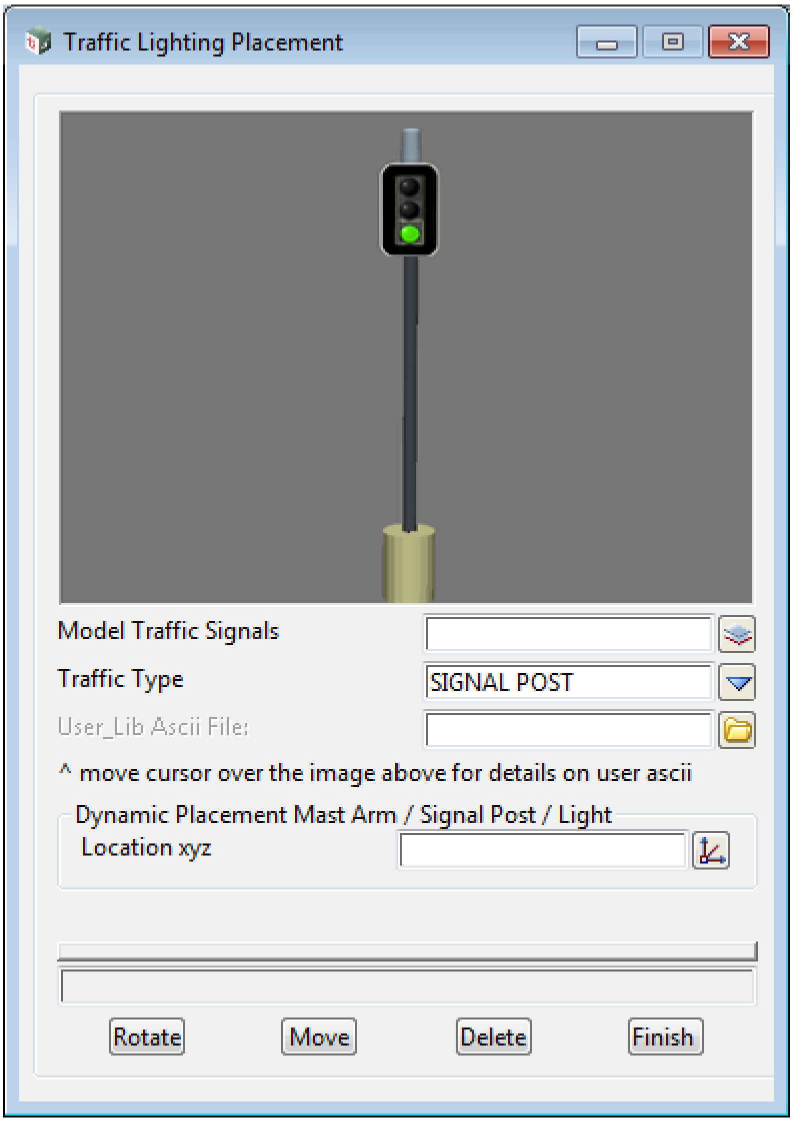
12.13.35.7 Traffic Lighting Placement

Position of option on menu: **View =>Visualisation =>Utilities =>Traffic signals**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **Traffic signals** option, the **Traffic Lighting Placement** panel is displayed:



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model Traffic Signals	model box		available models
Traffic Type	choice box	SIGNAL POST	available choices
User_Lib Ascii File:	file		
Location xyz			
Rotate	button		
Move	button		
Delete	button		

12.13.35.8 Colour Within Polygon

Position of option on menu: **View =>Visualisation =>Utilities =>Colour within polygon**

This option colours triangles in a tin. It has already been documented as

Tins =>Colour =>Colour within polygon

in the section 16.8.2 Colour Within Polygon.

12.13.35.9 Explode Text

Position of option on menu: **View =>Visualisation =>Utilities =>Explode text**

This option explodes text into lines and arcs. It has already been documented as

Utilities =>A-G => Explode text

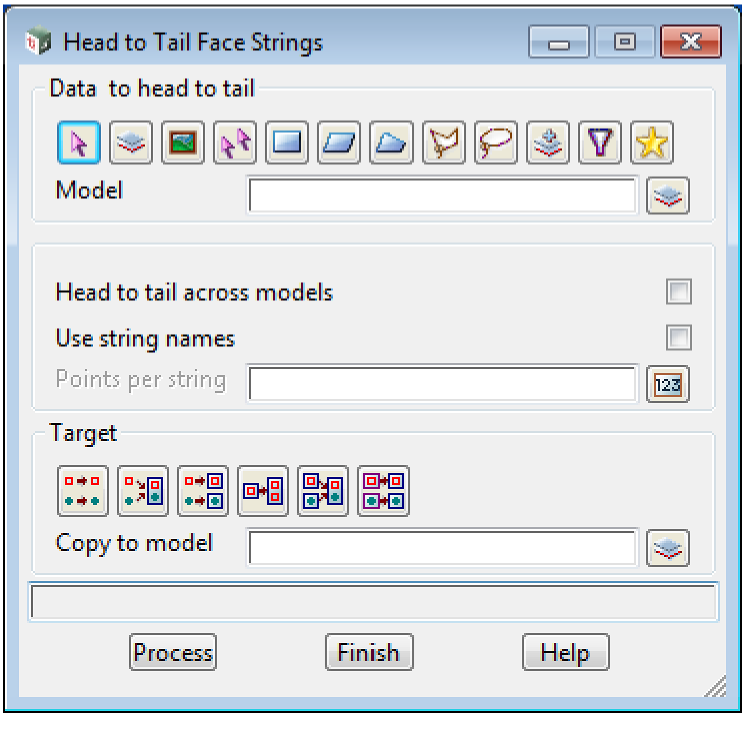
in the section 28.9.18 Explode Text.

12.13.35.10 Head to tail faces

Position of option on menu: **View =>Visualisation =>Utilities =>Head to tail faces**

This section of documentation is a work in progress and will be updated in subsequent releases.

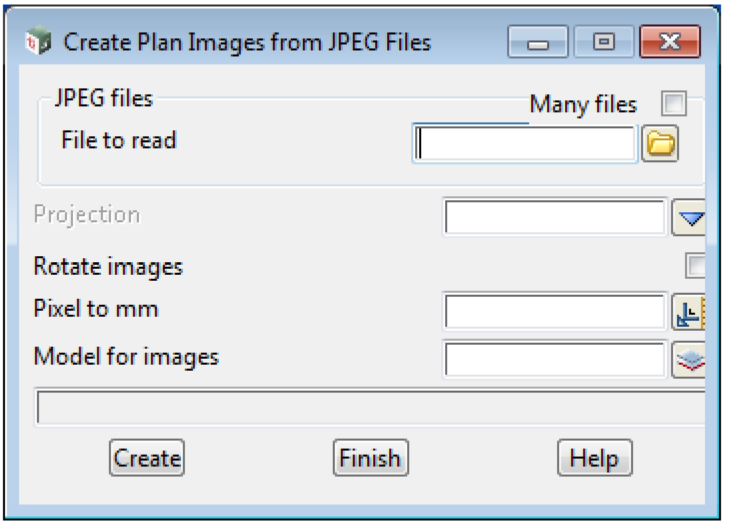
Selecting **Head to tail faces** brings up the **Head to Tail Face Strings** panel.



12.13.35.11 Create Plan Images from JPEG Files

Position of option on menu: **View =>Visualisation =>Utilities =>Create plan images from JPEG's**

Selecting **Create plan images from JPEG's** brings up the **Create Plan Images from JPEG Files** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Advanced	tick box	not ticked	

clicking **Advanced** *brings up a grid to allow the user to enter many JPEG files.*

File to read	file box		available *.jpg files

the JPEG files to read in and create images from. The JPEG file must include EXIF and GPS information, which is used to position the image. If Projection *is not blank, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If* Projection *is blank, then the co-ordinates are left as lat/long.*

Projection	choice box		

if a Project Projection is set, then it is placed in the Projection *field. This can be changed to any other projection. The projection is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no projection is set, then the co-ordinates are left as lat/long.*

Rotate images	tick box	not ticked	

*if **ticked**, the rotate value from the EXIF will be used to rotate the image.*

Pixel to mm	input box		

the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the **Pixel to mm** *(mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.*

Model for images	input box		

the model for the image to be inserted into.

Create	button		

*when all the fields have been entered, the **Create** button creates images from the selected files.*

13 Models

Position of menu: **Model**

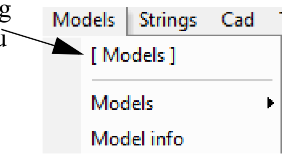
In 12d Model, models contain all the terrain and design information in the form of strings, tins and trimeshes.

The **Models** menu contains the options needed to create new models, rename models, report, clean models and delete models from the project.

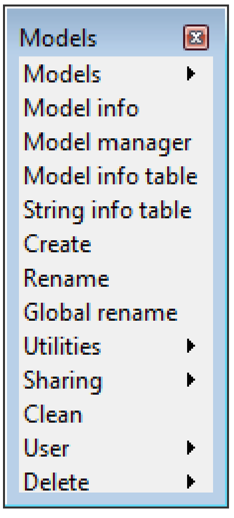
The **Models** walk-right menu is

on Main menu

create floating
Models menu



on 12d Model menu and
floating Models menu



list of models and model info
information on models

in table form, gives min, max x,y,z for each model
" " gives min, max x,y,z for each string in model
create a model
rename a model
rename many models
options to add, remove and save models
sharing models
clean all items in a model
Models User menu
delete models from disk

For the option *Models*, go to section	13.1 Models
Model info	13.2 Model Information
Model manager	
Model info table	13.3 Model Information Table
String info table	13.4 String Information Table
Create	13.5 Create
Rename	13.6 Rename
Global rename	13.7 Global Rename
Utilities	13.8 Utilities
Sharing	13.9 Sharing
Clean	13.10 Clean
Delete	13.11 Delete

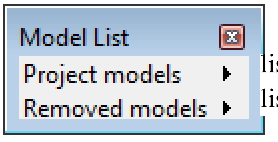
13.1 Models

Position of menu: **Model =>Models**

The **Models** walk-right menu provides options to list all the models in the project, and list all the models in the project area but not added to the project (removed models).

If a model is selected from the project model list, then it is automatically loaded into the **Model Information** panel.

The **Models** walk-right menu is



list of models in project
list of non-project models

For Project models go to 13.1.1 Project Models
Removed models 13.1.2 Removed Models

13.1.1 Project Models

Position of option on menu: **Model =>Models =>Project models**

The **project models** walk-right menu provides a list of all the models in the project and if a model name is selected from the list, a model information panel is fired up with the selected model name already in the model field.

13.1.2 Removed Models

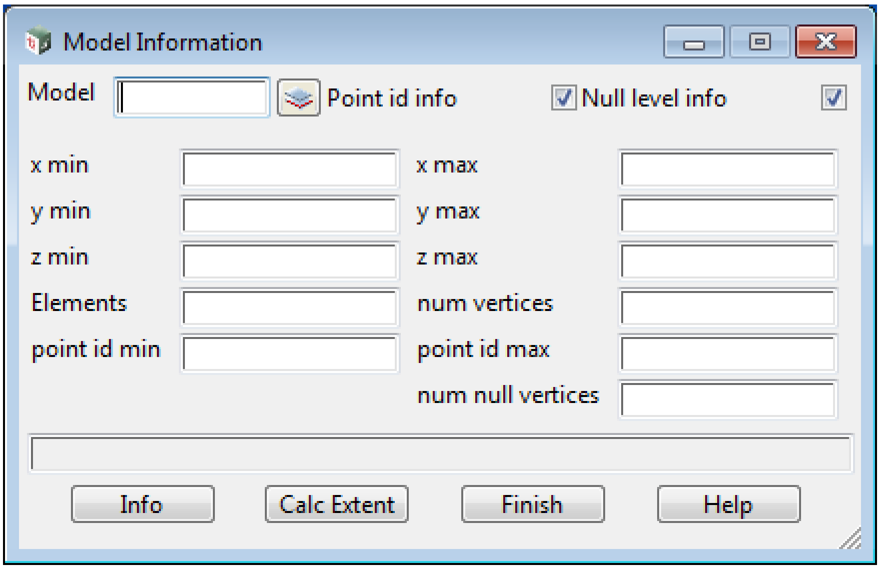
Position of option on menu: **Model =>Models =>Removed Models**

The **removed models** walk-right menu provides a list of all the models in the project area that are not in the project.

They would be mainly models that were in the project but have been removed from the project but not deleted from the disk.

13.2 Model Information

Position of option on menu: **Model =>Model Info**
Selecting **Model info** fires up the **Model Information** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

input the name of the model to get information about

xmin/ymin/zmin, xmax/ymax/zmax output

returns the model limits

point id min/max output

minimum/maximum integer point id in the model

Elements output

returns the number of elements in the model

num vertices output

returns the number of vertices in the model

num null vertices output

returns the number of null vertices in the model

Info button

get the information for the model given in the Model field.

Calc Extent button

recalculate the x, y, z bounding box for the model given in the Model field.

How to Use the Panel

The model information for the model given in the model field is retrieved and placed in the appropriate panel fields when the model name is entered into the model field from the pop-ups, or a <return> is entered after entering the model name into the model field, or on selecting the **Info** button.

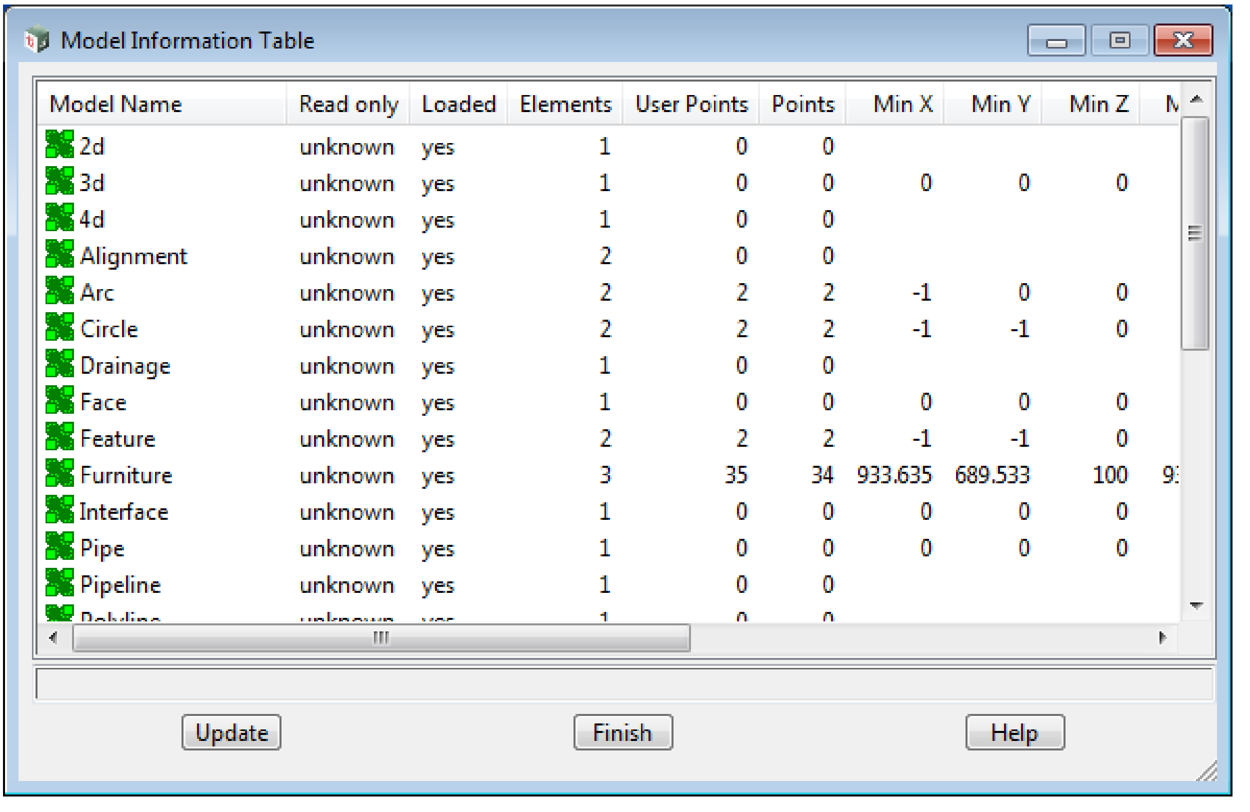
13.3 Model Information Table

Position of option on menu: **Model =>Model Info Table**

The **Model info table** option displays the minimum and maximum x, y and z values for every model in the project in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the **sort** menu on the column header fields.

Selecting **Model info table** fires up the **Model Information Table** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	column		**sort** menu

all the models in the project are listed in the model *column.*

Read only	column		**sort** menu
Loaded	column		**sort** menu

if no, in this current opening of the project, the model has not yet been fully loaded into **12d Model**.

Min X, Min Y, Min Z **Max X, Max Y, Max Z**	columns		**sort** menu

the minimum/maximum values for the model are displayed in the columns

Created/Updated	columns	dates	

date the model was first created/updated

Update	button		

recalculate the minimum/maximum information in the table.

Notes

1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.

13.4 String Information Table

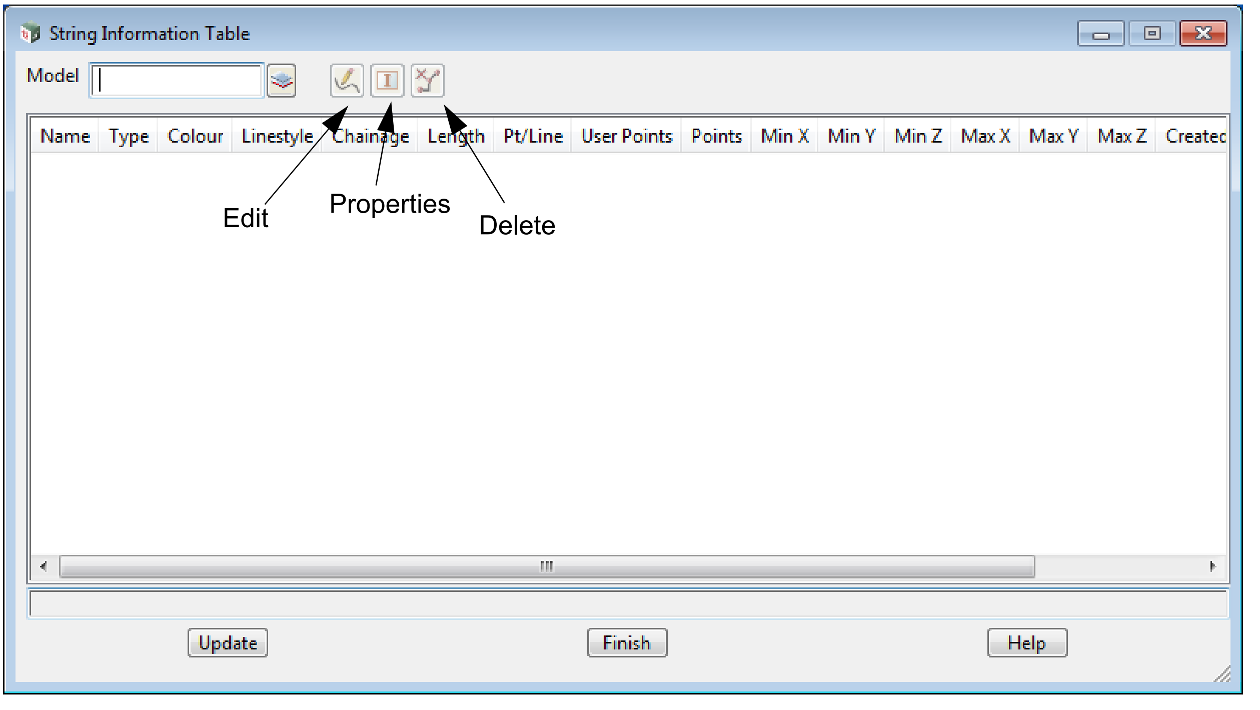
Position of option on menu: **Model =>String info table**

The **String info table** option displays the minimum and maximum x, y and z values for every string in a given model in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the **sort** menu on the column header fields.

Selecting **String info table** fires up the **String Information Table** panel.

The greyed out icons ***Edit***, ***Properties***, ***Delete*** only appear when a model has been selected and a row of the table selected.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	Model box		available models
give the name of the model to calculate the minimum/maximum string information for the table.			
Name	column		**sort** menu
all the strings in the selected model are listed in the name *column.*			
Type, Colour, Linestyle	column		**sort** menu
type, colour and linestyle of the string			
Chainage	column		**sort** menu
start chainage of the string			
Length	column		**sort** menu
2d length of the string			
Pt/Line	column		**sort** menu
point/line breakline type for the string			
Min X, Min Y, Min Z	columns		**sort** menu

Max X, Max Y, Max Z

the minimum/maximum values for each string in the model are displayed in the columns

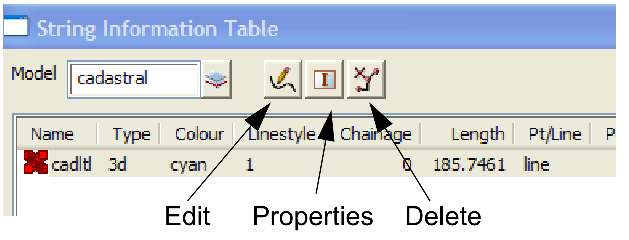
Created/Updated columns dates

date the string was first created/updated

Update button

recalculate the minimum/maximum information in the table.

When data has been read in for a model, the three icons, ***Edit***, ***Properties***, ***Delete*** appear



After clicking on a row in the table (and hence specifying a string), the specified string is highlighted on any plan views it is on, and the icons can be used to *edit* the string, bring up the string properties table or *delete* the string.

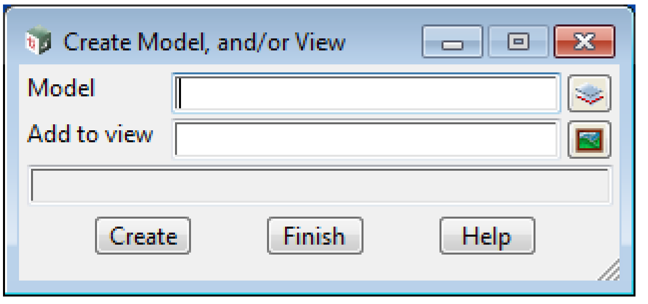
Notes

1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.

13.5 Create

Position of option on menu: **Model =>Create**

On selecting the **Create** option, the **Create Model, and/or View** panel is displayed.This panel can be used to create new models and add a model to a view.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	model box		all models

name of the model to be created and/or added to a model and/or view.

Add to view	view box		all views

if non-blank, the name of the view to which the model given in the model-field will be added.

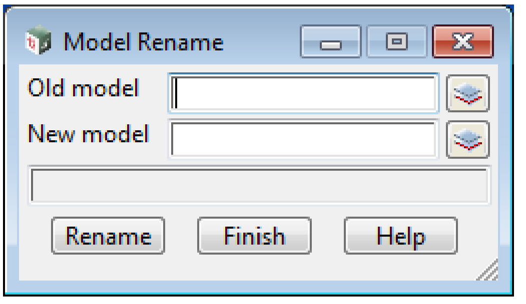
Create	button		

If the model given in the Model field does not exist, it will be created.
If the add to view *field is non-blank, then the model given in the model field will be added to the view given in the* add to view *field.*

13.6 Rename

Position of option on menu: **Model =>Rename**

On selecting the **rename** option, the **Model Rename** panel is displayed. This panel can be used to change the names of existing models



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old model	model box		all models

name of the model to be renamed.

New model	model box		

new name for the model

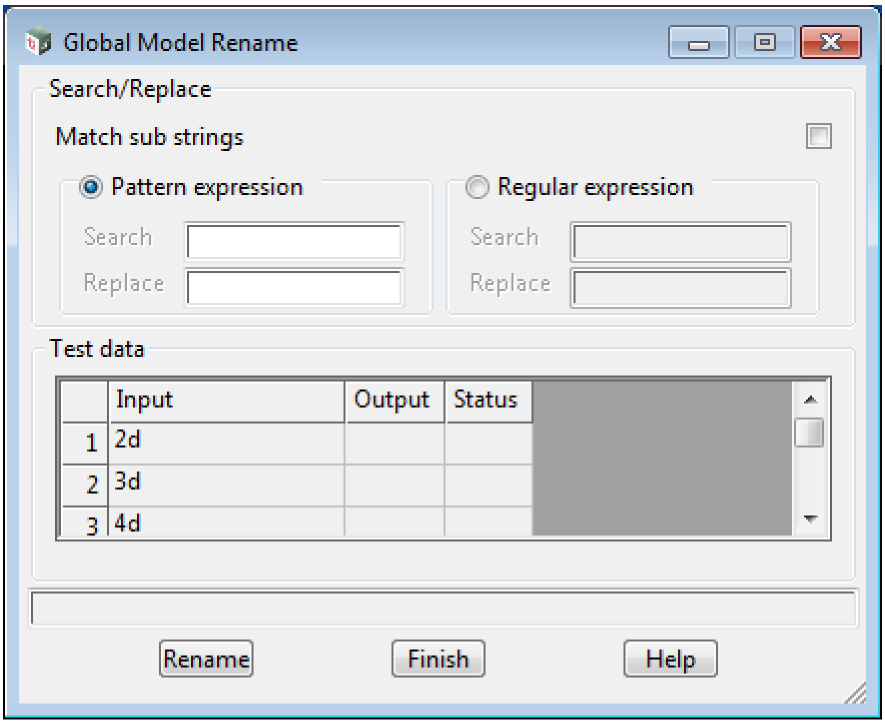
Rename	button		

Change the name of the model in the old model *field to the name given in the* new model *field.*

13.7 Global Rename

Position of option on menu: **Model =>Global rename**

Selecting the **Global rename**, displays the **Global Model Rename** panel. This panel is used to change the names of many existing models by matching according to a *pattern* expression or a *regular* expression.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Match sub strings	tick box		

*if **ticked**, the* Search *expression is used to match against part of each model name.*
*If **not ticked**, the* Search *expression is used to match against the entire model name.*

Pattern expression radio button

*if set on, then **Pattern** expressions given in the* Search *and* Replace *fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the model names. For example " tin" will select all models with a name ending with " tin"*

Replace input

replacement for the search pattern found in the model name. For example, "tin " in the Replace *field, takes the matched part of the model name and adds "tin " to the front of it.*

Hence the Search pattern " tin" and Replace pattern "tin *" finds all models with names ending in " tin" and renames them with the name starting with "tin " (and the " tin" at the end of the name is dropped off).*

Regular expression radio button

*if set on, then **Regular** expressions given in the* Search *and* Replace *fields are used to modify model names.*

Search input

regular expression to search for in the model names.

Replace input

replacement for the search expression found in the model name.

Test data grid

The Test data *grid shows the effect of the Search and Replace on all the model names in the project.*

*The **Input** column shows the existing model name.*
*The **Output** column shows the name after applying the* Search *and* Replace.
*The **Status** column displays if their has been a **match** or **no match**.*

Rename button

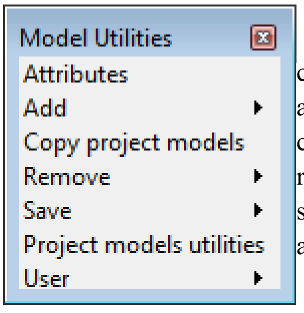
change the name of all the models in the project according to the selected Search *and* Replace *fields.*

13.8 Utilities

Position of menu: **Model =>Utilities**

The **utilities** menu contains miscellaneous options involving models.

The **utilities** walk-right menu is



create/edit attributes for models
add removed and other project models to project
copy model from another project
remove models from project
save models to disk
add/removes, saves, cleans, deletes models

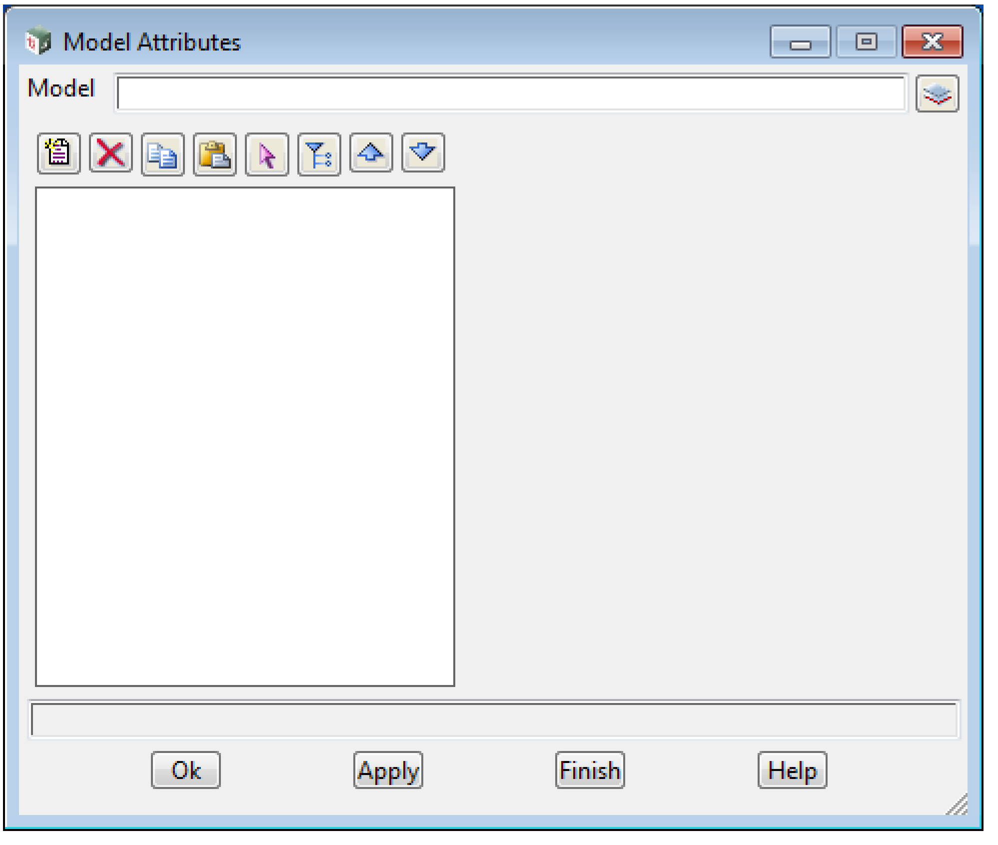
For the option *Attributes*, go to 13.8.1 Attributes
Add 13.8.2 Add
Copy project models 13.8.3 Copy Project Models
Remove 13.8.4 Remove
Save 13.8.5 Save
Project model utilities 13.8.6 Project Model Utilities

13.8.1 Attributes

Position of option on menu: **Model =>Utilities =>Attributes**

The **Attributes** options displays, creates and edits attributes for models.

On selecting **Attributes**, the **Model Attributes** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	DefaultsPop-Up
Model	model box	all available models

model to create/edit attributes of

Name

name of the attribute

Type integer, real, text

type of attribute - integer, real or text

Data

value for the attribute

OK button

set the attributes to the values in the panel and then exit the panel.

Apply button

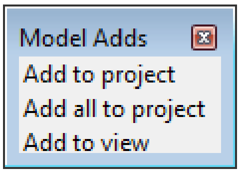
set the attributes to the values in the panel but don't exit the panel.

13.8.2 Add

Position of menu: **Model =>Utilities =>Add**

Models can be added to the project and to views.

The **model adds** walk-right menu is



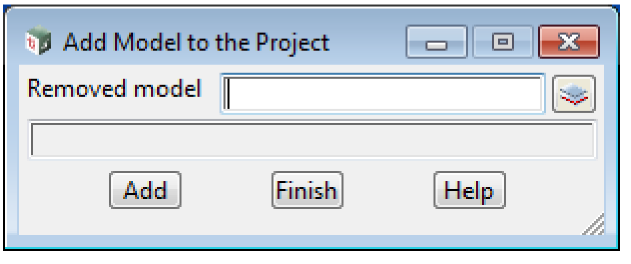
For the option Add to project go to [13.8.2.1 Add To Project](#)
Add all to project [13.8.2.2 Add All To Project](#)
Add to view [13.8.2.3 Add to View](#)

13.8.2.1 Add To Project

Position of option on menu: **Model =>Utilities =>Add =>Add to project**

The **add to project** option is used to add a removed model back into the project.

On selecting the **add to project** option, the **add model to the project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed model	input		removed models

name of the model not in the project that is to be added to the project.

Add	button

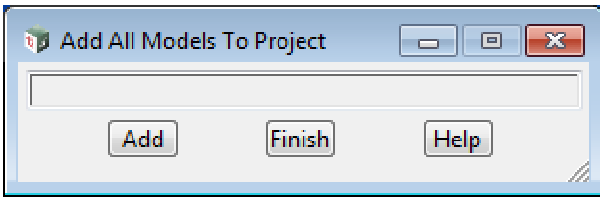
add the model given in the removed model *field to the working project.*

13.8.2.2 Add All To Project

Position of option on menu: **Model =>Utilities =>Add => Add all to Project**

The **add all to project** option is used to add all the removed models back into the project.

On selecting the **add all to project** option, the **add all models to project** panel is displayed.



The fields and buttons used in this panel have the following functions.

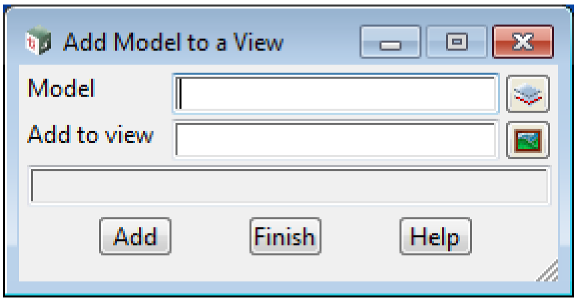
Field Description	Type	Defaults	Pop-Up
Add	button		

after selecting this button, all removed models in the working project will be added to the project.

13.8.2.3 Add to View

Position of option on menu: **Model =>Utilities =>Add =>Add to view**

On selecting the **add to view** option, the **add model to a view** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

name of the model to be added to a view.

Field Description	Type	Defaults	Pop-Up
Add to view	input		available views

name of the view to which the model given in the model *field will be added.*

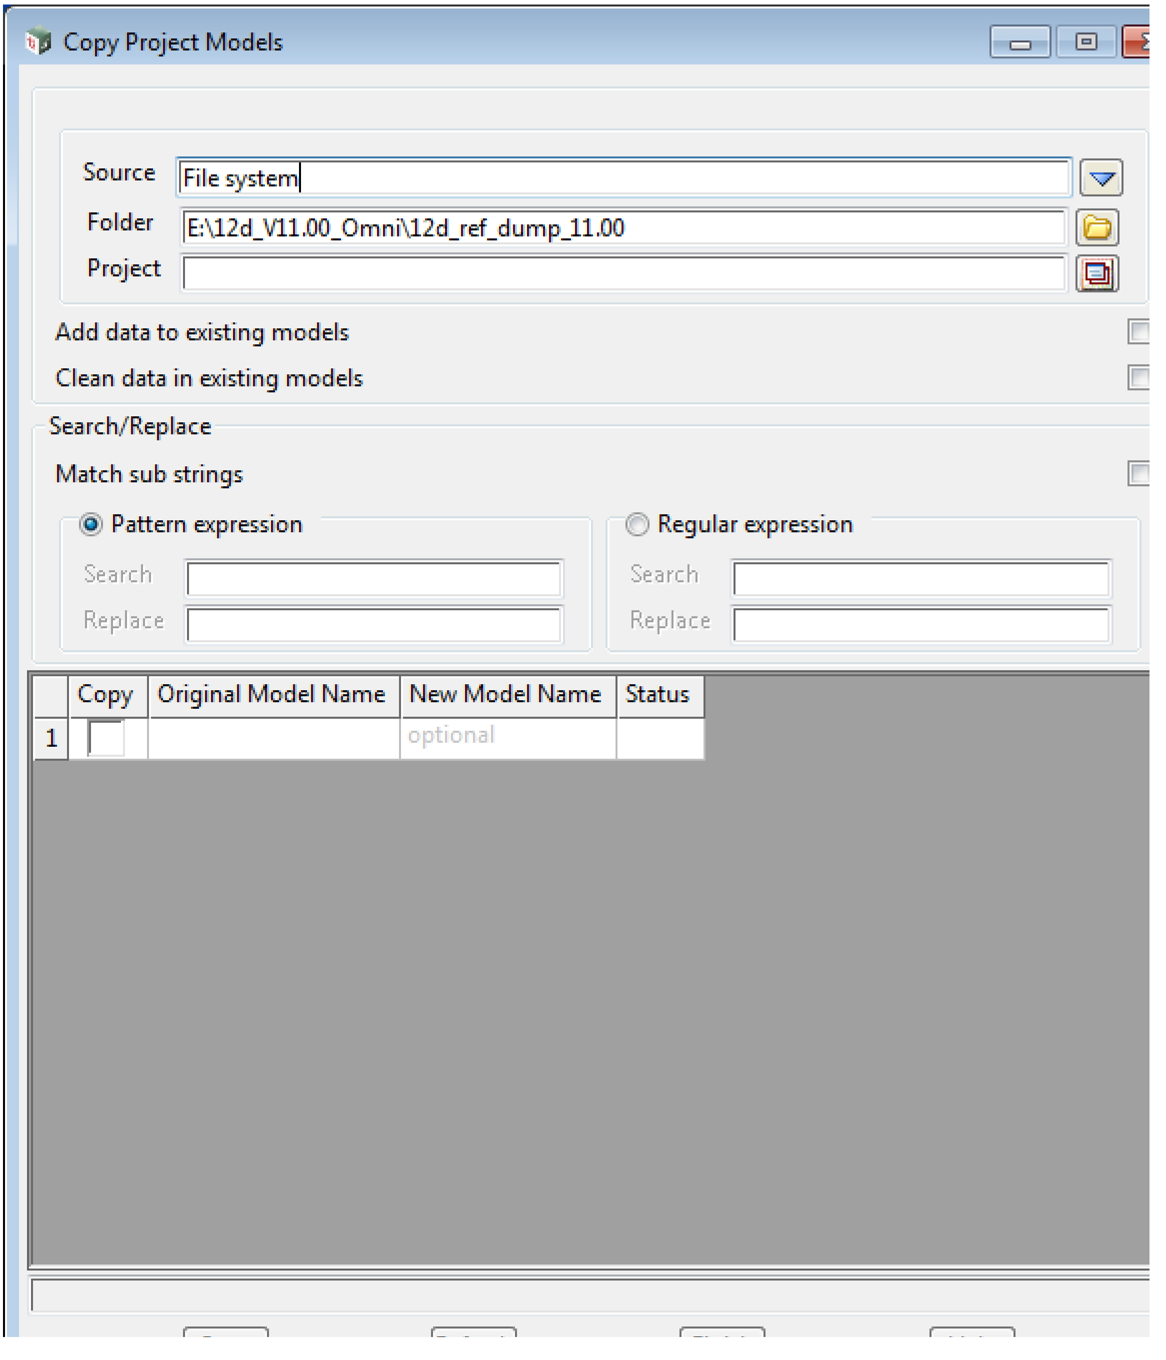
Field Description	Type	Defaults	Pop-Up
Add	button		

add the model given in the model *field to the view given by the* add to view *field.*

13.8.3 Copy Project Models

Position of option on menu: **Model =>Utilities =>Copy Project Models**

Selecting **copy project models** brings up the **Copy Project Models** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	input		Select folder panel

name of the folder that the project to get the model from, is in.

Project	input		projects in the folder

name of the project in the folder given in the folder *field, that the model is to be copied from. Once a project is selected, all the models from that project will be listed in the Original Model Name* *column.*

Add data to existing models tick box

if ticked, if the model that the data is being read into already exists, the new data is copied into the model

Clean data in existing models tick box

if ticked, any existing data in the models being read into, is first cleaned out.

*NOTE - If neither tick box is ticked then if the model already exists, **no data is copied**.*

Search/Replace

section for renaming models from the selected project

Match sub strings tick box

*if **ticked**, the **Search** expression is used to match against part of each model name.*
*If **not ticked**, the **Search** expression is used to match against the entire model name.*

Pattern expression radio button

*if set on, then **Pattern** expressions given in the* Search *and* Replace *fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the model names. For example " tin" will select all models with a name ending with "tin "*

Replace input

replacement for the search pattern found in the model name. For example, "tin " takes the matched part of the model name and adds " tin " to the front of it.

Hence the Search pattern " tin" and Replace pattern "tin *" finds all models with names ending in " tin" and renames them with the name starting with "tin " (and the " tin" at the end of the name is dropped off).*

Regular expression radio button

*if set on, then **Regular** expressions given in the* Search *and* Replace *fields are used to modify model names.*

Search input

regular expression to search for in the model names.

Replace input

replacement for the search expression found in the model name.

Model Names Grid

*The models selected by the Search and Replace expressions are shown in the **Original Model Name** column. Note that if the model already exists in the current project, then the cell for that model in Original Model Name column will be displayed in yellow.*

Copy tick box

if ticked, the model will be copied.
If not ticked, the model will not be copied

*Clicking RB on **Copy** at the top of the column brings up a menu to **Clear** which turns all the ticks off.*

Original Model Name column

name of the existing model in the selected project

New Model Name column

*if **non-blank**, the new name to be given to the copied model.*
If blank, the original model name is used.

The New Model Names can be from applying the Search *and* Replace, or just typing them in.

Status column

displays if their has been a match *or* no match *for the search/replace for renaming models*

Copy button

copy to this project, the model given in the model *field from the project given in the* project *field.*

Refresh button

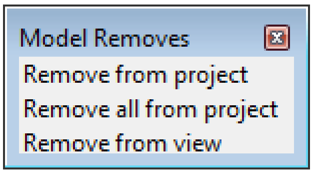
refresh the list of all models in the selected project

13.8.4 Remove

Position of menu: **Model =>Utilities =>Remove**

Models can be removed from the project and from views.

The **model removes** walk-right menu is



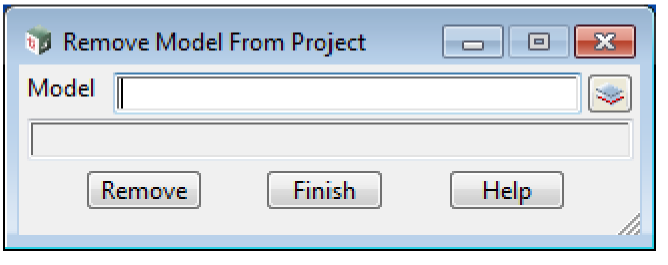
The options in the menu will now be described.

For the option Remove from project go to 13.8.4.1 Remove Model from Project
Remove all from project 13.8.4.2 Remove All Models From Project
Remove from view 13.8.4.3 Remove From View

13.8.4.1 Remove Model from Project

Position of option on menu: **Model =>Utilities =>Remove =>Remove from project**

On selecting the **remove from project** option, the **remove model from project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

name of the model to be remove from the working project.

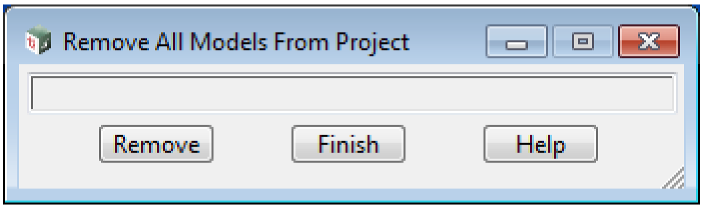
Remove	button		

after selecting this button, the model given in the model field will be removed from the working project.

13.8.4.2 Remove All Models From Project

Position of option on menu: **Model =>Utilities =>Remove =>Remove from all projects**

On selecting the **remove all** option, the **remove all models from project** panel is displayed.



The fields and buttons used in this panel have the following functions.

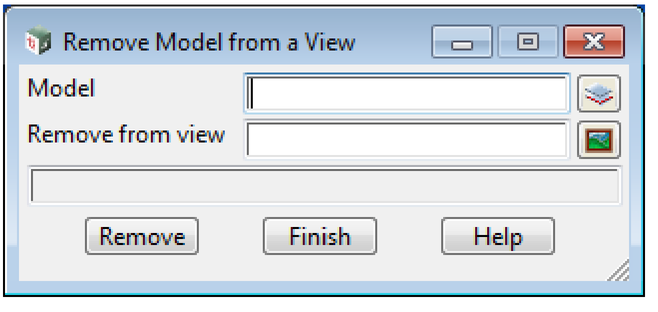
Field Description	Type	Defaults	Pop-Up
Remove	button		

after selecting this button, all models in the working project will be removed. Next, all views will be refreshed. Finally, unless an error occurs, the panel will be removed.

13.8.4.3 Remove From View

Position of option on menu: **Model =>Utilities =>Remove =>Remove from view**

On selecting the **remove from view** option, the **remove model from a view** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

name of the model to be removed from a view.

Field Description	Type	Defaults	Pop-Up
Remove from view	input		available views

name of the view from which the model given in the model *field will be removed.*

Field Description	Type	Defaults	Pop-Up
Remove	button		

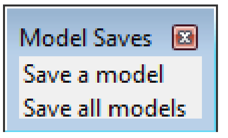
remove the model given in the model *field from the view given in the* remove from view *field.*

13.8.5 Save

Position of menu: **Model =>Utilities =>Save**

Models can be saved on disk so that they can be used for future project work or in other projects.

The **model saves** walk-right menu is



The options in the menu will now be described.

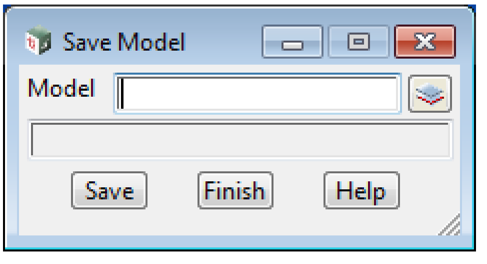
For the option Save a model go to 13.8.5.1 Save a Model

Save all models 13.8.5.2 Save All Models

13.8.5.1 Save a Model

Position of option on menu: **Model =>Utilities =>Save =>Save a model**

On selecting the **save a model** option, the **save model** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

name of the model to be saved.

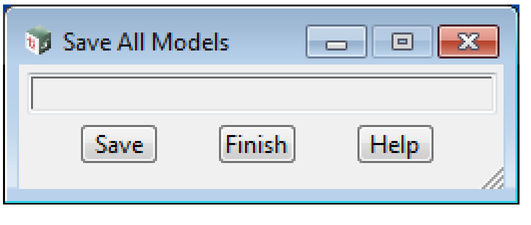
Save	button		

after selecting this button, the model given in the model field will be saved to disk.

13.8.5.2 Save All Models

Position of option on menu: **Model =>Utilities =>Save =>Save all models**

On selecting the **save all models** option, the **save all models** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Save button

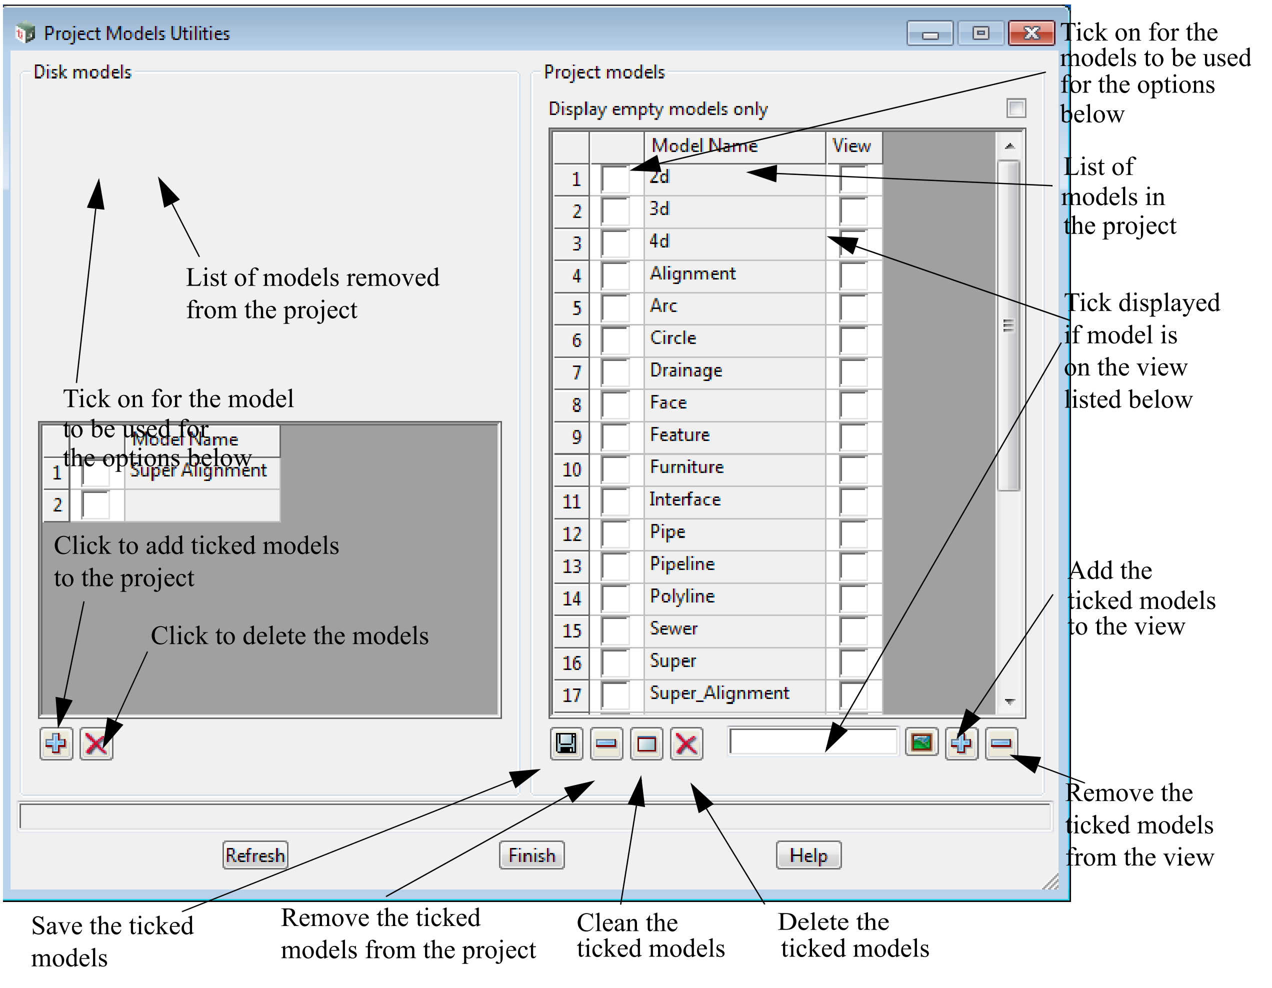
after selecting this button, all models in the working project that have been modified since they were last saved, will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

13.8.6 Project Model Utilities

Position of option on menu: **Model =>Utilities =>Project model utilities**

The **Project Model Utilities** panels can add/remove models from the project, clean and delete models, add/remove models from views.

On selecting **Project model utilities**, the **Project Model Utilities** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type DefaultsPop-Up

Disk Models section

options to add removed models to the project and delete removed models

Project Models section

options to save/remove/clean/delete models, add/remove models from a view

Display empty models only tick box

*if **ticked**, only empty models are listed.*

Refresh button

refresh the model properties displayed in the panel

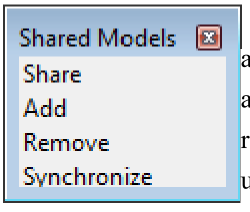
13.9 Sharing

Position of menu: **Model =>Sharing**

Sharing allows models from a project (the server project) to be added to other projects (client projects).

Before any models can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The **Sharing** walk-right menu is



allow models in this project to used by other projects
add a shared model from another project
remove a model shared from another project
updated models shared from other projects

For the option *Share*, go to	13.9.1 Share Models
Add	13.9.2 Add Shared Models
Remove	13.9.3 Remove Shared Models
Synchronize	13.9.4 Synchronize Shared Models

13.9.1 Share Models

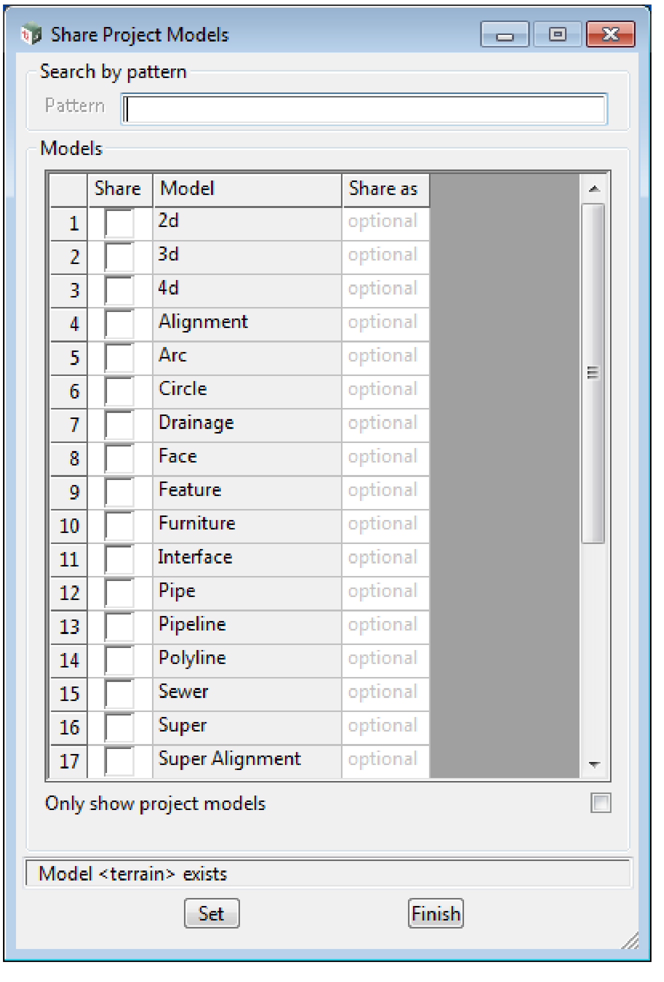
Position of option on menu: **Model =>Sharing =>Share**

Before models in a server project can be added to client projects, the models must be made available for sharing in the server project by using the **Share** option.

All models that have been made available for sharing are displayed in model lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0))

This option also can reverse the process. That is, remove the availability of a model for sharing. If this is done then clients who have shared this model will be warned.when starting up their project and/or synchronizing occurs

Selecting **Share** displays the **Share Project Models** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type DefaultsPop-Up

All the models in the project are listed in the **Share Project Models** *panel and if a model has been tagged for Sharing, a tick will be displayed in the* ***Share*** *column of the grid.*

Pattern

if a pattern is typed then all the models matching the pattern will have a tick placed in the ***Share*** *column. If * is typed then all models are ticked for sharing.*

Share grid column

tick if the model is to be made available for sharing when the **Set** *button is pressed.*

All models that have been made available for sharing are displayed in model lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

Clicking RB on ***Share*** *at the top of the column brings up a menu to* ***Toggle*** *the ticks,* ***Set*** *all the ticks on,* ***Clear*** *to turn all the ticks off.*

Model grid column

this column lists all the models in the project

Share as grid column

an optional name with which the model will be shared out to clients. Leave it blank to share under the original name.

Only show project models tick box

if ticked, only the models which originated from the current project are shown.

Set button

clicking ***Set*** *marks all the models with a tick in the* ***Tick*** *column as being available for sharing. Those models without a tick will not be available for sharing.*

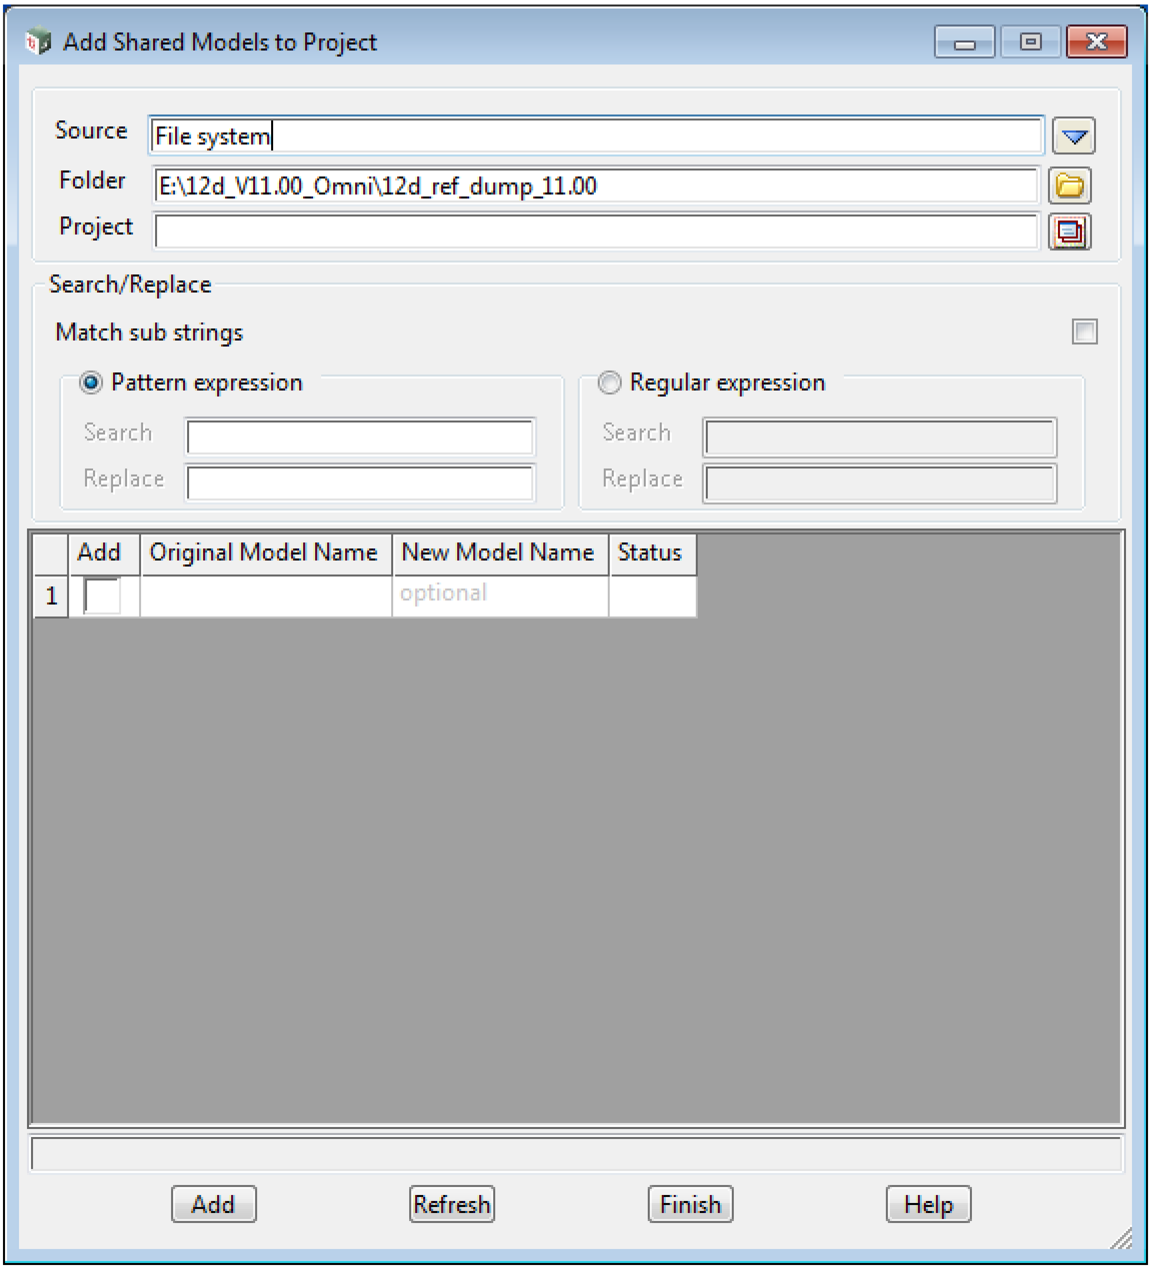
13.9.2 Add Shared Models

Position of option on menu: **Model =>Sharing =>Add**

The **Add** option is used to add shared models from a server project, to this project (a client project).

All models that have been added as shared models are displayed in model lists in a colour defined by an environment variable. The default colour is blue.

Selecting **Add** displays the **Add Shared Models to Project** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	DefaultsPop-Up
Folder	folder box	select folder

folder to look for ***12d Model*** *projects. When a folder is selected, all the* ***12d Model*** *projects in the* *folder will be displayed in a **Projects** pop-up list.*

Project folder box select folder

name of the **12d Model** *project in the folder given in the* Folder *field, to search for models marked for sharing. Once a project is selected, all the models marked for sharing from that project will be listed in the* Original Model Name *column.*

Search/Replace

section for renaming models from the selected project

Match sub strings tick box

*if **ticked**, the **Search** expression is used to match against part of each model name.*
*If **not ticked**, the **Search** expression is used to match against the entire model name.*

Pattern expression radio button

*if set on, then **Pattern** expressions given in the* Search *and* Replace *fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the model names. For example " exist" will select all models with a name ending with " exist"*

Replace input

replacement for the search pattern found in the model name. For example, "exist " in the Replace *field takes the matched part of the model name and adds " exist " to the front of it.*

Hence the Search pattern " exist" and Replace pattern "exist *" finds all models with names ending in " exist" and renames them with the name starting with "exist " (and the " exist" at the end of the name is dropped off).*

Regular expression radio button

*if set on, then **Regular** expressions given in the* Search *and* Replace *fields are used to modify model names.*

Search input

regular expression to search for in the model names.

Replace input

replacement for the search expression found in the model name.

Model Names Grid

The models available for sharing in the selected project are shown in the Original Model Name *column. Any renaming by the Search and Replace expressions are shown in the* New Model Name *column. Note that if the model already exists in the current project, then the cell for that model in* Original Model Name *column will be displayed in yellow.*

Add tick box

if ticked, the model will be added to this project as a shared model.
If not ticked, the model will not be added to this project as a shared model.

*Clicking RB on **Add** at the top of the column brings up a menu to **Clear** which turns all the ticks off.*

Note - a shared model that has been previously added can only be removed by using the **Model =>Sharing =>Remove** *option.*

Original Model Name column

this column lists all the models in the server project available for sharing.

New Model Name column

*if **non-blank**, the new name to be given to shared model in this project.*
If blank, the original model name is used.

The New Model Names *can be from applying the* Search *and* Replace, *or by just typing them in.*

Status output column

displays if their has been a match *or* no match *for the search/replace for renaming models*

Add button

add to this project (a client project) as a shared model, the ticked models given in the Original Model Name *field from the project given in the* Project *field.*

Refresh button

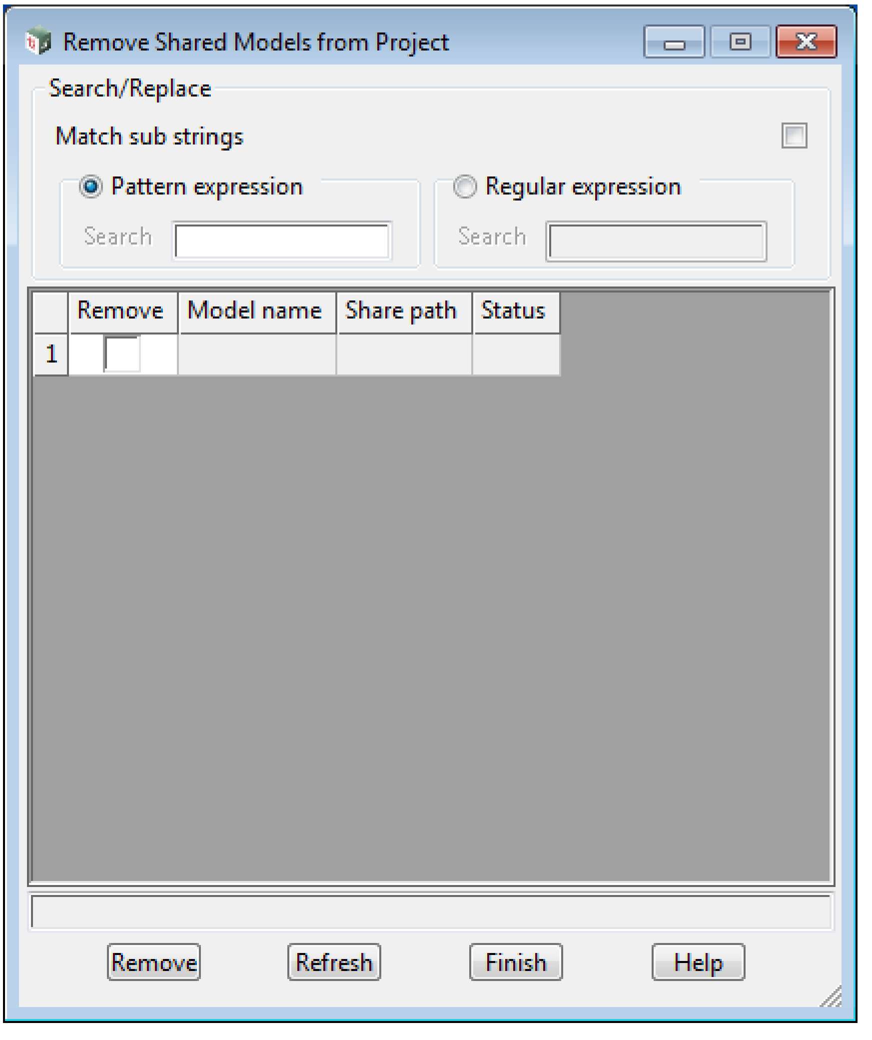
refresh the list of all models available for sharing in the selected server project

13.9.3 Remove Shared Models

Position of option on menu: **Model =>Sharing =>Remove**

The **Remove** option is used to remove shared models from the.project. The shared models would have been previously added to the project with the **Model =>Sharing =>Add** option.

Selecting **Remove** displays the **Remove Shared Models from Project** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type DefaultsPop-Up

Search/Replace

section for selecting by expressions, models in this project that are shared from other projects

Match sub strings tick box

*if **ticked**, the **Search** expression is used to match against part of each model name.*
*If **not ticked**, the **Search** expression is used to match against the entire model name.*

Pattern expression radio button

*if set on, then **Pattern** expressions given in the* Search *fields are used to select shared model names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the model names. For example " exist" will select all models with a name ending with " exist"*

Regular expression radio button

*if set on, then **Regular** expressions given in the* Search *field are used to select shared model names.*

Search input

regular expression to search for in the shared model names.

Model Names Grid

list of all shared models added to the project.

Remove tick box

if ticked, the model will be removed from this project as a shared model.
If not ticked, the model will not be removed.

*Clicking RB on **Remove** at the top of the column brings up a menu to **Clear** which turns all the ticks off.*

Model Name column

this column lists all the models added as shared models from other server projects

Share path

this column lists the path name to the server project and the original model name in the server project

Status column

displays if their has been a match *or* no match *for the* Search *for selecting shared models*

Remove button

*clicking **Remove** removes as shared models from this project, all the models with a tick.*

Refresh button

*clicking **Refresh** refreshes the list of all shared models previously added to the project*

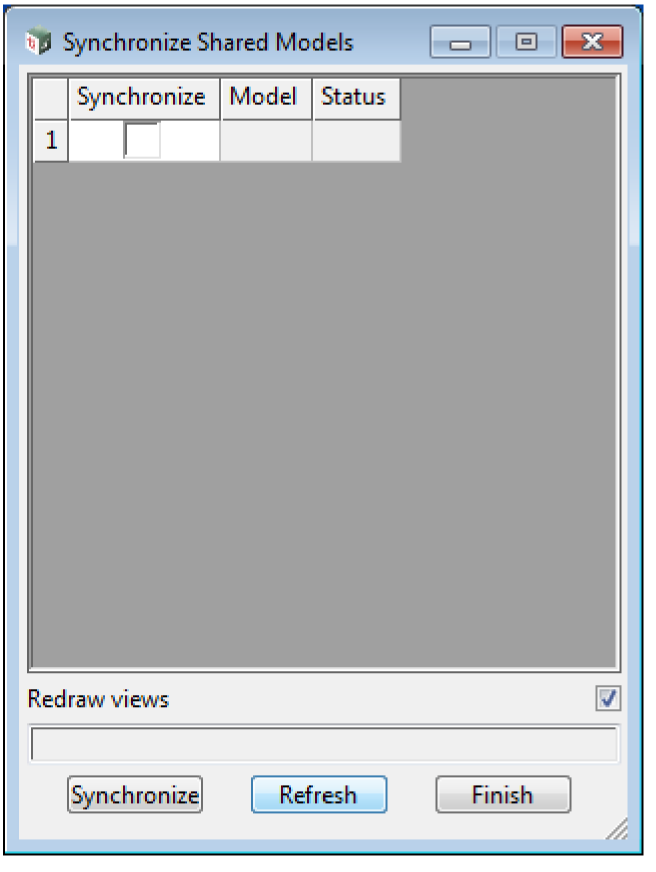
13.9.4 Synchronize Shared Models

Position of option on menu: **Model =>Sharing =>Synchronize**

The **Synchronize** option is used to updated any added shared models. The shared models would have been previously added to the project with the **Model =>Sharing =>Add** option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section 7.6.13.4 Project Share Settings.

Selecting **Synchronize** displays the **Synchronize Shared Models** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type DefaultsPop-Up

Synchronize tick boxes in grid column

*if ticked and the model has changed in the server project, then it will be re-copied from the server project when the **Synchronize** button is pressed.*

*Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Model grid column

this column lists all the models in this project that have been added from other (server) projects

Synchronize button

*clicking **Synchronize** re-copies any models with a tick from the server projects*

Status

*Status will either be **Ok** or **No Longer Shared** to reflect the status of the model on that row.*

Redraw views tick box

Whether or not to redraw all the views any of the synchronized models are on.

Refresh button

*clicking **Refresh** refreshes the list of all shared models previously added to the project*

13.10 Clean

Position of option on menu: **Model => Clean**

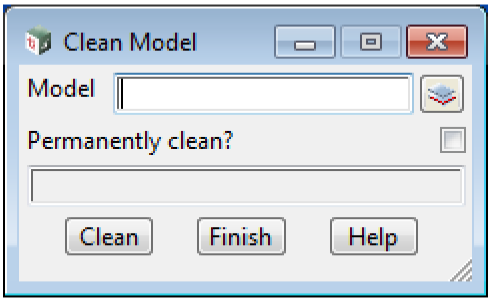
The **clean** option is used to delete all the strings in a model but the model itself is not deleted. The model is still attached to any views it had been added to.

To help protect the user against disasters, when a model is selected for cleaning, a **yes-no** pop-up menu is invoked to confirm that the user did intend cleaning out the model.

Wild cards (*) and wild characters (!) can be used to select the models to clean and then a list of selected models is displayed for confirmation.

If cleaning is confirmed, all the strings in the selected models are deleted.

Selecting **Clean** displays the **Clean Model** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	model box		available models

*name of the model to be cleaned out. Wild cards * and characters ? can be used to give a list of models to be cleaned.*

Permanently clean?	tick box		

if ticked, the cleaned strings will not go to the trash bin but will be permanently deleted.

Clean	button		

after selecting this button, all strings in the model given in the model *field will be deleted. A* **yes-no** *pop-up is used to confirm that cleaning is required.*

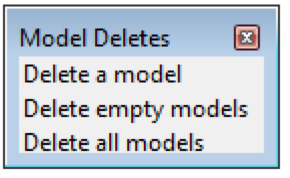
13.11 Delete

Position of menu: **Model => Delete**

Using the **delete** option, models can be deleted from disk so that they no longer can be accessed or take up disk space.

To help protect the user against disasters, when a model is selected for deletion, a **yes-no** pop-up menu is used to confirm that deleting the model is intended. If deletion is confirmed, the selected model is deleted from the project and the disk. For extra security, there is also a ***Trash Bin*** (see 7.6.15 Trash Bin) where models can automatically be moved to on delete before being permanently deleted from disk.

The model **delete** walk-right menu is



For the option *Delete a model*, go to	13.11.1 Delete a Model
Delete empty models	13.11.2 Delete Empty Models
Delete all models	13.11.3 Delete All Models

13.11.1 Delete a Model

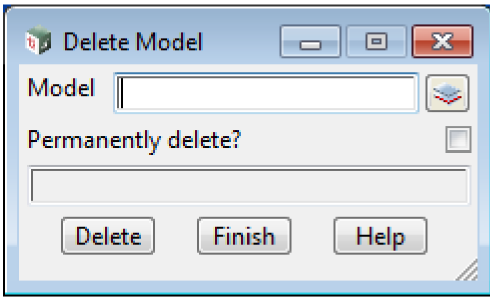
Position of option on menu: **Model =>Delete =>Delete a Model**

The **delete a model** option is used to delete a model in the working project.

Wild cards (*) and wild characters (!) can be used to select the models to delete and then a list of selected models is displayed for confirmation.

If a ***12d Model*** *trash bin* is being used, the deleted models may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

Selecting **Delete a model** brings up the **Delete Model** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

*name of the model to be deleted. Wild cards * and characters ? can be used to give a list of models to be deleted.*

Permanently delete	tick box		

if ticked, the deleted models will not go to the trash bin but will be permanently deleted from disk.

Delete	button		

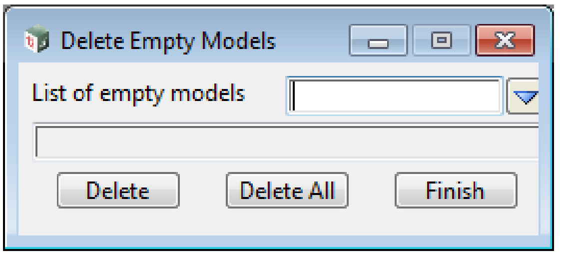
after selecting this button, the model given in the model field will be deleted from the computer disk. A **yes-no** *pop-up is used to confirm that deletion is required.*

13.11.2 Delete Empty Models

Position of option on menu: **Model =>Delete =>Delete Empty Models**

The **delete empty models** option displays a list of all the empty models in the project and can delete selected empty models or all of them.

Selecting **Delete empty models** brings up the **Delete Empty Models** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
List of empty models	models		available models

the pop-up brings up a list of all the empty models in the project. A model can be selected from the list and it will be deleted after selecting the **delete** *button.*

Delete	button		

delete the model given in the list of empty models *field.*

Delete all	button		

delete all the empty models in the project.

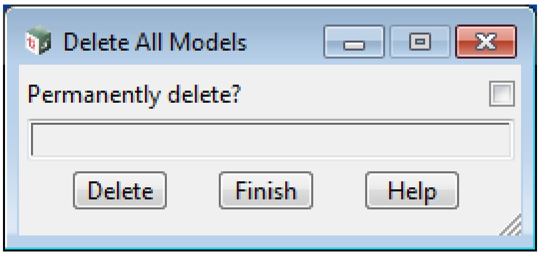
13.11.3 Delete All Models

Position of option on menu: **Model =>Delete =>Delete All Models**

The **delete all models** option will delete all the models in the project. It does not delete models that are in the project area but not yet added to the project.

If a ***12d Model*** *trash bin* is being used, the deleted models may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

On selecting the **Delete all models** option, the **Delete All Models** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Permanently delete	tick box		

if ticked, the deleted models will not go to the trash bin but will be permanently deleted from disk.

Delete	button		

after selecting this button, a **yes-no** *pop-up is used to confirm that deletion is required. If it is, all models in the working project will be deleted from disk. All views will be refreshed and unless an error occurs, the panel will be removed.*

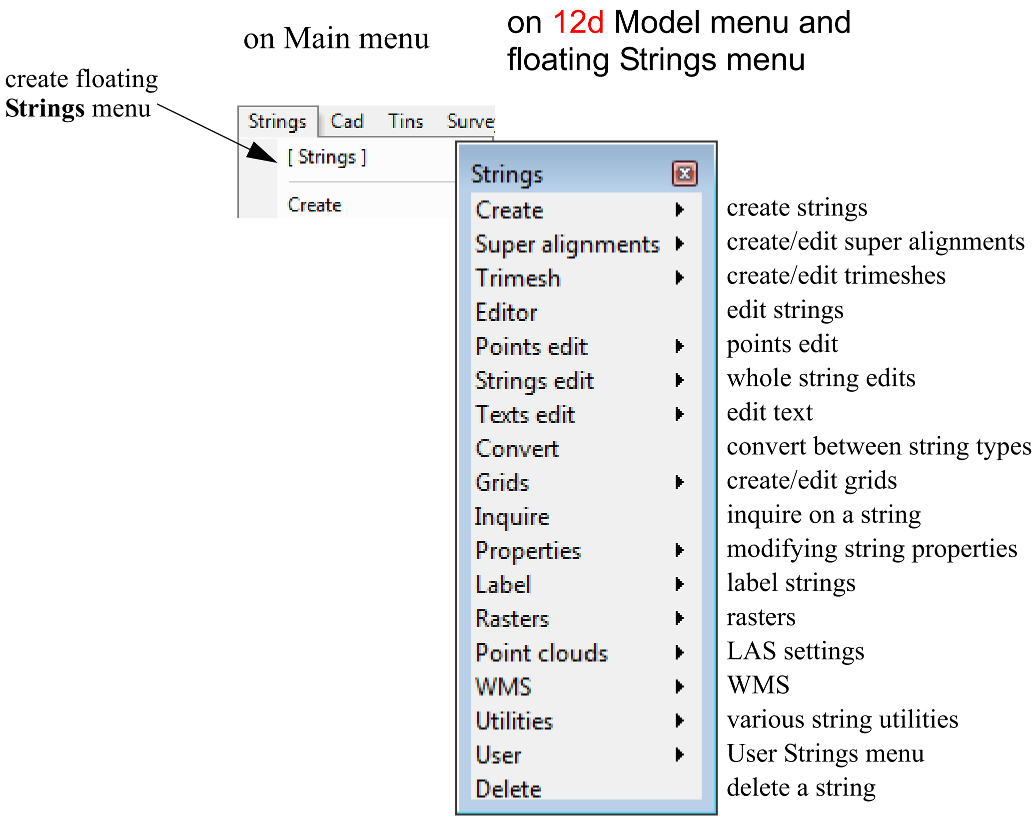
14 Strings

Position of menu: **Strings**

Strings are the basic modelling elements of 12d Model.

The Strings walk-right menu contains options to create, edit and manipulate strings in a variety of ways including copying, moving strings between models and deleting strings.

The **Strings** walk-right menu is



For the options:

Create	14.1 Create
Super alignments	14.2 Super Alignments
Trimesh	14.3 Trimesh
Editor	14.4 Editor
Points edit	14.5 Points Edit
Strings edit	14.6 Strings Edit
Texts edit	14.8 Texts Edit
Convert	14.9 Convert
Grids	14.10 Grids
Inquire	14.11 Inquire
Properties	14.12 Properties
Label	14.13 Label
Rasters	14.14 Rasters
Point clouds	14.15 Point Clouds
WMS	14.16 WMS

Note

For the floating menu, the **Strings** option has another mode of operation. Rather than moving onto the walk-right arrow, if LB is clicked when the **Strings** button is highlighted on the 12d Model menu, the **String inquire** panel is displayed on the screen. Unfortunately this does not work on the *Main* menu.

14.1 Create

Position of option on menu: **Strings =>Create**

The **Create** option is used to produce new strings. If a string already exists, the **Editor** option is used to modify it.

The **Create** walk-right menu contains options to create 2d, 3d, 4d, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Note that the 2d, 3d, 4d, pipe and polyline strings are actually super strings but automatically set some of the properties of the super string. For example a 2d string is a super string with just one constant z-value. Any of these strings can be made a full super string by clicking on the *Advanced Mode* icon in the string editor.

Once a string has been created, it can be converted to most of the other string types using the string **Convert** option.

To create a new string of the same type and with similar header information as an existing string, the **same as** option is selected from the **String Create** menu.

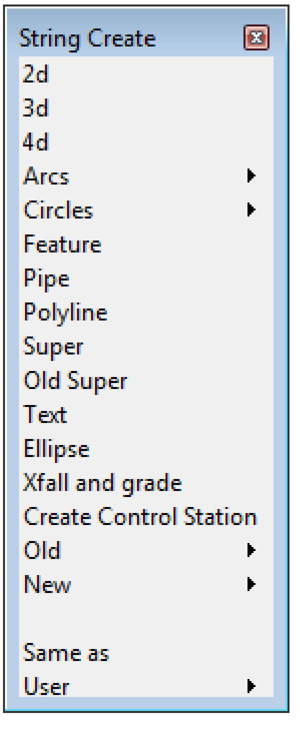
Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

   Linestyles can be defined that drawn lines between the points even though the breakline type is **point**.

2. The string vertices are also called intersection points (IP's).

The **String Create** walk-right menu is



The string creation process is similar for each string type and for editing strings as well.

For the option *2d,* go to 14.1.1 Create - 2d Super

3d 14.1.2 Create - 3d Super

4d	14.1.3 Create - 4d Super
Super alignment	14.1.4 Create Arcs
Arcs	14.1.4 Create Arcs
Circles	14.1.5 Create - Circles
Feature	14.1.6 Create - Feature
Pipe	14.1.7 Create - Pipe Super
Polyline	14.1.8 Create - Polyline Super
Super	14.1.9 Create - Super
Text	14.1.10 Create - Text
Ellipse	14.1.11 Create - Ellipse
Xfall and grade	20.8.11 String by Xfall and Grade
Control stations	14.1.12 Create - Control Stations
Old	14.20.1 Old
New	14.1.13 New
Same as	14.1.14 Create - Same As

14.1.1 Create - 2d Super

Position of option on menu: **Strings =>Create =>2d**

A *2d super string* is a *super string* with the restriction that it has:

(a) vertices of (x,y) co-ordinates joined by straight segments only

(b) One z-value for the entire string

That is, a 2d string consists of a series of (x,y) vertices joined only by straight segments, and all with the same z-value (height). 2d strings are often referred to as “contour strings” because contours are the most common example of a string with a constant height.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super 2d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super 2d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

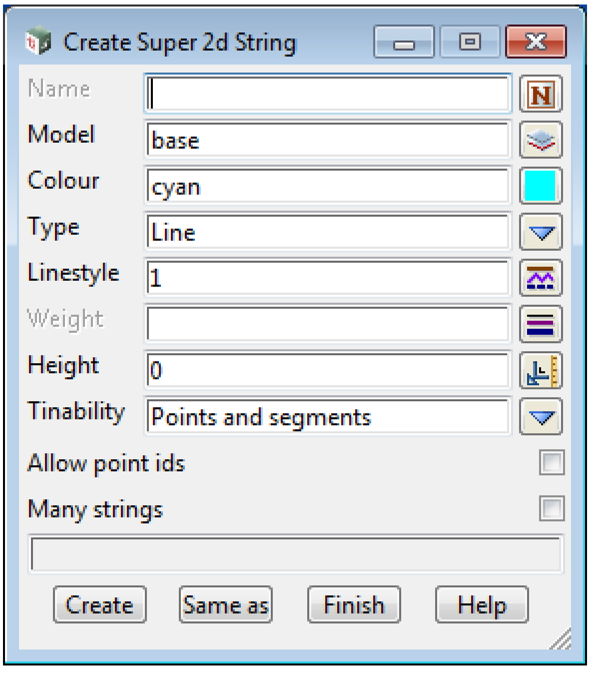
The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, model, colour, type, linestyle, weigh of the **Create Super 2d String** panel.

From *12d Model 8* onwards, the default is to create *2d super strings* rather than the *2d strings* used up to *12d Model 7*. A *2d super string* is a *super string* with *Constant height*. That is, there is only one z-value for the entire string. The advantage is using a *2d super string* is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id’s for setout.

The older *2d string* create options are still available under

Strings =>Create =>Old (go to the section 14.20.1.2 Create - 2d (pre V8))

On selecting **2d** the **Create Super 2d String** panel is displayed.



The default values for the panel fields are taken from the *CAD Controlbar (see* 15.1 Controlbars*)*

To create a *new 2d super string* (a *2d super string* is a *super string* with the *constant height* flag set on), the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super 2d String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input	from CAD controlbar	
the name of the new string			
Model	model box	from CAD controlbar	available models
name of the model that the new string is in			
Colour	colour box	from CAD controlbar	available colours
the colour of the new string			
Type	choice box	line	line, point
breakline type (point-line type) of the string			
Linestyle	input	from CAD controlbar	available line styles
line style of the string			
Weight	input	from CAD controlbar	
thickness of the string			
Height	input	from CAD controlbar	
for a 2d super string, there is only one height (z-value) for the entire string.			
Tinability	choice box	Points and segments	Points and segments Points only Not tinable

*if **Vertices and segments**, all the vertices and segments of the string are set to **tinable**.
If **Vertices only**, all the vertices are set to tinable and the segments to not tinable.
If **Not tinable**, all the vertices or segments are set to **not tinable**.*

Allow point ids tick box

*if **ticked**, the 2d super string can have point ids for each vertex.
If **not ticked**, the 2d super string will not have point ids. This can be reversed if point ids are required in the future.*

Many strings tick box

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the **Create** *button is chosen, the* **Edit 2d** *menu is displayed.*

Same as button

After the **Same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

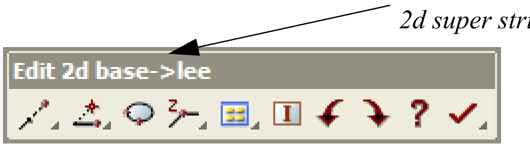
Finish button

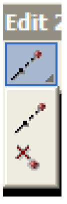
*end the option, **don't** proceed to the edit stage.*

Start Edit - 2d Super

On selecting the **Create** button in the **Create Super 2d String** panel the **Edit 2d** menu is placed on the screen. The **Edit 2d** menu for a *2d super string* is

model ->string_name *for the 2d super string being edited*





append or prepend an IP

delete an IP

To create a new *2d super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Edit 2d** menu are usable.

The options in the **Edit 2d** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit 2d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 2d Editor, go to the section 14.4.2 Edit 2d

14.1.2 Create - 3d Super

Position of option on menu: **Strings =>Create =>3d**

A 3d super string consists of a series of (x,y,z) vertices, joined only by straight segments.

The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each string vertex, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a special case of a 3d string where the heights at all the vertices are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is required at each string vertex.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super 3d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super 3d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

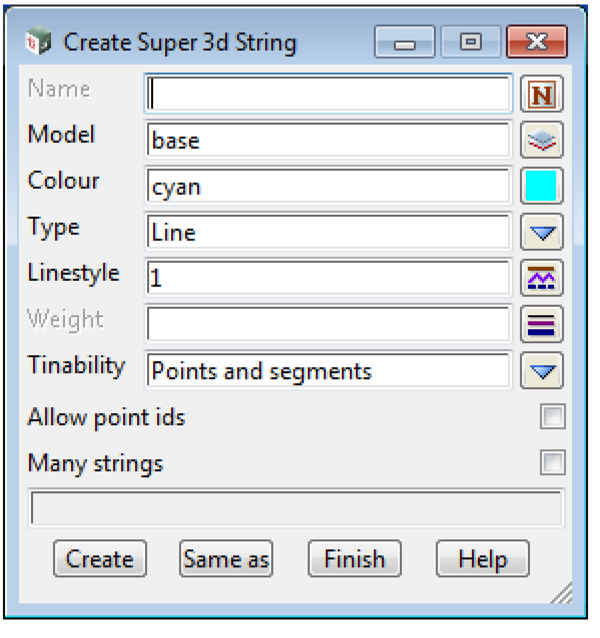
The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, model, colour, type, linestyle and weight of the **Create Super 3d String** panel.

From *12d Model 8* onwards, the default is to create *3d super strings* rather than the *3d strings* used up to *12d Model 7*. The advantage is using a *3d super string* is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older *3d string* create option is still available under

Strings =>Create =>Old (go to the section 14.20.1.3 Create - 3d (pre V8))

On selecting the **3d** option, the **Create Super 3d String** panel is displayed.



The default values for the panel fields are taken from the *CAD Controlbar (see* 15.1 Controlbars*)*

To create a *new 3d super string*, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super 3d String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input	from CAD controlbar	

the name of the new string

Model	model box	from CAD controlbar	available models

name of the model that the new string is in

Colour	colour box	from CAD controlbar	available colours

the colour of the new string

Type	choice box	line	line, point

breakline type (point-line type) of the string

Linestyle	input	from CAD controlbar	available line styles

line style of the string

Weight	input	from CAD controlbar	

thickness of the string

Tinability	choice box	Points and segments	Points and segments Points only Not tinable

*if **Vertices and segments**, all the vertices and segments of the string are set to **tinable**.*
*If **Vertices only**, all the vertices are set to tinable and the segments to not tinable.*
*If **Not tinable**, all the vertices or segments are set to **not tinable**.*

Allow point ids tick box

*if **ticked**, the super string can have point ids for each vertex.*
*If **not ticked**, the super string will not have point ids. This can be reversed if point ids are required in the future.*

Many strings tick box

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

after the **Create** *button is chosen, the* **Edit 3d** *menu is displayed*

Same as button

after the **Same as** *button is chosen, another string is selected and information about it is used for the fields in this panel*

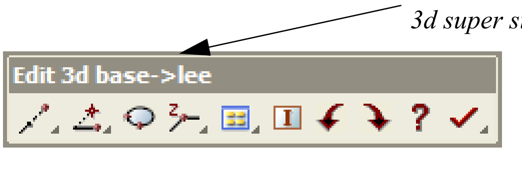
Finish button

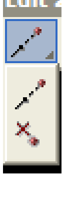
*end the option, **don't** proceed to the edit stage*

Start Edit - 3d Super

On selecting the **Create** button in the **Create Super 3d String** panel the **Edit 3d** menu is placed on the screen. The **Edit 3d** menu for a *3d super string* is

model ->string_name *for the 3d super string being edited*





append or prepend an IP

delete an IP

To create a new *3d super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Edit 3d** menu are usable.

The options in the **Edit 3d** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit 3d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 3d Editor, go to the section 14.4.3 Edit 3d

14.1.3 Create - 4d Super

Position of option on menu: **Strings =>Create =>4d**

A 4dsuper string consists of a series of (x,y,z) co-ordinates joined only by straight segments, and a text label at each vertex.

Creating and editing a 4d string is very similar to a 3d string.- the major difference is that a height and a text label is required at each string vertex.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super 4d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super 4d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

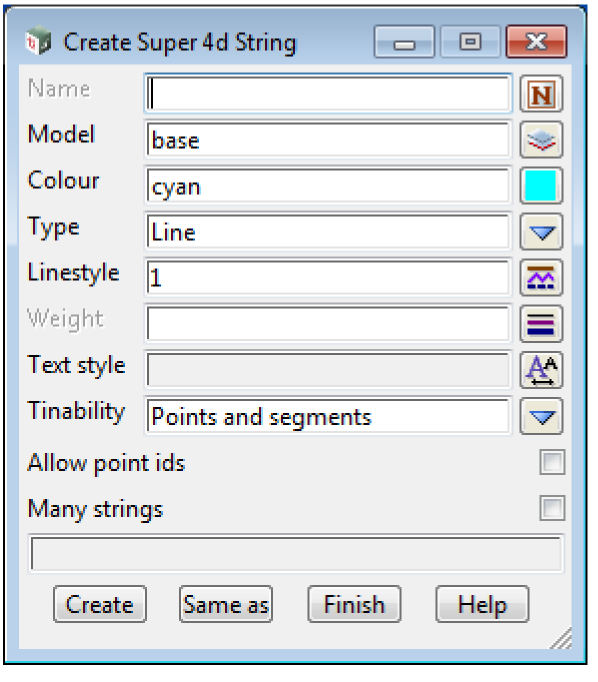
The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle and weight of the **Create Super 4d String** panel.

From *12d Model 8* onwards, the default is to create *4d super strings* rather than the *4d strings* used up to *12d Model 7*. The advantage is using a *4d super string* is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older *4d string* create option is still available under

Strings =>Create =>Old (go to the section 14.20.1.4 Create - 4d (Pre V8))

On selecting the **4d** option, the **Create Super 4d String** panel is displayed.



The default values for the panel fields are taken from the *CAD Controlbar (*see 15.1 Controlbars*)*

To create a *new 4d super string*, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super 4d String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input	from CAD controlbar	
the name of the new string			
Model	model box	from CAD controlbar	available models
name of the model that the new string is in			

Colour colour box from CAD controlbar available colours

the colour of the new string

Type choice box line line, point

breakline type (point-line type) of the string

Linestyle linestyle box from CAD controlbar available line styles

*if **Vertices and segments**, all the vertices and segments of the string are set to **tinable**.*
*If **Vertices only**, all the vertices are set to tinable and the segments to not tinable.*
*If **Not tinable**, all the vertices or segments are set to **not tinable**.*

Allow point ids tick box

*if **ticked**, the super string can have point ids for each vertex.*
*If **not ticked**, the super string will not have point ids. This can be reversed if point ids are required in the future.*

Many strings tick box

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

after the **Create** *button is chosen, the* **Edit 4d** *menu is displayed*

Same as button

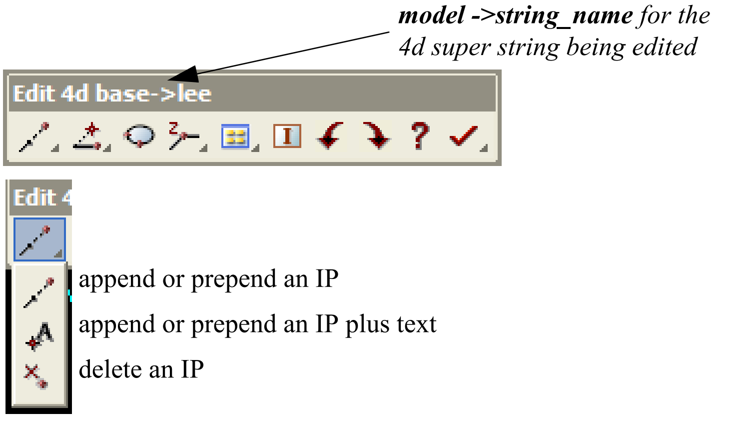
after the **Same as** *button is chosen, another string is selected and information about it is used for the fields in this panel*

Finish button

*end the option, **don't** proceed to the edit stage*

Start Edit - 4d Super

On selecting the **Create** button in the **Create Super 4d String** panel the **Edit 4d** menu is placed on the screen. The **Edit 4d** menu for a *4d super string* is



To create a new *4d super string*, select the **Append** or **Append** + **Text** icon.

The **Append** and or **Append** + **Text** option are used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex. **Append** + **Text** also asks for text at each vertex.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

If **Append** + **text** was selected, the user will then be prompted for the text to be placed at that vertex.

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Edit 4d** menu are usable.

The options in the **Edit 4d** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit 4d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 4d Editor, go to the section 14.4.4 Edit 4d

14.1.4 Create Arcs

Position of menu: **Strings =>Create =>Arcs**

The **Create arcs** option is used to create 12d Model arcs.

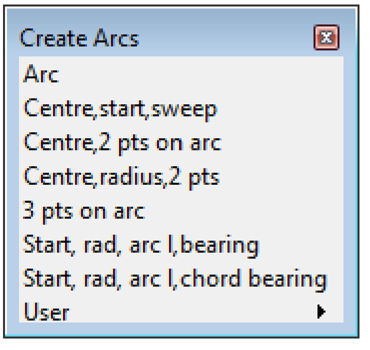
A 12d Model arc consists of a radius, a centre point, and a start and end point on the arc.

The radius can be positive or negative. If the radius is positive, the arc is drawn from the start-point to the end-point in a clockwise direction. If the radius is negative, the arc is drawn from the start-point to the end-point in counter-clockwise direction.

The height at the start point and at the end point can be different. In that case, the arc is still a plan arc but the z- value varies linearly from the start point to the end point as one moves around the arc. Hence the 12d Model arc string is actually a helix with its centre-line perpendicular to the xy-plane.

For convenient 12d Model includes a variety of methods for creating arcs.

On selecting the **Arcs** option, the **Create arcs** menu is displayed giving all the different methods for creating arcs.



Each option in the **Create arcs** menu fires up its own special panel to collect the necessary information for defining the arc.

The mouse is used to select the special points required for the arc and circle definitions. For example, in the **arc - 3 points on arc** option, the three points are selected using the mouse.

Unlike the other strings created under strings=>create, the arc can be created immediately without needing any options from the arc editors.

Consequently, after an arc is defined, the create panel is not removed and is left on the screen to create another arc. Any information that needs modifying is changed in the **arc** panel and is used for the new create.

New arcs are created until either the panel is removed by selecting the **finish** or **[X]** button, or the create terminated by selecting **cancel** from the **pick ops** menu in which case the panel will be left on the screen. In the last case, the arc button is then used to begin a new create sequence.

Each of the methods for creating arcs will now be described.

For the option

Arc, go to 14.1.4.1 Create - Arc
Centre,start,sweep 14.1.4.2 Create Arc - Centre Point, Start Point and Sweep
Centre,2 pts on arc 14.1.4.3 Create Arc - Centre Point, Start and End Points
Centre,radius,2 pts 14.1.4.4 Create Arc - Centre, Radius, Start and End Points
3 pts on arc 14.1.4.5 Create Arc - Three Points on Arc
Start, rad, arc l, bearing 14.1.4.6 Create Arc - Start Point, Radius, Arc Length and Start Bearing
Start, rad, arc l, chord bearing 14.1.4.7 Create Arc - Start Point, Radius, Arc Length and Chord Bearing

14.1.4.1 Create - Arc

Position of option on menu: **Strings =>Create =>Arcs =>Create Arcs**

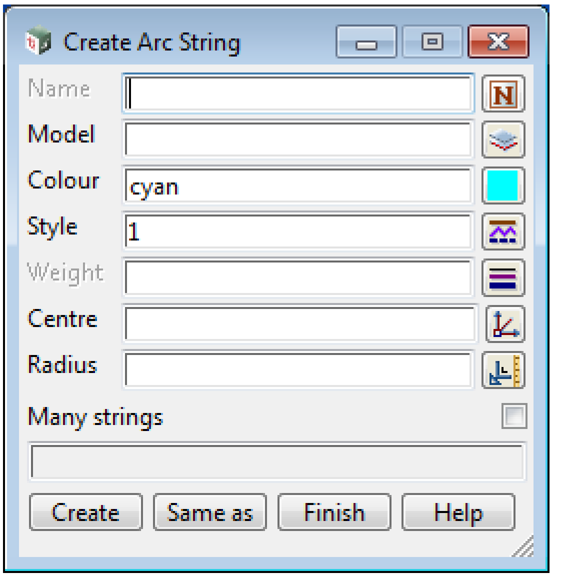
Arcs and circles are normally created using the **strings=>create=> arcs** or **strings=>create=> circles** menu. Please see the documentation on that option for creating arcs and circles.

This option is a special arc creator so that a menu exists if the **strings=>create=>same as** option is used on an arc. It creates an arc with an initial sweep angle of 360 degrees.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Arc String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Arc String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Arc String** panel.

After selecting the option, the **Create arc string** panel is displayed.



The new fields and buttons used in the **create arc string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Style	input	1	available line styles
line style of the string.			
Weight	input	0	
thickness of the string.			
Centre	input		**xyz ops** menu
co-ordinates of the centre of the arc.			

Radius input

the radius for the arc.

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the **create** *button is chosen, the* **arc edit** *menu and* **arc edit info** *panel are displayed.*

Same as button

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

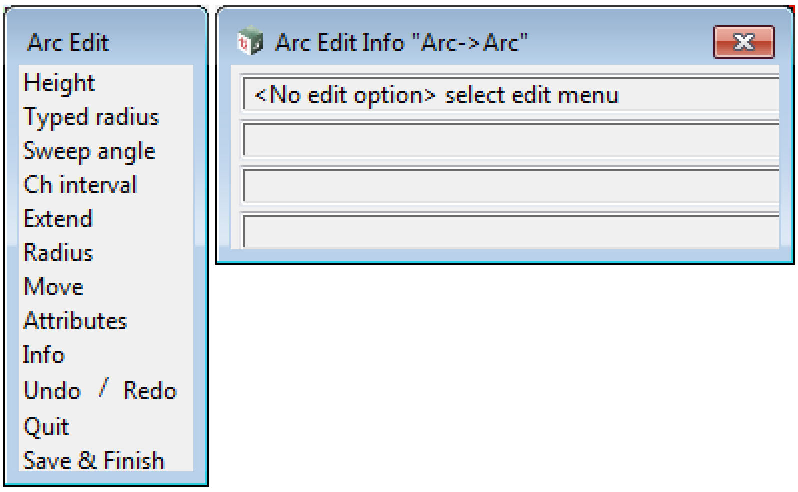
Note - the centre co-ordinates can either be typed into the centre panel field, or if LB is clicked on **[+]** for the centre panel field, the **xyz ops** menu comes up and the **pick xyz** option used to select a point as the arc centre.

Continue to the next section 14.1.4.2 Create Arc - Centre Point, Start Point and Sweep or go back to 14.1.4 Create Arcs.

Start Edit - Arc

Unlike the other string creates, on selecting the **Create** button the arc string is immediately created with a sweep angle of 360 degrees.The **arc edit** menu and **arc edit info** panel are also placed on the screen at the same time

The **arc edit** menu and **arc edit info** panel for an arc string are



For full information in the Arc Editor, go to the section 14.4.5 Arc Edit

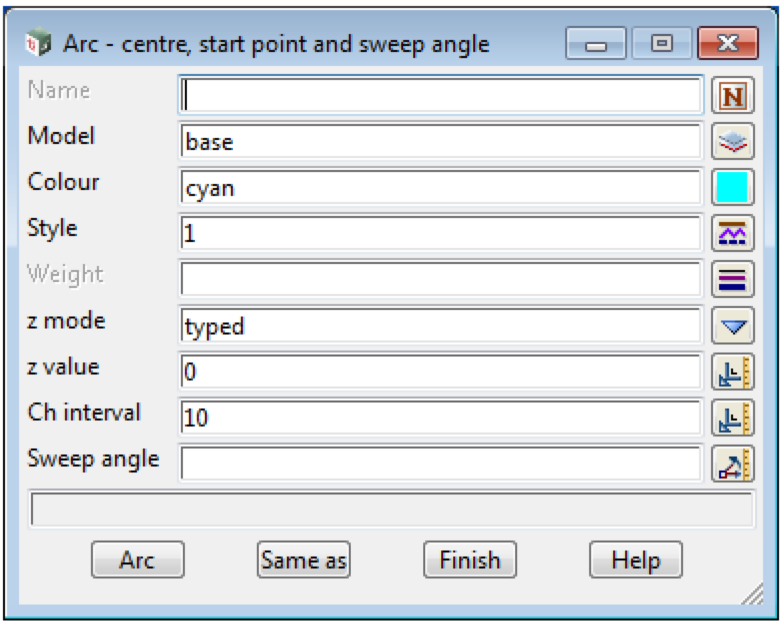
14.1.4.2 Create Arc - Centre Point, Start Point and Sweep

Position of option on menu: **Strings =>Create =>Arcs =>Centre,Start,Sweep**

This option defines an arc by selecting a centre point, the start point of the arc and the sweep angle of the arc. The sweep angle is measured in the clockwise direction.

The radius is calculated by the option and is simply the distance between the centre and start points. The arc end point is also automatically calculated using the known points, radius and sweep angle.

After selecting the option, the **arc - centre, start point and sweep angle** panel is displayed.



To create an arc, the name, colour, model, chainage interval and sweep angle are entered into the appropriate fields and then the centre point and start point of the arc are selected with the cursor. The arc is then created using the information provided in the panel.

The new fields and buttons used in the **arc - centre, start point and sweep angle** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		

the name of the new string.

Model	input		available models

name of the model that the new string is in.

Colour	input	default colour	available colours

the colour of the new string.

Style	input	1	available line styles

line style of the string.

Weight	input	0	

thickness of the string.

z mode	input	typed	snap, typed

the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.

z value	input	0	

if the z mode *method is typed, then the height (z-value) of the end points is the value in the field.*

Ch interval	input	10	

the chainage interval used when a chord approximation is needed for the arc.

Sweep angle	input		

sweep angle for the arc - Note: clockwise is positive for sweep angles

Arc	button		

*The **arc** button is used to begin a new create if the previous one was cancelled.*

Same as	button		

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

Continue to the next section 14.1.4.3 Create Arc - Centre Point, Start and End Points or go back to 14.1.4 Create Arcs.

14.1.4.3 Create Arc - Centre Point, Start and End Points

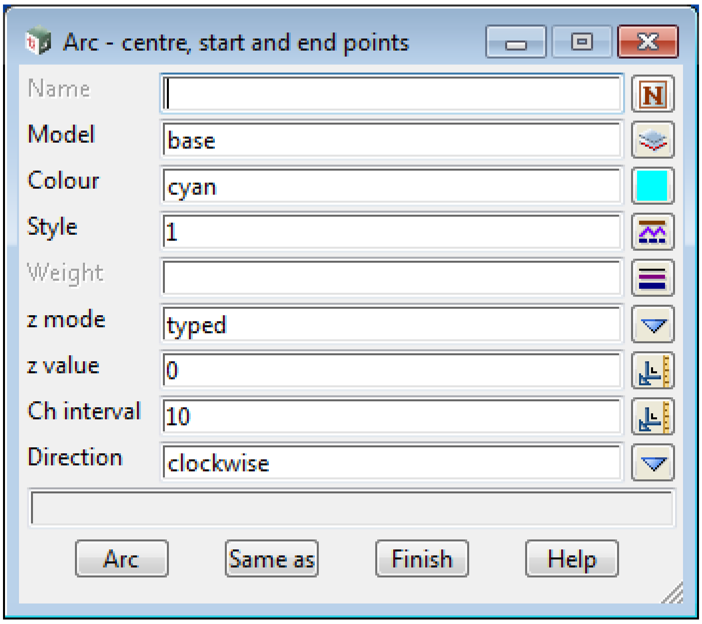
Position of option on menu: **Strings =>Create =>Arcs =>Centre, 2 pts on arc**

This option defines an arc by selecting a centre point, a start and end points for the arc and the direction (clockwise, anti-clockwise) that the arc travels in. The radius is calculated by the option and is simply the distance between the centre and start points.

It is difficult to choose the end point correctly so that it lies exactly on the arc since it only occurs when the distance between the centre and selected end point is exactly the radius of the arc.

Hence, the selected end point and arc direction is used to determine the sweep angle from the start point to the “end point to centre point” line. This is enough information to define the arc. The real end point is then calculated so that it lies on the arc.

After selecting the option, the **arc - centre, start and end points** panel is displayed.



To **create** an arc, the name, colour, model, chainage interval and direction are entered into the appropriate fields and then the centre point, start and end points of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The fields and buttons used in the **arc - centre, start and end points** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Style	input	1	available line styles
line style of the string.			
Weight	input	0	
thickness of the string.			
z mode	input	typed	snap, typed
the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.			
z value	input	0	
if the z mode *method is typed, then the height (z-value) of the end points is the value in the field.*			
Ch interval	input	10	
the chainage interval used when a chord approximation is needed for the arc.			

Direction	input	clockwise	clockwise, anti-clockwise

the direction for the arc

Arc button

*The **arc** button is used to begin a new create if the previous one was cancelled.*

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

14.1.4.4 Create Arc - Centre, Radius, Start and End Points

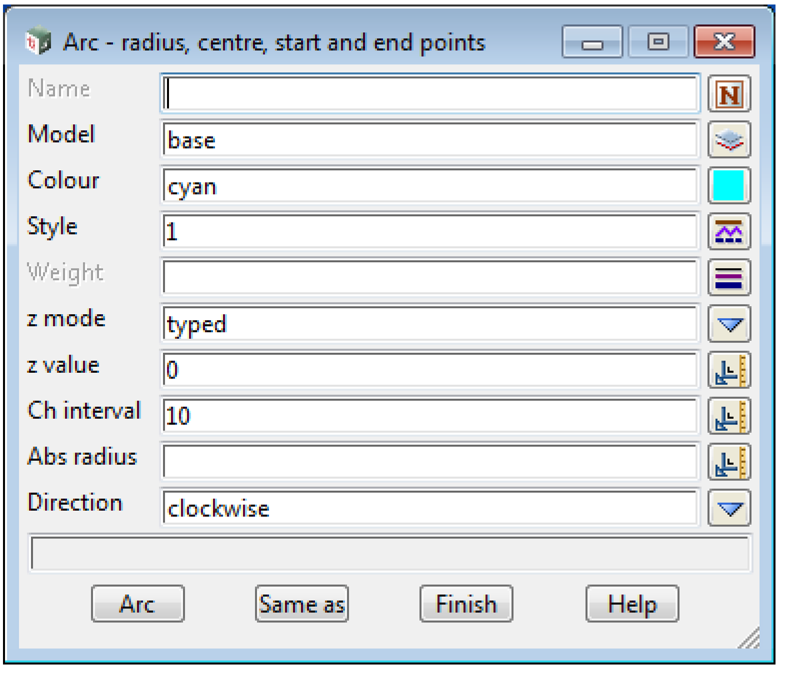
Position of option on menu: **Strings =>Create =>Arcs =>Centre, radius, 2pts**

This option defines an arc by the user setting a radius and direction of arc and then selecting the centre, start and end points for the arc.

Since the radius is given exactly, it is difficult to choose the start and end points so that they lie exactly on the arc. This only occurs when the distance between the centre and selected start and end points is exactly the radius of the arc.

Hence, the selected start point is dropped perpendicularly onto the arc to give the real start point. Similarly, for the real end point.

After selecting the option, the **arc - radius, centre, start and end points** panel is displayed.



To **create** an arc, the name, colour, model, chainage interval, radius and direction are entered into the appropriate fields and then the centre point, start and end points of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The fields and buttons used in the **arc - radius, centre, start and end points** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Style	input	1	available line styles
line style of the string.			
Weight	input	0	
thickness of the string.			
z mode	input	typed	snap, typed
the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.			
z value	input	0	
if the z mode *method is typed, then the height (z-value) of the end points is the value in the field.*			
Ch interval	input	10	
the chainage interval used when a chord approximation is needed for the arc.

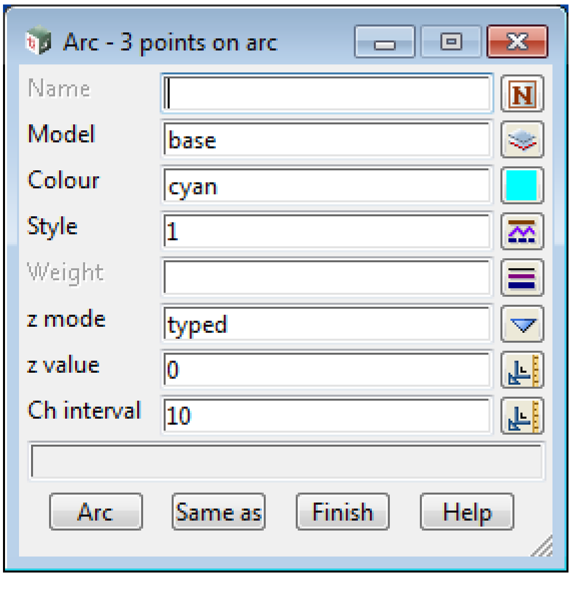
14.1.4.5 Create Arc - Three Points on Arc

Position of option on menu: **Strings =>Create =>Arcs =>3 pts on arc**

This option defines an arc by selecting three points that lie on the arc.

The selected arc points are the start point, a point between the start and end point, and the end point. The three points must be selected in that order.

After selecting the option, the **arc - 3 points on arc** panel is displayed.



To **create** an arc, the name, colour, model and chainage interval are entered into the appropriate fields and then three points - start point, point between the start and end point, and the end point- which lie on the arc are selected with the cursor.

After the three points are picked, the arc is created using the information provided in the panel.

After a arc is defined, the option does not terminate. Another arc can be created by simply modifying any of the information that needs changing in the **arc - 3 points on arc** panel and then selecting three points on a new arc.

The fields and buttons used in the **arc - 3 points on arc** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		

the name of the new arc.

Model	input		available models

name of the model that the new arc is in.

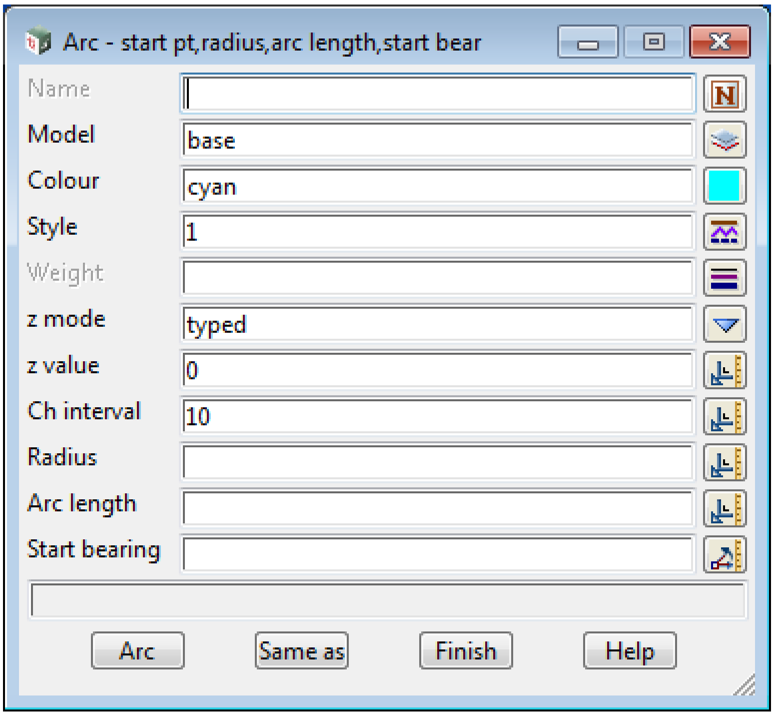
14.1.4.6 Create Arc - Start Point, Radius, Arc Length and Start Bearing

Position of option on menu: **Strings =>Create =>Arcs =>Start, rad, arc, bear**

This option defines an arc by giving the radius, the arc length and start bearing and then selecting a start point for the arc.

This is enough information for the option to calculate the centre and end points and the direction of the arc, and hence, fully define the arc.

After selecting the option, the **arc - start pt, radius, arc length, start bear** panel is displayed.



To **create** an arc, the name, colour, model, chainage interval, radius, arc length and start bearing are entered into the appropriate fields and then the start point of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The new fields and buttons used in the **arc - start pt, radius, arc length, start bear** panel have the following functions.

<Arc start> [picks][accepts][menu]

Go back to 14.1.4 Create Arcs.

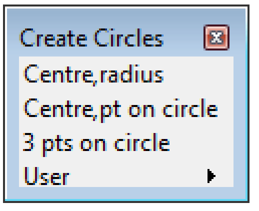
14.1.5 Create - Circles

Position of menu: **Strings =>Create =>Circles**

The create circles option is used to create 12d Model circles.

A 12d Model circle has no start and end points but is defined by a centre point and a radius. The circle has a constant height (z-value).

For convenient 12d Model includes a variety of methods for creating circles. On walking-right on the **circles** option, the **create circles** menu is displayed giving all the different methods for creating circles.



For Centre, radius, go to 14.1.5.1 Create Circle - Centre Point, Radius
Centre, pt on circle 14.1.5.2 Create Circle - Centre Point, Point on Circle
3 pts on circle 14.1.5.3 Create Circle - Three Points on Circle

Each option in the **create circles** menu fires up its own special panel to collect the necessary information for defining the circle.

The mouse is used to select the special points required for the circle definitions. For example, the **circle - centre, radius** option required the value of the radius to be entered into the **circle - centre point, radius** panel and the centre point is selected using the cursor.

Unlike the other strings created under **strings=>create**, the circles can be created immediately without needing any options from the circle editor. Consequently, after a circle is defined, the create panel is not removed and is left on the screen to create another circle. Any information that needs modifying is changed in the **circle** panel and is used for the new create.

New circles are created until either the panel is removed by selecting the **finish** or **[X]** button, or the create terminated by selecting **cancel** from the **pick ops** menu in which case the panel will be left on the screen. In the last case, the circle button is then used to begin a new create sequence.

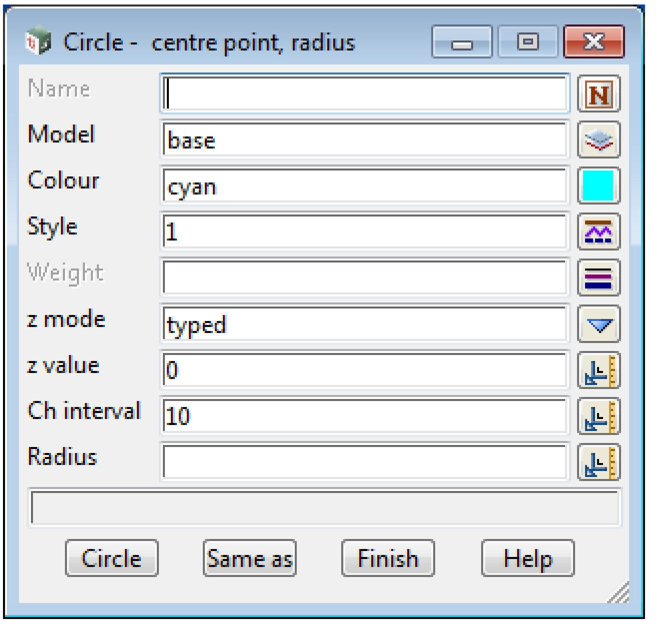
Each of the methods for creating circles and arcs will now be described.

14.1.5.1 Create Circle - Centre Point, Radius

Position of option on menu: **Strings =>Create =>Circles =>Centre, radius**

This option defines a circle by supplying a typed radius and selecting a centre point with the mouse

After selecting the option, the **circle - centre point, radius** panel is displayed.



To **create** a circle, the name, colour, model, chainage interval and radius are entered into the appropriate fields and the centre point selected with the cursor. The circle is then created using the information provided in the panel.

The new fields and buttons used in the **circle - centre point, radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		

the name of the new string.

Model	input		available models

name of the model that the new string is in.

Colour	input	default colour	available colours

the colour of the new string.

Style	input	1	available line styles

line style of the string.

Weight	input	0	

thickness of the string.

z mode	input	typed	snap, typed

the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.

z value	input	0	

if the z mode *method is typed, then the height (z-value) of the circle is the value in the field.*

Ch interval	input	10	

the chainage interval used when a chord approximation is needed for the circle.

Radius	input	10	

the radius for the circle.

Circle	button		

*The **circle** button is used to begin a new create if the previous one was cancelled.*

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

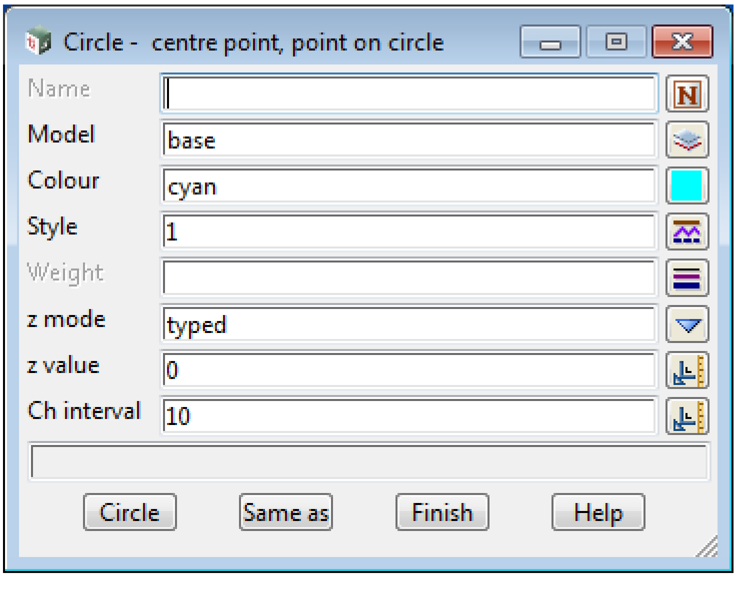
<Circle centre> [picks][accepts][menu]

14.1.5.2 Create Circle - Centre Point, Point on Circle

Position of option on menu: **Strings =>Create =>Circles =>Centre, pt on circle**

This option defines a circle by selecting a centre point and a point on the circle. The radius is automatically calculated by the option and is simply the distance between the two selected points.

After selecting the option, the **circle - centre point, point on circle** panel is displayed.



To create a circle, the name, colour, model and chainage interval are entered into the appropriate fields and the centre point and a point on the circle selected with the cursor. Then the circle is created using the information provided in the panel.

The new fields and buttons used in the **circle - centre point, point on circle** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Style	input	1	available line styles
line style of the string.			
Weight	input	0	
thickness of the string.			

z mode input typed snap, typed

the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.

z value input 0

if the z mode *method is typed, then the height (z-value) of the circle is the value in the field.*

Ch interval input 10

the chainage interval used when a chord approximation is needed for the circle.

Circle button

*The **circle** button is used to begin a new create if the previous one was cancelled.*

Same as button

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

How to Use the Panel to Create a Circle

(a) The panel fields are filled in with the appropriate data for use in defining the circle.

(b) The mouse is then used to select the centre point for the circle.

14.1.6 Create - Feature

Position of option on menu: **Strings =>Create =>Feature**

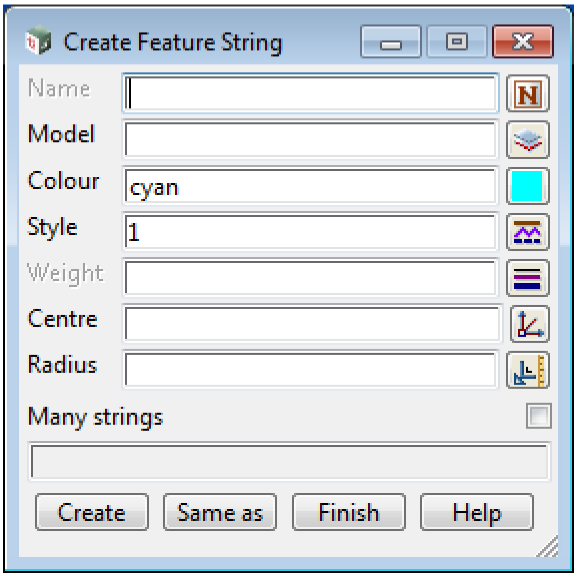
A feature string consists of a centre point (x,y,z) and a user given radius.

The difference between a circle and a feature string is that for a feature string the centre point is considered to be a valid (x,y,z) point but all the points on the circumference of the feature string are null values. Feature strings can be used to represent objects such as trees.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Feature String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Feature String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Feature String** panel.

After selecting the option, the **Create feature string** panel is displayed.



The new fields and buttons used in the **create feature string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Style	input	1	available line styles
line style of the string.			
Weight	input	0	
thickness of the string.			
Centre	input		**xyz ops** menu
co-ordinates of the centre of the feature.			

Radius input

the radius for the feature.

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the **create** *button is chosen, the* **Feature Edit** *menu and* **Feature Edit Info** *panel are displayed.*

Same as button

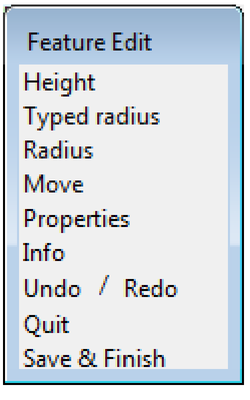
After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

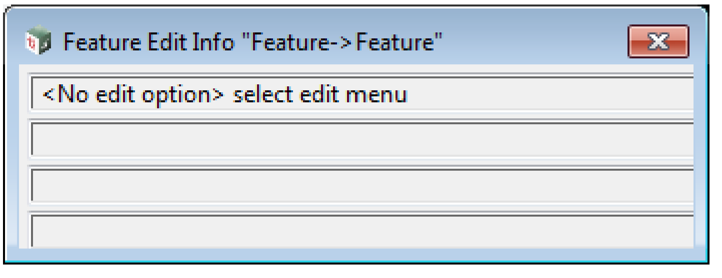
Note - the centre co-ordinates can either be typed into the centre panel field, or if LB is clicked on **[+]** for the centre panel field, the **xyz ops** menu comes up and the **pick xyz** option can be used from it to select a point as the arc centre.

Start Edit - Feature

Like the arc creates, on selecting the **Create** button the feature string is immediately created. The **Feature Edit** menu and **feature edit info** panel are also placed on the screen at the same time

The **Feature Edit** menu and panel for a feature string are





For full information in the Feature Editor, go to the section 14.4.7 Feature Edit

14.1.7 Create - Pipe Super

Position of option on menu: **Strings =>Create =>Pipe**

A pipe super string is the same as a 3d string except that the pipe string also has a diameter hence the options for creating and editing a pipe string are almost the same as for a 3d string.

The main difference is that the pipe diameter can be modified in the Properties panel for the string.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super Pipe String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super Pipe String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

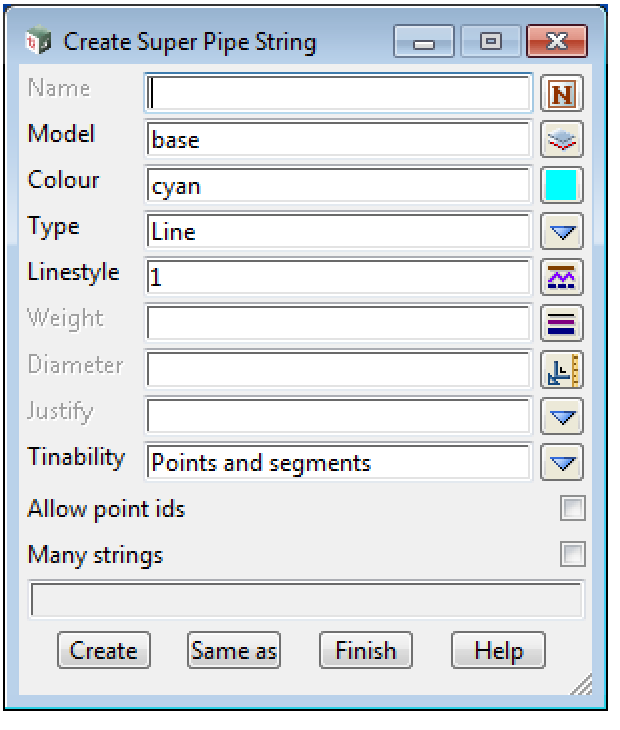
The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle style, weight, diameter and tinability fields of the **Create Super Pipe String** panel.

From *12d Model 8* onwards, the default is to create *super pipe strings* rather than the *pipe strings* used up to *12d Model 7*. The advantage is using a *pipe super string* is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older *pipe string* create option is still available under

Strings =>Create =>Old   (go to the section 14.20.1.5 Create - Pipe (Pre V8))

On selecting the **Pipe** option, the **Create Super Pipe String** panel is displayed.



The default values for the panel fields are taken from the *CAD Controlbar (see* 15.1 Controlbars*)*

To create a *new pipe super string*, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super Pipe String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input	from CAD controlbar	

the name of the new string

Model	model box	from CAD controlbar	available models

name of the model that the new string is in

Colour	colour box	from CAD controlbar	available colours

the colour of the new string

Type	choice box	line	line, point

breakline type (point-line type) of the string

Linestyle	input	from CAD controlbar	available line styles

line style of the string

Weight	input	from CAD controlbar	

thickness of the string

Diameter	input	0	

diameter of the pipe

Justify	input	invert	invert, centre, overt

justification of the pipe with respect to the co-ordinates given for the pipe string.

Tinability	choice box	Points and segments	Points and segments Points only Not tinable

*if **Vertices and segments**, all the vertices and segments of the string are set to **tinable**.*
*If **Vertices only**, all the vertices are set to tinable and the segments to not tinable.*
*If **Not tinable**, all the vertices or segments are set to **not tinable**.*

Allow point ids tick box

*if **ticked**, the super string can have point ids for each vertex.*
*If **not ticked**, the super string will not have point ids. This can be reversed if point ids are required in the future.*

Many strings tick box

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

after the **Create** *button is chosen, the* **Edit Pipe** *menu is displayed*

Same as button

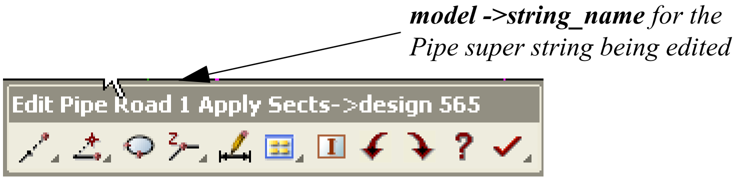
after the **Same as** *button is chosen, another string is selected and information about it is used for the fields in this panel*

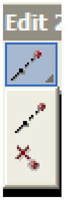
Finish button

*end the option, **don't** proceed to the edit stage*

Start Edit - Pipe Super

On selecting the **Create** button in the **Create Super Pipe String** panel the **Edit Pipe** menu is placed on the screen. The **Edit Pipe** menu for a *pipe super string* is





To create a new *pipe super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all pipe strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit options on the string’s **Edit Pipe** menu are usable.

The options in the **Edit Pipe** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit Pipe** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Pipe Editor, go to the section 14.4.8 Edit Pipe

14.1.8 Create - Polyline Super

Position of option on menu: **Strings =>Create =>Polyline**

A polyline string is similar to a 3d string except that it can have either straight lines or arcs joining the (x,y,z) vertices of the string. The arcs are plan arcs with possibly a different z at either end and the z values are linearly interpolated between the end points. Hence in a long section, the end vertices are joined by straight lines for both line and arc segments of the polyline.

Creating and editing a polyline string is very similar to a 3d string. The only major difference is that a radius is required at each string segment (a radius of 0 means no arc, just a straight line).

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super Polyline String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super Polyline String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

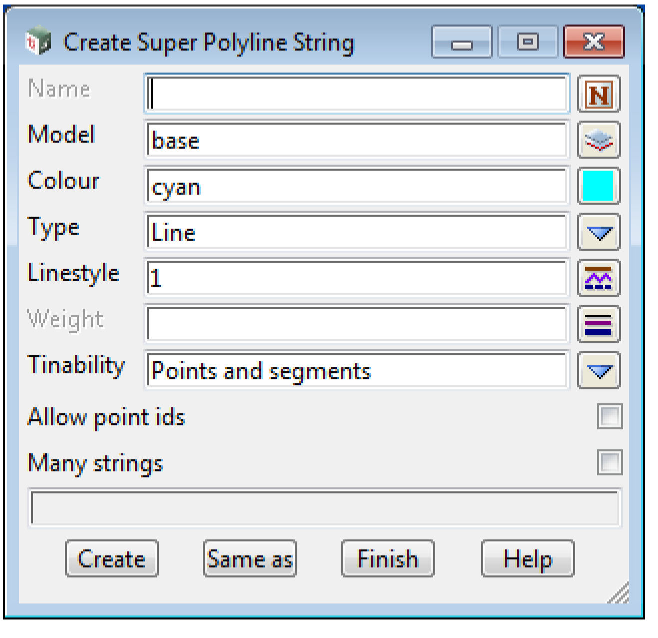
The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle style and weight fields of the **Create Super Polyline String** panel.

From *12d Model 8* onwards, the default is to create *super polyline strings* rather than the *polyline strings* used up to *12d Model 7*. The advantage is using a *super polyline string* is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older *pipe string* create option is still available under

Strings =>Create =>Old (go to the section 14.20.1.6 Create - Polyline (Pre V8))

On selecting the **Polyline** option, the **Create Super Polyline String** panel is displayed.



The default values for the panel fields are taken from the *CAD Controlbar (see* 15.1 Controlbars*)*

To create a *new polyline super string*, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super Polyline String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input	from CAD controlbar	

the name of the new string

Model	model box	from CAD controlbar	available models

name of the model that the new string is in

Colour	colour box	from CAD controlbar	available colours

the colour of the new string

Type	choice box	line	line, point

breakline type (point-line type) of the string

Linestyle	input	from CAD controlbar	available line styles

line style of the string

Weight	input	from CAD controlbar	

thickness of the string

Tinability	choice box	Points and segments	Points and segments Points only Not tinable

*if **Vertices and segments**, all the vertices and segments of the string are set to **tinable**.*
*If **Vertices only**, all the vertices are set to tinable and the segments to not tinable.*
*If **Not tinable**, all the vertices or segments are set to **not tinable**.*

Allow point ids tick box

*if **ticked**, the super string can have point ids for each vertex.*
*If **not ticked**, the super string will not have point ids. This can be reversed if point ids are required in the future.*

Many strings tick box

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

after the **Create** *button is chosen, the* **Edit Polyline** *menu is displayed*

Same as button

after the **Same as** *button is chosen, another string is selected and information about it is used for the fields in this panel*

Finish button

*end the option, **don't** proceed to the edit stage*

Start Edit - Polyline Super

On selecting the **Create** button in the **Create Super Polyline String** panel the **Edit Polyline** menu is placed on the screen. The **Edit Polyline** menu for a *polyline super string* is

***model ->string_name** for the*
Polyline super string being edited

append or prepend a vertex

append or prepend a vertex plus radius

delete an IP

To create a new polyline string, the user must select one of the two append options (**Append** or **Append + radius**) on the **Append** drop-down toolbar on the **Edit Polyline** toolbar. The **Append** option simply creates vertices which are joined by a straight segment whereas the **Append + radius** creates vertices with a radius for the segment.

The **Append** options are used to add vertices to either end of an existing string, or in the case of a new string, places the 1st vertex and then begins appending vertices to the 1st vertex.

For all polyline strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

The options in the **Edit Polyline** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit Polyline** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Polyline Editor, go to the section 14.4.9 Edit Polyline

14.1.9 Create - Super

Position of option on menu: **Strings =>Create =>Super**

A super string is a combination and generalisation of a 4d string, a pipe string and a polyline string.

A super strings consists of a series of (x,y) vertices, plus it can have either straight lines or arcs joining the vertices of the string.

At each vertex, the super string has:

height
text
visibility
tinability (contourability)
point number
symbol
user defined attributes

For each segment, the super string has:

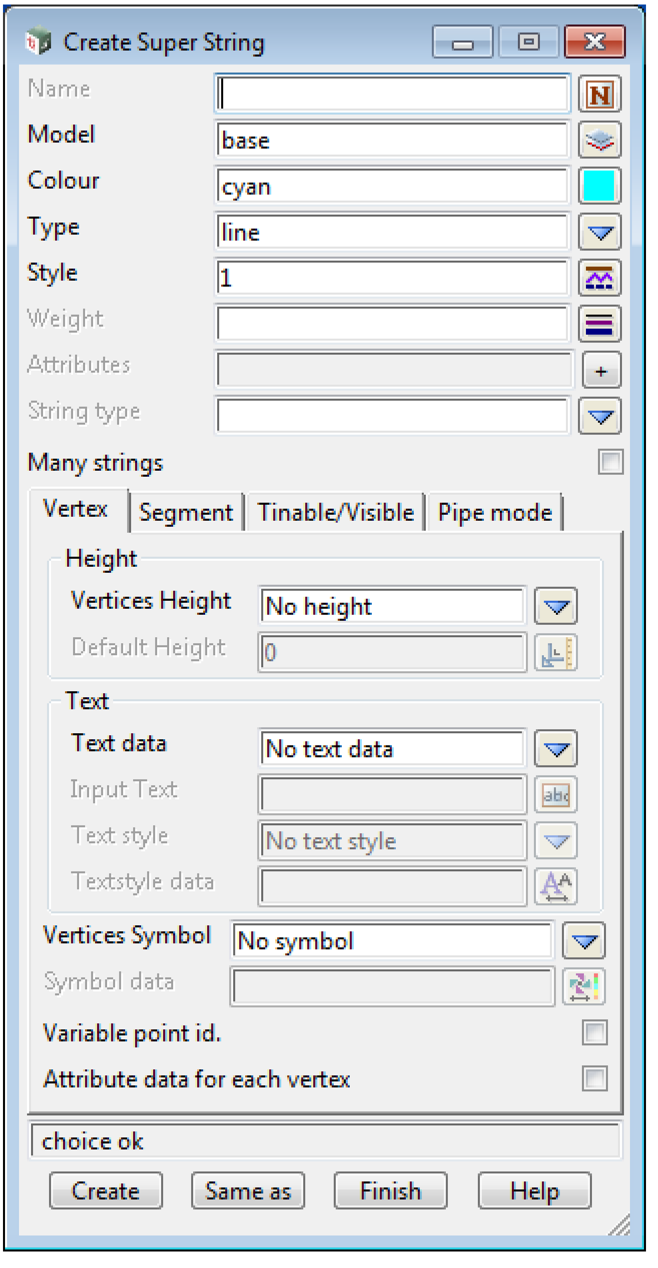
plan radius
colour
text
tinability (breakline)
pipe diameter or box dimensions
visibility
user defined attributes

Creating and editing a super string is very similar to a polyline string in that a radius is can be given at each string segment (a radius of 0 means no arc, just a straight line), and also like a 4d string in that there can be text at each vertex. However there are many more choices about what is defined for each vertex and segment of the super string.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Super String** panel.

On selecting the **Super string** option, the **Create Super String** panel is displayed.



When the panel opens, various panel field values are taken from the **ControlBars**.

The information in **Name**, **Model**, **Colour**, **Style** and **Tinable** are taken from the CAD ControlBar, **Attributes** from the Attributes ControlBar and **Pipe** information from the Pipe ControlBar.

If the **Name** icon is used in the **Create Super String** panel to select a name from the names.4d pop up, then the panel fields are updated from the names.4d file.

To **create** a new super string, the appropriate panel fields are filled in and the **Create** button clicked.

The new fields and buttons used in the **Create Super String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	names.4d box		names.4d file

the name of the new string.

Model	model box		available models

name of the model for the new string.

Colour	colour box	default colour	available colours

the colour of the new string.

Note that each segment can have a different colour if in the **Segment** *tab, the* **Segment colour** *choice is* ***Varied****.*

Type	choice box	line	line, point

breakline type (point-line type) of the string

As an overall string property:
If a string has type **line***, then all vertices and all segments are tinable.*
If a string has type **point***, then all vertices are tinable but the segments are not tinable.*

Note that each vertex and segment can have different tinabilities and it is controlled in the **Tinable** *tab.*

Style	linestyle box	1	available line styles

line style of the new string.

Weight	weight box	0	

thickness of the string when plotted.

String type	choice box		2d like, 3d like, 4d like

if ***not blank****, the like type sets a number of the panel field settings.*

Many strings	tick box		

if ticked then after the current string is finished, a new **Create Super String** *panel is placed on the screen with all the same values for the panel fields as in the current panel.*

Vertex tab

The fields for setting up what information is required for vertices.

Vertices height	choice box		Constant for all Varied No height

if ***Constant for all****, there is only one height that is used for all vertices of the string (2d like).*
If ***Varied****, there is a different height for each vertex (3d like)*
If ***No height****, there is no height at all for the string.*

if the Vertices height *choice is* Constant for all *then the field* Default height *is enabled.*

Default height	real box		

the one height that is used for every vertex of the string.

Text data	choice box		Constant for all Varied No text data

if ***Constant for all****, there is one text for all the vertices of the string.*
If ***Varied****, there is different text for each vertex.*
If ***No text data****, there is no text at all for the string.*

if the Text data *choice is* Constant for all *then the fields* Input text *and T*ext style *are enabled.*

Input text	text box		

the one bit of text that is used for every vertex of the string.

Text style	choice box		Constant for all Varied

No text style

*if **Constant for all**, there is one textstyle that is used for all the vertices of the string.*
*If **Varied**, there is a different textstyle for each vertex.*
*If **No text data**, there is no textstyle at all for the string.*

if the Text style *choice is* Constant for all *then the field* Textstyle data *is enabled.*

Textstyle data textstyle data box

the one textstyle data that is used for every vertex of the string.

Symbol data choice box Constant for all
Varied
No symbol

*if **Constant for all**, there is one symbol that is used for all vertices of the string.*
*If **Varied**, there is a different symbol for each vertex*
*If **No symbol**, there is no symbols at all for the string.*

if the Symbol data *choice is* Constant for all *then the field* Symbol data *is enabled.*

Symbol data symbol data box

the one symbol data that is used for every vertex of the string.

Variable point id tick box

if ticked, there is a different point id for each vertex.
If not ticked, there are no vertex ids for any vertex of the string.

Attribute data for each vertex tick box

if ticked, there can be attributes for each vertex.
If not ticked, there are no attributes on any vertex.

Segment tab

The fields for setting up what information is required for segments.

Segments colour choice box Constant for all
Varied

*if **Constant for all**, there is one colour for every segment of the string and that is the colour in the* **Colour** *field.*

*If **Varied**, there is a different colour for each segment.*

Text data choice box Constant for all
Varied
No text data

*if **Constant for all**, there is one text for all the segments of the string.*
*If **Varied**, there is different text for each segment.*
*If **No text data**, there is no text at all for the string.*

if the Text data *choice is* Constant for all *then the fields* Input text *and* Text style *are enabled.*

Input text text box

the one bit of text that is used for every segment of the string.

Text style choice box Constant for all
Varied
No text style

*if **Constant for all**, there is one textstyle that is used for all the segments of the string.*

*If **Varied**, there is a different textstyle for each segment.*
*If **No text data**, there is no textstyle at all for the string.*

if the Text style *choice is* Constant for all *then the field* Textstyle data *is enabled.*

Textstyle data textstyle data box

the one textstyle data that is used for every segment of the string.

Radius/Major tick box

if ticked, each segment can have a radius and a major flag.
If not ticked, all segments are straight lines.

***Note:** the radius is a signed value and in the direction of travel along the arc, a negative radius means the arc bends to the left and a positive radius means the arc bends to the right. However this is still not enough to uniquely define the arc and it can be a minor major arc (turns through less than or equal to 180 degrees), or a major arc (turns through more than 180 degrees). The Major flag is 0 for a minor arc and 1 for a major arc.*

Attribute data for each segment tick box

if ticked, there can be attributes for each segment.
If not ticked, there are no attributes on any segment.

Tinable/Visible tab

The fields for setting up what tinability is allowed for vertices and segments.

***Tinability** for a **vertex** is the property that the vertex is included in a tin (triangulation).*

If a vertex is tinable then it is included in a tin.

If a vertex is not tinable, then it is not included in a tin.

***Tinability** for a **segment** is the property that the segment is to be included in a tin (triangulation). That is, the segment is to be a side of a triangle in a tin. Another name for a tinable segment is that it is a **breakline**. Even though a segment is tinable, it may not end up in a tin if there are crossing breaklines. Also a tinable segment can not be included in a tin if either of its end vertices are not tinable.*

If a segment is tinable then if possible, it is included as the side of a triangle in a tin.

If a segment is not tinable, then it does not have to be included as a side of a triangle in a tin.

As an overall string property,:
If a string has type **line**, *then all vertices and all segments are tinable.*
If a string has type **point**, *then all vertices are tinable but the segments are not tinable.*

Vertex tinability choice box Constant
Varied
Not tinable

*if **Constant**, there is one tinability and it is the same for all vertices in the string.*
*If **Varied**, each vertex can have a different tinability.*
*If **Not tinable**, then all vertices are not tinable.*

Segment tinability choice box Constant
Varied
Not tinable

*if **Constant**, there is one tinability and it is the same for all segments in the string.*
*If **Varied**, each segment can have a different tinability.*
*If **Not tinable**, then all segments are not tinable.*

Pipe mode tab

The fields for setting up what pipe modes are allowed for segments.

Segments can be all round for a string, or all box (culvert) for a string but can't be a mixture of round and box in the one string.

If a segment is round then it just needs a diameter.

If a segment is culvert (or box), it needs a width and a height.

Pipe choice

There are five choice: the string is a
constant pipe string and has one diameter for the entire string
a variable pipe string and can have a different diameter for each segment
a constant culvert string and has the one width and height for each segment
a variable culvert string and can have a different width and height for each segment
or the string has no diameter or width and height for any segment.

Pipe mode	choice box	no round pipe or culvert round pipe entire string round pipe each segment culvert entire string culvert each segment

if **no round pipe or culvert**, *there is no diameters, or any widths or heights for any segment.*
if **round pipe entire string,** *there is* ***one*** *diameter for all segments in the string.*
if **round pipe each segment**, *there is a different diameter for each segments of the string.*
if **culvert entire string**, *there is* ***one*** *width and a height for all segments in the string.*
if **culvert each segment**, *there is a different width and height for each segment of the string.*

if the Pipe mode *choice is* round pipe entire string *then the field* Diameter *is enabled*.

Diameter real box

diameter to use for every segment of the string.

if the Pipe mode *choice is* culvert entire string *then the fields* Width *and* Height *are enabled*.

Width/Height real box

width/height to use for every segment of the string.

if the Pipe mode *choice is NOT* no round pipe or culvert *then the field* Justify *is enabled.*

Justify choice box Invert, centre, obvert

If **invert**, *the coordinates of the vertices are on the top of the pipe/culvert.*
If **centre**, *the coordinates of the vertices are in the centre of the pipe/culvert.*
If **obvert**, *the coordinates of the vertices are at the bottom of the pipe/culvert.*

Buttons at bottom

Create button

After the **create** *button is chosen, the* **super edit** *menu and* **super edit info** *panel are displayed.*

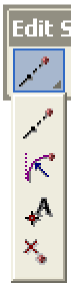
Same as button

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

Start Edit - Super String

On selecting the **Create** button in the **Create Super String** panel the **Super Edit** menu and **Super Edit Info** panels are placed on the screen.

model ->string_name *for the super string being edited*



append or prepend an IP

append or prepend an IP plus radius

append or prepend and IP plus text

delete an IP

To create a new super string, select the **Append** or **Append + radius** or **Append + text** icons.

The **Append** and **Append + text** options simply creates vertices that are joined by a straight segments. **Append + text** also asks for text at each vertex.

The **Append + radius** create vertices with a radius for the segment.

For all super strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

If **Append + text** was selected, the user will then be prompted for the text to be placed at the vertex.

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Super Edit** menu are usable.

The options in the **Super Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Super Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Super Editor, go to the section 14.4.10 Edit Super

14.1.10 Create - Text

Position of option on menu: **Strings =>Create =>Text**

A text string consists of

(a) the text

(b) an (x,y) position for the text

(c) a text style

(d) a justification

(e) the height of the text in pixels, paper or world units

(f) the x factor and slant of the text

(g) the colour of the text

(h) the angle to write the text at

The default text style uses a non-proportional font but user defined fonts can be proportional or non-proportional.

The justification of the text with respect to text string's (x,y) position is user specified.

The text angle is measured in a counter- clockwise direction with respect to the horizontal axis.

For more information on text definitions, go to the section 4.6 Text Definitions.

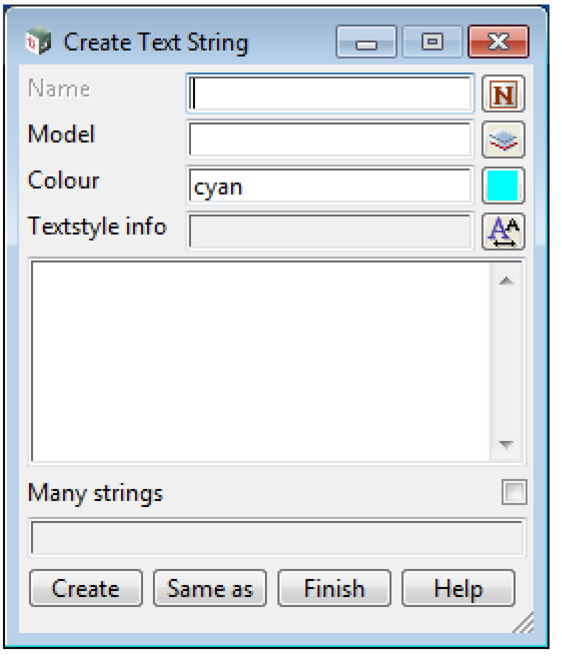
Note - deleting text

Text is deleted as a normal string with the picking point at the text string's definition point. The relationship of the definition point and the text depends on the text offset and justification

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Text String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Text String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Text String** panel.

On selecting the **Text string** option, the **Create text string** panel is displayed.



To **create** a new text string, the name, model, colour and actual text of the new string are entered into the appropriate fields, and the textstyle info such as height, offset, justification, angle are entered by clicking on the Textstyle info box. The **create** button is then selected.

The new fields and buttons used in the **create text string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		

the name of the new string.

Model	model box		available models

name of the model that the new string is in.

Colour	colour box	default colour	available colours

the colour of the new string.

Textstyle info	textstyle info box		

textstyle information.

Text	multi-line text box		

the actual text.

Many strings	tick box	not ticked	

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create	button		

*After the **create** button is chosen, the **text edit** menu and **text edit info** panel are displayed.*

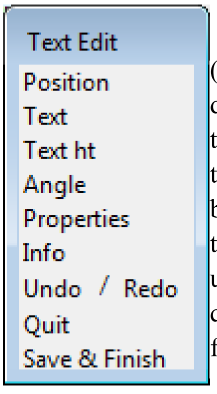
Same as	button		

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

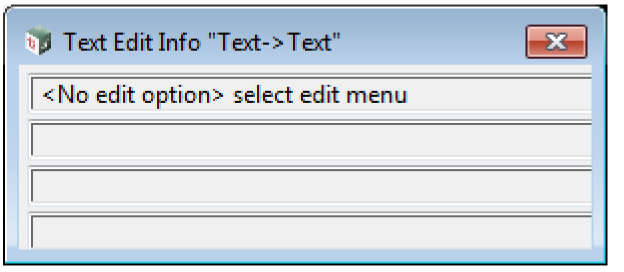
Start Edit - Text

On selecting the **create** button in the **create text string** panel the **text edit** menu and **text edit info** panel are placed on the screen.

The **text edit** menu for a text string is and the **text edit** panel is



(x,y) position of text
define the actual text
text height
text angle
bring up attribute panel
toggle edit info panel
undo/redo
quit the create
finish the text edit



To creating a new text string, the user must first select the **Position** option from the **Text edit** menu. Then after selecting a position, the text is created and displayed (if the model is on the view).

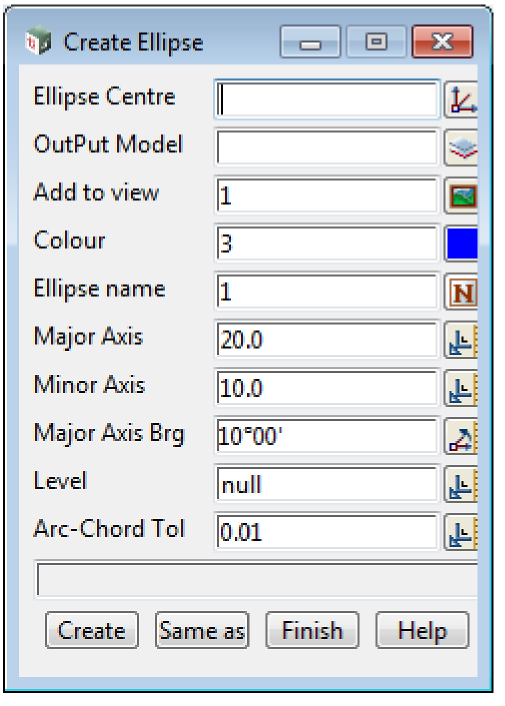
For full information in the Text Editor, go to the section 14.4.12 Text Edit

14.1.11 Create - Ellipse

Position of option on menu: **Strings =>Create =>Ellipse**

.This option creates a super string of points along the ellipse defined in the panel. The frequency of points is determined by a user defined chord-to-arc tolerance.

After selecting the **Ellipse** option, the **Create Ellipse** panel is displayed.



Field Description	Type	Defaults	Pop-Up
Ellipse centre	model select		
centre of the ellipse			
OutPut model	model box		available models
name of the model to place put the ellipse string in			
Add to view	view select	1	
add the model to the given view			
Colour	colour box	default colour	available colours
the colour of the new string.			
Ellipse name	name mapping box		names in name mapping file
the name of the new string.			
Major Axis	measure box	20	
the length of the major axis of the ellipse			
Minor Axis	measure box	10	
the length of the minor axis of the ellipse			
Major Axis Brg	measure box		
bearing of the major axis of the ellipse			
Level	measure box	null	
z-value for the points on the ellipse			

Arc-Chord Tol measure box 0.01

the chord to arc tolerance to use for deciding how often to create points around the ellipse

Create button

after the **Create** *button is chosen, a string of points around the ellipse is created*

Same as button

after the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

14.1.12 Create - Control Stations

Position of option on menu: **Strings =>Create =>Create Control Station**

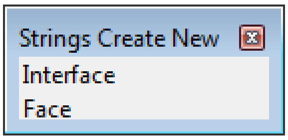
This option is documented in **Survey =>Extras =>Create Control stations** in the section 17.14.5 Create Control Stations.

14.1.13 New

Position of option on menu: **Strings =>Create =>New**

This section of documentation is a work in progress and will be updated in subsequent releases.

The **New** walk-right menu contains options *Interface* and *Face*.



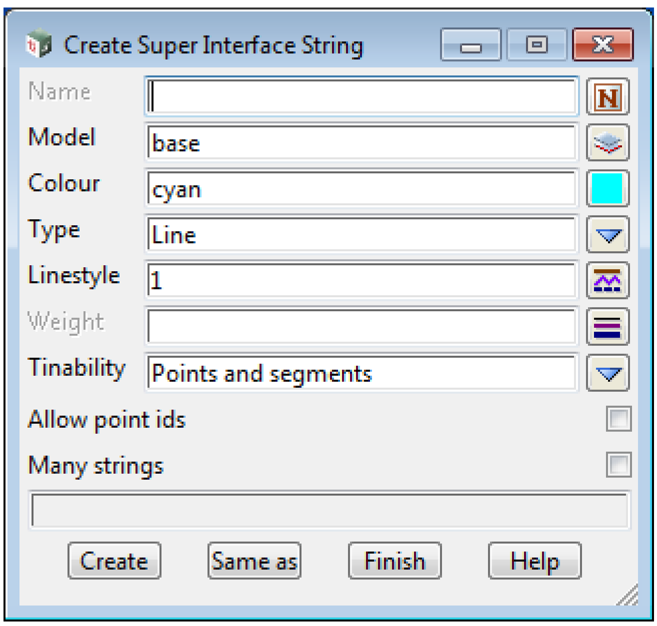
For the option *Interface*, go to 14.1.13.1 Interface
Face 14.1.13.2 Face

14.1.13.1 Interface

Position of option on menu: **Strings =>Create =>New =>Interface**

This section of documentation is a work in progress and will be updated in subsequent releases.

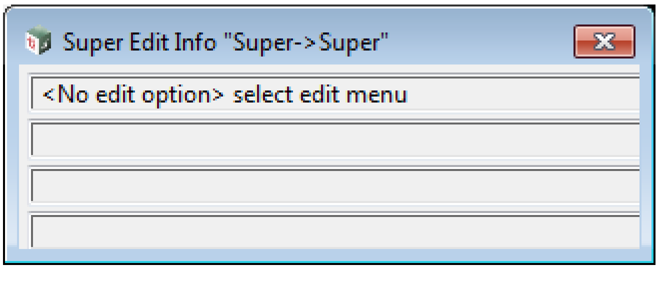
On selecting the **Interface** option, the Create Super Interface String panel is displayed.



The fields and buttons used in the **Create Super Interface String panel** have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
Model	model box		available models
Colour	colour box		available colours
Type	choice box	line	point, line
Linestyle	input	from CAD controlbar	available line styles
Weight	input	from CAD controlbar	
Tinability	choice box	Points and segments	Points and segments Points only Not tinable
Allow point ids	tick box		
Many strings	tick box		
Create	button		
Same as	button		

Once the Create button has been pressed, the Edit Interface toolbar and Super edit Info panel appears on the screen, containing the list of available edit options for the Super Interface String.

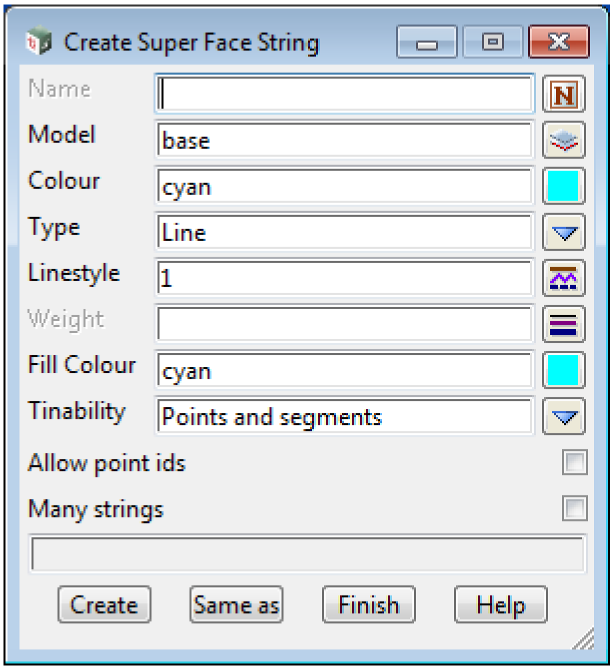


14.1.13.2 Face

Position of option on menu: **Strings =>Create =>New =>Face**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **Face** option, the Create Super Face String panel is displayed.

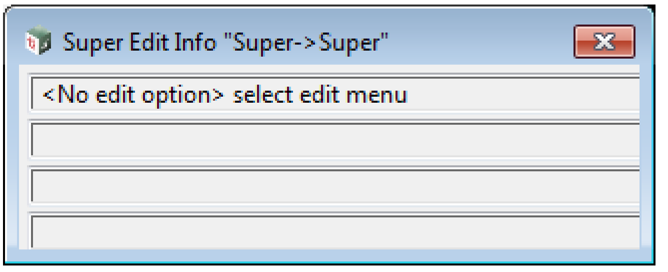


The fields and buttons used in the **Create Super Face String panel** have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
Model	model box		available models
Colour	colour box		available colours
Type	choice box	line	point, line
Linestyle	input	from CAD controlbar	available line styles
Weight	input	from CAD controlbar	
Fill Colour	colour box		available colours
Tinability	choice box	Points and segments	Points and segments Points only Not tinable
Allow point ids	tick box		
Many strings	tick box		
Create	button		
Same as	button		

Once the Create button has been pressed, the Edit Face toolbar and Super edit Info panel appears on the screen, containing the list of available edit options for the Super Face String

Edit Face BUILDING PAD->FOOTING EDGE



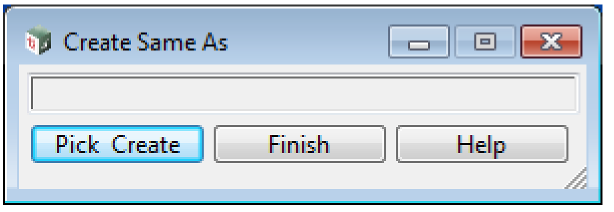
Super Edit Info "Super->Super"
<No edit option> select edit menu

14.1.14 Create - Same As

Position of option on menu: **Strings =>Create =>Same as**

The **same as** option is used to create a new string of the same type and with similar header information as an existing string.

On selecting the **same as** create option, the **create same as** panel is displayed.



After selecting the option, the option is already running and waiting for a string to be selected.

Once a string is selected from a view, a new **create nd string** panel of the same type as the selected string and with all the header information from the selected string, is displayed on the screen.

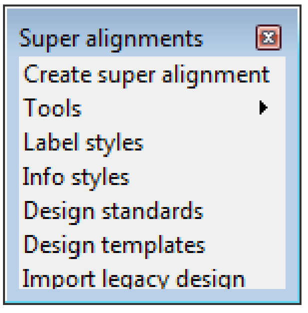
The user then proceeds as a normal create string option.

If the pick is terminated by clicking RB to get up the **pick ops** menu and selecting **cancel** from it, the option can be started again by selecting the **pick & create** button.

14.2 Super Alignments

Position of menu: **Strings =>Super alignments**

The **Super Alignment** walk-right menu contains options to create a super alignment string, plus options to created/edit labelling and information styles, and design standards and templates.



create super alignment
super alignment tools
create/edit a super alignment label style
create/edit a style for super alignment information panel
define design standards
create/edit a design template using selections from Design Standards
read in V9 design tables

For the option *Super alignment*, go to	14.2.1 Create Super Alignment
Tools	14.2.2 Super Alignment Tools
Label styles	14.2.3 Super Alignment Style
Info styles	14.2.4 Super Alignment Info Styles
Design standards	14.2.5 Design Standards
Design templates	14.2.6 Design Templates
Import legacy design	14.2.7 Import Legacy Design

14.2.1 Create Super Alignment

Position of option on menu: **Strings =>Super Alignments =>Super alignments**

A super alignment string is defined by specifying both its horizontal and vertical geometry.

If the user does not have the *Alignment Module*, then the *super alignment* acts like the pre-V10 *alignment* string and consists of only horizontal and vertical intersection points consisting of leading transitions-arc-trailing transition for each horizontal intersection point, and parabolas or arcs on the intersection points for vertical geometry. The resultant elements are linked tangentially to form the horizontal and vertical geometry. The intersection points and the tangent points can be moved.

If the user has the *Alignment Module* then the *Super Alignment* includes IP constructions but also allows much more complicated parametric design.

The Horizontal Geometry of a Super Alignment is made up of **parts**, which may be as simple as a straight line between two points or an arc with a given centre and radius, or a horizontal intersection point with given leading and trailing transitions or the **parts** can be very complicated where for example the points of a line are defined by the offset intersection of the two arcs from other strings.

Often a horizontal part is not fully defined (parts are classified as fixed which are fully defined, floating which have one degree of freedom and free which have two degrees of freedom) and the extra restriction that the horizontal parts must be linked tangentially is necessary to fully defined the horizontal geometry. The horizontal geometry is then said to be solved.

Once solved, the horizontal geometry simply consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called parts, and if the horizontal geometry solves, it also contains the resultant horizontal segments.

Similarly the Vertical Geometry is made up of parts, which are made up of simple or complicated combinations of straight lines, arcs or a parabolas. Again the extra restriction that the vertical parts must be linked tangentially is often necessary to fully defined the vertical geometry. The vertical geometry is then said to be solved and the solved vertical geometry simply consists of linked known segments of types lines, arcs and parabolas, and so can be drawn in a section view.

So the vertical geometry is made up of the constructive definitions called **parts**, and if the vertical geometry solves, it also contains the resultant **vertical segments**.

Important Note

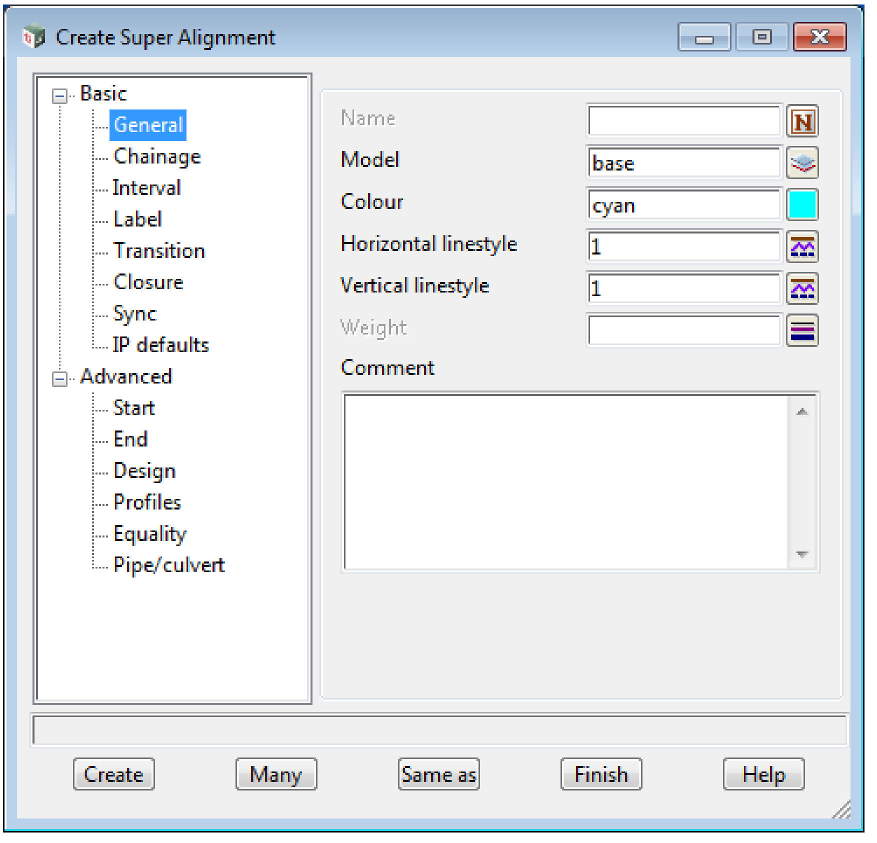
The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the solved segments are displayed and any unsolved parts are displayed as red crosses.

For more information on Super Alignments and Parts, see 21.9 Placing Parts for Super Alignments.

Notes:

1. vertical geometry can only be added to an **existing** super alignment string. That is, to a string with some horizontal geometry.
2. for both the alignment and super alignment, the horizontal geometry is defined in a **plan** view and the vertical geometry in a ***section*** view.

On selecting the **Super Alignment** option, the **Create Super Alignment** panel is displayed.



To create a new super alignment string, the name, model, colour, *etc.* of the new string are entered into the appropriate fields for each branch on the tree on the left-hand side of the panel, and the **Create** or **Many** button selected.

For information on each branch and the buttons (Create, Many, Same as), and starting to edit after selecting the **Create** or **Many** button, go to:

Basic > General branch

Basic > Chainage branch

Basic > Interval branch

Basic > Label branch

Basic > Transition branch

Basic > Closure branch

Basic > Sync branch

Basic > IP defaults branch

Advanced > Start branch

Advanced > End branch

Advanced > Design branch

Advanced > Profiles branch

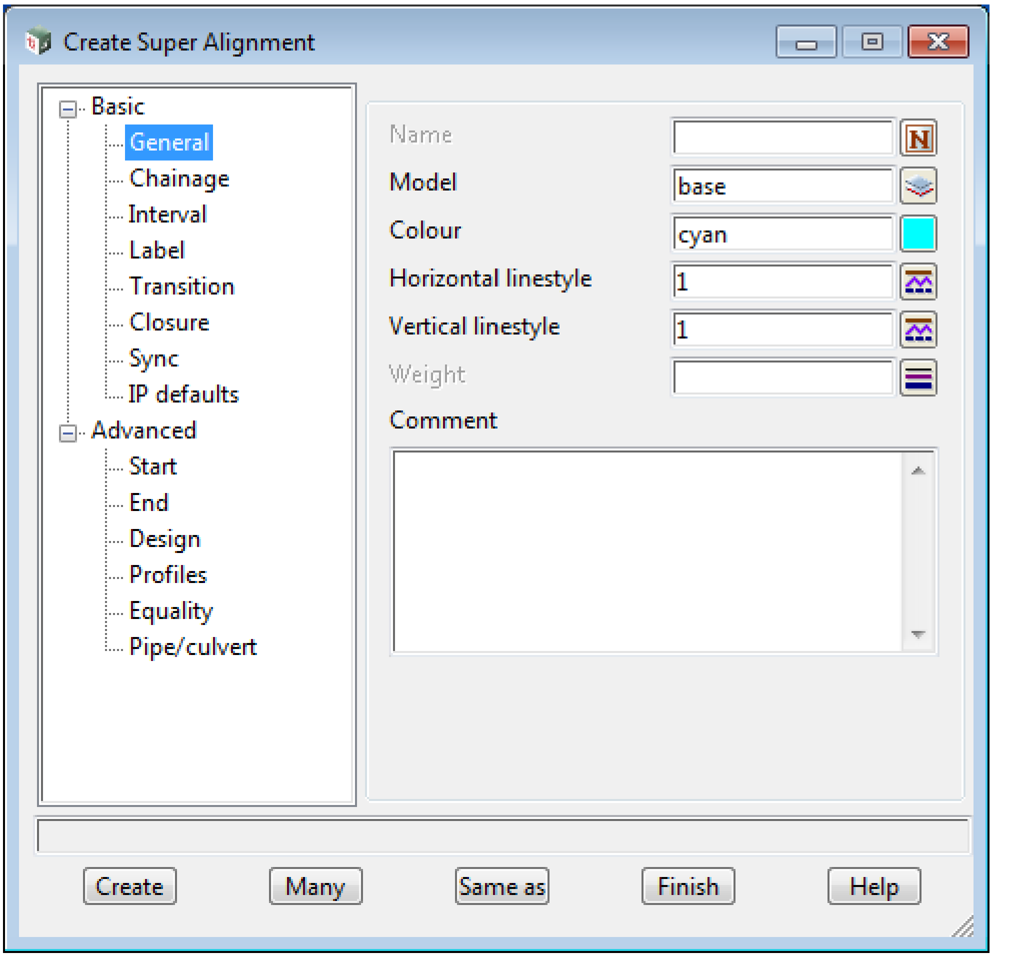
Advanced > Equality branch

Advanced > Chain branch (not yet implemented)

Buttons at Bottom

Start Edit - Super Alignment

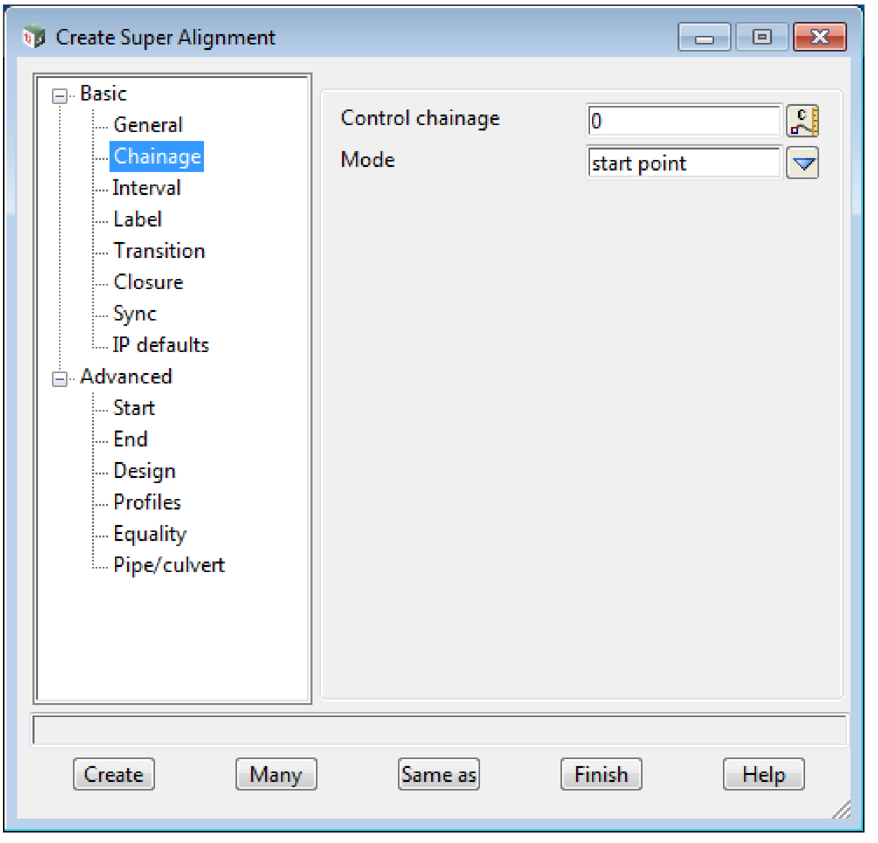
Basic > General branch



The fields and buttons used in the **Basic > General** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box	from CAD controlbar	available names
the name of the new string			
Model	model box	from CAD controlbar	available models
name of the model that the new string is in			
Colour	colour box	from CAD controlbar	available colours
the colour of the new string. Note that the super alignment may not appear to have this colour if a Label style is set. The Label can define different colours to parts of the super alignment.			
Horizontal Linestyle	linestyle box	from CAD controlbar	available linestyles
linestyle of the string when displayed on a Plan view			
Vertical Linestyle	linestyle box	from CAD controlbar	available linestyles
linestyle of the string when profiled on a Section view			
Weight	weight box	from CAD controlbar	
thickness of the string when plotted			

Basic > Chainage branch



The fields and buttons used in the **Basic > Chainage** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control chainage	measure box	0	Measure Point/String from point

defines the control chainage for the horizontal geometry. What this value refers to depends on the Mode.

Field Description	Type	Defaults	Pop-Up
Mode	choice box		start point end point control point start part end part

if ***start point****, the* Control chainage *value is applied to the start of the usable horizontal geometry.*

If ***end point****, the* Control chainage *value is applied to the end of the usable horizontal geometry.*

If ***control point****, a user given control point is dropped perpendicularly onto the horizontal geometry and that position is given the* Control chainage *value.*

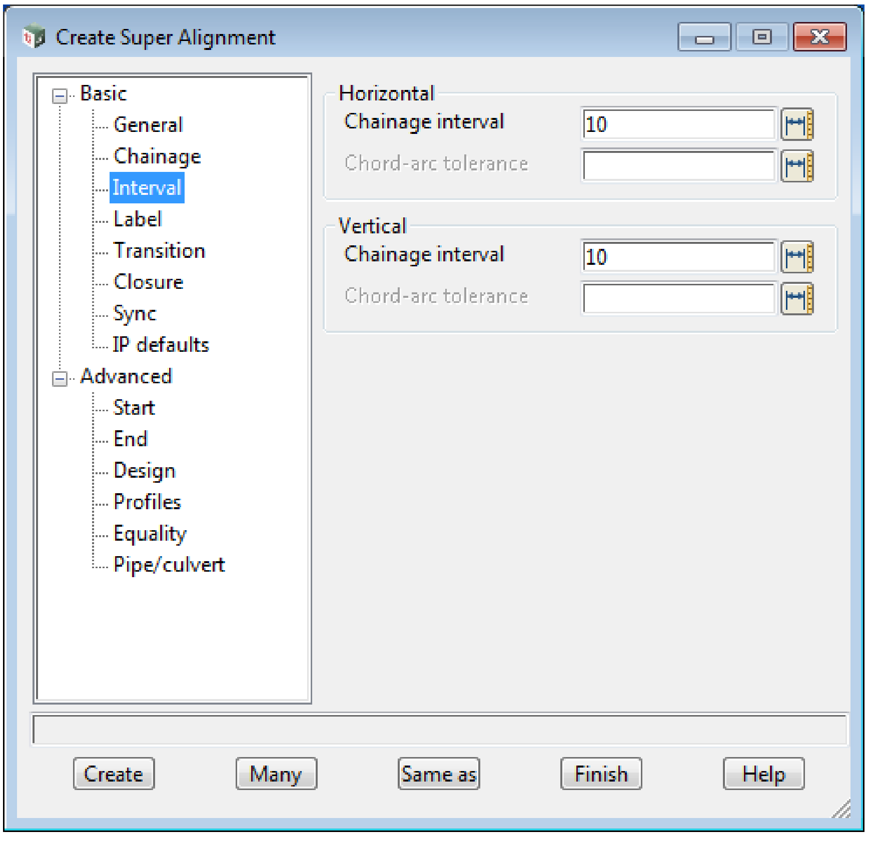
Control point X/Y coordinate select x, y box

coordinates of the control point

If ***start part****, the* Control chainage *value is applied to the start of the first part of horizontal geometry, even if it is invisible.*

If ***end part****, the* Control chainage *value is applied to the end of the last part of horizontal geometry, even if it is invisible.*

Basic > Interval branch



The fields and buttons used in the **Basic > Interval** branch of the **Create Super Alignment** panel have the following functions.

Field Description Type Defaults Pop-Up

Horizontal Chainage interval measure box Point to point/String to point

horizontal chainage interval for the string

If blank, the default is 10.

Horizontal Chord to arc tol measure box Point to point/String to point

horizontal chord to arc tolerance to use for any arcs and transitions

If blank, the default is 0.1.

Vertical Chainage interval measure box Point to point/String to point

vertical chainage interval for the string

If blank, the default is 10.

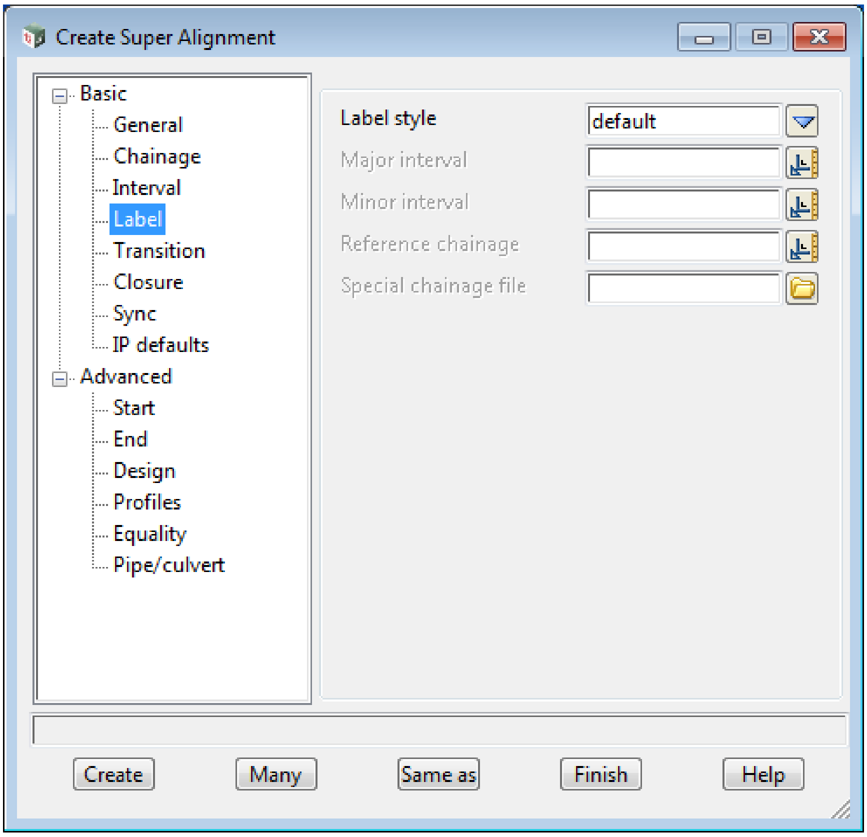
Vertical Chord to arc tol measure box Point to point/String to point

vertical chord to arc tolerance to use for any parabolas or circular curves.

If blank, the default is 0.1.

***Note**: the horizontal and vertical intervals and chord to arc tolerances are used when the super alignment is approximated by straights in three dimensions.*

Basic > Label branch



The fields and buttons used in the **Basic > Label** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Label style	choice box	default	available label styles

The super alignment style controls the way the super alignment draws and highlights on the screen.
For more information please go to the section 14.2.3 Super Alignment Style

Label Major Chainage interval measure box

major chainage interval to use for labelling

If blank, the default is 10.

Label Minor Chainage interval measure box

minor chainage interval to use for labelling

Label Reference chainage interval measure box

reference value for the chainage labelling intervals

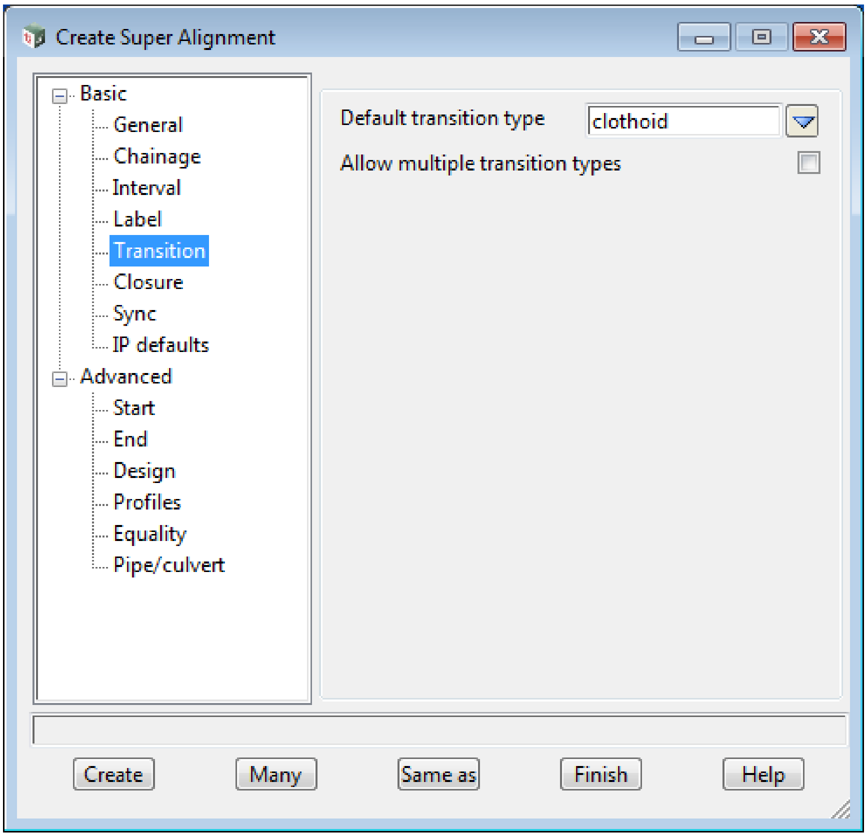
Label Special chainage file file box available *.spc files

file of special chainages for labelling

***Note**: the labelling of the super alignment is given by the **Label style** on the **General** tab.*

For more information please go to the section 14.2.3 Super Alignment Style

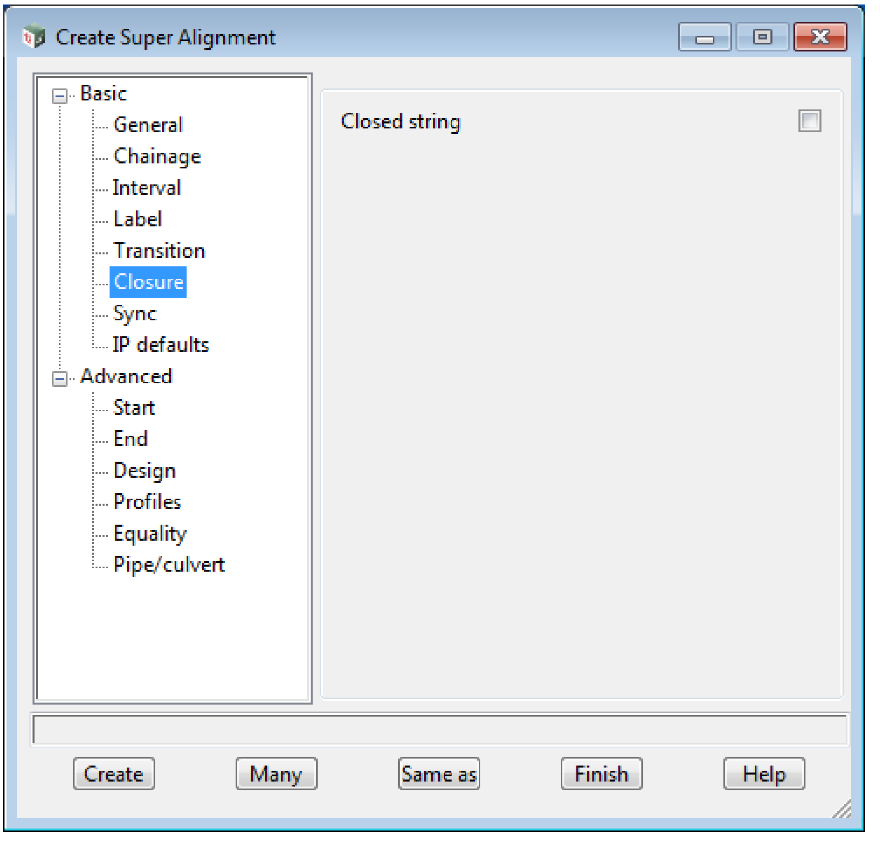
Basic > Transition branch



The fields and buttons used in the **Basic > Transition** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Transition type	choice box	clothoid	
transition (for example clothoid) to be used for this super alignment string.
For more information see 39.2.7.5 Transitions and Spirals File.

Basic > Closure branch

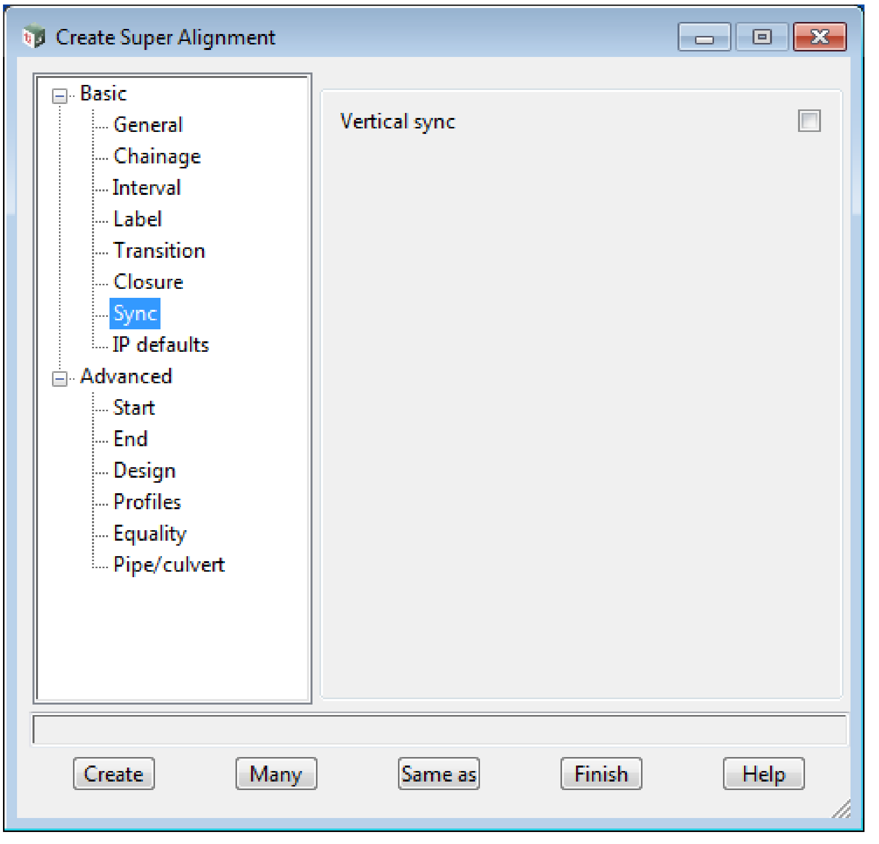


The fields and buttons used in the **Basic > Closure** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Closed string	tick box	not ticked	

*if **ticked**, the super alignment is automatically closed*

Basic > Sync branch



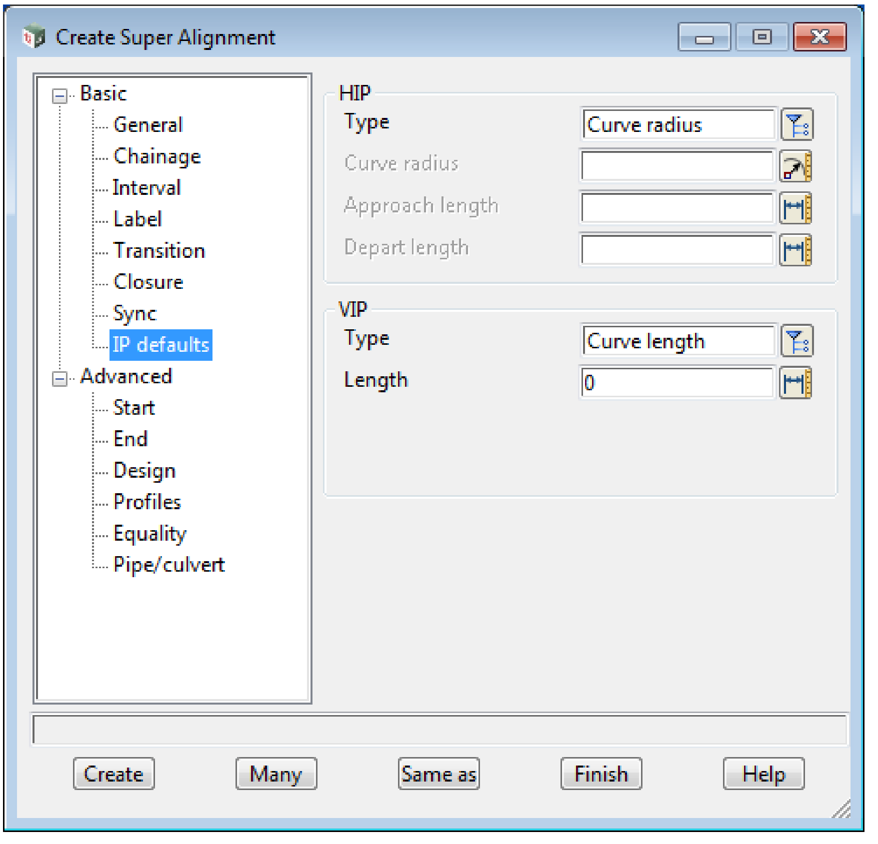
The fields and buttons used in the **Basic > Sync** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertical sync	tick box	not ticked	

*if **ticked**, when the horizontal geometry is modified, an attempt is made to modify the chainage position of the vertical geometry so that it remains locked to the same parts of the horizontal geometry as before the horizontal geometry was modified.*
*If **not ticked**, after horizontal geometry is modified, the vertical geometry will possibly be moved in relation to the horizontal geometry because the (x,y) position for a given chainage will change.*

Basic > IP defaults branch

*the **IP Defaults** branch defines the types of HIPs and VIPs that are placed when laying down horizontal and vertical geometry.*

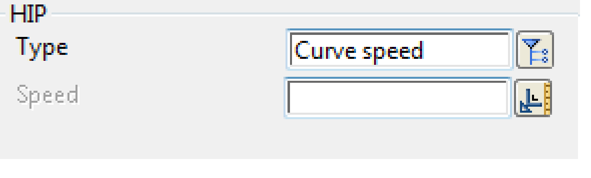


The fields and buttons used in the **Basic > IP defaults** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
HIP type	choice box	Curve radius	Curve speed/radius/length

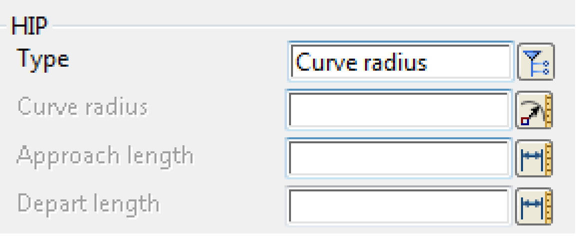
The default HIP type given to any placed HIPs. The default for the panel is a Curve radius *with blank Curve radius, Approach and Depart length. That is, just a HIP with no curve or transitions on it.*

*If **Curve speed**, any new HIP being created will be a Speed IP with the speed specified in the* Speed *field.*



If the Speed *field is blank, the default alignment speed is used.*

*If **Curve radius**, any new HIP being created will be a Radius IP with the radius of the arc on the HIP specified in the* Curve Radius *field. Optional approaching and departing transitions can also be defined in the* Approach length *and* Depart length *fields.*



If the Curve Radius *field is non-zero, an arc of the given value is placed on the HIP.*

If the Curve Radius *field is blank, the HIP won't have an arc associated with it.*

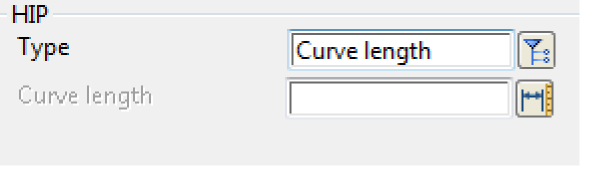
If the Approach length *field is non-zero, then a leading transition of the given value is placed on the HIP. If there is a non-zero value then there must also be a non-zero* Curve Radius *value.*

If the Depart length *field is non-zero, then a trailing transition of the given value is placed on the HIP. If there is a non-zero value then there must also be a non-zero* Curve Radius *value.*

***Note** - if either the* Approach length *or* Depart length *fields are non zero then there must be a non zero* Curve radius.

If the HIP is defined by **Curve radius***, then as the HIP is moved around, the values in the Curve radius definition are held for the HIP. That is, the radius of the arc and the transition lengths are kept constant and the length of the arc is modified.*

If ***Curve length****, any new HIP being created will be a Length IP with the length specified in the* Curve length *field.*



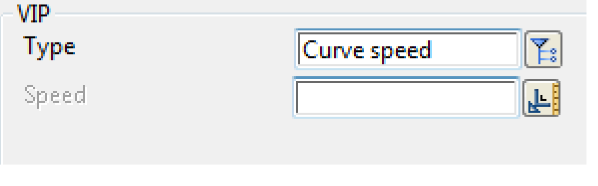
If the Curve length *field is blank, the HIP will have an arc of length zero.*

If the HIP is defined by **Curve length***, then as the HIP is moved around, the arc length is held for the arc on the HIP and arc radius is modified.*

VIP type	choice box	Curve length	Curve speed/radius/length Asymmetric

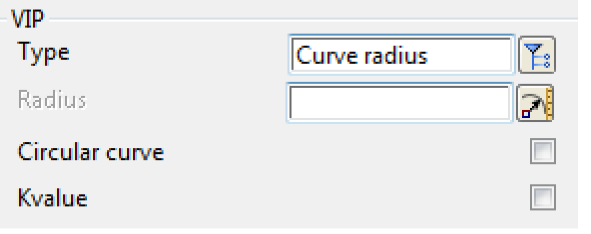
The default VIP type given to any placed VIPs. The default for the panel is a Curve length *with a* Length *of 0.*

If ***Curve speed****, any new VIP being created will be a Speed IP with the speed specified in the* Speed *field.*



If the Speed *field is blank, the default alignment speed is used.*

*If **Curve radius**, any new VIP being created will be a Radius IP with the radius specified in the* Radius *field.*



If the Radius *field is blank, the VIP won't have an parabola/arc associated with it. The value in the Radius field can be a k-value for a parabola, an effective radius (100 x k-value) for a parabola, or the radius of an arc.*

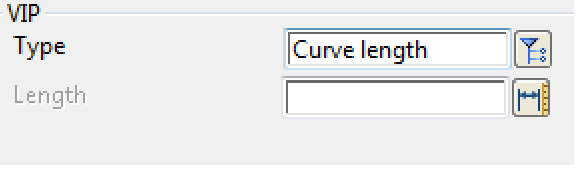
If the Kvalue *tick box is ticked, a parabola is placed on the VIP and the k-value of the parabola is the value in the* Radius *field.*

If the Circular curve *tick box is ticked, an arc is placed on the VIP and the radius of the arc is the value in the* Radius *field.*

*If **neither** Kvalue or Circular curve is ticked, a parabola is placed on the VIP and the effective radius of the parabola is the value in the* Radius *field.*

If the VIP is defined by **Curve radius***, then as the VIP is moved up or down, the values in the Curve radius definition is held for the VIP. That is, the radius or k-value will be kept constant and the length of the parabola/arc is varied.*

*If **Curve length**, any new VIP being created will be a parabolic Length IP with the length specified in the* Length *field.*

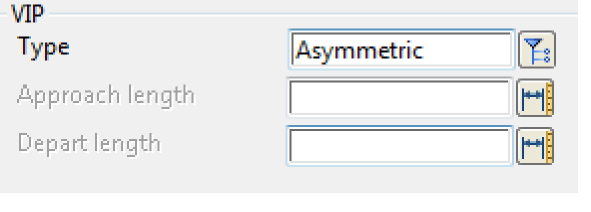


If the Length *field is 0, then just the VIP will be drawn with no parabola on it.*

If the Length *field is blank, the VIP will be associated with an parabola of maximum length.*

If the VIP is defined by **Curve length***, then as the VIP is moved up or down, the length of the parabola given in the Curve Length definition is held for the VIP. That is, the length is kept constant and the radius/k-value of the parabola is varied.*

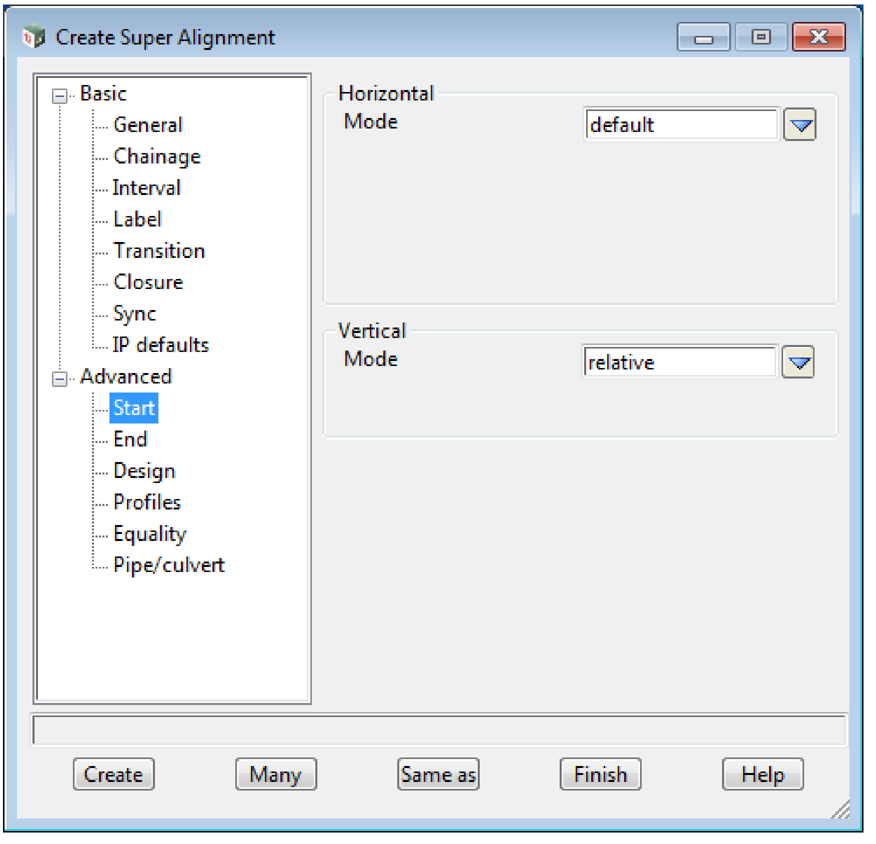
*If **Asymmetric**, any new VIP being created will have parabolas of the combined lengths of* Approach length *and* Depart length*.*



If the VIP is defined by **Asymmetric***, then as the VIP is moved up or down, the Approach and Depart Lengths of the parabolas given in the Asymmetric definition are held for the VIP. That is, the lengths are kept constant and the radius/k-value of the parabolas are varied.*

Advanced > Start branch

*the **Start** branch defines where the usable horizontal and vertical geometry starts for the super alignment. Note that the super alignment can have more horizontal and vertical geometry than is actually used.*



The fields and buttons used in the **Advanced > Start** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start Horizontal mode	choice box		default segment point

specifies how the start of the usable horizontal geometry is defined.

*If **default**, the beginning of the first visible horizontal part is the start of the usable horizontal geometry.*

*If **segment**, a user selected segment of the horizontal geometry is the start of the usable horizontal geometry.*

*If **point**, a user selected position is dropped perpendicularly onto the super alignment to define the start of the usable horizontal geometry.*

Start Control point X/Y coordinate select x, y box

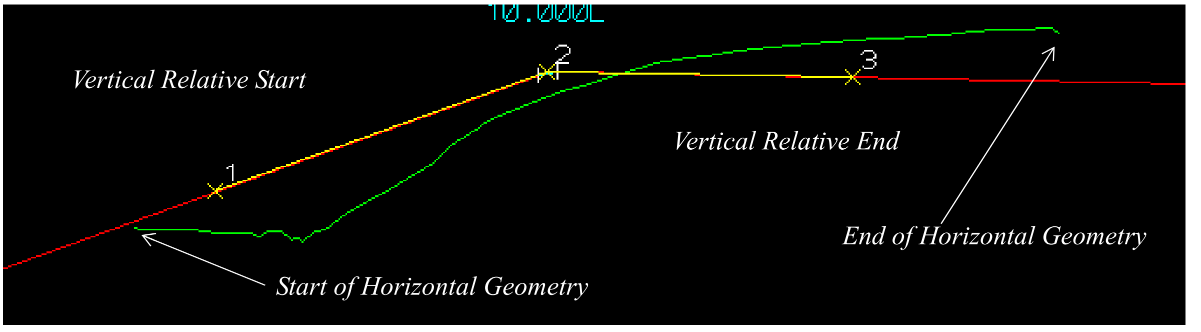
*used in the **segment** and **point** cases of the **Start Horizontal mode**.*

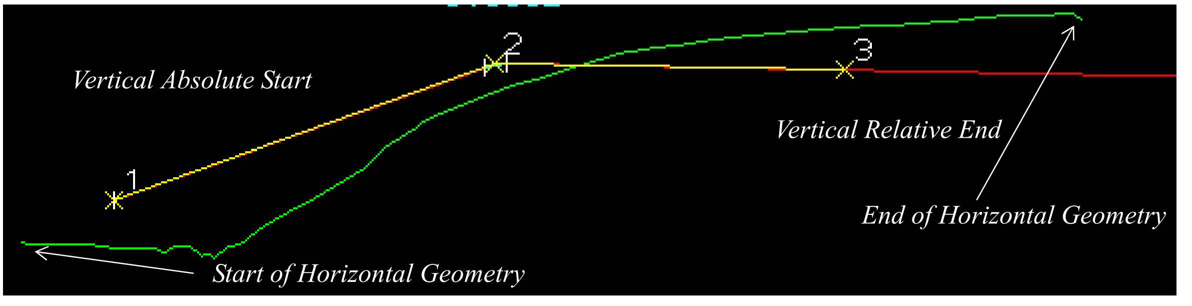
Start Vertical mode	choice box		absolute relative chainage

specifies how the start of the usable vertical geometry is defined.

