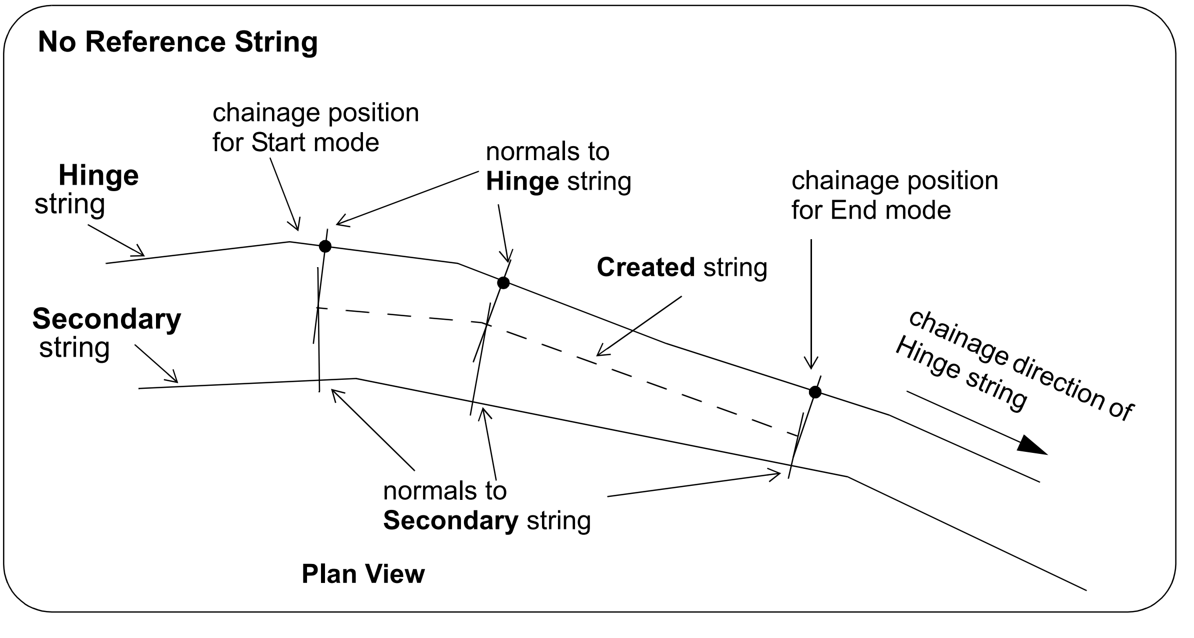
If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string.

At each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Hinge string** and the **Xfall** is taken along this section.

This is then intersected with a section **normal** to the **Secondary** string and with the given **Xfall**.

The new string is formed from the intersection points.

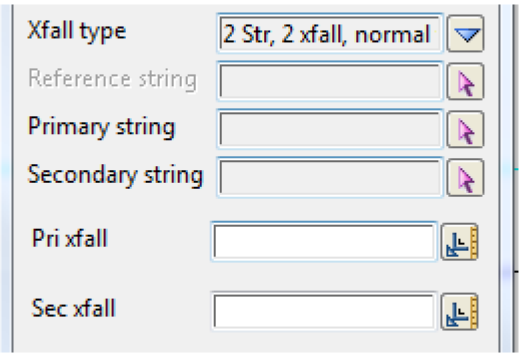
Note - it may not be possible to find such an intersection point.



Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice 20.8.11.1.6 2 Strings, 2 Xfalls and Normal to Reference String or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.6 2 Strings, 2 Xfalls and Normal to Reference String or Hinge String



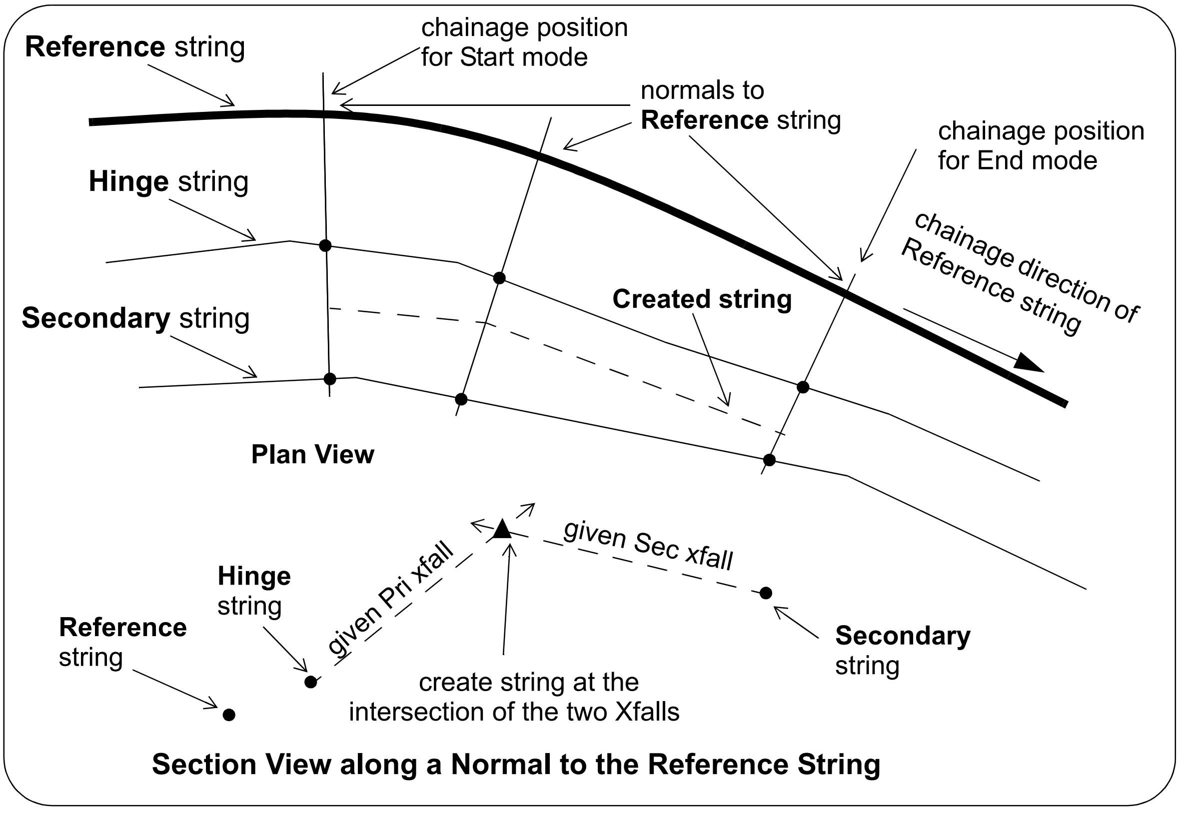
This option requires a **Hinge** and a **Secondary** string, two **Xfalls**, and an **option Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string and the **Secondary** strings.

On this section, the xfall **Pri xfall** is taken from the Hinge string, and xfall **Sec xfall** from the Secondary string, and a vertex of a new string created where the two xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

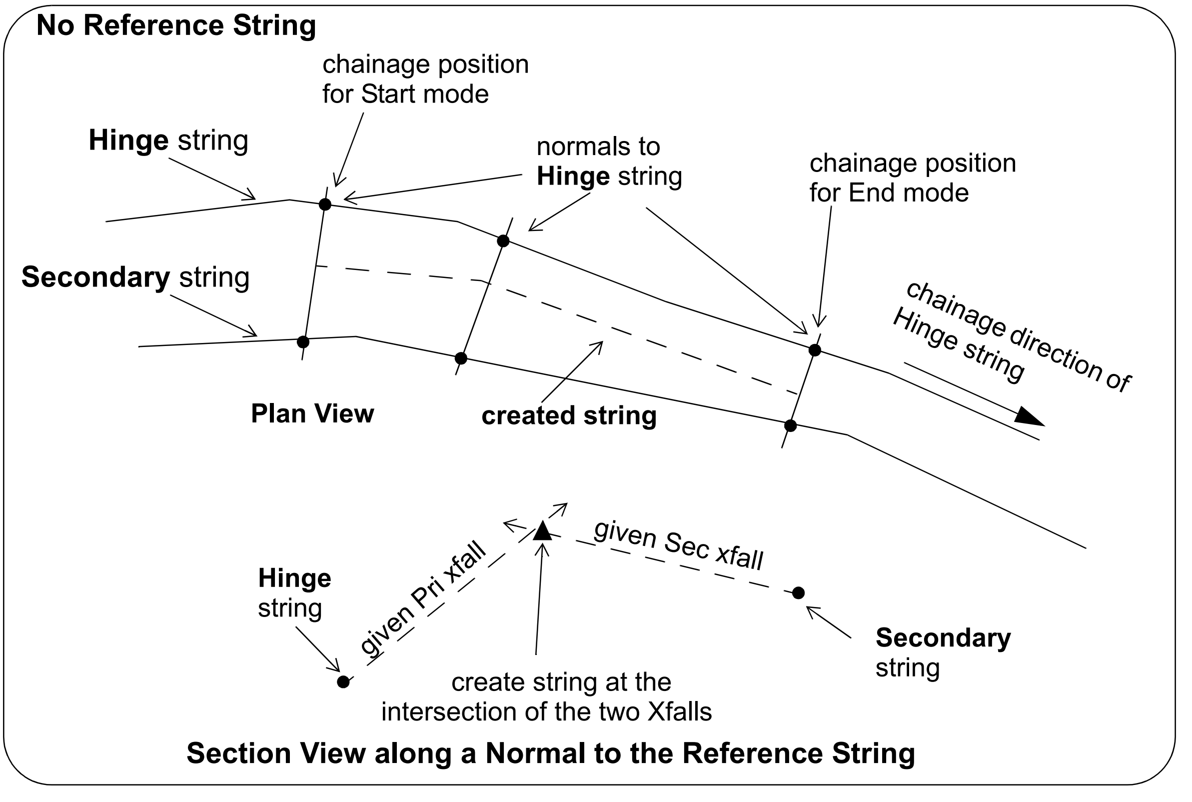


Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to **Hinge** string and at each chainage (ch), a section is taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** strings.

On this section, the xfall **Pri xfall** is taken from the Hinge string, and xfall **Sec xfall** from the Secondary string, and a vertex of a new string created where the two xfalls intersect.

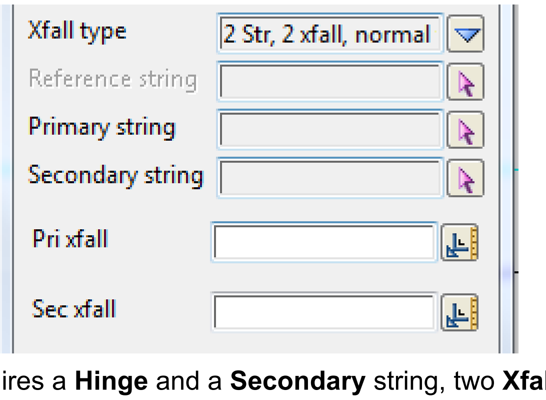
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice 20.8.11.1.7 2 Strings, 2 Xfalls and Normal to Both or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.7 2 Strings, 2 Xfalls and Normal to Both



This option requires a **Hinge** and a **Secondary** string, two **Xfalls**, and an **option Reference** string.

Reference String Selected

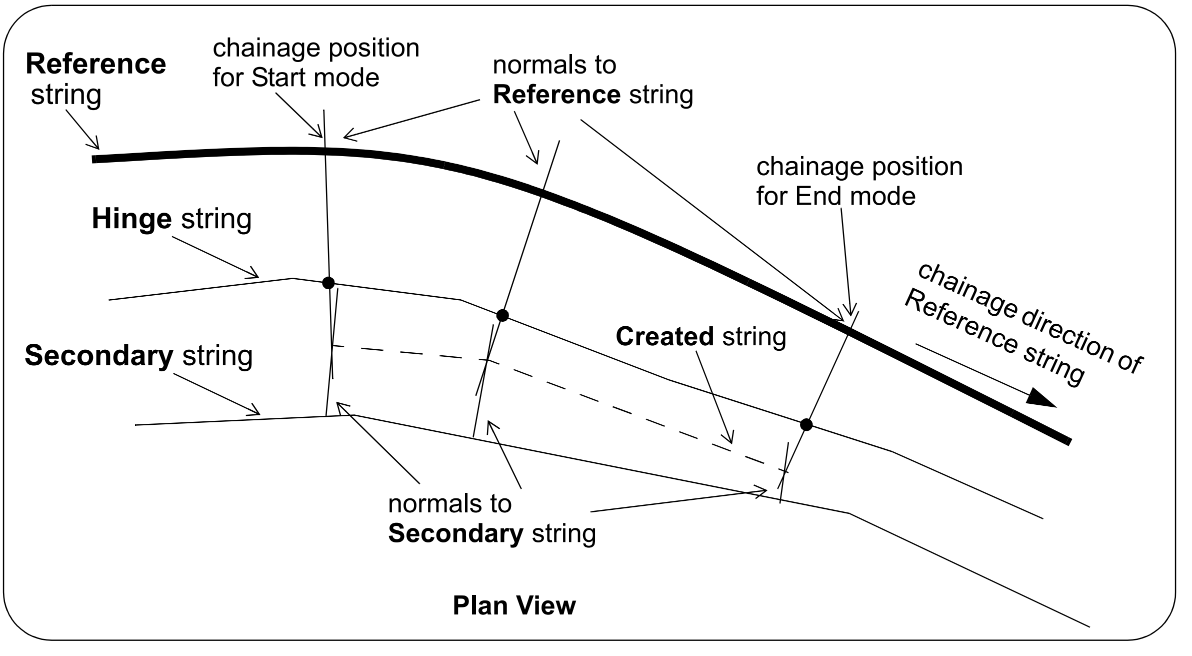
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string, and the xfall **Pri xfall** is taken from the cut with the Hinge string and along the section.

This is then intersected with a section **normal** to the **Secondary** string and with the xfall **Sec xfall**.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string.

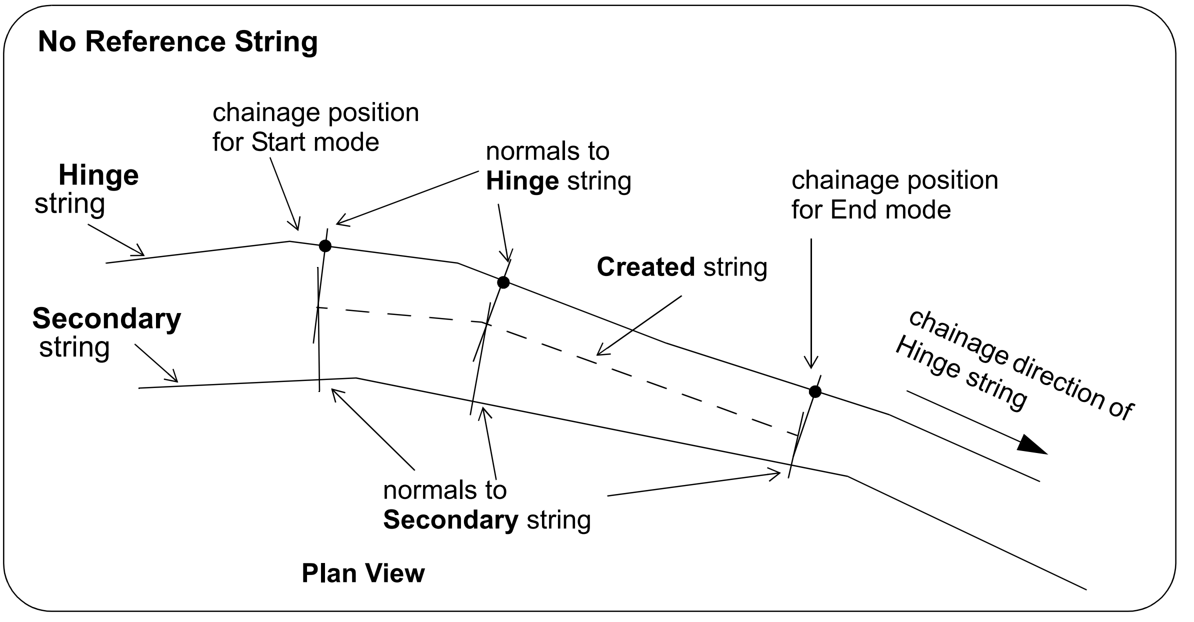
At each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Hinge string** and the xfall **Pri xfall** is taken along this section.

This is then intersected with a section **normal** to the **Secondary** string and with the xfall **Sec xfall**.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

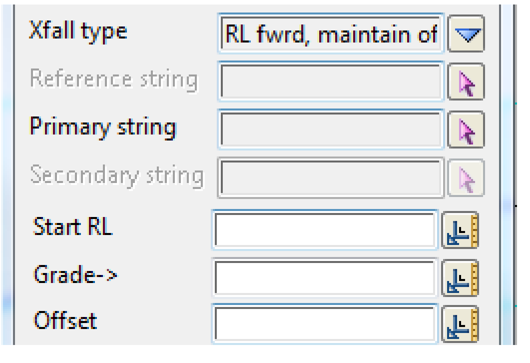
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice 20.8.11.1.8 1 String, Start RL and Grade, Fixed Offset or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.8 1 String, Start RL and Grade, Fixed Offset



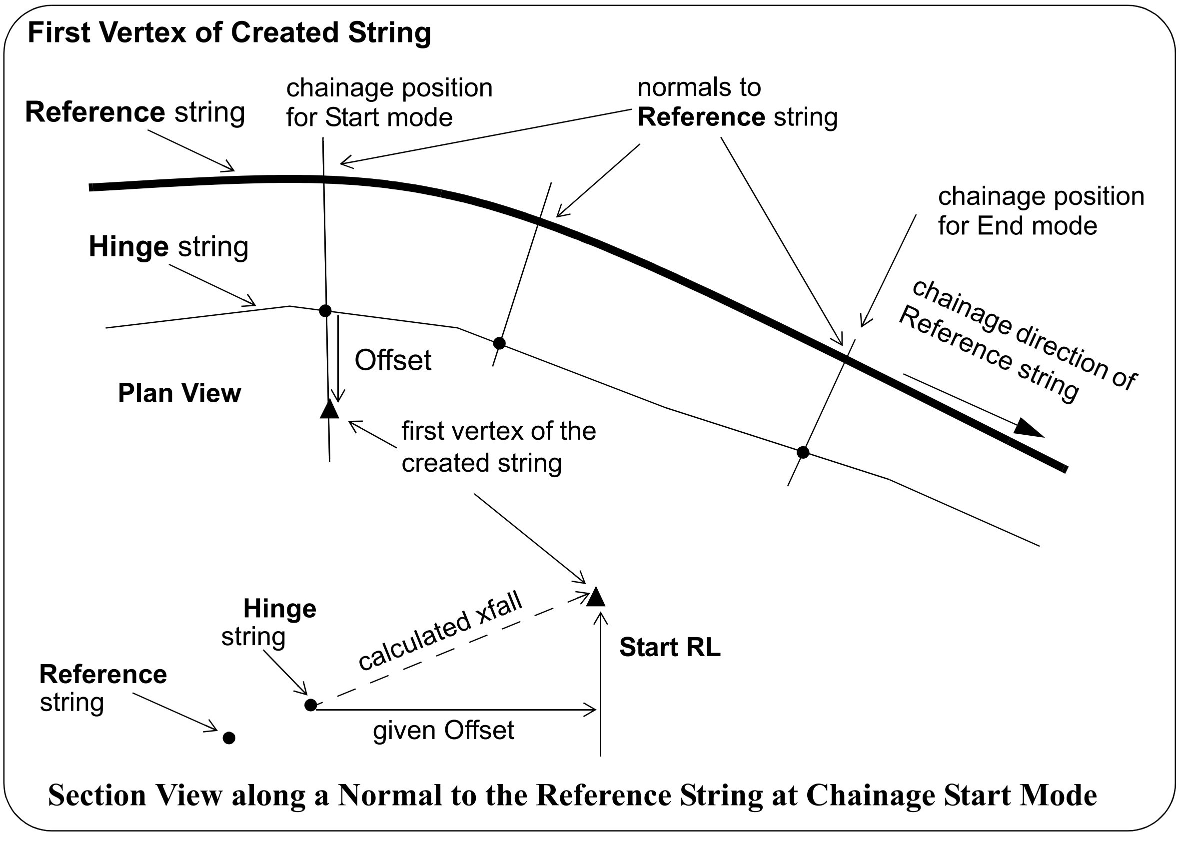
This option requires a **Hinge** string, a **Start RL** and forward **Grade**, an **Offset**, and an **optional Reference** string.

Reference String Selected

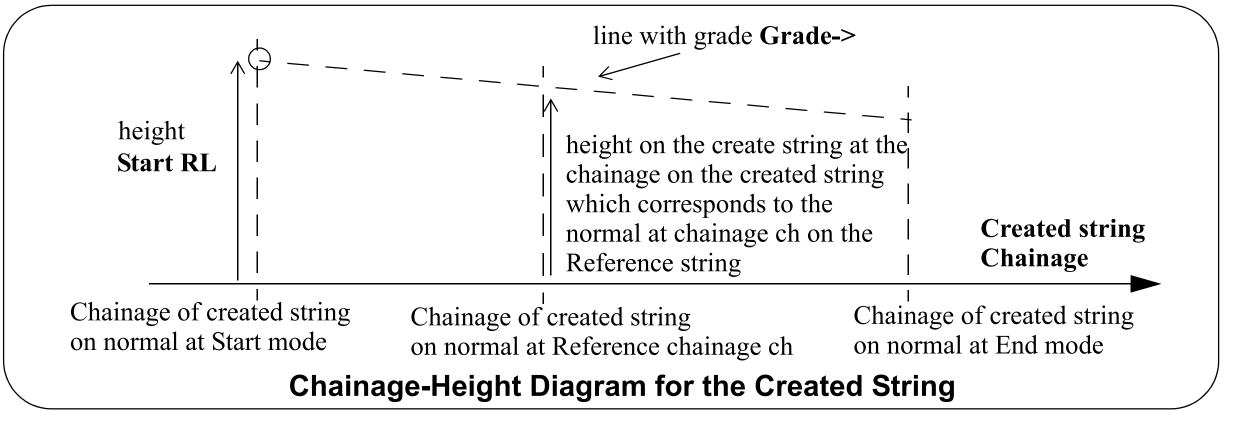
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

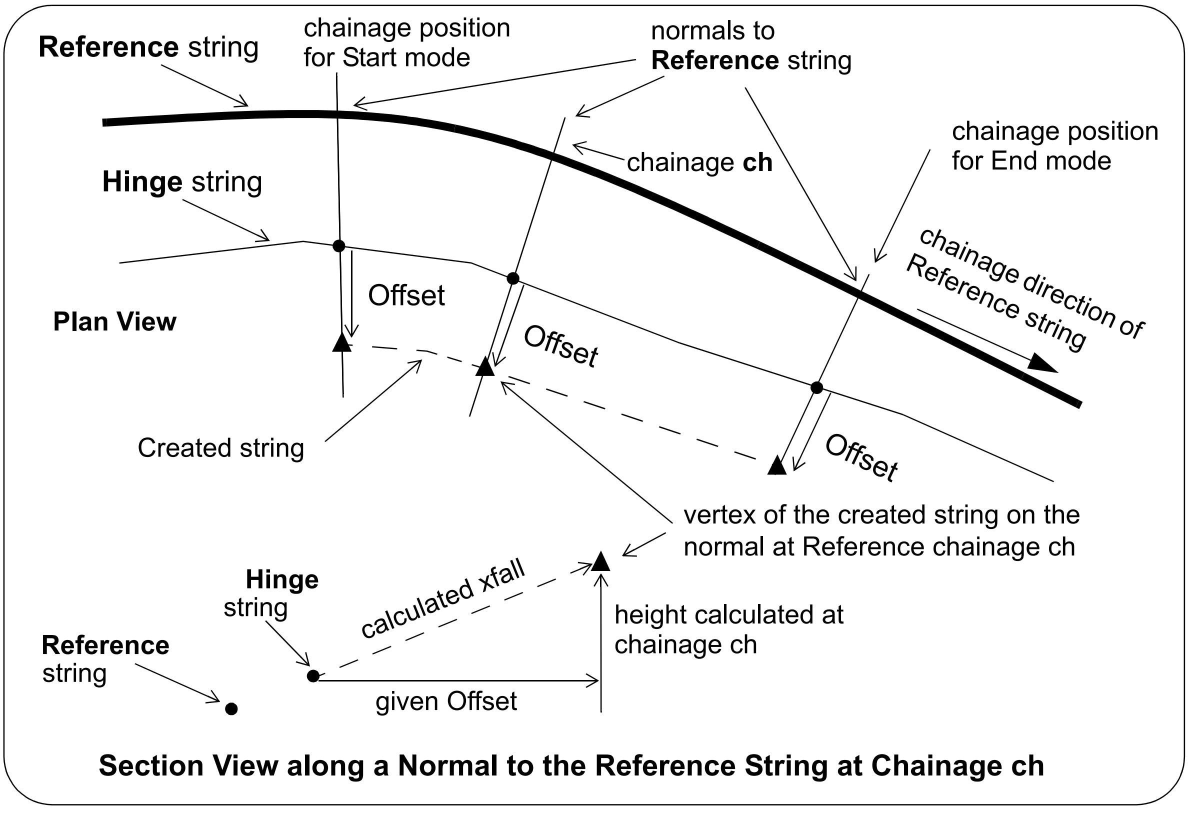
The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset.**

The **first vertex** of the created string is on the normal to the Reference string at chainage **Start mode**, with an offset from the **Hinge** string of **Offset** and with a **height** of **Start RL**.



The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade ***Grade->*** and going through the first vertex.





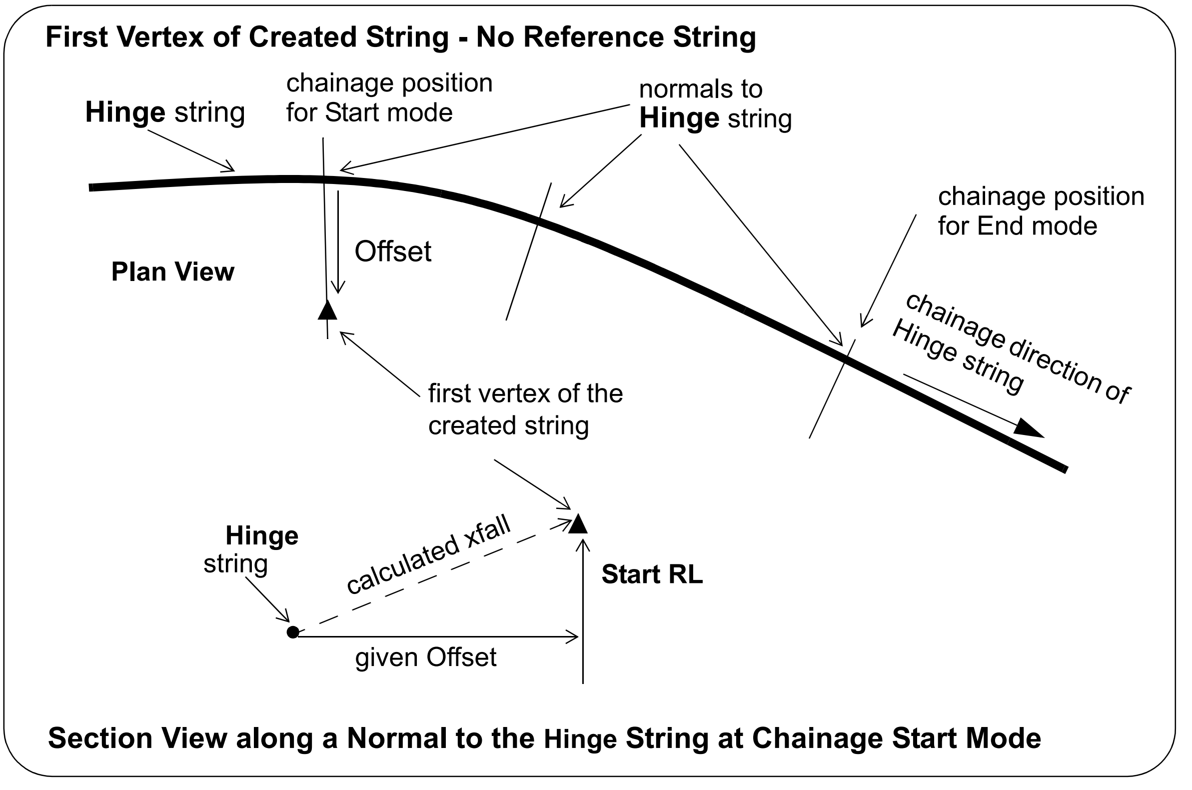
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Reference String NOT Selected

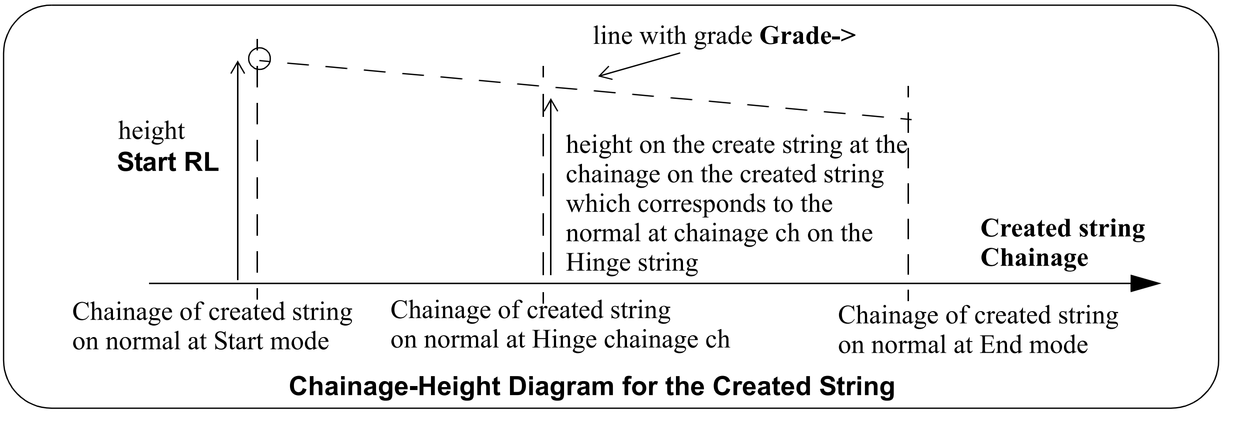
If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

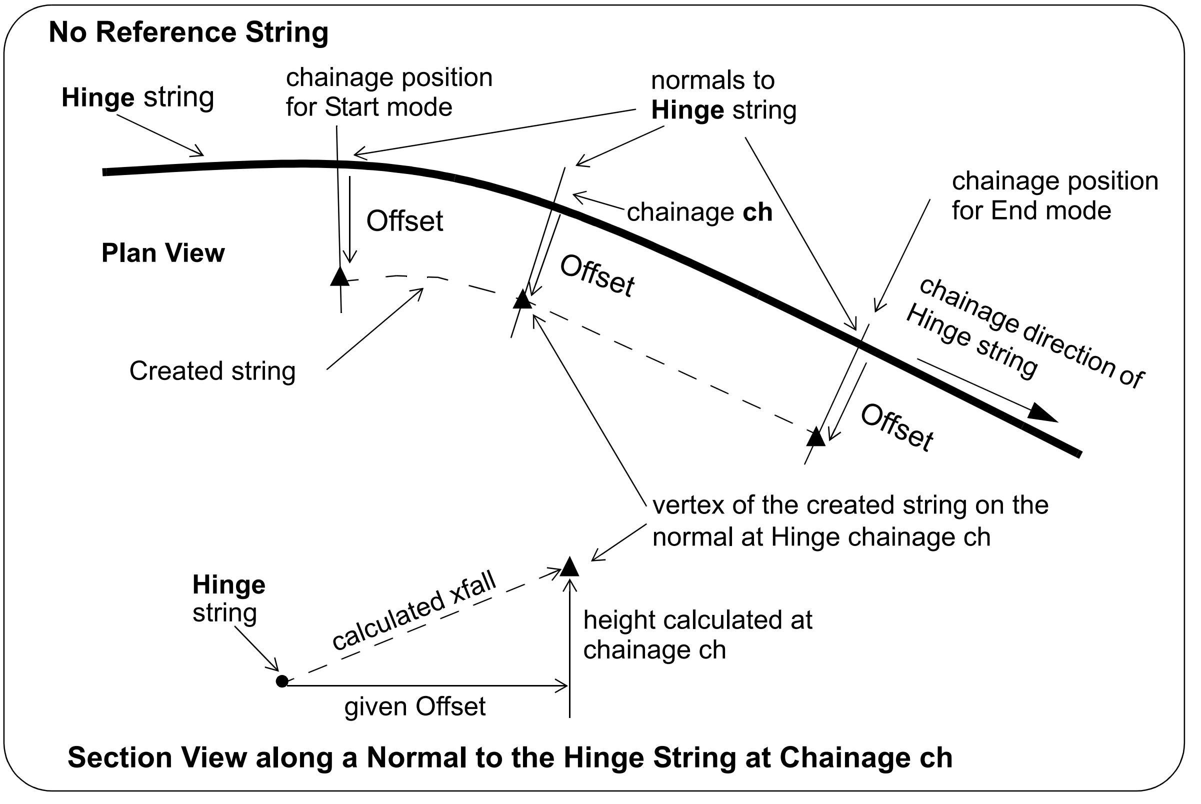
The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset.**

The **first vertex** of the created string is on the normal to the Hinge string at chainage **Start mode**, with an offset from the **Hinge** string of **Offset**, and with a **height** of **Start RL**.



The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade ***Grade->*** and going through the first vertex.

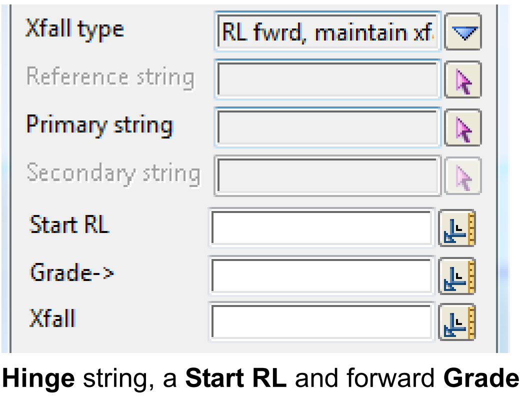




For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.9 1 String, Start RL and Grade, Fixed Xfall or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.9 1 String, Start RL and Grade, Fixed Xfall



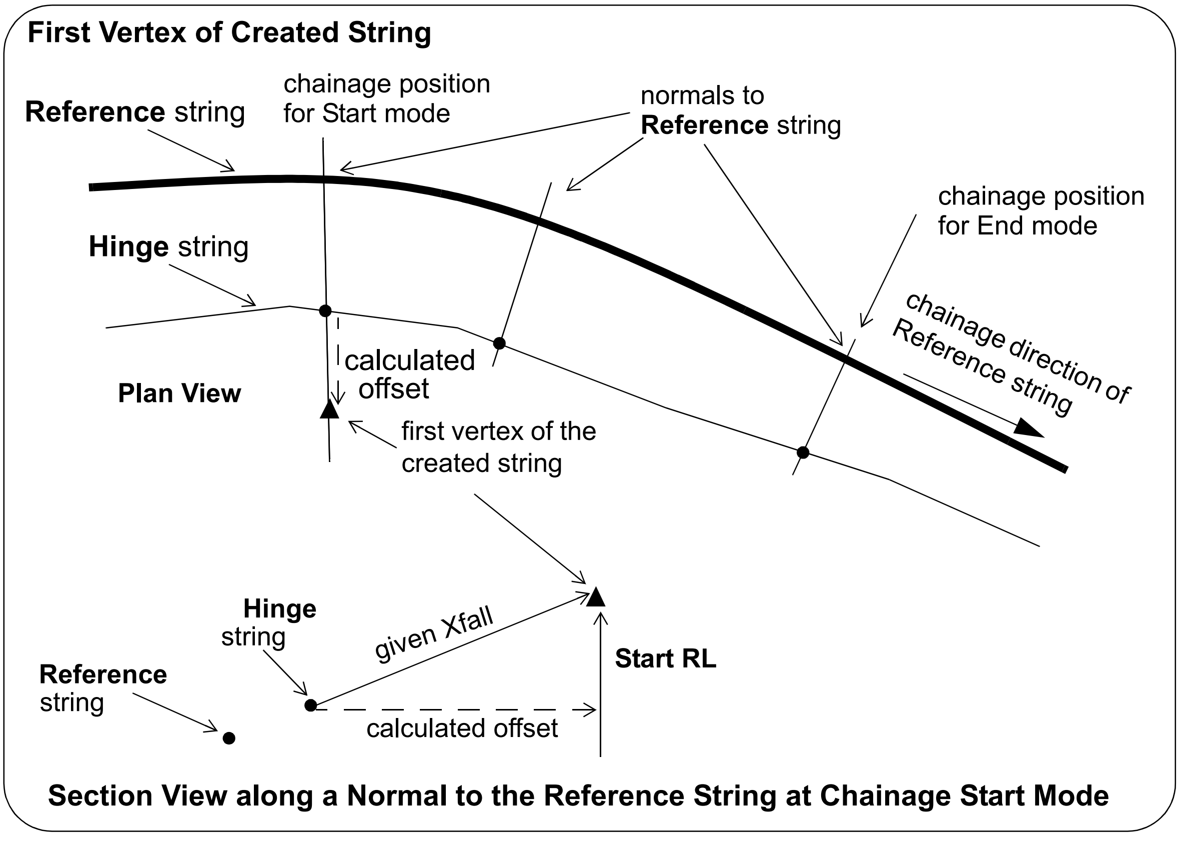
This option requires a **Hinge** string, a **Start RL** and forward **Grade**, a **Xfall**, and an **optional Reference** string.

Reference String Selected

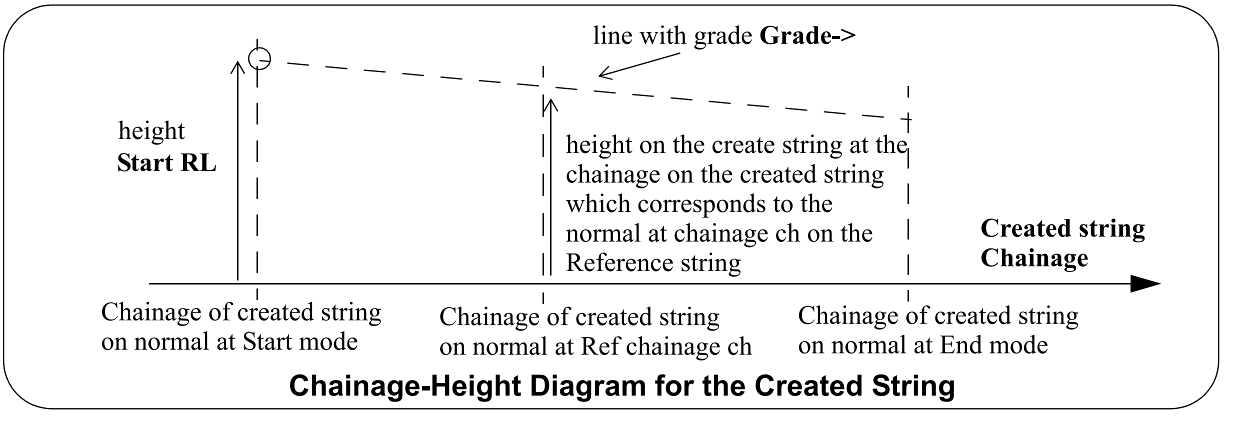
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Reference string and has a **height**

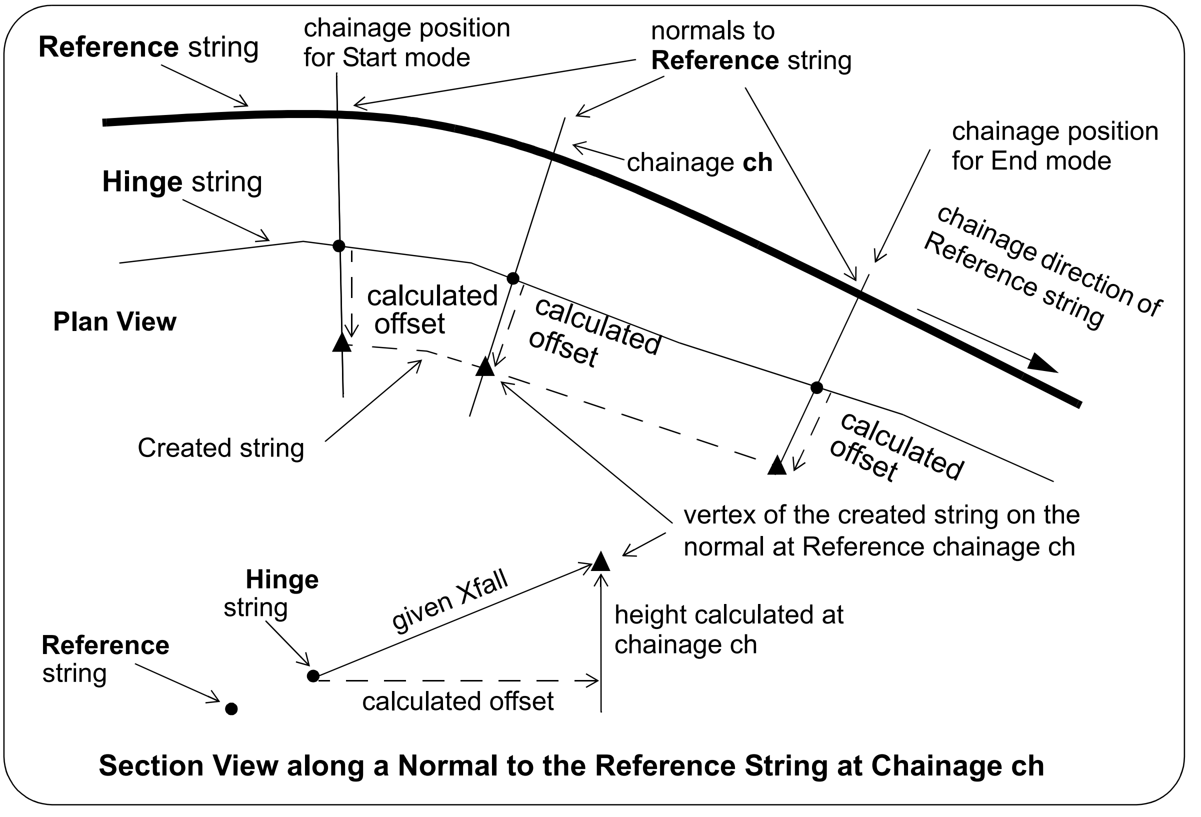
Start RL. The offset for the first vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **Start RL**.



The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade ***Grade->*** and going through the first vertex.



The offsets for the vertices are calculated and are such that the given **Xfall** from Hinge string will give the vertex the correct **height** for that chainage.

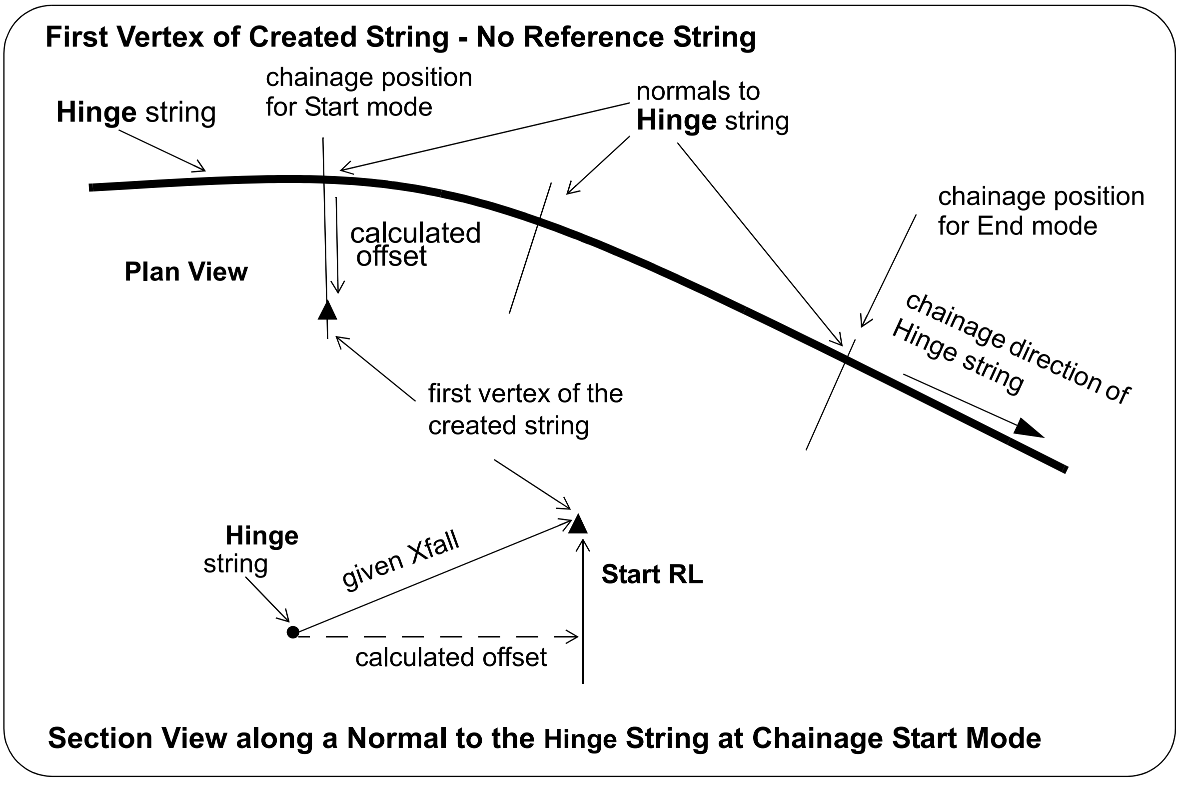


For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

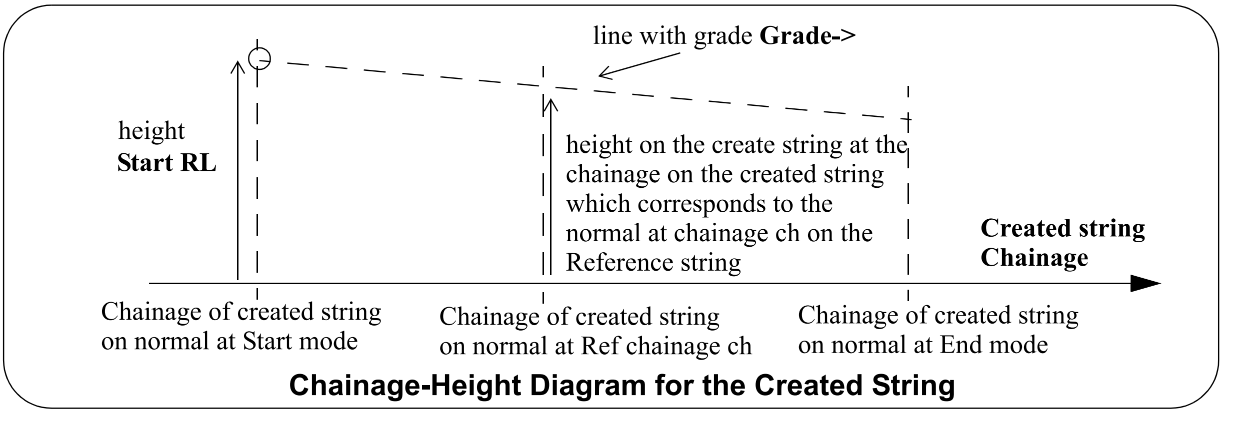
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

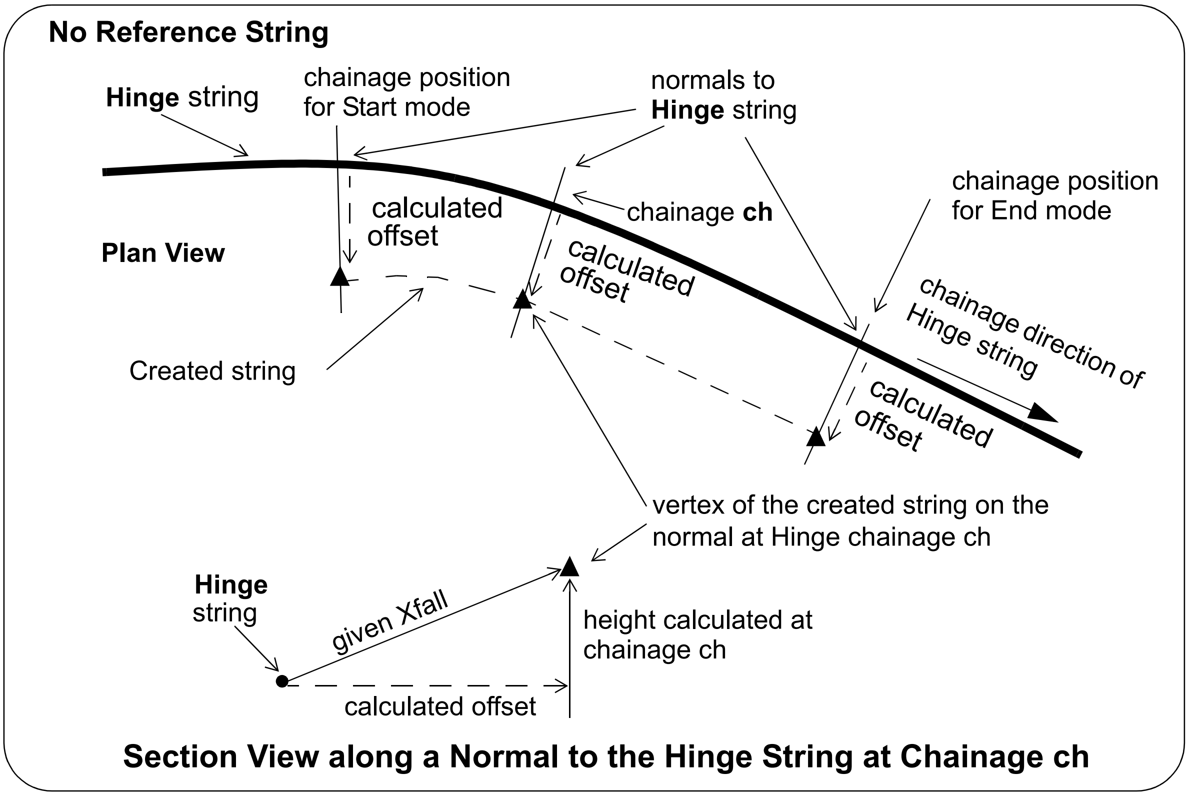
The **first vertex** of the created string is on the normal to the Hinge string and has a **height Start RL**. The offset for the first vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **Start RL**.



The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade ***Grade->*** and going through the first vertex.



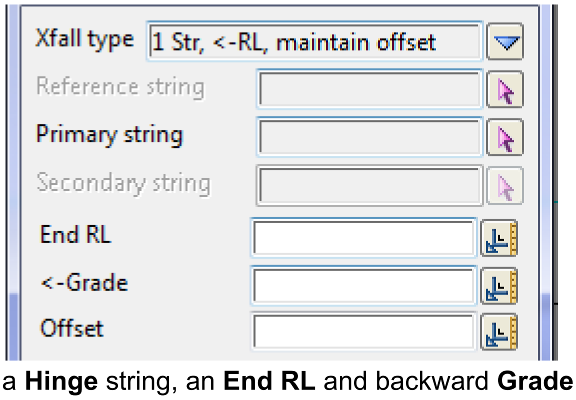
The offsets for the vertices are calculated and are such that the given **Xfall** from Hinge string will give the vertex the correct **height** for that chainage.



For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.10 1 String, End RL and Grade, Fixed Offset or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.10 1 String, End RL and Grade, Fixed Offset



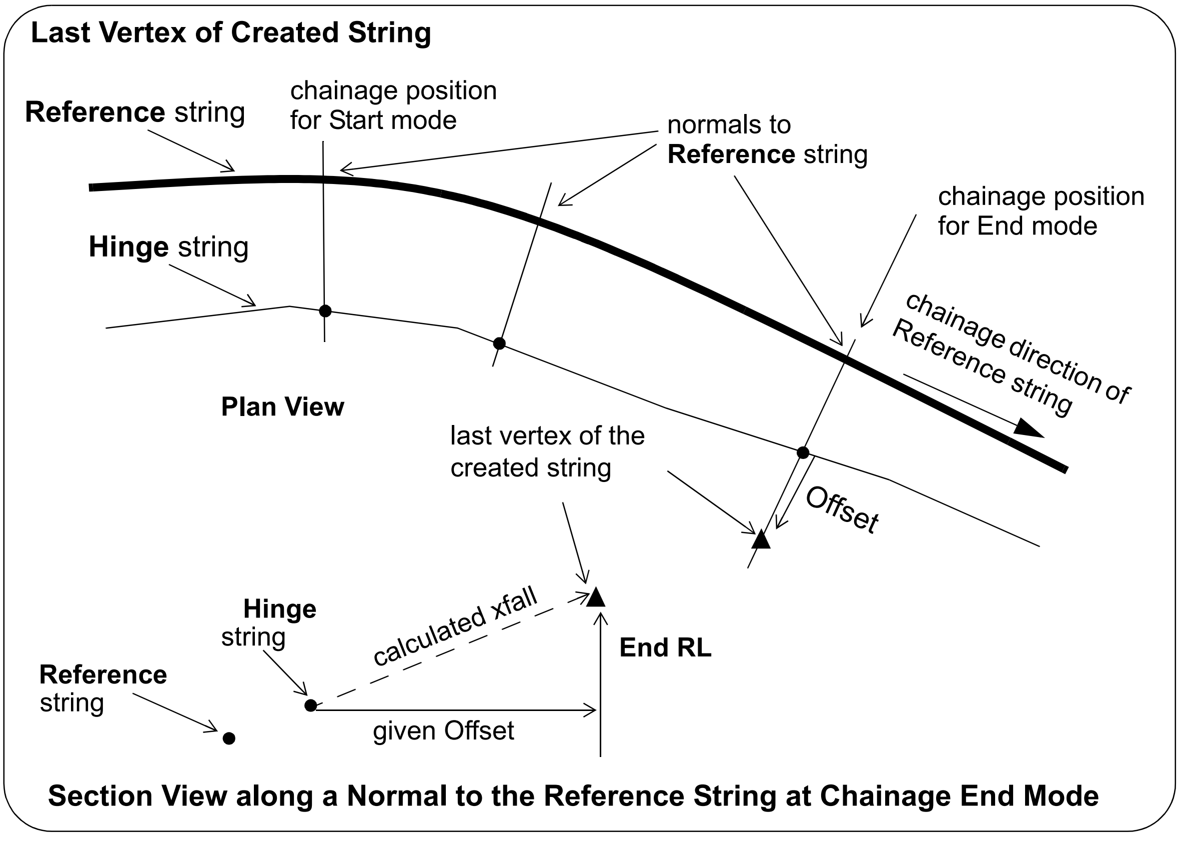
This option requires a **Hinge** string, an **End RL** and backward **Grade**, an **Offset**, and an **optional Reference** string.

Reference String Selected

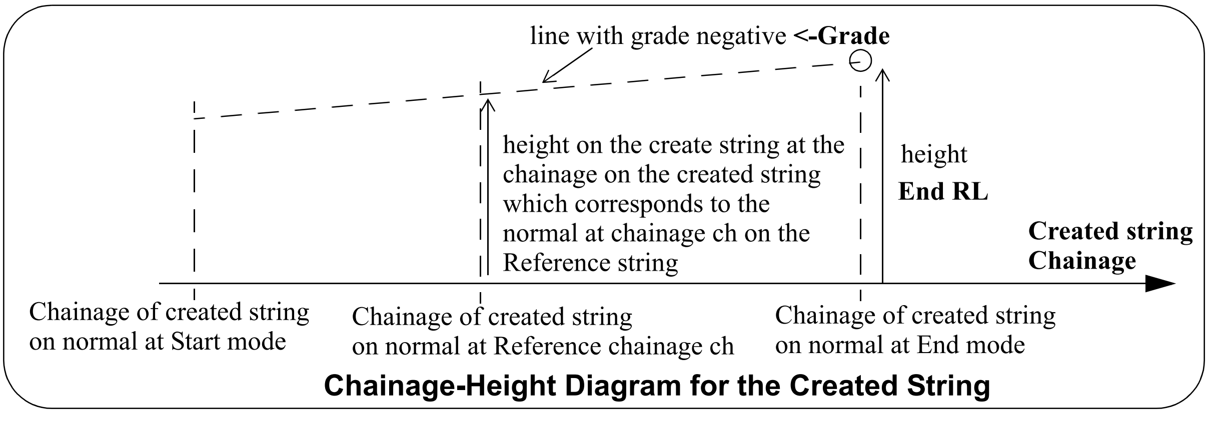
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

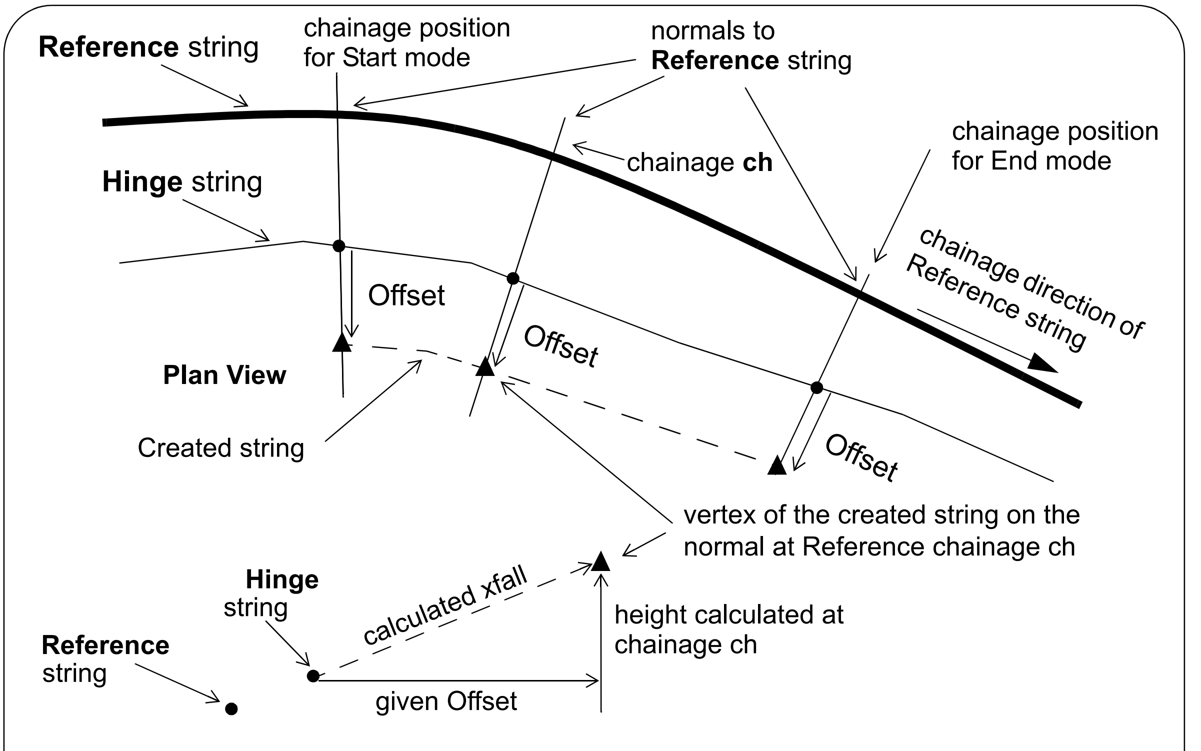
The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset**.

The **last vertex** of the created string is on the normal to the Reference string at chainage **End mode**, with an offset from the **Hinge** string of **Offset** and with a **height** of **End RL**.



The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative ***<-Grade*** and going through the last vertex.





Section View along a Normal to the Reference String at Chainage ch

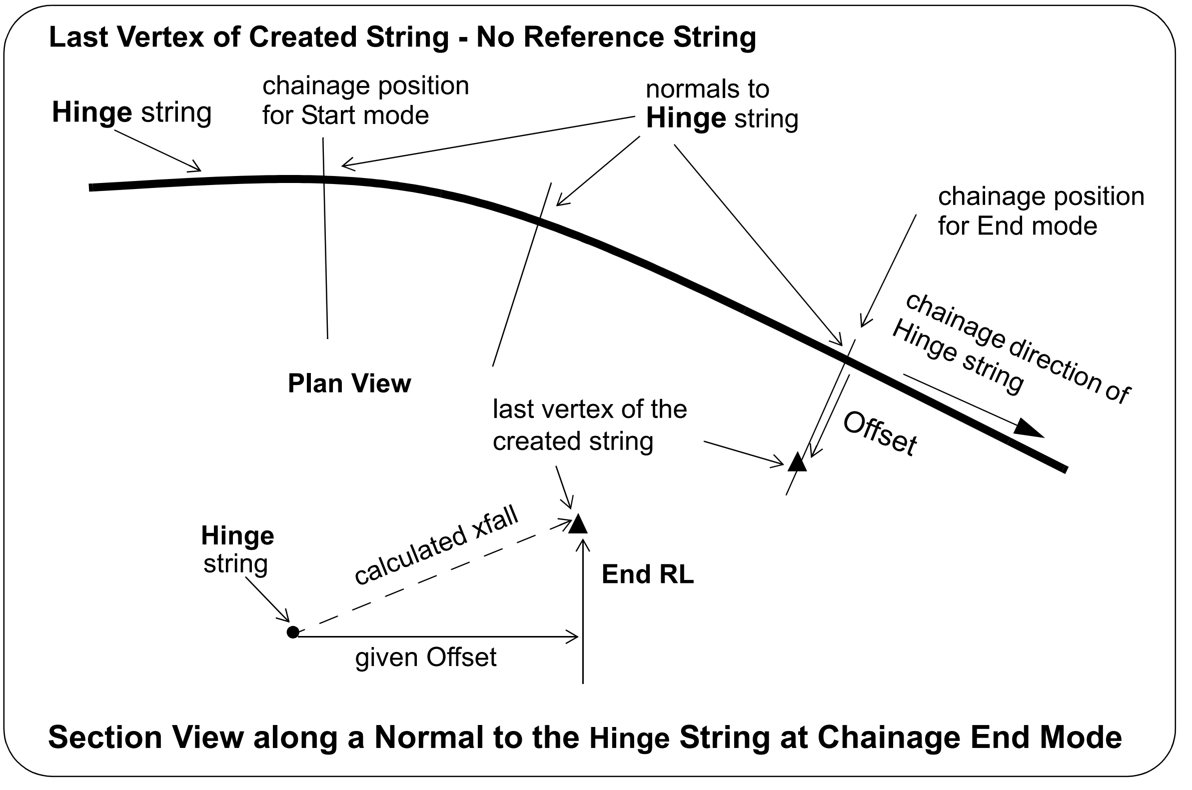
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Reference String NOT Selected

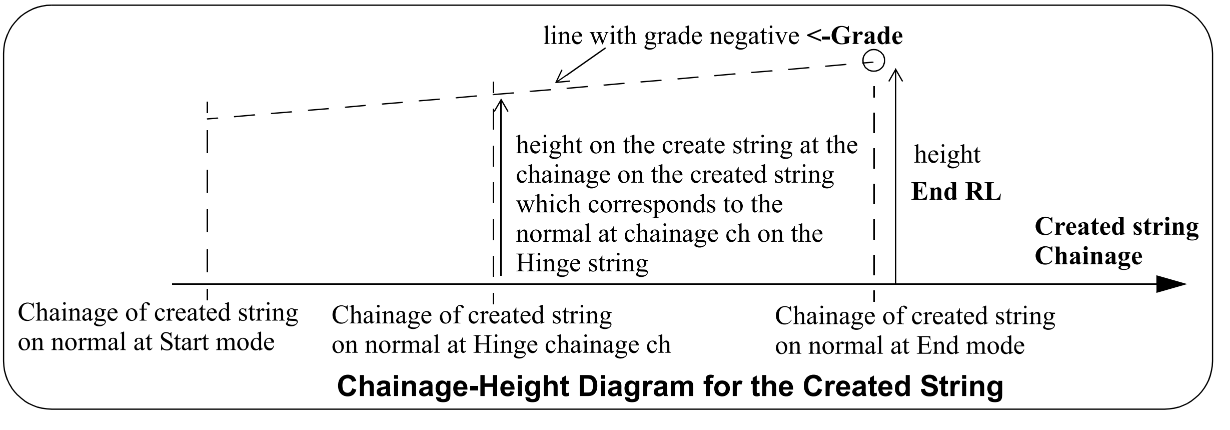
If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

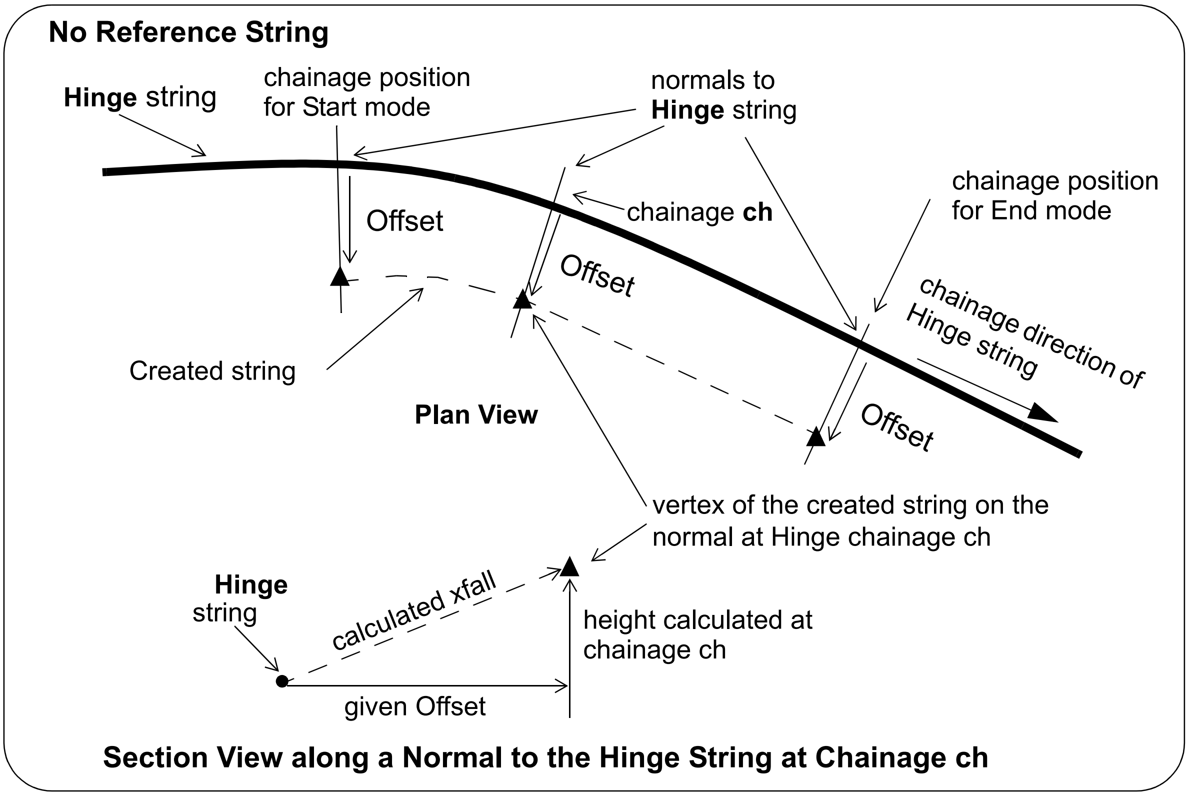
The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset.**

The **last vertex** of the created string is on the normal to the Hinge string at chainage **End mode**, with an offset from the **Hinge** string of **Offset** and with a **height** of **End RL**.



The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative ***<-Grade*** and going through the last vertex.

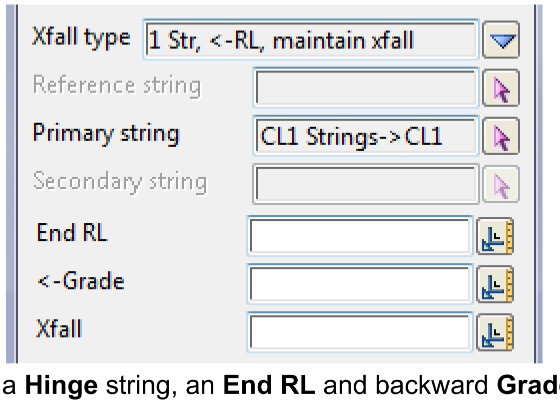




For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.11 1 String, End RL and Grade, Fixed Xfall or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.11 1 String, End RL and Grade, Fixed Xfall



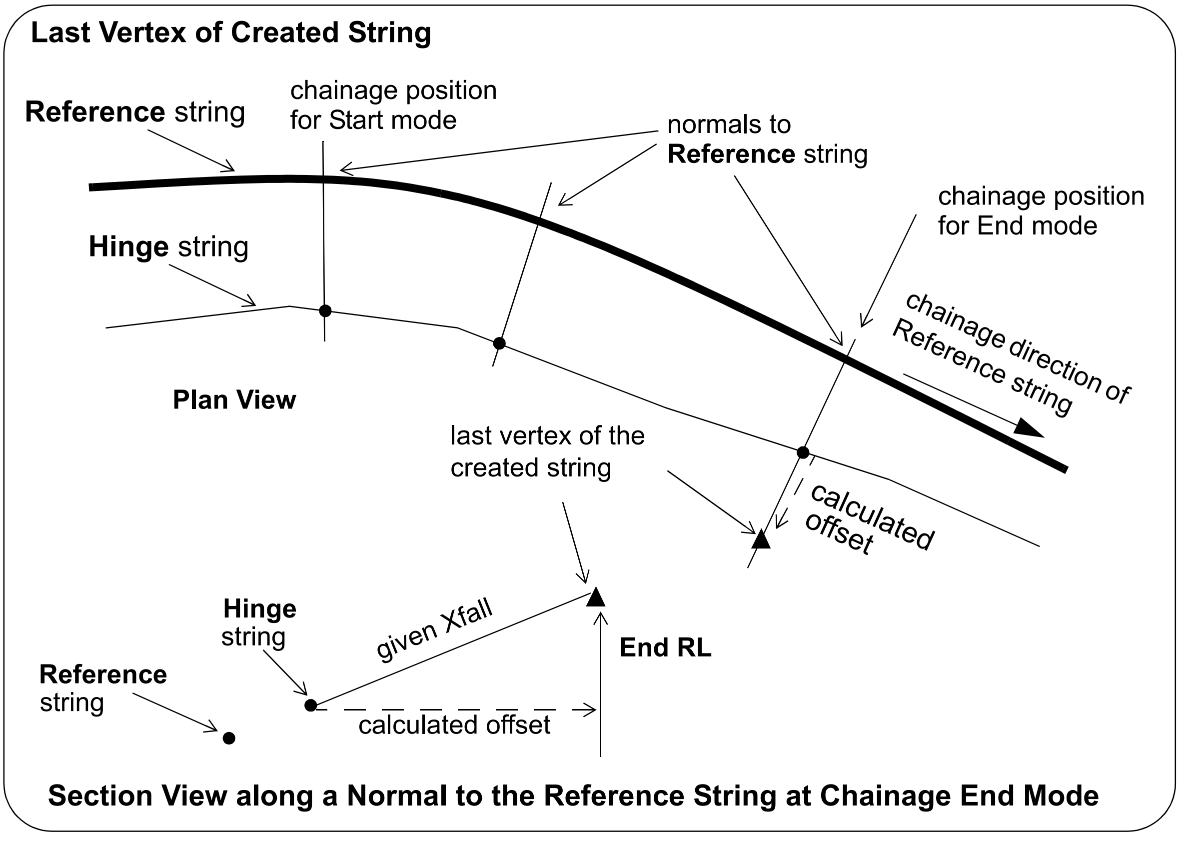
This option requires a **Hinge** string, an **End RL** and backward **Grade**, a **Xfall**, and an **optional Reference** string.

Reference String Selected

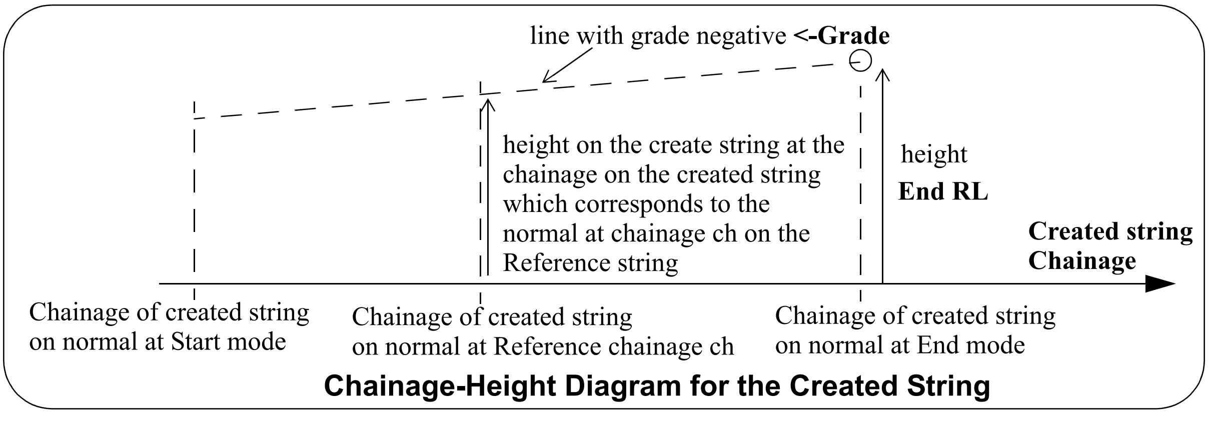
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

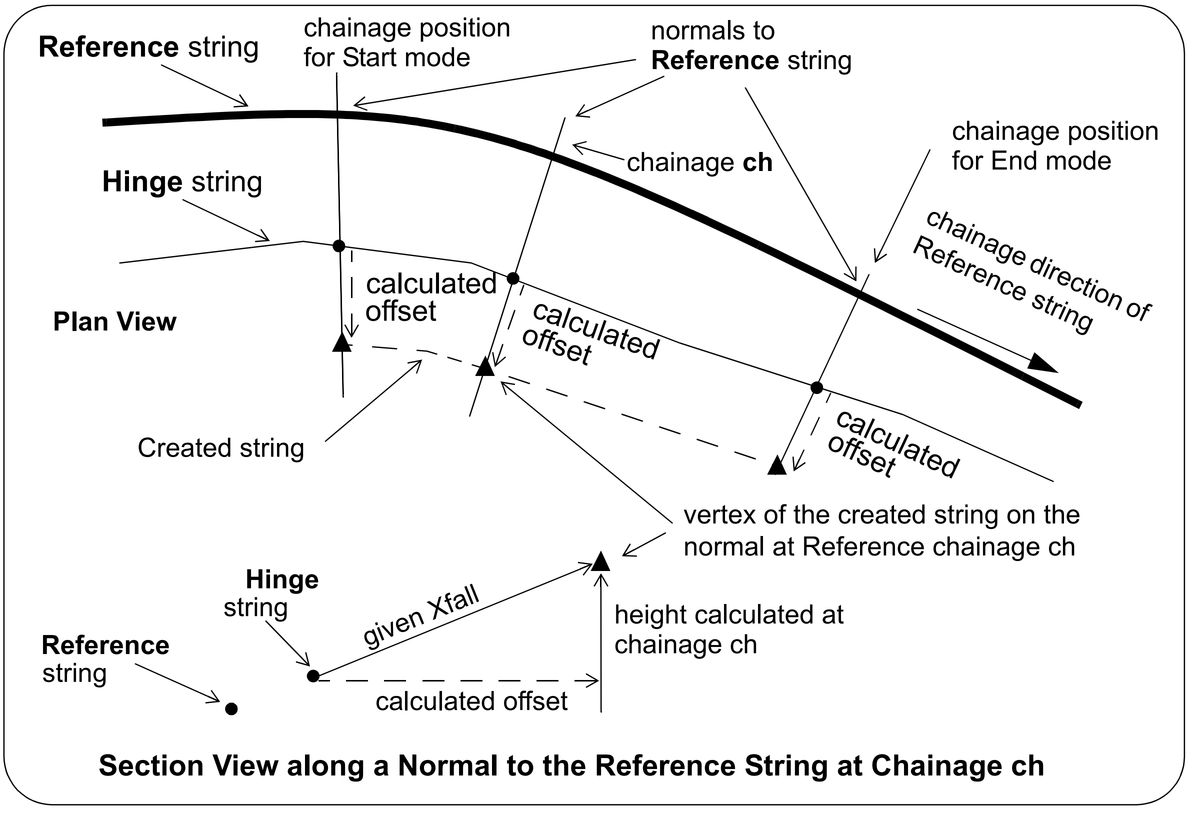
The **last vertex** of the created string is on the normal to the Reference string and has a **height**

End RL. The offset for the last vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **End RL**.



The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative ***<-Grade*** and going through the last vertex.



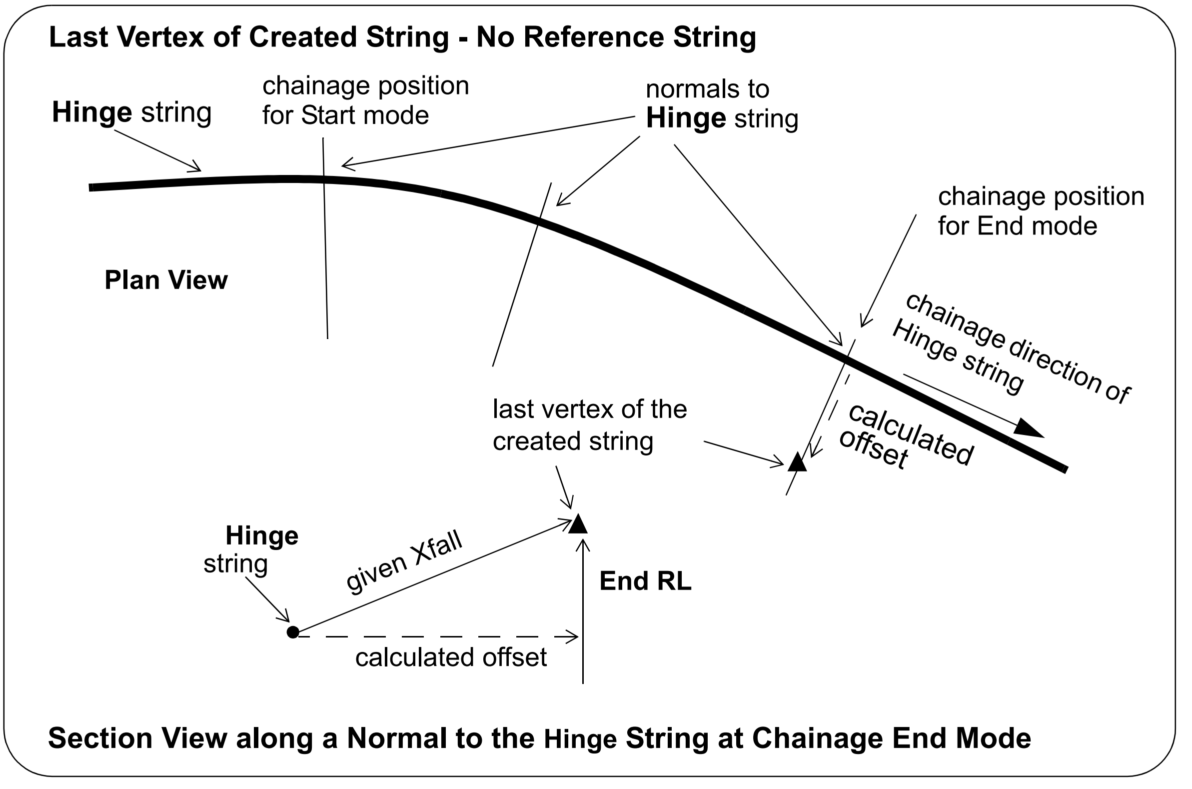


For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

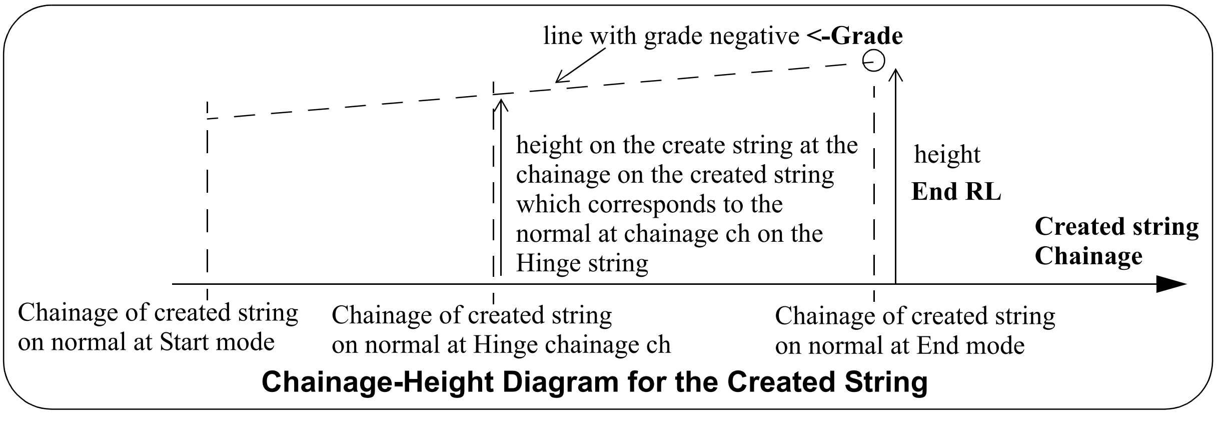
Reference String NOT Selected

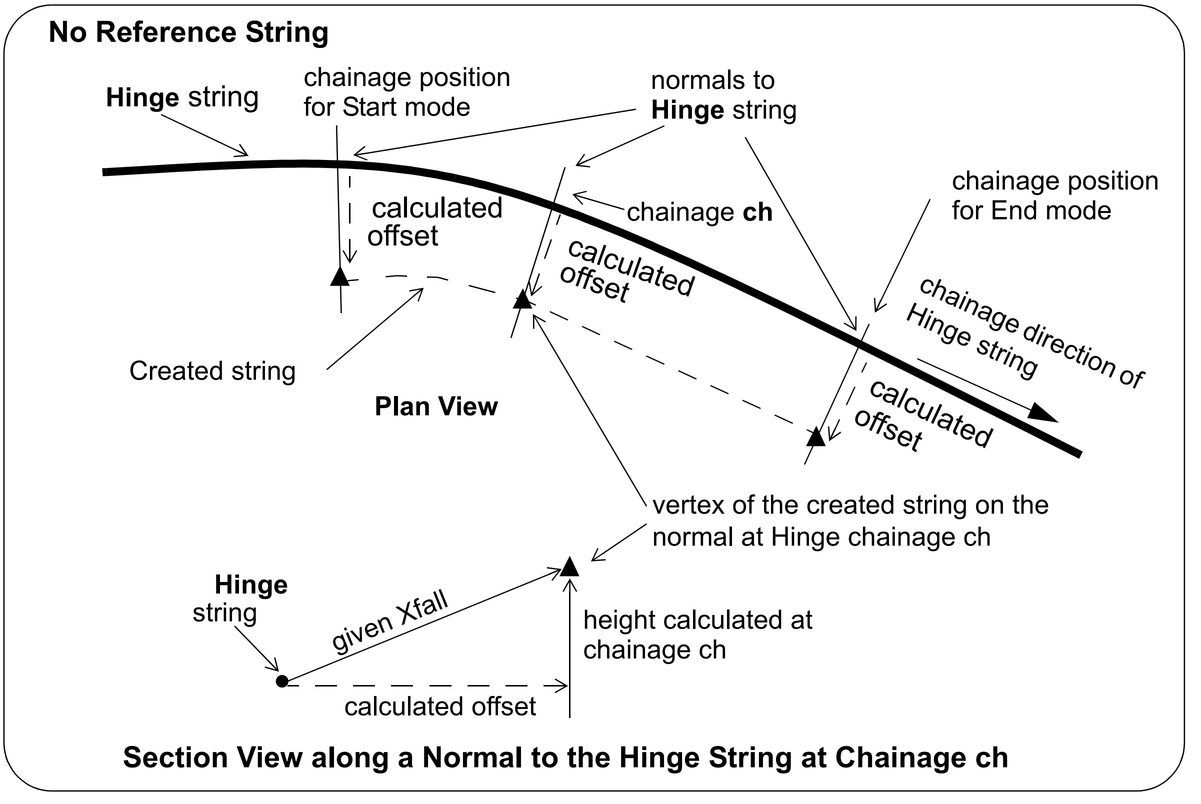
If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The **last vertex** of the created string is on the normal to the Hinge string and has a **height End RL**. The offset for the last vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **End RL**.



The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative ***<-Grade*** and going through the last vertex.

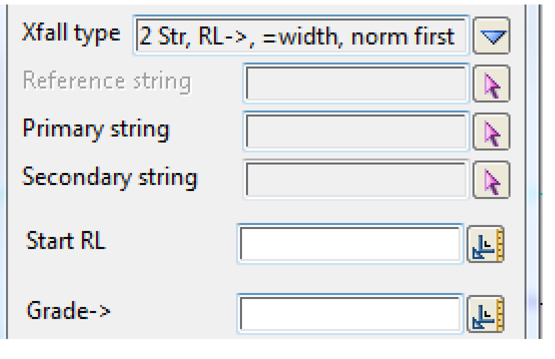




For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.12 2 Strings, Start RL & Grade, Equal Width, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.12 2 Strings, Start RL & Grade, Equal Width, Normal to Reference or Hinge String

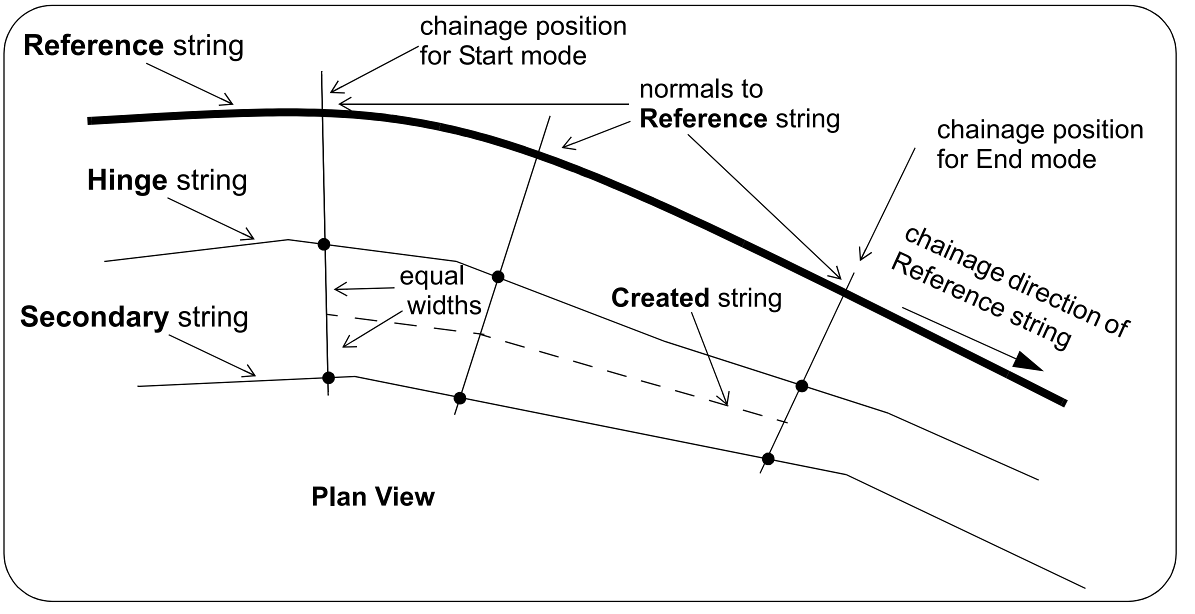


This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an **optional Reference** string.

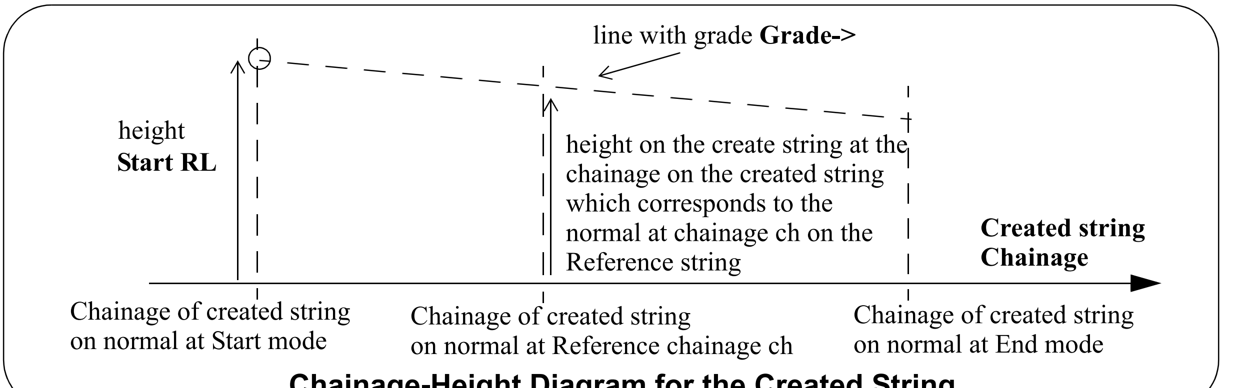
Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.



The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal to Start mode, Start RL).

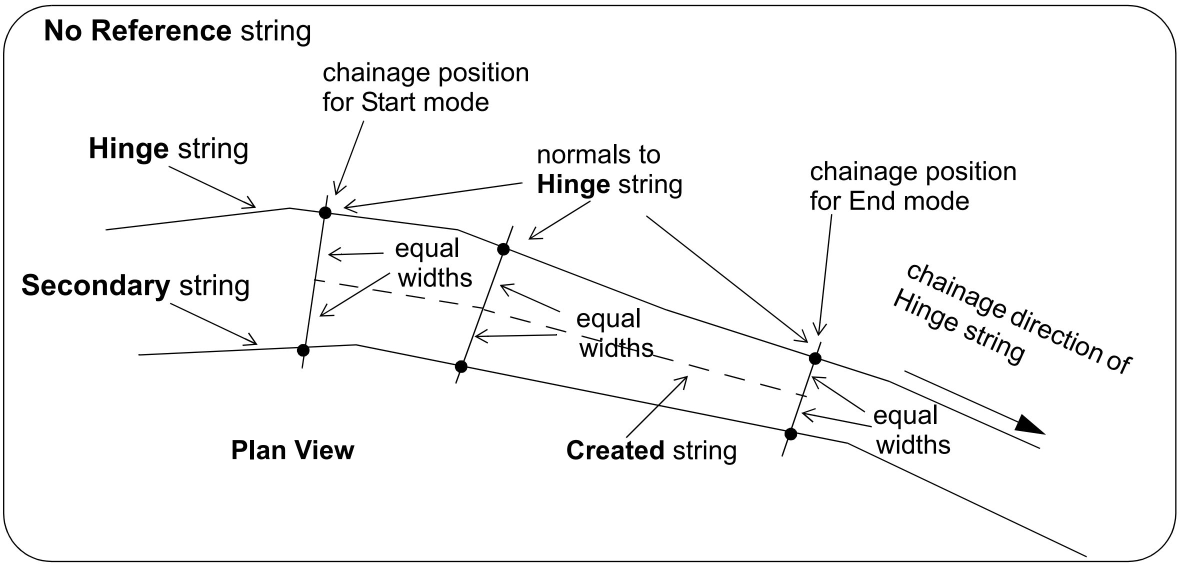


Chainage-Height Diagram for the Created String

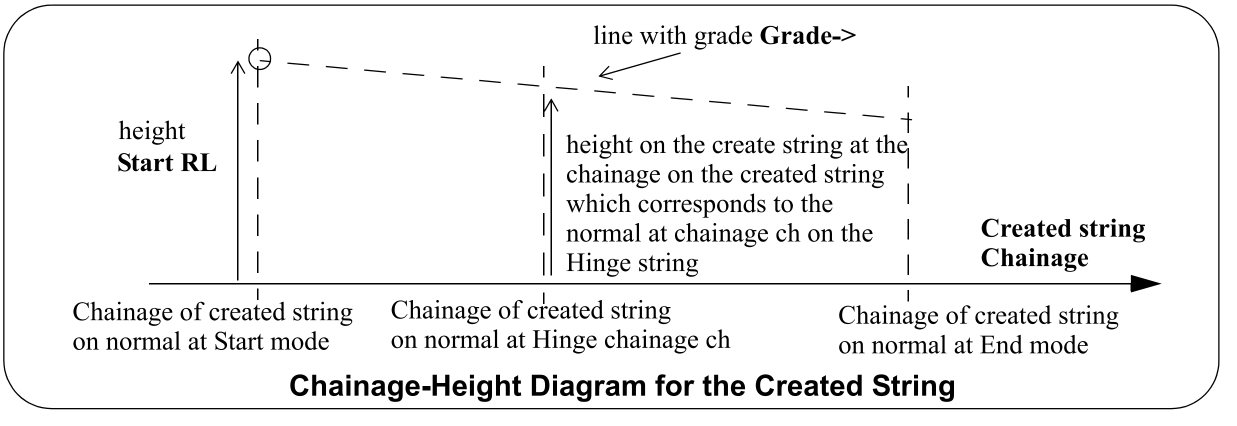
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

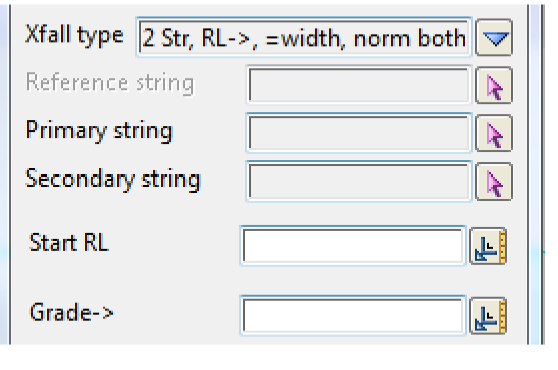


The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal to Start mode, Start RL).



Continue to the next choice 20.8.11.1.13 2 Strings, Start RL & Grade, Equal Width and Normal to Both or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.13 2 Strings, Start RL & Grade, Equal Width and Normal to Both



This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an **optional Reference** string.

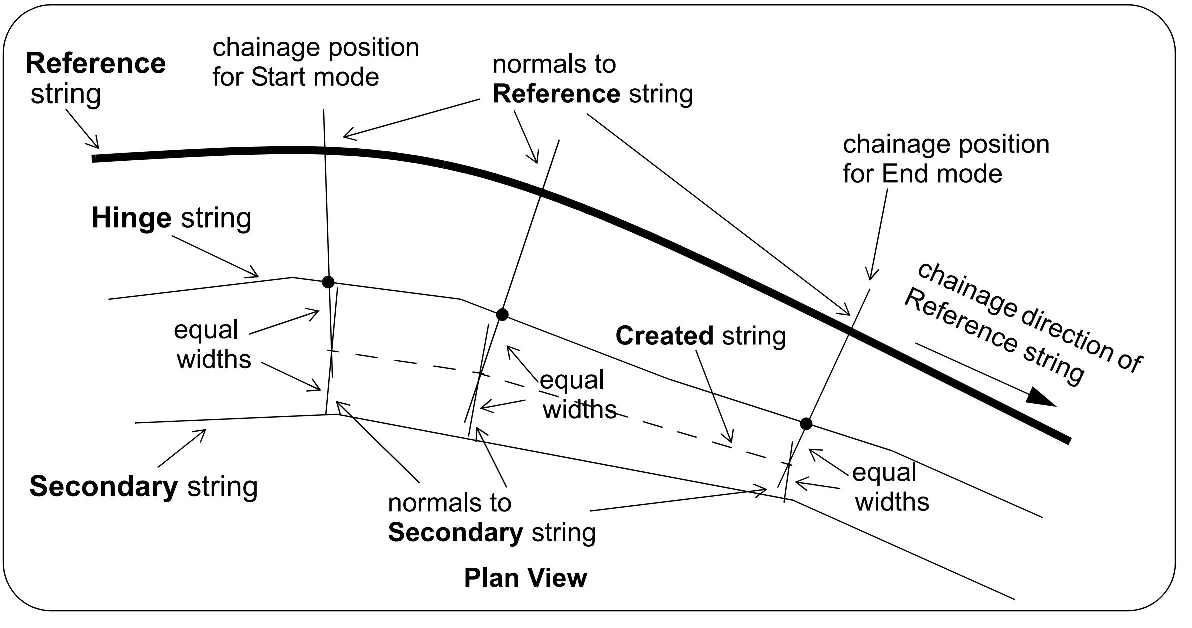
Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

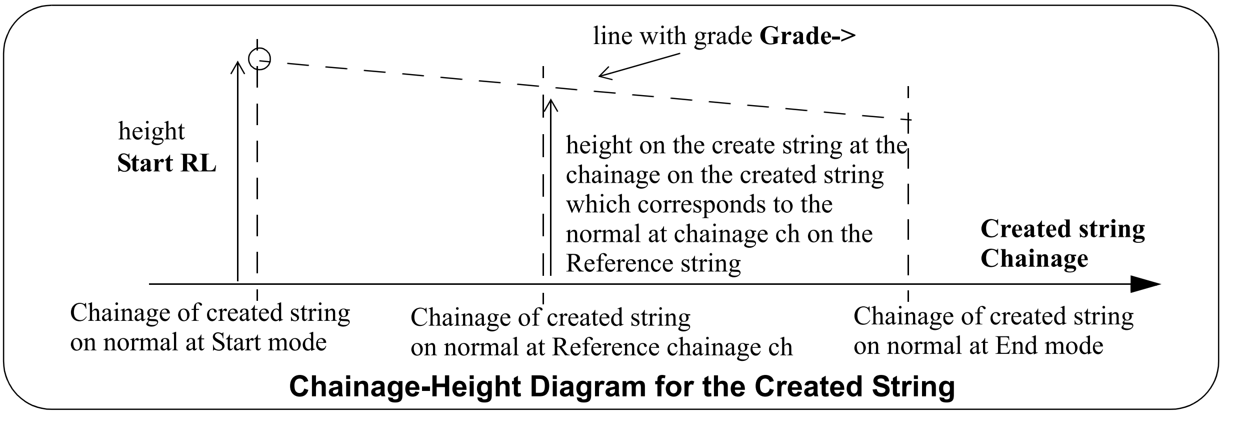
On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.



The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal to Start mode, Start RL).



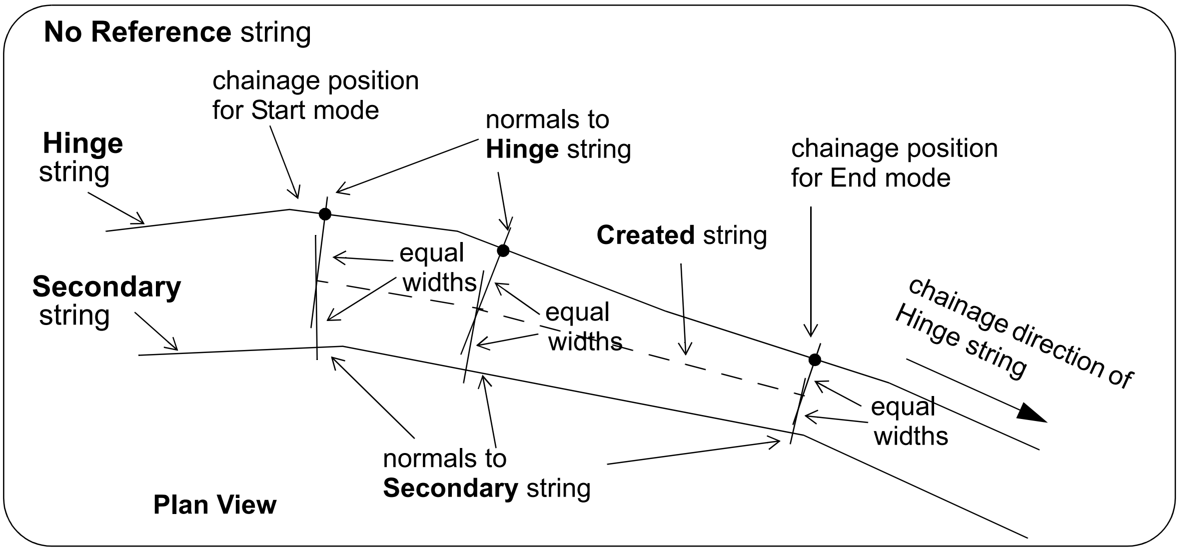
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge** string. The vertices of the created string lie on these normals.

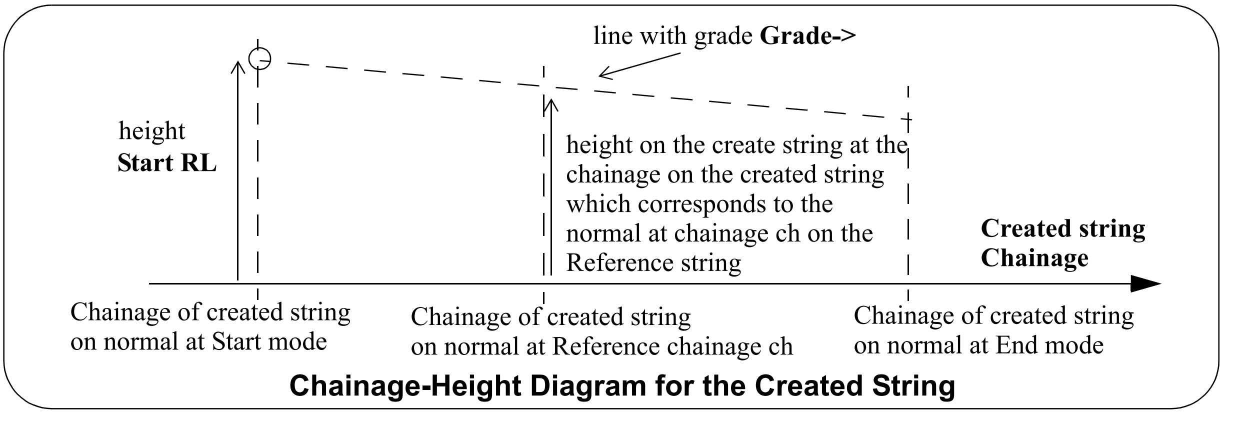
On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a **normal** to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Hinge string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.

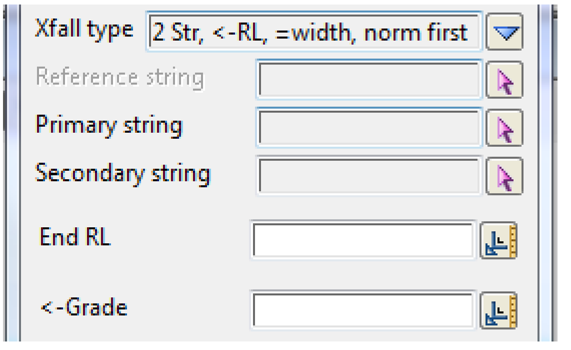


The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal to Start mode, Start RL).



Continue to the next choice 20.8.11.1.14 2 Strings, End RL & Grade, Equal Width, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.14 2 Strings, End RL & Grade, Equal Width, Normal to Reference or Hinge String

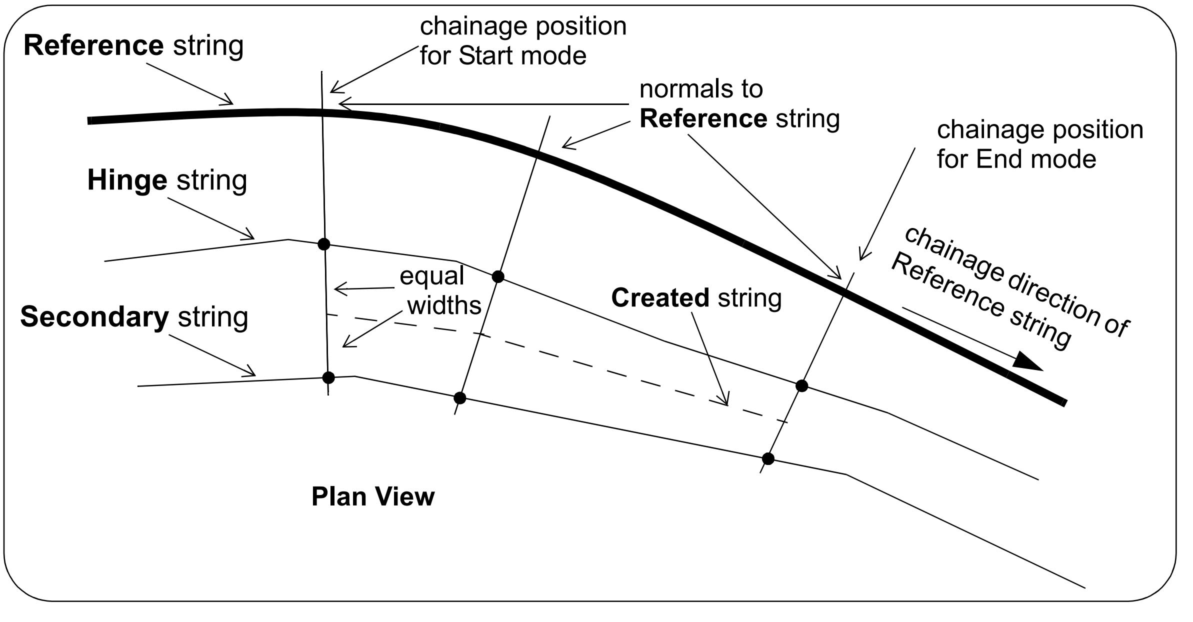


This option requires a **Hinge** and a **Secondary** string, a **End RL** and backward **Grade**, and an **optional Reference** string.

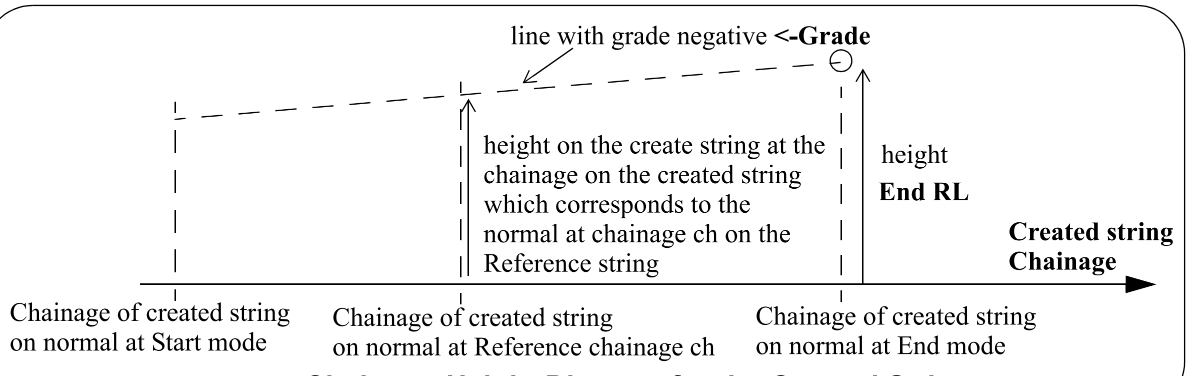
Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.



The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).



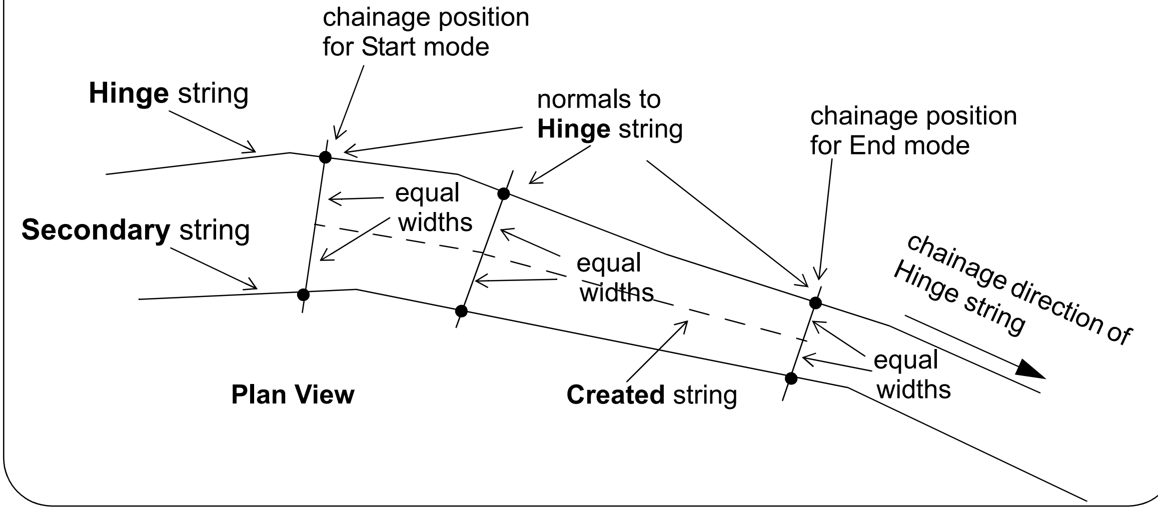
Chainage-Height Diagram for the Created String

Reference String NOT Selected

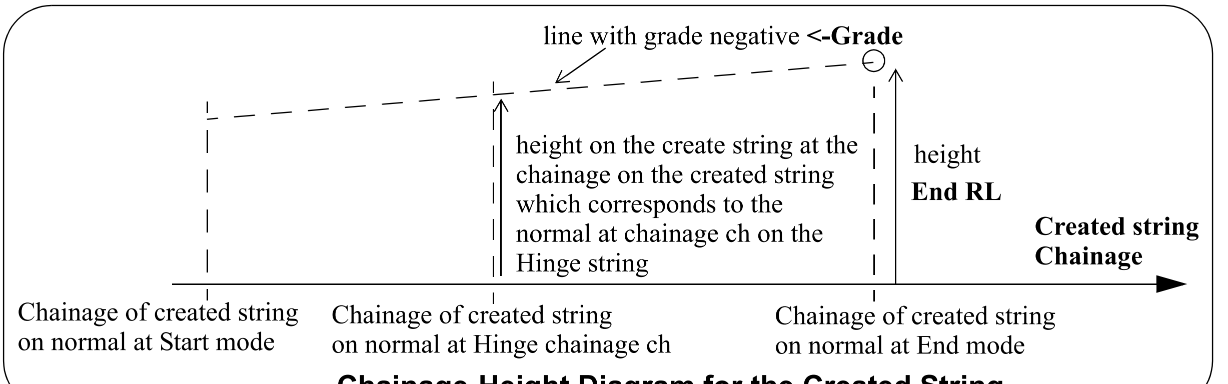
If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

No Reference string



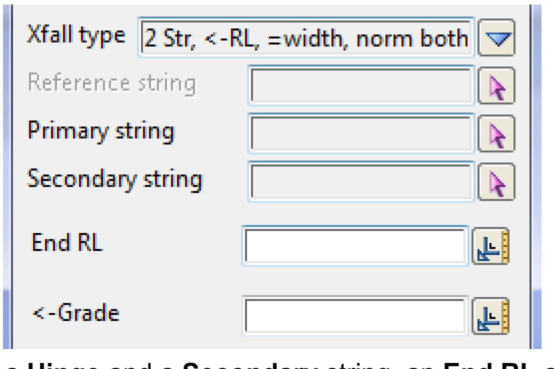
The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).



Chainage-Height Diagram for the Created String

Continue to the next choice 20.8.11.1.15 2 Strings, End RL & Grade, Equal Width and Normal to Both or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.15 2 Strings, End RL & Grade, Equal Width and Normal to Both



This option requires a **Hinge** and a **Secondary** string, an **End RL** and backward **Grade**, and an **optional Reference** string.

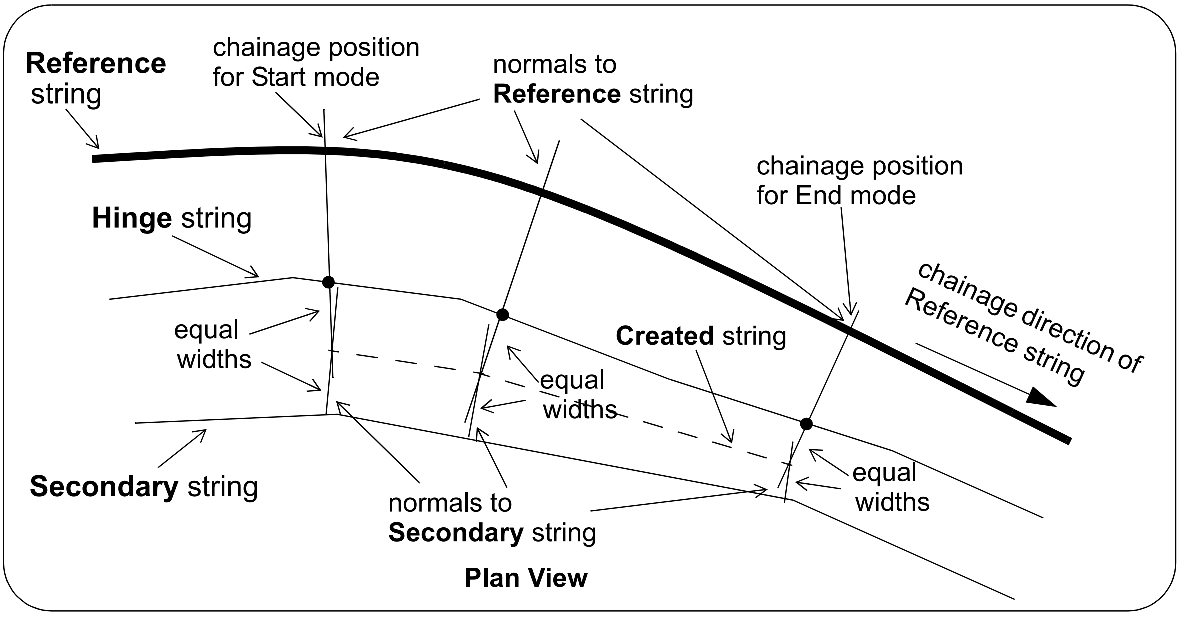
Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

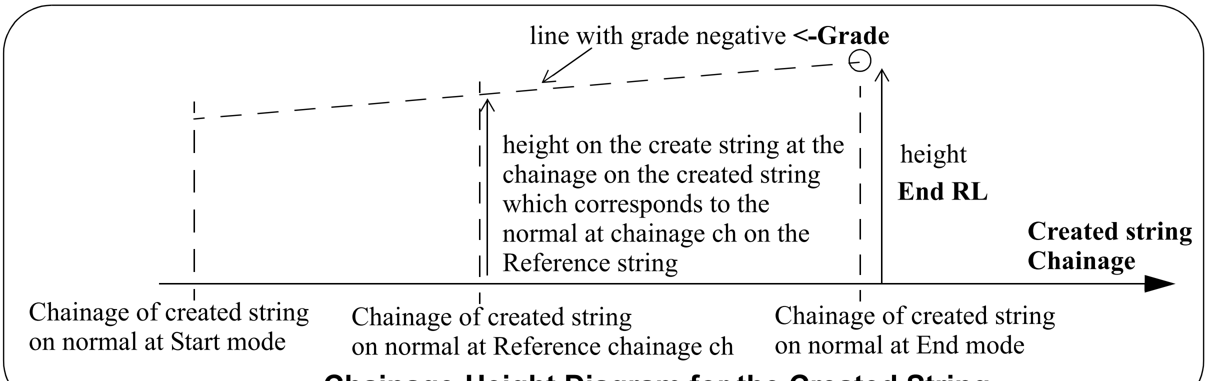
On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.



The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).



Chainage-Height Diagram for the Created String

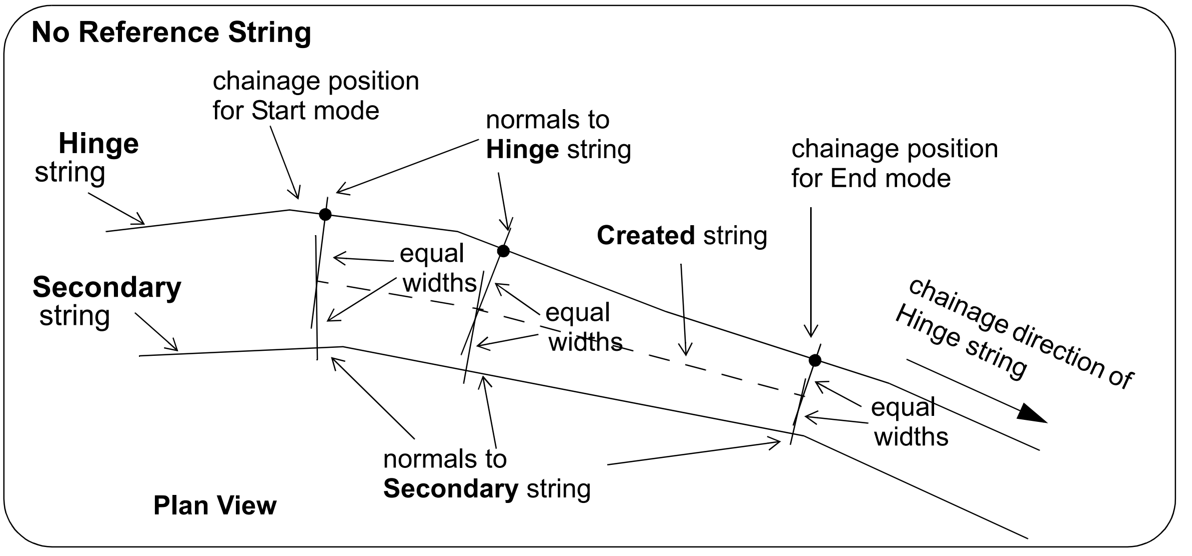
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge** string. The vertices of the created string lie on these normals.

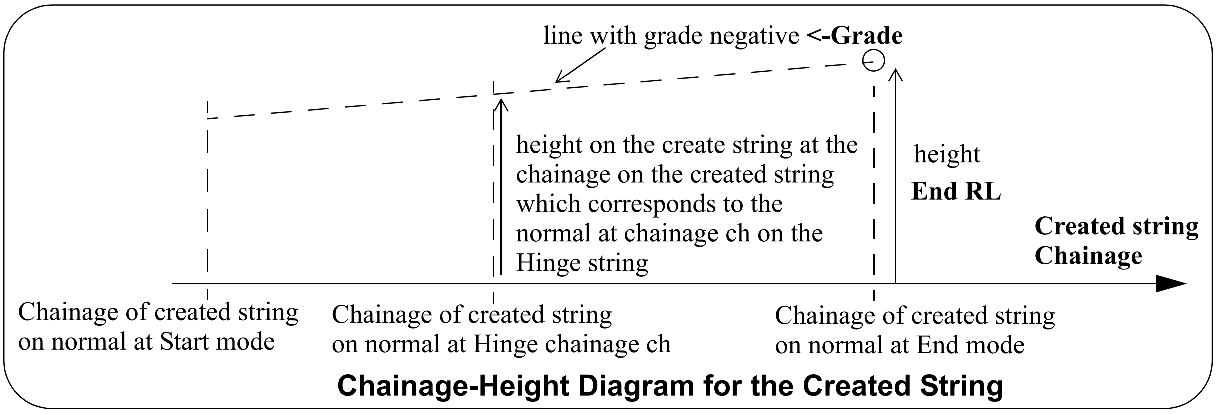
On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a **normal** to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Hinge string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.



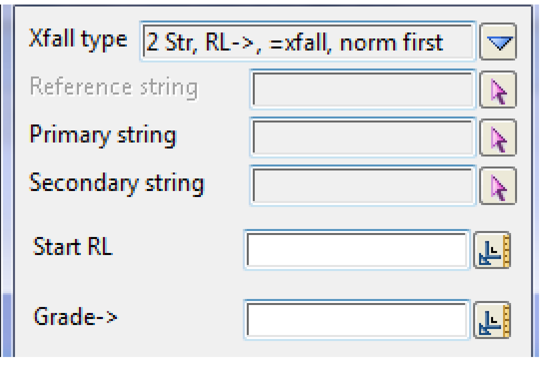
The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).



Chainage-Height Diagram for the Created String

Continue to the next choice 20.8.11.1.16 2 Strings, Start RL & Grade, Equal Xfall, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.16 2 Strings, Start RL & Grade, Equal Xfall, Normal to Reference or Hinge String

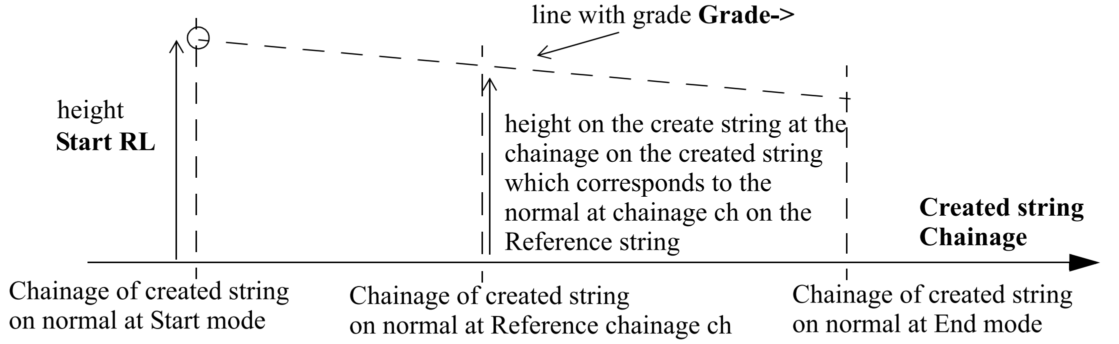


This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an **optional Reference** string.

Reference String Selected

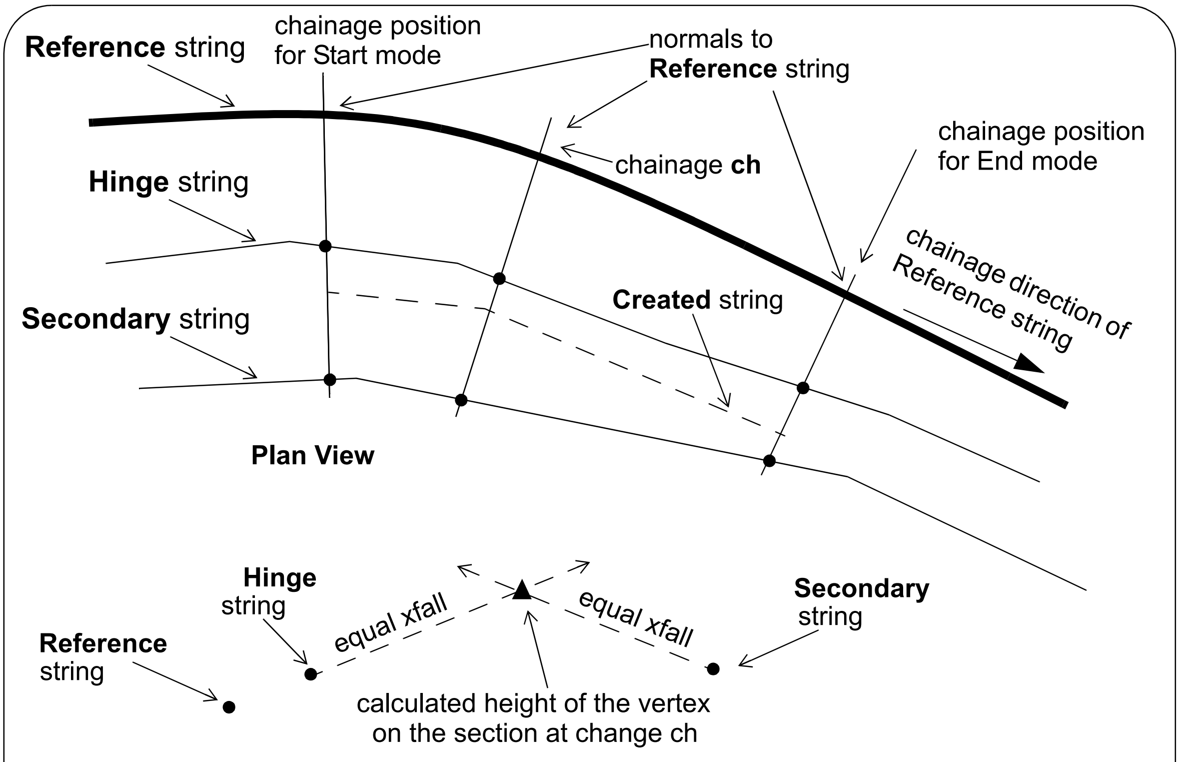
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal at Start mode, Start RL).



Chainage-Height Diagram for the Created String

On the section normal to the Reference string at chainage ch, the plan position of the vertex (with the calculated height) is such that the absolute value of the xfall from the Hinge string to the vertex, and the vertex to the Secondary string, is the same.This gives the plan position of the new vertex of the new string.

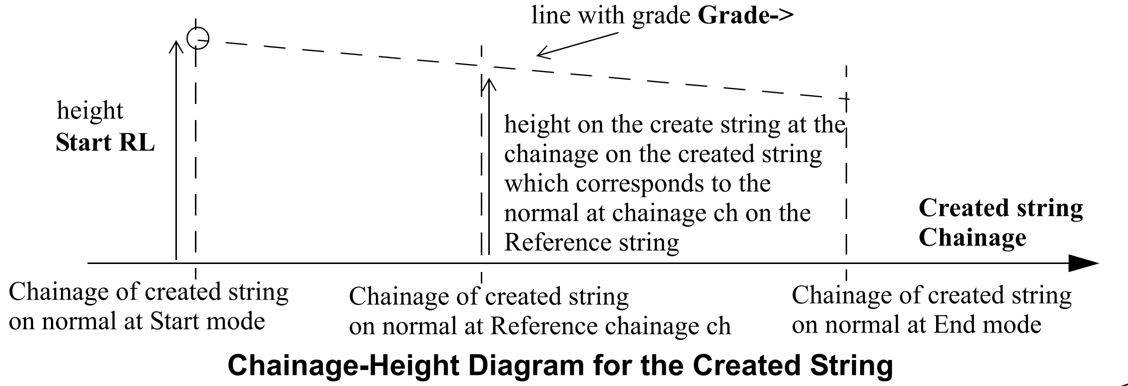


Section View along a Normal to the Reference String at Chainage ch

Reference String NOT Selected

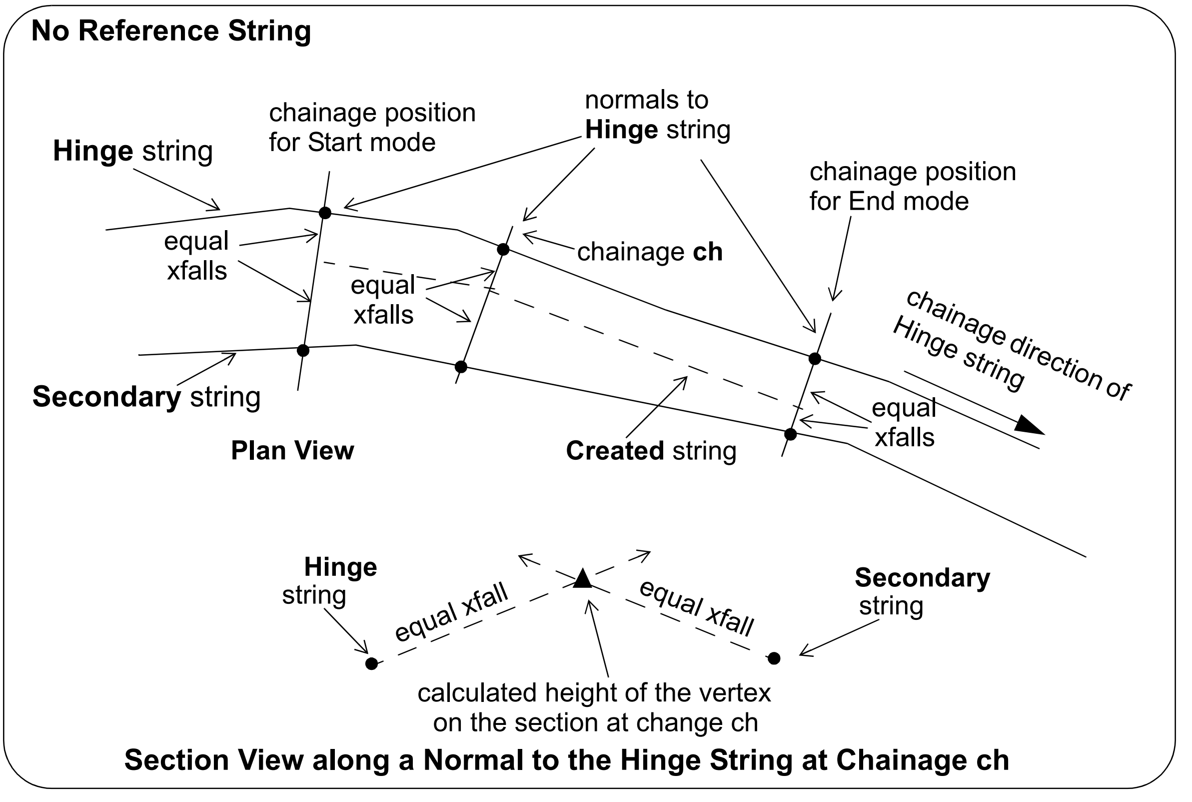
If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** string. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal at Start mode, Start RL).



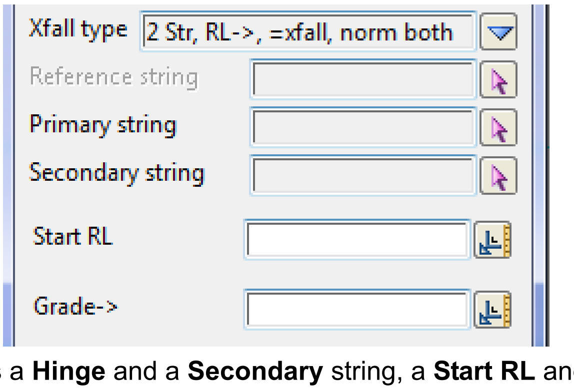
Chainage-Height Diagram for the Created String

On the section normal to the Hinge string at chainage ch, the plan position of the vertex (with the calculated height) is such that the absolute value of the xfall from the Hinge string to the vertex, and the vertex to the Secondary string, is the same.This gives the plan position of the new vertex of the new string.



Continue to the next choice 20.8.11.1.17 2 Strings, Start RL & Grade, Equal Xfall and Normal to Both or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.17 2 Strings, Start RL & Grade, Equal Xfall and Normal to Both

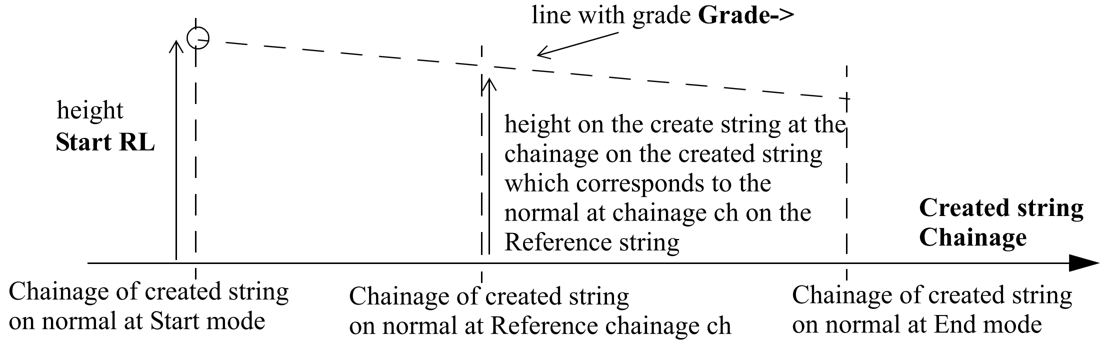


This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an **optional Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal at Start mode, Start RL).

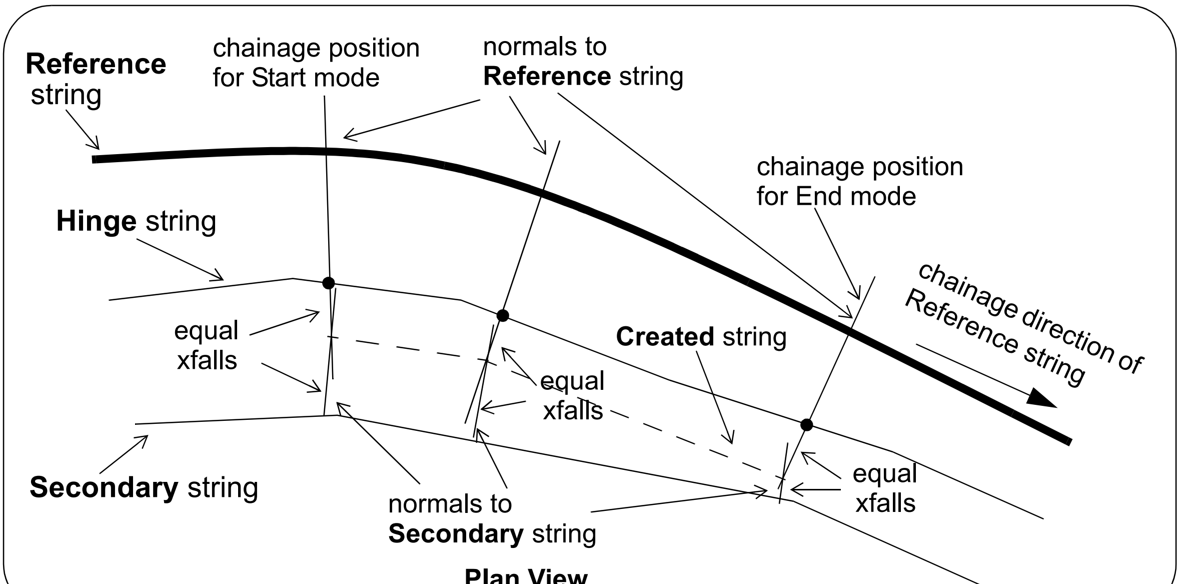


Chainage-Height Diagram for the Created String

On the section at Reference chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary** string, is the same.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.

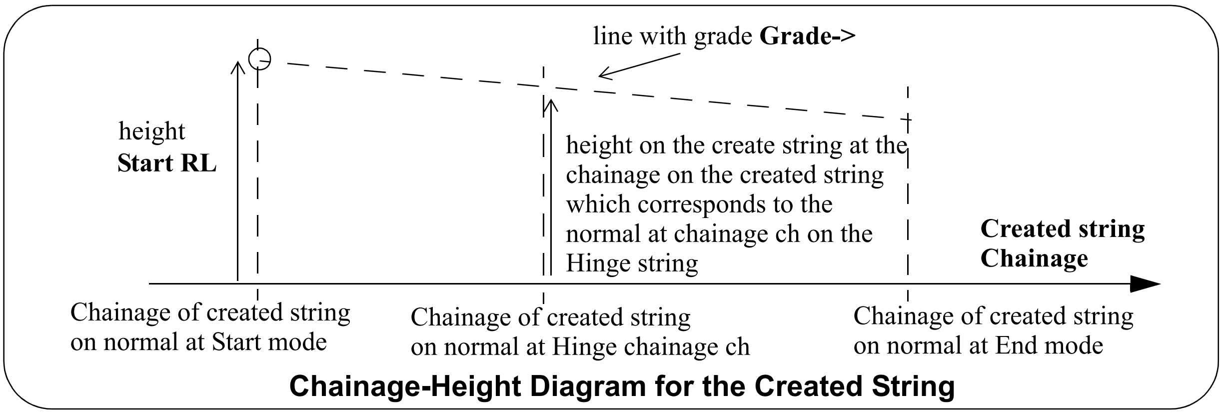


Plan View

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string.** The vertices of the created string lie on these normals.

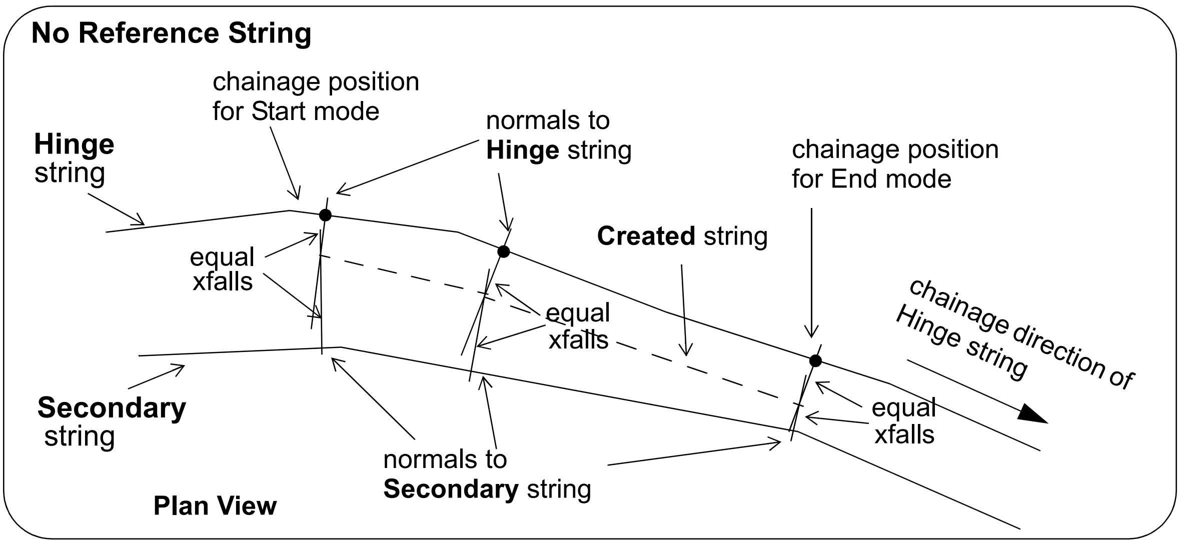
The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade ***Grade->*** and going through the point (normal at Start mode, Start RL).



On the section at Hinge chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary** string, is the same.

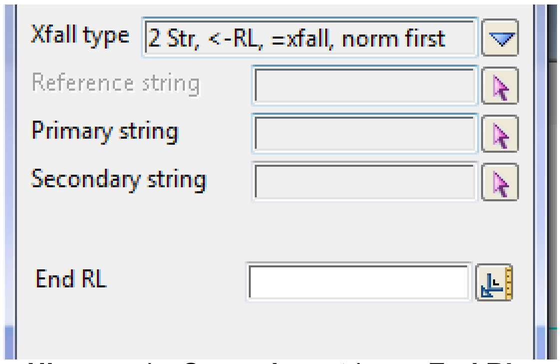
That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Hinge string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.



Continue to the next choice 20.8.11.1.18 2 Strings, End RL & Grade, Equal Xfall, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.18 2 Strings, End RL & Grade, Equal Xfall, Normal to Reference or Hinge String

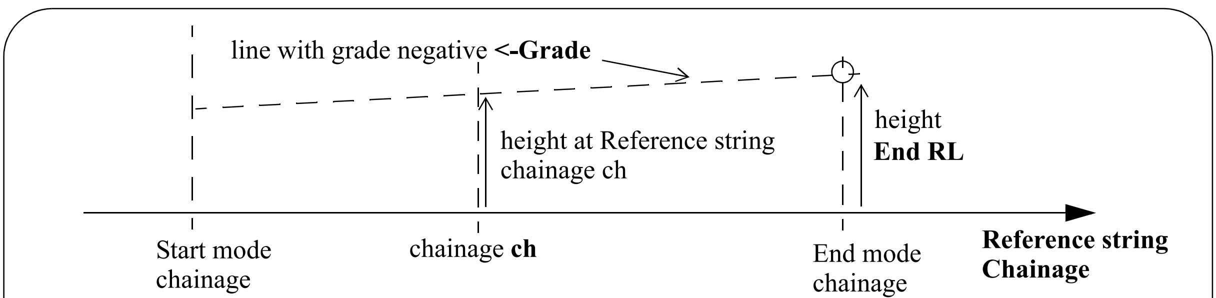


This option requires a **Hinge** and a **Secondary** string, a **End RL** and backward **Grade**, and an **optional Reference** string.

The height of the vertex (of the new string) on the section at chainage ch, is in (Reference string chainage, height) space, on the line with grade of negative **<-Grade** and going through the point (End mode, End RL).

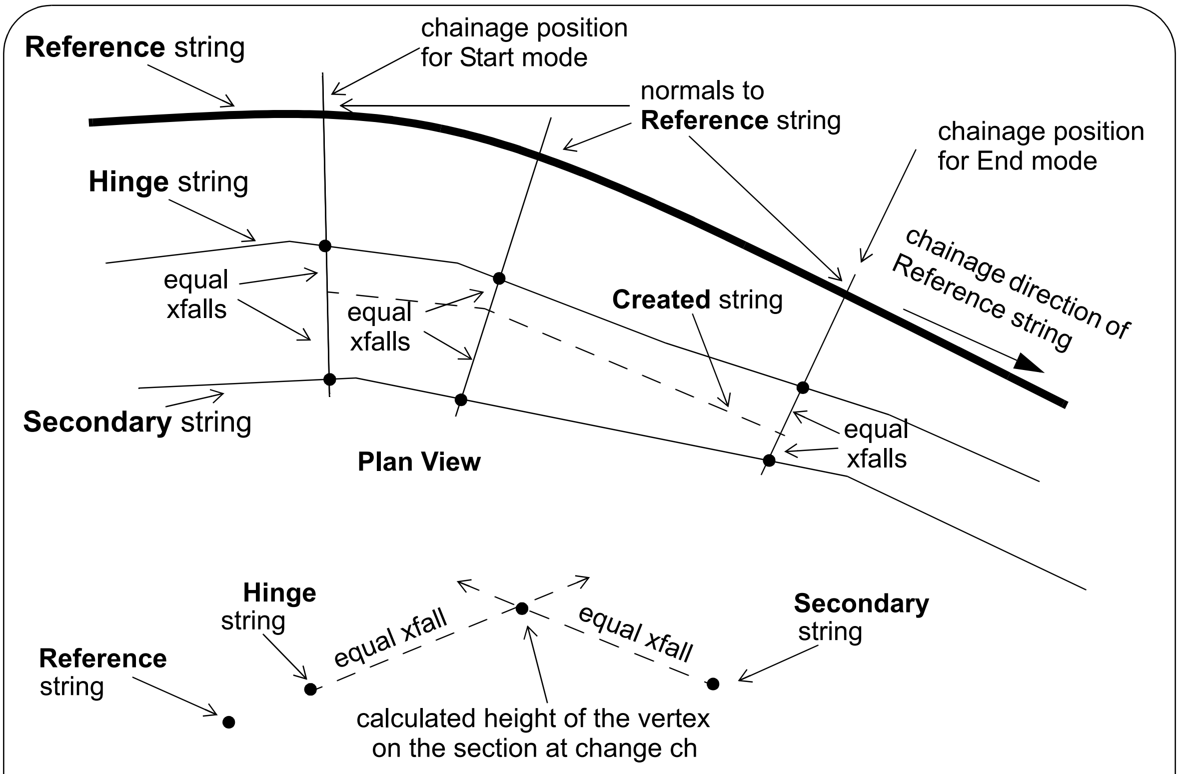
That is,

the "height at ch" = End RL - <-Grade *(End mode - ch)/(End mode - Start mode)/100



Chainage-Height Diagram for End RL and <-Grade

On the section normal to the Reference string at chainage ch, the position of the vertex with the calculated height is such that the absolute value of the xfall from the Hinge string to the vertex, and the absolute value of the xfall from the vertex to the Secondary string, are the same.



Section View along a Normal to the Reference String

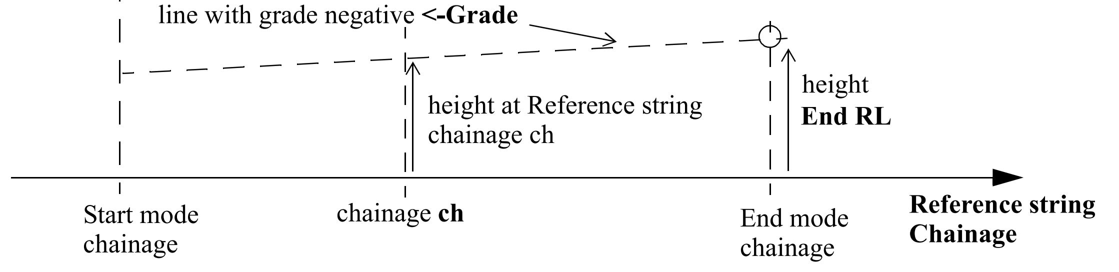
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to **Hinge** string and at each chainage (ch), a section is taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** strings.

The height of the vertex (of the new string) on the section at chainage ch, is in (Hinge string chainage, height) space, on the line with grade of negative **<-Grade** and going through the point (End mode, End RL).

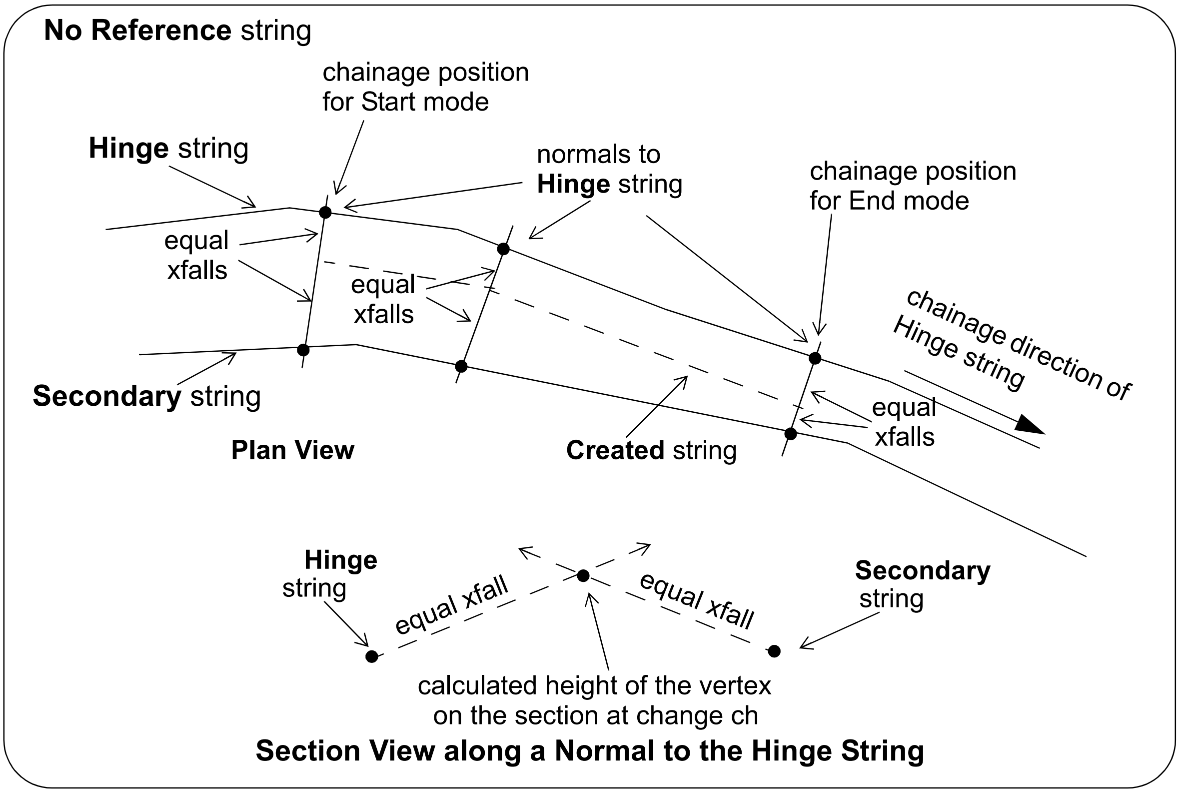
That is,

the "height at ch" = End RL - <-Grade *(End mode - ch)/(End mode - Start mode)/100



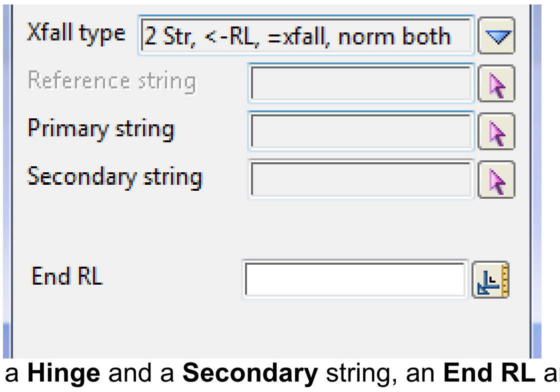
Chainage-Height Diagram for End RL and <-Grade

On the section normal to the Hinge string at chainage ch, the position of the vertex with the calculated height is such that the absolute value of the xfall from the Hinge string to the vertex, and the absolute value of the xfall from the vertex to the Secondary string, are the same.



Continue to the next choice 20.8.11.1.19 2 Strings, End RL & Grade, Equal Xfall and Normal to Both or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.19 2 Strings, End RL & Grade, Equal Xfall and Normal to Both

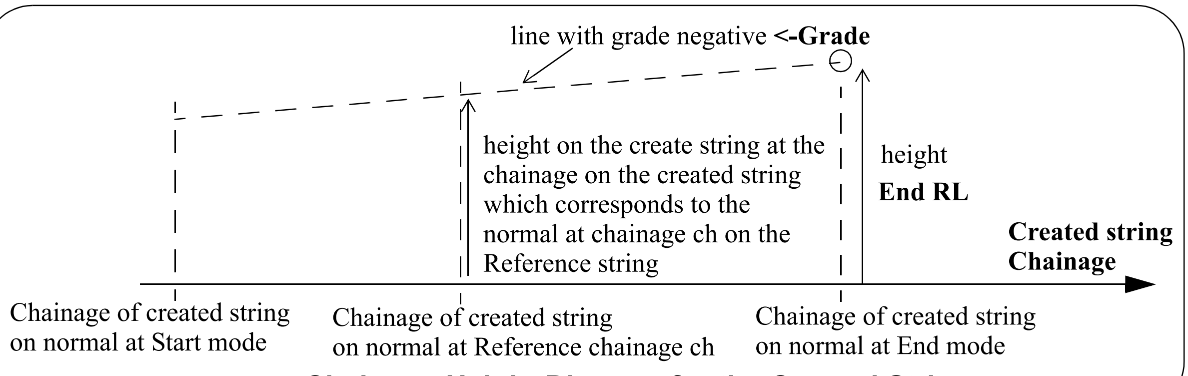


This option requires a **Hinge** and a **Secondary** string, an **End RL** and backward **Grade**, and an **optional Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).

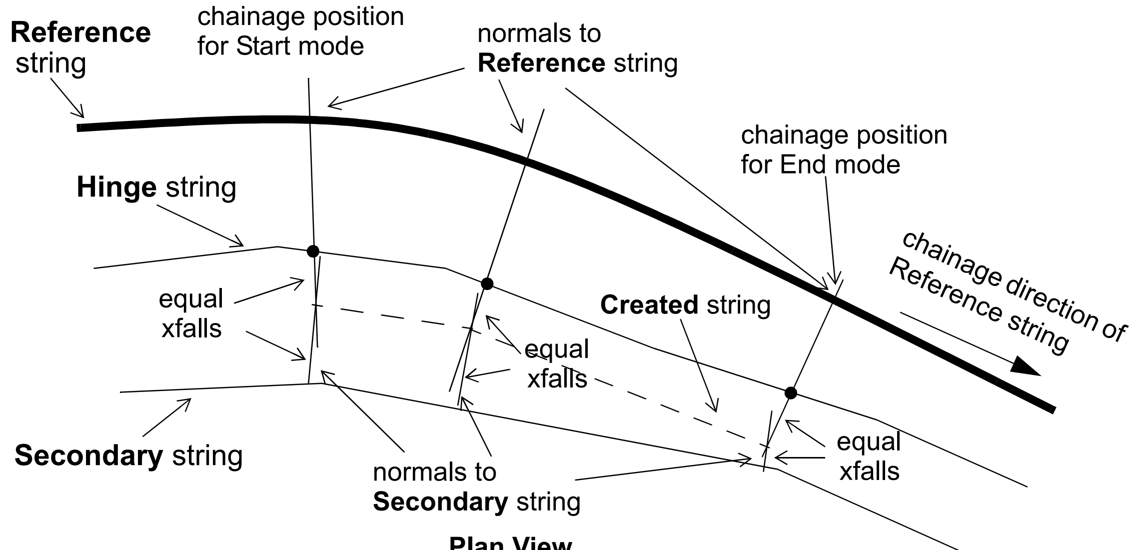


Chainage-Height Diagram for the Created String

On the section at Reference chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary** string, is the same.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.

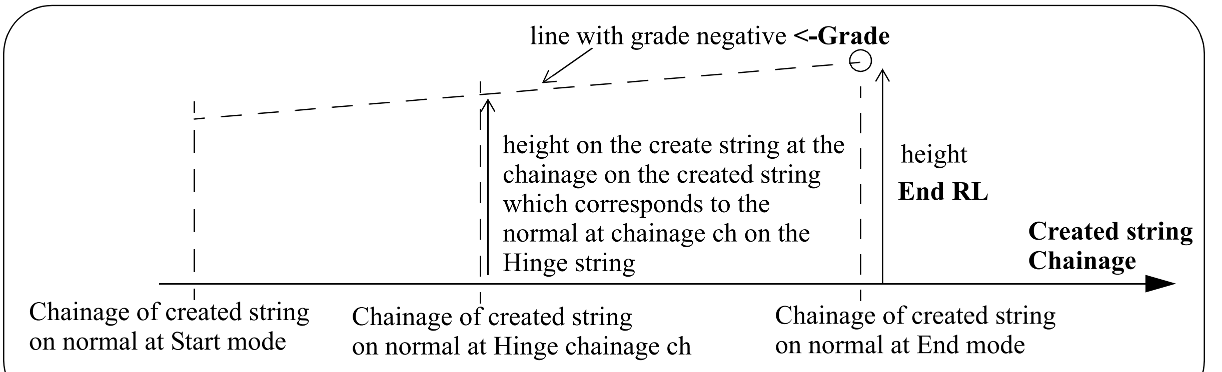


Plan View

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).

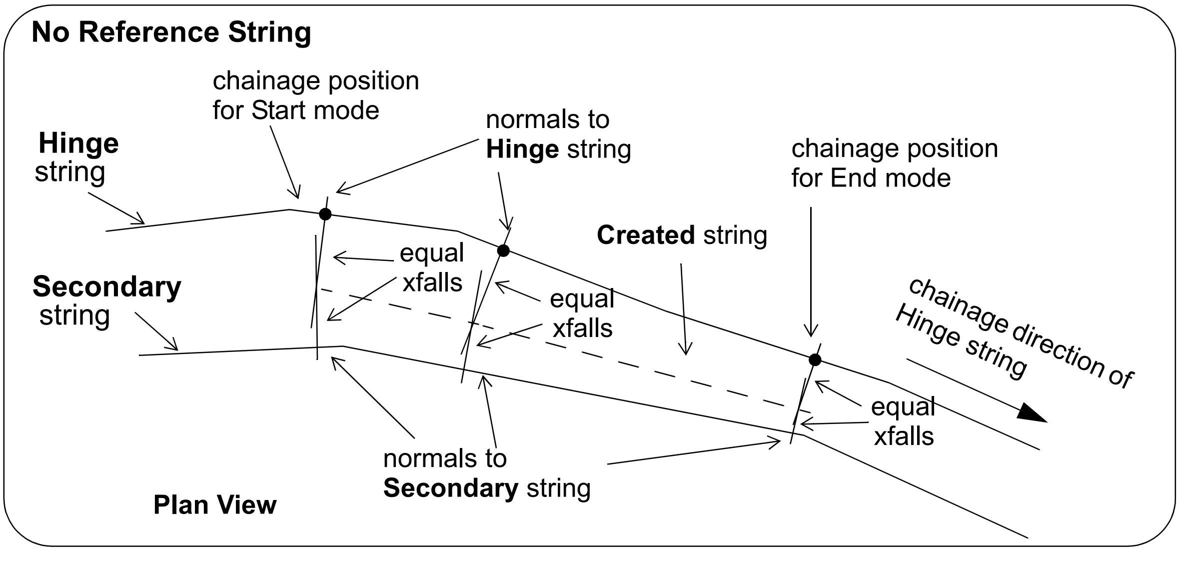


Chainage-Height Diagram for the Created String

On the section at Hinge chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary** string, is the same.

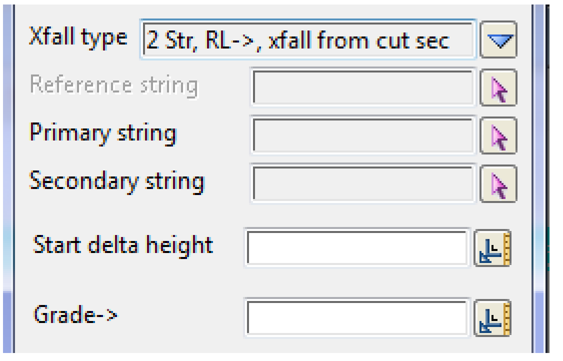
That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Hinge string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.



Continue to the next choice 20.8.11.1.20 2 Strings, Start Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.20 2 Strings, Start Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String



This option requires a **Hinge** and a **Secondary** string, a **Start delta height** and forward **Grade**, and an **optional Reference** string.

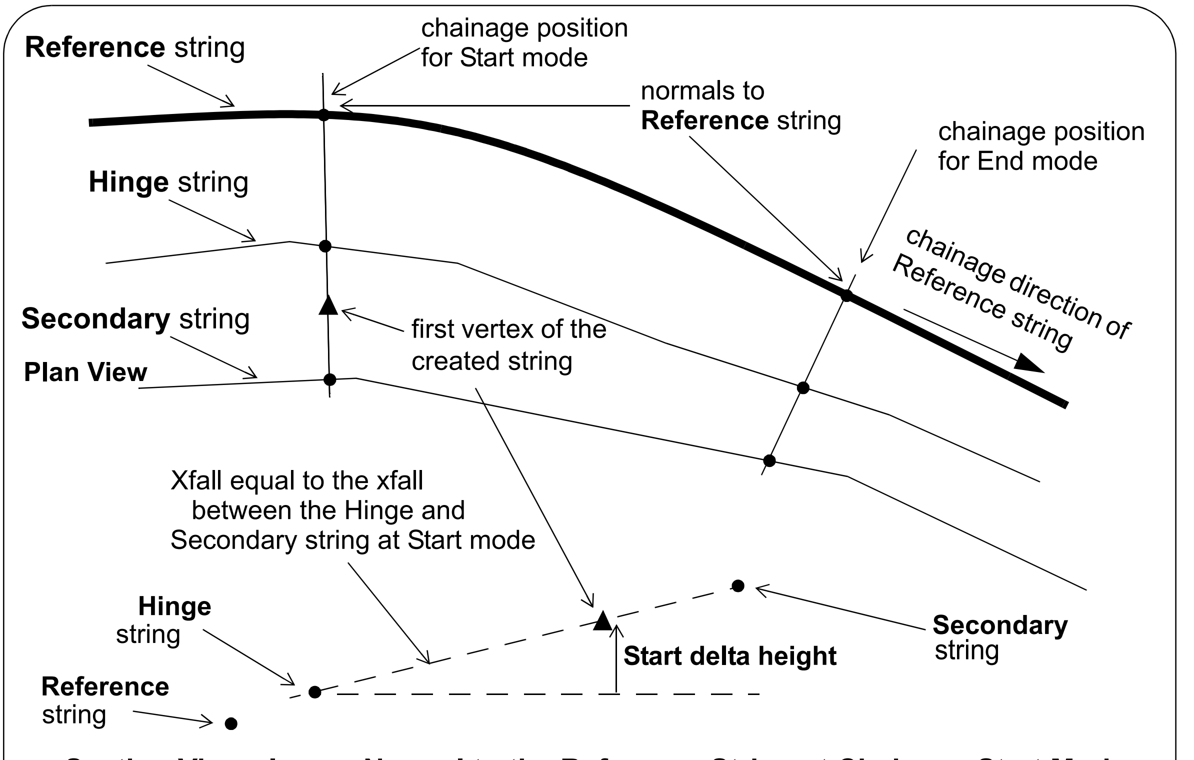
Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Reference string at chainage **Start mode**, and its **height** is the height of the Hinge string on the Start mode normal, plus Start delta height.

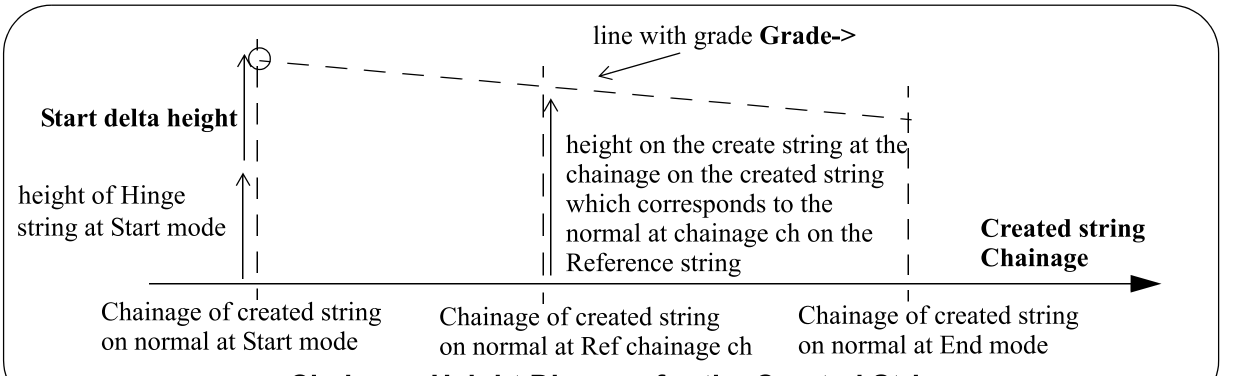
height of first vertex = height of Hinge string on Start mode normal + Start delta height

The plan position of the first vertex is on the Start mode normal, and with an offset from the Hinge string such that the Xfall is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **Start delta height**.



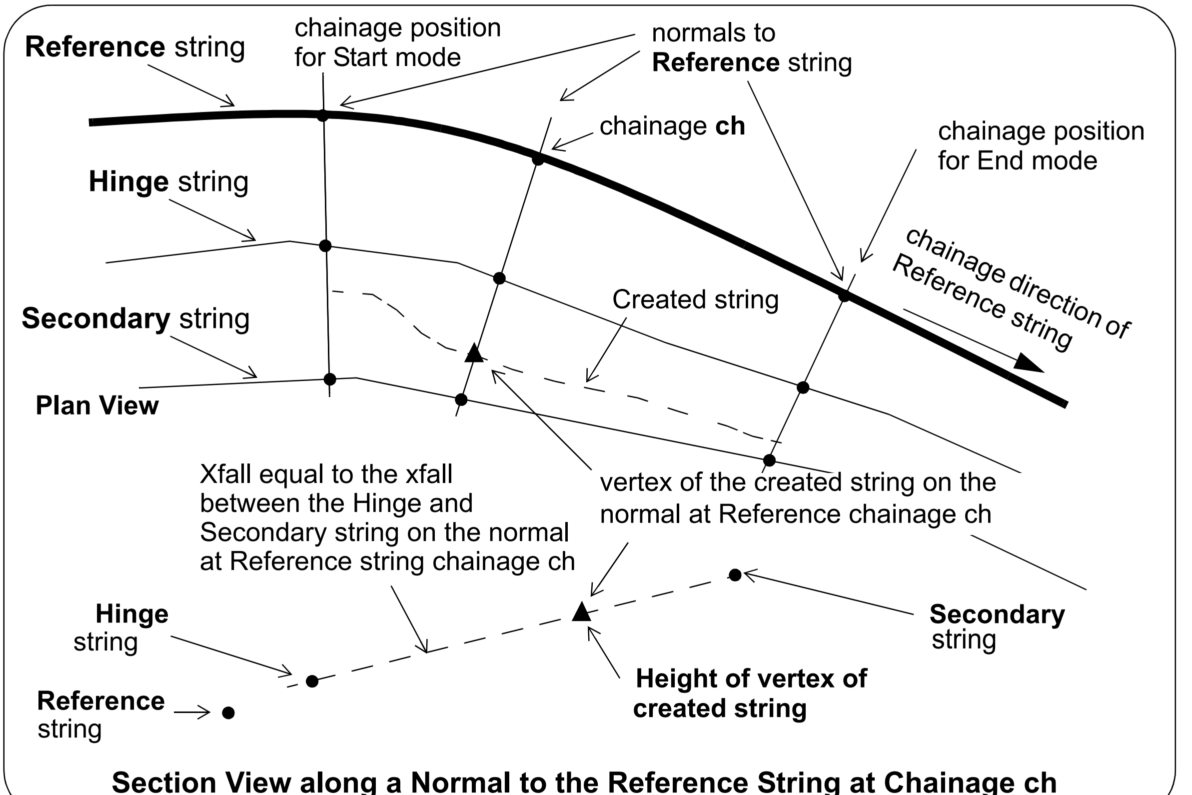
Section View along a Normal to the Reference String at Chainage Start Mode

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade ***Grade->*** and going through the first vertex.



Chainage-Height Diagram for the Created String

The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is such that it is on the line through the Hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.



Section View along a Normal to the Reference String at Chainage ch

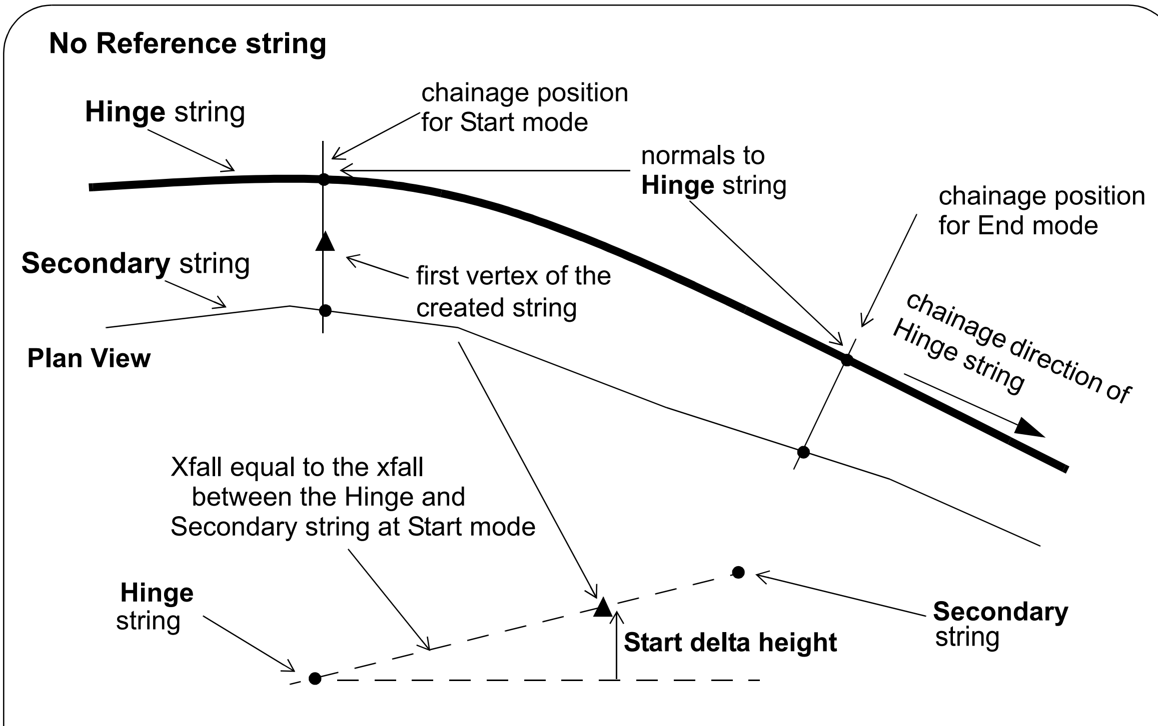
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** string. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Hinge string at chainage **Start mode**, and its height is the height of the Hinge string on the Start mode normal, plus Start delta height.

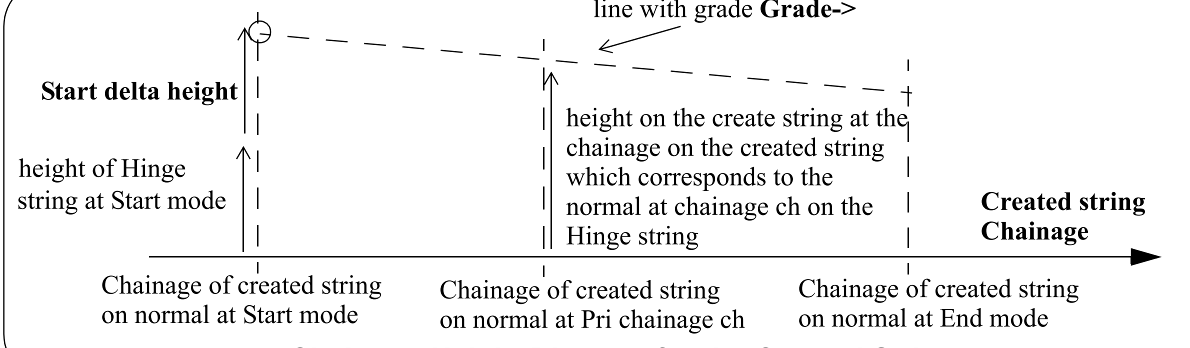
height of first vertex = height of Hinge string on Start mode normal + Start delta height

The plan position of the first vertex is on the Start mode normal, and with an offset from the Hinge string such that the Xfall is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **Start delta height**.



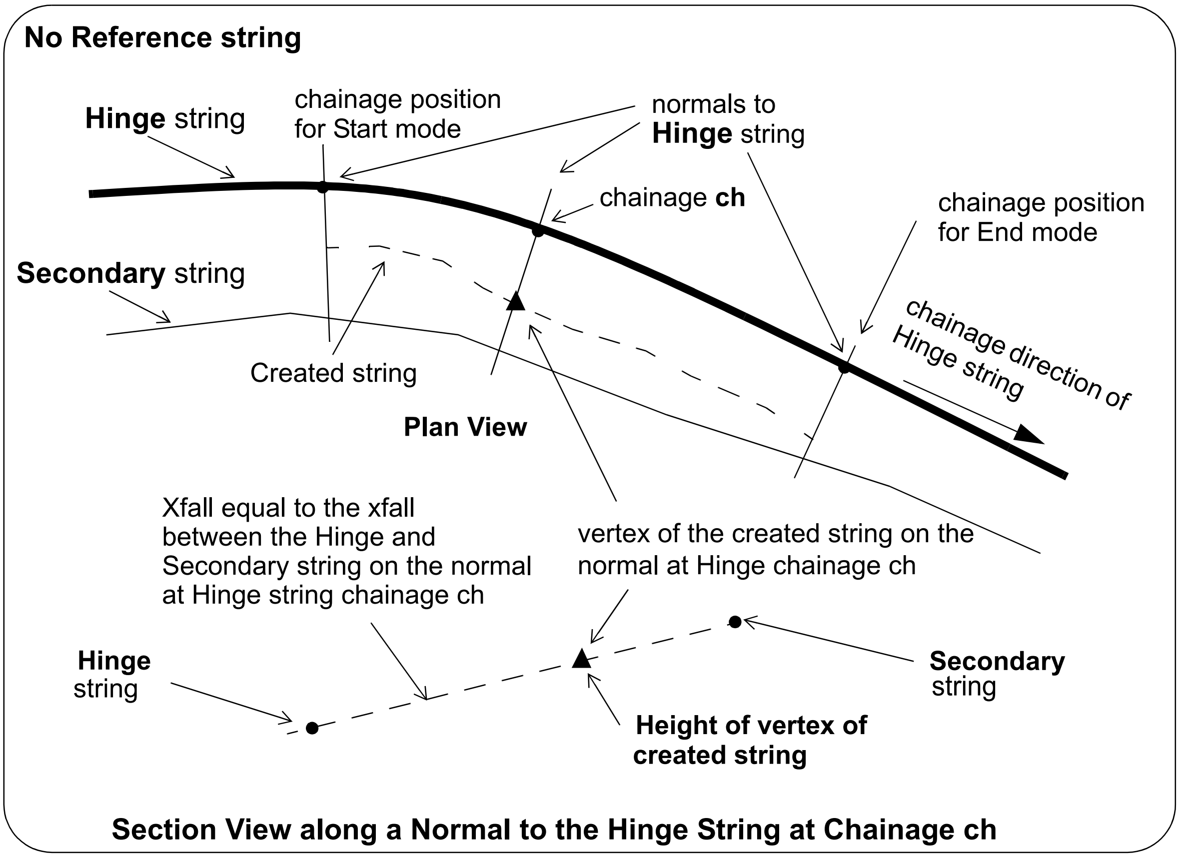
Section View along a Normal to the Hinge String at Chainage Start Mode

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade ***Grade->*** and going through the first vertex.



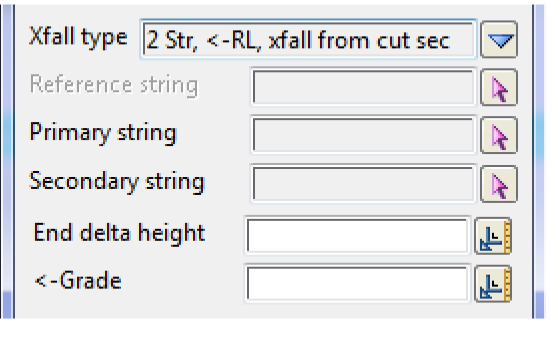
Chainage-Height Diagram for the Created String

The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is such that it is on the line through the Hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.



Continue to the next choice 20.8.11.1.21 2 Strings, End Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.21 2 Strings, End Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String



This option requires a **Hinge** and a **Secondary** string, an **End delta height** and backward **Grade**, and an **optional Reference** string.

Reference String Selected

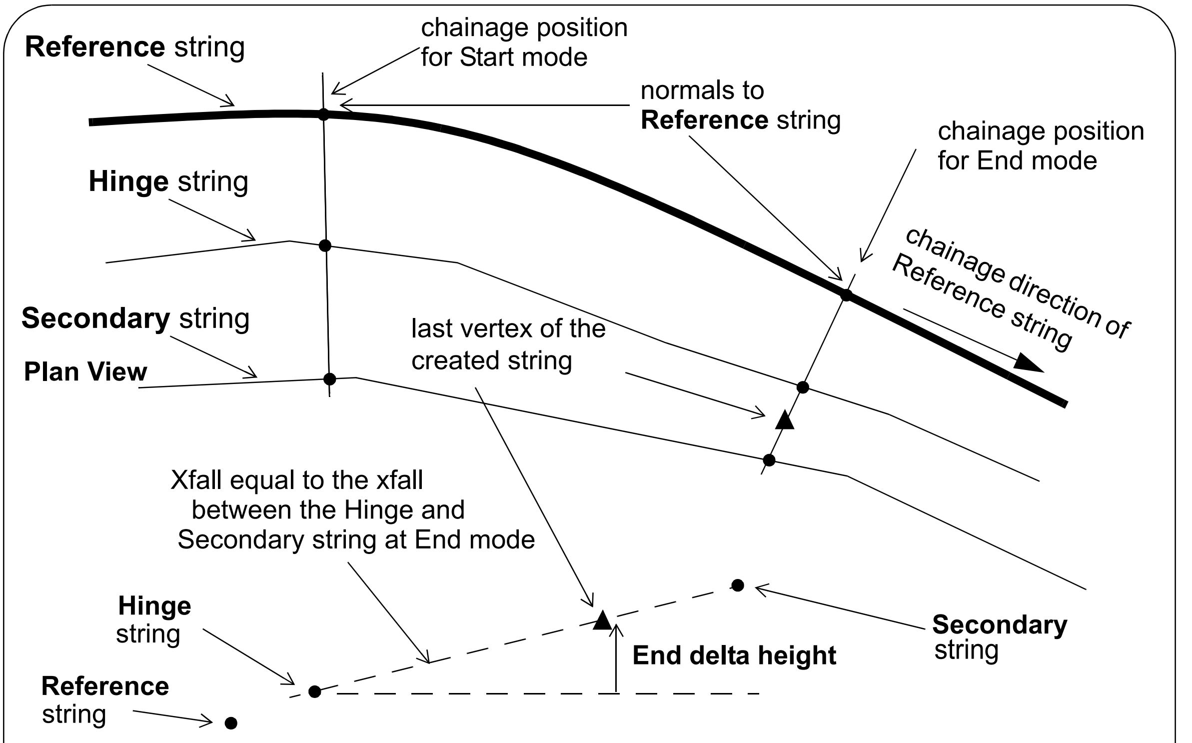
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The **last vertex** of the created string is on the normal to the Reference string at chainage **End**

mode, and its height is the height of the Hinge string on the End mode normal, plus End delta height.

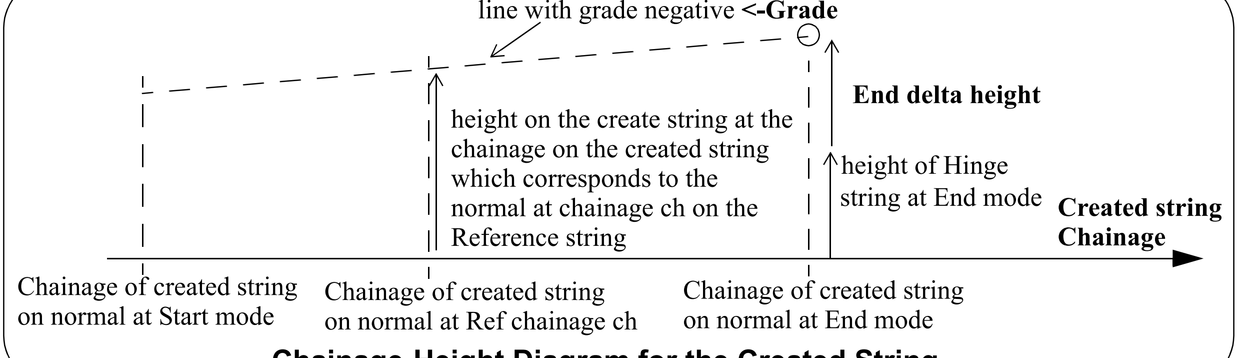
height of last vertex = height of Hinge string on End mode normal + End delta height

The plan position of the last vertex is on the End mode normal, and with an offset from the Hinge string such that the Xfall is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **End delta height**.



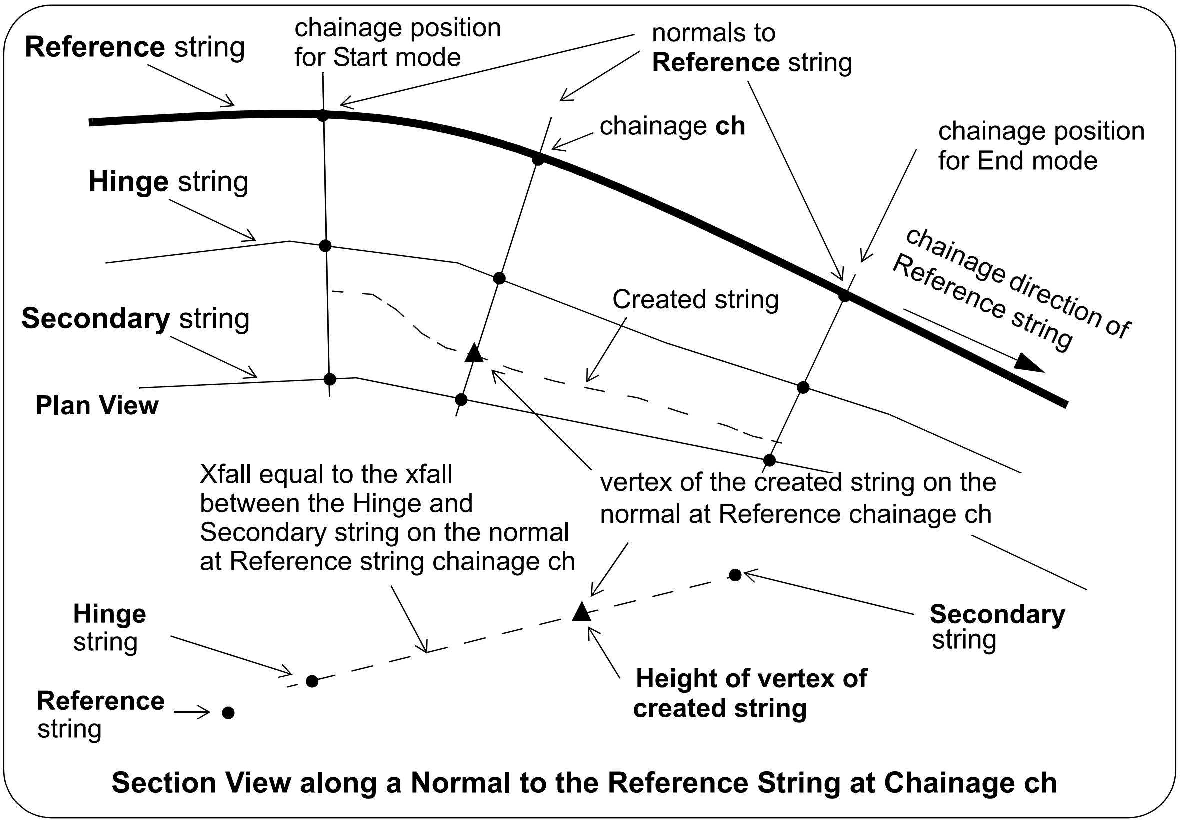
Section View along a Normal to the Reference String at Chainage End Mode

The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative ***<-Grade*** and going through the last vertex.



Chainage-Height Diagram for the Created String

The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is such that it is on the line through the Hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.



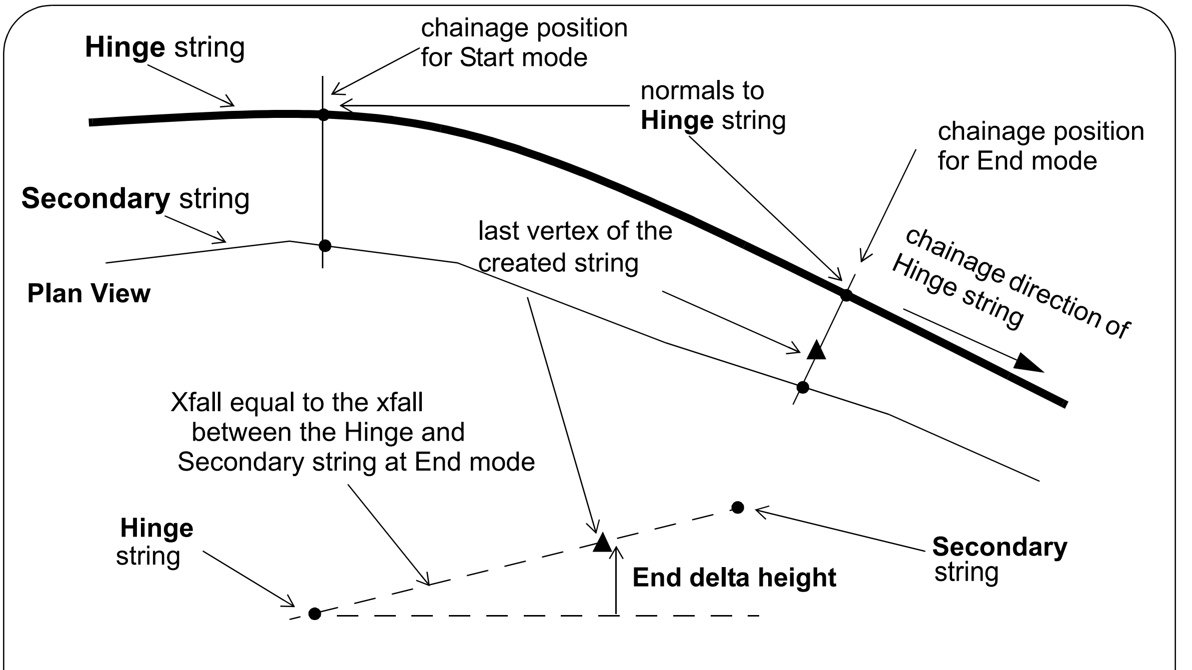
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** string. The vertices of the created string lie on these normals.

The **last vertex** of the created string is on the normal to the Hinge string at chainage **End mode**, and its height is the height of the Hinge string on the End mode normal, plus End delta height.

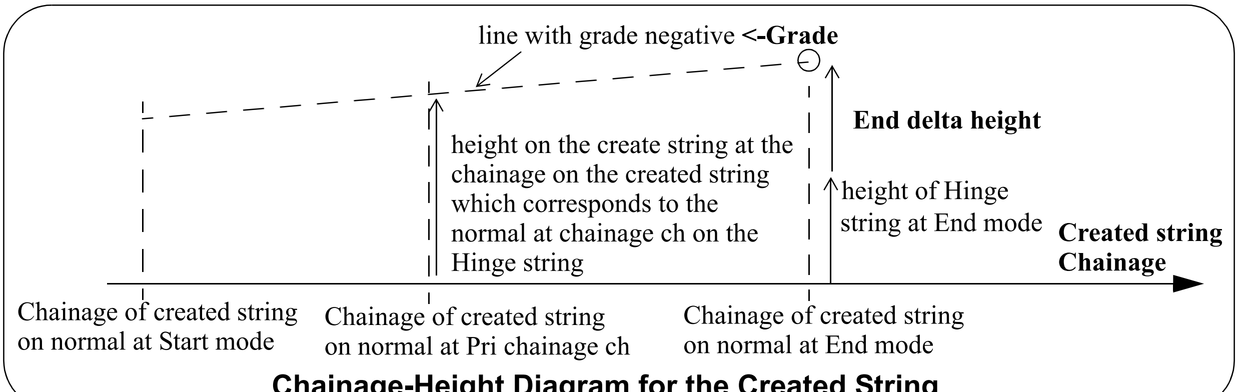
height of last vertex = height of Hinge string on End mode normal + End delta height

The plan position of the last vertex is on the End mode normal, and with an offset from the Hinge string such that the Xfall is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **End delta height**.



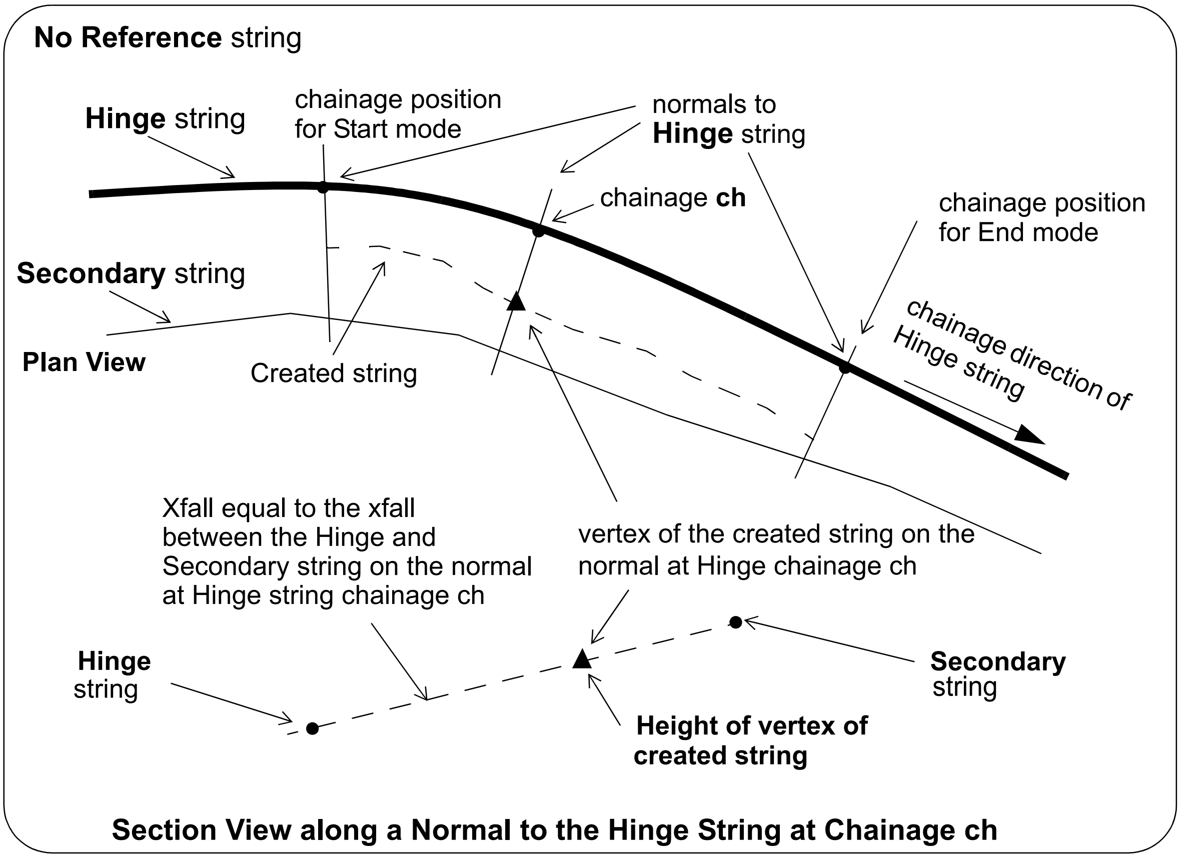
Section View along a Normal to the Hinge String at Chainage End Mode

The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative ***<-Grade*** and going through the last vertex.



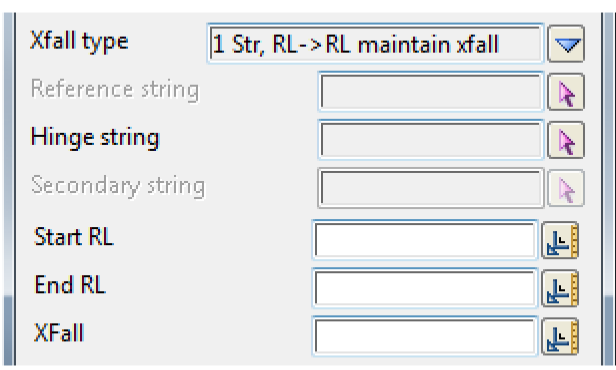
Chainage-Height Diagram for the Created String

The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is such that it is on the line through the Hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.



Continue to the next choice 20.8.11.1.22 1 String, Start RL and End RL, Fixed Xfall or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.22 1 String, Start RL and End RL, Fixed Xfall



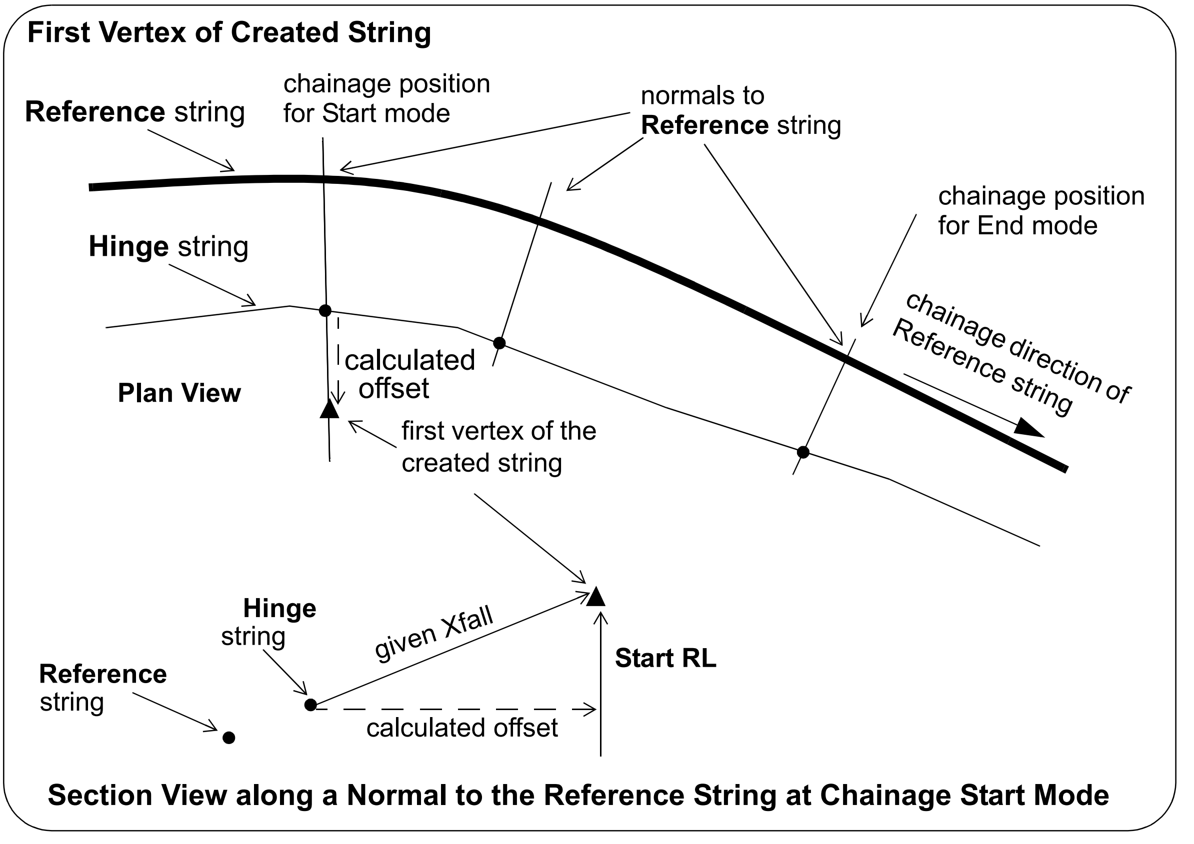
This option requires a **Hinge** string, a **Start RL** and **End RL**, a **Xfall**, and an **optional Reference** string.

Reference String Selected

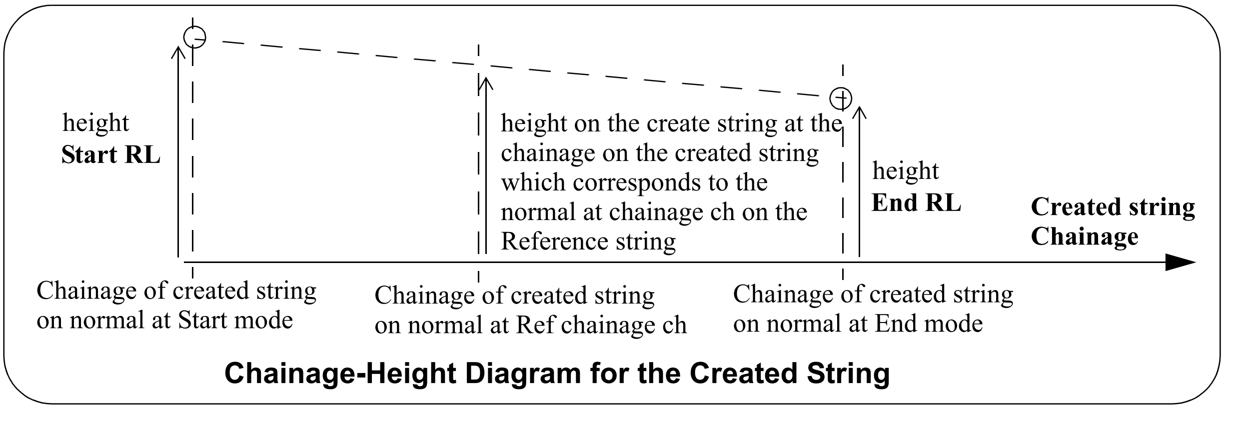
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Reference string and has a **height**

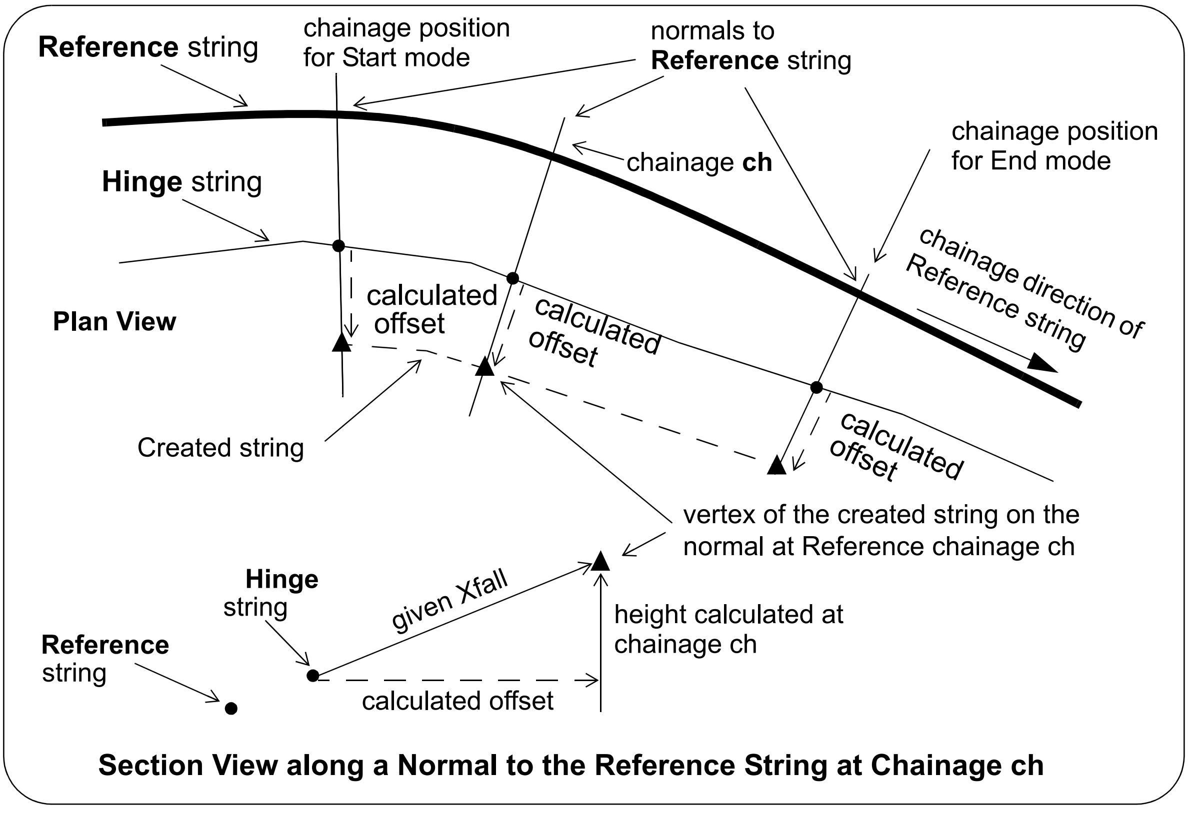
Start RL. The offset for the first vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **Start RL**.



The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL,** and ending with **End RL** on the normal at End mode.



The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is constructed by going out from the hinge string with xfall equal to the **Xfall**, and for an offset so that the height is equal to the required height at chainage **ch**.

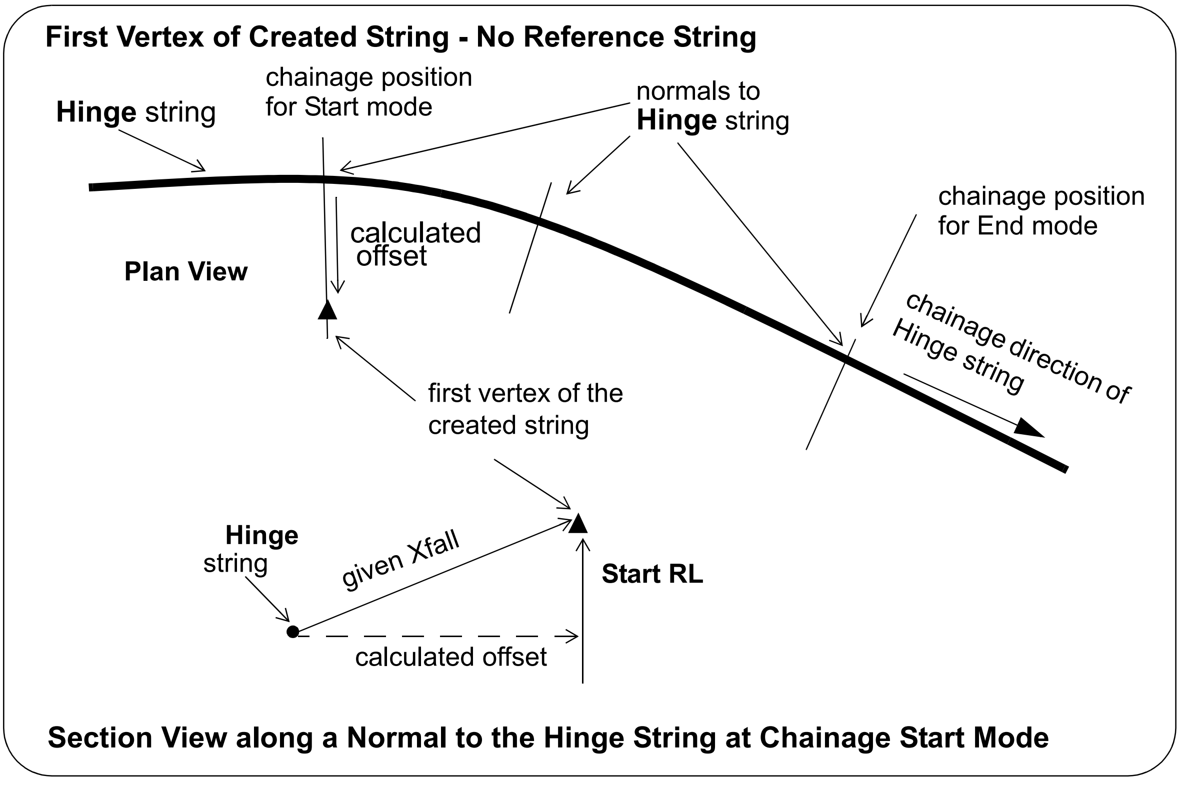


For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

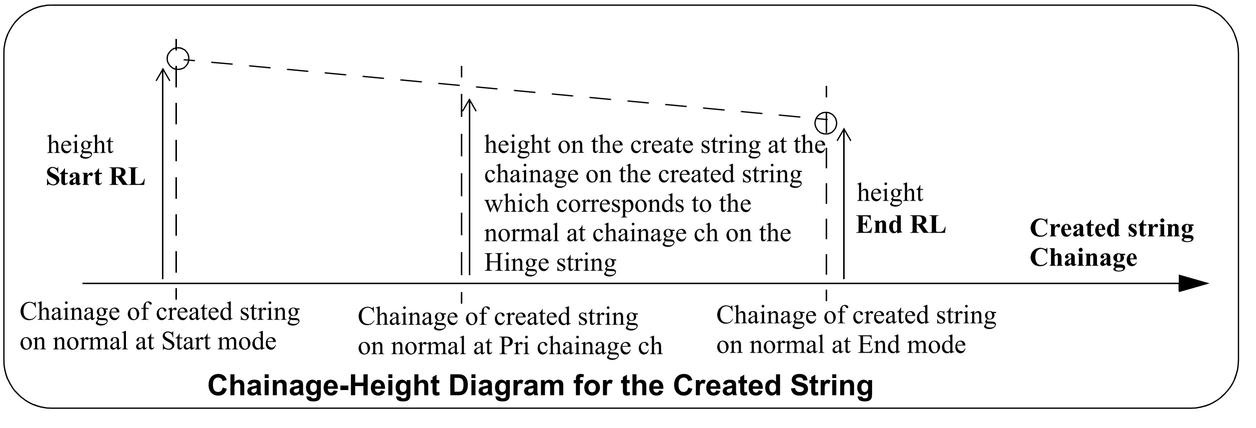
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

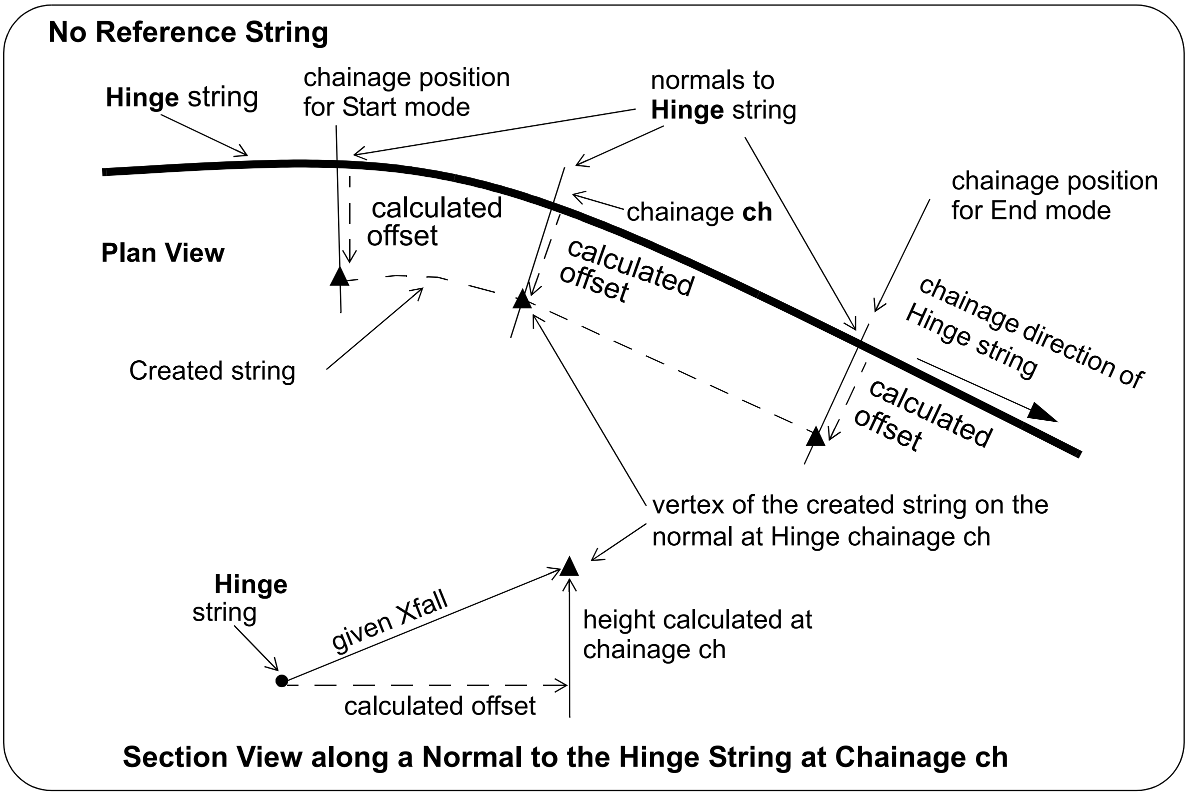
The **first vertex** of the created string is on the normal to the Hinge string and has a **height Start RL**. The offset for the first vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **Start RL**.



The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL,** and ending with **End RL** on the normal at End mode.



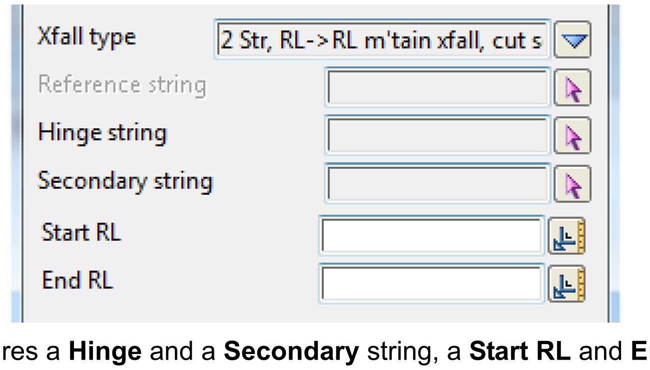
The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is constructed by going out from the hinge string with xfall equal to the **Xfall** and for an offset so that the height is equal to the required height at chainage **ch**.



For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.

Continue to the next choice 20.8.11.1.23 2 Strings, Start RL and End RL, Xfall from Secondary String, Normal to Reference or Hinge String or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.1.23 2 Strings, Start RL and End RL, Xfall from Secondary String, Normal to Reference or Hinge String

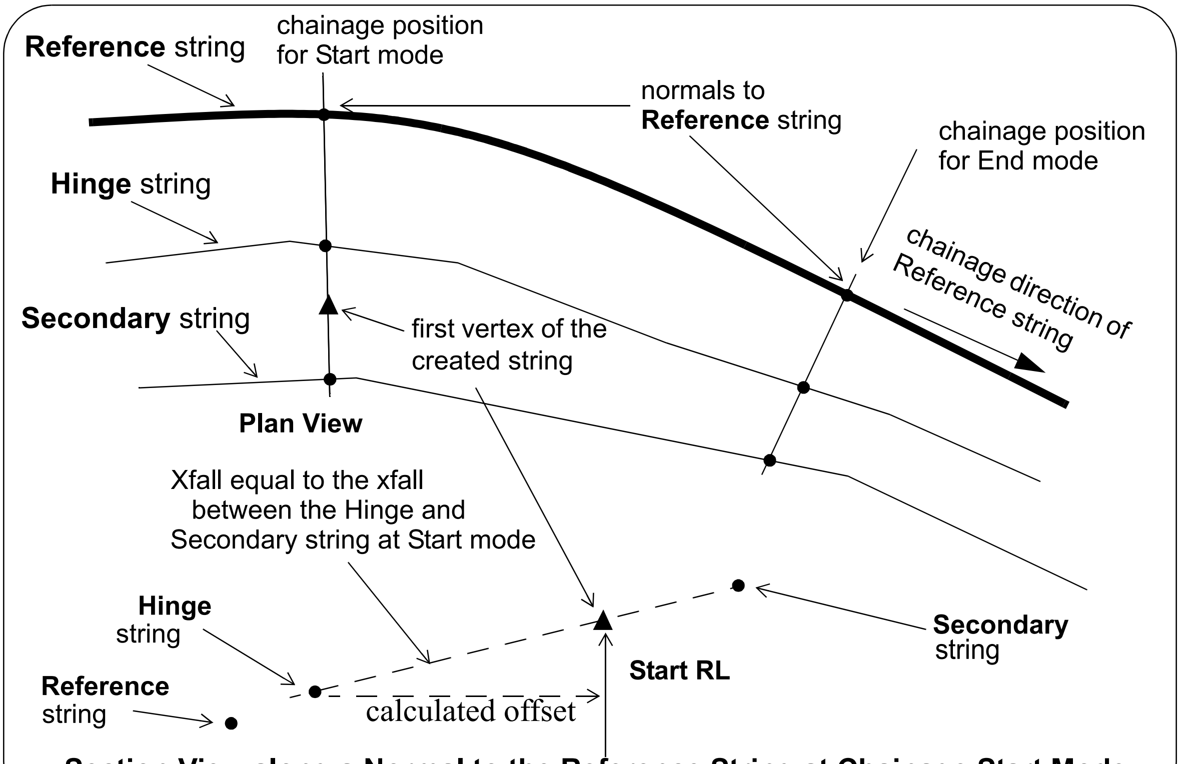


This option requires a **Hinge** and a **Secondary** string, a **Start RL** and **End RL**, and an **optional Reference** string.

Reference String Selected

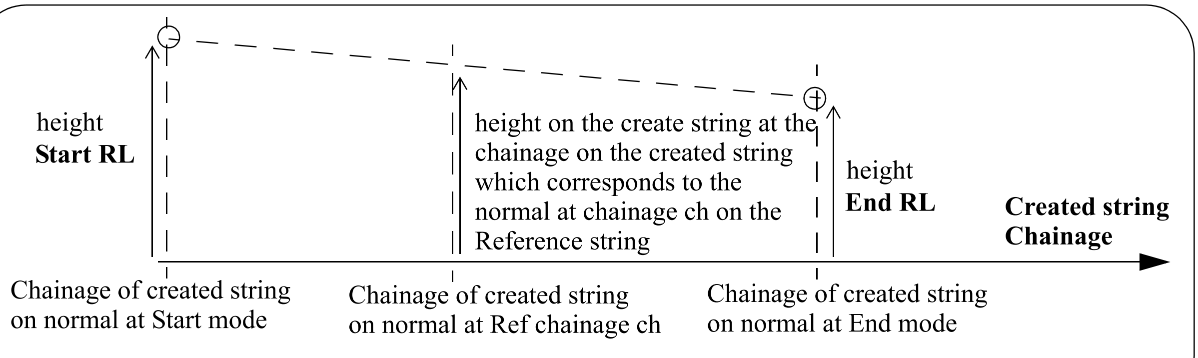
If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Reference string at chainage **Start mode**, with height **Start RL**. The plan position of the first vertex is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and for the required offset so that the height is **Start RL**.



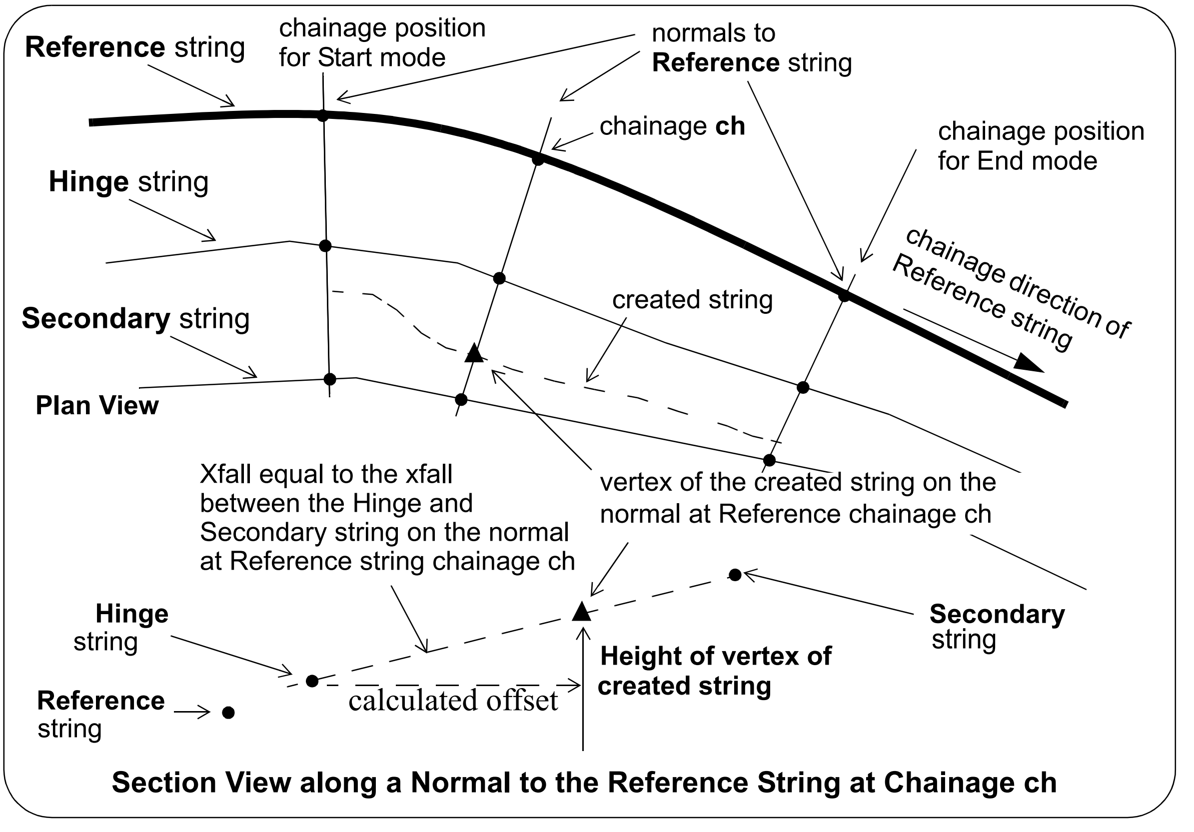
Section View along a Normal to the Reference String at Chainage Start Mode

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL,** and ending with **End RL** on the normal at End mode.



Chainage-Height Diagram for the Created String

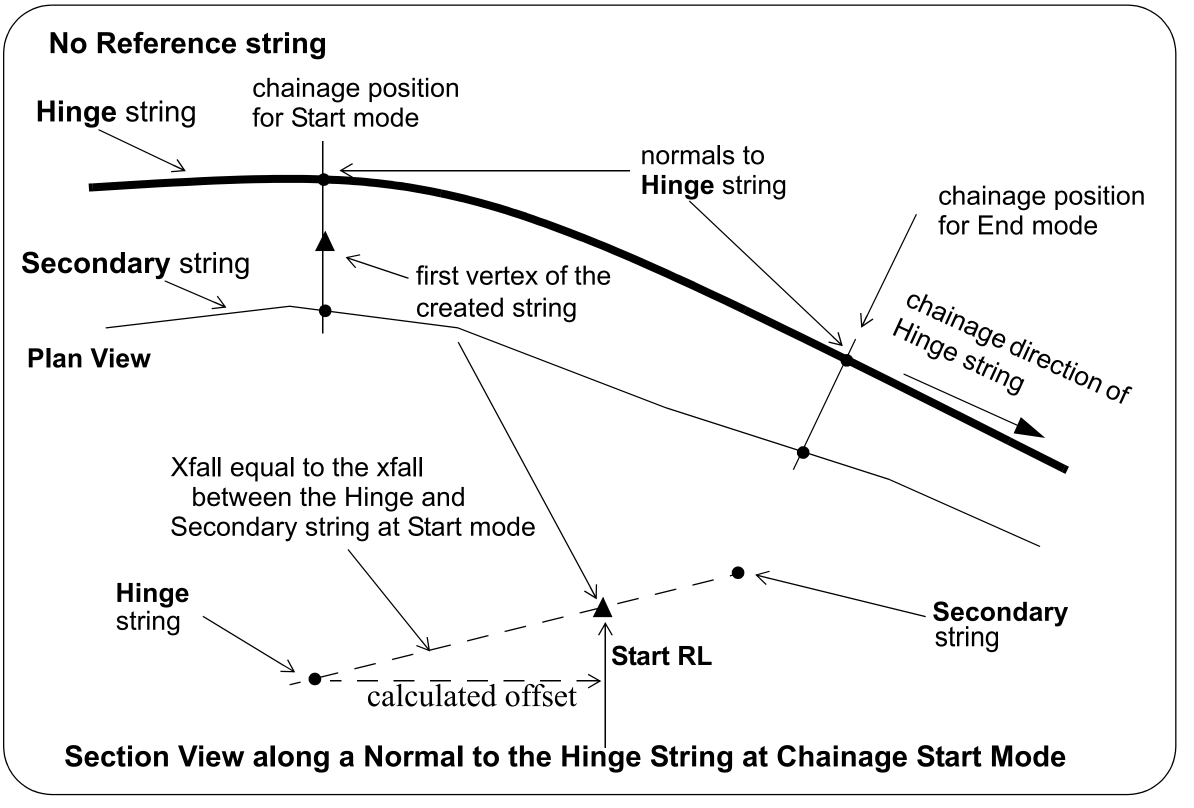
The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings** at chainage **ch**, and for an offset so that the height is equal to the required height at chainage **ch**.



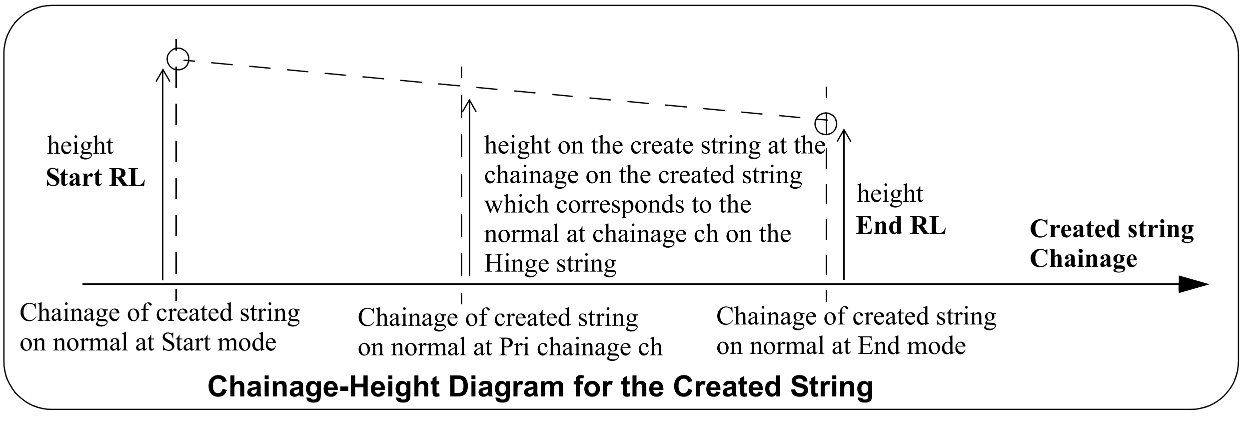
Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** string. The vertices of the created string lie on these normals.

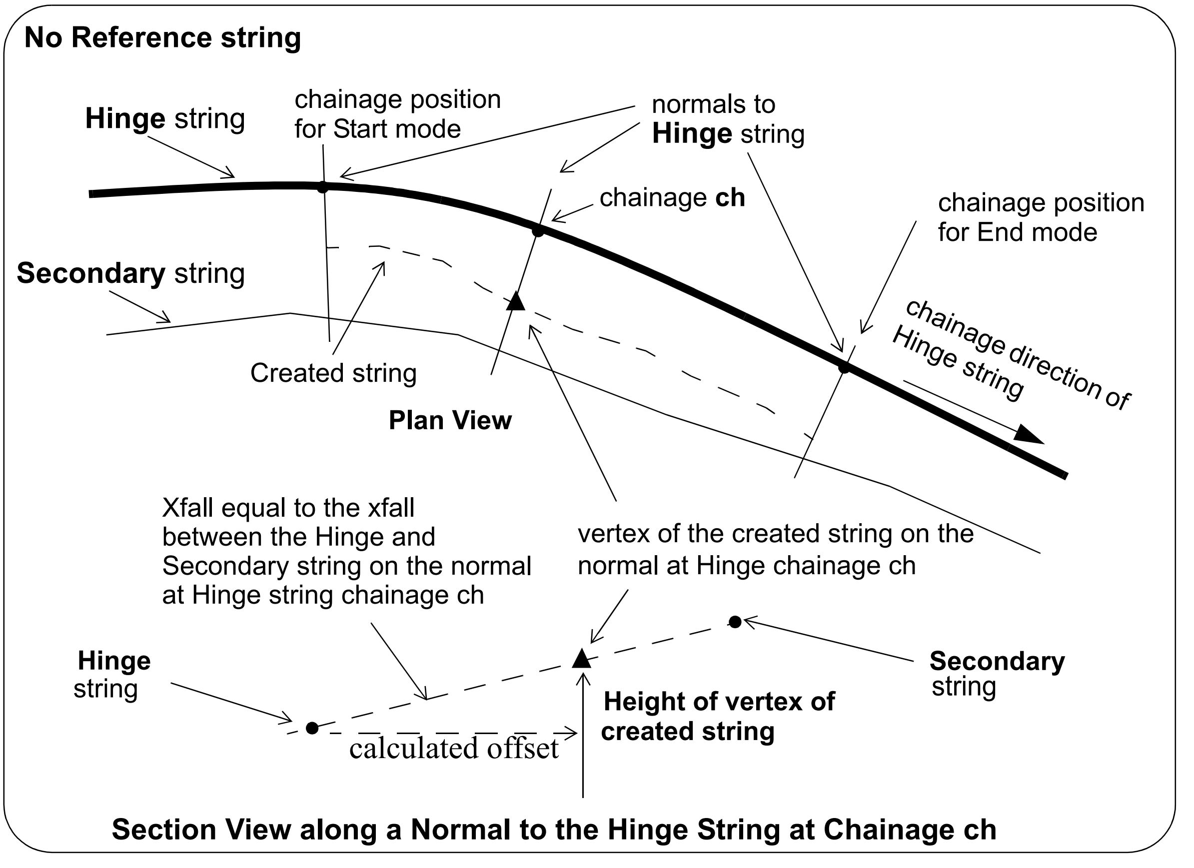
The **first vertex** of the created string is on the normal to the Hinge string at chainage **Start mode**, with height **Start RL**. The plan position of the first vertex is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and for the required offset so that the height is **Start RL**.



The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL,** and ending with **End RL** on the normal at End mode.



The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings** at chainage **ch**, and for an offset so that the height is equal to the required height at chainage **ch**.



Continue to the next section 20.8.12 More Roads or return to 20.8.11.1 Xfall Types or 20.8.11 String by Xfall and Grade.

20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade

Because of the number of different ways **Create by Xfall and Grade** can be used, there is a strict sign convention followed for heights, offsets and xfalls.

In all cases, a positive height or delta height is **up** and a negative height or delta height is **down**.

For any string, there is a definition for the left and right of a string (see Left and Right Side of a String), and there is a definition of Offset and Xfall for just that string (see Offset and Offset Distance for a String.)

However, ***Create by Xfall and Grade*** involves not just one string, but often two or three strings, so needs a standard sign convention of Offset and Xfall.

In **Create by Xfall and Grade**, if a Reference string is selected, then the direction of the Reference string is paramount and the sign convention for Offset and Xfall for a Hinge and Secondary string refers back to the Reference string. See Offset and Xfall - When Controlled by a Reference String.

In **Create by Xfall and Grade**, if a Reference string is NOT selected, then the direction of the Hinge string is paramount and the sign convention for Offset and Xfall for the Hinge and Secondary string refer back to the Hinge string. See Offset and Xfall - No Reference String and Controlled by Hinge String.

See Height
See Left and Right Side of a String.
See Offset and Offset Distance for a String
See Xfall for a String
See Offset and Xfall - When Controlled by a Reference String
See Offset and Xfall - No Reference String and Controlled by Hinge String

Height

For any string a positive height or delta height is up and a negative height or delta height is down.

Left and Right Side of a String

For any string:

the **right** side of the string is defined to be to the right of the string when travelling down the string in the **direction of the increasing chainage.**

the **left** side of the string is defined to be to the left of the string when travelling down the string in the **direction of the increasing chainage.**

Offset and Offset Distance for a String

Offset at chainage ch on a particular string is plan distance measured normal (perpendicular) to the string, starting at zero on the string and **positive** when going out to the **right** of the string, and **negative** when going out to the **left** of the string. Offset is only a (x,y) plane distance. It does not involve z values.

The **offset distance** of a point (x,y,z) from a particular string is the plan distance from the point (x,y) to the position on the string calculated by dropping the point (x,y) perpendicularly in the (x,y) plane onto the string. The offset distance is positive if the point (x,y,z) is on the right of the string, and negative is the point (x,y,z) is on the left of the string.

Xfall for a String

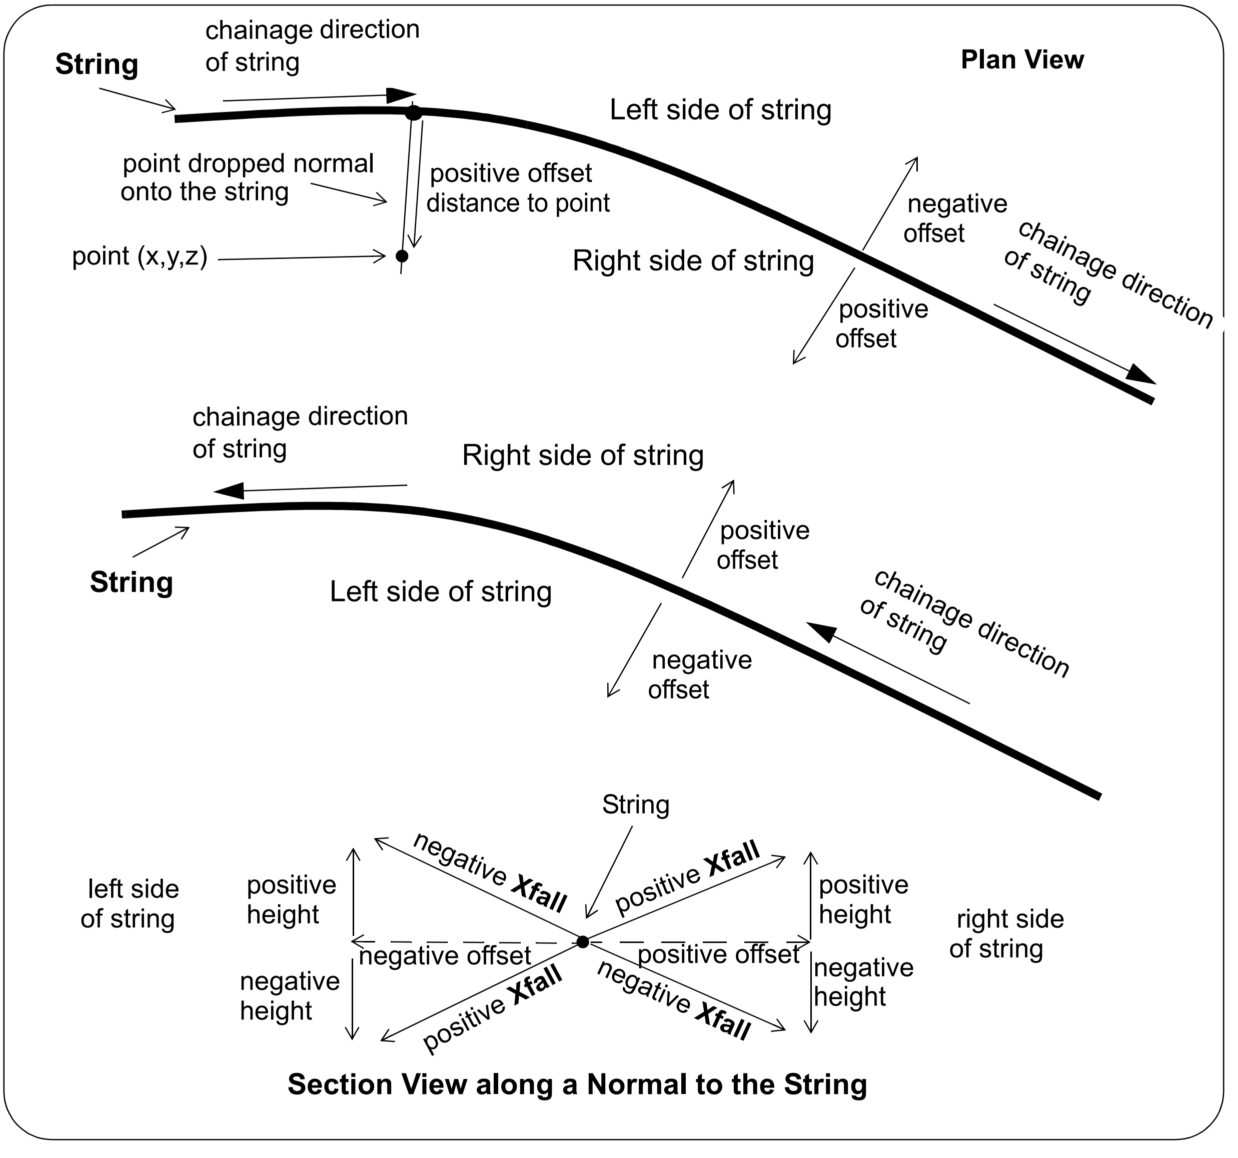
For **Xfall**:

a **xfall** is **positive** when it is going up when measured in the direction of increasing positive offset. That is, it is going up when going to the **right** of the string.

a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset. That is, it is going down when going to the **right** of the string.

a **xfall** is **negative** when it is going up in the direction of increasing negative offset (decreasing positive offset). That is, it is going up when going to the **left** of the string.

a **xfall** is **positive** when it is going down in the direction of increasing negative offset (decreasing positive offset). That is, it is going down when going to the **left** of the string.



Offset and Xfall - When Controlled by a Reference String

Offset

When a Reference string is selected, the **Reference** string is used to determine the sign convention for Offset and Xfall for the Hinge and Secondary strings. Hence the direction of the Hinge and Secondary strings are not used.

When a Reference string is selected:

an **offset** is **positive** when it is going in the direction of increasing positive offset with respect to the Reference string. That is, it is moving in the direction of going to the **right** of the Reference string.

an **offset** is **negative** when it is going in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is moving in the direction of going to the **left** of the Reference string.

Xfall

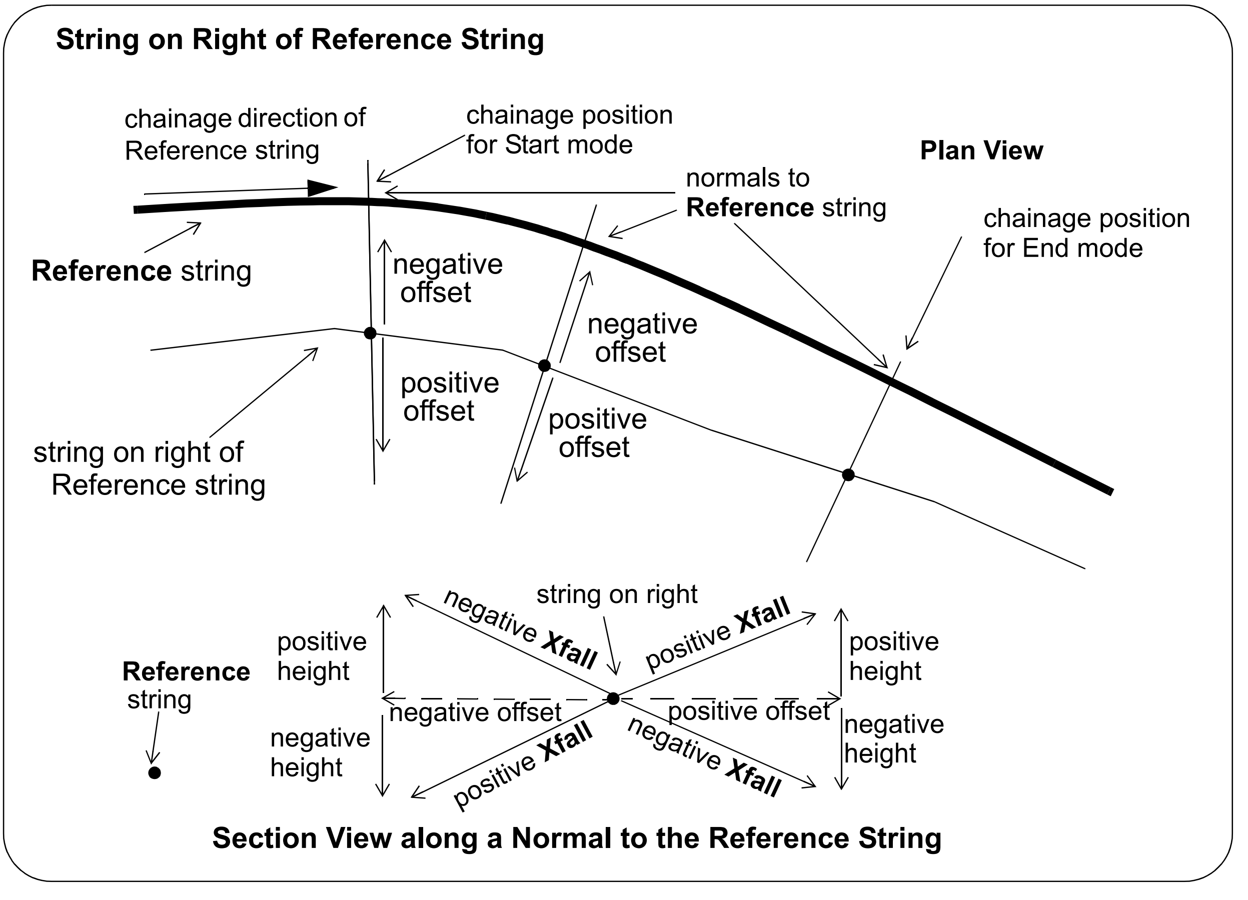
When a Reference string is selected:

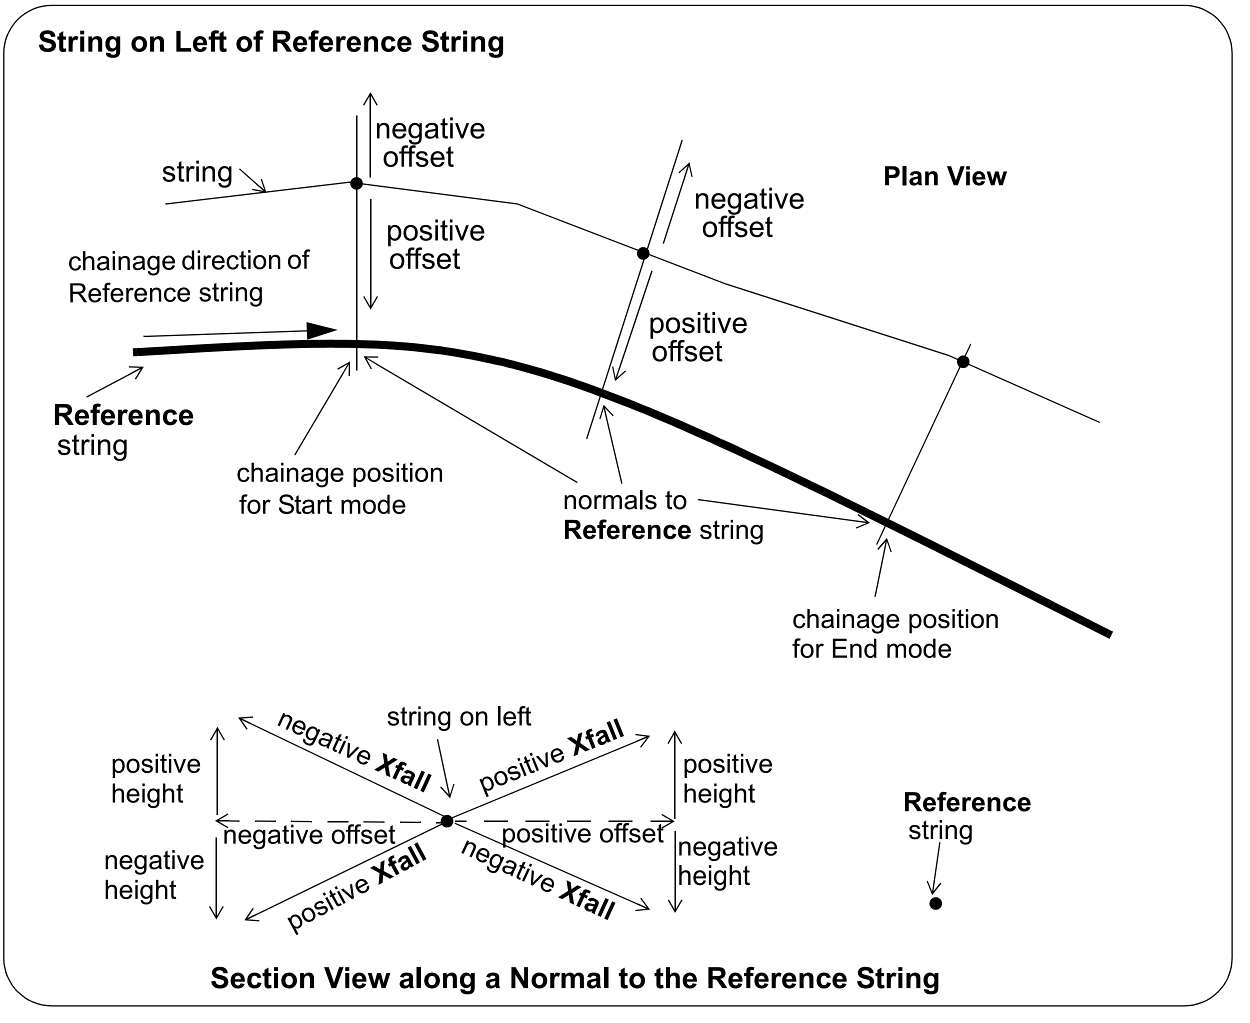
a **xfall** is **positive** when it is going up when measured in the direction of increasing positive offset with respect to the Reference string. That is, it is going up when moving in the direction of going to the **right** of the Reference string.

a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset with respect to the Reference string. That is, it is going down when moving in the direction of going to the **right** of the Reference string.

a **xfall** is **negative** when it is going up when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is going up when moving in the direction of going to the **left** of the Reference string.

a **xfall** is **positive** when it is going down in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is going down when moving in the direction of going to the **left** of the Reference string.





Offset and Xfall - No Reference String and Controlled by Hinge String

When no Reference string is selected, then the Hinge string is used to determine the sign convention for Offset and Xfall for the Hinge and Secondary strings. Hence the direction of the Secondary strings is not used.

Offset

When no Reference string is selected then the Hinge string is used and:

an **offset** is **positive** when it is going in the direction of increasing positive offset with respect to the Hinge string. That is, it is moving in the direction of going to the **right** of the Hinge string.

an **offset** is **negative** when it is going in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is moving in the direction of going to the **left** of the Hinge string.

Xfall

When no Reference string is selected then the Hinge string is used and:

a **xfall** is **positive** when it is going up when measured in the direction of increasing positive offset with respect to the Hinge string. That is, it is going up when moving in the direction of going to the **right** of the Hinge string.

a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset with respect to the Hinge string. That is, it is going down when moving in the direction of going to the **right** of the Hinge string.

a **xfall** is **negative** when it is going up when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is going up when moving in the direction of going to the **left** of the Hinge string.

a **xfall** is **positive** when it is going down when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is going down when moving in the direction of going to the **left** of the Hinge string.

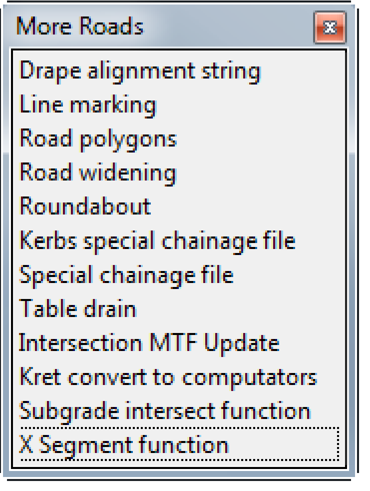
20.8.12 More Roads

Position of menu: **Design =>Roads =>More**

The **more roads** menu contains miscellaneous options to drape alignments, create line marking etc.

The **more roads** walk-right menu is



Drape alignment string	16.10.3 Drape Alignment (Macro)
Line marking	24.2 Line Marking
Road polygons	20.14.5 Polygons from Sections
Road widening	20.8.12.4 Road Widening with Minimum and Maximum Crossfall
Roundabout	20.8.12.5 Create Roundabout
Kerbs special chainage file	20.8.12.6 Kerb Special Chainage File
Special chainage file	20.8.12.7 Special Chainage File
Table drain	20.8.12.8 Table Drain - Intersection of Slopes from Two Strings
Intersection MTF Update	20.8.12.9 Intersection MTF Update
Kret convert to computators	20.8.12.10 Kret Convert to Computators
Subgrade intersect function	20.8.12.11 Subgrade Intersect Function
X Segment function	20.8.12.12 X Segment function

20.8.12.1 Drape Alignment

Position of option on menu: **Design =>Roads =>More =>Drape alignment string**

This option has already been documented in **Tins => Drape=> Drape align.**

For the option *Drape align,* please continue to the section 16.10.3 Drape Alignment (Macro).

20.8.12.2 Line Marking

Position of option on menu: **Design =>Roads =>More =>Line marking**

This option creates an alignment string for a traffic island and has already been documented as

Drafting => Line marking

For more information on the option *Line marking*, please continue to the section 24.2 Line Marking.

20.8.12.3 Road Polygons

Position of option on menu: **Design =>Roads =>More =>Road polygons**

This option takes a model of cross-sections and create polygons between specified points on the cross-sections. This option is already documented under

Design => X-Sections =>Polygons from sections

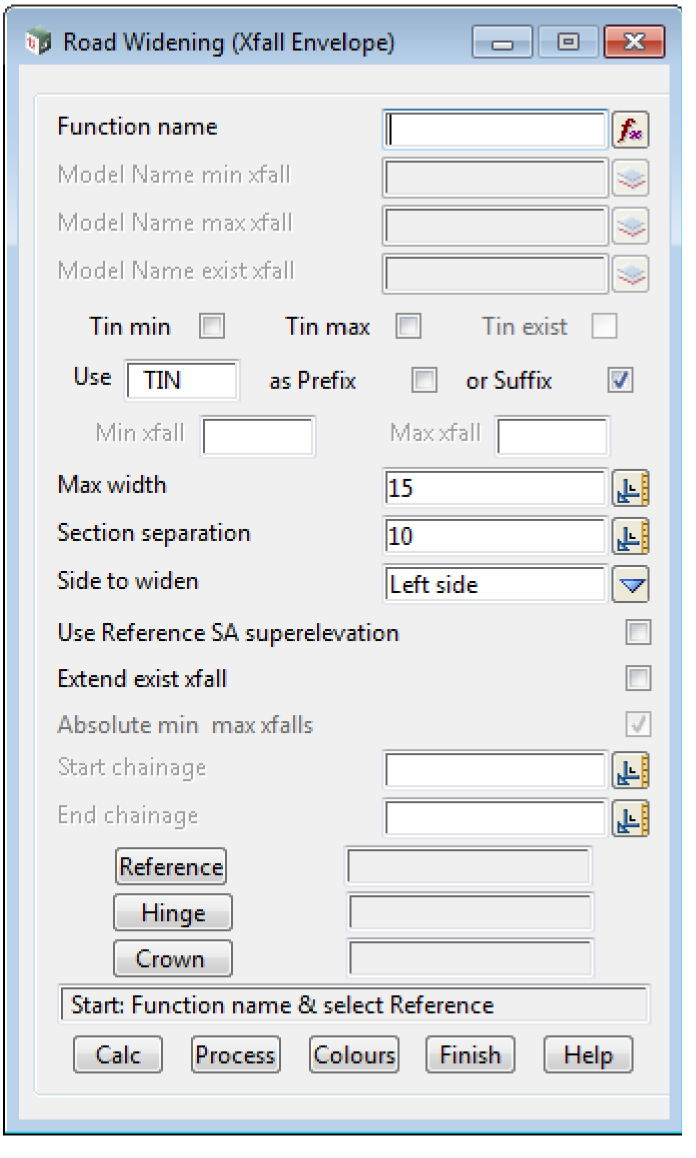
For more information on the option *Polygons from sections*, please go to the section 20.14.5 Polygons from Sections in the this chapter

20.8.12.4 Road Widening with Minimum and Maximum Crossfall

Position of option on menu: **Design =>Roads =>More =>Road widening**

This option creates cross sections using the minimum and maximum cross-fall when going out from a selected reference string (usually and alignment string).

Adding these cross sections to a section view when designing the vertical geometry gives an envelope of maximum and minimum crossfall points.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Model name min/max xfall model box

model for minimum/maximum cross fall cross sections.

Min xfall input box -2

minimum cross-fall (in %)

Max xfall input box **-5**

maximum cross-fall (in %)

Max width input box 10

maximum width to go out at the minimum and maximum cross falls.

Chg interval input box 20

chainage interval for calculating the minimum and maximum cross fall cross sections.

View to add view box

view to add the created cross sections to.

Reference string select

pick the reference string with direction for the x-sections to go out from. The cross sections are created to the right of the reference string as defined by the direction that the Reference string is picked. To get the sections on the other side, pick the reference string in the opposite direction.

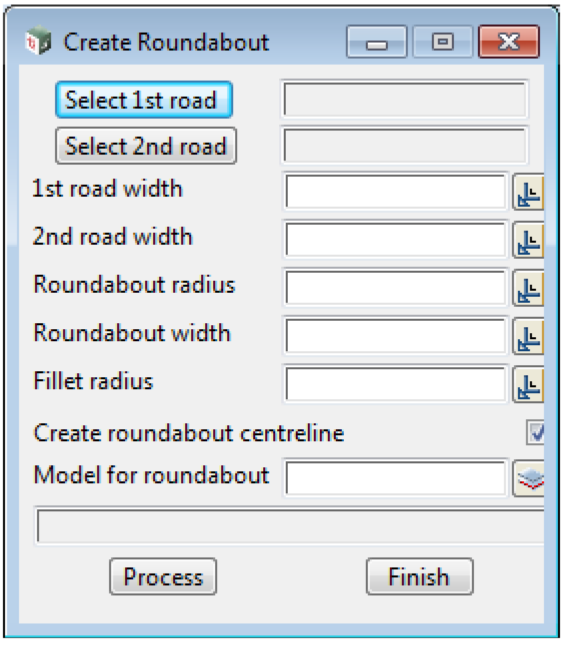
Process button

create the minimum and maximum cross fall cross sections.

20.8.12.5 Create Roundabout

Position of option on menu: **Design =>Roads =>More =>Roundabout**

This option creates a roundabout between two alignment strings. The road widths for the two roads (the distance from the road centre line to the edge of the road) plus the roundabout radius (the distance from the centre of the roundabout to the centreline of the roundabout road), the roundabout width (added and subtracted from the roundabout width to give the inner and outer edges of the roundabout roadway - the inner and outer roundabout radii) and the fillet radius for the turning lanes.



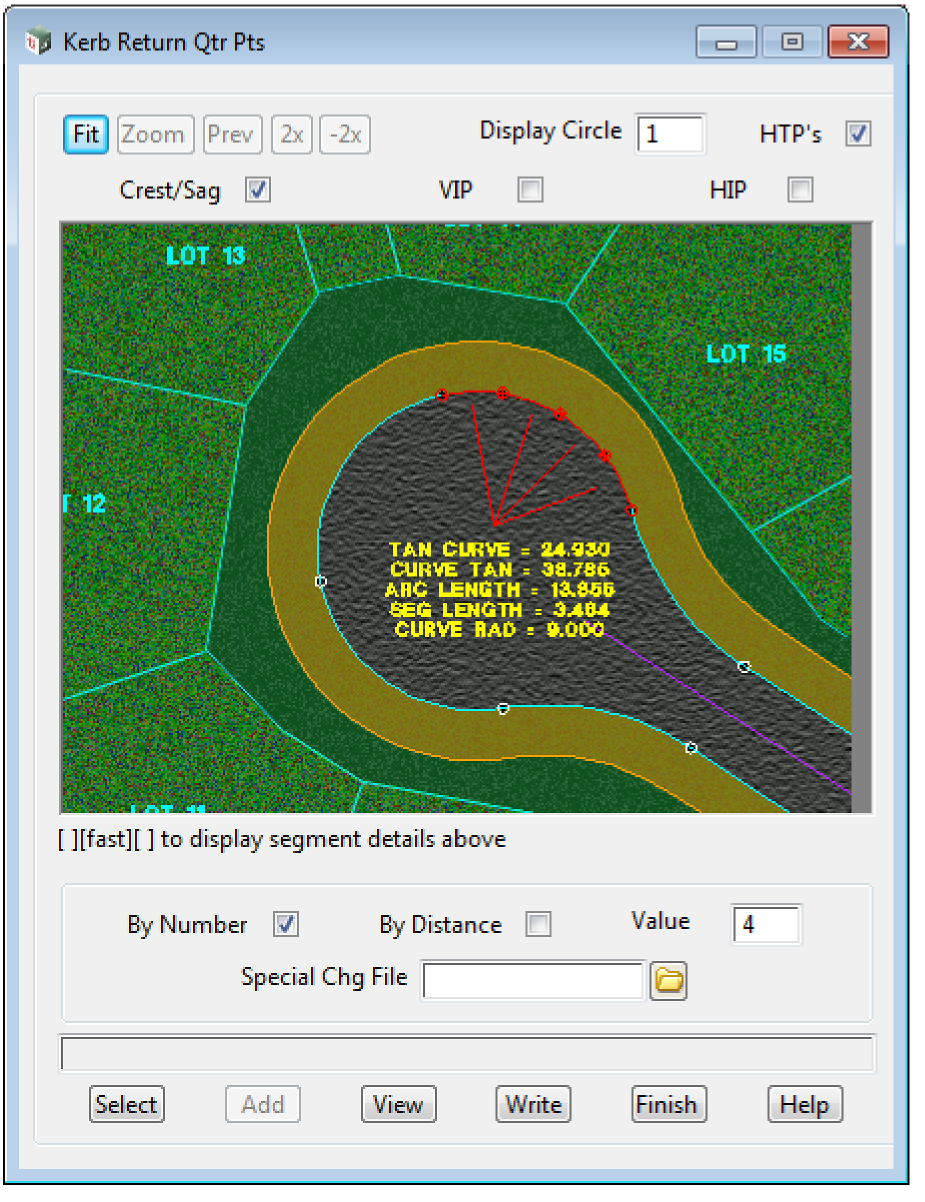
The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select 1st road	string select		
first alignment string for the roundabout.			
Select 2nd road	string select		
second alignment string for the roundabout.			
1st road width	input box		
distance from the first alignment string to the edge of the road.			
2nd road width	input box		
distance from the second alignment string to the edge of the road.			
Roundabout radius	input box		
distance from the centre of the roundabout to the centreline of the roundabout road.			
Roundabout width	input box		
distance to add and subtract from the roundabout width to give the inner and outer edges of the roundabout roadway (the roundabout radii).			
Fillet radius	input box		
fillet radius of the turning lanes.			
Create roundabout centreline	tick box		
if ticked, an alignment string is created for the centreline of the roundabout.			
Model for roundabout	input box		
model for the created roundabout.			
Process	button		
run the option.			

20.8.12.6 Kerb Special Chainage File

Position of option on menu: **Design =>Roads =>More =>Kerb special chainage file**

This option is used to create a special chainage file for an alignment string. The method of creating the chainages is defined differently for each segment of the alignment string.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
By number	tick box	tick	

if ticked, break the selected segment of the selected string into the number of pieces given by the **Value** *field.*

By distance	tick box		

if ticked, break the selected segment of the selected string into pieces of length given by the **Value** *field.*

Value	tick box	tick	

the number of pieces or the chainage length to break the selected segment into.

Special chg file	file box		

file to write chainages to

Select	button		

pick the alignment string to create chainages for. The alignment string is then drawn in the panel draw box. Each segment of the alignment string is selected by clicking MB over it in the panel draw box. The special chainages are then defined for that segment.

Add button

add the chainages given by number of length to the special chainages list

View button

view the special chainages list. The special chainages list can be edited

Write button

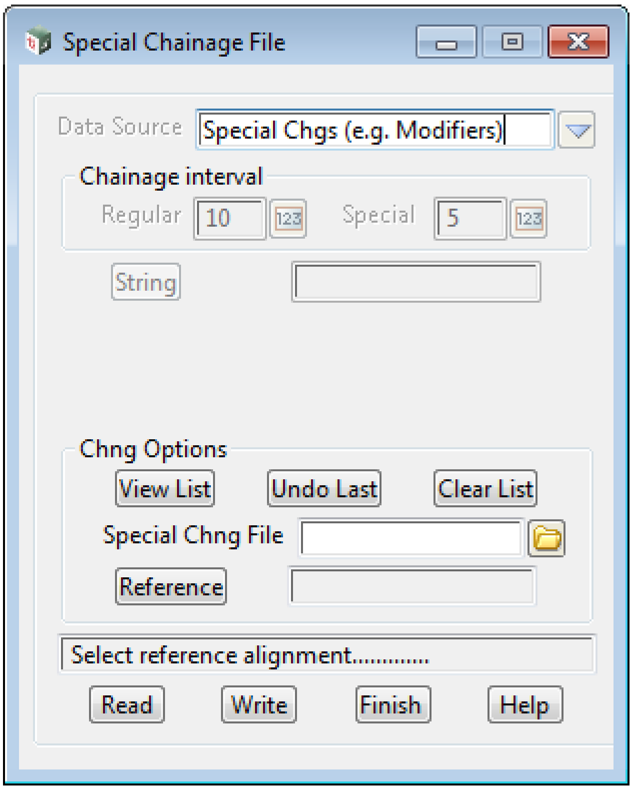
write the special chainages list to the special chainages file

20.8.12.7 Special Chainage File

Position of option on menu: **Design =>Roads =>More =>Special chainage file**

This option is used to create a special chainage file for an alignment string.

The chainages are created for a selected reference string but can then be defined by dropping strings and/or individual points onto the reference string.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source	choice box	Special chainages	Special chainages String Points
Regular			

Special

String string select

Reference string select

select the string to create special chainages for.

View list button

view the special chainage list.

Undo last button

undo the last set of created chainages.

Clear list button

clear the chainages list.

Special chng file file box

file to read chainages from or write chainages to

read button

read in a file of special chainages.

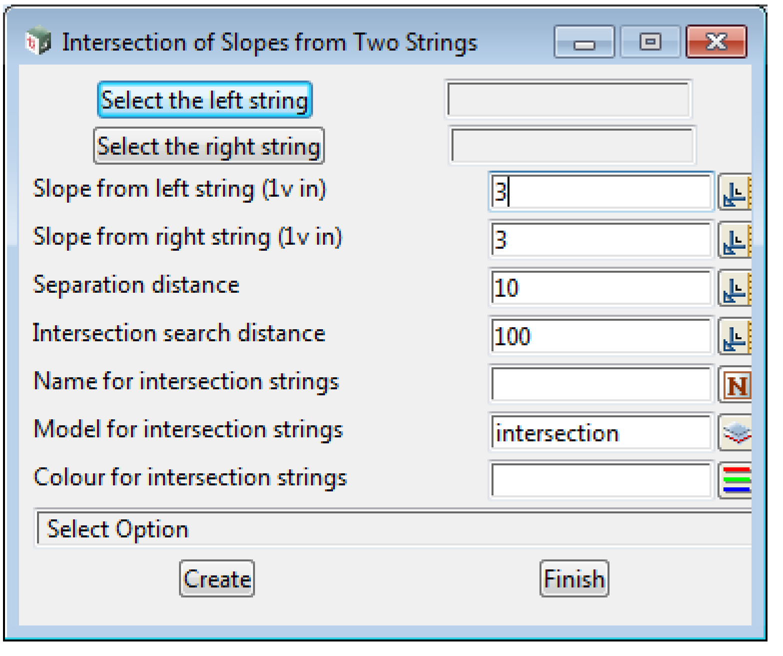
Write button

write the chainages list to the special chainages file.

20.8.12.8 Table Drain - Intersection of Slopes from Two Strings

Position of option on menu: **Design =>Roads =>More =>Table drain**

This option is used to create a string which is the intersection of slopes from a left and right string.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Select the left string string select

select the left hand side string

Select the right string string select

select the right hand side string

Cross fall (1 in...) from left/right string input box 3

batter slope to go from left/right string

Separation distance input box 10

distance to create batter lines and find intersection

Intersection search distance input box 100

distance to search to find an intersection of the batter slopes

Name for intersection strings input box

name for the strings created by the intersection of the batters

Model/Colour for intersection strings intersection available models/colours

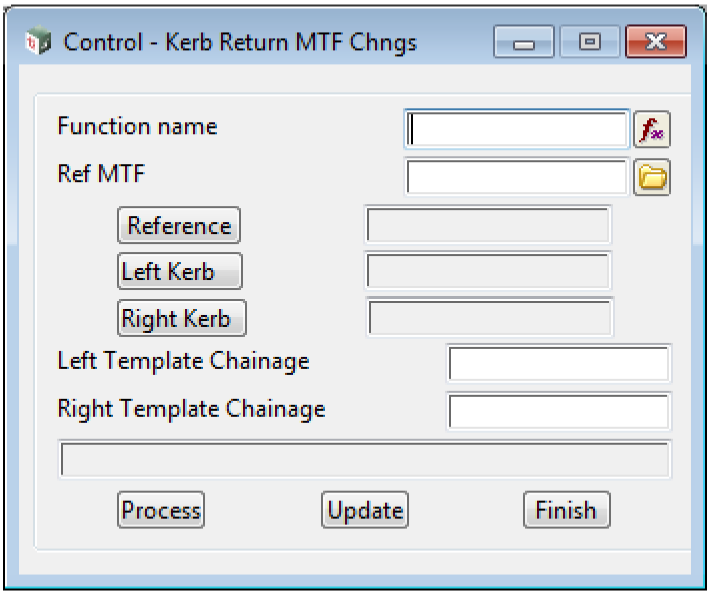
model/colour for the intersection strings

Create button

Create the intersection strings by battering of the left and right strings

20.8.12.9 Intersection MTF Update

Position of option on menu: **Design =>Roads =>More =>Intersection MTF updates**



The fields and buttons used in this panel have the following functions.

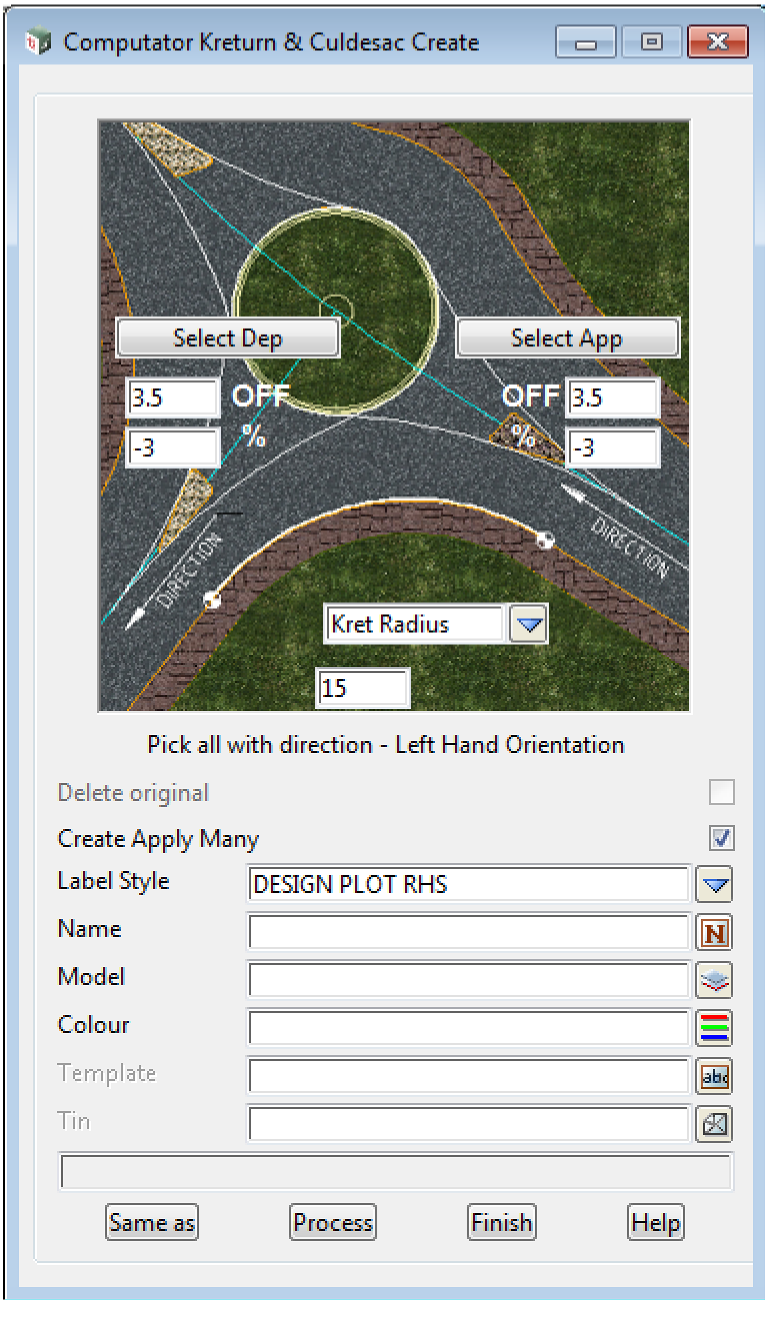
Field Description	Type	Defaults	Pop-Up
Function name	function box		available functions
name for the function			
Ref MTF	file box		*.mtf files
Reference	string select		
select the reference string			
Left kerb	string select		
select the left kerb string			
Right kerb	string select		
select the right kerb string			
Left template chainage	input		
Right template chainage	input		
Process	button		
Update	button		

20.8.12.10 Kret Convert to Computators

Position of option on menu: **Design =>Roads =>More =>Kret convert to computators**

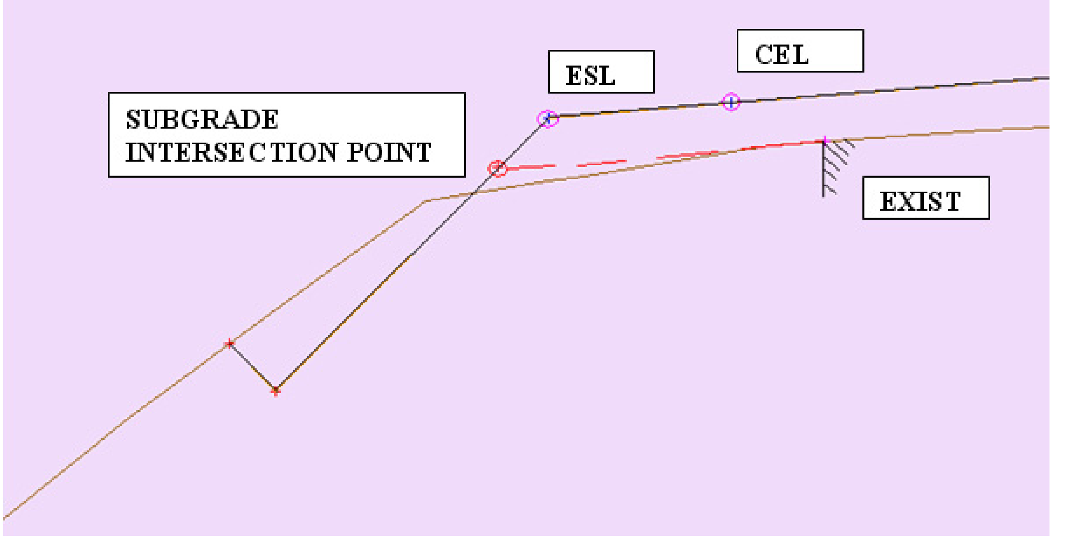
This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Kret convert to computators**, displays the **Computator Kreturn & Culdesac Create** panel on the screen



20.8.12.11 Subgrade Intersect Function

Position of option on menu: **Design =>Roads =>More =>Subgrade Intersect Function**



Typical Application

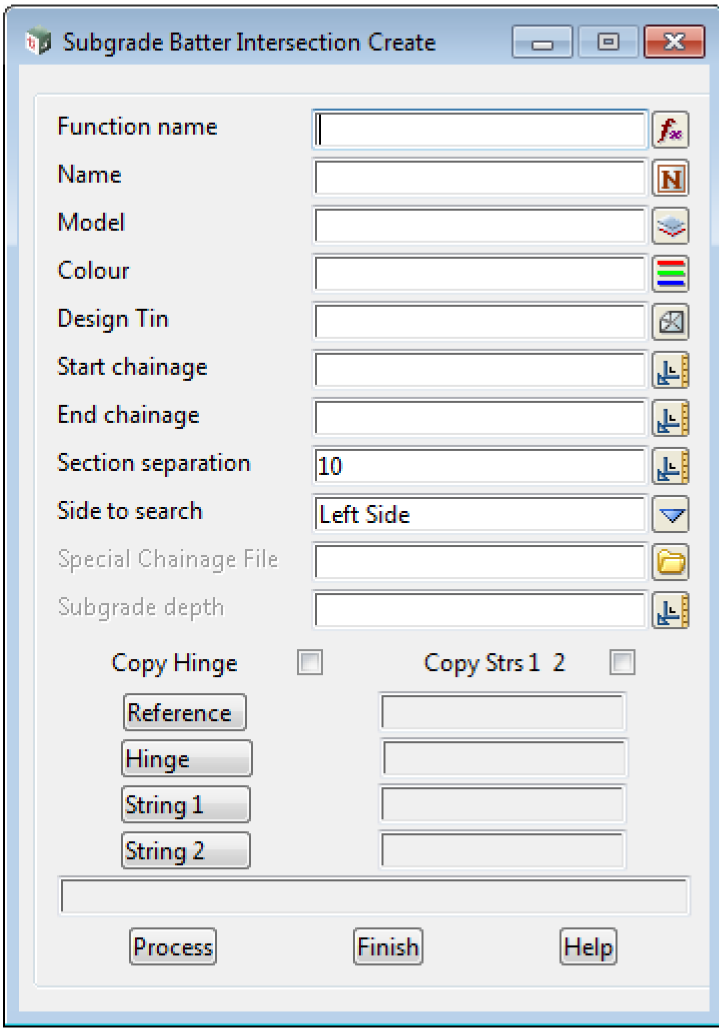
1. Widening job where the intersection of the **design xfall** from the **existing road edge** and the **design batter** is required.
2. Design strings are **ESL** (shoulder edge) and **CEL** (carriageway edge)

This panel is used to create a string that could be used in the subgrade surface of a road design, in particular road widening.

The crossfall between these strings is calculated, and applied from the hinge string, offset by the subgrade depth, to intersect with the design tin specified.

The intersecting string created is placed on the selected model.

Selecting **Subgrade Intersect Function**, displays the **Subgrade Batter Intersection Create** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		select function

name for use in recalc or chains

Name	name box		

Name for string created

Model	model box		

model name for string created

Colour	input		available colours

Colour for string created

Design Tin	input		select tin

Design surface above

Start Chainage	measures box		At Point, Point to Point, String from Point, String to Point

Enter start chainage

End Chainage	measures box		At Point, Point to Point, String from Point, String to Point)

Enter end chainage

Section separation	measures box	10	At Point, Point to Point, String from Point, String to Point)

Distance along the reference to create points on the string created

Side to search	choice box	Left side	Left or Right

Side to search in relation to reference string

Special chainages	input		*.spf files

a file containing chainages, one per line, that are also used as chainages to create points on the string created

Subgrade Depth	measures box		At Point, Point to Point, String from Point, String to Point)

Depth below the design tin (in metres)

Copy Hinge tick

If ticked, makes a copy of the hinge in the model specified.

Copy Strs 1 2 tick

If ticked, makes a copy at subgrade depth of strings 1 & 2 in the model specified.

Reference string select

Selection must be Super alignment, used to calculate chainages

Hinge string string select

selected as a start point for the subgrade (Existing bitumen or cutback strings e.g.)

String 1 string select

string in the design surface, used in xfall calculations

String 2 string select

string in the design surface, used in xfall calculations

Process button

runs the option

20.8.12.12 X Segment function

Position of option on menu: **Design =>Roads =>More =>X Segment function**

This option is used for the removal of segments on design and boxing cross sections.

Typically it is used where road widening has been applied to both sides of a roadway.

Design sections in this case would be created using "Cuts through strings", where the two widenings are now joined.

The design may also have a small overlay on the existing roadway and boxing definitions have been defined for each side of the widening.

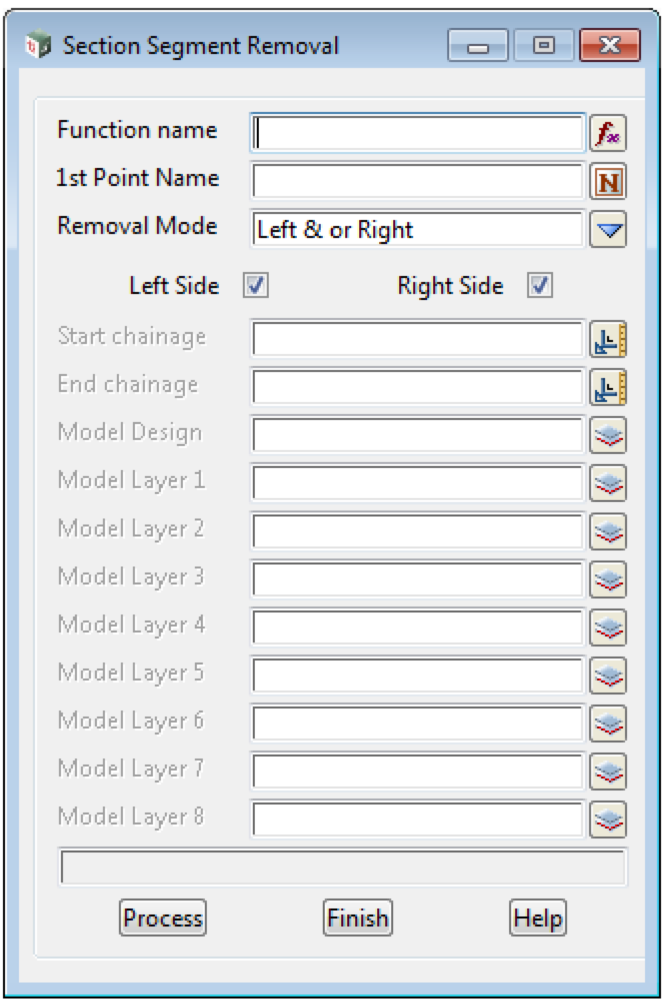
In each case again, the sections, especially the boxing subgrade, are joined.

The sections are converted to super strings and segments that need to be removed are defined at vertex points by name.

A point name is entered as the "First Point" and segments are defined as either left or right of that point or a second point along the section can be specified.

A "Design" section model can be entered along with multiple boxing models...Layer1, Layer2, Layer3 etc.

Selecting **X Segment function**, displays the **Section Segment Removal** panel on the screen



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function Name	input		

name for use in recalc or chains

1st point name input

Point name on design section

Removal Mode choice box Left & or Right Left & or Right, 2nd Point

Removal type left or right of first point or to a second point

Left Side tick box

Right Side tick box

Start Chainage real

if blank, then all the sections are used

End Chainage real

if blank, then all the sections are used

Model Design input

existing model name of design sections

Model Layer (n) input

existing model name of boxing sections

Process button

runs the option

20.9 Components

Position of menu: **Design =>Roads =>Components**

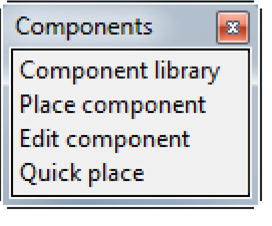
Components are parametric road objects that can be placed on existing design strings to generate complex geometry. This includes geometry for:

- Intersections
- Roundabouts
- Exit Ramps
- Entry Ramps
- Bus Bays
- Parking Bays
- CHR Intersections
- Culdesacs
- Hammerheads

Each component has a number of parameters that may be modified before and after they are placed to meet your requirements.

Components are stored in a library. Every time you place a component, you will reference the library definition. Once it is placed, if you wish to customise only that placed instance of the component, you may detach it from the library so that changes to the component will not affect the library component and vice versa.

The **Components** walk-right menu is



For *the options see*

Component library	20.9.1 Component Library
Place component	20.9.32 Place a Component
Edit component	20.9.34 Edit a Placed Component
Quick place	20.9.35 Component Quick Place

For information on

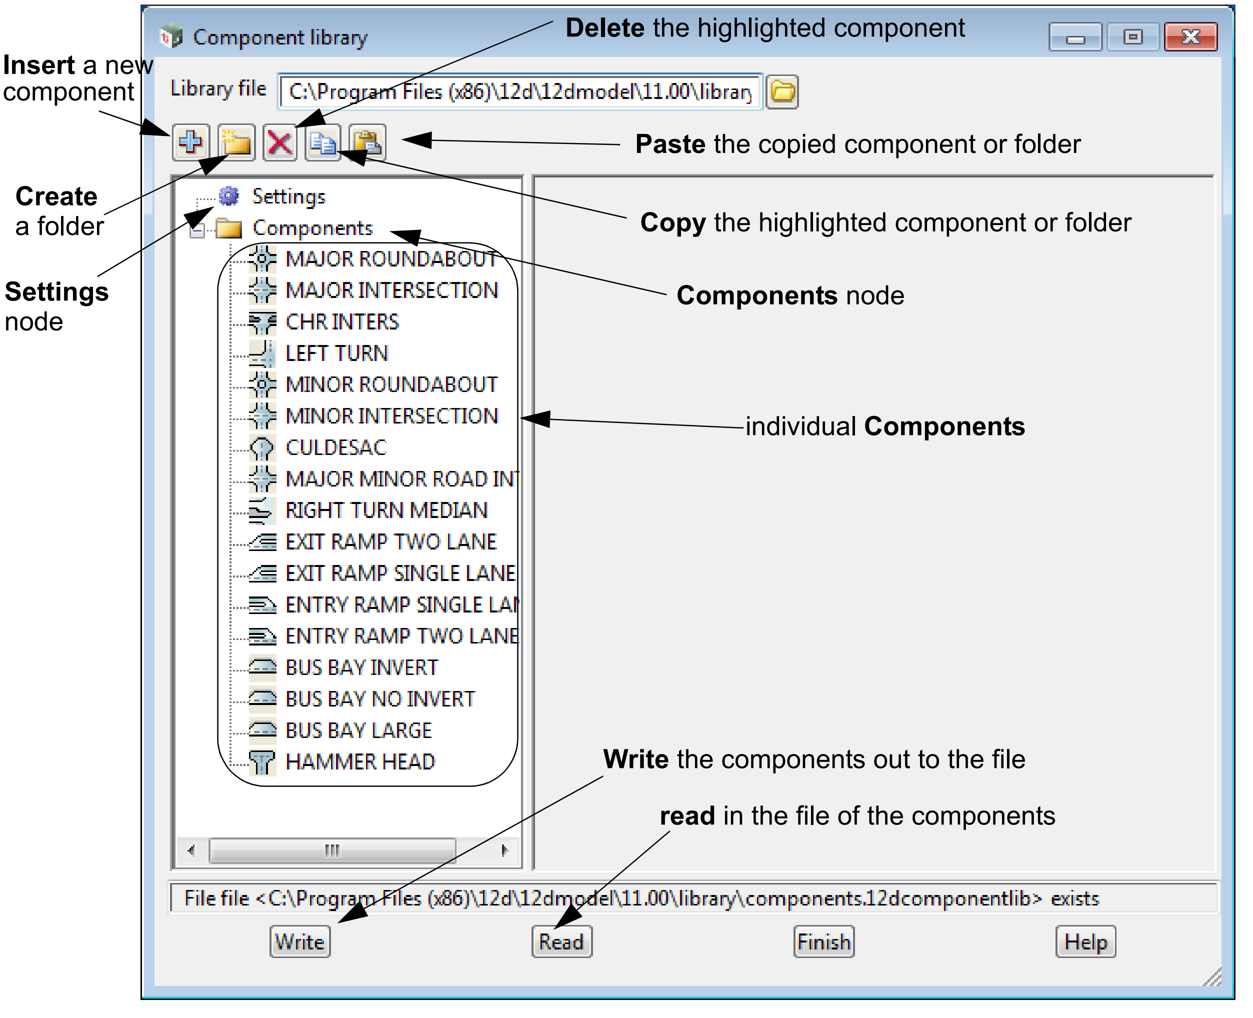
Editing Components	20.9.32.1 Editing Components
Specific Component Types	20.9.2 Component Types

20.9.1 Component Library

Position of option on menu: Design =>Roads =>Components => Component library

This panel is used to define the components in your current project. Components are initially based off predefined 'base' components (see Base component). Once you add a base or template component to your library, you may customise it as you require.

Selecting **Component library** brings up the **Component library** panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Library file	file box		*.12dcompnonentslib files

the current component library you are editing

 icon

Inserts a new component (See 20.9.1.4 New Component)

Folder icon

creates a new folder or subfolder under the **Components** *node.*

This is to allowing grouping of similar components.

Delete icon

deletes the highlighted component or folder.

Copy icon

copies the highlighted component or folder.

Paste icon

pastes the selected component or folder at the current highlighted level.

Write button

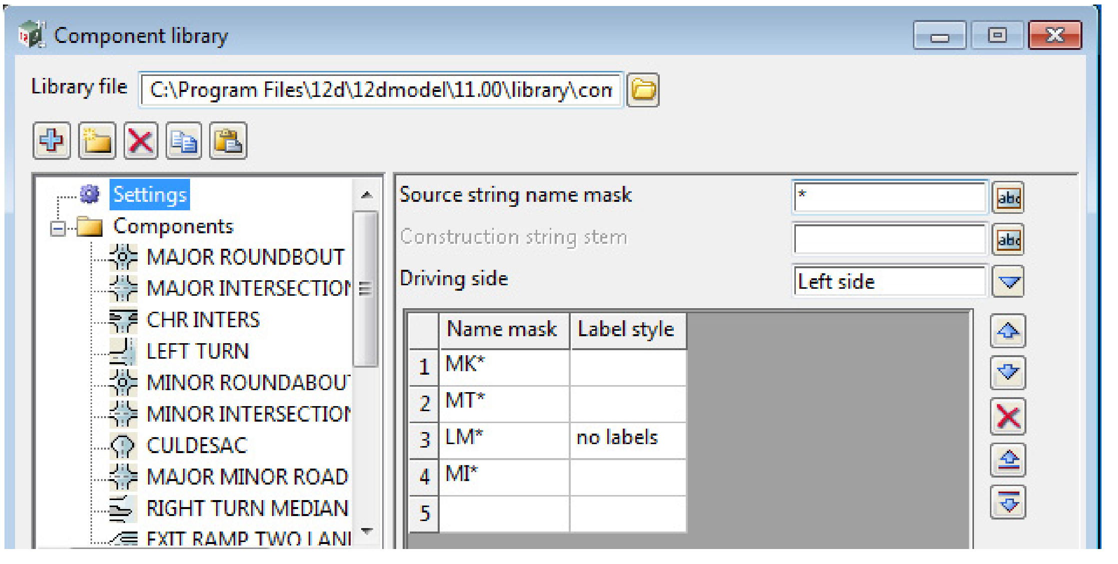
writes the components out to the given component library file.

Read button

reads in the given component library file.

20.9.1.1 Settings Node

This node defines library wide settings. Whenever you use a component from this library, these settings will apply.



20.9.1.1.1 Naming of Strings in a Component

Each string generated as part of the component can be named. They can either be set to something static or they can be dynamically generated using a number of variables as part of the name field.

The variables generally concern which side of the road the string is being created for, whether it was the approach or departure or the '**source**' or '**destination**'.

For example, in a left turn, the '**source**' is the string a driver is leaving from and the '**destination**' is the string entering.

$source_name - the name of the source string after the **source string name mask** is applied (see 20.9.1.1.2 Source String Name Mask)

$destination_name - the name of the destination string after the **source string name mask** is applied (see 20.9.1.1.2 Source String Name Mask)

$full_source_name - the full name of the source string

$full_destination_name - the full name of the destination string

$source_approach_or_departure - '**approach**' if we are generating strings for the approach of the source string, otherwise '**departure**'

$destination_approach_or_departure - '**approach**' if we are generating strings for the approach of the destination string, otherwise '**departure**'

$source_side - the side of the road we are currently generating strings for on the source string

$destination_side - the side of the road we are currently generating strings for on the destination string

$count[1-9] - allows up to 9 counters, of the form **%count1, $count2** ... **$count9**

Each time this counter variable is seen, it's value is incremented by 1.

20.9.1.1.2 Source String Name Mask

The **source string name mask** is defined in the **Component Library**. It allows you to extract part of a centreline string name. This is quite useful to maintain your own naming conventions.

For example, if you have a centreline named ***MC01*** and you wish to name your left turn ***MK01***, the part of the name that is common is ***01***.

If you set the source string name mask to **MC***, the name used when you use the **$source_name** or **$destination_name** variables will be everything represented by the '*'. In this case, **01**.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Source string name mask			

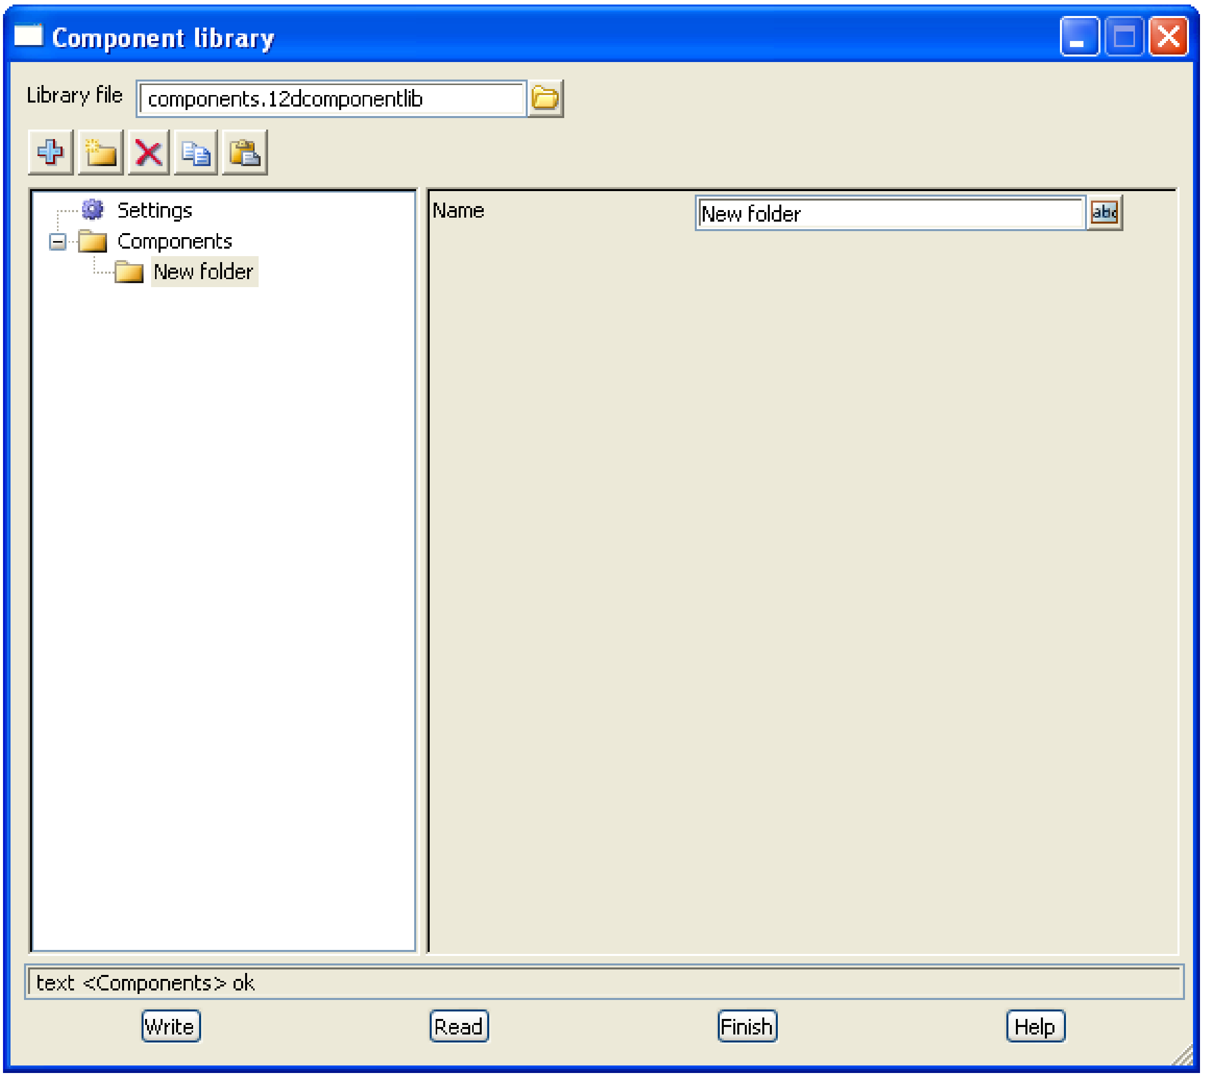
an optional field used to assist in naming individual strings created as part of a component. See 20.9.1.1.2 Source String Name Mask *for more information.*

Driving side	choice box	Left side	Left side, Right side

whether or not the component should be created for left or right hand side driving.

20.9.1.2 Folder Nodes

Folders can be created to group components. You can create a folder and give it whatever name you wish.



The fields and buttons used in this panel have the following functions:

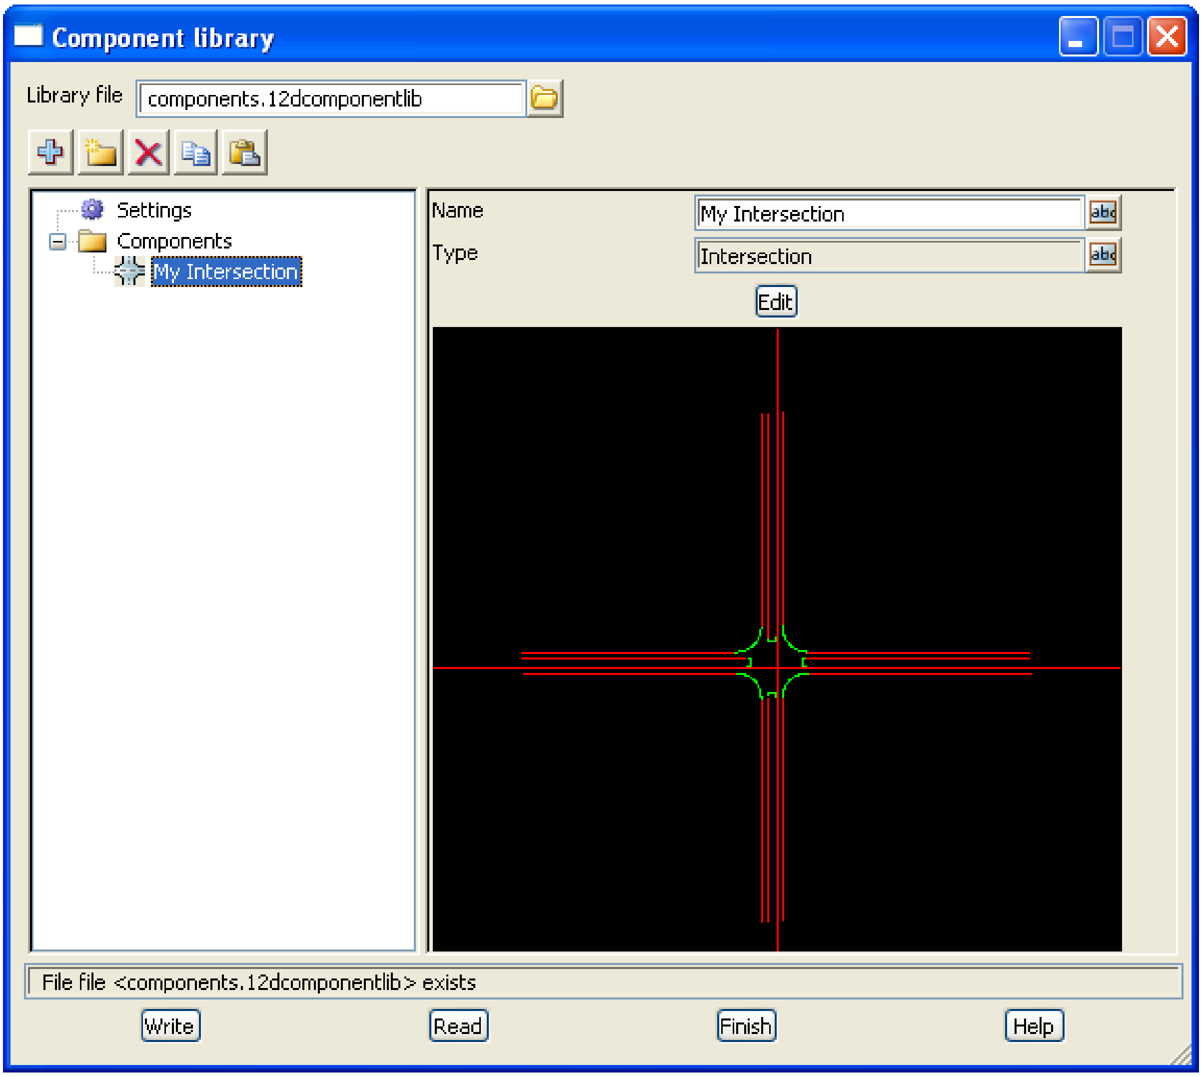
Field Description Type Defaults Pop-Up

Name

the name of the folder

20.9.1.3 Components Node

Each component node displays the name and type of the component, as well as what it will look like on a theoretical set of centreline strings. The generated geometry will change when you place it depending on the selected strings but this view gives you an idea of what it may look like.



The fields and buttons used in this panel have the following functions:

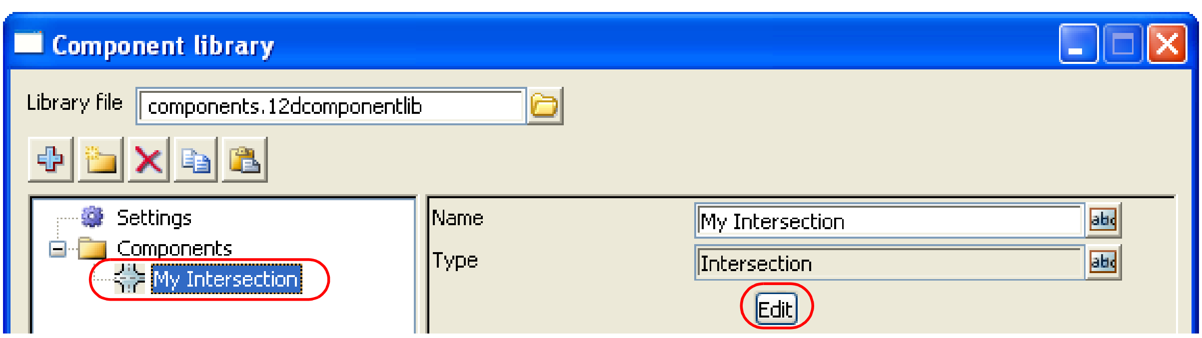
Field Description Type Defaults Pop-Up

Name

the name of the component

Type

the type of the component - read only



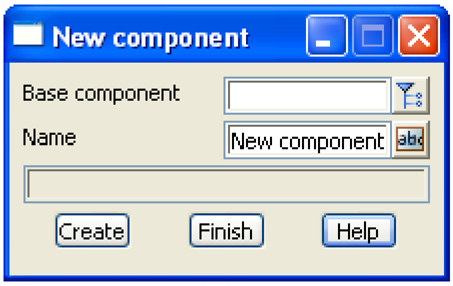
Edit button

edits the component. For more information please see [20.9.32.1.1 Editing in the Component library - Component Editor]

20.9.1.4 New Component

This panel allows you to create a new component from a base component. A base component may be from either one of your own library components, or a component shipped with ***12d Model***.

Selecting  brings up the **New component** panel.

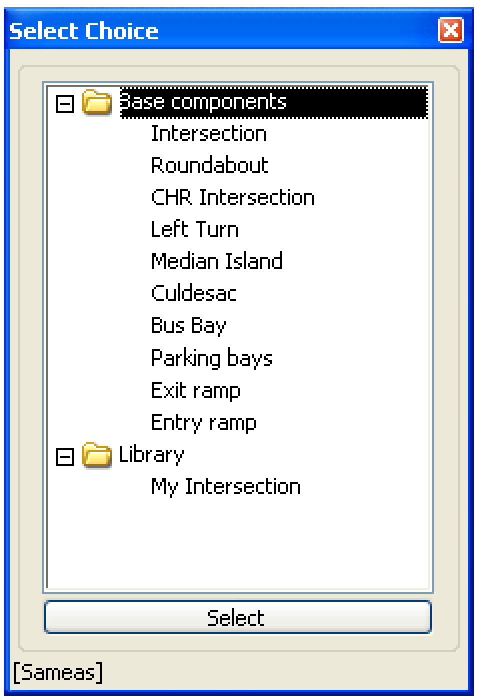


The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Base component

the component you wish your component to be based on



*This may be either a **Base Component**, as shipped by 12d, or one from your **Library**.*

*For information on **Component Types** please go to the section* [20.9.2 Component Types]

Name

the name of your component, which must be unique

Create button

creates the component and adds it to the library

20.9.2 Component Types

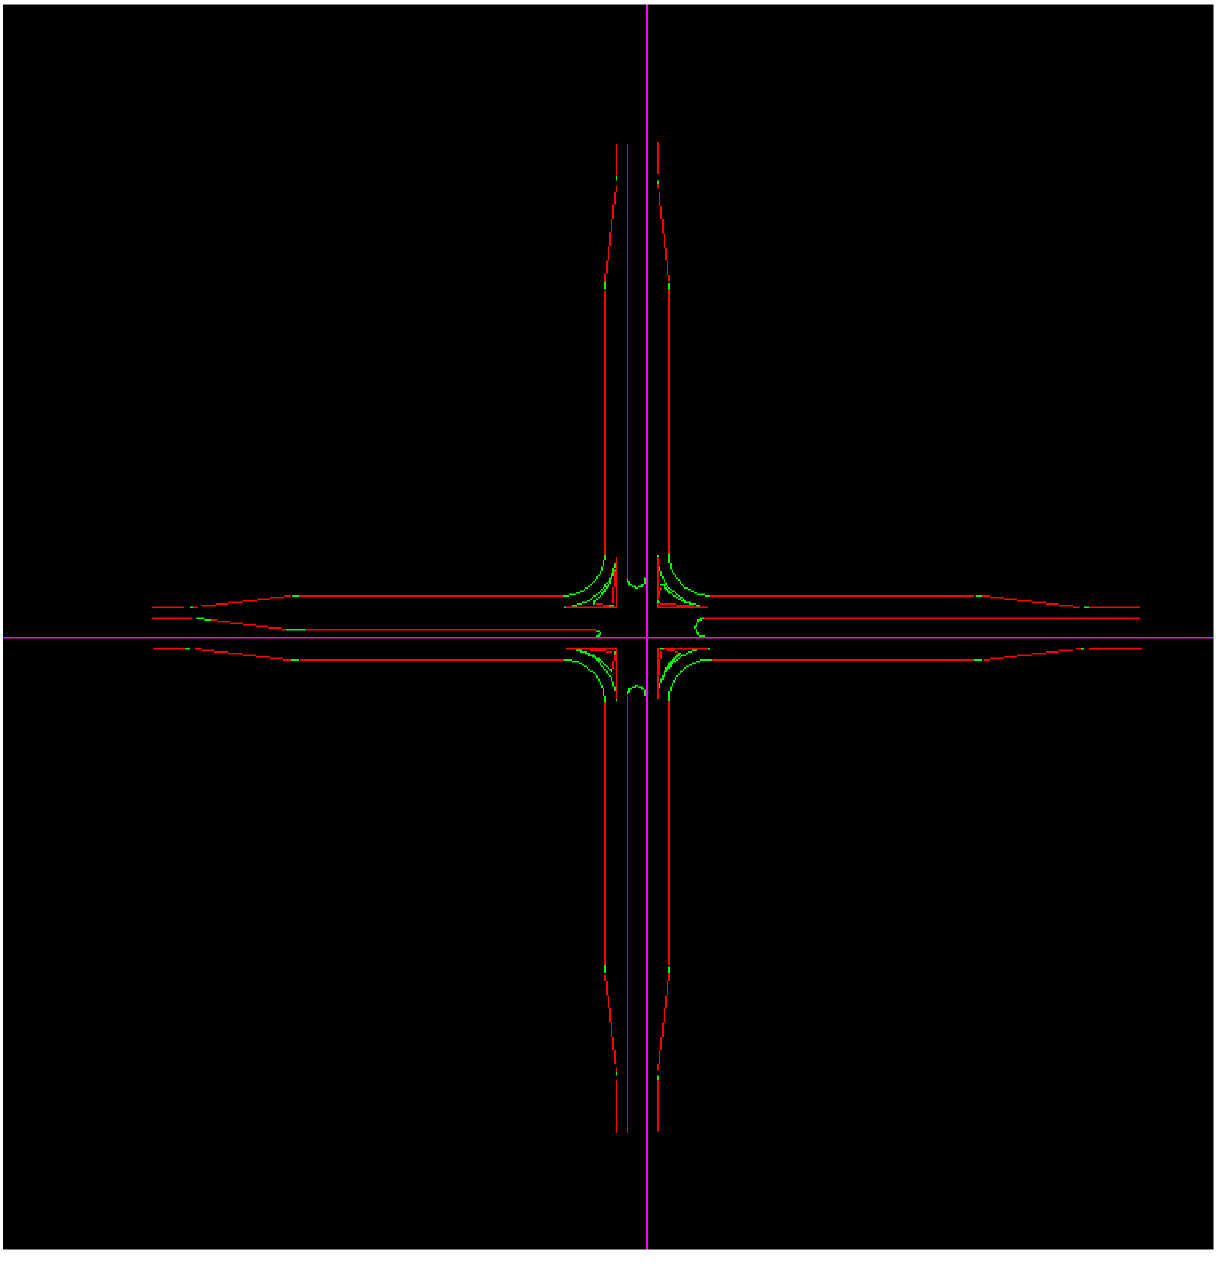
For

Minor Intersection	20.9.2.1 Minor Intersection
CHR Inters	20.9.27.2 CHR Intersection
Left Turn	20.9.13.2 Left Turn
Minor Roundabout	20.9.7.2 Roundabout
Median Island	20.9.15.2 Median Island
Culdesac	20.9.11.9 Culdesac
Bus Bay	20.9.11.8 Bus Bay
Parking bays	20.9.11.11 Parking Bays
Exit ramp	20.9.22.3 Exit Ramp
Entry ramp	20.9.17.2 Entry Ramp

20.9.2.1 Minor Intersection

An intersection component can be edited via the 20.9.1 Component Library or by editing the definition of a placed component. While an intersection is defined as a crossroad, the intersection will automatically close off any leg of the intersection that does not have valid strings.

For information on *Defining an Intersection* see 20.9.2.1.1 Defining an Intersection
Placing Intersections 20.9.7.1.4 Placing Intersections



20.9.2.1.1 Defining an Intersection

An intersection is broken into two roads - the **Major road** and the **Minor road**.

Each road, major or minor, may have an approach (the section of the road leading in to the intersection) and the departure (the section of the road leading away from the intersection).

The approach and departure for both the Major and Minor Road are defined by the same set of parameters.

For information on:
Placement Parameters Node see 20.9.3 Placement Parameters
Carriageway Node 20.9.4 Carriageway Node
Approach / Departure => Left turn Node 20.9.5 Left Turn - Approach / Departure
Approach / Departure => Left Turn =>Kerb Return Node 20.9.6 Approach / Departure =>Left

Turn =>Kerb Return Node

Approach / Departure => Median / Right Turn Node 20.9.7 Approach / Departure =>Median / Right Turn Node

20.9.3 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.7.1.4 Placing Intersections.

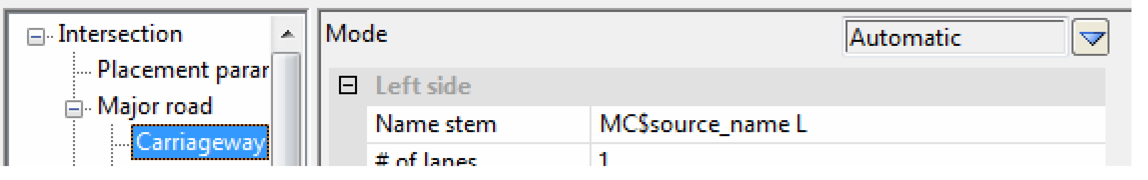
20.9.4 Carriageway Node

This node defines the carriageway of the road, in terms of the number of lanes and the type of lanes.

There are two modes for defining the carriageway: Automatic Mode and Manual Mode.

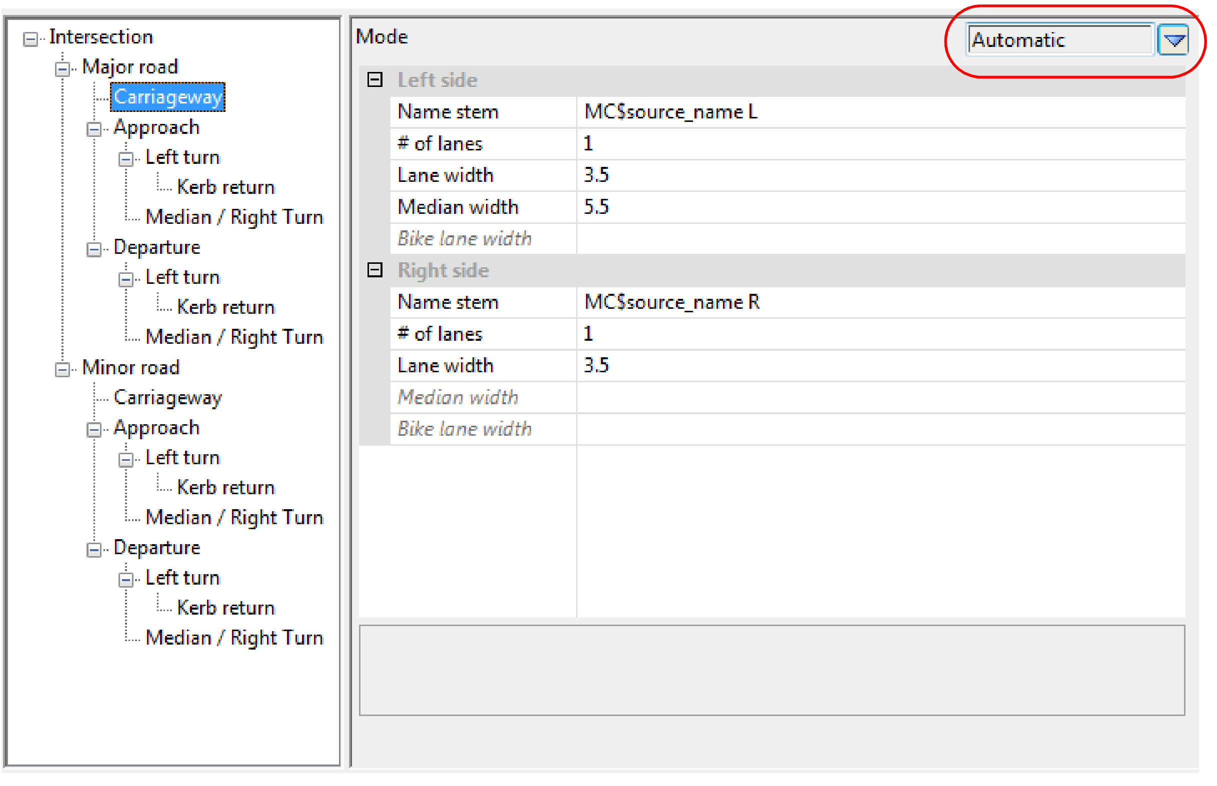
Note that regardless of the mode, you can only define a median on one side of the carriageway.

If you place your intersection using dual carriageways, the width will be ignored.



Automatic Mode

Automatic mode does not allow you to define names for each lane of your carriageway and only allows a basic layout. It is the simplest and quickest way to define a carriageway.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Left Side

Name Stem

the name to apply to each created lane on the left side of the carriageway

# of lanes

the number of lanes to create on the left side of the carriageway

Lane width

the lane width for each lane on the left side of the carriageway

Median width

the width for an optional median on the left side of the carriageway.

Bike lane width

the width for an optional bike lane on the left side of the median.

Right Side

Name Stem

the name to apply to each created lane on the right side of the carriageway

# of lanes

the number of lanes to create on the right side of the carriageway

Lane width

the lane width for each lane on the right side of the carriageway

Median width

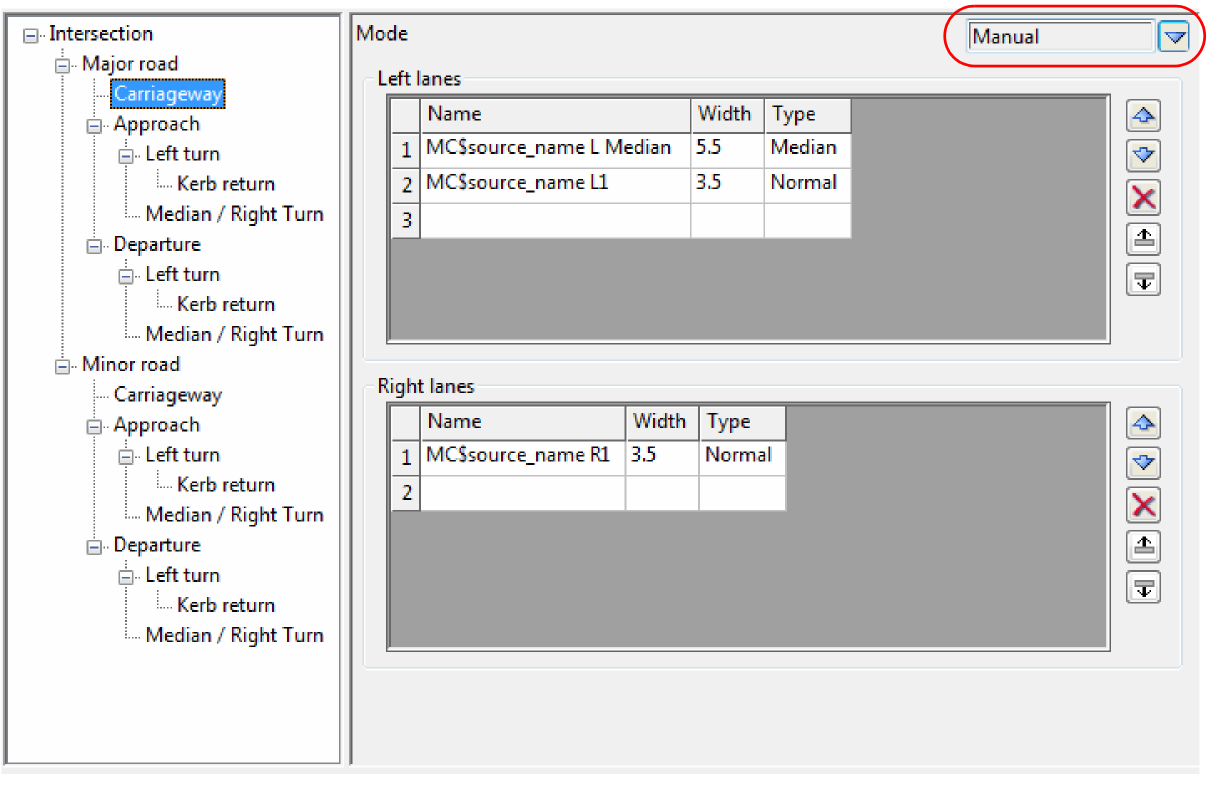
the width for an optional median on the right side of the carriageway.

Bike lane width

the width for an optional bike lane on the right side of the median

Manual Mode

Manual mode allows you to define the carriageway in more detail, by specifying each lane individually, along with its width and type.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Left Lanes Grid

Name

the name of the lane on the left side

Width

the width of the lane

Type

the type of lane (Normal, Bike or Median)

Right Lanes Grid

Name

the name of the lane on the right side

Width

the width of the lane

Type

the type of lane (Normal, Bike or Median)

20.9.5 Left Turn - Approach / Departure

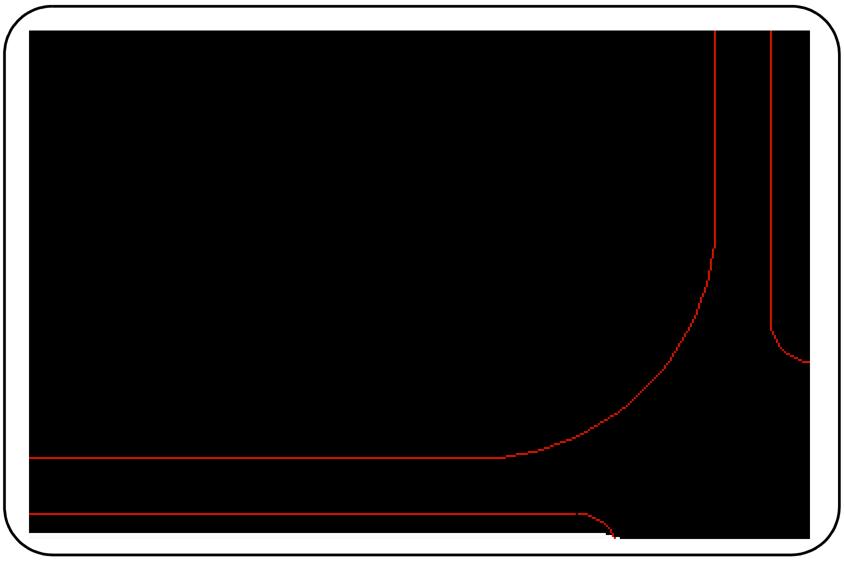
This node defines the **Left turn** of an intersection. If you are in Right Side driving mode, this will be called **Right Turn**.

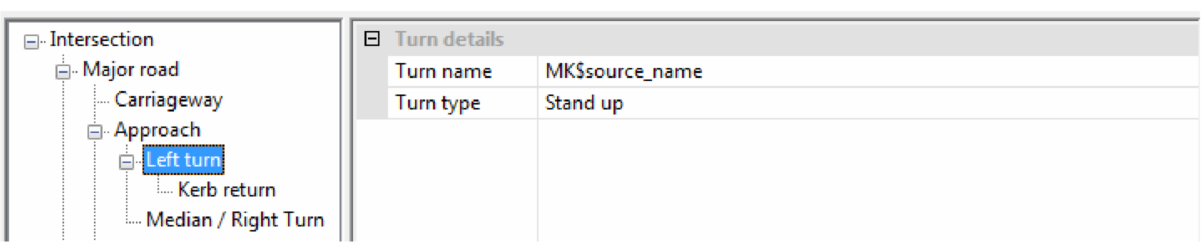
There are three types of turns currently available:

1. Stand up - for more information go to Stand Up Turn
2. Free - for more information go to Free Turn
3. High entry - for more information go to High Entry Turn

Both **Stand up** and **Free** turns allow you to define the type of kerb return being used.

Stand Up Turn





The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Turn name

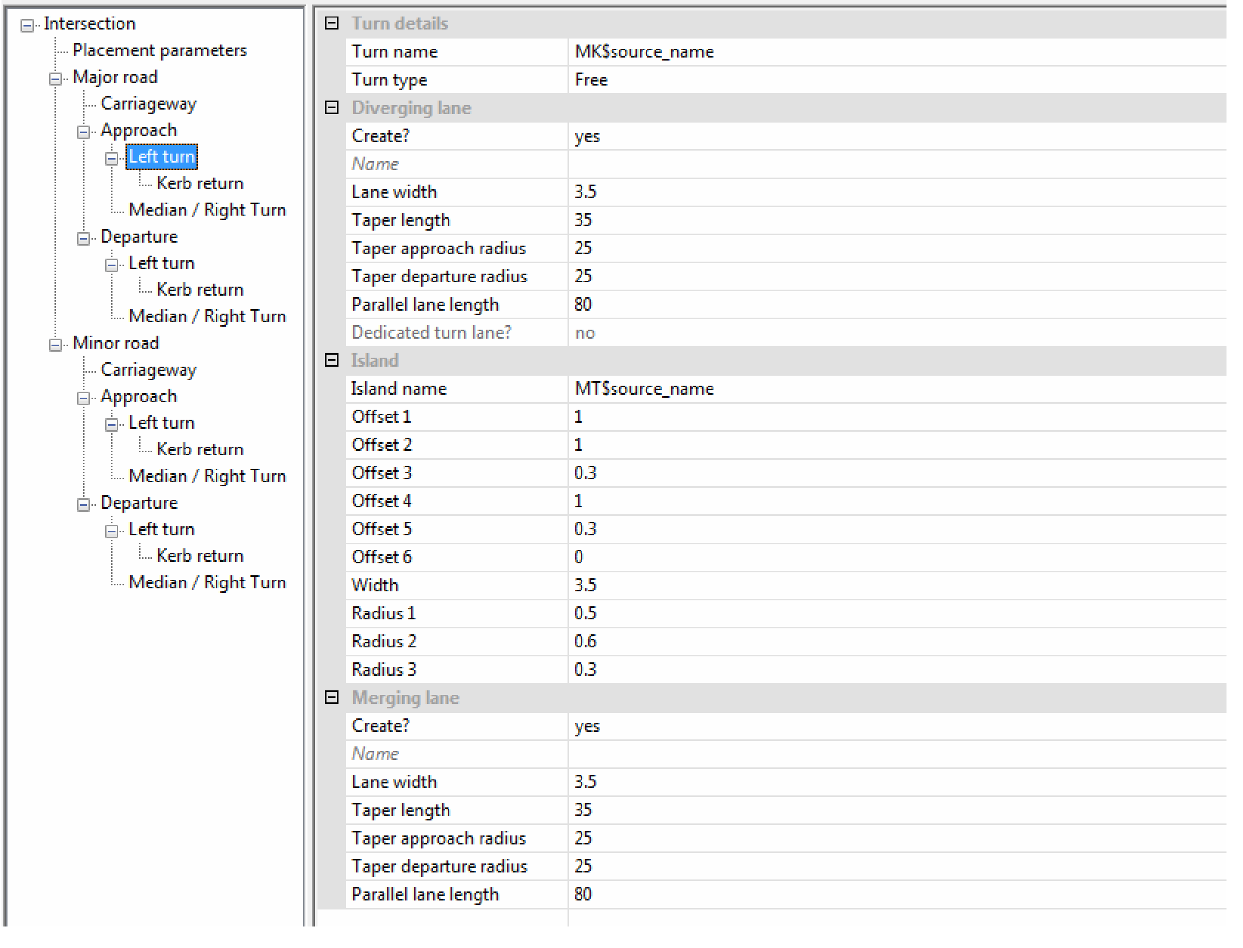
the name to use for created geometry

Turn type

the type of turn (in this case, Stand up)

Free Turn

A **Free turn** supports an optional diverging lane, a traffic island and an optional merging island.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Turn Details

Turn name

the name to use for created geometry

Turn type

the type of turn (in this case, Free)

Diverging Lane

Create?

whether or not to create a diverging lane

Name

an optional name to use for the diverging lane

Lane width

the width of the diverging lane

Taper length

the length of the leading taper on the diverging lane

Taper approach radius

the approach radius of the taper

Taper Departure radius

the departure radius of the taper

Parallel lane length

the length of the parallel lane of the diverging lane

Dedicated turn lane?

whether or not to create a dedicated turn lane - only available if not creating a diverging lane

Island

Island name

the name of the island string

Offset 1

the first offset of the painted island from the internal island

Offset 2

the second offset of the painted island from the internal island

Offset 3

the third offset of the painted island from the internal island

Offset 4

the fourth offset of the painted island from the internal island

Offset 5

the fifth offset of the painted island from the internal island

Offset 6

the sixth offset of the painted island from the internal island

Width

the width of the island from the kerb return

Radius 1

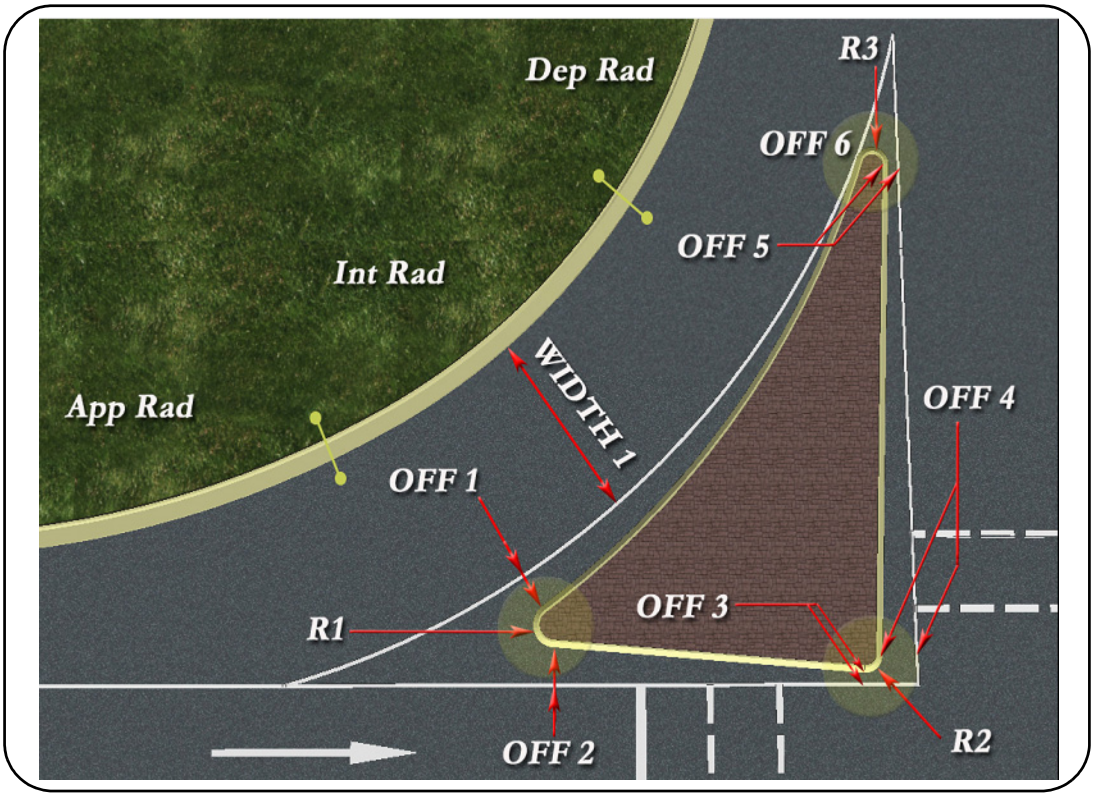
the first radius of the internal island

Radius 2

the second radius of the internal island

Radius 3

the third radius of the internal island



Merging Lane

Create?

whether or not to create a merging lane

Name

an optional name to use for the merging lane

Lane width

the width of the merging lane

Taper length

the length of the leading taper on the merging lane

Taper approach radius

the approach radius of the taper

Taper Departure radius

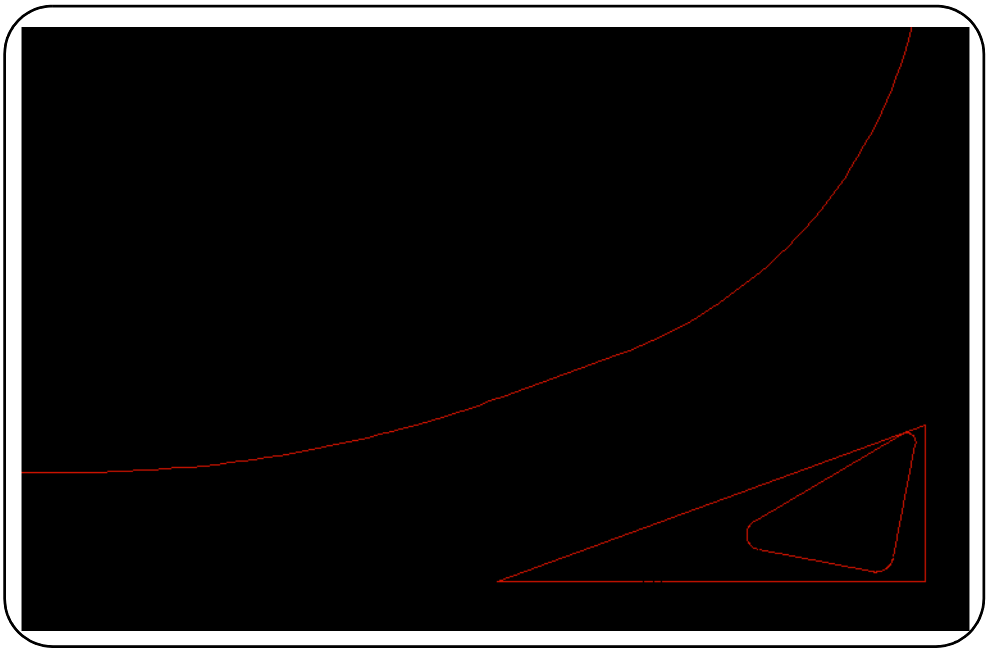
the departure radius of the taper

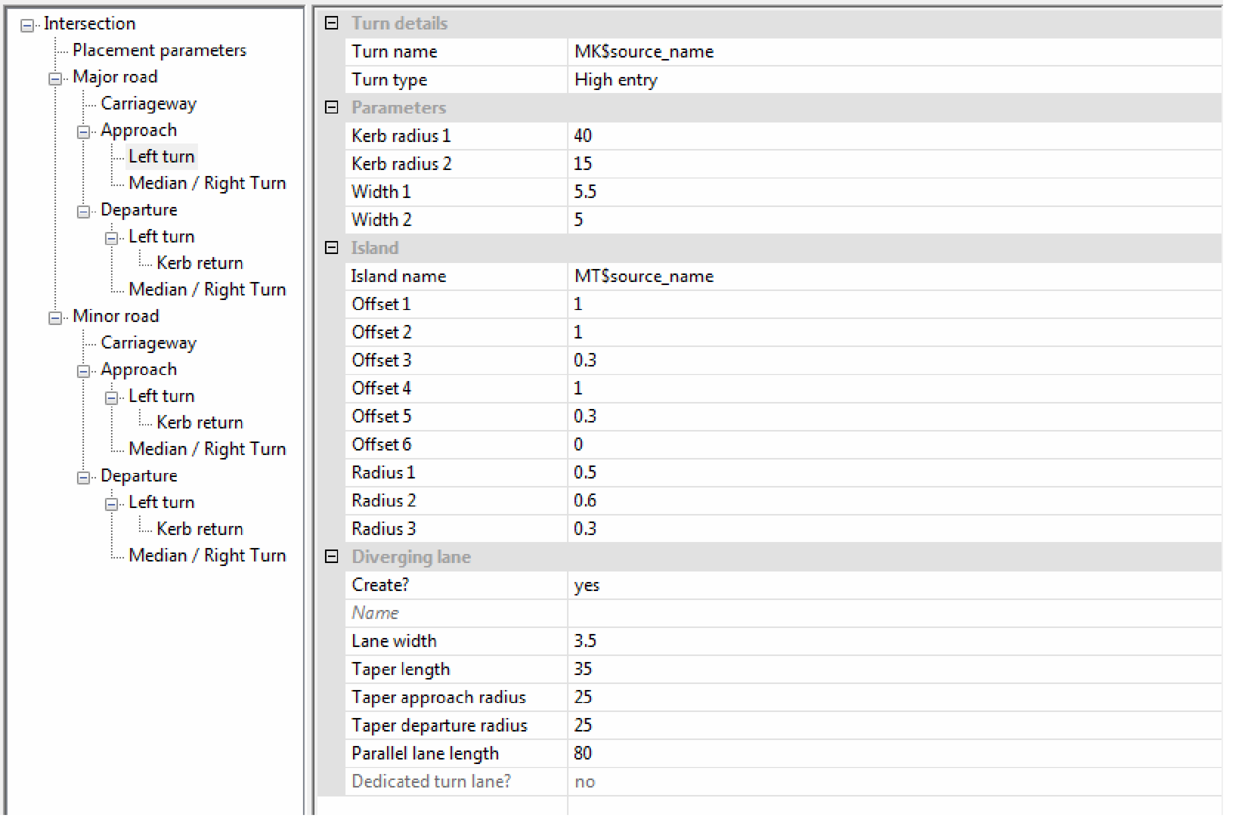
Parallel lane length

the length of the parallel lane of the merging lane

High Entry Turn

A **High Entry Turn** supports an island and optional diverging lane, as well as an optional dedicated turning lane when no diverging lane is used.





The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Turn Details

Turn name

the name to use for created geometry

Turn type

the type of turn (in this case, High entry)

Parameters

Kerb radius 1

the approach radius of the high entry kerb

Kerb radius 2

the departing radius of the high entry kerb

Width 1

the distance between the kerb return and the painted island

Width 2

the width of the painted island

Island

Island name

the name of the island string

Offset 1

the first offset of the painted island from the internal island

Offset 2

the second offset of the painted island from the internal island

Offset 3

the third offset of the painted island from the internal island

Offset 4

the fourth offset of the painted island from the internal island

Offset 5

the fifth offset of the painted island from the internal island

Offset 6

the sixth offset of the painted island from the internal island

Radius 1

the first radius of the internal island

Radius 2

the second radius of the internal island

Radius 3

the third radius of the internal island

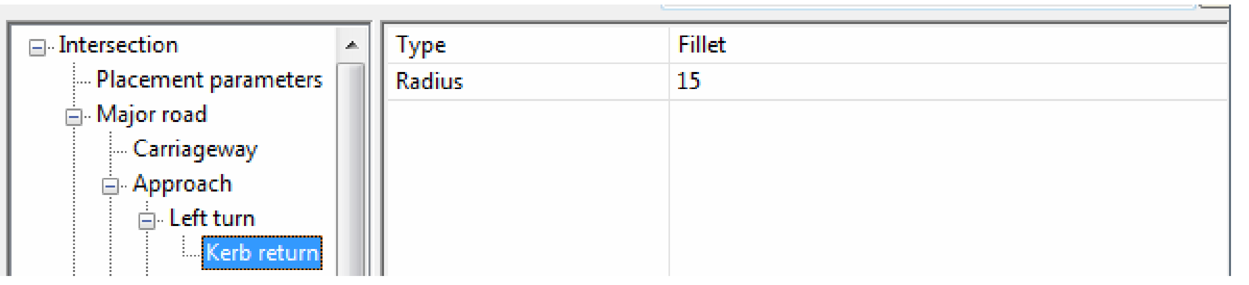
20.9.6 Approach / Departure =>Left Turn =>Kerb Return Node

The stand up and free left turn types allow you to define the kerb return to be used.

These options include 20.9.6.1 Fillet Kerb Return, 20.9.6.2 Two Centred Kerb Return and 20.9.6.3 Three Centred Kerb Return

20.9.6.1 Fillet Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

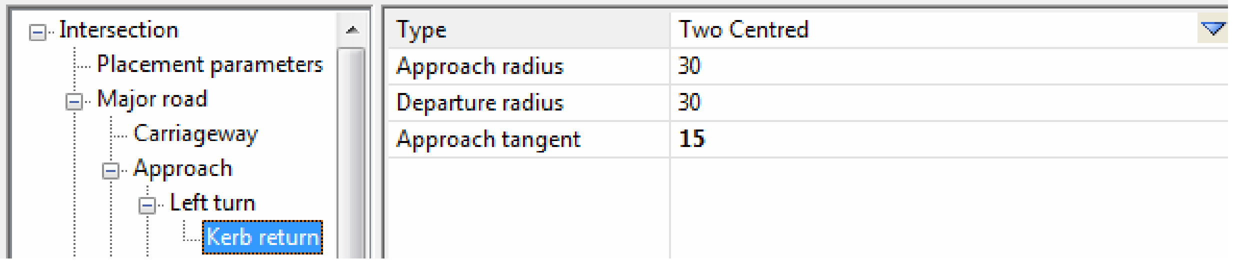
Type

the type of kerb return to create (in this case, ***Fillet****)*

Radius

the radius for the fillet kerb return

20.9.6.2 Two Centred Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Type

the type of kerb return to create (in this case, ***Two Centred****)*

Approach radius

the approach radius of the two centred curve

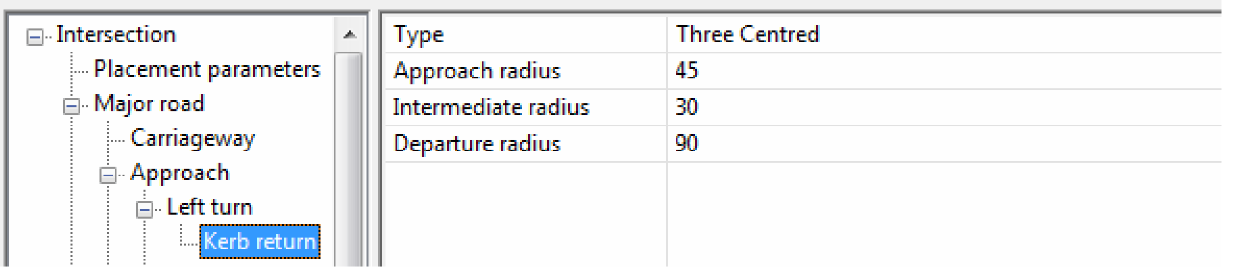
Departure radius

the departure radius of the two centred curve

Approach tangent

the approach tangent for the two centred curve

20.9.6.3 Three Centred Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Type

*the type of kerb to create (in this case, **Three Centred**)*

Approach radius

the approach radius of the three centred curve

Intermediate radius

the intermediate radius of the three centred curve

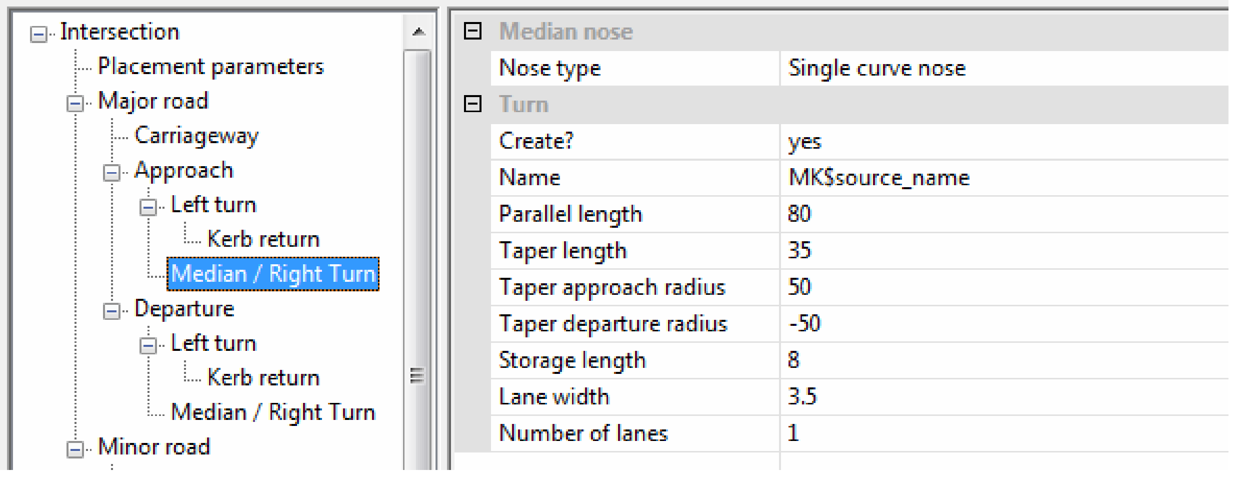
Departure radius

the departure radius of the three centred curve

20.9.7 Approach / Departure =>Median / Right Turn Node

This node is used to define the median and an optional right turn for an intersection road approach or departure.
Note that if you are using Right Side driving, then this will say Median / Left Turn.

This node is only used if a median has been defined as part of the carriageway.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Median Nose

Nose type

the type of nose to create for the median (see 20.9.7.1 Nose Types*)*

Turn

Create?

whether or not to create a right turn

Name

the name to apply to the turn

Parallel length

the length of the parallel lane

Taper

the length of the leading taper

Taper approach radius

the approach radius of the leading taper

Taper departure radius

the departure radius of the leading taper

Storage length

the storage length of the turn lane

Lane width

the width of the turn lane - must be less than the median width

Number of lanes

the number of turn lanes to create

20.9.7.1 Nose Types

For more information on *Single Curve Nose* see 20.9.7.1.1 Single Curve Nose

Two Curve Nose 20.9.7.1.2 Two Curve Nose

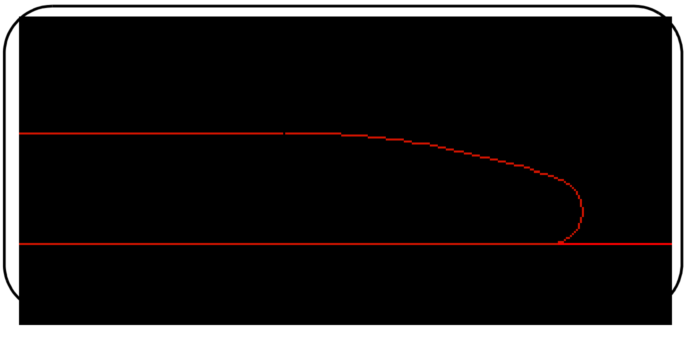
Three Curve Nose 20.9.7.1.3 Three Curve Nose

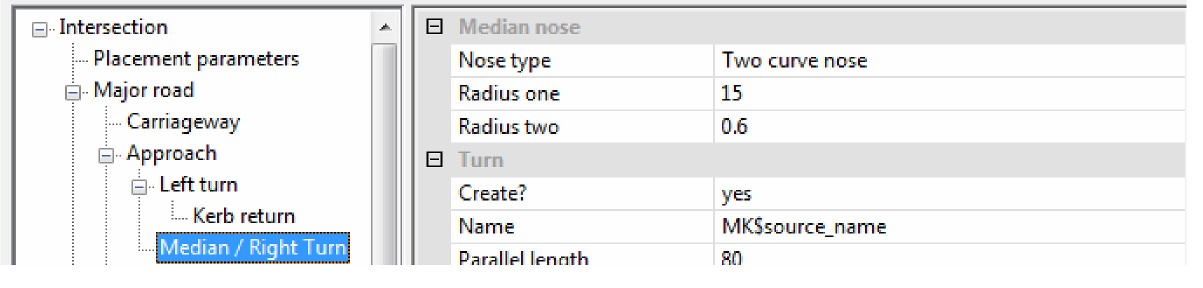
20.9.7.1.1 Single Curve Nose

a median nose created from a single fillet curve

20.9.7.1.2 Two Curve Nose

A median nose created from two curves





The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Radius one

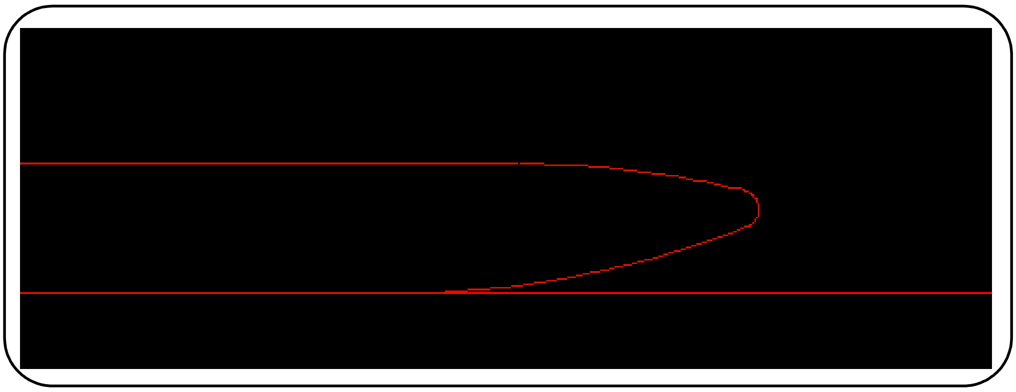
the radius of the first curve

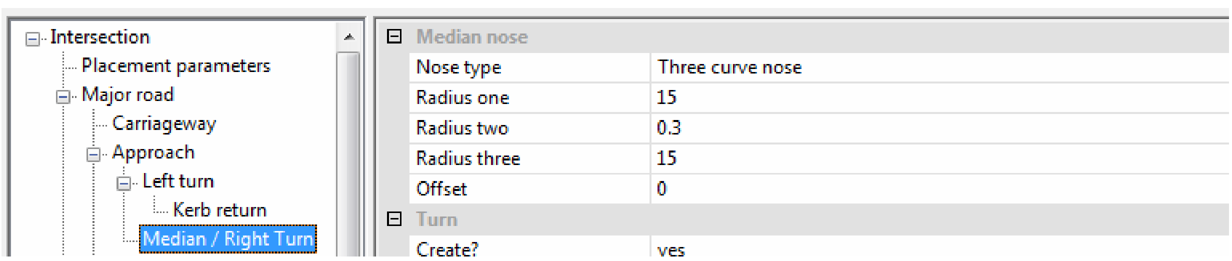
Radius two

the radius of the second curve

20.9.7.1.3 Three Curve Nose

A median nose created from three curves and an optional offset





The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Radius one

the radius of the first curve

Radius two

the radius of the second curve

Radius three

the radius of the third curve

Offset

the offset of the nose from the centreline

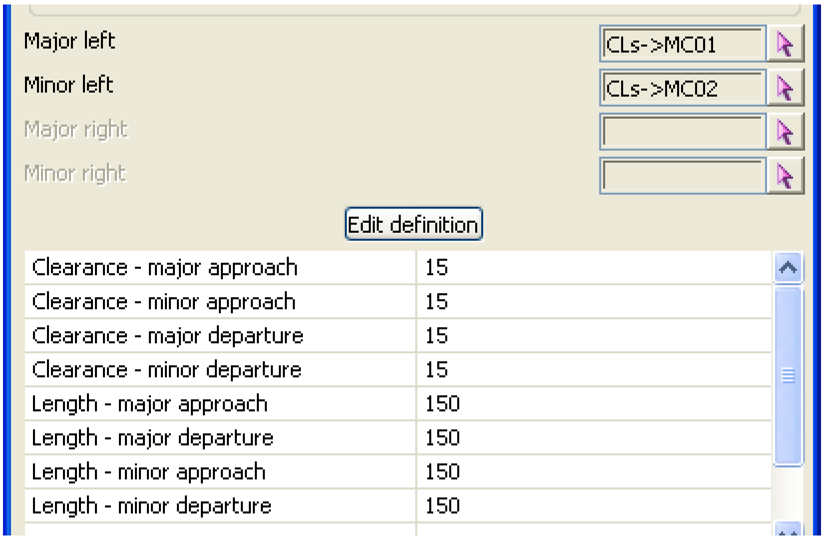
20.9.7.1.4 Placing Intersections

When placing an intersection, there are several placement specific settings. This means they are separate from the definition but help define how the intersection is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed

Component Editor Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Major left

the left most major road

Minor left

the left most minor road

Major right

the right most major road (optional)

Minor right

the right most minor road (optional)

Major right and minor right can be set when there is a dual carriageway.

Edit definition button

Selecting this button displays the **Edit a Placed Component Definition** *panel. For more information please see* 20.9.34.2 Edit a Placed Component Definition

Clearance - major approach

the clearance of geometry on the approach of the major road, from the intersection

Clearance - minor approach

the clearance of geometry on the approach of the minor road, from the intersection

Clearance - major departure

the clearance of geometry on the departure of the major road, from the intersection

Clearance - minor departure

the clearance of geometry on the departure of the minor road, from the intersection

Length - major approach

the length of the geometry created for the approach of the major road

Length - minor approach

the length of the geometry created for the approach of the minor road

Length - major departure

the length of the geometry created for the departure of the major road

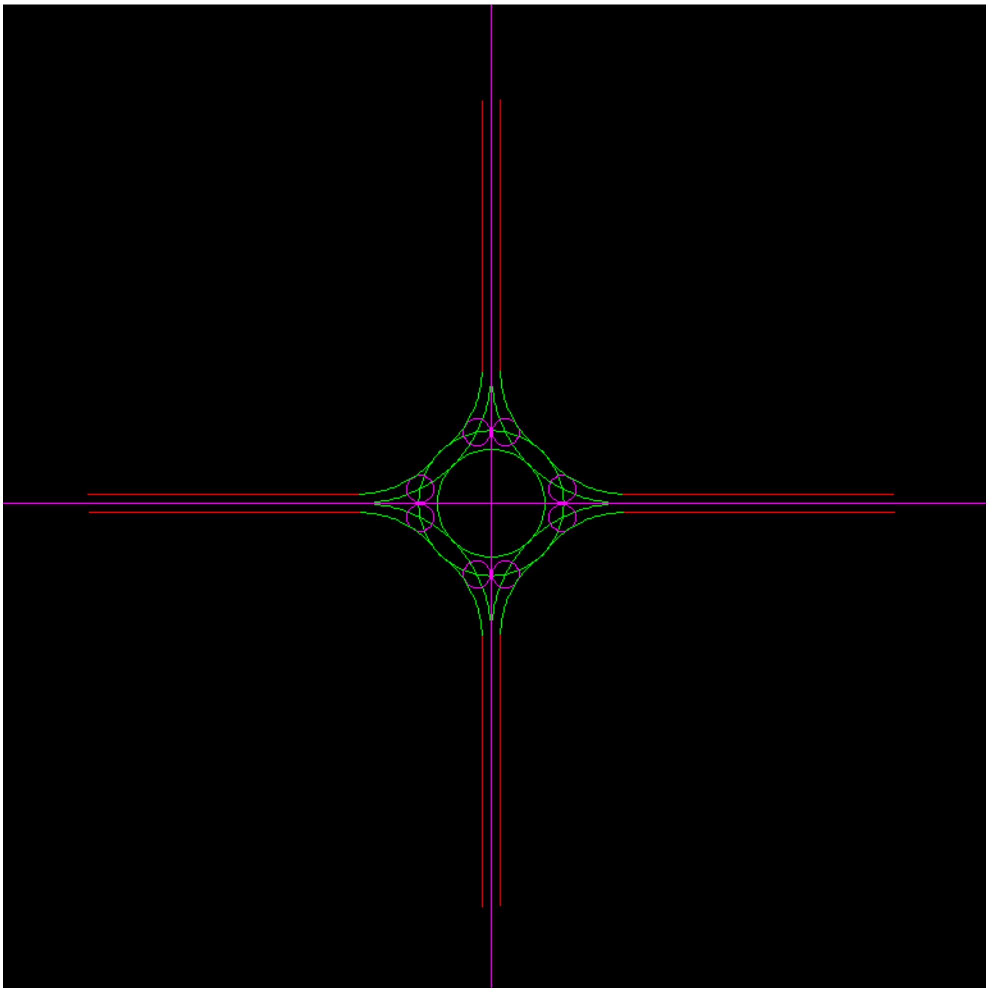
Length - minor departure

the length of the geometry created for the departure of the minor road

20.9.7.2 Roundabout

A Roundabout component can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

For information on *Defining a Roundabout* see 20.9.7.2.1 Defining a Roundabout
Placing Roundabouts 20.9.11.7.1 Placing Roundabouts



20.9.7.2.1 Defining a Roundabout

A Roundabout is defined around two intersecting roads - the **Major road** and the **Minor road**.

Each road, major or minor, may have an approach (the section of the road leading in to the roundabout) and the departure (the section of the road leading away from the roundabout).

The approach and departure for both the Major and Minor road are defined by the same

set of parameters.

For information on:

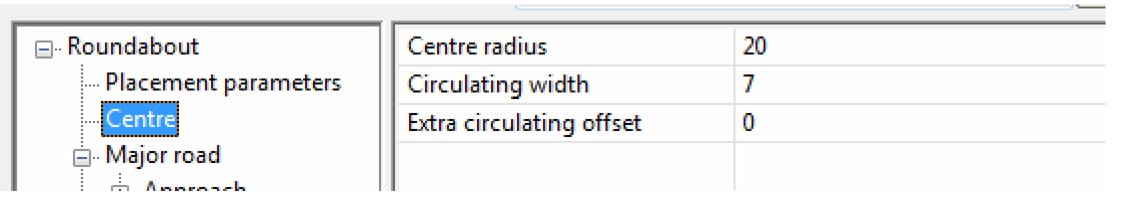
Placement Parameters Node see	20.9.8 Placement Parameters
Centre Node	20.9.9 Centre Node
Approach/ Departure Node	20.9.10 Approach / Departure Node
Approach/ Departure => Kerb Node	20.9.11 Approach / Departure => Kerb Node

20.9.8 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.11.7.1 Placing Roundabouts.

20.9.9 Centre Node

This node defines parameters for the centre of the roundabout.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Centre radius

the radius of the centre island of the roundabout

Circulating width

the width around the centre island

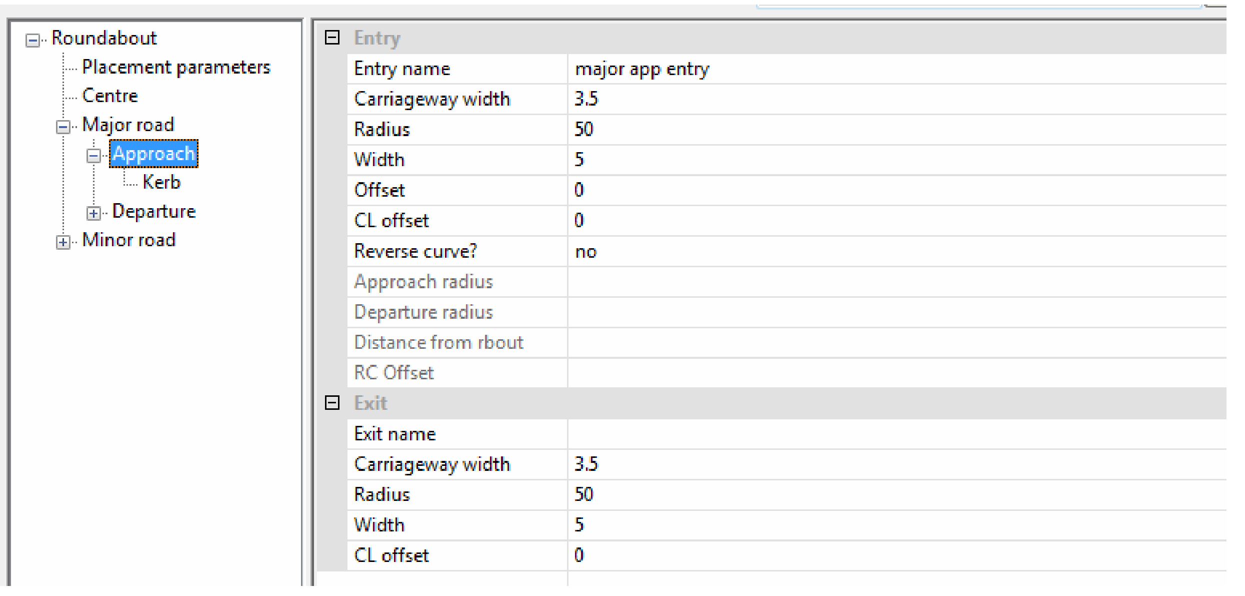
Extra circulating offset

an additional offset to apply to throat and kerb return strings from the circulating width

20.9.10 Approach / Departure Node

This node defines parameters for the approach or departure of a specific Roundabout road.

This node is made up of two sub parts - the **Entry** into the roundabout and the **Exit** from the roundabout. They can be configured independently.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Entry

Entry name

the name to apply to the entry string

Carriageway width

the width of the carriageway at the entry to the roundabout

Radius

the radius of the entry into the roundabout

Width

the width of the entry throat into the roundabout

Offset

an offset of the entry string from the centre of the roundabout

CL offset

an offset of the entry from the centreline, for medians

Reverse curve?

whether or not to create a reverse curve (yes or no)

Approach radius

the approach radius for the reverse curve

Departure radius

the departure radius of the reverse curve

Distance from rbout

the distance of the start of the reverse curve from the roundabout

RC Offset

the offset of the reverse curve from the centreline

Exit

Exit name

the name to apply to the exit string

Carriageway width

the width of the carriageway at the exit to the roundabout

Radius

the radius of the exit from the roundabout

Width

the width of the exit throat from the roundabout

CL Offset

an offset of the exit string from the centre of the roundabout

20.9.11 Approach / Departure => Kerb Node

This defines the kerb return between the entry at the approach / departure and the adjacent exit.

There are several types of kerb returns available.

- *Arc / Three Tangents / Arc see* 20.9.11.2 Arc / Three Tangents / Arc
- *Three Tangents / Locked Arc / Three Tangents see* 20.9.11.3 Three Tangents / Locked Arc / Three Tangents
- *Three Tangents / Arc / Three Tangents see* 20.9.11.4 Three Tangents / Arc / Three Tangents
- *Fillet see* 20.9.11.5 Fillet
- *Two Centre Curve see* 20.9.11.6 Two Centre Curve
- *Three Centre Curve see* 20.9.11.7 Three Centre Curve

Getting the geometry right for your roundabout can be complex. The geometry is not guaranteed to solve and you may need to try another kerb return type if the current one does not suit your needs.

20.9.11.1 Common Fields

Name

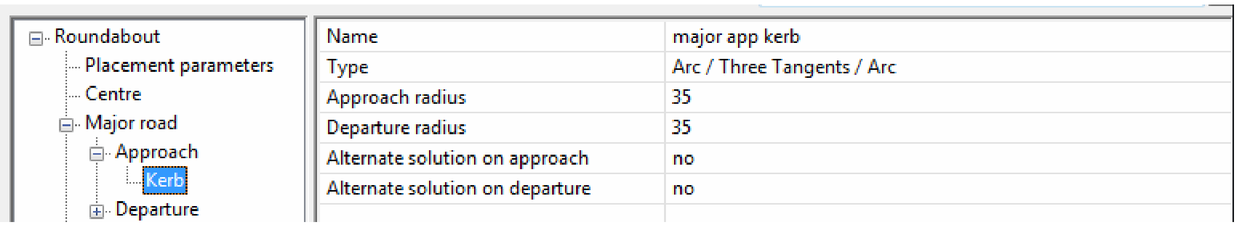
the name of the kerb return

Type

the type of kerb return

20.9.11.2 Arc / Three Tangents / Arc

This creates a kerb return with an approaching arc, an arc with three tangents (to the edge of the entry throat, the circulating width and the edge of the exit throat) and a departing arc.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Approach radius

the radius of the approach arc

Departure radius

the radius of the departure arc

Alternate solution on approach

whether or not to attempt a different solution on the approach arc

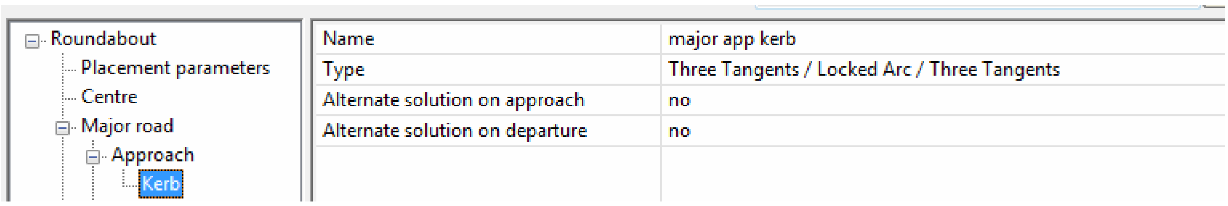
Alternate solution on departure

whether or not to attempt a different solution on the departure arc

20.9.11.3 Three Tangents / Locked Arc / Three Tangents

This creates a kerb return with the following components:

- an arc tangential to the entry carriageway, the edge of the entry throat and the circulating width of the roundabout
- an arc with a radius locked to the radius of the circulating width
- an arc tangential to the circulating width of the roundabout, the edge of the exit throat and the exit carriageway



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Alternate solution on approach

whether or not to attempt a different solution on the approach arc

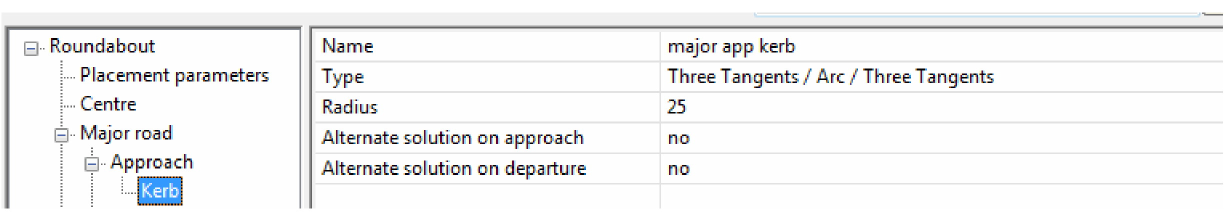
Alternate solution on departure

whether or not to attempt a different solution on the departure arc

20.9.11.4 Three Tangents / Arc / Three Tangents

This creates a kerb return with the following components:

- an arc tangential to the entry carriageway, the edge of the entry throat and the circulating width of the roundabout
- an arc with a user defined radius
- an arc tangential to the circulating width of the roundabout, the edge of the exit throat and the exit carriageway



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Radius

a user defined radius for the internal arc

Alternate solution on approach

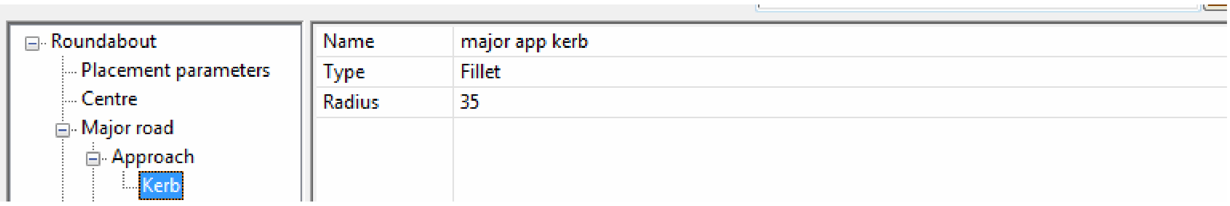
whether or not to attempt a different solution on the approach arc

Alternate solution on departure

whether or not to attempt a different solution on the departure arc

20.9.11.5 Fillet

This creates a kerb return as a simple fillet between the approach / departure and the adjacent carriageway.



The fields and buttons used in this panel have the following functions:

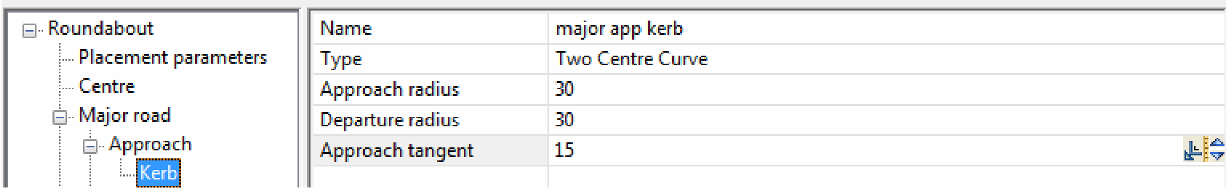
Field Description Type Defaults Pop-Up

Radius

the radius to use for the fillet

20.9.11.6 Two Centre Curve

This creates a kerb return as a two centre curve.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Approach radius

the radius for the approach of the curve

Departure radius

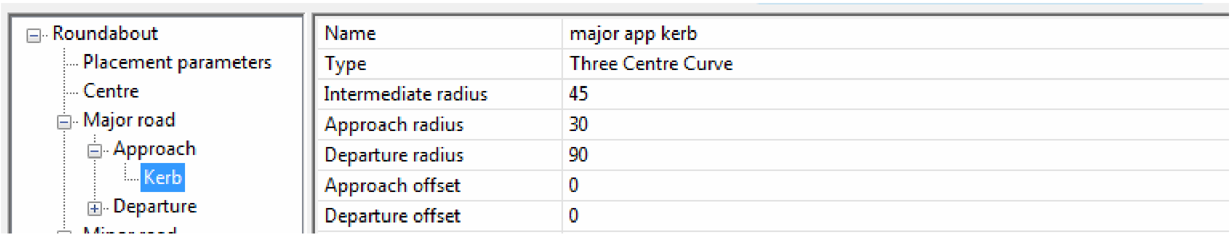
the radius for the departure of the curve

Approach tangent

the approach tangent to the curve

20.9.11.7 Three Centre Curve

This creates a kerb return as a three centre curve.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Intermediate radius

the radius of the intermediate part of the curve

Approach radius

the radius of the approach part of the curve

Departure radius

the radius of the departure part of the curve

Approach offset

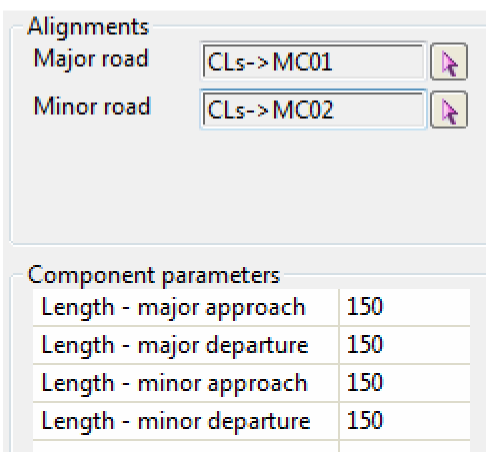
Departure offset

20.9.11.7.1 Placing Roundabouts

A roundabout is placed at the intersection of two roads - the Major and Minor road. When placing a roundabout, there are several placement specific settings. This means they are separate from the definition but help define how the roundabout is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Alignments

Major road

the major road of the roundabout

Minor road

the minor road of the roundabout

Component parameters

Length - major approach

the length strings to generate along the major approach

Length - major departure

the length strings to generate along the major departure

Length - minor approach

the length strings to generate along the minor approach

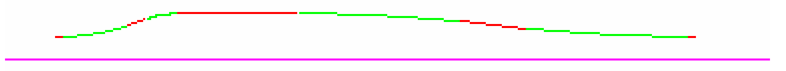
Length - minor departure

the length strings to generate along the minor departure

Note that setting a length to 0 will effectively close that leg of the roundabout.

20.9.11.8 Bus Bay

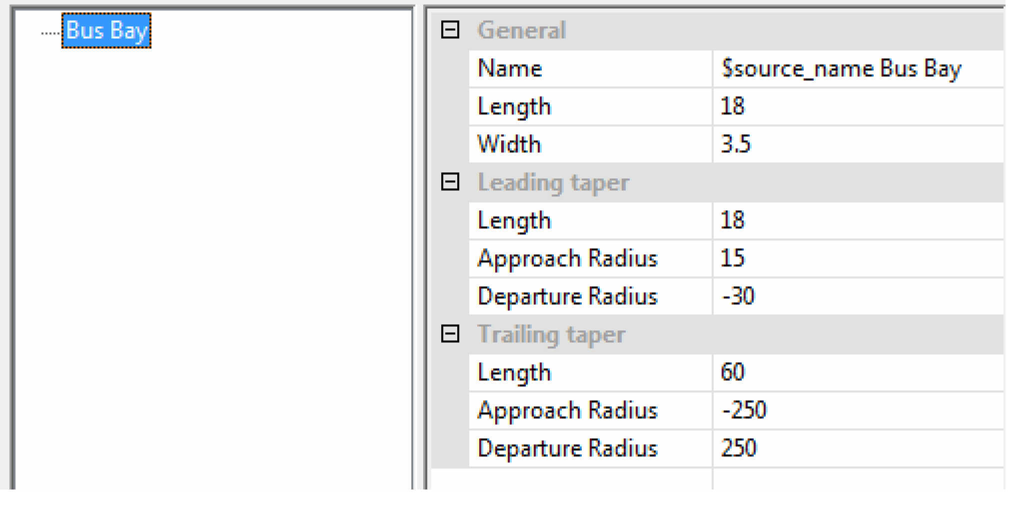
A **Bus Bay** component can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.



For information on *Defining a Bus Bay* see 20.9.11.8.1 Defining a Bus Bay
Placing Bus Bays 20.9.11.8.2 Placing Bus Bays

20.9.11.8.1 Defining a Bus Bay

A **Bus Bay** is defined as being created from a known chainage on one centreline string.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

General

Name

the name of the Bus Bay string

Length

the length of the Bus Bay

Width

the width of the widest part of the Bus Bay

Leading Taper

Length

the length of the leading taper into the Bus Bay

Approach radius

the approach radius of the leading taper into the Bus Bay

Departure radius

the departing radius of the leading taper into the Bus Bay

Trailing Taper

Length

the length of the trailing taper from the Bus Bay

Approach radius

the approach radius of the trailing taper from the Bus Bay

Departure radius

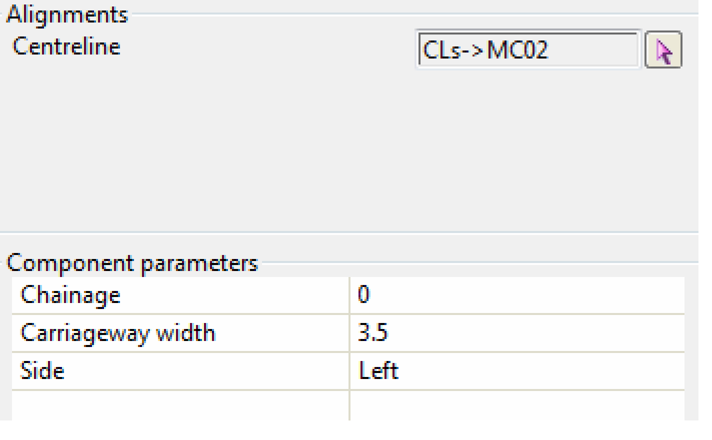
the departing radius of the trailing taper from the Bus Bay

20.9.11.8.2 Placing Bus Bays

A **Bus Bay** is placed at a known chainage along one centreline string. When placing a **Bus Bay**, there are several placement specific settings. This means they are separate from the definition but help define how the **Bus Bay** is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Centreline

the centreline string on which the Bus Bay is created

Chainage

the chainage of the Bus Bay on the nominated centreline string

Carriageway width

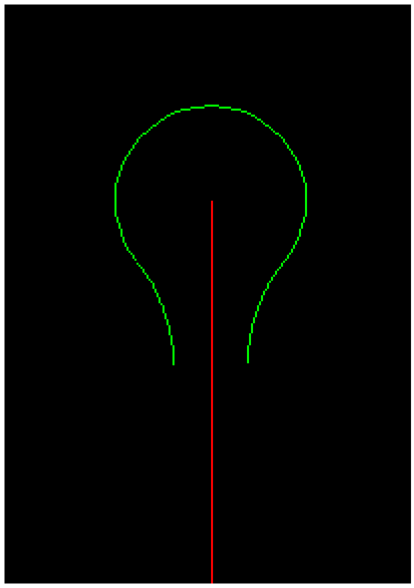
the width of the carriageway

Side

the side of the road on which the Bus Bay is created (Left or Right). This will influence the direction of the Bus Bay, depending on your drive side settings in your library.

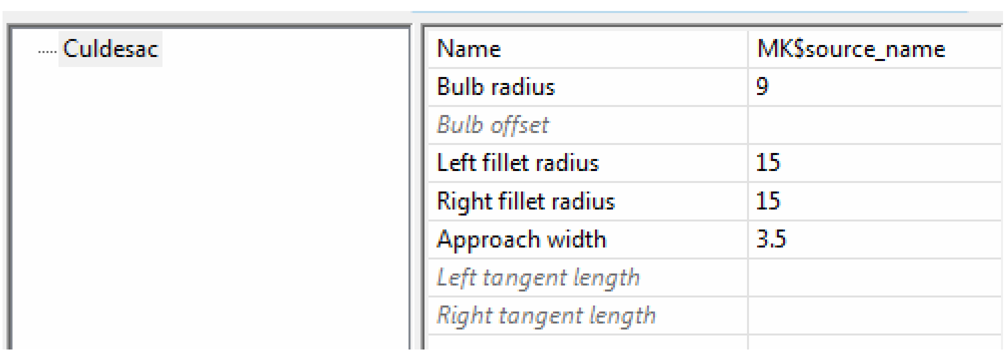
20.9.11.9 Culdesac

A **Culdesac** component can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.



For information on *Defining a Culdesac* see 20.9.11.9.1 Defining a Culdesac
Placing Culdesac 20.9.11.9.2 Placing Culdesacs

20.9.11.9.1 Defining a Culdesac



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name

the name of the culdesac string

Bulb radius

the radius of the bulb of the culdesac

Bulb offset

an optional offset of the bulb from the centreline

Left fillet radius

the radius of the left fillet of the culdesac

Right fillet radius

the radius of the right fillet of the culdesac

Approach width

the width of the carriageway approaching the culdesac

Left tangent length

an optional length of a tangent between the left fillet and the bulb

Right tangent length

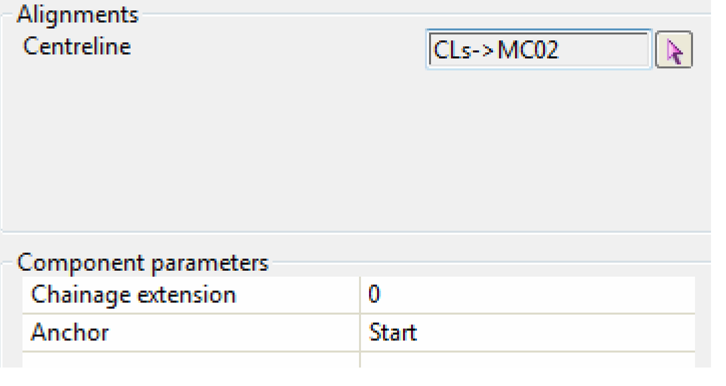
an optional length of a tangent between the right fillet and the bulb

20.9.11.9.2 Placing Culdesacs

A **Culdesac** is placed either at the start or end of a road. When placing a culdesac, there are several placement specific settings. This means they are separate from the definition but help define how the culdesac is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Centreline

the centreline the culdesac is created for

Chainage extension

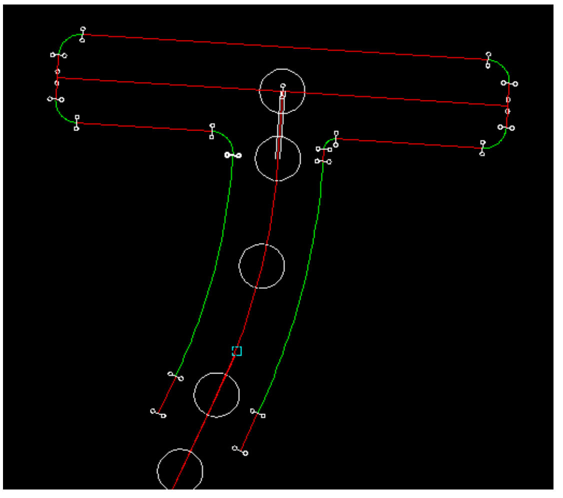
an extension from the anchor

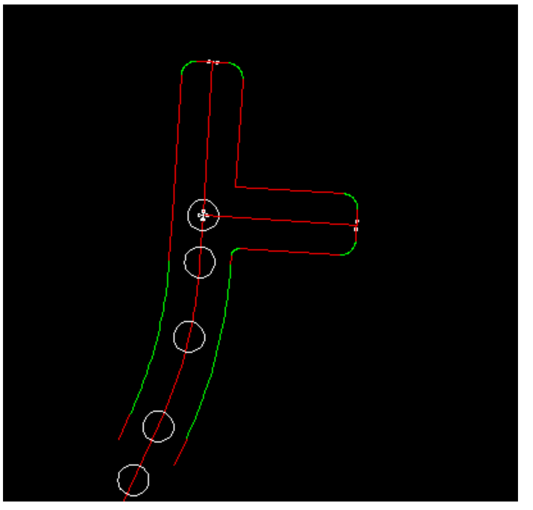
Anchor

where the culdesac is anchored (Start or End)

20.9.11.10 HAMMERHEAD

The HAMMERHEAD has parameters to cover most situations. For example, by modifying the parameters, the Hammerhead covers both of the cases:

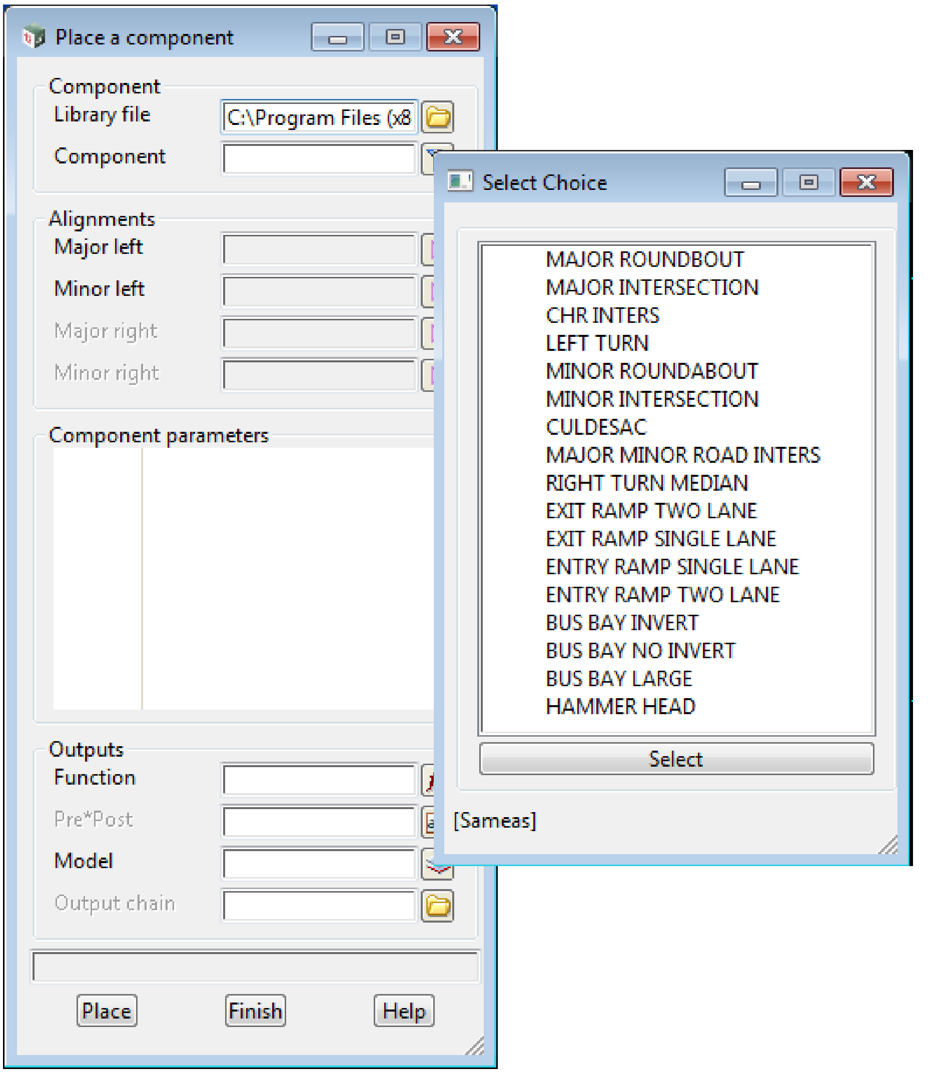




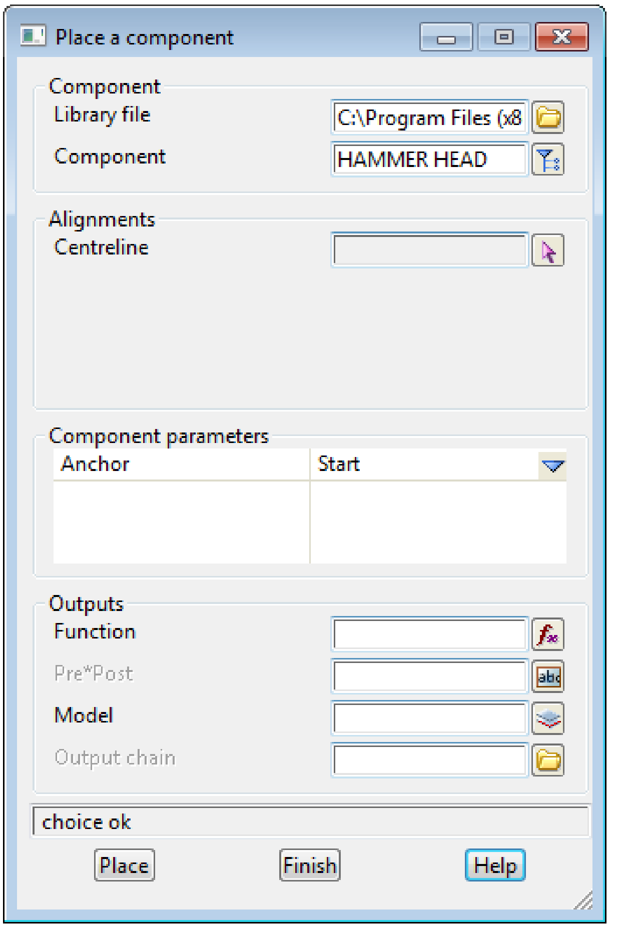
Selecting

Design =>Roads =>Components =>Place component

brings up the **Place a Component** panel.



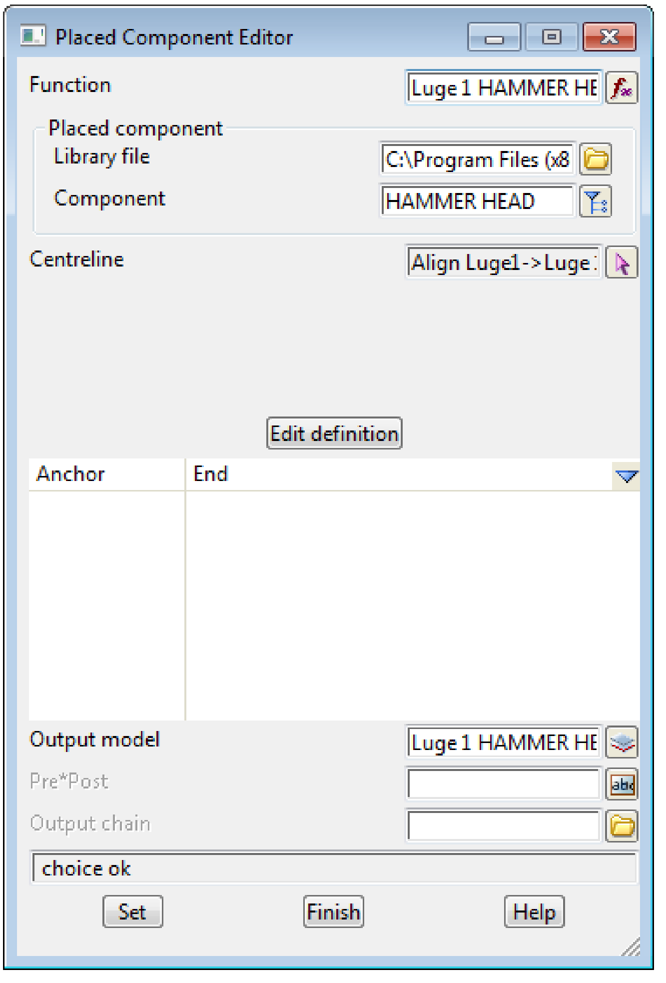
Clicking on the **Component** choice icon and selecting HAMMERHEAD puts information specific to a HAMMERHEAD on the panel.



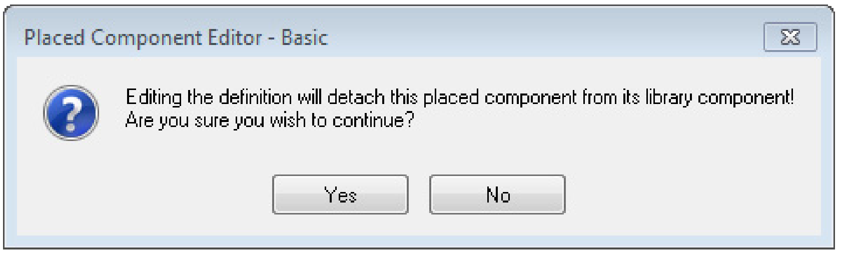
If you select a **Centreline**, the **Function** and **Model** boxes are automatically filled out using a combination of the string name, the word HAMMERHEAD and a unique number amongst the HAMMERHEAD functions already in the project.

Anchor says whether the HAMMERHEAD is to go at the **Start** or **End** of the Centreline.

Click **Place** to create the Hammerhead component.



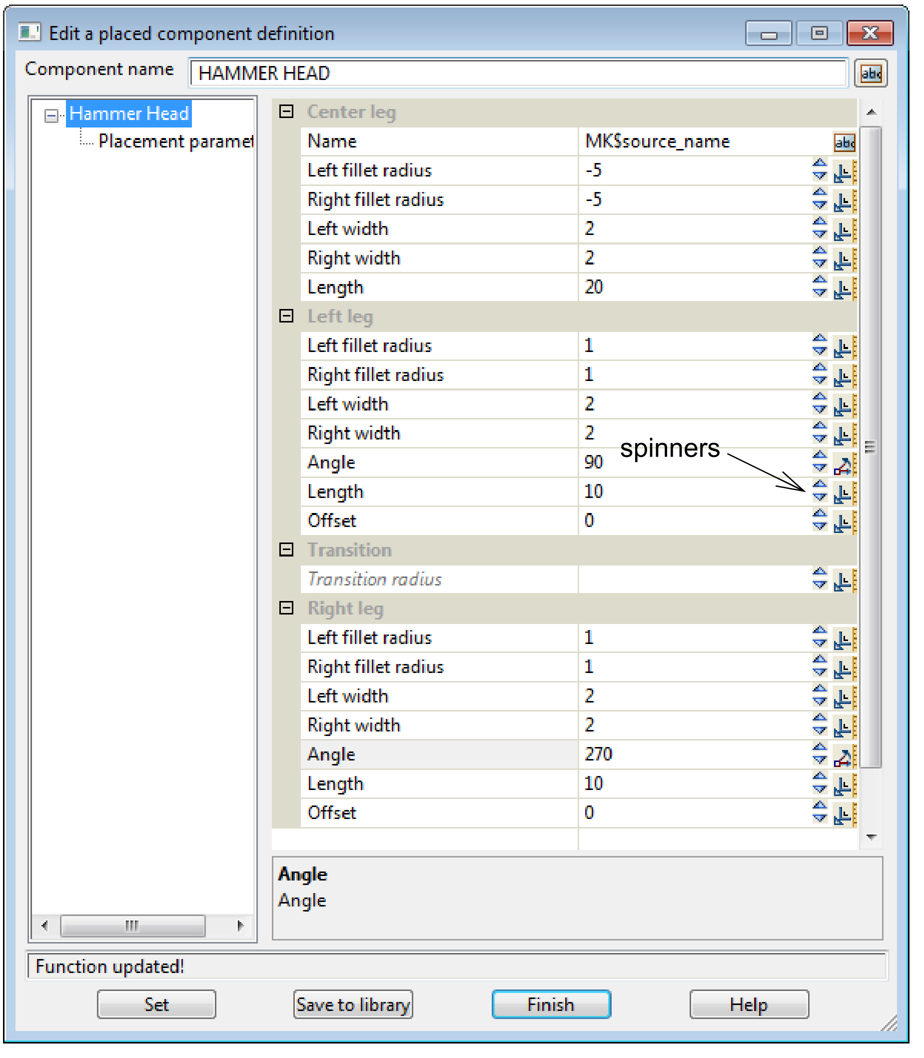
Clicking **Edit** definitions will first bring up a panel to let you know that editing the definition will modify the Hammerhead from the one that was in the library.



Clicking on **Yes** opens the **Edit a Placed Component Definition** panel.

Clicking on the tab **Placement parameters** will show the field **Anchor** (which was set before) but can be changed to either **Start** and **End**.

Clicking on **Hammer Head** displays the general tab of parameters.



The values in the fields can be modified and the Hammerhead will dynamically change. Clicking on the spinners will increase/decrease the value by a certain amount.

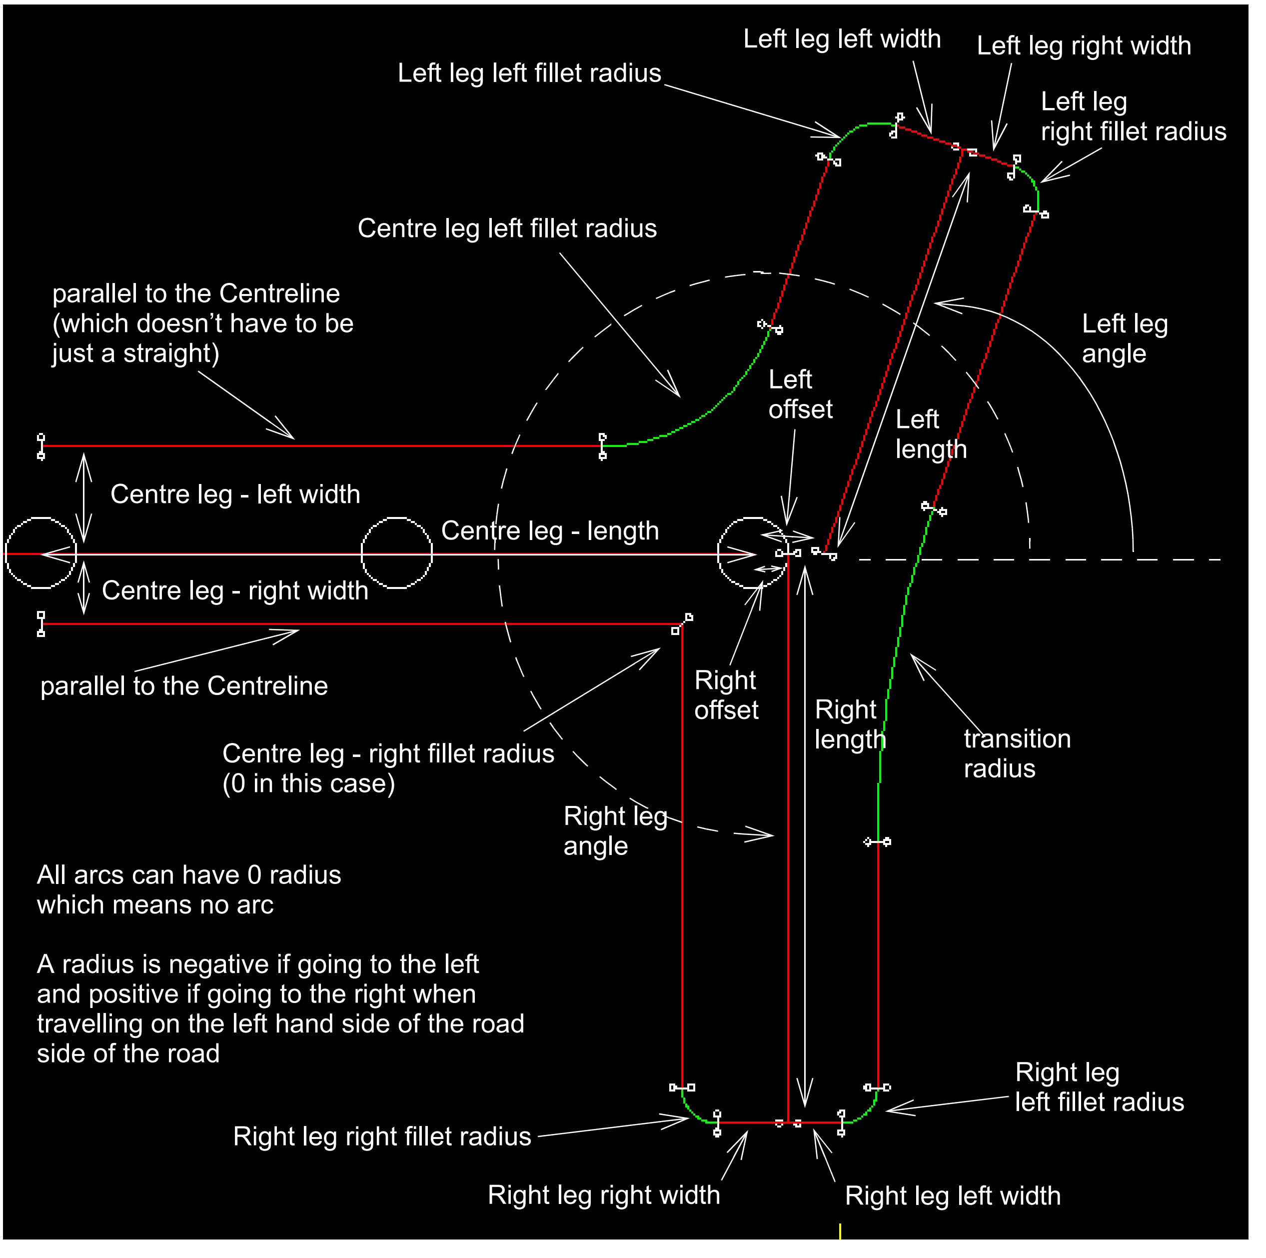
All arc radius values can be zero which means that there is no arc.

A radius is negative if it is going to the left and positive if it is going to the right, when travelling on the left hand side of the road.

Clicking on **Set** stores the current values of the parameters in the function.

Clicking on **Save to library** writes the component to the library with its current values. It is then available in the library to use in the future.

The definitions of all the parameters in the panel are:

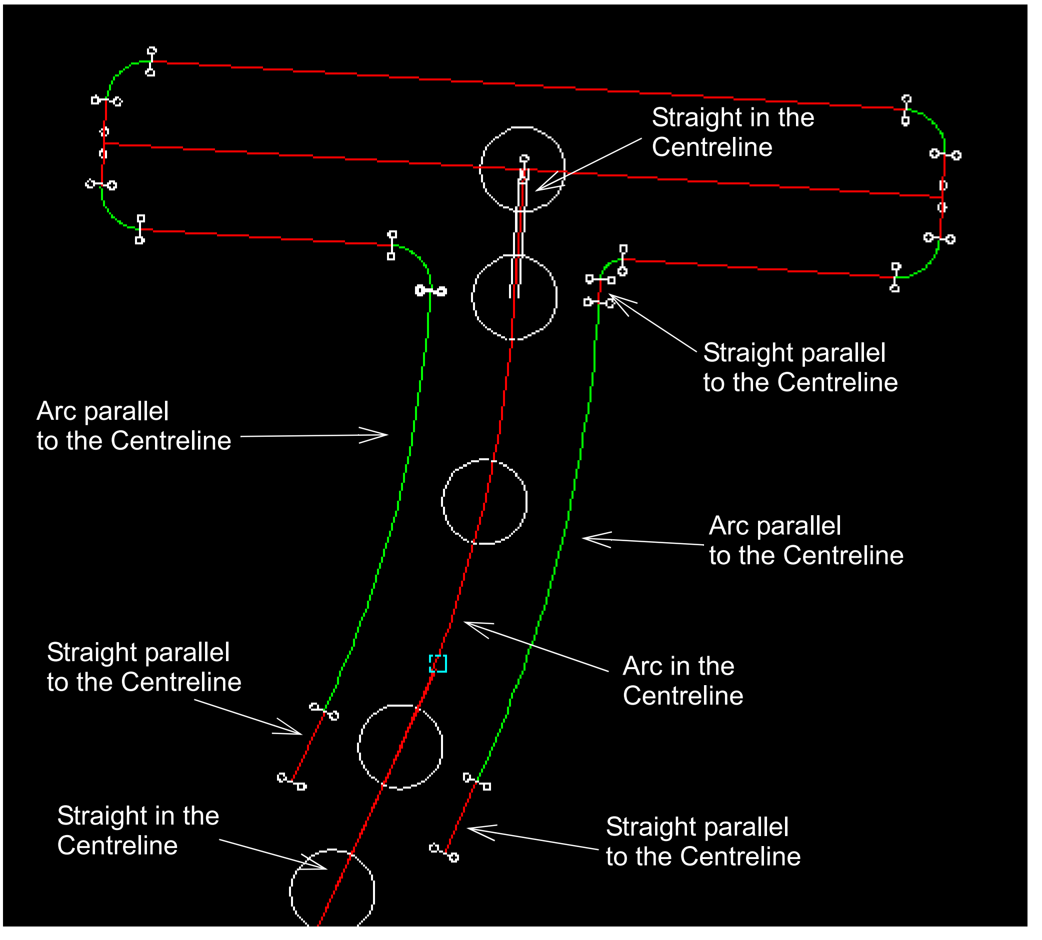


and the parameters that produced this diagram are:

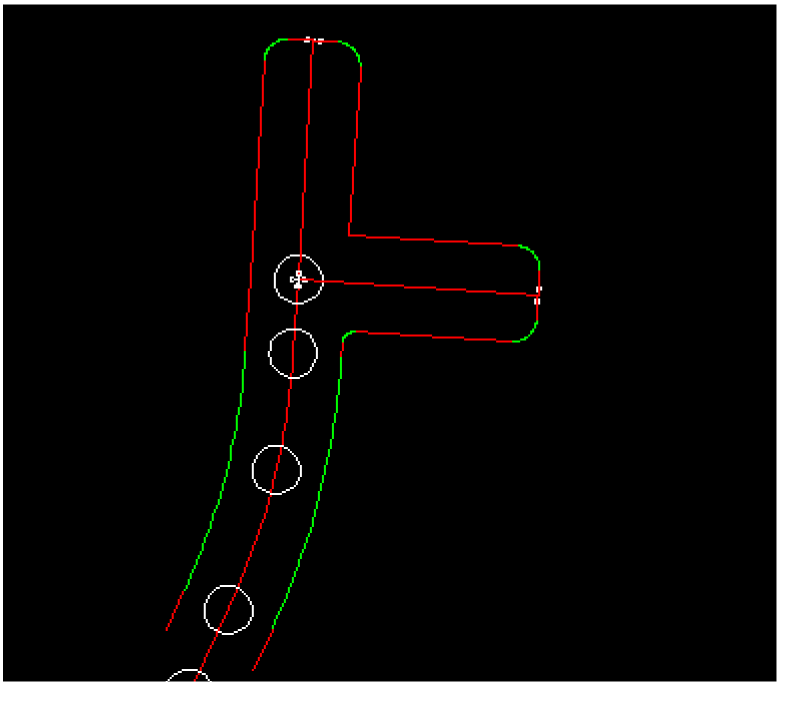
Center leg	
Name	MK$source_name
Left fillet radius	-5
Right fillet radius	0
Left width	3
Right width	2
Length	20
Left leg	
Left fillet radius	1.5
Right fillet radius	1
Left width	3.5
Right width	2.5
Angle	58
Length	12
Offset	-1
Transition	
Transition radius	-28.5
Right leg	
Left fillet radius	1
Right fillet radius	1
Left width	2.5
Right width	3
Angle	270
Length	17
Offset	1

Note that the Centreline does not have to be a straight. It could involve straights, arcs and transitions.

In the next example, the Hammerhead is coming off a Centreline and the Hammerhead **Centre leg width** value means that the **Centre leg** of the Hammerhead includes a straight, a curve and another straight from the Centreline.

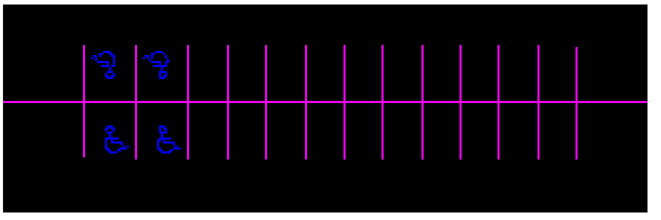


Also note that simply changing the **Left leg angle** to **0** gives



20.9.11.11 Parking Bays

Parking Bays can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.



For information on *Defining a Parking Bay* 20.9.11.11.1 Defining Parking Bays
Placing Parking Bay 20.9.13.1 Placing Parking Bays

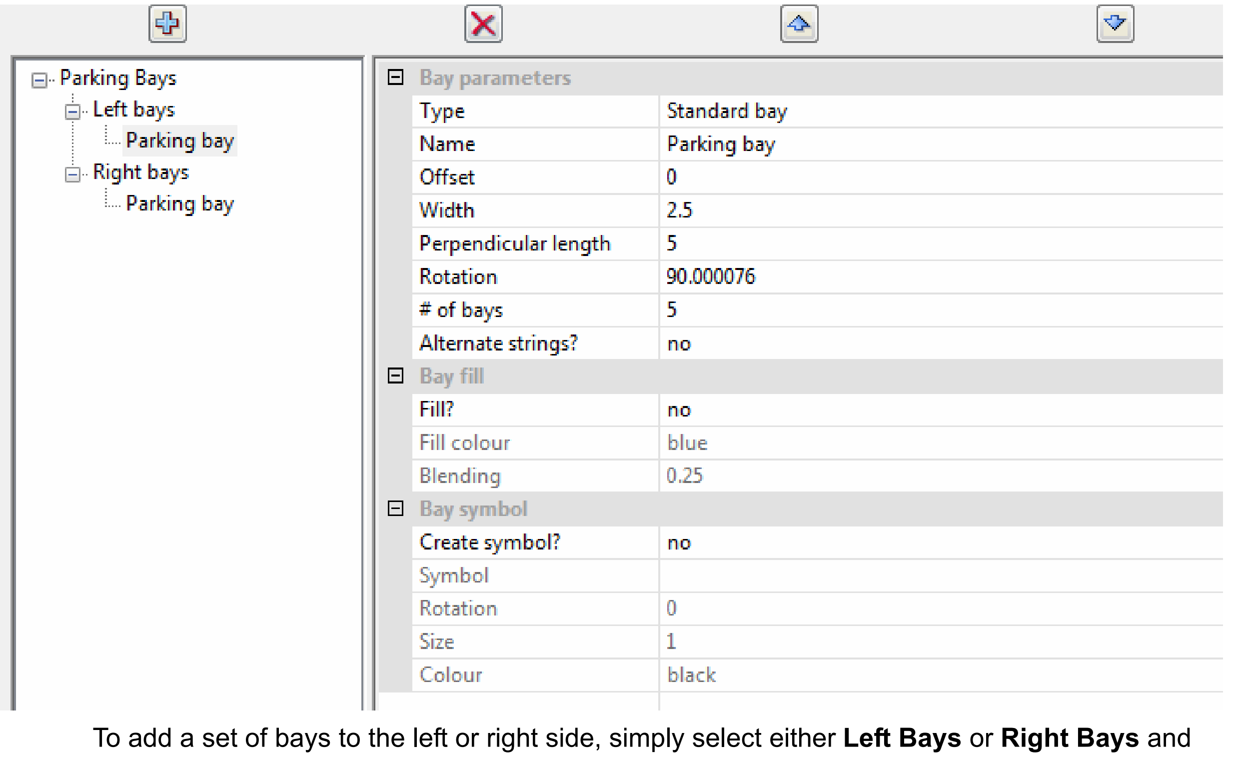
20.9.11.11.1 Defining Parking Bays

Parking Bays are created along a nominated centreline string. A **Parking Bays** component consists of a user defined number of 'sets of bays' on the left and right side.

A set of bays can consist of one or more actual parking bays. It is defined by a number of parameters for width, length, offset and rotation, as well as several cosmetic settings.

A set of bays can either be a 20.9.12 Standard Bay or a 20.9.13 Separation.

Bays on the left and right side are defined in the same manner.



To add a set of bays to the left or right side, simply select either **Left Bays** or **Right Bays** and click the  button

The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

adds a bay set to the selected side

deletes the selected bay set

moves the selected bay definition up

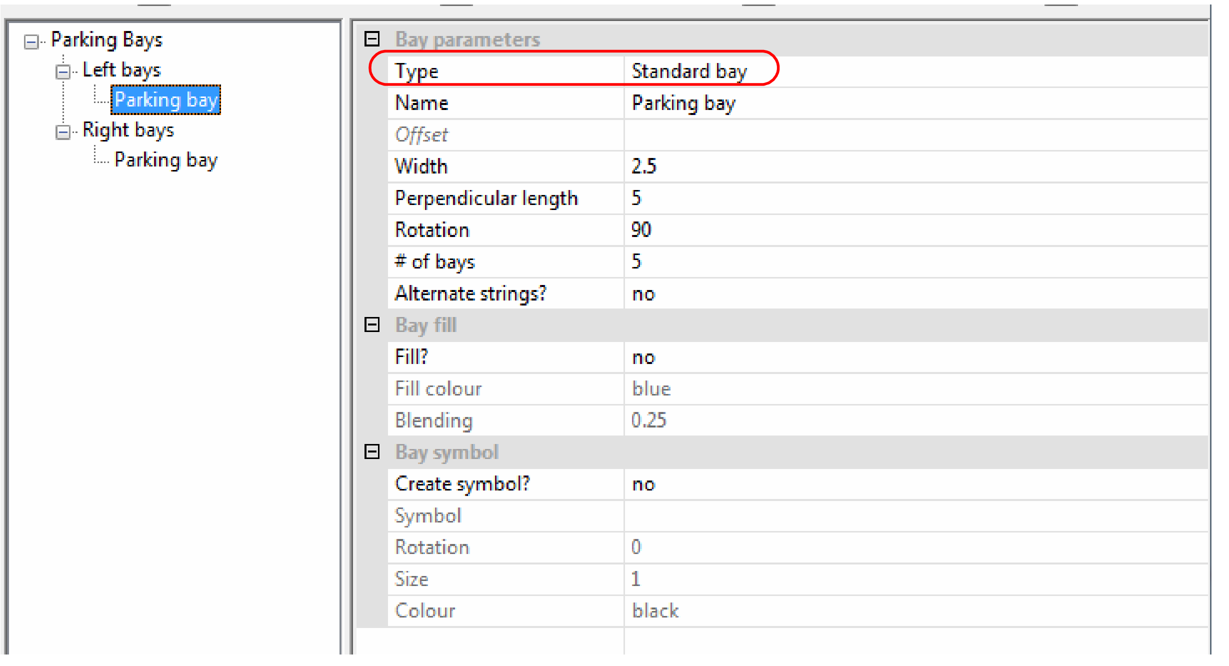
moves the selected bay definition down

Bay Parameters

Type

the type of bay - Standard or Separation. For more information please see 20.9.12 Standard Bay *and* 20.9.13 Separation

20.9.12 Standard Bay



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Bay Parameters

Name

the name of the bay

Offset

an optional offset of each bay from the centreline

Width

the width of each bay

Perpendicular length

the perpendicular length of each bay

Rotation

the rotation of each bay

# of bays

the number of bays to create for this set

Alternate strings?

whether or not to create every other string

Bay fill

Fill?

whether or not to fill each bay with a colour

Fill Colour

the colour to use when filling

Blending

an optional blend to apply, for transparency

Bay symbol

Create symbol?

whether or not to create a symbol in the centre (yes or no)

Symbol

the symbol to place

Rotation

the additional rotation of the symbol. All symbols will be rotated to match the rotation of the parking bay.

Size

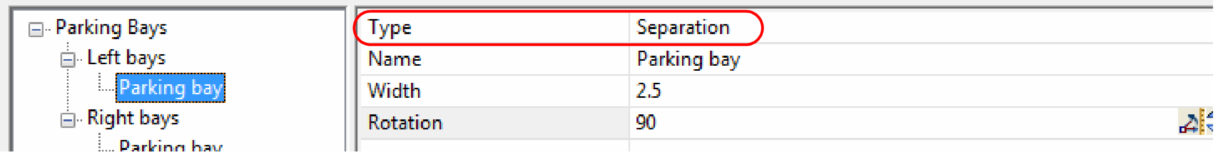
the size / scale of the symbol

Colour

the colour of the symbol

20.9.13 Separation

A separation represents a space between parking bays.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name

the name of the separation

Width

the width of the separation

Rotation

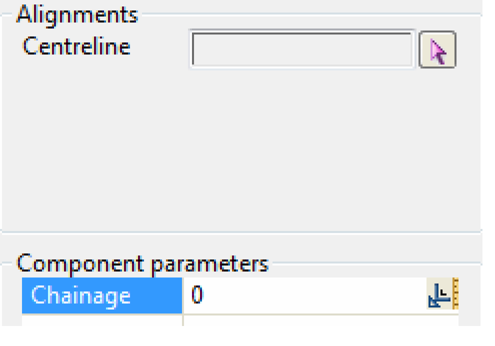
the rotation of the separation

20.9.13.1 Placing Parking Bays

Parking Bays are placed either at the start or end of a road. When placing a Parking Bay component, there are several placement specific settings. This means they are separate from the definition but help define how the Parking Bay is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Centreline string select

the centreline along which the bays are created

Chainage

the chainage at which the bays should start being created

20.9.13.2 Left Turn

A **Left Turn** is a subset of an intersection, compromising of just a **Left Turn.** A **Left Turn** can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

For information on *Defining a Left Turn* 20.9.13.2.1 Defining a Left Turn
Placing Left Turns 20.9.15.1.1 Placing Left Turns

20.9.13.2.1 Defining a Left Turn

A **Left Turn** is only defined by the parameters involving the **Left Turn** - the type of turn and the kerb return.

For information on Placement Parameters see 20.9.14 Placement Parameters
Left Turn Node 20.9.15 Left Turn
Left Turn => Kerb Return Node 20.9.15.1 Left Turn => Kerb Return

20.9.14 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.15.1.1 Placing Left Turns.

20.9.15 Left Turn

A **Left Turn** is defined in the same way as the Intersection Left Turn. For more information, please see the section on the 20.9.5 Left Turn - Approach / Departure

20.9.15.1 Left Turn => Kerb Return

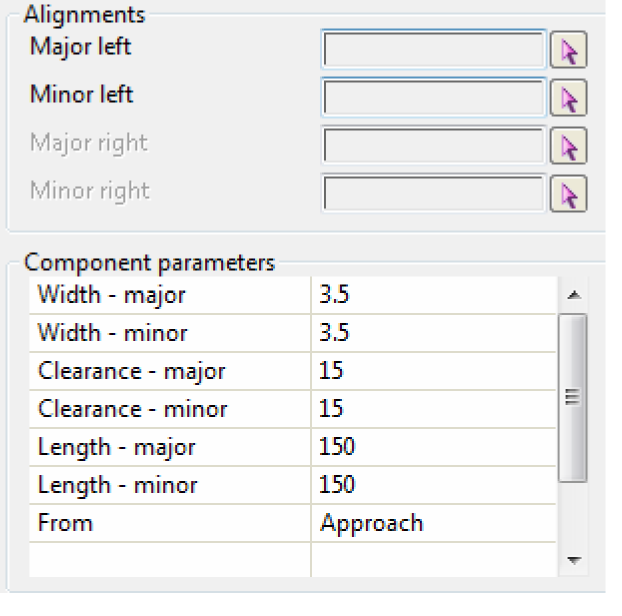
A **Left Turn Kerb Return** is defined in the same was as the Intersection kerb return. For more information, please see the section on the 20.9.6 Approach / Departure =>Left Turn =>Kerb Return Node

20.9.15.1.1 Placing Left Turns

Left Turns are placed at the intersection of two roads - a Major and a Minor, with an approach or departure. Like an intersection, they can also support dual carriageways. When placing a Left Turn component, there are several placement specific settings. This means they are separate from the definition but help define how the Left Turn is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Alignments

Major left

the left most major road

Minor left

the left most minor road

Major right

the right most major road (optional)

Minor right

the right most minor road (optional)

Major right and Minor right can be set when there is a dual carriageway.

Component parameters

Width - major

the width of the carriageway of the major road

Width - minor

the width of the carriageway of the minor road

Clearance - major

the clearance of geometry on major road

Clearance - minor

the clearance of geometry on minor road

Length - major

the length of the geometry created for major road

Length - minor

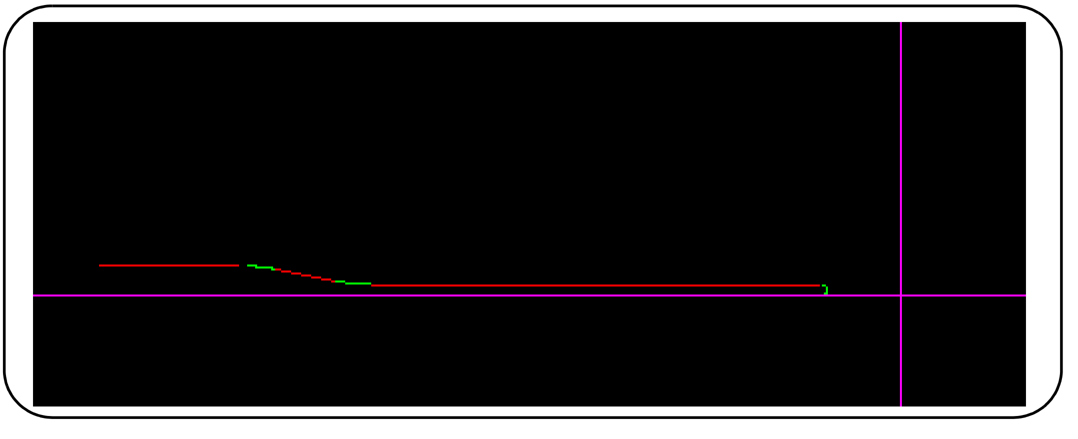
the length of the geometry created minor road

From

whether or not to create the left turn leading from the approach or the departure

20.9.15.2 Median Island

A **Median Island** is a subset of an intersection, compromising of just a median and an optional right hand turn. A **Median Island** can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

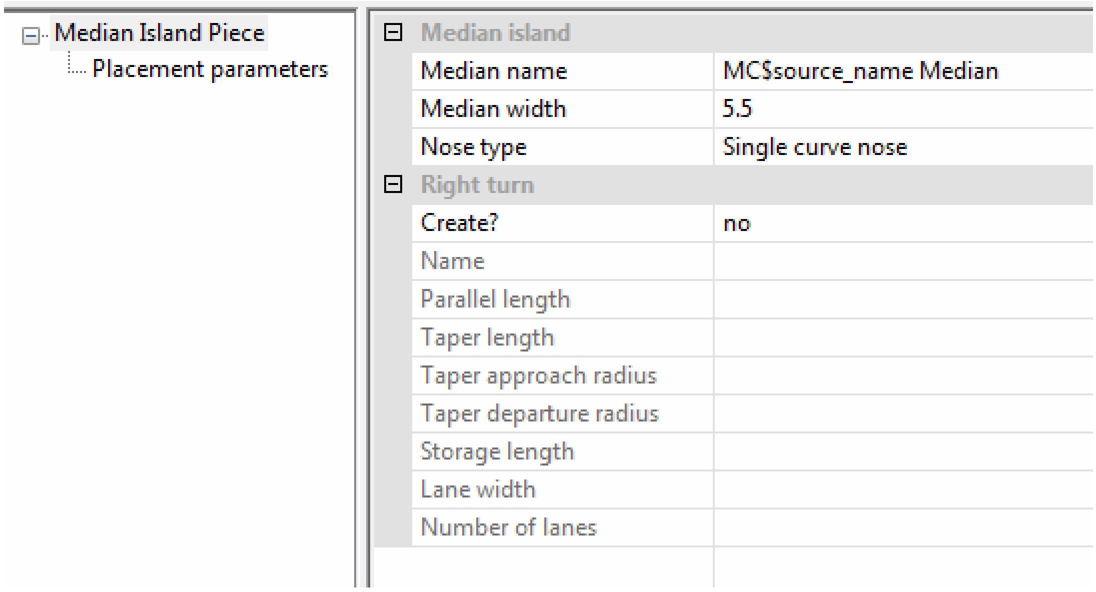


For information on *Defining a Median Island* 20.9.15.2.1 Defining a Median Island
Placing Median Islands 20.9.17.1 Placing Median Islands
Placement Parameters 20.9.17 Placement Parameters

20.9.15.2.1 Defining a Median Island

A median is only defined by the parameters involving the Median Island and the right hand turn.

20.9.16 Median Island Piece



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Median island

Median name

the name of the median string to create

Median width

the width of the median

Nose type

the type of nose to create for the median (see 20.9.16.1 Nose Types*)*

Right Turn

Create?

whether or not to create a right turn

Name

the name to apply to the turn

Parallel length

the length of the parallel lane

Taper length

the length of the leading taper

Taper approach radius

the approach radius of the leading taper

Taper departure radius

the departure radius of the leading taper

Storage length

the storage length of the turn lane

Lane width

the width of the turn lane - must be less than the median width

Number of lanes

the number of turn lanes to create

20.9.16.1 Nose Types

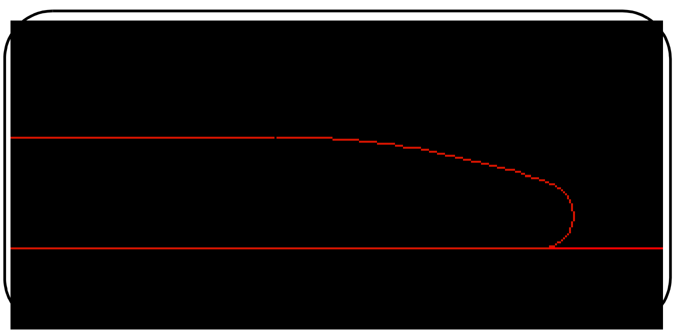
For more information on Single Curve Nose see 20.9.16.1.1 Single Curve Nose
Two Curve Nose 20.9.16.1.2 Two Curve Nose
Three Curve Nose 20.9.16.1.3 Three Curve Nose

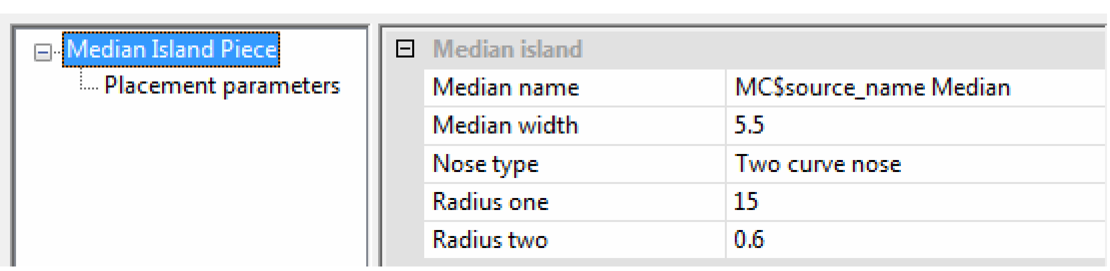
20.9.16.1.1 Single Curve Nose

a median nose created from a single fillet curve

20.9.16.1.2 Two Curve Nose

a median nose created from two curves





The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Radius one

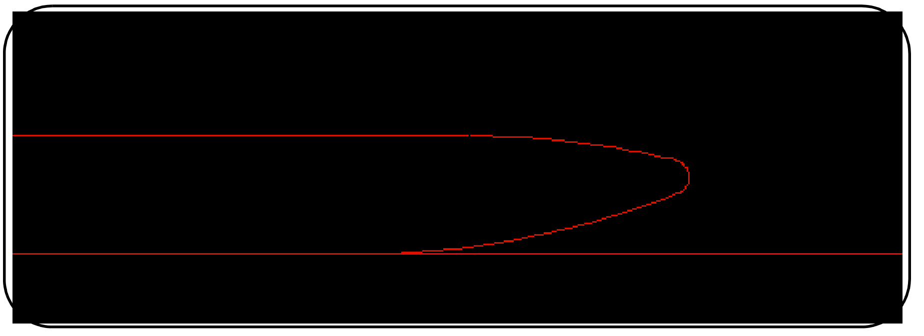
the radius of the first curve

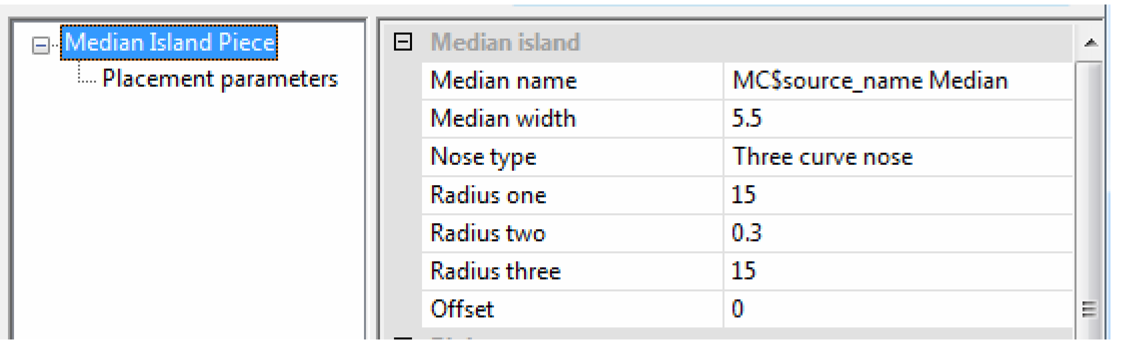
Radius two

the radius of the second curve

20.9.16.1.3 Three Curve Nose

a median nose created from three curves and an optional offset





The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Radius one

the radius of the first curve

Radius two

the radius of the second curve

Radius three

the radius of the third curve

Offset

the offset of the nose from the centreline

20.9.17 Placement Parameters

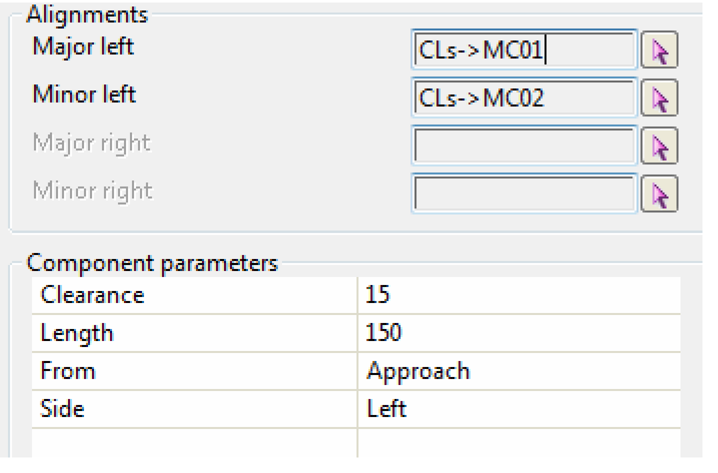
This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.17.1 Placing Median Islands.

20.9.17.1 Placing Median Islands

Median Islands are placed at the intersection of two roads - a Major and a Minor, with an approach or departure. Like an intersection, they can also support dual carriageways. When placing a Median Island, there are several placement specific settings. This means they are separate from the definition but help define how the Median Island, is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Alignments

Major left

the left most major road

Minor left

the left most minor road

Major right

the right most major road (optional)

Minor right

the right most minor road (optional)

Component parameters

Clearance

the distance from the intersection at which to start creating the median island

Length

the length of the geometry to create

From

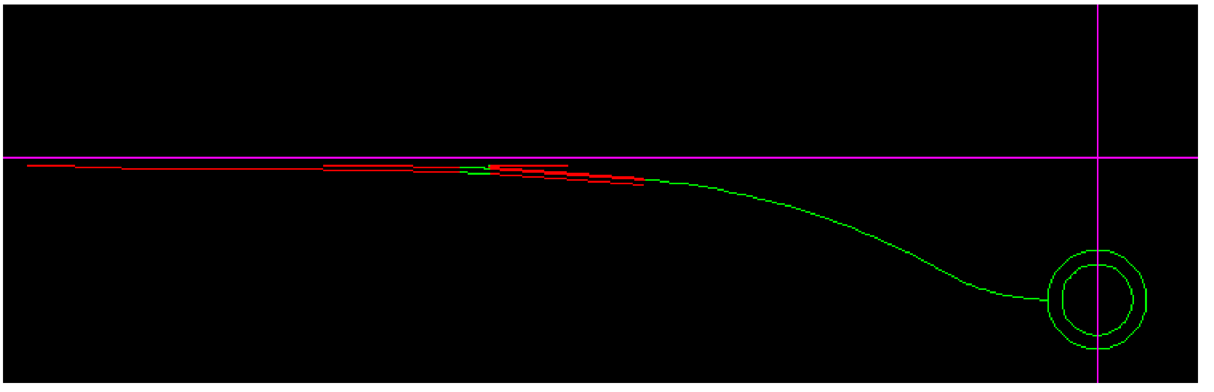
whether or not the median should be created on the approach or departure side of the major string

Side

the side on which the median should be bound

20.9.17.2 Entry Ramp

An **Entry Ramp** component creates an **Entry Ramp** from an overpass or other adjoining road to a freeway or other major road. It can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.



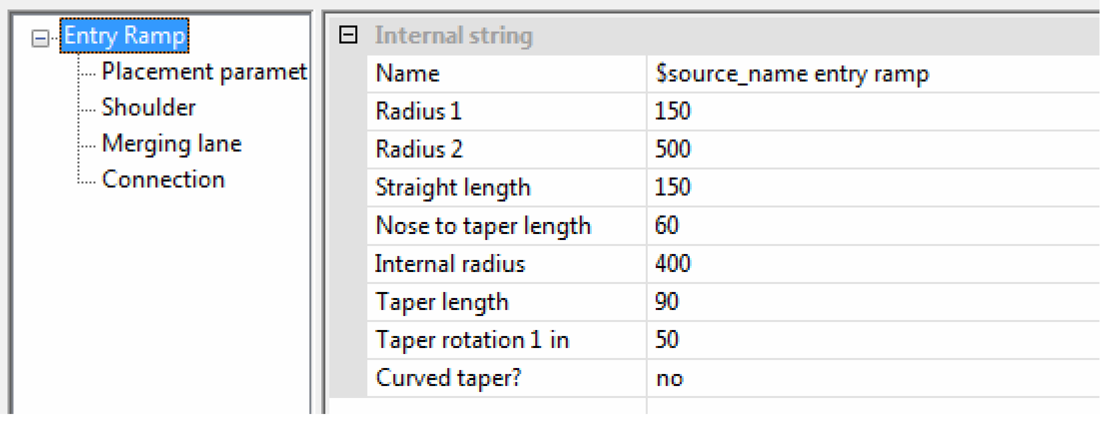
For information on *Defining an Entry Ramp* 20.9.17.2.1 Defining a Entry Ramp
Placing Entry Ramps 20.9.22.2.1 Placing Entry Ramps

20.9.17.2.1 Defining a Entry Ramp

An **Entry Ramp** is defined by the ramp itself, a shoulder, a merging lane and an optional connection.

For information on Entry Ramp node see	20.9.18 Entry Ramp Node
Placement Parameters	20.9.19 Placement Parameters
Shoulder node	20.9.20 Shoulder Node
Merging lane node	20.9.21 Merging Lane Node
Connection node	20.9.22 Connection

20.9.18 Entry Ramp Node



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name

the name of the entry ramp string

Radius 1

the first radius of the entry reverse curve

Radius 2

the second radius of the entry reverse curve

Nose to taper length

The distance between the nose of the shoulder and the taper

Internal radius

the radius of the final, internal arc

Taper length

the length of the trailing taper

Taper rotation 1 in

the rotation of the trailing taper

Curved taper?

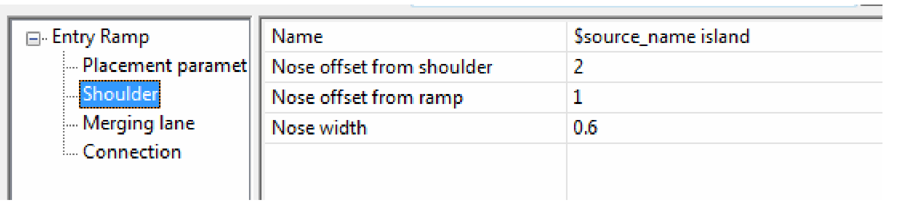
whether or not to use a curved taper (may be more suitable for curving centrelines)

20.9.19 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.22.2.1 Placing Entry Ramps.

20.9.20 Shoulder Node

This node defines properties for the shoulder of the **Entry Ramp**.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name

the name of the shoulder string

Nose offset from shoulder

the offset of the island nose from the shoulder

Nose offset from ramp

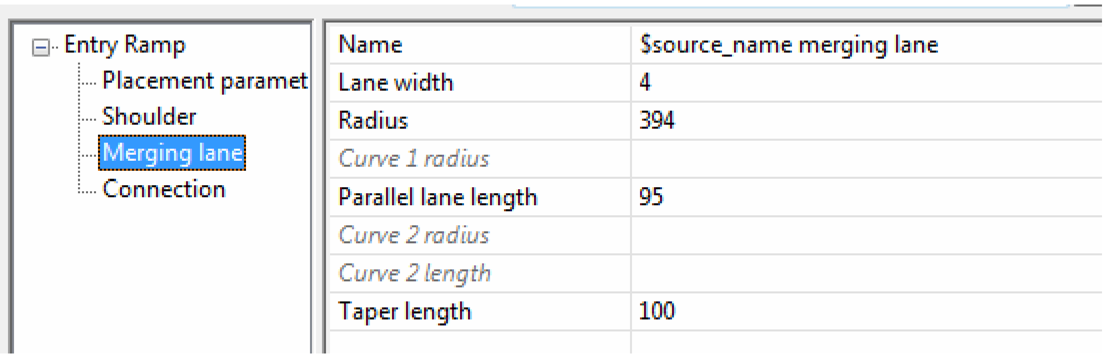
the offset of the island nose from the ramp itself

Nose width

the width of the nose

20.9.21 Merging Lane Node

This node defines the parameters for the **Merging lane**.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name

the name of the merging lane string

Lane width

the width of the merging lane

Radius

the radius used to construct the merging lane

Curve 1 radius

the radius of the first optional curve, before the parallel lane length

Parallel lane length

the length of the parallel lane

Curve 2 radius

the radius of the second optional curve, after the parallel lane

Curve 2 length

the length of the second optional curve, after the parallel lane

Taper length

the length of the taper at the end of the merging lane

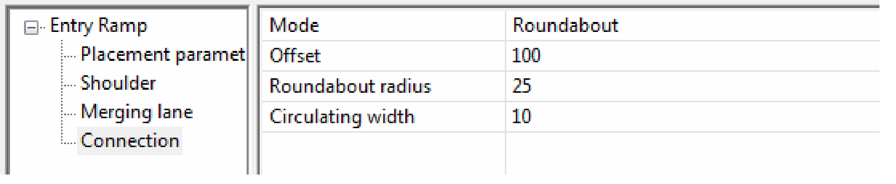
20.9.22 Connection

This node defines the properties for an optional connection from the overpass / minor road. At the moment, this supports either no connection strings or a roundabout.

Mode

the mode of the connection (either 20.9.22.1 Roundabout Mode *or* 20.9.22.2 No Strings Mode*)*

20.9.22.1 Roundabout Mode



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Offset

the offset from the intersection, along the minor road, that the connection should be created

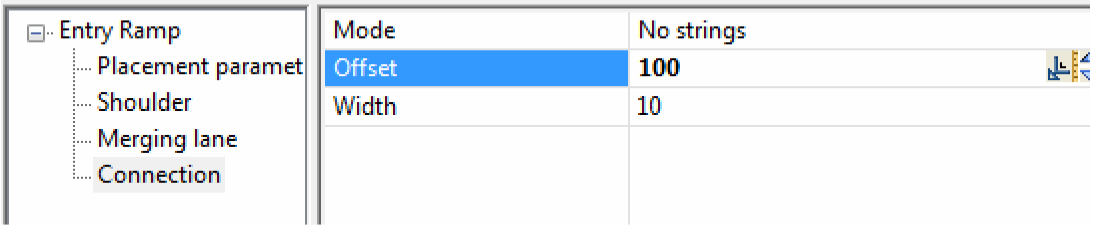
Roundabout radius

the radius of the roundabout

Circulating width

the circulating width of the roundabout

20.9.22.2 No Strings Mode



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Offset

the offset from the intersection, along the minor road, that the connection should be created

Width

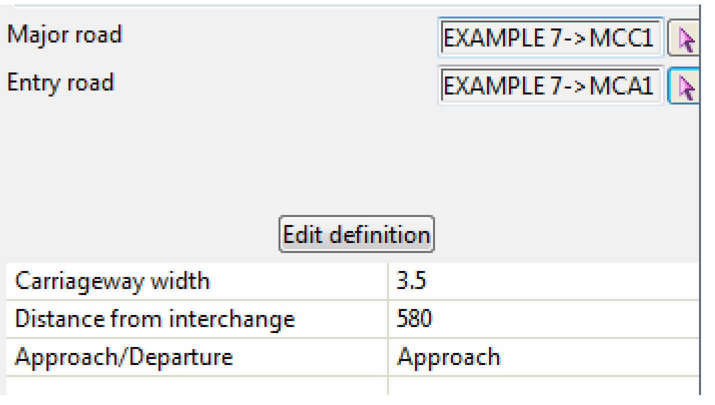
how far away from the minor road the entry ramp should start

20.9.22.2.1 Placing Entry Ramps

Entry Ramps are placed at the intersection of two roads - a major freeway and a minor adjoining or overpass road. When placing an **Entry Ramp**, there are several placement specific settings. This means they are separate from the definition but help define how the **Entry Ramp** is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Major road

the freeway or major road to enter

Entry road

the road to enter from

Edit definition button

Selecting this button displays the **Edit a Placed Component Definition** *panel. For more information please see* 20.9.34.2 Edit a Placed Component Definition

Carriageway width

the width of the freeway carriageway

Distance from interchange

the distance of the end of the entry ramp from the interchange

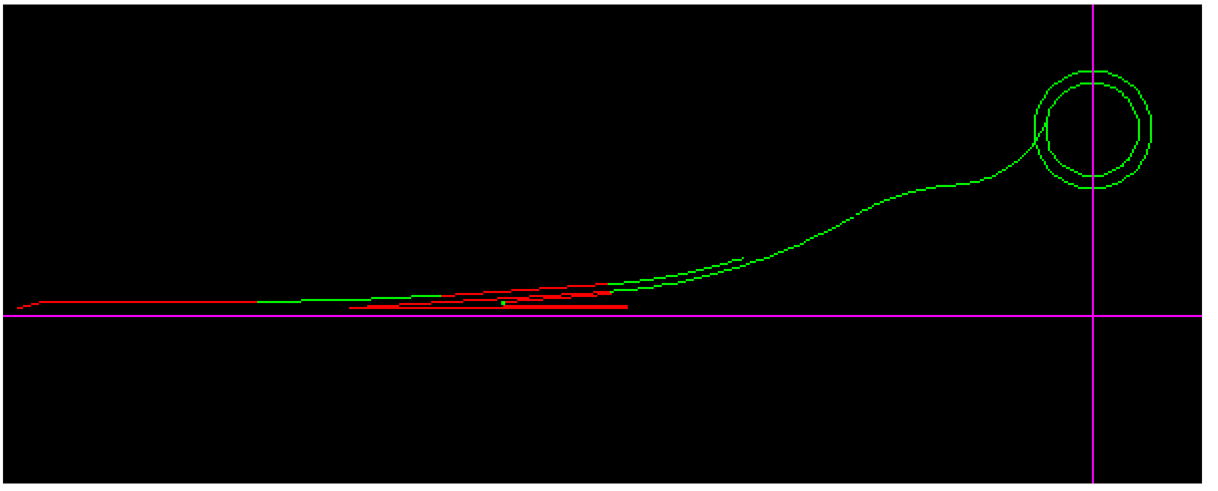
Approach/Departure

whether the entry ramp is bound to the approach or departure of the freeway / major road

20.9.22.3 Exit Ramp

An **Exit Ramp** component creates an **Exit Ramp** from a freeway or other major road to an overpass or other adjoining road. It can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

For more information on Defining an Exit Ramp see 20.9.22.3.1 Defining an Exit Ramp
Placing an Exit Ramp 20.9.27.1.1 Placing Exit Ramps



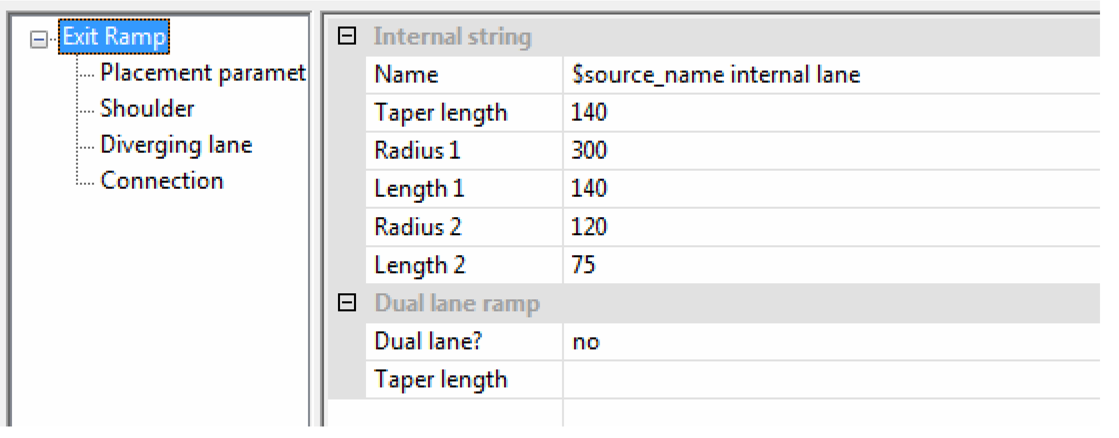
20.9.22.3.1 Defining an Exit Ramp

An **Exit Ramp** is defined by the ramp itself, a shoulder, a diverging lane and an optional connection.

For information on the Exit Ramp Node see 20.9.23 Exit Ramp Node
Placement Parameters Node 20.9.24 Placement Parameters
Shoulder Node 20.9.25 Shoulder Node
Diverging Lane Node 20.9.26 Diverging Lane Node
Connection Node 20.9.27 Connection Node

20.9.23 Exit Ramp Node

This node defines the ramp itself.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Internal String

Name

the name of the string to create

Taper length

the length of the ramp taper

Radius 1

the first radius of a reverse curve

Length 1

the first length of a reverse curve

Radius 2

the second radius of a reverse curve

Length 2

the second length of a reverse curve

Dual Lane Ramp

Dual lane

whether or not this is a dual lane exit ramp

Taper length

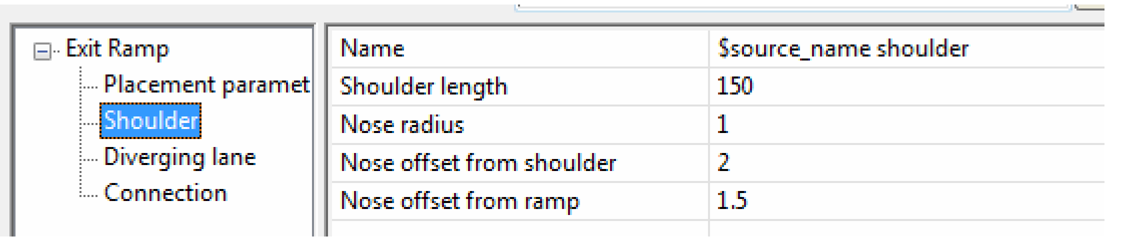
the taper length on the dual lane exit ramp

20.9.24 Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on 20.9.27.1.1 Placing Exit Ramps.

20.9.25 Shoulder Node

This node defines the shoulder part of the exit ramp.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name

the name of the created shoulder string

Shoulder length

the length of the shoulder

Nose radius

the radius of the nose of the exit ramp island

Nose offset from shoulder

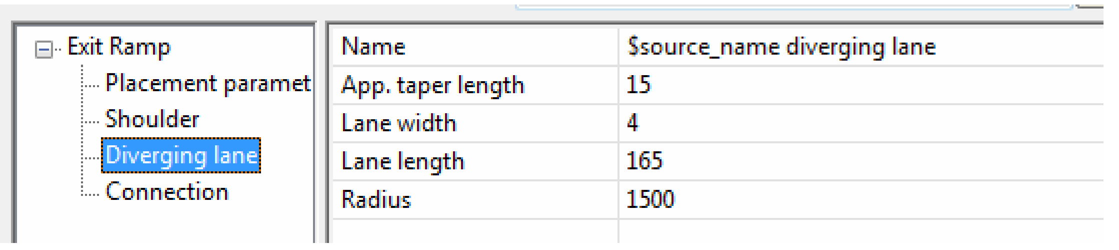
the offset of the island nose from the shoulder

Nose offset from ramp

the offset of the island nose from the ramp

20.9.26 Diverging Lane Node

This node defines the details for the diverging lane of the exit ramp.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name

the name of the created string of the diverging lane

App. taper length

the length of approaching taper

Lane width

the width of the diverging lane

Lane length

the length of the diverging lane

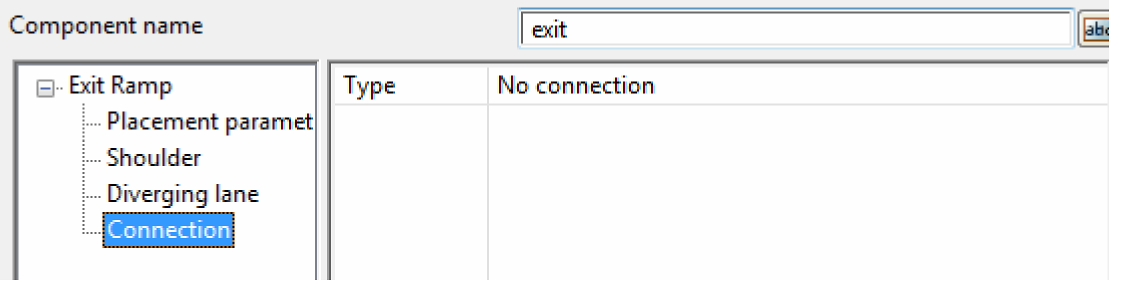
Radius

the radius for the diverging lane

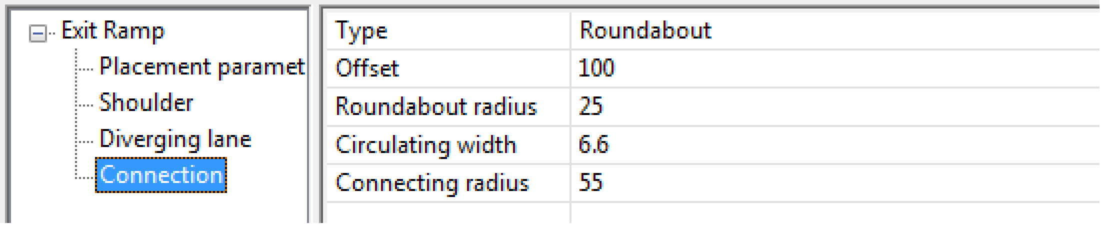
20.9.27 Connection Node

The connection node defines how the Exit Ramp connects to the adjoining road or overpass.

There are two types of connection currently; either no visible connection or a Roundabout (see 20.9.27.1 Roundabout Connection).



20.9.27.1 Roundabout Connection



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Offset

the offset of the roundabout from the major road

Roundabout radius

the radius of the centre of the roundabout

Circulating width

the circulating width around the roundabout

Connecting radius

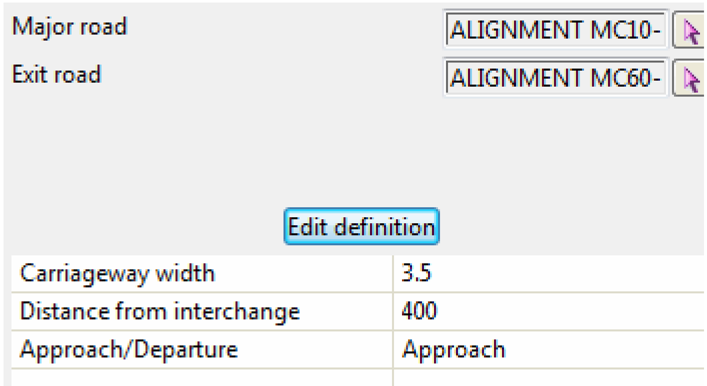
the radius of an arc connecting the exit ramp to the roundabout

20.9.27.1.1 Placing Exit Ramps

Exit Ramps are placed at the intersection of two roads - a major freeway and a minor adjoining or overpass road. When placing an **Exit Ramp**, there are several placement specific settings. This means they are separate from the definition but help define how the **Exit Ramp** is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor. Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Major road

the freeway or major road to exit from

Exit road

the road the ramp leads to

Carriageway width

the width of the major road

Distance from interchange

the distance from the interchange that the exit ramp should start

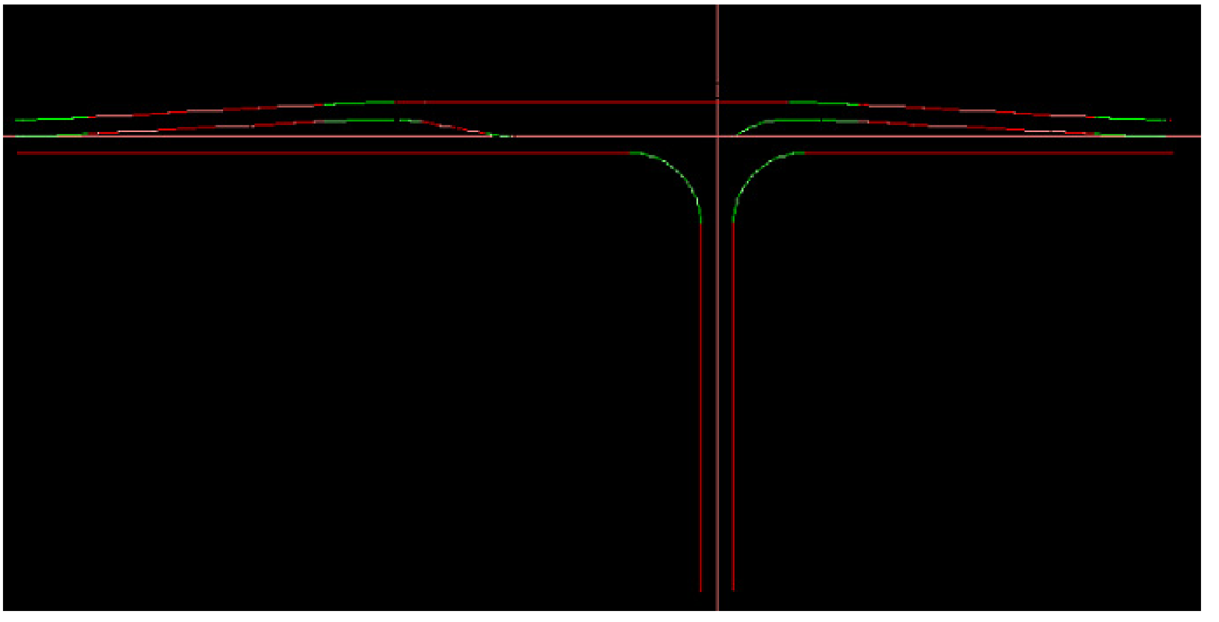
Approach / Departure

whether the exit ramp is bound to the approach or departure of the major road

20.9.27.2 CHR Intersection

A **CHR** or **Channelised Rural Intersection** creates an intersection between two roads, typically in a T-Junction configuration. It can be edited via the 20.9.1 Component Library or by editing the definition of a placed component.

For information on Predefined Values Node see 20.9.28 Predefined Values Node
Major Road Node 20.9.29 Major Road Node
Major Road => Kerb return Node 20.9.30 Major Road => Kerb Return Node
Minor Road Node 20.9.31 Minor Road Node
Placing CHR Intersections 20.9.31.3.1 Placing CHR Intersections

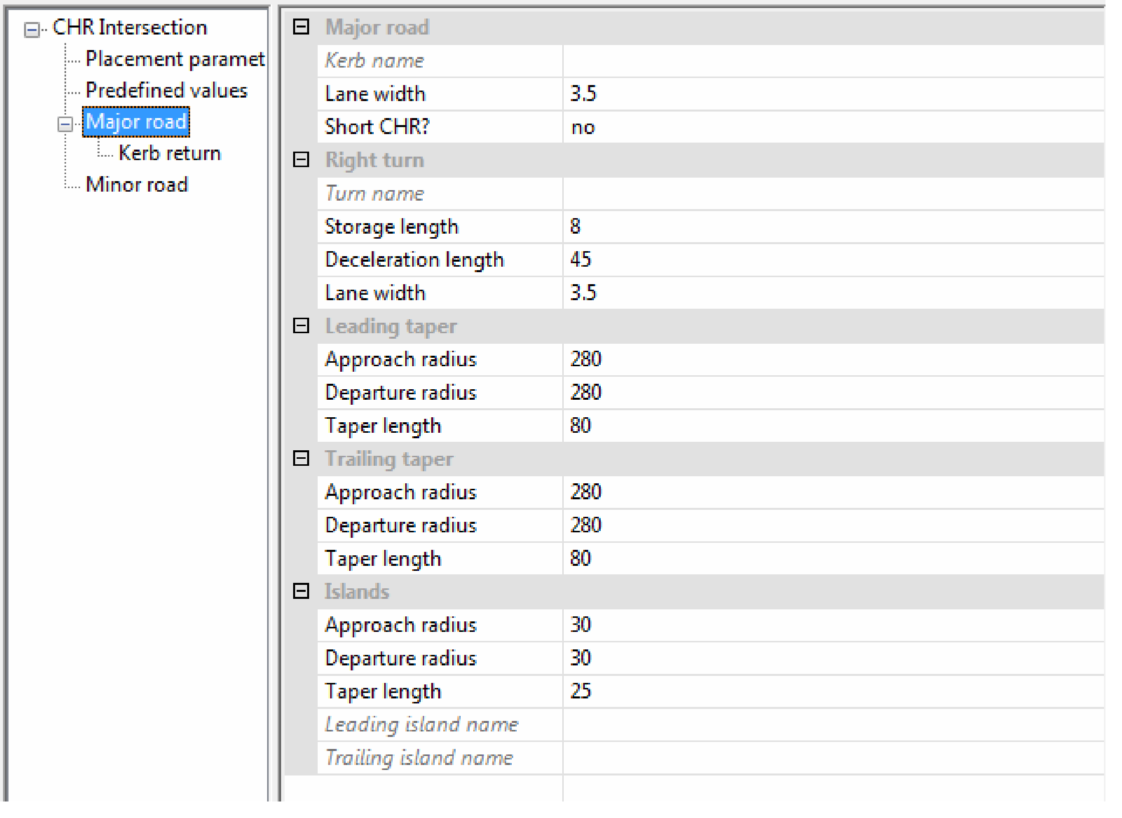


20.9.28 Predefined Values Node

The Predefined Values node is used to populate the details of the **CHR** based on one of a set of predefined speeds and a supplied lane width.

20.9.29 Major Road Node

This defines the details for the major road.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Major Road

Kerb name

the name of the kerb string to create

Lane width

the width of the carriageway

Short CHR?

whether or not to create a short CHR

Right Turn

Turn name

the name of the right turn string

Storage length

the storage length of the right turn

Deceleration length

the deceleration length of the right turn

Lane width

the width of the right turn lane

Leading Taper

Approach radius

the approach radius of the leading taper

Departure radius

the departure radius of the leading taper

Taper length

the length of the leading taper

Trailing Taper

Approach radius

the approach radius of the trailing taper

Departure radius

the departure radius of the trailing taper

Taper length

the length of the trailing taper

Islands

Approach radius

the approach radius of the islands

Departure radius

the departure radius of the islands

Taper length

the taper length for the islands

Leading island name

the name of the leading island of the CHR

Trailing island name

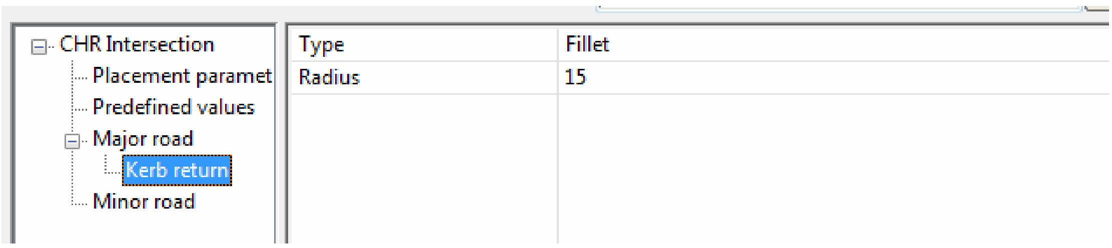
the name of the trailing island of the CHR

20.9.30 Major Road => Kerb Return Node

There are several different kerb return types available:

Fillet	20.9.30.1 Fillet Kerb Return
Two Centred	20.9.30.2 Two Centred Kerb Return
Three Centred	20.9.30.3 Three Centred Kerb Return

20.9.30.1 Fillet Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

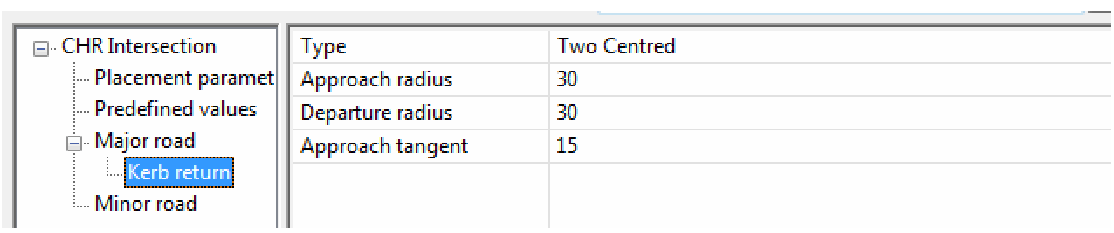
Type

*the type of kerb return to create (in this case, **Fillet**)*

Radius

the radius for the fillet kerb return

20.9.30.2 Two Centred Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Type

*the type of kerb return to create (in this case, **Two Centred**)*

Approach radius

the approach radius of the two centred curve

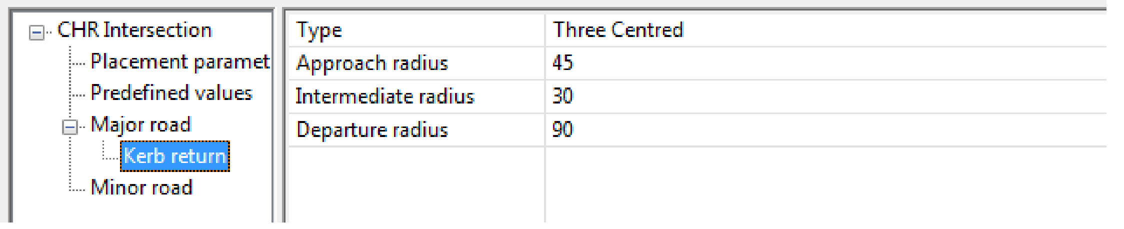
Departure radius

the departure radius of the two centred curve

Approach tangent

the approach tangent for the two centred curve

20.9.30.3 Three Centred Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Type

the type of kerb to create (in this case, ***Three Centred****)*

Approach radius

the approach radius of the three centred curve

Intermediate radius

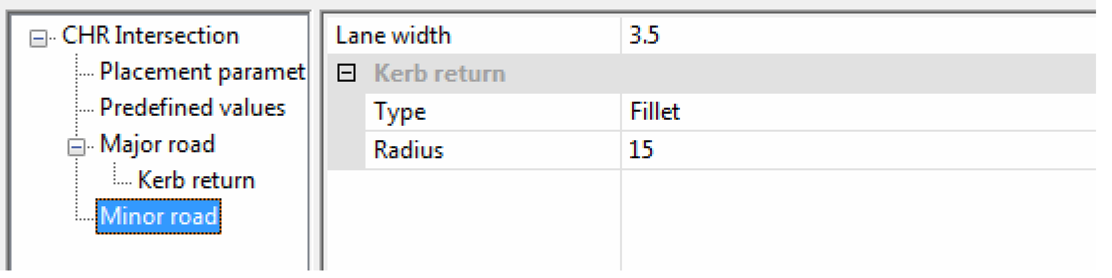
the intermediate radius of the three centred curve

Departure radius

the departure radius of the three centred curve

20.9.31 Minor Road Node

This node defines the details for the Minor road.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Lane width

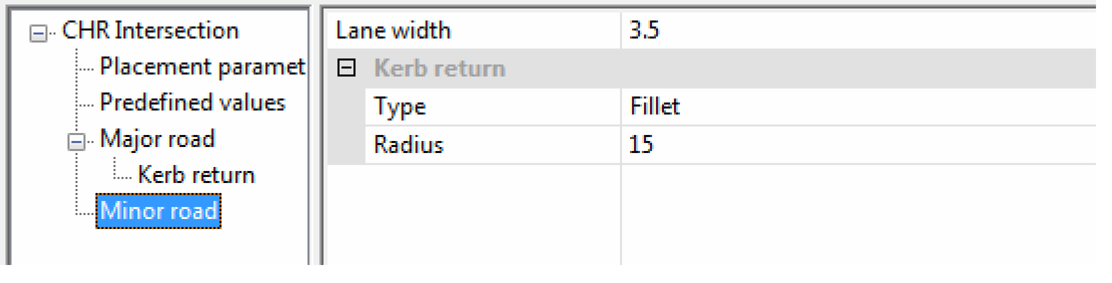
the width of the carriageway of the minor road

Kerb Return

There are several different kerb return types available:

Fillet	20.9.31.1 Fillet Kerb Return
Two Centred	20.9.31.2 Two Centred Kerb Return
Three Centred	20.9.31.3 Three Centred Kerb Return

20.9.31.1 Fillet Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

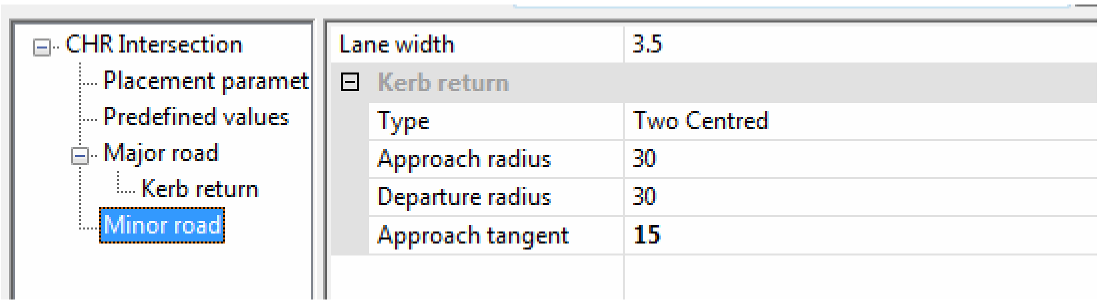
Type

*the type of kerb return to create (in this case, **Fillet**)*

Radius

the radius for the fillet kerb return

20.9.31.2 Two Centred Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Type

the type of kerb return to create (in this case, ***Two Centred****)*

Approach radius

the approach radius of the two centred curve

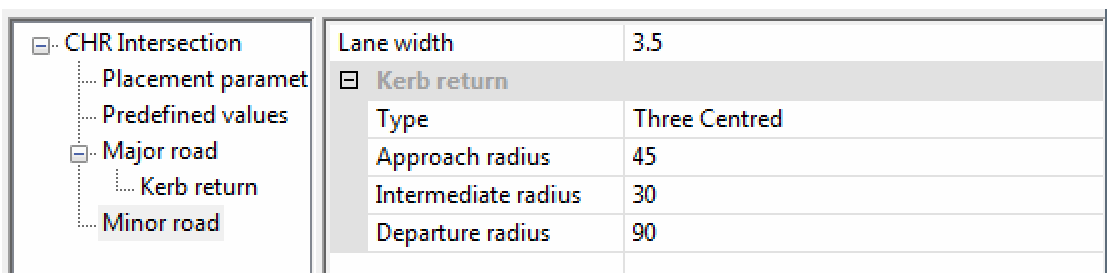
Departure radius

the departure radius of the two centred curve

Approach tangent

the approach tangent for the two centred curve

20.9.31.3 Three Centred Kerb Return



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Type

the type of kerb to create (in this case, ***Three Centred****)*

Approach radius

the approach radius of the three centred curve

Intermediate radius

the intermediate radius of the three centred curve

Departure radius

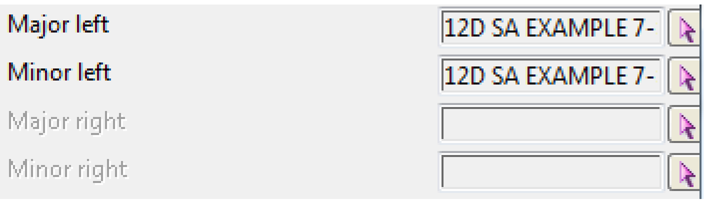
the departure radius of the three centred curve

20.9.31.3.1 Placing CHR Intersections

CHR Intersections are placed at the intersection of two roads - a major road and a minor road. Each road can be optionally defined with a second carriageway. When placing a CHR intersection, there are several placement specific settings. This means they are separate from the definition but help define how the CHR is placed.