*If **absolute**, the beginning of the first visible vertical part is the start of the usable vertical geometry.*

*If **relative**, the chainage of the start of the usable horizontal geometry is used as the start of* *the usable vertical geometry. If the beginning of the defined vertical geometry is **after** this chainage, then the first segment is extrapolated back to the required chainage.*





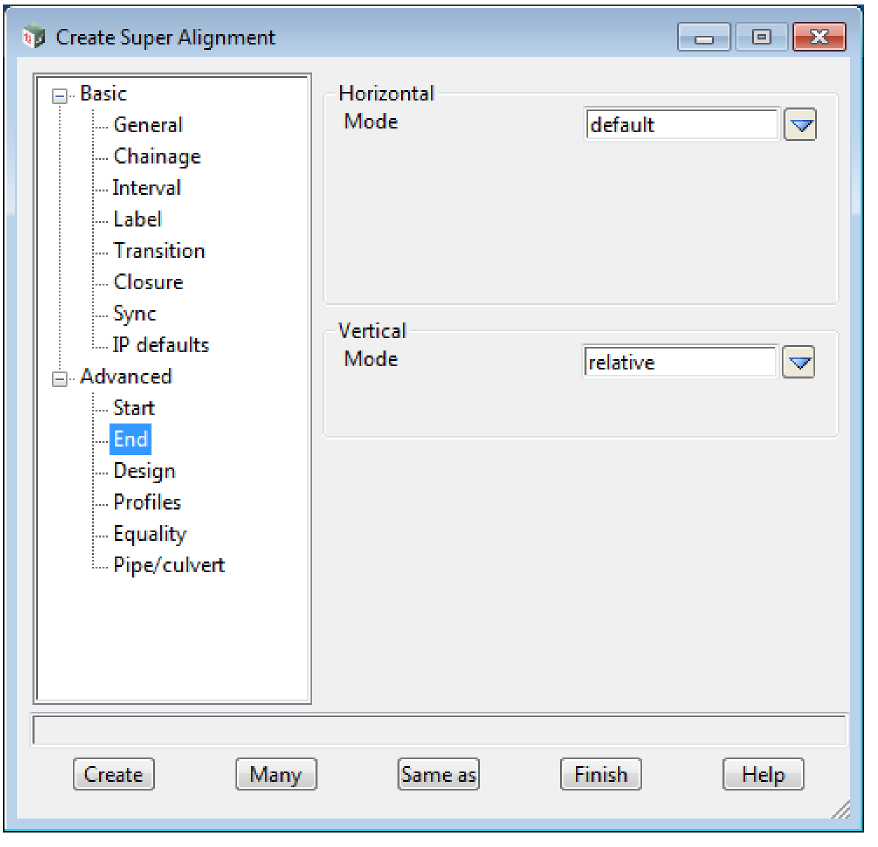
*If **chainage**, a user given chainage defines the start of the usable vertical geometry.*

Chainage measure box available measures

*used in the **chainage** case of the **Start Vertical mode**.*

Advanced > End branch

*the **End** branch defines where the usable horizontal and vertical geometry ends for the super alignment. Note that the super alignment can have more horizontal and vertical geometry than is actually used.*



The fields and buttons used in the **Advanced > End** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
End Horizontal mode	choice box		default segment point

specifies how the end of the usable horizontal geometry is defined.

*If **default**, the end of the last visible horizontal part is the end of the usable horizontal geometry.*

*If **segment**, a user selected segment of the horizontal geometry is the end of the usable horizontal geometry.*

*If **point**, a user selected position is dropped perpendicularly onto the super alignment to define the end of the usable horizontal geometry.*

End Control X/Y coordinate select x, y box

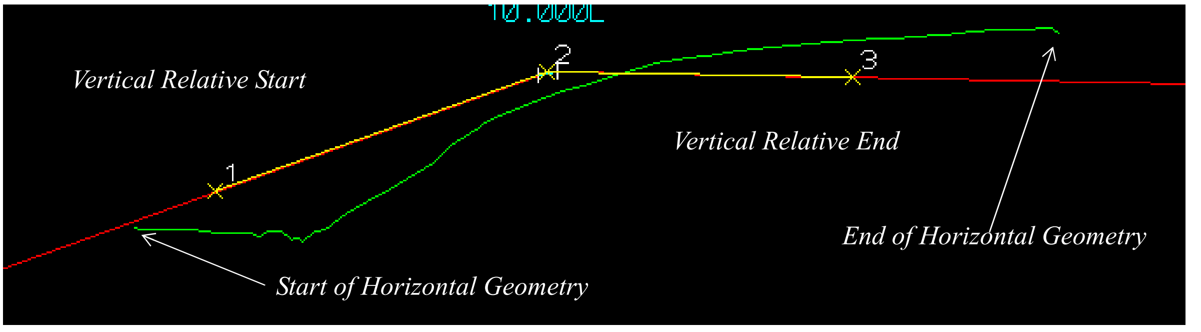
*used in the **segment** and **point** cases of the **End Horizontal mode**.*

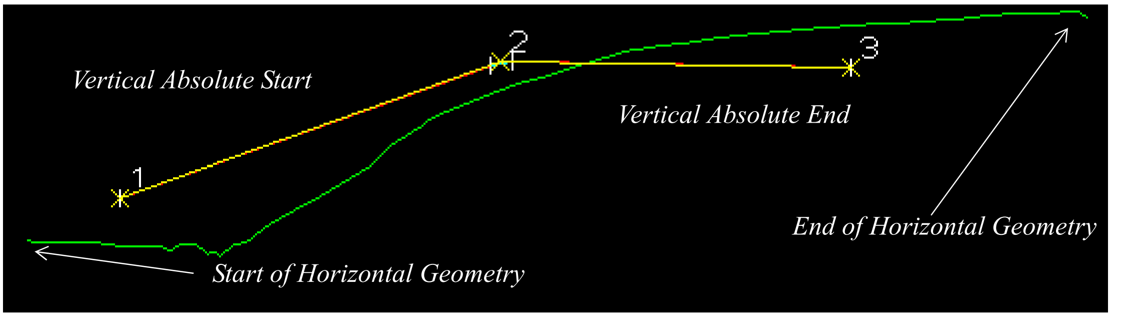
Field Description	Type	Defaults	Pop-Up
End Vertical mode	choice box		absolute relative chainage

specifies how the end of the usable vertical geometry is defined.

*If **absolute**, the end of the last visible vertical part is the end of the usable vertical geometry.*

*If **relative**, the chainage of the end of the usable horizontal geometry is used as the end of the* *usable vertical geometry. If the end of the defined vertical geometry is* ***before*** *this chainage, then the last segment is extrapolated to the required chainage.*



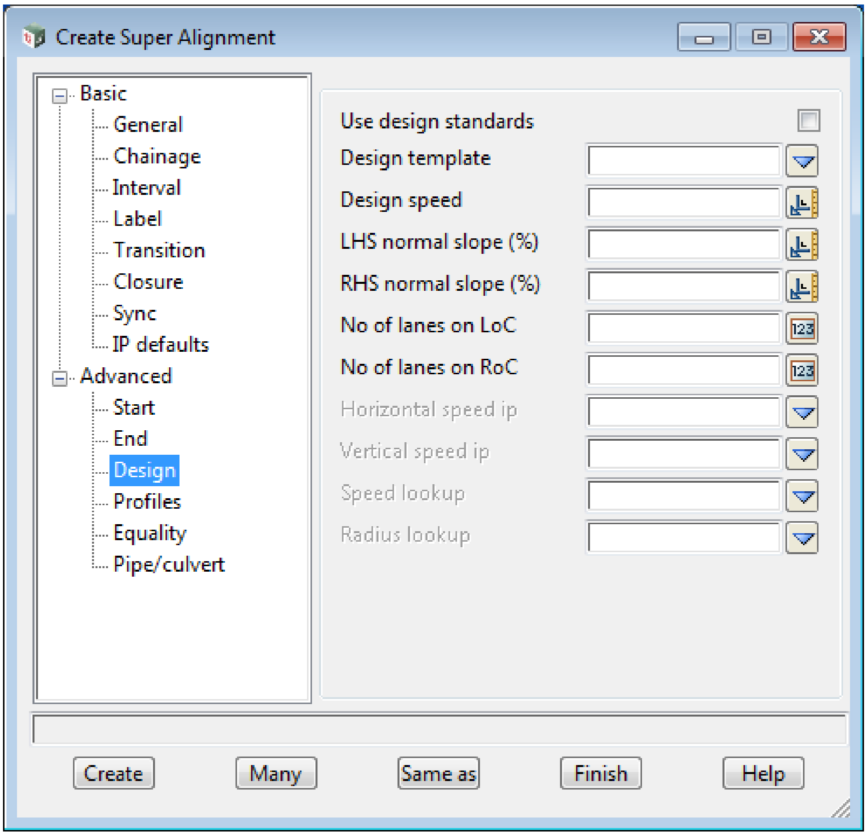


If ***chainage****, a user given chainage defines the end of the usable vertical geometry.*

Chainage measure box available measures

used in the ***chainage*** *case of the* ***End Vertical mode****.*

Advanced > Design branch



*the **Design** branch is only used if a design template has been set up and is to be used for automatically inserting curves and transition curves in horizontal geometry, apply super elevation and widening, and automatically inserting vertical curves in the vertical geometry.*

The fields and buttons used in the **Advanced > Design** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use design standards	tick box	not ticked	

*if **ticked**, the selected design template is used when creating horizontal and vertical geometry.*
*If **not ticked**, no design template is used with **Alignment speed** elements.*

Design template	choice box		available design templates

Design template to use when creating horizontal and vertical geometry. For more information see 14.2.6 Design Templates.

Design speed			*.design files

the general design speed for the road. This is used with the design template when creating horizontal and vertical geometry. This can be over written by Speed IPs.

LHS normal slope (%)

RHS normal slope (%)

No of lanes on LoC

number of lanes on the left of the centreline. The number of lanes can be zero.

No of lanes on RoC

number of lanes on the right of the centreline. The number of lanes can be zero.

Horizontal speed IP	choice box	minimum maximum

*For **Alignment speed** and **Curve speed HIPs**.*

*If **minimum**, when an arc is automatically placed on an HIP using the design table, the arc with the smallest radius for the design speed is used.*
*If **maximum**, when an arc is automatically placed on an HIP using the design table, the arc with the largest radius for the design speed is used.*

Vertical speed IP	choice box	minimum maximum

*For **Alignment speed** and **Speed VIPs**.*

*If **minimum**, when a parabola is automatically placed on an VIP using the design table, the parabola with the smallest kvalue for the design speed is used.*
*If **maximum**, when a parabola is automatically placed on an VIP using the design table, the parabola with the largest kvalue for the design speed is used.*

Speed lookup	choice box	ceiling floor round up round down

Different method to achieve the actual speed from the speed table.

*If **ceiling**, then the design speed is the upper speed from the table.*

*If **floor**, then the design speed is the lower speed from the table.*

*If **round up**, the speed will be the upper speed from the table when the calculated speed is greater than or equal to the half way speed. Otherwise it will be the lower speed.*

*If **round down**, the speed will be the lower speed from the table when the calculated speed is less than or equal to the half way speed. Otherwise it will be the upper speed.*

Radius lookup	choice box	ceiling floor round up round down interpolate

Different method to achieve the actual radius from the radius table.

*If **ceiling**, then the design radius is the upper radius from the table.*

*If **floor**, then the design radius is the lower radius from the table.*

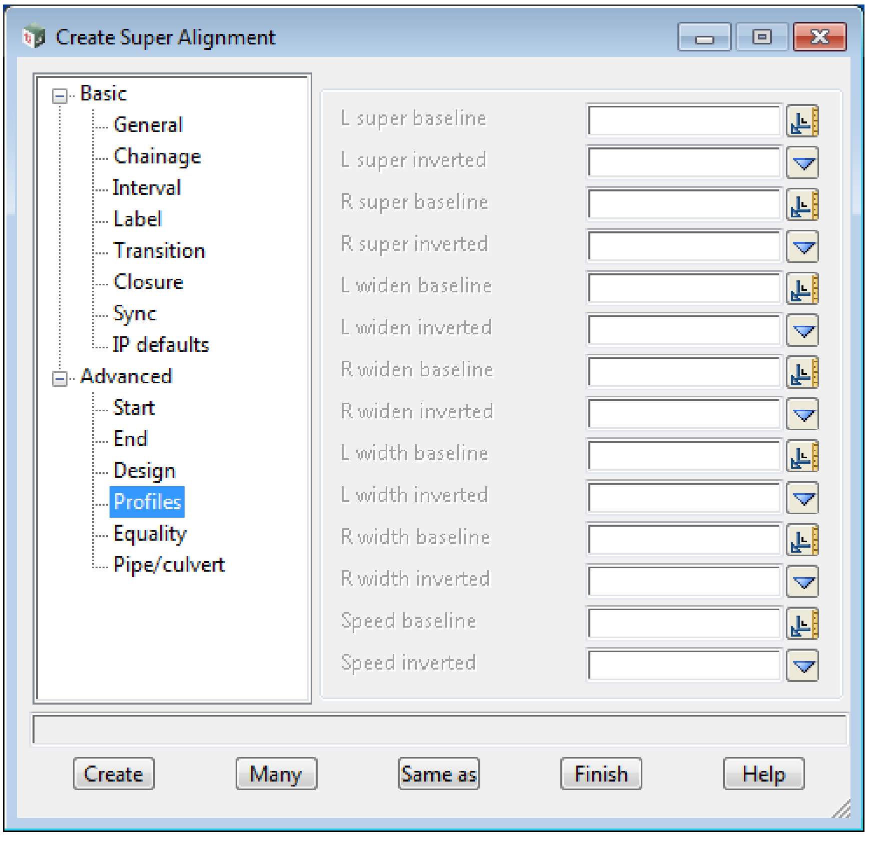
*If **round up**, the radius will be the upper radius from the table when the calculated radius is greater than or equal to the half way radius. Otherwise it will be the lower radius.*

*If **round down**, the radius will be the lower radius from the table when the calculated radius is less than or equal to the half way radius. Otherwise it will be the upper radius.*

*If **interpolate**, the radius is the calculated based on the specified speed.*

*For **non speed HIPs only** (that is, not **Alignment speed** or **Curve speed HIPs).***
The radius has been defined by the user and LJG?

Advanced > Profiles branch



The fields and buttons used in the **Advanced > Profiles** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
L super baseline	measure box		available measures

the left super elevation diagram will be drawn at this Z value in the Section view

L super inverted	choice box	no	yes, no

*if **no**, positive super elevation is drawn above the left super baseline and negative super elevation is drawn below the left super baseline. This is the default.*

*if **yes**, positive super elevation is drawn below the left super baseline and negative super elevation is drawn above the left super baseline, i.e. the diagram is turned upside down*

R super baseline	measure box		available measures

the right super elevation diagram will be drawn at this Z value in the Section view

R super inverted	choice box	no	yes, no

*if **no**, positive super elevation is drawn above the right super baseline and negative super elevation is drawn below the right super baseline. This is the default.*

*if **yes**, positive super elevation is drawn below the right super baseline and negative super elevation is drawn above the right super baseline, i.e. the diagram is turned upside down*

L widen baseline	measure box		available measures

the left widening diagram will be drawn at this Z value in the Section view

L widen inverted	choice box	no	yes, no

*if **no**, widening is drawn above the left widen baseline. Widening is always positive (or zero). This is the* *default.*

*if **yes**, positive widening is drawn below the left widen baseline, i.e. the diagram is turned upside down*

R widen baseline	measure box		available measures

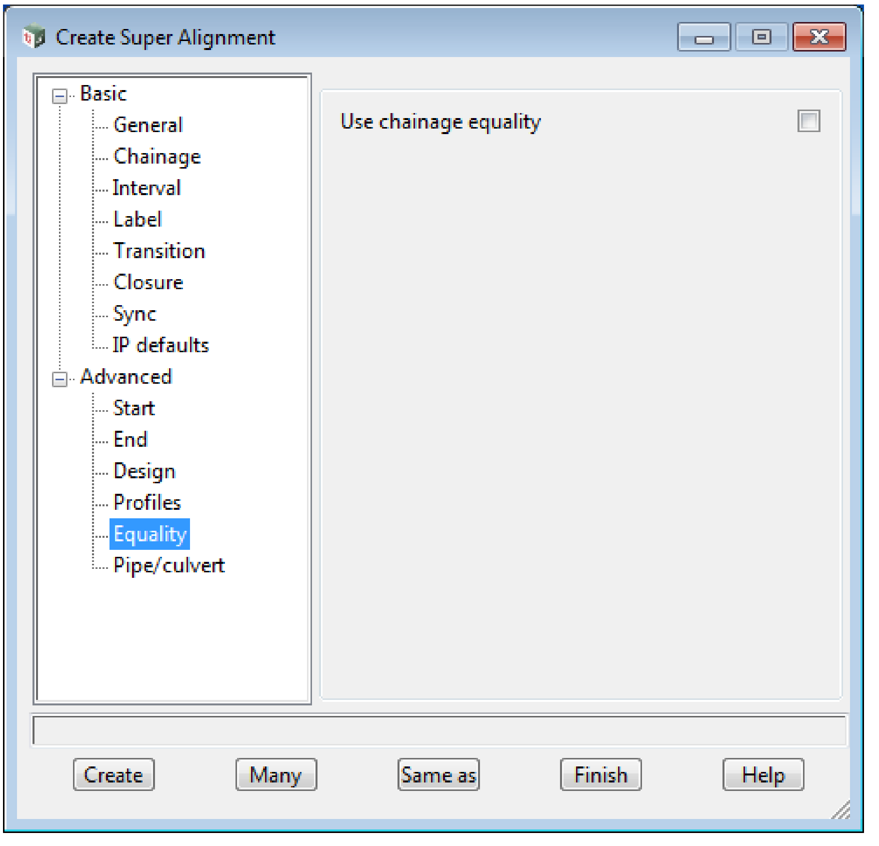
the right widening diagram will be drawn at this Z value in the Section view

R widen inverted	choice box	no	yes, no

*if **no**, widening is drawn above the right widen baseline. Widening is always positive (or zero). This is the default.*

*if **yes**, positive widening is drawn below the right widen baseline, i.e. the diagram is turned upside down*

Advanced > Equality branch



The fields and buttons used in the **Advanced > Equality** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use chainage equality	tick box	not ticked	

*if **ticked**, chainage equalities can be defined and the automatic labelling of the string will use the equalities.*

Advanced > Chain branch (not yet implemented)

The fields and buttons used in the **Advanced > Chain** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chain file	file box		available *.chain files

the chain parameter file to run every time the super alignment is resolved/recalced.

For more information see the section 28.3 Chains *in the book* 28 Utilities.

Run chain after set	tick box	not ticked	

Buttons at Bottom

Create button

when only one super alignment is to be created, click on the **Create** *button. The* **Edit Super Alignment** *toolbar is displayed.*

Many button

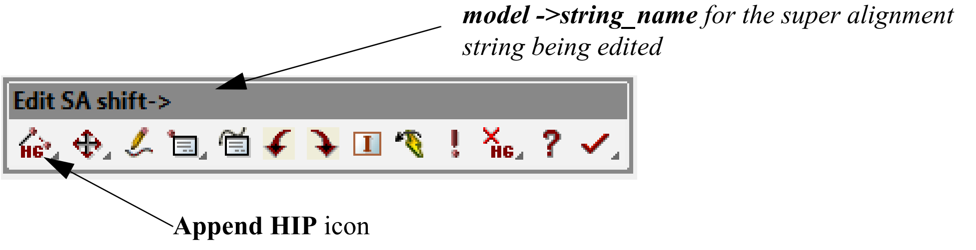
when more than one super alignment is to be created using the same set-up information, then click on the **Many** *button.* **Edit Super Alignment** *toolbar is displayed.*
After the editing for this string is finished, a new ***Create Super Alignment*** *panel is placed on the screen with the same values for the panel fields as the string just created.*
Hence new super alignments can be created (by clicking on the **Create** *or* **Many** *button) without having to go back to the* ***String Create*** *menu.*
If no more super alignments are to be created, click on the **Finish** *button*

Same as button

after the **Same as** *button is chosen, another string is selected and information about it is used to fill in fields for this panel*

Start Edit - Super Alignment

After selecting the **Create** or **Many** button, the **Super Alignment** toolbar is created and placed on the screen.



To create a new Super Alignment, select the **Append HIP** icon.

The **Append HIP** simply creates horizontal intersection points (HIPs) that are joined by a straight segments.

For Appending HIPs, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the first HIP of the string (using the appropriate snaps).

The string is then drawn from the first HIP to the cursor position, which represents the second HIP of the string. Clicking LB and accepting with MB selects the second string HIP and the process repeats for subsequent string HIPs.

Now that the string is created, all the edit option on the string's **Edit SA** toolbar are usable.

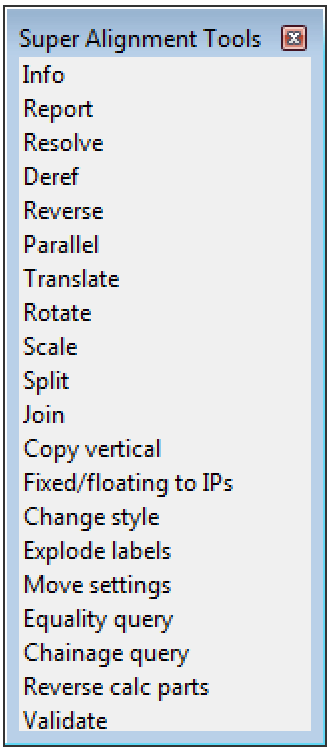
The options in the **Edit SA** toolbar are not only used for placing the initial HIPs of the string, but for editing the super alignment once it is created. Since the **Append HIP** and other options in the **Edit SA** toolbar are identical to the options used when editing an existing string, they will be discussed in detail in the **Editor** section.

For full information on the Super Alignment Editor, go to the section 14.4.11 Edit Super Alignment

14.2.2 Super Alignment Tools

Position of Menu: **Strings =>Super alignments =>Tools**

The Super Alignment Tools walk-right menu is



information about a super alignment
create a report on a super alignment
resolve a super alignment
dereference a super alignment
reverse the super alignment direction
parallel a super alignment
translate a super alignment
rotate a super alignment
scale a super alignment
split a super alignment
join two super alignments
copy the vertical geometry between super alignments
convert fixed/floating to IPs
change the style for super alignments
explode the labelling to text and lines
setting to lock the movement of IPs
inquire about chainage equalities
inquire about chainages
make construction parts from super alignment segments
run validation on a super alignment

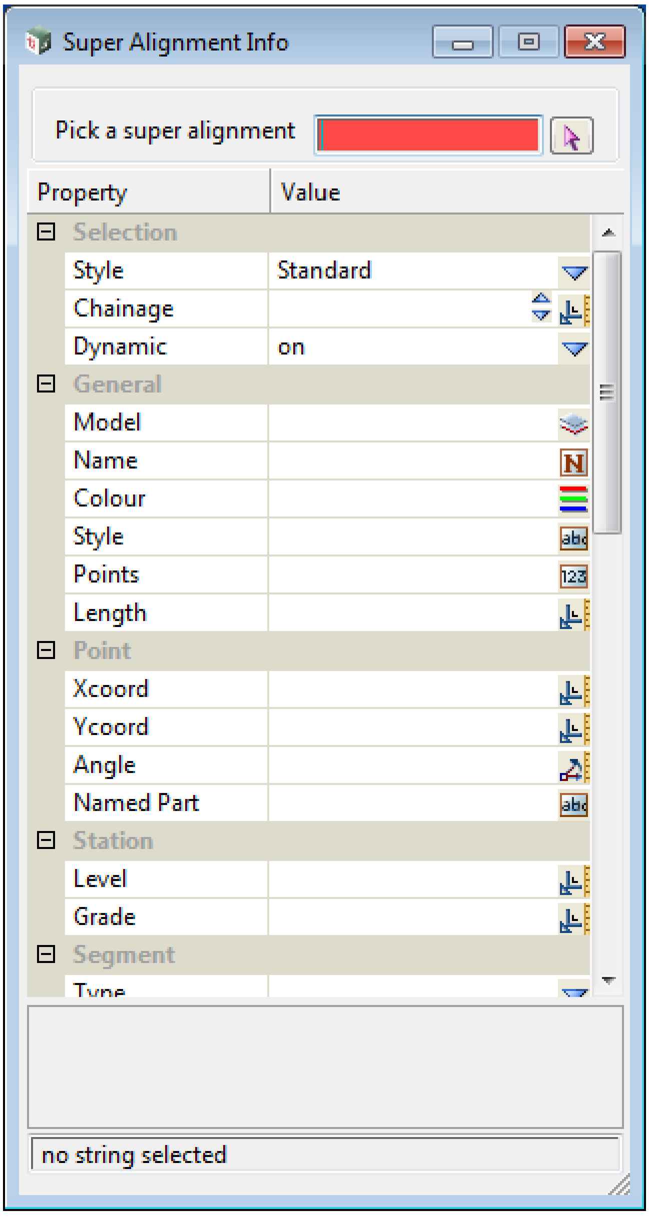
Explode labels	14.2.2.15 Explode the Super Alignments Labelling
Move settings	14.2.2.16 Constrain the Movement of Super Alignment Points
Equality query	14.2.2.17 Equality Query
Chainage query	14.2.2.18 Chainage Query
Reverse calc parts	14.2.2.19 Reverse Calc Parts
Validate	14.2.2.20 Validate Super Alignment

14.2.2.1 Super Alignment Info

Position of option on menu: **Strings =>Super alignments =>Tools =>Info**

This section of documentation is a work in progress and will be updated in subsequent releases.

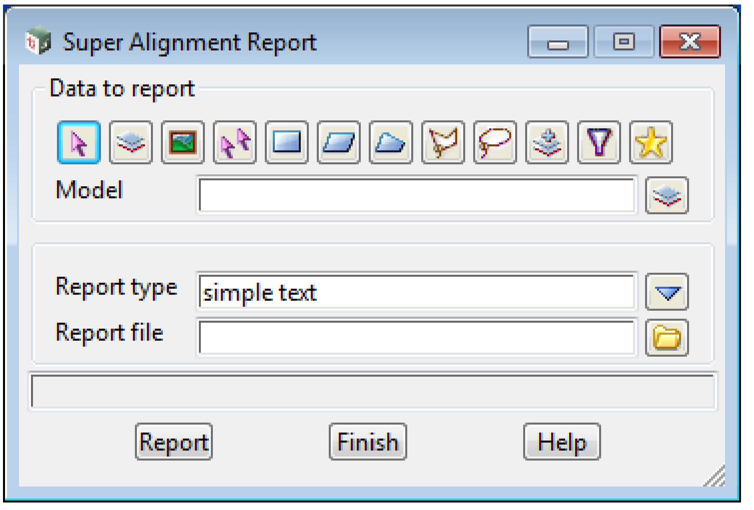
Selecting **Info** displays the **Super Alignment Info** panel.



14.2.2.2 Super Alignment Report

Position of option on menu: **Strings =>Super alignments =>Tools =>Report**

Selecting **Report** displays the **Super Alignment Report** panel.



For more information, please see 27.2.4 Super Alignment Report.

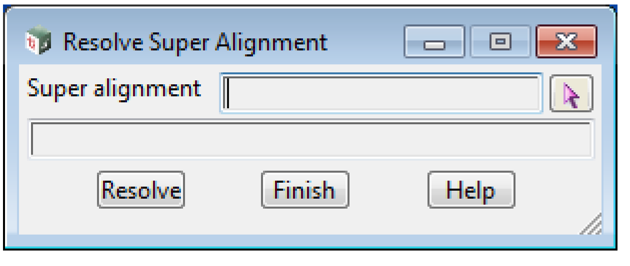
14.2.2.3 Resolve a Super Alignment

Position of option on menu: **Strings =>Super alignments =>Tools =>Resolve**

When a super alignment is created using *computators*, the super alignment is defined with *references* to other strings. If the referenced strings are modified, then the super alignment will not automatically reflect the changes in the referenced strings.

Resolve forces the string to be resolved using the current position and properties of any referenced strings.

Selecting **Resolve** displays the **Resolve Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		

select a super string to resolve.

Resolve	button		

*after the **Resolve** button is clicked, the super alignment is resolved using the new position and properties of any referenced strings.*

14.2.2.4 Dereference Super Alignments

Position of option on menu: **Strings =>Super alignments =>Tools =>Deref**

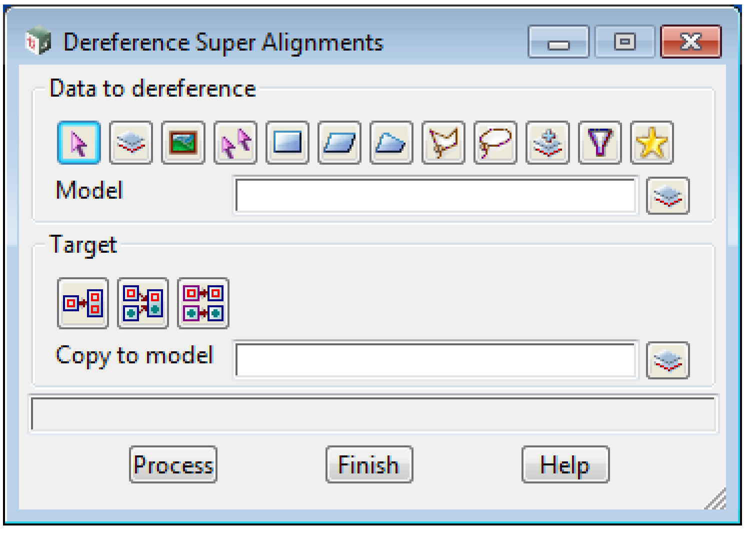
When a super alignment is created using *computators*, the super alignment is defined with *references* to other strings.

Dereferencing removes the *references* to other strings in a super alignment, and inserts copies of the referenced string in its place. Hence a dereferenced string looks like the original string, but it no longer has links to any other strings.

The **Deref** option copies the original string, and *dereferences* the copied string.

So after running **Deref** there are no longer any references to other strings in the copy of the super alignment.

Selecting **Deref** displays the **Dereference Super Alignments** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to dereference		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data info	input		

extra information required for the Data source.

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info	input		

extra information required for the target. Only the Copy Targets are allowed.

Process	button		

after the **Process** *button is clicked, the selected strings are copied and dereferenced.*

14.2.2.5 Reverse Super Alignment

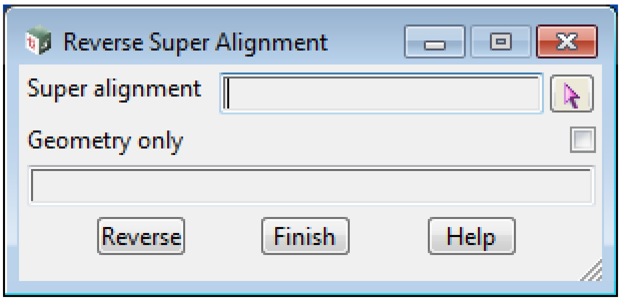
Position of option on menu: **Strings =>Super alignments =>Tools =>Reverse**

Reverse creates a copy of the selected super alignment, and then reverses the direction of the copied super alignment.

If there are any computators in the super alignment, the copy of the super alignment will be dereferenced before being reversed.

Even if the super alignment will not solve, it can still be reversed. This is useful when strings come in from other systems and have geometry (that is horizontal and vertical segments) but won't solve. These strings can now be reversed.

Selecting **Reverse** displays the **Reverse Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		

select the super alignment to copy and reverse the direction of the copied string

Geometry only	tick box	not ticked	

*if **ticked** then only the Geometry of the Super Alignment (the segments for the horizontal and the segments for the vertical) is used, and a reverse string is created by simply reversing the segments. All construction data is removed. So this will work for super alignments that have geometry but won't solve.*

The reversed string no longer has any constructive definition but just consists of the horizontal and vertical data.

This is useful when strings come in from other systems and have geometry (that is, horizontal and vertical segments) but won't solve.

*If **not ticked** then the string will need to solve before it can be reversed.*

***Note 1**: This reverses and replaces the existing string so if you don't want to lose the data in your existing string, make a copy of it first.*

***Note 2:** The horizontal segments can be straights, arcs, transitions and offset transitions. The vertical segments can be straights, arcs and parabolas.*

Reverse	button		

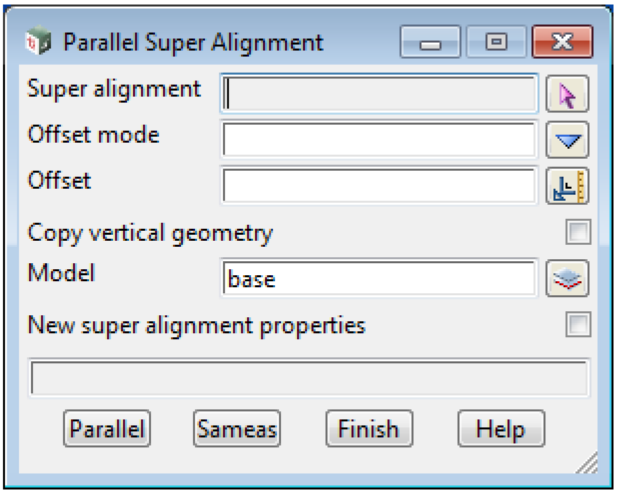
*after the **Reverse** button is clicked, the direction of the copied super alignment is reversed.*

14.2.2.6 Parallel a Super Alignment

Position of option on menu: **Strings =>Super alignments =>Tools =>Parallel**

Parallel parallels the horizontal geometry of a super alignment by a user given offset.

Selecting **Parallel** displays the **Parallel Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		

select a super alignment to parallel

Offset mode	choice box		fix and free, floating, ip

*if **fix and free**, fixed free fixed elements will be used to parallel the super alignment.*
*If **floating**, the super alignment will start with a fixed element followed by floating elements.*
*If **ip**, an IP based super alignment will be created.*

Offset	input		

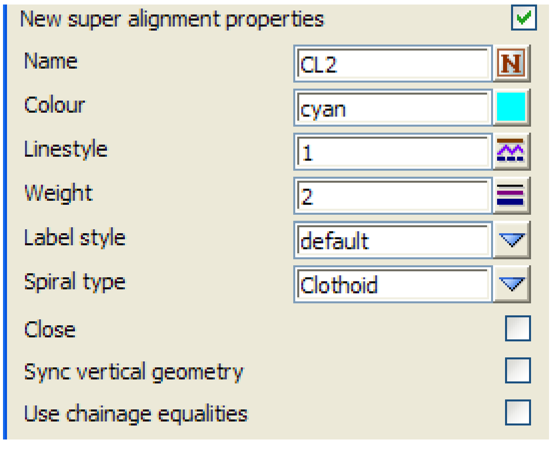
distance to offset the selected super alignment

Model	model box		available models

if not blank, the model for the paralleled string.
If blank, the model is the same as the selected string.

New super alignment properties tick box

*if **ticked**, the panel is expanded to show all the properties that can be set for the new paralleled string.*



Extra panel fields when ***New super alignment properties*** is ticked on

Name	input	from CAD controlbar	

the name of the new string

Colour	input	from CAD controlbar	available colours

the colour of the new string

Linestyle	linestyle box	from CAD controlbar	available line styles

line style of the string

Weight	input		

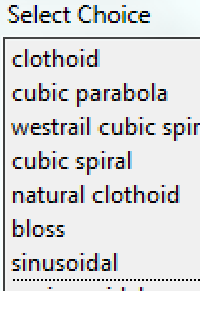
thickness of the string

Label style	choice box	default	available label styles

The super alignment style controls the way the super alignment draws and highlights on the screen.
For more information please go to the section 14.2.3 Super Alignment Style

Transition type	input	clothoid	clothoid, cubic parabola westrail-cubic, cubic spiral natural clothoid, bloss sinusoidal, cosinusoidal

transition (for example clothoid spiral) to be used for this super alignment string. For more information see 39.2.7.5 Transitions and Spirals File.



Chain file	file		

The chain parameter file to run every time the super alignment is resolved/recalced.

For more information see the section 28.3 Chains in the book 28 Utilities

Close	tick box		

*if **ticked**, the super alignment is automatically closed.*

Sync vertical geometry tick box

*if **ticked**, when the horizontal geometry is modified, an attempt is made to modify the chainage position of the vertical geometry so that remains locked to the same parts of the horizontal geometry as before the horizontal geometry was modified.*
*If **not ticked**, after horizontal geometry is modified, the vertical will possibly be moved in relation to the horizontal geometry because the (x,y) position for a given chainage will change.*

Use chainage equalities tick box

*if **ticked**, chainage equalities can be defined and the automatic labelling of the string will use the equalities.*

Parallel button

after the **Parallel** *button is clicked, a dereferenced copy of the horizontal geometry of the super alignment is paralleled. The vertical geometry is deleted.*

Same as button

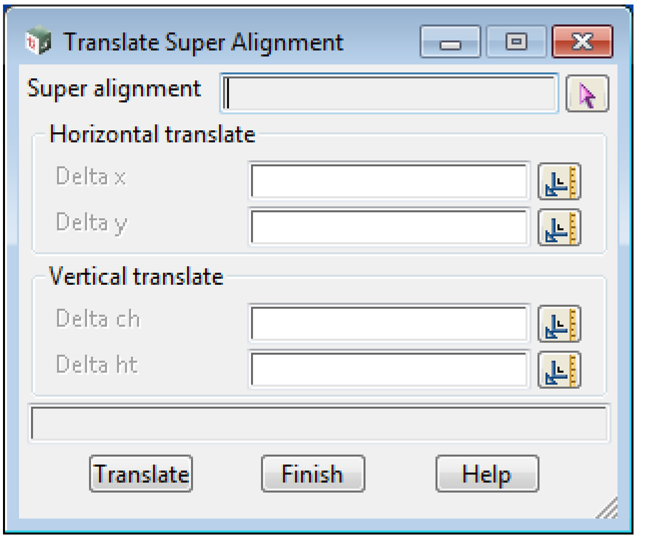
after clicking **Same as** *and then select a string. All the picked string properties will be loaded into the panel fields.*

14.2.2.7 Translate Super Alignment

Position of option on menu: **Strings =>Super alignments =>Tools =>Translate**

Translate copies the selected super alignment, and then dereferences and translates the copied string.

Selecting **Translate** displays the **Translate Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		

select the super alignment to translate

Horizontal translate

Delta x, Delta y: the x/y amounts to translate the string

Vertical translate

Delta ch, Delta z: the chainage/z amounts to translate the string

Translate button

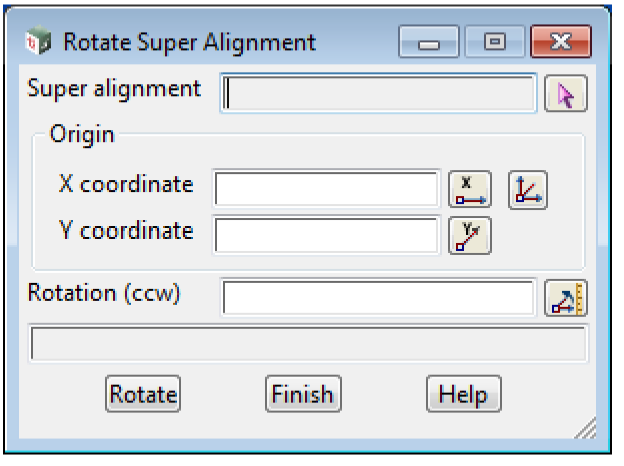
after the **Translate** *button is clicked, the selected string is copied, and the copied string is translated.*

14.2.2.8 Rotate Super Alignment

Position of option on menu: **Strings =>Super alignments =>Tools =>Rotate**

Rotate copies the selected super alignment, and then dereferences and rotates the copied string about a user defined origin.

Selecting **Rotate** displays the **Rotate Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Super alignment string select

select the super alignment to copy and rotate the copied string

Origin xyz ops

select the centre (origin) of the rotation. The origin can be changed at any time.

Rotation string select

the clockwise angle in dms to rotate through.

Rotate button

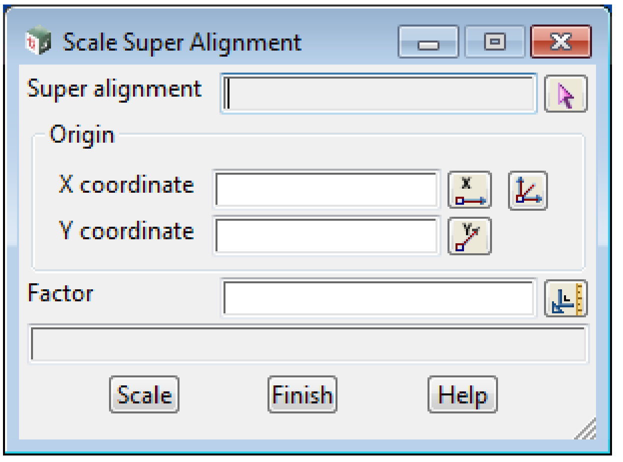
after the **Rotate** *button is clicked, the selected string is copied, and the copied string is rotated about the origin.*

14.2.2.9 Scale Super Alignment

Position of option on menu: **Strings =>Super alignments =>Tools =>Scale**

Scale copies the selected super alignment, and then dereferences and scales the copied string about a user defined origin.

Selecting **Scale** displays the **Scale Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		

select the super alignment to copy and scale

Origin xyz ops

select the origin to scale about. The origin can be changed at any time.

Factor

amount to scale the copy of the super alignment by.

Scale button

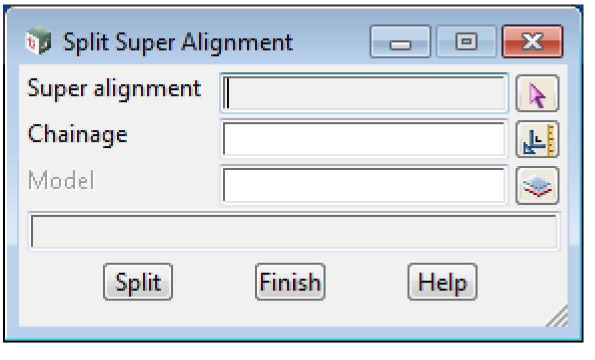
*after the **Scale** button is clicked, the selected string is copied, and the copied string then scaled about the origin.*

14.2.2.10 Split a Super Alignment

Position of option on menu: **Strings =>Super alignments =>Tools =>Split**

Split copies and splits the copy of the super alignment at a user given chainage.

Selecting **Split** displays the **Split Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		

select a super alignment to split

Chainage input

chainage to split the super alignment at

Model model box available models

if not blank, model for the split string
If blank, use the model of the selected string

Split button

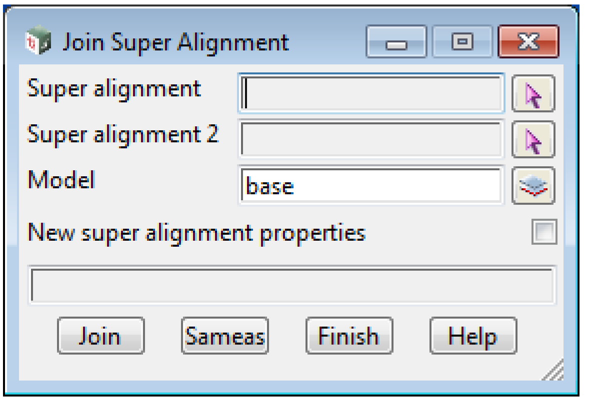
after the **Split** *button is clicked, the super alignment is copied and split at the given chainage.*

14.2.2.11 Joining Two Super Alignments

Position of option on menu: **Strings =>Super alignments =>Tools =>Join**

Join joins two super alignments at their ends to make a new super alignment.

Selecting **Join** displays the **Join Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Super alignment string select

select a super alignment to join

Super alignment 2 string select

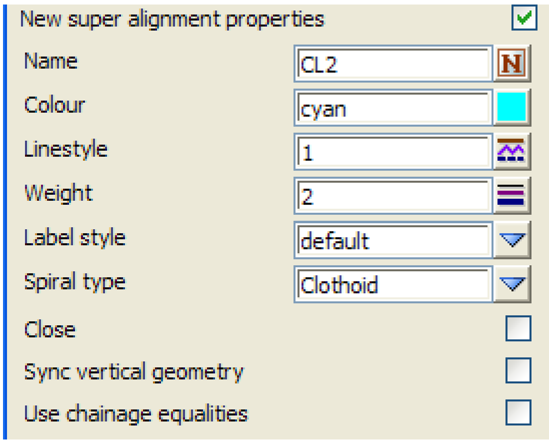
select a super alignment to join to the first selected super alignment

Model model box available models

if not blank, model for the joined string
If blank, use the model of the selected string for the joined string.

New super alignment properties tick box

if ***ticked****, the panel is expanded to show all the properties that can be set for the new joined string.*



Extra panel fields when
New super alignment properties
is ticked on

Join button

*after the **Join** button is clicked, a new super alignments is created by joining the two super alignments*

Same as button

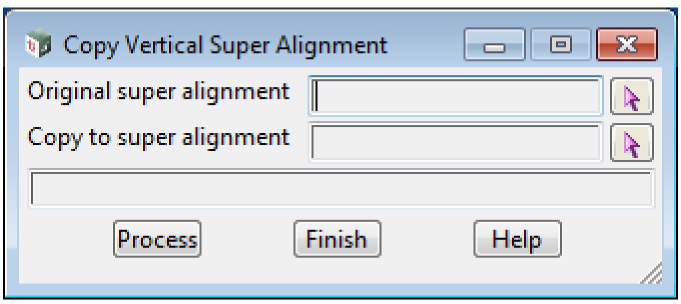
*after clicking **Same as** and then select a string. All the picked string properties will be loaded into the panel fields.*

14.2.2.12 Copy Vertical Geometry

Position of option on menu: **Strings =>Super alignments =>Tools =>Copy vertical**

Copies the vertical geometry from one super alignment to another super alignment. This will not work for a super alignment with computators.

Selecting **Copy vertical** displays the **Copy Vertical Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Original super alignment string select

select the super alignment to copy vertical geometry from

Copy to super alignment string select

select the super alignment to copy vertical geometry to

Process button

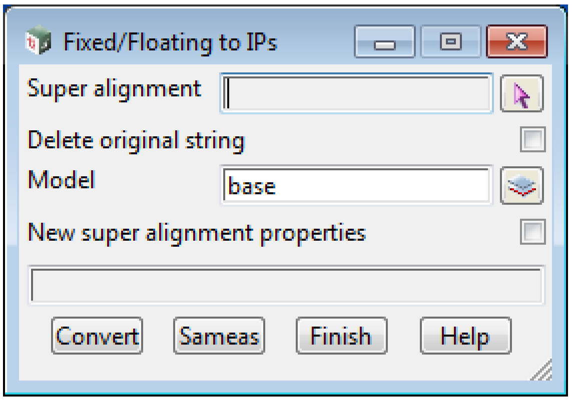
*after the **Process** button is clicked, the vertical geometry is copied from the original alignment to the second super alignment.*

14.2.2.13 Convert Fixed/Floating Elements to IPs

Position of option on menu: **Strings =>Super alignments =>Tools =>Fixed/floating to IPs**

Fixed/floating to IPs converts the fixed and floating elements of the horizontal and vertical geometry to horizontal and vertical intersection points joins with arcs and transitions for HIPs and parabolas or vertical arcs for VIPs.

Selecting **Fixed/floating to IPs** displays the **Fixed/floating to IPs** panel.



The new fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Super alignment string select

select a super alignment to convert

Tolerance real box

when the string is converted, the new IP string may be slightly different to the original string. The underlying vertices of the original and new strings are compared and if they differ by the given tolerance value, then a warning is given.
If blank, the tolerance is 0.001 (1 mm)

Delete original string tick box

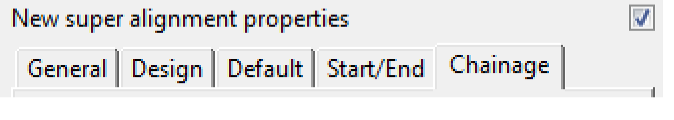
if ticked, the original super alignment is deleted after the conversion is successful

Model model box available models

if not blank, model for the converted string.
If blank, use the model of the selected string for the converted string.

New super alignment properties tick box

*if **ticked**, the panel is expanded to show all the properties that can be set for the new converted string.*



Extra panel fields when New super alignment properties is ticked.

The tabs are the same as when Creating a Super Alignment - go to On selecting the Super Alignment option, the Create Super Alignment panel is displayed.
*Please note that under **New Super Alignment properties => General Tab*** **Many Strings** *is not applicable to* **Fixed/Floating to IPs.**

Convert button

after the **Convert** *button is clicked, a new super alignments is created by converting all the elements to IPs*

Same as button

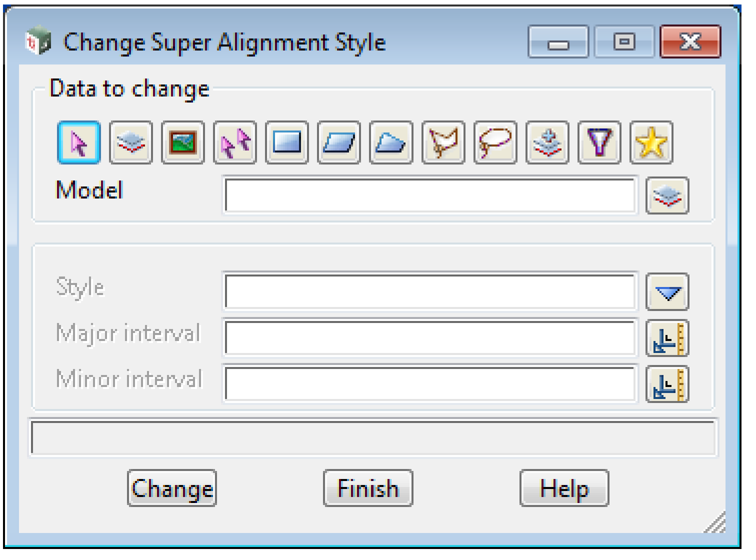
after clicking **Same as** *and then select a string. All the picked string properties will be loaded* *into the panel fields.*

14.2.2.14 Change the Styles for Selected Super Alignments

Position of option on menu: **Strings =>Super alignments =>Tools =>Change style**

Change style changes the super alignment style for all the selected super alignments.

Selecting **Change style** displays the **Change Super Alignment Style** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Style	SA style box		available SA styles

super alignment style to apply to all the selected super alignments

Change	button		

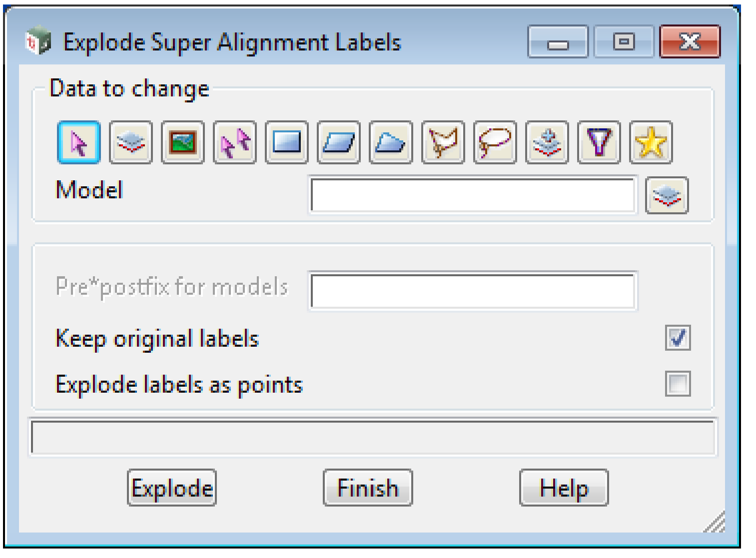
*after the **Change** button is clicked, all the selected super alignments are given the super alignment style*

14.2.2.15 Explode the Super Alignments Labelling

Position of option on menu: **Strings =>Super alignments =>Tools =>Explode labels**

Explode labels creates text and lines from the automatic labelling of the selected super alignments.

Selecting **Explode labels** displays the **Explode Super Alignment Labels** panel.



The new fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data to be processed.

pre*postfix for models text

the models for the text are the model name containing the super alignment, with prefixing and postfixing as given by this field

Keep original labels tick box

if not ticked, the label style of the original strings are modified to ***no labels***

Explode labels as points tick box

if ticked, the labels are created as single point super strings with the label as vertex text.

If not ticked, the labels are created in the one super string with the text as vertex text.

Explode button

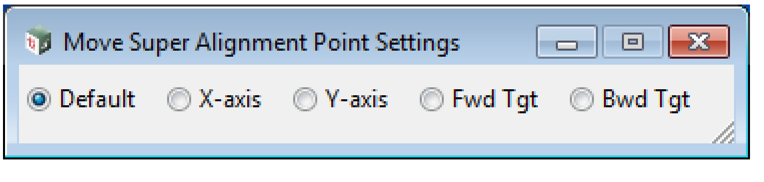
create text strings for all the text in the automatic labels of the selected super alignments

14.2.2.16 Constrain the Movement of Super Alignment Points

Position of option on menu: **Strings =>Super alignments =>Tools =>Move settings**

Move settings constrains the movement of horizontal and vertical intersection points for any super alignment being edited.

Selecting **Move settings** displays the **Move Super Alignment Point Settings** panel.



The buttons are radio buttons - that is, only one can be selected:

Default

allows any movement in the selected HIP or VIP point

X-axis

constrains an HIPs to only move along the x-axis. That is, the y coordinate is fixed.

Constrains a VIPs to only move along the chainage-axis. That is, the height coordinate is fixed.

Y-axis

constrains an HIPs to only move along the y-axis. That is, the x coordinate is fixed.

Constrains a VIPs to only move along the height-axis. That is, the chainage coordinate is fixed.

Fwd Tgt

constrains an HIPs to only move along the incoming straight to the HIP.

Constrains a VIPs to only move along the incoming straight to the VIP.

Bwd Tgt

constrains an HIPs to only move along the outgoing straight from the HIP.

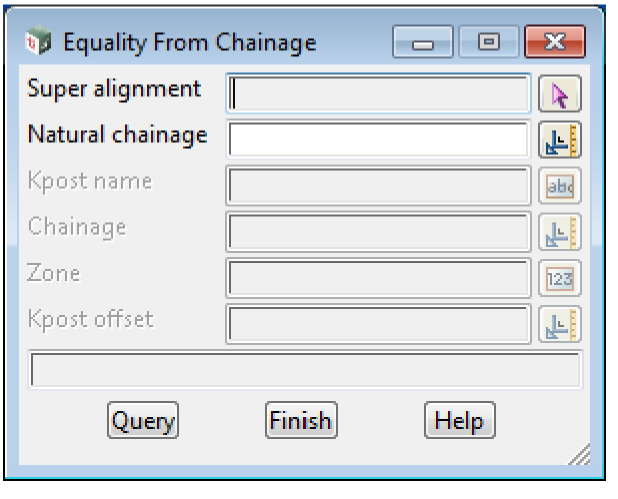
Constrains a VIPs to only move along the outgoing straight from the VIP.

14.2.2.17 Equality Query

Position of option on menu: **Strings =>Super alignments =>Tools =>Equality query**

Displays the Kpost name, offset from Kpost and Zone of the Kpost for a selected position on a super alignment.

Selecting **Equality query** displays the **Equality From Chainage** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		

select the super alignment to display the Kpost name, Offset and Zone for

Chainage

the raw chainage to calculate the Kpost name, Offset and Zone at. When the super alignment is first selected, the raw chainage of the selected position is written to the Chainage *box.*

Query button

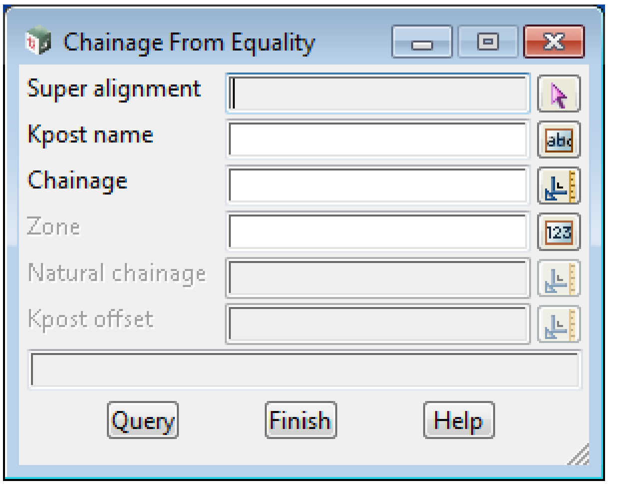
*after the **Query** button is clicked, the vertical geometry is copies from the original alignment to the second super alignment.*

14.2.2.18 Chainage Query

Position of option on menu: **Strings =>Super alignments =>Tools =>Chainage query**

For a user given Kpost name, offset from Kpost and Zone, this option displays the raw chainage of that point.

Selecting **Chainage query** displays the **Chainage From Equality** panel.



The new fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Super alignment string select

select the super alignment to get the raw chainage for

Kpost name

name of a Kpost on the selected string

Offset

offset from the Kpost

Zone

Kpost zone

Query button

*after the **Query** button is clicked, the raw chainage of the point given by the Kpost name, Offset from Kpost and Zone.*

14.2.2.19 Reverse Calc Parts

Position of option on menu: **Strings =>Super alignments =>Tools =>Reverse calc parts**

A super alignment is made up of the methods for constructing each part of the super alignment (one set for the horizontal geometry and another set for the vertical geometry), and if the methods are consistent, then they define a string of tangential segments which defines the super alignment in plan and in section.

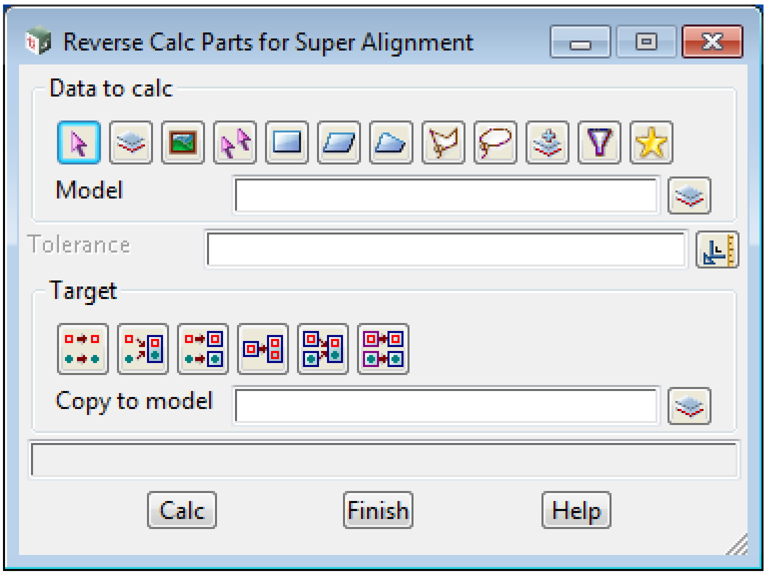
In plan the segments can be lines, arcs or transitions. In section the segments are lines, arcs or parabolas. Normally the segments are tangential to each other.

Sometimes a super alignment is missing the construction parts and only consists of the underlying segments. Then the super alignment can not be edited since there are no methods defining the string.

The *Reverse Calc Parts* option takes a super alignment consisting only of segments, and tries to build construction methods for the super alignment. If it is successful, then the super alignment can then be edited.

Note - the segments should be tangential to each other but if that is not the case, the option will try and move the vertices by a user defined tolerance to find a tangential solution.

Selecting **Reverse calc parts** displays the **Reverse Calc Parts For Super Alignment** panel.



The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data to be processed.

Tolerance Measure box

the segments need to be tangential to each other for the reverse calculation of parts to work. If segments are not tangential, the vertices will be moved by up to the given Tolerance to make them tangential. There is a warning if the resultant super alignment can't solve.

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Calc button

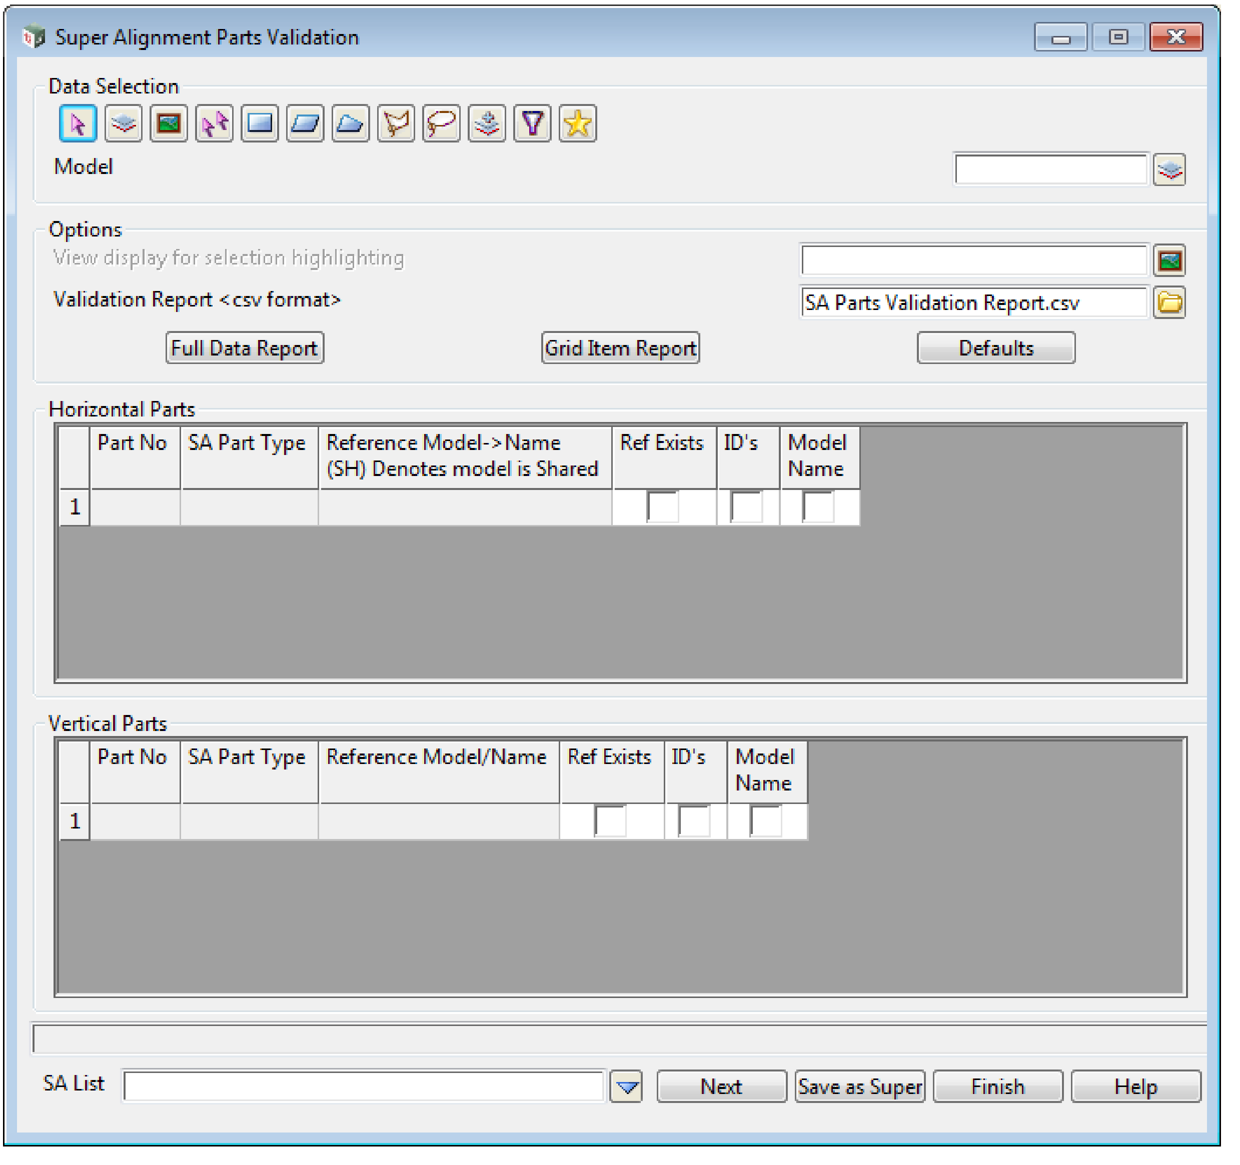
*after the **Calc** button is clicked, the option tries to create calculation parts for any super alignments with only segments and no calculation parts.*

14.2.2.20 Validate Super Alignment

Position of option on menu: **Strings =>Super alignments =>Tools =>Validate**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Validate** displays the **Super Alignment Parts Validation** panel.

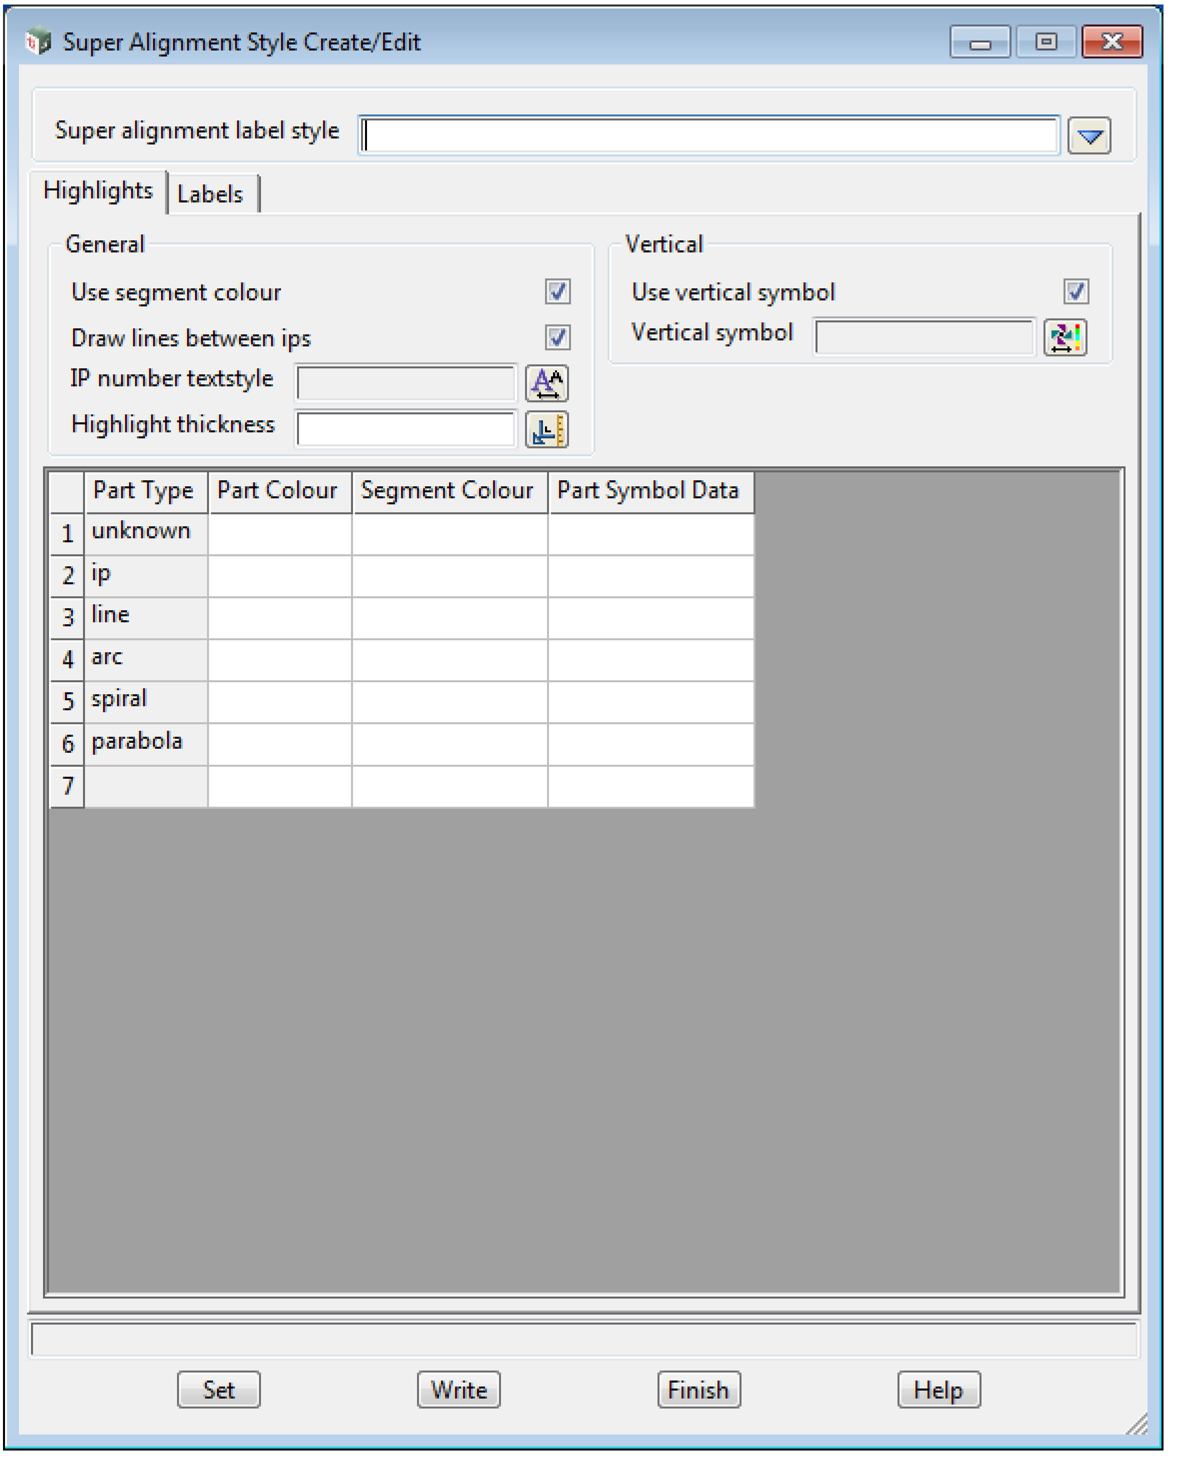


14.2.3 Super Alignment Style

Position of option on menu: **Strings =>Super alignments =>Label styles**

The super alignment label styles control the way that the super alignment draws on the screen and when it is being edited.

Selecting **Super alignment style** displays the **Super Alignment Style Create/Edit** panel.



For the tab ***Highlights*** *go to* Highlights tab
For the tab ***Labels*** go to Highlights Table

For the ***Buttons at the bottom*** go to Buttons at Bottom

The fields and buttons used in the **Super Alignment Style Create/Edit** panel have the following functions.

Field Description Type Defaults Pop-Up

Super alignment label style choice box design styles defined in astyles.4d

*all the information in the panel refers to the selected labelling style. Note - the labelling styles are stored in the file **astyles.4d**.*

Highlights tab

the definition of how to show the horizontal and vertical parts of the super alignment and also how to colour and label the segments when in and

Use segment colour tick box

*if **ticked**, each of the segment types are drawn in the colour given in the Highlights table given below (when the super alignment is on any view).*

Draw lines between IPs tick box

*if **ticked**, lines are drawn between intersection points (IPs).*

IP number textstyle textstyle box

the textstyle used to draw IP numbers in Plan and Section views.

Highlight thickness input

line thickness in pixels

Use vertical symbols tick box

*if **ticked**, vertical symbols are drawn when the super alignment is profiled on a Section view.*

Vertical symbol symbol box

the symbol to use for common points between segments in the Section views.

Highlights Table

the definition of the segments that make up the definition of the part (part colour and part symbol for the fixed points) and the colour of the solved segments as a result of the part definition.
Defined for ip, line, arc, spiral (transition), parabola and unknowns.

Part type

the part type - unknown, ip, line, arc, spiral (transition), parabola

Part colour colour box

the definition of the part is only shown when in the edit mode.
When the string is being edited, the segments of the part are drawn in these colours.
For ip, this is the colour of the cross at the ip.
For line/arc/spiral/parabola, this is the colour of any line/arc/spiral/parabola segment.

Segment colour colour box

the resulting segments defined by the part are drawn in these colours.
for ip, this is the colour of the cross at the ip
line/arc/spiral/parabola, this is the colour of any line/arc/spiral/parabola segment

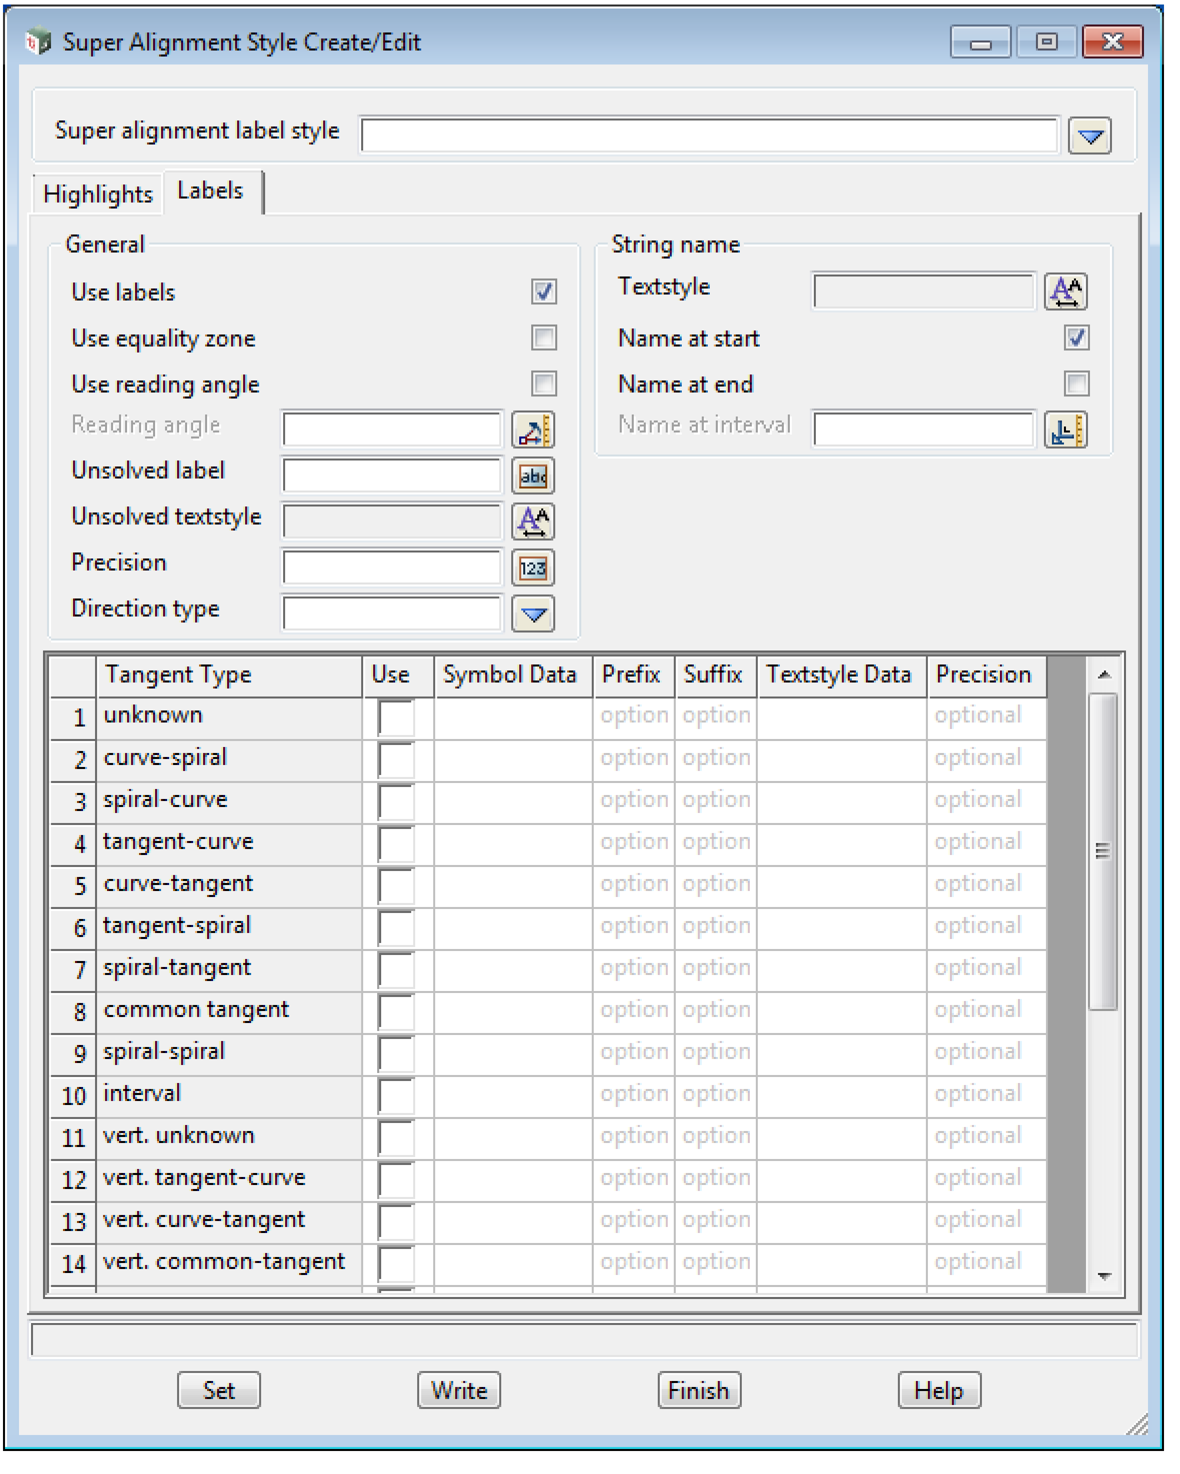
Part symbol data symbol box

when a string is being edited, the fixed points of the parts are displayed with these symbols.
for ip, the symbol at the ip of a part.

For line/arc/spiral/parabola, this is the symbols of the fixed points of any line/arc/spiral/ parabola in the part. For example, if an arc is defined by going through three points, the three points will be drawn with the symbol for Part type arc.

Labels tab

on a plan view, the definition of what text, symbols and decimal places (precision) should be used in labelling tangent points, crest and sag points, major and minor intervals, segment radii and lengths, and special chainages.



The fields and buttons used in the **Super Alignment Style Create/Edit** panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Use labels tick box

*if **ticked**, labels are automatically drawn when the super alignment is on a Plan view.*

Use equality zone tick box

*if **ticked** and chainage equalities exist in the super alignment, the chainage intervals are relative to the beginning of the zone it is in.*

Use reading angle tick box

*if **ticked** and the angle of the label relative to the Reading angle is over 180 degrees, the label will be flipped.*

Reading angle input

the angle to take as a base line for reading text. The angle is in 4.17.1 HP Notation *and is measured from the x axis in a counter clockwise direction.*

Unsolved label text box

the text label to use when a part is not solved. It is placed in the middle of the unsolved segment.

Unsolved textstyle textstyle data box

the textstyle of the unsolved text label

Precision input

the number of decimal places to use in the chainage labels

Direction type choice box none, at start, each segment

how to draw the string direction symbol which is given in row 18 of the table below (horz. direction)
*If **none**, no direction symbol is drawn.*
*If **at start**, a single direction symbol is drawn at the start of the string*
*If **each segment**, a direction symbol is drawn at the middle of each segment of the string*

String name textstyle textstyle data box

the textstyle to use for drawing the name of the string

Name at start tick box

*if **tick**, draw the name of the string at the start of the string.*
*If **not ticked**, no string name is drawn at the start of the string.*

Name at end tick box

*if **tick**, draw the name of the string at the end of the string.*
*If **not ticked**, no string name is drawn at the end of the string.*

Name at interval double box

*if **not blank**, the name of the string is drawn at this chainage interval along the string, excluding the start and the end of the string.*

Label Type Table

*For each label type in the table, the Use flag is ticked if it is to be drawn, and if it is drawn, the symbol is given in the Symbol Data column, text is prefixed/postfixed as given in the Pre*Postfix column, the text used the textstyle data given in the Textstyle Data column with the number of decimal places given in the Precision column.*
There are twenty four (24) types:

unknown - when it is not any of the other horizontal critical points
curve-spiral - the tangent point between an arc and a transition. Eg CS
spiral-curve - the tangent point between a transition and an arc. Eg SC

tangent-curve - the tangent point between a straight line and an arc. Eg TC
curve-tangent - the tangent point between an arc and a straight line. Eg CT
tangent-spiral - the tangent point between a straight line and a transition. Eg TS
spiral-tangent - the tangent point between a transition and a straight line. Eg ST
common tangent - the tangent point between two arcs. Eg CTP
spiral-spiral - the tangent point between two transitions Eg SS
interval - the chainage label at the major interval
vert. unknown - when it is not any of the other vertical critical points
vert. tangent-curve - the tangent point between a straight grade and a vertical curve (parabola or an arc). Eg VTC
vert. curve- tangent- - the tangent point between a vertical curve (parabola or an arc) and a straight grade. Eg VCT
vert. common tangent - the tangent point between two vertical curves. Eg VCTP
crest - a vertical crest (local maximum) point. Eg CREST
sag - a vertical sag (local minimum) point. Eg SAG
special chainages - chainages from a special chainage file given in the Special chainage file field in the Basic Label section of the Super Alignment Properties
horz. direction - the direction symbol of the string
minor interval - the chainage label at the minor interval
k post equality - label the k posts equations. Eg 15 Km 998 = 16 Km
internal equality - label the internal equality equation Eg 17 Km 500 = 17 Km 600
segment radius - label the radius of an arc segment Eg R 500.0
segment length - label the length of a segment Eg L 500.0
segment bearing - label the bearing of a segment in dms format Eg 125 30 20

Buttons at Bottom

Set button

clicking the **Set** *button means that for this session, all the definitions in the panel will be used for the style given in the* ***Super alignment label style*** *field. Unless the* **Write** *button is used to write the values out to the* ***astyles.4d*** *file, the values will be lost when the project is exited.*

Write button

clicking the **Write** *button writes out all the values in this panel to the* ***astyles.4d*** *file as the style given in the* ***Super alignment label style*** *field*

Note

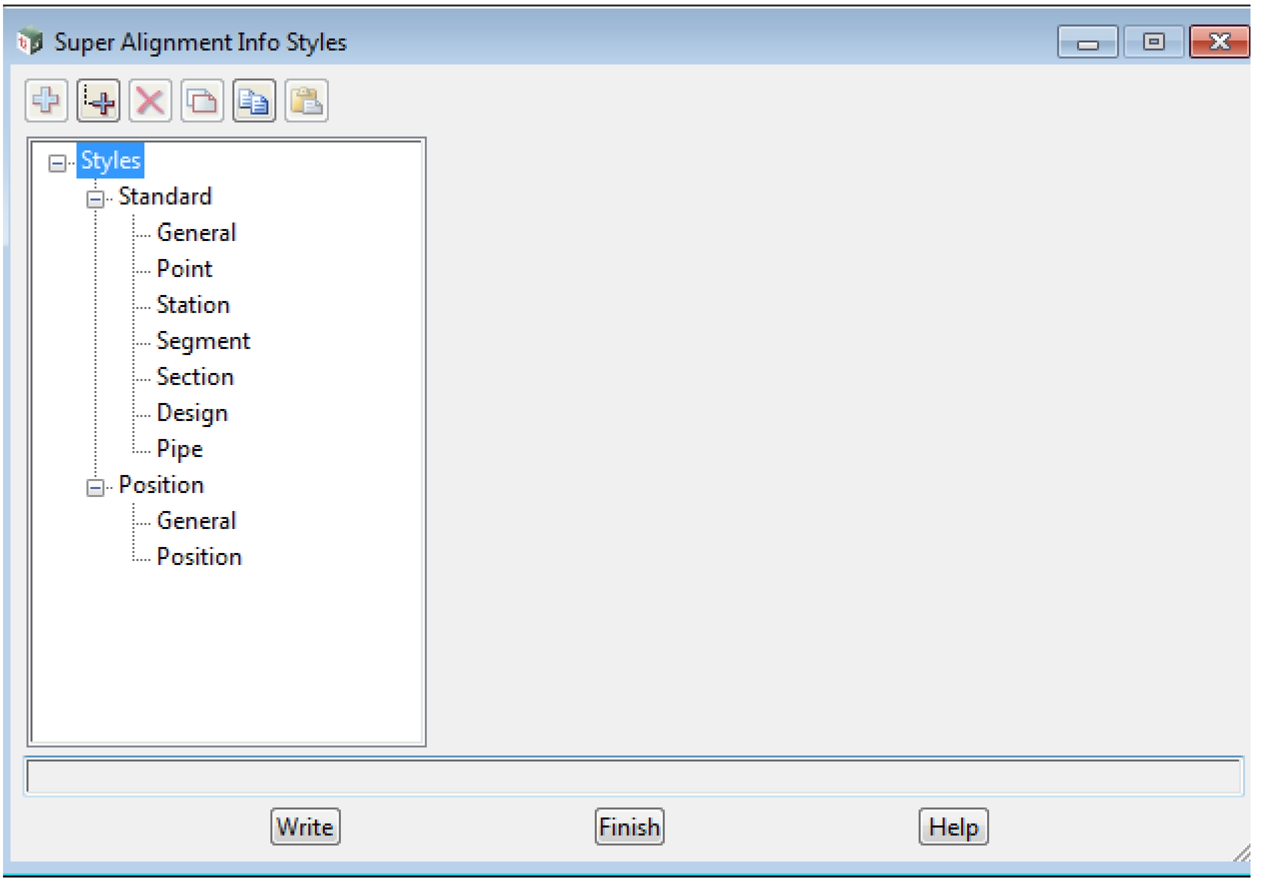
The new Super alignment label style is not used until a resolve is done on the super alignment string.

14.2.4 Super Alignment Info Styles

Position of option on menu: **Strings =>Super alignments =>Info style**

The *super alignment info styles* control what information is displayed in the **Super Alignment Info** panel brought up by the 14.2.2.1 Super Alignment Info option on the **SA Tools** menu or toolbar.

Selecting **Super alignment info** displays the **Super Alignment Info Styles** panel.



14.2.5 Design Standards

Position of option on menu: **Strings =>Super alignments =>Design standards**

The ***design standards*** sets up numerous standard tables for

(a) horizontal speed (speed_standards)

defines for various speeds, the use of horizontal arcs and transition curves, super elevation for various numbers of lanes.

(b) horizontal widening (widening_standards)

defines the road widening for various lane widths, speeds and curve radii.

(c) horizontal small deflection (small_deflection_standards)

(d) vertical crest (crest_standards)

defines for crest curves the k-values of allowed parabolas for different speeds

(e) vertical sag (sag_standards)

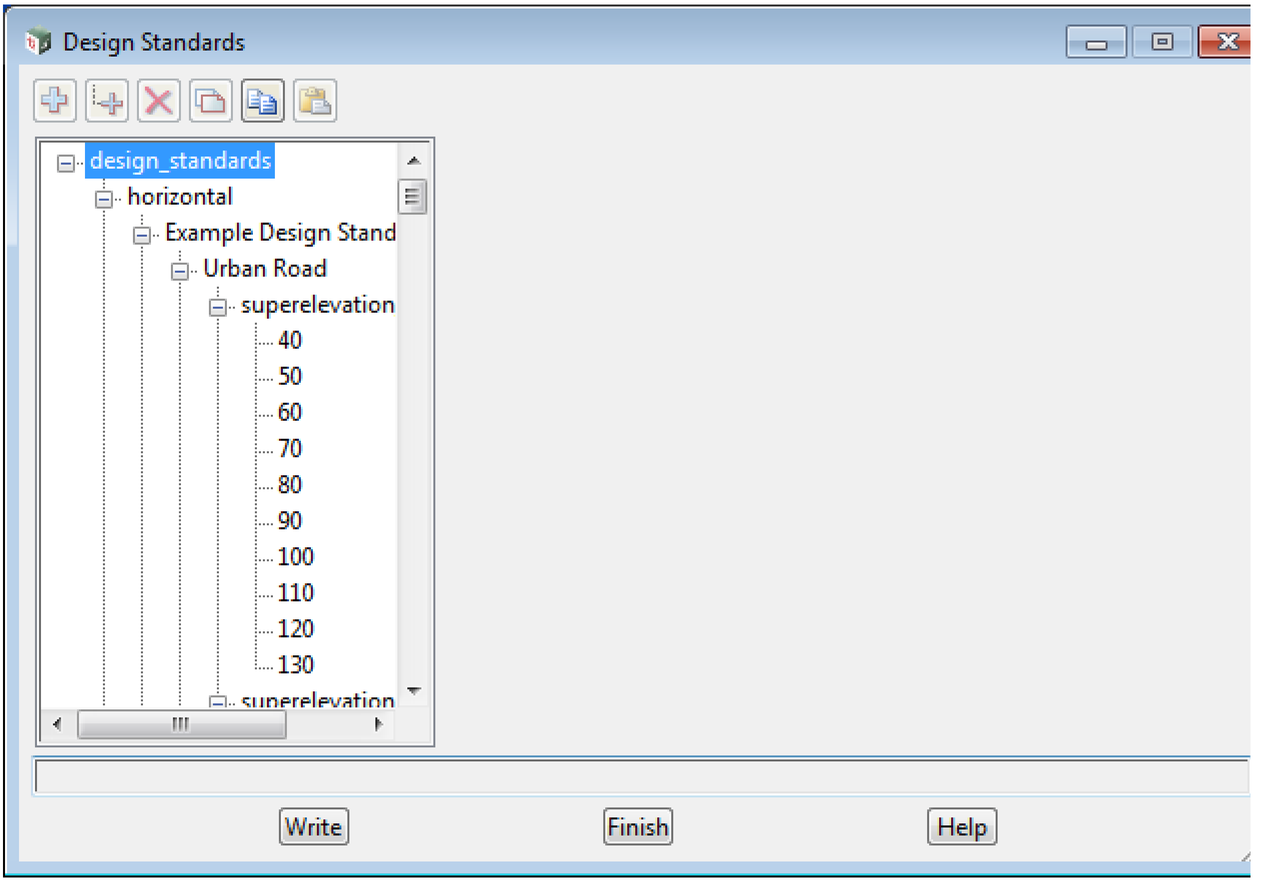
defines for sag curves the k-values of allowed parabolas for different speeds

For each of the five types of tables, specific tables of values are set up by the user for each of the different design scenarios that the user will undertaken. Each specific table is given a name, and the names must be unique within each of the five types of tables.

The tables are written to a file (design_standards.xml) which is then read in whenever a project is opened.

The tables in the design standards file are used in the option **Strings =>Create =>Super alignments =>Design templates** to define ***Design Templates*** (see 14.2.6 Design Templates), and when a super alignment is created, ***one*** *Design Template* is selected for use with that super alignment (see the section Advanced > Design branch from 14.2.1 Create Super Alignment).

Selecting **Design standards** displays the **Design Standards** panel.



DOCO TO GO INTO DEFINITIONS OF DESIGN PARAMETERS

Ease-off choice box none
maximum
by length

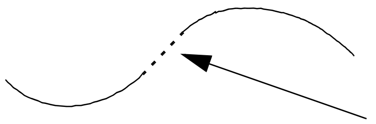
method of transitioning between minimum and maximum super elevation.
*If **none**, no transition is done.*
*If **maximum**, maximum back to back curves are added to the super diagram between the minimum and maximum super elevation and are used to transition the super.*
*If **by length**, the ease off distance is given by the **Ease off length** value.*

Ease-off length input

*the length of the ease off for the transition of super elevation when the **by length** method is selected*

Min on reverse input

*if the chainage distance between two curves of opposite sign is less than the **Minimum on reverse** value then the two curves are treated as reverse curves when applying the design rules.*

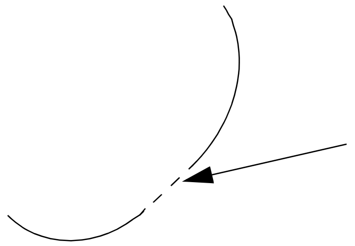


If this distance is less than
Min on reverse then the two curves
are treated as reverse curves

Plan View

Min on broken back input

*if the chainage distance between two curves of the same sign is less than the **Minimum on broken-back** value then the two curves are treated as broken-back curves when applying the design rules.*



If this distance is less than
Min on broken-back then the two curves
are treated as broken back curves

Plan View

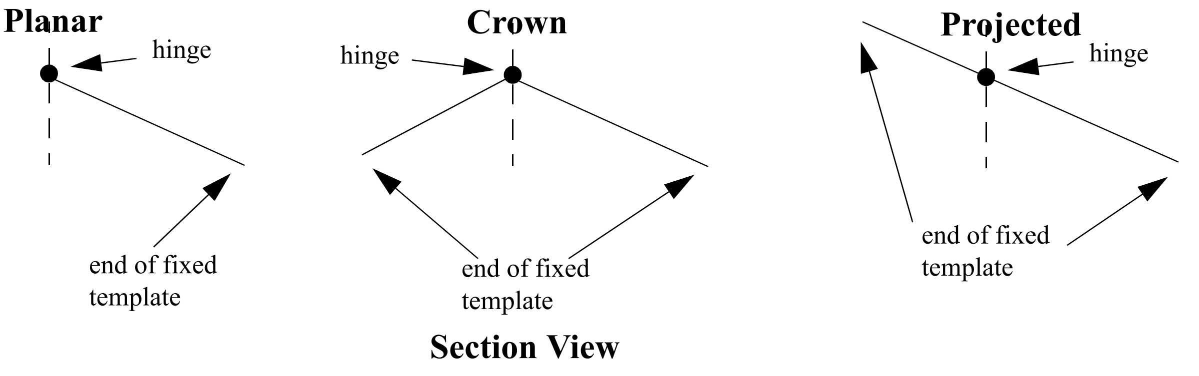
FROM V9 DOCO

Slope type choice box planar
crowned
projected

*If **planar**, then the design table is only applied for half of the road (from the hinge string to the end of the fixed template). The side used is given by **Highside**.*

*If **crowned**, then the design table is used for each side of the roads (from the left most fixed template to the hinge string, and from the hinge string to the right most fixed template).*

*If **projected**, then the design table is first applied to half of the road given by **Highside** (from the hinge string to the end of the fixed template). Then the grade from the **Highside** is projected through the hinge string and used on the other side of the road.*



Highside	choice box	left edge	left edge, right edge

*used if the **Slope type** is planar or projected to define the higher side of the road pavement.*

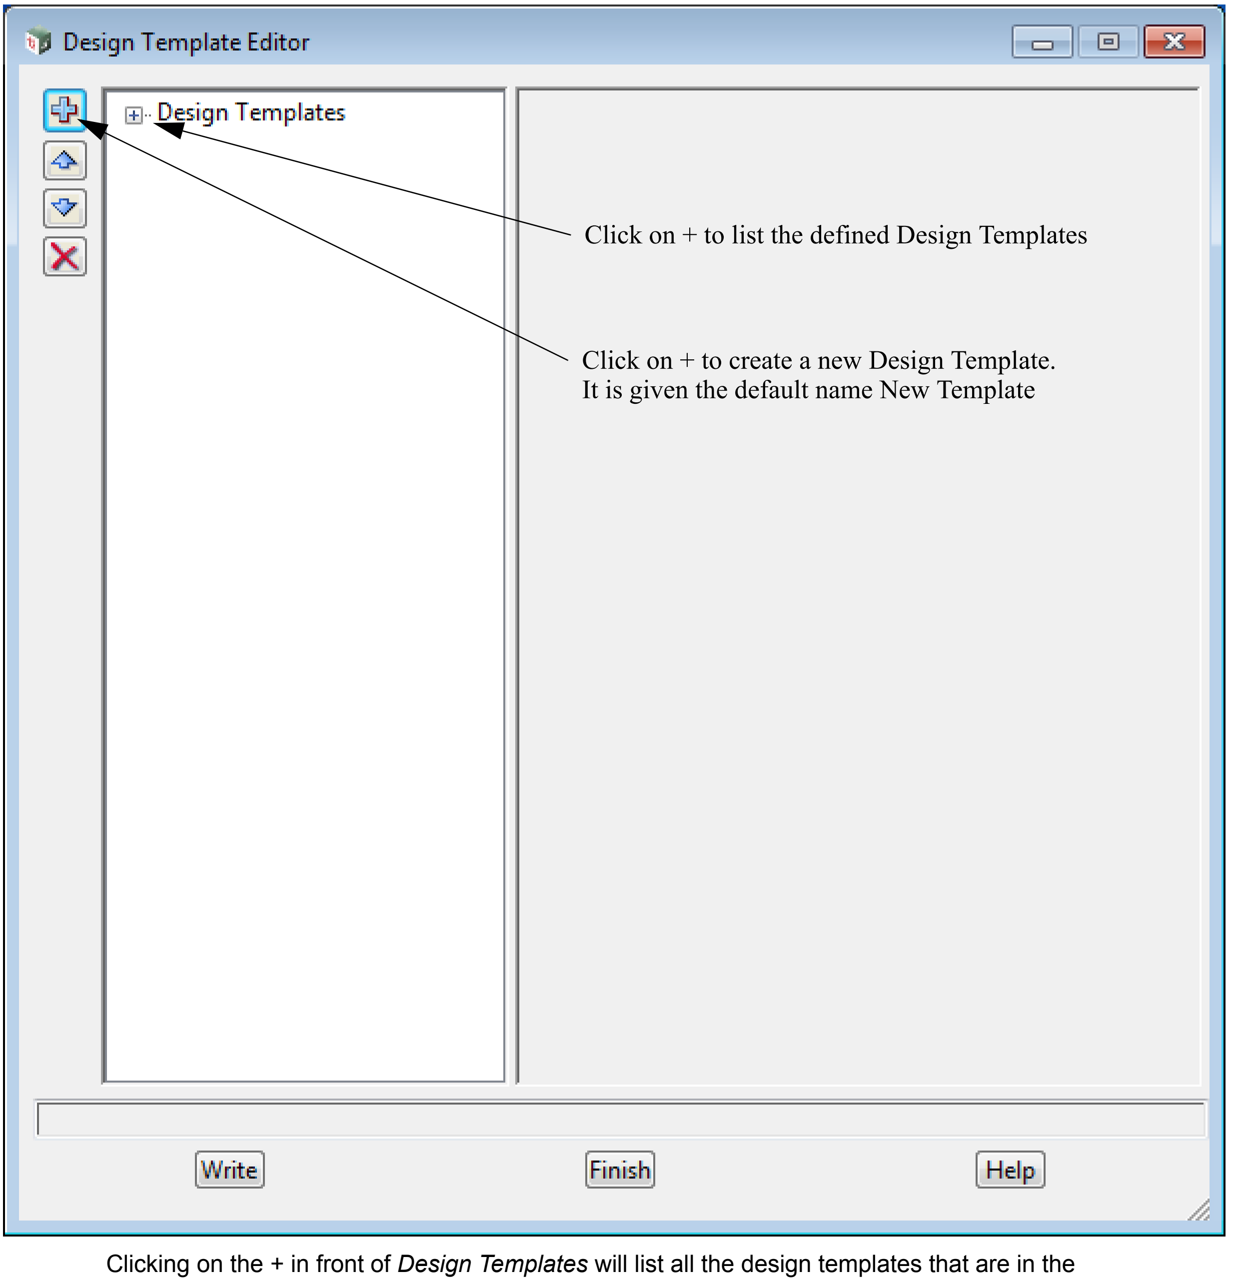
14.2.6 Design Templates

Position of option on menu: **Strings =>Super alignments =>Design templates**

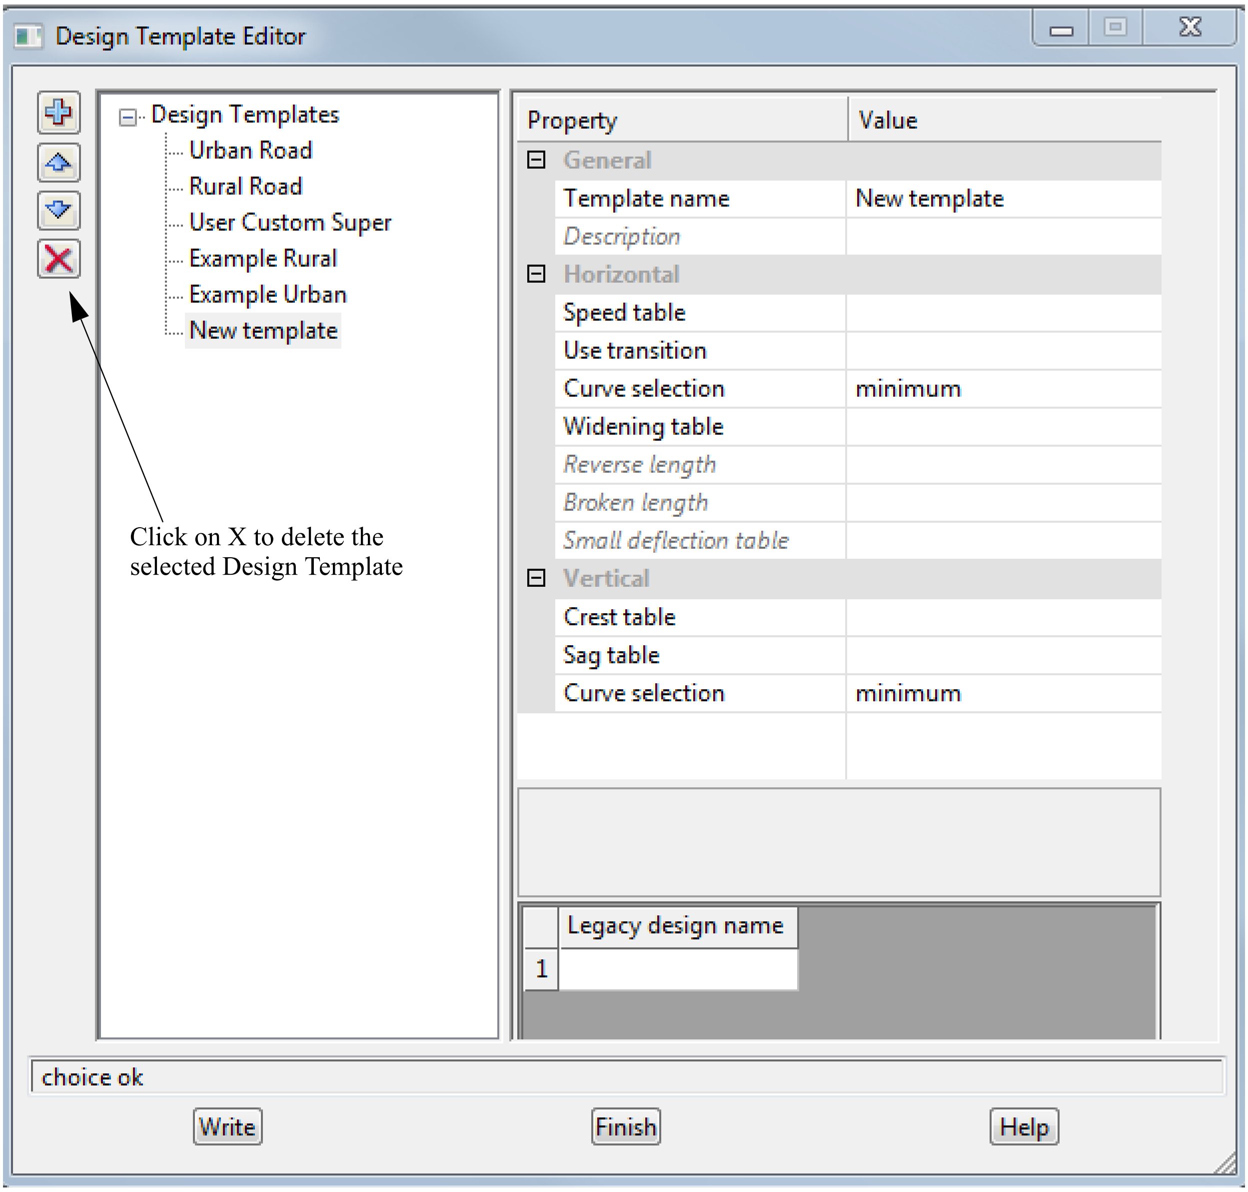
The ***Design Templates*** option is used to create Design Templates (each with a unique name) that have one of each of the five design table types (horizontal speed, horizontal widening, horizontal small deflection, vertical crest, vertical sag) that have been defined by the **Strings =>Create =>Super alignments =>Design standards** option (see 14.2.5 Design Standards), plus whether curve transitions are allowed, whether minimum or maximum curve radii are used, and reverse and broken back curve lengths.

When a super alignment is created, ***one*** *Design Template* is selected for use with that super alignment (see the section Advanced > Design branch from 14.2.1 Create Super Alignment).

Selecting **Design templates** displays the **Design Template Editor** panel.



Clicking on the + in front of *Design Templates* will list all the design templates that are in the *design_templates.xml* file currently be used in the *12d Model* project.



The fields and buttons used in the **Design Template Editor** panel when creating a new *Design Template*, or when clicking on an existing *Design Template*, have the following functions.

Field Description	Type	Defaults	Pop-Up
Template name	text box		

the name of the Design Template. This can not be blank and must be unique amongst the list of Design Templates. The default name is New Template and this can be changed by typing a new name into this field.

Description	text box		

a description for this Design Template. This can be blank.

Speed table	choice box		list of speed_standards

the name of the Speed Table to use. This is selected from the all the speed_standards defined in the Design Standards file (design_standards.xml) being used for the project.

User transitions	yes/no box		

*if **yes**, transition curves are allowed in the horizontal geometry.*
*If **no**, transition curves are not allowed in the horizontal geometry.*

Curve selection choice box minimum minimum. maximum

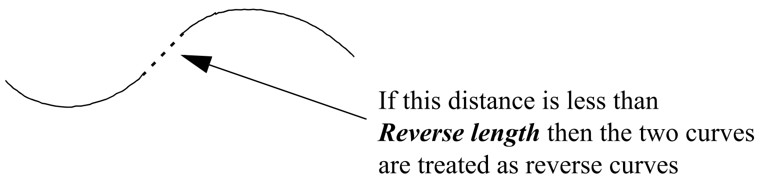
*if **minimum** and more than one horizontal curve radius exists for the speed, the minimum curve radius is used.*
*If **maximum** and more than one horizontal curve radius exists for the speed, the maximum curve radius is used.*

Widening table choice box list of widening_standards

the name of the Widening Table to use. This is selected from the all the widening_standards defined in the Design Standards file (design_standards.xml) being used for the project.

Reverse length input

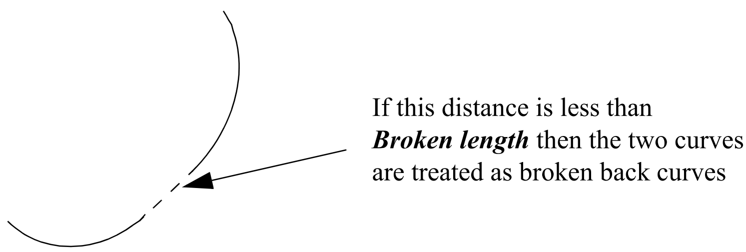
*if the chainage distance between two curves of opposite sign is less than the **Reverse length** value then the two curves are treated as reverse curves when applying the design rules.*



Plan View

Broken length input

*if the chainage distance between two curves of the same sign is less than the **Broken length** value then the two curves are treated as broken-back curves when applying the design rules.*



Plan View

Small deflection table choice box list of small_deflection_standards

the name of the Small Deflection Table to use. This is selected from the all the small_deflection_standards defined in the Design Standards file (design_standards.xml) being used for the project.

Crest table choice box list of crest_standards

the name of the Crest Table to use. This is selected from the all the crest_standards defined in the Design Standards file (design_standards.xml) being used for the project.

Sag table choice box list of sag_standards

the name of the Sag Table to use. This is selected from the all the sag_standards defined in the Design Standards file (design_standards.xml) being used for the project.

Curve selection choice box minimum minimum. maximum

*if **minimum** and more than one vertical curve k-value exists for the speed, the minimum curve k-value is used.*
*If **maximum** and more than one vertical curve k-value exists for the speed, the maximum curve k-value is used.*

Buttons at Bottom

Write button

clicking the **Write** *button writes out all the Design Templates defined in this panel to the* ***design_templates.xml*** *file.*

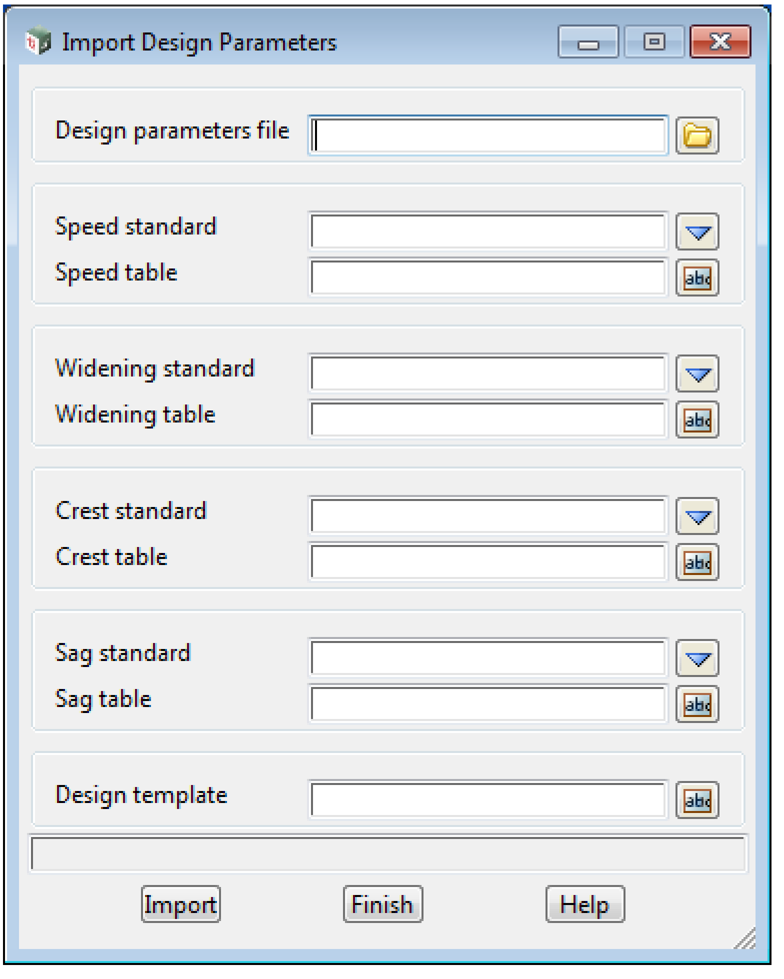
14.2.7 Import Legacy Design

Position of option on menu: **Strings =>Super alignments =>Import legacy design**

The ***Import legacy design*** option reads a ***12d Model 9*** *Design Parameter File* and converts it to a ***Design Template*** for use in ***12d Model 10*** or higher.

Note:

Selecting **Import legacy design** displays the **Import Design Parameters** panel.



Selecting a *Design parameters file* will read in the selected *.design* file and populate fields in the panel.

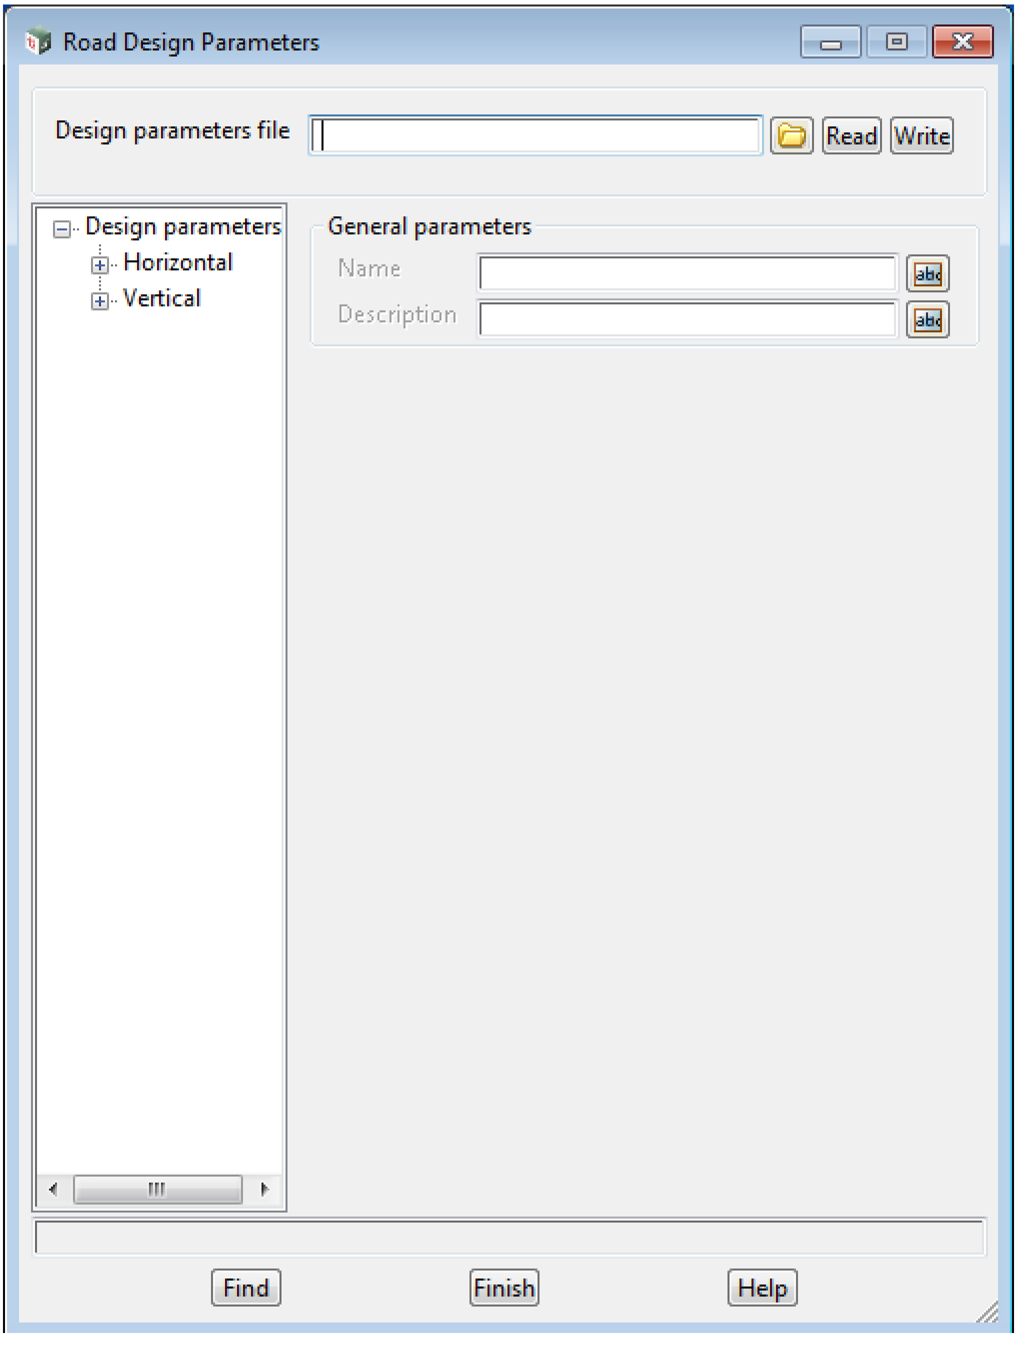
14.2.8 Define Design Parameters - from V9

Position of option on menu: **Strings =>Create =>Super alignments =>Design parameters**

This was superseded in 12d Model 10 by Design Tables and Design Templates.

The ***design parameters table*** defines the use arcs, transition curves, parabolas, super elevation and road widening for given design speeds. The table is used to use by a super alignment in conjunction with user supplied information given in the ***Design*** tab of the super alignment.

Selecting **Design parameters** displays the **Road Design Parameters** panel.

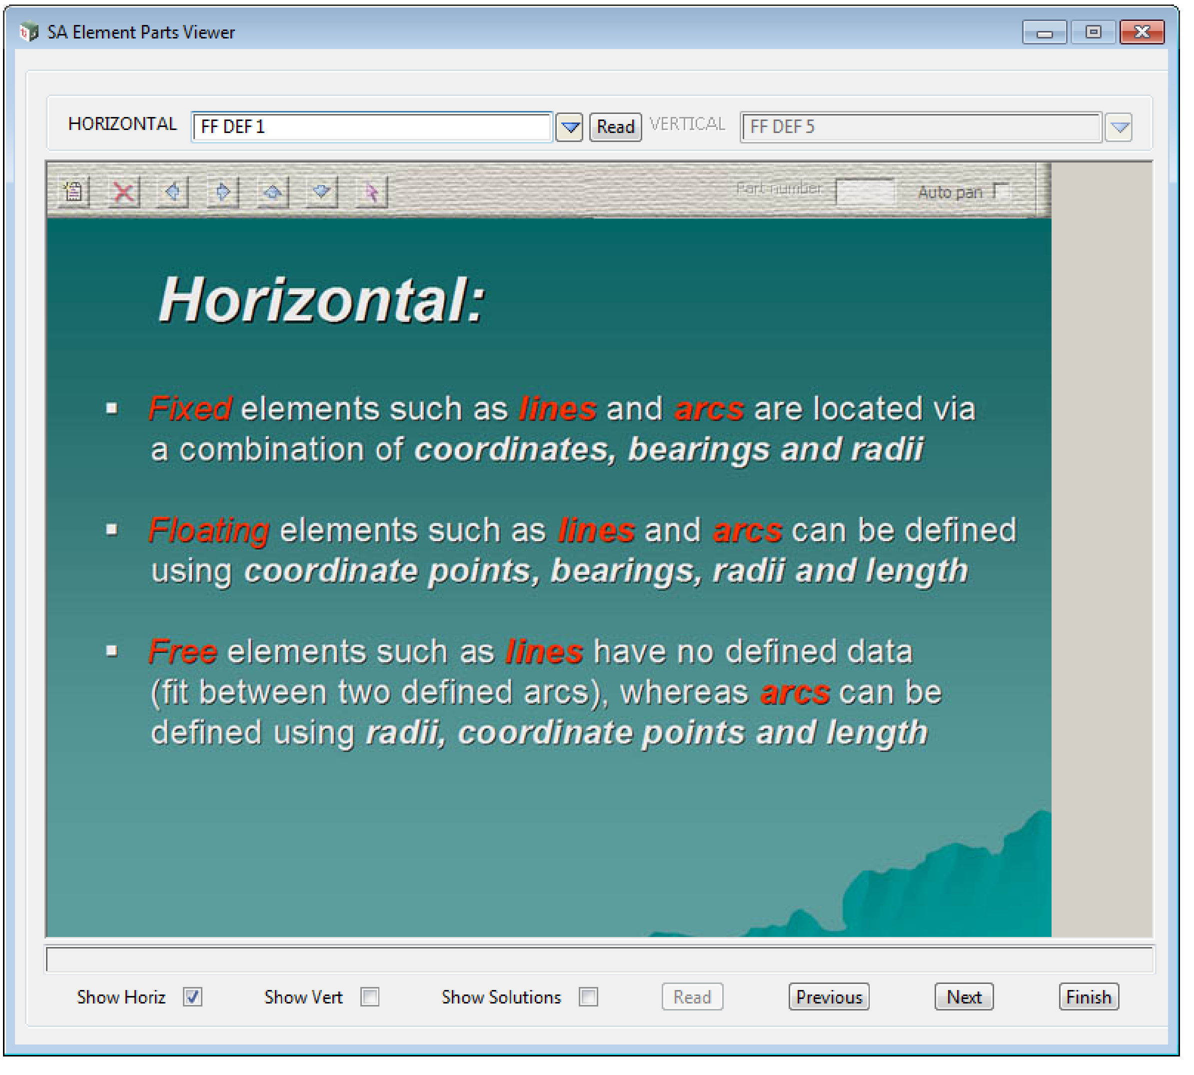


14.2.9 SA Element Parts Viewer

Position of option on menu: **Super Alignment Toolbar=>Help**

This option displays and explains all the parts in both horizontal and vertical, available in the Super Alignment.

Examples from the library can be read in for editing.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Horizontal	choice box		various
Quick selection of Horizontal parts			
Vertical	choice box		various

Quick selection of Vertical parts

Read Both button

Will read in 12da examples of all the parts. Most include vertical parts that are similar to their horizontal counter parts.

A plan view is created, called "SA Examples", and a model called "12D HOR ELEMENTS" is added to the plan view.

Show Horiz tick box

If ticked, allows the explanation and viewing of all horizontal parts

Show Vert tick box

If ticked, allows the explanation and viewing of all vertical parts

Show Solutions tick box

If ticked, allows the viewing of examples that can be read in

Read button

Will read in 12da examples of Super Alignments. Most include vertical geometry.

A plan view is created, called "SA Examples", and a model in the format "12D SA EXAMPLE 1" is added to the plan view.

Previous button

Step backward through examples

Next button

Step forward through examples

14.2.10 Super to SA Element Convert

Position of option on menu: **Road Toolbar**

This option is used to convert super strings that may have come in from other software.

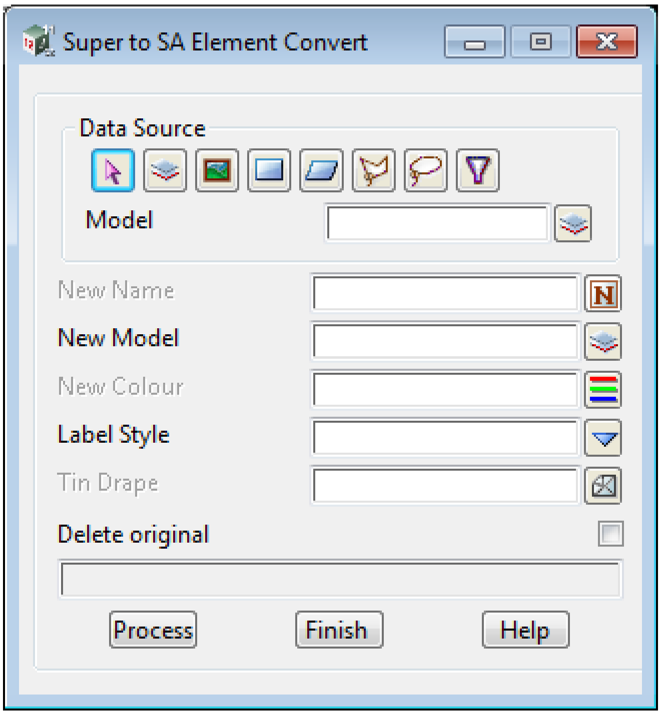
The conversion will attempt to create a Super Alignment made up in the horizontal of element parts.

The parts will mainly include at least one fixed part followed by floating parts of varying types (lines and arcs).

A label style can be set and a tin set in the vertical as a drape computator.

Note: If the original string had a geometry error (non-tangential arcs *e.g.*), then the resulting Super Alignment will show an error.
The error however will be easy to find as any parts prior to the error, will still show as solved.

Selecting the convert alignment option brings up the Super to SA Element Convert panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input

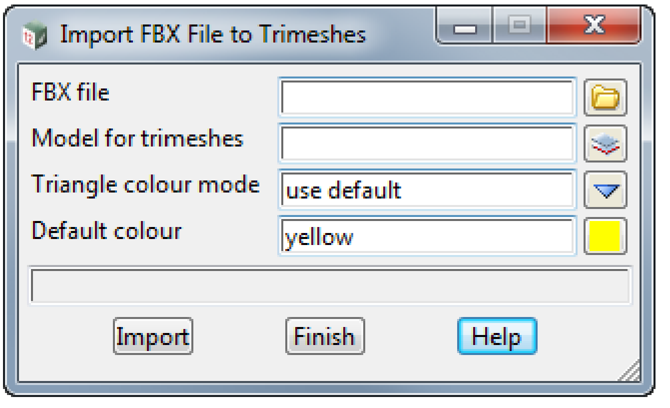
14.3.4 Trimeshes from FBX File

Position of option on menu: **Strings =>Trimesh =>Trimeshes from FBX file**

Position of option on menu: **File I/O =>Data input =>FBX**

FBX (Filmbox) is a proprietary format developed by Kaydara and owned by AutoDesk since 2006, to provide interoperability between digital content creation applications.

This option reads in a FBX file and converts all possible objects to trimeshes.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
FBX file	file box		*.fbx files

name of the FBX file to be read in

Model for trimeshes	model box		available models

model to add all the created trimeshes to.

Triangle colour mode	choice box		use default, RGB of diffuse colour material name

*if **user default**, use the* Default colour *for the trimeshes.*

*If **RGB diffuse colour**, use the RGB diffuse colour of the FBX triangle object as the triangle colour.*

*If **material name**, use the material name of the FBX triangle as the triangle colour.*

Default colour	colour box		available colours

default colour for the trimeshes.

Import	button		

read the FBX file and where ever possible create trimeshes from the FBX data.

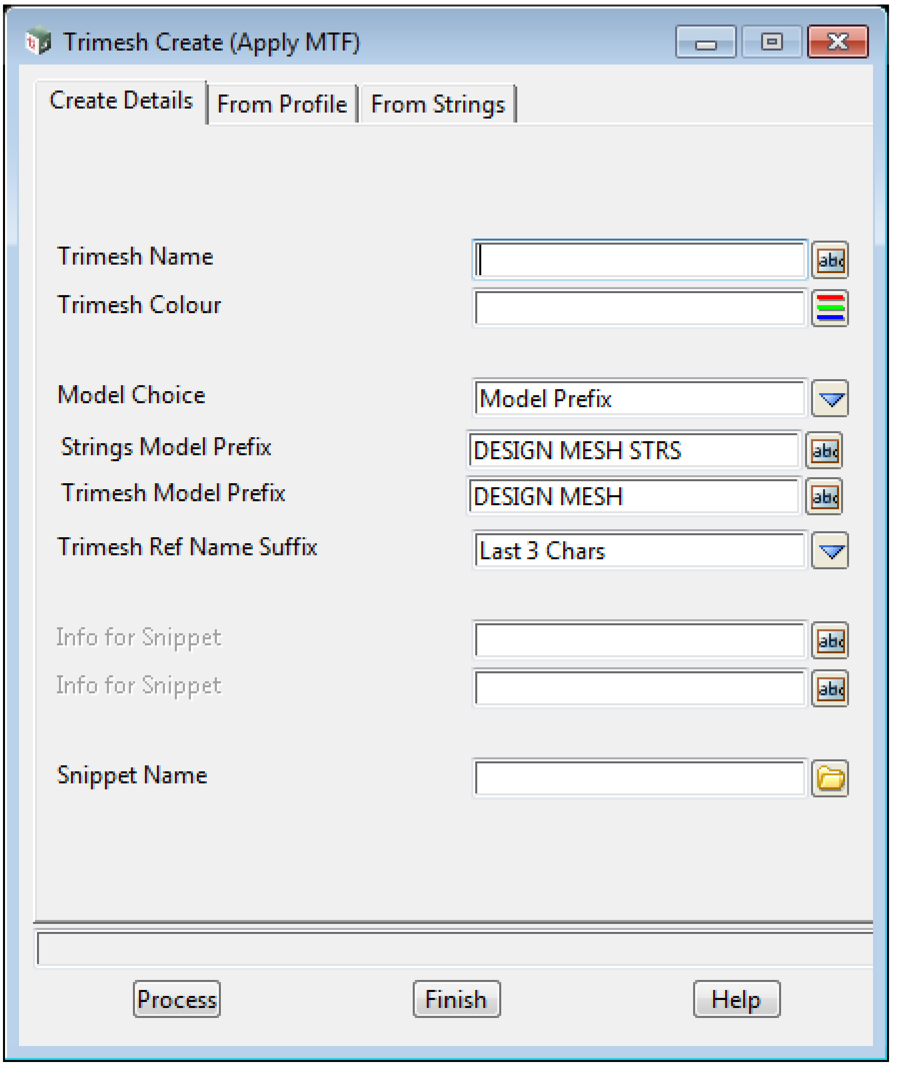
Continue to 14.3.5 Create Trimesh Snippet or return to 14.3 Trimesh.

14.3.5 Create Trimesh Snippet

Position of option on menu: **Strings =>Trimesh =>Create trimesh snippet**

THIS OPTION IS CURRENTLY UNDER DEVELOPMENT.

The option is for creating snippets that will create trimeshes using an *Apply MTF*.



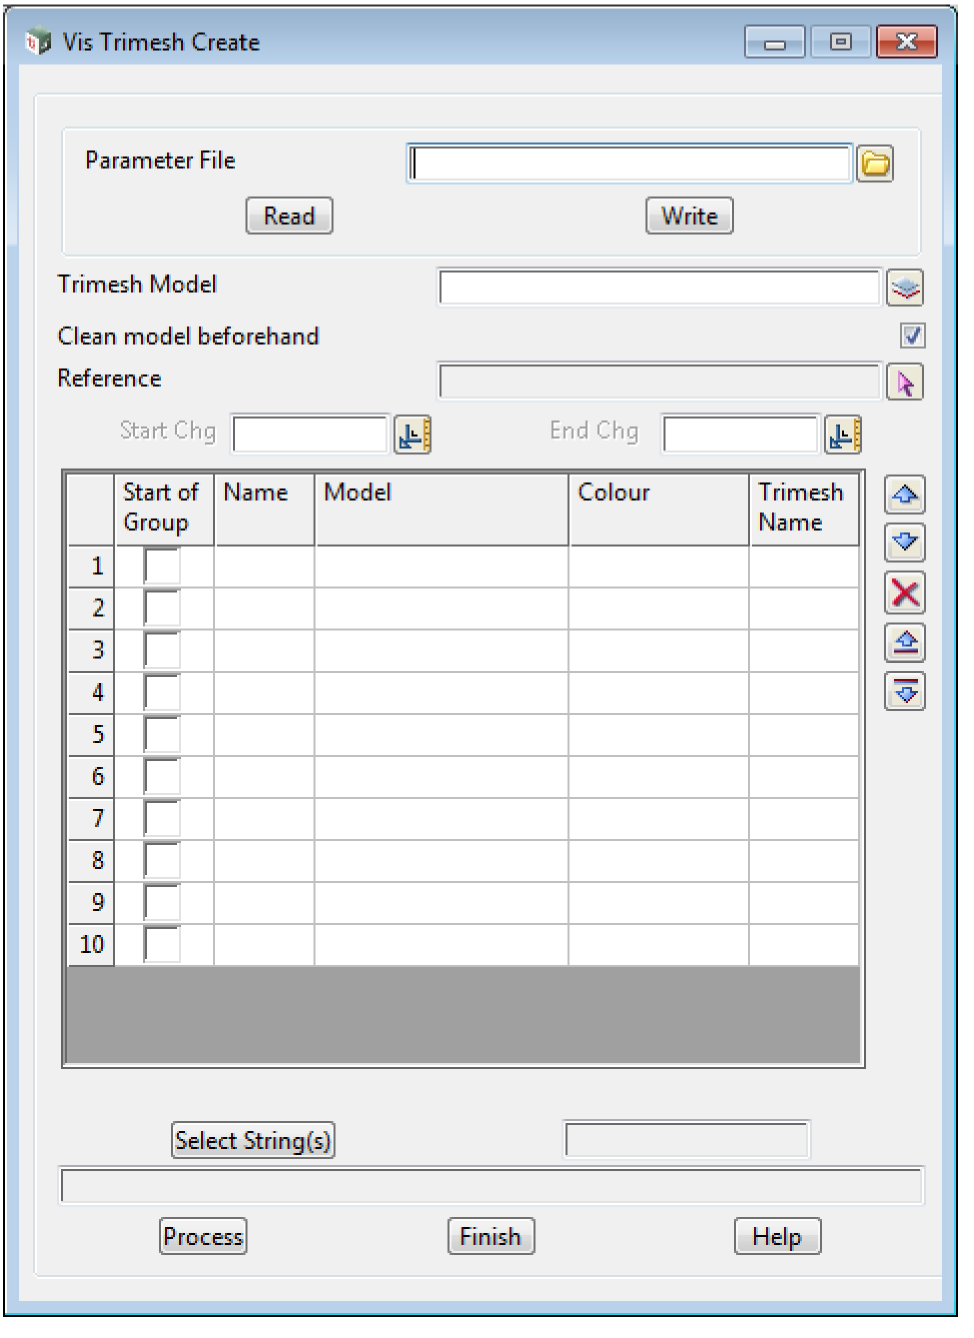
Continue to 14.3.6 Create Trimesh Vis or return to 14.3 Trimesh.

14.3.6 Create Trimesh Vis

Position of option on menu: **Strings =>Trimesh =>Create trimesh vis**

THIS OPTION IS CURRENTLY UNDER DEVELOPMENT.

The option is for creating.



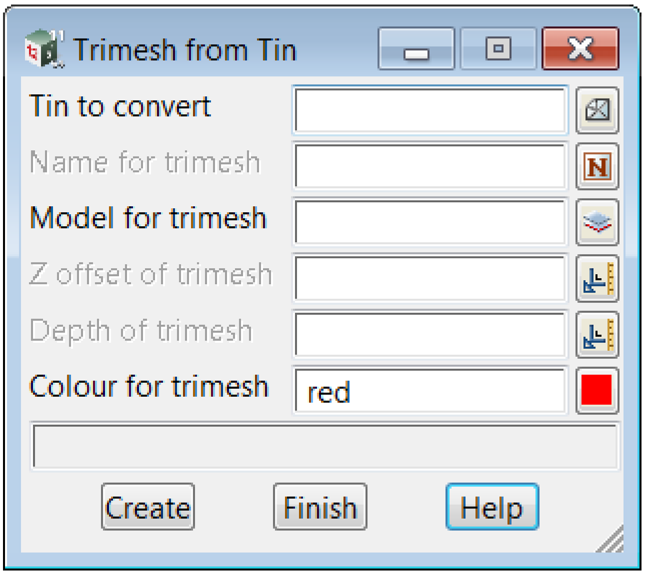
Continue to 14.3.6 Create Trimesh Vis or return to 14.3 Trimesh.

14.3.7 Trimeshes from Tin

Position of option on menu: **Strings =>Trimesh =>Trimeshes from tin**

This option takes a tin and creates a trimesh by first moving the tin up vertically by a use given Z offset of trimesh to form the top of the trimesh, and then copying the top a vertical down by a user given Depth of trimesh.

Selecting **Trimeshes from tin** brings up the **Generate Trimesh from tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to convert	tin box		
tin to create a trimesh from.			
Name for trimesh	name box		
name for the created trimesh.			
Model for trimesh	model box		available models
model to add the created trimesh to.			
Z offset of trimesh	real box		
the top of the trimesh is the tin translated vertically up by this value. *This value can be negative and then the top of the trimesh is lower rather than above the tin.*			
Depth Z offset of trimesh	real box		
the bottom of the trimesh is this value vertically below the top of the trimesh. *This value can be negative then the "bottom" of the trimesh is above the "top" of the trimesh.*			
Colour for trimesh	colour box		available colours
colour for the created trimesh.			
Create	button		
create trimesh from the tin.			

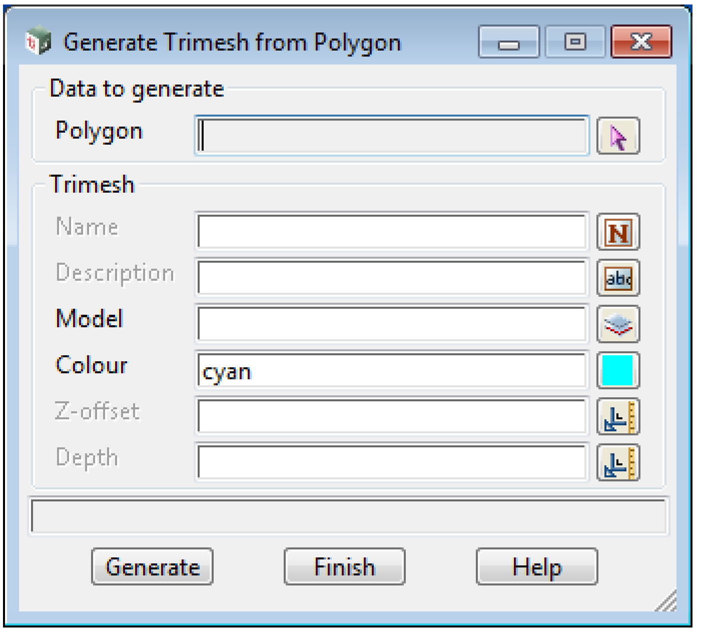
Continue to 14.3.8 Trimeshes from Polygon or return to 14.3 Trimesh.

14.3.8 Trimeshes from Polygon

Position of option on menu: **Strings =>Trimesh =>Trimeshes from polygon**

This option takes a polygon and first creates a tin of the polygon, and then creates a trimesh by first moving the tin up vertically by a use given Z offset of trimesh to form the top of the trimesh, and then copying the top a vertical down by a user given Depth of trimesh.

Selecting **Trimeshes from polygon** brings up the **Generate Trimesh from Polygon** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Polygon	string select		

polygon to create the trimesh from.

Field Description	Type	Defaults	Pop-Up
Name	name box		

name for the created trimesh.

Field Description	Type	Defaults	Pop-Up
Description	input		

a description that is recorded in the trimesh.

Field Description	Type	Defaults	Pop-Up
Model	model box		available models

model to add the created trimesh to.

Field Description	Type	Defaults	Pop-Up
Colour	colour box		available colours

colour for the created trimesh.

Field Description	Type	Defaults	Pop-Up
Z-offset	real box		

the top of the trimesh is the tin of the polygon translated vertically up by this value.

This value can be negative and then the top of the trimesh is lower rather than above the tin of the polygon.

Field Description	Type	Defaults	Pop-Up
Depth	real box		

the bottom of the trimesh is this value vertically below the top of the trimesh of the polygon.

This value can be negative then the "bottom" of the trimesh is above the "top" of the trimesh.

Field Description	Type	Defaults	Pop-Up
Generate	button		

create trimesh from the polygon.

Continue to 14.3.9 Trimesh Tools or return to 14.3 Trimesh.

14.3.9 Trimesh Tools

Position of option on menu: **Strings =>Trimesh**

See

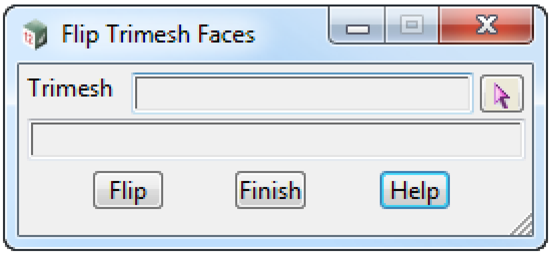
14.3.9.1 Trimesh Flip Faces

14.3.9.1 Trimesh Flip Faces

Position of option on menu: **Strings =>Trimesh =>Tools =>Flip Trimesh Faces**

This option reverses the order of the vertices in all the triangle in a trimesh.

Selecting **Flip faces** brings up the **Flip Trimesh Faces** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Trimesh	trimesh select		

trimesh to flip the faces.

Flip	button		

reverse the order of the vertices in all the triangles in the selected trimesh.

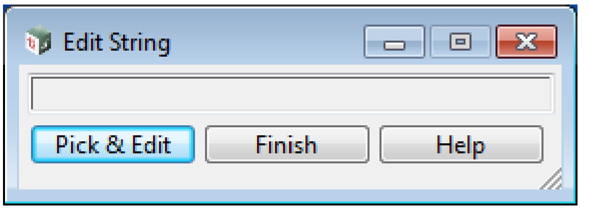
Return to 14.3 Trimesh.

14.4 Editor

Position of option on menu: **Strings =>Editor**

The string editor is used for modifying any of the *12d Model* strings.

After selecting the **editor** option, the **edit string** panel is placed on the screen to record any error messages.



The option is already in **pick** mode (the **pick & edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited. From the picked string's type, the editor is able to determine the appropriate editor and placed on the screen.

Each string type has its own edit operations which will now be discussed in detail.

Note - if the **edit** menu is deleted from the screen using the **menu delete** option, it can be raised again by clicking RB in any view.

For the option *2d*, go to 14.4.2 Edit 2d
3d 14.4.3 Edit 3d
4d 14.4.4 Edit 4d

Super Alignment 14.4.11 Edit Super Alignment
Text 14.4.12 Text Edit

For the old string options:
2d, go to 14.20.3 2d Edit - Old.
3d - old 14.20.4 3d Edit - Old
4d - old 14.20.5 4d Edit - Old
Alignment 14.20.2 Alignment Edit
Pipe - old 14.20.6 Pipe Edit - Old
Polyline - *old* 14.20.7 Polyline Edit - Old

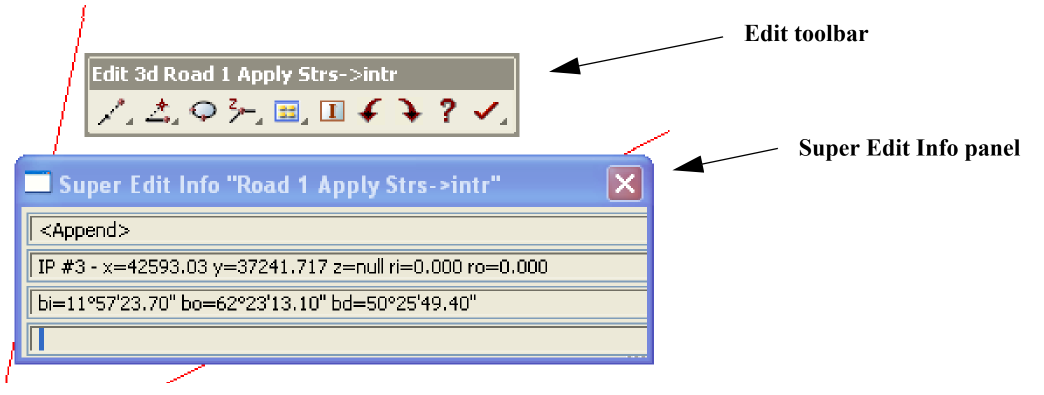
Please continue to the next section 14.4.1 Super String Edit - Common Information.

14.4.1 Super String Edit - Common Information

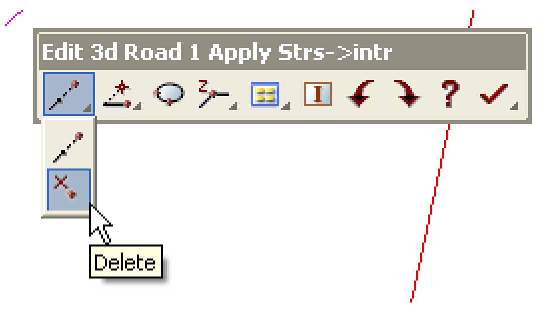
14.4.1.1 nd edit menu

After selecting the string to be edited, the toolbar containing the list of available edit options (the string's **Edit nd** menu) is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project** =>**Management** =>**Defaults**), an information panel, (the string's **Edit nd info** panel) is also displayed.

For example, the **Edit String** menu and **Super Edit Info** panel for a 3d super string are

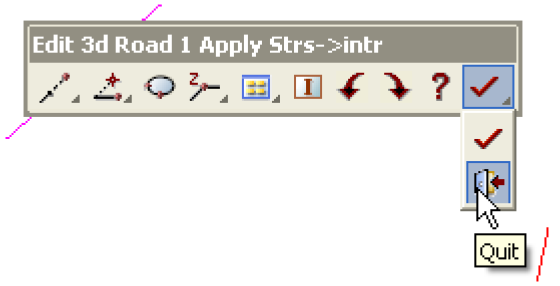


Most of the options chosen from the **Edit nd** menus repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

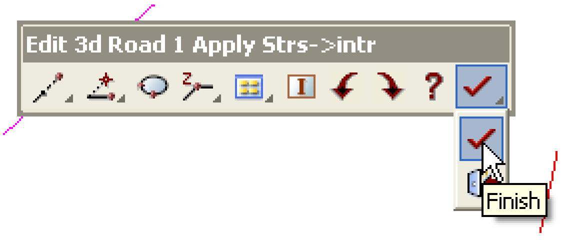


For example, if the **Delete** option is selected, any number of vertices can be deleted from the chosen string without re-selecting the **Delete** option.For full information on the **Delete** option, go to the section 14.4.1.2 Delete

To select a new edit nd option, simply select the option from the **Edit nd** toolbar. The current option is automatically terminated and the new option begins.



An option is also terminated when the entire string editing option is ended by selecting either the **Quit** or **Finish** button in the **Edit nd** menu.



Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertices (point type) or with straight lines joining the vertices (line type). Linestyles can be defined that drawn lines between the vertices even though the breakline type is **point**.
2. The string vertices are called intersection points (IPs).
3. The string **Super Edit Info** panel will not automatically appear if **Display edit info** is set to **off** in the ***System Settings*** tab of the **Project =>Management =>Defaults** panel.

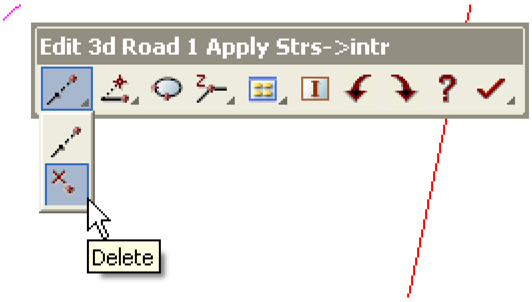
14.4.1.14 Typed input

14.4.1.2 Delete



The **delete** option is used to delete selected vertices from the string.

The vertex to be deleted is picked (LB) and accepted (MB). When the vertex is accepted, it is deleted. The string, minus the deleted point, is then redrawn.

Once a vertex has been deleted, another vertex in the string can then be selected and deleted. Hence any number of vertices from the string can be deleted one after another.

message area 1 <Delete>

Screen message area

<Select a vertex to delete> [picks][fast][menu]

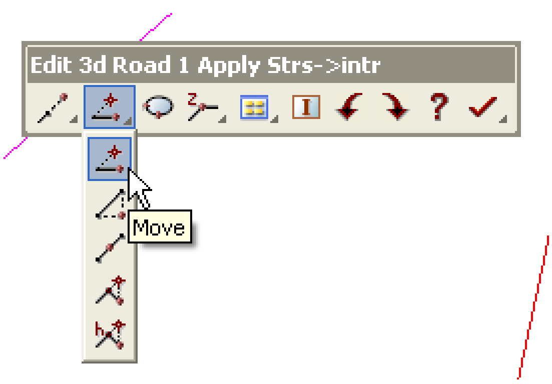
The **delete** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit nd** menu.

Typed input can be used to select a point for deletion.

Continue to the next section 14.4.1.3 Move or return to 14.4.1 Super String Edit - Common Information.

14.4.1.3 Move

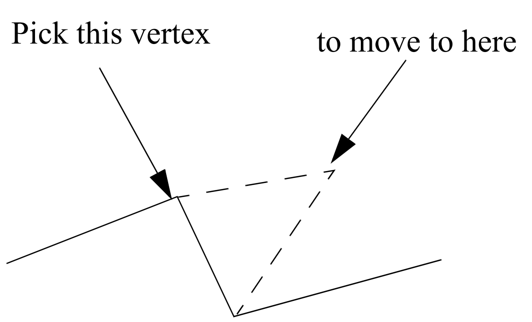
The **move** option is for moving individual vertices (intersection points - IPs) of the string.



The move cycle consists of two steps:

(a) selecting the vertex to move

(b) selecting the new position for the vertex.



Step (a)

First the point to be moved is selected. The selected vertex will then move around the view and the string redrawn to show the change as the cursor is moved.

message area 1 <Move>

Screen message area

<Pick vertex to move> [picks][fast][Menu

Step (b)

The current cursor position is selected as the new position for the vertex by selecting (LB) and accepting (MB). The vertex being moved is then anchored at the cursor position for the vertex, and the string redrawn.

message area 1 <Move>

Screen message area

<Pick new location of vertex> [picks][fast][menu]

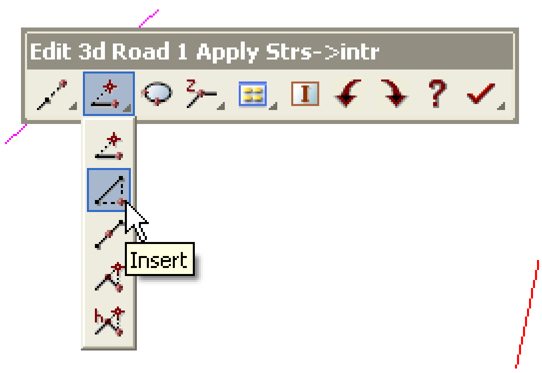
Typed input can be used in either step.

Once the move cycle is completed and the vertex moved, the move option is still current and can be repeated for other vertices without having to re-select the **move** option.

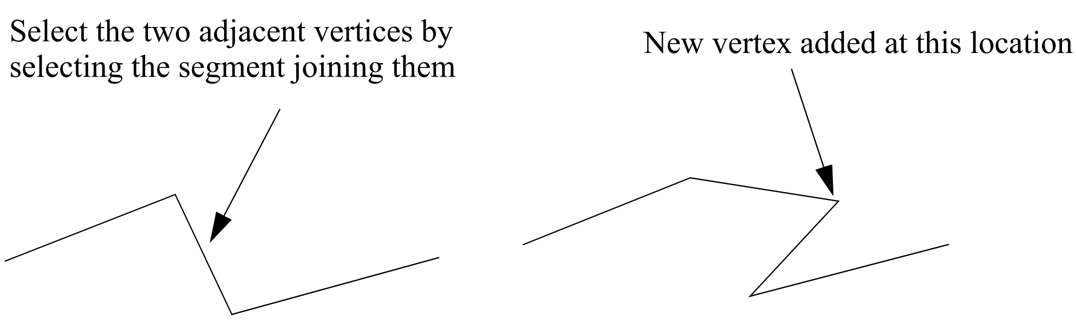
The **Move** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **Edit nd** option.

Continue to the next section 14.4.1.4 Insert or return to 14.4.1 Super String Edit - Common Information.

14.4.1.4 Insert



The **insert** option is designed to place a new vertex in a string between two adjacent vertices (note that the inserted point **does not** have to be on the segment joining the two vertices).



Inserting a vertex, like moving a vertex, is a two step process.

Step (a) - selecting the vertices to be on either side of the new vertex by selected the segment

The two adjacent vertices are chosen by selecting the segment connecting the two vertices. Once the segment is selected, the new vertex is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted vertex.

message area 1 <Insert >

Screen message area

<Pick position to insert vertex> [picks][fast][menu]

Step (b) - selecting the position for the new vertex

The position of the new vertex is selecting

message area 1 <Insert >
Screen message area
<Pick new location of vertex> [picks][fast][menu]

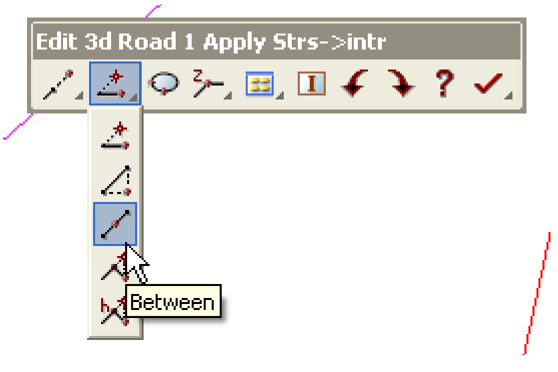
Once the insert cycle is completed and the vertex inserted, the insert option is still current and can be repeated for other insertions without having to re-select the **insert** option.

The **insert** option is terminated by selecting **Cancel** from the **Pick ops** menu or by selecting a new option from the **Edit nd** menu.

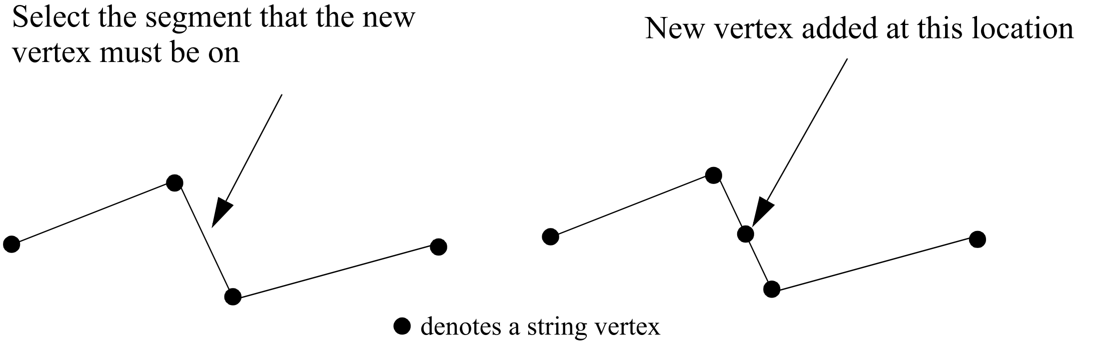
Typed input can be used in either step.

Continue to the next section 14.4.1.5 Between or return to 14.4.1 Super String Edit - Common Information.

14.4.1.5 Between



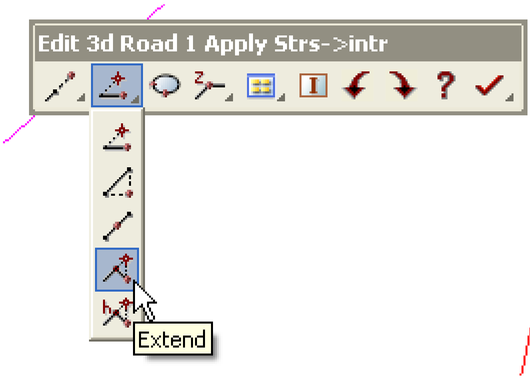
The **between** option is similar to the **insert** option except that the inserted vertex does have to be on the segment joining the two vertices. To accomplish this, the cursor position is projected onto the segment to give the new vertex position.



The **between** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit nd** menu.

Continue to the next section 14.4.1.6 Extend or return to 14.4.1 Super String Edit - Common Information.

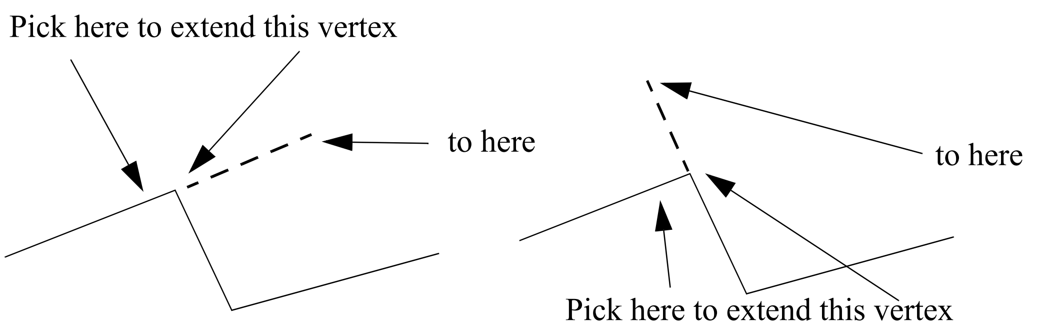
14.4.1.6 Extend



The **extend** option is used to move a vertex along the line joining the vertex to its neighbouring vertex.

The **extend** option is used to move a vertex along the line joining the vertex to its neighbouring vertex.

That is, the bearing of the segment is kept constant and the vertex is moved along that segment either towards or away from its neighbouring vertex on the segment.



Extending, like moving a vertex, is a two step process.

Step (a) - selecting the segment and the vertex to be moved along that segment

The segment and the vertex to be moved are chosen in the one operation by picking (LB) and accepting (MB) at a co- ordinate point near the segment and close to the vertex to be moved along that segment.

Once the segment and vertex are selected, the new position of the selected vertex is assumed to be at the current cursor position projected along the selected segment.

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex.

message area 1 <Extend>
Screen message area
<Pick position to extend> [picks][fast][Menu]

Step (b) - selecting the final position for the vertex

The final position for the vertex is set to the projection of the selected cursor position onto the segment.

message area 1 <Extend>
Screen message area
<Pick new location of vertex> [picks][fast][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **extend** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit nd** menu.

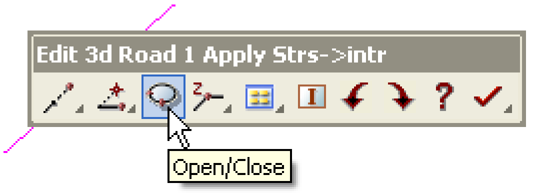
Typed input can be used in either step.

Note - Extend can be used on the end points of the string.

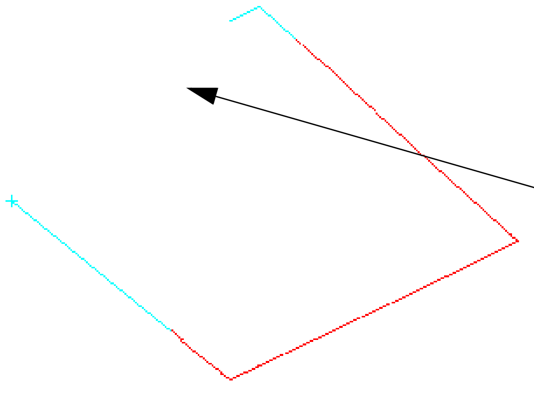
Continue to the next section 14.4.1.7 Open/Close or return to 14.4.1 Super String Edit - Common

Information.

14.4.1.7 Open/Close



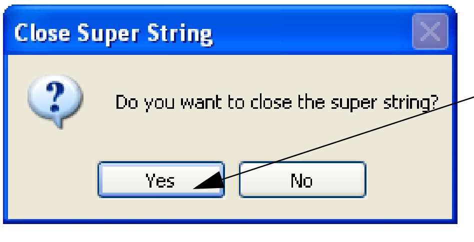
Toggles a string between Open and Closed.



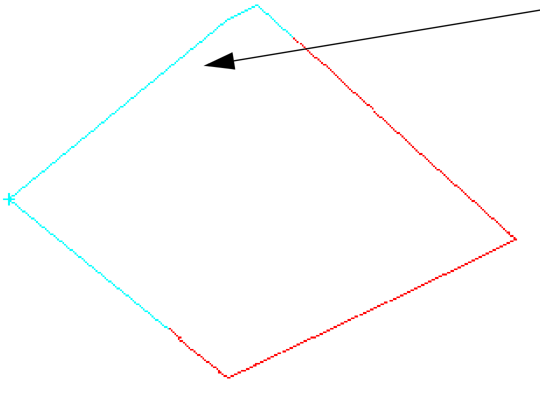
If the string is open (that is, the start and end vertices are not the same), selecting the **Open/ Close** option adds a segment joining the first and last vertices of the string.

open string

Selecting **Yes** If the string is open adds a segment, joining the first and last vertices of the string.



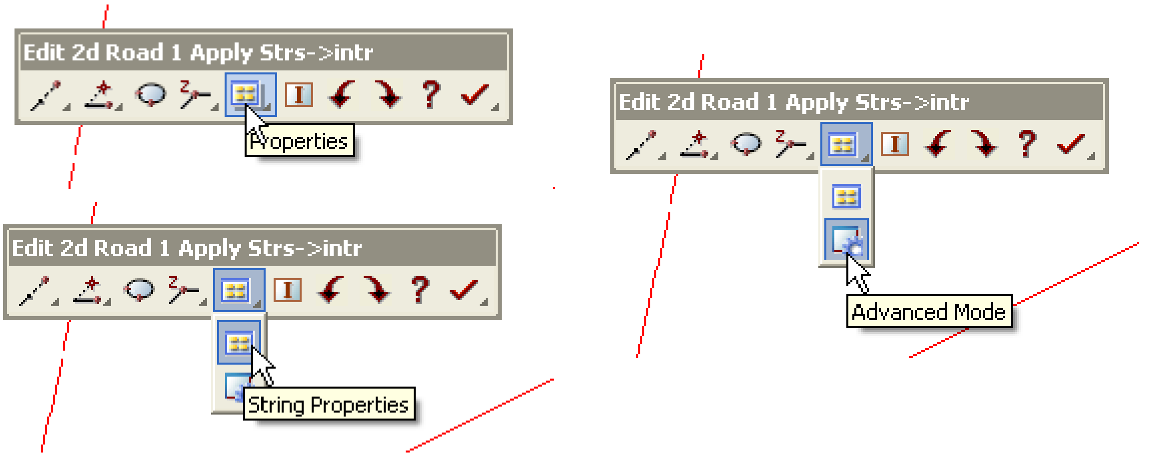
The string is now closed.



If the string is closed (that is, there is a segment from the start to the end vertices), selecting the **Open/Close** option removes the last segment of the string.

Continue to the next section 14.4.1.8 Properties or return to 14.4.1 Super String Edit - Common Information.

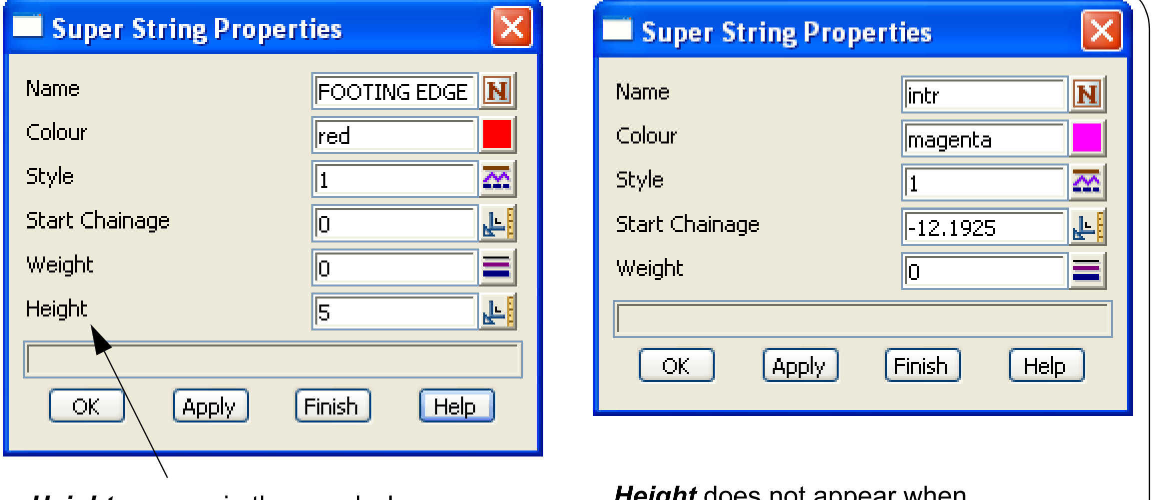
14.4.1.8 Properties



Selecting Properties brings up the **Super String Properties** panel which is used to modify the string's header information.

What is displayed in the **Super String Properties** panel depends on the type of the super string. That is, it depends on what properties of the super string have been enabled.

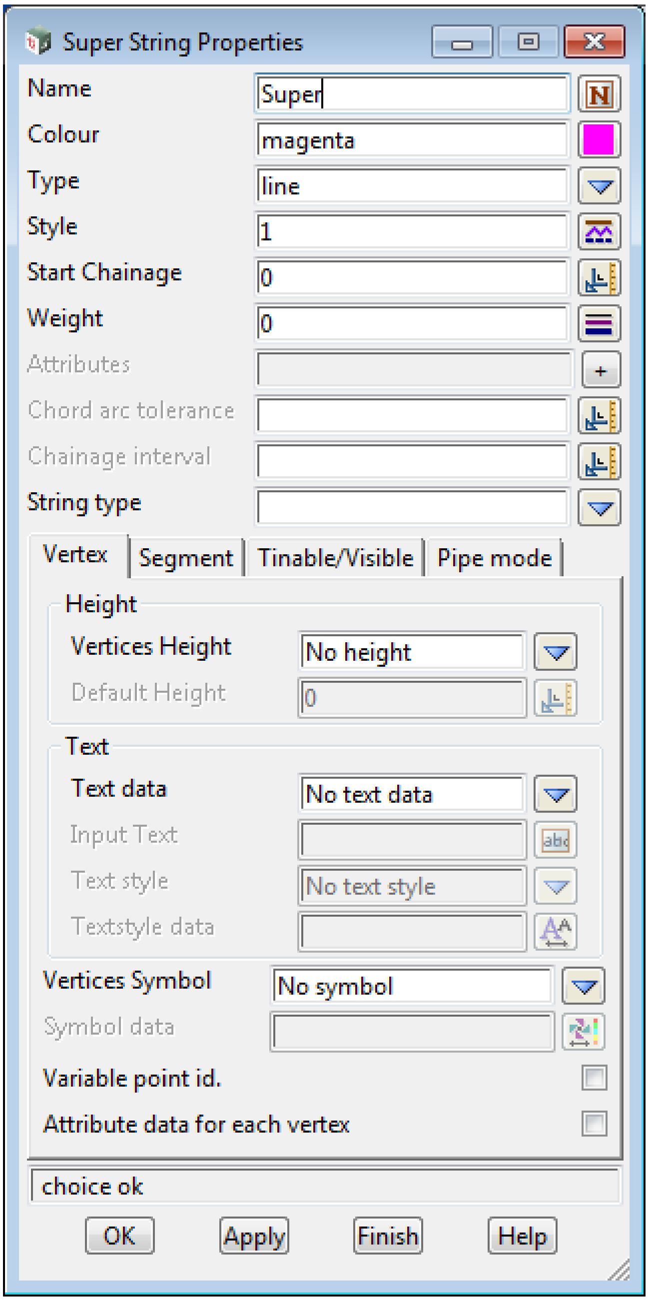
For example, constant height enabled means that there is only one height for the entire super string so height appears in the S**uper String Properties** panel. If variable height is enabled, there is a height for each vertex and so height does not appear in the S**uper String Properties** panel.



Height appears in the panel when ***Constant height*** is set for the super string (*e.g.* 2d super string)

Height does not appear when ***Variable height*** s set for the super string (*e.g.* 3d super string)

In the ***Advanced*** mode, all the super string properties can be modified and so all possible super string fields are displayed in the **Super String Properties** panel.



The fields in the panels are similar to those in the **Create Super String** panels. The only new fields are the **OK** and **Apply** which are used in the normal way.

Continue to the next section 14.4.1.9 Info or return to 14.4.1 Super String Edit - Common Information.

14.4.1.9 Info

Toggles the **Super Edit Info** panel on/off for the string.

For more information on the Super Edit Info panel see 14.4.1.1 nd edit menu in the section 14.4.1 Super String Edit - Common Information.

Continue to the next section 14.4.1.10 Undo/Redo or return to 14.4.1 Super String Edit - Common Information.

14.4.1.10 Undo/Redo

An undo and redo list is defined for each editor on the screen. That is, each editor has its own undo/redo lists. If an option is undone, it is added to the redo list so that it can be redone.

When the editor is exited by either **Quit** or **Finish**, the undo and redo lists are deleted and are no longer usable.

14.4.1.10.1 Undo

Undoes the last editor operation for this string and adds it to the top of the redo list.

Undoes the last editor operation for this string and adds it to the top of the redo list.

14.4.1.10.2 Redo

Redo the last editor operation that was undone for this string. Add the undone operation to the top of the undo list.

Continue to the next section 14.4.1.11 ‘?’ Help or return to 14.4.1 Super String Edit - Common Information.

14.4.1.11 ‘?’ Help

Help button to go to the Help topic for the panel.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings, the panel **Super Edit Info**, and the options, 14.4.1.2 Delete,14.4.1.4 Insert,14.4.1.3

Move,14.4.1.5 Between,14.4.1.6 Extend, 14.4.1.7 Open/Close, 14.4.1.8 Properties, 14.4.1.9 Info, 14.4.1.10.1 Undo, 14.4.1.10.2 Redo, 14.4.1.11 '?' Help, 14.4.1.12 Finish, 14.4.1.13 Quit and 14.4.1.14 Typed input.

For the **Edit 2d** options not mentioned in 14.4.1 Super String Edit - Common Information see 14.4.2 Edit 2d

For the **Edit 3d** options not mentioned in 14.4.1 Super String Edit - Common Information see 14.4.3 Edit 3d

For the **Edit 4d** options not mentioned in 14.4.1 Super String Edit - Common Information see 14.4.4 Edit 4d

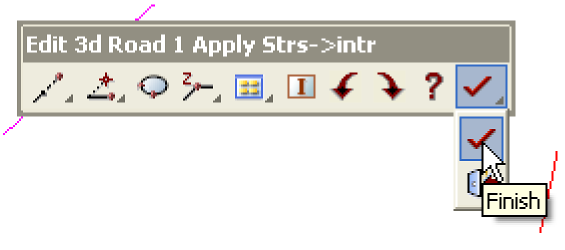
For the **Edit Super** options not mentioned in 14.4.1 Super String Edit - Common Information see 14.4.10 Edit Super

For the **Edit Pipe** options not mentioned in 14.4.1 Super String Edit - Common Information see 14.4.8 Edit Pipe

For the **Edit Polyline** options not mentioned in 14.4.1 Super String Edit - Common Information see 14.4.9 Edit Polyline

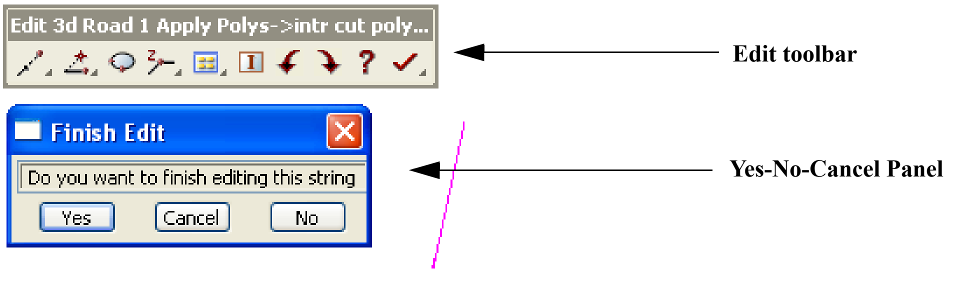
Continue to the next section 14.4.1.12 Finish or return to 14.4.1 Super String Edit - Common Information.

14.4.1.12 Finish



The edit process is completed and the modified string stored in the given model when the **Finish** option is chosen from the **Edit nd** menu.

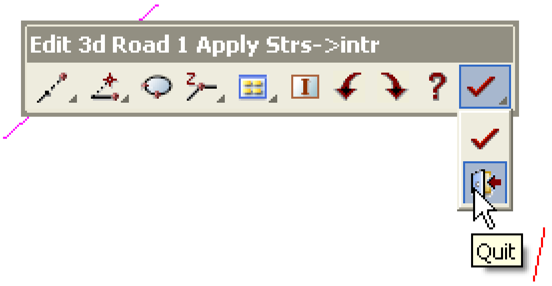
After selecting the **Finish** option, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be ended. If **Yes** is selected, the edits will be stored.



Continue to the next section 14.4.1.13 Quit or return to 14.4.1 Super String Edit - Common Information.

14.4.1.13 Quit

Even after points are created for the new string, the create process can be aborted by selecting the **Quit** option from the **Edit nd** menu. The option then terminates and no string is created.



The **Quit** option is used to terminate the nd string edit session without storing any of the edits. That is, the string is left as it was *before* the edit was begun

After selecting the **Quit** option, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be ended. If **yes** is selected, the edits will be ignored and the unedited string kept.

Note that if it was a new string being created, the option terminates by Quit and no string is created.

Continue to the next section 14.4.1.14 Typed input or return to 14.4.1 Super String Edit - Common Information.

14.4.1.14 Typed input

Typed input can be used wherever a select is required to obtain a co-ordinate. For example an (x,y), (x, y, z) or (chainage, height).

To start typed input, start typing, and a special typed-input box appears on the screen

If the focus is on a Plan or Perspective view, then an **Enter X Y Z** box comes up when you are placing horizontal geometry for an alignment or super alignment, or vertices for all other string types. If you are creating vertical geometry for an alignment or super alignment and the focus is on a Section view, then a **Enter Ch Ht** box appears.

These are also called the *XYZ typed input* box and the *Chainage Height typed input* box respectively.

An <enter> terminates the typed input and the entered values taken as the position of the required point. The typed-input box then disappears.

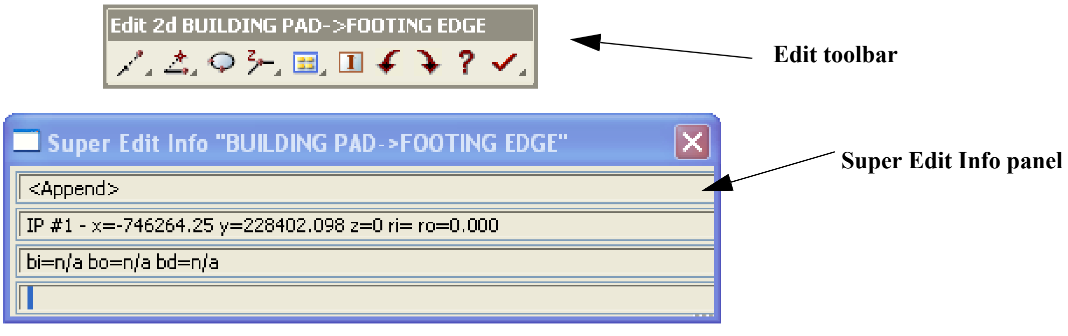
If the user wishes to abort the typed input and return to mouse input, simply select the [X] button on the typed input box or type <enter> with no values in the typed input box.

Continue to the next section 14.4.2 Edit 2d or return to 14.4.1 Super String Edit - Common Information.

14.4.2 Edit 2d

Position of option on menu: **Strings =>Editor**

On picking a 2d string, the **Edit 2d** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.



See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings, the panel **Super Edit Info**, and the options, 14.4.1.2 Delete,14.4.1.4 Insert,14.4.1.3 Move,14.4.1.5 Between,14.4.1.6 Extend, 14.4.1.7 Open/Close, 14.4.1.8 Properties, 14.4.1.9 Info, 14.4.1.10.1 Undo, 14.4.1.10.2 Redo, 14.4.1.13 Quit, 14.4.1.11 '?' Help, 14.4.1.12 Finish and 14.4.1.14 Typed input.

Each **Edit 2d** option not mentioned in the earlier section 14.4.1 Super String Edit - Common Information will now be described.

See 14.4.2.1 2d - Append
14.4.2.2 2d - Height
14.4.2.3 2d - Height (Nav)
14.4.2.4 2d Properties

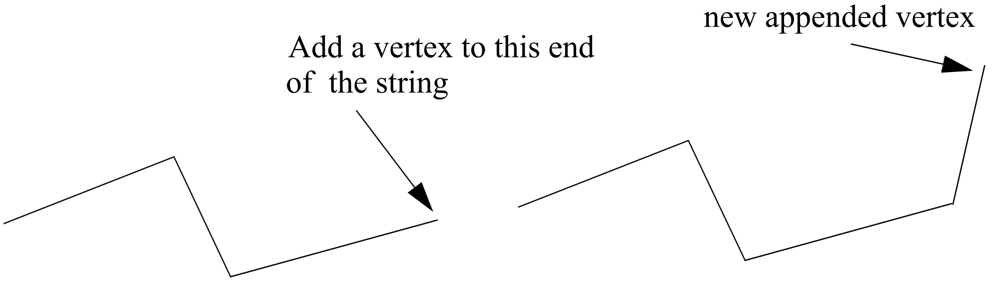
14.4.2.1 2d - Append

The **append** option is used to

- create the 1st vertex in a new string
- or , to append a new vertex to the end of the string
- or to prepend a new vertex to the beginning of the string.

In this option, both appending and prepending will be referred to as *appending.*

14.4.2.1.1 Existing 2d Strings



Appending a vertex is a two step process.

Step (a) - For an existing string - selecting the end of the string to append the vertex to.

After the **Append** option has been selected, the end of the string to append the vertex to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1 <Append>
Screen message area
<Pick end to append to> [picks][fast][menu]

Step (b) - selecting the position for the new appended vertex.

The position of the new appended vertex is set to the current cursor position by picking (LB) and accepting (MB).

message area 1 <Append>
Screen message area
<Pick location of vertex> [picks][fast][Menu]

Once a vertex has been appended to the string, the appended vertex is considered to be the selected string end and a new step (b) begins. The current cursor position indicates the new position for the next appended vertex.

Hence a series of string vertices is easily entered by first selecting the string end that the new vertices are to be appended to (step (a)) and then moving the cursor to the position of each new vertex and selecting them in turn (setup (b)).

Once the move cycle is completed and the vertex moved, the move option is still current and can be repeated for other vertices without having to re-select the **move** option.

The **Append** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new **Edit 2d** option.

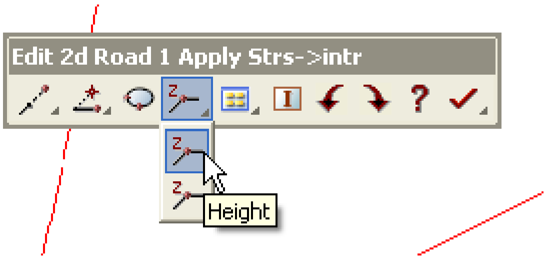
14.4.2.1.2 New 2d String

For creating a new string, the cursor is used to select the 1st vertex of the string. The option then continues as if appending to an existing 2d string where the end vertex has already been selected.

Typed input can be used in either step.

Continue to next section 14.4.2.2 2d - Height or return to 14.4.2 Edit 2d.

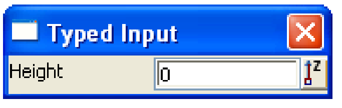
14.4.2.2 2d - Height



The **height** option is used to modify the height (z value) of the 2d string.

After the height option is chosen, a height typed input box is displayed on the screen with the string's current height (z value).

The height typed-input box looks like:



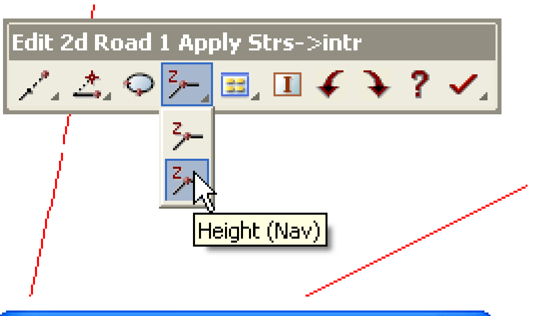
The height is entered into the typed-input box, terminated by <enter>. The entered value is taken as the height of the 2d string and the string redrawn with the new height. The typed-input box then disappears.

The height option automatically terminates and a new option is selected from the **Edit 2d**.

Note - all the points in a 2d string have the same height.

Continue to next section 14.4.2.3 2d - Height (Nav) or return to 14.4.2 Edit 2d.

14.4.2.3 2d - Height (Nav)



The **height (Nav)** option is used to modify the height (z value) of the 2d string.
After the **height (Nav)** option is chosen, a **Super Vertex Height panel** is displayed on the screen with the string's current height (z value).

Super Vertex Height panel

To change the height of the selected string, enter the value into the height field and press **ok** or **apply**. The entered value is then taken as the height of the 2d string and the string redrawn with the new height.

Note - all the points in a 2d string have the same height.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Height input height of vertex/string

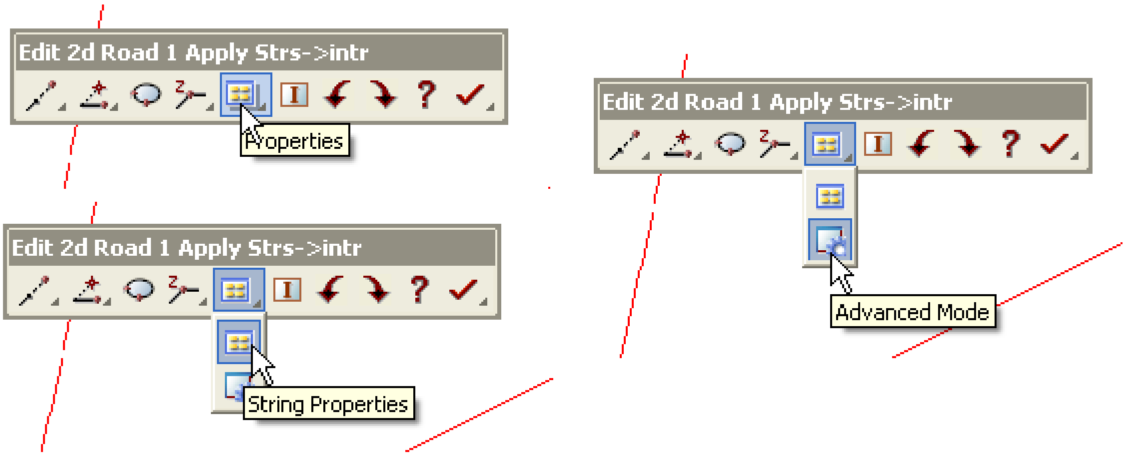
the height used for the entire string.

OK/Apply button

OK *sets the string with the value in the panel field and removes the panel.* **Apply** *set the string with the value in the panel field and leaves the panel on the screen.*

Continue to next section 14.4.2.4 2d Properties or return to 14.4.2 Edit 2d.

14.4.2.4 2d Properties

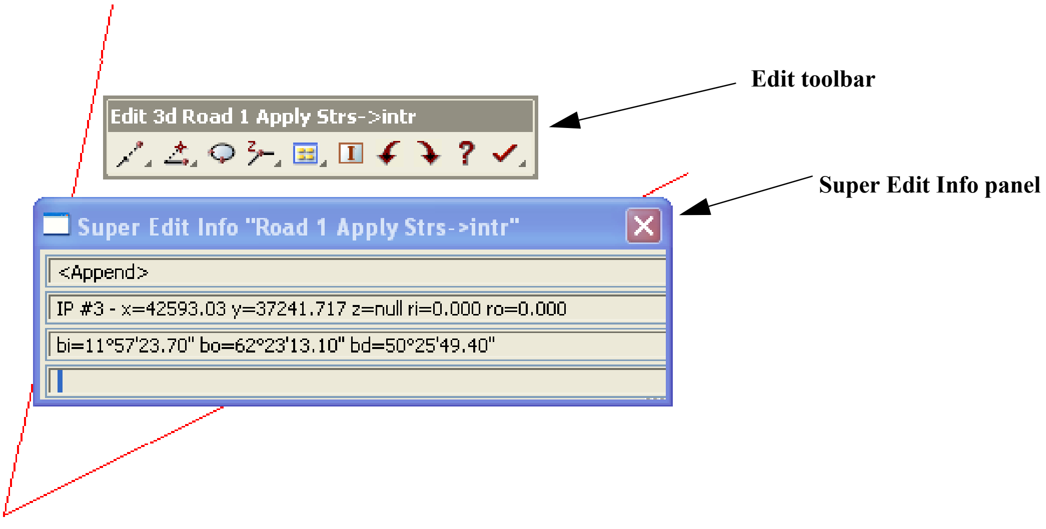


For information on the **Super String Properties** panel, go to 14.4.1.8 Properties

14.4.3 Edit 3d

Position of option on menu: **Strings =>Editor**

On picking a 3d string, the **Edit 3d** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.



Each option in the **Edit 3d** menu will now be described.

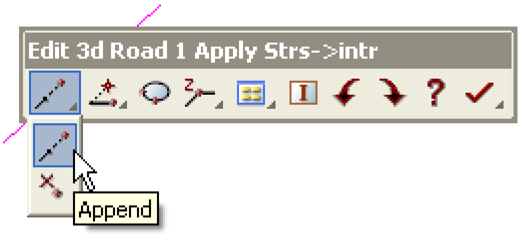
See 14.4.3.1 3d - Append
14.4.3.2 3d - Extend and Extend ht
14.4.3.3 3d - Height
14.4.3.4 3d - Height (Nav)
14.4.3.5 3d Properties

The difference between a 2d and a 3d string is that all points in a 2d string have the same z-value, whereas for a 3d string, each point can have a different z-value.

Hence most of the options in the **Edit 3d** menu are similar to the **Edit 2d** options of the same name, and only the differences for each option will be discussed. The **Edit 2d** options are given in the section 14.4.2 Edit 2d

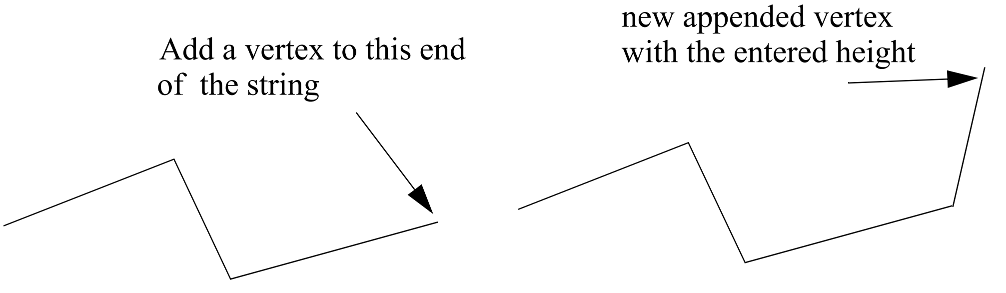
See the earlier section 14.4.1 Super String Edit - Common Informationfor general information about editing strings, the panel **Super Edit Info**, and the options, 14.4.1.2 Delete,14.4.1.4 Insert,14.4.1.3 Move,14.4.1.5 Between,14.4.1.6 Extend, 14.4.1.7 Open/Close, 14.4.1.8 Properties, 14.4.1.9 Info, 14.4.1.10.1 Undo, 14.4.1.10.2 Redo, 14.4.1.13 Quit, 14.4.1.11 '?' Help, 14.4.1.12 Finish and 14.4.1.14 Typed input.

14.4.3.1 3d - Append



The **Append** operation for a 3d string is similar to that for a 2d string except that a height (z-value) is required for each new vertex.

Since in most cases, it would be tiresome to ask for a height every time a vertex is added, the entry of a new height is controlled by the **height** toggle in the snaps menu. If **height** is toggled to on, then every time a vertex is placed or moved an enter height typed-input box is displayed on the screen.



The enter height typed-input box looks like:

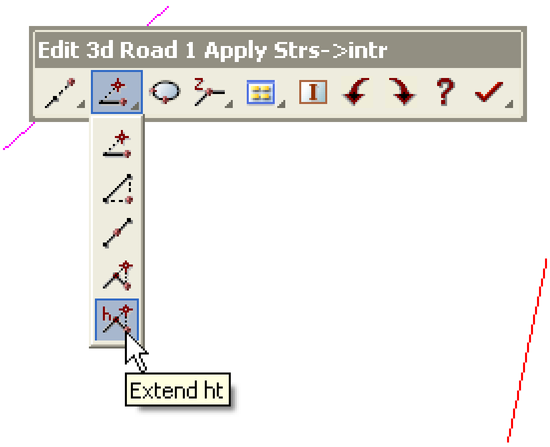
The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the 3d string vertex and the string redrawn with the new height at the vertex. The typed-input box then disappears.

When the enter height box is placed on the screen, it will already have a value in it depending on the circumstances preceding the operation.

For example, if a vertex or segment was snapped to, the height at that vertex or segment will be displayed in the box.

Continue to next section 14.4.3.2 3d - Extend and Extend ht or return to 14.4.3 Edit 3d.

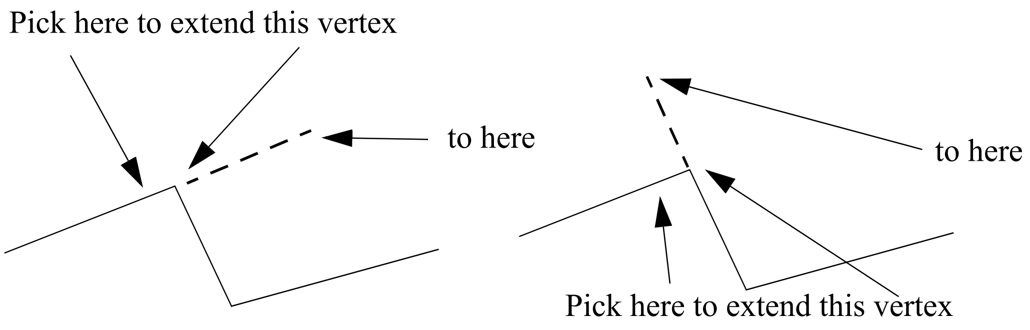
14.4.3.2 3d - Extend and Extend ht



The **Extend ht** option is used to move a vertex along the line joining the vertex to its neighbouring vertex plus the z-value is interpolated from the z-values at either end of the segment.

The **Extend ht** option is similar to the **Extend** option except that the z-value of the moved vertex is modified by linearly interpolating the z-value from the original vertices at the end of the selected segment.

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend.



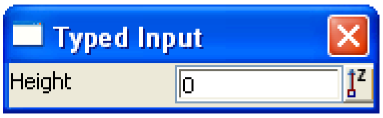
Continue to next section 14.4.3.3 3d - Height or return to 14.4.3 Edit 3d.

14.4.3.3 3d - Height

The **height** option is used to modify the height (z value) of any vertex in the string.

After the height option is chosen, the user must select which vertex is going to have its height modified.

After the vertex has been selected, a Height typed-input box is displayed on the screen with the vertex's current height (z value).



The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the vertex in the 3d string and the string redrawn with the new height at that point. The typed-input box then disappears.

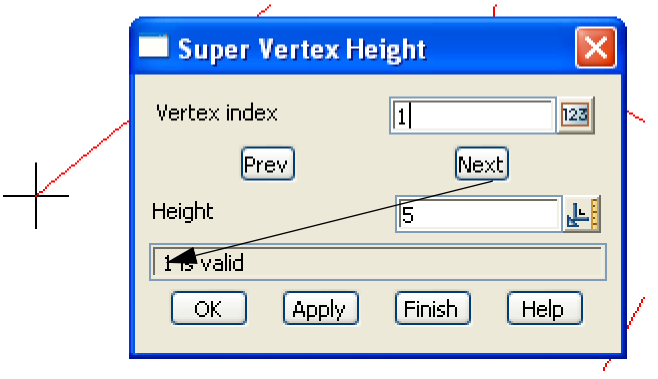
The **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit 3d** menu.

Continue to next section 14.4.3.4 3d - Height (Nav) or return to 14.4.3 Edit 3d.

14.4.3.4 3d - Height (Nav)

As soon as **Height (Nav)** is chosen, a **Super Vertex Height panel** is displayed on the screen with the string's current height (z value) in the Height field.

The **Super Vertex Height** panel is used to set the height value for vertices.



When the **Super Vertex Height** panel appears on the screen, the vertex index field is the vertex index of the selected vertex, with its associated height in the Height field of the panel. To select another vertex to alter, the vertex to modify is selected by typing the vertex index into the Vertex index field or by selecting **Prev** or **next** to switch to another vertex. The selected vertex is highlighted on the string and its *vertex index*, and *height* are written to the appropriate panel fields in the **Super Vertex Height** panel. The values can be changed and either **OK** or **Apply** the changed value to the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	

if a vertex is selected, then its vertex index is displayed in this field. An index can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev	button		

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next	button		

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Height	input	height of vertex/string	

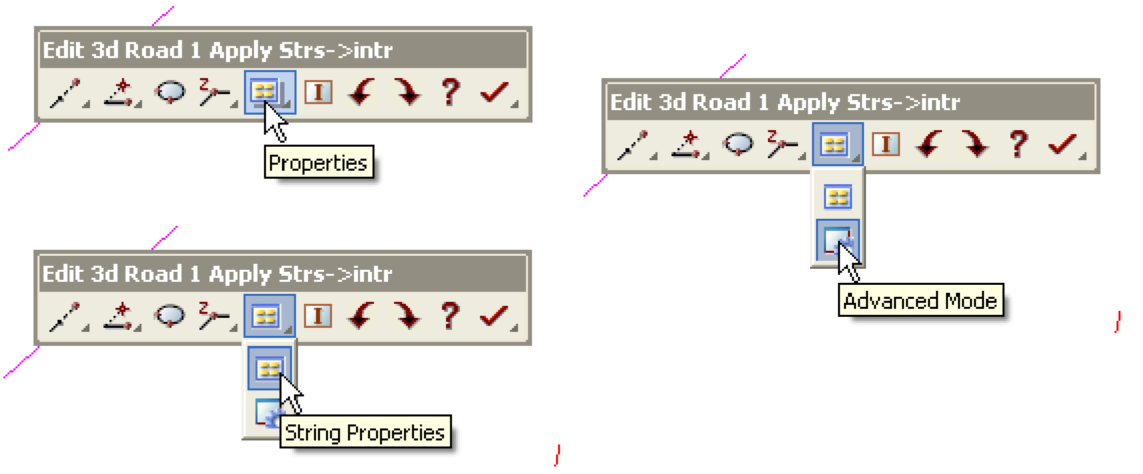
the height used for the vertex or for the entire string.

OK/Apply	button		

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Continue to next section 14.4.3.5 3d Properties or return to 14.4.3 Edit 3d.

14.4.3.5 3d Properties



For information on the **Super String Properties** panel, go to 14.4.1.8 Properties.

14.4.4 Edit 4d

Position of option on menu: **Strings =>Editor**

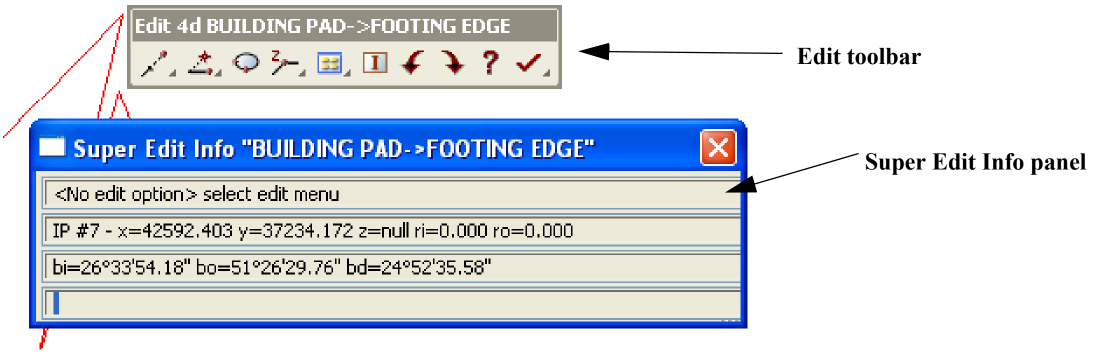
A *4d super string* is a *super string* with the restriction that it has:

(a) vertices of (x,y,z) co-ordinates joined by straight segments only

(b) Text at each vertex

(c) All text has the same height, rotation, *etc.* So it is controlled by the one Text Style for the entire string

On picking a 4d string, the **Edit 4d** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.



Only the options **append**, **Append** + **Text,** text, size and angle will be described in detail since all the other options are similar to the equivalent 3d string option (see the section 14.4.3 Edit 3d).

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings, the panel **Super Edit Info**, and the options, 14.4.1.2 Delete,14.4.1.4 Insert,14.4.1.3 Move,14.4.1.5 Between,14.4.1.6 Extend, 14.4.1.7 Open/Close, 14.4.1.8 Properties, 14.4.1.9 Info, 14.4.1.10.1 Undo, 14.4.1.10.2 Redo, 14.4.1.13 Quit, 14.4.1.11 '?' Help, 14.4.1.12 Finish and 14.4.1.14 Typed input.

See 14.4.4.1 4d - Append +Text

14.4.4.2 4d - Height

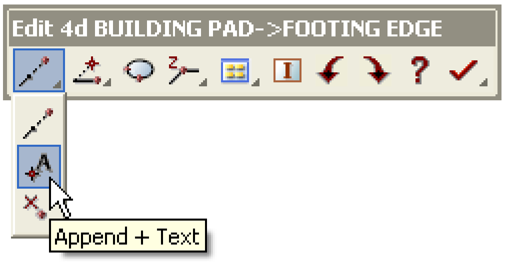
14.4.4.3 4d - Height (Nav)

14.4.4.4 4d - Text (Nav)

14.4.4.5 4d - Text Info

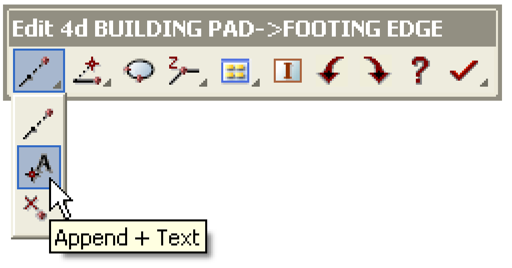
14.4.4.6 4d Properties

14.4.4.1 4d - Append +Text



The **append** operation for a 4d string is similar to the 3d string case except that a height and an optional text label is required for each new vertex.

Since in many cases a text label is not required at every vertex of a 4d string, there is an append option that asks for text at every vertex **(Append** + **Text)** and another that does not ask **(Append)**.



Append + **text** is a three step process.

Step (a) - For an existing string - selecting the end of the string to append the vertex and text to.

After the **Append** + **text** option has been selected, the end of the string to append the vertex to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1 <Append + Text>
Screen message area
<Pick end to append to> [picks][fast][menu]

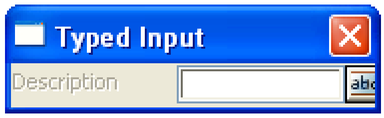
Step (b) - selecting the position for the new appended vertex.

The position of the new appended vertex is set to the current cursor position by picking (LB) and accepting (MB).

message area 1 <Append + Text>
Screen message area
<Pick location of vertex> [picks][fast][Menu]

Step (c) - Creating a text label for the vertex.

Once the new appended vertex is set to the current cursor position a Description typed-input box is displayed on the screen.



message area 1 <Append + Text>
Screen message area
<Super edit> [][][Menu]

Type the description into the typed-input box, finishing with <enter> and the typed-input box then disappears.

The appended vertex is now considered to be the selected string end and a new step (b) begins. The current cursor position indicates the new position for the next appended vertex.

Hence a series of string vertices is easily entered by first selecting the string end that the new vertices are to be appended to (step (a)) and then moving the cursor to the position of each new vertex and selecting them in turn (setup (b)).

The **append** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit 4d** menu.

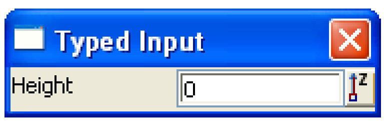
Continue to next section 14.4.4.2 4d - Height or return to 14.4.4 Edit 4d.

14.4.4.2 4d - Height

The **height** option is used to modify the height (z value) of any vertex in the string.

After the height option is chosen, the user selects which vertex is going to have its height modified.

After the vertex has been selected, a Height typed-input box is displayed on the screen with the vertex current height (z value).



The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the vertex in the 4d string and the string redrawn with the new height at that vertex. The typed-input box then disappears.

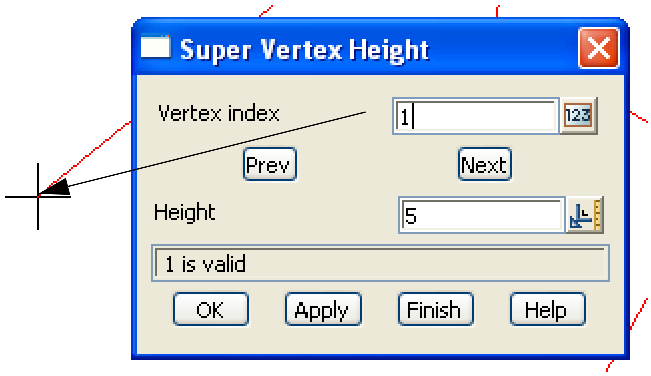
Another vertex can then be selected for modifying its height.

The **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit 4d** menu.

Continue to next section 14.4.4.3 4d - Height (Nav) or return to 14.4.4 Edit 4d.

14.4.4.3 4d - Height (Nav)

Selecting **Height (Nav)** brings up the **Super Vertex Height** panel with the height at the first vertex of the string displayed.
The **Super Vertex Height** panel is used to set the height value for any vertex of the string.



Any vertex can then be selected by clicking on the number icon at the end of the Vertex index panel field and selecting the required vertex, or by typing in its Vertex index and pressing <Enter>, or by using the **Prev** and **Next** buttons used to move to adjacent vertices until the required vertex is selected.

When the vertex to modify is selected, the vertex is highlighted on the string and its *vertex index*, and *height* are displayed in the appropriate panel fields in the **Super Vertex Height** panel. The new vertex height is stored by clicking either **OK** or **Apply**.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	

if a vertex is selected, then its vertex index is displayed in this field. An index can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev	button		

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next	button		

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Height	input	height of vertex/string	

the height used for the selected vertex.

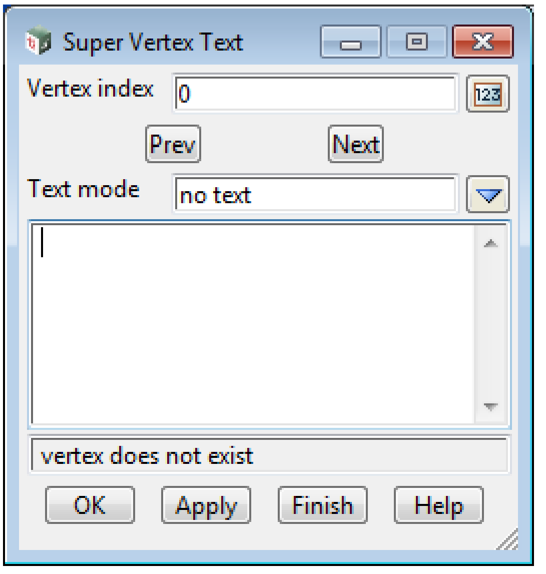
OK/Apply	button		

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Continue to next section 14.4.4.4 4d - Text (Nav) or return to 14.4.4 Edit 4d.

14.4.4.4 4d - Text (Nav)

Selecting **Text (Nav)** brings up the **Super Vertex Text** panel with the text at the first vertex of the string displayed.
The **Super Vertex Text** panel is used to set the text for any vertex of the string.



Any vertex can then be selected by clicking on the number icon at the end of the Vertex index panel field and selecting the required vertex, or by typing in its Vertex index and pressing <Enter>, or by using the **Prev** and **Next** buttons used to move to adjacent vertices until the required vertex is selected.

When the vertex to modify is selected, the vertex is highlighted on the string and its *vertex index* and vertex *text* are displayed in the appropriate panel fields in the **Super Vertex Text** panel. The new vertex text is stored by clicking either **OK** or **Apply**.

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	

if a vertex is selected, then its vertex index is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Text mode choice box no text, entire string, each vertex

*if **no text**, there is no text for the vertex.*
*if **entire string**, then the string has the same text for each vertex.*
*if **each vertex**, then each vertex has a separate text value.*

Text input text of vertex/string

the text used for the vertex.

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Continue to next section 14.4.4.5 4d - Text Info or return to 14.4.4 Edit 4d.

14.4.4.5 4d - Text Info

For a 4d super string, the size, colour, slant, offset, *etc.* of vertex text is all the same and is controlled by the *Text Style* for the 4d super string.

Selecting **Text Info** brings up the **Super Vertex Annotate** panel with the text style for the string displayed.

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Text style	text style box	string's text style	available text styles

the text style string. This can be modified to change the values for all the text on the 4d string.

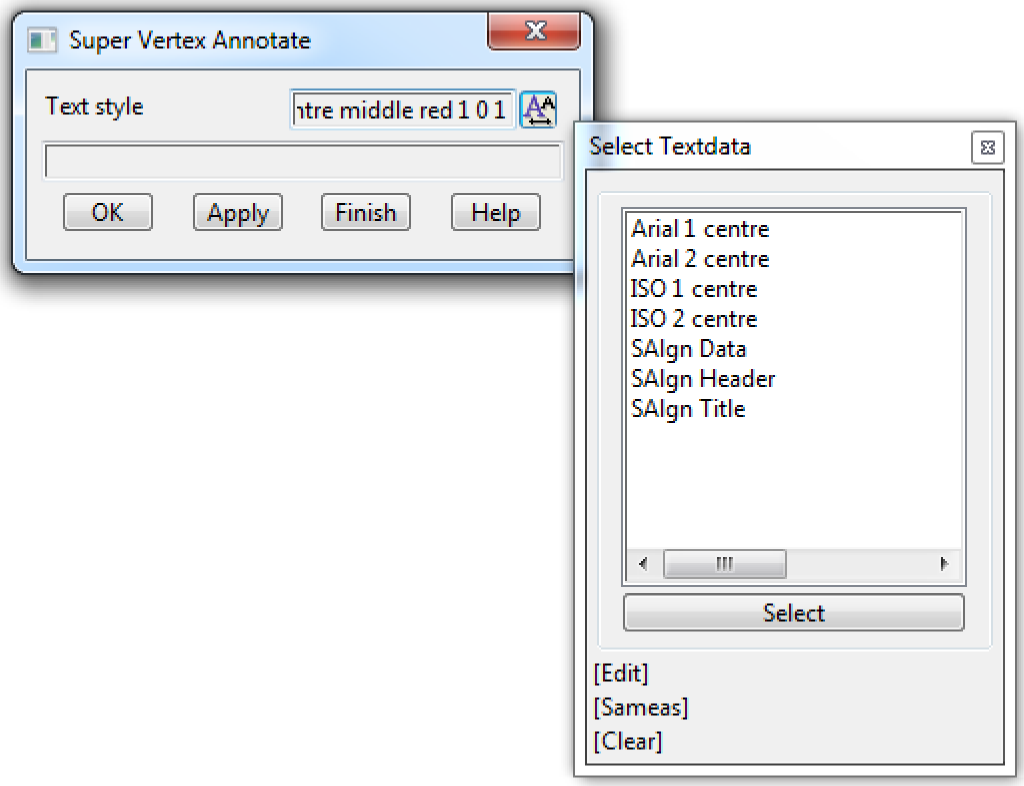
Prev	button		

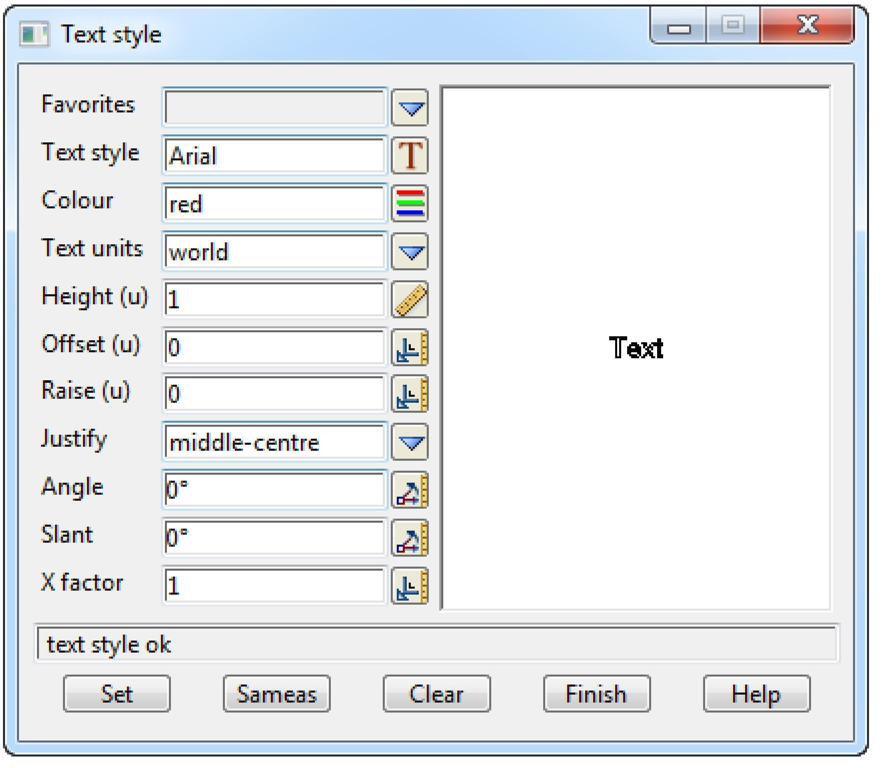
move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

OK/Apply	button		

for the string being edited, **OK** *sets the text style for the string and removes the panel.* **Apply** *sets the text style for the string and leaves the panel on the screen.*

To modify any of the values of the ***Text Style***, click on the ***Text style*** icon at the end of the Text style panel field to bring up the ***Select Textdata*** panel, and then select ***[Edit].***





To change any of the values in the **Text Style** panel:

1. Modify the value in the Text Style panel and then click on **Set** and **Finish**. The panel will then close.
2. Click on **Apply** or **OK** in the **Super Vertex Annotate** panel.

Modifying the Text Height

All the text labels in the 4d string have the same height.

The height of all the text is modified by changing the Height (u) in the *Text Style Info* for the string (see 14.4.4.5 4d - Text Info

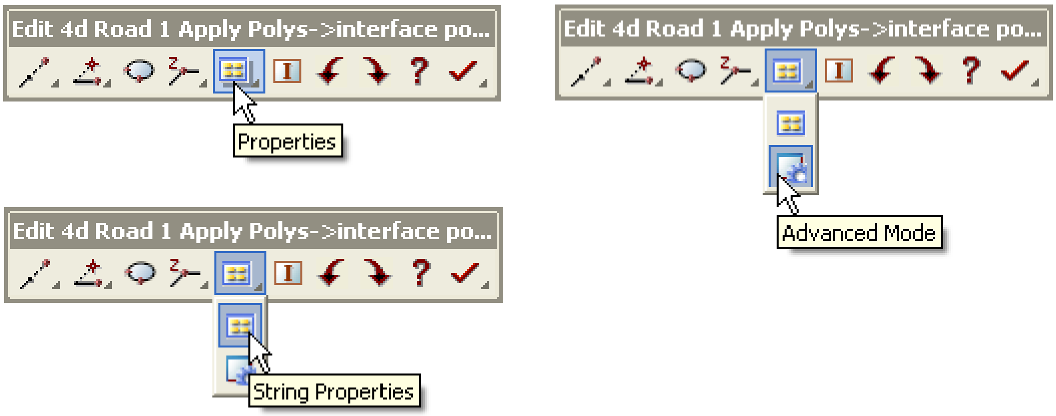
Modifying the Text Angle

All the text labels in the 4d string are drawn rotated about their defining string point with the *same* rotation angle. The angle, in degrees, is measured in a counter-clockwise direction about the horizontal axis.

The angle of all the text is modified by changing the Angle in the *Text Style Info* for the string (see 14.4.4.5 4d - Text Info).

Continue to next section 14.4.4.6 4d Properties or return to 14.4.4 Edit 4d.

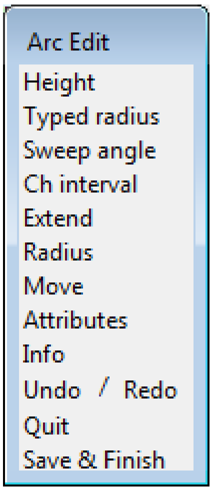
14.4.4.6 4d Properties

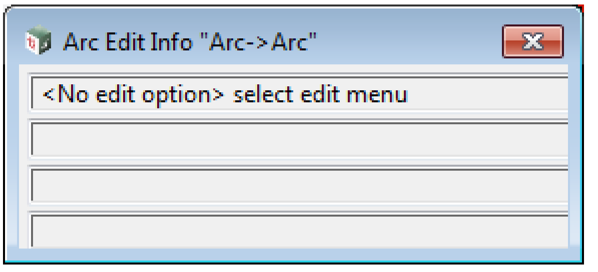


For information on the **Super String Properties** panel, go to 14.4.1.8 Properties

14.4.5 Arc Edit

On picking an Arc string, the **Arc Edit** menu and **Arc Edit Info** panel are placed on the screen.





Each option in the **arc edit** menu will now be described.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.5.1 Height

The **Height** option is used to define the z-value at the start or end point of the arc.

The z-value at any point on the arc is an interpolation on arc length of the values at the end points. Hence, the arc is an arc in plan only - in three dimensions, it is a helix.

Height is a two step process.

Step (a) - selecting the start or end point of the arc

After picking **height**, the end point of the arc whose height is to be modified is selected.

message area 1 <Height of arc>

Screen message area

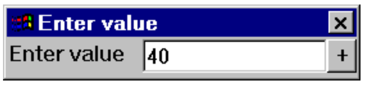
<Select point to change height> [picks][][menu]

<Select point to change height> [picks][accepts][menu]

Step (b) - entering the new height

After the start or end point of the arc is selected, an enter value typed-input box is placed on the screen with the points current height displayed in it.

The **enter value** typed-input box looks like:



The new height for the point is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **height** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **arc edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the height option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **height** option still current.

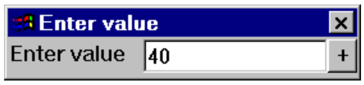
Continue to next section 14.4.5.2 Typed Radius or return to 14.4.5 Arc Edit.

14.4.5.2 Typed Radius

The **Typed radius** option is used to modify the radius of the selected arc.

After the **typed radius** option is chosen, an enter value typed-input box is placed on the screen with the arcs current radius displayed in it.

The **enter value** typed-input box looks like:



The arc radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc and the arc is redrawn with its new radius.

The typed-input box then disappears.

The **typed radius** option is automatically terminated and a new option needs to be selected from the **arc edit** menu.

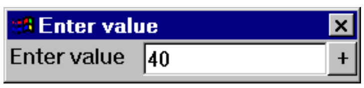
Continue to next section 14.4.5.3 Sweep Angle or return to 14.4.5 Arc Edit.

14.4.5.3 Sweep Angle

The **Sweep angle** option is used to modify the sweep angle of the selected arc.

After the **sweep angle** option is chosen, an enter value typed-input box is placed on the screen with the arcs current sweep angle displayed in it.

The **enter value** typed-input box looks like:



The arc sweep angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the sweep angle of the arc and the arc is redrawn with its new sweep angle.

The typed-input box then disappears.

The **sweep angle** option is automatically terminated and a new option needs to be selected from the **arc edit** menu.

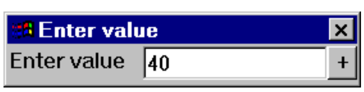
Continue to next section 14.4.5.4 Chainage Interval or return to 14.4.5 Arc Edit.

14.4.5.4 Chainage Interval

The **ch interval** option is used to modify the chainage interval of the selected arc.

After the **ch interval** option is chosen, an enter value typed-input box is placed on the screen with the arcs current chainage interval displayed in it.

The **enter value** typed-input box looks like:



The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the arc and the arc is redrawn with its new chainage interval.

The typed-input box then disappears.

The **ch interval** option is automatically terminated and a new option needs to be selected from the **arc edit** menu.

Continue to next section 14.4.5.5 Move End or return to 14.4.5 Arc Edit.

14.4.5.5 Move End

The **move end** option is used to re-position either the start or the end point of the arc.

Move end is a two step process.

Step (a) - selecting the start or end point of the arc

After selecting the **move end** option, the end point to be move is selected.

message area 1 <Move End>

Screen message area

<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the end point

After selecting the end point to move, the new position for the end point is selected.

message area 1 <Move End>

Screen message area

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

The **move end** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **arc edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the **move end** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **move end** option still current.

Continue to next section 14.4.5.6 Radius or return to 14.4.5 Arc Edit.

14.4.5.6 Radius

The **radius** option is used to change the radius of the arc by leaving the centre point alone and re-positioning a point on the arc. The new position for the point will define a new radius for the arc.

Radius is a two step process.

Step (a) - selecting the point on the arc to move

After selecting the **radius** option, the point on the arc to be moved is selected.

message area 1 <Radius>

Screen message area

<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

message area 1 <Radius>

Screen message area

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

The **radius** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **arc edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the **radius** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **radius** option still current.

Continue to next section 14.4.5.7 Move or return to 14.4.5 Arc Edit.

14.4.5.7 Move

The **Move** option is used to change the position of the entire arc by selecting and moving the arc centre or any point on the arc.

Move is a two step process.

Step (a) - selecting the point on the arc to move

After selecting the **move** option, the point on the arc to move is selected.

message area 1 <Move>

Screen message area

<Select point to move> [picks][][menu]

<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

message area 1 <Move>

Screen message area

<Select final position of point> [picks][][menu]

<Select final position of point> [picks][accepts][menu]

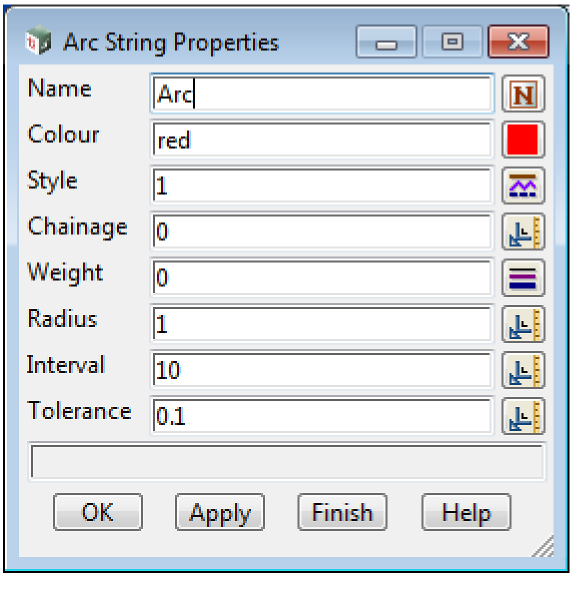
The **Move** option repeats until cancelled by the user by either bringing up the **Pick ops** menu and selecting **Cancel** or by selecting a new option from the **Arc edit** menu.

If, after bringing up the **Pick ops** menu, it is decided to continue with the **move** option, simply select the **restart** option from the **Pick ops** menu and the **Pick ops** menu will disappear leaving the **move** option still current.

Continue to next section 14.4.5.8 Properties or return to 14.4.5 Arc Edit.

14.4.5.8 Properties

Selecting **Properties** brings up the **Arc String Properties** panel which is used to modify the string's header information.



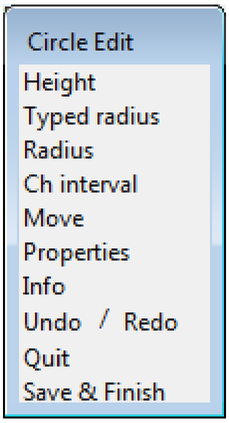
The fields in this panel are similar to those in the **create arc string** panel and the arc editor options. The only new field is

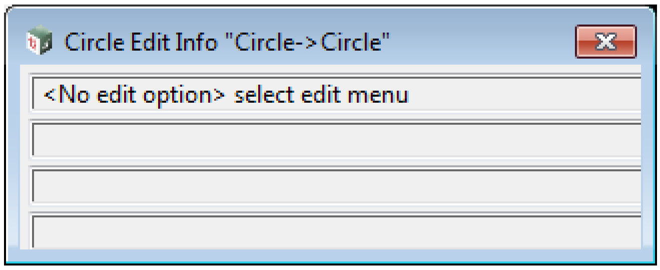
Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

14.4.6 Circle Edit

On picking a circle string, the **circle edit** menu and **circle edit info** panel are placed on the screen.





Each option in the **circle edit** menu will now be described.

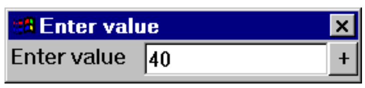
See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.6.1 Height

The **height** option is used to define the z-value for the entire circle.

After selecting the **height** option, an enter value typed-input box is placed on the screen with the circles current height displayed in it.

The enter value typed-input box looks like:



The new height for the circle is entered into the typed-input box, terminated with <enter>.

The typed-input box then disappears.

The **height** option is automatically terminated and a new option needs to be selected from the **circle edit** menu.

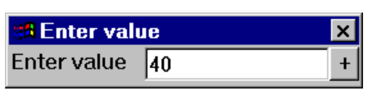
Continue to next section 14.4.6.2 Typed Radius or return to 14.4.6 Circle Edit.

14.4.6.2 Typed Radius

The **typed radius** option is used to modify the radius of the selected circle.

After the **typed radius** option is chosen, an enter value typed-input box is placed on the screen with the circles current radius displayed in it.

The enter value typed-input box looks like:



The circle radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the circle and the circle redrawn with its new radius.

The typed-input box then disappears.

The **typed radius** option is automatically terminated and a new option needs to be selected from the **circle edit** menu.

Continue to next section 14.4.6.3 Radius or return to 14.4.6 Circle Edit.

14.4.6.3 Radius

The **radius** option is used to change the radius of the circle by leaving the centre point alone and re-positioning a point on the circle. The new position for the point will define a new radius for the circle.

Radius is a two step process.

Step (a) - selecting the point on the circle to move

After selecting the **radius** option, the point on the circle to be moved is selected.

message area 1 <Radius>
Screen message area
<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

message area 1 <Radius>
Screen message area
<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

The **radius** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **circle edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the **radius** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **radius** option still current.

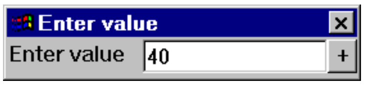
Continue to next section 14.4.6.4 Chainage Interval or return to 14.4.6 Circle Edit.

14.4.6.4 Chainage Interval

The **ch interval** option is used to modify the chainage interval of the selected circle.

After the **ch interval** option is chosen, an enter value typed-input box is placed on the screen with the circles current chainage interval displayed in it.

The enter value typed-input box looks like:



The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the circle.

The typed-input box then disappears.

The **ch interval** option is automatically terminated and a new option needs to be selected from the **circle edit** menu.

Continue to next section 14.4.6.5 Move or return to 14.4.6 Circle Edit.

14.4.6.5 Move

The **move** option is used to change the position of the entire circle by selecting and moving the circle centre or any point on the circle.

Move is a two step process.

Step (a) - selecting the point on the circle to move

After selecting the **move** option, the point on the circle to move is selected.

message area <Move>
Screen message area
<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

message area 1 <Move>
Screen message area
<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

The **move** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **circle edit** menu.

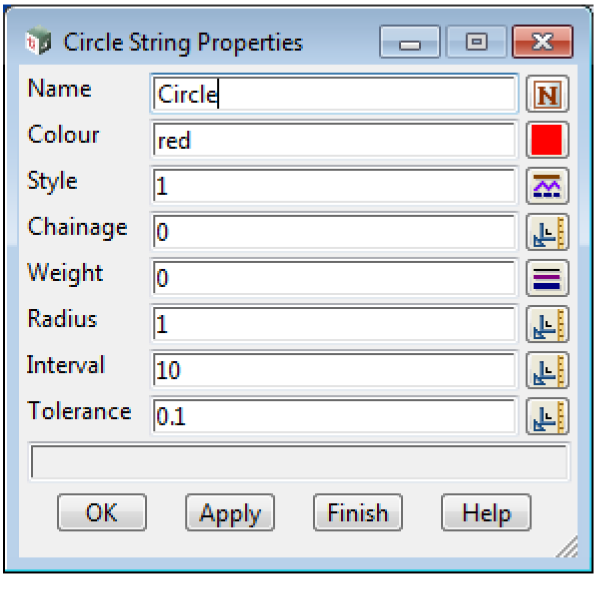
If, after bringing up the **pick ops** menu, it is decided to continue with the **move** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **move** option still current.

Note - the centre point of the circle can be selected and moved with the **move** option.

Continue to next section 14.4.6.6 Properties or return to 14.4.6 Circle Edit.

14.4.6.6 Properties

Selecting **Properties** brings up the **Circle String Properties** panel which is used to modify the string's header information.



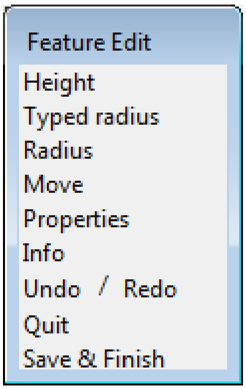
The fields in this panel are similar to those in the **create circle string** panel and the circle editor options. The only new field is

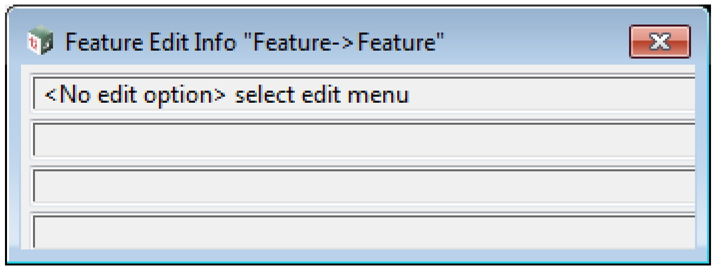
Field Description	Type	Defaults	Pop-Up
Set	button		

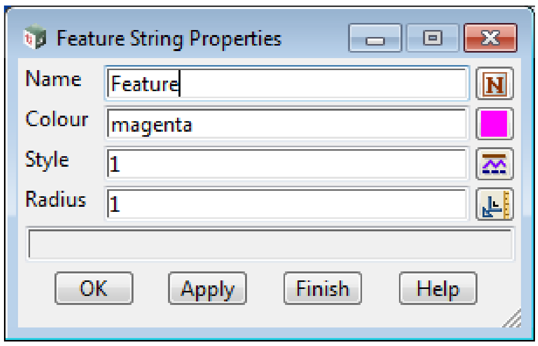
for the circle being edited, set all the items in the **circle string Properties** *panel to the values given in the panel.*

14.4.7 Feature Edit

On picking a feature string, the **Feature Edit** menu and panel are placed on the screen.







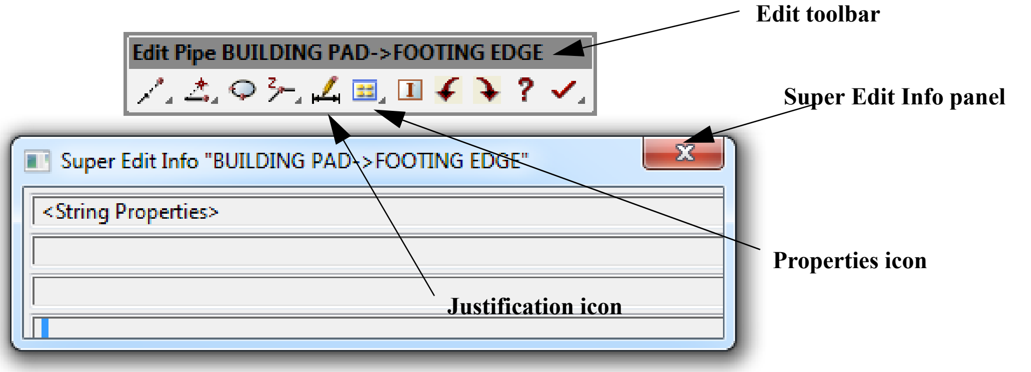
Each option in the **Feature Edit** menu is identical to those from the **circle edit** menu and will not be described again. See the section 14.4.6 Circle Edit

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.8 Edit Pipe

Position of option on menu: **Strings =>Editor**

On picking a pipe string, the **Edit Pipe** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.



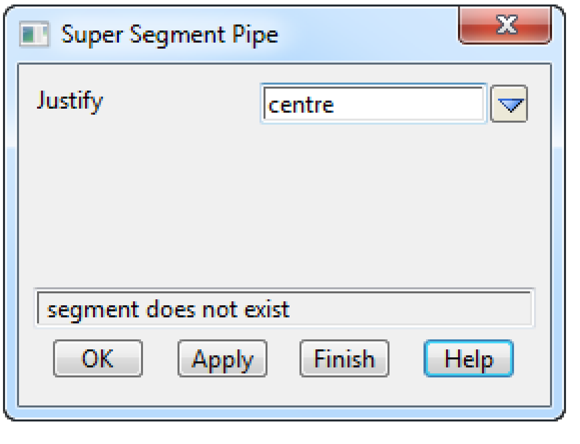
The only difference between a 3d and a pipe string is that the pipe string has a diameter.

Hence most of the options in the **pipe edit** toolbar are similar to the Edit **3d** options of the same name, and only the **Properties** option which includes **diameter** need to be discussed. See the section 14.4.3 Edit 3d for information on the Edit 3d editor.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.8.1 Pipe Justification

Selecting the **Pipe** icon brings up the **Super Segment Pipe** panel which is used to modify the string's ***pipe justification***.



Justify choice box invert, centre, obvert

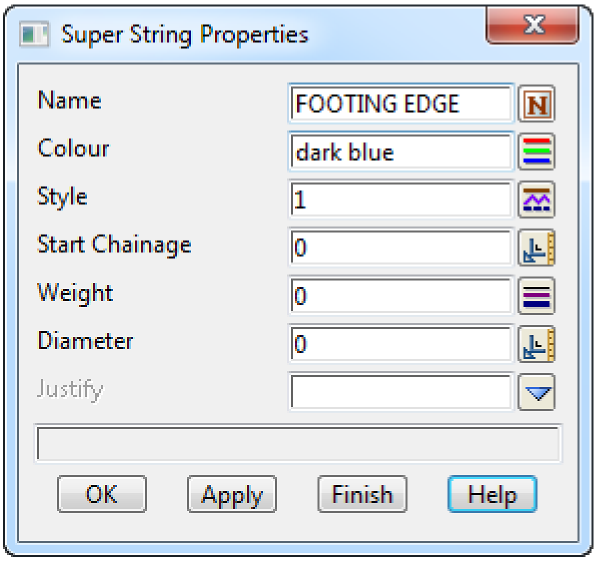
*The **Justify** field is used to modify the justification of the pipe string.*

***Note** - the default pipe string has only one justification for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own justification.*

Continue to next section 14.4.8.2 Super Pipe String Properties or return to 14.4.8 Edit Pipe.

14.4.8.2 Super Pipe String Properties

Selecting the **Properties** icon brings up the **Pipe String Properties** panel which is used to modify the string's header information, the ***pipe diameter*** and the ***pipe justification***.



The fields in this panel are similar to those in the **create pipe string** panel and the 3d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Diameter	real box		

The **diameter** *field is used to modify the diameter of the pipe string.*

Note *- the default pipe string has only one diameter for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own diameter, or can be a box culvert rather than a pipe.*

Justify	choice box		invert, centre, obvert

The **Justify** *field is used to modify the justification of the pipe string.*

Note *- the default pipe string has only one justification for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own justification.*

OK/Apply	button		

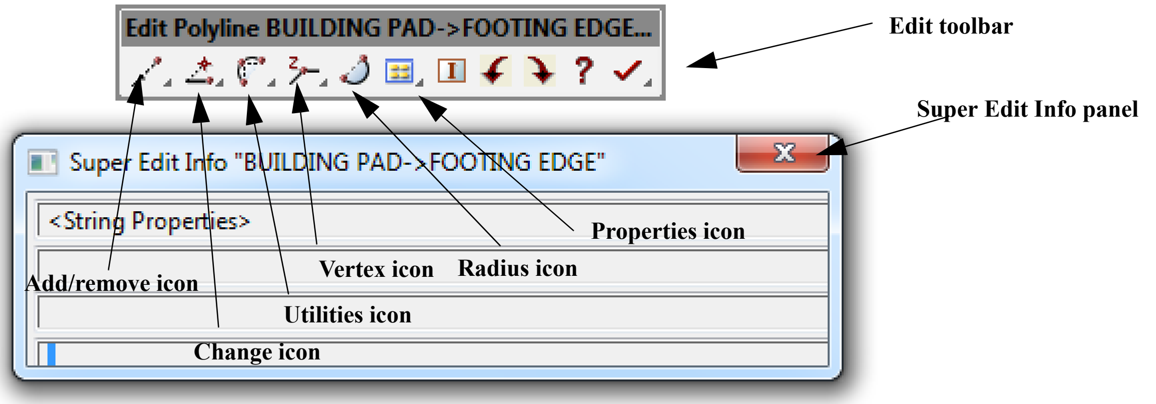
for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

14.4.9 Edit Polyline

Position of option on menu: **Strings =>Editor**

On picking a Polyline string, the **Edit Polyline** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.

On picking a polyline string, the **Polyline edit** menu and **Polyline edit info** panel are placed on the screen.



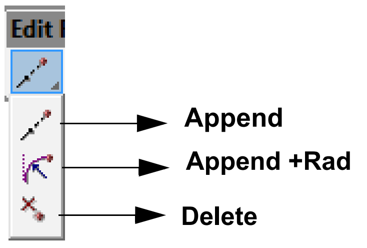
The major difference between a *polyline* and a 3d string is that a polyline string can have an arc instead of a line joining adjacent string vertices. Hence most of the options in the **Edit Polyline** toolbar are similar to the **Edit 3d** options of the same name, and only the differences for each option will be discussed. See the section 14.4.3 Edit 3d for information on the 3d string editor.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

For the option *Add/ Remove Toolbar* go to 14.4.9.1 Add/Remove Toolbar
Change Toolbar 14.4.9.2 Change Toolbar
Utilities Toolbar 14.4.9.3 Utilities Toolbar
Vertex Toolbar
Radius Toolbar 14.4.9.4 Radius
Properties Toolbar 14.4.9.5 Properties toolbar
Info Toolbar 14.4.1 Super String Edit - Common Information
Undo Toolbar 14.4.1 Super String Edit - Common Information
Redo Toolbar 14.4.1 Super String Edit - Common Information
Help Toolbar 14.4.1 Super String Edit - Common Information
Finish Toolbar 14.4.1 Super String Edit - Common Information

14.4.9.1 Add/Remove Toolbar

The **Add/remove** toolbar is



The **Append/Prepend** options allow for simply adding vertices, or adding vertices plus radii for the segments.

Append

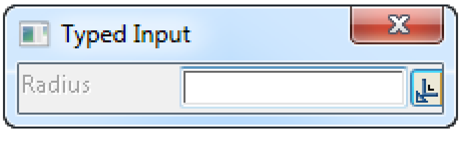
For the cases when no arc is required, the Append option simply places vertices.

Append + Radius

If an arc radius is required for every segment of the super string, there is an Append + Radius option that asks for the radius for every segment.

If the **Append** + **Radius** option is selected, then before each vertex is appended, a Radius typed-input box is placed on the screen.

The **Radius** typed-input box looks like



The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

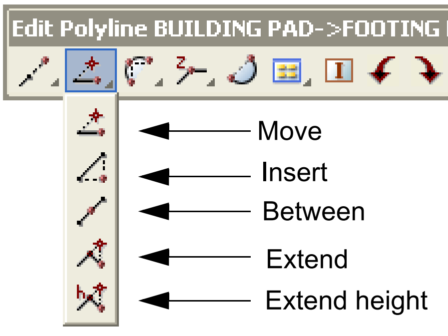
A radius value of 0 is taken to mean no arc.

The height question for each point is toggled on/off in the snaps menu just as it was for a 3d string.

The **Append** options are terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit polyline** toolbar

Go to the next section 14.4.9.2 Change Toolbar

14.4.9.2 Change Toolbar

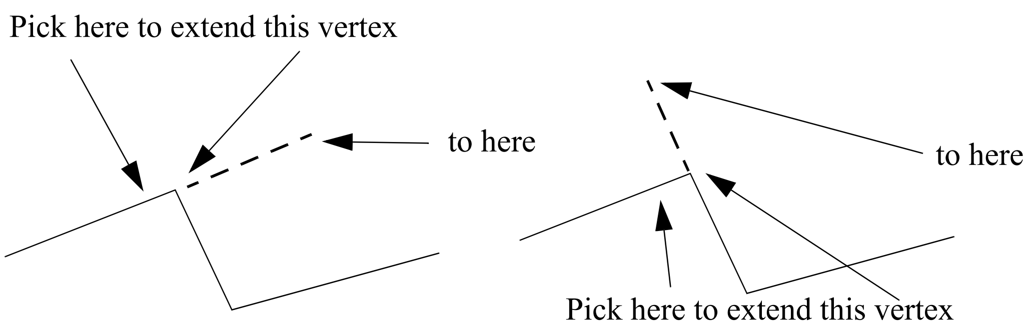


The **Extend ht** option is used to move a vertex along the line joining the vertex to its neighbouring vertex plus the z-value is interpolated from the z-values at either end of the segment.

The Move, Insert and Between options are the same as for a 3d string.

There are two **Extend** options for a polyline string - **Extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **Extend ht** where the z-value of the point being extended is linearly interpolated by the extension distance.

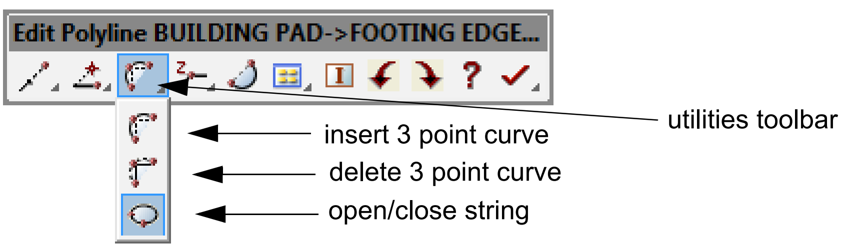
Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend. The segment to extend can be a straight or an arc segment.



Go to the next section 14.4.9.3 Utilities Toolbar

14.4.9.3 Utilities Toolbar

The **utilities** toolbar contains a number of useful miscellaneous option for the polyline string. The menu is



Each of the new options will now be discussed.

14.4.9.3.1 Ins 3 Point Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent vertices.

After selecting the option, the middle vertex of the three adjacent vertices is selected.

When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

14.4.9.3.2 Del 3 Point Curve

The **del 3 pt curve** option is used to delete the curves on either side of a vertex.

After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the vertex are effectively removed.

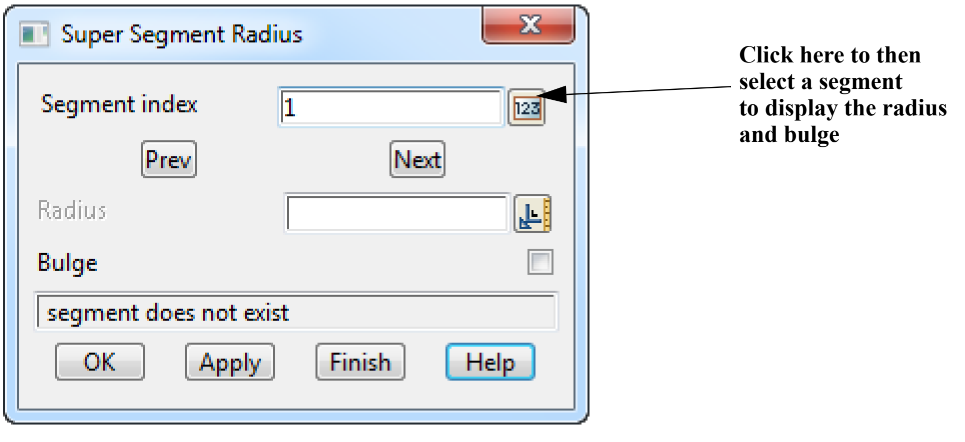
14.4.9.3.3 Open/Close

Toggles the string between being open and closed.

Go to the next section 14.4.9.4 Radius

14.4.9.4 Radius

Selecting **Radius** icon brings up the **Super Segment Radius** panel which is used to modify the radius of any arc/line joining adjacent polyline points.



The panel displays the arc radius and bulge setting for segment 1 and the next/previous buttons can be used to display the values for any segment.

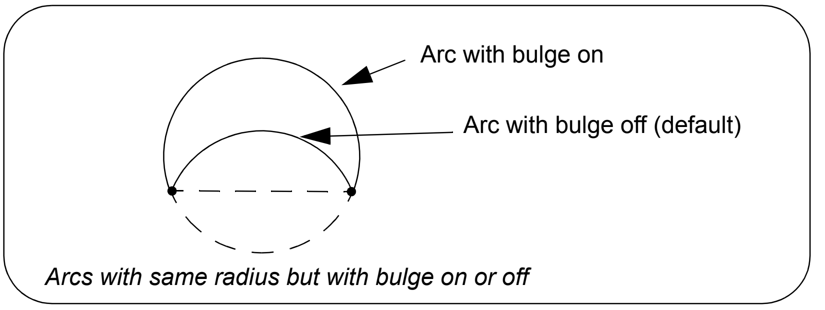
A particular segment can be selected by clicking on the value box for the Segment index field and then picking the segment. The current arc radius and bulge for the segment are displayed.

New values can then be entered into the panel field and the arc modified by selecting the **OK** or **Apply** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

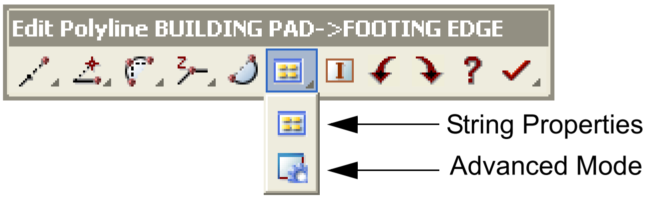
If *bulge* is ticked, the larger arc is used. The default is *bulge* turned off.

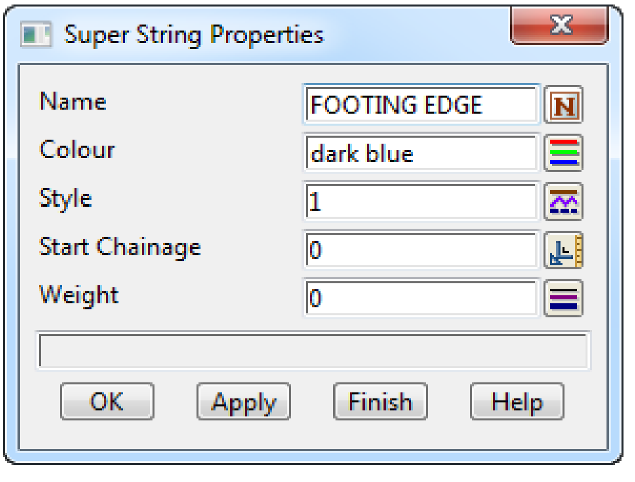


Go to the next section 14.4.9.5 Properties toolbar

14.4.9.5 Properties toolbar

Selecting the **Properties** icon brings up the **Polyline String Properties** toolbar which is used to modify the string's header information.

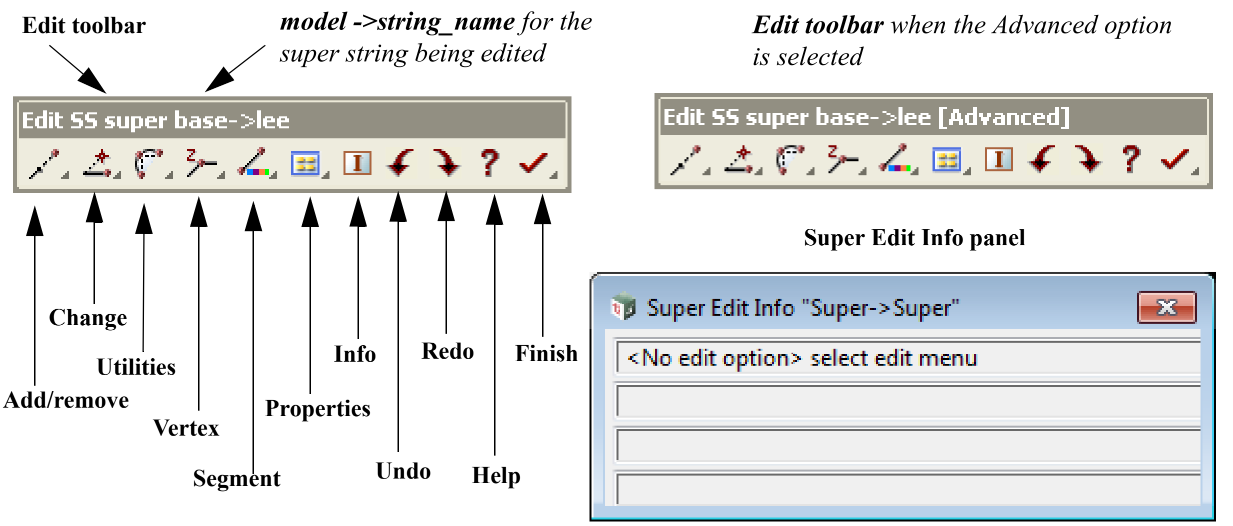




The fields in this panel are the same as for a 3d string.

14.4.10 Edit Super

On picking a super string, the **Super Edit** menu and **Super Edit Info** panel are placed on the screen.



The super string is similar to a polyline string in that it can have an arc instead of a line joining adjacent string points. Hence most of the options in the **super edit** menu are similar to the **polyline edit** options of the same name, and only the differences for each option will be discussed.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

For the option Add/ Remove Toolbar go to 14.4.10.1 Add/Remove Toolbar
Change Toolbar 14.4.10.2 Change Toolbar
Utilities Toolbar 14.4.10.3 Utilities Toolbar
Vertex Toolbar 14.4.10.4 Vertex Toolbar
Segment Toolbar 14.4.10.5 Segment Toolbar

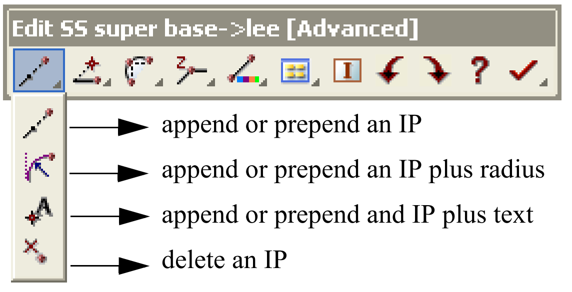
Help Toolbar 14.4.1 Super String Edit - Common Information
Finish Toolbar 14.4.1 Super String Edit - Common Information

14.4.10.1 Add/Remove Toolbar

The Add/Remove toolbar is



The **Append/Prepend** options allow for simply adding vertices, or adding a vertex plus a radius for the segment, or adding vertices and text for each vertex.

Append

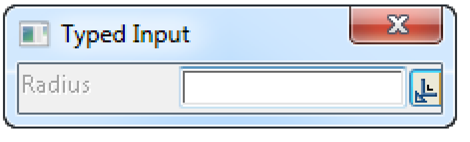
For the cases when no arc or text is required, the Append option simply places vertices.

Append + Radius

If an arc radius is required for every segment of the super string, there is an Append + Radius option that asks for the radius for every segment.

If the **Append + Radius** option is selected, then before each vertex is appended, a radius typed-input box is placed on the screen.

The radius typed-input box looks like



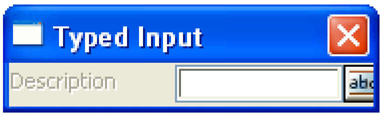
The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next super string vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A radius value of 0 is taken to mean *no arc*.

Append +Text

If text is required at every vertex of the super string, there the Append + Text option that asks for the text at every vertex.

When **Append + Text** is selected, then before each vertex is appended, a Description typed-input box is placed on the screen.



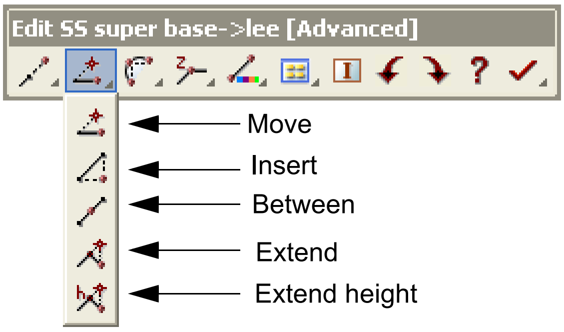
The text is entered into the typed-input box, terminated with <enter> and the entered text is taken as the vertex text,

The height question for each vertex is toggled on/off in the snaps menu just as it was for a polyline string.

The **Append** options are terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Super Edit** toolbar

Go to the next section 14.4.10.2 Change Toolbar

14.4.10.2 Change Toolbar



The **Extend ht** option is used to move a vertex along the line joining the vertex to its neighbouring vertex plus the z-value is interpolated from the z-values at either end of the segment.

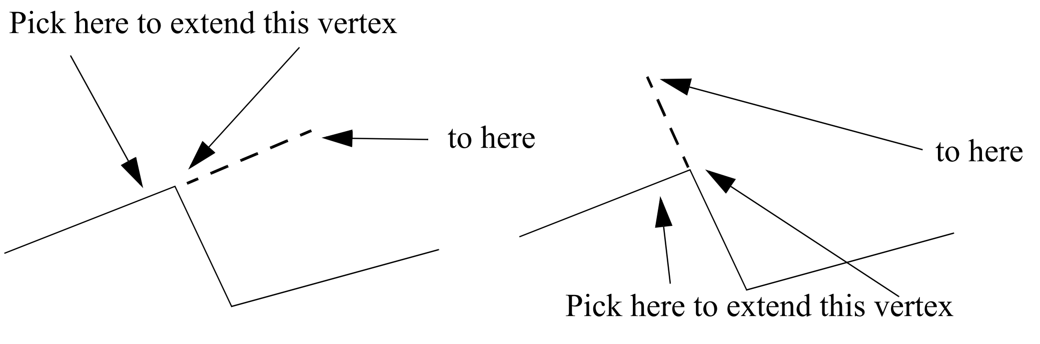
Move, Insert and Between

The **Move**, **Insert** and **Between** options are the same as for a 3d string. See

Extend and Extend Height

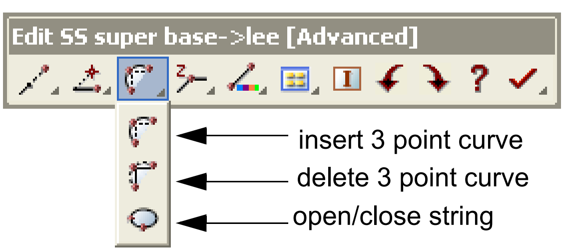
There are two **Extend** options for a super string - **Extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **Extend ht** where the z-value of the point being extended is linearly interpolated by the extension distance (either along the straight or arc segment).

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend. The segment to extend can be a straight or an arc segment.



Please continue to the next section 14.4.10.3 Utilities Toolbar.

14.4.10.3 Utilities Toolbar



Insert 3 Point Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent vertices.

After selecting the option, the middle vertex of the three adjacent vertices is selected.

When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

Delete 3 Point Curve

The **del 3 pt curve** option is used to delete the curves on either side of a vertex.

After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the vertex are effectively removed.

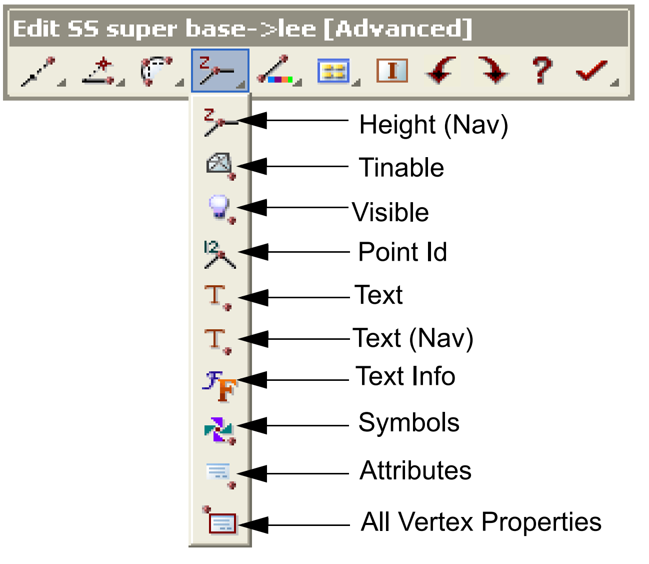
Open/Close

Toggles the string between being open and closed.

Please continue to the next section 14.4.10.4 Vertex Toolbar.

14.4.10.4 Vertex Toolbar

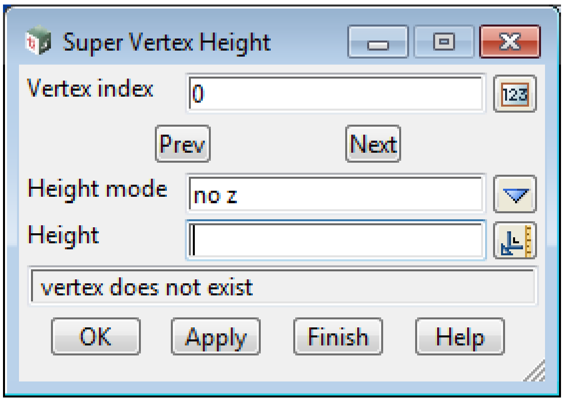
The **Vertex** toolbar contains options to modify information at any vertex of the super string.



For the option *Height (Nav)* go to	14.4.10.4.1 Height (Nav)
Tinable	14.4.10.4.2 Tinable
Visible	14.4.10.4.3 Visible
Point Id	14.4.10.4.4 Point Id
Text	14.4.10.4.5 Text
Text (Nav)	14.4.10.4.6 Text (Nav)
Text Info	14.4.10.4.7 Text Info
Symbols	14.4.10.4.8 Symbols
Attributes	14.4.10.4.9 Attributes
All vertex properties	14.4.10.4.10 All Vertex Properties

14.4.10.4.1 Height (Nav)

Selecting **Height (Nav)** brings up the **Super Vertex Height** panel which is used to set the height value for vertices.



As soon as **Height (Nav)** is chosen, the height information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *vertex number*, *height mode* and *height* are written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	number box	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field.

Prev	button		

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next	button		

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Height mode	choice box		no z, entire string, each vertex

*if **no z**, there is no z value for the vertex.*
*if **entire string**, then the string has the same z value for each vertex.*
*if **each vertex**, then each vertex has a separate z value.*

Height	input	height of vertex/string	

the height used for the vertex or for the entire string.

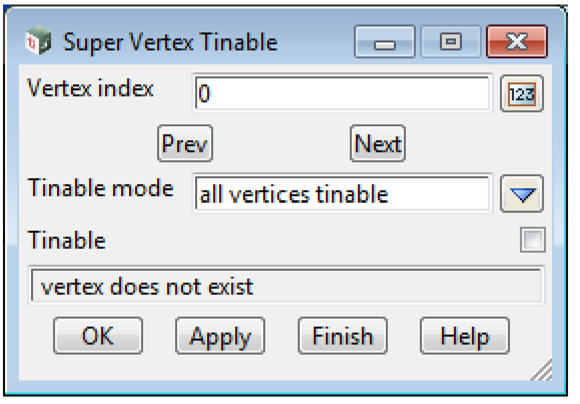
OK/Apply	button		

for the vertex being edited, **OK** *sets the vertex with the values in the panel fields and removes the panel.* **Apply** *sets the vertex with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.4.2 Tinable

14.4.10.4.2 Tinable

Selecting **Tinable** brings up the **Super Vertex Tinable** panel which is used to set the tinability information for vertices.



As soon as **Tinable** is chosen, the tinability information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *tinability* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Tinable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex Index	number box	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field.

Prev	button		

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next	button		

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Tinable mode	choice box		all vertices tinable all vertices not tinable each vertex

*if **all vertices tinable**, all vertices are included in a triangulation.*
*if **all vertices not tinable**, no vertices are included in a triangulation.*
*if **each vertex**, then each vertex has a separate tinability value.*

Tinable	tick box		

*if **ticked**, the vertex is tinable. That is, it is included in tins.*
*if **not ticked**, then the vertex is ignored when triangulating.*

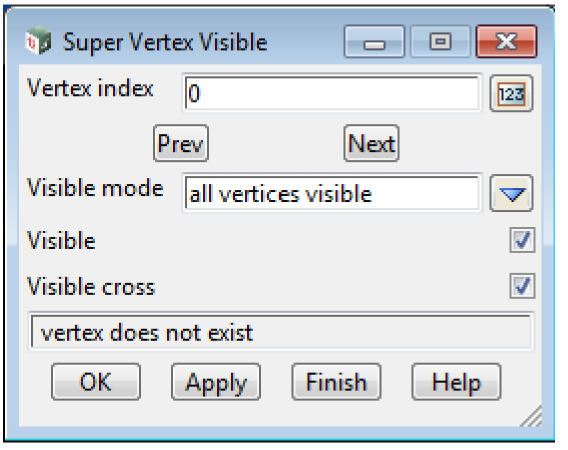
OK/Apply	button		

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.4.3 Visible

14.4.10.4.3 Visible

Selecting **Visible** brings up the **Super Vertex Visible** panel which is used to set the visibility flag for vertices.



As soon as **Visible** is chosen, the visibility information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *visibility* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	number box	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field.

Prev button

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Visible mode choice box — all vertices visible / visibility for entire string / visibility for each vertex

*if **all vertices visible**, all vertices are visible.*
*if **visibility for the entire string**, the* Visible *and* Visible cross *setting is used for all vertices in the string.*
*if **visibility each vertex**, then each vertex has its own* Visible *and* Visible cross *setting.*

Visible tick box

*if **ticked**, the vertex is visible.*
*if **not ticked**, then the vertex is invisible.*

Visible cross tick box

*if **ticked**, when it is a point string, a cross is drawn at each vertex.*
*if **not ticked**, when it is a point string, no cross is drawn at each vertex.*

***Note** - this is important when there is a symbol at the vertex. In that case, the vertex needs to be visible so that the symbol is drawn, but the standard cross drawn at vertices is not wanted.*

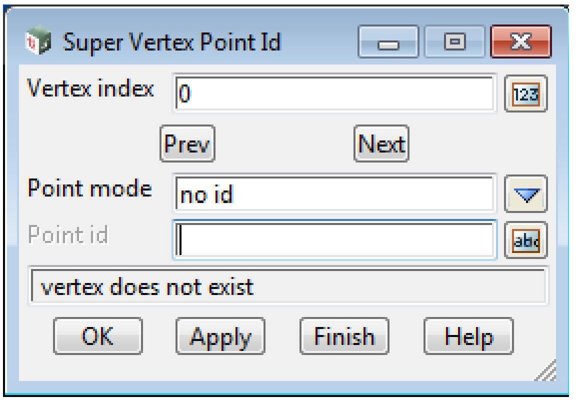
OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.4.4 Point Id

14.4.10.4.4 Point Id

Selecting **Point Id** brings up the **Super Vertex Point Id** panel which is used to set the point IDs for vertices.



As soon as **Point Id** is chosen, the Point id information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *Point id* information written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Point Id** panel have the following functions.

Field Description Type Defaults Pop-Up

Vertex index number box selected vertex

if a vertex is selected, then its vertex number is displayed in this field.

Prev button

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Point id mode choice box no ids, each vertex

*if **no ids**, there are no Point ids for any vertex.*
*if **each vertex**, then each vertex has a Point id.*

Point id text box point id of vertex

the point id for the vertex.

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the* *panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.4.5 Text

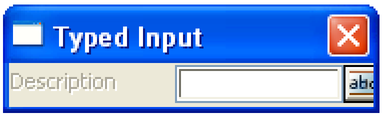
14.4.10.4.5 Text

As soon as **Text** is chosen, the Vertex Select is running and the message

<Pick vertex to set text> [Picks][Accept][Menu]

is displayed in the screen message area.

The vertex to have its text modified is then selected and the Description typed-input box is displayed on the screen with the current text for the vertex in it.

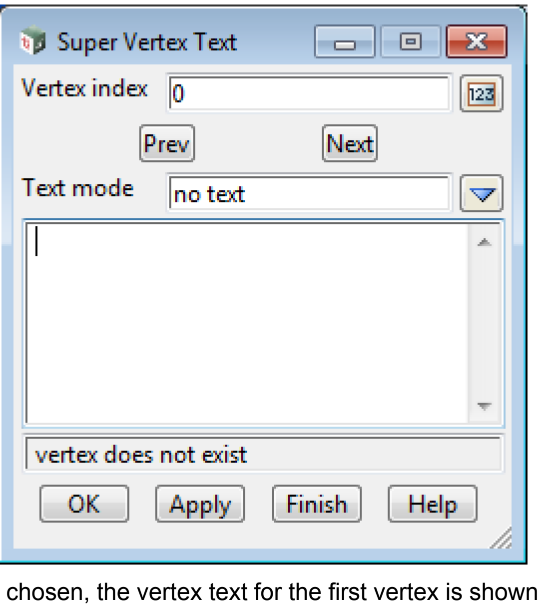


To modify the vertex text, type the new text into the Description typed-input box, finishing with <enter> and the vertex text is updated and the typed-input box.

Please continue to the next section 14.4.10.4.6 Text (Nav)

14.4.10.4.6 Text (Nav)

Selecting **Text (Nav)** brings up the **Super Vertex Text** panel which is used to set the text for vertices.



As soon as **Text (Nav)** is chosen, the vertex text for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its vertex *text* is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Vertex Index input selected vertex

if a vertex is selected, then its vertex number is displayed in this field.

Prev button

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Text mode input no text, entire string, each vertex

*if **no text**, there is no text for any vertex.*
*if **entire string**, then the string has the same text for each vertex.*
*if **each vertex**, then each vertex has a separate text value.*

Text input text of vertex/string

the text used for the vertex or for the entire string.

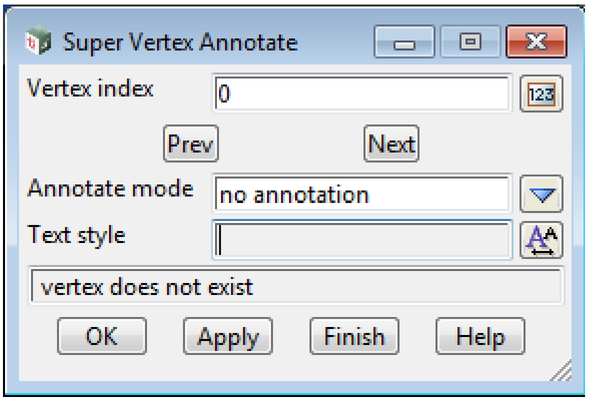
OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.4.7 Text Info

14.4.10.4.7 Text Info

Selecting **Text info** brings up the **Super Vertex Annotate** panel which is used to set the annotation styles for the text at vertices.



As soon as **Text info** is chosen, the text annotation information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *text annotation* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex Index	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field.

Prev	button		

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next	button		

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Annotate mode	input		no annotation, entire string, each vertex

*if **no annotation**, then the text at the vertex is **not** displayed.*
*if **entire string**, then the same annotation settings are used for each vertex.*
*if **each vertex**, then each vertex has separate annotations settings.*

Text style	input	1	available text styles

text annotation for the text at the vertex.

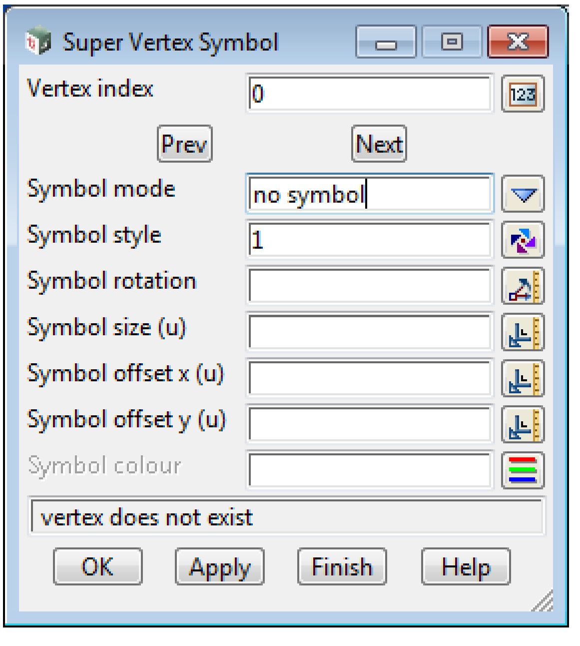
OK/Apply	button		

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.4.8 Symbols

14.4.10.4.8 Symbols

Selecting **Symbols** brings up the **Super Vertex Symbol** panel which is used to set symbols and their display parameters at vertices.



As soon as **Symbols** is chosen, the symbol annotation information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *symbol* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Symbol** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field.

Prev button

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Symbol mode input no symbol, entire string, each vertex

*if **no symbol**, then there is no symbol at any vertex.*
*if **entire string**, then the same symbol and settings are used for each vertex.*
*if **each vertex**, then each vertex has separate symbols and settings.*

Symbol style symbol box 1 available symbols

symbol at the vertex

Symbol rotation angle box

rotation angle of the symbol (measured from the positive x-axis in the counter-clockwise direction).

Symbol size (u) real box

size of the symbol (in units for the symbol).

Symbol offset x (u) real box 0

distance (in units for the symbol) to offset the symbol in the x direction from its (x,y) placement position.

Symbol offset y (u) real box 0

distance (in units for the symbol) to offset the symbol in the y direction from its (x,y) placement position.

Symbol colour input available colours

colour of the symbol if none is defined in the symbol definition

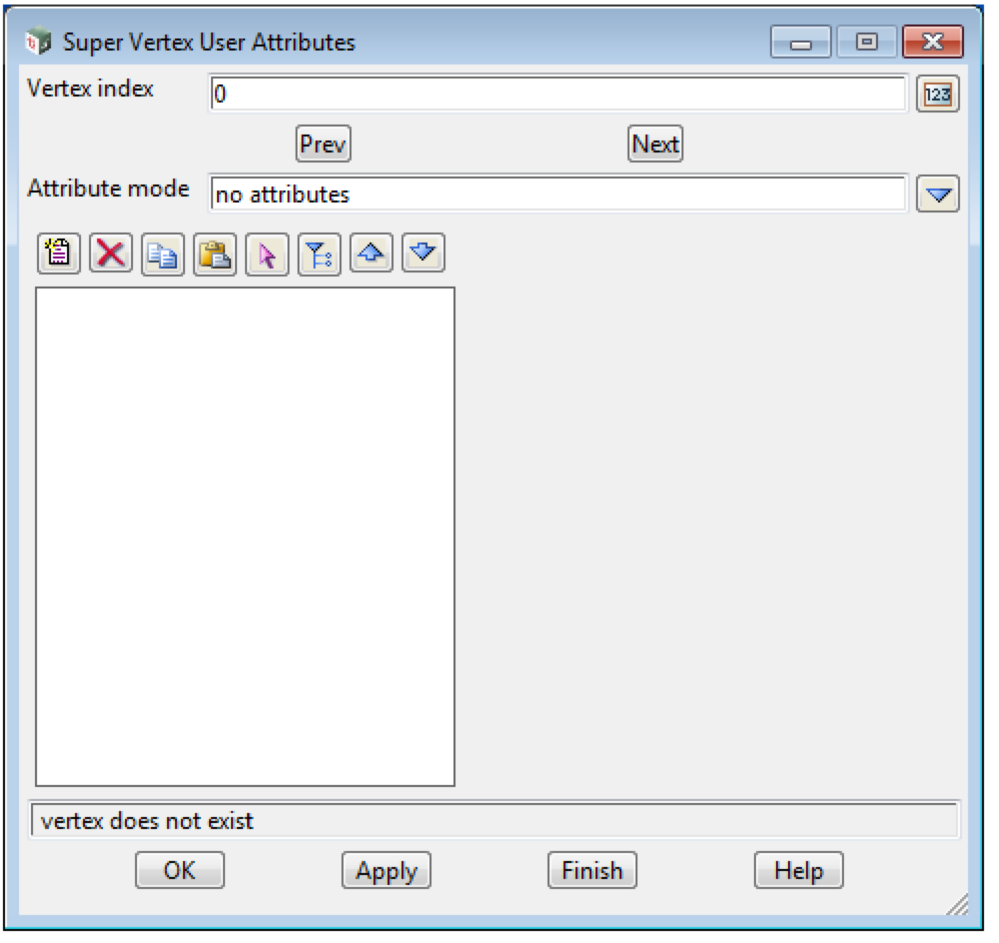
OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.4.9 Attributes

14.4.10.4.9 Attributes

Selecting **Attributes** brings up the **Super Vertex User Attributes** panel which is used to display and edit user defined attributes at vertices of the super string.



As soon as **Attribute** is chosen, the attribute information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *attribute* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field.

Prev	button		

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next	button		

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Attribute mode	choice box		no attributes, each vertex

*if **no attributes**, then no vertices have user attributes.*

*if **each vertex**, then each vertex can have user attributes.*

Name/Type/Data Grid

Name input

name for the user attribute. This must be unique for all attributes at this vertex.

Type choice box integer, real, text

type of the attribute.

Data input

value for the attribute.

OK/Apply button

for the vertex being edited, **OK** *sets the vertex with the values in the panel fields and removes the panel.* **Apply** *sets the vertex with the values in the panel fields and leaves the panel on the screen.*

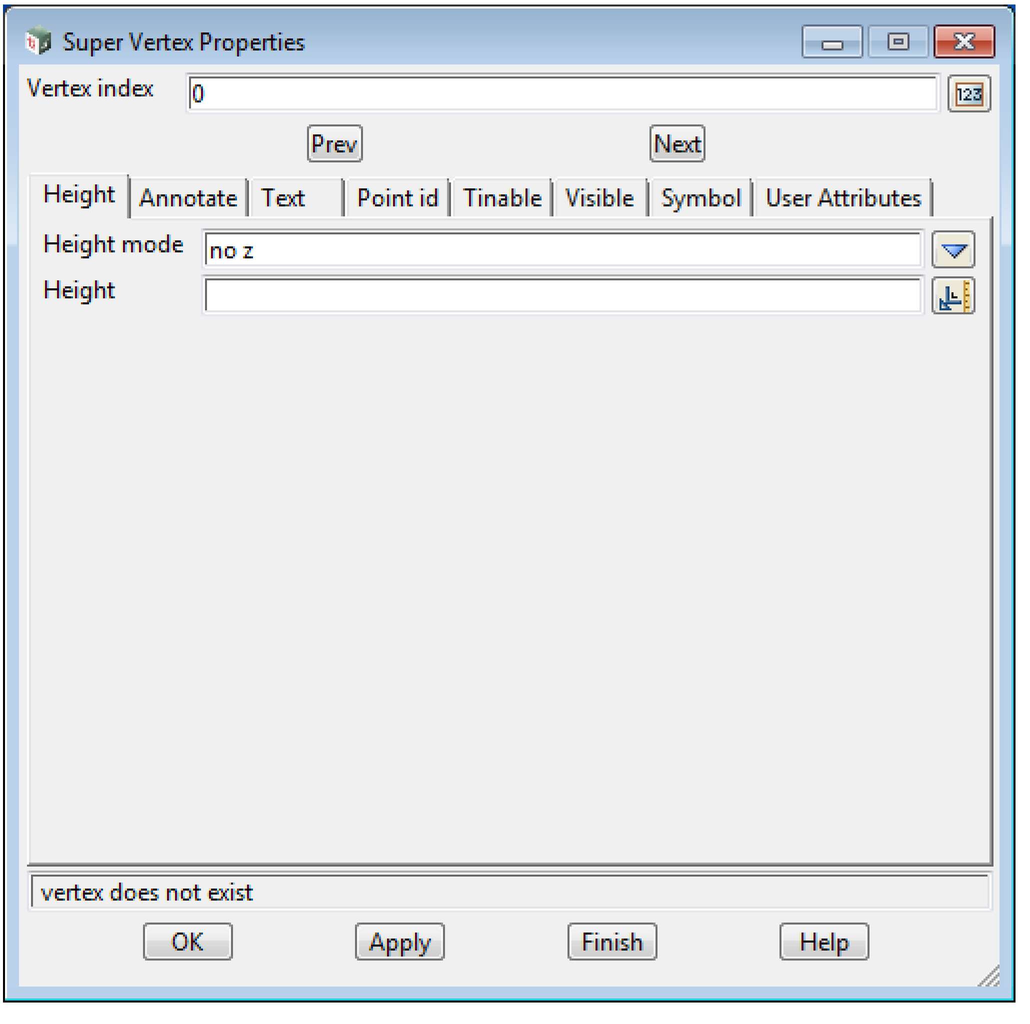
Please continue to the next section 14.4.10.4.10 All Vertex Properties

14.4.10.4.10 All Vertex Properties

Selecting **All properties** brings up the **Super Vertex Properties** panel which is used to display all the properties for a vertex.

This option is also available from the *Strings* menu

Position of option on menu: **Strings =>Properties =>Vertex (all)**



As soon as **All vertex properties** is chosen, the height information for the first segment is shown in the panel. Clicking on the various tabs will show the various vertex information for the first vertex.

A particular vertex can be selected by first clicking on the icon at the end of the Vertex index field, and then selecting the required vertex, or by typing a number into the Vertex index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *attribute* information is written to the appropriate tabs and panel fields.

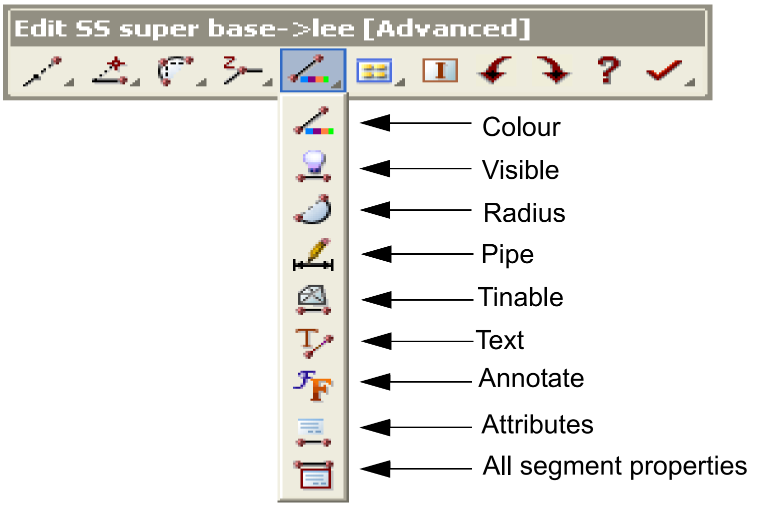
If any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields in each of the tabs for the **Super Vertex Properties** panel have already been described in the other options on the Vertex Toolbar. See 14.4.10.4 Vertex Toolbar.

For information on the Segment Toolbar, please continue to the next section 14.4.10.5 Segment Toolbar.

14.4.10.5 Segment Toolbar

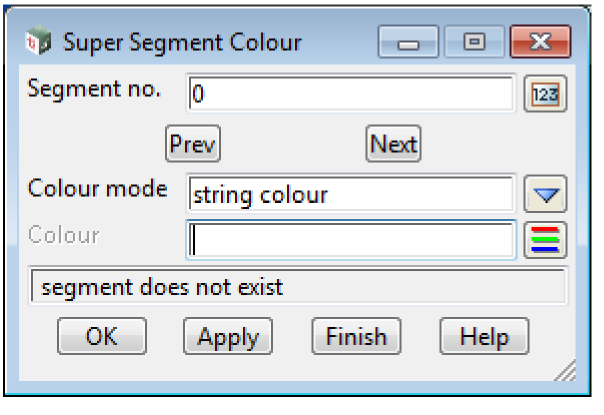
The **Segment** toolbar contains options to modify information at any segment of the super string.



For the option *Colour* go to	14.4.10.5.1 Colour
Visible	14.4.10.5.2 Visible
Radius	14.4.10.5.3 Radius
Pipe	14.4.10.5.4 Pipe
Tinable	14.4.10.5.5 Tinable
Text	14.4.10.5.6 Text
Annotate	14.4.10.5.7 Annotate
Attributes	14.4.10.5.8 Attributes
All segment properties	14.4.10.5.9 All Segment Properties

14.4.10.5.1 Colour

Selecting **Colour** brings up the **Super Segment Colour** panel which is used to set the colour of the string segments.



As soon as **Colour** is chosen, the colour information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *colour* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Colour** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	

if a segment is selected, then its segment index is displayed in this field.

Prev	button		

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next	button		

move to the next segment (successor). The information for the next new is displayed in the panel fields.

Colour mode	choice box		string colour, each segment

*if **string colour**, then all the segments in the string have the same colour.*
*If **each segment**, then each segment has a separate colour.*

Colour	colour box	colour of segment/string	available colours

the colour used for the segment or for the entire string.

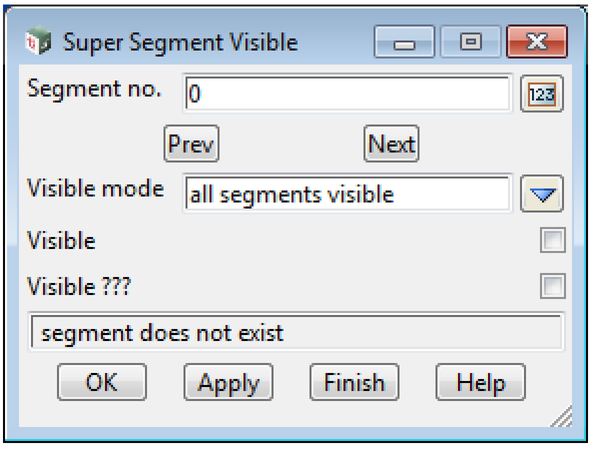
OK/Apply	button		

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.5.2 Visible

14.4.10.5.2 Visible

Selecting **Visible** brings up the **Super Segment Visible** panel which is used to set the visibility flag for segments.



As soon as **Visible** is chosen, the visibility information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *visibility* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	

if a segment is selected, then its segment index is displayed in this field.

Prev button

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next new is displayed in the panel fields.

Visible mode choice box — all segments visible / visibility for entire string / visibility for each segment

*if **all segments visible**, all segments are visible.*
*if **visibility for the entire string**, the* Visible *and* Visible ??? *setting is used for all vertices in the string.*
*if **visibility each segment**, then each vertex has its own* Visible *and* Visible ??? *setting.*

Visible tick box

*if **ticked**, the segment is visible.*
*if **not ticked**, then the segment is invisible.*

Visible??? tick box

*if **ticked**,*
*if **not ticked**,.*

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.5.3 Radius

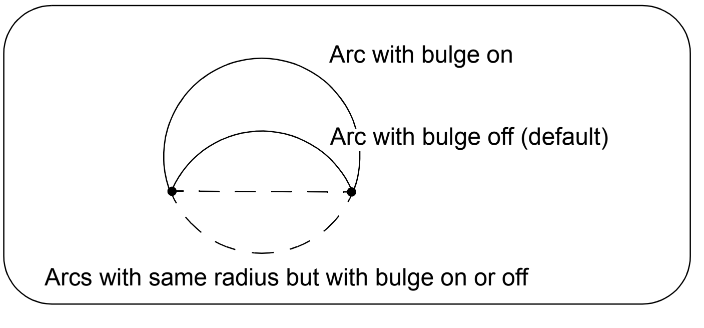
14.4.10.5.3 Radius

When viewed in plan, the segments of a super string can be joined by string lines or arcs.
If the radius is positive, the arc is drawn from the start vertex to the end vertex of the segment in a clockwise direction. If the radius is negative, the arc is drawn from the start vertex to the end vertex on the segment in a counter-clockwise direction.

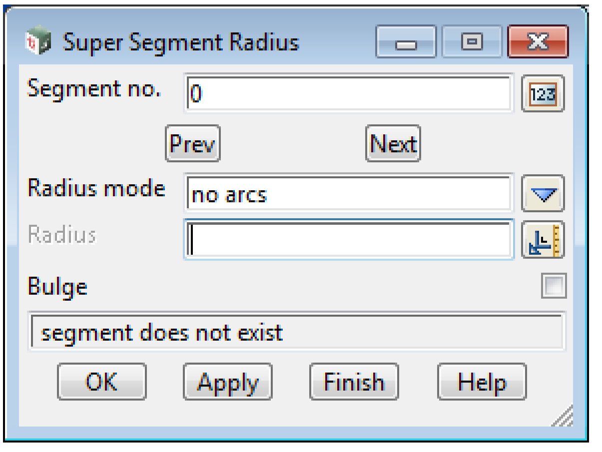
For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned *on*, the larger arc is used. The default is bulge turned off.

A zero radius is interpreted to be a just a straight line segment with no arc.



Selecting **Radius** brings up the **Super Segment Radius** panel which is used to set the plan radius of the segment.



As soon as **Radius** is chosen, the radius information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *radius* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	

if a segment is selected, then its segment index is displayed in this field.

Prev	button		

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next	button		

move to the next segment (successor). The information for the new segment is displayed in the panel fields.

Radius mode	choice box		no arcs, each segment

*if **no arcs**, then no segments have a diameter (that is, they are all line segments).*
*If **each segment**, then each segment has a radius.*

Radius	real box	0	

radius of the segment arc. A radius of 0 mean no arc.

Bulge	tick box		

*if **ticked**, the larger arc is used.*
if not-ticked, the smaller arc is used.

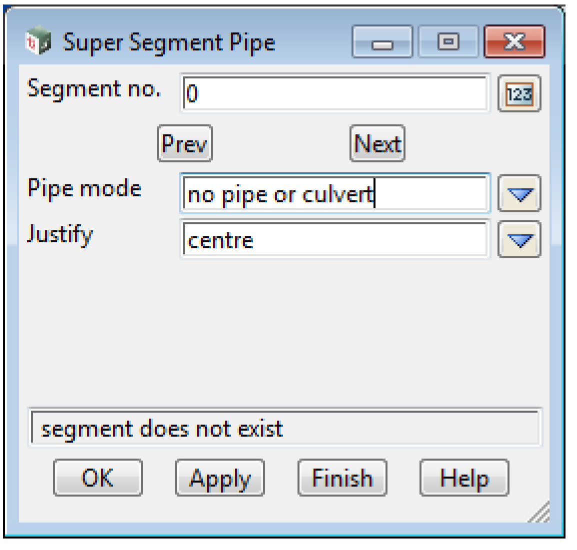
OK/Apply	button		

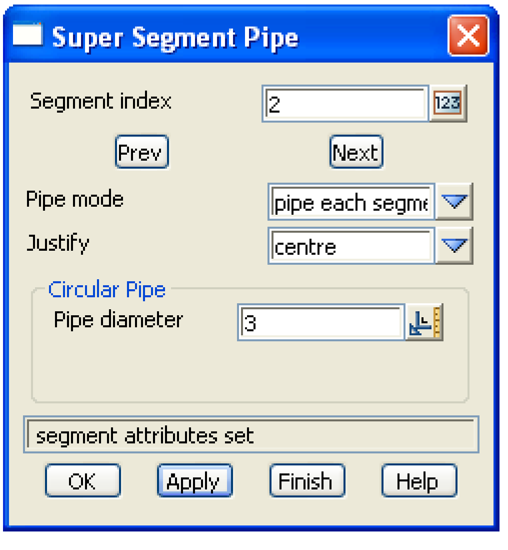
for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

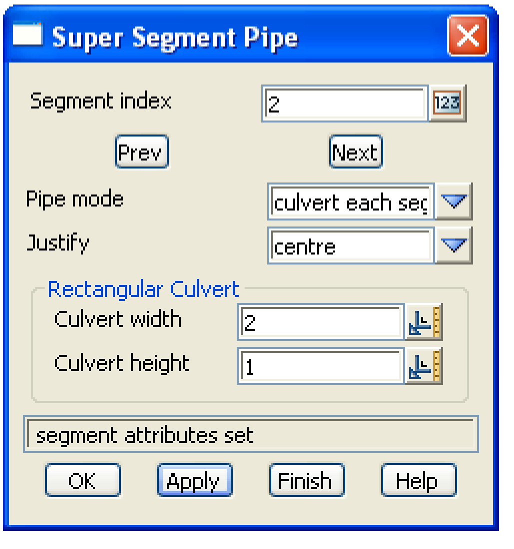
Please continue to the next section 14.4.10.5.4 Pipe

14.4.10.5.4 Pipe

The segments of a super string can have either a pipe or box cross section, or none.
Selecting **Pipe** brings up the **Super Segment Pipe** panel which is used to set the pipe mode and size for the string segments.







As soon as **Pipe** is chosen, the pipe information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *pipe* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Pipe** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	

if a segment is selected, then its segment index is displayed in this field.

Prev button

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the new segment is displayed in the panel fields.

Pipe mode choice box — no pipe or culvert, pipe entire string, pipe each segment, culvert entire string, culvert each segment

*if **no pipe or culvert**, there is no pipe or culvert for the segment.*
*If **pipe entire string**, then all the segments in the string are pipes and have the same diameter.*
*If **pipe each segment**, then each segment is a pipe and can have a different diameter.*
*If **culvert entire string**, then all the segments in the string are culverts and have the same width and height.*
*If **culvert each segment**, then each segment is a culvert and can have a different width and height.*

Justify choice box — invert, centre, overt

justification of the pipe/culvert with respect to the co-ordinates given for the vertices of the super string.

Pipe diameter real box

diameter of the pipe in world units.

Culvert width real box

width of the culvert section in world units.

Culvert height real box

height of the culvert section in world units.

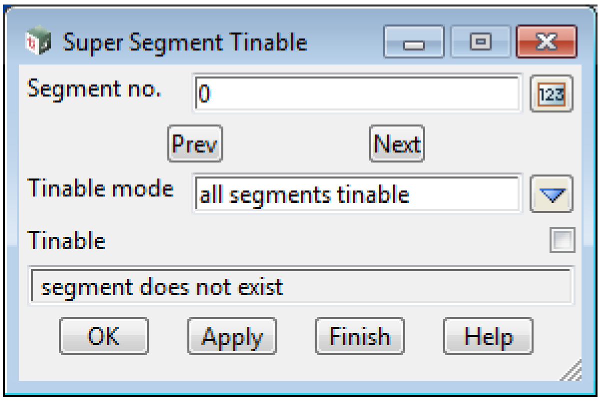
OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.5.5 Tinable

14.4.10.5.5 Tinable

Selecting **Segment=>Tinable** brings up the **Super Segment Tinable** panel which is used to set the tinable flag for segments.



As soon as **Tinable** is chosen, the tinability information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *tinability* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Tinable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	

if a segment is selected, then its segment index is displayed in this field.

Prev	button		

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next	button		

move to the next segment (successor). The information for the next new is displayed in the panel fields.

Tinable mode	choice box		all segments tinable all segments not tinable each segment

*if **all segments tinable**, all segments are included as break lines in a triangulation.*
*if **all segments not tinable**, no segments are included as break lines in a triangulation.*
*if **each segment**, then each segment has a separate tinability value.*

Tinable	tick box		

*if **ticked**, the segment is used as a break line in a triangulation. That is, the triangulation process tries to preserve the segment as a side of a triangle in the tin.*
*if **not ticked**, then the segment is used as a break line when triangulating.*

***Note** - for a tinable segment to be used as a breakline, the vertex at the segment ends must also be tinable.*

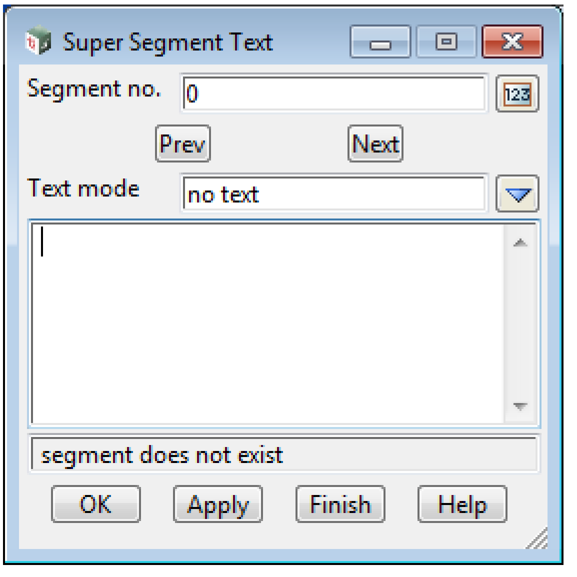
OK/Apply	button		

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.5.6 Text

14.4.10.5.6 Text

Selecting **Segment=>Text** brings up the **Super Segment Text** panel which is used to set the text for segments.



As soon as **Text** is chosen, the segment text for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *segment text* is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	

if a segment is selected, then its segment index is displayed in this field.

Prev	button		

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next	button		

move to the next segment (successor). The information for the next new is displayed in the panel fields.

Text mode	choice box		no text, entire string, each segment

*if **no text**, there is no text for the segment.*
*if **entire string**, then the string has the same text for each segment.*
*if **each segment**, then each segment has a separate text value.*

Text	text box	text of segment/string	

the text used for the segment or for the entire string.

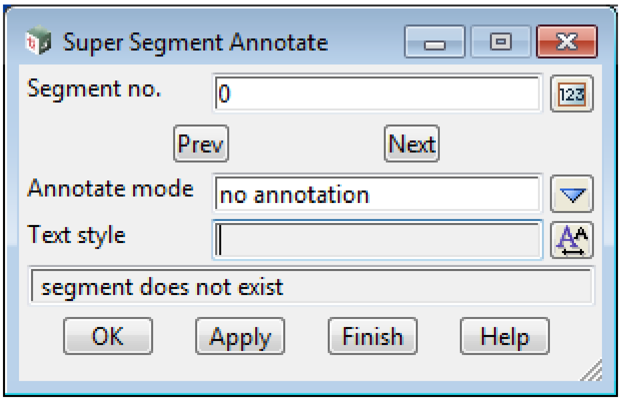
OK/Apply	button		

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.5.7 Annotate

14.4.10.5.7 Annotate

Selecting **Annotate** brings up the **Super Segment Annotate** panel which is used to set the annotation styles for the text at segments.



As soon as **Annotate** is chosen, the annotation information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *annotation* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Annotate** panel have the following functions.

Field Description Type Defaults Pop-Up

Segment index number box selected vertex

if a segment is selected, then its segment index is displayed in this field.

Prev button

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the new segment is displayed in the panel fields.

Annotate mode choice box no annotation, entire string, each segment

if ***no annotation****, then the text at the segment is not displayed.*
if ***entire string****, then the same annotation settings are used all each segments and the Text style information is given in the* Text style *field.*
if ***each segment****, then each segment has separate annotations settings and the Text style information for each segment is given in the* Text style *field.*

Text style textstyle data box

textstyle information.

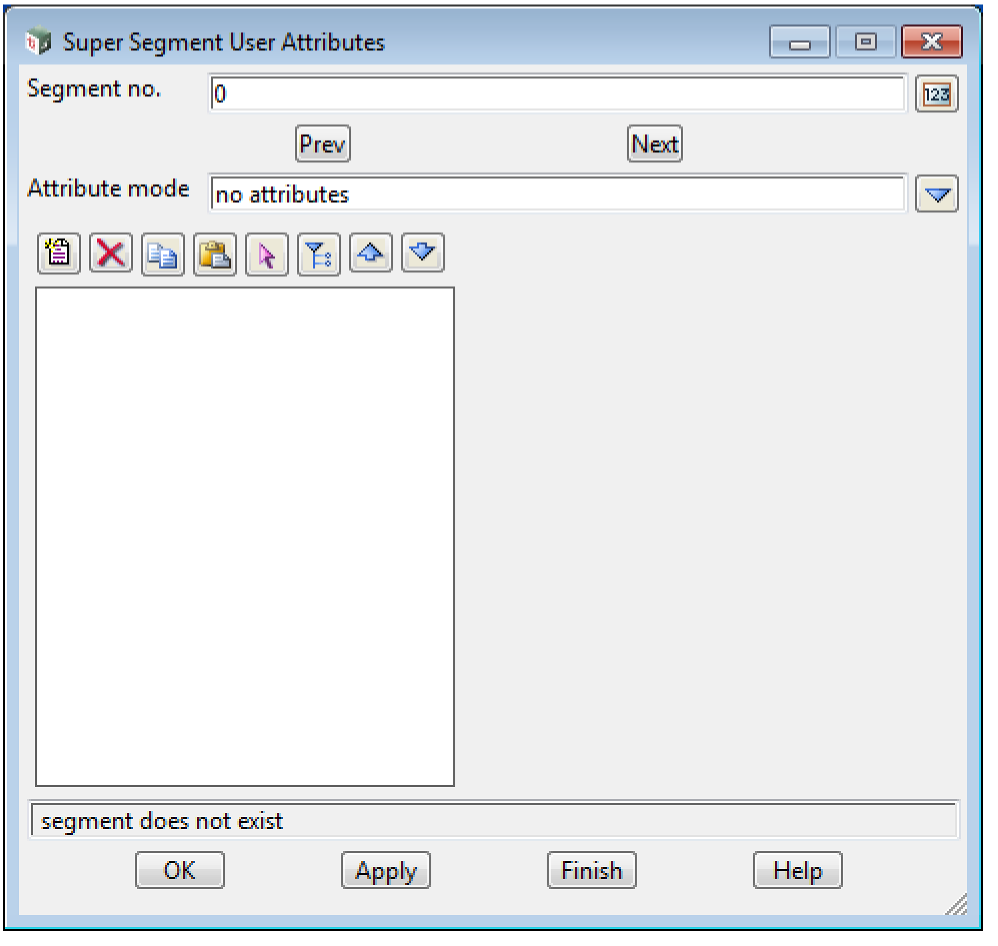
OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section 14.4.10.5.8 Attributes.

14.4.10.5.8 Attributes

Selecting **Attributes** brings up the **Super Segment User Attributes** panel which is used to display and edit user defined attributes at segments of the super string.



As soon as **Attributes** is chosen, the attributes for the first segment are shown.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment, or by typing a number into the Segment index field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *attribute* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	

if a segment is selected, then its segment index is displayed in this field.

Prev button

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the new segment is displayed in the panel fields.

Attribute mode choice box no attributes, each segment

*if **no attributes**, then no segments have user attributes.*
*if **each segment**, then each segment can have user attributes.*

Name/Type/Data Grid

Name input

name for the user attribute. This must be unique for all attributes at this segment.

Type choice box integer, real, text

type of the attribute.

Data Grid grid

values for the attributes.

OK/Apply button

for the segment being edited, **OK** *sets the segment with the values in the panel fields and removes the panel.* **Apply** *sets the segment with the values in the panel fields and leaves the panel on the screen.*

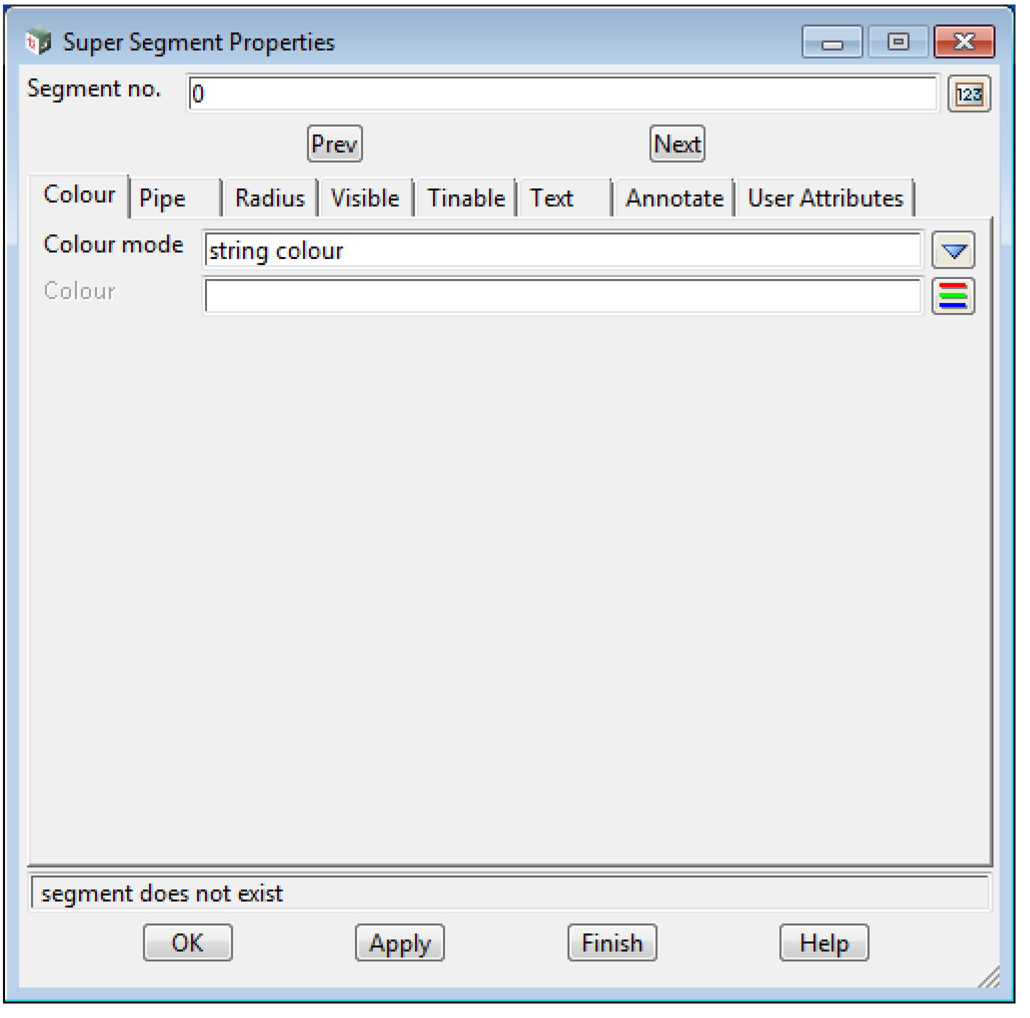
Please continue to the next section 14.4.10.5.9 All Segment Properties

14.4.10.5.9 All Segment Properties

Selecting **All properties** brings up the **Super Segment Properties** panel which is used to display all the properties of a segment.

This option is also available from the *Strings* menu

Position of option on menu: **Strings =>Properties =>Segment (all)**



As soon as **All segment properties** is chosen, the colour information for the first segment is shown. Clicking on the various tabs will show the various segment information for the first segment.

A particular segment can be selected by first clicking on the icon at the end of the Segment index field, and then selecting the required segment.

When the segment to modify is selected, its *segment index* and all other *information* are written to the appropriate panel fields.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments and display data for that segment.

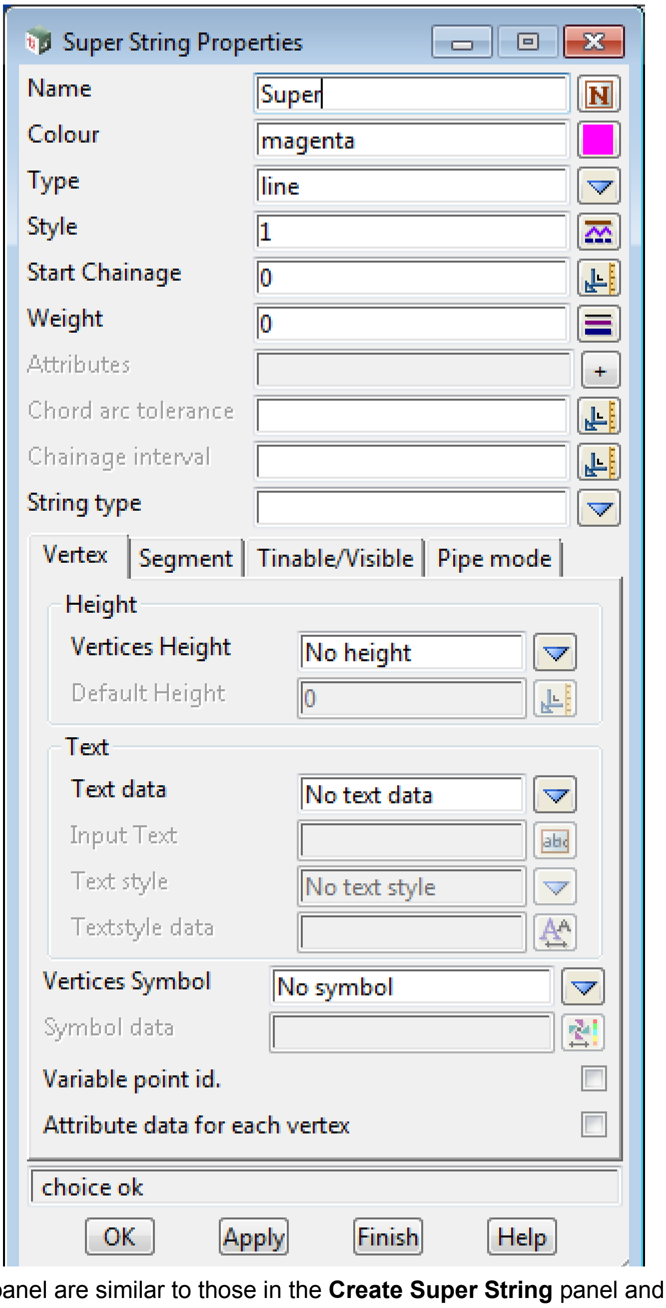
After any panel fields are modified, selecting either **OK** or **Apply** will change the information for the segment.

The fields in each of the tabs for the **Super Segment Properties** panel have already been described in the other options on the Segment Toolbar. See 14.4.10.5 Segment Toolbar.

For information on the Properties Toolbar, please continue to the next section 14.4.10.5.10 Properties Toolbar

14.4.10.5.10 Properties Toolbar

Selecting **Properties** brings up the **Super String Properties** panel which is used to modify the string's header information.



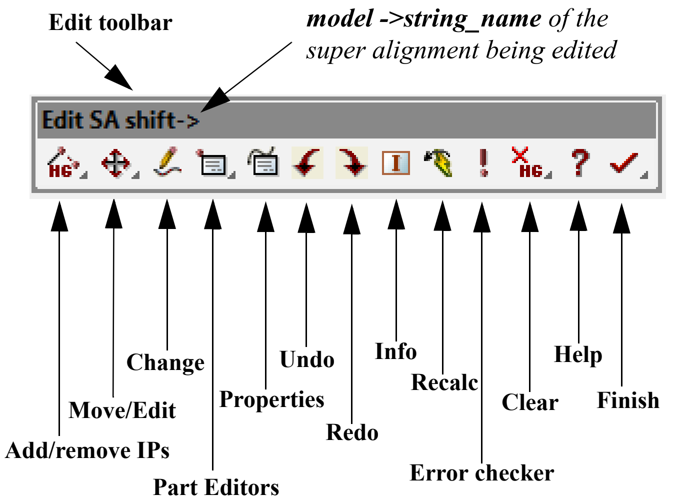
The fields in this panel are similar to those in the **Create Super String** panel and the Super String Editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

14.4.11 Edit Super Alignment

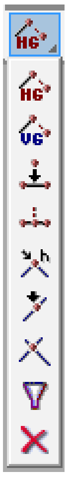
On picking a super alignment, the **Super Alignment Edit** menu is placed on the screen.



For the option *Add/ Remove* toolbar go to 14.4.11.1 SA - Add/Remove IPs Toolbar
Move/Edit toolbar 14.4.11.2 SA - Move/Edit Toolbar
Change icon 14.4.11.3 SA - Change Icon
Part Editors toolbar 14.4.11.4 SA - Part Editors Toolbar
Properties toolbar 14.4.11.5 SA - Super Alignment
Properties Icon
Undo icon 14.4.11.6 SA - Undo and Redo Icons
Redo icon 14.4.11.6 SA - Undo and Redo Icons
Info icon 14.4.11.7 SA - Info Icon
Recalc icon 14.4.11.8 SA - Recalc Icon
Error Checker icon 14.4.11.9 SA - Error Checker Icon
Clear toolbar 14.4.11.10 SA - Clear Toolbar
Help icon 14.4.11.11 SA - Help Icon
Finish toolbar 14.4.11.12 SA - Finish Toolbar

14.4.11.1 SA - Add/Remove IPs Toolbar

The Add/Remove IPs toolbar is



append or prepend a HIP
append or prepend a VIP
insert IP
between IP
insert VIP height
insert VIP grade
intersect VIP grades
filter IPs
delete an IP

The **Append** operations for a super alignment string are similar to the 2d string case except that there are separate **Append** options for the horizontal and vertical geometry of the string.

For the option:

Append HIP go to	14.4.11.1.1 SA - Append/Prepend HIP - Horizontal Geometry
Append VIP	14.4.11.1.2 SA - Append/Prepend VIP - Vertical Geometry

The **Insert IP, Between IP** and **Delete IP** work on the horizontal geometry if used on a plan view, and if used on a section view that the super alignment is profiled on, they work on the vertical geometry.

For the option *Insert IP* go to	14.4.11.1.3 SA - Insert IP
Between IP	14.4.11.1.4 SA - Between IP
Delete IP	14.4.11.1.9 SA - Delete IP

For the option *Insert VIP Height*, go to	14.4.11.1.5 SA - Insert VIP Height
Insert VIP Grade	14.4.11.1.6 SA - Insert VIP Grade
Intersect VIP Grades	14.4.11.1.7 SA - Intersect VIP Grades
Filter IPs	14.4.11.1.8 SA - Filter IPs
Delete an IP	14.4.11.1.9 SA - Delete IP

14.4.11.1.1 SA - Append/Prepend HIP - Horizontal Geometry

The **Append HIP** option is used in a plan view to create the first horizontal intersection point (HIP) in a new super alignment string and then append further HIPs, or for an existing super alignment string to append news HIPs to the end of the string, or to new HIPs to the beginning of the string. In this option, both appending and prepending will be referred to as Appending.

14.4.11.1.1.1 Existing Super Alignment

Appending an HIP is a two step process.

Step (a) - selecting the end to Append the HIP to.

After picking **Append HIP**, the end of the string to append the point to is selected. Once the string end is selected, the new HIP is assumed to be at the current cursor location. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

screen message area <Pick end to append to> [picks][fast][Menu>

Step (b) - selecting the position for the new appended HIP.

The position of the new appended HIP is set to the current cursor position by picking (LB) and accepting (MB).

screen message area <Pick IP location or (r)elative, (b)earing/distance> [picks][fast][Menu

Once an HIP has been appended to the string, the appended HIP is considered to be the selected string end and a new Append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position of the next appended HIP.

Hence a series of HIPs is easily entered by first selecting the string end in a plan view that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting it.

Typed input: **r** for relative, **b** for bearing-distance can be used in either step.

14.4.11.1.1.2 New Super Alignment

When the **Append HIP** option is selected, a cross will appear on any plan views that have the super alignment string's model on them.

screen message area <Pick start IP location> [picks][fast][Menu>

The first HIP is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing super alignment string where the end HIP has already been accepted.

Typed input: **r** for relative, **b** for bearing-distance can be used in either step.

The **Append HIP** option is terminated by either pressing RB to bring up the **Pick Ops** menu and selecting **Cancel** or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Append HIP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Append HIP** option still current.

14.4.11.1.2 SA - Append/Prepend VIP - Vertical Geometry

The **Append HIP** option is used in a section view to create vertical geometry for a super alignment that must already have some horizontal geometry. The existing super alignment needs to be the primary string on the section view. That is, it is the string profiled on the section view that is going to be used to create the vertical geometry. This can be achieved by using either the **VG edit** or the **Profile** option from the section view menu

Note: on a section view, the option **Utilities =>VG edit** takes the selected super alignment and profiles it on the section view and also opens the **SA Editor** for the string.

The **Append HIP** option can the first vertical intersection point (VIP) in an existing super alignment string that has **no vertical geometry**, and then appends further VIPs, or for an existing super alignment string **with vertical geometry**, OR appends new VIPs to the end or the beginning of the vertical geometry of the string. In this option, both appending and prepending will be referred to as Appending.

14.4.11.1.2.1 Existing Vertical Geometry

Appending a VIP point is almost the same as for a HIP except that the co-ordinate system is (chainage,height) rather than (x,y) values.

Appending an VIP is a two step process.

Step (a) - selecting the end to Append the VIP to.

After picking **Append VIP**, the end of the vertical geometry to append the point to is selected in the section view. Once the vertical geometry end is selected, the new VIP is assumed to be at the current cursor location and as the cursor is moved, the string is redrawn reflecting the changing position of the appended VIP

screen message area <Pick end to append to> [picks][fast][Menu>

Step (b) - selecting the position for the new appended HIP.

The position of the new appended VIP is set to the current cursor position by picking (LB) and accepting (MB).

screen message area <Pick IP location or (r)elative, (g)rade/height> [picks][fast][Menu

Once a VIP has been appended to the string, the appended VIP is considered to be the selected vertical geometry end and a new Append cycle begins. That is, stage (a) is already set up. The current cursor position in the section view indicates the new position of the next appended VIP.

Typed input: r for relative, **g** for grade-height can be used in either step.

Hence a series of VIPs is easily entered by first selecting the vertical geometry end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting them in.

14.4.11.1.2.2 New Vertical Geometry

Creating the **first VIP** is similar to the first HIP.

When the **Append VIP** option is selected, a cross will appear on any section views that have the super alignment string profiled on them.

screen message area <Pick start IP location> [picks][fast][Menu>

The first VIP is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing vertical geometry where the end point has already been accepted.

Typed input: r for relative, **g** for grade-height can be used in either step.

The **Append VIP** option is terminated by either pressing RB to bring up the **Pick Ops** menu and selecting **Cancel** or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Append VIP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Append VIP** option still current.

14.4.11.1.3 SA - Insert IP

The **Insert** option is designed to place a new HIP or VIP between two adjacent IPs.

Insert IP works on the horizontal or the vertical geometry depending on whether a plan or section view is used for the editing.

The inserted IP does not have to be on the line joining the two intersection points - the Between IP option is used to guarantee that the IP is on the IP-IP line.

Inserting an IP is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent IPs are chosen by selecting the line connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

For horizontal and vertical inserts

screen message area <Pick position to insert point> [picks][fast][Menu>

Step (b) - selecting the position for the new IP

The position of the new IP is set to the current cursor position by picking (LB) and accepting (MB).

screen message area <Pick final position of point> [picks][fast][Menu>

Once the insert cycle is completed and the IP inserted, the Insert IP option is still current and can be repeated for other insertions (in either plan or section views) without having to re-select the Insert IP option.

The **Insert IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Insert IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Insert IP** option still current.

14.4.11.1.4 SA - Between IP

The **Between IP** option is similar to the Insert IP option (see 14.4.11.1.3 SA - Insert IP) except the inserted point does have to be on the line joining the two IPs. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP position.

The **Between IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Between IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Between IP** option still current.

14.4.11.1.5 SA - Insert VIP Height

The **Insert VIP Height** option is used to insert a vertical intersection point (VIP) into the super alignment by clicking on the super alignment in either plan or section view to select the chainage that the VIP is to be inserted at, and then giving the height for the VIP.

So inserting the VIP is a two step process.

Step (a) - selecting the chainage for the VIP to inserted

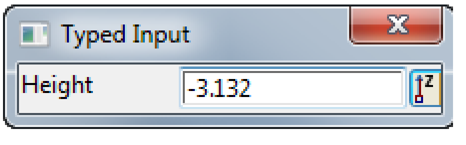
After selecting **Insert VIP Height**, a chainage to insert the new VIP at is selected by picking (LB) and accepting (MB) at that position on the super alignment.

For horizontal and vertical inserts

screen message area <Select point to add VIP> [picks][fast][Menu>

Step (b) - giving the height for the new VIP

After the chainage of the new VIP is selected, a *Height* Typed Input box is placed on the screen with the height of the super alignment at the selected chainage already displayed.



The required value is type into the *Height* Typed Input box and <Enter>.

The *Height* Typed Input box is removed from the screen and the new VIP inserted into the super alignment.

Once the Insert VIP cycle is completed and the VIP inserted, the **Insert VIP Height** is still current and can be repeated for other insertions (in either plan or section views) without having to re-select the **Insert VIP Height** option.

The **Insert VIP Height** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

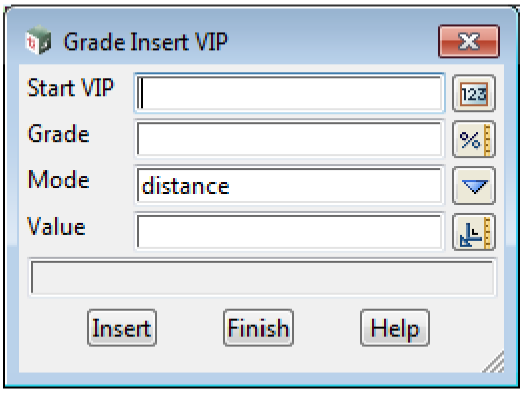
If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Insert VIP Height** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Insert VIP Height** option still current.

14.4.11.1.6 SA - Insert VIP Grade

The **Insert VIP Grade** option inserts a vertical intersection point (VIP) at a given grade from an existing VIP.

The new VIP position is given by either a distance from the picked VIP or at given chainage on the super alignment.

After selecting **Insert VIP Grade**, the **Grade Insert VIP** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP	VIP number box		

the VIP number whose (chainage, height) position is used to start the Grade Insert from. The number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the Start VIP *field.*

Grade	measure x-fall box		

percent grade to be used.

Note ***positive*** *is* ***up*** *when going in the direction of* ***increasing chainage*** *and* ***negative*** *is* ***up*** *when going in the direction of* ***decreasing chainage****.*

Mode	choice	distance	distance, chainage

if ***distance****, the new VIP is inserted at the (chainage) distance given in the* Value *field from the start VIP, but with height determined by going with the given grade from the start VIP.*
If ***chainage****, the new VIP is inserted at the chainage given in the* value *field but with height determined by going with the given grade from the start VIP.*

Insert	button		

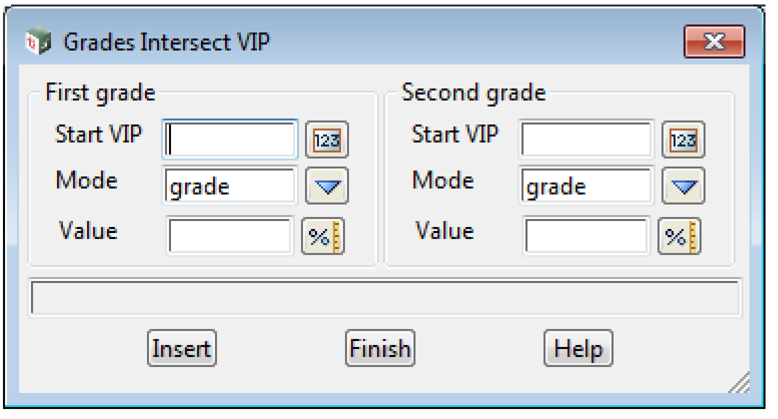
insert the new VIP into the alignment string.

14.4.11.1.7 SA - Intersect VIP Grades

The **Intersect VIP Grades** option inserts a VIP which is given by intersecting lines of given grades from two existing VIPs in the (chainage,height) plane.

The grades are either typed in or calculated by giving another VIP that the line goes through.

After selecting the option, the **Grades Intersect VIP** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
First Grade			
Start VIP	input		
Mode	choice	grade	grade, VIP #
Value or **End VIP**	input		

First Grade

Start VIP input

the VIP number whose (chainage,height) position is the start of a line.
The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the Start VIP *field.*

Mode choice grade grade, VIP #

*if **grade**, the field* Value *is a percent grade and a line is defined as going through the start VIP and with the given grade.*
*If **VIP #**, the field is* End VIP *and is the number of a VIP and a line is defined as going through the start VIP and this End VIP.*
Note for grades ***positive** is **up** when going in the direction of **increasing chainage** and*
***negative** is **up** when going in the direction of **decreasing chainage**.*

Value or **End VIP** input

if mode *is grade, the box is called* Value *and the value is a percent grade.*
if mode *is VIP #, the box is called* End VIP *and the value is the number of a VIP.*
For End VIP*, The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the* End VIP *field.*

Second Grade

Start VIP input

the VIP number whose (chainage,height) position is the start of a line.
The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the Start VIP *field.*

Mode choice grade grade, VIP #

*if **grade**, the field* Value *is a percent grade and a line is defined as going through the start VIP and with the given grade.*
*If **VIP #**, the field is* End VIP *and is the number of a VIP and a line is defined as going through the start VIP and this End VIP.*
Note for grades ***positive** is **up** when going in the direction of **increasing chainage** and*
***negative** is **up** when going in the direction of **decreasing chainage**.*

Value or **End VIP** input

if mode *is grade, the box is called* Value *and the value is a percent grade.*
if mode *is VIP #, the box is called* End VIP *and the value is the number of a VIP.*
For End VIP*, The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the* End VIP *field.*

Insert button

calculate in (chainage,height) space the intersection of the two lines given above and insert it as a new VIP into the super alignment.

14.4.11.1.8 SA - Filter IPs

The **Filter IPs** option tries to remove redundant HIPs and VIPs. That is, IP's that are very close to one another, or extra IPs on a straight line.

The extra IPs are often created when data is loaded from a CAD package and the elements are not tangential.

The **Filter IPs** option terminates after it is run and then a new option needs to be selected from the **Edit SA** toolbar.

14.4.11.1.9 SA - Delete IP

The **Delete IP** option is used to delete HIPs or VIPs points from the super alignment.

After picking **Delete IP**, any selected IP in the string is deleted. The string, minus the deleted IP, is redrawn after each deletion.

Once an IP has been deleted, another IP in the selected string can be deleted. Hence any number of the IPs can be deleted, one after another.

A HIP is deleted if the IP is chosen from a plan view and a VIP deleted if the IP is selected from a section view.

For HIP and VIP deletes

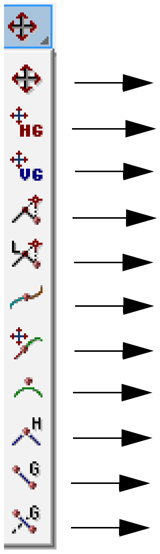
screen message area <Pick point to delete> [picks][fast][Menu>

The **Delete IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Delete IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Delete IP** option still current.

14.4.11.2 SA - Move/Edit Toolbar

The Move/Edit toolbar is



move IPs and Part definition points
move horizontal geometry parts
move vertical geometry parts
extend IP
extend by length
Tangent Wizard
move tangent point
change curve
change height
change grade
change grade 2

The **Move IP, Move Tangent** and **Extend IP** work on the horizontal geometry if used in a plan view and if used in a section view that the super alignment is profiled on, they work on the vertical geometry.

For the option *Move IP* go to	14.4.11.2.1 SA - Move
Move HG parts	14.4.11.2.2 SA - Move HG Parts
Move VG parts	14.4.11.2.3 SA - Move VG Parts
Extend IP	14.4.11.2.5 SA - Extend IP
Extend by length	14.4.11.2.6 SA - Extend by Length
Tangent Wizard	14.4.11.2.7 SA - Tangent Wizard
Move Tangent	14.4.11.2.4 SA - Move Tangent Point
Change curve	14.4.11.2.8 SA - Change Curve
Change height	14.4.11.2.9 SA - Change Height
Change grade	14.4.11.2.10 SA - Change Grade
Change grade 2	14.4.11.2.11 SA - Change Grade 2

14.4.11.2.1 SA - Move

The **Move** option allows the user to move

individual HIPs or Horizontal Parts definition points if the points are selected in a plan view

individual VIPs or Vertical Parts definition points if the points are selected in a section view that the super alignment is profiled on.

The **Move** cycle consists of two steps:

(a) selecting the point to be moved

(b) selecting the new position for the point.

Step (a)

First the point to be moved is selected. The selected point will then move around the view as the cursor is moved. The IPs/Parts recalculate and redraw as the point is moved.

screen message area <Pick point to move> [picks][fast][Menu>

Step (b)

The current cursor position is selected as the new position for the point by picking (LB) and accepting (MB). The point being moved is then anchored at the cursor position and the string redrawn.

screen message area <Pick final position of point> [picks][fast][Menu>

Once the **Move** cycle is completed and the point moved, the **Move** option is still current and can be repeated for other points without having to re-select the **Move** option.

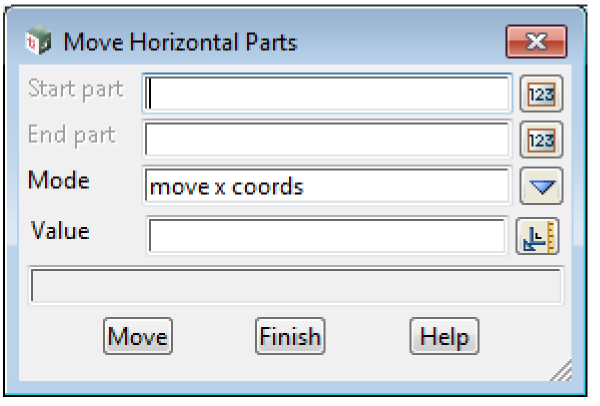
The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Move** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Move** option still current.

14.4.11.2.2 SA - Move HG Parts

Move HG Parts translates the X or the Y coordinates for a given range of Horizontal Parts in the super alignment being edited.

Clicking on the **Move HG Parts** icon brings up the **Move Horizontal Parts** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start part	input box		

the number of the Part in the Horizontal Geometry to start translating in x or y. Clicking MB in the field or RB on the number icon brings up the **Same as** *picker and a Horizontal Part from the super alignment can be selected from a plan view and the Part Number will be piped into the field.*

End part input box

the number of the Part in the Horizontal Geometry to end the translating in x or y. Clicking MB in the field or RB on the number icon brings up the **Same as** *picker and a Horizontal Part from the super alignment can be selected from a plan view and the Part Number will be piped into the field.*

Mode choice box move x coords, move y coords

if Mode *is* move x coords, *the x coordinates of all the parts from the* Start part *to* End part *are translated by* Value.
if Mode *is* move y coords, *the y coordinates of all the parts from the* Start part *to* End part *are translated by* Value.

Value measure box Measure X or Measure Y

the distance to move the coordinates.

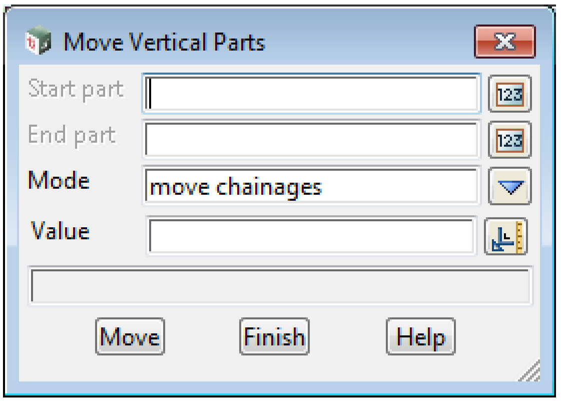
Move button

move the specified coordinates for the given range of Horizontal Parts.

14.4.11.2.3 SA - Move VG Parts

Move VG Parts translates the chainages or the heights for a given range of Vertical Parts in the super alignment being edited.

Clicking on the **Move VG Parts** icon brings up the **Move Vertical Parts** panel.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Start part input box

the number of the Part in the Vertical Geometry to start translating in chainage or height. Clicking MB in the field or RB on the Number icon brings up the **Same as** *picker and a Vertical Part from the super alignment can be selected from a section view, and the Part Number piped into the field.*

End part input box

the number of the Part in the Vertical Geometry to end the translating in chainage or height. Clicking MB in the field or RB on the Number icon brings up the **Same as** *picker and a Vertical Part from the super alignment can be selected from a section view and the Part Number will be piped into the field.*

Mode choice box move x coords, move y coords

if Mode *is* move chainages*, the chainage coordinates of all the parts from the* Start part *to* End part *are translated by* Value*.*
if Mode *is* move heights*, the height coordinates of all the parts from the* Start part *to* End part *are translated by* Value*.*

Value measure box Measure Chainage or Measure Z

the distance to move the coordinates

Move button

move the specified coordinates for the given range of Vertical Parts

14.4.11.2.4 SA - Move Tangent Point

The **Move Tangent** option allows the user to move

individual horizontal tangent points in a plan view if the horizontal tangent point (HTP) is part of an HIP with a curve on it but no approaching or departing transitions.

individual vertical tangent points in a section view that the super alignment is profiled on if the vertical tangent point (VTP) is part of a VIP with a parabola or curve on it.

The **Move Tangent** cycle consists of two steps:

(a) selecting the tangent point (TP) to be moved

(b) selecting the new position for the TP.

Step (a)

First the tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a horizontal tangent point is selected, the string will be redrawn with the HTP moved to the cursor position and the circular curve radius will be modified appropriately.

If a vertical tangent point is selected, the string will be redrawn with the VTP moved to the cursor position and the vertical curve modified appropriately.

screen message area <Pick tangent to extend> [picks][fast][Menu>

Step (b)

The current cursor position is selected as the new position for the point by picking (LB) and accepting (MB). The tangent being moved is then anchored at the cursor position and the string redrawn.

screen message area <Pick final position of tangent> [picks][fast][Menu>

Once the Move Tangent cycle is completed and the TP moved, the **Move Tangent** option is still current and can be repeated for other tangent points without having to re-select the **Move Tangent** option.

The **Move Tangent** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Move Tangent** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Move Tangent** option still current.

14.4.11.2.5 SA - Extend IP

The **Extend IP** option is used to move an IP along the line joining the IP to its neighbouring IP.

That is, in a plan view, the bearing of the HIP-HIP line is kept constant and the intersection point is moved along that line either towards or away from its neighbouring intersection point on the HIP-HIP line.

In a section view, the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either towards or away from its neighbouring intersection point on the VIP-VIP line.

Extending, like moving an IP, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a position near the IP-IP line and close to the intersection point to be moved along that line.

screen message area <Pick point to extend> [picks][fast][Menu>

Once the line and IP are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line. As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

Step (b) - selecting the final position for the IP

The current cursor position is selected as the new position for the IP by picking (LB) and accepting (MB). The final position for the intersection point is set to the projection of the selected cursor position onto the IP-IP line.

screen message area <Pick final position of point> [picks][fast][Menu>

Once the **Extend IP** is completed, the extend option is still current and can be repeated without re-selecting the **Extend IP** option.

The **Extend IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Extend IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Extend IP** option still current.

Note - **Extend IP** can be used on the end points of the horizontal or vertical geometry of a super alignment string.

14.4.11.2.6 SA - Extend by Length

The **Extend by length** option is used to move a horizontal IP or vertical IP by a given length along the line joining the IP to its neighbouring IP.

A horizontal IP is modified in a plan view and the bearing of the HIP-HIP line is kept constant and the intersection point is moved by a given length along that line either towards or away from its neighbouring intersection point on the HIP-HIP line.

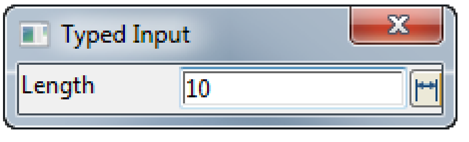
A vertical IP is modified in a section view and the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either towards or away from its neighbouring intersection point on the VIP-VIP line.

To modify a horizontal IP, the string is edited in a plan view. To modify a vertical IP, the string is edited in a section view.

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a position near the IP-IP line and close to the intersection point to be moved along that line.

screen message area <[F]orward: pick IP to extend, (or [B]ackward)> [picks][fast][Menu]

Once the line and IP are selected, a **Length Typed Input** box is displayed and the required length typed into the box and <Enter> pressed.



The IP then moves to its new position.

Note: When in Forward mode, the IP moves along the selected segment. When in Backward mode, the IP moves along the segment on the other side of the selected IP.

The default is Forward. To select Backward mode, type ’B’. To select Forward mode, type ’F’.

Once the **Extend by length** is completed, the extend option is still current and can be repeated without re-selecting the **Extend by length** option.

The **Extend by length** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

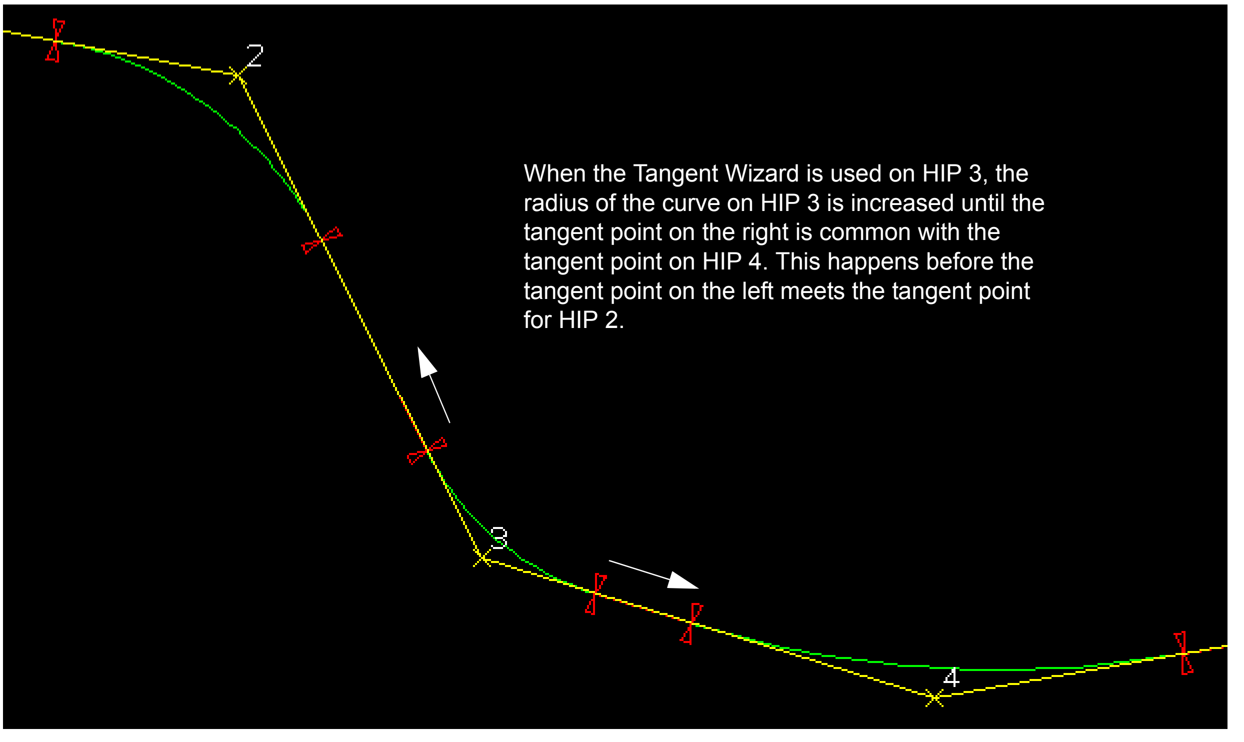
If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Extend by length** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Extend by length** option still current.

Extend by length can be used on the end points of the horizontal or vertical geometry of a super alignment string.

14.4.11.2.7 SA - Tangent Wizard

The **Tangent Wizard** works for a HIP defined with just an arc on it and no transitions, or a VIP with a parabola or curve defined on it.

If a suitable HIP or VIP is selected, the **Tangent Wizard** modifies the curve/parabola on the selected HIP/VIP so that a common curve-curve tangent point is created on at least one side of the HIP/VIP.



When the **Tangent Wizard** run successfully, the **Tangent Wizard** option is still current and can be repeated without re-selecting **Tangent Wizard**. If an incorrect IP is selected, the **Tangent Wizard** terminates and an option needs to be selected from the **Edit SA** toolbar.

The **Tangent Wizard** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Tangent Wizard** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Tangent Wizard** option still current.

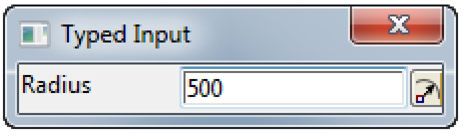
14.4.11.2.8 SA - Change Curve

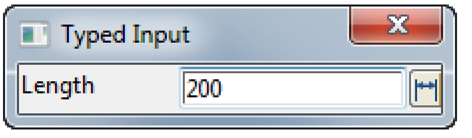
The **Change Curve** option is used to change the defining value for the horizontal curve (radius or length) of a curve on a horizontal intersection point, or the defining value for the vertical curve (length, k-value or radius) on a vertical intersection point.

After selecting **Change Curve**:

screen message area <Pick IP to change curve info> [picks][fast][Menu>

If an HIP is selected from a plan view, the value defining the horizontal curve (radius or length) on the HIP is displayed.

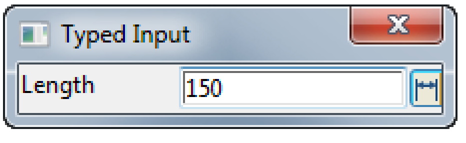




The required Radius (or Length) is typed into the Typed Input box and <Enter> pressed.

The HIP is given the new value and the Typed Input box is removed from the screen.

If an VIP is selected from a section view that the super alignment is profiled on, the value defining the vertical curve (length, k-value or length) on the VIP is displayed.



The required Length (or k value or Length) is typed into the Typed Input box and <Enter> pressed.

The VIP is given the new value and the Typed Input box is removed from the screen.

Once the curve value is changed, the **Change Curve** is still current and can be repeated for other IPs in the super alignment without having to re-select the **Change Curve** option.

The **Change Curve** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Curve** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Curve** option still current.

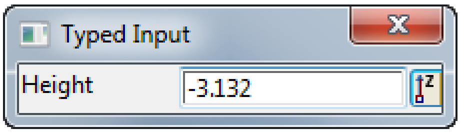
14.4.11.2.9 SA - Change Height

The **Change Height** option is used to change the height of an existing vertical intersection point (VIP).

After selecting **Change Height**, a VIP is selected from a section view that the super alignment is profiled on:

screen message area <Pick IP to change height> [picks][fast][Menu>

After the VIP is selected, a ***Height*** Typed Input box is placed on the screen with the height of the selected VIP already displayed.



The required height is typed into the *Height* Typed Input box and <Enter> pressed.

The *Height* Typed Input box is removed from the screen and the VIP is given the new height.

Once the height is changed, the **Change Height** is still current and can be repeated for other VIPs in the super alignment without having to re-select the **Change Height** option.

The **Change Height** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Height** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Height** option still current.

14.4.11.2.10 SA - Change Grade

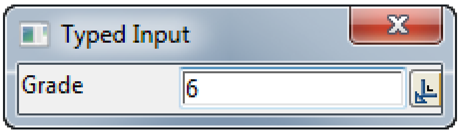
The **Change Grade** option is used to change the grade of the line between two consecutive vertical intersection points (VIPs) by moving the VIP at the selected end of the line up or down to achieve the given grade.

Note that the chainage position of the VIP remains the same and the grade on both sides of the moved VIP change.

After selecting **Change Grade**, the line joining consecutive VIP is picked with direction from a section view that the super alignment is profiled on

screen message area <Pick grade to change> [picks][fast][Menu>

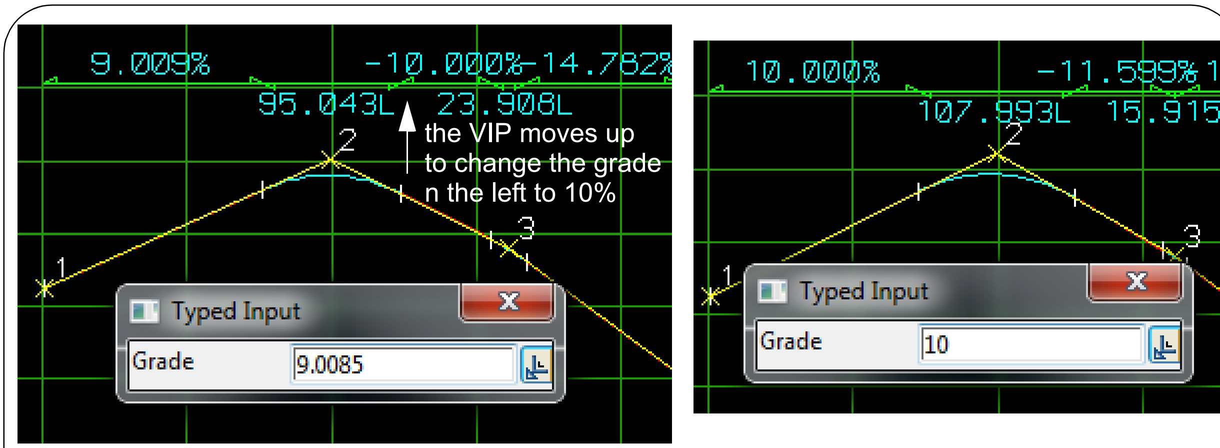
After the VIP is selected, a ***Grade*** Typed Input box is placed on the screen with the grade of the selected line, measured from left to right, is already displayed.



Note: going from left to right in the section view (that is, increasing chainage), positive grade is up and negative grade is down.

If the line was picked with direction going from left to right in the section view (increasing chainage), then the position of the VIP at the left end of the line is kept constant and the line is graded with the new grade and the height of the VIP at the right end of the line is modified so that it sits on the new graded line. The chainage of the VIP is kept constant. That is, the VIP just moves up or down until the new grade is reached.

The *Grade* Typed Input box is removed from the screen.



Change Grade: The line going from VIP 1 to VIP 2 with direction going from left to right.
VIP 2 is moved up to give the new grade for the line between VIP 1 and VIP 2

If the line was picked with direction going from right to left in the section view (decreasing chainage), then the position of the VIP at the right end of the line is kept constant and the line is graded with the new grade and the height of the VIP at the left end of the line is modified so that it sits on the new graded line. The chainage of the VIP is kept constant. That is, the VIP just moves up or down until the new grade is reached.

The *Grade* Typed Input box is removed from the screen.

Once the grade is changed, the **Change Grade** is still current and can be repeated for other lines between VIPs in the super alignment without having to re-select the **Change Grade** option.

The **Change Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Grade** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Grade** option still current.

14.4.11.2.11 SA - Change Grade 2

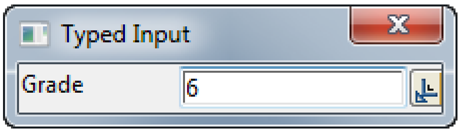
The **Change Grade 2** option is used to change the grade of the line between two consecutive vertical intersection points (VIPs) by sliding the VIP at the selected end of the line along the VIP-VIP line on the other side of the VIP so that the grade of the other line is not modified.

Note that the chainage position of the VIP changes and only the grade on the selected line of the moved VIP changes.

After selecting **Change Grade**, the line joining consecutive VIP is picked with direction from a section view that the super alignment is profiled on

screen message area <Pick grade to change> [picks][fast][Menu>

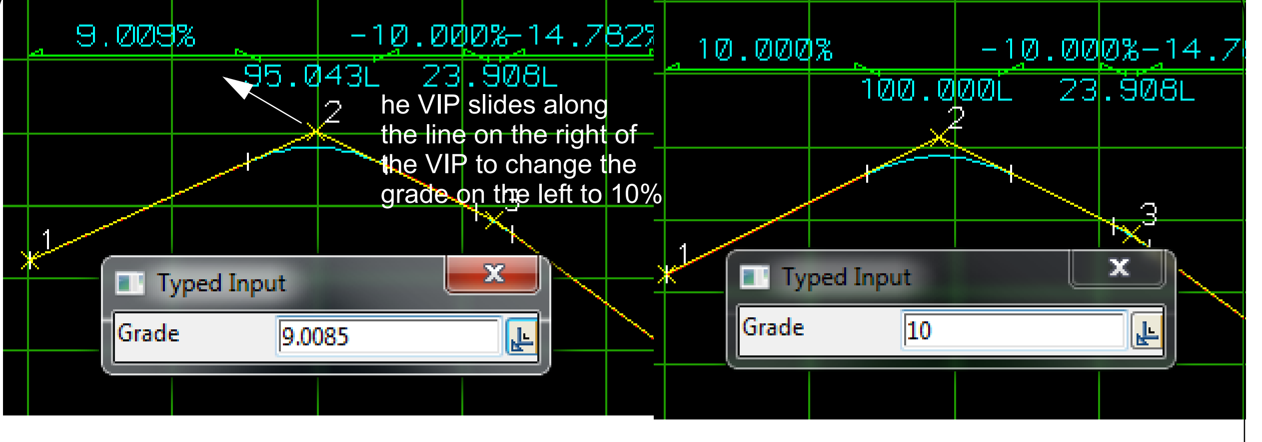
After the VIP is selected, a ***Grade*** Typed Input box is placed on the screen with the grade of the selected line, measured from left to right, is already displayed.



Note: going from left to right in the section view (that is, increasing chainage), positive grade is up and negative grade is down.

If the line was picked with direction going from left to right in the section view (increasing chainage), then the position of the VIP at the left end of the line is kept constant and the line is graded with the new grade by sliding the VIP at the right end of the line along the VIP-VIP line on the other side of the VIP to keep that grade constant. So the grade on the other side of the VIP is kept constant. That is, the VIP slides up or down the other line until the new grade is reached.

The *Grade* Typed Input box is removed from the screen.



Change Grade 2: The line going from VIP 1 to VIP 2 with direction going from left to right.
VIP 2 is slid along the line between VIP2 and VIP 3 (keeping its grade constant)
to give the new grade for the line between VIP 1 and VIP 2

If the line was picked with direction going from right to left in the section view (decreasing chainage), then the position of the VIP at the right end of the line is kept constant and the line is graded to the new grade by sliding the VIP at the left end of the line along the VIP-VIP line on the other side of the VIP to keep that grade constant. So the grade on the other side of the VIP is kept constant. That is, the VIP slides up or down the other VIP-VIP line until the new grade is reached.

The *Grade* Typed Input box is removed from the screen.

Once the grade is changed, the **Change Grade 2** is still current and can be repeated for other lines between VIPs in the super alignment without having to re-select the **Change Grade 2** option.

The **Change Grade 2** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Grade 2** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Grade 2** option still current.

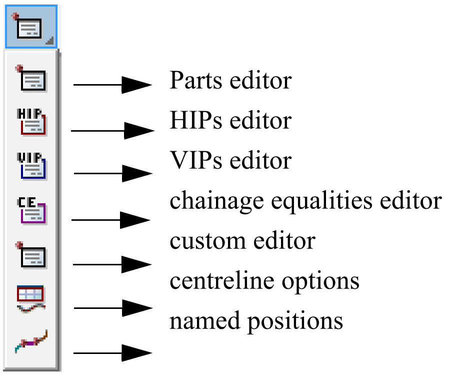
14.4.11.3 SA - Change Icon

The Change icon is

Selecting this icon allows the user to change the radius of arcs placed by Parts.

14.4.11.4 SA - Part Editors Toolbar

The Part Editors toolbar is



For the option *Parts Editor*, go to [14.4.11.4.1 SA - Parts Editor](#)
HIPs Editor [14.4.11.4.2 SA - HIPs Editor](#)
VIPs Editor [14.4.11.4.3 SA - VIPs Editor](#)
Chainage Equalities Editor [14.4.11.4.4 SA - Chainage Equalities Editor](#)
Custom Editor [14.4.11.4.5 SA - Custom Superelevation and Widening Editor](#)
Centreline Options [14.4.11.4.6 SA - Centreline Options](#)
Named Positions [14.4.11.4.7 SA - Named Positions](#)

14.4.11.4.1 SA - Parts Editor

Placing a super alignment consists of:

(a) defining the horizontal geometry consisting of lines, arcs, transitions and tapers

(b) defining the vertical geometry consisting of lines, parabolas and arcs.

A simple way to create horizontal and vertical geometry for the super alignment is by using horizontal intersection points (HIPs) with arcs and transitions (eg spirals), and vertical intersection points (VIP's) with parabolas or arcs for placing the vertical geometry.

However the super alignment also allows for more complex construction methods to define the lines, arcs and transitions (the horizontal elements) that within ***12d Model*** are be grouped together to make up the Parts of the horizontal geometry.

For example, a horizontal line is defined to be a given parallel offset of a selected line segment from another string. Or a more complex part such *Free Arc with Known Radius* that consists of the three elements: an arc of a known radius plus a leading and a trailing transition.

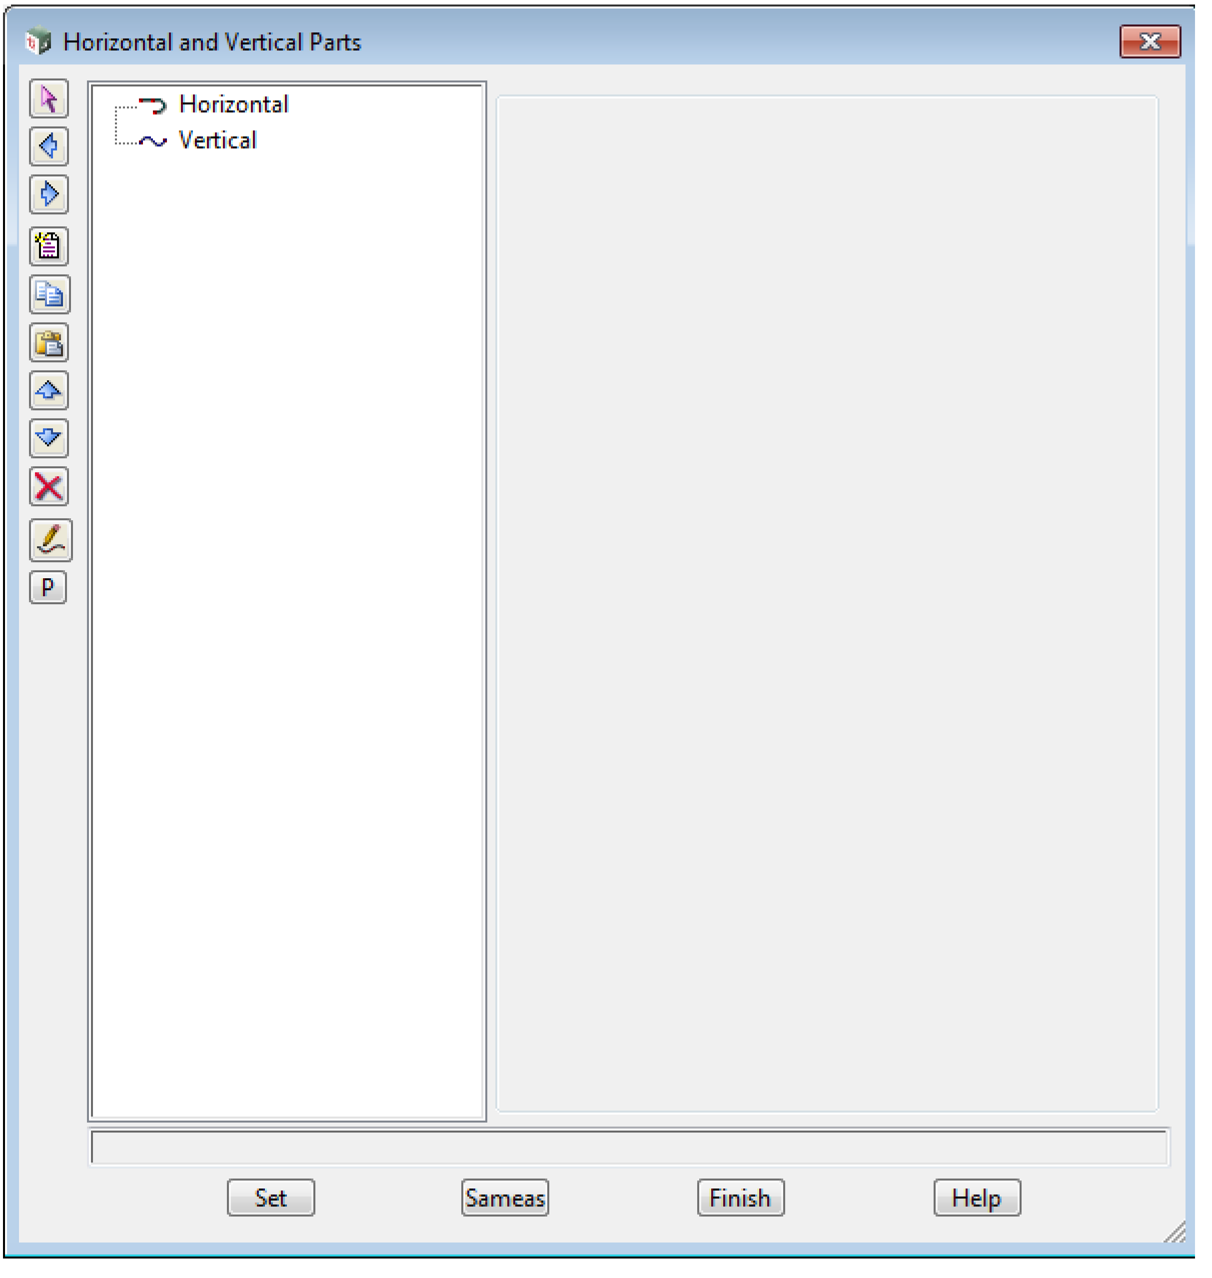
Similarly more complex construction methods are available to define the lines, parabolas and arcs (the vertical elements) that are grouped together within***12d Model*** to make up the Parts of the vertical geometry.

Some of the Parts definitions have some degree of freedom in the definition of the elements in the Parts, and the sequencing and types of the Parts, plus the condition that, if possible, each element is tangential to the adjacent elements, allows *12d Model* to calculate and solve for some unknowns in the Part definitions that make up the super alignment.

For example, if a *Free Arc with Known Radius* placed between two known lines then the tangentiality condition means that the position of the *Free Arc with Known Radius* (arc and two transitions) is uniquely defined as a arc and leading and trailing transitions on the intersection point of the two lines. Or just a fillet between the two lines if the two transitions have zero length.

For more information on placing parts, fixed and floating parts and solving, go to 21.9 Placing Parts for Super Alignments.

The general creating and editing of the horizontal and vertical Parts inside ***12d Model*** is done in the **Horizontal and Vertical Parts** panel and this is brought up by clicking on the on the **Parts Editor** icon.

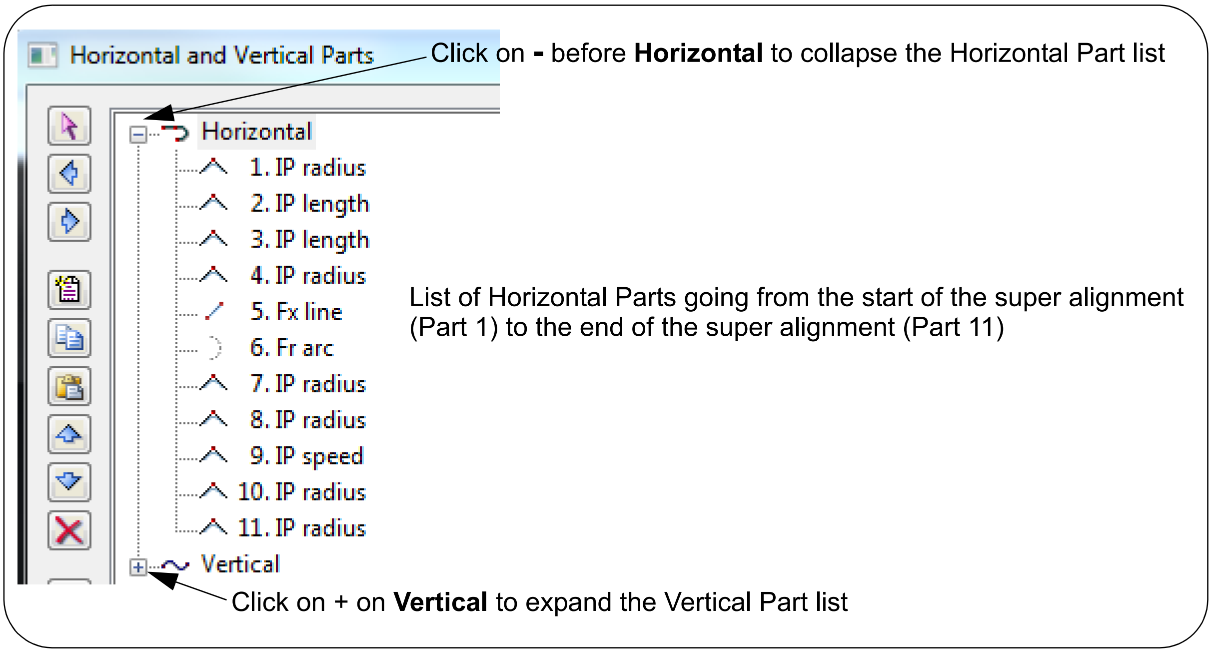


See 14.4.11.4.1.1 Icons on the Horizontal and Vertical Parts Panel
See 14.4.11.4.1.2 Creating and Editing a Part
See 14.4.11.4.1.3 Types of Horizontal Parts
See 14.4.11.4.1.4 Types of Vertical Parts

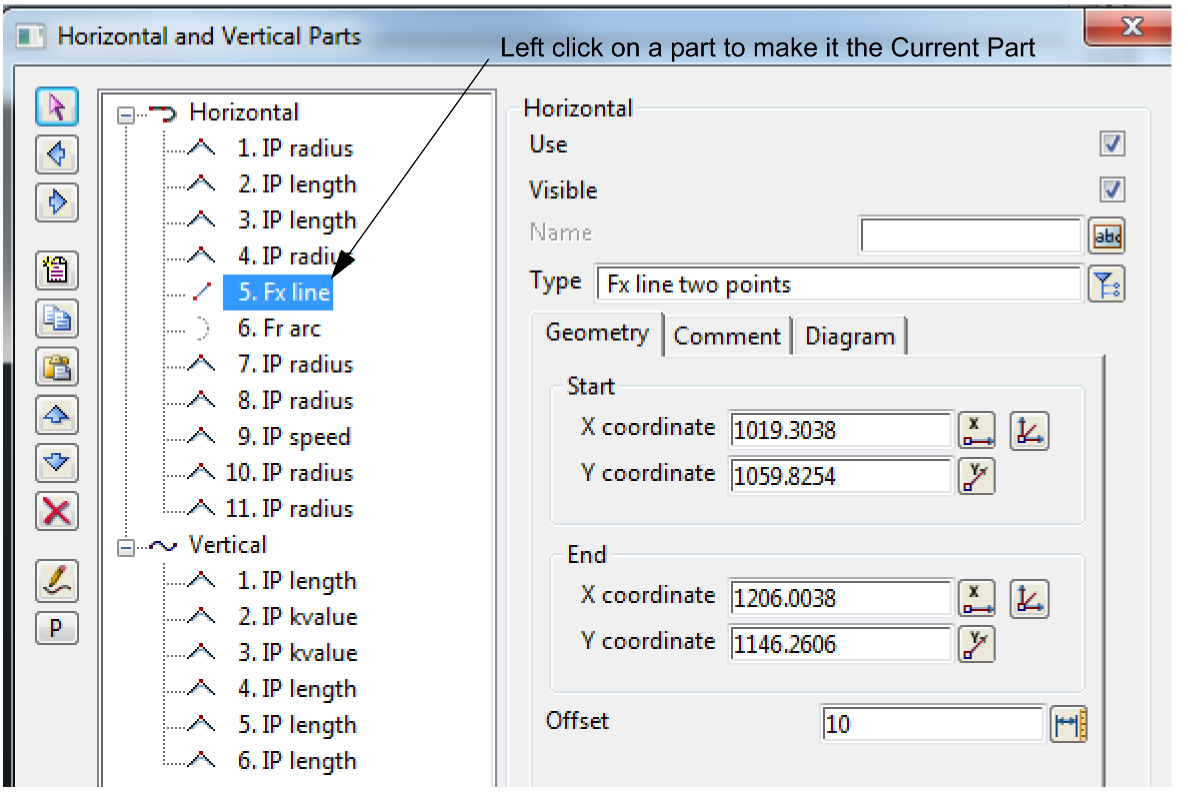
14.4.11.4.1.1 Icons on the Horizontal and Vertical Parts Panel

If there are any existing horizontal parts in the super alignment, then a + will appear to the left of Horizontal in the tree. Similarly if there are any existing vertical parts then a + will appear next to Vertical in the tree.

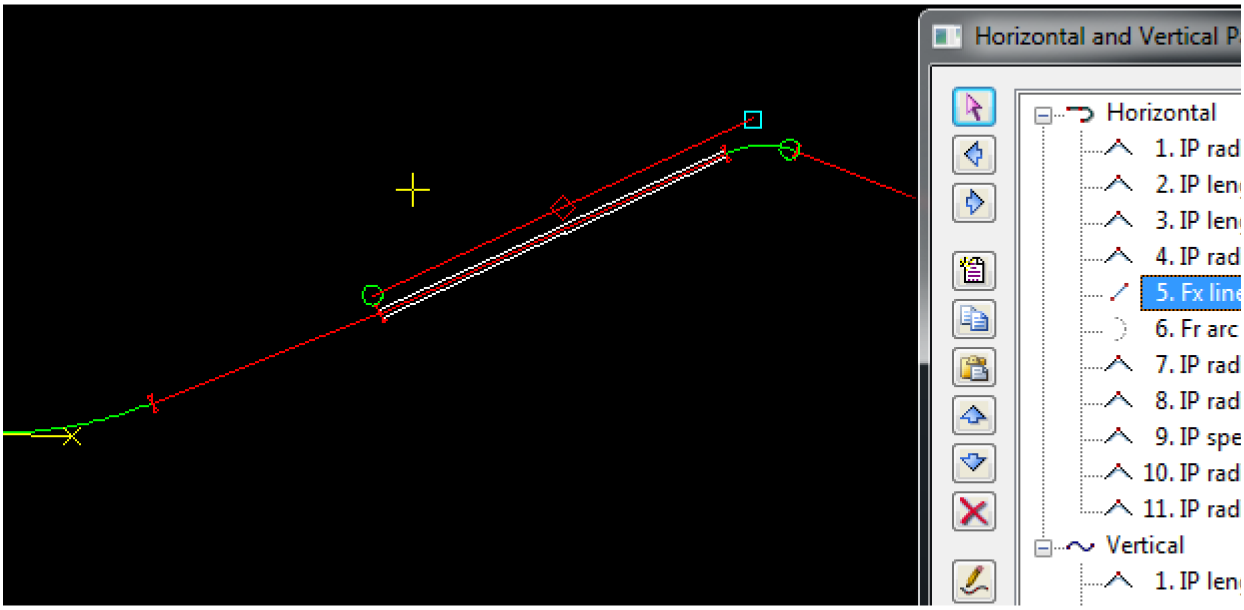
Clicking on the **+** next to Horizontal/Vertical will then list all the horizontal/vertical parts in order from the start of the super alignment to the end of the super alignment.

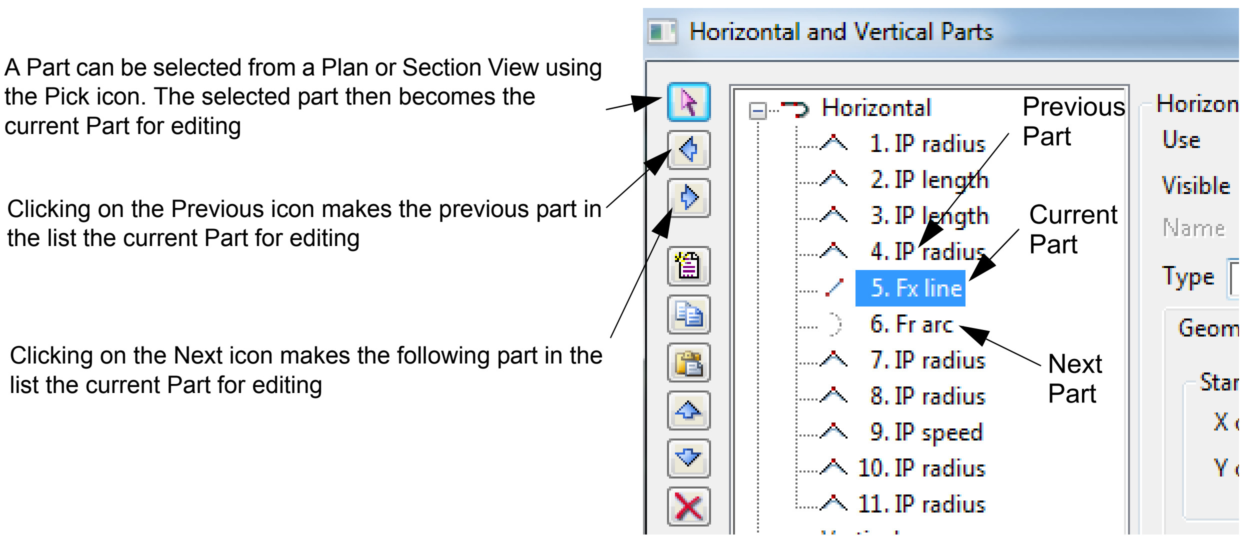


To make a Part the current Part being edited, simply Left click on the Part in the expanded list and the selected Part will be highlighted and the information about the part displayed on the right hand side of the panel.

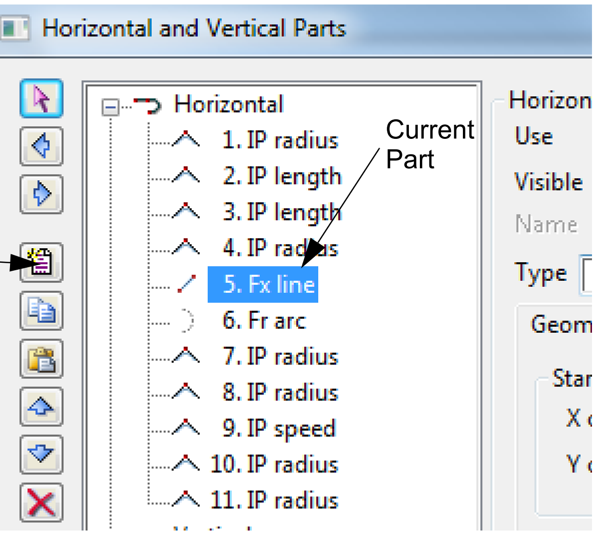


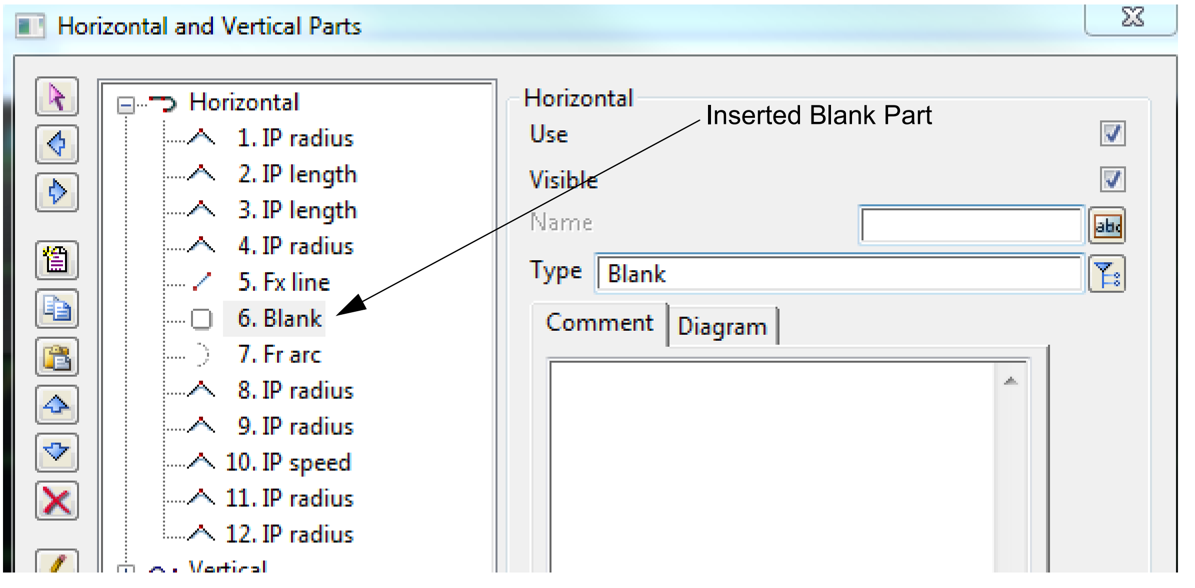
The selected part will also highlight in any Plan views the super alignment is on if it is a Horizontal Part, or any Section views that the super alignment is profiled on if it is a Vertical Part.





A new Blank Part is inserted after the current Part by clicking on the Insert icon.

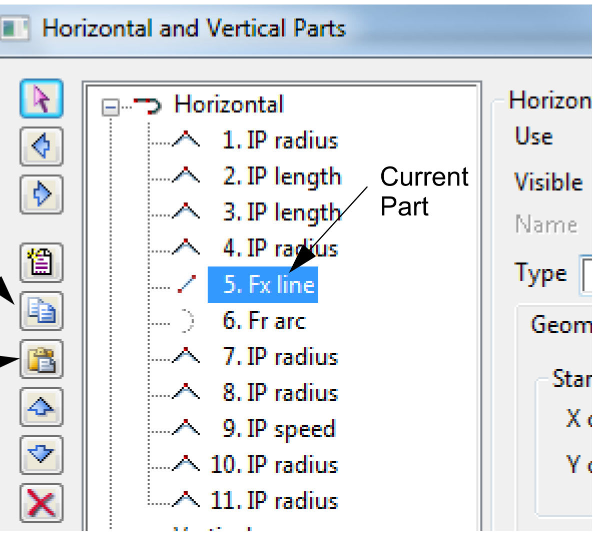




The current Part can be copied by clicking on the Copy icon.

The part that the copied Part is to be inserted after is then made the current Part (by Picking, clicking on the Part in the Editor, *etc.*)

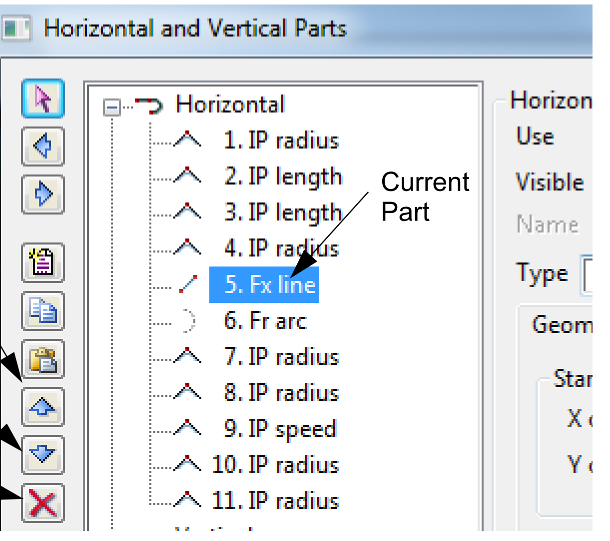
And clicking on the Paste icon then inserts the copied part after the current Part.



The current Part is moved one place closer to the start of the list by clicking on the Move up icon.

The current Part is moved one place down towards the bottom of the list by clicking on the Move down icon.

The current Part is deleted by clicking on the Delete icon.

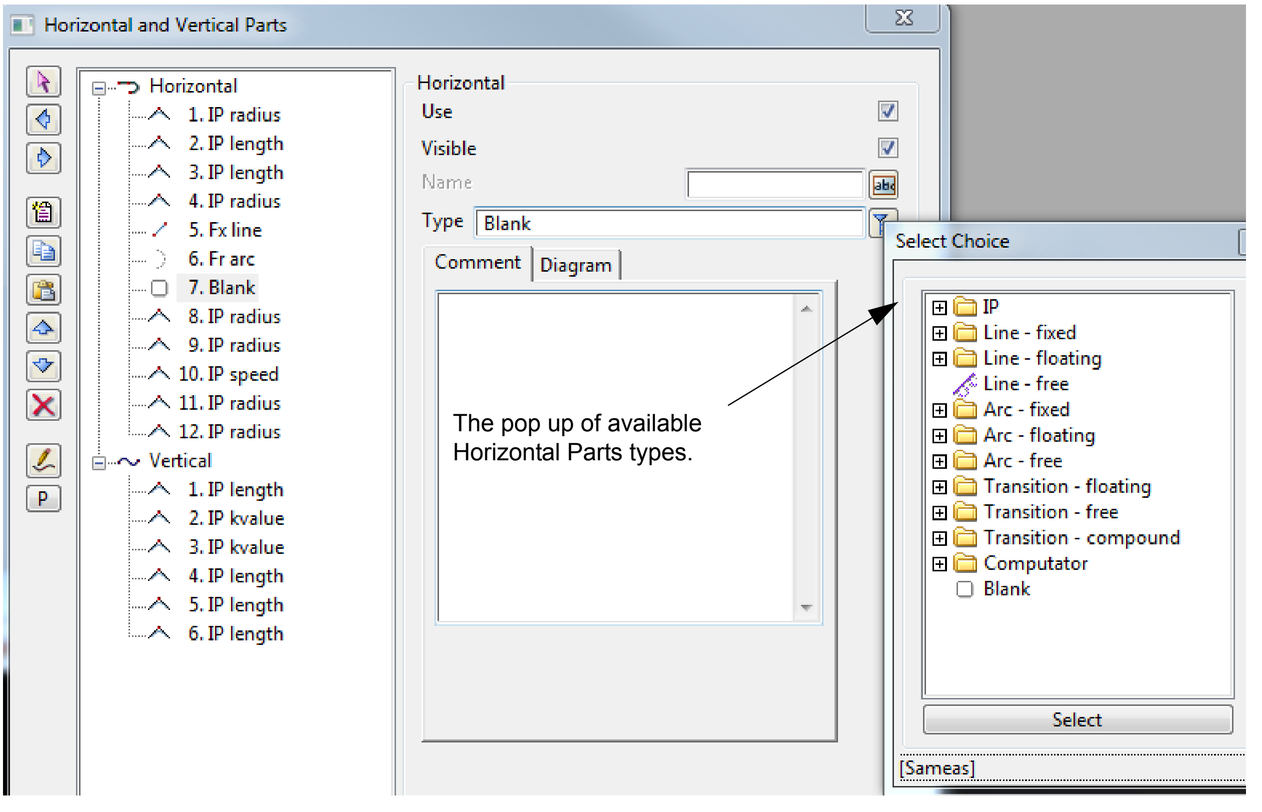


14.4.11.4.1.2 Creating and Editing a Part

A new Part is created by Inserting a new Blank Part and then clicking on the Type choice box to get the list of available Parts. After choosing a Part, the information required to define the selected part is displayed on the right hand side of the **Horizontal and Vertical Parts** panel. The required information is filled in and then the **Set** button at the bottom of the panel is clicked to create the new Part.

An existing Part can be edited by selecting it to make it the current Part which will display its defining information on the right hand side of the **Horizontal and Vertical Parts** panel. Any required changes to the information are made and then click on the **Set** button at the bottom of the panel to update the Part.

An existing Part can be changed to a different type of Part by selecting it to make it the current Part, then click on the Type choice box and select the new Type for the Part from the pop-up list.



The list of the available Horizontal and Vertical Parts for Type are given below with links to the full definition of each Part.

14.4.11.4.1.3 Types of Horizontal Parts

See 21.9.2.1 Horizontal IPs
See 21.9.2.2 Horizontal Lines - Fixed
See 21.9.2.3 Horizontal Lines - Floating
See 21.9.2.4 Horizontal Lines - Free
See 21.9.2.5 Horizontal Arcs - Fixed
See 21.9.2.6 Horizontal Arcs - Floating
See 21.9.2.7 Horizontal Arcs - Free
See 21.9.2.8 Horizontal Transitions - Floating
See 21.9.2.9 Horizontal Transitions - Free
See 21.9.2.10 Horizontal Transitions - Compound

14.4.11.4.1.4 Types of Vertical Parts

See 21.9.3.1 Vertical IPs
See 21.9.3.2 Vertical Lines - Fixed

See 21.9.3.3 Vertical Lines - Floating
See 21.9.3.4 Vertical Lines - Free

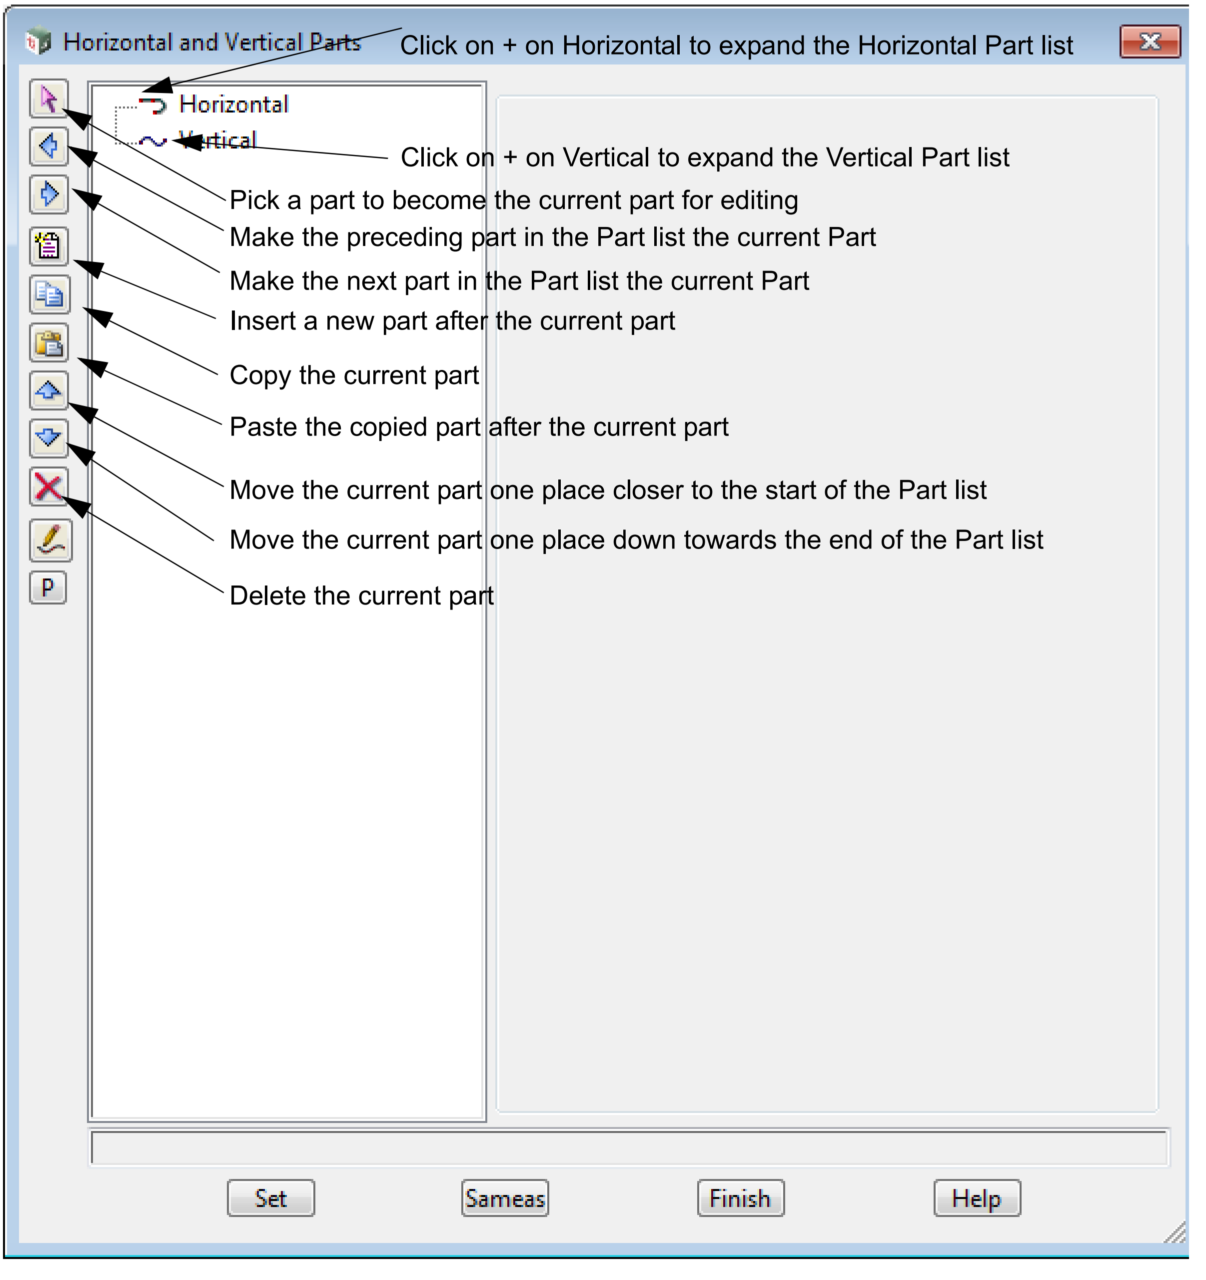
See 21.9.3.6 Vertical Parabolas - Floating
See 21.9.3.7 Vertical Parabolas - Free
See 21.9.3.8 Vertical Arcs - Fixed
See 21.9.3.9 Vertical Arcs - Floating
See 21.9.3.10 Vertical Arcs - Free

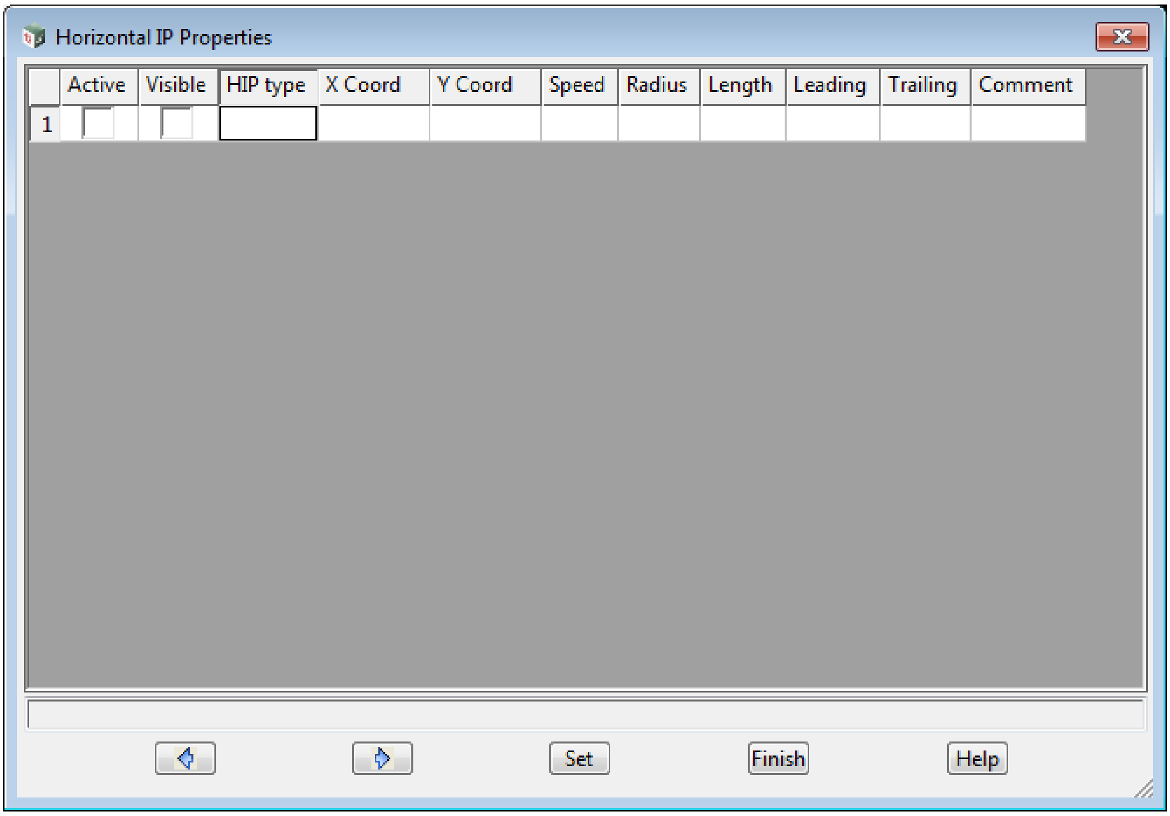


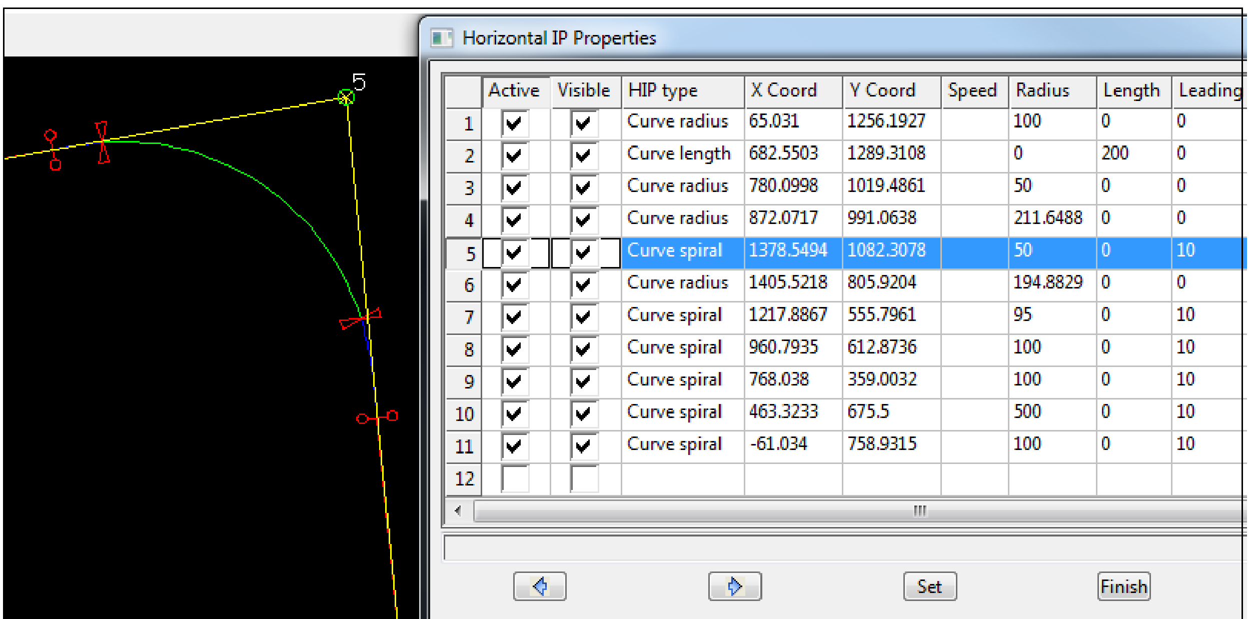
For definitions of the horizontal and vertical elements, go to 21.9 Placing Parts for Super Alignments

14.4.11.4.2 SA - HIPs Editor

If the horizontal geometry of the super alignment consists of only HIP's (that is, no horizontal parts) then clicking on **HIPs Editor** brings up the **Horizontal IP Properties** panel which lists all the HIP's in the super alignment showing how the curves on the HIP are defined and the values for the HIP and accompanying arcs and transitions (spirals).

The **Horizontal IP Properties** panel is:





Super Alignment Profiled on a Plan View Table of HIP Information

Clicking on the row number in the table draws a green circle around the corresponding HIP in any plan views where the HIP is visible.

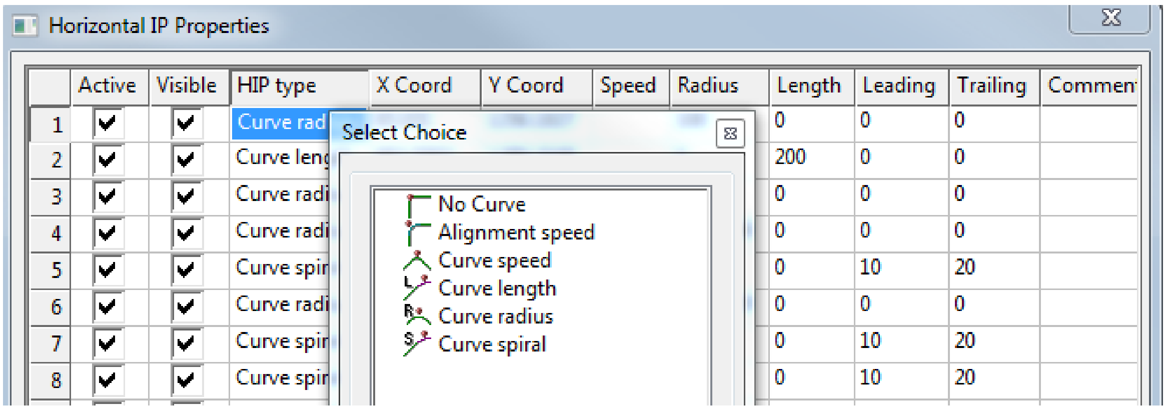
The Left arrow and Right arrow moves the highlighting to the previous HIP and next HIP respectively.

If Active is ticked for a row then that HIP is used in the super alignment.
If Active is not ticked for a row then that HIP is not used in the super alignment.

If Visible is ticked for a row then the curve at the HIP is used in the super alignment.
If Visible is not ticked for a row then the curve at the HIP is not used in the super alignment.

Warning: the row number will not be the same as the HIP numbers shown on a plan view if there are HIP's that are not Active.

The **HIP type** can be modified by clicking RB in the **HIP Type** column for the HIP to be modified to bring up the choices for the HIP.



When the HIP Type is changed, the new information can be typed into the appropriate cells for that HIP and then the **Set** button is pressed to make the change.

Note: if the entire line is already highlighted, you will need to first click LB in the appropriate HIP Type cell to get focus just on that cell and then click RB. If a pop-up with Browse comes up, select Browse to get the HIP Type choices.

Any of the values in the other columns X Coord, Y Coord, Speed, Radius, Length, Leading, Trailing and Comment can be modified and the **Set** button pressed to use the new values (if they are appropriate for the HIP Type).

Note:

Length is the length of the arc when the HIP Type is *Curve length*

Speed is the design speed for the curves at the HIP Type is *Curve speed*.

Radius is the radius of the arc when HIP Type is *Curve radius* or *Curve spiral.*

Leading is the length of the leading transition (spiral) when HIP Type is *Curve spiral*.

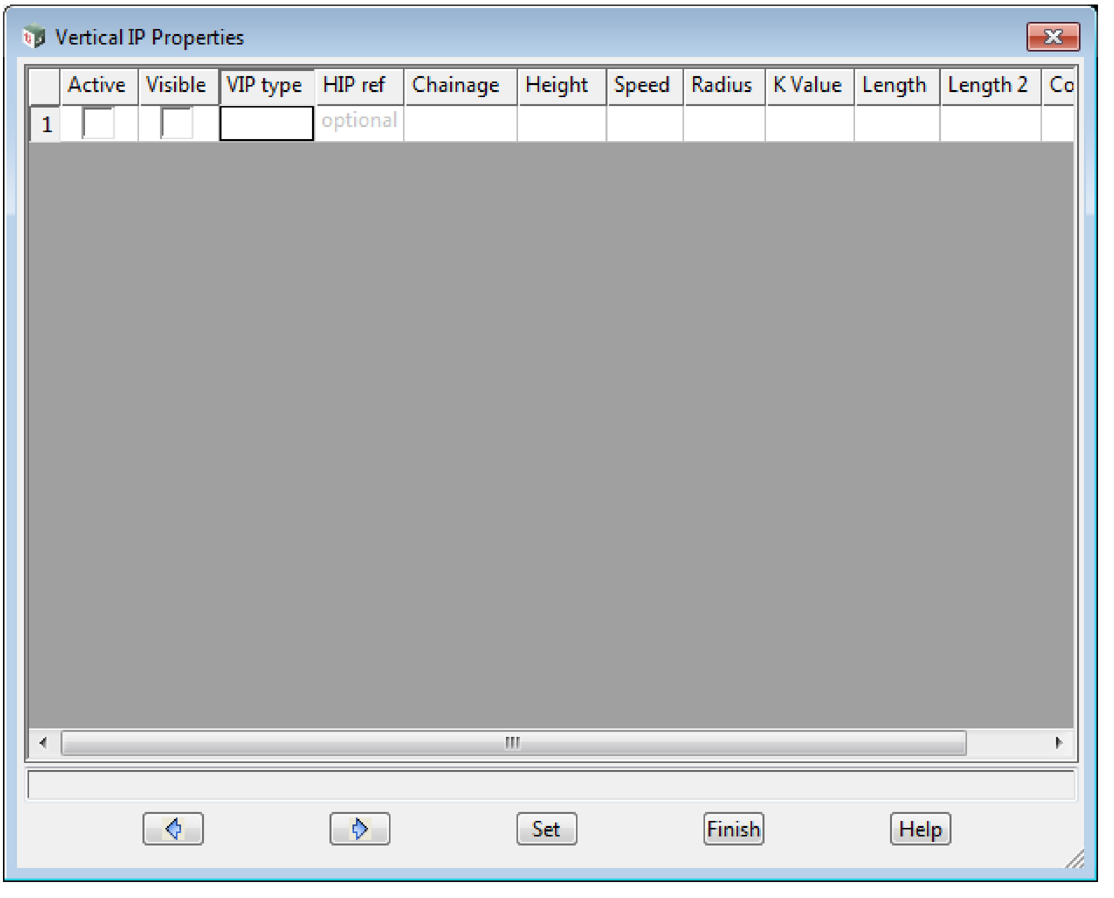
Trailing is the length of the trailing transition (spiral) when HIP Type is *Curve spiral*.

Warning: the *not Active* HIP's are still listed in the HIP table but the labelling of the HIP's on a plan view does not include them so in that case, the line number in the **Horizontal IP Properties** panel is not the same as the HIP number displayed on a plan view.

14.4.11.4.3 SA - VIPs Editor

If the vertical geometry of the super alignment consists of only VIPs (that is, no vertical parts) then clicking on **VIPs Editor** brings up the **Vertical IP Properties** panel which lists all the VIP's in the super alignment showing how the parabolas, asymmetric parabolas and arcs on the VIP are defined and the values for the VIP and accompanying parabolas and arcs.

The **Vertical IP Properties** is:



and when there is VIP information to display, looks like:

	Active	Visible	VIP type	Chainage	Height	Speed	Radius	K Value	Length	Len
1	✓	✓	Length	0.9657	-7.6827		0	0	0	
2	✓	✓	Kvalue	199.463	12.167		0	5	0	
3	✓	✓	Kvalue	322.4306	-2.1147		0	5	0	
4	✓	✓	Asymmetric	513.69	-30.3861		0	0	150	75
5	✓	✓	Circular arc	778.9741	-3.8577		500	0	0	
6	✓	✓	Length	1148.8236	-30.3087		0	0	100	
7										

Super Alignment Profiled on a Section View

Table of VIP Information

Clicking on the row number in the table draws a green circle around the corresponding HIP in any plan views where the HIP is visible.

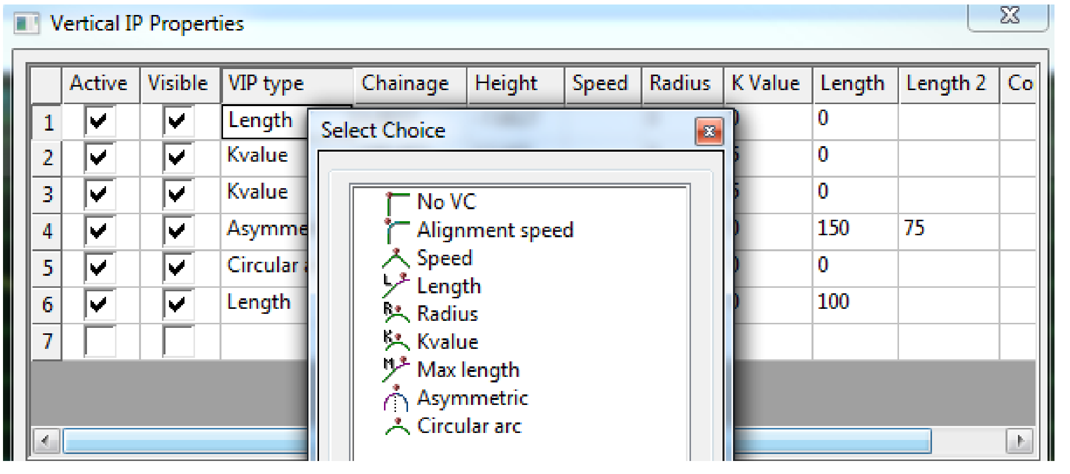
The Left arrow and Right arrow moves the highlighting to the previous VIP and next VIP respectively.

If Active is *ticked* for a row then that VIP is used in the super alignment.
If Active is *not ticked* for a row then that VIP is not used in the super alignment.

If Visible is *ticked* for a row then the curve at the VIP is used in the super alignment.
If Visible is *not ticked* for a row then the curve at the VIP is not used in the super alignment.

Warning: the row number will not be the same as the VIP numbers shown on a section view if there are VIP's that are not Active.

The **VIP type** can be modified by clicking RB in the **VIP Type** column for the VIP to be modified to bring up the choices for the VIP.



When the VIP Type is changed, the new information can be typed into the appropriate cells for that VIP and then the **Set** button is pressed to make the change.

Note: if the entire line is already highlighted, you will need to first click LB in the appropriate VIP Type cell to get focus just on that cell and then click RB. If a pop-up with Browse comes up, select Browse to get the HIP Type choices.

Any of the values in the other columns Chainage, Height, Speed, Radius, K Value, Length, Length2 and Comment can be modified and the **Set** button pressed to use the new values (if they are appropriate for the VIP Type).

Note:

Length is the length of the parabola when the VIP Type is *Length*

Length and Length2 are the lengths for an Asymmetric parabola when VIP Type is *Asymmetric*

Speed is the design speed for the parabola when VIP Type is *Speed*.

Radius is the radius of the arc when VIP Type is *Circular arc* or the effective radius for a parabola when VIP Type is *Radius.*

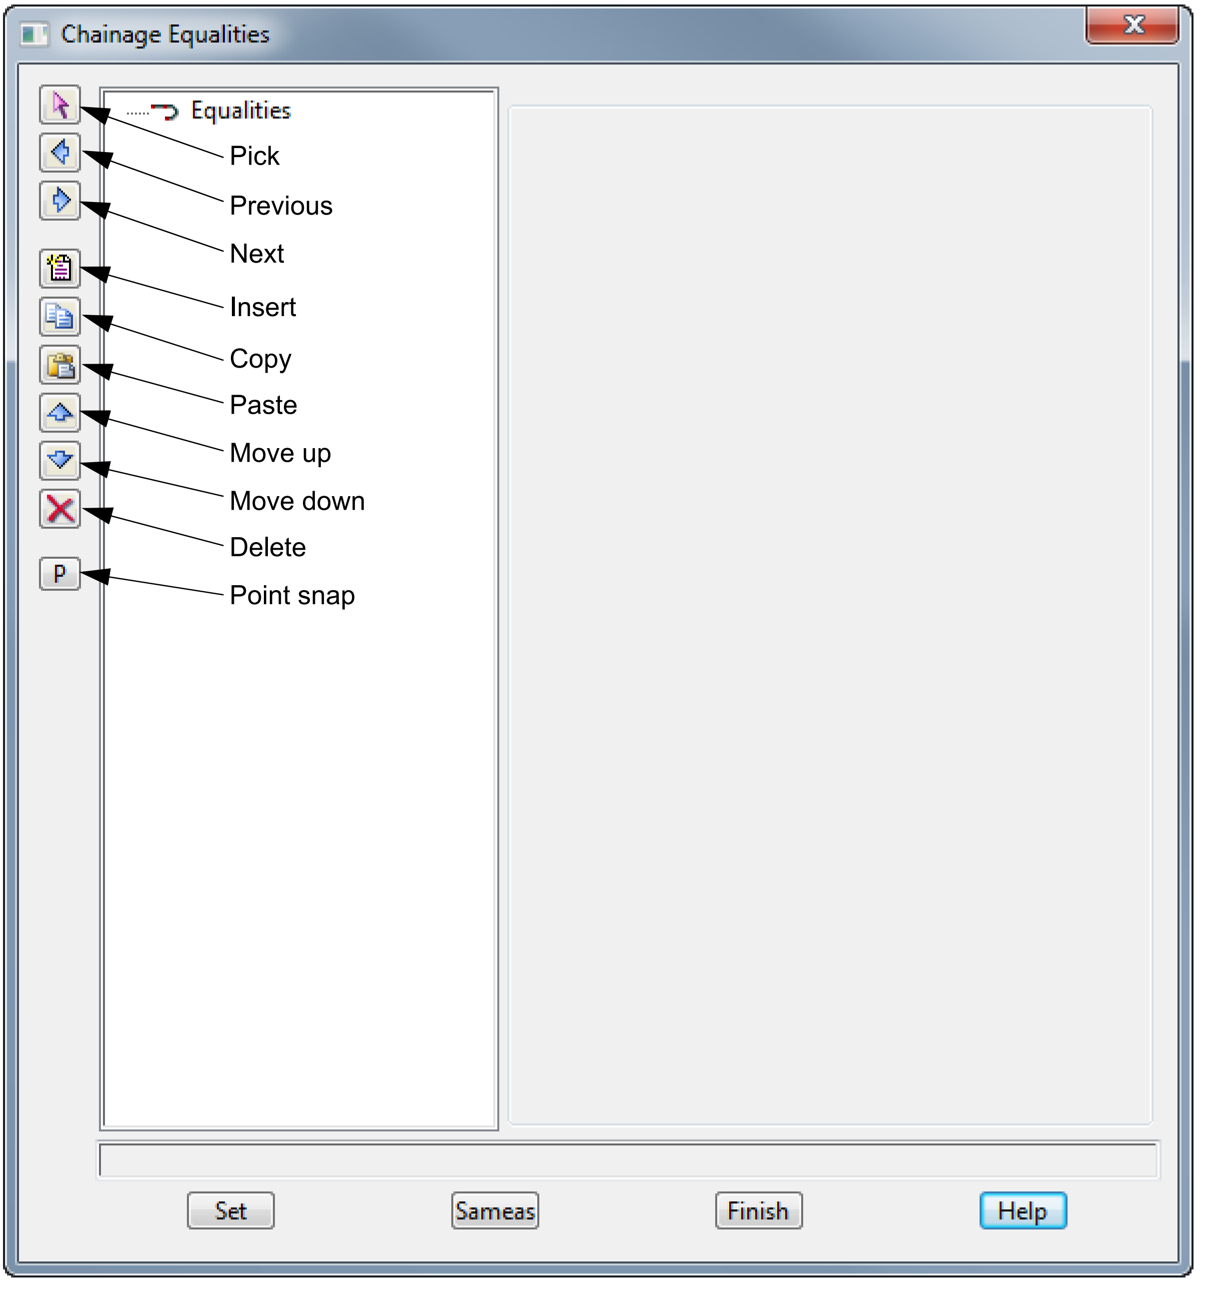
K Value is the K value for the parabola when HIP Type is *K value*.

Warning: the *not Active* are still listed in the VIP table but the labelling of the VIP's on a section view does not include them so in that case, the line number in the **Vertical IP Properties** panel is not the same as the VIP number displayed on a section view.

14.4.11.4.4 SA - Chainage Equalities Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

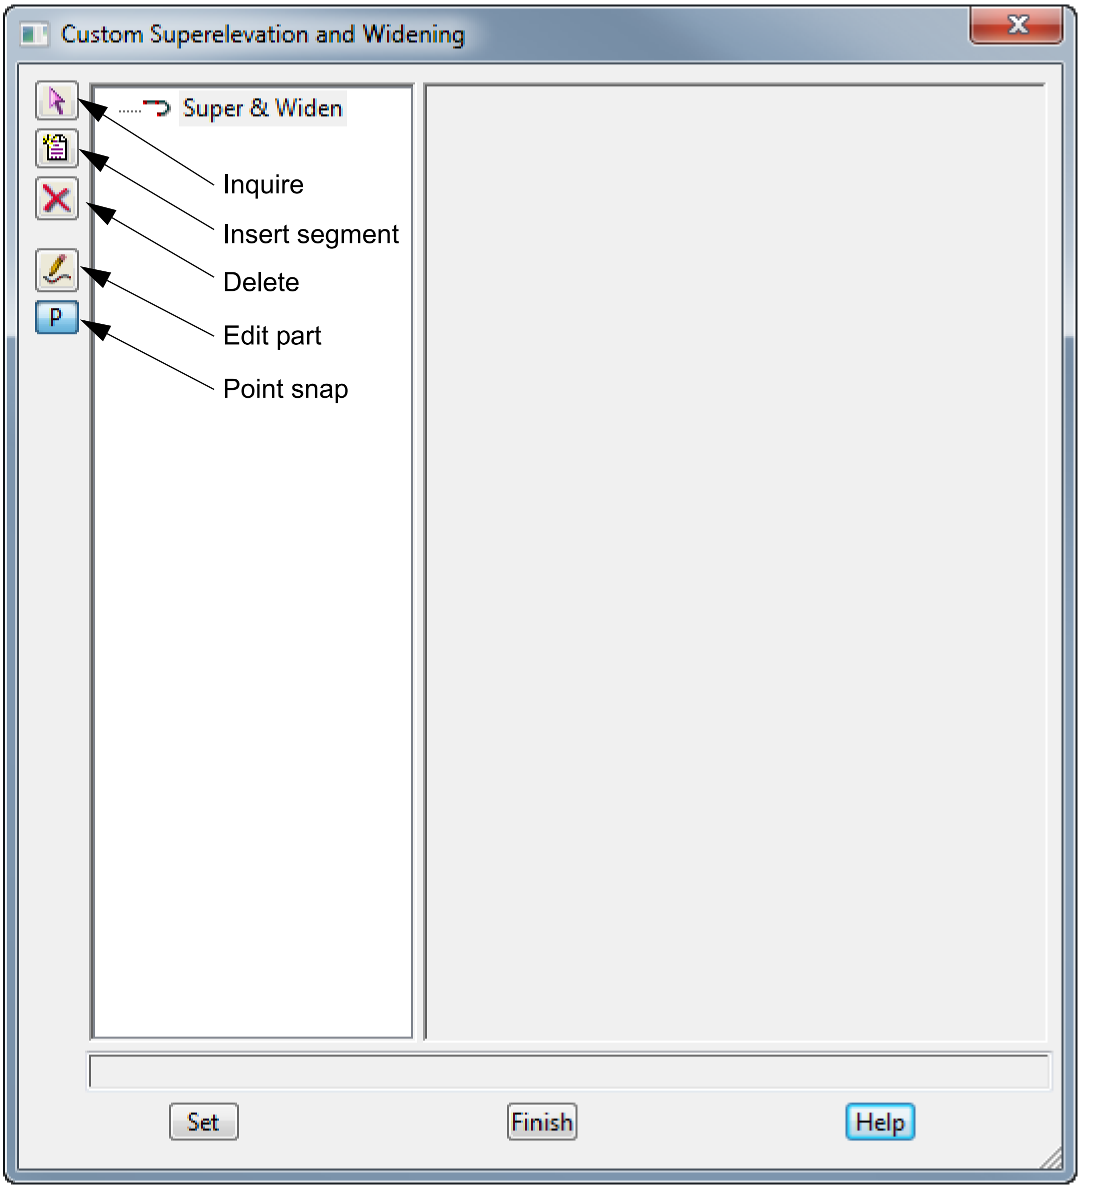
If Use chainage equality is ticked in the Advanced > Equality section of the Properties for the super alignment, then the **Chainage Equalities** panel is displayed.



14.4.11.4.5 SA - Custom Superelevation and Widening Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

If Use design standards is ticked in the Advanced > Design section of the Properties for the super alignment, then the **Custom Superelevation and Widening** panel is displayed.

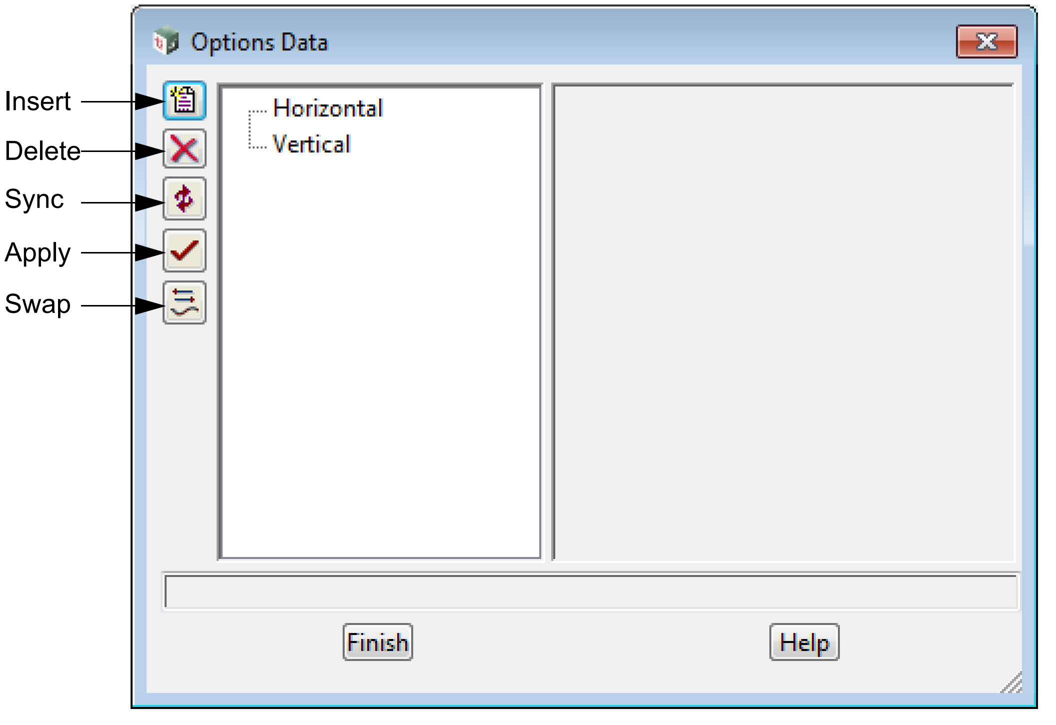


14.4.11.4.6 SA - Centreline Options

At any time, a copy of the current horizontal or vertical geometry can be made and stored under an Option name.

So an Option is like a backup (safe copy) of the current horizontal or vertical geometry and can be restored as the super alignment geometry at a later time.

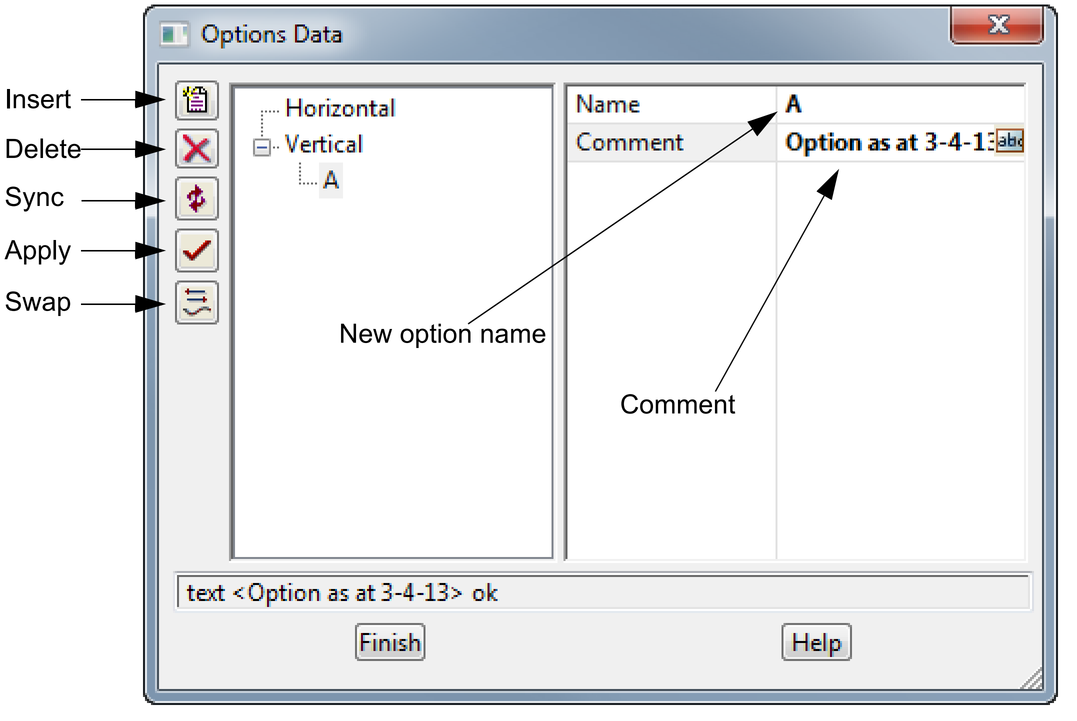
Clicking Centreline Options brings up the **Options Data** panel.