These are defined when placing the component, and may be edited from the 20.9.34.1 Placed Component Editor Some of these are also available from the 20.9.34.2 Edit a Placed Component Definition panel.

These parameters are shown below, as they are displayed when placing the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Major left string select

the left most major road

Minor left string select

the left most minor road

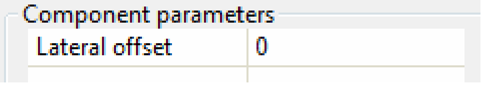
Major right string select

the right most major road (optional)

Minor right string select

the right most minor road (optional)

Major right and **Minor right** can be set when there is a dual carriageway.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Lateral offset

an offset of the CHR intersection from the major left control line. This is useful when the control line is not the centreline.

20.9.32 Place a Component

Position of option on menu: **Design =>Roads =>Components => Place component**

The **Place a component** panel allows you to place a component from your library.

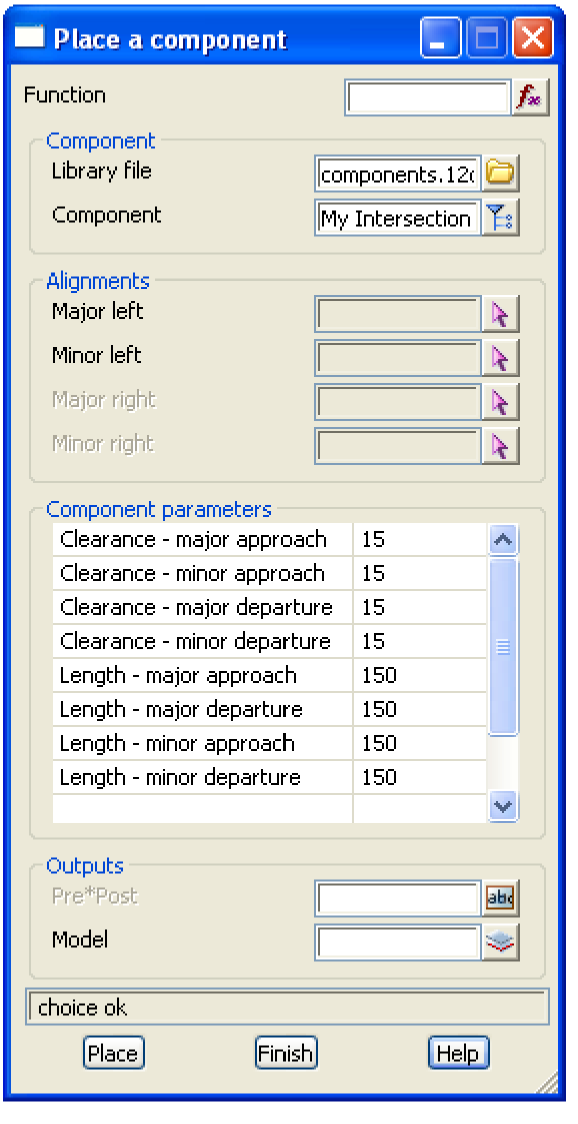
The placement specific parameters required will depend on which component you are attempting to place.

Each component is created as a function, which means you can easily recalc after you change the strings to which it is attached or make it part of a chain.

Please note that there are two types of parameters involved in defining a component:

1. **Component Specific** – meaning how the geometry is generated. These are edited via the library or by editing the definition of a placed component.
2. **Placement Specific** – how the component is placed. These are edited when placing a component on the **Place a component** panel or on **Editing a Placed Component.**

Selecting **Place component** brings up the **Place a component** panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Common Fields

Function function

the function to create

Library file file

the library file to read components from

Component choice box

the component to place

Pre*Post

*an optional pre*post to apply to generated strings*

Model model box

the model to create the component strings in

Place button

places the components

For more information on the placement specific parameters required for each component, see the section on the specific component type (see 20.9.2 Component Types).

20.9.32.1 Editing Components

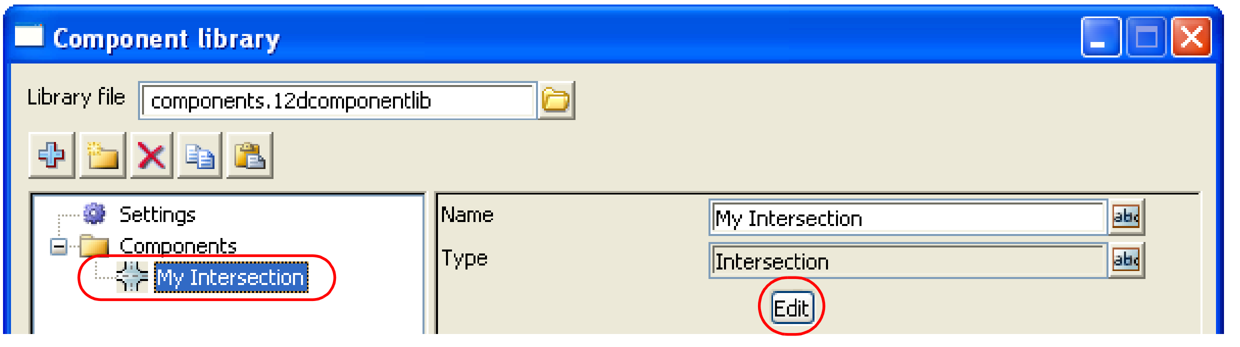
Components may be edited either in the library or directly from a placed component.

For information on **Editing in the Component library** go to 20.9.32.1.1 Editing in the Component library - Component Editor

For information on **Editing a Placed Component** go to 20.9.33.1 Editing a Placed Component

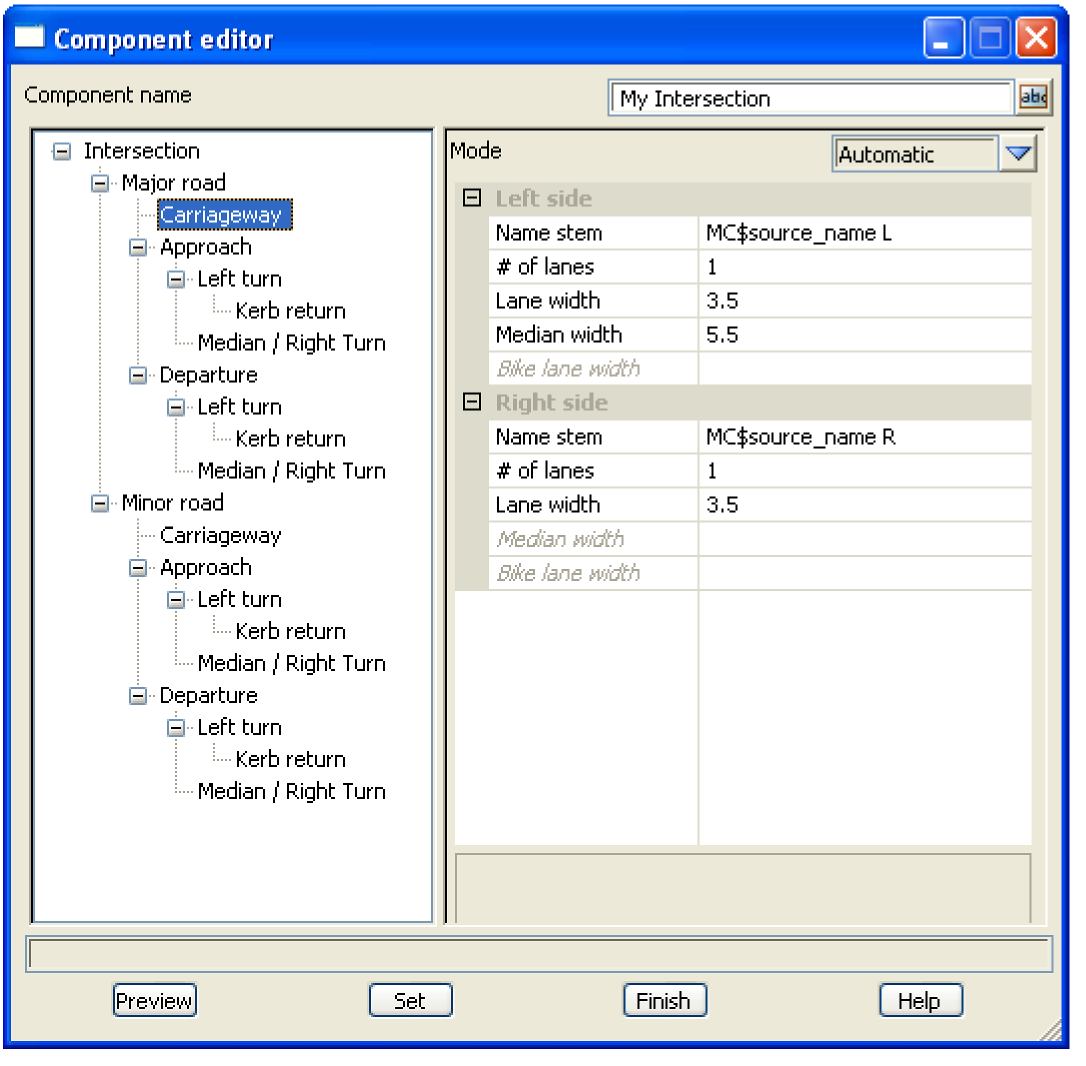
20.9.32.1.1 Editing in the Component library - Component Editor

Design =>Roads =>Components => Component library =>Component Node =>Edit button



To edit in the **Component Library**, select your component and then select the **edit** button, this brings up the **Component Editor panel.**

The **Component Editor panel** changes depending on the component, so for specific information on parameters, please see the section on that component type (see 20.9.2 Component Types). The following example shows editing an intersection component.



The fields and buttons used in this panel have the following functions:

Field Description   Type   Defaults   Pop-Up

Common fields and buttons

Component name

the name of the component

Preview button

shows a preview of the component with theoretical centreline strings. For more information please go to 20.9.33 Component Viewer.

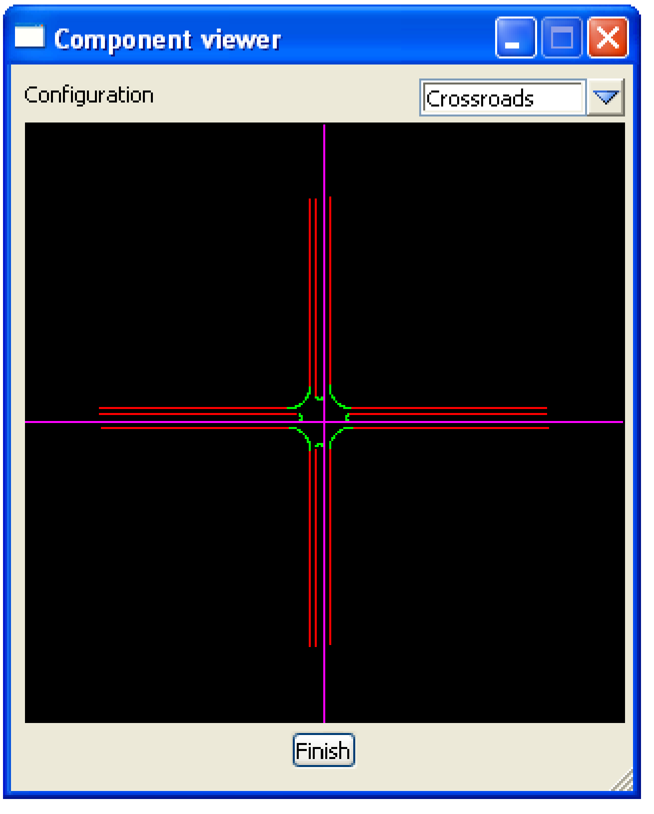
Set button

sets the component in the library

20.9.33 Component Viewer

The **Component viewer**, which is updated as you make changes to your library component, gives you an idea of what your component may look like when it is placed. The following example shows a standard intersection.

Selecting the **Preview** button on the **Component Editor** panel displays the **Component viewer** panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Configuration	choice box		Crossroads, T Junction

this field allows you to change what strings are generated to show you how the component will change based on different centrelines.

Options include: ***Crossroads*** *and* ***T-Junction***

Note that this does not affect the component in anyway – this is only for previewing purposes.

20.9.33.1 Editing a Placed Component

You may edit a placed component, either by changing the placement specific parameters or by changing the definition itself.

A placed component may be edited by using the **Functions** =>**Editor** (**Utilities** => **Functions** =>**Editor)** or by using the **Edit Component** option on the **Components** menu **(Design** =>**Roads** =>**Components** => **Edit Component).**

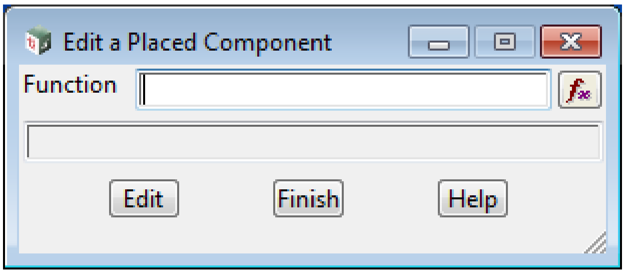
As when placing the component, the placement specific parameters will vary based on the type of component.

For more information on **Edit a Placed Component** please see 20.9.34 Edit a Placed Component

20.9.34 Edit a Placed Component

Position of menu: **Design =>Roads =>Components => Edit Component**

The **Edit a Placed Component** panel, edits an existing component by its function.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Function

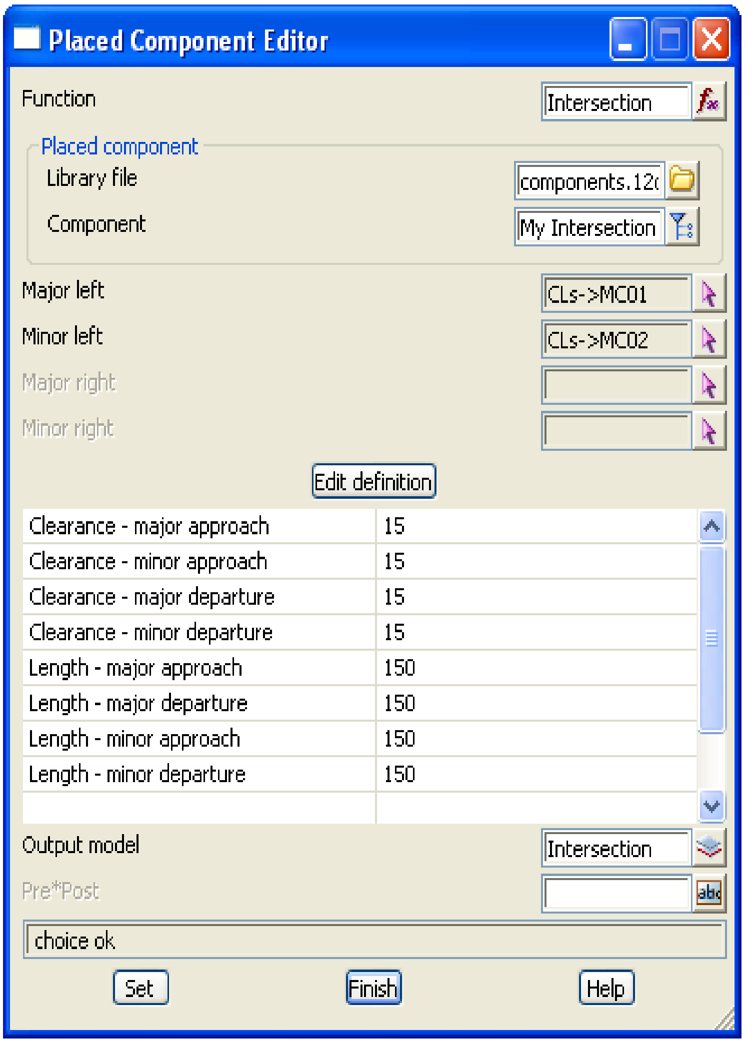
the component function

Edit button

edits the placed component (see 20.9.34.1 Placed Component Editor).

20.9.34.1 Placed Component Editor

This panel is only accessible by using the 20.9.34 Edit a Placed Component **(Design =>Roads =>Components => Edit Component)** or by editing the function directly from the **Utilities => Functions =>Editor.**



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Function	function		

the function you wish to edit

Placed Component

Library	file		

the library your component is read from

Component	choice box		

the component that is being placed

Please note that Library and Component will be read only if you have opted to detach the component from the library.

Edit Definition	button		

allows you to edit the definition of the placed component, which will detach it from the library. After you do this, any changes to the library component will not affect your component.For more information please see 20.9.34.2 Edit a Placed Component Definition

For information on the placement specific parameters, please see the section for that component (see 20.9.2 Component Types).

Output Model model box

the model the geometry will be generated into

Pre*Post

*an optional pre*post*

Set button

Sets the details

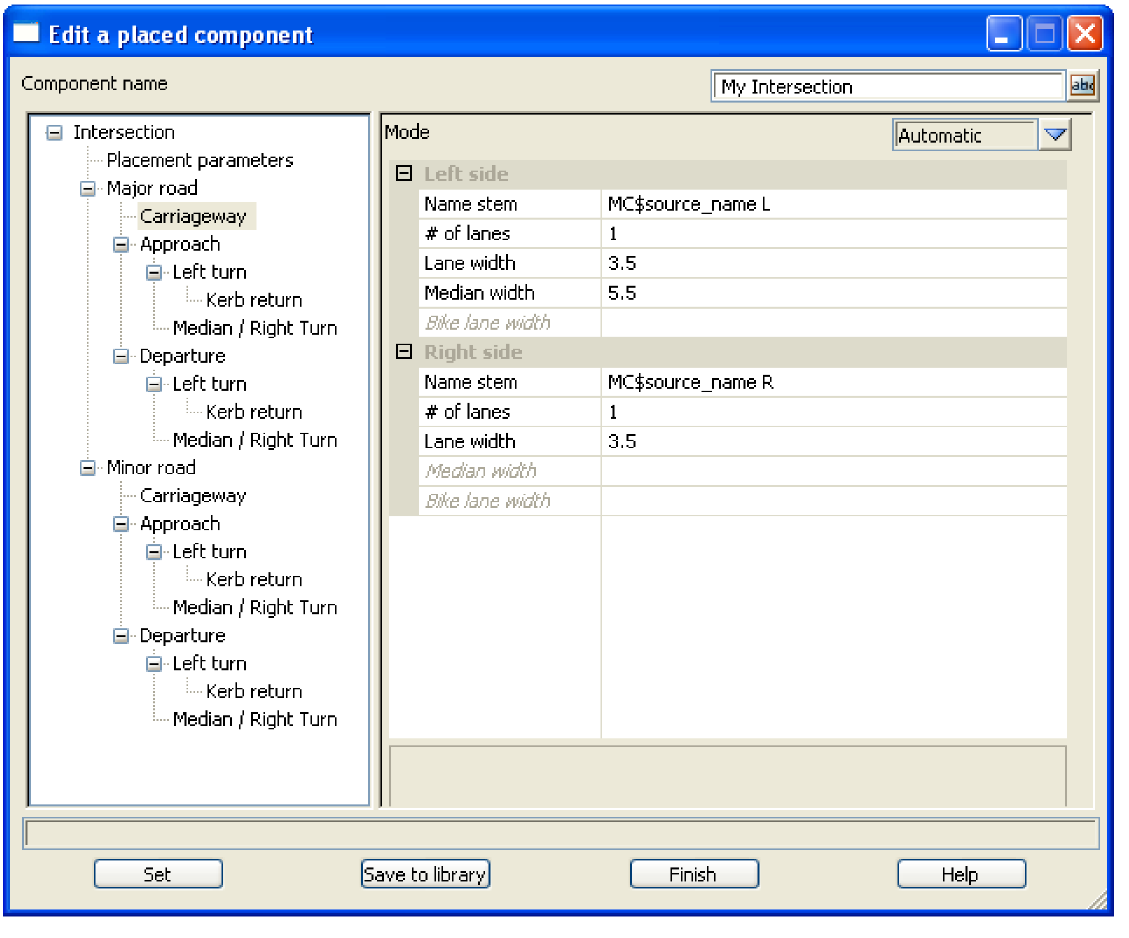
20.9.34.2 Edit a Placed Component Definition

To edit the definition of a placed component, you must edit the function (**Utilities** => **Functions** =>**Editor or Design** =>**Roads** =>**Components** => **Edit Component**) and then select '**Edit Definition**' on the 20.9.34.1 Placed Component Editor panel.

The following example shows the intersection editor. For details on the component specific parameters, see the section on that component type (see 20.9.2 Component Types).

As you edit the component, your changes will be reflected on the component strings.

If you do not wish to keep the changes, simply press '**Finish**' without pressing '**Set**'.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Component name

the name of the component

Set button

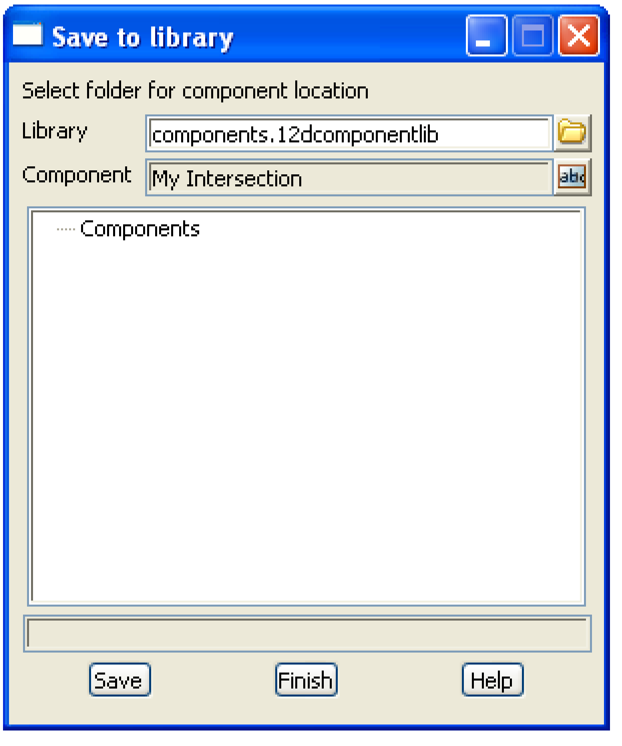
sets the component specific parameters

Save to library button

allows you to save your component definition back into your library. This is useful after you have made changes which you wish to reuse in other components.For more information please see 20.9.34.3 Save to Library

20.9.34.3 Save to Library

This panel allows you to save an edited definition back in to your library.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Library file

the library file to save to

Component

the name of the component you are saving

The panel displays a list of all the folders in your library. Select which folder you wish to save it into.

Save button

saves the component into your library

20.9.35 Component Quick Place

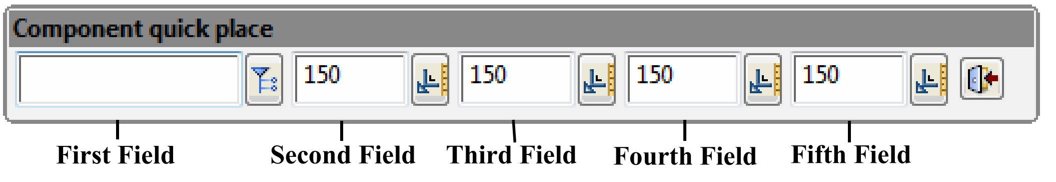
Position of option on menu: **Design =>Roads =>Components => Quick place**

The **Component quick place** toolbar is an easy way to quickly drop components on to existing strings.

Simply start the toolbar, pick your component and hover your mouse over where you would like the component created. If the placement point is correct, a preview of the component will be drawn on your view.

Once you have picked the position correctly, hitting **C** on your keyboard will create the component.

You can then press **E** to edit the component.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

First field

the list of components from your local library (searched for in the working directory, or in your library)

Second field

the length on the major approach (does not apply to all components)

Third field

the length on the major departure (does not apply to all components)

Fourth field

the length on the minor approach (does not apply to all components)

Fifth field

the length on the minor departure (does not apply to all components)

Last button

close the toolbar

20.10 Sight Lines

Position of menu: **Design =>Sight lines**
Utilities =>H-Z =>Sight lines

A **Sight Line** is a lines of sight emanate from an eye point and continuing until it is stopped by an object.

In ***12d Model*** Sight lines are stopped by the items:

(i) A Tin (tin or super tin)

(ii) Bridge tins

(iii) Super stings that are round pipes or rectangular pipes

(iv) Drainage strings

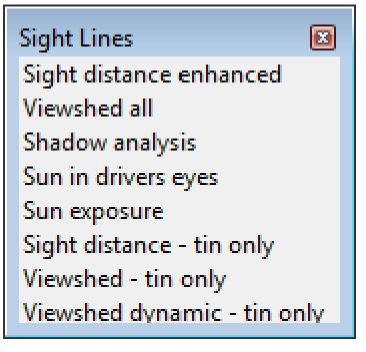
(v) Billboards

(vi) Extrusions down a super string

(vii) Trimeshes

(viii) Meshes

The sight line calculations are used in various forms in all the options on the **Sight Lines** menu.



See

20.10.2 Sight Distance Enhanced

20.10.3 Viewshed All

20.10.4 Shadow Analysis

20.10.5 Sun in Driver Eyes

20.10.6 Sun Exposure

20.10.7 Sight Distance - Tin Only

20.10.8 Viewshed - Tin Only

20.10.9 Dynamic Viewshed - Tin Only

20.10.1 Sight Lines

Position of option on menu: **Design =>Sight lines =>Sight distance enhanced**
Utilities =>H-Z =>Sight lines =>Sight distance enhanced

An **eye point** can see a t**arget point** if a straight line can be drawn from the eye point to the target point and the line is not stopped by any obstruction along the way.

If the target point **can** be seen from the eye point then it is **visible** to the eye point. If not, then it is **invisible** to the eye point.

Note that this is a reciprocal relationship - if **you** can **see** the **target** point **then** the **target** point can **see you**.

In ***12d Model*** the items that can stop an eye from seeing a target point are:

(a) A Tin (tin or super tin)

This is the ground surface. If in a plan view, the eye is on the tin then in z-value it must be above the tin.

For some options the eye can be off the Tin.

In some options, the tin can contain null regions.

(b) Bridge tins

A Bridge Tin is a tin where the underside of the tin is used in the visibility calculations.

These tins can be used to model some obstructions.

(c) Obstructions.

These are Objects in models that can stop a ray emanating from the eye point. Valid obstructions are

(i) Super stings that are round pipes or rectangular pipes

(ii) Drainage strings

(iii) Billboards

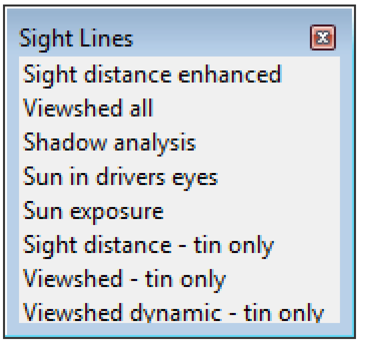
(iv) Extrusions

(v) Trimeshes

(vi) Meshes

A **Sight Line** is a line emanating from an eye point and continuing until it is stopped by one of the above items.

In ***12d Model***, visibility/invisibility/sight line calculations are used in various forms in all the options on the **Sight Line** menu.



Sight distance options - determining for each chainage down a road, how far ahead you can see.

Viewshed options - determining all the points that can be seen from a given eye position.

Shadow analysis - determining what shadows are created by objects.

Sun in drivers eyes - determining when the sun is in a drivers eyes.

Sun exposure - determining when the sun comes in a given window.

20.10.2 Sight Distance Enhanced

Position of option on menu: **Design =>Sight lines =>Sight distance enhanced**
Utilities =>H-Z =>Sight lines =>Sight distance enhanced

For a string (Super Alignment etc), the **sight distance enhanced** option calculates the maximum distance that can be seen from an eye point on the tin to a target point further along the string.

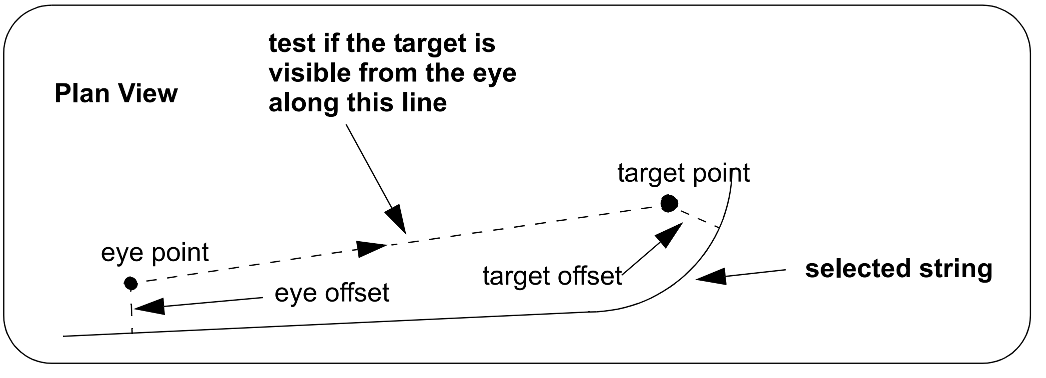
A string and (optionally) an eye point offset and height, and a target offset and height define the direction of the sight lines.

Tins, Bridge Tins and Obstructions are supplied for the sight line calculations.

To calculate the sight distances, ***12d Model*** positions the **eye point** at the given **start chainage** on the selected string, and then goes out perpendicularly for the **distance eye offset**. That position is dropped onto the tin, and finally raises it by the given **eye height.**

From the **eye point**, a target point is placed at a chainage distance equal to the given **minimum sight distance** along the string. The target point is offset by the given **target offset**, then dropped onto the tin and finally raised by the given **target height**.

The ***target point*** is then tested for visibility from the eye point, against the given tin. That is, a test is made to see if the *target point can be seen from the eye point*, against the surface given by the tin.



If the target point is visible, it is moved a given chainage distance **trial interval** further along the string and the visibility test redone.

The process is repeated until either the target point is invisible, or the target point is the given **maximum sight distance** (in chainage) away from the eye point.

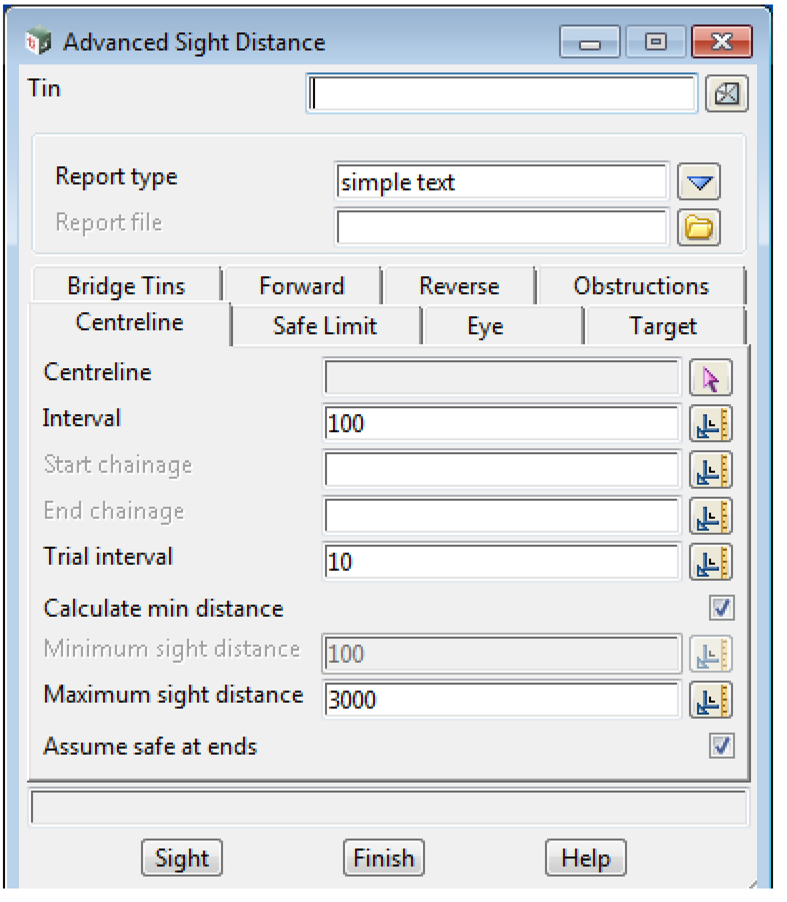
A line joining the eye and ***final target point position*** is created and placed in the **model for sight lines**. The ***chainage*** distance between the eye and the final target point is placed as a text string in the **model for sight text**, positioned at the eye point.

The eye point is then moved the given chainage distance **interval** along the string, and the process repeated until the eye point is past the given **end chainage**.

The eye point is then place at the **end chainage** and the negative of the **trial interval** and **interval** values used to calculate sight distance for the reverse direction along the string.

It is also possible to use a speed, reaction time and deceleration coefficient to calculate a minimum distance.

Selecting **Sight distance enhanced** brings up the **Advanced Sight Distance** panel



The fields and buttons used in this panel have the following functions.

Field Description — Type — Defaults — Pop-Up

Tin — tin box — — available tins

name of the tin to use as the surface for testing visibility.

Report type — choice box

type of report file to be produced (only if **Report file** *has a file name in it)*

Report file — file box — — depends on Report type

*if **not blank**, a report of the type selected in* **Report type** *is produced and written out to this file name.*

Centreline tab

Centreline — string-select

the string to be used for calculating the chainage position for the eye and target points, is selected from a view.

Interval — real box — 100 — measures pop-up

once the sight distance is calculated for the eye at a chainage, the eye chainage is incremented by this amount the sight distance calculation repeated.

Start/end chainage — real box

the sight distance is calculated for points on the selected string covering the chainage range given by the start and end chainage fields. If the **start/end chainage** *is blank, the start/end chainage of the selected string is used.*

Trial interval real box 10 measures pop-up

if the target point is visible, it is then moved along by this chainage increment and the sight test repeated.

There are also values under the **Safe Limit** tab that can be used in the sight distance calculations instead of the fixed **Minimum sight distance.**

If **Calculate min distance** is ticked, then the values on the **Safe Limit** tab can be entered and are used to calculate a minimum sight distance.

Calculate min distance tick box

*if ticked then the minimum sight distance is calculated from the values in the **Safe Limit** tab which allows for a* **Speed**, **Reaction time** *and a* **Deceleration coefficient**.

If not ticked then the constant **Minimum sight distance** *is used.*

Minimum sight distance real box 100 measures pop-up

If **Calculate min distance** *is **not ticked**, then this is the minimum chainage distance from the eye point to place the test target point. The first test of a target is made at this minimum chainage distance from the eye chainage.*

Maximum sight distance real box 3000 measures pop-up

maximum chainage distance to use for placing the test target point. The testing stops if the test target position goes over this chainage distance. In this case, the sight distance will be the **maximum sight distance**.

Safe Limit tab

Speed (km/hr) real box 60 measures pop-up

speed that the vehicle is travelling.

Reaction time (s) real box 2 measures pop-up

time in seconds for the driver to react.

Deceleration coefficient (m/s2) real box 0.36 measures pop-up

the Deceleration coefficient in metres per second per second.

Eye tab

the eye position is determined by finding the chainage along the selected string, going out perpendicularly for the given **eye offset** *(negative to the left, positive to the right), dropping that position onto the given tin, and then adding the* **eye height** *to the height on the tin. Hence the eye point is always the eye height above the tin.*

Height real box 1.3

height of the eye point above the given tin.

Offset real box -0.5

offset of the eye point from the picked string.

Target tab

the target position is determined by finding the chainage along the selected string, going out perpendicularly for the given **target offset** *(negative to the left, positive to the right), dropping that position onto the given tin, and then adding the* **target height** *to the height on the tin. Hence the target point is always the target height above the tin.*

Height real box 0.3

height of the target point above the given tin

Offset real box -0.5

offset of the target point from the picked string.

Bridge Tins tab

*A **Bridge Tin** is a tin where the underside of the tin is used in the visibility calculations.*

Tins grid of tins available tins

the underside of these tins are used in the visibility calculations. These tins can be used to model some obstructions.

Forward tab

Do calcs tick box

if ticked, do the calculations for the forward direction. That is, from the start of the string and in increasing string chainage.

Sight lines model box available models

*if **not blank**, the name of the model to contain the sight lines.*
*If **blank**, the sight lines are not created.*

Clean models first tick box not ticked

if ticked, the models of results are cleaned out before the option runs.

Good colour colour box default colour available colours

when the minimum sight distance is achieved, sight lines are created in the good colour

Bad colour colour box default colour available colours

when the minimum sight distance is not achieved, sight lines are created in the Bad colour

Sight text model box available models

if non-blank, the name of the model to contain the sight distance text.
If blank, the sight distance text is not created.

Sight text info text info

drawing information for the sight text.

Reverse tab

Do calcs tick box

if ticked, do the calcs for the reverse direction. That is, from the end of the sting and going in reverse string chainage direction.

Sight lines model box available models

*if **not blank**, the name of the model to contain the sight lines when going down the string in the reverse direction Note that the eye and target offsets are then applied in the reverse direction of the string.*
*If **blank**, the sight lines are not created.*

Clean models first tick box not ticked *if ticked, the models of results are cleaned out before the option runs.*

Good colour colour box default colour available colours

when the minimum sight distance is achieved, sight lines are created in the good colour

Bad colour colour box default colour available colours

when the minimum sight distance is not achieved, sight lines are created in the Bad colour

Sight text model box available models

if non-blank, the name of the model to contain the sight distance text.
If blank, the sight distance text is not created.

Sight text info text info

definition of the sight text.

Obstructions tab

all the 3d objects in the data source that can be used as obstructions, are used. For a list of valid obstructions, see 20.10.1 Sight Lines.

Data source type Model

data selection type - XX

Data source for obstructions

source of data to look through for elements to use as obstructions.

Sight button button

clicking this button runs the operation.

In the report, the definition for safe distance is

reaction_distance = ***reaction_time*** * ***speed_value*** /3.6

safe_distance = ***reaction_distance*** + ***speed_value*** * ***speed_value*** /(254
*(***deceleration_coefficient*** + ***grade**** ***change_deceleration_per_grade***)

where

reaction_time is in seconds

speed_value is the Operating speed in km/h

deceleration_coefficient is the coefficient of deceleration (longitudinal friction factor)

grade is longitudinal grade (a percentage), with sign + for upgrades and - for downgrades.

change_deceleration_per_grade is

Note: 3.6 is the conversion from *km/h* to *m/s*

20.10.3 Viewshed All

Position of option on menu: **Design =>Sight lines =>Viewshed all**
Utilities =>H-Z =>Sight lines =>Viewshed all

This panel is used to calculates the points, on or above a tin, that are visible and invisible from a user selected **eye** position. That is, it is calculating the sight lines from an eye point.

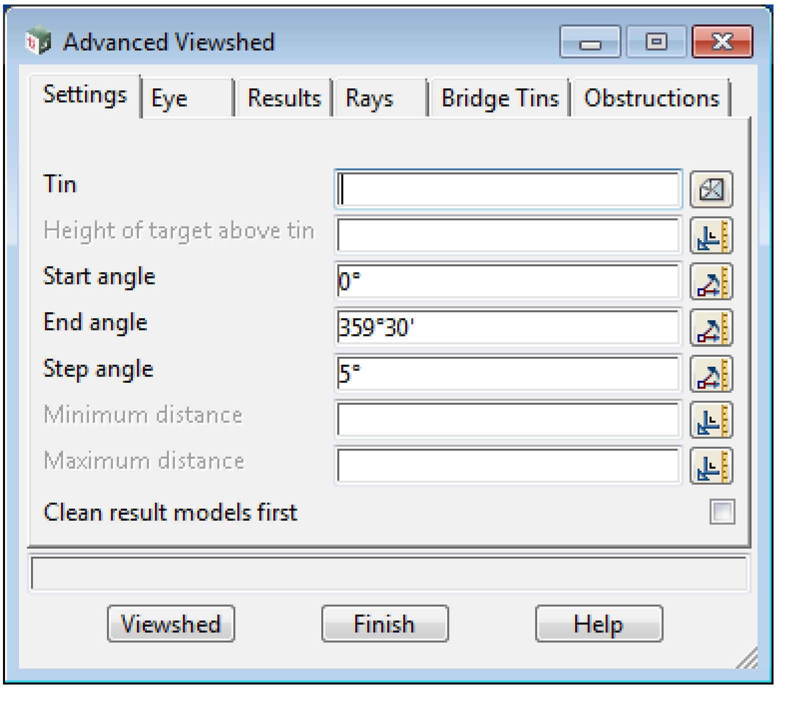
This is equivalent to calculating the points that can, or can not, see a selected **eye** point.

Bridge Tins and Obstructions are used in the sight line calculations. For a list of valid obstructions, see 20.10.1 Sight Lines

The calculations are made along rays emanating from the eye point from a minimum plan distance to a maximum plan distance from the eye point. The rays are created at regular angular steps from a start angle to an end angle.

The eye point can be off the tin and there can be null triangles in the tin.

Selecting **Viewshed all** displays the **Advanced Viewshed** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Settings tab

Tin	tin box		available tins

name of the tin to be used for the viewshed analysis.

Height of target above tin	real box		

the distance that the target is above the tin. This can be positive or negative.

Start angle	angle box	0	

the angle to begin taking sight rays emanating from the eye point. Measured in a counter clockwise direction from the positive x-axis.

End angle angle box 359.30

the angle to stop taking sight rays emanating from the eye point. Measured in a counter clockwise direction from the positive x-axis.

Step angle angle box 5

the angle between successive sight rays emanating from the eye point.

Minimum distance real box

*if **not blank**, the minimum distance from the eye point along the sight ray to begin recording visible/ invisible points.*
*If **blank**, the minimum distance is zero.*

Maximum distance real box

the maximum distance from the eye point along the sight ray to record visible/invisible points.
If blank, the entire tin is considered.

Clean models first tick box

*if **ticked**, the models of results are cleaned out before the option runs.*

Eye tab

Eye XYZ input/output **xyz ops** menu

X/Y/Z coordinate

the XYZ co-ordinates of the eye point.

Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

***Note** - the z-value must be above the surface of the tin at the (x,y) eye position minus the target height. So the eye can not be below the tin by more than the target height, or even the target height below the tin.*

Results tab

More tick box

*if **ticked**, ask for name, model, linestyle, weight.*
*If **not ticked**, only ask for model.*

Name name box names in names.4d

the name for the visible/invisible sight strings.

Model model box available models

the model for the visible/invisible sight strings.

Linestyle linestyle box available linestyles

the linestyle for the visible/invisible sight strings.

Weight weight box

thickness of the string when plotted

Colour of visible bits colour box default line colour

*if **not blank**, the colour for the visible parts of the rays.*
*If **blank**, the visible parts are not created.*

Colour of invisible bits colour box default point colour

*if **not blank**, the colour for the invisible parts of the rays.*

*If **blank**, the invisible parts are not created.*

Separate strings tick box

if ticked, the visible and invisible sections are separate strings.

If not ticked, the visible and invisible sections are combined into one super string.

Rays tab

Visible Rays

*the **visible** rays are the lines from the **eye** point to the **point on the tin** where the **target goes from being visible to invisible**.*

If **Colour of visible bits** *is not blank then this is the colour used for these rays.*

If **Colour of visible bits** *is blank then the colour is the default line colour.*

The ray will be coloured where it is over invisible targets with the colour for the invisible bits (this can happen in undulating country).

More tick box

*if **ticked**, ask for name, model, linestyle, weight.*
*If **not ticked**, only ask for model.*

Name name box names in names.4d

the name for the visible ray strings.

Model model box available models

*if **not blank**, the model for the visible ray strings.*
*If **blank**, don't create the visible ray strings*

Linestyle linestyle box available linestyles

the linestyle for the visible ray strings.

Weight weight box

thickness of the visible ray strings when plotted

Invisible Rays

*the **invisible** rays are the lines from the **eye point** to the **point on the tin** where the **target goes from being invisible to visible**.*

If **Colour of invisible bits** *is not blank then this is the colour used for these rays.*

If **Colour of invisible bits** *is blank then the colour is the default point colour.*

The ray comes from the eye and is coloured with the **Colour of visible bits** *to the change over from visible to invisible and then coloured with the* **Colour of invisible bits** *to where the ray ends (the change over visible to invisible).*

More tick box

*if **ticked**, ask for name, model, linestyle, weight.*
*If **not ticked,** only ask for model.*

Name name box names in names.4d

the name for the invisible ray strings.

Model model box available models

*if **not blank**, the model for the invisible ray strings.*
*If **blank**, don't create the invisible ray strings*

Linestyle linestyle box available linestyles

the linestyle for the invisible ray strings.

Weight weight box

thickness of the invisible ray strings when plotted

Bridge Tins tab

*A **Bridge Tin** is a tin where the underside of the tin is used in the visibility calculations.*

Tins grid of tins available tins

the underside of these tins are used in the visibility calculations. These tins can be used to model some obstructions.

Obstructions tab

the following elements can also obstruct the view line.

(i) super strings with round or rectangular sections.
(ii) bill boards
(iii) extrusions along a string

Data source type Model

data selection type - XX

Data source for obstructions

source of data to look through for elements to use as obstructions.

Viewshed button

On selecting this button, the lines of sight emanating from the **eye XYZ** *point are calculated.*

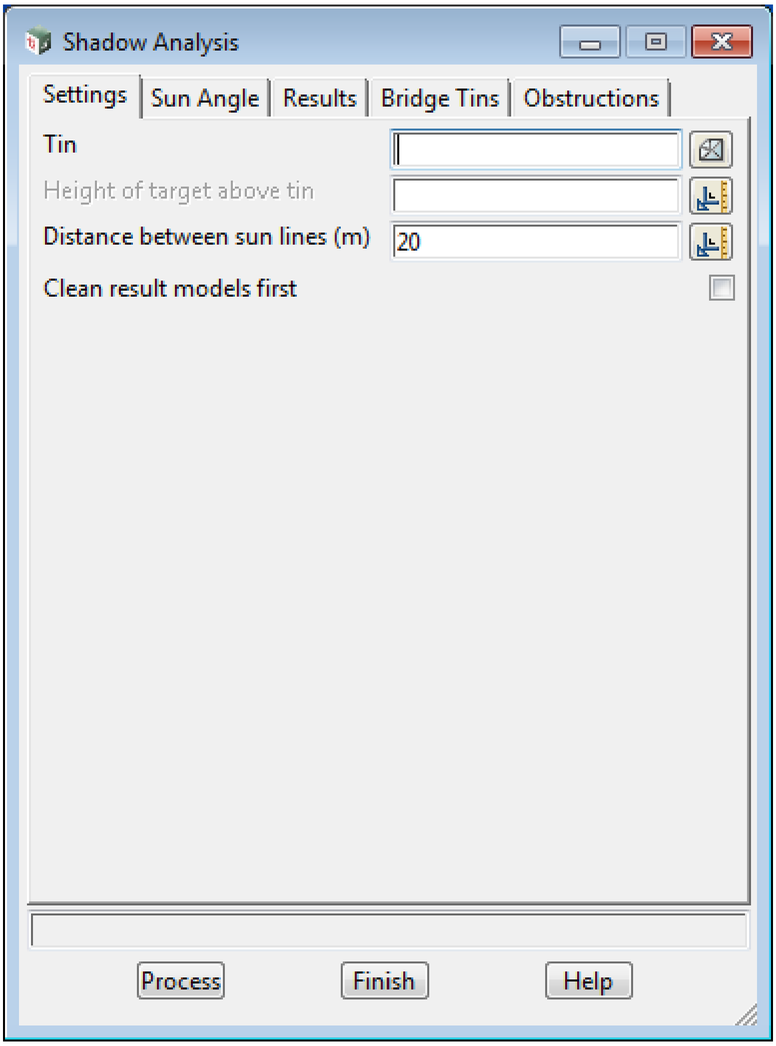
20.10.4 Shadow Analysis

Position of option on menu: **Design =>Sight lines =>Shadow analysis**
Utilities =>H-Z =>Sight lines =>Shadow analysis

This option is under development.

The **Shadow Analysis** option is similar to the *Viewshed* option except that the **sun** is used as the **eye** position. This means that the **visible** areas are those in **sunlight** and the **invisible** areas are those in the **shade** (in **shadows**).

Selecting **Shadow analysis** displays the **Shadow Analysis** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Settings tab

Tin tin box available tins

name of the tin to be used for the shadow analysis.

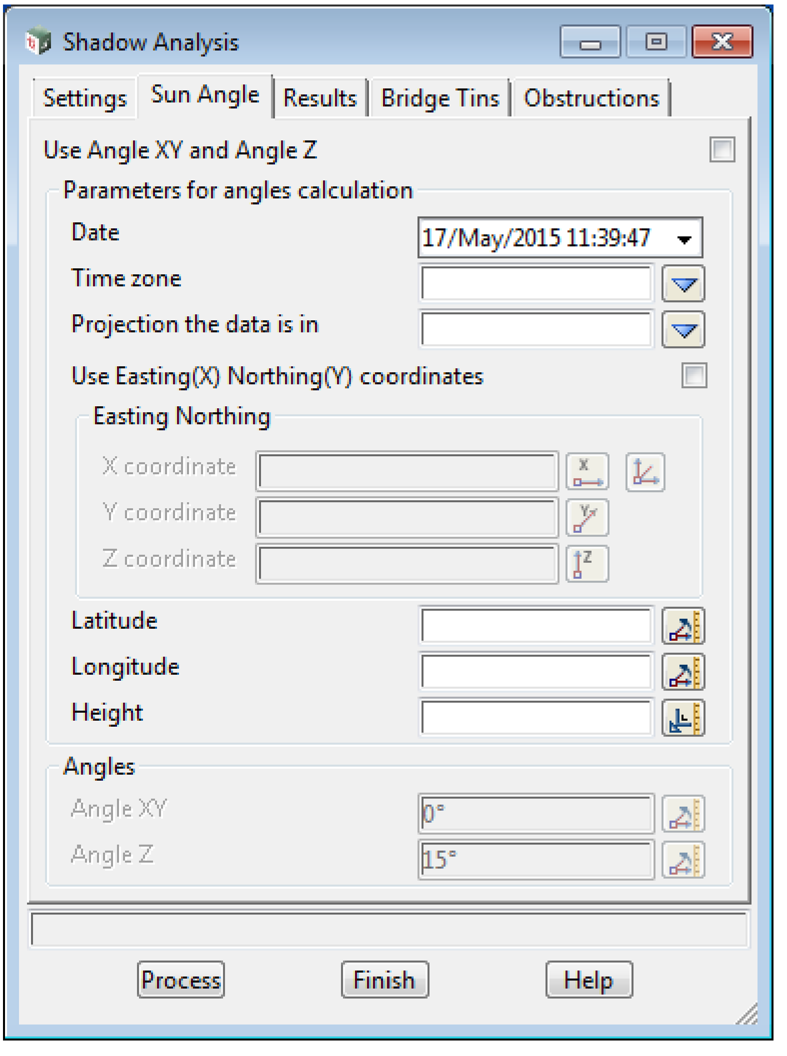
Distance between sun lines real box 20 measures pop up

the perpendicular distance between the result lines.

Clean models first tick box not ticked

if ticked, the models of results are cleaned out before the option runs.

Sun Angle tab



Use Angle XY and Angle Z tick box not ticked

*this controls whether Angle XY and Angle Z are typed in and used to specify the position of he sun, **or** if the sun position (and hence Angle XY and Angle Z) are calculated by giving the date and time of day, and either the (Easting, Northing) or the longitude and latitude of a point in the middle of the data.*

*If **ticked**, the user specifies the position of the sun with respect to the data by giving* **Angle XY** *and* **Angle Z** *(see below for their definitions). This method if used when the data is in an arbitrary coordinate system so there is no way to calculate the position of the sun from the data.*

*If **not ticked**, then the data needs to be in a Projection and the angle to the sun is calculated by giving the date and time, and either the (x,y) coordinate, or the longitude and latitude and of a point in the data.*

So if **Use Angle XY and Angle Z for sun position** *is **not** ticked:*

Date

the sun position is calculated for this date and time.

Time zone choice box

used to define the time zone for the time and date.

Projection the data is in projection box

the data to do Shadow Analysis on must be in this projection.

Use Easting (X) Northing (Y) coordinates tick box not ticked

*if **ticked**, the (x,y) coordinates of a point in the middle of the data is given. Using the Projection, the longitude and latitude can be calculated for this point. **Note** - because the data is in a projection, then the (x,y) coordinates are often referred to as Eastings and Northings.*

*If **not ticked**, the latitude and longitude of a point in the middle of the data is given. Using the Projection, the (x,y) position of the point can be calculated.*

If **Use Easting (X) Northing (Y) coordinates** is **ticked:**

X/Y/Z coordinate real box measure box

the x,y and z coordinates for a typical point in the data can be typed in or a point can be selected using he Point select and the values for x, y an dz will be written to these fields.

The z coordinate will also be written to the **Height** *field.*

If **Use Easting (X) Northing (Y) coordinates** is **not ticked:**

Longitude/Latitude angle box measure box

the longitude and latitude for a typical point in the data is typed in.

Height measure box

height of a typical point on the ground.

If **Use Easting (X) Northing (Y) coordinates** is **ticked:**

Angle XY angle box 0

the angle of the sun in the XY plane measured in a counter clockwise direction from the positive x axis. It is dms in HP notation.

Angle Z angle box 15

the angle of the sun in the vertical plane, measured from the horizontal plane with positive angle going up (Elevation angle?). It is dms in HP notation.

Results tab

More tick box

if ticked, ask for name, model, linestyle, weight.
If not ticked, only ask for model.

Name name box names in names.4d

the name for the sunshine (visible)/shade (invisible) sight strings.

Model model box available models

the model for the sunshine (visible)/shade (invisible) sight strings.

Linestyle linestyle box available linestyles

the linestyle for the sunshine (visible)/shade (invisible) sight strings.

Weight weight box

thickness of the sunshine (visible)/shade (invisible) sight strings when plotted

Colour of bits in sunshine colour box default line colour

*if **not blank**, the colour for the parts in sunshine. These are the visible parts of the view lines.*

*If **blank**, the sunshine parts are not created.*

Colour of bits in shade bits colour box default point colour

*if **not blank**, the colour for the parts in the shade (in shadows). These are is the invisible parts of the view lines.*

*If **blank**, the shade parts are not created.*

Separate strings tick box

*if **ticked**, the sunshine (visible) and shade (invisible) sections are separate strings.*

*If **not ticked**, the sunshine (visible) and shade (invisible) sections are combined into one multicoloured string.*

Bridge Tins tab

*A **Bridge Tin** is a tin where the underside of the tin is used in the visibility calculations.*

Tins grid of tins available tins

the underside of these tins are used in the visibility calculations. These tins can be used to model some obstructions.

Obstructions tab

the following elements can also obstruct the line from the sun.

(i) super strings with round or rectangular sections.

(ii) bill boards

(iii) extrusions along a string

Data source type Model

data selection type - XX

Data source for obstructions

source of data to look through for elements to use as obstructions.

Process **button**

On selecting this button, the lines of sight emanating from the sun are calculated.

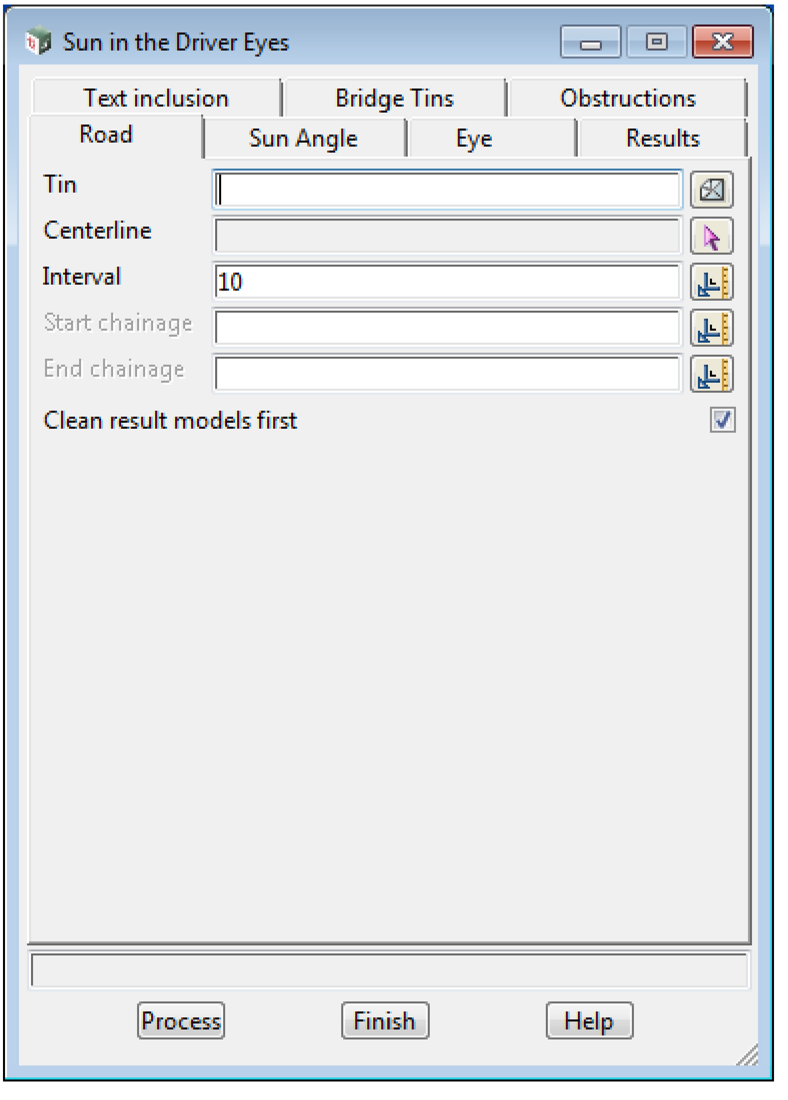
<Esc> can be used to terminate the option during the processing.

20.10.5 Sun in Driver Eyes

Position of option on menu: **Design =>Sight lines =>Sun in driver eyes**
Utilities =>H-Z =>Sight lines => Sun in driver eyes

This option is under development.

Selecting **Sun in driver eyes** displays the **Sun in the Driver Eyes** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Road tab			
Tin	tin box		available tins

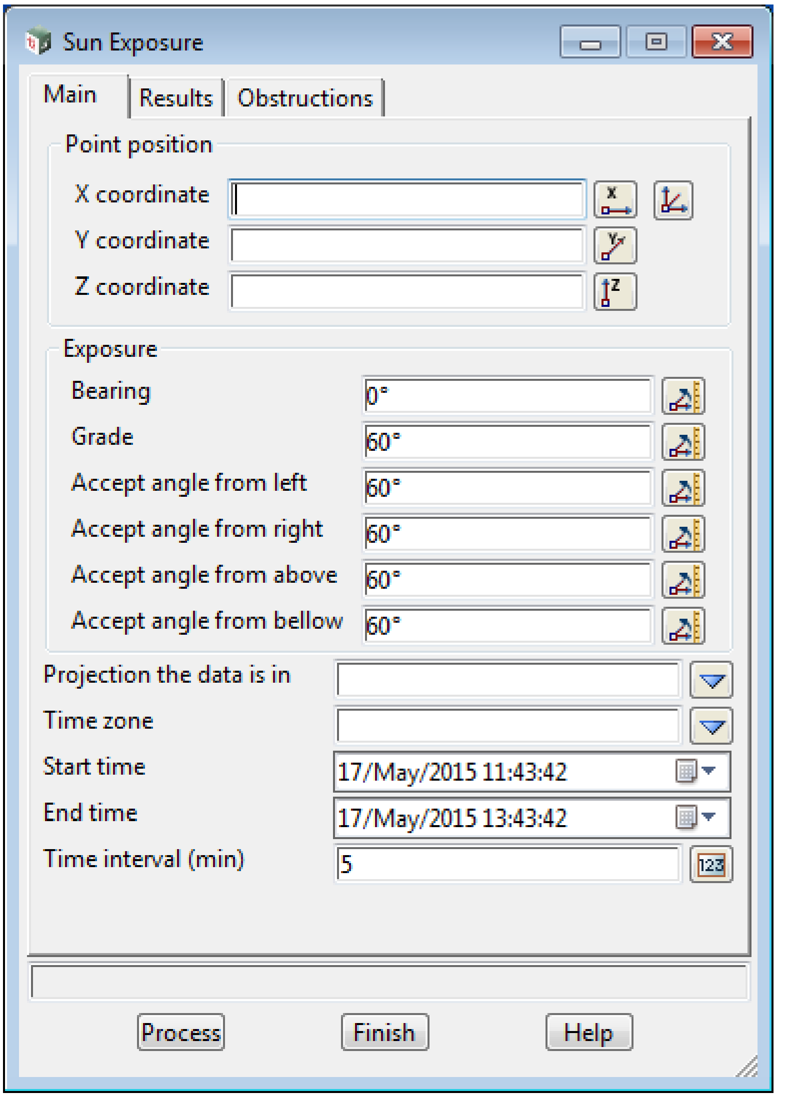
name of the tin to be used for the analysis.

20.10.6 Sun Exposure

Position of option on menu: **Design =>Sight lines =>Sun exposure**
Utilities =>H-Z =>Sight lines => Sun exposure

This option is under development.

Selecting **Sun exposure** displays the **Sun Exposure** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Main tab

Point position

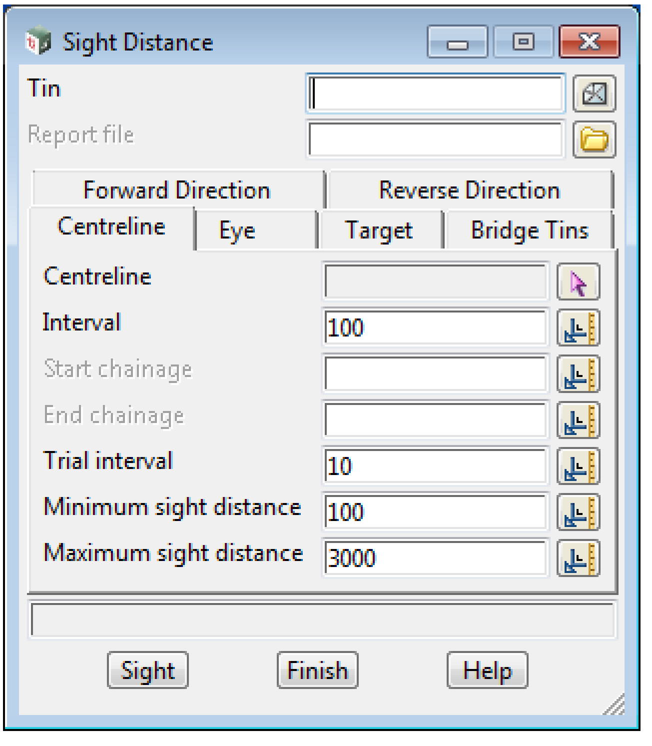
20.10.7 Sight Distance - Tin Only

Position of option on menu: **Design =>Sight lines =>Sight distance - tin only**
Utilities =>H-Z =>Sight lines =>Sight distance - tin only

For a string (Super Alignment etc), the **sight distance** option calculates the maximum distance along the road that can be seen from an eye point.

The calculations are done in the same manner as for the **Advanced Sight Distance** except that there is only a Tin and Bridge Tins. There are no Obstructions (see 20.10.2 Sight Distance Enhanced).

Selecting **Sight distance - tin only** brings up the **Sight Distance** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin to use as the surface for testing visibility.

Report file	file box		*.rpt files

if non blank, a report is produced and written out to this file name.

Centreline tab

Centreline	string-select		

the string to be used for calculating the chainage position for the eye and target points, is selected from a view.

Interval	input	100	

once the sight distance is calculated for the eye at a chainage, the eye chainage is incremented by this amount the sight distance calculation repeated.

Start/end chainage	input		

the sight distance is calculated for points on the selected string covering the chainage range given by the start and end chainage fields. If the **start/end chainage** *is blank, the star/end chainage of the selected string is used.*

Trial interval input 10

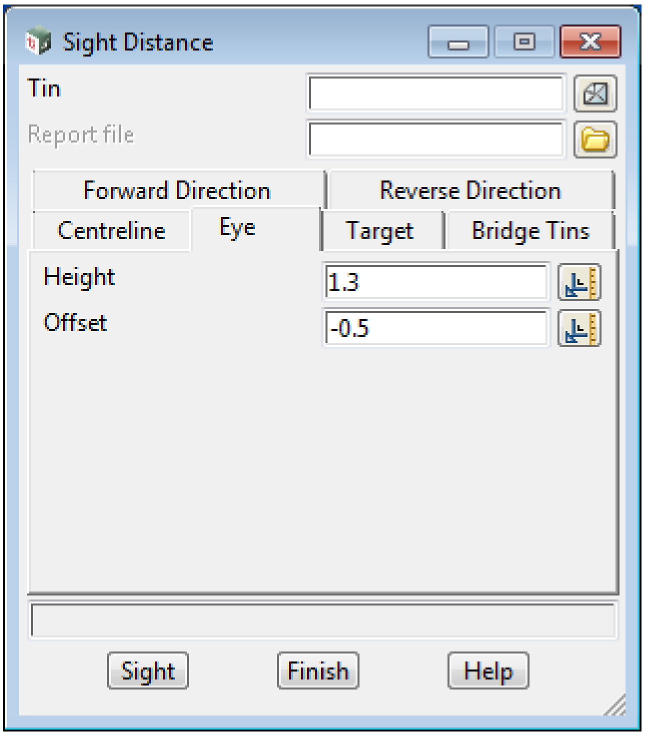
if the target point is visible, it is then moved along by this chainage increment and the sight test repeated.

Minimum sight distance input 100

minimum chainage distance from the eye point to place the test target point. The first test of a target is made at this minimum chainage distance from the eye chainage.

Maximum sight distance input 3000

maximum chainage distance to use for placing the test target point. The testing stops if the test target position goes over this chainage distance. In this case, the sight distance will be the **maximum sight distance**.



Eye tab

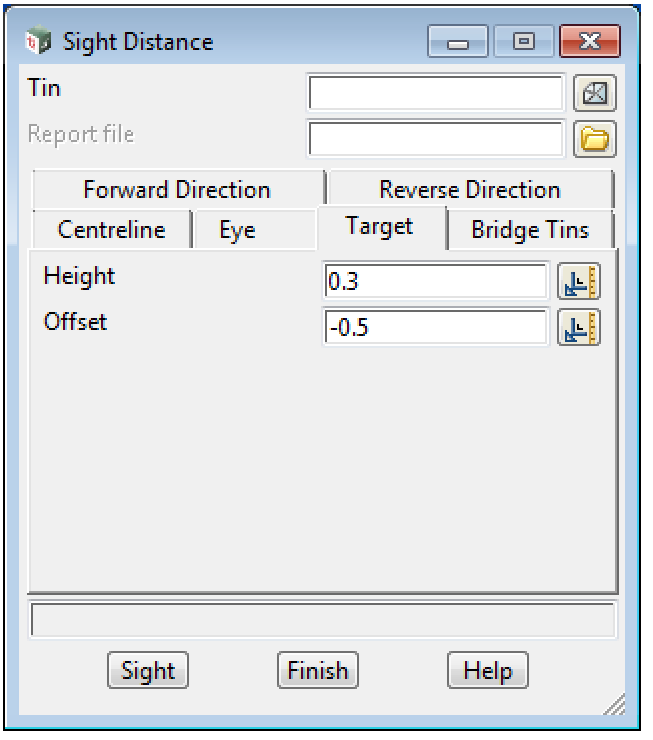
the eye position is determined by finding the chainage along the selected string, going out perpendicularly for the given **eye offset** *(negative to the left, positive to the right), dropping that position onto the given tin, and then adding the* **eye height** *to the height on the tin. Hence the eye point is always the eye height above the tin.*

Height input 1.3

height of the eye point above the given tin.

Offset input -0.5

offset of the eye point from the picked string.



Target tab

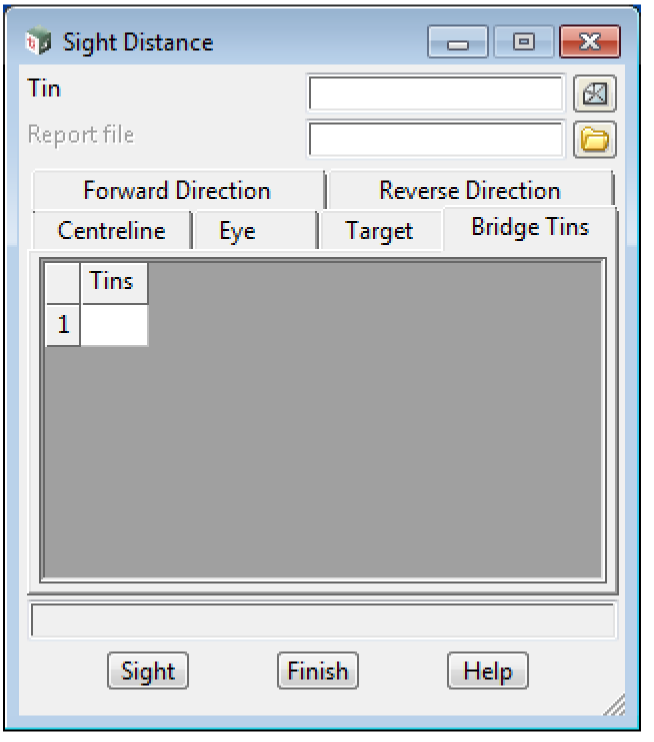
the target position is determined by finding the chainage along the selected string, going out perpendicularly for the given **target offset** *(negative to the left, positive to the right), dropping that position onto the given tin, and then adding the* **target height** *to the height on the tin. Hence the target point is always the target height above the tin.*

Height input 0.3

height of the target point above the given tin

Offset input -0.5

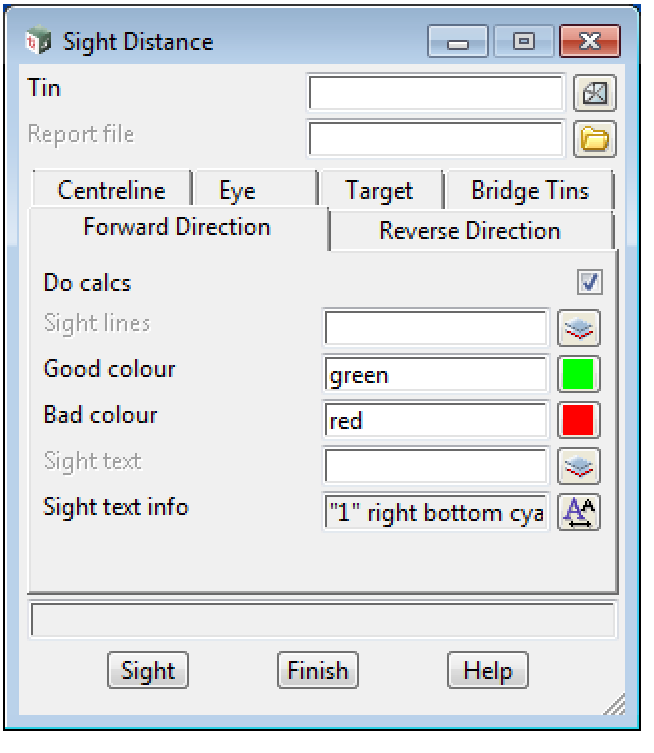
offset of the target point from the picked string.



Bridge Tins tab

Tin grid available tins

name of the tins to use as vertical obstructions when testing visibility.



Forward Direction tab

Do calcs tick box

if ticked, do the calcs for the forward direction

Sight lines model box available models

if non-blank, the name of the model to contain the sight lines.
If blank, the sight lines are not created.

Good colour colour box default colour available colours

when the minimum sight distance is achieved, sight lines are created in the good colour

Bad colour colour box default colour available colours

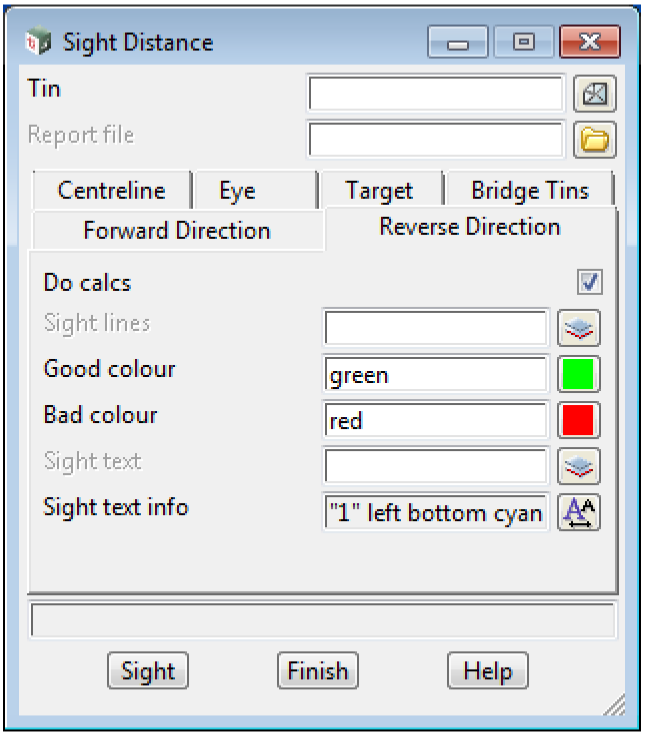
when the minimum sight distance is not achieved, sight lines are created in the Bad colour

Sight text model box available models

if non-blank, the name of the model to contain the sight distance text.
If blank, the sight distance text is not created.

Sight text info text info

definition of the sight text.



Reverse Direction tab

Do calcs tick box

if ticked, do the calcs for the reverse direction

Sight lines model box available models

if non-blank, the name of the model to contain the sight lines when going down the string in the reverse direction Note that the eye and target offsets are then applied in the reverse direction of the string.
If blank, the sight lines are not created.

Good colour colour box default colour available colours

when the minimum sight distance is achieved, sight lines are created in the good colour

Bad colour colour box default colour available colours *when the minimum sight distance is not achieved, sight lines are created in the Bad colour*

Sight text model box available models

if non-blank, the name of the model to contain the sight distance text.
If blank, the sight distance text is not created.

Sight text info text info

definition of the sight text.

Sight button

sight lines and text will be calculated for the given string and tin, and placed in the sight line and text models.

20.10.8 Viewshed - Tin Only

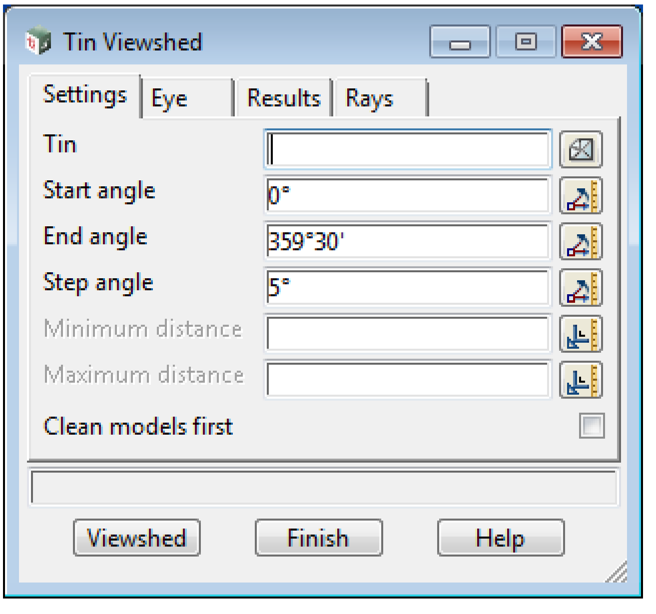
Position of option on menu: **Design =>Sight lines =>Viewshed - tin only**
Utilities =>H-Z =>Sight lines => Viewshed - tin only

This panel is used to calculate the points that are visible and invisible from a user selected eye position. This is equivalent to calculating the points that can or can not see a selected point.

The calculations are made along rays emanating from the eye point from a minimum to a maximum distance from the eye point. The rays are created at regular angular steps from a start angle to an end angle.

The calculations are done in the same manner as for the **Advanced Viewshed** except that there is only a Tin. There are no Bridge Tins or Obstructions (see 20.10.3 Viewshed All).

Selecting **Viewshed** displays the **Tin Viewshed** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Setting tab

Tin	tin box		available tins

name of the tin to be used for the viewshed analysis.

Start angle	angle box	0	

the angle to begin taking sight rays emanating from the eye point.

End angle	angle box	359.30	

the angle to stop taking sight rays emanating from the eye point.

Step angle	angle box	5	

the angle between successive sight rays emanating from the eye point.

Minimum distance	input		

if not blank, the minimum distance from the eye point along the sight ray to begin recording visible/ invisible points.
If blank, the minimum distance is zero.

Maximum distance	input		

the maximum distance from the eye point along the sight ray to record visible/invisible points. If blank, the entire tin is considered.

Clean model first tick box

if ticked, the models of results are cleaned out before the option runs.

Eye tab

Eye XYZ input/output **xyz ops** menu

X/Y/Z coordinate

the XYZ co-ordinates of the eye point.

Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

Note - the z-value is normally above the surface of the tin and should not be on the tin.

Results tab

More tick box

if ticked, ask for name, model, linestyle, weight.

if not ticked, only ask for model.

Name input

name for the created strings

Model model box available models

the model for the visible/invisible sight strings.

Linestyle linestyle box

linestyle for the created strings

Weight weight box

weight for the created strings

Colour of visible bits colour box default line colour

if not blank, the colour for the visible parts of the rays. If blank, the visible parts are not created.

Colour of invisible bits colour box default point colour

if not blank, the colour for the invisible parts of the rays. If blank, the invisible parts are not created.

Separate strings tick box

if ticked, the visible and invisible sections are separate strings.

If not ticked, the visible and invisible sections are combined into one super string.

Rays tab

Visible Rays

the visible rays are the lines from the eye point to the point on the tin where the terrain goes from being visible to invisible.

If **Colour of visible bits** *is not blank then this is the colour used for these rays.*

If **Colour of visible bits** *is blank then the colour is the default line colour.*

The ray will be coloured where it is over invisible terrain with the colour for the invisible bits (this happens in undulating country. That is where there are valleys).

More tick box

if ticked, ask for name, model, linestyle, weight.

if not ticked, only ask for model.

Name input

name for the created strings

Model model box available models

if not blank, the model for the visible ray strings.
If blank, don't create the visible ray strings

Linestyle linestyle box

linestyle for the created strings

Weight weight box

weight for the created strings

Invisible Rays

the invisible rays are the lines from the eye point to the point on the tin where the terrain goes from being invisible to visible.

If **Colour of invisible bits** *is not blank then this is the colour used for these rays.*

If **Colour of invisible bits** *is blank then the colour is the default point colour.*

The ray comes from the eye and is coloured with the **Colour of visible bits** *to the change over from visible to invisible and then coloured with the* **Colour of invisible bits** *to where the ray ends (the change over visible to invisible).*

More tick box

if ticked, ask for name, model, linestyle, weight.

if not ticked, only ask for model.

Name input

name for the created strings

Model model box available models

if not blank, the model for the invisible ray strings.
If blank, don't create the invisible ray strings

Linestyle linestyle box

linestyle for the created strings

Weight weight box

weight for the created strings

Viewshed button

On selecting this button, the lines of sight emanating from the **eye XYZ** *point are calculated.*

20.10.9 Dynamic Viewshed - Tin Only

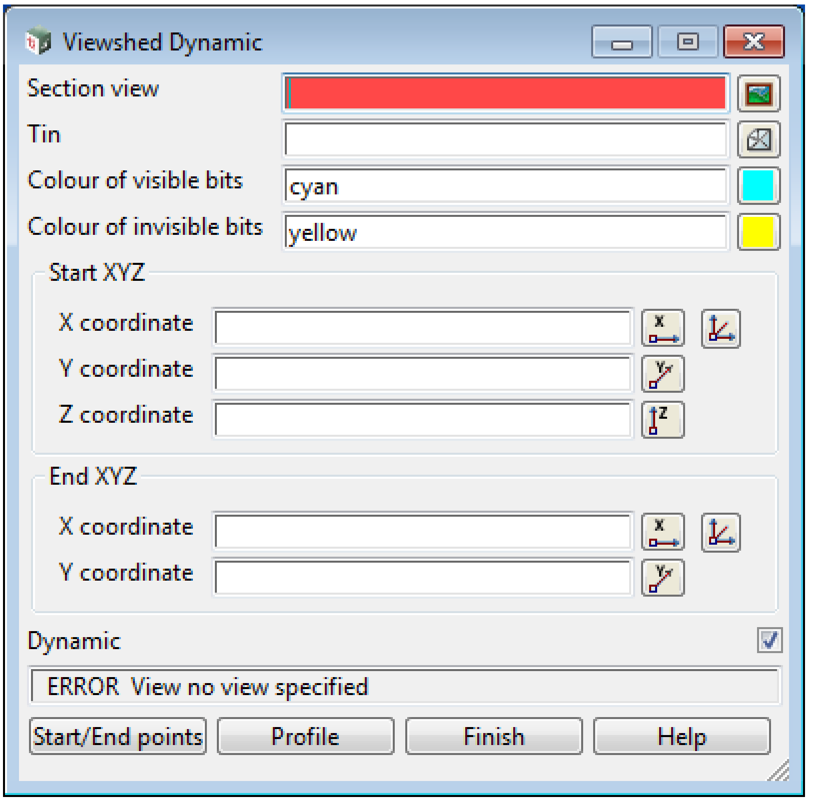
Position of option on menu: **Design =>Sight lines => Viewshed dynamic - tin only**
Utilities =>H-Z =>Sight lines => Viewshed dynamic - tin only

Dynamic viewshed is used to calculate and display on a section view, the points that are visible and invisible from a user selected eye position to a user selected target position.

The target point can be dynamically moved and the sight line is automatically recalculated and displayed on the section view.

The calculations are done in the same manner as for the **Advanced Viewshed** except that there is only a Tin. There are no Bridge Tins or Obstructions (see 20.10.3 Viewshed All).

Selecting **Viewshed dynamic** displays the **Viewshed Dynamic** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Section view	view box		available section view
section view to display the sight lines on			
Tin	tin box		available tins
name of the tin to be used for the viewshed analysis.			
Colour of visible bits	colour box		default line colour
the colour for the visible parts of the viewshed string			
Colour of invisible bits	colour box		default point colour
the colour for the invisible parts of the viewshed string			
Start XYZ	input/output		**xyz ops** menu

X/Y/Z coordinate

the XYZ co-ordinates of the start of the line to determine viewshed for.

Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

End XY input/output **xyz ops** menu

X/Y coordinate

the XY co-ordinates of the end of the line to determine viewshed for.

Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

No Z is required.

Dynamic tick box

if ticked and the **Start/End points** *button is used, once the Start point is selected, the viewshed analysis is carried out from the start point to the cursor position which represents the end point. The results are displayed in the section view.*

Start/End points button

if picked, an start point is selected and then the height displayed in an **enter height** *input box. If required, a new height can be typed into the* **enter height** *box. After typing an <enter> into the input box, the box is removed from the screen and the x, y and height is piped into the* **Start XYZ** *panel field.*

The cursor is then used to select the End point.

If Dynamic *is ticked, as the Cursor position is moved, the viewshed is carried out to the new cursor position and the results displayed in the section view.*

Profile button

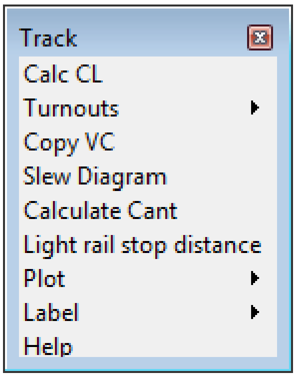
Selecting this button calculates the line of sight from the start to the end position.

20.11 Track

Position of menu: **Design =>Track**

The Track options are for working on rail design.

The **Track** walk-right menu is



The ***Track*** options have their own Help system which is brought up by clicking on **Help** on the **Track menu**, or clicking **Help** on each of the **Track panels.**

For the option *Calc CL*, go to	20.11.1 Calc CL Panel

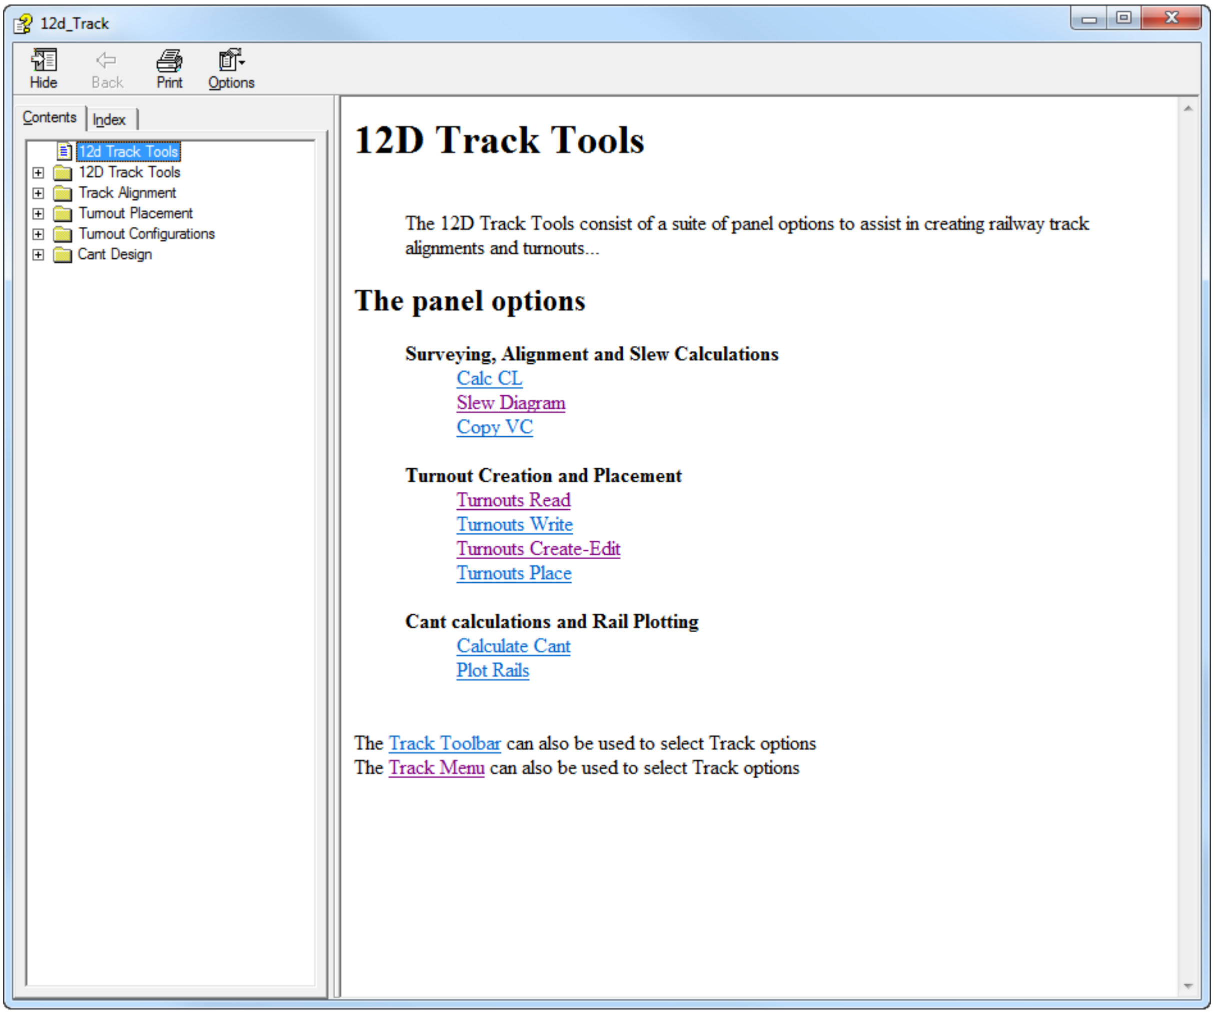
20.11.9 Help

Position of menu: **Design =>Track => Help**

The ***Track*** options have their own Help system which is brought up by clicking on **Help** on the **Track menu,** or clicking **Help** on each of the **Track** panels.



20.12 Tunnels and Structures

Position of menu: **Design =>Tunnel-Structures**

In *Version 11.0*, the creation of tunnel profiles and the generation of a tunnel or structure has been enhanced from *Version 10.0* to make the process easier.

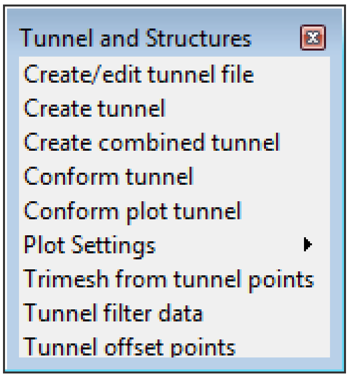
Tunnels and structures are defined by a number of ***profiles***, each of which must have the same number of named vertices, and these profiles are applied along a centreline (alignment). New profiles are generated at user given chainages along the tunnel/structure centreline, and any profile generated between two defined profiles is the linear interpolation by chainage of the two defined profiles.

The defined tunnel profiles and how they are applied down a string are specified in the **Create/ Edit Tunnel File** panel, and this information is stored in a *Tunnel Definition File* (ending in ***.12d_Tunnel***).

The *Tunnel Definition File* is used in other options such as **Create Tunnel** which generates the profile and longitudinal strings, and trimesh, for the tunnel, **Conform Tunnel** for tunnel conformance, and in ***12d Field*** for setting out tunnels.

Note: a ***Trimesh*** can be generated for a tunnel by the **Create Tunnel** panel.

The **Tunnel** menu is:



See

20.12.1 Creating/Editing a Tunnel Definition File
20.12.2 Create Tunnel

20.12.4 Conform Tunnel
20.12.5 Conform Plot Tunnel
20.12.6 Plot Settings
20.12.7 Trimesh from Tunnel Points

20.12.1 Creating/Editing a Tunnel Definition File

Position of option on menu: **Design =>Tunnel-Structures =>Create/edit tunnel file**

The **Create/Edit Tunnel File** panel is used to define the tunnel definition file which records:

(a) the profiles used to define the tunnel

(b) the tunnel centreline (the tunnel reference string) that the tunnel profiles are applied to

(c) whether the tunnel profiles are applied perpendicular (*i.e.* normal) or vertically to the tunnel centreline

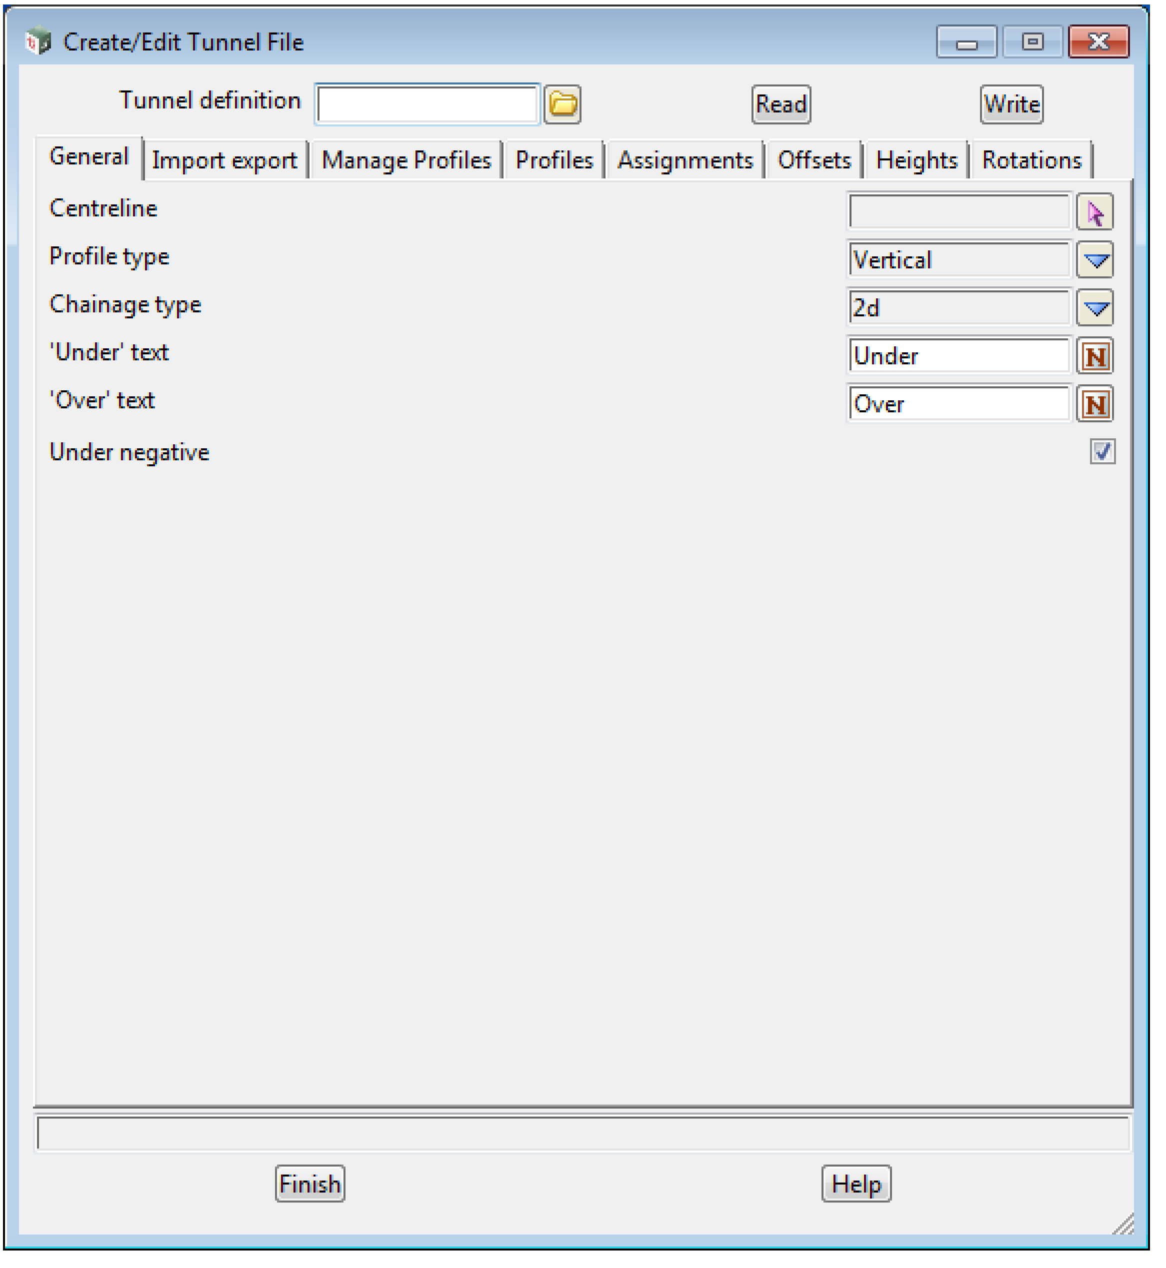
(d) whether 2d or 3d chainages are used in the tunnel definitions.

(e) the chainages where the profiles are applied, and optional height, grade and rotation changes when the profiles are applied along the tunnel centreline.

Note tunnel profiles and longitudinal strings can be generated perpendicular (*i.e.* normal) to the defined centreline resulting in a true 3d representation of the tunnel.

One restriction is that a tunnel cannot be completely vertical - there must be some chainage difference in the vertical alignment. But given that a chainage difference as small as 0.01mm can be used then this restriction is rarely a problem.

Selecting **Create/edit tunnel file** brings up the **Create/Edit Tunnel File** panel



Top Section

Tunnel definition tunnel file box available 12d_tunnel files

the tunnel file to contain all the definitions for the tunnel. That is, the tunnel centreline, the tunnel profiles and which profiles and how often they are applied along the centreline of the tunnel.

Read button

read in the file given in the **Tunnel definition** *field.*

Write button

write out all the values in the panel to the file giving in the **Tunnel definition** *field.*

Export (PRO/PRA) button

write out the appropriate values in the panel as a PRO *and* PRA *file.*

Note*: PRO and PRA are files use in TP Setout and TP Stakeout. See* 20.12.10 Definition of the PRO and PRA definition files.

General tab

Tunnel centreline

*the centreline that the tunnel definitions are applied to. The centreline must have valid vertical geometry for all the chainage ranges used in the **Assignments**, **Offsets Heights** and **Rotations** tabs.*

Profile type choice box perpendicular, vertical

if **perpendicular**, *the tunnel profiles are applied perpendicularly (i.e. normal) to the vertical alignment of the centreline. That is, perpendicular to the tangent vector to the centreline at that chainage. This results in a true 3d model.*

If **vertical,** *the tunnel is calculated vertical to the vertical alignment of the centreline. This may mean an effective loss of clearance on steeper grades.*

Chainage type choice box 2d, 3d

if **2d**, *the chainages in the tunnel definitions are taken as plan chainages.*

if **3d**, *are interpreted as 3d. That is, it is the plan/2d chainage of the **1st point** where the horizontal and vertical geometry coincide, plus the 3d length along the centreline from there.*

Manage Profiles tab

A tunnel can contain any number of defined profiles that are used to linearly extrapolate between.

*The **Manage Profile** tab lets you create a new profile:*

(a) using an existing profile as a seed profile and the new profile is given a copy of the seed profile's geometry. The profile geometry is then edited using the **Profiles** *tab.*

or

(b) create a new profile that has no geometry and the geometry is entered using the **Profiles** *tab.*

Seed profile profiles box available profiles in this tunnel definitions file

*if **not blank**, it must be a profile in this tunnel definitions file and it is used as a Seed profile for the new profile being created.*

New name text box

name for the new profile being created. The new name must be unique amongst the profiles in this tunnel definitions file.

Create button

create a new profile with the geometry being a copy of the geometry of the Seed profile.

Delete profile profiles box available profiles in this tunnel definitions file

the profile in this tunnel definitions file to delete.

Delete button

delete the profile given in the **Delete profile** *field.*

Profile to rename profiles box available profiles in this tunnel definitions file

the profile in this tunnel definitions file to be renamed.

New name text box

new name for the profile. The new name must be unique amongst the profiles in this tunnel definitions file.

Rename button

rename the profile given in the **Profile to rename** *field to the name given in the* **New name** *field.*

Import profile profiles box available profiles in this tunnel definitions file

the profile in this tunnel definitions file to delete.

Delete button

delete the profile given in the **Delete profile** *field.*

Profiles tab

A tunnel can contain any number of defined profiles that are used to linearly extrapolate between.

The ***Profile*** *tab lets you create new profiles, pick existing profiles to edit and graphically display the shape of the profile for you.*

Current Profile choice box list of profiles in the current tunnel

Select the profile you wish to create or edit. If the selected profile already has vertices defined, they will be displayed in the grid, and the shape drawn in the area under the grid.

Set button

Records the contents of the current grid as the profile given in the **Current profile** *field.* **Set** *must be pressed before moving to another profile or the contents of the current grid will be lost.*

Profile grid

Name text box

the name of the vertex of the profile. It must be unique to this profile.

Offset real box

the offset of the vertex from the centreline. Positive offset is to the right of the centreline, negative offset is to the left of the centreline.

Height real box

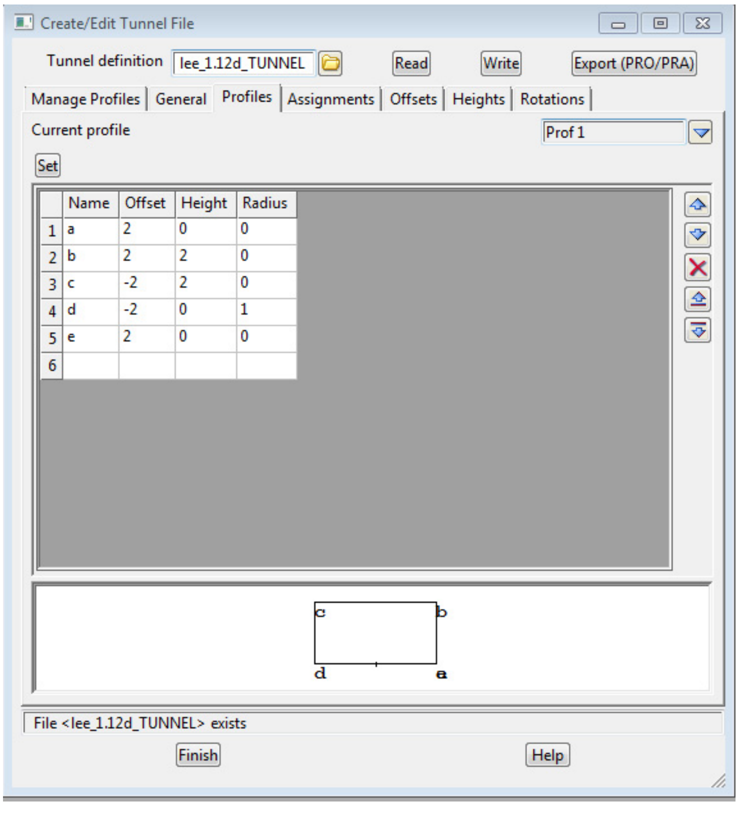
the height difference of the vertex from the centreline. Positive height is above the centreline, negative height is below the centreline.

Radius real box

the radius of the segment from this named vertex to the next named vertex. A positive radius is a right handed or clockwise curve with respect to the order of the vertices in the grid.

Zero (0) means that there is no radius and there is a straight line between this vertex and the next named vertex.

There must always be a value for the radius.



Assignments tab

This grid is used to define where the defined profiles are assigned on the centreline.
For a row in the grid, the named profile starts at the chainage in that row. For any chainage between this chainage and the chainage on the next row of the grid, a profile is ***generated*** *by interpolating by chainage between the name profile on this row and the named profile on the next row.*

The same profile can be used any number of times in the Assignment grid.

The chainages in the Assignments grid must be in ascending order.

Set button

Records the contents of the Assignments grid. **Set** *must be pressed before moving to another tab or the contents of the current grid will be lost.*

Assignments grid

Chainage real cell

The chainage where the named profile begins.

For any chainage between this chainage and the one on the next row, a profile is generated by interpolated by chainage between this profile and the one on the next row of the grid.

Name profiles cell available profiles

The name of the profile to start at this chainage.

Offsets/Heights/Rotations tab

A profile can be adjusted by applying an offset, a (delta) height and a rotation.
The Offsets/Heights/Rotations grid is used to define the offset/height/grade or angle applied to a profile.

The offset/height/grade or angle on a row of the grid starts at the chainage in that row. For any chainage between the chainage of this row and the chainage of the next row, an offset/height/grade or angle for the profile at the chainage is calculated by interpolating between the offset/height/grade or angle of the profile in this row and the offset/height/grade or angle on the following row of the grid.

The chainages in the Offsets/Heights/Rotations grid must be in ascending order.

***Notes**:*

***1**. the **height** is a **delta height**. That is, it is added to the height of the profile.*

***2.** the **rotation** in a row can be given as either a **Percent Grade** (positive is up) **or** an **Angle** (dms in hp notation and is measure in counterclockwise from the offset axis). The percent grade or angle will be referred to as the rotation.*

Set button

Records the contents of the Offsets/Heights/Rotations grid. **Set** *must be pressed before moving to another tab or the contents of the current grid will be lost.*

Offsets/Heights/Rotations grid

Chainage real cell

The chainage to start applying the offset/height/rotation.

For any chainage between this chainage and the one on the next row of the grid, an offset/height/rotation is generated by interpolated by chainage between this offset/height/rotation and the one in the next row of the grid.

Offset/Height/Grade or Angle real cell

the offset/height/grade or angle to start at this chainage.

For any chainage between this chainage and the one on the next row, an offset/height/rotation is calculated by interpolated by chainage between this offset/height/rotation and the one on the next row of the grid.

Type choice cell None, Linear, Cubic Rev C, Biquadratic

the type of interpolation used for the offset/height/rotation at chainage between the chainage of this row and the chainage on the next row.

***None**: no interpolation is done and the offset/height/ at this chainage is used. If there is a different offset/height/rotation on the next row then there will be a problem and you need to insert another row after this row with a chainage slightly less than the chainage on the next row. The offset/height/rotation of the inserted row needs to be the same as this row and the Type should be **Linear**.*

***Linear**: offset/height/rotation is linearly interpolated by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.*

***Cubic**: offset/height/rotation is interpolated as a cubic by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.*

***Rev C**: offset/height/rotation is interpolated as a reverse cubic by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.*

***Biquadratic**: offset/height/rotation is interpolated as a back to back quadratics by chainage between the offset/height/rotation on this row and the offset/height/rotation on the next row.*

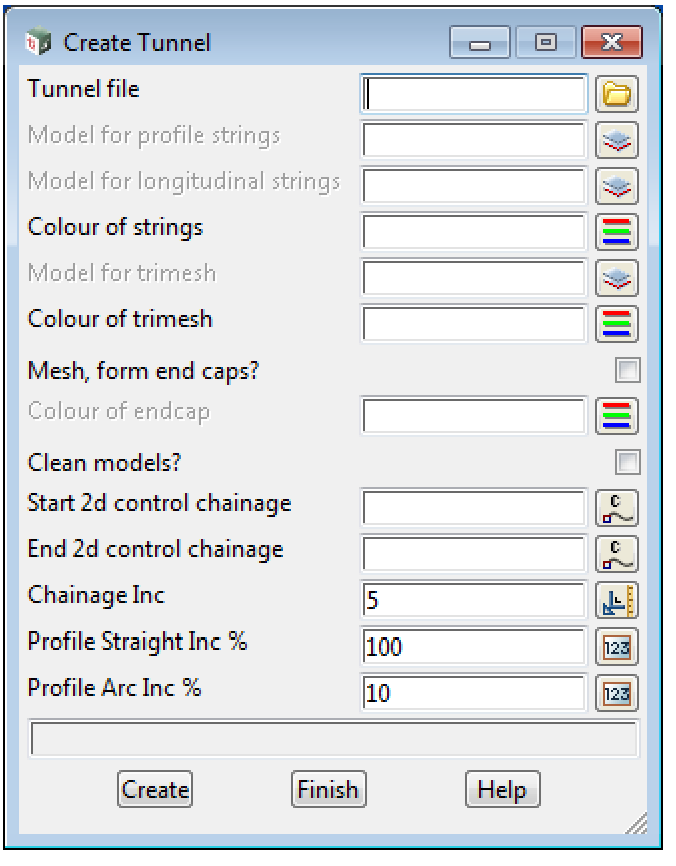
20.12.2 Create Tunnel

Position of option on menu: **Design =>Tunnel-Structures =>Create tunnel**

The **Create Tunnel** panel is used to generate the strings defining the shape of the tunnel - the profile and longitudinal strings, and the trimesh, for the tunnel.

The tunnel is defined in a ***Tunnel File*** that has been created in the **Create/Edit Tunnel File** panel.

Selecting **Create Tunnel** brings up the **Create Tunnel** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Tunnel file tunnel file box available 12d_tunnel files

the tunnel file containing all the definitions for the tunnel. That is, the tunnel centreline, the tunnel profiles and which profiles and how often they are applied along the centreline of the tunnel.

Model for profile strings model box

*if **not blank**, a string of the tunnel profile is created at each chainage point along the tunnel centreline and stored in this model.*

*If **blank**, no strings of the tunnel profiles are created.*

Model for longitudinal strings model box

*if **not blank**, strings are created by joining common vertices of the profiles along the tunnel centreline and stored in this model.*

*If **blank**, no longitudinal strings are created.*

Colour of strings colour box available colours

colour of the profiles and longitudinal strings.

Model for trimesh model box

*if **not blank**, a trimesh is created for the tunnel and placed in this model.*
*If **blank**, no trimesh is created.*

Colour of trimesh colour box available colours

colour of the trimesh.

Mesh, form end caps? tick box

*if **ticked**, the trimesh includes a mesh over each end of the tunnel. This creates a closed trimesh. A volumes is calculated and reported in a String inquire on a closed trimesh.*

*If not **ticked**, the trimesh ends are left open. A volumes is NOT reported in a String inquire on an open trimesh.*

Colour of endcap colour box available colours

colour of the endcap.

Clean models? tick box

*if **ticked** the profile and longitudinal strings, and trimesh models are cleaned before the new strings and trimesh are created.*

Start/End 2d control chainage real box

the Start/End 2d chainage on the centreline to create the trimesh, longitudinal strings and profile strings for.

Chainage Inc real box

the chainage increment to create the sections and vertices of the strings at. Whether the chainage is 2d or 3d is defined in the Tunnel Definition File.

Profile Straight/Arc Inc% real box

this defines how often vertices are generated around the tunnel profiles between the vertices of the tunnel profile, and hence how may vertices are created in the sections, how many longitudinal strings and the density of triangles in the trimesh.
*The value is a percentage to the length of the tunnel profile and for each tunnel section, vertices are generated at each of the defining vertices of the tunnel profile, and then at the **Profile Straight/Arc Inc%** distance between adjacent defining vertices of the tunnel profile.*
*Hence the **Profile Straight/Arc Inc%** options control the accuracy of the shapes generated for the tunnel - straights and arcs are detected, and defined values assigned accordingly.*
***Note** - the values **Profile Straight/Arc Inc%** give a good approximation to the number of vertices are created on each section but there may be a few more because all the defining vertices of the profile as in the sections. So if **Profile Straight/Arc Inc%** is 5 then there will be approximately 20 vertices on each section.*

Create button

create the tunnel profile strings, longitudinal strings, and trimesh.

20.12.3 Create Combined Tunnel

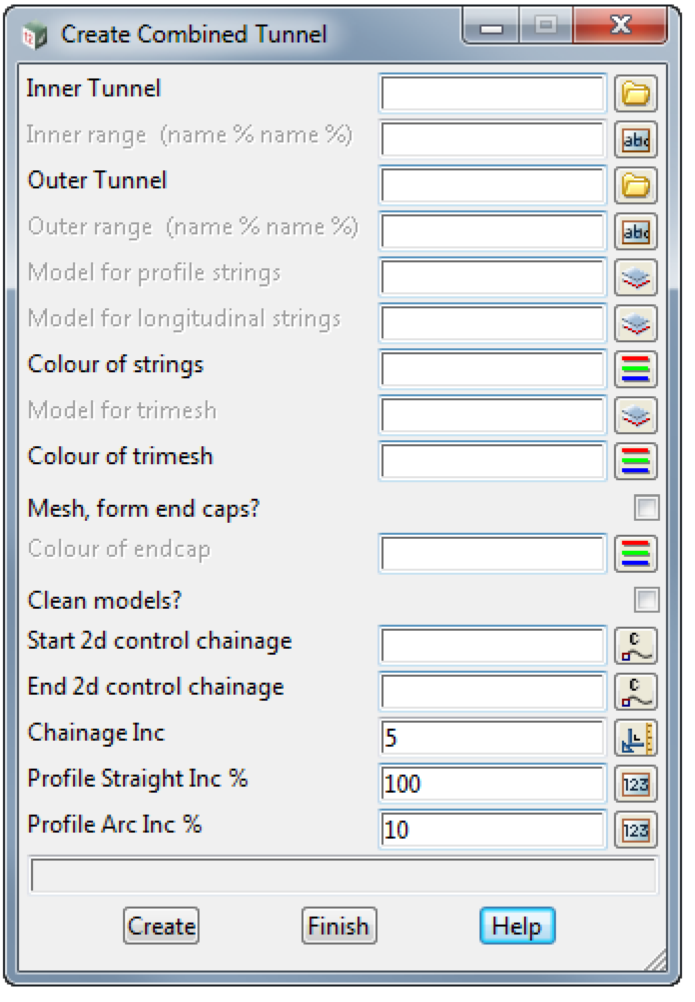
Position of option on menu: **Design =>Tunnel-Structures =>Create combined tunnel**

CURRENTLY A WORK IN PROGRESS

The **Create Combined Tunnel** panel is used to

The tunnel is defined in a ***Tunnel File*** that has been created in the **Create/Edit Tunnel File** panel.

Selecting **Create combined tunnel** brings up the **Create CombinedTunnel** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Inner Tunnel	tunnel file box		available 12d_tunnel files
Inner range (name % name %	name box		
Outer Tunnel	file box		
Outer range (name % name %)	name box		
Model for profile strings	model box		

*if **not blank**, a string of the tunnel profile is created at each chainage point along the tunnel centreline and stored in this model.*

*If **blank**, no strings of the tunnel profiles are created.*

Model for longitudinal strings model box

*if **not blank**, strings are created by joining common vertices of the profiles along the tunnel centreline and stored in this model.*

*If **blank**, no longitudinal strings are created.*

Colour of strings colour box available colours

colour of the profiles and longitudinal strings.

Model for trimesh model box

*if **not blank**, a trimesh is created for the tunnel and placed in this model.*

*If **blank**, no trimesh is created.*

Colour of trimesh colour box available colours

colour of the trimesh.

Mesh, form end caps? tick box

*if **ticked**, the trimesh includes a mesh over each end of the tunnel. This creates a closed trimesh. A volumes is calculated and reported in a String inquire on a closed trimesh.*

*If not **ticked**, the trimesh ends are left open. A volumes is NOT reported in a String inquire on an open trimesh.*

Colour of endcap colour box available colours

colour of the endcap.

Clean models? tick box

*if **ticked** the profile and longitudinal strings, and trimesh models are cleaned before the new strings and trimesh are created.*

Start/End 2d control chainage real box

the Start/End 2d chainage on the centreline to create the trimesh, longitudinal strings and profile strings for.

Chainage Inc real box

the chainage increment to create the sections and vertices of the strings at. Whether the chainage is 2d or 3d is defined in the Tunnel Definition File.

Profile Straight/Arc Inc% real box

this defines how often vertices are generated around the tunnel profiles between the vertices of the tunnel profile, and hence how may vertices are created in the sections, how many longitudinal strings and the density of triangles in the trimesh.

*The value is a percentage to the length of the tunnel profile and for each tunnel section, vertices are generated at each of the defining vertices of the tunnel profile, and then at the **Profile Straight/Arc Inc%** distance between adjacent defining vertices of the tunnel profile.*

*Hence the **Profile Straight/Arc Inc%** options control the accuracy of the shapes generated for the tunnel - straights and arcs are detected, and defined values assigned accordingly.*

***Note** - the values **Profile Straight/Arc Inc%** give a good approximation to the number of vertices are* *created on each section but there may be a few more because all the defining vertices of the profile as in the sections. So if **Profile Straight/Arc Inc%** is 5 then there will be approximately 20 vertices on each section.*

Create button

create the tunnel profile strings, longitudinal strings, and trimesh.

20.12.4 Conform Tunnel

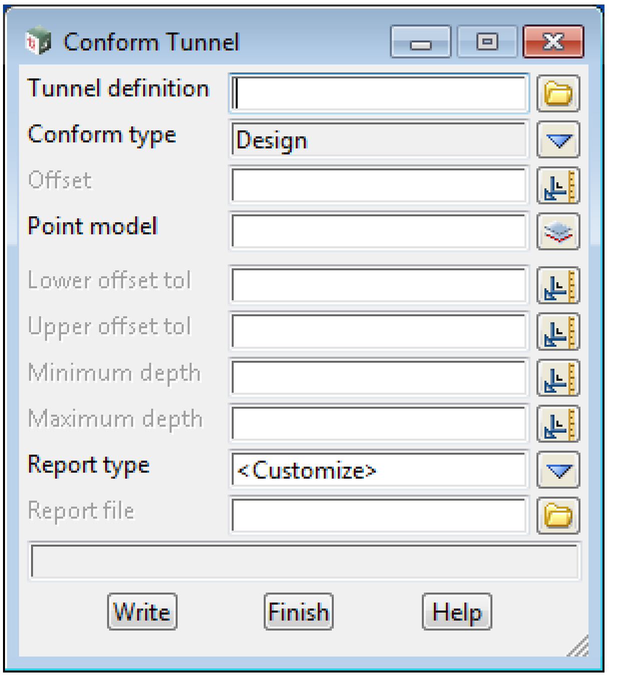
Position of option on menu: **Design =>Tunnel-Structures =>Conform Tunnel**

CURRENTLY A WORK IN PROGRESS

The **Conform Tunnel** panel creates a conformance report between points and a tunnel.

The tunnel is defined in a ***Tunnel definition*** file that has been created in the **Create/Edit Tunnel File** panel.

Selecting **Conform Tunnel** brings up the **Conform Tunnel** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tunnel definition	tunnel file box		available 12d_tunnel files

the tunnel file containing all the definitions for the tunnel. That is, the tunnel centreline, the tunnel profiles and which profiles and how often they are applied along the centreline of the tunnel.

Conform type	choice box		
Offset	measure box		
Point model	model box		
Lower offset tol	measure box		
Upper offset tol	measure box		
Minimum depth	measure box		
Maximum depth	measure box		

Report type choice box

Report file file box

Write button

create the tunnel conformance report.

20.12.5 Conform Plot Tunnel

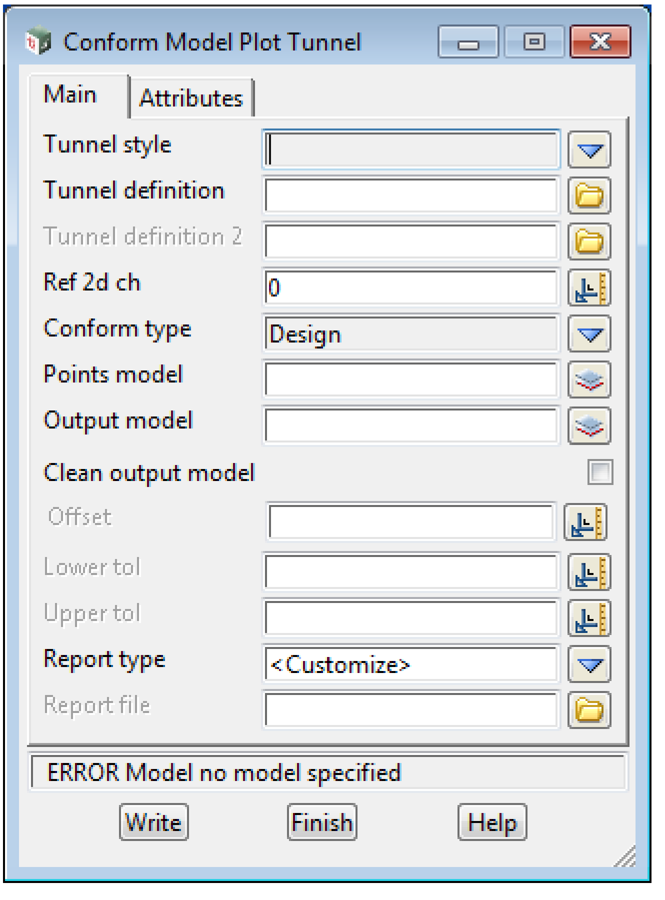
Position of option on menu: **Design =>Tunnel-Structures =>Conform plot tunnel**

CURRENTLY A WORK IN PROGRESS

The **Conform Model Plot Tunnel** panel creates a conformance plot for a tunnel.

The tunnel is defined in a ***Tunnel definition*** file that has been created in the **Create/Edit Tunnel File** panel.

Selecting **Conform plot tunnel** brings up the **Conform Model Plot Tunnel** panel

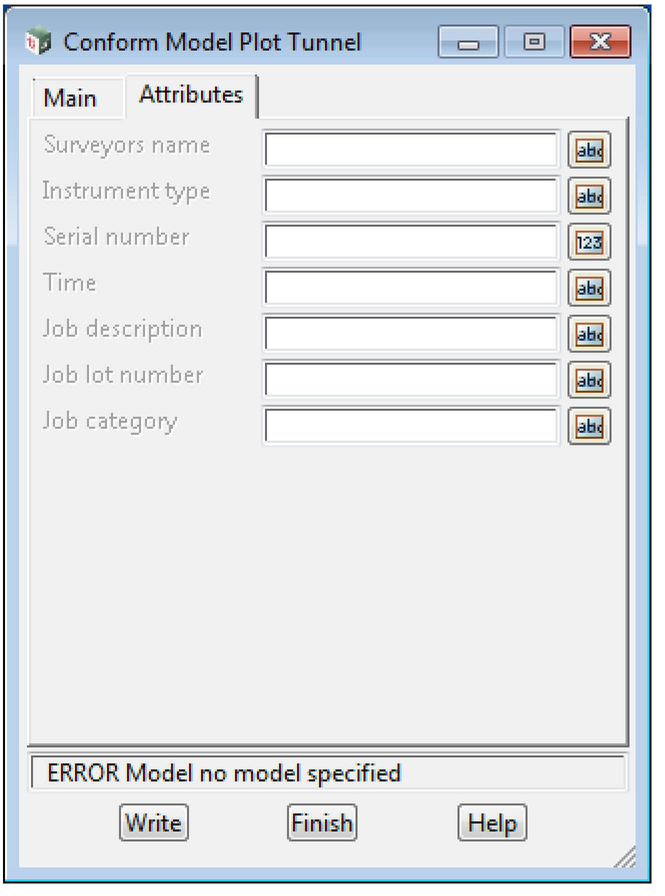


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tunnel definition	tunnel file box		available 12d_tunnel files

the tunnel definition file containing all the definitions for the tunnel. That is, the tunnel centreline, the tunnel profiles and which profiles and how often they are applied along the centreline of the tunnel.

Field Description	Type	Defaults	Pop-Up
Point model	model box		



Write button

create the tunnel conformance plot.

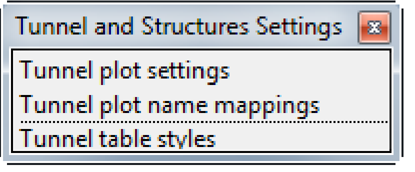
20.12.6 Plot Settings

Position of menu: **Design =>Tunnel-Structures =>Plot settings**

CURRENTLY A WORK IN PROGRESS

The **Plot Settings** options define the look of the tunnel conformance plot.

The **Plot Settings** menu is:



See

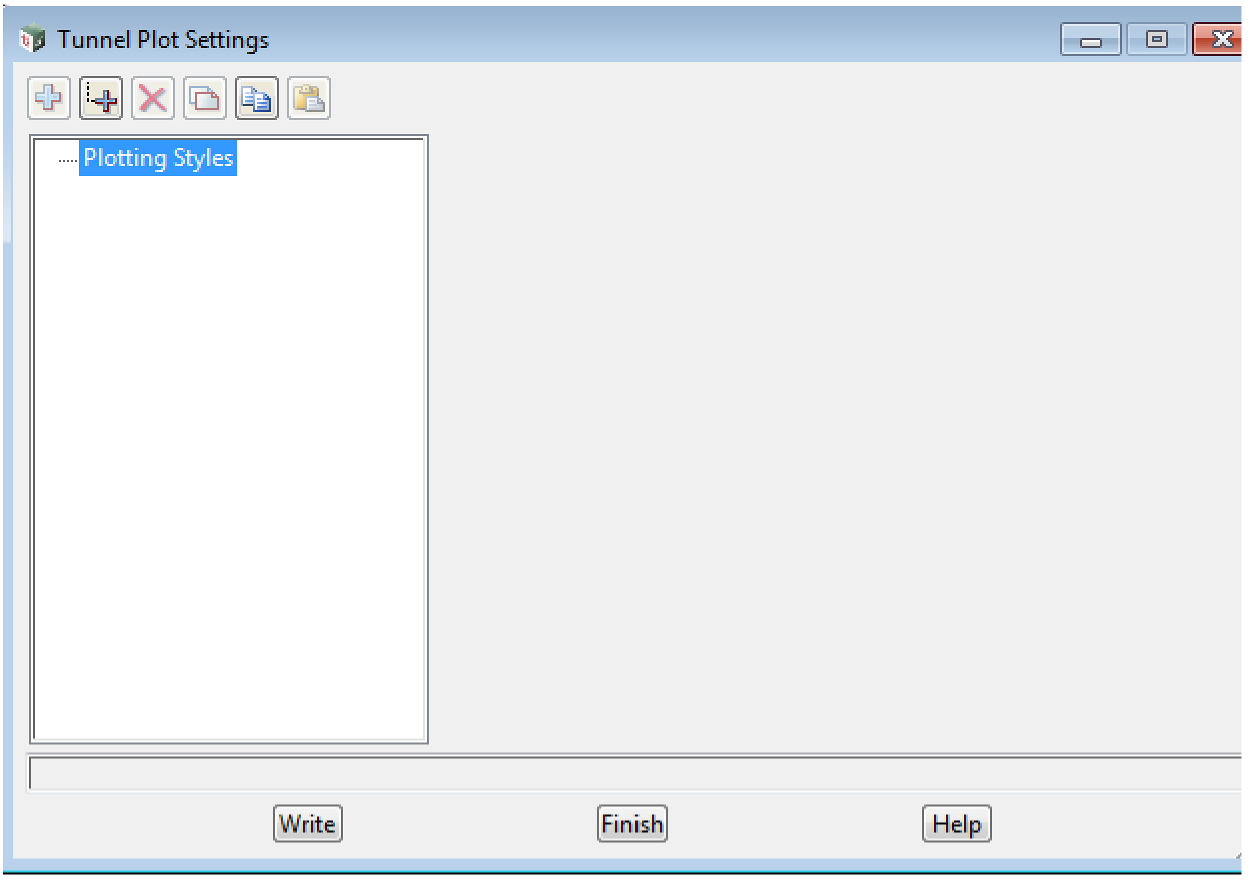
20.12.6.1 Tunnel Plot Settings
20.12.6.2 Tunnel Plot Name Mappings
20.12.6.3 Tunnel Table Styles

20.12.6.1 Tunnel Plot Settings

Position of option on menu: **Design =>Tunnel-Structures =>Plot settings =>Tunnel plot settings**

CURRENTLY A WORK IN PROGRESS

Selecting **Tunnel plot settings** brings up the **Tunnel Plot Settings** panel



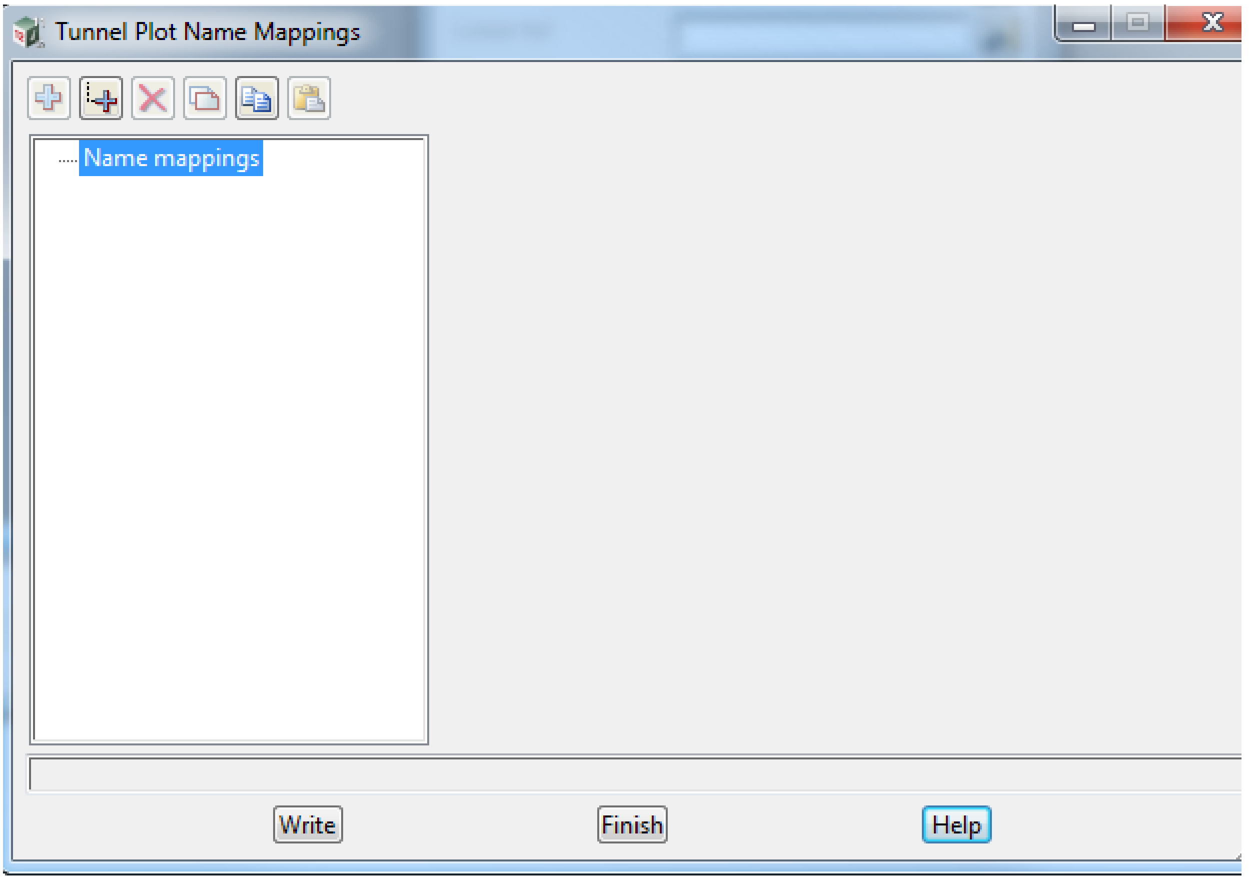
20.12.6.2 Tunnel Plot Name Mappings

Position of option on menu:

Design =>Tunnel-Structures =>Plot settings =>Tunnel plot name mappings

CURRENTLY A WORK IN PROGRESS

Selecting **Tunnel plot name mappings** brings up the **Tunnel Plot Name Mappings** panel



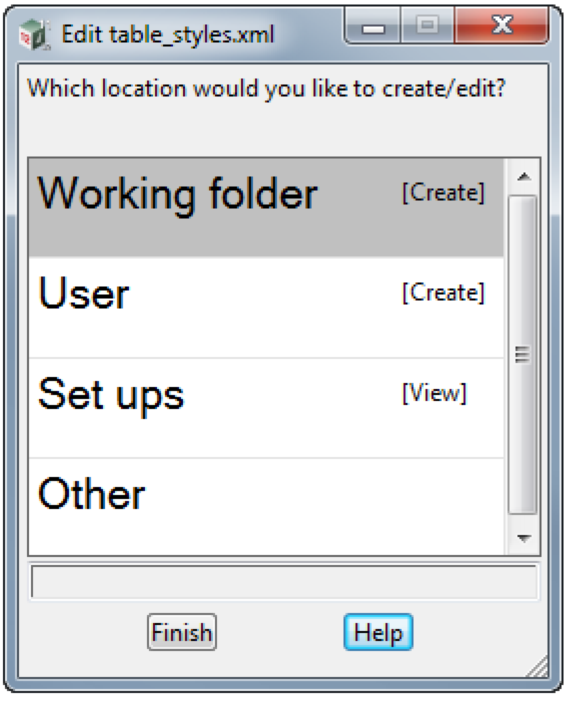
20.12.6.3 Tunnel Table Styles

Position of option on menu:

Design =>Tunnel-Structures =>Plot settings =>Tunnel table styles

CURRENTLY A WORK IN PROGRESS

Selecting **Tunnel table styles** brings up the **Edit tables_styles.xml** panel



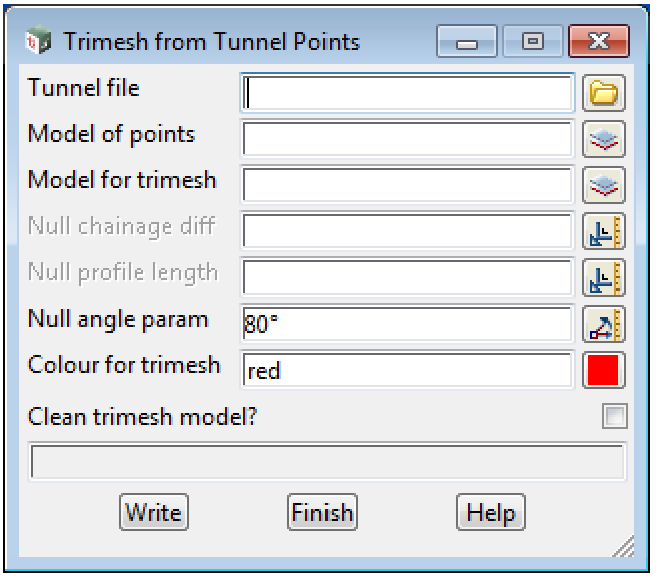
20.12.7 Trimesh from Tunnel Points

Position of option on menu: **Design =>Tunnel-Structures =>Trimesh from tunnel points**

Trimesh from tunnel points takes points that are approximately on the tunnel surface (usually survey shots of the surface of the tunnel), and creates a trimesh from them.

The tunnel itself is defined in a ***Tunnel File*** that has been created in the **Create/Edit Tunnel File** panel. See 20.12.1 Creating/Editing a Tunnel Definition File.

Selecting **Trimesh from tunnel points** brings up the **Trimesh from Tunnel Points** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tunnel file	tunnel file box		available 12d_tunnel files

the tunnel file containing all the definitions for the tunnel. That is, the tunnel centreline, the tunnel profiles and which profiles and how often they are applied along the centreline of the tunnel.

Model of points	model box		available models

the model of points that are approximately on the tunnel surface.

Model for trimesh	model box		available models

model for the created trimesh.

Null chainage diff	real box		

a triangle in a trimesh has an ***outside edge*** *if that edge of the triangle has no adjacent triangle in the trimesh. A triangle in the trimesh with an outside edge is called an* ***outside triangle****.*

Any triangle in the created trimesh that has an outside edge whose difference in the chainages of the two ends of the edge dropped onto the tunnel alignment, is greater than **Null chainage diff***, will be nulled.*

This is used for cleaning up triangles on the edge of the trimesh going along the length of the tunnel.

Null angle param	real box		

*a triangle in a trimesh has an **outside edge** if that edge of the triangle has no adjacent triangle in the trimesh. A triangle in the trimesh with an outside edge is called an **outside triangle**.*

Any outside triangle in the created trimesh whose angle of its normal is greater than the angle of the normal to the tunnel (at the first vertex of the triangle), is greater than **Null angle param** *will be nulled.*

This is useful for cleaning up the end caps, and edge triangles that deviate too much from the direction along the length of the tunnel.

Null profile length real box

*a triangle in a trimesh has an **outside edge** if that edge of the triangle has no adjacent triangle in the trimesh. A triangle in the trimesh with an outside edge is called an **outside triangle**.*

Any outside triangle in the created trimesh with an outside edge whose difference in the profile distance of the two ends of the edge dropped onto the profile around the tunnel, is greater than **Null profile length***, will be nulled.*

This should not be needed too often because **Null chainage diff** *and* **Null angle param** *would generally do the job. Also if there is a radical change in profile across this mesh face then this nulling may not work as intended.*

Colour for trimesh colour box available colours

colour of the trimesh.

Clean trimesh model? tick box

if ticked the model for the trimesh is cleaned before the new trimesh is created.

Create button

create the trimesh from the points.

20.12.8 Tunnel Filter Data

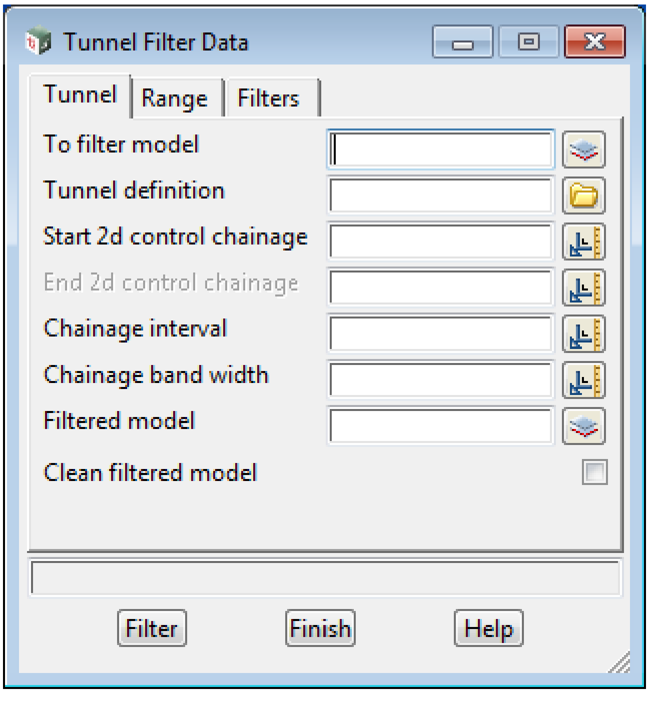
Position of option on menu: **Design =>Tunnel-Structures =>Tunnel filter data**

CURRENTLY A WORK IN PROGRESS

Tunnel Filter Data takes

The tunnel itself is defined in a ***Tunnel File*** that has been created in the **Create/Edit Tunnel File** panel. See 20.12.1 Creating/Editing a Tunnel Definition File.

Selecting **Tunnel filter data** brings up the **Tunnel Filter Data** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tunnel tab			
To filter model	model box		available models

20.13 Overlay

Position of menu: **Design =>Overlay**

The overlay options are for the design and optimisation of pavement overlay design.

The **Overlay** options is available to all users with the **Detailed Alignment Design** and **Volumes** modules.

The **Optimal Overlay** is under development and has not been released.

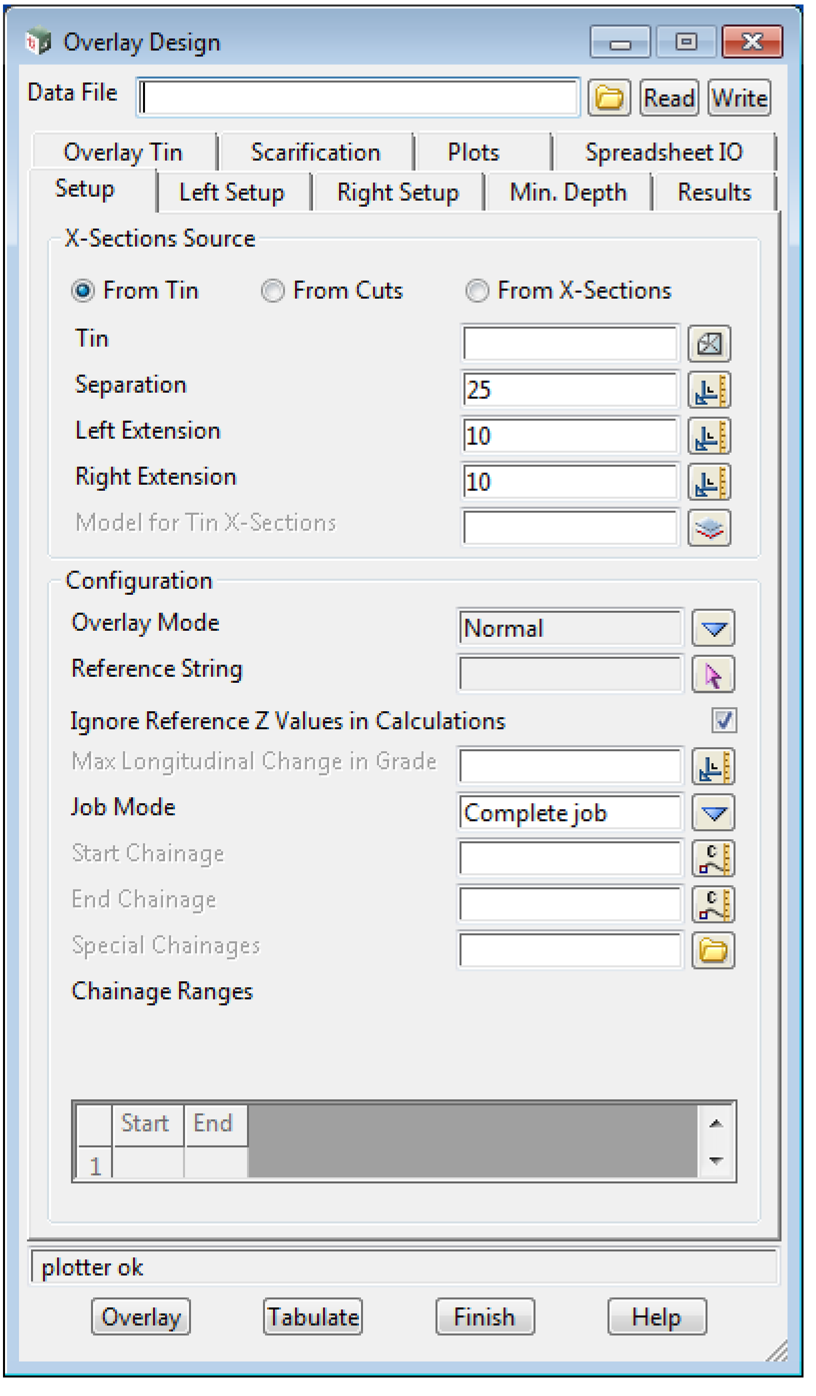
The **Overlay** walk-right menu is

For the option *Overlay*, please continue to the section 20.13.1 Overlay Design

20.13.1 Overlay Design

Position of option on menu: **Design =>Overlay =>Overlay design**

Selecting **Overlay** brings up the **Overlay Design** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data file	file box		*.ovd files

file with all the settings used in the Overlay panel. Used for storing information between runs.

Read	button		

read in a data file of settings for the panel

Write button

write out a data file of the settings in the panel

Buttons at bottom of panel

Overlay button

run the overlay.

Setup

Radio buttons

radio buttons to define how cross sections for existing road are produced

From Tin radio button

*if **selected**, the road x-sections are created by taking sections though a tin. The following fields are displayed*

Tin tin box available tins

sections are created through this tin to represent the existing road

Separation input

chainage distance between cross sections

Left/Right extension input

Left/Right distance to define the limits of the cross sections

Model for tin x-sections model box available models

model for the created cross sections

From Cuts radio button

*if **selected**, the road x-sections are created by taking cuts through strings. The following fields are displayed*

Strings model model box available models

sections are created by taking cuts through the strings in this model

Separation input

chainage distance between cross sections

Model for cuts model box available models

model for the created cross sections

From X-sections radio button

*if **selected**, the road x-sections already exist. The following fields are displayed*

X-sections model model box available models

existing model of x-sections to use for the road

Overlay mode choice box Normal Normal, Use Crossfalls Only
Use Reference Z Values and Crossfalls only

*if **Normal**, at each section the left/right z-value is calculated so that the left/right crossfall and minimum overlay is obeyed. The z-value for the section is the maximum of the calculated z-values for the left and right.*

*If **User Crossfalls only**, the crossfalls from the Left and Right Setups tabs are used and no minimum* *overlay applied.*

*If **Reference Z values and Crossfalls only**, no overlay calculations are performed and the crossfalls in the Left and Rights Setups tabs are applied to the actual z-values on the reference string.*

Reference string string select box

select the string for the centreline of the road

Ignore reference z values in calculations tick box

if not ticked, when the z-value is calculated at each section obeying just the minimum overlay criteria then use the maximum of the and the calculated z-value and the reference z-value at that section.

If ticked, use the calculated z-value at each section.

Start chainage input

chainage to start the overlay calculations

End chainage input

chainage to end the overlay calculations

Special chainages file box

special chainage file to define additional cross sections for overlay processing

Left/Right Setup tab

setup for the left/right side sections

Radio buttons

radio buttons to define how cross sections for existing road are produced

By offset radio button

*if **selected**, the width of the left/right cross sections is given in the **Offset** field*

Offset input

left/right offset distance to define the edge of the left/fight section

By String radio button

*if **selected**, the width of the left/right cross section is defined by a selected **Edge** string minus the **Cut Back/Extension** value. The following fields are displayed*

Edge string string select

select the left/right edge string

Cut Back/Extension input

value to subtract from the distance to the edge string to define the left/right section

*When **By String** is selected, the Chainage-Minimum X-Fall grid can also be automatically filled in by using the crossfall between the **Road Crown** and the **Edge String**.*

Road crown string select

*select the road crown the use for calculating the cross fall to the **Edge string***

Only critical points tick box

*if ticked, the crossfall between the **Road crown** and the **Edge string** is only calculated at the tangent points of the Reference string**.***

*If not ticked, the crossfall between the **Road crown** and the **Edge string** is calculated at the regular* *interval given by **Xfall Load Interval** and also at the tangent points of the Reference string.*

Xfall load interval input

regular interval to calculate crossfall

Load Xfalls from Strings button

*when selected, the **Chainage-Minimum X-Fall** grid is automatically filled in by using the crossfall between the **Road Crown** and the **Edge String***

By name radio button

*if **selected**, the width of the left/right cross section is defined by the name of a given string minus the **Cut Back/Extension** value. The following fields are displayed*

Name

name of the string to select as the left/right edge string

Cut Back/Extension input

value to subtract from the distance to the edge string to define the left/right section

Default Xfall input

*if **non blank**, the default crossfall to use for the left/right cross section.*

*If **blank**, the **Chainage-Minimum X-fall** grid is used.*

Chainage- Minimum Xfall grid

*this grid is only used if the **Default Xfall** is **blank***

Chainage input

chainage to use the Min xfall

Min X-fall input

minimum X-fall to use at that chainage

Min. Depth tab

there can be one minimum depth value for the entire job or the minimum depth can vary between chainages

Default depth input

*if **non blank**, the default minimum depth to use for the left and right cross section.*

*If **blank**, the **Chainage-Minimum Depth** grid is used.*

Chainage- Minimum Depth grid

*this grid is only used if the **Default depth** is **blank***

Chainage input

chainage to start the minimum depth

Min Depth input

*minimum depth to start at this chainage and either go to the next chainage **or** if there is a **Min Depth 2**, interpolate to Min Depth 2 from this chainage to the next chainage*

Min Depth 2 input

minimum depth to end with at the next chainage

Results tab

Transfer Z-values to reference string tick box

if ticked, the calculated z-values are used to update the z-values on the reference string

Clean models before overlay tick box

if ticked, the models of results are cleaned before the overlay option is run

Model for overlay x-sections model box available models

model for the created overlay x-sections

Model for overlay strings model box available models

model for the created overlay strings

Colour colour box available colours

colour for the created overlay strings

Model for xfall strings model box available models

*if **non blank**, left and right strings with z-value equal to the left/right crossfall are created and placed in this model*

Model for min/max points model box available models

*if **non blank**, points for the minimum and the maximum of the calculated z-values for the left and right sections are created and placed in this model*

X-sections depth range file file box available depth range files

a depth range file used for colouring x-sections by the depth between the overlay and the road tin

Overlay report file box *.rpt files

report on the overlay

Volumes report file box *.rpt files

volumes of overlay report

Write volumes as CSV tick box

if ticked, the volume report is written as a CSV file (for Excel(

Overlay Tin tab

*the **Overlay Tin** tab controls the creation of an overlay tin and depth polygons*

Create overlay tin tick box

if ticked, the fields in this tab are used to create an overlay tin

Tin name tin box available tins

name for the tin created from the overlay strings and sections

Tin colour colour box available colours

colour of the overlay tin

Model for tin model box available models

model for the overlay tin

Create depth polygons tick box

if ticked, depth polygons are created between the road tin and the overlay tin

Depth range file file box *.drf files

depth range file used when creating polygons

Model for depth polygons model box available models *model for the depth polygons*

Scarification tab

*the **Scarification** tab controls any scarification to be applied to the road sections before calculating overlays*

Perform scarification tick box

if ticked, scarification is performed on the road sections before overlay is calculated

Model for scarified x-sections model box available models

*if **non blank**, road x-sections after scarification are created and placed in this model*

Colour colour box available colours

colour of the scarified sections

Clean scarification x-sections model tick box

if ticked, the clean the model of scarified sections before running calculations

Default scarification depth input

*if **non blank**, the default scarification depth to use for road cross section.*

*If **blank**, the **Overlay-Depth** grid is used.*

Chainage- Minimum Depth grid

*this grid is only used if the **Default scarification depth** is **blank***

Chainage input

chainage to start the scarification depth

Depth input

*scarification depth to start at this chainage and either go to the next chainage **or** if there is a **Depth 2**, interpolate to Min Depth 2 from this chainage to the next chainage*

Depth 2 input

scarification depth to end with at the next chainage

Plots tab

Generate long section plots tick box

if ticked, long section plots are created

Long section PPF file box *.lplotppf files

binary ppf file to use for the long section plots

Plotter type plotter box model available plotters

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box

*if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created*

Generate cross section plots tick box

if ticked, cross section plots are created

Cross section PPF file box *.lplotppf files

binary ppf file to use for the cross section plots

Plotter type plotter box model available plotters

type of plotter to use for the cross section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model beforehand tick box

*if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created*

20.14 X-Sections

Position of menu: **Design =>X-Sections**

Cross sections can be created in a variety of ways including

(a) sections through triangulations created with the options in the menu **Tins =>Sections.**

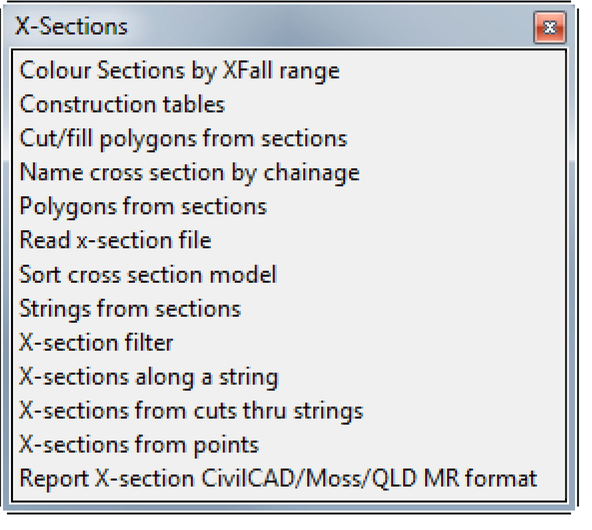
(b) sections generated by cutting through strings with the options **Utilities =>A-G =>Cuts.**

(c) design sections generated from options on the menu **Design =Apply**

(d) sections generated by the end area volumes options **Design =>Volumes =>End area**

The x-sections menu contains options to read cross-sections in from a file and for working with cross sections in a variety of way.

Walking right on **X-Sections** bring up the **X-Sections** menu:



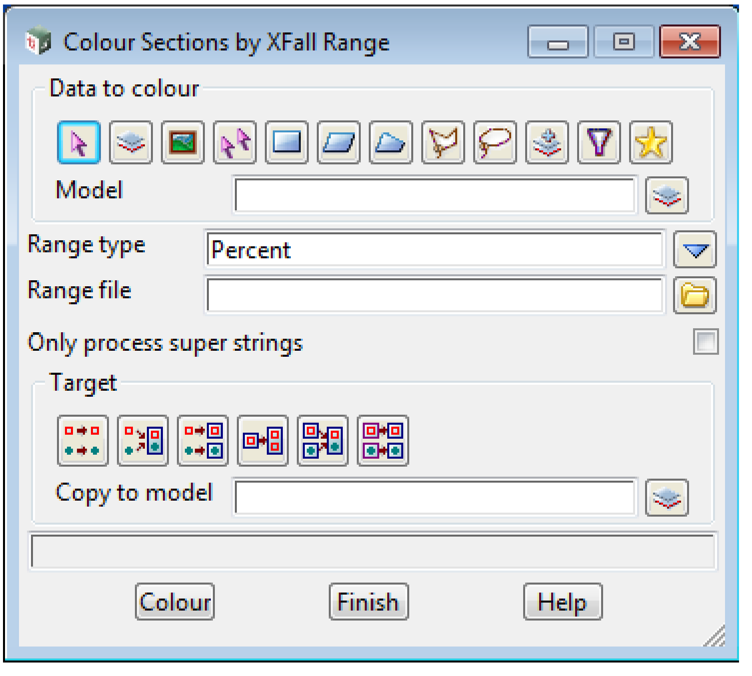
For Colour X-Sections by Xfall range go to	20.14.1 Colour Sections by XFall Range
Construction tables	20.14.2 Construction Tables
Cut/fill polygons from sections	20.14.3 Cut/Fill Polygons from Sections
Name cross sections by chainage	20.14.4 Name Cross Sections by Chainage
. *Polygons from sections*	20.14.5 Polygons from Sections
Read x-section file	20.14.6 Read X-Section Data
Sort cross-section mode	20.14.7 Sort X-Sections in a Model
Strings from sections	20.14.8 Strings from Sections
X-section filter	20.14.10 X Section Filter (Sections at Even Chainages)
X-sections along a string	16.15.4 X-Sections
X-sections from cuts thru strings	28.9.13.2 Cuts by Centreline
X-sections from points	20.14.9 Sections from Points
Report X-section CivilCAD/Moss/QLD MR format	27.11.12 X-Sections Report

20.14.1 Colour Sections by XFall Range

Position of option on menu: **Design =>X-Sections =>Colour X-Sections by Xfall range**
Utilities =>A-G =>Colour X-Sections by Xfall range

This panel will colour the segments of a set of x-sections, based on their x-fall.

Selecting **Colour X-Sections by Xfall range** displays the **Colour Sections by XFall Range** panel.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Data to colour

the set of x-sections to colour.

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data to be processed - for a full description go to 4.19.3 Data Source.

Range type choice box Percent, 1v in, Degrees

the type of range file to use

Range file file

the range file to use for colouring

Only process super strings tick box

whether or not to ignore non super strings

Target

the target for the colour x-sections

Colour button

colours the x-sections

20.14.2 Construction Tables

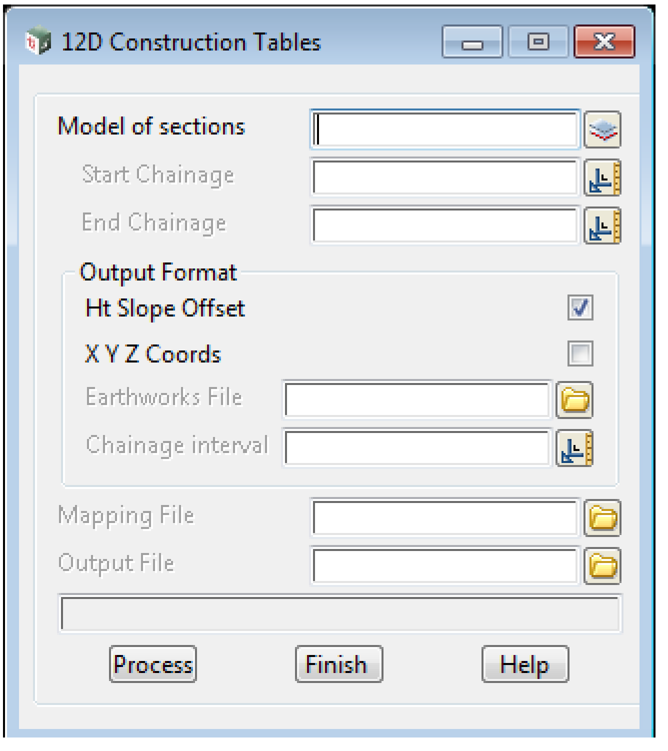
Position of option on menu: Design =>X-Sections =>Construction tables

This option is used to create construction tables from design cross section model.

Output can be in Ht, Slope or xfall, Offset or X,Y,Z.

A volume report file from the Apply MTF road function can be used if Earthworks is required.

Selecting **Construction tables** brings up the **12D Construction Tables** panel:



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of Sections	input		

model name for existing sections

Start Chainage	real		

if blank, means optional and the extents of the sections are used instead

End chainage	real		

if blank, means optional and the extents of the sections are used instead

Output Format

Height Slope Offset	tick	true	
XYZ Coords	tick	false	
Earthworks File	file		

*if non-blank, file from **Apply MTF** is used*

Chainage Interval	real		

if non-blank, value must be a multiple of chainages reported in the earthworks file

Map File	file		

Please refer to the extra help file for details

Output File file

Please refer to the extra help file for details

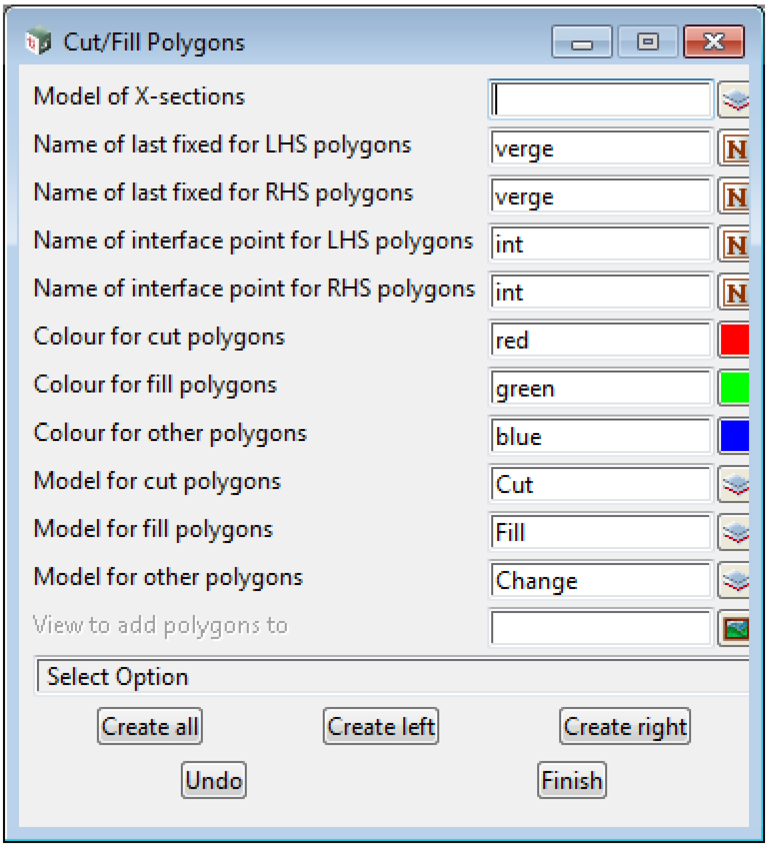
Process button

runs the option

20.14.3 Cut/Fill Polygons from Sections

Position of option on menu: Design =>X-Sections =>Cut/fill polygons from sections

This option takes cross sections and by using the user-supplied names of points on the cross section, cut and fill polygons for the strings joining the named points in successive cross sections.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model of x-sections	model box		available models

model containing the cross sections used to define the cut and fill polygons.

Name of last fixed for LHS polygons	input	verge	

Name of the cross section point to be the inner point of the left hand side polygons.

Name of last fixed for RHS polygons	input	verge	

name of the cross section point to be the inner point of the right hand side polygons.

Name of interface point for LHS polygons	input	int	

name of the cross section point to be the outer point of the left hand side polygons.

Name of interface point for RHS polygons	input	int	

name of the cross section point to be the outer point of the right hand side polygons.

Colour for cut polygons	input	red	available colours

colour for the cut polygons.

Colour for fill polygons	input	green	available colours

colour for the fill polygons.

Colour for other polygons input blue available colours

colour for the polygons that are neither cut or fill – they are either flat or change from cut to fill.

Model for cut polygons input cut available models

model for the cut polygons.

Model for fill polygons input fill available models

model for the fill polygons.

Model for other polygons input other available models

model for the polygons that are neither cut or fill – they are either flat or change from cut to fill.

View to add polygons input available views

if non-blank, the models of polygons are added to the view.

Create all button

run the option and create left and right polygons.

Create left button

run the option and only create the left polygons.

Create right button

run the option and only create the right polygons.

Undo button

undo the last set of polygons created whilst the panel has been up.

Finish button

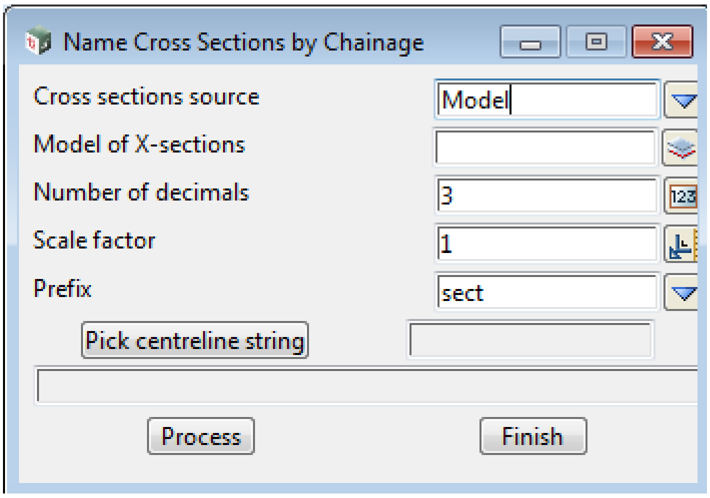
end the option and remove the panel. The undo capability for the polygons is terminated.

20.14.4 Name Cross Sections by Chainage

Position of option on menu: **Design =>X-Sections =>Name cross sections by chainage**

This option names cross-sections with the chainage from a selected string.

Note that the chainage from the string that the cross section comes from is in the name of the cross section so this option effectively gives the chainage to the cross section.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Cross sections source	choice box	model	string, model, view

type of data source.

Model/String/View of x-sections source box

source of the cross section data.

Number of decimals	input box	3

number of decimal places to use in the chainage label.

Scale factor	input box	1

factor to multiply the chainage by before creating the label.

Prefix	choice box	sect	sect, design, none

prefix for the chainage value - for cross-section options to work, this should be sect or design.

Pick centreline string output box

select the string that is used to find a chainage for the cross sections.

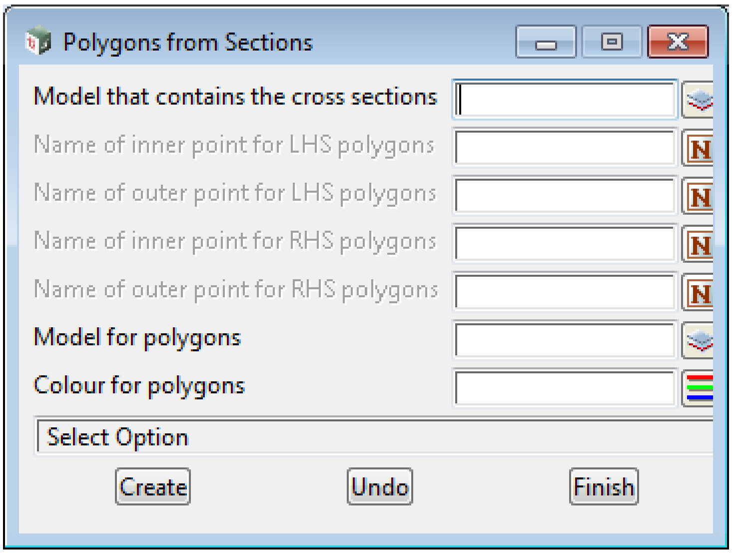
Process button

run the option.

20.14.5 Polygons from Sections

Position of option on menu: **Design =>X-Sections =>Polygons from sections**

Option to take a model of cross-sections and create polygons between specified points on the cross-sections.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Model that contains the cross sections model box

model of cross sections

Name of first/last point for lhs polygons input box

name of the first/last point on left hand side of the cross-section to creating polygon for.

Name of first/last point for rhs polygons input box

name of the first/last point on right hand side of the cross-section to creating polygon for.

Model/colour for polygons input box

model/colour of the created polygons.

Create button

create polygons between the first and last points on the left and right side of the cross-sections.

Undo button

undo the last set of polygons created whilst the panel was up.

20.14.6 Read X-Section Data

Position of option on menu: **Design =>X-Sections =>Read x-section file**

This option is used to read in cross section data from a file and convert it to x-section strings (4d strings).

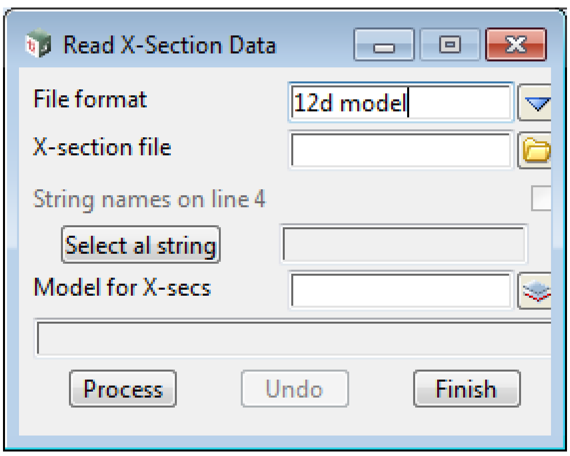
The data in the file is only centre-line chainage values, offset, heights and text (Code) so an alignment string needs to be selected to give an (x,y) position for the centre-line chainage and a direction (at right angles to the alignment string at the chainage) to convert the (offset, height) values into (x,y,z) points on a string.

NOTE - after reading in the x-section data and hence creating 4d strings, the

Design =>X-Sections =>Strings from sections

option can be run to create 3d strings by joining points with the same Code from adjacent x-sections. The created 3d strings are given the string name of the Code that they joined.

Selecting **Read x-section file** brings up the **Read X-Section Data** panel:



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File format	input box	***12d Model***	12d Model, Alg, Moss, Chainage/Offset/Height/ Text

format of the x-section data in the file.

12d Model Format

The 12d Model *format is a simple text file format with the text CH followed by one or more spaces and then the alignment chainage (centre line chainage) of the x-section, and then on the following lines, the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then the text (Code) for that point on the x-section. The x-section continues until the next Ch line. For example, the following defines two x-sections at chainage 10 and 20 respectively.*

ch 10

-3 5 A

0 6 "Second label"

4 7 C

ch 20

-3.5 5.5 A

0 6 D

4.5 7.5 ""

Note that if the Code includes a space, then it must be enclosed in quotes.For example "Second label". Also the Code is not optional - if there is no code, put "".

Chainage/Offset/Height/Text Format

The Chainage/Offset/Height/Tex**t** *format is a very simple text file format with each line containing the alignment chainage (centre line chainage) for the x-section followed by one or more spaces and then on the same line the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then optionally, the text (Code) for that point on the x-section. The x-section continues until the alignment chainage changes. For example, the following defines two x-sections at chainage 10 and 20 respectively.*

10 -3 5 A

10 0 6 "Second label"

10 4 7 C

20 -3.5 5.5 A

20 0 6 D

20 4.5 7.5 E

Note that if the Code includes a space, then it must be enclosed in quotes.For example "Second label". Also the Code is optional (whereas it was compulsory for the **12d Model** *format).*

Moss (MX) Format

Please refer to Moss (MX) documentation or ask the group who supplied the data.

Alg Format

Not documented.

X-section file input box

file of x-section data.

String names on line 4 tick box

ONLY used for the ALG format which is not documented

Select al string string select

select the string that is used to define the (x,y) position of the zero offset of the x-section and also the bearing for the x-section.

Model for x-secs model box available models

model for the created x-sections

Process button

read the file and create the x-sections

Undo button

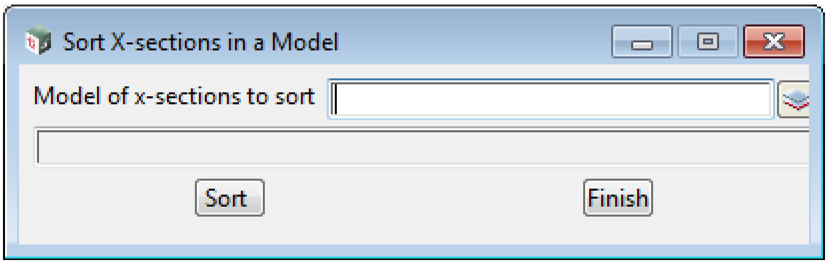
undo the last set of x-sections created since the panel has been active

20.14.7 Sort X-Sections in a Model

Position of option on menu: **Design =>X-Sections =>Sort cross section model**

This option is used to sort cross sections in a model so that they are in the order of the chainages embedded in the cross section name.

Selecting **Sort cross section model** brings up the **Sort X-Sections in a Model** panel:



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of x-sections	model box		available models

model containing the cross sections to be sorted into chainage order.

Sort button

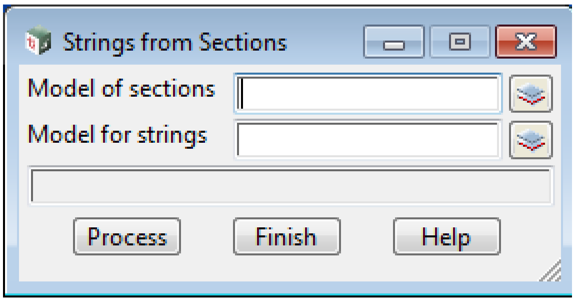
run the option.

20.14.8 Strings from Sections

Position of option on menu: **Design =>X-Sections =>Strings from sections**

The **strings from sections** option creates strings by joining the common named points on successive 4d strings (usually generated as sections).

Selecting **strings from sections** fires up the **strings from sections** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model of sections	input		available models

model of the 4d strings (sections) to try and join common points from to form strings.

Model for string	input		available models

model for the created strings to go to.

Process	button		

try and join points with the same name from successive sections to form strings.

20.14.9 Sections from Points

Position of option on menu: **Design =>X-Sections =>X-sections from points**

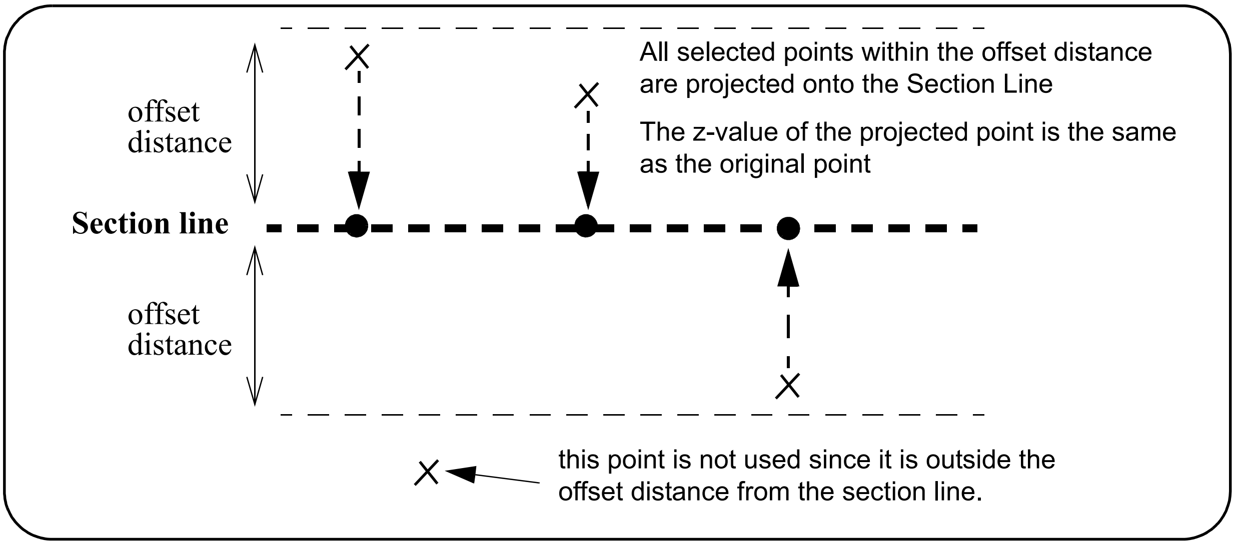
The **X-sections from points** option creates a cross section by first defining s section line and then dropping all selected points in a user defined offset distance from the section line, onto the section line.

(a) The z-value for the dropped point is the same as for the original point.

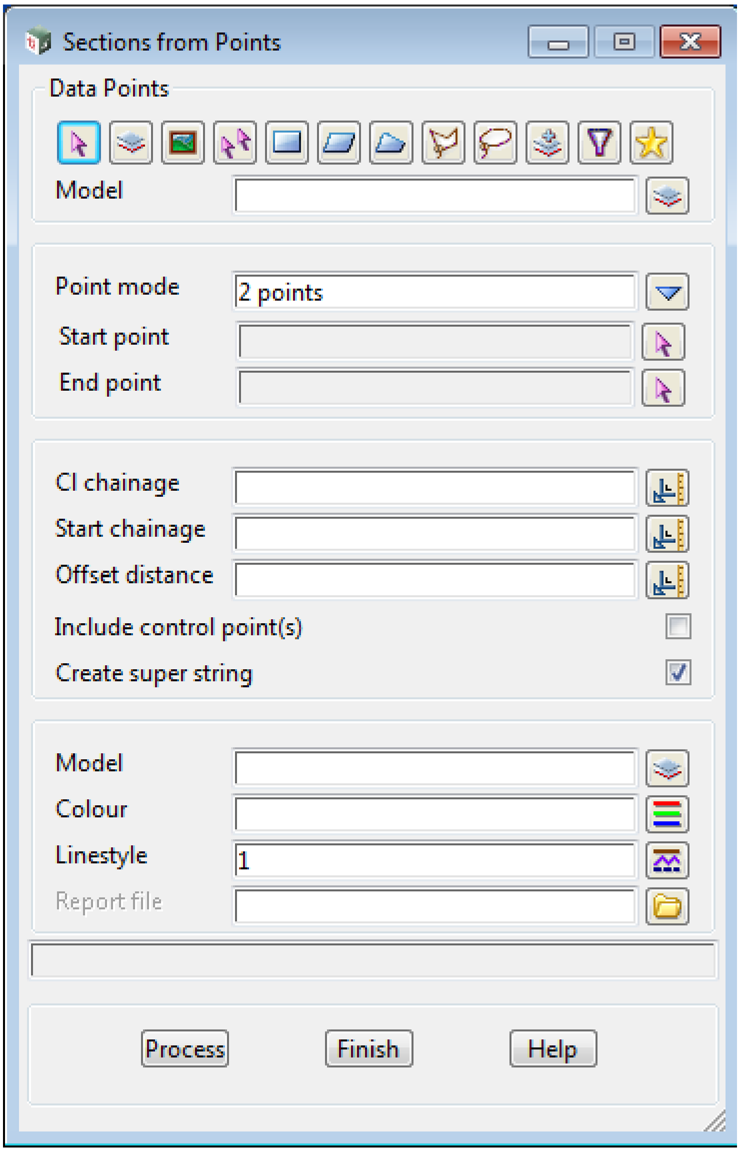
(b) The Point number (Vertex id) of the dropped point is the Point number (Vertex id) of the original point.

(c) The Vertex text of the dropped is the code (string name) of the original point.

The user specifies the start chainage for the created section and the value for the "centreline chainage" of the section.



Selecting **Sections from points** fires up the **Sections from points** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type			

data source type.

Data source

data source for points to create sections from.

Point mode	choice box	2 points	2 points, 1 point and bearing point on centreline

*if **2 points**, then the **Start point** and **End point** are selected. The section goes through the two points.*

*If **1 point and bearing**, then the **Start point** is selected and a **Bearing** given. The section goes through the start point with the given bearing.*

*If **point on centreline**, then a **Centreline** is selected and a **point on the centreline** selected. The section goes through the selected point on the centreline and is perpendicular to the selected centreline at the selected point.*

If Point mode is *2 points*:

Start point	string select	
End point	string select	

If Point mode is *1 point and bearing*:

Start point	string select	
Bearing	angle box	

If Point mode is *point on centreline*

Centreline string select

depends on **Point mode**.

Point on cl string select

depends on **Point mode**.

Cl chainage input

the chainage to give to the created section

Start chainage input

the start chainage to give to the created section.

Offset distance input

distance to search either side of the section for points to project onto the section

Include contrl points (s) tick box

if ticked, the selected start and end points are included as part of the section.

Create super string tick box

if ticked, then the created section is a super string.

Model model box available models

model for created sections.

Colour colour box available colours

colour for the created sections.

Linestyle linestyle box available linestyles

linestyle for the created sections.

Report file file box

a report.

Process button

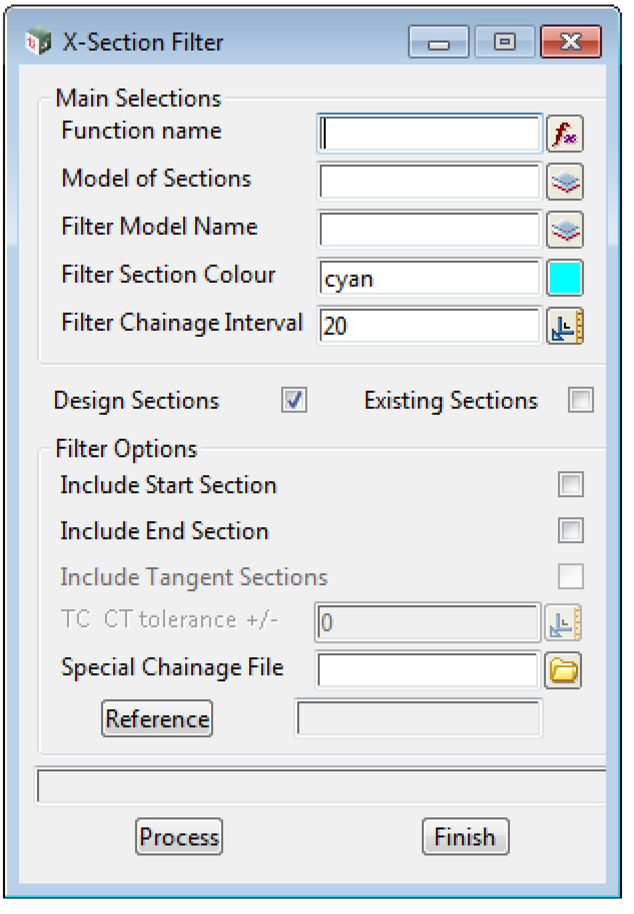
create a cross section from the selected points.

20.14.10 X Section Filter (Sections at Even Chainages)

Position of option on menu: **Design =>X-Sections =>X-section filter**

This panel selects user specified cross-sections from a model of cross-sections and copies them into another model. The cross sections must already exist - no new cross-sections are created.

It is a function so can be recalced when the cross-section model is changed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Function name			

name of the function.

Model of sections	string select		

model of existing cross sections to select some cross sections from.

Filter model name	model box		

model for the selected cross sections

Filter section colour	colour box	cyan	

colour for the filtered cross sections

Filter chainage interval	input	20	

chainage interval to select cross sections. Sections are selected which are multiples of the ***filter chainage interval****.*

Design/Existing sections	radio button	design sections	

cross sections are 3d strings with the name

***Design** and the chainage of the cross-section (usually created by an Apply),*

or ***Sect** and the chainage of the cross-section (usually created by Tins =>Section =>X section)*

*If **Design sections** is selected, then sections starting with the name **Design** are selected.*

*If **Existing sections** is selected, then sections starting with the name **Sect** are selected.*

Include TC_CT sections tick box

if ticked, include cross sections at tangent points from the reference string.

Include start/end section tick box

include a cross section at the start/end chainage of the reference string

TC_CT tolerance +/- input box

*if **non-zero**, then regular cross sections (i.e. those selected by the filter chainage interval) are **not** included if they are closer than the given tolerance distance to a tangent point.*

Special chainage file input box

include cross sections with chainages given in the given special chainage file.

Reference output box

select reference string to use for the filter options requiring tangent points and start/end chainages.

Process button

copy the specified cross-sections to the Filtered Model.

20.14.10.1 X-Sections Along a String

Position of option on menu: **Design =>X-Sections =>X-Sections along a string**

This option has already been documented in **Tins => Sections=> X-Sections**

For the option ***X-Sections along a string***, please continue to the section 16.15.4 X-Sections.

20.14.10.2 X-Sections from Cuts Through Strings

Position of option on menu: **Design =>X-Sections =>X-Sections from cuts thru strings**

This option has already been documented in **Utilities =>A-G =>Cuts =>by centreline**

For more information please go to the section 28.9.13.2 Cuts by Centreline.

20.15 Check/Clash

Position of menu: **Design =>Check/clash**
Utilities =>A-G =>Check/clash

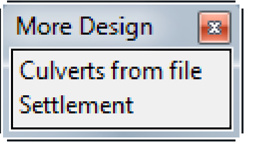
See 28.9.9 Check/Clash in 28 Utilities.

20.16 More Design

Position of menu: **Design =>More**

The **More Design** menu contains extra design options.

The **More Design** walk-right menu is

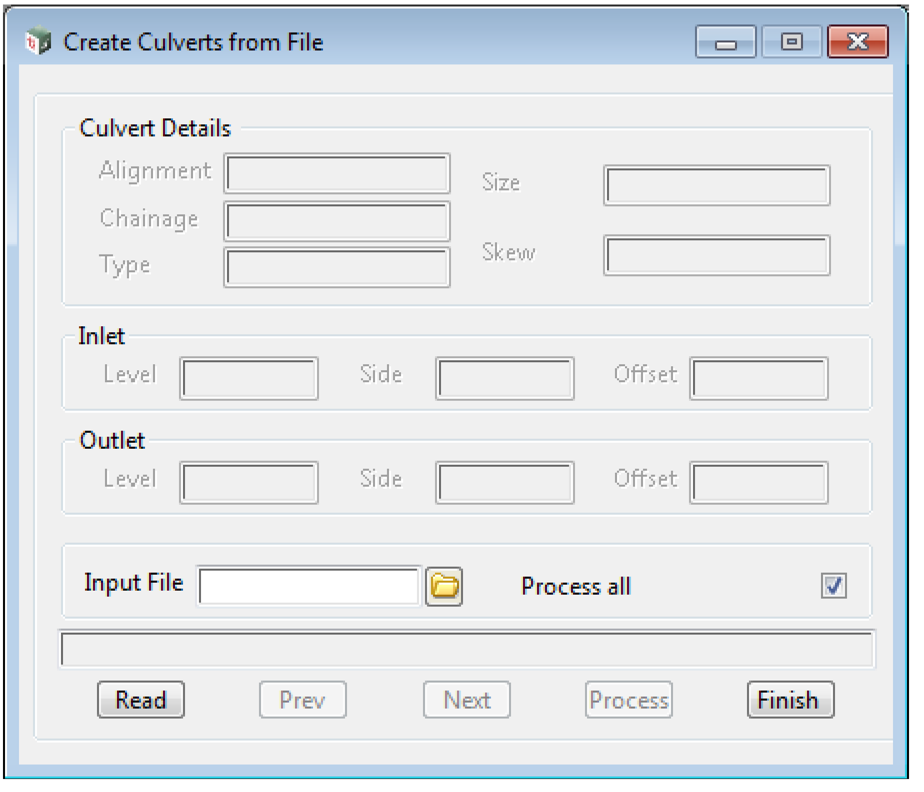


For the option *Culverts from file*, go to 20.16.1 Culverts from File.
Settlement 20.16.2 Settlement

20.16.1 Culverts from File

Position of option on menu: **Design =>More =>Culverts from file**

This option is currently under development.



20.16.2 Settlement

Position of option on menu: **Design =>More =>Settlement**

This option uses a tin of settlement values to adjust the z-values of strings.

The idea behind the option is that a number of string may have been surveyed as well as a number of control points. At a later date, the z-value at the control points is again measured and there is a major difference in the two z-value at each control point due to say settlement (subsidence) of the ground.

A tin of the ***difference*** of the z-values at each control point is called the ***settlement*** tin. The tin is not normally a constant value because *differential settlement* usually occurs. That is, the settlement is *different at each point over the surface*.

The Settlement option can adjust ***all*** the z-values of the selected data by the amount in the settlement tin.

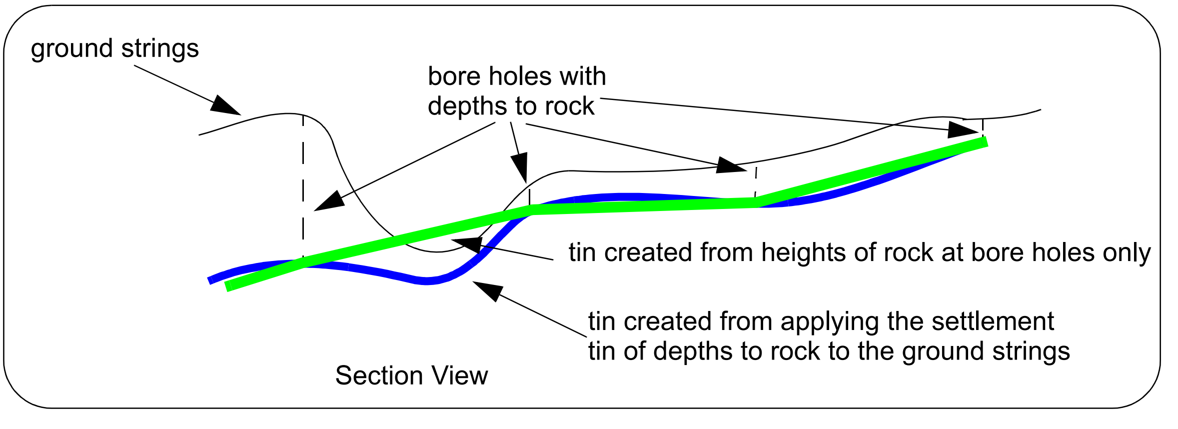
It can be applied to just to the vertices of the strings (mode ***relative points***), or to the vertices and the segments of the strings (mode ***relative string***). In ***relative string*** mode, where ever a segment crosses a triangle of the settlement tin, a new vertex is inserted into the string (with initial z-value interpolated from the adjacent string vertices) and the settlement tin value applied to the new vertex.

The ***settlement tin*** values can be added to, or subtracted from, the string values.

One interesting use of the *Settlement* option is when the settlement tin is constructed from the ***depths*** from the surface to a rock or soil strata (as given from ***bore hole*** logs).

The surface of the rock could be constructed by simply calculating the height of the rock at each bore hole and triangulating the heights. The original surface would have no affect on such a rock surface.

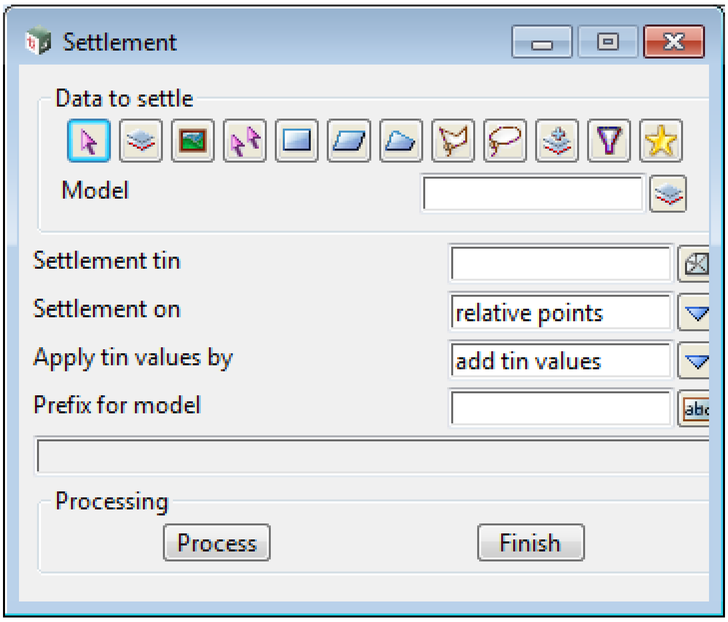
However by applying the ***Settlement*** option to the ground data, using the depths as the settlement tin, and then triangulating the resultant strings to give the rock surface, undulations in the ground data will also be reflected in the rock surface. This is what usually happens when the earth is folded and both surfaces fold in a similar manner.



The Settlement option can also be used ***without*** creating a tin of the difference of the z-values at each control point. A tin can simply be created from ***the new z-values*** of the control points.

In ***absolute points*** mode, each vertex of the strings are given the z-value from the tin. This is the same as draping just the vertices of strings onto a tin (see 16.10.1 Drape)

In ***absolute string*** mode, not only do the string vertices take their z-values from the tin, but where ever a segment crosses a triangle of the tin, a new vertex is inserted into the string and the z-value for the new vertex is taken from the tin. This is the same as a draping the strings onto the tin (see 16.10.1 Drape).



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to settle		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Settlement tin			available tins

tin of values (settlement values) to be used to reduce/increase the z-values of strings by.

Settlement on	choice box	relative points	relative points relative strings absolute points absolute strings

if **Settlement on is:**

relative points *then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point.*

relative string *then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which then has the settlement value applied to it (the initial z-value for the inserted point is interpolated from its adjacent points in the string).*

absolute points *then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point.*

absolute string *then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which is given the settlement value at that point.*

Apply tin values by	choice box	add tin values	add tin values subtract tin values

if "add tin values", then the tin values are added to the string values.

If "subtract tin values", then the tin values are subtracted from the string values.

Prefix for models

prefix to apply to the name of each model in the data source to create new models for the processed data.

Process button

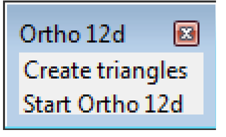
adjust the heights of the selected data.

20.17 Ortho 12d

Position of menu: **Design =>Ortho 12d**

The **Ortho 12d** menu contains the option to write out tins in a format suitable for the *Ortho 32* rectification software.

The **Ortho 12d** walk-right menu is



Continue to the next section 20.17.1 Create Triangles

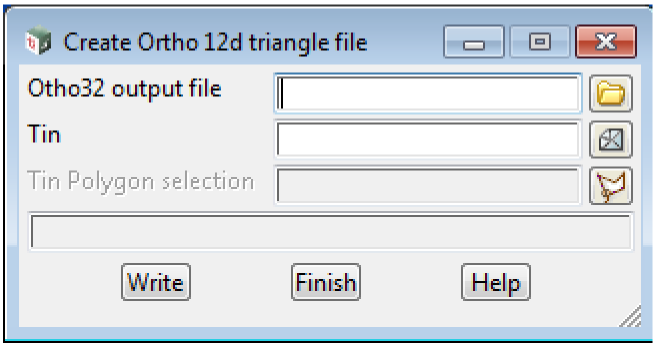
20.17.1 Create Triangles

Position of option on menu: **Design =>Ortho 12d =>Create triangles**

This option writes out a ***12d Model*** tin in a format suitable for the software ***Ortho12d*** software from Digital Mapping Systems (www.digmapsys.com).

Ortho12d is an image rectification package which can be used for ortho-rectifying photographs.

For more information on *Ortho12d*, please contact Ian Hall from Digital Mapping Systems on *ian.hall@digmapsys.com*



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

tin to write out in Ortho12d format

Tin polygon selection	Polygon select box		

if used, only triangles whose centroid is inside the polygon are written out.

Ortho12d output file	file box		*.T12 files

file to write the tin out to

Write	button		

write the tin out in the Ortho12d format

20.17.2 Moved/Reused Documentation

20.17.2.1 New Island Create (Function)

Position of option on menu: **Design =>Roads =>More =>New Island Create (Function)**

This option applies a kerb profile, either from the **12d** library or from a user defined file.

The template profile is applied to a Super Alignment, creating strings, and a triangulation.

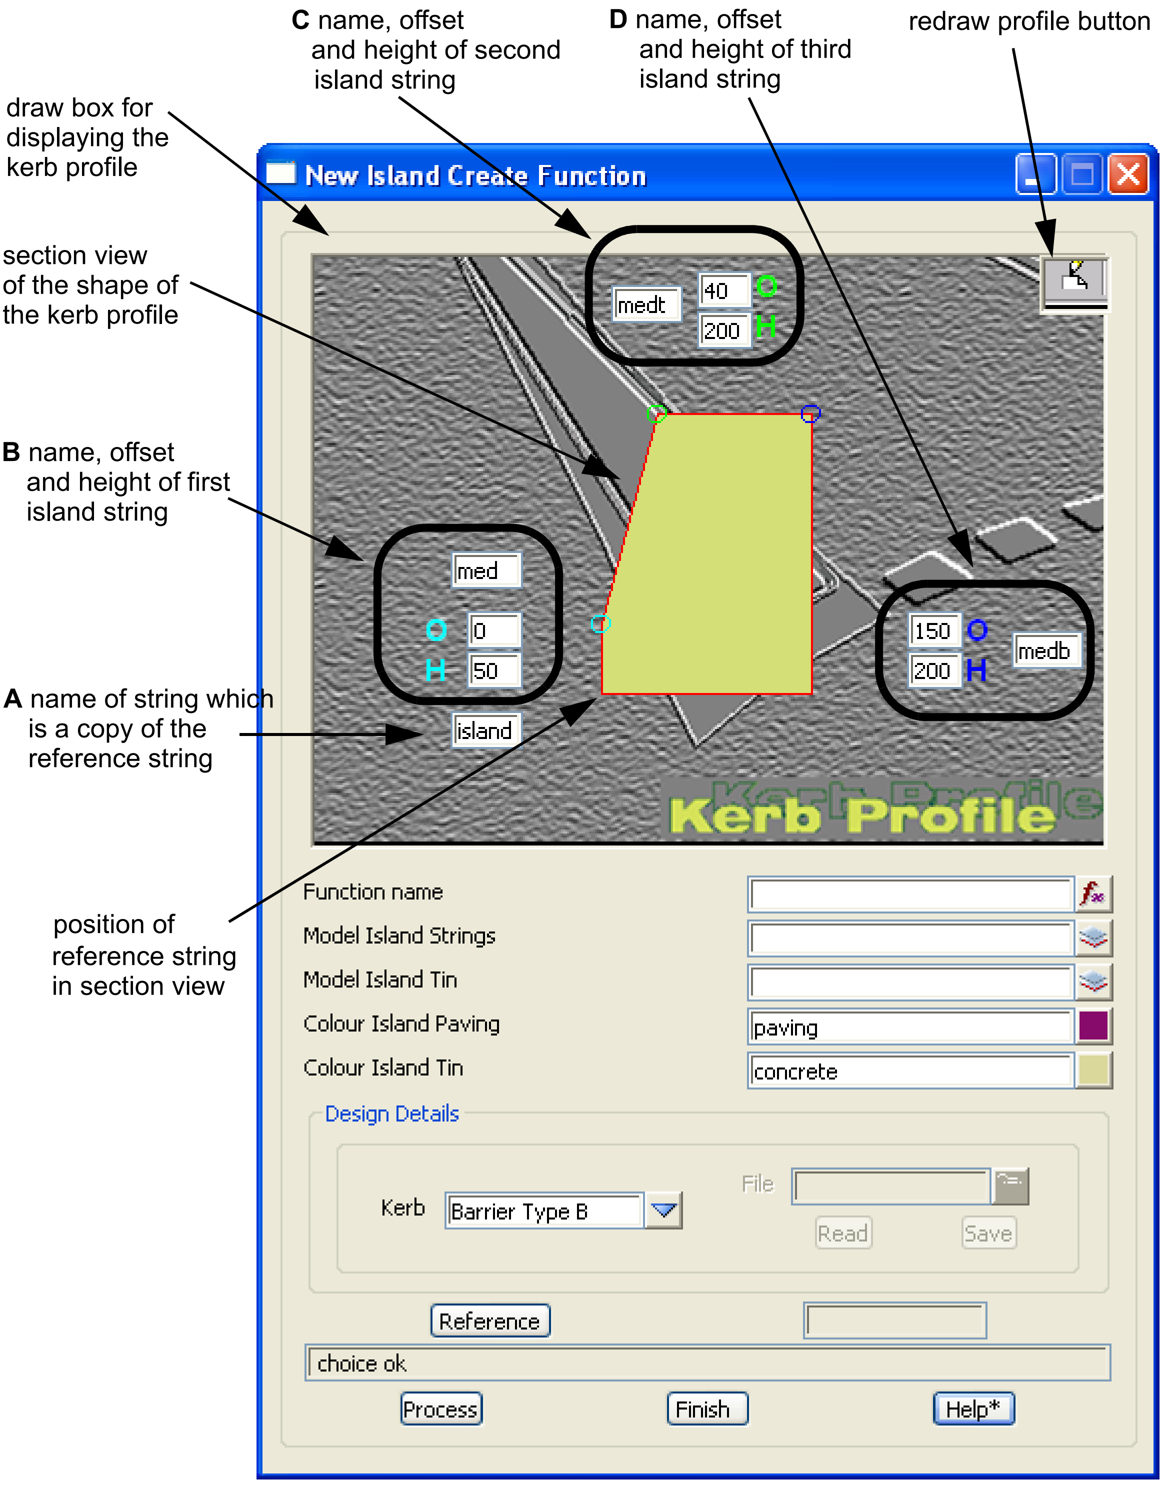
The option is saved as a function within **12d** and as a function can be re-run at any time if changes occur with the Super Alignment.

Some default kerb profiles are available under **Kerb** on the panel.

User defined kerbs are created by entering offset, height and string names in the fields in the draw box at the top of the panel, and then saved as a User Kerb Type file (*.ukt)

User Kerb Type files can then be written out, or read in as required.

On selecting the **New Island Create (Function)** option, the **New Island Create (Function)** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Default Pop-Up

Function name function available functions

name of the Island Create function

Model Island Strings model box available models

model for the created island strings

Model Island Tin	model box		

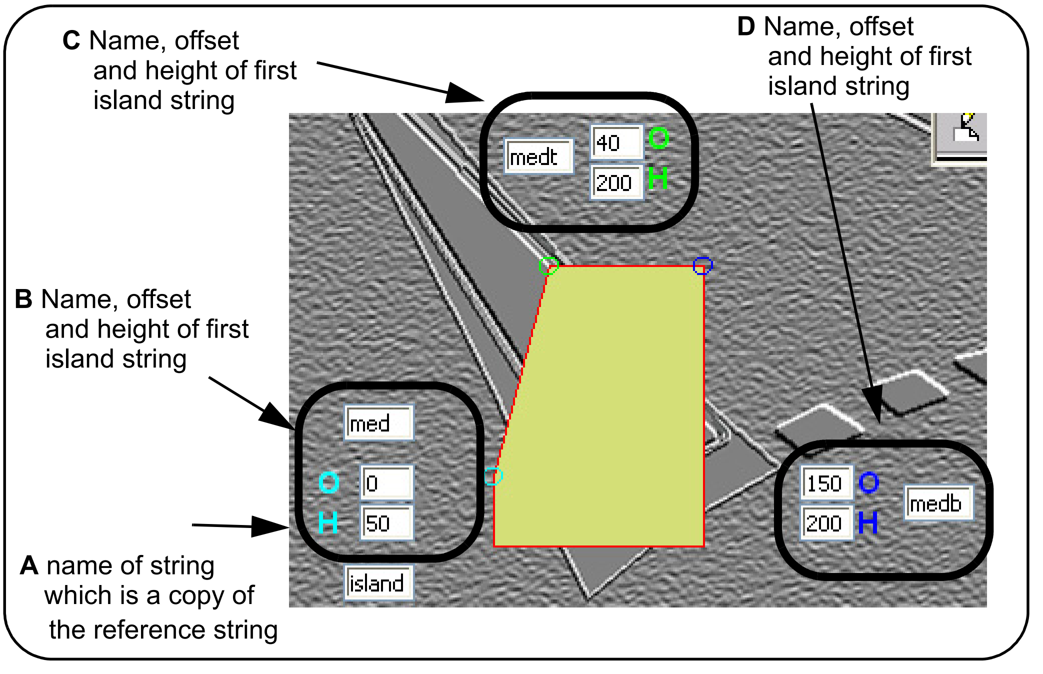
model for the tin of the created island

Colour Island Paving	input	paving	available colours

*if non-blank, then the colour is used to colour the island triangulation within innermost kerb string (**D**)*

Colour Island Tin	input	concrete	available colours

*if non-blank, then the colour is the colour is used to colour the island triangulation between the strings defined by **A** and **D**.*



In the drawing area:

A

a string is created which is a copy of the reference string and given this name. It is added to the **Model Island Strings** *model.*

B

name, offset and height from the reference string, of the first string of the island. It is added to the **Model Island Strings** *model. If offset and height are both zero, then the string is not created.*

C

name, offset and height from the reference string, of the second string of the island. It is added to the **Model Island Strings** *model. If offset and height are both zero, then the string is not created.*

D

name, offset and height from the reference string, of the third string of the island. It is added to the **Model Island Strings** *model. If offset and height are both zero, then the string is not created.*

Design Details

Kerb	choice box	Barrier Type A	Barrier Type A, Barrier Type B, Mountable, Semi - Mountable, User

selected kerb type is displayed in draw box above

If **Kerb** *is* ***User*** *then the* **File** *field and the* **Read** *and* **Save** *buttons are made active, and are used to read in an existing user defined Kerb type, or to create a new one.*

File file box files ending in.ukt

name of the user kerb type file (ukt) to read in or create

Read button

Reads in the user defined kerb definition from the ukt file given in the **File** *field and displays the profile and Offsets and Height in the draw box at the top of the Panel*

Save button

Writes out the kerb profile information (O and H values, and string names) as a user defined kerb, into the file given in the **File** *field.*

Reference select pick

Select the reference alignment which will have the kerb profile applied to it to create the island."pick with direction" in a clockwise manner as the kerb profile is always on the RHS.

Process button

runs the option which created the island string and the coloured island tin

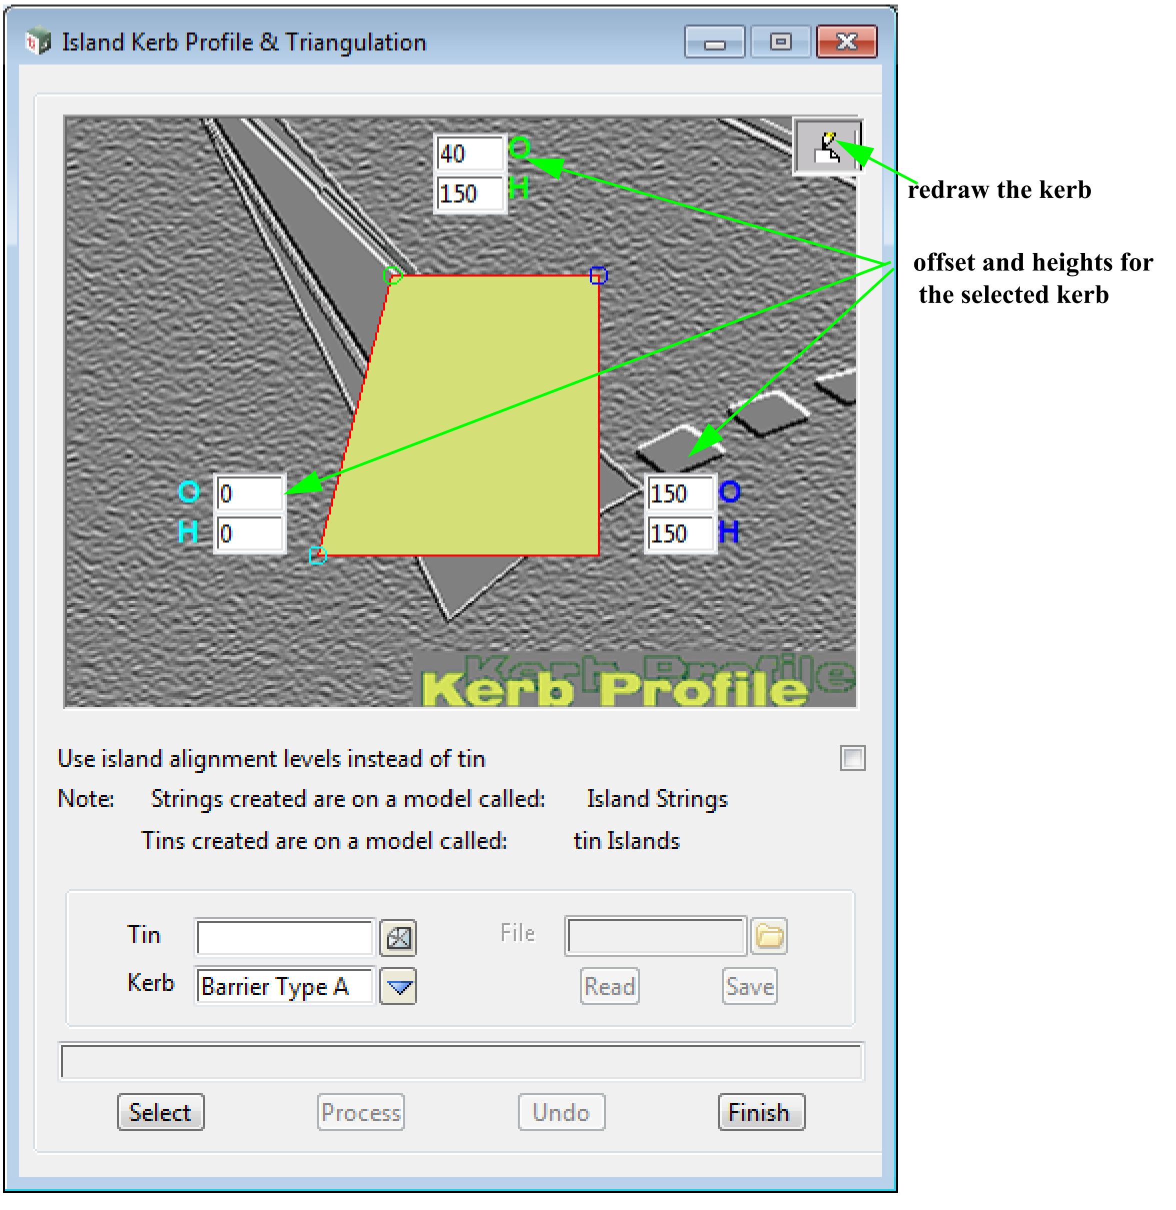
Note:

The New Island Create Function reads in the standard kerb profiles as templates and if required, creates a template from the ukt files. The function needs these templates because an apply is used (internally) to create the Island.

20.17.2.2 Traffic Island Profile and Triangulation Creation

Position of option on menu: **Design =>Roads =>More =>Island profile/tin**

This option creates strings by offsetting from a selected string using a kerb profile. The resultant strings are draped onto a given tin and then triangulated to form a traffic island.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Offset kerb face/top/back input box

offset for kerb face/top/back for the selected kerb type.

Height kerb face/top/back input box

height for kerb face/top/back.

Tin tin box available tins

triangulation to drape the traffic island strings onto.

Kerb type input box

type of kerb to apply to the reference string of the traffic island. If type **User** *is selected from the pop-up list, a file which defines the kerb profile can be selected and used.*

File file box *.ukt files

file to read/write the user defined kerb type to.

Read button

read the given **File** *to define a kerb type.*

Save button

save the kerb parameters to the given **File**.

Select button

select the string representing the traffic island.

Process button

create the traffic island strings and tin.

Undo button

undo the last traffic island created whilst the option was running.

20.17.2.3 Create Mass Haul String and Report

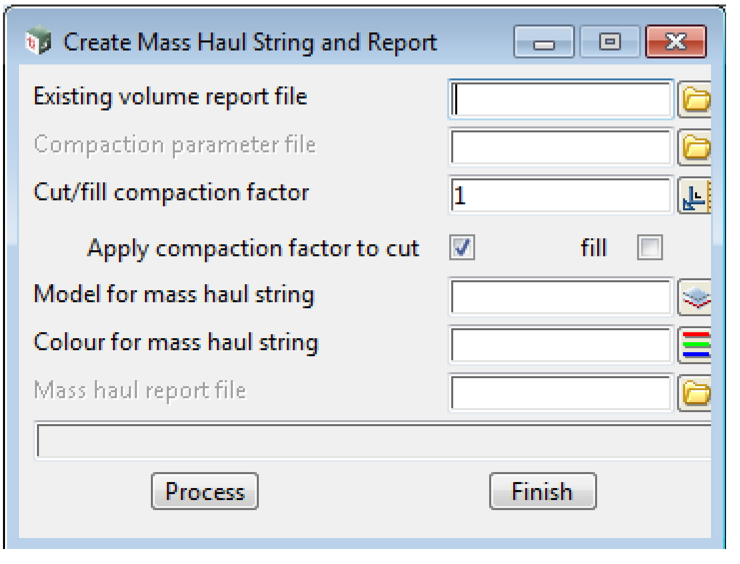
Position of option on menu: **Design =>Roads =>More =>Mass haul**

This option has been replaced by 20.8.8.3 Mass Haul String and Report.

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Existing volume report file	file box		*.rpt files

name of the existing volumes report.

Field Description	Type	Defaults	Pop-Up
Cut/fill compaction factor	input	1.0	

cut/fill compaction factor for any chainages not in the compaction parameter file or if there is no file.

Field Description	Type	Defaults	Pop-Up
Compaction parameter file	input		*.mhf files

file containing compaction factors to be used.

Apply compaction factor to cut fill tick box

if cut, the cut volumes are multiplied by the compaction factors.
If fill, the fill volumes are divided by the compaction factors.

Model for mass haul string input

model for the created mass haul string.

Colour for mass haul string input

colour of the created mass haul string.

Mass haul report file input box

if non-blank, a mass haul volumes file is created.

Process button

run the option.

```
// Sample cut/fill compaction parameter file - the file ending
is .mhf
// All lines starting with // are comments and blank lines are
ignored
//
// A range is specified by a start and end chainage and a compaction
factor.
// A compaction factor of 1.0 means there is no compaction.
// A compaction factor of 0.9 means that 1.0 cubic metres of cut is
equivalent
// to 0.9 cubic metres of fill due to compaction.

// format is
// Start_ch    End_ch   Compaction_factor

      0         100        0.9
     100        500        1.0
     500        2000       1.1
```

21 Advanced Design

See

For some special definitions and information required for Modifiers and Templates, see

21.1 The Modifiers and Templates File - MTF

12d Model uses templates as a quick and easy method for defining design details along a string, and in the ***Apply MTF*** option, modifiers are introduced to handle the most complex design details such as sophisticated urban design including intersections and roundabouts.

12d Model uses templates as a quick and easy method for defining design details along a string.

So for simple work, the **Design=>Apply=> Apply** option cuts a left and right template into a surface to produce a design. For information on how Templates are defined in ***12d Model***, see 20.1 Templates in 12d Model

For more sophisticated design such as highways and complex urban design, intersections and roundabouts, templates are impractical and not an efficient solution. For these cases ***12d Model*** uses ***MTF modifiers*** to provide much finer control and provide all the power of string design without losing the ease of template design for simpler cases

The **Design =>Apply =>Apply MTF** option uses a **Modifiers and Templates File** or **MTF** file) applied to a Reference and Hinge string to tackle complex tasks and:

(a) run Hinge modifiers to adjust the Hinge string

(b) Insert Templates

(c) run Modifiers to adjust any links in the inserted templates, or create new links without needing a Template, and then make adjustments to these links.

(d) generate Sections, Boxing and Strings

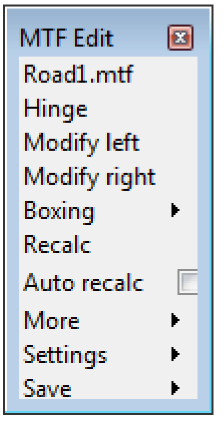
(a) defined shapes and produce **trimeshes** to give a solid representation of the road components.

For more definitions of these items used in MTF's, see 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes.

Note - the *Alignment* module is required to use the *Apply MTF* option.

The **MTF** file used in an ***Apply MTF*** is created and edited **interactively** from within 12d Model.

An **MTF** can be created using the **Create MTF** panel (***Design =>MTF =>Create***) and edited using the **MTF Edit** menu.



Alternatively an **MTF** can be created and edited from within the **Apply MTF** option itself by:

once the **Apply MTF** option has been selected and the **Apply MTF Function** panel is on the screen, simply enter the name of the mtf file into the **MTF file** field and click on the *Folder* icon to bring up the pop-up menu and select **[Open]** from the pop-up.

If the **MTF** does not exist, then the **Create MTF** panel (with the MTF file name already filled in) is placed on the screen and the user simply selects the **Create** button. If the MTF file does exist, then it is loaded into the **MTF Edit** menu.

For full documentation on the **MTF Edit** menu, see 21.2 MTF Edit.

Note - although the *MTF file* can be edited with a text editor that **supports unicode**, it is easy to get the syntax wrong and create and invalid MTF file. So it is always best to use the interactive editor, **MTF Edit**.

For some special definitions and information required for Modifiers and Templates, see
21.1.1.1 MTF Links, Points and Strings
21.1.1.2 MTF Links and Layers
21.1.1.3 MTF Shapes and Trimeshes
21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions
21.1.2.2 Modify X, Hold Y in MTF Modifiers
21.1.2.3 New Value Usage

21.1.1 MTF Links, Points, Sections, Strings and Trimeshes

See

21.1.1.1 MTF Links, Points and Strings
21.1.1.2 MTF Links and Layers
21.1.1.3 MTF Shapes and Trimeshes

21.1.1.1 MTF Links, Points and Strings

A **Modifiers and Template File** (**MTF**), like a Template, is defined in terms of the links which go together to make up an **MTF section**.

As for a ***12d Template,*** an **MTF Section** consists of a **left hand side** ending at the **Hinge Point**, followed by a **right hand side**.

Each side if made up of a number of **MTF links** and each link is defined by any two of the three

(a) width of the link

(b) change in z-value from the beginning of the link to the end of the link. that is, the z-value at the end of the link minus the z-value at the start of the link. This is referred to as the **height** of the link.

(c) xfall or slope

and the links are connected sequentially to form a cross section.

Notice that the height is only a **relative** height and **not** a z-value.

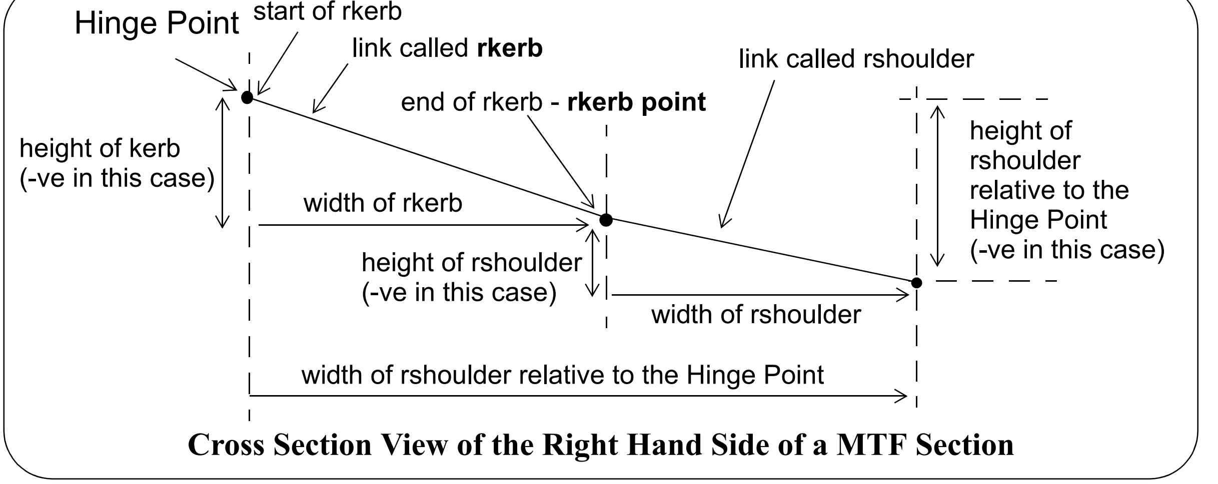
On the **left hand side**, the MTF links go from right to left.The vertex (point) at the end of the link is given the same name as the link. The far right of the left hand side is the Hinge Point. So on the left hand side, positive widths go to the left.

On the **right hand side**, the MTF links go from left to right. The vertex (point) at the end of the link is given the same name as the link. The far left of the right hand size is also the Hinge Point. So on the right hand side, positive widths go to the right.

Note that this definition of the MTF Section is given in terms of **MTF links** and each MTF Link is defined by a **relative width** and **relative height** to the **previous link**, and the left and right hand sides are positioned around a **Hinge Point**.

A **width from the Hinge point** and a **height above the Hinge point** can be calculated for each ***MTF Link point*** by accumulating the widths and heights of all the links from the Hinge point to the this link, and including this link. These values of the width and height for the Link Point are referred to as the **width relative to the Hinge Point** and **height relative to the Hinge Point**. Or sometimes ***absolute width*** *(or **absolute offset**)* and ***absolute height*** for short.

Note that this use of the word **absolute** must not to be confused with the absolute value of a number (which is always positive).



Cross Section View of the Right Hand Side of a MTF Section

Similarly for the Left Hand Side of a MTF Section except that the diagram goes to the left of the Hinge Point and positive widths are measure as **going to the left.**

Also if the **(x,y,z) coordinates** are known for the **Hinge point** and the **plan angle** that the

section makes through the Hinge point, then the **(x,y,z) coordinates** for each **Link point** can be calculated by accumulating all the relative widths and heights and applying them along the section line.

Each **MTF link** has a **name** and **colour** and it is best for all the links in an MTF section to have unique names.

The **point** at the **end** of the **MTF link** is given the **name** of the **link** and is called a **MTF Link Point,** or an **Link Point** or **MTF Point** for short

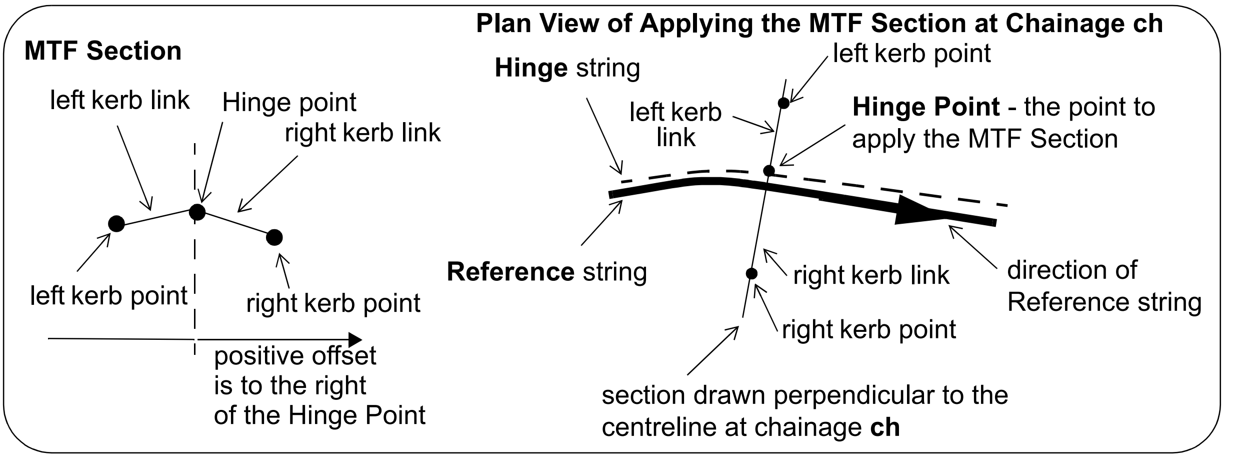
So on the left hand side of the Hinge Point, the MTF Link Point is at the left hand end of the link and on the right hand side of the Hinge Point, the MTF Link Point is at the right hand end of the link.

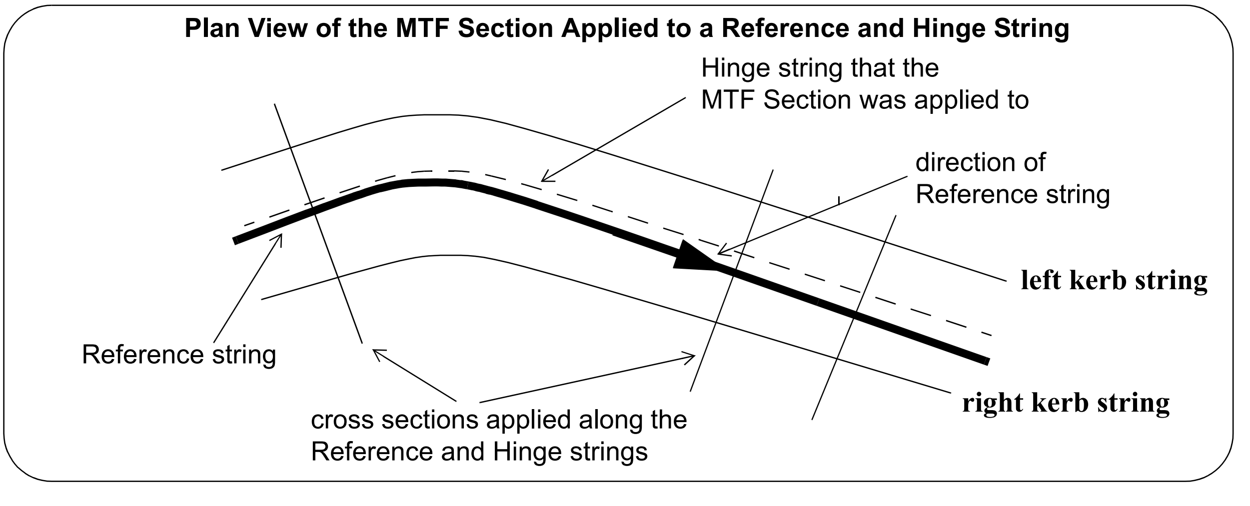
When the **MTF** is **Applied** to a **Reference** and a **Hinge String**, ***MTF links** and **points*** are created at each chainage, and it is also known, whether or not, the **same *MTF link* and point exists** at the **next chainage**.

So applying the **MTF** defines not only each *MTF link* and but also how each *link point* is connected **longitudinally** along the Reference and Hinge strings to form a string, **or more than one string** if there are some chainages where the *link point* does not exist.

The longitudinal strings (**MTF strings**) created by a *link point* are given the same name and colour as the *link point*.

As an example, the MTF with one link called *left kerb* and one link on the right called *right kerb* applied down the a Reference and Hinge String with produce two strings called *left kerb* and *right kerb:*





For brevity, when there is no confusion, the longitudinal MTF strings created by the MTF are often just called e **strings**.

Unlike the simpler *Apply Template*, the ***Apply MTF*** option does not automatically create strings for all the *MTF points* but allows the user to specify which strings are created. *See* 21.2.2.5.2 Create Strings.

Continue to the next section 21.1.1.2 MTF Links and Layers or return to 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes

21.1.1.2 MTF Links and Layers

As well as having a name, each **MTF Link** also has a unique **Layer**. The default **Layer** is **Design**.

Layers are simply a way of grouping certain links together so that they can be referred to as one thing. For example, the default Layer **Design** is usually where all the links go that make up the Design.