Insert

If the Horizontal/Vertical branch is highlighted and **Insert** clicked, a new Option is created under Horizontal/ Vertical with the default name Horizontal/Vertical, and a copy of the current horizontal/vertical geometry of the super alignment is stored with the new option.

Name and Comment can be modified and are changed when <Enter> is pressed.



Delete

If the Horizontal/Vertical Option is highlighted and **Delete** clicked, then the Option is deleted.

Sync

If the Horizontal/Vertical Option is highlighted and **Sync** clicked, the horizontal/vertical geometry of the Option is deleted and replaced by the current horizontal/vertical geometry of the super alignment. That is, the Option geometry is taken from the super alignment.

Apply

If the Horizontal/Vertical branch is highlighted and **Apply** clicked, the horizontal/vertical geometry of the super alignment is deleted and replaced by the horizontal/vertical geometry of the Option. That is, the super alignment geometry is taken from the Option.

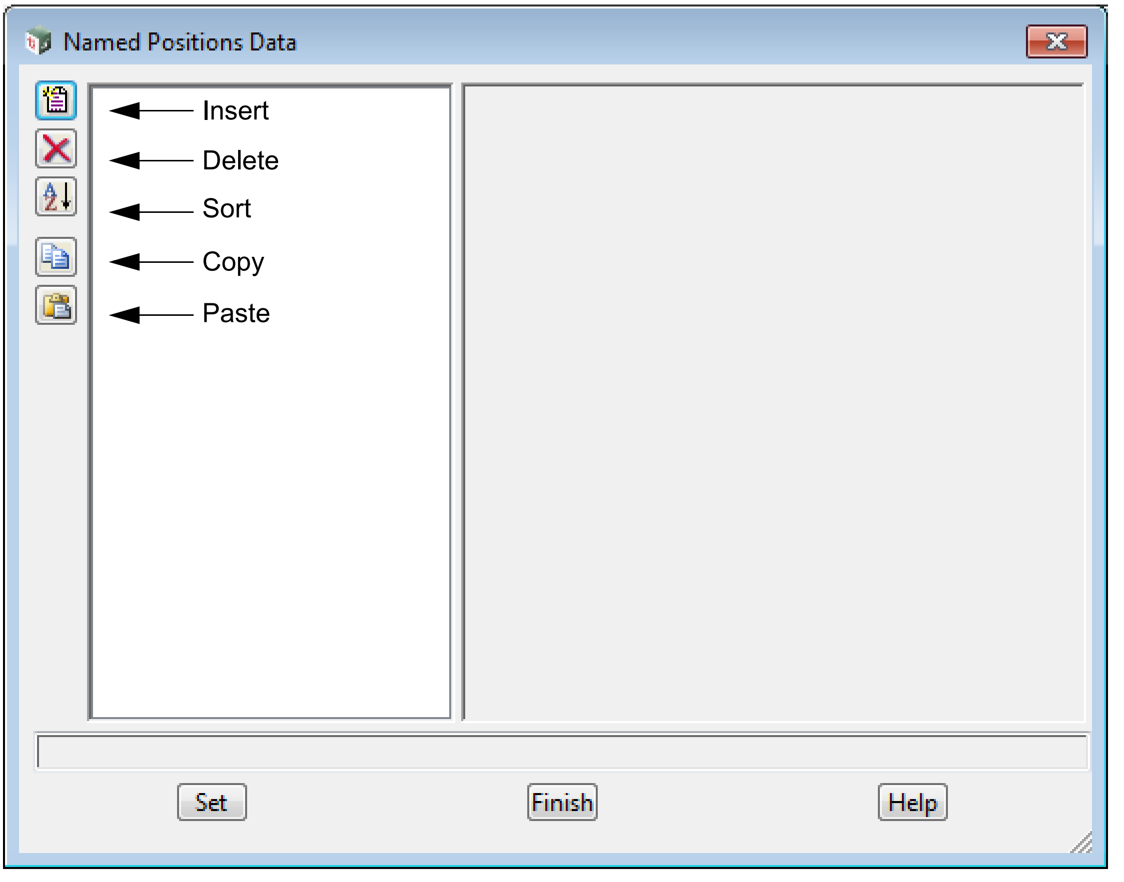
Swap

If the Horizontal/Vertical branch is highlighted and **Swap** clicked, the current horizontal/vertical geometry of the super alignment is replaced by the horizontal/vertical geometry of the Option and the horizontal/vertical geometry of the Option is replaced by the current horizontal/vertical geometry of the super alignment. That is, the two geometries are swapped.

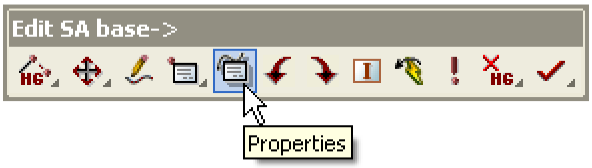
14.4.11.4.7 SA - Named Positions

This section of documentation is a work in progress and will be updated in subsequent releases.

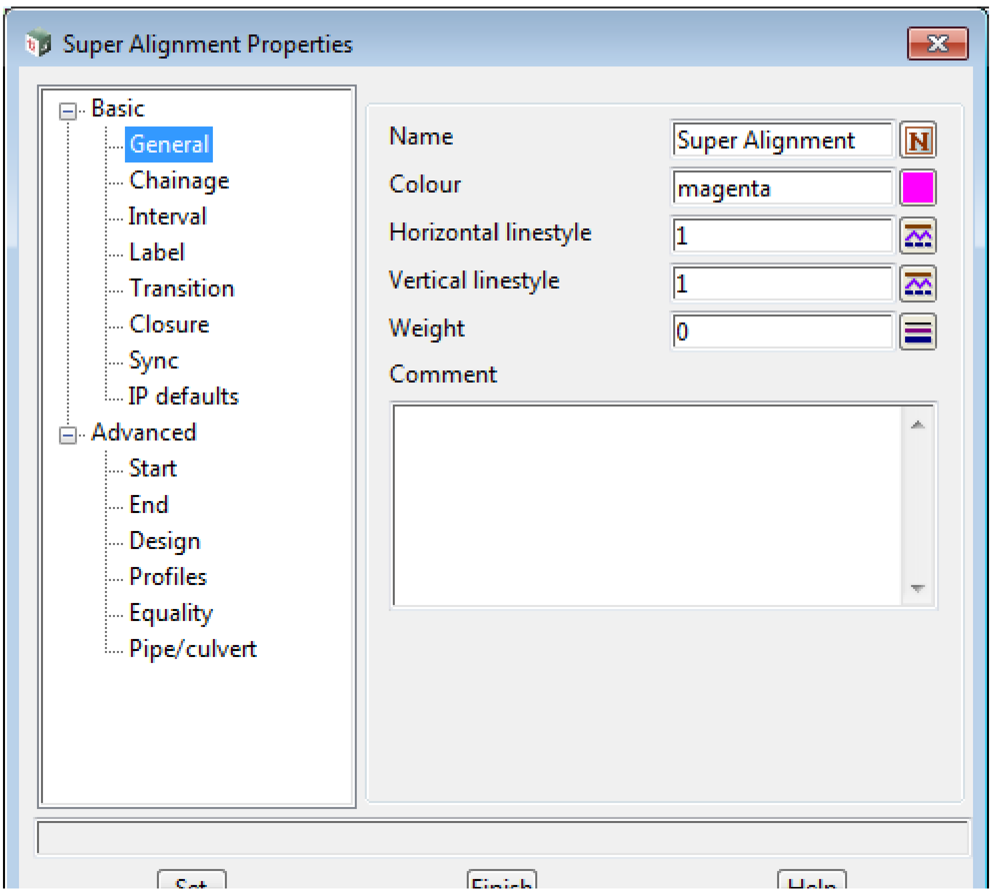
Clicking Named Positions brings up the **Named Positions Data** panel.



14.4.11.5 SA - Super Alignment Properties Icon



Selecting **Properties**  displays the **Super Alignment Properties** panel



The information in the **Super Alignment Properties** panel is the same as for the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on any branch, then the **Set** button must be clicked before leaving that branch to modify the values for the string.

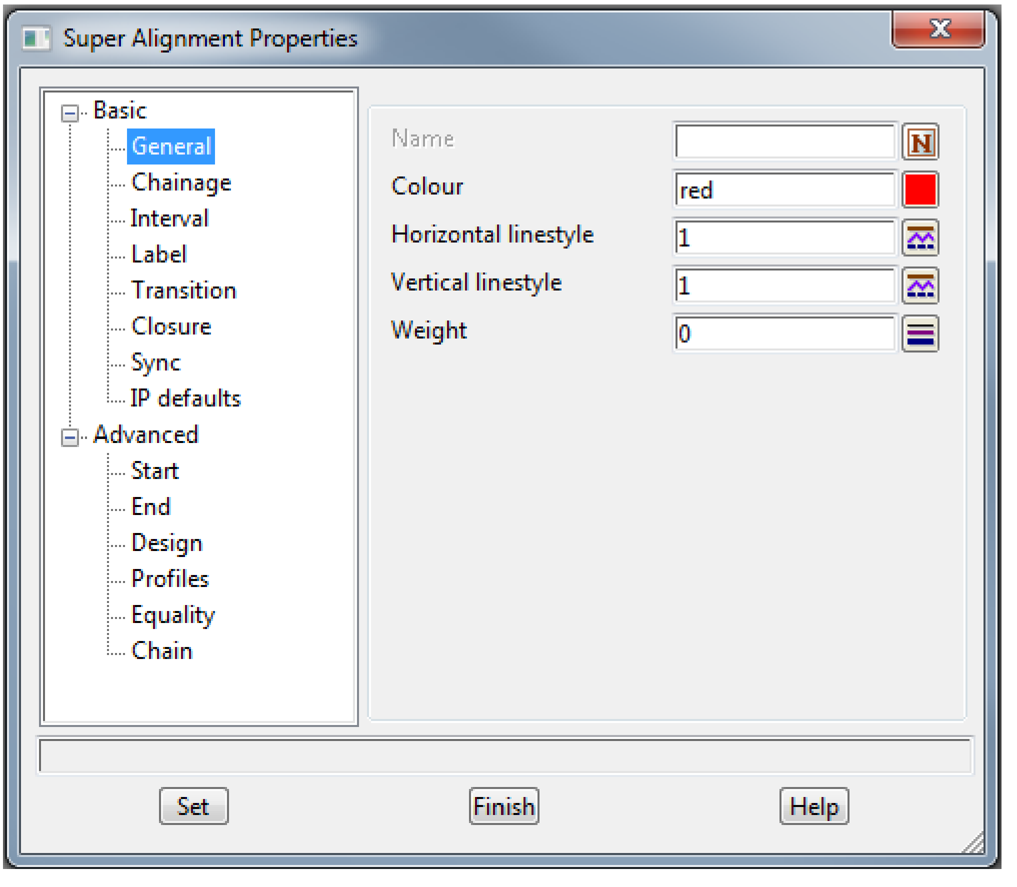
WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See 14.2.1 Create Super Alignment for details on all the fields and values in the branches of this panel.

For information on each branch, go to:

Basic > General branch
Basic > Chainage branch
Basic > Interval branch
Basic > Label branch

Basic > General branch



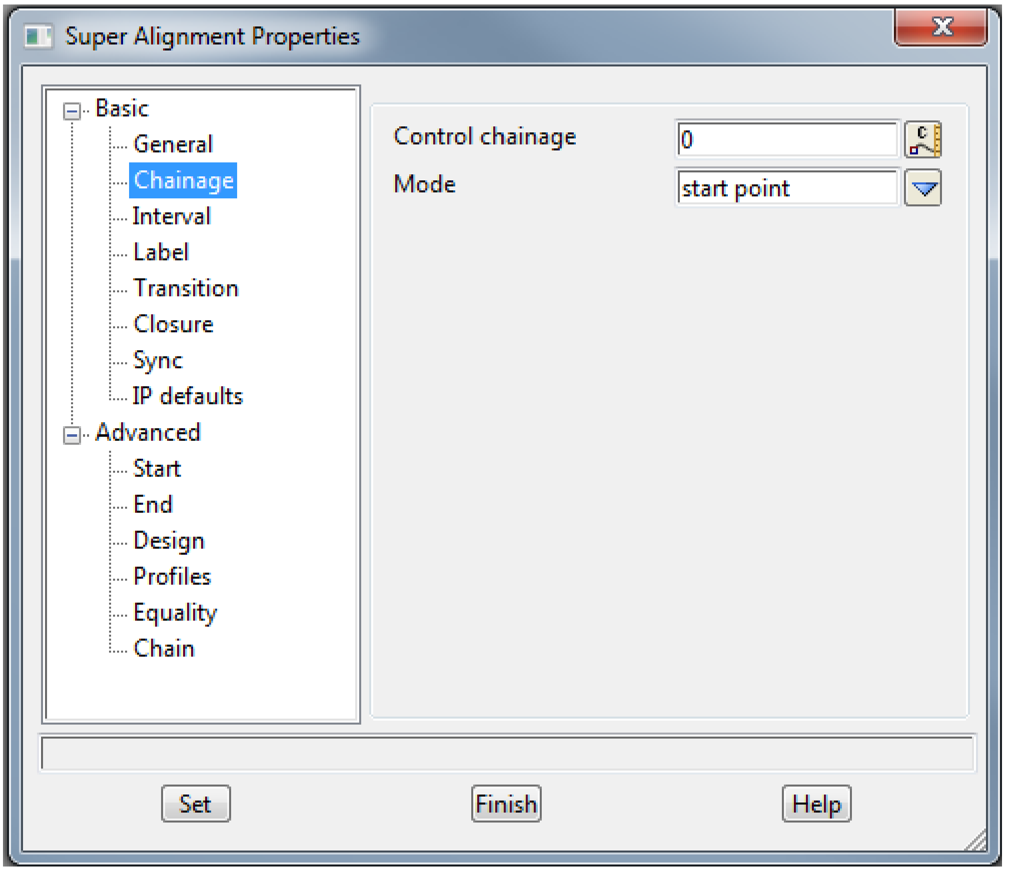
The information in the Basic >General branch is the same as for the Basic >General branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >General branch, then the **Set** button must be clicked before leaving the Basic >General branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Basic > General branch for details on all the fields and values in the Basic >General branch.

Basic > Chainage branch



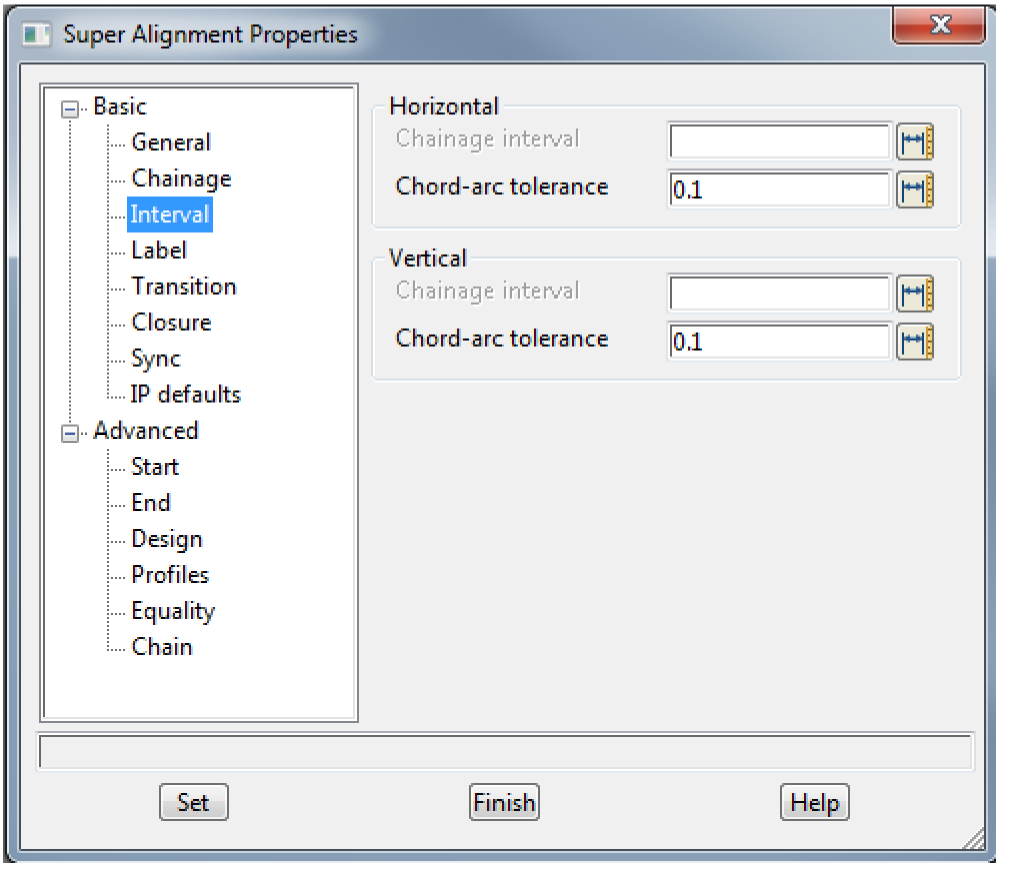
The information in the Basic >Chainage branch is the same as for the Basic >Chainage branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >Chainage branch, then the **Set** button must be clicked before leaving the Basic >Chainage branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Basic > Chainage branch for details on all the fields and values in the Basic >Chainage branch.

Basic > Interval branch



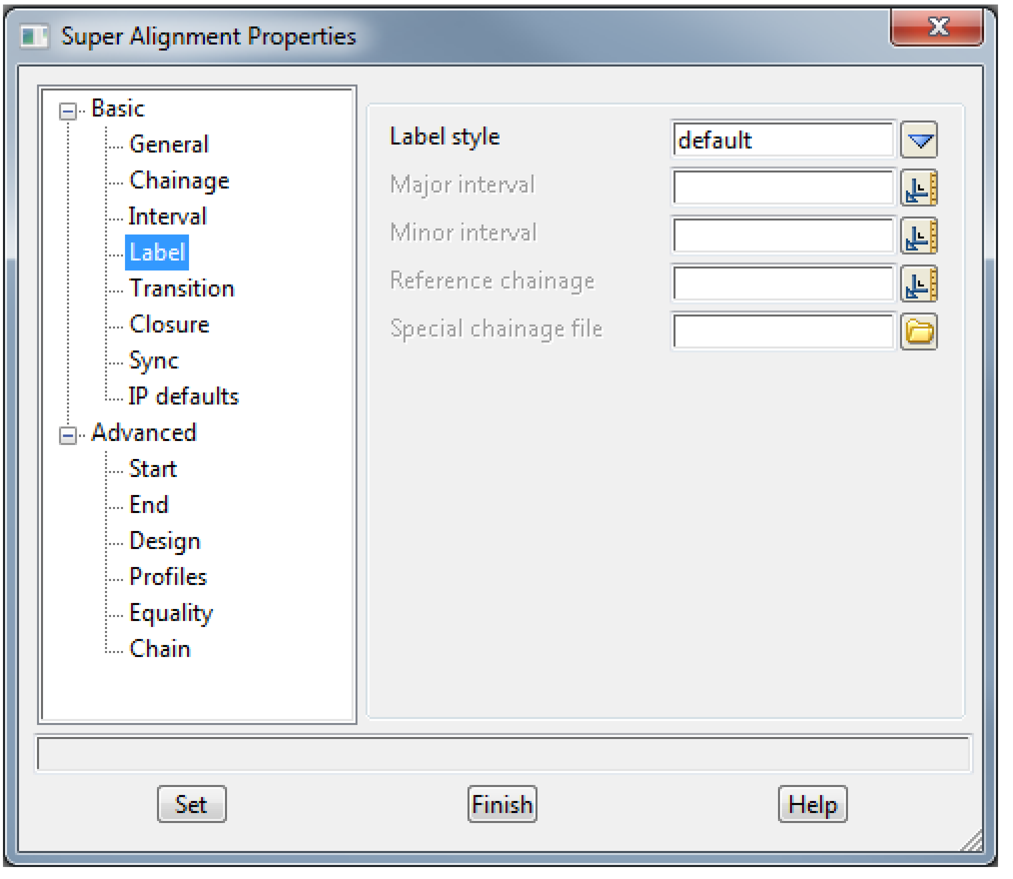
The information in the Basic >Interval branch is the same as for the Basic >Interval branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >Interval branch, then the **Set** button must be clicked before leaving the Basic >Interval branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Basic > Interval branch for details on all the fields and values in the Basic >Interval branch.

Basic > Label branch



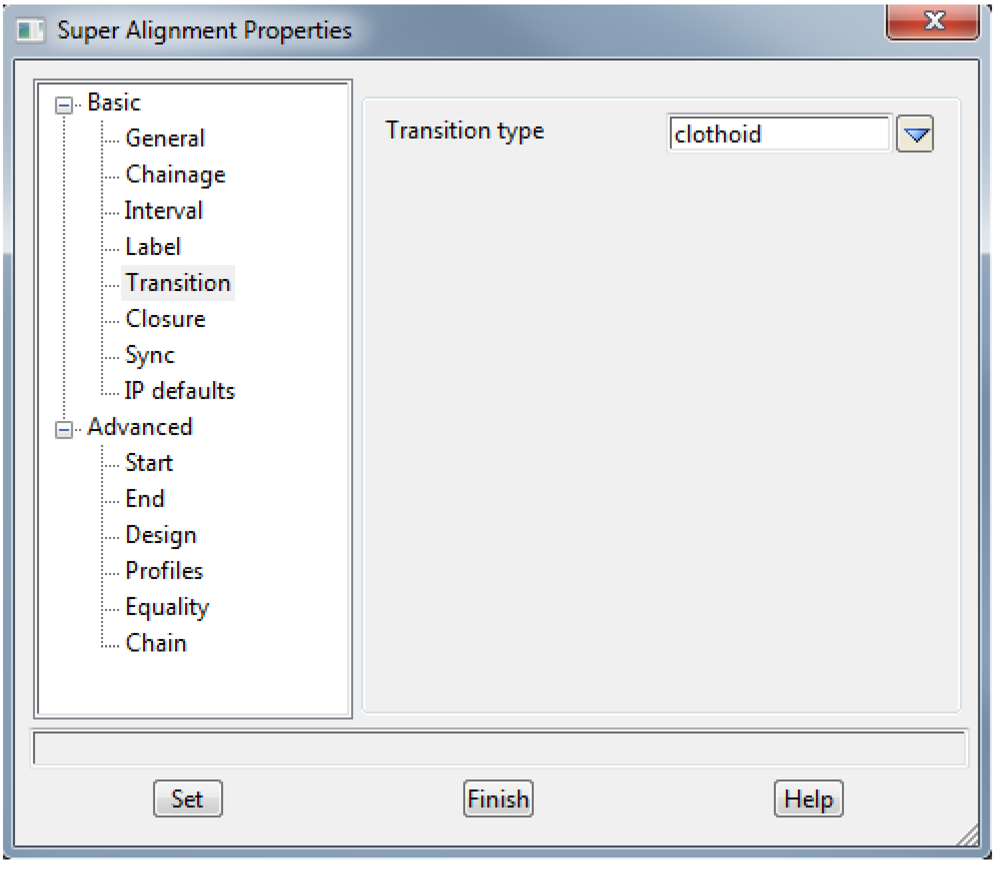
The information in the Basic >Label branch is the same as for the Basic >Label branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >Label branch, then the **Set** button must be clicked before leaving the Basic >Label branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Basic > Label branch for details on all the fields and values in the Basic >Label branch.

Basic > Transition branch



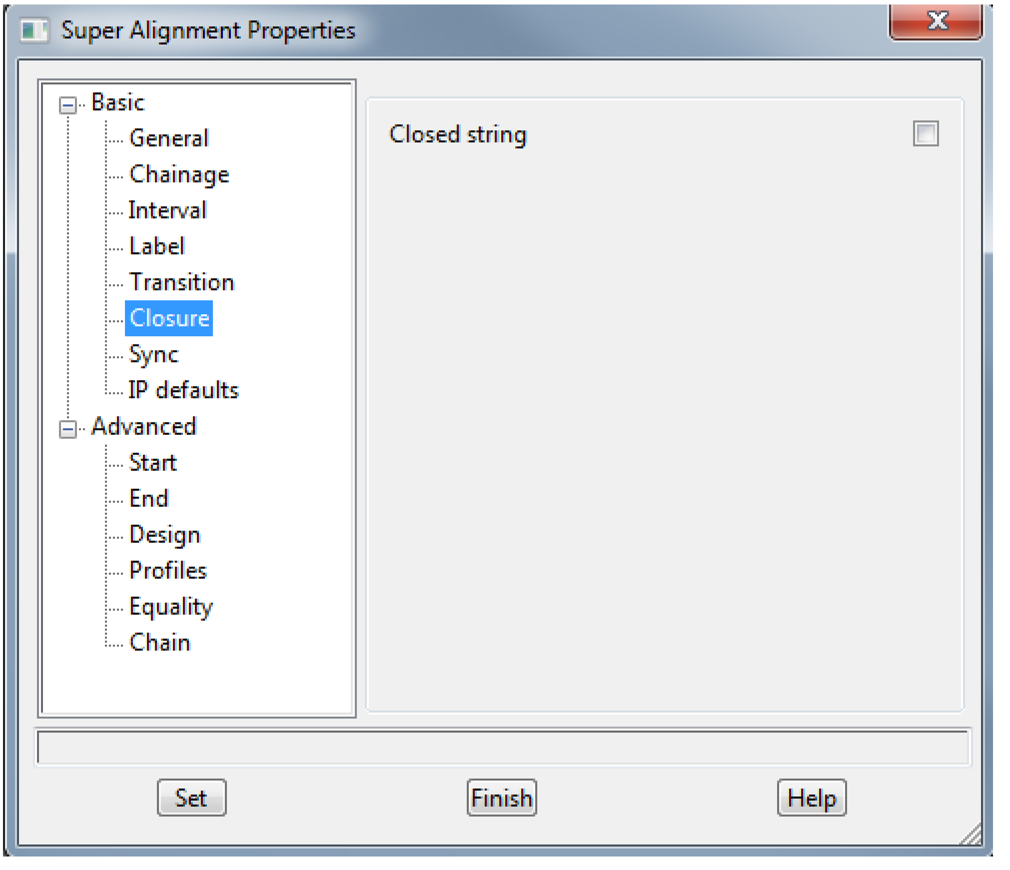
The information in the Basic >Transition branch is the same as for the Basic >Transition branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >Transition branch, then the **Set** button must be clicked before leaving the Basic >Transition branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Basic > Transition branch for details on all the fields and values in the Basic >Transition branch.

Basic > Closure branch



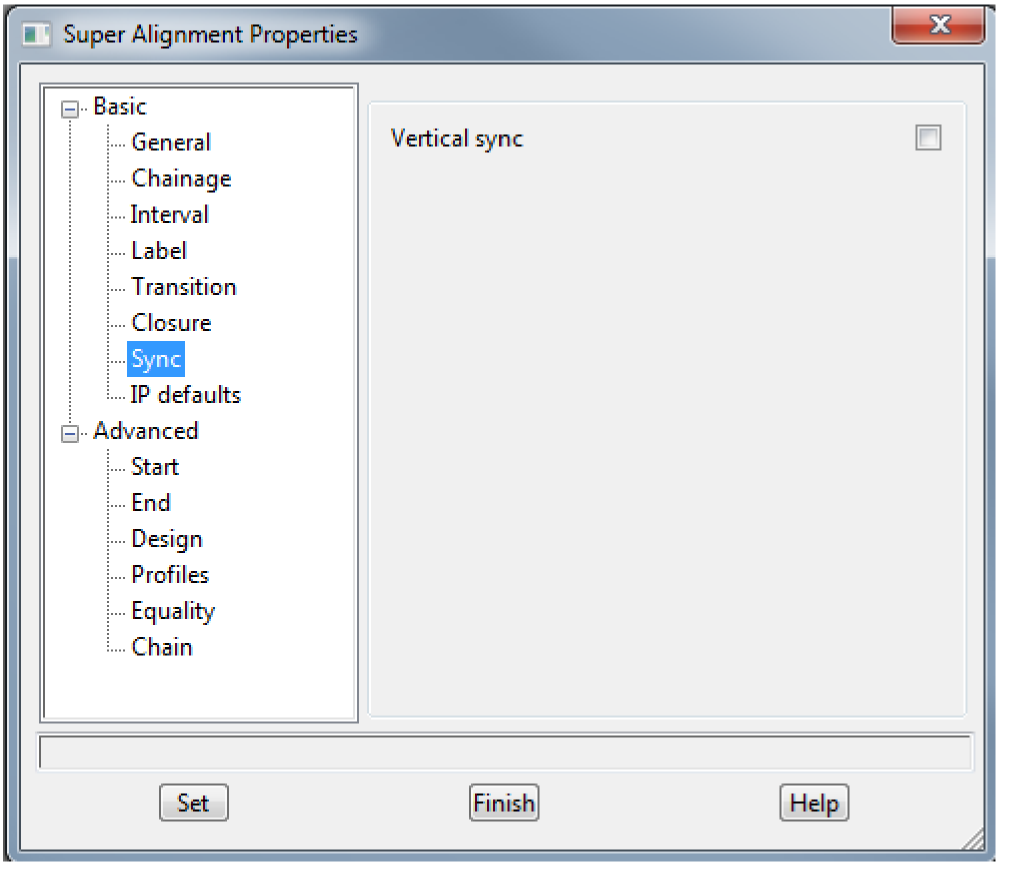
The information in the Basic >Closure branch is the same as for the Basic >Closure branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >Closure branch, then the **Set** button must be clicked before leaving the Basic >Closure branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can’t change values on a number of branches and then click **Set**.

See Basic > Closure branch for details on all the fields and values in the Basic >Closure branch.

Basic > Sync branch



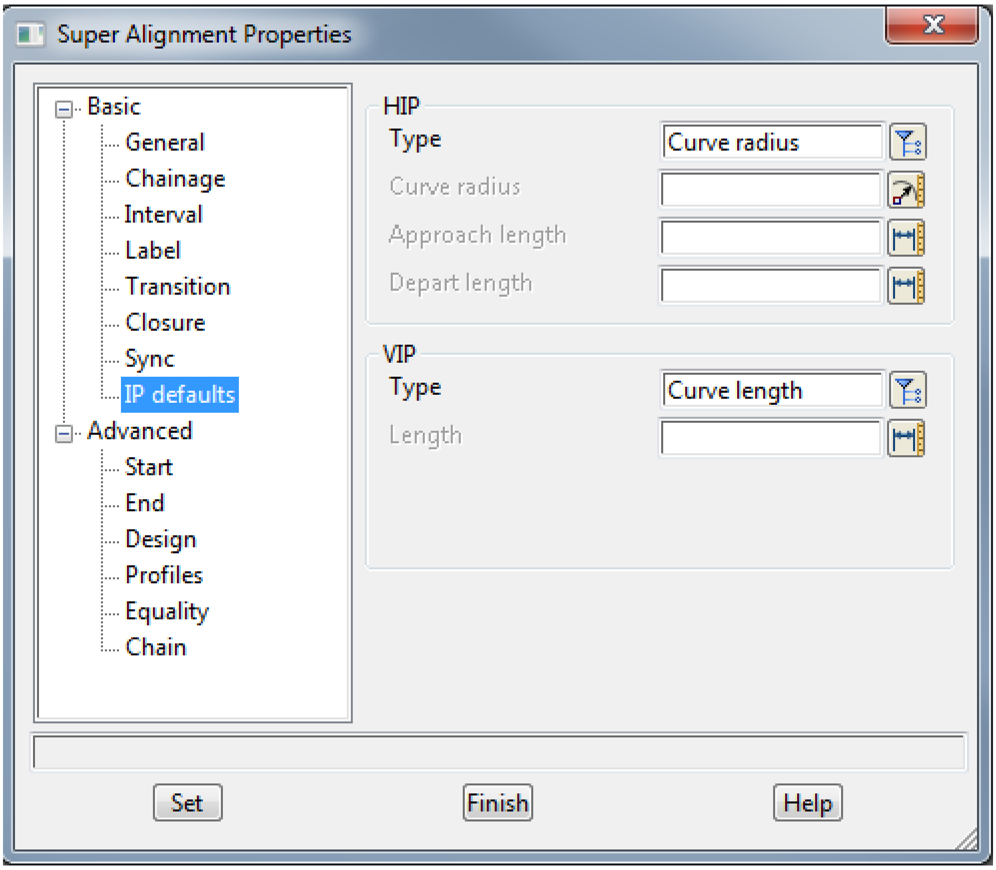
The information in the Basic >Sync branch is the same as for the Basic >Sync branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >Sync branch, then the **Set** button must be clicked before leaving the Basic >Sync branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Basic > Sync branch for details on all the fields and values in the Basic >Sync branch.

Basic > IP defaults branch



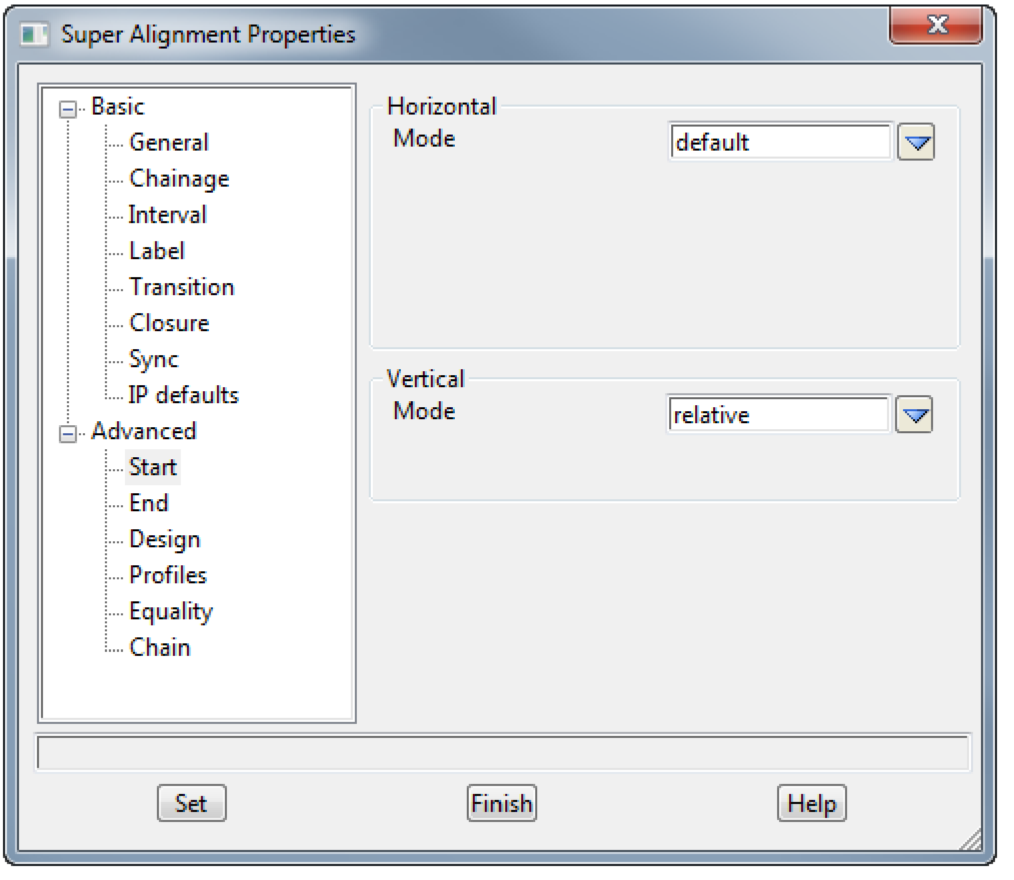
The information in the Basic >IP defaults branch is the same as for the Basic >IP defaults branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Basic >IP defaults branch, then the **Set** button must be clicked before leaving the Basic >IP defaults branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Basic > IP defaults branch for details on all the fields and values in the Basic >IP defaults branch.

Advanced > Start branch



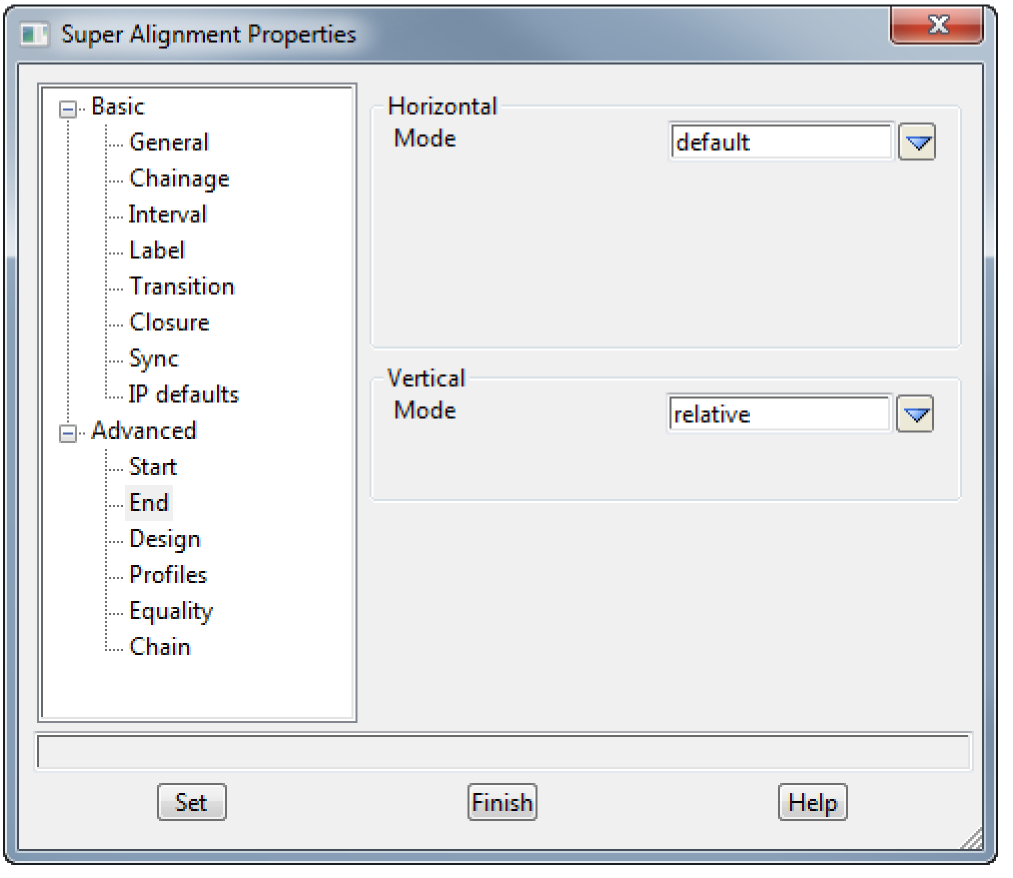
The information in the Advanced >Start branch is the same as for the Advanced >Start branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Advanced >Start branch, then the **Set** button must be clicked before leaving the Advanced >Start branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Advanced > Start branch for details on all the fields and values in the Advanced >Start branch.

Advanced > End branch



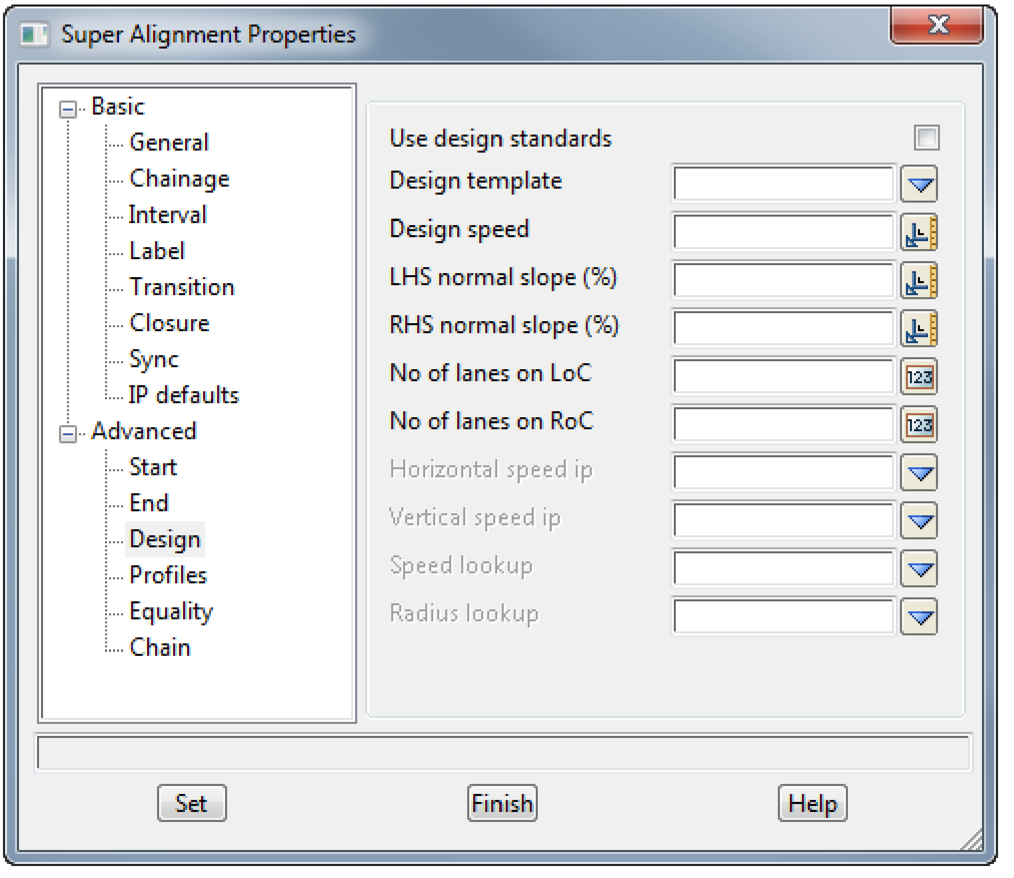
The information in the Advanced >End branch is the same as for the Advanced >End branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Advanced >End branch, then the **Set** button must be clicked before leaving the Advanced >End branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Advanced > End branch for details on all the fields and values in the Advanced >End branch.

Advanced > Design branch



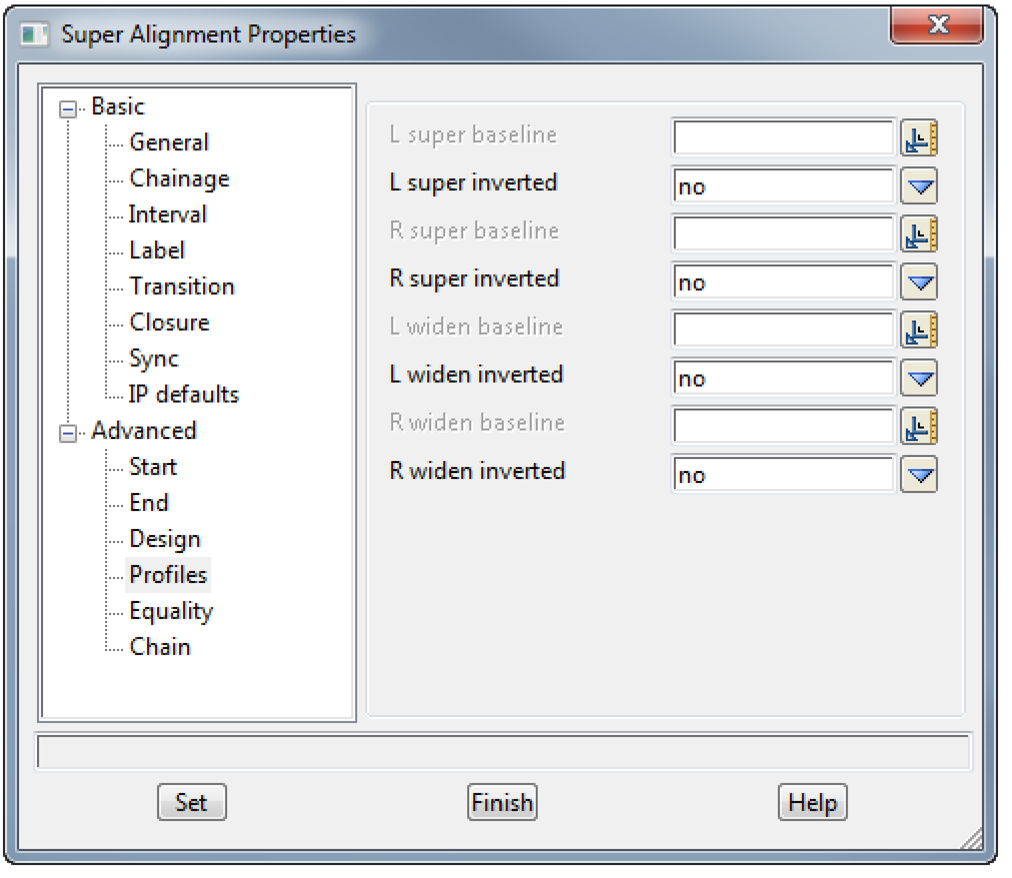
The information in the Advanced >Design branch is the same as for the Advanced >Design branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Advanced >Design branch, then the **Set** button must be clicked before leaving the Advanced >Design branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Advanced > Design branch for details on all the fields and values in the Advanced >Design branch.

Advanced > Profiles branch



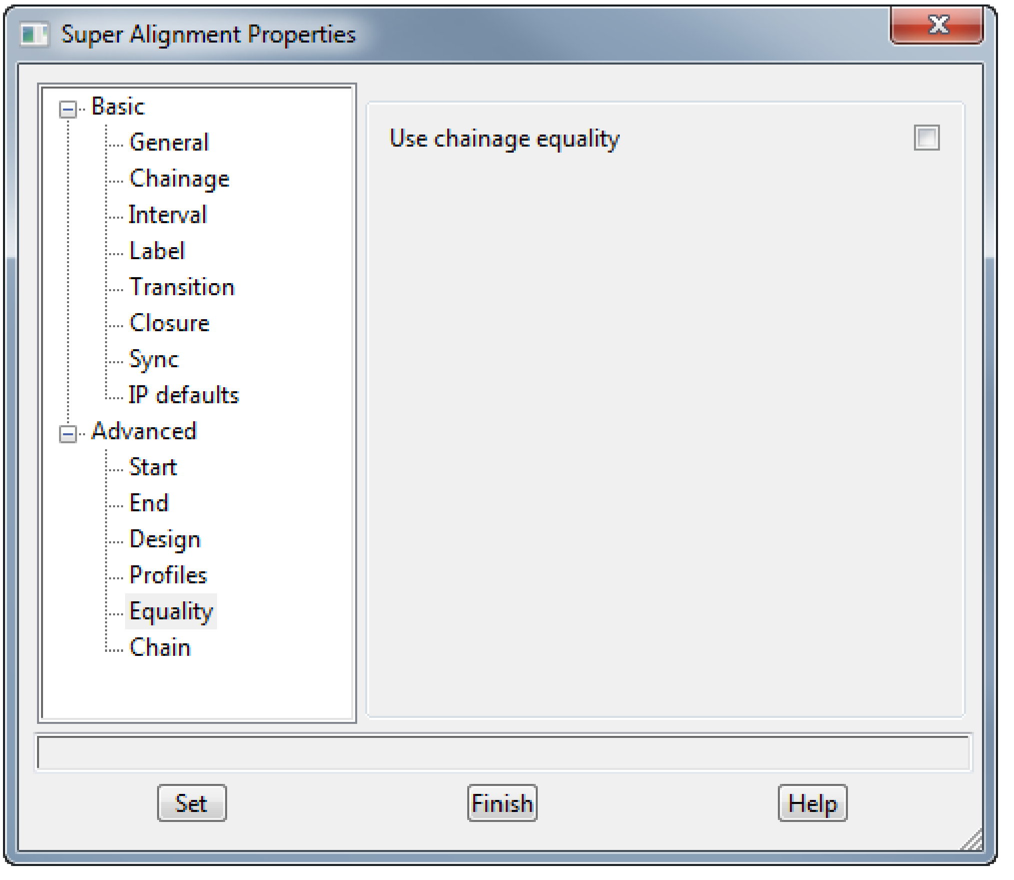
The information in the Advanced >Profiles branch is the same as for the Advanced >Profiles branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Advanced >Profiles branch, then the **Set** button must be clicked before leaving the Advanced >Profiles branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Advanced > Profiles branch for details on all the fields and values in the Advanced >Profiles branch.

Advanced > Equality branch



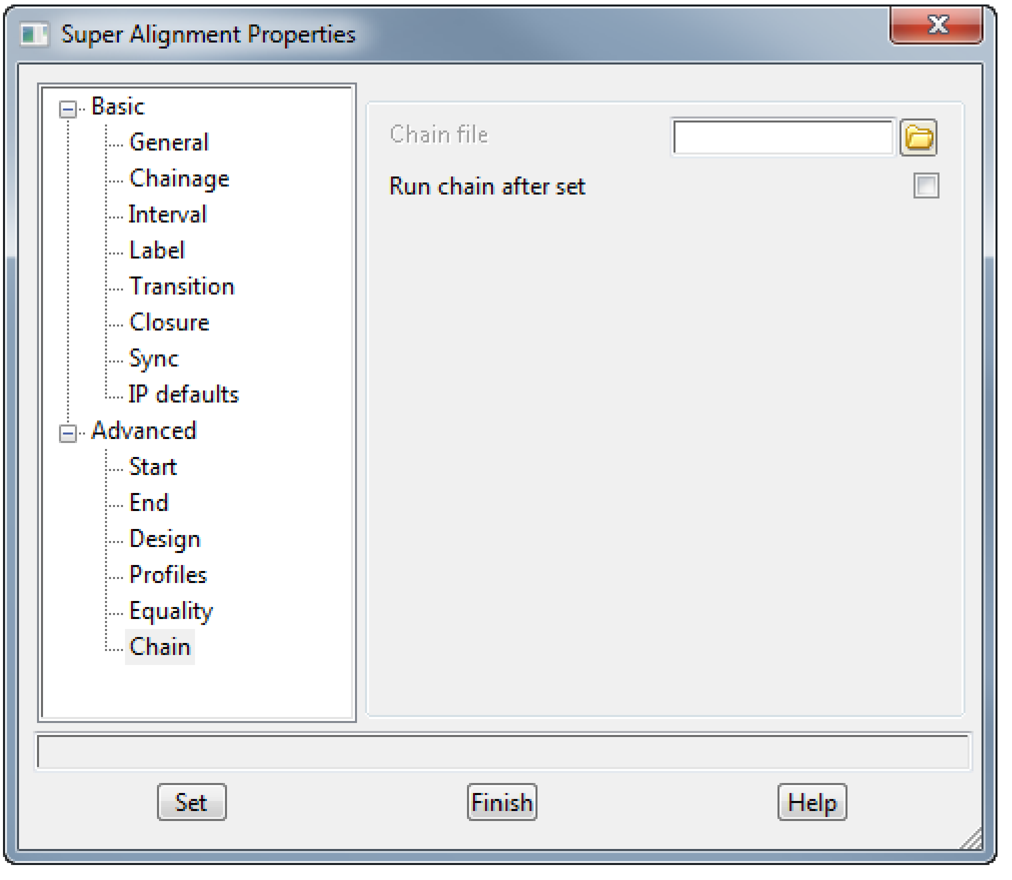
The information in the Advanced >Equality branch is the same as for the Advanced >Equality branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Advanced >Equality branch, then the **Set** button must be clicked before leaving the Advanced >Equality branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can’t change values on a number of branches and then click **Set**.

See Advanced > Equality branch for details on all the fields and values in the Advanced >Equality branch.

Advanced > Chain branch



The information in the Advanced >Chain branch is the same as for the Advanced >Chain branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if any changes are made to the values on the Advanced >Chain branch, then the **Set** button must be clicked before leaving the Advanced >Chain branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See Advanced > Chain branch (not yet implemented) for details on all the fields and values in the Advanced >Chain branch.

14.4.11.6 SA - Undo and Redo Icons

An Undo and Redo list is defined for each Editor open on the screen. That is, each open Editor has its own Undo/Redo lists.

As each option is performed in an open Editor, the reverse of the option is added to the Editors Undo list. Hence an option can be undone (reversed) by immediately clicking on the Undo icon.

Note: the Undo icon is.

If an option is undone, it is added to the Redo list so that it can be redone.

So clicking on the **Undo** icon undoes the last Editor operation for this super alignment and adds it to the top of the Redo list

Note: the Redo icon is

Clicking on the **Redo** icon redoes the last Editor operation that was undone for this super alignment and the undone operation is added to the top of the Undo list.

Important Note: as each option is added to an Undo or Redo list, the options already on the list are pushed down and none of the options pushed down can be undone/redone until all the options above it have been undone/redone. So both the Undo and Redo lists are last in, first out lists.

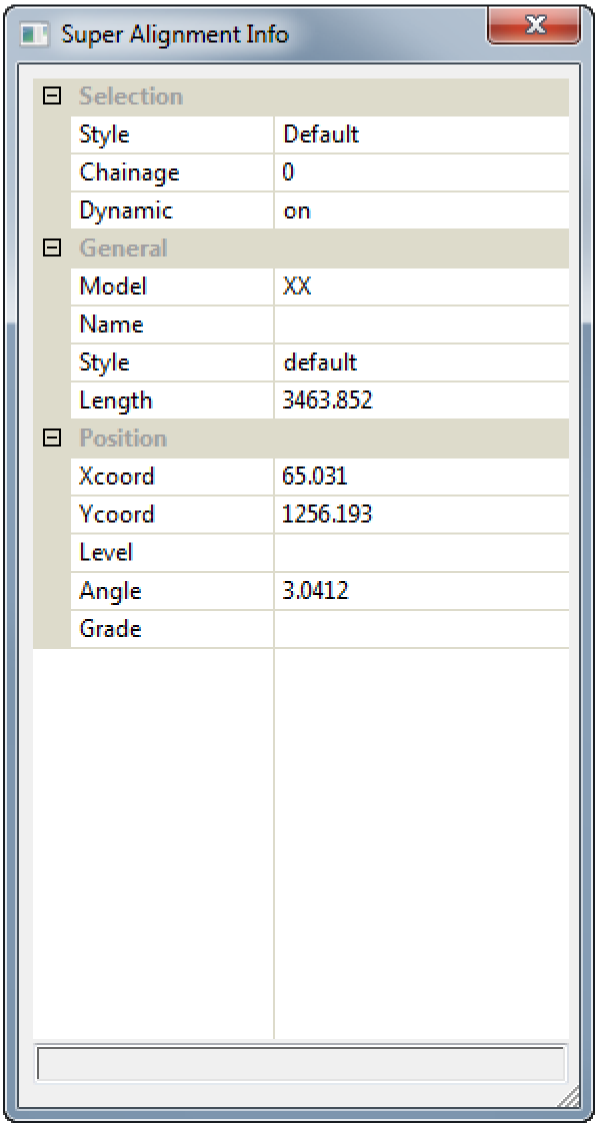
So the order in the Undo/Redo lists is important and can not be altered.

When the Editor is exited by either **Quit** or **Finish**, the undo and redo lists are deleted and are no longer usable.

14.4.11.7 SA - Info Icon

The Info icon is

and clicking on the **Info** icon brings up the **Super Alignment Info** panel (see 14.2.2.1 Super Alignment Info).



Super Alignment Info

14.4.11.8 SA - Recalc Icon

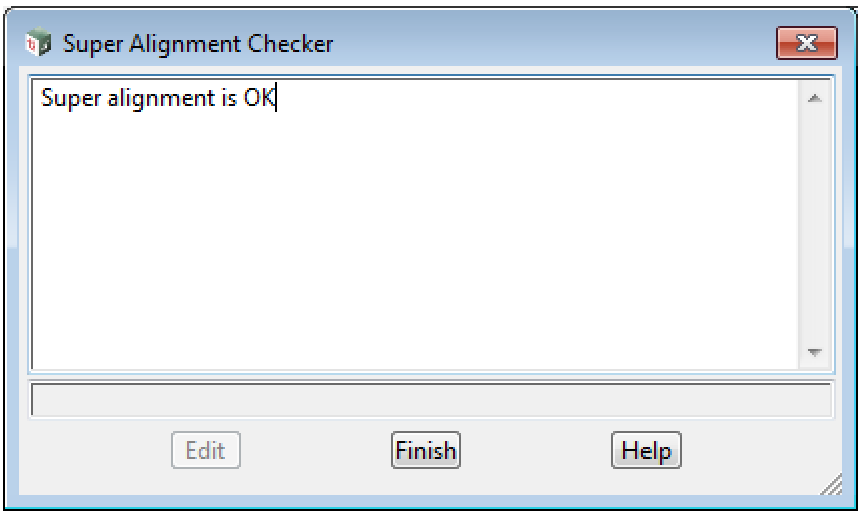
The Recalc icon is

and clicking on the Recalc icon does a *recalc* for the super alignment.

14.4.11.9 SA - Error Checker Icon

The Error Checker icon is

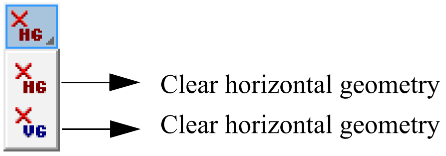
and clicking on the Error Checker icon brings up the **Super Alignment Checker** panel and runs the SA checking routines.



Warning: This options is still under development.

14.4.11.10 SA - Clear Toolbar

The Clear toolbar is

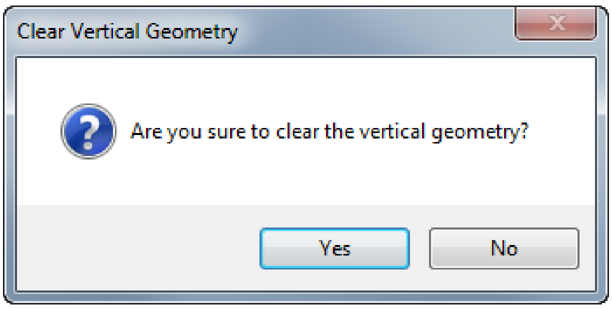


The **Clear VG** and **Clear HG** options are used to delete all the horizontal and/or vertical geometry points in the super alignment string.

14.4.11.10.1 SA - Clear VG

The **Clear VG** option removes all the vertical geometry from the string.

The horizontal geometry still exists plus all the other string properties (model, name, colour and type).

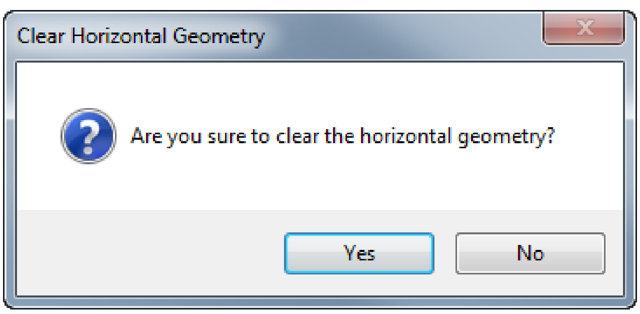


After a **Clear VG**, the vertical geometry can be re- entered using the SA Edit options.

14.4.11.10.2 SA - Clear HG

The **Clear HG** option removes all the horizontal **and** vertical geometry from the string.

The string still exists and keeps its other properties such as model, name, colour and type.



After a **Clear HG**, the horizontal and vertical geometry can be re- entered using the SA Edit options.

14.4.11.11 SA - Help Icon

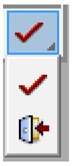
The Help icon is

Clicking on **Help** icon opens the context sensitive Help and jumps to this section.

For more information on the super alignment options, see 14.4.11 Edit Super Alignment.

14.4.11.12 SA - Finish Toolbar

The Finish toolbar is



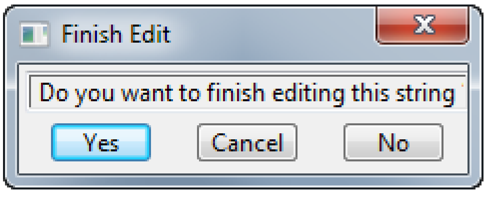
finish - save the SA and finish the editing session

quit - end the editing session without saving

14.4.11.12.1 SA - Finish

When editing of the super alignment is completed, **Finish** is used to save the modifications and exit the SA Editor.

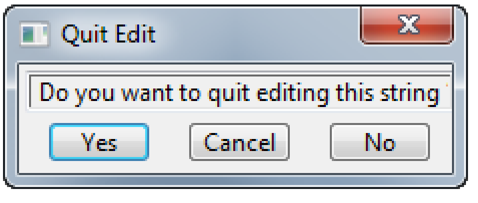
After selecting **Finish**, a **Yes-No-Cancel** panel is displayed to confirm that the edit session has ended and all the edits are to be kept. If **Yes** is selected, the edits will be stored and the SA Editor exited.



14.4.11.12.2 SA - Quit

At any time the Editing process can be aborted and all the edits thrown away by selecting the **Quit** option. That is, the super alignment is left as it was before the *Edit* was begun.

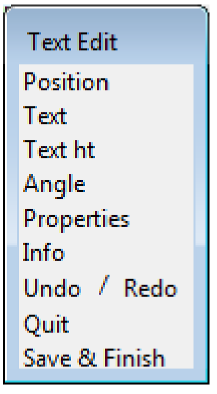
After selecting**Quit** , a**Yes-No-Cancel** panel is displayed to confirm that the edit is to be terminated. If **Yes** is selected, the edits will be ignored and the original unedited super alignment kept.

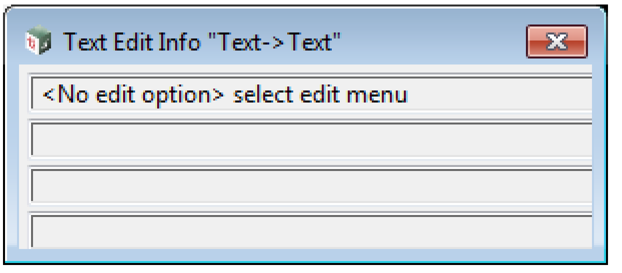


Note that if it was a new string being created, the Editor is terminated by Quit and no string is created.

14.4.12 Text Edit

On picking a text string, the **text edit** menu and the panel are placed on the screen.





Each option in the **text edit** menu will now be described.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.4.12.1 Position

The **position** option is used to place the text string for the first time and to re-position (move) an existing text string.

Position is a one step process.

After selecting the **position** option, the new position for the text is selected. The text is then redrawn at the new position.

message area 1 <Position>

Screen message area

<Select point position> [picks][][menu]

<Select point position> [picks][accepts][menu]

The **position** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **text edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the position option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **position** option still current.

Typed input can be used at any stage.

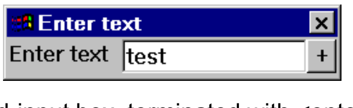
Continue to the next section 14.4.12.2 Text or return to 14.4.12 Text Edit.

14.4.12.2 Text

The **text** option is used to modify the text of the text string.

After the **text** option is chosen, an enter text typed-input box is placed on the screen with the string's current text displayed in it.

The enter text typed-input box looks like:



The text is entered into the typed-input box, terminated with <enter>. The entered value is taken as the text of the text string and the string redrawn with the new text. The typed-input box then disappears.

The **text** option automatically terminates and a new option needs to selected from the **text edit** menu.

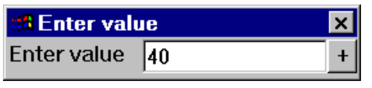
Continue to the next section 14.4.12.3 Text ht or return to 14.4.12 Text Edit.

14.4.12.3 Text ht

The **text ht** option is used to modify the height of the text in the text string.

After the **text ht** option is chosen, an enter value typed-input box is placed on the screen with the string's current text height displayed in it.

The enter value typed-input box looks like:



The text height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the text in the text string and the string redrawn with the new height.

The typed-input box then disappears.

The **height** option is automatically terminated and a new option needs to selected from the **text edit** menu.

Continue to the next section 14.4.12.4 Angle or return to 14.4.12 Text Edit.

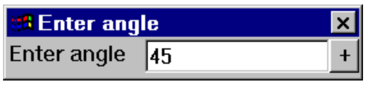
14.4.12.4 Angle

The **angle** option is used to modify the angle that the text in the text string is drawn at.

The text angle is measured in a counter- clockwise direction with respect to the horizontal axis.

After the **angle** option is chosen, an enter angle typed-input box is placed on the screen with the string's current text angle displayed in it.

The enter angle typed-input box looks like:



The text angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the angle of the text in the text string and the string redrawn with the new angle.

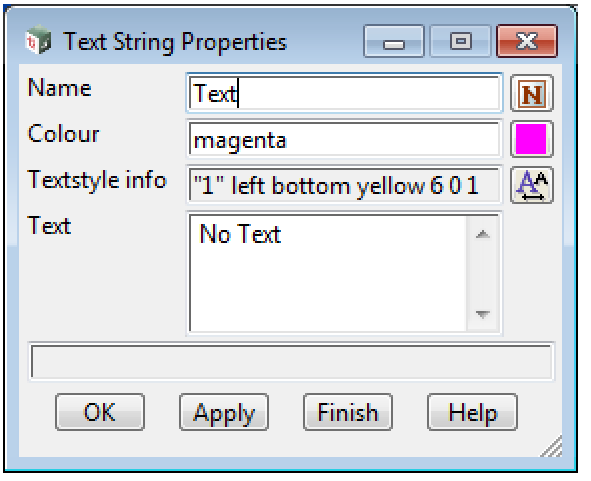
The typed-input box then disappears.

The **angle** option is automatically terminated and a new option needs to selected from the **text edit** menu.

Continue to the next section 14.4.12.5 Properties or return to 14.4.12 Text Edit.

14.4.12.5 Properties

Selecting **Properties** brings up the **Text String Properties** panel which is used to modify the string’s header information.



Field Description	Type	Defaults	Pop-Up
Name	name box		
the name of the string.			
Colour	colour box	default colour	available colours
the colour of the string.			
Textstyle info	textstyle info box		
textstyle information.			
Text	multi-line text box		
the actual text.			
OK/Apply	buttons		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

Continue to the next section 14.5 Points Edit or return to 14.4.12 Text Edit.

14.5 Points Edit

Position of menu: **Strings =>Points Edit**

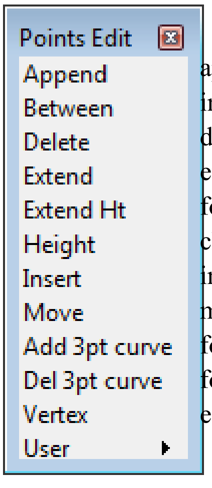
The points operations available in the **Points edit** menu are similar to the create/edit options.

However, in the **Points edit** options, the user does not begin by picking the particular string to be edited. Instead, the required option is selected followed by the point to be modified from any string.

The option can then be applied to another point on that or any other string, or another point operation chosen, and applied to any point.

If the user wants to make a large number of point edits to the one string, the **editor** option discussed in the last section is the easiest option to use. However, if a number of strings are going to be edited with the same operation or a selection of operations, then the **points edit** option is more suitable.

After selecting the **Points edit** option, the **Points edit** menu is displayed.



append to a string
insert on the line between string points
delete a string point
extend a string point
for polyline/superstring - extend point and extrapolated height
change height of a point
insert a point into a string
move a string point, or a text string
for polyline/superstring - add curve through 3 points
for polyline/superstring - delete adjacent curves
edit vertex data for a super string

Each of the options performs the same work as the option of the same name in the **Edit** string option.

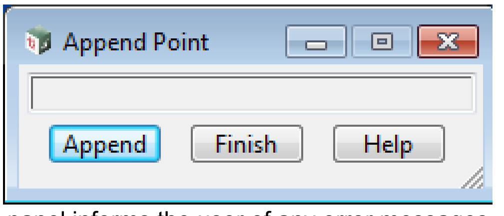
The individual options in the **Points Edit** menu will now be discussed in detail.

For the option *Append*, go to 14.5.1 Append Point
Between 14.5.2 Between Point
Delete 14.5.3 Delete Point
Extend 14.5.4 Extend Point
Extend Ht 14.5.5 Extend Height
Height 14.5.6 Height
Insert 14.5.7 Insert Point
Move 14.5.8 Move Point
Add 3pt curve 14.5.9 Add 3 Point Curve
Del 3pt curve 14.5.10 Delete 3 Point Curve
Vertex 14.5.11 Edit Vertex

14.5.1 Append Point

Position of option on menu: **Strings =>Points Edit => Append**

The **append** option adds additional points to the end of a string. On selecting the **Append** option, an **append point** panel is displayed.



The message area of this panel informs the user of any error messages.

Once in the **append** option, the particular end of the string to append points to is selected using the standard LB and MB pick and accept sequence.

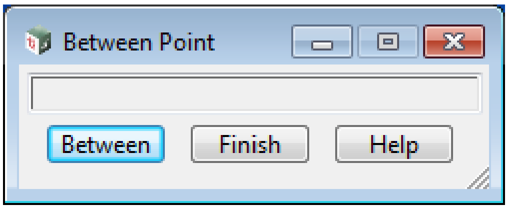
The points to be appended are then selected. The option keeps adding points to the selected string until the **pick ops** menu is brought up using RB and **cancel** is selected.

After the *append* has been completed, the option repeats. That is, the user is asked to select another string to append to. This continues until **finish** or **[X]** is selected from the **append point** panel.

14.5.2 Between Point

Position of option on menu: **Strings =>Points Edit => Between**

On selecting the **between** option, a **between point** panel is displayed.



The message area of this panel informs the user of any error messages.

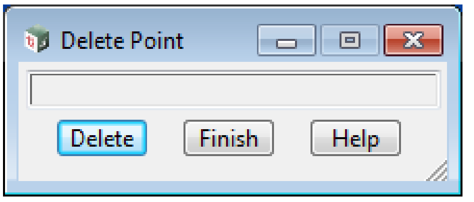
Once in the **between** option, the particular segment to insert a point on is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the *between* has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until **finish** or **[X]** is selected from the **between point** panel.

14.5.3 Delete Point

Position of option on menu: **Strings =>Points Edit => Delete**

On selecting the **delete** option, a **delete point** message panel is displayed.



The message area of this panel informs the user of any error messages.

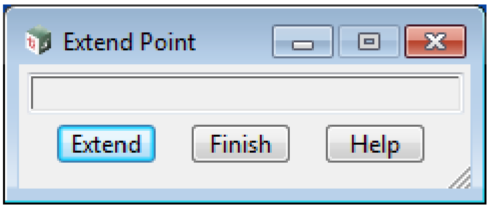
Once in the **delete** option, the particular point to delete is selected using the standard LB and MB pick and accept sequence. When the point is accepted, it is deleted.

After the *delete* has been completed, the option repeats. That is, the user is asked to select another point to delete (the point can be on any string). This continues until **finish** or **[X]** is selected from the **delete point** panel.

14.5.4 Extend Point

Position of option on menu: **Strings =>Points Edit => Extend**

On selecting the **extend** option, a **extend point** panel is displayed.



The message area of this panel informs the user of any error messages.

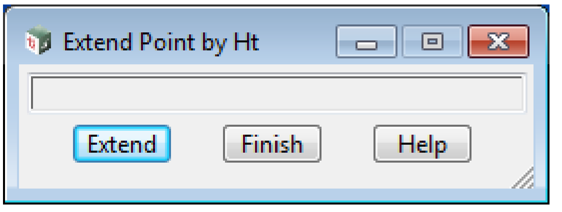
Once in the **extend** option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted.

After the *extend* has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until **finish** or **[X]** is selected from the **extend point** panel.

14.5.5 Extend Height

Position of option on menu: **Strings =>Points Edit => Extend Ht**

The extend point by height option is similar to the extend option except that the z-value of the moved point is modified by linearly interpolating the z-value from the original points at the end of the selected segment. On selecting the **extend by ht** option, an **extend point by ht** panel is displayed.



The message area of this panel informs the user of any error messages.

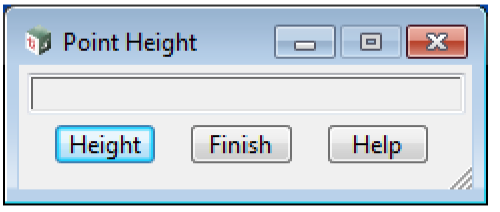
Once in the **extend point by ht** option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted. The z-value of the moved point is the linear interpolation of the selected segment.

After the *extend point by ht* has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until **finish** or **[X]** is selected from the **extend point by ht** panel.

14.5.6 Height

Position of option on menu: **Strings =>Points Edit => Height**

On selecting the **height** option, a **point height** panel is displayed.



The message area of this panel informs the user of any error messages.

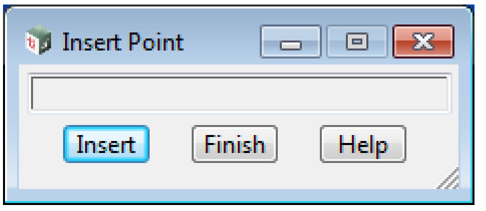
Once in the **height** option, the particular point to modify the height for is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the height existing height is displayed in a **height** box which can be modified and accepted by typing <enter>.

After the *height* has been completed, the option repeats. That is, the user is asked to select another point to modify the height for (the point can be on any string). This continues until **finish** or **[X]** is selected from the **point height** panel.

14.5.7 Insert Point

Position of option on menu: **Strings =>Points Edit => Insert**

On selecting the **insert** option, an **insert point** message panel is displayed.



The message area of this panel informs the user of any error messages.

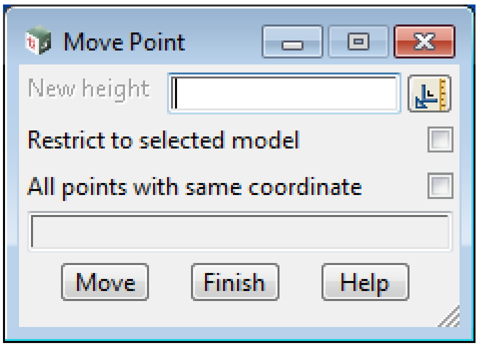
Once in the **insert** option, the particular segment to identify the two points to insert the point is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the *insert* has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until **finish** or **[X]** is selected from the **insert point** panel.

14.5.8 Move Point

Position of option on menu: **Strings =>Points Edit => Move**

On selecting the **move** option, a **move point** panel is displayed.



The message area of this panel informs the user of any error messages. There are similar panels for each of the other **points edit** options.

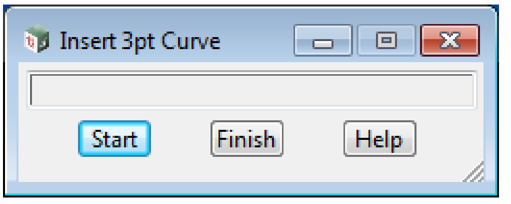
Once in the **move** option, the particular point to move is selected using the standard LB and MB pick and accept sequence. The position that the point is to be moved to is then selected and accepted.

After the move has been completed, the option repeats. That is, the user is asked to select another point to move (the point can be on any string). This continues until **finish** or **[X]** is selected from the **move point** panel.

14.5.9 Add 3 Point Curve

Position of option on menu: **Strings =>Points Edit => Add 3pt Curve**

On selecting the **add 3pt curve** option, a **insert 3pt curve** panel is displayed.



The message area of this panel informs the user of any error messages.

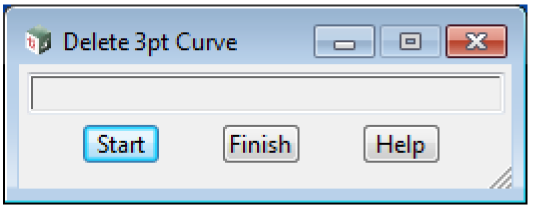
Once in the **add 3pt curve** option, the middle point of the three points of the super string to fit a curve for, is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the curve is fitted between it and the left and right adjacent points of the super string.

After the *add 3pt curve* has been completed, the option repeats. That is, the user is asked to select another point to add a curve to (the point can be on any super string). This continues until **finish** or **[X]** is selected from the **insert 3pt curve** panel.

14.5.10 Delete 3 Point Curve

Position of option on menu: **Strings =>Points Edit => Del 3pt Curve**

On selecting the **del 3pt curve** option, a **delete 3pt curve** panel is displayed.



The message area of this panel informs the user of any error messages.

Once in the **Delete 3pt curve** option, a vertex from a super string is selected using the standard LB and MB pick and accept sequence and if there is curves on both sides of the vertex, the radii are removed and the vertices are joined by straight line segments.

After the *Delete 3pt curve* has been completed, the option repeats. That is, the user is asked to select another point on a super string to remove the curves on either side (the point can be on any super string). This continues until **finish** or **[X]** is selected from the **Delete 3pt curve** panel.

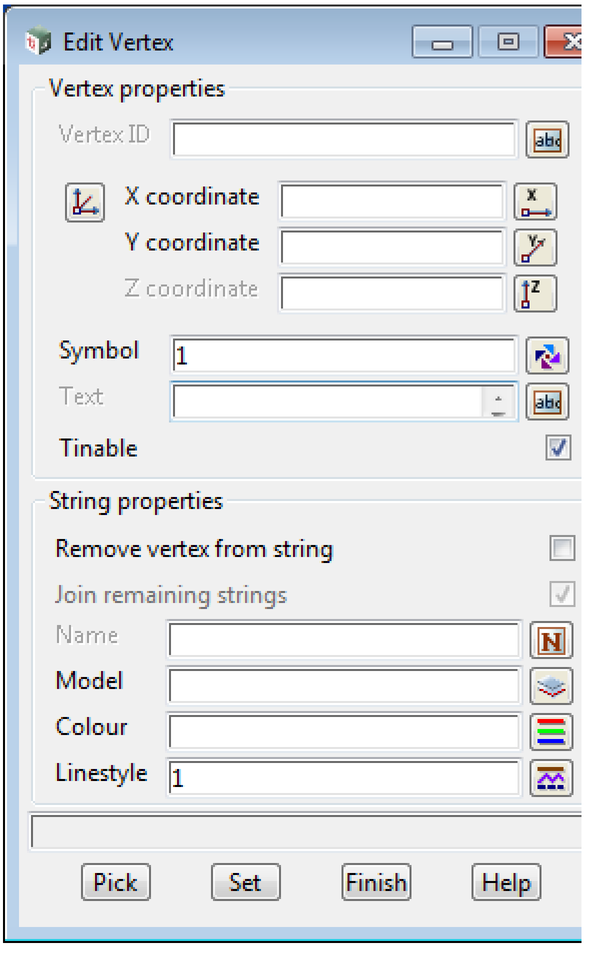
14.5.11 Edit Vertex

Position of option on menu: **Strings =>Points Edit => Vertex**

The Edit Vertex option allows the quick editing of the co-ordinates, vertex id, symbol, vertex text and tinability of a selected string vertex.

The name, model, colour and linestyle, which are string properties, can also be modified however the user has the choice of modifying the string properties for the entire string, or have the option remove the selected vertex from the string and only give the string properties to the newly created one vertex string. If a vertex is removed from the string, the adjacent vertices of the removed vertex can be joined.

On selecting the **Vertex** option, a **Edit Vertex** panel is displayed.



The **Edit Vertex** option is already running and a super string vertex is selected.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Vertex properties

Vertex id input

the vertex id (point number) for the selected vertex. Change this to the required value.

X coordinate Measure X panel

the x coordinate (easting) of the selected vertex. Change this to the required value.

Y coordinate Measure Y panel

the y coordinate (northing) of the selected vertex. Change this to the required value.

Z coordinate Measure Z panel

the y coordinate (elevation) of the selected vertex. Change this to the required value.

Symbol symbol box available symbols

the symbol on the selected vertex. Change this to the required symbol.

Text input

the text on the selected vertex. Change this to the required text.

Tinable tick box

ticked if the selected vertex is tinable. Change if required.

String/New vertex properties

Remove vertex from string tick box

tick if the selected vertex is to be removed from its current string.

Join remaining points tick box

*only setable if **Remove vertex from string** is ticked.*
If ticked then the vertices on either side of the removed vertex are joined.
If not ticked then the original string will be broken into two strings when the vertex is removed.

Name input

the name of the string containing the selected vertex. Change this to the required name.

Model model box available models

the model of the string containing the selected vertex. Change this to the required model.

Colour colour box available colours

the colour of the string containing the selected vertex. Change this to the required colour.

Linestyle linestyle box

the linestyle of the string containing the selected vertex. Change this to the required linestyle.

Pick button

chose Pick and then select the vertex to be edited.

Set button

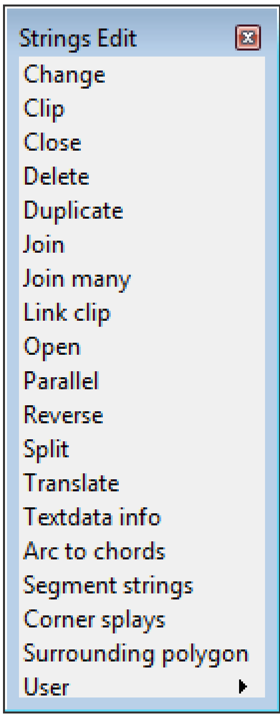
apply the values in the panel to the selected vertex. Pick is still active so that another vertex can be selected.

14.6 Strings Edit

Position of menu: **Strings =>Strings Edit**

The **Strings edit** option contains operations to be applied, not to individual points of a string, but to entire strings.

After selecting the **Strings edit** option, the **Strings edit** menu is displayed.



change string colour, type, name or model
delete or keep part of a string
connect the first and last points
delete a string
duplicate a string
join two strings to form one string
join many strings to form one string
delete a string link
disconnect the first and last points
parallel the string
reverse the order of string points
split a string into two strings
translate a string to a new position
change the text information
create inner and outer chords for an arc
segment a super string
create corner splay

The individual options in the **Strings edit** menu will now be discussed in detail.

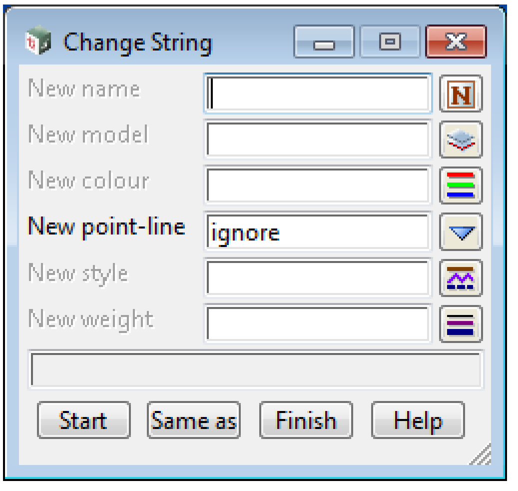
For the option *Change*, go to	14.6.1 Change
Clip	14.6.2 Clip
Close	14.6.3 Close
Delete	14.6.4 Delete
Duplicate	14.6.5 Duplicate
Join	14.6.6 Join
Join many	14.6.7 Join Many
Link clip	14.6.8 Link Clip
Open	14.6.9 Open
Parallel	14.6.10 Parallel
Reverse	14.6.11 Reverse
Split	14.6.12 Split
Translate	14.6.13 Translate
Textdata info	14.6.14 Textdata Info
Arc to chords	14.6.15 Arc to Chords
Segment strings	14.6.16 Segment Strings
Corner splays	14.6.17 Corner Splays
Surrounding polygon	14.6.18 Surrounding Polygon

14.6.1 Change

Position of option on menu: **Strings =>Strings Edit =>Change**

The **Change** option can be used to change the mode, colour, style, name and point-line type of a string.

On selecting the **Change** option, the **Change string** panel is displayed.



The **Change** option is already is progress and if a string is selected, the model, colour, style, name and point-line type are changed according to the fields in the **change string** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if non-blank, the name of the selected string will be changed to the name given in the new name *field.*

New model	input		available models

if non-blank, the selected string will be moved to the model given in the new model *field.*

New colour	input		available colours

if non-blank, the colour of the selected string will be changed to the colour given in the new colour *field.*

New point-line	input		point, line

if non-blank, the breakline type of the selected string will be changed to the type given in the new point-line *field (point or line type).*

New style	input		

if non-blank, the style of the selected string will be changed to the name given in the new style *field.*

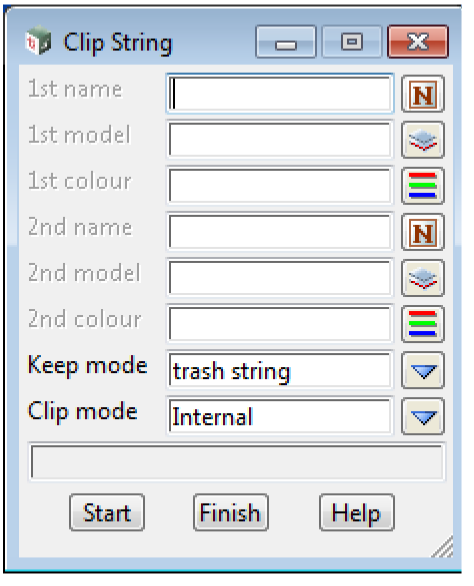
Please continue to the next section 14.6.2 Clip.

14.6.2 Clip

Position of option on menu: **Strings =>Strings Edit =>Clip**

The **Clip** option can be used to delete or keep part of a string.

On selecting the Clip option, the **Clip string** panel is displayed.



After selecting the **clip** option, the user is asked to select the string to be clipped. The user is then asked to select two points on the string to define the section to be clipped.

Depending on the clip mode, either

(a) a new string is created from the section of the string between the two points

(b) two new strings are created by deleting the section of the string between the two points

(c) one new string is created by deleting the section of the string between the two points and then joining the two selected points.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the 1st half of the clipped string. Otherwise the values of the original string are used for the 1st half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the clipped string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to **keep string**, the original string is kept
trash string, the original string is moved to the trash model
delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name	input		

if blank, the first half of the clipped string is given the name of the original string.
If non-blank, the first half of the clipped string is given the name in the 1st name *field.*

1st model	input		available models

if blank, the first half of the clipped string is placed in the same model as the original selected string.
If non-blank, the first half of the clipped string is placed in the model given in the 1st model *field.*

1st colour input available colours

if blank, the first half of the clipped string is given the colour of the original string. If non-blank, the first half of the clipped string is given the colour specified in the 1st colour *field.*

2nd name input

if blank, the second half of the clipped string is given the name of the original string. If non-blank, the second half of the clipped string is given the name in the 2nd name *field.*

2nd model input available models

if blank, the second half of the clipped string is placed in the same model as the original selected string. If non-blank, the second half of the clipped string is placed in the model given in the 2nd model *field.*

2nd colour input available colours

if blank, the second half of the clipped string is given the colour of the original string. If non-blank, the second half of the clipped string is given the colour specified in the 2nd colour *field.*

Keep mode input keep string delete, keep, trash string

if ***delete string****, the string selected to be clipped is deleted.*
keep string*, the selected string is not deleted.*
trash string*, the string selected to be clipped is moved to the trash model.*

Clip mode input internal internal, external, join external

if ***internal****, a new string is created from the section of string between the two selected points.*
external*, two new strings are created by deleting the section of the string between the two points.*
join external*, one new string is created by deleting the section of the string between the two points and then joining the two selected points.*

How to Use the Panel and Panel Messages

(a) Enter the new model, colour and name for the first and second parts of the clipped string.

(b) The string to be clipped is selected.

(c) The points to be used as the clipped point are then selected.

(d) The section of the string is then clipped between the selected points and depending on the clip mode, the selected string is then clipped or the clipped section kept.

Please continue to the next section 14.6.3 Close.

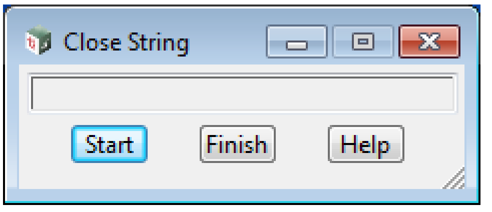
14.6.3 Close

Position of option on menu: **Strings =>Strings Edit =>Close**

A closed string is simply a string whose 1st and last points are the same.

The **close** string option adds to the end of the string, a point that is identical to the 1st string point. This then forms a closed string.

On selecting the **close** option, the **close string** panel is displayed.



The **close** option is already is progress and if a string is selected, it is closed.

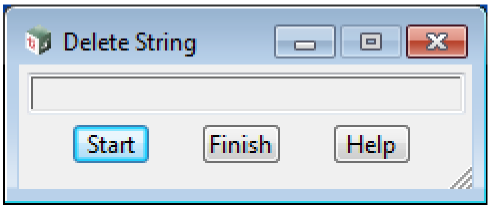
Please continue to the next section 14.6.4 Delete.

14.6.4 Delete

Position of option on menu: **Strings =>Strings Edit =>Delete**

Entire strings can be deleted from the model using the **Delete** option.

On selecting the **Delete** string option, the **Delete string** panel is displayed.



The **delete** option is already in progress and if a string is selected (LB) and accepted (MB), it is deleted

If the trash mode in the **trash defaults** panel is set to **trash string**, the original string is not deleted but moved to the trash model.

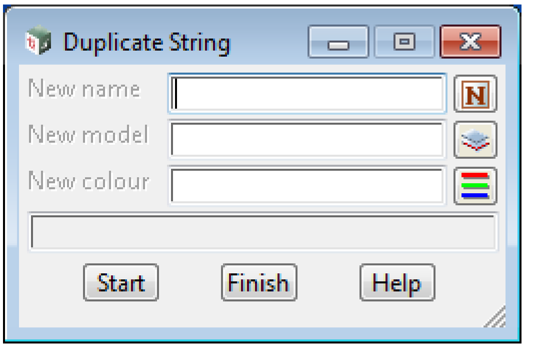
Please continue to the next section 14.6.5 Duplicate.

14.6.5 Duplicate

Position of option on menu: **Strings =>Strings Edit =>Duplicate**

The **duplicate** option is used to make a copy of the string with the option of giving the duplicate string a new model, colour and/or name.

On selecting the **duplicate** option, the **duplicate string** panel is displayed.



The **duplicate** option is already is progress and if a string is selected, then a copy of the string will be created and possibly given a new model, colour or name depending on the fields in the **duplicate string** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if the new name field is blank, the duplicate string has the same name as the original string. If the new name field is non-blank, then the duplicate string is given the name in the new name field.

New model	input		available models

if new model *is blank, the duplicate string is placed in the same model as the original string. If the* new model *field is non-blank, then the duplicate string is placed in the model given in the* new model *field.*

New colour	input		available colours

if the new colour *field is blank, the duplicate string has the same colour as the original string. If the* new colour *field is non-blank, then the duplicate string is given the colour specified in the* new colour *field.*

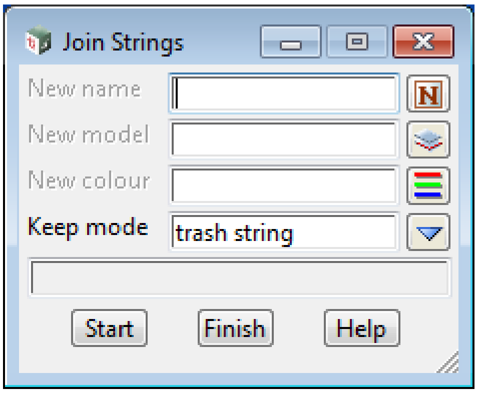
Please continue to the next section 14.6.6 Join.

14.6.6 Join

Position of option on menu: **Strings =>Strings Edit =>Join**

The **Join** option is used to create a new string by joining two existing strings together.

On selecting the **Join** option, the **Join strings** panel is displayed.



After selecting the **Join** option, the user is asked to select in turn the two strings that make up the joined string.

First, the string that will become the first half of the new joined string is selected with the direction that the string will have as the first half of the new string.

Next, the string that will become the second half of the new joined string is selected with the direction that the string will have as the second half of the new string.

The end of the first selected directed string and the beginning of the second selected directed string are joined to form the new joined string.

If the model, colour and/or name panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the keep mode is set to **keep string**, the original strings are kept
trash string, the original strings are moved to the trash model
delete string, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if the new name *field is blank, the joined string is given the name of the first selected string. If the* new name *field is non-blank, the joined string is given the name in the* new name *field.*

Field Description	Type	Defaults	Pop-Up
New model	input		available models

if new model *is blank, the joined string is placed in the same model as the first selected string. If the* new model *field is non-blank, the joined string is placed in the model given in the* new model *field.*

Field Description	Type	Defaults	Pop-Up
New colour	input		available colours

if the new colour *field is blank, the joined string is given the colour of the first selected string. If the* new colour *field is non-blank, then the joined string is given the colour specified in the* new colour *field.*

Field Description	Type	Defaults	Pop-Up
Keep mode	input	keep strings	delete string, keep strings

if ***delete string****, the selected strings selected are deleted.*
keep string*, the selected strings are not deleted.*
trash string*, the strings selected to be joined are moved to the trash model.*

How to Use the Panel

(a) Enter the new model, colour and name for the joined string.

(b) The 1st string is selected by picking it with the required direction.
(c) The string to be joined to the 1st selected string is selected by picking it with the required direction.
(d) The last point of the 1st directed string and the 1st point of the second directed string are joined to create a new string with model, colour, name as specified in the **join strings** panel.

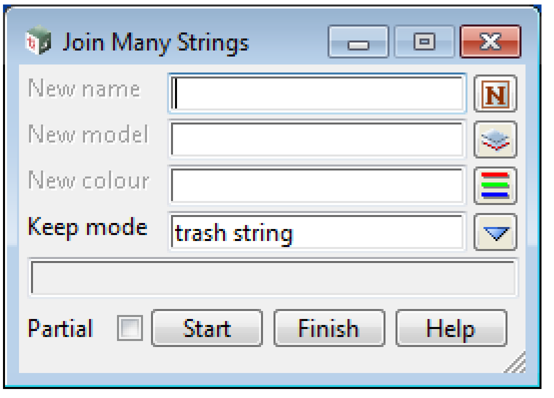
Please continue to the next section 14.6.7 Join Many.

14.6.7 Join Many

Position of option on menu: **Strings =>Strings Edit =>Join many**

The **Join many** option is used to create a new string by joining two or more existing strings, or parts or strings, together.

On selecting the **Join many** option, the **Join many strings** panel is displayed.



After selecting the **Join many** option, the user is asked to select in turn the strings that will make up the joined string. Using the partial mode, parts of strings can be joined.

First, the string that will become the first part of the new joined string is selected with the direction that the string will have as the first part of the new string.

If partial is set (tick), two points are then picked on the string and only the part of the string between the picked points is used in the join.

Next, the strings that will become the subsequent parts of the new joined string are selected in order with the direction that the strings will have in the new joined string.

Again, whenever partial is set (tick), two points are picked on the selected string and only the part of the string between the picked points is used in the join.

The end of each selected directed string (or partial string) is joined to the beginning of the subsequent selected directed string (or partial string) when forming the joined string.

If the name, model and/or colour panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the keep mode is set to **keep string**, the original strings are kept
trash string, the original strings are moved to the trash model
delete string, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if blank, the joined string is given the name of the first selected string.
If non-blank, the joined string is given the name in the new name *field.*

Field Description	Type	Defaults	Pop-Up
New model	input		available models

if blank, the joined string is placed in the same model as the first selected string.
If non-blank, the joined string is placed in the model given in the **new model** *field.*

Field Description	Type	Defaults	Pop-Up
New colour	input		available colours

if blank, the joined string is given the colour of the first selected string.
If non-blank, the joined string is given the colour specified in the new colour *field.*

Field Description	Type	Defaults	Pop-Up
Keep mode	input	keep strings	delete strings, keep strings

if ***delete string****, the selected strings are deleted.*
keep string*, the selected strings are not deleted.*

***trash string**, the strings selected to be joined are moved to the trash model.*

Partial tick

*if **ticked**, two points are then picked on the string and only the part of the string between the picked points is used in the join.*
*if **not ticked**, no extra points are required and the entire string is used.*

How to Use the Panel and Panel Messages

(a) Enter the new model, colour and name for the joined string.

(b) The first string to be joined is then selected by picking the required string with the required direction, plus two points to restrict the string if partial is set on.

(c) The second and subsequent strings to be joined are then selected (or partial string if partial is set on) in order and with the required direction.

(d) The last point of each directed string is connected to the first point of the subsequent directed string to create a new joined string. The model, colour and name as specified in the **join many strings** panel are used for the new string.

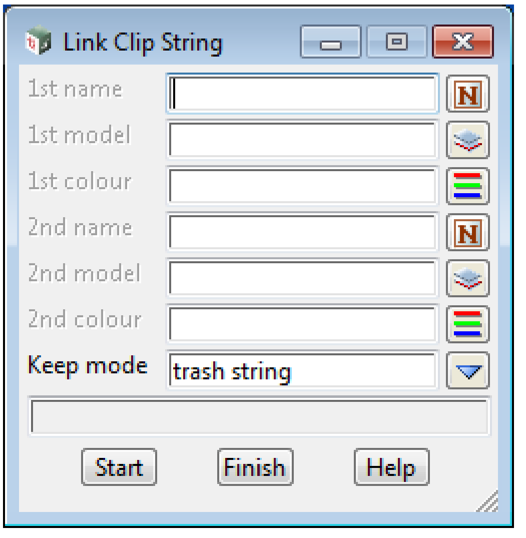
Please continue to the next section 14.6.8 Link Clip.

14.6.8 Link Clip

Position of option on menu: **Strings =>Strings Edit =>Link clip**

The **link clip** option can be used to delete the link joining two adjacent vertices of a string.

On selecting the link clip option, the **link clip string** panel is displayed.



After selecting the **link clip** option, the user selects the link of the string to be clipped. On acceptance, the selected link is deleted from the string, thus creating two new strings.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the first half of the link clipped string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the link clipped string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to **keep string**, the original string is kept
trash string, the original string is moved to the trash model
delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name	input		

if blank, the first half of the clipped string is given the name of the original string.
If non-blank, the first half of the clipped string is given the name in the 1st name *field.*

1st model	input		available models

if blank, the first half of the clipped string is placed in the same model as the original selected string.
If non-blank, the first half of the clipped string is placed in the model given in the 1st model *field.*

1st colour	input		available colours

if blank, the first half of the clipped string is given the colour of the original string.
If non-blank, the first half of the clipped string is given the colour specified in the 1st colour *field.*

2nd name	input		

if blank, the second half of the clipped string is given the name of the original string.
If non-blank, the second half of the clipped string is given the name in the 2nd name *field.*

2nd model	input		available models

if blank, the second half of the clipped string is placed in the same model as the original selected string. If non-blank, the second half of the clipped string is placed in the model given in the 2nd model *field.*

2nd colour		input	available colours

if blank, the second half of the clipped string is given the colour of the original string.
If non-blank, the second half of the clipped string is given the colour specified in the 2nd colour *field.*

Keep mode	input	keep string	delete, keep, trash string

if ***delete string****, the string selected to be clipped is deleted.*
keep string*, the selected string is not deleted.*
trash string*, the string selected to be clipped is moved to the trash model.*

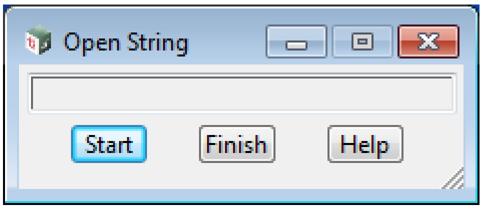
Please continue to the next section 14.6.9 Open.

14.6.9 Open

Position of option on menu: **Strings =>Strings Edit =>Open**

A closed string is opened by removing the last point of the string.

On selecting the **open** option, the **open string** panel is displayed.



The **open** option is already is progress and if a closed string is selected, it is opened.

Please continue to the next section 14.6.10 Parallel.

14.6.10 Parallel

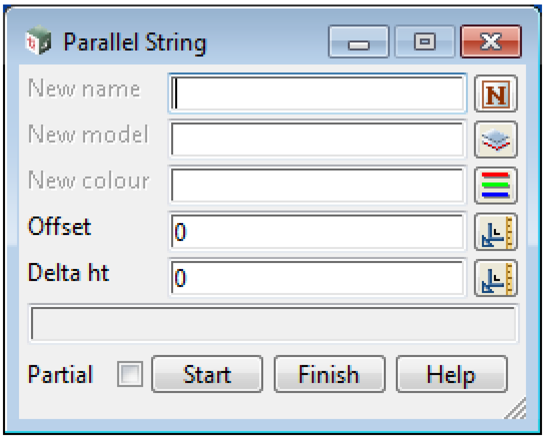
Position of option on menu: **Strings =>Strings Edit =>Parallel**

Strings, or parts of strings, can be translated perpendicularly to either the left or right using the **parallel** option. The z-values of the string can also be adjusted by a constant value.

The difference between a **translate** and a **parallel** is that for a straight **translate**, the translation vector is the same for the whole string. In a **parallel**, the translation is at right angles to each link of the string and hence the translation direction varies along the string.

For example, the edge of a road is a parallel of the centre-line, not a copy of the centre-line.

On selecting the **parallel** option, the **Parallel String** panel is displayed.



The user is then asked to select the string to parallel.

If partial is not set, the string is copied parallel through the distance given in the offset field.

If partial is set (tick), two points are then picked on the string and only the part of the string between the picked points is copied parallel through the distance given in the offset field.

The value in the delta ht field is then added to the z-values of the string.

The direction imposed upon the string when selecting it is used to determine what is the left and right side of the string in the **parallel** operation.

A positive offset parallels the string to the right with respect to the direction of picking. A negative offset parallels to the left with respect to the direction of picking.

Hence, the fields and buttons used in the **parallel string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if blank, the paralleled string is given the name of the original string.
If non-blank, the parallel string is given the name in the new name *field.*

New model	input		available models

if blank, the paralleled string is placed in the same model as the original selected string.
If non-blank, the paralleled string is placed in the model given in the new model *field.*

New colour	input		available colours

if blank, the paralleled string is given the colour of the original string.
If non-blank, the paralleled string is given the colour specified in the new colour *field.*

Offset	input		

distance (in world units) that the string will be copied parallel through. A positive distance denotes that the string will be paralleled to the right of the original string.

Delta ht	input		

value to add to the z-values of the string.

Partial tick

*if **ticked**, two points are then picked on the string and only the part of the string between the picked points is used in the parallel.*
*if **no ticked**, no extra points are required and the entire string is used.*

How to Use the Panel

(a) Enter the new model, colour and name for the paralleled string.

(b) Enter the offset distance for the parallel - left and right is determined by picking direction.

(c) Enter the height to add to the string’s z-values in the delta ht field.

(d) The selected string (or partial string if partial is set on) is then copied parallel as required.

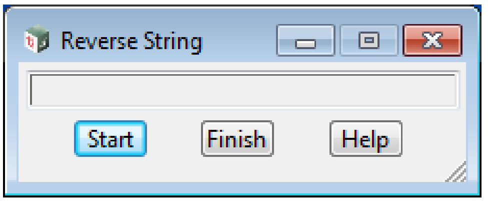
Please continue to the next section 14.6.11 Reverse.

14.6.11 Reverse

Position of option on menu: **Strings =>Strings Edit =>Reverse**

The **reverse** string option simply reverses the order of the points in a string.

On selecting the **reverse** option, the **reverse string** panel is displayed.



After selecting the **reverse** option, the user simply picks (LB) the string that is to have its point order reversed and on acceptance (MB) of the string, the reversing takes place.

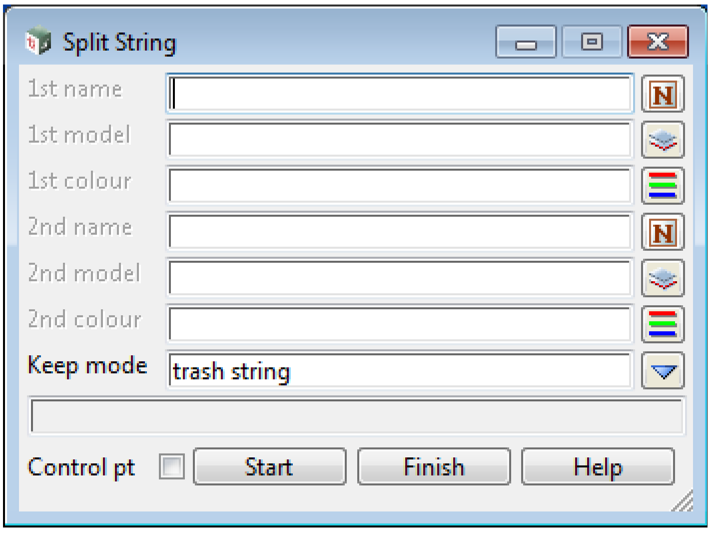
Please continue to the next section 14.6.12 Split.

14.6.12 Split

Position of option on menu: **Strings =>Strings Edit =>Split**

The **Split** option is used to create two new strings by splitting an existing string about a selected point on the string.

On selecting the **Split** option, the **Split string** panel is displayed.



If **control point** is set **off**, after selecting the **split** option, the user is asked to select the string and the selection point is **also** used as a split point. Hence the one point is used to select the string and as the split point.

If **control point** is set **on**, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point. Hence the **string select** and the **split point** are selected separately.

Two strings are then created by splitting the chosen string about the split point.

If the 1st name, 1st model and/or 1st colour panel fields are non- blank, the values are used for the first half of the split string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the split string. Otherwise the values of the original string are used for the second half of the string.

If the keep mode is set to **keep string**, the original string is kept
trash string, the original string is moved to the trash model
delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name	input		

if blank, the first half of the split string is given the name of the original string.
If non-blank, the first half of the split string is given the name in the 1st name *field.*

1st model	input		available models

if blank, the first half of the split string is placed in the same model as the original selected string.
If non-blank, the first half of the split string is placed in the model given in the 1st model *field.*

1st colour	input		available colours

if blank, the first half of the split string is given the colour of the original string.
If non-blank, then the first half of the split string is given the colour specified in the 1st colour

field.

2nd name input

if blank, the second half of the split string is given the name of the original string.
If non-blank, the second half of the split string is given the name in the 2nd name *field.*

2nd model input available models

if blank, the second half of the split string is placed in the same model as the original selected string.
If non-blank, the second half of the split string is placed in the model given in the 2nd model *field.*

2nd colour input available colours

if blank, the second half of the split string is given the colour of the original string.
If non-blank, then the second half of the split string is given the colour specified in the 2nd colour *field.*

Keep mode input keep string delete, keep, trash string

if ***delete string****, the string selected to be split is deleted.*
keep string*, the selected string is not deleted.*
trash string*, the string selected to be split is moved to the trash model.*

Control pt tick

If ***ticked****, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point.*
If ***not ticked****, the user is asked to select the string and the selection point is* ***also*** *used as a split point.*

How to Use the Panel and Panel Messages

(a) Enter the new model, colour and name for the first and second parts of the split string.

(b) If control is on, the string is selected and then the split point is selected.
If control is off, the string is selected and the same point is to be used as the split point.

(c) The chosen string is then split about the split point and the two halves given models, colours and names as defined by the split string panel.

Please continue to the next section 14.6.13 Translate.

14.6.13 Translate

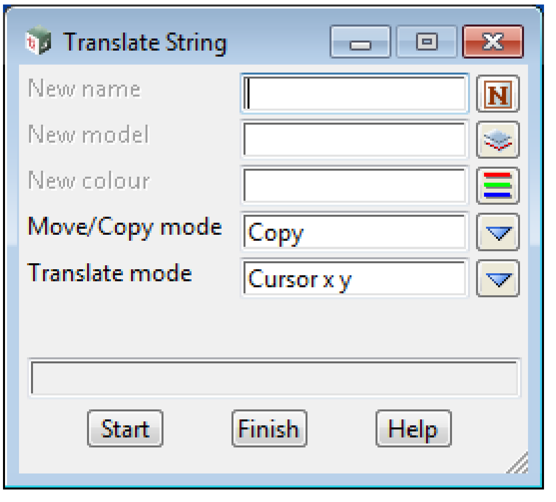
Position of option on menu: **Strings =>Strings Edit =>Translate**

Entire strings can be translated in the x,y and z directions using the **translate** option.

The translated string can either be moved or copied to its new translated position.

The difference between a **copy** or a **move** is simply that if a string is copied, a copy of the string is translated and the original string left untouched, whereas for a move, the actual string is moved from its original position to the new translated position.

On selecting the **Translate** option, the **Translate string** panel is displayed.



The selected string is translated by using the cursor to select a position on the string (the before point) and then selecting the position (not necessarily on a string) that the point will be translated to (after point).

Hence the translate operation requires two positions - a before and an after point - for the translation to be defined.

The first position (the before point) is selected using the normal select procedures. The second position (the after point) depends entirely on the translate mode.

If the translate mode is set to

cursor x y z or **cursor x y**

the cursor is used to not only select the string point but also to indicate where it is to be moved/copied to.

typed x y z

the second point has the absolute coordinates given in the x y z field.

typed dx dy dz

the second point is defined relative to the first point by the adding the dx dy dz given in the dx dy dz field.

Selected strings will be translated until the option is finished.

The fields and buttons used in the **translate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if blank, the string is given the name of the original string.
If non-blank, the string is given the name in the new name *field.*

New model	input		available models

if blank, the string is placed in the same model as the original selected string.
If non-blank, the string is placed in the model given in the New model *field.*

New colour	input		available colours

if blank, the string is given the colour of the original string.
If non-blank, then the string is given the colour specified in the new colour *field.*

Translate mode	input	cursor xy	cursor xy, cursor xyz, typed xyz, typed dxdydz

see comments about translate mode in the general description of move/copy

x y z	input		

if Translate mode *is* ***Typed x y z*** *then this field appears and the position on the string where the string was selected is translated to this co-ordinate.*

dx dy dz	input		

if Translate **mode** *is* ***Typed dx dy dz*** *then this field appears and the selected string is translated by the given dx dy dz.*

Move/copy mode	input	move	copy, move

if the mode is set to ***move,*** *the string is translated as defined in the panel fields and the original string is deleted. If the mode is* ***copy,*** *the original string is left alone.*

How to Use the Panel and Panel Messages

(a) Enter the new model, colour and name for the translated string.

(b) The string to be translated and its “before” point is chosen.

(c) The “after” point is chosen according to the translate mode.

(d) The selected string is then translated (moved or copied) as required.

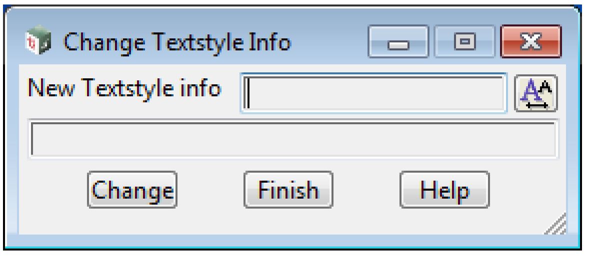
Please continue to the next section 14.6.14 Textdata Info.

14.6.14 Textdata Info

Position of option on menu: **Strings =>Strings Edit =>Textdata info**

The **Textdata info** option is used to change the information about the text for a text string, super strings and text for 4d strings.

Selecting the option, the **Change Textstyle Info** panel:



The parameters for the textstyle information are set and then any selected string is given the new textstyle parameters. If any of the parameters are left blank, then that parameter is not modified for the selected string.

To define the Textstyle info parameters, click on the text button and then the **edit** button.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New textstyle info	textstyle data		

textstyle information to use for the selected strings.

Change	button		

selected strings will have their text modified by the parameters in the new textstyle info *field.*

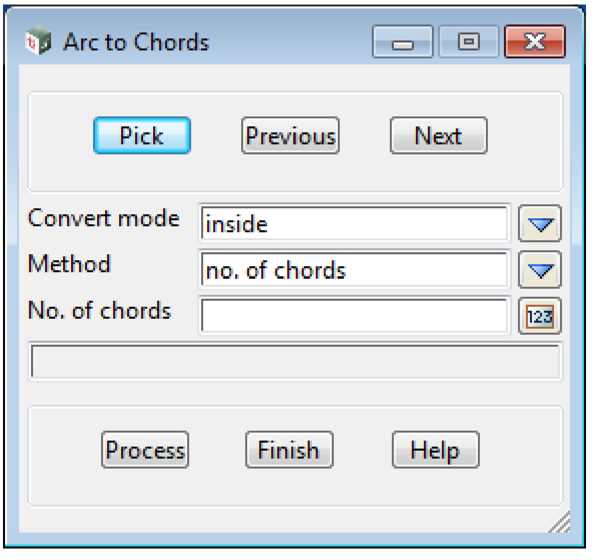
14.6.15 Arc to Chords

Position of option on menu: **Strings =>Strings Edit =>Arc to chords**

The *Arc to Chord* option works on a super string and creates inside or outside chords for any arc segments in the super string.

The number of chords created can be defined by giving the number of chords required, a chord length to use for each chord, or an arc to chord tolerance.

On selecting the **Arc to chords** option, the **Arc to Chords** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		
select the super string to edit.			
Previous	button		
move to the previous segment of the super string.			
Next	button		
move to the next segment of the super string.			
Convert mode	choice box	inside	inside outside
create the chords on the inside or the outside of the arc.			
Method	choice box	no. of chords	no. of chords chord length arc to chord tolerance
method for creating the chord.			
No. of Chords, Chord length, Arc to chord tolerance			
value to use with the Method.			
Process	button		
create chords for the selected segment of the super string.			

14.6.16 Segment Strings

Position of option on menu: **Strings =>Strings Edit =>Segment string**

The *Segment string* option works on a super string and inserts extra points on an arc or line segment of the super string to break it into smaller arc or line segments.

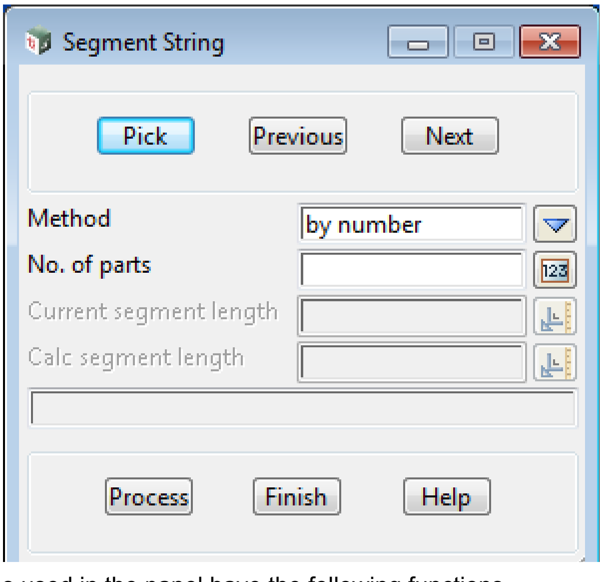
The number of arcs/lines created can be controlled by specifying either

(a) the number of sub-segments required

(b) a single sub-segment length to break the start of the segment into that length

(c) a sub-segment length to break the segment into as many sub-segments of that length as possible.

On selecting the **Segment strings** option, the **Segment String** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

select the super string to edit.

Field Description	Type	Defaults	Pop-Up
Previous	button		

move to the previous segment of the super string.

Field Description	Type	Defaults	Pop-Up
Next	button		

move to the next segment of the super string.

Field Description	Type	Defaults	Pop-Up
Method	choice box	by number	by number one distance by distance

method for creating the sub-segments.

*by number - the segment is broken into **No of parts** equal segments*
*one distance - the segment is broken into two parts with the first part having the length **Distance** (which end will depend on the direction that the segment was selected.*
*by distance - the segment is broken into as many sub-segments of length **Distance** as possible (which end the division starts at depends on the direction that the segment was selected).*

No of parts, Distance

value to use with the Method.

Current segment length output only

length of the currently selected segment of the super string.

Calc segment length output only

calculated length of the segment that will be created.

Process button

create sub-segments for the selected segment of the super string.

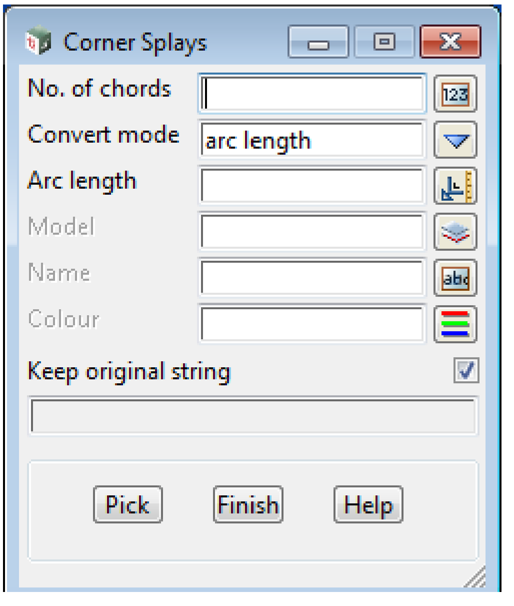
14.6.17 Corner Splays

Position of option on menu: **Strings =>Strings Edit =>Corner splays**

The *Corner splays* option works on a super string and creates splays between two adjacent straight segments.

The number of chords created can be defined by giving the number of sub-segments required, one sub-segment length to beak of the segment or a sub-segment length to beak the segment into as many sub-segments as possible.

On selecting the **Corner splays** option, the **Corner splays** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
No of chords			

value to use with the Method.

Convert mode	choice box	arc length	arc length arc radius chord length total chords length tangent length

method for creating the corner splays.

Arc length, Arc radius, Chord length, Total chords length, tangent length

value to use with the Convert mode.

Name	input		

the name of the new string.

Model	input		available models

name of the model that the new string is in.

Colour	input	default colour	available colours

the colour of the new string.

Keep original string	tick box	tick	

if ticked, the original string is not modified and a new string is created with the corner splays. If not ticked, the original string is modified.

Pick button

select a super string and the splays will be created.

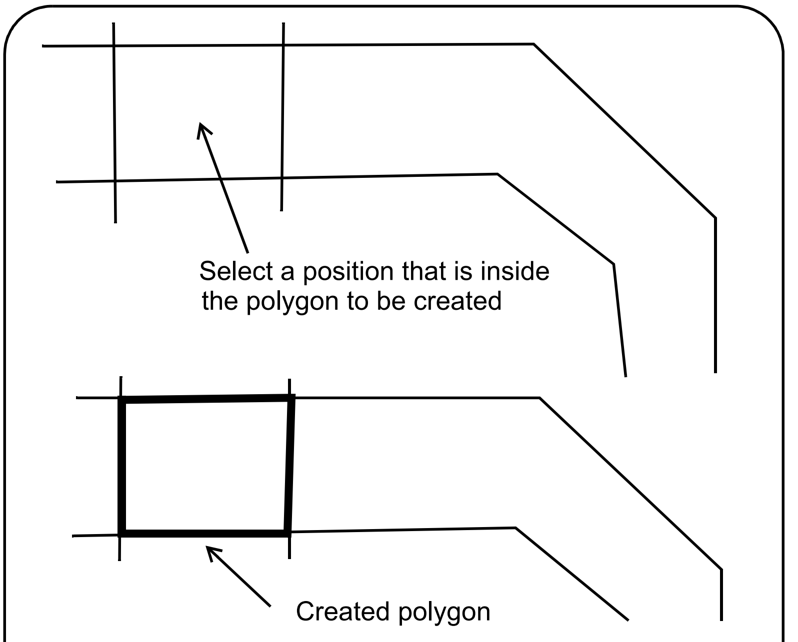
14.6.18 Surrounding Polygon

Position of option on menu: **Strings =>Strings Edit =>Surrounding polygon**

The *Surrounding polygon* option works on all the super strings on the view surrounding a selected position (point) and, if possible, creates a closed polygon from parts of the strings surrounding the selected point.

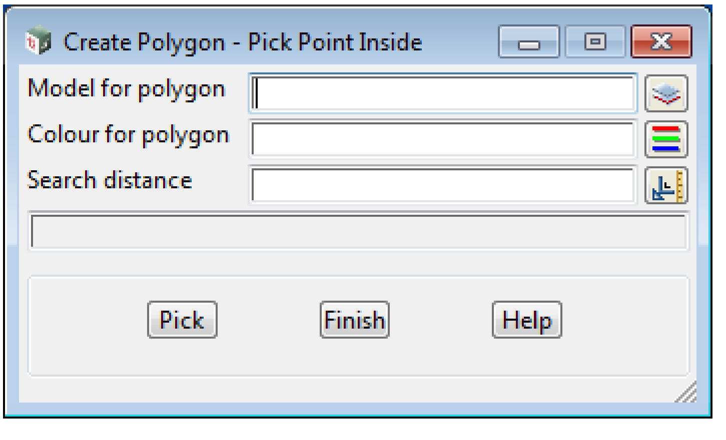
A straight line must be able to be drawn from the selected point to the lines/arcs that could be used in the surrounding strings.

This option creates a lot/polygon by a picking inside a collection of strings and the lot/polygon is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot/polygon can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot/polygon side without cutting any other segment.



Creating a Polygon by Picking Inside the Polygon

On selecting the **Surrounding polygon** option, the **Create Polygon - Pick Point Inside** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		

the name of the new created polygon.

Model	input		available models

model for the created polygon.

Colour	input	default colour	available colours

colour for the created polygon.

Pick	button		

pick a position on a view and the surrounding polygon will be created from all the super strings on the view.

14.7 Cogo

Position on menu: **Strings =>Cogo**

Note: This option is no longer available.

The **Cogo (co-ordinate geometry)** options provide methods of constructing points, lines and arcs from a variety of operations such as picking, filleting, intersecting and finding tangents.

Selecting the **cogo** option creates the **Cogo edit ops** menu and the **Cogo edit** panel.

The options in the **cogo edit ops** menu all create either a point, string or arc and the **cogo edit** panel remains on the screen for each of the menu options and provides the string properties for any created objects.

All of the options chosen from the **Cogo edits ops** menu and its sub-menus repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

The name of the current selected option is displayed in the first message area of the **cogo edit** panel.

To select a new **Cogo edits ops** option, simply select the new option from the **Cogo edit ops** menu or sub-menus. The current option is automatically terminated and the new option begun.

An option is also terminated when either the **cancel** or **finish** button is selected in the **Cogo edit** panel, or **finish** is elected from the **Cogo edit ops** menu.

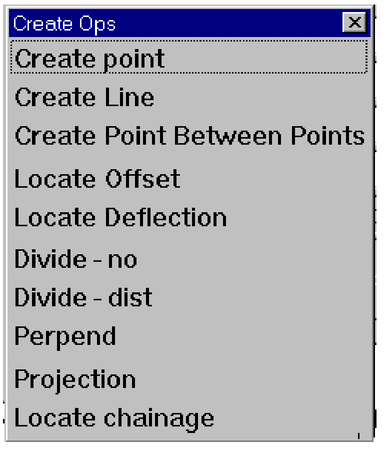
Each of the options in the **Cogo edit ops** menu will now be discussed.

For the option *Create ops*, go to 14.7.1 Create Ops
Intersect ops 14.7.2 Intersect Ops
Vector 14.7.3 Vector
Parallel 14.7.4 Parallel
Fillet ops 14.7.5 Fillet Ops
Fillet ops (T) 14.7.6 Fillet Ops (T)
Fillet ops (TJ) 14.7.7 Fillet Ops (TJ)
Tangent 14.7.8 Tangent

Please continue to the next section 14.7.1 Create Ops.

14.7.1 Create Ops

The **Create ops** walk-right menu is



Each of the options in the **Create Ops** menu will now be discussed.

For the option *Create point*, go to	14.7.1.1 Create Point
Create line	14.7.1.2 Create Line
Create point between points	14.7.1.3 Create Point Between Points
Locate offset	14.7.1.4 Locate Offset
Locate deflection	14.7.1.5 Locate Deflection
Divide - no	14.7.1.6 Divide - Number
Divide - dist	14.7.1.7 Divide - Distance
Perpedn	14.7.1.8 Perpendicular
Projection	14.7.1.9 Projection
Locate chainage	14.7.1.10 Locate Chainage

14.7.1.1 Create Point

After selecting the **Create point** option, the user simply selects a point using the normal picking sequence.

The point will be created with name, colour and model from the **cogo edit** panel.

If no z-value is given in the **cogo edit** panel, then a null z-value is used.

If height snap is on and the point is created by snapping to an existing point or line, the z-value for the point is taken from the snapped point or if tin snap is on, from the underlying triangulation. The snapped z-value will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is taken from the **cogo edit** panel. If no value exists in the **cogo edit**, an error message **please specify z value** is displayed in the **cogo edit** message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then disappears.

Screen message area

<<Create Point> Select position for point> [picks][][menu]

14.7.1.2 Create Line

After selecting the **create line** option, the user simply selects two points to be the end points of the line using the normal picking sequence.

The line will be created with name, colour and model from the **cogo edit** panel.

If either end point is created by snapping to an existing point or line, the z-value for the point is taken from the snapped point or if tin snap is on, from the underlying triangulation. If no z-value exists, the z-value is taken from the **cogo edit** panel.

If height snap is on, the snapped z-value will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is taken from the **cogo edit** panel. If no value exists in the **cogo edit**, an error message **please specify z value** is displayed in the **cogo edit** message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then disappears.

Screen message area

<<Create Line> Select 1st point on line> [picks][][menu]
<<Create Line> Select 2nd point on line> [picks][][menu]

14.7.1.3 Create Point Between Points

The **create point between points** option allows the user to select two point to act as the end points of a line and then create a new point a user supplied given distance along that line.

After selecting the **create point between points** option, the user simply selects two points to act as the end points of the line using the normal picking sequence.

An enter distance from 1st point box is then displayed on the screen and the user simply enters the appropriate distance into the box, terminated with a <enter>. The box then disappears.

The point is then created with name, colour and model and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

<<Between> Select 1st point> [picks][][menu]
<<Between> Select 2nd point> [picks][][menu]
<Between> Enter distance from 1st point [caret][][menu] select a button

14.7.1.4 Locate Offset

The **locate offset** option is used to create a point at a given perpendicular offset distance from a user defined point on a selected item.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the **locate offset** option needs

(a) a selected item

(b) a control point

(c) a projection distance

(d) an offset distance

After selecting the **locate offset** option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

A distance along item box is then displayed on the screen and the user enters the appropriate distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.

Finally an offset distance box is displayed on the screen. The user enters the appropriate offset distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

<<Locate Offset> Select item to project along> [picks][][menu]
<<Locate Offset> Select control point> [picks][][menu]
<Locate Offset> distance along item [caret][][menu] select a button
<Locate Offset> offset distance [caret][][menu] select a button

14.7.1.5 Locate Deflection

The **locate deflection** option is used to create a point at a given deflection angle and distance from a user defined point on a selected item.

The **locate deflection** option is very similar to the **locate offset** option except instead of going out perpendicular to the item, the user provides a deflection angle. Hence the **locate offset** is a special case of the **locate deflection** option when the deflection angle is ninety degrees.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the **locate deflection** option needs

(a) a selected item

(b) a control point

(c) a projection distance

(d) a deflection angle

(e) a deflection distance

After selecting the **locate offset** option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

Boxes for the distance along item, deflection angle and deflection distance are then (sequentially) displayed on the screen and the user enters the appropriate values into each box, terminated with a <enter>. The box then disappears.

A positive distance is in the picking direction of the item and a positive angle is an angle to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

<<Locate Deflection> Select item to project along> [picks][][menu]
<<Locate Deflection> Select control point> [picks][][menu]
<Locate Deflection> distance along item [caret][][menu] select a button
<Locate Deflection> deflection distance [caret][][menu] select a button
<Locate Deflection> deflection angle [caret][][menu] select a button

14.7.1.6 Divide - Number

The **divide - nos** option is used to place points at positions which would divide an arc or a line into an equal number of pieces.

For example, if the option was used to show how and an arc could be divided into seven pieces, points would be placed at the six division marks. No point is placed at the start or end of the arc. Hence, the start and end points plus the division points divide the arc into the required number of divisions.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the **divide - nos** option, the user picks the item to divide using the normal picking sequence.

A no of divisions box is then displayed on the screen and the user enters the required number of divisions into the box, terminated with a <enter>. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

<<Divide by #> Select item to divide> [picks][][menu]
<Divide by #> no division [caret][][menu] select a button

14.7.1.7 Divide - Distance

The **divide - dist** option is used to place points at positions which would divide an arc or a line into pieces of a given distance.

Note - unless the arc or line is exactly divisible by the distance, the last division will be smaller than the required distance.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the **divide - dist** option, the user picks the item to divide using the normal picking sequence.

A distance box is then displayed on the screen and the user enters the required distance for each division into the box, terminated with a <enter>. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

<<Divide by distance> Select item to divide> [picks][][menu]
<Divide by #> distance [caret][][menu] select a button

14.7.1.8 Perpendicular

The **perpend** option is used to create the point which is the perpendicular projection of a selected point onto a selected line or arc.

Since the option can only drop a point onto an arc or a line, when the item is selected to project onto, only the picked line or arc sub-element of the item is used.

On selecting the **perpend** option, the user picks the point to drop perpendicularly.

The item to drop perpendicularly onto is then selected.

The point representing the perpendicular projection of the chosen point onto the selected item is then created. The created point has the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

<<Perpend> Select point to drop> [picks][][menu]
<<Perpend> Select item to drop onto> [picks][][menu]

14.7.1.9 Projection

The **projection** option is used to create a point which is given distance along a line or arc.

Since the option can only project a point along an arc or a line, when the item is selected to project along, only the picked line or arc sub-element of the item is used.

On selecting the **projection** option, the user picks the item to project along.

A distance box is then displayed on the screen and the user enters the appropriate projection distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.

The point representing the projected point along the selected item is then created using the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

<<Projection> Select item to project along> [picks][][menu]
<Projection> distance [caret][][menu] select a button

14.7.1.10 Locate Chainage

The **locate chainage** option is used to create a point at a given chainage on a selected string.

On selecting the **locate chainage** option, the user picks the item to locate the chainage on.

A locate chainage box is then displayed on the screen and the user enters the appropriate chainage into the box, terminated with a <enter>. The box then disappears.

A point at the given chainage on the selected item is then created using the name, colour, model and z-value from the **cogo edit** panel.

Screen message area

<<Locate chainage> Select item to locate on> [picks][][menu]
<Locate chainage> chainage [caret][][menu] select a button

Please continue to the next section 14.7.2 Intersect Ops.

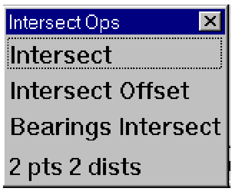
14.7.2 Intersect Ops

The **Intersection** options are for finding various intersections of lines and arcs.

Most of intersect cases can have more that one solution. For example, the intersection of a line with an arc.

To easily distinguish between the cases, 12d Model uses the sense of direction implied when picking items to determine which case was required by the user.

The **Intersect ops** walk-right menu is



Each of the options in the **Intersect Ops** menu will now be discussed.

For the option *Intersect*, go to	14.7.2.1 Intersect
Create line	14.7.1.2 Create Line
intersect offset	14.7.2.2 Intersect Offset
Bearings intersect	14.7.2.3 Bearings Intersect
2 pts 2 dists	14.7.2.4 Two Points, Two Distances

14.7.2.1 Intersect

The **Intersect** option creates a point at the intersection of lines and arcs.

That is, it will find the intersection of

(a) a line with a line

(b) a line with an arc

or

(c) an arc with an arc

After selecting the **Intersect** option, the user simply selects the two items to intersect using the normal picking sequence.

If an intersect exists, a point is created at the intersection with name, colour, model and z-value from the **Cogo edit** panel.

If no z-value exists in the panel, no point is created.

When there is more than one possible solution, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

<<Intersect> Select 1st item to intersect> [picks][][menu]
<<Intersect> Select 2st item to intersect> [picks][][menu]

14.7.2.2 Intersect Offset

Like the **Intersect** option, **Intersect offset** is for creating points at the intersection of lines and arcs.

However, before the line or arc is used, it is offset by a user supplied distance.

Hence the intersection is between displaced lines and arcs.

A practical example of **intersect offset** is for finding the position of a manhole in a subdivision which is three metres from one property line and two metres from the culdesac arc.

After selecting the **intersect** option, the user selects the first item to intersect using the normal picking sequence.

A 1st offset box is then displayed on the screen and the user enters the appropriate offset for the first line into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The second item to intersect is then selected and a 2nd offset box is displayed on the screen for the user to enter the offset for the second line.

If an intersect exists for the two offset items, a point is created at the intersection with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

As in the **intersect** option, when more than one solutions is possible, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

<<Intersect Offset> Select 1st item to intersect> [picks][][menu]
<Intersect Offset> 1st offset [caret][][menu] select a button
<<Intersect Offset> Select 2st item to intersect> [picks][][menu]
<Intersect Offset> 2nd offset [caret][][menu] select a button

14.7.2.3 Bearings Intersect

The **Bearings intersect** option finds the intersect of the lines going through two user selected points at user supplied bearings.

Hence the option will calculate the point that is at given bearings from two selected points

After selecting the **bearings intersect** option, the user selects the first point using the normal picking sequence.

A bearing 1 box is then displayed on the screen and the user enters the bearing for the line through the point into the box, terminated with a <enter>. The box then disappears. The bearing is entered in degrees, minutes and seconds.

The second point is then selected and a bearing 2 box is displayed on the screen for the user to enter the bearing for the line through the second point.

The intersection of the two lines is then calculated and if it exists, a point is created at the intersection with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Note

The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid **point** for the option

Screen message area

<<Bearings Intersect> Select 1st point> [picks][][menu]
<Bearings Intersect> bearing 1 [caret][][menu] select a button
<<Bearings Intersect> Select 2nd point> [picks][][menu]
<Bearings Intersect> bearing 2 [caret][][menu] select a button

14.7.2.4 Two Points, Two Distances

The **2 pts 2 dists** option find the point that given distances from two user selected points.

This problem is equivalent to finding the intersection of two circles centred on the points and with radii the same as the distances.

When there is more than one solution, the solution to the right of the line joining the two points is used. (the direction of the line is from the first point to the second point). To obtain the other solution, simply select the points in the opposite order.

After selecting the **2 pts 2 dists** option, the user selects the first point using the normal picking sequence.

A 1st distance box is then displayed on the screen and the user enters the distance that the new point is from the selected point into the box, terminated with a <enter>. The box then disappears.

The second point is then selected and a 2nd distance box is displayed on the screen for the user to enter the distance to the second point.

The point that is the required distances from the two points is created with name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, no point is created.

Note

The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid **point** for the option

Screen message area

<<Locate 2 pts 2 dists> Select 1st point> [picks][][menu]
<Locate 2 pts 2 dists> 1st distance [caret][][menu] select a button
<<Locate 2 pts 2 dists> Select 2nd point> [picks][][menu]
<Locate 2 pts 2 dists> 2nd distance [caret][][menu] select a button

Please continue to the next section 14.7.3 Vector.

14.7.3 Vector

The **vector** options are for creating points which are a given as at a given vector from another point.

The default definition of the vector is as (bearing, distance) but other combinations such as (angle, distance), relative (x,y) and absolute (x,y) are possible using normal typed input.

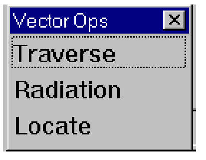
The methods for creating the new points are

(a) locate - create a new point using a vector

(b) radiation - the points created are all a vector from the initial point selected

(c) traverse - the last point created becomes the next point to work from

The **vector** walk-right menu is



Each of the options in the **Vector Ops** menu will now be discussed.

For the option *Traverse*, go to 14.7.3.3 Traverse
Radiation 14.7.3.2 Radiation
Intersect offset 14.7.2.2 Intersect Offset
Locate 14.7.3.1 Locate

14.7.3.1 Locate

In the **locate** option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point.

The sequence is then repeated by selecting another point and giving another vector.

After selecting the **locate** option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>. The box then disappears.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The sequence of picking a point and giving a vector is then repeated.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

<<Locate> Select point> [picks][][menu]
<Locate> bearing distance [caret][][menu] select a button

14.7.3.2 Radiation

In the **radiation** option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point.

After selecting the **radiation** option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the new given bearing and distance from the original selected point.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

<<Radiation> Select point> [picks][][menu]
<Radiation> bearing distance [caret][][menu] select a button

14.7.3.3 Traverse

In the **traverse** option, an initial point is chosen and a vector supplied to produce a new point which is the vector away from the initial point.

The created point is then taken to be the start point for the next sequence of creating a new point by a vector.

After selecting the **traverse** option, the user simply selects the first point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point.

The new point is given the name, colour, model and z-value from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the given bearing and distance from the last created point.

Hence, the last created point takes the place of the original selected point.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

<<Traverse> Select point> [picks][][menu]
<Traverse> bearing distance [caret][][menu] select a button

Please continue to the next section 14.7.4 Parallel.

14.7.4 Parallel

Items can be translated perpendicularly to either the left or right using the parallel option (also known as a copy parallel operation).

After selecting the **parallel** option, the user simply selects the item to paralleled using the normal picking sequence.

A offset box is then displayed on the screen and the user enters the required offset distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

A new item is then created which is a copy parallel of the selected item by the given offset distance. The new item has the name, colour and model from the **cogo edit** panel.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

<<Parallel> Select item to parallel> [picks][][menu]
<Parallel> offset> [caret][][menu] select a button

Please continue to the next section 14.7.5 Fillet Ops.

14.7.5 Fillet Ops

The **fillet** options are for creating an arc between lines and arcs.

That is, it will try and fit an arc between

(a) two lines

(b) a line and an arc

or

(c) two arcs

The created arc is determined by tangents from the items it is a fillet for and another piece of information such as a radius or a start point.

Since the option can only fillet between arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the fillet.

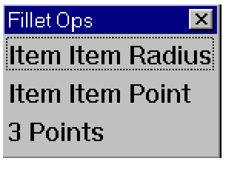
Most fillet cases can have more that one solution. For example, the fillet of a given radius between two lines can have up to four solutions.

To easily distinguish between the cases, 12d Model uses the order of picking and the sense of direction implied when picking the items to determine which case was required by the user.

The direction is used as follow -

> the arc comes off the first item in the direction that the first item is picked and lands on the second in the direction that the second item is picked.

The **fillet ops** walk-right menu is



Each of the options in the **Fillet Ops** menu will now be discussed.

For the option *Item Item Radius*, go to 14.7.5.1 Fillet Item Item Radius
Item Item Point 14.7.5.2 Fillet Item Item Point
3 points 14.7.5.3 Fillet Three Points

14.7.5.1 Fillet Item Item Radius

This fillet option creates an arc of a user given radius between two user selected items.

After selecting the **fillet item item radius** option, the user selects the first item to be used in the fillet using the normal picking sequence.

Next the second item to be used in the fillet is selected.

An enter radius box is then displayed on the screen and the user types the appropriate radius for the fillet into the box, terminated with a <enter>. The box then disappears.

A positive radius implies that the arc travels in a clockwise direction and a negative radius for an arc travelling in an anti-clockwise direction.

If a fillet exists for the two items and the radius, an fillet arc is created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, no arc is created.

Screen message area

<<Fillet by radius> Select 1st item> [picks][][menu]

<<Fillet by radius> Select 2nd item> [picks][][menu]
<Fillet by radius> Enter radius [caret][][menu] select a button

14.7.5.2 Fillet Item Item Point

This fillet option creates an arc between two user selected items starting at a user defined control point.

After selecting the **fillet item item pt** option, the user selects the first item to be used in the fillet using the normal picking sequence.

Next the second item to be used in the fillet is selected.

Finally, a point is selected to act as the starting point for the fillet. This point, called the control point, must lie on the first item selected. If the selected point doesn't lie on the first item, the selected point is projected perpendicularly onto the item and the projected point used as the control point.

If a fillet exists for the two items and the control point, a fillet arc is created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used.

Screen message area

<<Fillet by start point> Select 1st item> [picks][][menu]
<<Fillet by start point> Select 2nd item> [picks][][menu]
<<Fillet by start point> Select start point> [picks][][menu]

14.7.5.3 Fillet Three Points

This option creates an arc between three user selected points.

After selecting the **fillet 3 pts** option, the user selects the three points one after another using the normal picking sequence.

The three arc points must be selected in the order

(a) the start point
(b) a point between the start and end point
(c) the end point

If an arc does exist containing the three points, it will be unique including its direction. The arc will be created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used.

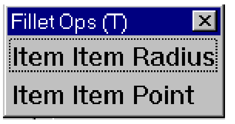
Screen message area

<<Fillet 3 points> Select 1st item> [picks][][menu]
<<Fillet 3 points> Select 2nd item> [picks][][menu]
<<Fillet 3 points> Select start point> [picks][][menu]

Please continue to the next section 14.7.6 Fillet Ops (T).

14.7.6 Fillet Ops (T)

The **fillet (T)** options are the almost identical to the fillet options.



The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc.

The trimmed items are not joined to the fillet arc.

The original strings obey the trash defaults from the **utilities=>defaults=>trash defaults** option.

That is, if the trash mode is set to *keep string*, the original strings are untouched.
delete string, deleted.
trash string, moved to the trash model.

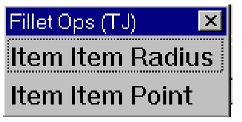
For information on the fillet options, see the section 14.7.5 Fillet Ops

For the option *Item Item Radius*, please go to the section 14.7.5.1 Fillet Item Item Radius.
Item Item Point 14.7.5.2 Fillet Item Item Point.

Please continue to the next section 14.7.7 Fillet Ops (TJ).

14.7.7 Fillet Ops (TJ)

The **fillet (TJ)** options are the almost identical to the fillet and fillet (T) options.



The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc and the three items joined to form a new item.

That is, the trimmed items are joined to the fillet arc.

The original strings obey the trash defaults from the **Utilities=>Defaults=>Trash defaults** option.

That is, if the trash mode is set to *keep string*, the original strings are untouched.
delete string, deleted.
trash string, moved to the trash model.

For information on the fillet options, see the section 14.7.5 Fillet Ops

For the option *Item Item Radius*, please continue to the section 14.7.5.1 Fillet Item Item Radius.
Item Item Point 14.7.5.2 Fillet Item Item Point.

Please continue to the next section 14.7.8 Tangent.

14.7.8 Tangent

The **tangent** option creates tangent lines between point and arcs.

That is, tangents can be defined between

(a) a point and an arc

(b) two arcs

or

(c) two points - simply a line between the two points

Since the option can only fillet between points and arcs, when an item is selected, only the picked sub-arc of the item is used as an arc.

Most tangent cases can have more that one solution. For example, two tangents from a point to an arc.

To easily distinguish between the cases, 12d Model uses the order of picking the items and the sense of direction implied when picking an arc to determine which case was required by the user.

After selecting the **tangent** option, the user selects the first item to be used in the tangent calculations using the normal picking sequence.

Next the second item to be used is selected.

If a tangent line exists between the two items selected, a line string is created with name, colour, model and z-value from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used for the line.

Screen message area

<<Tangent> Select 1st item> [picks][][menu]
<<Tangent> Select 2nd item> [picks][][menu]

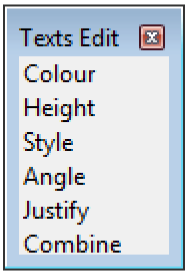
14.8 Texts Edit

Position of menu: **Strings =>Texts Edit**

These options are like the **Strings =>Points edit** options in that the options only does the one thing to a selected string. You then pick another string to do the same type of change.

For each of the Texts Edit options, press <Esc> or select **Cancel** from the **Pick Ops** menu to terminate the option. Selecting another CAD option will also terminate the option and start the new option.

Walking right on **Texts edit** displays the **Texts edit** menu

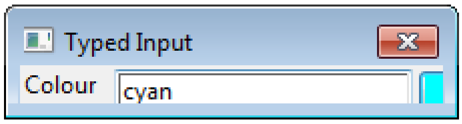


set/edit colour of text
set/edit height of text
set/edit style of text
set/edit angle of text
justify text
combine text

For the option *Colour*, go to 14.8.1 Change Text Colour
Height 14.8.2 Change Text Height
Style 14.8.3 Change Text Style
Angle 14.8.4 Change Text Angle
Justify 14.8.5 Change Text Justify
Combine 14.8.6 Change Combine

14.8.1 Change Text Colour

Click on **Colour** and a *Colour* **Typed Input** box comes up



The new colour is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area

Pick text and its colour will be changed to that shown in the square brackets ([]). Then pick another text to change its colour.

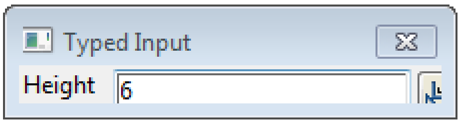
Typing c or C brings up the *Colour* **Typed Input** box to select a new colour.

All subsequent selected texts will have their colour changed to this colour until either the option is terminated or a new colour is selected

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

14.8.2 Change Text Height

Click on **Height** and a *Height* **Typed Input** box comes up



The new height is typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area

Pick text and its height will be changed to that shown in the square brackets ([]). Then pick another text to change its height.

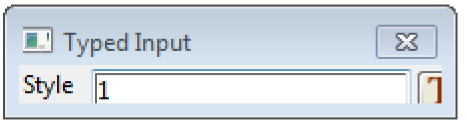
Typing h or H bring up the *Height* **Typed Input** box to select a new height.

All subsequent selected texts will have their height changed to this height until either the option is terminated or a new height is selected

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

14.8.3 Change Text Style

Click on **Style** and a *Style* **Typed Input** box comes up



The new style is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area

Pick text and its style will be changed to that shown in the square brackets ([]). Then pick another text to change its style.

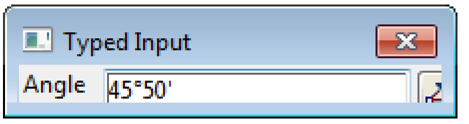
Typing s or S brings up the *Style* **Typed Input** box to select a new style.

All subsequent selected texts will have their style changed to this style until either the option is terminated or a new style is selected

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

14.8.4 Change Text Angle

Click on **Angle** and an *Angle* **Typed Input** box comes up



The new angle is typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area

Pick text and its angle will be changed to that shown in the square brackets ([]). Then pick another text to change its angle.

Typing a or A brings up the *Angle* **Typed Input** box to select a new angle.

All subsequent selected texts will have their angle changed to this angle until either the option is terminated or a new angle is selected

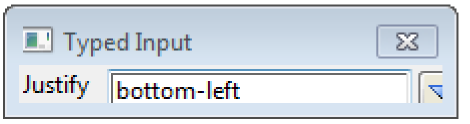
To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

Note

The angle is type in in hp notation and measured counter clockwise from the positive x-axis. The box will convert the hp notation and display it in degrees, minutes and seconds. For example, 45.5 in hp notation become 45 degrees 50 minutes.

14.8.5 Change Text Justify

Click on **Justify** and a *Justify* **Typed Input** box comes up



The new justification is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area

Pick text and its justification will be changed to that shown in the square brackets ([]). Then pick another text to change its justification.

Typing j or J brings up the *Justify* **Typed Input** box to select a new justification.

All subsequent selected texts will have their justification changed to this justification until either the option is terminated or a new justification is selected

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

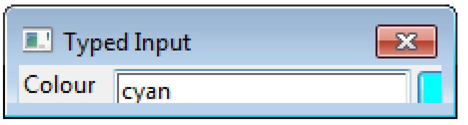
14.8.6 Change Combine

This option allows you to change one or more of Colour, Height, Angle, Textstyle and Justification.

Selecting **Combine** writes the following message to the screen message area

<Pick text to change (c)olour (h)eight (a)ngle (s)tyle (j)ustify> [picks][fast][Menu]

Type **c** or **C** and a *Colour* **Typed Input** box comes up



The new colour is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the following message is written to the screen message area

<Pick text to change (c)olour[cyan] (h)eight (a)ngle (s)tyle (j)ustify> [picks][fast][Men

This sets the colour to cyan.

Pick text and its colour will be changed to that shown in the square brackets ([]). Then pick another text to change its colour.

Typing c or C when there is a colour shown between the square brackets (for example [cyan]), removes the colour from the square brackets.

If any text is picked when there is no colour in the square brackets then its colour will not be changed.

Similarly:

Height

IF there is no height in square brackets after *(h)eight,* typing **h** or **H** brings up the *Height* **Typed Input** box to select a new height. Entering a height and pressing <Enter> **sets** the new height and it will appear in square brackets after *(h)eight* in the message written to the screen message area.

Typing **h** or **H** when there is a height shown between the square brackets (for example [2.00]), **removes** the height from the square brackets.

Angle

IF there is no angle in square brackets after *(a)ngle,* typing **a** or **A** brings up the *Angle* **Typed Input** box to select a new angle. Entering an angle and pressing <Enter> **sets** the new angle and it will appear in square brackets after *(a)ngle* in the message written to the screen message area.

Typing **a** or **A** when there is an angle shown between the square brackets, **removes** the angle from the square brackets.

Textstyle

IF there is no textstyle in square brackets after *(s)tyle,* typing **s** or **S** brings up the *Style* **Typed Input** box to select a new textstyle. Entering an textstyle and pressing <Enter> **sets** the new textstyle and it will appear in square brackets after *(s)tyle* in the message written to the screen message area.

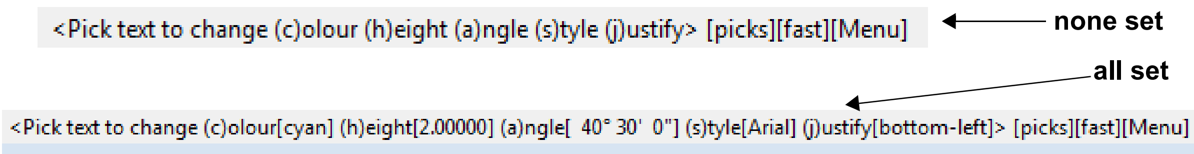
Typing **s** or **S** when there is an textstyle shown between the square brackets, **removes** the textstyle from the square brackets.

Justification

IF there is no justification in square brackets after *(j)ustify,* typing **s** or **S** brings up the *Justify*

Typed Input box to select a new justification. Entering a justification and pressing <Enter> **sets** the new justification and it will appear in square brackets after *(j)ustify* in the message written to the screen message area.

Typing **j** or **J** when there is an justification shown between the square brackets, **removes** the justification from the square brackets.



If any text is picked then the values of the text are changed for any that there is a value in the square brackets otherwise that value of the text is not changed.

To terminate the option, press <Esc>, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

14.9 Convert

Position of option on menu: **Strings =>Convert**

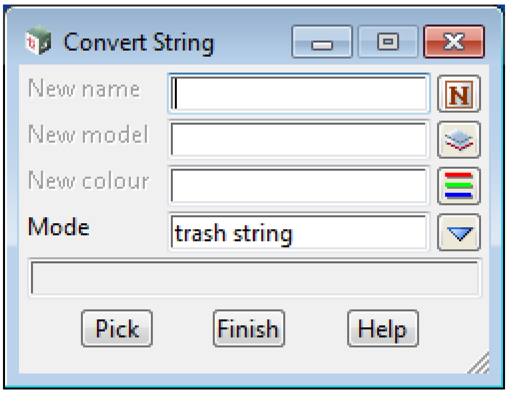
The **Convert** option is used to create a new string of possibly a different string type from a chosen string.

Since not all string conversion are possible, or even make sense (for example, converting a 3d string to a text string), the list of defined conversion depends on the type of the string chosen for conversion.

After selecting the string to convert, a menu containing the possible conversions is raised and the required conversion selected from it.

After the type of conversion is selected, a string Properties panel containing the attribute information for the new string is displayed and can be used to modify any properties of the new string.

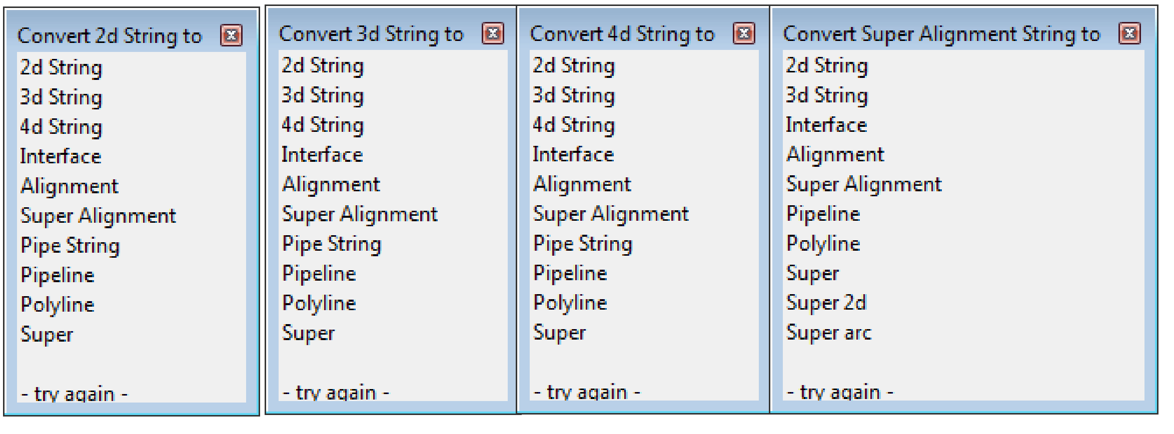
After selecting the **Convert option**, the **Convert String** panel is placed on the screen.

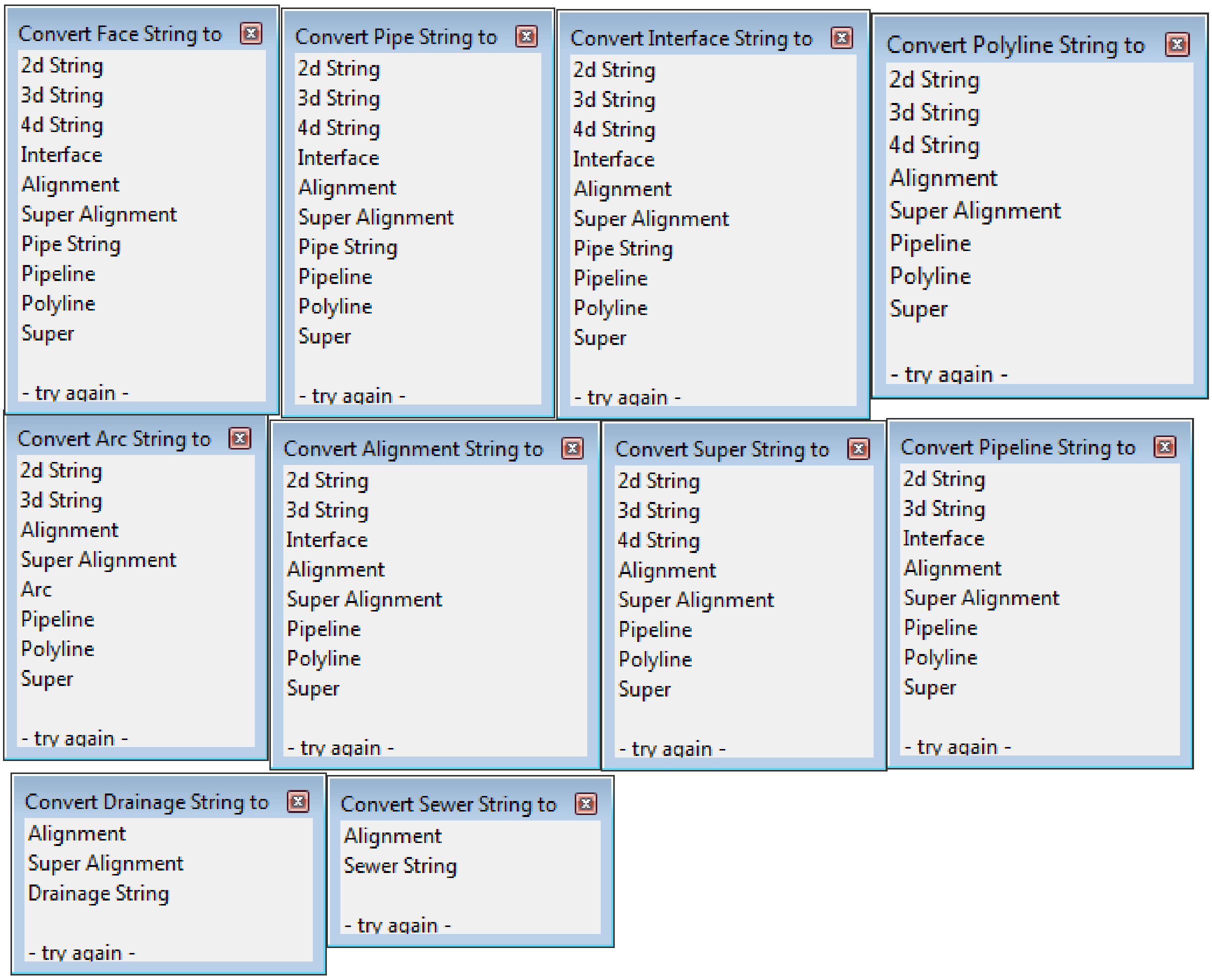


If a new name, model or colour is required for the converted string, the new data is entered into the **Convert String** panel. If a change isn't required, leave the appropriate panel field blank.

The **Convert** option is already in progress and if a string is selected and accepted, a menu containing all the available conversions for that particular string type is displayed.

For example, for each string type the choices are:





After selecting the conversion to be made, a new string of the selected type is created and given the model, colour and name according to the fields in the **Convert String** panel.

The Properties panel for the new string is also displayed and hence any of the strings properties can be modified for the new string.

The fields and buttons used in the **Convert String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

If blank, the converted string is given the same name as the original string.
If non-blank, then the converted string is given the name in the **new name** *field.*

New model	input		available models

if blank, the converted string is placed in the same model as the original string.
If non-blank, then the converted string will be placed in the model given in the new model *field.*

New colour	input		available colours

if blank, the converted string is given the same colour as the original string.
If non-blank, then the converted string is given the colour in the new colour *field.*

Mode	input	keep string	keep, delete, trash string

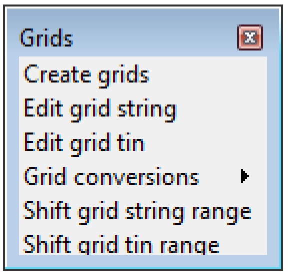
if ***delete string****, the string selected to be converted is deleted.*
keep string*, the selected string is not deleted.*
trash string*, the string selected to be converted is moved to the trash model.*

14.10 Grids

Position of option on menu: **Strings =>Grids**

The Grids menu allows the user to create and edit grids.

After selecting **Grids**, the **Grids** menu is placed on the screen.



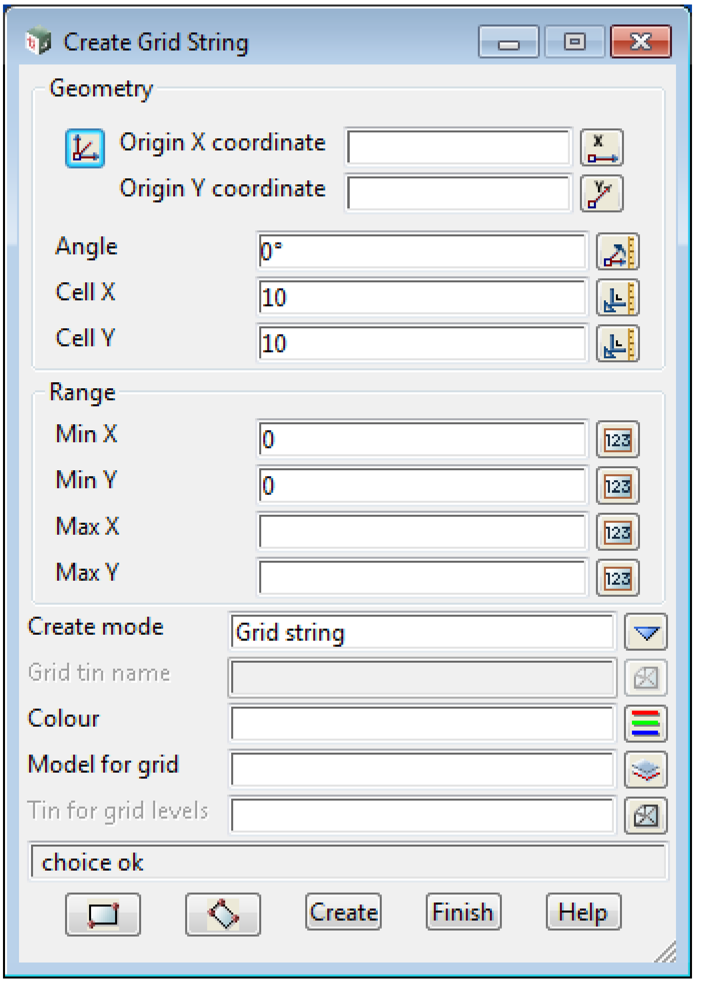
For the option:

Create grids	14.10.1 Create Grids
Edit grid string	14.10.2 Edit Grid String
Edit grid tin	14.10.3 Edit Grid Tin
Grid conversions	14.10.4 Grid Conversions
Shift grid string range	14.10.5 Shift Grid String Range
Shift grid tin range	14.10.6 Shift Grid Tin Range

14.10.1 Create Grids

Position of option on menu: **Strings =>Grids =>Create grids**

Selecting **Create grids** brings up the **Create Grid String** panel



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Geometry

Origin X/Y coordinate coordinate box

coordinates signifying the position where the range 0,0 exists. The Range group below specifies how many cells exist either side of this origin.

Angle angle box 0

the angle of the grid's local X axis

Cell X/Y measurement box 10

the local X axis and Y axis spacings

Range

Min X number box 0

the number of cells relative to the origin in the grid's local X axis. The sign of the number denotes whether it is to the left or right of the origin.

Min Y number box 0

the number of cells relative to the origin in the grid's local Y axis. The sign of the number denotes whether it is below or above the origin.

Max X number box

the number of cells relative to the origin in the grid's local X axis. The sign of the number denotes whether it is to the left or right of the origin.

Max Y number box

the number of cells relative to the origin in the grid's local Y axis. The sign of the number denotes whether it is below or above the origin.

Create mode choice box Grid string Grid string, Grid tin

the type of grid to be created.

Grid tin name tin box

enabled only if Create mode *is set to* Grid tin. *The name of the grid tin to be created. The tin must not already exist.*

Colour colour box

string colour for all points on the grid

Model for grid model box

name of the model in which the data is to be placed. The model will be created if it does not already exist. This field must be filled in.

Tin for grid levels tin box

optional information. If tin is selected, the height on each grid point is obtained from the grid. If blank, the height of each grid point is null.

Rectangle button

if selected, the origin X/Y, angle and all range values are calculated from two corners of the selected rectangle. ***Note****: Cell X/Y must be defined.*

Rectangle by 3 Points button

if selected, the origin X/Y, angle and all range values are calculated from three corners of the selected rectangle. The first point defines the origin, the second point defines the angle and range X values, and the third point defines the range Y values. ***Note****: Cell X/Y must be defined.*

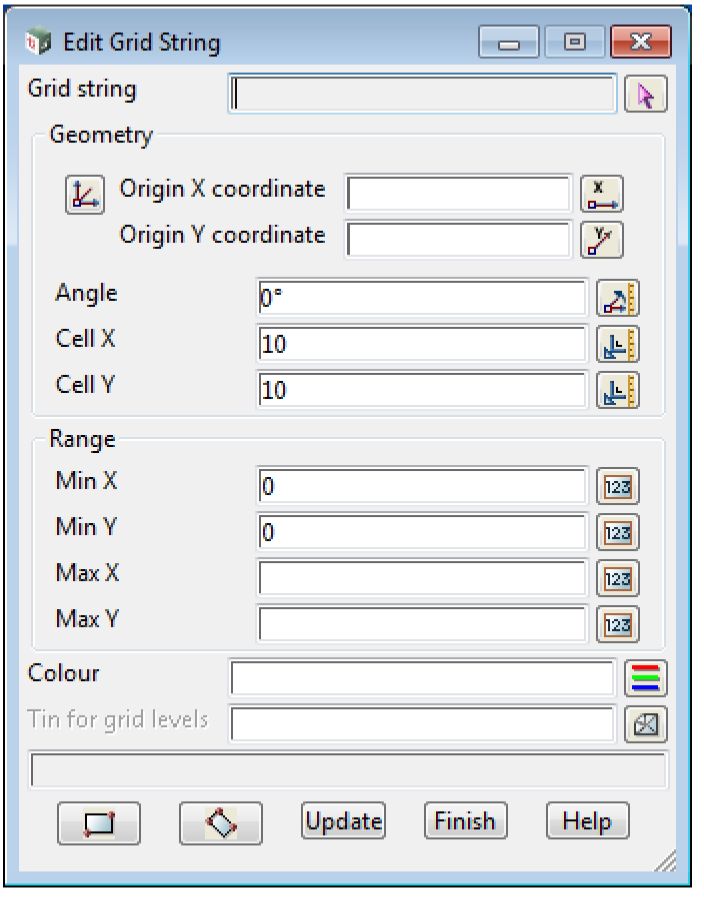
Create button

creates the grid string/tin.

14.10.2 Edit Grid String

Position of option on menu: **Strings =>Grids =>Edit grid string**

Selecting **Edit grid string** brings up the **Edit Grid String** panel



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Grid string	string select		

the grid string to be edited.

Geometry

Origin X/Y coordinate	coordinate box		

coordinates signifying the position where the range 0,0 exists. The Range group below specifies how many cells exist either side of this origin.

Angle	angle box	0	

the angle of the grid's local X axis

Cell X/Y	measurement box	10	

the local X axis and Y axis spacings

Range

Min X	number box	0	

the number of cells relative to the origin in the grid's local X axis. The sign of the number denotes whether it is to the left or right of the origin.

Min Y	number box	0	

the number of cells relative to the origin in the grid's local Y axis. The sign of the number denotes whether it is below or above the origin.

Max X number box

the number of cells relative to the origin in the grid's local X axis. The sign of the number denotes whether it is to the left or right of the origin.

Max Y number box

the number of cells relative to the origin in the grid's local Y axis. The sign of the number denotes whether it is below or above the origin.

Colour colour box

string colour for all points on the grid

Tin for grid levels tin box

optional information. If tin is selected, the height on each grid point is obtained from the grid. If blank, the height of each grid point is null.

Rectangle button

if selected, the origin X/Y, angle and all range values are calculated from the two corners of the selected rectangle. Note: Cell X/Y must be defined.

Rectangle by 3 Points button

if selected, the origin X/Y, angle and all range values are calculated from three corners of the selected rectangle. The first point defines the origin, the second point defines the angle and range X values, and the third point defines the range Y values. Note: Cell X/Y must be defined.

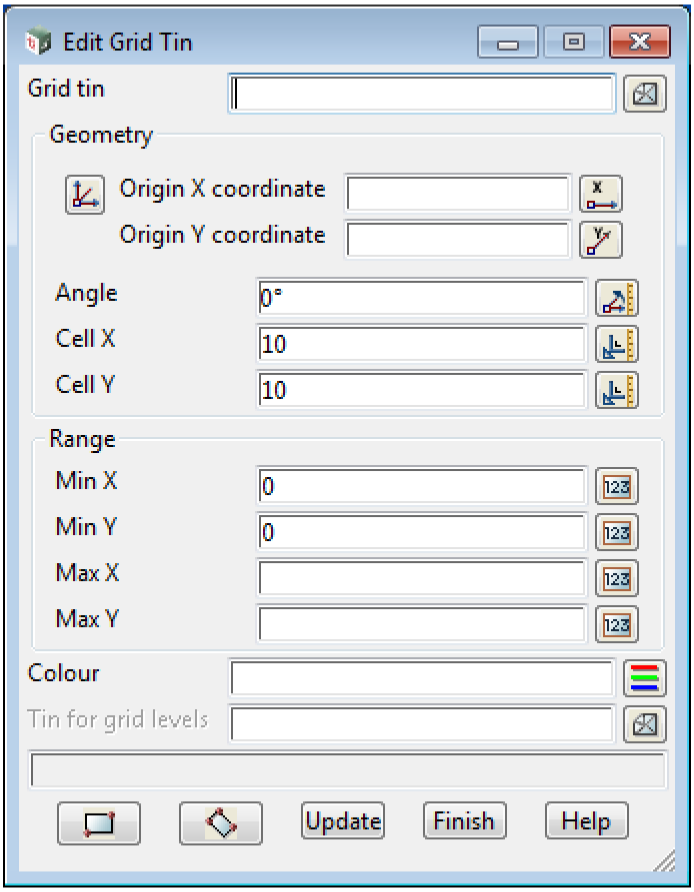
Update button

updates the grid string.

14.10.3 Edit Grid Tin

Position of option on menu: **Strings =>Grids =>Edit grid tin**

Selecting **Edit grid tin** brings up the **Edit Grid Tin** panel



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Grid string	string select		

the grid tin to be edited.

Geometry

Origin X/Y coordinate coordinate box

coordinates signifying the position where the range 0,0 exists. The Range group below specifies how many cells exist either side of this origin.

Angle angle box 0

the angle of the grid's local X axis

Cell X/Y measurement box 10

the local X axis and Y axis spacings

Range

Min X number box 0

the number of cells relative to the origin in the grid's local X axis. The sign of the number denotes whether it is to the left or right of the origin.

Min Y number box 0

the number of cells relative to the origin in the grid's local Y axis. The sign of the number denotes whether it is below or above the origin.

Max X number box

the number of cells relative to the origin in the grid's local X axis. The sign of the number denotes whether it is to the left or right of the origin.

Max Y number box

the number of cells relative to the origin in the grid's local Y axis. The sign of the number denotes whether it is below or above the origin.

Colour colour box

string colour for all points on the grid

Tin for grid levels tin box

optional information. If tin is selected, the height on each grid point is obtained from the grid. If blank, the height of each grid point is null.

Rectangle button

if selected, the origin X/Y, angle and all range values are calculated from the two corners of the selected rectangle. Note: Cell X/Y must be defined.

Rectangle by 3 Points button

if selected, the origin X/Y, angle and all range values are calculated from three corners of the selected rectangle. The first point defines the origin, the second point defines the angle and range X values, and the third point defines the range Y values. Note: Cell X/Y must be defined.

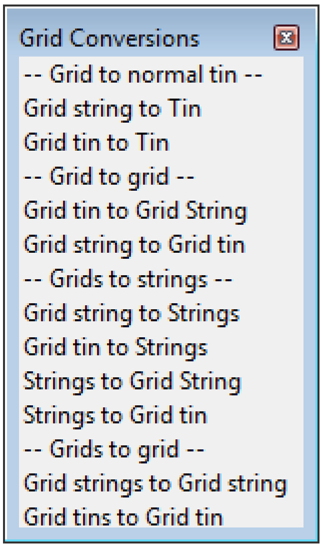
Update button

updates the grid tin.

14.10.4 Grid Conversions

Position of option on menu: **Strings =>Grids =>Grid conversions**

Selecting **Grid conversions** brings up the **Grid conversions** menu



The fields and buttons used in the panel have the following functions.

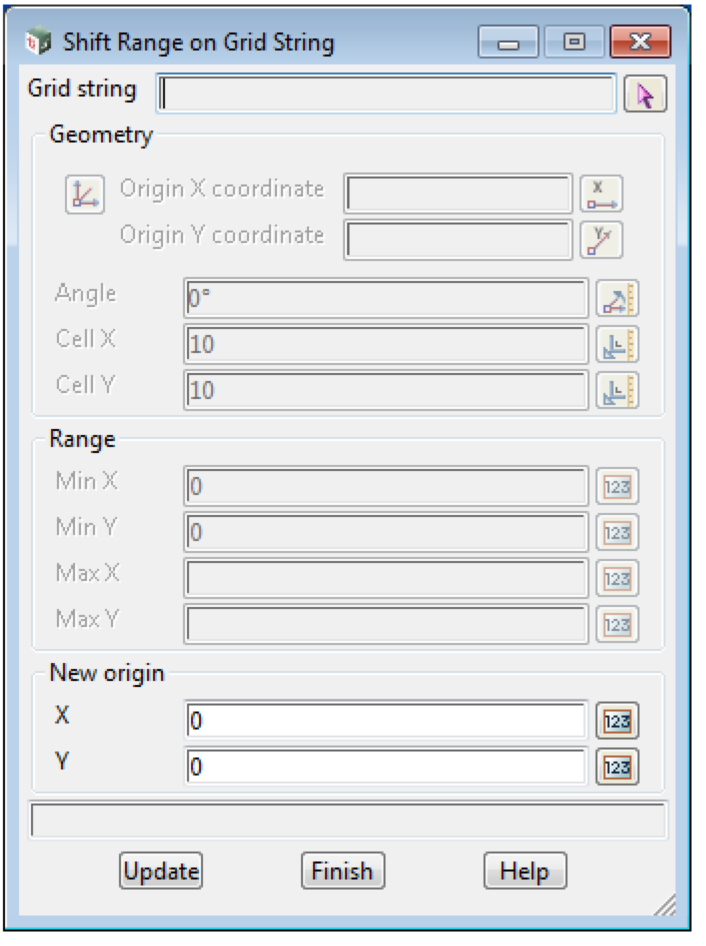
Field Description Type Defaults Pop-Up

Origin X/Y coordinate

14.10.5 Shift Grid String Range

Position of option on menu: **Strings =>Grids =>Shift grid string range**

Selecting **Shift grid string range** brings up the **Shift Range on Grid String** panel



The fields and buttons used in the panel have the following functions.

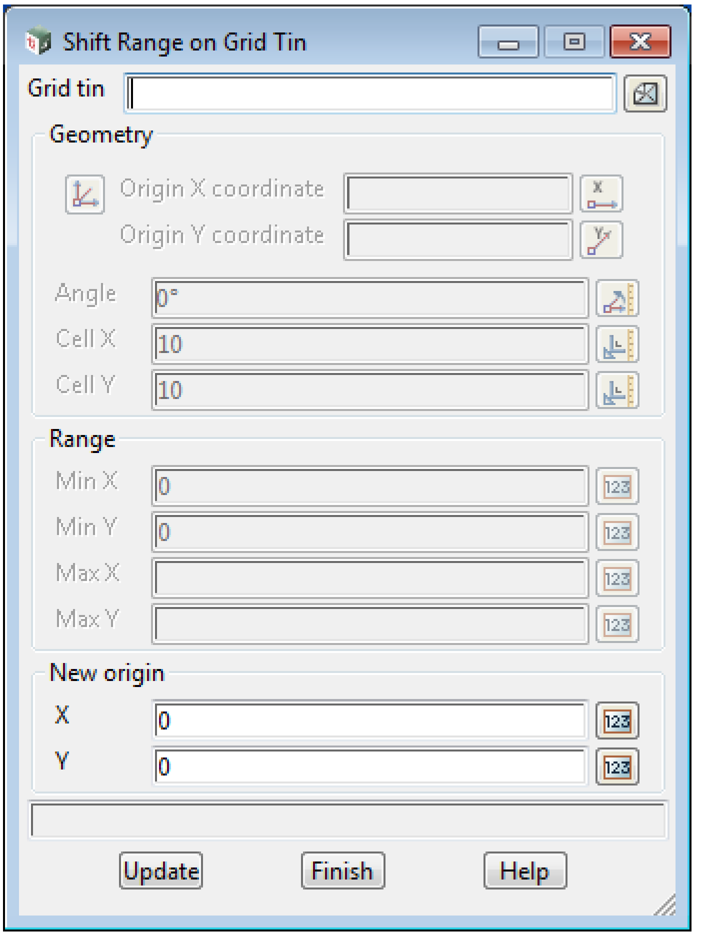
Field Description	Type	Defaults	Pop-Up
Geometry			
Origin X/Y coordinate	coordinate box		
Angle	angle box	0	
Cell X	measurement box	10	
Cell Y	measurement box	10	
Range			
Min X	number box	0	
Min Y	number box	0	
Max X	number box		
Max Y	number box		
New origin			
X	number box		

Y	number box
Update	button

14.10.6 Shift Grid Tin Range

Position of option on menu: **Strings =>Grids =>Shift grid tin range**

Selecting **Shift grid tin range** brings up the **Shift Range on Grid Tin** panel



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Grid tin	tin box		
Geometry			
Origin X/Y coordinate	coordinate box		
Angle	angle box	0	
Cell X	measurement box	10	
Cell Y	measurement box	10	
Range			
Min X	number box	0	
Min Y	number box	0	
Max X	number box		
Max Y	number box		

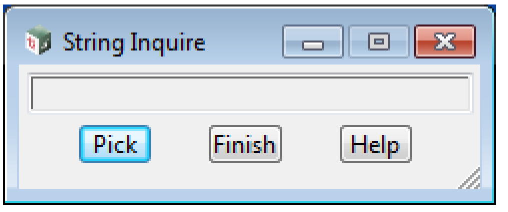
New origin	
X	number box
Y	number box
Update	button

14.11 Inquire

Position of option on menu: **Strings =>Inquire**

The **inquire** option is used to obtain information about a string displayed on the screen.The amount and type of information varies between string types.

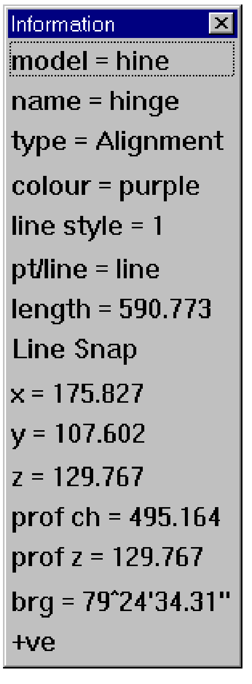
On selecting the **Inquire** option, the **String Inquire** panel is displayed.



The panel is used for any special messages and to end the option.

After selecting the **inquire** option, the strings are selected using the normal 12d Model selecting mechanism (LB to pick a string, MB to accept a string, RB for the **pick ops** menu). Whenever a string is picked, the information about the picked string is displayed on the screen in the **Information** menu.

An example of the **Information** menu for an Alignment string is



For more details on the **Information** menu, go to the section 14.11.1 String Information

Any number of string inquiries can be made with the option by repeated use of the mouse buttons LB and MB to pick and accept strings.

The inquire option is terminated by either selecting the **Cancel** option from the **Pick Ops** menu (raised by clicking RB) or selecting **Finish** or **[X]** from the **String Inquire** panel.

14.11.1 String Information

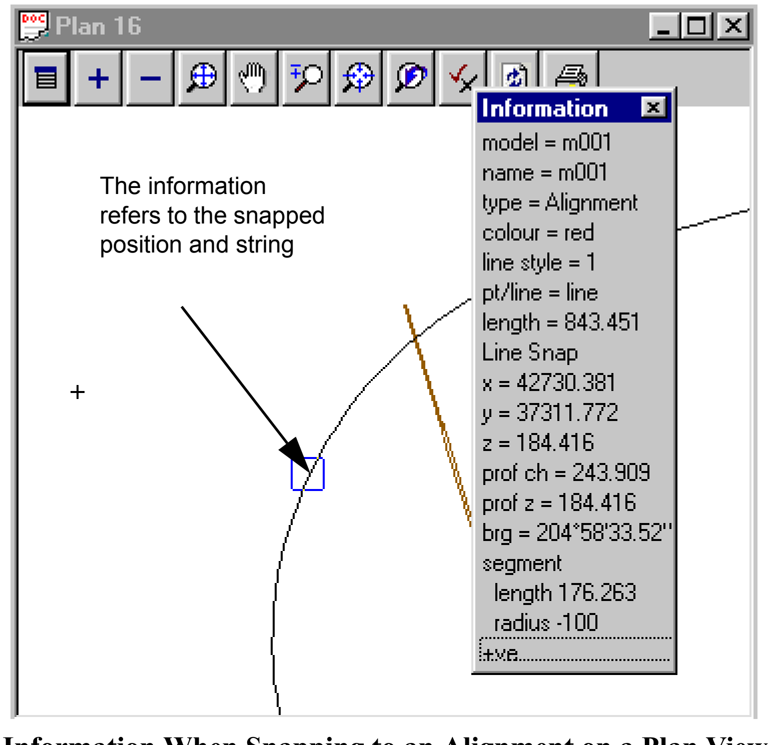
Whenever a string is picked, the information about the picked string is displayed on the screen in the **Information** menu

The **Information** menu displays different information depending on whether the string was picked in a Plan or Perspective view or in a Section view.

For a Plan or Perspective View

The details on the Information menu can include:

model =	- gives the model of the selected string
name =	- " name " " "
type =	- " type " " "
colour =	- " colour " " "
line style =	- " line style " " "
pt/line =	- " " breakline type " " "
# pts =	- " " number of points " " "
area =	- " " area if it is a closed string
length =	- " " length of the string
Snap type	- *e.g.* Line Snap, Point Snap
x =	- " " x co-ordinate of the selected position
y =	- " " y co-ordinate of the selected position
prof ch =	- " " chainage of the selected position on the string
prof z =	- " " z-value of the selected position on the string
brg =	- " instantaneous bearing of the selected position on the string
segment length	- " length of the string segment containing the selected position
+ve or -ve	- if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.



Information When Snapping to an Alignment on a Plan View

For a Section View

For a section view, the x-axis of the view is defined by the chainage along the string that is being profiled on the section view (the ***profiled*** string). The profiled string is displayed on the section view.

For any tins in models added to the section view, the sections through the tins along the profiled string are also displayed in the section view.

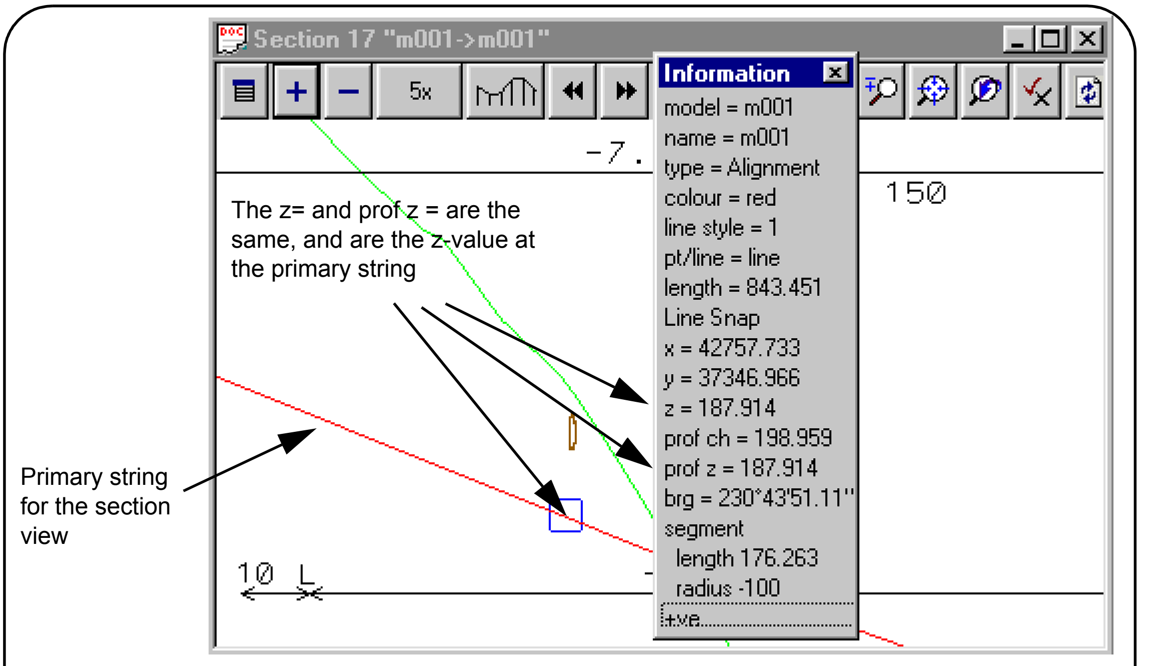
Finally, any parts of any strings in models added to the section view that are in the corridor defined for the section view are projected onto the section view and displayed.

The details on the Information menu can include:

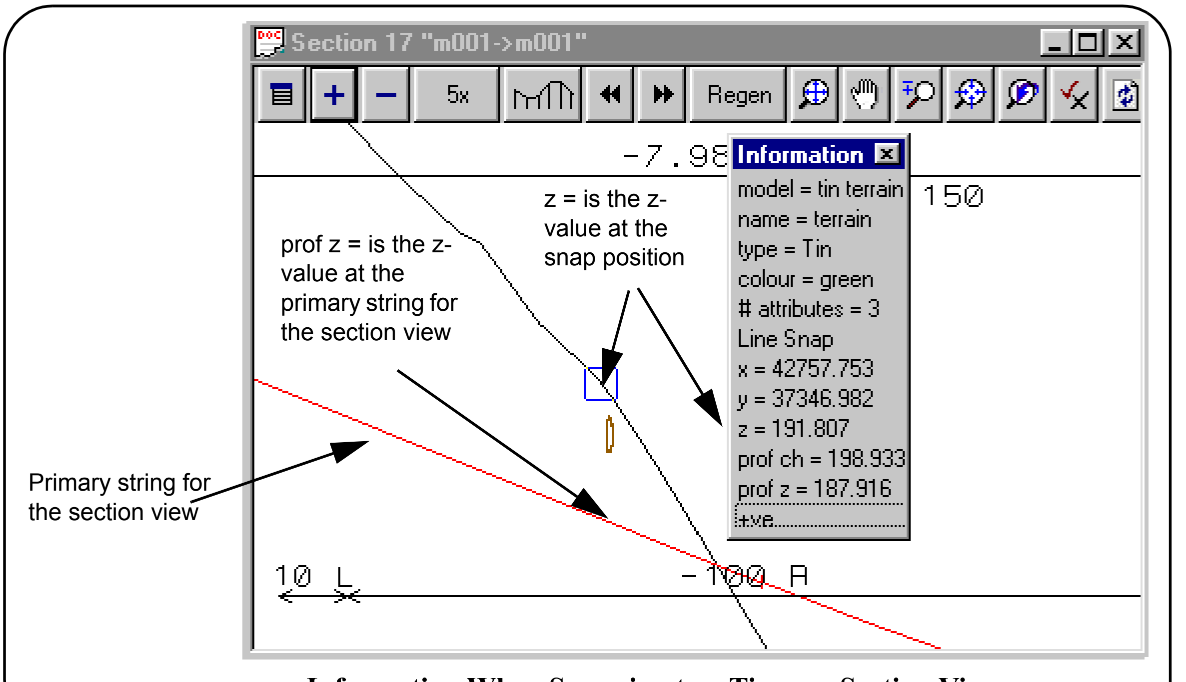
model =	- gives the model of the selected string
name =	- " name " " "
type =	- " type " " "
colour =	- " colour " " "
line style =	- " line style " " "
pt/line =	- " breakline type " " "
# pts =	- " number of points " " "
area =	- " area if it is a closed string
length =	- " length of the string
Snap type	- *e.g.* Line Snap, Point Snap
x =	- " x co-ordinate of the selected position
y =	- " y co-ordinate of the selected position
z =	- " z co-ordinate of the selected position
prof ch =	- " chainage of the *profiled* string at the selected position Note that this is not the chainage of the selected string unless the selected string is the profiled string
prof z =	- " " z-value of the *profiled* string at the profile chainage of the selected position Note that this is not the z of the selected position unless the selected string is the profiled string
brg =	- " instantaneous bearing of the selected position on the string
segment length	- " length of the string segment containing the selected position
+ve or -ve	- if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.

IMPORTANT NOTES

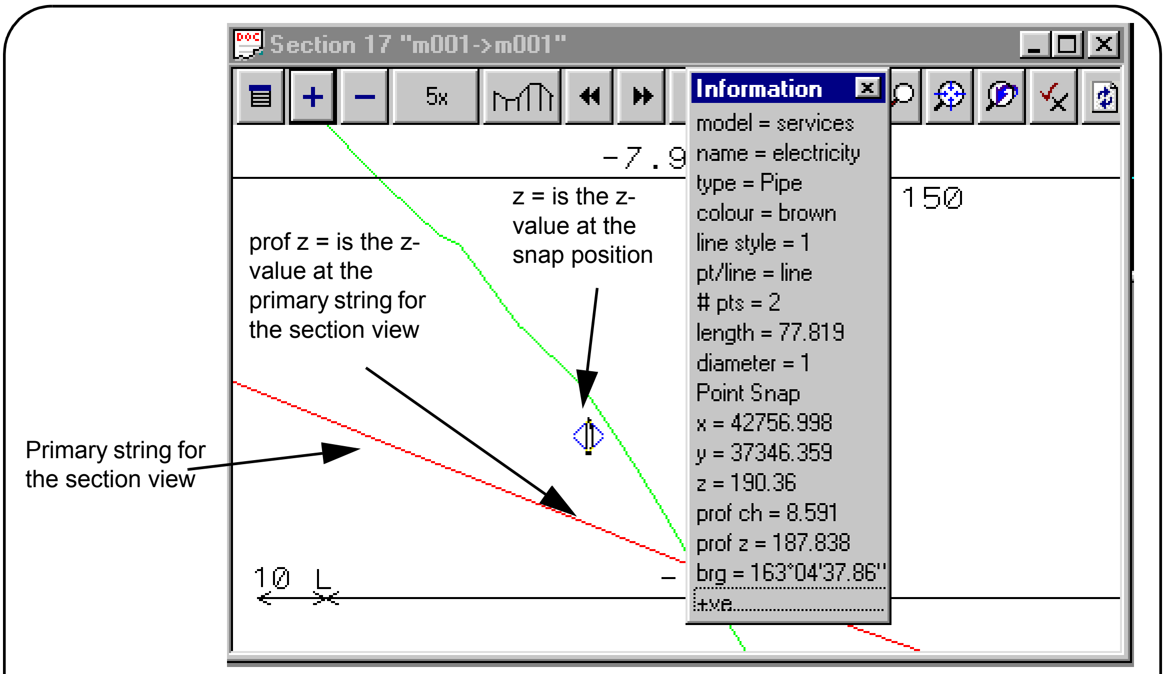
1. for a string selected on a section view, the " ***z =*** " value is the z co-ordinate of the selected position. The "***prof z =*** " value is the z co-ordinate of the string profiled on the section view.
2. The "***prof ch =*** " value is the chainage of the string profiled on the section view, not the chainage of the selected string.



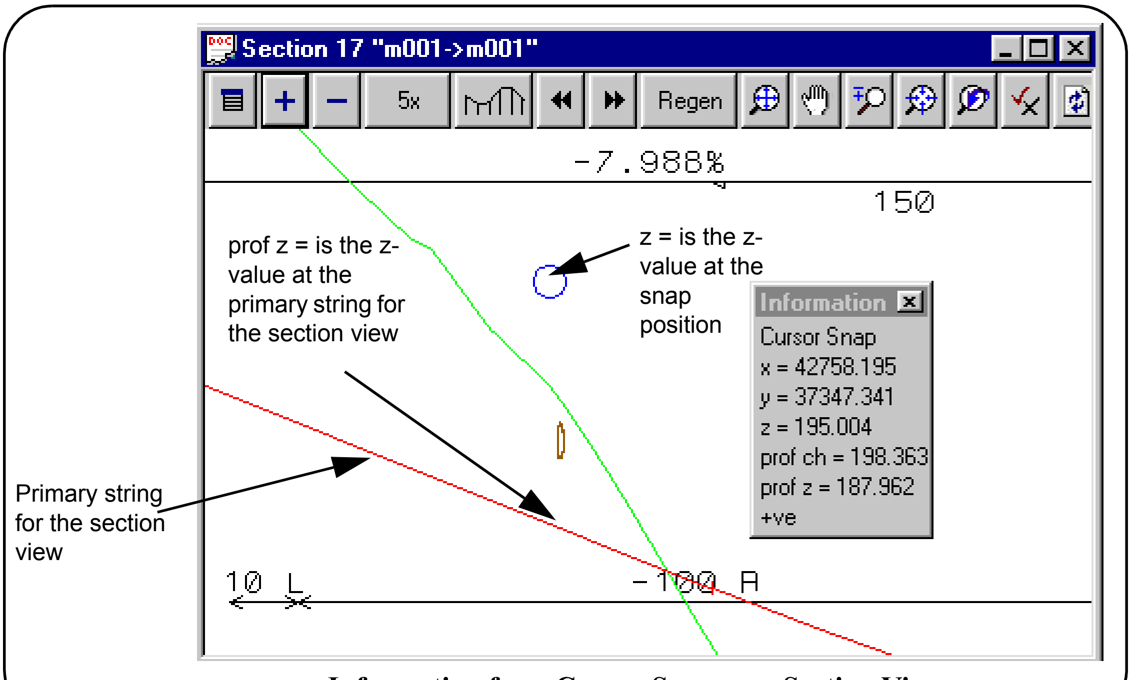
Information When Snapping to the Primary String for a Section View



Information When Snapping to a Tin on a Section View



Information When Snapping to a Service String on a Section View



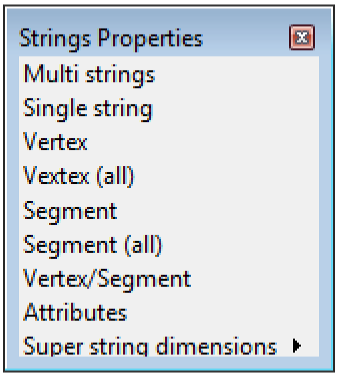
Information for a Cursor Snap on a Section View

14.12 Properties

Position of menu: **Strings =>Properties**

The **Properties** walk-right menu contains options to obtain and/or modify the properties of any string displayed on the screen, or obtain and/or modify the vertices and segments of a super string.

The **Properties** walk-right menu is



For the option:

Multi strings, go to	14.12.1 Multi String Properties
Single string	14.12.2 Single String
Vertex	14.12.3 Vertex
Vertex (all)	14.12.6 Vertex (all)
Segment	14.12.4 Segment
Segment (all)	14.12.5 Segment (all)
Vertex/Segment	14.12.7 Vertex/Segment
Attributes	14.12.8 Attributes
Super string dimensions	14.12.9 Super Strings

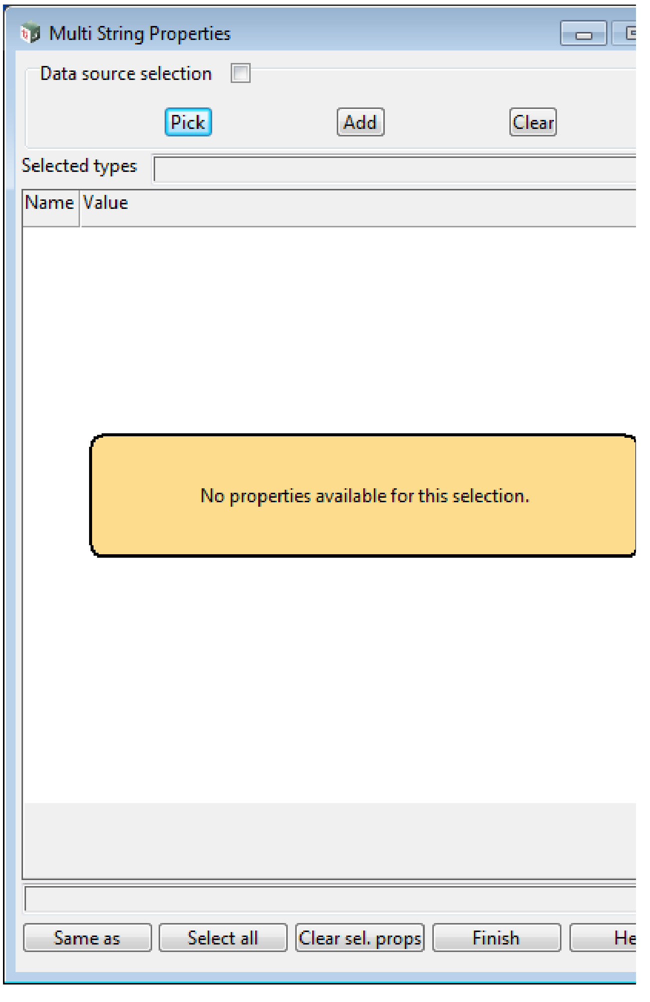
14.12.1 Multi String Properties

Position of option on menu: **Strings =>Properties =>Multi strings**

The **Multi String Properties** panel allows you to select strings and the panel displays all the common properties of the selected strings, and the value of a property if it is the same for all the selected elements.

The value of any of these properties can then be modified and all the selected strings will have the property changed to the modified value.

Selecting **Multi strings** brings up the **Multi String Properties** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source selection	tick box	not ticked	

*if **ticked**, a Data Source is displayed and used to define the strings in the Selection Set.*

Data Source	data source box		

all the strings in the Data Source are selected for the Selection Set.

*If **not ticked**,* **Add** *and* **Clear** *buttons are displayed and used to defined the strings in the selection Set.*

Add	button		

when **Add** *is clicked, strings are selected/deselected using the Multipick method, and are added to any string already selected for the Selection Set by the* **Add** *button.*

The **Add** *button and be used any number of times and each time it adds the new selected items to the Selection Set.*

Clear button

When **Clear** *is clicked, the Selection Set is cleared. That is, there are no strings in the Selection Set.*

The common properties of all the strings in the Selection Set are displayed in the **Name-Value** *property list. If the value of a common property is the same for* ***all*** *the strings in the Selection Set, then the common value is displayed in the* **Value** *column for that property. Otherwise the* **Value** *column for that property is left blank.*

Common Property List

the Common Property Tree displays all the common properties of the selected strings that can be modified.

The name of each common property is displayed in a row in the **Name** *column.*

For a particular common property, if all the selected strings have the same value for that common property then the common value is displayed in the **Value** *column for the row of the common property. Otherwise the value column is blank.*

If a value is ***modified*** *in the* **Value** *column, then for all the strings in the Selection Set, that property is* ***changed*** *to the new value.*

Same As, Select All and Clear Selection Buttons

these three buttons work together. Rows in the ***Property List*** *can be selected (highlighted), and then the* ***Same As*** *button used to select a string whose properties are used to update the strings in the selection set for the highlighted common properties.*

Same As button

when **Same As** *is clicked and an string is selected, then for all the strings in the Selection Set, the values of the highlighted properties in the* ***Common Property List*** *are set to the values of the* ***Same As*** *string.*

Select All button

clicking **Select All** *highlights all the rows of properties in the* ***Property List****. If required, individual rows can then be deselected using Ctrl-LB.*

Clear Property Selection button

clicking **Clear Property Selection** *clears all the highlighted property rows.*

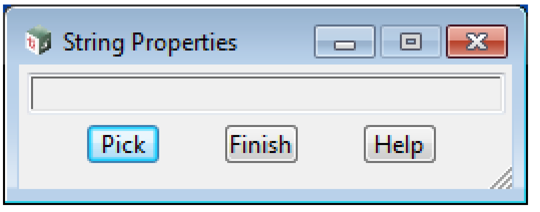
14.12.2 Single String

Position of option on menu: **Strings =>Properties =>Single string**

The **Single string** option obtains and/or modify property information about any string displayed on the screen.

For example, the string's name, colour and style are string properties. Each string type has its own particular set of properties.

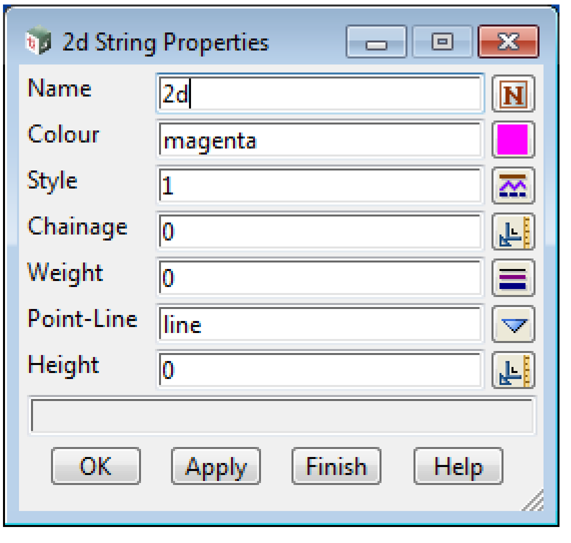
On selecting the **Single string** option, the **String Properties** panel is displayed.



The panel is only used for any special messages and to end the option.

The **String Properties** option is automatically in a pick mode and the user selects strings using the normal 12d Model picking mechanism (LB to select a string, MB to accept a string, RB for the **pick ops** menu). Whenever a string is selected, the appropriate **Properties** panel for the string type is displayed on the screen with all the picked string's properties shown.

For example, for a 2d string, the **Properties** panel is



To modify any of the properties for the selected string, simply change the information in the appropriate panel field and select the **OK or Apply** button.

The **Properties** panel is also brought up by the **Properties** option on each string editor and the **Properties** panel have been shown for each string in the Editor section of the manual.

Please continue to the next section 14.12.3 Vertex.

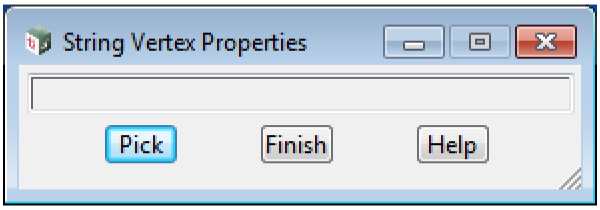
14.12.3 Vertex

Position of option on menu: **Strings =>Properties =>Vertex**

The **Vertex** option obtains and/or modify property information about the vertex of any super string displayed on the screen.

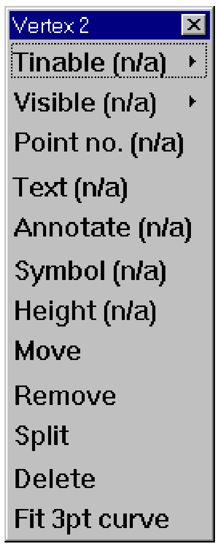
For example, the height, symbol, annotation, point no are all properties of a super string vertex.

On selecting the **Vertex** option, the **String Vertex Properties** panel is displayed.



The panel is only used for any special messages and to end the option.

The **String Vertex Properties** option is automatically in a pick mode and the user selects the *vertex* of a super string using the normal 12d Model picking mechanism. Whenever a *vertex* is selected, a **Vertex** menu showing the properties of the vertex is displayed on the screen.