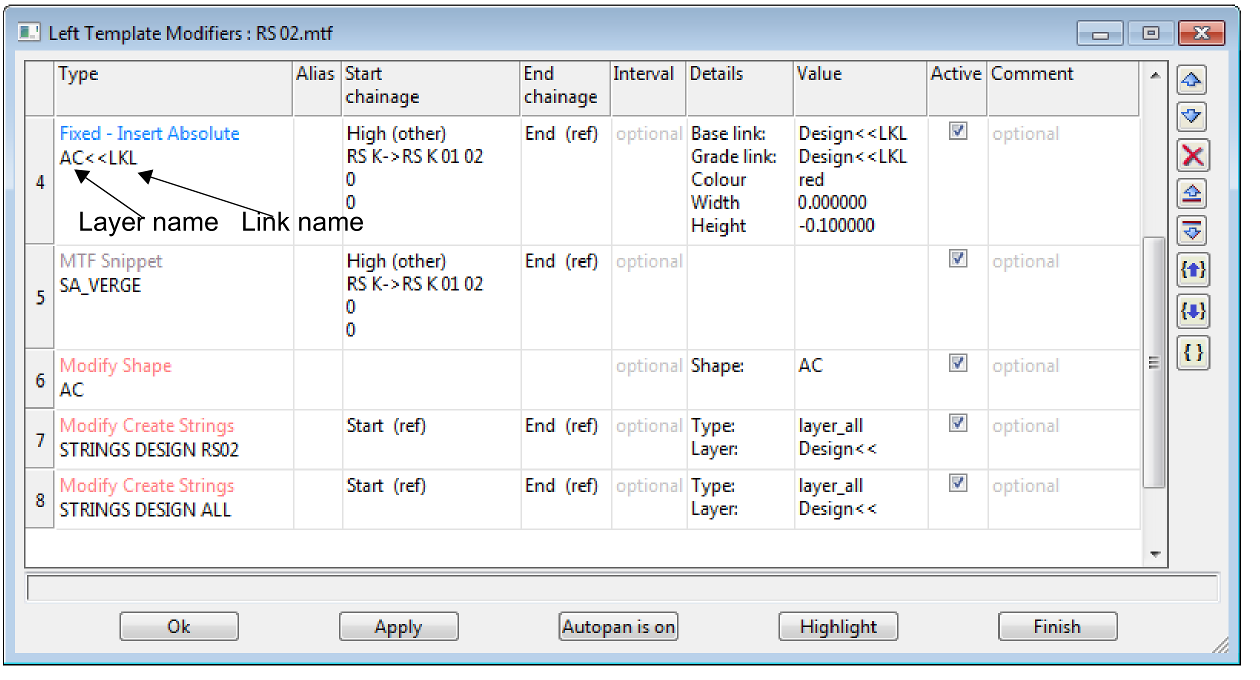
When a MTF Link is created, the Layer is given at the same time as the link name and colour and most MTF commands work for any Layer.

A **MTF Link** of name ***link_name*** in the layer ***layer_name*** is denoted by:

layer_name << link_name *when* ***link_name*** *is a left side link.*

layer_name >>link_name *when* ***link_name*** *is a a right side link.*

layer_name =>link_name *when the side for* ***link_name*** *has not yet been evaluated (this can happen in general Snippet code that can work when inserted in the Left or Right Modifiers panel.)*



In the **Apply MTF Function**, strings or sections are only automatically created for the layer **Design**.

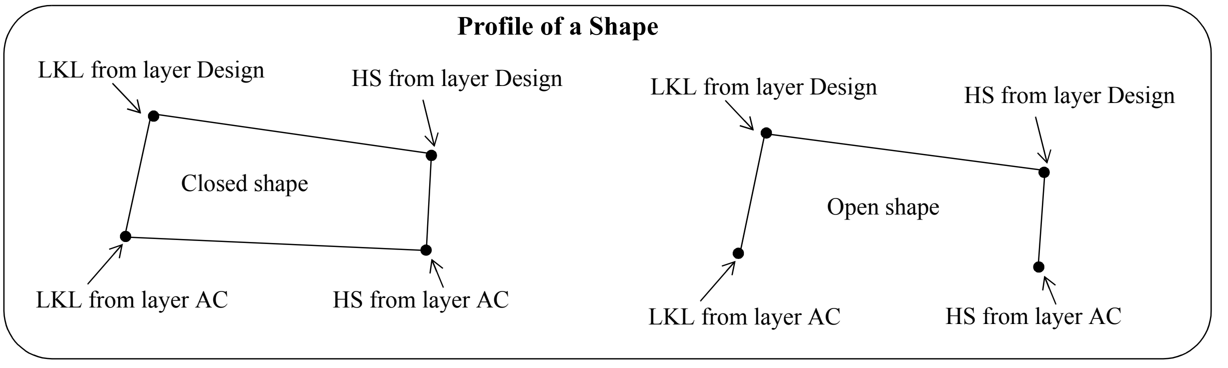
For other Layers, strings are created using the MTF command **Create Strings.** See 21.2.2.5.2 Create Strings.

Continue to the next section 21.1.1.3 MTF Shapes and Trimeshes or return to 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes

21.1.1.3 MTF Shapes and Trimeshes

A **Shape** is made up of a group of **MTF link points** that in profile are joined together in a specific order. Each **MTF link point** can come from any **Layer**.

A Shape can be open or closed

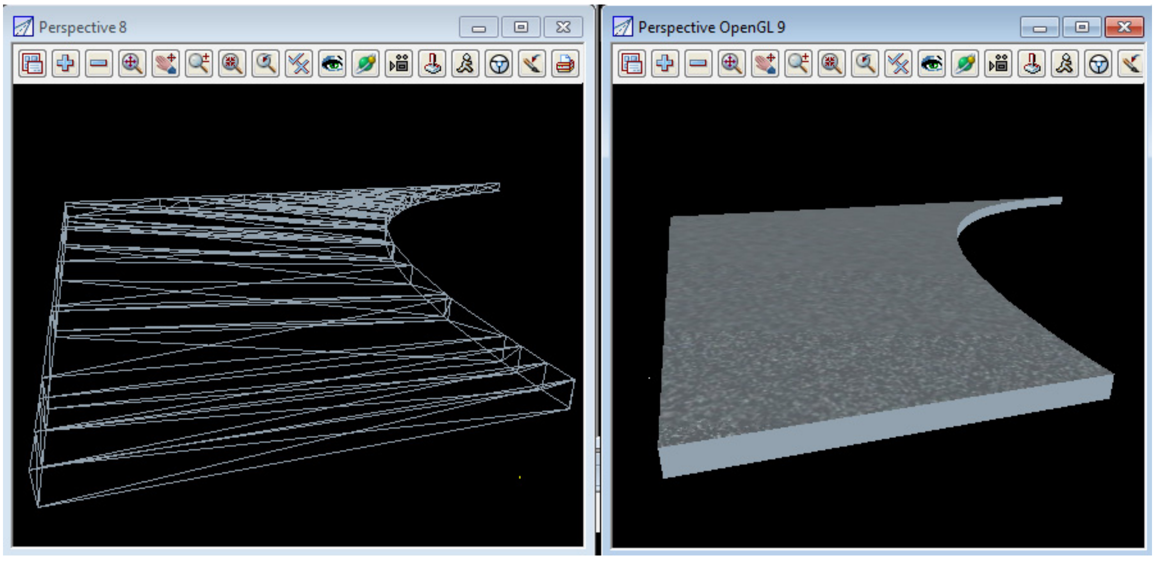


So shapes are similar to cross sections except a shape can go back under or over itself, and can be closed.

When and **MTF** is Applied to a Defence and Hinge string (**Apply MTF Function)**, the Shape will be defined at chainages along the Reference string and Hinge string, and the MTF Link Points of the Shape can generate MTF strings for the Shape.

A **Trimesh** can be constructed from the MTF sections and MTF strings generated by applying the Shape along the Reference and Hinge string. See 4.5.5 Trimeshes.

So the **Trimesh of a Shape** can be thought of as a profile swept (extruded) along the Reference and Hinge string. But remember that at any chainage, the **MTF** can change the positions of each MTF point so the profile of the Shape can change from chainage to chainage.



There is a **MTF** option to creates a Trimesh of a *Shape* and its *trimesh*. *See* 21.2.2.5.1 Create Shapes

Continue to the section 21.1.2 Calculating Link Values or return to 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes.

21.1.2 Calculating Link Values

See

21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions

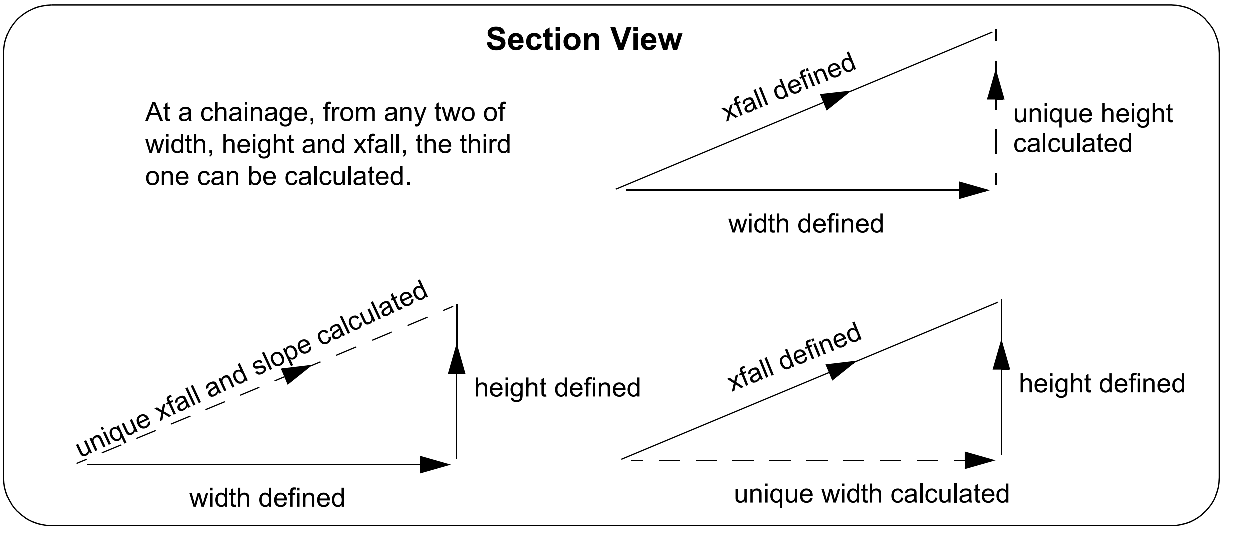
For most of the ***MTF Modifier*** commands and the ***MTF Absolute*** command, the command **modifies** the current value of the link of one for one of Width, Height, Xfall or Slope, and uses (**holds**) the current value of the link of another one of Width, Height, Xfall or Slope.

Together, the **modified** value and the **held** value defines the new values for the link.

It doesn't matter which two of width, height and xfall or slope were originally used to define the link, the option will internally convert the definition to what is required to be **modified** and **held**.

For example the link may be originally defined by **xfall** and **height** but the link **Modifier type** could be **Modify Width, Hold Xfall** or **Modify Xfall, Hold Width**.

Even though the existing link is not defined by width, for each required chainage, the xfall and height values of the existing link **uniquely define a width** at that chainage. And it is this calculated width that is then modified by **Modify Width, Hold Xfall** or used (held) by a **Modify Xfall, Hold Width.**



So no matter how the link is originally defined, any one of width, height or xfall/slope can be calculated and modified or held by the option.

Continue to the section 21.1.2.2 Modify X, Hold Y in MTF Modifiers or return to 21.1.2 Calculating Link Values.

21.1.2.2 Modify X, Hold Y in MTF Modifiers

A **link** in an **MTF** is initially defined by two out of three of width, height and xfall/slope because **only two** are needed to uniquely define the link. Any values not used in the link definition can be calculated from the defining values.so any of the values width, height, xfall and slope for the link are always known. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

In an ***Apply MTF***, there are MTF Modifiers such as the **Modify link** command that act on the link and ***modifier*** one or some times two of the values defining the **link**.

One of the most common methods to modify the definition of a link is that **one** of the link values **is not modified** and keeps the same value (it is **held**) and **another value** is **modified** until a given condition is satisfied.

That is, for the link:

(a) **one** of Width, Height or Xfall **keeps its existing value** (i.e. **holds** its **existing value)**.

and

(b) **a different one** of Width, Height or Xfall **is modified** and takes the value needed to satisfy a given condition.

This is summarised as

Hold X, Modify Y

or **Modify Y, Hold X**

For example, for the **To String** modifier

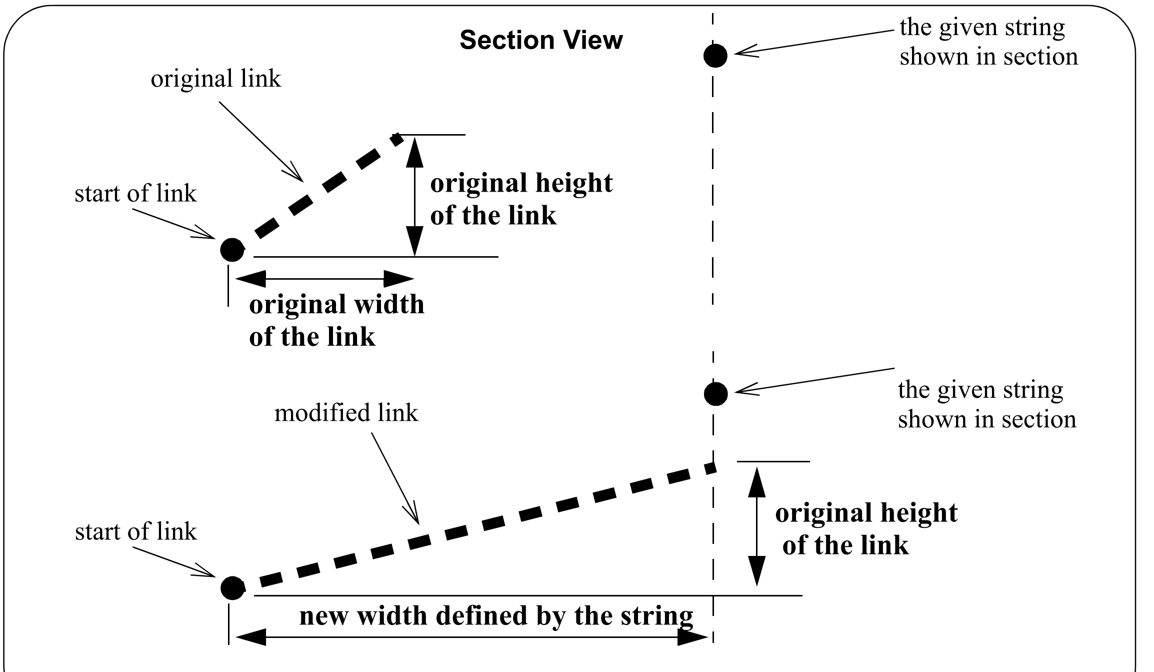
Modify Width, Hold Height.

(a) the **Height keeps its existing value** for the link (i.e. **holds** its existing value).

and

(b) the **Width is modified** to be the value that puts the end of the link directly under a given string.

(see 21.2.2.2.10 Fixed Link - To String)



Modify Width to a String and Hold Height

With the **To String** modifier, if the string is moved, the **Width** will also change to keep the end of the link under the string.

Continue to the section 21.1.2.3 New Value Usage or return to 21.1.2 Calculating Link Values.

21.1.2.3 New Value Usage

New value usage has the choices:

(a) *Add to the current value of the link*

If **Add to the current value of the link**, the value of the parameter width/height/xfall/slope at each chainage is **added to** the current value for the parameter. For compactness, in a grid, this will be displayed in an **Absolute** column with **Absolute not ticked** or **no.**

and

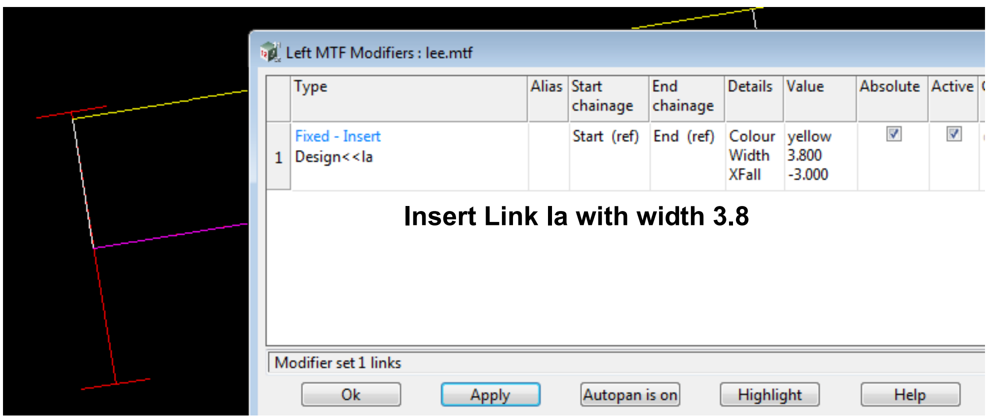
(b) *Replace the current value of the link*.

If **Replace the current value of the link**, the value of the parameter width/height/xfall/slope at each chainage **replaces** the current value for the parameter. For compactness, In a grid, this will be shown in an **Absolute** column with **Absolute ticked** or **yes**.

The different is best understood by running a Modifier command on a simple one Link job and then modifying the Width with the two values of **New value usage**.

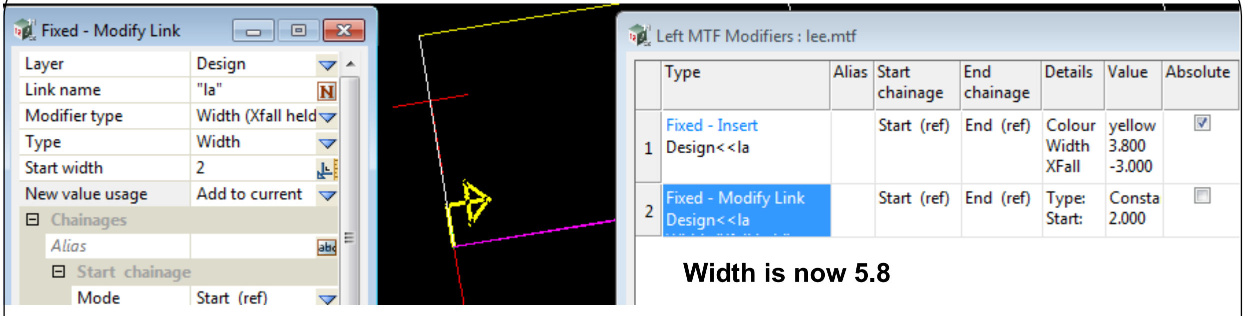
First insert a link called **la** with a **width** of **3.8.**

.



Then add a Modify a **Modify Link** command **to Modify the Width** with a **constant width of 2,** and **New value usage** with the value *Add to the current value of the link* (also denoted as **Absolute off)**.

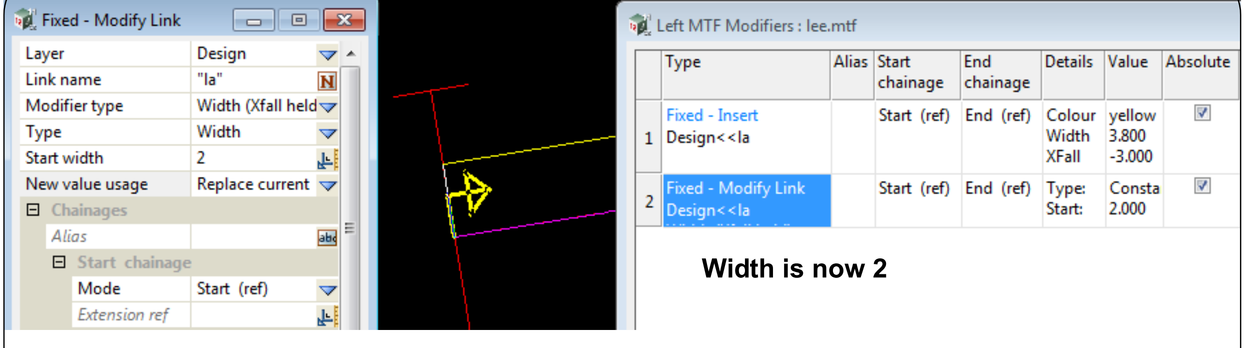
The **Width** is then **5.8.**



Modify Link command **to Modify the Width** with a **constant width of 2**
New value usage: Add to the current value of the link (Absolute **off**)

Now change the value of **New value usage** to *Replace the current value of the link* (i.e. **Absolute on).**

The **Width** is then **2.**



Modify Link command to Modify the Width with a **constant width of 2**
New value usage: Replace the current value of the link to current value (Absolute **on**)

So a **New value usage** of *Add to the current value of the link* (i.e. Absolute **off**) **adds** to the current value of the link and you may not even know what the final width of the link is until the MTF is run.

Whereas a **New value usage** of *Replace the current value of the link* (i.e Absolute **on**) **resets** the value to a given value. So at that point in the MTF, you know exactly what the value of Width is.

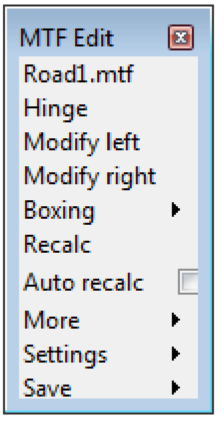
Note that there may be more *Width* commands further down in the MTF command list that may change the value of Width again so the final Width will only be definitely be known when the entire MTF is processed.

Continue to the section 21.2 MTF Edit or return to 21.1.2 Calculating Link Values.

21.2 MTF Edit

For general information about the MTF (Modifiers and Template File) see 21.1 The Modifiers and Templates File - MTF.

The **MTF Edit** menu is



For documentation on the options see:

Hinge	21.2.1 MTF Hinge Modifiers
Modify left	21.2.2 Left and Right MTF Modifiers
Modify right	21.2.2 Left and Right MTF Modifiers
Boxing	21.2.3 MTF Boxing

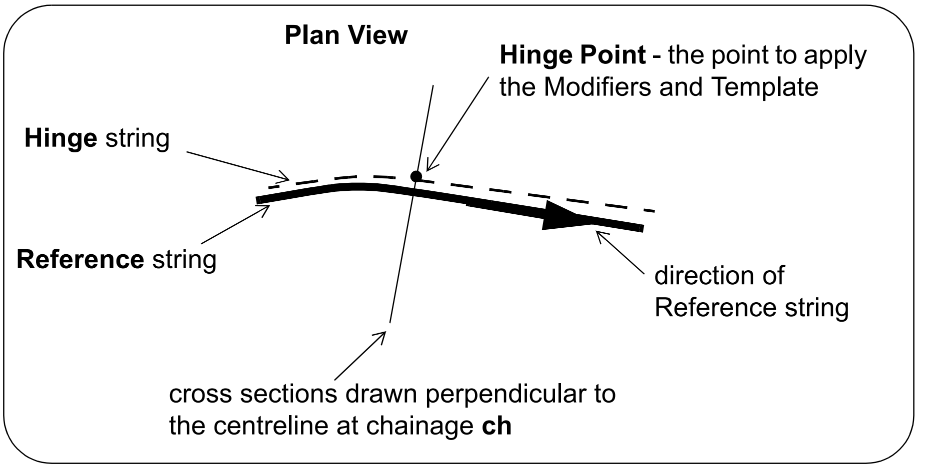
Auto recalc	21.2.5 MTF Auto Recalc
More	21.2.6 MTF More
Settings	21.2.7 MTF Settings
Save	21.2.8 MTF Save

Please continue to the next section 21.2.1 MTF Hinge Modifiers or return to 21.2 MTF Edit.

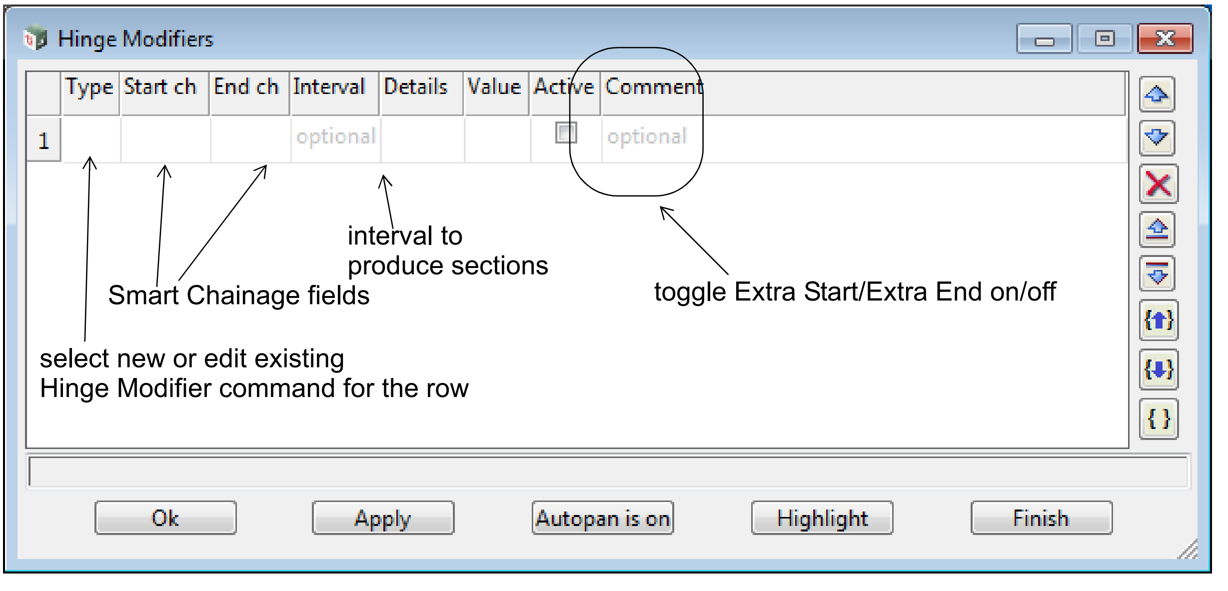
21.2.1 MTF Hinge Modifiers

The **hinge string** is selected using the **Hinge** panel field in the **Apply MTF Function** panel.

Hinge modifiers are used to **modify** the position of the point on the hinge string (the **Hinge point**) that is considered the zero offset and Height point when applying the Templates and Modifier commands. See 20.1 Templates in 12d Model.



Selecting **Hinge** from the **MTF Edit** menu brings up the **Hinge Modifiers** panel.



The **Hinge Modifiers** panel consists of a grid with of rows (or lines) with **commands** in them, and an **OK** or **Apply** button to record the results.

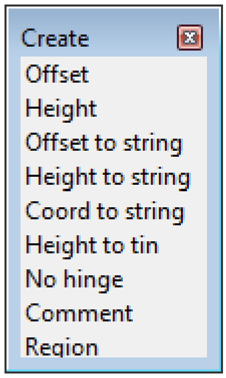
Hinge Modifier Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

*The **commands** in the* **Hinge Modifier** *grid are processed sequentially from the top to the bottom of the grid.*

When the Grid Row is Empty

*If the row of the grid is **empty**, clicking LB in the empty row will bring up the* **Create** *menu which contains all the available hinge commands.Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the* **Create** *menu.*



Selecting a menu item will bring up an associated panel which displays the information required for the hinge command. When the panel is filled in and **OK** or **Apply** *selected, the panel information is written out to the row of the grid and is known as a* **hinge command**. *For information on each of the Hinge Commands, see* 21.2.1.1 Create Hinge Commands.

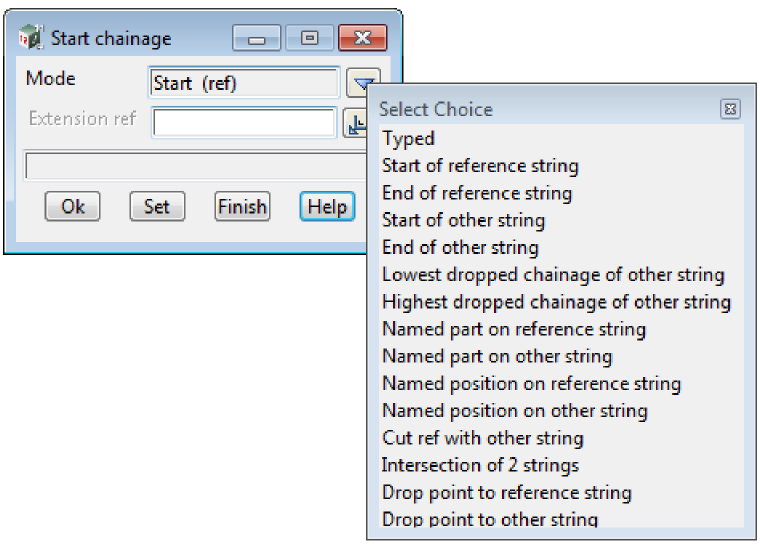
When the Grid Row is Not Empty

If the row of the grid is ***not empty*** *(and hence filled with a* **hinge command***) then clicking LB in the cell:*

(a) ***Type*** *will bring up the associated panel for the hinge command.*

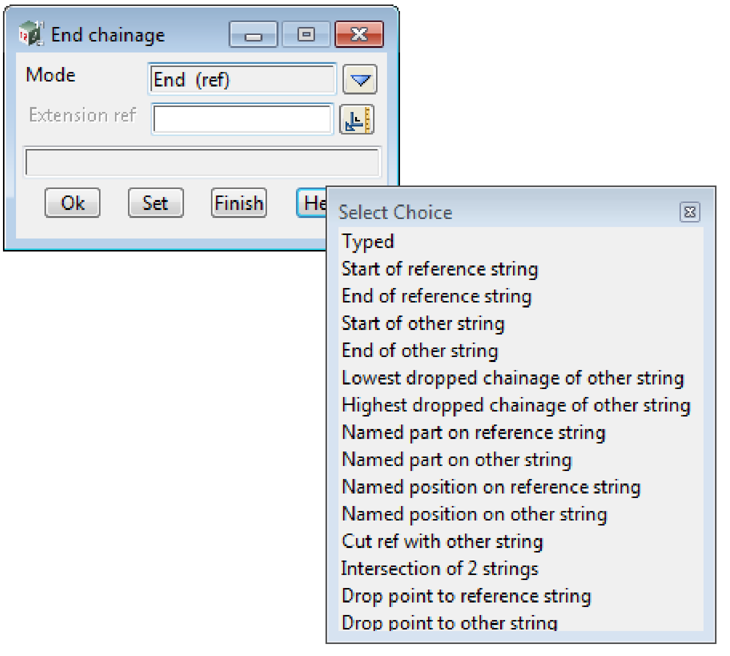
For information on each of the Hinge Commands, see 21.2.1.1 Create Hinge Commands.

(b) ***Start chainage*** *cell brings up the Smart* ***Start Chainage*** *panel*



The **Start Chainage Mode** *will determine what other fields are also on the panel (for example* **Extension ref** *for* **Mode** ***Start of reference string***. *For more information on Chainage Modes, see* 21.2.1 MTF Hinge Modifiers

(c) ***End Chainge*** *cell brings up the Smart* ***End Chainage*** *panel*



The **End Chainage Mode** *will determine what other fields are also on the panel (for example* **Extension ref** *for* **Mode** ***End of reference string***. *For more information on Chainage Modes, see* 21.2.1 MTF Hinge Modifiers

(d) ***Interval*** *will allow a real value to be typed into the cell*

Note that the ***Interval*** *column will not appear in the grid if* ***Show interval column?*** *is* ***not*** *ticked in the MTF Settings. See* 21.2.7.8 MTF Setting Show Interval Column

(e) ***Extra Start***, ***Extra End*** *or* ***Active*** *will toggle the* ***tick/not ticked***

Note that the ***Extra start*** *and* ***Extra end*** *columns will not appear in the grid if* ***Show extra start/ end column?*** *is* ***not*** *ticked in the MTF Settings. See* 21.2.7.6 MTF Setting Show Extra Start/ End column.

(f) ***Comment*** *will allow text to be typed into the cell*

Note *that clicking in the* **Type**, **Start chainage**, **End chainage**, **Interval**, **Extra Start**, **Extra End**, **Active** *and* **Comment** *cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.*

Buttons at Bottom

OK button

OK *stores the values in the fields and removes the panel BUT no* ***recalc*** *is done.*

Apply button

Apply *stores the values in the grid and leaves the panel on the screen.*

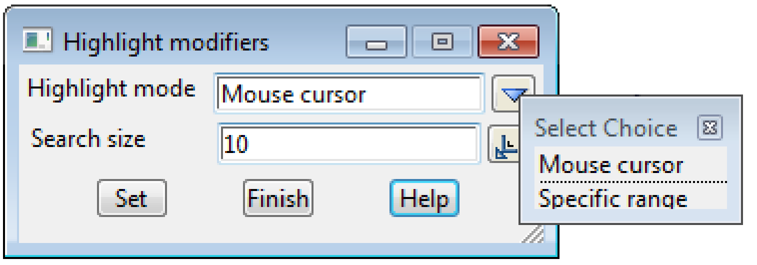
If ***Auto recalc*** *is* ***ticked*** *in the MTF, then whenever the* ***Apply*** *button is clicked, a* ***recalc*** *of the associated* ***Apply Many*** *for the MTF is done.*

Autopan on/off button

when clicked to say **Autopan is on** *then if the chainage range is not in the view that the Reference string is on then the view will be panned so that it is on the view.*

Highlight button

clicking the ***Highlight*** *button brings up the* **Highlight Modifiers** *panel.*

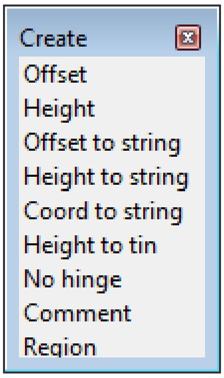


Continue to the next section 21.2.1.1 Create Hinge Commands.

21.2.1.1 Create Hinge Commands

The **commands** in the **Hinge Modifiers** grid are processed sequentially from top to bottom.

The **Hinge Modifier commands** are selected from the **Create** menu that is displayed when clicking in a cell in the **Type** column of the **Hinge Modifiers** panel.



adjust offset of hinge string
adjust offset of hinge to a height
use offset to a string
use height from a string
take coords from a string
use height from a string
stop the apply
comment
define a region

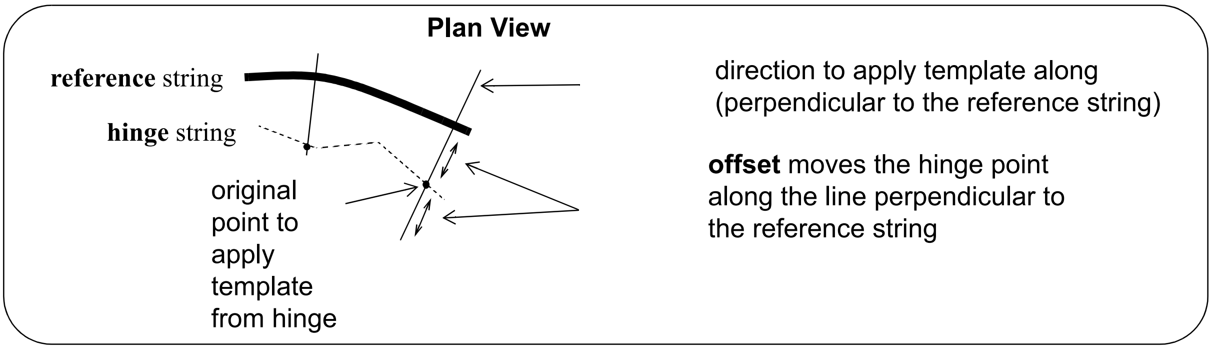
For a description of the options, see

Offset	21.2.1.2 Offset
Height	21.2.1.3 Height
Offset to string	21.2.1.4 Offset to String
Height to string	21.2.1.5 Height to String
Coord to sting	21.2.1.6 Coord to String
Height to tin	21.2.1.7 Height to Tin
No hinge	21.2.1.8 No Hinge
Comment	21.2.1.9 Comment
Region	21.2.1.10 Region

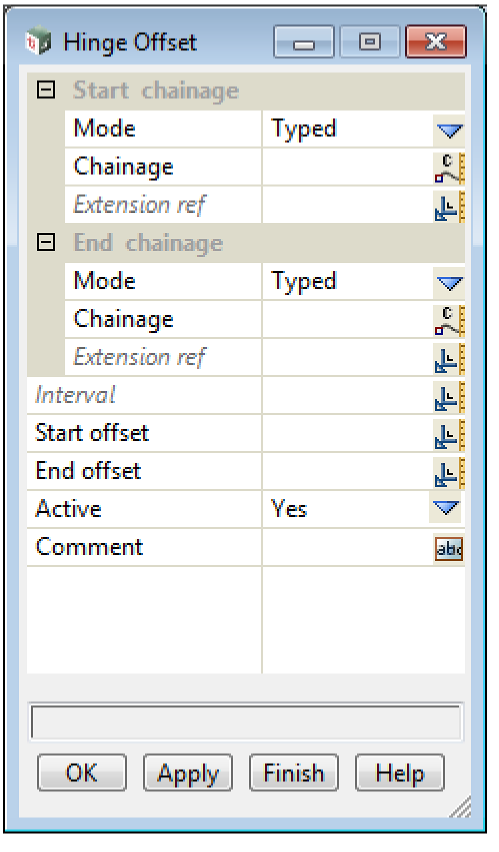
21.2.1.2 Offset

The **offset** hinge modifier will move the hinge point a given offset distance (perpendicular to the reference string) from its current plan position. A positive offset is to the right of the hinge string and a negative offset to the left.

.



Selecting **Offset** brings up the **Hinge Offset** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start chainage, End chainage, Interval			

defines the start/end chainages for modifying the offset of the hinge string.

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Start/End offset	input		measures menu

start/end offset.

Absolute tick box tick

*if **ticked**, the offset is set to the values given in the* **start** *and* **end value** *fields.*
*if **not ticked**, the values given in the* **start** *and* **end value** *fields are added to the existing offsets.*

Cubic tick box

*if **ticked**, the offset is varied as a reverse cubic between the start and end chainages.*
*if **not ticked**, the offset is varied linearly between the start and end chainages.*

Active, Comment, Extra start, Extra end, OK, Apply

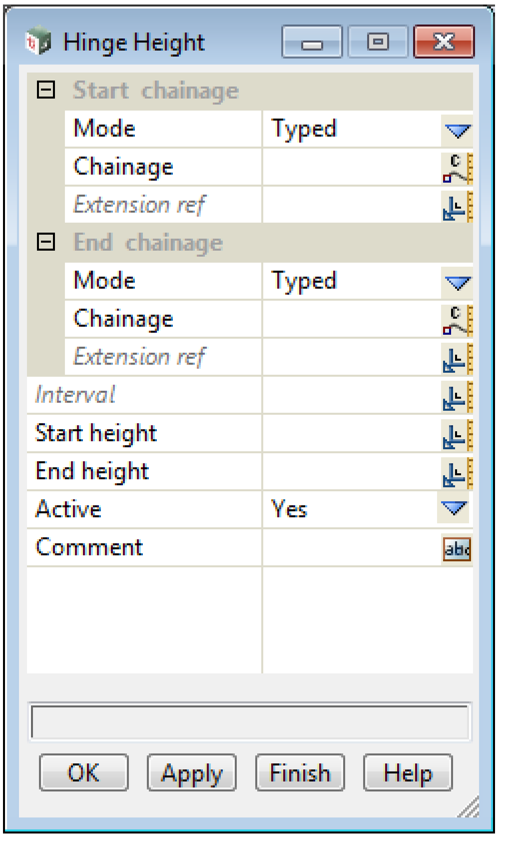
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Go to the next section 21.2.1.3 Height or return to 21.2.1 MTF Hinge Modifiers

21.2.1.3 Height

The **Height** modifier linearly varies the height of the hinge point between the given chainages.

Selecting **Height** brings up the **Hinge Height** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start chainage, End chainage, Interval			

defines the start/end chainages for modifying the height of the hinge string.

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Start/End height	real box		measures menu

start/end height.

Extra start/end	tick box	tick	

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute	tick box	tick	

*if **ticked**, the height is set to the values given in the* **start** *and* **end value** *fields.*
*if **not ticked**, the values given in the* **start** *and* **end value** *fields are added to the existing heights.*

Cubic	tick box		

*if **ticked**, the height is varied as a reverse cubic between the start and end chainages.*
*if **not ticked**, the height is varied linearly between the start and end chainages.*

Active, Comment, Extra start, Extra end, OK, Apply

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge

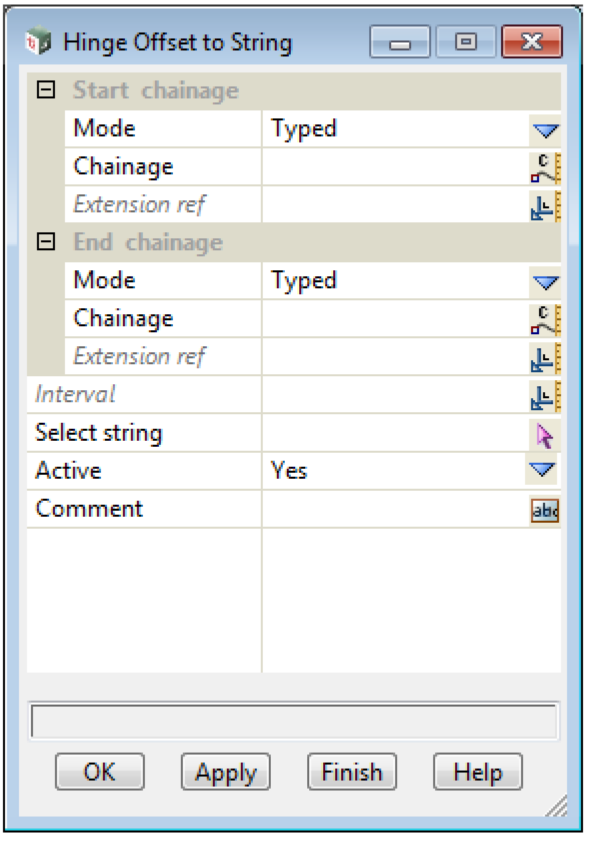
Modifier Panels.

Go to the next section 21.2.1.4 Offset to String or return to 21.2.1 MTF Hinge Modifiers

21.2.1.4 Offset to String

The **Offset to string** hinge modifier makes the offset of the hinge point the same as the offset of a selected string

Selecting **Offset to string** brings up the **Hinge Offset to String** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Start chainage, End chainage, Interval

defines the start/end chainages for modifying the offset of the hinge string.

For information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

*When the **Start mode** is **Start (ref),** or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.*

*When the **End mode** is **End (ref),** or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

String string-select

select string to use for defining offset from hinge.

Active, Comment, Extra start, Extra end, OK, Apply

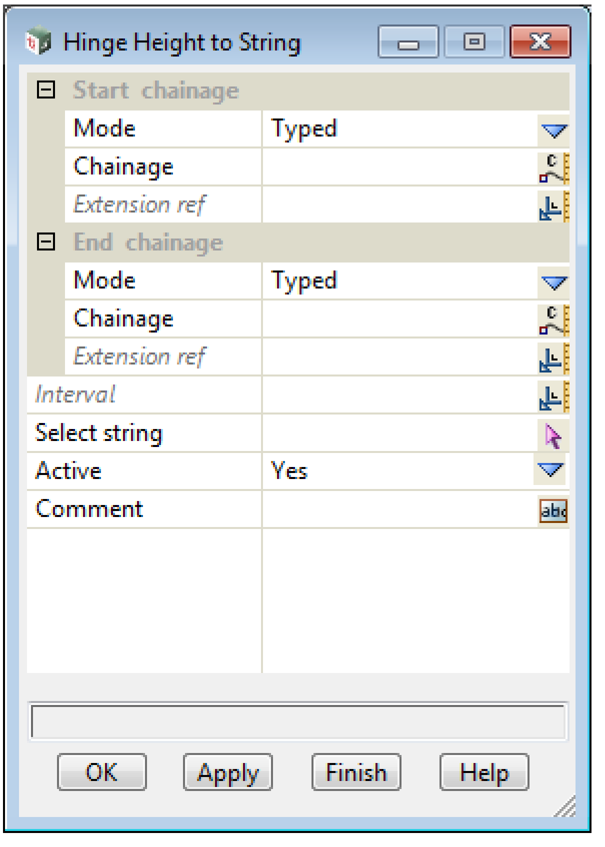
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Go to the next section 21.2.1.5 Height to String or return to 21.2.1 MTF Hinge Modifiers

21.2.1.5 Height to String

The **Height to string** hinge modifier makes the height of the hinge point the same as the height of a selected string

Selecting **Height to string** brings up the **Hinge Height to String** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Start chainage, End chainage, Interval

defines the start/end chainages for modifying the height of the hinge string

For information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

When the ***Start mode*** *is* ***Start (ref),*** *or* ***Typed*** *and the chainage is* ***blank****, the modification begins at the low dropped chainage of the selected string.*

When the ***End mode*** *is* ***End (ref),*** *or* ***Typed*** *and the chainage is* ***blank****, the modification ends at the high dropped chainage of the selected string.*

String string-select

select string to use for defining height of hinge.

Active, Comment, Extra start, Extra end, OK, Apply

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

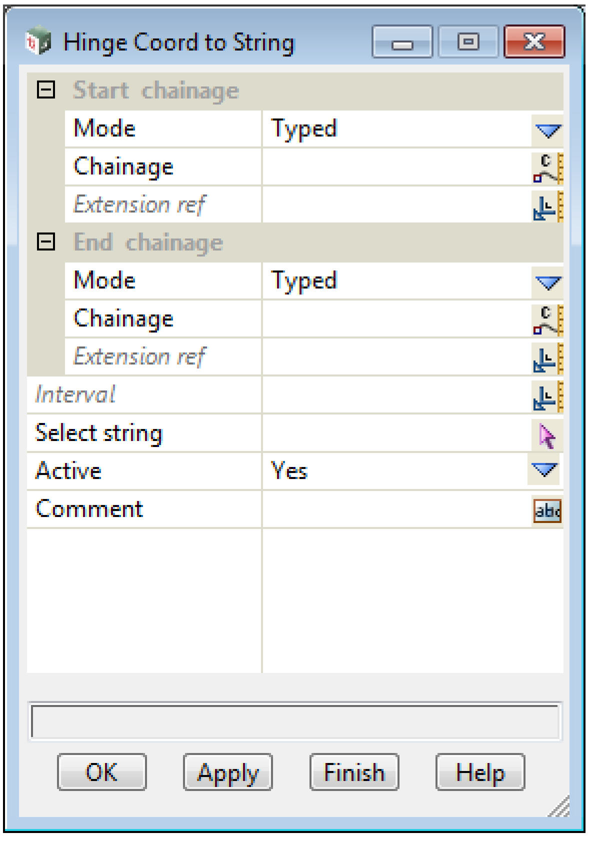
Go to the next section 21.2.1.6 Coord to String or return to 21.2.1 MTF Hinge Modifiers

21.2.1.6 Coord to String

The **Coord** hinge modifier is used to replace the x, y and z position of the hinge point by the x, y and z position of **another *12d Model* string**.

Hence **Coord** replaces the hinge string by another string between the given chainages.

Selecting **Coord to string** brings up the **Hinge Coord to String** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Start chainage, End chainage, Interval

defines the start/end chainages for modifying the coordinates of the hinge string

For information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

*When the **Start mode** is **Start (ref),** or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.*

*When the **End mode** is **End (ref),** or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

String string-select

select string to use for defining the coordinates of the hinge string.

Active, Comment, Extra start, Extra end, OK, Apply

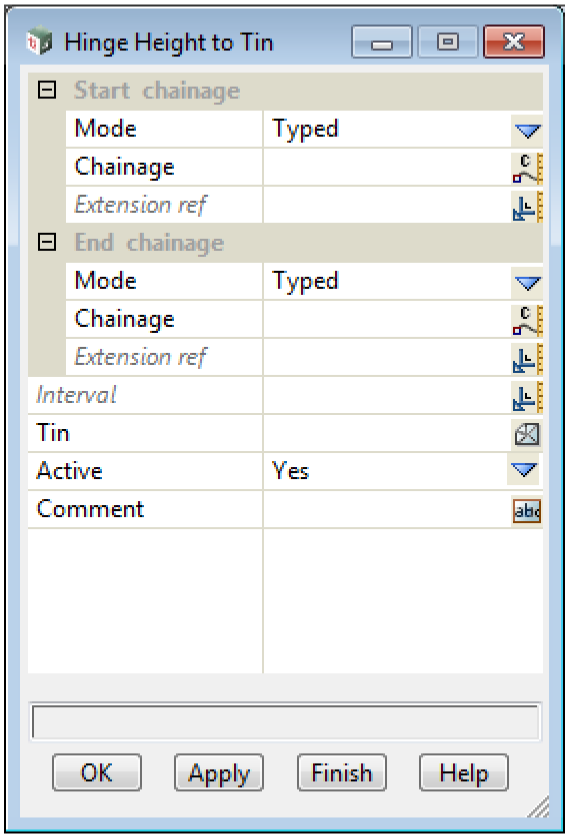
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Go to the next section 21.2.1.7 Height to Tin or return to 21.2.1 MTF Hinge Modifiers.

21.2.1.7 Height to Tin

The **Height to tin** hinge modifier makes the height of the hinge point the same as the height of a tin at the same (x,y) location as the hinge point.

Selecting **Height to tin** brings up the **Hinge Height to Tin** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Start chainage, End chainage, Interval

defines the start/end chainages for modifying the height of the hinge string

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Tin tin box

tin to use for z-values. At each vertex of the hinge string in he chainage range, set the z-value to be the tin z-value at the same (x,y) position as the vertex.

Active, Comment, Extra start, Extra end, OK, Apply

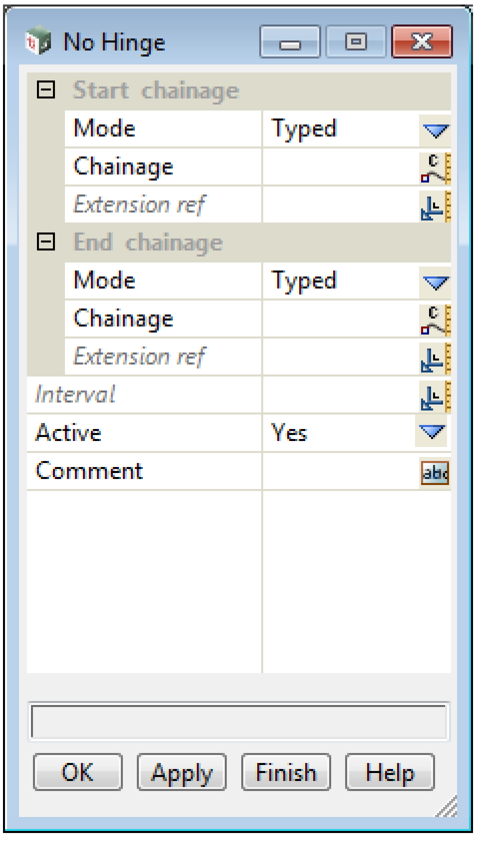
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Go to the next section 21.2.1.8 No Hinge or return to 21.2.1 MTF Hinge Modifiers.

21.2.1.8 No Hinge

The **Nohinge** hinge modifier is used to **stop** the hinge string (and hence the apply) between given chainages. This will leave a gap in the strings created by the apply between the given chainages.

Selecting **No hinge** brings up the **No Hinge** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Start chainage, End chainage, Interval

defines the start/end chainages for stopping the hinge string

for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Active, Comment, Extra start, Extra end, OK, Apply

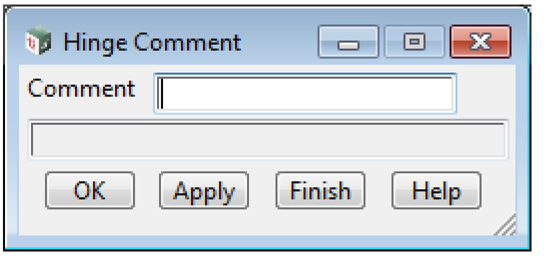
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Go to the next section 21.2.1.9 Comment or return to 21.2.1 MTF Hinge Modifiers

21.2.1.9 Comment

The **Comment** option inserts a comment into the row.

Selecting **Comment** brings up the **Hinge Comment** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Comment, OK, Apply

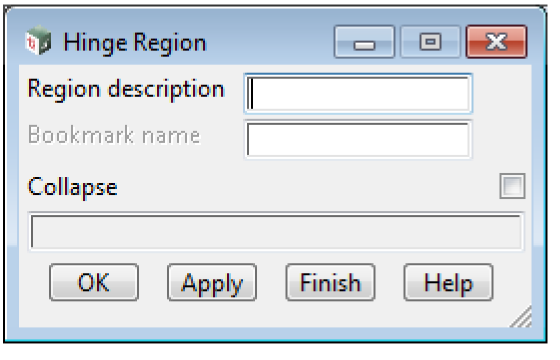
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

Go to the next section 21.2.1.10 Region or return to 21.2.1 MTF Hinge Modifiers.

21.2.1.10 Region

The **Region** option inserts a **Region command** into the grid.

Selecting **Region** brings up the **Hinge Region** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Region description text box

name for the Region.

Bookmark name text box

*if **not blank**, this is a secondary name, often a shorter name, that is used in the **Region** pop up rather than using the **Region description.***

*If **blank**, then when the grid is saved, the* **Bookmark name** *is set to be the same as the* **Region description**.

Collapse tick box

*if **ticked**, all the commands in the grid until the next **Region** command are collapsed into this Region command.*
*If **not ticked**, the commands in the grid until the next **Region** command are not collapsed.*

OK, Apply

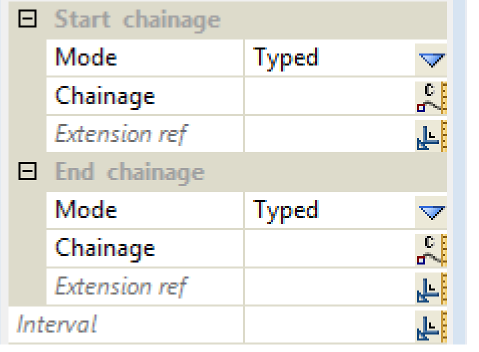
for information on these panel fields, see 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels.

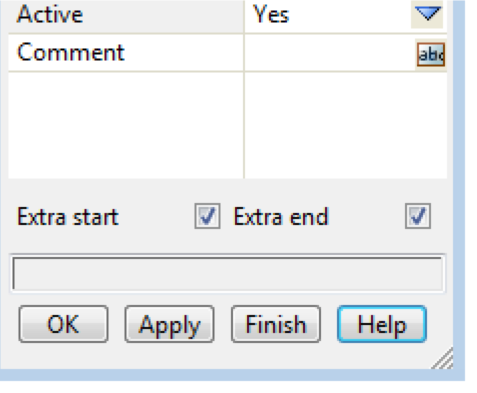
There are **Regions**, **Previous Region** and **Next Region** icons at the right hand side of the **Hinge Modifiers** panel that use this created *Region*. For information on using these icons and information on **Regions** in a grid, see 4.19.6 Grids in Panels.

Go to the next section 21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels or return to 21.2.1 MTF Hinge Modifiers.

21.2.1.11 Common Fields and Buttons on Hinge Modifier Panels

Most of the ***Hinge Modifier*** panels have the following common panels fields and buttons.





Start/End chainage smart chainage box Start (ref)/End (ref)

defines the start/end chainages for use in the Modifier.
For more information on Start/End Chainages and Modes, see 21.4 Smart Chainages

Interval real box

*if **not blank**, the interval to use to create cross sections and strings over the given chainage range.*
*If **blank**, the interval given by any **MTF Edit => Interval commands**, and/or the* **Section separation** *value from the* **Apply MTF** *panel, is used.*

Extra start tick box tick

*if **ticked**, add an extra x-section a distance* **Extra start/value** *millimetres **before** the start chainage. See* 21.2.7.4 MTF Setting Show Extra Start/End *and* 21.2.7.5 MTF Setting Extra Start/End value.

Extra end tick box tick

*if **ticked**, add an extra x-section a distance* **Extra start/value** *millimetres **before** the end chainage. See* 21.2.7.4 MTF Setting Show Extra Start/End *and* 21.2.7.5 MTF Setting Extra Start/End value.

Comment text box

comment to add to the Comment column for the row of the grid.

Active yes/no choice box

*if **yes**, use this modifier.*
*If **no**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

Go to the next section 21.2.2 Left and Right MTF Modifiers or return to 21.2.1 MTF Hinge Modifiers

21.2.2 Left and Right MTF Modifiers

In its **simplest** form, the **MTF** (**Modifiers and Templates File** defines what templates are used on either side of the hinge string, where the templates stop and start with linear interpolation between two templates over a chainage range.

For more complex work, **MTF Modifiers** are used to **modify** the strings defined by the templates, and even totally replace the use of templates and insert links and modify the inserted links and generate sections, strings and trimeshes.

Just as templates are defined on the left and the right side, there are ***left*** and ***right MTF Modifiers*** for working on the links on the left or right side of the Hinge string.

Most of the ***MTF Modifiers*** have a common methodology:

(a) an existing link from a template (referenced by its name from the template definition), or a new link that is created by an MTF Insert, can be removed or modified between given start and end chainages on the reference string.

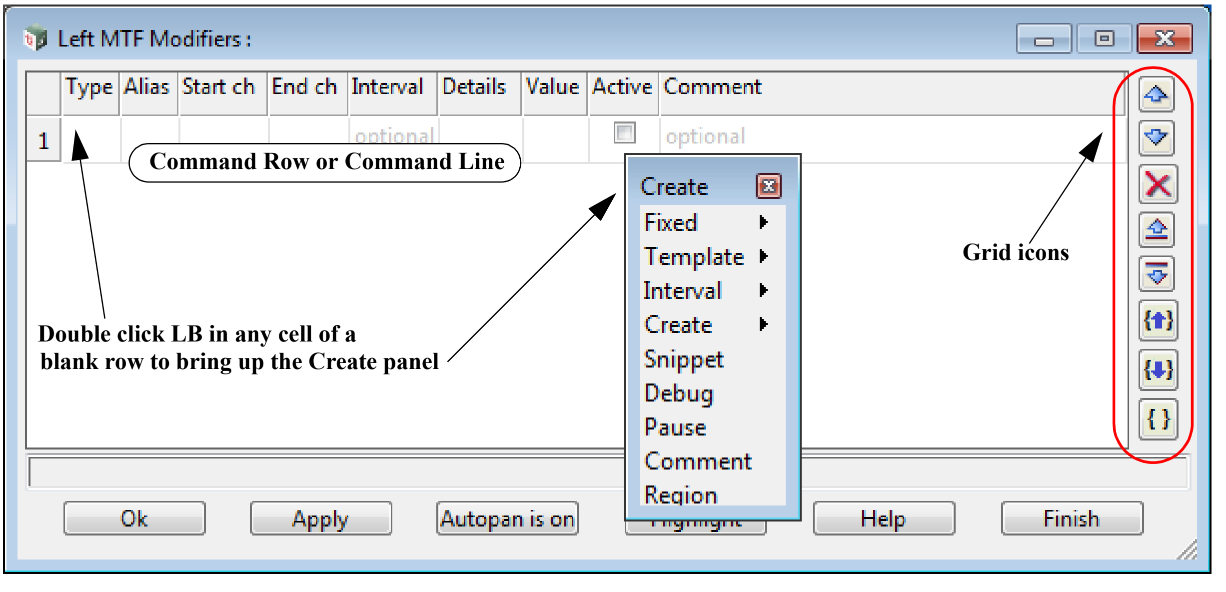
(b) values defining a link are modified over a given start and end chainage. How the values are modified depends on the particular modifier command.

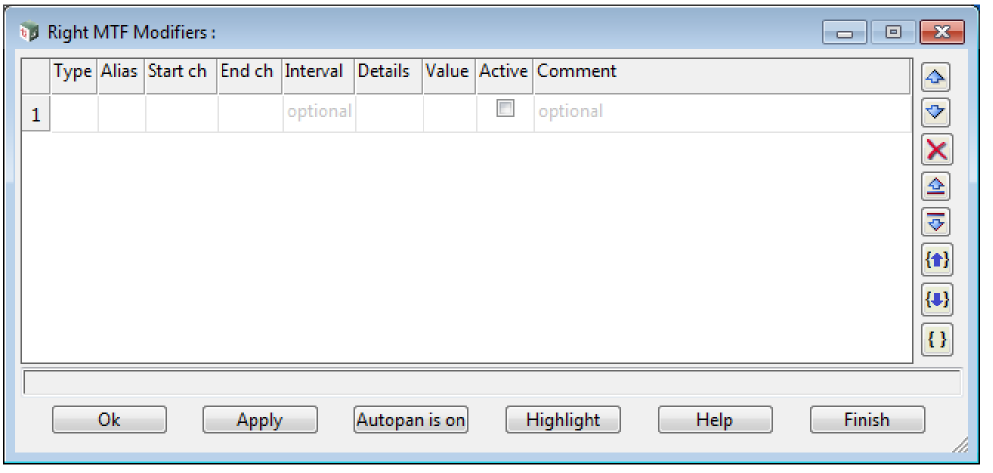
Note: regardless of how the link is originally defined (for example by width and xfall), any of the values width, height, xfall and slope then exist and can be modified. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

(c) more than one ***MTF modifier*** may exist for a link at a given chainage hence the order of the MTF modifiers is important.

Modify left option brings up the **Left MTF Modifiers** panel which is used to create and edit modifiers to use on the left hand side of the Hinge string.

Similarly the **Modify right** option brings up the **Right MTF Modifiers** panel which is used to create and edit modifiers on the right hand side of the Hinge string.





The **Left/Right MTF Modifiers** panel consists of a grid with of rows (or lines) with **Commands** in them, and an **OK** or **Apply** button to record the results.

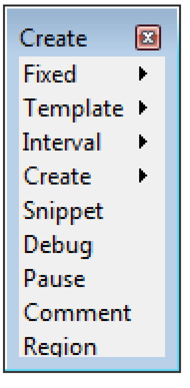
Left/Right MTF Modifier Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

The ***commands*** *in the* **Hinge Modifier** *grid are processed sequentially from the top to the bottom of the grid.*

When the Grid Row is Empty

If the row of the grid is ***empty****, clicking LB in the empty row will bring up the* **Create** *menu which contains all the available MTF Modifier commands.Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the* **Create** *menu.*



Selecting a menu item will bring up an associated panel which displays the information required for the MTF Modifier command. When the panel is filled in and **OK** or **Apply** *selected, the panel information is written out to the row of the grid and is known as a* **MTF modifier command** *or* **modifier command** *for short. For information on each of the Hinge Commands, see* 21.2.2.1 Create MTF Commands.

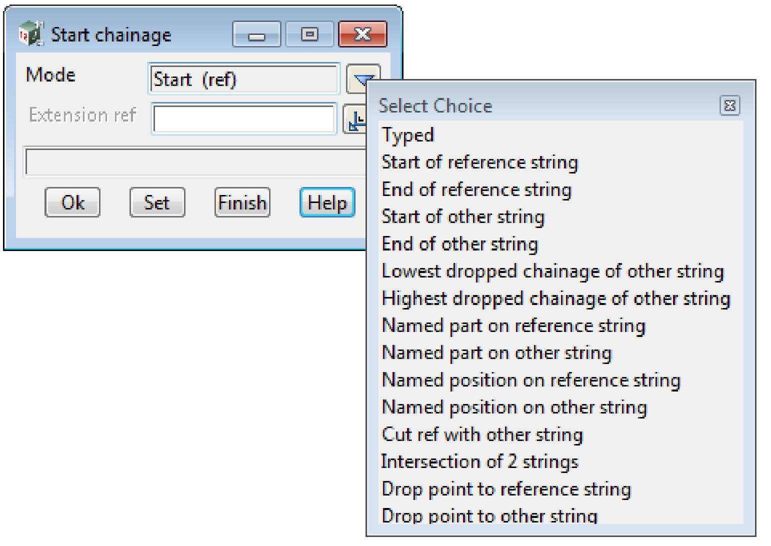
When the Grid Row is Not Empty

If the row of the grid is ***not empty*** *(and hence filled with a* **modifier command***) then clicking LB in the cell:*

(a) ***Type*** *will bring up the associated panel for the modifier command.*

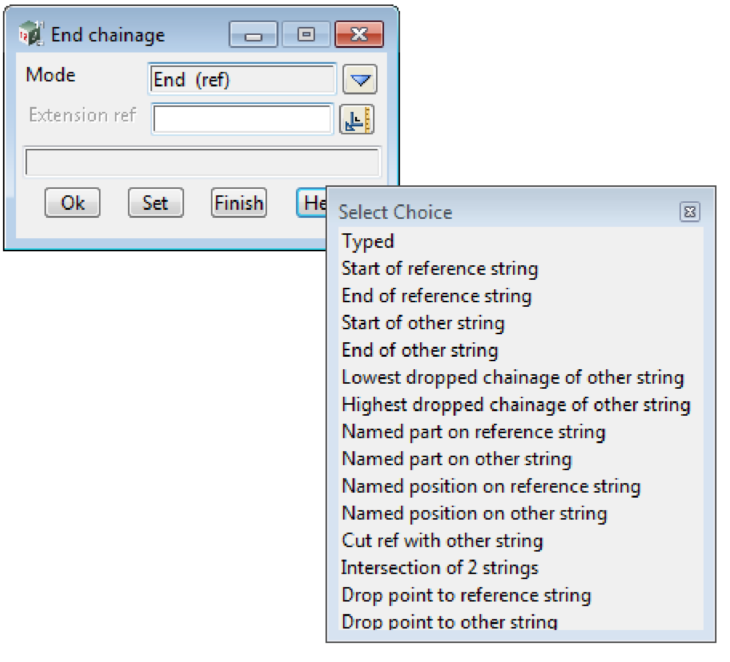
For information on each of the Hinge Commands, see 21.2.2.1 Create MTF Commands.

(b) ***Start chainage*** *cell brings up the Smart* ***Start Chainage*** *panel*



The **Start Chainage Mode** *will determine what other fields are also on the panel (for example* **Extension ref** *for* **Mode** ***Start of reference string****. For more information on Chainage Modes, see* 21.2.1 MTF Hinge Modifiers

(c) ***End Chainge*** *cell brings up the Smart* ***End Chainage*** *panel*



The **End Chainage Mode** *will determine what other fields are also on the panel (for example* **Extension ref** *for* **Mode** ***End of reference string****. For more information on Chainage Modes, see* 21.2.1 MTF Hinge Modifiers

(d) ***Interval*** *will allow a real value to be typed into the cell*

Note that the ***Interval*** *column will not appear in the grid if* ***Show interval column?*** *is* ***not*** *ticked in the MTF Settings. See* 21.2.7.8 MTF Setting Show Interval Column

(e) ***Extra Start****,* ***Extra End*** *or* ***Active*** *will toggle the* ***tick/not ticked***

Note that the ***Extra start*** *and* ***Extra end*** *columns will not appear in the grid if* ***Show extra start/ end column?*** *is* ***not*** *ticked in the MTF Settings. See* 21.2.7.6 MTF Setting Show Extra Start/ End column.

(f) ***Comment*** *will allow text to be typed into the cell*

Note that clicking in the **Type**, **Start chainage**, **End chainage**, **Interval**, **Extra Start**, **Extra End**, **Active** *and* **Comment** *cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.*

Buttons at Bottom

OK button

OK *stores the values in the fields and removes the panel BUT no* ***recalc*** *is done.*

Apply button

Apply *stores the values in the grid and leaves the panel on the screen.*

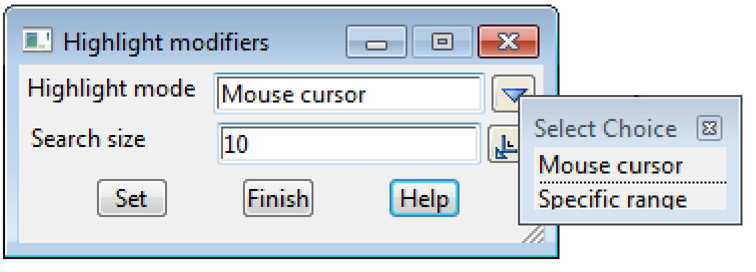
If ***Auto recalc*** *is* ***ticked*** *in the MTF, then whenever the* ***Apply*** *button is clicked, a* ***recalc*** *of the associated* ***Apply Many*** *for the MTF is done.*

Autopan on/off button

when clicked to say **Autopan is on** *then if the chainage range is not in the view that the Reference string is on then the view will be panned so that it is on the view. See*21.2.2.2 Fixed Link Modifiers.

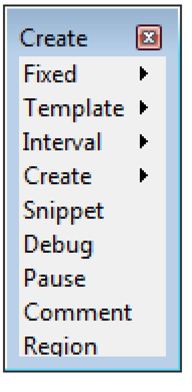
Highlight button

clicking the ***Highlight*** *button brings up the* **Highlight Modifiers** *panel.*



*See*21.2.2.1.6 Highlight Button

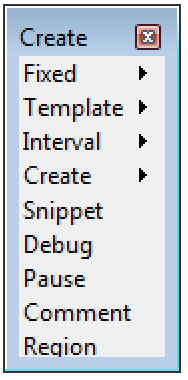
Each of the **Create** commands will be descried in the following sections.



The **Create** commands for the l***eft side modifiers*** and the ***right side modifiers*** work in the same way so the modifiers will only be described the once.

Continue to the next section 21.2.2.1 Create MTF Commands.

21.2.2.1 Create MTF Commands



modify fixed section
modify the cut, fill, final cut/fill of a template
define interval values, aliases etc
create shapes, strings, tins and trimeshes
insert snippets
turn on debugging
pause the MTF
add a comment row
define a region in the grid

When brought up from **Modifiers left**, the **Create** options work on the **links** are on the **left hand side** of the **Hinge string**. And on the left, the links are placed from right to left so the **start of a left side link** is at the **right hand end of the link**. See 21.1.1.1 MTF Links, Points and Strings.

When brought up from **Modifiers right**, the **Create** options work on the **links** are on the **right hand side** of the **Hinge string**. And on the right, the links are placed from left to right so the **start of a right side link** is at the **left hand end of the link**. See 21.1.1.1 MTF Links, Points and Strings.

For the options see

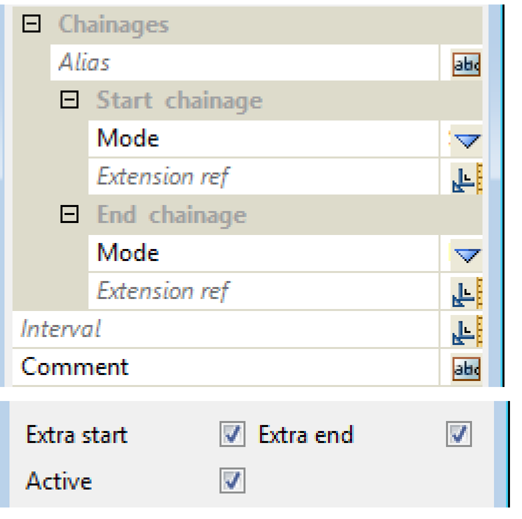
Fixed	21.2.2.2 Fixed Link Modifiers
Template	21.2.2.3 Template Modifiers
Interval	21.2.2.4 Interval
Create	21.2.2.5 MTF Create
Snippet	21.2.2.6 Snippet
Debug	21.2.2.7 Debug
Pause	21.2.2.8 Pause
Comment	21.2.2.9 Comment
Region	21.2.2.10 Region

For general information about the MTF Commands, see

21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels
21.2.2.1.2 Link or Link(s)
21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels
21.2.2.1.4 Alias for MTF Modifiers
21.2.2.1.5 Autopan Button
21.2.2.1.6 Highlight Button

21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels

Most of the ***Modifier*** panels have the following common panels fields.



The fields and buttons have the following functions.

Field Description Type Defaults Pop-Up

Alias text box

*if **not blank**, a text name that can be used to refer to for this row in the grid.*

*The **Alias** is a reference to this command in the **Left/Right MTF Modifiers** grid that can be referred to by Smart Chainages used in the **Left/Right MTF Modifiers** commands in the grid*

See 21.2.2.1.4 Alias for MTF Modifiers

Start/End chainage smart chainage box Start (ref)/End (ref)

defines the start/end chainages for use in the Modifier.

For more information on Start/End Chainages and Modes, see 21.4 Smart Chainages

Interval real box

*if **not blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the interval given by any **MTF Edit** => **Interval commands**, and/or the* **Section separation** *value from the* **Apply MTF** *panel, is used.*

Extra start tick box tick

*if **ticked**, add an extra x-section a distance* **Extra start/value** *millimetres **before** the start chainage. See* 21.2.7.4 MTF Setting Show Extra Start/End *and* 21.2.7.5 MTF Setting Extra Start/End value.

Extra end tick box tick

*if **ticked**, add an extra x-section a distance* **Extra start/value** *millimetres **before** the end chainage. See* 21.2.7.4 MTF Setting Show Extra Start/End *and* 21.2.7.5 MTF Setting Extra Start/End value.

Comment text box

comment to add to the Comment column for the row of the grid.

Active tick box tick

*if **ticked**, use this modifier.*
*If **not ticked**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

If the ***MTF*** *is being used in an* ***Apply MTF*** *and* ***Auto recalc*** *is ticked in the MTF, then whenever the* ***Apply*** *button is clicked, a* ***recalc*** *of the associated* ***Apply MTF*** *for the MTF is done.*

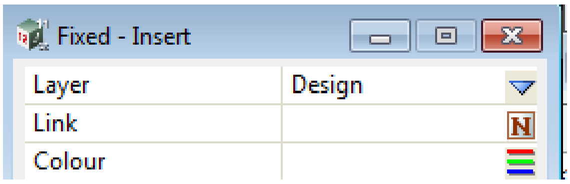
Go to the next section 21.2.2.1.2 Link or Link(s) or return to 21.2.2.1 Create MTF Commands

21.2.2.1.2 Link or Link(s)

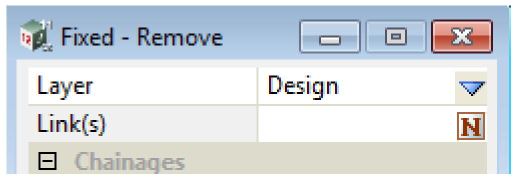
Some ***Modifier*** panels allow more than one link name to be specified.

If only one Link is allowed, then the panel field will be **Link**.

If more than on Link is allowed, then the panel field will be **Link(s)**.



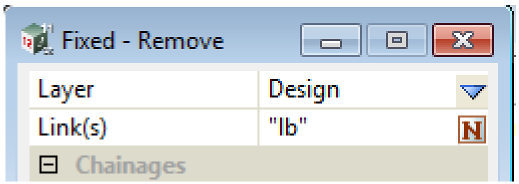
Option that allows only one Link name



Option that allows more than one Link name

When multiple Links are allowed, each Link name is separated by one or more spaces. If the Link name contains a space then it must be surrounded by double quotes. For example "name with a space".

When an MTF panel that allows multiple Link names is edited, all the Link names will be displayed surrounded by double quotes. This applies even if there is only one Link name in the field.



Go to the next section 21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels or return to 21.2.2.1 Create MTF Commands

21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels

When creating a link, the ***Modifier*** panels have the following common panels fields.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Width	real box		measure menu

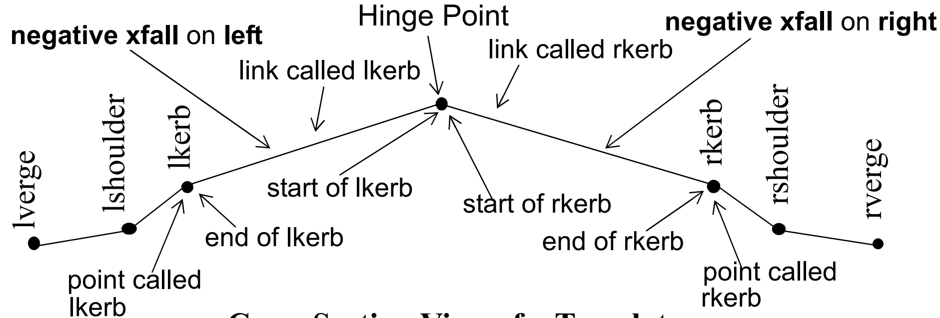
width of the link.

Height	real box		measure menu

the z-value of the end of the link minus the z-value of the start of the link. That is, the delta z for the link.

xfall	real box		measure menu

the crossfall of the link. This is the percent grade and positive is up and negative down when measured in the direction of the link. Note that for a link on the left side, the link goes from right to left. And for a link on the right hand side, a link goes from left to right.



Cross Section View of a Template

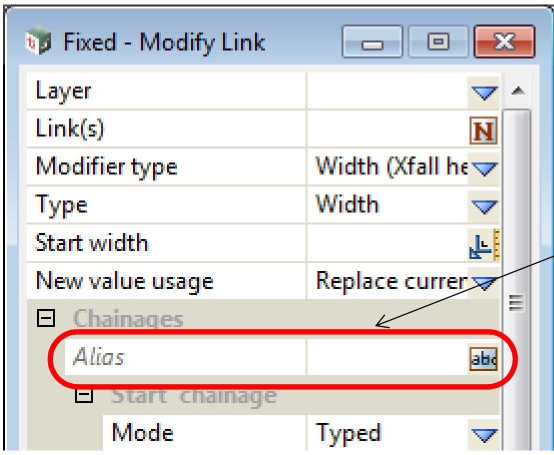
Go to the next section 21.2.2.1.4 Alias for MTF Modifiers or return to 21.2.2.1 Create MTF Commands

21.2.2.1.4 Alias for MTF Modifiers

For each *Left/Right Modifiers* Command, there is an optional text field called **Alias**.

An **Alias** can be used to uniquely refer to a particular command in the **Left** or **Right MTF Modifiers** grid **independently** of its row number.

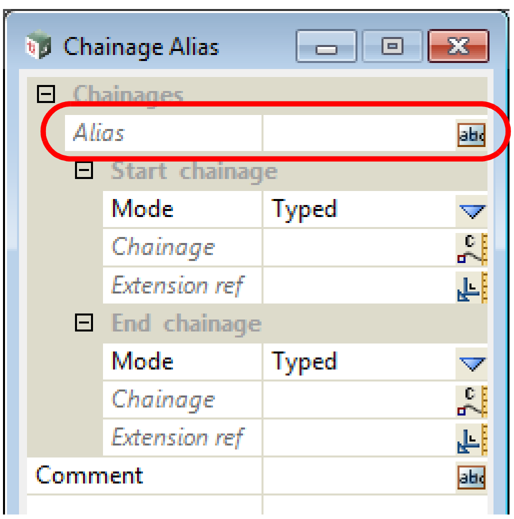
Most **MTF Commands** have an **Alias** field and if it is filled in then the value will be the **Alias** for that row.



If text is entered into the **Alias** field then that becomes the **Alias** for this row

There is also a special command **Chainage Alias** that defines an **Alias** for that row and those Start and End Chainages. See 21.2.2.4.1 Chainage Alias.

Apart from defining an **Alias** and associated **Start** and **End Chainages** for that row, **Chainage Alias** has no other effect.



If text is entered into the **Alias** field then that becomes the **Alias** for this row.

Once an **Alias** exists, it can be used in the two **Smart Chainage** modes, **Relative to Alias Start** and **Relative to Alias End**. See 21.4.19 Relative to Alias Start and 21.4.20 Relative to Alias End.

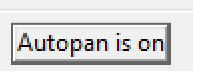
If an **Alias** is given for a command in the **Left MTF Modifiers** panel then it must be unique amongst all the Aliases for the **Left MTF Modifiers** commands.

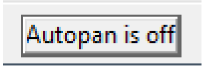
Similarly if an **Alias** is given for a command in the **Right MTF Modifiers** panel then it must be unique amongst all the Aliases for the **Right MTF Modifiers** commands.

Go to the next section 21.2.2.1.5 Autopan Button or return to 21.2.2.1 Create MTF Commands

21.2.2.1.5 Autopan Button

The **Autopan** button is at the button of the **Left/Right MTF Modifiers** panels and clicking on the button will toggle between the **on**/**off** states.

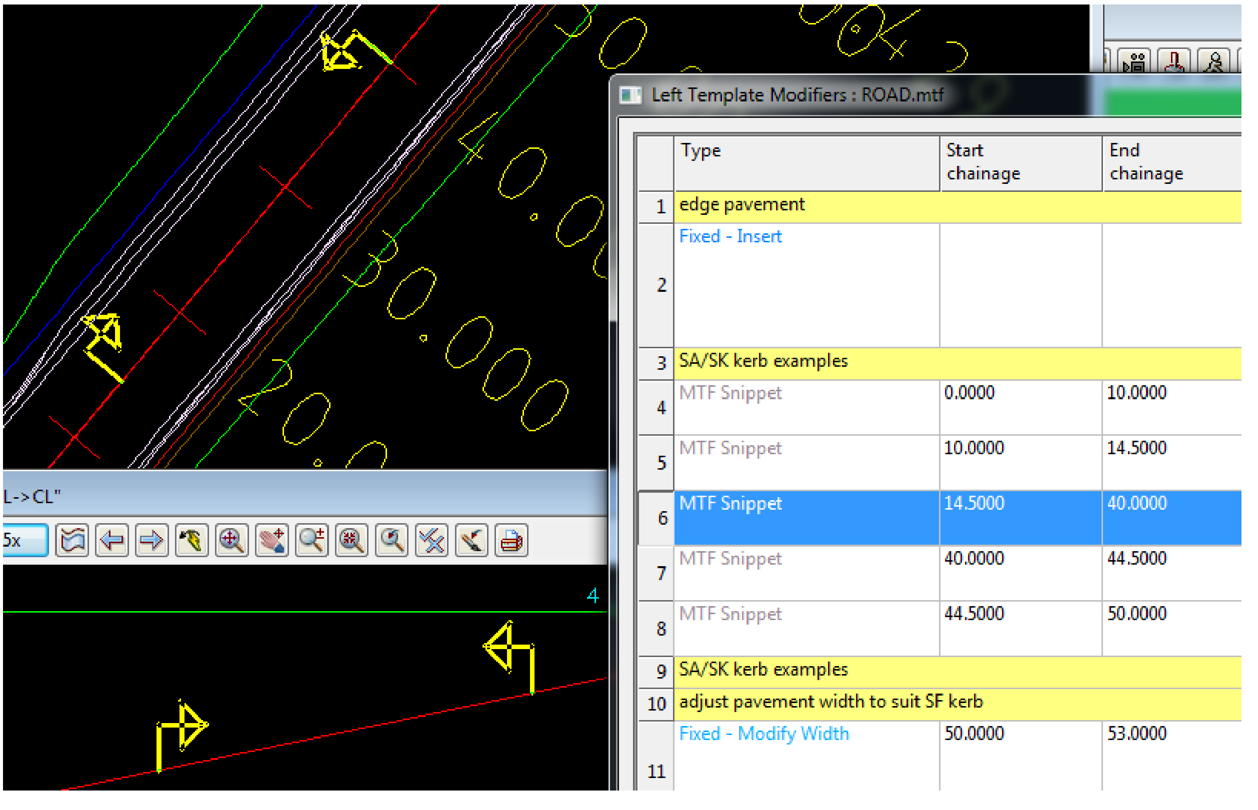




The **Autopan** button is used is conjunction with clicking LB in the Type, Start chainage and End Chainage columns.

For all **plan** views that the ***Reference string*** for the MTF is on, and all **section views** where the ***Reference string*** is ***profiled***:, clicking in the grid on the **Left/Right MTF Modifiers** panels will have the following effect:

(a) if LB is clicked on the ***number*** in the grid of a command then the entire line in the grid highlights, and highlight arrows are placed at the Start and End chainage of the command.

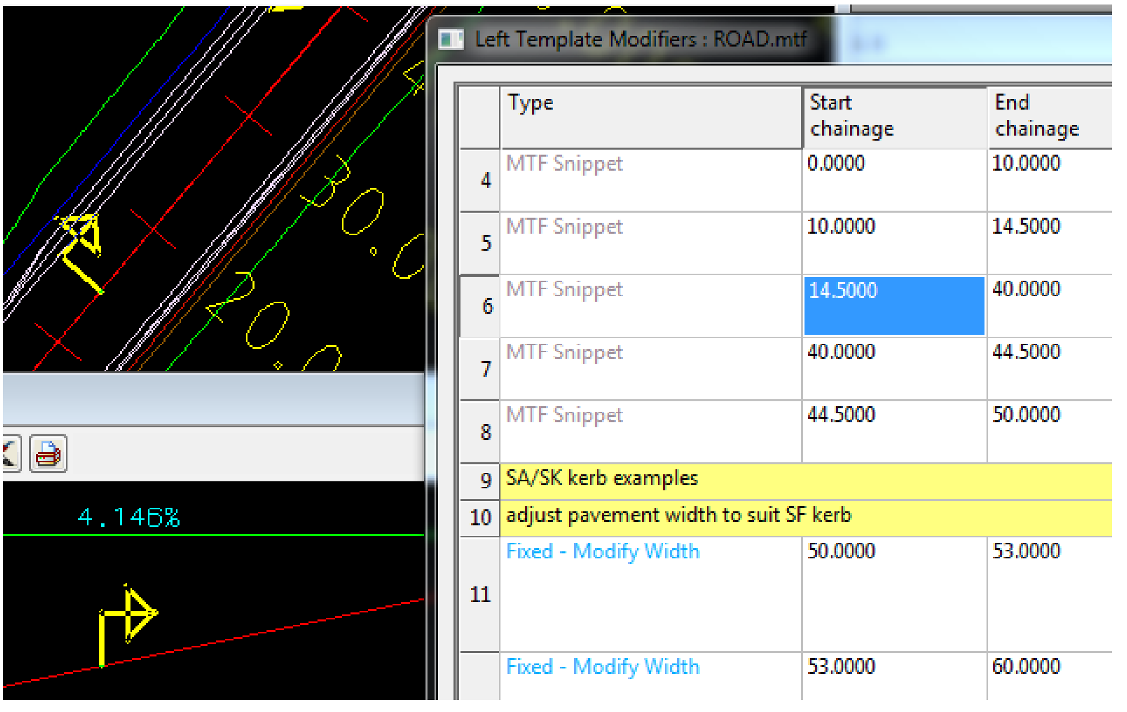


Important Note: the scale and the centre point of the views are not changed so if the Start/ End chainage is not visible on the view, then the highlight arrow for the Start/End will not appear.

(b) if LB is clicked in the ***Start chainage*** column of a command, then that cell of the grid highlights, and

If ***Autopan is on*** then the plan and/or section views will pan so that the Start chainage highlight arrow shows on the views.

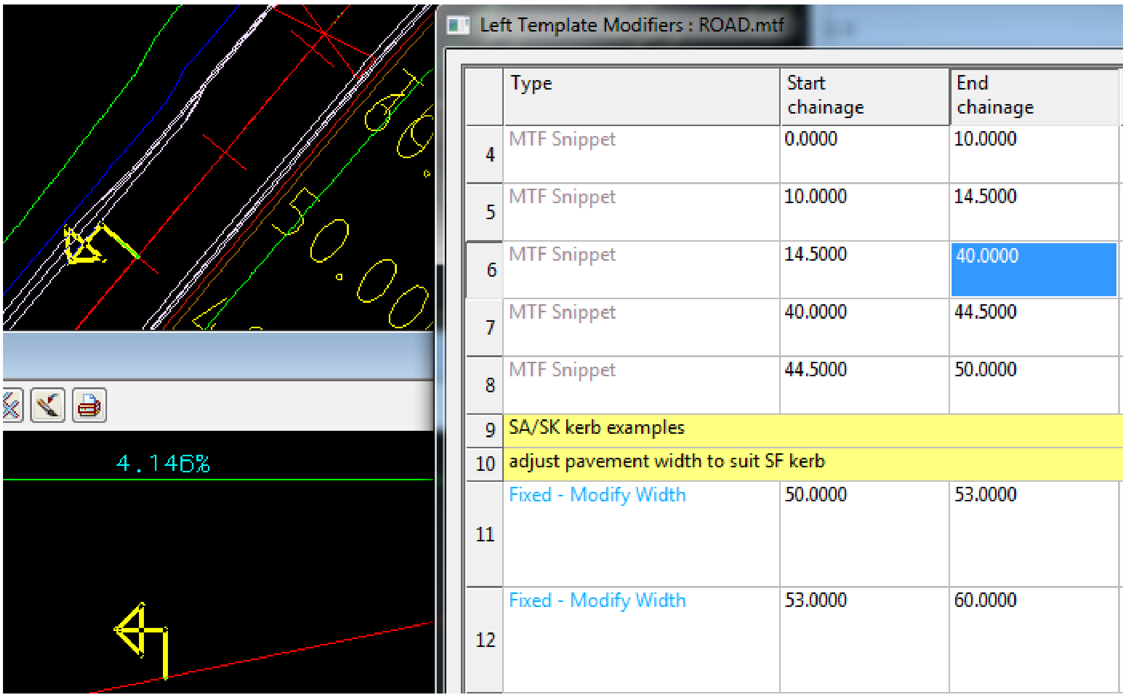
If ***Autopan is off*** then the Start chainage highlight arrow occurs but the view does not change. So the Start chainage highlight arrow will only show if the Start chainage is already visible on the plan and/or section views.



(c) if LB is clicked in the ***End chainage*** column of a command, then that cell of the grid highlights, and

If ***Autopan is on*** then the plan and/or section views will pan so that the End chainage highlight arrow shows on the views.

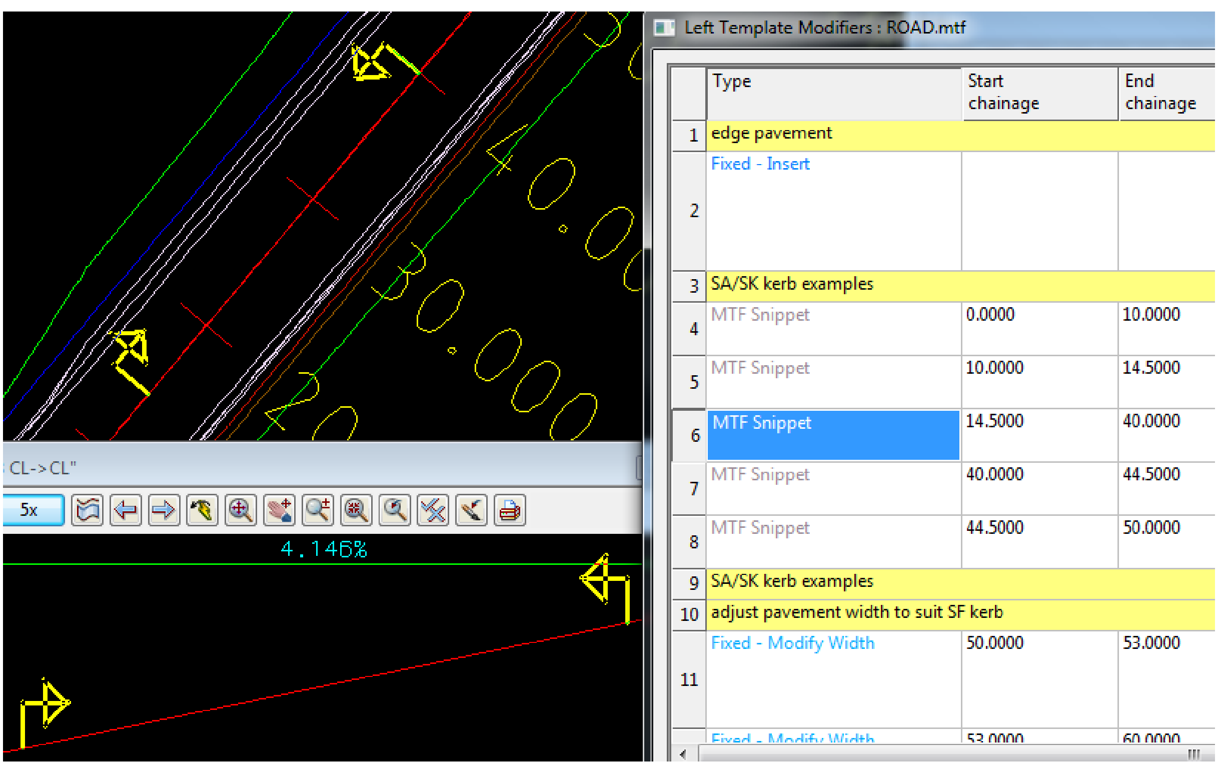
If ***Autopan is off*** then the End chainage highlight arrow occurs but the view does not change. So the End chainage highlight arrow will only show if the End chainage is already visible on the plan and/or section views.



(d) if LB is clicked in the ***Type*** column of a command, then that cell of the grid highlights, and

If ***Autopan is on*** then the plan and/or section views will do a fit about the Start chainage and End chainage so that both the Start chainage highlight arrow and the End chainage highlight arrow are visible in the plan and/or section views.

If ***Autopan is off*** then the plan and/or section views do not change. The Start chainage highlight arrow and the End chainage highlight arrow are turned on but they will only be visible if the Start chainage and/or End chainage are already visible on the views.



LJG??

reference string If ***Autopan is on*** is showing AND the ***Reference string*** for the MTF is on a plan view:

(a) whenever you click on ***Type*** column in the grid for a command that does not involve the entire string, the scale and centre of the view is modified so that the *Start* and *End* chainage extents of the command are displayed in the plan view (with the addition of an extra percentage that is set in env.4d)

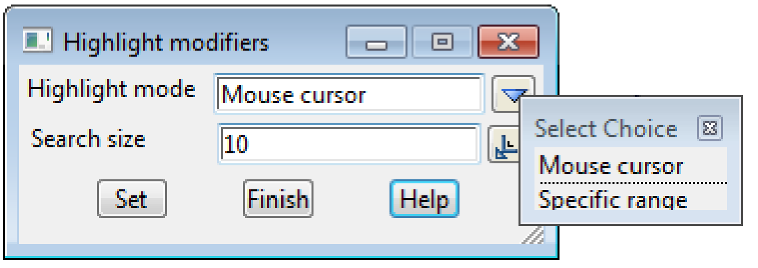
(b) whenever you click on ***Start* chainage** column of a command that does not involve the entire string, the scale and centre of the view is modified so that the *Start* and *End* chainage extents of the command are displayed in the plan view (with the addition of an extra percentage that is set in env.4d)

Go to the next section 21.2.2.1.6 Highlight Button or return to 21.2.2.1 Create MTF Commands

21.2.2.1.6 Highlight Button

Highlight button

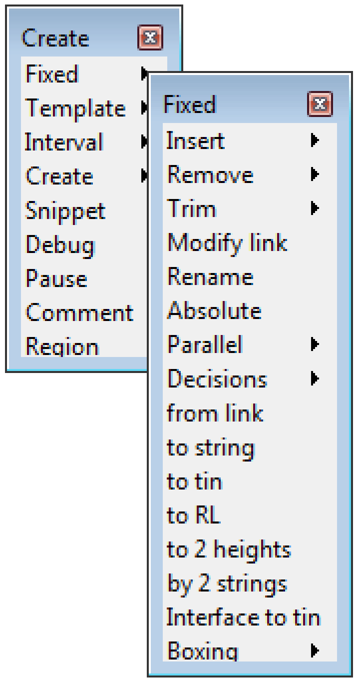
*clicking the **Highlight** button brings up the* **Highlight Modifiers** *panel.*



Return to 21.2 MTF Edit.

21.2.2.2 Fixed Link Modifiers

The **Fixed** walk-right brings up the **Fixed** menu with options to insert and modify the fixed links.

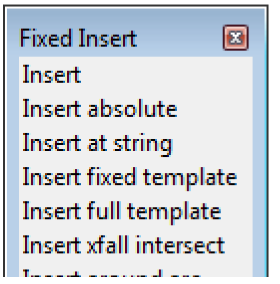


For

Insert	21.2.2.2.1 Fixed Link - Insert
Remove	21.2.2.2.2 Fixed Link - Remove
Trim	21.2.2.2.3 Fixed - Trim
Modify link	21.2.2.2.4 Fixed - Modify Link
Rename	21.2.2.2.5 Fixed Link - Rename Link
Absolute	21.2.2.2.6 Fixed Link - Absolute to a Base Link
Parallel	21.2.2.2.7 Fixed Link- Parallel
Decisions	21.2.2.2.8 Fixed Link - Decisions
from link	21.2.2.2.9 Fixed Link - From link
to string	21.2.2.2.10 Fixed Link - To String
to tin	21.2.2.2.11 Fixed Link - To Tin
to RL	21.2.2.2.12 Fixed - To RL
to 2 heights	21.2.2.2.13 Fixed - to 2 Heights
to 2 strings	21.2.2.2.14 Fixed - by 2 strings
Interface to tin	21.2.2.2.15 Fixed - Interface to Tin
Boxing	21.2.2.2.16 Fixed - Boxing

21.2.2.2.1 Fixed Link - Insert

The **Fixed Insert** walk-right brings up the **Fixed Insert** menu with options to insert fixed links, insert a fixed part of a template, and insert a full template.



For

Insert	21.2.2.2.1.1 Insert a Fixed Link
Insert absolute	21.2.2.2.1.2 Insert a Fixed Link Absolute
Insert at string	21.2.2.2.1.3 Insert a Fixed Link at a String
Insert fixed template	21.2.2.2.1.4 Insert Fixed Links from a Template
Insert full template	21.2.2.2.1.5 Insert Full Template
Insert xfall intersect	21.2.2.2.1.6 Fixed Link - Insert Xfall Intersect

21.2.2.2.1.1 Insert a Fixed Link

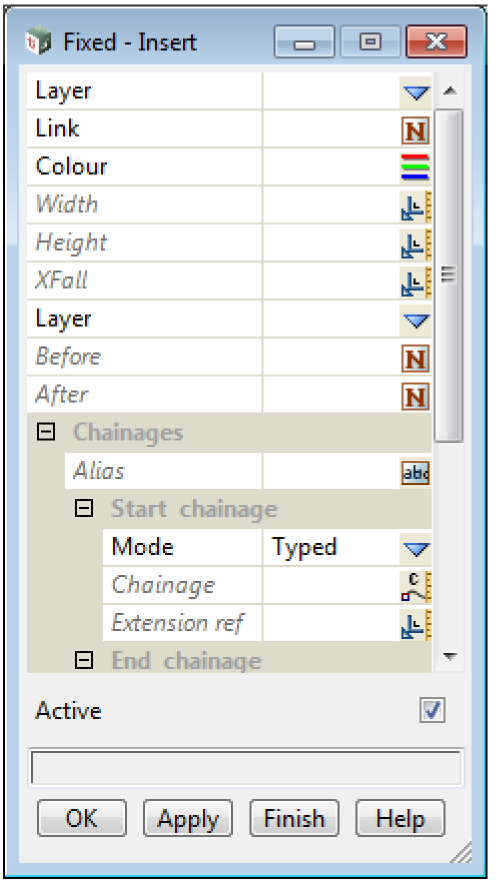
Fixed links can be inserted by specifying either width and height, width and xfall, or height and xfall, where width/height/xfall are **measured** from the **last fixed link before** this link.

Note - height is not a z-value (RL) but the difference in z-values between the start and the end of the link.

It doesn't matter which of the two is used to define the link, the third (plus slope) can be calculated.*See* 21.2 MTF Edit.

So the link can be modified by varying the width, xfall, height or slope.

Selecting **Insert** brings up the **Fixed - Insert** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer for the new link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link	text box		

name for the new link.

Colour	colour box		available colours

colour of the link being created.

Width /Height/Xfall	real box		measures menu

width/ height/ crossfall of the link being created - only use two of the three.

For more information on these panel fields, see 21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels.

Before choice box select name menu

*if **not blank**, the name of the link to insert the new link before.*
*If **blank** and **After** is **blank**, the link is appended to the end of the fixed part of the template.*

After choice box select name menu

*if **Before** is **not blank**, **After** is ignored.*
*If **not blank** and **Before** is **blank**, the name of the link to insert the new link after.*
*If **blank** and **Before** is **blank**, **Before** is used.*
***Note**: **One** of **Before** or **After** must be **blank**. If they are both blank then **Before** takes precedence over **After**.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for inserting the new link

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.1.2 Insert a Fixed Link Absolute or return to 21.2.2.2.1 Fixed Link - Insert.

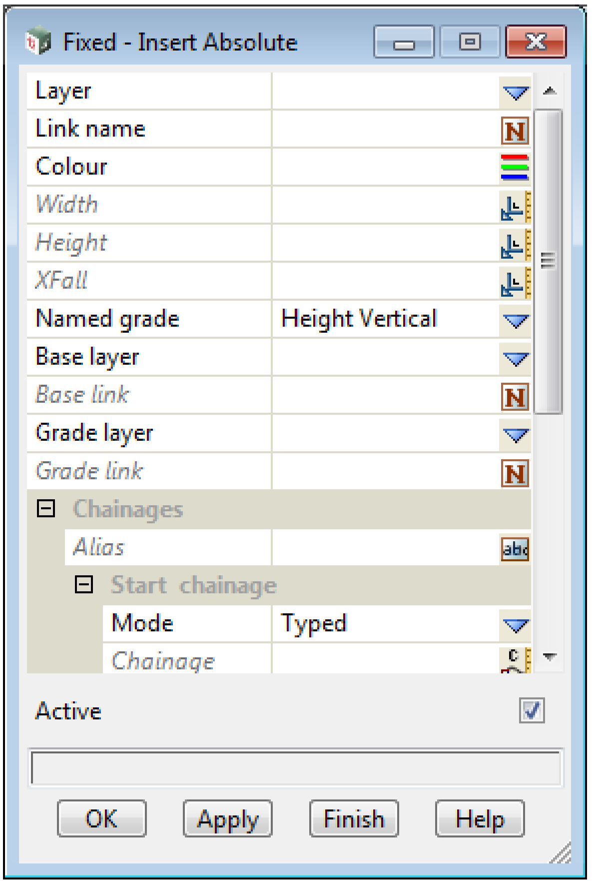
21.2.2.2.1.2 Insert a Fixed Link Absolute

Fixed links can be inserted by specifying either width and height, width and xfall, or height and xfall, where the width/height/xfall are **measured from a Base link,** or a **combination** of a **Base** link and a **Grade** link.

The new inserted link must end up outside any previous links.

Note - height is not a z-value (RL) but a delta height.

Selecting **Insert absolute** brings up the **Fixed - Insert Absolute** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer for the new link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	names box		select name menu

name for the new link.

***Note**: the new inserted link must end up outside any previous links.*

Colour	colour box		available colours

colour of the link being created.

Width /height/xfall	input		measures menu

width/ height/ crossfall of the link being created - only use two of the three.

For more information on these panel fields, see 21.2.2.1.3 Width, Height and Xfall Fields on MTF Modifier Panels.

If a Grade link is given, only the combinations width and crossfall, or width and height, are allowed.

If there is no Grade link, any two of the three can be used.

Base link, Grade link names box select name menu

*If **Grade link is blank**:*

any combination of two of width, height an xfall can be used to define the new link.

if Base link is non blank, then it is the name of the link to take the width/height/xfall from.

If Base link is blank, then the option acts as a normal Insert and the width/height/xfall are taken from the last fixed link before this insert.

*If **Grade link is not blank**:*

only the combinations width and crossfall, or width and height, are allowed.

Width:

*if Base link is non blank, then it is the name of the link to take the **width** from.*

*If Base link is blank, then the **width** is from the last fixed link before this insert.*

Xfall or Height

*If **xfall** is given, then the xfall is applied from the Grade link.*

*If **height** is given, then the height is added to the height of the Grade link.*

***Note**: the new inserted link must end up outside any previous links.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for inserting the new link

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

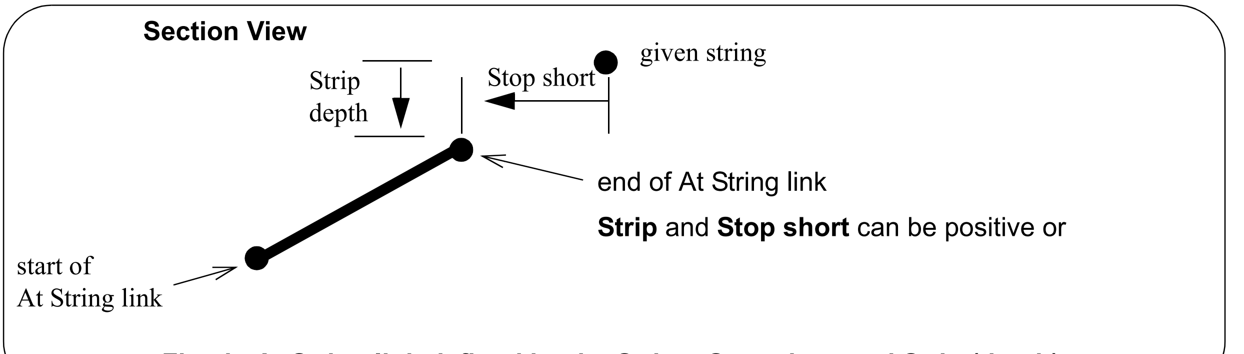
Go to the next section 21.2.2.2.1.3 Insert a Fixed Link at a String or return to 21.2.2.2.1 Fixed Link - Insert.

21.2.2.2.1.3 Insert a Fixed Link at a String

The **Insert at string** modifier copies an existing string between the two given chainages and inserts it as a link of the template.

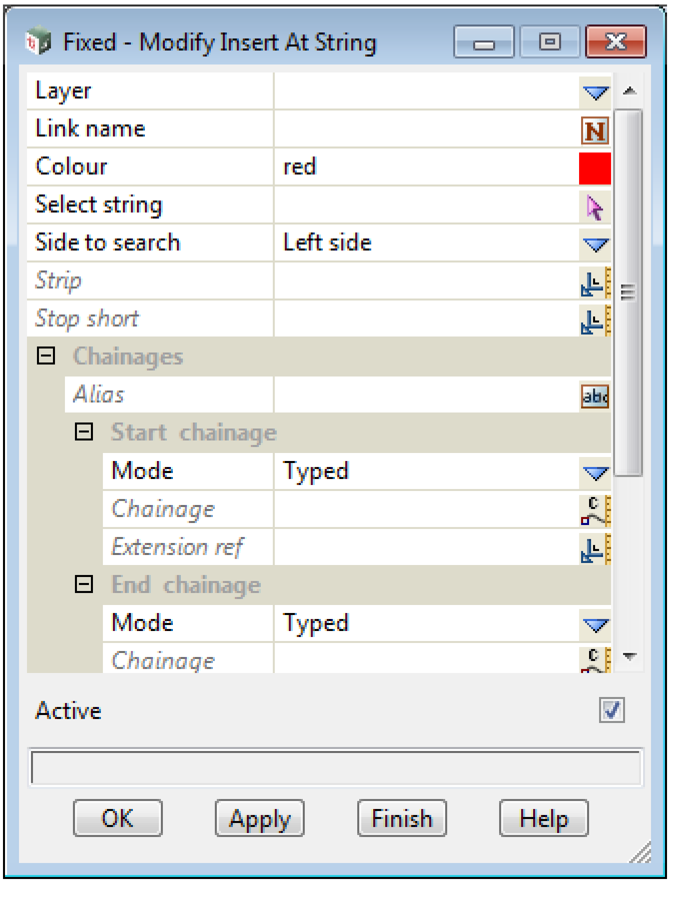
The **Insert at string** copies an existing string between the two given chainages and inserts it as a link of the template. The created link can also be given an offset and depth from the string.

Hence the end of the new link is constructed so that it is a given plan distance **Stop short** from the ***string***, and stops at the depth **Strip *below*** the ***string***.



Fixed - At String link defined by the String, Stop short and Strip (depth).

Selecting **Insert at string** brings up the **Fixed - Modify Insert at String** panel



The new fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

New link type choice box Width and Xfall, Width and Height, Height and Xfall

states how the link is to be defined.

Layer layer box available Layers

Layer for the new link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name names box select name menu

name for the new link.

Colour colour box available colours

colour for the new link

Strip real box measures menu

the new link is constructed so that its end is **Strip** *below the selected string.*

Strip *is a depth and is positive in the downward direction It can be positive or negative.*

Stop short real box measures menu

the new link is constructed so that its end is the plan distance **Stop short** *of the selected string.*

When the command is a Left Modifier, positive plan distance is measured from the Hinge string as zero and then going out to the left.

When the command is a Right Modifier, positive plan distance is measured from the Hinge string as zero and then going out to the right.

Stop short *can be positive or negative.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for inserting the new link

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Select string string select box

select the string to copy as a link

Side to search choice box Left side, Right side, Both sides

side to search to find the string.

Comment, **Extra start**, **Extra End, Active**

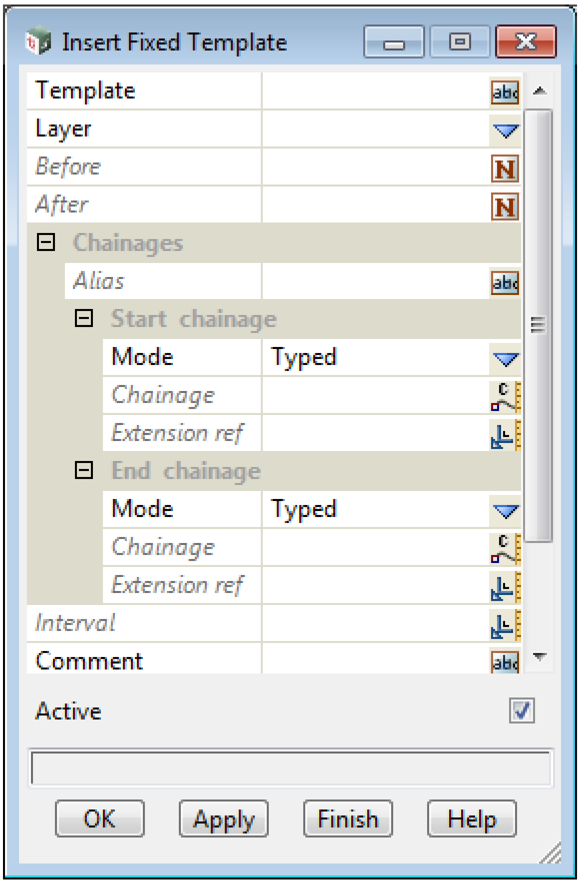
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.1.4 Insert Fixed Links from a Template or return to 21.2.2.2.1 Fixed Link - Insert.

21.2.2.2.1.4 Insert Fixed Links from a Template

The **Insert fixed template** modifier inserts all the fixed links from an existing Template.

Selecting **Insert fixed template** brings up the **Insert Fixed Template** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		select template menu

the name of the Template to take the fixed links from.

Layer	layer box		available Layers

Layer for the new links. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Before	choice box		select name menu

*if **not blank**, the fixed links from the selected template are inserted before the given link.*
*If **blank** and **After** is **blank**, the fixed links from the selected template are appended to the end of the existing fixed links.*

After	choice box		select name menu

*if **Before** is **not blank**, **After** is ignored.*
*If **not blank** and **Before** is **blank**, the fixed links from the selected template are inserted after the given link.*
*If **blank** and **Before** is **blank**, **Before** is used.*
***Note**: **One** of **Before** or **After** must be **blank**. If they are both blank then **Before** takes precedence over **After**.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for inserting the new fixed links

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

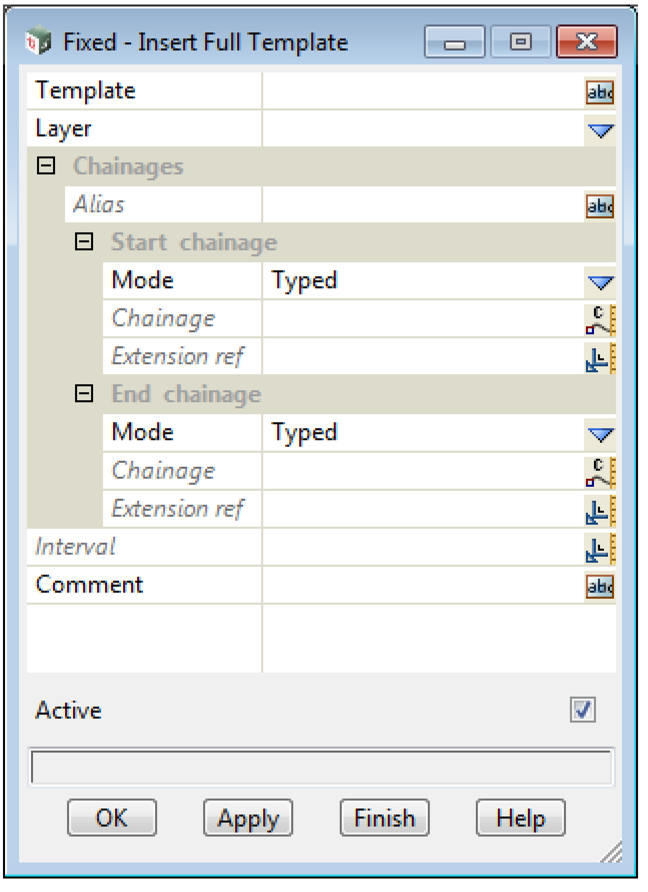
Go to the next section 21.2.2.2.1.5 Insert Full Template or return to 21.2.2.2.1 Fixed Link - Insert.

21.2.2.2.1.5 Insert Full Template

The **Insert Full Template** ***inserts*** all the fixed links from a selected template after the existing fixed links **AND** also ***replaces*** the decision, cut, fill and final cut/fill links of the existing template with those from the selected template.

So the option **leaves** the existing fixed links from the template but **removes the existing** decision, cut, fill and final cut/fill links in the template.

Selecting **Insert Full Template** brings up the **Fixed - Insert Full Template** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		select template menu

the name of the template to take the fixed, decision, cut, fill and final cut/fill links from.

Layer	layer box		available Layers

Layer for the new links. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for inserting the new fixed links

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.1.6 Fixed Link - Insert Xfall Intersect or return to 21.2.2.2.1 Fixed Link - Insert.

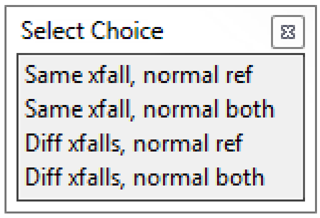
21.2.2.2.1.6 Fixed Link - Insert Xfall Intersect

The **Xfall insert** modifier **inserts** a new link.

And the new link is created by coming off the last link of the fixed template before the ***Insert Xfall Intersect*** command, and going out from that last fixed link in a variety of ways and meeting a **selected string**.

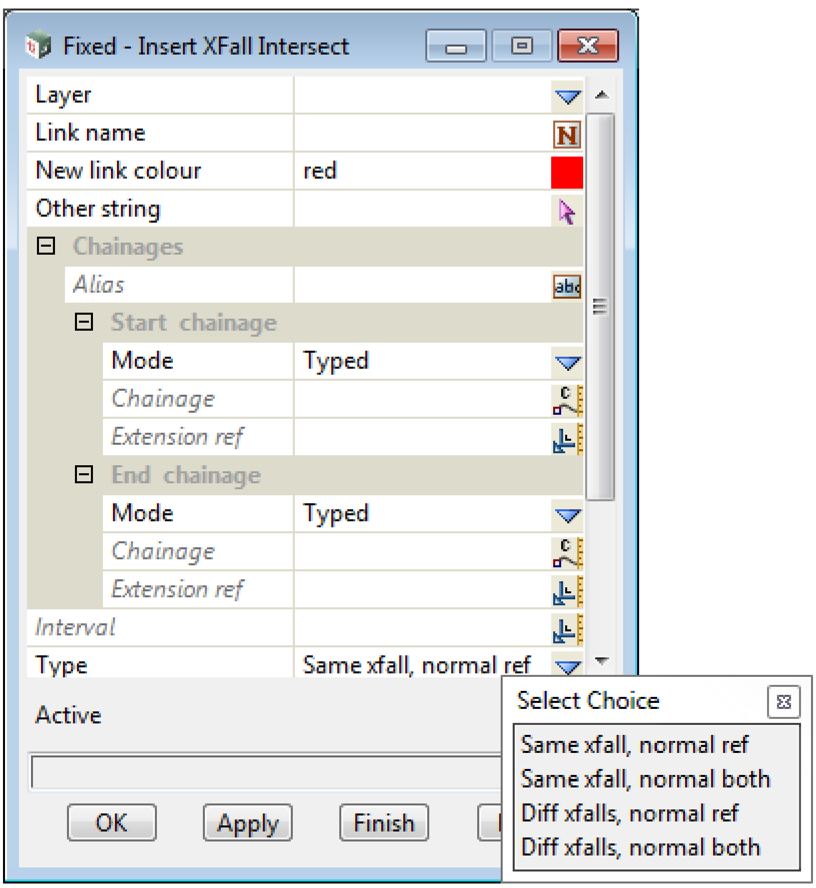
For example, over the chainage range, a given xfall is taken from the last link and the selected string, and the new link is the intersection of the two xfalls.

The different methods for creating the new link are:



and for the definitions go to 21.2.2.2.1.6.1 Fixed - Calculating the New Link for each Type.

Selecting **Insert xfall intersect** brings up the **Fixed - Xfall Intersect** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer for the new link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Field Description	Type	Defaults	Pop-Up
Link name	name box		available names

name of the new link.

New link colour colour box available colours

colour of the new link.

Other String string select

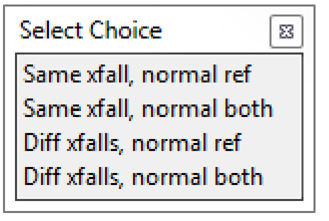
select the secondary string to use in the methods for creating the new link.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for inserting the new fixed links

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Type choice box



For the types of ways to create the new link, go to 21.2.2.2.1.6.1 Fixed - Calculating the New Link for each Type

Xfall, Xfall hinge, Xfall sec etc

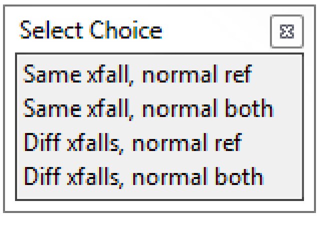
which of these fields are present, and what they are for, depends on **Type**.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.2.1 Fixed Link - Insert.

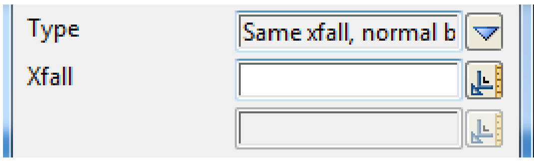
21.2.2.2.1.6.1 Fixed - Calculating the New Link for each Type



for the definitions of the calculations for each choice

go to Same Xfall and Normal to Reference String
Same Xfall and Normal to Reference String and to Other String
Two Xfalls and Normal to Reference String
Two Xfalls and Normal to Reference String and to Other String

Same Xfall and Normal to Reference String

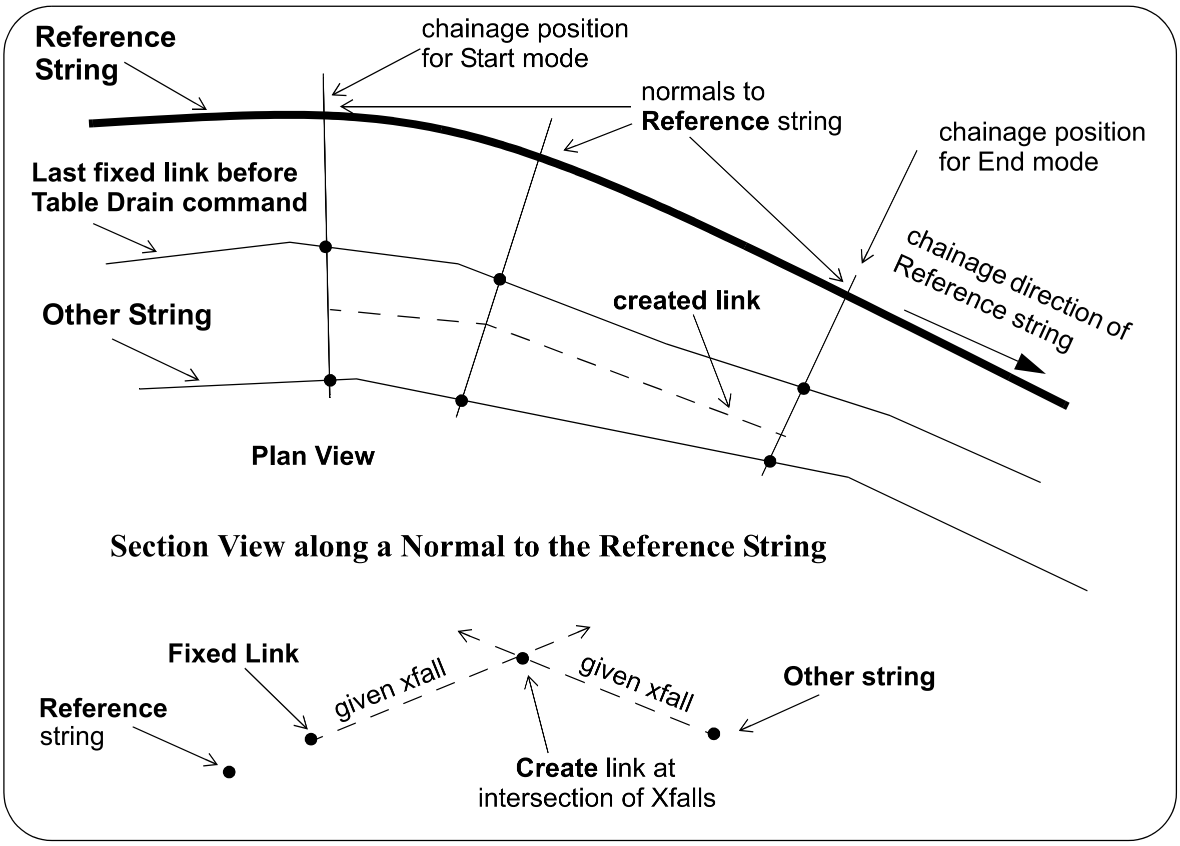


This option requires a **Xfall**.

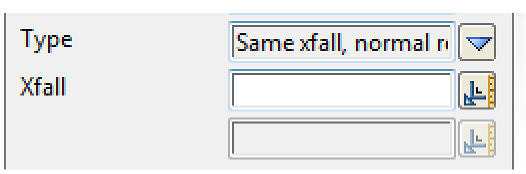
The **Start mode** and **End Mode** refer to **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the *Table Drain* command**, and the **Other string**.

On this section, the given xfall **Xfall** is taken from the last fixed link, and the xfall of **negative Xfall** from **Other string**, and a vertex of the new link created where the xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Same Xfall and Normal to Reference String and to Other String



This option requires a **Xfall**.

The **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference**

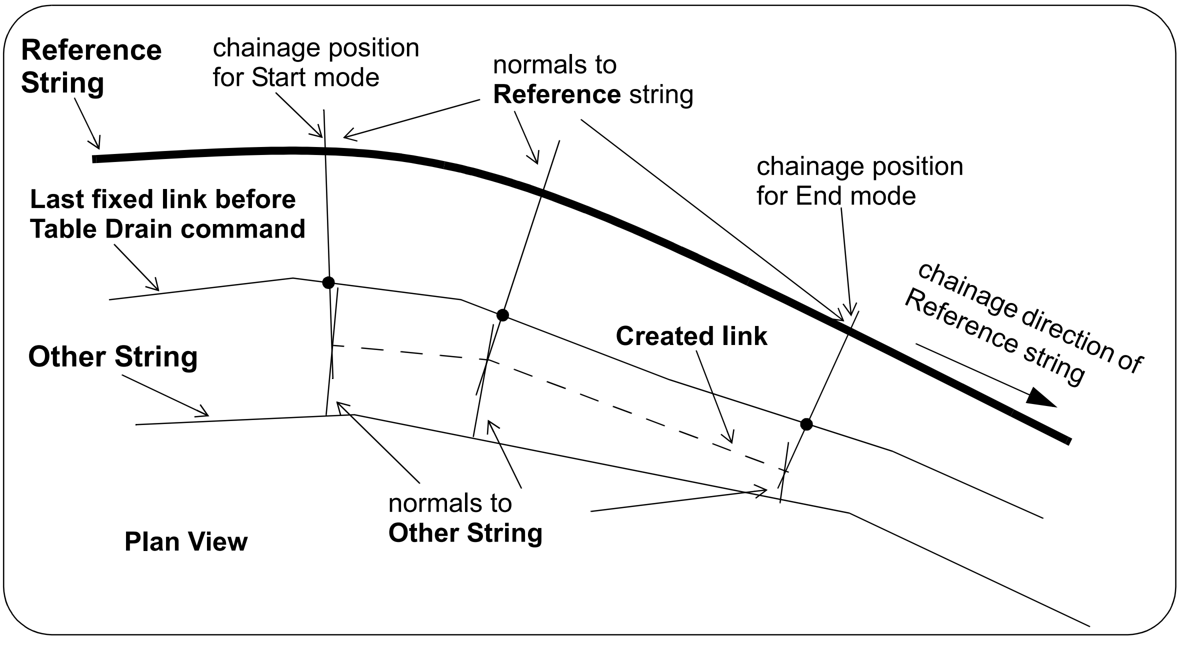
string and cutting the **last fixed link before the *Table Drain* command**, and the xfall **Xfall** is taken from the cut with the last fixed link and along the section.

This is then intersected with a section **normal** to the **Other string** and with the xfall **negative Xfall**.

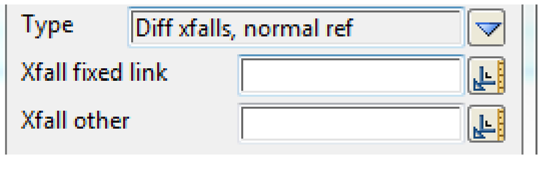
The new link is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Two Xfalls and Normal to Reference String

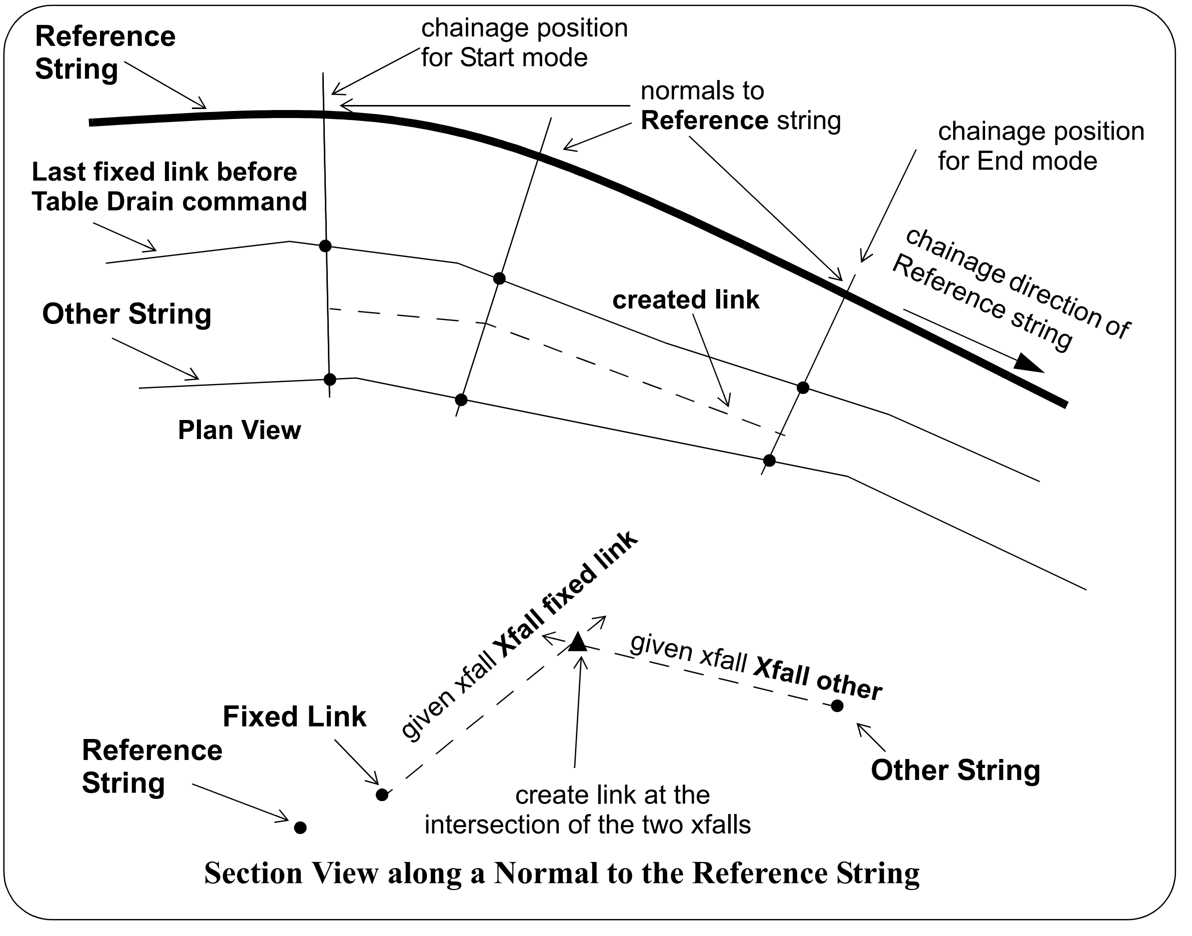


This option requires to xfalls: **Xfall fixed link** and **Xfall other**.

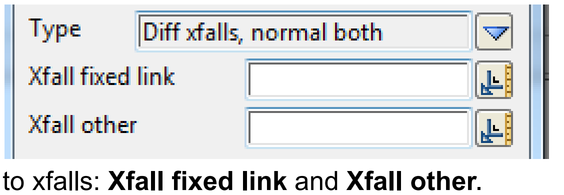
The **Start mode** and **End Mode** refer to **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the *Table Drain* command**, and the **Other string**.

On this section, the given xfall **Xfall fixed link** is taken from the last fixed link, and the xfall of **Xfall other** from **Other string**, and a vertex of the new link created where the xfalls intersect.

For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Two Xfalls and Normal to Reference String and to Other String



This option requires to xfalls: **Xfall fixed link** and **Xfall other**.

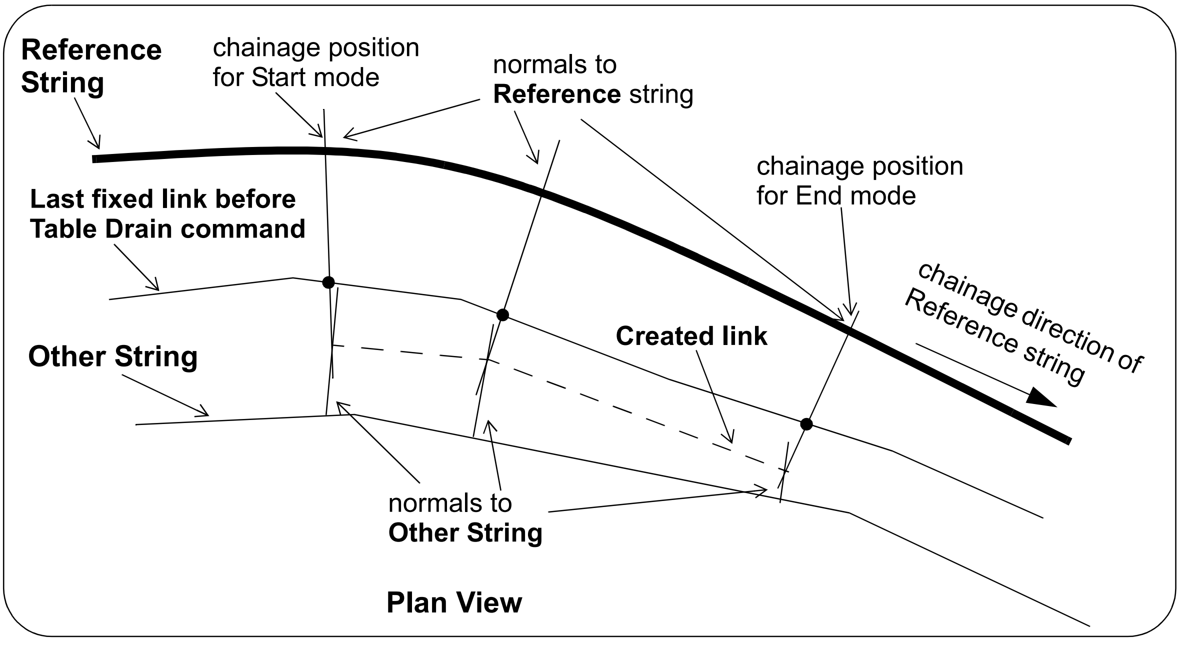
The **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the *Table Drain* command**, and the xfall **Xfall fixed link** is taken from the cut with the last fixed link and along the section.

This is then intersected with a section **normal** to the **Other string** and with the xfall **Xfall other**.

The new link is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

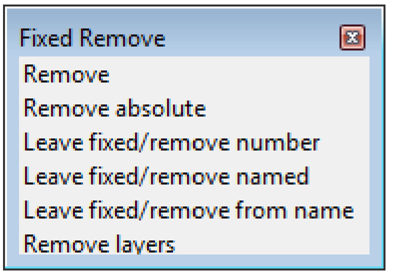
For information about the sign convention for offset and xfalls, go to 20.8.11.2 Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade.



Continue to the next section 21.2.2.2.2 Fixed Link - Remove or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.2.2.2.2 Fixed Link - Remove

The **fixed Remove** walk-right brings up the **fixed Remove** menu with options to remove links.



To go straight to the documentation on each of the options on the **Fixed** modifier menu:

See

Remove 21.2.2.2.2.1 Remove a Fixed link

Remove absolute 21.2.2.2.2.2 Remove a Fixed link - Absolute

Leave fixed/remove number 21.2.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links

Leave fixed/remove named 21.2.2.2.2.4 Fixed Link - Remove All But Fixed & Remove Named Fixed Links

Leave fixed/remove from name 21.2.2.2.2.5 Fixed Link - Remove All But Fixed & Remove Fixed Links from a Named Link

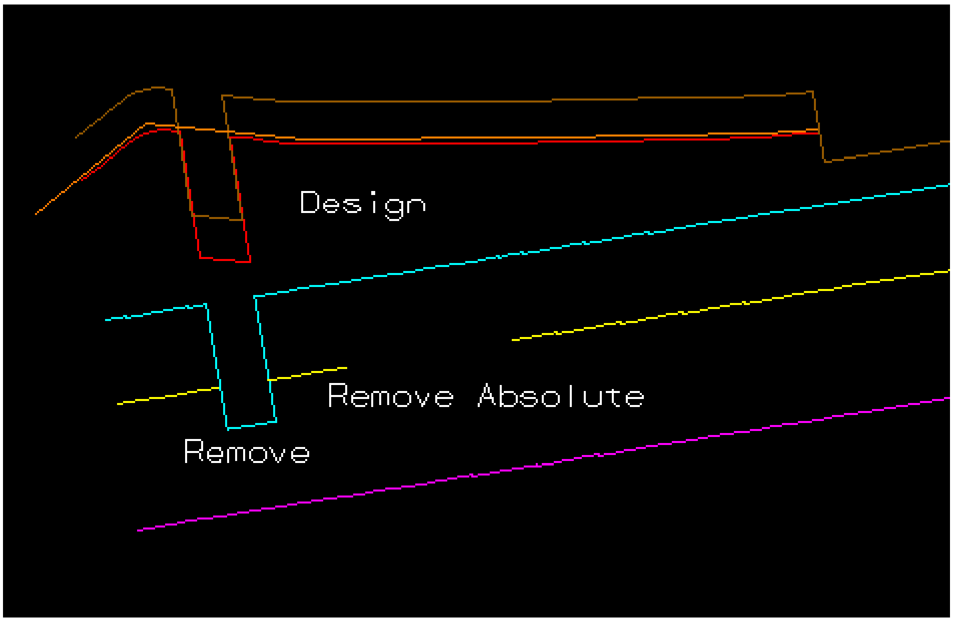
Remove layers 21.2.2.2.2.6 Fixed Link - Remove Layer

21.2.2.2.2.1 Remove a Fixed link

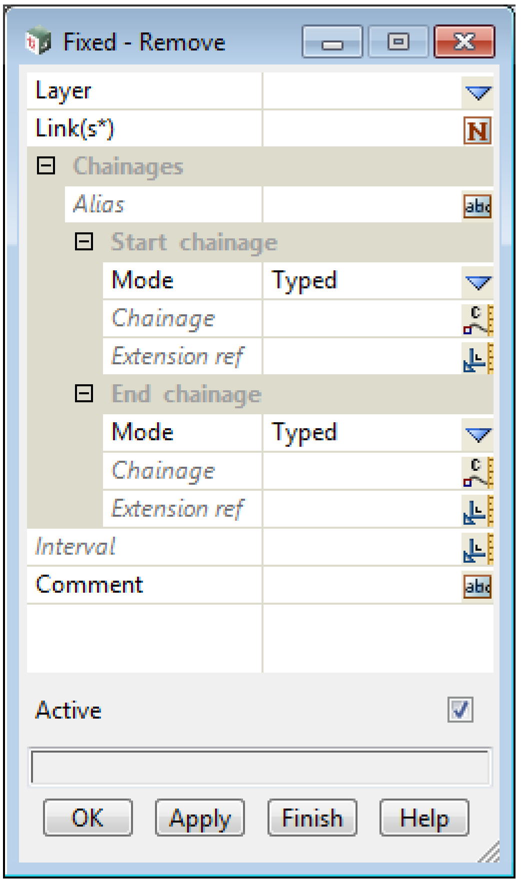
The **Remove** option deletes fixed links between given chainages.

Because the link is no longer there, any following links will then be relative to the link before the deleted link.

Note that there is also a **Remove Absolute** option that deletes a link but leave the absolute position of the other links undisturbed. See 21.2.2.2.2.2 Remove a Fixed link - Absolute.



Selecting **Remove** brings up the **Fixed - Remove** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer to remove the link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Field Description	Type	Defaults	Pop-Up
Link(s)	name box		select name menu

name of the links to remove. See 21.2.2.1.2 Link or Link(s).

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for removing the given fixed links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

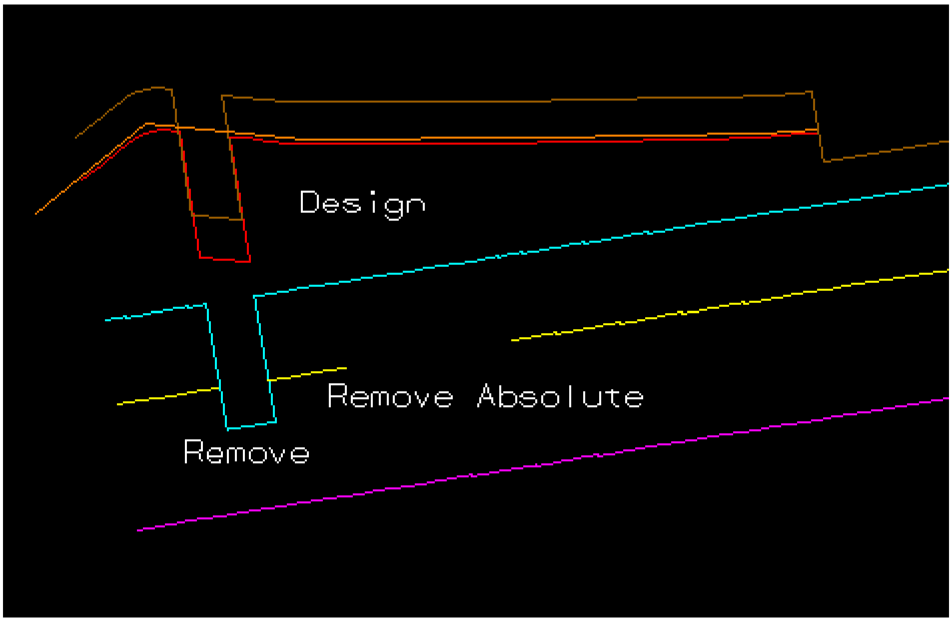
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

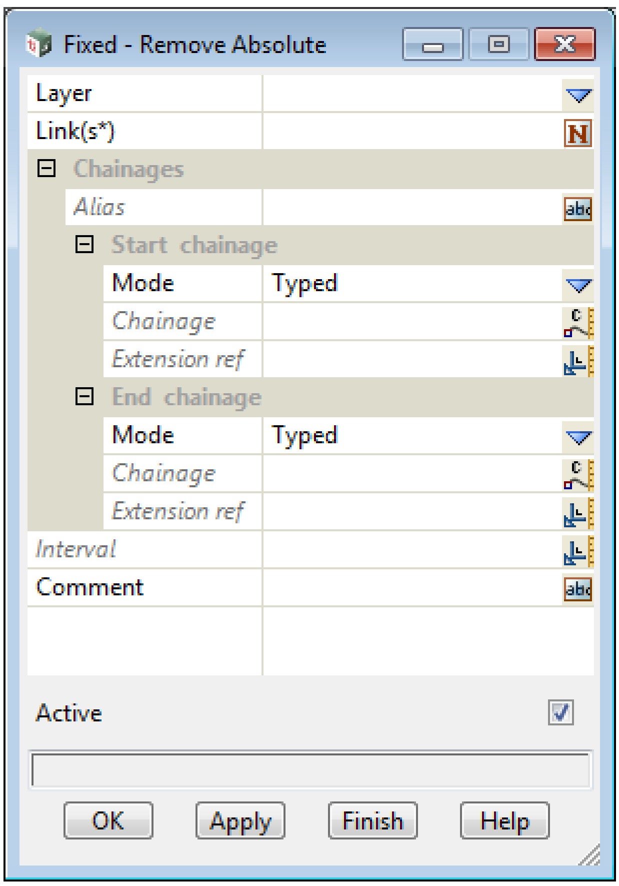
Go to the next section 21.2.2.2.2.2 Remove a Fixed link - Absolute or return to 21.2.2.2.2 Fixed Link - Remove.

21.2.2.2.2.2 Remove a Fixed link - Absolute

The **Remove Absolute** option deletes fixed links between given chainages whilst leaving the absolute position of the other links undisturbed.



Selecting **Remove absolute** brings up the **Fixed - Remove Absolute** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer to remove the link. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link(s)	name box		select name menu

name of the links to remove. See 21.2.2.1.2 Link or Link(s).

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for removing the given fixed links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

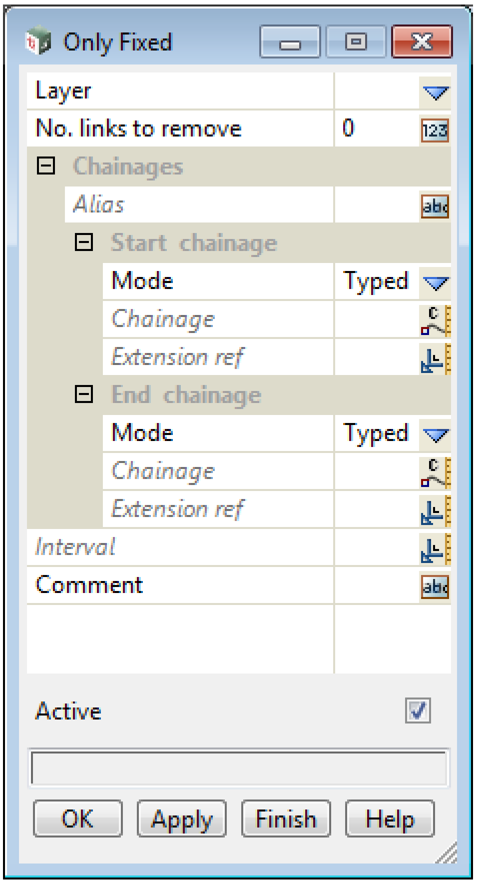
Go to the next section 21.2.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links or return to 21.2.2.2.2 Fixed Link - Remove.

21.2.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links

The **Only Fixed** option removes any of the variable cut and fill, final cut/fill links and decisions that have been defined up to this point in the modifiers grid.

Also starting from the outermost fixed link, it can also removed one or more of the remaining fixed links.

Selecting **Only Fixed** brings up the **Only Fixed** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to remove the cut, fill and final cut/fill links, and some fixed links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Layer	layer box		available Layers

Layer to remove the links from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

No. links to remove	integer box	0	

*if **greater than zero**, then starting from the outside link of the fixed links, this number of fixed links are removed. If the number is larger than the number of fixed links, then it removes all the fixed links. So a large number will remove all the links - fixed, cut, fill and final cut/fill.*

*If **zero** then no fixed links are removed.*

*If **less than zero**, then starting from the first link of the fixed links, this number of fixed links are kept and the outer fixed links are removed. If the number is larger than the number of fixed links, then it* *removes all the fixed links.So a large number will remove all the links - fixed, cut, fill and final cut/fill.*

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

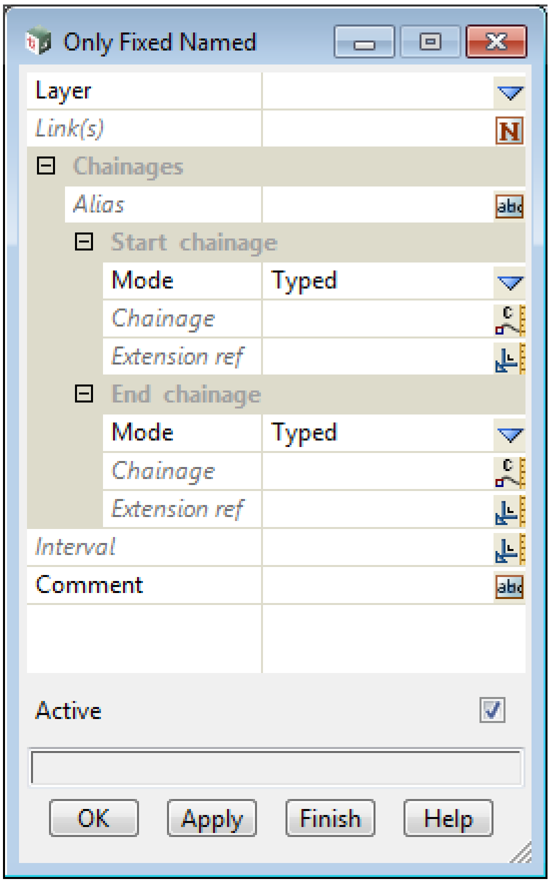
Go to the next section 21.2.2.2.2.3 Fixed Link - Remove All But Fixed & Remove a Number of Fixed Links or return to 21.2.2.2.2 Fixed Link - Remove.

21.2.2.2.2.4 Fixed Link - Remove All But Fixed & Remove Named Fixed Links

The **Only Fixed Named** option removes any of the variable cut and fill, final cut/fill links and decisions that have been defined up to this point in the modifiers grid.

It also removes a list of fixed links from the remaining fixed links.

Selecting **Only Fixed Named** brings up the **Only Fixed Named** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer to remove the links from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link(s)	name box		names.4d list

*if **not blank**, one or more link names can be entered separated by spaces. If the link name contains spaces then the link name must be surrounded by the quotes ". For example " EB 1". See* 21.2.2.1.2 Link or Link(s).

All the links listed in the **Link(s)** *field are removed from the fixed links.*

*If **blank**, all but the fixed links are removed (same as Only Fixed with 0 links).*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to remove the cut, fill and final cut/fill links, and some fixed links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF

Modifier Panels.

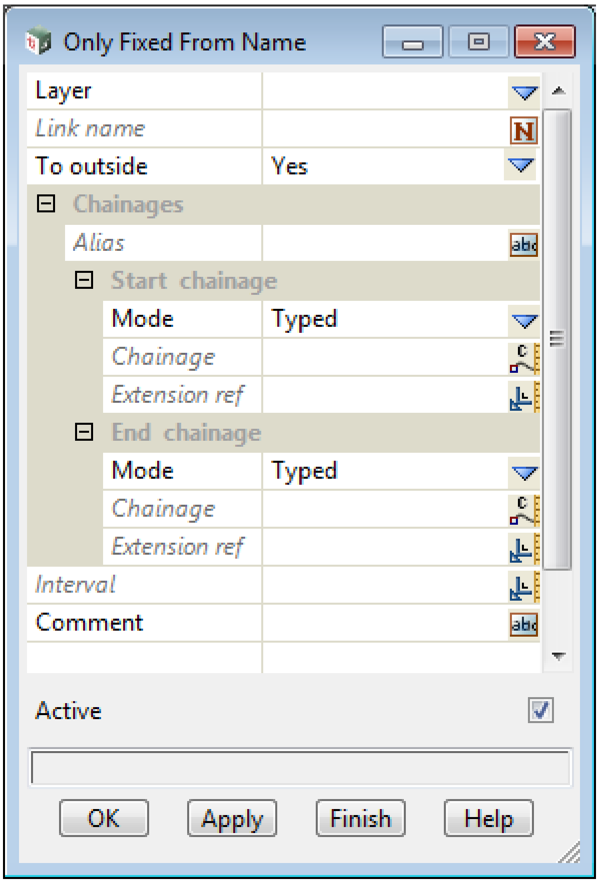
Go to the next section 21.2.2.2.2.5 Fixed Link - Remove All But Fixed & Remove Fixed Links from a Named Link or return to 21.2.2.2.2 Fixed Link - Remove.

21.2.2.2.2.5 Fixed Link - Remove All But Fixed & Remove Fixed Links from a Named Link

The **Leave fixed/remove from name** option removes any of the variable cut and fill, final cut/fill links and decisions that have been defined up to this point in the modifiers grid.

It also removes all the links from a named link to the last fixed link, **or** from a named link to the beginning of the fixed links.

Selecting **Leave fixed/remove from name** brings up the **Only Fixed from Name** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer to remove the links from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	name box		names.4d list

name of the fixed link in the layer to start removing links from/to.

To outside	choice box		yes, no

*if **yes**, all the links from* **Link name** *out are removed.* **Link name** *is not removed.*
*If **no**, all the links from the beginning of the Fixed zone until* **Link name** *are removed.* **Link name** *is not removed.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to remove the cut, fill and final cut/fill links, and some fixed links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

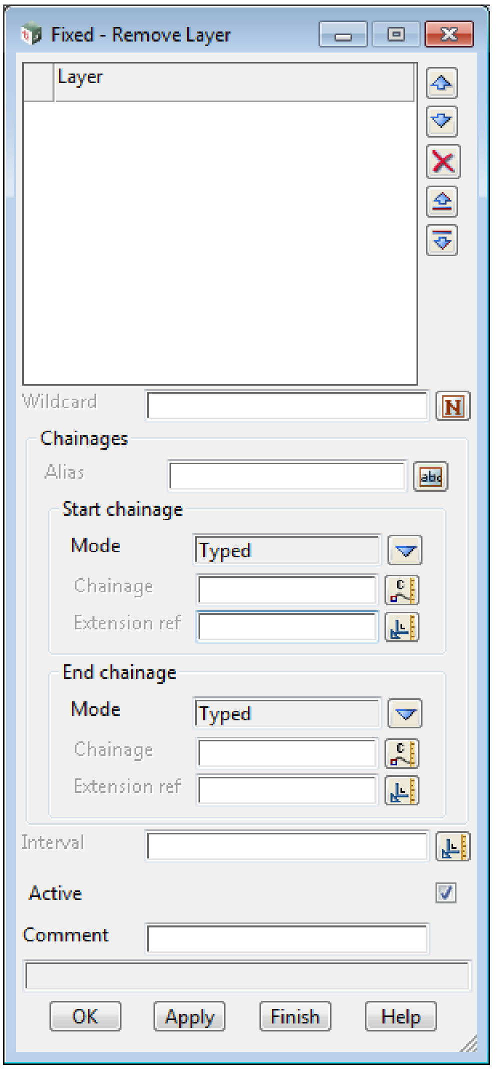
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.2.6 Fixed Link - Remove Layer or return to 21.2.2.2.2 Fixed Link - Remove.

21.2.2.2.2.6 Fixed Link - Remove Layer

The **Remove layers** option removes any links in the Layers that have been defined up to this point in the modifiers grid.

Selecting **Remove layers** brings up the **Only Fixed from Name** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Layer Grid

Layer	layer box		available Layers

link names that match **Wildcard** *are removed from the layers listed in the grid. For information on Layers, see* 21.1.1.2 MTF Links and Layers.

Wild card	text box		

text including wild cards (*) and wild characters () that the link names are matched against.

Link name	name box		names.4d list

name of the fixed link in the layer to start removing links from/to.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to remove the links from layers.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

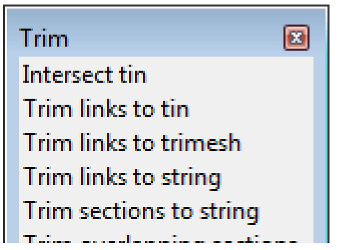
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.2.2 Fixed Link - Remove.

21.2.2.2.3 Fixed - Trim

The **Trim** walk-right brings up the **Trim** menu with options to perform various trimming operations.



See

Intersect tin	21.2.2.2.3.1 Intersect Tin
Trim links to tin	21.2.2.2.3.2 Trim Links to Tin
Trim sections to string	21.2.2.2.3.3 Trim Sections to String
Trim links to string	21.2.2.2.3.4 Trim Links to String
Trim overlapping sections	21.2.2.2.3.5 Trim Overlapping Sections

21.2.2.2.3.1 Intersect Tin

This option finds the intersection points of the link **Link** within the given vertical tolerance **Intersect z tol** of the stripped **Tin** and creates extra section at nominated chainage distances from the intersection chainages.

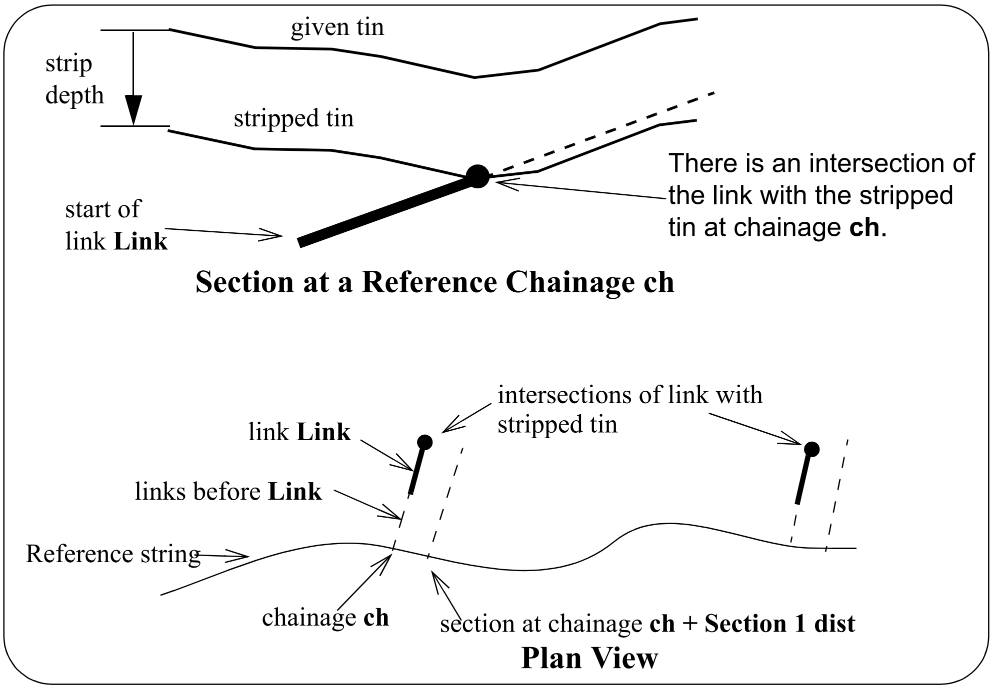
Extra sections are then created at the reference chainages

Reference chainage of intersection of link with (tin - Strip) + **Section 1 dist**

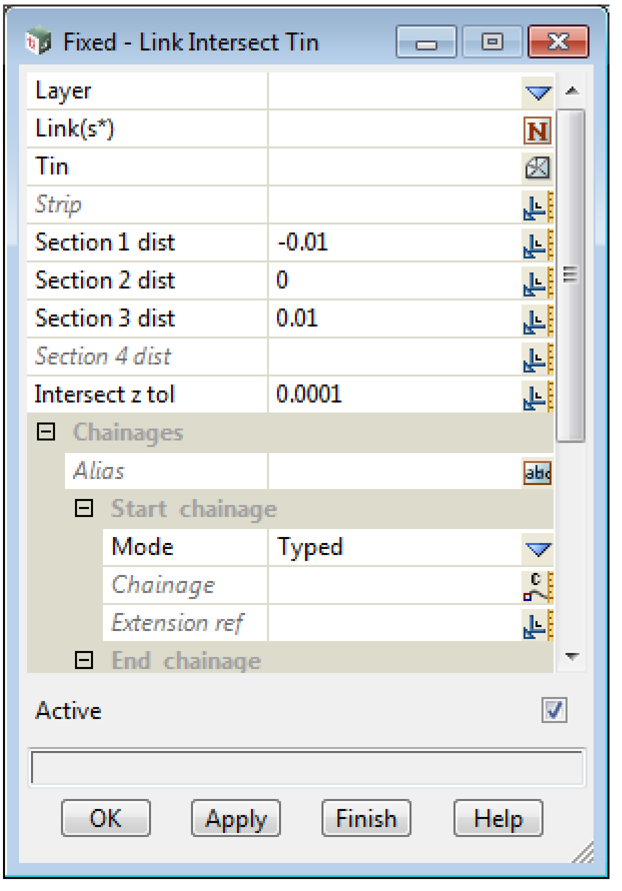
Reference chainage of intersection of link with (tin - Strip) + **Section 2 dist**

Reference chainage of intersection of link with (tin - Strip) + **Section 3 dist**

Reference chainage of intersection of link with (tin - Strip) + **Section 4 dist**



Selecting **Intersect tin** brings up the **Fixed - Link Intersect Tin** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer of the link to cut with the stripped tin. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link	name box		select name menu

name of the link to cut with the stripped tin. See 21.2.2.1.2 Link or Link(s).

Tin	tin box		available tins

name of the tin to use as the stepped tin to find the intersections with the link **Link**.

Strip	real box	0	

the depth to vertically drop the tin before calculating intersections. This is then referred to as the stripped tin.

Section 1, 2, 3, 4 dist	real box		

*if **not blank**, this value is added to the reference chainages of the intersection of the link with the stripped tin, and new sections are created at this new chainage. The value can be positive, negative and zero.*

*If **blank**, no section is created for this* **Section i dist.**

Notes

1. There may be more than one reference string chainage where the link intersects the stripped tin.

2. A section is only produced at the intersections of the link with the stripped tin if one of **Section i dist** *is zero.*

Intersect z tol real box 0.0001

the intersection of the link with the stripped tin can occur within this vertical distance of the striped tin.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for trimming the given fixed link against the tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

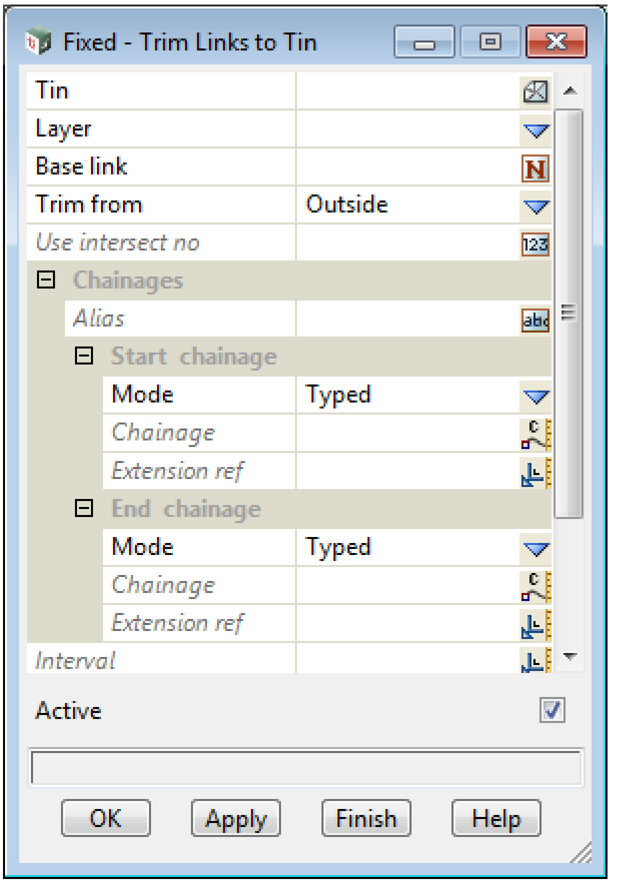
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.3.2 Trim Links to Tin or return to 21.2.2.2.3 Fixed - Trim.

21.2.2.2.3.2 Trim Links to Tin

Selecting **Trim links to tin** brings up the **Fixed - Trim Links to Tin** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer of strings to trim. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link	name box		select name menu

name of the link to trim against the tin. See 21.2.2.1.2 Link or Link(s).

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for trimming the given fixed link against the tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

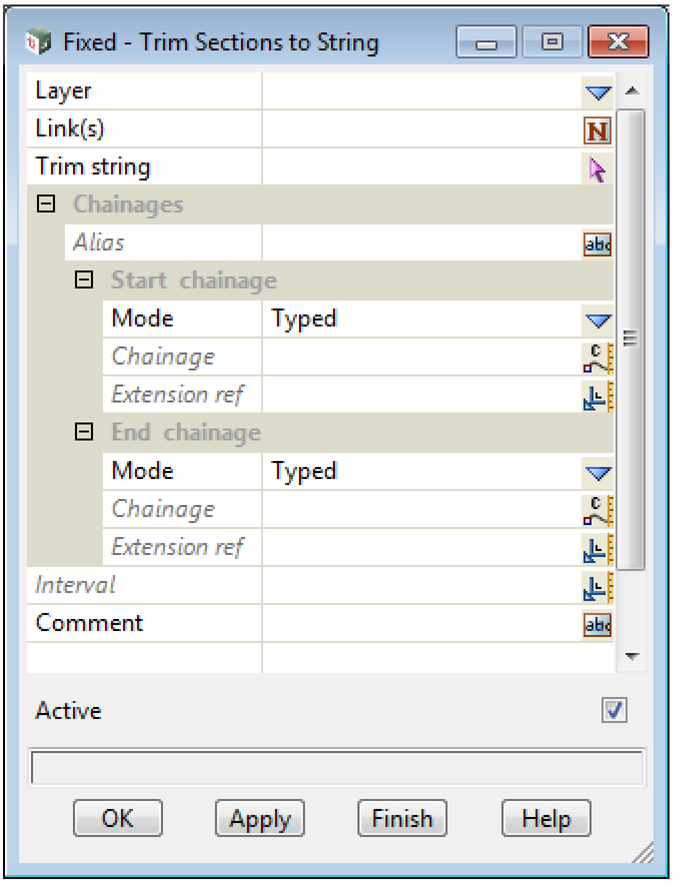
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.3.3 Trim Sections to String or return to 21.2.2.2.3 Fixed - Trim.

21.2.2.2.3.3 Trim Sections to String

Selecting **Trim sections to string** brings up the **Fixed - Trim Sections to String** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer of strings to trim. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link(s)	name box		select name menu

name of the link to trim against the tin. See 21.2.2.1.2 Link or Link(s).

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for trimming the given fixed link against the tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

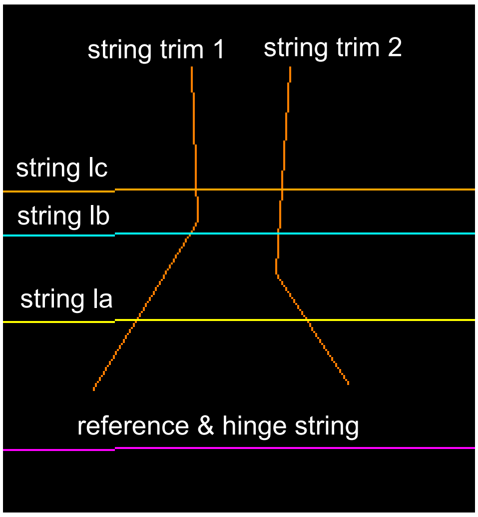
Comment, **Extra start**, **Extra End, Active, OK, Apply**

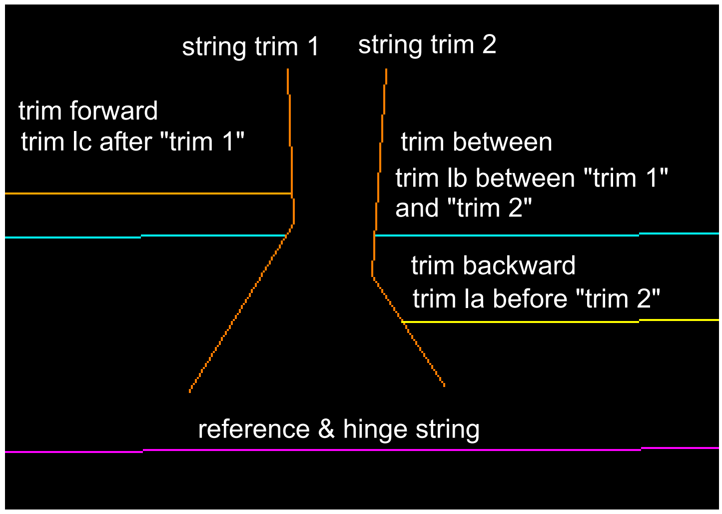
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.3.4 Trim Links to String or return to 21.2.2.2.3 Fixed - Trim.

21.2.2.2.3.4 Trim Links to String

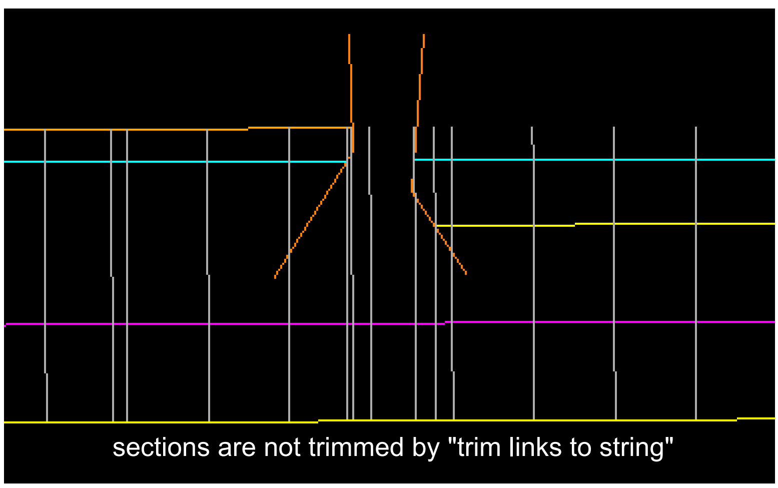
This option trims links before a selected string, or after a selected string, or between two selected strings.



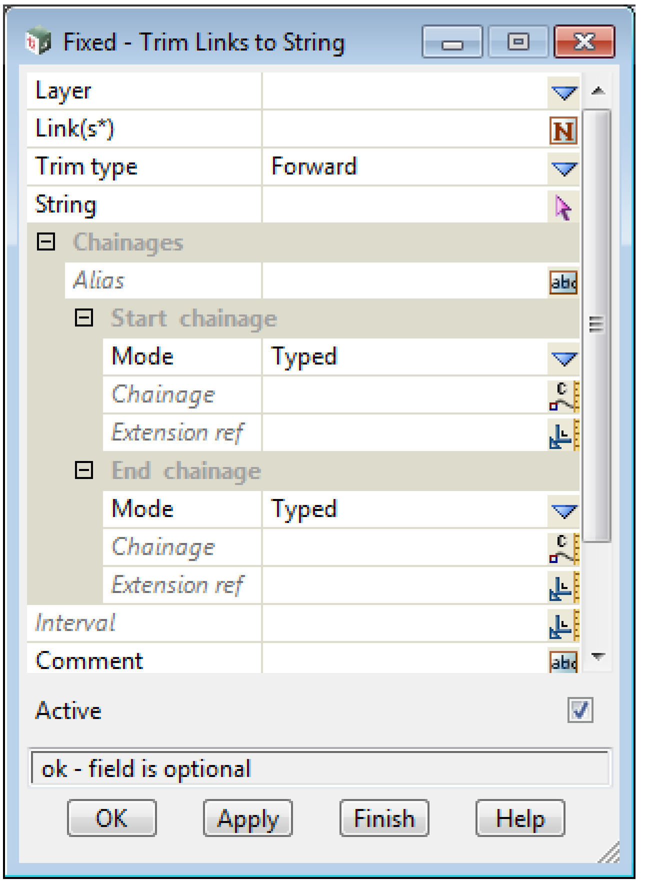


Important Note:

This option only trims the strings that are created from the links. It does NOT trim the sections. So it is a process that is performed **after** the sections and strings are first generated and it is only performed on the strings.



Selecting **Trim links to string** brings up the **Fixed - Trim Links to String** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

Layer of link to trim. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link(s)	name box		select name menu

name of the links to trim against a string. See 21.2.2.1.2 Link or Link(s).

Trim type	choice box		forward, between, backward

type of the trim for the links

*if **forward**, there is a* **String** *select field and a string is user selected. All the links are trimmed so that they stop after the selected string.*

*If **between**, there is a* **Start string** *and* **End string** *select field and both strings are user selected. All the links are trimmed so that they stop between* **Start string** *and* **End string**.

*If **backward**, there is a* **String** *select field and a string is user selected. All the links are trimmed so that they only start at the selected string.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for trimming the given fixed link against the tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.3.5 Trim Overlapping Sections or return to 21.2.2.2.3 Fixed - Trim.

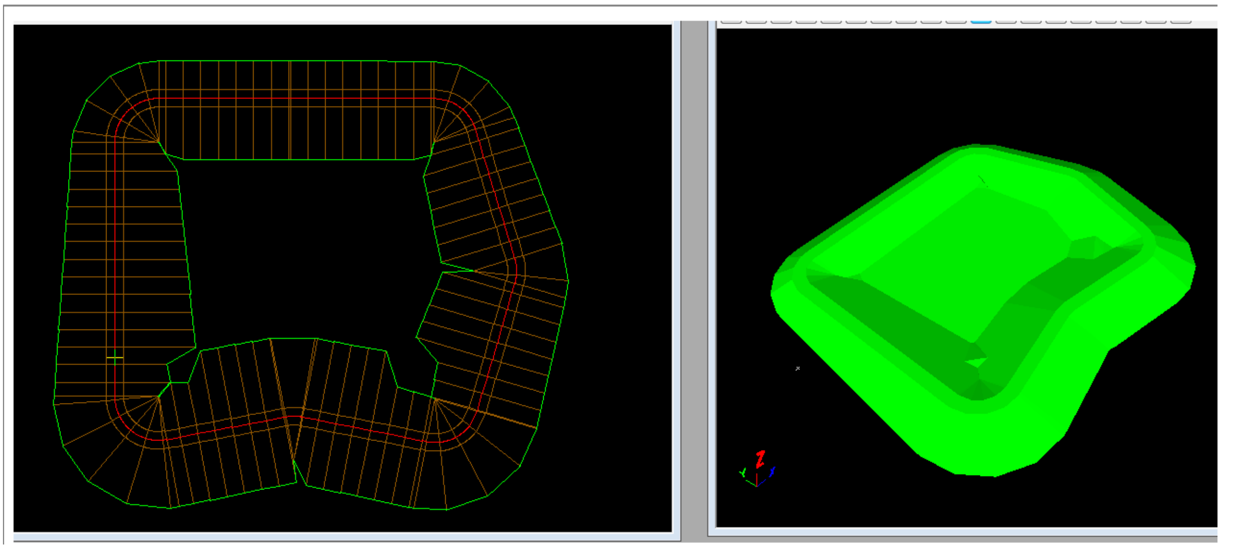
21.2.2.2.3.5 Trim Overlapping Sections

The **Trim Overlapping Sections** option takes a Layer and modifies the internally calculated sections so that the sections do not overlay each other.

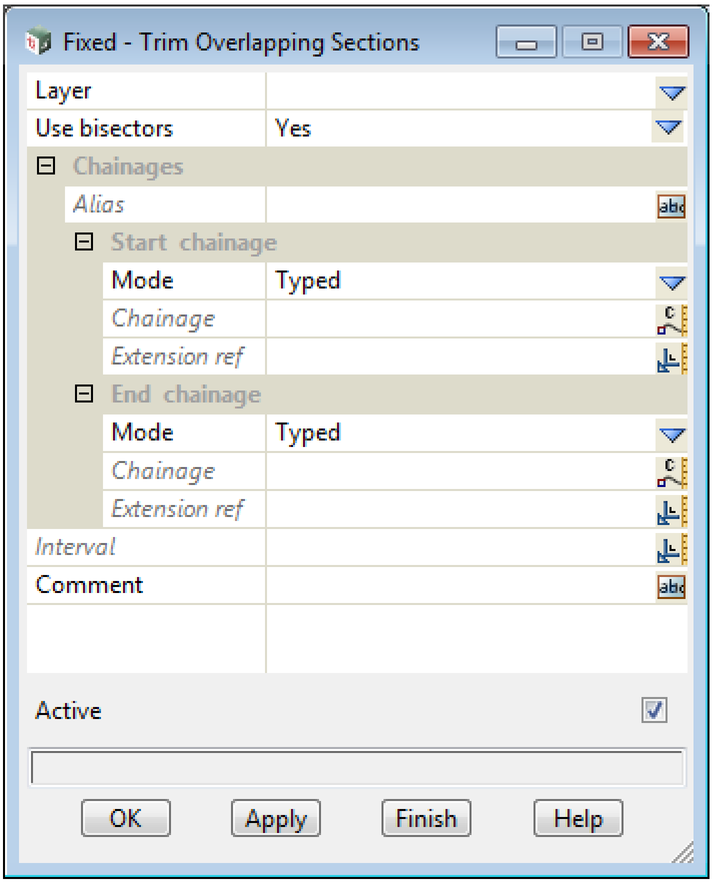
Any strings that are generated for that Layer will come from those modified internal sections and so will also not cross over themselves.

So any triangulation using those strings should not need any further cleanups to produce a fairly accurate tin. Certainly the tin should be accurate enough for any earthworks.

For the Design Layer, both sections and strings can be created and using the **Trim Overlapping Sections** option will produce results such as the example below.



Selecting **Trim overlapping sections** brings up the **Fixed - Trim Overlapping Sections** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box		available Layers

name of the Layer to modify the internally calculated sections so that the sections do not overlay each other. Any strings that are generated for that Layer after this process will come from the modified internal sections and so will also not cross over themselves.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for trimming the given fixed link against the tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.2.3 Fixed - Trim.

21.2.2.2.4 Fixed - Modify Link

The **Fixed =>Link** option can modify the width, height, xfall or slope **of any Fixed link.**

At a given chainage, it doesn't matter which of the two values from width, height or xfall were used to defined a Fixed link, all of the values width, height, xfall and slope can be then calculated. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions

So for a Fixed Link, the **Link** option allows to user to chose which one of **width**, **height**, **xfall** or **slope** to **modify** and **how to modify it**, and which of **width**, **height**, **xfall** or **slope** is **held** to be the **current value** for the **Fixed link.**

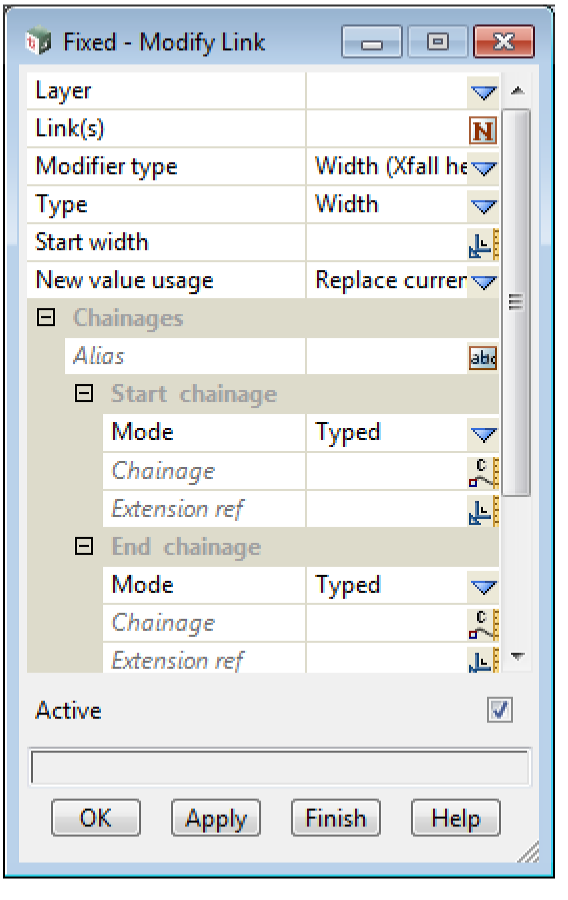
Notes

1. The combination Modify xfall and Hold slope makes no sense because xfall and slope measure exactly the same thing.
2. There is an important difference between Modify Xfall and Modify Slope.

   Modify Xfall linearly interpolates the xfall between the Start Chainage and the End Chainage where xfall is the percentage of the proportion of metres vertically to metres horizontally.

   Modify Slope linearly interpolates the slope between the Start Chainage and the End Chainage where slope is the ratio between one unit vertically to a number of units horizontally (1 in).

Selecting **Link** brings up the **Fixed - Modify Link** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available Layers

name of the layer that the link to be modified is in. For information on Layers, see 21.1.1.2 MTF

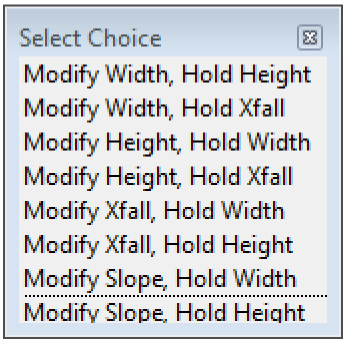
Links and Layers.

Link(s) name box names.4d pop-up

the name of the links in **Layer** *to modify the width/height/xfall/slope using the method given in* **Modifier type,** *between the chainages given by* **Start chainage** *and* **End chainage.** *See* 21.2.2.1.2 Link or Link(s).

When describing how the Link option works, this link is referred to as the ***Current link*** *and the values of width, height, xfall and slope for the Current Link as the* ***Current*** *or* ***Existing Values.***

Modifier type choice box



modify Width and take Height from current link
modify Width and take Xfall from current link
modify Height and take Width from current link
modify Height and take Xfall from current link
modify Xfall and take With from current link
modify Xfall and take Height from current link
modify Slope and take With from current link
modify Slope and take Height from current link

A fixed link can be modified in any of the **Modify type** *ways regardless of how the link was originally defined in terms of width, height, xfall or slope. See* 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

The ***Modify*** *width/height/xfall/slope is the part of the current link that is modified from its current value by the method given by* **Modifier type**.

How *the width/height/xfall/slope is modified depends on the choice made in the* **Type** *field described below.*

The ***Hold*** *width/height/xfall is the part of the current link that is held at its current value for the link.*

New value usage choice box Add to the current value of the link, Replace the current value of the link

if ***Add to the current value of the link****, the value of the parameter width/height/xfall/slope at each chainage is* ***added to*** *the current value for the parameter. For compactness, in a grid, this will be displayed in an* **Absolute** *column with* ***Absolute not ticked*** *or* ***no.***

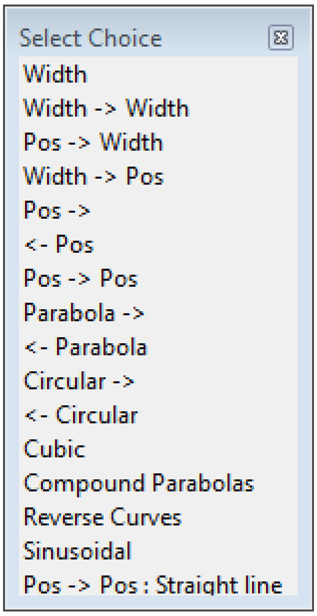
if ***Replace the current value of the link****, the value of the parameter width/height/xfall/slope at each chainage* ***replaces*** *the current value for the parameter. For compactness, In a grid, this will be shown in an* **Absolute** *column with* ***Absolute ticked*** *or* ***yes****.*

See 21.1.2.3 New Value Usage.

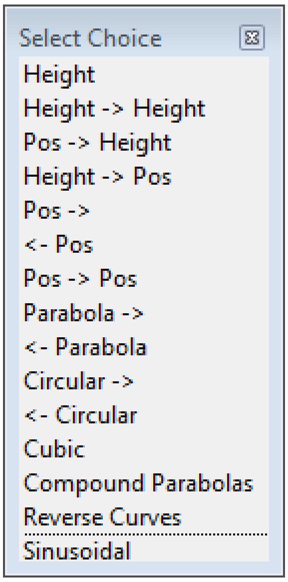
Type choice box

the choices for **Type** *depends on the choice selected for* **Modifier type**.

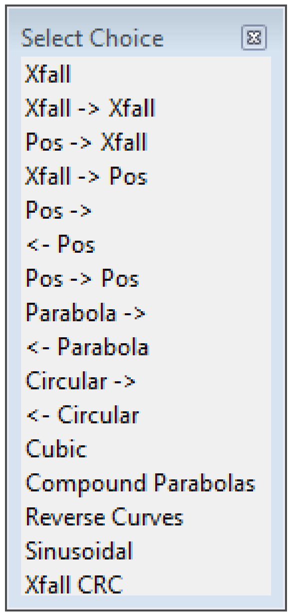
When **Modify type** is **Modify Width** the choices for **Type** are



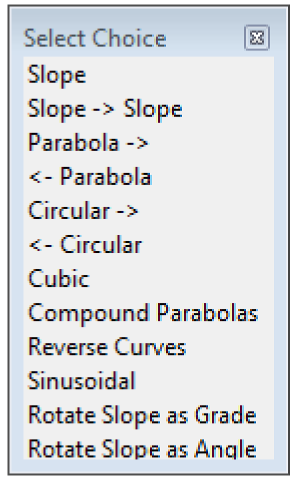
When **Modify type** is **Modify Height** the choices for **Type** are



When **Modify type** is **Modify Xfall** the choices for **Type** are



When **Modify type** is **Modify Slope** the choices for **Type** are



For a description of the choices of **Type** *when* **Modifier type** *is* ***Modify Width***, *see* 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall"

For a description of the choices of **Type** *when* **Modifier type** *is* ***Modify Height***, *see* 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall"

For a description of the choices of **Type** *when* **Modifier type** *is* ***Modify Xfall***, *see* 21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height"

For a description of the choices of **Type** *when* **Modifier type** *is* ***Modify Slope***, *see* 21.2.2.2.4.4 Type for Modifier Types "Modify Slope, Hold Width/Height"

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for modifying the new link

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall"

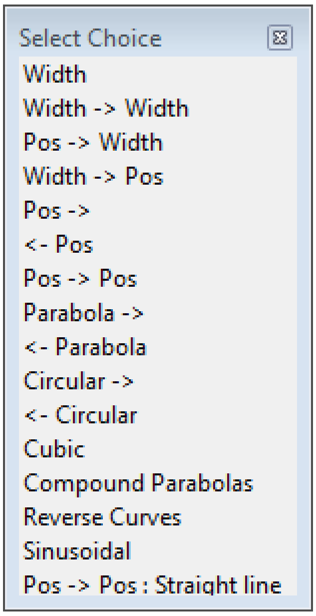
The choices for **Type** when **Modify type** is:

(a) **Modify Width, Hold Height**

or

(b) **Modify Width, Hold Xfall**

are



use a given width for the chainage range
interpolate between a given start width and a given end width
interpolate between the current start width and a given end width
interpolate between a given start width and the current end width
use the current start width for the chainage range
use the current start width for the chainage range
interpolate between the current start width and the current end width
use a parabola from the current start width
use a parabola that goes through the current end width
use an arc from the current start width
use an arc that goes through the current end width
use a cubic between the current start and end widths
use a compound parabola between the current start and end widths
use reverse curves between the current start and end widths
use a sinusoidal curve between the current start and end widths
use a straight line between the current start and end widths

For the description of each **Type** see

21.2.2.2.4.1.1 Width

21.2.2.2.4.1.13 Pos-> Pos: Straight line

21.2.2.2.4.1.1 Width

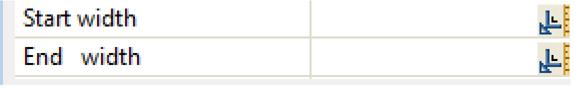
Use a Given Width from the Start Chainage to the End Chainage

At each chainage ch between the **Start chainage** and **End chainage**, the width is that given in the **Width** panel field. That is, the width has the constant value of **Width**.

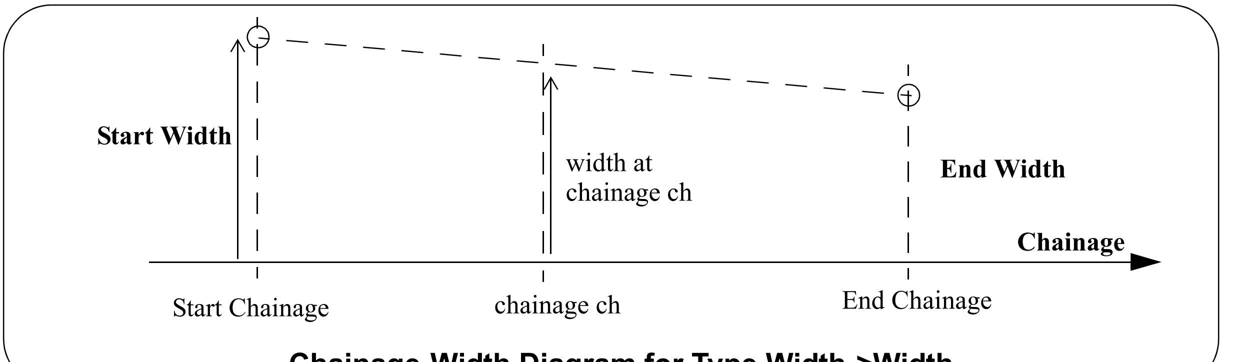
Go to the next section 21.2.2.2.4.1.2 Width -> Width or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.2 Width -> Width

Interpolate Between a Given Start Width and a Given End Width



At each chainage ch between the **Start chainage** and **End chainage**, the width is linearly interpolated by chainage between the given **Start width** and the **End width**.



Chainage-Width Diagram for Type Width->Width

Go to the next section 21.2.2.2.4.1.3 Pos -> Width or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.3 Pos -> Width

Interpolate Between the Existing Start Width & a Given End width

At each chainage ch between the **Start chainage** and **End chainage**, the width is linearly interpolated by chainage between the width at the **Start chainage** and the given width **Width** at the **End chainage**.

This allows you to use the width at the **End chainage** without knowing what the actual value of the width is.

Go to the next section 21.2.2.2.4.1.4 Width -> Pos or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.4 Width -> Pos

Interpolate Between a Given Start Width & the Existing End Width

At each chainage ch between the **Start chainage** and **End chainage**, the width is linearly interpolated by chainage between the given width **Width** at the **Start chainage** and the width at the **End chainage**.

This allows you to use the width at the **Start chainage** without knowing what the actual value of the width is.

Go to the next section 21.2.2.2.4.1.5 Pos -> or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.5 Pos ->

Use the Current Start Width for the Entire Chainage Range

At each chainage ch between the **Start chainage** and **End chainage**, the width is that at the **Start chainage**. That is, the width has the constant value of what it is a the **Start chainage**.

This allows you to use the width at the **Start chainage** without knowing what the actual value of the width is.

Go to the next section 21.2.2.2.4.1.6 <- Pos or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.6 <- Pos

Use the Current End Width for the Entire Chainage Range

At each chainage ch between the **Start chainage** and **End chainage**, the width is that at the **End chainage**. That is, the width has the constant value of what it is a the **End chainage**.

This allows you to use the width at the **End chainage** without knowing what the actual value of the width is.

Go to the next section 21.2.2.2.4.1.7 Pos-> Pos: or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.7 Pos-> Pos:

Interpolate Between the Existing Start Width and the Existing End Widths

At each chainage ch between the **Start chainage** and **End chainage**, the width is linearly interpolated by chainage between the width at the **Start chainage** and the width at the **End chainage**.

This allows you to use the widths at the **Start chainage** and the **End chainage** without knowing what the actual value of the widths are.

Go to the next section 21.2.2.2.4.1.8 Parabola -> or return to 21.2.2.2.4.1 Type for Modifier Types "Modify Width, Hold Height/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.1.8 Parabola ->

Calculation of Width for Type Parabola ->

This option is still under development

*In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.*

*Between the start position (**Start mode + S Ext**, **Start width)**, and the end position (**End mode + E Ext**, **End width**), the width varies as a **parabola** a*X*X with its origin at (**Start mode + S Ext**, **Start width)** and going through (**End mode + E Ext**, **End width**).*

21.2.2.2.4.2.11 <-Circular
21.2.2.2.4.2.12 Cubic

21.2.2.2.4.2.1 Height

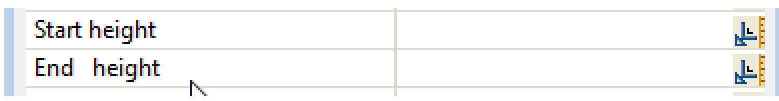
Use a Given Height from the Start Chainage to the End Chainage

At each chainage ch between the **Start chainage** and **End chainage**, the width is that given in the **Height** panel field. That is, the height has the constant value of **Height**.

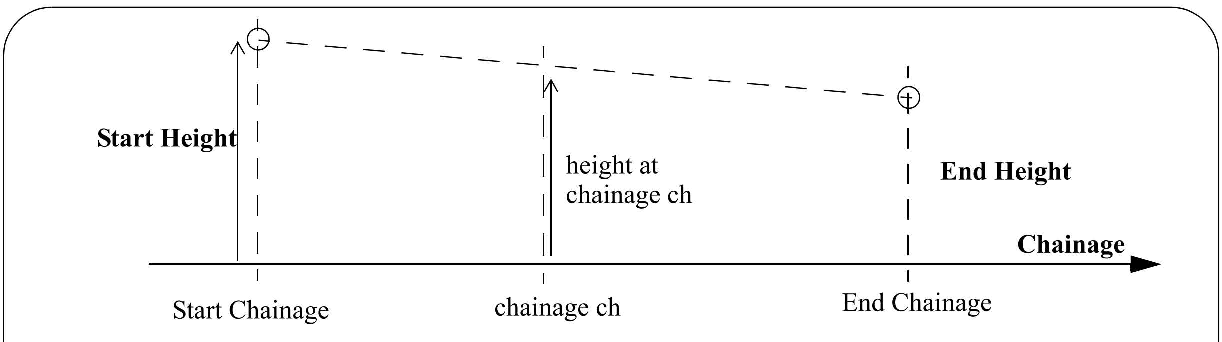
Go to the next section 21.2.2.2.4.2.2 Height -> Height or return to 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.2.2 Height -> Height

Interpolate Between a Given Start Height and a Given End Height



At each chainage ch between the **Start chainage** and **End chainage**, the height is linearly interpolated by chainage between the given **Start height** and the **End height**.



Chainage-Height Diagram for Type Height->Height

Go to the next section 21.2.2.2.4.2.3 Pos -> Height or return to 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.2.3 Pos -> Height

Interpolate Between the Existing Start Height & a Given End Height

At each chainage ch between the **Start chainage** and **End chainage**, the height is linearly interpolated by chainage between the height at the **Start chainage** and the given height **Height** at the **End chainage**.

This allows you to use the height at the **End chainage** without knowing what the actual value of the height is.

Go to the next section 21.2.2.2.4.2.4 Height -> Pos or return to 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.2.4 Height -> Pos

Interpolate Between a Given Start Height & the Existing End Height

At each chainage ch between the **Start chainage** and **End chainage**, the height is linearly interpolated by chainage between the given height **Height** at the **Start chainage** and the height at the **End chainage**.

This allows you to use the height at the **Start chainage** without knowing what the actual value of the height is.

Go to the next section 21.2.2.2.4.2.5 Pos -> or return to 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.2.5 Pos ->

Use the Current Start Height for the Entire Chainage Range

At each chainage ch between the **Start chainage** and **End chainage**, the height is that at the **Start chainage**. That is, the height has the constant value of what it is a the **Start chainage**.

This allows you to use the height at the **Start chainage** without knowing what the actual value of the height is.

Go to the next section 21.2.2.2.4.2.6 <- Pos or return to 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.2.6 <- Pos

Use the Current End Height for the Entire Chainage Range

At each chainage ch between the **Start chainage** and **End chainage**, the height is that at the **End chainage**. That is, the height has the constant value of what it is a the **End chainage**.

This allows you to use the height at the **End chainage** without knowing what the actual value of the height is.

Go to the next section 21.2.2.2.4.2.7 Pos-> Pos: or return to 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.2.7 Pos-> Pos:

Interpolate Between the Existing Start and End Heights

At each chainage ch between the **Start chainage** and **End chainage**, the height is linearly interpolated by chainage between the height at the **Start chainage** and the height at the **End chainage**.

This allows you to use the heights at the **Start chainage** and the **End chainage** without knowing what the actual value of the heights are.

Go to the next section 21.2.2.2.4.2.8 Parabola -> or return to 21.2.2.2.4.2 Type for Modifier Types "Modify Height, Hold Width/Xfall" or 21.2.2.2.4 Fixed - Modify Link

21.2.2.2.4.3 Type for Modifier Types "Modify Xfall, Hold Width/Height"

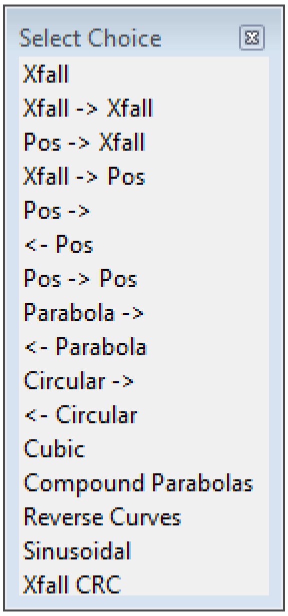
The choices for **Type** when **Modify type** is:

(a) **Modify Xfall, Hold Width**

or

(b) **Modify Xfall, Hold Height**

are



use a given xfall for chainage range
interpolate between a given start xfall and a given end xfall
interpolate between the current start xfall and a given end xfall
interpolate between a given start xfall and the current end xfall
keep the current start xfall for the chainage range
use the current end xfall for the chainage range
interpolate between the current start xfall and the current end xfall
use a parabola from the current start xfall
use a parabola that goes through the current end xfall
use an arc from the current start xfall
use an arc that goes through the current end xfall
use a cubic between the current start and end xfalls
use a compound parabola between the current start and end xfalls
use reverse curves between the current start and end xfalls
use a sinusoidal curve between the current start and end xfalls

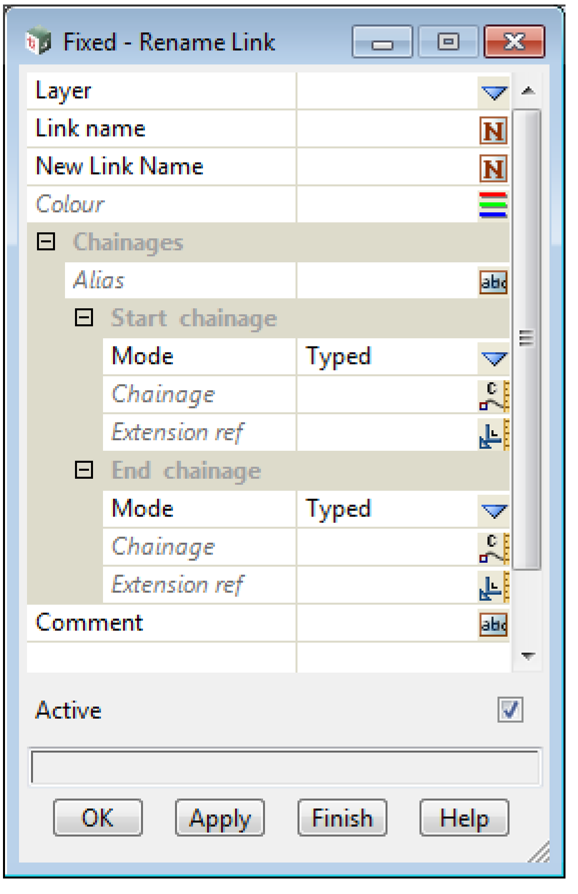
21.2.2.2.5 Fixed Link - Rename Link

The **Rename Link** option renames a link to a new name.

If strings are created in the ***Apply MTF*** then the original string stops and a string with the new name and colour is created between the two chainages. The original string starts again after the end chainage.

Selecting **Rename Link** brings up the **Fixed - Rename Link** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available Layers

name of the layer that the link to rename is in. For information on Layers, see [21.1.1.2 MTF Links and Layers](#).

Old link name	name box		names.4d pop-up

the name of the link to rename between the chainages given by **Start mode** *and* **End mode**

New link name	name box		names.4d pop-up

the new name of the link between the chainages given by **Start mode** *and* **End mode.**
If strings are created in the Apply MTF then the old string will be stopped between the chainages, and a new string with the new name is created between the chainages.

Colour			available colours

if non blank, the colour for the new link.

If blank, the new has the colour of the old link.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to rename the link.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.6 Fixed Link - Absolute to a Base Link or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

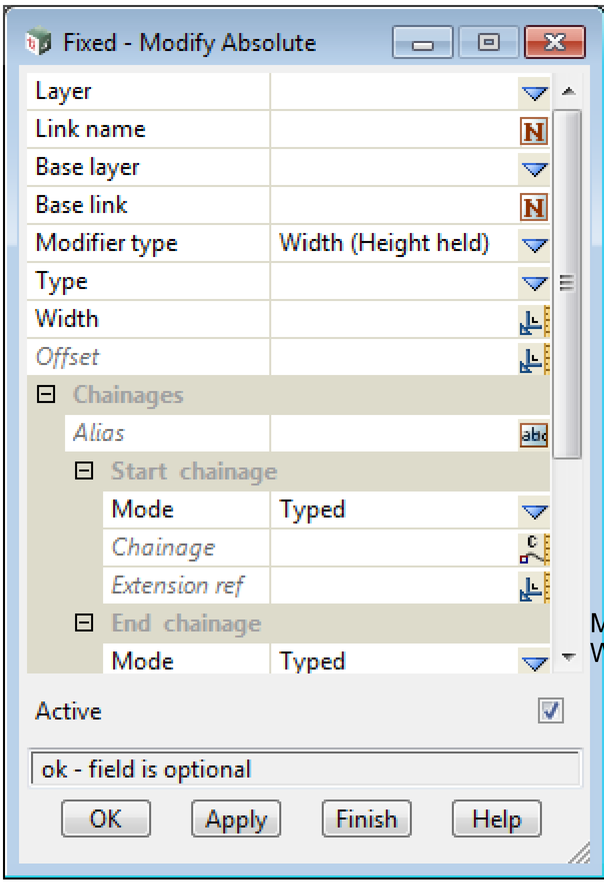
21.2.2.2.6 Fixed Link - Absolute to a Base Link

For an existing link, the **Absolute** option has most of the methods available in **Modify link** for defining either the width, height or xfall of the link, but the values are then **measured from a given Base link** rather than from the previous link.

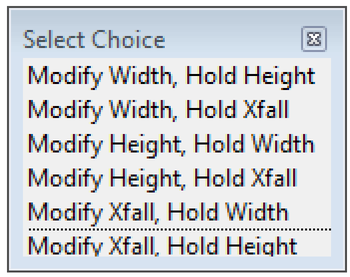
For example, over the chainage range, the **width from the Base link** can be set to a constant, be interpolated linearly between two widths, or have the width follow a parabolic, circular curve or cubic shape.

So **Absolute** is almost identical to ***Modify Link*** but values are measured from a given **Base Link** rather than the previous link (see 21.2.2.2.4 Fixed - Modify Link). But there is some additional parameters for controlling the values.

Selecting the **Absolute** brings up the **Fixed - Modify Absolute** panel.

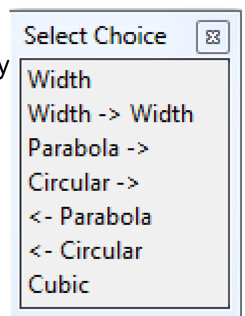


Choices for **Modifier Type**

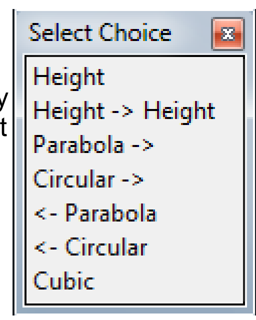


Choices for **Type** when **Modifier type** is

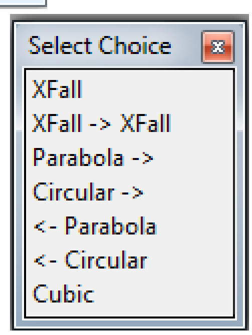
Modify Width



Modify Height



Modify Xfall



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available Layers

name of the layer that the link to modify. For information on Layers, see 21.1.1.2 MTF Links and

Layers.

Link name name box names.4d pop-up

the name of the link to modify the width/height/xfall (by the method given in ***Type)*** *and the values are then measured from the* **Base link** *rather than the previous link.*

Base layer layer box Design available Layers

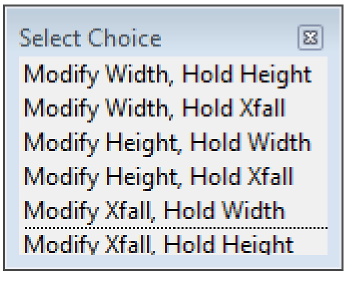
name of the layer for the **Base link**. *For information on Layers, see* 21.1.1.2 MTF Links and Layers.

Base link name box names.4d pop-up

the values of width/height/xfall calculated for **Link name** *are measured from the link given by* **Base link**.

Modifier type choice box

modify Width and take Height from current link
modify Width and take Xfall from current link
modify Height and take Width from current link
modify Height and take Xfall from current link
modify Xfall and take With from current link
modify Xfall and take Height from selected link



A fixed link can be modified in any of the **Modifier type** *ways regardless of how the link was originally defined in terms of width, height, xfall or slope.See* 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

The ***Modify*** *width/height/xfall/slope is the part of the current link that is modified from its current value by the method given by* **Modifier type**.

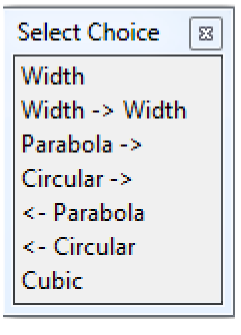
How *the width/height/xfall/slope is modified depends on the choice made in the* **Type** *field described below.*

The ***Hold*** *width/height/xfall is the part of the current link that is held at its current value for the link.*

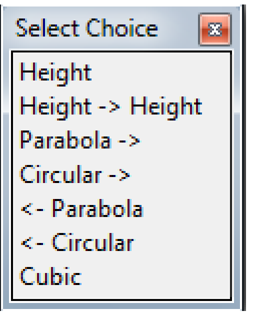
Type choice box

the choices for **Type** *depends on the choice selected for* **Modifier type**

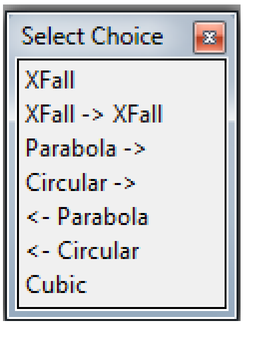
When **Modify type** is **Modify Width** the choices for **Type** are



When **Modify type** is **Modify Height** the choices for **Type** are



When **Modify type** is **Modify Xfall** the choices for **Type** are



For a description of the choices of **Type** *when the* **Modifier type** *is* ***Modify Width,*** *see* 21.2.2.2.6.1 For Modifier Types Modify Width, Hold Height or Xfall

For a description of the choices of **Type** *when the* **Modifier type** *is* ***Modify Height,*** *see* 21.2.2.2.6.2 For Modifier Types "Modify Height Maintain Width/Xfall"

For a description of the choices of **Type** *when the* **Modifier type** *is* ***Modify Xfall,*** *see* 21.2.2.2.6.3 For

Modifier Types "Modify Xfall Maintain Width/Height"

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for modifying the link.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.7 Fixed Link- Parallel or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

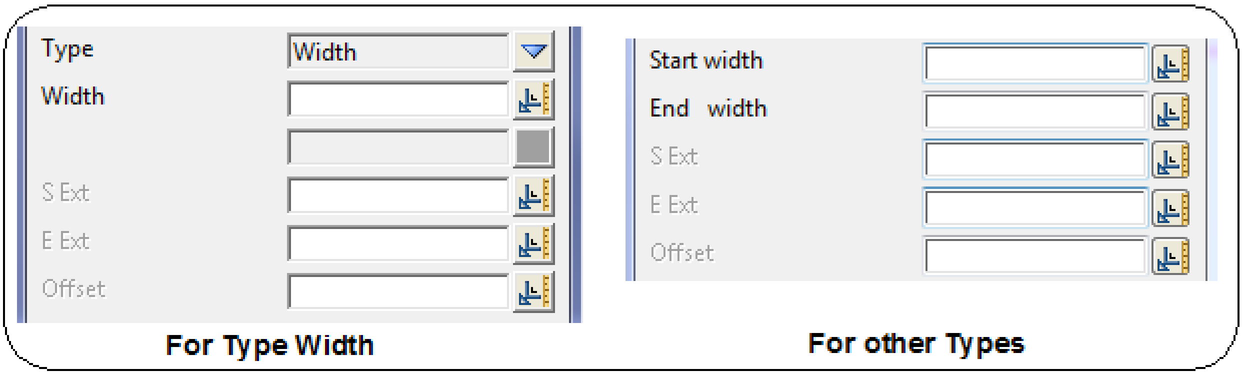
21.2.2.2.6.1 For Modifier Types Modify Width, Hold Height or Xfall

Go to Applying the Calculated Widths

Go to Calculating the Widths for each Type

Applying the Calculated Widths

When



Start width input measures menu

width at (Start mode + S Ext)

Start width can be positive or negative. See diagram after **Offset**

S Ext and E Ext have no effect for Type Width.

End width input measures menu

width at (End mode + E Ext)

End width can be positive or negative. See diagram after **Offset**

End width *does not exist for Type Width.*

S Ext/E Ext input measures menu

Start/End extension to add to the Start/end mode chainage. S Ext/E Ext can be positive or negative.

See diagram after **Offset**

Offset input measures menu

Final offset to be added to the width calculated at each point. Offset can be positive or negative.

For a chainage **ch** between the *Start mode* and the *End mode*, a *width* is calculated at chainage **ch** and that *width* goes out from the Base Link ***perpendicular*** to the Centreline.

The definition for calculating the width is best described in a **Chainage-Width** diagram. That is, in a plot with **Centreline chainage** as the **x-axis**, and **Width** at that chainage as the **y-axis**. This is similar to a long section plot where centreline chainage is the x-axis and height is the y-axis.

Then for a point **A** at chainage **ch** on the centreline, the **Width** calculated at chainage **ch** in the Chainage-Width diagram is used for the Width measured from the Base link corresponding to the section *Modify Width Maintain Height*, to the Centreline at chainage **ch**.

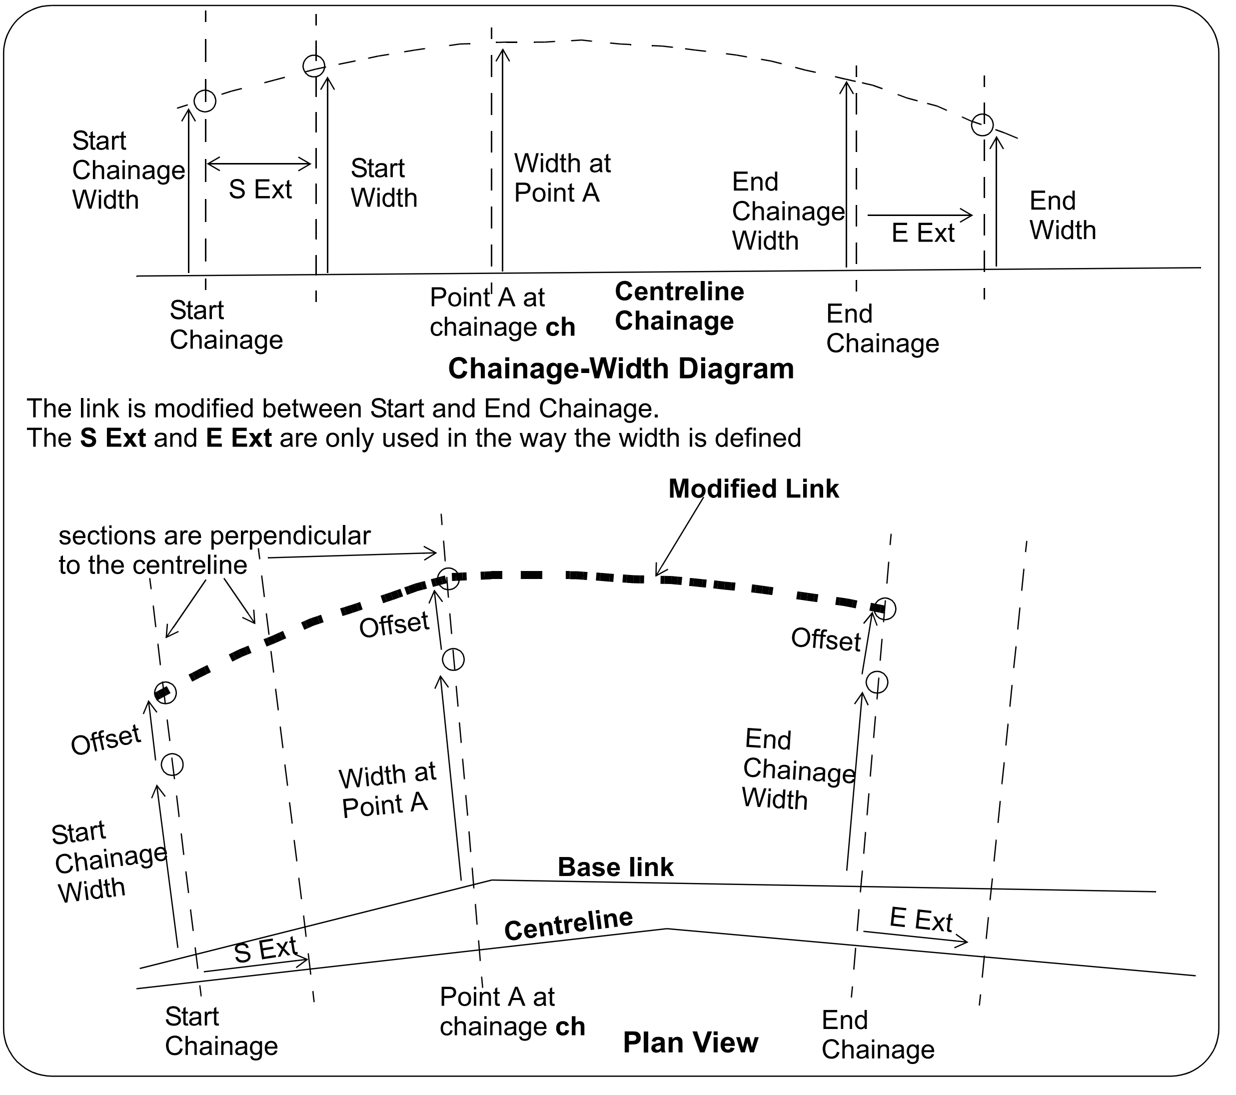
For the **Modify Width** commands, the method defining the widths may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the widths are calculated, a width Offset can be applied to all the widths.

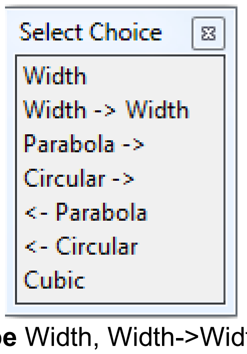
Although the definition for calculating the widths in the chainage-width diagram may involve points outside the Start mode/End mode chainage range, the calculated widths are **only applied** to the centreline **between** the **Start mode** chainage and the End mode chainage.

Please examine the diagrams below to help understand the process.

Relationship Between Chainage-Width Diagram and Centreline



Calculating the Widths for each Type



For **Type** Width, Width->Width, go to Calculation of Width for Types Width, Width -> Width

For **Type** Parabola->, go to Calculation of Width for Type Parabola ->

For **Type** Circular->, go to Calculation of Width for Type Circular->

For **Type** <-Parabola, go to [Calculation of WIdth for Type <- Parabola]

For **Type** <-Circular, go to [Calculation of Width for Type <-Circular]

For **Type** Cubic, go to [Calculation of Width for Type Cubic]

Calculation of Width for Types Width, Width -> Width

*In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.*

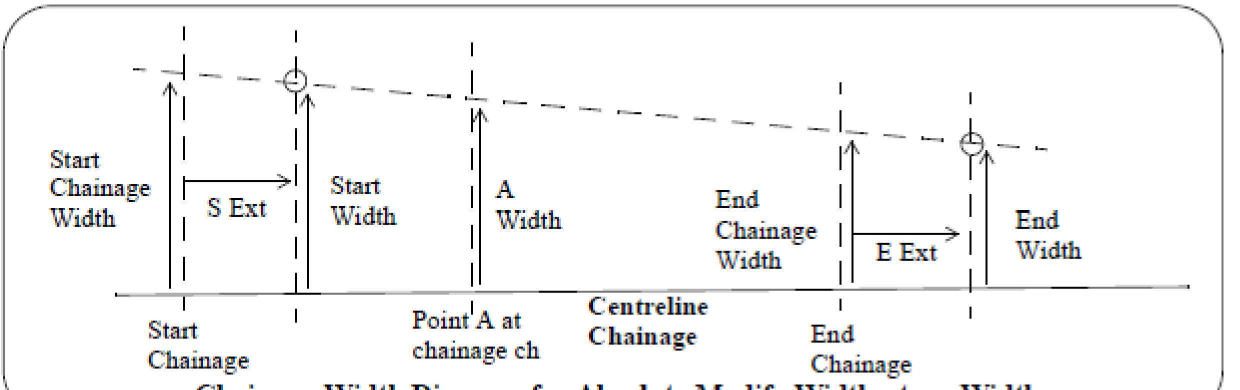
*The width is **linearly** interpolated between the **Start width** and the **End width**, **plus** the given **Offset** in the chainage-width diagram.*

That is, the rate change of width per unit chainage is

*rate of width change = (***End Width** - **Start Width***)/(***End mode** + **E Ext** - **Start mode** - **S Ext***)*

*and the width at chainage **ch** is*

*(***Start Width** + **Offset)** + *(ch -* **Start Mode** *chainage -* **S Ext***) * rate of width change*



Chainage-Width Diagram for Absolute Modify Width - type Width

*These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See .*

The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type Parabola ->

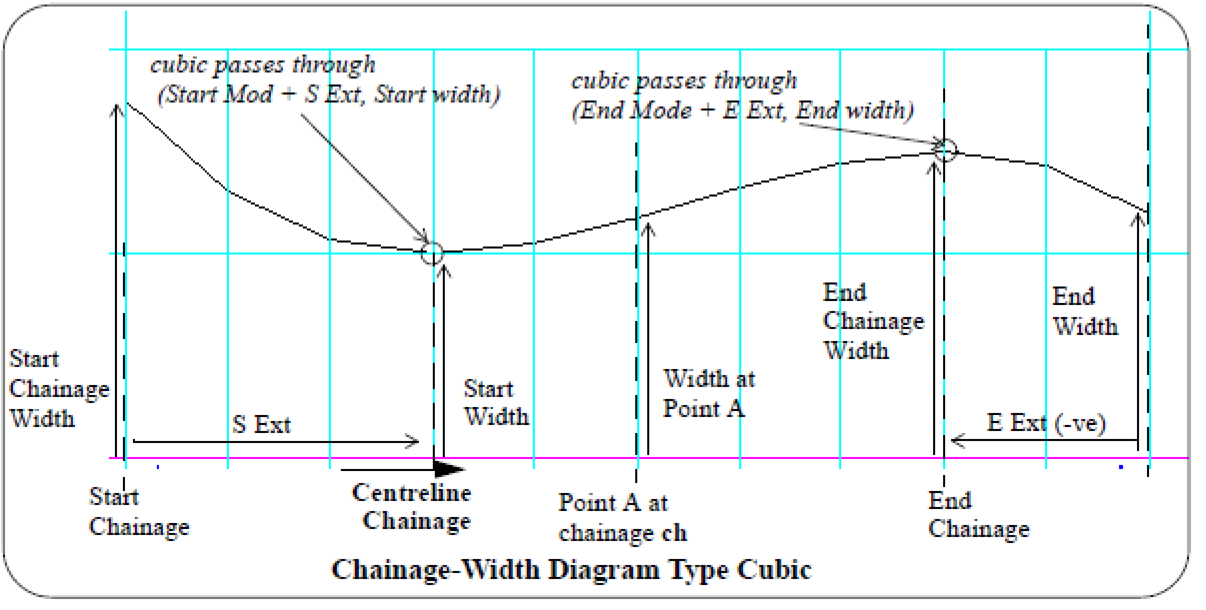
*Between the start position (**Start mode + S Ext**, **Start width)**, and the end position (**End mode + E Ext**, **End width**), the width varies as a **cubic** going through (**Start mode + S Ext**, **Start width)** and (**End mode + E Ext**, **End width**).*



*These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See*

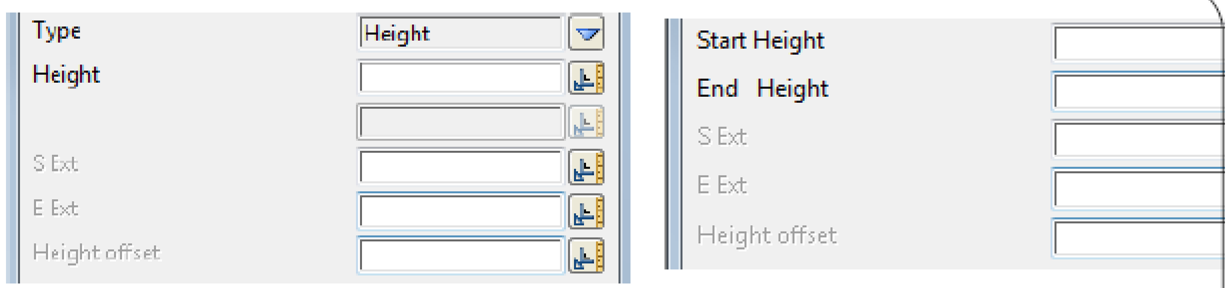
The Height/Xfall is maintained as that originally defined in the selected link.

21.2.2.2.6.2 For Modifier Types "Modify Height Maintain Width/Xfall"

Go to Applying the Calculated Heights

Go to Calculating the Heights for each Type

Applying the Calculated Heights



For Type Height   **For other Types**

Start height input measures menu

height at (Start mode + S Ext)

Start height can be positive or negative. See diagram after Height **Offset**

S Ext and E Ext have no effect for Type Height.

End width input measures menu

height at (End mode + E Ext)

End height can be positive or negative. See diagram after Height **Offset**

End height *does not exist for Type Height.*

S Ext/E Ext input measures menu

Start/End extension to add to the Start/end mode chainage. S Ext/E Ext can be positive or negative.

See diagram after **Offset**

Height offset input measures menu

Final height to be added to the height calculated at each point. **Height offset** *can be positive or negative.*

For a chainage **ch** between the *Start mode* and the *End mode*, a ***height*** is calculated for at **ch** chainage and that height is used for the link that goes out from the Base Link perpendicular to the Centreline.

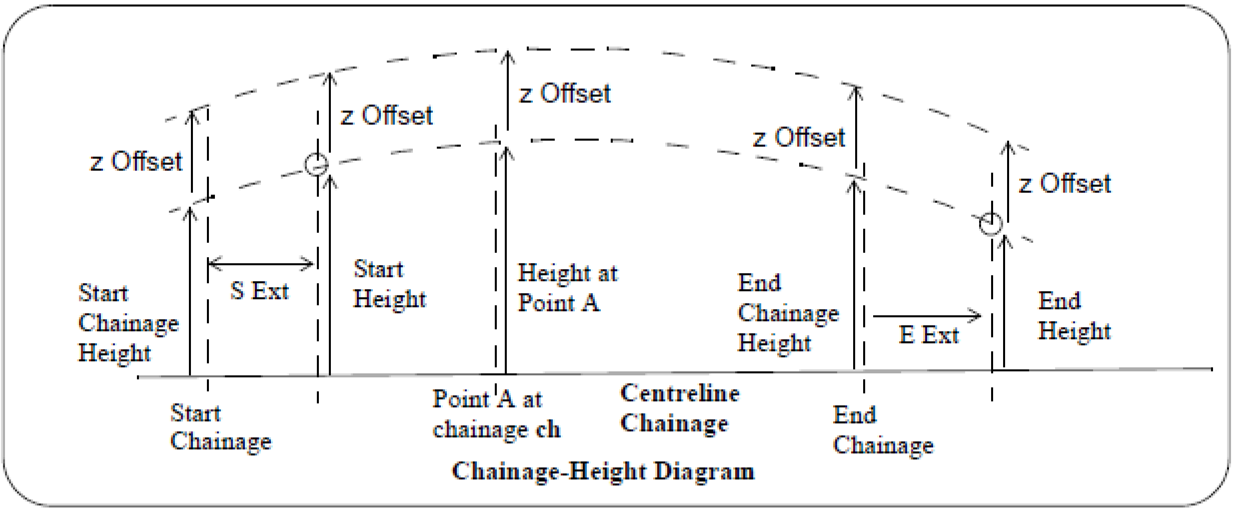
The definition for calculating the height is best described in a **Chainage-Height** diagram. That is, in a plot with **Centreline chainage** as the **x-axis**, and **Height** at that chainage as the **y-axis**. This is similar to a long section plot.

Then for a point **A** at a chainage **ch** on the centreline, the **Height** calculated at chainage **ch** in the Chainage-Height diagram is used for the Height measured from the Base link corresponding at the Centreline at chainage **ch**.

For the **Modify Height** commands, the method defining the heights may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the heights are calculated, *Height offset* is added to all the heights.

Although the definition for calculating the heights in the chainage-height diagram may involve points outside the Start mode/End mode chainage range, the calculated heights are **only applied** to the centreline **between** the **Start mode** chainage and the End mode chainage.



Chainage-Height Diagram

Chainage-Height Diagram for Type <-Circular

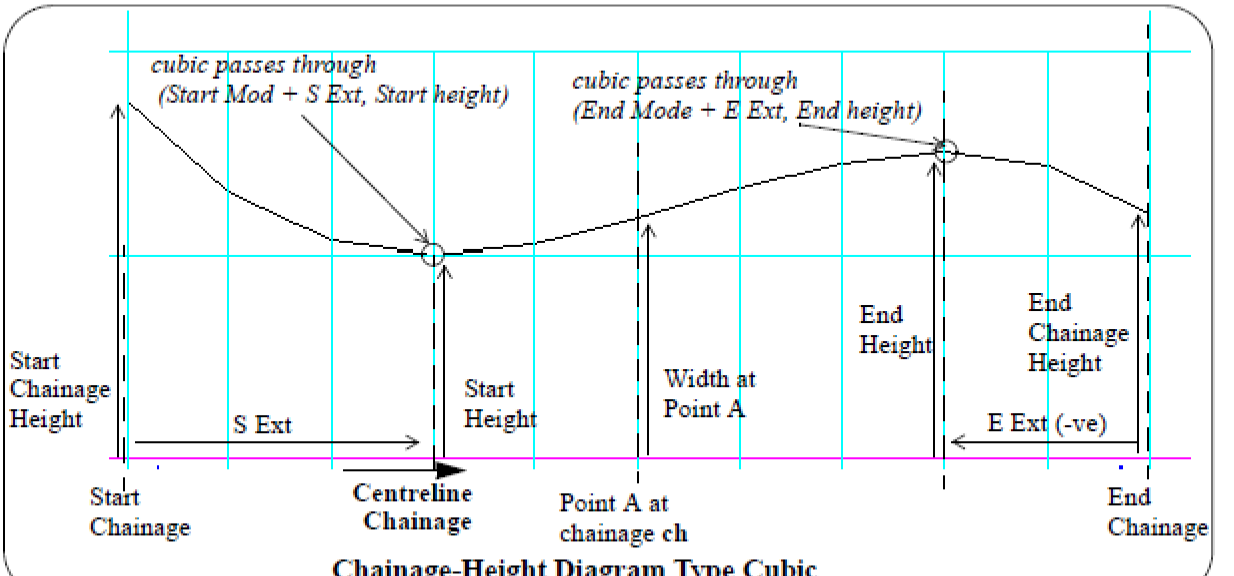
*These heights and the **Height offset** are then used for the link being modified as the height that the link is **from the Base Link** when measured along the section perpendicular to the centreline.*

The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type Cubic

*In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext**, and **End height** is the height at chainage **End mode plus E Ext**.*

*Between the start position (**Start mode + S Ext**, **Start height)**, and the end position (**End mode + E Ext**, **End height**), the height varies as a **cubic** going through (**Start mode + S Ext**, **Start height)** and (**End mode + E Ext**, **End height**).*



Chainage-Height Diagram Type Cubic

*These heights and the **Height offset** are then used for the link being modified as the height that the link is **from the Base Link** when measured along the section perpendicular to the centreline.*

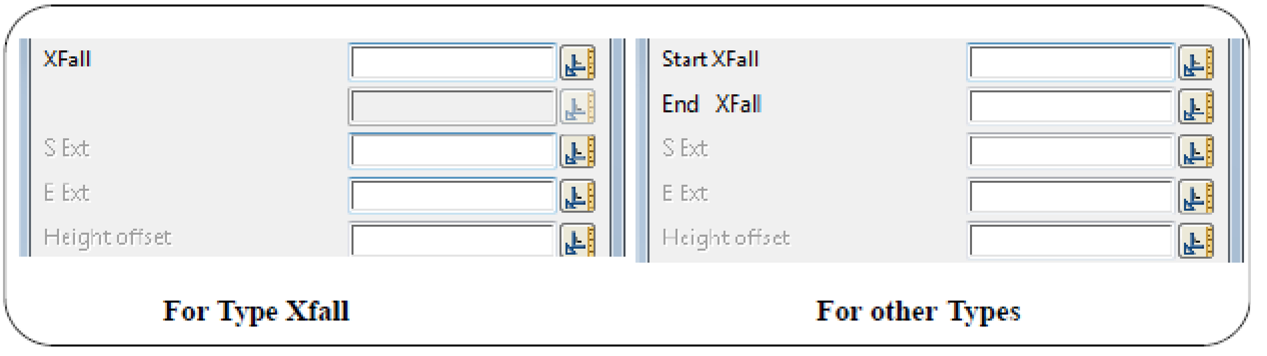
The Width/Xfall is maintained as that originally defined in the selected link.