To modify any of the properties for the selected vertex, simply click on the appropriate item on the **Vertex** menu and the appropriate panel will come up to modify the vertex property.

Please continue to the next section 14.12.4 Segment.

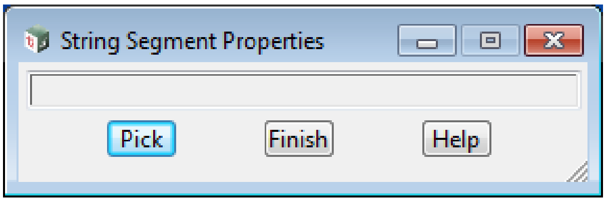
14.12.4 Segment

Position of option on menu: **Strings =>Properties =>Segment**

The **Segment** option obtains and/or modify property information about the segment of any super string displayed on the screen.

For example, the visibility, radius, colour, text are all properties of a super string segment.

On selecting the **Segment** option, the **String Segment Properties** panel is displayed.



The panel is only used for any special messages and to end the option.

The **String Segment Properties** option is automatically in a pick mode and the user selects the *segment* of a super string using the normal 12d Model picking mechanism. Whenever a *segment* is selected, a **Segment** menu showing the properties of the segment is displayed on the screen.

To modify any of the properties for the selected segment, simply click on the appropriate item on the **Segment** menu and the appropriate panel will come up to modify the segment property.

Please continue to the next section 14.12.7 Vertex/Segment.

14.12.5 Segment (all)

Position of option on menu: **Strings =>Properties =>Segment (all)**

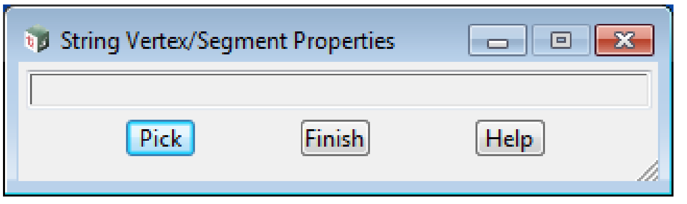
14.12.7 Vertex/Segment

Position of option on menu: **Strings =>Properties =>Vertex/Segment**

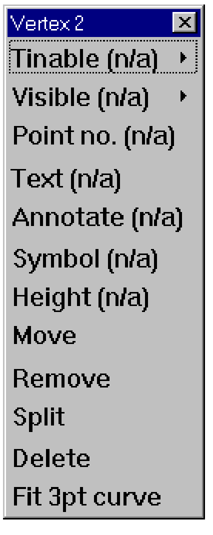
This option is a combination of the Vertex and Segment options already documented.

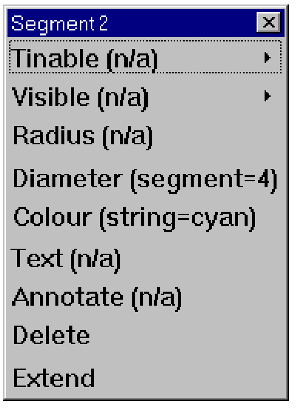
The **Vertex/ Segment** option obtains and/or modify property information about the vertex or segment of any super string displayed on the screen.
On selecting the **Vertex/Segment** option, the **String Vertex/Segment Properties** panel is displayed.



The panel is only used for any special messages and to end the option.

The **String Vertex/Segment Properties** option is automatically in a pick mode and the user selects either the *vertex* or the *segment* of a super string using the normal 12d Model picking mechanism. Whenever a *vertex* or *segment* is selected, the **Vertex** or **Segment** menu showing the properties of the selected vertex or segment is displayed on the screen.



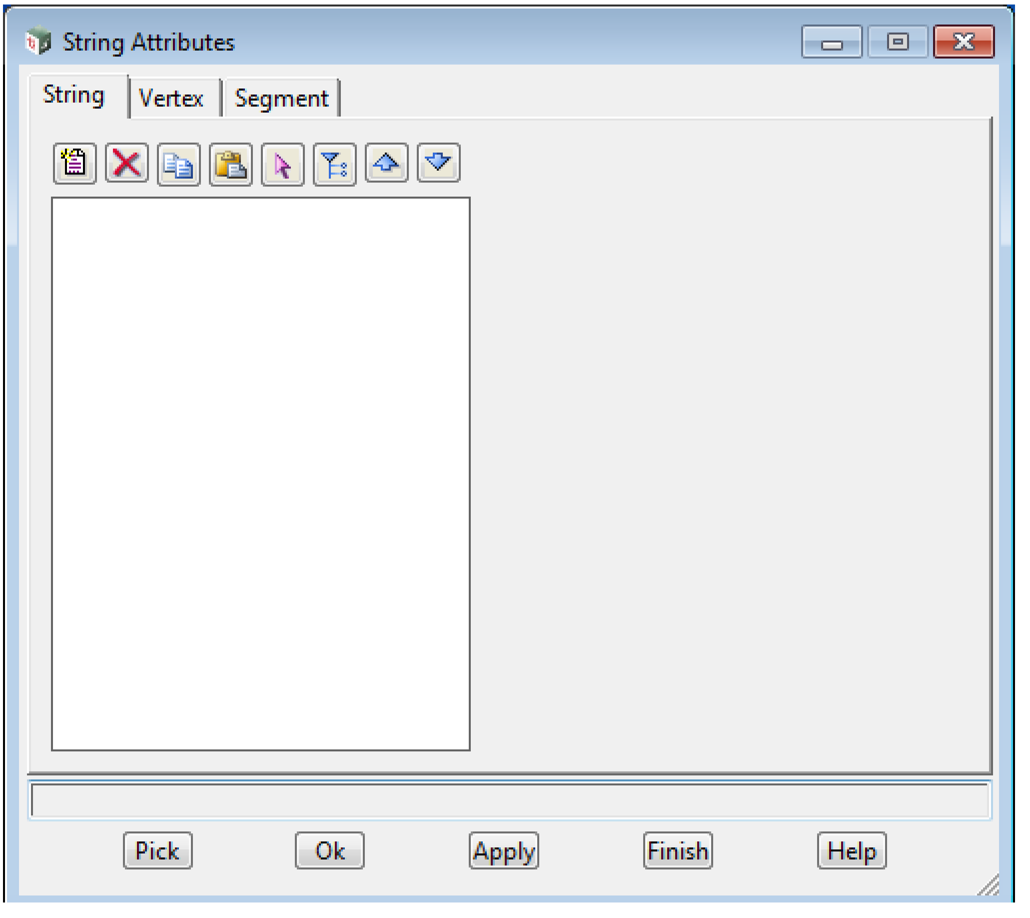


14.12.8 Attributes

Position of option on menu: **String =>Properties =>Attributes**

The **Attributes** options displays, creates and edits attributes for any strings in the project.

On selecting **Attributes**, the **String Attributes** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

String tab

this tab displays/edits the attributes that apply for the entire string. All string types have these.

Name

name of the string attribute

Type integer, real, text

type of attribute - integer, real or text

Data

value for the string attribute

Segment tab

this tab displays/edits the attributes for each segment of a super string or pipe of a drainage or sewer string.

Segment no.

number of the segment of the string to display/edit attributes for

Prev button

go to the previous segment of the string.

Next button

go to the next segment of the string.

Name

name of the attribute for the segment

Type integer, real, text

type of attribute - integer, real or text

Data

value for the attribute for the segment

Vertex tab

this tab displays/edits the attributes for each vertex of a super string or pit of a drainage or sewer string.

Vertex no.

number of the vertex of the string to display/edit attributes for

Prev button

go to the previous vertex of the string.

Next button

go to the next vertex of the string.

Name

name of the attribute for the vertex

Type integer, real, text

type of attribute - integer, real or text

Data

value for the attribute for the vertex

Pick button

pick the string to display/edit the attributes for

OK button

set the attributes to the values in the panel and then exit the panel.

Apply button

set the attributes to the values in the panel but don't exit the panel.

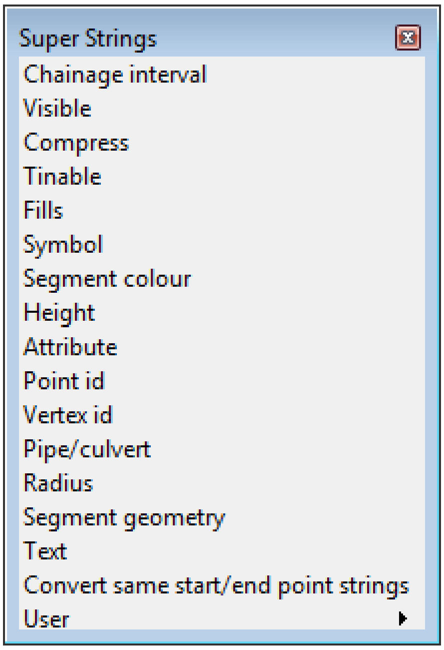
14.12.9 Super Strings

Position of menu: **Strings =>Properties =>Super string dimensions**

Position of menu: **Utilities =>Super strings**

These options change many of the super string properties.

The **Super strings** walk-right menu is:



set/reset the chainage interval and chord/arc tolerance
set visibility flags to constant/variable or clear the flag
compress a super string
set tinability to constant/variable or clear the flag
set fill styles for the string
define symbols constant/each vertex or have no symbols
set a colour for every segment in the super string
set the height(s) of the super string
clear the super string attributes for the string, vertex and/or segment
set the Vertex IDs to sequential numbers or clears the existing vertex IDs
ss segments can have a diameter or a box cross-section
clear any segment radii
clear any segment geometry
set or clear vertex and segment text and annotations
convert strings with same start and end points to closed super strings

For the options

Chainage interval, go to 14.12.9.1 Chainage Interval
Visible 14.12.9.2 Visible
Compress 14.12.9.3 Compress
Tinable 14.12.9.4 Tinable
Fills 14.12.9.5 Fills
Symbol 14.12.9.6 Symbol
Segment colour 14.12.9.7 Segment Colour
Height 14.12.9.8 Height
Attribute 14.12.9.9 Attribute
Vertex id 14.12.9.10 Vertex ID
Pipe/culvert 14.12.9.11 Pipe/Culvert
Radius 14.12.9.12 Radius
Segment geometry 14.12.9.13 Segment Geometry
Text 14.12.9.14 Text
Convert same start/end points strings 28.9.12.7 Same Start/End Point Strings

14.12.9.1 Chainage Interval

Position of option on menu: **Strings =>Properties =>Super string dimensions =>Chainage interval**

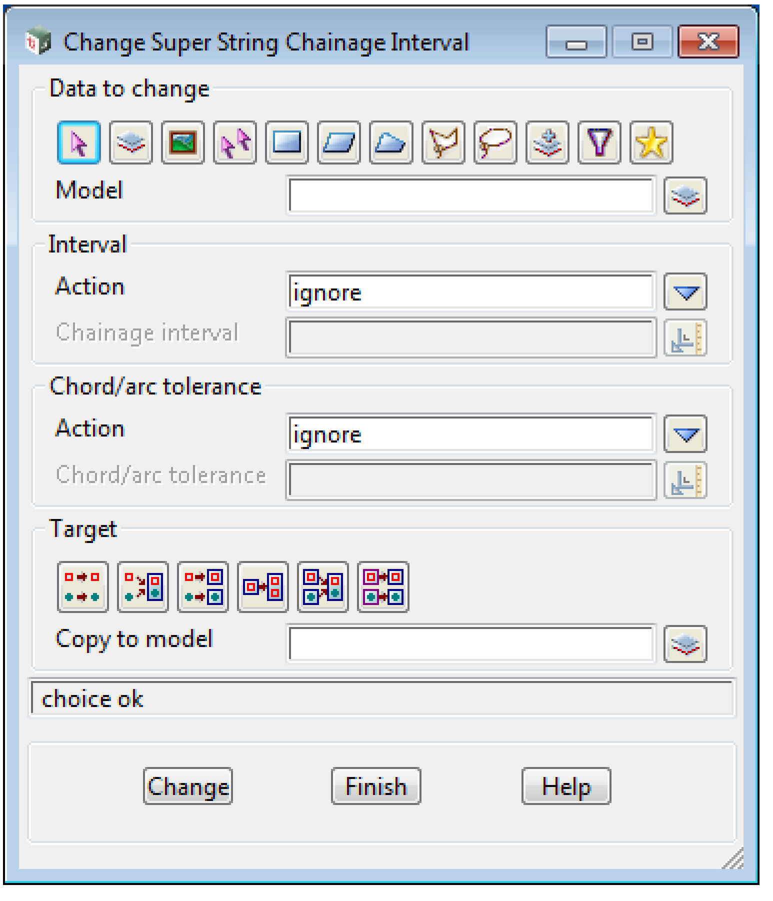
Position of option on menu: **Utilities =>Super strings =>Chainage interval**

A super string has one *chainage interval* value for the entire string. If the value is non-zero, then any line segments of the string are subdivided by the chainage interval when the super string is used in triangulations.

A super string also has one *arc-chord tolerance* value for the entire string. If the value is non-zero, then any curved segments are subdivided by the arc-chord tolerance when used in triangulations.

The **Chainage interval** option can set the *chainage interval* value and/or the *chord-to-arc tolerance* value for selected super strings.

On selecting the **Chainage interval** option, the **Change Super String Chainage Interval** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Interval tab

Action	choice box	ignore	set, clear, ignore

*if **set**, set the chainage intervals of the selected super strings to the value in* Chainage interval*.*
*If **clear**, set all the selected super strings to not use a chainage interval.*
*If **ignore**, don't modify the chainage interval of the selected super strings.*

Chainage interval input

the chainage interval to use for a super string.

Chord/arc tolerance tab

Action choice box ignore set, clear, ignore

*if **set**, set the chord/arc tolerance of the selected super strings to the value in* Chord/arc tolerance*.*
*If **clear**, set all the selected super strings to not use a chord/arc tolerance.*
*If **ignore**, don't modify the chord/arc tolerance of the selected super strings.*

Chord/arc tolerance input

the chord/arc tolerance to use for a super string.

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected strings

14.12.9.2 Visible

Position of option on menu: **Strings =>Properties =>Super string dimensions =>Visible**

Position of option on menu: **Utilities =>Super strings =>Visible**

For selected super strings, the **Visible** option can set the flags that determine how visibility is defined for a super string.

Segment visibility can

(a) be not setable at all for the string - it is always visible

(b) have one setting for the entire string - visible only

(c) have separate settings for each segment (and all set to visible)

Similarly, vertex visibility can

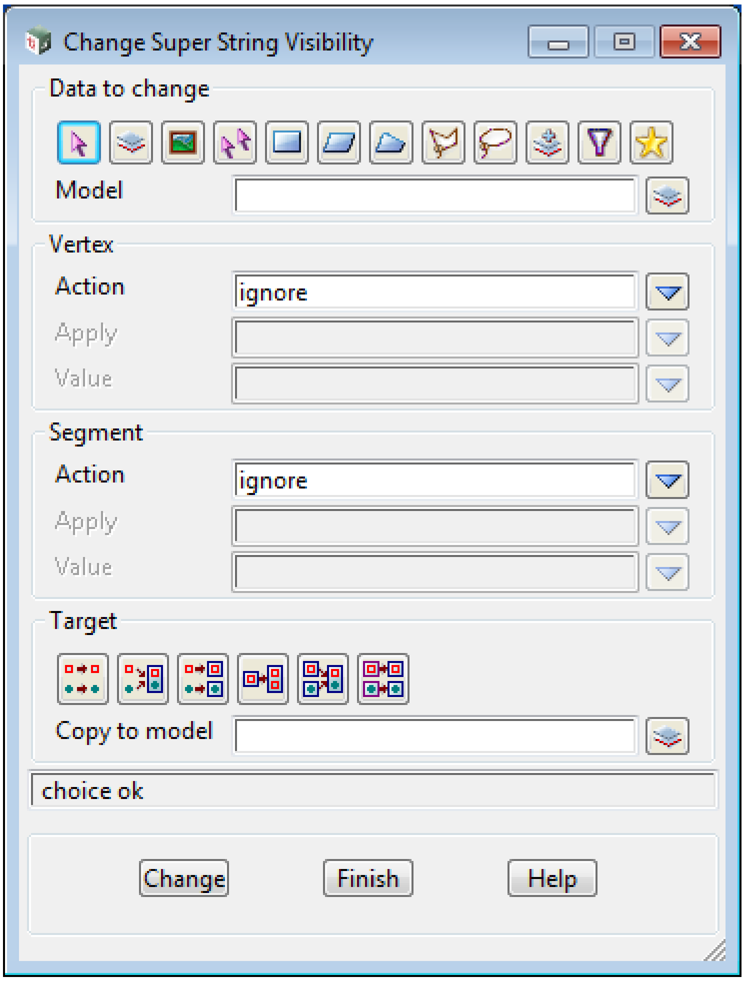
(a) be not setable at all for the string - it is always visible

(b) have one setting for the entire string - visible only

(c) have separate settings for each segment (and all set to visible).

The **Visible** option allows any of the above cases to be set up for the selected super strings.

On selecting the **Visible** option, the **Change Super String Visibility** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data to be processed.

Vertex tab

Action choice box ignore set, clear, ignore

*if **set**, the vertex visibility can be allowed to be a constant for all vertices in the string, or to be different for each vertex in the string.*
*If **clear**, the vertex visibility flags are removed for the string and the string vertices are always visible.*
*If **ignore**, don't modify the visibility flags for the vertices of the string.*

Apply choice box

*if **Action** is **set**, then the Apply field is used.*
*If Apply is **constant**, the string has only one visibility flag and it applies to all vertices in the string. It is set to visible.*
*If Apply is **variable**, each vertex in the string has its own visibility flag and each flag is set to visible.*

Segment tab

Action choice box ignore set, clear, ignore

*if **set**, the segment visibility can be allowed to be a constant for all segments in the string, or to be different for each segment in the string.*
*If **clear**, the segment visibility are removed for the string and the string segments are always visible.*
*If **ignore**, don't modify the visibility flags for segments of the string.*

Apply choice box

*if **Action** is **set**, then the Apply field is used.*
*If Apply is **constant**, the string has only one visibility flag and it applies to all segments in the string It is set to visible*
*If Apply is **variable**, each segment in the string has its own visibility flag and each flag is set to visible.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected strings.

14.12.9.3 Compress

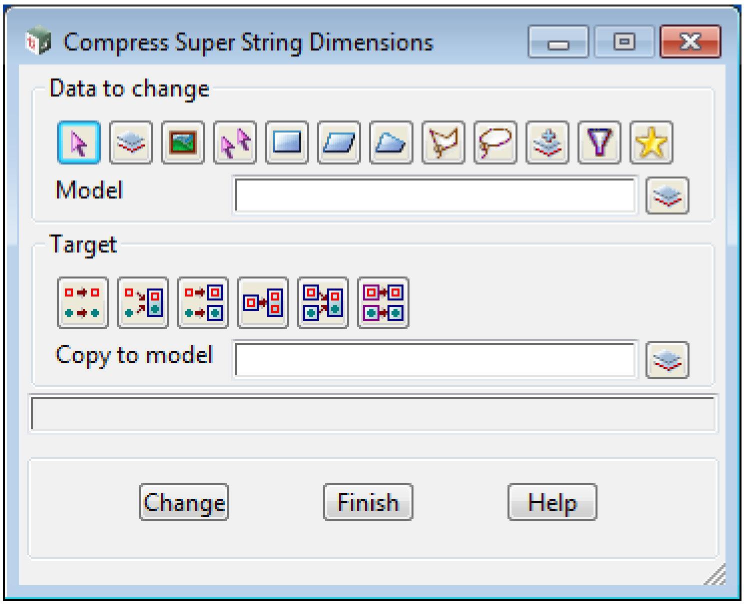
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Compress**

Position of option on menu: **Utilities =>Super strings =>Compress**

The compress option removes any super string dimensions that are not needed. For example, dimensions such radius, variable z, *etc*. that are not being used in the string are removed.

This reduces the storage required for the super string.

On selecting the **Compress** option, the **Compress Super String Dimensions** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Data source type | | Model |

data selection type - for a full description go to 4.19.3 Data Source.

Data source | input

source of data to be processed.

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info | input

extra information required for the target.

Change | button

process the selected strings

14.12.9.4 Tinable

Position of option on menu: **Strings =>Properties =>Super string dimensions =>Tinable**

Position of option on menu: **Utilities =>Super strings =>Tinable**

For selected super strings, the **Tinable** option can set the flags that determine how tinability is defined for a super string and can also set whether segments or vertices are tinable or not.

Segment tinability can

(a) be not setable at all for the string - it is always tinable

(b) have one setting for the entire string

(c) have separate settings for each segment.

Similarly, vertex tinability can

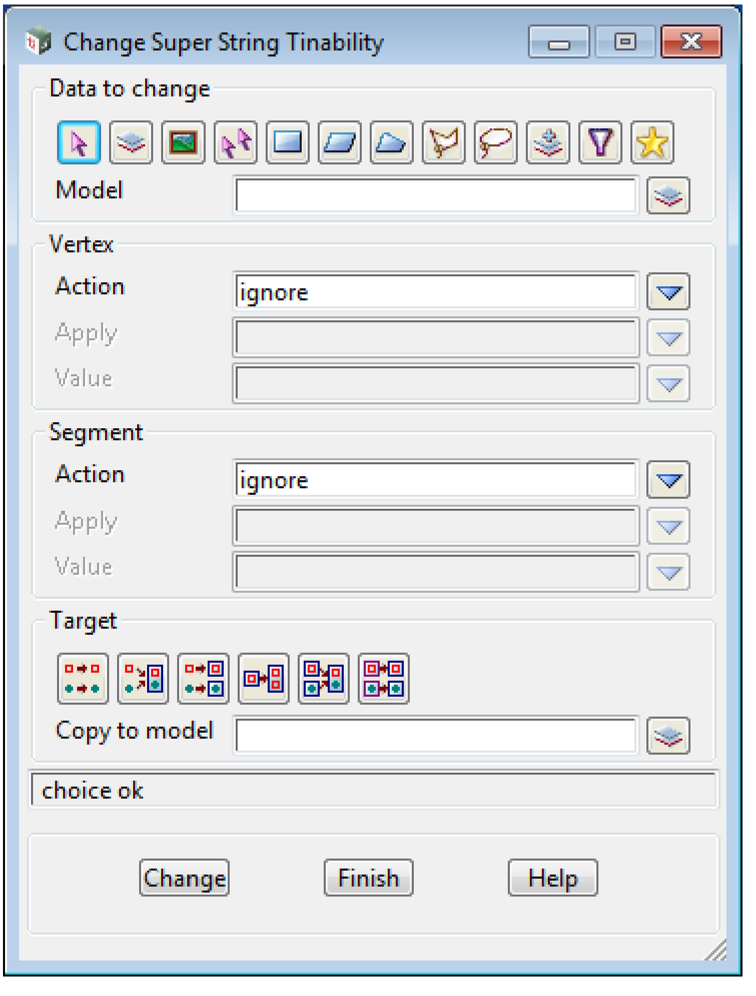
(a) be not setable at all for the string - it is always tinable

(b) have one setting for the entire string

(c) have separate settings for each segment.

The **Tinable** option allows any of the above cases to be set up for the selected super strings.

On selecting the **Tinable** option, the **Change Super String Tinability** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data to be processed.

Vertex tab

Action choice box ignore set, clear, ignore

*if **set**, the vertex tinability can be allowed to be a constant for all vertices in the string, or to be different for each vertex in the string.*
*If **clear**, the vertex tinability can not be modified for the string and the string vertices are always tinable.*
*If **ignore**, don't modify the tinability flags for the vertices of the string.*

Apply choice box

*if **Action** is **set**, then the Apply field is used.*
*If Apply is **constant**, the string has only one tinability flag and it applies to all vertices in the string. The tinability flag it is set to the value in the Value field.*
*If Apply is **variable**, each vertex in the string has its own tinability flag. The tinability flag it is set to the value in the Value field.*

Value choice box

*if **Value** is **on**, then the tinable flag is set to **tinable**.*
*If **Value**' is **off**, then the tinable flag is set to **not tinable**.*

Segment tab

Action choice box ignore set, clear, ignore

*if **set**, the segment tinability can be allowed to be a constant for all segments in the string, or to be different for each segment in the string.*
*If **clear**, the segment tinability can not be modified for the string and the string segments are always tinable.*
*If **ignore**, don't modify the tinability flags for segments of the string.*

Apply choice box

*if **Action** is **set**, then the Apply field is used.*
*If Apply is **constant**, the string has only one tinability flag and it applies to all segments in the string.The tinability flag it is set to the value in the Value field.*
*If Apply is **variable**, each segment in the string has its own tinability flag. The tinability flag it is set to the value in the Value field*

Value choice box

*if **Value** is **on**, then the tinable flag is set to **tinable**.*
*If **Value** is **off**, then the tinable flag is set to **not tinable**.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected strings

14.12.9.5 Fills

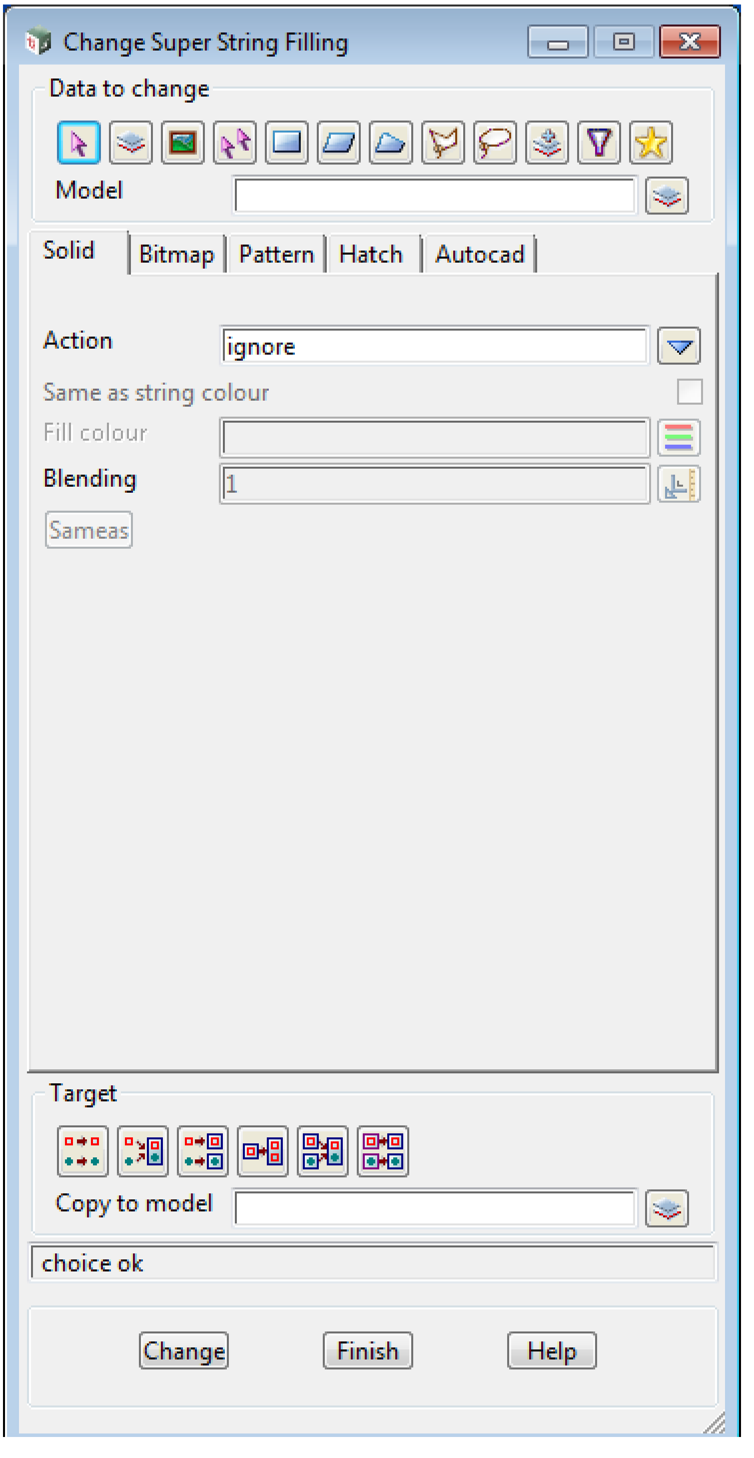
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Fills**

Position of option on menu: **Utilities =>Super strings =>Fills**

The **Fills** option set the flags that determine how filling is defined for a super string. If the string is not closed, the first and last vertices are joined to define the closed region to fill.

A string can have zero, one or more types of fills from the types Solid, Bitmap, Pattern, Hatch and Autocad.

On selecting the **Fill** option, the **Change Super String Filling** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to change		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Target type

data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Same as button on each tab

after selecting the **Same as** *button a string with a fill is selected and if the string has a fill the same as the Tab containing the* **Same as** *button then the values for that fill in of the string is used to fill in the appropriate fields of the Tab.*

Buttons at Bottom

Change button

process the selected strings

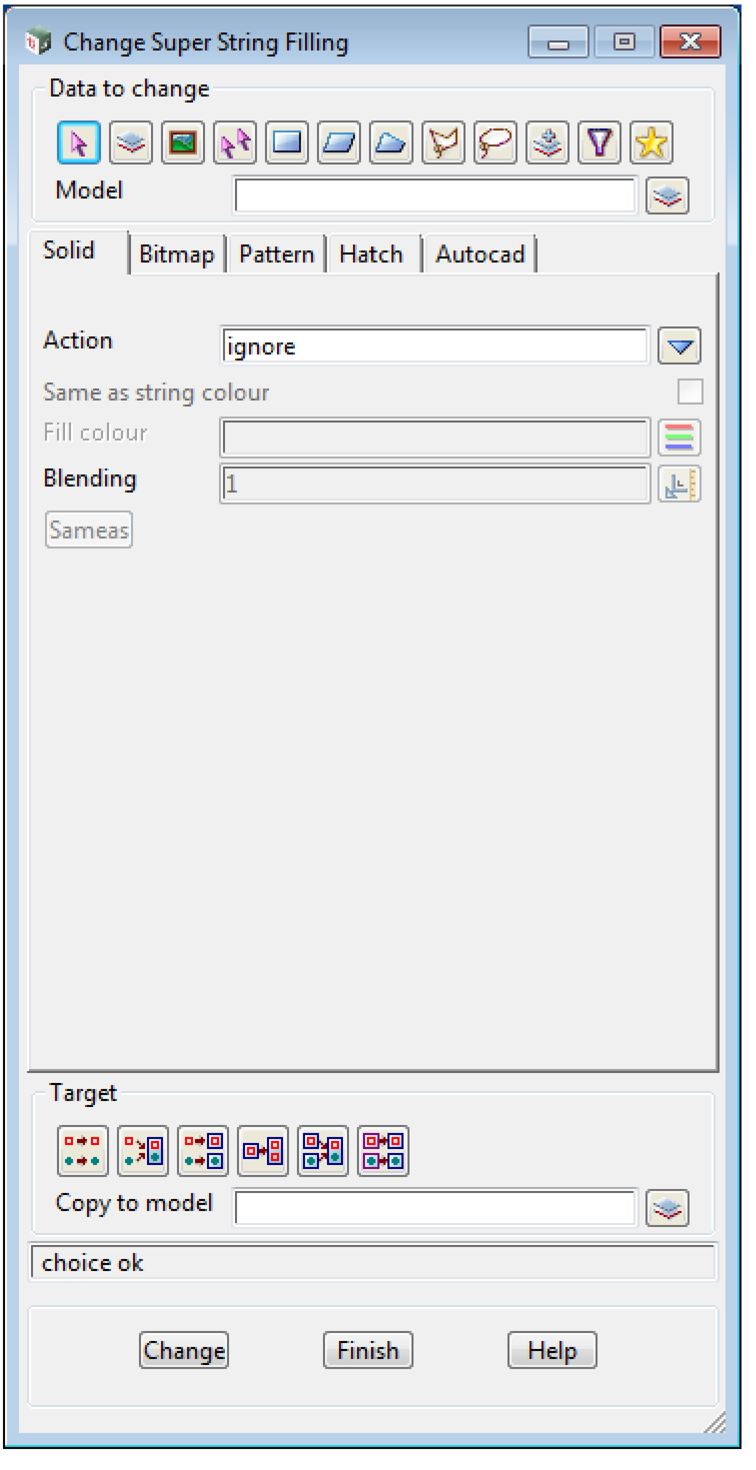
Solid, Bitmap, Pattern, Hatch and Autocad Tabs

each tab defines how that type of fill is applied to the string. Zero, one or more fill types can be applied to a string.Each tab will now be described.

See

14.12.9.5.1 Solid Tab
14.12.9.5.2 Bitmap Tab
14.12.9.5.3 Pattern Tab
14.12.9.5.4 Hatch tab
14.12.9.5.5 Autocad tab

14.12.9.5.1 Solid Tab



The fields and buttons used in the panel have the following functions.

Action choice box ignore set, clear, ignore

*if **set**, this type of fill is set for the string.*
*If **clear**, this type of fill is turned off for the string.*
*If **ignore**, don't modify this type of fill for the string.*

Same as string colour tick box

*if **ticked**, then for all the strings that are to have their **Solid fills** modified, the colour of the super string* *solid fill is set to be the same as the string colour.*

If ***not ticked****, the fill colour is used for the* ***Solid fill****.*

Fill colour colour box

if Same as string colour *is not ticked, the* Fill colour *is used to fill the super string. If the super string is not closed, the fill will apply as if the super string was closed.*

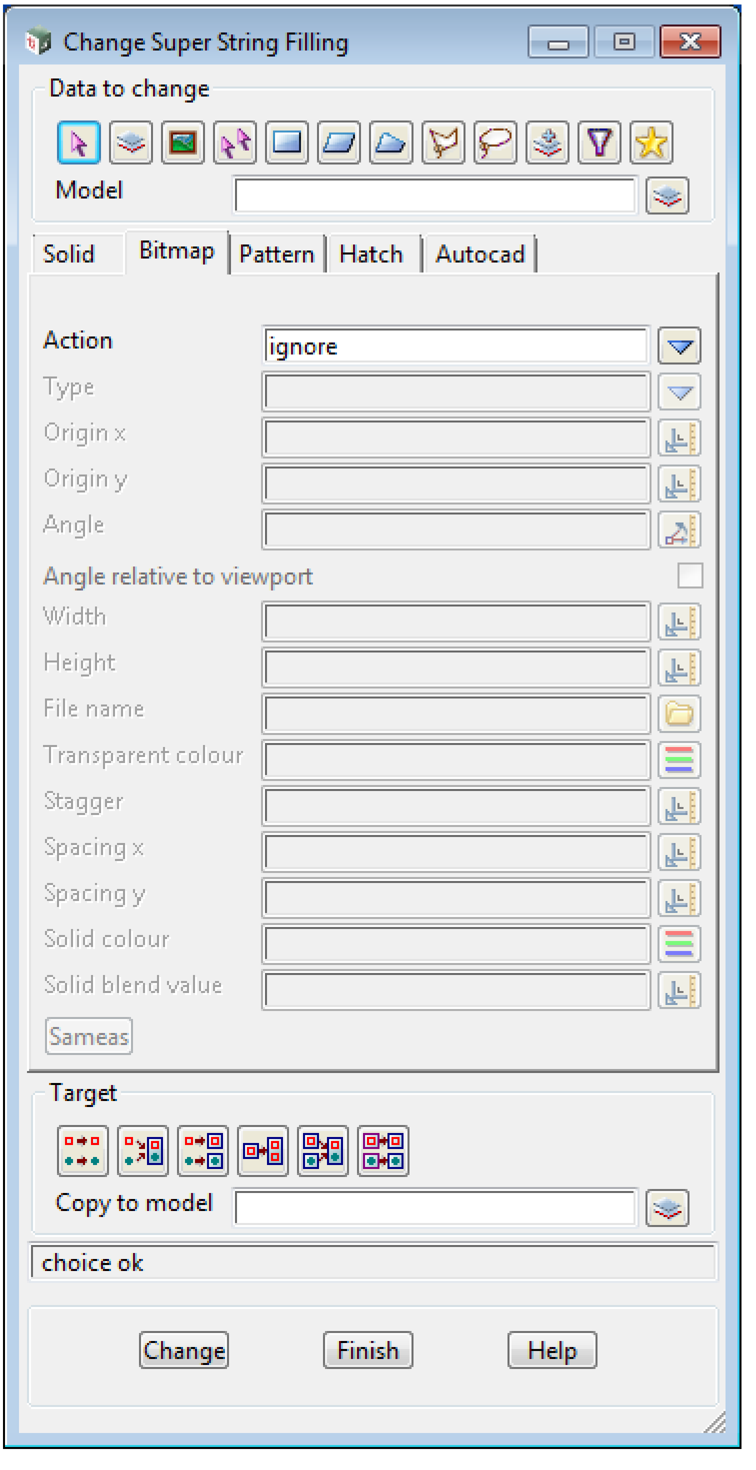
Blending real box

the blend value is used for the solid fill.This value is between 0.0 and 1.0 and controls the amount of transparency of the fill.

if blank, a blend value of 1.0 is assumed.

Continue to 14.12.9.5.2 Bitmap Tab or return to 14.12.9.5 Fills.

14.12.9.5.2 Bitmap Tab



The fields and buttons used in the panel have the following functions.

Action choice box ignore set, clear, ignore

*if **set**, this type of fill is set for the string.*
*If **clear**, this type of fill is turned off for the string.*
*If **ignore**, don't modify this type of fill for the string.*

Type choice box device, world, paper

the units of Width, Height, Stagger, *and* Spacing. *This means the bitmap can be drawn in either world* *size, paper size (mm) or device size.*

Origin X real box

the x co-ordinate of the origin point of the repeated pattern.

Origin Y real box

the y co-ordinate of the origin point of the repeated pattern.

Angle angle

the orientation of the bitmap pattern relative to the x axis measured in the anti-clockwise direction in dms.

Angle relative to view tick box

this field controls whether the Angle is relative to the x axis or to the plotting x axis.

*If **ticked** and we are plotting,* **Angle** *is measured relative to the x axis of the plot rotation.*

*If **not ticked**,* **Angle** *is always absolute to the world x axis.*

Height real box

the height of the bitmap in the selected units.

File name file box .*bmp files

the bitmap file to be used for filling. Only BMP files are currently supported.

Transparent colour colour box **Select Colour** pop up

the transparency colour within the bitmap.This means any pixel of this colour within the bitmap is not drawn.

Stagger real box

if not blank, this field allows each alternate row of bitmaps to be staggered (or offset) by the specified value. Stagger is measured in the selected units along the x axis in the rotated system.

If blank, a Stagger value of 0.0 is assumed.

Spacing X input

the distance in the selected units along the x axis in the rotated system between each instance of the bitmap.

Spacing Y input

the distance in the selected units along the y axis in the rotated system between each instance of the bitmap.

Solid colour colour box **Select Colour** pop up

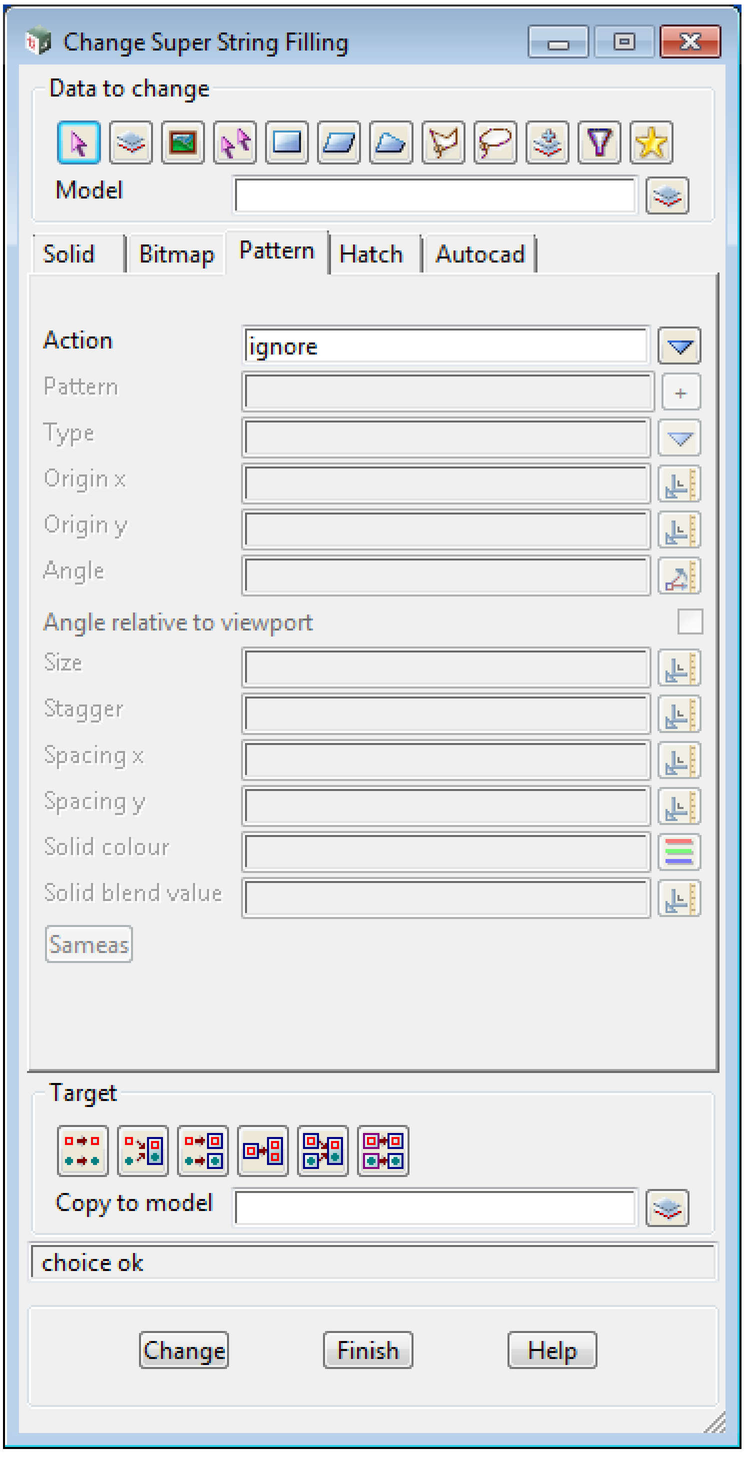
if not blank, when the bitmaps become too small to be legible, the super string is solid filled instead with **Solid colour**.

Solid blend value input

if not blank, and **Solid Colour** *is specified, the solid fill is drawn with transparency. The blend value is between 0.0 and 1.0 and controls the transparency of the solid colour.*

Continue to 14.12.9.5.3 Pattern Tab or return to 14.12.9.5 Fills.

14.12.9.5.3 Pattern Tab



The fields and buttons used in the panel have the following functions.

Action choice box ignore set, clear, ignore

*if **set**, this type of fill is set for the string.*
*If **clear**, this type of fill is turned off for the string.*
*If **ignore**, don't modify this type of fill for the string.*

Pattern **select pattern** pop up

the pattern name to be applied. The patterns are defined in the patterns.4d

For more information on the 12d pattern definition go to the section 40.4 Patterns.

Type choice box device, world, paper

the units of Size*. This means the pattern can be drawn as either world size, paper size (mm) or screen (device) size (pixels).*

Origin X real box

the x co-ordinate of the origin point of the repeated pattern.

Origin Y real box

the y co-ordinate of the origin point of the repeated pattern.

Angle angle

the orientation of the pattern relative to the x axis measured in the anti-clockwise direction in dms in hp notation.

Angle relative to view tick box

this field controls whether the Angle is relative to the x axis or to the plotting x axis.

*If **ticked** and a plot is being generated,* **Angle** *is measured relative to the x axis of the rotation of the plot.*

*If **not ticked**,* **Angle** *is always absolute to the world x axis.*

Size real box real greater of equal to 1.

the size of the pattern in the selected units.

If 0 then the pattern is not drawn.

Stagger real box

if not blank, this field allows each alternate row of patterns to be staggered (or offset) by the specified value. Stagger is measured in the selected units along the x axis in the rotated system.

If blank, a Stagger value of 0 is assumed.

Spacing X real box

the distance in the selected units along the x axis in the rotated system between each instance of the pattern.

Spacing Y real box

the distance in the selected units along the y axis in the rotated system between each instance of the pattern.

Solid colour colour box **Select Colour** pop up

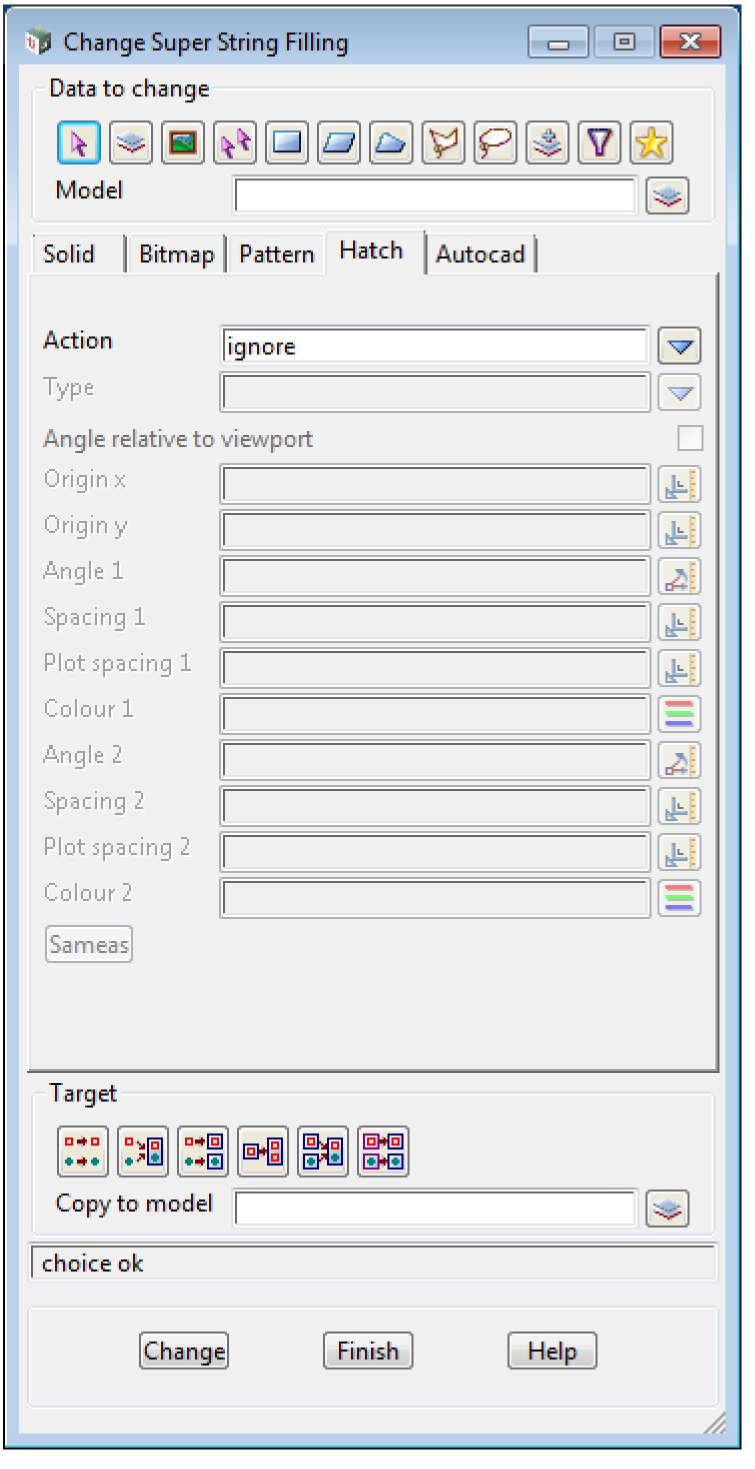
if not blank, when the patterns become too small to be legible, the super string is solid filled instead with **Solid colour**

Solid blend value real box

if not blank, and **Solid Colour** *is specified, the solid fill is drawn with transparency. The blend value is between 0.0 and 1.0 and controls the transparency of the solid colour.*

Continue to 14.12.9.5.4 Hatch tab or return to 14.12.9.5 Fills.

14.12.9.5.4 Hatch tab



The fields and buttons used in the panel have the following functions.

Action choice box ignore set, clear, ignore

*if **set**, this type of fill is set for the string.*
*If **clear**, this type of fill is turned off for the string.*
*If **ignore**, don't modify this type of fill for the string.*

Type choice box device, world, paper

the units of Spacing and Plot spacing. *This means the bitmap can be drawn in either world size, paper* *size (mm) or screen (device) size (pixels).*

Angle relative to view tick box

this field controls whether the Angle is relative to the x axis or to the plotting x axis.

*if **ticked** and we are plotting,* **Angle** *is measured relative to the x axis of the plot rotation.*

*If **not ticked**,* **Angle** *is always absolute to the world x axis.*

Origin X real box

the x co-ordinate of the anchor point of the repeated pattern.

Origin Y real box

the y co-ordinate of the anchor point of the repeated pattern.

Angle 1 angle

the first orientation of the hatch pattern relative to the x axis measured in the anti-clockwise direction in dms.

Spacing 1 real box

the first distance in the units selected in Type between the lines drawn at **Angle 1**.

Plot spacing 1 real box

the first distance in the units selected in Type between the lines drawn at **Angle 1** *except it is the value used when you are plotting to or doing a plot of the super string containing the fill.*
if the field is blank it uses the **Spacing 1** *value.*

Colour 1 colour box **Select Colour** pop up

the colour of all the lines drawn at **Angle 1**.

Angle 2 angle

the second orientation of the hatch pattern relative to the x axis measured in the anti-clockwise direction in dms.

Spacing 2 real box

the second distance in the units selected in Type column between the lines drawn at **Angle 2**.

Plot spacing 2 real box

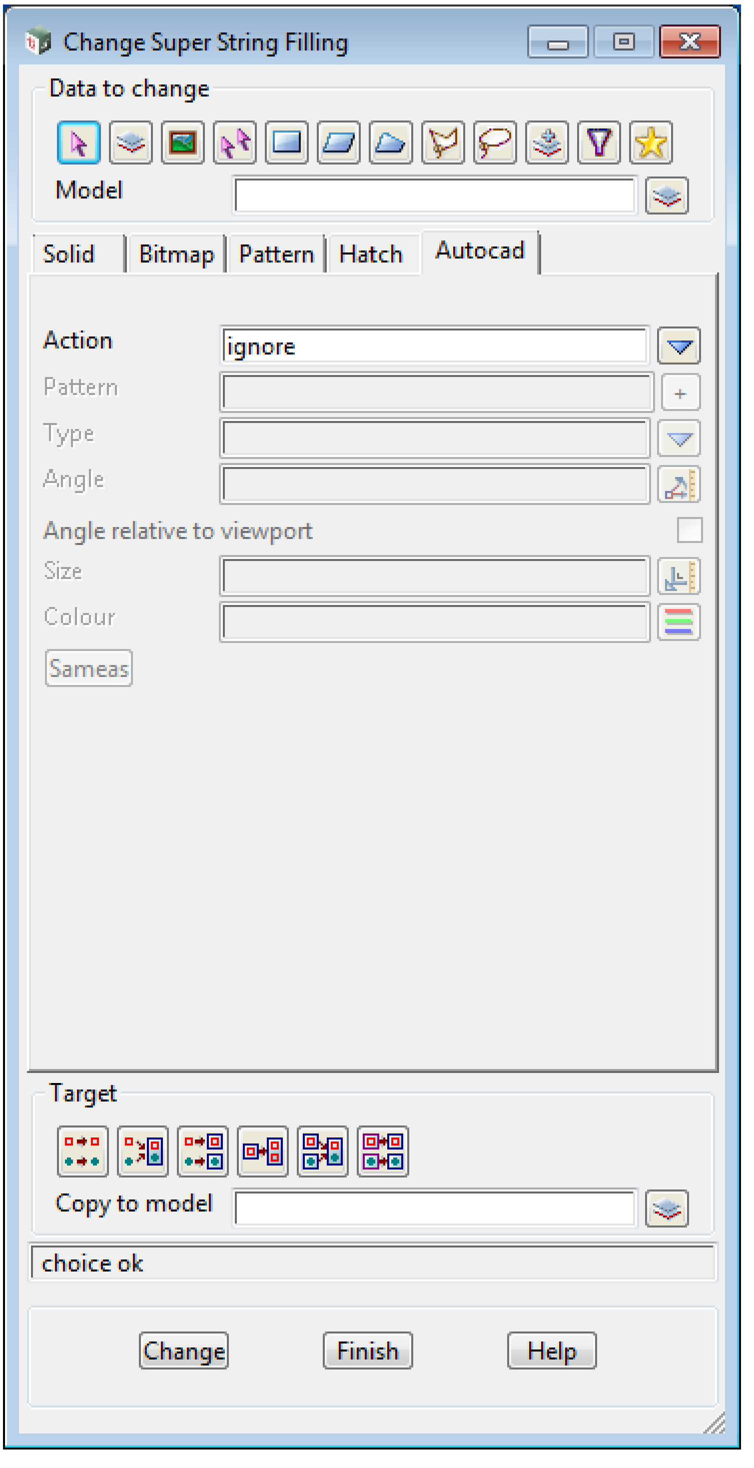
the first distance in the units selected in Type between the lines drawn at **Angle 2** *except it is the value used when you are plotting to or doing a plot of the super string containing the fill.*
if the field is blank it uses the **Spacing 2** *value.*

Colour 2 colour box **Select Colour** pop up

the colour of all the lines drawn at **Angle 2**.

Continue to 14.12.9.5.5 Autocad tab or return to 14.12.9.5 Fills.

14.12.9.5.5 Autocad tab



The fields and buttons used in the panel have the following functions.

Action	choice box	ignore	set, clear, ignore

*if **set**, this type of fill is set for the string.*
*If **clear**, this type of fill is turned off for the string.*
*If **ignore**, don't modify this type of fill for the string.*

Pattern **select autocad pattern** pop-up

The Autocad pattern name to be applied. These patterns are defined in the file acad.pat.

This file is an Autocad file.

Type choice box device, world, paper

the units of Size*. This means the bitmap can be drawn in either world size, paper size (mm) or screen (device) size (pixels).*

Angle angle

the orientation of the pattern relative to the x axis measured in the anti-clockwise direction in dms.

Angle relative to view tick box

this field controls whether the Angle is relative to the x axis or to the plotting x axis.

If ticked and we are plotting, **Angle** *is measured relative to the x axis of the plot rotation.*

If not ticked, **Angle** *is always absolute to the world x axis.*

Size real box

the size of the pattern in the selected type.

Colour colour box **Select Colour** pop up

the colour of the pattern.

Return to 14.12.9.5 Fills.

14.12.9.6 Symbol

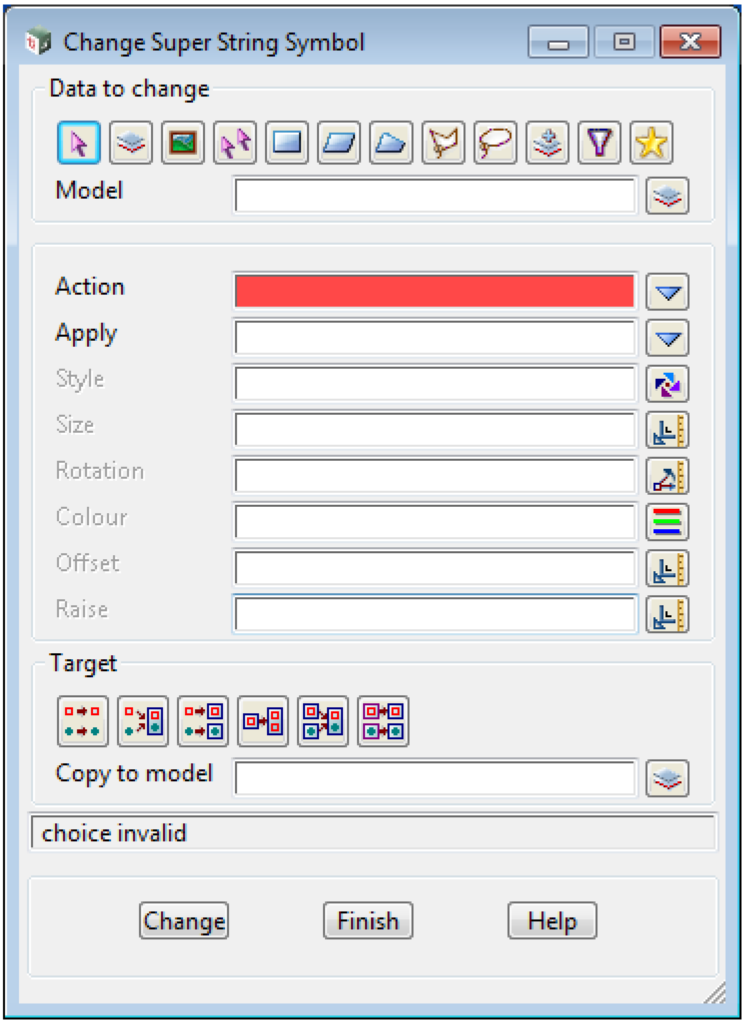
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Symbol**

Position of option on menu: **Utilities =>Super strings =>Symbol**

For selected super strings, the **symbols** option can set the flags that determine how symbols are defined for a super string.

A super string can have no symbols, a constant symbol definition for the entire string or different symbol definitions at each vertex.

On selecting the **symbol** option, the **Change Super String Symbols** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Action	choice box	ignore	set, clear, ignore

*if **set**, a symbol can be constant for all vertices in the string, or can be different for each vertex in the string.*
*If **clear**, there are no symbols for the string.*
*If **ignore**, don't modify the symbol flags for the vertices of the string.*

Apply choice box constant, variable

*if **Action** is **set**, then the Apply field is used.*
*If Apply is **constant**, the string has only one symbol and it used for each vertices in the string. It is set to visible.*
*If Apply is **variable**, each vertex in the string has its own symbol.*

Symbol symbol box

symbol to be used.

Size

size of the symbol.

Rotation angle box

angle to rotation the symbol - positive is counter-clockwise.

Colour colour box

colour for the symbol (if the symbol has no imbedded colours).

Offset

distance the centre of the symbol is from the vertex.

Raise

distance the centre of the symbol is raised off the line through the vertex with the given angle.

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected strings

14.12.9.7 Segment Colour

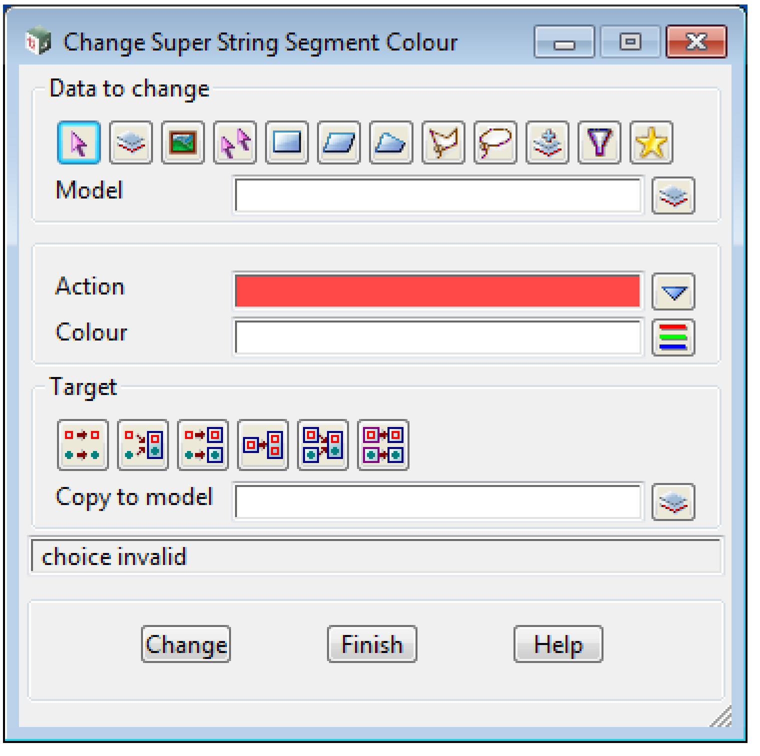
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Segment colour**

Position of option on menu: **Utilities =>Super strings =>Segment colour**

A super string has a default colour used for the entire string and segment colours setable for each segment which override the string colour for that segment.

The **Segment colour** option can set a segment colour for every segment in the super string or clear all the set segment colours so that the default string colour is used.

On selecting the **Segment colour** option, the **Change Super String Segment Colour** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Action	choice box		set, clear

*if **set**, each segment colour is set to the colour in the* Colour *box.*
*If **clear**, any segment colours are removed and each segment set to having no segment colour.*

Colour	colour box		

*if Action is **set**, then every segment is set to this colour.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info	input		

extra information required for the target.

Change button

process the selected strings

14.12.9.8 Height

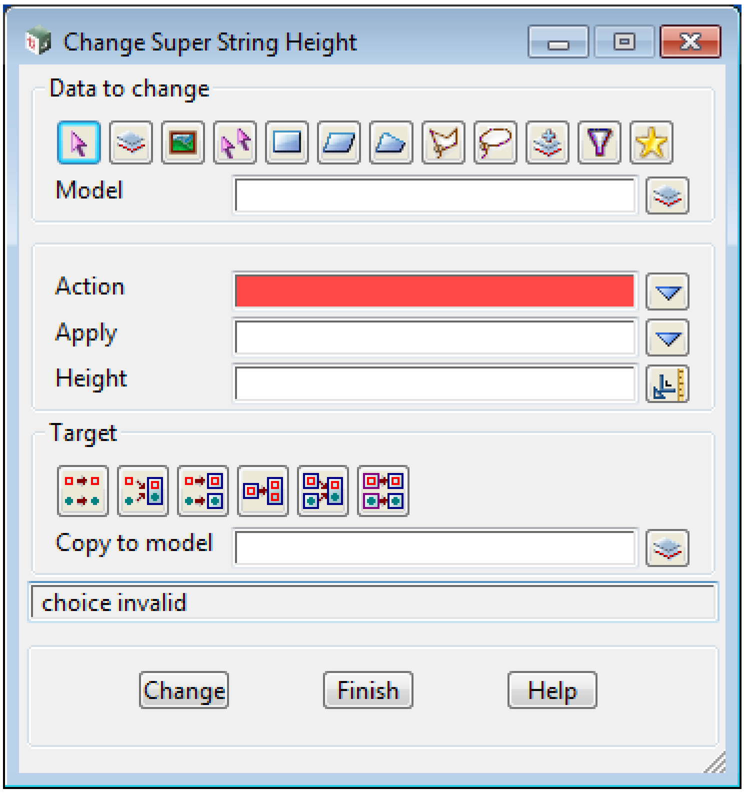
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Height**

Position of option on menu: **Utilities =>Super strings =>Height**

A super string can have the one height that is used for every vertex in the super string (constant height) or it can have a different height at each vertex.

The **Height** option can set the super string to either having a constant height or to allow each vertex to have independent heights.

On selecting the **Height** option, the **Change Super String Height** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Action	choice box	ignore	set, clear

if ***set****, the string height can be a constant for the entire string, or to be different for each vertex in the string.*
If ***clear****, the entire string and each vertex has no height.*

Apply	choice box		constant, variable

if ***Action*** *is* ***set****, then the Apply field is used.*
If Apply is ***constant****, the string has only one height and no vertex has its own height. The height for the string is set to the height in the* Height *field.*
If Apply is ***variable****, each vertex in the string is set to have has its own height and it is set to the value in the* Height *field.*

Height

*if Action is **set**, then either the entire string or every vertex is set to this height.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected strings

14.12.9.9 Attribute

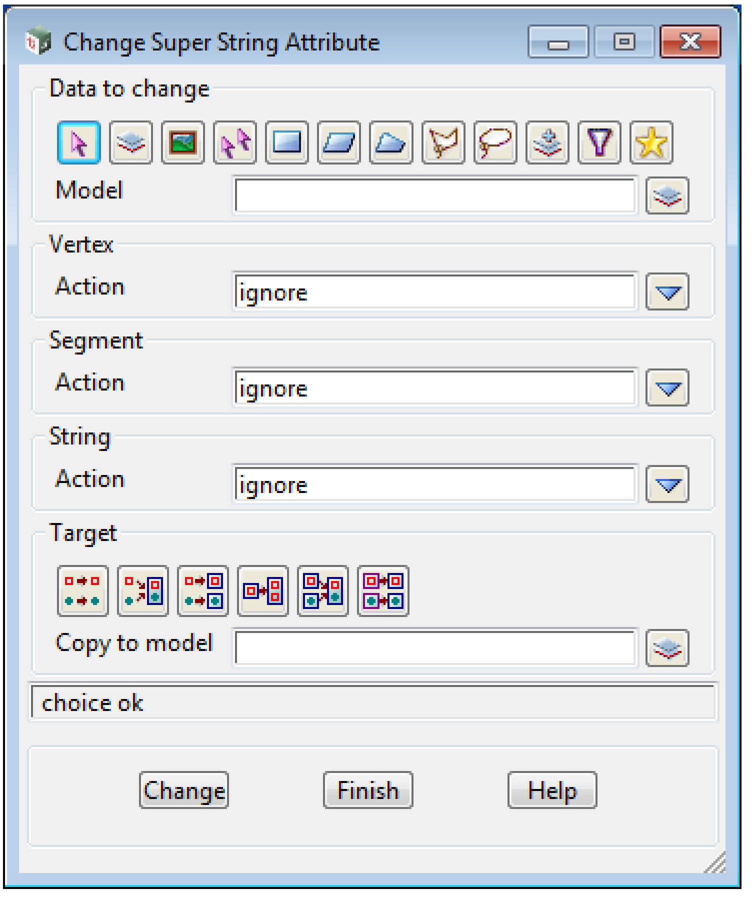
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Attribute**

Position of option on menu: **Utilities =>Super strings =>Attribute**

A super string can have independent attributes for the entire string, independent attributes for each segment and for each vertex.

The **Attributes** option can clear the super string attributes for the entire string, each vertex and/or each segment.

On selecting the **Attributes** option, the **Change Super String Attributes** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Vertex Action	choice box	ignore	ignore, clear

*if **clear**, the attributes are cleared at each vertex.*
*If **ignore**, nothing is done for the vertex attributes.*

Segment Action	choice box	ignore	ignore, clear

*if **clear**, the attributes are cleared on each segment.*
*If **ignore**, nothing is done for the segment attributes.*

String Action	choice box	ignore	ignore, clear

*if **clear**, the string attributes are cleared.*

*If **ignore**, nothing is done for the string attributes.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

process the selected strings.

14.12.9.10 Vertex ID

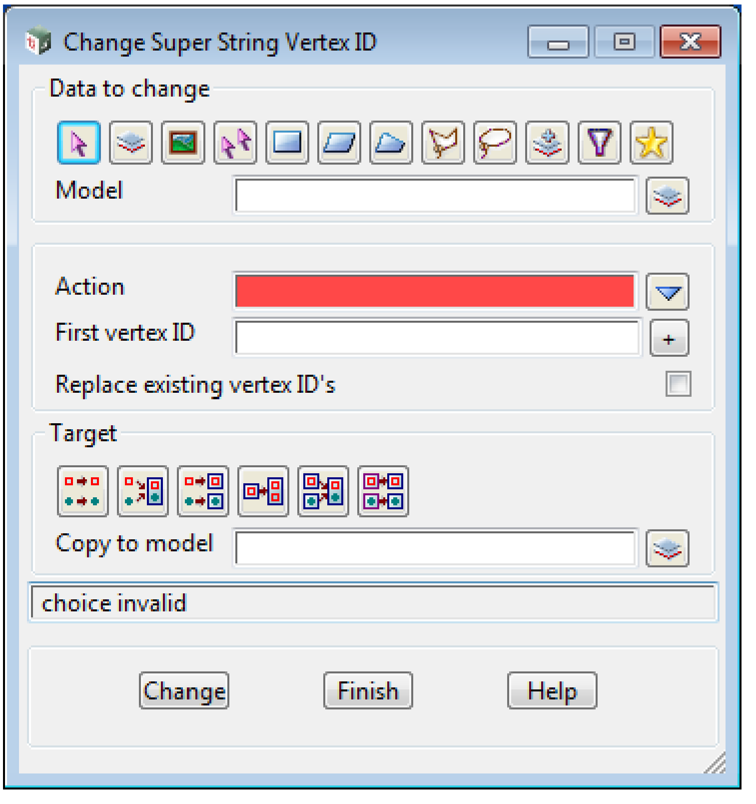
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Vertex id**

Position of option on menu: **Utilities =>Super strings =>Vertex id**

A super string has a *Vertex id* for each vertex.

The **Vertex id** option can set the Vertex IDs to sequential numbers (optionally ignoring existing Vertex ids) or clear all the existing vertex IDs for the super string.

On selecting the **Vertex id** option, the **Change Super String Vertex ID** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Action	choice box		set, clear

*if **clear**, the vertex IDs are cleared at each vertex.*
*If **set**, the vertex IDs are given sequential numbers starting with the number given in* First vertex id *field.*

First vertex id

*if Action is **set**, the vertex IDs start with this value.*

Replace existing vertex id's tick box

*if **ticked**, any vertex with an existing vertex is not given a new vertex ID.*
*If **not ticked**, all vertices are given new vertex IDs.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected strings.

14.12.9.11 Pipe/Culvert

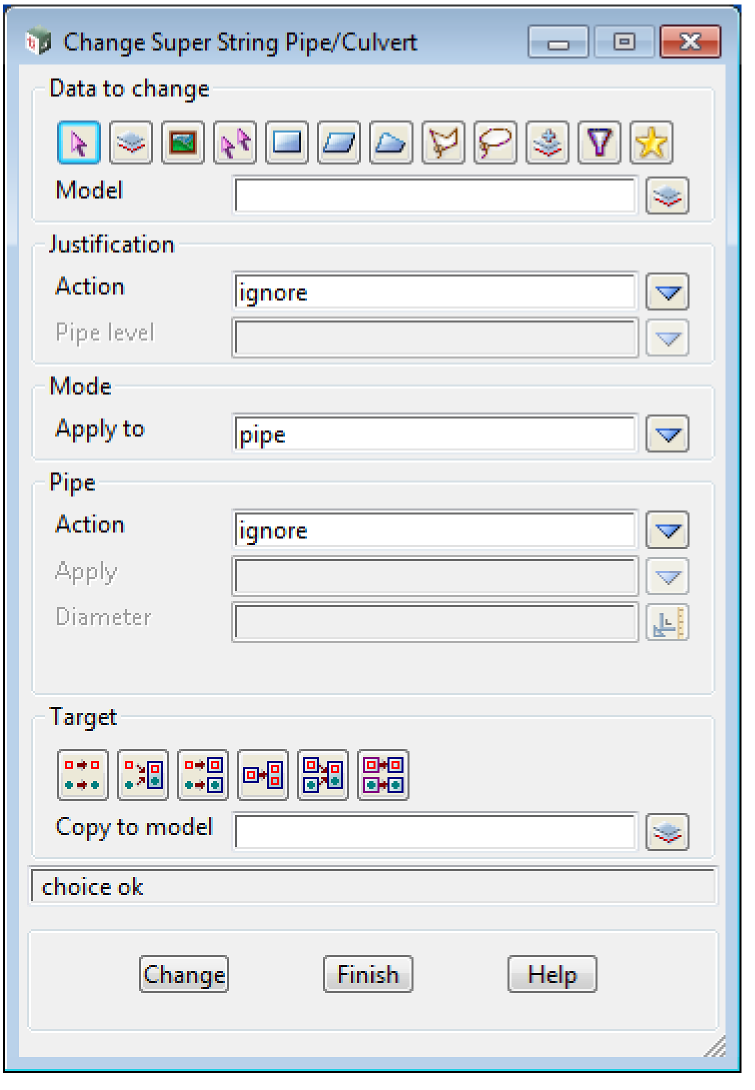
Position of option on menu: **Strings =>Properties =>Super string dimensions =>Pipe/culvert**

Position of option on menu: **Utilities =>Super strings =>Pipe/culvert**

Each segment of a super string can have a diameter or a rectangular cross-section (box culvert).

This option can define or clear the pipe diameter, width and height, and justification.

On selecting the **Pipe/culvert** option, the **Change Super String Pipe/Culvert** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Justification

Action	choice box		set, clear, ignore

*if **set**, the string justification is set to the type given in the* Pipe level *field.*
*If **clear**, the string justification information is cleared.*
*If **ignore**, nothing is done to the string justification.*

Pipe level

*if Action is **set**, the string justification is set to this value.*

Mode

Apply to choice box pipe, culvert

*if **pipe**, the next section of the panel has fields for setting pipe information.*
*if **culvert**, the next section of the panel has fields for setting culvert information.*

Pipe - when Mode is Pipe

Action choice box set, clear, ignore

*if **set**, then the* Pipe Apply *field specifies how the pipe information is modified.*
*If **clear**, the pipe information is cleared at each segment.*
*If **ignore**, nothing is done to the pipe information.*

Apply choice box constant, variable

*if **Pipe Action** is **set**, then the Apply field is used.*
*If Apply is **constant**, the string has only one diameter and no segment has its own diameter. The diameter for the string is set to the value in the* Diameter *field.*
*If Apply is **variable**, each segment in the string is set to have has its own diameter and it is set to the value in the* Diameter *field.*

Diameter

diameter for each pipe segment.

Culvert - when Mode is Culvert

Action choice box set, clear, ignore

*if **set**, then the* Culvert Apply *field specifies how the culvert information is modified.*
*If **clear**, the culvert information is cleared at each segment.*
*If **ignore**, nothing is done to the culvert information.*

Apply choice box constant, variable

*if **Culvert Action** is **set**, then the Apply field is used.*
*If Apply is **constant**, the string has only one width and height and no segment has its own width and height. The width and height for the string is set to the values in the* Width *and* Height *fields.*
*If Apply is **variable**, each segment in the string is set to have has its own width and height and they are set to the values in the* Width *and* Height *fields.*

Width/Height

width/height for each culvert segment.

Target type

data selection type - for a full description go to 4.19.3 Data Source.

Target info input

extra information required for the target.

Change button

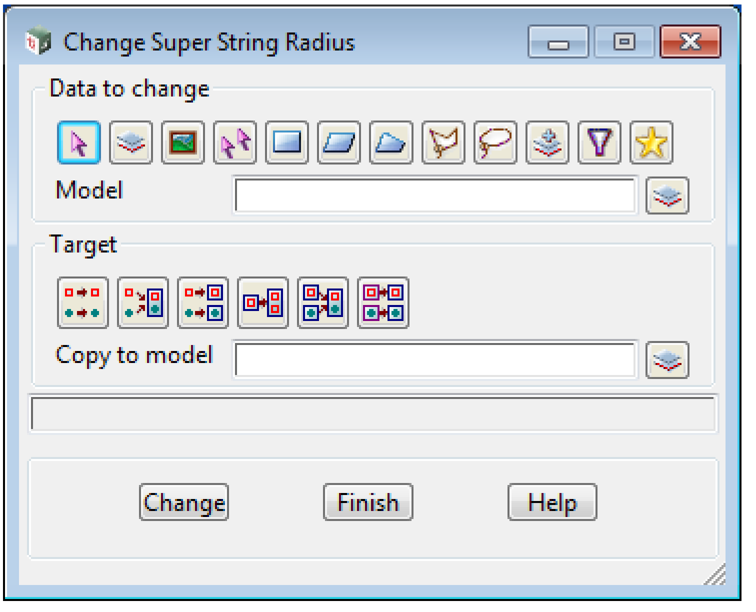
process the selected strings.

14.12.9.12 Radius

Position of option on menu: **Strings =>Properties =>Super string dimensions =>Radius**

Position of option on menu: **Utilities =>Super strings =>Radius**

The **Radius** option clears any segment radii.

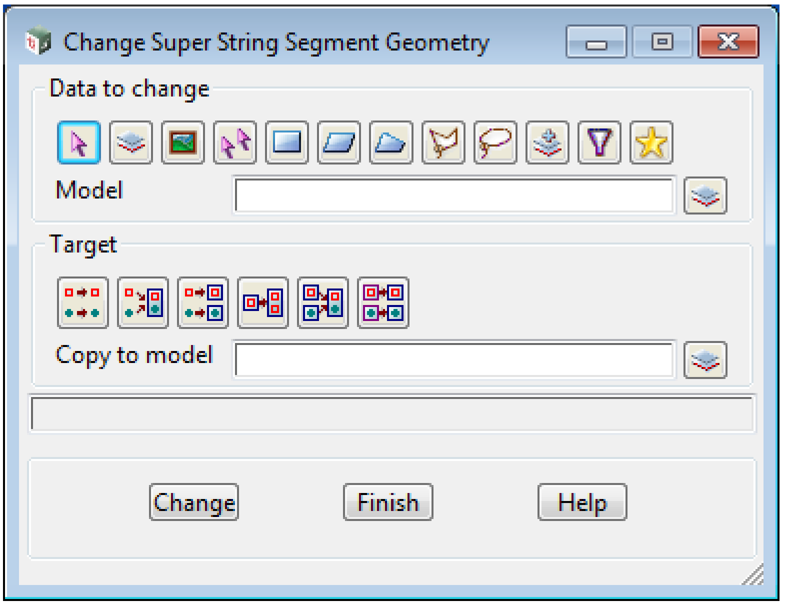


14.12.9.13 Segment Geometry

Position of option on menu: **Strings =>Properties =>Super string dimensions =>Segment geometry**

Position of option on menu: **Utilities =>Super strings =>Segment geometry**

The **Segment geometry** option clears any segment geometry.



14.12.9.14 Text

Position of option on menu: **Strings =>Properties =>Super string dimensions =>Text**

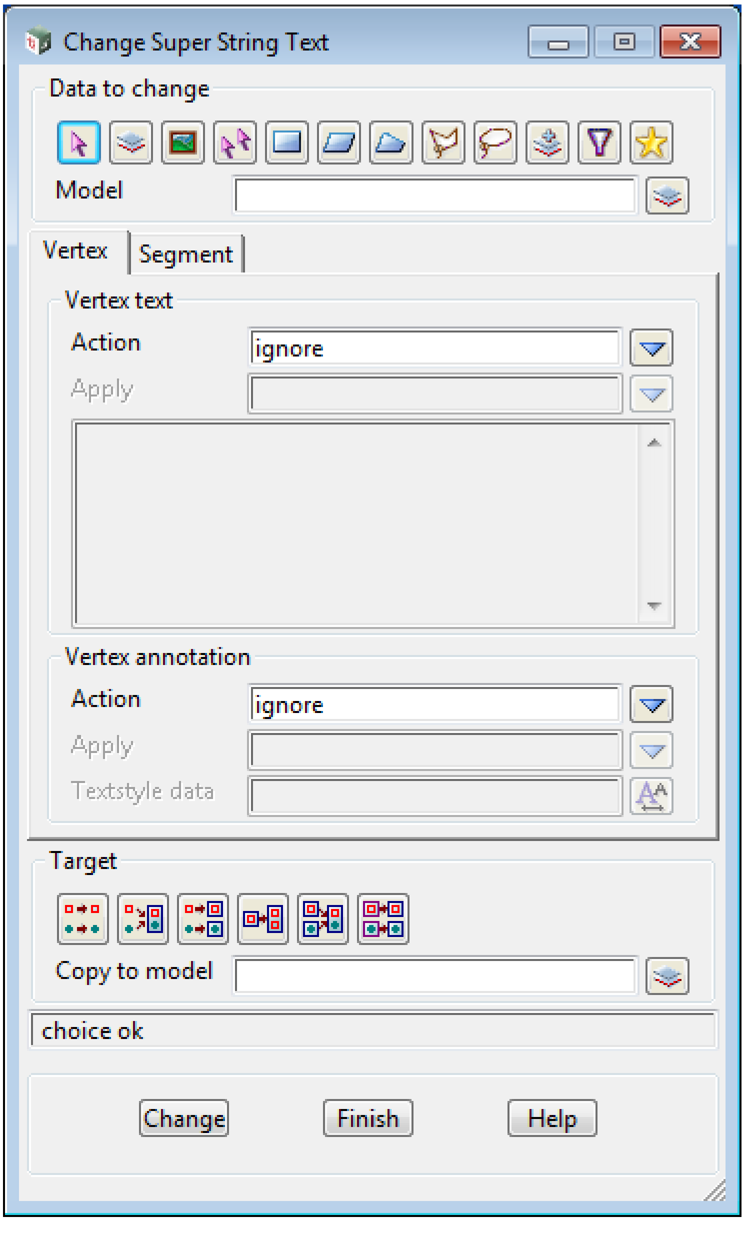
Position of option on menu: **Utilities =>Super strings =>Text**

This section of documentation is a work in progress and will be updated in subsequent releases.

Each vertex and segment of a super string can have its own text.

The **Text** option can set, clear the vertex or segment text and/or textstyle data for the super string.

On selecting the **Text** option, the **Change Super String Text** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Change button

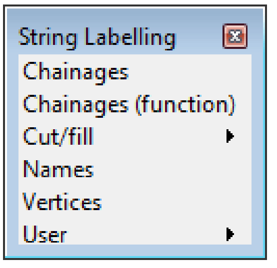
process the selected strings.

14.13 Label

Position of menu: **Strings =>Label**

The **Label** menu contains options to label string chainages, create tadpoles for cut and fill, label string vertices with their x, y, z or point numbers and names.

The **Label** walk-right menu is



For the option *Chainages*, go to 14.13.1 Label Chainages
Chainages (function) 14.13.2 Chainages (function)
Cut/fill 14.13.3 Label Cut/Fill
Names 14.13.4 Label Names
Vertices 14.13.5 Label Vertices

14.13.1 Label Chainages

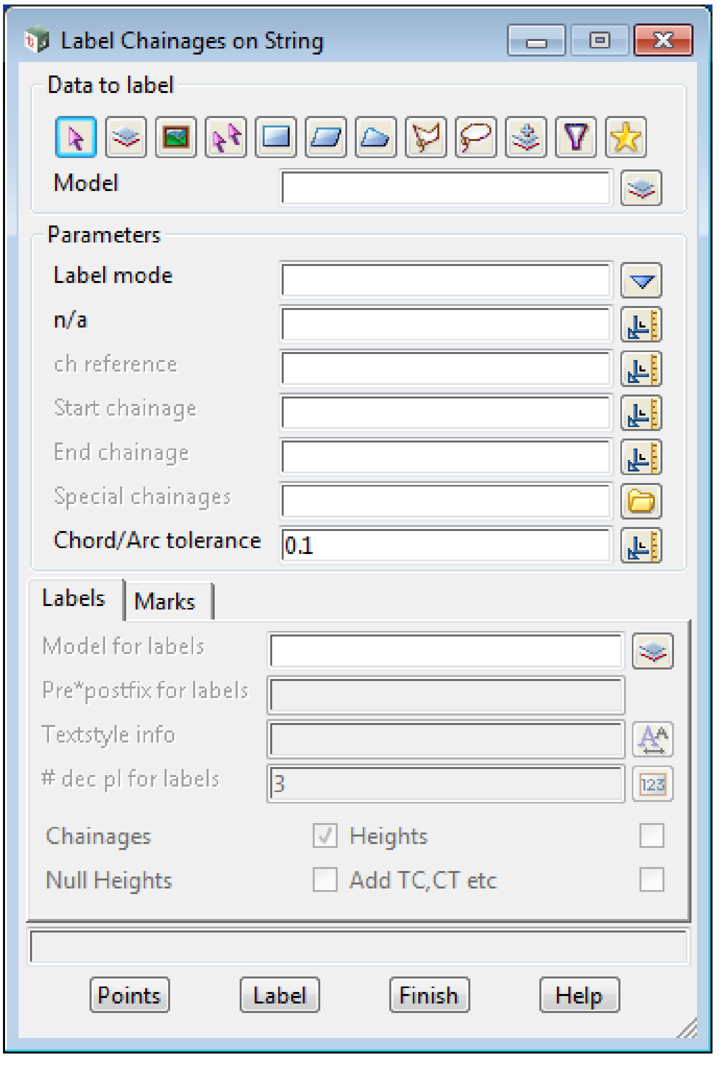
Position of option on menu: **Strings =>Label => Chainages**

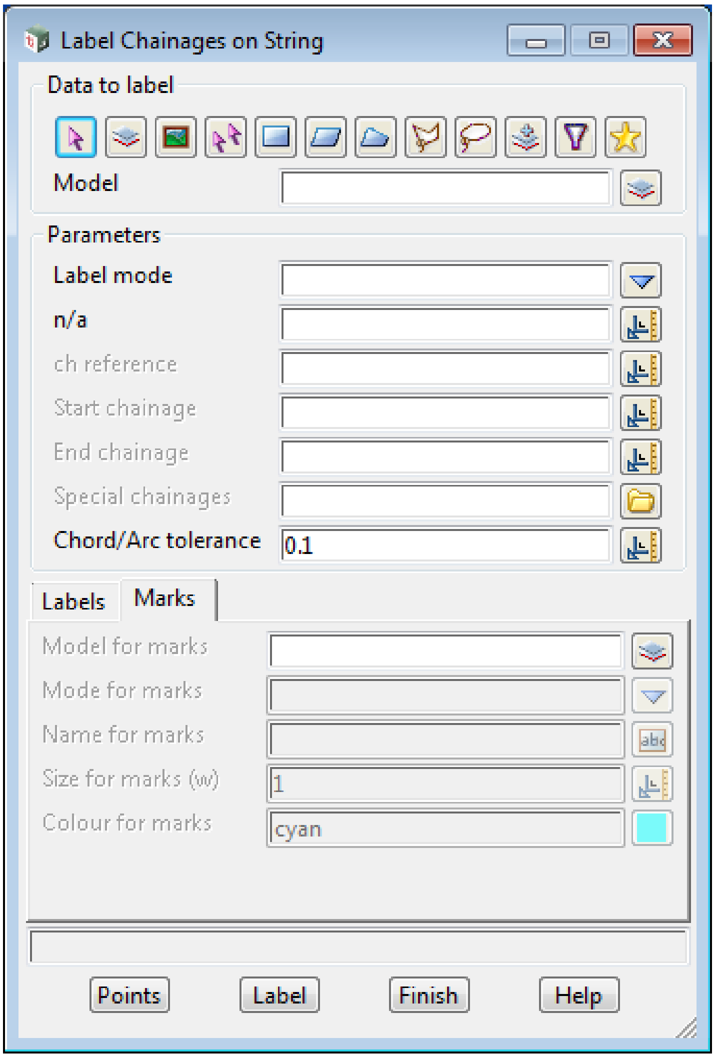
The **Label chainages** option is used to create text at regular chainages and special points on a string such as horizontal and vertical tangent points, crest and sag points and user selected points. It can also create tick marks at selected chainages.

The user has control over the label height, colour, angle, offset and the number of decimal places displayed, plus the size and colour of the tick marks.

As well as being used for labelling centre-lines, this option is used in conjunction with the sewer option to created special labels for sewer long section plots.

On selecting the **Label chainages** option, the **Label chainages on string** panel is displayed.





Individual points can be labelled by selecting them after picking the **Points** button.

The **marks** button brings up the **label chainages on string (marks)** panel which is used to place marks at the chosen chainages.

The fields and buttons used in the **label chainages on string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type *data source type.*			
Data source *data source for strings to label.*			
Label mode	input		regular interval, regular interval plus end pts end points only horizontal TPs, vertical TPs, horizontal discontinuities vertical discontinuities all discontinuities, crests/sags

all horizontal points

type of labelling required.

Ch interval or **n/a** input

the regular interval to use for labelling points.

Ch reference input 0

the chainages to be labelled are integer multiples of the chainage interval added to the reference chainage. For example, if the reference chainage is 23.2 and the chainage interval 10, the chainages 3.2, 13.2, 23.2, 33.2 etc. will be labelled.

Start chainage input

if non-blank, the string chainage to start labelling from.
If blank, start at the beginning of the string.

End chainage input

if non-blank, the string chainage to end the labelling at.
If blank, go to the end of the selected string.

Special chainage input

file of special chainages to create labels at.

Chord/arc tolerance input default chord/arc tolerance

the chord to arc tolerance to use on the strings being labelled for determining how many points are labelled around horizontal curves.

Labels tab

Model for labels model box available models

*if **non-blank**, labels are generated and placed in this model.*
*If **blank**, no labels are created (but tick marks may be).*

Pre*postfix for labels input

*the beginning and ending of the label to be given at each point. Spaces are significant. This uses the standard 12d method of pre-text*post-text. That is, 'Ch * m' would add 'Ch ' before the value and ' m' after the label.*

Textstyle info textstyle box 1 available textstyle data

textstyle data to use when creating the labels.

 # dec pl for labels input 0

number of decimal places used in the labels.

Chainages tick tick

*if **ticked**, the chainage of each point is appended to the label stem to create the label for the point.*
*If **not ticked**, only the label stem is used as the label.*

Heights tick

*if **ticked**, the height of each point is used in the label for the point.*
*If **not ticked**, heights are not used in the label.*

Null heights tick

*if **ticked** and the height of a point null, **(null)** is used in the label for the point.*
*If **not ticked**, null heights are not used in the label.*

Add TC, CT, *etc.* tick

*if **ticked** and labelling an alignment string, the critical point types are used in the label for the point.*
*If **not ticked**, critical point types are not used in the label.*

Marks tab

Model for marks	input		available models

*if **non-blank**, tick marks are generated according to the* label mode *and placed in this model. If **blank**, no tick marks are created.*

Mode for marks	input	ticks centred	ticks on lhs, ticks on rhs, ticks centred

mode for the tick marks.

Name for marks	input	1	

name to give the tick marks (mainly used for mapping files)

Size for marks (w)	input	1	

size in world units for the tick marks

Colour for marks	input	orange	available colours

colour of the tick marks.

Points	button		

pick individual positions to label with a label stem and chainage (if the chainages *field is set to* ***tick****).*

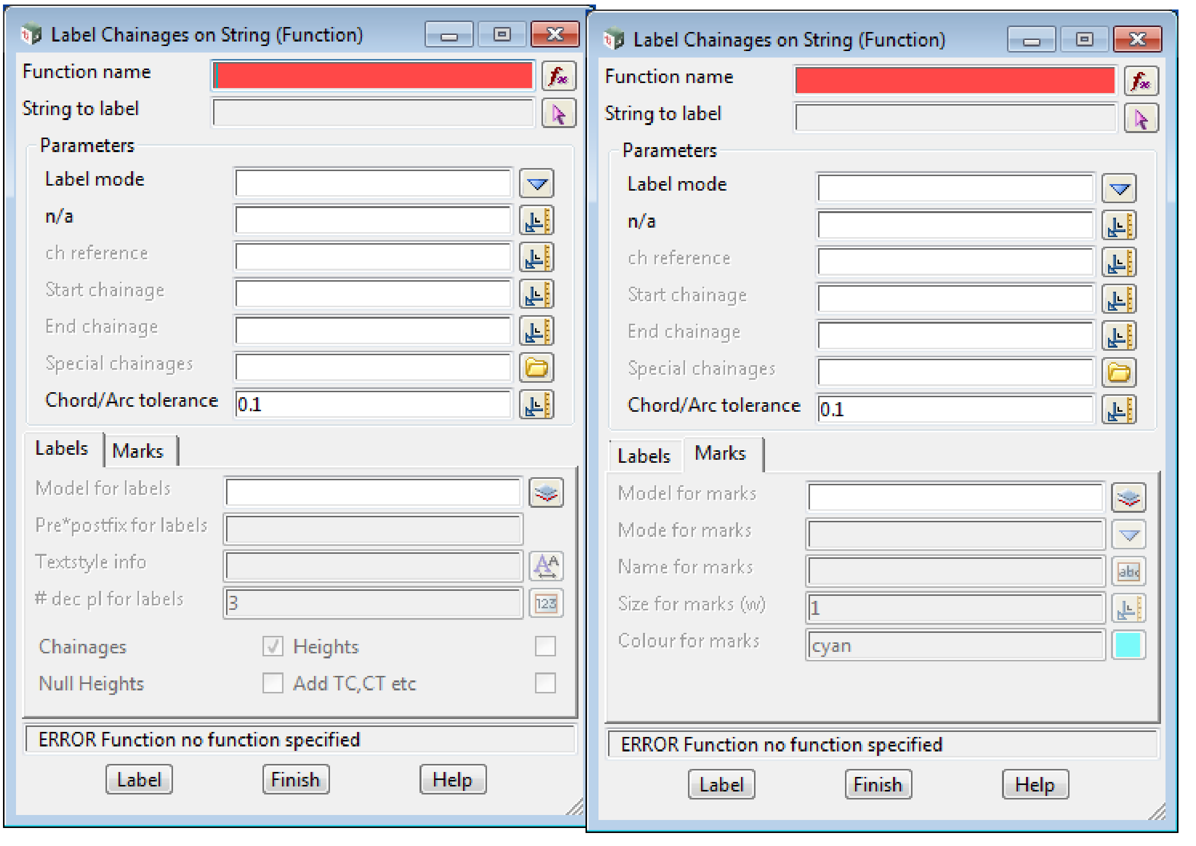
Label	button		

label the selected strings as specified by the label mode, mode for marks *and other fields in the panel.*

14.13.2 Chainages (function)

Position of option on menu: **Strings =>Label => Chainages (function)**

The parameters for this panel are identical to **Label Chainages on String,** however instead of selecting data source for labels this option will create a function associated with a specified string.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		select function

The name of the function to run.

String to label	string select		

The string to label.

For more information on this panel and its fields and buttons, please go to 14.13.1 Label Chainages.

Please continue to the next section 14.13.3 Label Cut/Fill.

14.13.3 Label Cut/Fill

Position of menu: **Strings =>Label => Cut/Fill**

The **cut/fill** menu contains options to create cut and fill tick marks between selected strings.

The options can generate standard tadpoles, tick marks or use user specified model as the tick symbol.

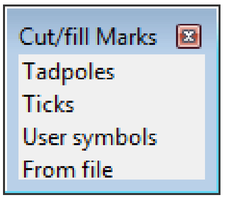
For each option, a reference string is selected which defines the chainages used for labelling cut/fill. The cut/fill symbols are drawn perpendicular to the reference string.

Two strings, str1 and str2 are selected for labelling.

The tick symbols are drawn at right angles to the reference string at a user specified chainage going between the two strings, str1 and str2, from the higher string point to the lower string point (which string is higher or lower may vary along the strings). The tick symbol is repeated at the given chainage interval.

The tick symbol is drawn as a percentage of the distance from the high point to the low point between the two strings, str1 and str2 and this percentage is specified separately for the odd and even numbered ticks.

The **cut/fill** walk-right menu is



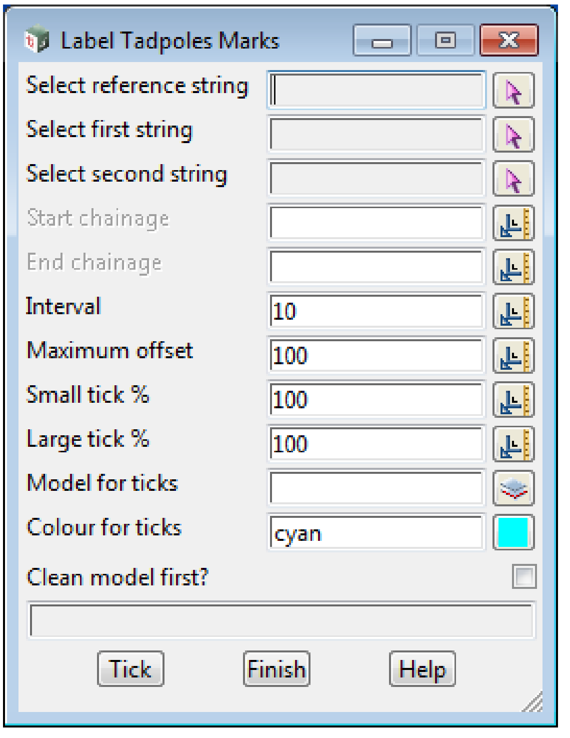
For the option *Tadpoles*, go to 14.13.3.1 Tadpoles
Ticks 14.13.3.2 Ticks
User symbols 14.13.3.3 User Symbols
From file 14.13.3.4 From File

14.13.3.1 Tadpoles

Position of option on menu: **Strings =>Label => Cut/Fill => Tadpoles**

The **Tadpoles** option is used to generate tadpole symbols between two strings.

On selecting the **Tadpoles** option, the **Label tadpoles marks** panel is displayed.



The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Start chainage	input		

*if **non-blank**, the reference string chainage to start creating tadpoles from.*
*if **blank**, the reference string start chainage is used.*

End chainage	input		

*if **non-blank**, the reference string chainage to end the tadpoles at.*
*if **blank**, the reference string end chainage is used.*

Interval	input	10	

the chainage interval to use for creating tadpoles.

Maximum offset	input	100	

the maximum distance to search from the reference string to find strings str1 and str2.

Small tick%	input	100	

the percentage of the distance between the two strings, str1 and str2, that is taken up by the odd numbered tadpoles.

Large tick%	input	100	

the percentage of the distance between the two strings, str1 and str2, that is taken up by the even numbered tadpole.

Model for ticks	input		available models

the models for the tadpoles to placed into.

Colour for ticks	input	cyan	available colours

the colour for the tadpoles.

Ref/Str1/Str	button		

*the selected string is used as the **reference/str1/str2** string.*

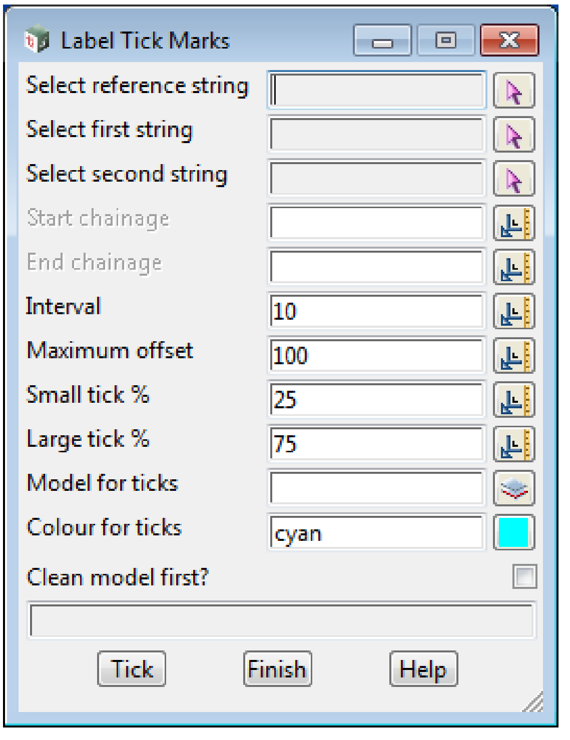
Continue to the next section 14.13.3.2 Ticks or return to 14.13.3 Label Cut/Fill.

14.13.3.2 Ticks

Position of option on menu: **Strings =>Label => Cut/Fill => Ticks**

The **ticks** option is used to generate ticks (straight lines) between two strings.

On selecting the **ticks** option, the **label tick marks** panel is displayed.



The fields and buttons in this panel are used in exactly the same way as for the **label tadpoles marks** panels. The only difference is that the defaults for the small tick % and large tick % panel fields are 25 and 75 respectively.

14.13.3.3 User Symbols

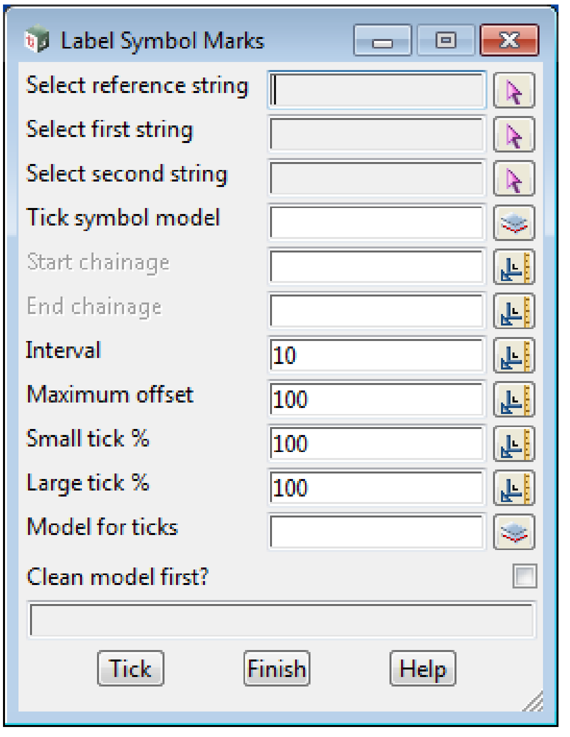
Position of option on menu: **Strings =>Label => Cut/Fill => User symbols**

The **user symbols** option uses a given model, the tick symbol model, as the symbol to drawn between the low and high points on the two strings.

The tick symbol model is aligned so that the model origin is at the high string point and the model's positive x-axis goes from the high string point to the low string point.

On selecting the **ticks** option, the **label tick marks** panel is displayed.

Continue to the next section 14.13.3.3 User Symbols or return to 14.13.3 Label Cut/Fill.



The fields and buttons in this panel are used in exactly the same way as for the **label tadpoles marks** panels except that a tick symbol model panel field is used to specify the symbol to be drawn for the cut/fill tick marks.

Field Description	Type	Defaults	Pop-Up
Tick symbol model	input		available models

the model to be used as the tick mark symbols.

Continue to the next section 14.13.3.4 From File or return to 14.13.3 Label Cut/Fill.

14.13.3.4 From File

Position of option on menu: **Strings =>Label => Cut/Fill => From file**

This is the same option as **Drafting =>Create cut/fill symbols**

Please go to the section 14.13.3 Label Cut/Fill.

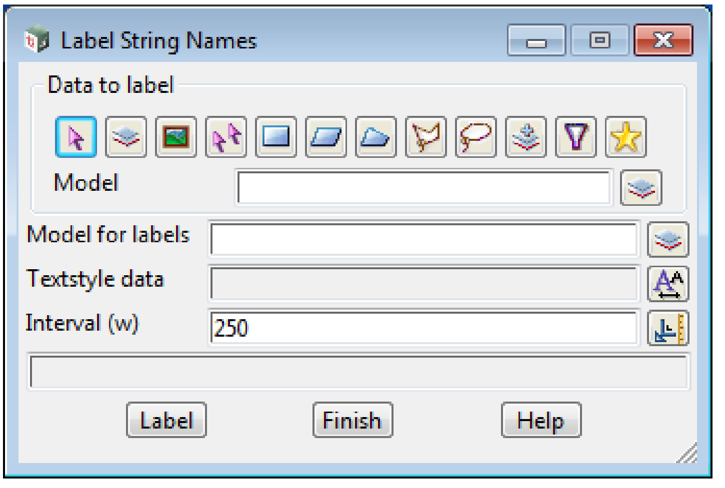
14.13.4 Label Names

Position of option on menu: **Strings => Label => Names**

The **label names** option is used to label individual strings or all the strings in a model, with their string names.

The user has control over the label height, colour, and the distance between the labels.

On selecting the **label names** option, the **label string names** panel is displayed.



By using the **pick** button, individual strings can be labelled using the values in the panel fields. The model to label field is ignored.

If the **label** button is selected, then all the strings in the model given by the model to label field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the **label names** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type			
data source type.			
Data source			
data source for strings to label.			
Textstyle data	input		
textstyle information.			
Interval (w)	input	250	
chainage interval in world units between the labels.			
Label	button		
label all the strings in the model given in the model to label *field.*			

Please continue to the next section 14.13.5 Label Vertices.

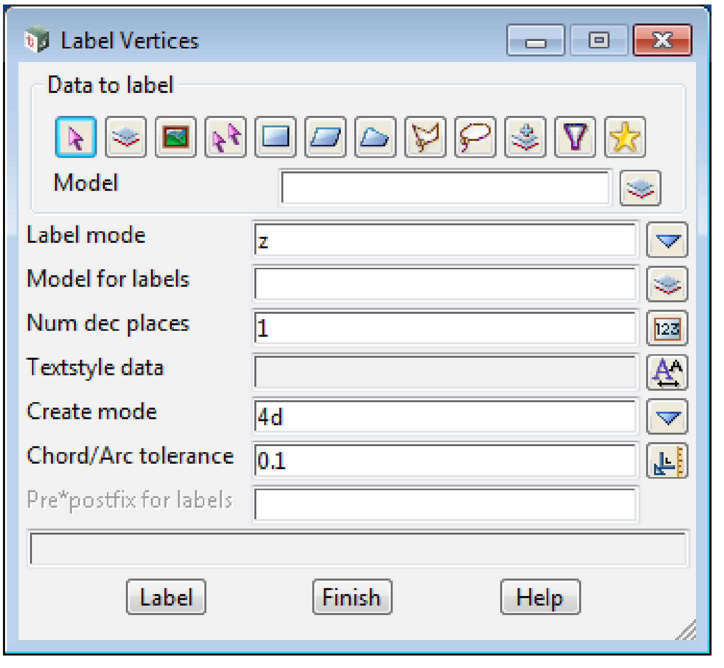
14.13.5 Label Vertices

Position of option on menu: **Strings =>Label => Vertices**

The **Label vertices** option can be used to label the x, y, z, z no nulls, point numbers, id-pt no, name and descriptions of strings selected by the data source.

The user has control over the label height, colour, the number of decimal places, the distance between the labels, the distance the label is from the point position, and the angle to draw the label at.

On selecting the **Label vertices** option, the **Label vertices** panel is displayed.



Individual strings can be labelled by using the **pick** button and then selecting the strings, to be labelled using the values in the panel fields. The string model field is ignored.

If the **label** button is selected, then all the strings in the model given by the string model field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the label strings panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type			

data source type.

Field Description	Type	Defaults	Pop-Up
Data source			

data source for strings to label.

Field Description	Type	Defaults	Pop-Up
Label mode	input	z	x,y,z, point number, Vertex no x and y id-vertex no z no nulls name

type of labelling required - x, y, z, point number, vertex no. for each point in the string.

Field Description	Type	Defaults	Pop-Up
String model	input		available models

name of the model containing the strings to be labelled. Not used with the pick button.

Model for labels	input		available models

name of the model to place the labels in.

Num dec places	input	0	0,1,2,3,4,5

number of decimal places used in the x,y,z labels.

Textstyle data	input		

textstyle information.

Create mode	input	4d	4d, text

*if **4d**, the vertex labels for the one string are placed in a 4d string.*
***text**, the vertex labels are created as individual text strings.*

Chord/arc tolerance	input	default chord/arc tolerance

the chord to arc tolerance to use on any alignment string being labelled for determining how many points are labelled around horizontal curves.

Label	button

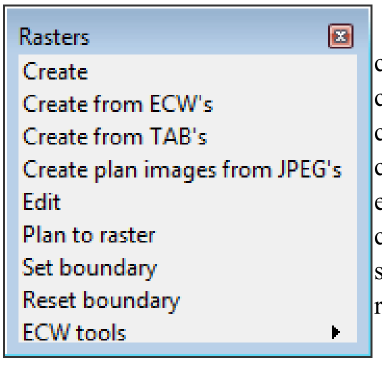
label all the strings in the model given in the string model *field.*

14.14 Rasters

Position of menu: **Strings =>Rasters**

The **Rasters** menu contains options for working with rasters.

The **Rasters** walk-right menu is



create a raster
create a raster from an ECW file
create a raster from an TAB file
create plan images from JPEGs
edit a raster
convert plan view to a raster
set a boundary for a raster
remove the boundary from a raster

For the option *Create* go to	14.14.1 Create a Raster
Create from ECW's	14.14.2 Create Rasters from ECW Files
Create from TAB's	14.14.3 Create Rasters from TAB Files
Create plan images from JPEG's	14.14.4 Create Plan Images from JPEG Files
Edit	14.14.5 Edit a Raster
Plan to raster	9.1.4.7 Create Raster from Plan View
Set boundary	14.14.6 Set a Boundary for a Raster
Reset boundary	14.14.7 Reset the Boundary for a Raster
ECW tools	14.14.8 ECW Tools - Not Supported!

14.14.1 Create a Raster

Position of option on menu: **Strings =>Rasters =>Create**

A raster element consists of a raster image and positioning information for the raster so that it can be mapped into world units.

A raster element is added to a model just like any other string but for convenience it is suggested that no other strings are in the same model as a raster.

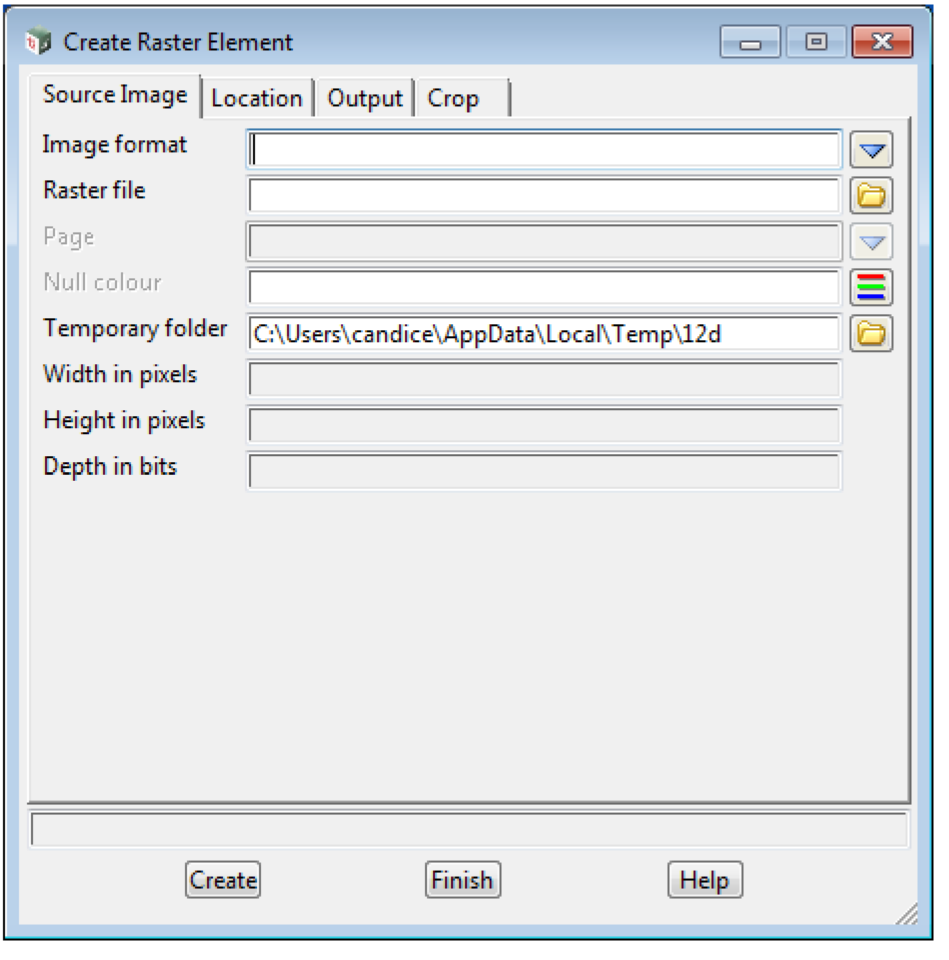
To help speed up drawing on a view, there is toggle for displaying/not displaying rasters on plan views.

Raster Restrictions

(a) The Raster file must have read/write permission

(b) Rasters are only supported on Win 2000 and above.

Selecting **Create** brings up the **Create Raster Element** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source Image tab			
Image format	choice box		BMP, DIB, GIF ECW, JPEG, JPEG 2000 PNG, TGA, TIFF

format that the original image is in. Non ECW rasters must be 24 bit colour.

Raster file	file box		

name of the original raster image. The file must have read/write access and be 24 bit colour.

Page

page number of the raster when the format can contain more than one image (e.g. in a TIFF)

Null colour colour box available colours

colour when there is no pixel in the raster

Temporary folder file box c:\temp select folder

folder to use as a temporary storage area whilst converting the raster to the 12d raster format. The temporary folder needs to have enough free disk space to convert the largest of the rasters to bmp format.

Width/Height in pixels output only

the width/height in pixels of the selected raster

Depth in bits output only

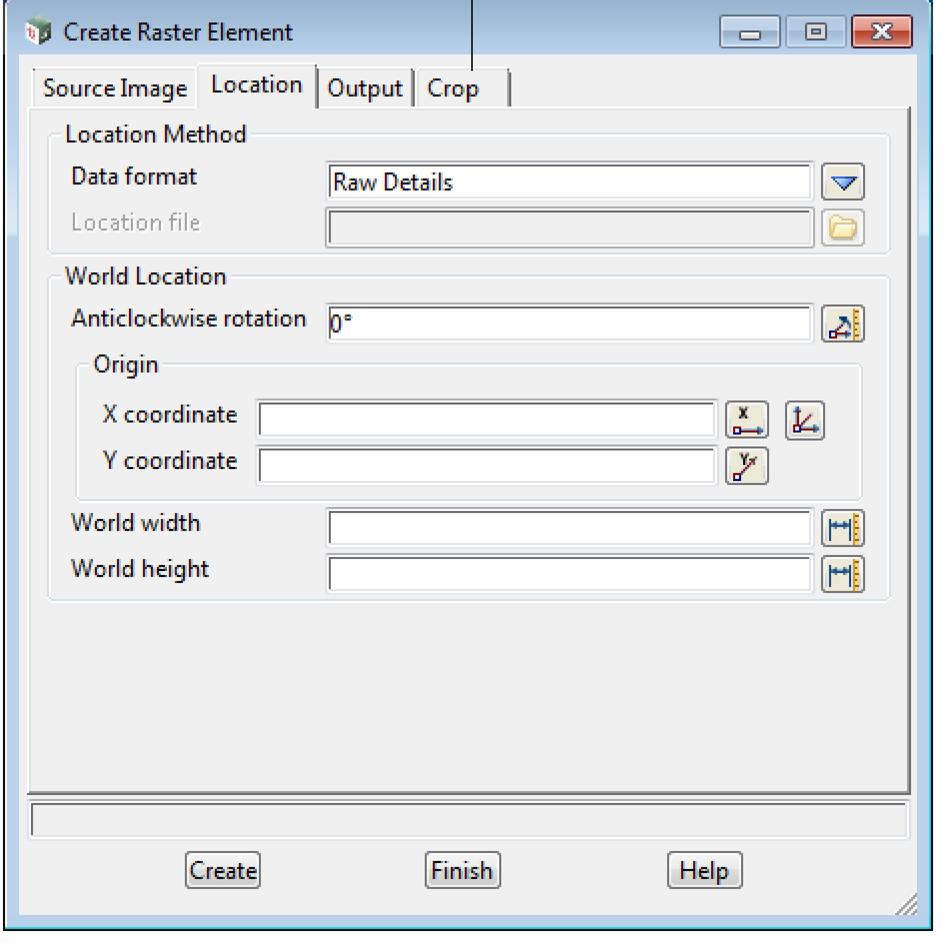
display the colour depth of the source data

Projection output only

display the projection of the source data if available

Location tab

*The Location tab supplies the information for positioning the raster in world units in **12d Model**. Most rasters formats, other than ECW or Geotiff, do not include this information so it must be supplied by other means, either in a file or by typing in a world origin, anticlockwise rotation angle and world width and height.*



Data format	choice box	Raw details	Raw Details, Autocad scr file ESRI world, Geo Tiff, Mapinfo tab

if ***Raw details****, the location details are typed into the* World Location Details *section as rotation, world origin, world width and height.*
If **Autocad scr file***, the location details are taken from the scr file given in* Location file*. An Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom left hand corner, bottom right hand corner, top left hand corner and top right hand corner. An example of a scr file is:*

line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695

If **ESRI world***, the location details are taken from the ESCRI world file given in* Location file*. An ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.*
If **Geo Tif**f*, the Location details are taken from the geotiff file given in* Location file *panel field.*
If **Mapinfo Tab***, the location details are taken from the Mapinfo tab file given in* Location file.

Location file file box

file with the location details

Anticlockwise rotation angle box

the world rotation of the raster.

X/Y co-ordinate real box

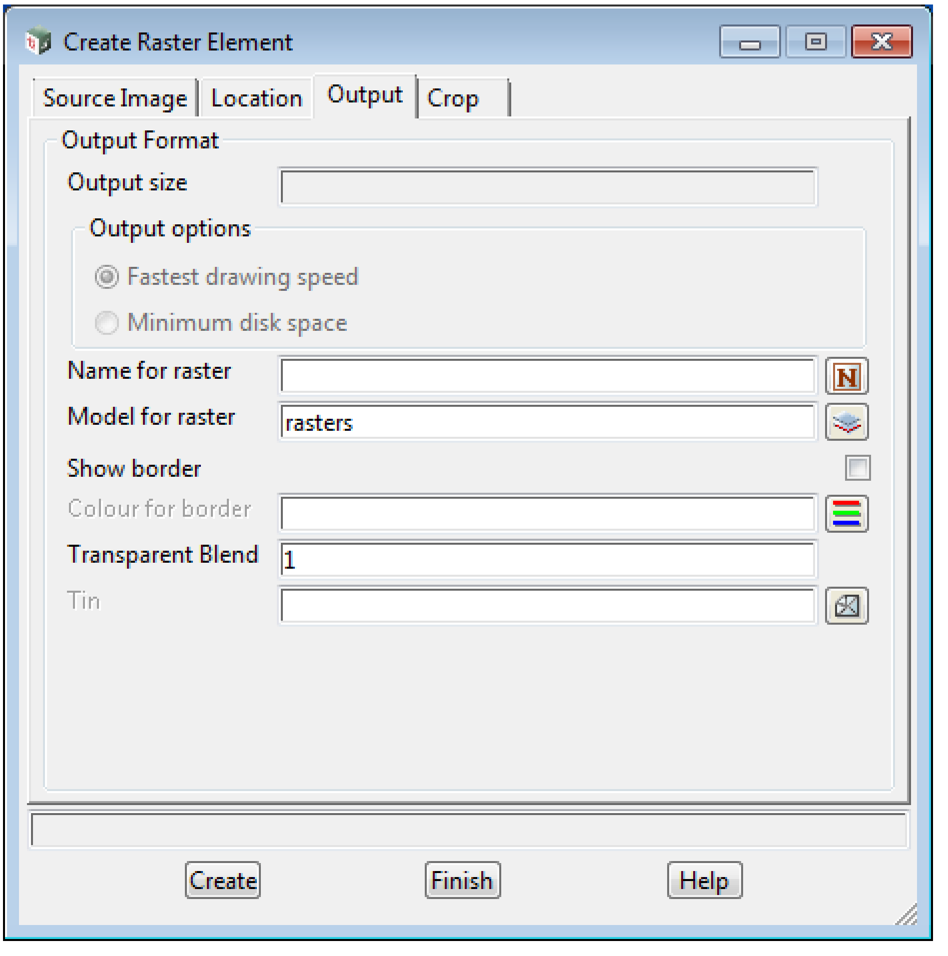
the world x/y co-ordinate of the left hand bottom corner of the raster.

World width/height real box

the width/height in world units of the raster.

Output tab

the parameters for the created 12d raster.



Output size output

an estimate of the amount of disk space the raster will use in ***12d Model***

Fastest drawing speed input

only if raster is less than 24 bit depth - if selected, the raster is converted to a 24 bit image.

Minimum disk space input

only if raster is less than 24 bit depth - if selected, the raster is not converted to a 24 bit image and hence will take up less disk space. However it is converted at drawing time and so will be slower to display than a 24 bit image.

Name for raster input

the name for the raster

Model for raster input available models

name of the model for the raster element

Show border tick tick

if tick then the border of the raster element is displayed

Colour for border input default colour available colours

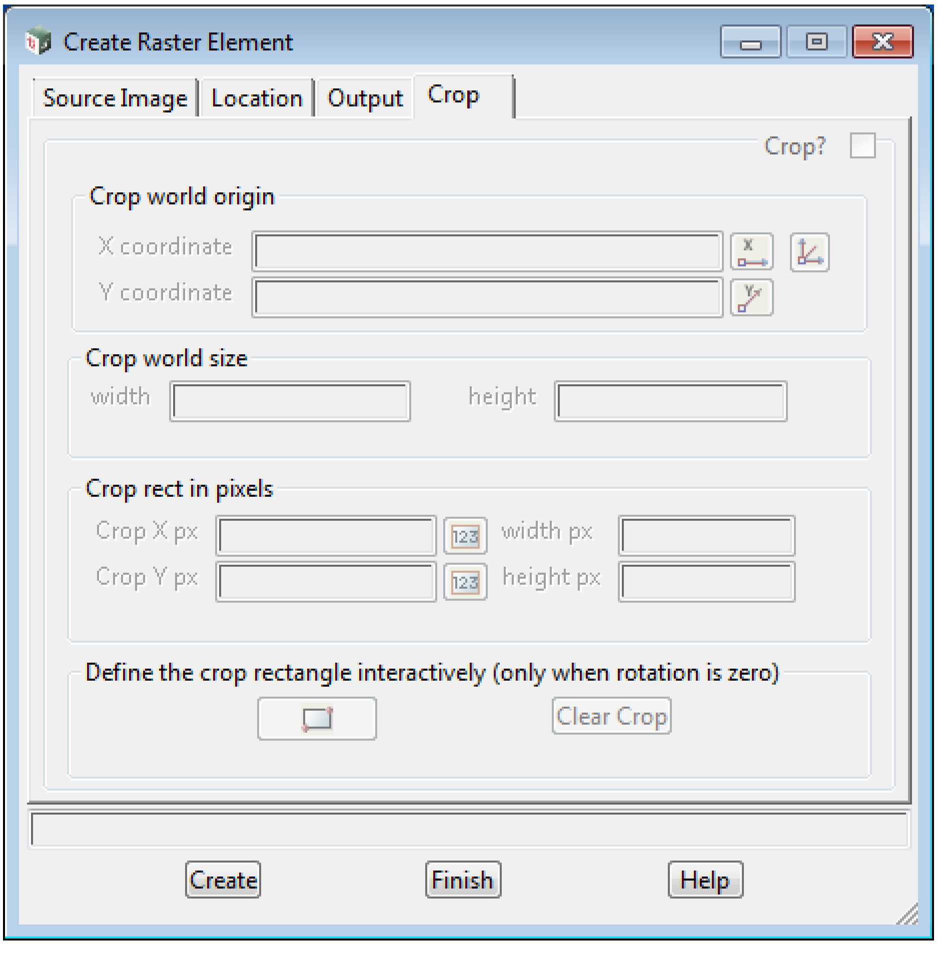
the colour of the border for the raster

Tin tin box available tins

*if **not blank**, this tin is tagged with this raster so the raster is used for draping on the tin when the tin is used in visualisations*

Crop tab

This section of documentation is a work in progress and will be updated in subsequent releases.



Crop? tick box

if ticked,

Crop world origin

X coordinate

Y coordinate

Crop world size

Width

Height

Crop rect in pixels

Crop X px

Crop Y px

Width px

Height px

Define the crop rectangle interactively (only when rotation is zero)

Clear crop

Create button

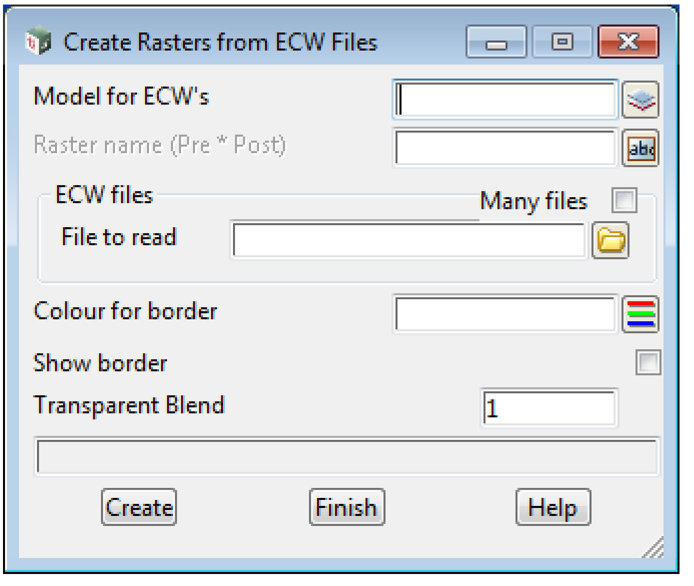
after the **Create** *button is chosen, the raster element is created.*

14.14.2 Create Rasters from ECW Files

Position of option on menu: **Strings =>Rasters =>Create from ECWs**

This option attaches one or more ECW files to a model.

Selecting **Create from ECWs** brings up the **Create Rasters from ECW Files** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for ECWs	input		available models

name of the model to hold the new ECW rasters

Raster name (Pre*post)	text input		

*if **not blank**, pre*post text to use for the name of the raster(s) from the ECW file(s) (see* 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix)*

ECW files

Advanced	tick box	not ticked	

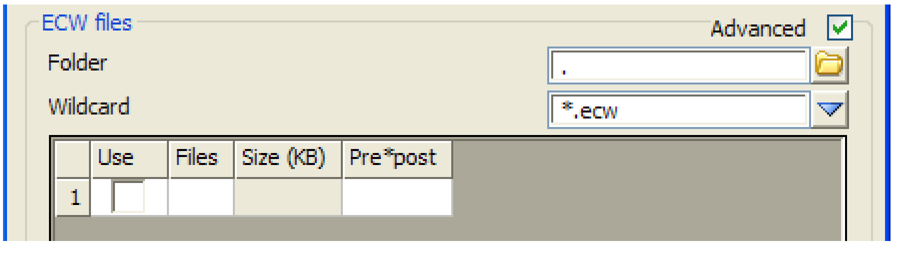
*if not ticked, **File To Read** is visible.*

File to read	file box		*.ecw files

name of the ECW file to attach to the model

Advanced	tick box		

*if ticked**,** the **File To Read** field is replaced by a grid to allow multiple ECW files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the Wild card

Wildcard choice box *.ecw, *

wild card to use in search for files in the given folder

Grid

The following fields are repeated for every row.

Use tick box

if ticked, read in the file on this row

Files output

name of the file found in the folder

Size output

file size

Colour for border colour box

colour for the border around the raster

Show border tick box

if ticked, the border will be visible

Transparent Blend

The degree of opacity, 1 = opaque, 0.1 = very transparent

Create button

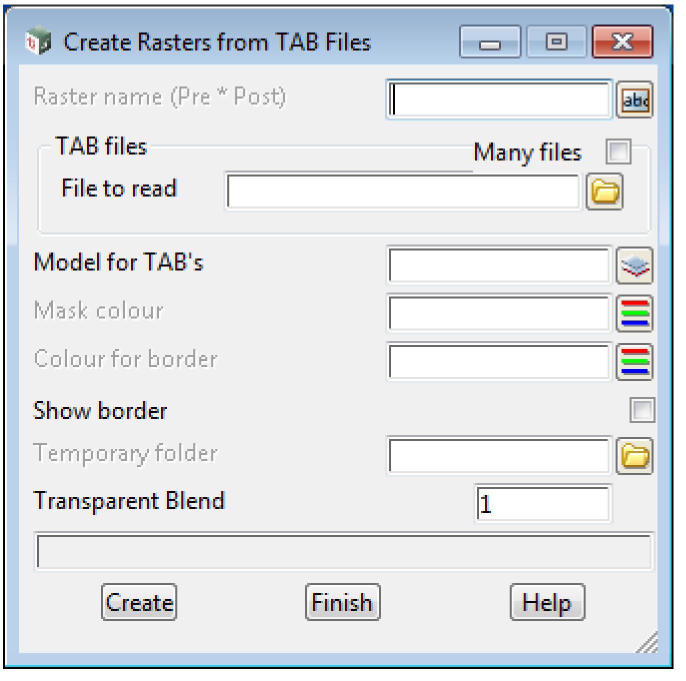
after the **Read** *button is chosen, the raster elements are created.*

14.14.3 Create Rasters from TAB Files

Position of option on menu: **Strings =>Rasters =>Create from TAB's**

This option reads one or more rasters as define by TAB files and places them in a model.

Selecting **Create from TAB's** brings up the **Create Rasters from TAB Files** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raster name (Pre*post)	text input		

*if **not blank**, pre*post text to use for the name of the raster(s) from the ECW file(s) (see* 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix)*

TAB files

Advanced	tick box	not ticked	

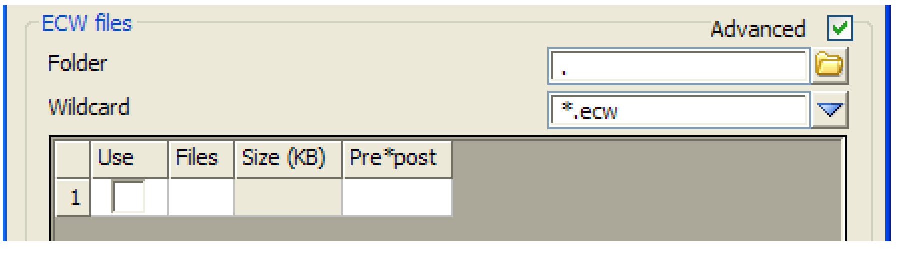
*if not ticked, **File To Read** is visible.*

File to read	file box		*.tab files

name of the TAB file to attach to the model

Advanced	tick box		

*if ticked, the **File To Read** field is replaced by a grid to allow multiple TAB files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the Wild card

Wildcard choice box *.tab, *

wild card to use in search for files in the given folder

Grid

The following fields are repeated for every row.

Use tick box

if ticked, read in the file on this row

Files output

name of the file found in the folder

Size output

file size

Model for TAB's input available models

name of the model for the rasters defined by the TAB files

Mask colour colour box available colours

colour when there is no pixel in the raster

Colour for border input default colour available colours

the colour of the border for the raster

Show border tick tick

if ticked then the border of the raster element is displayed

Temporary folder file box c:\temp select folder

folder to use as a temporary storage area whilst converting the raster to the 12d raster format. The temporary folder needs to have enough free disk space to convert the largest of the rasters to bmp format.

Transparent Blend

The degree of opacity, 1 = opaque, 0.1 = very transparent

Create button

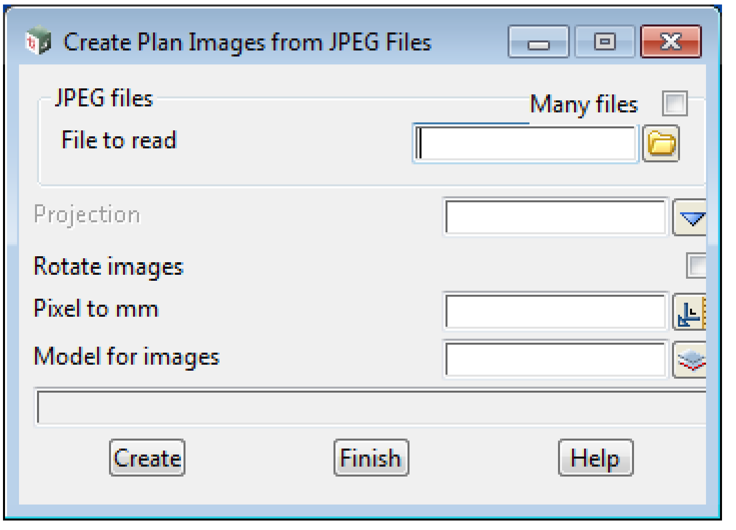
after the **Read** *button is chosen, the raster elements are created.*

14.14.4 Create Plan Images from JPEG Files

Position of option on menu: **Strings =>Rasters =>Create plan images from JPEG's**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Create plan images from JPEG's** brings up the **Create Plan Images from JPEG Files** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File to read	file box		*.jpg files

name of the JPEG file to attach to the model

Advanced	tick box		

*if ticked, the **File To Read** field is replaced by a grid to allow multiple JPEG files to be read in, is opened. A wild card is used to select all the files to be read in.*

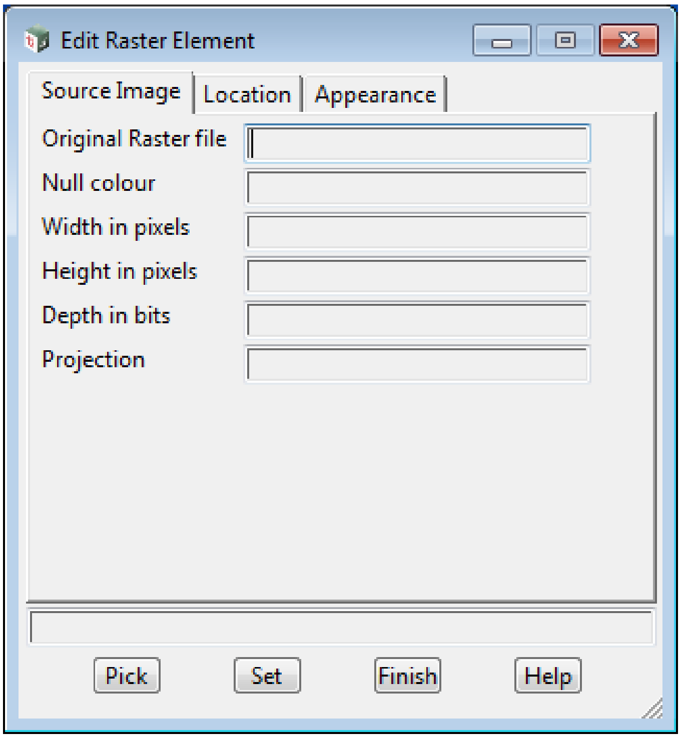
Projection	choice box		
Rotate images	tick box		
Pixel to mm	measure box		
Model for images	model box		available models

14.14.5 Edit a Raster

Position of option on menu: **Strings =>Rasters =>Edit**

The **Edit** option modifies the properties of any raster displayed in a *12d Model* view.

Selecting **Edit** brings up the **Edit Raster Element** panel.



The fields and buttons used in the panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Source Image tab

Original raster file output

file that the raster originally came from

Null colour colour box available colours

colour when there is no pixel in the raster

Width/Height in pixels output only

the width/height in pixels of the selected raster

Depth in bits output only

display the colour depth of the raster

Projection output only

display the original projection of the raster (if available)

Location tab

*When the raster is selected, the raw details for the raster (or ECW details) are displayed. The location details can then be modified and hence how the raster is positioned in world units in **12d Model** is modified.*

Data format	choice box	Raw details	Raw Details, Autocad scr file ESRI world, Geo Tiff, Mapinfo tab

*if **Raw details**, the location details are typed into the* World Location Details *section as rotation, world origin, world width and height.*
If **Autocad scr file**, *the location details are taken from the scr file given in* Location file. *An Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom left hand corner, bottom right hand corner, top left hand corner and top right hand corner. An example of a scr file is:*

line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695

If **ESRI world**, *the location details are taken from the ESCRI world file given in* Location file. *An ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.*
If **Geo Tiff**, *the Location details are taken from the geotiff file given in* Location file *panel field.*
If **Mapinfo Tab**, *the location details are taken the Mapinfo tab file given in* Location file.

Location file file box
file with the location details

Anticlockwise rotation angle box
the world rotation of the raster

X/Y co-ordinate real box
the world x/y co-ordinate of the bottom left hand corner of the raster

World width/height real box
the width/height in world units of the raster

Appearance tab

Name for raster	input		

the name of the raster element

Model for raster	input		available models

model for the raster element.

Show border	tick	tick	

if ticked then the border of the raster element is displayed

Colour for border	input	default colour	available colours

the colour of the border for the raster element

Buttons at Bottom

Pick button
select the raster element to edit by clicking on the border of the raster. The details for the selected raster are then displayed in the panel.

Set button
give the raster element the new values from the panels fields

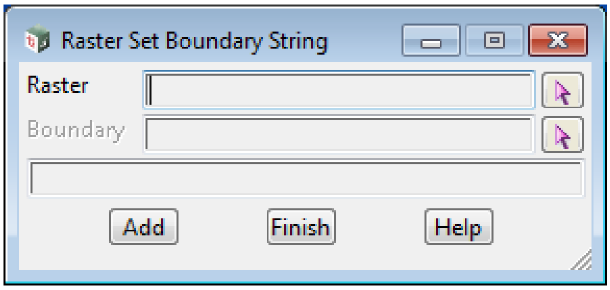
NOTE: A raster is **deleted** by using the string *Delete* option. The raster is selected for deleting by picking on the border of the raster.

14.14.6 Set a Boundary for a Raster

Position of option on menu: **Strings =>Rasters =>Set boundary**

The **Set boundary** option defines a boundary polygon for the raster. Only the parts of the raster inside the boundary polygon are displayed. The boundary polygon can have holes.

Selecting **Set boundary** brings up the **Raster Set Boundary String** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raster	raster select box		

select the raster to have a drawing polygon set for it

Field Description	Type	Defaults	Pop-Up
Boundary	string select box		

select a polygon

Field Description	Type	Defaults	Pop-Up
Add	button		

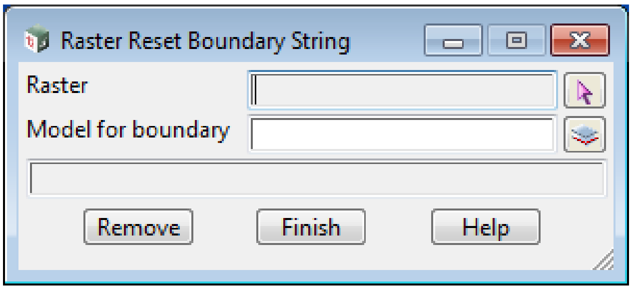
add the selected polygon as a boundary polygon for the selected raster

14.14.7 Reset the Boundary for a Raster

Position of option on menu: **Strings =>Rasters =>Reset boundary**

The **Reset boundary** option removes the boundary polygon from a raster.

Selecting **Remove boundary** brings up the **Raster Reset Boundary String** panel.



The fields and buttons used in the panel have the following functions.

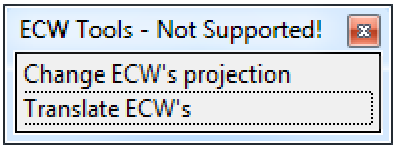
Field Description	Type	Defaults	Pop-Up
Raster	raster select box		
select the raster to have its drawing polygon removed			
Model for boundary	model box		available models
model to place the removed boundary polygon in			
Remove	button		
remove the boundary polygon from the selected raster			

14.14.8 ECW Tools - Not Supported!

Position of option on menu: **Strings =>Rasters =>ECW tools**

Selecting **ECW tools** brings up the **ECW tools -Not Supported!** menu.

This section of documentation is a work in progress and will be updated in subsequent releases.



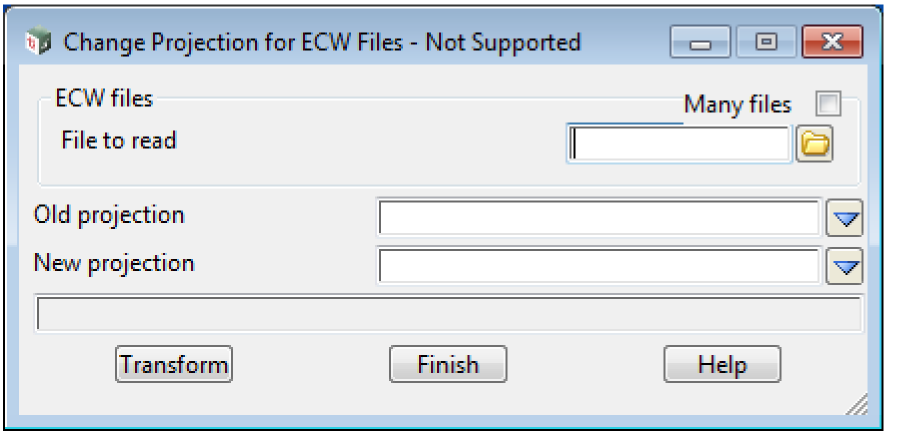
For the option Change ECW's projection go to 14.14.8.1 Change ECWs Projection
Translate ECW's 14.14.8.2 Translate ECWs

14.14.8.1 Change ECWs Projection

Position of option on menu: **Strings =>Rasters =>ECW tools=> Change ECW's Projection**

Selecting **Change ECW's Projection** brings up the **Change Projection for ECW Files - Not Supported** panel.

This section of documentation is a work in progress and will be updated in subsequent releases.



14.14.8.2 Translate ECWs

Position of option on menu: **Strings =>Rasters =>ECW tools=> Translate ECW's**

Selecting **Translate ECW's** brings up the **Translate ECW Files - Not Supported** panel.

This section of documentation is a work in progress and will be updated in subsequent releases.

See

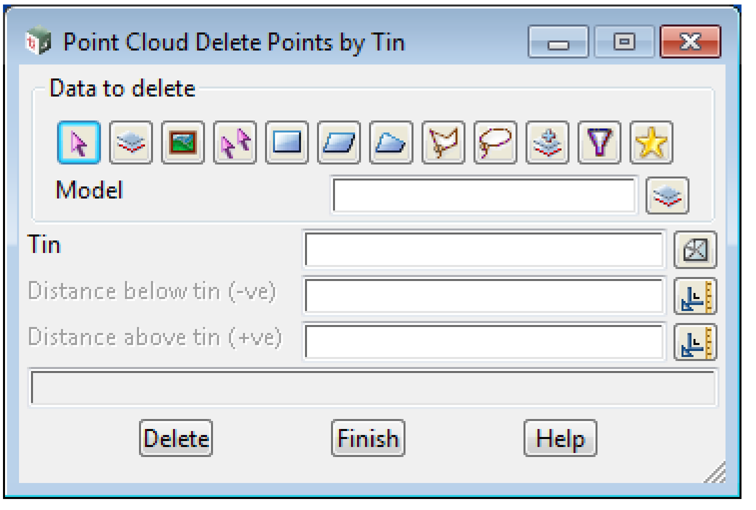
14.15.2.1 Deleting Point Cloud Points by TIN
14.15.2.2 Deleting LAS File Points by TIN

14.15.2.1 Deleting Point Cloud Points by TIN

Position of option on menu: **Strings =>Point clouds =>Delete Points =>Delete Point cloud points by tin**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Delete Point cloud points by tin** fires up the **Point Cloud Delete Points by Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Data to change

Data source type — Defaults: Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source — Type: input

source of data to be processed.

Tin — Type: tin box — Pop-Up: available tins

the delete status of each point cloud point is set from the triangle the point is over, so if the point is over a valid triangle, the point is marked as active. Points not over any triangle are marked as deleted.

Distance below tin (-ve) — Type: measure box

the delete status of each point cloud point is set from the distance relative to the tin, so if the distance is less than the number entered, the point is marked as deleted.

Note: If 'Distance above tin' is also entered, the point must lie in between the two values for the point to be marked as active.

Distance above tin (+ve) — Type: measure box

the delete status of each point cloud point is set from the distance relative to the tin, so if the distance is greater than the number entered, the point is marked as deleted.

Note: If 'Distance below tin' is also entered, the point must lie in between the two values for the point to be marked as active.

Delete — Type: button

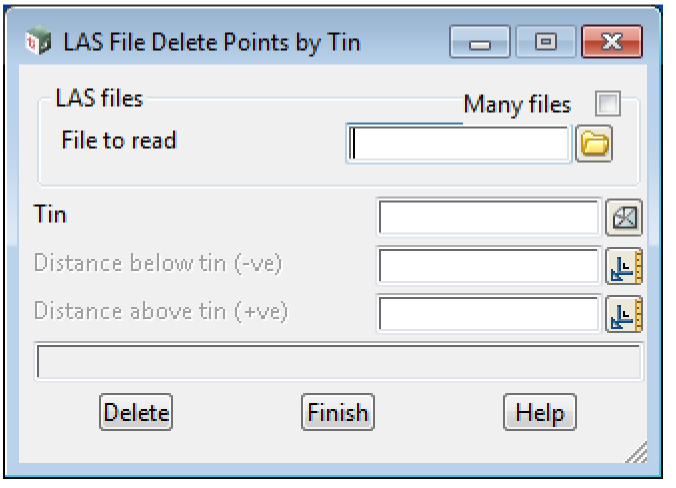
mark point cloud points as active or deleted according to the data entered above.

14.15.2.2 Deleting LAS File Points by TIN

Position of option on menu: **Strings =>Point clouds =>Delete Points =>Delete LAS file points by tin**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Delete LAS file points by tin** fires up the **LAS File Delete Points by Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Many files tick box

File to read file box

Tin tin box

the delete status of each point in the LAS file is set from the triangle the point is over, so if the point is over a valid triangle, the point is marked as active. Points not over any triangle are marked as deleted.

Distance below tin (-ve) measure box

the delete status of each point in each LAS file is set from the distance relative to the tin, so if the distance is less than the number entered, the point is marked as deleted.

Note: If 'Distance above tin' is also entered, the point must lie in between the two values for the point to be marked as active.

Distance above tin (+ve) measure box

the delete status of each point in each LAS file is set from the distance relative to the tin, so if the distance is greater than the number entered, the point is marked as deleted.

Note: If 'Distance below tin' is also entered, the point must lie in between the two values for the point to be marked as active.

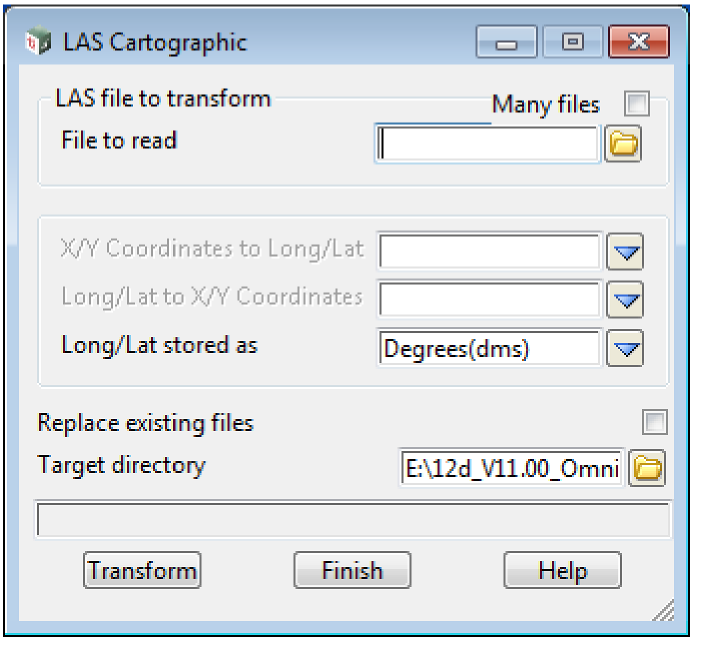
Delete button

mark point cloud points as active or deleted according to the data entered above.

14.15.3 Cartographic Transform

Position of option on menu: **Strings =>Point clouds =>Cartographic transform**

Selecting **Cartographic transform** brings up the **LAS Cartographic** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Many files	tick box	not ticked	

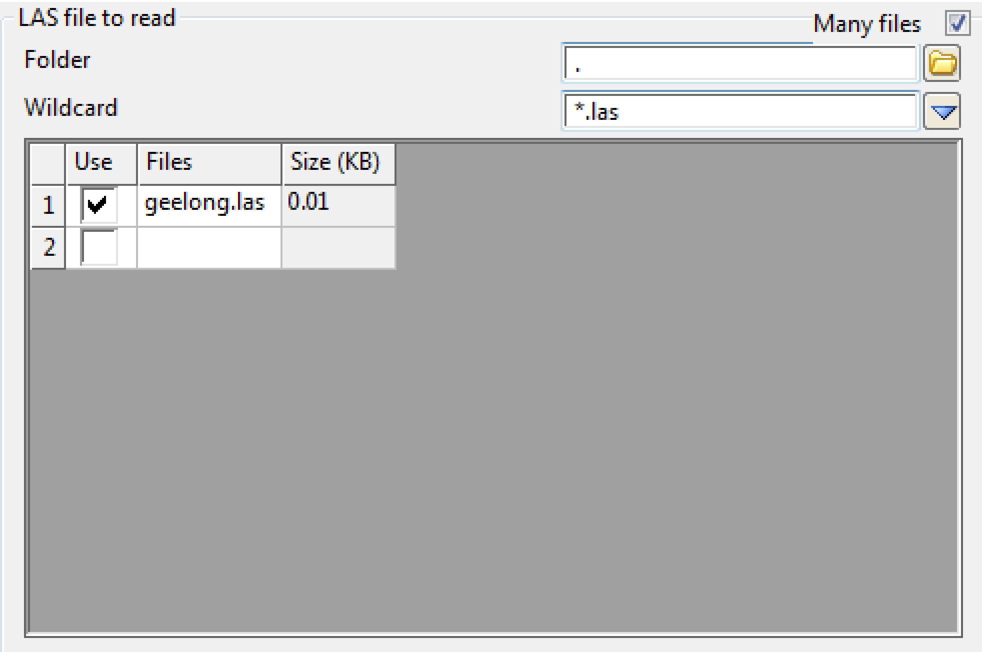
*if **ticked**, a grid to allow multiple .las files to be read in is opened. A wild card is used to select all the files to be read in.*

Folder	file box		

folder to search for files using the Wild card

Wildcard	input		

wild card to use in search for files in the given folder



Use tick box

Target directory file box

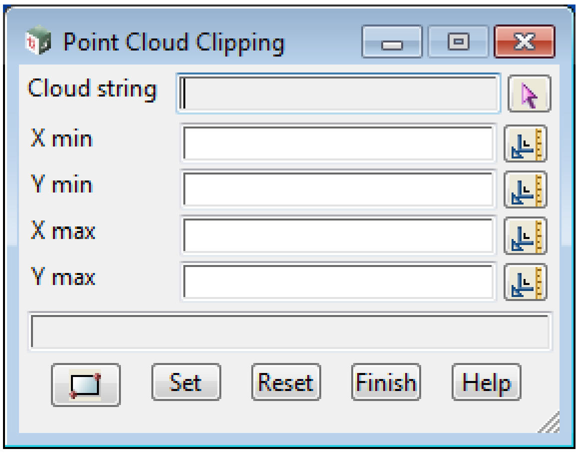
directory where the file will be saved

Transform button

14.15.4 Limiting Cloud Drawing on View

Position of option on menu: **Strings =>Point clouds =>Limit cloud drawing on view**

Selecting **Limit cloud drawing on view** fires up the **Point Cloud Clipping** panel.



The fields and buttons used in this panel have the following functions.

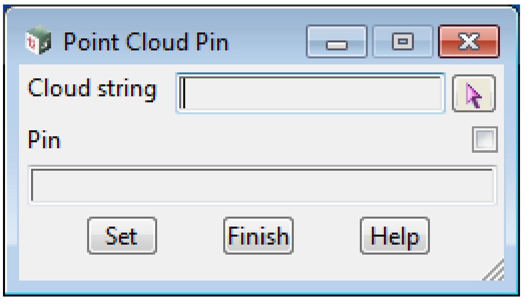
Field Description	Type	Defaults	Pop-Up
Cloud string	string select		
X/Y min	measure boxes		
X/Y max	measure boxes		
Set	button		
Reset	button		

14.15.5 Point Cloud Pinning

Position of option on menu: **Strings =>Point clouds =>Pin cloud**

The **Point Cloud Pin** option allows a point cloud to be stored in memory rather than read from disk on demand. If on demand, once the point cloud is not needed, it is removed from memory, so this 'pinning' may improve performance.

Selecting **Pin cloud** fires up the **Point Cloud Pin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Cloud string	string select		

select the point cloud string to be pinned or unpinned.

Pin	tick box		

if ticked, the selected point cloud string will be pinned.

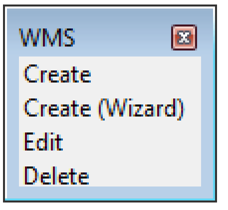
Set	button		

runs the option.

14.16 WMS

Position of option on menu: **File I/O =>WMS**
Position of option on menu: **Strings =>WMS**

The **WMS** walk-right menu containing these options is:



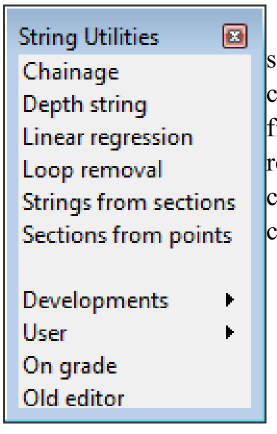
For the option *Create* go to	8.6.21.1 Download from a WMS
Create (Wizard)	8.6.21.2 WMS Wizard
Edit	8.6.22.1 Edit a WMS Image
Delete	8.6.22.2 Delete a WMS Image

14.17 Utilities

Position of menu: **Strings =>Utilities**

The **Utilities** menu contains miscellaneous options involving strings.

The Utilities walk-right menu is



set string chainage at a point
calculate depth string, report offset & xfall
fit lines and arcs
remove loops from strings
create strings from labelled sections
create section from projecting points onto a line

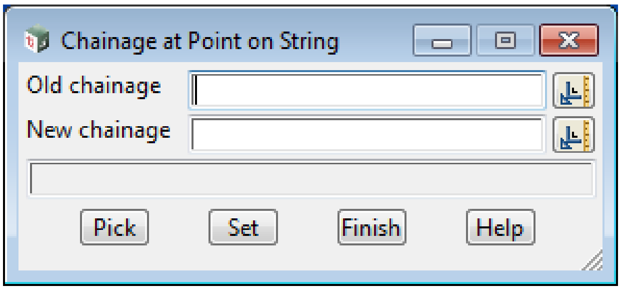
For the option *Chainage* go to	14.17.1 Chainage.
Depth string	14.17.2 Depth String
Linear regression	17.14.7 Linear Regression
Loop removal	14.17.4 Loop Removal
Strings from sections	14.17.5 Strings from Sections
Sections from points	20.14.9 Sections from Points
Developments	14.17.6 Developments
On grade	14.17.7 On Grade
Old editor	14.17.8 Old Editor

14.17.1 Chainage

Position of option on menu: **Strings =>Utilities =>Chainage**

The **chainage** menu option allows the user to specify the start chainage for a string by specifying what the chainage will be at a selected point on the string. The string's start chainage is then adjusted so that the point has the given chainage.

Selecting **chainage** fires up the **chainage at point on string** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Old chainage output

reports the initial chainage of the dropped point

New chainage input

the new chainage for the dropped point.

Pick button

two objects to pick - pick the string to modify the chainage at a point and then pick a point which will be dropped onto the selected string to give the point that will have its chainage modified. The existing chainage on the string of the dropped point is then written to the old chainage *panel field.*

Set button

on selecting set, the start chainage is modified so that the chainage at the picked point is the value in the new chainage *field. The* old chainage *field is then updated with the new chainage.*

Please continue to the next section 14.17.2 Depth String.

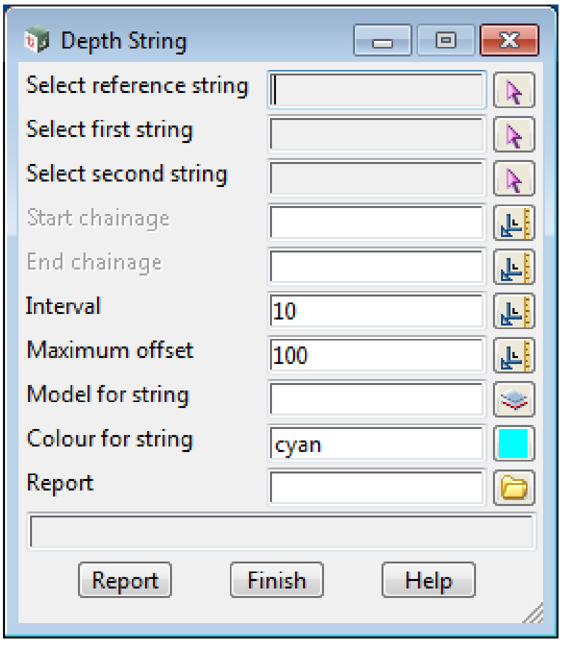
14.17.2 Depth String

Position of option on menu: **Strings =>Utilities =>Depth string**

The **depth string** option calculates the horizontal and vertical offsets and the cross-fall between two strings and then creates and/or reports on the string.

A reference string is selected which is used to define chainages. Lines perpendicular to the reference string are taken at regular chainages and intersected (in plan) with the first and second strings. The horizontal and vertical offsets and the cross-fall between the two strings are calculated at the intersection points.

On selecting the **Depth string** option, the **Depth string** panel is displayed.



The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up

Start/End chainage input

if blank, the start/end chainage of the reference string is used.
if non-blank, the given chainage is used as the start/end chainage.

Interval input

chainage interval to calculate values at.

Maximum offset input

if non-blank, the maximum distance to search from the reference string to find the 1st and 2nd strings.

Model for string input available models

if non-blank, a depth string is created and placed in this model.

Colour for string input available colours

the colour for the depth string.

Report file input *.rpt

if non-blank, the file for the offset and cross-fall report

Ref/1st/2nd button

select the reference/first/second string.

Report button

calculate a depth string and produce an offset and cross-fall report on it.

Please continue to the next section 14.17.3 Linear Regression.

14.17.3 Linear Regression

Position of option on menu: **Strings =>Utilities =>Linear regression**

Position of option on menu: **Survey =>Extras =>Linear regression**

This option is documented in 17.14.7 Linear Regression.

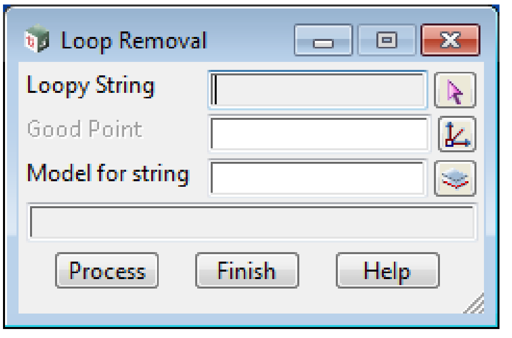
Please continue to the next section 14.17.4 Loop Removal.

14.17.4 Loop Removal

Position of option on menu: **Strings =>Utilities =>Loop removal**

The **loop removal** option tries to remove loops from strings by adding points where the string self intersects and removing the loops at those points. The level of the added points are the mean of the self intersect points.

Selecting **loop removal** fires up the **loop removal** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Loopy string	string select		
pick the string to try and remove loops from.			
Good point	xyz box		
If the automatic loop removal is incorrect, pick a good point on the string.			
Model for string	model box		available models
model for the processed string to go to.			
Process	button		
try and remove string points from the loops in the string.			

Please continue to the next section 14.17.5 Strings from Sections.

14.17.5 Strings from Sections

Position of option on menu: **Strings =>Utilities =>Strings from sections**

The **strings from sections** option creates strings by joining the common named points on successive 4d strings (usually generated as sections). This option is documented under

Design => X-Sections => Strings from Sections

Please go to the section 20.14.8 Strings from Sections.

14.17.6 Developments

Position of menu: **Strings =>Utilities =>Developments**

Some of the options under **string utilities** are still under development, or are being phased out (Cogo (trial)) and won't be documented or released until future versions of 12d Model. The current options on the *Developments* menu are

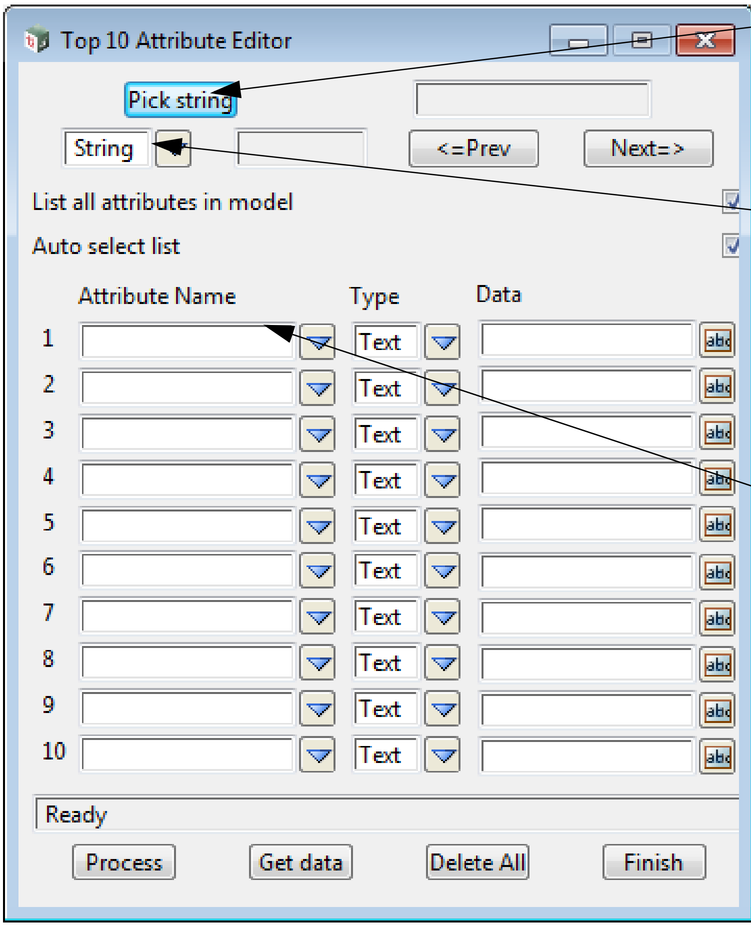
14.18.1 Attribute Editor

On selecting the **Attribute editor**, the **Top 10 Attribute Editor** panel is displayed.

This option displays ten (10) attributes of type string, vertex or segment for a selected string.

This option was written before the **Strings =>Properties =>Attributes** editor existed and was mainly used for editing drainage data. For more documentation, go to 23.10.2 Attribute Editor.

Most of the detailed catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d or edited inside 12d using this panel.



First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **Pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
pick string	button		

used to pick the initial string in a model

string-pit-pipe	choice box		**string, pit, pipe**

select the type of attribute to be displayed. Pit and pipe attributes are only available for drainage strings.

attribute name	input box		

3 top 10 attributes lists are maintained (pit, pipe and string). The attributes that you can select from are all of the attributes that exist on all of the strings in the model. If the attribute does not exist for the string/pit/pipe that you are displaying the ***data*** *field will display* ***Not found.***

type choice box **Text, Real, Integer**

for existing attributes this will display Text, Real or Integer.
When defining a new attribute select the type of data to be stored in the attribute

data input box

the data stored in the attribute is displayed/edited/created in this field.

<= prev button

move to next *string in the model*
pit on the string
pipe on the string

next => button

move to next *string in the model*
pit on the string
pipe on the string

process button

updates the attributes displayed in the dialogue.

Notes:

First select Pick to select the string that contains the user attributes. All catchment data is stored with the pits in drainage strings. The strings will be highlighted in white when they are selected.

To access the pit attributes LB this field then select Pit. A circle will be drawn around the pit selected.

LB the Attribute Name field and then select from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in. They may not be defined for the string you are editing. If the string does not have that attribute defined not found will be displayed in the Data field.

To change the value for the attribute enter the new value in the data field. If the attribute does not exist, deleting the not found text and adding data will create it. The following message will be displayed whenever you are creating a new attribute.

For more documentation on setting the attributes for this option, go to 23.10.2 Attribute Editor

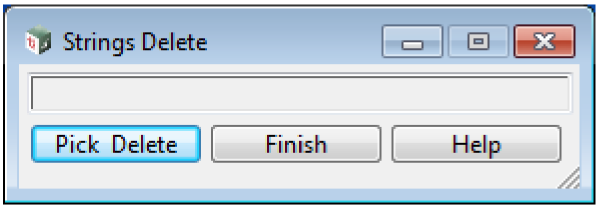
14.19 Delete

Position of option on menu: **Strings =>Delete**

Entire strings can be deleted from *12d Model* using the **delete** option.

Any number of strings can be deleted by successively selecting the strings.

On selecting the **delete** string option, the **strings delete** panel is displayed.



Field Description	Type	Defaults	Pop-Up
Pick & Delete	button		

any selected strings are deleted.
The cycle is terminated by clicking RB to raise the **pick ops** *menu and selecting* ***cancel*** *from it.*

14.20 Old String Create and Editors

14.20.1 Old

Position of option on menu: **Strings =>Create =>Old**

These old options are the string creation options that were available before *12d Model 8* was released.

The **Create** option is used to produce new strings. If a string already exists, the **Editor** option is used to modify it.

The **Create** walk-right menu contains options to create 2d, 3d, 4d, alignment, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Once a string has been created, it can be converted to most of the other string types using the string **Convert** option.

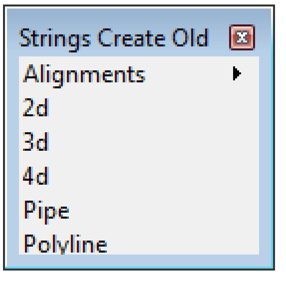
To create a new string of the same type and with similar header information as an existing string, the **same as** option is selected from the **String Create** menu.

Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

   Linestyles can be defined that drawn lines between the points even though the breakline type is **point**.
2. The string vertices are also called intersection points (IP's).

The **String Create Old** walk-right menu is



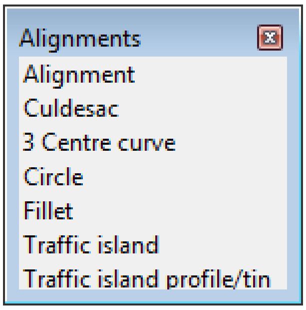
The string creation process is similar for each string type and for editing strings as well.

For the option *Alignments*, go to 14.20.1.1 Alignments
2d 14.20.1.2 Create - 2d (pre V8)
3d 14.20.1.3 Create - 3d (pre V8)
4d 14.20.1.4 Create - 4d (Pre V8)
Pipe 14.20.1.5 Create - Pipe (Pre V8)
Polyline 14.20.1.6 Create - Polyline (Pre V8)

14.20.1.1 Alignments

Position of menu: **Strings =>Create =>Old =>Alignments**

The **Alignment** walk-right menu contains options to create an alignment string, plus quick methods of creating an alignment string with horizontal geometry already created for culdesacs, circles and fillets.



create alignment
create culdesac
create three centred curve
create alignment forming a circle
create alignment fillet
create alignment for traffic island
create traffic island profile/tin

For the option *Alignment*, go to 14.20.1.1.1 Create - Alignment.
Culdesac 14.20.1.1.2 Create - Culdesac
3 centre curve 14.20.1.1.3 Create - Three centre curve
Circle 14.20.1.1.4 Create - Circle
Fillet 14.20.1.1.5 Create - Fillet
Traffic island 20.8.9.1 Create Traffic Island
Traffic island profile/tin 20.8.9.2 Traffic Island Profile/Tin

14.20.1.1.1 Create - Alignment

Position of option on menu: **Strings =>Create =>Old =>Alignments =>Alignment**

An alignment string is defined by specifying both its horizontal and vertical geometry.

The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points) with circular curves and transition spirals applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points (called vertical intersection points) and either parabolic or circular curves applied to the vertical intersection points.

The horizontal geometry is defined in a plan view and the vertical geometry in a section view.

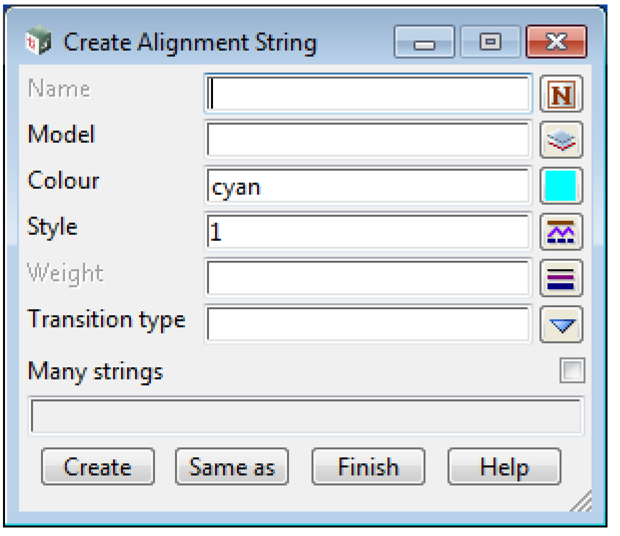
Alignment strings are often referred to as “centre-line strings” because road centre-lines are common examples of alignment strings.

Note vertical geometry can only be added to an existing string.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Alignment String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Alignment String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Alignment String** panel.

On selecting the **Alignment string** option, the **Create Alignment String** panel is displayed.



To create a new alignment string, the name, model, colour, style and transition spiral type of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **Create Alignment String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		

the name of the new string.

Model	input		available models

name of the model that the new string is in.

Colour	input	default colour	available colours

the colour of the new string.

Style	input	1	available line styles

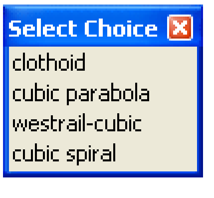
line style of the string.

Weight	input	0	

thickness of the string.

Transition type	input	clothoid	clothoid, cubic parabola westrail-cubic, cubic spiral

transition (for example clothoid spiral) to be used for this alignment string. For more information see 39.2.7.5 Transitions and Spirals File.



Many strings	tick		

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create	button		

After the **create** *button is chosen, the* **alignment edit** *menu and* **alignment edit info** *panel are* *displayed.*

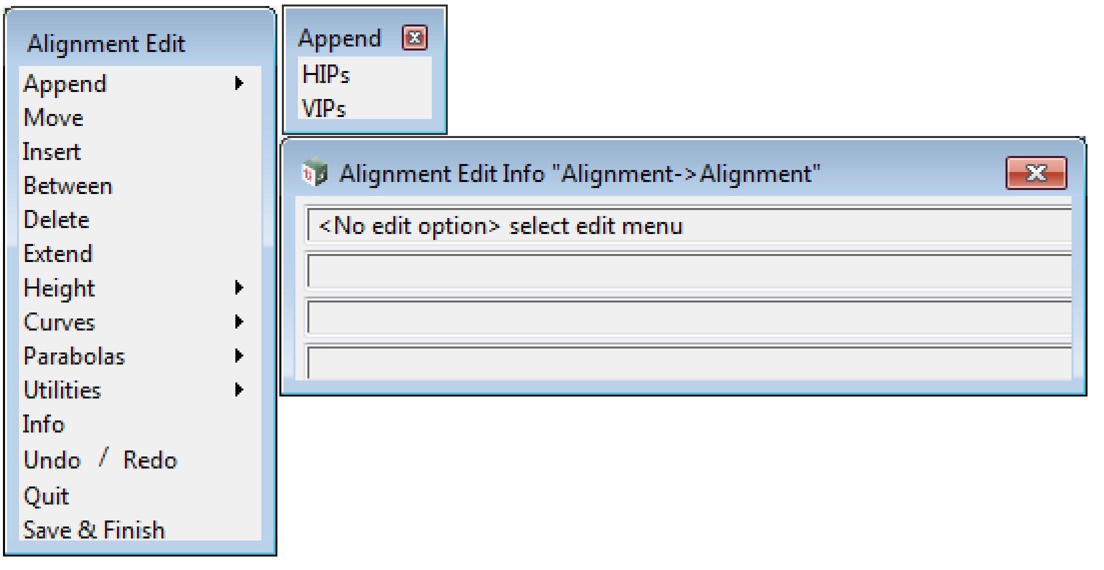
Same as button

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

14.20.1.1.1.1 Alignment Edit

Selecting the create button in the **create alignment string** panel the **alignment edit** menu and **alignment edit info** panel are placed on the screen.

The **Alignment edit** menu and **Alignment edit info** panel for an alignment string are



To begin creating an alignment string, the user must select the **Append=>HIPs** option from the **Alignment Edit** menu and start placing points in a plan view.

To create a new alignment string, select the **Append** => **HIPs** option from the **Alignment Edit** menu.

The **Append** =>**HIPs** option is used to add horizontal intersection points to either end of an existing alignment string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all alignment strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Alignment Edit** menu are usable.

The options in the **Alignment Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Alignment edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

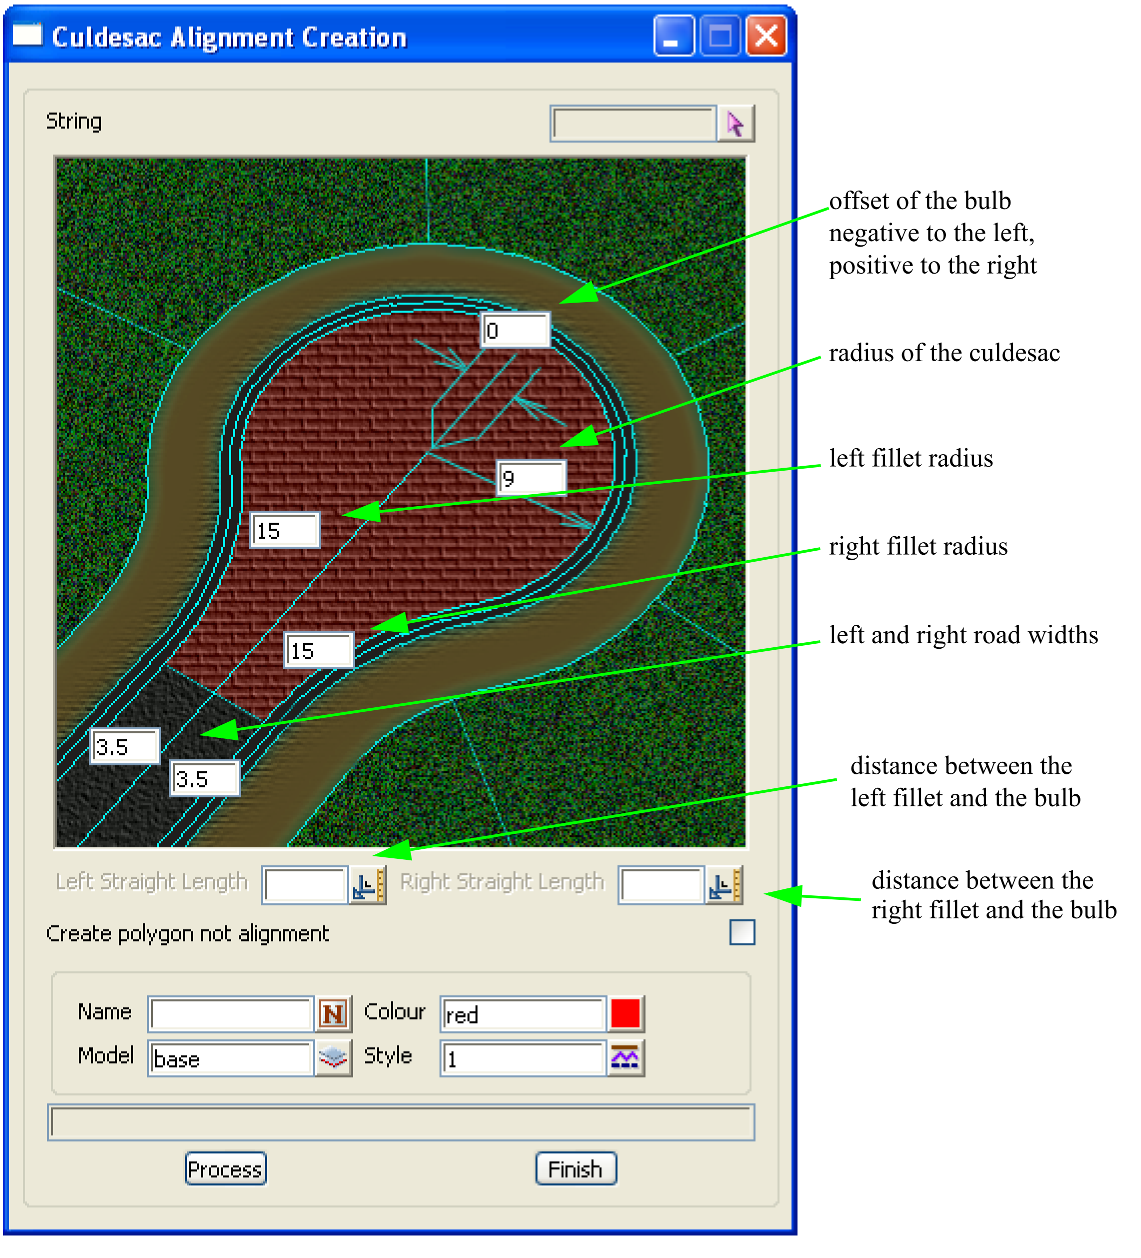
For full information on the Alignment Editor, go to the section 14.20.2 Alignment Edit

14.20.1.1.2 Create - Culdesac

Position of option on menu: **Strings =>Create =>Old =>Alignments =>Culdesac**

Create an alignment string for a culdesac for user defined road widths, culdesac radius and offset. No vertical geometry is defined.

On selecting the **Culdesac** option, the **Culdesac Alignment Creation** panel is displayed.



The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Offset	input box		

offset of the centre of the culdesac bulb. Use a negative value if the offset is to the left, positive if the offset is to the right.

Radius input box

radius of the culdesac bulb

Left/Right fillet radii input box

radii for the left and right fillets from the roads to the culdesac bulb.

Left/Right road widths input box

left and right widths of the road.

Name/Model/Colour/Style input box

name/model/colour/style of the created alignment string.

Select string select

select with direction the string to create the culdesac for.

Preview string select

draw the culdesac with the given parameters in the panel draw box.

Process button

create the alignment string

Undo button

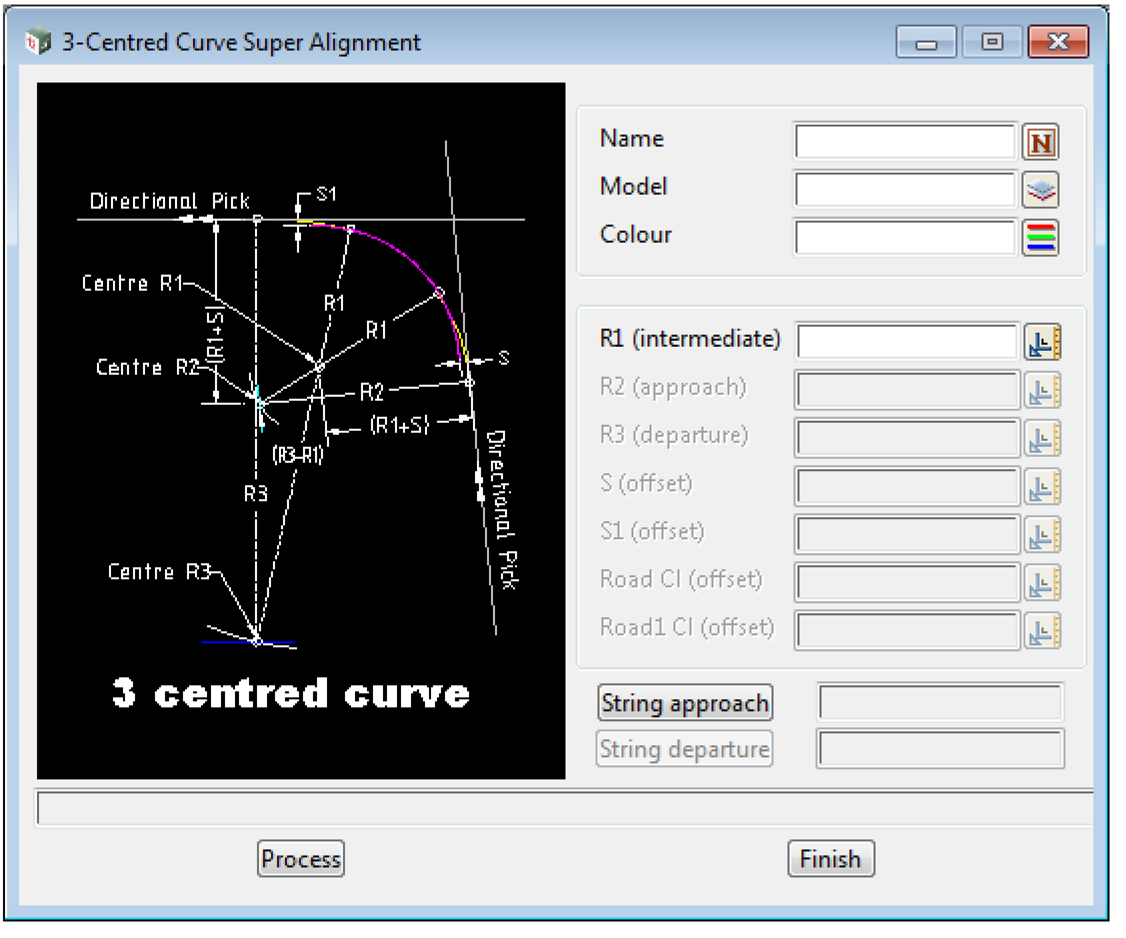
undo the last alignment string created whilst the panel has been active.

14.20.1.1.3 Create - Three centre curve

Position of option on menu: **Strings =>Create =>Old =>Alignments =>3 Centre Curve**

Create an alignment string for a three centred curve for user defined parameters and selected strings.

On selecting the **3 centre curve** option, the **3 centred curve construction** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Name/Model/Colour/Style input box

name/model/colour/style of the created alignment string.

R1 (intermediate) input box

radius of the intermediate curve. If a value is entered and <enter> typed, values for R2, R3, S and S1 are computed and place in the appropriate fields

R2 (approach) input box

radius of the approach curve.

R3 (departure) input box

radius of the departure curve.

S (offset) input box

approach offset.

S1 (offset) input box

departure offset.

Kerb line approach string select

select the approach string

Kerb line departure string select

select the departure string

Process button

create the alignment string

Undo button

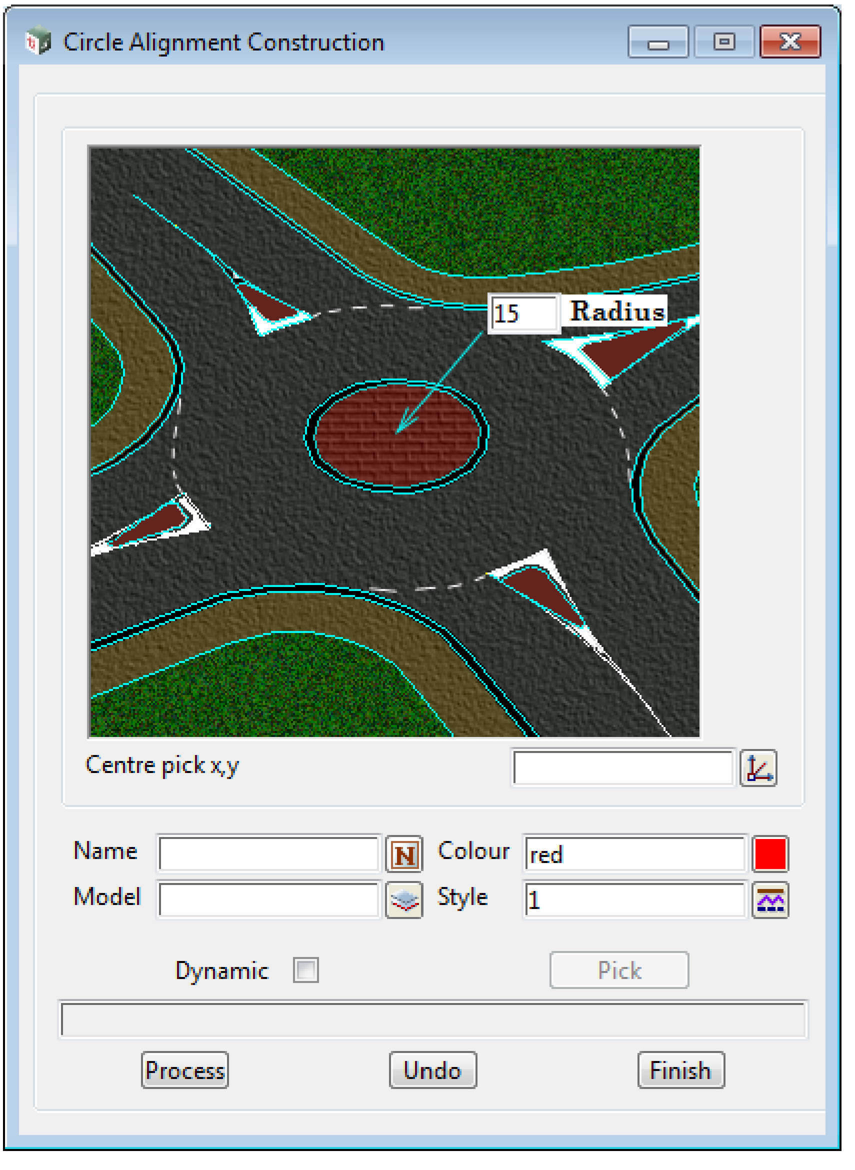
undo the last alignment string created whilst the panel has been active.

14.20.1.1.4 Create - Circle

Position of option on menu: **Strings =>Create =>Old =>Alignments =>Circle**

Create an alignment string for a circle with a for user radius and selected centre or with a dynamic mode set, selected centre and interactively positioned circumference.

On selecting the **curve** option, the **circle alignment construction** panel is displayed.



The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Radius	input box		

the radius of the circle.

Centre pick x,y	x,y,z box		

if Dynamic *in not ticked, select the centre of the circle.*

Name/Model/Colour/Style	input box		

name/model/colour/style of the created alignment string.

Dynamic tick box

if not ticked, then the Centre pick x,y *and* radius *fields are used to define the circle.*

if ticked, then the Pick *button is used to select the centre and then the cursor is taken to be on the circle to dynamically define the radius.*

Pick button

pick the circle centre when in dynamic mode.

Process button

create the alignment string.

Undo button

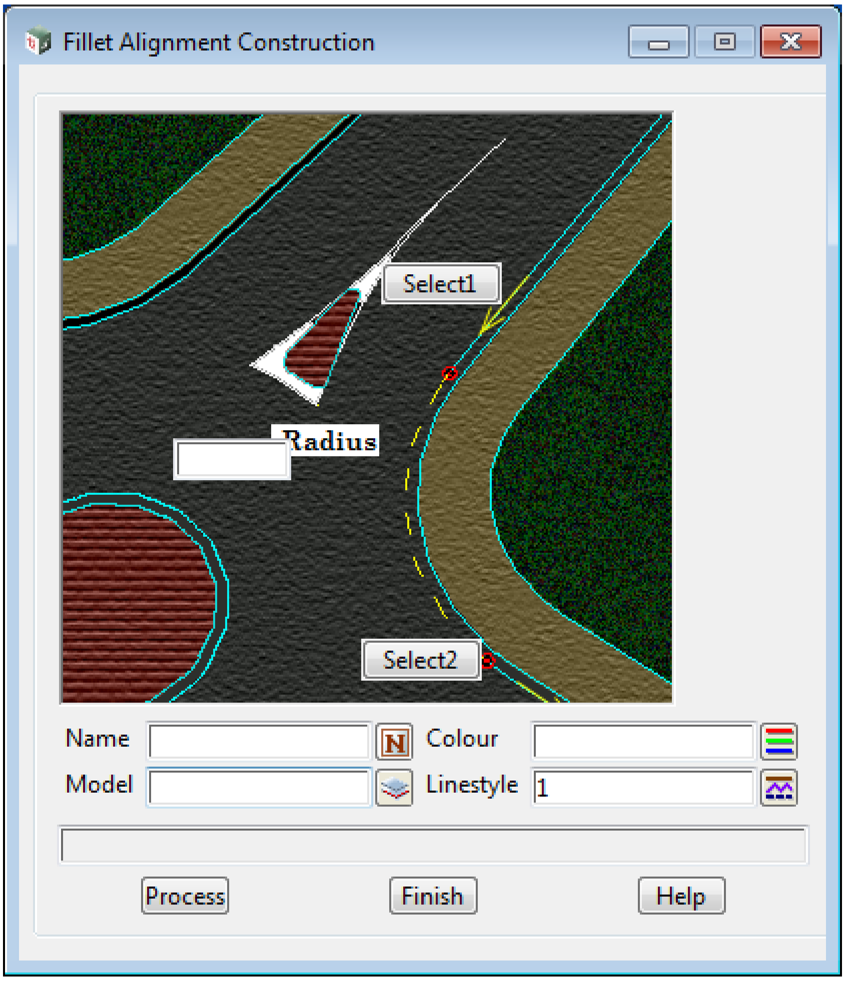
undo the last alignment string created whilst the panel has been active.

14.20.1.1.5 Create - Fillet

Position of option on menu: **Strings =>Create =>Old =>Alignments =>Fillet**

Create an alignment string for a fillet with a for user radius and selected in and out strings.

On selecting the **fillet** option, the **fillet alignment construction** panel is displayed.



The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select 1	string select		

select the approach string. Pick with direction.

Radius	input box		

the radius of the fillet.

Select 2	string select		

select the departure string. Pick with direction.

Name/Model/Colour/Style	input box		

name/model/colour/style of the created alignment string.

Process	button		

create the alignment string.

Undo button

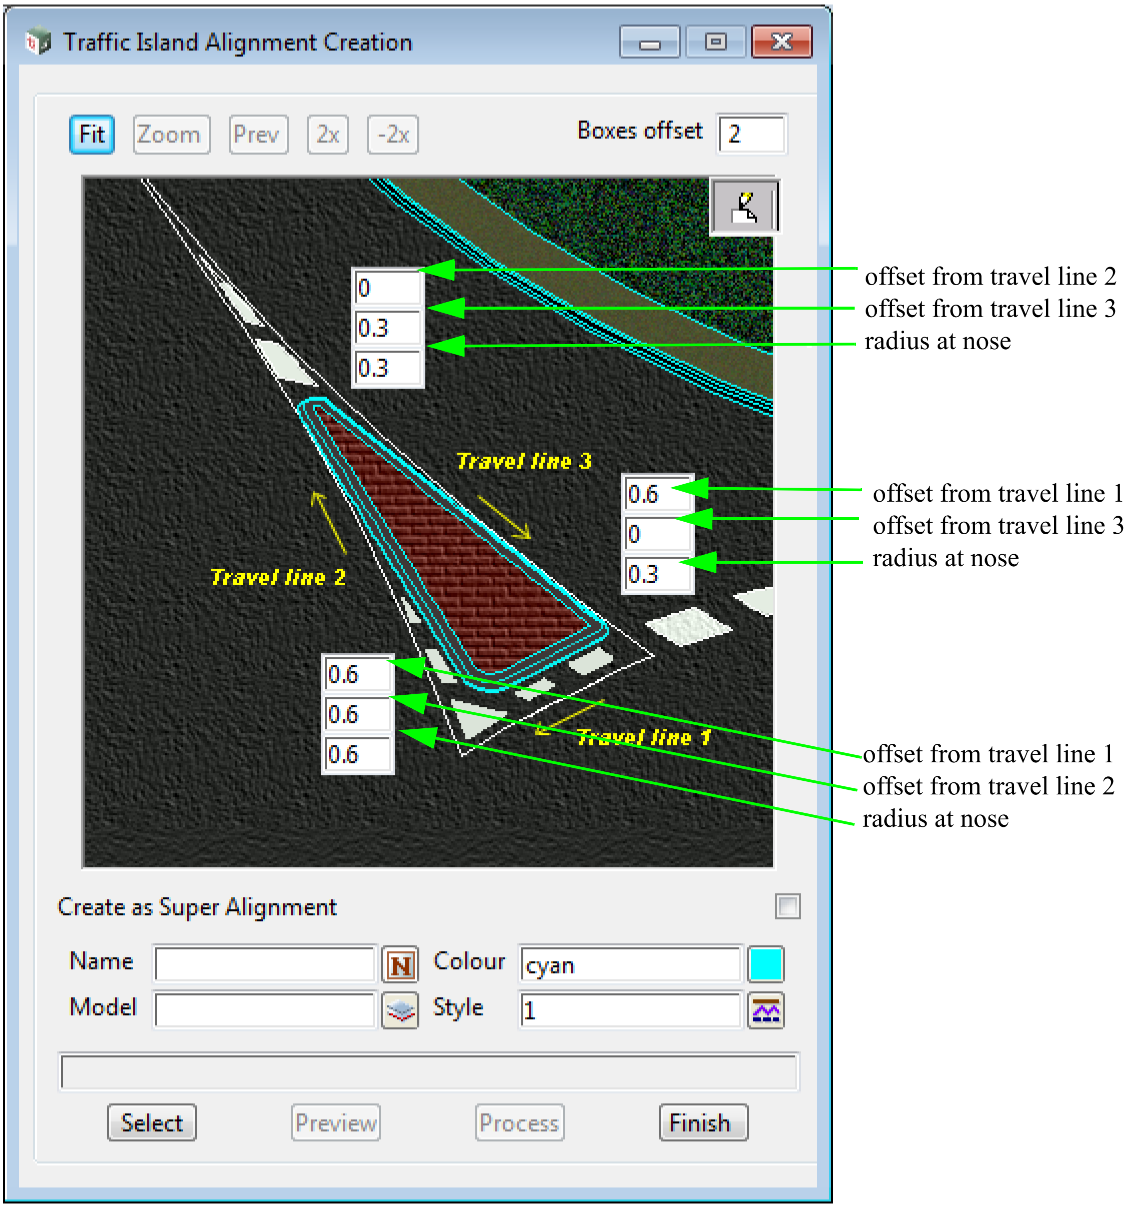
undo the last alignment string created whilst the panel has been active.

14.20.1.1.6 Create - Traffic Island

Position of option on menu: **Strings =>Create =>Old =>Alignments =>Traffic Island**

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. No vertical geometry is defined.

On selecting the **traffic island** option, the **traffic island alignment creation** panel is displayed.



The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Offset from travel lines	input box		

offset distance from the selected travel lines.

Radius at nose	input box		

radius of the corner of the traffic island between the selected travel lines.

Name/Model/Colour/Style input box

name/model/colour/style of the created alignment string.

Select strings select

select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.

Preview string select

draw the traffic island with the given parameters in the panel draw box.

Process button

create the alignment string

Undo button

undo the last alignment string created whilst the panel has been active.

14.20.1.2 Create - 2d (pre V8)

Position of option on menu: **Strings =>Create =>Old =>2d**

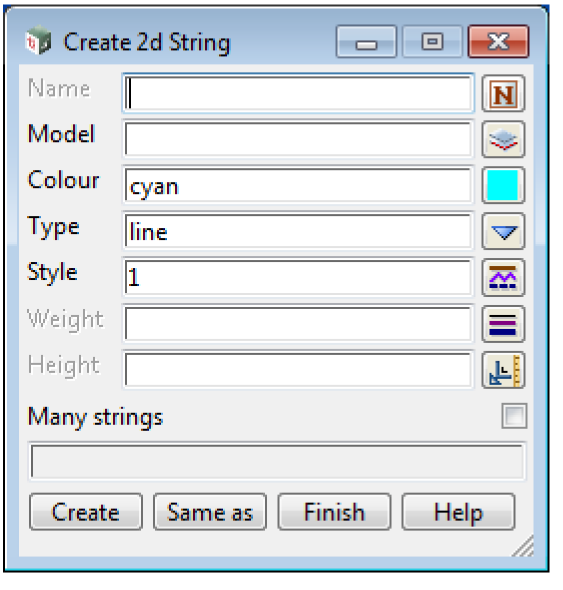
A 2d string consists of a series of (x,y) vertices all with the same z-value (height). 2d strings are often referred to as “contour strings” because contours are the most common example of a string with a constant height.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create 2d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 2d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 2d String** panel.

From *12d Model 8* onwards, the default is to create *2d super strings* rather than the *2d strings* used up to *12d Model 7*. A *2d super string* is a *super string* with *Constant height*. That is, there is only one z-value for the entire string. The advantage is using a *2d super string* is that all the CAD options will work for it and it can be given point id’s for setout.

On selecting the **2d string** option, the **create 2d string** panel is displayed.



The default values for the panel fields are taken from the *CAD Controlbar (see* 15.1 Controlbars*)*

To create a *new* 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **create 2d string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Type	input	line	line, point
breakline type (point-line type) of the string.			

Style	input	1	available line styles

line style of the string.

Weight	input	0

thickness of the string.

Height input

height (z-value) of the entire string.

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the **create** *button is chosen, the* **2d edit** *menu and* **2d edit info** *panel are displayed.*

Same as button

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

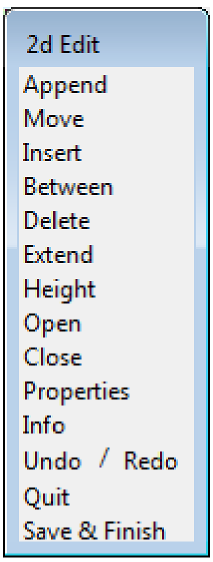
Finish button

end the option, ***don't*** *proceed to the edit stage.*

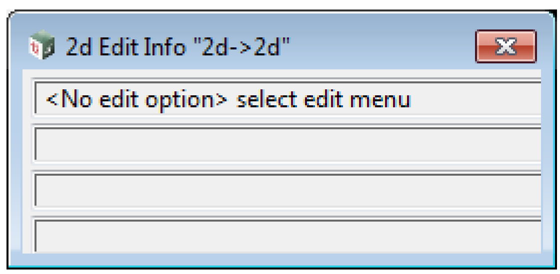
14.20.1.2.1 2d Edit for New String

On selecting the **Create** button in the **Create 2d String** panel the **2d edit** menu and **2d Edit Info** panel are placed on the screen.

The **2d edit** menu for a 2d string is and the **2d edit info** panel is



append or prepend an IP
move an IP
insert an IP
insert IP on line joining IPs
delete an IP
extend an IP
modify the string's z-value
open a closed string
close a string
bring up Properties panel
toggle edit info panel
undo/redo
quit the create
finish the 2d create



To create a new 2d string, select the **Append** option from the **2d Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the 2nd vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **2d Edit** menu are usable.

The options in the **2d Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **2d Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 2d Editor, go to the section 14.20.3 2d Edit - Old

14.20.1.3 Create - 3d (pre V8)

Position of option on menu: **Strings =>Create =>Old =>3d**

A 3d string consists of a series of (x,y,z) points.

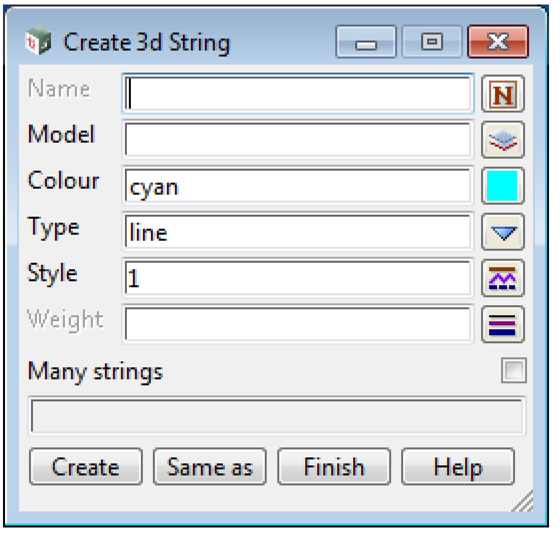
The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each string point, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a special case of a 3d string where the heights at all the points are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is required at each string point.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create 3d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 3d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 3d String** panel.

On selecting the **3d string** option, the **create 3d string** panel is displayed.



To **create** a new 3d string, the name, colour, model and point-line type of the new string are entered into the appropriate fields and the **create** button selected.

To create a new 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **create 3d string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Type	input	line	line, point
breakline type (point-line type) of the string.			

Style	input	1	available line styles

line style of the string.

Weight	input	0

thickness of the string.

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the **create** *button is chosen, the* **3d edit** *menu and* **3d edit info** *panel are displayed.*

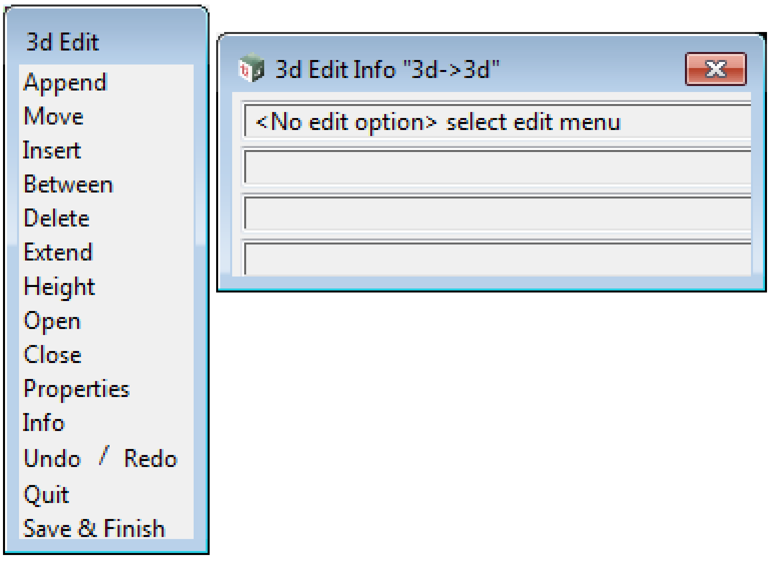
Same as button

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

14.20.1.3.1 3d Edit

Selecting the **create** button in the **create 3d string** panel the **3d edit** menu and **3d edit info** panel are placed on the screen.

The **3d edit** menu and panel for a 3d string are



To create the new 3d string, select the **Append** option from the **3d Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **3d Edit** menu are usable.

The options in the **3d Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **3d edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 3d Editor, go to the section 14.20.4 3d Edit - Old

14.20.1.4 Create - 4d (Pre V8)

Position of option on menu: **Strings =>Create =>4d**

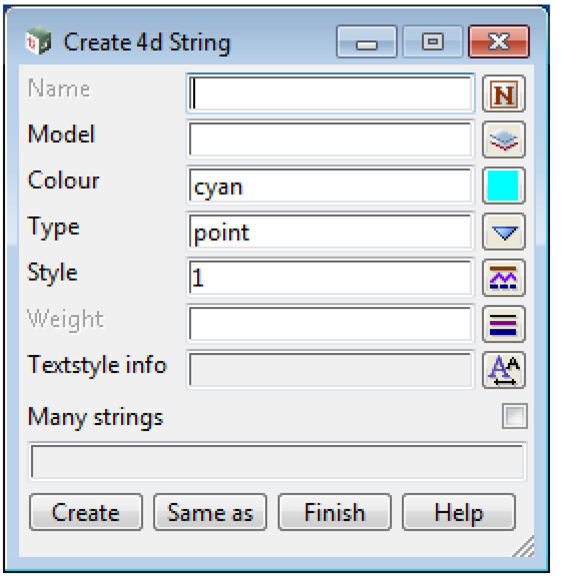
A 4d string consists of a series of (x,y,z) points and a text label at each point.

Creating and editing a 4d string is very similar to a 3d string.- the major difference is that a height and a text label is required at each string point.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create 4d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 4d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 4d String** panel.

On selecting the **4d string** option, the **create 4d string** panel is displayed.



To **create** a new 4d string, the name, colour, model, point-line type, text size and units, offset, justification and angle for the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create 4d string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Type	input	line	line, point
breakline type (point-line type) of the string.			
Style	input	1	available line styles
line style of the string.			

Weight input 0

thickness of the string.

Textstyle info input

textstyle information.

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the **create** *button is chosen, the* **4d edit** *menu and* **4d edit info** *panel are displayed.*

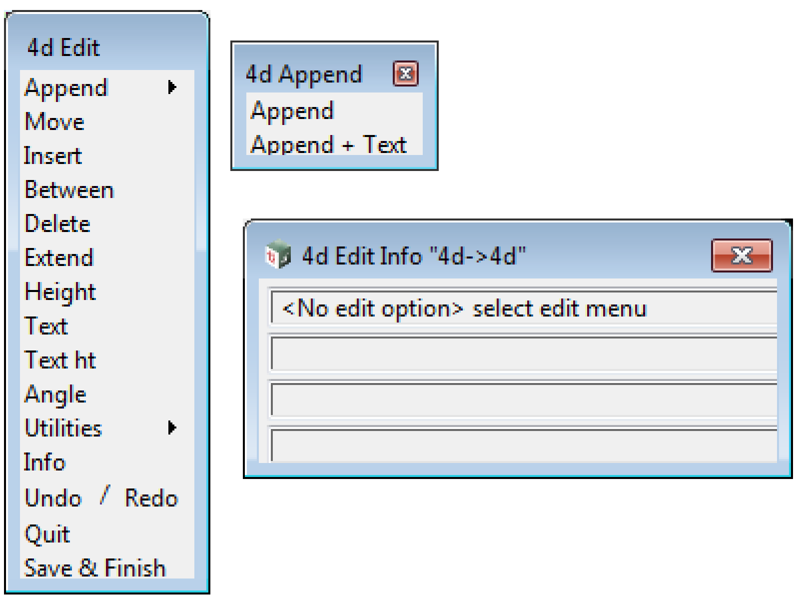
Same as button

After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

14.20.1.4.1 4d Edit

Selecting the **create** button in the **create 4d string** panel the **4d edit** menu and **4d edit info** panel are placed on the screen.

The **4d edit** menu and panel for a 4d string are



To create a new 4d string, the user must select one of the two Append options on the **Append** walk-right of the **4d Edit** menu which has options to simply create points or to create points and text at the points.

The **Append** and **Append + text** options are used to add points and text (in a plan view) to either end of an existing string, or in the case of a new string, places the 1st point and text and then begins appending points and text to the 1st point.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

If **Append + text** was selected, the user will then be prompted for the text to be placed at that points.

The string and text is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **4d Edit** menu are usable.

The options in the **4d Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **4d edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 4d Editor, go to the section 14.20.5 4d Edit - Old

14.20.1.5 Create - Pipe (Pre V8)

Position of option on menu: **Strings =>Create =>Old =>Pipe**

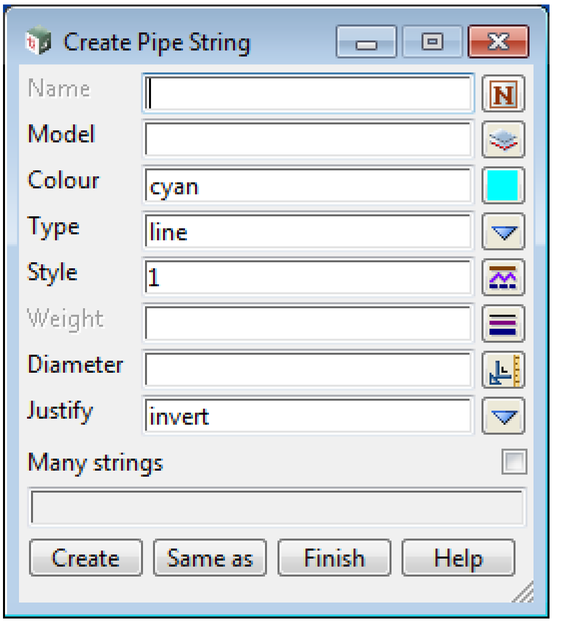
A pipe string is the same as a 3d string except that the pipe string also has a diameter hence the options for creating and editing a pipe string are almost the same as for a 3d string.

The main difference is that there are no options to open and close a pipe string and there is an additional option for modifying the pipe diameter.

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Pipe String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Pipe String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Pipe String** panel.

On selecting the **Pipe string** option, the **Create Pipe String** panel is displayed.



To **create** a new pipe string, the name, colour, model, point-line type and diameter of the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create pipe string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Style	input	1	available line styles
line style of the string.			

Weight input 0

thickness of the string.

Diameter input 0

diameter of the pipe

Justify input invert invert, centre, overt

justification of the pipe with respect to the co-ordinates given for the pipe string.

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

After the **create** *button is chosen, the* **pipe edit** *menu and* **pipe edit info** *panel are displayed.*

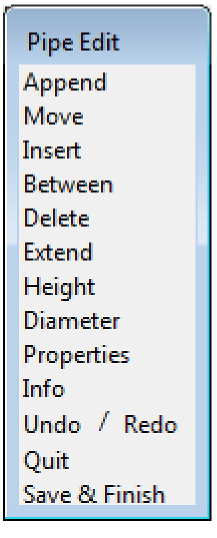
Same as button

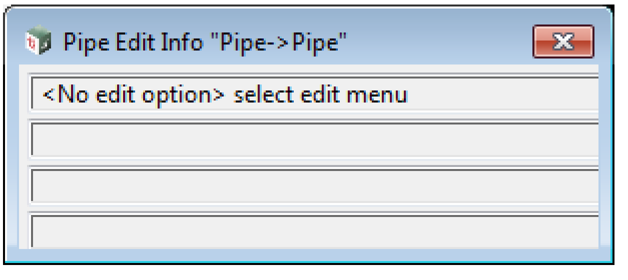
After the **same as** *button is chosen, another string is selected and information about it is used for the fields in this panel.*

14.20.1.5.1 Pipe Edit

On selecting the **Create** button in the **Create Pipe String** panel the **Pipe Edit** menu and **Pipe Edit info** panel are placed on the screen.

The **Pipe Edit** menu and panel for a pipe string are





To create a new pipe string, select the **Append** option from the **Pipe Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all pipe strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Pipe Edit** menu are usable.

The options in the **Pipe Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Pipe Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Pipe Editor, go to the section 14.20.6 Pipe Edit - Old

14.20.1.6 Create - Polyline (Pre V8)

Position of option on menu: **Strings =>Create =>Old =>Polyline**

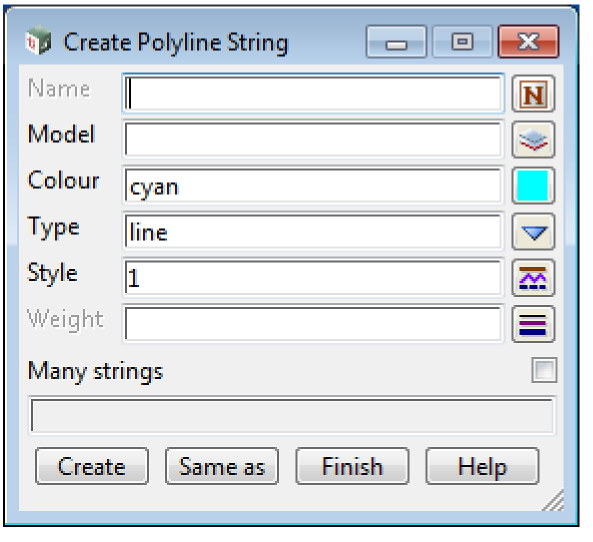
A polyline string is similar to a 3d string except that it can have either straight lines or arcs joining the (x,y,z) points of the string. The arcs are plan arcs with possibly a different z at either end and the z values are linearly interpolated between the end points. Hence in a long section, the end points are joined by a straight lines for both line and arc segments of the polyline.

Creating and editing a polyline string is very similar to a 3d string. The only major difference is that a radius is required at each string segment (a radius of 0 means no arc, just a straight line).

The Many strings tick-box is used when more than one string of the same type is to be created, If many strings is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Polyline String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Polyline String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The Same as button is used to obtain information from and existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Polyline String** panel.

On selecting the **polyline string** option, the **create polyline string** panel is displayed.



To **create** a new polyline string, the name, colour, model, point-line type and linestyle of the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create pipe string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
the name of the new string.			
Model	input		available models
name of the model that the new string is in.			
Colour	input	default colour	available colours
the colour of the new string.			
Style	input	1	available line styles
line style of the string.			
Weight	input	0	
thickness of the string.			

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

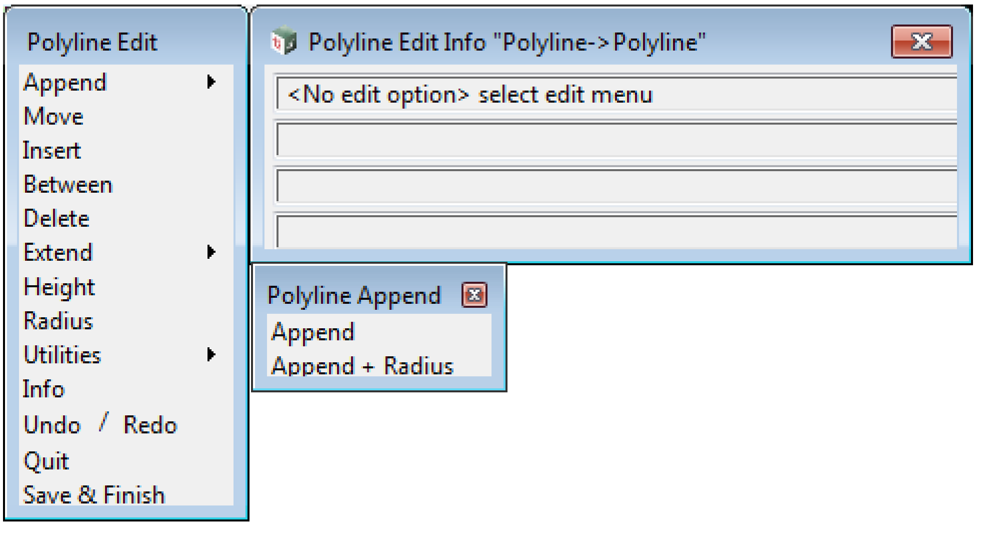
*After the **create** button is chosen, the **polyline edit** menu and **polyline edit info** panel are displayed.*

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

14.20.1.6.1 Polyline Edit

Selecting the **create** button in the **create polyline string** panel the **polyline edit** menu and **polyline edit info** panels are placed on the screen.



To create a new polyline string, the user must select one of the two append options (**Append** or **Append + radius**) on the **Append** walk-right of the **Polyline Edit** menu. The which **Append** option to simply creates points which are joined by a straight segment whereas the **Append + radius** create points with a radius for the segment.

The **Append** options are used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all polyline strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is not added to any plan view, the model is automatically added to all plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the 1st vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Polyline Edit** menu are usable.

The options in the **Polyline Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Polyline Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Polyline Editor, go to the section 14.20.7 Polyline Edit - Old

14.20.2 Alignment Edit

Position of option on menu: **Strings =>Editor**

An alignment string is defined by specifying the horizontal and vertical geometry as separate operations.

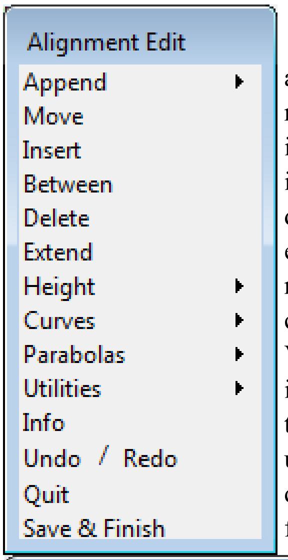
The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points, HIP's) and circular curves and transitions (eg clothoid spiral) applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points called vertical intersection points (VIP's) and parabolic or circular curves applied to the vertical intersection points.

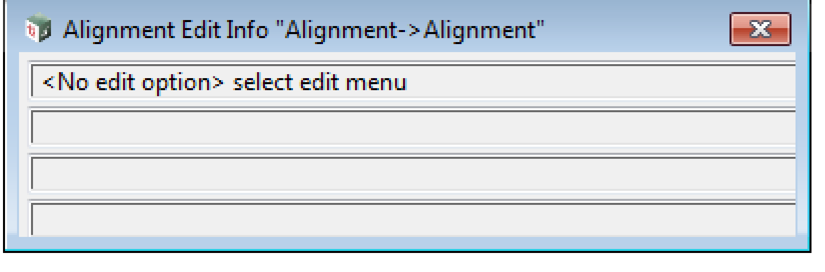
The horizontal geometry is defined in a plan view and the vertical geometry in a section view. Hence the alignment string editor can edit information for the string on both plan and section views.

Since a section view is only defined in relation to a specific string (called the primary string for the section view), the vertical geometry of the picked string can only be edited in a section view if the string is the primary string for that section view. That is, the string can only be edited on a section view if the string being edited is profiled on that section view.

On selecting an alignment string, the **alignment edit** menu and the **alignment edit info** are placed on the screen.



append or prepend an IP
move an IP or TP
insert an IP
insert on IP-IP line
delete an IP
extend an IP
modify the strings z-value
circular curves, transitions (*e.g.* spirals)
VG only, radius or length
interval, start ch, validate, *etc*.
toggle edit info panel
undo/redo
quit the edit session
finish the edit session



Most of the options are applicable to either horizontal or vertical geometry. The meaning of the option depends on whether the string is being edited in a plan or a section view. Hence the description of the option will often need to be split into its separate action on horizontal or vertical geometry.

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

Each option will now be discussed in detail.

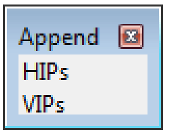
Go to 14.20.2.1 Alignment Append

Go to 14.20.2.2 Alignment Move
Go to 14.20.2.3 Alignment Insert
Go to 14.20.2.4 Alignment Between
Go to 14.20.2.5 Alignment Delete
Go to 14.20.2.6 Alignment Extend
Go to 14.20.2.7 Alignment Height
Go to 14.20.2.8 Alignment Curves
Go to 14.20.2.9 Alignment Parabolas
Go to 14.20.2.10 Alignment Utilities

14.20.2.1 Alignment Append

The **append** operation for an alignment string is similar to the 3d string case except that there are separate append options for the horizontal and vertical geometry of the string.

The **append** walk-right is



14.20.2.1.1 Append HIPs - Horizontal Geometry

The **append=>HIPs** option in a plan view is used to create the 1st horizontal point in a new alignment string, to append a new horizontal intersect point to the end of the string or to prepend a new horizontal intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

14.20.2.1.1.1 Existing Alignment String

Appending a point is a two step process.

Step (a) - selecting the end to append the point to.

After picking **append=>HIPs**, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1 <Append Points>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for an IP
message area 4 select final position - after pick
Screen message area
<Select string end to append to> [picks][][menu]
<Select string end to append to> [picks][accepts][menu]

Step (b) - selecting the position for the new appended point.

A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

message area 1 <Append Points>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for closest IP
message area 4 select final position - before pick
Screen message area
<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Once an intersection point has been appended to the string, the appended intersection point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position of the next appended intersection point.

Hence a series of string points is easily entered by first selecting the string end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting them in turn.

Typed input can be used in either step.

The **append** option is terminated by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **alignment edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the append option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the append option still current.

14.20.2.1.1.2 New Alignment String

When the **append**=>**HIPs** option is selected, a cross will appear on any plan views that have the alignment string's model on them.

The first horizontal intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing alignment string where the end point has already been accepted.

14.20.2.1.2 Append VIPs - Vertical Geometry

The **append**=>**VIPs** option is used to create and edit the vertical geometry of the picked string if the string is a primary string on any section view. This can be achieved by using either the **VG edit** or the **profile** option from the section view **view**=>**utilities** menu.

Vertical geometry can only be defined for a string with existing horizontal geometry.

On a section view, **Append**=>**VIPs** is used to create the first vertical intersection point in an existing string, to append a new vertical intersect point to the end of the string or to prepend a new vertical intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

14.20.2.1.2.1 Existing Vertical Geometry

Appending a vertical point is the same as for a horizontal intersection point except that the co-ordinate system is (chainage,height) rather than (x,y) values and the information messages displayed in the **alignment edit info** panel show chainage, height and percentage grade rather than x,y,z and bearings.

For example -

message area 1	<Append Points>	
message area 2	VIP point number, chainage,height of VIP	
message area 3	curve length, %grade-in, %grade-out, grade difference for an VIP	
message area 4	edit finished - before pick	select final position - after pick

14.20.2.1.2.2 New Vertical Geometry

Creating the **1st vertical intersection point** (VIP) in a string is similar to the 1st horizontal IP.

When the **append**=>**VIPs** option is selected, a cross will appear on any section views that have the alignment string profiled on them.

The 1st vertical intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing vertical geometry where the end point has already been accepted.

Typed input can be used at any stage of the append.

See the next section 14.20.2.2 Alignment Move or return to 14.20.2 Alignment Edit.

14.20.2.2 Alignment Move

The **move** option allows the user to move

(a) individual horizontal intersection points (HIPs)

(b) individual tangent points (HTPs) if their is no transition on the HIP.

(c) individual vertical intersection points or tangent points (VIPs or VTPs).

move acts on the horizontal geometry if the point to move is selected in a plan view, or the vertical geometry if the point to move is selected in a section view.

14.20.2.2.1 Move - Horizontal Geometry

The **move** option in a plan view is for moving individual horizontal intersection points (HIP's) or horizontal tangent points (HTPs) of the string.

The move cycle consists of two steps:

(a) selecting the point to be moved

(b) selecting the new position for the point.

Step (a)

First the horizontal intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a horizontal intersection point is selected, the string will be redrawn with the intersection point moved to the cursor position and the circular curve radius and transition lengths left constant.

A horizontal tangent point only occurs on a line connecting two adjacent horizontal intersection points (the HIP-HIP line). Hence, a horizontal tangent point can only move along its HIP-HIP line. Moving a horizontal tangent point actually means that the radius of the circular curve at the tangent point is modified so that the new position of the point is still a tangent point on the HIP-HIP line for the new circular curve.

To guarantee that the new position for the tangent point is on the HIP-HIP line, the cursor position is automatically projected perpendicularly onto the HIP-HIP line to give the new tangent point.

message area 1	<Move Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - after pick
Screen message area	

<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position (or its projection for a HTP) is selected as the new position for the point by picking (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the HIP (or at the projected point for a HTP), and the string redrawn.

message area 1	<Move Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.

move is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **alignment edit** option.

14.20.2.2.2 Move - Vertical Geometry

The **move** option is used in a section view to move individual vertical intersection points (VIP's) or vertical tangent points (VTP's).

The move cycle consists of two steps:

(a) selecting the point to be moved

(b) selecting the new position for the point.

Step (a)

First the vertical intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a vertical intersection point (VIP) is selected, the string will be redrawn with the vertical intersection point moved to the cursor position and the parabolic curve length or the circular curve radius left constant.

A vertical tangent point (VTP) only occurs on a line connecting two adjacent vertical intersection points (the VIP-VIP line). Hence, a vertical tangent point can only move along its VIP-VIP line. Moving a vertical tangent point actually means that the length of the parabolic curve at the vertical tangent point is modified so that the new position of the point is still a vertical tangent point on the VIP-VIP line for the new parabolic curve.

To guarantee that the new position for the vertical tangent point is on the VIP-VIP line, the cursor position is automatically projected perpendicularly onto the VIP-VIP line to give the new vertical tangent point.

message area 1 <Move Point>
message area 2 VIP point number, ch, ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 select final position - after pick
Screen message area
<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position (or its projection for a VTP) is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for an VIP (or at the projected point for a VTP), and the string redrawn.

message area 1 <Move Point>
message area 2 VIP point number, ch, ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 select final position - before pick, edit finished - after pick
Screen message area
<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the **move** option is still current and can be repeated for other points without having to re-select the move option.

The **move** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **alignment edit** option.

See the next section 14.20.2.3 Alignment Insert or return to 14.20.2 Alignment Edit.

14.20.2.3 Alignment Insert

The **insert** option is designed to place a new intersection point in a string between two adjacent intersection points. The inserted point does not have to be on the line joining the two intersection points - the between option is used to guarantee that the IP is on the IP-IP line.

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the line connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

Like the **move** option, the **insert** works on the horizontal or the vertical geometry depending on whether a plan or section view is used to select the connecting line.

For horizontal inserts

message area 1 <Insert Point>
message area 2 IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3 bearing-in, bearing out, bearing difference for the inserted IP
message area 4 select final position - after pick
Screen message area
<Select line to insert on> [picks][][menu]
<Select line to insert on> [picks][accepts][menu]

For vertical inserts

message area 1 <Insert Point>
message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 select final position - after pick
Screen message area
<Select line to insert on> [picks][][menu]

<Select line to insert on> [picks][accepts][menu]

Step (b) - selecting the position for the new intersection point

The position of the new intersection point is set to the current cursor position by picking (LB) and accepting (MB).

horizontal

message area 1	<Insert Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick

Screen message area

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

vertical

message area 1	<Insert Point>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - before pick, edit finished - after pick

Screen message area

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the insert option.

The **insert** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Typed input can be used in either step.

See the next section 14.20.2.4 Alignment Between or return to 14.20.2 Alignment Edit.

14.20.2.4 Alignment Between

The **between** option is similar to the insert option except the inserted point does have to be on the line joining the two intersection points. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP point position.

The **between** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

See the next section 14.20.2.5 Alignment Delete or return to 14.20.2 Alignment Edit.

14.20.2.5 Alignment Delete

The **delete** option is used to delete intersection points from the string.

After picking the delete option, any selected intersection point in the string is deleted. The string, minus the deleted point, is redrawn after each deletion.

Once an intersection point has been deleted, another intersection point in the selected string can selected for deletion. Hence any number of the string points can be deleted one after another.

A horizontal intersection point is deleted if the point is chosen from a plan view and a vertical intersection point deleted if the point is selected from a vertical view.

For horizontal deletes

message area 1	<Delete Points>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP

Screen message area

<Select point to delete> [picks][][menu]
<Select point to delete> [picks][accepts][menu]

For vertical deletes

message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
Screen message area
<Select point to delete> [picks][][menu]
<Select point to delete> [picks][accepts][menu]

The delete option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Typed input can be used to select a point for deletion.

See the next section 14.20.2.6 Alignment Extend or return to 14.20.2 Alignment Edit.

14.20.2.6 Alignment Extend

The **extend** option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, in a plan view, the bearing of the HIP-HIP line is kept constant and the intersection point is moved along that line either towards or away from its neighbouring intersection point on the HIP-HIP line.

In a section view, the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either towards or away from its neighbouring intersection point on the VIP-VIP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a co-ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and IP are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line. As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

For horizontal extends

message area 1 <Extend Point>
message area 2 IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3 bearing-in, bearing out, bearing difference for the inserted IP
message area 4 select final position - after pick
Screen message area
<Select line to extend> [picks][][menu]
<Select line to extend> [picks][accepts][menu]

For vertical extends

message area 1 <Extend Point>
message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 select final position - after pick
Screen message area
<Select line to extend> [picks][][menu]
<Select line to extend> [picks][accepts][menu]

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the current cursor position onto the IP-IP line.

horizontal -

message area 1 <Extend Points>
message area 2 IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3 bearing-in, bearing out, bearing difference for the inserted IP
message area 4 select final position - before pick, edit finished- after pick

Screen message area

<Select final position of point> [picks][][menu]

<Select final position of point> [picks][accepts][menu]

vertical

message area 1	<Extend Points>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - before pick, edit finished- after pick

Screen message area

<Select final position of point> [picks][][menu]

<Select final position of point> [picks][accepts][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **extend** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Typed input can be used in either step.

Note - **Extend** can be used on the end points of the string.

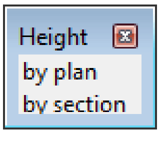
See the next section 14.20.2.7 Alignment Height or return to 14.20.2 Alignment Edit.

14.20.2.7 Alignment Height

The **height** option is used to insert and/or modify the height of a vertical intersection point in a plan view, or to modify the height of a vertical intersection point in a section view.

Hence the height option is unique - it only affects the vertical geometry of the string but can be used in a plan or section view.

The **height** walk-right is



14.20.2.7.1 By Plan - Height in a Plan View

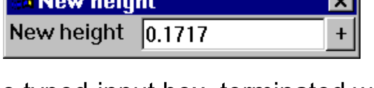
In a plan view, the **height=>by plan** option is used to create a **vertical intersection point** of a given height, or modify the height of an existing vertical point, at a selected plan position on the string.

After the **height** option is chosen, the user selects a position on the string in a plan view. The use of point and line snap will important for selecting the correct position.

If a vertical intersection point already exists at the chainage of the selected position, it will be selected for modification. Otherwise a new vertical intersection point will be inserted into the vertical geometry at the chainage of the selected position.

A **new height** typed-input box is then displayed on the screen with the vertical intersection point's current height (z value).

The **new height** typed-input box looks like:



The height is entered into the typed-input box, terminated with <Enter>. The entered value is taken as the new height of the vertical intersection point in the alignment.

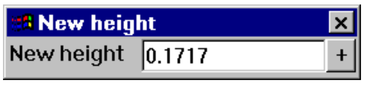
The typed-input box then disappears.

14.20.2.7.2 By Section - Height in a Section View

In a section view, the **height=>by section** option can only be used to modify the height of an **existing** vertical intersection point.

After the **height** option is chosen, the user selects the vertical intersection point that will have its height modified from a section view. After selecting the VIP, a **new height** typed-input box is displayed on the screen with the point's current height (z value).

The **new height** typed-input box looks like:



The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new height of the vertical intersection point in the alignment string and the string redrawn with the new height at that point.

The typed-input box then disappears.

For either **height=>by plan** or **height=>by section**, the **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

See the next section 14.20.2.8 Alignment Curves or return to 14.20.2 Alignment Edit.

14.20.2.8 Alignment Curves

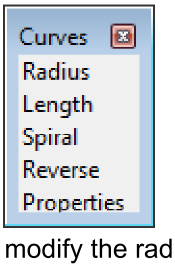
The **Curves** option allows the user to

(a) add a circular curve of a specified radius or curve length to a horizontal intersection point

(b) add start and end transition (eg spiral) to an intersection point with and existing circular curve

(c) add a circular curve of a specified radius or curve length to a vertical intersection point

The **Curves** walk-right menu is



The **radius** option is used to create or modify the radius of a circular curve at a horizontal or vertical intersection point. **radius** acts on the horizontal geometry if the point is selected in a plan view, or the vertical geometry if the point is selected in a section view.

Similarly the **length** option is used to set a circular curve by giving its total curve length rather than the radius. **length** acts on the horizontal geometry if the point is selected in a plan view, or the vertical geometry if the point is selected in a section view.

The **spiral** option is for adding transitions to a horizontal intersection point with a curve already on it.

14.20.2.8.1 Radius

In a plan view, the **radius** option is used to add a circular curve to an intersection point with no curve or to modify the radius of the circular curve if one already exists.

In a section view, the **radius** option is used to add a circular curve to an intersection point with no curve or to modify the radius of a circular curve if one already exists.

Radius is a two step process.

Step (a) - selecting the intersection point

First the intersection point whose curve is to be modified is selected.

For horizontal radius

message area 1	<Radius>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP

For vertical radius

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	radius, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value- after pick

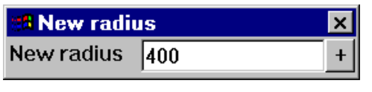
Screen message area

<Select point to change radius> [picks][][menu]
<Select point to change radius> [picks][accepts][menu]

Step (b) - entering the new radius

after an intersection point is chosen, a new radius typed-input box is displayed on the screen with either the intersection point's current curve radius or, if no curve exists, zero.

The new radius typed-input box looks like:



The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the curve at that intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing curve is to be removed from an intersection point, enter the value zero into the new radius typed-input box.

horizontal

message area 1	<Radius>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing diff for the inserted IP
message area 4	enter value - before value entered edit finished- after value entered

vertical

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	radius, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value - before value entered edit finished- after value entered

Like most of the other **alignment edit** options, after a radius has been modified the option is still current and another intersection point can be chosen to have its curve radius modified.

The **radius** option is terminated by selecting a different **alignment edit** option.

14.20.2.8.2 Length

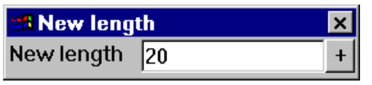
Although the circular curve on an intersection point is stored as a radius, it is possible to define the radius indirectly by giving the total curve length by using the **length** option.

The option works in plan or section views.

To use **length**, first select the intersection point to add a new circular curve to, or to modify the existing curve.

A new length typed-input box is then displayed on the screen with either the current curve length, or if no curve exists, zero.

The new length typed-input box looks like:



The total curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new curve length. The typed-input box then disappears.

If an existing circular curve is to be removed, zero is entered into the new length typed-input box.

Like most of the other **alignment edit** options, after the **length** has been modified the option is still current and another IP can be chosen to have its curve modified.

The **length** option is terminated by selecting a different **alignment edit** option.

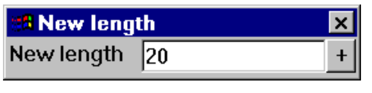
WARNING - when **length** is used, the equivalent radius is computed and stored with the curve. If the IP is moved, the **radius** is kept **constant** and the total curve **length** is **modified**.

14.20.2.8.3 Spiral

In a plan view, the **spiral** option is used to add a start or end transitions (eg spirals) to a curve on an intersection point, or to modify an existing transition. Spiral does not work on a section view.

After picking **spiral**, select the end of the curve to add a new transition to, or the existing transition to be modified. A new length **typed-input box** is displayed on the screen with either the current transition length, or zero if no transition exists.

The new length typed-input box looks like:



The transition length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new transition length. The typed-input box then disappears.

If an existing transition is to be removed, zero is entered into the new length typed-input box.

Like most of the other **alignment edit** options, after the **spiral** has been modified the option is still current and another curve can be chosen to have its transitions modified.

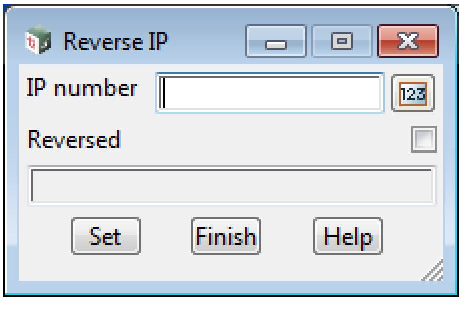
The **spiral** option is terminated by selecting a different **alignment edit** option.

14.20.2.8.4 Reverse

12d Model normally creates a curve on the side of the IP that has the smallest angle. The sign of the radius (positive or negative) is automatically determined by *12d Model*.

The **Reverse** option creates a circular curve that is the part left over from the standard curve.

On selecting **Reverse**, the **Reverse IP** panel is displayed.



The HIP is chosen by either typing in the HIP number in the IP number field, or by clicking on the **123** button and then selecting the HIP.

To change the curve from reversed/not reversed, simply tick on/off the Reversed tick box and then click on **Set**.

See the next section 14.20.2.9 Alignment Parabolas or return to 14.20.2 Alignment Edit.

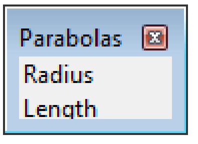
14.20.2.9 Alignment Parabolas

The **parabolas** option is for adding, removing or modifying parabolic curves to the vertical geometry. It allows the user to

(a) add a parabolic curve of a given curve length to a vertical intersection point

(b) add a parabolic curve of a given effective radius to a vertical intersection point

The **parabolas** walk-right menu is



The **radius** option is used to set a parabolic curve of given effective radius to a vertical intersection point.

The **length** option is used to set a parabolic curve of a given curve length to a vertical intersection point.

Note - the option only works on the vertical geometry if the VIP is selected in a section view. Points cannot be selected in any other view.

14.20.2.9.1 Radius

In a section view, the **radius** option is used to add a parabolic curve to an intersection point with no curve or to modify the radius of the parabolic curve if one already exists.

Radius is a two step process.

Step (a) - selecting the intersection point

First the intersection point whose parabola is to be modified is selected.

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value- after pick

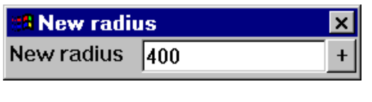
Screen message area

<Select point to change radius> [picks][][menu]
<Select point to change radius> [picks][accepts][menu]

Step (b) - entering the new radius

After an intersection point is chosen, a new radius typed-input box is displayed on the screen with either the intersection point's current parabolic radius or, if no parabola exists, the last value entered into the radius typed-input box.

The new radius typed-input box looks like:



The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the parabola at that intersection point and the string redrawn with the new parabola. The typed-input box then disappears.

If an existing parabola is to be removed from an intersection point, enter the value zero into the radius typed-input box.

message area 1 <Radius>
message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 enter value - before value entered edit finished- after value entered

Like most of the other **alignment edit** options, after the radius has been modified the option is still current and another intersection point can be chosen to have its parabolic radius modified.

The **radius** option is terminated by selecting a different **alignment edit** option.

WARNING - when **radius** is used, the equivalent parabolic length is computed and stored with the curve. If the VIP is moved, the **parabolic length** is kept **constant** and the **effective radius** is **modified**.

14.20.2.9.2 Length

The **length** option is used to add a parabolic curve to a vertical intersection point with no curve or to modify the length of the parabolic curve if one already exists.

Adding or modifying curve length is a two step process.

Step (a) - selecting the vertical intersection point

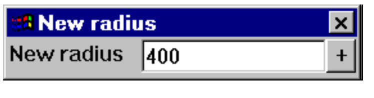
First the vertical intersection point whose parabola is to be modified is selected.

message area 1 <Length>
message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 edit finished - before pick enter value - after pick
Screen message area
<Select point to change length> [picks][][menu]
<Select point to change length> [picks][accepts][menu]

Step (b) - entering the new curve length

After a VIP is selected, a new length typed-input box is displayed on the screen with the point's current parabolic curve length.

The new length typed-input box looks like



The curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the length of the parabolic curve at that vertical intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing parabola is to be removed from a vertical intersection point, enter the value zero into the curve length typed-input box.

message area 1 <Length>
message area 2 VIP point number, Ch, Ht co-ords of VIP
message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4 enter value- before value entered edit finished- after value entered

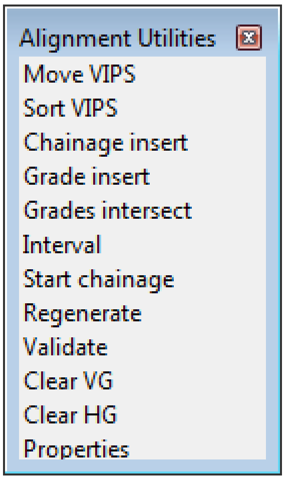
Like most of the other **alignment edit** options, after the parabolic curve length has been modified the option is still current and another vertical intersection point can be chosen to have its parabola modified.

The **length** option is terminated by selecting a different **alignment edit** option.

See the next section 14.20.2.10 Alignment Utilities or return to 14.20.2 Alignment Edit.

14.20.2.10 Alignment Utilities

The **Utilities** walk-right menu contains a number of useful miscellaneous option for the alignment string. The menu is

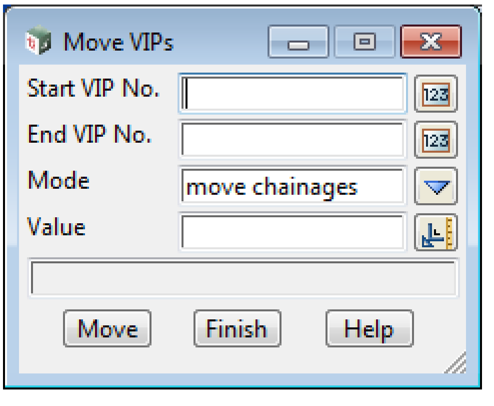


Each of the options will now be discussed.

14.20.2.10.1 Move VIPs

The **Move VIPs** option is for moving a range of vertical intersection points (VIPs) by a chainage or an elevation increment.

After selecting the option, the **Move VIPs** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP No.	input		

the VIP number of the 1st VIP in the range to be moved. If blank, then 1.

End VIP No.	input		

the VIP number of the last VIP in the range to be moved.If blank, then the last VIP.

Mode	input	move chainage	move chainage move hts

if ***move chainage****, the chainage of all the points in the specified range are incremented by the given value. If* ***move hts****, the heights (elevations) of all the points in the specified range are incremented by the given value.*

Value	input	0	

value to increment either the chainage or the height for all the VIPs in the specified range.

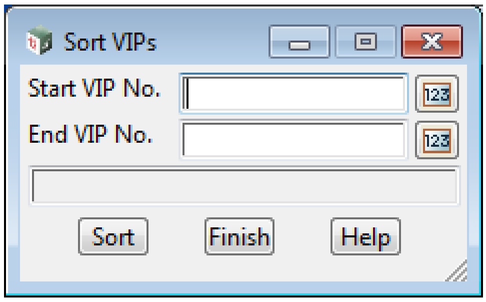
Move button

move the VIPs in the range given by the start and end ip field by the chainage or height given in the value field.

14.20.2.10.2 Sort VIPs

The **sort VIPs** option is for sorting VIP's into increasing chainage order.

After selecting the option, the **sort VIPs** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Start VIP No. input

if not blank, the VIP number of the 1st VIP in the range to be sorted. If blank, then 1.

End VIP No. input

the VIP number of the last VIP in the range to be sorted. If blank, then the last VIP.

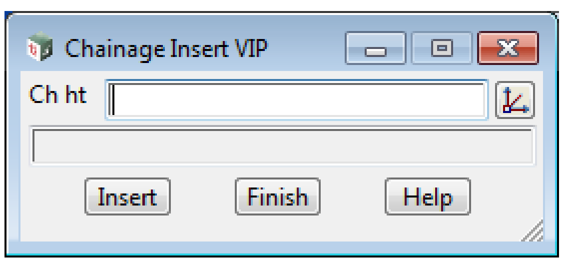
Sort button

sort the VIPs in the range given by the start and end ip field into chainage order.

14.20.2.10.3 Chainage Insert

The **chainage insert** option inserts a vertical intersection point (VIP) at a given chainage and height.

After selecting the option, the **chainage insert VIP** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Ch ht input

the chainage and height of the VIP to insert - separate values by spaces.

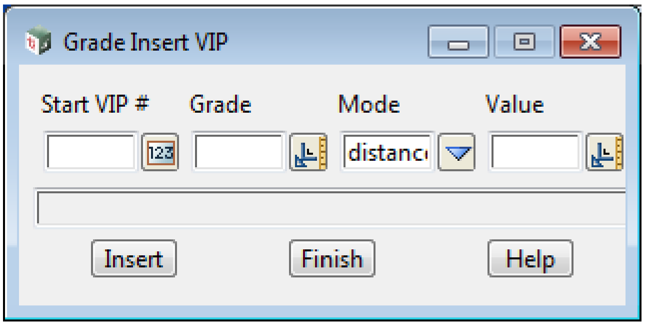
Insert button

insert the VIP point given in the Ch ht *field into the alignment string.*

14.20.2.10.4 Grade Insert

The **grade insert** option inserts a VIP at a given grade from an existing VIP. The new VIP position is given by either a distance from the picked VIP or at given chainage.

After selecting the option, the **grade insert VIP** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP #	input		

the VIP number whose position is used to start the grade insert from.

Grade	input		

percent grade to be used.

Note ***positive** is **up** when going in the direction of **increasing chainage** and **negative** is **up** when going in the direction of **decreasing chainage**.*

Mode	choice	distance	distance, chainage

*if **distance**, the new VIP is inserted at the given grade and distance (given in the* value *field) from the start VIP.*
*if **chainage**, the new VIP is inserted at the chainage (given in the* value *field but having the given grade from the start VIP.*

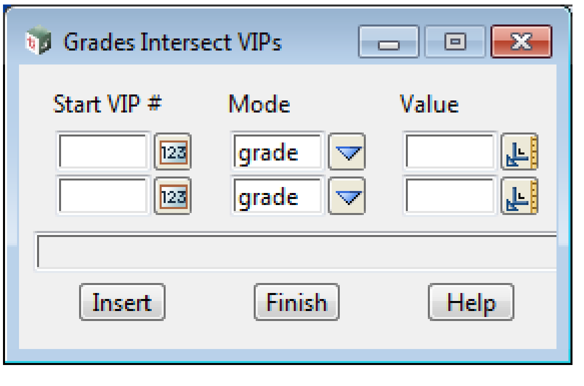
Insert	button		

insert the new VIP into the alignment string.

14.20.2.10.5 Grades Intersect

The **grades intersect** option inserts a VIP which is given by intersecting lines of given grades from two existing VIPs. The grades are either typed in or calculated by giving another VIP that the line goes through.

After selecting the option, the **Grades Intersect VIPs** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP #	input		

the VIP number which is used in defining a line.

Mode	choice	grade	grade, VIP #

if ***grade****, the field* value *is a percent grade and a line is defined as going through the start VIP and with the given grade.*
if ***VIP #****, the field* value *is the number of a VIP and a line is defined as going through the start VIP and this VIP.*
Note for grades ***positive*** *is* ***up*** *when going in the direction of* ***increasing chainage*** *and* ***negative*** *is* ***up*** *when going in the direction of* ***decreasing chainage****.*

Value	input		

if mode *is grade, value is a percent grade.*
if mode *is VIP #, value is the number of a VIP.*

Insert	button		

calculate the point which is the intersection of the two lines and insert it as a new VIP into the alignment string.

14.20.2.10.6 Interval

Each alignment string has a chainage interval that is used to define regular points along the string. The chainage interval is used for approximation the alignment in operations such as triangulating and applying templates to an alignment string.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current chainage interval placed in it.

The new chainage interval is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **interval** option terminates after use.

14.20.2.10.7 Start Chainage

Each alignment string has a start chainage which can be positive, negative or zero.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current start chainage in it.

The new start chainage is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

When a new start chainage is entered, the vertical intersection points are automatically moved so that they retain their same relative chainage with respect to the start point on the alignment.

The **start chainage** option terminates after use.

14.20.2.10.8 Regenerate

If the horizontal geometry of an alignment string is modified, then the profile through any triangulations would also change. Hence, if the alignment string being edited was profiled on any section views, then the profile would be need to be recalculated after any horizontal geometry changes.

On selecting the **regenerate** option, **any** section view that has the alignment string being edited as its primary string (that is, as the string defining the chainage for the section view) is automatically re-profiled.

Hence the **regenerate** option is equivalent to running the **regenerate** option for each section view with the edited alignment string as its primary string.

14.20.2.10.9 Validate

When constructing horizontal and vertical geometry, it is possible to end of with invalid constructs such as overlapping tangent points.

On selecting the **validate** option, the alignment string will be checked for

horizontal geometry checks

s at least two horizontal intersection points

s no co-incident horizontal intersection points

s no overlapping horizontal tangent points

vertical geometry checks

s at least two vertical intersection points

s no co-incident vertical intersection points

s no overlapping vertical tangent point

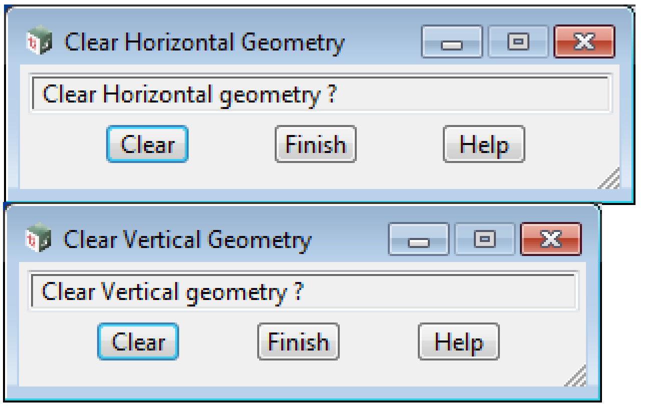
s vertical intersection points chainages are in ascending order

If any errors occur, an **errors** menu is placed on the screen.

The **errors** menu remains on the screen and only disappears when either the **[X]** is picked or one of the error messages is picked with LB.

Note - the **validate** option is automatically run when the edit is finished.

14.20.2.10.10 Clear VG and Clear HG



The **Clear VG** and **Clear HG** options are used to delete all the horizontal and/or vertical intersection points in the string.

The **Clear VG** option removes all the vertical geometry from the string.

The horizontal geometry still exists plus all the other string properties (model, name, colour and type).

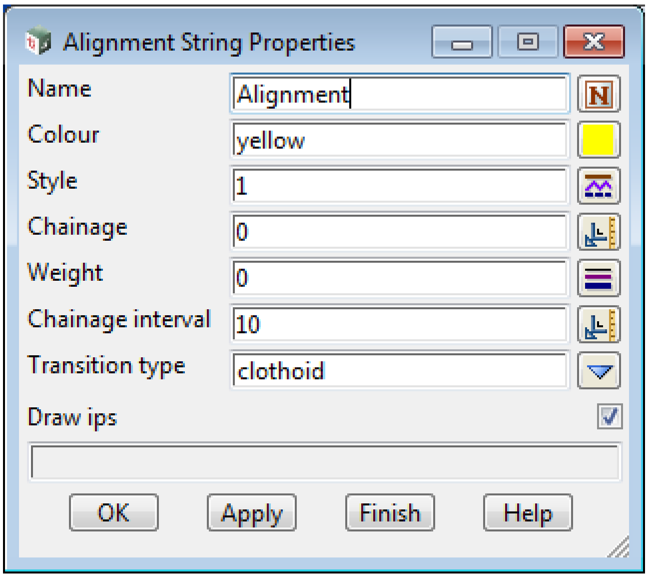
The **Clear HG** option removes all the horizontal and vertical geometry from the string.

The string still exists and keeps its other properties such as model, name, colour and type.

After a **Clear**, the horizontal or vertical geometry can be re- entered using the edit options.

14.20.2.10.11 Properties

Selecting Properties brings up the **Alignment String Properties** panel which is used to modify the string's header information.



The fields in this panel are similar to those in the **Create Alignment String** panel and the alignment string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Draw ips	tick	tick	

if ***ticked****, the horizontal and vertical intersection points are draw on plan and section views. If* ***not ticked****, the ips are not draw on the plan and section views.*

OK/Apply	button		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

See the next section 14.20.2.11 Finish or return to 14.20.2 Alignment Edit.

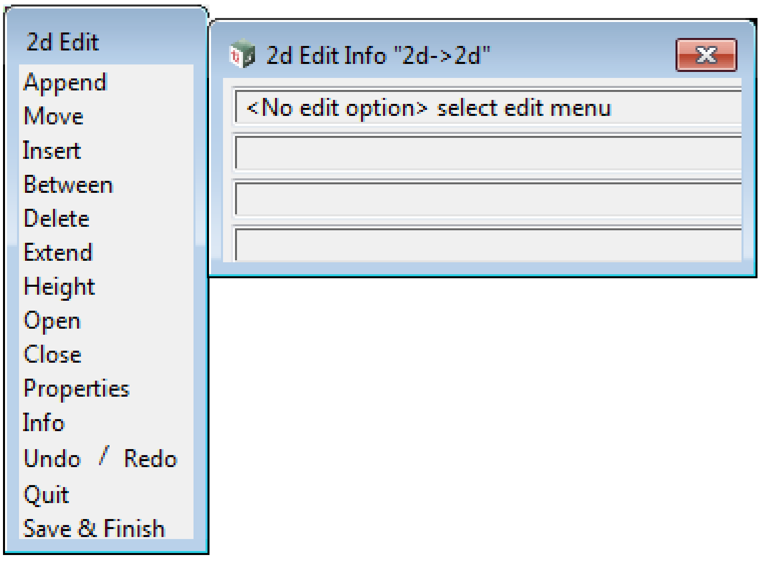
14.20.2.11 Finish

The **Finish** option is used to terminate the alignment string edits. After selecting the **Finish** option, the string is checked for overlapping horizontal or vertical tangent points and any errors reported.

14.20.3 2d Edit - Old

Position of option on menu: **Strings =>Editor**

On picking a 2d string, the **2d edit** menu and the **2d edit info** panel are placed on the screen.



See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

Each option in the **2d edit** menu will now be described.

14.20.3.1 Append

The **append** option is used to create the 1st point in a new string, to append a new intersect point to the end of the string or to prepend a new intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

14.20.3.1.1 Existing 2d Strings

Appending a point is a two step process.

Step (a) - selecting the end to append the point to.

After the **append** option has been selected, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for an IP
message area 4	select final position- after pick

Screen message area

<Select string end to append to> [picks][][menu]
<Select string end to append to> [picks][accepts][menu]

Step (b) - selecting the position for the new appended point.

A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for closest IP
message area 4	select final position- before pick

Screen message area

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Once a point has been appended to the string, the appended point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position for the next appended point.

Hence a series of string points is easily entered by first selecting the string end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point and selecting them in turn.

Typed input can be used in either step.

The **append** option is terminated by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **2d edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the append option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the append option still current.

14.20.3.1.2 New 2d String

For creating a new string, the cursor is used to select the 1st point of the string. The option then continues as if appending to an existing 2d string where the end point has already been selected.

See the next section 14.20.3.2 Move or return to 14.20.3 2d Edit - Old.

14.20.3.2 Move

The **move** option is for moving individual points (intersection points - IP's) of the string.

The move cycle consists of two steps:

(a) selecting the point to be moved

(b) selecting the new position for the point.

Step (a)

First the point to be moved is selected. The selected point will then move around the view and the string redrawn to show the change as the cursor is moved.

message area 1	<Move Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the closest IP
message area 4	select final position- after pick

Screen message area

<Select point to move> [picks][][menu]
<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the IP, and the string redrawn.

message area 1	<Move Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the moved IP
message area 4	select final position- before pick, edit finished- after pick

Screen message area

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the **move** option.

The **move** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **2d edit** option.

See the next section 14.20.3.3 Insert or return to 14.20.3 2d Edit - Old.

14.20.3.3 Insert

The **Insert** option is designed to place a new intersection point in a string between two adjacent intersection points (note that the inserted point does not have to be on the line joining the two intersection points).

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the line connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

message area 1	<Insert Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for closest IP
message area 4	select final position- after pick

Screen message area

<Select line to insert on> [picks][][menu]
<Select line to insert on> [picks][accepts][menu]

Step (b) - selecting the position for the new intersection point

The position of the new intersection point is selecting

message area 1	<Insert Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick

Screen message area

<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the **insert** option.

The **insert** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit** menu.

Typed input can be used in either step.

See the next section 14.20.3.4 Between or return to 14.20.3 2d Edit - Old.

14.20.3.4 Between

The **between** option is similar to the **insert** option except that the inserted point does have to be on the line joining the two intersection points. To accomplish this, the cursor position is projected onto the IP-IP line to give the new IP point position.

The **between** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit.**

See the next section 14.20.3.5 Delete or return to 14.20.3 2d Edit - Old.

14.20.3.5 Delete

The **delete** option is used to delete selected intersection points from the string.

The point to be deleted is picked (LB) and accepted (MB). When the point is accepted, it is deleted. The string, minus the deleted point, is then redrawn.

Once a point has been deleted, another point in the string can then be selected and deleted. Hence any number of points from the string can be deleted one after another.

message area 1 <Delete Points>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for closest IP
message area 5
Screen message area
<Select point to delete> [picks][][menu]
<Select point to delete> [picks][accepts][menu]

The **delete** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit** menu.

Typed input can be used to select a point for deletion.

See the next section 14.20.3.6 Extend or return to 14.20.3 2d Edit - Old.

14.20.3.6 Extend

The **extend** option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, the bearing of the IP-IP line is kept constant and the intersection point is moved along that line either towards or away from its neighbouring intersection point on the IP-IP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by picking (LB) and accepting (MB) a co- ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and intersection point (IP) are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line.

As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

message area 1 <Extend Point>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for closest IP
message area 4 select final position- after pick
Screen message area
<Select line to extend> [picks][][menu]
<Select line to extend> [picks][accepts][menu]

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the selected cursor position onto the IP-IP line.

message area 1 <Extend Points>
message area 2 IP point number, x, y, z co-ords of IP
message area 3 bearing-in, bearing out, bearing difference for closest IP
message area 4 select final position - before pick, edit finished - after pick
Screen message area
<Select final position of point> [picks][][menu]
<Select final position of point> [picks][accepts][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **extend** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit** menu.

Typed input can be used in either step.

Note - Extend can be used on the end points of the string.

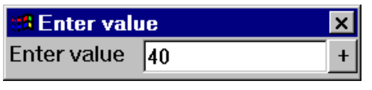
See the next section 14.20.3.7 Height or return to 14.20.3 2d Edit - Old.

14.20.3.7 Height

The **height** option is used to modify the height (z value) of the 2d string.

After the height option is chosen, an enter value typed-input box is displayed on the screen with the string's current height (z value).

The enter value typed-input box looks like:



The height is entered into the typed-input box, terminated by <enter>. The entered value is taken as the height of the 2dstring and the string redrawn with the new height. The typed-input box then disappears.

The height option automatically terminates and a new option is selected from the **2d edit**.

Note - all the points in a 2d string have the same height.

See the next section 14.20.3.8 Open or return to 14.20.3 2d Edit - Old.

14.20.3.8 Open

If the string is closed (that is, the end points have the same x and y values), selecting the **open** option removes the last point of the string.

If the string is not closed, the **open** option does nothing.

See the next section 14.20.3.9 Close or return to 14.20.3 2d Edit - Old.

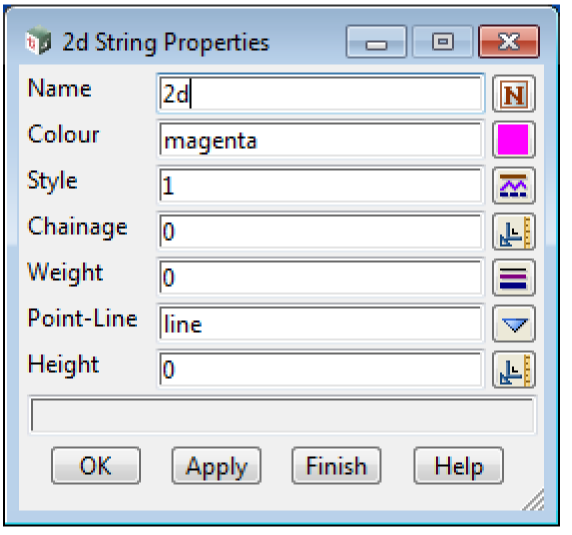
14.20.3.9 Close

Selecting the **close** option adds a point to the end of the string with the same co-ordinate values as the 1st point in the string.

See the next section 14.20.3.10 Properties or return to 14.20.3 2d Edit - Old.

14.20.3.10 Properties

Selecting Properties brings up the **2d String Properties** panel which is used to modify the string's header information.



The fields in this panel are similar to those in the **Create 2d String** panel and the 2d string editor options. The only new field is

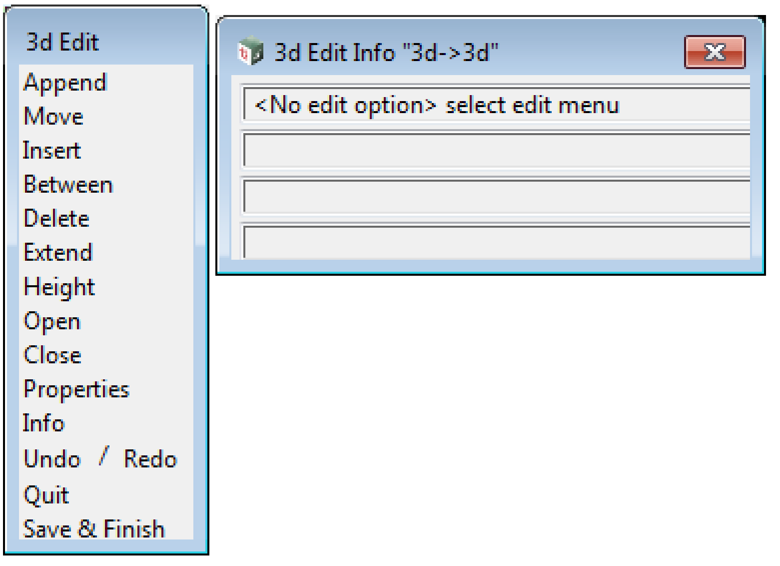
Field Description	Type	Defaults	Pop-Up
Set	button		

for the 2d string being edited, set all the items in the **2d String Properties** *panel to the values given in the panel.*

14.20.4 3d Edit - Old

Position of option on menu: **Strings =>Editor**

On picking a 3d string, the **3d edit** menu and 3d edit info panel are placed on the screen.



The difference between a 2d and a 3d string is that all points in a 2d string have the same z-value, whereas for a 3d string, each point can have a different z-value.

Hence most of the options in the **3d edit** menu are similar to the **2d edit** options of the same name, and only the differences for each option will be discussed. The *2d Edit* options are given in the section 14.4.2 Edit 2d

See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.4.1 Append

The **Append** operation for a 3d string is similar to that for a 2d string except that a height (z-value) is required for each new point.

Since in most cases, it would be tiresome to ask for a height every time a point is added, the entry of a new height is controlled by the **height** toggle in the snaps menu. If **height** is toggled to on, then every time a point is placed or moved an enter height typed-input box is displayed on the screen.

The enter height typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the 3d string point and the string redrawn with the new height at the point. The typed-input box then disappears.

When the enter height box is placed on the screen, it will already have a value in it depending on the circumstances preceding the operation.

For example, if a point or line was snapped to, the height at that point or line will be displayed in the box.

See the next section 14.20.3.7 Height or return to 14.20.4 3d Edit - Old.

14.20.4.2 Height

The **height** option is used to modify the height (z value) of any point in the string.

After the height option is chosen, the user must select which point is going to have its height modified.

After the point has been selected, an New height typed-input box is displayed on the screen with the point's current height (z value).

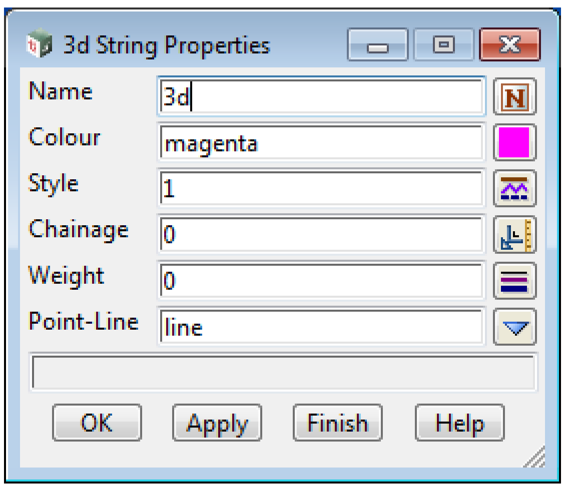
The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the point in the 3d string and the string redrawn with the new height at that point. The typed-input box then disappears.

The **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **3d edit** menu.

See the next section 14.20.3.10 Properties or return to 14.20.4 3d Edit - Old.

14.20.4.3 Properties

Selecting Properties brings up the **3d String Properties** panel which is used to modify the string's header information.



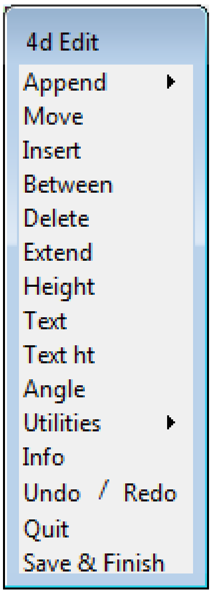
The fields in this panel are similar to those in the **create 3d string** panel and the 3dd string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

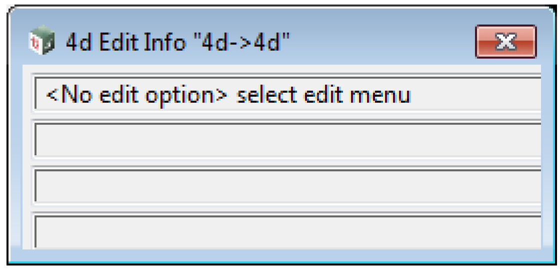
for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the 3d string with the values in the panel fields and leaves the panel on the screen.*

14.20.5 4d Edit - Old

Position of option on menu: **Strings =>Editor**
On picking a 4d string, the **4d edit** menu and **4d edit info** panel are placed on the screen.



append/prepend an IP and text
move an IP
insert an IP
insert IP on line between IP's
delete an IP
extend an IP
modify the strings z-value
modify the text labels
set height of text labels
set angle of text labels
open/close and Properties
toggle info panel
undo/redo
quit the edit session
finish the edit session



Only the options append, text, size and angle will be described in detail since all the other options are similar to the equivalent 3d string option (see the section 14.4.3 Edit 3d).

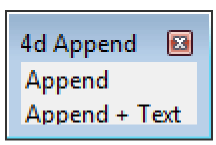
See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.5.1 Append

The **append** operation for a 4d string is similar to the 3d string case except that a height and an optional text label is required for each new point.

Since in many cases a text label is not required at every point of a 4d string, there is an append option that asks for text at every point and another that does not ask.

The **4d append** walk-right is



The height question for each point is toggled on or off in the snaps menu just as it was for a 3d string.

The **append** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **4d edit** menu.

See the next section 14.20.5.2 Text or return to 14.20.5 4d Edit - Old.

14.20.5.2 Text

The **text** option is used to modify the text label of any point in the 4d string.

After the **text** option is chosen, the user must select which point is going to have its text label modified. Once the point has been selected, an enter text typed-input box is displayed on the screen with the point's current text label placed in it.

The new text label is entered into the typed-input box, terminated with <enter>. The entered value is taken as the text label of the point in the 4d string and the string redrawn with the new text at that point. The typed-input box then disappears.

The **text** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **4d edit** menu.

See the next section 14.20.5.3 Text ht or return to 14.20.5 4d Edit - Old.

14.20.5.3 Text ht

All the text labels in the 4d string have the same height (given in pixel or world units). The **text ht** option is used to modify this text label height.

After selecting the option, an enter value typed-input box is displayed on the screen with the string's current text label height placed in it.

The new text label height is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text label height for all the points in the 4d string and the string redrawn using the new height. The typed-input box then disappears.

The **text ht** option automatically terminates after use.

See the next section 14.20.5.4 Angle or return to 14.20.5 4d Edit - Old.

14.20.5.4 Angle

All the text labels in the 4d string are drawn rotated about their defining string point with the same rotation angle. The angle, in degrees, is measured in a counter-clockwise direction about the horizontal axis.

The **angle** option is used to modify the text rotation angle.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current text rotation angle placed in it.

The new text rotation angle is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text rotation angle for all the points in the 4d string and the string redrawn using the new angle. The typed-input box then disappears.

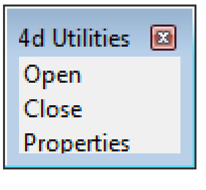
The **angle** option automatically terminates after use.

See the next section 14.20.5.5 Utilities or return to 14.20.5 4d Edit - Old.

14.20.5.5 Utilities

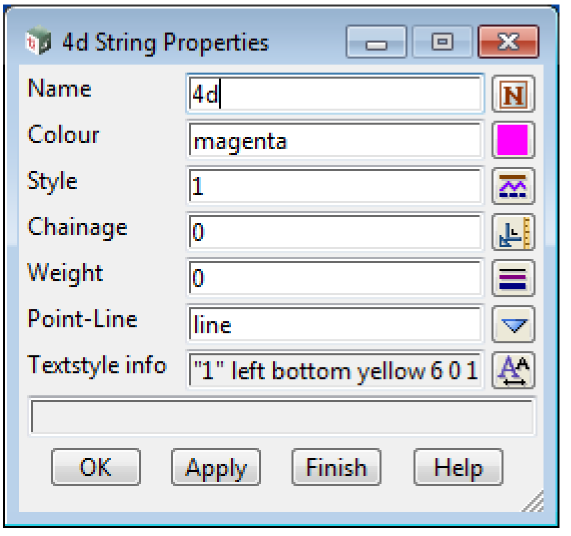
Position of option on menu: **Strings =>Editor**

The **4d utilities** walk-right is



14.20.5.5.1 Properties

Selecting Properties brings up the **4d String Properties** panel which is used to modify the string’s header information.



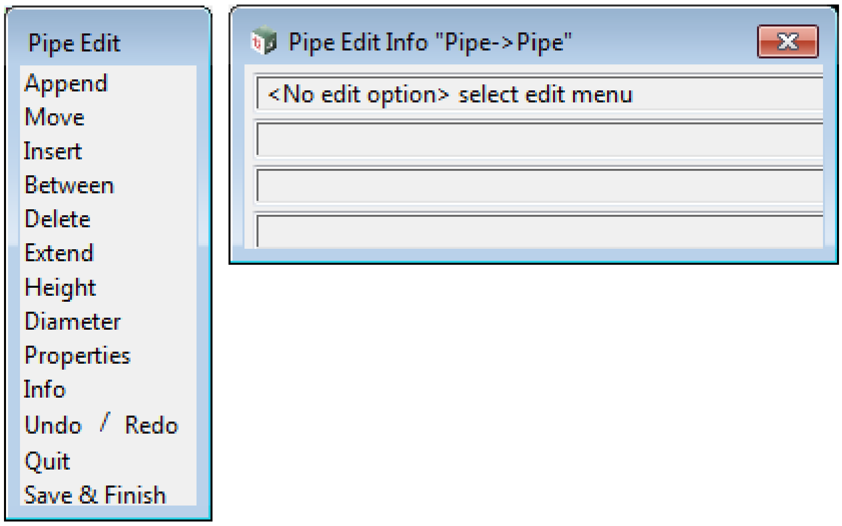
The fields in this panel are similar to those in the **create 4d string** panel and the 4d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

14.20.6 Pipe Edit - Old

On picking a pipe string, the pipe edit menu and panel are placed on the screen.



The only difference between a 3d and a pipe string is that the pipe string has a diameter.

Hence most of the options in the **pipe edit** menu are similar to the **3d edit** options of the same name, and only the **diameter** and **Properties** options need to be discussed. See the section 14.4.3 Edit 3dfor information on the 3d string editor.

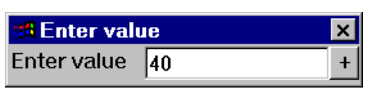
See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.6.1 Diameter

The **diameter** option is used to modify the diameter of the pipe string.

After the **diameter** option is chosen, an enter value typed-input box is displayed on the screen with the string's current diameter.

The enter value typed-input box looks like:



The diameter is entered into the typed-input box, terminated with <enter>. The entered value is taken as the diameter of the pipe string. The typed-input box then disappears.

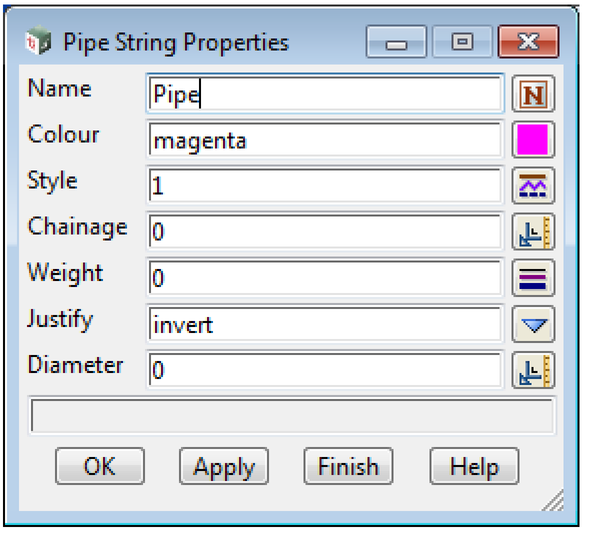
The **diameter** option automatically terminates and a new option is selected from the **pipe edit** menu.

Note - the pipe string has only one diameter for the entire string.

See the next section 14.20.6.2 Properties or return to 14.20.6 Pipe Edit - Old.

14.20.6.2 Properties

Selecting **Properties** brings up the **Pipe String Properties** panel which is used to modify the string's header information.



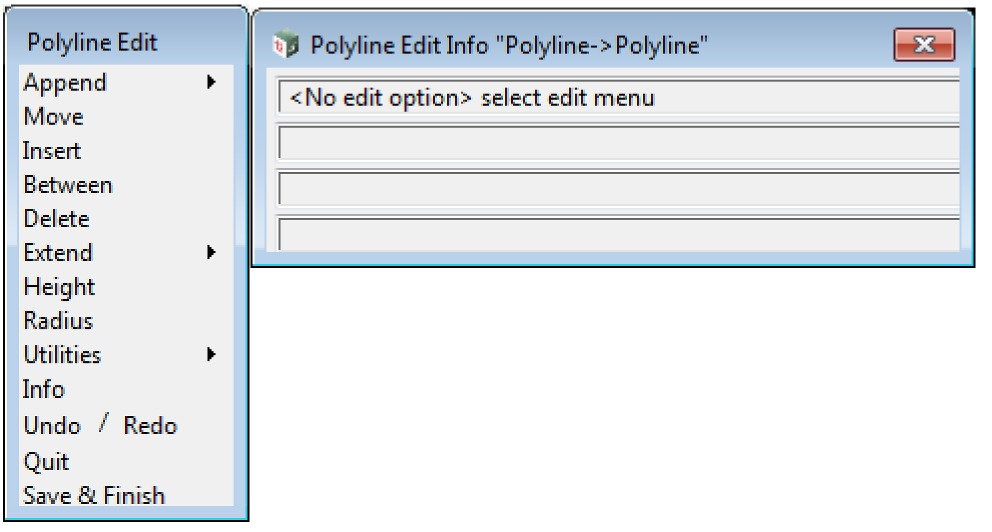
The fields in this panel are similar to those in the **create pipe string** panel and the 3d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

14.20.7 Polyline Edit - Old

On picking a polyline string, the **polyline edit** menu and **polyline edit info** panel are placed on the screen.



The major difference between a polyline and a 3d string is that a polyline string can have an arc instead of a line joining adjacent string points. Hence most of the options in the **polyline edit** menu are similar to the **3d edit** options of the same name, and only the differences for each option will be discussed. See the section 14.4.3 Edit 3d for information on the 3d string editor.

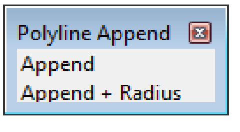
See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.7.1 Append

The **append** operation for a polyline string is similar to the 3d string case except that an arc radius can be given for each new line segment.

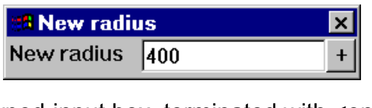
Since in many cases an arc radius is not required at every segment of a polyline string, there is an append option that asks for the radius at every point and another that does not ask.

The **append** walk-right is



If the **append + radius** option selected, then before each point is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like



The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next polyline string point and the arc will be drawn correctly as the cursor is moved to the next point.

A radius value of 0 is taken to mean no arc.

The height question for each point is toggled on/off in the snaps menu just as it was for a 3d string.

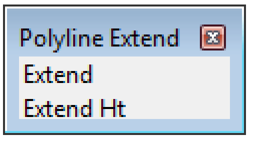
The **append** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **polyline edit** menu.

See the next section 14.20.7.2 Extend or return to 14.20.7 Polyline Edit - Old.

14.20.7.2 Extend

There are two **extend** options for a polyline string - **extend=>extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **extend=>extend ht** where the z-value of the point being extended is linearly interpolated by the extension distance.

The **Extend** walk-right is



14.20.7.2.1 Extend

extend=>extend that is identical to the 3d string case where the z-value of the point being extended is kept constant**.**

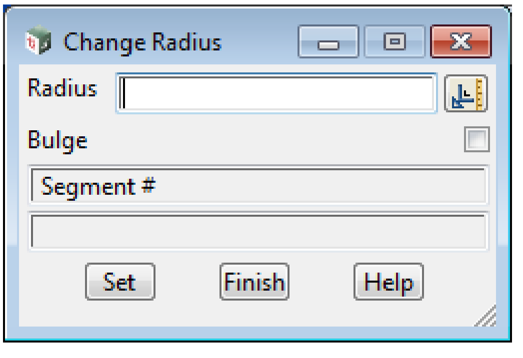
14.20.7.2.2 Extend by ht

extend=>extend ht not only moves the point but also linearly interpolates the z-value of the point being extended.

See the next section 14.20.7.3 Radius or return to 14.20.7 Polyline Edit - Old.

14.20.7.3 Radius

Selecting **radius** brings up the **change radius** panel which is used to modify the radius of any arc/ line joining adjacent polyline points.



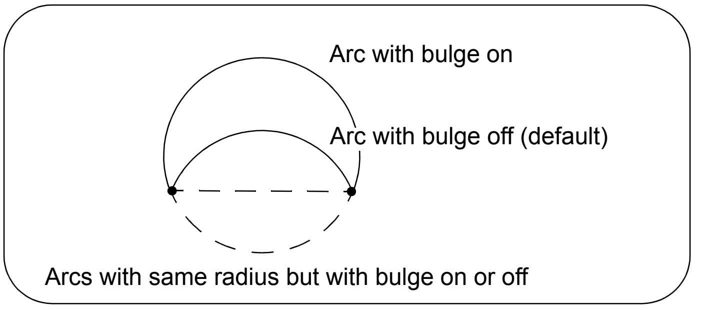
After selecting the **radius** option, the user selects the arc/straight to be modified and the current arc radius and bulge setting will be displayed in the **change radius** panel.

New values can then be entered and the arc modified by selecting the **set** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

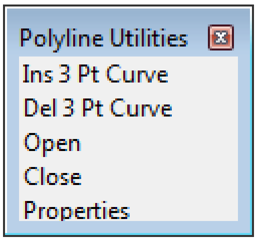
If bulge is turned on, the larger arc is used. The default is bulge turned off.



See the next section 14.20.7.4 Utilities or return to 14.20.7 Polyline Edit - Old.

14.20.7.4 Utilities

The **Utilities** walk-right menu contains a number of useful miscellaneous option for the polyline string. The menu is



Each of the new options will now be discussed.

14.20.7.4.1 Ins 3 Pt Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent polyline points.

After selecting the option, the middle IP of the three adjacent polyline points is selected.

When the IP is accepted, the radius required to fit a curve through the IP and the two adjacent IP's is calculated, and this radius is then applied to the segments joining the adjacent IP's.

14.20.7.4.2 Del 3 Pt Curve

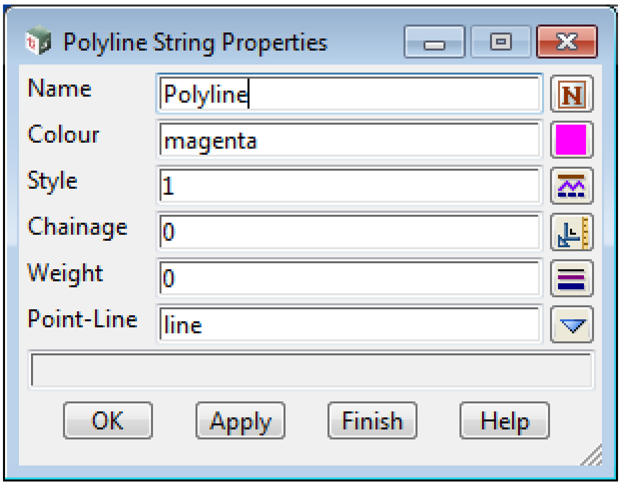
The **del 3 pt curve** option is used to delete the curves on either side of a polyline point.

After selecting the option, an IP is selected and when the IP is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the IP are effectively removed.

14.20.7.4.3 Properties

Selecting **Properties** brings up the **Polyline String Properties** panel which is used to modify the string's header information.



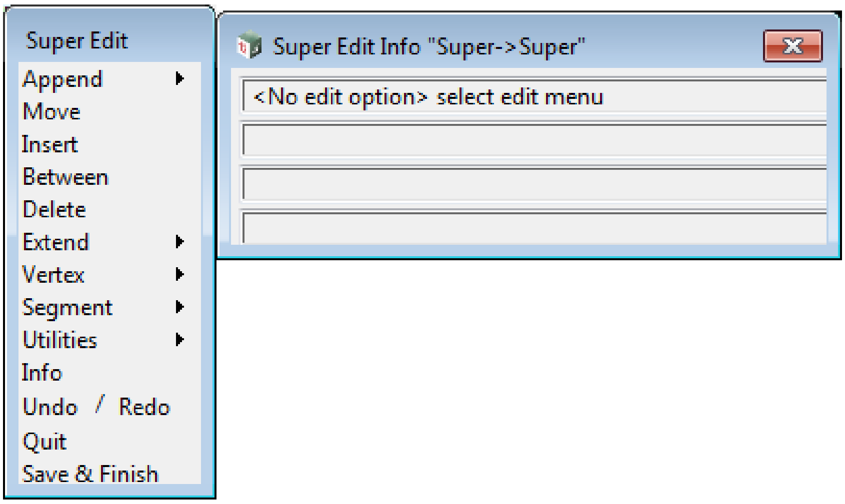
The fields in this panel are similar to those in the **create polyline string** panel and the polyline string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

14.20.8 Super Edit - Old

On picking a super string, the **Super Edit** menu and **Super Edit Info** panel are placed on the screen.



The super string is similar to a polyline string in that it can have an arc instead of a line joining adjacent string points. Hence most of the options in the **super edit** menu are similar to the **polyline edit** options of the same name, and only the differences for each option will be discussed.

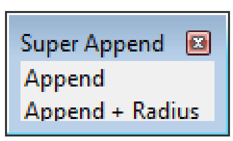
See the earlier section 14.4.1 Super String Edit - Common Information for general information about editing strings.

14.20.8.1 Append

The **Append** operation for a super is the same as the polyline case and an arc radius can be given for each new line segment.

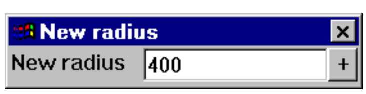
Since in many cases an arc radius is not required at every segment of a super string, there is an append option that asks for the radius at every point and another that does not ask.

The **Append** walk-right is



If the **Append + Radius** option selected, then before each vertex is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like



The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next super string vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A radius value of 0 is taken to mean *no arc*.

The height question for each vertex is toggled on/off in the snaps menu just as it was for a polyline string.

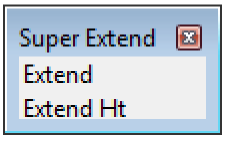
The **Append** option is terminated on selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Super Edit** menu

See the next section 14.20.8.2 Extend or return to 14.20.8 Super Edit - Old.

14.20.8.2 Extend

There are two **extend** options for a polyline string - **Extend=>Extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **Extend=>Extend Ht** where the z-value of the point being extended is linearly interpolated by the extension distance.

The **Extend** walk-right is



14.20.8.2.1 Extend

Extend=>Extend that is identical to the 3d string case where the z-value of the point being extended is kept constant.

14.20.8.2.2 Extend by Ht

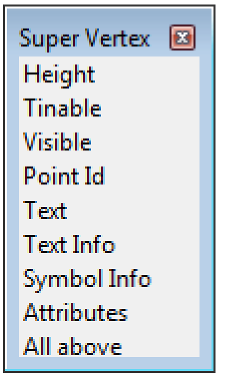
Extend=>Extend Ht not only moves the point but also linearly interpolates the z-value of the point being extended.

See the next section 14.20.8.3 Vertex or return to 14.20.8 Super Edit - Old.

14.20.8.3 Vertex

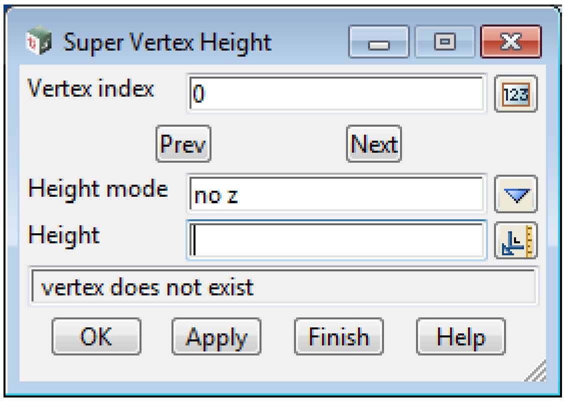
The **Vertex** menu contains options to modify information at any vertex of the super string.

The **Vertex** walk-right is



14.20.8.3.1 Height

Selecting **Vertex=>Height** brings up the **Super Vertex Height** panel which is used to set the height value for vertices.



As soon as **Height** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *height mode* and *height* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description Type Defaults Pop-Up

Vertex no. input selected vertex

if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Height mode input no z, entire string, each vertex

if ***no z****, there is no z value for the vertex.*
if ***entire string****, then the string has the same z value for each vertex.*
if ***each vertex****, then each vertex has a separate z value.*

Height input height of vertex/string

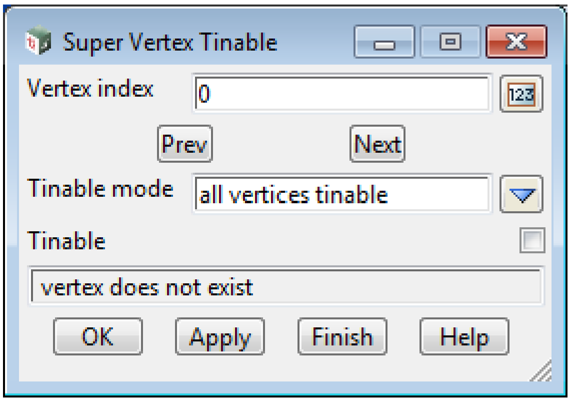
the height used for the vertex or for the entire string.

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.2 Tinable

Selecting **Vertex=>Tinable** brings up the **Super Vertex Tinable** panel which is used to set the tinable flag for vertices.



As soon as **Tinable** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *tinable flag* are displayed in the panel. The tinable flag can be changed and either **OK** or **Apply** selected to change the tinable flag of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Tinable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Tinable tick

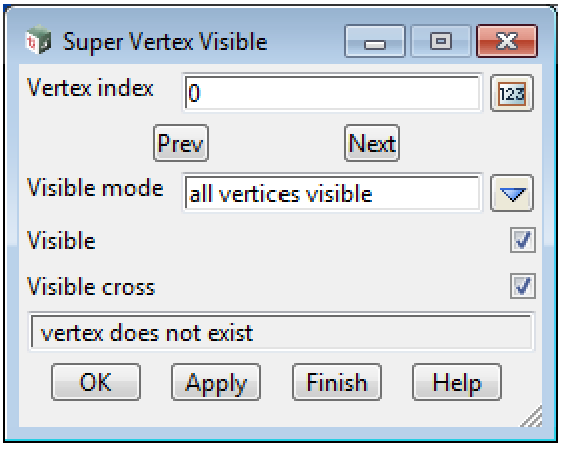
*if **ticked**, the vertex is included in tins.*
*if **not ticked**, then the vertex is ignored when triangulating.*

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.3 Visible

Selecting **Vertex=>Visible** brings up the **Super Vertex Visible** panel which is used to set the visibility flag for vertices.



As soon as **Visible** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *visibility flag* are displayed in the panel. The visibility flag can be changed and either **OK** or **Apply** selected to change the visibility flag of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Visible tick

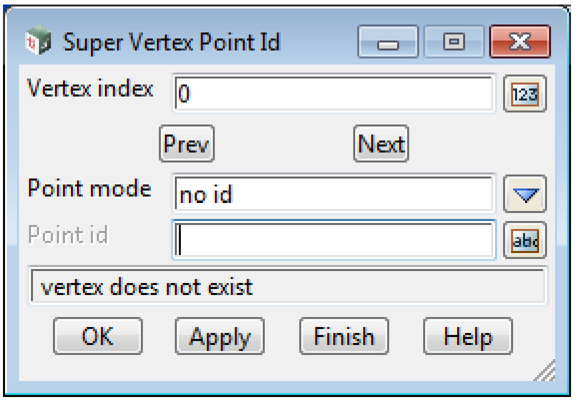
if ***ticked****, the vertex is visible.*
if ***not ticked****, then the vertex is invisible.*

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.4 Point no

Selecting **Vertex=>Point no** brings up the **Super Vertex Point Number** panel which is used to set the point numbers for vertices.



As soon as **Point no** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *point number* are displayed in the panel. The point number can be changed and either **OK** or **Apply** selected to change the point number of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Point no. input point no of vertex

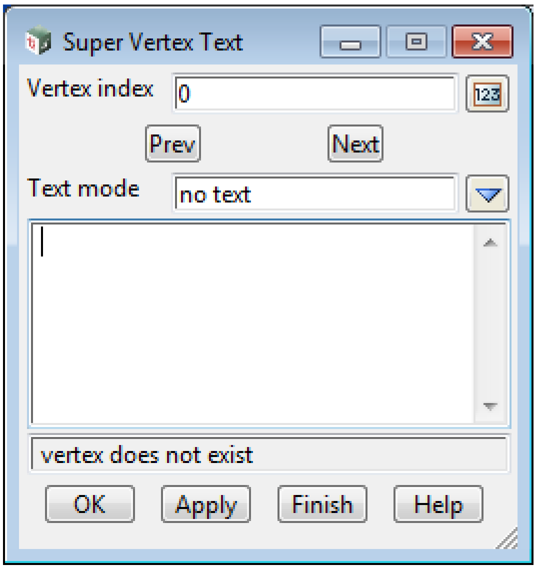
the point number used for the vertex.

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.5 Text

Selecting **Vertex=>Text** brings up the **Super Vertex Text** panel which is used to set the text for vertices.



As soon as **Text** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *text mode* and *text* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Text mode input no text, entire string, each vertex

*if **no text**, there is no text for the vertex.*
*if **entire string**, then the string has the same text for each vertex.*
*if **each vertex**, then each vertex has a separate text value.*

Text input text of vertex/string

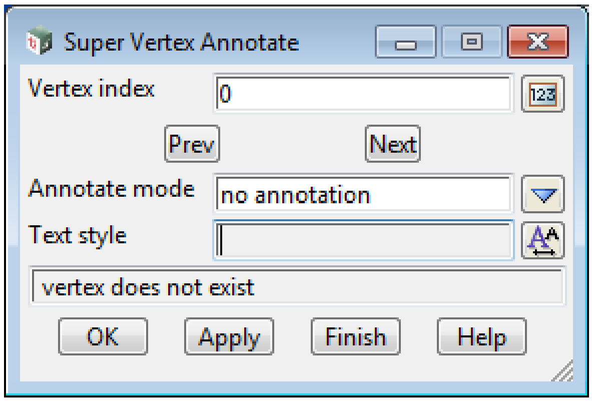
the text used for the vertex or for the entire string.

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.6 Text Info

Selecting **Vertex=>Text info** brings up the **Super Vertex Annotate** panel which is used to set the annotation styles for the text at vertices.



As soon as **Text info** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex nunber*, *annotate mode* and *annotation information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Annotate mode input no annotation, entire string, each vertex

*if **no annotation**, then the text at the vertex is not displayed.*
*if **entire string**, then the same annotation settings are used for each vertex.*
*if **each vertex**, then each vertex has separate annotations settings.*

Text style input 1 available text styles

text style for the text at the vertex.

Text units input pixels pixels, world

units for the height of the text.

Height (u) input

height of the text (in text units).

X factor input 1

x factor of the text.

Offset (u) input 0

distance (in text units) to offset the text from its (x,y) placement position.

Raise (u) input 0

distance (in text units) to raise the text above the line for its (x,y) placement position.

Justify input bottom-left bot-left/cent/right, mid-left/cent/right top-left/cent/right

text justification (about the offset position).

Angle input

angle of the text.

Slant input 0

slant, in degrees, of the text.

Colour input available colours

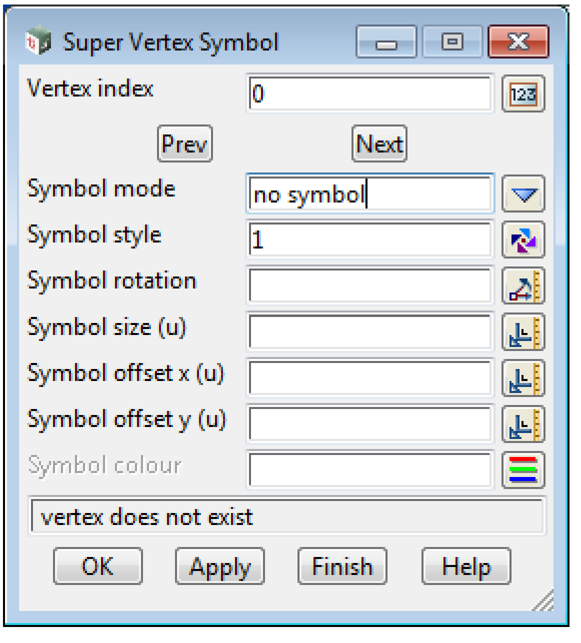
colour of the text.

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.7 Symbol Info

Selecting **Vertex=>Symbol info** brings up the **Super Vertex Symbol** panel which is used to set symbols and their display parameters at vertices.



As soon as **Symbol info** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex nunber*, *symbol mode* and *symbol information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Symbol** panel have the following functions.

Field Description Type Defaults Pop-Up

Vertex no. input selected vertex

if a vertex is selected, then its vertex number is displayed in this field. A number can also be *typed in and any information in the panel will then be applied to that vertex if* **OK** *or* **Apply** *is selected.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Symbol mode input no symbol, entire string, each vertex

if ***no symbol****, then there is no symbol at the vertex.*
if ***entire string****, then the same symbol and settings are used for each vertex.*
if ***each vertex****, then each vertex has separate symbols and settings.*

Symbol style input 1 available line styles

line style for the symbol at the vertex.

Symbol rotation input

rotation angle of the symbol.

Symbol size (u) input

size of the symbol (in xxx units).

Symbol offset (u) input 0

distance (in xxx units) to offset the symbol from its (x,y) placement position.

Symbol raise (u) input 0

distance (in xxx units) to raise the symbol above the line for its (x,y) placement position.

Symbol colour input available colours

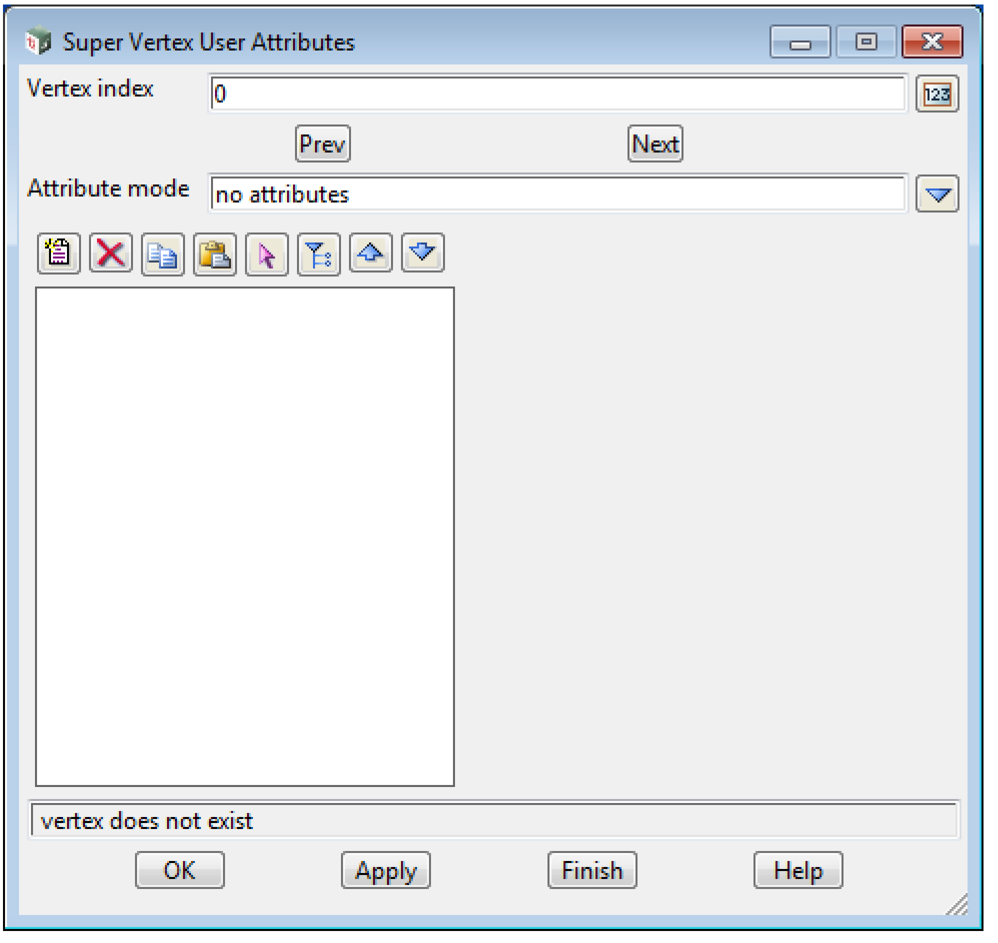
colour of the symbol if none is defined in the symbol definition

OK/Apply button

for the vertex being edited, **OK** *sets the vertex/string with the values in the panel fields and removes the panel.* **Apply** *sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.8 Attributes

Selecting **Vertex=>Attributes** brings up the **Super Vertex User Attributes** panel which is used to display and edit user defined attributes at vertices of the super string.



The **Prev** and **Next** buttons are used to cycle through and display the attributes for each vertex in the super string in the *Name/Type/Data* grid.

The data in the *Name/Type/Data* grid can be deleted, modified or added to and then updated for the vertex using the **OK** or **Apply** button.

The fields and buttons used in the **Super Vertex User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

when the option starts, the user attributes for the first vertex is displayed. The **Next** *and* **Prev** *buttons will move onto other vertices. Also a number can be typed into the field and any information in the panel will then be applied to that vertex if* **OK** *or* **Apply** *is selected. Typing <Enter> after entering a number will go to that vertex number and display the attributes.*

Prev button

move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button

move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Attribute mode choice box no attributes, each vertex

if ***no attributes****, then no vertices have user attributes.*
if ***each vertex****, then each vertex can have user attributes.*

Name/Type/Data Grid

Name input

name for the user attribute. This must be unique for all attributes at this vertex.

Type choice box integer, real, text

type of the attribute.

Data input

value for the attribute.

OK/Apply button

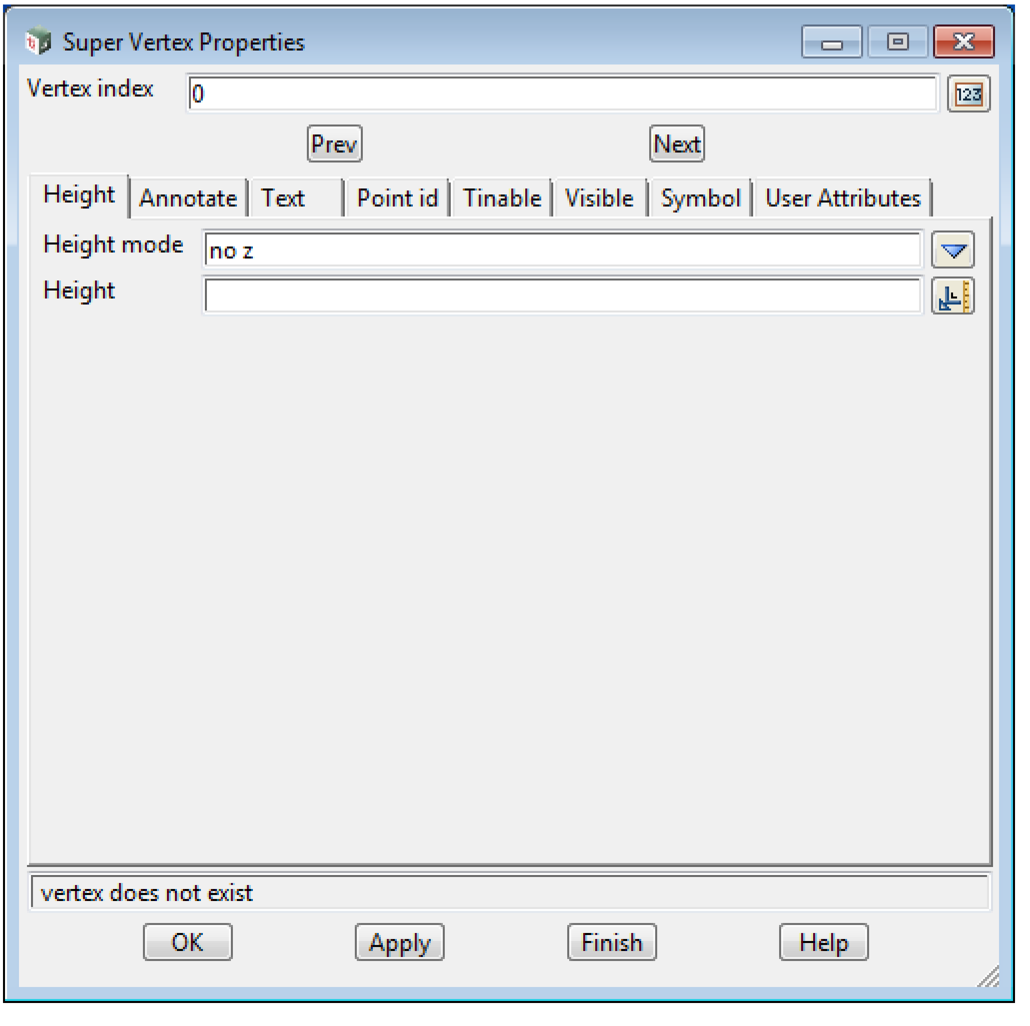
for the vertex being edited, **OK** *sets the vertex with the values in the panel fields and removes the panel.* **Apply** *sets the vertex with the values in the panel fields and leaves the panel on the screen.*

14.20.8.3.9 Vertex - All above

Selecting **Vertex=>All above** brings up the **Super Vertex Properties** panel which is used to display all the properties for a vertex.

This option is also available from the *Strings* menu

Position of option on menu: **Strings =>Properties =>Vertex (all)**



As soon as **All above** is chosen, a *<Select vertex> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the vertex to modify is selected, its *vertex nunber* and all other *information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the vertex.

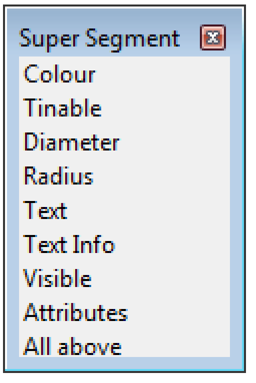
The fields in the **Super Vertex Properties** panel have already been described in the other Vertex options and so will not be described again.

Please continue to the next section 14.4.10.5 Segment Toolbar.

14.20.8.4 Segment

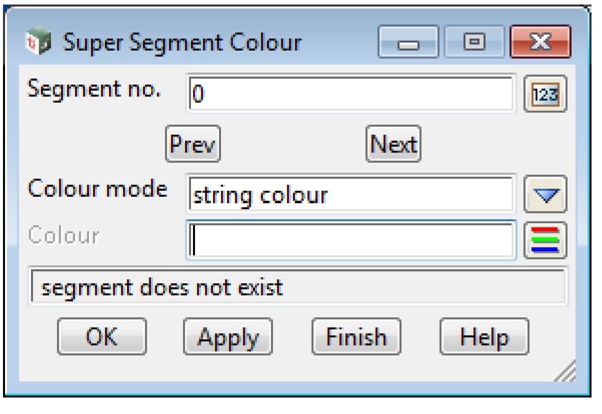
The **Segment** menu contains options to modify information at any segment of the super string.

The **Segment** walk-right is



14.20.8.4.1 Colour

Selecting **Segment=>Colour** brings up the **Super Segment Colour** panel which is used to set the colour of the string segments.



As soon as **Colour** is chosen, a *<Select segment> [Picks][][Menu]* message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its *segment number*, *colour mode* and *colour* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

The fields and buttons used in the **Super Segment Colour** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	

if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if **OK** *or*

Apply *is selected.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Colour mode input string colour, each segment

if ***no z****, there is no z value for the vertex.*
if ***string colour****, then all the segments in the string have the same colour.*
if ***each segment****, then each segment has a separate colour.*

Colour input colour of segment/stringavailable colours

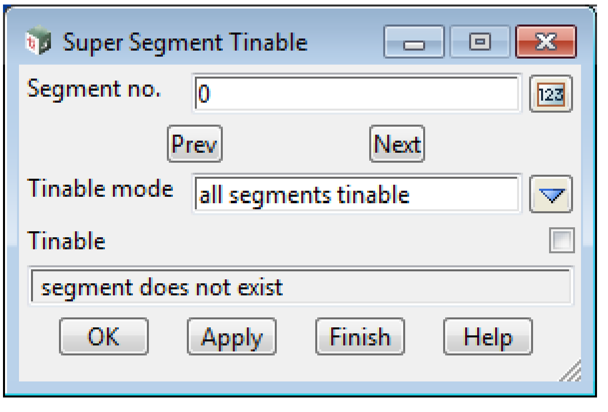
the colour used for the segment or for the entire string.

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.4.2 Tinable

Selecting **Segment=>Tinable** brings up the **Super Segment Tinable** panel which is used to set the tinable flag for segments.



As soon as **Tinable** is chosen, a *<Select segment> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the segment to modify is selected, its *segment number* and *tinable flag* are displayed in the panel. The tinable flag can be changed and either **OK** or **Apply** selected to change the tinable flag of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Tinable** panel have the following functions.

Field Description Type Defaults Pop-Up

Segment no. input selected segment

if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Tinable tick

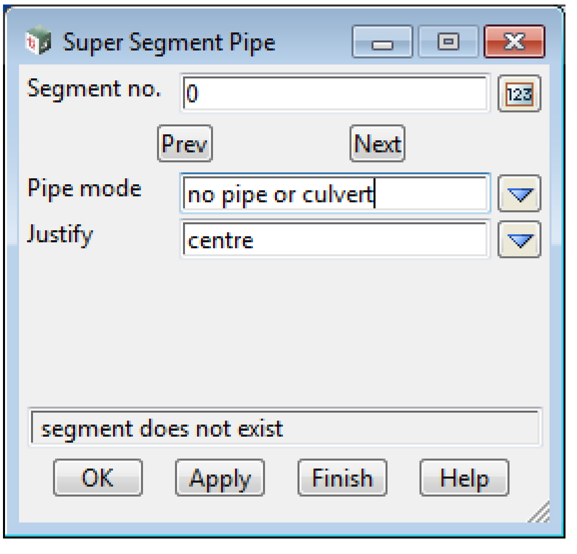
if ***ticked****, the triangulation process tries to preserve the segment as a side of a triangle in the tin.*

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

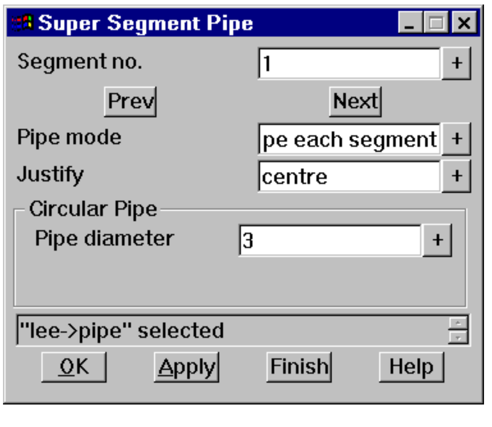
14.20.8.4.3 Diameter

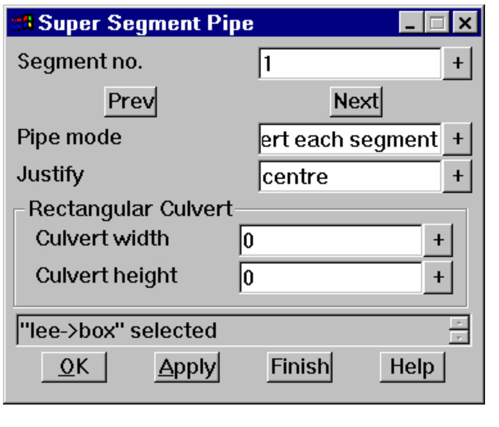
The segments of a super string can have either a pipe or box cross section, or none.
Selecting **Segment=>Diameter** brings up the **Super Segment Pipe** panel which is used to set the pipe mode and size for the string segments.



As soon as **Diameter** is chosen, a *<Select segment> [Picks][][Menu]* message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its *segment number*, *pipe mode* and *information* are written to the appropriate panel fields and the **Super Segment Pipe** panel will change depending on whether it was a pip or box cross-section for the string.





After any panel fields are modified, selecting either **OK** or **Apply** will change the pipe information for the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

The fields and buttons used in the **Super Segment Pipe** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	

if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Pipe mode input — no pipe or box, pipe entire string, pipe each segment, box entire string, box each segment

if ***no pipe or box****, there is no z value for the vertex.*
if ***string colour****, then all the segments in the string have the same colour.*
if ***each segment****, then each segment has a separate colour.*

Justify input — invert, centre, overt

justification of the pipe/box with respect to the co-ordinates given for the vertices of the super string.
rotation angle of the symbol.

Pipe diameter input

diameter of the pipe in world units.

Box width input

width of the box section in world units.

Box height input

height of the box section in world units.

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.4.4 Radius

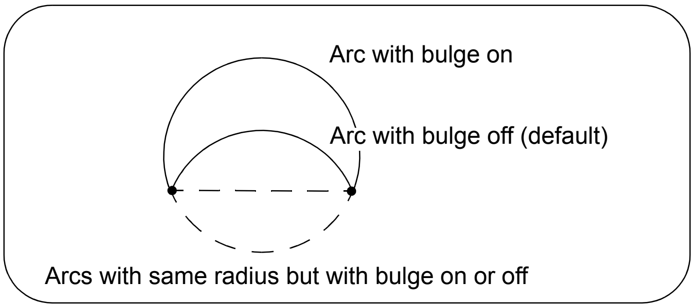
When viewed in plan, the segments of a super string can be joined by string lines or arcs.
If the radius is positive, the arc is drawn from the start vertex to the end vertex of the segment in a clockwise direction. If the radius is negative, the arc is drawn from the start vertex to the end vertex on the segment in a counter-clockwise direction.

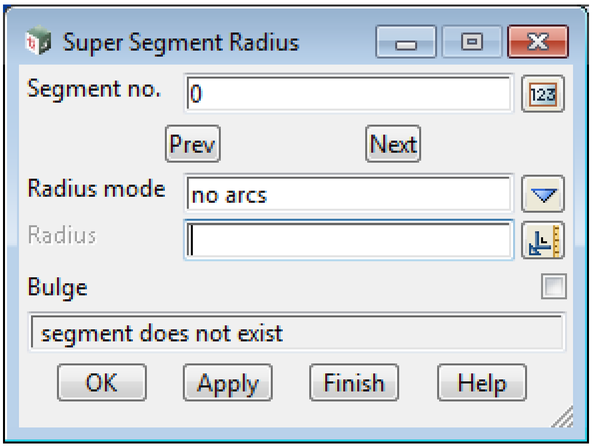
For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned *on*, the larger arc is used. The default is bulge turned off.

A zero radius is interpreted to be a just a straight line segment with no arc.

Selecting **Segment=>Radius** brings up the **Super Segment Radius** panel which is used to set the plan radius of the segment.





As soon as **Radius** is chosen, a <*Select segment*> *[Picks][][Menu]* message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its *segment number*, *radius* and *bulge* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

The fields and buttons used in the **Super Segment Radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	

if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if **OK** *or* **Apply** *is selected.*

Prev	button		

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next	button		

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Colour mode	input		string colour, each segment

if ***no z****, there is no z value for the vertex.*
if ***string colour****, then all the segments in the string have the same colour.*
if ***each segment****, then each segment has a separate colour.*

Radius	tick		

if ***ticked****, the larger arc is used.*
if not-ticked, the smaller arc is used.

Bulge input 0

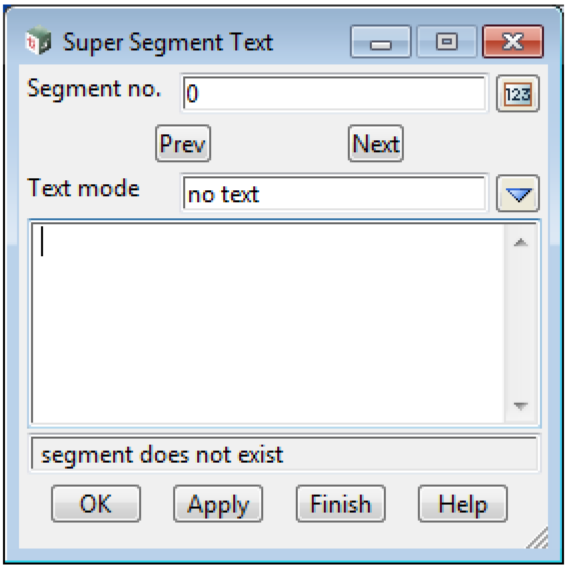
radius of the segment arc. A radius of 0 mean no arc.

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.4.5 Text

Selecting **Segment=>Text** brings up the **Super Segment Text** panel which is used to set the text for segments.



As soon as **Text** is chosen, a *<Select segment> [Picks][][Menu]* message is written to the Status Bar and vertices can be selected.

When the segment to modify is selected, its *segment number*, *text mode* and *text* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Text** panel have the following functions.

Field Description Type Defaults Pop-Up

Segment no. input selected vertex

if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Text mode input no text, entire string, each segment

if ***no text****, there is no text for the segment.*
if ***entire string****, then the string has the same text for each segment.*
if ***each segment****, then each segment has a separate text value.*

Text input text of segment/string

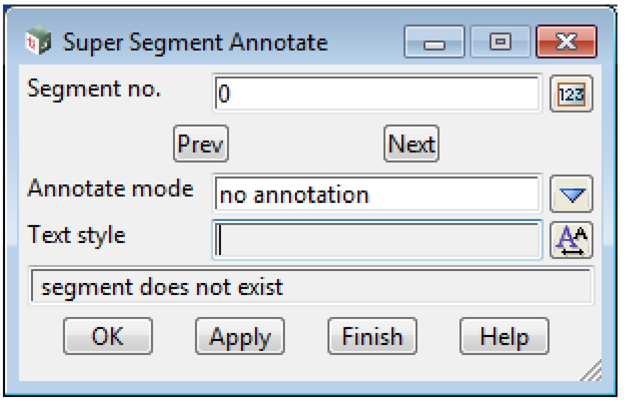
the text used for the segment or for the entire string.

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.4.6 Text Info

Selecting **Segment=>Text info** brings up the **Super Segment Annotate** panel which is used to set the annotation styles for the text at segments.



As soon as **Text info** is chosen, a *<Select segment> [Picks][][Menu]* message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its *segment nunber*, *annotate mode* and *annotation information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Annotate** panel have the following functions.

Field Description Type Defaults Pop-Up

Segment no. input selected vertex

if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Annotate mode input no annotation, entire string, each segment

if ***no annotation****, then the text at the segment is not displayed.*
if ***entire string****, then the same annotation settings are used for each segment.*
if ***each vertex****, then each segment has separate annotations settings.*

Textstyle info input

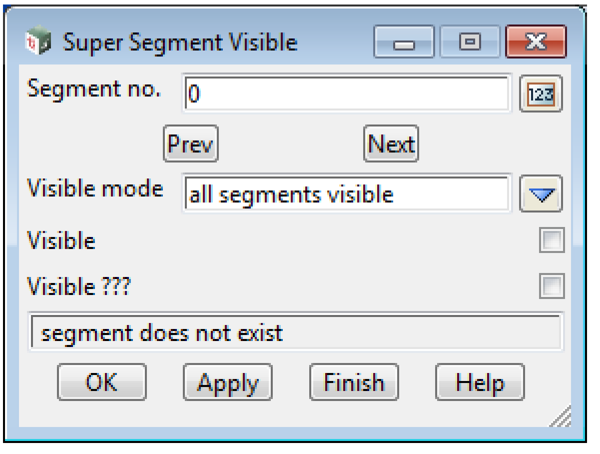
textstyle information.

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.4.7 Visible

Selecting **Segment=>Visible** brings up the **Super Segment Visible** panel which is used to set the visibility flag for segments.



As soon as **Visible** is chosen, a <*Select segment*> *[Picks][][Menu]* message is written to the Status Bar and segments can be selected.

When the segment to modify is selected, its *segment number* and *visibility flag* are displayed in the panel. The visibility flag can be changed and either **OK** or **Apply** selected to change the visibility flag of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	

if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if **OK** *or* **Apply** *is selected.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Visible tick

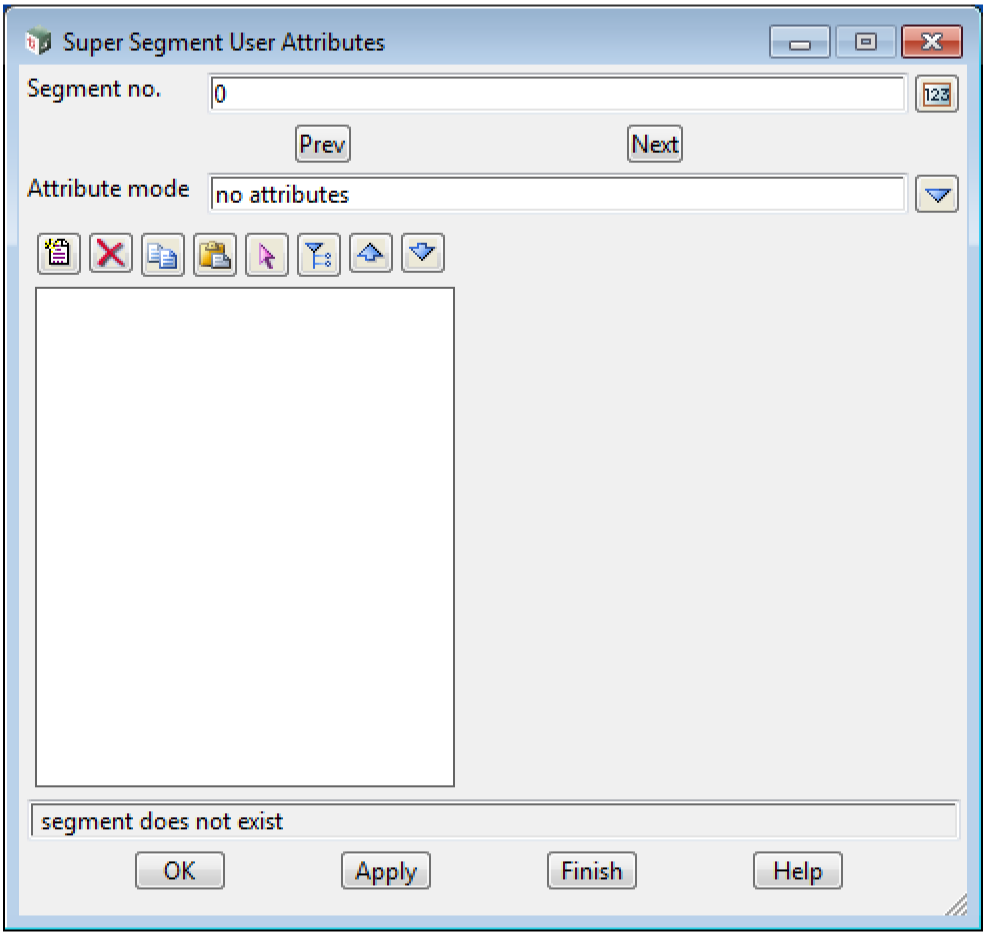
*if **ticked**, the segment is visible.*
*if **not ticked**, then the segment is invisible.*

OK/Apply button

for the segment being edited, **OK** *sets the segment/string with the values in the panel fields and removes the panel.* **Apply** *sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

14.20.8.4.8 Attributes

Selecting **Segment=>Attributes** brings up the **Super Segment User Attributes** panel which is used to display and edit user defined attributes at segments of the super string.



The **Prev** and **Next** buttons are used to cycle through and display the attributes for each segment in the super string in the *Name/Type/Data* grid.

The data in the *Name/Type/Data* grid can be deleted, modified or added to and then updated for the segment using the **OK** or **Apply** button.

The fields and buttons used in the **Super Segment User Attributes** panel have the following functions.

Field Description Type Defaults Pop-Up

Segment no.

when the option starts, the user attributes for the first segment is displayed. The **Next** *and* **Prev** *buttons will move onto other segments. Also a number can be typed into the field and any information in the panel will then be applied to that segment if* **OK** *or* **Apply** *is selected. Typing <Enter> after entering a number will go to that segment number and display the attributes.*

Prev button

move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.

Attribute mode choice box no attributes, each segment

if ***no attributes****, then no segments have user attributes.*

*if **each segment**, then each segment can have user attributes.*

Name/Type/Data Grid

Name input

name for the user attribute. This must be unique for all attributes at this segment.

Type choice box integer, real, text

type of the attribute.

Data input

value for the attribute.

OK/Apply button

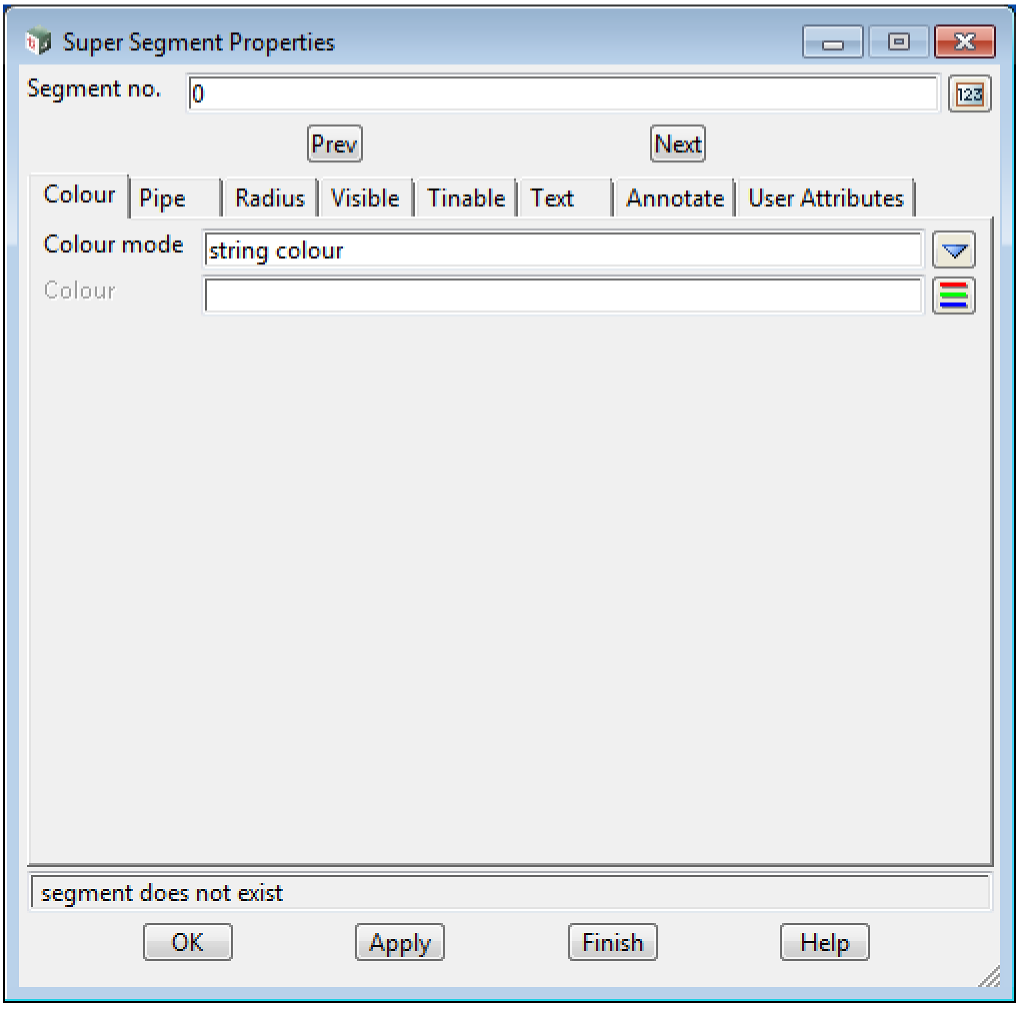
for the segment being edited, **OK** *sets the segment with the values in the panel fields and removes the panel.* **Apply** *sets the segment with the values in the panel fields and leaves the panel on the screen.*

14.20.8.4.9 Segment - All above

Selecting **Segment=>All above** brings up the **Super Segment Properties** panel which is used to display all the properties of a segment.

This option is also available from the *Strings* menu

Position of option on menu: **Strings =>Properties =>Segment (all)**



As soon as **All above** is chosen, a *<Select segment> [Picks][][Menu]* message is written to the Status Bar and segments can be selected.

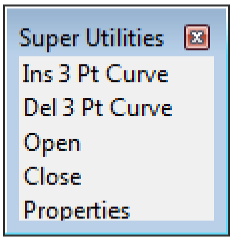
When the segment to modify is selected, its *segment nunber* and all other *information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the segment.

The fields in the **Super Segment Properties** panel have already been described in the other Segment options and so will not be described again.

See the next section 14.20.8.5 Utilities or return to 14.20.8 Super Edit - Old.

14.20.8.5 Utilities

The **Utilities** walk-right menu contains a number of useful miscellaneous option for the super string. The menu is



Each of the new options will now be discussed.

14.20.8.5.1 Ins 3 Pt Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent super string vertices.

After selecting the option, the middle vertex of the three adjacent super string vertices is selected.

When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

14.20.8.5.2 Del 3 Pt Curve

The **del 3 pt curve** option is used to delete the curves on either side of a super string vertex.

After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the vertex are effectively removed.

14.20.8.5.3 Open

If the string is closed, selecting the **open** option removes the segment between the 1st and last vertex of the super string.

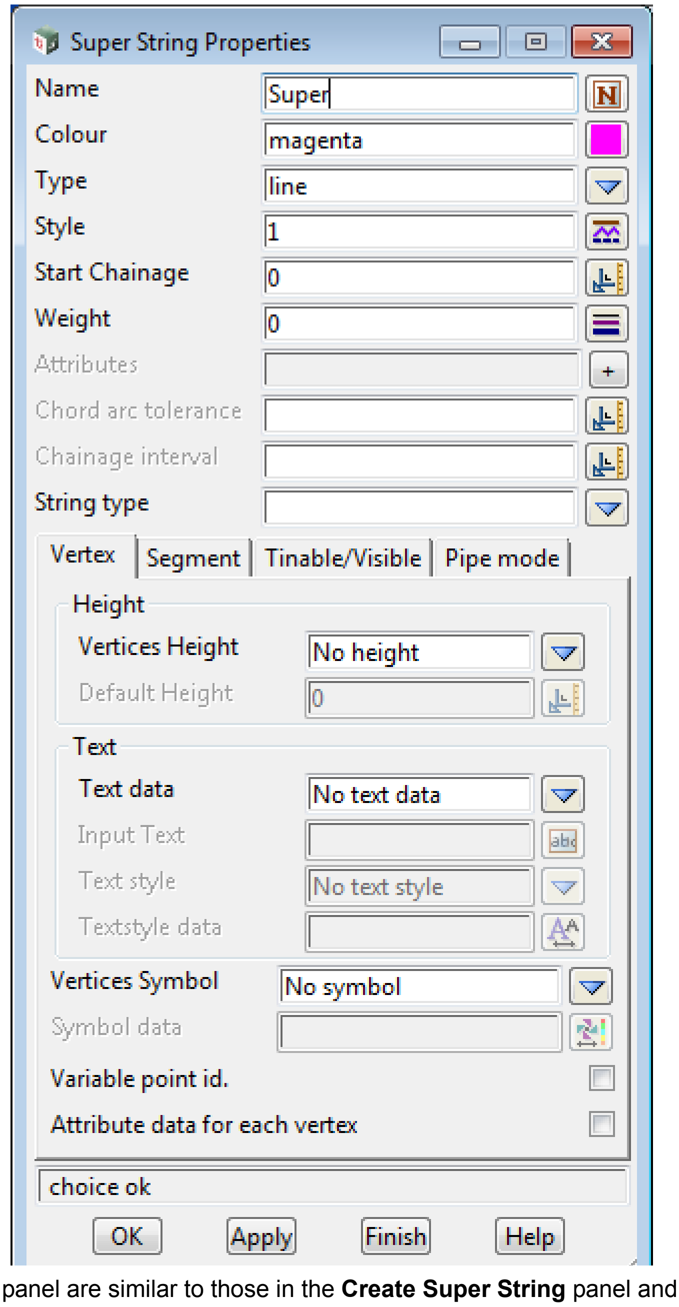
If the string is not closed, the **open** option does nothing.

14.20.8.5.4 Close

Selecting the **close** option adds a segment between the 1st and the last vertices of the super string. Note that unlike other strings, no extra vertices are added.

14.20.8.5.5 Properties

Selecting **Properties** brings up the **Super String Properties** panel which is used to modify the string's header information.



The fields in this panel are similar to those in the **Create Super String** panel and the Super String Editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, **OK** *sets the string with the values in the panel fields and removes the panel.* **Apply** *sets the string with the values in the panel fields and leaves the panel on the screen.*

15 CAD

In ***12d Model*** there are CAD options which are available under both the **CAD** menu and flyouts on the *CAD Toolbar* which by default, is on the left hand side of the ***12d Model*** screen.

The **CAD** options create and edit strings using a variety of methods and are fully described in the section 15.2 CAD Options.

The *strings* created by the *CAD menu* or *CAD toolbars* use values in the three *controlbars* (**Cad Controlbar**, **Symbol Controlbar**, and **Text Controlbar**) to define string attributes such as name, model and colour.

So the controlbars will be described in full in the section 15.1 Controlbars before the CAD options.

For basic information on toolbars and ControlBars, see the section 4.3.5 Toolbars and Controlbars.

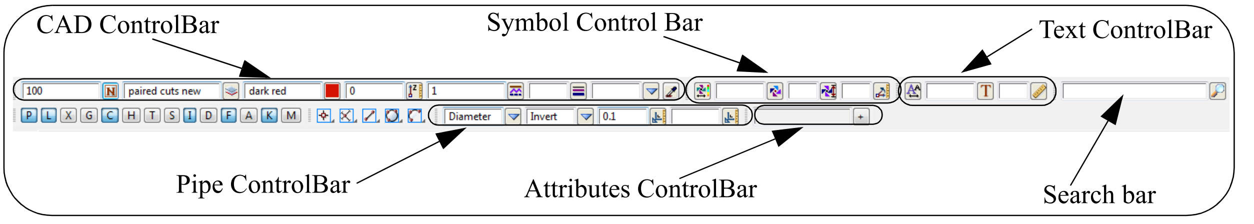
The **CAD** options create various elements using a number of methods. These options make use of **Tool bars** and **Control bars**. Tool bars just have icons on them but Control bars have icons and also controls such as a model box on them. The method groupings are shown on the toolbars (*e.g.* Points, Lines).

For details on each of the walk rights menus on the CAD menu, go to the section 15.2 CAD Options

For details on the Controlbars go to the section 15.1 Controlbars

15.1 Controlbars

This default position of the *ControlBars* is on the top left hand side of the screen under the main menu.



See

15.1.1 CAD Controlbar

15.1.2 Symbol Controlbar

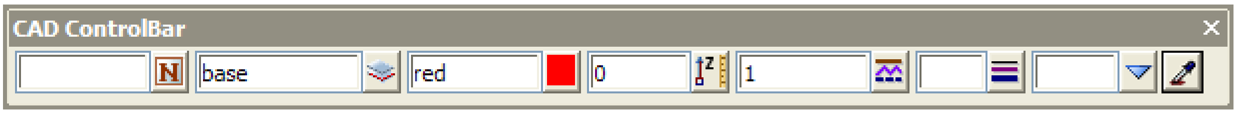
15.1.3 Text Controlbar

15.1.4 Pipe Controlbar

15.1.5 Attributes Controlbar

15.1.6 Search Bar

15.1.1 CAD Controlbar



The fields and buttons used in CAD controlbar have the following functions.

Field Description | Type | Defaults | Pop-Up

name box | | names.4d names

name of string. If a valid name already exists in names.4d, the + button can be used to bring up a choice box of available names. On selection of a valid name, the rest of the values in the control bar will be filled out. e.g. colour, linetype etc.

model box | cogo | existing models

this field can be recognised by the model icon button on the right hand side of the field. The user can select an existing model by selecting the model icon. If a new model is to be used, the user simply types the model name into the field.

colour box | red | standard 12d colours

this field can be recognised by the colour icon button on the right hand side of the field. The user can select a12d standard colour model by selecting the colour icon

input | | height measures menu

this field allows a height or z value to be assigned to the created elements. If a valid value exists, this value will be applied to the created element. This is regardless if the z value was specified in an XYZ box. If blank, the null value is used.
If no value is specified, the level will be interpolated where possible. A value of null can be entered into the height field as well so that created vertices will be given a null height value.

linetype box | 1 | valid linestyles

this field can be recognised by the linestyle icon button on the right hand side of the field. The user can select a valid linestyle by selecting the linestyle icon.

weight box

this field can be recognised by the weight icon button on the right hand side of the field. The user can type in the required weight (millimetres on the plot). If blank, no weight is assigned.

tinability box | | no, yes, points

the choices in this field set the tinability for the string.
*If **no**, no vertices or segments in the string are tinable.*
*If **yes**, all vertices and segments in the string are tinable.*
*If **point**, all vertices in the string are tinable but not the segments.*

button

the eye dropper allows the user to select an existing element which will define the cad control bar values.

Continue to the next section 15.1.2 Symbol Controlbar or return to 15.1 Controlbars.

15.1.2 Symbol Controlbar

The fields and buttons used in Symbol controlbar have the following functions.

Field Description | Type | Defaults | Pop-Up

The  symbols data box allows a symbols favourite to be selected and fill the other boxes. The symbols data box will be described after the other controls.

 symbols box | valid symbols

this field can be recognised by the symbol icon button on the right hand side of the field. The user can select a valid symbol by selecting the symbol icon.

 input | size measures menu

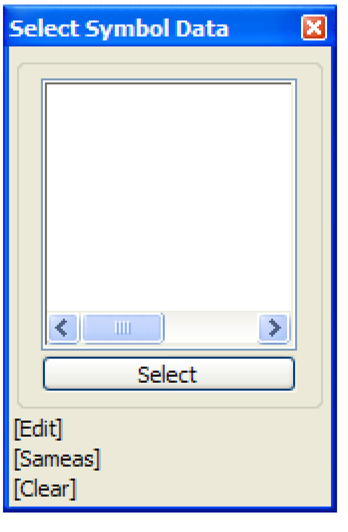
this field gives the size of the created symbols. If a valid value exists, this value will be applied to the created symbol.

 input | angle measures menu

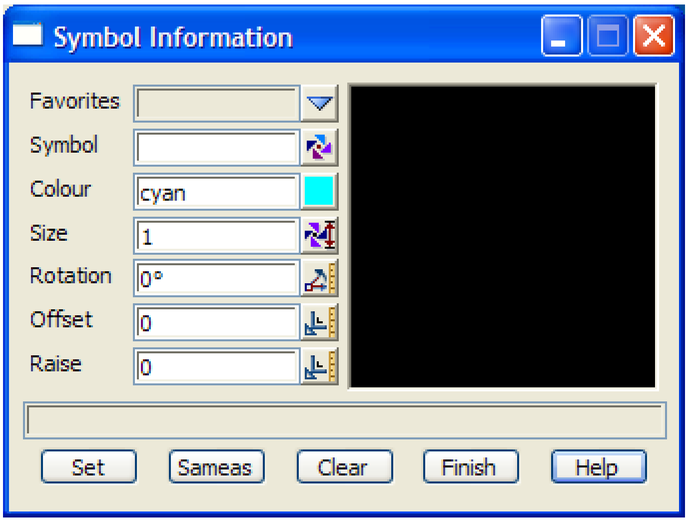
this field gives the angle of the created symbols. If a valid value exists, this value will be applied to the created symbol.

 Symbols data box

on pressing the button a list of available symbols data predefined names read from the ***symbols_names.4d*** *file are displayed. If a symbols data is selected, the values are used for the other Symbol Controlbar fields.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Symbols Information** *panel. This allows for definition of symbol colour, sized, rotation, offset and raise.*



Continue to the next section 15.1.3 Text Controlbar or return to 15.1 Controlbars.

15.1.3 Text Controlbar

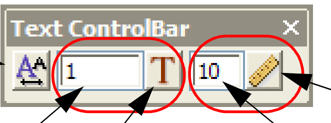
Text can occur as a text string, or on vertices and segments of a super string.

Each type of text has a vertex (these are displayed when Vertices are toggle on in a plan view), a justification point, a rotation, an offset and raise value.

The vertex and justification point only coincide if the offset and raise values are both zero. What parts of the text on a super string vertex or segment that can be independently modified depends on the settings for the super string.

For the CAD text options, the created elements will have attributes as defined by the **Text Controlbar**. The default position of the Text Controlbar is in top middle of the screen under the main menu.

The **Text Controlbar** is



select textstyle data

a textstyle favourite can be selected which then defines the text style and height values.

textstyle select textstyle

the user can select an existing textstyle by selecting the textstyle icon or entering a value into the input box to the left of the button.

text height

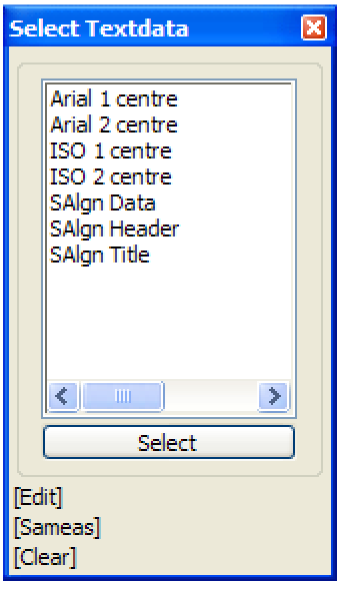
measure for height

the user can measure a height by selecting the text height icon or entering a value into the input box to the left of the button. The value units are defaulted to world units. This can be changed in the textstyle data box

The operation of the Textstyle data box is as follows:

Textstyle data box

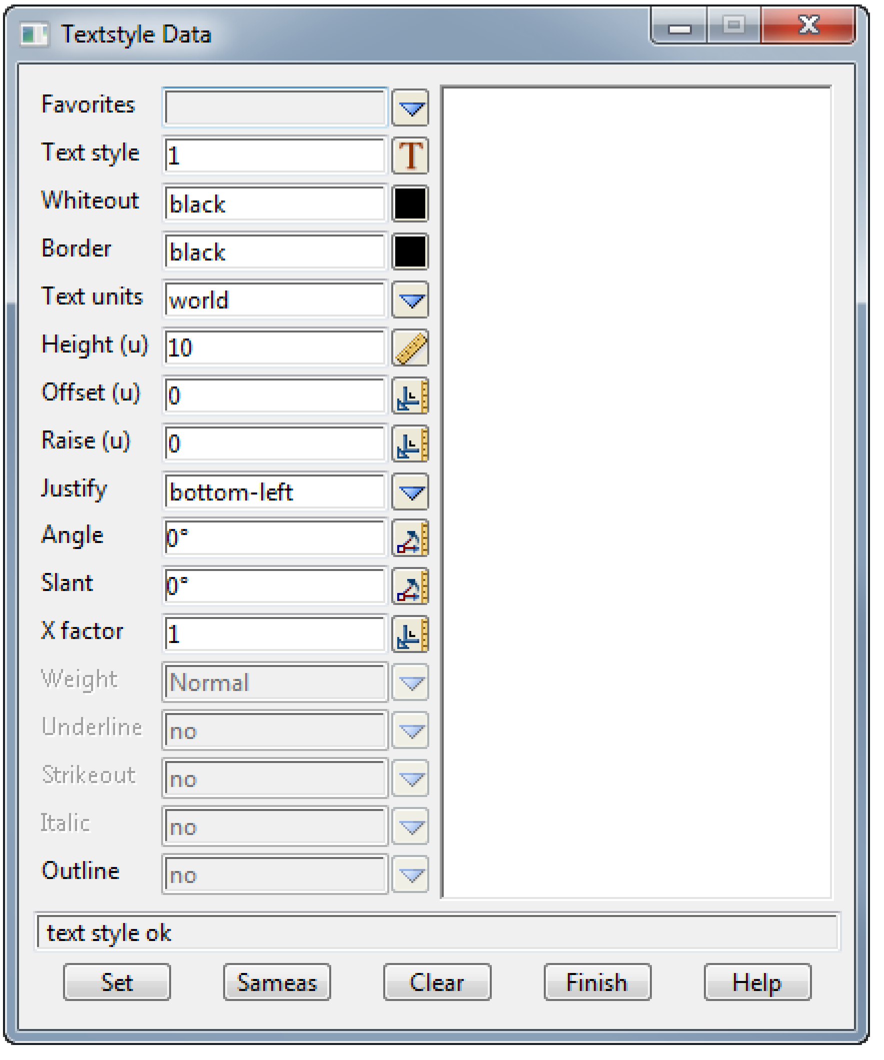
on pressing the button a list of available textdata predefined names read from the ***texstyle_names.4d*** *file are displayed.*



If no names exist, the user can edit the current settings by selecting the edit button and bring up the

Textstyle Data *panel. This allows for definition of textstyle, units, height offset raise etc.*

.



Continue to the next section 15.1.4 Pipe Controlbar or return to 15.1 Controlbars.

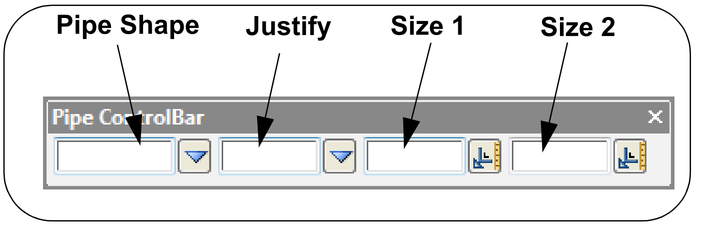
15.1.4 Pipe Controlbar

The Pipe ControlBar is used to set the Pipe dimension when a super string is create with CAD.

The Pipe ControlBar can set the entire super string to be a round pipe or a box culvert pipe.

The **Pipe Controlbar** is

There is a ***Pipe ControlBar*** and it is used to make a round or culvert string whenever a new string is created by the CAD options.



When a new string is created with the CAD options and the value in the **Shape** field of the **Pipe ControlBar** is **Diameter** or **Culvert**, then the **Justify**, **Size 1** and **Size 2** fields from the **Pipe ControlBar** are given to the created string.

To clear **all** the fields in the Pipe ControlBar, clear the **Pipe Shape** field and press <Enter>. This clears all the other fields of the **Pipe ControlBar**.

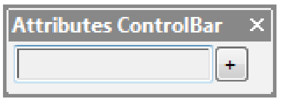
Note

The *Names.4d* now has a **Pipe** section so that the **Pipe ControlBar** can be automatically filled in when a name is selected in the **CAD ControlBar** that is in the **Pipe** section. See 7.9.1.6 Pipe Node in 7.9.1 Name Mappings - Names.4d File.

Continue to the next section 15.1.5 Attributes Controlbar or return to 15.1 Controlbars.

15.1.5 Attributes Controlbar

There is a ***Attributes ControlBar*** and it is used to apply **string** attributes whenever a new super string is created by the CAD options, the attributes in the Attributes ControlBar are given to the string as string attributes.



When a new string is created with the CAD options, the string is given the attributes in the **Attributes ControlBar** as string attributes.

Note

The *Names.4d* now has an **Attribute Data** section so that the ***Attributes*** **ControlBar** can be automatically filled in when a name is selected in the **CAD ControlBar** that is in the ***Attributes*** section. See 7.9.1.7 Attributes Data Node in 7.9.1 Name Mappings - Names.4d File.

Continue to the next section 15.1.6 Search Bar or return to 15.1 Controlbars.

15.1.6 Search Bar

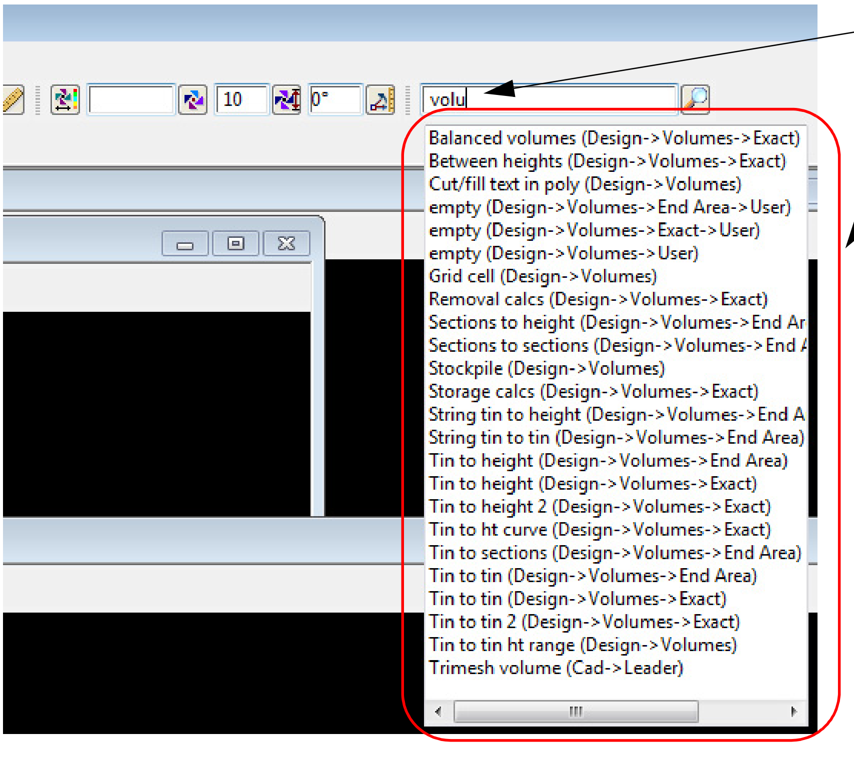
The **Search Bar** allows quick access to any option in ***12d Model***.

Search bar

By simply typing text into the **Search Bar,** the option searches for matches of the typed text amongst the **full path names** of all the **options on the menus**, and then lists the menu items and the position of the menu that contains the menu item.

For example, typing in **volu** will bring up the list shown below.

Typing **volu** in the *Search Bar*



List of matches for **volu** in the full path to the name of the option on a menu, and the position in brackets of the menu that contains the text **volu**.

Clicking on any item in the list brings up the panel for the option

Double clicking on an item in the list brings up the panel for that item.

Note that case is ignored when searching for matches.

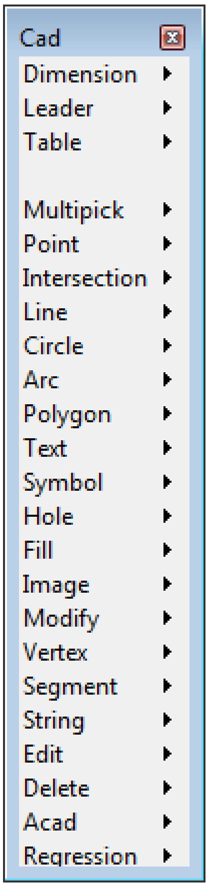
Return to 15.1 Controlbars.

15.2 CAD Options

Position of option on menu: **CAD**

The **CAD** options are available from the **CAD** menu or from the **CAD toolbar**. The **CAD toolbar** is a flyout toolbar.

The **CAD** walk-right menu is



and the **CAD Toolbar** is

The string creation process is similar for each string type and for editing strings as well. On selecting the appropriate option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

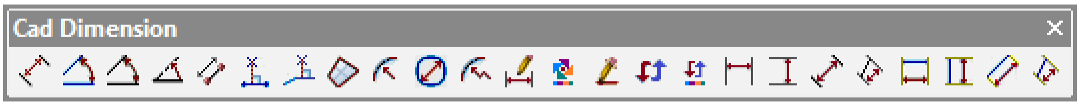
For the options see

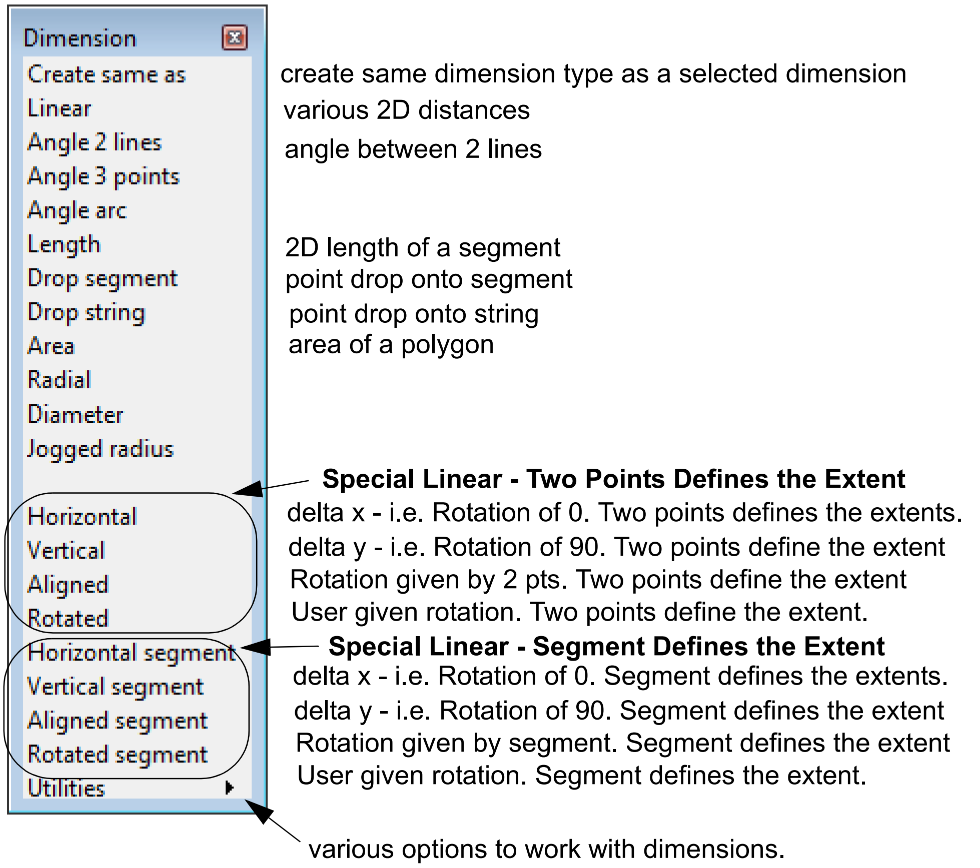
Dimension	15.3 CAD Dimension
Leader, go to	15.4 CAD Leader
Table, go to	15.6 CAD Table
Multipick, go to	15.8 CAD Multipick
Point	15.9 CAD Point
Intersection	15.10 CAD Intersection
Line	15.11 CAD Line

15.3 CAD Dimension

Position of option on menu: **CAD =>Dimension**

Various types of **Dimensions** can be created with the **Dimension** options.





Each type of **Dimension** remembers the items it was created from (Association). In most cases when the items are modified, the **Dimensions** and the associated values on the Dimension dynamically change. See 15.3.1 Dimension Association.

For information about the meaning of the linear dimension commands Linear, Horizontal, Vertical, Aligned, Rotated, Horizontal segment, Vertical segment, Aligned segment and Rotated segment see

For information about the meaning of the linear dimension commands Linear, Horizontal, Vertical, Aligned, Rotated, Horizontal segment, Vertical segment, Aligned segment and Rotated segment see 15.3.6 Linear Dimension Commands.

For more information on each of the dimension commands, see

Create same as - create new dimension of same type as selected dimension15.3.5 Dimension - Create Same As

Linear - various 2D distances. *See* 15.3.6.1 Linear

Angle 2 lines - angle between two selected lines. *See* 15.3.14 Angle 2 Lines

Angle 3 points - angle between two lines defined by 3 points.*See* 15.3.15 Angle 3 points

Angle Arc - angle subtended by existing arc or a segment with a radius. *See* 15.3.16 Angle Arc

Length - the 2D length of selected segments *See* 15.3.7 Length

Drop segment - point dropped onto segment. *See* 15.3.8 Drop Segment

Drop string - point dropped onto a string. *See* 15.3.8 Drop Segment

Area - area of selected strings. *See* 15.3.10 Area

Radius - radius of a selected arc. *See* 15.3.13 Radius

Diameter - diameter of an arc 15.3.12 Diameter.

Jogged radius - radius of a selected arc with jog. *See* 15.3.11 Jogged radius

Arc Length - Arc by Centre, 2 Points - length of an arc with arc defined by selecting a centre and two points on the arc. *See* 15.3.17 Arc Length by Centre, 2 Points

Horizontal - the horizontal distance (delta x) between two selected points. *See* 15.3.6.3 Horizontal

Vertical - the vertical distance (delta y) between two selected points. *See* 15.3.6.4 Vertical

Aligned - 2D distance between two selected points. *See* 15.3.6.2 Aligned

Rotated - the 2D between a selected point and another selected point dropped onto the line going through the first point with a user given angle. *See* 15.3.6.5 Rotated

Horizontal segment - the horizontal distance (delta x) between the end vertices of selected segments. *See* 15.3.6.7 Horizontal Segment

Vertical segment - the vertical distance (delta y) between the vertical points of the selected segment. *See* 15.3.6.8 Vertical Segment

Aligned segment - the 2D distance between the end vertices of selected segments. *See* 15.3.6.6 Aligned Segment

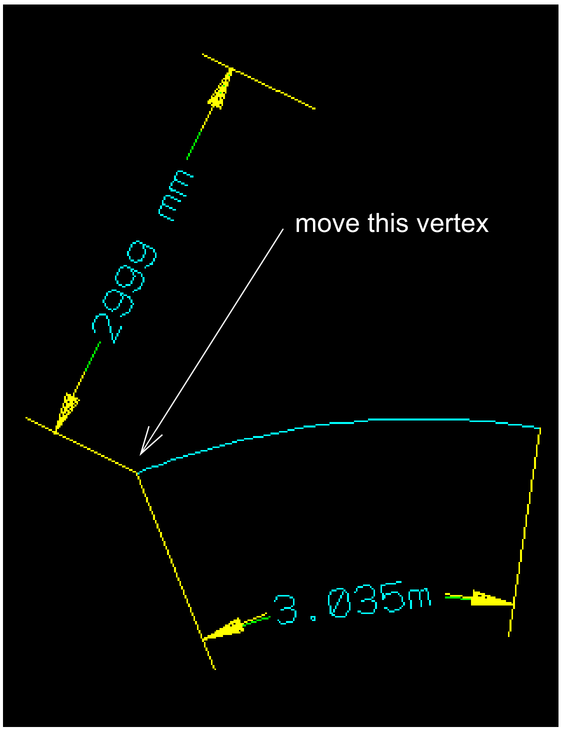
Rotated segment -the 2D between the first vertex of a selected segment and the end vertex of the segment dropped onto the line going through the first vertex with a user given angle. *See* 15.3.6.9 Rotated Segment

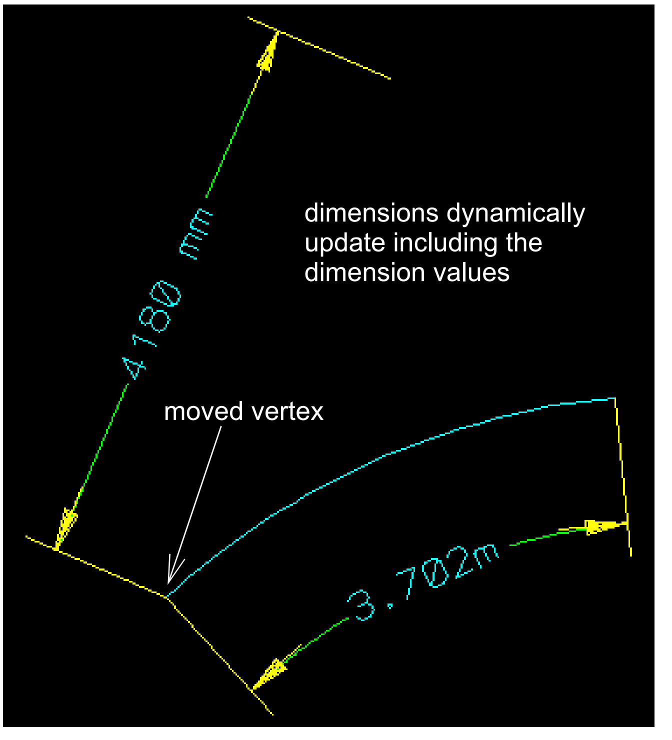
Utilities - various dimension utilities. *See* 15.3.18 Dimension Utilities

15.3.1 Dimension Association

When *dimensions* are created, the dimension can remember the items that were used to create them (**Association**).

In most cases when items are moved, the dimensions associated with the items dynamically change.



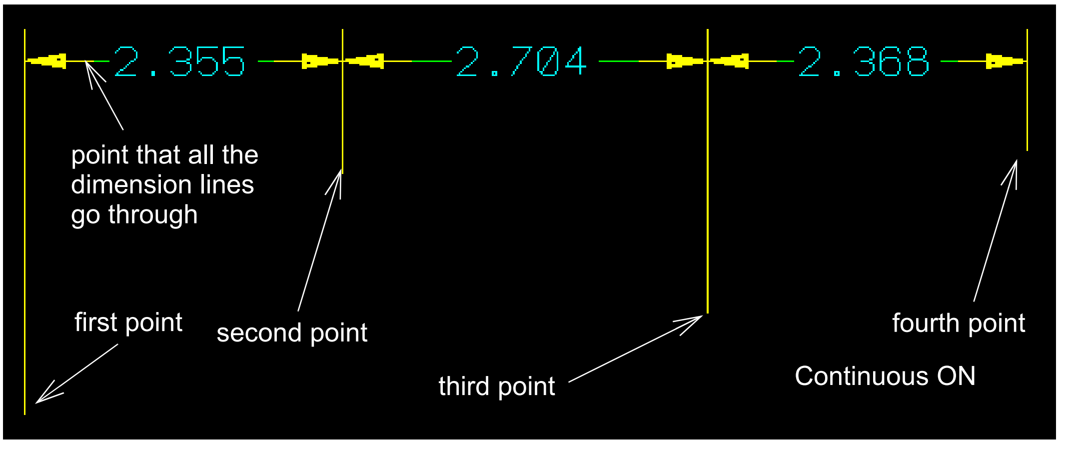


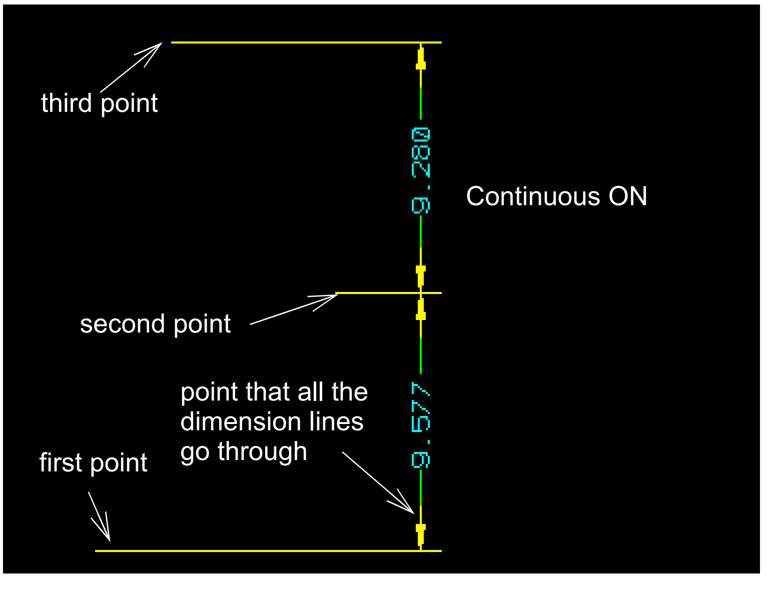
In cases where it is not automatic, there is a **Recalc** and **Recalc all** for dimensions and leaders. In the dimension options, typing **a** or **A** toggles Association **ON** and **OFF**.

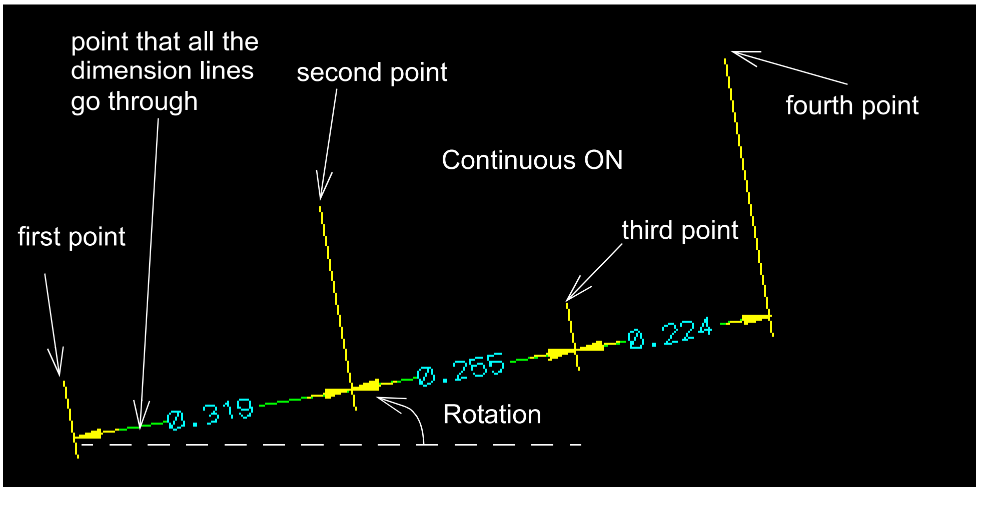
15.3.2 Continuous Mode

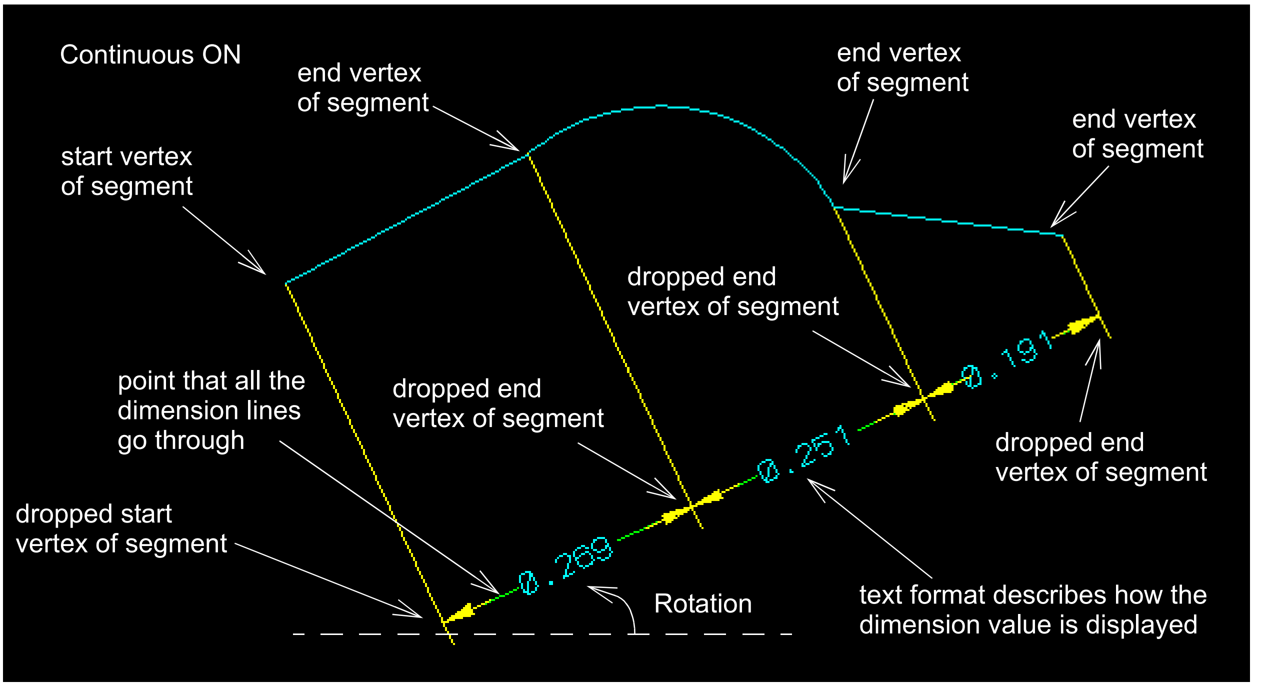
For all the **Linear** dimension options except **Aligned**, there is a **Continuous** mode.

When Continues mode is **on**, all the dimensions lines are on the same line as the dimension line of the first dimension done in the sequence.









In the dimension options which support Continuous, typing **c** or **C** toggles Continuous **ON** and **OFF**.

15.3.3 Baseline Mode

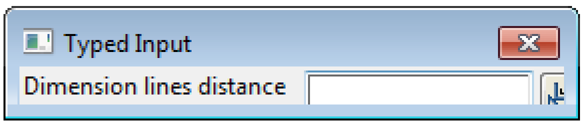
For all the dimension options *Horizontal*, *Vertical* and *Rotated*, there is a **Baseline** mode.

When **Baseline** mode is **ON**, the distances are all measured from the first picked point, the first dimension line goes through the picked dimension point, and for each subsequent dimension line, the distance is measured from the first point, and the dimension line is moved a give distance offset to the previous dimension line so that the dimension lines for not overlap.

In the dimension options which support *Baseline*, **(b)aseline** appears in the message in the screen message area:

<[(a)ssociation ON] [(c)ontinuous OFF] [(b)aseline OFF] Pick start point or choose (s)tyle[d1] > [picks][accepts][Menu]

Typing **b** or **B** toggles **Baseline ON** and **OFF** and when **Baseline** is toggle **ON** for the first time, the *Dimension lines distance* **Typed Input** box is place on the screen.



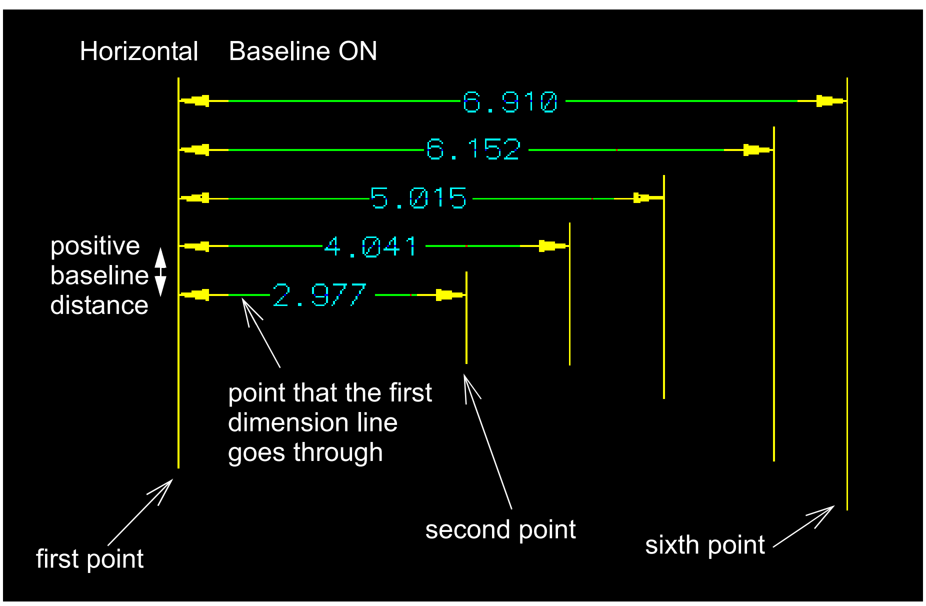
The new distance is typed into the box and <Enter> pressed.

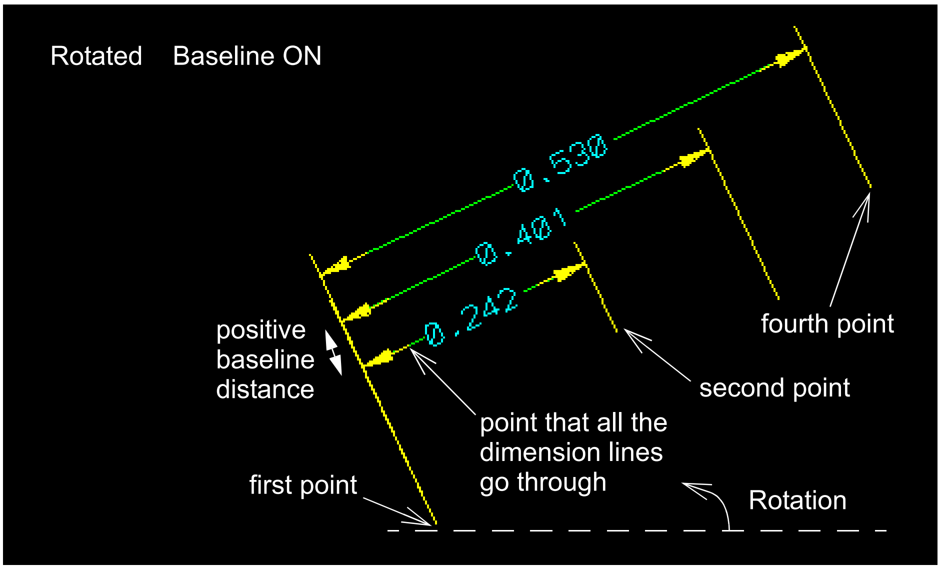
Whenever *Baseline* is toggled **ON**, (**d)istance** appears in the message in the screen message area:

<[(a)ssociation ON] [(c)ontinuous OFF] [(b)aseline ON (d)istance[0.500]]Pick start point or choose (s)tyle[d1] > [picks]

Typing **d** or **D** toggles brings up the *Dimension lines distance* **Typed Input** box and a new distance can be entered.

Whenever **Baseline** is **ON**, **Continuous** is turned **OFF**.





Rotated Baseline ON
0.530
0.401
0.242

15.121
11.162
6.944
fifth point
point that all the
dimension lines
go through
negative baseline distance
first point

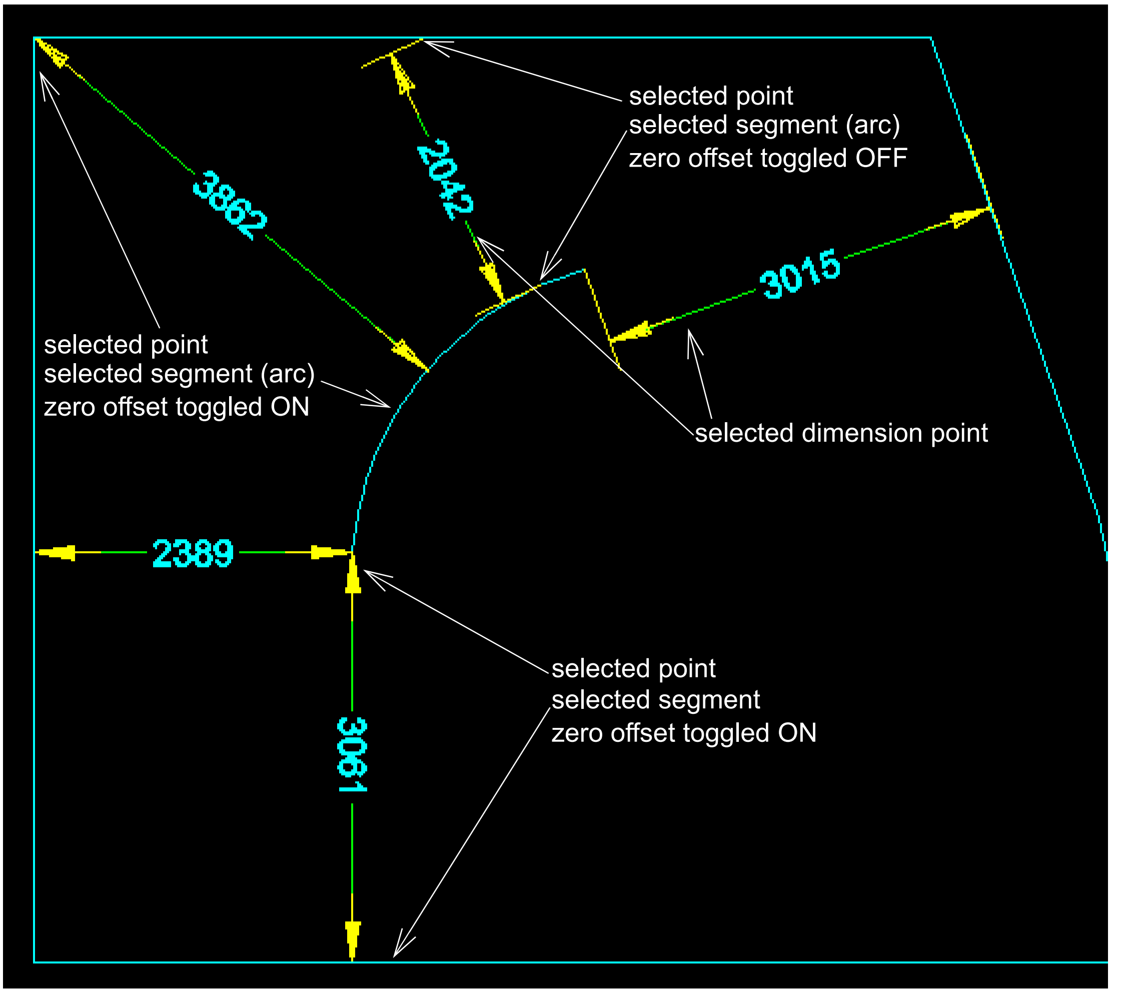
15.3.4 Zero Offset Mode

For some dimension options there is a **Zero Offset** mode.

When **Zero Offset** mode is **ON**, then the user is not asked to select a dimension point.

The dimension line is automatically placed on the line between the two points

When **Zero Offset** is available, typing **z** or **Z** toggles **Zero offset ON** and **OFF**.



15.3.5 Dimension - Create Same As

Create same as creates a new Dimension of the same type as a selected Dimension.

Step 1.

Select **Create same as** and the following message is written to the screen message area

<[Pick dimension]> [picks][fast][Menu]

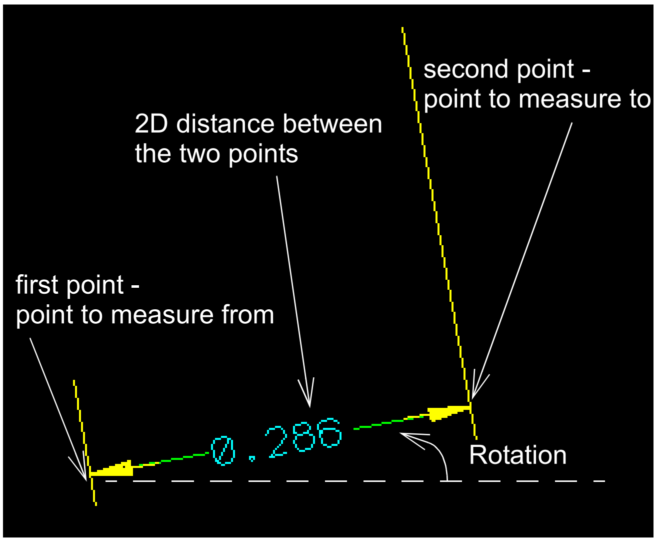
Step 2.Select an existing Dimension

When an existing **Dimension** is selected, a new **create Dimension** of the same Dimension type as the selected Dimension, is started.

15.3.6 Linear Dimension Commands

The **Linear Dimension** commands measure the **2D** (plan) **distance between two points**.

The two points to measure between define a line and that line has a **Rotation** angle with respect to the x-axis (Rotation is measured in an anticlockwise direction from the positive x-axis).



Note that the two points may be selected individually or can be the end points of a selected segment (if the segment is an arc or a transition, only the end points of the segment are used).

Because most drawings to be dimensioned are very regular and often drawn so that the major line work is parallel to the x and y axes, it is an advantage to have special forms of the **Linear Dimension** so that the intent is clearer and less information has to be provided by the user.

The **special Linear Dimensions** are best classified by their **Rotation** angle.

(a) **Horizontal** - **rotation angle of 0**

This is the difference between the two x coordinates of the points or segment (delta x).

The Rotation is known (0) so once the first point is selected, the software automatically drops the second point onto the line with Rotation 0 that goes through the first point and uses the x value from the dropped point.

Horizontal and selecting **two points**. *See* 15.3.6.3 Horizontal
Horizontal and selecting a **segment**. *See* 15.3.6.7 Horizontal Segment

(b) **Vertical** - **rotation angle of 90**

This is the difference between the two y coordinates (delta y).

The Rotation is known (90) so once the first point is selected, the software automatically drops the second point onto the line with Rotation 90 that goes through the first point and uses the y value from the dropped point.

Vertical and selecting **two points**. *See* 15.3.6.4 Vertical
Vertical and selecting a **segment** *See* 15.3.6.8 Vertical Segment

(c) **Rotated - a user given rotation value**.

The Rotation is known so once the first point is selected, the software automatically drops the second point onto the line with the given Rotation that goes through the first point and uses the dropped point to measure the 2D distance to.

Rotated and selecting **two points**. *See* 15.3.6.5 Rotated
Rotated and selecting a **segment** *See* 15.3.6.9 Rotated Segment

(d) **Aligned** - **rotation defined by selecting two points or a segment**

This is a more general case where the two points have to accurately selected and are used to defined the Rotation. This is the only case when the Rotation is not known before selecting anything.

Aligned and selecting two points. *See* 15.3.6.2 Aligned

Aligned and selecting a **segment** *See* 15.3.6.6 Aligned Segment

Hence in ***12d Model*** there are **eight separate commands** for defining a Linear dimension with a special rotation, and **one** general **Linear** command that covers all **eight Linear command**.

See

Linear - all eight cases. *See* 15.3.6.1 Linear

15.3.6.1 Linear

The **Linear** option allows the use any of the eight modes of defining a Linear dimension.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.

Select **Linear** and the following message is written to the screen message area

<[Pick start poi(n)t] [(h)orizontal (v)(l)(r)] [(c)ontinuous OFF] [(b)aseline OFF] (a)ssociative (s)tyle[Arial Aligned] forma(t) > [picks][fast][Menu]

Step 2.Settings

Typed one characters commands are now required and the first ones to set are those that don't actually start a dimension but are set ups - **n**, **a**, **c**, **s**.

Some of the commands, **n**, **a**, **c**, **s**

n or **N** toggles between picking two poi**n**ts or picking a segme**n**t.

<[Pick start poi(n)t] [(h)orizontal (v)(l)(r)] [(c)ontinuous OFF ... (s)tyle[Arial Aligned] forma(t) > [picks][fast][Menu]
<[Pick segme(n)t] [(h)orizontal (v)(l)(r)] [(c)ontinuous O... Aligned] forma(t) > [picks][fast][Menu]

clicking **n** toggles between poi**n**t and segme**n**t

a or **A** toggles association **ON** and **OFF**.
c or **C** toggles continuous **ON** and **OFF**.
s or **S** brings up the dimension style list.

Step 3.Dimension Commands

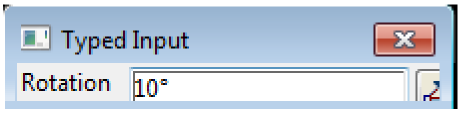
The dimension commands are **h**orizontal, **v**ertical, **a**ligned or **r**otated and the current **active** dimension command has square brackets around it.

h makes **h**orizontal the active dimension command.
v makes **v**ertical the active dimension command.
l makes a**l**igned the active dimension command.
r makes **r**otated the active dimension command.

Note - When **rotated** is the active dimension command, the current value for the rotation angle is displayed in the message area.

[(h)(v)(l) (r)otated] an(g)le[0°] rotation angle

Whenever the angle is displayed, typing **g** or **G** will bring up a **Typed Input** box to change the rotation angle.



Step 4.Creating a Dimension - picking first point or a segment.

What type of linear dimension is to be created has been set (h, v, l, r).
Whether it requires two points or a segment **has** been set.

Whether it will be **a**ssociated or not, or **c**ontinuous or not **has** been set.

Depending on the point/segment mode, the start of the message indicates whether picking a point or picking a segment is required. So now pick the first point or a segment.

How the **Linear** option operates is now identical to one of eight specialised linear dimension options so it will not be documented now but done in each of the specialised cases.

If **Horizontal** and **point**, see 15.3.6.3 Horizontal
If **Horizontal** and **segment**, see 15.3.6.7 Horizontal Segment

If **Vertical** and **point**, see 15.3.6.4 Vertical
If **Vertical** and **segment**, see 15.3.6.8 Vertical Segment

If **Aligned** and **point**, see 15.3.6.2 Aligned
If **Aligned** and **segment**, see 15.3.6.6 Aligned Segment

With Rotated, the angle is already set so you won't be asked for that again.
If **Rotated** and **point**, see 15.3.6.5 Rotated
If **Rotated** and **segment**, see 15.3.6.9 Rotated Segment

Step 5.

After the dimension has been created, the **Linear** option then starts again. That is, goes back to **Step 1**. You can continue with the current dimension type or switch to another dimension type by clicking on **h**, **v**, **l** or **r** (or **H**, **V**, **L** or **R**).

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.2 Aligned

Aligned labels the 2D distance between two selected points.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles
z or **Z** toggles *Zero Offset* mode **ON** and **OFF**. See 15.3.4 Zero Offset Mode

Step 1. Pick the start point

Select **Aligned** and the following message is written to the screen message area

```
<[Pick start point] (a)ssociative (s)tyle[default] forma(t) [(z)ero offset OFF] > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected start point.

Step 2.Pick the end point

The following message is written to the screen message area.

```
<[Pick end point] (a)ssociative > [picks][fast][Menu]
```

If Association is **ON** then the end of dimension is associated with the selected end point.

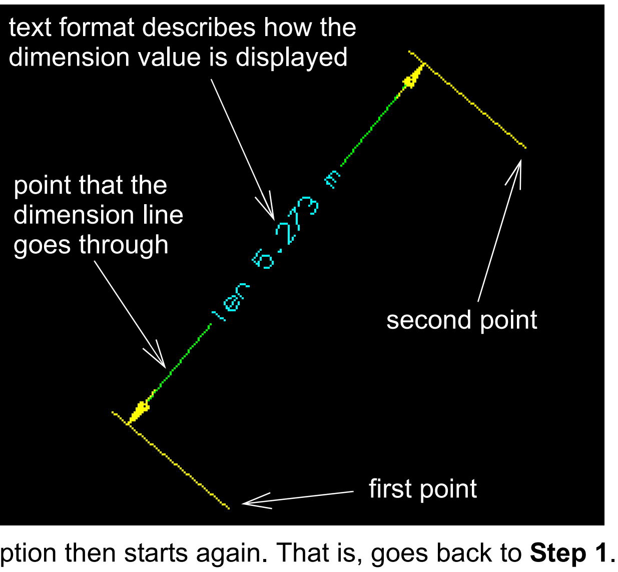
The **2D distance** is calculated between these two points.

Step 3.Pick the point that the dimension line will go through (dimension point)

The following message is written to the screen message area.

```
<Pick dimension point> [picks][fast][Menu]
```

The dimension line is then drawn parallel to the line between the two selected points and going through the dimension point.



The **Aligned** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.3 Horizontal

Horizontal labels the horizontal distance (delta x) between two selected points.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the start point

Select **Horizontal** and the following message is written to the screen message area

```
<[Pick start point] [(c)ontinuous OFF] [(b)aseline OFF] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected first point.

Step 2.Pick the end point

The following message is written to the screen message area.

```
<[Pick end point] (a)ssociative > [picks][fast][Menu]
```

If Association is **ON** then the end of dimension is associated with the selected end point.

The horizontal distance (delta x) is calculated between these two points.

Step 3.Pick the point that the dimension line will go through (dimension point)

The following message is then written to the left hand side of the screen message area.

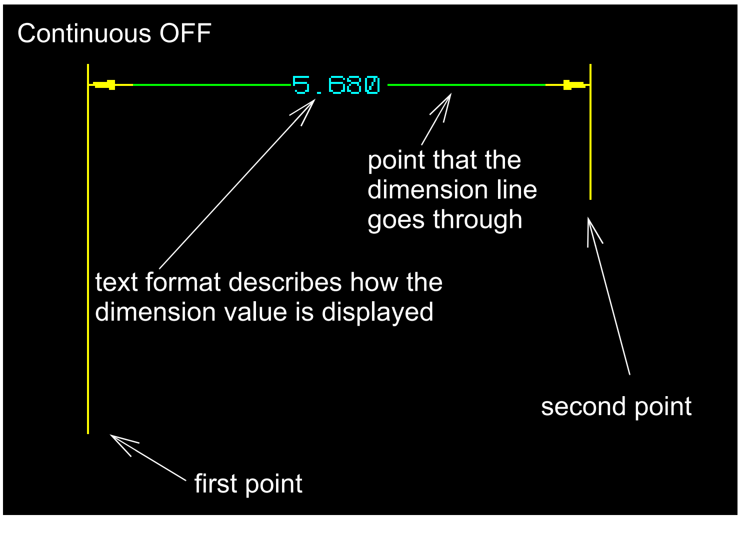
```
<Pick dimension point> [picks][fast][Menu]
```

The horizontal dimension line is then drawn parallel to the x-axis going through the dimension point.

Step 4.I

If Continuous is **OFF**

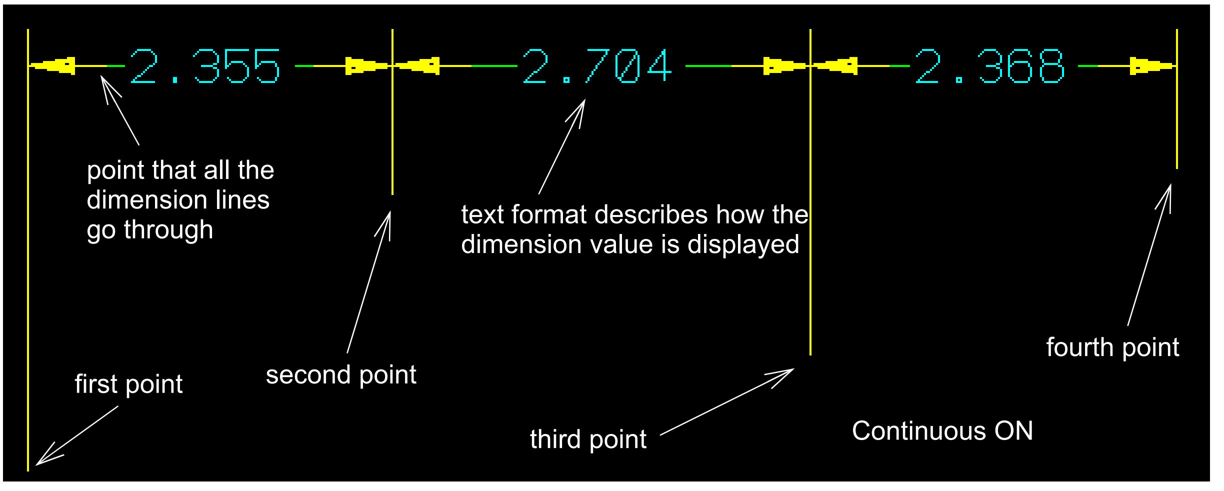
The **Horizontal** option then starts again. That is, goes back to **Step 1**.



If Continuous is **ON**

If Continuous is **ON** then you are asked to pick another end point and another Horizontal dimension is created with the start of the horizontal dimension being the previous dimension end, and the dimension point is the same as the previous dimension point.

This repeats until Continuous is toggle **OFF** and then the next selected end point is the last horizontal dimension in the sequence.



For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.4 Vertical

Vertical labels the vertical distance (delta y) between two selected points.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the start point

Select **Vertical** and the following message is written to the screen message area

<[Pick start point] [(c)ontinuous OFF] [(b)aseline OFF] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]

If Association is **ON** then the start of the dimension is associated with the selected first point.

Step 2.Pick the end point

The following message is written to the screen message area.

<[Pick end point] (a)ssociative > [picks][fast][Menu]

If Association is **ON** then the end of dimension is associated with the selected end point.

The vertical length (delta y) is calculated between these two points.

Step 3.Pick the point that the dimension line will go through (dimension point)

The following message is then written to the left hand side of the screen message area.

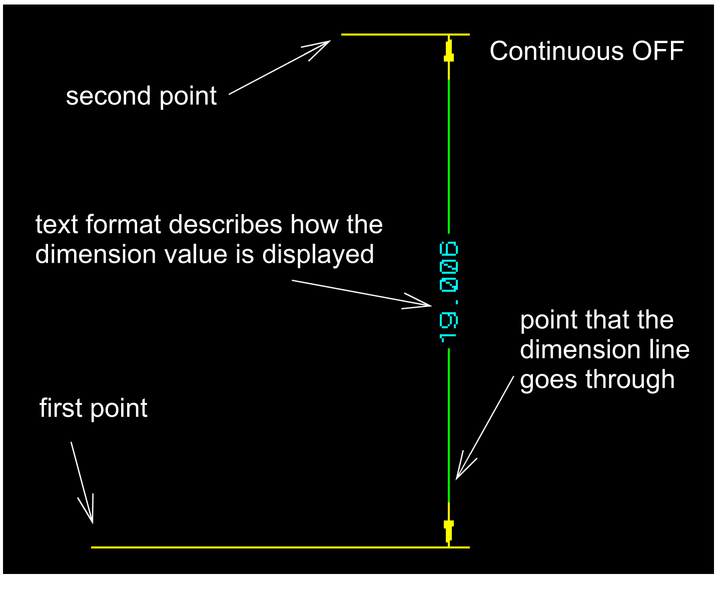
<Pick dimension point> [picks][fast][Menu]

The vertical dimension line is then drawn parallel to the y-axis going through the dimension point.

Step 4.I

If Continuous is **OFF**

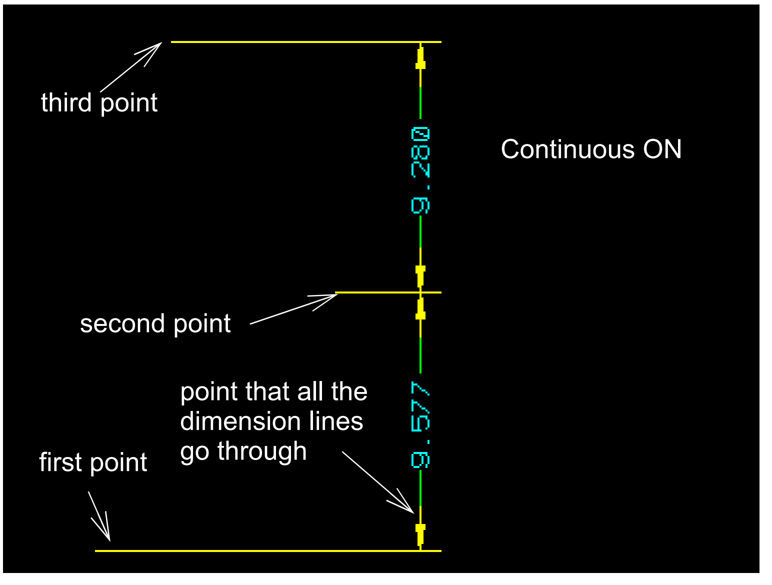
The **Vertical** option then starts again. That is, goes back to **Step 1**.



If Continuous is **ON**

If Continuous is ON then you are asked to pick another end point and another Vertical dimension is created with the start of the vertical dimension being the previous dimension end, and the dimension point is the same as the previous dimension point.

This repeats until Continuous is toggle **OFF** and then the next selected end point is the last vertical dimension in the sequence.



For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.5 Rotated

Rotated labels the **2D distance** between the first selected point and the second selected point **dropped** onto the line with a user given angle (Rotation).and going through the first selected point.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the start point

Select **Rotated** and the following message is written to the screen message area

<[Pick start point] [(c)ontinuous OFF] [(b)aseline OFF] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]

If Association is **ON** then the start of the dimension is associated with the selected first point.

Step 2.Pick the end point

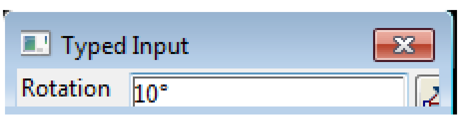
The following message is written to the screen message area.

<[Pick end point] (a)ssociative > [picks][fast][Menu]

If Association is **ON** then the end of dimension is associated with the selected end point.

Step 3.Type in the Rotation value

The following message is written to the screen message area.



The Rotation is in degrees in hp notation and is measured in an anticlockwise direction from the positive x axis.

Type in the Rotation value and <Enter>

When in **Continuous** mode the Rotation is only asked for when placing the first **Rotated** dimensions otherwise it is asked for each time.

Note: for the **Linear** command, the **Rotation** value is not asked for because it will have already been set.

Step 4.Pick the point that the dimension line will go through (dimension point)

The following message is then written to the left hand side of the screen message area.

<Pick dimension point> [picks][fast][Menu]

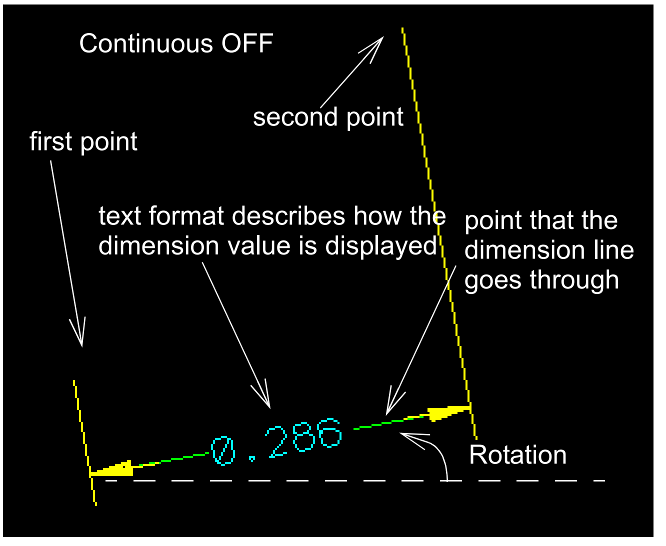
The **2D (plan) distance** is calculated between the first selected point and the second selected point dropped onto the line going through the first selected and with the user given angle (Rotation).

The dimension line is then drawn with the angle of the dimension line equal to the entered Rotation.

Step 5.I

If Continuous is **OFF**

The **Rotated** option then starts again. That is, goes back to **Step 1.**

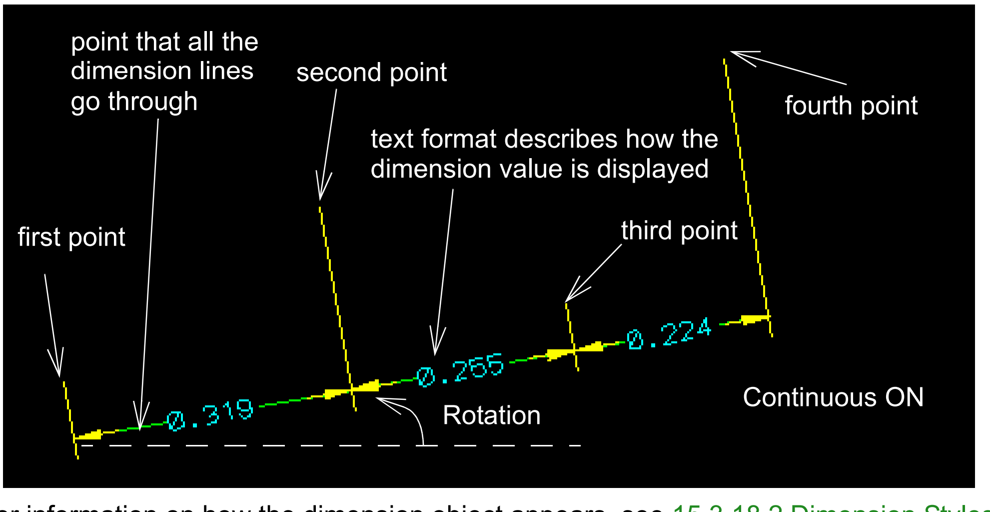


If Continuous is **ON**

If Continuous is ON then you are asked to pick another end point and another Rotated dimension is created with the start of the Rotated dimension being the previous dimension end, and the dimension point is the same as the previous dimension point.

The **2D (plan) distance** is calculated between the previous dropped selected point and the new selected point dropped onto the line with the user given angle (Rotation) going through the first selected point.

This repeats until Continuous is toggle OFF and then the next selected end point is the last Rotated dimension in the sequence.



For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.6 Aligned Segment

Aligned segment labels the **2D distance** between the start and end vertices of a selected segment. The segment can be straight, arc or a transition.

The dimension is added to the model given in the CAD toolbar.

Note that this is **not** the same as the length of a segment for an arc, a transition or offset transition.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the segment

Select **Aligned segment** and the following message is written to the screen message area

<[Pick segment] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]

If Association is **ON** then the dimension is associated with the selected segment.

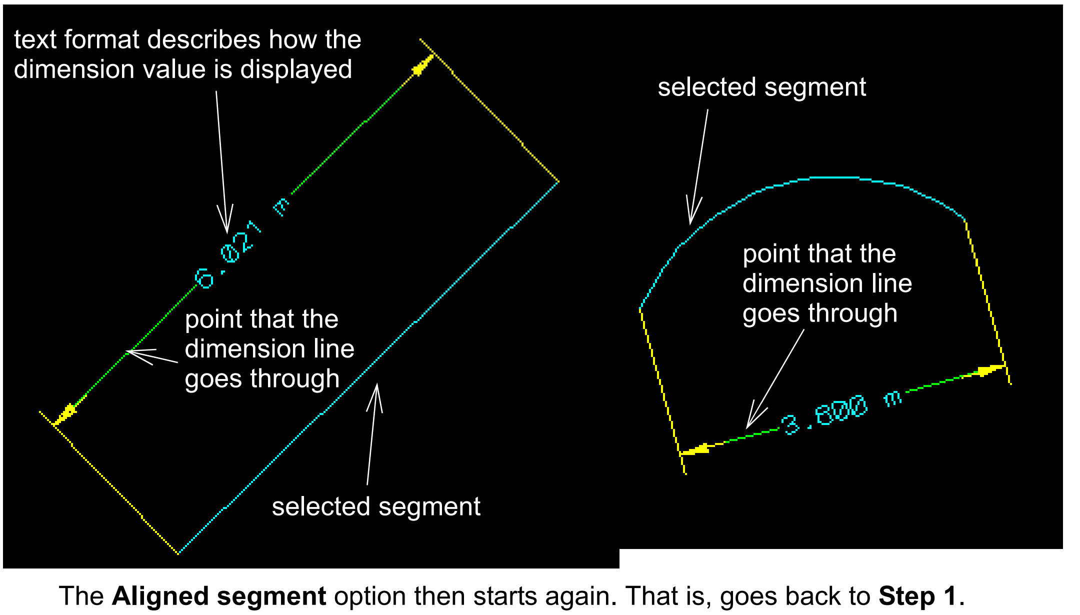
The 2D distance is calculated between the start and end vertices of the selected segment.

Step 2.Pick the point that the dimension line will go through (dimension point)

The following message is then written to the left hand side of the screen message area.

<Pick dimension point> [picks][fast][Menu]

The dimension line is then drawn parallel to the line from the start to the end vertices of the segment and going through the dimension point.



The **Aligned segment** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.7 Horizontal Segment

Horizontal segment labels the horizontal distance (delta x) between the start and end vertices of a selected segment. The segment can be straight, arc or a transition.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the segment

Select Horizontal segment and the following message is written to the screen message area

<[Pick segment] (a)ssociative (s)tyle[default] forma(t) [(c)ontinuous OFF] > [picks][fast][Menu]

If Association is **ON** then the dimension is associated with the selected segment.

The horizontal distance (delta x) is calculated between the start and end vertices of the selected segment.

Step 2.Pick the point that the dimension line will go through (dimension point)

The following message is then written to the screen message area.

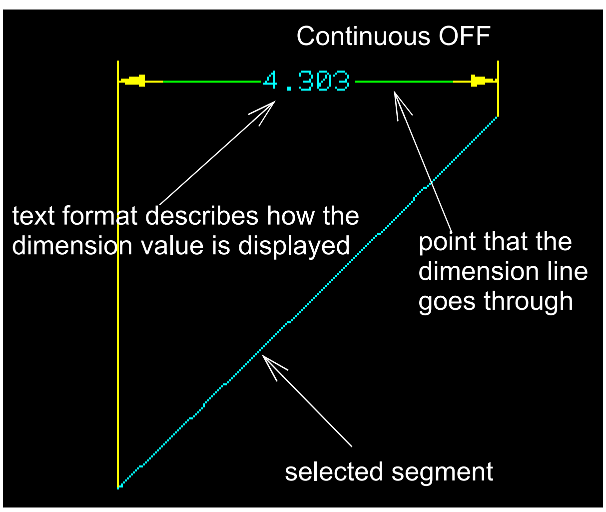
<Pick dimension point> [picks][fast][Menu]

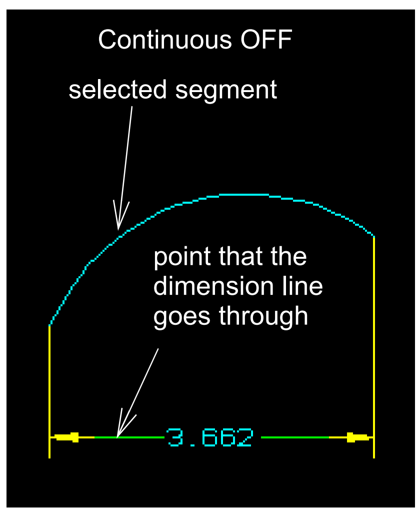
The horizontal dimension line is then drawn parallel to the x-axis going through the dimension point.

Step 3.I

If Continuous is **OFF**

The **Horizontal segment** option then starts again. That is, goes back to **Step 1.**

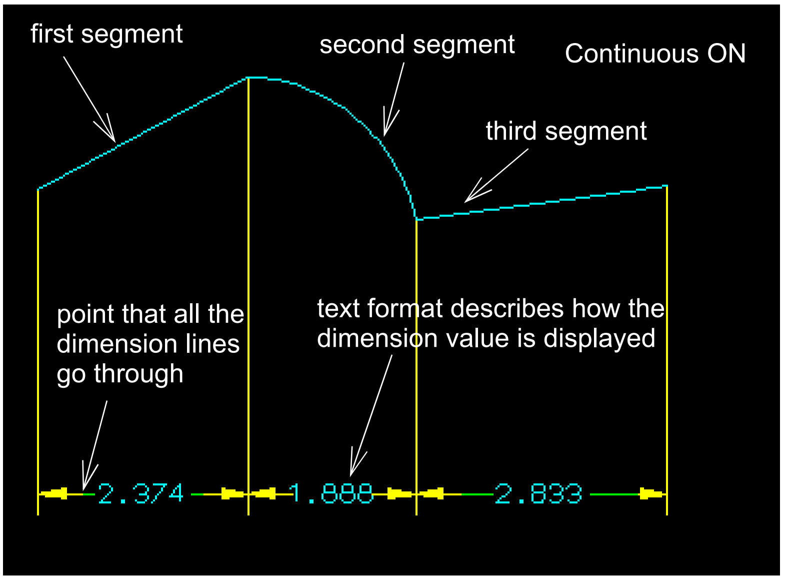




If Continuous is **ON**

If Continuous is **ON** then you are asked to pick another segment and another Horizontal segment dimension is created for the next segment and the dimension point is the same as the previous dimension point.

This repeats until Continuous is toggle **OFF** and then the next selected segment is the last horizontal dimension in the sequence.



For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.8 Vertical Segment

Vertical segment labels the vertical distance (delta y) between end vertices of a selected segment.The segment can be straight, arc or a transition.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the segment

Select Vertical segment and the following message is written to the screen message area

```
<[Pick segment] (a)ssociative (s)tyle[default] forma(t) [(c)ontinuous OFF] > [picks][fast][Menu]
```

If Association is **ON** then the dimension is associated with the selected segment.

The vertical distance (delta y) is calculated between the start and end vertices of the selected segment.

Step 2.Pick the point that the dimension line will go through (dimension point)

The following message is then written to the screen message area.

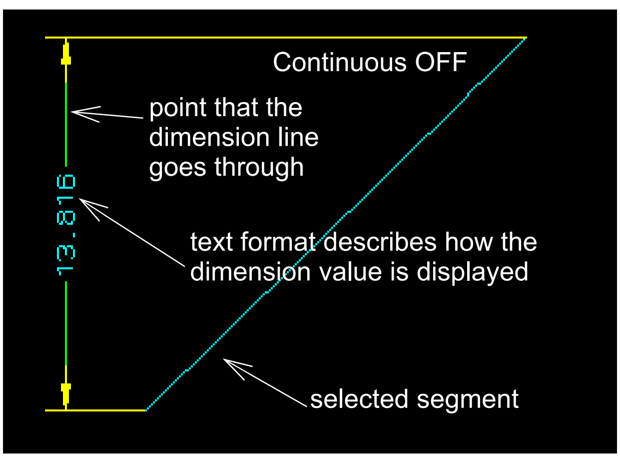
```
<Pick dimension point> [picks][fast][Menu]
```

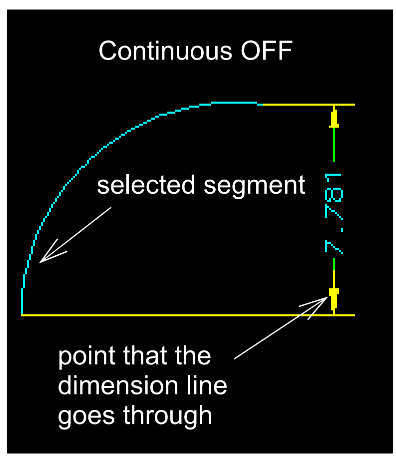
The vertical dimension line is then drawn parallel to the y-axis going through the dimension point.

Step 3.I

If Continuous is **OFF**

The **Vertical segment** option then starts again. That is, goes back to **Step 1**.

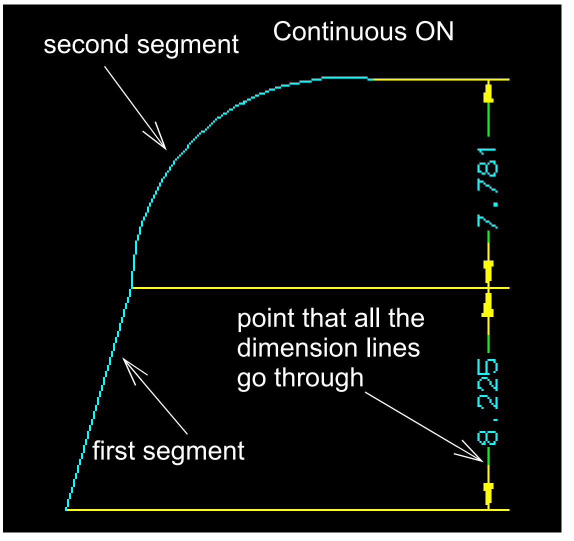




If Continuous is **ON**

If Continuous is **ON** then you are asked to pick another segment and another Vertical segment dimension is created for the next segment and the dimension point is the same as the previous dimension point.