21.2.2.2.6.3 For Modifier Types "Modify Xfall Maintain Width/Height"

Go to Applying the Calculated Xfall

Go to Calculating the Xfall for each Type

Applying the Calculated Xfall



Start xfall input measures menu

xfall at (Start mode + S Ext)

Start xfall can be positive or negative. See diagram after **Height offset**

S Ext and E Ext have no effect for Type Xfall.

End xfall input measures menu

xfall at (End mode + E Ext)

End xfall can be positive or negative. See diagram after **Offset**

End xfall *does not exist for Type Xfall.*

S Ext/E Ext input measures menu

Start/End extension to add to the Start/end mode chainage. S Ext/E Ext can be positive or negative.

See diagram after **Offset**

Height offset input measures menu

Final height offset to be added to the ***height*** *calculated at each point. Height offset can be positive or negative.*

For a chainage **ch** between the *Start mode* and the *End mode*, a ***xfall*** is calculated at **ch** chainage and that xfall is used for the link that goes out from the Base Link perpendicular to the Centreline.

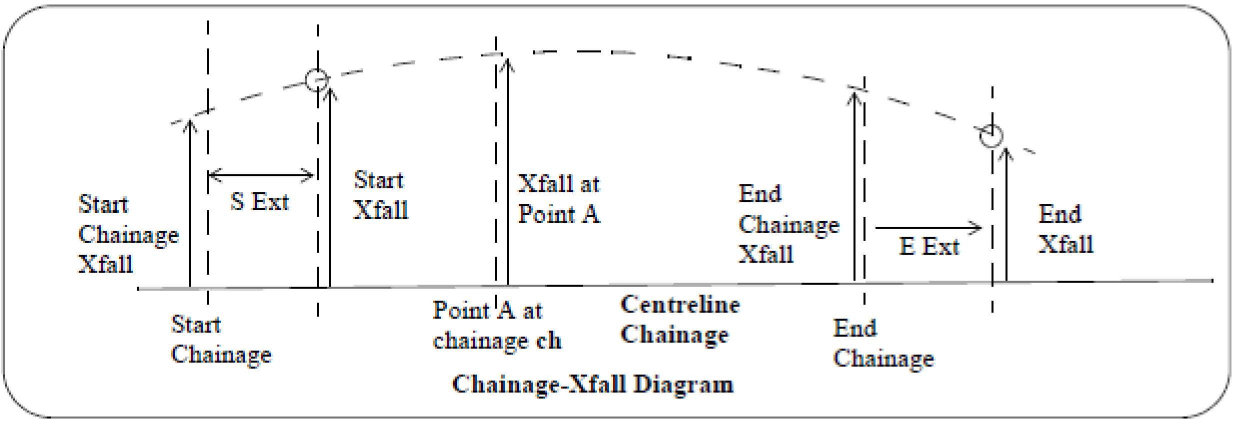
The definition for calculating the xfall is best described in a **Chainage-Xfall** diagram. That is, in a plot with **Centreline chainage** as the **x-axis**, and **Xfall** at that chainage as the **y-axis**. This is similar to a super elevation diagram where chainage is the x-axis and xfall is the y-axis.

Then for a point **A** at a chainage **ch** on the centreline, the **Xfall** calculated at chainage **ch** in the Chainage-Xfall diagram is used for the Xfall measured from the Base link corresponding at chainage **ch**.

For the **Modify Xfall** commands, the method defining the xfalls may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the xfalls and height/widths are applied to the link, a Height offset is added **to all the heights**.

Although the definition for calculating the xfalls in the chainage-xfall diagram may involve points outside the Start mode/End mode chainage range, the calculated xfalls are **only applied** to the centreline **between** the **Start mode** chainage and the End mode chainage.



Calculating the Xfall for each Type

Chainage-Xfall Diagram Type Cubic

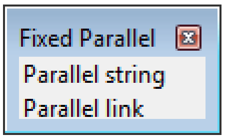
*These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is **from the Base Link** when measured along the section perpendicular to the centreline.*

The Width/Height is maintained as that originally defined in the selected link.

Continue to the next section 21.2.2.2.7 Fixed Link- Parallel or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.2.2.2.7 Fixed Link- Parallel

The **Parallel** walk-right brings up the **fixed Parallel** menu with options to adjust all the links between specified fixed links and make them parallel offsets of a given link, of a selected string.



To go straight to the documentation on each of the options on the **Fixed** modifier menu:

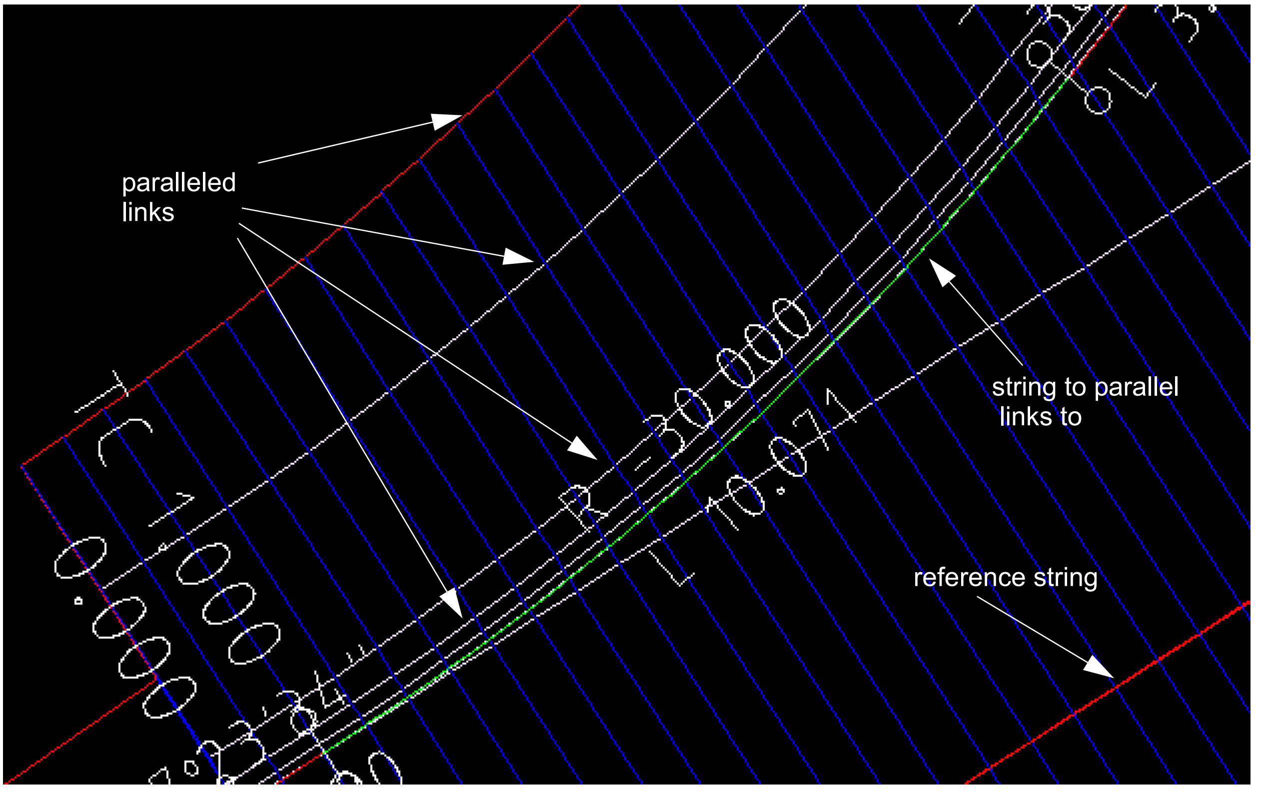
See

Parallel string	21.2.2.2.7.1 Fixed Link - Parallel Links to String
Parallel link	21.2.2.2.7.2 Fixed Link - Parallel Links to Link

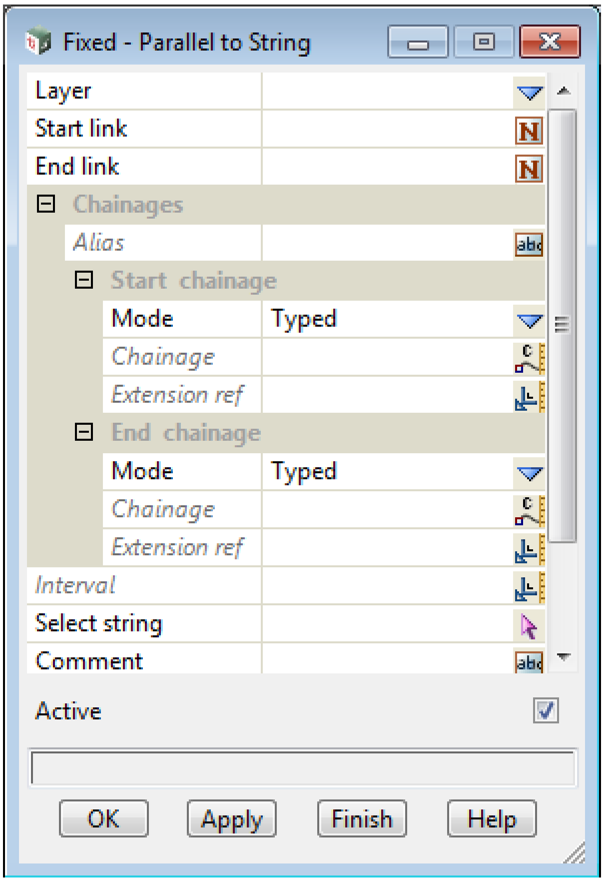
21.2.2.2.7.1 Fixed Link - Parallel Links to String

The **Parallel string** option takes all the fixed links between two nominated link names (inclusive) and adjusts them so that the specified widths, cross falls and heights of the links are used **perpendicular** to a **selected string** rather than measured perpendicular to the reference string.

If sections and strings are created in the ***Apply MTF,*** then vertices are still created on the section and on the strings **perpendicular** to the reference string.



Selecting **Parallel** brings up the **Fixed - Parallel to String** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available Layers

name of the layer that the links to parallel are in. For information on Layers, see [21.1.1.2 MTF Links and Layers](#).

Start link	name box		names.4d pop-up

the name of the link to start making the widths distances measure parallel to the selected string.

End link	name box		names.4d pop-up

the name of the last link to make the widths distances measure parallel to the selected string.

Select string	string-select		

select the string to measure perpendicular to. The width, cross fall and height that a link is from the previous link are still used but they are measured along a perpendicular to the selected string rather than the reference string.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to parallel the links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

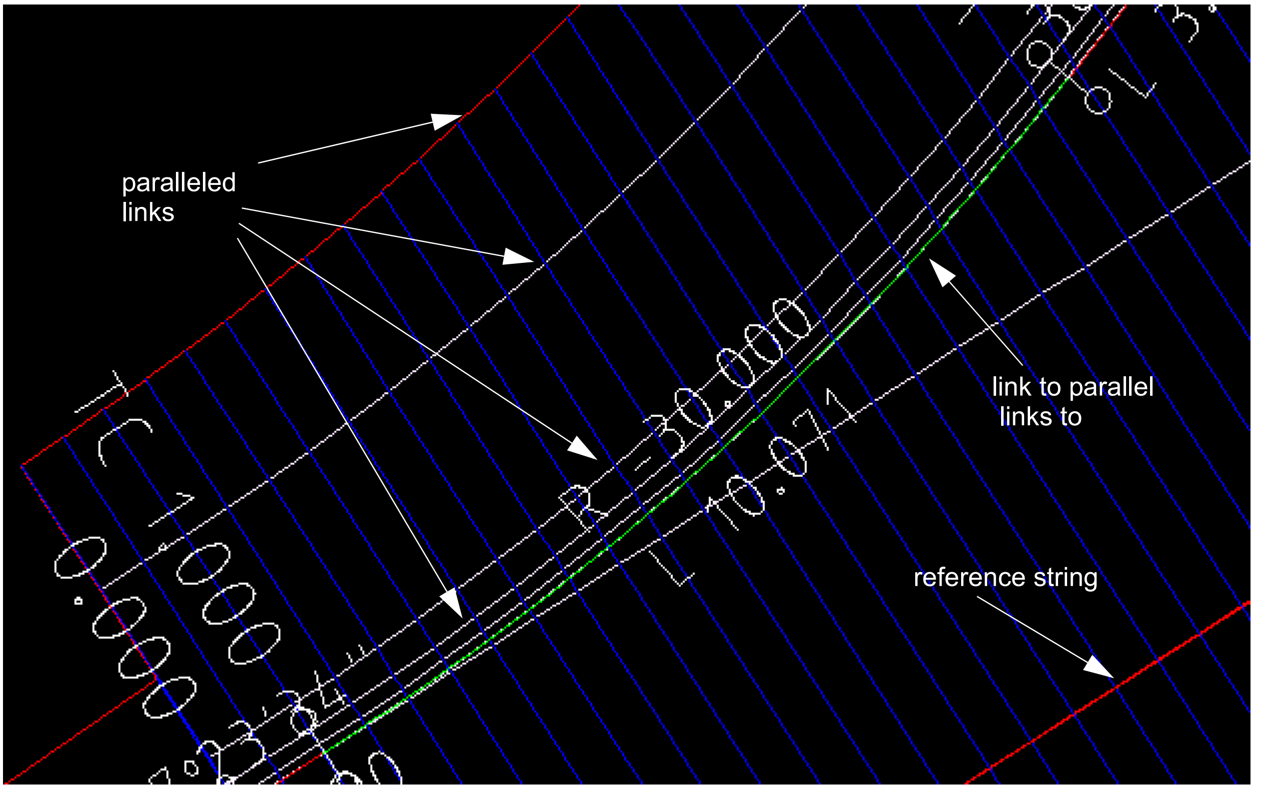
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.7.2 Fixed Link - Parallel Links to Link or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

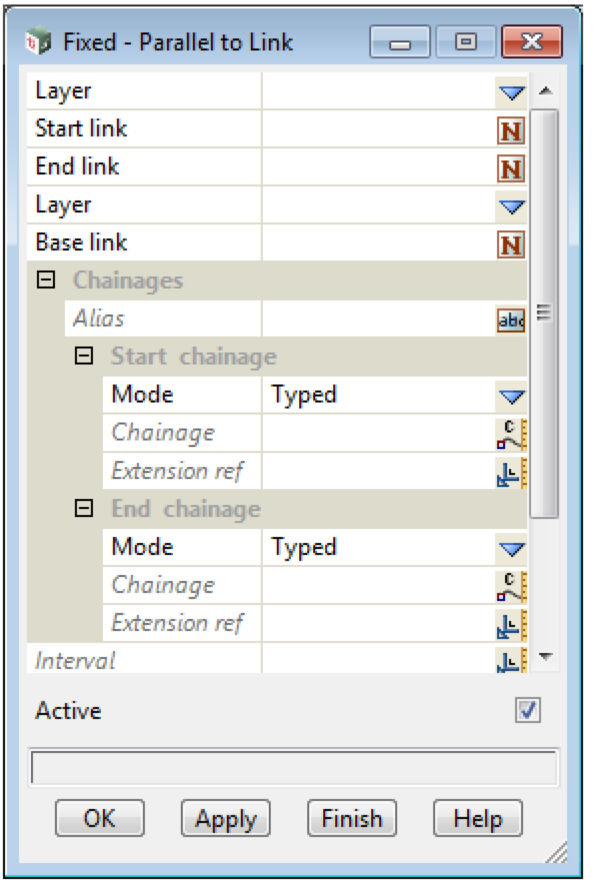
21.2.2.2.7.2 Fixed Link - Parallel Links to Link

The **Parallel link** option takes all the fixed links between two nominated link names (inclusive) and adjusts them so that the specified widths, cross falls and heights between the links are calculated perpendicular to a selected link **Base link** rather than measured perpendicular to the reference string.

If sections and strings are created in the ***Apply MTF,*** then vertices are still created on the section and on the strings **perpendicular** to the reference string.



Selecting **Parallel link** brings up the **Fixed - Parallel to Link** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available Layers

name of the layer that the links to parallel are in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Start Link	name box		names.4d pop-up

the name of the link to start making the widths distances measure parallel to the **Base link**.

End link	name box		names.4d pop-up

the name of the last link to make the widths distances measure parallel to the selected link.

Base Layer	layer box	Design	available Layers

name of the layer for the **Base link.** *For information on Layers, see* 21.1.1.2 MTF Links and Layers.

Base link	name box		

select the link to use to measure perpendicular to. The width, cross fall and height that a link is from the previous link are still used but they are measured along a perpendicular to the **Base link** *rather than the reference string.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to parallel the links.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

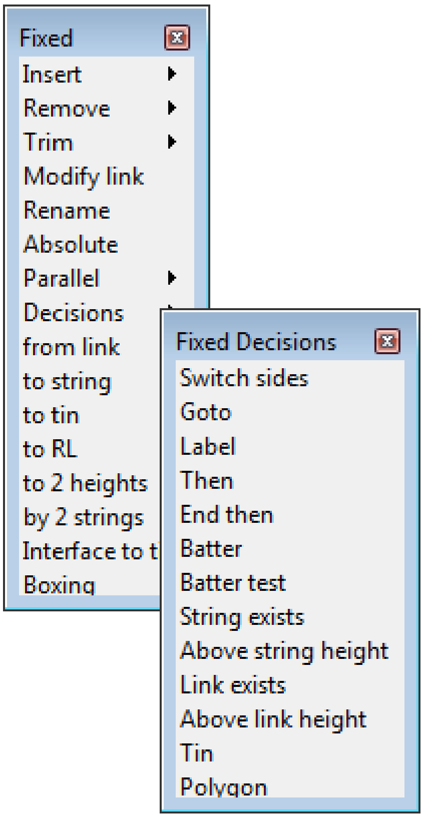
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.8 Fixed Link - Decisions or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.2.2.2.8 Fixed Link - Decisions

The **Decisions** walk-right brings up the **Fixed Decisions** menu with options to make decisions on tests such as being able to batter into a tin, or how deep you are under a tin. There are labels and gotos to build complex tests.



See

Switch side	21.2.2.2.8.1 Fixed Decisions - Switch Sides
Goto	21.2.2.2.8.2 Fixed Decisions - Goto
Label	21.2.2.2.8.3 Fixed Decisions - Label
Then	21.2.2.2.8.4 Fixed Decisions - Then
End then	21.2.2.2.8.5 Fixed Decisions - End Then
Batter	21.2.2.2.8.6 Fixed Decisions - Batter
Batter test	21.2.2.2.8.7 Fixed Decisions - Batter Test
String exists	21.2.2.2.8.8 Fixed Decisions - String Exists
Above string height	21.2.2.2.8.9 Fixed Decisions - Above String Height
Link exists	21.2.2.2.8.10 Fixed Decisions - Link Exists
Above link height	21.2.2.2.8.11 Fixed Decisions - Above Link Height
Tin	21.2.2.2.8.12 Fixed Decisions - Tin
Polygon	21.2.2.2.8.13 Fixed Decisions - Polygon

21.2.2.2.8.1 Fixed Decisions - Switch Sides

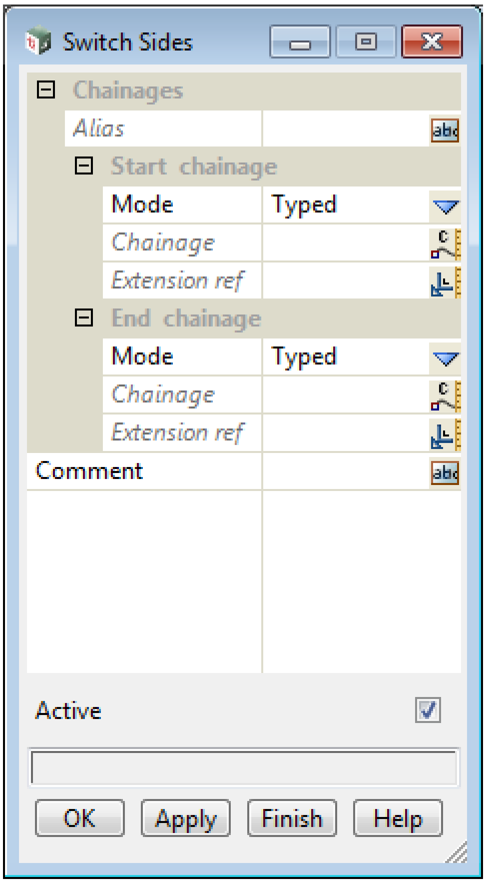
The **Switch Sides** command transfers processing to the other side of the **Modifiers**.

That is, if a **Switch Sides** command is processed in a **Left MTF Modifiers** grid, then processing stops at that point in the **Left MTF Modifiers** grid, and processing is transferred to the **Right MTF Modifiers** grid. In the **Right MTF Modifiers** grid it from the row where the last **Switch Sides** command was executed **in the Right MTF Modifiers** grid, or if that hasn't occurred before, processing starts at the top row of the **Right MTF Modifiers** grid.

And similarly if a **Switch Sides** command is processed in a **Right MTF Modifiers** grid

So processing can switch a number of times between the two sides.

Selecting **Switch sides** brings up the **Switch Sides** panel.



Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages where the Switch Sides command is.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

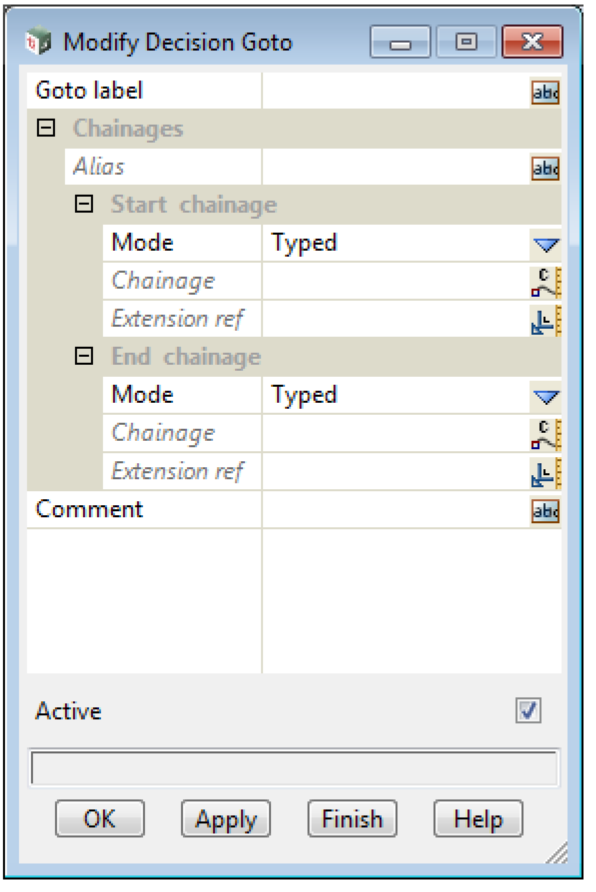
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.8.2 Fixed Decisions - Goto or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.2 Fixed Decisions - Goto

Goto will transfer control to the row of the **Left/Right MTF Modifiers** grid with the label **Goto label.**

Selecting **Goto** brings up the panel **Modify Decision Goto**



Goto label text box

transfer processing to the row of the Left/Right MTF Modifiers grid with this label.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages where the GoTo command exists.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

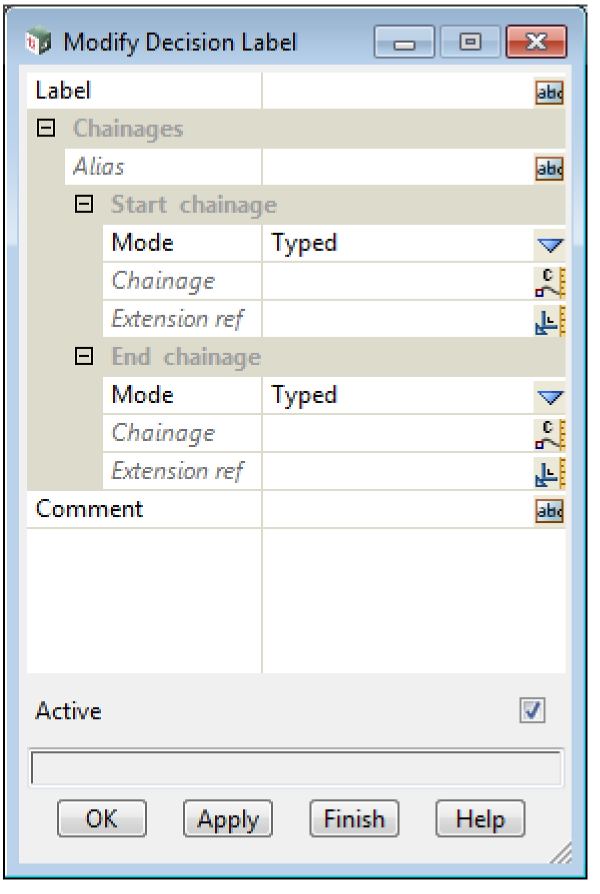
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.8.3 Fixed Decisions - Label or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.3 Fixed Decisions - Label

The **Label** option creates a row in the **Left/Right MTF Modifiers** grid with the label **Label.**

Selecting **Label** brings up the panel **Modify Decision Label**



Label text box

name of the label that goes with this row of the Left/Right MTF Modifiers grid.

Alias, **Start Chainage**, **End Chainage**, **Interval**

the Label exists when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.8.4 Fixed Decisions - Then or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.4 Fixed Decisions - Then

The **Then** Command works in conjunction with an **End Then** command, and they both work with any one of the ***Decision*** commands that has a *test* and a **Goto Label** that is executed when the test succeeds (.e.g Batter Decision, String Exist, Tin).

The **Then** and the **End Then** must have the value for the **Label** field to be the same as the **GoTo Label** in a Test command.

If such an **Then-End Then** block exists for a Test command, then whenever the **GoTo Label** is executed for the Test command then processing is transferred to the **Then** command and continues from there.

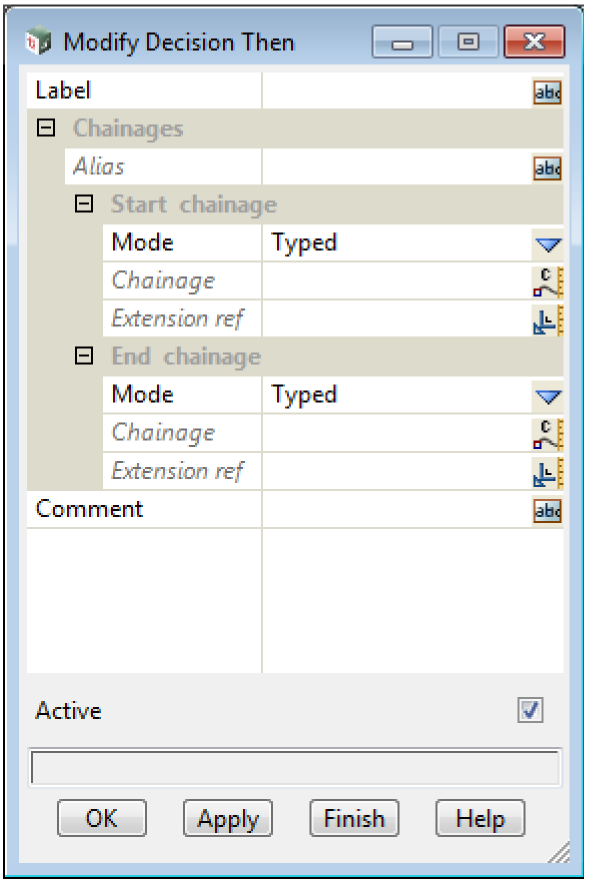
However if processing reaches a **Then** command by any mean other than from a Test command, then all the commands are ignored until the **End Then** command is reached.

So a **Then-End Then** block is ignored except by a Test command with a matching **GoTo Label**.

Notes

1. More than one Test command can use the same **Then-End Then** block.
2. Jumping into the middle of a **Then-End Then** block should not be done and will have unpredictable consequences.

Selecting **Then** brings up the **Modify Decision Then** panel



Label text box

*name of the label that is the same as its matching **End Then** command, and matches the* **Goto Label** *of any Test command that wants to use the **Then-End Then** block.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

the Then exists when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

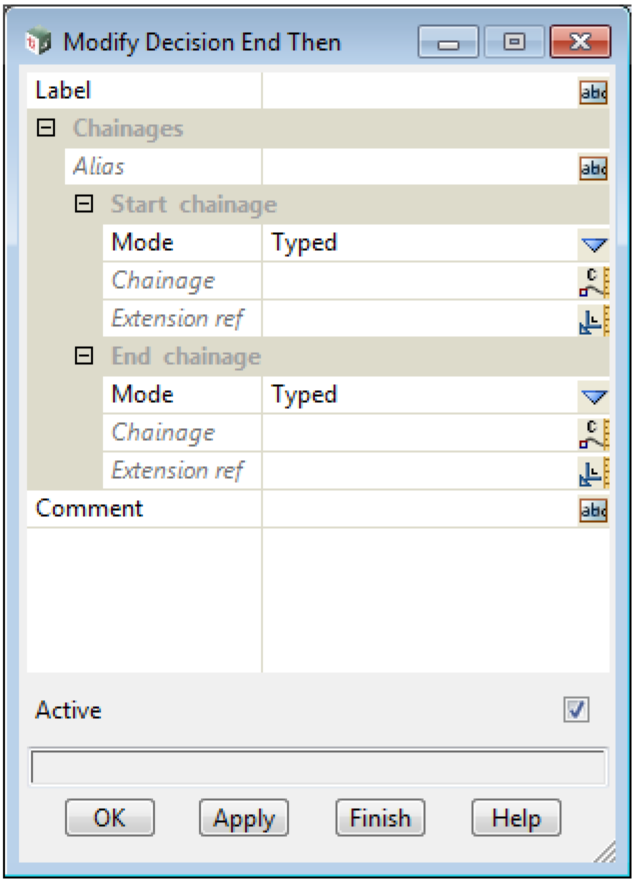
Go to the next section 21.2.2.2.8.5 Fixed Decisions - End Then or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.5 Fixed Decisions - End Then

MTF_Edit_Modify_Decision_End_Then

The **End Then** goes with a matching **Then** command. For a description of how the **Then-End Then** commands are used, see 21.2.2.2.8.4 Fixed Decisions - Then.

Selecting **End then** brings up the panel **Modify Decision End Then**



Label text box

*name of the label that is the same as its matching **Then** command, and matches the* **Goto Label** *of any Test command that wants to use the **Then-End Then** block.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

the End Then exists when the chainage is between the Start and End chainages.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.8.6 Fixed Decisions - Batter or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.6 Fixed Decisions - Batter

The **Batter** option is used to **construct** a **new link** which stops if it comes within

(a) a **Strip** depth of a **Tin**

(b) an **Offset** distance from a **Tin**.

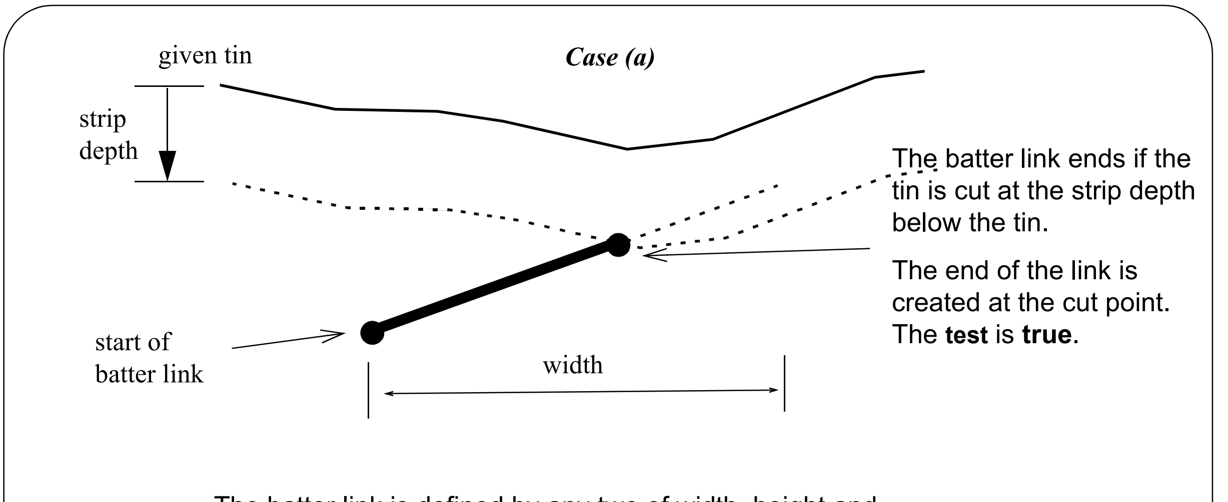
(c) a **Strip** depth of a **Tin** calculated at a given **Offset** from the link.

If the link does stop, control is transferred via a **Goto label**, otherwise control continues onto the next row in the **Left/Right MTF Modifiers** grid.

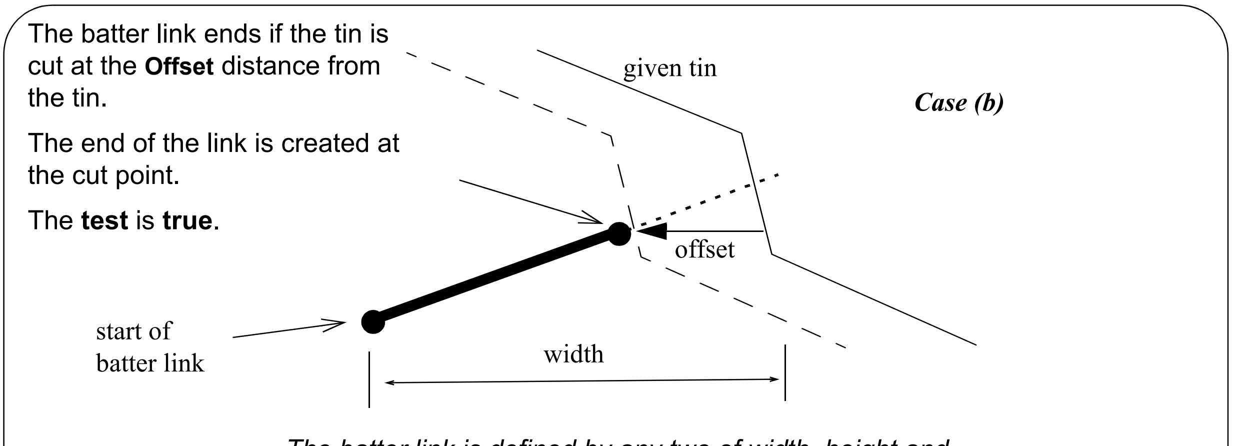
The maximum length of the **batter** link is defined by specifying values for two of the three fields **Width**, **Height** and **Slope**. The **Width**, **Height** and **Slope** values of the created link may be different if the link stops because of one of the conditions (a), (b) or (c).

Notes

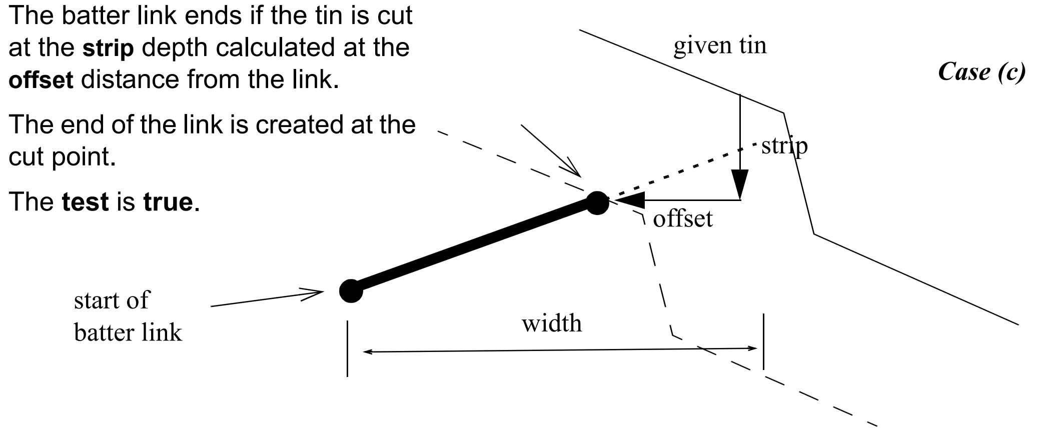
1. cases (a) and (b) are just special cases of (c)
2. strip and offset can be used to stop the link to allow for a fixed structure (such as a drain) to be inserted so that it ends up on the tin.



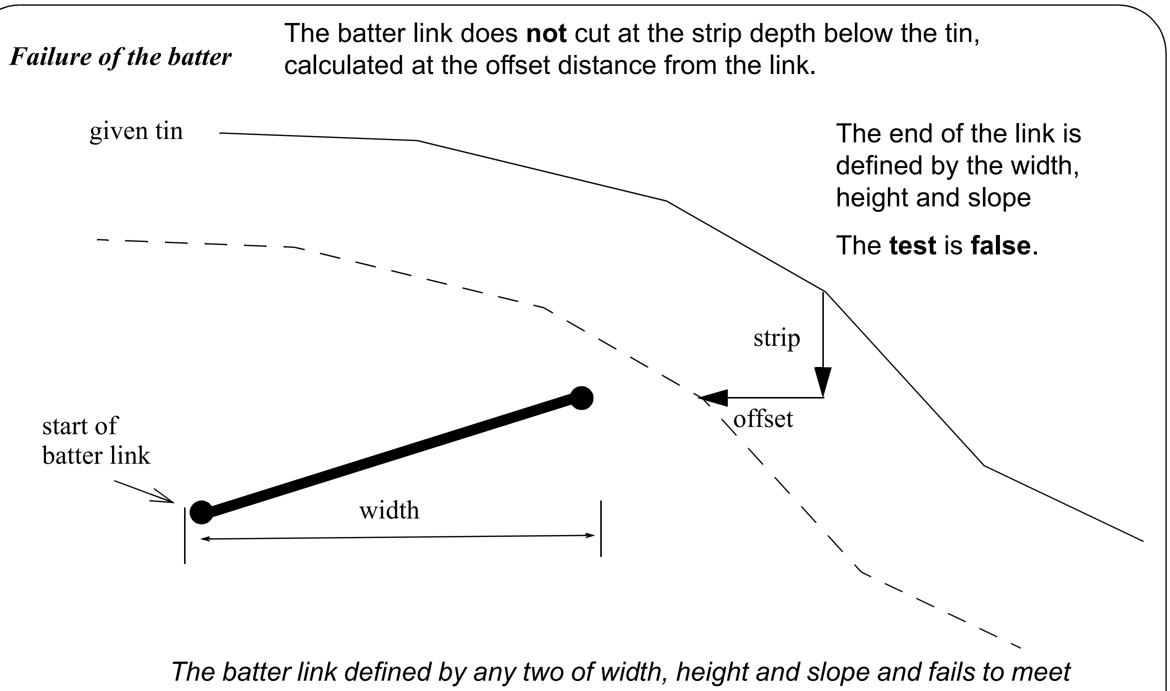
The batter link is defined by any two of width, height and slope and stops if it meets the tin at the strip depth.



The batter link is defined by any two of width, height and slope and stops if it meets the tin at the offset distance.

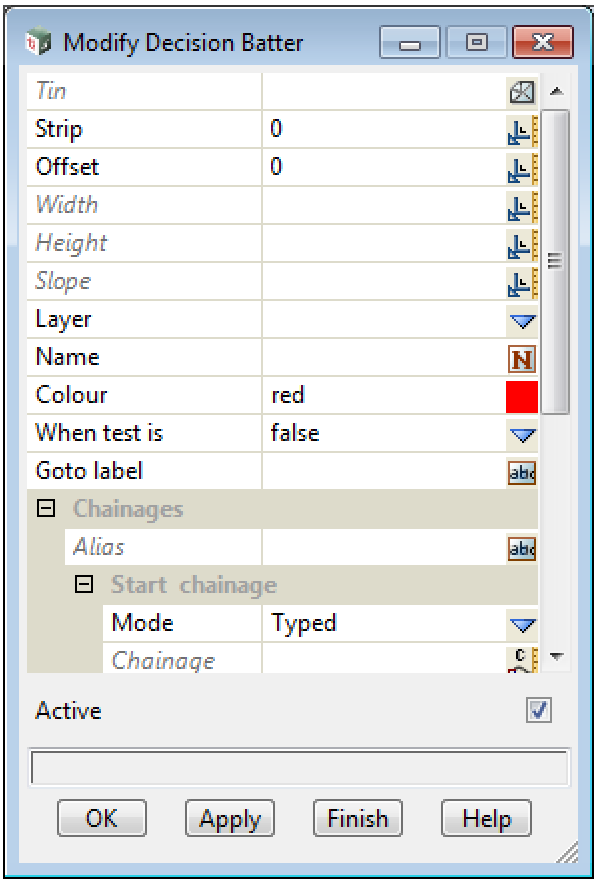


The batter link is defined by any two of width, height and slope and stops if it meets the tin at the strip depth calculated at the given offset distance from the link.



The batter link defined by any two of width, height and slope and fails to meet the tin at the strip depth calculated at the given offset distance from the link.

Selecting **Batter** brings up the **Modify Decision Batter** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	tin box		available tins

tin to batter to.

Strip	real box	0	

distance below the tin to stop at.

Offset	real box	0	

offset distance from the link to check strip depth

Width	real box		

the width for the link. Any two of Width, Height and Slope can be used.

Height	real box		

the height for the link. Any two of Width, Height and Slope can be used.

Slope	real box		

the slope, in 1v in, of the link. Positive is up and negative down.
Any two of Width, Height and Slope can be used.

Layer	layer box	Design	available layers

name of the layer that the new link is to go in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Name	name box		available names

the name to be used for the created link.

Colour	colour box	cyan	available colours

the colour to be used for the created link

When test is choice box false true, false

*if **When test is** has the value **true**, and the test is **true** (i.e. the batter link comes within the depth* **Strip** *and offset* **Offset** *of the tin) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

*If **When test is** has the value **false**, and the test is **false** then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label text box

used with **When test is**.

*Note that there may be a **Then-End Then** block that matches the* **GoTo Label**. *For a description of a **Then-End Then** block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the batter is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.8.7 Fixed Decisions - Batter Test or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.7 Fixed Decisions - Batter Test

The **Batter test** option ***tests*** if a user defined link comes within

(a) a **Strip** depth of a **Tin**

(b) an **Offset** distance from a **Tin**.

(c) a **Strip** depth of a **Tin** calculated at a given **Offset** from the link.

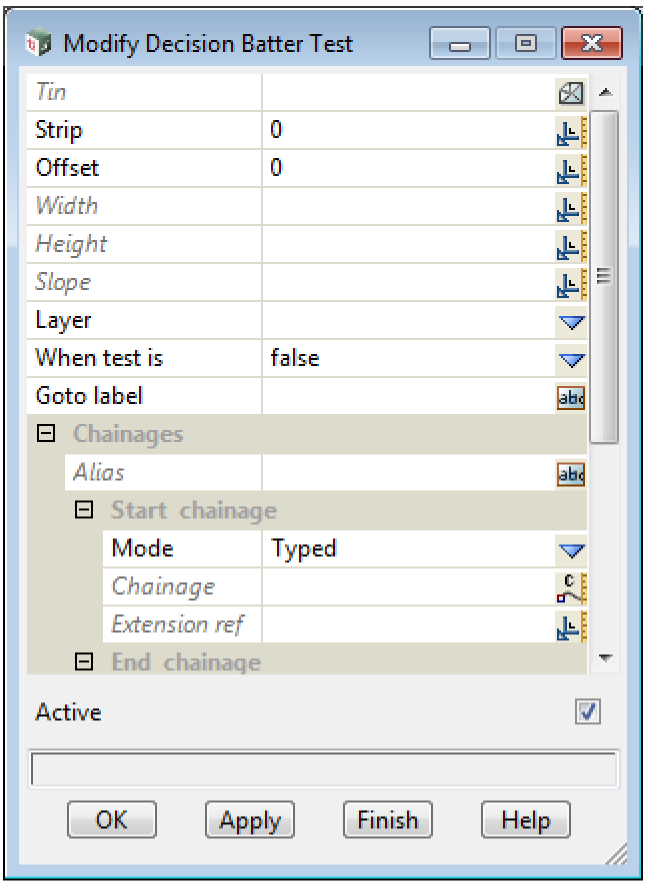
The **test link** is defined by specifying values for two of the three fields **Width**, **Height** and **Slope**.

Notes

1. The tests are the same as in 21.2.2.2.8.6 Fixed Decisions - Batter but **no link is created**. That is, The batter test is used to test if a batter will stop/not stop without creating a batter link.
2. Cases (a) and (b) are just special cases of (c)

For diagrams describing the tests, see 21.2.2.2.8.6 Fixed Decisions - Batter.

Selecting **Batter test** brings up the **Modify Decision Batter Test** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	tin box		available tins
tin to test battering to.			
Strip	real box	0	
distance below the tin to stop at.			
Offset	real box	0	
offset distance from the link to check strip depth			

Width real box

the width for the link. Any two of Width, Height and Slope can be used.

Height real box

the height for the link. Any two of Width, Height and Slope can be used.

Slope real box

the slope, in 1v in, of the link. Positive is up and negative down.
Any two of Width, Height and Slope can be used.

Layer layer box Design available layers

name of the layer that the test link is appended to. For information on Layers, see 21.1.1.2 MTF Links and Layers.

When test is choice box false true, false

*if **When test is** has the value **true**, and the test is **true** (i.e. the test link comes within the depth* **Strip** *and offset* **Offset** *of the tin) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

*If **When test is** has the value **false**, and the test is **false** then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label text box

used with **When test is**.

*Note that there may be a **Then-End Then** block that matches the* **GoTo Label**. *For a description of a **Then-End Then** block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the batter is tested when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

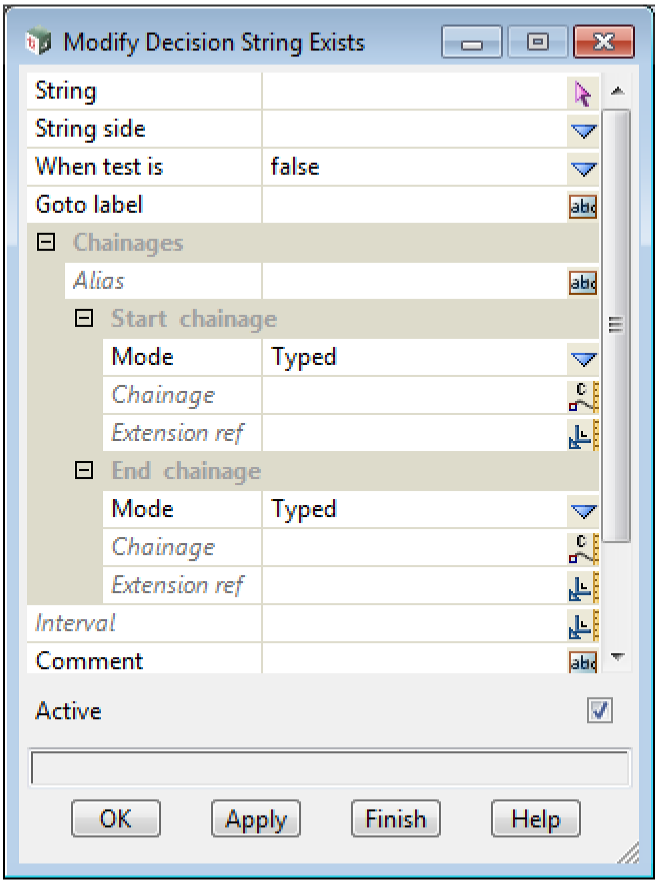
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.8.8 Fixed Decisions - String Exists or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.8 Fixed Decisions - String Exists

This options tests to see if a string is on the left and/or right of the reference string.

Selecting **String** brings up the panel **Modify Decision String Exists**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
String	string select		

the string to test.

String side	choice box	both	left, right, both

*if **left**, only the left side of the reference string is searched for the given string.*

*If **right**, only the right side of the reference string is searched for the given string.*

*If **both**, the left and the right side of the reference string is searched for the given string.*

When test is	choice box	false	true, false

*if **When test is** has the value **true**, and the test is **true** (i.e. the given string is found) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

*If **When test is** has the value **false**, and the test is **false** (i.e. the given string is not found) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label	text box		

used with **When test is**.

*Note that there may be a **Then-End Then** block that matches the* **GoTo Label**. *For a description of a **Then-End Then** block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the test is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

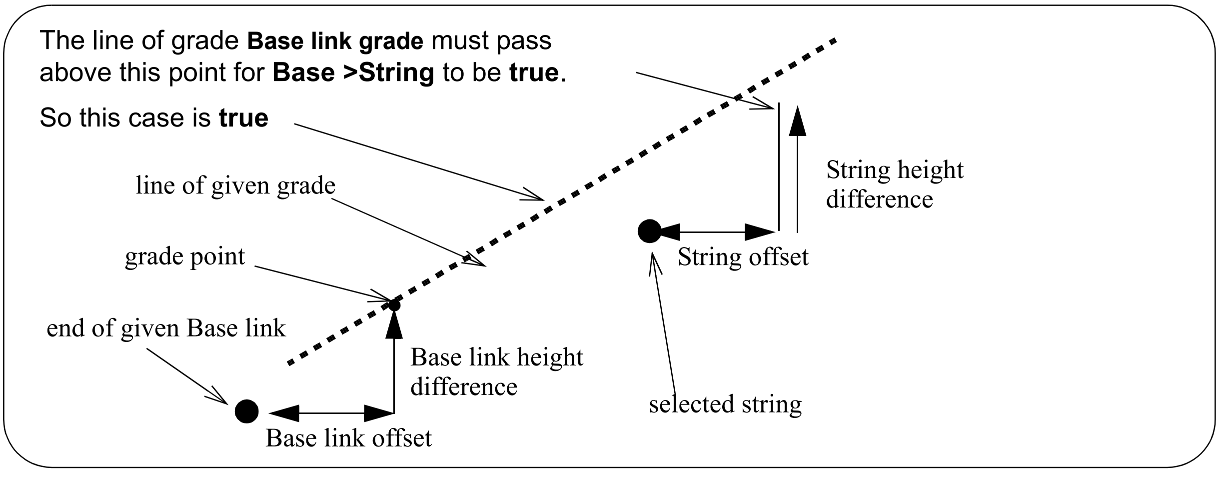
Go to the next section 21.2.2.2.8.9 Fixed Decisions - Above String Height or return to 21.2.2.2.8 Fixed Link - Decisions.

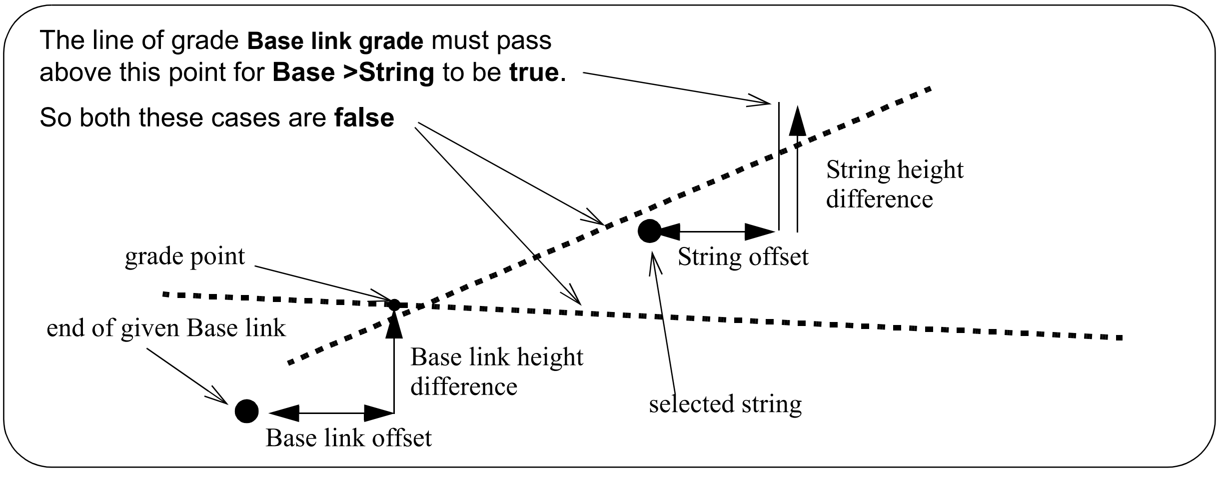
21.2.2.2.8.9 Fixed Decisions - Above String Height

The option ***tests*** if a line of a given grade (**grade line)** defined from the end of a Base link passes a given height difference above a selected string.

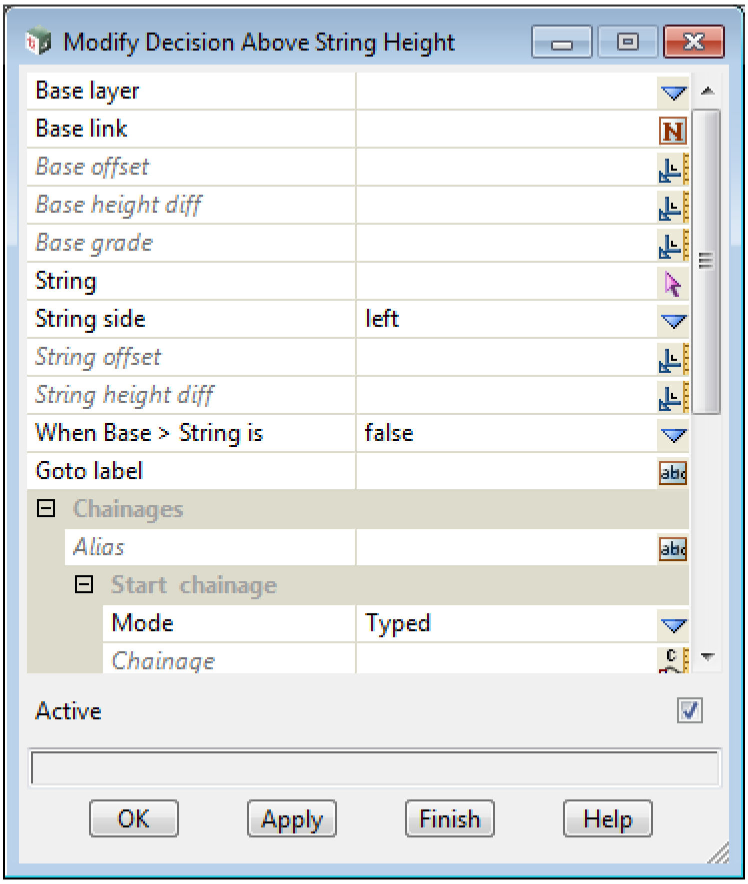
The **grade line** passes through the **grade point** which is a given **Base link offset** and **Base link height difference** from the end of the given link.

The height is tested at a given **string offset** from the selected string.





Selecting **Above string height** brings up the **Modify Decision Above String Height** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Base layer	layer box	Design	available layers

name of the layer that the link to test for is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Base link — link box

name of the link in **Base layer** *to test if the line of grade going from the link is a delta height above a selected string.*

Base link offset — real box

option "sided" offset distance from the end of the link **Base link** *that the line of grade* **Base link grade** *goes through (the grade point).*

Base link height diff — real box

the value to add to the height of the end of the link **Base link** *that the line of grade* **Base link grade** *goes through (the grade point).*

Base link grade — real box

percentage grade of a line through the grade point that is tested to see if it passed withing a given offset and height difference of the selected string.

String — string select

the string to test.

Field Description	Type	Default	Pop-Up
String side	choice box	both	left, right, both

if ***left****, only the left side of the reference string is searched for the selected string.*

If ***right****, only the right side of the reference string is searched for the selected string.*

*If **both**, the left and the right side of the reference string is searched for the selected string.*

String offset real box

optional "absolute" offset distance from the string of the point that is tested for the **grade link** *going above.*

String height diff real box

optional height difference added to the height of the string. This total height is used at the String offset point to give the point that is tested for the **grade link** *going above.*

When Base >String is choice box false true, false

*if **When Base >String** has the value **true**, and the test is **true** then go to the label* **Goto label**. *Otherwise proceed to the next row.*

*If **When Base > String** has the value **false**, and the test is **false** then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label text box

used with **When Base > String is**.

*Note that there may be a **Then-End Then** block that matches the* **GoTo Label**. *For a description of a **Then-End Then** block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the test is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

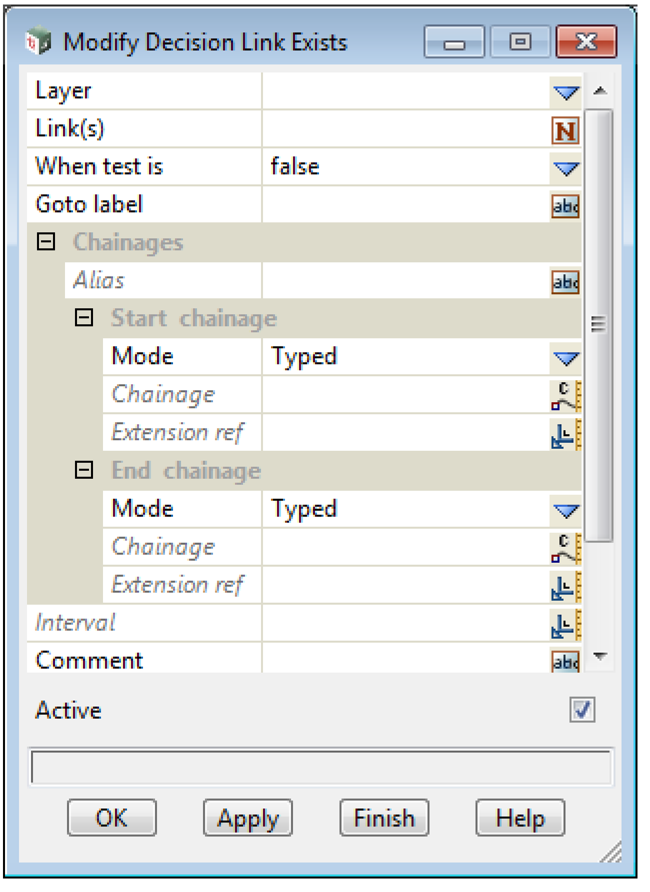
Go to the next section 21.2.2.2.8.10 Fixed Decisions - Link Exists or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.10 Fixed Decisions - Link Exists

This options tests to see if a given link exists.

Note that a link is only looked for on the side that the Link Exists command being processed is in.

Selecting **Link** brings up the panel **Modify Decision Link Exists**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to test for is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link(s)	name box		

name of the links in **Layer** *to test to see if any of them exist. See* 21.2.2.1.2 Link or Link(s).
The test only looks at the side that the Link Exists command being processed is in (Left or Right side).

When test is	choice box	false	true, false

*if **When test is** has the value **true**, and the test is **true** (i.e. the given link is found) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

*If **When test is** has the value **false**, and the test is **false** (i.e. the given link is **not** found) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label	text box		

used with **When test is**.

*Note that there may be a **Then-End Then** block that matches the* **GoTo Label**. *For a description of a **Then-End Then** block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the test is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

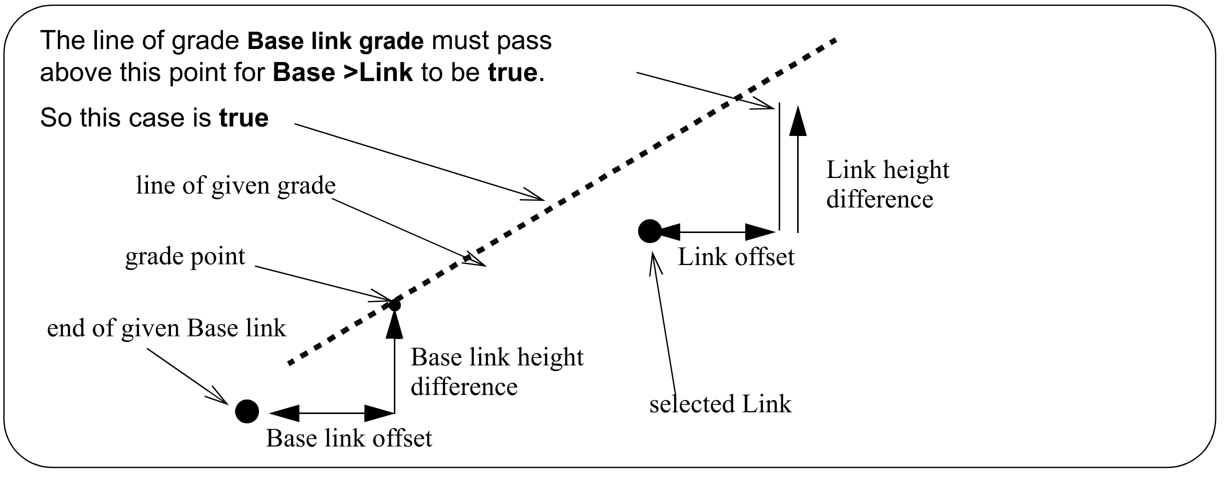
Go to the next section 21.2.2.2.8.12 Fixed Decisions - Tin or return to 21.2.2.2.8 Fixed Link - Decisions.

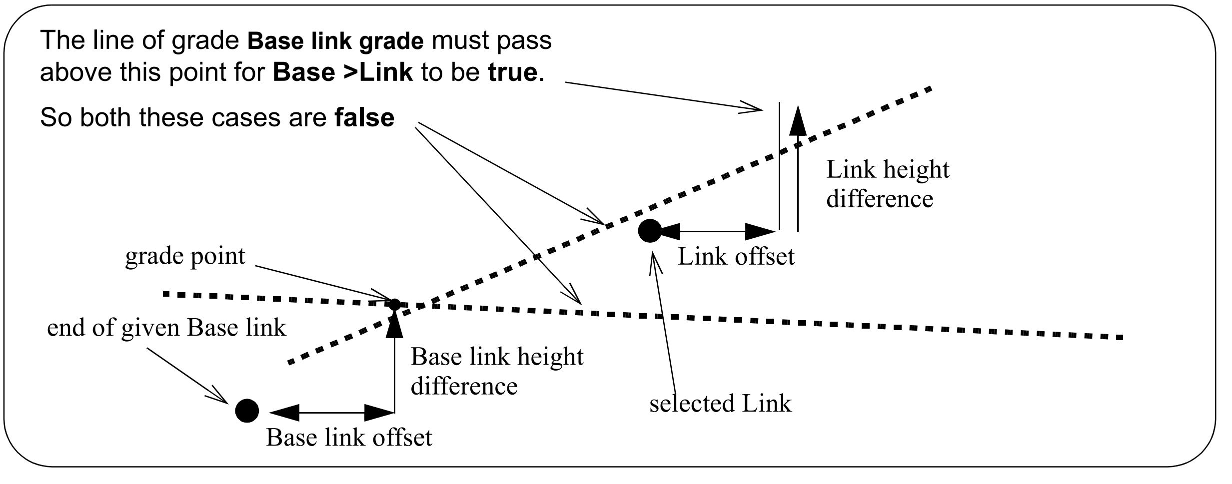
21.2.2.2.8.11 Fixed Decisions - Above Link Height

The option ***tests*** if a line of a given grade (**grade line)** defined from the end of a **Base link** passes a given height difference above a selected **Link**.

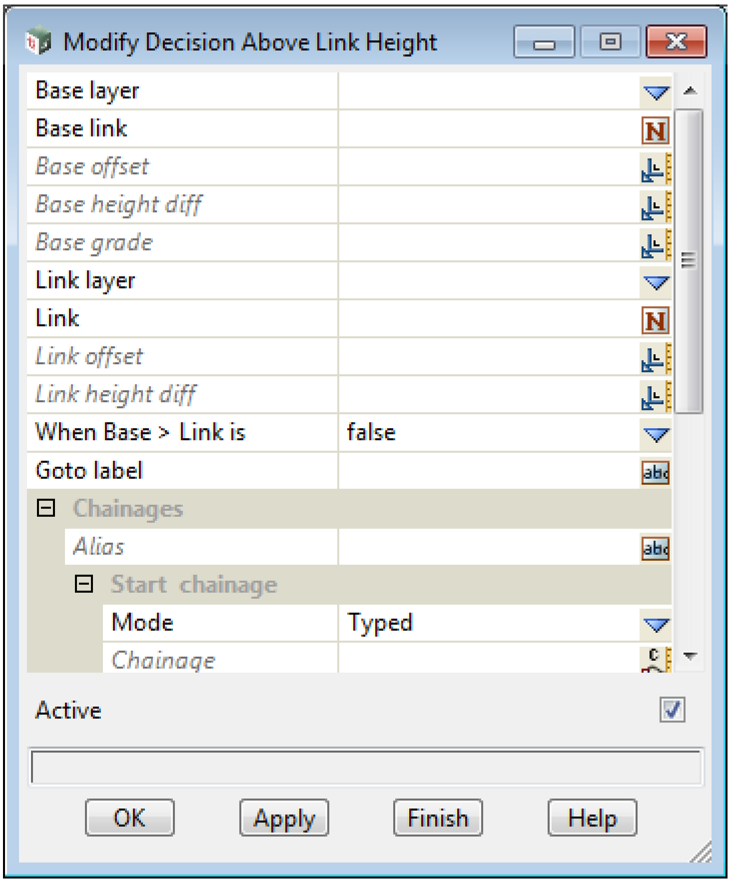
The **grade line** passes through the **grade point** which is a given **Base link offset** and **Base link height difference** from the end of the given link.

The height is tested at a given **Link offset** from the selected **Link**.





Selecting **Above link height** brings up the **Modify Decision Above Link Height** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Base layer	layer box	Design	available layers

name of the layer that the base link to test for is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Base link	link box		

name of the base link in **Base layer** *to test if the line of grade going from the base link is a delta height above a selected* **Link**.

Base link offset	real box		

option "sided" offset distance from the end of the link **Base link** *that the line of grade* **Base link grade** *goes through (the grade point).*

Base link height diff	real box		

the value to add to the height of the end of the link **Base link** *that the line of grade* **Base link grade** *goes through (the grade point).*

Base link grade	real box		

percentage grade of a line through the grade point that is tested to see if it passed above a given offset and height difference of a selected **Link**.

Link layer	layer box	Design	available layers

name of the layer that the link to test that the grade line is above, is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link	link box		

name of the link in **Layer** *to test if the line of grade going from the base link is a delta height above it.*

Link offset real box

optional "absolute" offset distance from the end of **Link** *of the point that is tested for the* **grade link** *going above.*

Link height diff real box

optional height difference added to the height of the end of **Link**. *This total height is used at the* **Link** *offset point to give the point that is tested for the* **grade link** *going above.*

When Base >String is choice box false true, false

if ***When Base >Link*** *has the value* ***true****, and the test is* ***true*** *then go to the label* **Goto label**. *Otherwise proceed to the next row.*

If ***When Base > Link*** *has the value* ***false****, and the test is* ***false*** *then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label text box

used with **When Base > Link is**.

Note that there may be a ***Then-End Then*** *block that matches the* **GoTo Label**. *For a description of a* ***Then-End Then*** *block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the test is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels**.**

Go to the next section 21.2.2.2.8.12 Fixed Decisions - Tin or return to 21.2.2.2.8 Fixed Link - Decisions.

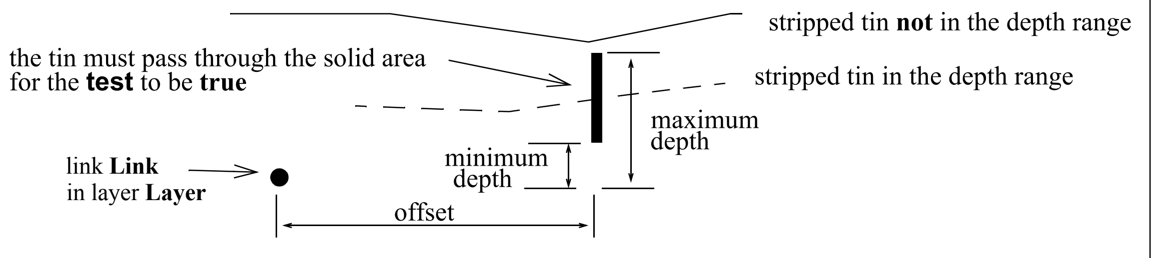
21.2.2.2.8.12 Fixed Decisions - Tin

Selecting **Tin** brings up the **Modify Decision Tin** panel which tests to see if the depth from the end of the given **Link** in a given **Layer**, offset by the amount given in the **Offset** field, is between the two values given in the **Minimum depth** and **Maximum depth** fields where the depths are taken from the stripped Tin (that is, the **Tin** dropped by the **Strip** value).

If the depth is between the values, then control is transferred to the row of the ***Modifiers*** grid with the label given by the **Goto label** field. Otherwise, control passes to the next row of the ***Modifiers*** grid.

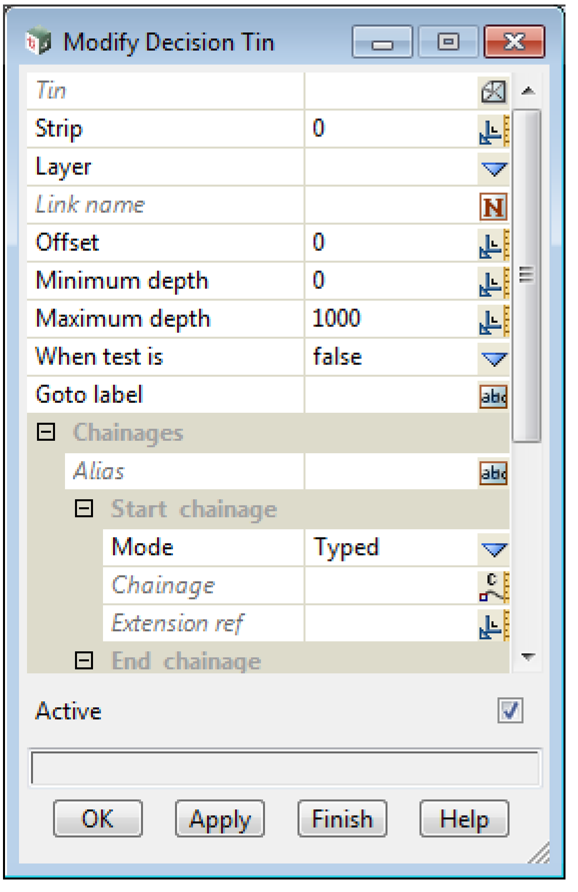
Offset, **Minimum depth** and **Maximum depth** can be positive or negative.

This is a test and does not create a link.



tin decision given by offset and minimum and maximum depths.

Selecting **Tin** brings up the panel **Modify Decision Tin**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	tin box		available tins

the tin to calculate the depth to.

Strip	real box	0	

the depth to drop the tin before testing.

Layer	layer box	Design	available layers

name of the layer that the link to test is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	input		

name o f link in **Layer** *to test against the tin.*

Offset	real box	0	

the depth is calculate at an offset distance of **offset** *from the end of the previous link.*

Minimum depth	real box	0	

if the depth is between the **Minimum depth** *and the* **Maximum depth**, *then the test is* ***true***, *otherwise the test is* ***false***.

Maximum depth	real box	1000	

see the description of the **Minimum depth** *field.*

When test is	choice box	false	true, false

if ***When test is*** *has the value* ***true***, *and the test is* ***true*** *(i.e. the depth is between the minimum and maximum depths) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

*If **When test is** has the value **false**, and the test is **false** (i.e. the depth is **not** between the minimum and maximum depths) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label text box

used with **When test is**.

*Note that there may be a **Then-End Then** block that matches the* **GoTo Label**. *For a description of a **Then-End Then** block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the test is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

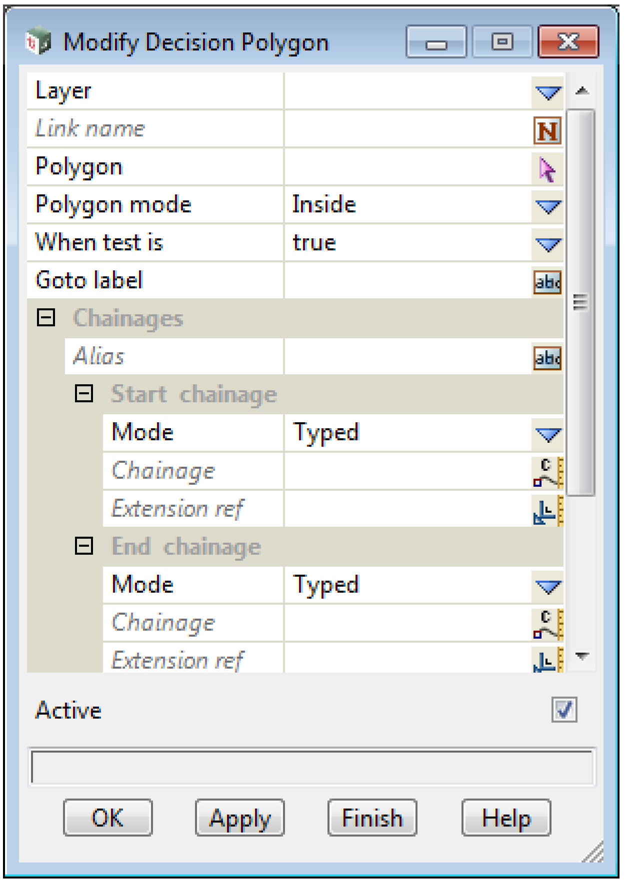
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.8.13 Fixed Decisions - Polygon or return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.8.13 Fixed Decisions - Polygon

This options tests to see if the (x,y) coordinates of a link is inside a user selected polygon.

Selecting **Polygon** brings up the panel **Modify Decision Polygon**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to test is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	input		

name o f link in **Layer** *to test against the polygon.*

Polygon	string sect		

the polygon to.use for testing if the link is inside or outside of it.

Polygon mode	choice box	Inside	Inside, Outside

*if **Inside**,.the test is true if the (x,y) coordinates of the link is inside the polygon.*

*If **Outside**, the test is true if the (x,y) coordinates of the link is outside the polygon*

When test is	choice box	false	true, false

*if **When test is** has the value **true**, and the test is **true** (i.e. the end of the given link is inside the polygon) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

*If **When test is** has the value **false**, and the test is **false** (i.e. the end of the given link is **not** inside the polygon) then go to the label* **Goto label**. *Otherwise proceed to the next row.*

Goto label text box

used with **When test is**.

Note that there may be a ***Then-End Then*** *block that matches the* **GoTo Label**. *For a description of a* ***Then-End Then*** *block and how it words, see* 21.2.2.2.8.4 Fixed Decisions - Then.

Alias, **Start Chainage**, **End Chainge**, **Interval**

the test is performed when the chainage is between the Start and End chainages.
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.2.8 Fixed Link - Decisions.

21.2.2.2.9 Fixed Link - From link

For a given link (the current link), the **from Link** option takes **one** of Width, Height or Xfall **from a selected link** whilst holding one to be what it is defined as by the current link.

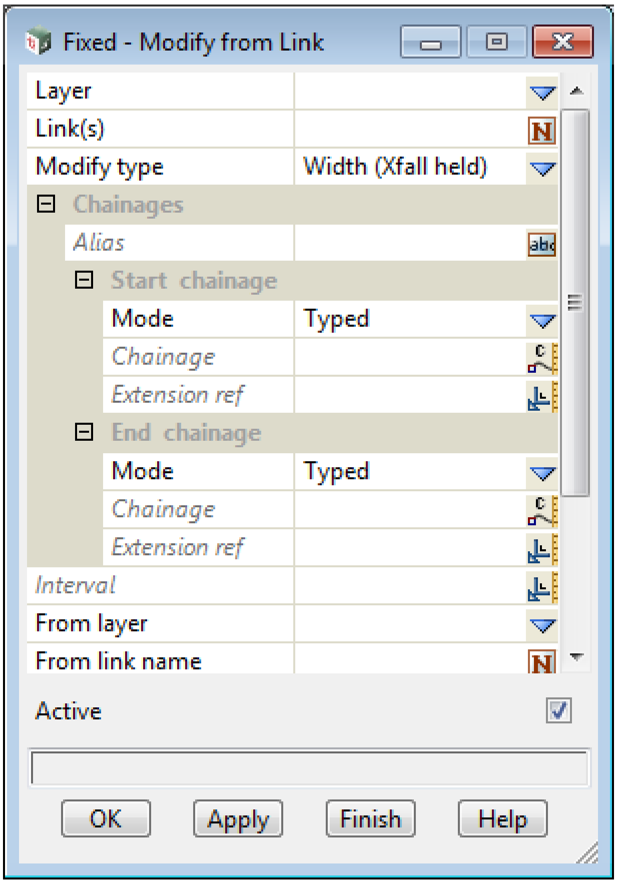
That is, for the current link:

(a) one of its existing Width, Height or Xfall **is modified** by taking its value **from a selected link**

and

(b) a different one of Width, Height or Xfall **keeps its existing value** (i.e. holds its existing value).

Selecting the **From link** brings up the **Fixed - Modify from Link** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

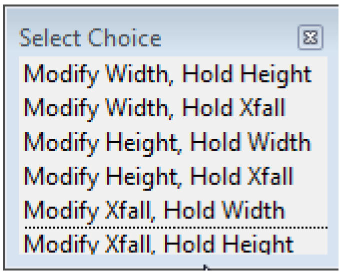
name of the layer that the link to be modified is in. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link(s)	name box		names.4d pop-up

the name of the links in the Layer to modify the width/height/xfall/slope using the method given in **Modifier type,** *between the chainages given by* **Start mode** *and* **End mode.** *See* 21.2.2.1.2 Link or Link(s).

Each of the links is processed as the current link.

Modifier type choice box



modify Width to take width from selected link, hold Height to be its current value
modify Width to take width from selected link, hold Xfall to be its current value
modify Height to take height from selected link, hold Width to be its current value
modify Height to take height from selected link, hold Xfall to be its current value
modify Xfall to take xfall from selected link, hold Width to be its current value
modify Xfall to take xfall from selected link, hold Height to be its current value

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions

*The **Modify Width/Height/Xfall** is the part of the current link that is modified and the new values are taken from a selected link.*

*The **Hold Width/Height/Xfall** is the part of the current link that is kept (held) at its current value.*

So for **Modifier type:**

***Modify Width**, **Hold Height** - the **Width** is taken from the link* **From link name** *that is in the layer* **From layer** *and zone* **From zone**, *and the **Height** is kept as it is.*

***Modify Width**, **Hold Xfall** - the **Width** is taken from the link* **From link name** *that is in the layer* **From layer** *and zone* **From zone**, *and the **Xfall** is kept as it is.*

***Modify Height**, **Hold Width -** the **Height** is taken from the link* **From link name** *that is in the layer* **From layer** *and zone* **From zone**, *and the **Width** is kept as it is.*

***Modify Height**, **Hold Xfall -** the **Height** is taken from the link* **From link name** *that is in the layer* **From layer** *and zone* **From zone**, *and the **Xfall** is kept as it is.*

***Modify Xfall**, **Hold Width -** the **Xfall** is taken from the link* **From link name** *that is in the layer* **From layer** *and zone* **From zone**, *and the **Width** is kept as it is.*

***Modify Xfall**, **Hold Height -** the **Xfall** is taken from the link* **From link name** *that is in the layer* **From layer** *and zone* **From zone**, *and the **Height** is kept as it is.*

From layer layer box Design available layers

name of the layer of the link to take values from.

From Link name name box names.4d pop-up

the name of the link in the **From Laye***r and* **From Zone** *to get the Width, Height or Xfall from.*

From zone choice box fixed, cut, fill

*the fixed, cut or fill zone that the **From link name** link is in.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages for the link to be modified.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.10 Fixed Link - To String or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.2.2.2.10 Fixed Link - To String

For a given link, (the current link), the **to string** option takes **one** of Width, Height or Xfall as the value you get by going from the start point of the current link to another selected string.

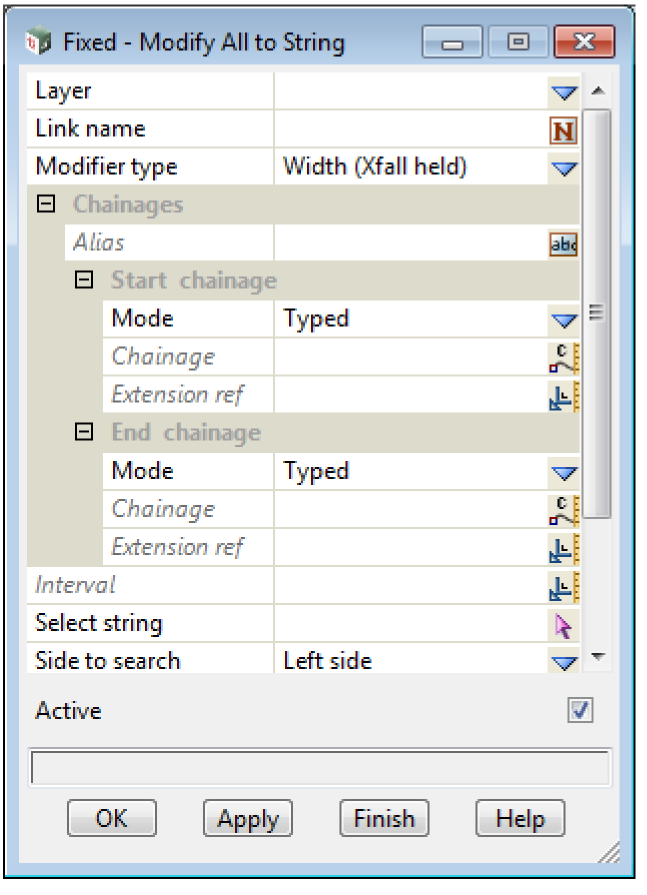
That is, for the current link:

(a) one of its existing Width, Height or Xfall **is modified** by taking its value the vector going from the start of the current link to another selected string**.**

and

(b) a different one of Width, Height or Xfall **keeps its existing value** (i.e. holds its existing value).

Selecting the **To string** brings up the **Fixed - Modify All to String** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to be modified is in (the current link).
For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	name box		names.4d pop-up

the name of the link in the Layer to modify the width/height/xfall/slope using the method given in **Modifier type,** *between the chainages given by* **Start mode** *and* **End mode.**
This is the current link.

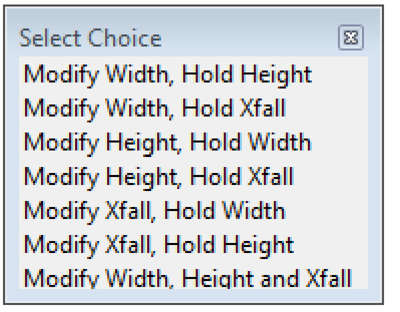
Select string	string-select		

select string to use for defining width/height/xfall for the link.

Side to search choice box left side left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/xfall.

Modifier type choice box



modify Width, hold Height to be its current value
modify Width, hold Xfall to be its current value
modify Height, hold Width to be its current value
modify Height, hold Xfall to be its current value
modify Xfall, hold Width to be its current value
modify Xfall, hold Height to be its current value
modify Width, Height and Xfall to get onto the selected string

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

*The **Modify Width/Height/Xfall** is the part of the current link that is modified and the new values are taken from a selected link.*

*The **Hold Width/Height/Xfall** is the part of the current link that is kept (held) at its current value.*

So for **Modifier type:**

***Modify Width**, **Hold Height** see* 21.2.2.2.10.1 Fixed - to String: Modifier Types Modify Width, Hold Height/Xfall

***Modify Width**, **Hold Xfall** see* 21.2.2.2.10.1 Fixed - to String: Modifier Types Modify Width, Hold Height/Xfall

*For **Modify Height**, **Hold Width** see* 21.2.2.2.10.2 Fixed - to String: Modifier Types Modify Height, Hold Width/Xfall

*For **Modify Height**, **Hold Xfall** see* 21.2.2.2.10.2 Fixed - to String: Modifier Types Modify Height, Hold Width/Xfall

*For **Modify Xfall, Hold Width** see* 21.2.2.2.10.3 Fixed - to String: Modifier Types Modify Xfall, Hold Width/Height

*For **Modify Xfall, Hold Height** see* 21.2.2.2.10.3 Fixed - to String: Modifier Types Modify Xfall, Hold Width/Height

*For **Modify Width, Height and Xfall**, see* 21.2.2.2.10.4 Fixed - to String: Modifier Type Modify Width, Height and Xfall

Alias, **Start Chainage**, **End Chainage**, **Interval**

defines the start/end chainages for the link to be modified.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

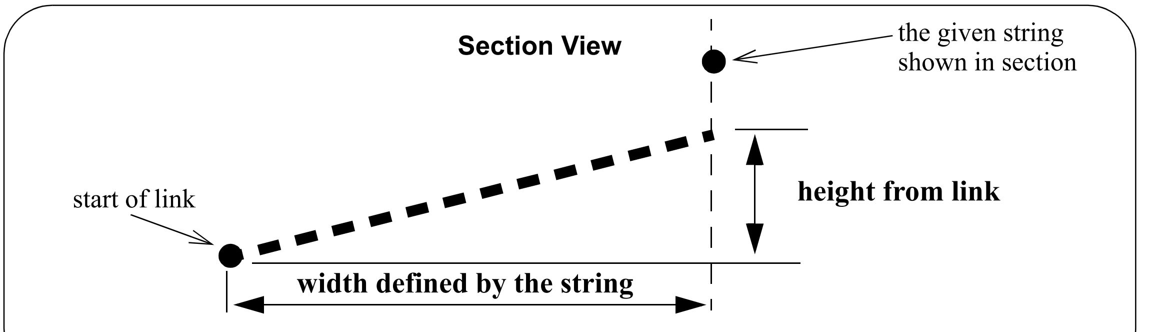
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.11 Fixed Link - To Tin or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.2.2.2.10.1 Fixed - to String: Modifier Types Modify Width, Hold Height/Xfall

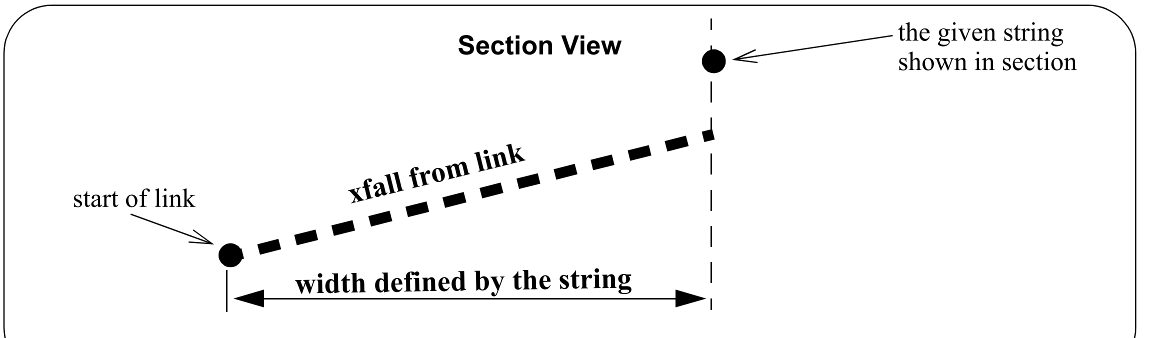
For a fixed link **Modify Width** calculates the **width** of the link as the width from the start point of the link, **to the selected string**.

For **Modify Width, Hold Height** the *height* is taken from the current link.



Modify Width to a String and Hold Height

For **Modify Width, Hold Xfall** the *xfall* is taken from the current link.

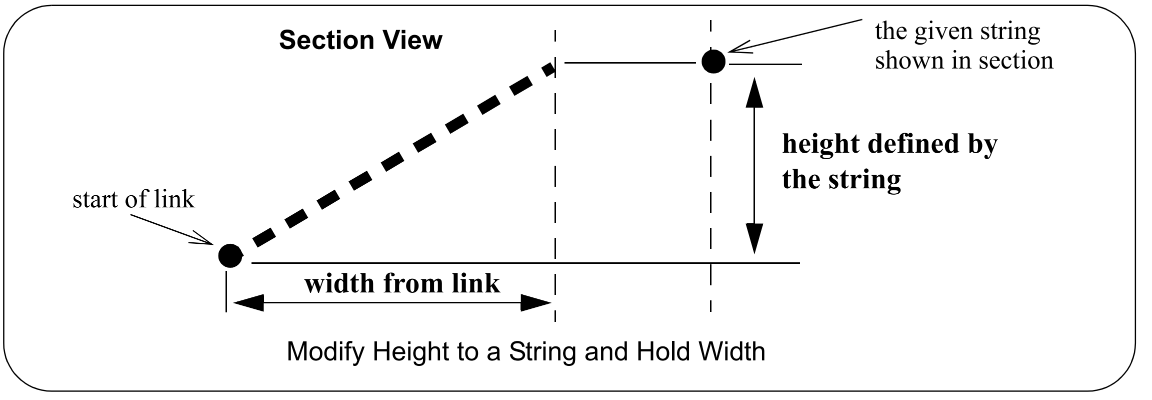


Modify Width to a String and Hold Xfall

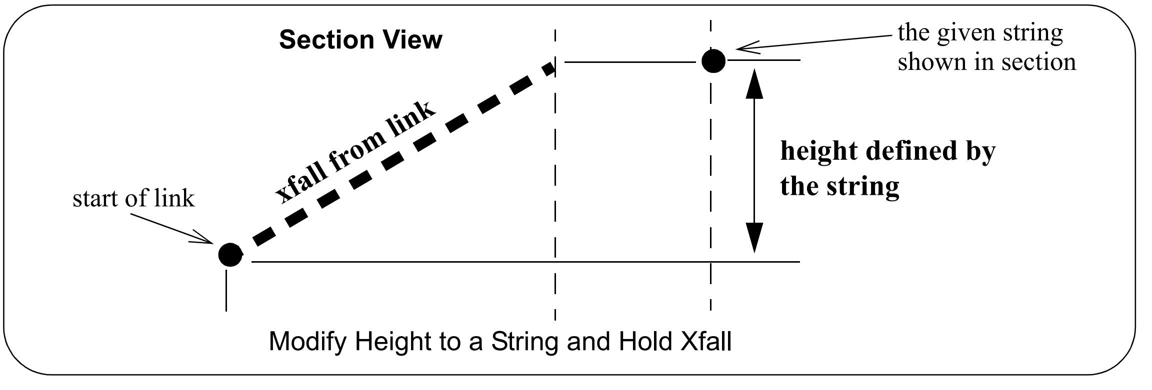
21.2.2.2.10.2 Fixed - to String: Modifier Types Modify Height, Hold Width/Xfall

For a fixed link **Modify Height** calculates the **height** of the link as the difference in the height at the start point of the link, and the height **at the selected string**.

For **Modify Height, Hold Width** the *width* is taken from the current link.



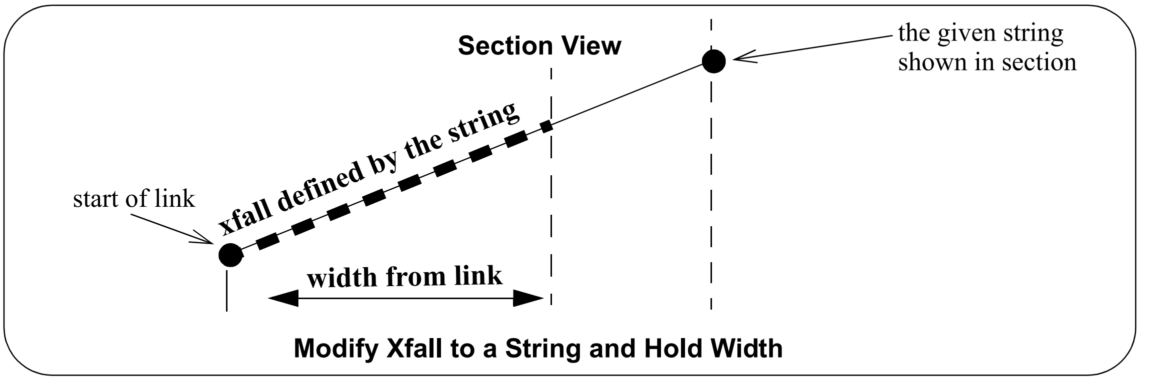
For **Modify Height, Hold Xfall** the *xfall* is taken from the current link.



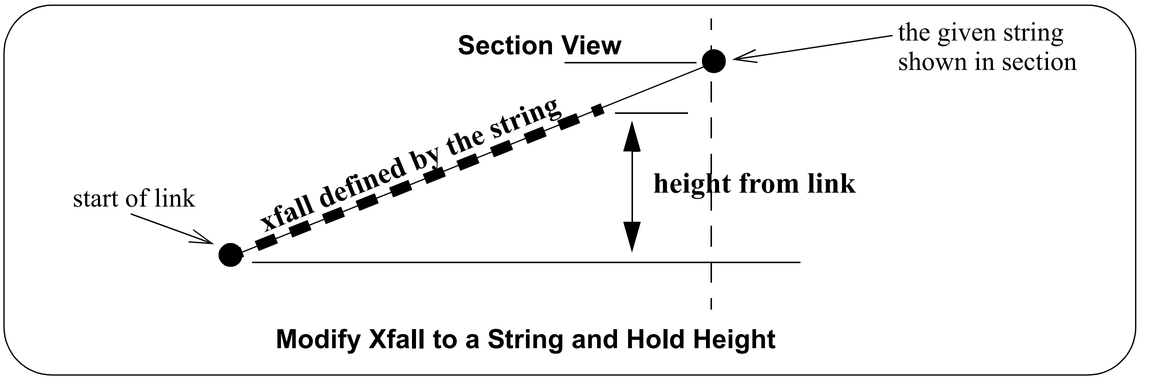
21.2.2.2.10.3 Fixed - to String: Modifier Types Modify Xfall, Hold Width/Height

For a fixed link **Modify Xfall** calculates the **xfall** of the link as the *xfall* from the start point of the link to the **selected string**.

For **Modify Xfall, Hold Width** the *width* is taken from the current link.

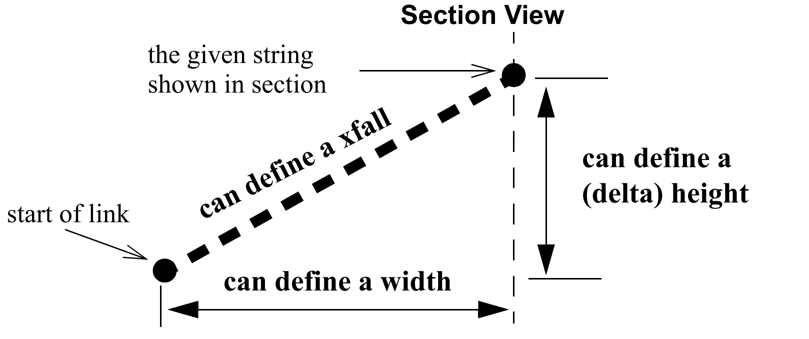


For **Modify Xfall, Hold Height** the *height* is taken from the link.



21.2.2.2.10.4 Fixed - to String: Modifier Type Modify Width, Height and Xfall

For a fixed link **Modify Width, Height and Xfall** calculates the required width, height and/or xfall that the link needs to get from the start point of the link **to the selected string**.



Modify Width, Height and Xfall - the start and end points are used to uniquely define the width, xfall and (delta) height

To use the option you must **first have a link defined** but there is a command **Fixed =>Insert =>Insert at string** which creates a link and also places it on a selected string. See 21.2.2.2.1.3 Insert a Fixed Link at a String.

21.2.2.2.11 Fixed Link - To Tin

For a given link, (the current link), the **to tin** option takes **one** of Width, Height or Xfall as the value you need so that the end of the link is at the point that is a given number of intersection with a given tin.

That is, for the current link:

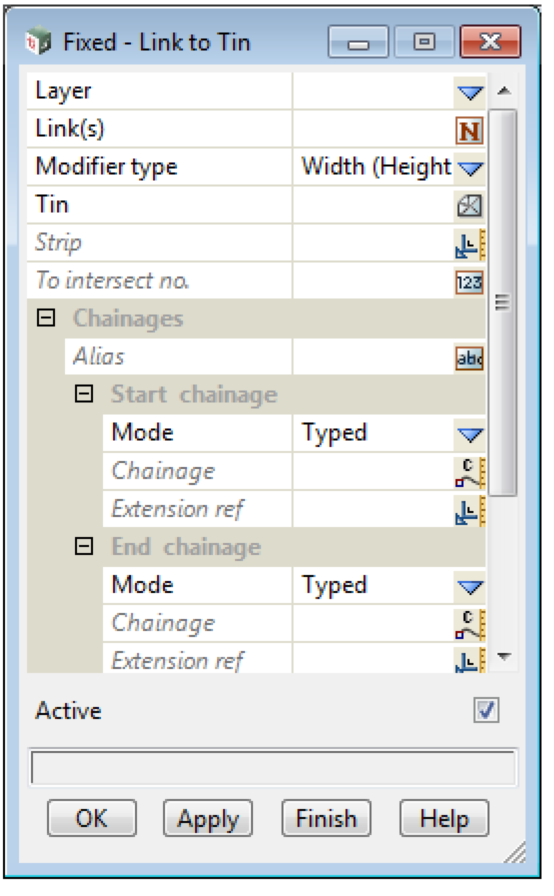
(a) one of Width, Height or Xfall **keeps its existing value** (i.e. holds its existing value).

and

(b) a different one of Width, Height or Xfall **is modified** so that the end of the link is at the point that is a given number of intersection with the given tin**.**

Note that the tin does not have to be the same tin as used in the ***Apply MTF*** function that is using the MTF.

Selecting the **To tin** brings up the **Fixed - Link to Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to be modified is in.
For information on Layers, see 21.1.1.2 MTF Links and Layers.

Field Description	Type	Defaults	Pop-Up
Link(s)	name box		names.4d pop-up

the name of the links in the Layer to modify the width/height/xfall/slope using the method given in **Modifier type,** *between the chainages given by* **Start mode** *and* **End mode.** *See* 21.2.2.1.2 Link or Link(s).
Each of the links is processed as the current link.

Tin tin box available tins

the tin to use for defining the width/height/xfall/slope by getting a point of intersection with the tin.

To intersect no. integer box

a tin could be intersected a number of times by the current link.

*If **not blank,** the number of the intersection with the tin to use. It should be greater than 0. If the number of intersections with the tin is less than this then the last intersection is used. For example, if the number is 5 then in the cases of 1,2,3,4 or 5 intersections, you get the last intersection.*

*If **blank**, the first intersect is used.*

Modifier type choice box

modify Width and take Height from current link
modify Width and take Xfall from current link
modify Height and take Width from current link
modify Height and take Xfall from current link
modify Xfall and take With from current link
modify Xfall and take Height from current link
modify Slope and take With from current link
modify Slope and take Height from current link

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

*The **Modify Width/Height/Xfall** is the part of the current link that is modified and the new values are obtained by get an intersection with the tin.*

*The **Hold Width/Height/Xfall** is the part of the current link that is kept (held) at its current value.*

So for **Modifier type:**

***Modify Width**, **Hold Height** see* 21.2.2.2.11.1 Fixed - to Tin: Modifier Types Modify Width, Hold Height/Xfall

***Modify Width**, **Hold Xfall** see* 21.2.2.2.11.1 Fixed - to Tin: Modifier Types Modify Width, Hold Height/Xfall

*For **Modify Height**, **Hold Width** see* 21.2.2.2.11.2 Fixed - to Tin: Modifier Types Modify Height, Hold Width/Xfall

*For **Modify Height**, **Hold Xfall** see* 21.2.2.2.11.2 Fixed - to Tin: Modifier Types Modify Height, Hold Width/Xfall

*For **Modify Xfall, Hold Width** see* 21.2.2.2.11.3 Fixed - to Tin: Modifier Types Modify Xfall, Hold Width/Height

*For **Modify Xfall, Hold Height** see* 21.2.2.2.11.3 Fixed - to Tin: Modifier Types Modify Xfall, Hold Width/Height

*For **Modify Slope, Hold Width** see* 21.2.2.2.11.4 Fixed - to Tin: Modifier Types Modify Slope, Hold Width/Height

*For **Modify Slope, Hold Height** see* 21.2.2.2.11.4 Fixed - to Tin: Modifier Types Modify Slope, Hold Width/Height

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages that the link is modified between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

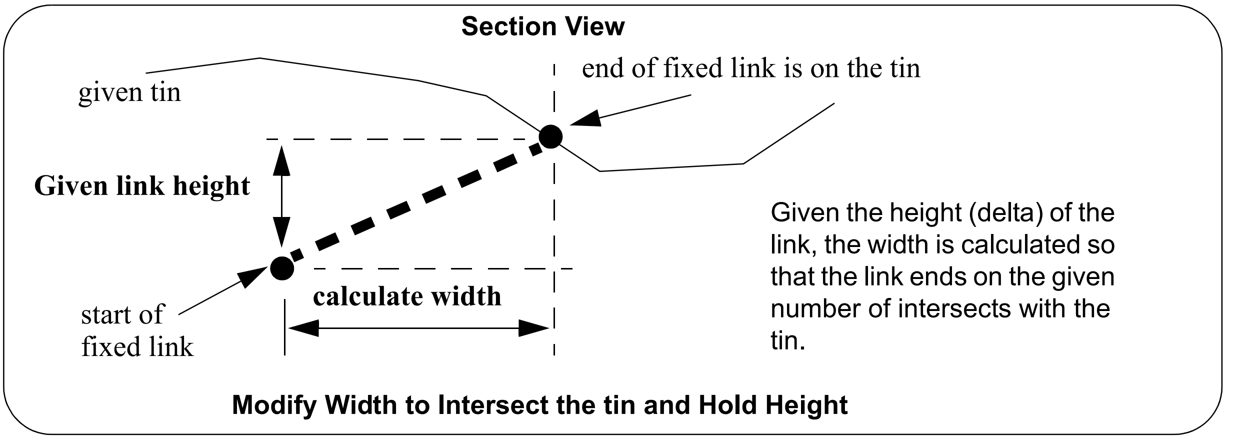
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.12 Fixed - To RL or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

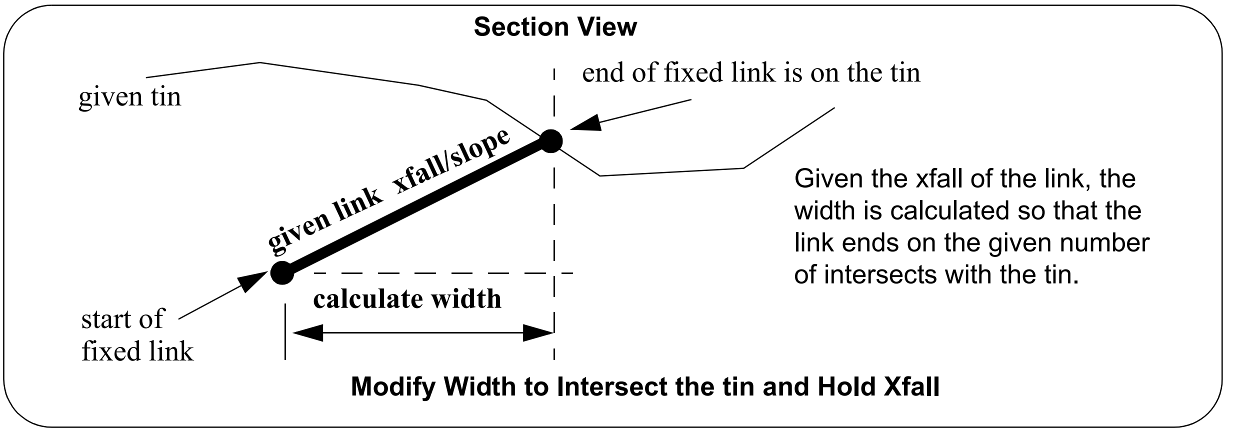
21.2.2.2.11.1 Fixed - to Tin: Modifier Types Modify Width, Hold Height/Xfall

For a fixed link **Modify Width** calculates the **width** of the link so that it intersects the tin at the number of intersects equal to **To intersect no**.

For **Modify Width, Hold Height** the *height* is taken from the current link.



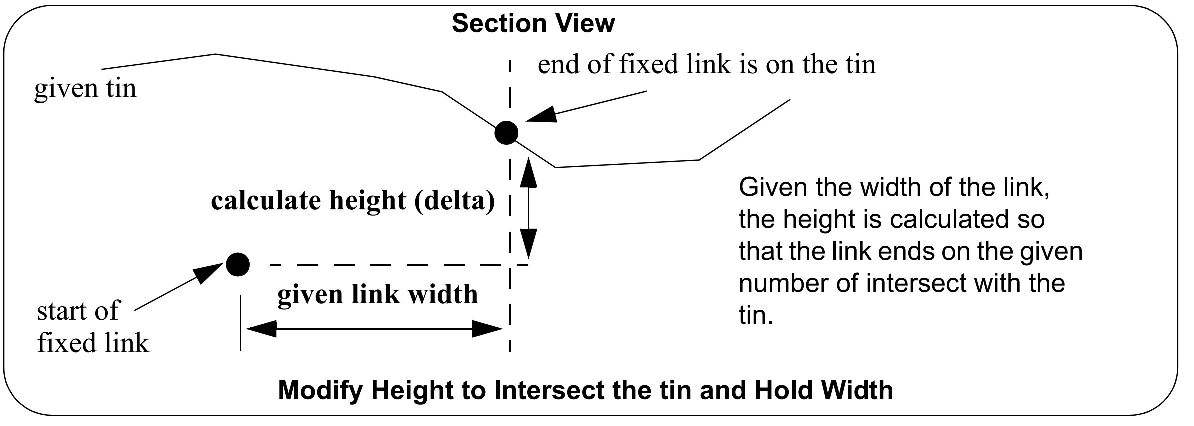
For **Modify Width, Hold Xfall** the *xfall* is taken from the current link.



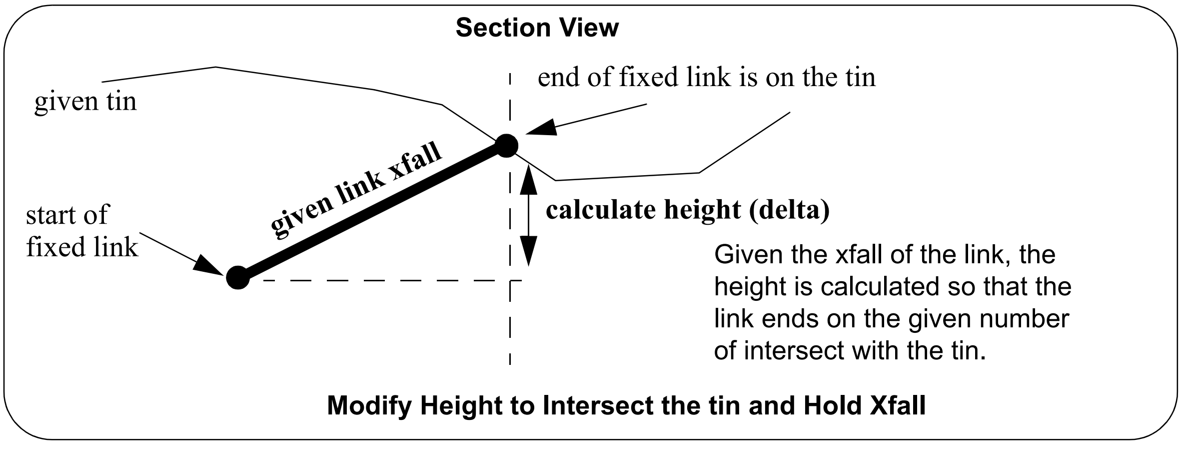
21.2.2.2.11.2 Fixed - to Tin: Modifier Types Modify Height, Hold Width/Xfall

For a fixed link **Modify Height** calculates the **height** of the link so that it intersects the tin at the number of intersects equal to **To intersect no**.

For **Modify Height, Hold Width** the *width* is taken from the current link.



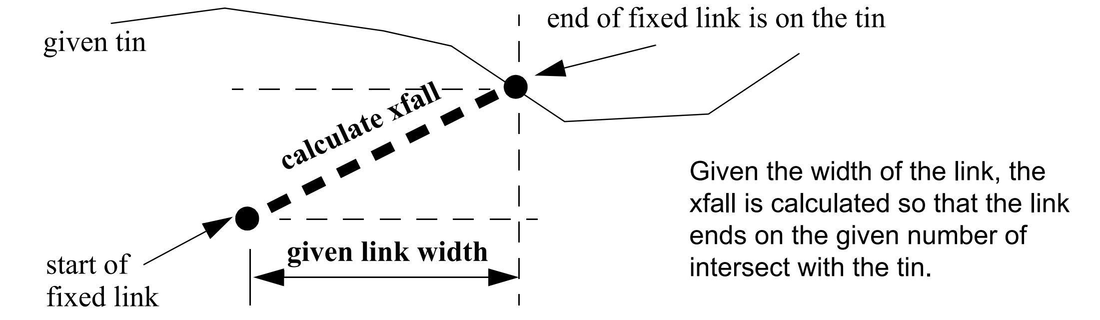
For **Modify Height, Hold Xfall** the *xfall* is taken from the current link.



21.2.2.2.11.3 Fixed - to Tin: Modifier Types Modify Xfall, Hold Width/Height

For a fixed link **Modify Xfall** calculates the **xfall** of the link so that it intersects the tin at the number of intersects equal to **To intersect no**.

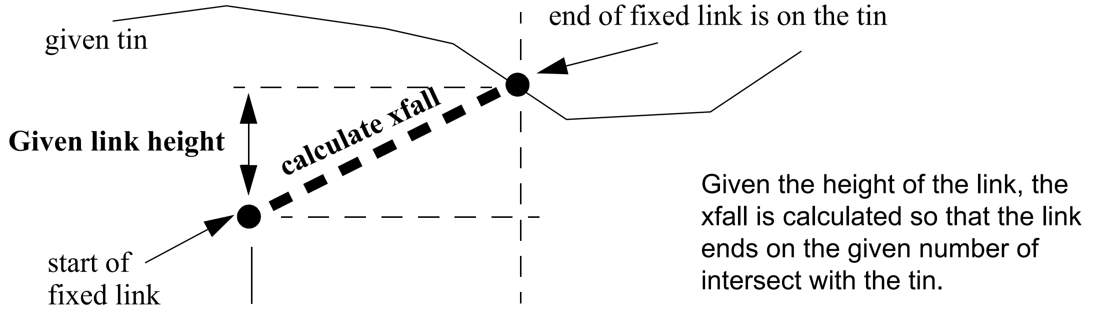
For **Modify Xfall, Hold Width** the *width* is taken from the current link.



Modify Xfall to Intersect the tin and Hold Width

For **Modify Xfall, Hold Height** the *height* is taken from current the link.

Section View

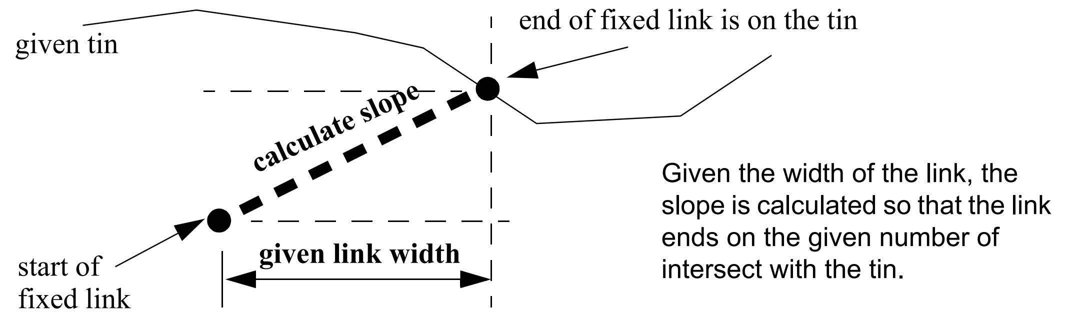


Modify Xfall to Intersect the tin and Hold Height

21.2.2.2.11.4 Fixed - to Tin: Modifier Types Modify Slope, Hold Width/Height

For a fixed link **Modify Slope** calculates the **slope** of the link so that it intersects the tin at the number of intersects equal to **To intersect no**.

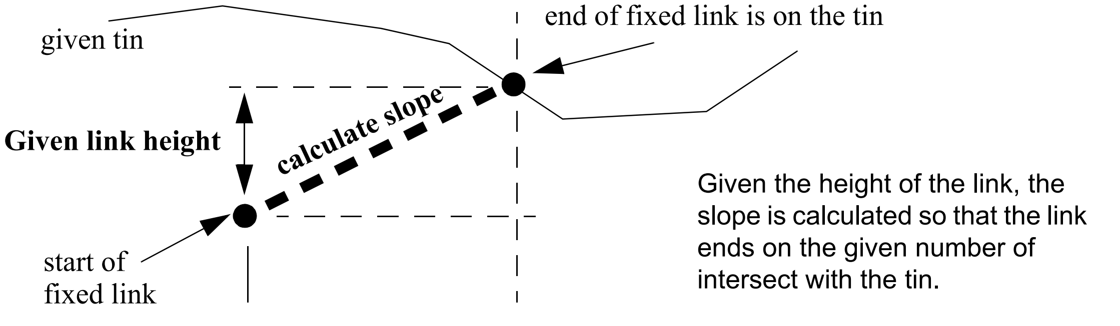
For **Modify Slope, Hold Width** the *width* is taken from the current link.



Modify Slope to Intersect the tin and Hold Width

For **Modify Slope, Hold Height** the *height* is taken from the current link.

Section View



Modify Slope to Intersect the tin and Hold Height

21.2.2.2.12 Fixed - To RL

For a given link (the current link), the **to RL** option **takes** (holds) **one** of Width, Height or Xfall as it currently is, and then modifies a different one of Width, Height or Xfall to get to a given RL.

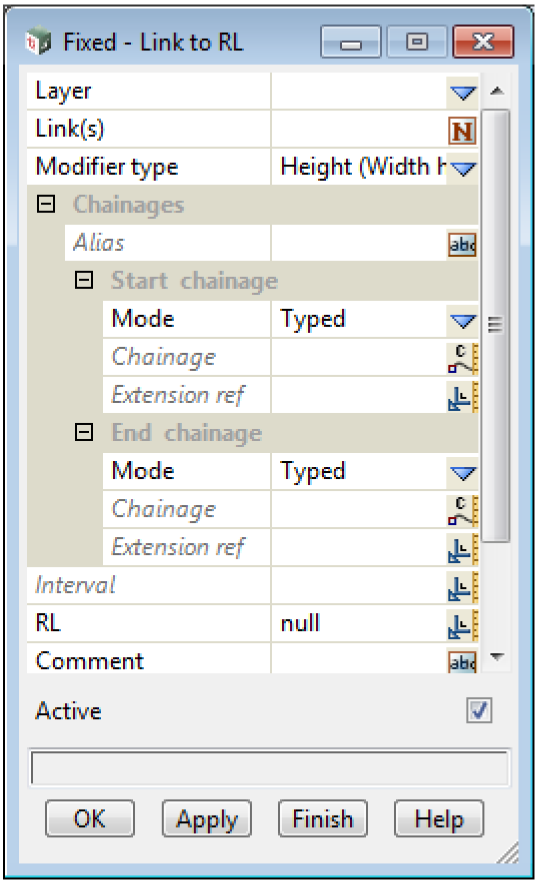
That is, for the current link:

(a) one of Width, Height or Xfall **keeps its existing value** (i.e. **holds** its **existing value)**.

and

(b) a different one of Width, Height or Xfall **is modified** to the value that is needed to get to a given RL (elevation).

Selecting the **To RL** brings up the **Fixed - Link to RL** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to be modified is in.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link(s)	name box		names.4d pop-up

the name of the links in the Layer to modify the width/height/xfall/slope using the method given in **Modifier type,** *between the chainages given by* **Start mode** *and* **End mode.** *See* 21.2.2.1.2 Link or Link(s).

Each of the links is processed as the current link.

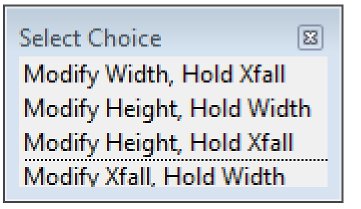
RL	real box		

the RL (Elevation) to be reached at the end of the link.

Side to search choice box left side left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/xfall.

Modifier type choice box



modify Width and take Xfall from current link
modify Height and take Width from current link
modify Height and take Xfall from current link
modify Xfall and take With from current link

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions.

The ***Hold Width/Height/Xfall*** *is the part of the current link that is kept (held) at its current value.*

The ***Modify Width/Height/Xfall*** *is the part of the current link that is then modified and the new values are obtained by getting to a given RL.*

So for **Modifier type:**

***Modify Width**, **Hold Xfall** see* 21.2.2.2.12.1 Fixed - to RL: Modifier Type Modify Width, Hold Xfall

*For **Modify Height**, **Hold Width** see* 21.2.2.2.12.2 Fixed - to RL: Modifier Types Modify Height, Hold Width/Xfall

*For **Modify Height**, **Hold Xfall** see* 21.2.2.2.12.2 Fixed - to RL: Modifier Types Modify Height, Hold Width/Xfall

*For **Modify Xfall, Hold Width** see* 21.2.2.2.12.3 Fixed - to RL: Modifier Type Modify Xfall, Hold Width

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages that the link is modified between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

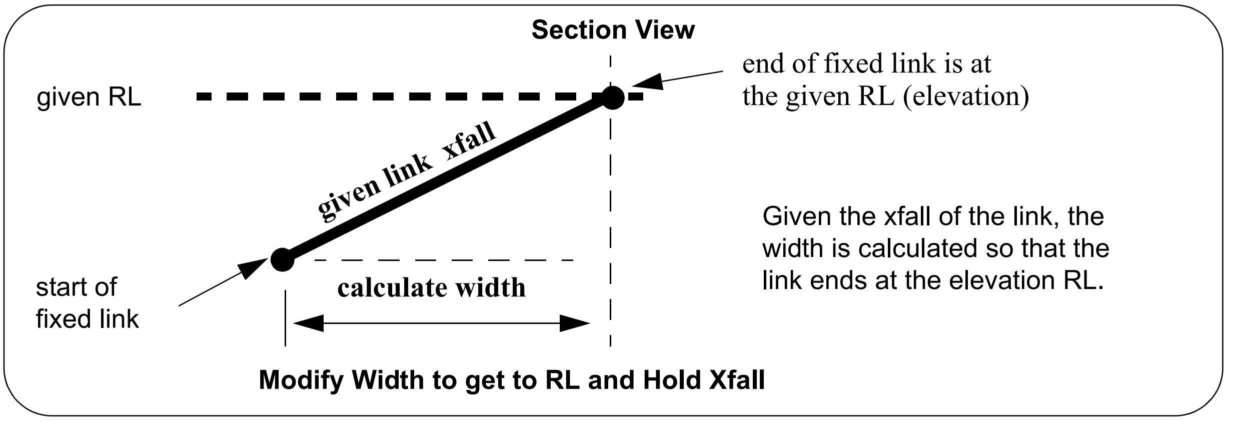
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.13 Fixed - to 2 Heights or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.2.2.2.12.1 Fixed - to RL: Modifier Type Modify Width, Hold Xfall

For a fixed link **Modify Width** calculates the **width** of the link required for link to end **at the given RL**.

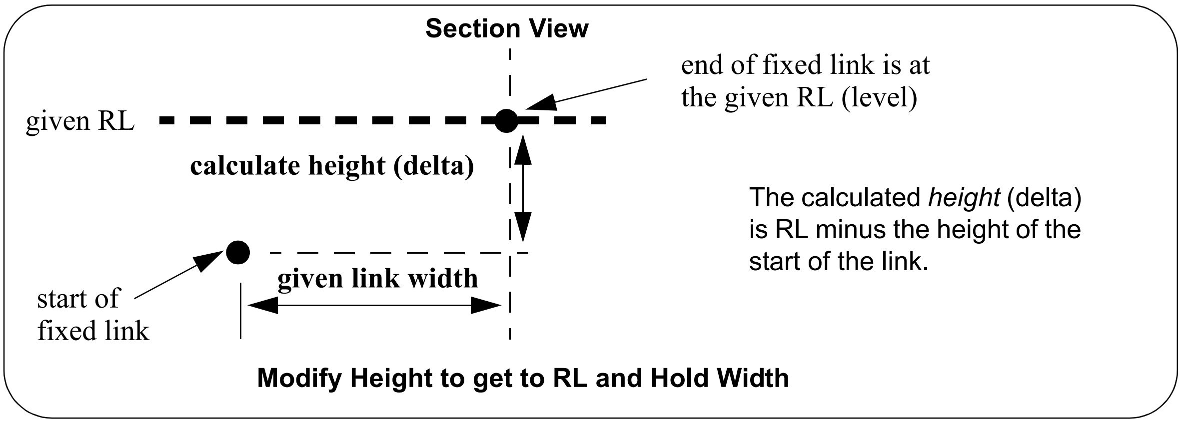
For **Modify Width, Hold Xfall** the *xfall* is taken from the current link.



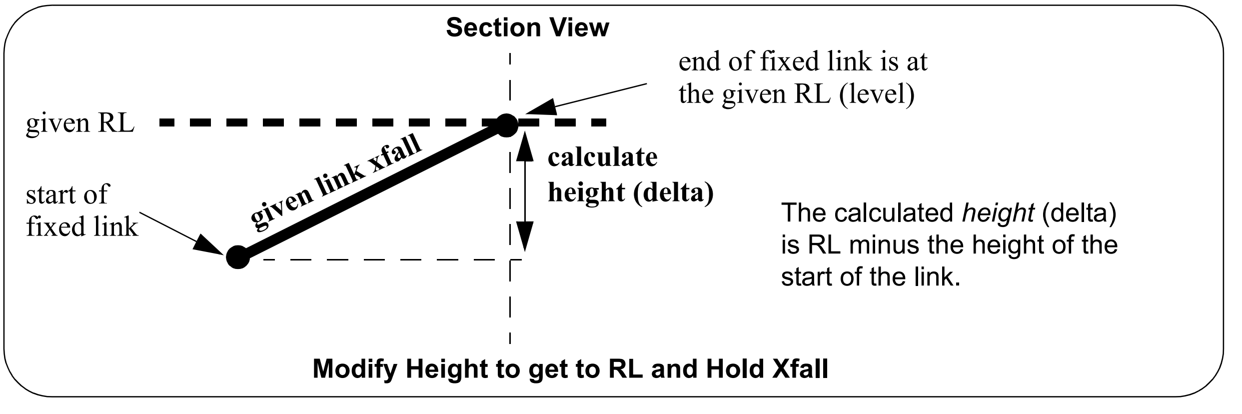
21.2.2.2.12.2 Fixed - to RL: Modifier Types Modify Height, Hold Width/Xfall

For a fixed link **Modify Height** calculates the **height** of the link as the difference in the height at the start point of the link, and the given **RL**.

For **Modify Height, Hold Width** the *width* is taken from the current link.



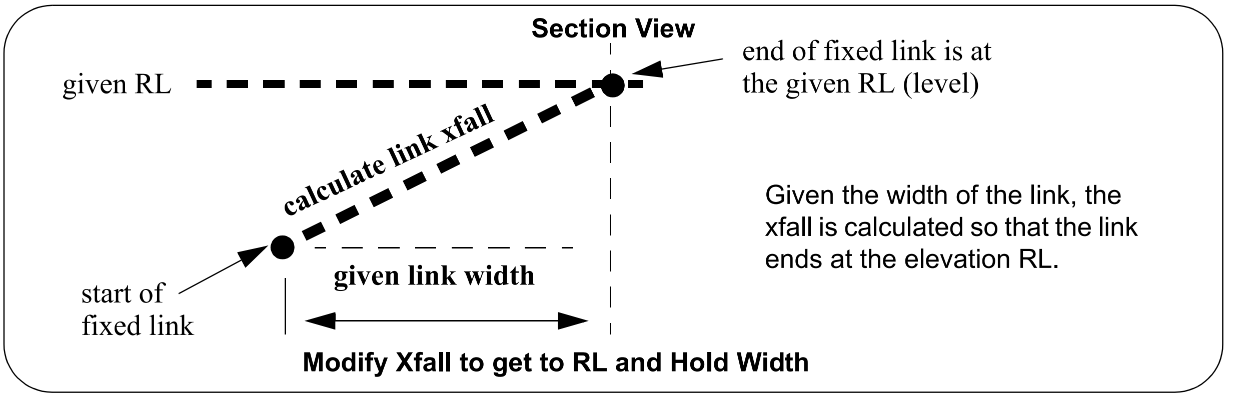
For **Modify Height, Hold Xfall** the *xfall* is taken from the current link.



21.2.2.2.12.3 Fixed - to RL: Modifier Type Modify Xfall, Hold Width

For a fixed link **Modify Xfall** calculates the **xfall** of the link as the *xfall* from the start point of the link to the **given RL**.

For **Modify Xfall, Hold Width** the *width* is taken from the current link.

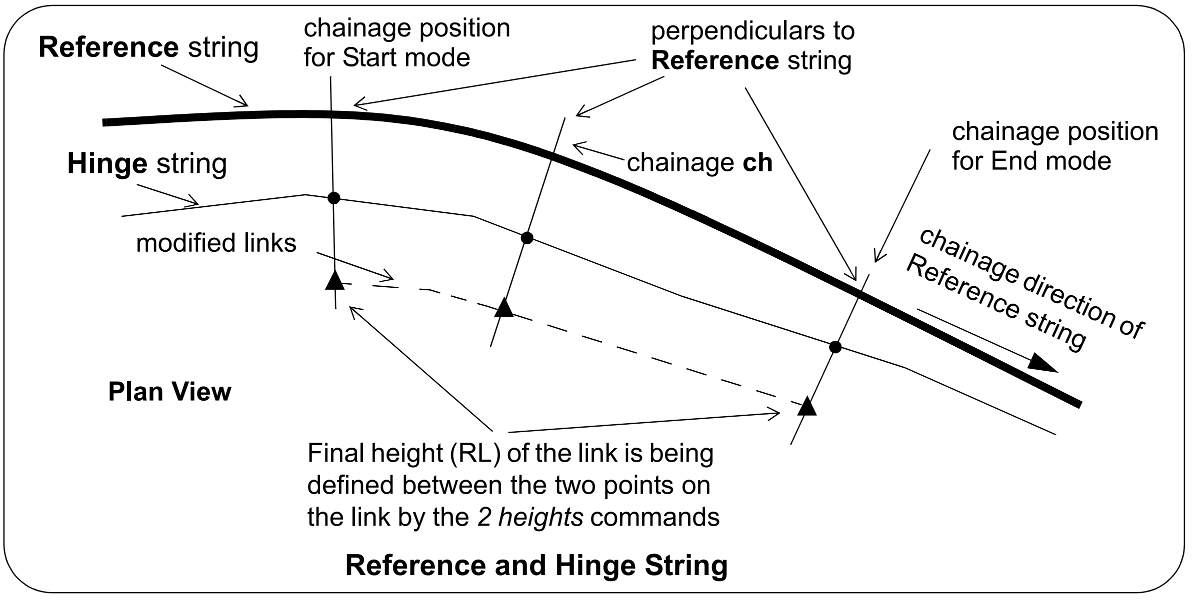


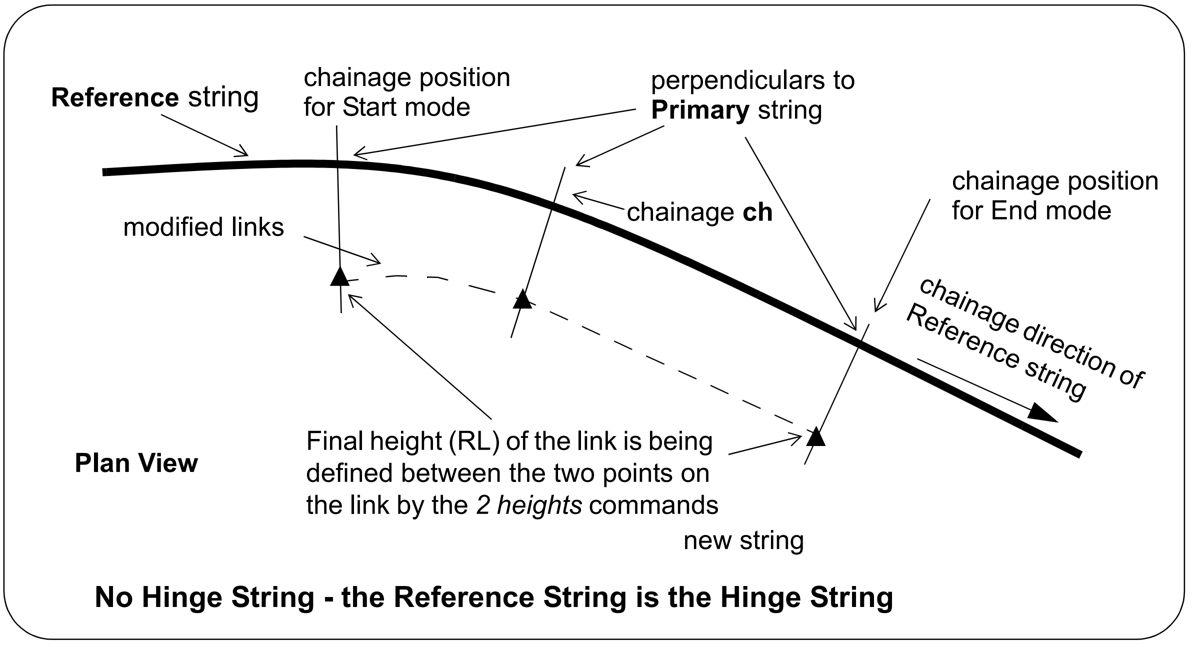
21.2.2.2.13 Fixed - to 2 Heights

MTF_Edit_Modify_Fixed___to_2_HeightsFor an existing link, the **to 2 heights** option has a number of methods for **defining the height** and **interpolation** occurs **over the length of the modified string** and **not** over the **length** of the **reference string** (the chainage range).

To options also includes **coming back** from an **RL** at the **end chainage** and using that to **define** the **RL** at the **start chainage**.

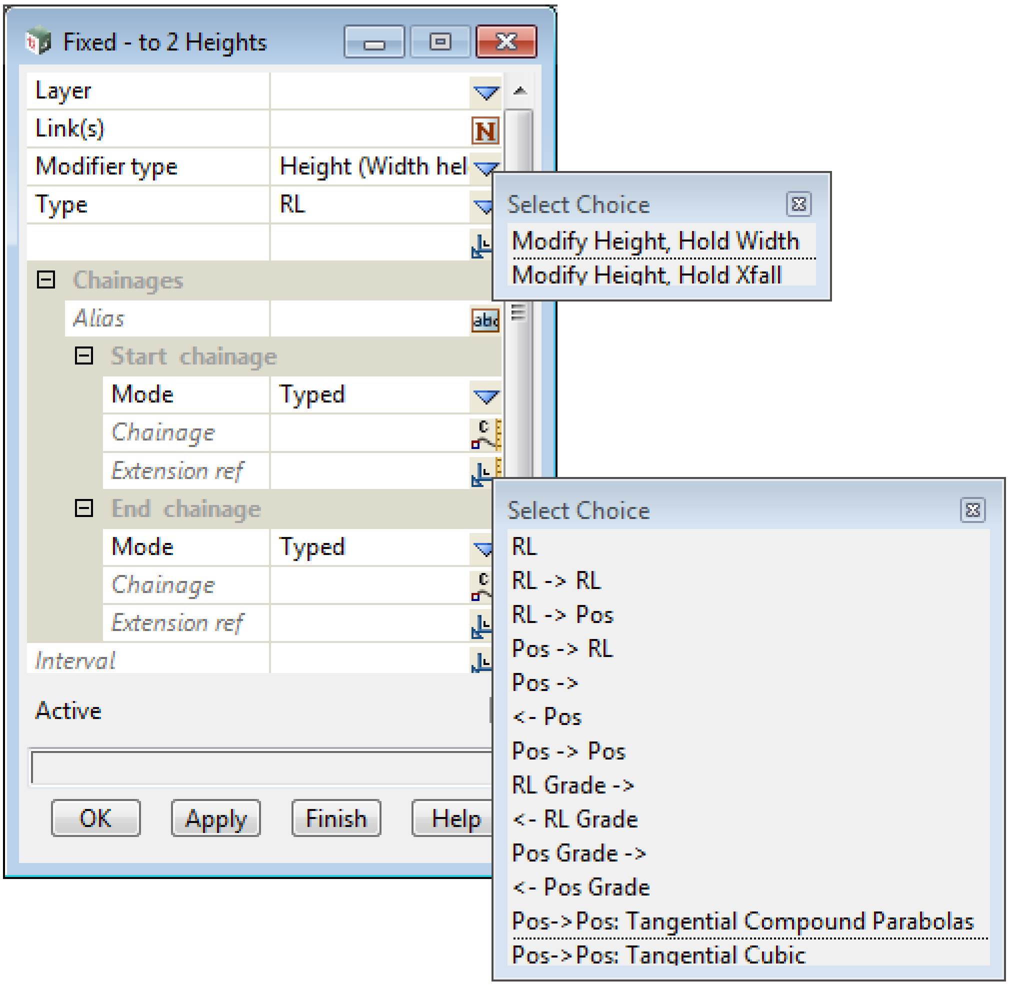
For example, over the chainage range, the height can be interpolated between two given RL's.





The modifier ***to RL (***21.2.2.2.12 Fixed - To RLmod has a **constant RL** whereas for **to 2 heights**, the RL at each chainage is calculated by a formula.

Selecting **to 2 heights** brings up the **Fixed - to 2 Heights** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

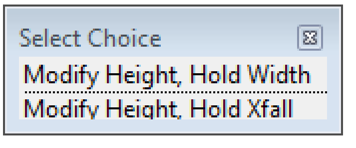
name of the layer that the link to be modified is in.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

Field Description	Type	Defaults	Pop-Up
Link(s)	input		select name menu

name of the links to modify. See 21.2.2.1.2 Link or Link(s).

Field Description	Type	Defaults	Pop-Up
Modifier type	choice box		

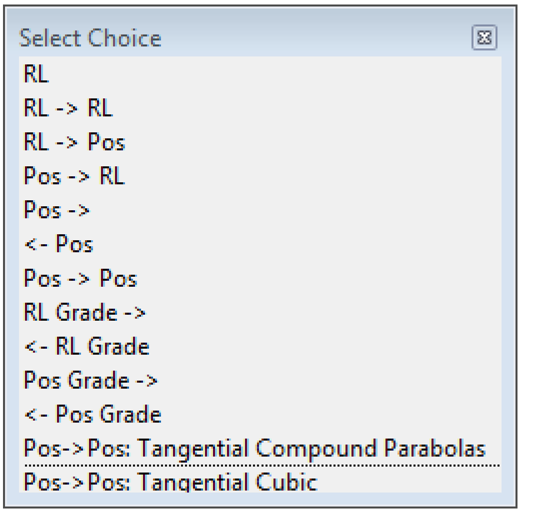


*The option **to 2 heights** defines the **Height** of the selected string so to completely define the link, only the Width or the Xfall is needed.*

*For the choice **Modify Height, Hold Width**, the **Width is kept** for the link (**hold**) and the **Height** is **calculated** by the method given by* **Type**.

*For the choice **Modify Height, Hold Xfall**, the **Xfall** is kept for the link (**hold**) and the **Height** is **calculated** by the method given by* **Type**.

Type choice box



*The **Height** for the current link is calculated by the method given by **Type**.*

For the calculation of Height for each type, go to 21.2.2.2.13.1 Fixed - Calculating the Heights for each Type

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages that the link is modified between.

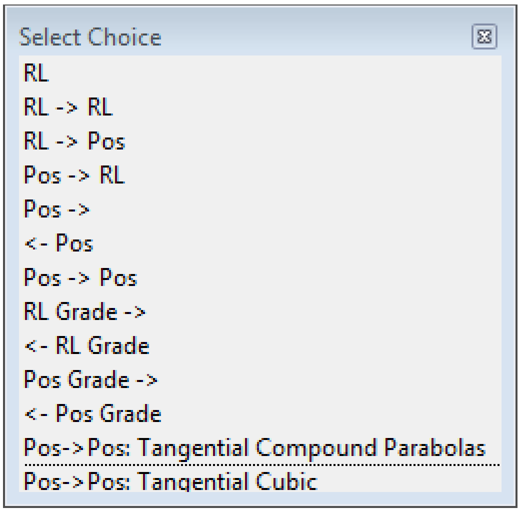
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.14 Fixed - by 2 strings or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.2.2.2.13.1 Fixed - Calculating the Heights for each Type

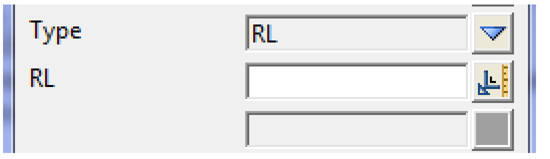


for the definitions of the calculations for each choice go to

21.2.2.2.13.1.1 RL: stay at a given RL
21.2.2.2.13.1.2 RL -> RL: interpolate between two given RL’s
21.2.2.2.13.1.6 RL -> Pos: interpolate between a given start RL & the calculated end height
21.2.2.2.13.1.7 Pos -> RL: interpolate between the calculated start height and a given RL at the end
21.2.2.2.13.1.3 Pos ->: all points have the same height as the start point
21.2.2.2.13.1.4 <- Pos: all points have the same height as the end point
21.2.2.2.13.1.5 Pos-> Pos: interpolate between the calculated start and end heights

21.2.2.2.13.1.8 RL Grade ->: start with a given Start RL and continue on the line at grade Grade->
21.2.2.2.13.1.9 <- RL Grade: all points are on a line with given grade and going through End RL
21.2.2.2.13.1.10 Pos Grade ->: start with the calculated height and continue at a given grade
21.2.2.2.13.1.11 <- Pos Grade: all points are on a line of given grade and going through the end point
21.2.2.2.13.1.12 Pos-> Pos: Tangential Compound Parabolas
21.2.2.2.13.1.13 Pos-> Pos: Tangential Cubic

21.2.2.2.13.1.1 RL: stay at a given RL

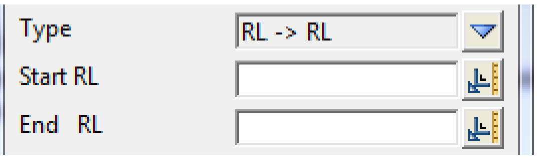


At the vertex of the link on the normal at each chainage ch between the **Start mode** and **End Mode**, the height at ch is that given in the **RL** panel field.

Hence the height is the same for all modified vertices between the *Start mode* and the *End mode*.

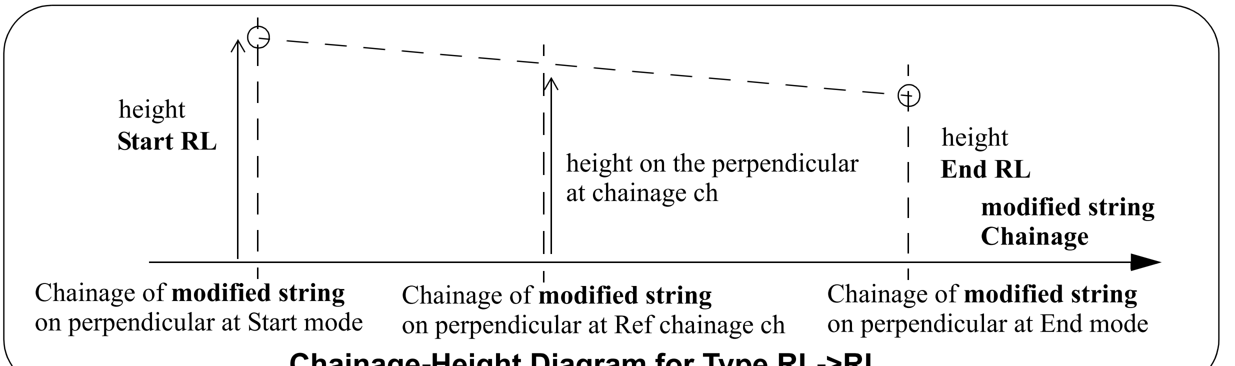
The modifiers with *Type* ***RL*** work the same as the modifier **to RL** with the RL being the *given RL* (see 21.2.2.2.12 Fixed - To RL).

21.2.2.2.13.1.2 RL -> RL: interpolate between two given RL's



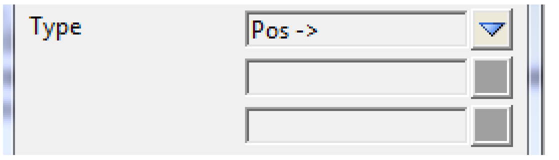
At each chainage **ch** between the **Start mode** and **End Mode**, the vertex of the modified string is on the perpendicular to the Reference string at chainage **ch**.

The height at of the vertex on the perpendicular to Reference chainage ch, is the *linear interpolation* of height **with respect to the string being modified**, between the given *Start RL* and the *End RL*.



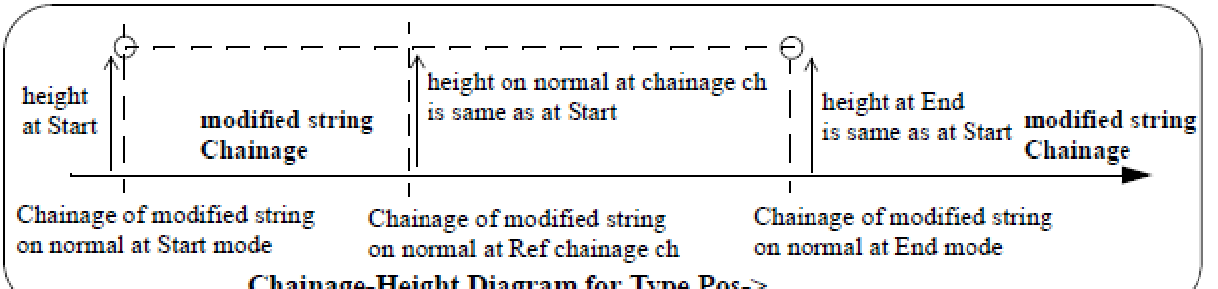
Chainage-Height Diagram for Type RL->RL

21.2.2.2.13.1.3 Pos ->: all points have the same height as the start point



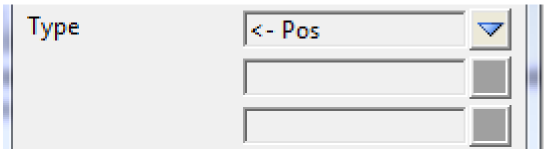
Let **Start RL** be the actual height calculated at the vertex of the string at the perpendicular to **Start mode** when all the modifiers before this modifier are applied.

Then for all vertices on the perpendiculars between **Start mode** and **End Mode**, the height of the vertex equal to **Start RL**.



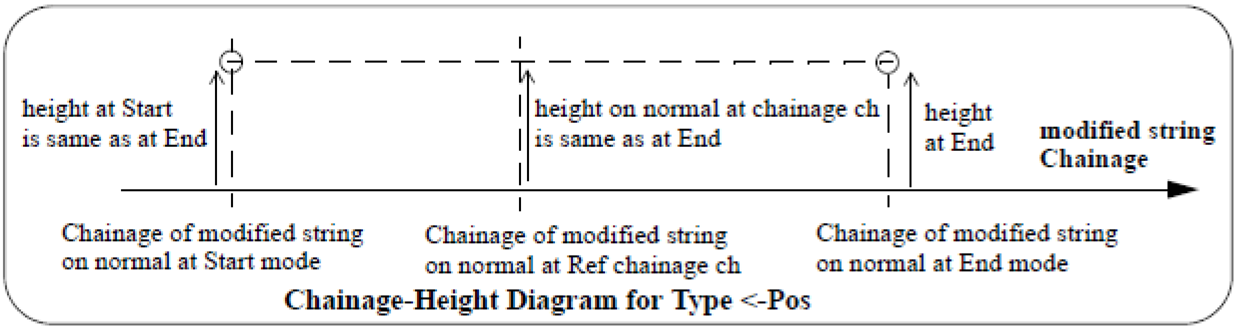
Chainage-Height Diagram for Type Pos->

21.2.2.2.13.1.4 <- Pos: all points have the same height as the end point



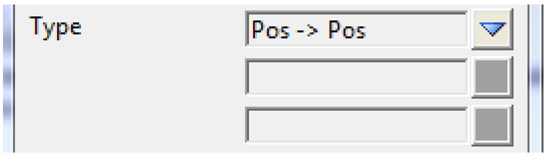
Let **End RL** be the actual height calculated at the vertex of the string at the perpendicular (normal) to **End mode** when all the modifiers before this modifier are applied.

Then for all vertices on the normals between the **Start mode** and **End Mode**, the height of the vertex is equal to **End RL**.



Chainage-Height Diagram for Type <-Pos

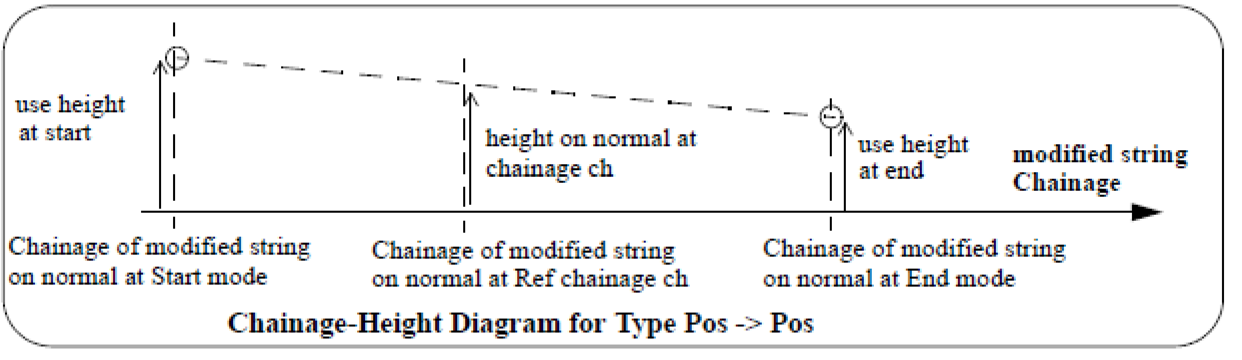
21.2.2.2.13.1.5 Pos-> Pos: interpolate between the calculated start and end heights



First let **Start RL** be the actual height calculated at the vertex of the string at the normal to **Start mode** when all the modifiers before this modifier are applied.

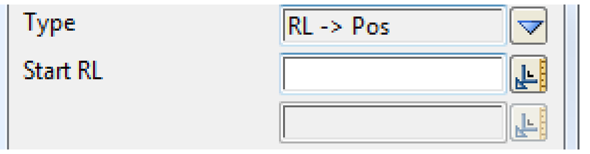
Let **End RL** be the actual height calculated at the vertex of the string at the normal to **End mode** when all the modifiers before this modifier are applied.

Then for each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation **with respect to modified string chainage** between the *Start RL* and the *End RL*.



Chainage-Height Diagram for Type Pos -> Pos

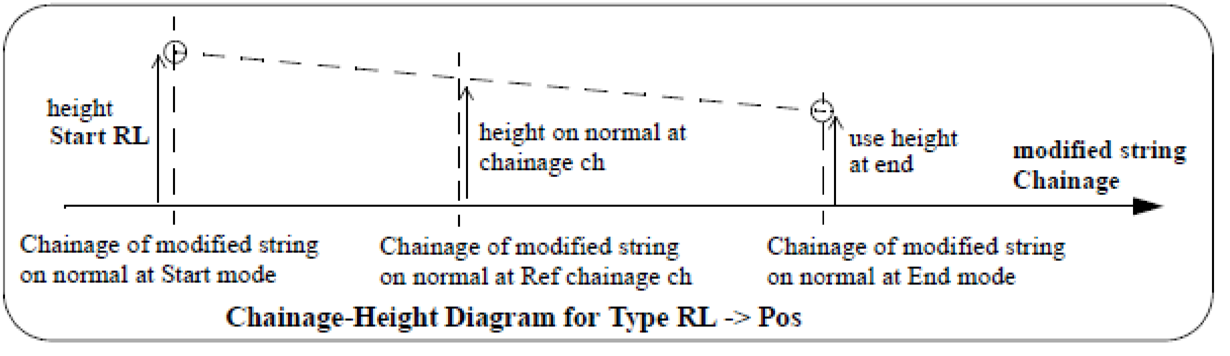
21.2.2.2.13.1.6 RL -> Pos: interpolate between a given start RL & the calculated end height



The height at the vertex on the normal at **Start mode** is the given **Start RL**.

And **End RL** is the **actual** height calculated at the vertex on the modified string at the normal at **End mode** when all the modifiers before this modifier are applied.

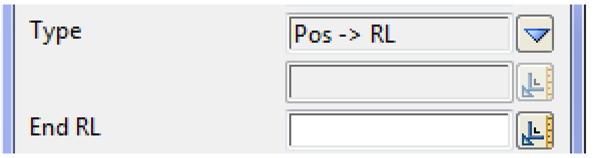
Then at each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation **with respect to modified string chainage** between the *Start RL* and the *End RL*.



Chainage-Height Diagram for Type RL -> Pos

Hence for the modifiers of *Type* ***RL -> Pos***, the calculations at chainage ch are the same as the modifiers **Width/Height/Xfall to RL** with the RL being the interpolated RL at chainage ch (see Fixed Link - Modify Width, Height or Xfall to Get to an RL).

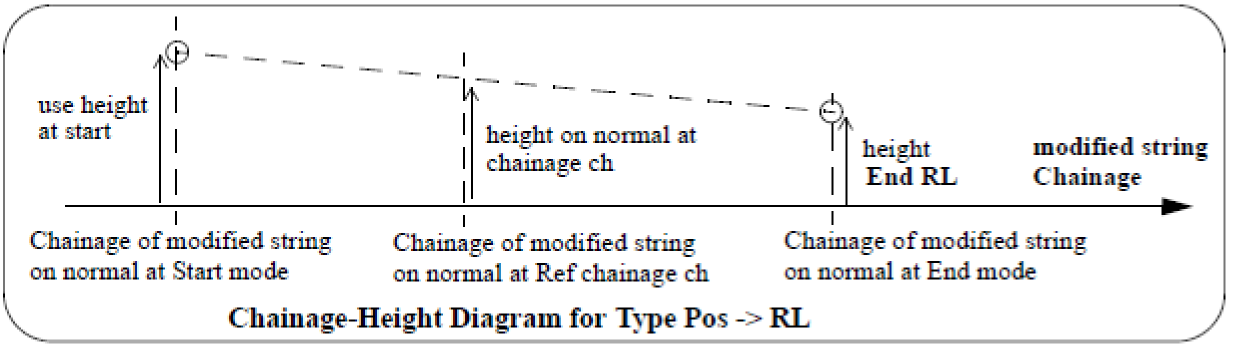
21.2.2.2.13.1.7 Pos -> RL: interpolate between the calculated start height and a given RL at the end



Start RL is the **actual** height calculated at the vertex on the normal at **Start mode** when all the modifiers before this modifier are applied.

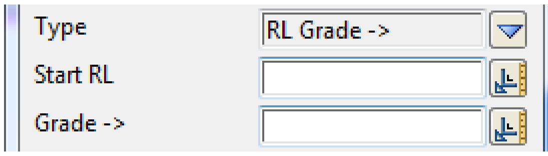
The height at the vertex on the normal at **End mode** is the given **End RL**.

Then at each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation **with respect to modified string chainage** between the *Start RL* and the *End RL*.



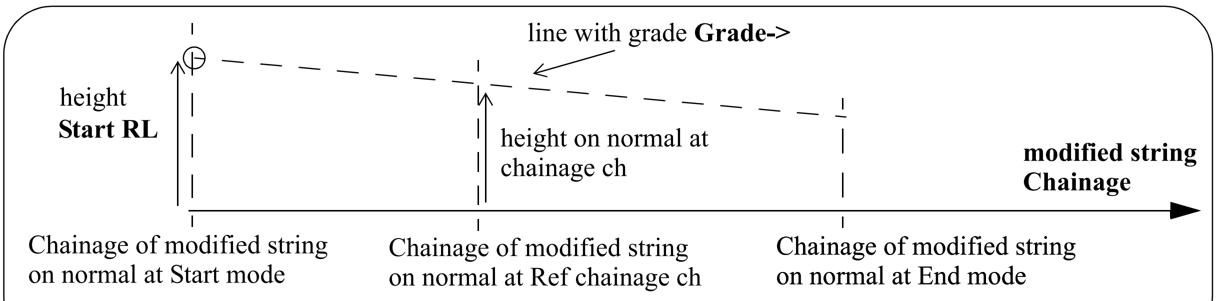
Chainage-Height Diagram for Type Pos -> RL

21.2.2.2.13.1.8 RL Grade ->: start with a given Start RL and continue on the line at grade Grade->



The height at the vertex on the normal at **Start mode** is the **Start RL**.

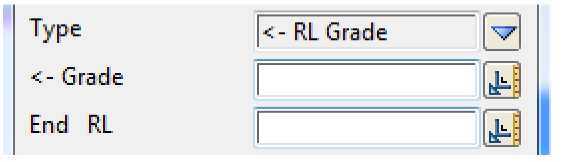
For each normal between the *Start mode* and the *End Mode*, the height of the vertex is on the line with grade ***Grade->*** with respect to the modified string, and going through the point (normal at Start mode, Start RL).



Chainage-Height Diagram for Type RL Grade ->

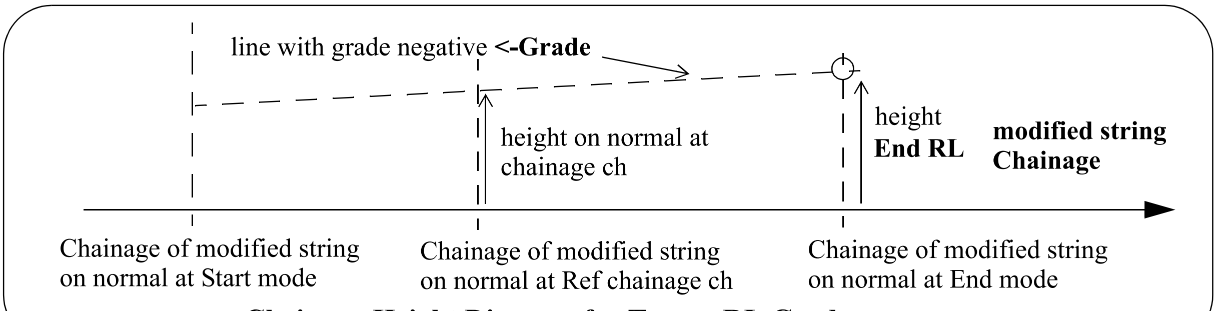
Important Note: Grade is calculated using **increasing Reference chainages**.

21.2.2.2.13.1.9 <- RL Grade: all points are on a line with given grade and going through End RL



The height on the vertex at **End mode** is **End RL**.

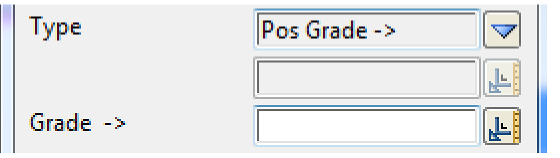
For each normal between the *Start mode* and the *End Mode*, the height of the vertex is on the line with grade of negative **<-Grade** with respect to the modified string chainage, and going through the point (normal at End mode, End RL).



Chainage-Height Diagram for Type <-RL Grade

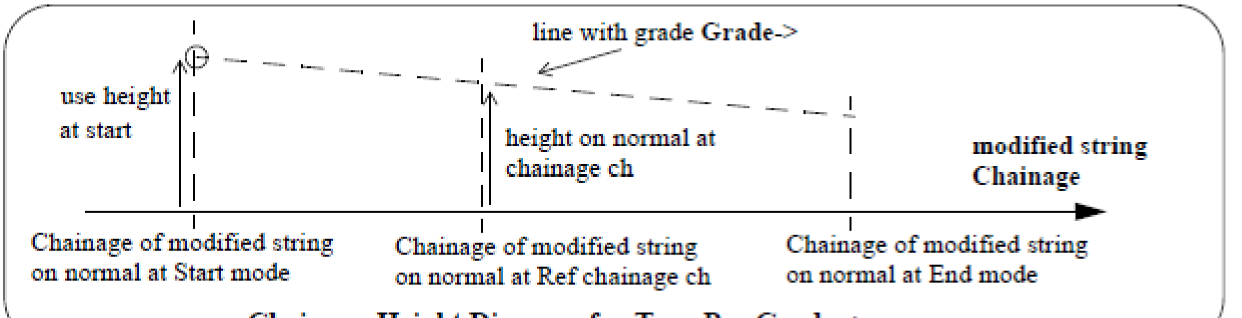
Important Note: <-Grade is calculated using **decreasing Alignment chainages**. So in a diagram with increasing chainage, the grade is negative **<-Grade**.

21.2.2.2.13.1.10 Pos Grade ->: start with the calculated height and continue at a given grade



Let **Start RL** be the actual height calculated at the vertex on the normal at **Start mode** when all the modifiers before this modifier are applied.

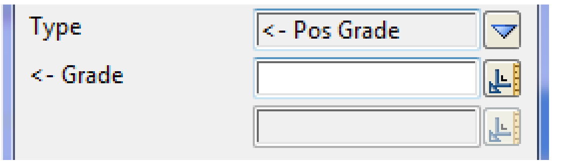
Then the height of each vertex on each normal between the *Start mode* and the *End Mode* is on the line with grade ***Grade->*** with respect to the modified string chainage, and going through the point (normal at Start mode, Start RL).



Chainage-Height Diagram for Type Pos Grade ->

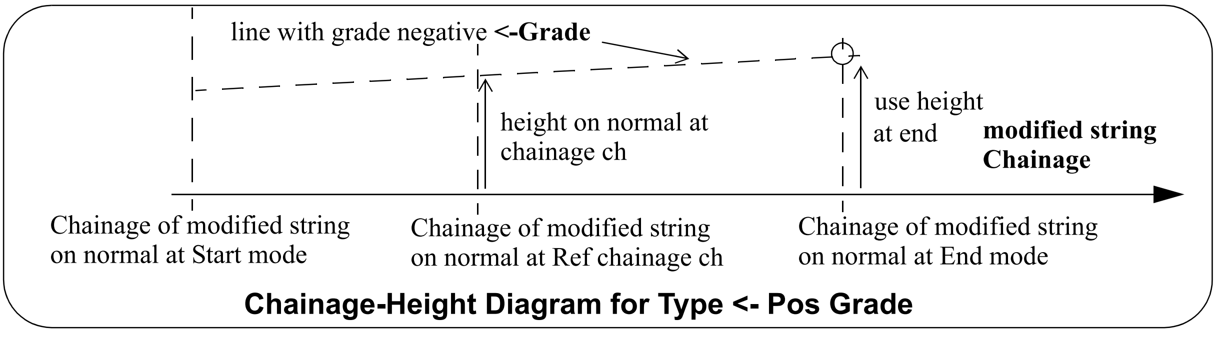
Important Note: **Grade->** is calculated using **increasing Alignment chainages.**

21.2.2.2.13.1.11 <- Pos Grade: all points are on a line of given grade and going through the end point



Let **End RL** be the actual height on the vertex on the normal at **End mode** when all the modifiers before this modifier are applied.

Then the height of each vertex on the normals between the *Start mode* and the *End Mode* is on the line with grade of negative **<-Grade** with respect to the modified string chainage, and going through the point (normal at End mode, End RL).



Chainage-Height Diagram for Type <- Pos Grade

Important Note: **<-Grade** is calculated using **decreasing Alignment chainages** and the **heights at the points** along the string being modified. So in a diagram with increasing chainage, the grade is negative **<-Grade**.

21.2.2.2.13.1.12 Pos-> Pos: Tangential Compound Parabolas

Let **Start RL** be the actual height calculated at the vertex of the string at the perpendicular to **Start mode** when all the modifiers **before this modifier** are applied.

Let **End RL** be the actual height calculated at the vertex of the string at the perpendicular to **End mode** when all the modifiers **before this modifier** are applied.

Then for each vertex on the perpendiculars between **Start mode** and **End Mode**, the height of the vertex is on the curve of tangential compound parabolas (in chainage-height space) between the *Start RL* and the *End RL*.

21.2.2.2.13.1.13 Pos-> Pos: Tangential Cubic

Let **Start RL** be the actual height calculated at the vertex of the string at the perpendicular to **Start mode** when all the modifiers **before this modifier** are applied.

Let **End RL** be the actual height calculated at the vertex of the string at the perpendicular to **End mode** when all the modifiers **before this modifier** are applied.

Then for each vertex on the perpendiculars between **Start mode** and **End Mode**, the height of the vertex is on the curve of tangential cubic (in chainage-height space) between the *Start RL* and the *End RL*.

21.2.2.2.14 Fixed - by 2 strings

MTF_Edit_Modify_Fixed___Modify_by_2_StringsThe **by 2 strings** option calculates one of the width, height and xfall or slope from two given strings.

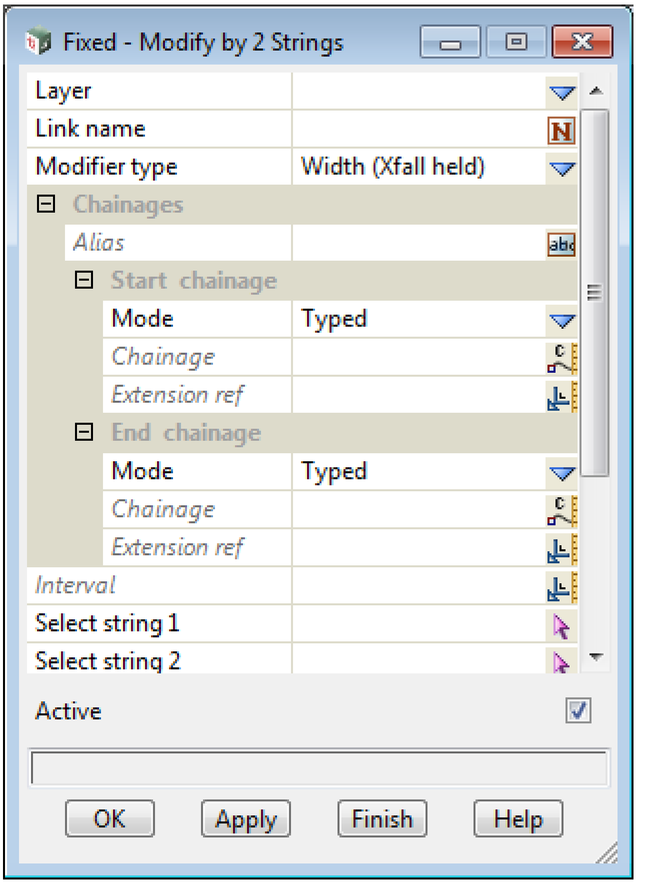
That is, for the current link:

(a) one of Width, Height or Xfall **keeps its existing value** (i.e. **holds** its **existing value)**.

and

(b) a different one of Width, Height or Xfall **is modified** and its value is taken form the differences of two selected strings.

Selecting the **by 2 strings** brings up the **Fixed - Modify by 2 Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to be modified is in.
For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	name box		names.4d pop-up

the name of the link in the Layer to modify the width/height/xfall/slope using the method given in **Modifier type,** *between the chainages given by* **Start mode** *and* **End mode.**
This is the current link.

String 1	string-select		

select the first string to use for defining width/height/xfall for the link.

String 2	string-select		

select the second string to use for defining width/height/xfall for the link.

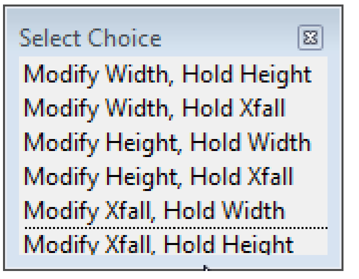
Side 1 to search choice box left side left side, right side, both sides

side of the hinge string to start searching to find string 1 to use in defining width/height/xfall.

Side 2 to search choice box left side left side, right side, both sides

side of the hinge string to start searching to find string 2 to use in defining width/height/xfall.

Modifier type choice box



modify Width and take Height from current link
modify Width and take Xfall from current link
modify Height and take Width from current link
modify Height and take Xfall from current link
modify Xfall and take With from current link
modify Xfall and take Height from current link

A link can be modified in any way regardless of how the link was defined in terms of width, height and xfall or slope. See 21.1.2.1 Calculating Width, Height, Xfall or Slope from Original Definitions

The ***Modify*** *width/height/xfall is the part of the current link that is modified from its current value by the method given by* **Modifier type**.

The ***Hold*** *width/height/xfall is the part of the current link that keeps its current value.*

For ***Modify Width****, see* 21.2.2.2.14.1 Fixed - by 2 Strings: Modifier Types Modify Width, Hold Height/Xfall
For ***Modify Height****, see* 21.2.2.2.14.2 Fixed - by 2 Strings: Modifier Types Modify Height, Hold Width/Xfall
For ***Modify Xfall****, see* 21.2.2.2.14.3 Fixed - by 2 Strings: Modifier Types Modify Xfall, Hold Width/Height

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to calculate the values between the two strings.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

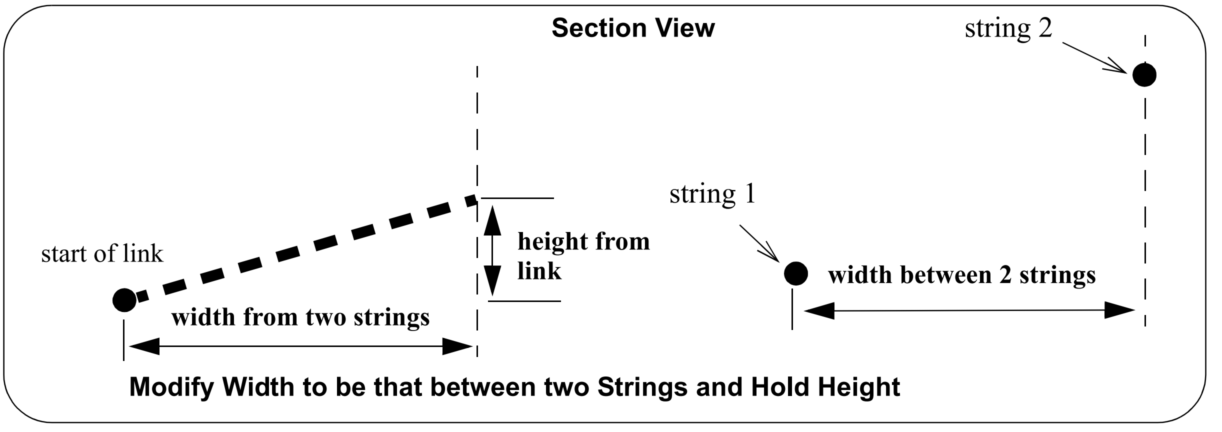
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to the next section 21.2.2.2.15 Fixed - Interface to Tin or return to 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

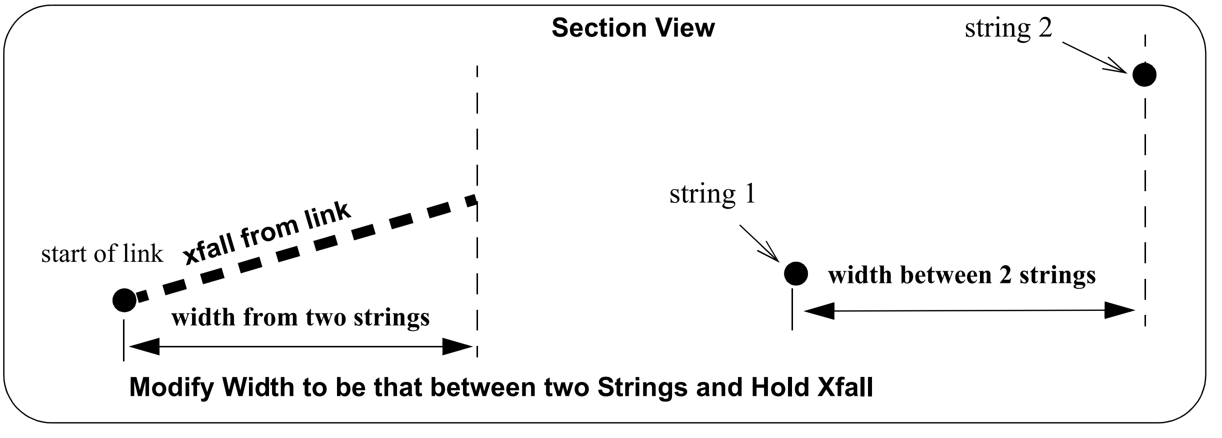
21.2.2.2.14.1 Fixed - by 2 Strings: Modifier Types Modify Width, Hold Height/ Xfall

For a fixed link **Modify Width** sets the **width** of the link to be the width between the two selected strings.

For **Modify Width, Hold Height** the *height* from the current link is kept.



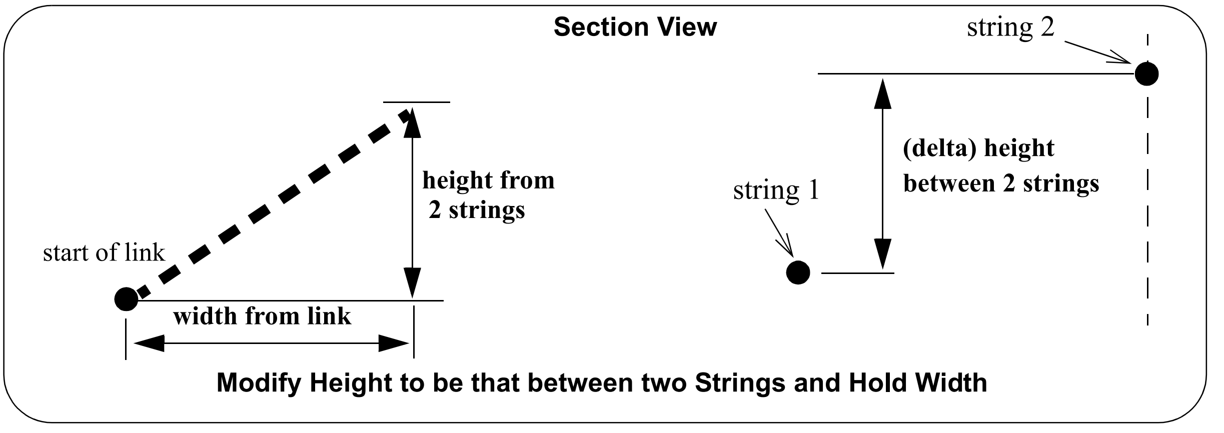
For **Modify Width, Hold Xfall**, the *xfall* from the current link is kept.



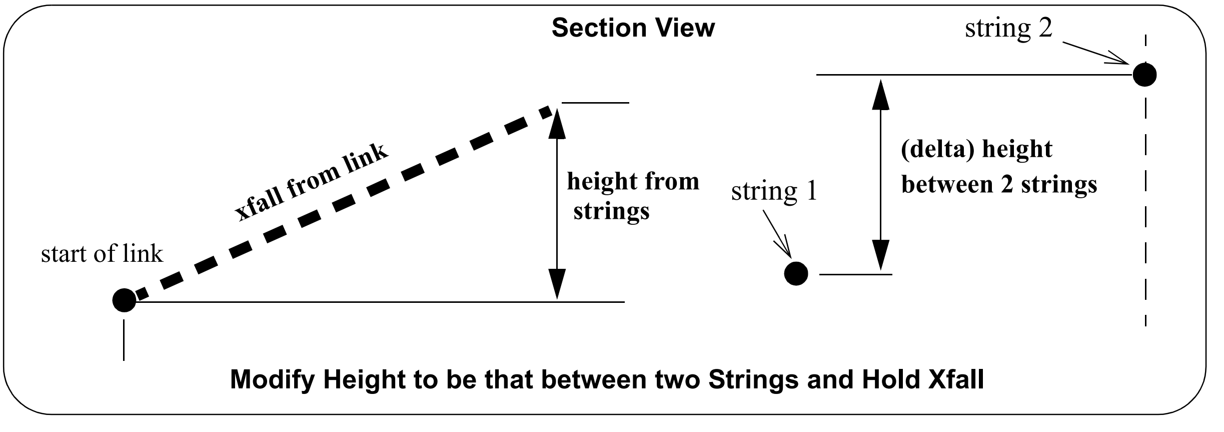
21.2.2.2.14.2 Fixed - by 2 Strings: Modifier Types Modify Height, Hold Width/ Xfall

For a fixed link **Modify Height** sets the **height** of the link to be the height between the two selected strings.

For **Modify Height, Hold Width** the *width* from the current link is kept.



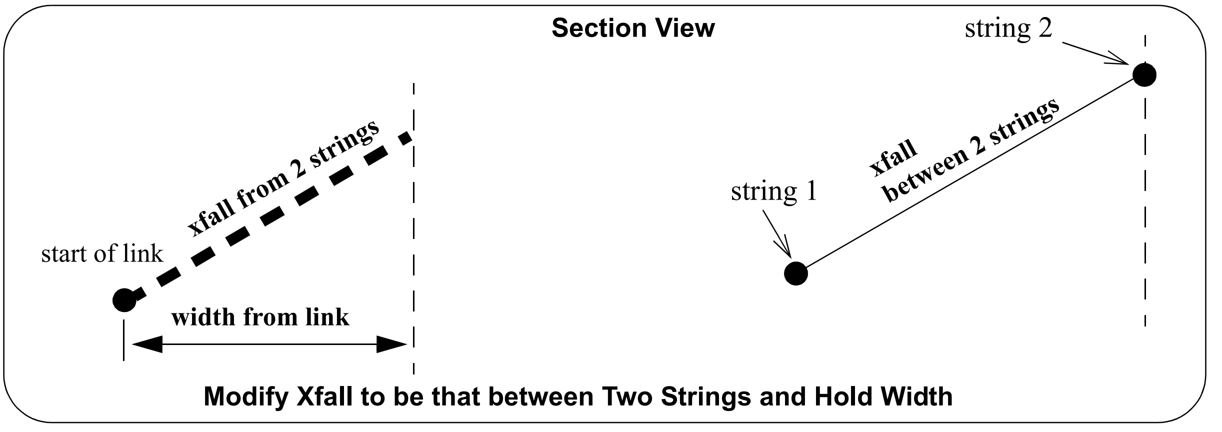
For **Modify Height, Hold Xfall** the *xfall* from the current link is kept.



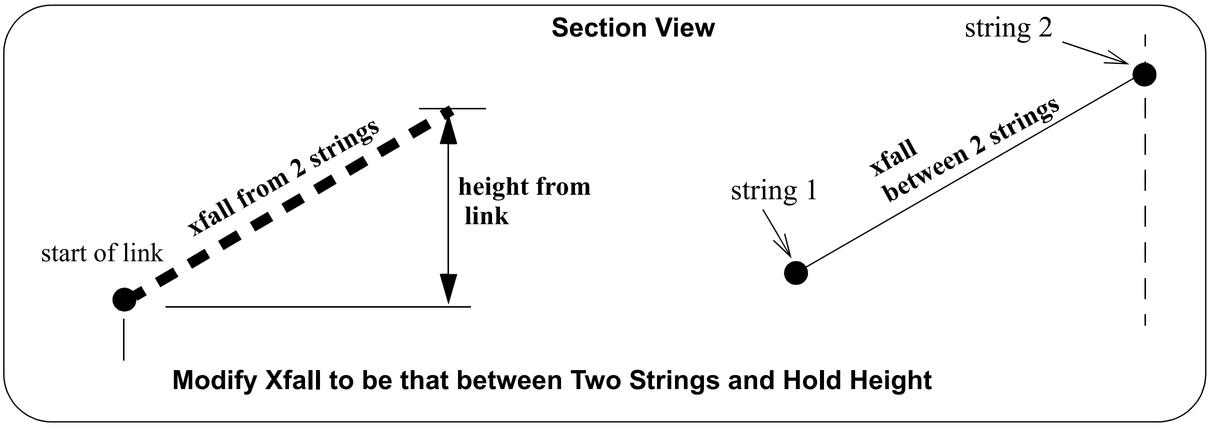
21.2.2.2.14.3 Fixed - by 2 Strings: Modifier Types Modify Xfall, Hold Width/ Height

For a fixed link **Modify Xfall** sets the **xfall** of the link to be the xfall between the two selected strings.

For **Modify Xfall, Hold Width** the *width* from the current link is kept.



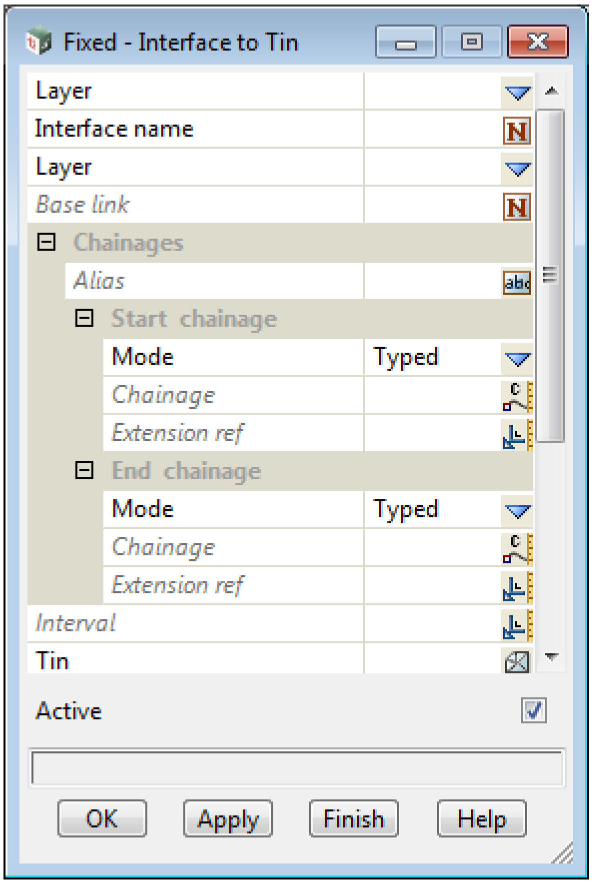
For **Modify Xfall, Hold Height** the *height* from the current link is kept.



21.2.2.2.15 Fixed - Interface to Tin

The **Fixed =>interface to string** option interfaces from the given link to a given tin dropped by a strip depth.

Selecting the **Interface to tin** brings up the **Fixed - Interface to tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to interface off is in.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

Field Description	Type	Defaults	Pop-Up
Base name	name box		names.4d pop-up

the name of the link in the layer **Layer** *to interface (batter) off.*
That is, a line is taken from the ***end*** *of the Base Link with either* **Final cut slope** *or* **Final fill slope**, *and extended until it cuts the stripped tin.*

Field Description	Type	Defaults	Pop-Up
Final cut slope 1 v in	real box	0	no slope, 0,1,2,3,4,5,10

the **cut slope** *is used if the Base link is in cut. That is, it is below the tin.*

The cut slope is the slope for the interface calculation to be done when the Base link is in cut. The batter continues at the cut slope until it hits the **Tin** *dropped by the* **Strip** *depth, or until it reaches the* **Maximum slope width**.

A cut slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a ***horizontal*** *slope - vertical slopes are not allowed.*

For ***final cut slope***, ***positive is up*** *and negative down*

Final fill slope 1 v in real box 0 no slope, 0,1,2,3,4,5,10

the **fill slope** *is used if the Base link is in cut. That is, it is above the tin.*

The fill slope is the slope to be used in the interface calculation when the Base link is in fill. The batter continues at the fill slope until it hits the **Tin** *dropped by the* **Strip** *depth, or until it reaches the* **Maximum slope width**.

A fill slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a ***horizontal*** *slope - vertical slopes are not allowed.*

For ***final fill slope***, ***positive is down*** *and negative is up.*

This definition of fill slope being positive when going down is used so that the value in the Final fill slope 1 v in *field is normally positive.*

Maximum slope width real box 100

the maximum width for the final slope. It it hasn't reached the tin by this distance then it stops.

Strip real box 0

the depth to vertically drop the tin before interfacing.

Tin tin box available tins

name of the tin to interface to.

Layer layer box Design available layers

name of the layer that the created link is added to.

Interface name name box

name for the link created by this link by battering.

Hence the end of string lies on the stripped tin. The string formed from the end of this link is called the ***interface*** *string.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to calculate interface

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

21.2.2.2.16.4 Boxing - Insert Intersect

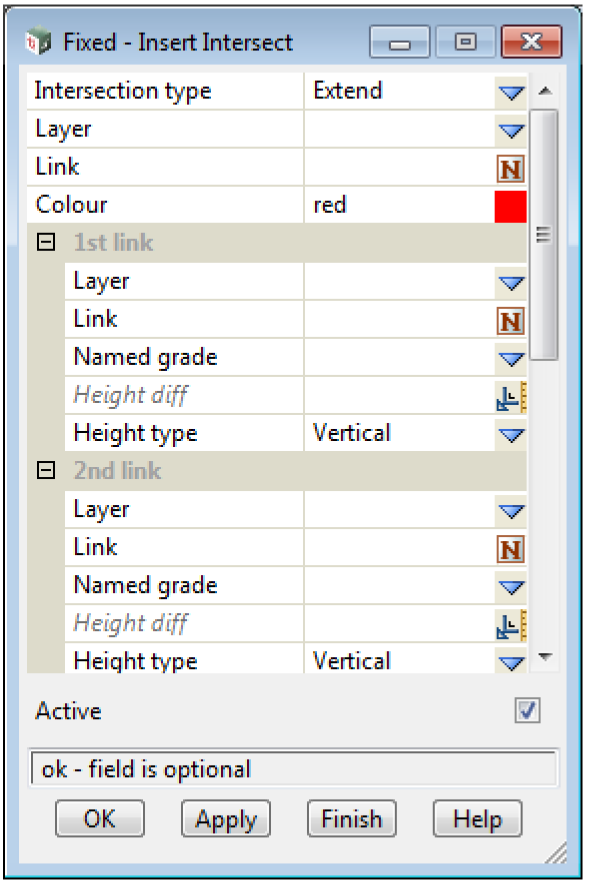
Selecting **Insert intersect** brings up the panel **Fixed - Insert Intersect**



Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages that the modifier exists between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

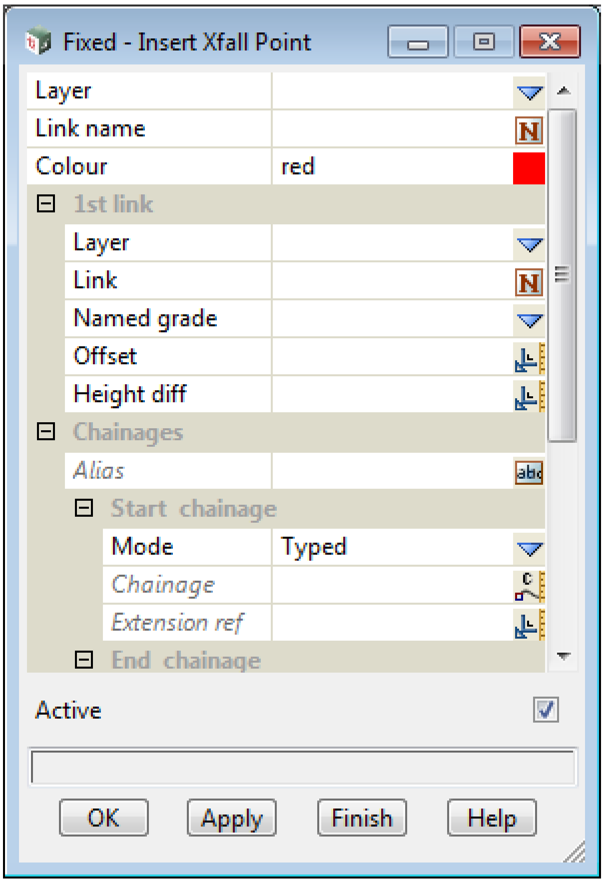
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.16.5 Boxing - Insert Xfall Pt or return to 21.2.2.2.16 Fixed - Boxing or 21.2.2.2 Fixed Link Modifiers.

21.2.2.2.16.5 Boxing - Insert Xfall Pt

Selecting **Insert xfall pt** brings up the panel **Fixed - Insert Xfall Point**



Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages that the modifier exists between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.2.16.6 Boxing - Copy Layer or return to 21.2.2.2.16 Fixed - Boxing or 21.2.2.2 Fixed Link Modifiers.

21.2.2.2.16.6 Boxing - Copy Layer

The **Copy layer** command copies the **Link Points** from part of one layer to another layer, with an optional value **Height diff** added to the copied points.

That is, the ***Copy layer*** command copies vertices from part of a selected **Layer** (from the vertex at the end of a **Start link** to the vertex at the end of an **End link**) and copies the vertices to a given **Layer**, with an optional value **Height diff** added to the copied vertices.

The option works by

(a) Calculating for each of the **vertices** from the vertex at the end of the **Start link** to the vertex at the end of the **End link,** the offset and height from the **Hinge Point** (the beginning of the layer).

That is, calculate an offset and delta height from the Hinge Point rather than just relative to the previous link.

(b) Adding the value **Height diff** to each of the height of each vertex.

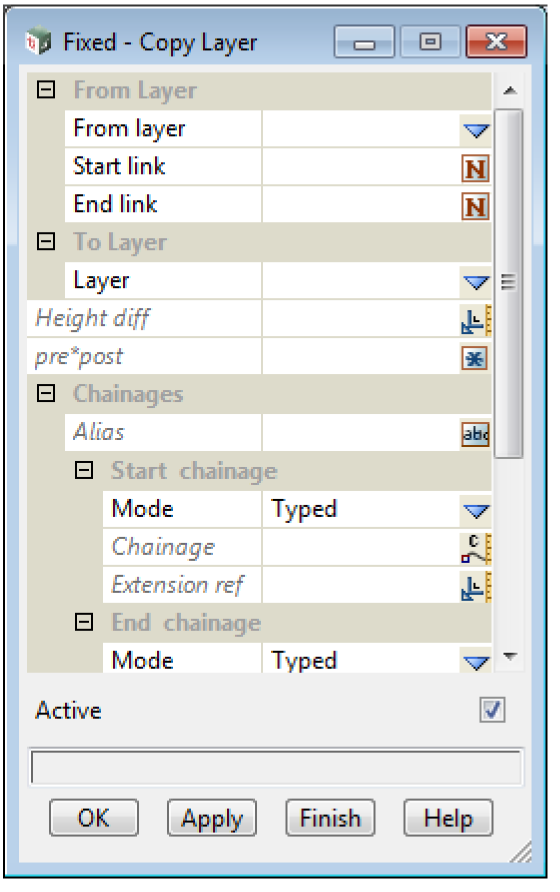
(c) Inserting the vertices into the **To Layer** using the calculated offsets and heights from the Hinge Point for each vertex.

Hence if **no links** already **exist** in the **To Layer** for the **calculated offset range** of the **copied vertices**, then the cross sectional shape of the copied links is maintained.

However if **links** already **exist** in the **To Layer** for the **calculated offset range** of the **copied vertices**, then the **existing** and **copied vertices** are **merged** together. The merging occurs by simply ordering the vertices by increasing offset and then joining adjacent vertices together. The cross sectional shape of the copied links may not be maintained.

Note that the **start vertex** of the **Start link** is not copied. This is normally not a problem unless you are trying to copy the first vertex of the first Link. To do this with the **Copy layer** command, you would need to add a new link with a width and height of zero at the beginning of the string. This new link would then be used as the **Start link.**

Selecting **Copy layer** brings up the panel **Fixed - Copy Layer**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
From layer	layer box	Design	available layers

name of the layer to copy links from.
For information on Layers, see 21.1.1.2 MTF Links and Layers.

Start link link box

name of the link in **From layer** *to start copying from.*

End link link box

name of the link in **From layer** *to stop copying from.*

Layer	layer box	Design	available layers

name of the layer to copy links from.
For information on Layers, see 21.1.1.2 MTF Links and Layers.

Height diff real box

the value to add to the height of the vertices of the links from the **Start link** *to the* **End link.**

Pre*post text input

each copied vertex is given a new name by apply the **Pre*pos** *text to the original name of the vertex.*

*That is, the text before the * is prepended to the vertex name, and the text after the * is postpended to the vertex name.*

Alias, **Start Chainage**, **End Chainage**, **Interval**

defines the start and end chainages to copy layer points.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF

Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

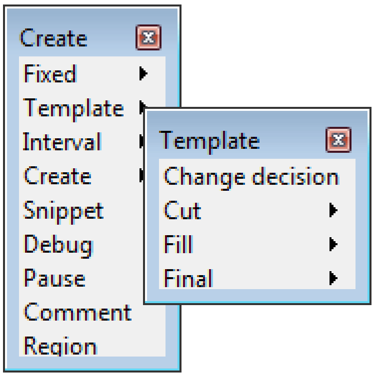
Return to 21.2.2.2.16 Fixed - Boxing or 21.2.2.2 Fixed Link Modifiers.

21.2.2.3 Template Modifiers

Each **12d Template** is made up of the sections *Fixed*, *Decisions*, *Cut*, *Fill* and *Final Cut/Fill*. See 20.1 Templates in 12d Model.

The options in the **MTF Template** menu are for working with the **Decisions**, **Cut**, **Fill** and **Final** Cut/Fill sections of inserted Templates.

The **Template** walk-right brings up the **Template** menu.



For

Change decision	21.2.2.3.1 Change Decision
Cut	21.2.2.3.2 Cut Link Modifiers
Cut	21.2.2.3.3 Fill Link Modifiers
Final	21.2.2.3.4 Final Modifiers

21.2.2.3.1 Change Decision

If a 12d Template has a **Decisions** section then the **Decisions** section is used before the **Cut**, **Fill** and **Final Cut/Fill** sections.

For an **Apply MTF**, a Template specified for a chainage range in the **Templates** section of the MTF (see 21.2.6.1 MTF Templates) is called the *original* template for that chainage range.

Using the **Change Decision** modifier, for a given chainage range it is possible to ***override*** the **Decisions** section from the original Template and:

(a) use the **Decisions** section **from another** Template instead of the **Decisions** section of the original Template.

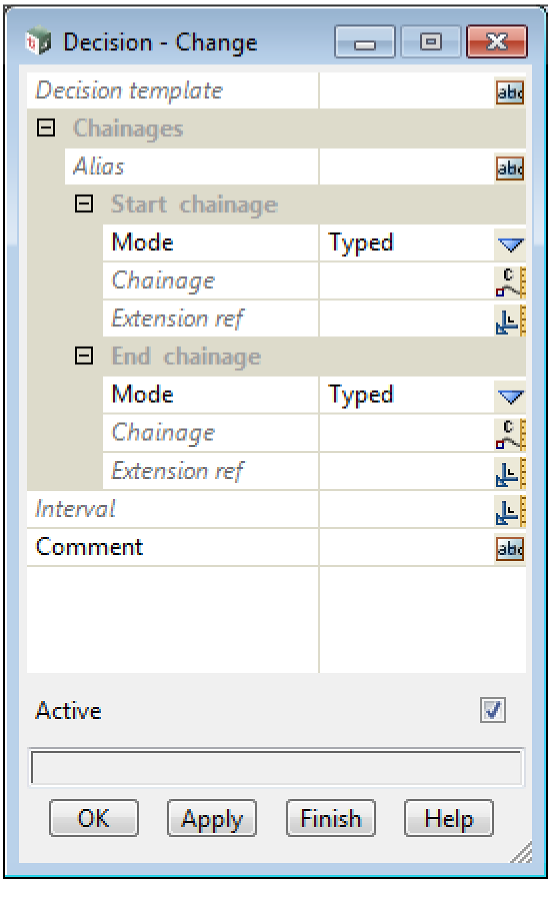
or

(b) use the cut, fill and final cut/fill sections of the original template **instead** of the **Decisions** section of the original template.

So the **Change Decision** option can be used to substitute a **Decisions** section from a different Template, or just **turn off** the **Decisions** section of the original Template.

In either case, the **Fixed** section of the *original* Template is ***still used.***

Selecting **Change decision** brings up the **Decision - Change** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Decision template	input		available templates

*if **non-blank**, this is the Template whose Decisions section is used over the given chainage range. If **blank**, the Cut, Fill and Final Cut/Fill sections of the original Template are used over the chainage range instead of the Decision section of the original Template.*

Note that if the new Template has no decisions, then the ***Cut and Fill section*** *of the original Template is used instead of the* ***Decisions*** *section of the original Template. That is, it is equivalent to leaving the* ***Decisions Template*** *field blank.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to changes/stop the Template Decisions.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

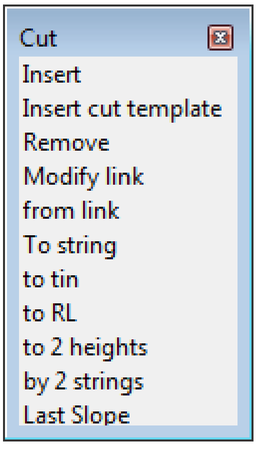
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.3 Template Modifiers.

21.2.2.3.2 Cut Link Modifiers

The **Cut** walk-right brings up the **Cut** menu with options to modify the cut links of the template.



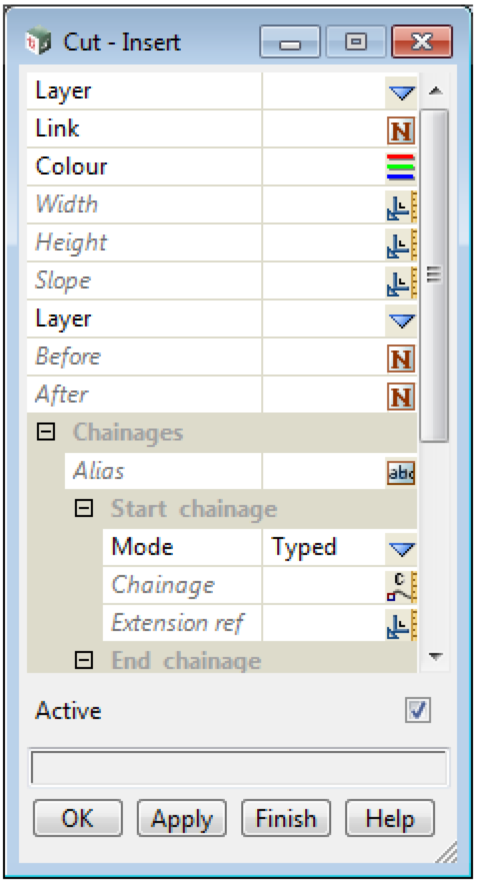
See

Insert	21.2.2.3.2.1 Cut Link - Insert
Insert cut template	21.3.0.1 Insert Cut Links from a Template
Remove	21.3.0.2 Cut Link - Remove
Width/Height	21.3.0.3 Cut Link - Modifier Width or Height
Slope	21.3.0.4 Cut Link - Modify Slope
from link	21.3.0.5 Cut Link - from Link
to string	21.3.0.6 Cut Link - to String
to tin	21.3.0.7 Cut Link - to Tin
to 2 heights	21.3.0.8 Cut Link - to Two Heights
by 2 strings	21.3.0.9 Cut Link - to 2 Strings21.3.0.9 Cut Link - to 2 Strings

21.2.2.3.2.1 Cut Link - Insert

Cut links can be created by the **cut Insert** command by specifying either the *width and height*, *width and slope* or *height and slope* for the link.

Selecting **Insert** brings up the **Cut - Insert** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	choice box		available Layers

Layer for the new link to go into.
For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	input		select name menu

name of the cut link to create in the Layer.

Colour	input		available colours

colour of the link being created.

Width /height/slope	input		measures menu

width/ height/slope of the link being created - only use two of the three.

Before	choice box		select name menu

*if **not blank**, the name of the link in the Layer to insert the new link before.*
*If **blank** and **After** is **blank**, the link is appended to the end of the fixed part of the template.*

After	choice box		select name menu

*if **Before** is **not blank**, **After** is ignored.*

*If **not blank** and **Before** is **blank**, the name of the link in the layer to insert the new link after. If **blank** and **Before** is **blank**, **Before** is used.*

***Note**: Only one of **Before** or **After** can not be blank. If they are both blank then **Before** takes precedence over **After**.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to changes/stop the Template Decisions.

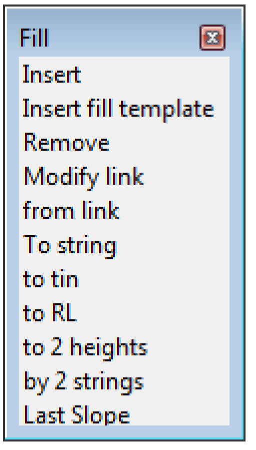
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels**.**

21.2.2.3.3 Fill Link Modifiers

The **Fill** walk-right brings up the **Fill** menu with options to modify the fill links of the template.



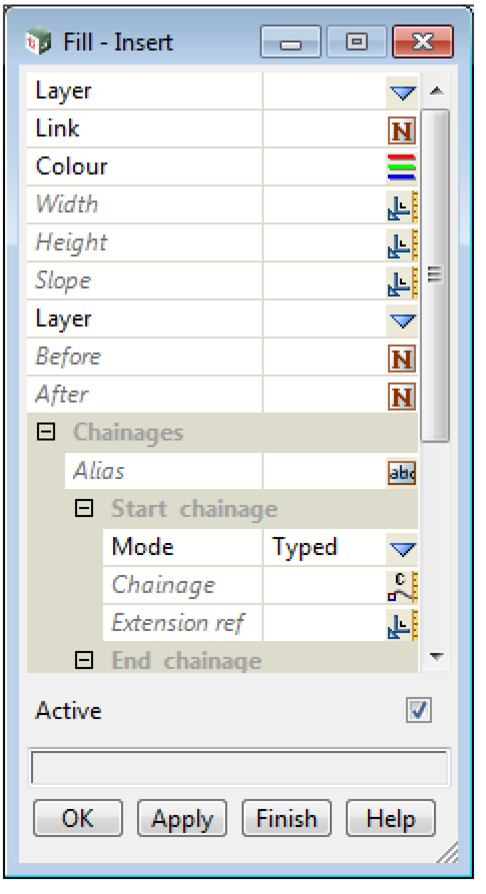
See

Insert	21.2.2.3.3.1 Fill Link - Insert
Insert fill template	21.3.0.10 Insert Fill Links from a Template
Remove	21.3.0.11 Fill Link - Remove
Width/Height	21.3.0.12 Fill Link - Modify Width or Height
Slope	21.3.0.13 Fill Link - Modify Slope
from link	21.3.0.14 Fill Link - from Link
to string	21.3.0.15 Fill Link - to String
to tin	21.3.0.16 Fill Link - to Tin
to 2 heights	21.3.0.17 Fill Link - to Two Heights
by 2 strings	21.3.0.18 Fill Link - to Two Strings

21.2.2.3.3.1 Fill Link - Insert

Fill links can be created by the **fill insert** modifier and by specifying either the width and height, width and slope or height and slope.

Selecting **Insert** brings up the **Fill - Insert** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	choice box		available Layers

Layer for the new link to go into.
For information on Layers, see 21.1.1.2 MTF Links and Layers.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the fill link to create in the given Layer.

Field Description	Type	Defaults	Pop-Up
Colour	input		available colours

colour of the link being created.

Field Description	Type	Defaults	Pop-Up
Width /height/slope	input		measures menu

width/ height/slope of the link being created - only use two of the three.

Field Description	Type	Defaults	Pop-Up
Before	choice box		select name menu

*if **not blank**, the name of the link in the Layer to insert the new link before.*
*If **blank** and **After** is **blank**, the link is appended to the end of the fixed part of the template.*

Field Description	Type	Defaults	Pop-Up
After	choice box		select name menu

*if **Before** is **not blank**, **After** is ignored.*

If ***not blank*** *and* ***Before*** *is* ***blank****, the name of the link in the layer to insert the new link after.*
If ***blank*** *and* ***Before*** *is* ***blank****,* ***Before*** *is used.*

Note*: Only one of* ***Before*** *or* ***After*** *can not be blank. If they are both blank then* ***Before*** *takes precedence over* ***After****.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to changes/stop the Template Decisions.

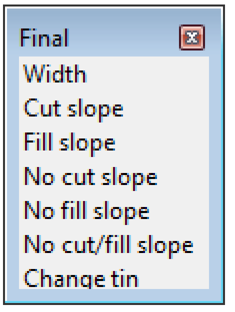
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels**.**

21.2.2.3.4 Final Modifiers

The **Final** walk-right brings up the **Final** menu with options to modify the final cut and fill links of the template.



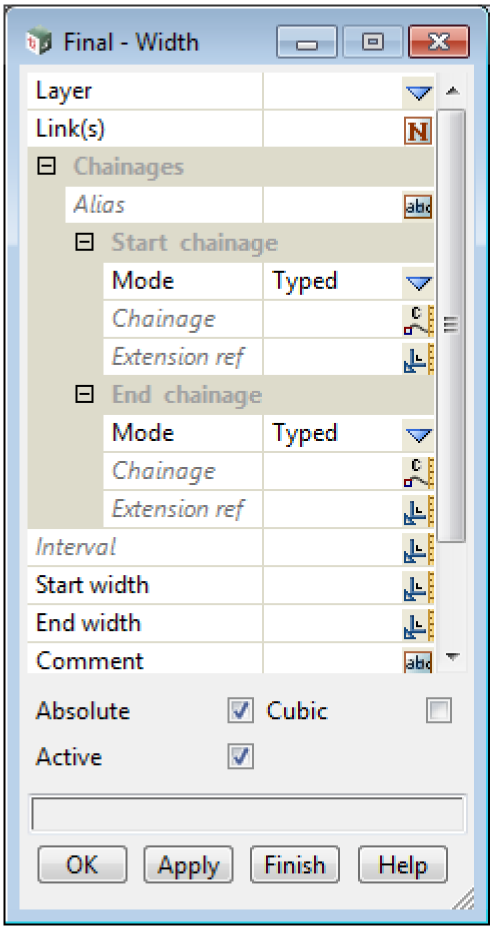
See

Width 21.2.2.3.4.1 Final Link - Width
Cut slope 21.2.2.3.4.2 Final Link - Cut or Final Fill Slope
Fill slope 21.2.2.3.4.2 Final Link - Cut or Final Fill Slope
No cut slope 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope
No fill slope 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope
No cut/fill slope 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope
Change tin 21.2.2.3.4.4 Change Final Tin
Final link name 21.2.2.3.4.5 Change Final Link Name

21.2.2.3.4.1 Final Link - Width

The *final* **Width** modifier varies the **Maximum slope width** of the *final* link of the template.

Selecting **Width** brings up the **Final - Width** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to modify is in.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	link box		select name menu

name of the final link to modify.

Start width	input		measures menu

width at the Start chainage for the **Maximum slope width** *of the final link of the template.*

End width	input		measures menu

width at the End chainage for the **Maximum slope width** *of the final link of the template.*

Cubic	tick box		

if ***ticked****, the width is varied as a reverse cubic between the start and end chainages.*
if ***not ticked****, the width is varied linearly between the start and end chainages.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to modify the maximum width of the final link.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

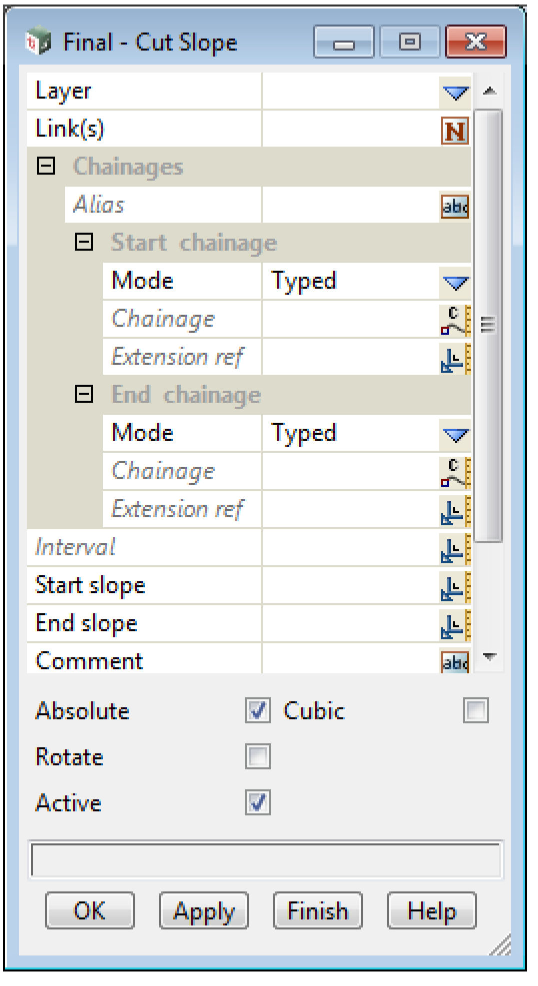
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

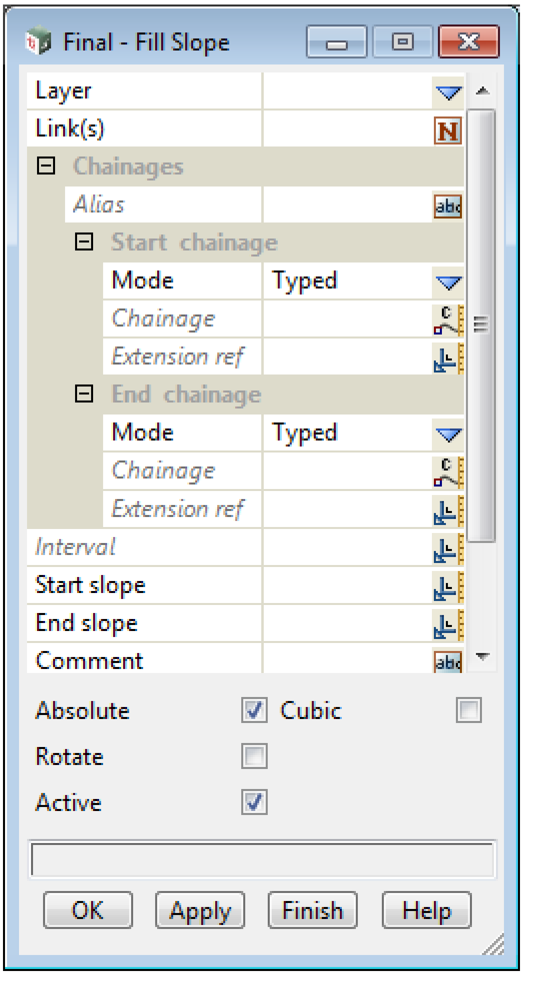
Continue to the next section 21.2.2.3.4.2 Final Link - Cut or Final Fill Slope or return to 21.2.2.3.4 Final Modifiers.

21.2.2.3.4.2 Final Link - Cut or Final Fill Slope

The final **Cut slope** modifier varies the cut slope of the *final* link of the template and the final **Fill slope** modifier varies the fill slope of the *final* link of the template.

Selecting the **Cut slope** or **Fill slope** options brings up the **Final - Cut Slope** and **Final - Fill Slope** panels respectively.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to modify is in.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	link box		select name menu

name of the final link to modify.

Start slope	input		measures menu

slope at the Start chainage for the **Final cut/fill slope 1v in** *of the final link of the template.*

End slope	input		measures menu

slope at the End chainage for the **Final cut/fill slope 1v in** *of the final link of the template.*

Important note:

*For a **cut** link, **positive** slope is **up**.*

*For a **fill** link, **positive** slope is **down**.*

Cubic	tick box		

*if **ticked**, the slope is varied as a reverse cubic between the start and end chainages.*

Rotate tick box

*if **ticked**, the slope is varied linearly **with respect to** the **angle,** between the start and end chainages.*

***Note** -*

*Only one of cubic and rotate can be set to **ticked.***
*If both are set to **not ticked**, then the slope is varied **linearly with respect to slope** between the start and end chainages (the default).*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to modify the final slope.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

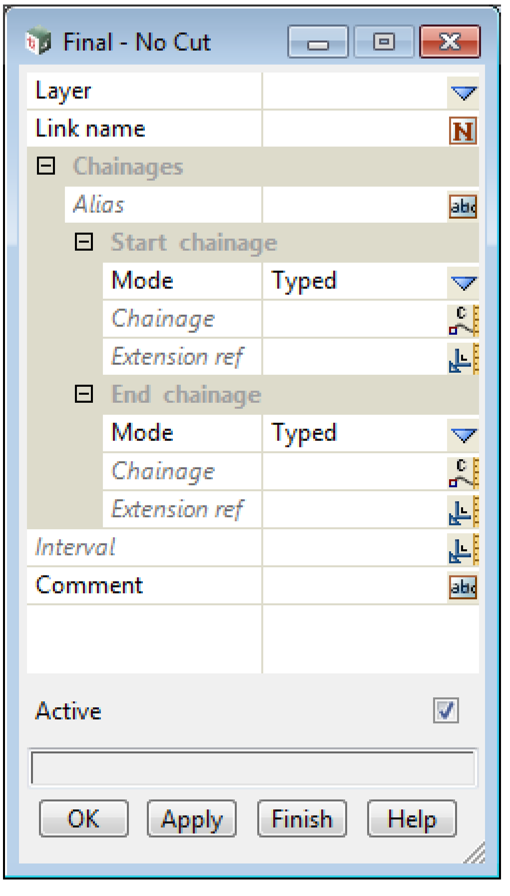
Continue to the next section 21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope or return to 21.2.2.3.4 Final Modifiers.

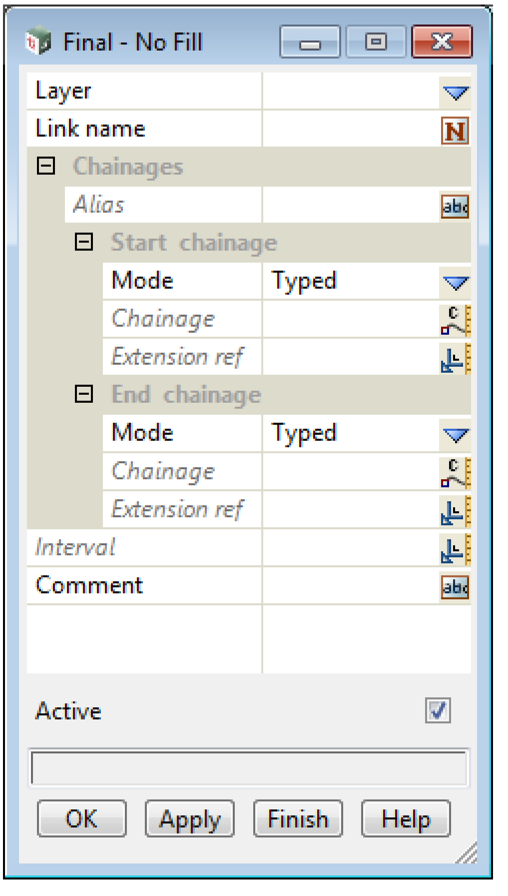
21.2.2.3.4.3 Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope

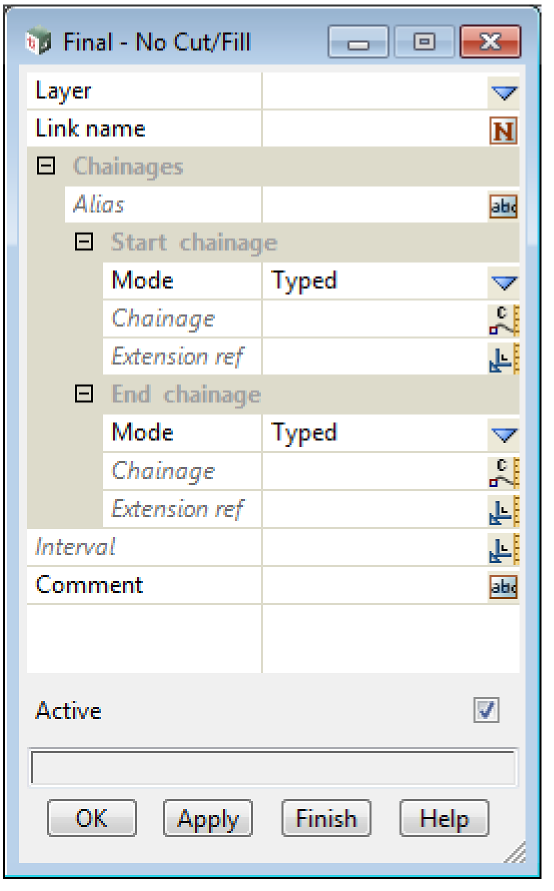
The final link can be stopped altogether or only stopped when it is in cut or only stopped when it is in fill.

The **No cut slope** modifier stops the final link when it is in *cut,* the **No fill slope** modifier stops the final link when it is in *fill* and the **No cut/fill fill slope** modifier stops the final link is any situation.

Selecting **No cut slope, No fill slope** or **No cut/fill slope** brings up the **Final - No Cut**, **Final - No Fill** or **Final - No Cut/Fill** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer	layer box	Design	available layers

name of the layer that the link to modify is in.

For information on Layers, see 21.1.1.2 MTF Links and Layers.

Link name	link box		select name menu

name of the final link to stop.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to stop the final link.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

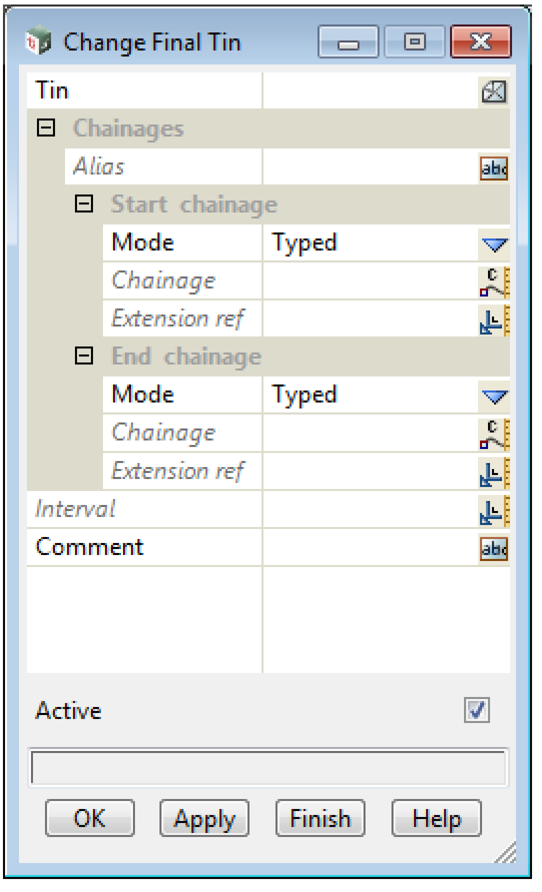
Continue to the next section 21.2.2.3.4.4 Change Final Tin or return to 21.2.2.3.4 Final Modifiers.

21.2.2.3.4.4 Change Final Tin

The **Change tin** modifier changes the tin that the final cut and fill slopes batter to.

Note that the default tin is the tin from the Apply MTF.

Selecting **Change tin** brings up the **Change Final Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin for the final cut and fill links to batter to.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to change the tin that the final link to batters to.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

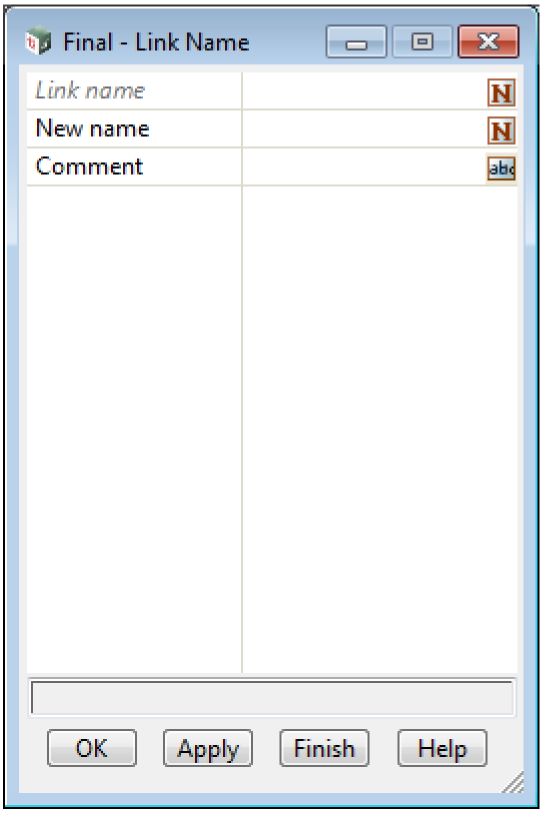
Continue to the next section 21.2.2.3.4.4 Change Final Tin or return to 21.2.2.3.4 Final Modifiers.

21.2.2.3.4.5 Change Final Link Name

NOTE: THIS OPTION HAS NOT BEEN IMPLEMENTED.

The **Final Link Name** modifier changes the name of the interface string.

Selecting **Final link name** brings up the **Final - Link Name** panel.



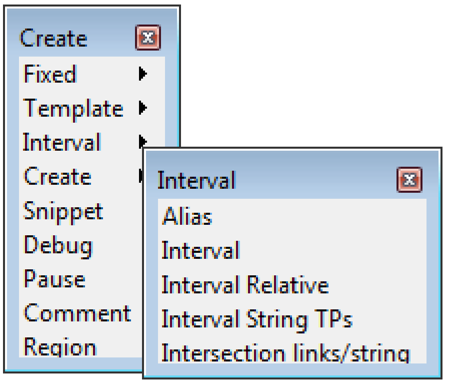
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	name box		available names
current name of the interface string.			
New name	name box		available names
new name of the interface string.			

Return to 21.2.2.3.4 Final Modifiers.

21.2.2.4 Interval

The **Create** walk-right brings up the **Interval** menu.



For

Alias	21.2.2.4.1 Chainage Alias
Interval	21.2.2.4.2 Change Interval
Interval relative	21.2.2.4.3 Change Interval Relative
Interval String TPs	21.2.2.4.4 Interval String Tangent Points
Intersection links/string	21.2.2.4.5 Intersect Links with String

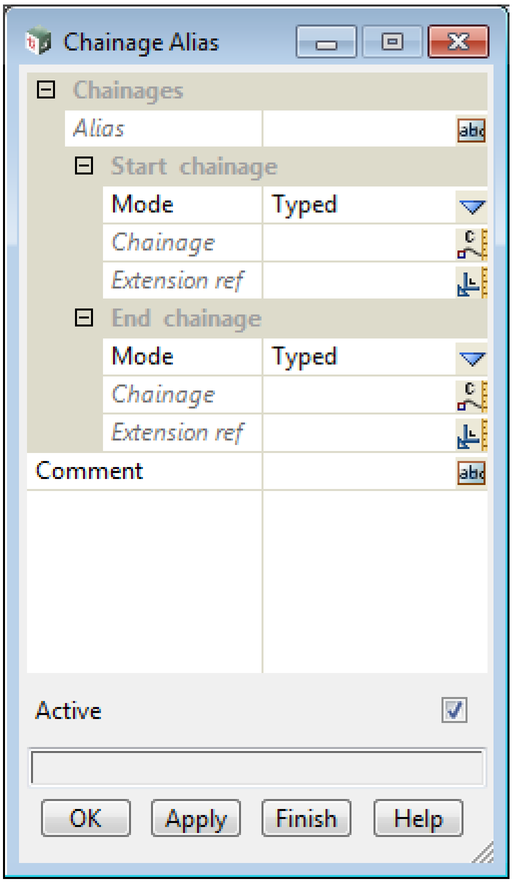
21.2.2.4.1 Chainage Alias

The **Alias** option creates a row in the grid with a given **Alias** name.

The *Alias* is then available to be used by *Smart Chainages*.

For the new information on **Smart Chainage,** see 21.4 Smart Chainages.

Selecting **Alias** brings up the panel **Chainage Alias**



Alias text box

a text name that can be used to refer to the row in the grid for this command.
See 21.2.2.1.4 Alias for MTF Modifiers

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to define an Alias for this row.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.4.2 Change Interval or return to 21.2.2.4 Interval.

21.2.2.4.2 Change Interval

The **Interval** option changes the interval between the MTF sections over the given chainage range.

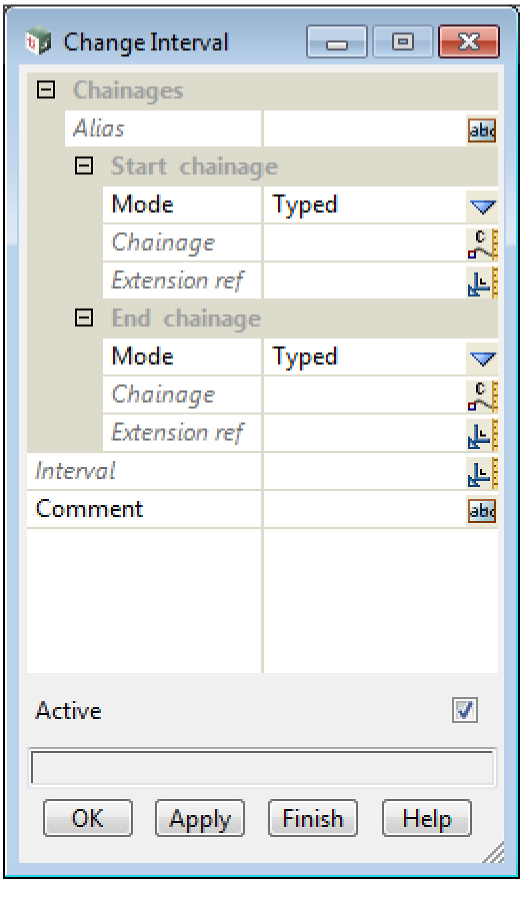
The sections are at the chainages that are integer multiples of the interval, and less than or equal to the start chainage and less than the end chainage. That is, the chainage values are referenced about zero and inside the start/end range.

For example, if the interval is 10 and the start chainage is -13 and the end chainage is 24 then there will be sections as

-10, 0, 10 and 20

The default value used for Interval is the **Separation distance** in the **Apply MTF** panel.

Selecting **Interval** brings up the **Change Interval** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Alias, **Start Chainage**, **End Chainge**

defines the start and end chainages to change the interval between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Interval input

*if **non blank**, the interval to use to create extra cross sections and strings over the given chainage range.*

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF

Modifier Panels.

Go to the next section 21.2.2.4.3 Change Interval Relative or return to 21.2.2.4 Interval.

21.2.2.4.3 Change Interval Relative

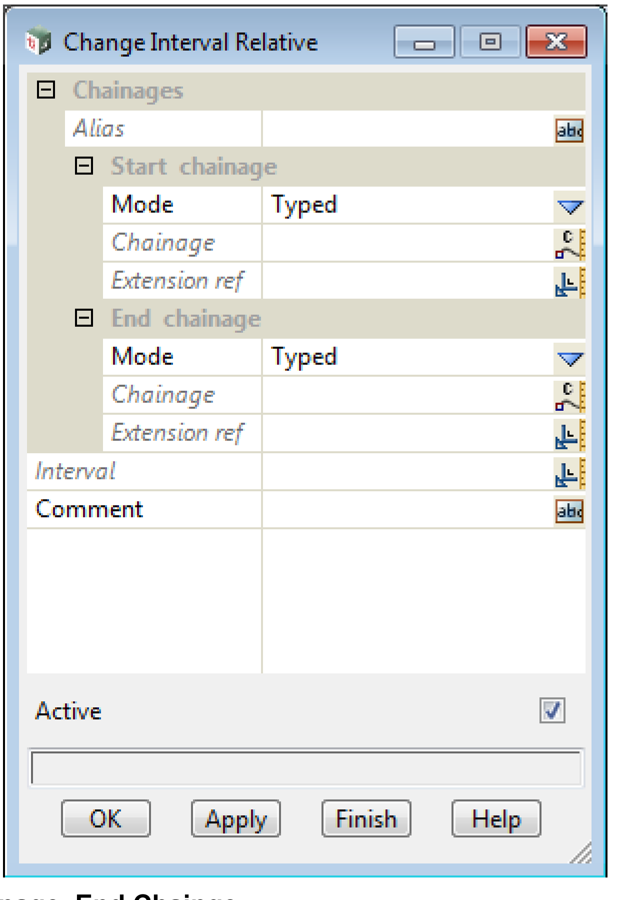
The **Interval Relative** option changes the interval between the MTF sections over the given chainage range but instead of being referenced about zero, the chainages are reference about the **start chainage**.

That is, the sections are at the chainages that are the start chainage plus integer multiples of the interval, and less than or equal to the start chainage and less than the end chainage. That is, the chainage values are referenced about the start chainage and inside the start/end range.

For example, if the interval is 10 and the start chainage is -13 and the end chainage is 24 then there will be sections as

-13, -3, 7 and 17

Selecting **Interval relative** brings up the **Change Interval Relative** panel



Alias, **Start Chainage**, **End Chainage**

defines the start and end chainages to change the interval between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Interval input

*if **non blank**, the interval to use to create extra cross sections and strings over the given chainage range. The values for chainage are referenced about the Start chainage.*

Comment, **Extra start**, **Extra End, Active, OK, Apply**

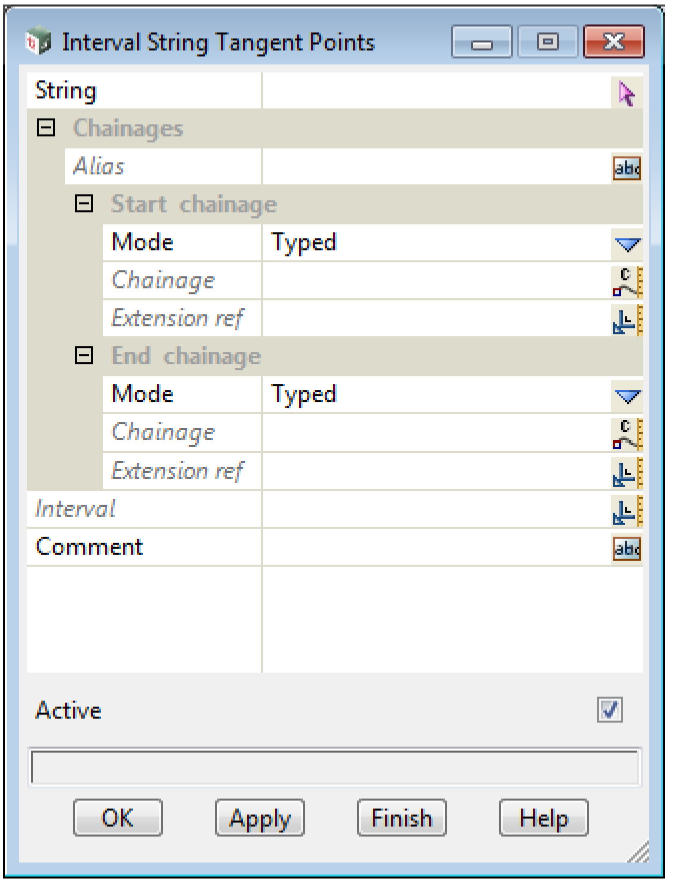
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Go to the next section 21.2.2.4.4 Interval String Tangent Points or return to 21.2.2.4 Interval.

21.2.2.4.4 Interval String Tangent Points

The **Interval String TPs** option drops the tangents points of a selected string onto the reference string and includes the dropped points as extra chainages where sections are generated.

Selecting **Interval string TPs** brings up the **Interval String Tangent Points** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
String	string select		

the string to select whose tangent points are dropped onto the reference string and if any of the dropped points are in the start and end chainage range then sections are generated at those dropped chainages.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages to drop tangent points.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

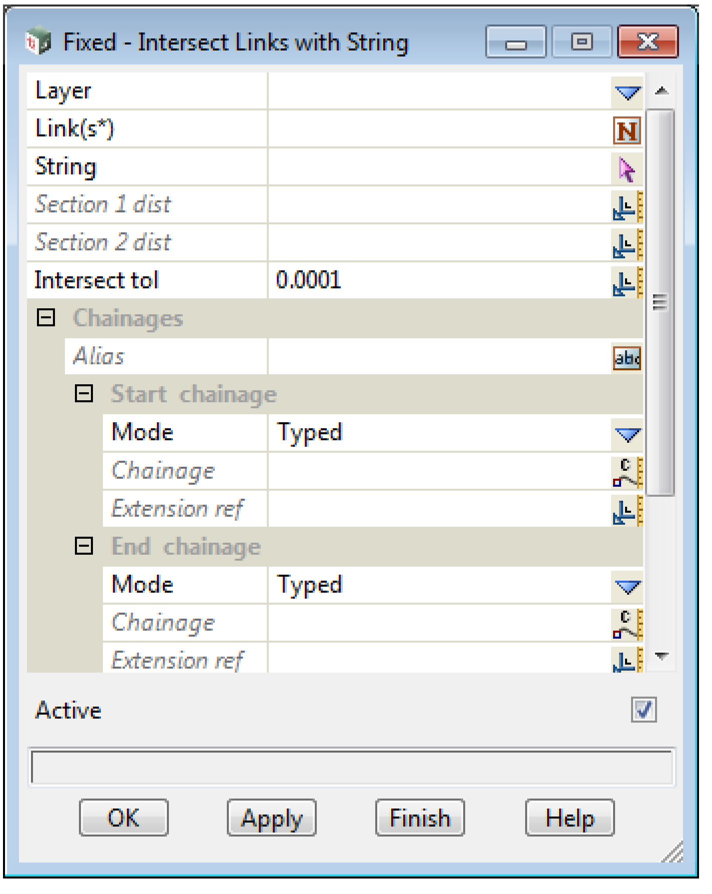
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Continue to next section 21.2.2.4.5 Intersect Links with String or return to 21.2.2.4 Interval.

21.2.2.4.5 Intersect Links with String

The **Intersection links/string** option

Selecting **Intersection links/string** brings up the **Fixed - Intersect Links with String** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
String	string select		

the string to select whose tangent points are dropped onto the reference string and if any of the dropped points are in the start and end chainage range then sections are generated at those dropped chainages.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages to drop tangent points.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

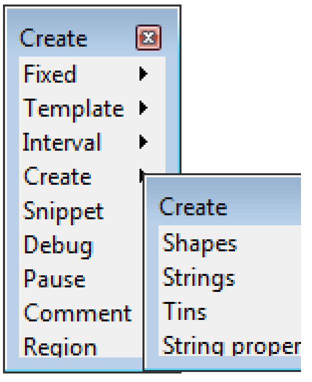
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.4 Interval.

21.2.2.5 MTF Create

The **Create** walk-right brings up the **Create** menu with options to create Shapes, Strings and Tins from selected MTF points.



For

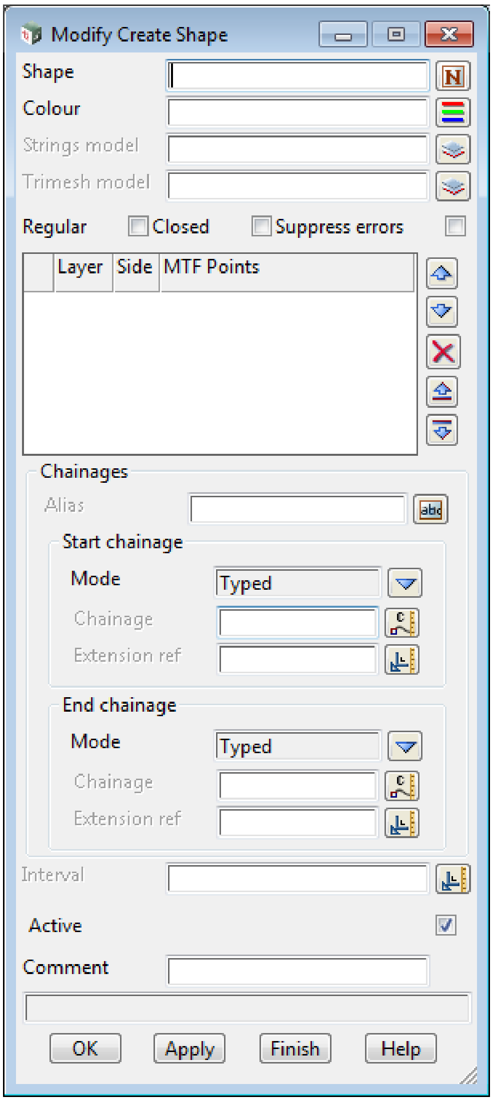
Shapes	21.2.2.5.1 Create Shapes
Strings	21.2.2.5.2 Create Strings
Tins	21.2.2.5.3 Create Tin

21.2.2.5.1 Create Shapes

The **Shapes** option creates a shape from nominated MTF Points, and optionally strings and trimeshes.

For information on MTF Points, Strings, Shapes and Trimeshes, see 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes.

Selecting **Shape** brings up the panel **Modify Create Shape**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Shape	text box		
name for the new shape			
Colour	colour box		available colours

colour of the shape.

Strings model model box available models

*if **not blank**, strings are created for the MTF point listed in the Shape grid and added to this model. The strings have the same name and colour as the MTF points.*

*If **blank**, strings are not created.*

Trimesh model model box available models

*if **not blank**, a trimesh is created for the shape and added to this model.*

*If **blank**, trimeshes are not created.*

Regular tick box

*if **ticked** the shape will only be formed when all of the nominated strings exist. E.g. it will form multiple shapes if strings come and go along the length of the apply.*

*If **not ticked**,.*

Closed tick box

*if **ticked**, the shape is closed off. That is, the last MTF point in the list is joined to the first MTF point.*

*If **not ticked**, the shape is not closed off.*

Shape Grid

Layer layer box available Layers

layer to take the MTF point from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Side choice box Left, Right

side of the template to take the MTF point from.

Links LJG? text box

the name of the MTF point from the layer **Layer** *and side* **Side**.

The shape profile is constructed from the shape grid defines by joining each MTF point to the next MTF point in the list. See 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes

If **Closed** *is ticked, t he last MTF point in the list is joined to the first MTF point.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

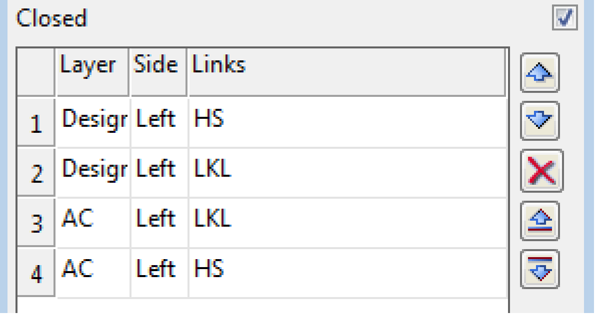
defines the start/end chainages to create the shape.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

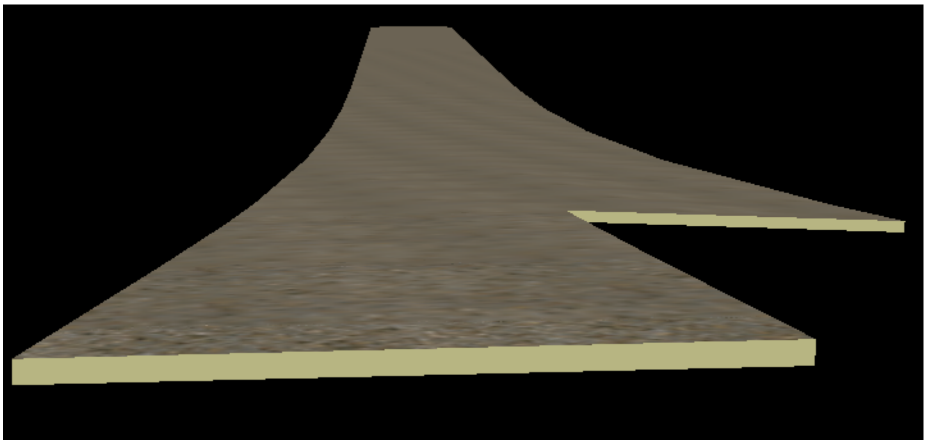
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

For example, the list of MTF points



creates a shape at each chainage by joining the four MTF points in the order down the list, and then closes the shape by joining the fourth MTF point to the first MTF point.



Go to the next section 21.2.2.5.2 Create Strings or return to 21.2.2.5 MTF Create.

21.2.2.5.2 Create Strings

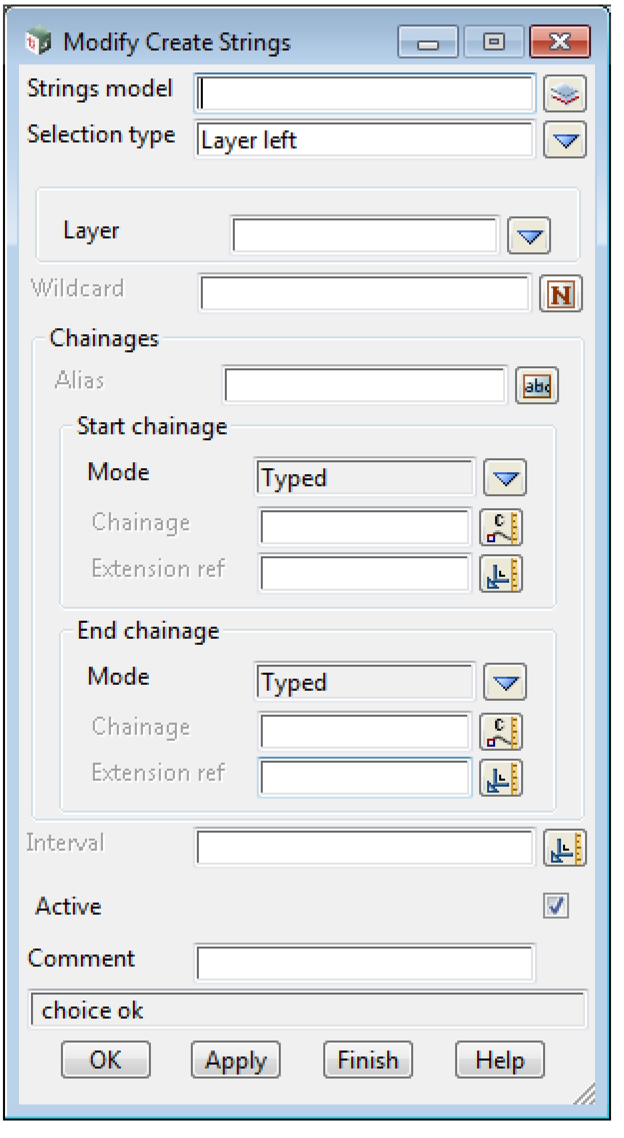
The **Strings** option creates longitudinal strings for nominated MTF points and places them in a given model.

One application of the **Strings** option is to create a model of strings for a given Layer instead of the **Boxing Layers** in the **Models** tab of the **Apply MTF Function.**

Note: Strings and sections are automatically created for all the MTF points in the default Layer **Design**.

For information on MTF Points, Strings, Shapes and Trimeshes, see 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes.

Selecting **Strings** brings up the panel **Modify Create Strings**

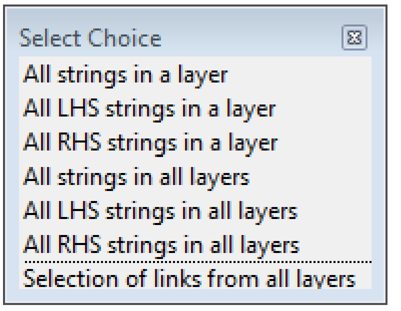


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Strings model	model box		available models

the strings that created for the nominated points are placed in this model.

Selection type choice box



***Selection type** specifies where to get all the names of points created at any section in the Start and End chainage range.*

*For any **Selection type** other than **Selection of links from all layers**, the points then have to match the* **Wildcard** *and then strings are created with the name and colour of the point, and placed in the* **Strings model**.

If **All points in a layer**, *all points in the layer given in* **Layer**.

If **All LHS points in a layer**, *all points in the layer given in* **Layer** *that are on the left hand side.*

If **All RHS points in a layer**, *all points in the layer given in* **Layer** *that are on the right hand side.*

If **All points in all layers**, *all points in the all layers.*

If **All LHS points in all layers**, *all points in the all layers that are on the left hand side.*

If **All RHS points in all layers**, *all points in the all layers that are on the right hand side.*

Layer layer box available Layers

used when **Selection type** *is* All points in a layer, All LHS points in a layer, *or* All RHS points in a layer. *For information on Layers, see* 21.1.1.2 MTF Links and Layers.

Wildcard text box

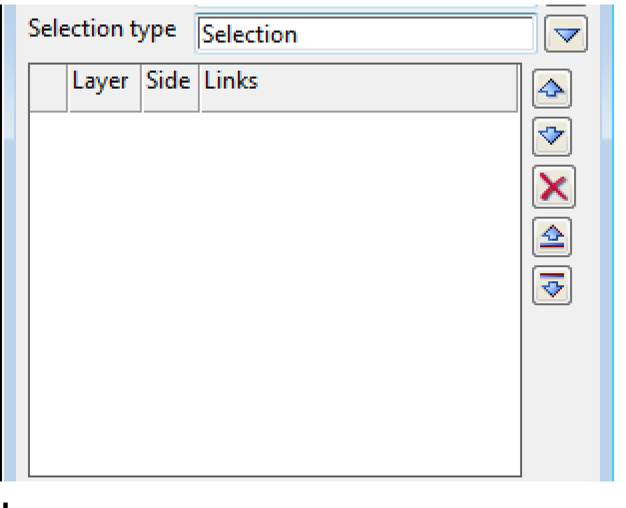
used for all **Selection type's** *except* Selection of points for all layers.

*text including wild cards * and wild characters ?.*

*If **blank**, all points from* **Selection type** *have strings created for them*

*If **not blank**, any names of points from the* **Selection type** *that **match** the* **Wildcard** *have strings created for them with the same name and colour as the point.*

If **Selection of points for all layers**, *then a grid is used to nominate the points to be selected. The points do no have to be from the same layer.*



Selection Grid

Layer	layer box	available Layers

layer to take the point from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Side	choice box	Left, Right

side of the template to use to take the point.

Points	text box

the name of the point from the layer **Layer** *and side* **Side**.

For any of the points in the table, strings are created and placed in the **Strings model**.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages to create strings between.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

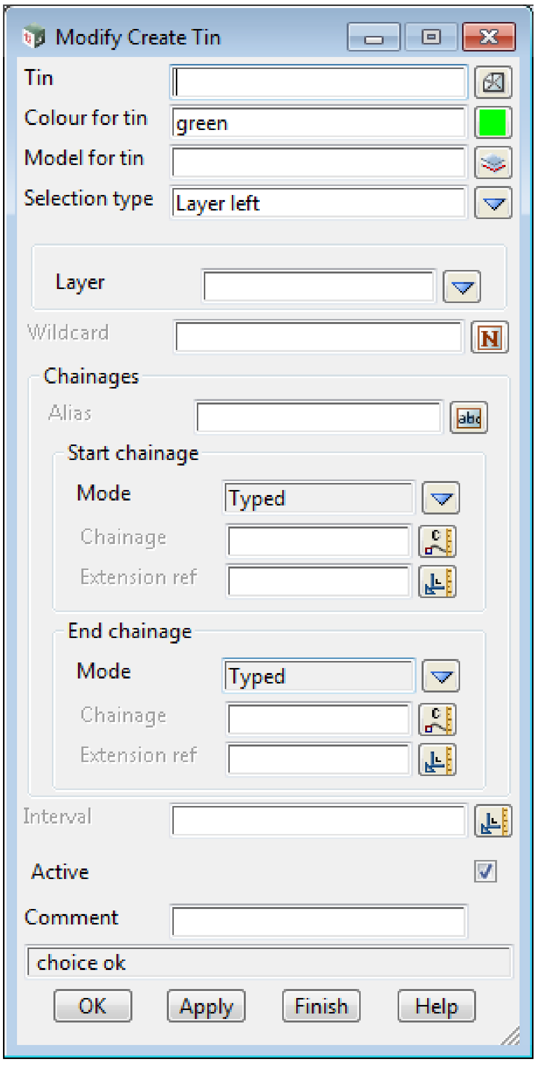
Go to the next section 21.2.2.5.3 Create Tin or return to 21.2.2.5 MTF Create.

21.2.2.5.3 Create Tin

The **Tins** option creates a tin from selected MTF strings.

For information on MTF Points, Strings, Shapes and Trimeshes, see 21.1.1 MTF Links, Points, Sections, Strings and Trimeshes.

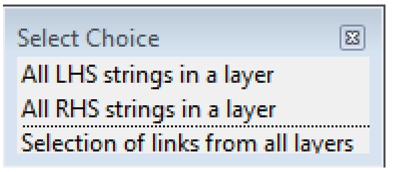
Selecting **Tins** brings up the panel **Modify Create Tin**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
the name for the created tin.			
Colour for tin	colour box		available colours
the colour of the created tin.			
Model for tin	model box		available models
the created tin is added to this model.			

Selection type choice box



Selection type *specifies where to get all the MTF points in sections in the Start and End chainage range, and create the strings that are used in the triangulation.*

For any ***Selection type*** *other than* ***Selection of links from all layers****, the points have to match the* **Wildcard**. *Then strings are created and used in the triangulation.*

If **All LHS strings in a layer***, then all points in the layer given in* **Layer** *that are on the left hand side and satisfy* **Wildcard** *are used to create strings, and the strings are used in the triangulation.*

If **All RHS strings in a layer***, then all points in the layer given in* **Layer** *that are on the right hand side and satisfy* **Wildcard** *are used to create strings, and the strings are used in the triangulation.*

Layer layer box available Layers

used for all **Selection type's** *except* Selection of points for all layers.

The Layer to take MTF points from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Wildcard text box

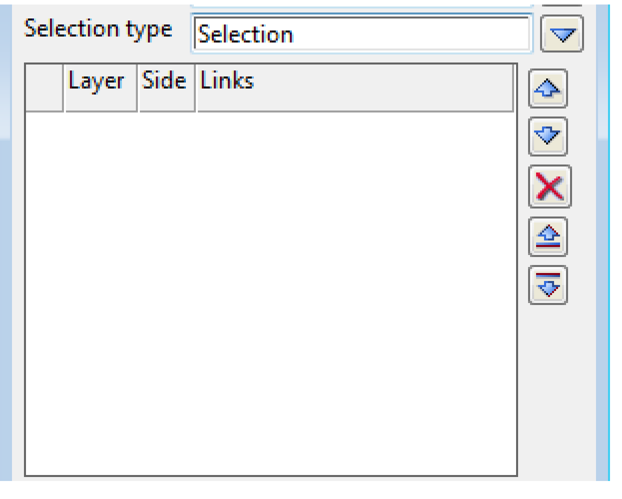
used for all **Selection type's** *except* Selection of points for all layers.

*Text including wild cards * and wild characters ?.*

If ***blank****, all points from* **Selection type** *have strings created for them, and the strings are used in the triangulation.*

If ***not blank****, any names of points from the* **Selection type** *that* ***match*** *the* **Wildcard** *have strings created for them and the strings are used in the triangulation.*

If **Selection of points for all layers***, then a grid is used to nominate the points to be selected. The points do no have to be from the same layer.*



Selection Grid

Layer layer box available Layers

layer to take the point from. For information on Layers, see 21.1.1.2 MTF Links and Layers.

Side choice box Left, Right

side of the template to use to take the point.

Points text box

the name of the point from the layer **Layer** *and side* **Side**.

For any of the points in the table, strings are created and placed in the **Strings model**.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages to create a tin.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

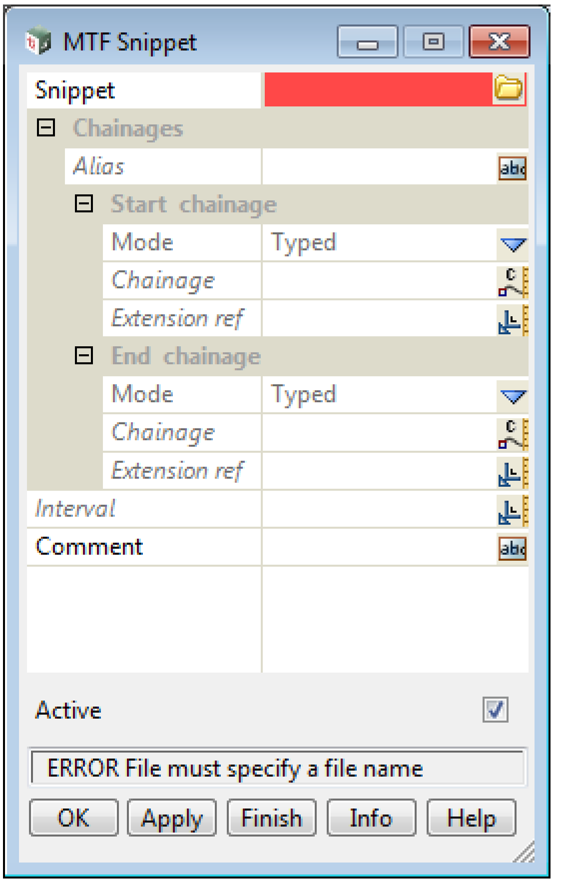
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Return to 21.2.2.5 MTF Create.

21.2.2.6 Snippet

Clicking on **Snippet** brings up the **MTF Snippet** panel which is used to insert snippets.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Snippet	snippet box		*.mtfsnippet, *.mtfsnippetc files

snippet to run.

If information on the snippets shipped by 12d Solutions and available from **[Lib]** *in the Folder pop up, see* 20.4.3.5 12d Supplied Snippets.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start and end chainages to apply a snippet.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra End, Active, OK, Apply**

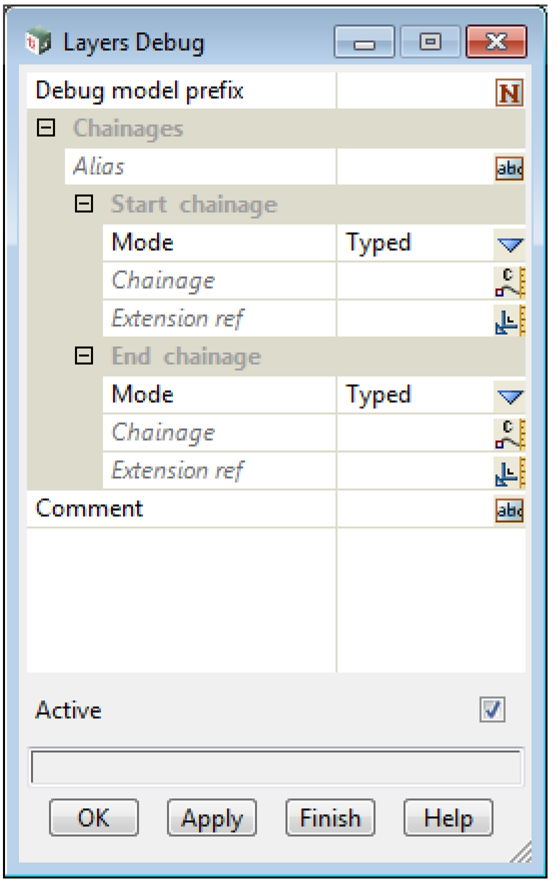
For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

For more information on the inserting and use of snippets, please go to the section 21.5 Defining and Using Snippets.

Go to the next section 21.2.2.7 Debug or return to 21.2.2.1 Create MTF Commands.

21.2.2.7 Debug

Clicking on **Debug** brings up the **Layers Debug** panel which is used to create debug information when you area having problems with your MTF, especially with Snippets.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Debug model prefix	text box		

debug models are created with the name of this prefix followed by the chainage.

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to create debug models and file.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

Comment, **Extra start**, **Extra end, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

What the Panel Does

For each chainage. a model is created with the name **Debug model prefix** *followed by the chainage value. In the model all the link in all the layers are drawn nut with the offset as the x-value and height as the y-value so that the model can be looked at on a* ***Plan View****.*

A report file is also created at the start chainage and it contains information debugging such as the snippets used and the values of the parameters in the snippets.

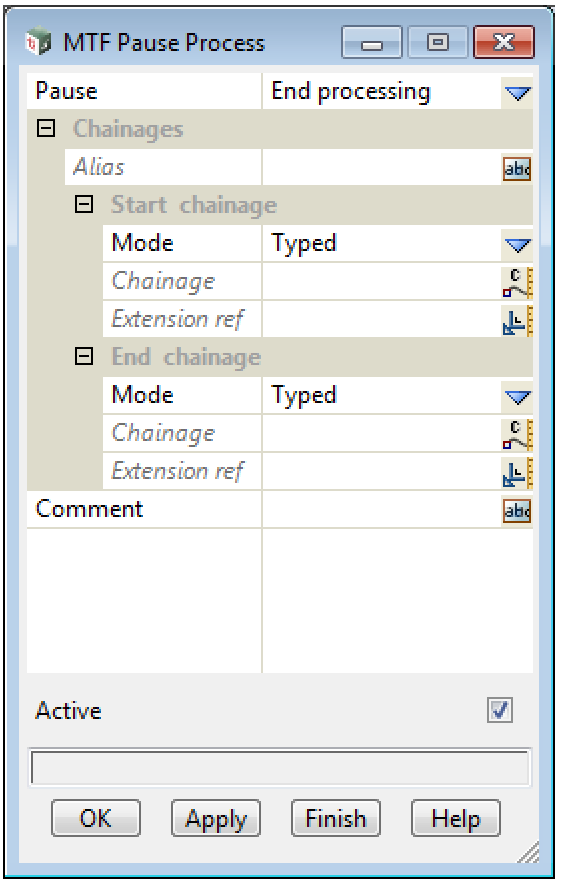
The Report has the name **Debug model prefix** *followed by the chainage value with the decimal point replaced by an underscore, with* ***12D_APPLY_MTF_DEBUG_DUMP*** *as the file extension.*

For example, **Lee Road debug 0_000.12D_APPLY_MTF_DEBUG_DUMP**

Go to the next section 21.2.2.8 Pause or return to 21.2.2.1 Create MTF Commands.

21.2.2.8 Pause

Clicking on **Pause** brings up the **MTF Pause Process** panel which is used to enable/disable the processing of all the MTF commands in the given chainage range.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pause	choice box	Stop processing	Start processing, Stop processing

*if **End processing**, then for a given chainage **ch** in the chainage range, all commands after this command will **NOT** be processed until a* **MTF Pause Process** *panel with* **Process** *set to* **Start processing** *(and whose chainage range includes this chainage **ch**) is met.*

*If **Start processing**, then for a given chainage **ch** in the chainage range, all commands after this command will be processed until a* **MTF Pause Process** *panel with* **Process** *set to* **End processing** *(and whose chainage range includes this chainage **ch**), is met.*

Alias, **Start Chainage**, **End Chainge**, **Interval**

defines the start/end chainages to use the Pause command.

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

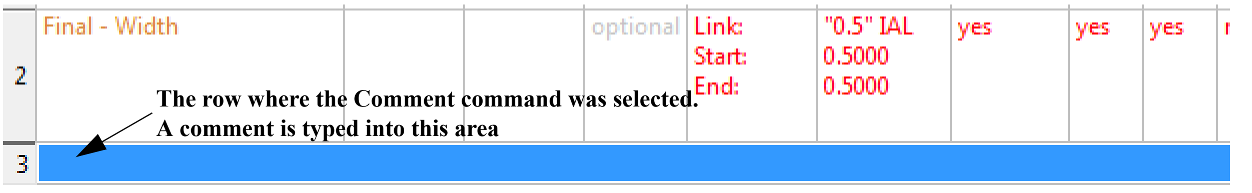
Comment, **Extra start**, **Extra End, Active, OK, Apply**

For information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

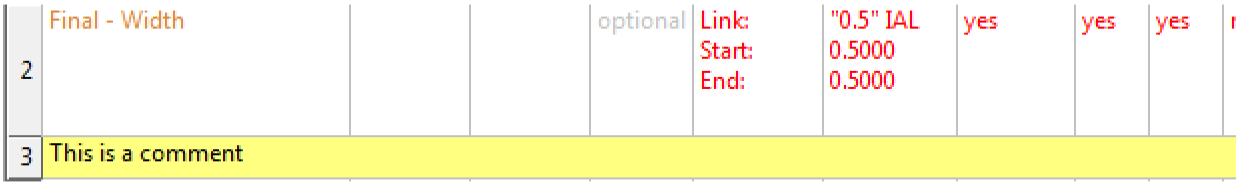
Go to the next section 21.2.2.9 Comment or return to 21.2.2.1 Create MTF Commands.

21.2.2.9 Comment

Selecting ***Comment*** turns the line of the ***Template Modifier*** into a field that a comment can be typed into.



Typing will then enter a comment into this line and the entire line contains just the comment.

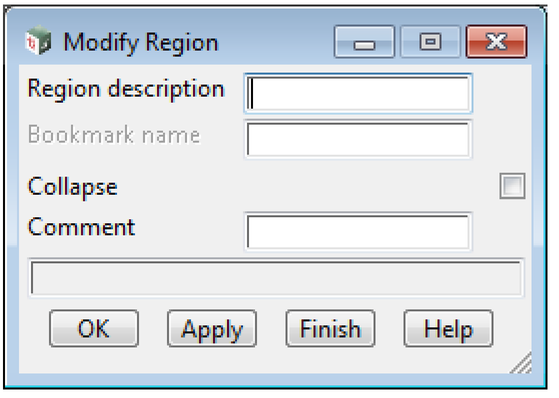


Go to the next section 21.2.2.10 Region or return to 21.2.2.1 Create MTF Commands.

21.2.2.10 Region

The **Region** option inserts a **Region command** into the grid.

Selecting **Region** brings up the **Modify Region** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Region description	text box		

name for the Region.

Bookmark name	text box		

*if **not blank**, this is a secondary name, often a shorter name, that is used in the **Region** pop up rather than using the **Region description.***

*If **blank**, then when the grid is saved, the* **Bookmark name** *is set to be the same as the* **Region description**.

Collapse	tick box		

*if **ticked**, all the commands in the grid until the next **Region** command are collapsed into this Region command.*

*If **not ticked**, the commands in the grid until the next **Region** command are not collapsed.*

OK, Apply

for information on these panel fields, see 21.2.2.1.1 Common Fields and Buttons on MTF Modifier Panels.

There are **Regions**, **Previous Region** and **Next Region** icons at the right hand side of the **Left/ Right Modifiers** panel that use this created *Region*. For information on using these icons and information on **Regions** in a grid, see 4.19.6 Grids in Panels.

Return to 21.2.2.1 Create MTF Commands.

21.2.3 MTF Boxing

In the **MTF**, up to eight (8) layers of boxing can be defined.

For each boxing layer, the boxing can be defined by

(a) the Left boxing only

(b) the Right boxing only

(c) the Left and Right boxing.

For cases (a) and (b), the Left boxing or the Right boxing defines the boxing across the **entire** design section and then only one of Left boxing or Right boxing is needed.

For case (c) where **both** Left and Right boxing are defined for a design section, then the *last point of the left boxing* is automatically connected to the *first point of the right boxing*.

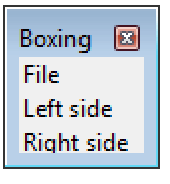
Warning for case (c), the Left boxing must end before the Right boxing begins. If there is an overlap, the Right boxing will be pushed to the **end** of the Left boxing.

Note - no interpolation or modifiers exist for boxing.

For a general discussion of Boxing, go to the section 21.6 What is Boxing?, for the scenarios of applying Boxing, including but not restricted to the MTF, go to the section 21.6.2 Applying Boxing, and in particular 21.6.2.1 Scenario 1 - Design Generated by One Apply MTF.

When boxing is used in the **Apply MTF**, the cut and fill areas and volumes are also calculated for all the inter-boxing layers. The ***last*** *layer* defined is also referred to as the ***subgrade*** layer and volumes are also given for the natural surface to the subgrade, and the design to the subgrade.

The **Boxing** walk-right in the **MTF Edit** menu brings up the **Boxing** menu with options to specify the file supplying the boxing definitions and options to apply the definitions to the Left and Right side of the design sections.



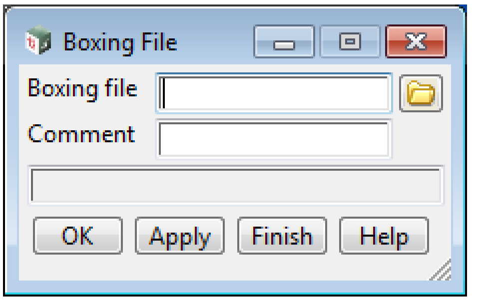
For the option

File	21.2.3.1 MTF Boxing File
Left/Right side	21.2.3.2 Left Side and Right Side Boxing
Left/Right side for each layer	21.2.3.2 Left Side and Right Side Boxing

Each of the options from this menu will now described.

21.2.3.1 MTF Boxing File

Selecting **File** from the **Boxing** menu brings up the **Boxing File** panel for defining the file of **Boxing Definitions** to be used in this **Apply MTF**.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file	input		*.bf files

name of the Boxing file containing the Boxing Definitions to be used for the MTF.

Comment column header

comment to add to the end of the line. In the text mtf file, the comment will be preceded by //.

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

The full definition of all the boxing command used in a **Boxing Definition** is given in the section 21.7 Full Definition of Boxing.

Please continue to the next section 21.2.3.2 Left Side and Right Side Boxing.

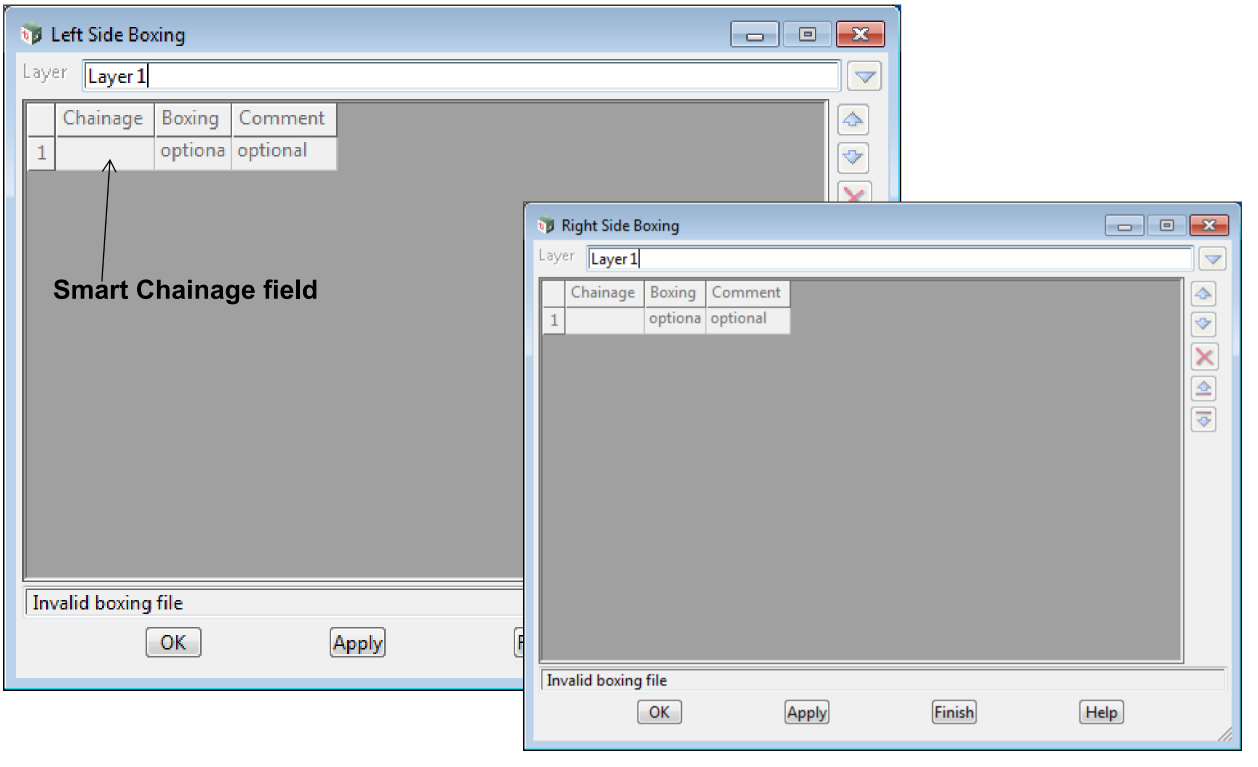
21.2.3.2 Left Side and Right Side Boxing

The panels brought up by selecting **Left side** or **Right side** from the **Boxing** menu brings up the **Left Side Boxing** and **Right Side Boxing** panels respectively. By default, this is for the first layer of boxing.

The **Left Side Boxing** and **Right Side Boxing** panels define for each boxing layer, what Boxing Definitions (from the boxing file) are applied, in what chainage ranges, along the reference string.

For the definition of boxing, go to the section 21.7 Full Definition of Boxing

The panels are brought up by selecting **Left side** or **Right side** for **Layer 2** to **Layer 8** from the **Boxing** menu and then selecting the *Layer number* in the **Layer** choice box. Similar panels exist for *Left* and *Right*, and for each selected layer, and so won't be documented separately.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Left/Right Boxing Grid

For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

Chainage smart chainage box

chainage to start applying the Boxing Definition given in the Boxing column. The Boxing Definition goes until the chainage on the next row of the Grid.

*If you right click in the **Chainage** column or select **Browse** if the Browse menu comes up, then a* **Chainage** *panel comes up which has the most of the standard MTF choices for **Smart Chainages**. See* 21.2.1 MTF Hinge Modifiers.

Boxing boxing definition box available boxing definitions

name of the Boxing Definition to apply from this chainage to the chainage in the next row of the Grid.

Comment text box

comment for this row of the grid.

Buttons at Bottom

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

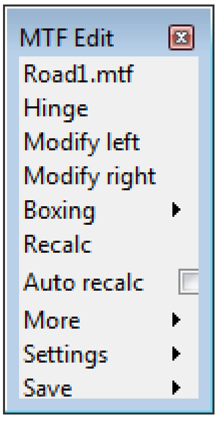
Please continue to the next section 21.2.4 MTF Recalc.

21.2.4 MTF Recalc

If ***Recalc*** is clicked, the ***Apply MTF*** associated with the MTF is ***recalced***.

Please continue to the next section 21.2.5 MTF Auto Recalc.

21.2.5 MTF Auto Recalc



if tick a recalc is done when "Apply" is clicked on Modifiers panels

If ***Auto recalc*** is ticked, then whenever the **Apply** button is clicked on any of the panels for the ***Modifiers - Left Side Modifiers*** or ***Modifiers - Right Side*** or ***Boxing Definitions*** used in the ***Boxing***, then a **recalc** of the associated ***Apply MTF*** for the MTF is done.

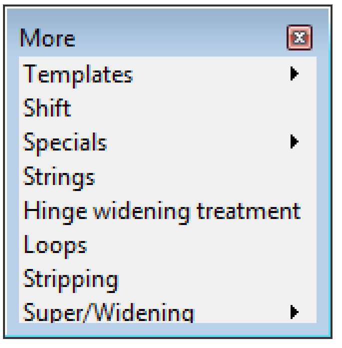
Please continue to the next section 21.2.6 MTF More.

21.2.6 MTF More

Position of menu: **Design =>MTF =>More**

The **More** walk-right menu has options to apply and interpolate between templates, shift chainages by a delta value, use special chainage values and files and apply Strings modifiers.

The **More** walk- right menu is



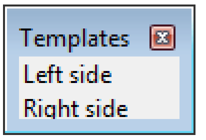
apply templates
shift chainge values
special chainages
apply string modifiers

For the options see:

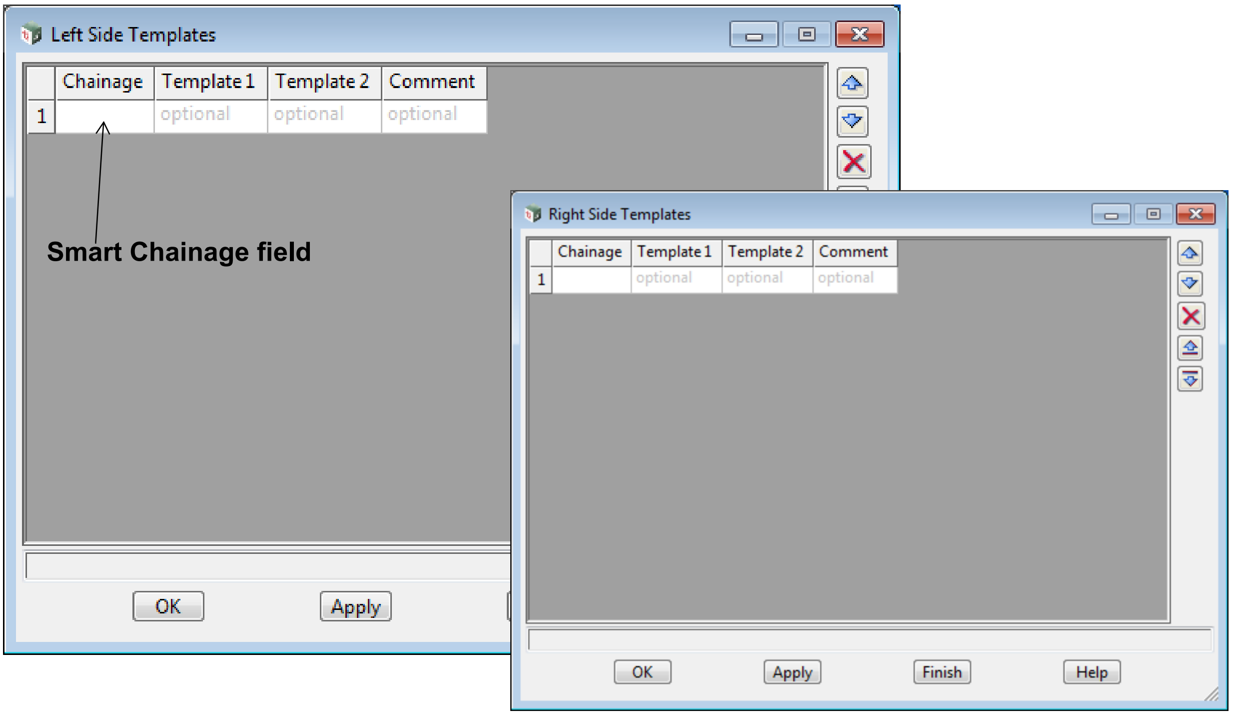
Templates	21.2.6.1 MTF Templates
Shift	21.2.6.2 MTF Shift
Specials	21.2.6.3 MTF Special Chainages
Strings	21.2.6.4 MTF String Modifiers
Hinge widening treatment	21.2.6.6 MTF Hinge Widening Treatment
Loops	21.2.6.7 MTF Remove Loops
Stripping	21.2.6.8 MTF Stripping
Super/Widening	21.2.6.9 MTF Super/Widening

21.2.6.1 MTF Templates

The **Templates** walk-right brings up the **Templates** menu



and selecting the **Left side or Right side** option brings up the **Left Side Templates** or **Right Side Templates** panels respectively which are used to specify which templates are used, and over what chainage range, for the Left and Right sides.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Templates Grid

For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

Chainage smart chainage box

list of chainages for applying templates on the left/right hand side of the hinge string.

*If you right click in the **Chainage** column or select **Browse** if the Browse menu comes up, then a* **Chainage** *panel comes up which has the most of the standard MTF choices for **Smart Chainages**. See* 21.2.1 MTF Hinge Modifiers.

Template 1 template box available templates

template to start applying at the chainage on the same row. If template 2 is blank, then template 1 is applied until the next chainage in the chainage column.

Template 2 template box available templates

template to linearly interpolate to and finish with at the next chainage in the chainage column. In the file, the two templates will be separated by a comma.

Note - template 2 must have the same number of fixed and variable links as template 1 otherwise a gap *of the section separation length will be left between the end of template 1 and the start of template 2.*

Comment column header

comment to add to the end of the line. In the file, the comment will be preceded by //.

Buttons at Bottom

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.2.6.2 MTF Shift or return to 21.2.6.2 MTF Shift21.2.6 MTF More.

21.2.6.2 MTF Shift

In an ***MTF***, most modifiers are defined in terms of chainage on the reference string. For example, the width modifier is defined to apply between a given start and end chainage on the reference string.

If the horizontal geometry of the reference string is modified, the reference chainages in the MTF that are defined by the Smart Chainage mode **Typed** will be incorrect.

Shift can help correct the **Typed** chainages in the MTF file when modifications are made to the reference string horizontal geometry *after the MTF has been defined*.

For the ***MTF*** and all special chainage files referred to in the ***mtf*** *that are only typed values*, **Shift** adds a delta chainage (the *shift distance*) to chainages within a user specified range.

However depending on the type of modifications made to the reference string, **shift** may have to be applied a number of times over a number of different chainage ranges. And apart from a simple change of start chainage, there may be chainages that can not be corrected with **Shift.**

Before using **Shift**, it is necessary to know ***how*** the reference string has changed from its original position so to use shift it is advantageous to make a **copy** of the reference string **before** any changes are made.

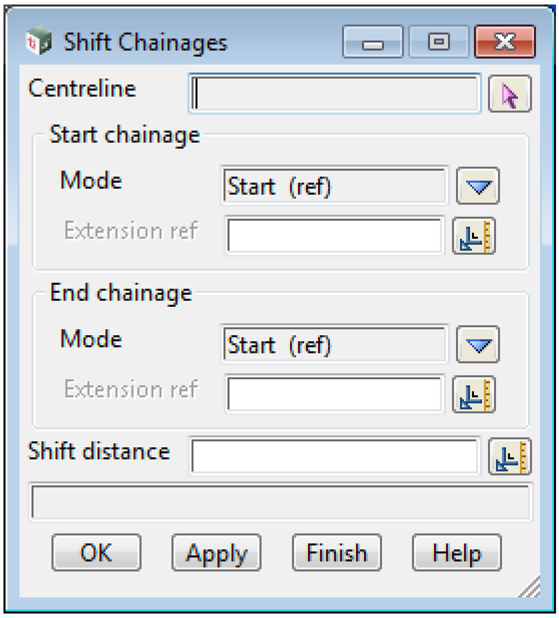
Examples Using **Shift**:

1. If only the start chainage of the reference string was modified, **shift** would be applied to the mtf for the entire ***original*** reference string and end chainages, with a *shift distance* equal to the difference between the new and the old start chainages for the reference string. For this case the horizontal geometry has not changed, just the chainages.
2. If the radius of a horizontal curve is changed in the middle of the reference string, all chainages from the beginning of the string up to point where the horizontal geometry starts to change would stay the same. At some point after the modified curve, the horizontal geometry of the string is unchanged and for this section of the mtf, a shift distance equal to the difference between the new and the old chainages of a non-modified point.

In all areas where the horizontal geometry has been modified, the chainages in the mtf would have to be carefully examined to see what changes are required.

Warning: **Shift** option is very powerful but is also very dangerous. Where ever possible, *Smart Chainage* **modes** other than **Typed** should be used.

Selecting **Shift** brings up the **Shift Chainages** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Centreline	string-select		

.

Start chainage smart chainage box

chainage in the mtf to start adding the **Shift distance.** *For information on* ***Smart Chainages****. See* 21.2.1 MTF Hinge Modifiers.

Any Typed chainages in the mtf file (and any associated special chainage files) between the ***Start Chainage*** *and the* ***End chainage*** *will have* **Shift distance added to them.**

End chainage smart chainage box

chainage in the mtf to stop adding the **Shift distance.** *For information on* ***Smart Chainages****. See* 21.2.1 MTF Hinge Modifiers.

Any Typed chainages in the mtf file (and any associated special chainage files) between the ***Start Chainage*** *and the* ***End chainage*** *will have* **Shift distance added to them.**

Shift distance real box

delta chainage to add to all the chainages in the mtf file and any special chainages that are between the ***Chainage to shift from*** *and the* ***Chainage to shift to***

Buttons at Bottom

OK/Apply button

OK *applies the shift and removes the panel.*
Apply *applies the shift and leaves the panel on the screen.*

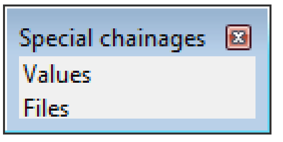
Continue to the next section 21.2.6.3 MTF Special Chainages or return to 21.2.6.2 MTF Shift21.2.6 MTF More.

21.2.6.3 MTF Special Chainages

The **Apply MTF** option automatically creates sections at a number of chainages including the supplied chainage interval, horizontal and vertical critical points, horizontal and vertical chord-arc tolerances, template change points and modifier change points.

However it is also possible to add extra sections at special chainages using the **Specials** option from the **MTF Edit** menu.

Walking right on the **Specials** menu brings up the **Special Chainages** walk-right menu:



For the options see:

Values 21.2.6.3.1 MTF Special Chainage Values

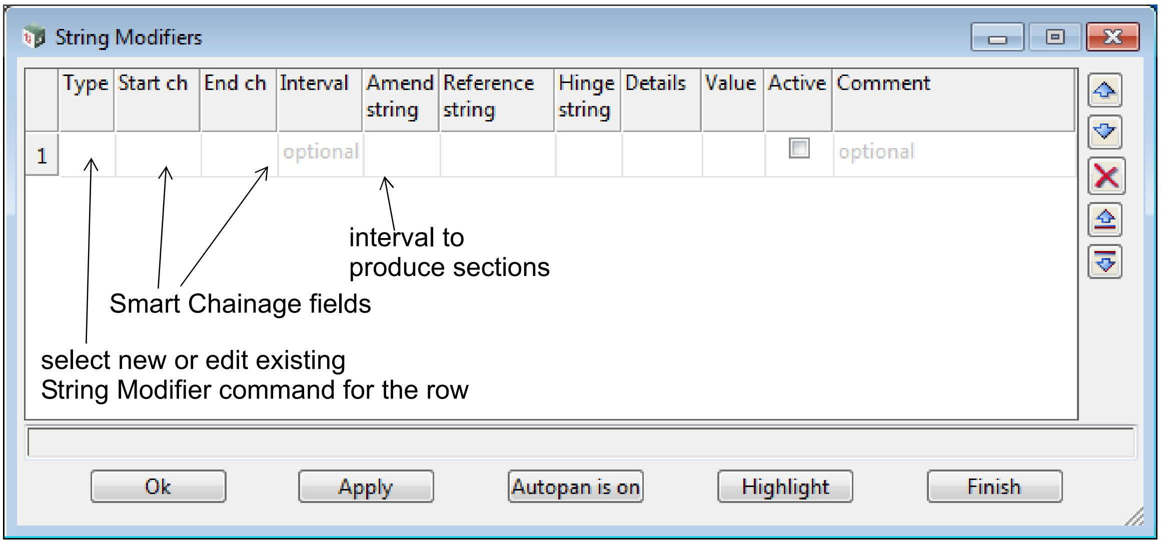
Continue to the next section 21.2.6.4 MTF String Modifiers or return to 21.2.6.3 MTF Special Chainages or 21.2.6 MTF More.

21.2.6.4 MTF String Modifiers

For information on how the String Modifiers in the MTF editor work, see 21.2.6.5.3 Description of String Modifiers in MTF.

Selecting **Strings** from the **MTF Edit** menu brings up the **String Modifiers** panel.



The **String Modifiers** panel consists of a grid with of rows (or lines) with **commands** in them, and an **OK** or **Apply** button to record the results.

String Modifier Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

*The **commands** in the* **String Modifier** *grid are processed sequentially from the top to the bottom of the grid.*

When the Grid Row is Empty

*If the row of the grid is **empty**, clicking LB in the empty row will bring up the* **Create** *menu which contains all the available string modifier commands. Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the* **Create** *menu.*

Selecting a menu item will bring up an associated panel which displays the information required for the hinge command. When the panel is filled in and **OK** or **Apply** *selected, the panel information is written out to the row of the grid and is known as a* **hinge command**. *For information on each of the Hinge Commands, see* 21.2.6.5 String Modifiers Commands.

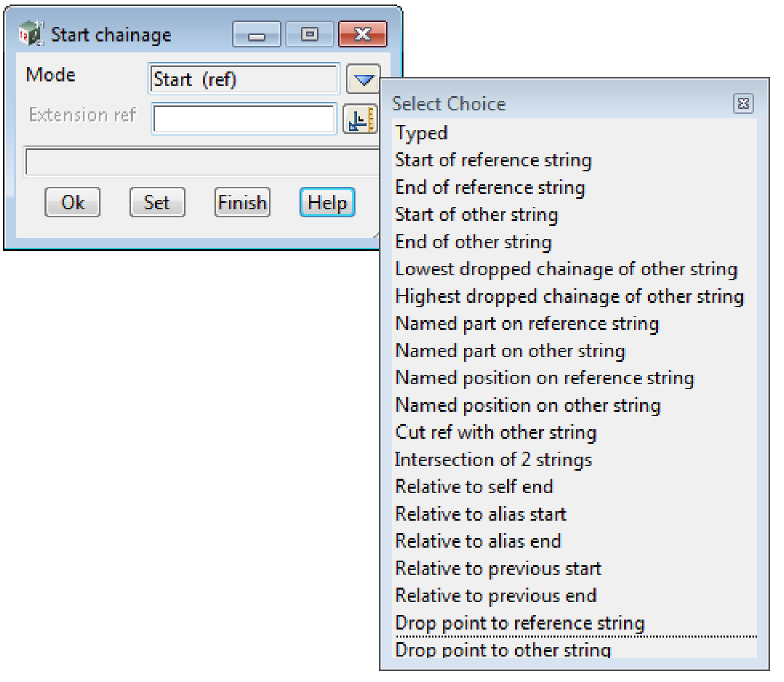
When the Grid Row is Not Empty

*If the row of the grid is **not empty** (and hence filled with a* **string modifier command**) *then clicking LB in the cell:*

(a) ***Type** will bring up the associated panel for the string modifier command.*

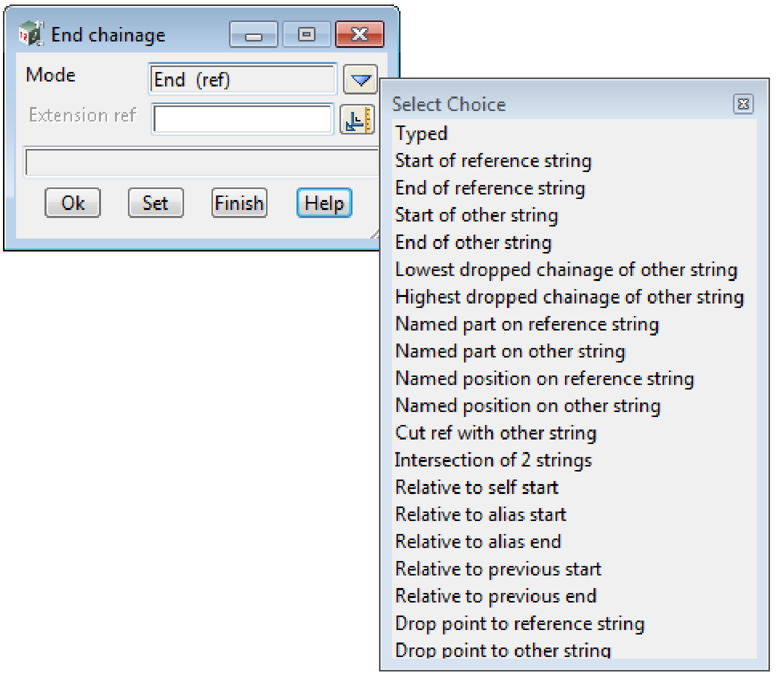
For information on each of the Hinge Commands, see 21.2.6.5 String Modifiers Commands.

(b) ***Start chainage** cell brings up the Smart **Start Chainage** panel*



The **Start Chainage Mode** *will determine what other fields are also on the panel (for example* **Extension ref** *for* **Mode** ***Start of reference string****. For more information on Chainage Modes, see* 21.4 Smart Chainages.

(c) ***End Chainge*** *cell brings up the Smart* ***End Chainage*** *panel*



The **End Chainage Mode** *will determine what other fields are also on the panel (for example* **Extension ref** *for* **Mode** ***End of reference string****. For more information on Chainage Modes, see* 21.4 Smart Chainages.

(d) ***Interval*** *will allow a real value to be typed into the cell*

Note that the **Interval** column will not appear in the grid if **Show interval column?** is **not** ticked in the MTF Settings. See 21.2.7.8 MTF Setting Show Interval Column

(e) **Active** *will toggle the* ***tick/not ticked***

(f) **Comment** will allow text to be typed into the cell

Note *that clicking in the* ***Type****,* ***Start chainage****,* ***End chainage****,* ***Interval****,* ***Extra Start****,* ***Extra End****,* ***Active*** *and* ***Comment*** *cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.*

Buttons at Bottom

OK button

OK *stores the values in the fields and removes the panel BUT no* ***recalc*** *is done.*

Apply button

Apply *stores the values in the grid and leaves the panel on the screen.*

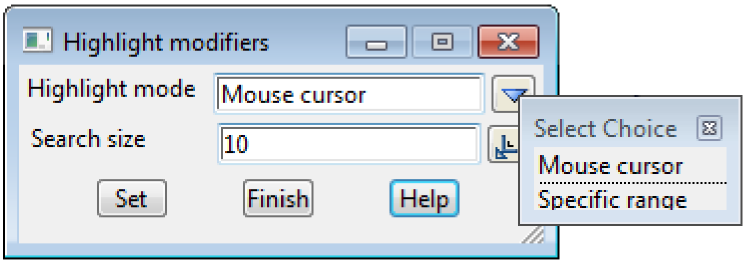
If ***Auto recalc*** *is* ***ticked*** *in the MTF, then whenever the* ***Apply*** *button is clicked, a* ***recalc*** *of the associated* ***Apply Many*** *for the MTF is done.*

Autopan on/off button

when clicked to say **Autopan is on** *then if the chainage range is not in the view that the Reference string is on then the view will be panned so that it is on the view.*

Highlight button

clicking the ***Highlight*** *button brings up the* **Highlight Modifiers** *panel.*



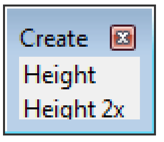
Continue to the next section 21.2.6.5 String Modifiers Commands. or return to 21.2.6 MTF More

21.2.6.5 String Modifiers Commands

The **commands** in the **String Modifiers** grid are processed sequentially from top to bottom.

The **String Modifier commands** are selected from the **Create** menu that is displayed when clicking in a cell in the **Type** column of the **String Modifiers** panel.

The **Create** menu is



modify by xfall and height
modify by 2-strings

For a description of the options, see

Height 21.2.6.5.1 Height
Height 2x 21.2.6.5.2 Height 2X

21.2.6.5.1 Height

The *height* the **Height** string modifier calculates for the amend point is given by:

(a) if the absolute flag is not set, the height of the hinge point, otherwize zero.

plus

(b) the interpolated height for the user given heights at the start and end chainages

plus

(c) the interpolated height for the user given cross falls at the start and end chainage.

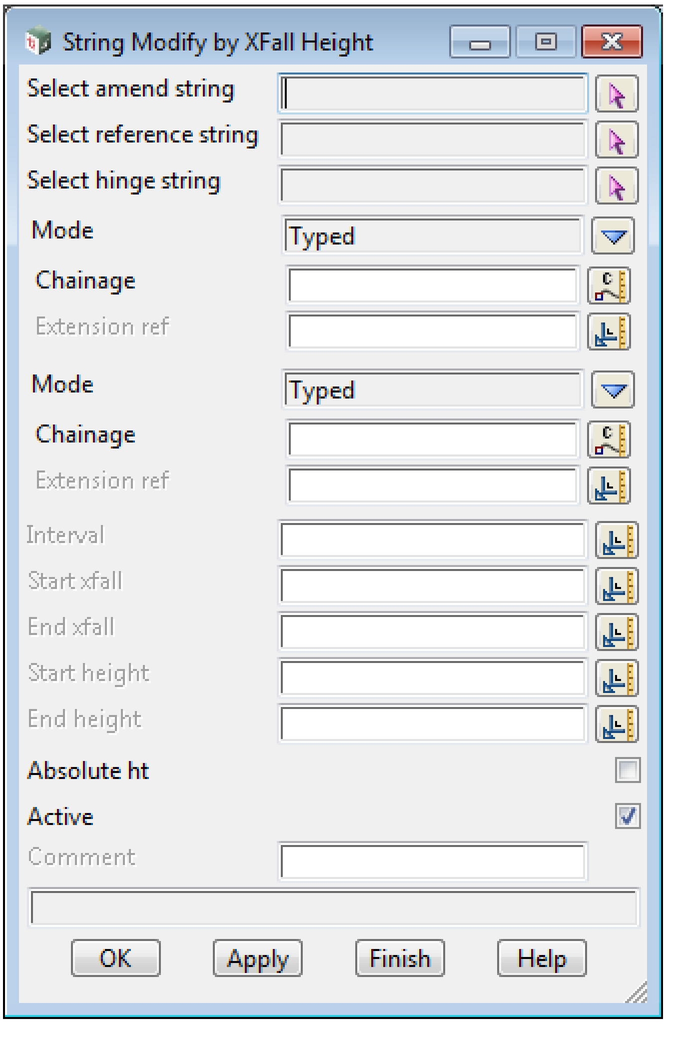
That is, if the **absolute flag** is **not set**:

new height = hinge height + (interpolated height) + (interpolated xfall) x (offset distance)

If the **absolute flag** is **set**:

new height = (interpolated height) + (interpolated xfall) x (offset distance)

Selecting **Height** brings up the **String Modify by Xfall Height** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Amend string	string-select		

select string to have heights amended.

Reference string string-select

select reference string.

Hinge string string-select

select hinge string.

Start/End chainage smart chainage box

start/end chainage on the reference string for applying the modifier. See 21.2.1 MTF Hinge Modifiers

Interval input

*if **non blank**, the chainage separation to apply the modifier.*
*If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End xfall input measures menu

start/end crossfall for the modifier.

Start/End height input measures menu

start/end height for modifier.

Absolute height tick box

*if **ticked**, the calculated height does not include the hinge height.*
*if **not ticked**, the calculated height includes the hinge height.*

Comment input

comment for this command line

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Apply *stores the values and leaves the panel on the screen.*

For more information on how the String Modifiers in the MTF editor work, please go to the section 21.2.6.5.3 Description of String Modifiers in MTF.

Continue to 21.2.6.6 MTF Hinge Widening Treatment or return to 21.2.6.4 MTF String Modifiers or 21.2.6 MTF More.

21.2.6.5.3 Description of String Modifiers in MTF

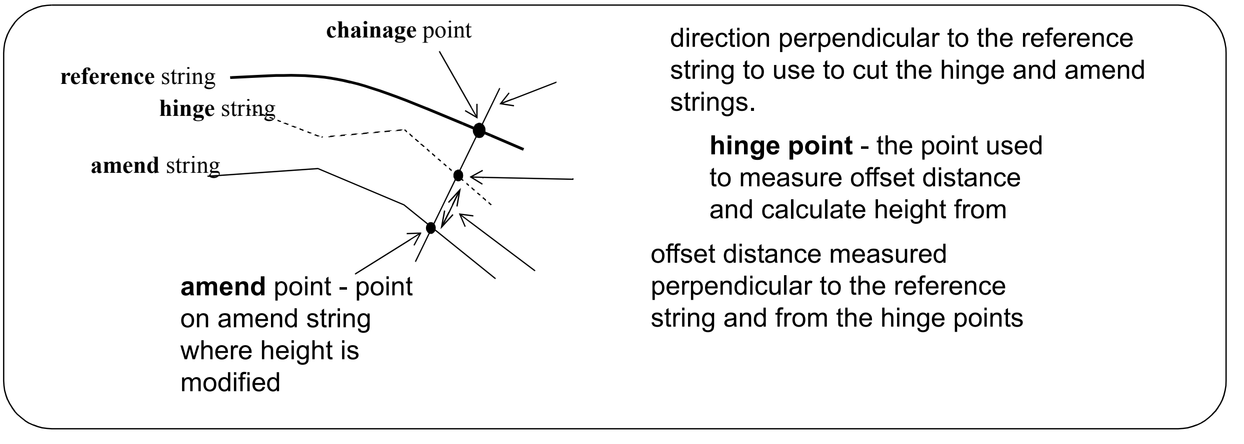
Unlike the other MTF options, the **string modifier** options modify the *heights* on an ***existing*** string called the ***amend string***.

Like the apply options, a reference string is used to define chainage and what is perpendicular at each chainage. A hinge string is used to define offsets and heights. If no hinge string is selected, the reference string is also used as the hinge string.

For a given chainage on the reference string (chainage point), a line perpendicular to the reference string is constructed to cut through the hinge string and the amend string (the cut points are called the ***hinge*** point and the ***amend*** point).

Horizontal offset is defined as the offset value from the hinge point, and the height of the ***amend*** point is a modification of the height at the hinge point.

The string modifier options create and/or modify the heights of the *amend* points on the amend string.



The *height* of the amend point is *derived from the hinge point* by starting with the height of the hinge point and applying a crossfall to it across the offset distance from the hinge string to the amend string.

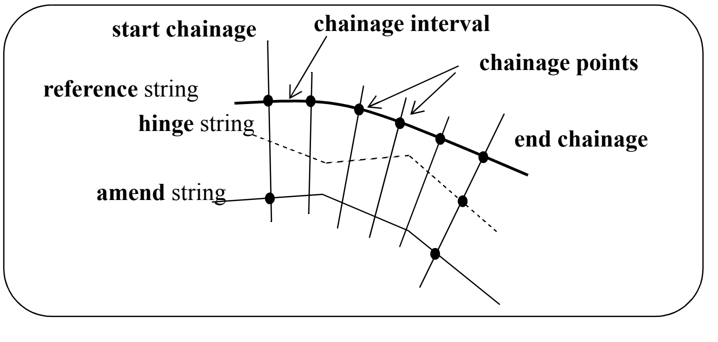
The cross fall can be defined by either:

(a) giving the cross fall

or

(b) using the cross fall between two user selected strings.

For the string options, the length of string being modified is restricted by giving a start and end reference chainage. A chainage interval can also be specified to define extra reference chainage points to use between the start and end chainages.



How and where the amend string is modified depends on the *type* of string and whether the chainage interval is blank (null) or not.

What Points are Modified

For 3d, 4d, polyline and super strings:

If the chainage interval is not blank:

(a) The start and end chainage points are projected *from the reference string* and ***inserted*** into the ***amend*** string. The *heights* of the inserted points are defined by the string modifier command.

(b) The chainage points at the given chainage interval are also projected from the reference string and ***inserted*** into the ***amend*** string. The *heights* of the inserted points are defined by the string modifier command.

(c) Finally, the ***vertices*** of the ***amend*** string are dropped perpendicularly *back onto* the hinge and reference string and then those points used to modify the *heights* of the same vertices of the amend string.

If the chainage interval is blank:

(a) The start and end chainage points are projected *from the reference string* and ***inserted*** into the ***amend*** string. The *heights* of the inserted points are defined by the string modifier command.

(b) The ***vertices*** of the ***amend*** string are dropped perpendicular *back onto* the hinge and reference string and then those points used to modify the *heights* of the same vertices of the amend string.

For Alignment strings:

If the chainage interval is not blank:

(a) All the vertical geometry is removed between the start and end chainages. That is, the vertical intersection points (VIP's) and their associated vertical curves are removed.

(b) The start and end chainage points are projected *from the reference string* and ***vertical intersection points (VIP's) inserted*** into the ***amend*** string. The *height* of the inserted VIP points are defined by the string modifier command.

If the chainage interval is blank:

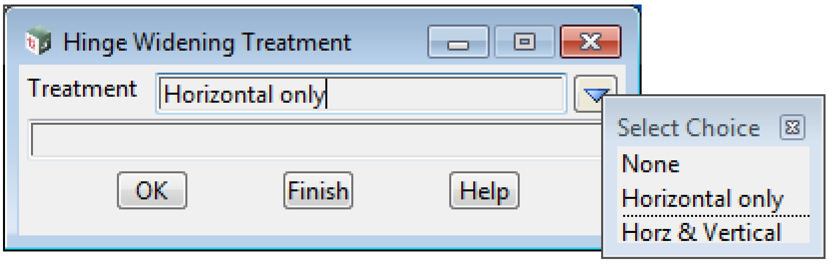
(a) The start and end chainage points are projected *from the reference string* and ***vertical intersection points (VIP's) inserted*** into the ***amend*** string. The *heights* of the inserted VIP points are defined by the string modifier command.

(b) The ***vertical intersection points (VIP's)*** of the ***amend*** string are dropped perpendicularly *back onto* the hinge and reference strings and then those points used to modify the *heights* of the same VIP's of the amend string. The vertical curves for the VIP's are not changed.

Return to 21.2.6.4 MTF String Modifiers or 21.2.1 MTF Hinge Modifiers

21.2.6.6 MTF Hinge Widening Treatment

The **Hinge Widening Treatment** specified in the **Hinge Widening Treatment** panel.



The choices are:

None -

Horizontal only -.

Horizontal & Vertical -.

OK - selecting *OK* sets the **Treatment**.

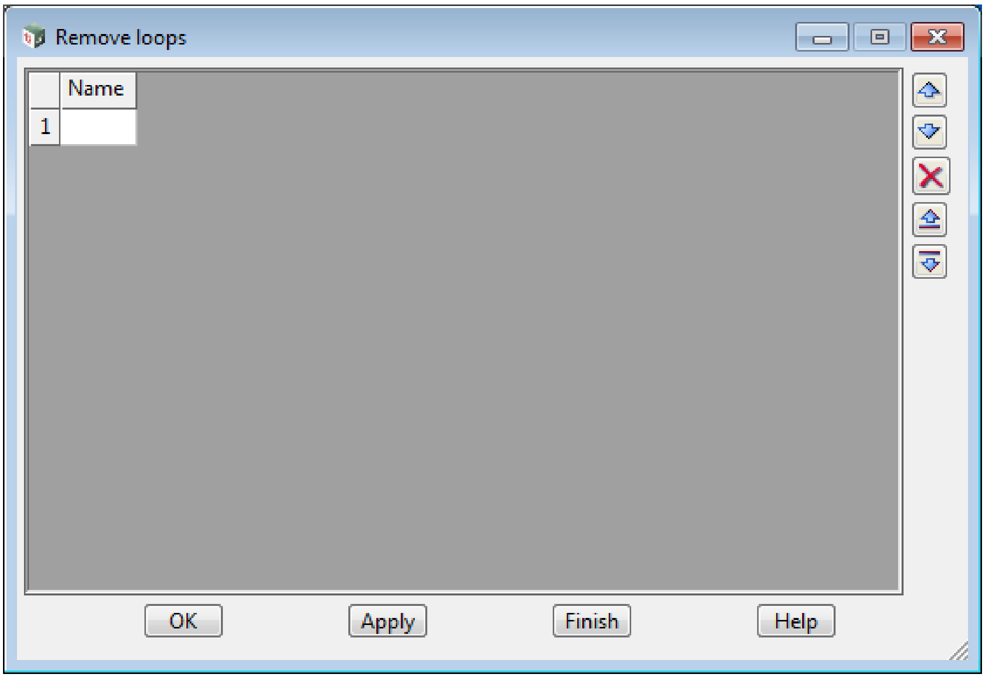
Continue to the next section 21.2.6.7 MTF Remove Loops or return to 21.2.6 MTF More.

21.2.6.7 MTF Remove Loops

The Loops options tries to remove loops in nominated strings generated by the Apply MTF.

Important Note - the sections generated from the Apply MTF will not be modified and will still intersect each other. In that case, the sections can be generated after the ***Apply MTF*** by cutting through strings. See 28.9.13.2 Cuts by Centreline.

Selecting **Loops** from the menu displays the **Remove loops** panel.



Name column header

names of the strings to process to try and remove any loops from. The names can include wild cards (*) and wild characters (!).

Continue to the next section 21.2.6.8 MTF Stripping or return to 21.2.6 MTF More.

21.2.6.8 MTF Stripping

A fixed stripping depth can be specified in the **Apply** option whilst the **Apply MTF** option allows for stripping depths that can **vary along the design**.

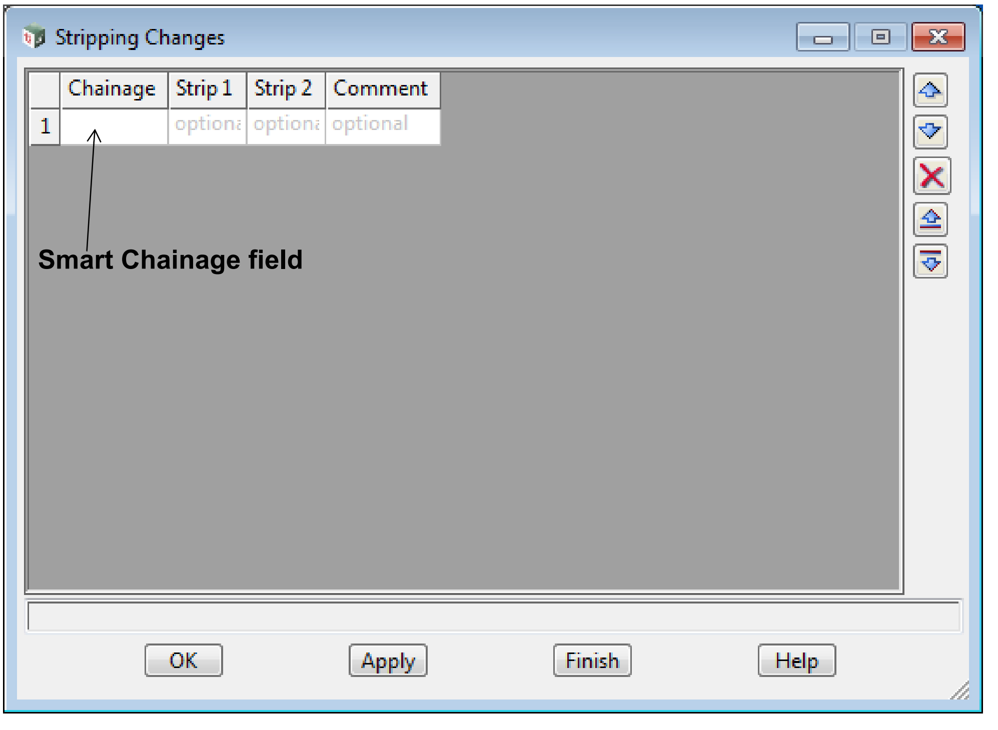
If a **non-zero stripping depth** exists at a chainage, the **cut** and **fill** calculations are done with respect to the section through the tin **dropped in height** by the stripping depth.

However, the **design strings** are generated by battering into the **unstripped** surface, and the stripping volume is the volume between the stripped and unstripped surface for the design.

Stripping depths are defined for chainages along the reference string and can be linearly interpolated between chainages.

NOTE: Cut and fill areas and volumes are adjusted for the stripping depths. The total stripping volume is given at the end of the volumes report.

Selecting the **Stripping** option on the **MTF edit** menu brings up the **Stripping Changes** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Stripping Chainages Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

Chainage smart chainage box

list of chainages for defining stripping depth.

*If you right click in the **Chainage** column or select **Browse** if the Browse menu comes up, then a* **Chainage** *panel comes up which has the most of the standard MTF choices for **Smart Chainages**. See* 21.2.1 MTF Hinge Modifiers.

Strip depth 1 real box measures menu

strip depth to apply at the chainage given for this row of information. If strip depth 2 is blank, then strip depth 1 is applied until the next chainage in the chainage column.

Strip depth 2 real box measures menu

*if **non-blank**, the strip depth to linearly interpolate to and finish with at the next chainage in the chainage column.*
if blank, then strip depth 1 applies to the next chainage in the chainage column.
In the mtf file, the two depths will be separated by a comma.

Comment column header

comment for the row.

Buttons at Bottom

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

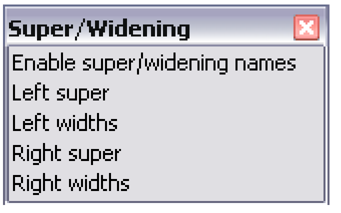
Continue to the next section 21.2.6.9 MTF Super/Widening or return to 21.2.6 MTF More.

21.2.6.9 MTF Super/Widening

The ***Super Alignment*** string can define the super elevation and widening for a design.

This super elevation and widening can be applied to the strings defined by the Apply MTF rather than having to use MTF crossfall and width modifiers.

This section defines which strings in the apply have super elevation/widening from the super alignment applied to them



For the options see

Enable super/widening names 21.2.6.9.1 Enable Super/Widening Names

Left super 21.2.6.9.2 Left Super

Left widths 21.2.6.9.3 Left Widths

Right super 21.2.6.9.4 Right Super

Right widths 21.2.6.9.5 Right Widths

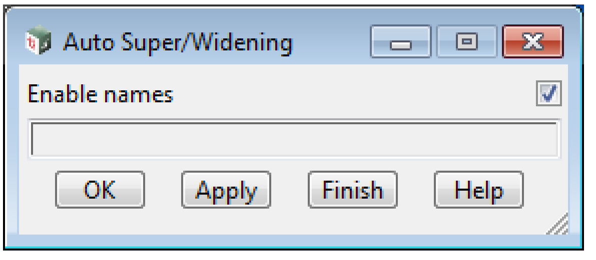
21.2.6.9.1 Enable Super/Widening Names

For ***12d Model*** Version 8, super elevation/widening from the super alignment was applied to strings in the fixed section of the template that were defined by crossfall.

For ***12d Model*** 9, this method was replaced by being able to ***define by string name***, which strings have super elevation and/or widening applied to them.

For backward compatibility, this option allows the user to either use string names, or to revert to the cross fall method used in version 8. The default is to use string names.

Selecting **Enable super/widening names** from the menu displays the **Auto Super/Widening** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Enable names	tick box	tick	

if ticked, the super elevation/widening in the super string is applied to the string names as given in the ***Left/Right super*** *and/or* ***Left/Right widths*** *options.*

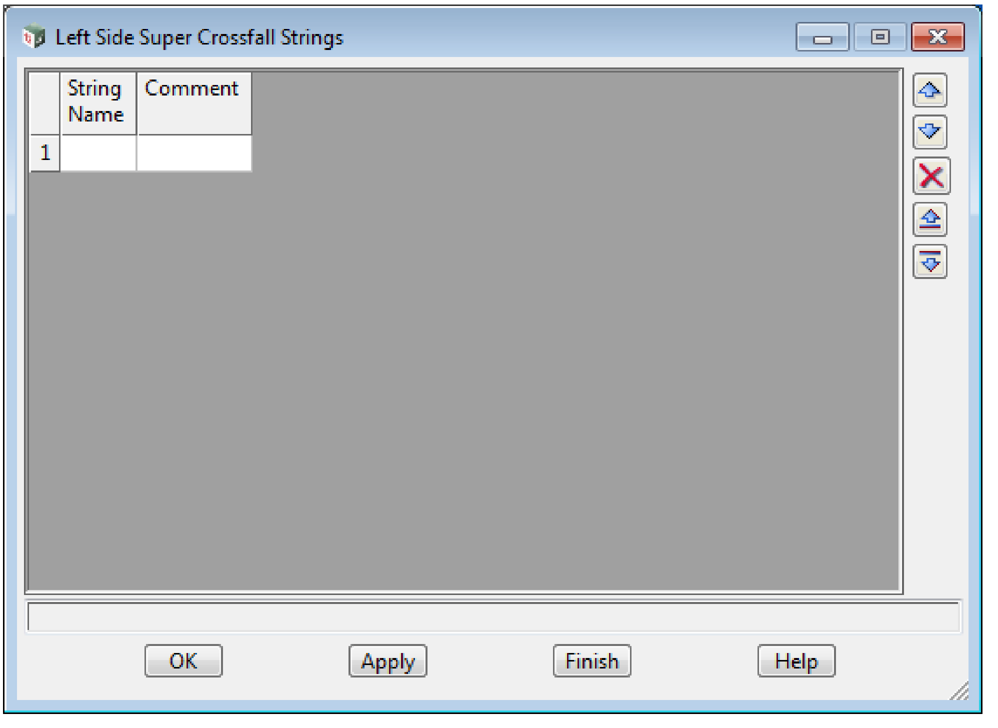
If not ticked, the super elevation/widening in the super string is applied to the string from the fixed template that are defined by crossfall.

Continue to the next section 21.2.6.9.2 Left Super or return to 21.2.6.9 MTF Super/Widening or return to 21.2.6 MTF More.

21.2.6.9.2 Left Super

This table defines the strings that have the left super elevation from the super alignment applied to them.

Selecting **Left Super** from the menu displays the **Left Side Super Crossfall Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
String name	column header		

names of the strings to apply the left super elevation of the super alignment to.

Comment	column header		

comment to be recorded.

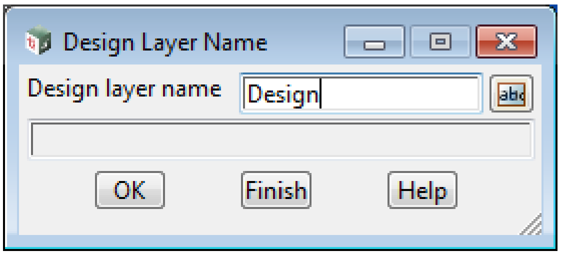
Hinge link name 21.2.7.9 MTF Setting Hinge Link Name
Width 21.2.7.10 MTF Width

21.2.7.1 MTF Setting Design layer name

In ***12d Model***, the *MTF Modifiers* can produce any number of named layers but there is one special layer referred to as the **Design Layer**, that is used to produce design x sections, design strings, the road tin, *etc.*

Any MTF points in the Design Layer will automatically generate points on the design x sections, and design strings will be generated without them having to be done by the **Create =>Strings** MTF Modifier command.

The name of the special Design Layer can be changed by clicking on **Design layer name** to bring up the **Design Layer Name** panel.



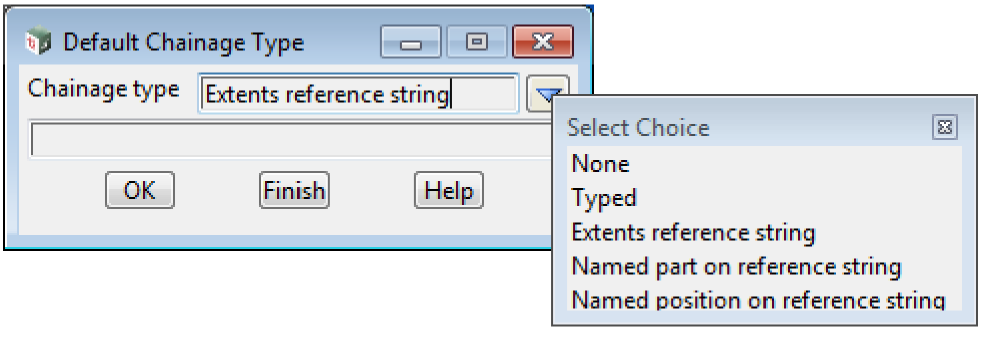
Design layer name - the name used for the special Design Layer.

OK - selecting *OK* sets the default name for the design layer.

Continue to the next section 21.2.7.2 MTF Setting Default Chainage Type or return to 21.2.7 MTF Settings.

21.2.7.2 MTF Setting Default Chainage Type

The **Default Chainage Type** panel specifies the default Smart Chainage Mode to use in the MTF Modifier commands in this MTF file.



The choices are:

None - no Smart Chainage choice is used as the default.

Typed - *Typed* is the default for Smart Chainages.

Extents reference string - the start of the reference string is used for *Start modes* and the end of the reference string is used for *End modes*.

Named part on reference string - *named part on reference string* is the default for Smart Chainages.

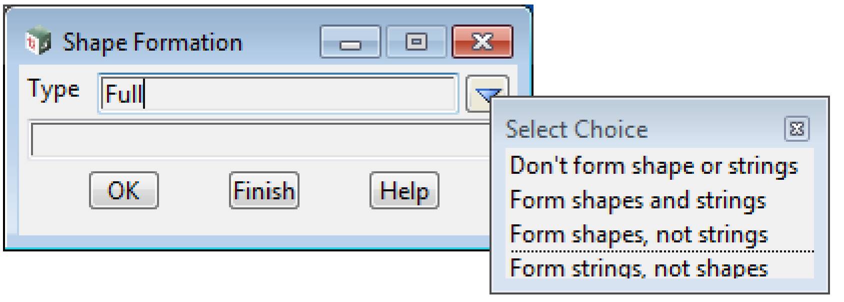
Named position on reference string - *named position on reference string* is the default for Smart Chainages.

OK - selecting *OK* sets the given *Chainage type* as the default.

Continue to the next section 21.2.7.3 MTF Setting Shape Formation Toggle or return to 21.2.7 MTF Settings.

21.2.7.3 MTF Setting Shape Formation Toggle

Creating shapes and strings can be a time consuming process so it is possible to set modes for if it occurs or not.



The choices are:

Don't form shapes or strings - don't create shapes or strings that are referred to in the **Create=> Shapes** and **Create =>Strings** MTF Modifier commands.

Form shapes or strings - generated the shapes and strings as specified in the **Create => Shapes** and **Create =>Strings** MTF Modifier commands.

Form shapes, not strings - generated the shapes as specified in the **Create => Shapes** MTF Modifier command but do not generated the strings referred to in the **Create =>Strings** MTF Modifier command.

Form strings, not shapes - generated the strings as specified in the **Create => Strings** MTF Modifier command but do not generated the shapes referred to in the **Create =>Shapes** MTF Modifier command.

OK - selecting *OK* sets the given *Shape Formation* **Type**.

Continue to the next section 21.2.7.4 MTF Setting Show Extra Start/End or return to 21.2.7 MTF Settings.

21.2.7.4 MTF Setting Show Extra Start/End

With MTF Modifier commands, a command applies from the start chainage and finished just before the end chainage. This is to prevent a doubling up in the definitions for the chainage between the end of one command and the beginning of the following command.

To make values change correctly between the MTF definitions at the start and end chainages, for most MTF Modifier commands there are **Extra start** and **Extra end** tick boxes,.

If **Extra start** is ticked on and the command is not the first, a section is created **Extra start/end value before** the Start chainage of the command. Because the definition for this extra section is given by the **previous** command. This ensures that the previous command applies to almost to the this Start chainage.

If **Extra end** is ticked on, a section is created **Extra start/end value** before the End chainage of the command. The definition of this extra section is given by the current command. This ensures that the current command applies almost to the end, especially when it is the last command and there is no next Start chainage.

For most situations, the **Extra start** and **Extra end** tick boxes for an **MTF Modifier Command** can be left ticked on and the default is to have them both ticked on.

If **Show Extra start/end?** is **ticked**, the **Extra start** and **Extra end** tick boxes are shown on the **MTF Modifier command** panels.

If **Show Extra start/end?** is **not ticked**, the **Extra start** and **Extra end** tick boxes are **not** shown on the **MTF Modifier command** panels

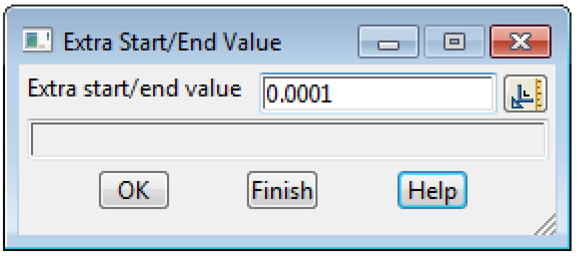
Notes:

1. The display of the **Extra start** and **Extra end** columns in the **Left/Right MTF Modifiers** panel is controlled by the 21.2.7.6 MTF Setting Show Extra Start/End column.
2. The **Extra start/end value** is set by 21.2.7.5 MTF Setting Extra Start/End value.

Continue to the next section 21.2.7.5 MTF Setting Extra Start/End value or return to 21.2.7 MTF Settings.

21.2.7.5 MTF Setting Extra Start/End value

For ***12d Model*** itself, the **Extra start/end value** does not need to be changed but when writing out sections that are to be loaded into some software products, the sections sometimes can't be closer than a fixed value in the other software. In that case modifying the **Extra start/end value** will allow you to get over that restriction.



Extra start/end value - the distance to use for placing extra sections before the start and end chainages.

OK - selecting *OK* sets the **Extra start/end value**.

Continue to the next section 21.2.7.6 MTF Setting Show Extra Start/End column or return to 21.2.7 MTF Settings.

21.2.7.6 MTF Setting Show Extra Start/End column

If **Show extra start/end column?** is **ticked**, the **Extra Start** and **Extra Start** columns are shown in the **Left/Right MTF Modifiers** panel.

If **Show extra start/end column?** is **not** ticked the **Extra Start** and **Extra Start** columns are **not** shown in the **Left/Right MTF Modifiers** panel.

Note that the Extra start/Extra end tick boxes appearing in the MTF Modifier Commands is controlled by the 21.2.7.4 MTF Setting Show Extra Start/End.

21.2.7.7 MTF Setting Show Absolute Column

The **Absolute** column is a condensed way of displaying the value of the **New value usage Absolute** field in the MTF command **Modify Link**.

If **Show absolute?** is **ticked**, the **Absolute** column is shown in the **Left/Right MTF Modifiers** panel.

If **Show absolute column?** the **Absolute** column is **not** shown in the **Left/Right MTF Modifiers** panel.

Note that in both cases, the **New value usage** field (which the Absolute column represents) **is** shown in the **MTF Modifier Link command** panels.

For an example of **New value usage** and **Absolute**, see 21.1.2.3 New Value Usage.

Continue to the next section 21.2.7.8 MTF Setting Show Interval Column or return to 21.2.7 MTF Settings.

21.2.7.8 MTF Setting Show Interval Column

If **Show interval column?** is **ticked**, the **Interval column** is shown in the **Left/Right MTF Modifiers** panel.

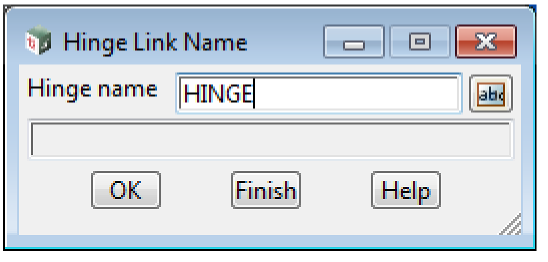
If **Show interval column?** the **Interval column** is **not** shown in the **Left/Right MTF Modifiers** panel.

Note that in both cases, the **Interval** field **is** shown on the **MTF Modifier command** panels.

Continue to the next section 21.2.7.9 MTF Setting Hinge Link Name or return to 21.2.7 MTF Settings.

21.2.7.9 MTF Setting Hinge Link Name

The name of the link for the Hinge string can now be given a user defined name.



Hinge name - the name used for the hinge link.

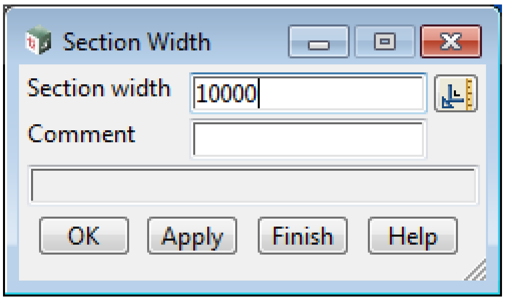
OK - selecting *OK* sets the **Hinge name**.

Continue to the next section 21.2.7.10 MTF Width or return to 21.2.7 MTF Settings.

21.2.7.10 MTF Width

A **section width** is used to limit the distance to search along a section when trying to find strings used in any of the MTF commands.

Selecting **Width** from the **MTF edit** men brings up the **Section Width** panel for setting the width.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Section width	input	10000	

__Section width__ defines the perpendicular offset from the Hinge string. It is used to limit the search distance for strings when performing MTF modifier commands.

Comment	column header		

comment to add to the end of the line. In the file, the comment will be preceded by //.

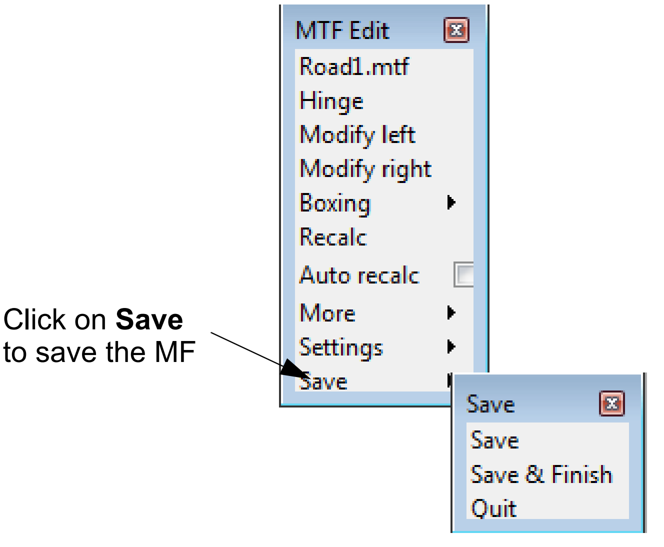
OK/Apply	button		

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Return to 21.2.7 MTF Settings.

21.2.8 MTF Save

Clicking **Save** on the **MTF Edit** menu (without walking right) saves the MTF file.



Clicking on the options on the walk right menu will:

If ***Save*** is clicked, the MTF is saved to disk and the **MTF Edit** panel is left on the screen.

If ***Quit*** is clicked, the MTF is **not** saved to disk and the **MTF Edit** panel is closed.

If ***Save & Finish*** is clicked, the MTF **is** saved to disk and the **MTF Edit** panel then closed.

Return to 21.1 The Modifiers and Templates File - MTF.

21.3 Options Not Yet Re-documented for V11

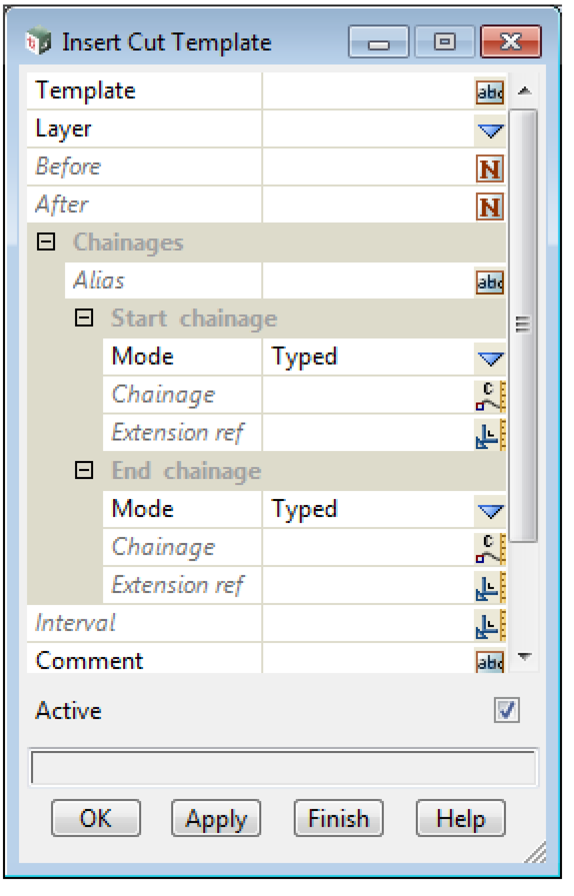
V11 introduced the concept of **Layers** and also removed the restriction that links could only be modified by the two of the three width, height, xfall or slope, that they were defined by.

These options have not yet been documented for the V11 changes.

21.3.0.1 Insert Cut Links from a Template

All the cut links from an existing template can be inserted by the **Insert cut template** command.

Selecting **Insert cut template** brings up the **Insert Cut Template** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		select template menu

the name of the template to take the cut links from.

Field Description	Type	Defaults	Pop-Up
Before	input		select name menu

*if **non-blank**, the cut links from the selected template are inserted before the given link.*
*If **blank**, the cut links from the selected template are appended to the end of the existing cut links.*

Field Description	Type	Defaults	Pop-Up
Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for inserting the new template links.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Field Description	Type	Defaults	Pop-Up
Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*

*If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button

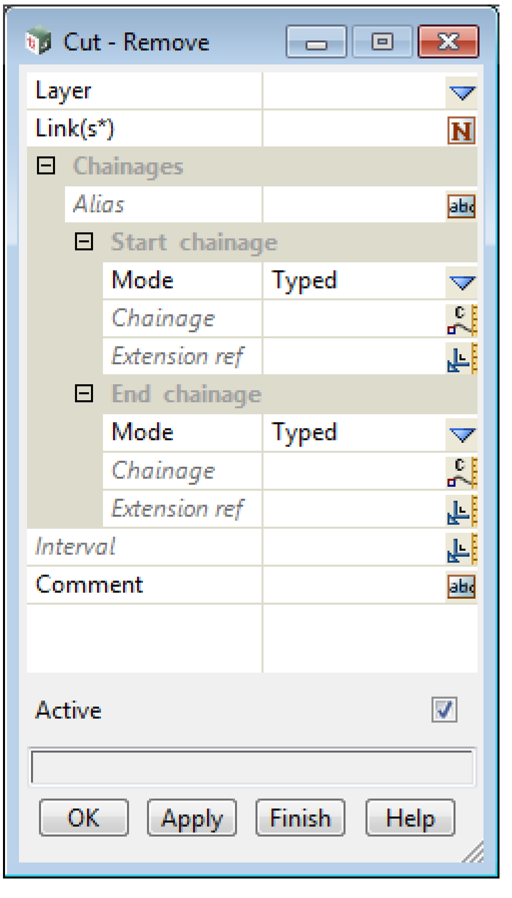
OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.2 Cut Link - Remove or return to 21.3.0.1 Insert Cut Links from a Template

21.3.0.2 Cut Link - Remove

Cut links can be deleted between given chainages by using the **Cut Remove** command.

Selecting **Remove** brings up the **Cut - Remove** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to removed.

Start/End mode choice box Start (ref)/End (ref)

defines the start/end chainages for removing the cut link.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*
*If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

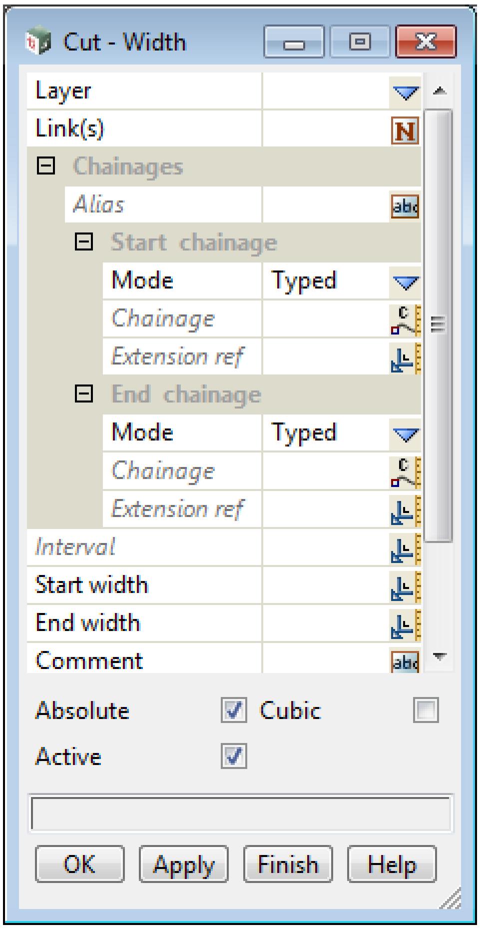
Continue to the next section 21.3.0.3 Cut Link - Modifier Width or Height or return to 21.3.0.1 Insert Cut Links from a Template.

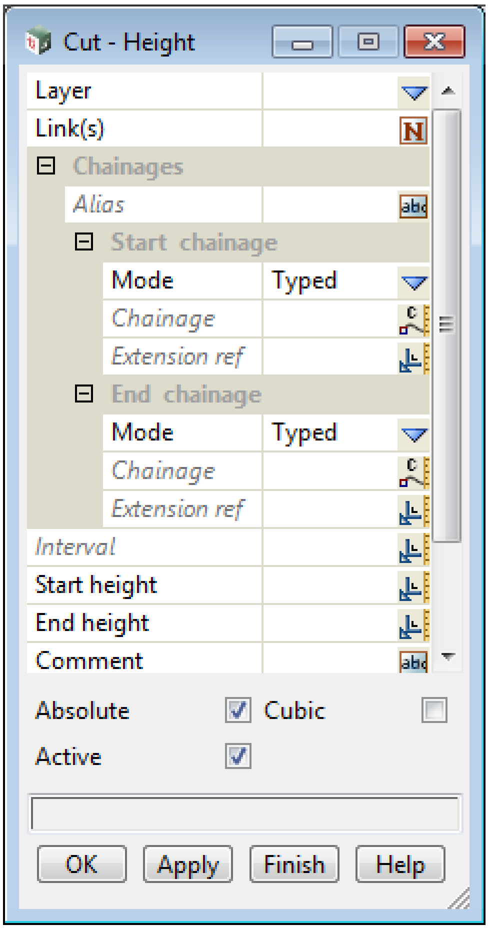
21.3.0.3 Cut Link - Modifier Width or Height

The **cut width** modifier is used to modify the width of variable cut links originally defined by width. That is, links defined by *width and slope* or *width and height*.

Similarly the **cut height** modifier is used to modify the height of variable cut links originally defined by height. That is, links defined by *height and width* or *height and slope*.

Selecting **Width or Height** brings up the **Cut - Width** and **Cut - Height** panels respectively.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the links.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval	input		

if ***non blank****, the interval to use to create cross sections and strings over the given chainage range.*
If ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End width/height	input		measures menu

start/end width/height for modifying the link.

Extra start/end	tick box		

if ***ticked****, add an extra x-section 0.1 mm* ***before*** *the start/end chainage.*

Absolute	tick box	tick	

if ***ticked****, the width/height is set to the values given in the* **start** *and* **end value** *fields.*
if ***not ticked****, the values given in the* **start** *and* **end value** *fields are added to the existing widths/heights.*

Cubic	tick box		

*if **ticked**, the width/height is varied as a reverse cubic between the start and end chainages.*
*if **not ticked**, the width/height is varied linearly between the start and end chainages.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button

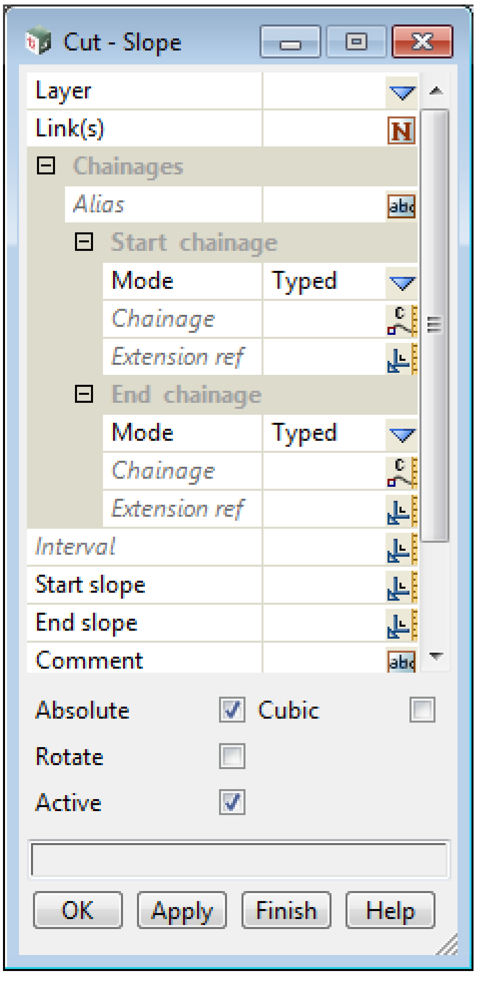
OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.4 Cut Link - Modify Slope or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.4 Cut Link - Modify Slope

The **cut slope** modifier is used to modify the slope of variable cut links originally defined by slope. That is, links defined by *slope and width* or *slope and height*.

Selecting **Slope** brings up the **Cut - Slope** panel



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Link name input select name menu

name of the link to modify.

Start/End mode choice box Start (ref)/End (ref)

defines the start/end chainages for modifying the link.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*
*If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End slope input measures menu

start/end slope for modifying the link.

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute tick box tick

*if **ticked**, the slope is set to the values given in the* **start** *and* **end slope** *fields.*
*if **not ticked**, the slopes given in the* **start** *and* **end value** *fields are added to the existing slopes.*

Cubic tick box:

*Only **none** or **one** of **Cubic** and **Rotate** can be set to **tick.***

*The **default** is **none** - that is, **neither is ticked** and in the default case, the slope is varied **linearly with respect to slope** between the start and end chainages.*

Cubic tick box

*if **ticked**, the slope is varied as a reverse cubic between the start and end chainages.*

Rotate tick box

*if **ticked**, the slope is varied linearly **with respect to** the **angle,** between the start and end chainages.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

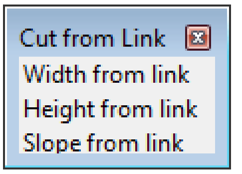
OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.5 Cut Link - from Link or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.5 Cut Link - from Link

The *Cut* **from link** walk-right brings up the **Cut from Link** menu with options to take the width, height or slope from another link.



For *Width/Height/Slope from link*, go to the next section [Cut Width, Height or Slope from a Link](#)

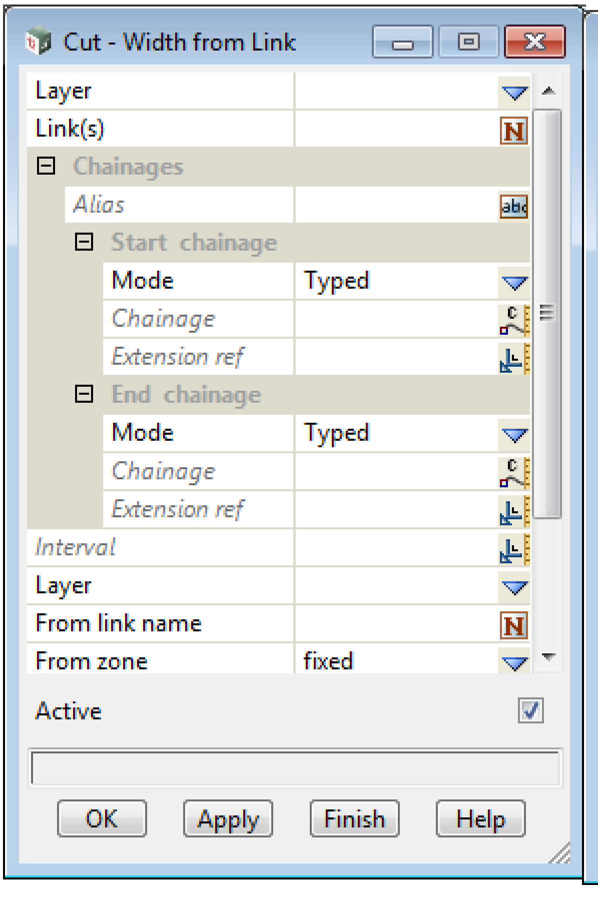
Cut Width, Height or Slope from a Link

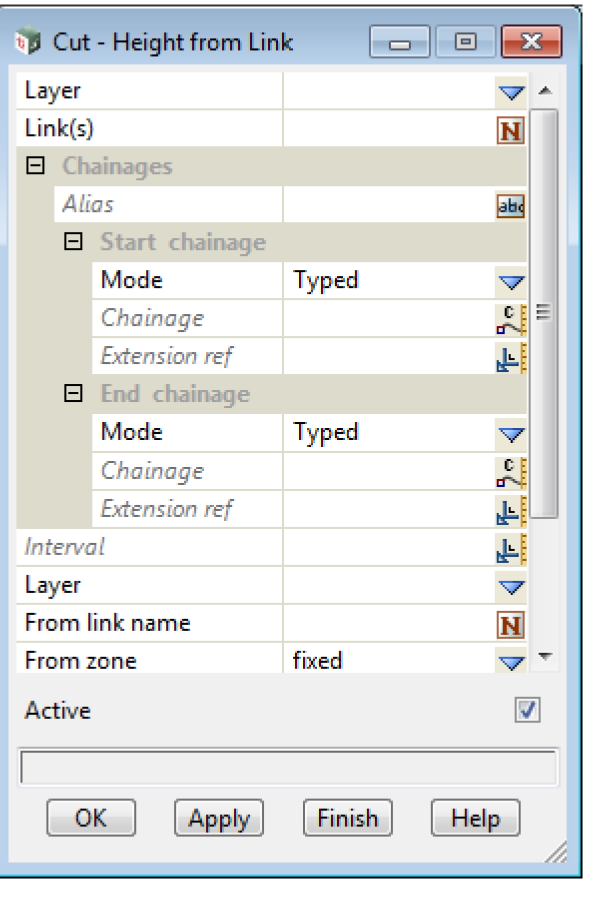
The **Width from link** modifier is used to modify the width of cut links originally defined by width to be the same width as another link. That is, the width of the link is a copy of the width of another link.

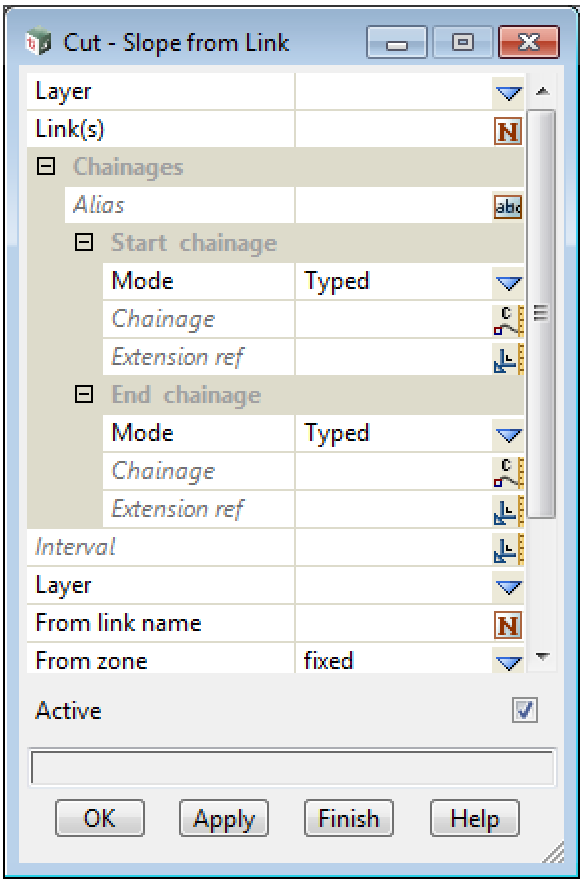
The **Height from link** modifier is used to modify the height of cut links originally defined by height to be the same height as another link. That is, the height of the link is a copy of the height of another link.

The **Slope from link** modifier is used to modify the slope of cut links originally defined by slope to be the same slope as another link. That is, the slope of the link is a copy of the slope of another link. The link to copy slope from can be defined in terms of slope or cross fall. If the link to copy is defined by cross fall, then the slope is calculated to match the cross fall.

Selecting **width from link, height from link or slope from link** brings up the **Cut - Width from Link**, **Cut Height - from Link** and **Cut - Slope from Link** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu
name of the link to modify.			
Start/End mode	choice box	Start (ref)/End (ref)	
defines the start/end chainages for modifying the link. *For more information on Start/End mode, see* 21.2.1 MTF Hinge Modifiers			
Interval	input		
*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.* *If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*			
From link name	input		select name menu
template link to take width/height/slope from.			
From zone	input	fixed	fixed, cut, fill
zone that the template link to take width/height/slope from, comes from.			
Extra start/end	tick box		
*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*			
Comment	input		
comment to add to the end of the line. In the file, the comment will be preceded by //.			
Active	tick box	tick	
*if **ticked**, use this modifier.*			

*if **not ticked**, don't use this modifier.*

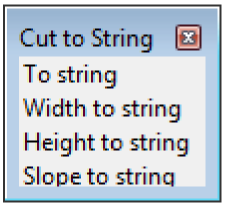
OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.6 Cut Link - to String or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.6 Cut Link - to String

The *Cut* **to string** walk-right brings up the **Cut to String** menu with options to take the width, height or slope by going to another string.

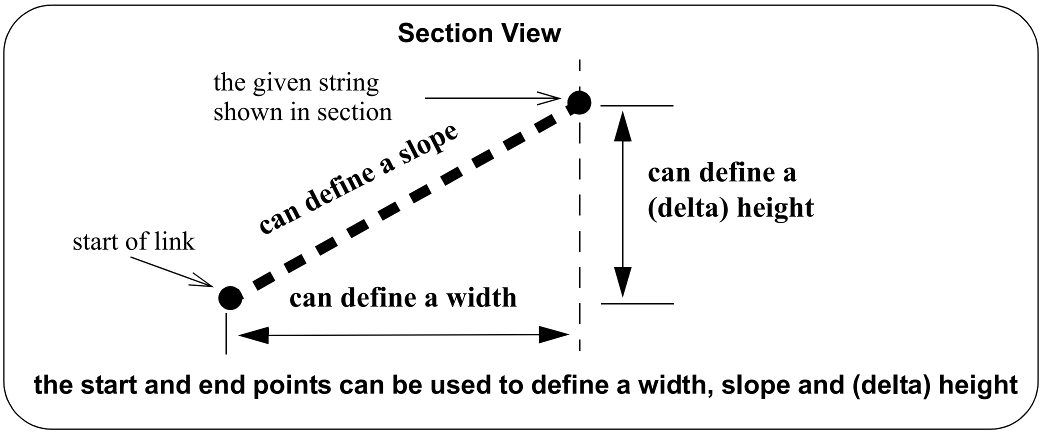


For *To string, go to* Cut Link - Modify To String
Width/Height/Slope to string Cut Link - Calculate Width, Height or Slope to a String

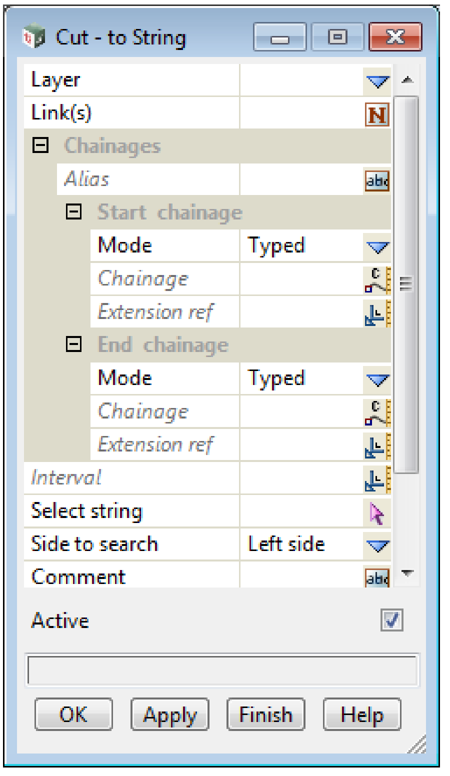
Cut Link - Modify To String

For any cut link, **To string** calculates the width, height and/or slope of the link needed to get from the start point of the link to the **to the selected string**.

However if the tin in the Apply MTF is cut before reaching the string, the ***cut link stops at the Apply MTF tin***.



Selecting **To string** bring up the **Cut - to String** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers ***except for this option****:*

When the ***Start mode*** *is* ***Start (ref),*** *or* ***Typed*** *and the chainage is* ***blank****, the modification begins at the low dropped chainage of the selected string.*

When the ***End mode*** *is* ***End (ref),*** *or* ***Typed*** *and the chainage is* ***blank****, the modification ends at the high dropped chainage of the selected string.*

Interval	input		

if ***non blank****, the interval to use to create cross sections and strings over the given chainage range. If* ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String	string-select		

select string to use for defining width/height/crossfall for the link.

Side to search	input	left side	left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/crossfall.

Extra start/end	tick box		

if ***ticked****, add an extra x-section 0.1 mm* ***before*** *the start/end chainage.*

Comment	input		

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

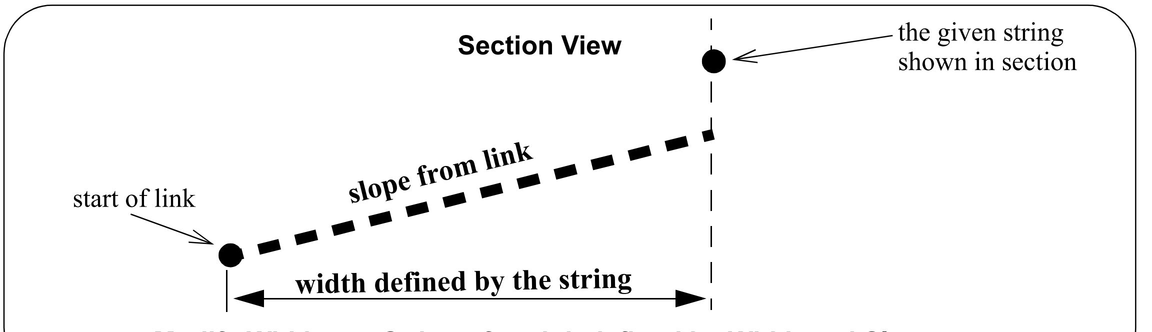
OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

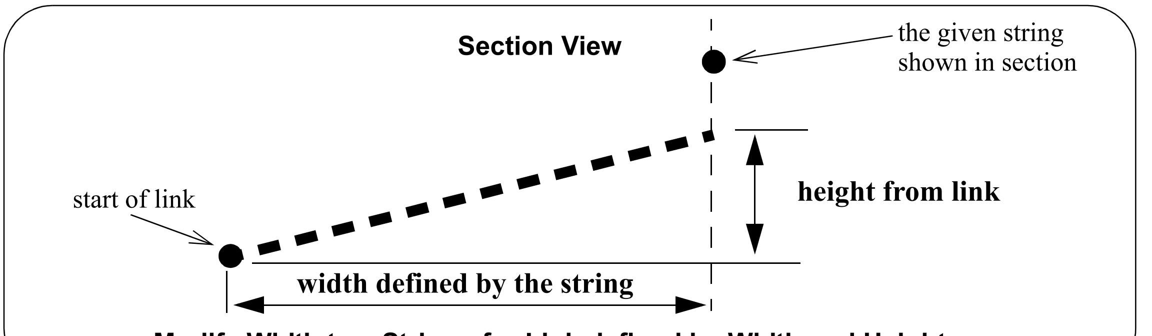
Cut Link - Calculate Width, Height or Slope to a String

Width to String:
For a cut link defined by *width and height* or *width and slope*, **Cut Width to string** calculates the **width** of the link as the width from the start point of the link, to the **to the selected string**. The *slope* or *height* is taken from the link. The option will give an error for a link defined by *height* and *slope*.

However if the tin in the Apply MTF is cut before reaching the string, the ***cut link stops at the Apply MTF tin***.



Modify Width to a String - for Link defined by Width and Slope

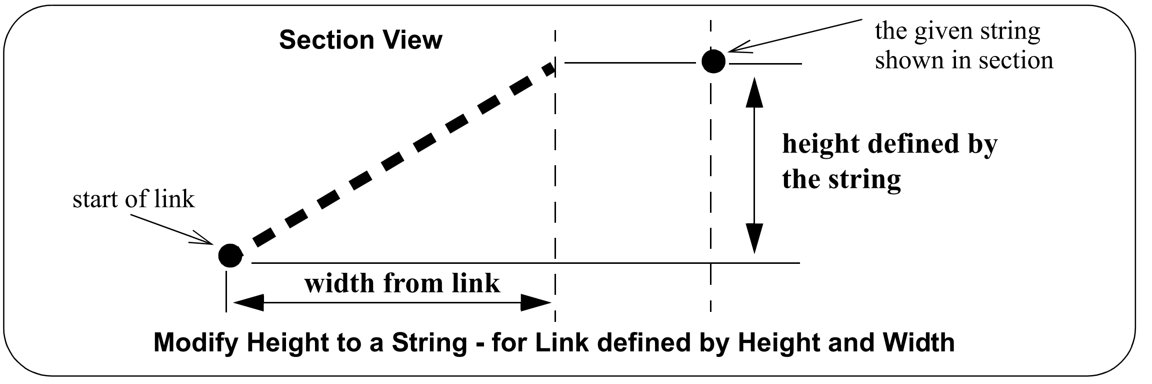


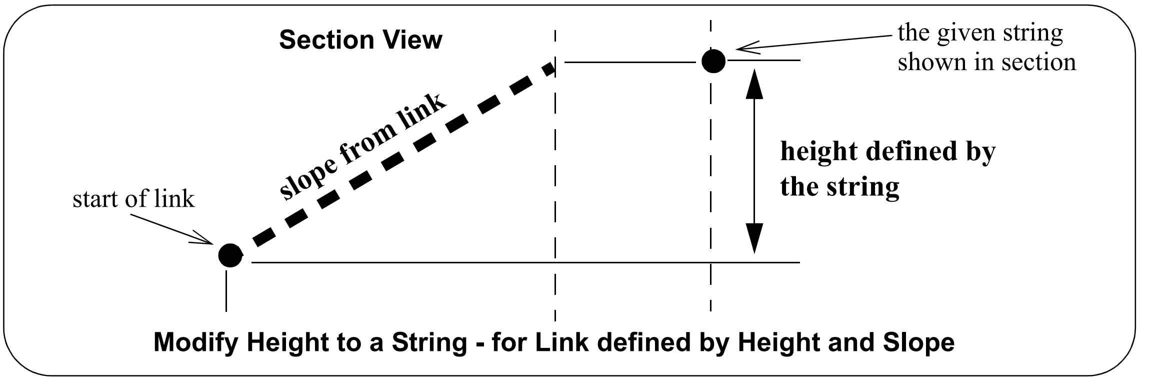
Modify Width to a String - for Link defined by Width and Height

Height to String:

For a cut link defined by *height and width* or *height and slope*, **Cut Height to string** calculates the **height** of the link as the difference in the height at the start point of the link, and the height **at the selected string**. The *slope* or *width* is taken from the link. The option will give an error for a link defined by *width* and *slope*.

However if the tin in the Apply MTF is cut before reaching the string, the ***cut link stops at the Apply MTF tin***.

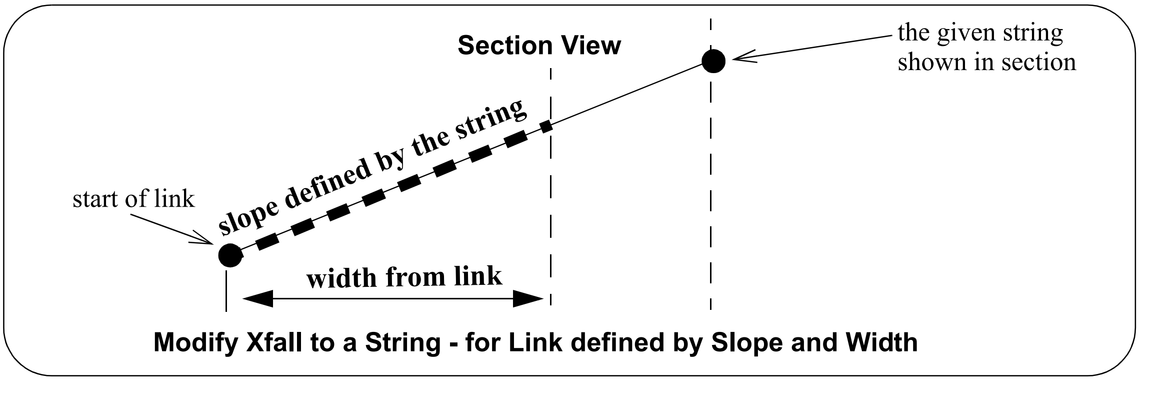


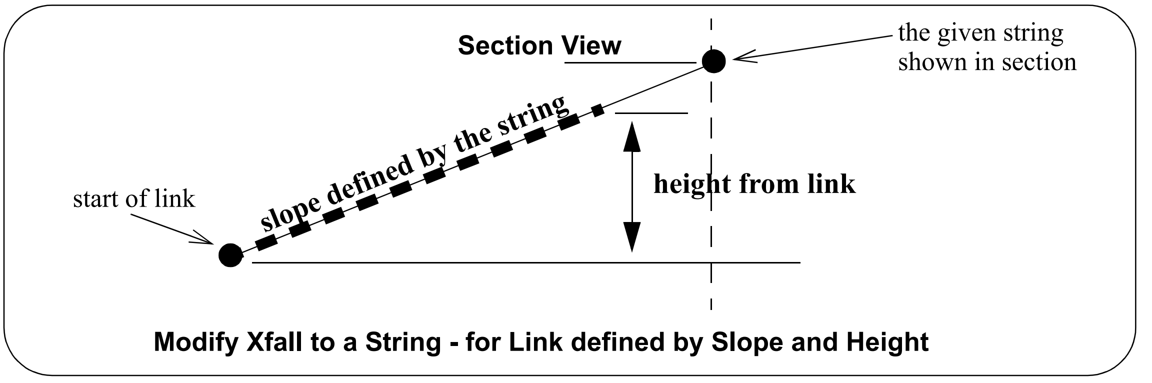


Xfall to String:

For a cut link defined by *slope and width* or *slope and height*, **Cut Slope to string** calculates the **slope** of the link as the *slope* from the start point of the link to the **selected string**. The *width* or *height* is taken from the link. The option will give an error for a link defined by *width* and *height*.

However if the tin in the Apply MTF is cut before reaching the string, the ***cut link stops at the Apply MTF tin***.



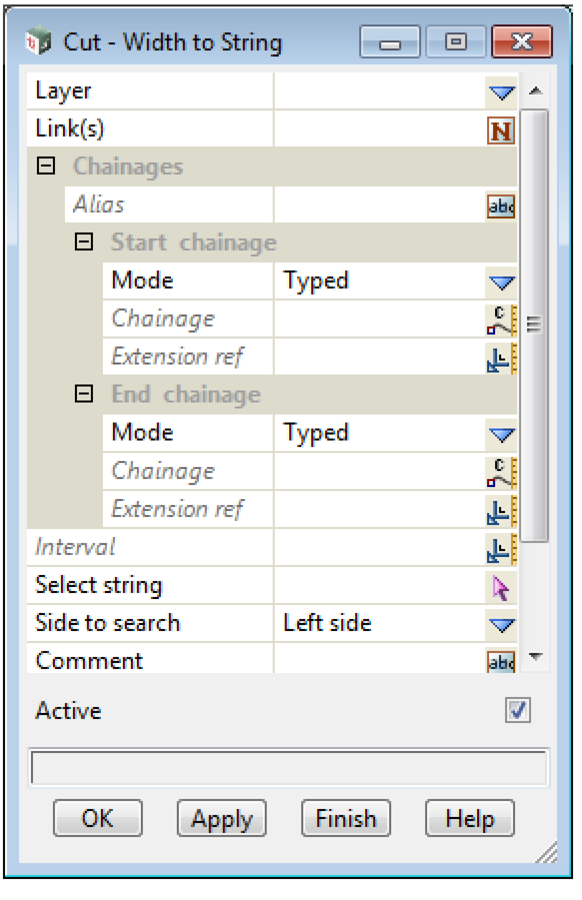


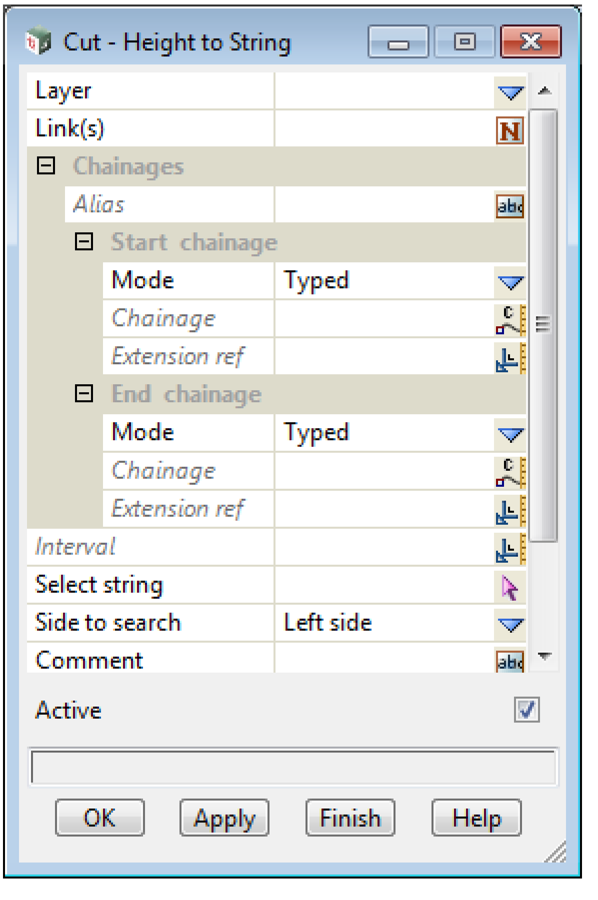
Note:

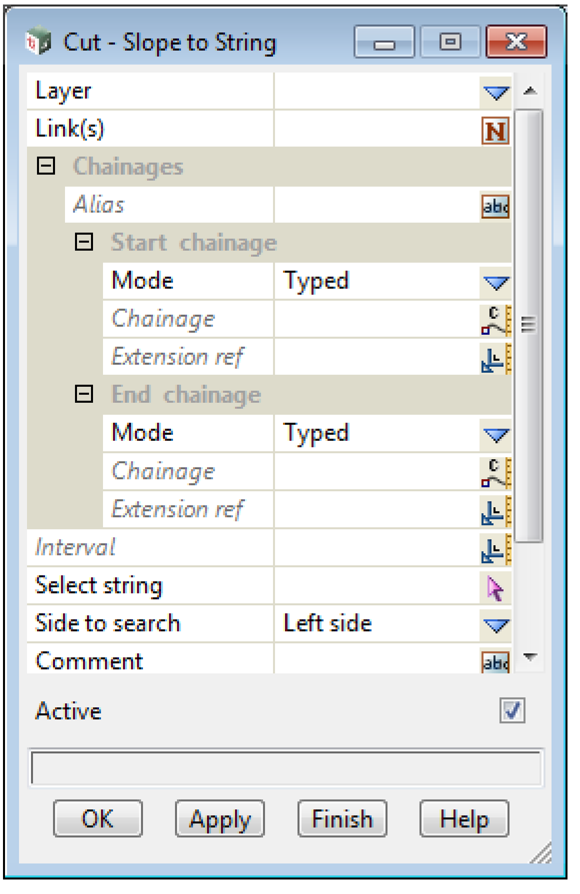
Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example for a modifier defined by *width and slope*, using *width to string* and a *slope to string* with the same string will place the end of the link on that string.

But the To string option will do the same thing in one command. See Cut Link - Modify To String.

Selecting **Width to string, Height to string or Slope to string** brings up the **Cut - Width to String**, **Cut - Height to String** and **Cut - Slope to String** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers ***except for this option****:*

*When the **Start mode** is **Start (ref),** or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.*

*When the **End mode** is **End (ref),** or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String	string-select		

select string to use for defining width/height/slope for the link.

Side to search	input	left side	left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/slope.

Extra start/end	tick box		

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

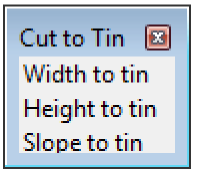
OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.7 Cut Link - to Tin or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.7 Cut Link - to Tin

The *Cut* **to tin** walk-right brings up the **Cut to Tin** menu with options to calculate the width, height or slope to get to a given tin (which doesn't have to be the Apply MTF tin).

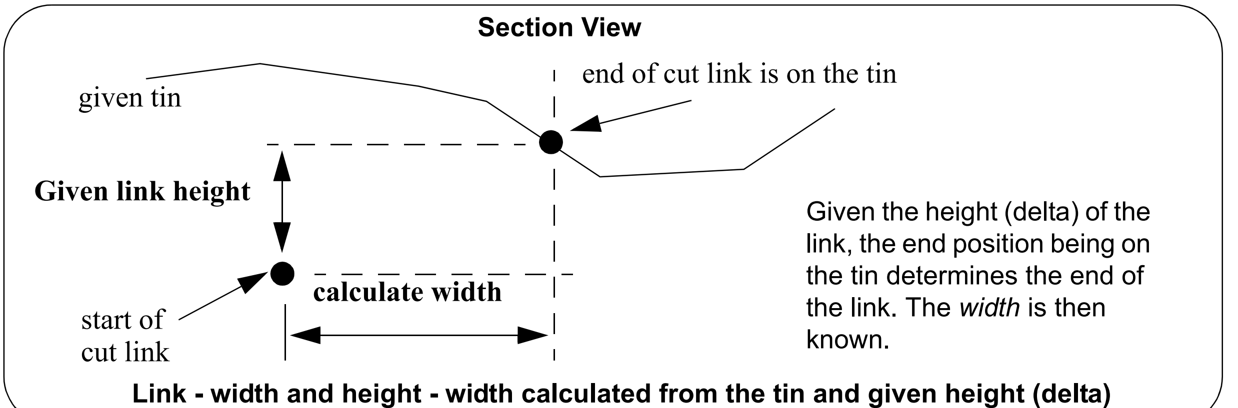


For *Width/Height/Tin to tin*, go to the next section Cut Link - Modify Width, Height or Xfall to Sit on User Tin

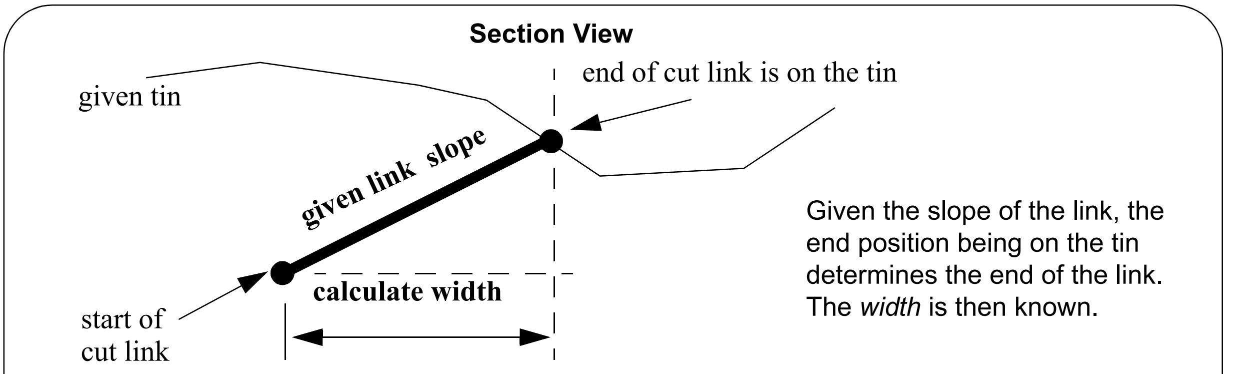
Cut Link - Modify Width, Height or Xfall to Sit on User Tin

Width to Tin

For a cut link defined by *width and height* or *width and slope*, **Width to tin** calculates the **width** of the link as the width required so that the link will sit on the user given tin at the ***height/slope given in the link***. The option gives an error for a link defined by *height* and *slope*.



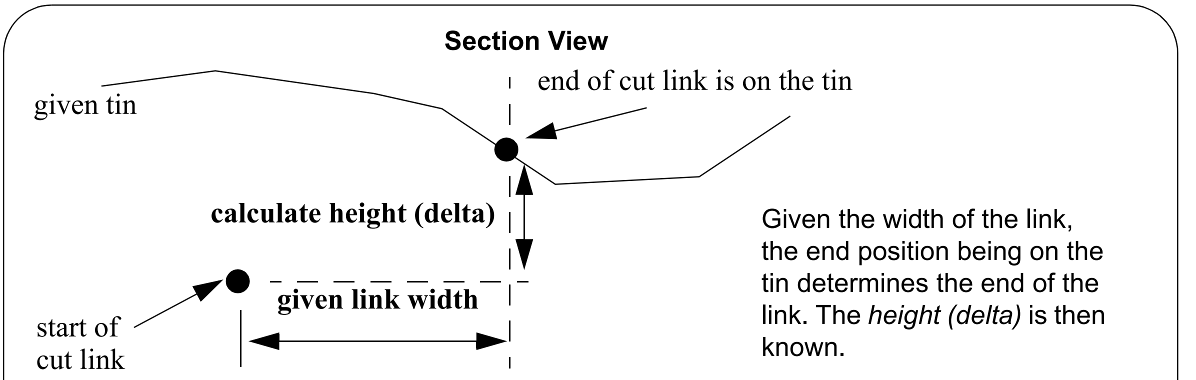
Link - width and height - width calculated from the tin and given height (delta)



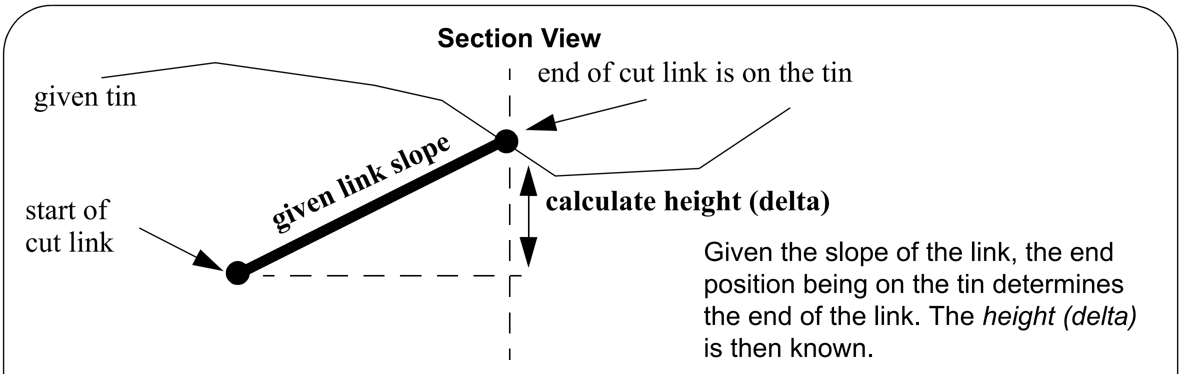
Link - width and slope - width calculated from the tin and given slope

Height to Tin

For a cut link defined by *height and width* or *height and slope*, the **Height to tin** calculates the ***height*** of the link as the difference in the height of the start point of the link, and the height that is required so that the link will sit on the user tin at the ***width/slope given in the link.*** The option gives an error for a link defined by *width and xfall*.



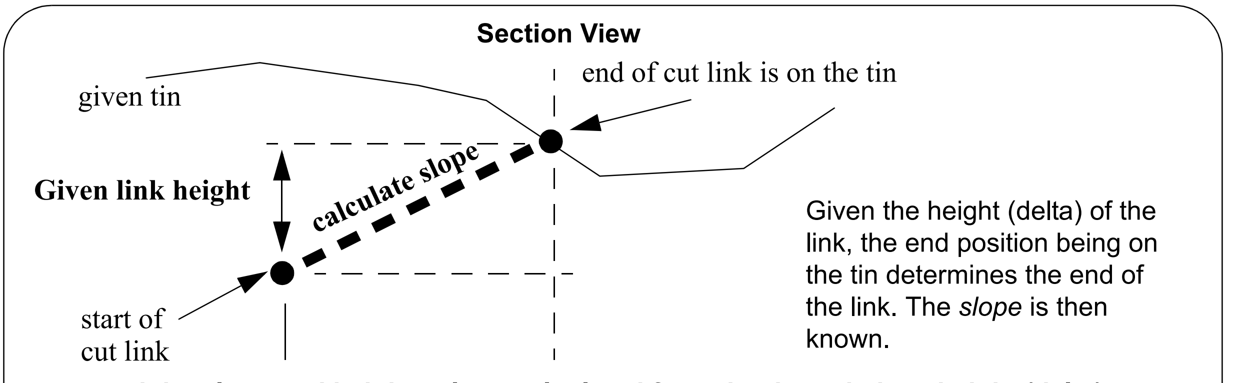
Link - height and width - height (delta) calculated from the tin and given width



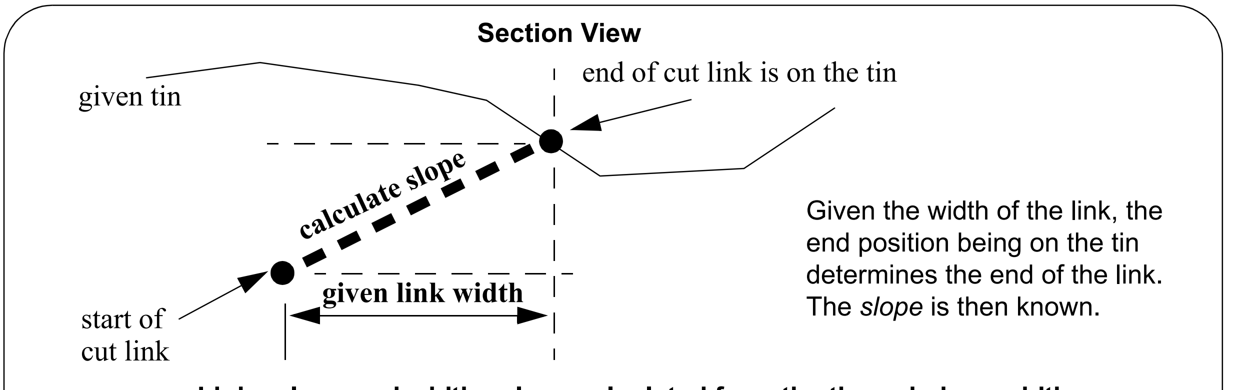
Link - height and slope - height (delta) calculated from the tin and given slope

Slope to Tin

For a cut link defined by *slope and width* or *slope and height*, **Slope to tin** calculates the **slope** of the link as the *slope* required so that the link will sit on the user tin at the ***width/height given in the link***. The option gives an error for a link defined by *width and height*.



Link - slope and height - slope calculated from the tin and given height (delta)



Link - slope and width - slope calculated from the tin and given width

Selecting **Width to tin**, **Height to tin, or Slope to tin** brings up the **Cut - Width to Tin**, **Cut - Height to Tin** and **Cut - Slope to Tin** panels respectively.

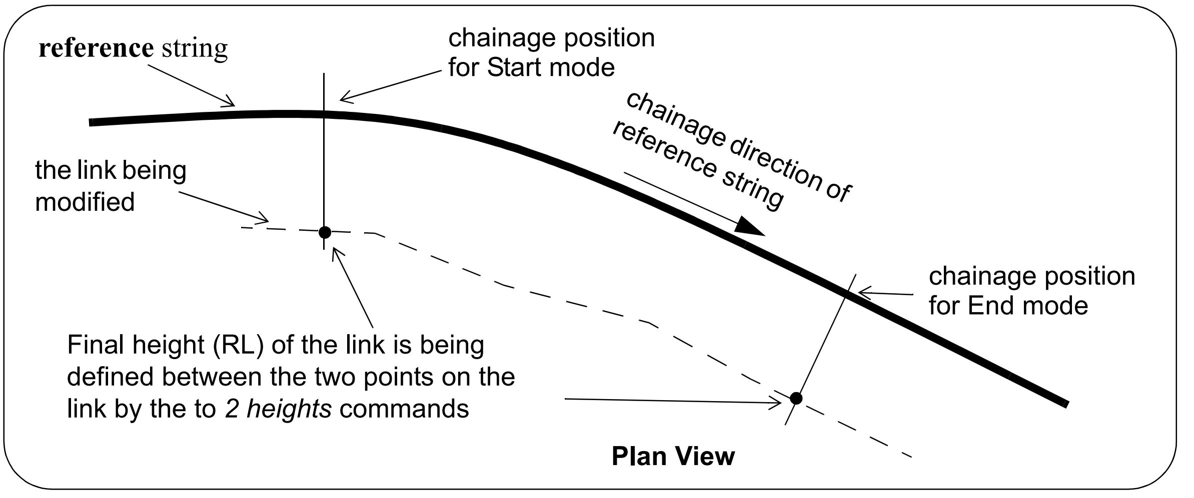
Continue to the next section 21.3.0.8 Cut Link - to Two Heights or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.8 Cut Link - to Two Heights

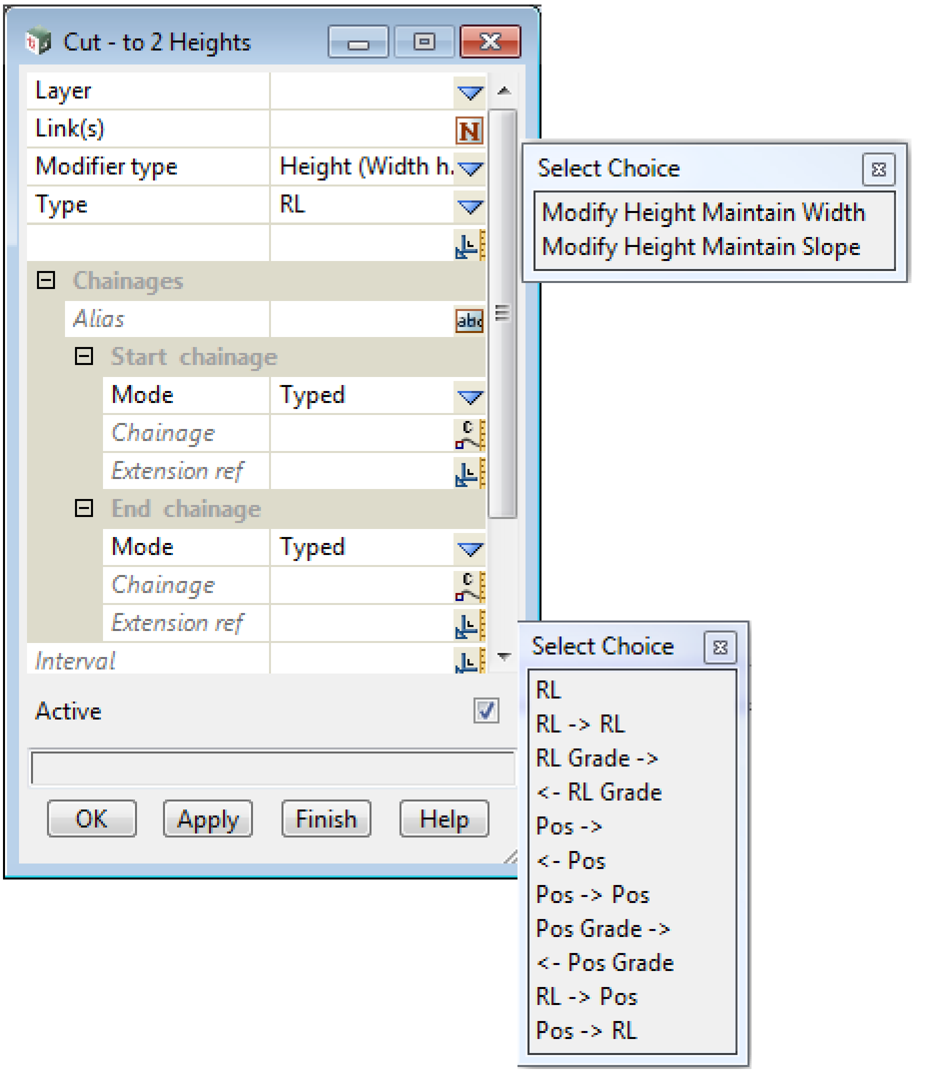
For an existing link, the **to 2 heights** option has a number of methods for **defining the height** from the start mode chainage to the end mode chainage. For example, over the chainage range, the height can be interpolated between two given RL's.

However if the *Apply MTF* tin is cut before reaching the end of the modified link, the ***cut link stops at the tin***.



Note: the ***2 Strings*** modifiers work with two points in a **section**. See 21.3.0.9 Cut Link - to 2 Strings.

Selecting **o 2 heights** brings up the **Cut - to 2 Heights** panel

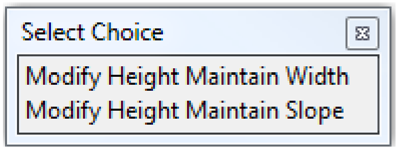


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Modifier type	choice box		



*The **Maintain** Slope/Width is the part of the new definition of the selected link that is taken from the selected* **Link name**. *See* Cut - Maintaining Width or Slope.

*The **Height** for the selected link is calculated by the method given by **Type**.*

Start/End mode	choice box	Start (ref)/End (ref)	

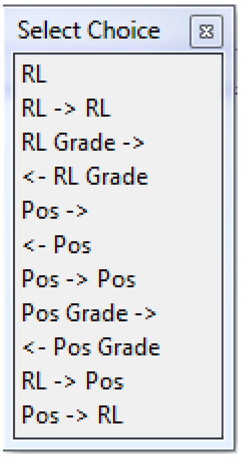
defines the start/end chainages for modifying the link.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers.

Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*

If ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Type choice box



For the calculation of height for each type, go to Cut - Calculating the Heights for each Type

Extra start/end tick box

if ***ticked****, add an extra x-section 0.1 mm* ***before*** *the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply button

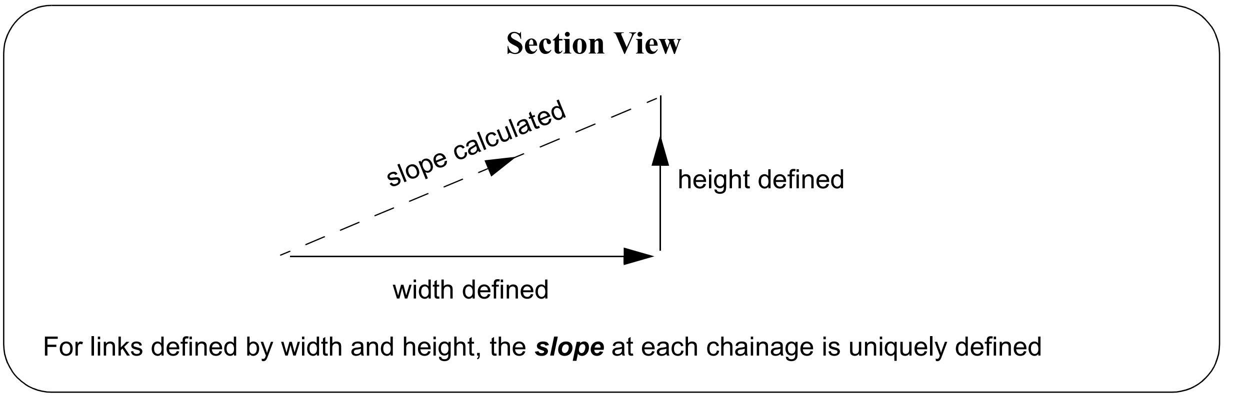
OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Cut - Maintaining Width or Slope

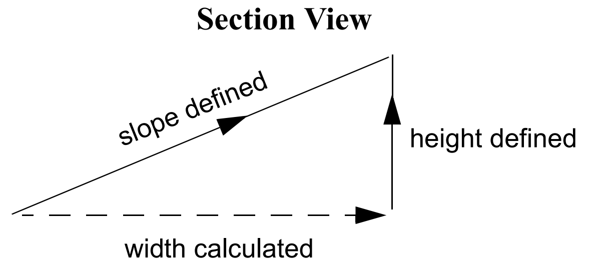
The option ***to 2 heights*** defines the ***height*** of the selected string so to completely define the link, only the width *or* the slope is needed.

So from the selected link only the *width* or the xfall is used (maintained) - the height is calculated by the **to 2 heights** option.

If the selected link is defined by ***width and height***, then at any chainage a ***slope*** can be calculated from the width and height at that chainage.



If the selected link is defined by ***slope and height***, then at any chainage a ***width*** can be calculated from the slope and height at that chainage.

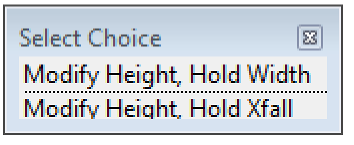


For links defined by slope and height, the ***width*** at each chainage is uniquely defined

Hence it doesn't matter if the selected link is defined by *width and slope*, *width and height*, or *slope and height*, at each chainage a *width and slope* are uniquely defined.

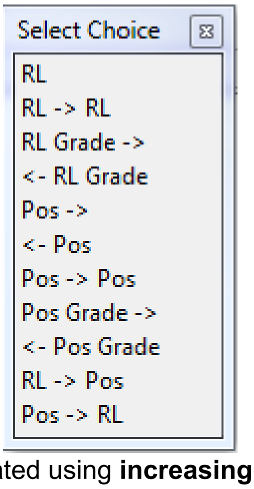
So no matter how the selected link is defined, at any chainage, a unique width or a slope is known and it is that **Width** or **Slope** can be maintained by the ***to 2 heights*** option.

So the choices for the option are:



Continue to the next section 21.3.0.9 Cut Link - to 2 Strings or return to 21.3.0.8 Cut Link - to Two Heights, 21.3.0.1 Insert Cut Links from a Template.

Cut - Calculating the Heights for each Type



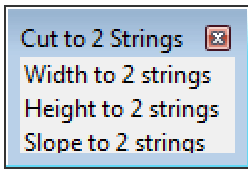
Important Note: Grade is calculated using **increasing Alignment chainages** and the **heights at the points** along the string being modifies. When going around a curve this will not be exactly the same as the grade along the string being modified.

The definitions of the calculations for each choice are the same as for the Fixed links. See 21.2.2.2.13.1 Fixed - Calculating the Heights for each Type.

Continue to the next section 21.3.0.9 Cut Link - to 2 Strings or return to 21.3.0.8 Cut Link - to Two Heights, 21.3.0.1 Insert Cut Links from a Template.

21.3.0.9 Cut Link - to 2 Strings

The *Cut* **to 2 strings** walk-right brings up the **Cut to 2 Strings** menu with options to calculate the width, height or slope from two given strings.



For *Width/Height/Slope to 2 Strings*, go to the next section Cut Link - Width, Height or Slope Between Two Strings

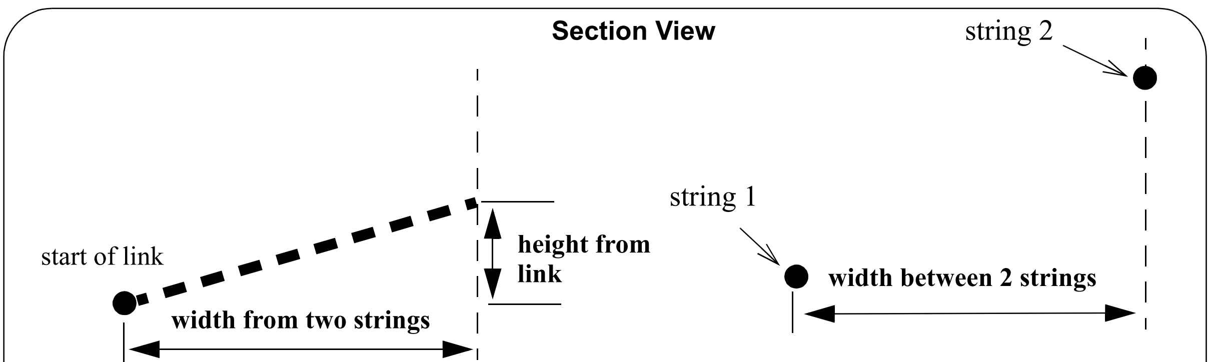
Cut Link - Width, Height or Slope Between Two Strings

Width Between Two Strings

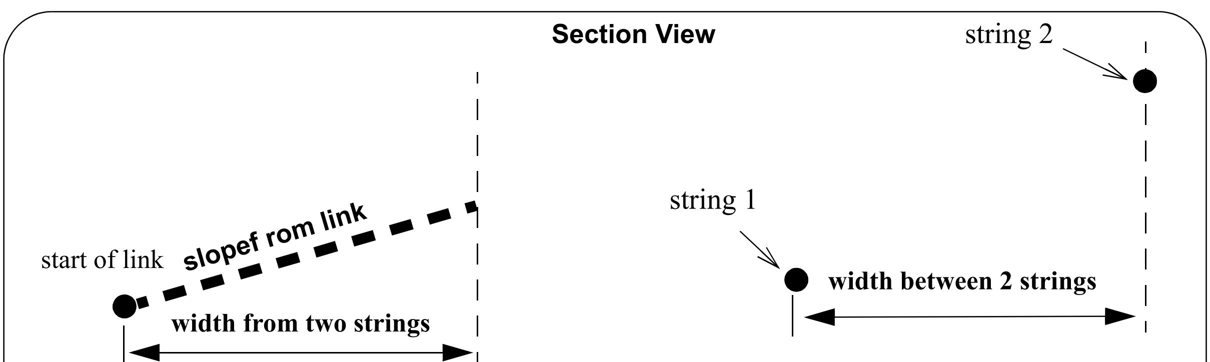
For a cut link defined by *width* and *height* or *width* and *slope*, **Width to 2 strings** sets the **width** for a link to be the **width between two** existing ***12d Model*** strings,

However if the Apply MTF tin is cut before reaching the string, the ***cut link stops at the tin***.

The option will give an error for a link defined by *height* and *slope*.



Modify Width to be that between two Strings - for Link defined by Width and Height



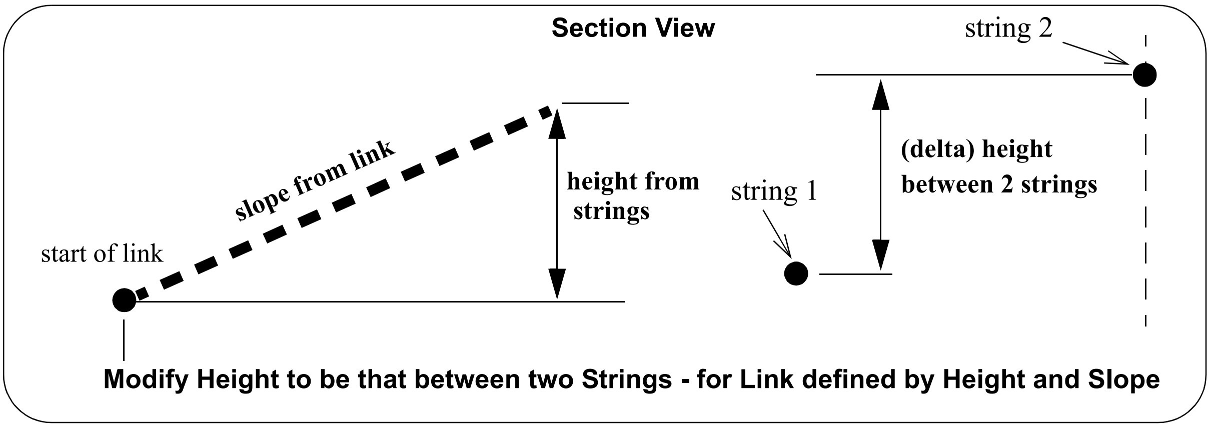
Modify Width to be that between two Strings - for Link defined by Width and Slope

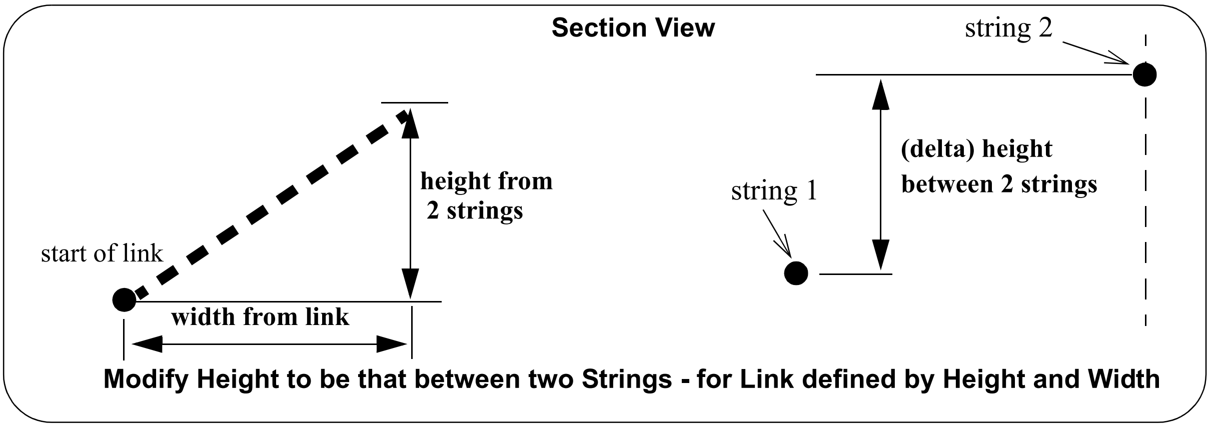
Height Between Two Strings

For a cut link defined by *height* and *width* or *height* and *slope*, **Height to 2 strings** sets the **height** for the link to be the **height between two** existing ***12d Model*** strings,

However if the Apply MTF tin is cut before reaching the string, the ***cut link stops at the tin***.

The option will give an error for a link defined by *width* and *slope*.



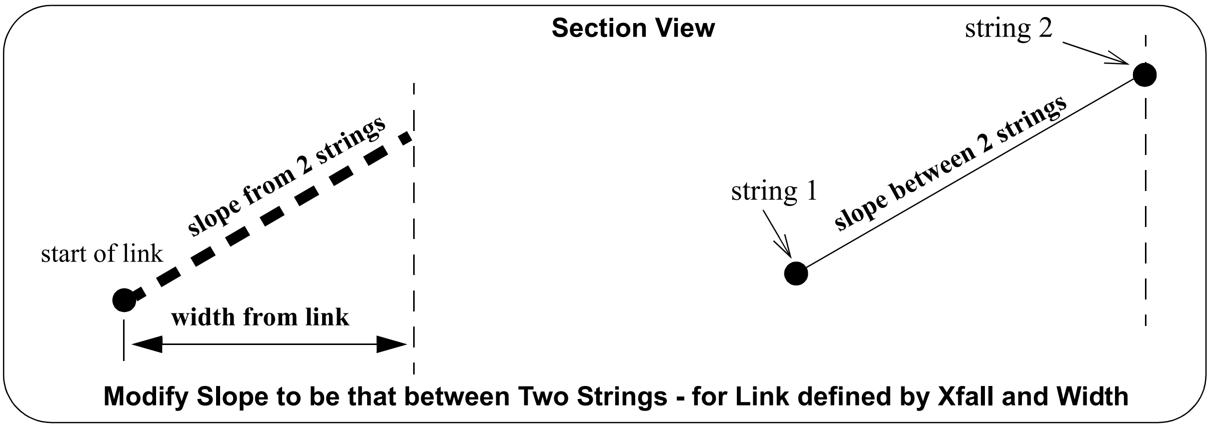


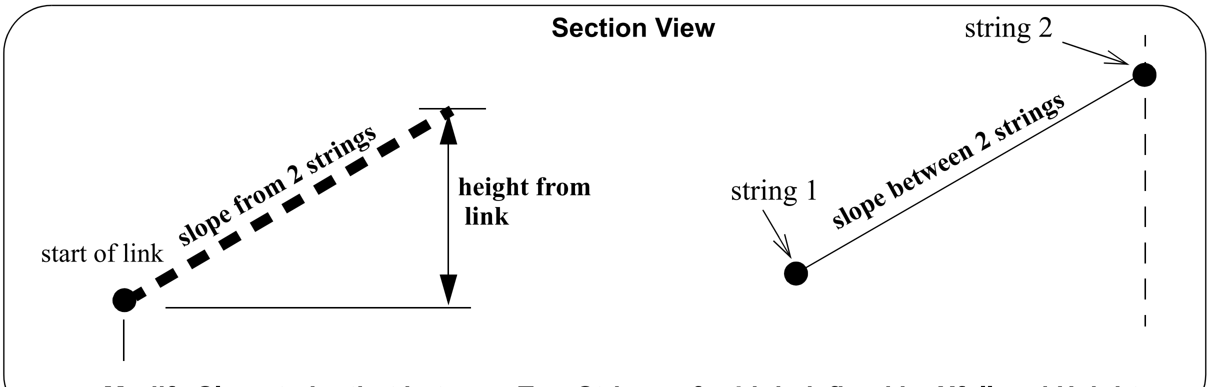
Slope Between Two Strings

For a cut link defined by *slope* and *width* or *slope* and *height*, **Slope to 2 strings** sets the **slope** for the link to be the **slope between two** existing ***12d Model*** strings,

However if the *Apply MTF* tin is cut before reaching the string, the ***cut link stops at the tin***.

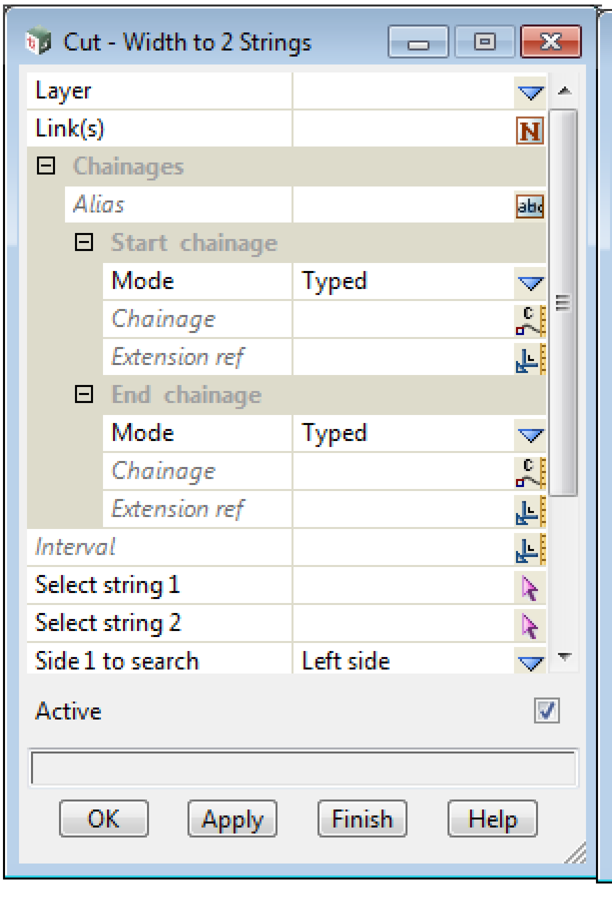
The option will give an error for a link defined by *width* and *height*.

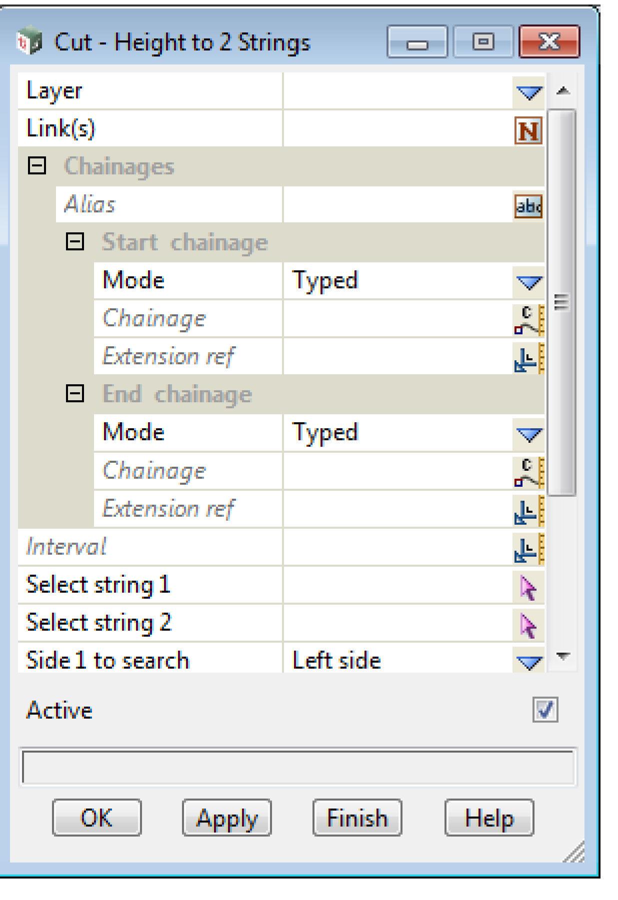


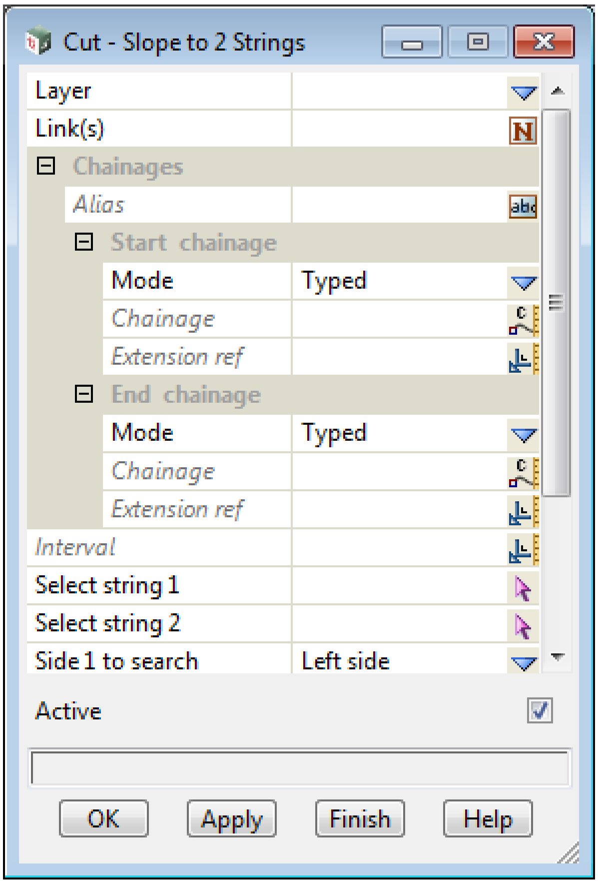


Modify Slope to be that between Two Strings - for Link defined by Xfall and Height

Selecting the **width to 2 strings, height to 2 strings or slope to 2 strings** option brings up the **Cut - Width to 2 Strings**, **Cut - Height to 2 Strings** and **Cut - Slope to 2 String** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*
*If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String 1 string-select

select the first string to use for defining width/height/slope for the link.

String 2 string-select

select the second string to use for defining width/height/slope for the link.

Side 1 to search	input	left side	left side, right side, both sides

side of the hinge string to start searching to find string 1 to use in defining width/height/slope.

Side 2 to search	input	left side	left side, right side, both sides

side of the hinge string to start searching to find string 2 to use in defining width/height/slope.

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button

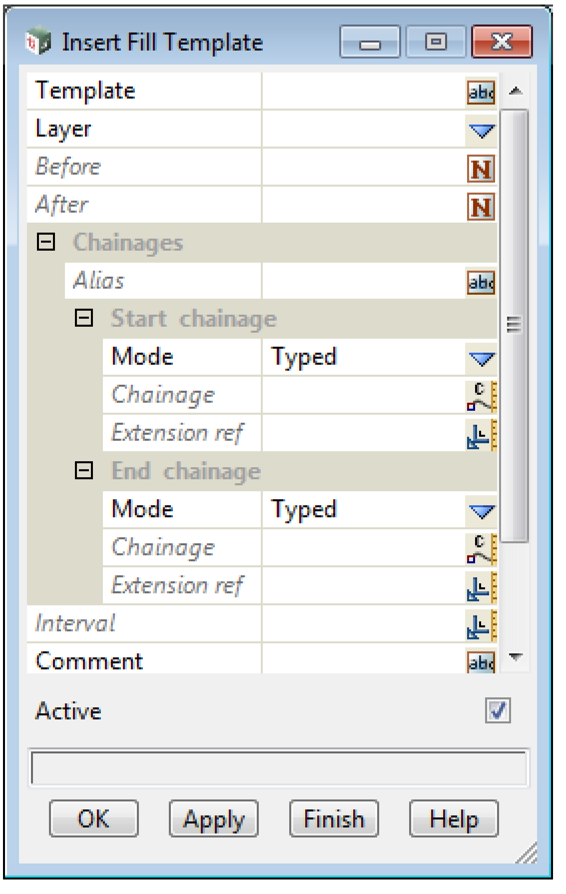
OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.10 Insert Fill Links from a Template or return to 21.3.0.1 Insert Cut Links from a Template.

21.3.0.10 Insert Fill Links from a Template

All the fill links from an existing template can be inserted by the **Insert Template** command.

Selecting **Insert fill template** brings up the **Insert Fill Template** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		select template menu

the name of the template to take the fill links from.

Before	input		select name menu

if ***non-blank****, the fill links from the selected template are inserted before the given link.*
If ***blank****, the fill links from the selected template are appended to the end of the existing fill links.*

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for inserting the new fill links.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval	input		

if ***non blank****, the interval to use to create cross sections and strings over the given chainage range.*
If ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Extra start/end	tick box		

if ***ticked****, add an extra x-section 0.1 mm* ***before*** *the start/end chainage.*

Comment	input		

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button

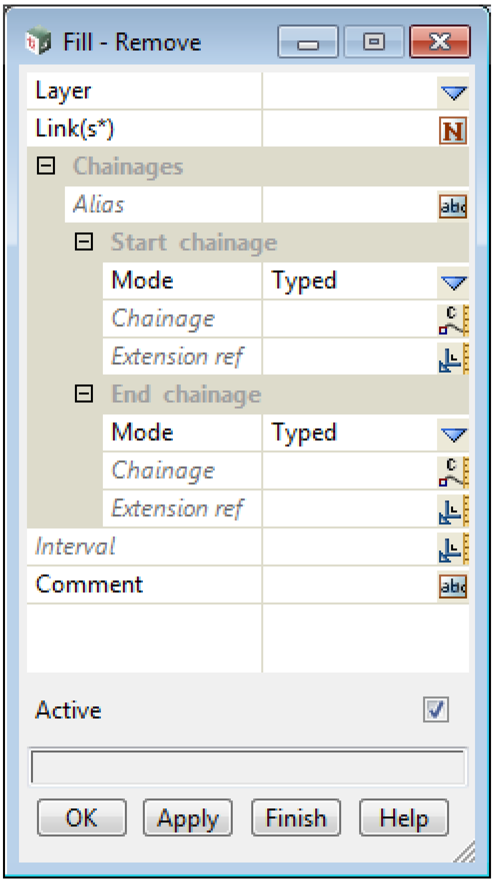
OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.11 Fill Link - Remove or return to 21.3.0.10 Insert Fill Links from a Template.

21.3.0.11 Fill Link - Remove

Fill links can be deleted between given chainages by using the **fill remove** modifier.

Selecting **Remove** brings up the **Fill - Remove** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to removed.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for removing the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval	input		

if ***non blank****, the interval to use to create cross sections and strings over the given chainage range.*
If ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Extra start/end	tick box		

if ***ticked****, add an extra x-section 0.1 mm* ***before*** *the start/end chainage.*

Comment	input		

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active	tick box	tick	

if ***ticked****, use this modifier.*
if ***not ticked****, don't use this modifier.*

OK/Apply button

__OK__ stores the values in the fields and removes the panel.
__Apply__ stores the values and leaves the panel on the screen.

Continue to the next section 21.3.0.12 Fill Link - Modify Width or Height or return to 21.3.0.10 Insert Fill Links from a Template.

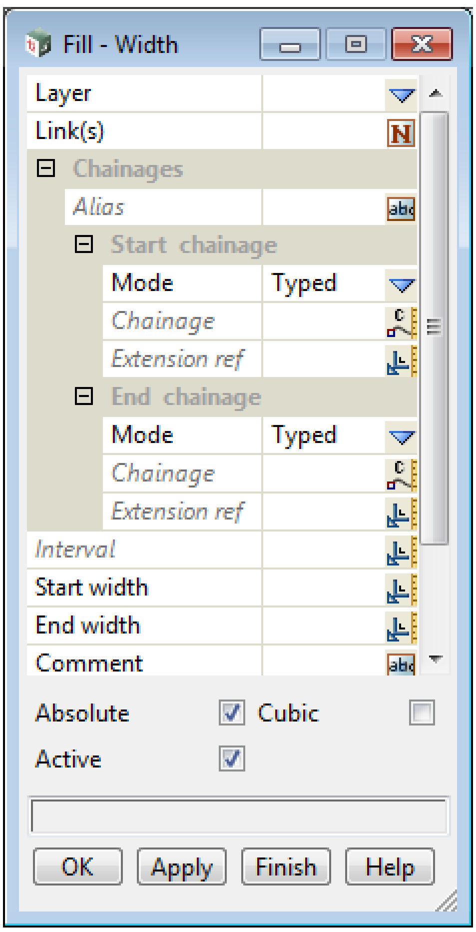
21.3.0.12 Fill Link - Modify Width or Height

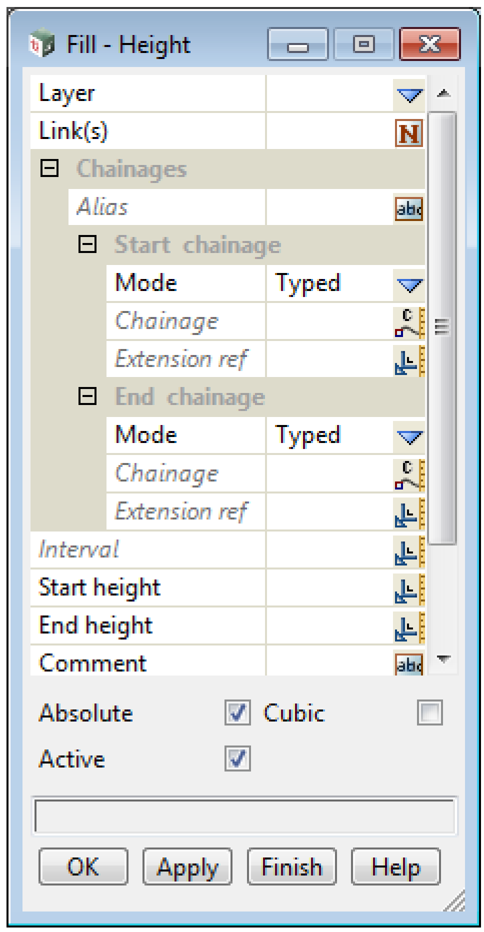
The **fill width** modifier is used to modify the ***width*** of variable fill links originally defined by width. That is, links defined by *width and slope* or *width and height*.

Similarly the **fill height** modifier is used to modify the ***height*** of variable fill links originally defined by height. That is, links defined by *height and slope* or *height and width*.

Important Note - for a Fill link, a **positive** height is **down**.

Selecting the **width and height** option brings up the **Fill - Width** and **Fill - Height** panels respectively.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*
*If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End width/height input measures menu

start/end width/height for modifying the template link.

***Important Note** - for a fill link, height **positive** is down.*

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute tick box tick

*if **ticked**, the width/height is set to the values given in the* **start** *and* **end width/height** *fields.*
*if **not ticked**, the values given in the* **start** *and* **end height/width** *fields are added to the existing widths/heights.*

Cubic tick box

*if **ticked**, the width/height is varied as a reverse cubic between the start and end chainages.*
*if **not ticked**, the width/height is varied linearly between the start and end chainages.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*

*if **not ticked**, don't use this modifier.*

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

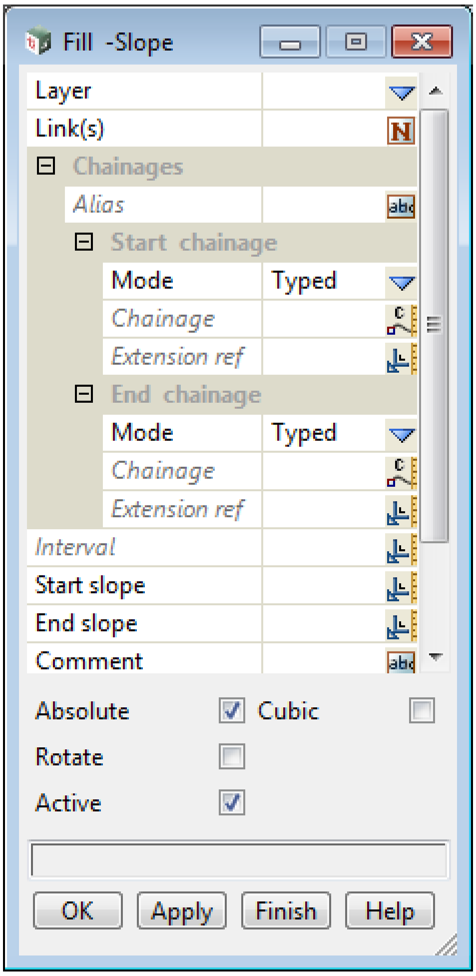
Continue to the next section 21.3.0.13 Fill Link - Modify Slope or return to 21.3.0.10 Insert Fill Links from a Template.

21.3.0.13 Fill Link - Modify Slope

The **fill slope** modifier is used to modify the ***slope*** of variable fill links originally defined by slope. That is, links defined by *slope and width* or *slope and height*.

Important Note - for a Fill link, a **positive** fill slope is **down**.

Selecting **slope** brings up the **Fill - Slope** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval	input		

if ***non blank****, the interval to use to create cross sections and strings over the given chainage range.*
If ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End slope	input		measures menu

start/end slope for modifying the template link.

Important Note *- for a fill link, a* ***positive*** *slope is down.*

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute tick box tick

*if **ticked**, the slope is set to the values given in the* **start** *and* **end slope** *fields.*
*if **not ticked**, the values given in the* **start** *and* **end slope** *fields are added to the existing slopes.*

Cubic and Rotate tick boxes:

*Only **none** or **one** of **Cubic** and **Rotate** can be set to **tick.***
*The **default** is **none** - that is, **neither is ticked** and in the default case, the slope is varied **linearly with respect to slope** between the start and end chainages.*

Cubic tick box

*if **ticked**, the slope is varied as a reverse cubic between the start and end chainages.*

Rotate tick box

*if **ticked**, the slope is varied linearly **with respect to** the **angle,** between the start and end chainages.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

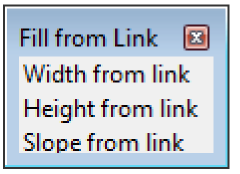
OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.14 Fill Link - from Link or return to 21.3.0.10 Insert Fill Links from a Template.

21.3.0.14 Fill Link - from Link

The *Fill* **from link** walk-right brings up the **Fill from Link** menu with options to take the width, height or slope from another link.



For *Width/Height/Slope from link*, go to the next section Fill Link - Take Width, Height or Slope from another Link

Fill Link - Take Width, Height or Slope from another Link

The **Width from link** modifier is used to modify the ***width*** of fill links originally defined by width to be the same width as another link (*width and height* or *width and slope*). That is, the width of the link is a copy of the width of another link.

The **Height from link** modifier is used to modify the ***height*** of fill links originally defined by height to be the same height as another link (*height and width* or *height and slope*). That is, the height of the link is a copy of the height of another link.

The **Slope from link** modifier is used to modify the slope of fill links originally defined by slope to be the same slope as another link (*slope and width* or *slope and height*). That is, the slope of the link is a copy of the slope of another link. The link to copy slope from can be defined in terms of slope or cross fall. If the link to copy is defined by cross fall, then the slope is calculated to match the cross fall.

Selecting the **width from link, height from link or slope from link** option brings up the **Fill - Width from Link**, **Fill - Height from Link** and **Fill - Slope from Link** panels respectively.

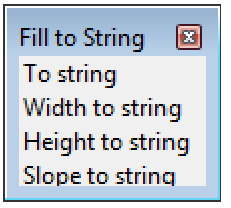
Continue to the next section 21.3.0.15 Fill Link - to String or return to 21.3.0.10 Insert Fill Links from a Template.

21.3.0.15 Fill Link - to String

The *Fill* **to string** walk-right brings up the **Fill to String** menu with options to take the width, height or slope by going to another string.



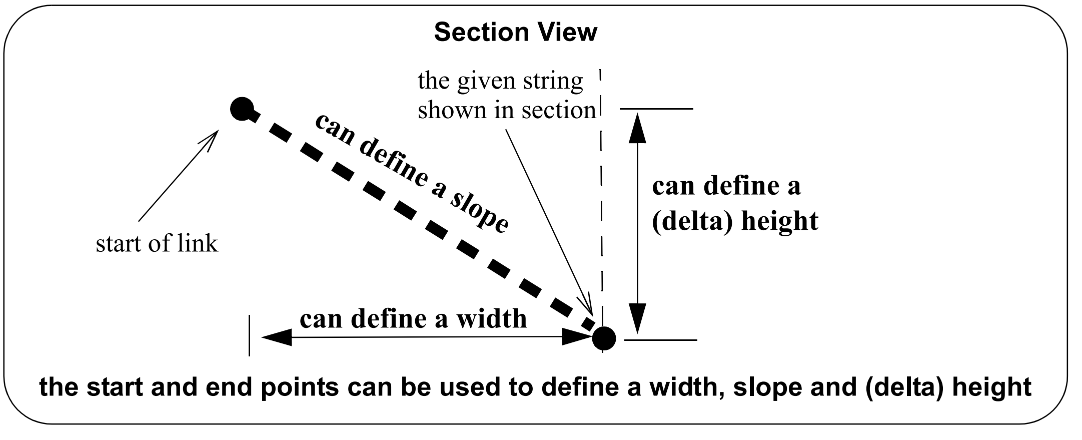
For *To string, go to* Fill Link - Modify To String

Width/Height/Slope to string Fill Link - Calculate Width, Height or Slope to a String

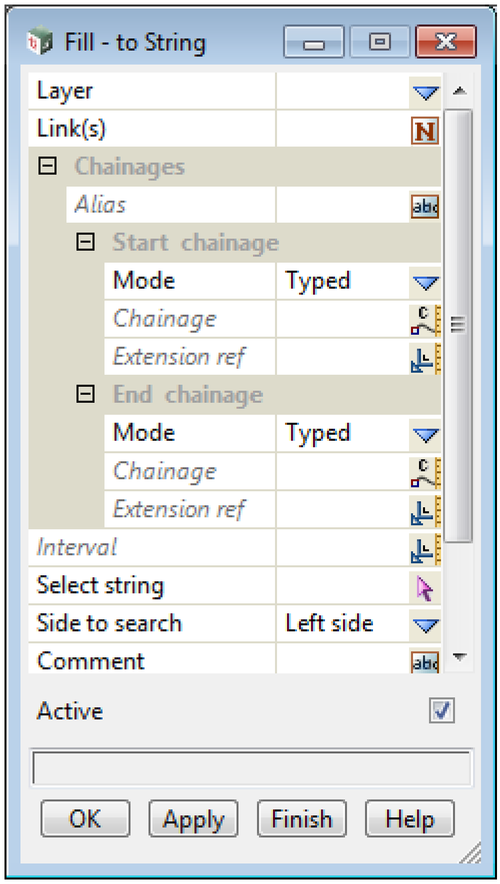
Fill Link - Modify To String

For any fill link, **To string** calculates the width, height and/or slope of the link needed to get from the start point of the link to the **to the selected string**.

However if the tin in the Apply MTF is cut before reaching the string, the ***cut link stops at the Apply MTF tin***.



Selecting **To string** brings up the **Fill - to String** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers ***except for this option****:*

*When the **Start mode** is **Start (ref),** or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.*

*When the **End mode** is **End (ref),** or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String	string-select		

select string to use for defining width/height/crossfall for the link.

Side to search	input	left side	left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/crossfall.

Extra start/end	tick box		

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **not ticked**, don't use this modifier.*

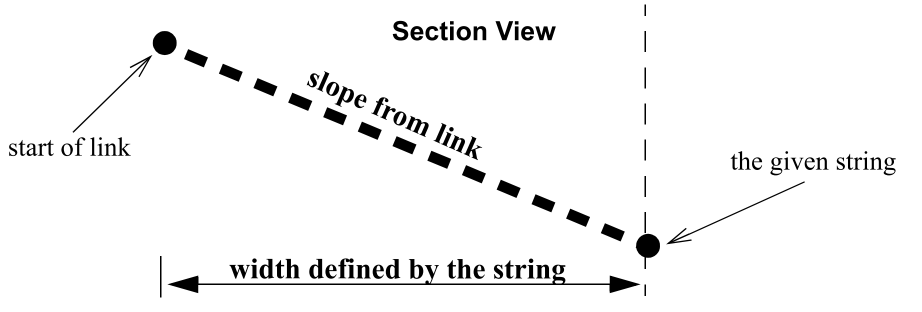
OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

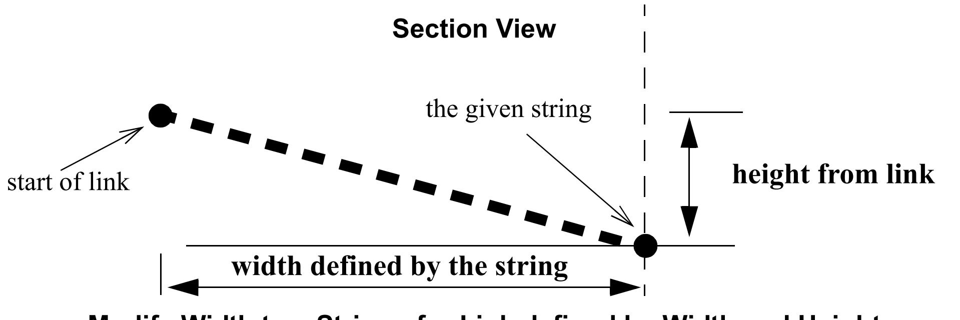
Fill Link - Calculate Width, Height or Slope to a String

Width to String:
For a fill link defined by *width and height* or *width and slope*, **Fill Width to string** calculates the **width** of the link as the width from the start point of the link, to the **to the selected string**. The *slope* or *height* is taken from the link. The option will give an error for a link defined by *height* and *slope*.

However if the tin in the Apply MTF is cut before reaching the string, the ***fill link stops at the Apply MTF tin***.



Modify Width to a String - for Link defined by Width and Slope

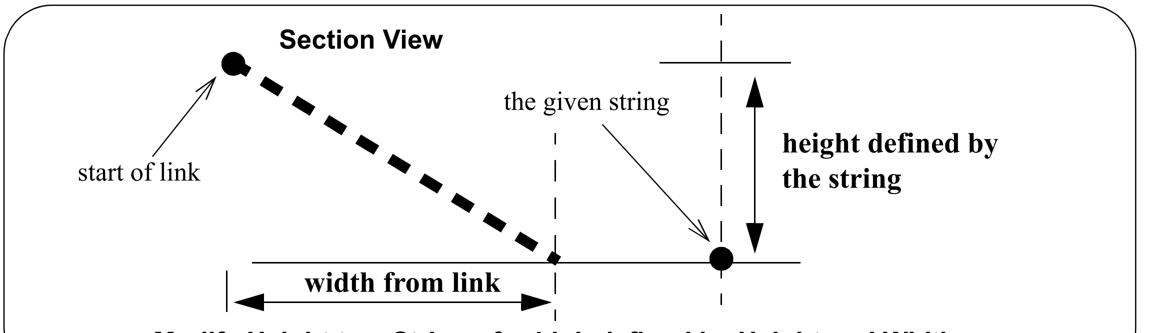


Modify Width to a String - for Link defined by Width and Height

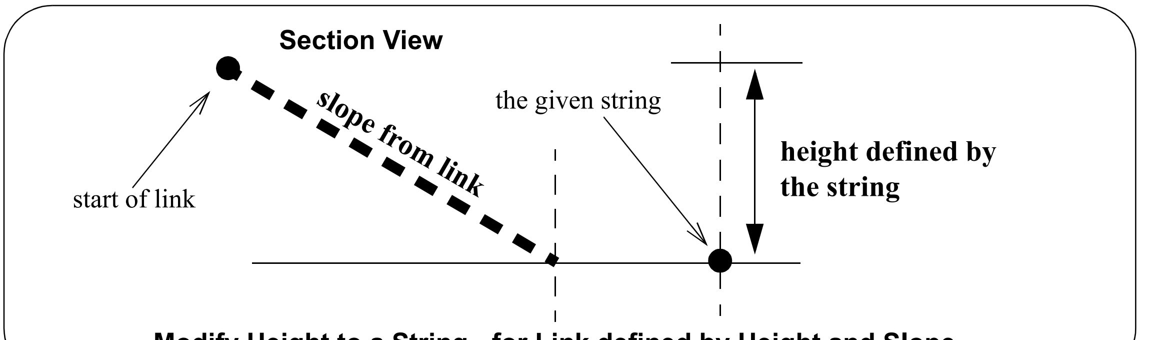
Height to String:

For a fill link defined by *height and width* or *height and slope*, **Fill Height to string** calculates the **height** of the link as the difference in the height at the start point of the link, and the height **at the selected string**. The *slope* or *width* is taken from the link. The option will give an error for a link defined by *width* and *slope*.

However if the tin in the Apply MTF is cut before reaching the string, the ***fill link stops at the Apply MTF tin***.



Modify Height to a String - for Link defined by Height and Width

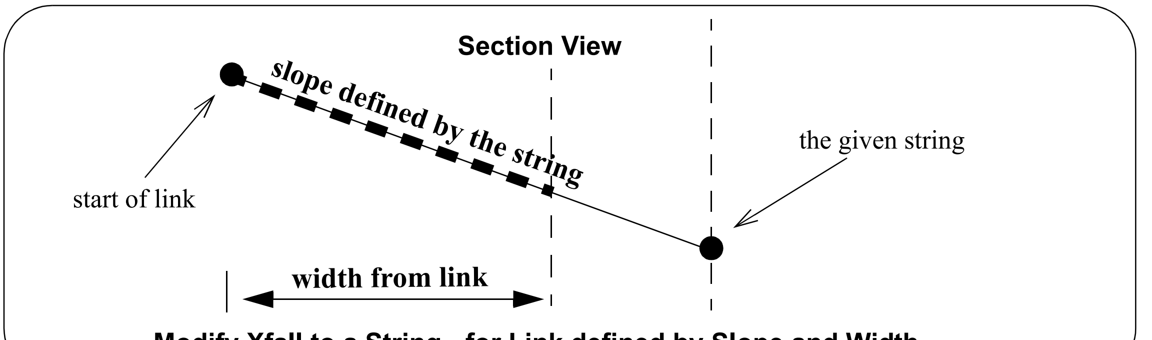


Modify Height to a String - for Link defined by Height and Slope

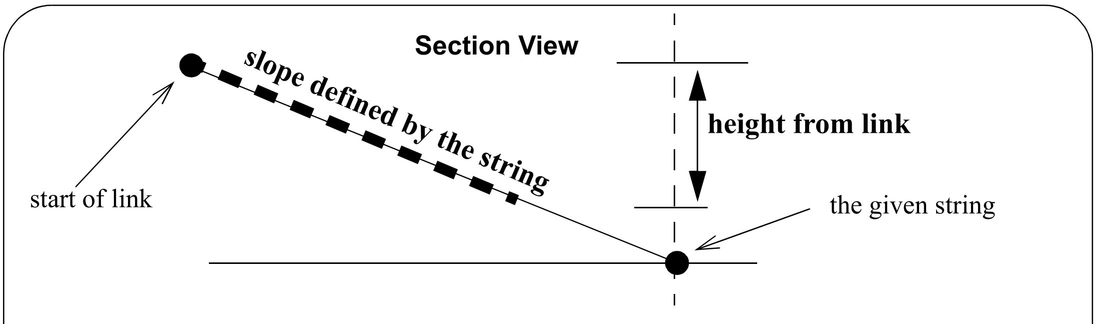
Slope to String:

For a fill link defined by *slope and width* or *slope and height*, **Fill Slope to string** calculates the **slope** of the link as the *slope* from the start point of the link to the **selected string**. The *width* or *height* is taken from the link. The option will give an error for a link defined by *width* and *height*.

However if the tin in the Apply MTF is cut before reaching the string, the ***fill link stops at the Apply MTF tin***.



Modify Xfall to a String - for Link defined by Slope and Width



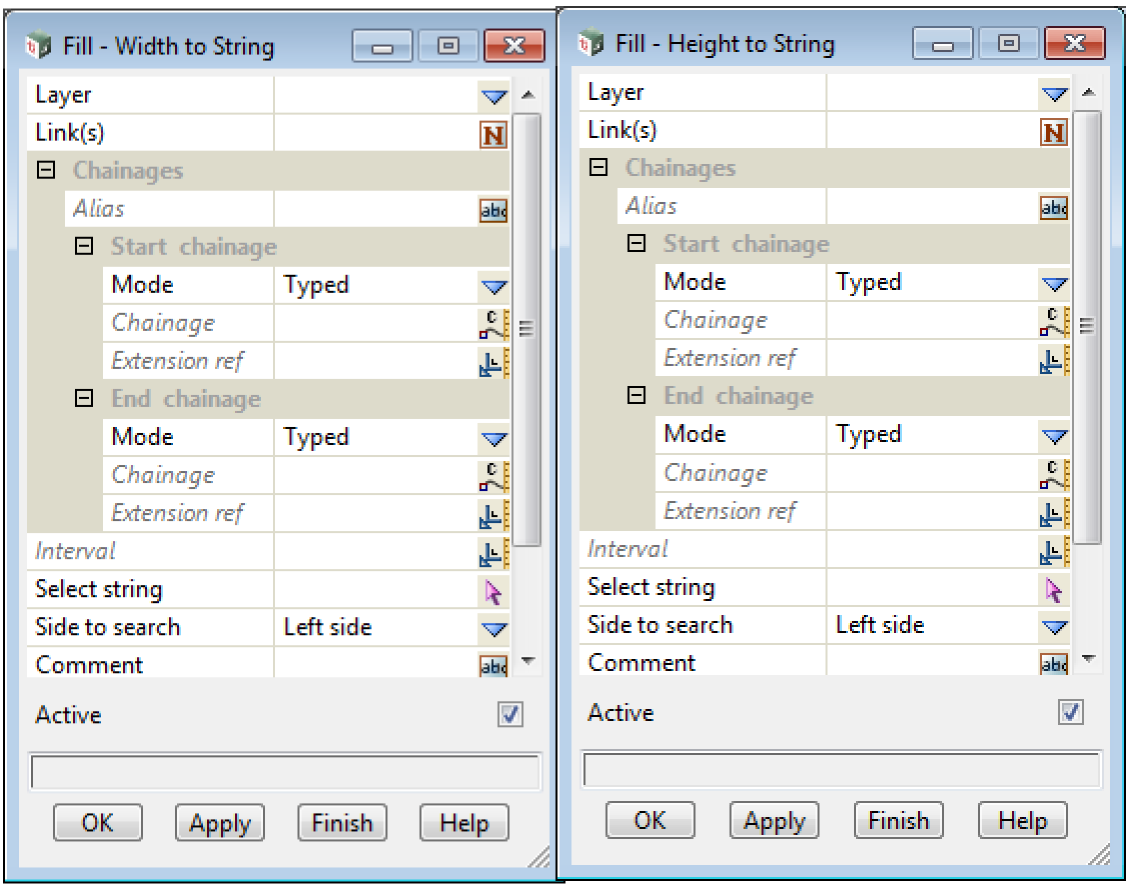
Modify Xfall to a String - for Link defined by Slope and Height

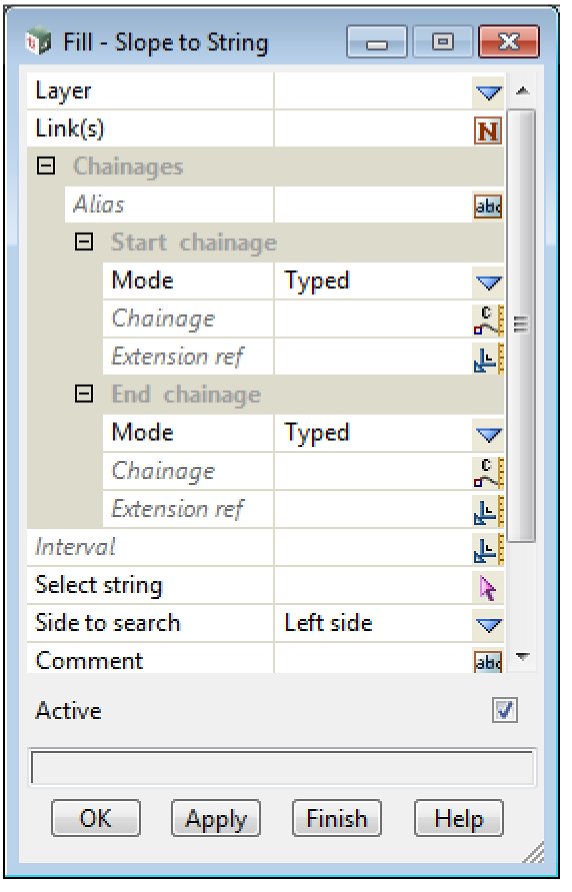
Note:

Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example for a modifier defined by *width and slope*, using *width to string* and a *slope to string* with the same string will place the end of the link on that string.

But the To string option will do the same thing in one command. See Cut Link - Modify To String.

Selecting the **width to string, height to string or slope to string** option brings up the **Fill - Width to String**, **Fill - Height to String** and **Fill - Slope to String** panels respectively.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers ***except for this option**:*

*When the **Start mode** is **Start (ref),** or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.*

*When the **End mode** is **End (ref),** or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String	string-select		

select string to use for defining width/height/slope for the link.

Side to search	input	left side	left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/slope.

Extra start/end	tick box		

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

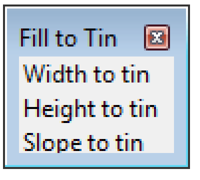
OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.3.0.16 Fill Link - to Tin or return to 21.3.0.10 Insert Fill Links from a Template.

21.3.0.16 Fill Link - to Tin

The *Fill* **to tin** walk-right brings up the **Fill to Tin** menu with options to calculate the width, height or slope to get to a given tin (which doesn't have to be the Apply MTF tin).

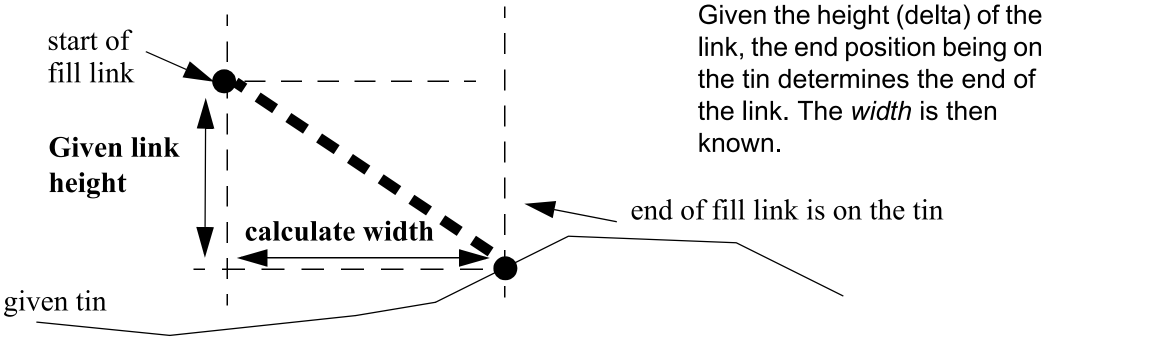


For *Width/Height/Tin to tin*, go to the next section Fill Link - Modify Width, Height or Xfall to Sit on User Tin

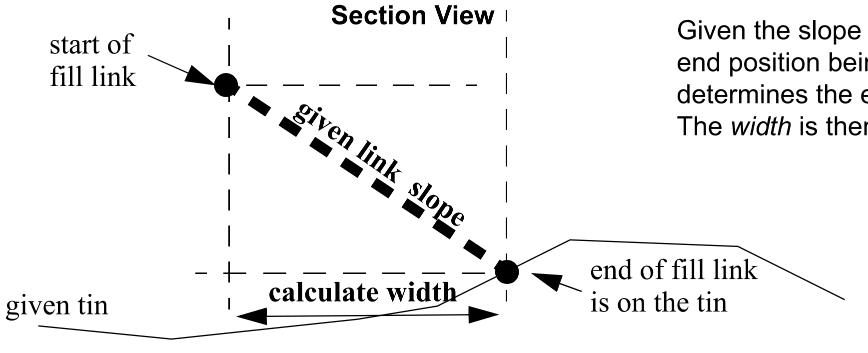
Fill Link - Modify Width, Height or Xfall to Sit on User Tin

Width to Tin

For a fill link defined by *width and height* or *width and slope*, **Width to tin** calculates the **width** of the link as the width required so that the link will sit on the user given tin at the ***height/slope given in the link***. The option gives an error for a link defined by *height and slope*.



Link - width and height - width calculated from the tin and given height (delta)



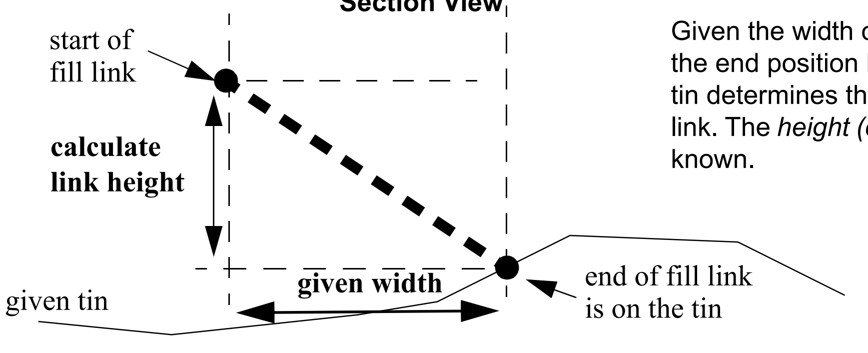
Given the slope of the link, the end position being on the tin determines the end of the link. The *width* is then known.

Link - width and slope - width calculated from the tin and given slope

Height to Tin

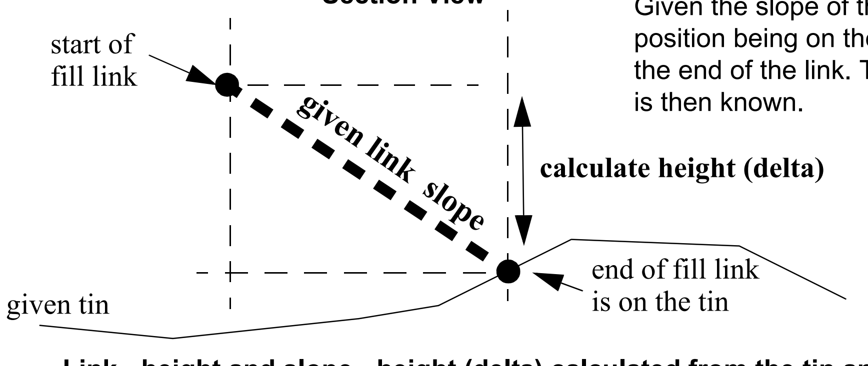
For a fill link defined by *height and width* or *height and slope*, the **Height to tin** calculates the ***height*** of the link as the difference in the height of the start point of the link, and the height that is required so that the link will sit on the user tin at the ***width/slope given in the link.*** The option gives an error for a link defined by *width and xfall*.

Important Note - for a Fill link, **positive** height and slopes are **down**.



Given the width of the link, the end position being on the tin determines the end of the link. The *height (delta)* is then known.

Link - height and width - height (delta) calculated from the tin and given width

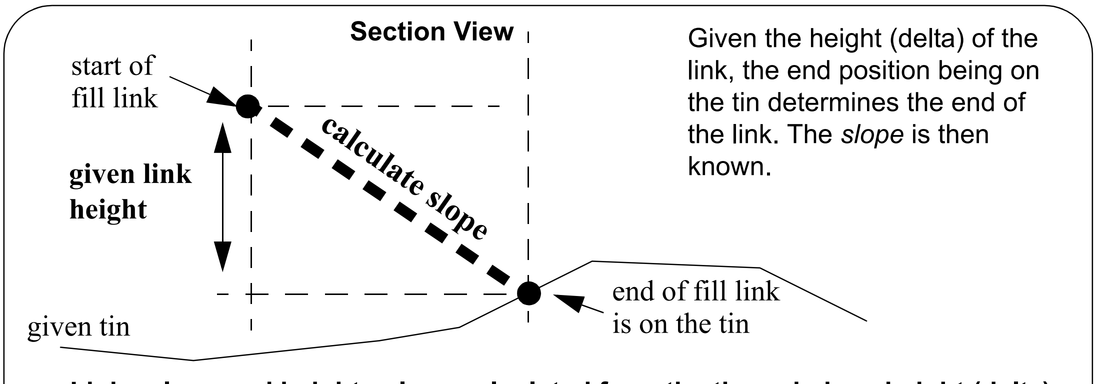


Given the slope of the link, the end position being on the tin determines the end of the link. The *height (delta)* is then known.

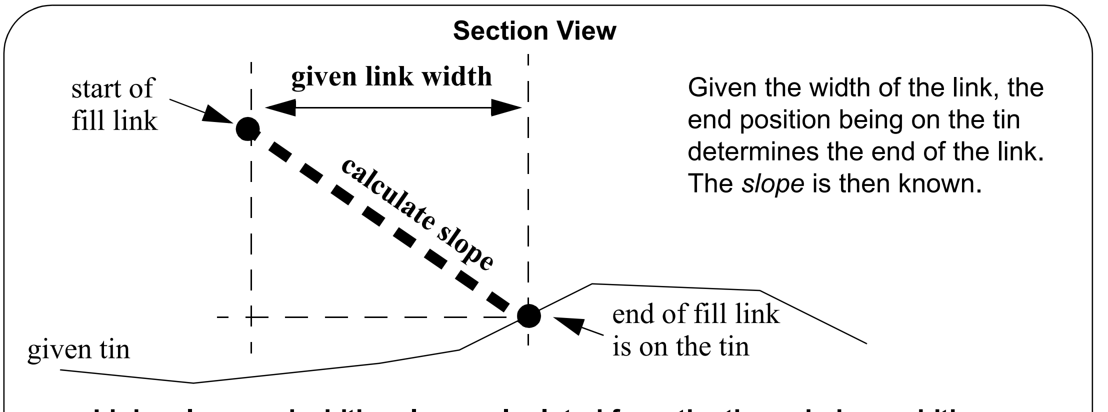
Link - height and slope - height (delta) calculated from the tin and given slope

Slope to Tin

For a fill link defined by *slope and width* or *slope and height*, **Slope to tin** calculates the **slope** of the link as the *slope* required so that the link will sit on the user tin at the ***width/height given in the link***. The option gives an error for a link defined by *width and height*.



Link - slope and height - slope calculated from the tin and given height (delta)



Link - slope and width - slope calculated from the tin and given width

Selecting **Width to tin**, **Height to tin, or Slope to tin** brings up the **Fill - Width to Tin**, **Fill - Height to Tin** and **Fill - Slope to Tin** panels respectively.

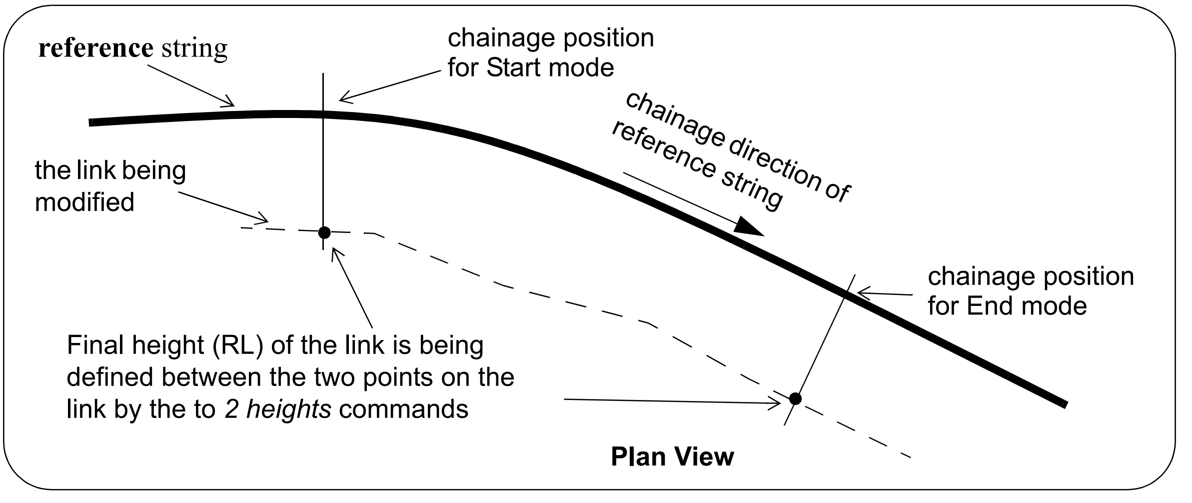
Continue to the next section 21.3.0.17 Fill Link - to Two Heights or return to 21.3.0.10 Insert Fill Links from a Template.

21.3.0.17 Fill Link - to Two Heights

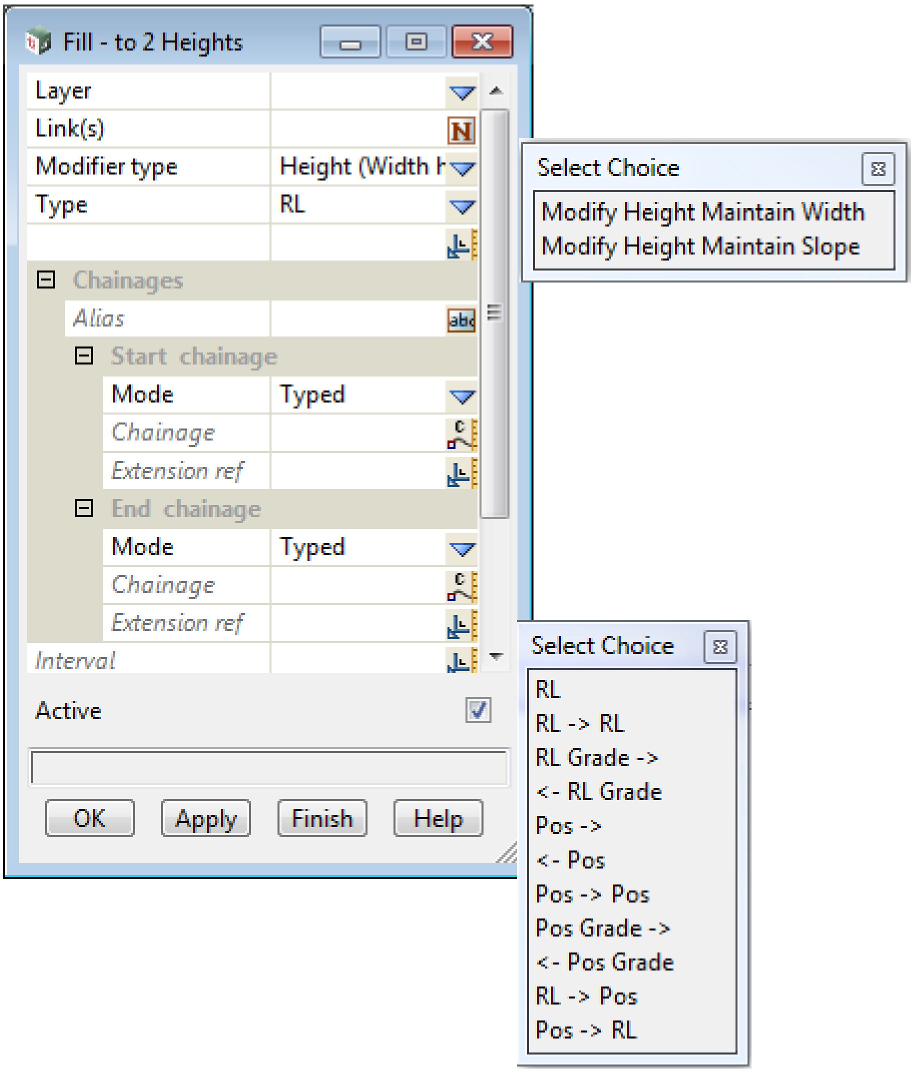
For an existing link, the **to 2 heights** option has a number of methods for **defining the height** from the start mode chainage to the end mode chainage. For example, over the chainage range, the height can be interpolated between two given RL's.

However if the *Apply MTF* tin is cut before reaching the end of the modified link, the ***fill link stops at the tin***.



Note: the ***2 Strings*** modifiers work with two points in a **section**. See 21.3.0.18 Fill Link - to Two Strings.

Selecting **o 2 heights** brings up the **Fill - to 2 Heights** panel

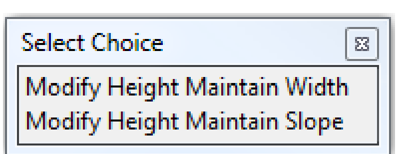


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Modifier type	choice box		



*The **Maintain** Slope/Width is the part of the new definition of the selected link that is taken from the selected* **Link name**. *See* Fill - Maintaining Width or Slope.

*The **Height** for the selected link is calculated by the method given by **Type**.*

Start/End mode	choice box	Start (ref)/End (ref)	

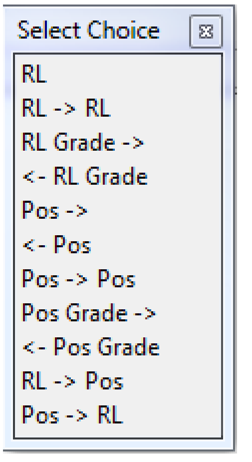
defines the start/end chainages for modifying the link.
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers.

Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*

*If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Type choice box



For the calculation of height for each type, go to Fill - Maintaining Width or Slope

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Fill - Maintaining Width or Slope

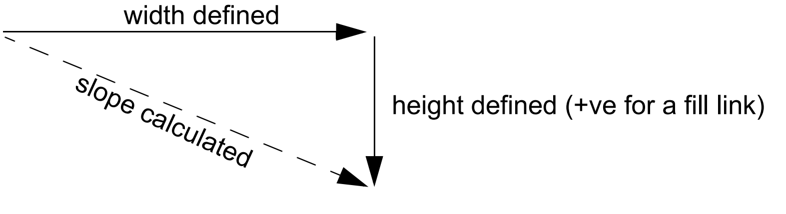
The option ***to 2 heights*** defines the ***height*** of the selected string so to completely define the link, only the width *or* the slope is needed.

So from the selected link only the *width* or the xfall is used (maintained) - the height is calculated by the **to 2 heights** option.

If the selected link is defined by ***width and height***, then at any chainage a ***slope*** can be calculated from the width and height at that chainage.

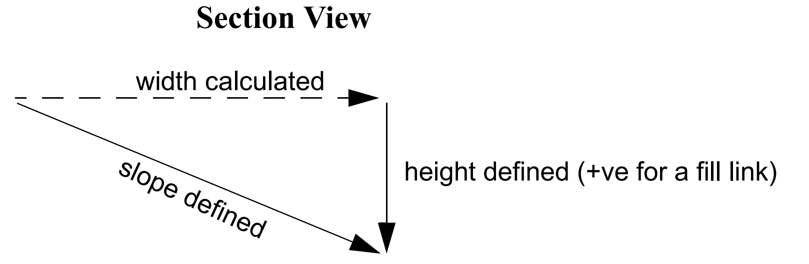
Important note - for a **fill link**, for slope and heights, **positive** is **down**.

Section View



For links defined by width and height, the ***slope*** at each chainage is uniquely defined

If the selected link is defined by ***slope and height***, then at any chainage a ***width*** can be calculated from the slope and height at that chainage.

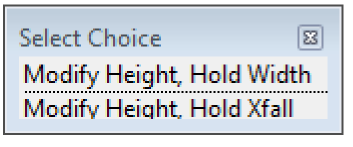


For links defined by slope and height, the ***width*** at each chainage is uniquely defined

Hence it doesn't matter if the selected link is defined by *width and slope*, *width and height*, or *slope and height*, at each chainage a *width and slope* are uniquely defined.

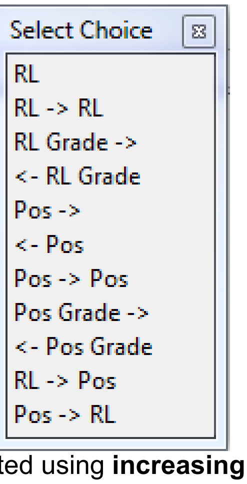
So no matter how the selected link is defined, at any chainage, a unique width or a slope is known and it is that **Width** or **Slope** can be maintained by the ***to 2 heights*** option.

So the choices for the option are:



Continue to the next section 21.3.0.18 Fill Link - to Two Strings or return to 21.3.0.17 Fill Link - to Two Heights, 21.3.0.10 Insert Fill Links from a Template.

Fill - Calculating the Heights for each Type



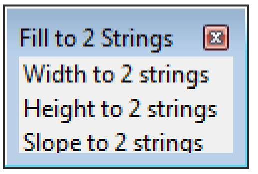
Important Note: Grade is calculated using **increasing Alignment chainages** and the **heights at the points** along the string being modifies. When going around a curve this will not be exactly the same as the grade along the string being modified.

The definitions of the calculations for each choice are the same as for the Fixed links. See 21.2.2.2.13.1 Fixed - Calculating the Heights for each Type.

Continue to the next section 21.3.0.18 Fill Link - to Two Strings or return to 21.3.0.17 Fill Link - to Two Heights, 21.3.0.10 Insert Fill Links from a Template.

21.3.0.18 Fill Link - to Two Strings

The *Fill* **to 2 strings** walk-right brings up the **Fill to 2 Strings** menu with options to calculate the width, height or slope from two given strings.



For *Width/Height/Slope to 2 Strings*, go to the next section [Fill Link - Width, Height or Slope Between Two Strings]

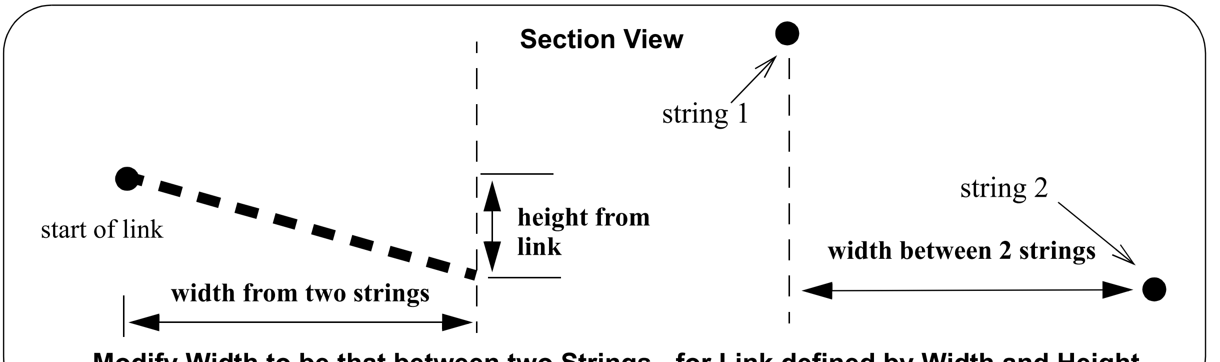
Fill Link - Width, Height or Slope Between Two Strings

Width Between Two Strings

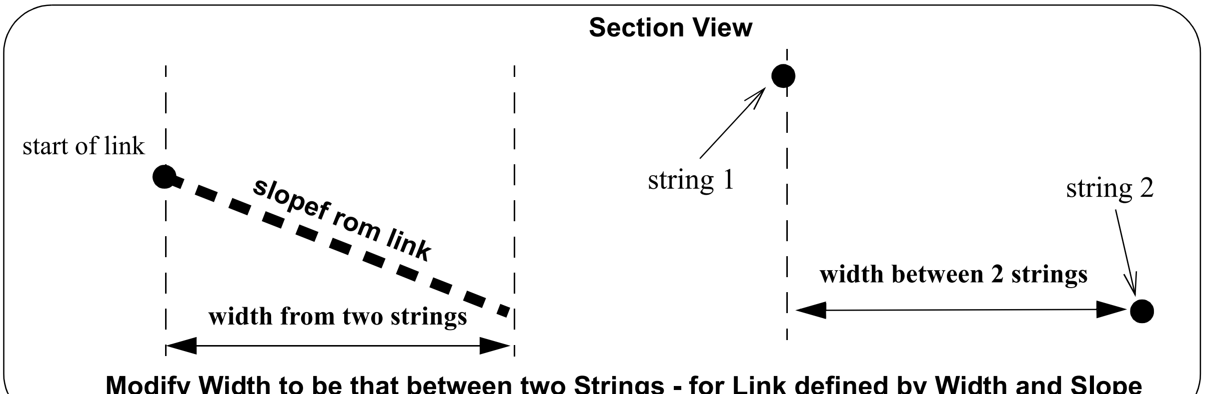
For a fill link defined by *width* and *height* or *width* and *slope*, **Width to 2 strings** sets the **width** for a link to be the **width between two** existing ***12d Model*** strings,

However if the Apply MTF tin is cut before reaching the string, the ***fill link stops at the tin***.