This repeats until Continuous is toggle **OFF** and then the next selected segment is the last vertical dimension in the sequence.



For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.6.9 Rotated Segment

Rotated segment labels the 2D distance between the start vertex of a segment, and the end vertex of the segment dropped onto the line with a user given angle (Rotation) and going through the first vertex.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.

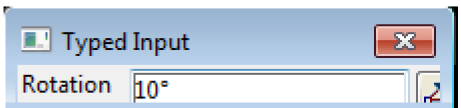
Select **Rotated segment** and the following message is written to the screen message area

<[Pick segment] (a)ssociative (s)tyle[default] forma(t) [(c)ontinuous OFF] an(g)le[10°] > [picks][fast][Menu]

If Association is **ON** then the dimension is associated with the selected segment.

Step 2.Type g to Change the Rotation Value

If the Rotation is to be changed, type **g** or **G** and the **Rotation** *Typed Input* box is then displayed.



Type in the Rotation value and press <Enter>.

The Rotation is in degrees in hp notation and is measured in an anticlockwise direction from the positive x axis.

Step 3.Pick the segment

The following message is written to the screen message area.

<[Pick segment] (a)ssociative (s)tyle[default] forma(t) [(c)ontinuous OFF] an(g)le[10°] > [picks][fast][Menu]

If Association is **ON** then the dimension is associated with the selected segment.

Step 4.Pick the point that the dimension line will go through (dimension point)

The following message is then written to the screen message area.

<Pick dimension point> [picks][fast][Menu]

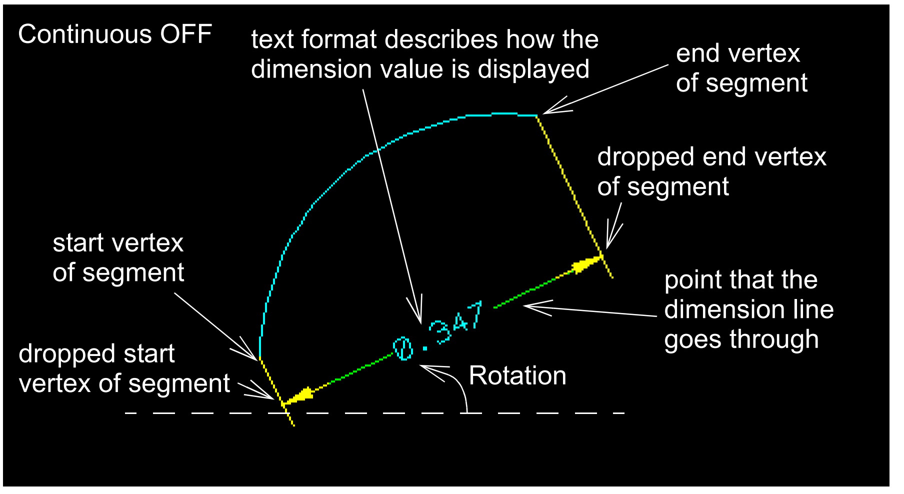
The **2D (plan) distance** is calculated between the start of the segment and the end of the segment dropped onto the line with the user given angle (Rotation) going through the start of the selected segment.

The dimension line is then drawn with the angle of the dimension line equal to the entered **Rotation**.

Step 5.

If Continuous is **OFF**

The **Rotated** option then starts again. That is, goes back to **Step 1.**



If Continuous is **ON**

If Continuous is ON then you are asked to pick another segment. The Rotation angle can also be changed.

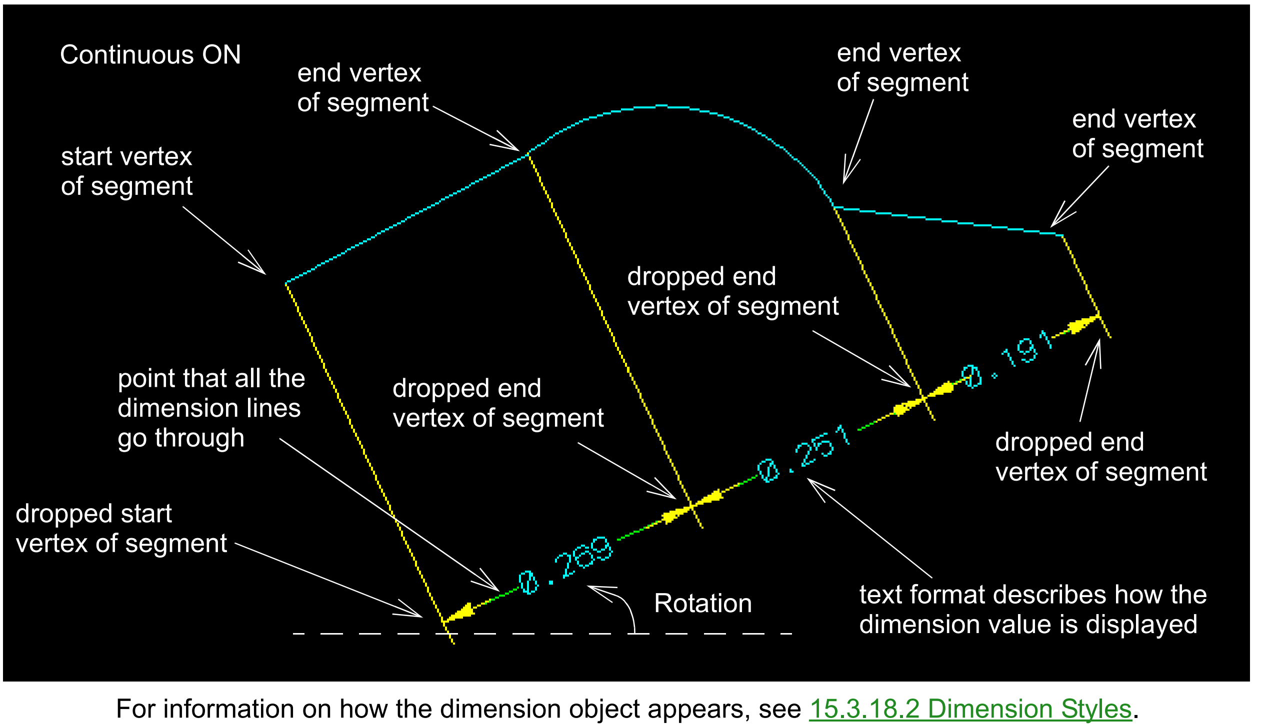
```
<[Pick segment] (a)ssociative (s)tyle[default] forma(t) [(c)ontinuous ON] an(g)le[10°] > [picks][fast][Menu]
```

When another segment is selected, the start and end vertices are dropped onto the line with the user given angle (Rotation) going through the current dimension point.

The **2D (plan) distance** is calculated between the dropped ends of the segment.

This repeats until Continuous is toggle **OFF** and then the next selected segment is the last **Rotated segment** dimension in the sequence.

The **Rotated segment** option then starts again. That is, goes back to **Step 1**.



For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.7 Length

Length labels the **2D length** of a selected **segment**. The segment may be a straight, arc, transition or offset transition.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles association **ON** and **OFF**. See 15.3.1 Dimension Association
c or **C** toggles Continuous **ON** and **OFF**. See 15.3.2 Continuous Mode
o or **O** toggles offset **ON** and **OFF**. See An Important Note about the Offset Toggle
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the segment

Select **Length** and the following message is written to the screen message area

<[Pick segment] (a)ssociative (s)tyle[default] forma(t) [(o)ffset ON] [(c)ontinuous OFF] > [picks][fast][Menu]

If **association** is **ON** then the dimension is associated with the selected segment.

Note: Continuous mode is only available if **offset** is **ON**.

The 2D length of the selected segment is calculated.

Step 2.Pick the dimension point

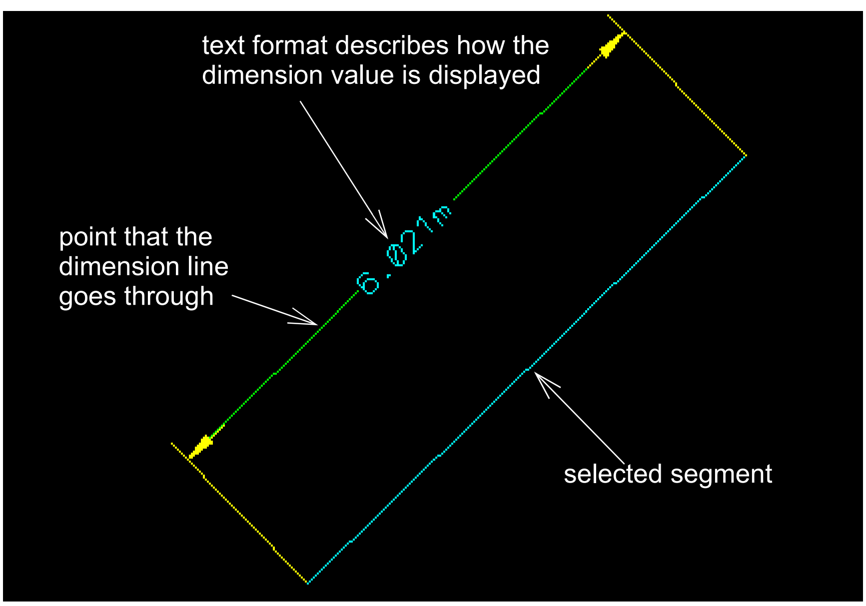
The following message is then written to the screen message area.

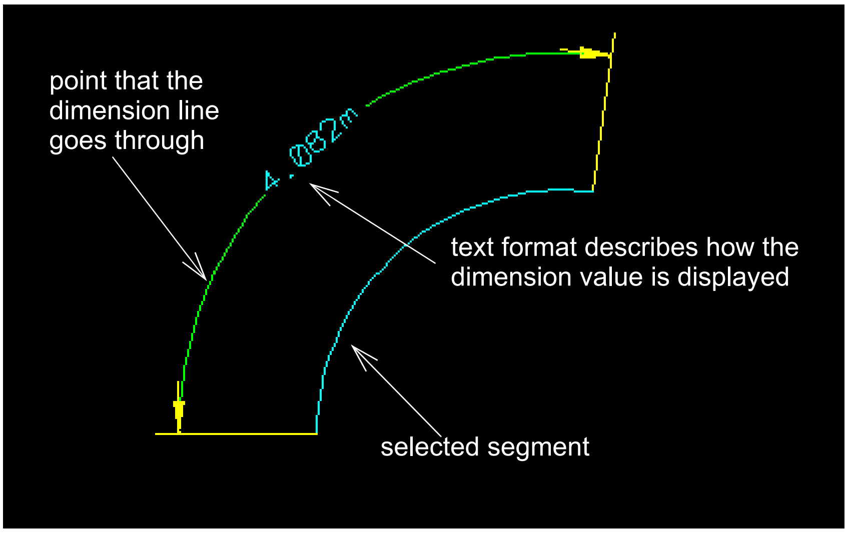
<Pick dimension point> [picks][fast][Menu]

The dimension line is then drawn parallel to the segment and going through the dimension point.

If **offset** is **ON** then the distance between the dimension point and the segment (the offset distance) is remembered with the dimension.

If **offset** is **OFF** then the dimension point itself is remembered with the dimension.





Step 3.I

If **Continuous** is **OFF:**

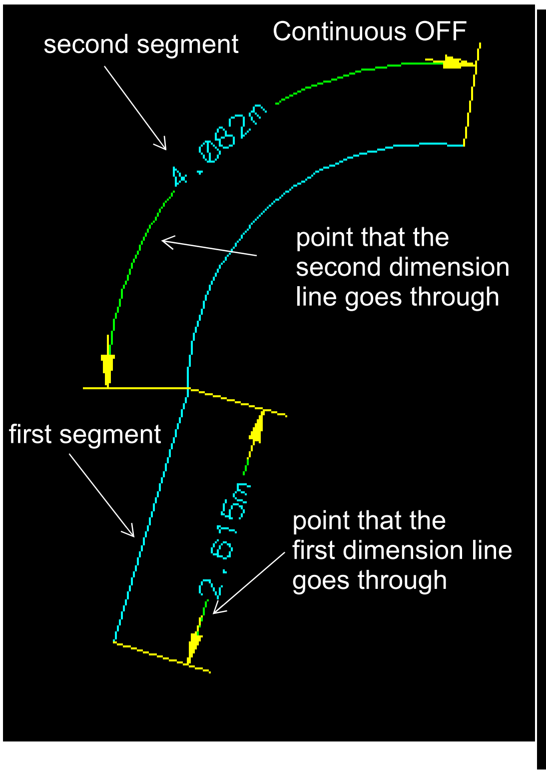
The **Length** option then starts again. That is, goes back to **Step 1**.

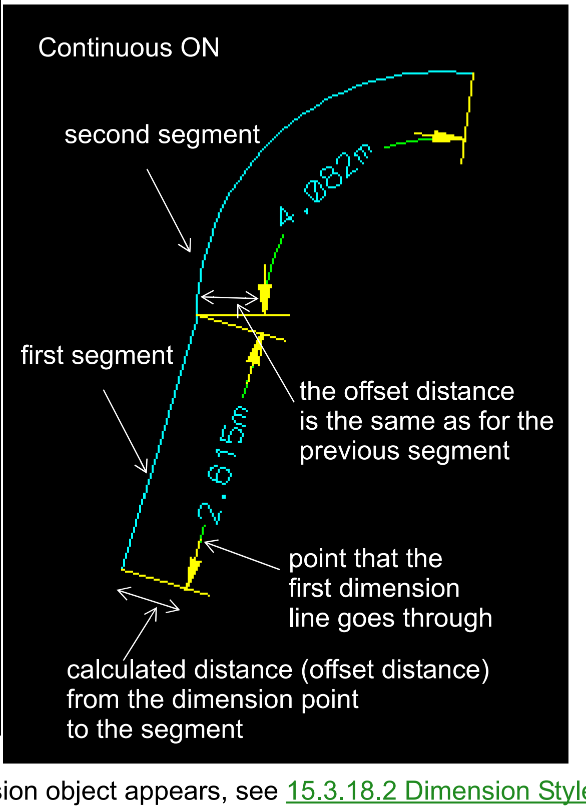
Continuous is **ON** (and for that **Offset** must also be ON):

If Continuous is **ON** then you are asked to pick another segment and another Length dimension is created for the next segment. The distance the dimension line is from the segment (offset distance) is the same as it was for the previous segment.

This repeats until Continuous is toggle **OFF** and then the next selected segment is the last Length dimension in the sequence.

The **Length** option then starts again. That is, goes back to **Step 1**.





For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

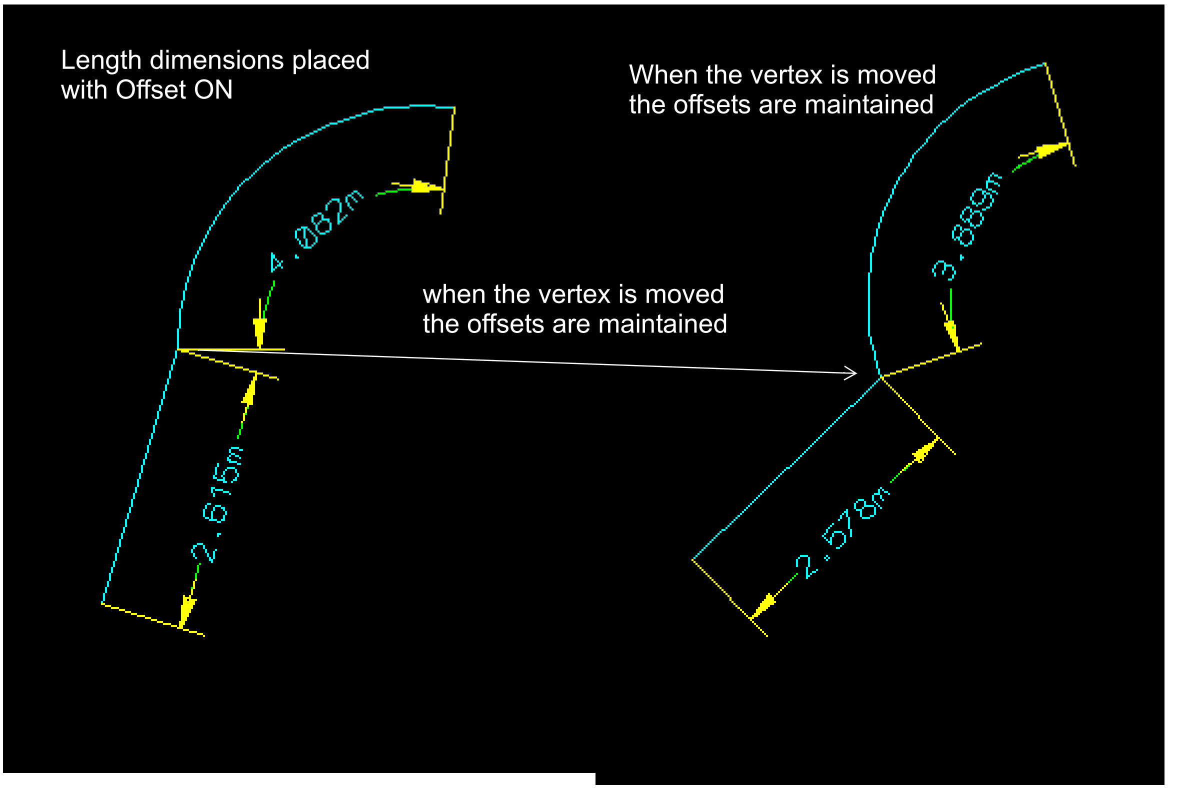
An Important Note about the Offset Toggle

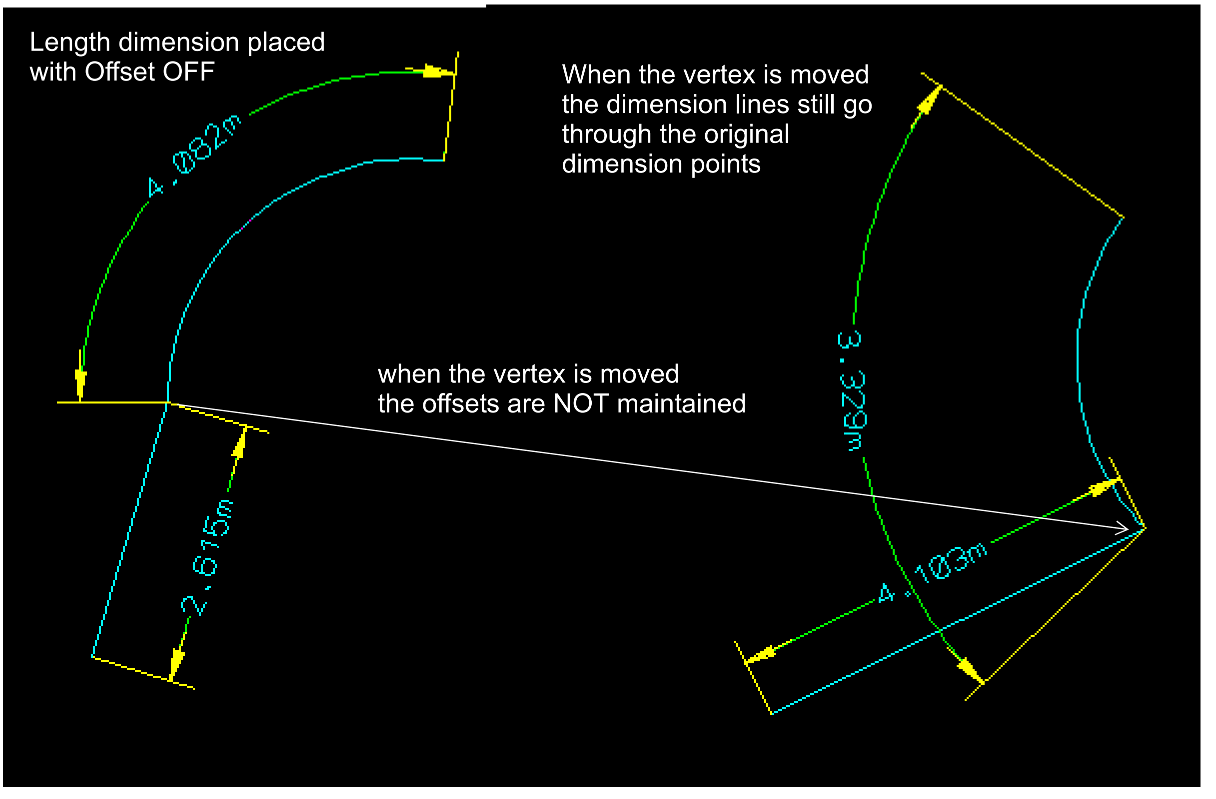
When the dimension line is first drawn, the difference between **Offset ON** and **Offset OFF** is not apparent.

But when you move a vertex and the associated **Length** dimensions go with it, the difference is move obvious.

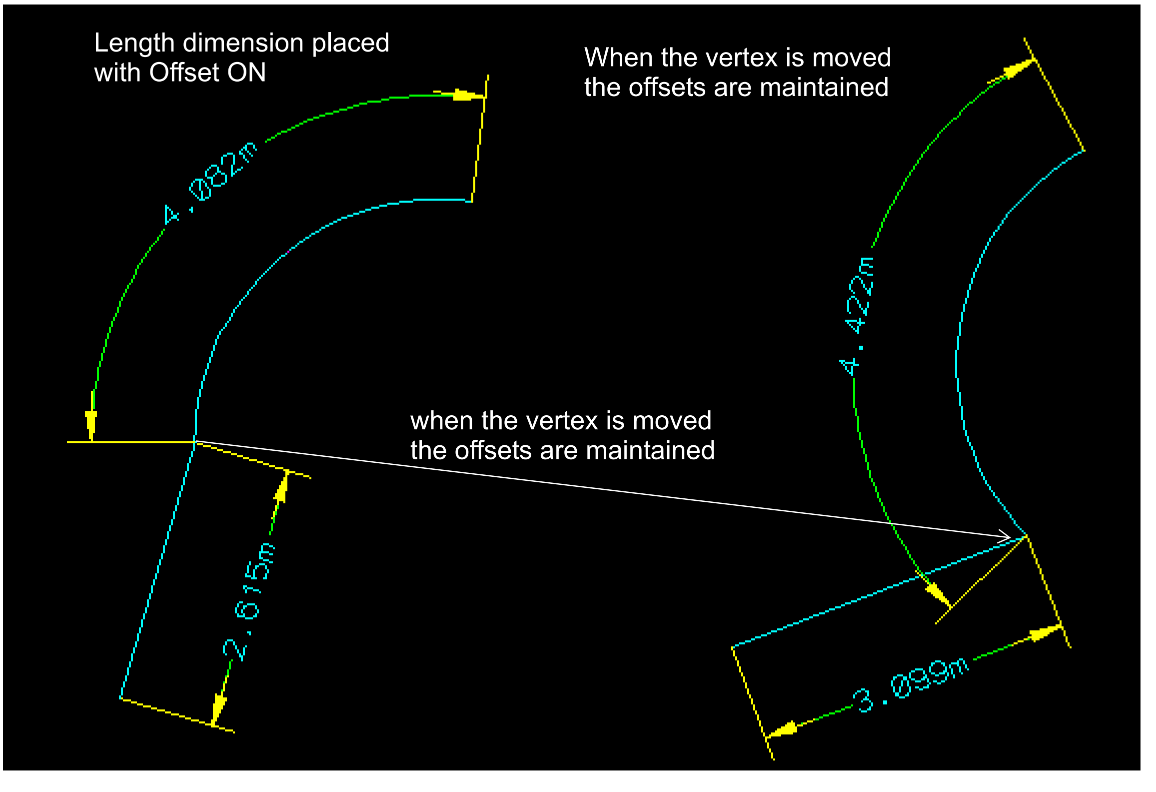
For the **Length** dimensions that are created with **Offset ON**, the **original offsets** are **maintained**. So the new dimension lines will be the same parallel distance from the segments as when they were originally dimensioned.

For the **Length** dimensions that are created with **Offset OFF**, the **original dimensions points** are **maintained**.So the new dimension lines will go through the original dimension points and so their parallel distance from the segments will be totally different from before





Length dimension placed
with Offset OFF
4.082m
2.615m
When the vertex is moved
the dimension lines still go
through the original
dimension points
3.329m
when the vertex is moved
the offsets are NOT maintained
4.103m



Length dimension placed
with Offset ON
4.082m
2.615m
When the vertex is moved
the offsets are maintained
4.422m
when the vertex is moved
the offsets are maintained
3.099m

15.3.8 Drop Segment

Drop segment labels the 2D distance between a selected point, and the point is dropped perpendicularly onto a selected base segment.

If the base segment is a line then the drop may occur on the extended segment.

If the base segment is an arc then it will drop to the outside or inside of the visible part of the arc.

If the base segment is a circle then the drop will go to the inside or outside of the circle depending on whether the point is inside or outside the circle.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles
z or **Z** toggles *Zero Offset* mode **ON** and **OFF**. See 15.3.4 Zero Offset Mode

Step 1.

Select **Drop segment** and the following message is written to the screen message area

```
<[(a)ssociation ON] Pick start point or change format (t)ext (s)tyle[d1] [(z)ero offset ON] > [picks][fast][Menu]
```

Pick the start point.

If Association is **ON** then the start of the dimension is associated with the selected start point.

Step 2.

The following message is written to the screen message area asking for a segment to be selected. The segment can be a straight, an arc, a transition or an offset transition.

```
<[(a)ssociation ON] Pick base segment> [picks][fast][Menu]
```

Pick the segment.

If Association is **ON** then the end of the dimension is associated with the selected segment.

The picked point is dropped perpendicularly onto the selected segment (or the extended line segment) and the 2D distance is calculated between these two points.

Step 3.

If **Zero Offset** is **OFF**, the following message is then written to the screen message area.

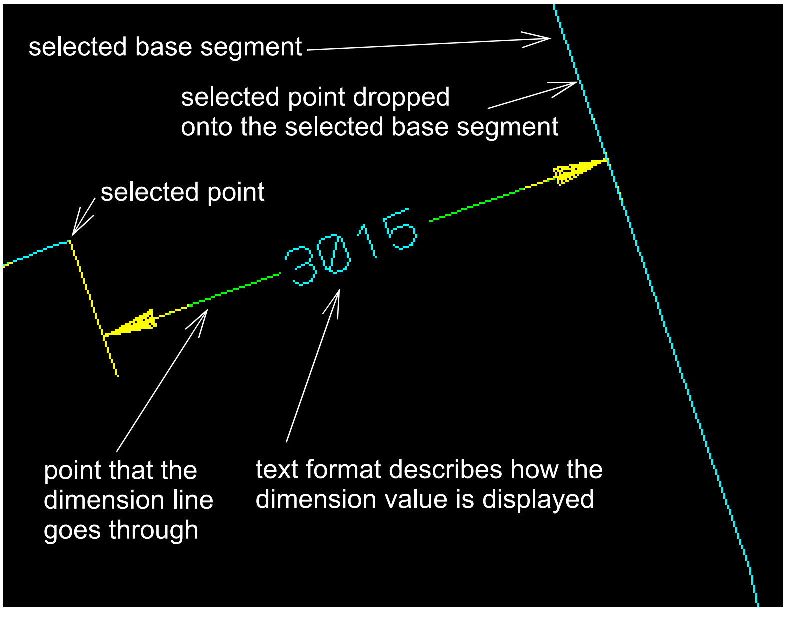
```
<Pick dimension point> [picks][fast][Menu]
```

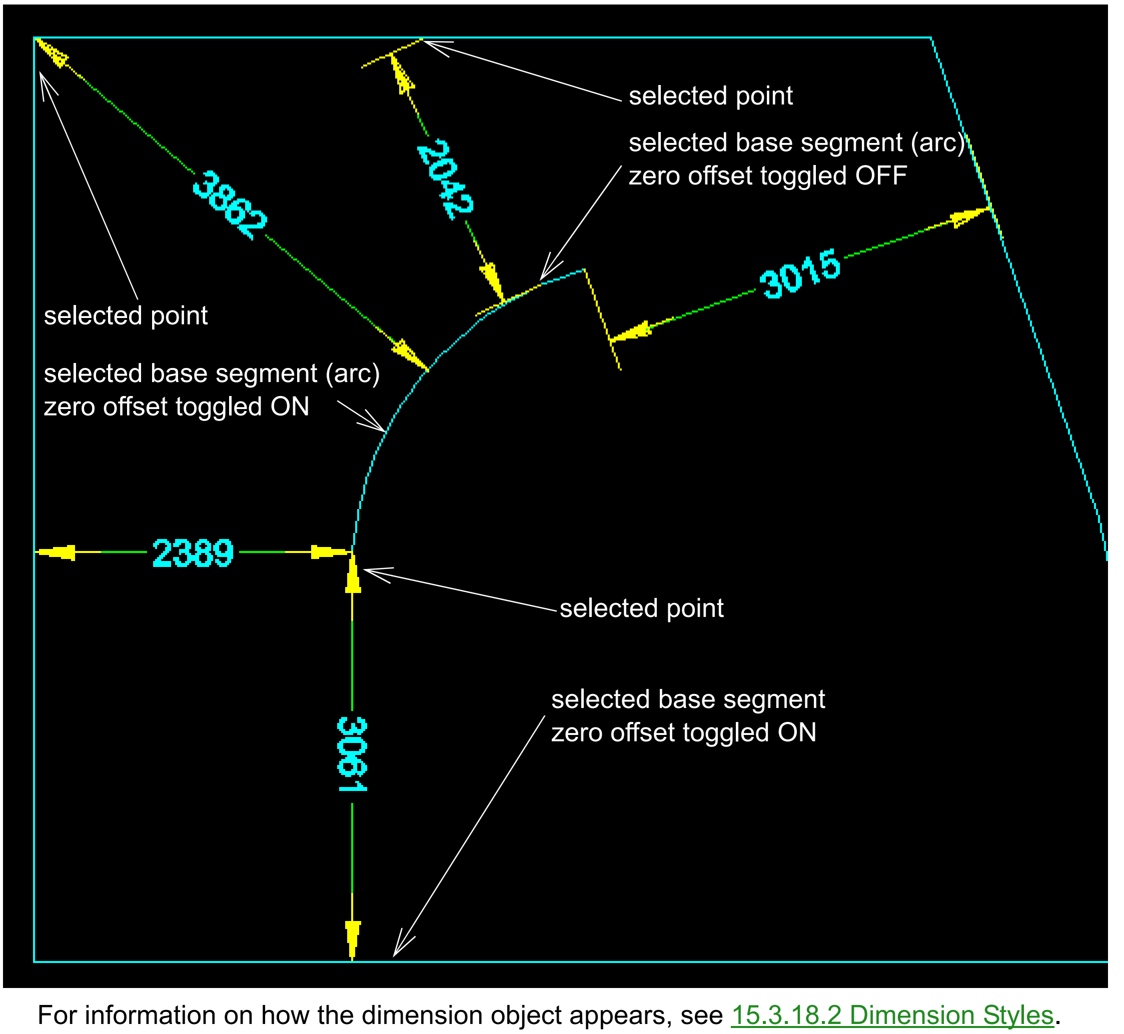
Pick the point that the dimension line will go through (dimension point).

The dimension line is then drawn parallel to the line between the selected point and the selected point dropped perpendicularly onto the selected segment, and going through the dimension point.

If **Zero Offset** is **ON**, then no dimension point is picked because the dimension point is taken to be on the line joining the picked point and the dropped point.

For both cases of **Zero Offset**, the **Drop segment** option then starts again. That is, goes back to **Step 1**.



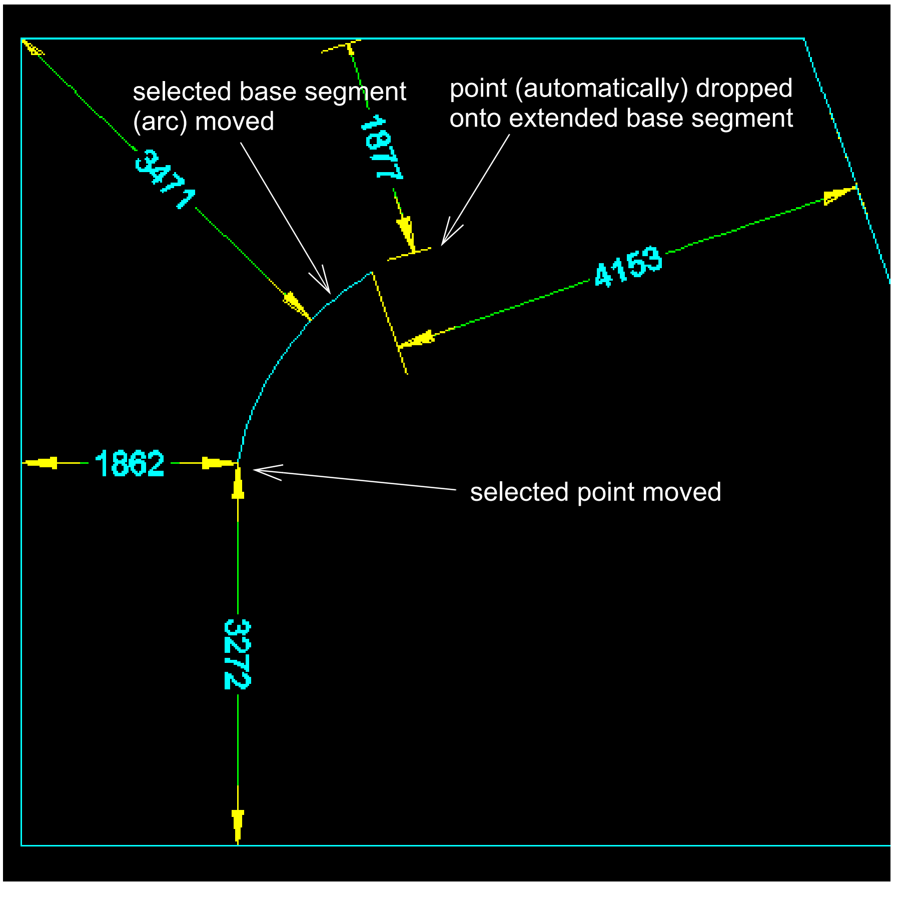


For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

Note on Automatic Recalculation of Drop Segment Dimension When the Point or Segment Moves

When **Association** in turned **ON**, the picked point and the picked base segment are associated with the *Drop segment* dimension. So if either the picked point or the picked base segment is moved, the drop dimensions automatically recalcs.

Also note that the drop onto the base segment may involve the extended base segment because the drop point may not be between the end points of the selected base segment.



15.3.9 Drop String

Drop string labels the 2D distance between a selected point and the point dropped onto a selected base string.

By Dropped onto a string we mean that the point is first checked to see that it can be dropped perpendicularly onto a segment of the selected string (not an extended segment), or if there is no segment that the point can drop perpendicularly onto then it will drop onto the **nearest vertex** of the string.

If the base string is an arc then it will drop to the outside or inside of the visible part of the arc.

If the base string is a circle then the drop will go to the inside or outside of the circle depending on whether the point is inside or outside the circle.

Hence **Drop string** will always end on the base string.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the start point

Select **Drop string** and the following message is written to the screen message area

```
<[Pick start point] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]
```

If Association is **ON** then the start of the dimension is associated with the selected start point.

Step 2.Pick the base string

The following message is written to the screen message area asking for a base string to be selected.

```
<(a)ssociative Pick base string> [picks][fast][Menu]
```

If Association is **ON** then the end of the dimension is associated with the selected base string.

The picked point is dropped onto the selected base string and the 2D distance is calculated between these two points.

The dimension line is then drawn between the selected point and the selected point dropped onto the selected base string.

The **Drop string** option then starts again. That is, goes back to **Step 1**.

15.3.10 Area

Area labels the plan area of a selected string.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the polygon to dimension

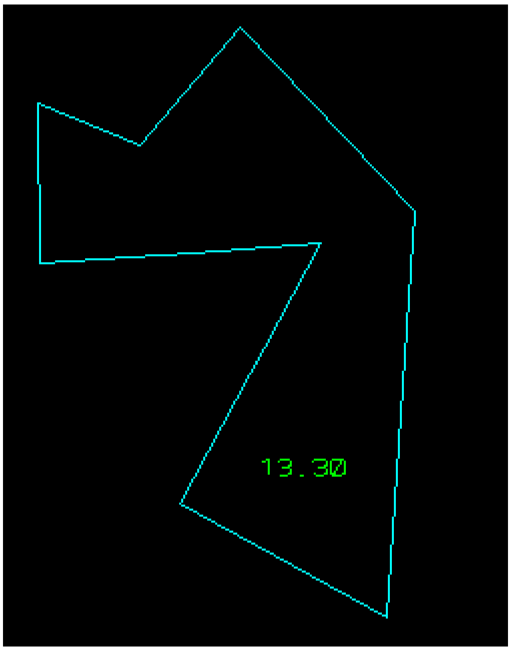
Select **Area** and the following message is written to the screen message area

<[Pick polygon] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]

If Association is **ON** then the dimension is associated with the polygon.

If the selected string is not closed, the area is calculated for the polygon formed by joining the first and last vertices of the string.

The plan area is calculated for the polygon and placed inside the polygon.



The **Area** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.11 Jogged radius

This option has not yet been completed

- radius of a selected arc with jog

  Pick an arc or a segment with a radius.

  Then pick the start point of the jog and then the dimension point.

  A dimension line is draw with a start symbol at the start and then a job between the dimension point and the start point of the jog.

The dimension is added to the model given in the CAD toolbar.

15.3.12 Diameter

This option has not yet been completed

Diameter labels the diameter of an arc or a segment with a non zero radius.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.

Select Diameter and the following message is written to the screen message area

<[(A)ssociation ON] Pick arc or choose (s)tyle[diags - yes fixed len dim line] > [picks][fast][Menu]

Pick the arc or segment with non zero radius.

If Association is **ON** then the dimension is associated with the selected arc or segment.

The segment must have a radius. That is, it can't be a line segment.

The diameter is calculated for the arc or segment.

Step 2.

The following message is then written to the left hand side of the screen message area.

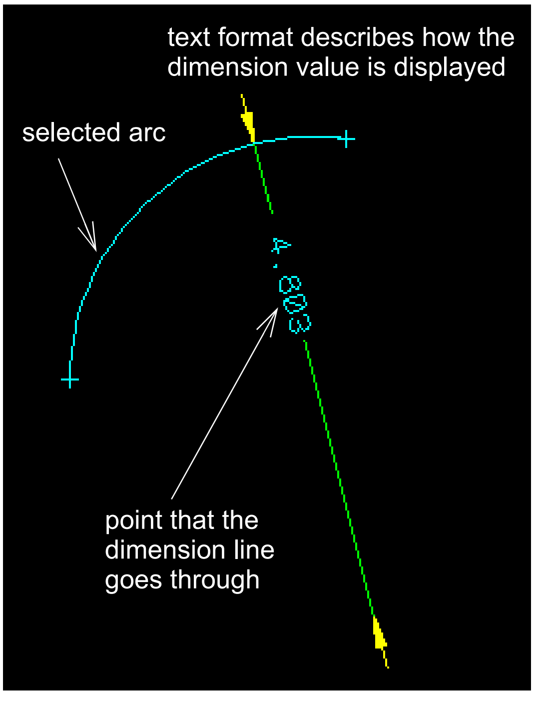
<Pick dimension point> [picks][fast][Menu]

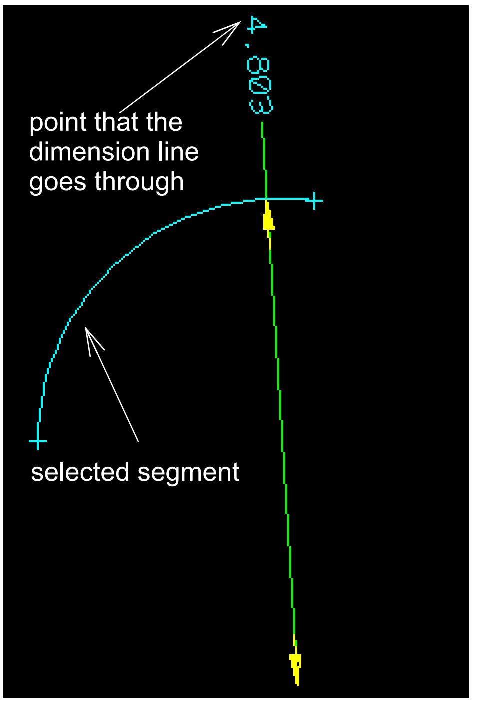
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders

Pick the point that the dimension line will go through (dimension point).

The dimension line is then drawn from the centre of the arc and through the dimension point and onto the arc. The text is placed at the dimension point.

If the dimension point is outside the arc, the dimension line continues through the arc.





The **Diameter** option then starts again. That is, goes back to Step 1.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.13 Radius

This option has not yet been completed

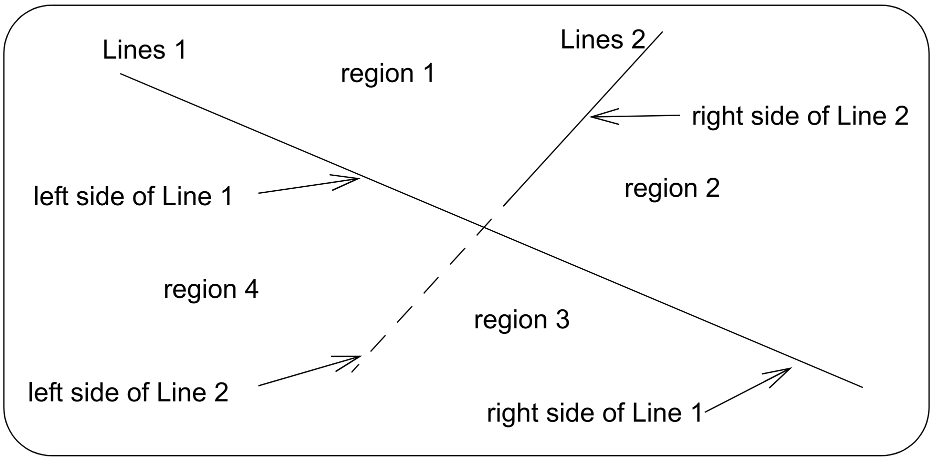
Radius of an arc or of a segment with a radius.

The dimension is added to the model given in the CAD toolbar.

15.3.14 Angle 2 Lines

Angle 2 lines labels the angle between two selected lines.

To define this dimension, the intersection point of the two extended lines divides the extended lines into two sides and the plane into four regions.



Although the lines can only be initially picked by the non extended part of the lines, the dimension can go between any of the halves of the extended lines.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders.
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the side to start the dimension from

Select **Angle 2 lines** and the following message is written to the screen message area

<[Pick start side] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]

If Association is **ON** then the start of the dimension is associated with the selected start line.

Step 2.Pick the side to end the dimension on

The following message is written to the screen message area.

<[Pick end side] (a)ssociative > [picks][fast][Menu]

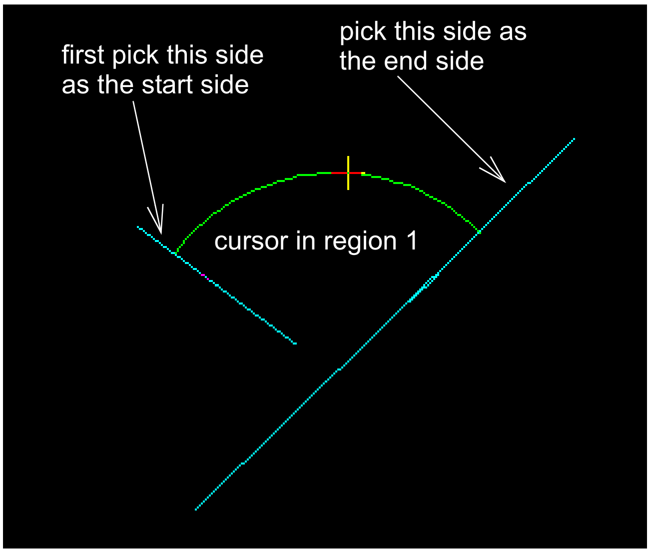
If Association is **ON** then the end of dimension is associated with the selected end line.

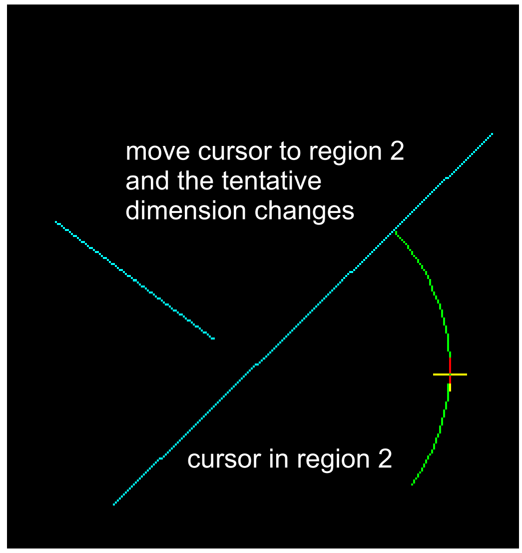
Step 3.

The following message is then written to the left hand side of the screen message area.

<Pick dimension point or reverse (d)irection (s)tart (e)nd line extension> [picks][fast][Menu]

As you move your cursor between the four regions, you will see the dimension line display as if the cursor was the selected dimension point.



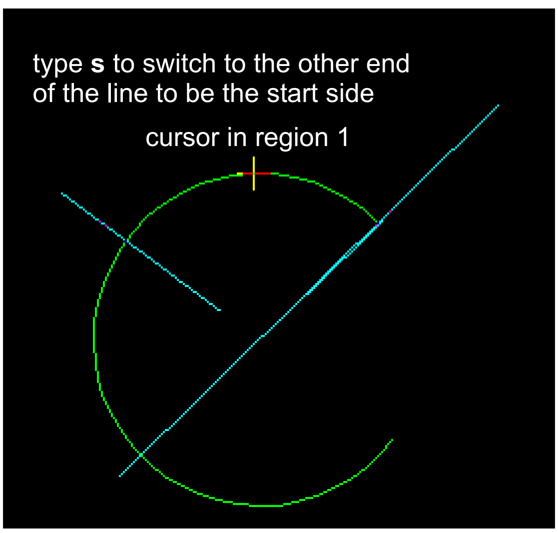


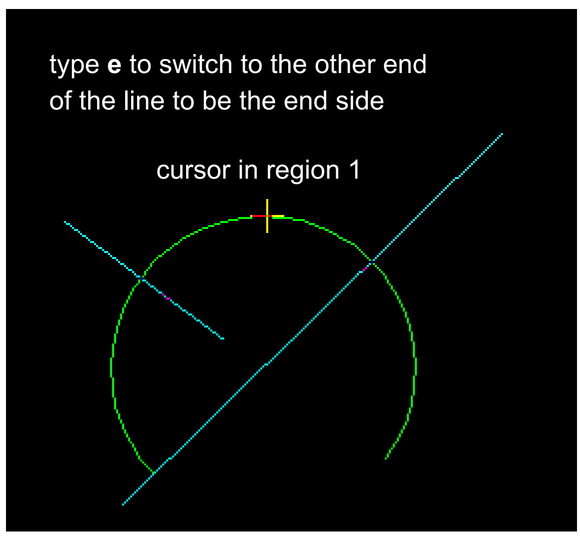
s or **S** takes the other end of the first line to start the dimension on.

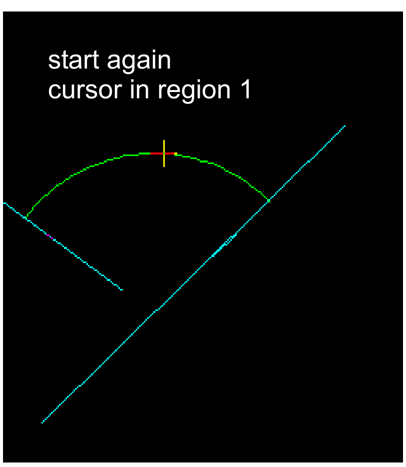
e or **E** takes the other end of the second line to end the dimension on.

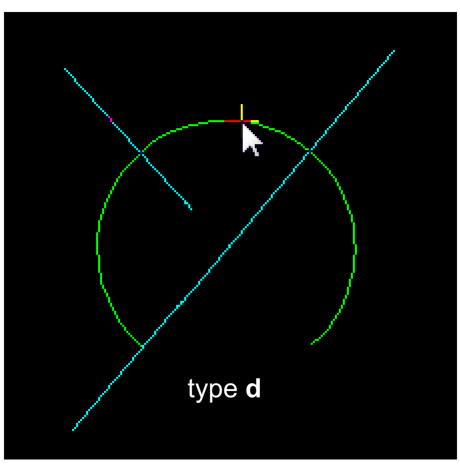
d or **D** toggles between a clockwise and counter clockwise angle for the dimension arc.

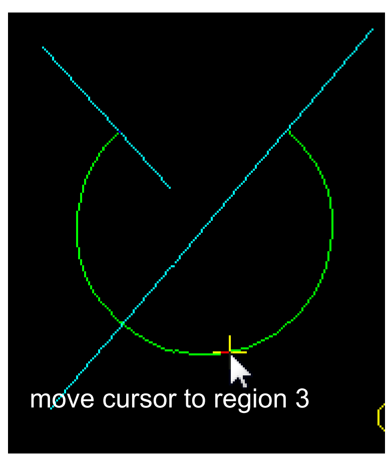
t or **T** can be typed to change the text format. See 15.5 Text Format for Dimensions and Leaders.





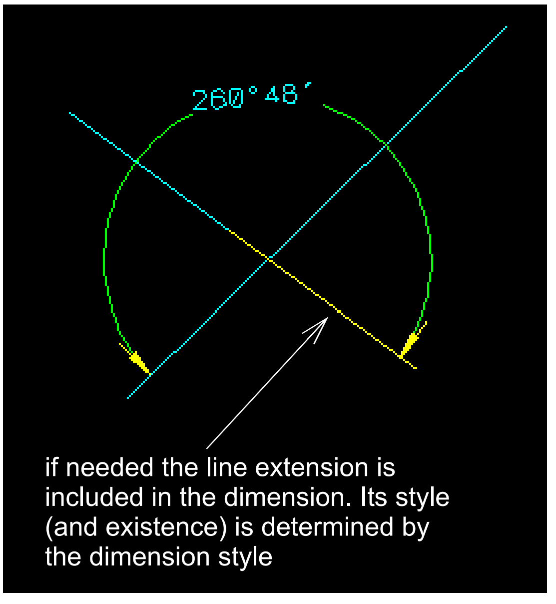


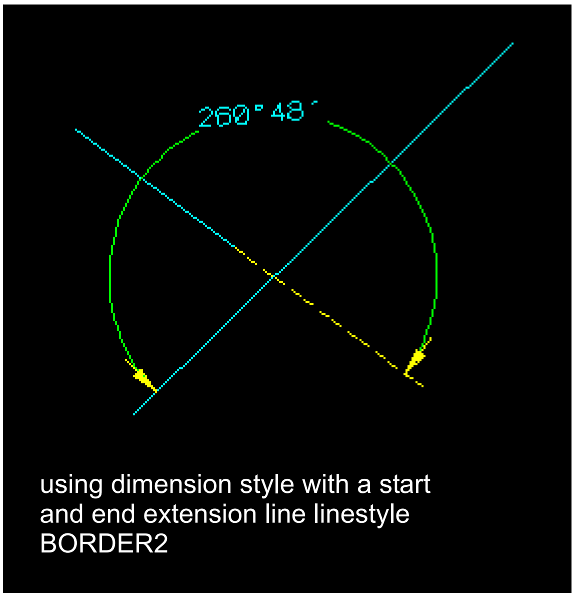




Pick the point that the dimension line will go through (dimension point).

The dimension line is then drawn from the start side to the end side and going through the dimension point.





The **Angle 2 lines** option then starts again. That is, goes back to **Step 1.**

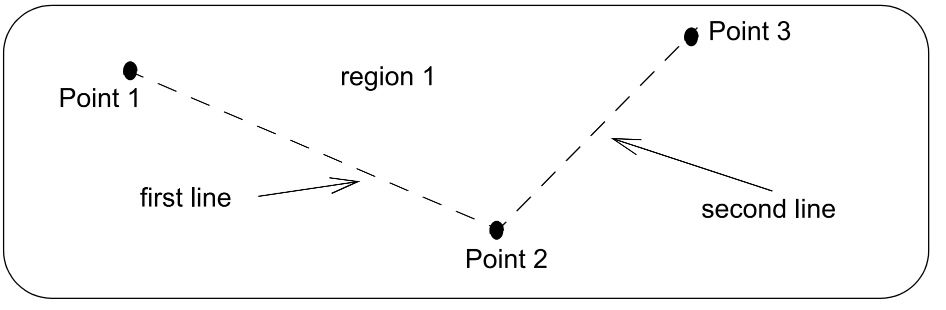
For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.15 Angle 3 points

Angle 3 points labels the angle between two temporary lines defined by 3 points. That is, it labels the angle between two lines that are constructed from the three points.

The first point is the start of the first line, the second point is the end of the first line and the start of the second line and the third point in the end of the second line.

The dimension is added to the model given in the CAD toolbar.



a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders.
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the first point of the first line

Select **Angle 3 points** and the following message is written to the screen message area

<[Pick start point] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]

If Association is **ON** then the start of the dimension is associated with the selected point.

Step 2.Pick the second point that is the end of the first line and the start of the second line

The following message is written to the screen message area.

<[Pick vertex point] (a)ssociative > [picks][fast][Menu]

If Association is **ON** then the vertex of the dimension is associated with the selected point.

Step 3.Pick the third point that is the end of the second line

The following message is written to the screen message area.

<[Pick end point] (a)ssociative [(d)irection counter-clockwise] > [picks][fast][Menu]

If Association is **ON** then the end of the dimension is associated with the selected point.

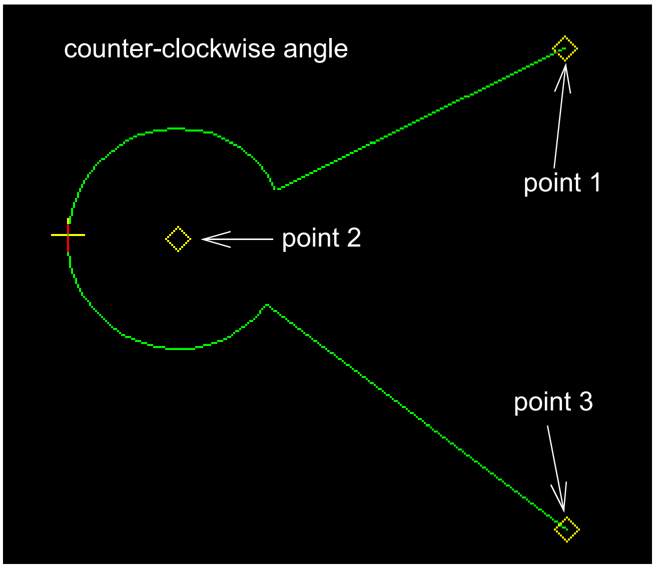
Step 4.Pick the point that the dimension arc will go through (dimension point)

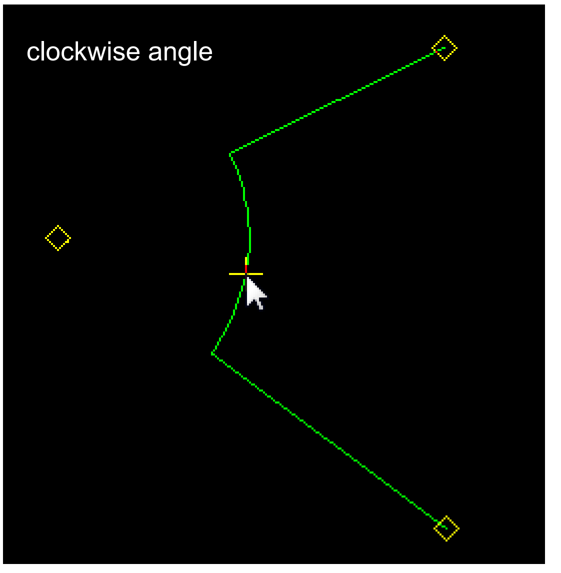
The following message is then written to the screen message area.

<[Pick dimension point] [(d)irection clockwise] > [picks][fast][Menu]

As you move your cursor you see how large the line of dimensions arc will be.

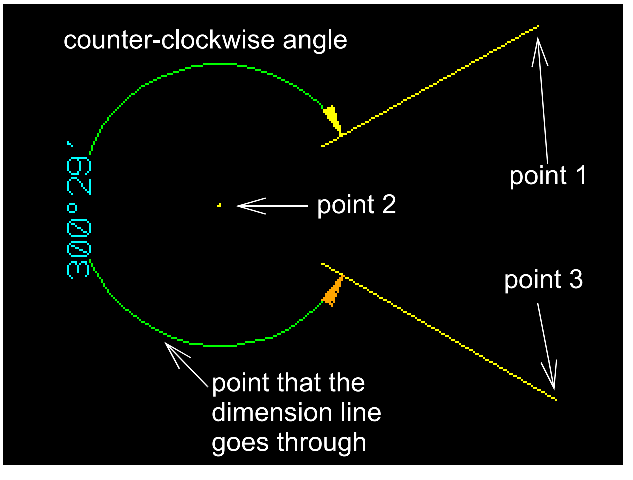
d or **D** toggles between a counter-clockwise and clockwise angle for the dimension arc.

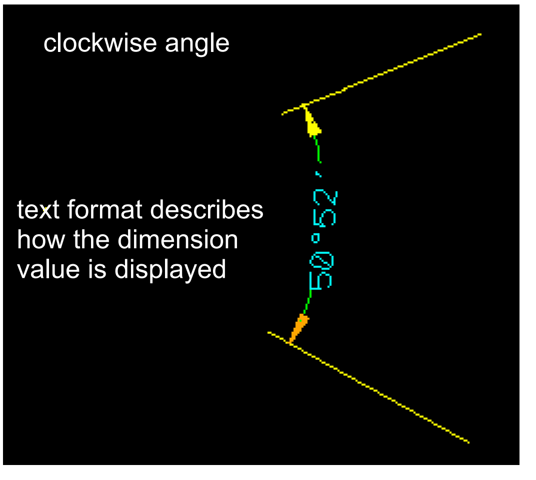




When the dimension point is selected, the dimension arc is drawn from the start side to the end side and going through the dimension point.

The **Angle 3 points** option then starts again. That is, goes back to **Step 1**.





For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.16 Angle Arc

Angle arc labels the angle subtended by an existing arc, or of a segment with a radius.

The dimension is added to the model given in the CAD toolbar.

a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.Pick the arc of arc segment to dimension

Select **Angle arc** and the following message is written to the screen message area

<[Pick segment] (a)ssociative (s)tyle[default] forma(t) > [picks][fast][Menu]

If Association is **ON** then the dimension is associated with the polygon.

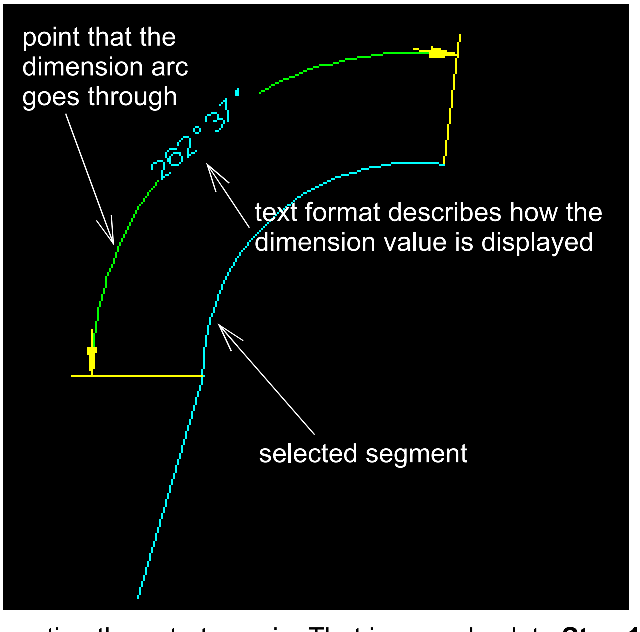
The angle of the arc can then be calculated.

Step 2.Pick the point that the dimension arc will go through (dimension point

The following message is then written to the left hand side of the screen message area.

<Pick dimension point> [picks][fast][Menu]

The dimension arc is then drawn parallel to the arc or segment and goes through the dimension point.



The **Angle arc** option then starts again. That is, goes back to **Step 1**.

For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

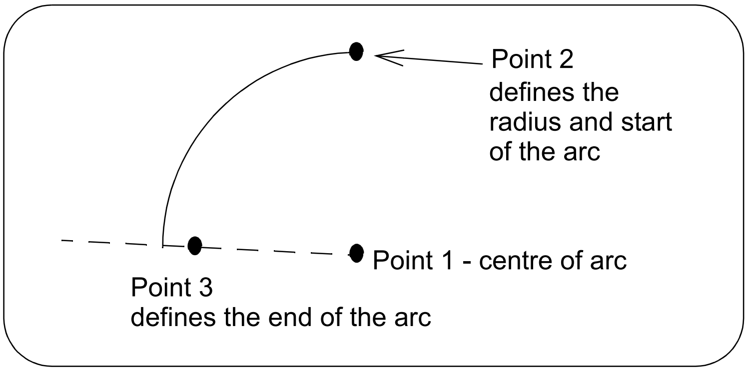
15.3.17 Arc Length by Centre, 2 Points

NOT currently on the menu.

Arc labels the length of an arc where the arc is temporarily defined by picking a centre point and two points on the arc.

Pick a position that will be centre point of the arc, and then the position that will be the first point of arc. This defines the centre, radius and start point of the arc.

A third position is then selected and it is dropped onto the arc defined by the first two points to give the end of the arc. This fully defines a temporary arc.



a or **A** toggles Association **ON** and **OFF**. See 15.3.1 Dimension Association
t or **T** brings up the dimension text format. See 15.5 Text Format for Dimensions and Leaders.
s or **S** brings up the dimension style list. 15.3.18.2 Dimension Styles

Step 1.

Select Arc and the following message is written to the screen message area

```
<[(a)ssociation ON] Pick centre point or choose (s)tyle[paper no clip orang end] c
```

Pick the position to be the centre point of the arc

If Association is **ON** then the start of the dimension is associated with the selected point.

Step 2.

The following message is written to the screen message area.

```
<[(a)ssociation ON] Pick start point> [picks][fast][Menu]
```

Pick the second point is the start of the arc

If Association is **ON** then the vertex of the dimension is associated with the selected point.

Step 3.

The following message is written to the screen message area.

```
<[(a)ssociation ON] Pick end point or change arc (d)irection [counter-clockwise] > [picks][fast][Menu]
```

d or **D** toggles between a counter-clockwise and clockwise angle for the dimension arc.

Pick the third point that is the end of the arc.

If Association is **ON** then the end of the dimension is associated with the selected point.

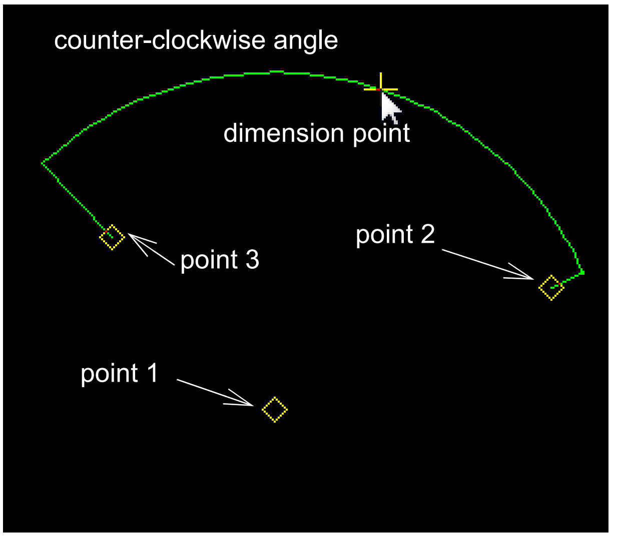
Step 4.

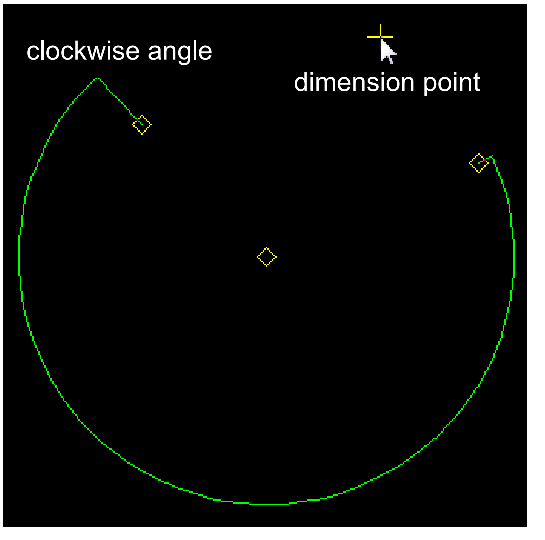
The following message is then written to the left hand side of the screen message area.

<[Pick dimension point] [(d)irection clockwise] > [picks][fast][Menu]

As you move your cursor you see how large the line of dimensions arc will be.

d or **D** toggles between a counter-clockwise and clockwise angle for the dimension arc.

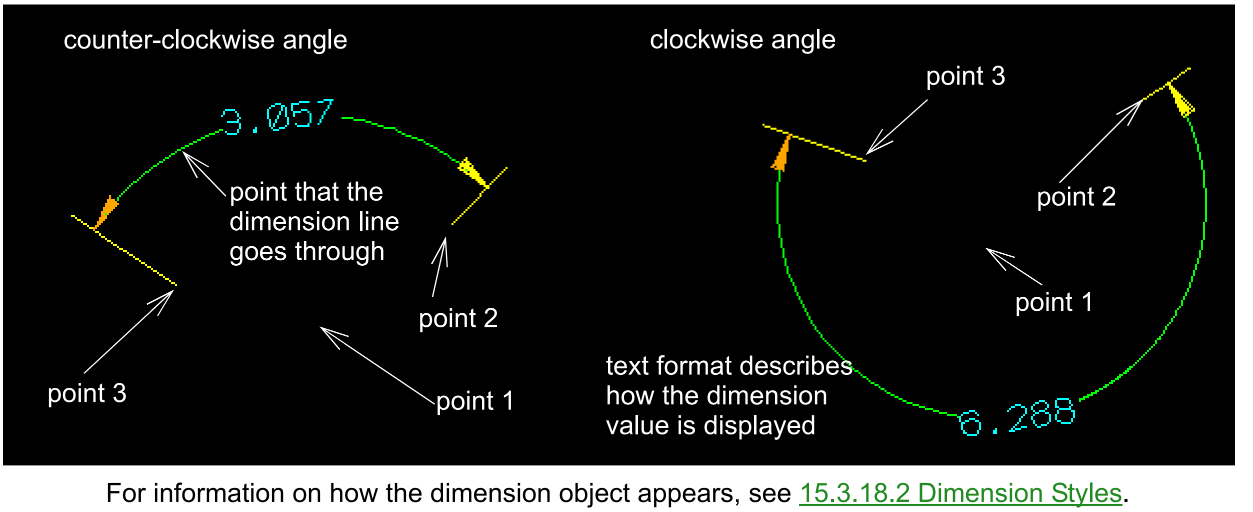




Pick the point that the dimension arc will go through (dimension point).

The dimension arc is then drawn from the start side to the end side and going through the dimension point and labelled with the subtended angle.

The **Arc** option then starts again. That is, goes back to Step 1.

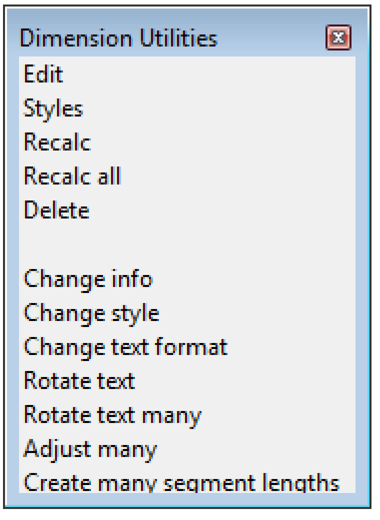


For information on how the dimension object appears, see 15.3.18.2 Dimension Styles.

15.3.18 Dimension Utilities

Position of menu: **Cad =>Dimension =>Utilities**

The **Dimension Utilities** menu is:



edit a dimension
define styles for dimensions

See

15.3.18.1 Dimension Edit
15.3.18.2 Dimension Styles
Recalc - select a dimension to recalc.
Recalc all - recalcs all dimensions.
Delete - select a dimension to delete.
15.3.18.3 Change Style of Dimension
15.3.18.4 Change Text Format
15.3.18.5 Create Many Segment Lengths

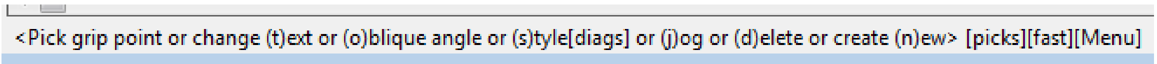
15.3.18.1 Dimension Edit

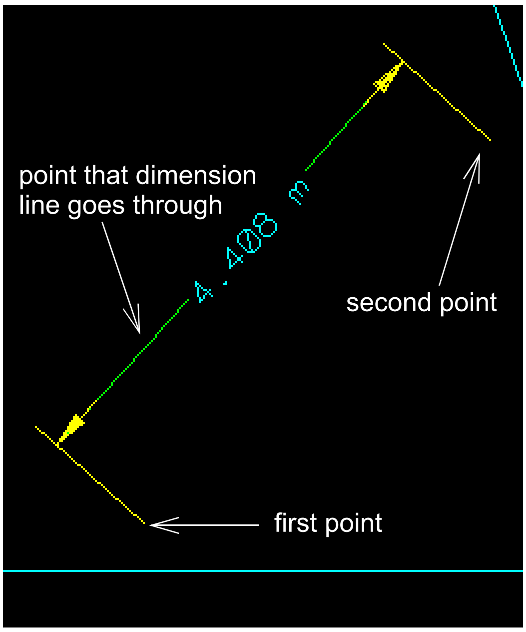
Picking an existing Dimension will bring up the Dimension editor.

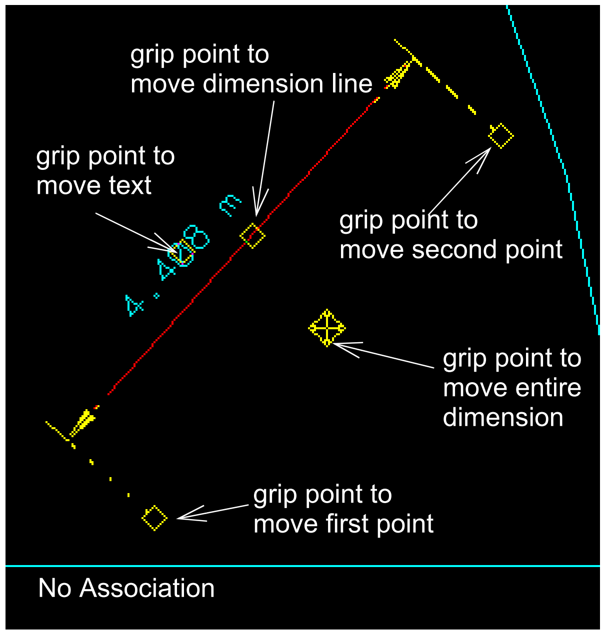
In the Dimension editor, grip points relevant to the type of dimension will be displayed.

If there is **no Association** because either the Association is OFF, or Association is ON but there is nothing currently associated with the dimension, then you won't get a grip point to move the entire dimension because the dimension is locked to its associated items.

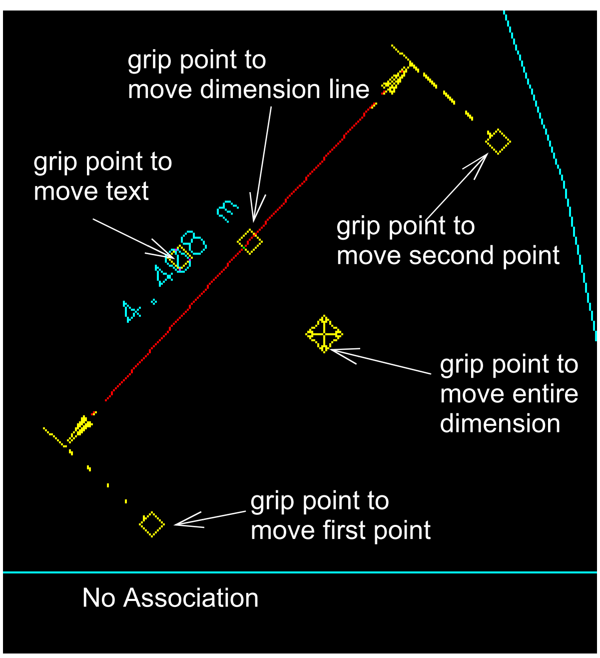
A list of typed options is also displayed in the screen message area.

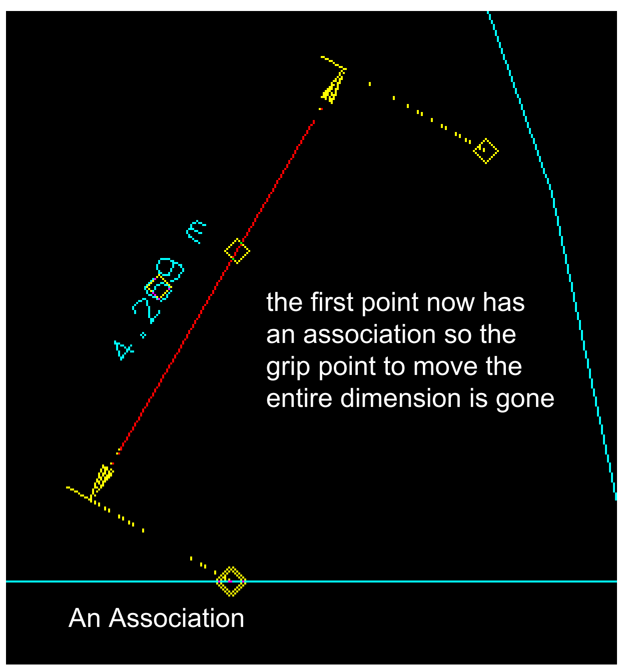






Picking and accepting a grip point will move the grip point and when it is placed again, the association is recalced and the new value for the dimension displayed.





For the typed options, typing

t or **T** changes the dimension text format. See 15.5 Text Format for Dimensions and Leaders

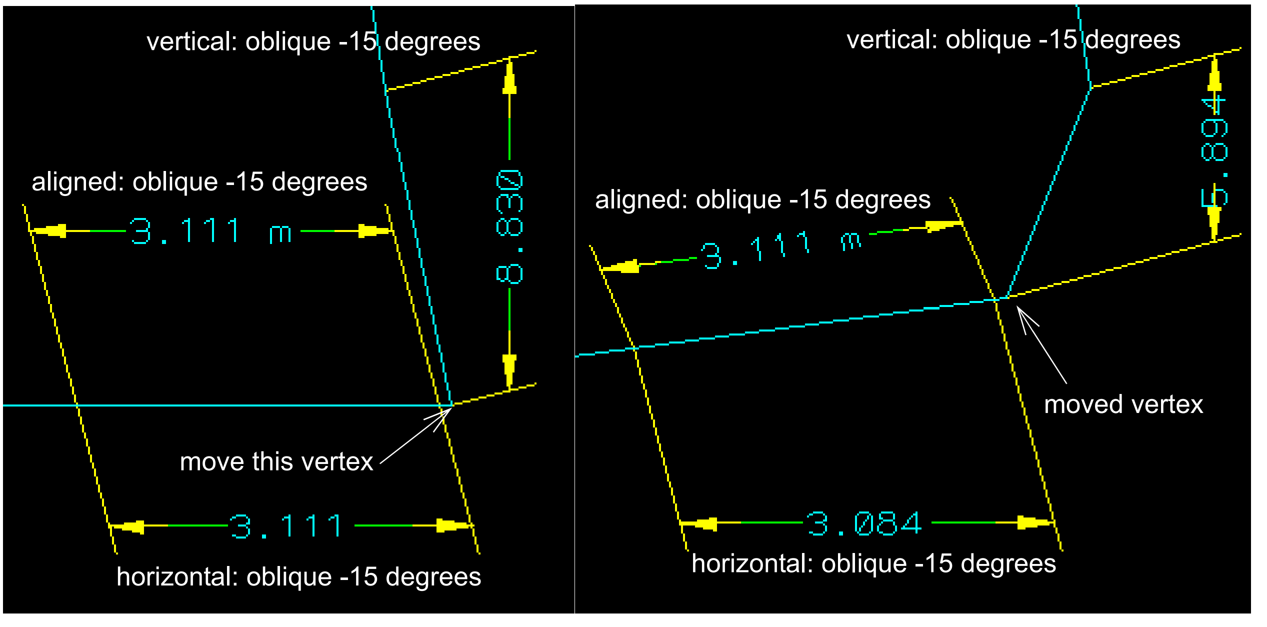
o or **O** changes the angle of the extension lines. The angle is measured in a counter clockwise direction and for horizontal dimensions it is measured from the positive y axis, vertical dimensions it is measured from the positive x axis and for aligned dimensions it is the measured from the perpendicular to the two points defining the dimension.

s or **S** changes the dimension style

j or **J** allows one **jog** to be inserted in a linear dimension

d or **D** deletes the dimension

n or **N** pick a new dimension to edit.



Also

Typing **<Esc>** will exit the editing of the current *dimension* and ask for a new drafting element (Leader or Dimension) to be selected for editing.

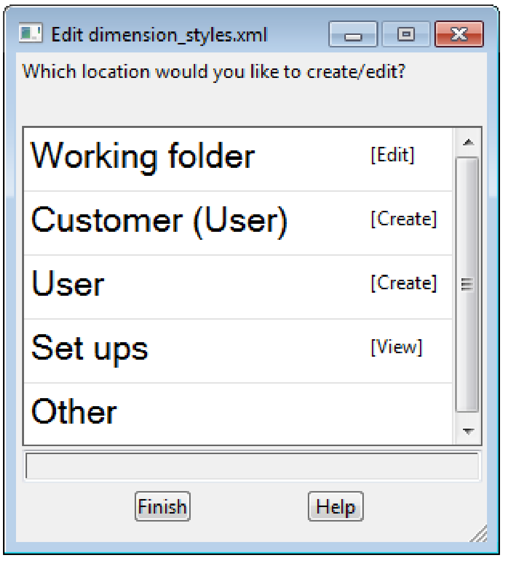
Similarly clicking **RB** and selecting **Cancel** from the **Pick Ops** menu will exit the editing of the current *dimension* and ask for a new drafting element (Leader or Dimension) to be selected for editing.

When back in the Drafting Editor, typing **<Esc>** or clicking **RB** and selecting **Cancel** from the **Pick Ops** menu, will exit the Drafting Editor

15.3.18.2 Dimension Styles

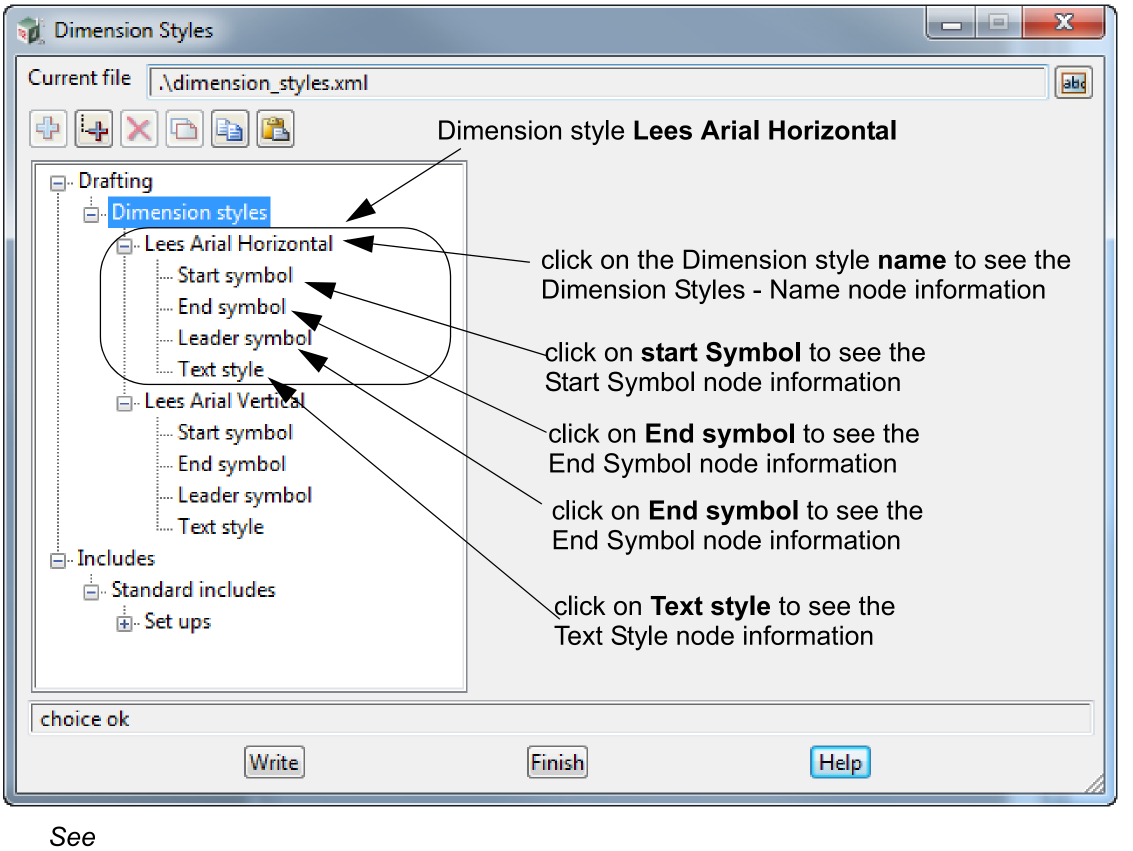
Position of option on menu: **CAD =>Dimension =>Styles**

When you click on the option an **Edit dimension_styles.xml** panel is brought up and the panel shows the standard areas for looking for the table_styles.XML files - Working folder, Customer (User), User, Set Ups and Other.



For information about where how to find and create dimension_styles.xml files, see 15.7 Style XML Files for Dimensions, Leaders & Tables.

Once a dimension_styles.xml file has been opened, the **Dimension Styles** panel is displayed.



See

15.3.18.2.1 Dimension Styles - Name Node

15.3.18.2.1 Dimension Styles - Name Node

This is on the right hand side of the panel when you click on the ***Dimension style*** name.

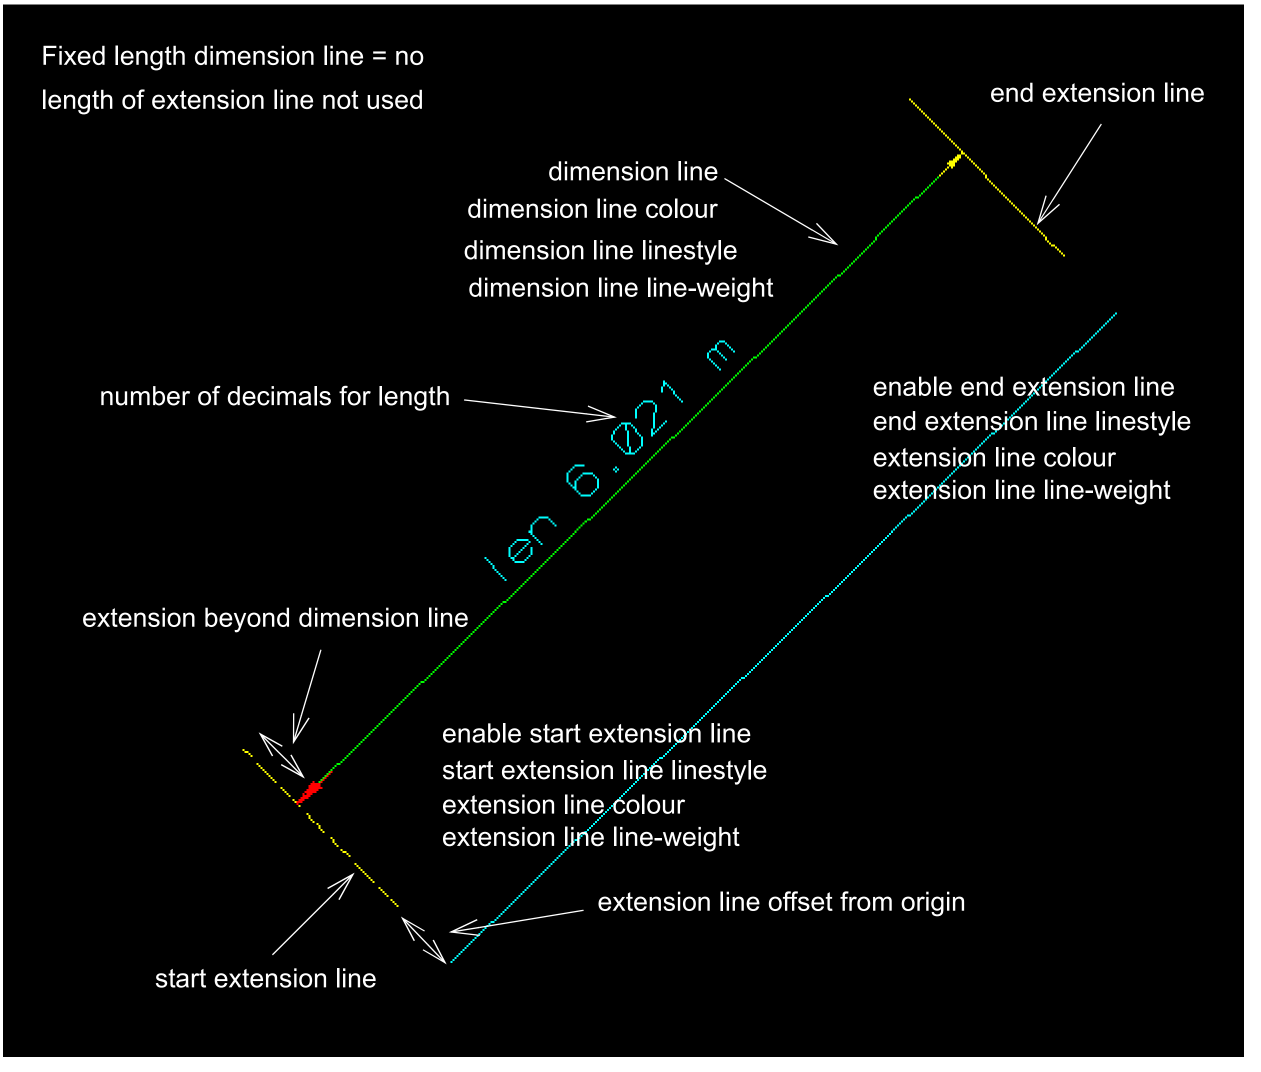
Name	d3
Description	test
Dimension line colour	green
Dimension line linestyle	THICK
Dimension line line-weight	0
Extension line colour	blue
Start extension line linestyle	BORDER
End extension line linestyle	BORDER
Extension line line-weight	0
Enable start extension line	yes
Enable end extension line	yes
Extension beyond dimension line	0.2
Extension line offset from origin	0.05
Fixed length extension line	no
Length of extension line	1
Centre mark style	centre_mark
Centre mark size	0.1
Radius jog angle	0.888
Radius jog factor	1.6
Text alignment	text_aligned
Forced text up	yes
Angle for reading text	0
Do not clip dimension line for text	no
Use box around text	yes
Use rounded box	yes
Text box colour	blue
Text box linestyle	THIN
Number of decimals for length	3
Number of decimals for area	2
Number of decimal for angle	2
Dimension line extension size	0
Baseline spacing	1
Enable start dimension line	yes
Enable end dimension line	yes
Dimension line break	0
Length symbol style	length_preceding
Text fit	fit_either
Text offset	0
Number of decimals for volume	2
Angle format style	show_angle

only used with some dimensions

if *Do not clip dimension line for text* is **yes** or Textstyle Type is not world then these are not used

if *Do not clip dimension line for text* is **no** and Textstyle Type is world, then these are used

these settings are not currently used



Fixed length dimension line = no
length of extension line not used
end extension line
dimension line
dimension line colour
dimension line linestyle
dimension line line-weight
number of decimals for length
len 6.021 m
enable end extension line
end extension line linestyle
extension line colour
extension line line-weight

Text offset
Number of decimals for volumes
Angle format style

15.3.18.2.2 Dimension Styles - Start Symbol Node

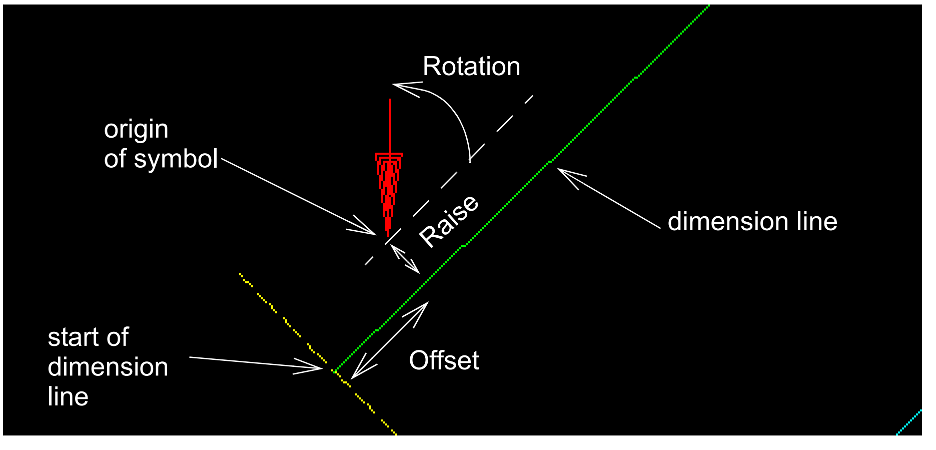
This is on the right hand side of the panel when you click on the ***Start symbol*** node.

Style	Arrow
Colour	red
Size	0.5
Rotation	45
Offset	0.2
Raise	0.5

For the **Start symbol**, the origin of the symbol is displaced from the **start** of the dimension line by the **Offset** and **Raise** values.

With a **Rotation** value of zero, the symbol is given the same rotation as the dimension line.

For a non zero **Rotation**, the value is **added** to the angle of the dimension line.



15.3.18.2.3 Dimension Styles - End Symbol Node

This is on the right hand side of the panel when you click on the ***End symbol*** node.

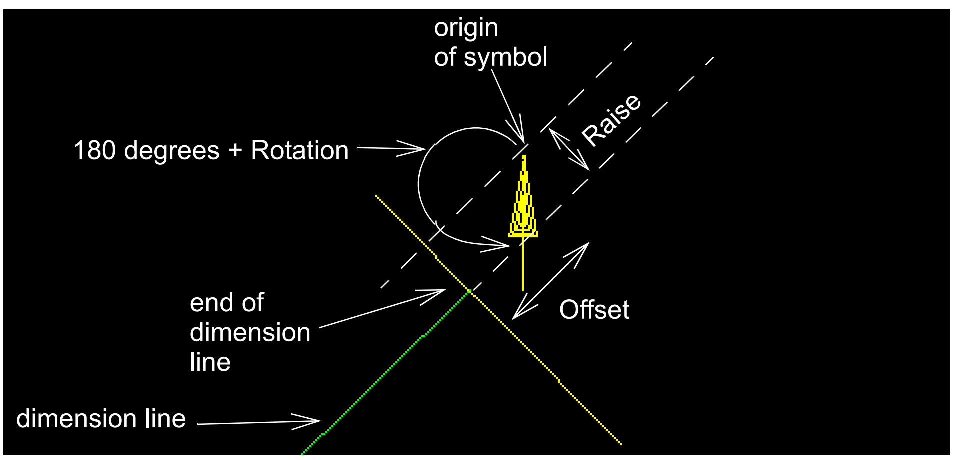
Style	ARROW
Colour	yellow
Size	0.5
Rotation	45
Offset	0.2
Raise	0.5

For the **End symbol**, the origin of the symbol is displaced from the **end** of the dimension line by the **Offset** and **Raise** values.

With a **Rotation** value of zero, the symbol is given the angle of the dimension line **plus 180 degrees**.

For a non zero **Rotation**, the value **plus 180 degrees** is **added** to the angle of the dimension line.

The addition of 180 degrees for the angle of the end symbol is so that the same symbol can be used for the start and the end of the dimension line.



15.3.18.2.4 Dimension Styles - Text style Node

This is on the right hand side of the panel when you click on the ***Text style*** node.

Textstyle	Arial
Name	
Type	paper
Size	0.2
Angle	0°
X-factor	1
Slant	0
Offset	0
Raise	0
Colour	cyan
Whiteout	no colour
Border	no colour
Border type	
Justify	bottom-left
TTF Underline	no
TTF Strikeout	no
TTF Italic	no
TTF Outline	no
TTF Weight	400

This is expected to be modified shortly so that it uses a *Textstyle Data* and all the features from *Textstyle Data* are automatically available. For the moment with paper text, only **Whiteout** is supported.

When the *Textstyle Data* is implemented, it can have its own *Border type* but there is no linestyle for the border in *Textstyle Data*. The only way to get a border with a linestyle is to use World text and set the border parameters in the *General* tab (15.3.18.2.1 Dimension Styles - Name Node).

If **Type** is not ***world***, then **Don't clip dimension line for tex**t is set to **no** and these items from the General tab are not used.

Use box around text
Use rounded box
Text box colour
Text box linestyle

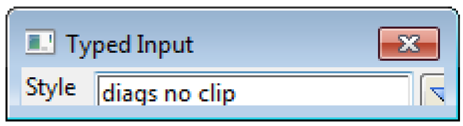
See 15.3.18.2.1 Dimension Styles - Name Node

15.3.18.3 Change Style of Dimension

Click on **Change style of dimension** and the following message is written to the screen message area

Pick a dimension and its style will be changed to that shown in the square brackets ([]). Then pick another dimension to change its style.

Typing **s** or **S** brings up the *Style* **Typed Input** box to select a new dimension style.



The new style is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the message again written to the screen message area.

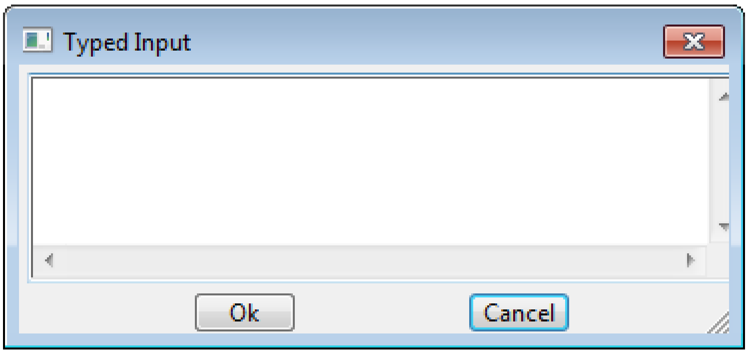
All subsequent selected dimensions will have their styles changed to this new style until either the option is terminated or a new dimension style is selected

To terminate the option, press **<Esc>**, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

15.3.18.4 Change Text Format

The **Change text format** option is used the change the text format for **Dimensions** or **Leaders**.

Click on **Change text format** and a **Typed Input** box comes up



and whilst you are in the **Typed Input** box the following message is written to the screen message area.

The new text format is typed into the **Typed Input** box and **OK** clicked.

The following message is written to the screen message area

Pick a **Dimension** or **Leader** and its text format will be changed to that shown in the square brackets ([]). Then pick another **Dimension** or **Leader** to change its text format

Typing **t** or **T** will bring the **Typed Input** box to type in a a new text format. See 15.5 Text Format for Dimensions and Leaders

All subsequent selected **Dimensions** or **Leaders** will have their text formats changed to this new text format until either the option is terminated or a new text format is selected

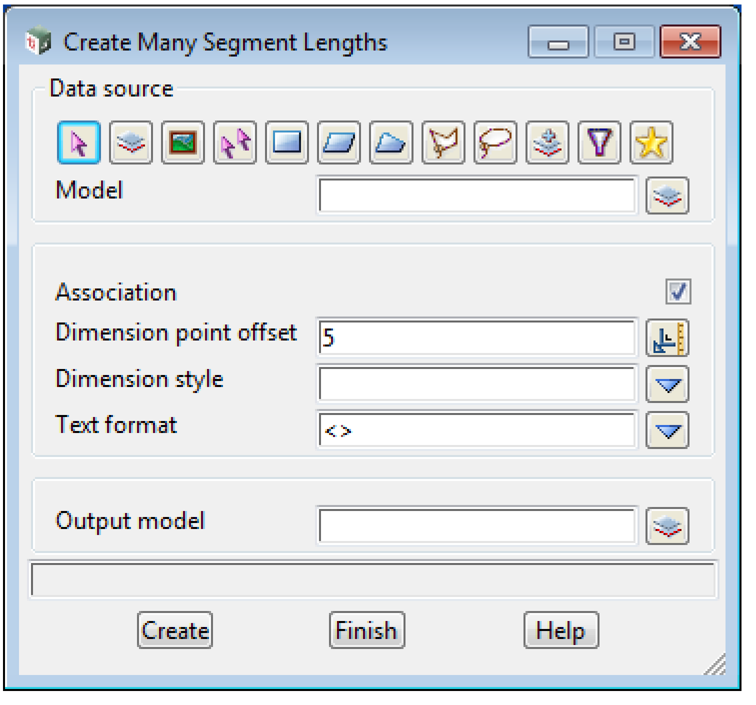
To terminate the option, press **<Esc>**, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

15.3.18.5 Create Many Segment Lengths

This option creates Length dimensions for all the segments of the strings in the Data Source.

The created **Length** Dimensions all have the given **Offset** and **Text format**.

Selecting the **Create many segment lengths** brings up the **Create Many Segment Lengths** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source *in the chapter* 4 Tools and Concepts.

Data source	input		

source of data to have labelled with Length dimensions.

Association	tick box	tick	

*if **ticked**, the Length dimensions are created with Association turned ON.*
*If **not ticked,** the Length dimensions are created with Association turned OFF.*

Dimension point offset	real box	5	

offset to use with the Length dimension. This will override the value from the **Style**.

Dimension Style	dimension style box		

the dimension style to use for the Length dimensions.

Text format	choice		Dim Length text format choice

the text format to use for the Length dimensions.

Output model	model box		available models

model to add all the created Length dimensions to.

Create	button		

create Length dimensions for all the segments in the data source.

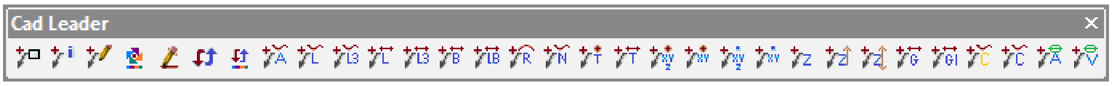
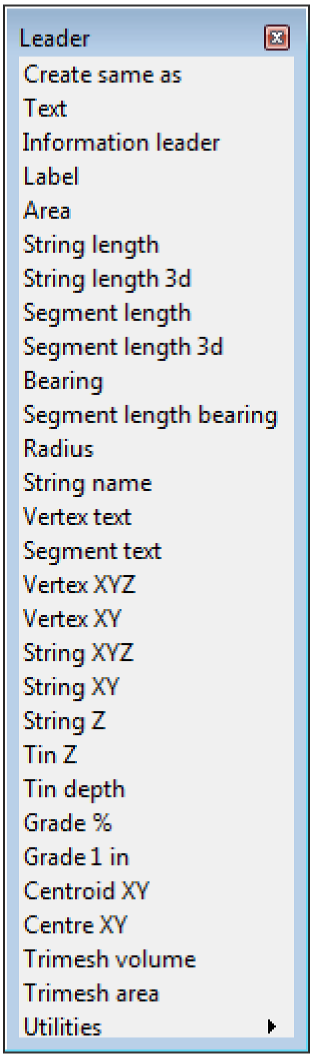
15.4 CAD Leader

Position of option on menu: **CAD =>Leader**

Various types of **Leaders** can be created with the **Leader** options





Apart from the Trimesh Volume and Trimesh area leaders, each type of Leader can remember the items it was created from (Association). In most cases when the items are modified, the Leader and the associated values from the items dynamically change. See 15.4.1 Leader Association

All of the **Leaders** on the menu except for **Trimesh Volume** and **Trimesh Area** are also special cases of the **Information Leader**. That is, when in the **Information Leader** option, all but the Trimesh Leaders can be selected as types of the **Information Leader**.

For more information on each of the **Leader** options and menus, see

Create same as - create new information leader of same type as selected Information leader 15.4.3 Leader - Create Same As

Text -simple leader that only displays text. *See* 15.4.4 Text Leader

Information Leader - leader with many choices of values. *See* 15.4.5 Information Leader

Label -a case of Information Leader that displays text. *See* 15.4.5.1 Label

Area - 2D area of a selected string. *See* 15.4.5.2 Area

String length - 2D length of a selected string. *See* 15.4.5.3 String Length

String length 3d - 3D length of a selected string. *See* 15.4.5.4 String Length 3D

Segment length - 2D length of a selected segment. *See* 15.4.5.5 Segment Length

Segment length 3d - 3D length of a selected segment. *See* 15.4.5.6 Segment Length 3D

Bearing - bearing of a selected string. *See* 15.4.5.7 Segment Bearing

Bearing & segment length - bearing at string pick point and length of the segment. *See* 15.4.5.8 Bearing & Segment Length

Radius - radius of a selected string. *See* 15.4.5.9 Segment Radius

String name - name of a selected string. *See* 15.4.5.10 String name

Vertex text - vertex text of a selected vertex. *See* 15.4.5.11 Vertex Text

Segment text - segment text of a selected segment. *See* 15.4.5.12 Segment Text

Vertex XYZ - (x,y,z) coordinates of a vertex. *See* 15.4.5.13 Vertex XYZ

Vertex XY - (x,y) coordinates of a vertex. *See* 15.4.5.14 Vertex XY

String XYZ - (x,y,z) coordinates of a position on a string. *See* 15.4.5.15 String XYZ

String XY - (x,y) coordinates of a position on a string *See* 15.4.5.16 String XY

String Z - z coordinates (level) of a position on a string *See* 15.4.5.17 String Z

Tin Z - z value of tin at a selected (x,y) position. *See* 15.4.5.18 Tin Z

Tin depth - depth from a string position to a tin. *See* 15.4.5.19 Tin Depth

Grade % - grade in percent at a point on a string. *See* 15.4.5.20 Grade (%)

Grade 1 in - grade as 1 in (ie slope) at a point on a string. *See* 15.4.5.21 Grade 1 n - Slope

Centroid XY - (x,y) coordinates of selected string. *See* 15.4.5.22 Centroid XY

Centre XY - (x,y) coordinates of medial centre of selected string. *See* 15.4.5.23 Medial Centre XY

Trimesh volume - volume of a closed trimesh. *See* 15.4.5.24 Trimesh Volume

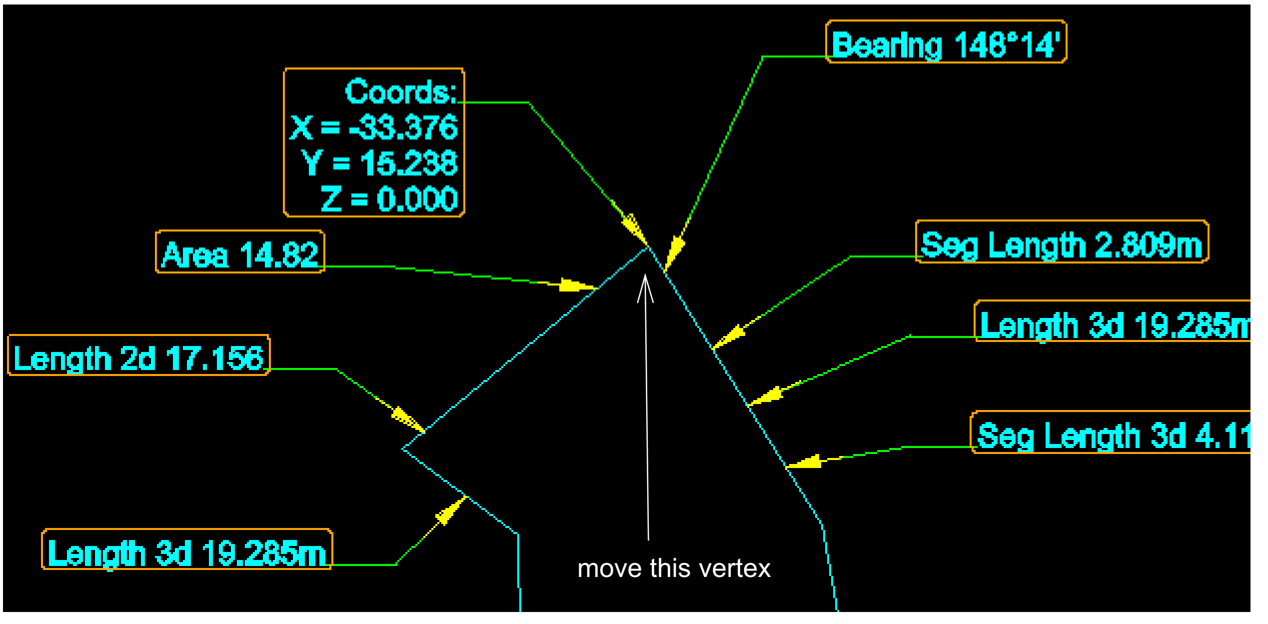
Trimesh area - surface area of one side of a trimesh. *See* 15.4.5.25 Trimesh Surface Area

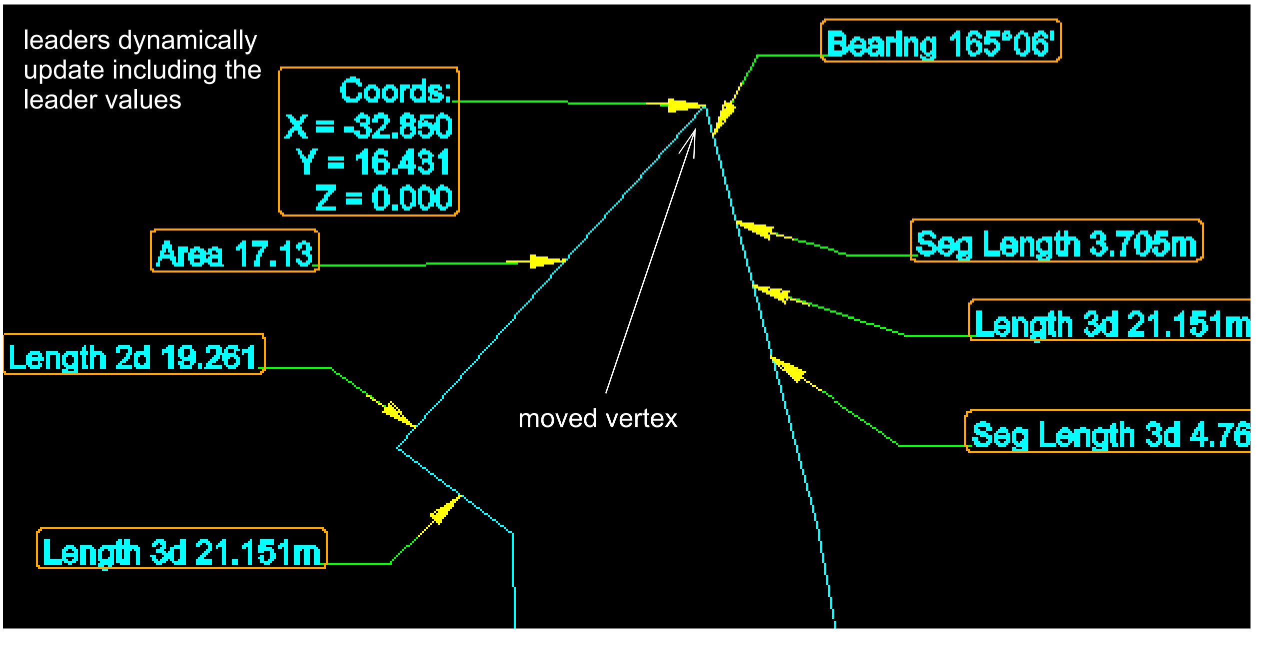
Utilities - various leader utilities. *See* 15.4.6 Leader Utilities

15.4.1 Leader Association

When *leaders* are created, the leader can remember the items that were used to create them (**Association**).

In most cases when items are moved, the leaders associated with the items dynamically change.



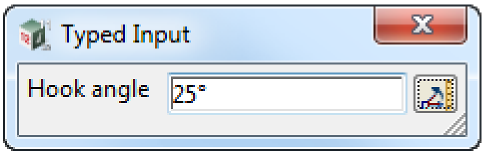


In cases where it is not automatic, there is a **Recalc** and **Recalc all** for leaders and dimensions.

In the leader options, typing **a** or **A** toggles Association **ON** and **OFF**.

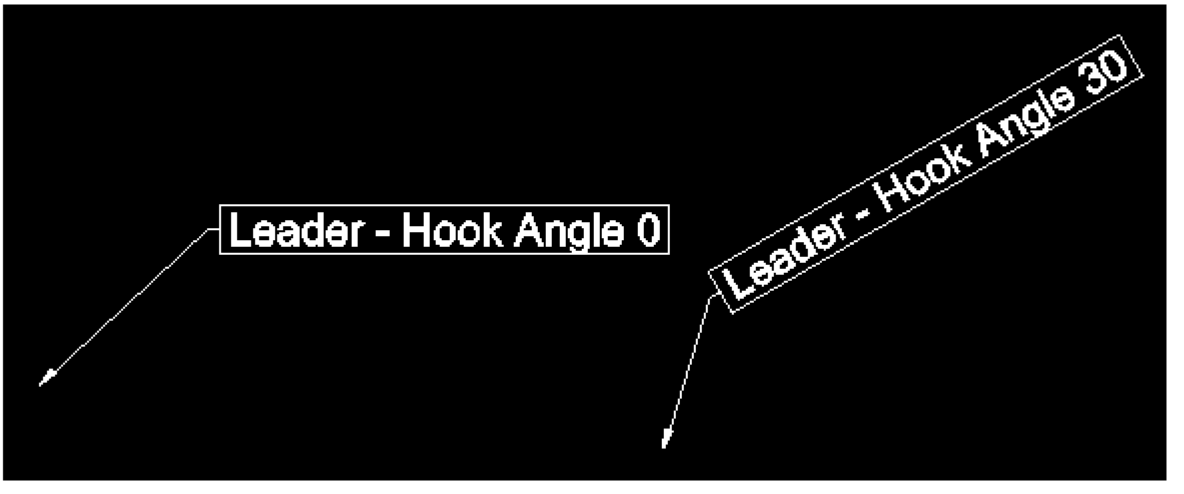
15.4.2 Hook Angle

Typing **h** or **H** allows you to change the **Hook Angle** and brings up the *Hook angle* **Typed Input** box.



The new hook angle is typed into the box and **<Enter>** pressed.

The units for hook angle is degrees entered in hp notation, and is measure in a counter clockwise direction from the positive x-axis.



15.4.3 Leader - Create Same As

Create same as creates a new Leader of the same type as a selected Leader.

Step 1.

Select **Create same as** and the following message is written to the screen message area

<[Pick leader]> [picks][fast][Menu]

Step 2.Select an existing Leader

When an existing **Leader** is selected, a new **create Leader** of the same Leader type as the selected Leader, is started.

15.4.4 Text Leader

This is simplest type of Leader and only creates a leader with user defined text.

Text Leader creates a leader line from a selected point (the arrow point) to a selected hook point, with user given text drawn at the end of the leader line.

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

Step 1.Pick the arrow point (the point to start the Leader from)

Select Leader and the following message is written to the screen message area

<[Pick arrow point] (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][I

If Association is **ON** then the start of the Leader is associated with the selected arrow point.

Step 2.Pick the hook point

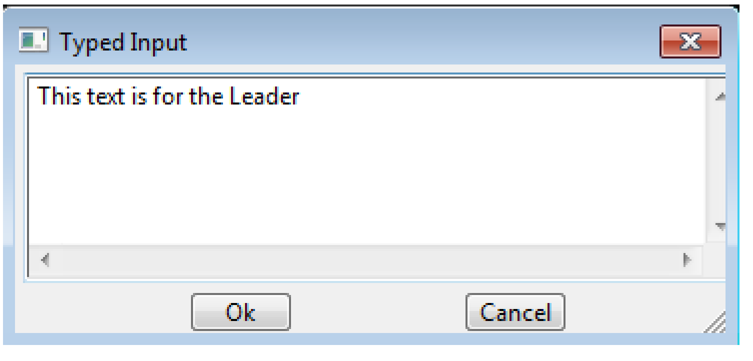
The following message is written to the screen message area.

<Pick hook point> [picks][fast][Menu]

If Association is **ON** then the hook point of the leader is associated with the selected hook point.

Step 3.

The text **Typed Input** box then comes up for the text for the leader to be typed into.



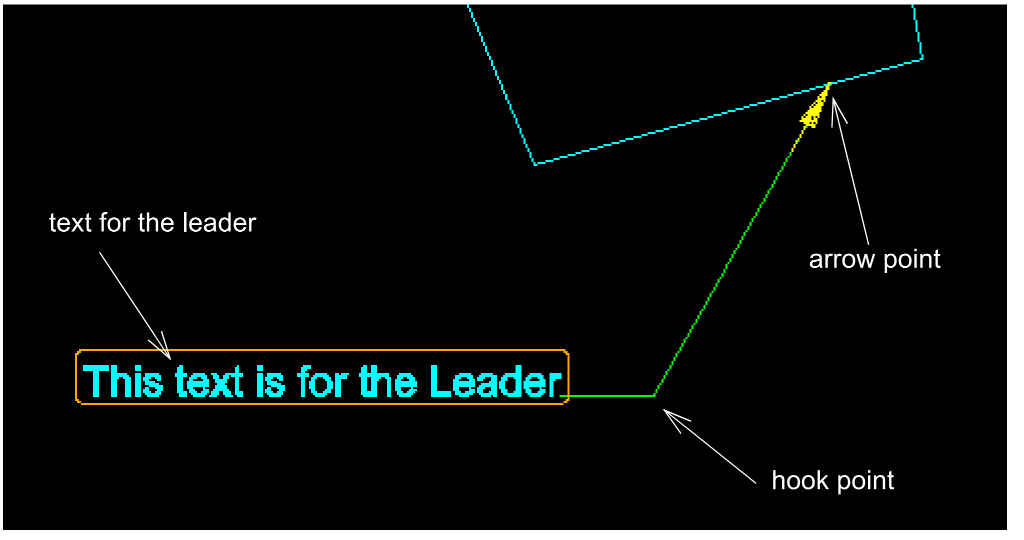
Whilst you are in the **Typed Input** box the following message is written to the screen message area.

Enter Text [Caret][Same as][Menu] select a button

The text for the Leader is typed into the **Typed Input** box and **OK** clicked.

The *Leader* is then created with the current hook angle.

The **Leader** option then starts again. That is, goes back to **Step 1**.



For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

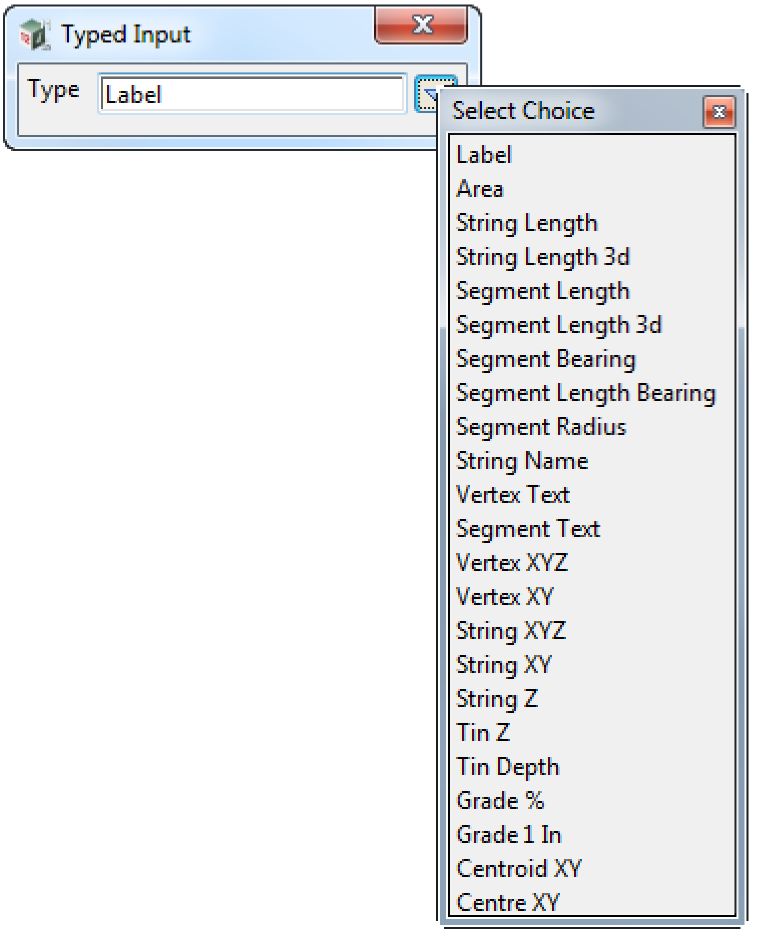
15.4.5 Information Leader

Information Leader creates a leader line from a selected point (the **arrow point)** to a selected **hook point**, with a user selected choice of what information is shown at the end of the leader line.

When **Information Leader** is selected, the following message is written to the screen message area.

<(a)ssociative (t)ype[Label] Pick arrow location (s)tyle[Arial Border] (h)ook-angle[25°] > [picks][fast][Menu]

Typing **t** or **T** brings up the **Information Leader** *Type* **Typed Input** box which has a choice pop up for selecting what information is drawn at the end of the leader.



After a selection is made, the message changes to indicate the current type of **Information Leader** being created. For example, for the choice **Area**

type of Information Leader being created

< (t)ype[Area] Pick string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] fixed-a(r)row> [picks][fast][Menu]

For more information on each of the types for Information Leader see

Label -simple leader that only displays text. *See* 15.4.5.1 Label

Area - 2D area of a selected string. *See* 15.4.5.2 Area

String length - 2D length of a selected string. *See* 15.4.5.3 String Length

String length 3d - 3D length of a selected string. *See* 15.4.5.4 String Length 3D

Segment length - 2D length of a selected segment. *See* 15.4.5.5 Segment Length

Segment length 3d - 3D length of a selected segment. *See* 15.4.5.6 Segment Length 3D

Bearing - bearing of a selected string. *See* 15.4.5.7 Segment Bearing

Bearing & segment length - bearing at string pick point and length of the segment. *See* 15.4.5.8 Bearing & Segment Length

Radius - radius of a selected string. *See* 15.4.5.9 Segment Radius

String name - name of a selected string. *See* 15.4.5.10 String name

Vertex text - vertex text of a selected vertex. *See* 15.4.5.11 Vertex Text

Segment text - segment text of a selected segment. *See* 15.4.5.12 Segment Text

Vertex XYZ- (x,y,z) coordinates of a vertex. *See* 15.4.5.13 Vertex XYZ

Vertex XY - (x,y) coordinates of a vertex. *See* 15.4.5.14 Vertex XY

String XYZ - (x,y,z) coordinates of a position on a string. *See* 15.4.5.15 String XYZ

String XY - (x,y) coordinates of a position on a string *See* 15.4.5.16 String XY

String Z - z coordinates (level) of a position on a string *See* 15.4.5.17 String Z

Tin Z - z value of tin at a selected (x,y) position. *See* 15.4.5.18 Tin Z

Tin depth - depth from a string position to a tin. *See* 15.4.5.19 Tin Depth

Grade % - grade in percent at a point on a string. *See* 15.4.5.20 Grade (%)

Grade 1 in - grade as 1 in (ie slope) at a point on a string. *See* 15.4.5.21 Grade 1 n - Slope

Centroid XY - (x,y) coordinates of selected string. *See* 15.4.5.22 Centroid XY

Centre XY - (x,y) coordinates of medial centre of selected string. *See* 15.4.5.23 Medial Centre XY

15.4.5.1 Label

Information Leader choice **Label** displays in the leader box, user given text.

Label creates a leader line from a selected point (the pick point) to a selected hook point, with the given text drawn at the end of the leader line.

The leader is added to the model given in the CAD toolbar.

Note: Unlike the **Text Leader** which is also used for placing text and brings up a Typed Input box for entering multiline text (see 15.4.4 Text Leader), **Label** is a single line format which needs new line characters if a new line is needed.

The case for using **Label** instead of the **Text** leader is when you have the same text to place multiple times. The **customise (t)ext** command uses the last specified text, and also remembers the last twelve of them.

Step 1.Pick the point to start the Leader from

Select **Leader** and the following message is written to the screen message area

```
< (t)ype[Label] Pick arrow location (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the selected pick point.

Step 2.Pick the hook point

The following message is written to the screen message area.

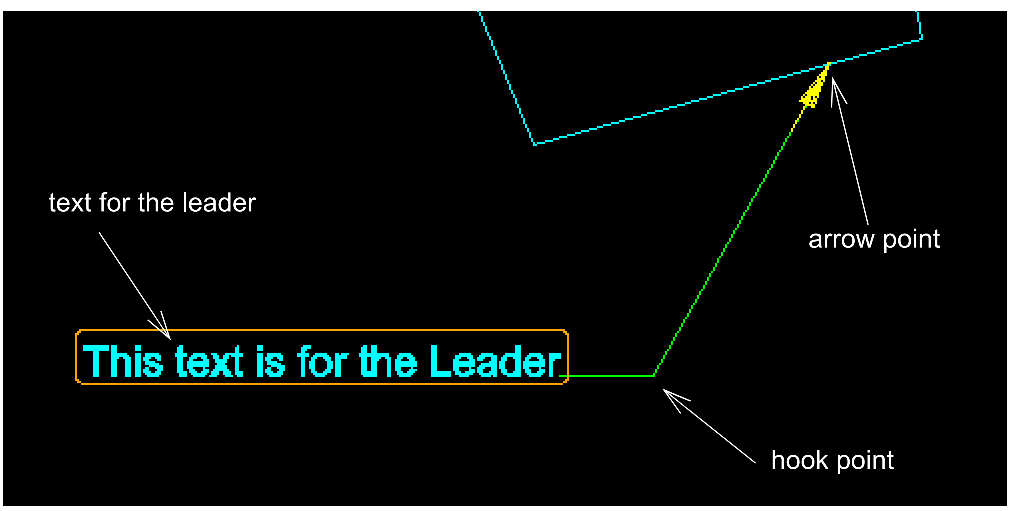
```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

Unlike the **Text Leader** which brings up a Typed Input box for entering multiline text (see 15.4.4 Text Leader), this is a single line format which needs new line characters if a new line is needed.

When the hook point is selected, the *Leader* is created.

The **Label Information Leader** then starts again. That is, it goes back to **Step 1**.



For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.2 Area

Information Leader choice **Area** displays in the leader box, the 2D (plan) area of a selected string. If the selected string is not closed, the area is calculated for the polygon formed by joining the first and the last vertices.

A leader line is drawn from either selected position on a string (string pick point) or the string centre, to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the area is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string to label with its 2D (plan) area

When **Area** is the choice, the following message is written to the screen message area

```
< (t)ype[Area] Pick string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] fixed-a(r)row> [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle
r or **R** toggles between the arrow starting at the pick point (**free arrow**) or at the polygon centre (**fixed arrow**)

If Association is **ON** then the start of the Leader is associated with the string pick point or the polygon centre (depending on **r**).

Step 2.Pick the hook point

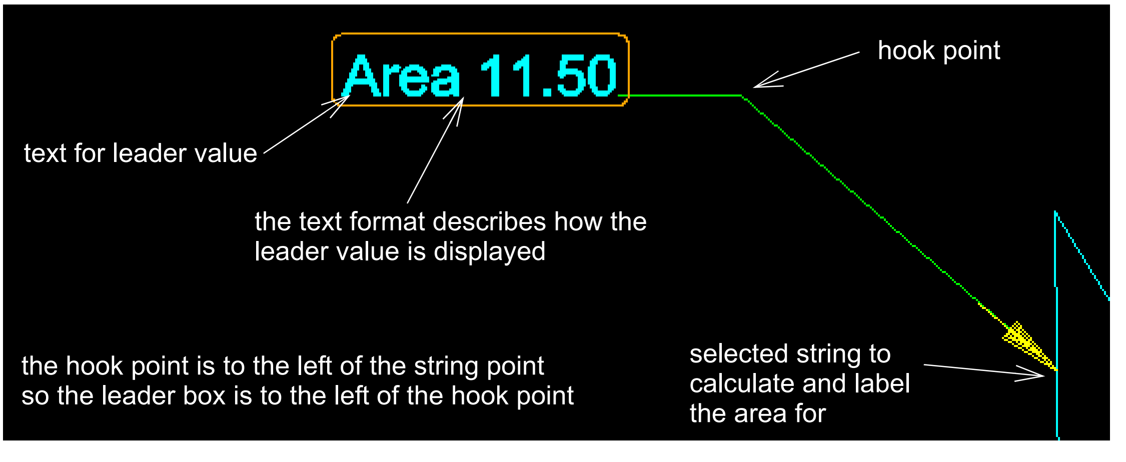
The following message is written to the screen message area.

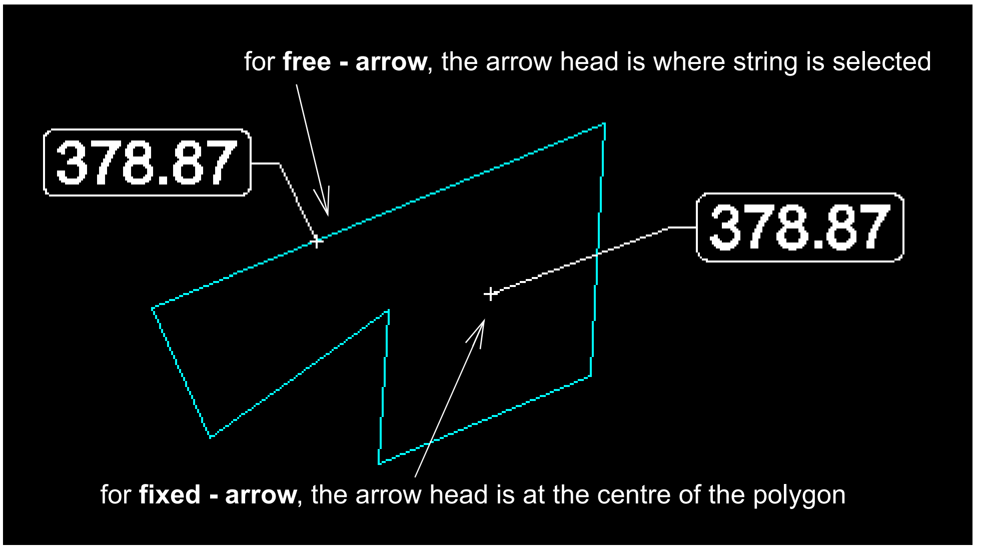
```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Area Information Leader** then starts again. That is, it goes back to **Step 1**.





Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.3 String Length

Information Leader choice **String length** displays in the leader box, the 2D (plan) length of a selected string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the string length is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string to label with its 2D length

When **String Length** is the choice, the following message is written to the screen message area

```
< (t)ype[String Length] Pick string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

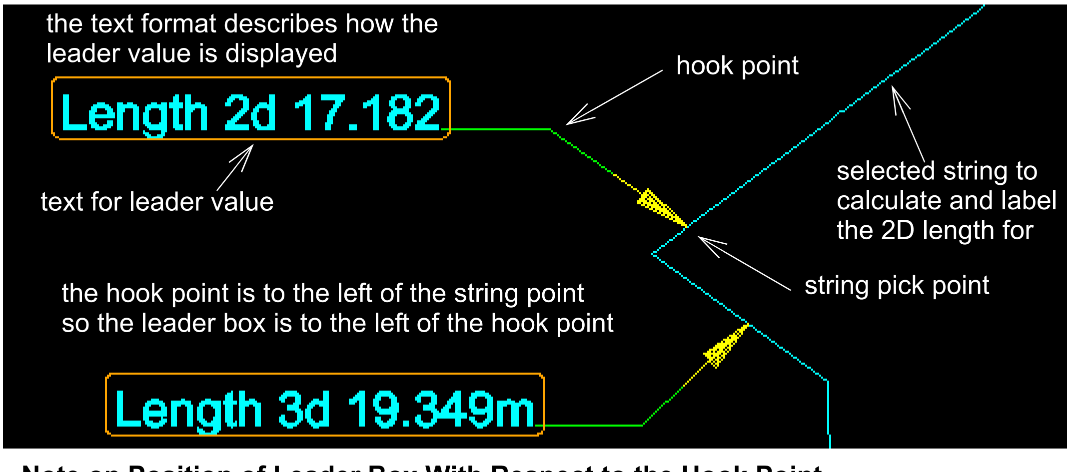
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **String Length Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.4 String Length 3D

Information Leader choice **String length 3d** displays in the leader box, the 3D length of a selected string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the length is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string to label with its 3D length

When **String length 3d** is the choice, the following message is written to the screen message area

```
< (t)ype[String Length 3d] Pick string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

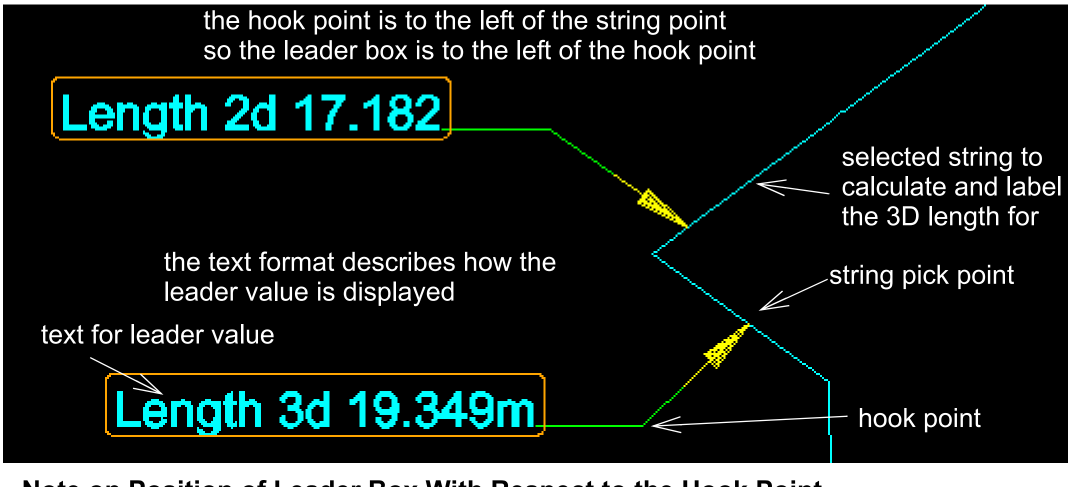
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **String Length 3D Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.5 Segment Length

Information Leader choice **Segment length** displays in the leader box, the 2D (plan) length of a selected **segment**.

A leader line is drawn from a selected position on a segment (segment pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the segment length is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the segment to label with its 2D length

When **Segment Length** is the choice, the following message is written to the screen message area

< (t)ype[Segment Length] Pick segment (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the segment pick point.

Step 2.Pick the hook point

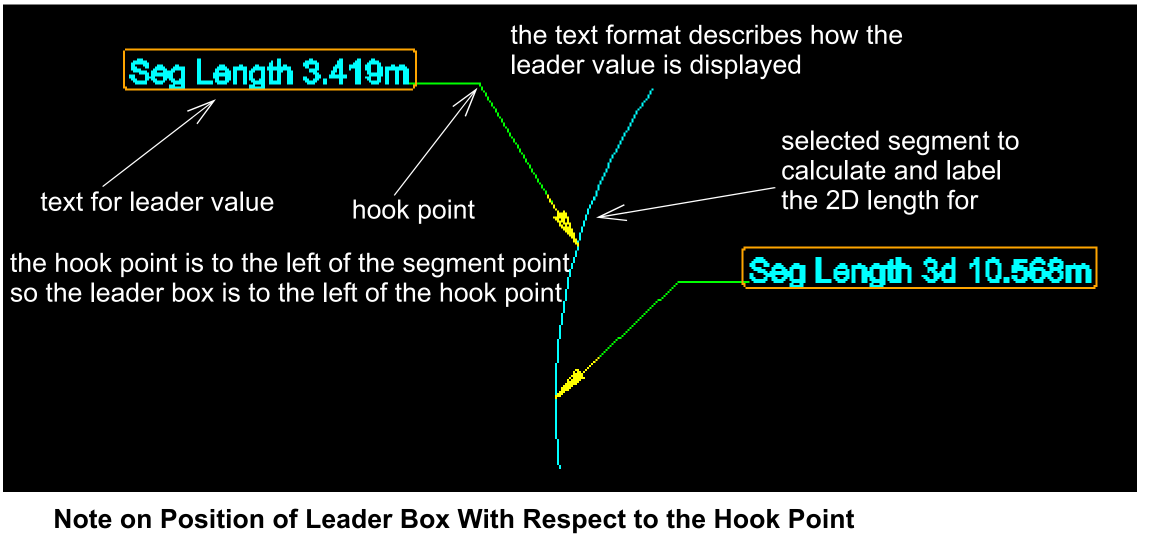
The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Segment Length Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.6 Segment Length 3D

Information Leader choice **Segment length 3d** displays in the leader box, the 3D length of a selected segment.

A leader line is drawn from the pick position on a selected segment (segment pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the 3d length of the segment is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the segment to label with its 3D length

When **Segment Length 3d** is the choice, the following message is written to the screen message area

< (t)ype[Segment Length 3d] Pick segment (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the segment pick point

Step 2.Pick the hook point

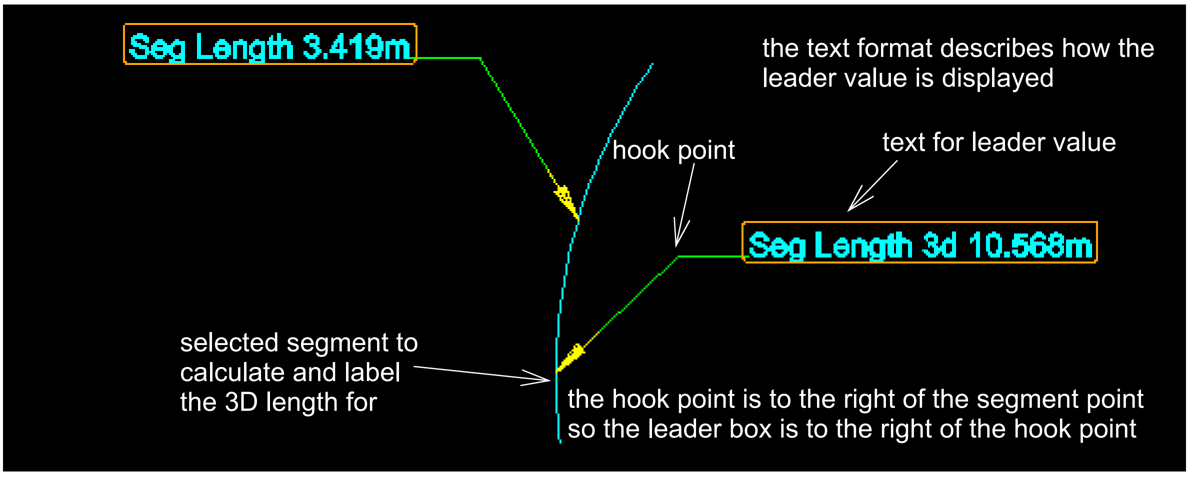
The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Segment Length 3D Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.7 Segment Bearing

Information Leader choice **Segment Bearing** displays in the leader box, the bearing of a selected position on string (string pick point).

A leader line is drawn from the string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the bearing at the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the segment to label with its bearing

When **Segment Bearing** is the choice, the following message is written to the screen message area

```
< (t)ype[Segment Bearing] Pick point on segment (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

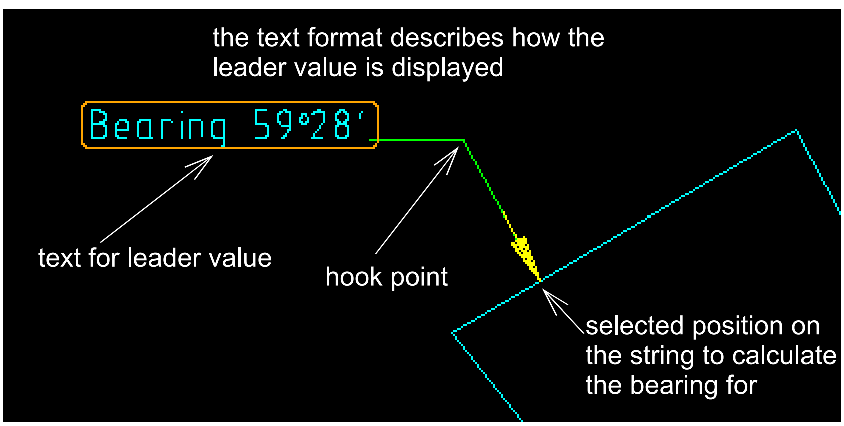
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Segment Bearing Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.8 Bearing & Segment Length

Information Leader choice **Bearing & segment length** displays in the leader box, the bearing at the string pick point and the length of the segment it is on.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the bearing and length of the pick point and segment is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string to label with its bearing & length

When **Segment Length & Bearing** is the choice, the following message is written to the screen message area

```
< (t)ype[Segment Length Bearing] Pick point on segment (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the segment pick point.

Step 2.Pick the hook point.

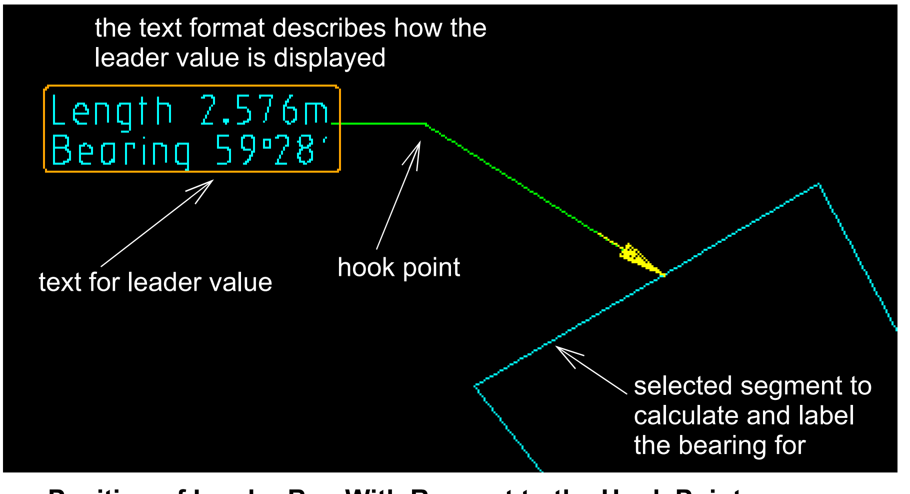
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Segment Length & Bearing Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.9 Segment Radius

Information Leader choice **Segment Radius** displays in the leader box the radius of a selected segment. If the segment is a straight then the radius is displayed as 0. If the segment is a transition, then the displayed radius is the radius of the transition at the picked position.

A leader line is drawn from a string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the radius of the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the segment to label with its radius

When **Segment Radius** is the choice, the following message is written to the screen message area

< (t)ype[Segment Radius] Pick point on segment (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

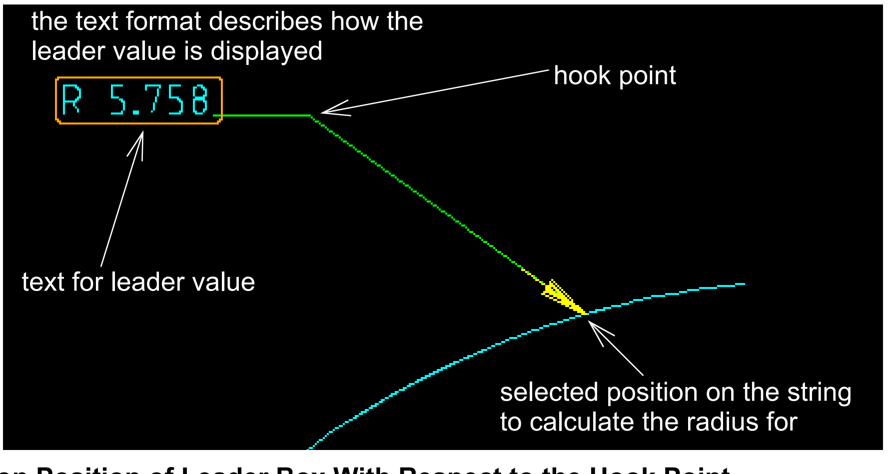
The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

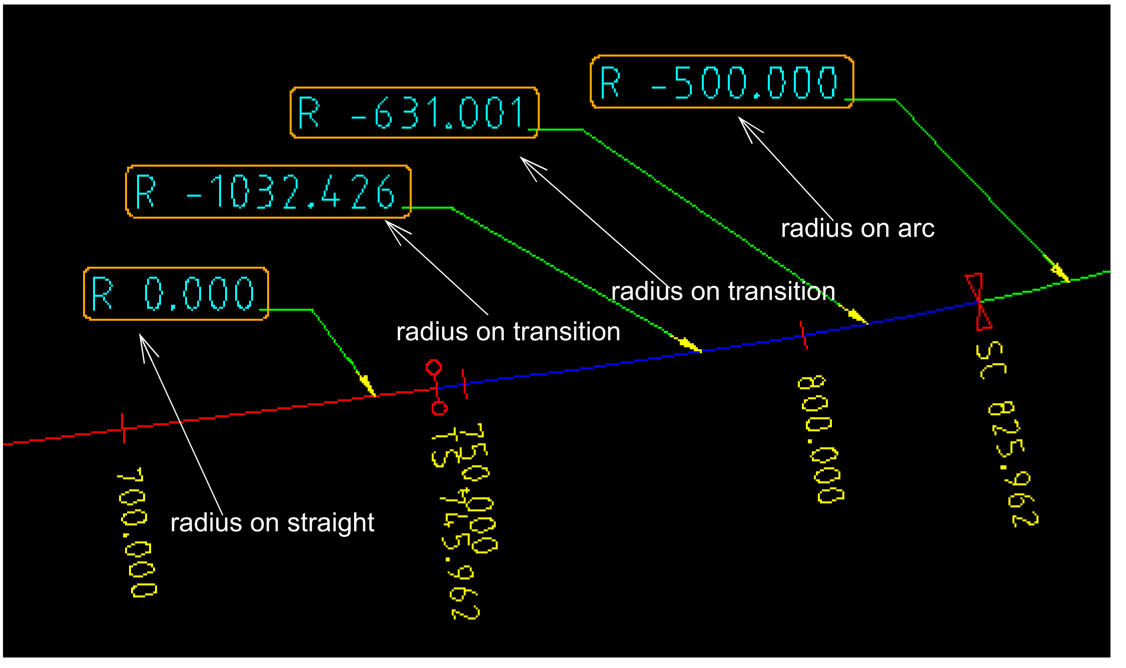
The **Segment Radius Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.



For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.10 String name

Information Leader choice **String name** displays in the leader box, the name of a selected string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the name of the string is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string to label with its name

When **String Name** is the choice, the following message is written to the screen message area

```
< (t)ype[String Name] Pick string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the segment pick point.

Step 2.Pick the hook point

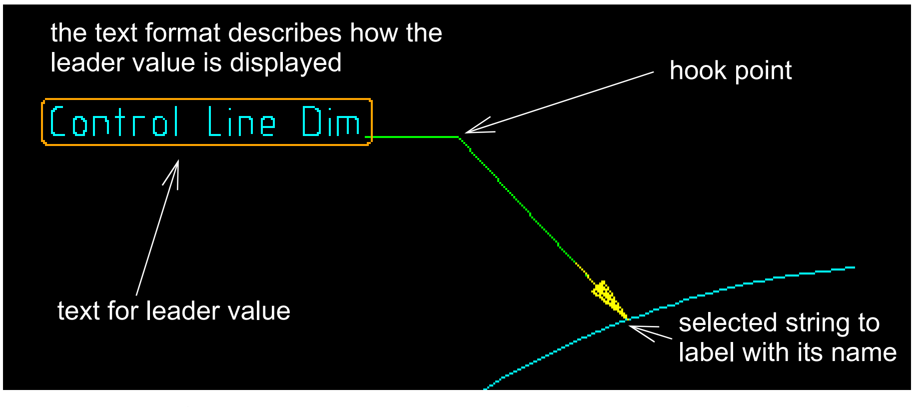
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **String Name Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.11 Vertex Text

Information Leader choice **Vertex text** displays in the leader box, the vertex text of a selected string vertex.

A leader line is drawn from a selected vertex on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the vertex text for the selected vertex of the string is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string vertex to label with its vertex text

When **Vertex Text** is the choice, the following message is written to the screen message area

```
< (t)ype[Vertex Text] Pick vertex (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the segment pick point.

Step 2.Pick the hook point

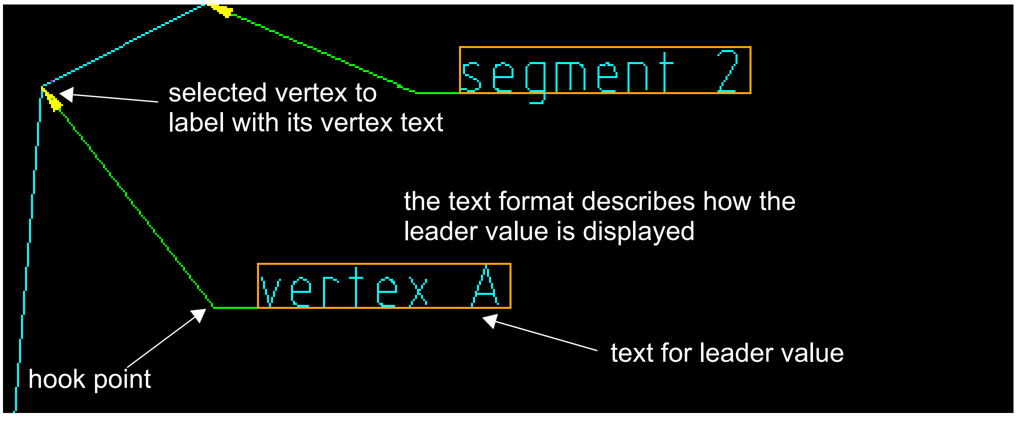
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Vertex Text Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.12 Segment Text

Information Leader choice **Segment text** displays in the leader box, the segment text of a selected string segment.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the segment text for the selected segment of the string is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string segment to label with its segment text

When **Segment Text** is the choice, the following message is written to the screen message area

```
< (t)ype[Segment Text] Pick segment (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the segment pick point.

Step 2.Pick the hook point

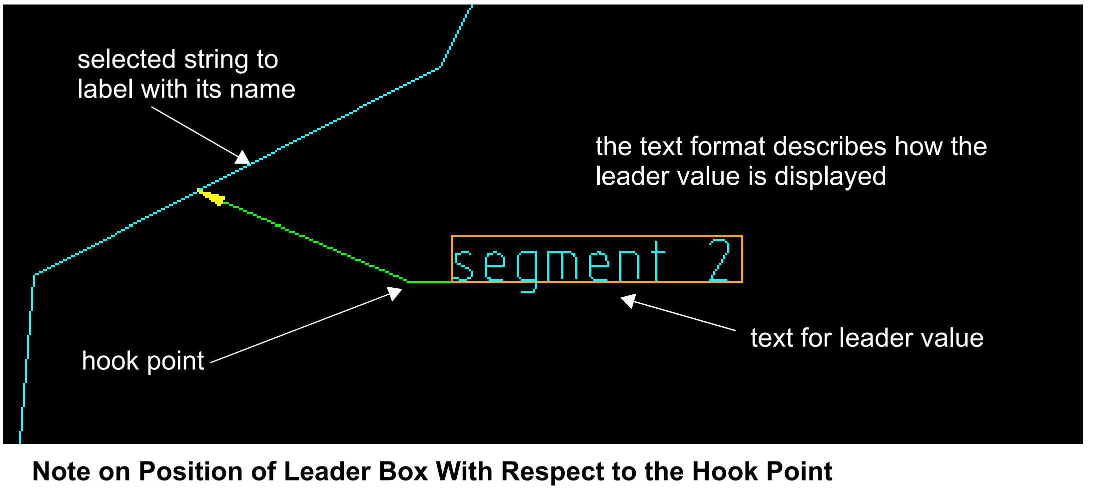
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Segment Text Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.13 Vertex XYZ

Information Leader choice **Vertex XYZ** displays in the leader box, the x, y and z coordinates of a selected vertex.

A leader line is drawn from a selected vertex on a string to a selected hook point, and then to the end of the hook itself.

Using the text format, the x, y and z coordinates of a selected vertex are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the vertex to label with its x, y and z coordinates

When **Vertex XYZ** is the choice, the following message is written to the screen message area

< (t)ype[Vertex XYZ] Pick vertex (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the vertex.

Step 2.Pick the hook point

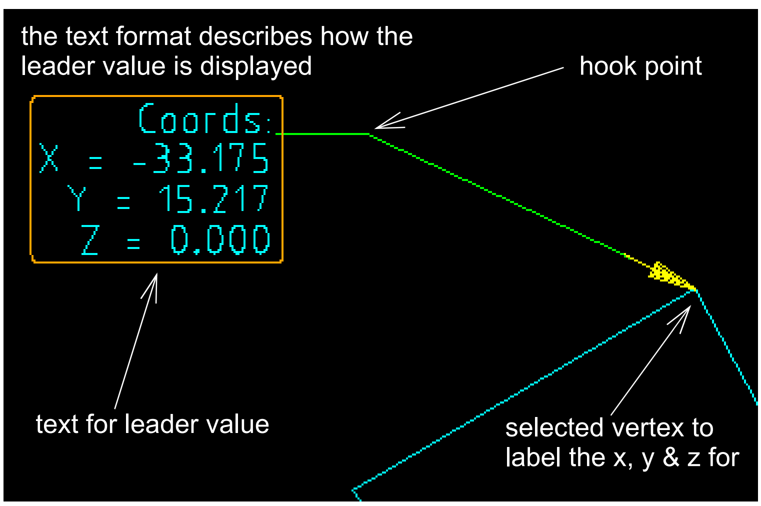
The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Vertex XYZ Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.14 Vertex XY

Information Leader choice **Vertex XY** displays in the leader box, the x and y coordinates of a selected vertex.

A leader line is drawn from a selected vertex on a string to a selected hook point, and then to the end of the hook itself.

Using the text format, the x and y coordinates of a selected vertex are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the vertex to label with its x and y coordinates

When **Vertex XY** is the choice, the following message is written to the screen message area

```
< (t)ype[Vertex XY] Pick vertex (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the vertex.

Step 2.Pick the hook point

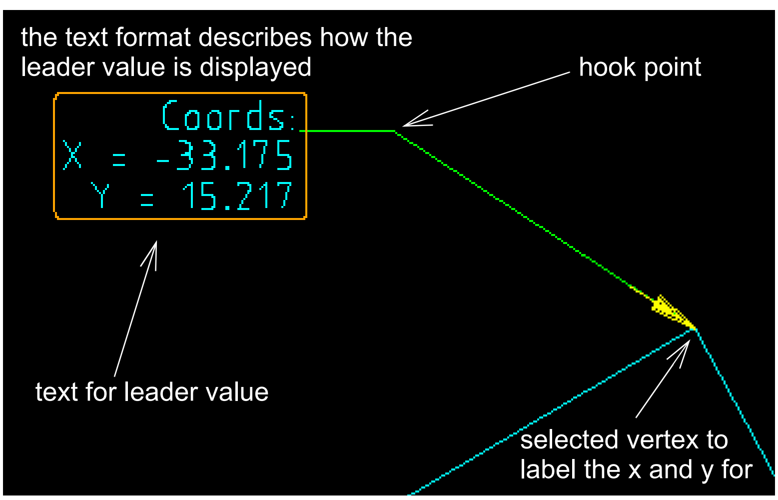
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Vertex XY Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.15 String XYZ

Information Leader choice **String XYZ** displays in the leader box, the x, y and z coordinates of any selected position on a string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the x, y and z coordinates of the selected string position are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string position to label with its x, y and z coordinates

When **String XYZ** is the choice, the following message is written to the screen message area

```
< (t)ype[String XYZ] Pick point (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

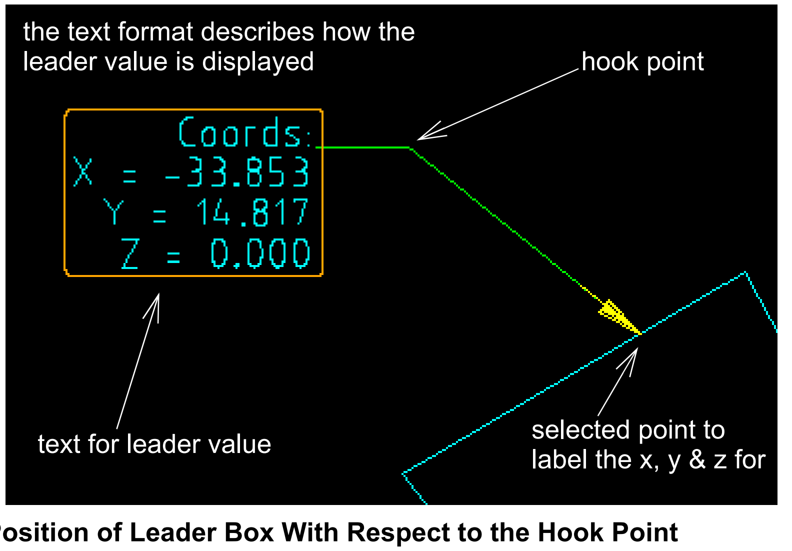
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **String XYZ Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.16 String XY

Information Leader choice **String XY** displays in the leader box, the x and y coordinates of any selected position on a string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the x and y coordinates of the selected string position are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string position to label with its x and y coordinates

When **String XY** is the choice, the following message is written to the screen message area

< (t)ype[String XY] Pick point (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

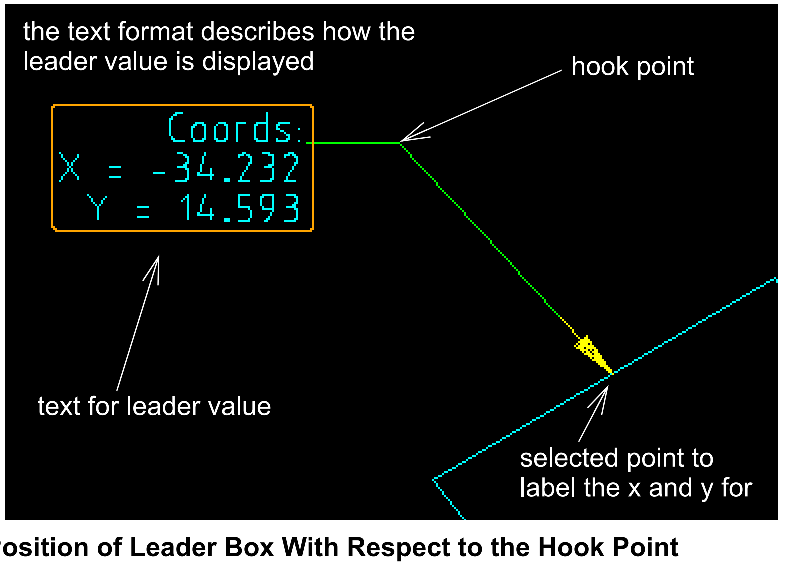
The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **String XY Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.17 String Z

Information Leader choice **String Z** displays in the leader box, the z coordinate (level) of any selected position on a string.

A leader line is drawn from a selected position on a string (string pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the z coordinate (level) of the selected string position are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string position to label with level (z coordinate)

When **String Z** is the choice, the following message is written to the screen message area

< (t)ype[String Z] Pick point (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

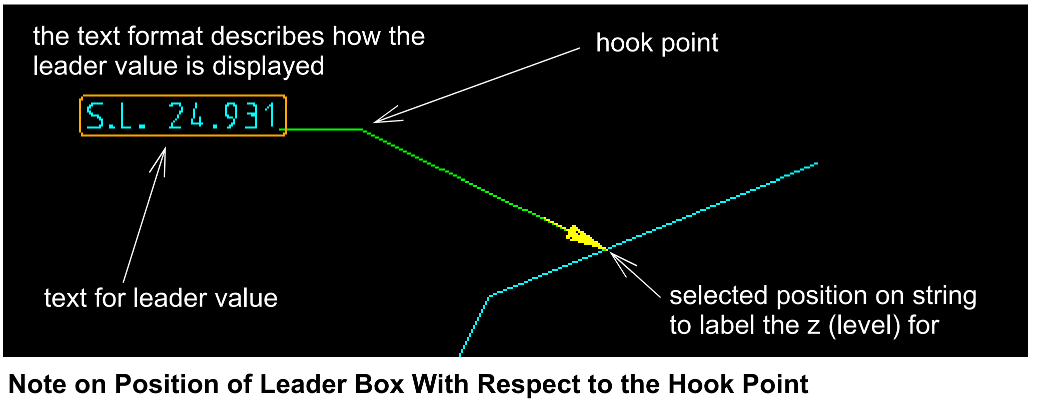
The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **String Z Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the segment pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the segment pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.18 Tin Z

Information Leader choice **Tin Z** displays in the leader box, the z value (level) from the tin at the (x,y) coordinates of a selected position.

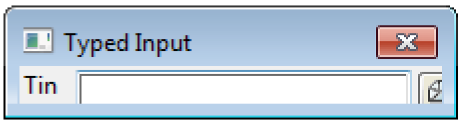
A leader line is drawn from the selected position (pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the level from the tin is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the position that is to be labelled with the level (z value) from the tin

When **Tin Z** is the choice, and if it is the first time the **Tin z** option has been used in this session, then the *Tin* **Typed Input** box is placed on the screen.



The tin to take the levels from is picked from the pop up list, or typed into the box and **<Enter>** pressed. The box is then removed.

The following message is written to the screen message area.

```
< (t)ype[Tin Z] Pick point on tin (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle
i or **I** brings up the *Tin* **Typed Input** box to select a new tin.

If Association is **ON** then the start of the Leader is associated with the pick point

Step 2.

The following message is written to the screen message area.

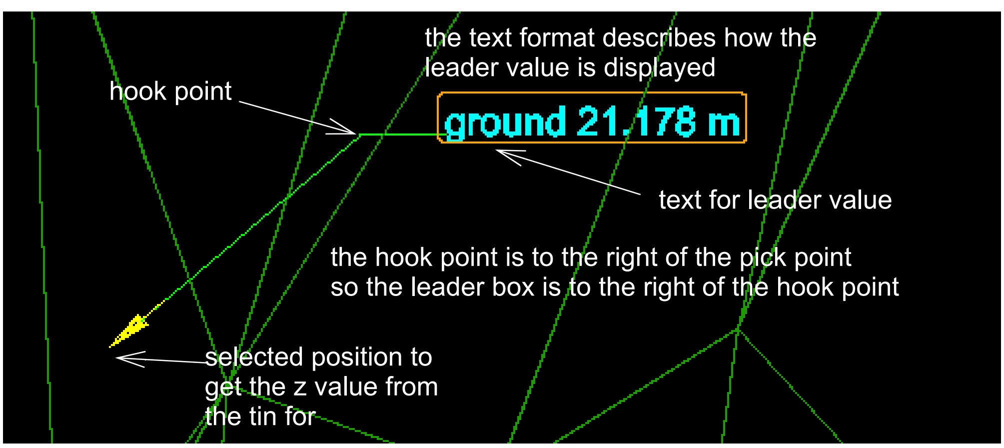
```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

Pick the hook point.

The *Information Leader* is then created.

The **Tin Z Information Leader** then starts again. That is, it goes back to **Step 1**.



Note - the tin itself does not have to be on any view.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.19 Tin Depth

Information Leader choice **Tin Depth** displays in the leader box, the depth at a selected position on a string to a tin.

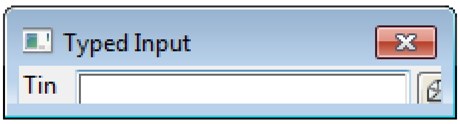
A leader line is drawn from the selected string position (pick point) to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the depth form the pick point to the tin is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the point that is to be labelled with its depth to the tin

When **Tin Depth** is the choice, and if it is the first time the **Tin z** option has been used in this session, then the *Tin* **Typed Input** box is placed on the screen.



The tin to take the levels from is picked from the pop up list, or typed into the box and **<Enter>** pressed. The box is then removed

The following message is written to the screen message area.

```
< (t)ype[Tin Depth] Pick point on tin (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle
i or **I** brings up the *Tin* **Typed Input** box to select a new tin.

If Association is **ON** then the start of the Leader is associated with the pick point

Step 2.Pick the hook point

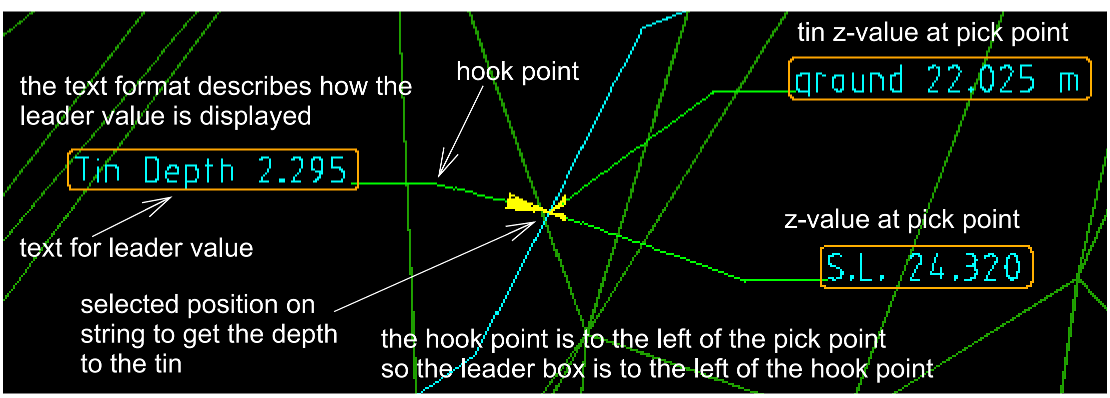
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Tin Depth Information Leader** then starts again. That is, it goes back to **Step 1**.



Note - the tin itself does not have to be on any view.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.20 Grade (%)

Information Leader choice **Grade (%)** displays in the leader box, the percent grade of a selected position on string (string pick point).

A leader line is drawn from the string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the percent grade at the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the position on a string to label with per cent grade

When **Grade per cent** is the choice, the following message is written to the screen message area

```
< (t)ype[Grade %] Pick point on string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

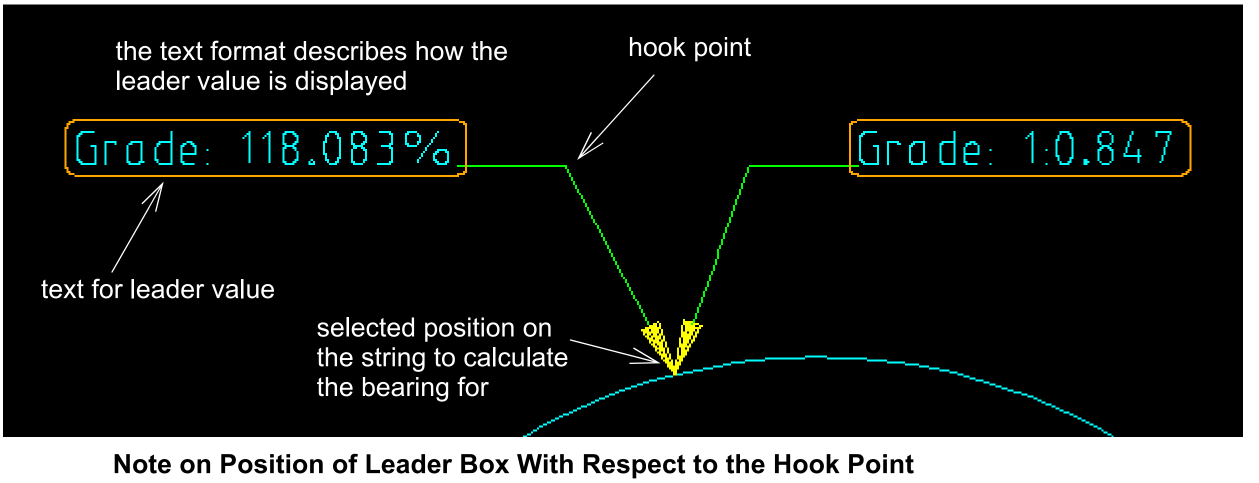
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Grade per cent Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.21 Grade 1 n - Slope

Information Leader choice **Grade 1 in** displays in the leader box, the grade as a 1 in (slope) of a selected position on string (string pick point).

A leader line is drawn from the string pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the value of the grade as a 1 in (slope) at the string pick point is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the position on a string to label with its grade as 1:in (slope)

When **Grade 1 in** is the choice, the following message is written to the screen message area

```
< (t)ype[Grade 1 In] Pick point on string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] > [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

If Association is **ON** then the start of the Leader is associated with the string pick point.

Step 2.Pick the hook point

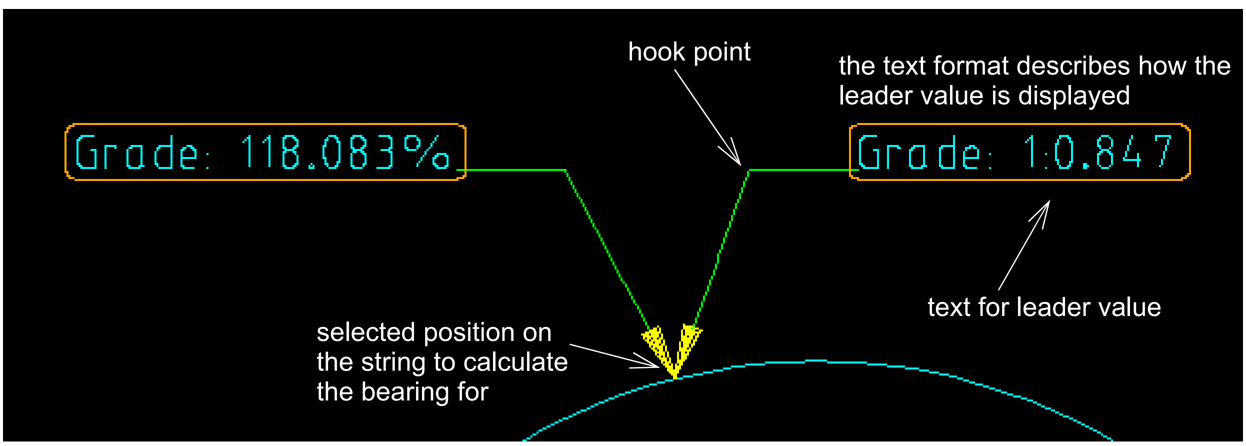
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Grade 1 in Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the string pick point then the leader box is drawn to the left of the hook point. If the hook point is to the right of the string pick point then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.22 Centroid XY

Information Leader choice **Centroid XY** displays in the leader box, the (x,y) coordinates of the centroid of a selected string. If the string is not a closed string (a polygon) then it is temporarily closed for calculating the Centroid. Note that the centroid may be outside the closed string - for a point that is inside the string, see 15.4.5.23 Medial Centre XY.

A string is selected (string pick point) and a position for the hook and leader line is drawn from either the string pick point or the **centroid** of the string, to a selected hook point, and then to the end of the hook itself.

Using the text format, the (x,y) coordinates of the centroid of the selected string are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string to label with the (x,y) coordinates of its centroid

When **Centroid XY** is the choice, the following message is written to the screen message area

< (t)ype[Centroid XY] Pick string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] fixed-a(r)row> [picks][fast][Menu]

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle
r or **R** toggles between the arrow starting at the pick point (**free arrow**) or at the polygon centre (**fixed arrow**)

If Association is **ON** then the start of the Leader is associated with the pick point or the centroid of the string.

Step 2.Pick the hook point

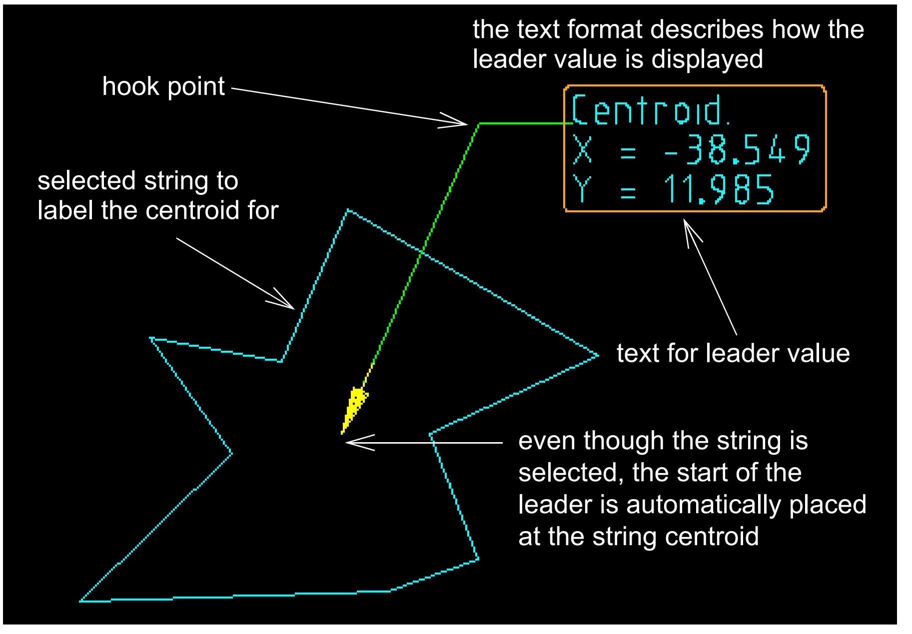
The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Centroid XY Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the centroid of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the centroid of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.23 Medial Centre XY

Information Leader choice **Centre XY** displays in the leader box, the (x,y) coordinates of the medial axis centre of a selected string. If the string is not a closed string (polygon) then it is temporarily closed for calculating the Medial centre.

Note - the Medial centre is a pointed calculated by 12d to use as the **"**centre**"** of a polygon and unlike a centroid, it is always **inside** the polygon. WARNING - this currently does not take arcs into consideration.

A string is selected (string pick point) and a position for the hook and leader line is drawn from either the string pick point or the **medial axis centre** of the string, to a selected hook point, and then to the end of the hook itself.

Using the text format, the (x,y) coordinates of the medial centre of the selected string are displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the string to label with the (x,y) coordinates of its (medial) centre

When **Centre XY** is the choice, the following message is written to the screen message area

```
< (t)ype[Centroid XY] Pick string (a)ssociative (s)tyle[Arial Border] (h)ook-angle[0°] fixed-a(r)row> [picks][fast][Menu]
```

a or **A** toggles Association **ON** and **OFF**. See 15.4.1 Leader Association
t or **T** changes the type of Information Leader. See 15.4.5 Information Leader
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle
r or **R** toggles between the arrow starting at the pick point (**free arrow**) or at the polygon centre (**fixed arrow**)

If Association is **ON** then the start of the Leader is associated with the centre of the string.

Step 2.Pick the hook point

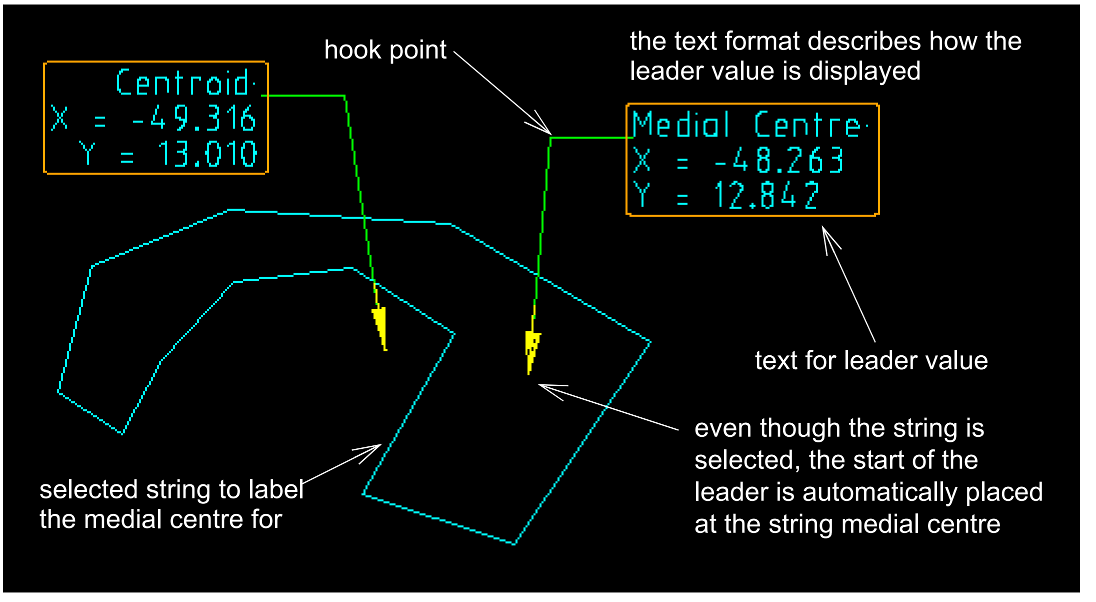
The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Information Leader* is then created.

The **Centre XY Information Leader** then starts again. That is, it goes back to **Step 1**.



Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the medial centre of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the medial centre of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.24 Trimesh Volume

The **Leader** choice **Trimesh volume** displays in the leader box, the volume of a selected closed trimesh.

A trimesh is selected (trimesh pick point) and a position for the hook and leader line is drawn from the trimesh pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the volume of the selected trimesh is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the trimesh to label with its volume

When **Trimesh Volume** is the choice, the following message is written to the screen message area

<Pick trimesh (s)tyle[default] (h)ook-angle[0°] > [picks][fast][Menu]

s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

Step 2.Pick the hook point

The following message is written to the screen message area.

<Pick hook point or customise (t)ext> [picks][fast][Menu]

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Trimesh Volume Leader* is then created.

The **Trimesh Volume Leader** then starts again. That is, it goes back to **Step 1**.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

If the hook point is to the left of the medial centre of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the medial centre of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.5.25 Trimesh Surface Area

The **Leader** choice **Trimesh area** displays in the leader box, the surface area of a selected trimesh.

A trimesh is selected (trimesh pick point) and a position for the hook and leader line is drawn from the trimesh pick point to a selected hook point, and then to the end of the hook itself.

Using the text format, the volume of the selected trimesh is displayed at the end of the hook line.

The leader is added to the model given in the CAD toolbar.

Step 1.Pick the trimesh to label with its surface area

When **Trimesh area** is the choice, the following message is written to the screen message area

```
<Pick trimesh (s)tyle[default] (h)ook-angle[0°] > [picks][fast][Menu]
```

s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
h or **H** brings up the Hook Angle 15.4.2 Hook Angle

Step 2.Pick the hook point

The following message is written to the screen message area.

```
<Pick hook point or customise (t)ext> [picks][fast][Menu]
```

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.

The *Trimesh Area Leader* is then created.

The **Trimesh Area Leader** then starts again. That is, it goes back to **Step 1**.

Note on Position of Leader Box With Respect to the Hook Point

As well as determining the length of the leader line, the hook point also determines whether the leader box goes to the left or the right of the hook point.

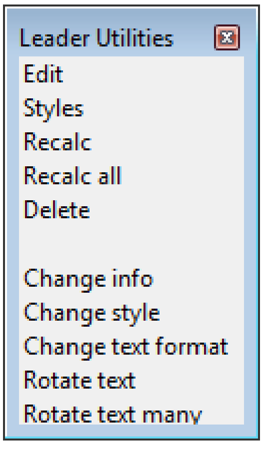
If the hook point is to the left of the medial centre of the string then the leader box is drawn to the left of the hook point. If the hook point is to the right of the medial centre of the string then the leader box is drawn to the right of the hook point.

For information on how the Leader object appears, see 15.4.6.2 Leader Styles.

15.4.6 Leader Utilities

Position of menu: **Cad =>Leader =>Utilities**

The **Leader Utilities** menu is:



edit a leader
define styles for leaders

See

15.4.6.1 Leader Edit
15.4.6.2 Leader Styles
Recalc - select a leader to recalc.
Recalc all - recalcs all leaders.
Delete - select a leader to delete.
15.4.6.3 Change Style of Leader
15.3.18.4 Change Text Format (same option for Dimensions and Leaders)

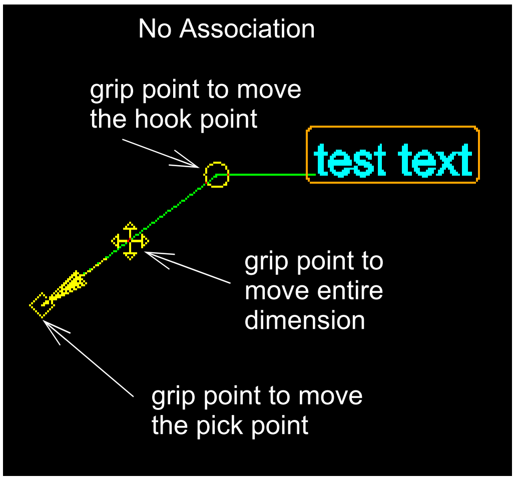
15.4.6.1 Leader Edit

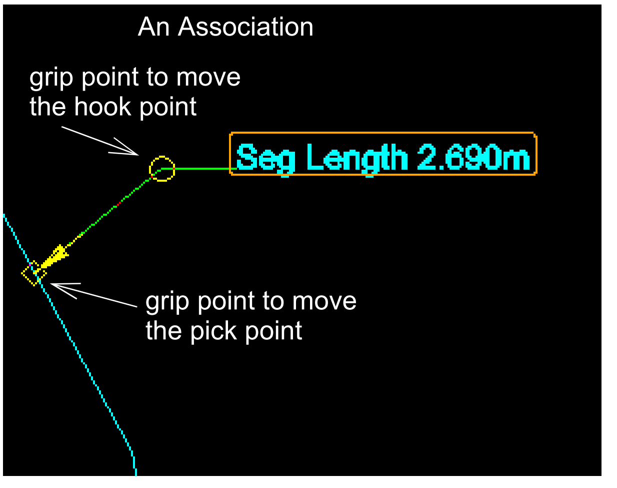
Picking an existing Leader will bring up the Leader editor and the grip points for the pick point and the hook point are displayed.

If there is **no Association** because either the Association is OFF, or Association is ON but there is nothing currently associated with the leader, then you won't get a grip point to move the entire leader because the leader is locked to its associated items.

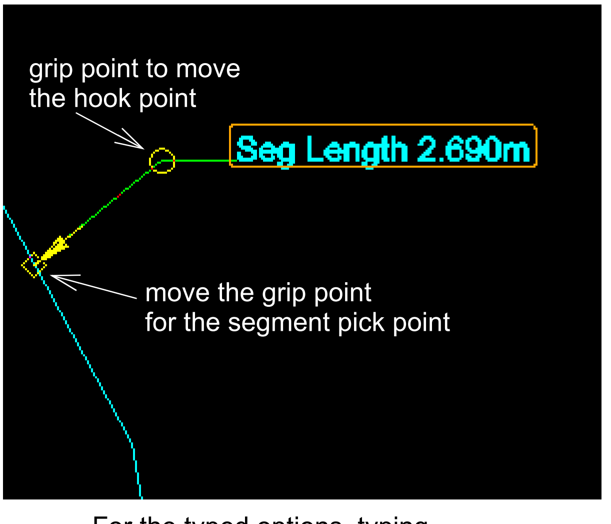
A list of typed options is also displayed in the screen message area.

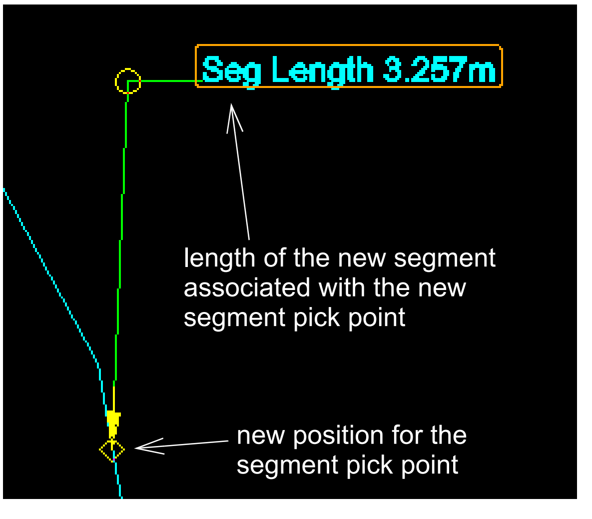
<[Pick grip point] (t)ext (s)tyle[default] (h)ook-angle[0°] (f)lip (d)elete a(n)other> [picks][fast][Menu]





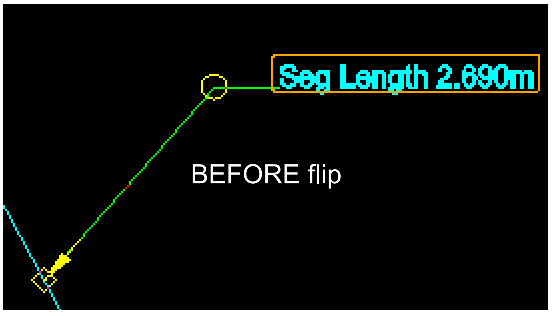
Picking and accepting a grip point will move the grip point and when it is placed again, the association is recalced and the new value for the leader displayed.

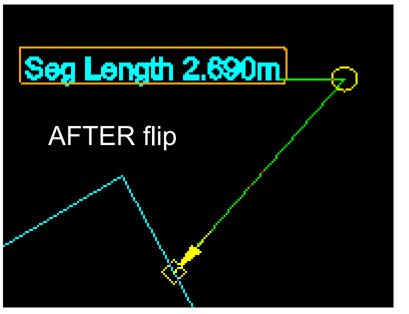




For the typed options, typing

t or **T** brings up the leader text format. See 15.5 Text Format for Dimensions and Leaders.
s or **S** brings up the leader style list. 15.4.6.2 Leader Styles
f or **F** to flip the side that the hook goes to.
d or **D** deletes the leader
n or **N** pick a new leader to edit.





Also

Pressing **<Esc>** will exit the editing of the current *leader* and ask for a new drafting element (Leader or Dimension) to be selected for editing.

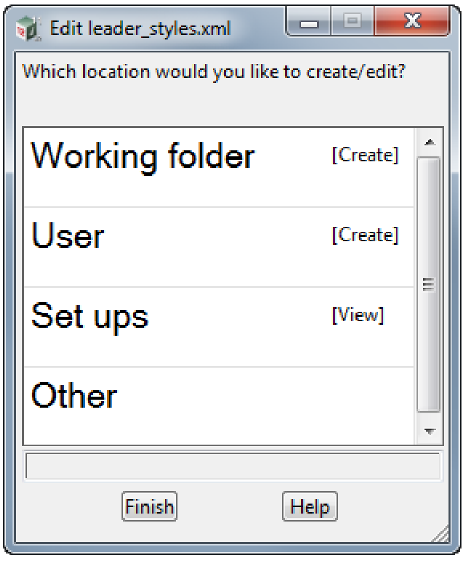
Similarly clicking **RB** and selecting **Cancel** from the **Pick Ops** menu will exit the editing of the current *leader* and ask for a new drafting element (Leader or Dimension) to be selected for editing.

When back in the Drafting Editor, pressing **<Esc>** or clicking **RB** and selecting **Cancel** from the **Pick Ops** menu, will exit the Drafting Editor

15.4.6.2 Leader Styles

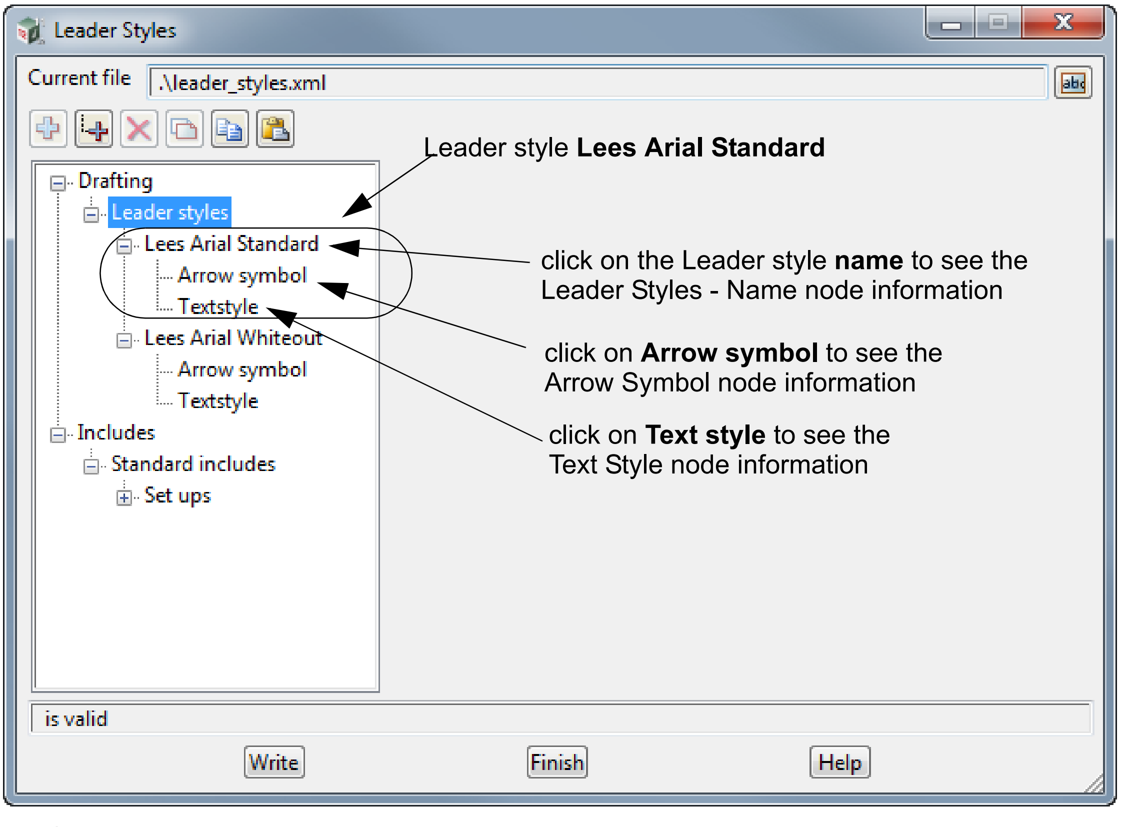
Position of option on menu: **CAD =>Leader =>Styles**

When you click on the option an **Edit leader_styles.xml** panel is brought up and the panel shows the standard areas for looking for the leader_styles.XML files - Working folder, Customer (User), User, Set Ups and Other.



For information about where how to find and create dimension_styles.xml files, see 15.7 Style XML Files for Dimensions, Leaders & Tables.

Once a leader_styles.xml file has been opened, the **Leader Styles** panel is displayed.



See

15.4.6.2.1 Leader Styles - Name Node

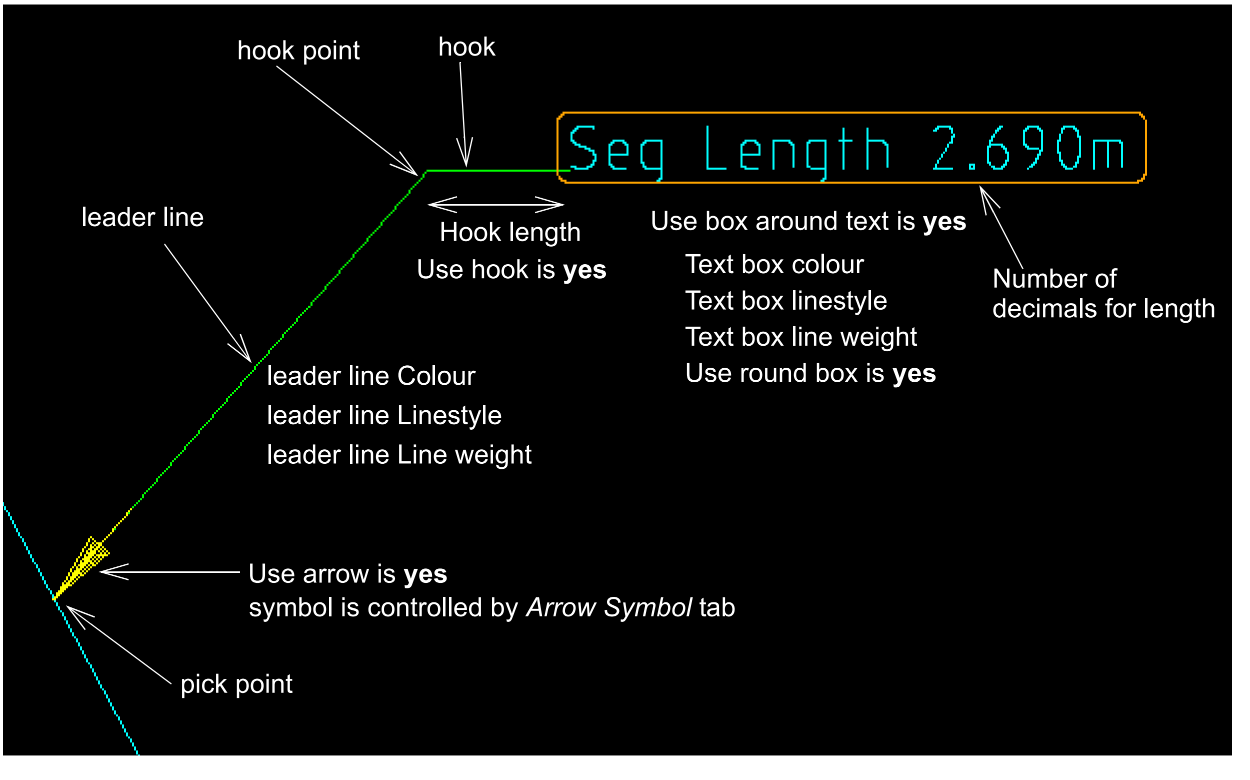
15.4.6.2.1 Leader Styles - Name Node

This is on the right hand side of the panel when you click on the ***Leader style*** name.

Name	Paper
Group	no hook
Colour	green
Linestyle	THIN
Lineweight	1
Use arrow	yes
Use hook	yes
Hook length	0.5
Use box around text	yes
Use rounded box	yes
Text box colour	orange
Text box linestyle	1
Text box lineweight	0
Number of decimals for length	3
Number of decimals for area	2
Use dynamic size	no
Hook angle	0
Angle format style	show_angle
Number of decimal for angle	2
Number of decimals for volume	2

Hook length has same units as Textstyle. So i the Textstyle is paper, then **Hook length** s in millimetres.

these settings are not currently used



If the **Type** from the **Textstyle** tab is **not world,** then the following are not used.

Use text box - should be *Use box around text* like dimension.

Text box rounded - should be *Use rounded box* like dimension?.
Text box colour
Text box linestyle

Text box line weight

The following items that are at the bottom of the tab have not yet been implemented.

Hook angle
Use dynamic size
Number of decimals for volumes
Angle format style

15.4.6.2.2 Leader Styles - Arrow Symbol Node

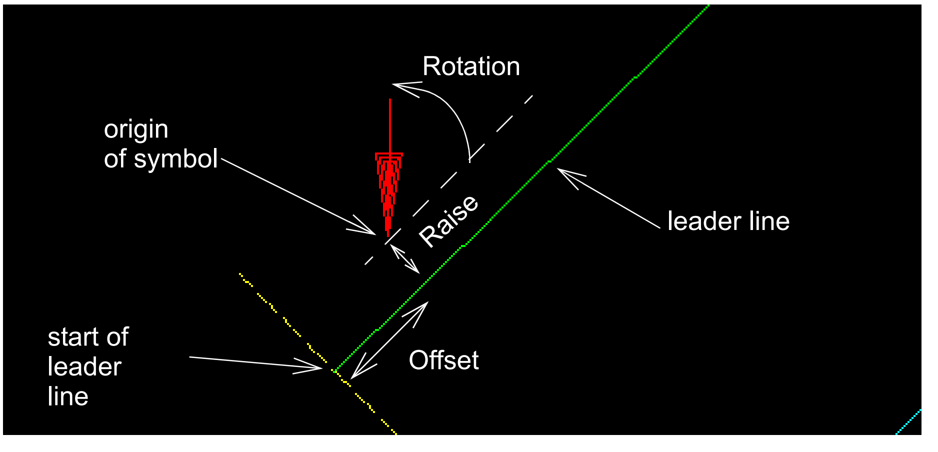
This is on the right hand side of the panel when you click on the ***Arrow symbol*** node.

Style	Arrow
Colour	red
Size	0.5
Rotation	45
Offset	0.2
Raise	0.5

The origin of the symbol is displaced from the **start** of the leader line by the **Offset** and **Raise** values.

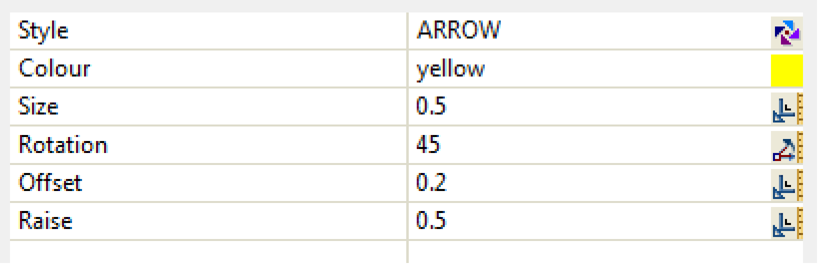
With a **Rotation** value of zero, the symbol is given the same rotation as the leader line.

For a non zero **Rotation**, the value is **added** to the angle of the leader line.



15.4.6.2.3 Leader Styles - Hook Symbol Tab

Not implemented at this stage.



Style	ARROW
Colour	yellow
Size	0.5
Rotation	45
Offset	0.2
Raise	0.5

15.4.6.2.4 Leader Styles - Textstyle Node

This is on the right hand side of the panel when you click on the ***Textstyle*** node.

Textstyle	Arial
Name	
Type	paper
Size	0.2
Angle	0°
X-factor	1
Slant	0
Offset	0
Raise	0
Colour	cyan
Whiteout	no colour
Border	no colour
Border type	
Justify	bottom-left
TTF Underline	no
TTF Strikeout	no
TTF Italic	no
TTF Outline	no
TTF Weight	400

This is expected to be modified shortly so that it uses a *Textstyle Data* and all the features from *Textstyle Data* are automatically available. For the moment with paper text, only **Whiteout** is supported.

When the *Textstyle Data* is implemented, it can have its own *Border type* but there is no linestyle for the border in *Textstyle Data*. The only way to get a border with a linestyle is to use World text and set the border parameters in the *General* tab (15.4.6.2.1 Leader Styles - Name Node).

If **Type** is not ***world***, then **Don't clip dimension line for tex**t is set to **no** and these items from the General tab are not used.

Use box around text
Use rounded box
Text box colour
Text box linestyle

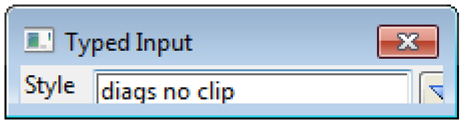
See 15.4.6.2.1 Leader Styles - Name Node

15.4.6.3 Change Style of Leader

Click on **Change style of style** and the following message is written to the screen message area

Pick a leader and its style will be changed to that shown in the square brackets ([]). Then pick another leader to change its style.

Typing **s** or **S** brings up the *Style* **Typed Input** box to select a new leaders style.



The new style is picked from the pop up list, or typed into the box and <Enter> pressed.

The box is then removed and the message again written to the screen message area.

All subsequent selected leaders will have their styles changed to this new style until either the option is terminated or a new leader style is selected

To terminate the option, press **<Esc>**, select **Cancel** from the **Pick Ops** menu, or select another CAD option.

15.5 Text Format for Dimensions and Leaders

For *Dimensions* and *Leaders*, there is one, and sometimes more than one, value that is to be displayed in the *Dimension* or *Leader* as text. For example, the length of a segment or the x an y coordinates of a point.

The user rarely want to display all the different dimes ion and leader values in the same way. For example, some values may be displayed in metres, others in millimetres. Or you may want to display both metres and yards.

In ***12d Model***, there are special **Text Formats** to allow the user to tailor how the values of the *Dimensions* and *Leaders* are displayed.

So a ***Text Format*** is used to describe how a single value for a dimension or leader is displayed.

In general is has the form

*pre_text***Expression***post_text*

where **Expression** can be either

(a) a set of angle brackets enclosing a *value_format* which describes how the value is modified and how many decimal places are used in the final text display of the value

<*value_format*>

of

(b) and expression involving an **IF** statement (known as a ***dynamic text format***)

The full structure of the **Text Format**, the *value_format* and dynamic text format is described in the following sections:

15.5.1 Angle Brackets <>
15.5.2 Pre and Post Text
15.5.3 Units Factor
15.5.4 Round Off
15.5.5 Number of Decimals
15.5.6 Dynamic Text Format
15.5.7 Multiple Text Formats
15.5.8 Typing t or T to Change the Text Format
15.5.9 Defaults File for Text Formats

15.5.1 Angle Brackets <>

In the Text Formats, angle brackets **<>** are used to indicate the position of the value of the *Dimension* or *Leader*.

There can be special value formatting instructions inside the angle brackets to indicate if and how the value is to be modified, and how many decimals to use when finally displayed as text.

<*value_format*>

What is available for *value_format* will be described in the following sections.

In some cases, the angle brackets may not appear at all in the Text Format and then the text does not include the actual value itself.

If the *Dimension* or *Leader* has only one value, then just <> is required.

If the *Dimension* or *Leader* has more than one value, then extra commands are needed to indicate which value is being talked about in the Text Format.

<x> is used for the x value of a coordinate

<y> is used for the y value of a coordinate

<z> is used for the z value of a coordinate

15.5.2 Pre and Post Text

The text displayed for a dimension or leader value can have user defined *pre* and *post* text around the value and that is indicated by the expression

*pre_text***<***value_format***>***post_text*

where **pre_text** is written before the dimension or leader value, **post_text** is written after the value.

Typing **\\n** into **pre_text** or **post_text** will be interpreted as a new line.

The angle brackets **<>** indicate where you want the value in relation to the **pre_text** and **post_text**. The angle brackets may even be missing.

For example, to show just the word “varies”, use the following with no angle brackets.

varies

15.5.3 Units Factor

The value to be displayed can be multiplied by a ***units_factor.*** The units_factor is written inside the angle brackets <>. That is

<*units_factor*>

So the expression

*pre_text***<***units_factor***>***post_text*

means that **pre_text** is written before the dimension or leader value, **post_text** is written after the value, **<>** indicates that you want the value and the value is multiplied by the **units_factor** before being displayed.

If **units_factor** is left blank then it is defaulted to 1.

If **<units_factor>** is left out, then there is no value in the dimension or leader text but you still get the **pre_text** and **post_text**.

Note

pre_text<units_factor>post_text is considered to be **one** block of text. So raise, offset, justification etc apply to the whole block, not to the *pre_text* or *post_text* individually.

As an example of *pre_text<units_factor>post_text*, you can show millimetres instead of metres by using:

<1000>

or, if you want the text “ mm” after the value

<1000> mm

15.5.4 Round Off

Inside the angle brackets <>, the type of Rounding Off can be specified by a key character **O** (down), **M** (middle) or **U** (up) followed immediately (with no spaces) by the ***rounding_unit***.

O*rounding_unit* means to round down to the closest rounding_unit

M*rounding_unit* means to round to the closest rounding_unit

U*rounding_unit* means to round up to the closest rounding_unit

For example

O1 means that 10.2 would round down to 10.

O0.1 means that 10.2 would round down to 10.2

D0.25 means that 10.2 would round up to 10.

U0.25 means that 10.2 would round up to 10.25

M0.25 means that 10.2 would round up to 10.25 rather than down to 10.

Note: the *units_factor* is applied first and then the *Round Off.*

15.5.5 Number of Decimals

Inside the angle brackets <>, you can give the number of decimal places to use when writing out the real value by using the key character **D** followed immediately (with no spaces) by the ***number of decimal places***.

D*n* where **n** is the number of decimal places.

*pre_text***<***units_factorDn***>***post_text*

The *units_factor* is applied first and then the number of decimal places used on the resulting value.

For example

<1000D1>

says to multiply the real by 1000 and only use one decimal place in the text for the value.

Note: the *units_factor* is applied first, followed by the *Round Off*, and finally the *number of decimal places* used in the text to display the resulting value.

So <100D2U0.25> is the same as <100U0.25D2> - multiply by 100, round Up using the *rounding_unit* of 0.25, and then writing the result with two decimal places.

15.5.6 Dynamic Text Format

It is also possible to change the format for a value depending on the size of the value by using an **Expression** with an **IF** test instead of the simple angle brackets **< >**.

The **Expression** has key words _IF_,_THEN_, _ELSE_ and _ELSEIF_ and can be

_IF_ op1 *comparison_value_1* **_THEN_** *single_value_format_1* **_ELSEIF_ op2** *comparison_value_2* **_THEN_** *single_value_format_2***_ELSE_IF_ op3** *comparison_value_3* **_THEN_** *single_value_format_3***…_ELSE_** *single_value_format_n*

where **op1** and **op2** are one of

=	for *equals*
>	for *greater than*
>=	for *greater than or equal to*
<	for *less than*
<=	for *less than or equal to*

and

single_value_format_n is a **Text Format** for a single value and **not** an Expression.

The comparison is always being made between the *dimension/leader value* and the *comparison_value* so we have left out the *dimension/leader value*.

That is, **_IF_** *>comparison_value* means **if** (*dimension value* is greater than *comparison_value*).