The option will give an error for a link defined by *height* and *slope*.



Modify Width to be that between two Strings - for Link defined by Width and Height



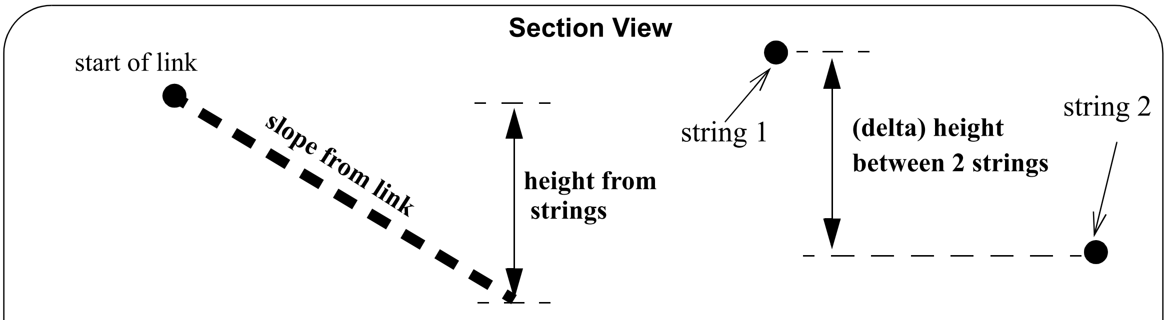
Modify Width to be that between two Strings - for Link defined by Width and Slope

Height Between Two Strings

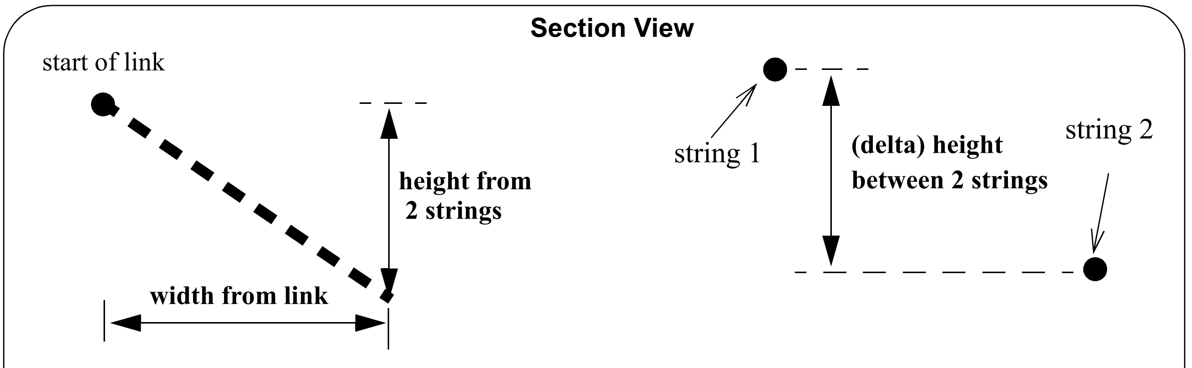
For a fill link defined by *height* and *width* or *height* and *slope*, **Height to 2 strings** sets the **height** for the link to be the **height between two** existing ***12d Model*** strings,

However if the Apply MTF tin is cut before reaching the string, the ***fill link stops at the tin***.

The option will give an error for a link defined by *width* and *slope*.



Modify Height to be that between two Strings - for Link defined by Height and Slope



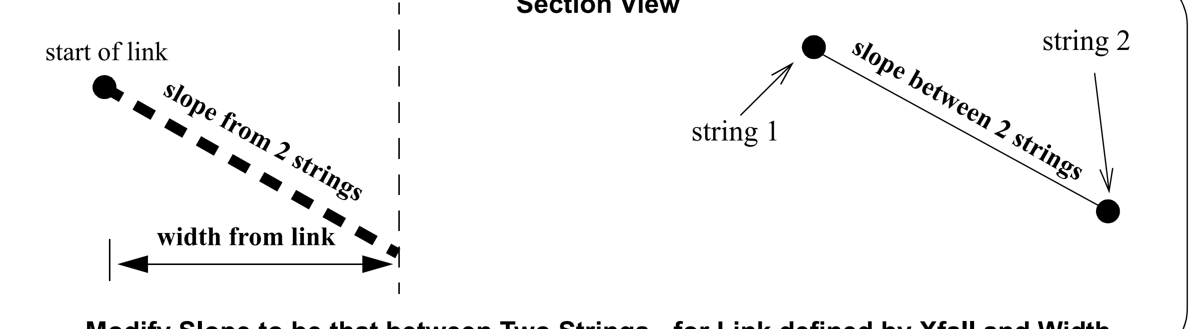
Modify Height to be that between two Strings - for Link defined by Height and Width

Slope Between Two Strings

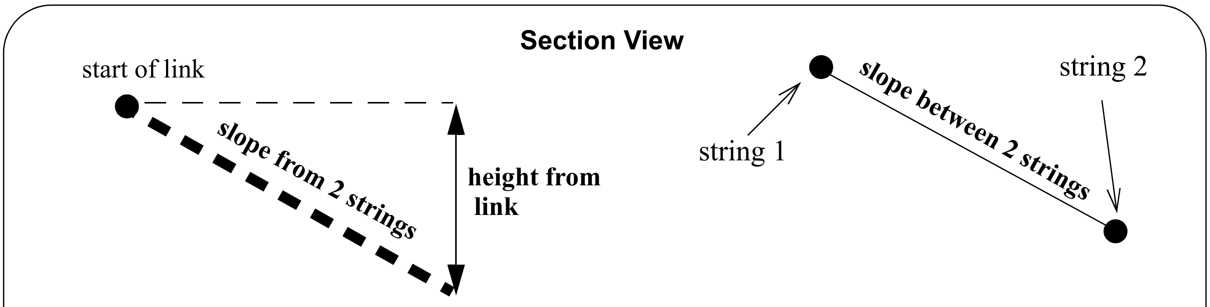
For a cut link defined by *slope* and *width* or *slope* and *height*, **Slope to 2 strings** sets the **slope** for the link to be the **slope between two** existing***12d Model*** strings,

However if the Apply MTF tin is cut before reaching the string, the ***cut link stops at the tin***.

The option will give an error for a link defined by *width* and *height*.

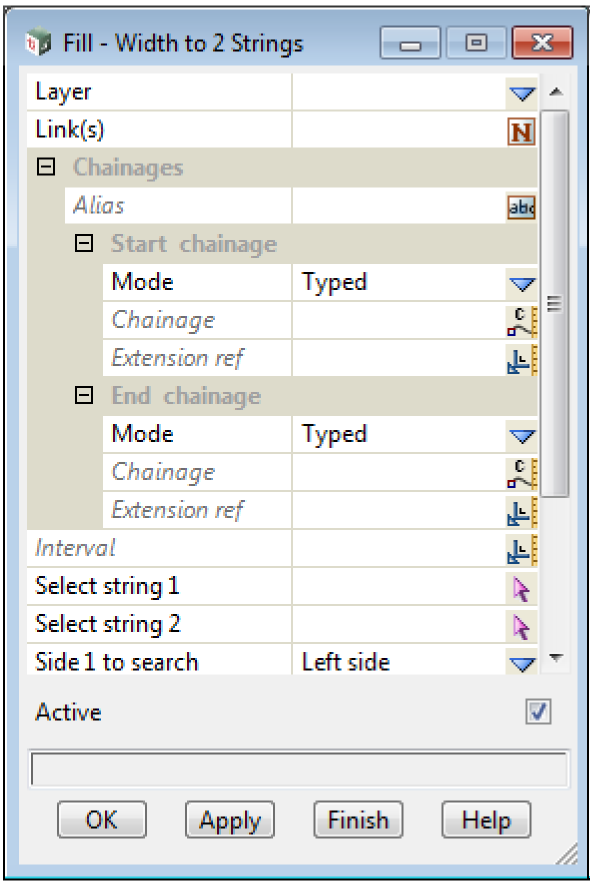


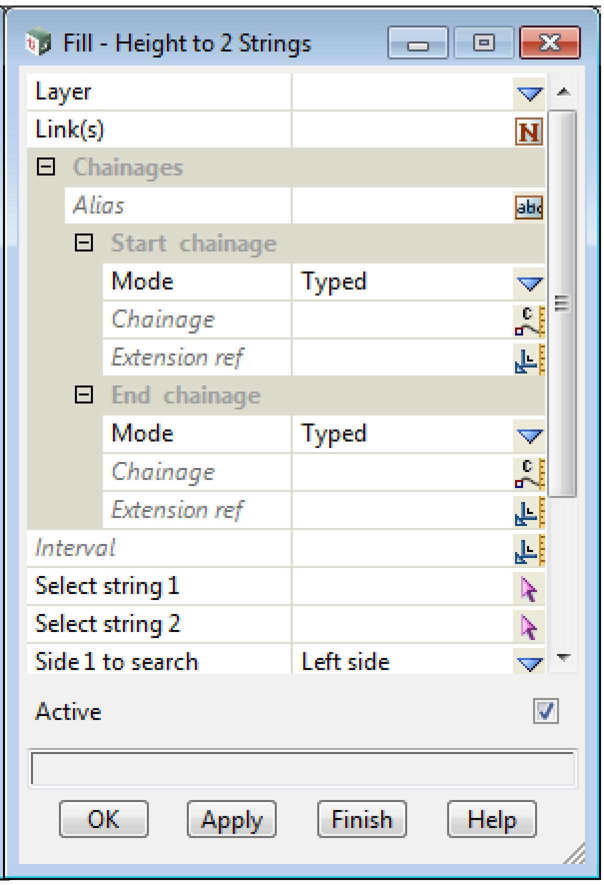
Modify Slope to be that between Two Strings - for Link defined by Xfall and Width

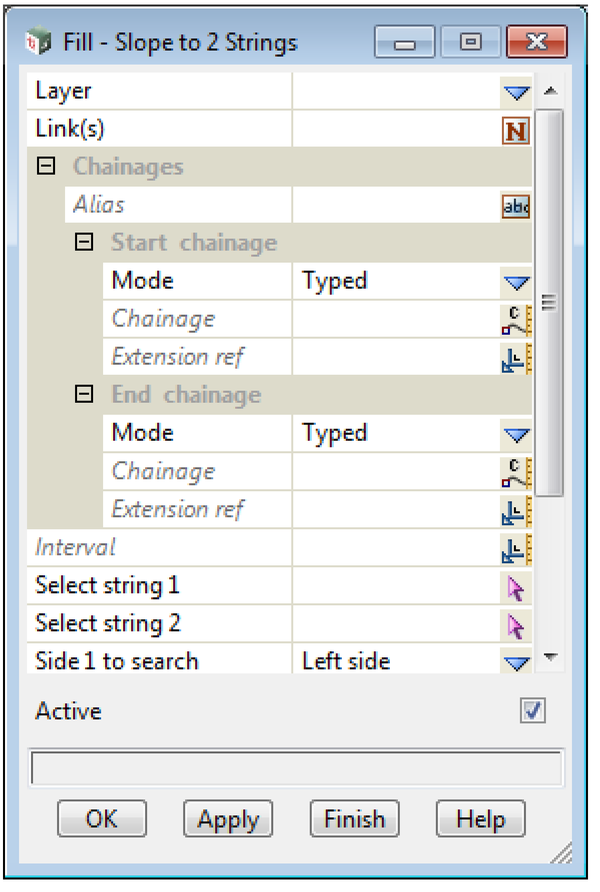


Modify Slope to be that between Two Strings - for Link defined by Xfall and Height

Selecting the **width to 2 strings**, **height to 2 strings or slope to 2 strings** option brings up the **Fill - Width to 2 Strings**, **Fill - Height to 2 Strings** and **Fill - Slope to 2 String** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Link name input select name menu

name of the link to modify.

Start/End mode choice box Start (ref)/End (ref)

defines the start/end chainages for modifying the link
For more information on Start/End mode, see 21.2.1 MTF Hinge Modifiers

Interval input

if ***non blank****, the interval to use to create cross sections and strings over the given chainage range. If* ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String 1 string-select

select the first string to use for defining width/height/slope for the link.

String 2 string-select

select the second string to use for defining width/height/slope for the link.

Side 1 to search input left side left side, right side, both sides

side of the hinge string to start searching to find string 1 to use in defining width/height/slope.

Side 2 to search input left side left side, right side, both sides

side of the hinge string to start searching to find string 2 to use in defining width/height/slope.

Extra start/end tick box

if ***ticked****, add an extra x-section 0.1 mm* ***before*** *the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

Continue to the next section 21.4 Smart Chainages or return to 21.3.0.10 Insert Fill Links from a Template.

21.4 Smart Chainages

Many options in ***12d Model*** require a chainage value from another string, usually referred to as a **reference** string.

For example, in the Apply MTF and in all the left and right side modifiers in an MTF, there are ***start*** and ***end chainages*** where the chainage values refer to chainages on the reference string.

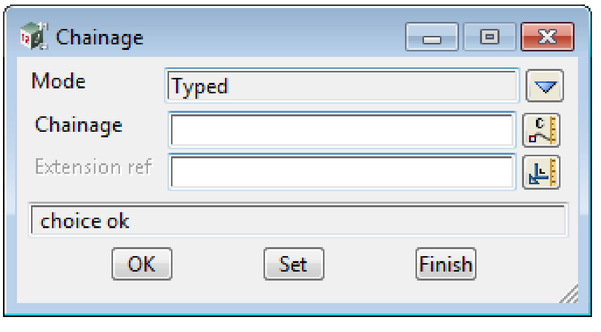
The traditional method of typing in a chainage value is supported but ***12d Model*** supports numerous other methods, called **smart chainages,** that calculate the chainage in various ways from the reference string geometry and from other strings.

The power of ***smart chainages*** is that when things move around, the smart chainages often don't have to be typed in again, but automatically recalculate themselves for the new situation. Hence the chainage values do not have to be revisited every time there is a change in geometry or for simple changes like modifying the start chainage of the reference string.

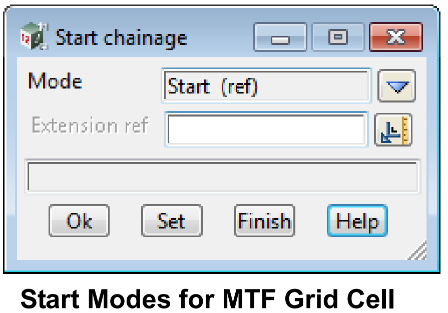
The ultimate goal is to be totally free of typed fixed chainages and to produce a **chainage free design**.

For panel fields and grids that allow smart chainages, instead of just a chainage field, there is also a **Mode** field with a pop up of all the smart chainages available for that field.

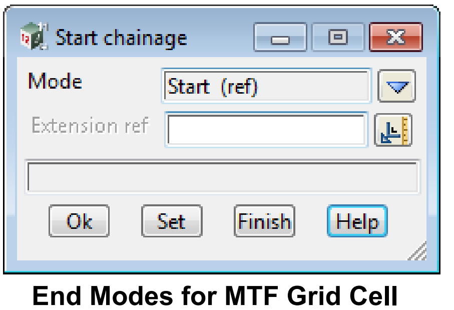
There is a **Modes**, **Start Mode** and/or **End Mode** depending on whether there is just a chainage value or the panel has start and end chainages and hence both a ***Start Mode*** and an ***End Mode***.



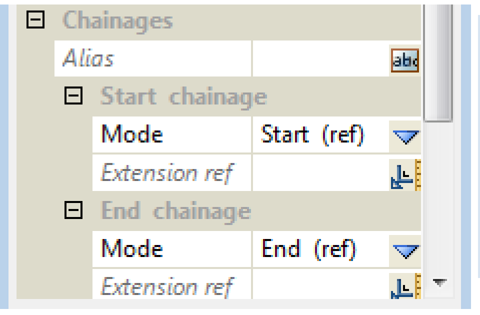
panel with just one chainage field in it and so just a Mode field



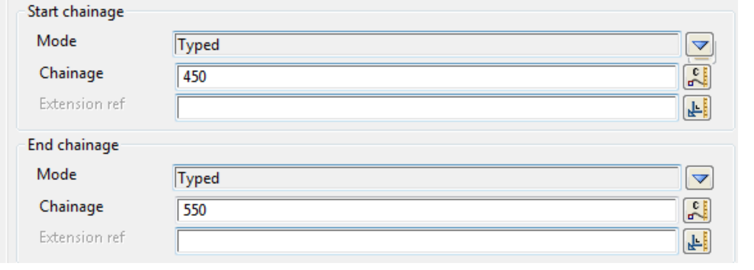
Start Modes for MTF Grid Cell



End Modes for MTF Grid Cell



Start and End Modes within MTF Modifiers

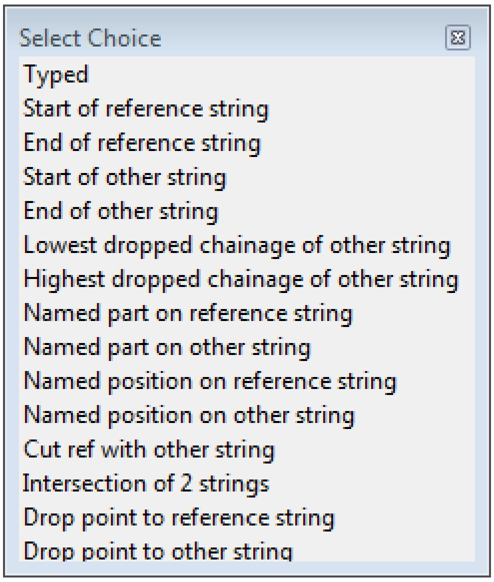


Start and End Modes within Apply MTF

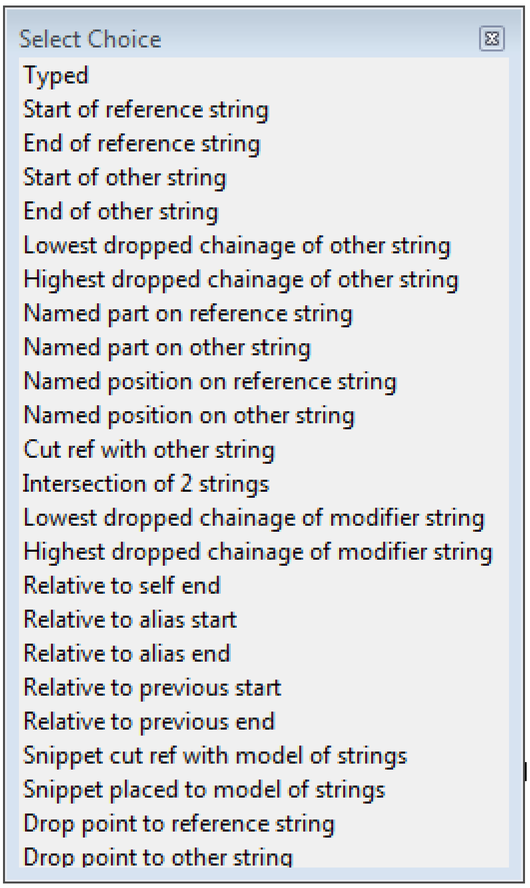
What choices are available for *Mode*, *Start Mode* and *End Mode* depends on the option that the smart chainage is in.

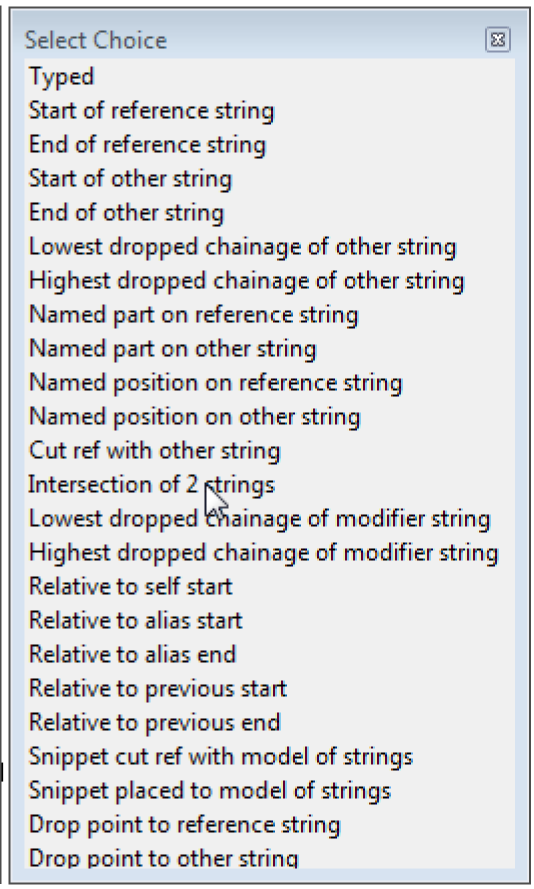
Finally most smart chainages also have an **Extension** field that is added to the chainage value calculated by the **Mode**.

For example, if the **Mode** was **End of reference string** and the **Extension** value was **-50** then the final smart chainage will be at chainage 50 before the end of the reference string, no matter what the actual end chainage is for the reference string. See 21.4.1 Extension Value.



Chainage Modes when option is not in the MTF Left and Right Modifiers





See

21.4.1 Extension Value
21.4.2 Typed
21.4.3 Start of Reference String
21.4.4 End of Reference String
21.4.5 Start of Other String
21.4.6 End of Other String
21.4.7 Lowest Dropped Chainage of Other String
21.4.8 Highest Dropped Chainage of Other String

21.4.1 Extension Value

For chainages given by **Start mode, End mode** or **Mode**, there is an **Extension ref** field in the **Chainage** panel and the **Extension ref** value is ***added*** to the reference chainage calculated by the **Smart Chainage**.

For example, if the **Mode** was **End of reference string** and the **Extension** value was **-50** then the final smart chainage will be at chainage 50 before the end of the reference string no matter what the actual end chainage is for the reference string.

In the cases when the **Mode** uses another string as well as the reference string, there is a **String** and **Extension other** field for the other string as well as an **Extension ref** field for the reference string.

For example, for the **Mode *Start of other string,*** there is a **Extension other** and an **Extension ref**.

To get the final chainage, the value of **Extension other** is added to the *Start chainage* of the string selected in **String** (the **other** string). This point on the other string is then dropped onto the Reference string.

The value of **Extension ref** is then added to the chainage of the dropped point onto the Reference string, to give the **final** chainage used.

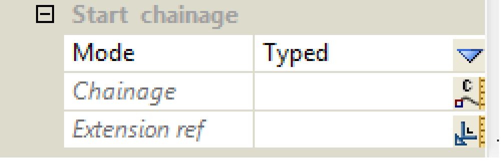
Notes

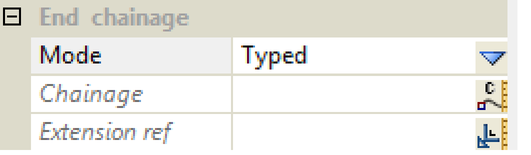
Extension other and **Extension ref** can be positive or negative.

Continue to the next section 21.4.2 Typed or return to 21.2.1 MTF Hinge Modifiers.

21.4.2 Typed

Selecting **Typed** adds a ***Chainage*** and an **Extension ref** field.





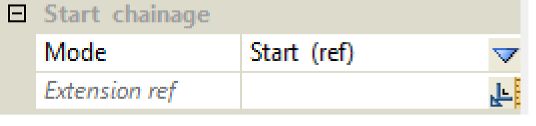
A reference string chainage is typed into the **Chainage** field and the value in the **Extension ref** field is then **added** to this value to give the chainage used as the ***final chainage***.

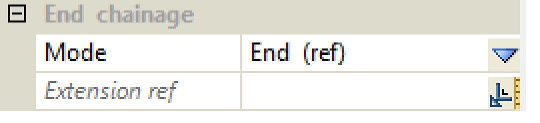
If the ***Chainage*** is left blank then the ***start/end chainage of the reference string*** is used as the **Chainage** value.

Continue to the next section 21.4.3 Start of Reference String or return to 21.2.1 MTF Hinge Modifiers.

21.4.3 Start of Reference String

Selecting **Start of reference string** adds an **Extension ref** field.



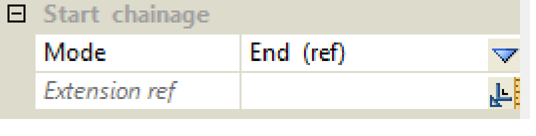


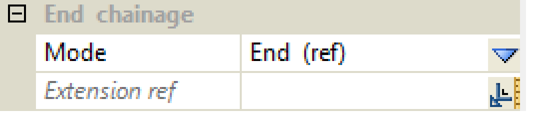
The value in the **Extension ref** field is **added** to the ***start chainage of the reference string*** to give the chainage used as the ***final chainage***.

Continue to the next section 21.4.4 End of Reference String or return to 21.2.1 MTF Hinge Modifiers.

21.4.4 End of Reference String

Selecting **End of reference string** adds an **Extension ref** field.



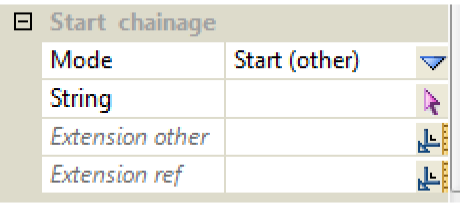


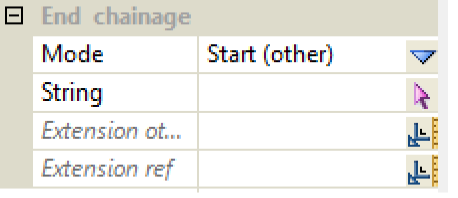
The value in the **Extension ref** field is **added** to the ***end chainage of the reference string*** to give the chainage used as the ***final chainage***.

Continue to the next section 21.4.5 Start of Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.5 Start of Other String

Selecting **Start of other string** adds ***String***, **Extension other** and **Extension ref** fields.



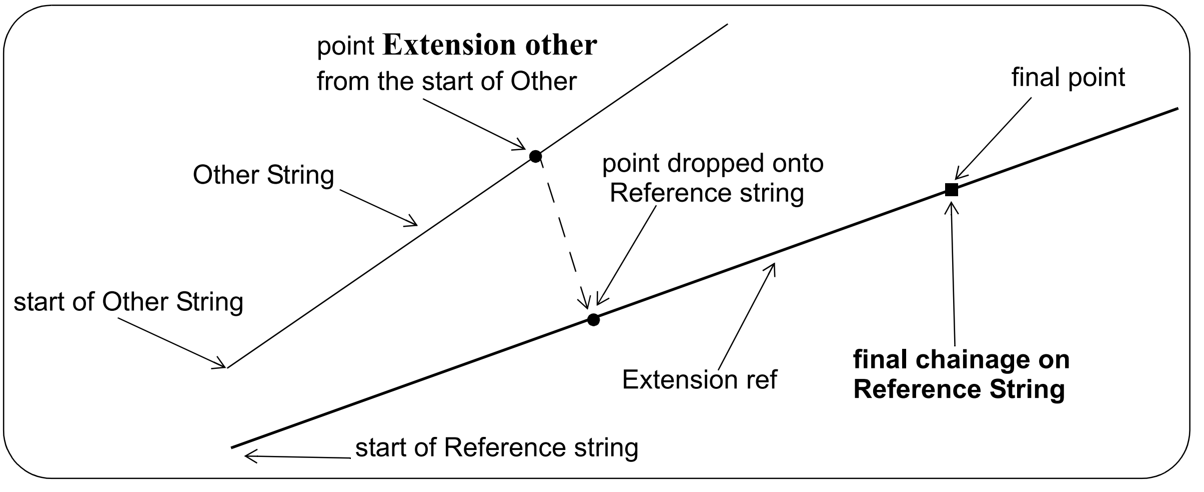


The **String** field is to select a string referred to as the **Other** string.

To get the final chainage, the value of **Extension other** is added to the ***Start chainage* of the Other string**. This point on the *other* string is dropped **onto** the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

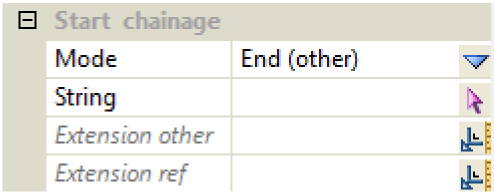
.

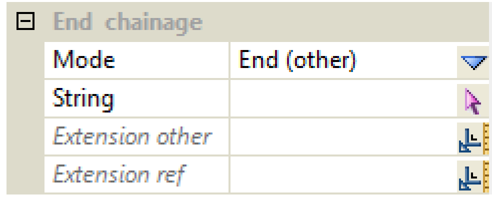


Continue to the next section 21.4.6 End of Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.6 End of Other String

Selecting **End of other string** adds ***String***, **Extension other** and **Extension ref** fields.



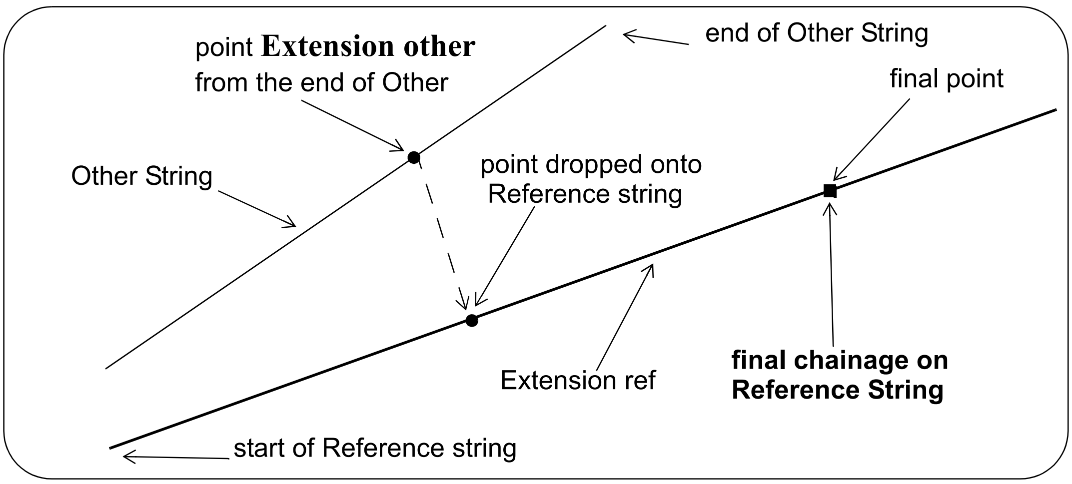


The **String** field is to select a string referred to as the **Other** string.

To get the final chainage, the value of **Extension other** is added to the ***End chainage* of the Other string**. This point on the *other* string is dropped **onto** the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

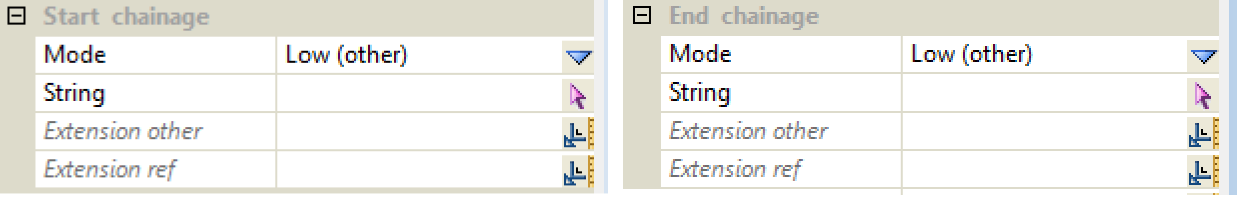
.



Continue to the next section [21.4.7 Lowest Dropped Chainage of Other String] or return to [21.2.1 MTF Hinge Modifiers].

21.4.7 Lowest Dropped Chainage of Other String

Selecting **Lowest dropped chainage of other string** adds ***String***, **Extension other** and **Extension ref** fields.



The **String** field is to select a string referred to as the **Other** string.

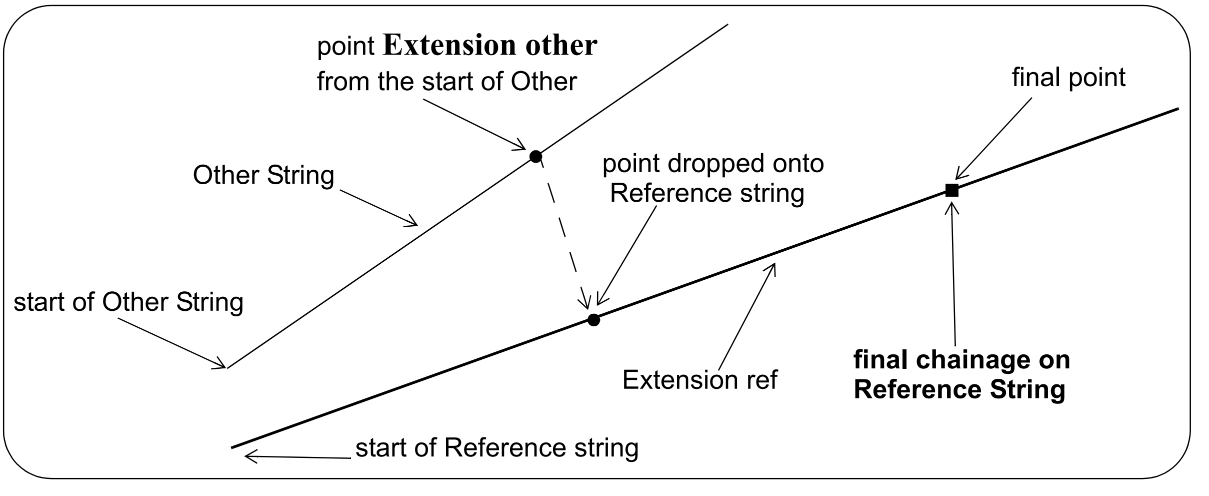
The *start* and *end* of the **Other** string are dropped onto the Reference string and the lower of the reference chainages of the two dropped end**??**.

How is Extension other used??

To get the final chainage, the value of **Extension other** is added to the ***Start chainage* of the Other string**. This point on the *other* string is dropped **onto** the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

.



Continue to the next section 21.4.8 Highest Dropped Chainage of Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.8 Highest Dropped Chainage of Other String

Selecting **Lowest dropped chainage of other string** adds ***String***, **Extension other** and **Extension ref** fields.

Start chainage		
Mode	High (other)	
String		
Extension other		
Extension ref		

End chainage		
Mode	High (other)	
String		
Extension other		
Extension ref		

The **String** field is to select a string referred to as the **Other** string.

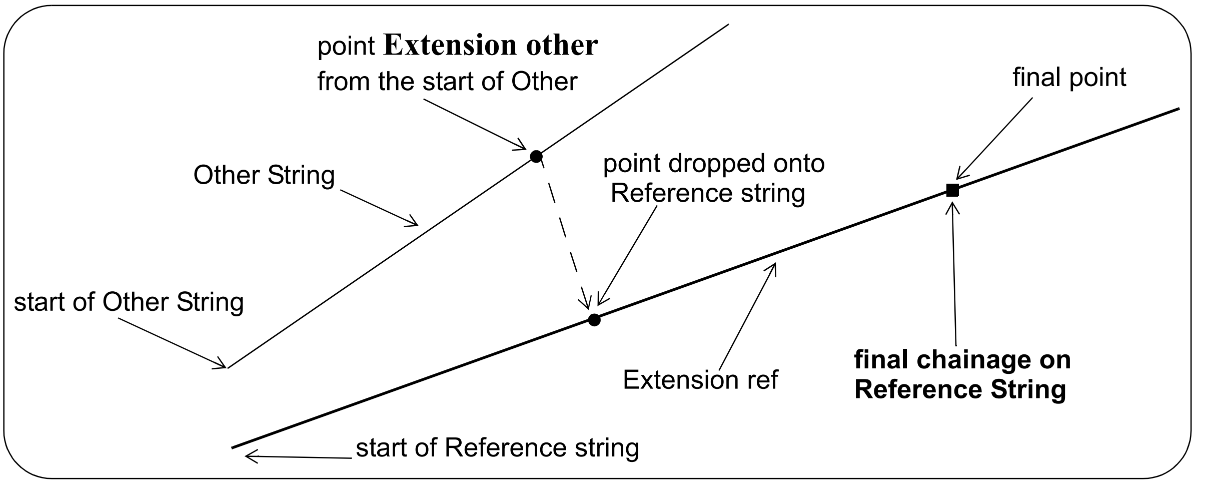
The *start* and *end* of the **Other** string are dropped onto the Reference string and the higher of the reference chainage of the two dropped end**??**.

How is Extension other used??

To get the final chainage, the value of **Extension other** is added to the ***Start chainage* of the Other string**. This point on the *other* string is dropped **onto** the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

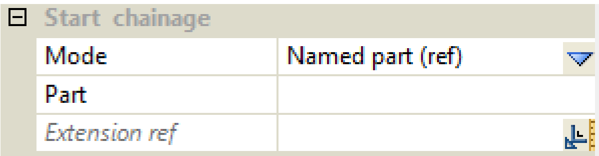
.

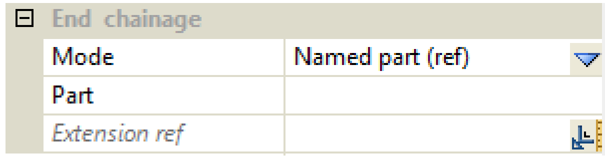


Continue to the next section [21.4.9 Named Part on Reference String]() or return to [21.2.1 MTF Hinge Modifiers]().

21.4.9 Named Part on Reference String

Selecting **Named part on reference string** adds the **Part** and **Extension ref** fields.

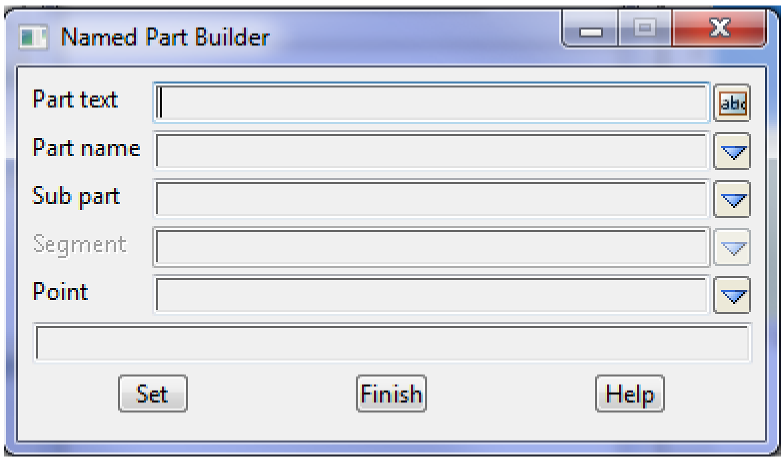




The syntax for the required **Named Part** on the **Reference** string can be typed into the **Part** field.

Or clicking LB or RB on the **+** for **Part** brings up the **Named Part Builder** for the reference string and this can be used to create the **Par text** for the section of a named part of the reference string that is required. Pressing **Set** then puts this value into the **Part** field.

.



The value in the **Extension ref** field is **added** to the reference chainage calculated for the selected named part to give the chainage used as the ***final chainage***.

Important Note

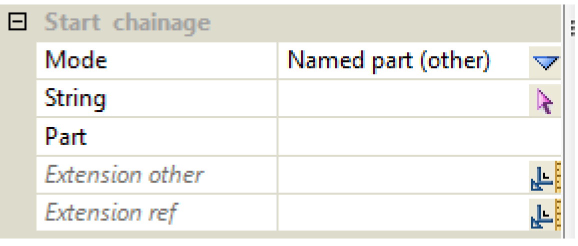
The **Named Parts** fields access the ***Vertical named parts*** as well as the ***Horizontal named Parts*** of a Super Alignment and the **Part name** pop up list **both** the horizontal and vertical named parts.

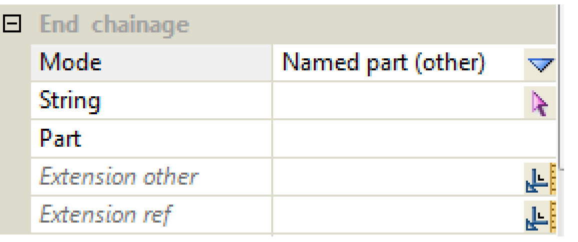
The **Modes** cannot distinguish between the names for horizontal and vertical named parts so **the horizontal names are given priority**. So if a vertical part has the same names as a horizontal part then the vertical name will not be shown in the **Part name** list.

Continue to the next section 21.4.10 Named Part on Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.10 Named Part on Other String

Selecting **Named part on other string** adds the **String**, **Part**, **Extension other** and **Extension ref** fields.



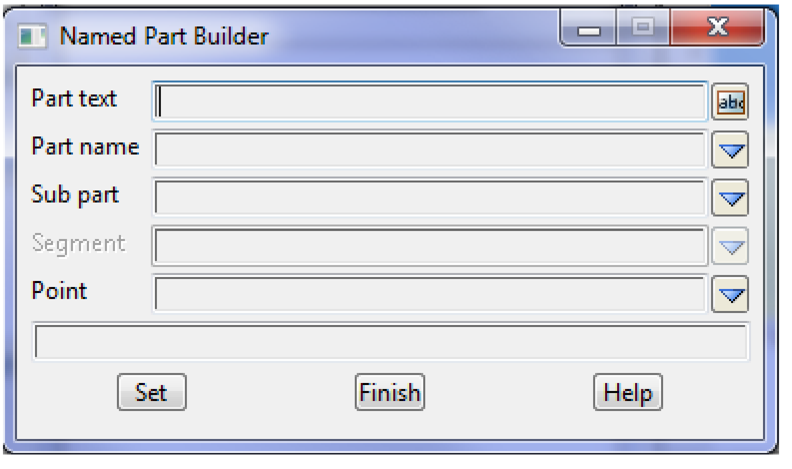


The **String** field is to select a string referred to as the **Other** string.

The syntax for the required **Named Part** on the **Other** string can be typed into the **Part** field.

Or clicking LB or RB on the **+** for **Part** brings up the **Named Part Builder** for the **Other** string and this can be used to create the **Par text** for the section of a named part of the Other string that is required. Pressing **Set** then puts this value into the **Part** field.

.



The value in the **Extension ref** field is **added** to the reference chainage calculated for the selected named part to give the chainage used as the ***final chainage***.

Important Note

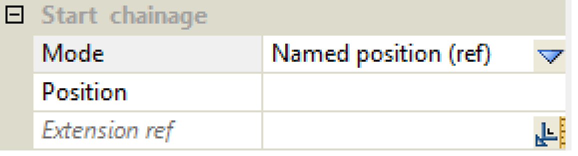
The **Named Parts** fields access the ***Vertical named parts*** as well as the ***Horizontal named Parts*** of a Super Alignment and the **Part name** pop up list **both** the horizontal and vertical named parts.

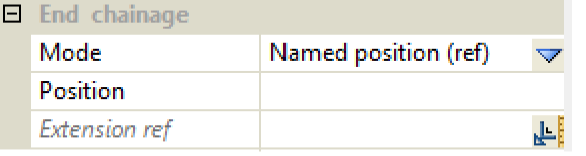
The **Modes** cannot distinguish between the names for horizontal and vertical named parts so **the horizontal names are given priority**. So if a vertical named part has the same names as a horizontal named part then the vertical name will not be shown in the **Part name** list.

Continue to the next section 21.4.11 Named Position on Reference String or return to 21.2.1 MTF Hinge Modifiers.

21.4.11 Named Position on Reference String

Selecting **Named position on reference string** adds the **Position** and **Extension ref** fields.





A ***Named Position*** for the ***Reference*** string can be typed into the **Position** field, or selected from the **Position** pop up which brings up the list of all *Named Positions* for the **Reference** string.

The value in the **Extension ref** field is **added** to the reference chainage calculated for the selected named position to give the chainage used as the ***final chainage***.

Important Note

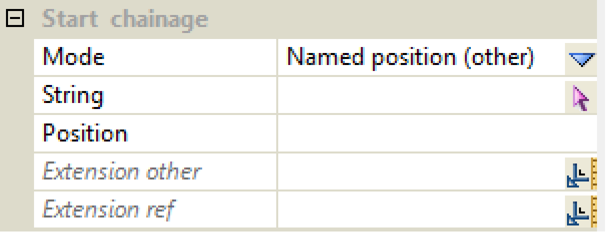
The **Named Position** fields access the ***Vertical named positions*** as well as the ***Horizontal named positions*** of a Super Alignment and the **Position** pop up list **both** the horizontal and vertical named positions.

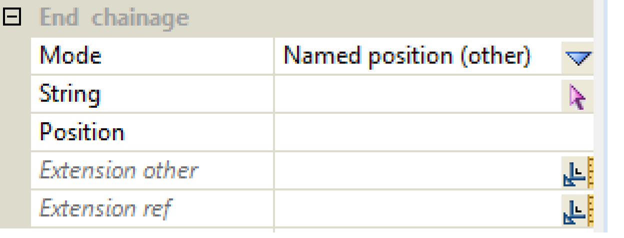
The **Modes** cannot distinguish between the names for horizontal and vertical named positions so **the horizontal names are given priority**. So if a vertical named part position has the same name as a horizontal named position then the vertical name will not be shown in the **Named Position** list.

Continue to the next section 21.4.12 Named Position on Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.12 Named Position on Other String

Selecting **Named position on other string** adds the **String**, **Position**, **Extension other** and **Extension ref** fields.





The **String** field is to select a string referred to as the **Other** string.

A ***Named Position*** for the ***Other*** string can be typed into the **Position** field, or selected from the **Position** pop up which brings up the list of all *Named Positions* for the **Other** string.

The value in the **Extension ref** field is **added** to the reference chainage calculated for the selected named part to give the chainage used as the ***final chainage***.

Important Note

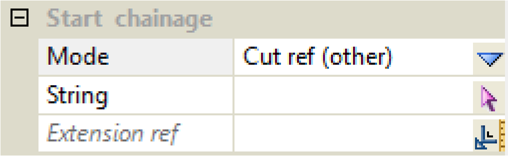
The **Named Position** fields access the ***Vertical named positions*** as well as the ***Horizontal named positions*** of a Super Alignment and the **Position** pop up list **both** the horizontal and vertical named positions.

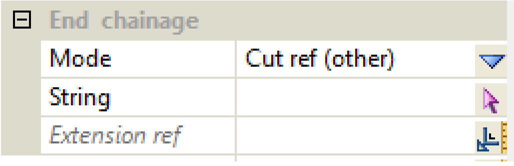
The **Modes** cannot distinguish between the names for horizontal and vertical named positions so **the horizontal names are given priority**. So if a vertical named part position has the same name as a horizontal named position then the vertical name will not be shown in the **Named Position** list.

Continue to the next section 21.4.13 Cut Reference with Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.13 Cut Reference with Other String

Selecting **Cut reference with other string** adds the **String** and **Extension ref** fields.



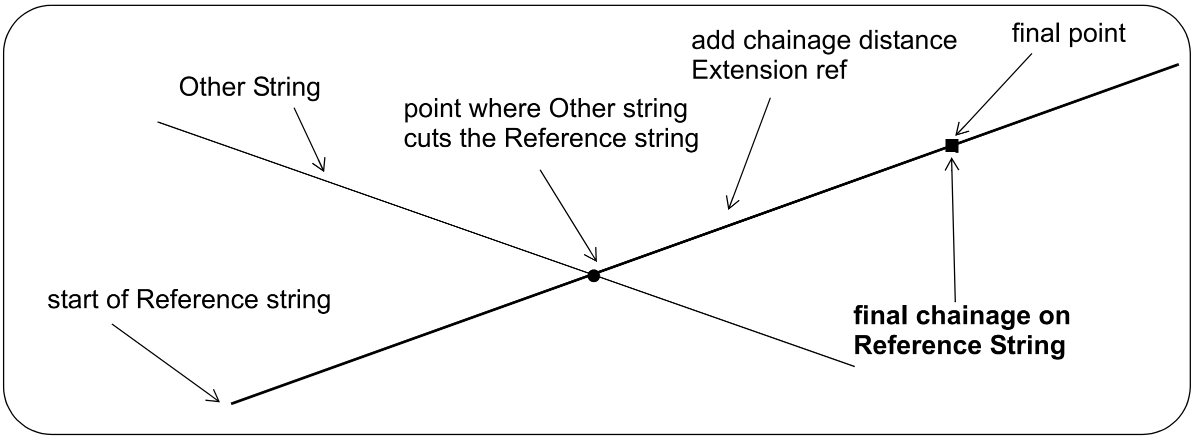


The **String** field is to select a string referred to as the **Other** string.

The point on the Reference string where the Other string cuts the Reference string is first calculated.

The value in the **Extension ref** field is **added** to the reference chainage calculated for the cut point to give the chainage used as the ***final chainage***.

.

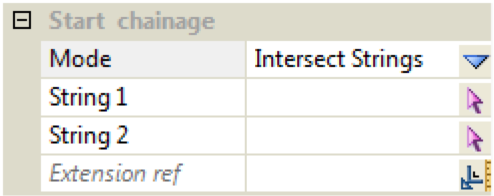


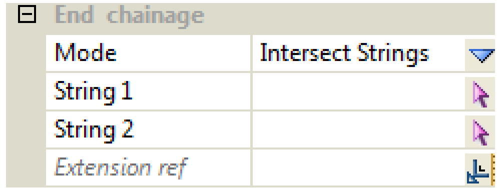
Note - if the other string does not cut the reference string, or cuts it in more than one place, then the *Mode* is invalid and an error message is generated.

Continue to the next section 21.4.14 Intersection of Two Strings or return to 21.2.1 MTF Hinge Modifiers.

21.4.14 Intersection of Two Strings

Selecting **Intersection of 2 strings** adds the **String 1**, **String 2** and **Extension ref** fields.





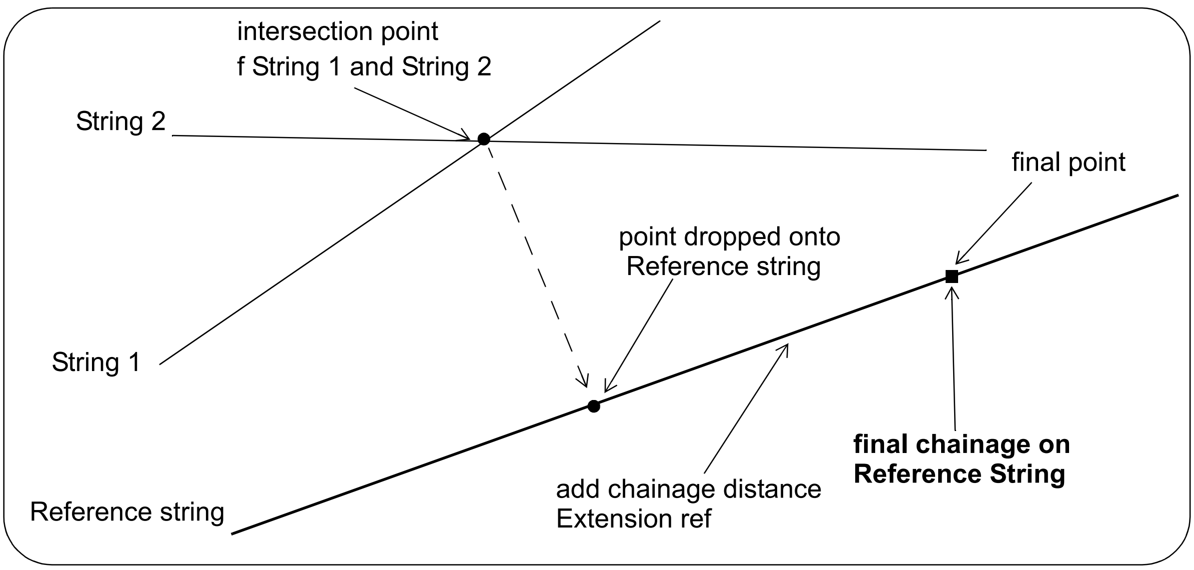
Two strings are selected with the **String 1** and **String 2** fields.

The value in the **Extension ref** field is **added** to the reference chainage calculated for the cut point to give the chainage used as the ***final chainage***.

The *intersection* point of the two selected strings is calculated and dropped onto the Reference string.

The value in the **Extension ref** field is **added** to the reference chainage of the dropped intersection point to give the chainage used as the ***final chainage***.

.

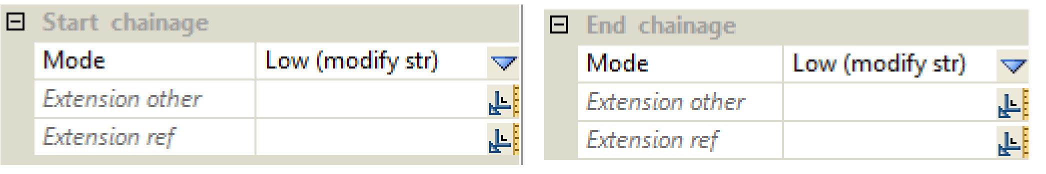


Continue to the next section 21.4.17 Relative to Self End or return to 21.2.1 MTF Hinge Modifiers.

21.4.15 Lowest Dropped Chainage of Modifier String

The Smart Chainage **Lowest dropped chainage of modifier string** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Lowest dropped chainage of modifier string** adds **Extension other** and **Extension ref** fields.



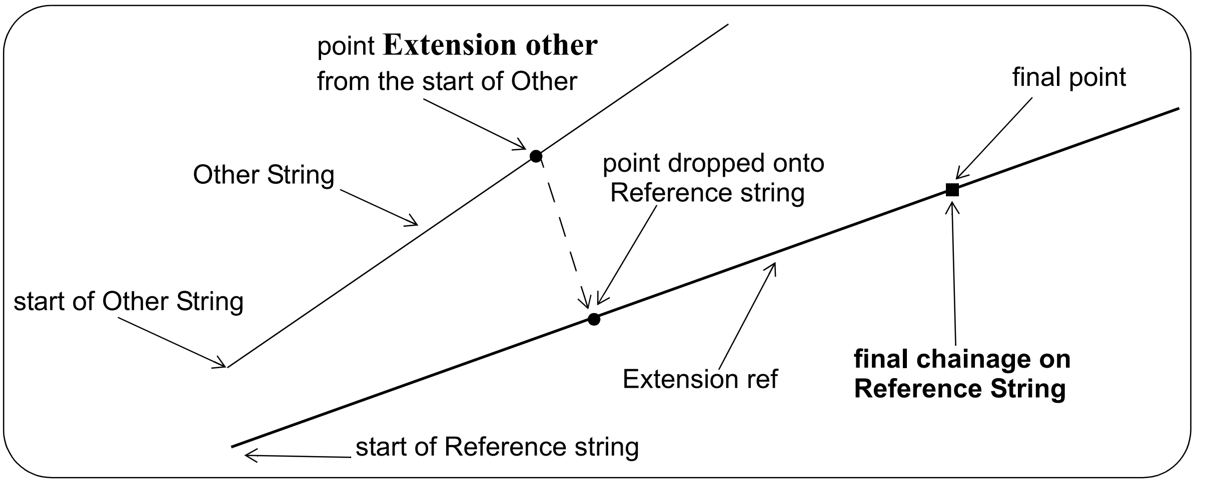
The *start* and *end* of the **Modifier** string are dropped onto the Reference string and the lower of the reference chainages of the two dropped ends**??**.

How is Extension other used??

To get the final chainage, the value of **Extension other** is added to the ***Start chainage* of the Other string**. This point on the *other* string is dropped **onto** the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

.

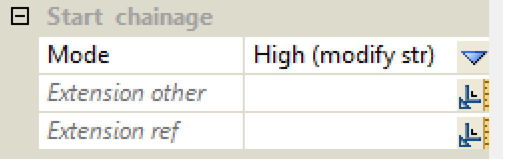


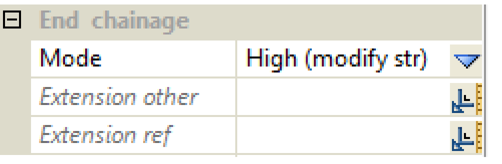
Continue to the next section 21.4.16 Highest Dropped Chainage of Modifier String or return to 21.2.1 MTF Hinge Modifiers.

21.4.16 Highest Dropped Chainage of Modifier String

The Smart Chainage **Lowest dropped chainage of modifier string** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Lowest dropped chainage of modifier string** adds **Extension other** and **Extension ref** fields.





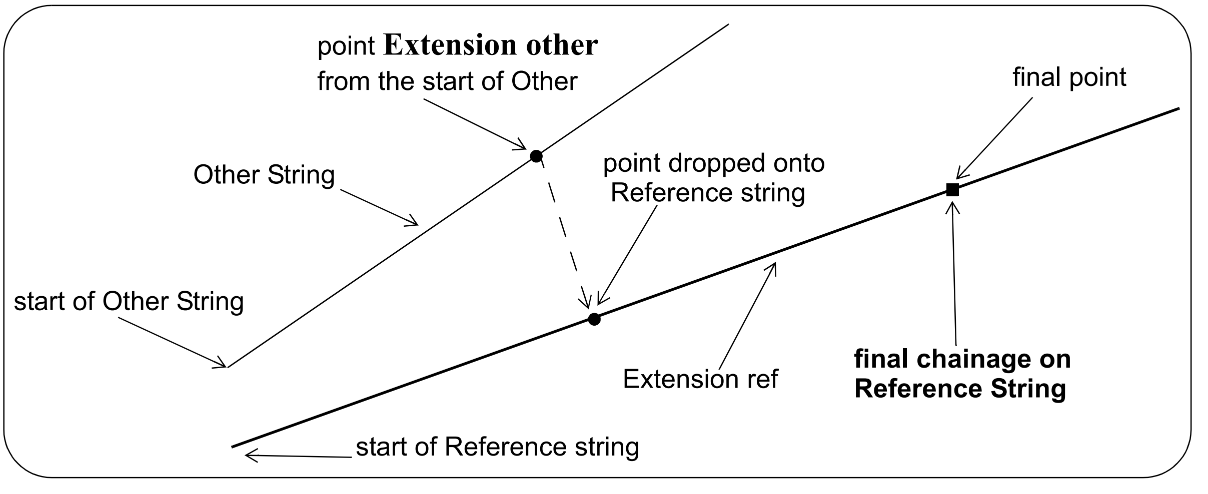
The *start* and *end* of the **Modifier** string are dropped onto the Reference string and the lower of the reference chainages of the two dropped ends**??**.

How is Extension other used??

To get the final chainage, the value of **Extension other** is added to the ***Start chainage* of the Other string**. This point on the *other* string is dropped **onto** the Reference string.

The value of **Extension ref** is then added to the chainage on the Reference string of the point dropped onto the Reference string, to give the **final** chainage used.

.

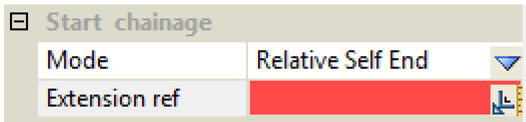


Continue to the next section 21.4.17 Relative to Self End or return to 21.2.1 MTF Hinge Modifiers.

21.4.17 Relative to Self End

The Smart Chainage **Relative to self end** is only available in the Apply MTF Left and Right Modifiers. This Mode is only available for a Start Chainage.

Selecting **Relative to Self End** adds an **Extension ref** field.



The value in the **Extension ref** field is **added** to the ***end chainage of the current MTF command*** to give the chainage used as the ***final chainage***.

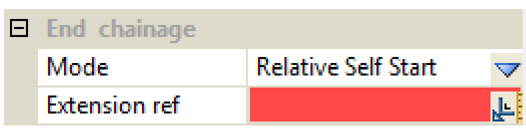
This Mode is useful when the **end chainage** of the current MTF command is known and you want the start chainage of the **same** command to be **relative** to the **known end chainage** of the **same command**.

Continue to the next section 21.4.18 Relative to Self Start or return to 21.2.1 MTF Hinge Modifiers.

21.4.18 Relative to Self Start

The Smart Chainage **Relative to self start** is only available in the Apply MTF Left and Right Modifiers. This Mode is only available for an End Chainage.

Selecting **Relative to Self Start** adds an **Extension ref** field.



The value in the **Extension ref** field is **added** to the ***start chainage of the current MTF command*** to give the chainage used as the ***final chainage***.

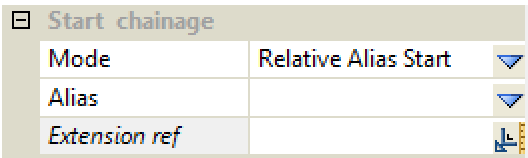
This Mode is useful when the **start chainage** of the current MTF command is known and you want the end chainage of the **same** command to be **relative** to the **known start chainage** of the **same command.**

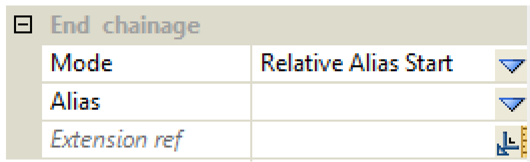
Continue to the next section 21.4.19 Relative to Alias Start or return to 21.2.1 MTF Hinge Modifiers.

21.4.19 Relative to Alias Start

The Smart Chainage **Relative to alias start** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Relative to alias start** adds **Alias** and **Extension ref** fields.





An ***Alias*** from the current MTF can be typed into the **Alias** field, or selected from the **Alias** pop up which brings up the list of all *Aliases* in the current MTF.

The value in the **Extension ref** field is **added** to the ***start chainage*** *of the* ***selected Alias*** to give the chainage used as the ***final chainage***.

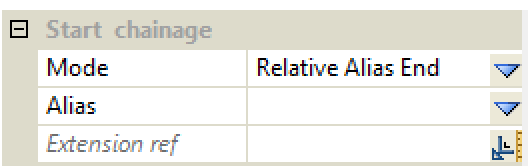
This Mode is useful when you want the start/end chainage to be **relative to the start chainage** of the command in the current MTF with the given Alias.

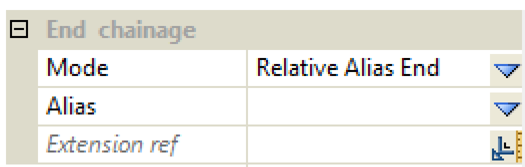
Continue to the next section 21.4.20 Relative to Alias End or return to 21.2.1 MTF Hinge Modifiers.

21.4.20 Relative to Alias End

The Smart Chainage **Relative to alias end** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Relative to alias end** adds **Alias** and **Extension ref** fields.





An ***Alias*** from the current MTF can be typed into the **Alias** field, or selected from the **Alias** pop up which brings up the list of all *Aliases* in the current MTF.

The value in the **Extension ref** field is **added** to the ***end chainage*** *of the* ***selected Alias*** to give the chainage used as the ***final chainage***.

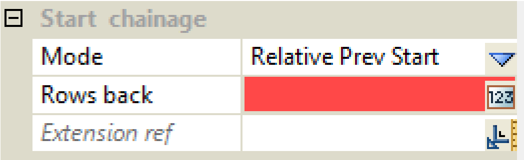
This Mode is useful when you want the start/end chainage to be **relative to the end chainage** of the command in the current MTF with the given Alias.

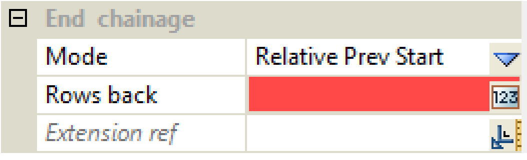
Continue to the next section 21.4.21 Relative to Previous Start or return to 21.2.1 MTF Hinge Modifiers.

21.4.21 Relative to Previous Start

The Smart Chainage **Relative to previous start** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Relative to previous start** adds **Rows back** and **Extension ref** fields.





Rows back gives the number of rows in the current MTF to go back to get the **Start chainage** from. **Rows back** must be greater or equal to one.

The value in the **Extension ref** field is added to the ***start chainage*** *of the* ***selected row*** to give the chainage used as the ***final chainage***.

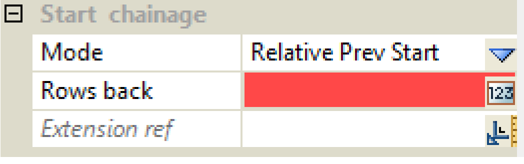
This Mode is useful when you want the start/end chainage to be **relative to the start chainage** of an earlier command that is a **known** number of **rows back** in the current MTF.

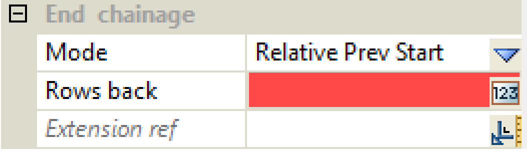
Continue to the next section 21.4.22 Relative to Previous End or return to 21.2.1 MTF Hinge Modifiers.

21.4.22 Relative to Previous End

The Smart Chainage **Relative to previous end** is only available in the Apply MTF Left and Right Modifiers.

Selecting **Relative to previous end** adds **Rows back** and **Extension ref** fields.





Rows back gives the number of rows in the current MTF to go back to get the **End chainage** from. **Rows back** must be greater or equal to one.

The value in the **Extension ref** field is added to the ***end chainage*** *of the* ***selected row*** to give the chainage used as the ***final chainage***.

This Mode is useful when you want the start/end chainage to be **relative to the end chainage** of an earlier command that is a **known** number of **rows back** in the current MTF.

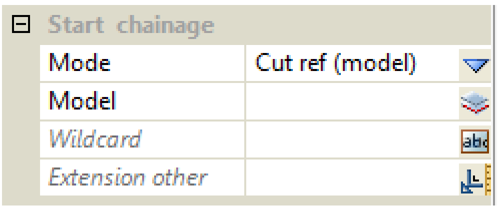
Continue to the next section 21.4.23 Snippet Cut Reference with Model of Strings or return to 21.2.1 MTF Hinge Modifiers.

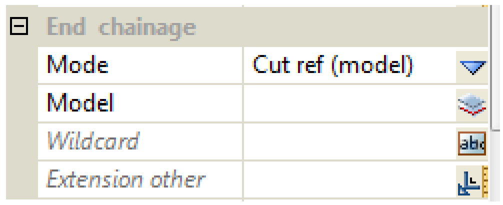
21.4.23 Snippet Cut Reference with Model of Strings

The Smart Chainage **Snippet cut ref with model of strings** is only available with the **Snippet** option in the Apply MTF Left and Right Modifier.

This Mode takes a model of strings and the Snippet is applied where **each string** in the model cuts the Reference string.

Selecting **Snippet cut ref with model of string** adds the **Model**, **Wildcard** and **Extension other** fields.





Model model box available models

the model of strings that is used for the snipped to be applied to where each of the strings cuts the Reference string.

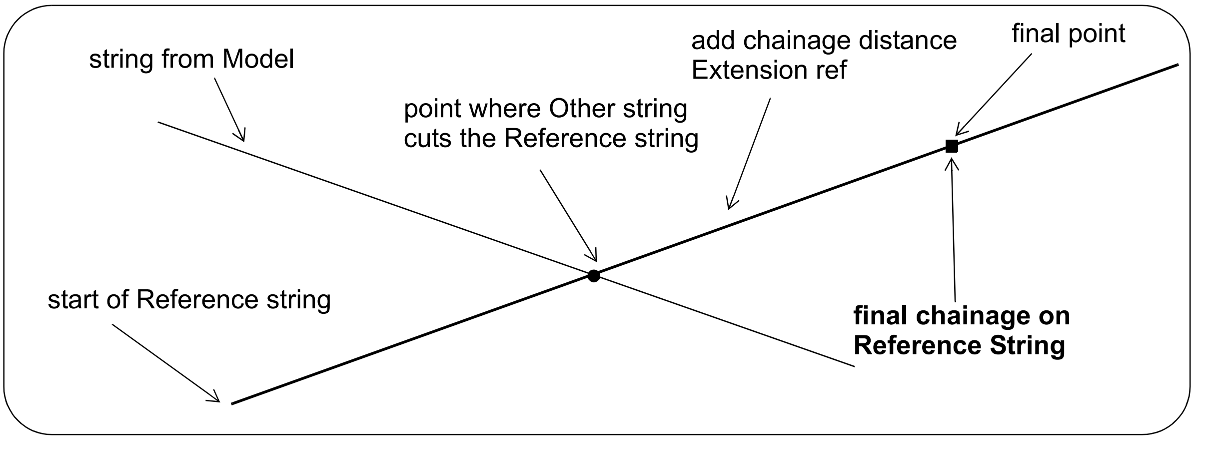
Wildcard text box

*if **not blank**, only those strings in the model* **Model** *that satisfy* **Wildcard** *are used.*
*If **blank**, all the strings in the model* **Model** *are used.*

For each string, the point on the Reference string where the string cuts the Reference string is first calculated.

The value in the **Extension ref** field is **added** to the reference chainage calculated for the cut point to give the chainage used as the ***final chainage***.

.



For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

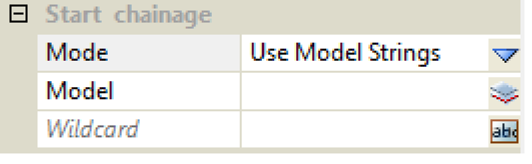
Continue to the next section 21.4.24 Snippet Placed to Model of Strings or return to 21.2.1 MTF Hinge Modifiers.

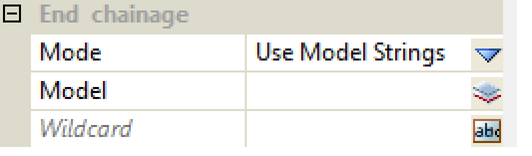
21.4.24 Snippet Placed to Model of Strings

The Smart Chainage **Snippet placed to model of strings** is only available with the **Snippet** option in the Apply MTF Left and Right Modifier.

This Mode takes a model of strings and the Snippet and for **each string** in the model, the end points of the string are dropped onto the Reference string and the Snippet is run with the **Start chainage** taken as the smaller of the two dropped chainages and the **End chainage** of the snippet taken as the larger of the two dropped chainages.

Selecting **Snippet cut ref with model of string** adds the **Model**, **Wildcard** and **Extension other** fields.





Model model box available models

the model of strings that the Snipped is applied to using the start and end of each string dropped onto the Reference string as the Start and End chainages for the Snippet.

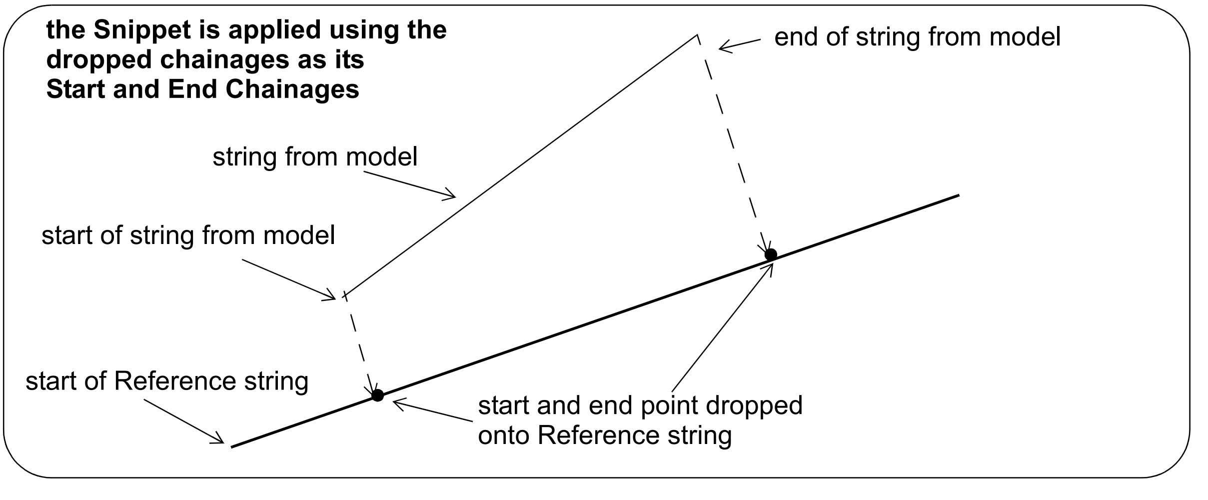
Wildcard text box

*if **not blank**, only those strings in the model* **Model** *that satisfy* **Wildcard** *are used.*

*If **blank**, all the strings in the model* **Model** *are used.*

For each string, the start and the end of the string are dropped onto the Reference string and the dropped chainages and used as the Start and End chainages of the Snippet

.

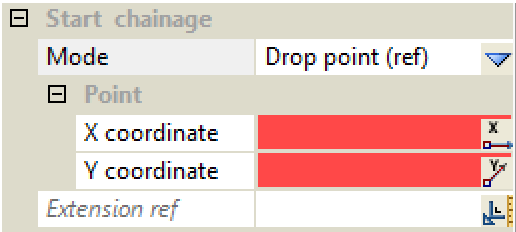


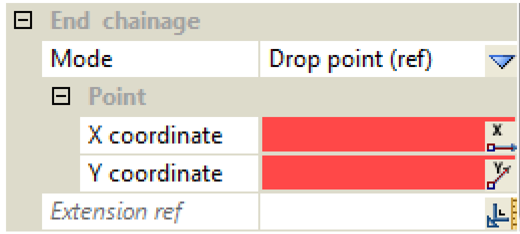
For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Continue to the next section 21.4.25 Drop Point to Reference String or return to 21.2.1 MTF Hinge Modifiers.

21.4.25 Drop Point to Reference String

Selecting **Drop point to reference string** adds **X coordinate**, **Y coordinate** and **Extension ref** fields.





X coordinate and **Y coordinate** are the coordinate of the point to drop onto the Reference string to give a reference chainage.

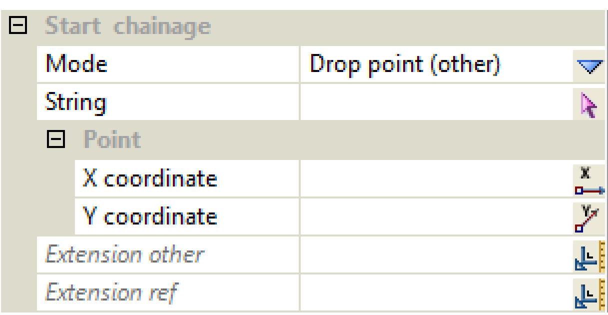
The value in **Extension ref** is added to the dropped chainage to give the chainage used as the ***final chainage***.

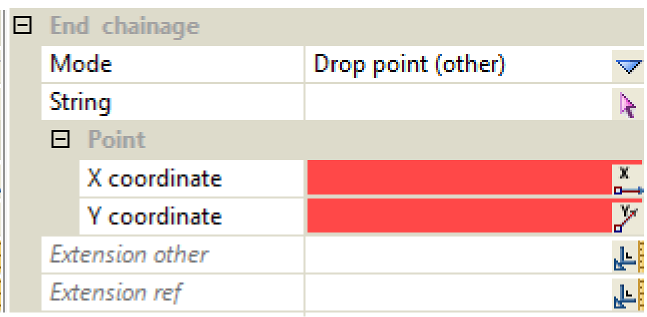
This Mode is useful when you know the coordinates of a point and you want the start/end chainage to be **relative** to the **chainage of the dropped point**.

Continue to the next section 21.4.26 Drop Point to Other String or return to 21.2.1 MTF Hinge Modifiers.

21.4.26 Drop Point to Other String

Selecting **Drop point to other string** adds **String**, **X coordinate**, **Y coordinate**, **Extension other** and **Extension ref** fields.





The **String** field is to select a string referred to as the **Other** string.

X coordinate and **Y coordinate** are the coordinate of the point to drop onto the **Other** string to give a chainage on the Other string.

The value in **Extension other** is added to the dropped chainage on the Other string and the point at this chainage is then dropped onto the Reference string.

The value in **Extension ref** is then added to the chainage of the point dropped onto the Reference string to give the chainage used as the ***final chainage***.

Return to 21.2.1 MTF Hinge Modifiers.

21.5 Defining and Using Snippets

The sections on snippets are:

21.5.1 What are MTF Snippets?

A snippet is a collection of many single MTF modifiers that can be inserted as a group into an MTF file.

However unlike an MTF file or an insert in an MTF, values to be used inside the snippet can be passed down to the snippet via parameters whose values are specified each time the snippet is placed.

So, snippets enable things such as driveway laybacks, kerb transitions, earthworks flares etc. to be a single entry in a MTF file thus reducing the size of the MTF file and enhancing it's readability.

Setting up a snippet is the same complexity as creating MTF items but once a snippet is created, it can be reused over and over again.

Snippets can also be used to hide complex modifiers from novice users.

Go to the next section 21.5.2 Creating a Snippet or back to 21.5 Defining and Using Snippets.

21.5.2 Creating a Snippet

There is currently no snippet Create/Editor in ***12d Model*** so for the moment snippets must be manually created as a text file. Snippet text files have the extension ***MTFSNIPPET***.

Note that this is case insensitive. That is, each letter can be in upper or lower case.

Luckily the format for each snippet command is almost identical to the normal modifier commands as written out to the left_side_modifier or right_side_modifier sections of the MTF file when viewed as a text file. The snippet commands differ slightly in that they can contain variables and parameters that can be substituted when the snippet is run.

So the easiest way to create a snippet file is to create a normal MTF inside ***12d Model*** with the modifiers to be included and used in the snippet. Once these modifier commands are in the MTF, they can be copied directly from the Modifiers grid in a snippet compatible format.

To do so, select one or more rows of modifiers in the grid. Then right-click on one of the row header to bring up the modifiers grid context menu and select **Copy (snippet paste)**. This will copy the selected commands to the Windows clipboard.

Now that the desired modifier commands have been copied to the clipboard, you can create a new text document in your preferred text editor and paste the commands into the new document. A snippet, at its simplest, can simply be these same modifier commands in a snippet file. However, the real power and flexibility of snippets comes from using the more advanced functionality discussed in the following sections.

It is also worth noting that the snippet commands can be created manually, rather than by copy and paste, by typing the required snippet and modifier commands directly into a text file. Note, however, that the syntax and format of the snippet and modifiers must be correct or you will get errors when the snippet is inserted or run.

How to construct the additional information in the snippet file, and how a snippet works, will be explained in the following sections.

Go to the next section 21.5.3 An Example of a Snippet or back to 21.5 Defining and Using Snippets.

21.5.3 An Example of a Snippet

The following is an example of a snippet called KERB_SA_DW places a layback at a driveway. It will be used as the example in describing the workings of a snippet.

```
// PARAMETER WIDTH REAL "Layback width" 0.6
// PARAMETER DEPTH REAL "Layback depth" -0.04

// drop into DW

insert "SAL" "grey" 0.001 0    unknown named_position "MODIFIER_START" 0 named_position
 "MODIFIER_START" 0.5 absolute extra_start extra_end
insert "SAI" "grey" 0.5  $DEPTH unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
insert "SAT" "grey" 0.03  0.15 unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
insert "SAB" "grey" 0.18  0    unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end

// push out links
width  "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.03 $WIDTH
absolute extra_start extra_end
width  "SAB" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.18 0.0    absolute
extra_start extra_end
height "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.15 0.2    absolute
extra_start extra_end
height "SAB" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0    0      absolute
extra_start extra_end

// DW to -0.5
insert "SKL" "grey" 0.001 0    unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end
insert "SKI" "grey" 0.5  $DEPTH unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end
insert "SKB" "grey" $WIDTH  0.2   unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end

//back out -0.5 to end
insert "SAL" "grey" 0.001 0    unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END"
0.0 absolute extra_start extra_end
insert "SAI" "grey" 0.5  $DEPTH unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
insert "SAT" "grey" 0.03  0.15 unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
insert "SAB" "grey" 0.18  0    unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END"
0.0 absolute extra_start extra_end

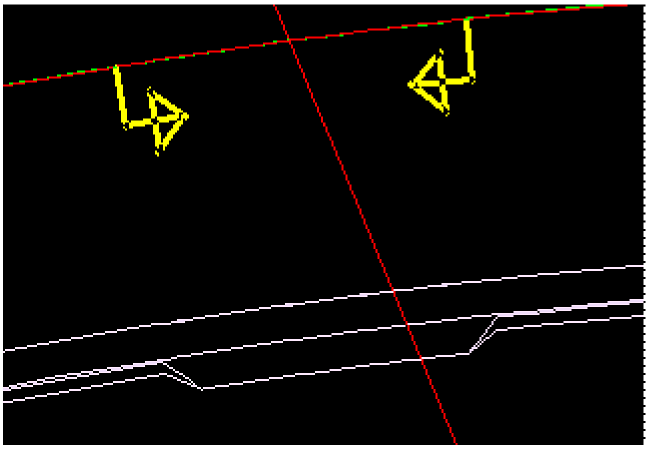
// push out links
width  "SAT" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 $WIDTH 0.03
```

absolute extra_start extra_end

width "SAB" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 0.0 0.18 absolute extra_start extra_end

height "SAT" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 0.2 0.15 absolute extra_start extra_end

height "SAB" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 0   0 absolute extra_start extra_end



Note: each line of the snippet is wrapping around because of the limited width of this document. Each line should be like:

```
// drop into DW
insert "SAL" "grey" 0.001 0  unknown named_position "MODIFIER_START" 0 named_position  "MODIFIER_START" 0.5 absolute extra_start extra_end
```

But that would be impossible to read.

Go to the next section 21.5.4 Editing a Snippet File or back to 21.5 Defining and Using Snippets.

21.5.4 Editing a Snippet File

The option

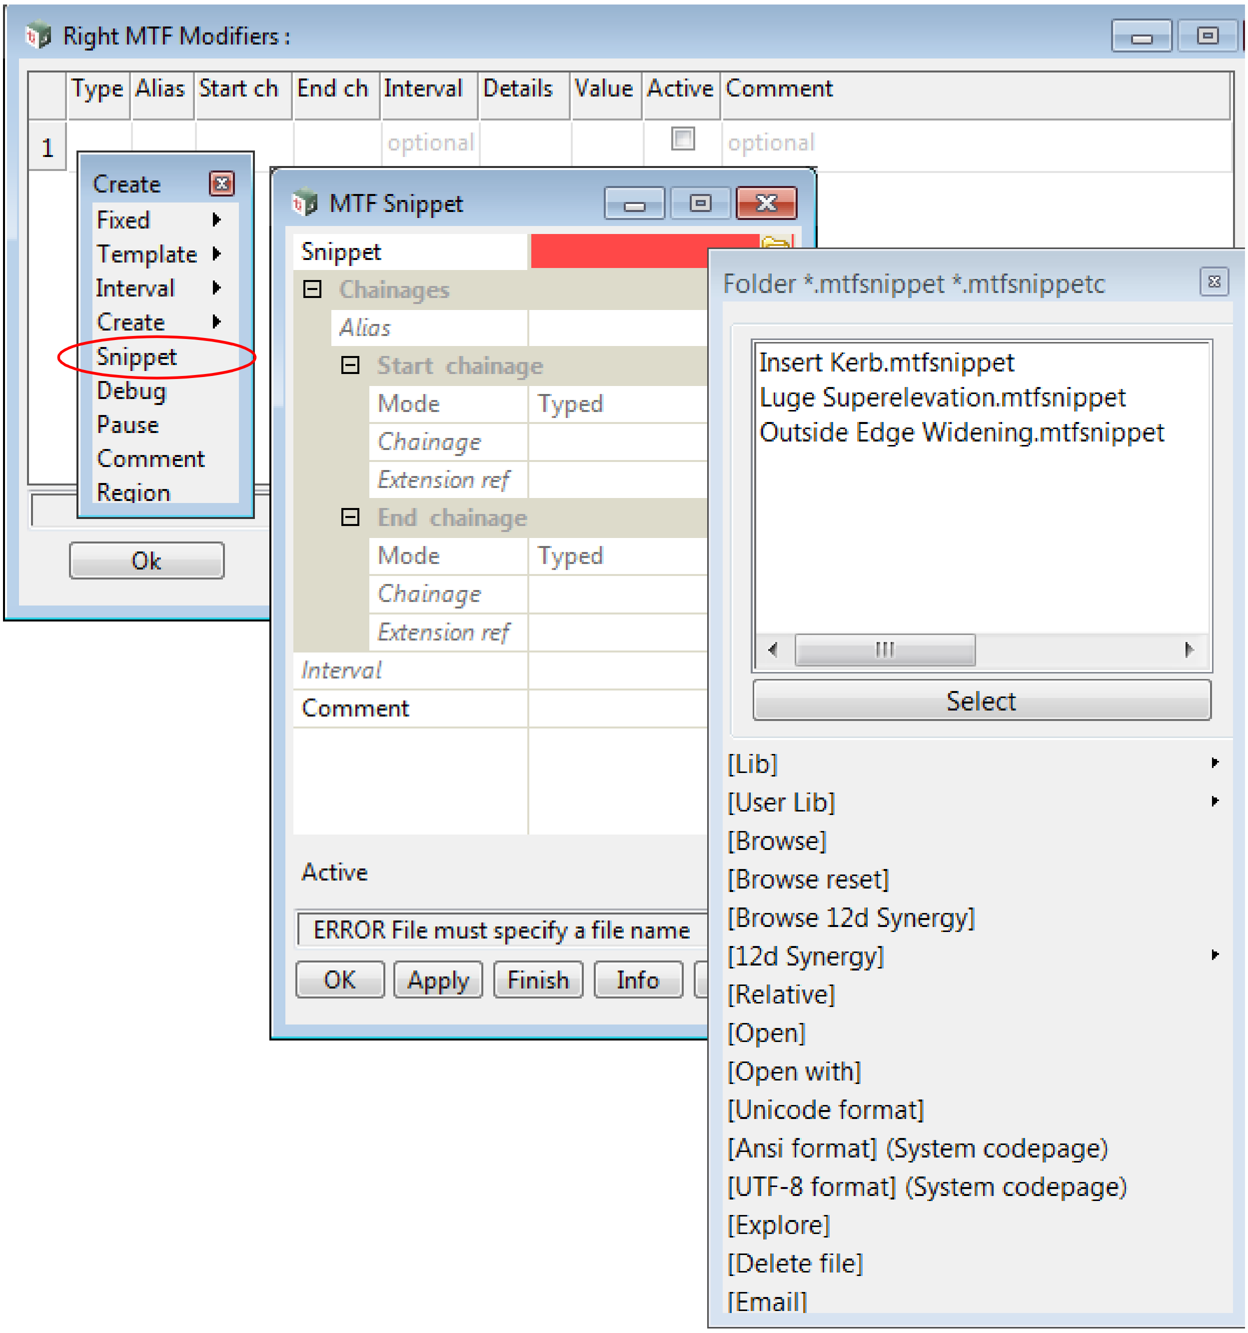
Design =>MTF =>Edit snippets

will list the local snippets files and if one is selected, opens it in the text editor.

Go to the next section 21.5.5 How To Select a Snippet in an MTF or back to 21.5 Defining and Using Snippets.

21.5.5 How To Select a Snippet in an MTF

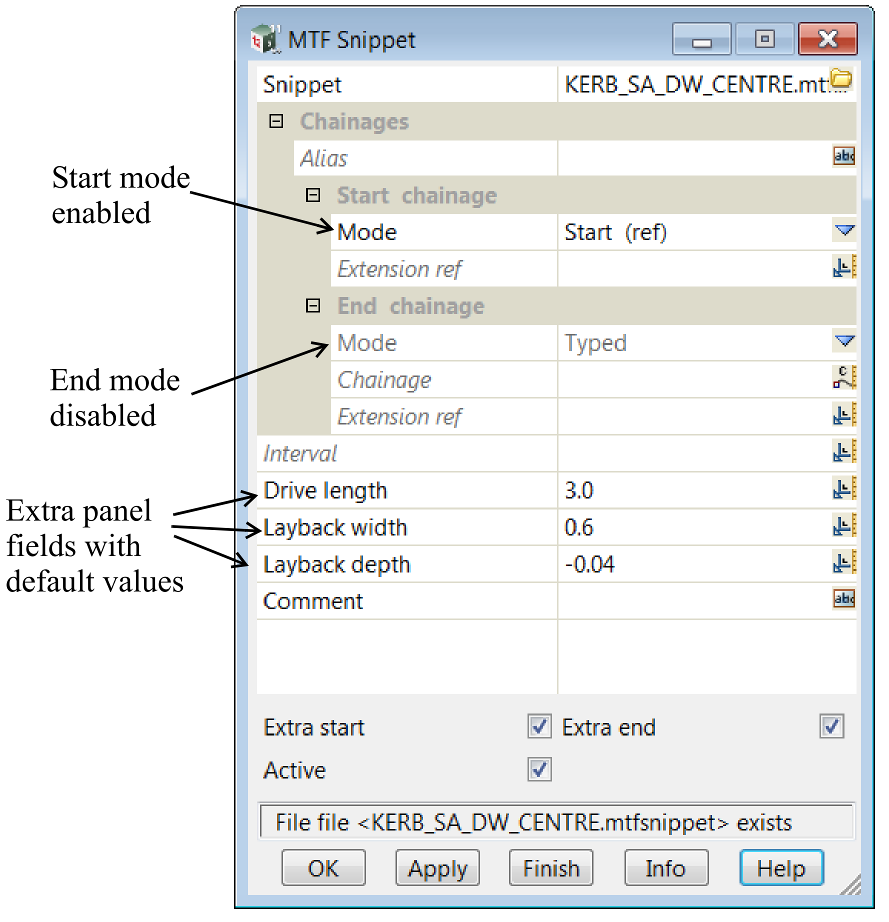
From the grid in the **Right MTF Modifiers** or **Left MTF Modifiers** panel, bring up the **Create** menu and select **Snippet**. This will display the **MTF Snippet** panel and clicking on the folder icon in the *Snippet* field brings up the choice of snippets to use.



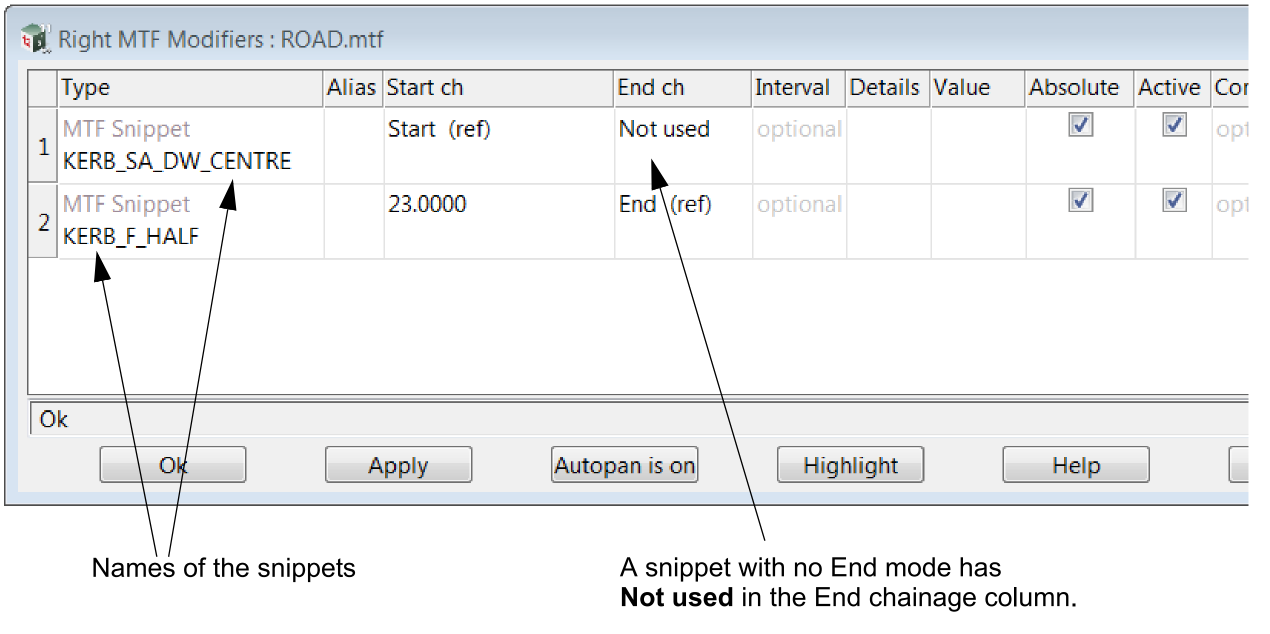
A snippet is then selected from the snippet pop-up list.

Selecting a snippet can modify the fields on the **MTF Snippet** panel. The ***Start*** and ***End modes*** may or may not be enabled, and there may be extra field on the panel, with or without values in them.

For example, selecting the *KERB_SA_DW* snippet modifies the **MTF Snipped** panel and there are two extra panel fields - ***Layback width*** with the value 0.6 and ***Layback height*** with the value -0.4. Selecting the *KERB_SA_DW_*CENT snippet adds the extra panel fields but also disables the ***End mode.***



If a Start mode or End mode is missing from the snippet, then the corresponding field will be left blank in the ***Start chainage/End chainage*** columns in the **Left** or **Right Templates Modifiers** panel. And the snippet name appears in the ***Type*** column under the text **MTF Snippet**.



How snippets control the ***Start*** and ***End*** modes is documented in the next section 21.5.7 Start and End Modes for a Snippet and how the extra panel fields are created is discussed in the sections 21.5.8.2 Snippet Parameter of Type REAL, 21.5.8.6 Snippet Parameter of Type CHOICE and 21.5.8.8 Snippet Parameter of Type TICK.

Go to the next section 21.5.6 Comments in Snippets or back to 21.5 Defining and Using Snippets.

21.5.6 Comments in Snippets

Snippets support the same commenting syntax as MTF files, which has two forms:

1. **A Line Comment**

   All characters from a double forward-slash **//** until the end of that line are ignored.

   However, if the first word after the line comment character is PARAMETER, INFO or DISPLAY then the line will be interpreted as a special command by 12d.

```
// PARAMETER this will not be interpreted as a normal line comment
// This is a normal line comment
@ def_tok WIDTH 3.5     // This is also a line comment
```

2. **A Block Comment**

   All characters between a starting /* and a terminating */ are ignored.

```
/* This comment can
 cover several lines
 until we get to the terminating */
```

Continue to the next section 21.5.7 Start and End Modes for a Snippet or return to 21.5 Defining and Using Snippets.

21.5.7 Start and End Modes for a Snippet

The ***Start*** and ***End*** modes on the **MTF Snippet** panel calculate a position on the Reference string just like any other *MTF modifier* but how the values are specified inside the snippet file is slightly different to a standard MTF modifier.

Also unlike other MTF modifiers, some snippets only require *one* of the ***Start mode*** and ***End mode*** and if that is the case, the mode not required will be greyed out so that it can't be filled in.

The lines in the snippet file are similar to the normal MTF modifiers when "named position" has been selected for the ***Start*** and ***End*** modes. However the value of the "named position" in the text command needs to be replaced by either MODIFIER_START or MODIFIER_END followed by a real number.

So for example, the "named_position" "name" "extension" in a MTF command is replaced by

"named_position" MODIFIER_START   snippet_extension

If a MODIFIER_START exists somewhere in the snippet then ***Start mode*** is enabled on the **MTF Snipped** panel.

If a MODIFIER_END exists somewhere in the snippet then ***End mode*** is enabled on the **MTF Snipped** panel.

Finally when a snippet runs, the chainage is calculated for the ***Start mode***/***End mode*** fields in the **MTF Snippet** panel and passed down to the snippet and where ever MODIFIER_START/ MODIFIER_END appears, the passed chainage value PLUS the additional snippet_extension for each occurrence of the MODIFIER_START/MODIFIER_END is used as the chainage for that part of the snippet.

The following example for the KERB_SA_DW snippet shows how the snippet determines when a ***Start mode*** and/or ***End mode*** is needed., and how the extra snippet_extension is used.

```
// drop into DW
insert "SAL" "grey" 0.001 0    unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
...
// DW to -0.5
insert "SKL" "grey" 0.001 0    unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end
...
// back out to -0.5 to end
insert "SAL" "grey" 0.001 0    unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
```

These lines in the KERB_SA_DW snippet a lip of kerb through a driveway layback. It starts off as an SA style kerb, the layback is an SK style and then back to the SA style.

1. Looking at the first line: - the SA->SK transition:

insert "SAL" "grey" 0.001 0   unknown named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 absolute extra_start extra_end

In this line, the ***"named_position" "MODIFIER_START" 0*** replaces the standard chainage command in that position in the text modifier.

"named position" "MODIFIER_START" - this tells the snippet to have a ***Start mode*** on the **MTF Snippet** panel. The calculated chainage for the ***Start mode*** field on the **MTF Snippet** panel is then passed to the snippet to be used as the chainage (plus the snippet_extension) in that *"named_position" MODIFIER_START"* position in the modifier command.

0 - the value after MODIFIER_START is an additional value to add to the chainage calculated in from the ***Start mode*** in the **MTF Snippet** panel and passed down to the snippet.

So ***"named_position" "MODIFIER_START" 0*** is replaced by the chainage defined by the ***Start mode*** of the **MTF Snippet** panel.

Similarly the ***"named_position" "MODIFIER_START" 0.5*** replaces the standard chainage command in that position in the modifier and evaluates to being chainage defined by the ***Start mode*** of the **MTF Snippet** panel **plus** 0.5.

So this snippet line inserts a link from the chainage value passed in from the ***Start mode*** on the **MTF Snippet** panel, to 0.5 **after** the chainage value passed in from the ***Start mode*** on the **MTF Snippet** panel.

2. Looking at the second line: - SK Layback:

insert "SKL" "grey" 0.001 0 unknown named_position "MODIFIER_START" 0.5 named_position "MODIFIER_END" -0.5 absolute extra_start extra_end

The difference to the previous line is that this line has the keywords ***MODIFIER_START*** and ***MODIFIER_END*** after "named_position" commands.

"named position" "MODIFIER_END" - this tells the snippet to have a ***End mode*** on the **MTF Snippet** panel. The calculated chainage for the ***End mode*** field on the **MTF Snippet** panel is then passed to the snippet to be used as the chainage (plus the snippet_extension) in that *"named_position" MODIFIER_END"* position in the modifier command.

-0.5 - the value after MODIFIER_END is an additional value to add to the chainage calculated in from the ***End mode*** in the **MTF Snippet** panel and passed down to the snippet.

So this snippet line inserts a link from 0.5 past the chainage value passed from ***Start mode*** in the **MTF Snippet** panel through to 0.5 ***before*** the chainage value passed in from ***End mode*** in the **MTF Snippet** panel.

3. Looking at the third line: - SK ->SA transition:

insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 absolute extra_start extra_end

So this snippet line inserts a link from 0.5 before the chainage value passed to the snippet from the ***Start mode*** in the **MTF Snippet** panel, to the chainage value passed to the snippet from the ***Start mode*** in the **MTF Snippet** panel.

Go to the next section 21.5.8 Snippet Parameters and Commands or back to 21.5 Defining and Using Snippets.

21.5.8 Snippet Parameters and Commands

A powerful feature of snippets is that parameters (fields presented to and populated by the user) can be defined and used throughout the snippet file.

To pass values for the parameters through to the snippet, each parameter is displayed as the appropriate panel Field in the **MTF Snippet** panel, with the label (descriptive text) for the panel field defined in the snippet. For example, a Real box panel field for a real parameter and a Model box panel field for a model parameter.

The user enters the value into the field on the **MTF Snippet** panel. This entered value is then passed through to the snippet during processing.

Note - Even if a parameter is defined in a snippet, it will only appear in the MTF Snippet panel if the parameter is actually used in the snippet.

WARNING - once a snippet with parameters has been saved in a MTF file, the parameters for the snippet are saved ***in the MTF file.*** Then when the Apply MTF is run, the parameters and their values are read in from the MTF file and passed into the current snippet file.

Hence if the snippet file has been modified and parameter definitions added, modified or removed since the snippet was originally place in the MTF, these modifications of parameters will be **ignored** until the snippet panel is reopened in the MTF editor which forces the snippet file to be parsed again and the changes to the parameter definitions are then recognised.

For the syntax of each available parameter types and commands, see

21.5.8.2 Snippet Parameter of Type REAL
21.5.8.3 Snippet Parameter of Type INTEGER
21.5.8.4 Snippet Parameter of Type TEXT
21.5.8.5 Snippet Parameter of Type SELECT
21.5.8.6 Snippet Parameter of Type CHOICE
21.5.8.7 Snippet Parameter of Type CHOICE2
21.5.8.8 Snippet Parameter of Type TICK
21.5.8.9 Snippet Parameter of Type COLOUR
21.5.8.10 Snippet Parameter of Type NAME
21.5.8.11 Snippet Parameters for Models
21.5.8.12 Snippet Parameters for Tins
21.5.8.13 Snippet Parameter of Type LAYER
21.5.8.14 Snippet Parameter of Type NAMED_GRADE
21.5.8.15 Snippet Command INFO
21.5.8.16 Snippet Command DISPLAY
21.5.8.17 Snippet Command INCREMENT
21.5.8.18 Optional Parameters in Snippets

21.5.8.1 Common Definitions for Snippet Parameters

The general syntax for a snippet parameter is:

// **PARAMETER param_name param_type param_desc param_default other_values**

where

// PARAMETER param_name

This signifies that it is a parameter definition. Note that there must be at least one space after the // and before the word PARAMETER.

param_name

This is the name to use for the parameter. Where ever the parameter is to be used in the snippet, put **$(param_name)**. The characters of the parameter name can only be alphanumeric (upper and lower case) and underscores, and the name cannot contain spaces. The name doesn't have quotes around it. The parameter names are not case sensitive so two names only differing by case are considered to be identical. The parameters names must be unique in a snippet.

param_descr param_default

param_desc

This description is written in the **MTF Snippet** panel for the field to enter values for this parameter. The description can include spaces and if it does then the description must be enclose in double quotes (").

param_default

This value is **optional**.

But if it exists then this value is displayed as the value in the field for the parameter on the **MTF Snippet** panel. If the default value is text and it contains any spaces then the text must be enclosed in double quotes (").

Important Note:

There will only be a panel field in the **MTF Snippet** panel for the parameter **param_name** if the parameter is **used** in the snippet.

21.5.8.2 Snippet Parameter of Type REAL

If a floating point number (a real number) is required then the **REAL** parameter type is used.

A Snippet Parameter of type **REAL** inserts a Real box panel field into the **MTF Snippet** panel.

The user can type a real number into the panel field which is then passed down to the snippet.

The syntax for type **REAL** is:

// PARAMETER param_name **REAL** param_descr param_default_value

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

REAL - the parameter type.

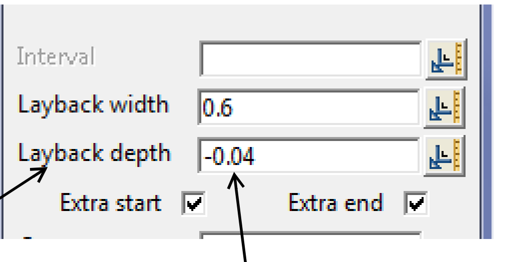
param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

The following lines from the KERB_SA_DW snippet define two REAL parameters WIDTH and DEPTH and the values for the parameters are then used inside the snippet commands by writing $WIDTH and $DEPTH.

```
// PARAMETER WIDTH REAL "Layback width" 0.6
// PARAMETER DEPTH REAL "Layback depth" -0.04
// drop into DW
...
// push out links
width "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5
0.03 $(WIDTH) absolute extra_start extra_end
...
```

Real panels field are in MTF Snippet panel because of the parameters WIDTH and DEPTH in the snippet



Description provided by the parameter definition in the snippet

Default value provided by the parameter definition in the snippet

Important Note:

The Real panel field for a REAL parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.3 Snippet Parameter of Type INTEGER or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.3 Snippet Parameter of Type INTEGER

If a whole number (an integer) is required then the **INTEGER** parameter type is used.

A Snippet Parameter of type **INTEGER** inserts an Integer box panel field into the **MTF Snippet** panel.

The user can type an integer into the panel field and it is then passed down to the snippet.

The syntax for type **INTEGER** is:

// PARAMETER param_name **INTEGER** param_desc param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

INTEGER - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

Important Note:
The Integer panel field for a INTEGER parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.4 Snippet Parameter of Type TEXT or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.4 Snippet Parameter of Type TEXT

If text is required then the **TEXT** parameter type is used.

A Snippet Parameter of type **TEXT** inserts an Text box panel field into the **MTF Snippet** panel.

The user can type text into the panel field and it is then passed down to the snippet.

The syntax for type **TEXT** is:

// PARAMETER param_name **TEXT** param_desc param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

TEXT - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

Note for the TEXT type, the $parameter should be enclosed in the double quotes character in the modifier line.

Important Note:
The Text panel field for a TEXT parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.5 Snippet Parameter of Type SELECT or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.5 Snippet Parameter of Type SELECT

If a string is to be selected then the **SELECT** parameter type is used.

A Snippet Parameter of type **SELECT** inserts a String Select box panel field into the **MTF Snippet** panel.

Using the Select box, a user can pick a string and it is then passed down to the snippet.

The syntax for type **SELECT** is:

// PARAMETER param_name **SELECT** param_desc param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

SELECT - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

```
// PARAMETER BB_STRING SELECT "Base string"

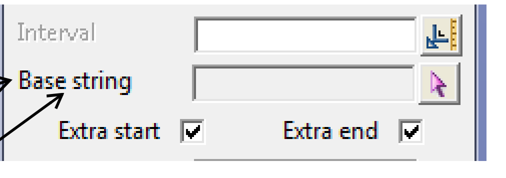
...

// parallel the selected string

fixed_parallel "SFML" "SFMB" named_position "MODIFIER_START" 0 named_position
"MODIFIER_FINAL" 0 "$BB_STRING" interval 0.5 absolute extra_start extra_end

...
```

String select panel field is in MTF Snippet panel because of the SELECT parameter BB_STRING in the snippet



Description provided by the parameter definition in the snippet

Here the parameter name is ***BB_STRING***, its type is ***SELECT*** and so a **Select** box appears in the **MTF Snippet** panel with the panel field text ***Base string***. The substitution point in the modifier is ***"$BB_STRING"***.

Note for the SELECT type, the $parameter should be quoted in the modifier line.

Important Note:
The String Select panel field for a SELECT parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.6 Snippet Parameter of Type CHOICE or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.6 Snippet Parameter of Type CHOICE

If the user is to select from a list of choices and the text of the choice is to be passed through to the snippet, then the **CHOICE** parameter type is used.

The Snippet Parameter of type **CHOICE** inserts a Choice box panel field into the **MTF Snippet** panel.

The format also defines the list of text to be displayed in the pop-up of choices and when a choice is selected, the text that is displayed is passed back to the snippet.

The syntax for type **CHOICE** is:

// PARAMETER param_name CHOICE param_desc choice_1 choice_2 ... choice_n

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

CHOICE - the parameter type.

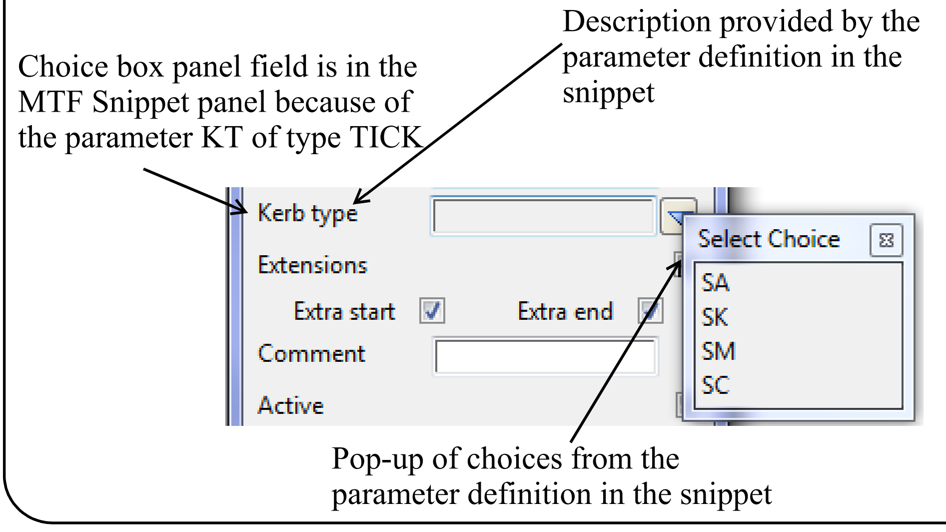
param_descr - this description is written to the **MTF Snippet** panel for the field to enter values for this parameter. The description can include spaces and if it does then the description must be enclose in double quotes (").

choice_1 choice_2 ... choice_n - the choices that will be displayed in the parameter pop-up in the **MTF Snippet** panel.

// PARAMETER KT **CHOICE** "Kerb type" "SA" "SK" "SM" "SC"

insert "$KT" "grey" 10 0   unknown named_position "MODIFIER_START" (0.0 - _E) named_position "MODIFIER_END" _E absolute extra_start extra_end

...



Important Note:
The Choice panel field for a CHOICE parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.7 Snippet Parameter of Type CHOICE2 or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.7 Snippet Parameter of Type CHOICE2

If the user is to select from a list of choices, but different text than what appears on the choice list is to be passed through to the snippet, then the **CHOICE2** parameter type is used.

The Snippet Parameter of type **CHOICE2** inserts a Choice box panel field into the **MTF Snippet** panel.

The format also defines the list of text to be displayed in the pop-up of choices for each text that is displayed, a parameter value that is passed back to the snippet if that choice is selected.

The syntax for type **CHOICE2** is:

// PARAMETER par_name **CHOICE2** par_desc par_def par_1 desc_1 par_2 desc_2 **...** par_n desc_n

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

CHOICE2 - the parameter type.

par_desc - this description is written in the **MTF Snippet** panel for the field to enter values for this parameter. The description can include spaces and if it does then the description must be enclose in double quotes (").

par_def - this value is **optional** but if it exists then this value is displayed as the value in the field for the parameter on the **MTF Snippet** panel. If the default value is text and it contains any spaces then the text must be enclosed in double quotes (").

par_i desc_i are pairs of parameters and description to go in the Choice box pop up. The description ***desc_i*** is displayed in the Choice pop up and if that description is selected, the parameter ***par_i*** is returned to the Snippet instead of the description.

For example

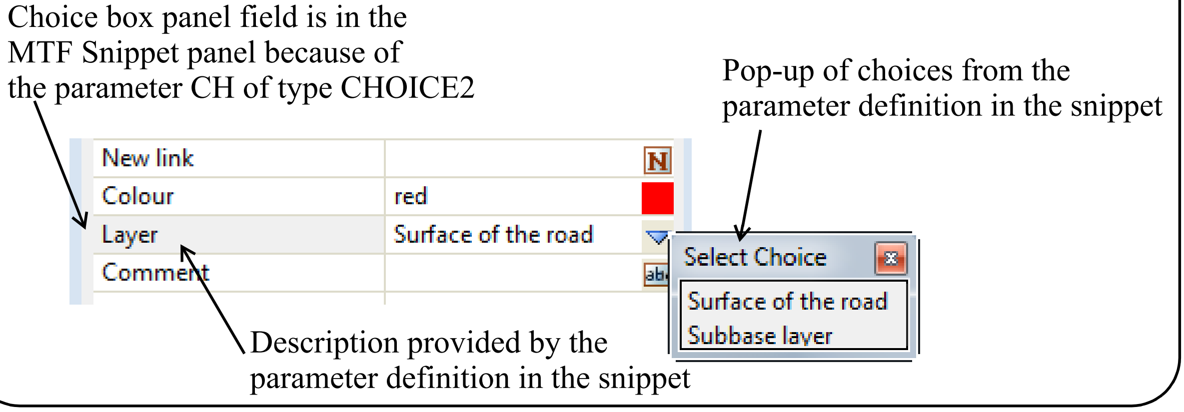
// PARAMETER CH CHOICE2 "Speed" S100 S80 "80 km/h" S100 "100 km/h"

This means that the text you have the default parameter, in this case **S100**, and then pairs of parameters and descriptions, **S80 "80 km/h"** etc.

// PARAMETER CH **CHOICE2** "Layer" "Design" "Design" "Surface of the road" "Subbase" "Subbase layer"

insert $CH=>$LINK" "$CLR" 0.001 0.20 unknown SCH 0.0 ECH 0.0 absolute extra_start extra_end

...



Important Note:

The Choice panel field for a CHOICE2 parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.8 Snippet Parameter of Type TICK or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.8 Snippet Parameter of Type TICK

If a true of false choice is required then the **TICK** parameter type is used.

The Snippet Parameter of type **TICK** inserts a Tick box panel field into the **MTF Snippet** panel. The user can set the tick to off or on.

The syntax for type TICK is:

// PARAMETER param_name **TICK** param_desc   param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

TICK - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

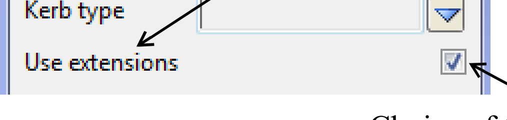
The value **param_default** is **optional** but if it exists then it must be 1 or a 0.
If 1, the tick box come up set to tick/on.
If 0, the tick box come up set to not ticked/off.

```
// PARAMETER  KT  CHOICE   "Kerb type"  "SA"  "SK"  "SM"   "SC"
// PARAMETER  TI   TICK   "Use extensions"    1
#if $TI
#define _E 3
#else
#define _E 0
#endif
 insert "$KT" "grey" 10 0   unknown named_position "MODIFIER_START" (0.0 - _E)
named_position "MODIFIER_END" _E absolute extra_start extra_end

...
```

Tick box panel field is in the MTF Snippet panel because of the parameter TI of type TICK

Description provided by the parameter definition in the snippet



Choice of tick and not tick because the parameter type is TICK

Note that in the above example, the value of the Tick box parameter TI ($TI), is used in a #define to set the value for **_E** (see 21.5.18 Major Warning - You Will be Caught by This).

Important Note:
The Tick panel field for a TICK parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.9 Snippet Parameter of Type COLOUR or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.9 Snippet Parameter of Type COLOUR

If a colour is required then the **COLOUR** parameter type is used.

The Snippet Parameter of type **COLOUR** inserts a Colour box panel field into the **MTF Snippet** panel.

The user can type a colour name or colour number into the panel field, or select a colour from the pop-up of available colours in the project.

The syntax for type **COLOUR** is:

// PARAMETER   param_name   **COLOUR**   param_desc   param_default

where

// PARAMETER   param_name

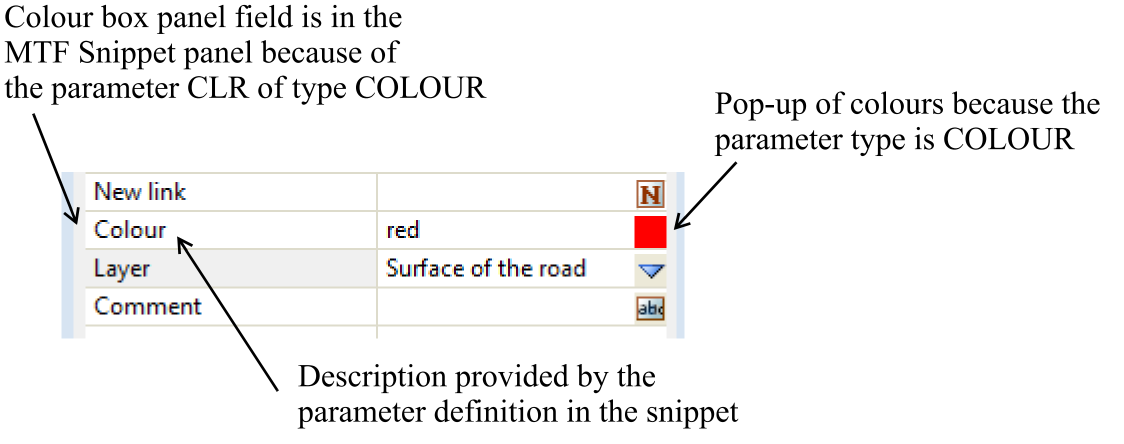
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

COLOUR - the parameter type.

param_desc   param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr   param_default.

```
// PARAMETER  CLR  COLOUR "Colour" "red"
insert "$INS_LYR=>$LINK"  "$CLR" 0.001  0.20 unknown SCH 0.0 ECH 0.0 absolute extra_start extra_end
...
```



Important Note:
The Colour panel field for a COLOUR parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.10 Snippet Parameter of Type NAME or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.10 Snippet Parameter of Type NAME

If a name of a string is required then the **NAME** parameter type is used.

The Snippet Parameter of type **NAME** inserts a Name box panel field into the **MTF Snippet** panel.

The user can type a string name into the panel field, or select a name from the pop-up of names that are taken from the names.4d file.

The syntax for type **NAME** is:

// PARAMETER param_name **NAME** param_descr param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

NAME - the parameter type.

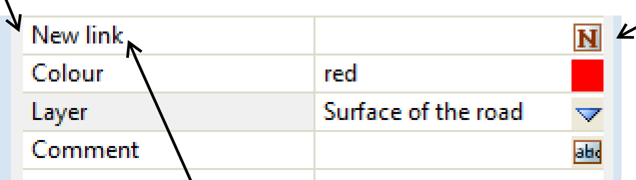
param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

```
// PARAMETER  LINK  NAME  "New link"
// PARAMETER  CLR  COLOUR "Colour" "red"
insert "$INS_LYR=>$LINK"  "$CLR" 0.001  0.20 unknown SCH 0.0 ECH 0.0 absolute extra_start extra_end
...
```

Name box panel field is in the MTF Snippet panel because of the parameter LINK of type NAME

Pop-up of names because the parameter type is NAME



Description provided by the parameter definition in the snippet

Important Note:
The String Name panel field for a NAME parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.11 Snippet Parameters for Models or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.11 Snippet Parameters for Models

There are three different Snippet parameter types for creating a Model box in the **MTF Snippet** panel. Which parameter is used depends on what is required to happen if the model exists or does not exit.

(a) use MODEL_CREATE when it doesn't matter if the selected model exists or doesn't exist.

See 21.5.8.11.1 Snippet Parameters of Type MODEL_CREATE

(b) use MODEL_MUST EXIST when the selected model must already exist.

See 21.5.8.11.2 Snippet Parameter of Type MODEL_MUST_EXIST

(c) use MODEL_MUST_NOT_EXIST when the model must **not** already exit.

21.5.8.11.3 Snippet Parameter Type MODEL_MUST_NOT_EXIST

Or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.11.1 Snippet Parameters of Type MODEL_CREATE

The Snippet Parameter of type **MODEL_CREATE** inserts a Model box panel field into the **MTF Snippet** panel.

The user can type a model name into the panel field, or select a model from the pop-up of models for the Model box.

If the model does not exist when the snippet is run, then a new model is created.

The syntax for type **MODEL_CREATE** is:

// PARAMETER param_name **MODEL_CREATE** param_desc param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

MODEL_CREATE - the parameter type.

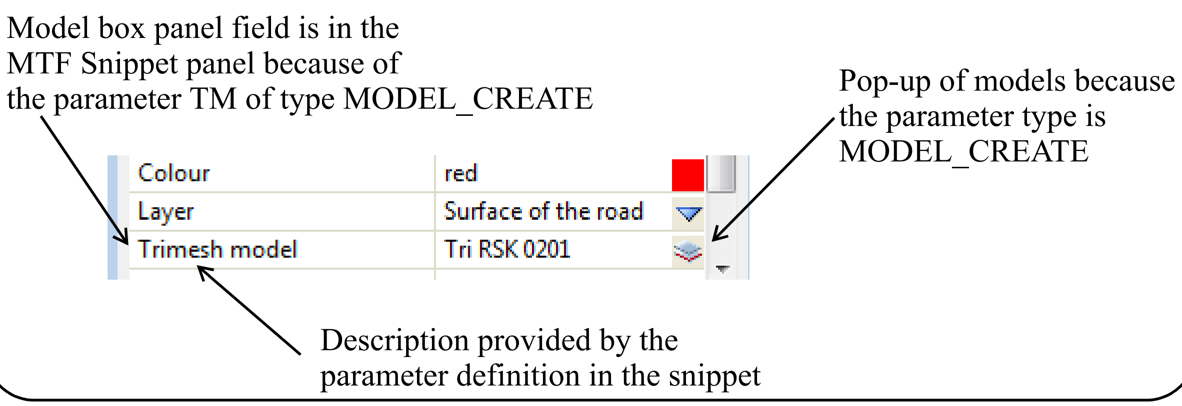
param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

```
// PARAMETER TM MODEL_CREATE "Trimesh model" "Tri RSK 0201"

create_strings "selection" "KSA<<LK" "KSA<<IK" "KSA<<TK" "KSA<<BK" start_ref 0 final_ref 0
                  "no_colour"  ""   "$TM" absolute extra_start extra_end

  ...
```



Important Note:
The Model panel field for a MODEL_CREATE parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.11.2 Snippet Parameter of Type MODEL_MUST_EXIST or return to 21.5.8.11 Snippet Parameters for Models or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.11.2 Snippet Parameter of Type MODEL_MUST_EXIST

The Snippet Parameter of type **MODEL_MUST_EXIST** inserts a Model box panel field into the **MTF Snippet** panel.

The user can type a model name into the panel field, or select a model from the pop-up of models for the Model box.

If the model does **not** exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type **MODEL_MUST_EXIST** is:

// PARAMETER param_name **MODEL_MUST_EXIST** param_desc param_default

where

// PARAMETER param_name

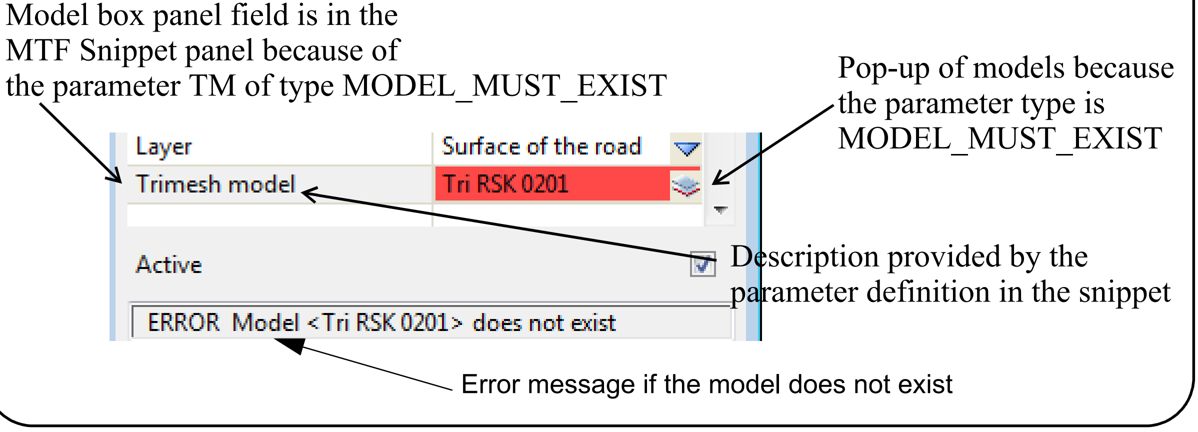
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

MODEL_MUST_EXIST - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

```
// PARAMETER TM MODEL_MUST_EXIST "Trimesh model" "Tri RSK 0201"
create_strings "selection" "KSA<<LK" "KSA<<IK" "KSA<<TK" "KSA<<BK" start_ref 0 final_ref 0
          "no_colour"  ""     "$TM"    absolute   extra_start  extra_end
   ...
```



Important Note:
The Model panel field for a MODEL_MUST_EXIST parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.11.3 Snippet Parameter Type MODEL_MUST_NOT_EXIST or return to 21.5.8.11 Snippet Parameters for Models or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.11.3 Snippet Parameter Type MODEL_MUST_NOT_EXIST

The Snippet Parameter of type **MODEL_MUST_NOT_EXIST** inserts a Model box panel field into the **MTF Snippet** panel.

The user can type a model name into the panel field, or select a model from the pop-up of models for the Model box.

If the model **does** exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type **MODEL_MUST_NOT_EXIST** is:

// PARAMETER param_name **MODEL_MUST_NOT_EXIST** param_desc param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See [// PARAMETER param_name] for what is allowed as the parameter name.

MODEL_MUST_NOT_EXIST - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See [param_descr param_default].

// PARAMETER TM MODEL_MUST_NOT_EXIST "Trimesh model" "Tri RSK 0201"

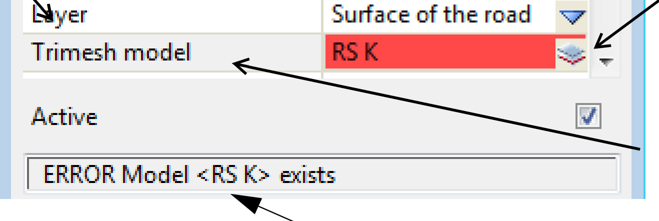
create_strings "selection" "KSA<<LK" "KSA<<IK" "KSA<<TK" "KSA<<BK" start_ref 0 final_ref 0

"no_colour" "" "$TM" absolute extra_start extra_end

...

Model box panel field is in the MTF Snippet panel because of the parameter TM of type MODEL_MUST_NOT_EXIST

Pop-up of models because the parameter type is MODEL_MUST_NOT_EXIST



Description provided by the parameter definition in the snippet

Error message if the model already exists

Important Note:

The Model panel field for a MODEL_MUST_NOT_EXIST parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section [21.5.8.12 Snippet Parameters for Tins] or return to [21.5.8.11 Snippet Parameters for Models] or [21.5.8 Snippet Parameters and Commands] or [21.5 Defining and Using Snippets].

21.5.8.12 Snippet Parameters for Tins

There are three different Snippet parameter types for creating a Tin box in the **MTF Snippet** panel. Which parameter is used depends on what is required to be done if the tin exists or does not exit.

(a) use TIN_CREATE when it doesn't matter if the selected tin exists or doesn't exist.

See 21.5.8.12.1 Snippet Parameter Type TIN_CREATE

(b) use TIN_MUST EXIST when the selected model must already exist.

See 21.5.8.12.2 Snippet Parameter Type TIN_MUST_EXIST

(c) use TIN_MUST_NOT_EXIST when the model must **not** already exit.

21.5.8.12.3 Snippet Parameter Type TIN_MUST_NOT_EXIST

Or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.12.1 Snippet Parameter Type TIN_CREATE

The Snippet Parameter of type **TIN_CREATE** inserts a Tin box panel field into the **MTF Snippet** panel.

The user can type a tin name into the panel field, or select a tin from the pop-up of tins for the Tin box.

If the tin does not exist when the snippet is run, then a new tin is created.

The syntax for type **TIN_CREATE** is:

// PARAMETER param_name **TIN_CREATE** param_desc param_default

where

// PARAMETER param_name

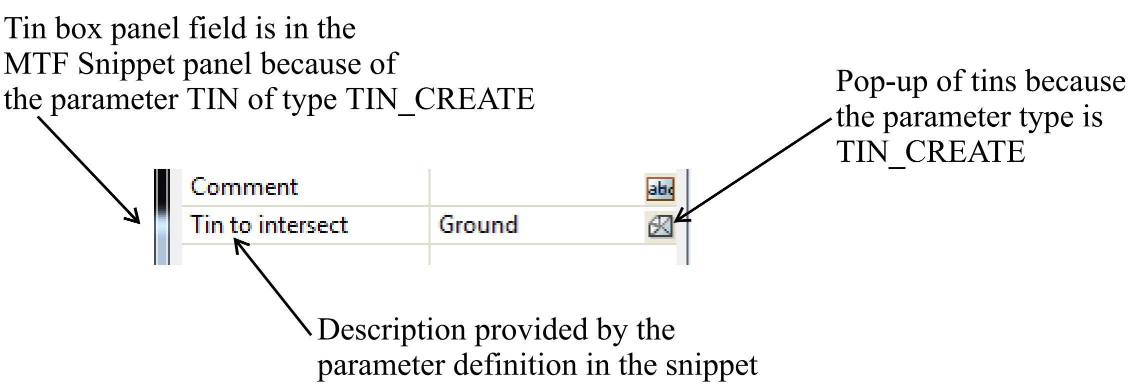
This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

TIN_CREATE - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

```
// PARAMETER TIN TIN_CREATE "Tin to intersect" "Ground"
tin_all_fixed "Design<<BA" start_ref 0 final_ref 0 "$TIN" "mod_wdt_hgt_fix" 1 absolute extra_start extra_end
...
```



Important Note:
The Tin panel field for a TIN_CREATE parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.12.2 Snippet Parameter Type TIN_MUST_EXIST or return to 21.5.8.12 Snippet Parameters for Tins or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.12.2 Snippet Parameter Type TIN_MUST_EXIST

The Snippet Parameter of type **TIN_MUST_EXIST** inserts a Tin box panel field into the **MTF Snippet** panel.

The user can type a tin name into the panel field, or select a tin from the pop-up of tins for the Tin box.

If the tin does **not** exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type **TIN_MUST_EXIST** is:

// PARAMETER param_name **TIN_MUST_EXIST** param_desc param_default

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

TIN_MUST_EXIST - the parameter type.

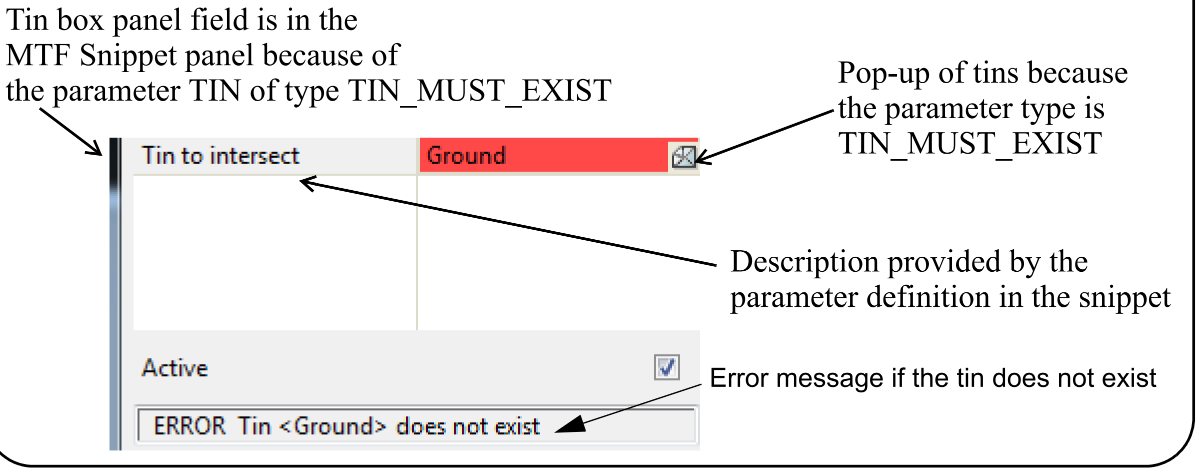
param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

// PARAMETER TIN **TIN_MUST_EXIST** "Tin to intersect" "Ground"

tin_all_fixed "Design<<BA" start_ref 0 final_ref 0 "$TIN" "mod_wdt_hgt_fix" 1 absolute extra_start extra_end

...



Important Note:
The Tin panel field for a TIN_MUST_EXIST parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.12.3 Snippet Parameter Type TIN_MUST_NOT_EXIST or return to 21.5.8.12 Snippet Parameters for Tins or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.12.3 Snippet Parameter Type TIN_MUST_NOT_EXIST

The Snippet Parameter of type **TIN_MUST_NOT_EXIST** inserts a Tin box panel field into the **MTF Snippet** panel.

The user can type a tin name into the panel field, or select a tin from the pop-up of tins for the Model box.

If the tin **does** exist when the Snippet is run, an error will occur and a message written to the panel message area.

The syntax for type **TIN_MUST_NOT_EXIST** is:

// PARAMETER   param_name   **TIN_MUST_NOT_EXIST**   param_desc   param_default

where

// PARAMETER   param_name

This defines a parameter of the given name. See [// PARAMETER param_name] for what is allowed as the parameter name.

TIN_MUST_NOT_EXIST - the parameter type.

param_desc   param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See [param_descr   param_default].

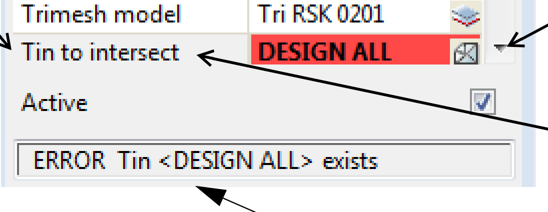
// PARAMETER TIN **TIN_MUST_NOT_EXIST** "Tin to intersect" "Ground"

tin_all_fixed "Design<<BA" start_ref 0 final_ref 0 "$TIN" "mod_wdt_hgt_fix" 1 absolute extra_start extra_end

...

Tin box panel field is in the MTF Snippet panel because of the parameter TIN of type TIN_MUST_NOT_EXIST

Pop-up of tins because the parameter type is TIN_MUST_NOT_EXIST



Description provided by the parameter definition in the snippet

Error message if the tin already exists

Important Note:
The Tin panel field for a TIN_MUST_NOT_EXIST parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.13 Snippet Parameter of Type LAYER or return to 21.5.8.12 Snippet Parameters for Tins or 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.13 Snippet Parameter of Type LAYER

If a layer for links is required then the **LAYER** parameter type is used.

A Snippet Parameter of type **LAYER** inserts an Layer box panel field into the **MTF Snippet** panel.

The user can type a layer name into the panel field or select a layer name from the pop-up of layers previously defined. The Layer name is then passed down to the snippet.

The syntax for type **LAYER** is:

// PARAMETER param_name **LAYER** param_desc param_default_value

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

LAYER - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

The value **param_default** is **optional**. But if it exists then if the default layer value does not already exist, it will be added to the choice list of Layer names.

Important Note:
The Layer panel field for a LAYER parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.14 Snippet Parameter of Type NAMED_GRADE or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.14 Snippet Parameter of Type NAMED_GRADE

If a **named grade definition** is required then the **NAMED_GRADE** parameter type is used.

A Snippet Parameter of type **NAMED_GRADE** inserts an Named Grade box panel field into the **MTF Snippet** panel.

The user can type a named grade into the panel field or select a named grade from the pop-up of named grades previously defined. The Named Grade is then passed down to the snippet.

The syntax for type **NAMED_GRADE** is:

// PARAMETER param_name **NAMED_GRADE** param_description param_default_value

where

// PARAMETER param_name

This defines a parameter of the given name. See // PARAMETER param_name for what is allowed as the parameter name.

NAMED_GRADE - the parameter type.

param_desc param_default

The description for the field in the **MTF Snippet** panel and an optional default value that is entered as the value in the field. See param_descr param_default.

Important Note:
The Named Grade panel field for a NAMED_GRADE parameter will only appear in the **MTF Snippet** panel if the parameter is used in the snippet.

Continue to the next section 21.5.8.15 Snippet Command INFO or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.8.15 Snippet Command INFO

There is an **Info** button on the **MTF Snippet** panel and when clicked, all the lines of the snippet file that start with "// INFO" are displayed in **Snippet Description** pop up.

The syntax for **INFO** is:

// INFO *text_to_display*

where

// INFO

this is at the beginning of the line and defines the command INFO. Note that there must be one or more spaces between the // and INFO.

text_to_display

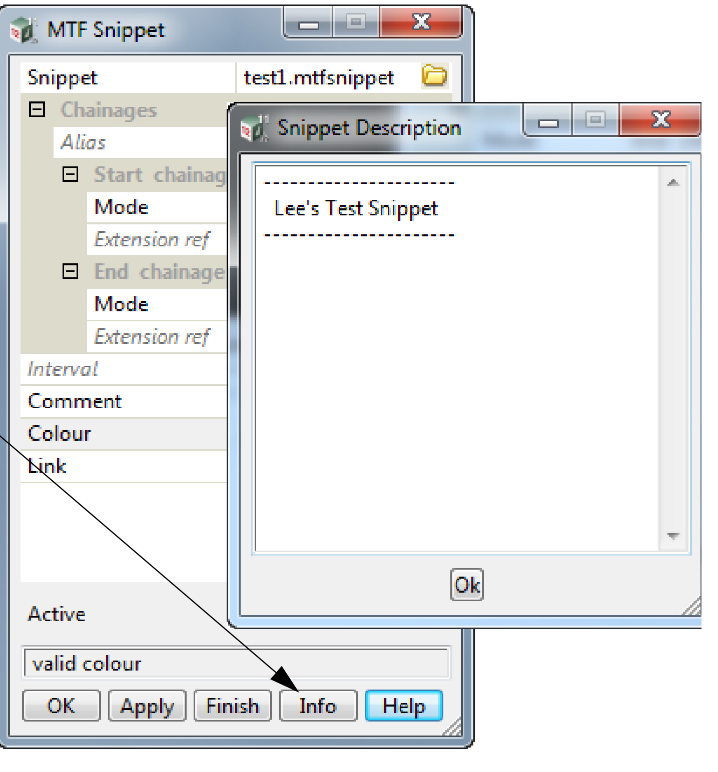
this is a line of text that is to be displayed in the **Snippet Description** pop up when the **Info** button is clicked on the **MTF Snippet** panel. The text is taken from one space after the word INFO and to the end of the line.

For example, in the Snippet code:

```
// PARAMETER      CLR    COLOUR      "Colour"      "red"
// PARAMETER      LN     TEXT        "Link"        ""
// INFO ----------------------
// INFO   Lee's Test Snippet
// INFO ----------------------
insert "Design=>$(LN)" $CLR  0.0  0.0 unknown $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

INFO commands

Click on **Info** and the **Snippet Description** pop-up. displays all the INFO lines in the Snippet.



Continue to the next section 21.5.8.16 Snippet Command DISPLAY or return to 21.5 Defining and Using Snippets.

21.5.8.16 Snippet Command DISPLAY

The **parameter description** and the **current value** that the parameter has can be displayed in the **Detail** and **Value** columns of the **MTF Modifiers** panel by using the **DISPLAY** command in the snippet.

The syntax for **DISPLAY** is:

// DISPLAY param_name

where

// DISPLAY

this is at the beginning of the line and defines the command DISPLAY. Note that there must be one or more spaces between the // and DISPLAY.

param_name

this is the name of the parameters to have its description and current value displayed in the **MTF Modifiers** panel.

When the **OK** or **Apply** button is clicked on the **MTF Snippets** panel, the ***description*** of the parameter **param_name** is displayed in the **Details** column of the **MTF Modifiers** panel and the ***current value*** of the parameter **param_name** is displayed in the **Value** column of the **MTF Modifiers** panel.

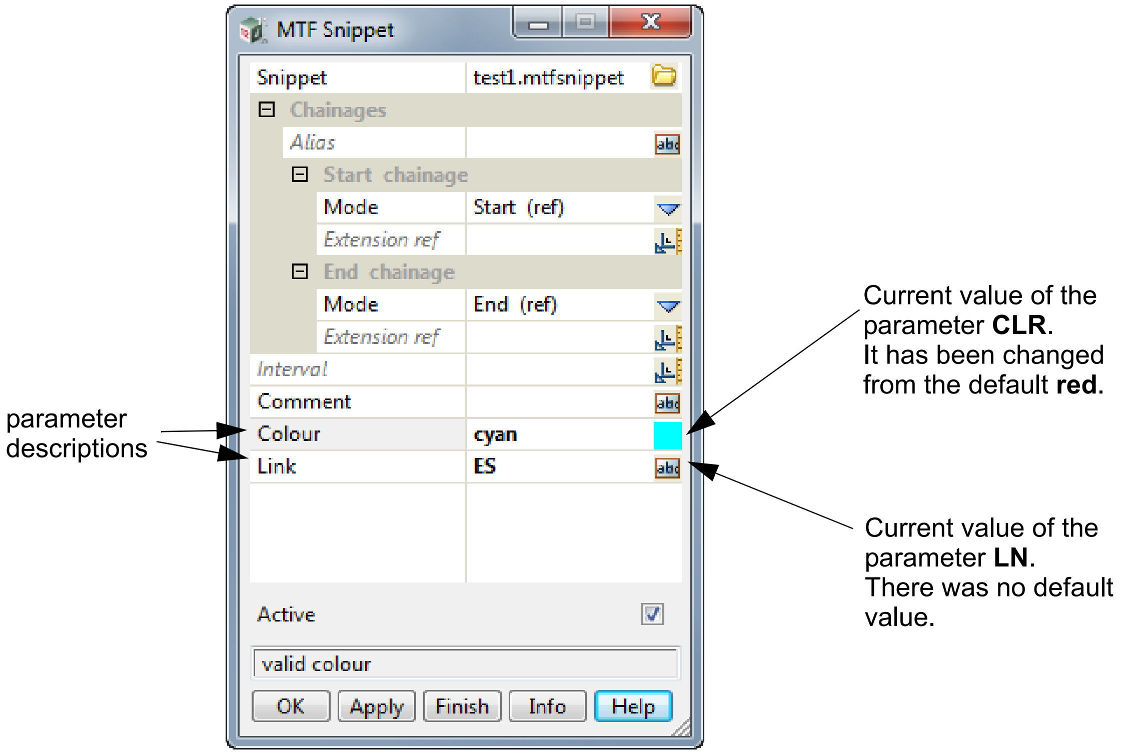
For example, in the Snippet code:

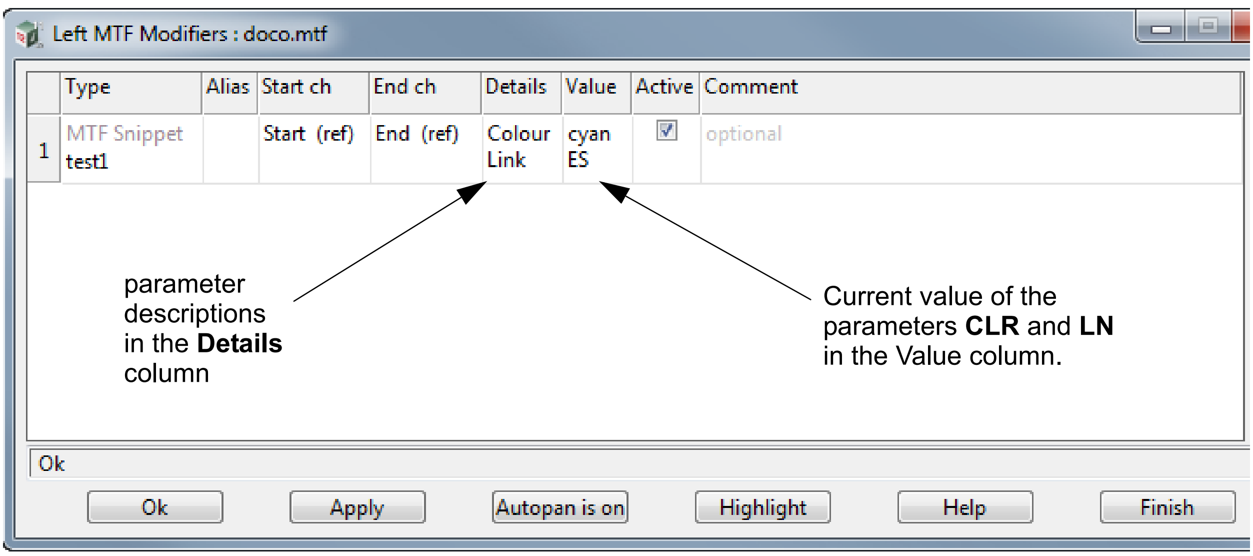
parameter description

```
// PARAMETER     CLR    COLOUR    "Colour"     "red"
// PARAMETER     LN     TEXT      "Link"       ""
// DISPLAY CLR
// DISPLAY LN
```

parameter description

```
insert "Design=>$(LN)" $CLR  0.0  0.0 unknown $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```





Continue to the next section 21.5.15.3 Temporary MTF Snippet File or return to 21.5 Defining and Using Snippets.

21.5.8.17 Snippet Command INCREMENT

There is an **INCREMENT** command to increment a snippet parameter by a given increment step. The increment step can be negative for a decrement.

The intended use is for TEXT parameters but it will actually work for any type of parameter but probably in an unexpected way.

How a parameter is incremented depends on the value of the parameter when it is interpreted as text. We will refer to the value of the parameter as text, as **value_text**.

For example, for an INTEGER, the value_text could be "13", for a TEXT it could be "STN003", for a REAL, it could be "23.45" and for a COLOUR, it could be "red". Obviously it usually doesn't make sense to increment some parameters like REAL or COLOUR but it can be done.

The INCREMENT command only increments either a

(a) a group of digits at the end of the text. That is each character is one of "0" to "9". The number of digits to increment is fixed (the length of the group).

or

(b) a group of letters at the end of the text. That is, each characters is one of "a" to "z". The number of letters to increment is fixed (the length of the group). Upper and lower case letters are considered to be the same thing.

Note that INCREMENT does not increment a mixture of digits and letters.

For the **value_text**, the group of characters at the end of the value_text that will be incremented is determined by looking at the last character of the value_text and

(a) if the last character is a **digit** then it will be a **digit group**.

The rest of **value_text** is then searched from right to left until a letter is found. So all the digits at the end of the value_text make up a **digit group** of a fixed length.

For example, for "STN001" the group is digit group of length 3 ("001").

For "ST2N02", the group is a digit group of length 2 ("02").

For "002", the group is a digit group of length 3 ("002").

The digit group increments by the increment step but it will always keep the same number of digits. So if the incremented digit group would need an extra digit then that extra leading digit is dropped. So the number wraps around.

For example, incrementing "568" by 1 will eventually reach "999" and the next increment will give you "000".

(b) if the last character is an letter (i.e. one of a to z) then it will be a **letter group**.

The rest of **value_text** is then searched from right to left until a digit is found. So all the letters at the end of value_text make up a **letter group** of a fixed length.

For example, for "123ABC" the group is an letter group of length 3 ("ABC").

"incrementing a letter" means that you take the letters position in the alphabet and add the increment step to it to give you the position of the new incremented letter. For example, **c** is the third letter and increment it by two give the fifth letter which is **e**. When you have a letter group then you work in base 26. For example, incrementing AZ by 1 gives you BA.

As in the case for a digit group, the letter group increments by the increment step but it will always keep the same number of letters. So if the incremented digit group would need an extra letter then that extra leading letter is dropped.

For example, incrementing "TUV" by 1 will eventually reach "ZZZ" and the next increment will give you "AAA".

The syntax for **INCREMENT** is:

// INCREMENT   param_name   increment_step

where

// INCREMENT

this is at the beginning of the line and defines the command INCREMENT. Note that there must be one or more spaces between the // and INCREMENT.

param_name

the name of the parameter to increment.

increment_step

this is the amount the increment the group of digits or letters. The increment step can be negative for a decrement.

As an example,

```
// PARAMETER  STRING_ID  TEXT   "String number"   1
// INCREMENT   STRING_ID   1
```

Continue to the next section 21.5.8.18 Optional Parameters in Snippets or return to 21.5 Defining and Using Snippets.

21.5.8.18 Optional Parameters in Snippets

Parameters can be set to be optional so that when they are displayed in the **MTF Snippet** panel and there is no value in the panel field, the Description is greyed out.

A parameters is made optional by adding **OPTIONAL** as the last word on the parameter line.

A default value for the parameter can still be passed in but in that case the Description in the **MTF Snippet** panel field will not be greyed out when it is first displayed because there is a value in it.

For example, in the Snippet code:

the default value has been omitted

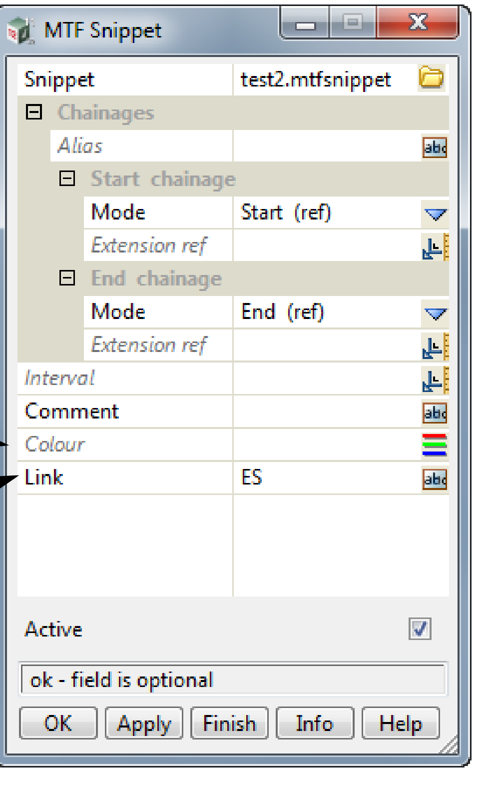
```
// PARAMETER   CLR   COLOUR   "Colour"   OPTIONAL
// PARAMETER   LN     TEXT       "Link"    "ES"   OPTIONAL
// DISPLAY CLR
// DISPLAY LN
```

default value

insert "Design=>$(LN)" $CLR 0.0 0.0 unknown $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end

Colour is optional

Link is optional but because there is a value in it, the word Link is not greyed out



WARNING

Be careful when making a parameter optional because the MTF may then have errors.

For example in the above example, if the **Colour** is not filled in then there will be an error in the MTF because the command

insert "Design=>$(LN)" $CLR 0.0 0.0 unknown $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end

will not be valid if CLR is blank and hence not there.

Continue to the next section 21.5.9 Automatic Parameters in Snippets or return to 21.5.8 Snippet Parameters and Commands or 21.5 Defining and Using Snippets.

21.5.9 Automatic Parameters in Snippets

In addition to the ability to create and define your own parameters in snippets, ***12d Model*** has a range of predefined parameters that are automatically created and calculated.

Automatic parameters allow for the use of values that are important to the snippet, but that you do not necessarily want to prompt the user to complete.

For example, string naming that is dependent on whether it is applied in the left side or right side modifiers. Rather than making the user select the correct left/right side value as a parameter, an automatic parameter can be used instead. In this way, automatic parameters can greatly simplify snippets and make them more portable.

Automatic parameters are fixed by the system and are identified by **starting with an underscore**, e.g. $(_AUTO_LR) or $_AUTO_LR.

All automatic parameter names are reserved in 12d. To ensure future compatibility, user-defined parameters should not start with an underscore.

Currently, the following automatic parameters are defined:

21.5.9.1 _AUTO_LR
21.5.9.2 _SCH 21.5.9.3 _ECH
21.5.9.4 _CL_REF 21.5.9.5 _CL_REF1 21.5.9.6 _CL_REF2
21.5.9.7 _CL_REF3 21.5.9.8 _CL_REF4
21.5.9.9 _NULL
21.5.9.10 _AUTO_0I, _AUTO_1J, ... , _AUTO_9R, _AUTO_AS, _AUTO_BT, ... _AUTO_HZ
21.5.9.11 _AUTO_05, _AUTO_16, _AUTO_27, ... _AUTO_49, _AUTO_AN, _AUTO_BO, ... _AUTO_MZ
21.5.9.12 _INS_05, _INS_LR, _INS_0I
21.5.9.13 _INS_SIDE_05
21.5.9.14 _SIDE_FX
21.5.9.15 _AUTO_LAYER_LR
21.5.9.16 _APPLY_TIN
21.5.9.17 _APPLY_DESIGN_MODEL
21.5.9.18 _HINGE
21.5.9.19 _SIDE
21.5.9.20 _SILENT_NG
21.5.9.21 _PROJECT_ATTRIBUTE

21.5.9.1 _AUTO_LR

Depending on the side from which the snippet is called this parameter will insert the value **L** if it is called from the left side modifiers and **R** if it is called from the right side modifiers.

```
insert "KLIP$(_AUTO_LR)" "red" 5 unknown -2 $(_SCH) 0 $(_ECH) 0 absolute
               extra_start extra_end
```

Continue to 21.5.9.2 _SCH or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.2 _SCH

Will insert **named_position MODIFIER_START**.

This is typically used to insert the start chainage mode that has been passed to the snippet.

Note that this parameter does **not** include the extension value.

```
insert "KLIP" "red" 5 unknown -2 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

Continue to 21.5.9.3 _ECH or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.3 _ECH

Will insert **named_position MODIFIER_END**.

This is typically used to insert the end chainage mode that has been passed to the snippet.

Note that this parameter does **not** include the extension value.

```
insert "KLIP" "red" 5 unknown -2 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

Continue to 21.5.9.4 _CL_REF or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.4 _CL_REF

This will insert the entire name of the Reference string from the Apply many function.

For example, if the reference string name is **RSR01**, $(_CL_REF) will insert **RSR01**

Continue to 21.5.9.5 _CL_REF1 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.5 _CL_REF1

This will insert the last character of the name of the Reference string from the Apply many function.

For example, if the reference string name is **RSR01**, $(_CL_REF1) will insert **1**.

Continue to 21.5.9.6 _CL_REF2 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.6 _CL_REF2

This will insert the last two characters of the name of the Reference string from the Apply many function.

For example, if the reference string name is **RSR01**, $(_CL_REF1) will insert **01**.

Continue to 21.5.9.7 _CL_REF3 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.7 _CL_REF3

This will insert the last three characters of the name of the Reference string from the Apply many function.

For example, if the reference string name is **RSR01**, $(_CL_REF1) will insert **R01**.

Continue to 21.5.9.8 _CL_REF4 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.8 _CL_REF4

This will insert the last four characters of the name of the Reference string from the Apply many function.

For example, if the reference string name is **RSR01**, $(_CL_REF1) will insert **SR01**.

Continue to 21.5.9.9 _NULL or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.9 _NULL

The current MTF syntax includes the use of $null for various values. In snippets, this would be interpreted as a parameter or token null.

Therefore, in snippets, if you would still like to include $null in MTF commands, they need to be replaced with this automatic parameter.

An example of MTF modifier syntax - note the present of $null values:

```
named_grade  "TEST"  start_ref  0  final_ref 0  "links"  "Design=>CLIN"  "Design=>EDGE"
        $null  $null  $null  $null  ""  absolute  extra_start  extra_end
```

The MTF snippet syntax for it - where $null has been replaced with $(_NULL):

```
named_grade  "TEST"  $(_SCH)  0  $(_ECH)  0  "links"  "Design=>CLIN"  "Design=>EDGE"
        $(_NULL)  $(_NULL)  $(_NULL)  $(_NULL)  ""  absolute  extra_start  extra_end
```

Continue to 21.5.9.10 _AUTO_0I, _AUTO_1J, … , _AUTO_9R, _AUTO_AS, _AUTO_BT, … _AUTO_HZ or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.10 _AUTO_0I, _AUTO_1J, … , _AUTO_9R, _AUTO_AS, _AUTO_BT, … _AUTO_HZ

This is a set of 18 different, but related, automatic parameters to assist with string naming conventions for multiple occurrences.

These automatic parameters follow the MOSS/MX naming convention for multiple occurrences:

Side	Occurrence																	
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
Left	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F	G	H
Right	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z

Left side is 0 to 9, A to H. **Right side** is I to Z.

So, for the 1st occurrence of a string, you would use the **_AUTO_0I** parameter.

For the 2nd occurrence of the string, you would use the **_AUTO_1J** parameter, and so on until for the 18th occurrence you would use the **_AUTO_HZ** parameter.

12d will automatically insert either 0/I, 1/J, 2/K … H/Z depending on whether the snippet is called on the **left** or **right** side of the modifiers.

Hence the names of the automatic parameter _AUTO_0I include the **0I** to indicate that it substitutes **0** when on the Left and **I** when on the right.

```
insert "LANE$(_AUTO_0I)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
insert "LANE$(_AUTO_1J)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
insert "LANE$(_AUTO_2K)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

Continue to 21.5.9.11 _AUTO_05, _AUTO_16, _AUTO_27, … _AUTO_49, _AUTO_AN, _AUTO_BO, …. _AUTO_MZ or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.11 _AUTO_05, _AUTO_16, _AUTO_27, … _AUTO_49, _AUTO_AN, _AUTO_BO, …. _AUTO_MZ

This is a set of 18 different, but related, automatic parameters to assist with string naming conventions for multiple occurrences.

These automatic parameters follow a similar, but alternative naming convention to the MOSS/MX for multiple occurrences:

Side	Occurrence																	
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
Left	0	1	2	3	4	A	B	C	D	E	F	G	H	I	J	K	L	M
Right	5	6	7	8	9	N	O	P	Q	R	S	T	U	V	W	X	Y	Z

Left side is 0 to 9, A to H. **Right side** is I to Z.

So, for the 1st occurrence of a string, you would use the _AUTO_05 parameter.

For the 2nd occurrence of the string, you would use the _AUTO_16 parameter, and so on until for the 18th occurrence you would use the _AUTO_MZ parameter.

12d will automatically insert either 0/5, 1/6, 3/7 … M/Z depending on whether the snippet is called on the **left** or **right** side of the modifiers.

Hence the names of the automatic parameter _AUTO_05 include the **05** to indicate that it substitutes **0** when on the Left and **5** when on the right.

```
insert "LANE$(_AUTO_05)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
insert "LANE$(_AUTO_16)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
insert "LANE$(_AUTO_27)" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute extra_start extra_end
```

Continue to 21.5.9.12 _INS_05, _INS_LR, _INS_0I or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.12 _INS_05, _INS_LR, _INS_0I

This is used as a normal TEXT parameter, which accepts a single character indicating the side.

Different automatic parameters are used depending on the character expected.

_INS_05 will insert **0** to **4** for left side, **5** to **9** for right side

_INS_LR will insert **L** for left side, **R** for right side

_INS_0I will insert **0** to **9** or **A** to **H** for left side, **I** to **Z** for right side

```
// PARAMETER _INS_05 TEXT "Insertion side (0...4 / 5...9)"
// PARAMETER _INS_LR TEXT "Insertion side (L / R)"
// PARAMETER _INS_0I TEXT "Insertion side (0...9,A...H / I...Z)"
```

Once set-up, the **_INS_??** automatic parameter is used to set the **_SIDE_FX** automatic parameter (see 21.5.9.14 _SIDE_FX).

Note that, as with any other parameter, in order for the _INS_05 / _INS_LR / _INS_0I parameter to appear in the MTF Snippet panel, it must be used at least once elsewhere in the snippet. This can be done in a token definition, directive, or expression.

Continue to 21.5.9.13 _INS_SIDE_05 or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.13 _INS_SIDE_05

This is similar to _INS_05 / _INS_0I / _INS_LR, but without the need to define it as a parameter.

The _INS_SIDE_05 takes a single character.

The value of _INS_SIDE_05 is used to determine the value for the _SIDE_FX automatic parameter.

_INS_SIDE_05 will be **0** to **4** for left side, **5** to **9** for right side

The _INS_SIDE_05 is unique as an automatic parameter, since its value can be set.

In this way, it behaves more like a Directive (See 21.5.12 Snippet Directives).

To set the value of the _INS_SIDE_05 automatic parameter

$(_INS_SIDE_05)<value>

<value> should be a parameter.

The _INS_SIDE_05 should not be used anywhere else in snippets, including user_message commands, except to define its value.

```
// PARAMETER LINK1 TEXT "Attach to link" "EDGE0R"
// Set the _INS_SIDE_05 auto parameter to the 5th character of the LINK1 parameter
$(_INS_SIDE_05)$(LINK1[5:5])
user_message "_SIDE_FX = $(_SIDE_FX) " // Display the current value of _SIDE_FX

insert "Design$(_SIDE_FX)KLIP0R" "red" 2 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute
        extra_start   extra_end
```

Continue to 21.5.9.14 _SIDE_FX or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.14 _SIDE_FX

This will insert the link side indicator **<<** for link on left side, or **>>** for link on right side, depending on the most recent use of **_INS_***.

That is, if the last state of **_INS_*** corresponds to the left side, **_SIDE_FX** will insert **<<** to indicate insertion to the left.

If the last state of **_INS_*** corresponds to the right side, **_SIDE_FX** will insert **>>** to indicate insertion to the right. Hence if

_INS_05 = 0 to 4, then _SIDE_FX = **<<**

_INS_05 = 5 to 9, then _SIDE_FX = >>

_INS_LR = L, then _SIDE_FX = <<

_INS_LR = R, then _SIDE_FX = >>

_INS_0I = 0 to 9, A to H, then _SIDE_FX = <<

_INS_0I = I to Z, then _SIDE_FX = >>

_INS_SIDE_05 = 0 to 4, then _SIDE_FX = <<

_INS_SIDE_05 = 5 to 9, then _SIDE_FX = >>

Note that in order for the _SIDE_FX parameter to be set, the corresponding parameter _INS_* must also have been set, given a value (0 to 9, A to Z) and used somewhere in the snippet.

For this reason, if not using the _INS_05 directly, it is necessary to reference it in a temporary parameter, token or expression.

```
// PARAMETER _INS_05 TEXT "Insertion side (0...4 / 5...9)"
// PARAMETER _INS_LR TEXT "Insertion side (L / R)"
// PARAMETER _INS_0I TEXT "Insertion side (0...9,A...H / I...Z)"
// DISPLAY _INS_05
// DISPLAY _INS_LR
// DISPLAY _INS_0I

// The _INS_* parameter must be used at least once in the snippet
// This can be done in a token, directive, expression or command.
// The $(_INS_*) must be used to correctly set the _SIDE_FX
// automatic parameter.
user_message_print "_INS_05 = $(_INS_05)"// _SIDE_FX now based on this parameter
user_message_print "_SIDE_FX after _INS_05 = $(_SIDE_FX) "
insert_absolute "Design$(_SIDE_FX)EDGE" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute
        extra_start   extra_end

user_message_print "_INS_LR = $(_INS_LR)"// _SIDE_FX now based on this parameter
user_message_print "_SIDE_FX after _INS_LR = $(_SIDE_FX) "
insert_absolute "Design$(_SIDE_FX)EDGE" "yellow" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute
        extra_start   extra_end

user_message_print "_INS_0I = $(_INS_0I)"// _SIDE_FX now based on this parameter
user_message_print "_SIDE_FX after _INS_0I = $(_SIDE_FX) "
insert_absolute "Design$(_SIDE_FX)EDGE" "green" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 absolute
        extra_start   extra_end
```

The _SIDE_FX allows links to be inserted on any side of the reference, regardless of the side calling the snippet. For example, a snippet on the right side could insert a link on the left side.

Once the _SIDE_FX value is used in the snippet, its value will remain the same until re-defined by any of the _INS_05 / _INS_LR / INS_0I / _INS_SIDE_05 automatic parameters.

Continue to 21.5.9.15 _AUTO_LAYER_LR or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.15 _AUTO_LAYER_LR

Depending on which side the snippet is called from, will insert the value **layer_left** if called from the left side modifiers and **layer_right** if called from the right side modifiers.

This is typically used for the Create String modifier commands.

```
create_strings "$(_AUTO_LAYER_LR)" "Design=>" "*" $(_SCH) 0 $(_ECH) 0 "no_colour" ""
      "DES ROAD STRS"   absolute   extra_start   extra_end
```

Continue to 21.5.9.16 _APPLY_TIN or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.16 _APPLY_TIN

This will insert the name of the tin from the **Apply MTF** function

```
interface_tin "Design=>INT" $(_SCH) 0 $(_ECH) 0 "Design=>"   "$(_APPLY_TIN)" 1 2 100 0
              "red"    "green"    0   0    absolute   extra_start     extra_end
```

Continue to 21.5.9.17 _APPLY_DESIGN_MODEL or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.17 _APPLY_DESIGN_MODEL

This will insert the name of the **Road Surface Strings** model entered in the **Models** tab of the **Apply MTF** function panel.

```
create_strings "$(_AUTO_LAYER_LR)" "Design=>"  "*"  $(_SCH) 0 $(_ECH)  0  "no_colour"   ""
               "$(_APPLY_DESIGN_MODEL)"    absolute    extra_start     extra_end
```

Continue to 21.5.9.18 _HINGE or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.18 _HINGE

This will insert the name of the **hinge string**.

Since the user can define a custom hinge name (the default is **HINGE**), this is needed to ensure portability and compatibility with different users and setups.

```
named_grade "CWAY" $(_SCH) 0 $(_ECH) 0 "links" "Design=>HING" "Design=>EDGE"
       $null   $null   $null   $null   ""    absolute   extra_start     extra_end
```

Continue to 21.5.9.19 _SIDE or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.19 _SIDE

Depending on which side the snippet is called from, will insert the value **-1** if called from the left side modifiers and **+1** if called from the right side modifiers.

Continue to 21.5.9.20 _SILENT_NG or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.20 _SILENT_NG

This will insert **_SILENT_NAMED_GRADE**.

When inserted in front of a named grade, the named grade will not appear in any Named Grade choice boxes.

This is typically used for temporary or construction named grades in snippets that you do not wish the end user to see in the GUI.

Continue to 21.5.9.21 _PROJECT_ATTRIBUTE or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.21 _PROJECT_ATTRIBUTE

This will insert a **project attribute** from the current 12d project.

The particular attribute to be inserted is specified between square brackets [ ] and follows the standard convention of attribute paths in ***12d Model***.

```
user_message "$(_PROJECT_ATTRIBUTE[ProjectDetails/ProjectNumber/Value])"
```

This will insert the value of the **ProjectNumber** entered in the **Project Details** panel (if ProjectNumber is defined).

Continue to 21.5.9.22 Substrings of parameters or return to 21.5.9 Automatic Parameters in Snippets.

21.5.9.22 Substrings of parameters

Although there are some preset automatic parameters for extracting a few characters from a string, e.g. _CL_REF3, it is possible to extract a substring of all **User** parameters, and the **one** special **auto parameter case**, _CL_REF.

This is done with the following syntax:.

```
param[start:end]
```

param is the parameter or token name

start is the character start position (the first character is at position 1). It must be an integer greater than or equal to 1.

end is the character end position (the first character is at position 1). It must be an integer greater than or equal to the start position.

For the value of the selected **param**, only the text from **start** to **end** will be inserted.

Both **start** and **end** are compulsory. The colon is also compulsory.

If **end** is greater than the length of the complete param value, an end position equal to the string length will be used. That is, everything from the start up to the end of the string will be returned.

start must be less than **end**.

Substrings are currently supported on all user parameters. Automatic parameters and tokens are not supported.

For example,

if $(TEXT_PARAM) has the value **Some text**

then	$(TEXT_PARAM[1:3])	is	**Som**
	$(TEXT_PARAM[4:7])	is	**e t**
	$(TEXT_PARAM[1:20])	is	**Some text**
	$(TEXT_PARAM[5:9])$(TEXT_PARAM[1:4])	is	**textSome**

For the special auto parameter case, an example is:

$(_CL_REF[2:6])

Continue to the next section 21.5.10 Arithmetic in Snippets or return to 21.5.9 Automatic Parameters in Snippets or 21.5 Defining and Using Snippets.

21.5.10 Arithmetic in Snippets

Arithmetic expressions can be used for any of the real values in the lines of a snippet file as long as special rules are obeyed.

1. If a real value is replaced by an expression then the expression must be surrounded by round brackets. That is "**(**" and "**)**".
2. If the arithmetic operators plus **+**, minus **-**, multiplication ***** and division **/** are used then there must be a space on both sides of them.

   For example, **($(TL) - $(PL))** and **(0.0 - ($(DL) / 2.0) - 0.5)**

   Note that the negative of a number has the negative sign hard up against the number with no space in-between. For example **-0.5**

WARNING - a future interactive Snippet editor may not be able to support arithmetic in snippets. Those snippets with arithmetic will still need to be modified using a text editor.

An example of some lines from a snippet file using an arithmetic expression is:

```
// RTA Type F Half Kerb to SA transition

// PARAMETER TL REAL "Transition Length" 5.5
// PARAMETER PL REAL "Part Length" 1.340

// insert the links for the 'F' to 'short F' transition

insert "1" "grey" 0.001  0.000 unknown named_position "MODIFIER_START" 0.0 named_position
"MODIFIER_START" ($(TL) - $(PL)) absolute extra_start extra_end
insert "2" "grey" 0.499 -0.040 unknown named_position "MODIFIER_START" 0.0 named_position
"MODIFIER_START" ($(TL) - $(PL)) absolute extra_start extra_end
...
```

Continue to the next section 21.5.11 Trig and Maths Function Capabilities in Snippets or return to 21.5 Defining and Using Snippets.

21.5.11 Trig and Maths Function Capabilities in Snippets

There is now some trig and maths capability in the MTF snippet grammar.

The trig functions supported are:

sin(x), cos(x), tan(x) - trig functions

asin(x), acos(x), atan(x) - the inverse trig functions

square(x) - return x*x

sqrt(x)

fabs(x) - returns the absolute value of its x.

ceil(x) - the ceil functions return a floating-point value that represents the smallest integer that is greater than or equal to x.

floor(x) - the floor functions return a floating-point value that represents the largest integer that is less than or equal to x.

log(x) - the log functions return the natural logarithm (base e) of x if successful.

exp(x) - the exp function returns the exponential value of the floating-point parameter, x, if successful. That is, the result is e to the power x, where e is the base of the natural logarithm.

cube(x) - return x*x*x

pow(x,y) - returns the value of x to the power y.

fmod(x,y) - returns the floating-point remainder of x / y

pi, halfpi, twopi - so you don't have to keep typing the values in

The trig functions etc then allows calculations in a snippet like

```
// Swept angle of 2nd radius.
//
@def_tok  A2  "(asin(($(D2) - $(R1) +$(DEL_R1_R2) * cos($(A1))) / $(R2)) - $(A1) + halfpi)
```

Note - Mathematical formulae in snippets should always be quoted to prevent concatenation and unexpected results.

Continue to the next section 21.5.12.1.1 #define in Snippets - Do Not Use or return to 21.5 Defining and Using Snippets.

21.5.12 Snippet Directives

See

Or return to 21.5 Defining and Using Snippets.

21.5.12.1 Deprecated C Preprocessor from V10

When Snippets were first introduced in ***12d Model 10***, the C preprocessor syntax (*e.g.* #define or #if / #else / #endif) was used to increase the power of snippets by performing conditional tests and evaluations on the final MTF file containing the snippet.

The C preprocessor is used throughout ***12d Model*** (*e.g.* setup files) but once you progress from simple uses, it can be very confusing for users to fully understand.

```
// PARAMETER DL REAL "Drive length"   3.0
// PARAMETER WD REAL "Layback width"  0.6
// PARAMETER DP REAL "Layback depth" -0.04
#define _DR1 (0.0 - ($DL / 2.0) - 0.5)
#define _DR2 (0.0 - ($DL / 2.0))
#define _DR3 ( ($DL / 2.0))
#define _DR4 (($DL / 2.0) + 0.5)
// drop into DW
insert "SAL" "grey" 0.001 0.000 unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAI" "grey" 0.499 $DP   unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAT" "grey" 0.030 0.150 unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAB" "grey" 0.180 0.000 unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
```

Due to the complexity and limitations of using the C preprocessor, a new preprocessor has been created in ***12d Model 11*** specifically for Snippets.

Snippets in ***12d Model 11*** can still use the C preprocessor style of directives and such snippets will still run in ***12d Model 11***. However, the use of the older style of directives has been superseded (deprecated) in ***12d Model 11*** and users are encouraged to only use the special Snippet Directives.

Continue to 21.5.12.1.1 #define in Snippets - Do Not Use or return to 21.5.12 Snippet Directives.

21.5.12.1.1 #define in Snippets - Do Not Use

IMPORTANT WARNING

From ***12d Model*** 11 onwards, **#define** has been replaced by **@def_tok** directive and #define should not be used.

It is only documented here in case you are working on an old Snippet and need to know what the command does.

#define can be used in a snippet file to define parameters for use inside the snippet file.

WARNING - a future interactive Snippet editor may not be able to support #define. Those snippets with #define will still need to be modified using a text editor.

The #define is placed at the beginning of a line, followed by one or more spaces and then the define_name to be used, and then one or more spaces and the expression that the define_name stands for.

```
#define   define_name    define_expression
```

Then the define_name can be used instead of the define_expression anywhere else in the snippet file following the #define.

Note - snippet parameters can be used in the define_expression as long as the definition of the parameter occurs before the #define.

For example

```
// PARAMETER DL REAL "Drive length"   3.0
// PARAMETER WD REAL "Layback width"  0.6
// PARAMETER DP REAL "Layback depth" -0.04

#define _DR1 (0.0 - ($DL / 2.0) - 0.5)
#define _DR2 (0.0 - ($DL / 2.0) )
#define _DR3 ( ($DL / 2.0) )
#define _DR4 ( ($DL / 2.0) + 0.5)

// drop into DW
insert "SAL" "grey" 0.001 0.000 unknown named_position "MODIFIER_START" _DR1 
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAI" "grey" 0.499 $DP   unknown named_position "MODIFIER_START" _DR1 
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAT" "grey" 0.030 0.150 unknown named_position "MODIFIER_START" _DR1 
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAB" "grey" 0.180 0.000 unknown named_position "MODIFIER_START" _DR1 
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
...
```

Return to 21.5.12.1 Deprecated C Preprocessor from V10.

21.5.12.2 Snippet Directives for V11 Onwards

The syntax for a Snippet Directive starts with a **@**, then **a space**, followed by the **directive** and **any additional arguments**.

```
@ <directive> <argument> [<argument>... <argument>]
```

<directive> - name of the directive.

<argument> - any required arguments for the directive. The number and type of these arguments will depend on the directive.

```
@ if_val_eq "$(KT)" "SM"
// Do something in here
@ end if
```

For information on all the snippet directives, see the sections

21.5.12.3 Flow control.
21.5.12.4 Abbreviations.
21.5.12.5 Comparisons of Data Types.
21.5.12.6 Tokens and Tokens vs Tokens.
21.5.12.7 Tokens vs Strings.
21.5.12.8 Tokens vs Doubles.
21.5.12.9 Tokens vs Integers.
21.5.12.10 Values Defined and Value vs Value.
21.5.12.11 Values vs Strings.
21.5.12.12 Values vs Doubles.
21.5.12.13 Values vs Integers.
21.5.12.10 Values Defined and Value vs Value.

Or return to 21.5.12 Snippet Directives or 21.5 Defining and Using Snippets.

21.5.12.3 Flow control

In a snippet, the normal processing flow is that each snippet command is processed in the order in which they are encountered. It is possible, however, to change the order in which such commands are processed or even to totally skip commands. These are done through **flow control directives** in the snippets.

See

21.5.12.3.1 Conditional flow control
21.5.12.3.2 Transferring Flow Control

Or return to 21.5.12 Snippet Directives or 21.5 Defining and Using Snippets.

21.5.12.3.1 Conditional flow control

Snippet commands can be processed or ignored based on the result of a test.

This is known as a conditional test.

Snippet directives based on conditional statements (*i.e.* testing whether a statement is true or false) are generally of the form **if/else/end if**.

```
@ if….
@ end_if
```

OR

```
@ if…
@ else
@ end_if
```

When the **if** condition is **true**, commands will be processed until the **else** or **end_if** directive is found.

When the **if** condition is **false**, commands will be ignored **until** the **else** or **end_if** directive is found.

When the **if** condition is **false** and an **else** directive is found the commands following the **else** until the **end_if** will be processed.

An **end_if** directive must always be present.

An **else** directive cannot exist without a preceding **if** directive.

There is **no else_if** directive.

```
@ if...
// When the if condition is true, the commands in this section,
// until the else or end_if will be processed.
@ else
// When the if condition is false, the commands in this section,
// until the end_if will be processed
@ end_if
```

Embedding if directives within other conditional directives (if or else), *i.e.* nested ifs, are **not allowed**.

Continue to 21.5.12.3.2 Transferring Flow Control or return to 21.5.12.3 Flow control or 21.5.12 Snippet Directives.

21.5.12.3.2 Transferring Flow Control

In addition to the conditional flow control, it is possible within snippets to transfer processing to an entirely different and disconnected section of the snippet.

These transfers (jumps) are performed by the **goto** and **label** directives.

See

21.5.12.3.2.1 Goto - transfer processing to a given location.
21.5.12.3.2.2 Label - mark a location for goto

Or return to 21.5.12 Defining and Using Snippets.

21.5.12.3.2.1 Goto - transfer processing to a given location

The **goto** directive transfers processing to a corresponding **label** directive within the snippet.

The syntax is:

```
@ goto <label>
```

<label> - is the name of the label to which control will be transferred. One and only one label should be specified.

The **goto** directive must be defined with a corresponding **label** directive.

Control can only be transferred **forwards** in a file (i.e. further down the contents of the file); control **cannot** be passed **backwards**.

The corresponding **label** should **not** be inside a conditional flow group, if/else/end_if.

```
// PARAMETER KT TEXT "Kerb type" OPTIONAL

@ def_tok EXTRAS "absolute extra_start extra_end"

@ if_val_neq "$(KT)" "SA Kerb"
  @ goto fred
  user_message "Should not get here." $(_SCH) 0 $(_ECH) 0 $(EXTRAS)
@ end_if

user_message "Should not get here." $(_SCH) 0 $(_ECH) 0 $(EXTRAS)

@ label fred

user_message "Should get here." $(_SCH) 0 $(_ECH) 0 $(EXTRAS)
```

Continue to 21.5.12.3.2.2 Label - mark a location for goto or return to 21.5.12.3.1 Conditional flow control or 21.5.12.3 Flow control or 21.5.12 Snippet Directives.

21.5.12.3.2.2 Label - mark a location for goto

The **label** directive is used in conjunction with a **goto** directive to indicate a position within the snippet.

The syntax is:

```
@ label <label>
```

<label> - is the name of this label. A label should normally be paired with a corresponding **goto** directive, though it is not compulsory. A label can exist without a **goto**.

The **label** must be placed **after** the **goto** directive to which it corresponds. Control can only be transferred forwards in a file (i.e. further down the contents of the file); control cannot be passed backwards.

The **label** directive should not be placed inside a conditional flow group, if/else/end_if.

The label does not have to be unique within the file and multiple pairs of goto/labels are permitted. Note, however, that goto will simply jump to the first/next found matching label.

```
@ goto end_earthowrks
@ label end_earthowrks
.
@ goto end_earthowrks
@ label end_earthowrks
```

Continue to 21.5.12.4 Abbreviations or return to 21.5.12.3.1 Conditional flow control or 21.5.12.3 Flow control or 21.5.12 Snippet Directives.

21.5.12.4 Abbreviations

When reading or writing snippet directives, it is useful to know and remember the abbreviations below.

if - conditional test

def - define a token

tok - token

val - value

str - string (i.e. text)

int - integer

dbl - double

tol - tolerance

eq - equal

neq - not equal

gt - greater than

lt - less than

ge - greater than or equal to

le - less than or equal to

in_range - within a range of values defined by lower and upper bounds

nin_range - not within (i.e. outside) a range of values defined by lower and upper bounds

These abbreviations can be used to determine the appropriate directive to use or interpret and understand directives in use.

For example, the **if_val_le_dbl_tol**, is a conditional directive (**if**) to test if a value (**val**) is less than or equal to (**le**) any of double values (**dbl**) with a user-specified tolerance (**tol**).

Continue to 21.5.12.5 Comparisons of Data Types or return to 21.5.12 Snippet Directives.

21.5.12.5 Comparisons of Data Types

There are two basic types of comparison used in snippets.

(a) The **first** is **character-based** and is typically used on strings of text.

In a character-based comparison of two values, the first character from one string is compared against the first character from the other string. If both characters are equal, processing continues to the next character in each string.

Character comparisons in snippets are **not case sensitive**.

```
@ def_tok TOK1 "SOME TEXT"

@ if_tok_eq_str TOK1 "some text"
  user_message "This will be true because comparisons are case insensitive"
@ end_if
```

Character comparisons should not be used to compare two numbers. All directives including the **str** abbreviation, e.g. if_tok_eq_str, if_val_neq_str, use character-based comparisons.

```
@ def_tok TOK1 1

@ if_tok_eq_str TOK1 1.0
@ else
  user_message "False because if_tok_eq_str uses a character-based comparison"
@ end_if
```

(b) The **second** type of comparison is **numeric** and is typically used on numbers both integers and doubles.

In a numerical-based comparison of two values, each value is first converted into a double. If the value cannot be converted to a number, then an error is usually generated.

```
@ def_tok TOK1 1                     // This is a valid number
@ def_tok TOK2 2.345                 // As is this
@ def_tok TOK3 "1.78                 "// This can still be converted to a valid number
@ def_tok TOK4 "1e-4                 "// As can this
@ def_tok TOK5 "RL1.234"// But not this

@ if_tok_eq_dbl TOK5 "1.234"
  user_message "TOK5 is not a valid number"
@ else
  user_message "TOK5 cannot be converted to a valid number"
@ end_if
```

Assuming both values in a numerical comparison are valid numbers (or can be converted as such), the numbers are then compared in standard mathematical fashion.

```
@ def_tok TOK1 1

@ if_tok_eq_dbl TOK1 1.0
  user_message "True because if_tok_eq_dbl uses a numerical-based comparison"
@ end_if

@ if_tok_eq_dbl TOK1 "0.001e3"
  user_message "Also true because if_tok_eq_dbl uses a numerical-based comparison"
@ end_if
```

Both double and integer numbers can be used in directive comparisons for doubles (contain **dbl** abbreviation). However, only integer numbers can be used in directive comparisons for integers (contain **int** abbreviation). Doubles will not be converted or truncated to integers in such cases, but instead produce an error.

Continue to 21.5.12.6 Tokens and Tokens vs Tokens or return to 21.5.12 Snippet Directives.

21.5.12.6 Tokens and Tokens vs Tokens

The following Snippet Directives define tokens, check whether tokens are defined and compare tokens with other tokens.

See

Or return to 21.5 Defining and Using Snippets.

21.5.12.6.1 def_tok

The **def_tok** directive **defines** a **token** that can have an **optional value**.

The syntax is:

```
@ def_tok <token> [<string>... <string>]
```

<token> - this is the name of the token.

Wherever the token is to be used in the snippet, put **$(token)**

Note that in the older V10 syntax, this was $token.

The characters of the token name can only be alphanumeric (upper and lower case) and underscores but the name **cannot contain spaces**.

The **token names** are **not case sensitive**.

So two names differing only by case are considered to be identical. That is, **THIS**, **This**, **this** and **tHis** are all considered identical by ***12d Model***.

Tokens are treated similarly to parameters, so any name must be unique within a snippet for all parameters and tokens.

<string> - one or more optional strings of character (text).

Any string with spaces must be enclosed in quotes.

Multiple strings are concatenated.

The string can contain other tokens, though any tokens must have previously been defined.

The string can also contain mathematical expressions.

The snippet preprocessor will preserve any white space within quoted strings.

However, multiple strings or values will be concatenated without any white space.

If a string has spaces that need to be retained, enclose the string in quotes.

Tokens are used and substituted in the same way as parameters, *e.g.* $(TOKEN).

```
@ def_tok TOK          //defines a token TOK with no value
@ def_tok TOK A        //defines a token TOK with the value "A"
@ def_tok TOK "A B"    //defines a token TOK with the value "A B"
@ def_tok TOK A B      //defines a token TOK with the value "AB", concatenates
@ def_tok TOK A B "C D" //defines a token TOK with the value "ABC D", concatenates
@ def_tok TOK $(KT)    //defines a token TOK with the value of the substituted parameter
```

Continue to 21.5.12.6.2 if_tok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.2 if_tok

The **if_tok** directive tests whether **any** of the given **tokens** are **defined**.

The syntax is:

```
@ if_tok <token> [<token>... <token>]
// Commands to be processed when statement is true
@ end_if
```

<token> - the name of the token to test.

At least one token must be specified, however, multiple tokens can be included.

Multiple tokens should be separated by whitespace.

If any of the tokens are defined, the statement is true.

If none of the tokens are defined, the statement is false.

Multiple tokens are handled as if joined by logical OR statements.

NOTE: This directive simply tests whether the token is defined and not whether the value is valid or blank.

```
@ def_tok "T1"
@ def_tok "T2"

@ if_tok "T1"
  user_message "Found token T1"
@ end_if

@ if_tok "T1" "T2"
  user_message "Found token T1 or T2"
@ end_if

@ if_tok "T2"
  user_message "Found token T2"
@ end_if
```

See also:

21.5.12.6.3 if_ntok - for logically opposite directive

21.5.12.6.7 if_all_toks - for testing if all tokens are defined

Continue to 21.5.12.6.3 if_ntok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.3 if_ntok

The **if_ntok** directive tests whether **particular tokens** are **undefined**.

The syntax is:

```
@ if_ntok <token> [<token>... <token>]
// Commands to be processed when statement is true
@ end_if
```

<token> - the name of the token to test.

At least one token must be specified, however, multiple tokens can be included.

Multiple tokens should be separated by whitespace.

If **none** of the **tokens** are **defined**, the statement is **true** and the snippet commands until the next end_if directive are processed.

If **any** of the **tokens** are **defined**, the statement is **false** and the entire block of commands (until the next end_if directive) are skipped.

Multiple tokens are handled as if **joined** by **logical OR** statements.

NOTE: This directive simply tests whether the token is defined and not whether the value is valid or blank.

```
@ def_tok T1
@ def_tok T2

@ if_ntok T1
  user_message "Didn't find token T1"
@ end_if

@ if_ntok T1 T2
  user_message "Didn't find token T1 or T2"
@ end_if

@ if_ntok T2
  user_message "Didn't find token T2"
@ end_if
```

See also:

21.5.12.6.2 if_tok - logically opposite directive

21.5.12.6.8 if_nall_toks - for testing if all tokens are undefined

Continue to 21.5.12.6.4 if_tok_ntok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.4 if_tok_ntok

The **if_tok_ntok** directive tests if **any** token in **one set** is **defined** and if **any** token in **another set** is **not defined**.

The syntax is:

```
@ if_tok_ntok <token> [<token>... <token>] ; <token> [<token>... <token>]
```

<token> - the name of the token to test.

At least one token in each set must be specified, however, multiple tokens can be included.

Multiple tokens should be separated by whitespace.

Two sets of tokens are separated by a semi-colon, which must be included.

Tokens in the first set, between the **if_tok_ntok** and the semi-colon, are tested to see if they are defined. Tokens in the second set, between the semi-colon and end, are tested to see if they are not defined.

If any of the tokens in the first set are defined and any of the tokens in the second set are undefined, the statement is true.

If none of the tokens in the first set are defined or if all of the tokens in the second set are defined, the statement is false.

Note that both sets must be true for the overall statement to be true. If either set is false, then the overall statement will be false.

```
@ def_tok A
@ def_tok B
// token C is undefined
@ if_tok_ntok A ; C
  user_message "Token A or B are defined, but token C is undefined"
@ end_if

@ if_tok_ntok A ; B
  user_message "True: Token A is defined and Token B is undefined"
@ else
  user_message "False: Token A is defined, but token B is not undefined"
@ end_if

@ if_tok_ntok A B ; C
  user_message "True: Token A or B is defined and Token C is undefined"
@ end_if

@ if_tok_ntok C ; A
  // Won't be true in this example
@ else
  user_message "False: Token C is not defined or Token A is not undefined"
@ end_if
```

Continue to 21.5.12.6.5 if_two_toks or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.5 if_two_toks

The **if_two_toks** directive tests the result of a logical comparison of if two tokens are defined.

The syntax is:

```
@ if_two_toks <token1> <op> <token2>
// Commands to be processed when statement is true
@ end_if
```

<token1> - the name of the token to test. Must be only one token

<op> - the logical operator to use for the two tokens. This can be **&&** for logical AND or **||** for logical OR

<token2> - the name of the token to test. Must be only one token.

The conditional result of this directive is dependent on the two tokens and the logical operator. The combination of possible values and their results are in the table below.

token1	op	token2	Result
defined	&&	defined	true
defined	&&	undefined	false
undefined	&&	defined	false
undefined	&&	undefined	false
defined	||	defined	true
defined	||	undefined	true
undefined	||	defined	true
undefined	||	undefined	false

```
@ def_tok T1
@ def_tok T2
// Token T3 is not defined

@ if_two_toks T1 && T2
  user_message "Tokens T1 and T2 are both defined"
@ end_if

@ if_two_toks T1 || T2
  user_message "Token T1 or T2 is defined"
@ end_if

@ if_two_toks T1 && T3
  user_message "Token T1 and T3 are both defined"// This shouldn't be shown
@ else
  user_message "Token T1 and T3 are not both defined" // This should be shown
@ end_if

@ if_two_toks T1 || T3
  user_message "Token T1 or T3 is defined"
@ end_if
```

See also:

21.5.12.6.6 if_two_toks_eq - for logical comparison against values

Continue to 21.5.12.6.6 if_two_toks_eq or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.6 if_two_toks_eq

The **if_two_toks_eq** directive tests the result of a two tests of tokens against corresponding values.

The syntax is:

```
@ if_two_toks_eq <token1> <value1> <op> <token2> <value2>
// Commands to be processed when statement is true
@ end_if
```

<token1> - the name of the first token to test. Must be only one token.

<value1> - the value to compare against token1.

<op> - the logical operator to use for the two tokens.

This can be && for logical AND or || for logical OR

<token2> - the name of the second token to test. Must be only one token.

<value2> - the value to compare against token2.

When evaluating the statement, token1 is compared against value1 and token2 is compared against value2. The results of both comparisons are then combined using the logical operator, **op**, and evaluated to set the final result of the if_two_toks_eq directive.

token1	value1	token1 = value1	op	token2 = value2	token2	value2	Overall Result
A	A	true	&&	true	B	B	true
A	C	false	&&	true	B	B	false
A	A	true	&&	false	B	D	false
A	C	false	&&	false	B	D	false
A	A	true	||	true	B	B	true
A	C	false	||	true	B	B	true
A	A	true	||	false	B	D	true
A	C	false	||	false	B	D	false

```
@ def_tok TOK_A "alpha"
@ def_tok TOK_B "bravo"

@ if_two_toks_eq TOK_A "alpha" || TOK_B "bravo"
  user_message "TOK_A = alpha or TOK_B = bravo"
@ end_if

@ if_two_toks_eq TOK_A "charlie" && TOK_B "bravo"
  user_message "TOK_A = charlie and TOK_B = bravo" // This should not be output
@ else
  user_message "TOK_A != charlie or TOK_B != bravo" // This should be output
@ end_if
```

21.5.12.6.5 if_two_toks - testing if two tokens are defined with logical operator

Continue to 21.5.12.6.7 if_all_toks or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.7 if_all_toks

The **if_all_toks** directive tests whether all given tokens are defined.

The syntax is:

```
@ if_all_toks <token> [<token>... <token>]
// Commands to be processed when statement is true
@ end_if
```

<token> - the name of the token to test.

At least one token must be specified, however, multiple tokens can be included.

Multiple tokens should be separated by whitespace.

If all of the tokens are defined, the statement is true.

If any of the tokens are undefined, the statement is false.

Multiple tokens are handled as if joined by logical AND statements.

NOTE: This directive simply tests whether the token is defined and not whether the value is valid or blank.

```
@ def_tok T1
@ def_tok T2
@ def_tok T3

@ if_all_toks T1
  user_message "Found token T1"
@ end_if

@ if_all_toks T1 T2
  user_message "Found token T1 and T2"
@ end_if

@ if_all_toks T1 T2 T3
  user_message "Found token T1, T2 and T3"
@ end_if
```

See also:

21.5.12.6.8 if_nall_toks - logically opposite directive

21.5.12.6.2 if_tok - test if any given tokens are defined

Continue to 21.5.12.6.8 if_nall_toks or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.8 if_nall_toks

The **if_nall_toks** directive tests whether all of the given tokens are undefined.

The syntax is:

```
@ if_nall_toks <token> [<token>... <token>]
// Commands to be processed when statement is true
@ end_if
```

<token> - the name of the token to test.

At least one token must be specified, however, multiple tokens can be included. Multiple tokens should be separated by whitespace.

If all of the tokens are undefined, the statement is true.

If any of the tokens are defined, the statement is false.

Multiple tokens are handled as if joined by logical AND statements.

NOTE: This directive simply tests whether the token is defined and not whether the value is valid or blank.

```
@ def_tok T1
@ def_tok T2
@ def_tok T3

@ if_nall_toks T1
  user_message "Didn't find token T1"
@ end_if

@ if_nall_toks T1 T2
  user_message "Didn't find tokens T1 or T2"
@ end_if

@ if_nall_toks T1 T2 T3
  user_message "Didn't find tokens T1, T2 or T3"
@ end_if
```

See also:

21.5.12.6.7 if_all_toks - logically opposite directive

21.5.12.6.3 if_ntok - testing if any given tokens are undefined

Continue to 21.5.12.6.9 if_tok_eq_tok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.9 if_tok_eq_tok

The **if_tok_eq_tok** directive tests whether a token is equal to another token.

The syntax is:

```
@ if_tok_eq_tok <token1> <token2>
// Commands to be processed when statement is true
@ end_if
```

<token1> - the first token to be compared.

<token2> - the second token to be compared.

token1 and **token2** are compared using a character comparison (*i.e.* text-based, not numeric).

If the token1 and token2 values are equal, the statement is true.

If the token1 and token2 values do not match, the statement is false.

If either or both token1 or token2 are undefined, the statement is false.

```
@ def_tok TOK1 "alpha"
@ def_tok TOK2 "bravo"

@ if_tok_eq TOK1 TOK2
  user_message "Tokens 1 and 2 are equal"
@ else
  user_message "Tokens 1 and 2 are not equal or undefined"
@ end_if
```

See also:

21.5.12.6.10 if_tok_neq_tok - logically opposite directive

if_tok_eq_str - testing against a string

if_tok_eq_dbl - testing against a double

if_tok_eq_int - testing against an integer

Continue to 21.5.12.6.10 if_tok_neq_tok or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.10 if_tok_neq_tok

The **if_tok_neq_tok** directive tests whether a token is not equal to another token.

The syntax is:

```
@ if_tok_neq_tok <token1> <token2>
// Commands to be processed when statement is true
@ end_if
```

<token1> - the first token to be compared.

<token2> - the second token to be compared.

Token1 and **token2** are compared using a character comparison (i.e. text-based, not numeric).

If token1 and token2 values do not match, the statement is true.

If token1 and token2 values match, the statement is false.

If either token1 or token2 is undefined, an error message is produced and the statement is evaluated as true.

```
@ def_tok TOK1 "alpha"
@ def_tok TOK2 "bravo"

@ if_tok_neq_tok TOK1 TOK2
  user_message "Tokens 1 and 2 are not equal"
@ else
  user_message "Tokens 1 and 2 are equal"
@ end_if
```

See also:

21.5.12.6.9 if_tok_eq_tok - logically opposite directive

if_tok_neq_str - comparison against string

if_tok_neq_dbl - comparison against double

if_tok_neq_int - comparison against integer

Continue to 21.5.12.6.11 def_tok_minus or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.11 def_tok_minus

The **def_tok_minus** directive defines a token as the result of a single digit or character subtracted from another.

The syntax is:

```
@ def_tok_minus <token> <value1> <value2>
```

<token> - the name of the token to define.

<value1> - a **single** integer or character or parameter that evaluates to such

<value2> - a **single** integer or character or parameter that evaluates to such

The value of token is taken as the result of subtracting value2 from value1.

To determine the value of <token>, **value1** and **value2** are converted to their equivalent numerical ASCII character code (e.g. 0 = 48, 9 = 57, A = 65, Z = 90, a = 97, z = 122).

The ASCII character code for value2 is subtracted from the ASCII character code for value1. The result is set as the value of <token>.

Example with integers:

Raw snippet values: <value1> = 5, <value2> = 2

Equivalent ASCII character codes:<value1> = 53, <value2> = 50

Token value = 53 - 50 = 3

Example with letters:

Raw snippet values: <value1> = D, <value2> = B

Equivalent ASCII character codes:<value1> = 68, <value2> = 66

Token value = 68 - 66 = 2

For single-digit integers, this is the same as the basic arithmetic on the integers.

For this reason, it is recommended that <value1> and <value2> are of the same type and case. That is, both values are:

- *integers (0-9)*
- *upper-case single letters (A-Z); or*
- *lower-case single letters (a-z).*

Mixing value types - *e.g.* integer and letter - will likely result in unexpected behaviour.

It is possible for <value1> or <value2> to contain parameters, *e.g.* "$(WIDTH)", so long as the parameters evaluate to a single digit or character.

It is not possible to use tokens in either <value1> or <value2> due to the order in which snippets are processed and tokens substituted. For more information see 21.5.14 Order of Snippet Processing.

If value1 or value2 is not a single character, an error message will be produced.

```
// PARAMETER LANE1 INTEGER "Start lane" 5
// PARAMETER LANE2 INTEGER "End lane" 2

// ASCII character codes:
// 5 = 53
// 2 = 50

@ def_tok_minus NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = 5, LANE2 = C, NUM_LANES = 53 - 50 = 3

user_message "Number of lanes between start and end = $(NUM_LANES)"
```

```
// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "F"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "C"

// ASCII character codes:
// F = 70
// C = 67

@ def_tok_minus NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = F and LANE2 = C, NUM_LANES = 70 - 67 = 3

user_message "Number of lanes between start and end = $(NUM_LANES)"
```

TIP - To ensure value1 and value2 are single characters, use the substring functionality to only use the first character.

```
// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "FAST"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "CAR"

// Using substring functionality to only use the 1st character of each parameter
@ def_tok_minus NUM_LANES $(LANE1[1:1]) $(LANE2[1:1])

user_message "Number of lanes between start and end = $(NUM_LANES)"
```

Continue to 21.5.12.6.12 def_tok_minus_inc or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.6.12 def_tok_minus_inc

The **def_tok_minus_inc** defines a token with the result of a single digit or single-character subtracted from another, plus one.

That is, it is similar to **def_tok_minus**, but the result is one more than the equivalent def_tok_minus value (i.e. it is an inclusive subtraction).

The syntax is:

```
@ def_tok_minus_inc <token> <value1> <value2>
```

<token> - the name of the token to define.

<value1> - a single integer or character or parameter that evaluates to such

<value2> - a single integer or character or parameter that evaluates to such

The value of token is taken as the result of subtracting value2 from value1 then adding one.

To determine the value of <token>, value1 and value2 are converted to their equivalent numerical ASCII character code (e.g. 0 = 48, 9 = 57, A = 65, Z = 90, a = 97, z = 122).

The ASCII character code for value2 is subtracted from the ASCII character code for value1 and one (1) is added. The result is set as the value of <token>.

Example with integers:

Raw snippet values: <value1> = 5, <value2> = 2

Equivalent ASCII character codes:<value1> = 53, <value2> = 50

Token value = 53 - 50 + 1 = 4

Example with letters:

Raw snippet values: <value1> = D, <value2> = B

Equivalent ASCII character codes:<value1> = 68, <value2> = 66

Token value = 68 - 66 + 1 = 3

For single-character integers, this is the same as the basic arithmetic on the integers.

For this reason, it is recommended that <value1> and <value2> are of the same type and case. That is, both values are:

- *integers (0-9)*
- *upper-case single letters (A-Z); or*
- *lower-case single letters (a-z).*

Mixing value types - *e.g.* integer and letter - will likely result in unexpected behaviour.

It is possible for <value1> or <value2> to contain parameters, *e.g.* "$(WIDTH)", so long as the parameters evaluate to a single character.

It is not possible to use tokens in either <value1> or <value2> due to the order in which snippets are processed and tokens substituted. For more information see 21.5.14 Order of Snippet Processing.

If value1 or value2 is not a single character, an error message will be produced.

```
// PARAMETER LANE1 INTEGER "Start lane" 5
// PARAMETER LANE2 INTEGER "End lane" 2

// ASCII character codes:
// 5 = 53
// 2 = 50

@ def_tok_minus_inc NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = 5, LANE2 = C, NUM_LANES = 53 - 50 + 1 = 4

user_message "Number of lanes between start and end (inclusive) = $(NUM_LANES)"
```

```
// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "F"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "C"

// ASCII character codes:
// F = 70
// C = 67

@ def_tok_minus NUM_LANES $(LANE1) $(LANE2)
// For LANE1 = F and LANE2 = C, NUM_LANES = 70 - 67 + 1 = 4

user_message "Number of lanes between start and end (inclusive) = $(NUM_LANES)"
```

TIP - To ensure value1 and value2 are single characters, use the substring functionality to only use the first character.

```
// PARAMETER LANE1 TEXT "Start lane character (A-Z)" "FAST"
// PARAMETER LANE2 TEXT "End lane character (A-Z)" "CAR"

// Using substring functionality to only use the 1st character of each parameter
@ def_tok_minus NUM_LANES $(LANE1[1:1]) $(LANE2[1:1])

user_message "Number of lanes between start and end (inclusive) = $(NUM_LANES)"
```

Continue to 21.5.12.7 Tokens vs Strings or return to 21.5.12.6 Tokens and Tokens vs Tokens or 21.5.12 Snippet Directives.

21.5.12.7 Tokens vs Strings

The following directives compare a token value against given strings.

See

21.5.12.7.1 if_tok_eq_str
21.5.12.7.2 if_tok_neq_str

21.5.12.7.1 if_tok_eq_str

The **if_tok_eq_str** directive tests if a token's **value** is **equal** to **any** given **strings**.

The syntax is:

```
@ if_tok_eq_str <token> <string> [<string>... <string>]
// Commands to be processed if statement is true
@ end_if
```

<token> - the name of the token to compare.

<string> - the string to compare against the value of token.

At least one string must be specified; however, multiple strings can be included.

Multiple strings should be separated by whitespace. Strings should be enclosed in quotes.

If the **value** of **token** is **equal** to **any** of the **strings**, the statement **is** true.

If the value of token is not equal to any of the strings (i.e. the token value is equal to none of the given strings), the statement is false.

Multiple strings are handled as if joined by logical OR statements.

```
@ def_tok A_TOKEN "a token"
@ def_tok B_TOKEN "b token"

@ if_tok_eq_str A_TOKEN "a token" "b token" // must equal one of the list, should pass
  user_message "if_tok_eq_str = TRUE , A = a token OR b token"

@ if_tok_eq_str A_TOKEN "x token" "y token" // must equal one of the list, should fail
@ else
  user_message "if_tok_eq_str = FALSE , A != x token OR y token"
@ end_if
```

Continue to 21.5.12.7.2 if_tok_neq_str or return to 21.5.12.7 Tokens vs Strings or 21.5.12 Snippet Directives.

21.5.12.7.2 if_tok_neq_str

The **if_tok_neq_str** directive tests if a token is **not equal** to **any** of the given **strings**.

The syntax is:

```
@ if_tok_neq_str <token> <string> [<string>... <string>]
// Commands to be processed if statement is true
@ end_if
```

<token> - the name of the token to compare.

<string> - the string to compare against the value of token.

At least one string must be specified, however, multiple strings can be included. Multiple strings should be separated by whitespace. Strings should be enclosed in quotes.

If the value of token is not equal to any of the strings, the statement is true.

If the value of token is equal to any of the string values, the statement is false.

Multiple strings are handled as if joined by logical OR statements.

```
@ def_tok A_TOKEN "a token"
@ def_tok B_TOKEN "b token"

@ if_tok_eq_str A_TOKEN "a token" "b token" // must equal one of the list, should pass
  user_message "if_tok_eq_str = TRUE , A = a token OR b token"

@ if_tok_eq_str A_TOKEN "x token" "y token" // must equal one of the list, should fail
@ else
  user_message "if_tok_eq_str = FALSE , A != x token OR y token"
@ end_if
```

Continue to 21.5.12.8 Tokens vs Doubles or return to 21.5.12.7 Tokens vs Strings or 21.5.12 Snippet Directives.

21.5.12.8 Tokens vs Doubles

The following directives compare a token value against given doubles.

In these directives, **<double>** can be either a real number or an evaluation of a previously defined token. For example $(T49).

See

21.5.12.8.1 if_tok_eq_dbl
21.5.12.8.2 if_tok_eq_dbl_tol
21.5.12.8.3 if_tok_neq_dbl
21.5.12.8.4 if_tok_neq_dbl_tol
21.5.12.8.5 if_tok_lt_dbl
21.5.12.8.6 if_tok_lt_dbl_tol
21.5.12.8.7 if_tok_le_dbl
21.5.12.8.8 if_tok_le_dbl_tol
21.5.12.8.9 if_tok_gt_dbl
21.5.12.8.10 if_tok_gt_dbl_tol
21.5.12.8.11 if_tok_ge_dbl
21.5.12.8.12 if_tok_le_dbl_tol
21.5.12.8.13 if_tok_gt_dbl
21.5.12.8.14 if_tok_gt_dbl_tol
21.5.12.8.15 if_tok_ge_dbl
21.5.12.8.16 if_tok_ge_dbl_tol
21.5.12.8.17 if_tok_in_range_dbl
21.5.12.8.18 if_tok_in_range_dbl_tol
21.5.12.8.19 if_tok_nin_range_dbl
21.5.12.8.20 if_tok_nin_range_dbl_tol

Or return to 21.5 Defining and Using Snippets.

21.5.12.8.1 if_tok_eq_dbl

The **if_tok_eq_dbl** directive tests if a token's **value** is **equal** to **any** given **double** values, within a fixed tolerance of 1.0x10-6 (i.e. 1.0E-6).

The syntax is:

```
@ if_tok_eq_dbl <token> <double> [<double>... <double>]
// Commands processed if statement is true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token.

double can be a real number or the evaluation of a token eg $(T49).

At least one double value must be specified, however, multiple double values can be included.

Multiple double values should be separated by whitespace.

If the value of token is equal to any of the doubles within the tolerance, the statement is true.

If the value of token is not equal to any of the doubles within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple double values are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_eq_dbl WIDTH 3.0 3.5 4.0
  user_message "WIDTH is equal to 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.2 if_tok_eq_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.2 if_tok_eq_dbl_tol

The **if_tok_eq_dbl_tol** directive tests if a token's **value** is **equal** to any given **double** value, within a given tolerance.

The syntax is:

```
@ if_tok_eq_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if statement is true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token.

At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace.

Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison.

This value must be specified and must be the last value.

If the value of token is equal to any of the doubles within the tolerance, the statement is true.

If the value of token is not equal to any of the doubles within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple double values are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_eq_dbl_tol WIDTH 3.5 0.1
  user_message "WIDTH is equal to 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.3 if_tok_neq_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.3 if_tok_neq_dbl

The **if_tok_neq_dbl** directive tests if a token's **value** is **not equal** to any of the given **doubles**, within a fixed tolerance of 1.0x10-6 (*i.e.* 1.0E-6).

The syntax is:

```
@ if_tok_neq_dbl <token> <double> [<double>... <double>]
// Commands processed if statement is true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token.

At least one double value must be specified, however, multiple double values can be included.

Multiple double values should be separated by whitespace.

Double values should not be quoted.

If the value of token is not equal to any of the doubles within the tolerance, the statement is true.

If the value of token is equal to any of the doubles within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple double values are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_neq_dbl WIDTH 3.0
  user_message "WIDTH is not equal to 3.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.4 if_tok_neq_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.4 if_tok_neq_dbl_tol

The **if_tok_neq_dbl_tol** directive tests if a token's **value** is **not equal** to any given **double** values, within a given tolerance.

The syntax is:

```
@ if_tok_neq_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if statement is true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token.

At least one double value must be specified, however, multiple double values can be included.

Multiple double values should be separated by whitespace.

Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison.

This value must be specified and must be the last value.

If the value of token is not equal to any of the double values within the tolerance, the statement is true.

If the value of token is equal to any of the double values within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple double values are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_neq_dbl_tol WIDTH 3.0 0.1
  user_message "WIDTH is not equal to 3.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.5 if_tok_lt_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.5 if_tok_lt_dbl

The **if_tok_lt_dbl** directive tests if a token is less than any given doubles, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_tok_lt_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is less than any of the double values within the tolerance, the statement is true.

If the token value is not less than any of the double values within the tolerance (i.e. the token value is greater than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_lt_dbl WIDTH 4.0
  user_message "WIDTH is less than 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.6 if_tok_lt_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.6 if_tok_lt_dbl_tol

The **if_tok_lt_dbl_tol** directive tests if a token is less than any given doubles, within a given tolerance. The comparison is numerical.

The syntax is
:

```
@ if_tok_lt_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is less than any of the double values within the tolerance, the statement is true.

If the token value is not less than any of the double values within the tolerance (i.e. the token is greater than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_lt_dbl_tol WIDTH 4.0 0.1
  user_message "WIDTH is less than 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.7 if_tok_le_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.7 if_tok_le_dbl

The **if_tok_le_dbl** directive tests if a token is less than or equal to any given doubles, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

:

```
@ if_tok_le_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is less than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not less than or equal to any of the double values within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_le_dbl WIDTH 3.5
  user_message "WIDTH is less than or equal to 3.5 within a tolerance of 1e-6"
@ end_if

@ if_tok_le_dbl WIDTH 3.5 4.0
  user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.8 if_tok_le_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.8 if_tok_le_dbl_tol

The if_tok_le_dbl_tol directive tests if a token is less than or equal to any given double values, within a given tolerance.

The syntax is:
:

```
@ if_tok_le_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is less than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not less than or equal to any of the double values within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_le_dbl_tol WIDTH 3.5 0.1
  user_message "WIDTH is less than or equal to 3.5 within a tolerance of 0.1"
@ end_if

@ if_tok_le_dbl WIDTH 3.5 4.0 0.1
  user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

@ if_tok_gt_dbl WIDTH 3.0 4.0
  user_message "WIDTH is greater than 3.0 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.10 if_tok_gt_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.10 if_tok_gt_dbl_tol

The **if_tok_gt_dbl_tol** directive tests if a token is greater than any given double values, within a given tolerance.

The syntax is:

:

```
@ if_tok_gt_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token.

At least one double value must be specified, however, multiple double values can be included.

Multiple double values should be separated by whitespace.

Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is greater than any of the double values within the tolerance, the statement is true.

If the token value is not greater than any of the double values within the tolerance (*i.e.* the token is less than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_gt_dbl_tol WIDTH 3.0 0.1
  user_message "WIDTH is greater than 3.5 within a tolerance of 0.1"
@ end_if

@ if_tok_gt_dbl_tol WIDTH 3.0 3.5
  user_message "WIDTH is greater than 3.0 or 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.11 if_tok_ge_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.11 if_tok_ge_dbl

The **if_tok_ge_dbl** directive tests if a token is greater than or equal to any given double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

:

```
@ if_tok_ge_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is greater than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not greater than or equal to any of the double values within the tolerance (i.e. the token value is less than all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_le_dbl WIDTH 3.5
 user_message "WIDTH is less than or equal to 3.5 within a tolerance of 1e-6"
@ end_if
@ if_tok_le_dbl WIDTH 3.5 4.0
 user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.12 if_tok_le_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.12 if_tok_le_dbl_tol

The **if_tok_le_dbl_tol** directive tests if a token is less than or equal to any given double values, within a given tolerance.

The syntax is:

```
@ if_tok_le_dbl_tol <token> <double> [<double> ... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is less than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not less than or equal to any of the double values within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_le_dbl_tol WIDTH 3.5 0.1
  user_message "WIDTH is less than or equal to 3.5 within a tolerance of 0.1"
@ end_if

@ if_tok_le_dbl WIDTH 3.5 4.0 0.1
  user_message "WIDTH is less than or equal to 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.13 if_tok_gt_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.13 if_tok_gt_dbl

The **if_tok_gt_dbl** directive tests if a token is greater than any given doubles, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_tok_gt_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is greater than any of the double values within the tolerance, the statement is true.

If the token value is not greater than any of the double values within the tolerance (i.e. the token value is less than or equal to all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_gt_dbl WIDTH 3.0
  user_message "WIDTH is greater than 3.0 within a tolerance of 1e-6"
@ end_if

@ if_tok_gt_dbl WIDTH 3.0 4.0
  user_message "WIDTH is greater than 3.0 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.14 if_tok_gt_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.14 if_tok_gt_dbl_tol

The **if_tok_gt_dbl_tol** directive tests if a token is greater than any given double values, within a given tolerance.

The syntax is:

```
@ if_tok_gt_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

  user_message "WIDTH is greater than 3.0 or 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.15 if_tok_ge_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.15 if_tok_ge_dbl

The **if_tok_ge_dbl** directive tests if a token is greater than or equal to any given double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_tok_ge_dbl <token> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

If the token value is greater than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not greater than or equal to any of the double values within the tolerance (i.e. the token value is less than all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_ge_dbl WIDTH 3.5
 user_message "WIDTH is greater than or equal to 3.5 within a tolerance of 1e-6"
@ end_if

@ if_tok_ge_dbl WIDTH 3.5 4.0
 user_message "WIDTH is greater than or equal to 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.16 if_tok_ge_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.16 if_tok_ge_dbl_tol

The **if_tok_ge_dbl_tol** directive tests if a token is greater than or equal to any given double values, within a given tolerance.

The syntax is:

```
@ if_tok_ge_dbl_tol <token> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<double> - the double value to compare against the value of token. At least one double value must be specified, however, multiple double values can be included. Multiple double values should be separated by whitespace. Double values should not be quoted.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is greater than or equal to any of the double values within the tolerance, the statement is true.

If the token value is not greater than or equal to any of the double values within the tolerance (*i.e.* the token value is less than all double values), the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple doubles are handled as if joined by logical OR statements.

```
@ def_tok WIDTH 3.5

@ if_tok_ge_dbl_tol WIDTH 3.5 0.1
  user_message "WIDTH is greater than or equal to 3.5 within a tolerance of 0.1"
@ end_if

@ if_tok_ge_dbl_tol WIDTH 3.5 4.0
  user_message "WIDTH is greater than or equal to 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.17 if_tok_in_range_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.17 if_tok_in_range_dbl

The **if_tok_in_range_dbl** directive tests if a token is between two double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_tok_in_range_dbl <token> <lower> <upper>
// Commands processed if true
@ end_if
```

<token> - the name of the token to test.

<lower> - the double representing the lower bound of the range to check against the token. This value must be specified.

<upper> - the double representing the upper bound of the range to check against the token. This value must be specified.

If the token value is within the range from lower to upper within the tolerance, the statement is true.

If the token is not defined or is outside the range from lower to upper within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

```
@ def_tok WIDTH 3.5

@ if_tok_in_range_dbl WIDTH 3.0 4.0
  user_message "WIDTH is within range 3.0 to 4.0 within a tolerance of 1e-6"
@ else
  user_message "WIDTH is outside range 3.0 to 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.8.18 if_tok_in_range_dbl_tol or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.18 if_tok_in_range_dbl_tol

The **if_tok_in_range_dbl** directive tests if a token is between two double values, within a given tolerance.

The syntax is:

```
@ if_tok_in_range_dbl <token> <lower> <upper> <tolerance>
// Commands processed if true
@ end_if
```

<token> - the name of the token to compare.

<lower> - the double value representing the lower bound of the range to check against the token. This value must be specified.

<upper> - the double value representing the upper bound of the range to check against the token. This value must be specified.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the token value is within the range from lower to upper within the tolerance, the statement is true.

If the token is outside the range from lower to upper within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

```
@ def_tok WIDTH 3.5

@ if_tok_in_range_dbl_tol WIDTH 3.0 4.0 0.1
  user_message "WIDTH is within range 3.0 to 4.0 within a tolerance of 0.1"
@ else
  user_message "WIDTH is outside range 3.0 to 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.8.19 if_tok_nin_range_dbl or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.8.19 if_tok_nin_range_dbl

The **if_tok_nin_range_dbl** directive tests if a token is not between two double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_tok_nin_range_dbl <token> <lower> <upper>
// Commands processed if true
@ end_if
```

<token> - the name of the token to compare.

<lower> - the double value representing the lower bound of the range to check against the token. This value must be specified.

<upper> - the double value representing the upper bound of the range to check against the token. This value must be specified.

If the token value is within the range from lower to upper within the tolerance, the statement is true.

If the token is outside the range from lower to upper within the tolerance, the statement is false.

If the token is undefined, the snippet will produce an error.

```
@ def_tok WIDTH 4.0

@ if_tok_nin_range WIDTH 3.0 3.5
  user_message "WIDTH is not within range 3.0 to 3.5 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.9 Tokens vs Integers or return to 21.5.12.8 Tokens vs Doubles or 21.5.12 Snippet Directives.

21.5.12.9 Tokens vs Integers

The following directives compare a token value against given integers.

See

21.5.12.9.1 if_tok_eq_int
21.5.12.9.2 if_tok_neq_int
21.5.12.9.3 if_tok_lt_int
21.5.12.9.4 if_tok_le_int
21.5.12.9.5 if_tok_gt_int
21.5.12.9.6 if_tok_ge_int

Or return to 21.5 Defining and Using Snippets.

21.5.12.9.1 if_tok_eq_int

The **if_tok_eq_int** directive tests if a token equals any of the given integers.

The syntax is:

```
@ if_tok_eq_int <token> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

<token> - the name of the token to compare.

<integer> - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value is equal to any of the integers, the statement is true.

If the token value is not equal to any of the integers, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple integers are handled as if joined by logical OR statements.

```
@ def_tok NUM_LANES 2

@ if_tok_eq_int NUM_LANES 2
  user_message "NUM_LANES equals 2"
@ end_if

@ if_tok_eq_int NUM_LANES 2 3 4
  user_message "NUM_LANES equals 2, 3 or 4"
@ end_if
```

21.5.12.9.2 if_tok_neq_int

The **if_tok_neq_int** directive tests if a token does not equal any of the integers.

The syntax is:

```
@ if_tok_neq_int <token> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

<token> - the name of the token to compare.

<integer> - the integer value to compare against the token. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the token value does not equal any of the integers, the statement is true.

If the token value equals any of the integers, the statement is false.

If the token is undefined, the snippet will produce an error.

Multiple integers are handled as if joined by logical OR statements.

```
@ def_tok NUM_LANES 2

@ if_tok_neq_int NUM_LANES 2
  user_message "NUM_LANES is not equal to 2"
@ end_if

@ if_tok_neq_int NUM_LANES 2 3 4
  user_message "NUM_LANES equal to 2, 3 or 4"
@ end_if
```

Continue to 21.5.12.10 Values Defined and Value vs Value or return to 21.5.12.9 Tokens vs Integers or 21.5.12 Snippet Directives.

21.5.12.10 Values Defined and Value vs Value

The following directives test whether values are empty and compare values with other values. Values can be parameter values (*i.e.* substituted) or raw values (*i.e.* in the file).

Note: these directives should not be used with tokens. The order in which parameters, directives and tokens are processed and substituted (see section 21.5.14 Order of Snippet Processing) will likely result in unexpected results.

See

21.5.12.10.1 if_val
21.5.12.10.2 if_nval
21.5.12.10.3 if_all_vals
21.5.12.10.4 if_nall_vals

Or return to 21.5 Defining and Using Snippets.

21.5.12.10.1 if_val

The **if_val** directive tests if any of the given values are empty.

The syntax is:

```
@ if_val <value> [<value>... <value>]
// Commands processed if statement is true
@ end_if
```

<value> - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.

If any of the values are not empty, the statement is true.

If all of the values are empty, the statement is false.

Multiple values are handled as if joined by logical OR statements.

NOTE: This directive simply tests whether the value is defined and exists and not whether the value is valid or blank.

```
// PARAMETER PA TEXT "PA" OPTIONAL
// PARAMETER PB TEXT "PB" OPTIONAL
// PARAMETER PC TEXT "PC" OPTIONAL

@ if_val "$(PA)"
user_message "Found PA"
@ end_if

@ if_val "$(PA)" "$(PB)"
user_message "Found PA or PB"
@ end_if

@ if_val "$(PA)" "$(PB)" "$(PC)"
user_message "Found PA or PB or PC"

@ end_if
```

Continue to 21.5.12.10.2 if_nval or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippet Directives.

21.5.12.10.2 if_nval

The **if_nval** directive tests if any of the given values are empty.

The syntax is:

```
@ if_nval <value> [<value>... <value>]
// Commands processed if statement is true
@ end_if
```

<value> - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.

If any of the values are empty, the statement is true.

If none of the values are empty, the statement is false.

Multiple values are handled as if joined by logical OR statements.

```
// PARAMETER PA TEXT "PA" OPTIONAL
// PARAMETER PB TEXT "PB" OPTIONAL
// PARAMETER PC TEXT "PC" OPTIONAL

@ if_nval "$(PA)"
user_message "Not found PA"
@ end_if

@ if_nval "$(PA)" "$(PB)"
user_message "Not found PA and PB"
@ end_if

@ if_nval "$(PA)" "$(PB)" "$(PC)"
user_message "Not found PA,PB and PC"
@ end_if
```

Continue to 21.5.12.10.3 if_all_vals or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippet Directives.

21.5.12.10.3 if_all_vals

The **if_all_vals** directive tests whether all given values are not empty.

The syntax is:

```
@ if_all_vals <value> [<value>... <value>]
// Commands to be processed when statement is true
@ end_if
```

<value> - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.

If all of the values are not empty, the statement is true.

If any of the values are empty, the statement is false.

Multiple values are handled as if joined by logical AND statements.

```
// PARAMETER PA TEXT "PA" OPTIONAL
// PARAMETER PB TEXT "PB" OPTIONAL

@ if_all_vals "$(PA)"
  user_message "PA exists"
@ end_if

@ if_all_vals "$(PA)" "$(PB)"
  user_message "PA and PB both exist!"
@ end_if

@ if_all_vals "$(PA)" "$(PB)" "$(PC)"
  user_message "PA, PB and PC all exist!"
@ else
  user_message "One of PA, PB or PC does not exist"
@ end_if
```

Continue to 21.5.12.10.4 if_nall_vals or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippet Directives.

21.5.12.10.4 if_nall_vals

The **if_nall_vals** directive tests if all of the given values are empty.

The syntax is:

```
@ if_nall_vals <value> [<value>... <value>]
// Commands to be processed when statement is true
@ end_if
```

<value> - the value to test. At least one value must be specified, however, multiple values can be included. Multiple values should be separated by whitespace.

If all of the values are empty, the statement is true.

If any of the values are not empty, the statement is false.

Multiple values are handled as if joined by logical AND statements.

```
// PARAMETER PA TEXT "PA" OPTIONAL
// PARAMETER PB TEXT "PB" OPTIONAL
// PARAMETER PC TEXT "PC" OPTIONAL

@ if_nall_vals "$(PA)"
user_message "PA does not exist."
@ end_if

@ if_nall_vals "$(PA)" "$(PB)"
user_message "PA and PB do not exist.!"
@ end_if

@ if_nall_vals "$(PA)" "$(PB)" "$(PC)"
user_message "PA,PB and PC do not exist."
@ end_if
```

Continue to 21.5.12.11 Values vs Strings or return to 21.5.12.10 Values Defined and Value vs Value or 21.5.12 Snippet Directives.

21.5.12.11 Values vs Strings

The following directives compare a value against given strings. Comparison is character-based and not numerical (e.g. "1" does not equal "1.0" or "01").

See

21.5.12.11.1 if_val_eq_str
21.5.12.11.2 if_val_neq_str

Or return to 21.5 Defining and Using Snippets.

21.5.12.11.1 if_val_eq_str

The **if_val_eq_str** directive tests if a value is equal to any of the given strings.

The syntax is:

```
@ if_val_eq_str <value> <string> [<string>... <string>]
// Commands processed if statement is true
@ end if
```

<value> - is the value to compare. One and only one value must be specified.

<string> - is the string to compare against the value. At least one string must be specified, however, multiple strings can be included. Multiple strings should be separated by whitespace.

Strings or values containing whitespace should be enclosed in quotation marks.

If the value is equal to any of the strings, the statement is true.

If the value is not equal to any of the string values, the statement is false.

Multiple strings are handled as if joined by logical OR statements.

```
// PARAMETER KT TEXT "Kerb type" "SA"

@ if_val_eq_str "$(KT)" "SA"
                user_message "Kerb type is equal to SA"
@ end_if

@ if_val_eq_str "$(KT)" "SA" "SM"
                user_message "Kerb type is equal to either SA or SM"
@ end_if
```

Continue to 21.5.12.11.2 if_val_neq_str or return to 21.5.12.11 Values vs Strings or 21.5.12 Snippet Directives.

21.5.12.11.2 if_val_neq_str

The **if_val_neq_str** directive tests if a value is not equal to any of the given strings.

The syntax is:

```
@ if_val_neq_str <value> <string> [<string>... <string>]
// Commands processed if statement is true
@ end if
```

<value> - is the value to compare. One and only one value must be specified.

<string> - is the string to compare against the value. At least one string must be specified, however, multiple strings can be included. Multiple strings should be separated by whitespace.

Strings or values containing whitespace should be enclosed in quotation marks.

If the value is not equal to any of the strings, the statement is true.

If the value is not equal to none of the strings (*i.e.* it is equal to all strings), the statement is false.

Multiple strings are handled as if joined by logical OR statements.

```
// PARAMETER KT TEXT "Kerb type" "SB"

@ if_val_neq_str "$(KT)" "SA"
  user_message "Kerb type is not equal to SA"
@ end_if

@ if_val_neq_str "$(KT)" "SA" "SM"
  user_message "Kerb type is not equal to either SA or SM"
@ end_if
```

Continue to 21.5.12.12 Values vs Doubles or return to 21.5.12.11 Values vs Strings or 21.5.12 Snippet Directives.

21.5.12.12 Values vs Doubles

The following directives compare a token value against given doubles. Comparison is numerical.

See

Or return to 21.5 Defining and Using Snippets.

21.5.12.12.1 if_val_eq_dbl

The **if_val_eq_dbl** directive tests if a value is equal to any of the given double values, with a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_val_eq_dbl <value> <double> [<double>... <double>]
// Commands processed if statement is true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value- integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

Values containing whitespace should be enclosed in quotation marks.

If the value is equal to any of the doubles within the tolerance, the statement is true.

If the value is not equal to any of the doubles within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_eq_dbl $(WIDTH) 3.5
  user_message "WIDTH is equal to 3.5 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.2 if_val_eq_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.2 if_val_eq_dbl_tol

The **if_val_eq_dbl_tol** directive tests if a value is equal to any given double value, within a given tolerance.

The syntax is:

```
@ if_val_eq_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if statement is true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value- integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is equal to any of the double values within the tolerance, the statement is true.

If the value is not equal to any of the double values within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple double values are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_eq_dbl_tol $(WIDTH) 3.5 0.1
  user_message "WIDTH is equal to 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.12.3 if_val_neq_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.3 if_val_neq_dbl

The **if_val_neq_dbl** directive tests if a value is not equal to any of the given doubles, with a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_val_neq_dbl <value> <double> [<double>... <double>]
// Commands processed if statement is true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value - integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is not equal to any of the doubles within the tolerance, the statement is true.

If the value is equal to all of the doubles within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_neq_dbl $(WIDTH) 3.0
  user_message "WIDTH is not equal to 3.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.4 if_val_neq_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.4 if_val_neq_dbl_tol

The **if_val_neq_dbl_tol** directive tests if a value is not equal to any given doubles, within a given tolerance.

The syntax is:

```
@ if_val_neq_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if statement is true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value- integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is not equal to any of the doubles within the tolerance, the statement is true.

If the value is equal to all of the doubles within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple double values are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_neq_dbl_tol $(WIDTH) 3.0 0.1
  user_message "WIDTH is not equal to 3.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.12.5 if_val_lt_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.5 if_val_lt_dbl

The **if_val_lt_dbl** directive tests if a value is less than any of the given double values within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_val_lt_dbl <value> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value - integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is less than any of the doubles within the tolerance, the statement is true.

If the value is not less than any of the doubles within the tolerance (*i.e.* the value is greater than or equal to all doubles), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_lt_dbl $(WIDTH) 4.0
  user_message "WIDTH is less than 4.0 within a tolerance of 1e-6"
@ end_if

@ if_val_lt_dbl $(WIDTH) 3.0 3.5 4.0
  user_message "WIDTH is less than 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.6 if_val_lt_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.6 if_val_lt_dbl_tol

The **if_val_lt_dbl_tol** directive tests if a value is less than any given double values, within a given tolerance.

The syntax is:

```
@ if_val_lt_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value - integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is less than any of the doubles within the tolerance, the statement is true.

If the value is not less than any of the doubles within the tolerance (*i.e.* the value is greater than or equal to all doubles), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_lt_dbl_tol $(WIDTH) 4.0 0.1
  user_message "WIDTH is less than 4.0 within a tolerance of 0.1"
@ end_if

@ if_val_lt_dbl_tol $(WIDTH) 3.0 3.5 4.0 0.1
  user_message "WIDTH is less than 3.0, 3.5 or 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.12.7 if_val_le_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.7 if_val_le_dbl

The **if_val_le_dbl** directive tests if a value is less than or equal to any of the given double values within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_val_le_dbl <value> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value - integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is less than or equal to any of the doubles within the tolerance, the statement is true.

If the value is not less than or equal to any of the doubles within the tolerance (*i.e.* the value is greater than all doubles), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_le_dbl $(WIDTH) 3.5
  user_message "WIDTH is less than or equal to 3.5 within a tolerance of 1e-6"
@ end_if

@ if_val_le_dbl $(WIDTH) 3.0 3.5 4.0
  user_message "WIDTH is less than or equal to 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.8 if_val_le_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.8 if_val_le_dbl_tol

The **if_val_le_dbl_tol** directive tests if a value is less than or equal to any given doubles, within a given tolerance.

The syntax is:

```
@ if_tok_le_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value - integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is less than or equal to any of the doubles within the tolerance, the statement is true.

If the value is not less than or equal to any of the doubles within the tolerance (*i.e.* the value is greater than all of the doubles), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

21.5.12.12.11 if_val_ge_dbl

The **if_val_ge_dbl** directive tests if a value is greater than or equal to any of the given double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_val_ge_dbl <value> <double> [<double>... <double>]
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value - integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

If the value is greater than or equal to any of the doubles within the tolerance, the statement is true.

If the value is not greater than or equal to any of the doubles within the tolerance(*i.e.* the value is less than all of the double values), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_ge_dbl $(WIDTH) 3.5
  user_message "WIDTH is greater than or equal to 3.5 within a tolerance of 1e-6"
@ end_if

@ if_val_gt_dbl $(WIDTH) 3.0 3.5 4.0
  user_message "WIDTH is greater than or equal to 3.0, 3.5 or 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.12 if_val_ge_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.12 if_val_ge_dbl_tol

The **if_val_ge_dbl_tol** directive tests if a value is greater than or equal to any given double values, within a given tolerance.

The syntax is:

```
@ if_val_ge_dbl_tol <value> <double> [<double>... <double>] <tolerance>
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value - integer or double.

<double> - the double to compare against the value. At least one double must be specified, however, multiple double can be included. Multiple double should be separated by whitespace.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is greater than or equal to any of the double within the tolerance, the statement is true.

If the value is not greater than or equal to any of the doubles within the tolerance (*i.e.* the value is less than all doubles), the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

Multiple doubles are handled as if joined by logical OR statements.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_ge_dbl_tol $(WIDTH) 3.0 0.1
  user_message "WIDTH is greater than or equal to 3.0 within a tolerance of 0.1"
@ end_if

@ if_val_ge_dbl_tol $(WIDTH) 3.0 3.5 4.0 0.1

@ end_if
```

Continue to 21.5.12.12.13 if_val_in_range_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.13 if_val_in_range_dbl

The **if_val_in_range_dbl** directive tests if a value exists and is between two double values, within a fixed tolerance of 1.0 x 10-6 (1.0E-6).

The syntax is:

```
@ if_val_in_range_dbl <value> <lower> <upper>
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value- integer or double.

<lower> - the double representing the lower bound of the range to check against value. This value must be specified.

<upper> - the double representing the upper bound of the range to check against value. This value must be specified.

If the value is within the range from lower to upper within the tolerance, the statement is true.

If the value is not within the range from lower to upper within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

  user_message "WIDTH is between 3.0 and 4.0 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.14 if_val_in_range_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.14 if_val_in_range_dbl_tol

The **if_val_in_range_dbl_tol** directive tests if a value exists and is between two doubles, within a given tolerance.

The syntax is:

```
@ if_val_in_range_dbl_tol <value> <lower> <upper> <tolerance>
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value- integer or double.

<lower> - the double value representing the lower bound of the range to check against value. This value must be specified.

<upper> - the double value representing the upper bound of the range to check against value. This value must be specified.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is within the range from lower to upper within the tolerance, the statement is true.

If the value is not within the range from lower to upper within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

```
// PARAMETER WIDTH REAL "Lane width" 3.5

@ if_val_in_range_dbl_tol $(WIDTH) 3.0 4.0 0.1
  user_message "WIDTH is between 3.0 and 4.0 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.12.15 if_val_nin_range_dbl or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.15 if_val_nin_range_dbl

The **if_val_nin_range_dbl** directive tests if a value exists and is not between two double values, within a given tolerance.

The syntax is:

```
@ if_val_nin_range_dbl  <value> <lower> <upper>
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value- integer or double.

<lower> - the double representing the lower bound of the range to check against value. This value must be specified.

<upper> - the double representing the upper bound of the range to check against value. This value must be specified.

If the value is not within the range from lower to upper within the tolerance, the statement is true.

If the value is within the range from lower to upper within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

```
// PARAMETER WIDTH REAL "Lane width" 4.0

@ if_val_nin_range_dbl $(WIDTH) 3.0 3.5
  user_message "WIDTH is outside the range 3.0 to 3.5 within a tolerance of 1e-6"
@ end_if
```

Continue to 21.5.12.12.16 if_val_nin_range_dbl_tol or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.12.16 if_val_nin_range_dbl_tol

The **if_val_nin_range_dbl_tol** directive tests if a value exists and is not between two double values, within a given tolerance.

The syntax is:

```
@ if_val_nin_range_dbl_tol  <value> <lower> <upper> <tolerance>
// Commands processed if true
@ end_if
```

<value> - the value to compare. The value should evaluate to a numeric value- integer or double.

<lower> - the double representing the lower bound of the range to check against value. This value must be specified.

<upper> - the double representing the upper bound of the range to check against value. This value must be specified.

<tolerance> - the tolerance, expressed as a valid double value, for comparison. This value must be specified and must be the last value.

If the value is not within the range from lower to upper within the tolerance, the statement is true.

If the value is within the range from lower to upper within the tolerance, the statement is false.

If the value or any doubles do not evaluate to a valid number, an error is produced.

```
// PARAMETER WIDTH REAL "Lane width" 4.0

@ if_val_nin_range_dbl_tol $(WIDTH) 3.0 3.5 0.1
  user_message "WIDTH is outside the range 3.0 to 3.5 within a tolerance of 0.1"
@ end_if
```

Continue to 21.5.12.13 Values vs Integers or return to 21.5.12.12 Values vs Doubles or 21.5.12 Snippet Directives.

21.5.12.13 Values vs Integers

The following directives compare a value against given integers.

See

21.5.12.13.1 if_val_eq_int
21.5.12.13.2 if_val_neq_int
21.5.12.13.3 if_val_eq_all_ints
21.5.12.13.4 if_val_neq_all_ints
21.5.12.13.5 if_val_lt_int
21.5.12.13.6 if_val_le_int
21.5.12.13.7 if_val_gt_int
21.5.12.13.8 if_val_ge_int
21.5.12.13.9 if_val_lt_all_ints
21.5.12.13.10 if_val_le_all_ints
21.5.12.13.11 if_val_gt_all_ints
21.5.12.13.12 if_val_ge_all_ints

Or return to 21.5 Defining and Using Snippets.

21.5.12.13.1 if_val_eq_int

The **if_val_eq_int** directive tests if a value equals any of the given integers.

The syntax is:

```
@ if_val_eq_int <value> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

<value> - the value to test. The value should evaluate to a valid integer.

<integer> - the integer to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is equal to any of the integers, the statement is true.

If the value is not equal to any of the integers, the statement is false.

If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical OR statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_eq_int  $(NUM_LANES) 2
  user_message "NUM_LANES is equal to 2"
@ end_if
```

Continue to 21.5.12.13.2 if_val_neq_int or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.

21.5.12.13.2 if_val_neq_int

The **if_val_neq_int** directive tests if a value is not equal to any of the integers.

The syntax is:

```
@ if_val_neq_int <value> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

<value> - the value to test. The value should evaluate to a valid integer.

<integer> - the integer value to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is not equal to any of the integers, the statement is true.

If the value is equal to all of the integers, the statement is false.

If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical OR statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_neq_int  $(NUM_LANES) 3
  user_message "NUM_LANES is not equal to 3"
@ end_if
```

Continue to 21.5.12.13.3 if_val_eq_all_ints or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.

21.5.12.13.3 if_val_eq_all_ints

The **if_val_eq_all_ints** directive tests if a value is equal to all of the given integers.

The syntax is:

```
@ if_val_eq_all_ints <value> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

<value> - the value to test. The value should evaluate to a valid integer.

<integer> - the integer to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is equal to all of the integers, the statement is true.

If the value is not equal to all of the integers, the statement is false.

If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical AND statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_eq_all_ints $(NUM_LANES) 2
  user_message "NUM_LANES is equal to 2"
@ end_if

@ if_val_eq_all_ints  $(NUM_LANES) 2 3 4
  user_message "NUM_LANES is equal to 2, 3 and 4"  // This should never be true
@ end_if
```

Continue to 21.5.12.13.4 if_val_neq_all_ints or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.

21.5.12.13.4 if_val_neq_all_ints

The **if_val_neq_all_ints** directive tests if a value is not equal to all of the given integers.

The syntax is:

```
@ if_val_neq_all_ints <value> <integer> [<integer>... <integer>]
// Commands to be processed if true
@ end_if
```

<value> - the value to test. The value should evaluate to a valid integer.

<integer> - the integer to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is not equal to all of the integer values, the statement is true.

If the value is equal to any of the integer values, the statement is false.

If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical AND statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_neq_all_ints $(NUM_LANES) 3 4 5
  user_message "NUM_LANES is not equal to 3, 4 AND 5"
@ end_if
```

Continue to 21.5.12.13.5 if_val_lt_int or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.

21.5.12.13.5 if_val_lt_int

The **if_val_lt_int** directive tests if a value is less than any given integers.

The syntax is:

```
@ if_val_lt_int <value> <integer> [<integer>... <integer>]
// Commands processed if true
@ end_if
```

<value> - the value to test. The value should evaluate to a valid integer.

<integer> - the integer value to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is less than any of the integers, the statement is true.

If the value is not less than any of the integers (*i.e.* the value is greater than or equal to all integer values), the statement is false.

If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical OR statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_lt_int $(NUM_LANES) 3 4
  user_message "NUM_LANES is less than 3 or 4"
@ end_if
```

21.5.12.13.6 if_val_le_int

The **if_val_le_int** directive tests if a value is less than or equal to any given integers.

The syntax is:

```
@ if_val_le_int <value> <integer> [<integer>... <integer>]
// Commands processed if true
@ end_if
```

<value> - the value to test. The value should evaluate to a valid integer.

<integer> - the integer value to compare against the value. At least one integer must be specified, however, multiple integers can be included. Multiple integers should be separated by whitespace.

If the value is less than or equal to any of the integers, the statement is true.

If the value is not less than or equal to any of the integers (*i.e.* the value is greater than all integer values), the statement is false.

If the value or any integers do not evaluate to a valid integer, an error is produced.

Multiple integers are handled as if joined by logical OR statements.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 2

@ if_val_le_int $(NUM_LANES) 3 4
  user_message "NUM_LANES is less than or equal to 3 or 4"
@ end_if
```

Continue to 21.5.13 Snippet Variables or return to 21.5.12.13 Values vs Integers or 21.5.12 Snippet Directives.

21.5.13 Snippet Variables

In ***12d Model 11*** snippets, it is possible to define variables whose values are calculated from the design model. For example, we can capture the offset or width of a link as a variable. This allows snippets to be more flexible and work with normal modifier commands that can alter the position of links.

See

21.5.13.1 Defining Link Variables
21.5.13.2 Defining General Variables
21.5.13.3 Snippet Helper Functions
21.5.13.4 Using Variables in Other Variables
21.5.13.5 Using Variables in Commands

Or return to 21.5 Defining and Using Snippets.

21.5.13.1 Defining Link Variables

The first necessary step in using snippet link variables is to define them. It is assumed that there are already some existing links in the design - not necessarily in the snippet or even output to a model. Defining a link variable allows 12d to identify which particular links need to be measured and calculated.

The syntax to define a link variable is:

```
link_variable <link_name> <chg_range> <alias>
```

<link_name> is the shorthand in MTF code for picking the desired link from the model. Refer to Sect. 19.1.1.2 of the 12d Help for more info.

<chg_range> is the chainage range for this variable, typically the standard range for the entire snippet: $(_SCH) 0 $(_ECH) 0

<alias> is the name for this particular link_variable. We will be able to refer to this link_variable elsewhere in our snippet by this name.

A link_variable is tied to a particular link in the MTF model. It is simply an alias to a particular link in our design.

So, for example, if we have a link called KLIP on the Design layer that we want to refer to, we would do this:

```
link_variable "Design=>KLIP" $(_SCH) 0 $(_ECH) 0 "LINK1"
```

"Design=>KLIP" is the link "KLIP" from the "Design" layer. The side (left/right) will be automatically selected depending on which side this snippet is applied.

$(_SCH) 0 $(_ECH) 0 is the standard snippet text defining the chainage range

"LINK1" is our custom alias for this particular link.

Continue to 21.5.13.2 Defining General Variables or return to 21.5.13 Snippet Variables

21.5.13.2 Defining General Variables

In addition to link variables, which are specifically tied to a particular link in the model, it is possible to define general variables for intermediate calculations or storage of values. These are done with the generic variable command.

The general variable command has the syntax:

```
variable <name> <chg_range> <value>
```

<name> is the name for this variable and must be in quotes, e.g. "VAR1"

<chg_range> is the chainage range for this variable, typically the standard range for the entire snippet: $(_SCH) 0 $(_ECH) 0

<value> is the value for this variable, which can include other variables, directives and formulae.

For example:

```
// PARAMETER WIDTH REAL "Road width" 3.5
variable "HALF_W" $(_SCH) 0 $(_ECH) 0 "($(WIDTH) / 2)"
```

So, if the WIDTH parameter had a value of 3.5, the resulting variable HALF_W would have a calculated value of 3.5 / 2 = 1.75. This value is calculated at run-time and at every section to which this snippet applies.

Continue to 21.5.13.3 Snippet Helper Functions or return to 21.5.13 Snippet Variables

21.5.13.3 Snippet Helper Functions

Snippets often require the calculation of various values and measurements. For example, the current offset of a link from the centreline or the height difference between two links.

These measurements and values could be used for performing conditional tests or simply as the basis for other parts of the snippet.

To this end, there are various helper functions available within snippets. 12d will automatically calculate the relevant value at every applicable section every time it is run. These can, therefore, also be used within variable commands.

```
link_variable "Design=>KLIP" $(_SCH) 0 $(_ECH) 0 "LINK1"
variable "HALF_W" $(_SCH) 0 $(_ECH) 0 "(link_width(LINK1) / 2)"
```

In this example, the value of the variable "HALF_W" is calculated from the width of the link_variable with the alias "LINK1" divided by 2. This way, if another modifier or snippet modified the link, we could still use it within our snippet without the user needing to manually enter any width manually.

The list of available helper functions is:

link_width(XX) - the width of the link XX relative to the previous link

link_height(XX) - the height of the link XX relative to the previous link

link_grade(XX) - the grade of the link XX in y/x (not in %) relative to the previous link

rel_offset(XX) - the unsigned offset of the link XX, typically +ve for LHS and RHS

abs_offset(XX) - the signed offset of the link XX, typically -ve for LHS and +ve for RHS

abs_height(XX) - the signed height difference from the hinge of the link XX, -ve lower, +ve higher

abs_level(XX) - the level of the link XX, equal to (hinge level + height difference)

x_coord(XX) - the X ordinate of the link XX

y_coord(XX) - the Y ordinate of the link XX

apply_tin_height(XX) - the height of the Apply MTF tin at the given link XX

other_tin_height(LINK;TIN) - to capture the height of any tin (TIN) at a link (LINK) (note the semicolon separating the captured link and the tin name).

named_grade(NG) - Capture signed grade (m/m) of a named grade, NG

named_grade_hdsd_fact(NG) - For named grade, NG, the factor to multiply a horizontal distance by to get a slope distance.

named_grade_sdhd_fact(NG) - For named grade, NG, the factor to multiply a slope distance by to get a horizontal distance.

named_grade_zdsd_fact(NG) - For named grade, NG, the factor to multiply a height difference by to get a slope distance.

named_grade_sdzd_fact(NG) - For named grade, NG, the factor to multiply a slope distance by to get a height difference.

named_grade_hdzd_fact(NG) - For named grade, NG, the factor to multiply a horizontal distance by to get a height difference.

named_grade_zdhd_fact(NG) - For named grade, NG, the factor to multiply a height difference by to get a horizontal distance.

More helper functions may be added in the future.

Continue to 21.5.13.4 Using Variables in Other Variables or return to 21.5.13 Snippet Variables

21.5.13.4 Using Variables in Other Variables

Once variables have been defined, they can be used and substituted into other variables.

To do so, wherever you would like to insert the variable, use the syntax:

```
variable(name)
```

Where variable is the keyword and name is the name of the variable to be substituted.

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 1
// PARAMETER LANE_WIDTH REAL "Lane width" 3.5
// PARAMETER XFALL "Crossfall %" -3

variable "W0" $(_SCH) 0 $(_ECH) 0 "($(LANE_WIDTH) * $(NUM_LANES))"
variable "H0" $(_SCH) 0 $(_ECH) 0 "(variable(W0) * $(XFALL) / 100)"
```

Continue to 21.5.13.5 Using Variables in Commands or return to 21.5.13 Snippet Variables

21.5.13.5 Using Variables in Commands

Once variables have been defined, they can be used in a selection of modifier commands. To do so, wherever you would like to insert the variable, use the syntax:

```
variable <name>
```

Where variable is a keyword and name is the name of the variable to be substituted.

For example:

```
// PARAMETER NUM_LANES INTEGER "Number of lanes" 1
// PARAMETER LANE_WIDTH REAL "Lane width" 3.5

variable "W0" $(_SCH) 0 $(_ECH) 0 "($(LANE_WIDTH) * $(NUM_LANES))"

insert "Design=>EDGE" "red" variable W0 unknown -3.0 $(_SCH) 0 $(_ECH) 0 absolute extra_start
extra_end
```

Note that an MTF modifier commands must be specifically written to support the use of variables. Currently, the MTF modifier commands and their values that support variables are:

Modify_Decision_Batter: width, height, slope

Modify_Decision_Batter_Test: width, height, slope

Modify_XFall_Point: m_offset, m_height1

Modify_Insert_Absolute: width, height, slope

Modify_Insert_Link: width, height, slope

Modify Link All

Modify_All_To_2_RL

More may be added in the future.

Continue to 21.5.14 Order of Snippet Processing or return to 21.5.13 Snippet Variables

21.5.14 Order of Snippet Processing

When a snippet is used in ***12d Model***, it is as part of an MTF.

Each Snippet referred to in the MTF is in its own file, and each snippet file goes through set steps to calculate and substitute values in the snippet, before it is used in the MTF file.

It is important to understand each step in the processing of a snippet file, and the order of the steps, to ensure that snippet runs as you expect it to.

See

Step 1. Initial Loading of the Snippet File
Step 2. Parameters from the MTF Snippet Panel Are Substituted
Step 3. Snippet Directives Executed
Step 4. Token Values Substituted
Step 5. Snippet Inserted into MTF
Step 6. C Preprocessor Run as Part of MTF processing

Or return to 21.5 Defining and Using Snippets.

Step 1.Initial Loading of the Snippet File

The snippet file is read and loaded into memory.

All comments and blank lines are removed.

An example of a snippet file that we will use at each step is:

```
// PARAMETER FRUIT TEXT "Enter a fruit"

@ def_tok FRUIT_TOKEN "$(FRUIT)"

@ if_val_eq_str "$(FRUIT)" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered $(FRUIT), I wanted an apple!"
@ end_if

@ if_val_eq_str "$(FRUIT_TOKEN)" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
@ end_if
```

Warning - this may not do what you first think it will as we will see shortly.

Continue to Step 2. Parameters from the MTF Snippet Panel Are Substituted or return to 21.5.14 Order of Snippet Processing

Step 2.Parameters from the MTF Snippet Panel Are Substituted

In the next step on the snippet file, any values of parameters that are specified in the **MTF Snippet** panel are substituted.

That is, all instances of parameter variables, *e.g.* $TOK or $(TOK), are replaced with the value that was selected by the user in the **MTF Snippet** panel.

Automatic parameters (*e.g.* $(_SCH)) are also substituted.

If a parameter cannot be substituted, for example, it has not been defined, it is left as-is in the temporary **MTF** file and an error to the user will be produced.

As an example of the parameter substitution, if in the snippet given in **Step 1**, the user entered a value of **apple** (or accepted the default value) for the **Enter a fruit** parameter field on the **MTF Snippet** panel, then after the Parameter Substitution for FRUIT, the snippet would then look like:

```
@ def_tok FRUIT_TOKEN "apple"

@ if_val_eq_str "apple" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered apple, I wanted an apple!"
@ end_if

@ if_val_eq_str "$(FRUIT_TOKEN)" "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
@ end_if
```

Continue to Step 3. Snippet Directives Executed or return to 21.5.14 Order of Snippet Processing

Step 3.Snippet Directives Executed

In the next pass of the snippet file, any snippet directives are parsed and executed.

At this point, no parameters (or automatic parameters) exist, because they have all been substituted in the previous processing step.

So the snippet started in **Step 1**, will now look like:

```
user_message "Correct, you entered apple!"
user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
```

Notice that the flow-control previously present has been evaluated and only the applicable commands (in this case, user_message commands) remain.

How did we get the second line ?

The second conditional test directive:

@ if_val_eq_str "$(FRUIT_TOKEN)" "apple"

has evaluated to **false**, because in *if_val_eq_str* the value "$(FRUIT_TOKEN)" is being treated as the raw text string **$(FRUIT_TOKEN)** which is not equal to **apple**.

Hence the corresponding **@ else** block of commands is used and we get the line

user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"

is left in the snippet. Which is probably not what you wanted.

In this particular case, the snippet author would have been better off using the **@ if_tok_eq_str** directive instead of the **@ if_val_eq_str** directive.

```
@ if_tok_eq_str FRUIT_TOKEN "apple"
  user_message "Correct, you entered apple!"
@ else
  user_message "You entered $(FRUIT_TOKEN), I wanted an apple!"
@ end_if
```

The conditional test directive:

@ if_tok_eq_str FRUIT_TOKEN "apple"

will evaluated to **true**, because FRUIT_TOKEN is **apple** and we then get the line in the snippet:

user_message "Correct, you entered apple!"

Continue to Step 4. Token Values Substituted or return to 21.5.14 Order of Snippet Processing

Step 4.Token Values Substituted

In the next processing stage of the snippet, tokens have their values substituted, in a similar manner to that in which parameters were substituted in the earlier step.

At this point, this is simply a replacement of tokens in the snippet file, $TOKEN or $(TOKEN), with their value.

There is no flow control at this point, since it has already been performed in the previous step.

So the snippet started in **Step 1**, will now look like:

```
user_message "Correct, you entered apple!"
user_message "You entered apple, I wanted an apple!"
```

Note that each line containing tokens is processed as many times as necessary until no further tokens remain to be substituted. This allows token values to contain other tokens.

```
@ def_tok TOK1 1.0
@ def_tok TOK2 2.0
@ def_tok TOK3 "($(TOK1) + $(TOK2))"// TOK3
will eventually equal 3.0
```

Although the substitution of parameters and tokens is similar, it is important to understand they occur at separate stages of the snippet processing.

After Step 4, the **temporary** MTF snippet file is generated (.temp_mtf).

All intelligence, formulae and user input have been removed in the temporary MTF snippet file.

Continue to Step 5. Snippet Inserted into MTF or return to 21.5.14 Order of Snippet Processing

Step 5.Snippet Inserted into MTF

At this stage, whatever remains of the snippet is inserted into the MTF File. No further processing is done by the 12d Snippet Preprocessor.

However, note, that the older C preprocessor- the one the handles #define, #ifdef, etc.- has not yet been run.

Continue to Step 6. C Preprocessor Run as Part of MTF processing or return to 21.5.14 Order of Snippet Processing

Step 6.C Preprocessor Run as Part of MTF processing

In the next pass, the C preprocessor- i.e. the one handling #define, #if, etc.- is used on the entire MTF, which now includes the interpreted and processed snippets.

Any parts of any snippets still using the older C preprocessor directives (#define, #if, etc) will be processed at this stage as part of the overall MTF. At this point there is no concept of a snippet as a separate entity- all snippet results have already been inserted into the MTF.

Note

Because of the power and predictability of the **Snippet Directives**, they should always be used instead of any C Preprocessor commands.

For more information on the substitutions and C preprocessor directives supported in the MTF, refer to the ***12d Model Help*** section 21.10.1.16 Substitutions in the Modifiers and Templates File.

Return to 21.5.14 Order of Snippet Processing or 21.5 Defining and Using Snippets, or continue to 21.5.15 Debugging Snippets.

21.5.15 Debugging Snippets

See

Or return to 21.5 Defining and Using Snippets.

21.5.15.1 Print Messages and Log Lines to the Output Window

To help with writing and debugging snippets, V11 provides the ability to write messages to the Output Window. These are done via special snippet commands *user_message_print*, *user_message_log* and *user_message* with the syntax:

(a) user_message_print

user_message_print text_msg **"variable"** "var_name" st_ch extra_st end_ch extra_end

"variable" - optional.

"var_name" is the name of a variable.

"variable" is optional but if it exists then "var_name" must also exist.

st_ch extra_st end_ch extra_end - optional

st_ch is a chainage

extra_st is added to st_ch to give the **start chainage**

end_ch is a chainage

extra_end is added to end_ch to give the **end chainage**

Print the text ***text_msg*** to the Output Window and then print the value of the variable *var_name* to the Output Window.

The messages are produced for every section in the chainage range given by the start chainage and the end chainage.

If the start and end chainage modes are omitted, they are taken to be from the start to the end of the reference string.

user_message_print "Value of REL_OFFSET: " "variable" "REL_OFFSET" $(_SCH) 0 $(_ECH) 0

For every section between the start and the end chainage, this will print the text "Value of REL_OFFSET " followed by the value of the variable REL_OFFSET to the Output Window,

(b) user_message_log, user_message

user_message_log text_msg **"variable"** "var_name" st_ch extra_st end_ch extra_end

user_message text_msg **"variable"** "var_name" st_ch extra_st end_ch extra_end

"variable" - optional.

"var_name" is the name of a variable.

"variable" is optional but if it exists then "var_name" must also exist.

st_ch extra_st end_ch extra_end - optional

st_ch is a chainage

extra_st is added to st_ch to give the **start chainage**

end_ch is a chainage

extra_end is added to end_ch to give the **end chainage**

Create a log line in the Output Window of the text ***text_msg*** followed by the value of the variable *var_name*.

The log lines are produced for every section in the chainage range given by the start chainage and the end chainage.

If the start and end chainage modes are omitted, they are taken to be from the start to the end of the reference string.

```
user_message_log "Value of REL_OFFSET: " "variable" "REL_OFFSET" $(_SCH) 0 $(_ECH) 0
```

For every section between the start and the end chainage, a log line will be created in the Output Window with the text "Value of REL_OFFSET " followed by the value of the variable REL_OFFSET

TIP: If you only want one message, rather than a message for every section, use:

$(_SCH) 0 ($_SCH) 0.0001

```
user_message_print "This will only print once!" $(_SCH) 0 $(_SCH) 0.0001
```

Continue to the next section21.5.15.2 Intermediate Parsing Results or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.

21.5.15.2 Intermediate Parsing Results

As explained in the section Order of Snippet Processing, any MTF Snippet file is processed in several rounds, with each round of the process performing various parsing, evaluation and substitution steps. To assist with debugging and understanding the manner in which snippets are processed by ***12d Model***, there is an additional snippet instruction that can be used.

```
// OUTPUT_PARSING_STAGES <filename>
```

For example:

```
// OUTPUT_PARSING_STAGES "dump.txt"
```

With this instruction present in a snippet, 12d will write a detailed log of the snippet at each stage of processing to the given file. The contents of the file are updated/overwritten on each recalc of the Apply MTF function.

For compiled snippets, even if this instruction is present, no output will be produced.

Continue to the next section21.5.15.3 Temporary MTF Snippet File or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.

21.5.15.3 Temporary MTF Snippet File

To assist with the development and debugging of MTF snippets, there are a number of environment variables to control the naming of, and stop the deletion of, the temporary MTF file that is created after the Snippet Directives are evaluated and the snippet parameters have been substituted (see Snippet Directives).

At the point of the temporary MTF snippet file being created (.mtfsnippet.temp_mtf), all intelligence has been removed from the output. All formulae, variables, directives and fixed decisions have been removed and only the raw modifier commands remain.

(a) Don't Delete Snippet Temp File

MTF_SNIPPET_TEMP_FILE_USE_SNIPPET_NAME_KEEP_4D 1/0

If enabled (non zero), the temporary MTF file that is generated when MTF snippets are processed and parsed will not be deleted. Each run of the **Apply MTF** function will create or update the contents of a file containing the snippet after processing. The file will be created in the current project's working directory.

(b) Snippet Temp File Use Snippet Name

MTF_SNIPPET_TEMP_FILE_USE_SNIPPET_NAME_4D 1/0

If enabled (non zero), the temporary snippet file generated when MTF snippets are processed will be given the name of the snippet file with the extension ".temp_mtf".

For example, if the snippet file is called "INSERT_KERB.mtfsnippet" then, by default and when enabled, the temporary snippet file produced will be "INSERT_KERB.mtfsnippet.temp_mtf".

This env variable enables the user to have this consistently named temporary file open in an editor and it can then be refreshed each time a snippet is run.

(c) Snippet Temp File Custom Extension

MTF_SNIPPET_TEMP_FILE_EXTENSION_4D *Extension_text*

If ***Extension_text*** is **not blank**, the temporary snippet file generated when MTF snippets have been processed will have the extension *Extension_text* rather than the default extension of "temp_mtf".

(d) Unique Snippet Temp File Name

MTF_SNIPPET_TEMP_FILE_UNIQUE_4D 1/0

If enabled (non zero), a temporary snippet file will be generated for each MTF Snippet instance in the corresponding MTF. To better relate the temporary snippet file with the actual instance in the MTF, this setting will produce a temporary snippet file for every inserted snippet and be named like so:

<Snippet_File> - <MTF> <side> <modifier_number>.<extension>

For example,

CP.mtfsnippet - RSCR01.mtf Left No. 7.temp_mtf

Corresponds to the CP.mtfsnippet file inserted in the left side modifiers of RSCR01.mtf file as modifier number 7.

These environment variables are defined in the ***MTF & Boxing >MTF General*** section of the ***env.4d Editor*** which is brought up by selecting ***Project =>Management =>env.4d.*** *See* MTF

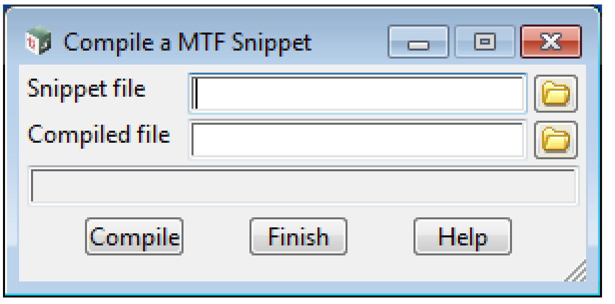
& Boxing > MTF General in 7 Project.

Continue to the next section21.5.16 Compiling Snippets or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.

21.5.16 Compiling Snippets

It is possible to compile a snippet via the option

Design =>MTF =>Snippet =>Compile snippet



This can be done to protect any intellectual property (IP) and minimise concerns people may have in developing and sharing snippets.

Compiling a snippet encrypts and encodes the snippet contents into a new file with an extension of **mtfsnippetc** (note the 'c' at the end, denoting a compiled snippet).

A compiled snippet can be run and used by anyone, but the snippet code itself cannot be viewed or edited.

Temporary snippet files, if enabled, are not generated for compiled snippets.

Original Snippet

// INFO Example compiled snippet

nyKgSBlhX6wGqQizY/fRfDcT/YReG2J34wsghywz6Ys+cfVn+Pi+crz/4c9XgNbYI+kmS14F

flh+I/bNu41RYyD4RtNvIiS9

Continue to the next section21.5.17 Tips and Tricks or return to 21.5.15 Debugging Snippets or 21.5 Defining and Using Snippets.

21.5.17 Tips and Tricks

• When creating snippets, create the MTF modifier commands first and then copy and paste into a snippet. This helps ensure the format and syntax of the modifier commands is correct.

• Use comments liberally to document your snippet. This makes it easier for you and anyone else to see and understand your thought processes, reasoning and logic within the snippet, making it easier to debug and modify.

• Define tokens for commonly-used values to make code more readable and portable.

```
@ def_tok ABS "absolute"
@ def_tok ES "extra_start"
@ def_tok EE "extra_end"
@ def_tok ASE "$(ABS) $(ES) $(EE)"
Insert "LINK" "red" 3.5 unknown -3 $(_SCH) 0 $(_ECH) 0 $(ASE)
```

• When writing or testing snippets, output messages using user_message commands with values of parameters, variables and tokens to check correct calculation of values. These can be commented out or removed before finalising your snippet.

• The user_message commands will, by default, output a message for every applicable Apply MTF section. To cut down on the number of repetitive messages, specify a start and end chainage.

```
// PARAMETER WIDTH REAL "Link width" 1.0
@ def_tok MSG_CH "$(_SCH) 0 $(_SCH) 0.0001"// Define a token for easier readability
user_message "Link width = $(WIDTH)" $(MSG_CH)// Only output one message
```

• For all directives, there is a space between the @ and the name of the directive!

• For expressions and formula, use parentheses as much as needed. If in doubt, add more and double-check the results

• Parameter names should not contain spaces and should not start with an underscore.

• Token names should not contain spaces and should not start with an underscore.

• It is recommended that token names only contain alphanumeric characters and underscores.

• Parameter names and token names must be unique within the snippet file!

• Use the new V11 syntax, where possible! The V10 syntax- e.g. #define, $VAL - is deprecated and only supported for backwards-compatibility.

Continue to the next section 21.5.18 Major Warning - You Will be Caught by This or return to 21.5 Defining and Using Snippets.

21.5.18 Major Warning - You Will be Caught by This

WARNING - once a snippet with parameters has been saved in a MTF file, the parameters for the snippet are saved ***in the MTF file.*** Then when the Apply MTF is run, the parameters and their values are read in from the MTF file and passed into the current snippet file.

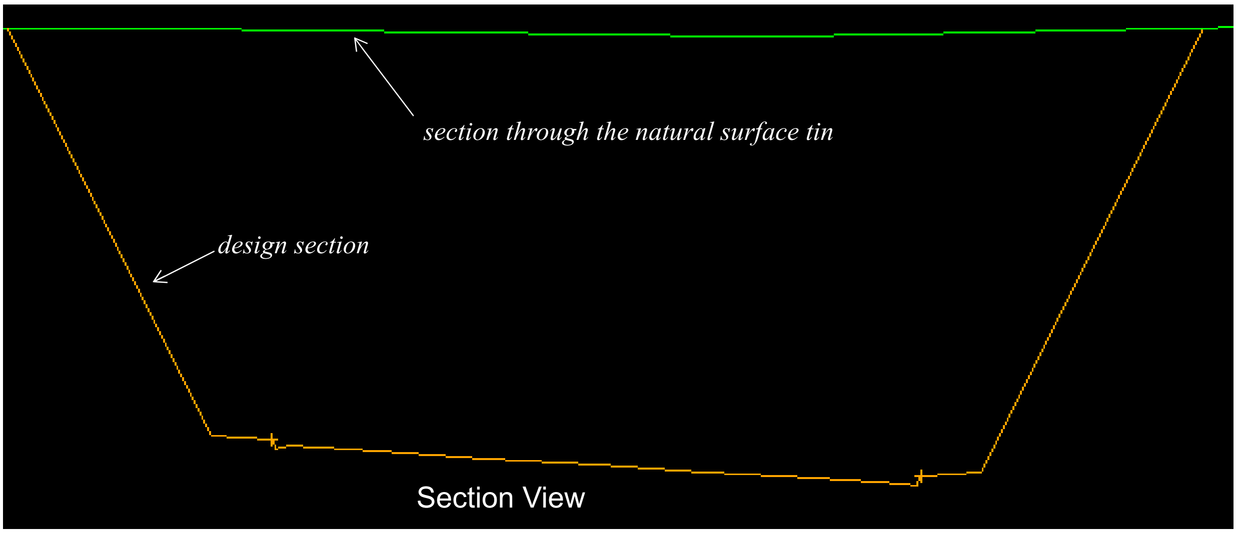
Hence if the snippet file has been modified and parameter definitions added, modified or removed since the snippet was originally place in the MTF, these modifications of parameters will be **ignored** until the snippet panel is reopened in the MTF editor which forces the snippet file to be parsed again and the changes to the parameter definitions are then recognised.

Note that when the Apply MTF for the MTF is run, the MTF used the ***current*** snippet file so if the snippet file has been modified since the snippet was placed in the MTF, the ***modified*** snippet file will be used (apart from any new parameter definitions and defaults)

Return to 21.5 Defining and Using Snippets.

21.6 What is Boxing?

A design is represented in 3d as a collection of strings. The design can also be approximated as a series of sections perpendicular to the centreline at various chainages. These are known as design cross section, or design sections.



See

[21.6.1 Representing Cross Sections in 12d Model](#)
[21.6.2 Applying Boxing](#)
[21.6.2 Applying Boxing](#)
[21.7 Full Definition of Boxing](#)

Go to the next section 21.6.1 Representing Cross Sections in 12d Model

21.6.1 Representing Cross Sections in 12d Model

In ***12d Model***, cross sections, are represented as ***4d super strings***.

A 4d super string has an (x,y,z) coordinate for each vertex, PLUS text at each vertex. Hence, there are four bits of information, an (x,y,z,text) value, for each vertex.

Cross sections are generated in ***12d Model*** by options such as

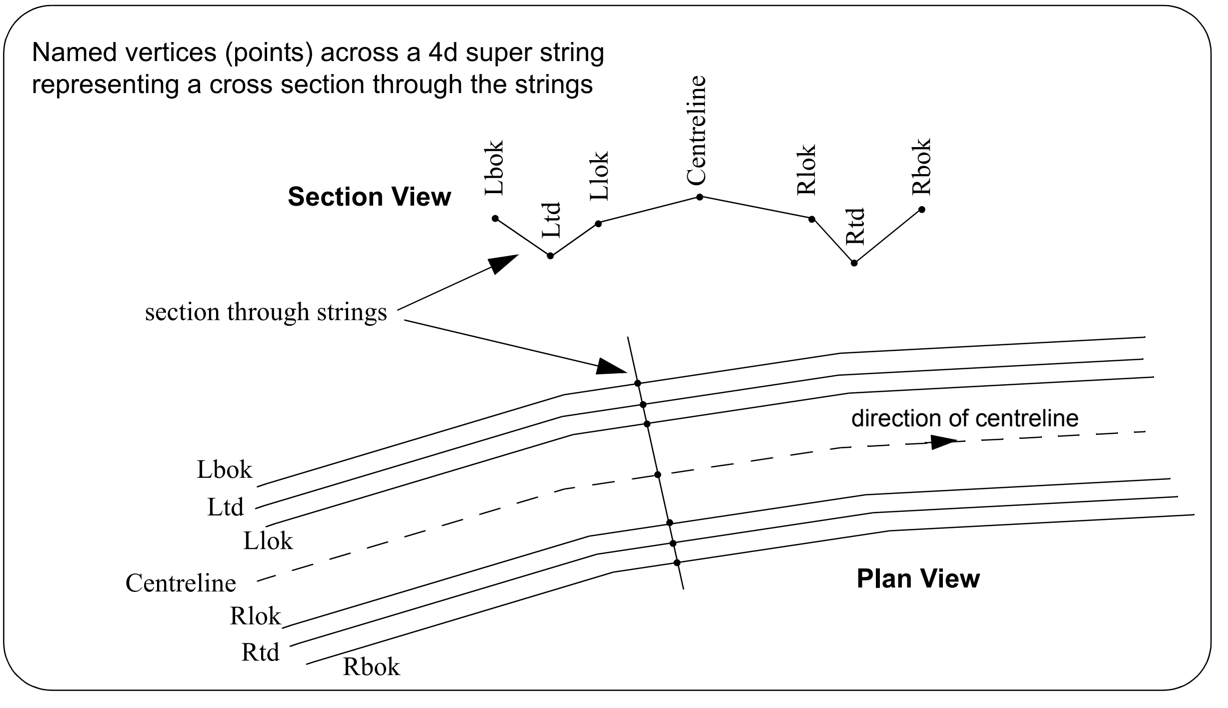
(a) cuts through strings along a centreline (see 28.9.13.2 Cuts by Centreline)

(b) the functions **Apply MTF** (see 20.3.2 Apply MTF Function) or **Apply** (see 20.3.1 Apply Template Function)

(c) the **Boxing Many Function** (see 20.5.4 Boxing Many Function)

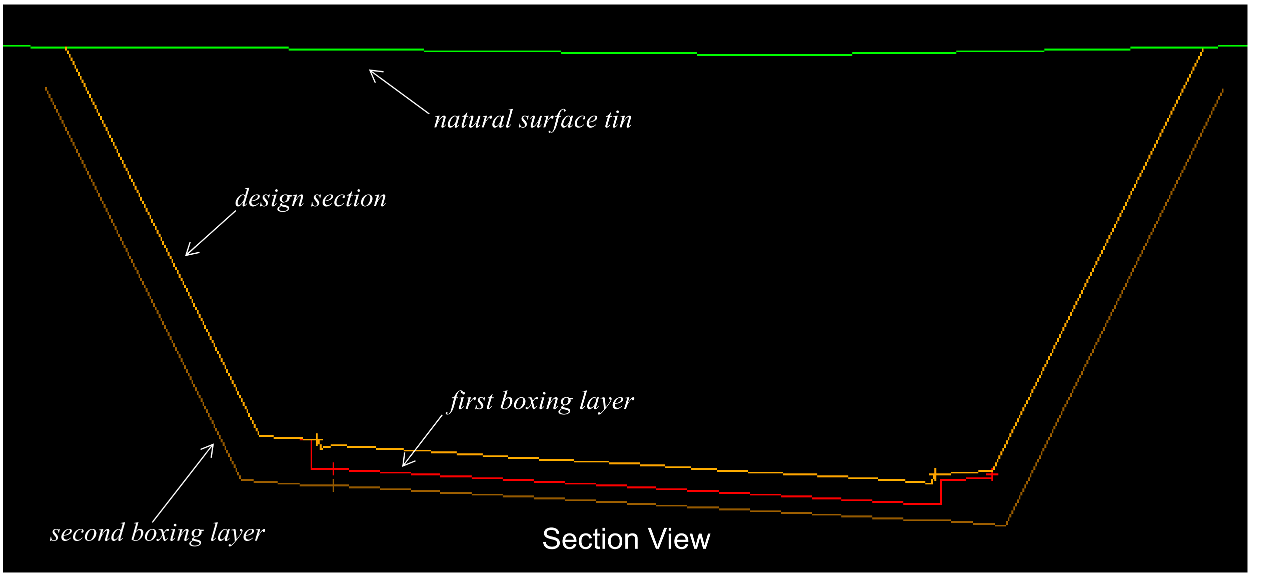
For these cross sections, the **text** at each vertex of the 4d super string (vertex/point text), is the **name of the string** that the section cuts through at that vertex.

Also when the cross sections are generated by these options, the start chainage of the 4d string is set so that the chainages **along the 4d string** are the same as the **offset** of the vertices from the centreline used when generating the sections.



Boxing Layers

A Boxing Layer is simply another surface, usually modelling a construction material layer, under (or above) the design. The Boxing Layer is represented by strings, and also as a series of sections at the same chainages as the design sections.



Boxing Layers are normally defined in terms of the named vertices across the design section, offsets from the centreline, in terms of other boxing layers already specified, or in relationships to other strings.

When boxing is generated in the **Apply MTF** or the **Boxing Many Function**, there can be up to **eight** (8) layers of boxing and the ***last*** *layer* defined is referred to as the ***subgrade*** layer.

In ***12d Model*** there are special commands called ***Boxing Commands*** that are be used to build a boxing layer.

A series of ***12d Model*** boxing commands are grouped together as a ***Boxing Definition*** and when a *Boxing Definition* is applied to a cross section, it generates a boxing section. That is, it generates a section that is part of a particular Boxing Layer.

Each ***Boxing Definition*** is given a name, and is stored in a ***Boxing*** file. The names of the *Boxing Definitions* must be unique within the *Boxing* file.

How the **Boxing** file and **Boxing Definitions** are applied in ***12d Model*** is described in the next section 21.6.2 Applying Boxing, and this is followed by the full definition of ***12d Model*** boxing and the ***12d Model*** boxing commands in the sections starting with 21.7 Full Definition of Boxing.

21.6.2 Applying Boxing

For any ***12d Model*** project there are a number of different data creation scenarios and the appropriate method to use to generate boxing depends on how the data has been created, or is available, inside ***12d Model.***

See 21.6.2.1 Scenario 1 - Design Generated by One Apply MTF

See 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design

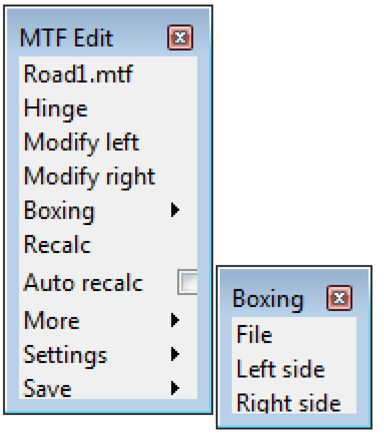
See 21.6.2.3 Scenario 3 - Design Provided as Strings Only

See 21.6.2.4 Scenario 4 - Design Sections Already Exist

21.6.2.1 Scenario 1 - Design Generated by One Apply MTF

If a design is generated by just ***one Apply MTF*** function, then up to eight (8) layers of boxing can also be generated at the same time by the ***Apply MTF*** function.

In the **Apply MTF** option, the ***MTF***, controls which ***Boxing*** file is used, and how the various Boxing Definitions from that file are used to create each layer of boxing.



In the **MTF Edit** menu, the *Boxing* ***File*** option specifies which **Boxing** file of ***Boxing Definitions*** is used.

For each boxing layer, the boxing can be defined by

(a)the Left boxing only

(b)the Right boxing only

or

(c)the Left and Right boxing.

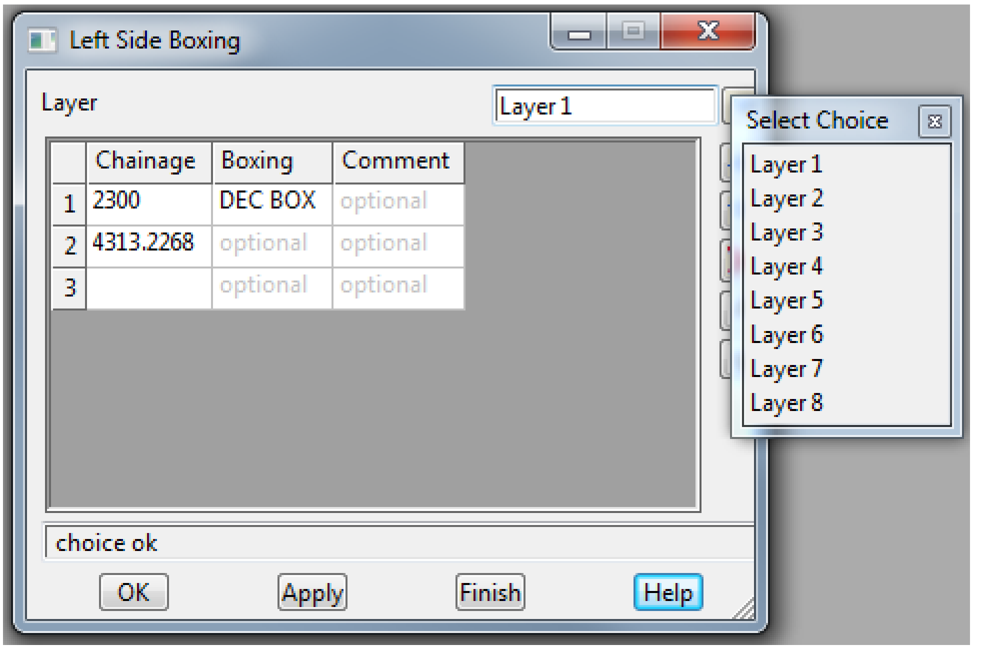
For cases (a) and (b), the Left boxing or the Right boxing defines the boxing across the entire design section and then only Left boxing or Right boxing is needed.

For case (c) where **both** Left and Right boxing are used to define the boxing across the design section, the ***last*** *point of the* ***Left*** *boxing* is automatically **connected** to the ***first point*** *of the* ***Right*** *boxing*.

Warning for case (c), the Left boxing must end before the Right boxing begins. If there is an overlap, the Right boxing will be pushed to the **end** of the Left boxing.

Note - no interpolation or modifiers exist for boxing.

For each layer, the ***Left side*** /***Right side*** specifies what Boxing Definition to use over what chainage range.



See 21.1 The Modifiers and Templates File - MTF and 21.4 Smart Chainages.

Go to the next section 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design or back to 21.6.2 Applying Boxing.

21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design

In more complex designs, a number of separate ***Apply MTF'***s may be needed, and even some strings hand crafted, to produce the final design. Hence the design is only fully represented by a ***collection of strings***.

In this situation, design sections are produced as a ***post process*** using ***Cuts through strings*** by either

Utilities =>A-G =>Cuts =>by centreline

which can cut through a Data Source of strings (see 28.9.13.2 Cuts by Centreline), or by

Design =>Boxing =>Boxing many (function)

which can only cut through one model of strings (see 20.5.4 Boxing Many Function).

Note - the design sections produced by both options are ***4d super strings*** where the text at each vertex of the super string is the **name** of the string **cut** to create that vertex of the super string.

The methods described in 21.6.2.4 Scenario 4 - Design Sections Already Exist are then used to generate boxing from the created design sections.

Go to the next section 21.6.2.3 Scenario 3 - Design Provided as Strings Only or back to 21.6.2 Applying Boxing.

21.6.2.3 Scenario 3 - Design Provided as Strings Only

Sometimes you only have the strings defining the design (the design strings).

This case is similar to 21.6.2.3 Scenario 3 - Design Provided as Strings Only and **design sections** are produced as 4d super string from the design strings using ***Cuts through strings*** by either

Utilities =>A-G =>Cuts =>by centreline

which can cut through a Data Source of strings (see 28.9.13.2 Cuts by Centreline), or by

Design =>Boxing =>Boxing many (function)

which can only cut through one model of strings (see 20.5.4 Boxing Many Function).

The methods described in 21.6.2.4 Scenario 4 - Design Sections Already Exist are then used to generate boxing from the created design sections.

Go to the next section 21.6.2.4 Scenario 4 - Design Sections Already Exist or back to 21.6.2 Applying Boxing.

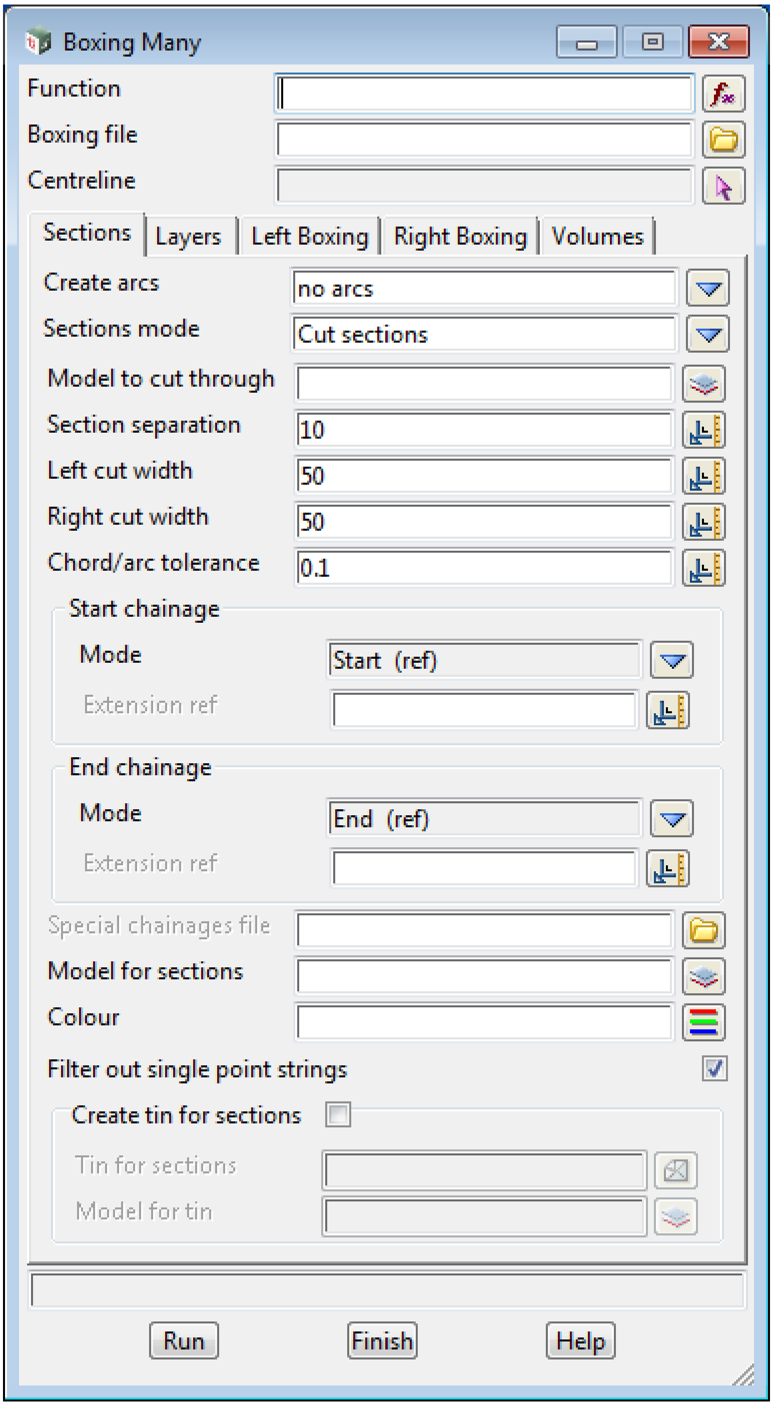
21.6.2.4 Scenario 4 - Design Sections Already Exist

There is the case where you already have the design sections as 4d super strings.

The design sections may have been created by an earlier ***Apply MTF*** or ***Apply*** run, or generated by cuts through strings as in 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design or 21.6.2.3 Scenario 3 - Design Provided as Strings Only, or simply provided.

Boxing can then be generated from the ***design sections*** using the options:

(a) *Design =>Boxing =>Boxing many function*



The ***Boxing Many Function*** can generate up to eight layers of boxing, as well as calculating volumes. See 20.5.4 Boxing Many Function.

Note that the ***Boxing Many Function*** can also create the cuts through a model of strings to create the design sections and so can be used to cover 21.6.2.2 Scenario 2 - More than One Apply MTF Needed to Generate the Design. 21.6.2.3 Scenario 3 - Design Provided as Strings Only and 21.6.2.4 Scenario 4 - Design Sections Already Exist in the one function.

(b) *Design =>Boxing =>Boxing many*

A simplified version of the *Boxing Many Function.*

For *Boxing Many*, an MTF is used to define the application of the Boxing Definitions, and the Boxing file containing the Boxing Definitions is either that defined in the MTF **or** a different Boxing file. See 20.5.6 Apply Boxing Many.

The boxing can be applied to a model of sections, or just a **single selected section**.

(c) *Design =>Boxing =>Boxing*

An even more simplified version of the *Boxing Many Function*.

The ***Boxing*** option can only apply one Boxing Definition to all the design sections in a model. See 20.5.5 Apply Boxing.

Note - in the case when only 4d super string are provided, the option

Design =>X-Sections =>Strings from sections

can be used to generate design strings from these sections (see 20.14.8 Strings from Sections).

Go to the next section 21.7 Full Definition of Boxing or back to 21.6 What is Boxing? or 21.6.2 Applying Boxing.

21.7 Full Definition of Boxing

In ***12d Model*** there are special commands called ***Boxing Commands*** that are be used to build up a boxing layer.

A series of ***12d Model*** boxing commands are grouped together as a ***Boxing Definition*** and when a *Boxing Definition* is applied to a cross section, it generates a boxing section. That is, it generates a section that is part of a particular Boxing Layer.

Each ***Boxing Definition*** (the rules for calculating a specific type of boxing) is given a name, and is stored in a ***Boxing*** file (with a file name ending in **.bf**).

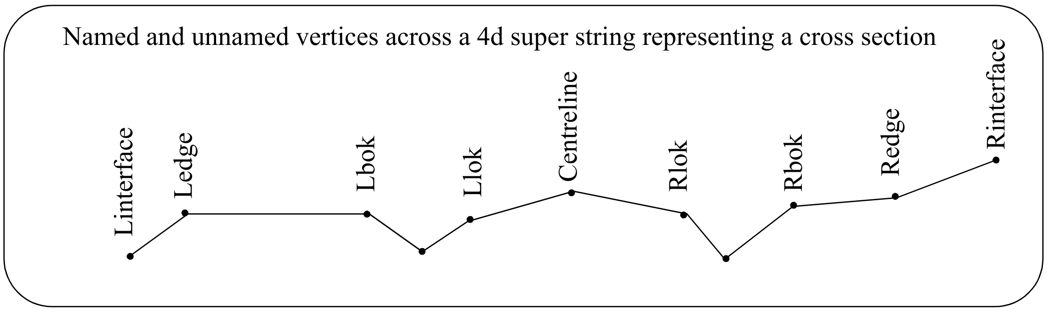
Any number of *Boxing Definitions* can be placed in the one *Boxing* file as long as each *Boxing Definition* in the ***Boxing*** file has a unique name.

Note that the same name of a *Boxing Definition* can appear in more than one *Boxing* file and even through they have the same name, the *Boxing Definition* in a different *Boxing* file can be completely different.

Please continue to the next section 21.7.1 Terminology Used in Boxing Commands

21.7.1 Terminology Used in Boxing Commands

The ***12d Model*** *Boxing Commands* work on a cross section, which is a 4d super string (see 21.6.1 Representing Cross Sections in 12d Model).



A *Boxing Definition* is a group of boxing commands and the boxing commands work from **left to right** across the cross section to produce a boxing section.

Most of the **boxing commands** apply from the **offset** specified at the beginning of that command (**Start Offset** for the command) to the start offset of the **next** boxing command (like chainages and templates in the MTF). That is, the start offset of a boxing command is the **End Offset** for the ***previous*** boxing command.

So most **boxing commands** go from the **Start Offset in the command** to the **Start Offset in the next boxing command**.

An **offset**, such as the **Start Offset**, can be defined as:

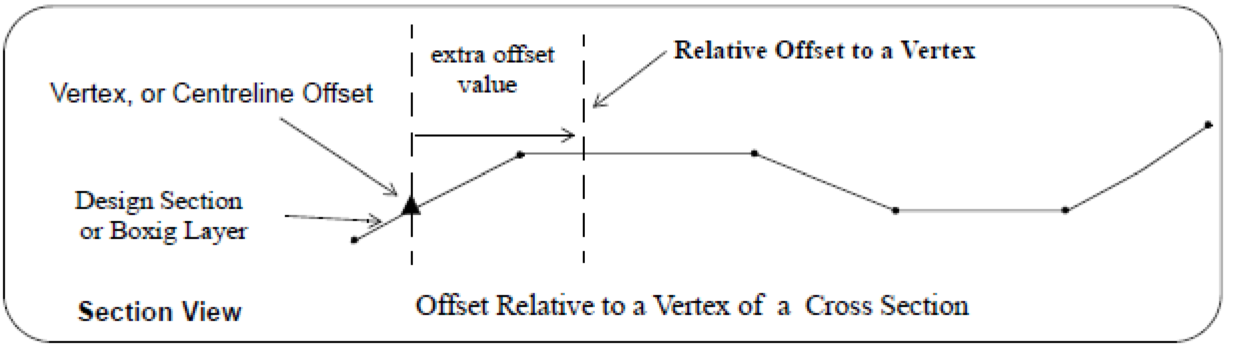
(a) a **fixed** Centreline offset value (*e.g.* 10.5)

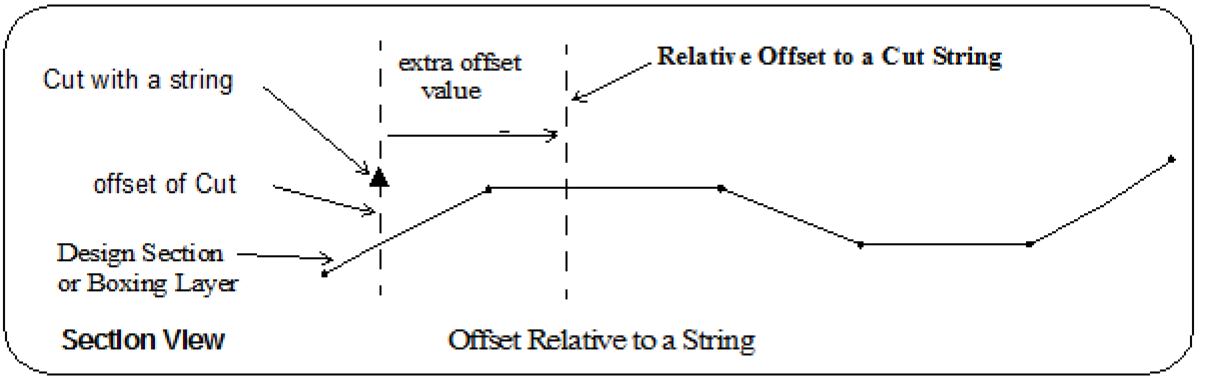
(b) specified **relative to a vertex name** on a design cross section, or any boxing section (at the section chainage) in a Boxing Layer already created.

(c) specified **relative to a selected string** that cuts the design cross section, or a specified Boxing Layer, in plan.

The **offset** represents a **plan** position on the cross section (a plan point on the cross section) which may or may not be the plan position of a vertex on the cross section.

The terminology used to specify such an offset is ***relative offse***t to a ***vertex*** or a ***string***.





Note - if not all the vertex names and strings mentioned in a *Boxing Definition* are present in the cross section at the centreline chainage, then no boxing section is produced for that centreline chainage.

Hence

1. an **offset relative to a vertex name** (**relative vertex offset**) is defined to be the **offset** at a **given named vertex** on the design section, or a boxing section previously created, **plus** a **given offset value**.

   That is

   take the **offset at** the 4d vertex called **"vertex name"** and add **"offset value"** to it. The offset value can be positive of negative.

   If the "vertex name" is blank, then the "**offset value**" is taken to be the *actual* offset on the 4d super string.

   Hence the *offset* can be specified as either an actual ***offset value*** or given **relative to the name of a vertex** on the super string (**relative offset**).

   For convenience, in both cases the offset will be denoted by **relative vertex offset**.

2. an **offset relative to string** (**relative string offset**) is defined to be the **offset** on the cross section where the string cuts the section in plan, **plus** a **given offset value**.

   That is

   take the **offset at** the plan cut of the section and the string and add **"offset value"** to it. The offset value can be positive of negative.

A major advantage of defining boxing in terms of vertex names and strings is that whenever the vertices or strings are modified using MTF modifiers, or string edits, the boxing across the section is also automatically modified on a recalc.

A *Boxing Definition* may be used in either a *Left Boxing* or *Right Boxing* in an **MTF**, or in a **Boxing Many Function** option, however unlike the case for MTF modifiers, the *Boxing Definition* is applied to the vertex names going from **left to right** regardless of whether the *Boxing Definition* is used on the left or the right. So it is possible to create the entire boxing with just the *Left Boxing* or *Right Boxing*. If both are used, the end of the *Left Boxing* is joined to the start of the *Right Boxing*.

Warning

For a *Boxing Definition* to work, any cross section vertex names referred to in the *Boxing Definition* must be **unique** for that cross section. Similarly any strings cut must have unique names.

In the *Apply MTF* and *Apply*, the **LHS prefix** and **RHS prefix** panel files can be used to give vertices on cross sections different names even when the same Template is used on the left and the right side of the centreline.

Boxing ***sections*** are generated by the *Apply MTF*, *Boxing Many Function, Boxing Many and Boxing options,* but ***boxing strings*** are only generated by the *Apply MTF* and *Boxing Many Function*. For the other cases, the option **Strings=>Utilities=>Strings from sections** can be used to create boxing strings from the boxing sections.

Vertical Walls

If a *Boxing Definition* creates two different height values at the one offset (i.e. a wall), then an extra offset point is automatically inserted into the boxing section (at offset 0.1 mm from the first vertex) so that **no vertices in the created boxing section are on top of each other.**

So in effect a **vertical wall** is created.

And since no vertices are created that are directly above each other, the boxing sections can be triangulated.

Please continue to the next section 21.7.2 Edit Boxing File or return to 21.7.1 Terminology Used in Boxing Commands.

21.7.2 Edit Boxing File

The option

Design =>Boxing =>Create

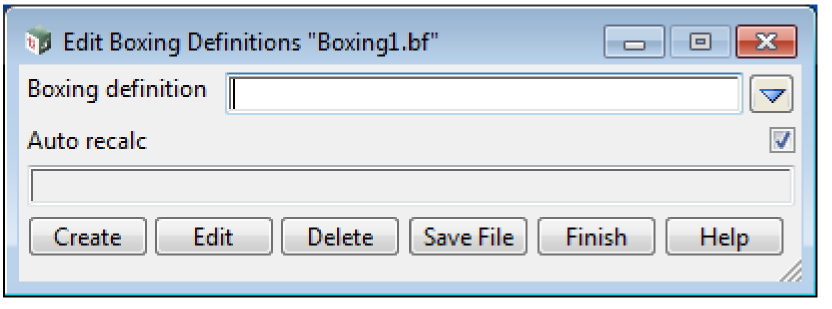
creates a ***Boxing*** file which contains ***Boxing Definitions***, and then brings up the **Edit Boxing Definitions** panel to create the actual *Boxing Definitions* (rules) to save in the *Boxing* file.

Similarly selecting a *Boxing* file from the walk-right list of

Design =>Boxing =>Edit

also brings up the **Edit Boxing Definitions** panel to create/edit boxing definitions from the selected *Boxing* file.

The **Edit Boxing Definitions** panel is



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing definition	input		boxing definitions in file

name of the Boxing Definition (in the current boxing file) to create or edit. Each Boxing Definition must have a unique name in the Boxing file

Create button

create a Boxing Definition with name given by the **Boxing definition** *panel field*
If the Boxing Definition given in the **Boxing definition** *field* ***does not exist****, then the* **Boxing Rules** *panel is placed on the screen and is used to created the new Boxing Definition for the Boxing file (see* 21.7.2.1 Boxing Rules Panel*).*

If the Boxing Definition already exists, then nothing will happen when clicking on **Create***.*

Edit button

edit an existing Boxing Definition with name given in the **Boxing definition** *panel field*
If the Boxing Definition given in the **Boxing definition** *field* ***exists****, then the* **Boxing Rules** *panel is placed on the screen and is used to edit the existing Boxing Definition (see* 21.7.2.1 Boxing Rules Panel*).*

If the Boxing Definition does not exist, then nothing happens when clicking on **Edit***.*

Delete button

delete the existing Boxing Definition with the name given in the **Boxing definition** *panel field*
A **Yes-No** *panel confirms the deletion.*

Save file button

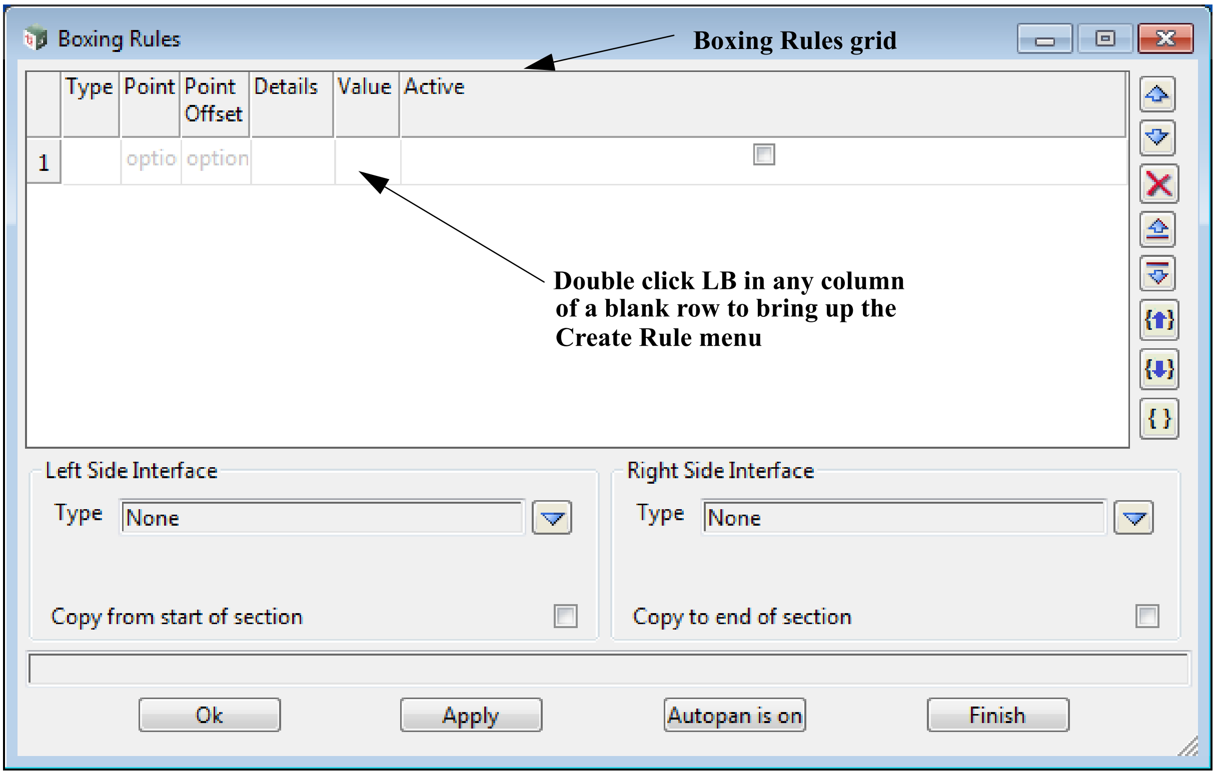
save the Boxing file with the Boxing Definitions to disk.

For more information on how Boxing works in ***12d Model***, go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.1 Boxing Rules Panel or return to 21.7.2 Edit Boxing File.

21.7.2.1 Boxing Rules Panel

Selecting the **Create** or **Edit** button on the **Edit Boxing Definitions** panel brings up the **Boxing Rules** panel which is used to build up/edit the nominated *Boxing Definition* from the **Boxing Commands.**



The **Boxing Rules** panel consists of:

(a) a **Boxing Rules** grid with rows (or lines) with **commands** in them

The commands for the Boxing Rules grid are fully described in the section 21.7.2.2 Commands for Boxing Rules Grid.

For more information on creating and editing data in a grid, see 4.19.6 Grids in Panels.

(b) **Left Side Interface** and **Right Side Interface** areas

See the following document ion on fields and buttons for this panel

(c) **Copy from start of section** and **Copy to end of section** tick boxes

See the following document ion on fields and buttons for this panel

(d) an **OK** or **Apply** button to record the results.

See the following document ion on fields and buttons for this panel

The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Boxing Rules Grid

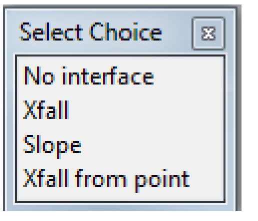
commands for defining the Boxing Definition.

The commands will be described in the section 21.7.2.2 Commands for Boxing Rules Grid.

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

Left Side Interface

Type choice box



*If **No interface:***

nothing is done

*If **Xfall:***

Xfall real box 0

*if non-zero, a batter with the given xfall is applied going to the **left** from the first point of the boxing, and goes until it intersects the design section. The intersection point is added as the first point in the boxing. If no intersection is made, nothing is added to the boxing. A positive xfall is up and negative xfall down.*

*If **Slope:***

Slope real box 0

*if non-zero, a batter with the given slope is applied going to the **left** of the first point of the boxing, and goes until it intersects the design section. The intersection point is added as the first point in the boxing. If no intersection is made, nothing is added to the boxing. A positive slope is up and negative slope down.*

*If **Xfall from point:***

Set point button

clicking on **Set point** *brings up the* **Boxing LHS Xfall** *panel which allows the battering xfall to be defined in more complex ways. This is described in the section* 21.7.2.2.17 Boxing Left Side Interface Xfall from Point.

Copy from start of section tick box

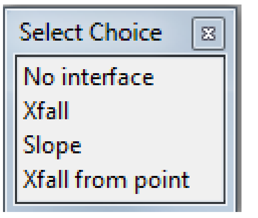
if ticked, then the part of the design section from the start of the design section to the offset that is the start of the boxing section, is copied and made the beginning of the boxing section.

*Hence the **Copy from start of section** tick is used to begin the boxing section with the start of the design section to make a full width left side boxing section.*

If not ticked, nothing is done

Right Side Interface

Type choice box



*If **No interface:***

nothing is done

*If **Xfall:***

Xfall real box

if non-blank, a batter with the given xfall is applied to the last point of the boxing and goes until it intersects the design section. The intersection point is added as the last point in the boxing. If no intersection is made, nothing is added to the boxing. A xfall slope is up and negative xfall down.

*If **Slope:***

Slope real box

if non-blank, a batter with the given slope is applied to the last point of the boxing and goes until it intersects the design section. The intersection point is added as the last point in the boxing. If no intersection is made, nothing is added to the boxing. A positive slope is up and negative slope down.

*If **Xfall from point:***

Set point button

clicking on **Set point** *brings up the* **Boxing RHS Xfall** *panel which allows the battering xfall to be defined in more complex ways. This is described in the section* 21.7.2.2.18 Boxing Right Side Interface Xfall from Point.

Copy to end of section tick box

if ticked, then the part of the design section from the offset of the last boxing vertex to the last vertex on the design section, is copied and made the end of the boxing section.

Hence the RHS copy flag is used to continue the boxing section from the last boxing point, with the design section to the end of the design section to make a full width right side boxing section.

If not ticked, nothing is done.

Buttons at Bottom

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

Notes

1. When a Boxing Definition is applied on the Left side in the MTF of an **Apply MTF**, or the Left side in a **Boxing Many Function**, any *Right Side Interface* and *Copy to end of section* is ignored. Similarly, when a Boxing Definition is applied on the right side the MTF of an **Apply MTF**, or the Right side in a **Boxing Many Function**, any *Left Side Interface* and *Copy from start of section* is ignored.

   Hence a boxing definition can have all of *Left Side Interface, Copy from start of section and Right Side Interface, Copy to end of section* but which set is used depends on whether the boxing definition is used on the Left or the Right.

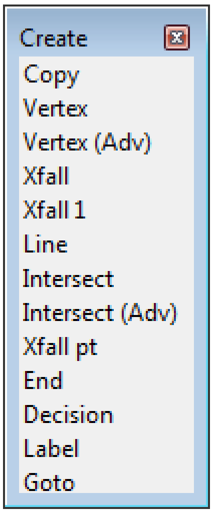
   In **Apply MTF**'s and **Boxing Many Function**s, if only the Left side boxing or only the Right side boxing exists, then the boxing for the entire design section can be created by just the Left/Right side boxing and then **all** of the *Left Side Interface* and the *Right Side Interface* is used.

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?

21.7.2.2 Commands for Boxing Rules Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

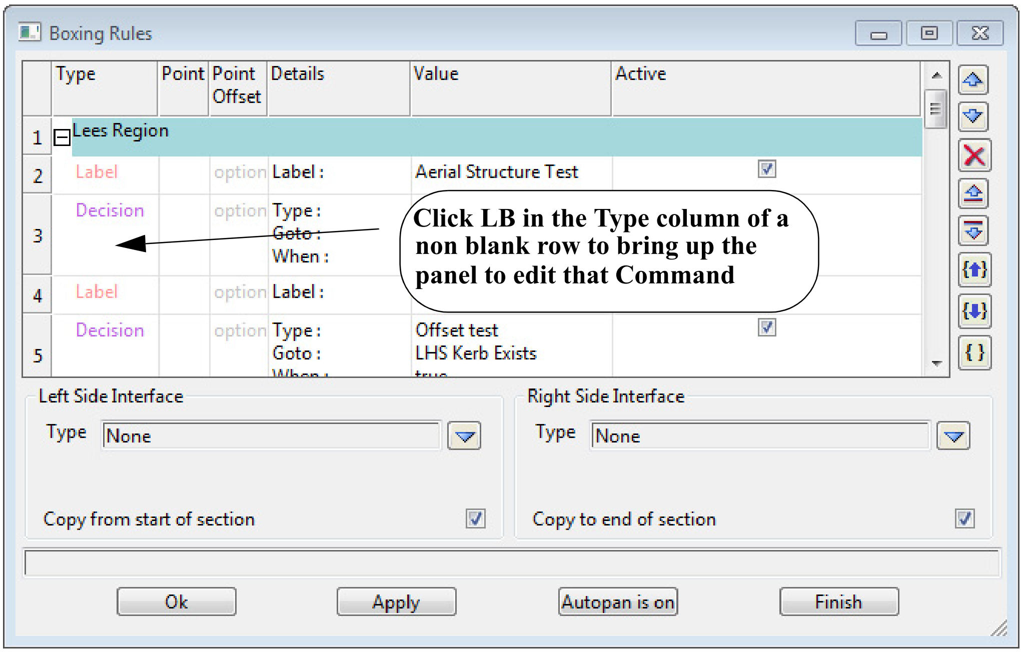
If the row of the grid is **empty**, clicking LB in the empty row will bring up the **Create** menu which contains all the available boxing commands.Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the **Create Rule** menu.



Selecting a menu item will bring up an associated panel which displays the information required for the boxing command.

When the panel is filled in and **OK** or **Apply** selected, the panel information is written out to the **command line** in the correct format for that boxing command.

If the row of the grid is **not empty** (and hence filled with a **command**) clicking LB in the **Type** column will bring up the associated panel for the boxing command. Note this may involve two clicks - one to highlight the **Type** column in a row and the second click to bring up the panel to edit that **Command**.



The information in the panel can be changed and if **OK** or **Apply** is selected, the modified panel information is written out to the row a a **command line**.

Each of the panels created by selecting a command from the **Create** menu, will now be described.

For

End 21.7.2.2.16 Boxing End

The text file format of all the Boxing Commands in the *Boxing* file is given in the section 21.10.2 Text Format of the Boxing File.

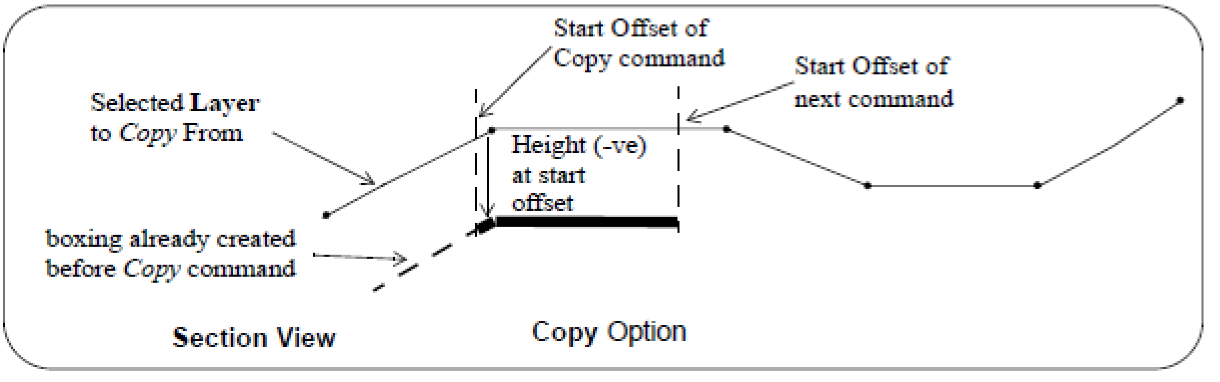
Go to the next section 21.7.2.2.1 Boxing Copy or return to 21.7.2.2 Commands for Boxing Rules Grid.

21.7.2.2.1 Boxing Copy

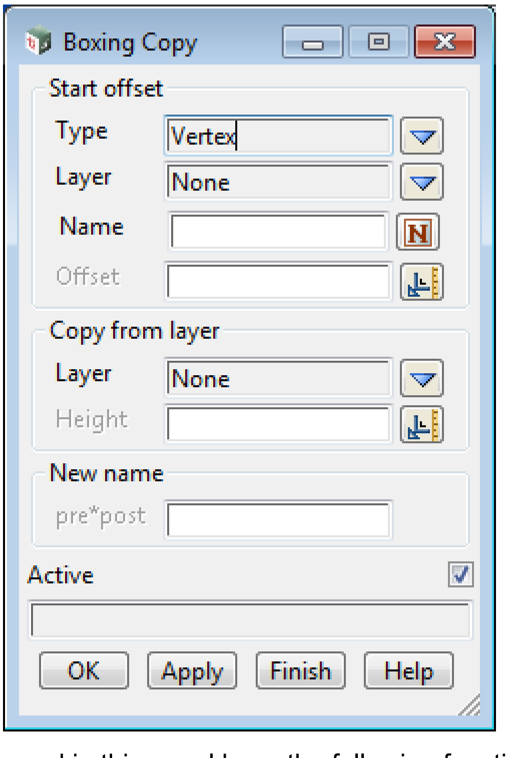
The *Copy* command copies part of the selected **Layer** from the **Start Offset** defined for the *Copy* command, to the **Start Offset of the *next* boxing command**.

The present slope of each segment is kept but the ***height of each segment is adjusted*** by a ***constant*** value provided by user.

Note: The height adjustment may be zero so that part of the selected **Layer** is copied as is.



Selecting **Copy** brings up the **Boxing Copy** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

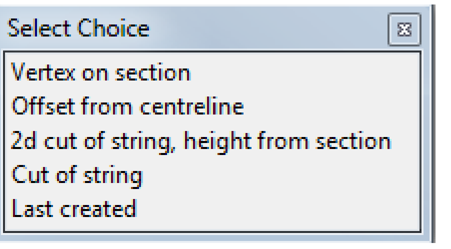
Start Offset

Start Offset defines where the Copy commands starts from.

If the 3d cut of string is used (Cut of string), the Z-Diff is used with **Height** *in determining how far the*

Layer is copied.

Type choice box



*For the documentation on the methods of defining the **Start Offset** except for* **Last created**, *see* 21.7.2.3 Defining Relative Offset for Boxing Commands

*If **Last created:***

*the Copy command starts at the Start Offset but for the boxing commands **Intersect** and **Intersect Adv**, the offset position for the vertex is calculated by intersection and its actual value may not be known.*

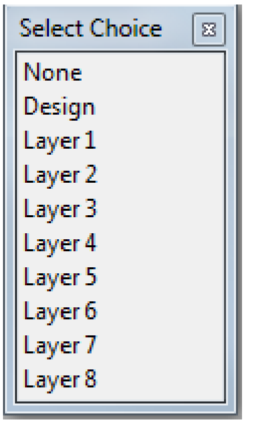
*So for **Last created**, the offset is the offset of the **last vertex** of the selected* **Layer**.

Offset real box 0

offset to add to the offset of the last vertex. **Offset** *can be positive or negative but the final Start Offset must still be on* **Layer**.

Copy from layer

Layer choice box



Height real box 0

*If Start Offset Type is NOT: **Cut of string:***

Height is added to the z-values of the part of the section of the Copy from layer **Layer** *being copied to give the z-values of the boxing. For example, if Height is -0.3, the part of the* Copy from layer **Layer** *being copied is dropped by 0.3*

*If Start Offset Type is: **Cut of string:***

At the plan cut of the string and the START OFFSET **Layer**, ***Z-Diff (****the difference of the z-values between the string and START OFFSET* **Layer*)*** *is calculated and* **Height** *added to it. This combined value is added to the z-values of the part of the COPY FROM LAYER* **Layer** *being copied, to give the z-values of the boxing*

New name

Pre*post text input

when part of a section is copied for the boxing, the vertices of the boxing are given names from either the vertices of the section, or the selected strings that are used in limiting the section, or a unique number not related to vertices or strings.

These constructed boxing vertex names are then modified by the text given in the **Pre*post** *field.*

*The text before the * is prepended to the vertex names, and the text after the * is postpended to the vertex names.*

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For the typed formats of the **Copy** and **Copy with height adjustment** commands created by this panel, see 21.10.2.1 Text Format - Boxing Copy and 21.10.2.2 Text Format - Boxing Copy with Height Adjustment.

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.2 Boxing Vertex or return to 21.7.2.2 Commands for Boxing Rules Grid.

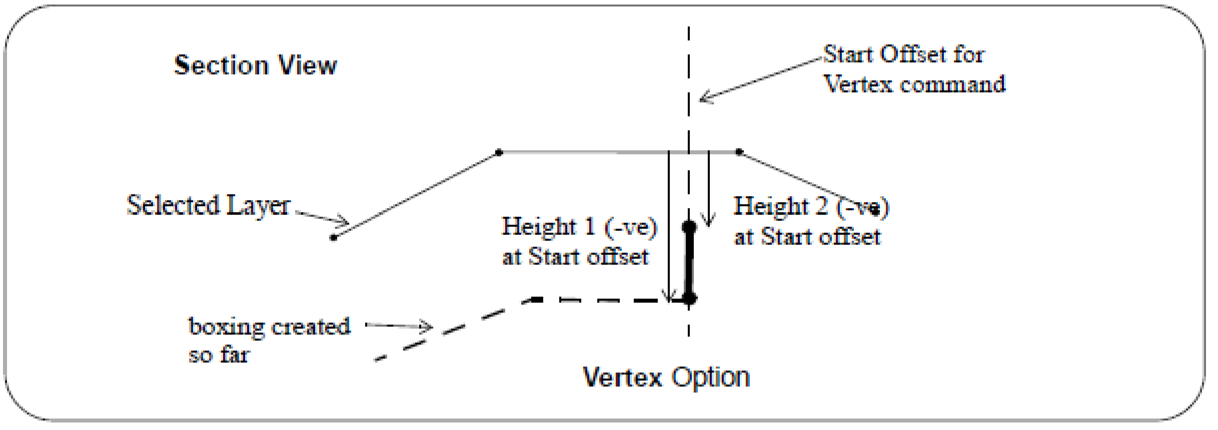
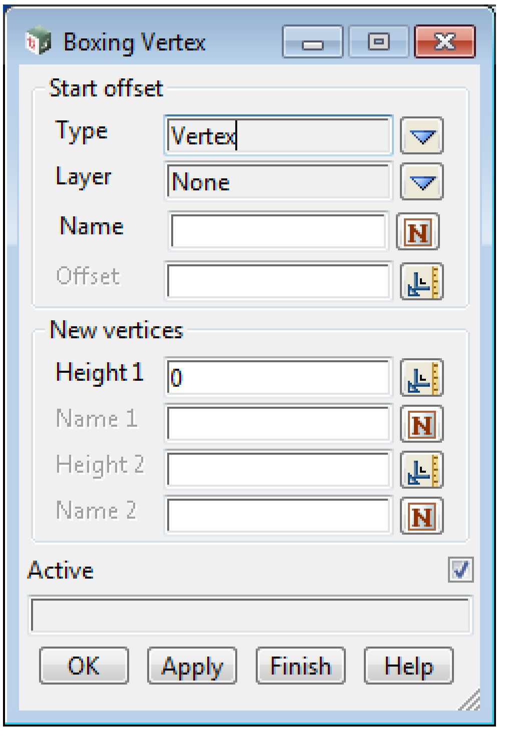
21.7.2.2.2 Boxing Vertex

The **Vertex** command inserts into the boxing section, one or two new vertices that are at the same *Start Offset*. So **Vertex** can be used to quickly create a vertical wall at a given *Start Offset*.

Note - to allow the boxing sections and strings to triangulate, ***12d Model*** increases the offset of the second vertex by ten thousandth of a unit.



Selecting **Vertex** brings up the **Boxing Vertex**



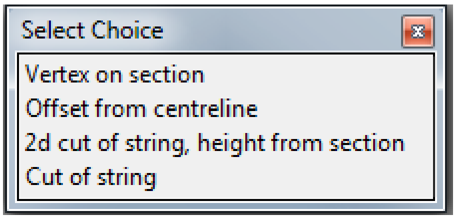
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Start Offset

Layer to use with **Offset** *to defined the Start Offset where the one or two vertices are created.*

Type choice box



*For the documentation on the methods of defining the **Start Offset,** see* 21.7.2.3 Defining Relative Offset for Boxing Commands

New vertices

Height 1 real box

*If Start Offset Type is NOT: **Cut of string:***

Height 1 is added to the z-value of the **Layer** *at the Start Offset to give the z-values of the new boxing vertex. For example, if Height 1 is -0.3, the vertex is dropped by 0.3 from* **Layer.**

*If Start Offset Type is: **Cut of string:***

At the plan cut of the string and **Layer**, ***Z-Diff*** *(the difference of the z-values between the string and the* **Layer)** *is calculated and **Height 1** added to it. This combined z-difference is added to z-value of the* **Layer** *at the **Start Offset** to give the z-value of the new boxing vertex.*

Name 1 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height using Type and Height 1.

If blank, a vertex is created with a default name.

Height 2 real box

*If Start Offset Type is NOT: **Cut of string:***

Height 2 is added to the z-value of the **Layer** *at the Start Offset to give the z-values of the new boxing vertex. For example, if Height 2 is -0.5, the vertex is dropped by 0.5 from* **Layer.**

*If Start Offset Type is: **Cut of string:***

At the plan cut of the string and **Layer**, ***Z-Diff*** *(the difference of z-values between the string and the* **Layer***) is calculated and **Height 2** added to it. This combined z-difference is added to z-value of the* **Layer** *at the **Start Offset** to give the z-value of the new boxing vertex.*

Name 2 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height using Type and Height 2.

If blank, no vertex is created.

Note - to allow the boxing sections and strings to triangulate, if two vertices are created, ***12d Model*** actually increases the offset of the second vertex by ten thousandth of a unit.

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no* ***recalc*** *is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

If the ***Boxing Definition*** *is being used in an* ***Apply MTF*** *and* ***Auto recalc*** *is ticked in the MTF, then whenever the* ***Apply*** *button is clicked, then a* ***recalc*** *of the associated* ***Apply MTF*** *for the MTF is done.*

If the ***Boxing Definition*** *is being used in a* ***Boxing Many Function*** *then whenever the* ***Apply*** *button is clicked, a* ***recalc*** *of the* ***Boxing Many Function*** *is done.*

For the typed format of the **Vertex** command created by this panel, see 21.10.2.3 Text Format - Boxing Vertex.

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.3 Boxing Vertex Advanced or return to 21.7.2.2 Commands for Boxing Rules Grid.

Section View

If **Hgt type** *is* ***Vertical****, the distance* **Height 1** *is taken from the point on the* **Layer** *at the Start Offset, and going vertically. For example, if Height 1 is -0.5, the vertex is dropped by 0.5 from* **Layer.**

If Start Offset Type is: ***Cut of string:***

??

Name 2 name box

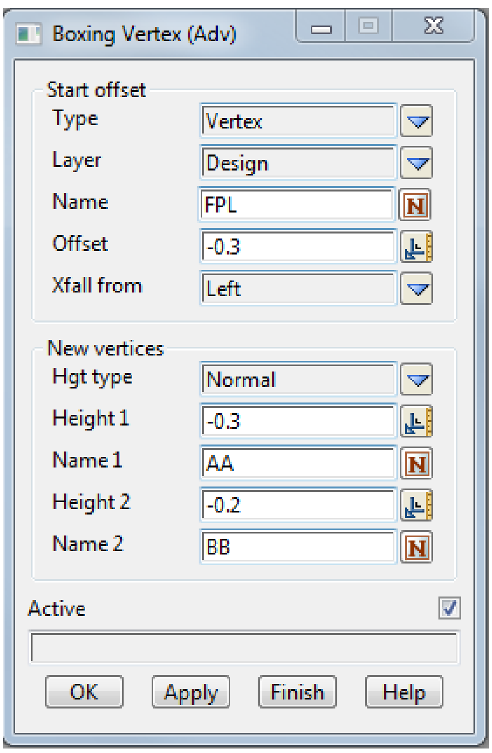
If blank, no vertex is created.

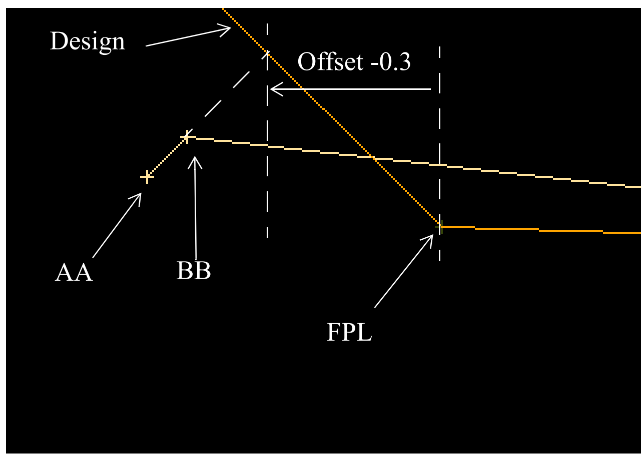
Height 2 real box

If Start Offset Type is NOT: ***Cut of string:***

If **Hgt type** *is* ***Normal****, the distance* **Height 2** *is taken from the point on the* **Layer** *at the Start Offset, and going out NORMAL to the segment specified by Start Offset and* **Xfall from**.

If **Hgt type** *is* ***Vertical****, the distance* **Height 2** *is taken from the point on the* **Layer** *at the Start Offset, and going vertically. For example, if Height 2 is -0.5, the vertex is dropped by 0.5 from* **Layer.**





Vertex (Adv) - Normal to Design Layer

Active tick box

if ***ticked****, use this Boxing Command.*
If ***not ticked****, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no* ***recalc*** *is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

If the ***Boxing Definition*** *is being used in an* ***Apply MTF*** *and* ***Auto recalc*** *is ticked in the MTF, then whenever the* ***Apply*** *button is clicked, then a* ***recalc*** *of the associated* ***Apply MTF*** *for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

Important Notes

1. the boxing vertices must be created from left to right so be careful that vertex Name 2 is no created to the left of vertex of Name 1. If it is then it will be move to be slightly to the right of vertex Name 1.
2. to allow the boxing sections and strings to triangulate, if two vertices are created that are on top of each other, ***12d Model*** actually increases the offset of the second vertex by ten thousandth of a unit.

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

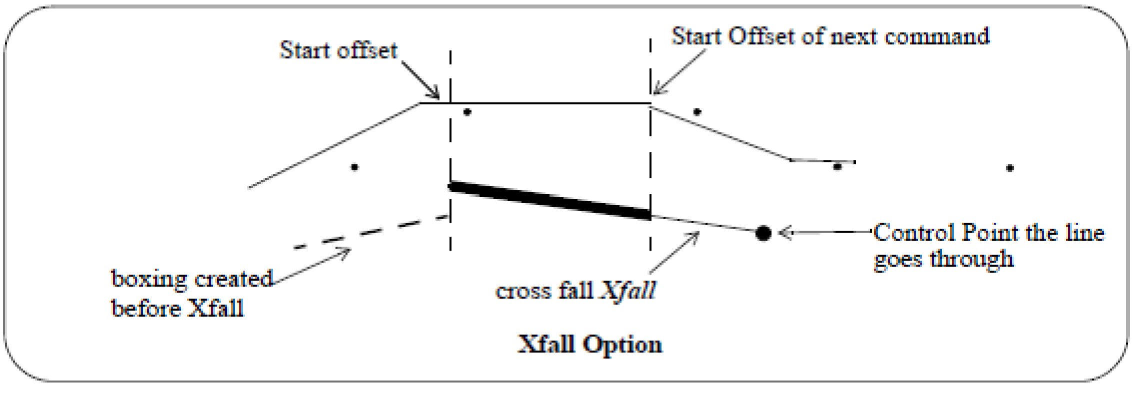
Go to the next section 21.7.2.2.4 Boxing Xfall - line through a point with a given crossfall or return to 21.7.2.2 Commands for Boxing Rules Grid.

21.7.2.2.4 Boxing Xfall - line through a point with a given crossfall

The Xfall command creates a link from the Start Offset to the Start Offset on the *next* boxing command, with a

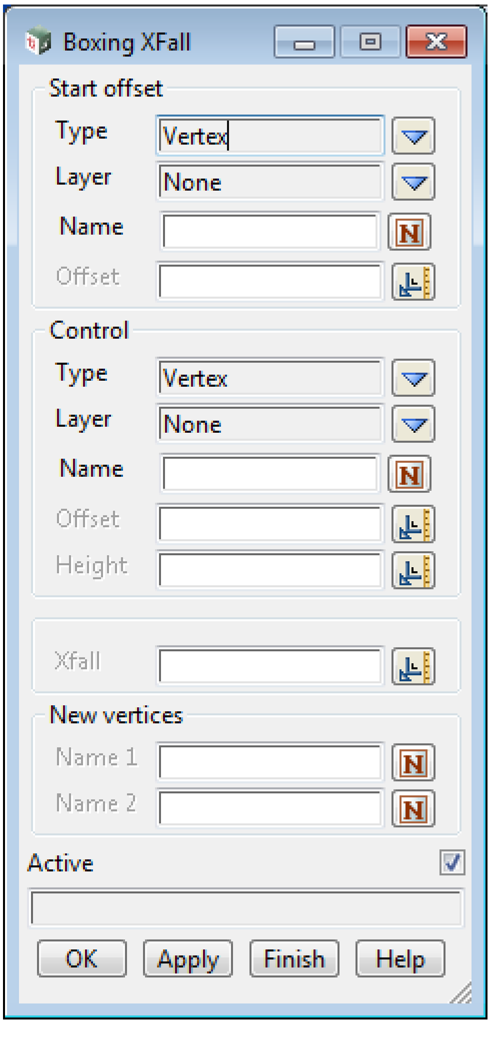
(a) user given cross fall (Xfall)

(b) start height given by projecting the line with a given xfall and going through a given control point, through to the Start Offset,



Xfall Option

Selecting **Xfall** brings up the **Boxing Xfall** panel



The fields and buttons used in this panel have the following functions.

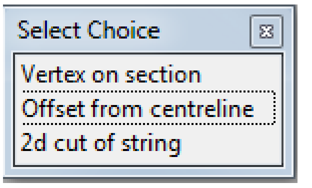
Field Description Type Defaults Pop-Up

Start Offset

Start Offset defines the offset where the new line starts from.

*For the **Xfall** command, the 3d cut of string is not needed. Only **2d cut of string** is required.*

Type choice box

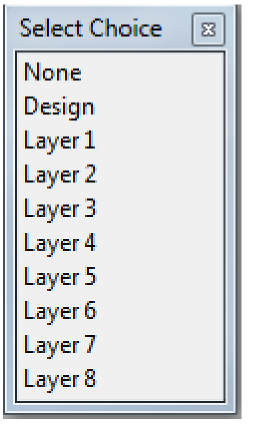


*For the documentation on the methods of defining the **Start Offset**, see* 21.7.2.3 Defining Relative Offset for Boxing Commands

Control

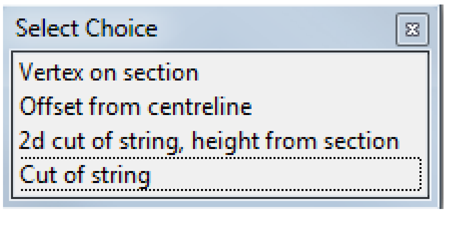
the definition of the Control Point that the line goes through.

Layer choice box



Layer to use with Control **Offset** *to define the offset of the Control Point.*

Type choice box



*If **Vertex on section**:*

Name name box

name of the vertex on the Control **Layer** *to use with* **Offset** *to defined the Control Offset. And used with* **Height** *to define the height of the Control Point*

Offset real box 0

this value is added to the offset of the vertex given in the **Name** *field to define the Control Offset.* **Offset** *can be positive or negative as long as the final Control Offset is still **on** the Control* **Layer**.

Height real box 0

Height is added to the z-value of the Control **Layer** *at the Control Offset to give the height of the Control Point.*

If ***Offset from centreline:***

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Control Offset. **Offset** *can be positive or negative as long as the Control Point is still on the Control* **Layer***.*

Height real box 0

Height is added to the z-value of the Control **Layer** *at the Control Offset to give the height of the Control Point.*

If ***2d cut of string, height from section:***

String string select

the selected string needs to cut the Control **Layer** *in plan wherever the boxing is being applied.*

The Control Offset is the offset of the plan cut of the selected string with the Control **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative as long as the final Control Offset is still on the Control* **Layer***.*

Offset real box 0

offset to add to the offset of the plan cut of the Control **Layer** *with the selected string to give the Start Offset.* **Offset** *can be positive or negative but the final Control Offset must still be on the Control* **Layer***.*

Height real box 0

Height is added to the z-value of the Control **Layer** *at the Control Offset to give the height of the Control Point.*

If ***Cut of string:***

String string select

the selected string needs to cut the Control **Layer** *in plan wherever the boxing is being applied.*

The Control Offset is the offset of the plan cut of the selected string with the Control **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative but the final position must still be on the Control* **Layer***.*

Offset real box 0

offset to add to the offset of the plan cut of the section with the selected string to give the Control Offset. **Offset** *can be positive or negative but the final Control Offset must still be on the section.*

Height real box 0

At the plan cut of the string and the Control **Layer***, the difference of the z-values between the string and the Control* **Layer** *is calculated and* **Height** *added to it. This combined value is added to the z-values on the Control* **Layer***, to give the z-value of the Control Point.*

Xfall input 0

xfall of the line going through the Control Point.

New vertices

Name 1 name box

if non blank, the vertex created at the Start Offset is given this name

If blank, the vertex created at the Start Offset is given a default name.

Name 2 name box

if non blank, the vertex created at the End Offset (the Start Offset of the next command) is given this name

If blank, the vertex created at the End Offset is given a default name.

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For the typed formats of the **Xfall** command created by this panel, see 21.10.2.5 Text Format - Boxing Xfall.

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.5 Boxing Xfall 1 - line through a point with a crossfall taken from a point or return to 21.7.2.2 Commands for Boxing Rules Grid.

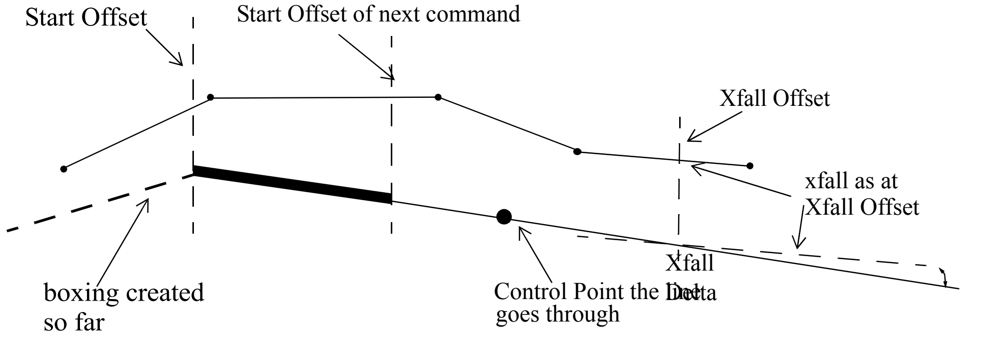
21.7.2.2.5 Boxing Xfall 1 - line through a point with a crossfall taken from a point

The **Xfall 1** command creates a link from the Start Offset, to the Start Offset on the *next* boxing command, with

(a) a Xfall which is the xfall at a given offset plus an additional xfall **Delta**

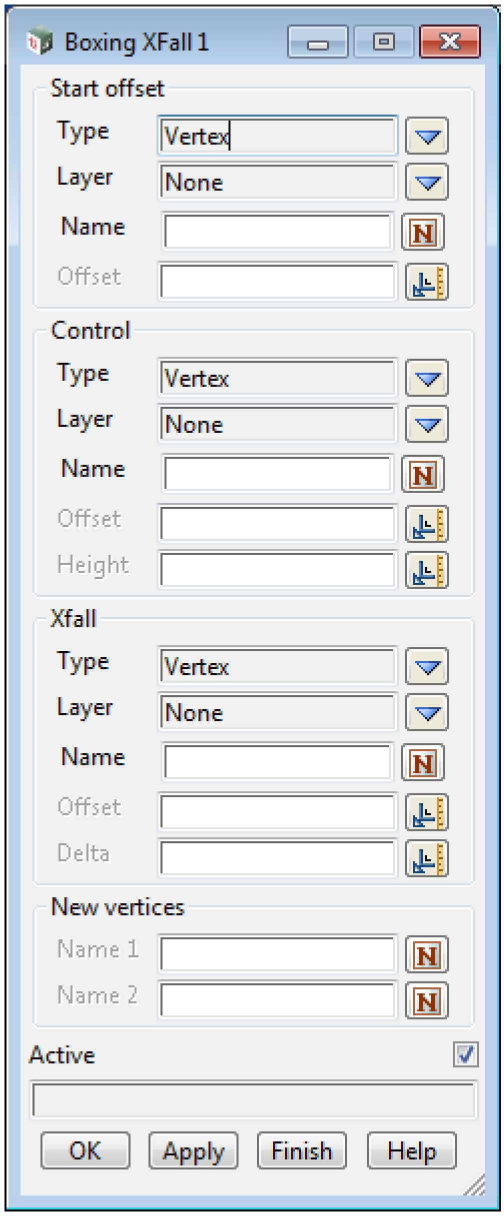
(b) a start height given by projecting to the Start Offset, the line with the specified Xfall and going through a given Control Point.



Section View **Xfall 1** Option

Note - the difference between the boxing commands ***Xfall*** and ***Xfall 1*** is that in the command **Xfall**, the user supplies the value of the xfall whereas in the command **Xfall 1**, the xfall is taken from a link on the Xfall **Layer**.

Selecting **Xfall 1** brings up the **Boxing Xfall 1** panel



The fields and buttons used in this panel have the following functions.

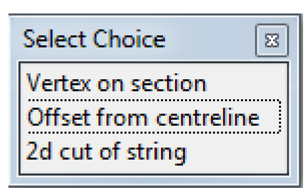
Field Description Type Defaults Pop-Up

Start offset

Start Offset defines the offset where the new line starts from.

*For the **Xfall 1** command, the 3d cut of string is not needed. Only **2d cut of string** is required.*

Type choice box

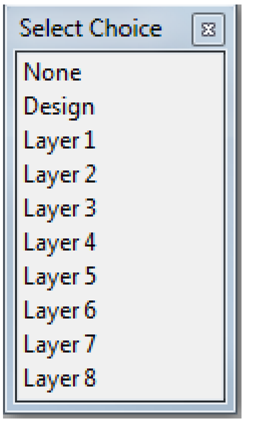


*For the documentation on the methods of defining the **Start Offset,** see* 21.7.2.3 Defining Relative Offset for Boxing Commands

Control

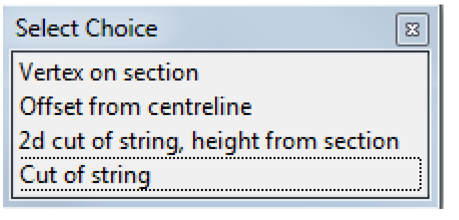
the definition of the Control Point for the line to go through.

Layer choice box



Layer to use with Control **Offset** *to define the offset of the Control Point.*

Type choice box



*If **Vertex on section**:*

Name name box

name of the vertex on the Control **Layer** *to use with* **Offset** *to defined the Control Offset. And used with* **Height** *to define the height of the Control Point*

Offset real box 0

this value is added to the offset of the vertex given in the **Name** *field to define the Control Offset.* **Offset** *can be positive or negative as long as the final Control Offset is still* ***on*** *the Control* **Layer**.

Height real box 0

Height is added to the z-value of the Control **Layer** *at the Control Offset to give the height of the Control Point.*

*If **Offset from centreline:***

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Control Offset. **Offset** *can be positive or negative as long as the Control Point is still on the Control* **Layer**.

Height real box 0

Height is added to the z-value of the Control **Layer** *at the Control Offset to give the height of the Control Point.*

*If **2d cut of string, height from section:***

String string select

the selected string needs to cut the Control **Layer** *in plan wherever the boxing is being applied.*

The Control Offset is the offset of the plan cut of the selected string with the Control **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative as long as the final Control Offset is still on the Control* **Layer***.*

Offset real box 0

offset to add to the offset of the plan cut of the Control **Layer** *with the selected string to give the Start Offset.* **Offset** *can be positive or negative but the final Control Offset must still be on the Control* **Layer***.*

Height real box 0

Height is added to the z-value of the Control **Layer** *at the Control Offset to give the height of the Control Point.*

If ***Cut of string:***

String string select

the selected string needs to cut the Control **Layer** *in plan wherever the boxing is being applied.*

The Control Offset is the offset of the plan cut of the selected string with the Control **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative but the final position must still be on the Control* **Layer***.*

Offset real box 0

offset to add to the offset of the plan cut of the section with the selected string to give the Control Offset. **Offset** *can be positive or negative but the final Control Offset must still be on the section.*

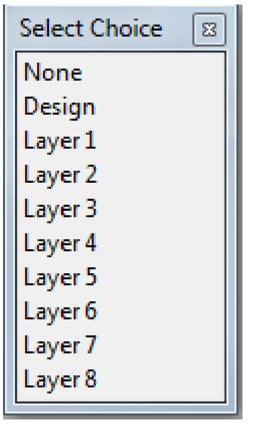
Height real box 0

At the plan cut of the string and the Control **Layer***, the difference of the z-values between the string and the Control* **Layer** *is calculated and* **Height** *added to it. This combined value is added to the z-values on the Control* **Layer***, to give the z-value of the Control Point.*

Xfall

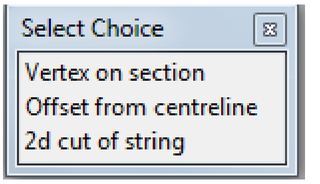
the xfall of the line going through the Control Point is:
the xfall of the Xfall **Layer** *at Xfall Offset, plus the value* **Delta***.*

Layer choice box



Layer to use with **Offset** *to defined the Xfall*

Type choice box



*If **Vertex on section**:*

Name name box

name of the vertex on Xfall **Layer** *to use with* **Offset** *to define the Xfall Offset.*

Offset real box

this value is added to the offset of the vertex given in the **Name** *field to define the Xfall Offset.* **Offset** *can be positive or negative as long as the final Xfall Offset is still **on** the Xfall* **Layer**.

Delta real box

the Xfall of the line is the xfall of the Xfall **Layer** *at Xfall Offset plus* **Delta**

*If **Offset from centreline:***

Offset real box

an actual offset from centreline (actually just the chainage of the section) which is used as the Xfall Offset. **Offset** *can be positive or negative as long as it is still on the Xfall* **Layer**.

Delta real box

the Xfall of the line is the xfall of the segment of Xfall **Layer** *at Xfall Offset plus* **Delta**

*If **2d cut of string:***

String string select

the selected string needs to cut the Xfall **Layer** *in plan wherever the boxing is being applied.*

The Xfall Offset is the offset of the plan cut of the selected string with the Xfall **Layer**, *plus the* **Offset** *value.* **Offset** *can be positive or negative but the final position Xfall Offset must still be on the Xfall* **Layer**.

Offset real box

offset to add to the offset of the plan cut of the Xfall **Layer** *with the selected string to give the Xfall Offset.* **Offset** *can be positive or negative but the final Xfall Offset must still be on the Xfall* **Layer**.

Delta real box

the Xfall of the line is the xfall of the segment of Xfall **Layer** *at Xfall Offset plus* **Delta.**

New vertices

21.7.2.2.6 Boxing Line - line through two points

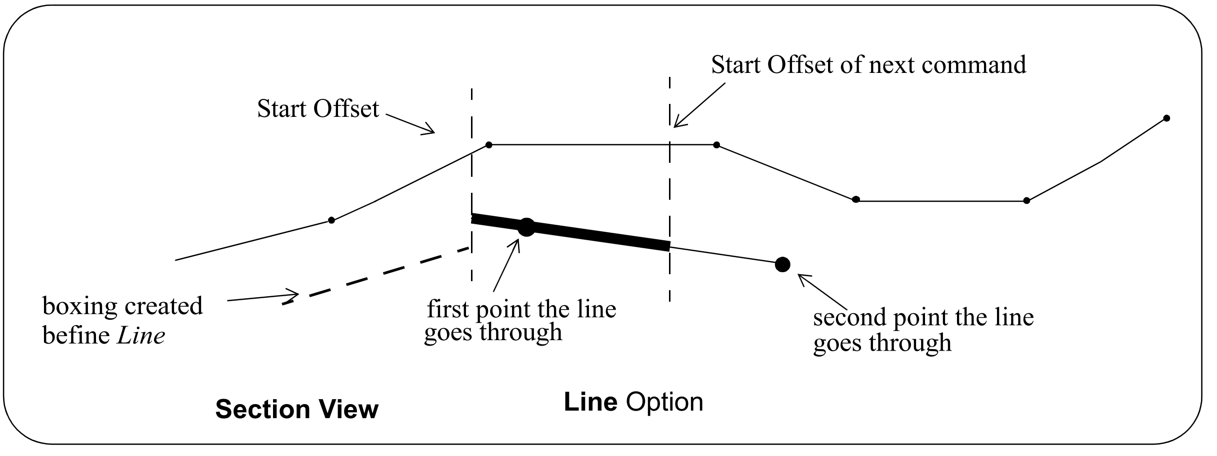
The Line command creates a line from the Start Offset to the Start Offset of the *next* boxing command, with a

(a) slope given by two points

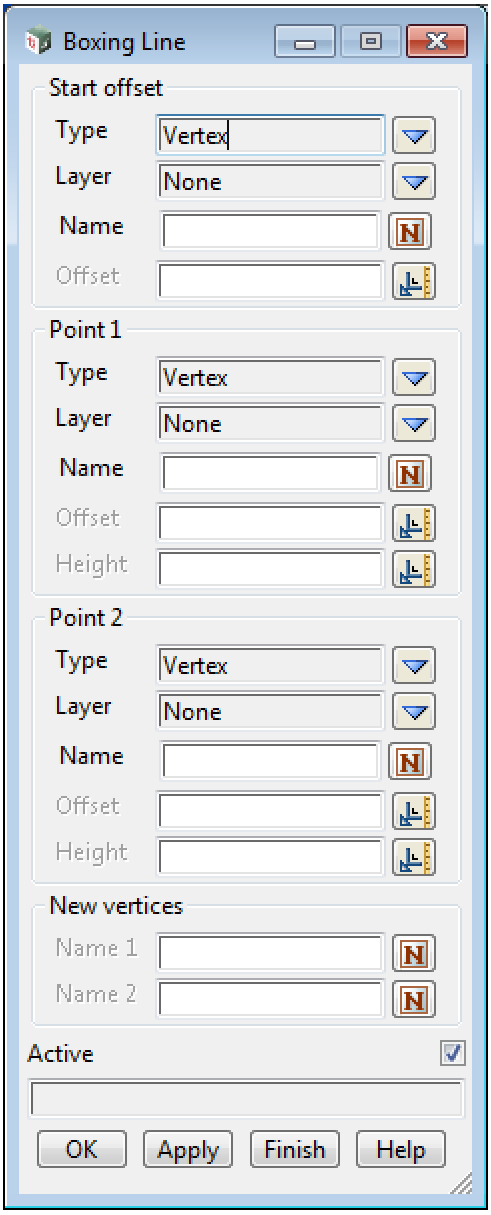
(b) start height given by projecting to the Start Offset, the line through the two points.

The first point defining the line has the offset **Point 1 Offset** which may be given in terms of a Vertex, or Cut with a string, and a height given by the height of a selected Layer, or at the Cut string, plus a given **Height**.

The second point defining the line has the offset **Point 2 Offset** which may be given in terms of a Vertex, or Cut with a string, and a height given by the height of a selected Layer, or at the Cut string, plus a given **Height**.



Selecting **Line** brings up the **Boxing Line** panel



The fields and buttons used in this panel have the following functions.

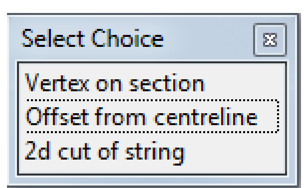
Field Description Type Defaults Pop-Up

Start offset

Start Offset defines the offset where the new line starts from.

*For the **Line** command, the 3d cut of string is not needed. Only **2d cut of string** is required.*

Type choice box

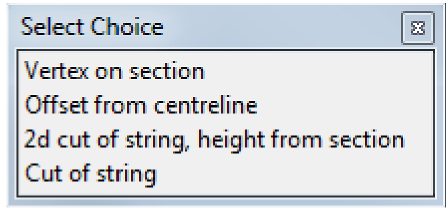


*For the documentation on the methods of defining the **Start Offset**, see* 21.7.2.3 Defining Relative Offset for Boxing Commands

Point 1

the definition of the first point that the line goes through.

Type choice box



For the documentation on the methods of defining the Point 1 Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands

*If **Vertex on section**:*

Height real box 0

Height is added to the z-value on the **Layer** *at the **Point 1 Offset** to give the height of Point 1.*

*If **Offset from centreline:***

Height real box 0

Height is added to the z-value on the **Layer** *at the **Point 1 Offset** to give the height of Point 1.*

*If **2d cut of string, height from section:***

Height real box 0

Height is added to the z-value on the **Layer** *at the **Point 1 Offset** to give the height of Point 1.*

*If **Cut of string:***

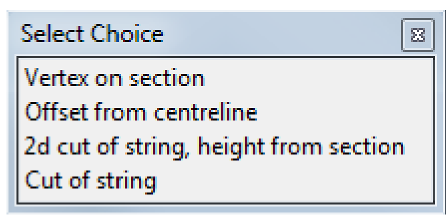
Height real box 0

Height is added to the z-value of the cut string to give the z-value of Point 1.

Point 2

the definition of the second point that the line goes through.

Type choice box



*For the documentation on the methods of defining the **Point 2 Offset,** see* 21.7.2.3 Defining Relative Offset for Boxing Commands

*If **Vertex on section**:*

Height real box 0

Height is added to the z-value on the **Layer** *at the Point 2 Offset to give the height of Point 2.*

*If **Offset from centreline:***

Height real box 0

Height is added to the z-value of the **Layer** *at the Point 2 Offset to give the height of Point 2.*

*If **2d cut of string, height from section:***

Height real box 0

Height is added to the z-value on the **Layer** *at the Point 2 Offset to give the height of Point 2.*

*If **Cut of string:***

Height real box 0

Height is added to the z-value of the cut string to give the z-value of Point 2.

New Vertices

Name 1 name box

if non blank, the vertex created at the Start Offset is given this name

If blank, the vertex created at the Start Offset is given a default name.

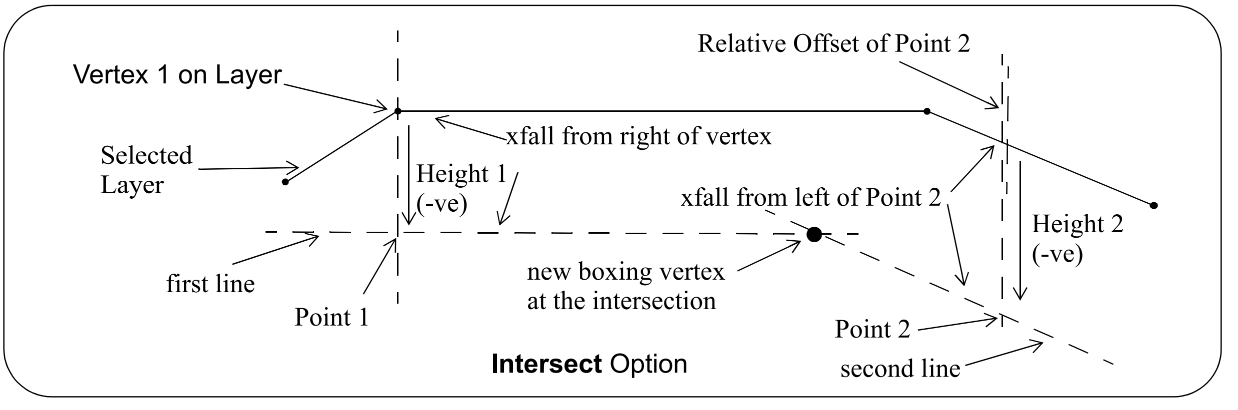
21.7.2.2.7 Boxing Intersect - Intersection of Two Lines

The **Intersect** command creates a vertex on the boxing section that is the **intersection** of two lines.

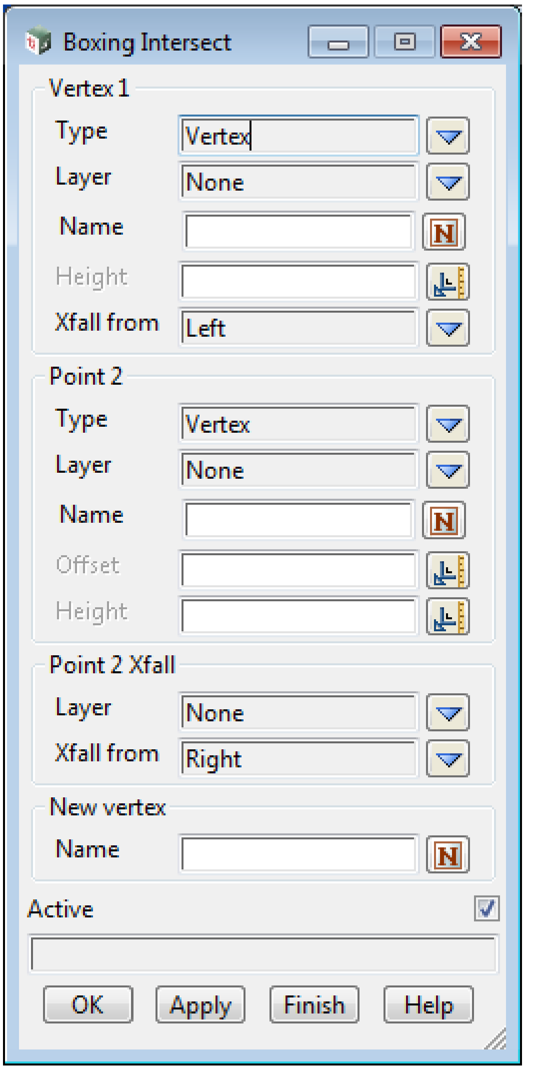
The first line goes through Point 1 where the offset for Point 1 is the offset of a vertex from a Layer, and the height at Point 1 is the height on the vertex plus of a given **Height**. The **xfall** of the line is taken from the Layer segment to either the Left or Right of the selected vertex.

The second line goes through Point 2 where the offset for Point 2 is a relative offset to a vertex or a selected string, and the height at Point 2 is either the height on the Layer section plus a given **Height**, or the height at the cut string, with the addition of a given **Height**. The **Xfall** of the line is taken from the Layer segment to either the Left or Right of the relative offset of Point 2.

A new boxing vertex is created at the intersection of the two lines.



Selecting **Intersect** brings up the **Boxing Intersect** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

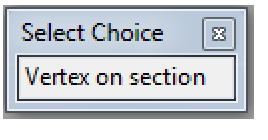
Vertex 1

the definition of the point that the first line goes through. The point must be vertically over a vertex from a Layer

Layer choice box Design, Layer 1 ... Layer 8

Layer to select the vertex from to define the offset of the point the first line goes through.

Type choice box



If ***Vertex on section****:*

Name name box

name of the vertex on **Layer** *to use with* **Height** *to defined the offset and height for point that the first line goes through*

Height real box

Height is added to the z-value of the selected vertex to give the point the first line goes through.

Xfall from choice box Left, Right

if Left, the xfall for the line is taken from the segment that is a little left of the selected vertex.

If Right, the xfall for the line is taken from the segment that is a little right of the selected vertex

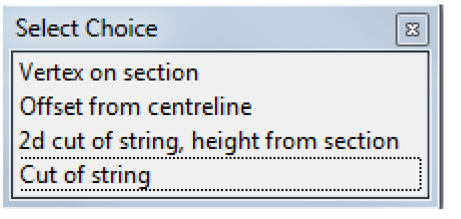
Point 2

the definition of the point that the second line goes through

Layer choice box Design, Layer 1 ... Layer 8

Layer to select the vertex from to define the offset of the point the second line goes through.

Type choice box



If ***Vertex on section****:*

Name name box

name of the vertex on the cross section to use with **Offset** *to defined the Point 2 Offset. And used with* **Height** *to define the height of the Point 2.*

Offset real box 0

this value is added to the offset of the vertex given in the **Name** *field to define the Point 2 Offset.* **Offset** *can be positive or negative as long as the final Point 2 Offset is still* ***on*** *the section.*

Height real box 0

Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

If ***Offset from centreline:***

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Point 2 Offset. **Offset** *can be positive or negative as long as the Point 2 Offset is still on the section.*

Height real box 0

Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

If ***2d cut of string, height from section:***

String string select

the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** *value.* **Offset** *can be positive or negative as long as the final Point 2 Offset is still on the section.*

Offset real box 0

this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. **Offset** *can be positive or negative but the final Point 2 Offset must still be on the section.*

Height real box 0

Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

*If **Cut of string:***

String string select

the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** *value.* **Offset** *can be positive or negative but the final position must still be on the section.*

Offset real box 0

this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. **Offset** *can be positive or negative but the final Point 2 Offset must still be on the section.*

Height real box 0

Height is added to the z-value of the cut string to give the z-value of Point 2.

Point 2 Xfall

the definition of xfall of the second line

Layer choice box Design, Layer 1 ... Layer 8

Layer to select the vertex from to define the offset of the point the second line goes through.

Xfall from choice box Left, Right

if Left, the xfall of the second line is taken from the segment that is a little to the left of the relative offset.

If Right, the xfall of the second line is taken from the segment that is a little to the right of the relative offset

New vertex

a new vertex is created at the intersection of the two lines

Name name box

the vertex created at the intersection of the two lines is given this name

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

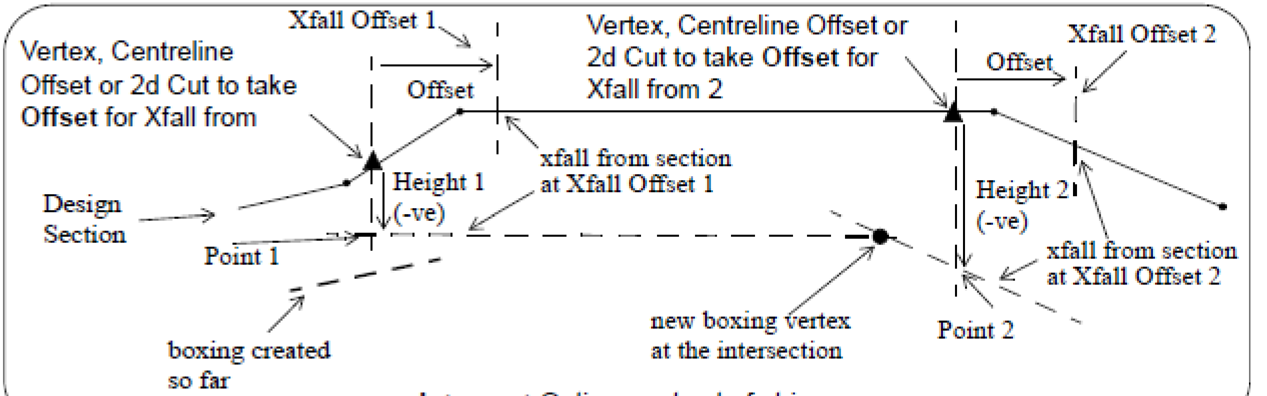
For the typed format of the **intersect** command created by this panel, see 21.10.2.7 Text Format

- Boxing Intersect.

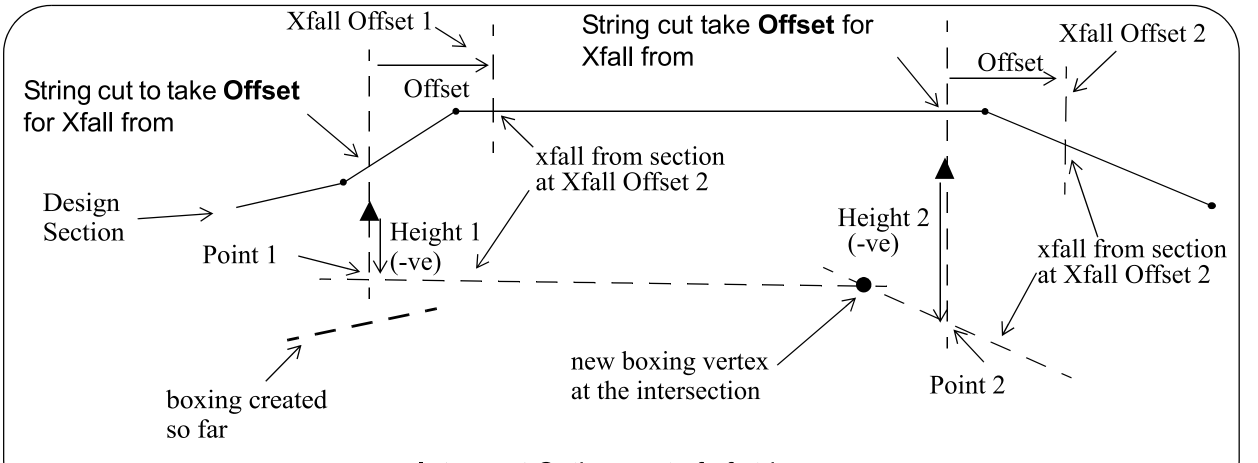
For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.8 Boxing Intersect Advanced or return to 21.7.2.2 Commands for Boxing Rules Grid.

Intersect diagrams for more methods of defining *Offsets*:



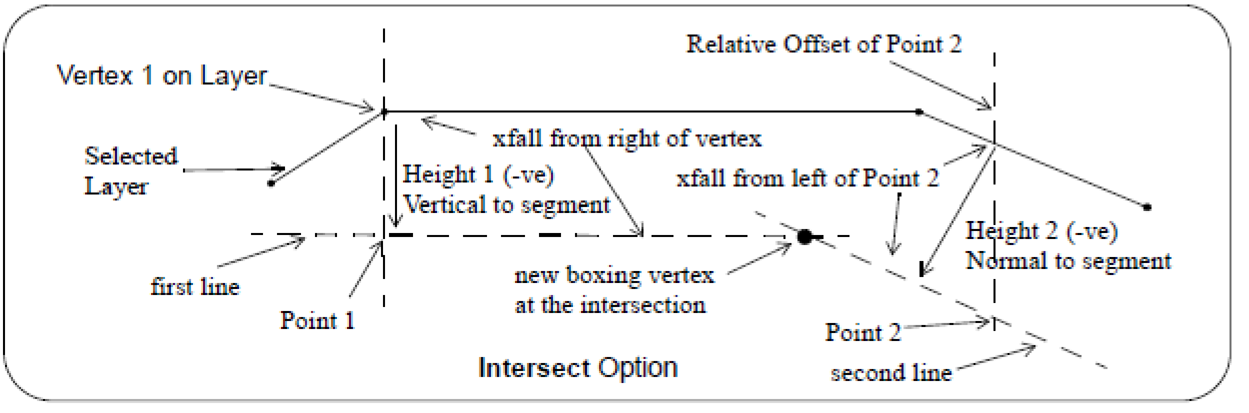
Intersect Option - not cut of string



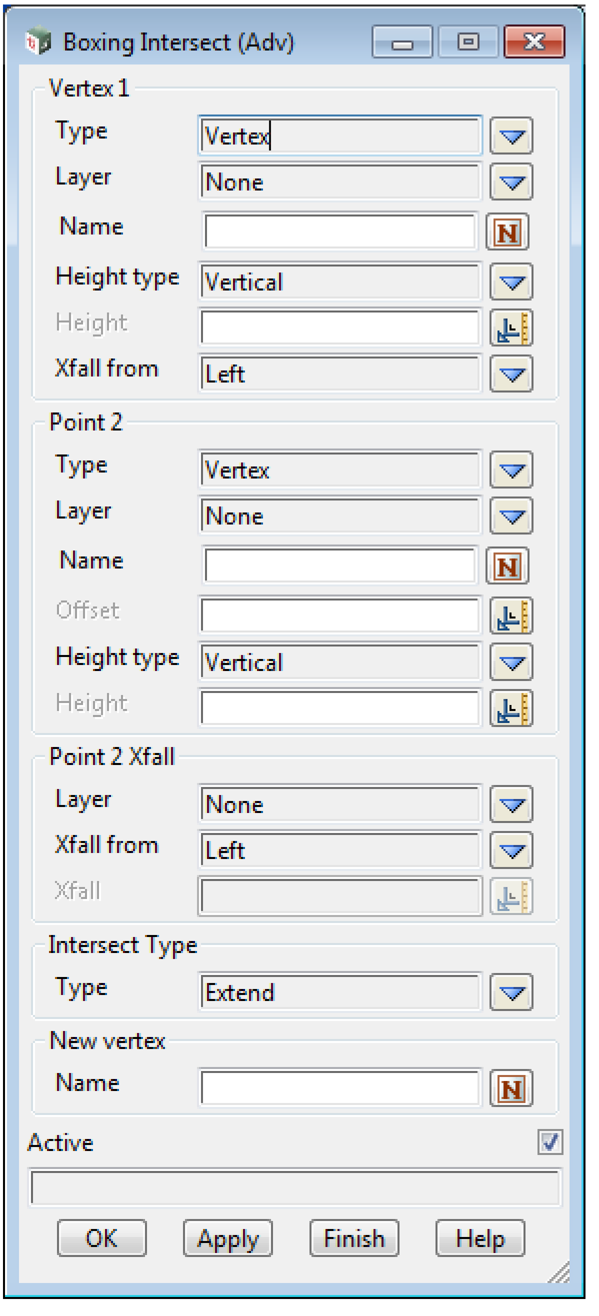
Intersect Option - cut of of strings

21.7.2.2.8 Boxing Intersect Advanced

The **Intersect Advanced** command is similar to the **Intersect** command where a vertex on the boxing section is the intersection of two lines. The major difference is that the distance of the lines from vertices etc can be measured NORMAL to a segment, not just a vertical distance (See 21.7.2.2.7 Boxing Intersect - Intersection of Two Lines).



Selecting **Intersect (Adv)** brings up the **Boxing Intersect (Adv)** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

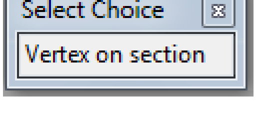
Vertex 1

the definition of the point that the first line goes through. The point can be normal to a segment left or right of a vertex from a Layer.

Layer - after Type	choice box		Design, Layer 1 ... Layer 8

Layer to select the vertex from to define the offset of the point the first line goes through.

Type	choice box		



*If **Vertex on section**:*

Name name box

name of the vertex on **Layer** *to use with* **Type**, **Xfall from**, **Height type** *and* **Height** *to define the offset and height for point that the first line goes through*

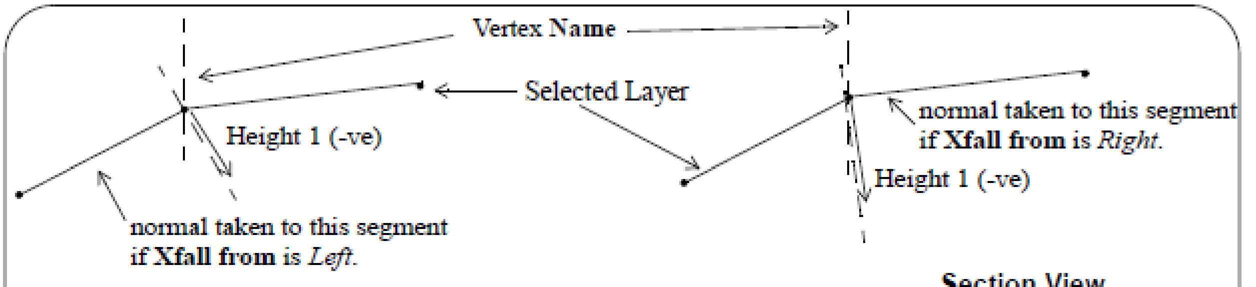
Height type choice box Vertical, Normal

When **Height type** *is Normal, the distance is measured NORMAL to a segment.*

If **Xfall from** *is Left, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the left of* **Name**.

If **Xfall from** *is Right, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the right of* **Name**.

When **Height type** *is Vertical, the distance is measured in the vertical plane and* **Xfall from** *is not used. For example, if Height is -0.5, the vertex is dropped by 0.5 from* **Layer**



Vertex Advanced Option - Normal

Height real box

depending on **Height type**, *Height is added to added vertically or normally to give the z-value of the point the first line goes through.*

Xfall from choice box Left, Right

if Left, the xfall for the line is taken from the segment that is a little left of the selected vertex.

If Right, the xfall for the line is taken from the segment that is a little right of the selected vertex

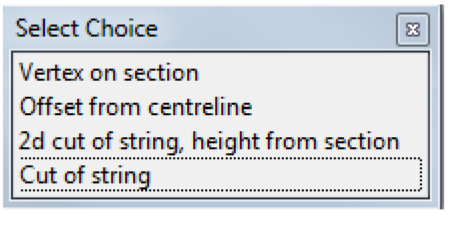
Point 2

the definition of the point that the second line goes through.

Layer choice box Design, Layer 1 ... Layer 8

Layer to select in defining the offset of the point the second line goes through. The point can be normal to a segment left or right of the relative offset from Layer.

Type choice box



*If **Vertex on section**:*

Name name box

name of the vertex on the cross section to use with **Offset** *to defined the Point 2 Offset. And used with* **Height type** *and* **Height** *to define the height of Point 2.*

Offset real box 0

this value is added to the offset of the vertex given in the **Name** *field to define the Point 2 Offset.* **Offset** *can be positive or negative as long as the final Point 2 Offset is still* ***on*** *the section.*

If ***Offset from centreline:***

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Point 2 Offset. **Offset** *can be positive or negative as long as the Point 2 Offset is still on the section.*

If ***2d cut of string, height from section:***

String string select

the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** *value.* **Offset** *can be positive or negative as long as the final Point 2 Offset is still on the section.*

Offset real box 0

this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. **Offset** *can be positive or negative but the final Point 2 Offset must still be on the section.*

If ***Cut of string:***

String string select

the selected string needs to cut the sections in plan wherever the boxing is being applied.

The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** *value.* **Offset** *can be positive or negative but the final position must still be on the section.*

Offset real box 0

this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. **Offset** *can be positive or negative but the final Point 2 Offset must still be on the section.*

Height type choice box Vertical, Normal

When **Height type** *is Normal, the distance is measured NORMAL to a segment.*

If **Xfall from** *is Left, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the left of the Point 2 offset.*

If **Xfall from** *is Right, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the right of the Point 2 offset.*

When **Height type** *is Vertical, the distance is measured in the vertical plane and* **Xfall from** *is not used. For example, if Height is -0.5, the vertex is dropped by 0.5 from* **Layer**

Height real box 0

depending on **Height type**, **Height** *is added vertically or normally to give the z-value of the point the second line goes through.*

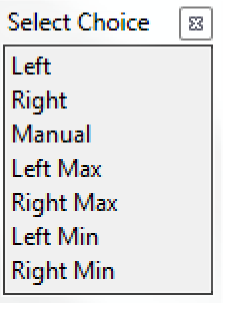
Point 2 Xfall

the definition of xfall of the second line. The xfall comes from the segment in the elected Layer slightly to the left or right of the Point 2 offset

Layer choice box Design, Layer 1 ... Layer 8

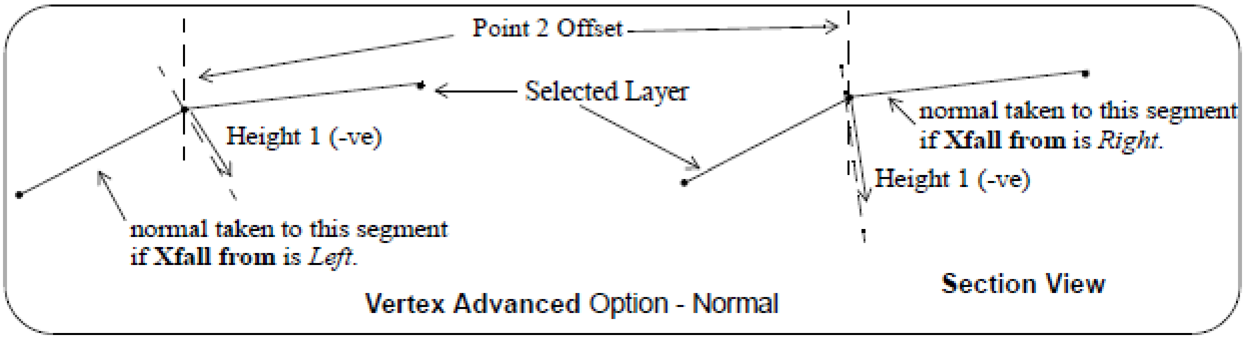
Layer to select the xfall from for the second line.

Xfall from choice box



if Left, the xfall of the second line is taken from the segment that is a little to the left of Point 2 Offset.

If Right, the xfall of the second line is taken from the segment that is a little to the right of Point 2 Offset.



If Manual, the xfall is taken from the **Xfall** *field.*

If Left Max, the xfall on the left side of Point 2 will never exceed the value in the **Xfall** *field. If the xfall is greater than the value in* **Xfall** *field then the xfall takes the value in the* **Xfall** *field.*

If Right Max, the xfall on the right side of Point 2 will never exceed the value in the **Xfall** *field. If the xfall is greater than the value in* **Xfall** *field then the xfall takes the value in the* **Xfall** *field.*

If Left Min, the xfall on the left side of Point 2 will never be less than the value in the **Xfall** *field. If the xfall is less than the value in* **Xfall** *field then the xfall takes the value in the* **Xfall** *field.*

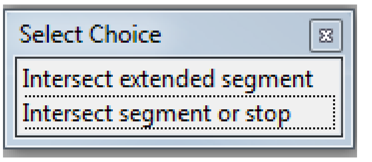
If Right Min, the xfall on the right side of Point 2 will never be less than the value in the **Xfall** *field. If the xfall is less than the value in* **Xfall** *field then the xfall takes the value in the* **Xfall** *field.*

For example, to force a crown in the subgrade no matter what the super elevation of the road is, you would use Left Min on the left hand side of the road and Right Max on the right side of the road.

Intersection Type

the definition of xfall of the second line. The xfall comes from the segment in the elected Layer slightly to the left or right of the Point 2 offset

Type choice box



*if **Intersect extended segment**,*

*If **Intersect segment stop**,*

New vertex

a new vertex is created at the intersection of the two lines

Name name box

the vertex created at the intersection of the two lines is given this name

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

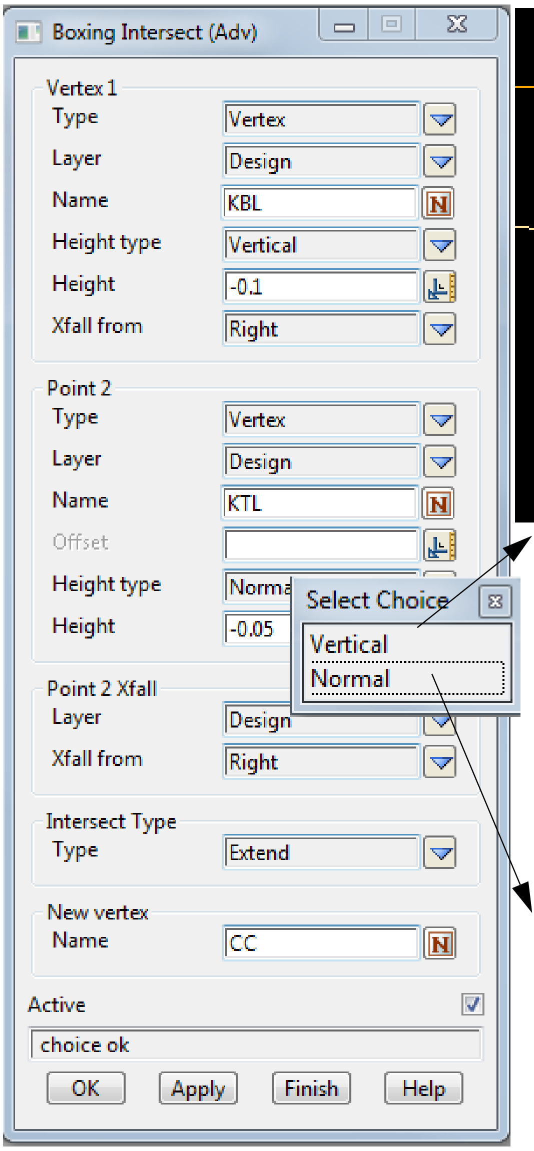
OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

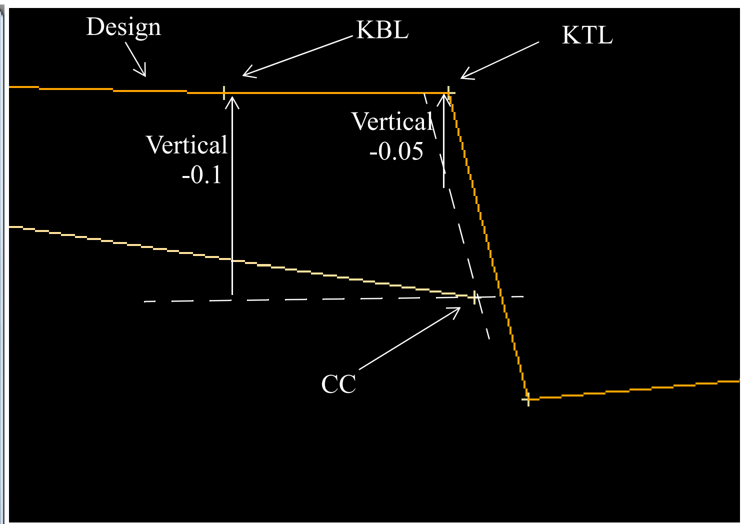
Apply button

Apply *stores the values and leaves the panel on the screen.*

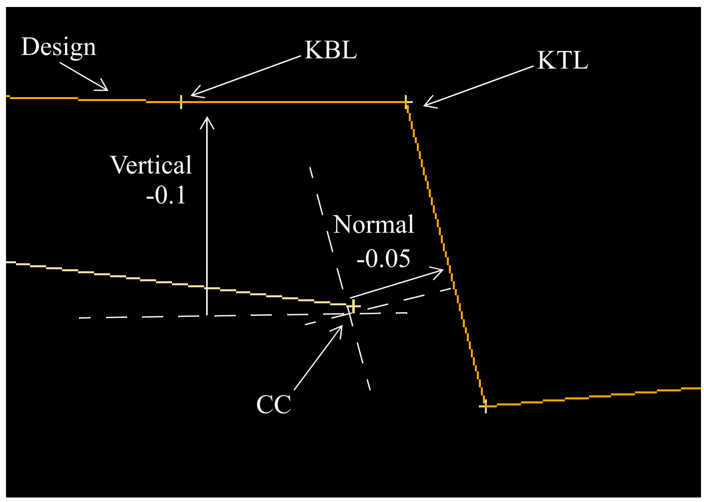
*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*





Intersect (Adv) - Point 2 Vertical to Design Layer



Intersect (Adv) - Point 2 Normal to Design Layer

For the typed format of the **intersect Advanced** command created by this panel, see 21.10.2.7 Text Format - Boxing Intersect.

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.9 Boxing Xfall Point or return to 21.7.2.2 Commands for Boxing Rules Grid.

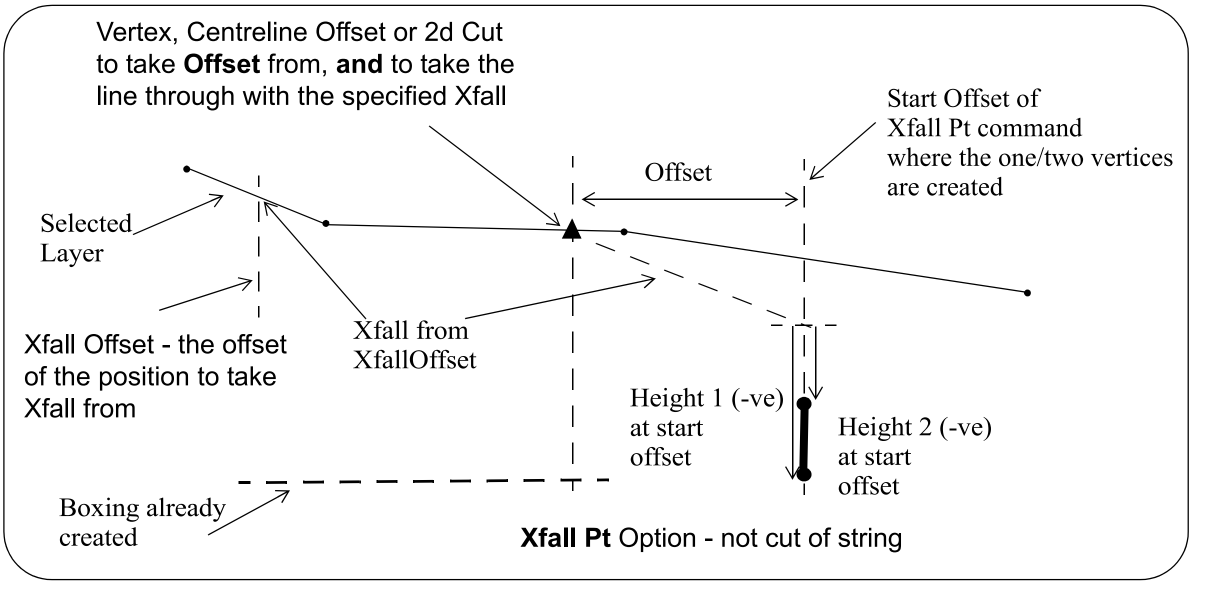
21.7.2.2.9 Boxing Xfall Point

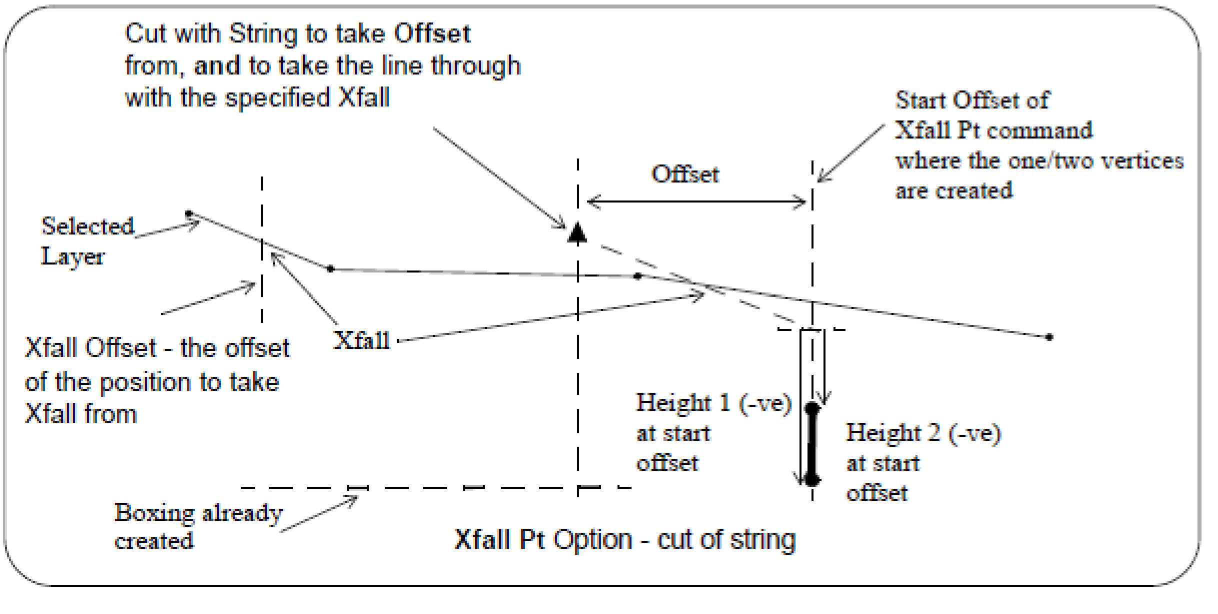
The **Xfall Pt** command is similar to the **Vertex** command in that it inserts one or two new vertices at the given Start *Offset*.

However, instead of adjusting the height from the z-value of the Layer, the ***Xfall Pt*** command extrapolates from the z-value of the selected Layer or 2d cut with a selected string (depending on Type) using the Xfall at the Xfall Offset given in the ***Xfall Pt*** command.

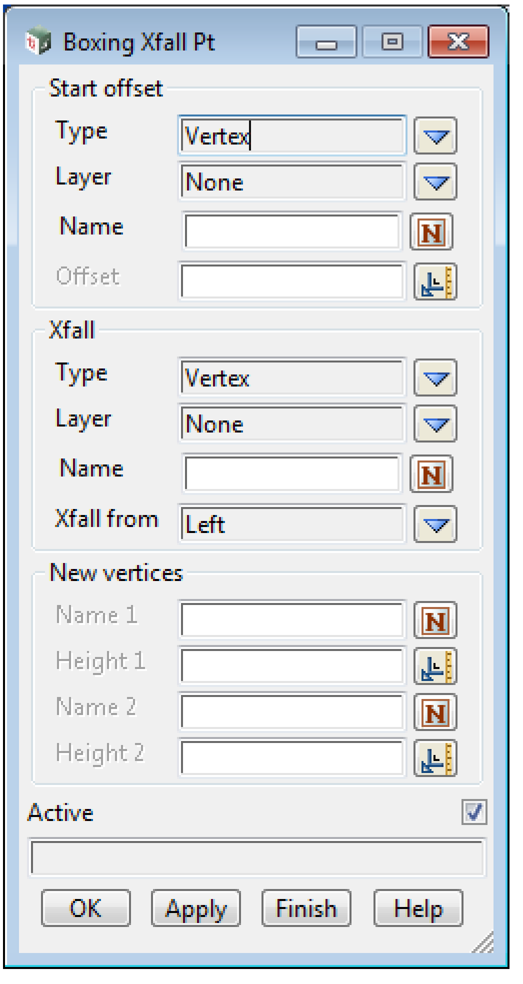
Like **Vertex**, **Xfall Pt** can be used to quickly create a vertical wall of two vertices.

Note - to allow the boxing sections and strings to triangulate, ***12d Model*** increases the offset of the second vertex by ten thousandth of a unit.





Selecting **Xfall pt** brings up the **Boxing Xfall Pt** panel



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

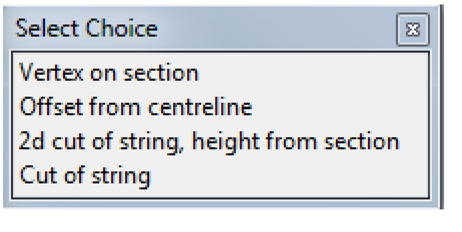
Start offset

Start Offset defines the vertex, plan cut or cut string to define where the grade line start goes through, and then the Offset defines where the line is projected to and creates the one or two new vertices.

Layer - after Type choice box None, Design, Layer 1 ... Layer 8

Layer to use with **Type** *to select the point the line goes through, and for how far.*

Type choice box



*If **Vertex on section**:*

Name name box

name of the vertex on the given **Layer** *that the line will go though. The line will have xfall given in the **Xfall** section.* **Offset** *is added to the offset of the vertex to defined the Start Offset, and the line is extended thought the vertex to Start Offset.*

Height 1/Height 2 *are then used with the projected point to define the heights of the new boxing* *vertices.*

Offset real box 0

this value is added to the offset of the vertex given in the **Name** *field to define the Start Offset.* **Offset** *can be positive or negative as long as the final Start Offset is still* ***on*** *the section.*

Height 1/Height 2 real box 0

Height 1/Height 2 is added to the z-value of the line that is extended to Start Offset to give the z-values of the new boxing vertices.

*If **Offset from centreline:***

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Start Offset. **Offset** *can be positive or negative as long as it is still on the section.*

*If **Offset from centreline is used**, the* **Xfall** *section is not used.*

Height 1/Height 2 real box 0

Height 1/Height 2 is added to the z-value of the section at the Start Offset, to give the z-values of the new boxing vertices. For example, if Height is -0.3, the vertex is dropped by 0.3

*If **2d Cut of string, height from section:***

String string select

The Start Offset is the offset of the plan cut of the selected string with the section from **Layer***, plus the* **Offset** *value.*

*The **plan cut** on the section from* **Layer** *is used as the position to take a line through with xfall given at the Xfall Offset defined in the Xfall section. This goes through the plan cut on* **Layer** *and is extended through to the z-value at Start Offset.*

Height 1/Height 2 *are then added to the z-value at Start Offset to define the heights of the new boxing vertices.*

The selected string needs to cut the sections from **Layer** *in plan wherever the boxing is being applied.*

Offset real box 0

offset to add to the offset of the plan cut of the section from **Layer** *with the selected string to give the Start Offset.* **Offset** *can be positive or negative but the final Start Offset must still be on* **Layer***.*

Height 1/Height 2 real box 0

Height 1/Height 2 is used with the z-value of the extended line at the Start Offset to give the z-value of the new boxing vertices.

*If **Cut of string:***

String string select

*the Start Offset is the offset of the **plan** cut of the selected string with the section from* **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative but the final position must still be on the section.*

*The line goes through the **3d cut** with the xfall given at the Xfall Offset defined in the Xfall section. This line goes through the 3d cut point and is extended to Start Offset to give a z-value.*

Height 1/Height 2 *are then added to the projected point to define the heights of the new boxing vertices.*

The selected string needs to cut the sections in plan wherever the boxing is being applied.

Offset real box 0

offset to add to the offset of the plan cut of the section with the selected string to give the Start Offset. **Offset** *can be positive or negative but the final Start Offset must still be on the section.*

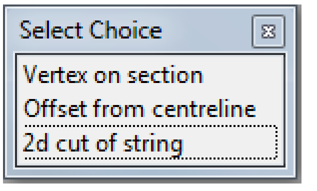
Height 1/Height 2 real box 0

Height 1/Height 2 is used with the z-value of the extended line at the Start Offset to give the z-value of the new boxing vertices.

Xfall

the definition of the offset that Xfall is taken from.

Type choice box



For the documentation on the methods of defining the Xfall Offset, see 21.7.2.3 Defining Relative Offset for Boxing Commands.

The xfall is taken from the point on the section in **Layer** *with offset Xfall Offset.*

Name 1 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height.

If blank, no vertex is created.

Height 1 real box

Height 1 to used in the calculation height of the new boxing vertex

Name 2 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height.

If blank, no vertex is created.

Height 2 real box

Height 2 to used in the calculation height of the new boxing vertex

Note - to allow the boxing sections and strings to triangulate, if two vertices are created, ***12d Model*** actually increases the offset of the second vertex by ten thousandth of a unit.

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

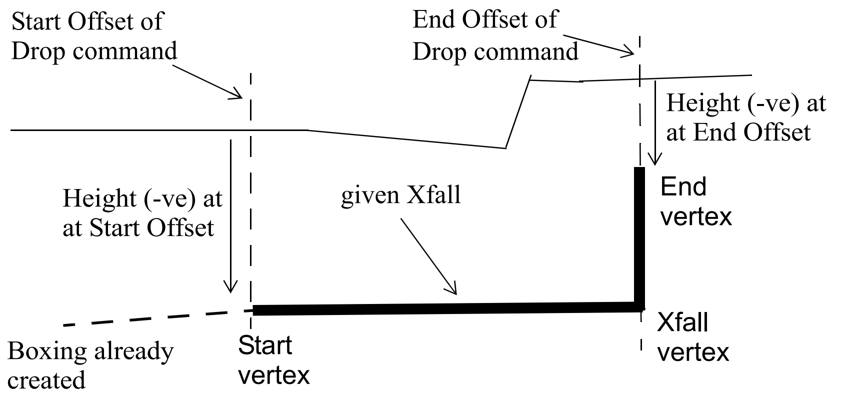
For the typed format of the **Xfall Point** command created by this panel, see 21.10.2.8 Text Format - Boxing Xfall Point.

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.10 Boxing Drop or return to 21.7.2.2 Commands for Boxing Rules Grid.

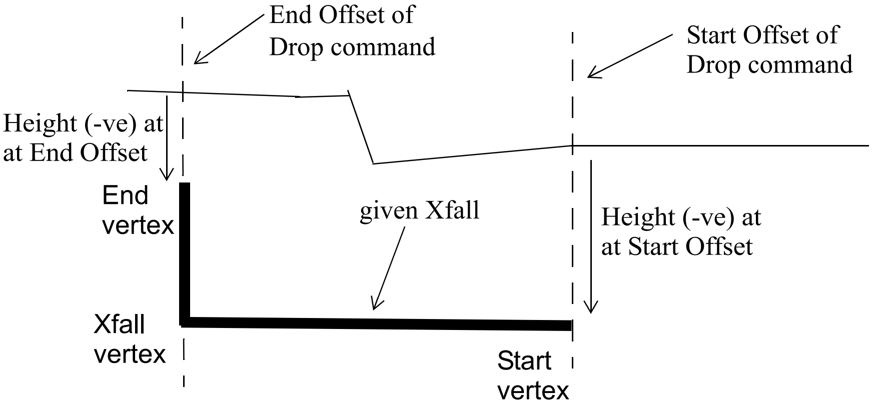
21.7.2.2.10 Boxing Drop

The **Drop** command is a quick way of creating three vertices, the first two on a line of given Xfall, and the third vertically above the second vertex.



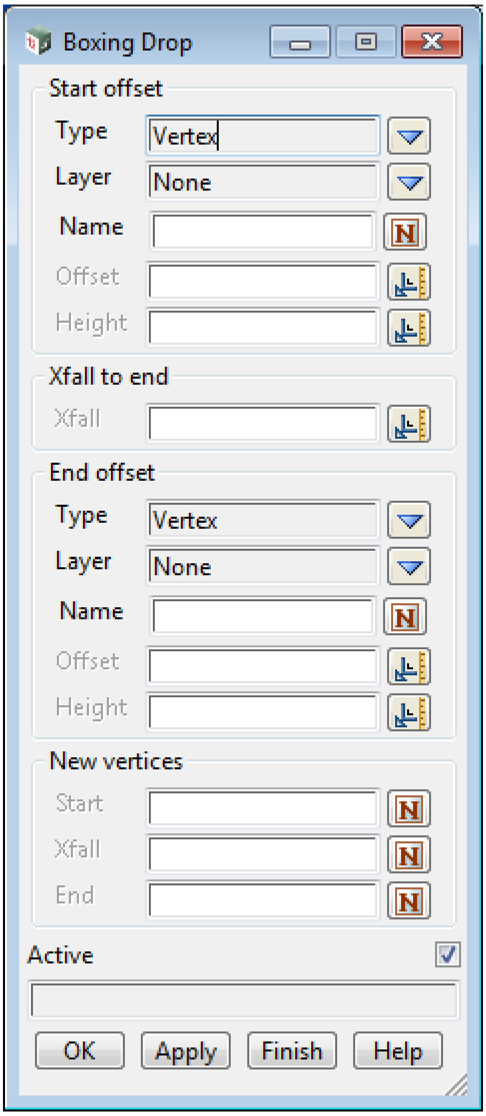
Drop Option - Start Offset before End Offset

If the **End** Offset is before the **Start** Offset then the ***Drop*** is done in reverse. That is, the line still goes through the Start vertex but it then goes to the **left**.



Drop Option - End Offset before Start Offset

Selecting **Drop (kerb)** brings up the **Boxing Drop** panel



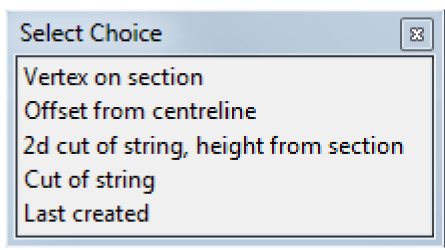
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Start offset

the first vertex is created with offset Start Offset and z-value determined by Start Offset Type and Height.

Type	choice box		



For the documentation on the methods of defining the ***Start Offset*** *except for* **Last created**, *see* 21.7.2.3 Defining Relative Offset for Boxing Commands

Height	real box	0	

If Start Offset Type is NOT: ***Cut of string:***

*the height of the fist vertex is **Height** added to the z-values of the selected* **Layer** *at Start Offset. For example, if Height is -0.3, the first vertex is 0.3 below the* **Layer** *at Start Offset.*

*If Start Offset Type is: **Cut of string:***

At the plan cut of the string and the START OFFSET **Layer***, **Z-Diff (**the difference of the z-values between the string and START OFFSET* **Layer*****)*** *is calculated and* **Height** *added to it. This combined value is added to the z-value of* **Layer** *at the Start Offset to give the z-values of the first vertex*

Xfall to end

Xfall real box

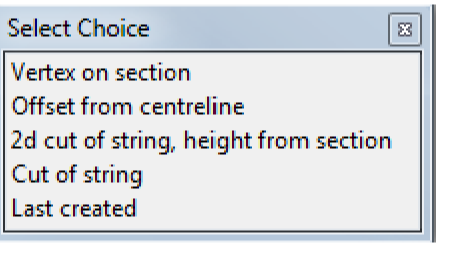
a line is created going through the first vertex (the Start vertex) with the xfall given in the **Xfall** *field. Positive Xfall is up and negative Xfall is down.*

End offset

the second vertex lies on the line through the first vertex when it is extrapolated to End Offset.

The third vertex is created with offset End Offset and z-value determined by End Offset Type and Height.

Type choice box



*For the documentation on the methods of defining the **Start Offset** except for* **Last created***, see* 21.7.2.3 Defining Relative Offset for Boxing Commands.

Height real box 0

*If End Offset Type is NOT: **Cut of string:***

*the height of the last vertex is **Height** added to the z-value of the selected* **Layer** *at End Offset. For example, if Height is -0.1, the third vertex is 0.1 below the* **Layer** *at End Offset.*

*If End Offset Type is: **Cut of string:***

At the plan cut of the string and the END OFFSET **Layer***, **Z-Diff (**the difference of the z-values between the string and END OFFSET* **Layer*****)*** *is calculated and* **Height** *added to it. This combined value is added to the z-value of* **Layer** *at the End Offset to give the z-values of the third vertex*

***IMPORTANT NOTE**: if the End Offset is **before** the Start Offset then the line from the first vertex is reversed and goes to the left rather than the right. The use of **Offset inside** the Start Offset and End Offset sections is also reversed so that a **positive offset goes to the left**.*

New Vertices

Start name box

If **Start** *is non blank then it is the name of the first vertex, otherwise a default name is used.*

Xfall name box

If **Xfall** *is non blank then it is the name of the second vertex, otherwise a default name is used.*

End name box

If **End** *is non blank then it is the name of the third vertex, otherwise a default name is used.*

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

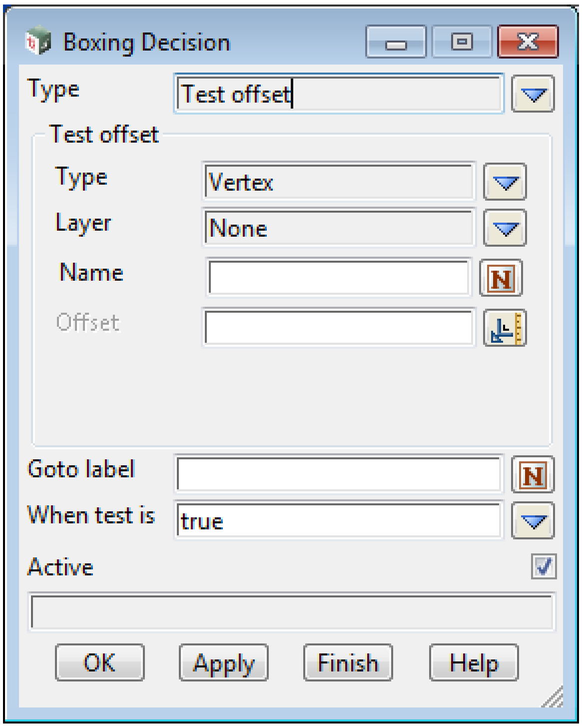
For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.11 Boxing Decision or return to 21.7.2.2 Commands for Boxing Rules Grid.

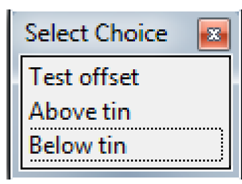
21.7.2.2.11 Boxing Decision

A Test is specified and depending on the result, processing of the boxing commands is sent to a specified ***Label*** in the *Boxing Definition* where processing then continues from the next command after the Label, or no jump is made and processing continues to the next boxing command in the *Boxing Definition.*

Selecting **Decision** brings up the **Boxing Decision** panel



Type choice box

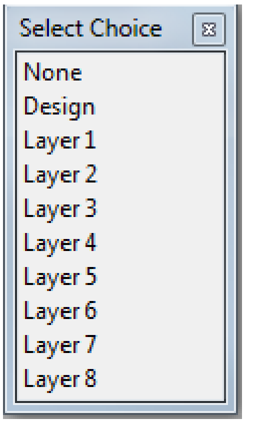


determines the type of test to be made.

If **Type** *is Test offset:*

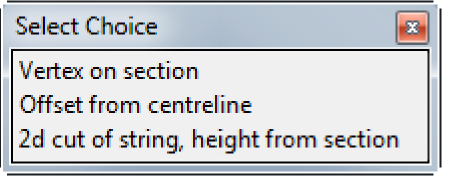
Test Offset

Layer - after Type choice box



Layer to use with **Type** *to defined the test.*

Type choice box



*If **Vertex on section**:*

the test is satisfied if the Test Offset defined by **Layer, Name** *and* **Offset** *is still on* **Layer.**

Name name box

name of the vertex on **Layer** *to use with* **Offset** *to defined the Test Offset. If it is not a name of a vertex then the test is not satisfied.*

Offset real box 0

this value is added to the offset of the vertex given in the **Name** *field to define the Test Offset.* **Offset** *can be positive or negative.*

*If **Offset from centreline:***

the test is satisfied if the Offset is on **Layer.**

Offset real box 0

an actual offset from centreline (actually just the chainage on **Layer***) which is used as the Test Offset.* **Offset** *can be positive or negative.*

*If **2d Cut of string, height from section:***

the test is satisfied if the selected string cuts **Layer** *in plan and the Test Offset given by the plan cut plus* **Offset** *is still on* **Layer***.*

String string select

the selected string needs to cut the sections of **Layer** *in plan wherever the boxing decision is being applied.*

The Test Offset is the offset of the plan cut of the selected string with **Layer***, plus the* **Offset** *value.*

Offset real box 0

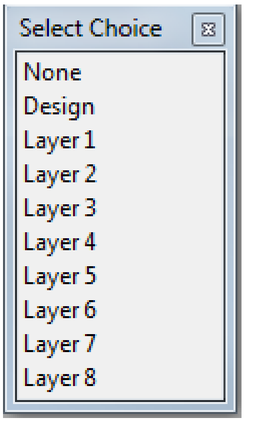
offset to add to the offset of the plan cut of the section from **Layer** *with the selected string to give the Test Offset.* **Offset** *can be positive or negative but the final Test Offset must still be on* **Layer***.*

End of definition for **Type** *equal to Test offset.*

If **Type** *is* ***Above Tin or Below Tin:***

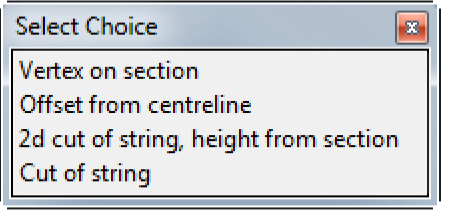
Above/Below Tin decision

Layer - Below Type choice box



Layer to use with **Type** *to defined the height for the test.*

Type choice box



If ***Vertex on section****:*

the test is satisfied if the ***height*** *on the section at Test Offset defined by* **Layer, Name** *and* **Offset** *is* ***ABOVE/BELOW*** *the sum of the value given in the field* **Tin height offset** *and the height of the tin given in the field* **Tin** *at Test Offset***.**

Name name box

name of the vertex on **Layer** *to use with* **Offset** *to defined the Test Offset. If it is not a name of a vertex then the test is not satisfied.*

Offset real box 0

this value is added to the offset of the vertex given in the **Name** *field to define the Test Offset.* **Offset** *can be positive or negative.*

If ***Offset from centreline:***

the test is satisfied if the height of the section at Offset is ***ABOVE/BELOW*** *the sum of the value given in the field* **Tin height offset** *and the height of the tin given in the field* **Tin** *at Test Offset***.**

Offset real box 0

an actual offset from centreline (actually just the chainage on **Layer***) which is used as the Test Offset.* **Offset** *can be positive or negative.*

If ***2d Cut of string, height from section:***

the test is satisfied if the selected string cuts **Layer** *in plan and the* ***height*** *of the section at Test Offset given by the plan cut plus* **Offset** *is* ***ABOVE/BELOW*** *the sum of the value given in the field* **Tin height offset** *and the height of the tin given in the field* **Tin** *at Test Offset.*

String string select

the selected string needs to cut the sections of **Layer** *in plan wherever the boxing decision is being applied.*

The Test Offset is the offset of the plan cut of the selected string with **Layer***, plus the* **Offset** *value.*

Offset real box 0

offset to add to the offset of the plan cut of the section from **Layer** *with the selected string to give the Test Offset.* **Offset** *can be positive or negative but the final Test Offset must still be on* **Layer***.*

*If **Cut of string:***

the selected string can not have only null z-values.

The test is satisfied if the selected string cuts **Layer** *in plan and the **height** on the cut string at Test Offset given by the plan cut plus* **Offset** *is **ABOVE/BELOW** the sum of the value given in the field* **Tin height offset** *and the height of the tin given in the field* **Tin** *at Test Offset.*

String string select

the selected string needs to cut the sections of **Layer** *in plan wherever the boxing decision is being applied.*

The Test Offset is the offset of the plan cut of the selected string with **Layer***, plus the* **Offset** *value.*

Offset real box 0

offset to add to the offset of the plan cut of the section from **Layer** *with the selected string to give the Test Offset.* **Offset** *can be positive or negative but the final Test Offset must still be on* **Layer***.*

End of definition for **Type** *equal to **Above Tin** or **Below Tin**.*

Goto label text box

the name of the Label in the Boxing Definition to pass control to.

When test is choice box True, False

*if **True**, then the Goto is done if the test **is** satisfied.*

*If **False**, then the Goto is done test is **not** satisfied.*

If the Goto is not done, then control passes to the next boxing command in the Boxing Definition.

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

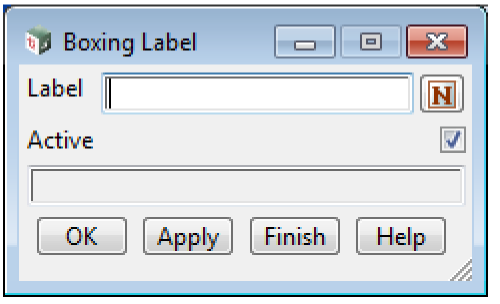
*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is* *clicked, a **recalc** of the **Boxing Many Function** is done.*

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.12 Boxing Label or return to 21.7.2.2 Commands for Boxing Rules Grid.

21.7.2.2.12 Boxing Label

Selecting **Label** brings up the **Boxing Label** panel which is used to define a label for this line in the *Boxing Definition*, and control can be passed to via a **Goto** or a **Decision** boxing command.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Goto Label	input		

name of the label for this line in the Boxing Definition.

Active	tick box		

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK	button		

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply	button		

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

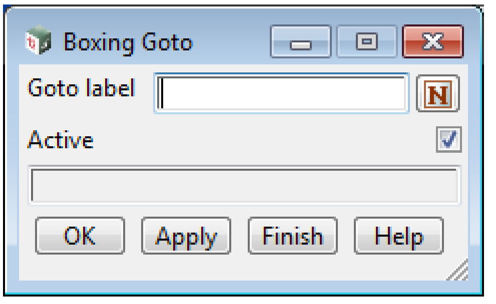
*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.13 Boxing Goto or return to 21.7.2.2 Commands for Boxing Rules Grid.

21.7.2.2.13 Boxing Goto

Selecting **Goto** brings up the **Boxing Goto** panel which is used to transfer control to the line in the *Boxing Definition* with the **Label** given in the **Goto label** field of the panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Goto label	input		

name of the Label in the Boxing Definition to transfer control to.

Active	tick box		

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK	button		

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply	button		

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

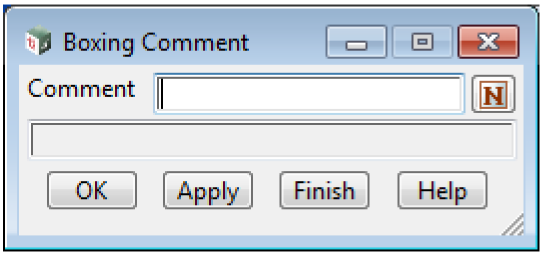
*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.14 Boxing Comment or return to 21.7.2.2 Commands for Boxing Rules Grid.

21.7.2.2.14 Boxing Comment

Selecting **Comment** brings up the **Boxing Comment** panel and the panel is used to insert a comment as a line of the *Boxing Definition*. Comments are not processed when running the boxing commands.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Comment	input		

user comment - for information purposes only

OK	button		

OK *stores the values in the fields and removes the panel BUT no* ***recalc*** *is done.*

Apply	button		

Apply *stores the values and leaves the panel on the screen.*

If the ***Boxing Definition*** *is being used in an* ***Apply MTF*** *and* ***Auto recalc*** *is ticked in the MTF, then whenever the* ***Apply*** *button is clicked, then a* ***recalc*** *of the associated* ***Apply MTF*** *for the MTF is done.*

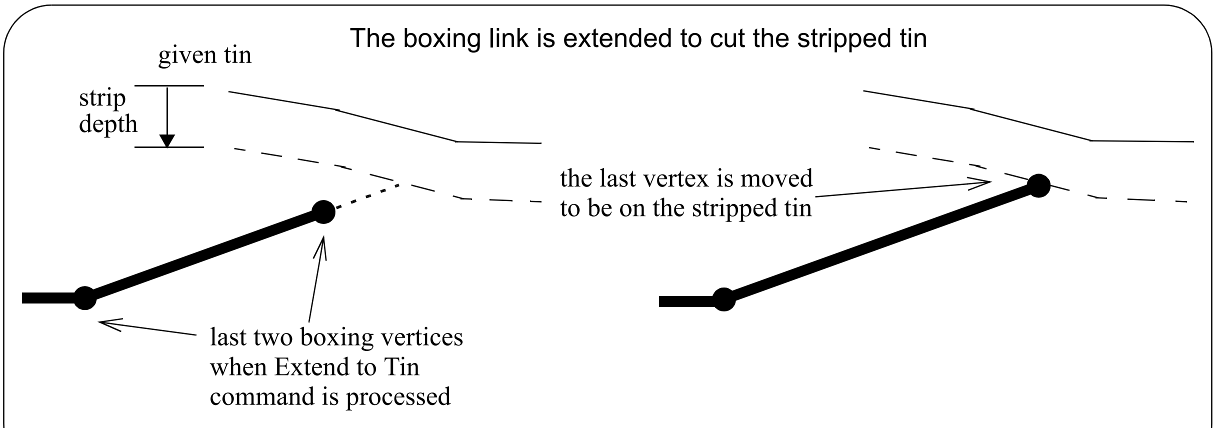
If the ***Boxing Definition*** *is being used in a* ***Boxing Many Function*** *then whenever the* ***Apply*** *button is clicked, a* ***recalc*** *of the* ***Boxing Many Function*** *is done.*

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.15 Boxing Extend Tin or return to 21.7.2.2 Commands for Boxing Rules Grid.

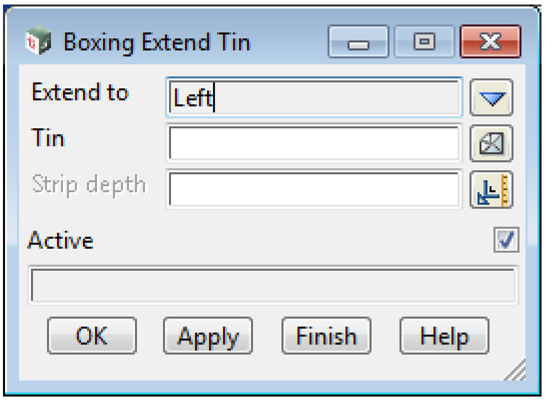
21.7.2.2.15 Boxing Extend Tin

The *Extend to Tin* option is used to extend the link containing the last two vertices (or the first two vertices) already created in the boxing layer until is hits the selected **Stripped Tin**.



Extend to Tin Option - Right Case

Selecting **Extend tin** brings up the **Boxing Extend Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Extend to	choice box		Left, Right

*if **Right**, then the link through the last two boxing vertices is extended until intersects the stripped tin. The last vertex is then **moved** to the intersection point. Other boxing commands can then follow.*

*If **Left**, then the link through the first two boxing vertices is extended until intersects the stripped tin. The first vertex is then **moved** to the intersection point. Note that this is moving the first vertex of the boxing defined so far. The "Copy from start of section" with the Left Side Interface will add vertices **before** this vertex.*

***Note** - there must be at least two vertices in the boxing before this command can be used.*

If the extend fails, then no vertex is moved and an error message is written to the output window and the boxing processing terminated at that chainage.

Tin	tin box		available tins

the tin, dropped by the **Strip depth**, *to batter to.*

Strip depth	input		

distance below the tin to stop at.

Active tick box

*if **ticked**, use this Boxing Command.*
*If **not ticked**, don't use this Boxing Command.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For more information on how Boxing works in ***12d Model***, please go to the section 21.6 What is Boxing?.

Go to the next section 21.7.2.2.16 Boxing End or return to 21.7.2.2 Commands for Boxing Rules Grid.

21.7.2.2.16 Boxing End

Most Boxing commands go from the ***Start Offset*** defined with the command, to the *Start Offset* of the **next** Boxing command.

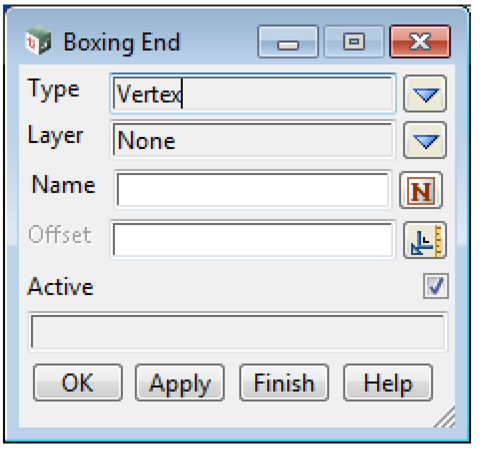
However sometimes a Boxing command needs to be stopped before the ***Start Offset*** of the next Boxing command.

The **End** command can be used to provide a "Start Offset" to act as the finishing position for the previous boxing command. So the **End** command simply terminates the previous Boxing command.

Apart from supplying the End Offset for the previous command, End is a "no operation" command.

Other Boxing commands can then follow the **End** command.

Selecting **End** brings up the **Boxing End** panel

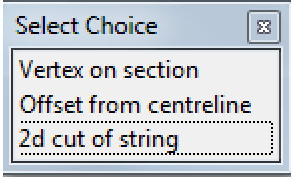


The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

the Relative Offset defined becomes the End Offset for the previous command.

Type choice box



*For the documentation on the methods of defining the **Relative Offset** see* 21.7.2.3 Defining Relative Offset for Boxing Commands.

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply MTF** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is* *clicked, a **recalc** of the **Boxing Many Function** is done.*

For the typed format of the **End** command created by this panel, see 21.10.2.9 Text Format - Boxing End.

For more information on how Boxing works in ***12d Model***, please go to the section 21.4 Smart Chainages.

Return to 21.7.2.2 Commands for Boxing Rules Grid.

21.7.2.2.17 Boxing Left Side Interface Xfall from Point

The **Xfall from Point** command creates a line from the left hand end of the boxing already defined and then batters to the ***left*** at a specified xfall until it intersects the design surface. The xfall of the batter is defined as

(a) the xfall on the section at a given section offset

(b) the xfall on the section at a *relative vertex offset*

(c) the xfall on the section at a *relative string offset*

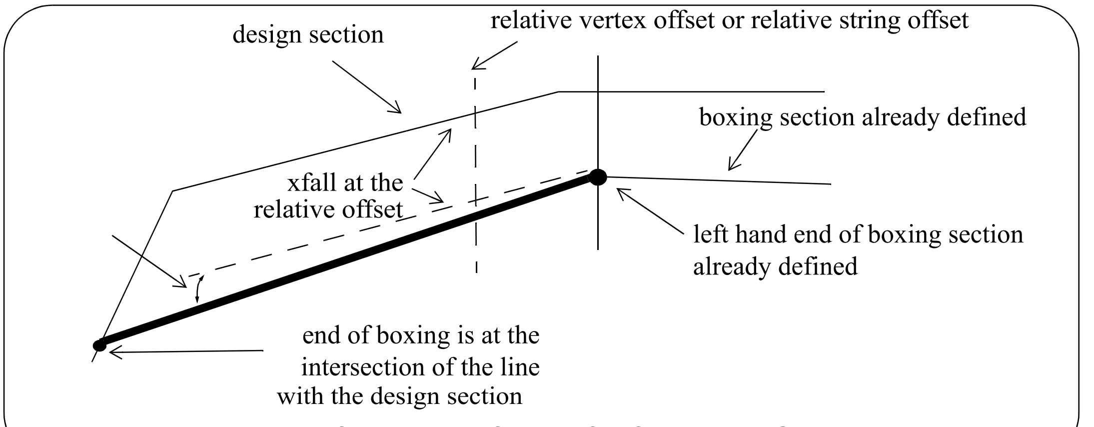
plus in each case:
an additional xfall value **Delta**.

If the design surface is not intersected by the batter, then no extra line is created.

Xfall is percent cross-fall and a positive xfall is up and negative xfall is down.

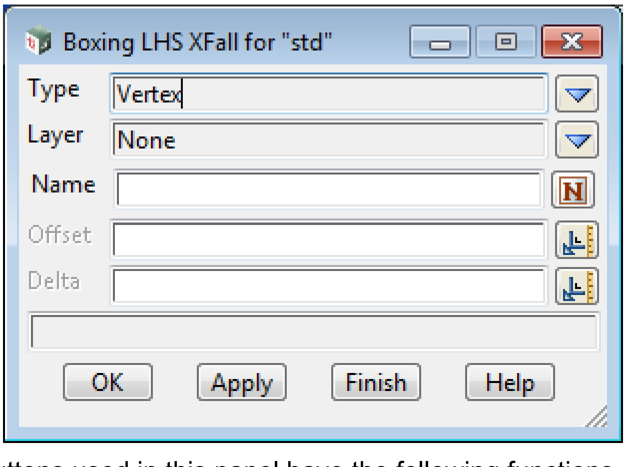
Note that the **Xfall from Point** creates a line at the ***beginning*** of the boxing created by running all the boxing commands in the boxing grid. So it is applied **after** all the other boxing commands have been run.

If **Copy from start of section** is ticked, then the part of the design section from the start of the design section to the offset that is the start of the boxing section, is copied and made the beginning of the boxing section.



Left Hand Interfaced Xfall from Point Option

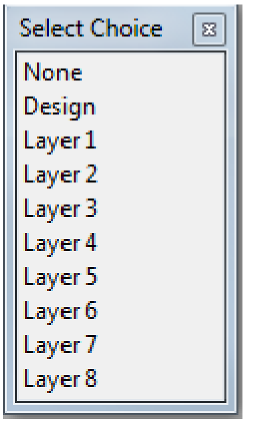
On the **Boxing Rules** panel, selecting the **Set Point** button when the *Left Side Interface* Type is **Xfall from Point** brings up the **Boxing LHS Xfall** panel



The fields and buttons used in this panel have the following functions.

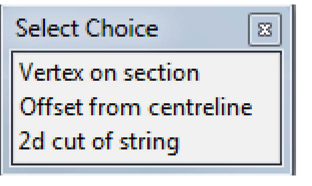
Field Description Type Defaults Pop-Up

Layer - after Type choice box



Layer of sections to use with **Type**.

Type choice box



If ***Vertex on section****:*

Name name box

name of the vertex on **Layer** *to use with* **Offset** *to define the section offset to take the Xfall value from*

Offset real box

this value is added to the offset of the vertex given in the **Name** *field to define the section offset to take the Xfall value from.* **Offset** *can be positive or negative as long as the final section offset is still* ***on*** *the section from* **Layer**.

If ***Offset from centreline:***

Offset real box

an actual offset from centreline (actually just the chainage of the section) which is used as the section from **Layer** *offset to take the Xfall value from.* **Offset** *can be positive or negative as long as it is still on the section. from* **Layer.**

If ***2d cut of string:***

String string select

the selected string needs to cut the sections from **Layer** *in plan wherever the boxing is being applied.*

The section offset to take the Xfall value from is the offset of the plan cut of the selected string with the section from **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative but the final section offset must still be on the section from* **Layer**.

Offset real box

offset to add to the offset of the plan cut of the section from **Layer** *with the selected string to give the section offset to take the Xfall value from.* **Offset** *can be positive or negative but the final section offset must still be on the section from* **Layer**.

Delta input 0

add the value **Delta** *to the xfall taken from the section from* **Layer**.

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

For the typed format of the **left_xfall** command created by this panel, see 21.10.2.13 Text Format - Boxing Left_Xfall, for **left_slope** see 21.10.2.14 Text Format - Boxing Left_slope and **left_copy** see 21.10.2.15 Text Format - Boxing Left_copy.

For more information on how Boxing works in ***12d Model***, please go to the section 21.4 Smart Chainages.

Go to the next section 21.7.2.2.18 Boxing Right Side Interface Xfall from Point or return to 21.7.2 Edit Boxing File.

21.7.2.2.18 Boxing Right Side Interface Xfall from Point

The **Xfall from Point** command creates a line from the right hand end of the boxing already defined and then batters to the ***right*** at a specified xfall until it intersects the design surface. The xfall of the batter is defined as

(a) the xfall on the section at a given section offset

(b) the xfall on the section at a *relative vertex offset*

(c) the xfall on the section at a *relative string offset*

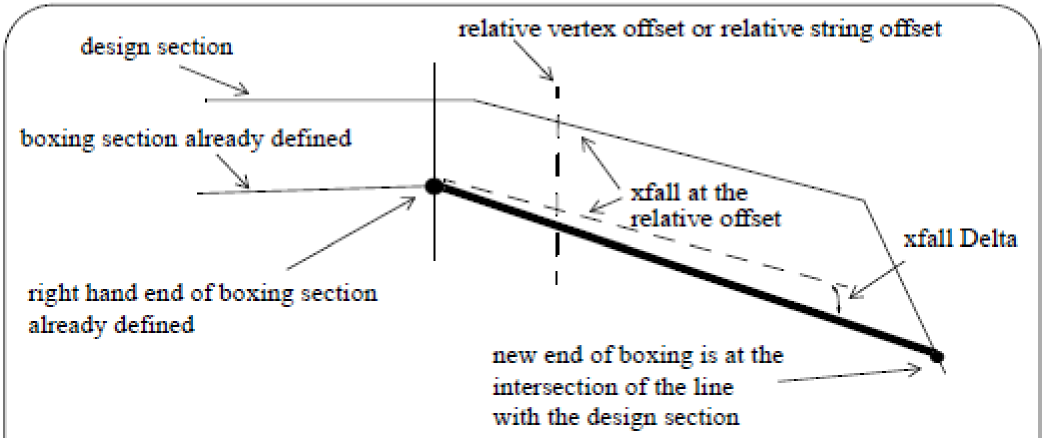
plus in each case:
an additional xfall value **Delta**.

If the design surface is not intersected by the batter, then no extra line is created.

xfall is percent cross-fall and a positive xfall is up and negative xfall is down.

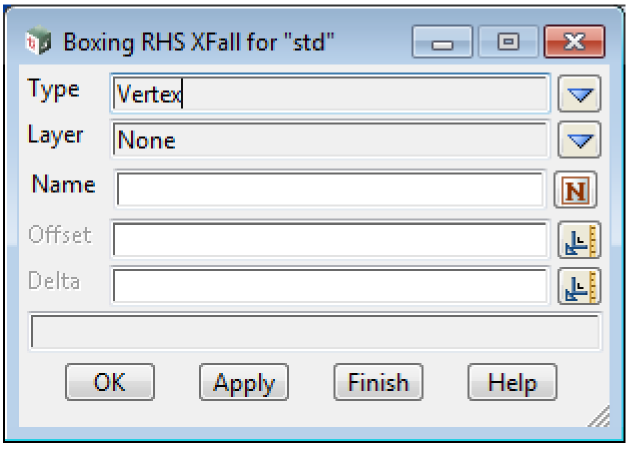
Note that the **Xfall from Point** creates a line at the ***end*** of the boxing created by running all the boxing commands in the boxing grid. So it is applied **after** all the other boxing commands have been run.

If **Copy to end of section** is ticked, then the part of the design section from the offset of the last boxing vertex to the last vertex on the design section, is copied and made the end of the boxing section.



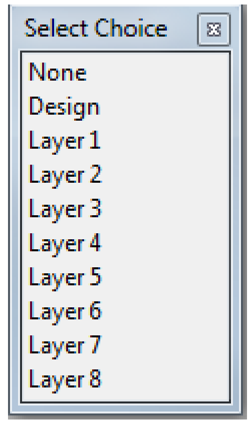
Right Hand Interfaced Xfall from Point Option

On the **Boxing Rules** panel, selecting the **Set Point** button when the *Right Side Interface* Type is **Xfall from Point** brings up the **Boxing RHS Xfall** panel



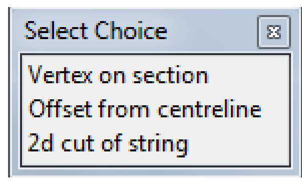
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer - after Type	choice box		



Layer of sections to use with **Type**.

Type	choice box		



If ***Vertex on section****:*

Name name box

name of the vertex on the section from **Layer** *to use with* **Offset** *to define the section offset to take the Xfall value from*

Offset real box

this value is added to the offset of the vertex given in the **Name** *field to define the section from* **Layer** *offset to take the Xfall value from.* **Offset** *can be positive or negative as long as the final section offset is still* ***on*** *the section from* **Layer***.*

If ***Offset from centreline:***

Offset real box

an actual offset from centreline (actually just the chainage of the section) which is used as the section from **Layer** *offset to take the Xfall value from.* **Offset** *can be positive or negative as long as it is still on the section from* **Layer***.*

If ***2d cut of string:***

String string select

the selected string needs to cut the sections from **Layer** *in plan wherever the boxing is being applied.*

The section offset to take the Xfall value from is the offset of the plan cut of the selected string with the section from **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative but the final section offset must still be on the section from* **Layer***.*

Offset real box

offset to add to the offset of the plan cut of the section from **Layer** *with the selected string to give the section offset to take the Xfall value from.* **Offset** *can be positive or negative but the final section offset must still be on the section from* **Layer***.*

Delta input 0

add the value **Delta** *to the xfall taken from the section from* **Layer**.

OK/Apply button

OK *stores the values in the fields and removes the panel.*
Apply *stores the values and leaves the panel on the screen.*

For the typed format of the **right_xfall** command created by this panel, see 21.10.2.10 Text Format - Boxing Right_Xfall, for **right_slope** see 21.10.2.11 Text Format - Boxing Right_slope and **right_copy** see 21.10.2.12 Text Format - Boxing Right_copy.

For more information on how Boxing works in ***12d Model***, please go to the section 21.4 Smart Chainages.

            left_copy       1
  }
boxing “right” {                // boxing defined from m001 to the far right of the section
            “m001”,       copy,        0.6
            “rkerb”,      end
            right_slope   5.0
            right_copy 1
  }
boxing “full” {         // a full width boxing - defines the entire boxing going from left to right
            “lkerb”,      copy,        -0.6
            “rkerb”,      end
            left_slope     5.0
            left_copy    1
            right_slope -5.0
            right_copy 1
  }
```

For more information on how Boxing works in ***12d Model***, please go to the section 21.4 Smart Chainages or to the section 21.6.2 Applying Boxing.

21.7.2.3 Defining Relative Offset for Boxing Commands

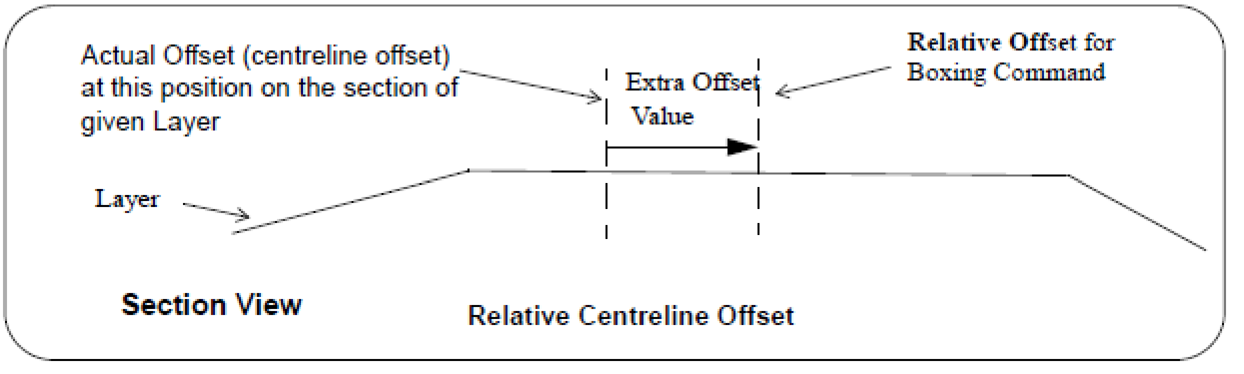
Most boxing commands use ***Relative Offsets*** to define offset positions across Design or Boxing Layers. For example, the ***Start Offset*** is a relative offset and is used in most boxing commands to specify where the boxing command starts.

There are a number of ways the ***Relative Offset*** can be defined:

(a) **Offset from centreline**

Relative to an actual Offset for the Design or Boxing Layer - relative offset

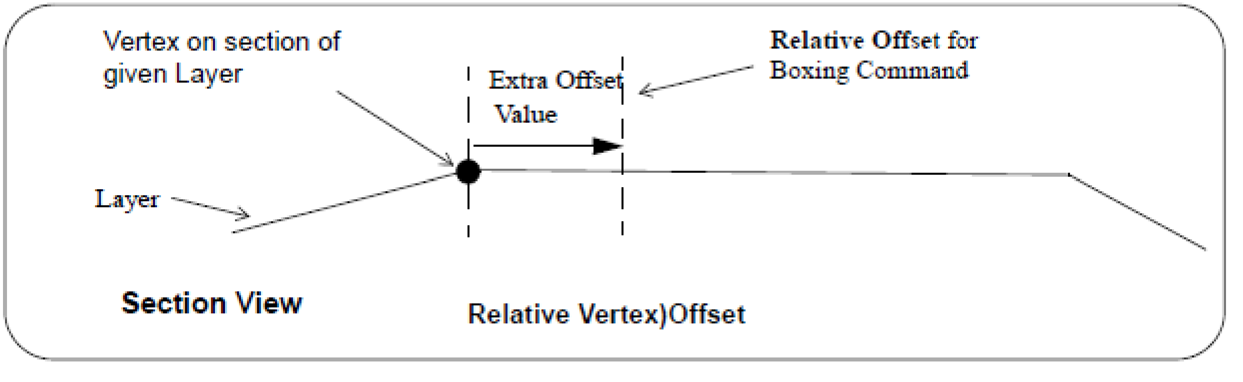
Adding a given value to an actual Offset of the given Layer.



(b) Vertex on section

Relative to a vertex on the Design or Boxing Layer - relative vertex offset

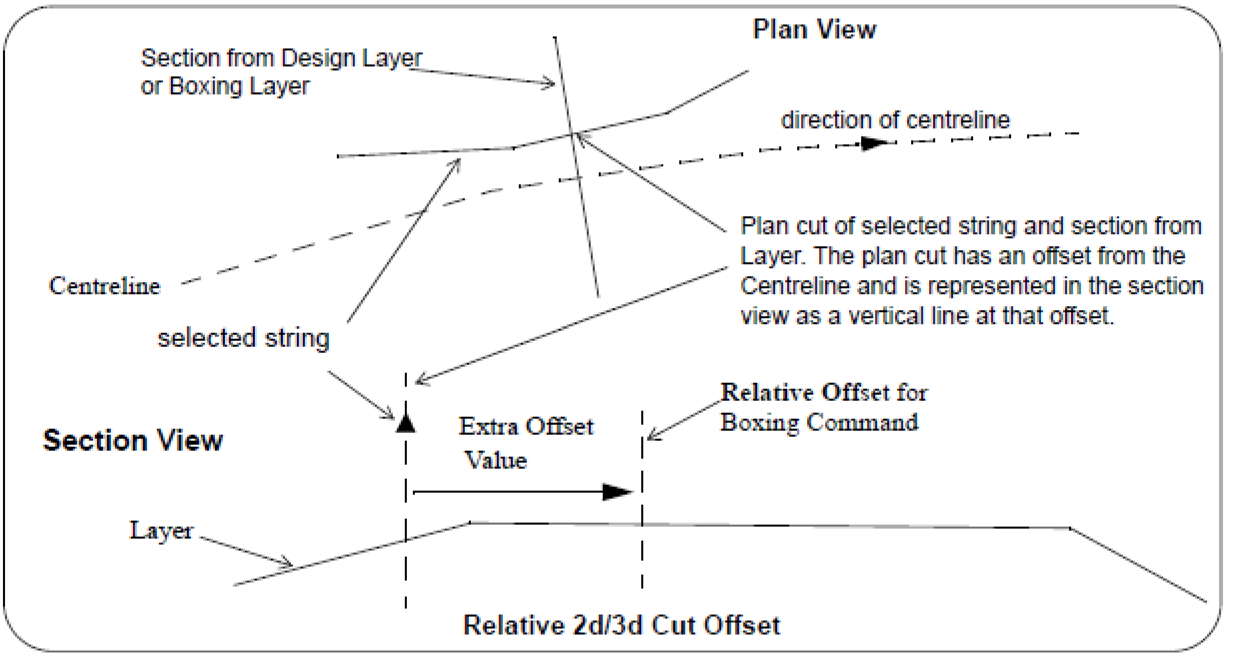
The offset of the given vertex is calculated and then a user given value added to it to the give the *relative vertex offset*.



(c) 2d cut of string

Relative to ***2d cut*** of a selected string with a given Layer.

First calculate the offset on the selected Layer of the plan cut of a selected string (2d cut). A user given value is then added to it to the give the *relative 2d offset*.

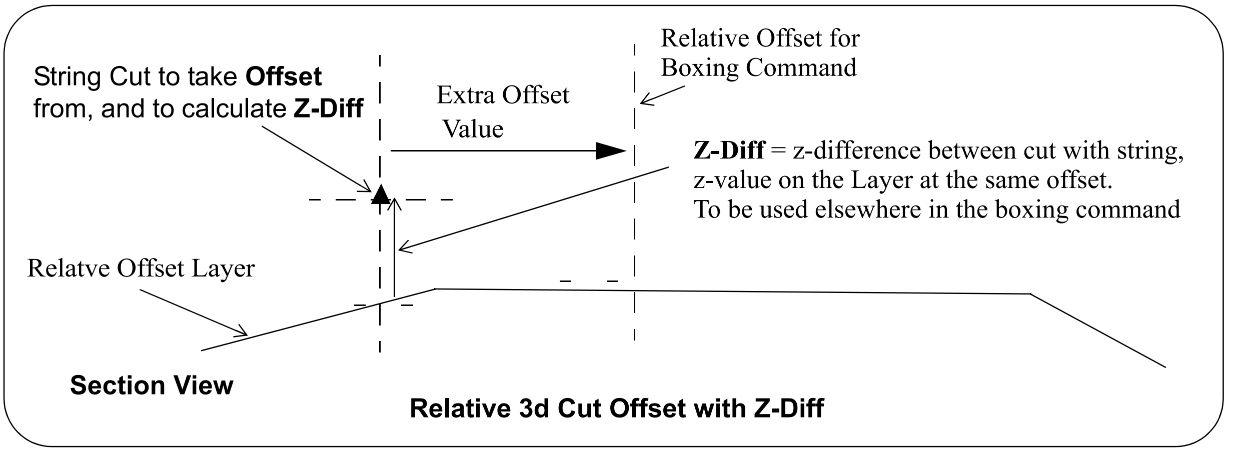


(d) Cut of string

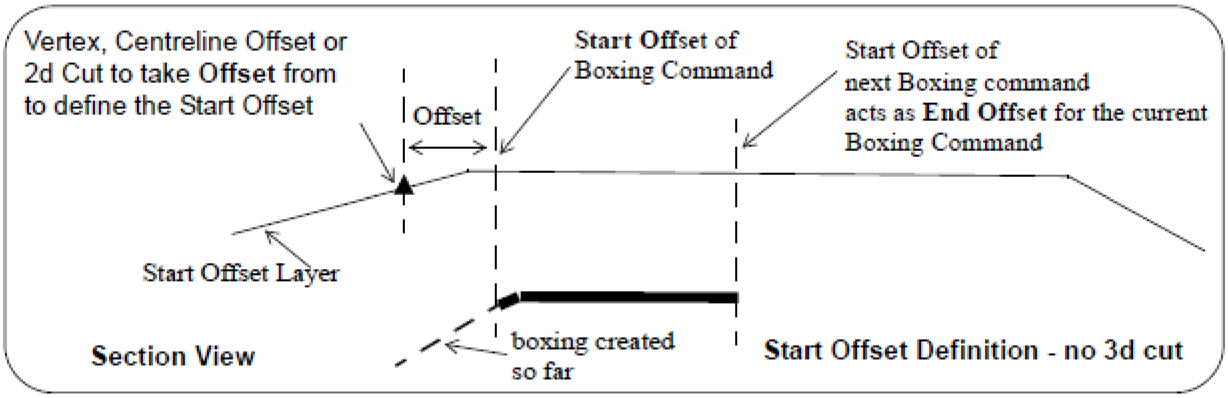
Relative to ***3d cut*** of a selected string

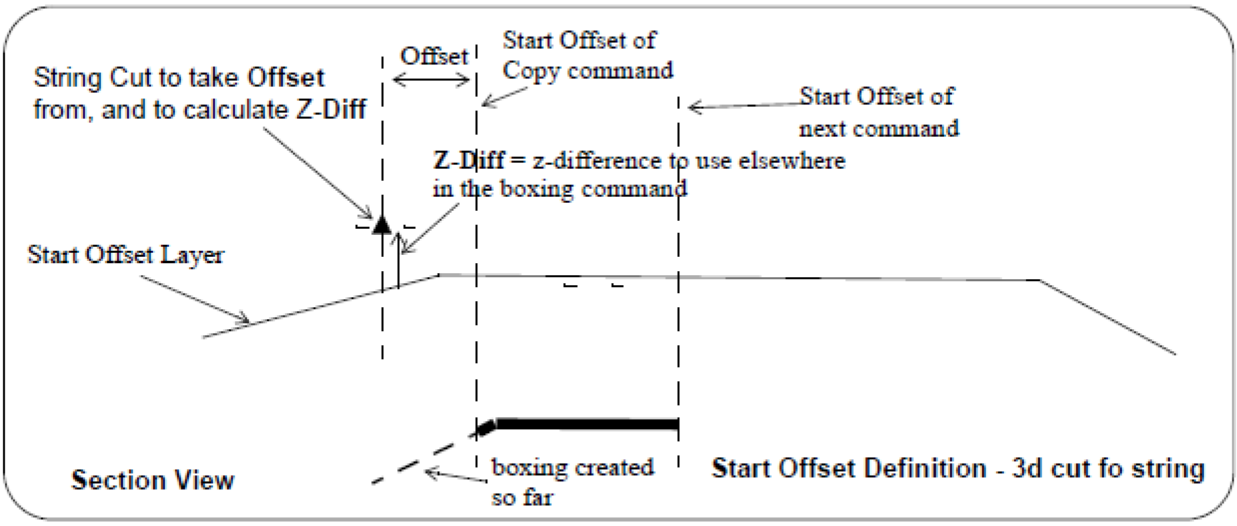
This is actually the same in *offset* value as the **2d** cut of a selected string but some boxing commands also take the ***3d cut*** of the selected string and use the **height difference** of the cut of the string and the height on the Layer elsewhere in the command. This is referred to as the Z-Diff of the 3d cut.

Note that some strings only have a horizontal (plan) definition and have no z-values at all. In that case, there is no 3d cut but there can be a 2d cut (plan cut). For example, a string with only null heights or a Super Alignment with no vertical geometry.



So for the case where Relative Offset is the ***Start Offset***:



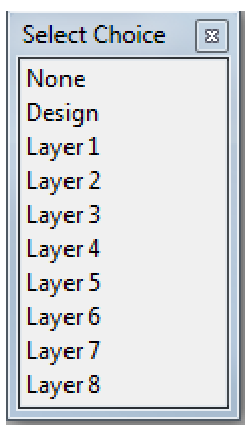


On a Boxing Command panel, the fields and buttons where a Relative Offset is required have the following functions:

Field Description Type Defaults Pop-Up

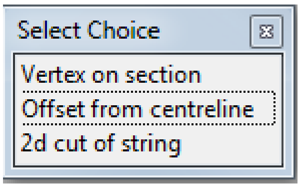
Relative Offset (e.g. Start Offset, Xfall Offset etc)

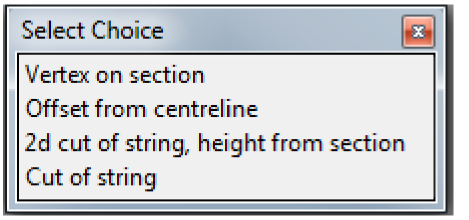
Layer - after Type choice box



Layer to use with **Offset** *to defined the Relative Offset.*

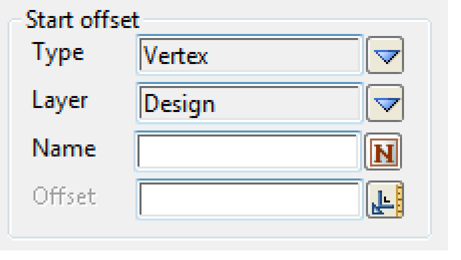
Type choice box





If ***Vertex on section****:*

this is the Relative (Vertex) Offset



Name name box

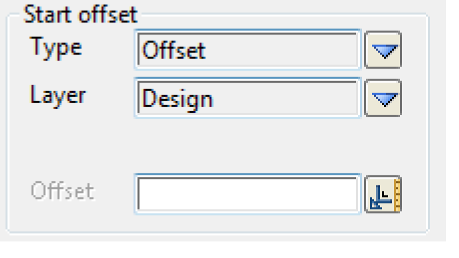
name of the vertex on the **Layer** *to use with* **Offset** *to define the Start Offset.*

Offset real box

this value is added to the offset of the vertex given in the **Name** *field to define the Relative Offset.* **Offset** *can be positive or negative as long as the final Start Offset is still* ***on*** **Layer***.*

If ***Offset from centreline:***

this is the Relative (Centreline) Offset

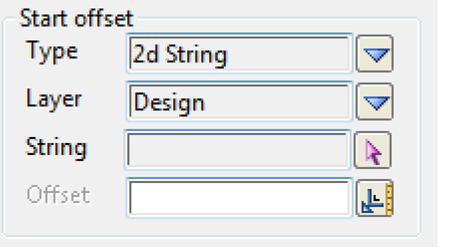


Offset real box

an actual offset from centreline (actually just the chainage of the section). **Offset** *can be positive or negative as long as it is still on* **Layer***.*

If ***2d cut of string:***

this is the Relative (2d Cut) Offset



String string select

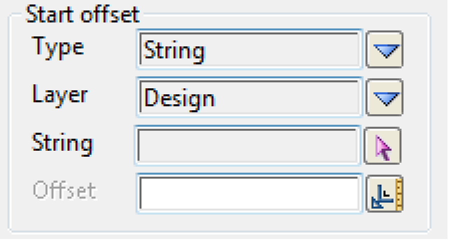
the selected string needs to cut the **Layer** *in plan wherever the boxing is being applied.*

Offset real box

the Relative Offset is the offset of the plan cut of the selected string with the **Layer***, plus the* **Offset** *value.* **Offset** *can be positive or negative but the final position Relative Offset must still be on* **Layer***.*

*If **Cut of string:***

this is the Relative (3d Cut) Offset



String string select

the selected string needs to cut the sections of the selected **Layer** *in plan wherever the boxing is being applied.*

Offset real box 0

The Relative Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** *value.* **Offset** *can be positive or negative but the final position must still be on* **Layer***.*

Z-Diff *is the difference between the z-value of the cut string, and the z-value on the* **Layer** *at the same plan position as the cut with the string. The use of Z-Diff depends on the boxing command.*

21.8 Full Definition of Template Decisions

12d Model supports templates with an unlimited number of fixed links which are in the **Fixed** table of the **Temple** definition and they are processed first.

At the end of the fixed links,***12d Model*** checks to see if a **Decisions** table exists.

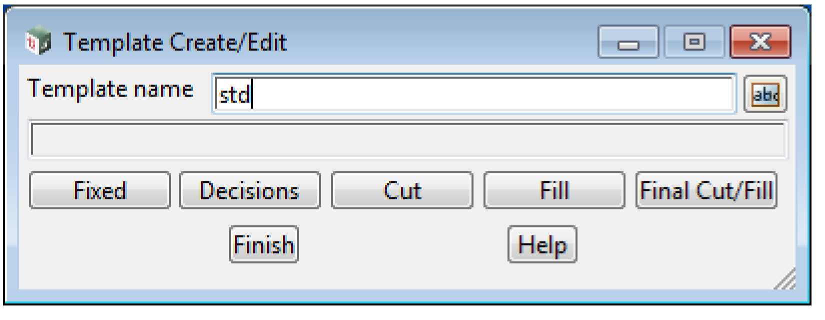
If a **Decisions** table exists, then it is used and the Decision commands processed.

If a ***Continue Cut/Fill*** command is reached in the decision command processing, then this stops the Decision command processing, and the processing moves onto the **Cut**, **Fill** and **Final Cut/Fill** tables.

If no ***Continue Cut/Fill*** command is reached in the decisions, then the processing stops after the decision commands are exhausted and the **Cut**, **Fill** and **Final Cut/Fill** tables ***ARE NOT USED***.

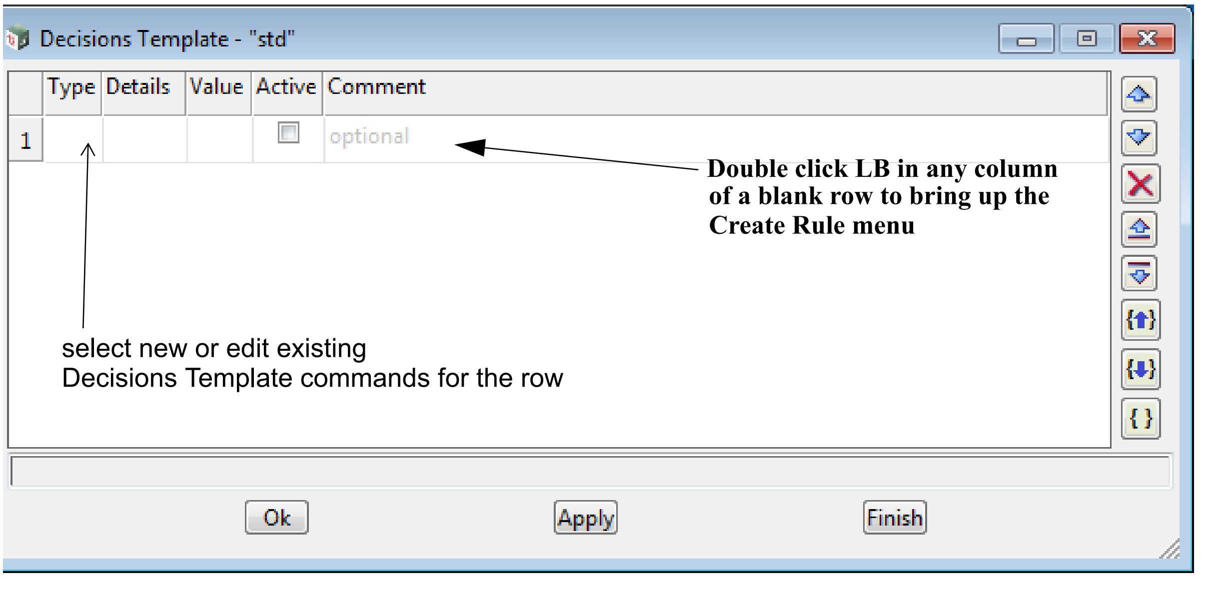
If **no Decisions** table exists, then the **Cut**, **Fill** and **Final Cut/Fill** tables are used after the **Fixed** table.

Templates are created and edited using the **Templates=>Create/edit** option which brings up the **Template Create/Edit** panel.



The description of the fields and the buttons **Fixed**, **Cut**, **Fill**, **Final Cut/Fill** in this panel are given in the section 20.2.1 Templates.

Selecting **Decisions** on the **Template Create/Edit** panel brings up the **Decisions Template** panel:



The **Decisions Template** panel consists of a grid with of rows (or lines) with **commands** in them, and an **OK** or **Apply** button to record the results.

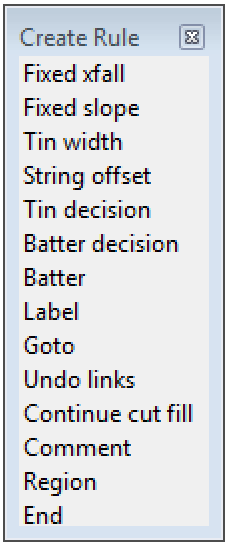
Decisions Templates Grid

For information on the general operation of a grid including the icons on the right hand side, see 4.19.6 Grids in Panels.

The ***commands*** *in the* **Decisions Template** *grid form a simple language where the commands are processed sequentially unless control is passed to a labelled line from where sequential processing continues, or the processing is terminated by an* ***end*** *command. For a description of all the Decisions Template Commands, see* 21.8.1 Decisions Template Commands.

When the Grid Row is Empty

If the row of the grid is ***empty****, clicking LB in the empty row will bring up the* **Create Rule** *menu which contains all the available decisions commands.Note this may involve two clicks - one to highlight a column in a row and the second click to bring up the* **Create Rule** *menu.*

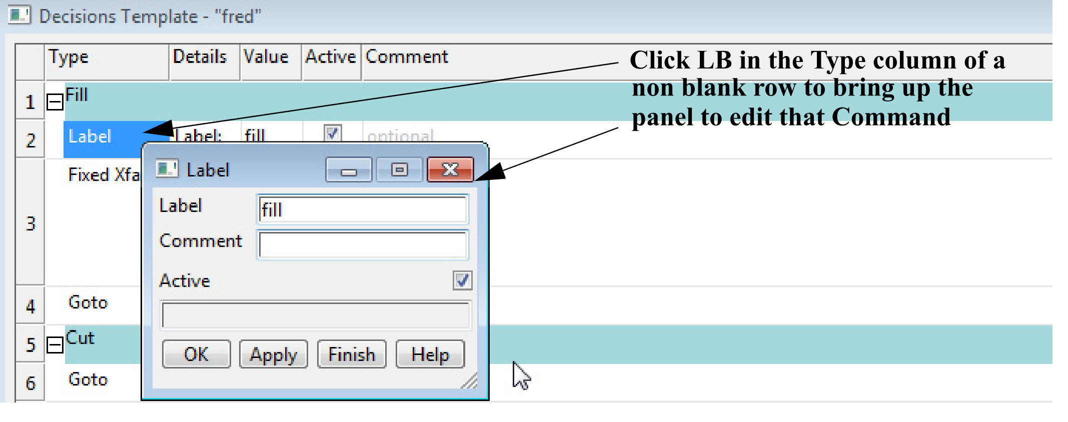


Selecting a menu item will bring up an associated panel which displays the information required for the Decisions Template command. When the panel is filled in and **OK** or **Apply** *selected, the panel information is written out to the row of the grid and is known as a* **decisions template command**.

When the Grid Row is Not Empty

If the row of the grid is ***not empty*** *(and hence filled with a* **Decisions Template command***) then clicking LB in the cell:*

(a) ***Type*** *will bring up the associated panel for the Decisions Template command.*



For a description of all the Decisions Template Commands, see 21.8.1 Decisions Template Commands.

(b) ***Active*** *will toggle the* ***tick/not ticked***

(c) ***Comment*** *will allow text to be typed into the cell*

Note *that clicking in the* ***Type***, ***Start chainage***, ***End chainage***, ***Interval***, ***Extra Start***, ***Extra End***, ***Active*** *and* ***Comment*** *cells may involve two clicks - one to highlight the cell in a row and the second click to edit or bring up the panel for the cell.*

Buttons at Bottom

OK button

OK *stores the values in the fields and removes the panel.*

Apply button

Apply *stores the values in the grid and leaves the panel on the screen.*

If the template is written out using **File I/O=>Templates output** or **Templates=>Utilities=>Output**, the Decisions Template commands will be written out in the order that they are displayed in the grid.

Please continue to the next section 21.8.1 Decisions Template Commands.

21.8.1 Decisions Template Commands

The **commands** in the **Decisions Template** grid form a simple language where the commands are processed sequentially unless control is passed to a labelled line from where sequential processing continues, or the processing is terminated by an **end** command.

The Decisions Template Commands can:

(a) create a fixed link - **fixed xfall** and **fixed slope**

(b) create a link of fixed width but with a slope automatically selected so that the link reaches a given tin in the width - **tin width**

(c) create a link that goes within an offset of a given string **string offset**

(d) test for being between two depths below a tin, and transfer control if true - **tin decision**

(e) test that a link would get within a given depth from a tin at a given offset, and transfer control if true - **batter decision**

(f) create a link of set slope that batters to a depth below a tin at a given offset - **batter**

(g) create a label which can have processing passed to - **label**

(h) transfer processing to a given label -**goto**