For example if you wanted to display kilometres to three decimal place, for anything greater than or equal to 1,000, metres to three decimal places for values greater or equal to 1, otherwise millimetres with no decimal places, then use

_IF_>=1000_THEN_<0.001D3> km _ELSEIF_>=1_THEN_<D3> m_ELSE_<1000D0>mm

Important Notes

1. The *Dynamic Text Format* always evaluates to only one piece of text.
2. The underscore is part of **_IF_**, **_THEN_**, **_ELSEIF_** and **_ELSE_**.
3. **_IF_ op** *comparison_value* must be followed by a **_THEN_** *single_value_format*.
4. **_ELSEIF_ op** *comparison_value* must be followed by a **_THEN_** *single_value_format*.
5. It is compulsory to have an **_ELSE_** at the end of the **Expression**.
6. An **Expression** is only for **<>** values and **not** <x>, <y> etc.

15.5.7 Multiple Text Formats

You can have just the one Text Format or multiple text formats in the dimension or leader.

That is, you can have

*pre_text***<***value_format_1***>***text_1<value_format_2>***…***text_n<value_format_n>*

where **pre_text** is written before the value with value_format_1, **text_n** is written after the n'th <> and the value in the n'th <> has the format *value_format_n*.

For example, to show metres and International feet, use

<> m or <3.28083895> ft

or to show metres and US Survey feet, use

<> m or <3.280833333> ft

15.5.8 Typing t or T to Change the Text Format

When using many of the **Dimension** or **Leader** commands, a list of typed options is often displayed in the screen message area and this may include **forma(t)** or **customise (t)ext.**

example for Dimensions

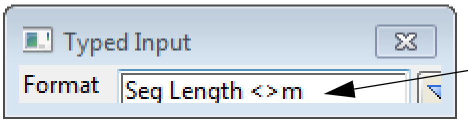
<[Pick start point] (a)ssociative (s)tyle[default] forma(t) [(z)ero offset OFF] > [picks][fast][Menu]

for Information Leaders

<Pick hook point or customise (t)ext> [picks][fast][Menu]

When this is the case, typing **t** or **T** is for changing the Text Format for the dimension or leader. The default value is the last one used.

After typing **t** or **T**, the *Format* **Typed Input** box is displayed showing the current text format of the selected dimension or leader.



format for a **Segment length** leader

Clicking on the Choice icon will bring up a list of *Text Formats* for the type of *dimension* or *leader* being worked on. This includes the **last six** used which is usefull when using the same format multiple times. See 15.5.9 Defaults File for Text Formats.

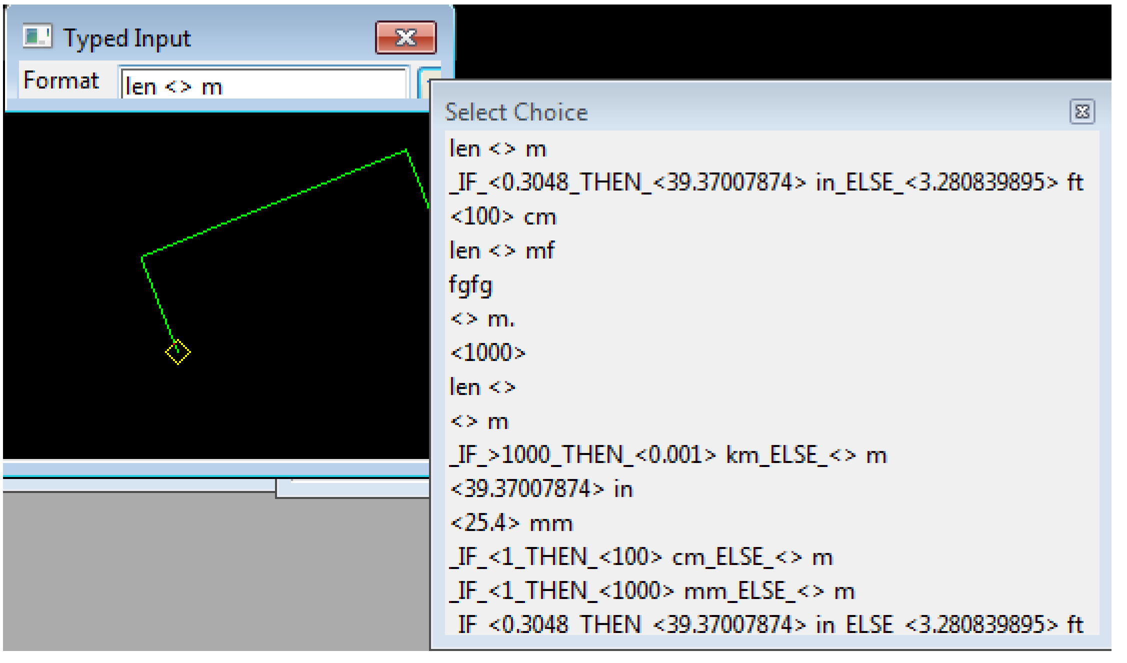
The new *Text Format* is picked from the pop up list, or typed into the box and **<Enter>** pressed.

The *Format* **Typed Input** box is then removed.

15.5.9 Defaults File for Text Formats

There is an XML file called ***draft_texts.xml*** which contains up to fifteen text formats for **each** *Dimension* type, and up to fifteen text formats for **each** type of *Information Leader*.

When you type **t** or **T** after seeing **(t)ext** included in the message in the screen message area, a *Format* **Typed Input** box is placed on the screen. The pop on the box up brings up a list of up to fifteen entries which come from the appropriate section of the ***draft_texts.xml*** file for the dimension or leader type being created or edited.



The first **six** of the fifteen in the pop up are the last six ones used in the current session of ***12d Model***, and the rest come from the *drafts_texts.xml* file.

So in a new session, all the entries in the pop up come from the ***drafts_texts.xml*** file. Each time one is selected from the list, or a new text format typed in, the selected or typed in text format is placed on the top of the list. If there is already six new entries on the top of the list, the sixth one is deleted and the first five are shuffled down.

As each of the six new entries are added to the top of the list, the bottom six that have come from the ***draft_texts.xml*** file are dropped off the list.

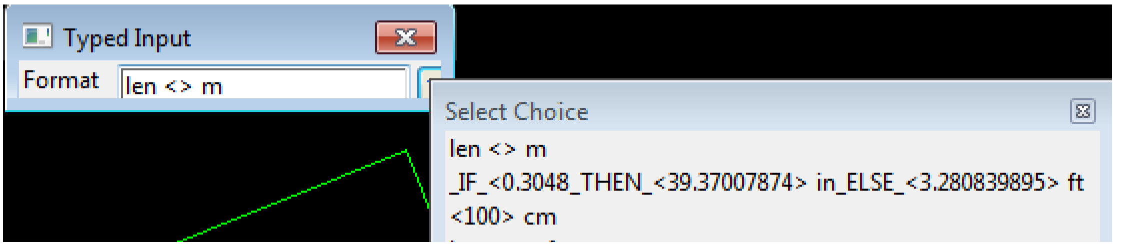
The ***draft_texts.xml*** file is read each time you open a ***12d Model*** project.

15.5.9.1 An Excerpt from a draft_text.xml File

The ***draft_text.xml*** file consists of a <meta_data> block at the top and then a <drafting> block with <Leader_Text> and <Dimension_Text> sections.

Note that because **<** and **>** are part of the XML syntax, in an XML file, less than (<) is written as **<** and greater than (>) is written as **>**.

An example of part of the *Dimension_Text* and *Leader_Text* sections of the ***drafts_texts.xml*** file, which includes the Aligned_Type dimension text formats for the first three entries in the pop up list.



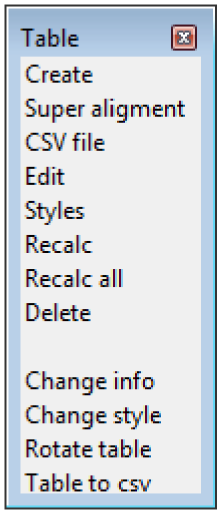
is:

```
<Dimension_Text>
    <Aligned_Type0>len &lt;&gt; m</Aligned_Type0>
    <Angular_Type0>&lt;&gt;</Angular_Type0>
    <Arc_Ang_Type0>&lt;&gt;</Arc_Ang_Type0>
    <Aligned_Type1>_IF_&lt;0.3048_THEN_&lt;39.37007874&gt; in_ELSE_&lt;3.280839895&gt; ft</Aligned_Type1>
    <Angular_Type1>&lt;&gt;</Angular_Type1>
    <Arc_Ang_Type1>&lt;&gt;</Arc_Ang_Type1>
    <Aligned_Type2>&lt;100&gt; cm</Aligned_Type2>
</Dimension_Text>
<Leader_Text>
    <Unknown_Type0>sadfsdfa\\nLine2</Unknown_Type0>
    <Area_Type0>Area &lt;&gt;</Area_Type0>
    <String_Length_3d_Type0>Length 3d &lt;&gt;m</String_Length_3d_Type0>
    <Unknown_Type1>sadfsdfa</Unknown_Type1>
    <Area_Type1>Area &lt;&gt;</Area_Type1>
    <String_Length_3d_Type1>Length 3d &lt;&gt;m</String_Length_3d_Type1>
    <Unknown_Type2>sadf</Unknown_Type2>
    <Area_Type2>Area &lt;&gt;</Area_Type2>
    <String_Length_3d_Type2>Length 3d &lt;&gt;m</String_Length_3d_Type2>
</Leader_Text>
```

15.6 CAD Table

Position of option on menu: **CAD =>Table**

The **CAD Table** options create and edit tables.



create a table
create a table for a super alignment
create a table for a CSV file
edit a table
create/edit table styles
recalc a selected table
recalc all tables
delete a table

change style of a table
rotate a table
convert a table to a CSV file

A user table can be created but also tables from super alignments or CSV files that can automatically update with changes in the super alignment or CSV file.

See

15.6.1 Create Table
15.6.2 Create Table from a Super Alignment
15.6.3 Create Table from a CSV File
15.6.4 Table Edit
15.6.5 Table Styles

Recalc - select a table to recalc.

Recalc all - recalcs all tables.

Delete - select a table to delete.

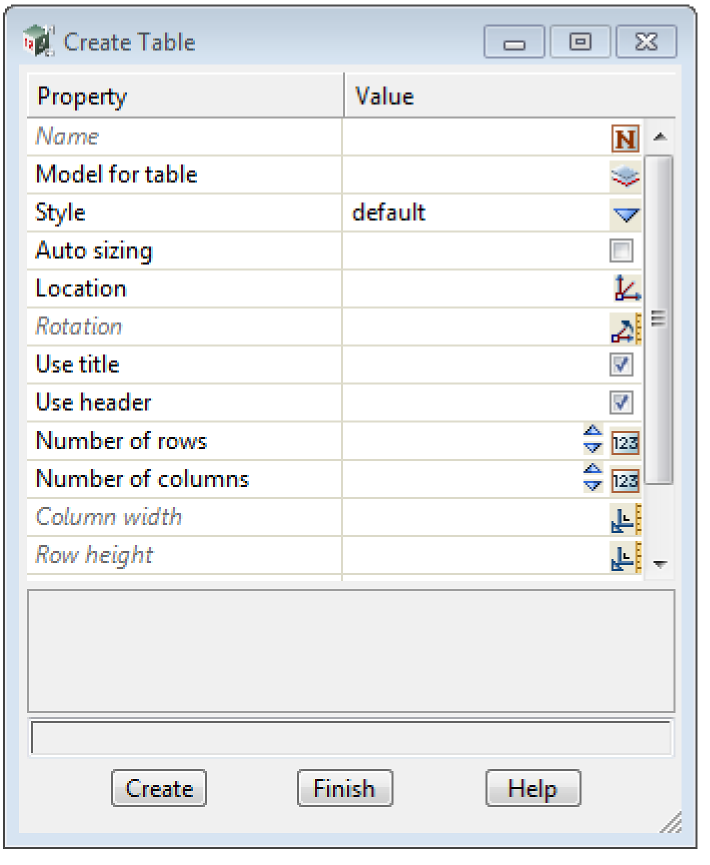
15.6.6 Table to CSV

15.6.1 Create Table

Position of option on menu: **CAD =>Table =>Create**

Important Note - all the text in a table will be treated as World Units.

Selecting **Create** brings up the **Create Table** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		available names

the name for the table. This must not be blank.

Model for table	model box		available models

the model for the table.

Style	table style box		available table styles

the table style to use for this table.

Auto sizing	tick box	not ticked	

*if **ticked**, the table automatically resizes the column widths and heights to fit the text into the columns. If **not ticked**, the table will not resize the column widths and heights to fit the text into the column.*

Location	x y box	0	

*the (x,y) coordinates of the **top left hand corner** of the table.*

Rotation	angle box	0	

the rotation of the table - entered in hp notation. It is measured in a counter clockwise direction from the positive x axis.

Use title tick box ticked

*if **ticked**, the table has a title as the first row and it only consists of one column which goes from the left side of the table to the right side of the table. The textstyle information for text in the title is given in the* **Title style** *node of the Drafting Styles for Tables.*
*If **not ticked**, the table does not have a title at the top.*

Use header tick box ticked

*if **ticked**, each column has as its first entry a header. The textstyle information for text in the row of headers is given in the* **Header style** *node of the Drafting Styles for Tables*
*If **not ticked**, the table does not have a title at the top.*

Number of rows integer box

the number of rows in the table.

Number of columns integer box

the number of columns in the table.

Column width real box

if **Auto sizing** *is **no**, the width of each column.*

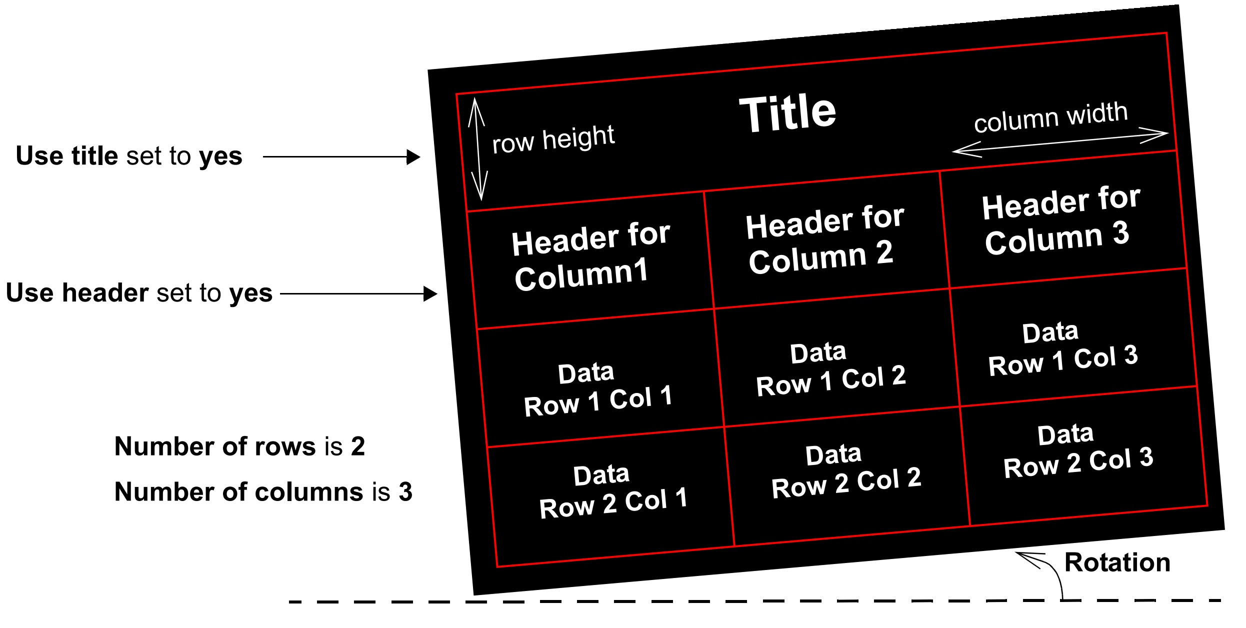
Row height real box

if **Auto sizing** *is **no**, the height of each column.*

Buttons at bottom

Create button

create the table with the properties in this panel at the location given in **Location**.



Continue to the next section 15.6.2 Create Table from a Super Alignment or return to 15.6 CAD Table.

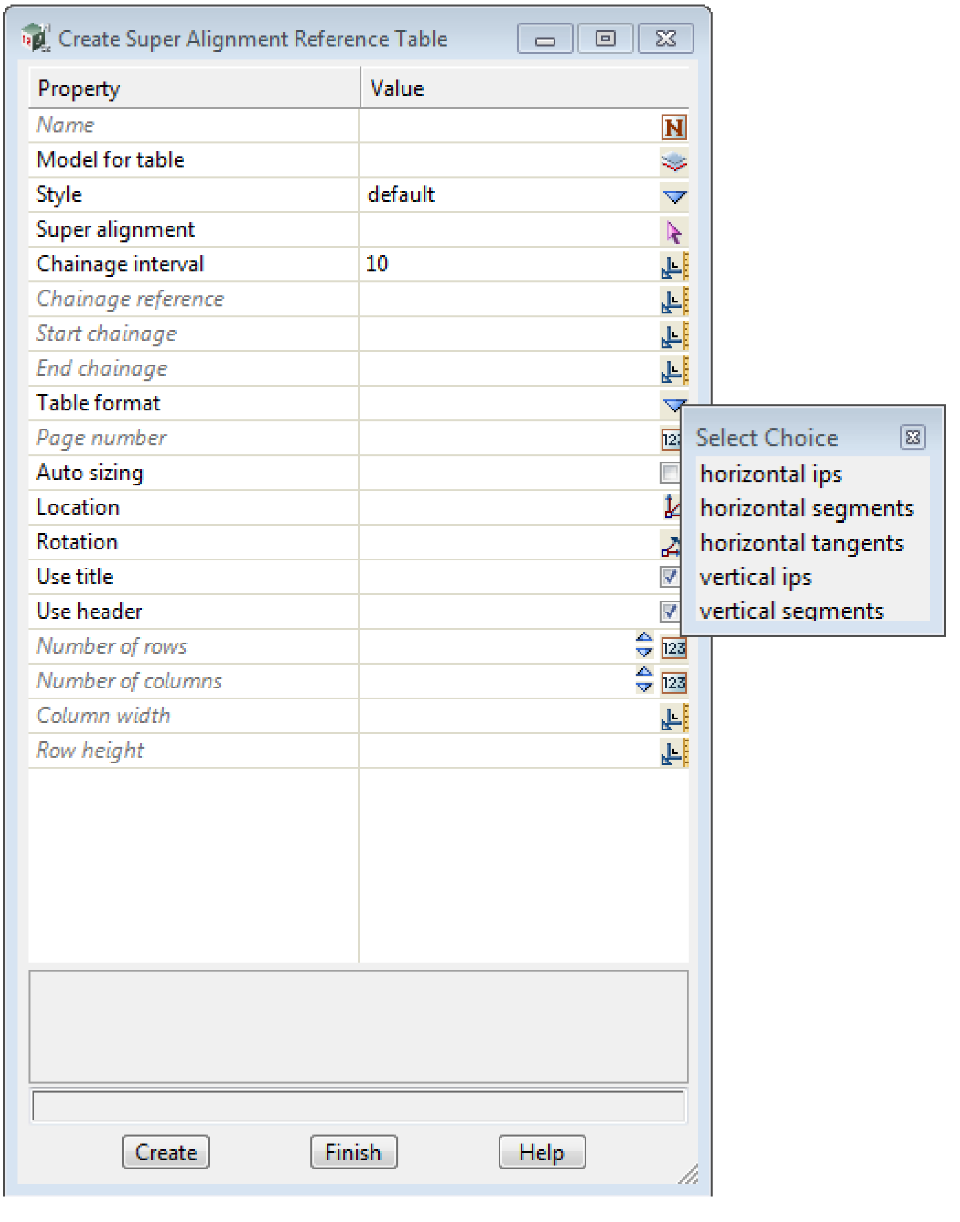
15.6.2 Create Table from a Super Alignment

Position of option on menu: **CAD =>Table =>Super alignment**

This table option is for creating a table of information about a selected ***super alignment***. The table is associated with the super alignment so that the table can be updated when the super alignment is modified.

Important Note - all the text in a table will be treated as World Units.

Selecting **Super alignment** brings up the **Create Super Alignment Reference Table** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		available names

the name for the table. This must not be blank.

Field Description	Type	Defaults	Pop-Up
Model for table	model box		available models

the model for the table.

Style table style box available table styles

the table style to use for this table.

Super alignment string select box

select the super alignment to provide the information to generate the table.

Chainage interval real box

the interval to use if reporting information at chainage intervals down the super alignment.

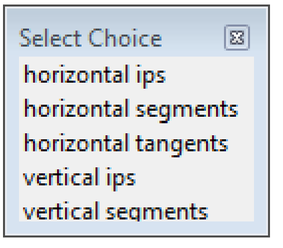
Chainage reference real box

the intervals for reporting are incremented about the Chainage reference value.

Start/End chainage choice box

*if **not blank**, the chainage to use for the Start/End chainages reported in the table.*
*If **blank**, the Start/End chainage of the super alignment is used.*

Table format choice box



*if **horizontal ips,** the table has information about the horizontal IP's for the super alignment, and includes columns for the horizontal IP number, the x, y, z coordinates of the HIP and the radius of any arc on the HIP.*

*If **horizontal segments**, the table has information on the vertices at the beginning of each segment along the horizontal geometry for the super alignment, and includes columns for the type of the segment that starts at that vertex, the x, y, z (level) coordinates of the vertex, the bearing of the segment coming into and leaving the vertex, and the radius of the segment coming into and leaving the vertex.*

*If **horizontal tangents**,*

*If **vertical ips**, the table has information about the vertical IP's for the super alignment, and includes columns for the vertical IP number, the chainage of the VIP and the height of the VIP.*

*If **vertical segments**, the table has information on the vertices at the beginning of each segment along the vertical geometry of the super alignment, and includes columns for the type of the segment that starts at that vertex, the chainage and z (level) coordinates of the vertex, the grade of the segment coming into and leaving the vertex, and the type of the segment coming into and leaving the vertex.*

Page number integer box

Auto sizing tick box not ticked

*if **ticked**, the table automatically resizes the column widths and heights to fit the text into the columns.*
*If **not ticked**, the table will not resize the column widths and heights to fit the text into the column.*

Location x y box 0

*the (x,y) coordinates of the **top left hand corner** of the table.*

Rotation angle box 0

the rotation of the table - entered in hp notation. It is measured in a counter clockwise direction from the positive x axis.

Use title tick box ticked

*if **ticked**, the table has a title as the first row and it only consists of one column which goes from the left side of the table to the right side of the table. The textstyle information for text in the title is given in the* **Title style** *node of the Drafting Styles for Tables.*

*If **not ticked**, the table does not have a title at the top.*

Use header tick box ticked

*if **ticked**, each column has as its first entry a header. The textstyle information for text in the row of headers is given in the* **Header style** *node of the Drafting Styles for Tables*
*If **not ticked**, the table does not have a title at the top.*

Number of rows integer box

the number of rows in the table.

Not used - the Table format and super alignment determines how many rows there are.

Number of columns integer box

the number of columns in the table.

Not used - the Table format and super alignment determines how many columns there are.

Column width real box

if **Auto sizing** *is **no**, the width of each column.*

Row height real box

if **Auto sizing** *is **no**, the height of each column.*

Buttons at bottom

Create button

create the table with the properties in this panel at the location given in **Location**.

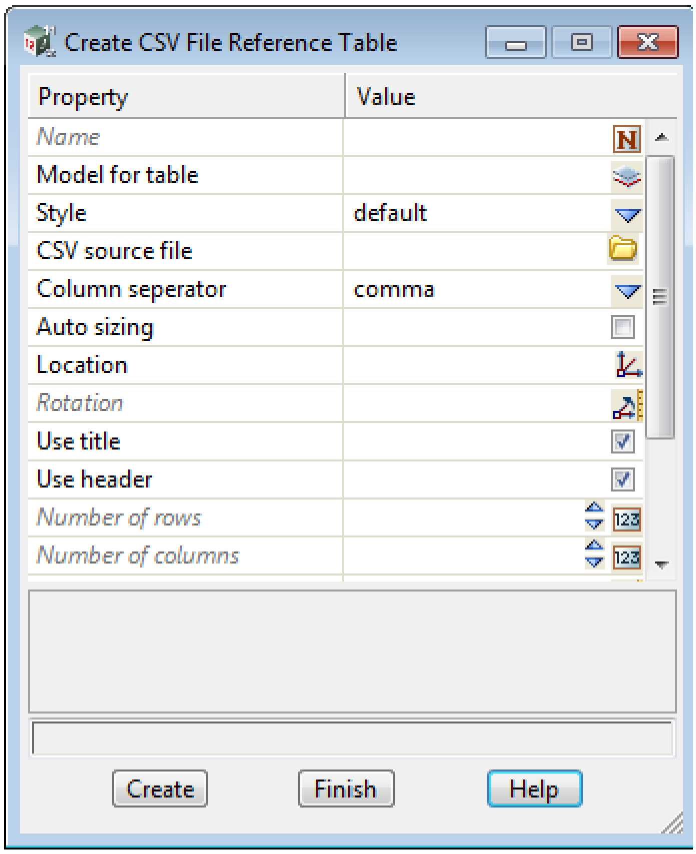
Continue to the next section 15.6.3 Create Table from a CSV File or return to 15.6 CAD Table.

15.6.3 Create Table from a CSV File

This table option is for creating a table of information from the information in a CSV file. The table is associated with the CSV file so that the table can be updated when the CSV file is modified.

Important Note - all the text in a table will be treated as World Units.

Selecting **CSV file** brings up the **Create CSV File Reference Table** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		available names

the name for the table. This must not be blank.

Model for table	model box		available models

the model for the table.

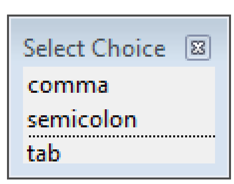
Style	table style box		available table styles

the table style to use for this table.

CSV source file	file box		

name of the CSV file to associate with the table.

Column separator	choice box		



*if **comma**, in the CSV file a comma (**,**) is used the separate the information for each column.*

*If **semicolon**, in the CSV file a semicolon (**;**) is used the separate the information for each column.*
*If **tab**, in the CSV file a tab is used the separate the information for each column.*

Auto sizing tick box not ticked

*if **ticked**, the table automatically resizes the column widths and heights to fit the text into the columns.*
*If **not ticked**, the table will not resize the column widths and heights to fit the text into the column.*

Location x y box 0

*the (x,y) coordinates of the **top left hand corner** of the table.*

Rotation angle box 0

the rotation of the table - entered in hp notation. It is measured in a counter clockwise direction from the positive x axis.

Use title tick box

*if **ticked** then the first line of the CSV file is taken as the titles for each column in the table. The textstyle information for text in the title is given in the* **Title style** *node of the Drafting Styles for Tables.*

*If **not ticked**, the table does not have a title.*

Use header tick box

*if **ticked** then the next line of the CSV file is taken to be the Headers for each column of the table. The textstyle information for text in the row of headers is given in the* **Header style** *node of the Drafting Styles for Tables*

*If **not ticked**, the table does not have a header.*

Number of rows integer box

the number of rows in the table.

Not used - the Table format and super alignment determines how many rows there are.

Number of columns integer box

the number of columns in the table.

Not used - the Table format and super alignment determines how many columns there are.

Column width real box

if **Auto sizing** *is **no**, the width of each column.*

Row height real box

if **Auto sizing** *is **no**, the height of each column.*

Buttons at bottom

Create button

create the table with the properties in this panel at the location given in **Location**.

Important Notes

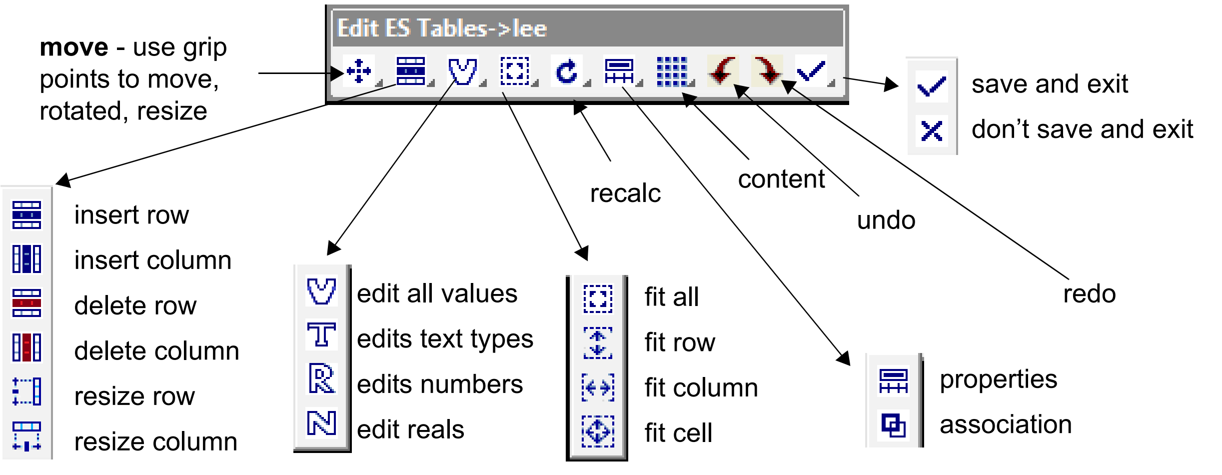
1. When a **Recalc** is done, the CSV file is reread and the information n the table updated.
2. **Auto size** in the table Properties must be ticked on for the new table to be automatically resized.
3. If you don't want the CSV file to be reread on a **Recalc**, you need to set **Type** back to **no reference** in the **Table Association** panel.

Continue to the next section 15.6.4 Table Edit or return to 15.6 CAD Table.

15.6.4 Table Edit

Picking an existing table will bring up the **Table** editor, and at the same time the grip points and point are displayed on the plan views that the table is on (*see* 15.6.4.1 Move).

Important Note - all the text in a table will be treated as World Units.



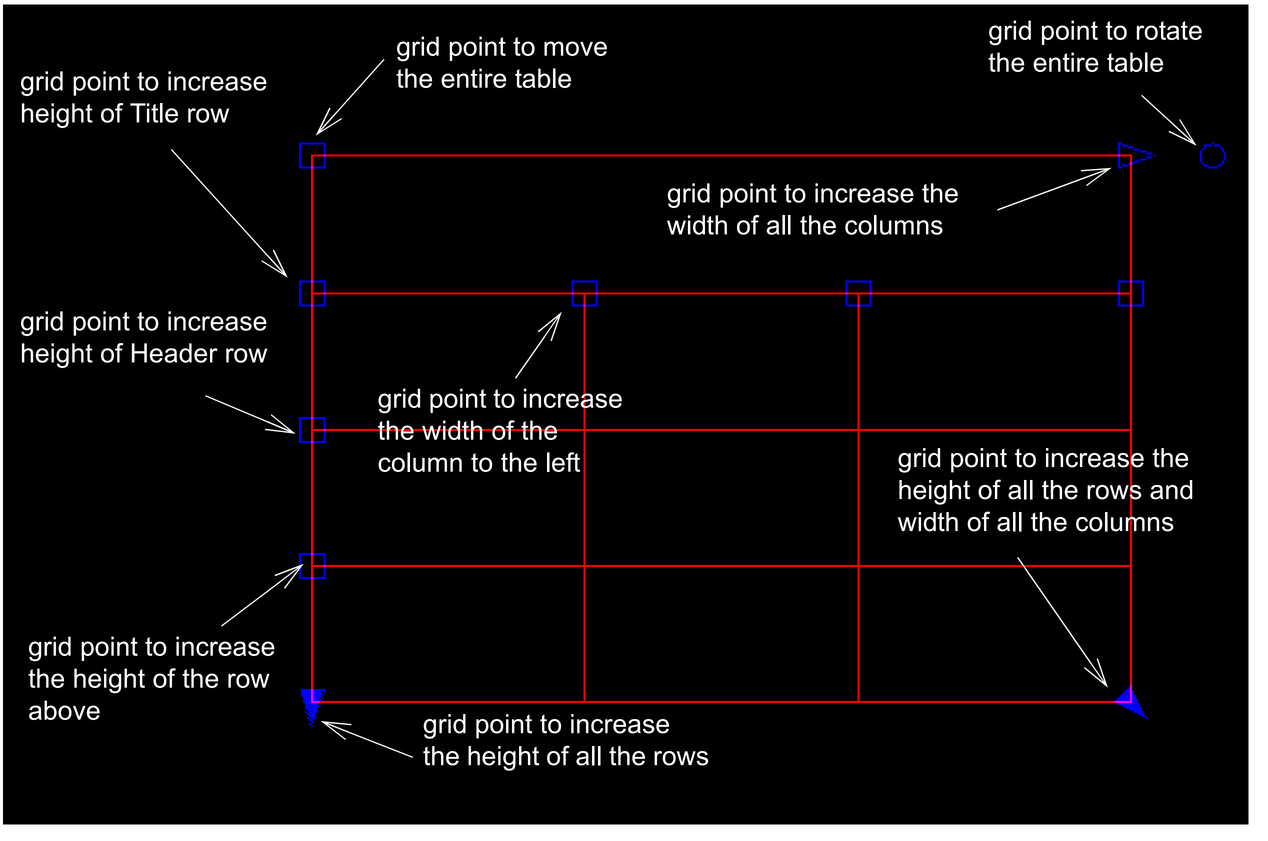
See

- 15.6.4.1 Move
- 15.6.4.2 Column and Row Edits
- 15.6.4.3 Text and Values Edit
- 15.6.4.4.1 Fit All
- 15.6.4.5 Recalc
- 15.6.4.6 Properties and Associations
- 15.6.4.7 Content

15.6.4.1 Move

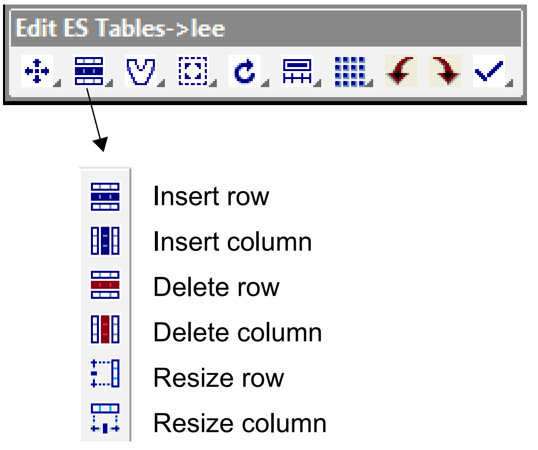
When the **Table Editor** is running, the grips points are displayed on any plan view that the table is on.

The use a grip point, you must first click on the **Move** icon on the **Table Editor** toolbar and then click and accept on the **grip** that you wish to use.



Continue to the next section 15.6.4.2 Column and Row Edits or return to 15.6.1 Create Table or to 15.6 CAD Table.

15.6.4.2 Column and Row Edits



See

[15.6.4.2.1 Insert Row](#)
[15.6.4.2.2 Insert Column](#)

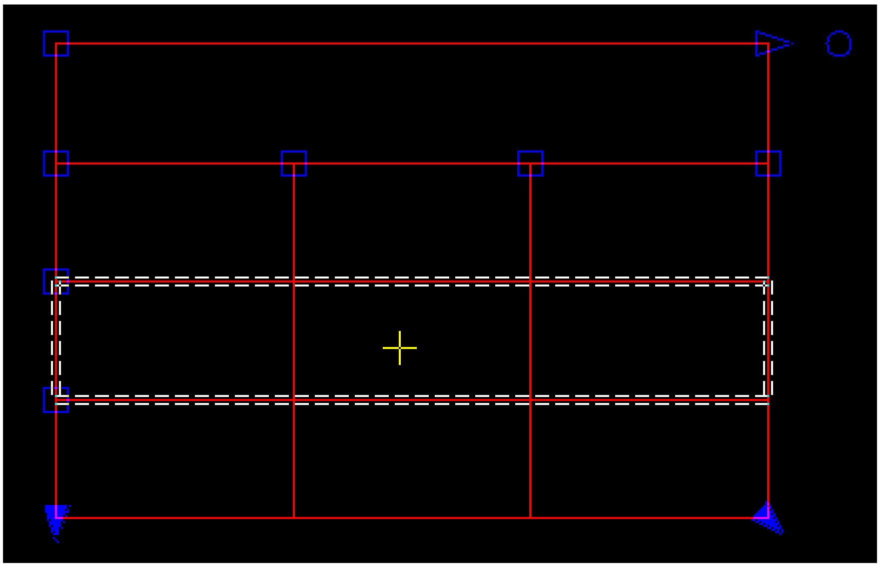
[15.6.4.2.4 Delete Column](#)
[15.6.4.2.5 Resize Row](#)
[15.6.4.2.6 Resize Column](#)

15.6.4.2.1 Insert Row

Click on the **Insert row** icon and the following message will appear in the screen message area.

<select row to insert (a)bove, (b)elow or a(p)pend> [picks][fast][Menu]

Then move over the table until the row you want to insert a row above or below highlights.



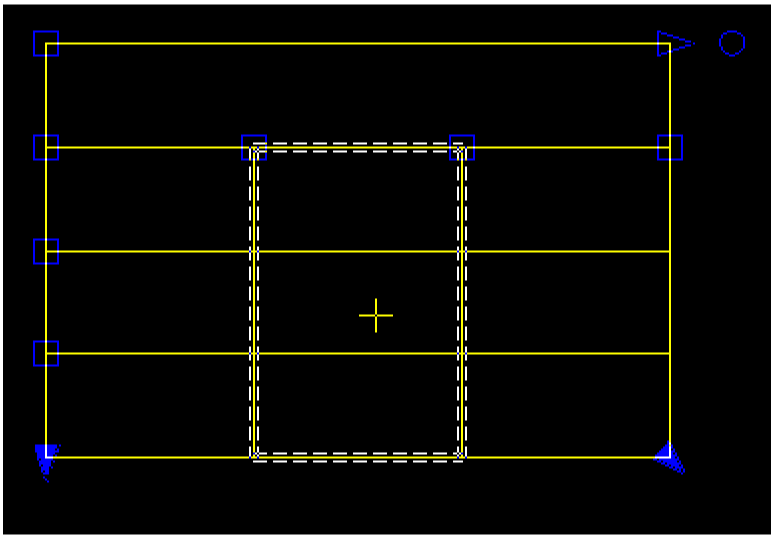
Press **a** or **A** to insert above, or **b** or **B** to insert below, the highlighted row.

Continue to the next section 15.6.4.2.2 Insert Column or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.2.2 Insert Column

Click on the **Insert column** icon and the following message will appear in the screen message area.

Then move over the table until the column you want to insert a column either to the left or right of highlights.



Press **l** or **L**, to insert to the left, or **r** or R to insert to the right, of the highlighted column.

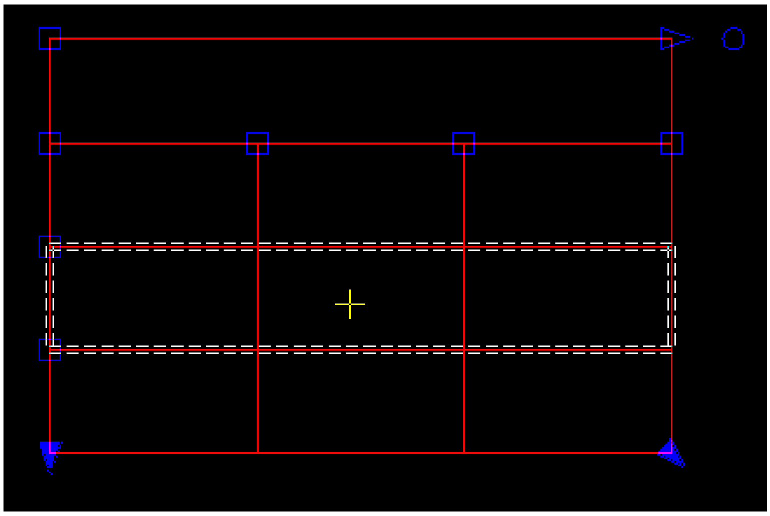
Continue to the next section 15.6.4.2.3 Delete Row or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.2.3 Delete Row

Click on the **Delete row** icon and the following message will appear in the screen message area.

<select row to (d)elete> [picks][accepts][Menu] Cursor-position

Then move over the table until the row you want to delete highlights



Press **d** or **D**, or pick and accept, to delete the highlighted row.

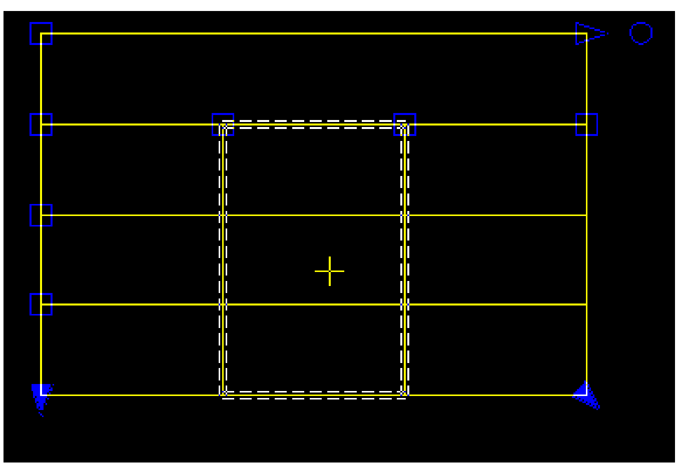
Continue to the next section 15.6.4.2.4 Delete Column or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.2.4 Delete Column

Click on the **Delete column** icon and the following message will appear in the screen message area.

<select column to (d)elete> [picks][accepts][Menu] Cursor-position

Then move over the table until the column you want to delete highlights



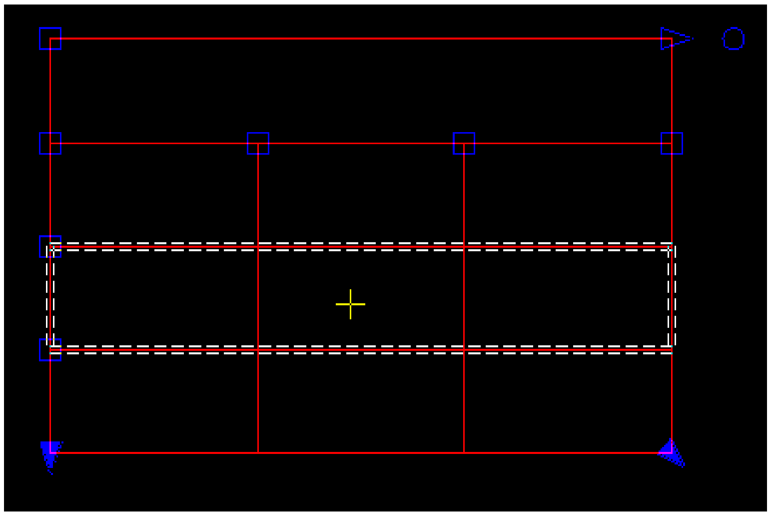
Press **d** or **D**, or pick and accept, to delete the highlighted column.

Continue to the next section 15.6.4.2.5 Resize Row or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.

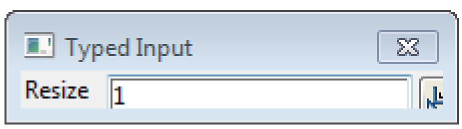
15.6.4.2.5 Resize Row

Click on the **Resize row** icon and the following message will appear in the screen message area.

Then move over the table until the row you want to resize highlights.



Press **s** or **S**, or pick and accept, and the *Resize* **Typed Input** box will appear with the current size of the row in it.



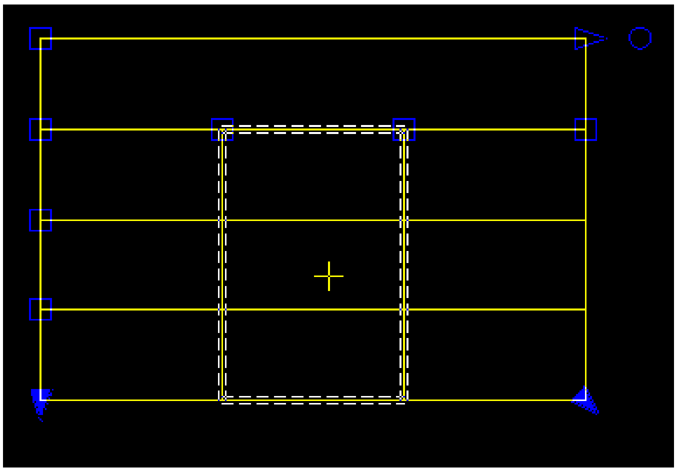
Type the new size into the box and then press <Enter>. The box will disappear and the row given the new size value.

Continue to the next section 15.6.4.2.6 Resize Column or return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.

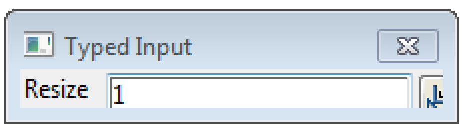
15.6.4.2.6 Resize Column

Click on the **Resize column** icon and the following message will appear in the screen message area.

Then move over the table until the column you want to resize highlights.



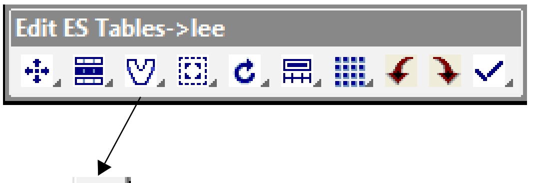
Press **s** or **S**, or pick and accept, and the *Resize* **Typed Input** box will appear with the current size of the selected column in it.

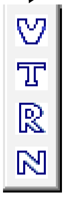


Type the new size into the box and then press <Enter>. The box will disappear and the column given the new size value.

Return to 15.6.4.2 Column and Row Edits or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.3 Text and Values Edit





create & edit all types of values

create and edit text

create and edit reals

create and edit numbers

See

[15.6.4.3.1 Value Create and Edit]
[15.6.4.3.2 Text Create and Edit]
[15.6.4.3.3 Real Create and Edit]
[15.6.4.3.3 Real Create and Edit]

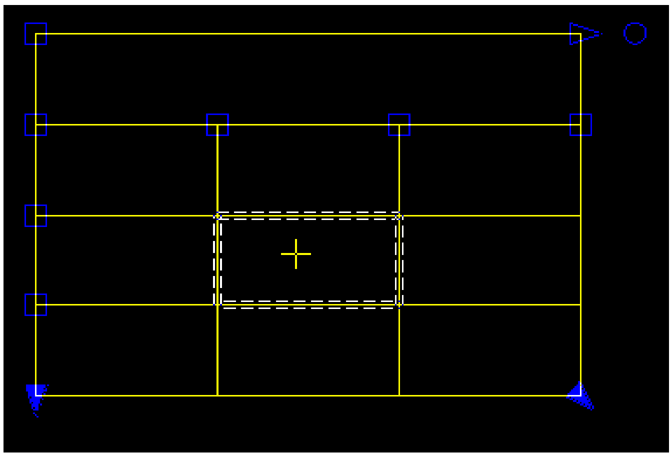
15.6.4.3.1 Value Create and Edit

For an empty cell, **Value** can create either a text, number or real value.

If used on a non empty cell, the cell contents are displayed in a Typed input box or type Text, Number of Real depending on the type of the cell contents.

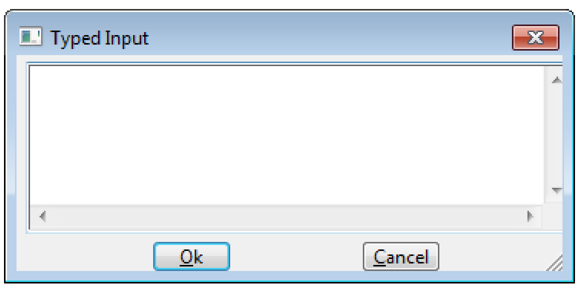
Click on the **Value** icon and the following message appears in the screen message area.

Move over the table until the cell you want to edit or create a value, highlights.

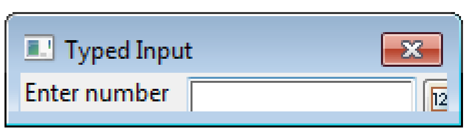


If the cell is **empty**,

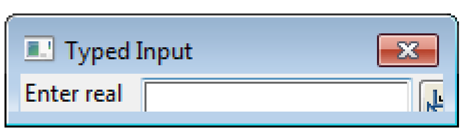
Type **t** or **T**, or pick and accept inside the cell, and the *Enter text* **Typed Input** box will appear.



Type **n** or **N**, and the *Enter number* **Typed Input** box will appear.



Type **r** or **R**, and the *Enter real* **Typed Input** box will appear.

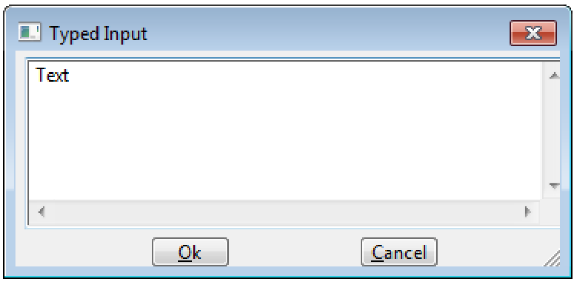


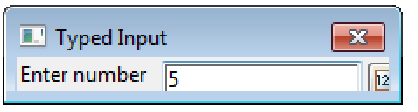
Type the new text, number or real into the box and press <Enter>.

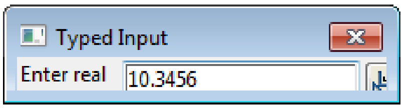
The box will disappear and the new text, number or real placed in the cell, and the cell given the appropriate type.

Note: If the type is **Real** then the actual typed in value is kept in the cell BUT it is displayed with the number of decimal places given in the Table style.

If the cell is **not** empty, then the cell value is displayed in a **Typed Input** box of the **same type** as the **cell contents**.







Type the new **Text**, **Number** or **Real** into the **Typed Input** box and press <Enter>.

The box will disappear and the new value placed in the cell.

Note: If the type is **Real** then the actual typed in value is kept in the cell BUT it is displayed with the number of decimal places given in the Table style.

Continue to the next section 15.6.4.3.2 Text Create and Edit or return to 15.6.4.3 Text and Values Edit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.3.2 Text Create and Edit

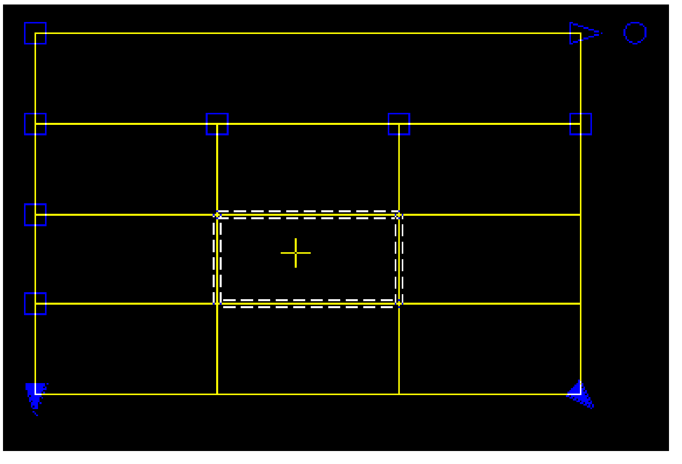
Important Note - all the text in a table will be treated as World Units.

For an empty cell, **Text** creates and displays one or more lines of text.

If used on a non empty cell, the cell contents are displayed in a Text box, and when saved, is written into the cell as a **Text** type

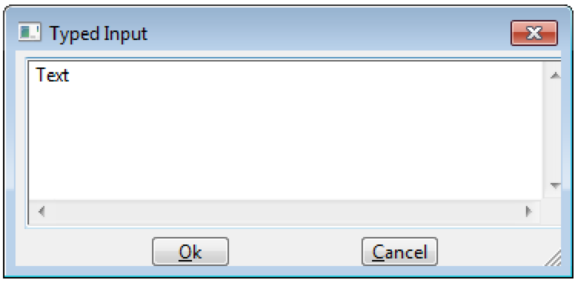
Click on the **Text** icon and the following message will appear in the screen message area.

Move over the table until the cell you want to edit or create a Text, highlights.



Type **t** or **T**, or pick and accept inside the cell, and the *Enter text* **Typed Input** box will appear.

If the cell was empty then nothing is in the *Enter text* box but if the cell is not empty, the contents of the cell are displayed as text.



Type the new text into the *Enter text* box and press <Enter>.

The box will disappear and the new text placed in the cell, and the cell given type **Text**.

Continue to the next section 15.6.4.3.3 Real Create and Edit or return to 15.6.4.3 Text and Values Edit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.3.3 Real Create and Edit

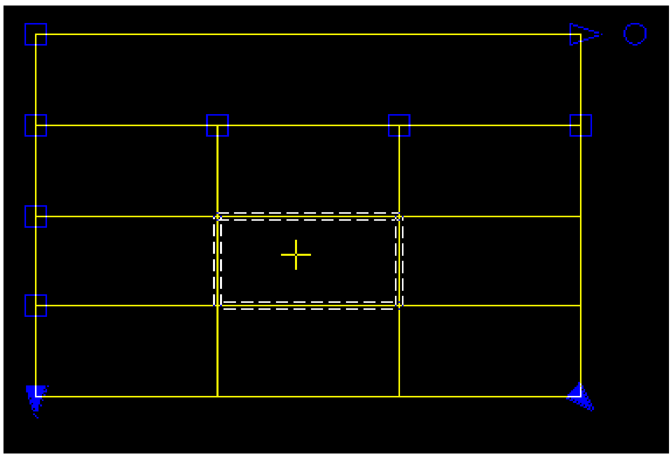
For an empty cell, **Real** creates and displays a real with the number of decimal places used in the display is taken from the Table style.

If used on a non empty cell, the cell contents are converted into a real and displayed in a Real box for editing, and when saved, is written into the cell as a **Real** type.

It the cell contains text that can't be converted to a real then the Real box is left empty.

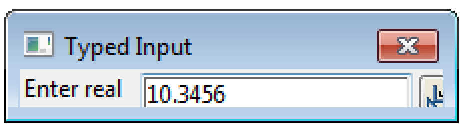
Click on the **Real** icon and the following message will appear in the screen message area.

Move over the table until the cell you want to edit or create a Number, highlights.



Type **r** or **R**, or pick and accept inside the cell, and the *Enter real* **Typed Input** box will appear.

If the cell was empty then nothing is in the *Enter real* box but if the cell is not empty, the contents of the cell are displayed a Real, or nothing if the contents can't convert to a real.



Type the new real into the *Enter real* box and press <Enter>.

The box will disappear and the new real placed in the cell and displayed with the number of decimal places given in the Table style. The cell given type **Real**.

Note: If the type is **Real** then the actual typed in value is kept in the cell BUT it is displayed with the number of decimal places given in the Table style.

Continue to the next section 15.6.4.3.4 Number Create and Edit or return to 15.6.4.3 Text and Values Edit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.3.4 Number Create and Edit

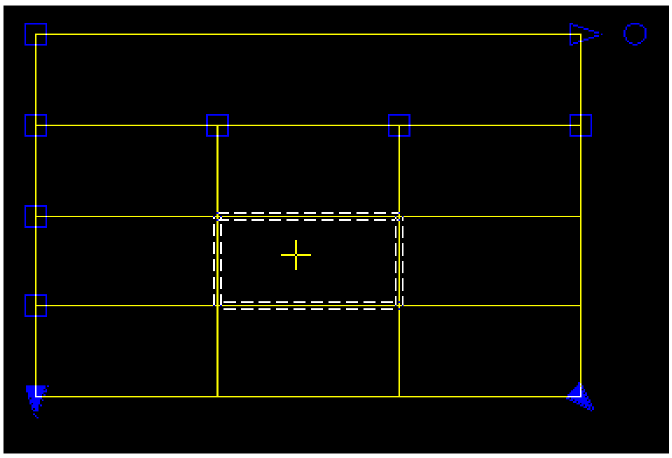
For an empty cell, **Number** creates and displays a number (a positive or negative integer).

If used on a non empty cell, the cell contents are converted into a number and displayed in a number box for editing, and when saved, is written into the cell as a **Number** type.

It the cell contains text that can’t be converted to a number then the Number box is left empty.

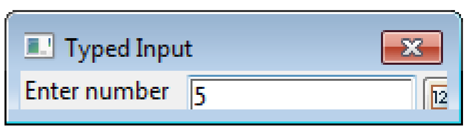
Click on the **Number** icon and the following message will appear in the screen message area.

Move over the table until the cell you want to edit or create a Number, highlights.



Type **n** or **N**, or pick and accept inside the cell, and the *Enter number* **Typed Input** box will appear.

If the cell was empty then nothing is in the *Enter number* box but if the cell is not empty, the contents of the cell are displayed a Number, or nothing if the contents can’t convert to a number.

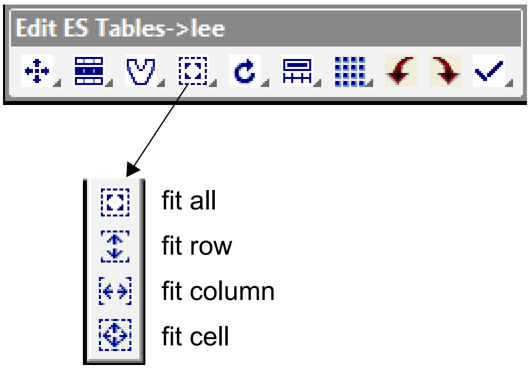


Type the new number into the *Enter number* box and press <Enter>.

The box will disappear and the new number placed in the cell, and the cell given type **Number**.

Return to 15.6.4.3 Text and Values Edit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.4 Fit



See

- 15.6.4.4.1 Fit All
- 15.6.4.4.2 Fit Row
- 15.6.4.4.3 Fit Column
- 15.6.4.4.4 Fit Cell

15.6.4.4.1 Fit All

Fit goes though each cell and resizes it both vertically and horizontally so that the text fits inside the cell.

It then looks at each row and makes all the cells in the same row as high as the highest one in the row.

It then looks at each column and makes all the cells in the same column as wide as the widest one in the column.

Fit runs even if **Auto sizing** is set to **no**.

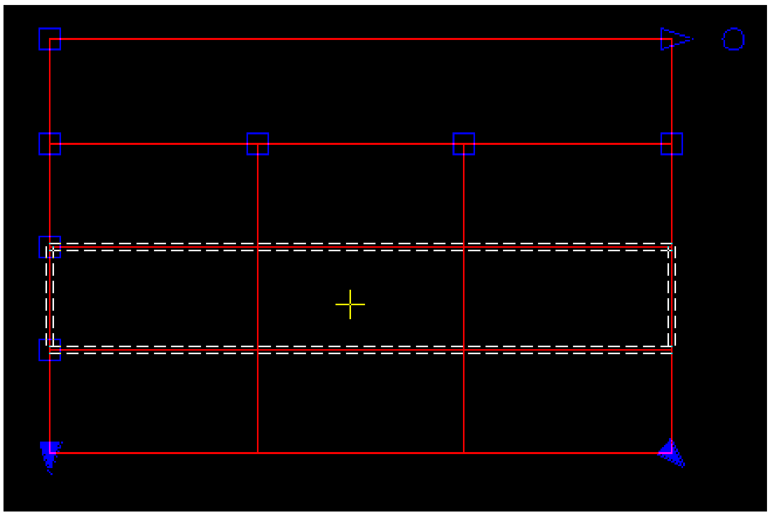
Continue to the next section 15.6.4.4.2 Fit Row or return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.4.2 Fit Row

Fit row goes though each cell in the selected row to find the maximum height required to fit the text vertically in the cell, and then makes the height of the row the maximum of all the heights required for each cell. That is, it makes the row high enough to fit the text vertically in every cell in the row.

Click on the **Fit row** icon and the following message will appear in the screen message area.

Then move over the table until the row you want to fit highlights.



Accepting makes the row high enough to fit any text in the row.

Fit row runs even if **Auto sizing** is set to **no**.

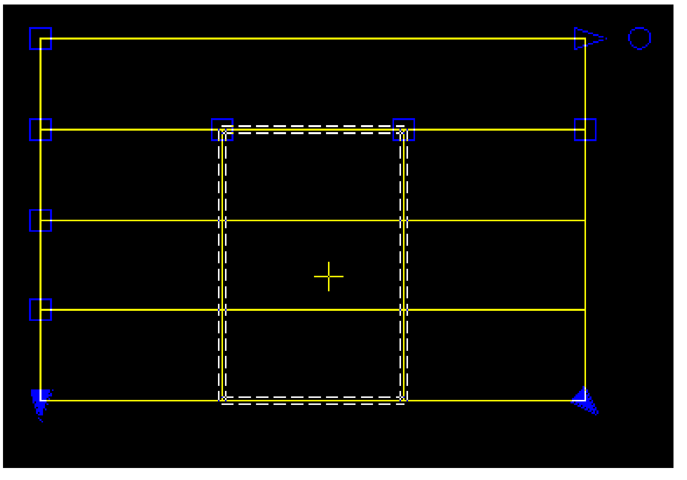
Continue to the next section 15.6.4.4.3 Fit Column or return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.4.3 Fit Column

Fit column goes though each cell in the selected column to find the maximum width required to fit the text horizontally in the cell, and then makes the width of the column the maximum of all the widths required for each cell. That is, it makes the column wide enough to fit the text horizontally in every cell in the column.

Click on the **Fit column** icon and the following message will appear in the screen message area.

Then move over the table until the column you want to fit highlights.



Accepting makes the column wide enough to fit any text in the column.

Fit row runs even if **Auto sizing** is set to **no**.

Continue to the next section 15.6.4.4.4 Fit Cell or return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.

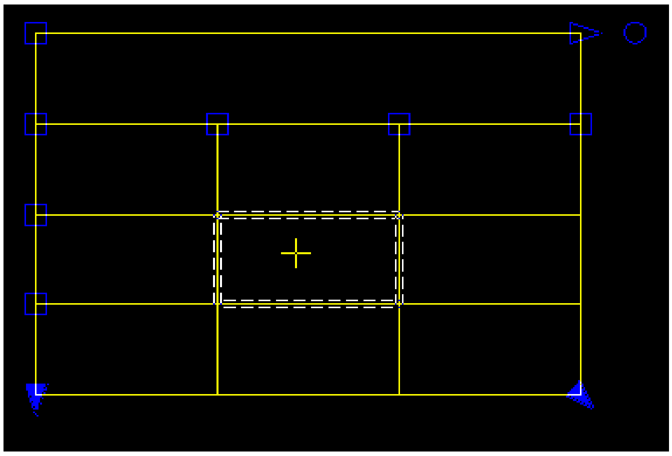
15.6.4.4.4 Fit Cell

Fit cell increases the row height enough to fit the text vertically in the cell and also increases the column width enough to fit the text horizontally in the cell. That is, it makes the row and column wide enough to fit the text in the selected cell.

Note that the row height and column width will not be decreased, only increased

Click on the **Fit cell** icon and the following message will appear in the screen message area.

Then move over the table until the cell you want to fit highlights.

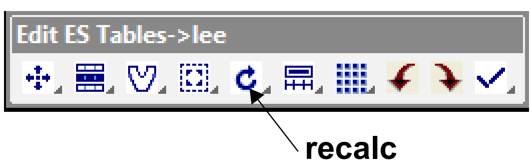


Accepting makes the column wide enough to fit any text in the column.

Fit cell runs if **Auto sizing** is set to **no**.

Return to 15.6.4.4 Fit or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.5 Recalc

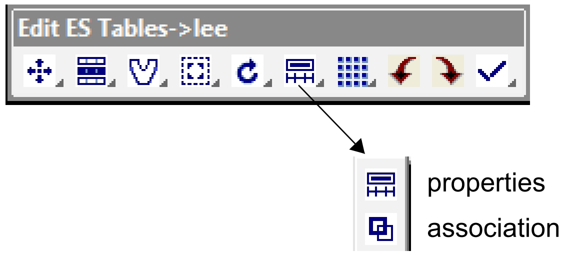


Sometime when the object is **associated** with the **Table** is modified, the **Table** does not update.

Recalc forces an update of all the information connected with the **Association** object.

Return to 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.6 Properties and Associations

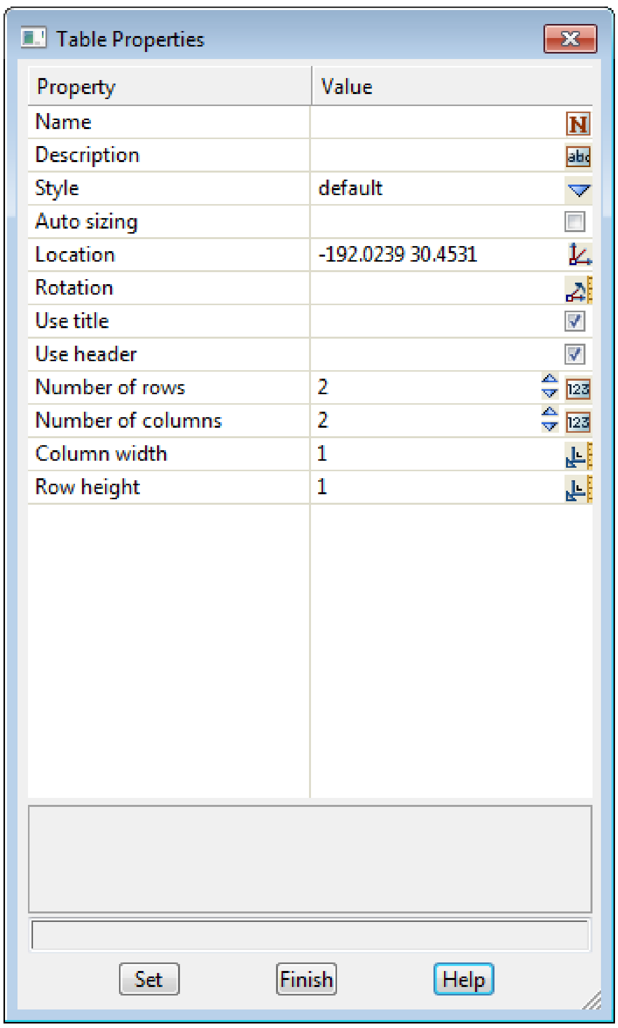


See

[15.6.4.6.1 Properties](#)
[15.6.4.6.2 Table Association](#)

15.6.4.6.1 Properties

Click on the **Properties** icon and the **Table Properties** panel comes up with the values for the current table in it.



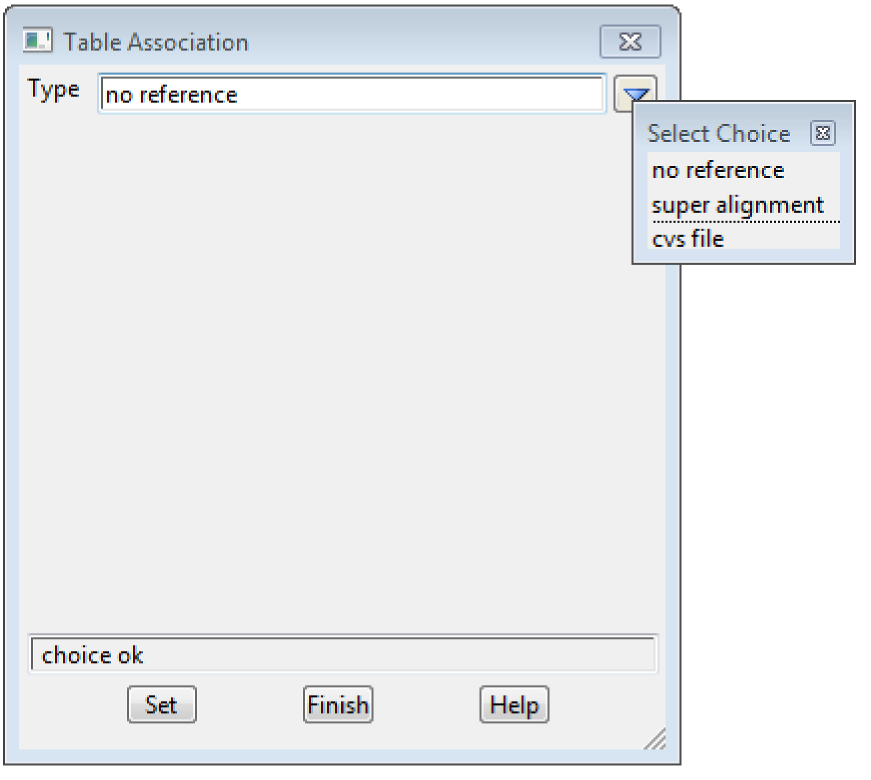
Change values in the panel and then click **Set** for them to become the tables new values.

Continue to the next section 15.6.4.6.2 Table Association or return to 15.6.4.6 Properties and Associations or 15.6.1 Create Table or 15.6 CAD Table.

15.6.4.6.2 Table Association

Click on the **Association** icon and the **Table Association** panel comes up.

If there is no Association for the table, one can be added with this option.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Type	choice box		no reference, super alignment csv file

if ***no reference****, then the table is not associated with anything.*

If ***super alignment****, read in and associate a CSV file with the table. See*[15.6.4.6.2.1 Associate a Super Alignment](#)

If ***CSV file****, read in and associate a CSV file with the table. See*[15.6.4.6.2.2 Associate a CSV File](#)

Set	button		

set the association for the table.

See

[15.6.4.6.2.1 Associate a Super Alignment](#)

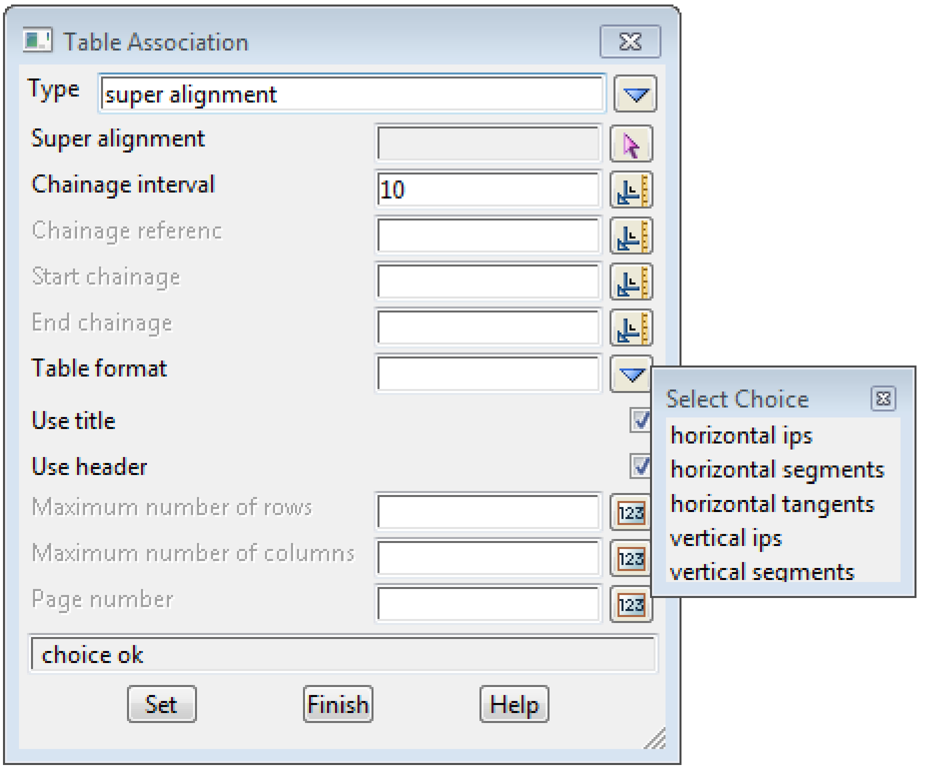
[15.6.4.6.2.2 Associate a CSV File](#)

Return to [15.6.1 Create Table](#) or [15.6 CAD Table](#).

15.6.4.6.2.1 Associate a Super Alignment

Choice ***super alignment*** is selected when a super alignment is to be associated with the table.

When ***super alignment*** is selected, the panel changes to display fields to enter information about the super alignment and how it is to be associated with the table.

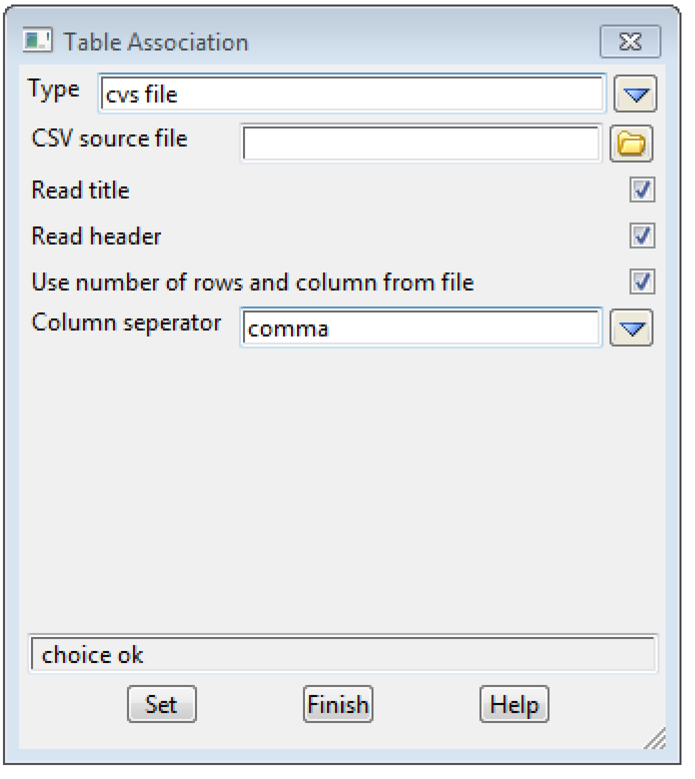


For information about the fields in this panel, see 15.6.2 Create Table from a Super Alignment

15.6.4.6.2.2 Associate a CSV File

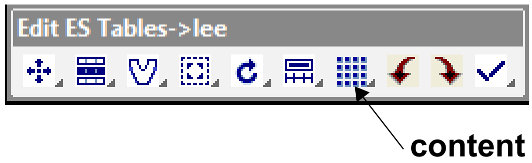
Choice ***CSV file*** is selected when a CSV file is to be associated with the table.

When ***CSV file*** is selected, the panel changes to display fields to enter for information about the CSV file and how it is to be associated with the table.

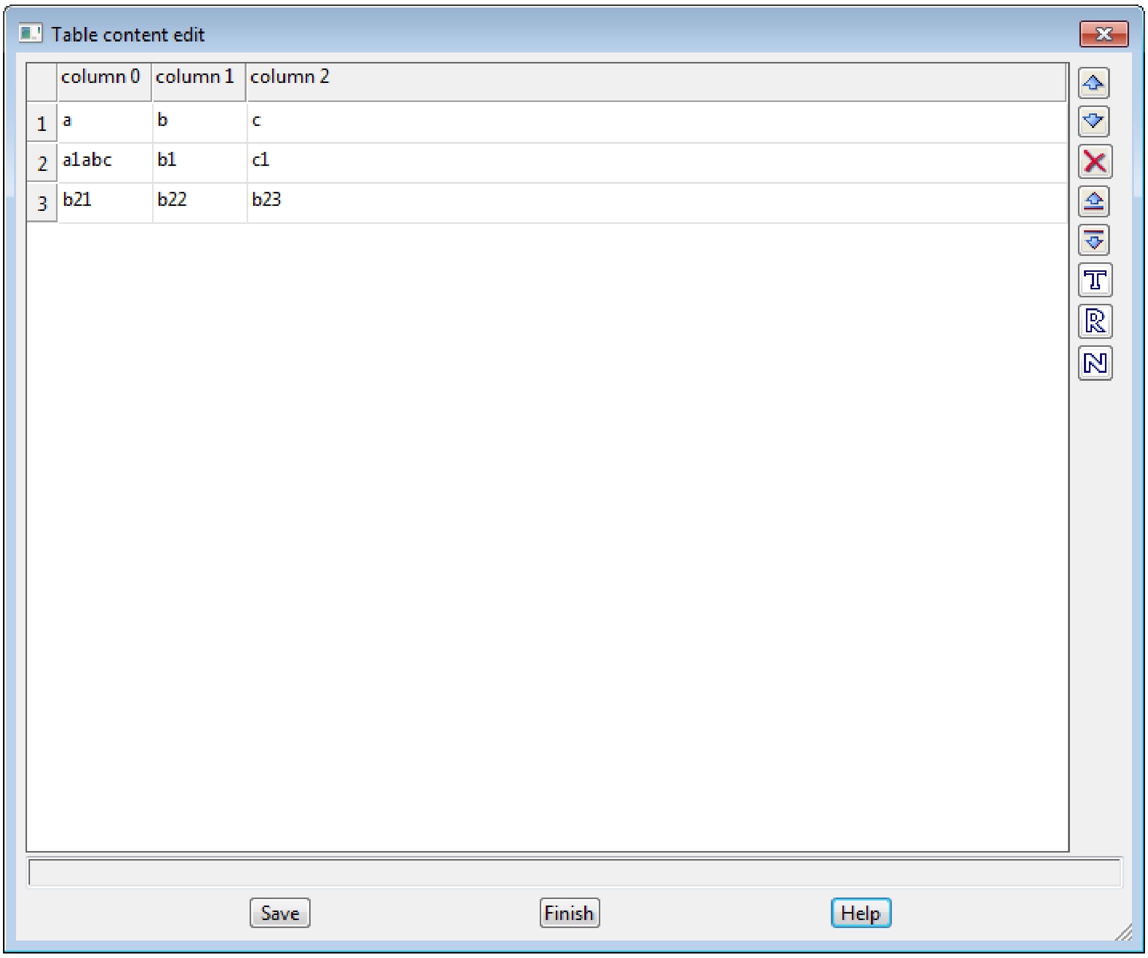


For information about the fields in this panel, see 15.6.3 Create Table from a CSV File

15.6.4.7 Content



Click on the **Content** icon and the **Table Content Edit** panel comes up with the values for the current table in it.



In the panel you can edit the values in each cell, add new values, add or delete rows or move rows up or down.

Finally click **Save** for the contents of the panel to become the new values in the table.

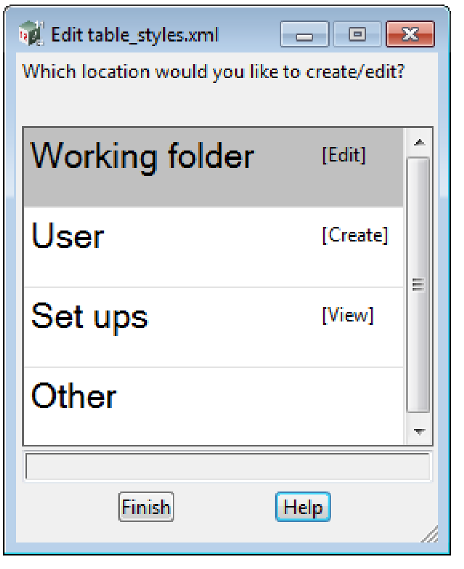
Return to 15.6.1 Create Table or 15.6 CAD Table.

15.6.5 Table Styles

Position of option on menu: **CAD =>Table =>Styles**

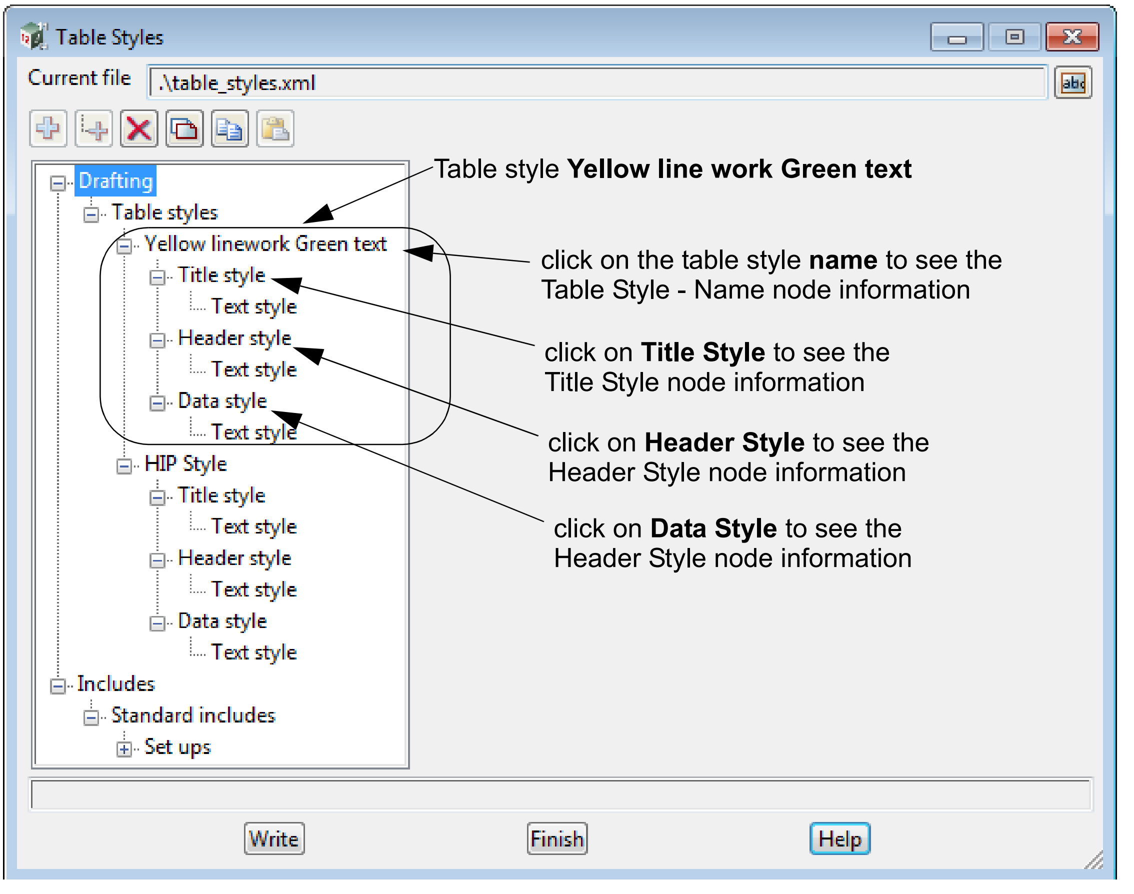
Important Note - all the text in a table will be treated as World Units.

When you click on the option an **Edit table_styles.xml** panel is brought up and the panel shows the standard areas for looking for the table_styles.XML files - Working folder, Customer (User), User, Set Ups and Other.



For information about where how to find and create table_styles.xml files, see 15.7 Style XML Files for Dimensions, Leaders & Tables.

Once a table_styles.xml has been opened, the **Table Styles** panel is displayed.

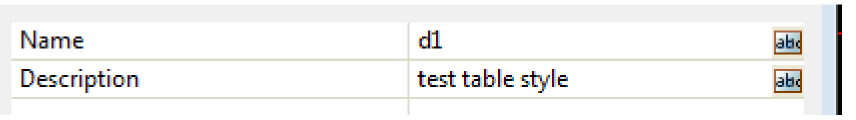


For the description of each of the nodes, see

15.6.5.1 Table Styles - Name Node
15.6.5.2 Table Styles - Title Style Node
15.6.5.3 Table Styles - Header Style Node
15.6.5.4 Table Styles - Data Style Node

15.6.5.1 Table Styles - Name Node

This is on the right hand side of the panel when you click on the ***Table Styles*** name.



Name text box

name of the table style.

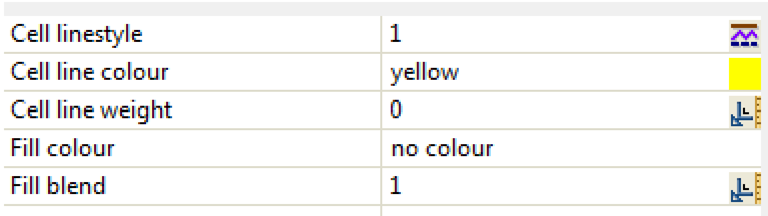
Description text box

description of the table style.

Continue to the next section 15.6.5.3.1 Table Styles - Header Style >Text Style Node or return to 15.6.5 Table Styles or 15.6.1 Create Table or 15.6 CAD Table.

15.6.5.2 Table Styles - Title Style Node

This is on the right hand side of the panel when you click on the ***Title style*** node.



Cell linestyle linestyle box available linestyles

linestyle for drawing the line work around the title row in the table.

Cell line colour colour box available colours

colour of the line work drawn around the title row.

Cell line weight real box

weight of the line work drawn around the title row.

Fill colour colour box available colours

colour to fill the title row.

Fill blend real box

blend for the fill colour for the title row.

To control the **text** in the Title row, see 15.6.5.3.1 Table Styles - Header Style >Text Style Node

15.6.5.2.1 Table Styles - Title Style > Text Style Node

Important Note - all the text in a table will be treated as World Units.

This is on the RHS of the panel when you click on the ***Table style*** **>Title style >Text style** node.

If **Use title** is **yes** in the tables **Properties** then this node controls the drawing of the text in the Title at the top of the table.

linestyle for drawing the line work around the data rows in the table.

Cell line colour text box

colour of the line work drawn around the data rows.

Cell line weight real box

weight of the line work drawn around the data rows.

Fill colour colour box available colours

colour to fill the data row cells.

Fill blend real box

blend for the fill colour for the data row cells.

To control the text in the Data rows, see 15.6.5.3.1 Table Styles - Header Style >Text Style Node

15.6.5.4.1 Table Styles - Data Style >Text Style Node

Important Note - all the text in a table will be treated as World Units.

This is on the RHS of the panel when you click on the **Data style >Text style** node.

This node controls the drawing of the text in the **Data** rows in the table.

Textstyle	Arial
Name	
Type	world
Size	0.5
Angle	0°00'
X-factor	1.0
Slant	0°00'
Offset	0.0
Raise	0.0
Colour	green
Whiteout	
Border	
Border type	
Justify	middle-centre
TTF Underline	no
TTF Strikeout	no
TTF Italic	no
TTF Outline	no
TTF Weight	400.0

These are the standard settings for defining text. See 4.6 Text Definitions.

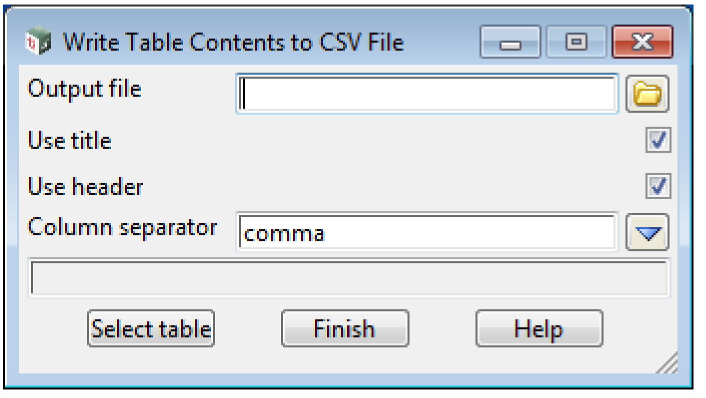
Return to 15.6.5 Table Styles or 15.6.1 Create Table or 15.6 CAD Table.

15.6.6 Table to CSV

Position of option on menu: **CAD =>Table =>Table to csv**

This option creates a CSV file for a table that is associated with a CSV file.

Selecting the **Table to csv** brings up the **Write Table Contents to CSV File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Output file	file box		*.csv files
name of the CSV file to write to the table out to.			
Use title	tick box		
*if **ticked**, the first line of the CSV file is the title of the table.*			
Use header	tick box		
*if **ticked**, the next line of the CSV file is the Headers for each column of the table.*			
Column separator	choice box	commas	comma, semicolon, tab
the column separator used when writing out the CSV file.			
Select table	button		
select the table AND then write out the contents of the table to a CSV file.			

Return to 15.6 CAD Table.

15.7 Style XML Files for Dimensions, Leaders & Tables

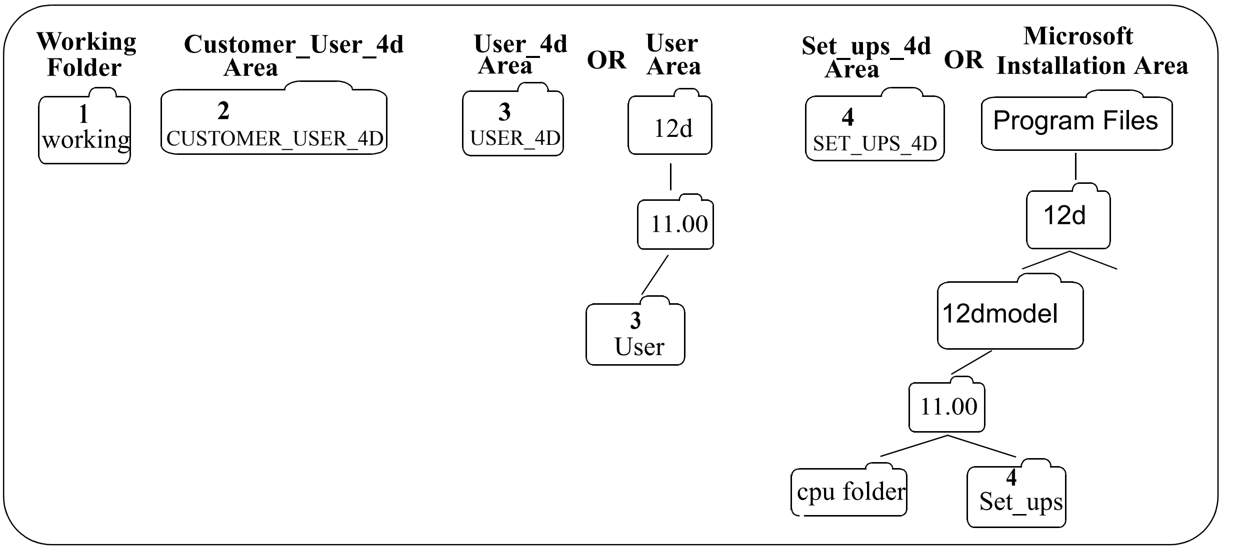
There are XML files to define the styes used for Dimensions, Leaders and Tables:

(a) for **Dimensions**, the file is **dimensions_styles.xml**

(b) for **Leaders**, the file is **leader_styles.xml**.

(c) for **Tables**, the file is **table_styles.xml.**

These XML files are all **Set Up** files like *colours.4d* and folders are searched is a specific order to find the files.



HOWEVER, unlike *colours.4d*, it doesn't matter if the styles xml file is found in one folder, the search **continues** and **all** the **folders** that **contain the file** are found.

And, again unlike *colours.4d*, the styles used are the **merger** of **all** the **found files**.

The search order is still important because if the **same name** exists in more than one file in the found folders, the **first** occurrence in the files in the search order is the one that **is used**.

For example, if you had a dimensions style called **d1** in the file *dimensions_styles.xml* in your working folder, and one called **d1** in the file *dimensions_styles.xml* in Programs files\12d\12dmodle\11.0\set_ups, then the **d1** is your **working folder** is the one that will be used and seen in any dimensions styles pop ups in ***12d Model***.

See

15.7.1 Create & Editing Dimensions, Leader & Table Styles

15.7.1 Create & Editing Dimensions, Leader & Table Styles

Position of option on menu: **CAD =>Dimension =>Styles**
Position of option on menu: **CAD =>Leader =>Styles**
Position of option on menu: **CAD =>Table =>Styles**

When you click on the options, a **Edit Styles** panel is brought up for the appropriate style and it shows the standard areas for looking for the Styles XML files - Working folder, Customer (User), User, Set Ups and Other - and displays whether the appropriate xml file:

(a) exists and available for editing (**Edit**)

If the xml file exists in the folder and you have access to edit it, then the folder name is written in the panel and **[Edit]** is written on the right hand side of the line.

(b) does not exist but can be created (**Create**) by the editor

If the xml file does not exist in the folder and you have access to create it, then the folder name is written in the panel and **[Create]** is written on the right hand side of the line.

In this case a new file is created and written out to the given folder.

(c) is in a folder that has no access for editing and so can only be viewed (**View**)

If there is no access the folder to create/edit the file, then the folder name is written in the panel and **[View]** is written on the right hand side of the line. Although the styles can't be edited, they can be **copied**.

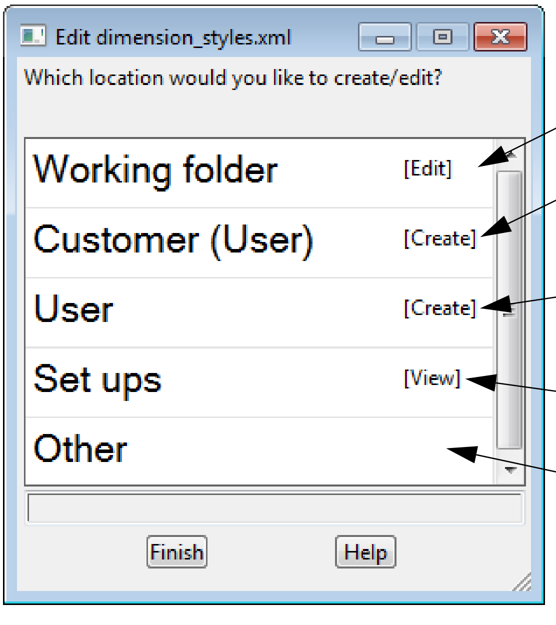
This usually applies to the **Set Ups** folder which normally needs Admin privileges to write to.

(d) is in **Customer (User)**.

This only appears if a *Customer User* area has been defined.

(e) is defined separately by the user and then **Other** is displayed.

In this case, the full path name of the XML file is given by the user.



[Edit] - there is an xml file and it can be edited

[Create] - there is no xml file but one can be created. **Customer (User)** only appears if you have defined a Customer User area

[Create] - there is no xml file but one can be created.

[View] - no xml file can be created because there is no access, just viewed.

nothing means that the user has not defined any additional files to use

See

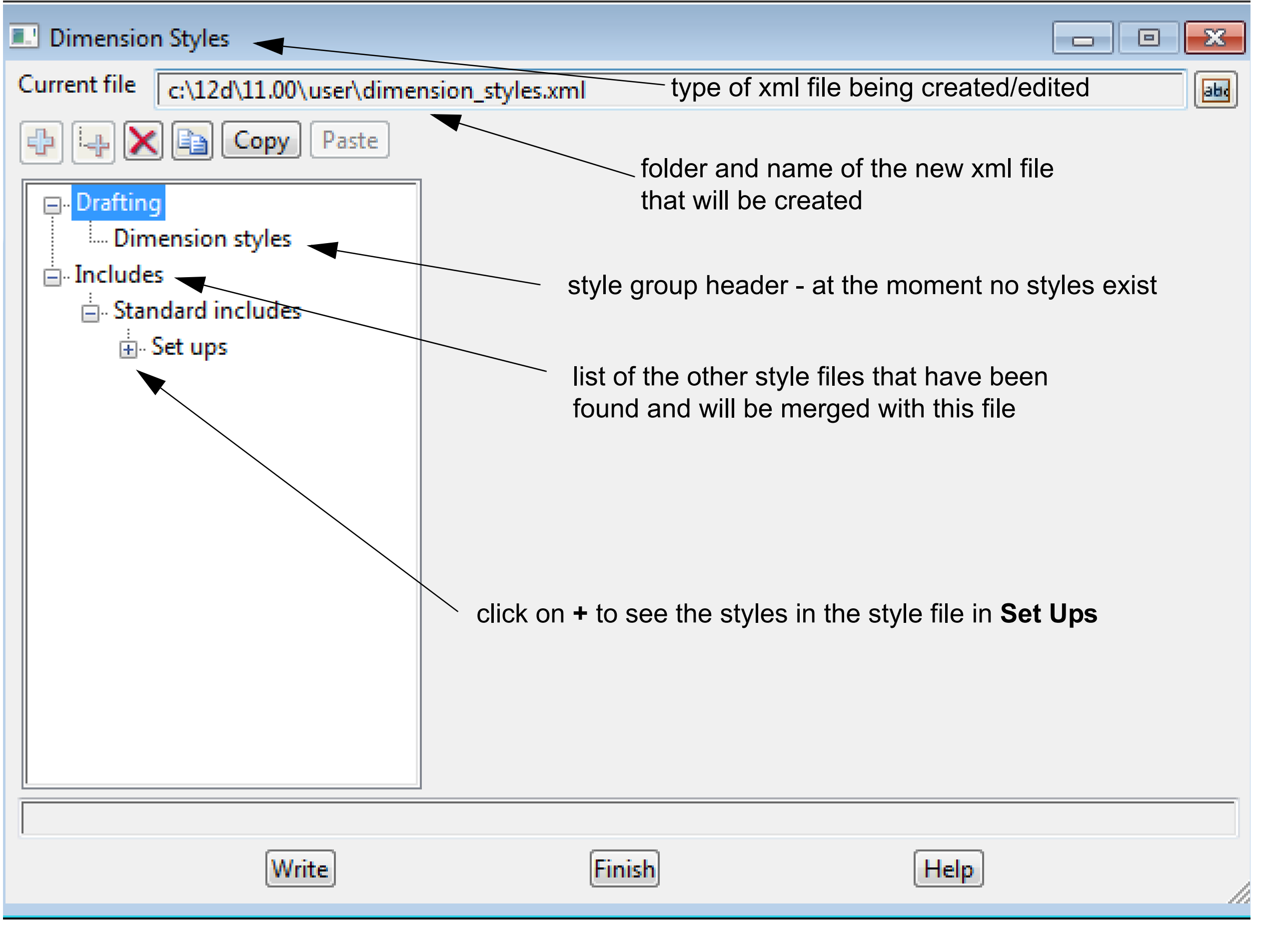
15.7.1.1 [Create] for Dimension, Leader and Table Styles
15.7.1.2 [Edit] for Dimension, Leader and Table Styles

15.7.1.1 [Create] for Dimension, Leader and Table Styles

When **[Create]** is shown, a new xml file can be created in that folder.

Click on the line with **[Create]** and the **Editor** for that Style starts up with a **style group header** but no styles in it.

All the other style files that are found are listed in the **Includes** section displayed at the bottom of the tree.



The included files can not be edited whilst create/editing this file BUT you can copy items from them and paste them into items in this file.

New styles can now be created (see 15.7.1.2.1 Creating New Styles) and a new XML created by clicking on the **Write** button.

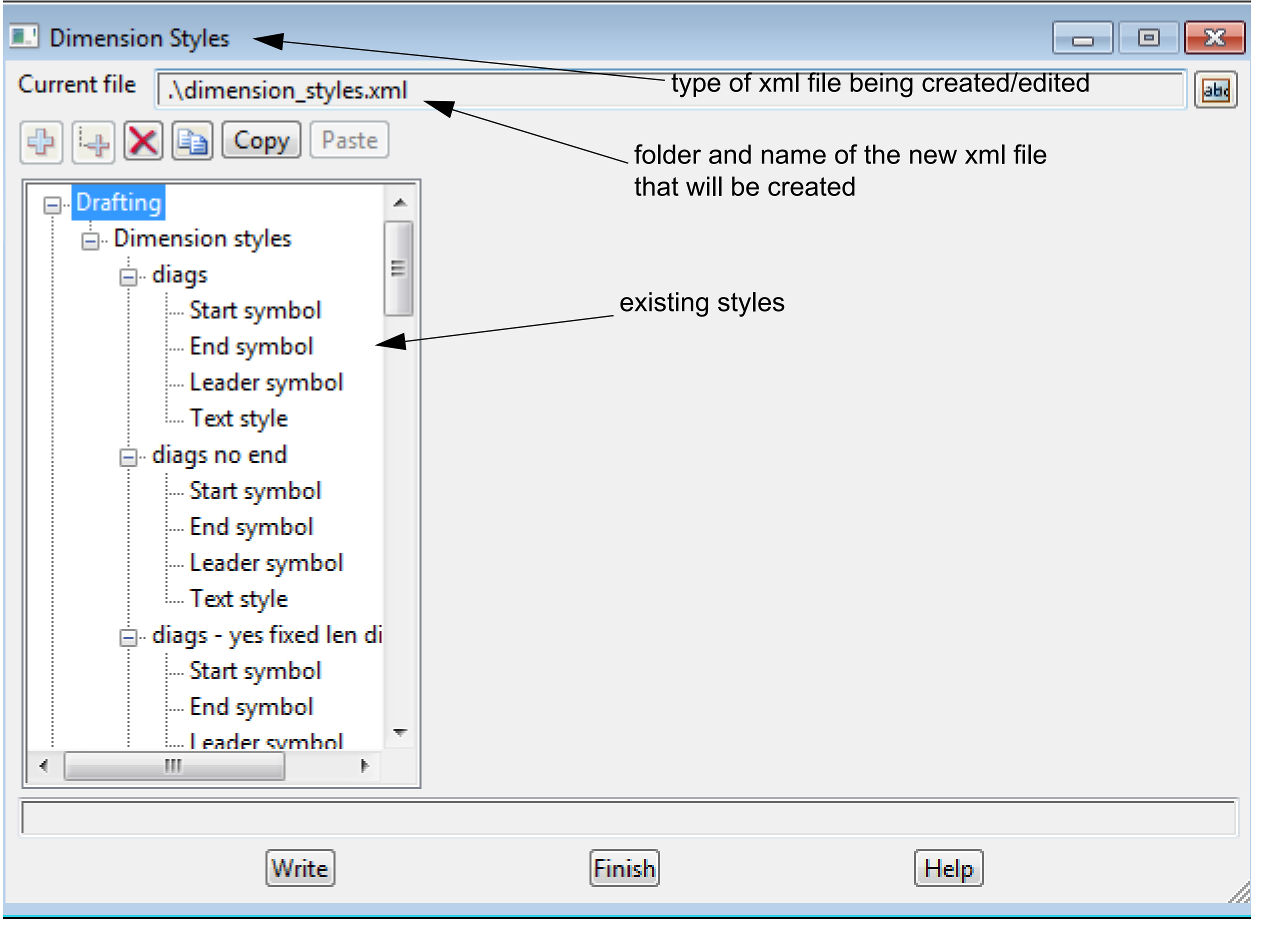
Creating and editing of styles is the same as for **[Edit]** and so is documented in that section. See 15.7.1.2 [Edit] for Dimension, Leader and Table Styles.

Write - writes out the information in the panel to the files name given in **Current file**.

15.7.1.2 [Edit] for Dimension, Leader and Table Styles

When **[Edit]** is shown, an xml file already exists and can be edited.

Click on the line with **[Edit]** and the **Editor** for that *Style* starts up with all the existing styles in that file displayed.



After completing any editing, the XML is saved by clicking on the **Write** button.

As in the **[Create]** case, all the other appropriate files that are found are listed in the Includes section are displayed at the bottom of the tree (see 15.7.1.1 [Create] for Dimension, Leader and Table Styles).

The included files can not be edited whilst create/editing this file BUT you and copy items from them and paste them into items in this file.

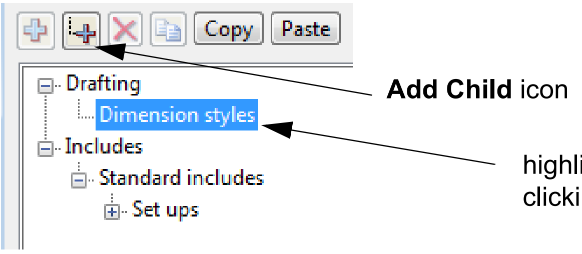
For editing in the panel, see

- 15.7.1.2.1 Creating New Styles
- 15.7.1.2.2 Copy and Paste
- 15.7.1.2.3 Deleting a Style
- 15.7.1.2.4 Duplicating a Style
- 15.7.1.2.5 Editing a Style

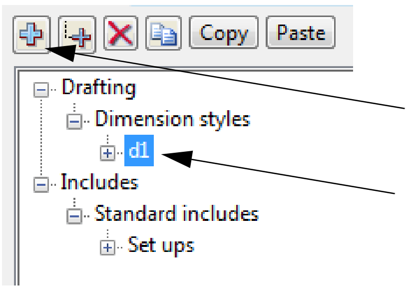
15.7.1.2.1 Creating New Styles

To create a **new style** from scratch when there are **no styles** already, highlight the **style group header** (Dimension style**s**, Leader style**s** or Table style**s**) and click on the **Add Child** icon.

Note - the **Add Child** icon adds a node as a subnode of the highlighted node.

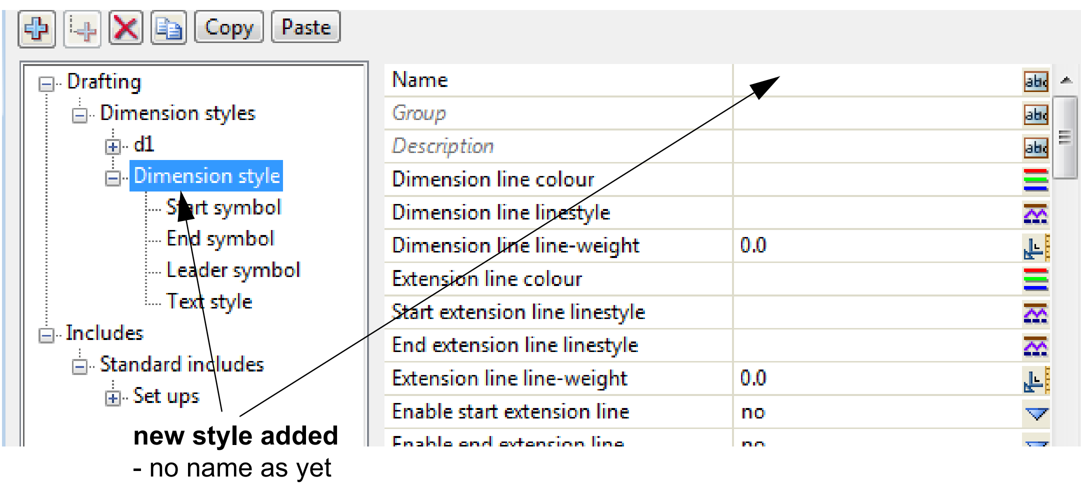


Too create a **new style** from scratch when **some styles already exist**, you can highlight the **style name** (name of the style or Dimension style, Leader style or Table style if it has not been given a name) and click on the **Add** (Add Sibling) icon.

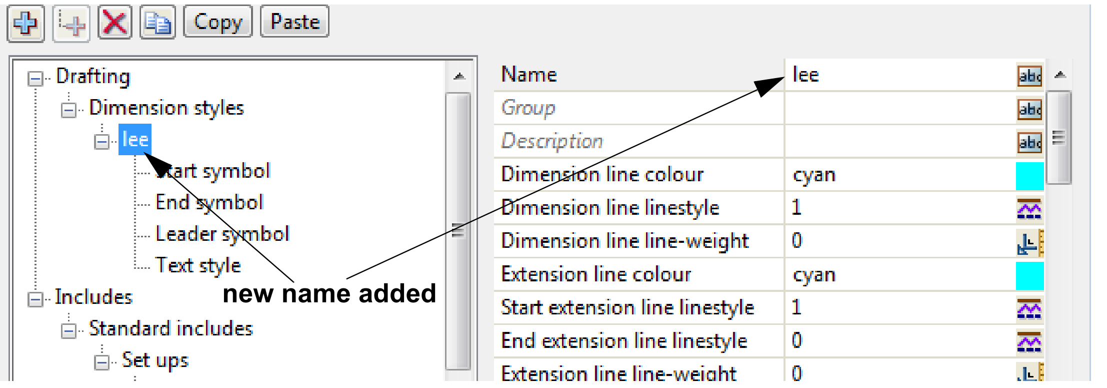


The **Add** icon adds a new item at **the same level** (a sibling) as the highlighted item and that is why a style must already exist so that one can be selected.

In both cases a new style is created with no name and so the general style name (Dimension style, Leader style or Table style) is written in the style list until the style is given a name.



Once the style is given a name then that name will appear in the tree.



Once the new style is created then it can be edited by going into each field of the style and making changes.

Quicker Methods for Creating New Styles

When you click on a node to edit that section of the tree, you can not leave the edited node until all the required values are filled in. Similarly you won't be able to save the style unless all the required values are filled in. And this may involve filling in a lot of values.

So rather than starting from scratch, it is often easier to use **Duplicate** (15.7.1.2.4 Duplicating a Style) if there are already existing styles in the file, or **Copy** and **Paste** (15.7.1.2.2 Copy and Paste).

Copy and **Paste** is particularly useful when there are **no** styles in the file you are creating styles but there are styles in the other files listed in the **Includes** node. Although these styles can't be edited, they can be copied.

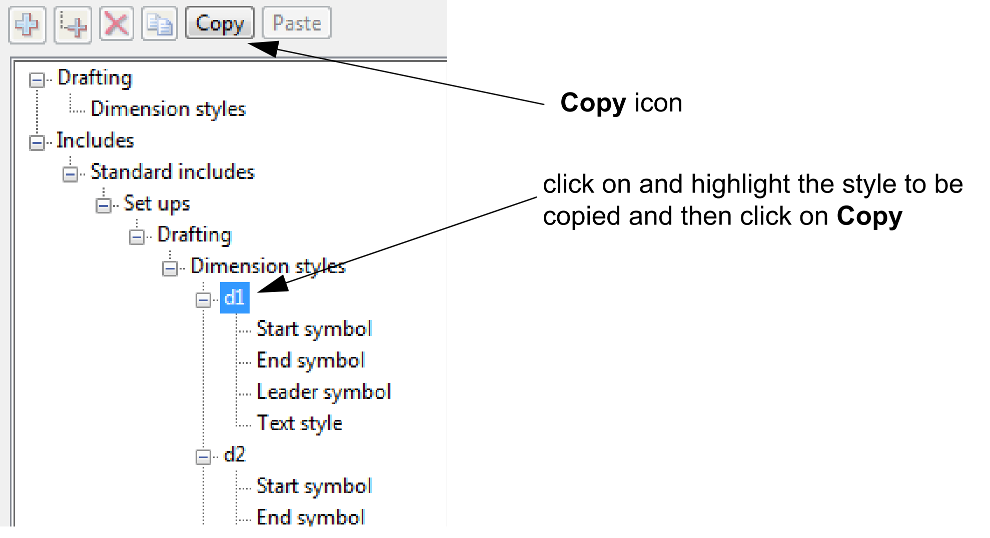
Continue to the next section 15.7.1.2.2 Copy and Paste or return to 15.7.1.2 [Edit] for Dimension, Leader and Table Styles or 15.7 Style XML Files for Dimensions, Leaders & Tables.

15.7.1.2.2 Copy and Paste

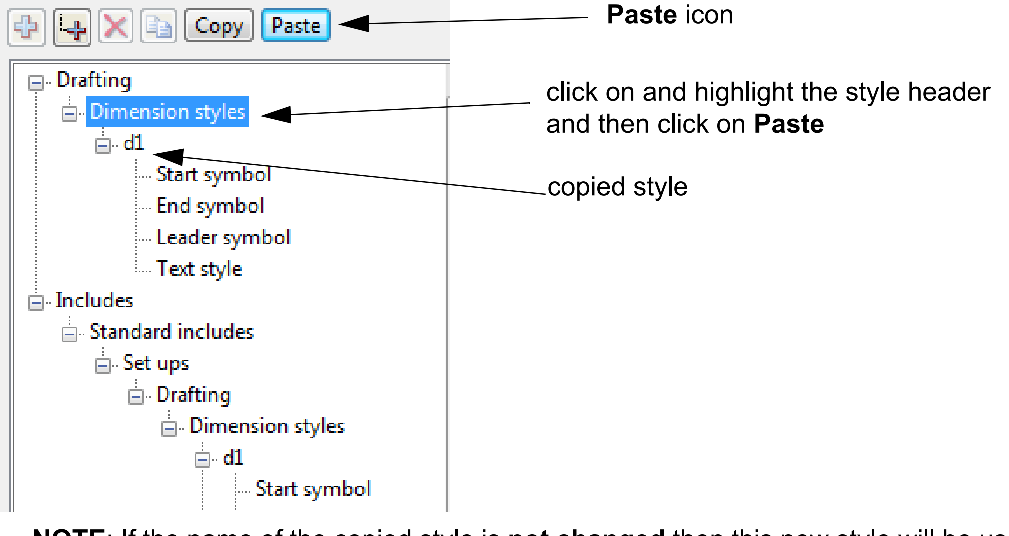
Rather than creating a new style from scratch, it is often easier to use **Copy** and **Paste** to create a copy of an existing style, and then edit the copied style.

Although there may be no styles in the folder you are creating styles for, there will usually be some styles in the XML file in **Set Ups** that can be copied.

In the tree in the **Editor**, click on the **+** in front of **Set Ups** to expand the tree and then click on the item in the tree that you want to copy. Then click on the **Copy** icon.



Next click on and highlight the style header (Dimension styles, Leader styles or Table styles) and click on **Paste**. The style will then appear under the style header with the same name as the original style. The copied style can then be edited.

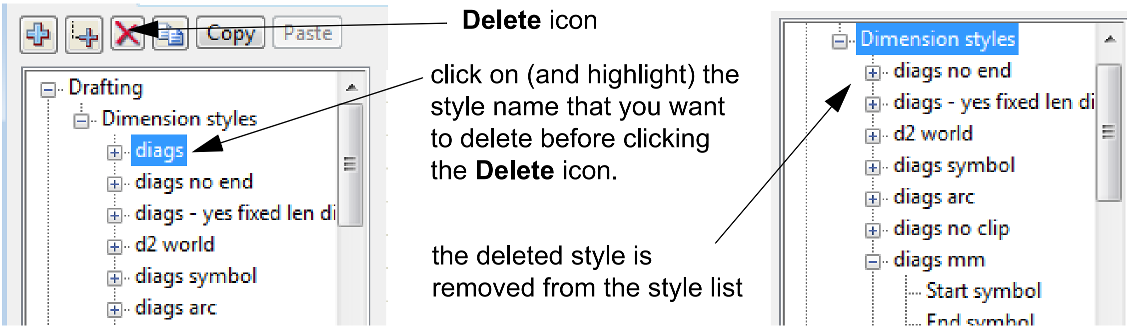


NOTE: If the name of the copied style is **not changed** then this new style will be used instead of the one in **Set Ups**.

Continue to the next section 15.7.1.2.3 Deleting a Style or return to 15.7.1.2 [Edit] for Dimension, Leader and Table Styles or 15.7 Style XML Files for Dimensions, Leaders & Tables.

15.7.1.2.3 Deleting a Style

To **delete** a style, simply click on and highlight the **style name,** and then click on the **Delete** icon.

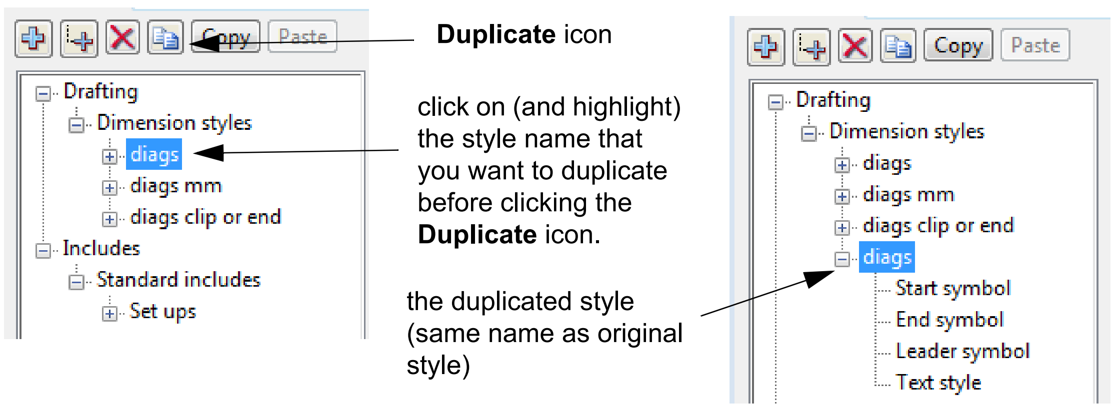


Continue to the next section 15.7.1.2.4 Duplicating a Style or return to 15.7.1.2 [Edit] for Dimension, Leader and Table Styles or 15.7 Style XML Files for Dimensions, Leaders & Tables.

15.7.1.2.4 Duplicating a Style

To **duplicate** a style, simply click on and highlight the **style name,** and then click on the **Duplicate** icon.

A copy of the style, with exactly the same name, is created and added to the end of the list of styles.

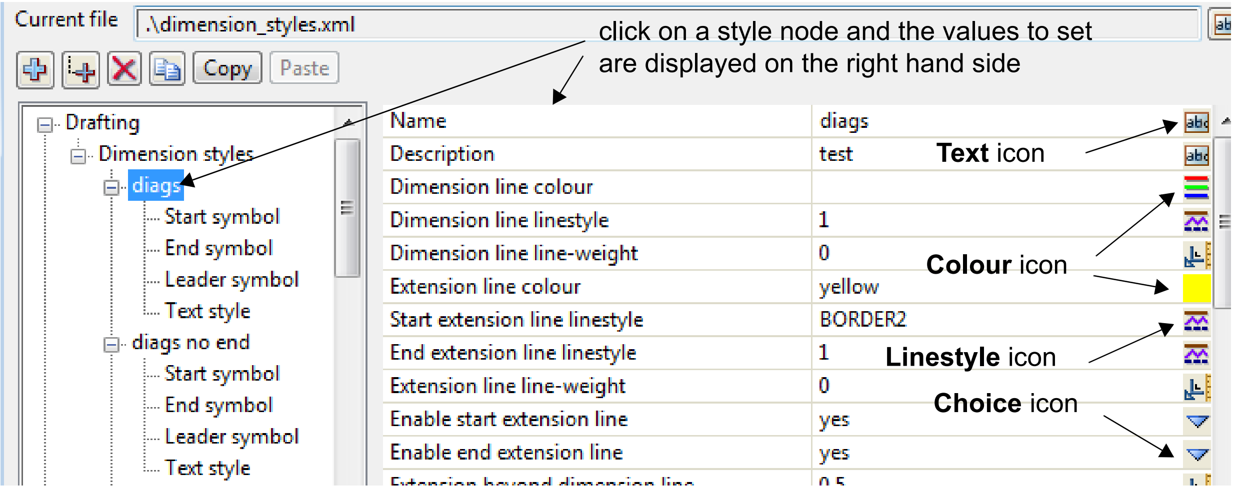


The name of the style needs to be changed and any other edits done that are required.

Continue to the next section 15.7.1.2.5 Editing a Style or return to 15.7.1.2 [Edit] for Dimension, Leader and Table Styles or 15.7 Style XML Files for Dimensions, Leaders & Tables.

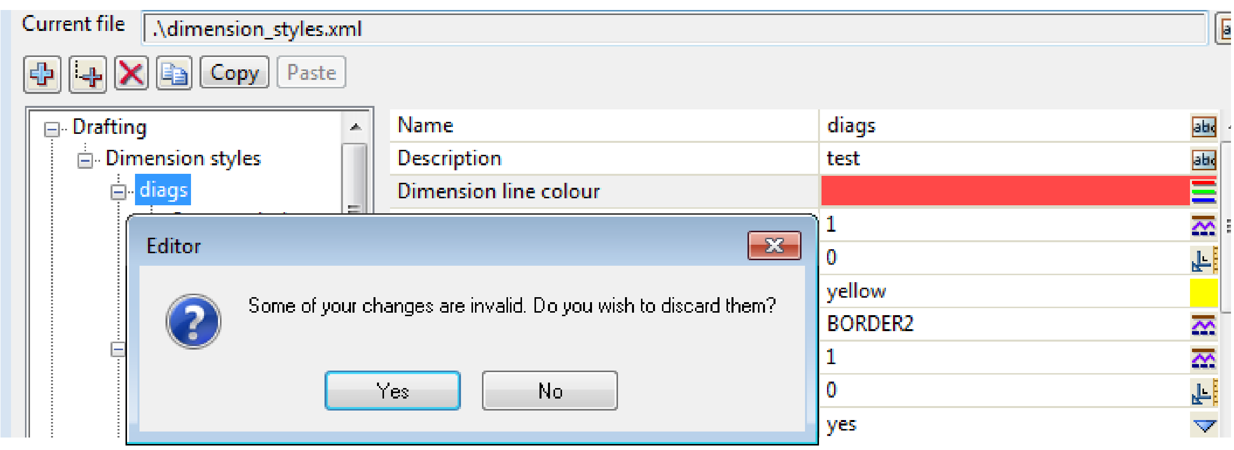
15.7.1.2.5 Editing a Style

To edit a **style**, you click on the style name, or expand the style and click on any of the sub nodes, and all the values for that node will be displayed on the right hand side of the panel.



The panel fields on the right hand side of the panel have the same icons as in other ***12d Model*** panels and the standard pop ups are all available. For example, text, colour and choice icons.

When clicking to go to another node, all the fields currently on the right hand side are validated and if there are any problems, the first line with an error is coloured red and an **Editor error** box is displayed.



If **Yes** is selected, then all the **invalid field** values are **discarded**, the **Editor error** panel removed, and the data for the new selected node displayed on the right hand side of the panel.

If **No** is selected, then the right hand side of the panel does not change and can undergo further edits.

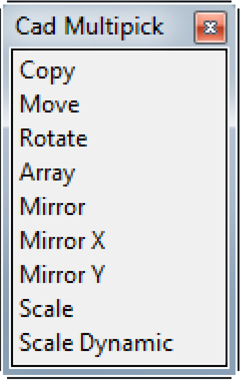
Return to 15.7 Style XML Files for Dimensions, Leaders & Tables.

15.8 CAD Multipick

Position of option on menu: **CAD =>Multipick**

This section of documentation is a work in progress and will be updated in subsequent releases.

The **Cad Multipick** walk-right menu is



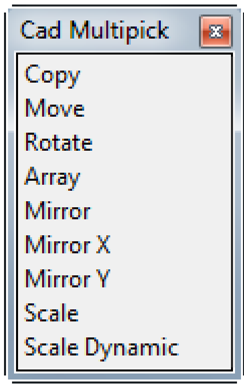
For selecting the data, see 15.8.1 Selecting with Multipick

For the options, see

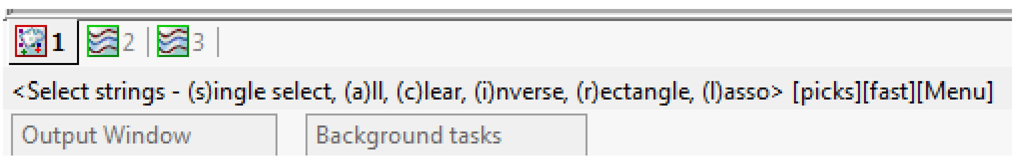
Copy	15.8.2 CAD Multipick Copy
Move	15.8.3 CAD Multipick Move
Rotate	15.8.4 CAD Multipick Rotate
Array	15.8.5 CAD Multipick Array
Mirror	15.8.6 CAD Multipick Mirror
Mirror X	15.8.7 CAD Multipick Mirror X
Mirror Y	15.8.8 CAD Multipick Mirror Y
Scale	15.8.10 CAD Multipick Scale
Scale Dynamic	15.8.11 CAD Multipick Scale Dynamic

15.8.1 Selecting with Multipick

Upon selecting any of the Multipick options from the **CAD Multipick** menu



the *Screen Message Area* prompts are shown for selecting selection options.

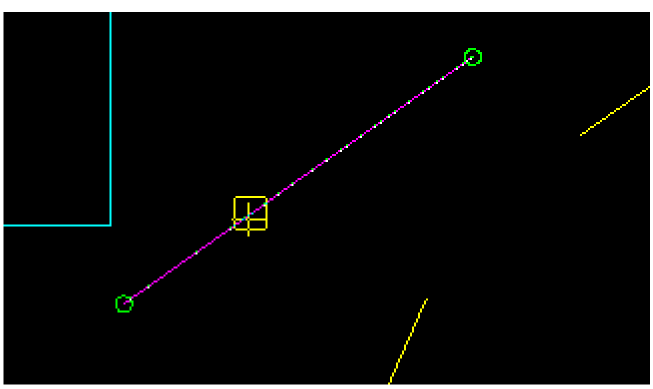


The default option is <**m**> for multipick select.

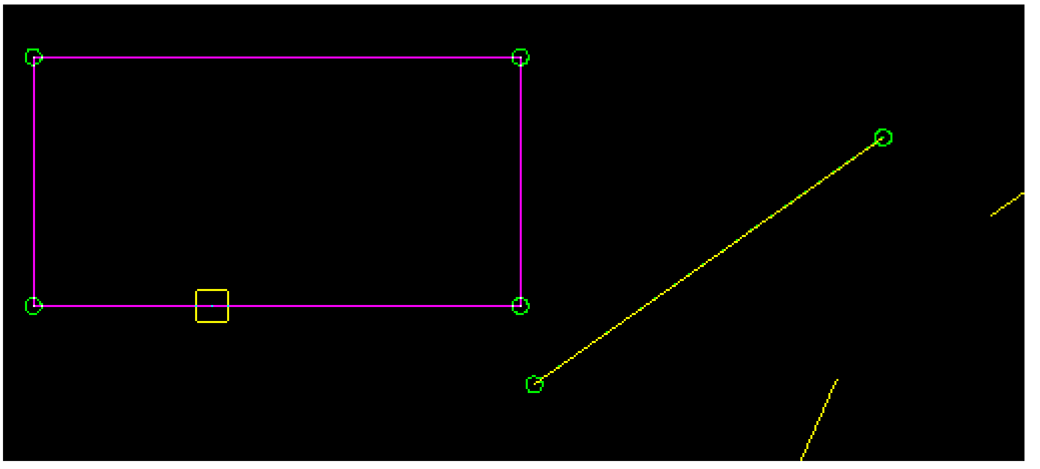
For <***m***> go to	Multipick
<***s***>	Single
<***a***>	All
<***c***>	Clear
<***i***>	Inverse
<***r***>	Rectangle
<***l***>	Lasso

Multipick

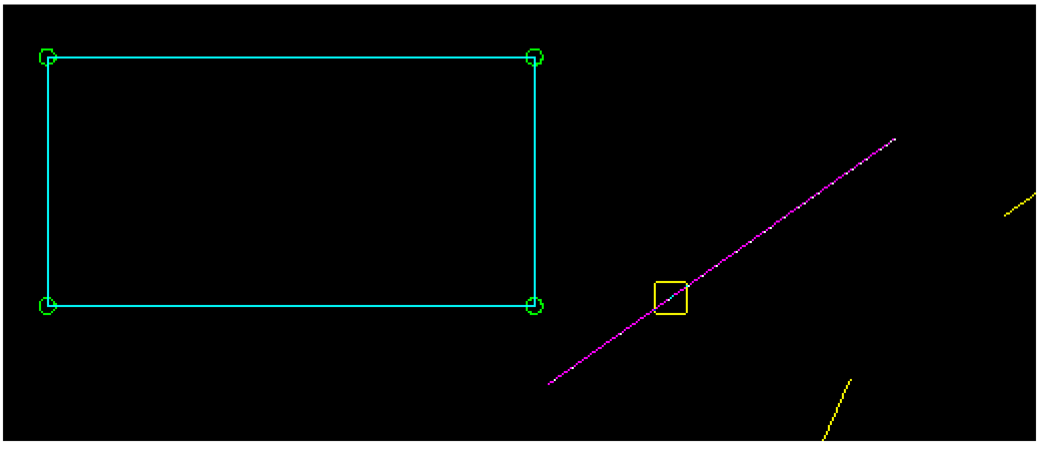
For <**m**>, strings are selected by clicking LB on the string, but unlike a normal select, ***the string is not accepted***. After LB is clicked, the string is highlighted and circles placed at the string vertices to indicate that the string is part of the ***Multipick set***.



Another string is added to the *Multipick set* by clicking LB on the new string and again ***not accepting***. This string will also be drawn with circles at each of its vertices to indicate that it is part of the *Multipick set*.



A string is ***removed*** from a *Multipick set* by simply clicking LB on the string (and not accepting). The string is then deselected and the circles are removed from the vertices of the string to indicate that it is no longer part of the *Multipick set*.



When all the required strings of the *Multipick set* have been selected, the Multipick selection is terminated by clicking MB (accepting).

The selected strings in the *Multipick set* are then passed on to the CAD Multipick option for processing. For example, if the Multipick was part of **Multipick Copy**, then after Accepting, the ***Copy*** part of the **Multipick Copy** takes over.

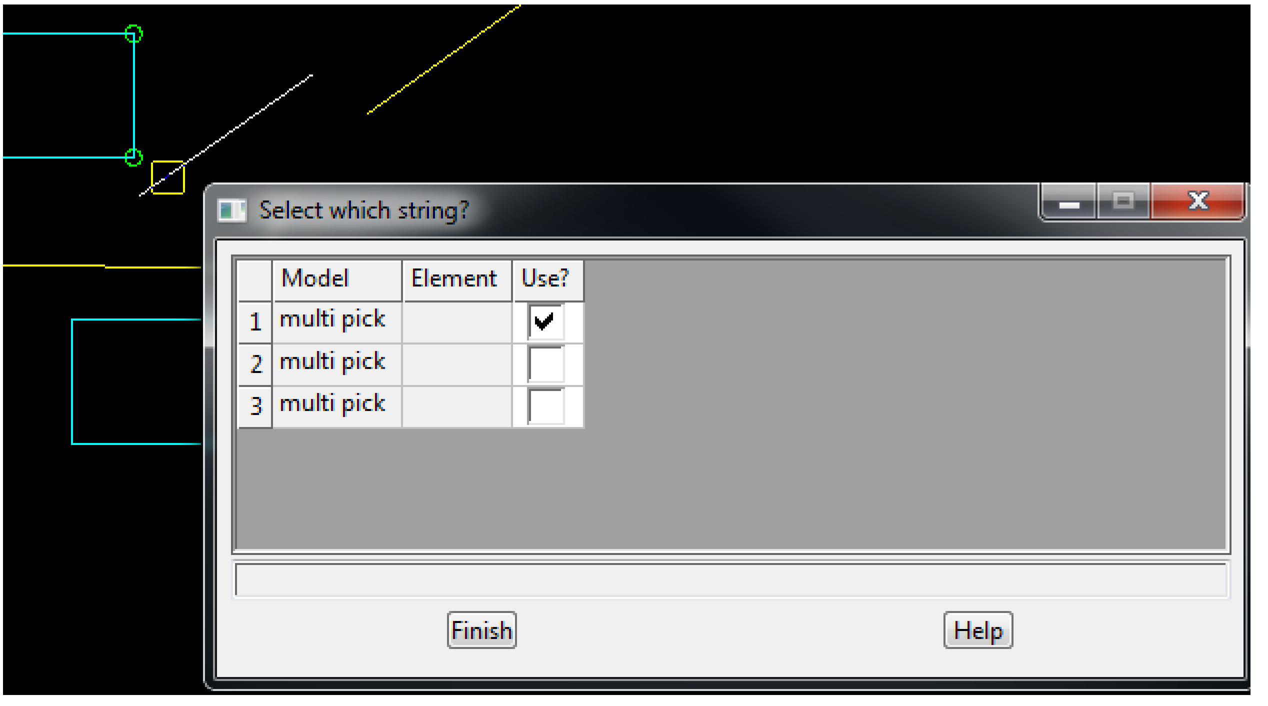
Once the Multipick option (*e.g.* **Multipick Copy**) is completed, the ***Multipick set*** is cleared and the Multipick CAD option begins again, and the process of building up a new ***Multipick set*** begins again for that same option.

To terminate the *Multipick option*, simply press <Esc>.

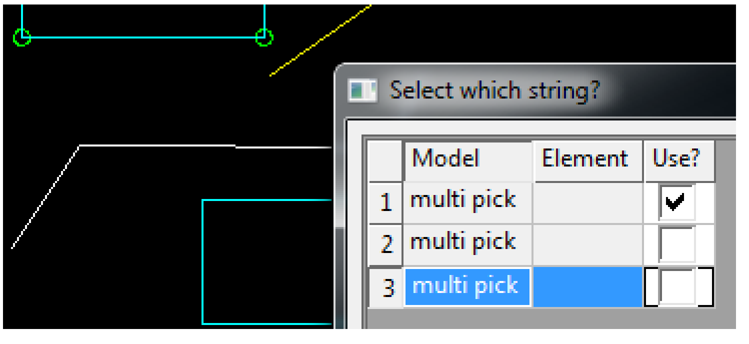
Note:

Because LB is used to keep adding new strings to the ***Multipick set***, it can't be used for the normal cycling through a selection set when more than one string satisfies the picking tolerance. So when more than one string satisfies the picking criteria a **Select which string?** panel is placed on the screen with the list of strings satisfying the LB picking criteria.

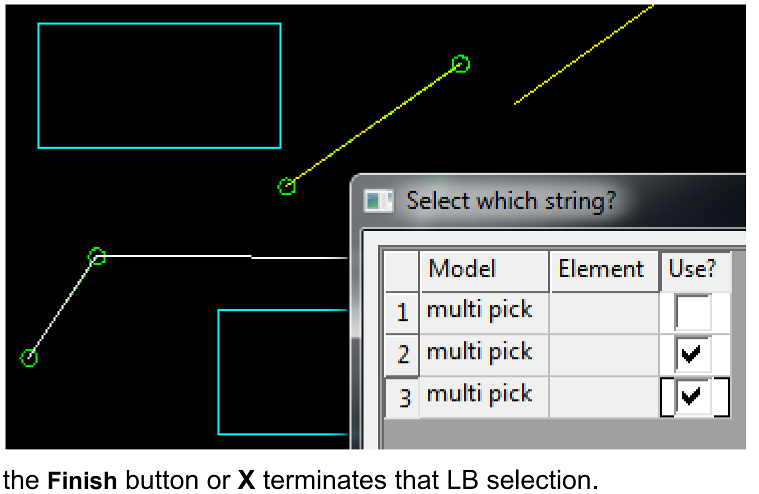
If the string is already in the *Multipick set*, there will be a *tick* in the **Use?** column.



Clicking on a line in the grid highlights the string.



And clicking in the **Use?** column to make a ***tick*** will add the string to the *Multipick set* and place circles on each of its vertices, or ***turning off a tick*** will deselect the string from the *Multipick set* and remove the circles from each of its vertices.



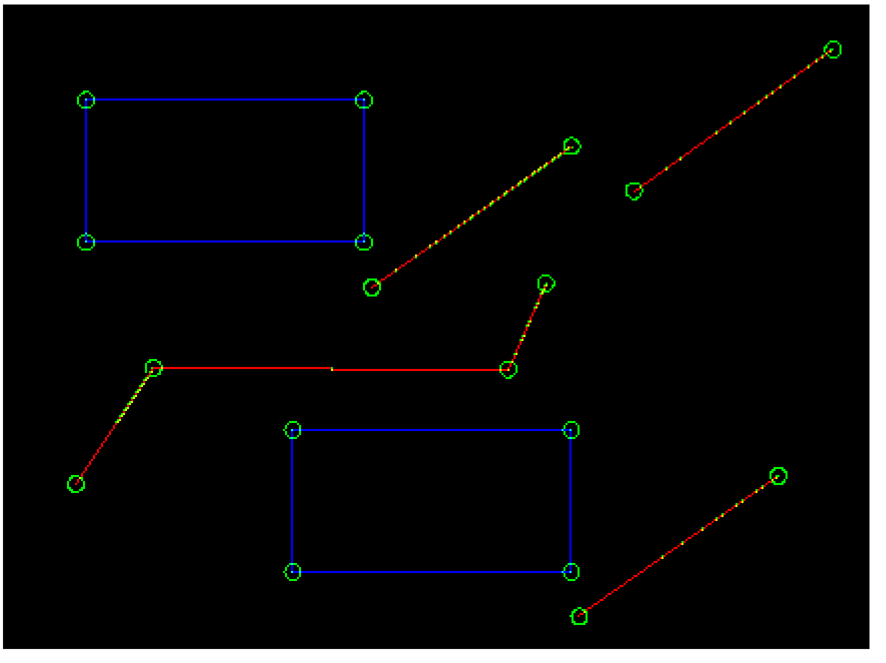
Clicking on the **Finish** button or **X** terminates that LB selection.

Single

<**s**> places the option back into the mode of selecting a single string. That is, Multipick is not used.

All

<**a**> will add all the strings in the models on the current view to the Multipick set. Note that the strings do not have to be visible on the view to be selected by <a>.

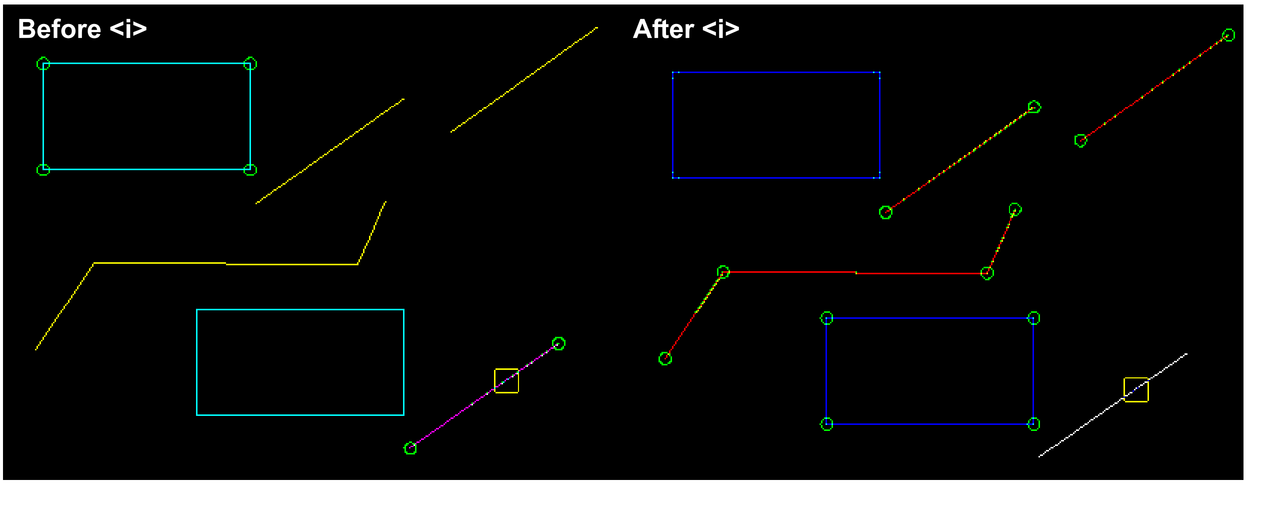


Clear

<**c**> will clear the current Multipick set. That is, all selected strings are deselected.

Inverse

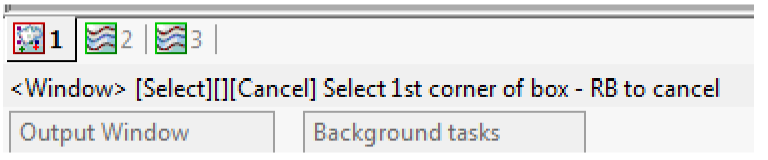
<**i**> will take the inverse of the current *Multipick set*. That is, all strings in the models on the current view that are currently in the *Multipick set* are deselected, and all strings in the models on the current view that are not n the *Multipick set* are added to the *Multipick set*. Note that the strings do not have to be visible on the view to be selected/deselected by <i>.

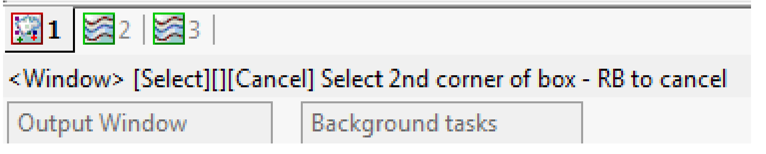


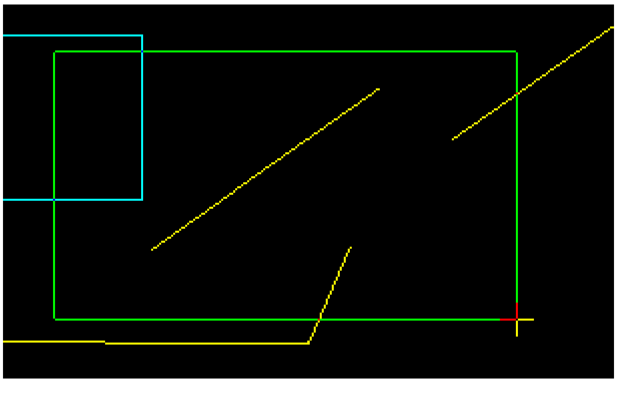
Rectangle

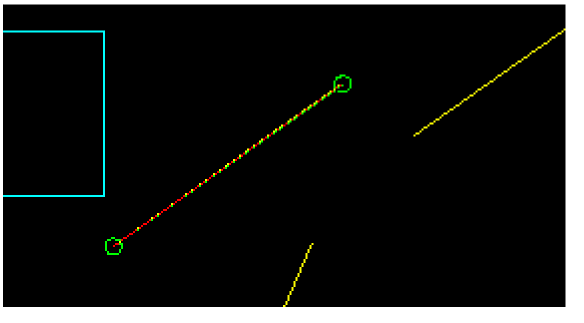
<**r**> requires the user to create a rectangle and all strings totally enclosed by that rectangle will be added to the *Multipick set* if they are not already in the *Multipick set*, or **deselected** if they are already in the *Multipick set*.

After pressing <r>, the first corner of the rectangle is selected by pressing and holding down LB, and the cursor is then dragged to the second corner of the rectangle and LB released.







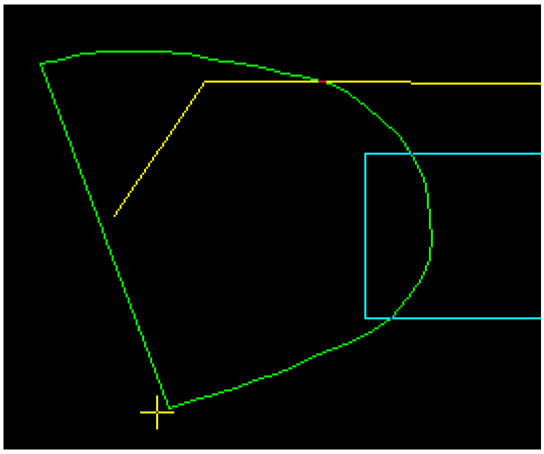


The strings totally enclosed by the rectangle are then added to/removed from the *Multipick set*.

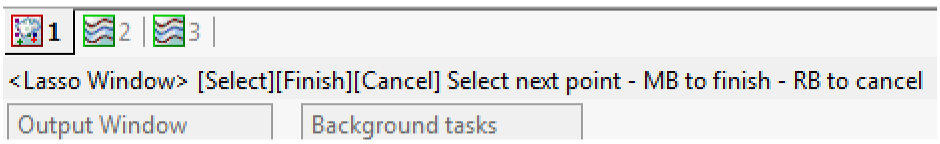
Lasso

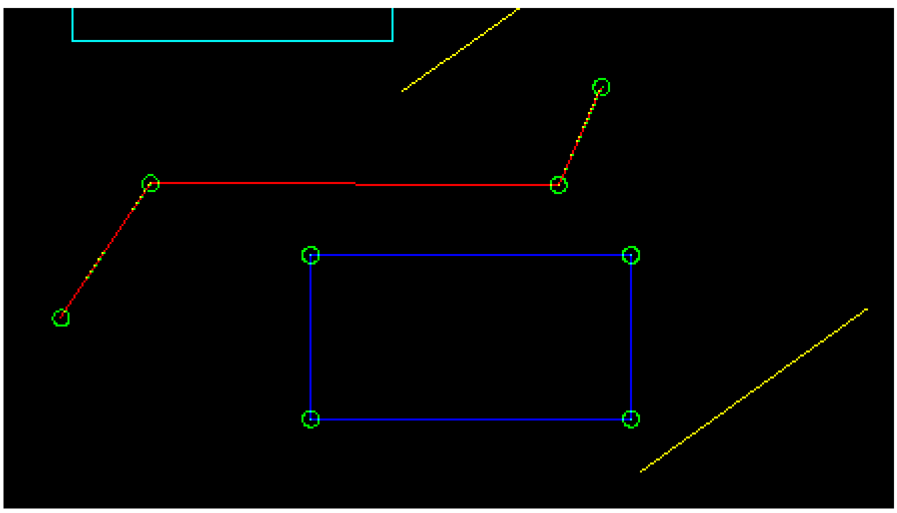
<**l**> requires the user to create a lasso, and all strings enclosed by or crossing the lasso will be added to the Multipick set if they are not in the Multipick set, or deselected if they are already in the Multipick set.

After pressing <l>, the lasso start point is selected by pressing and holding down LB and the cursor is then dragged to trace out the lasso. LB is then released to stop adding to the lasso.



MB is pressed and released to accept the lasso. If LB is pressed down before accepting the lasso, further points are added to the lasso until LB is released.





The strings totally enclosed by, or crossing, the lasso are then added/removed from the *Multipick set*.

15.8.2 CAD Multipick Copy

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Copy part of the option is the same as the 15.20.2 CAD Copy command.

15.8.3 CAD Multipick Move

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Move part of the option is the same as the 15.20.1 CAD Move command.

15.8.4 CAD Multipick Rotate

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Rotate part of the option is the same as the 15.20.4 CAD Rotate command.

15.8.5 CAD Multipick Array

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Array part of the option is the same as the 15.20.3 CAD Array command.

15.8.6 CAD Multipick Mirror

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Mirror part of the option is the same as the 15.20.5 CAD Mirror command.

15.8.7 CAD Multipick Mirror X

For selecting the data, see 15.8.1 Selecting with Multipick

After data has been selected, a base point is selected and the Mirror X part of the option is the same as the 15.20.6 CAD Mirror X Axis command.

15.8.8 CAD Multipick Mirror Y

For selecting the data, see 15.8.1 Selecting with Multipick

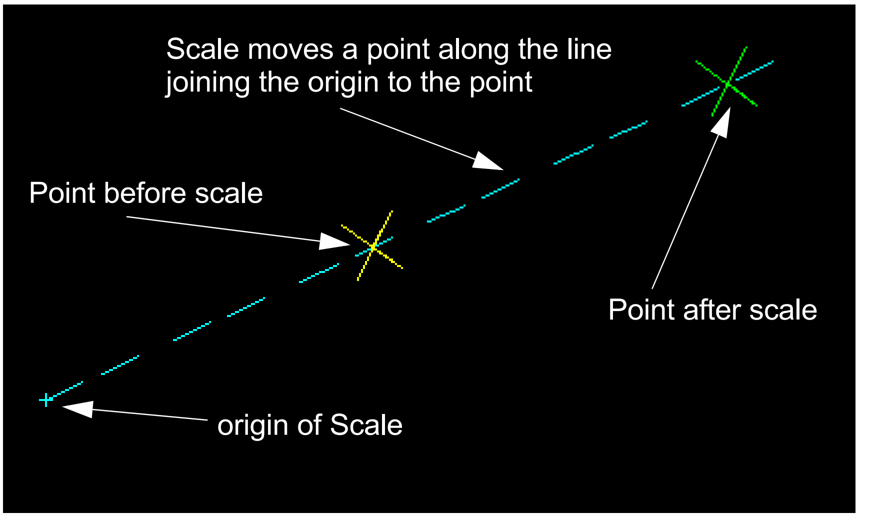
After data has been selected, a base point is selected and the Mirror Y part of the option is the same as the 15.20.7 CAD Mirror Y Axis command.

15.8.9 Scale About an Origin

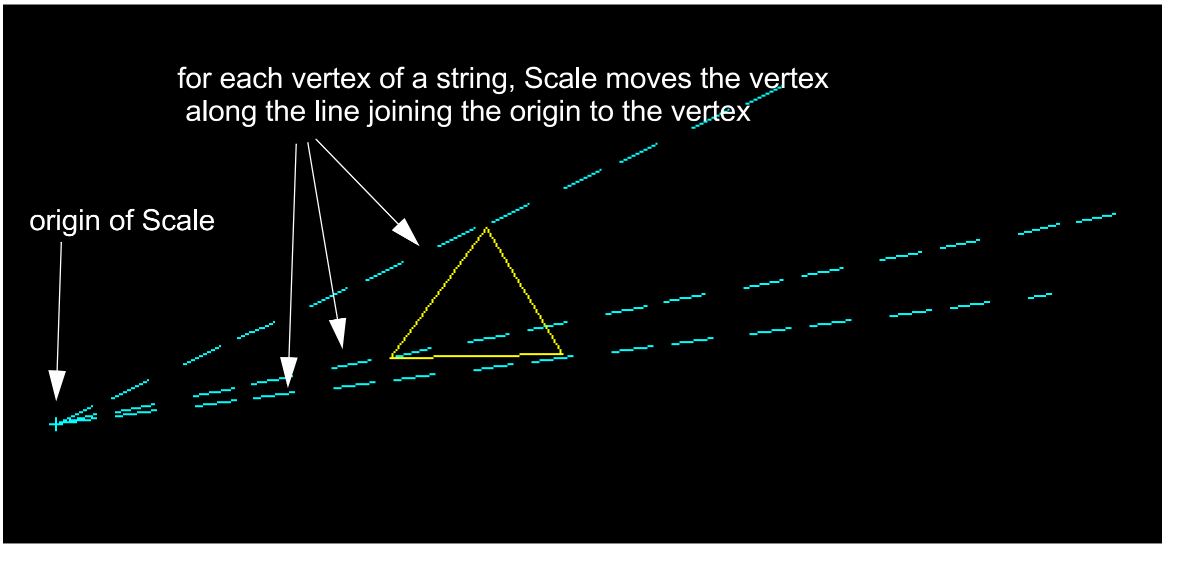
A number of options use the concept of **Scaling** about an **Origin**.

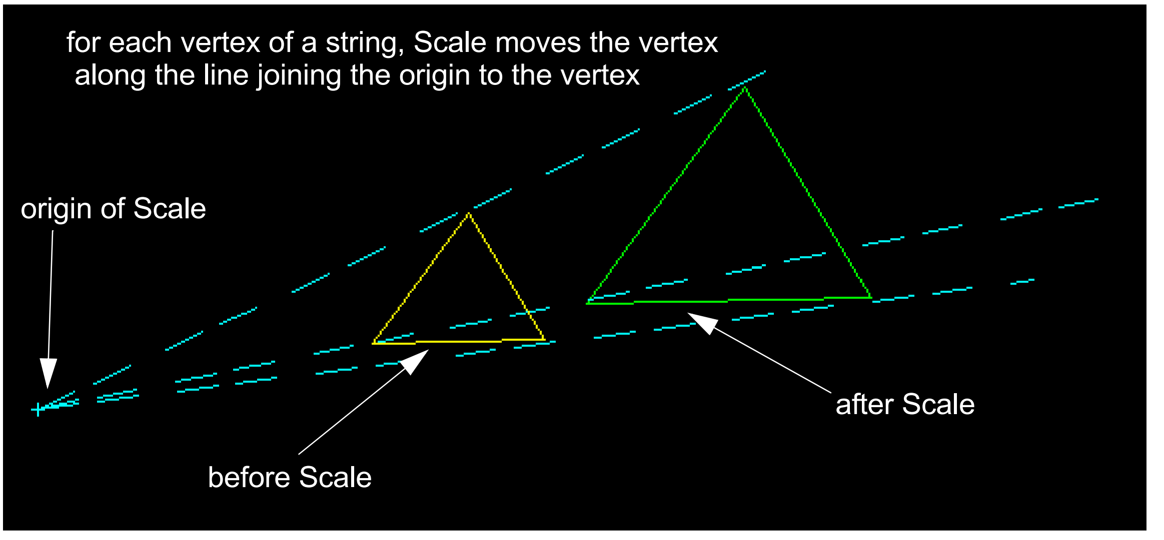
To scale a point about an Origin by a given scale factor, the point is moved along the line joining the point to the origin so that

distance between the scaled point and the origin = scale factor * distance from point to origin



A **string** is scaled about an origin by a given scale factor by scaling each vertex in the string about the origin by the scale factor.



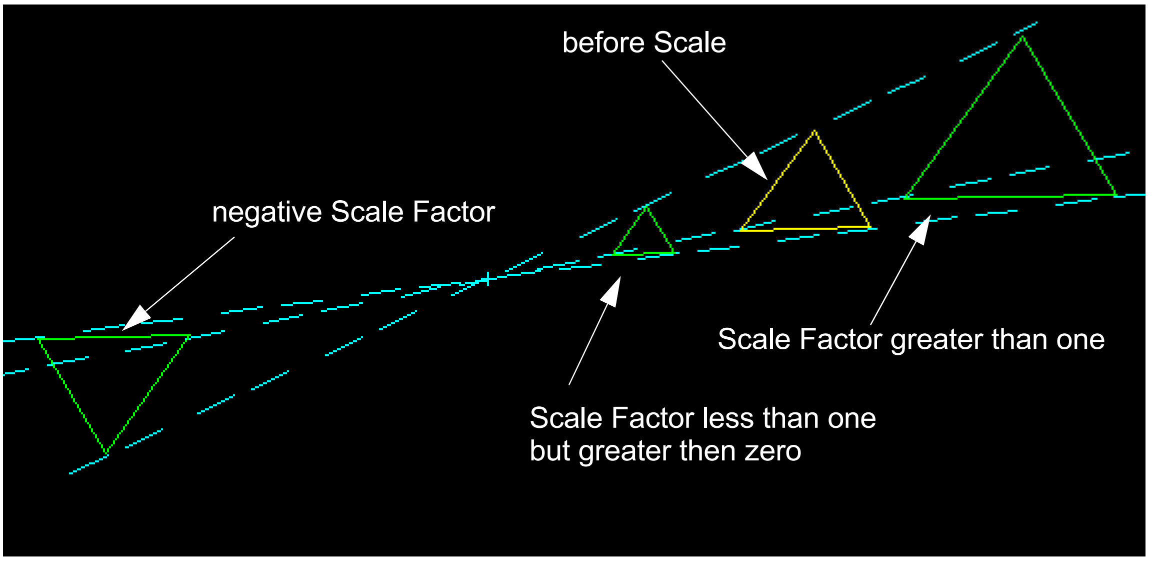


If the Scale Factor is greater than one, then the scaled string is enlarged and is on the same side of the origin as the original string but further from the origin than the original string.

If the Scale Factor is less than one but greater than zero, then the scaled string is reduced and is between the origin and the original string.

If the Scale Factor is negative then the scaled string is on the opposite side of the origin to the original string.

A Scale Factor of zero would put all the vertices of the string on top of the origin.



15.8.10 CAD Multipick Scale

For selecting the data, see 15.8.1 Selecting with Multipick

For the definition of scaling about an origin, see 15.8.9 Scale About an Origin

After data has been selected, an Origin point is selected and the Scale part of the option is the same as the 15.20.8 CAD Scale command.

15.8.11 CAD Multipick Scale Dynamic

For selecting the data, see 15.8.1 Selecting with Multipick

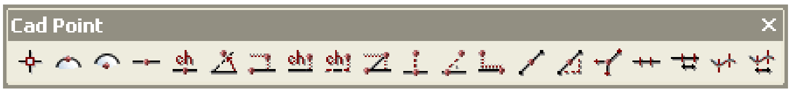
For the definition of scaling about an origin, see 15.8.9 Scale About an Origin

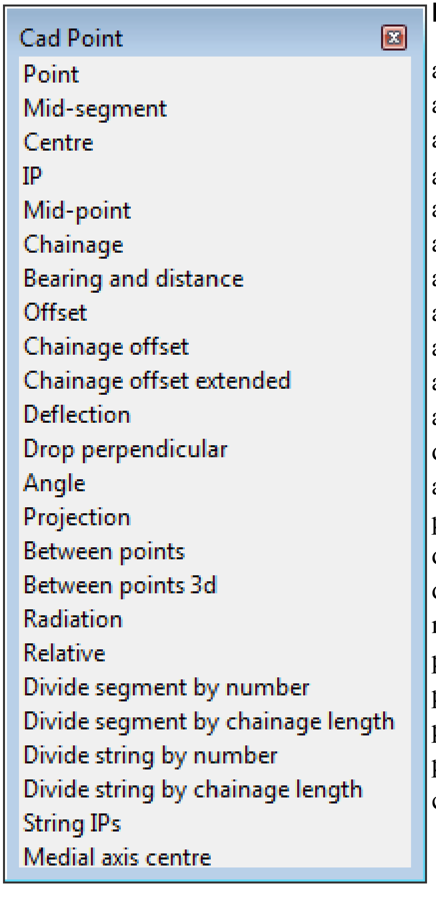
After data has been selected, an Origin point and Start Scale position is selected and the Scale Dynamic part of the option is then similar to the 15.20.9 CAD Scale Dynamic command.

15.9 CAD Point

Position of option on menu: **CAD =>Point**

The **Point** walk-right menu is





Menu of Options to Create New One Point Strings

at a user selected position
at middle of a selected segment
at the centre point of an arc
at the IP of a selected arc or transition segment
at the middle of the two selected points
at the position of a chainage along a selected string
a given bearing and distance from a selected position
at the offset position of a point on a selected string
at the offset position of a chainage along a selected string
at the offset position of a chainage along a selected string extended
a given distance at right angles to a selected string
dropped perpendicularly onto a selected string
a given distance at a given angle to a selected string
projected a chainage distance along a selected string
distance between two selected positions
distance between two selected positions with interpolated z
many points at given bearings and distances from a selected position
points which divide selected seg into a number of equal segs
points which divide selected seg into segs of given length
points which divide selected string into a number of equal pieces
points which divide selected string into pieces of given length
creates new points for each vertex of a string

For the option *Point*, go to	15.9.1 Point
Mid-segment	15.9.2 Mid Segment
Centre	15.9.3 Centre
IP	15.9.4 IP
Mid-point	15.9.5 Mid point
Chainage	15.9.6 Chainage
Bearing and distance	15.9.7 Bearing and distance
Offset	15.9.8 Offset
Chainage offset	15.9.9 Chainage offset
Chainage offset extended	15.9.10 Chainage offset extended
Deflection	15.9.11 Deflection
Drop perpendicular	15.9.12 Drop Perpendicular
Angle	15.9.13 Angle
Projection	15.9.14 Projection
Between points	15.9.15 Between Points

15.9.1 Point

Position of option on menu: **CAD =>Point =>Point**

or by selection of appropriate icon from the toolbar.

This option creates a single vertex (point) string.

On selecting **Point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar** then a value will be interpolated if possible, otherwise a null value will be assigned.

15.9.2 Mid Segment

Position of option on menu: **CAD =>Point =>Mid segment**

or by selection of appropriate icon from the toolbar. 

This option creates a point in the middle of a selected line or arc segment.

On selecting **Mid segment**, the user is prompted to select a segment and a vertex is created at the mid point of the segment. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

15.9.3 Centre

Position of option on menu: **CAD =>Point =>Centre**

or by selection of appropriate icon from the toolbar. 

This option creates a point at the centre of a selected arc or circle.

On selecting **Centre** the user is prompted to select an arc and a vertex is created at the centre of the arc. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

15.9.4 IP

Position of option on menu: **CAD =>Point =>IP**

or by selection of appropriate icon from the toolbar. 

This option creates a point at the IP of a selected arc or transition segment. That is, it creates a point at the intersection of the tangent from the start of the segment and the tangent at the end of the segment. Picking a straight segment will give an error.

On selecting **IP** the user is prompted to select an arc or transition segment and a new point is created at the IP of the selected segment. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

15.9.5 Mid point

Position of option on menu: **CAD =>Point =>Mid point**

or by selection of appropriate icon from the toolbar.

This option creates a point in the middle of two selected positions.

On selecting **Mid point**, the user is prompted to select the first position and then the second position. A vertex is created at the mid point of the two selected positions. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

15.9.6 Chainage

Position of option on menu: **CAD =>Point =>Chainage**

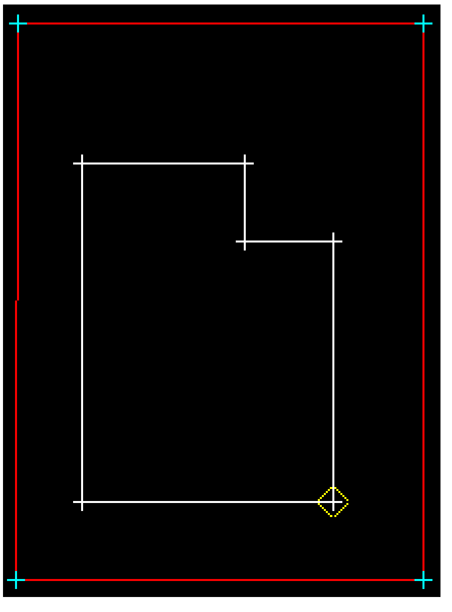
or by selection of appropriate icon from the toolbar. 

This option creates a new point at the position of a user specified chainage of an existing string.

On selecting **Chainage**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

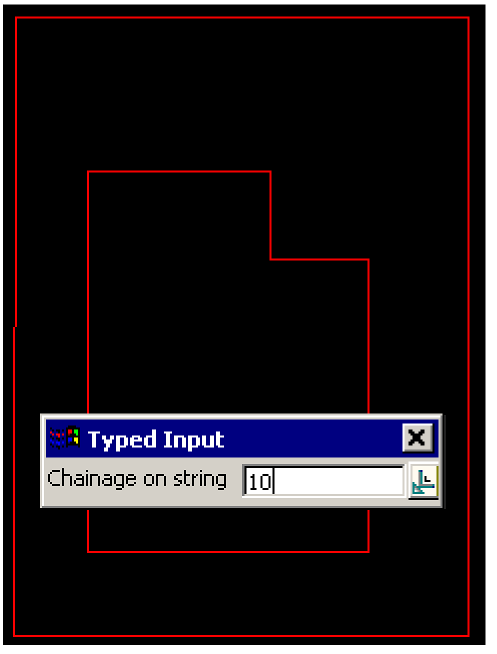
STEP 1:

The user selects a valid string (left mouse button) and accepts that string (Middle mouse button or <Enter>).



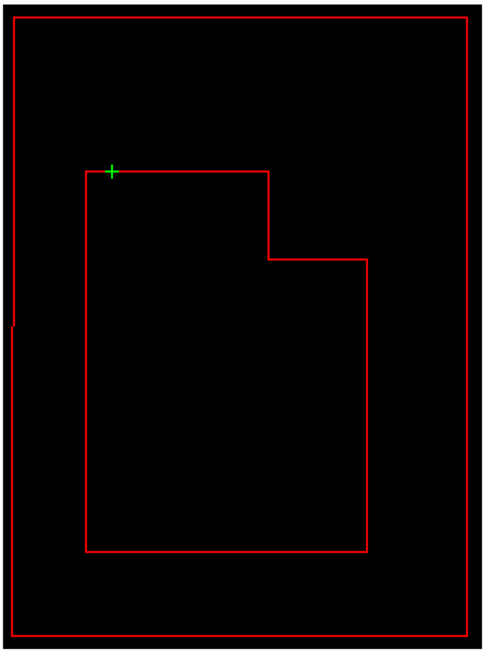
STEP 2:

The user enters a chainage value where a point should be placed followed by the <Enter> key. This chainage is with respect to the selected string.



STEP 3:

A new one point string is created at the positioned on the string at the given chainage.



To create another point, the user is prompted for the string as per **STEP 1**.

15.9.7 Bearing and distance

Position of option on menu: **CAD =>Point =>Bearing and distance**

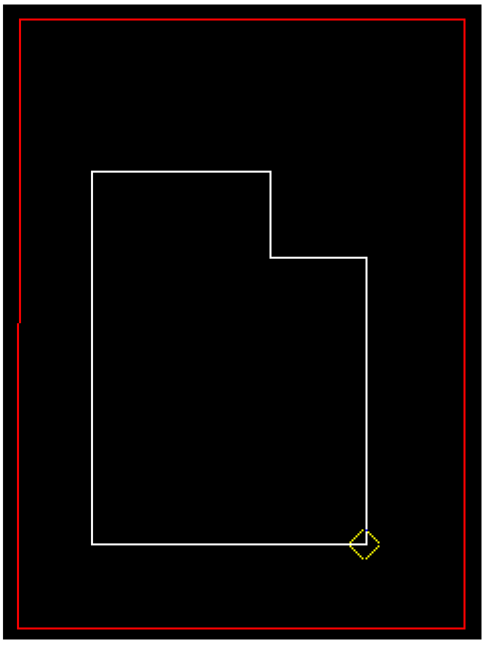
or by selection of appropriate icon from the toolbar. 

This option calculates a point string that is located a given bearing and distance from a start position.

On selecting **Bearing and distance**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start position is selected and accepted.

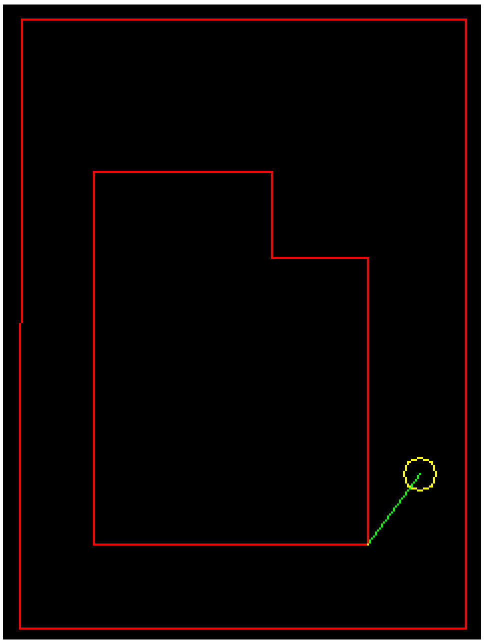


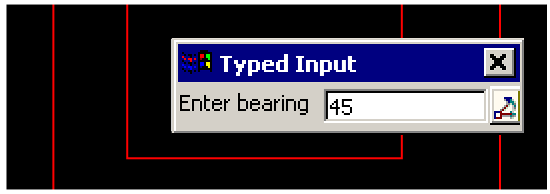
STEP 2:

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

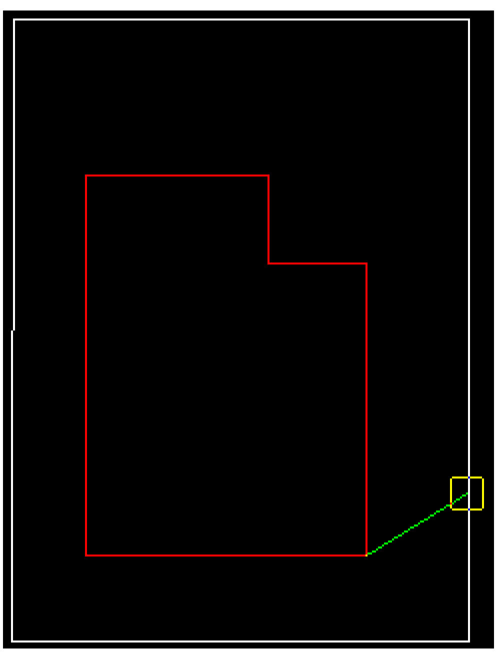
The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

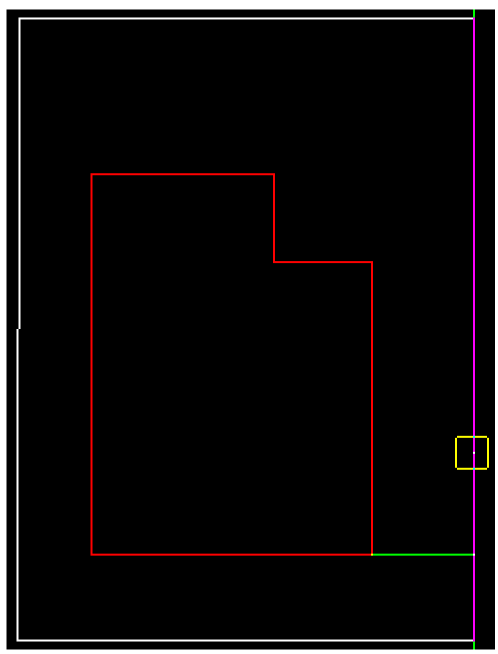
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**





This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

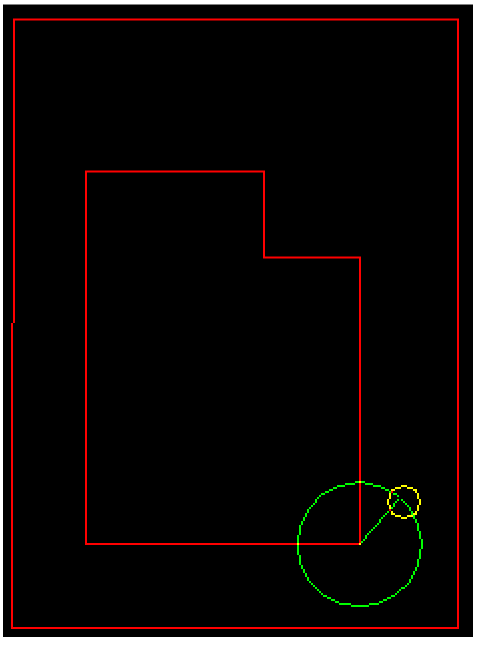


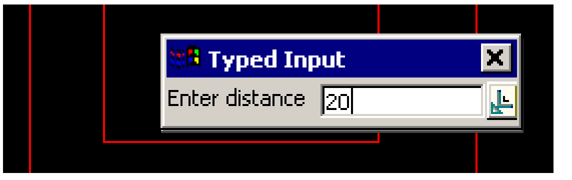


STEP 3:

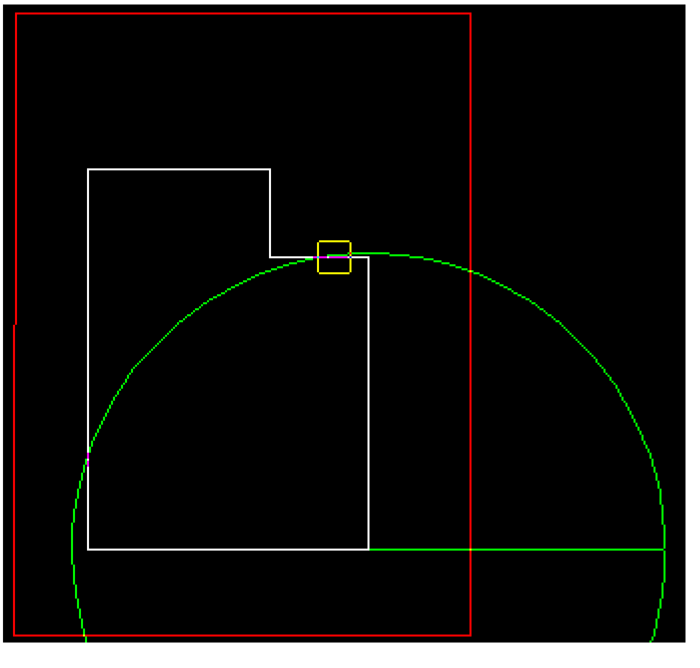
A distance is selected and accepted with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the distance entry box. The value is entered into the input box followed by the Enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

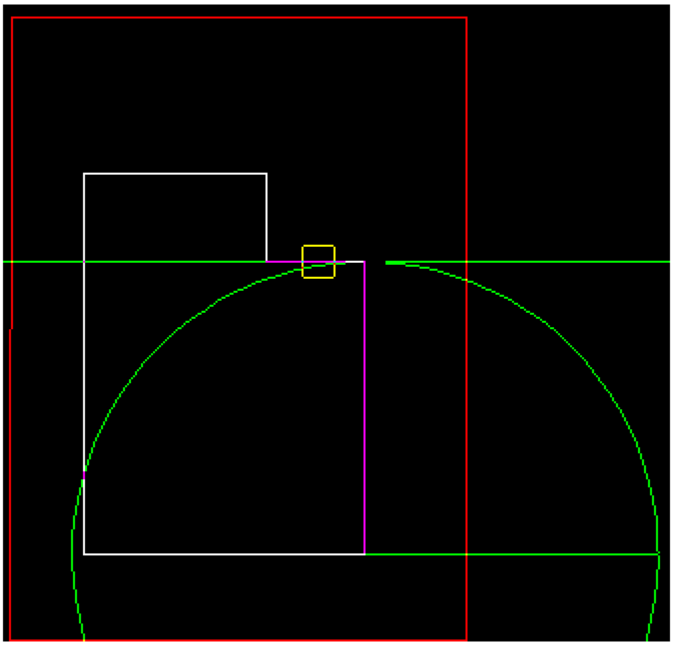




This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

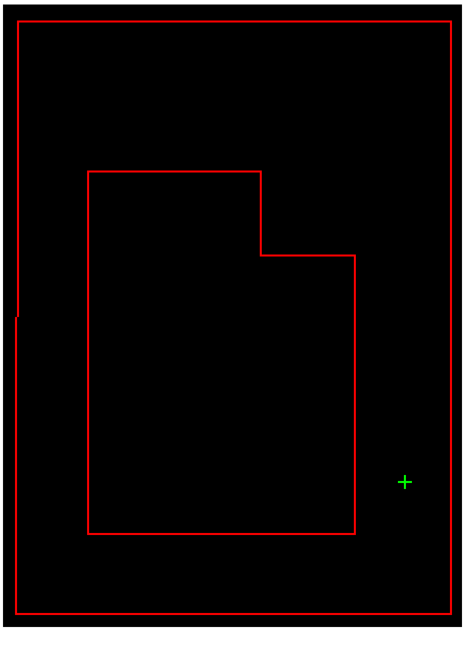


The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

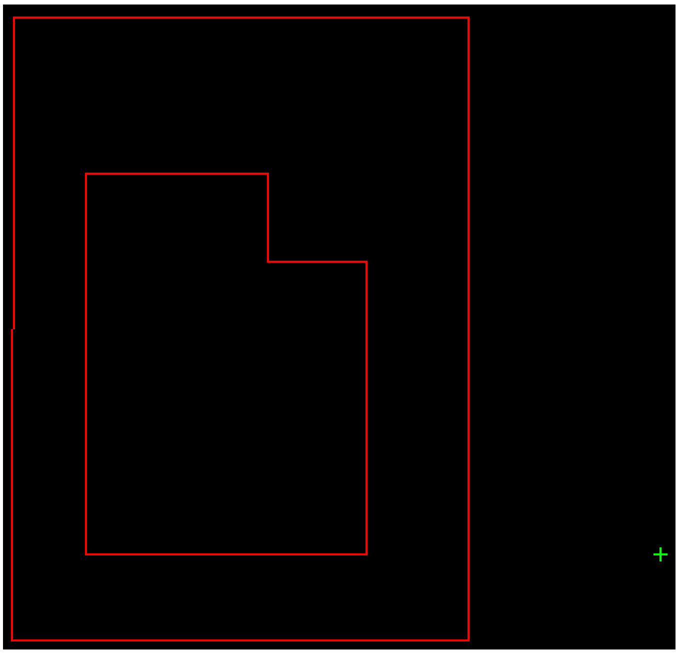


STEP 4:

A point string is created using the information supplied. By entry into the input boxes:



Or by using the perpendicular/tangential tools:



15.9.8 Offset

Position of option on menu: **CAD =>Point =>Offset**

or by selection of appropriate icon from the toolbar.

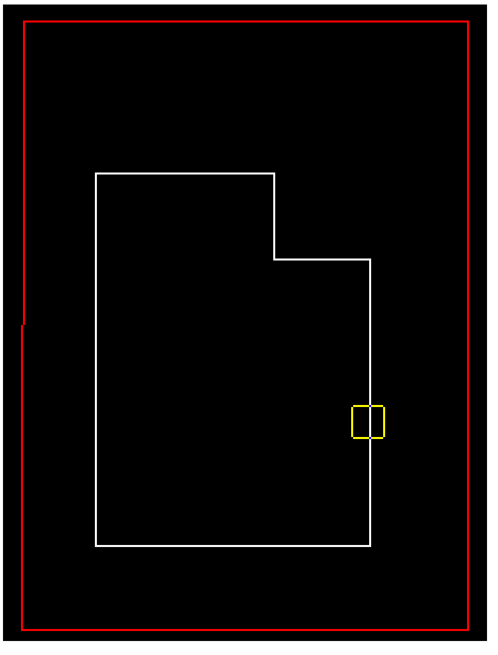
This option creates a one point string that is located by reference to a string, a control point, a chainage distance along the string from the control point and an offset to the selected string.

After selection and acceptance of a string, a control point is selected and accepted. This point is dropped perpendicular onto the string. The distance along the string is measured from this dropped point. Positive distances are in the direction that the string was picked. Finally a offset to the string can be specified for the placement of the new point string.

On selecting **Offset**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

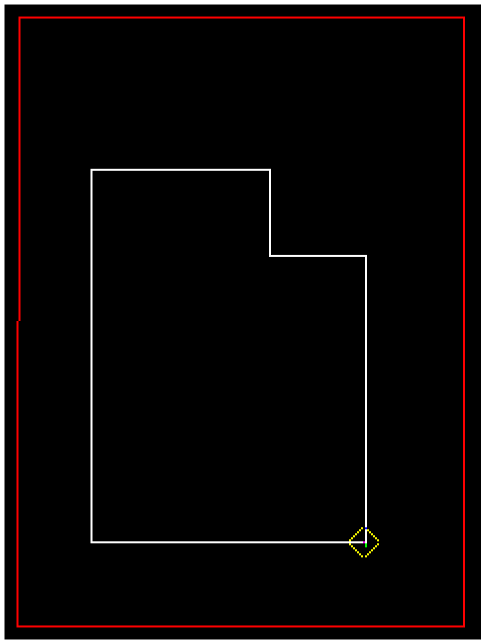
STEP 1:

The user selects and accepts a string with direction. This defines what side the offset applies to.



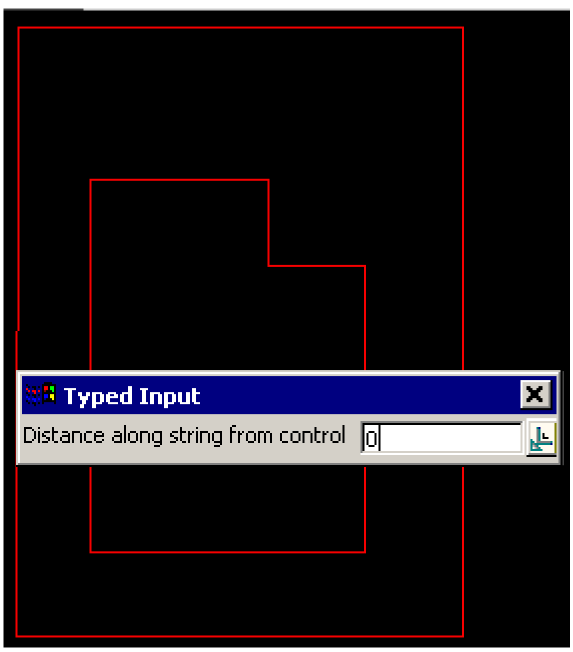
STEP 2:

The user picks and accepts a control point to be dropped onto the selected string.



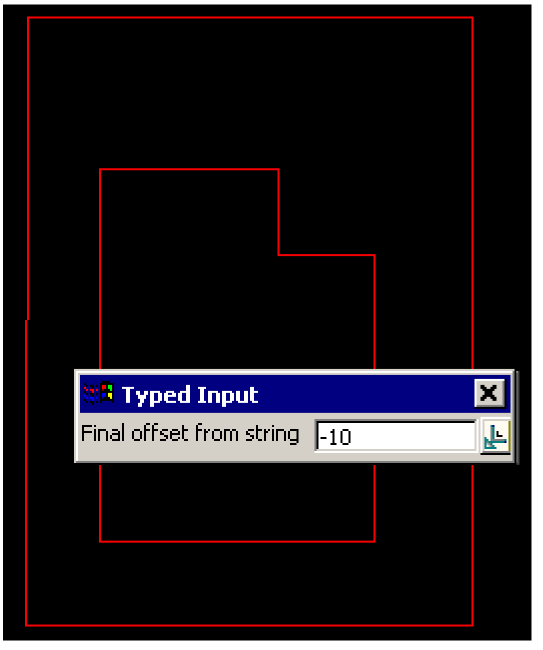
STEP 3:

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.



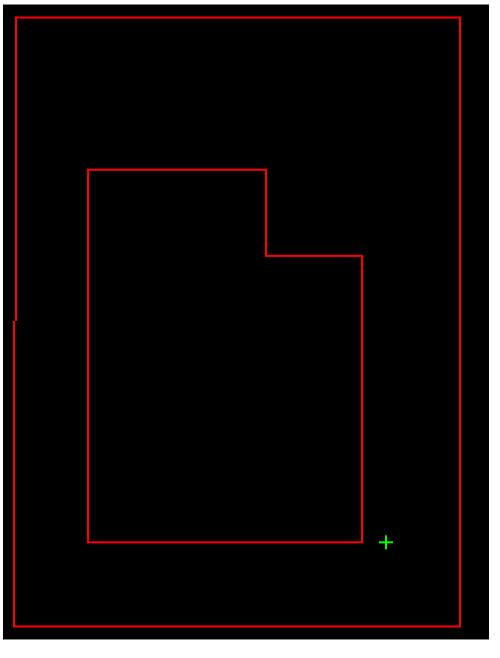
STEP 4:

An offset relative to the selected string (and direction) is specified in the input box followed by the enter key.



STEP 5:

A point string is created using the information supplied.



15.9.9 Chainage offset

This option creates a one point string that is located perpendicular to the reference string with a defined offset.

STEP 1:

The user selects the reference string with direction.

STEP 2:

The user specifies a chainage on the reference string.

STEP 3:

The user specifies an offset distance from the reference string.

A one point string is created using the information supplied.

15.9.10 Chainage offset extended

Is similar to chainage offset except the specified chainage can be extended beyond the start and end chainages of the selected string.

15.9.11 Deflection

Position of option on menu: **CAD =>Point =>Deflection**

or by selection of appropriate icon from the toolbar. 

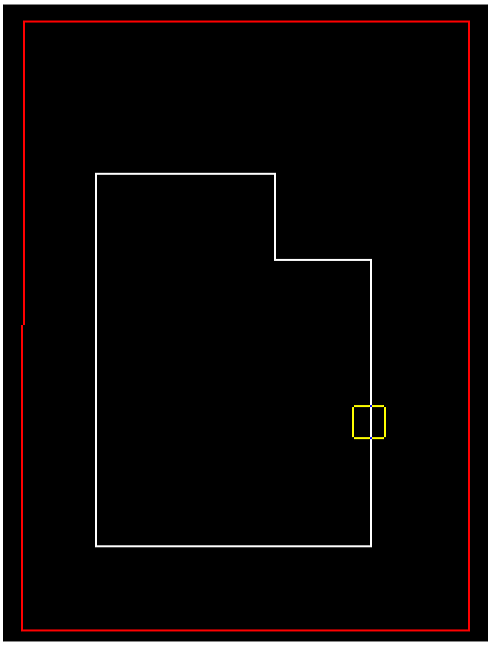
This option creates a one point string that is located by reference to a string, a control point, a distance along the string from the control point, a deflection angle and deflection distance.

After selection of a string, a control point is selected. This point is dropped perpendicular onto the string. A distance along the string can be entered to move the measure point. Positive distances are in the direction that the string was picked. A deflection angle is specified which is a clockwise angle from the measure point. The deflection distance is the distance from the measure point to the point which is to be created.

On selecting **Deflection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

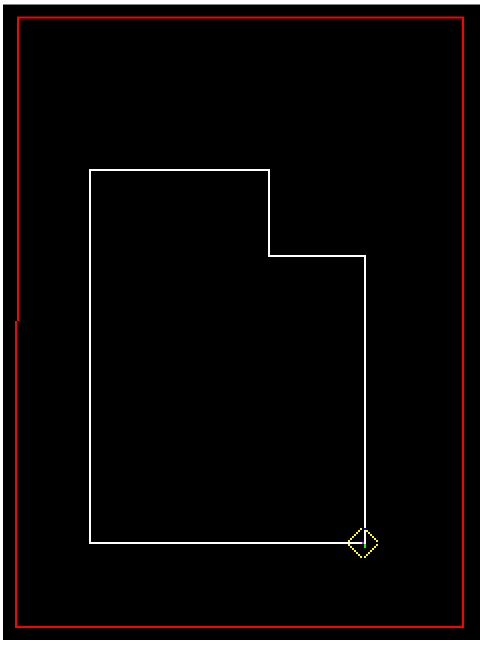
STEP 1:

The user selects and accepts a string with direction.



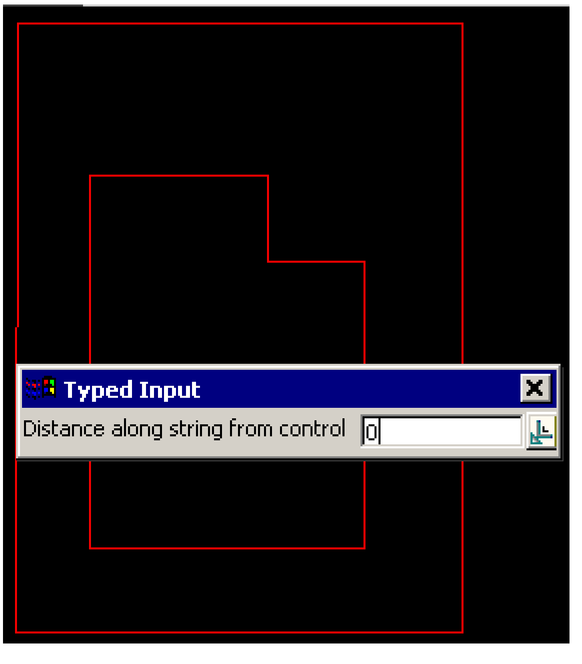
STEP 2:

The user picks and accepts a control point to be dropped onto the selected string.



STEP 3:

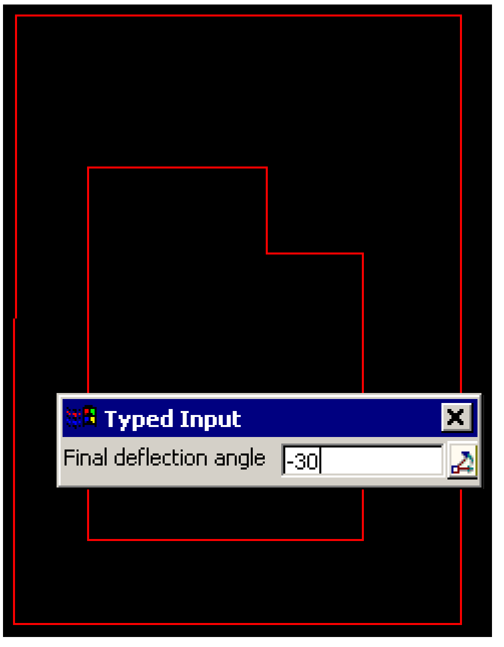
A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the enter key.



STEP 4:

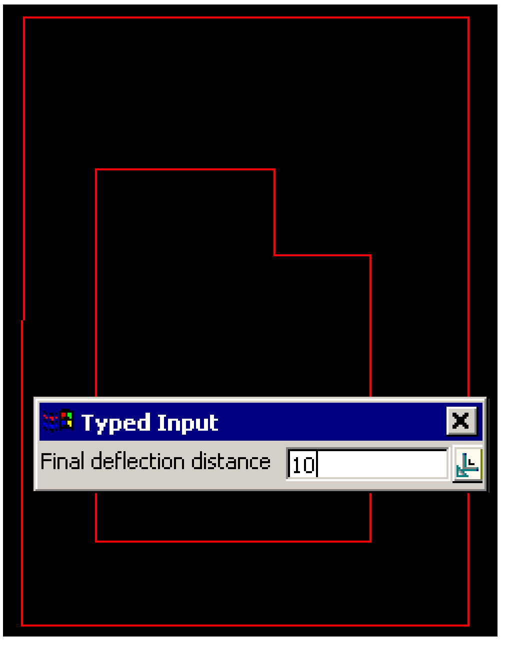
A deflection angle is specified. This angle is clockwise, relative to the direction of the string selection pick. The value is entered into the input box followed by the enter key.

Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



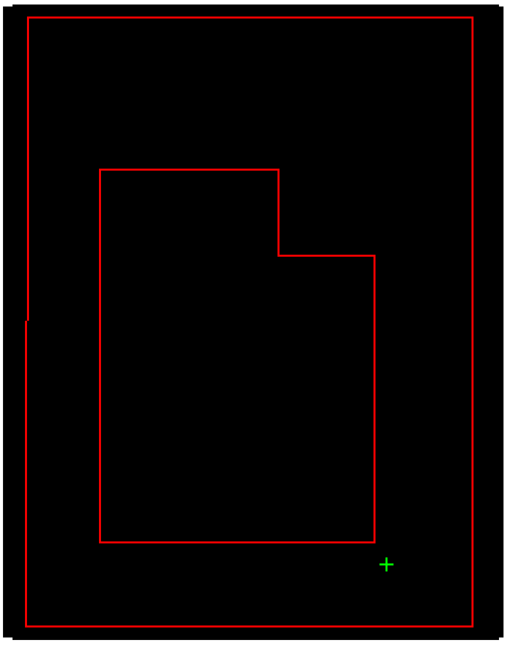
STEP 5:

A deflection distance is supplied. Positive is in the direction of the string selection pick. The value is entered into the input box followed by the enter key.



STEP 6:

A point string is created using the information supplied.



15.9.12 Drop Perpendicular

Position of option on menu: **CAD =>Point => Drop perpendicular**

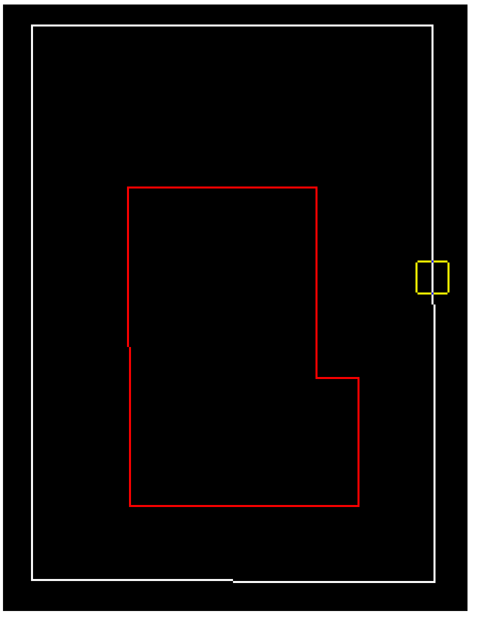
or by selection of appropriate icon from the toolbar. 

This option creates a one point string by dropping from a user selected position perpendicularly onto a user selected string.

On selecting **Drop perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

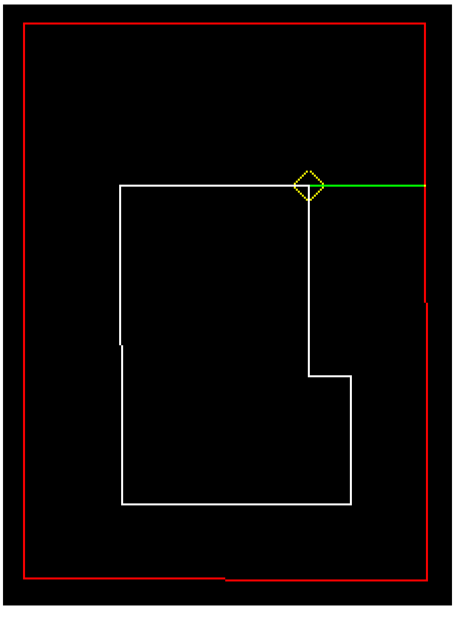
STEP 1:

The user selects a string and accepts (with direction) to have the point dropped onto.



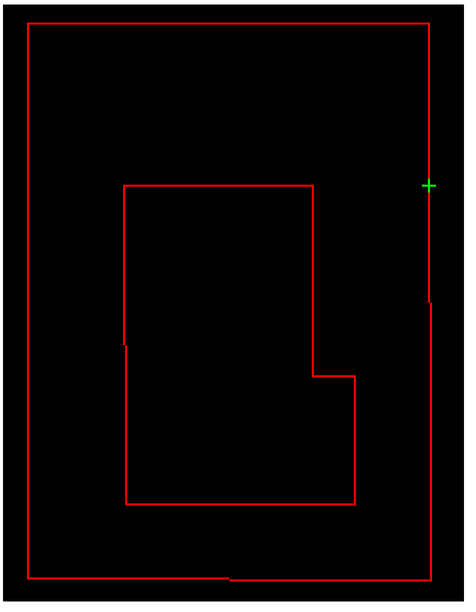
STEP 2:

The user picks and accepts a position to drop onto the nominated string



STEP 3:

A point string is created at the perpendicular drop point.



15.9.13 Angle

This option creates a one point string that is located by projecting a selected position back to a string by a specified angle.

STEP 1:

User selects and accepts a string to have the point projected onto.

STEP 2:

User specifies an angle for the projection.

STEP 3:

User selects a position on the screen to be projected back to the string.

STEP 4:

A one point string is created, which form the nominated angle with the selected position on **STEP 3.**

15.9.14 Projection

Position of option on menu: **CAD =>Point =>Projection**

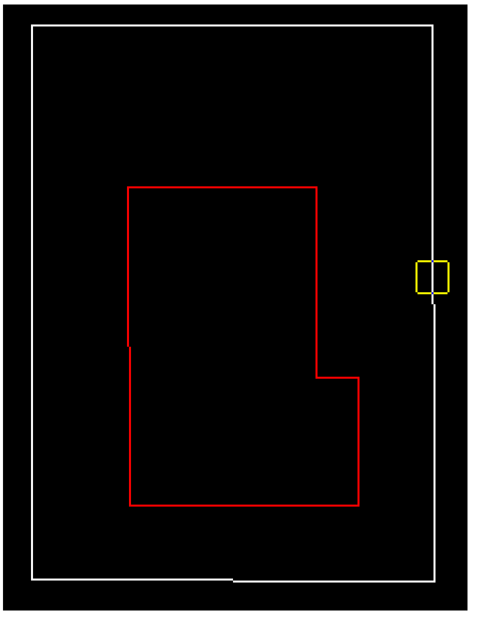
or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is located by firstly dropping a point onto a string and then giving a distance along the string from the dropped point.

On selecting **Projection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

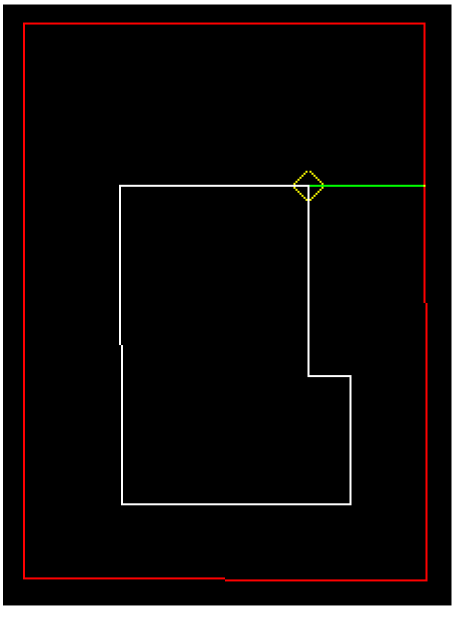
STEP 1:

The user selects and accepts a string (with direction) to have the point dropped onto



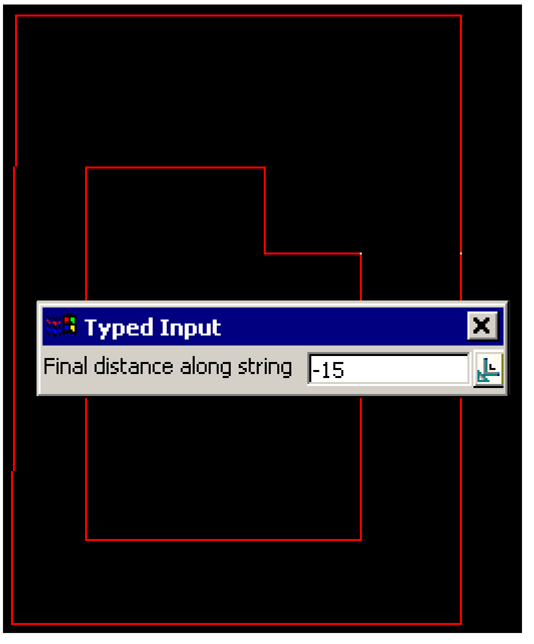
STEP 2:

The user picks and accepts a position to drop onto the nominated string



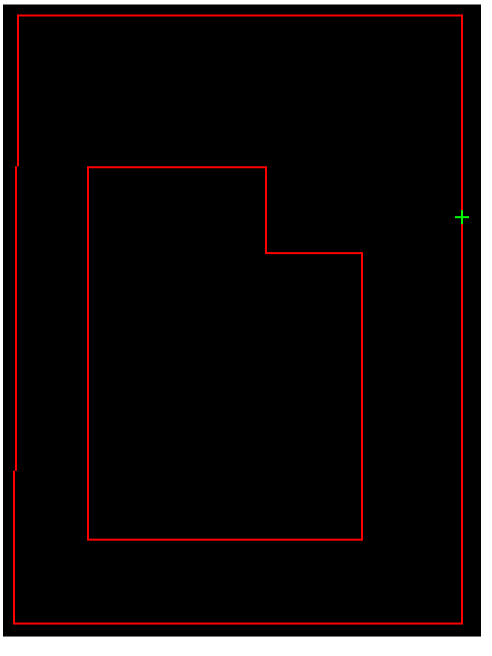
STEP 3:

The user is prompted for the distance along the string. Positive distances are in the direction that the string was picked. A value is entered into the input box followed by the enter key.



STEP 4:

The point string is created the nominated distance along the string from the dropped point.



15.9.15 Between Points

Position of option on menu: **CAD =>Point =>Between points**

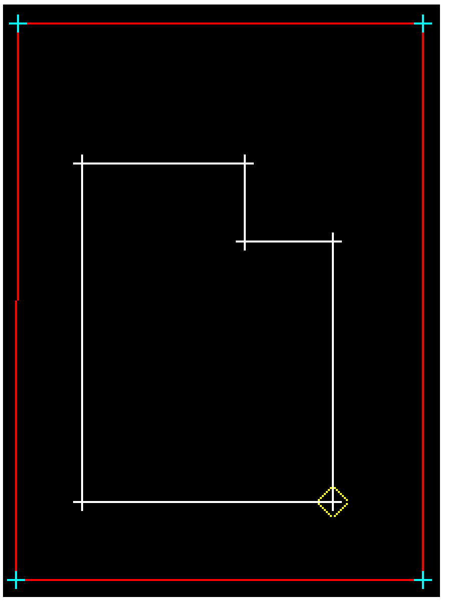
or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is on the line between two selected positions and a given distance from the first point.

On selecting **Between points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

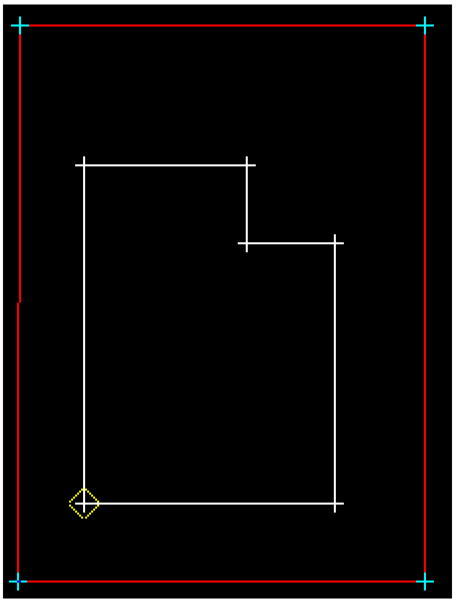
STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).



STEP 2:

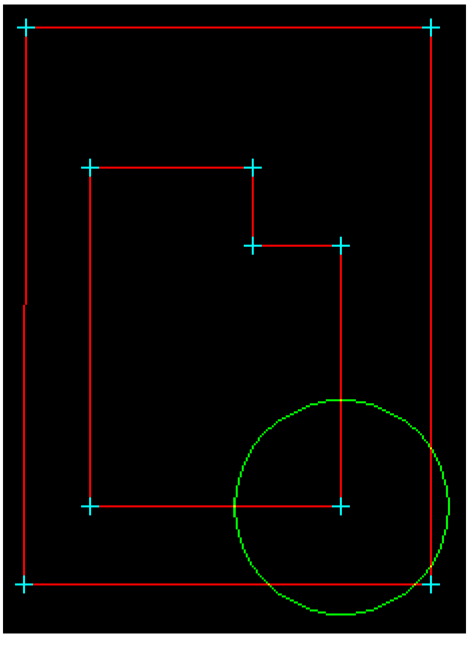
The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

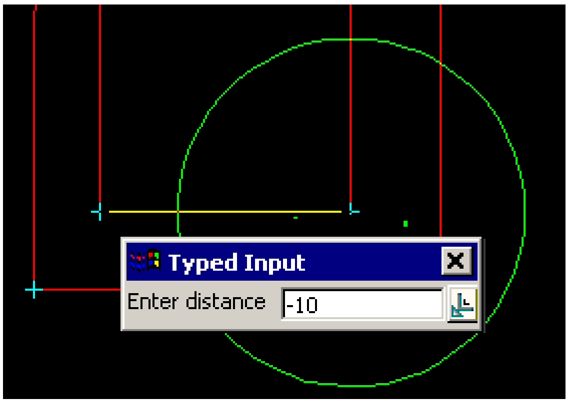


STEP 3:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

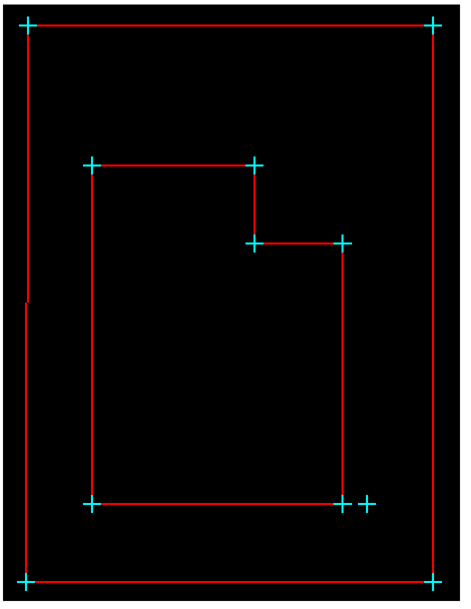
The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.





STEP 4:

A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.



15.9.16 Between points 3d

Position of option on menu: **CAD =>Point =>Between points 3d**

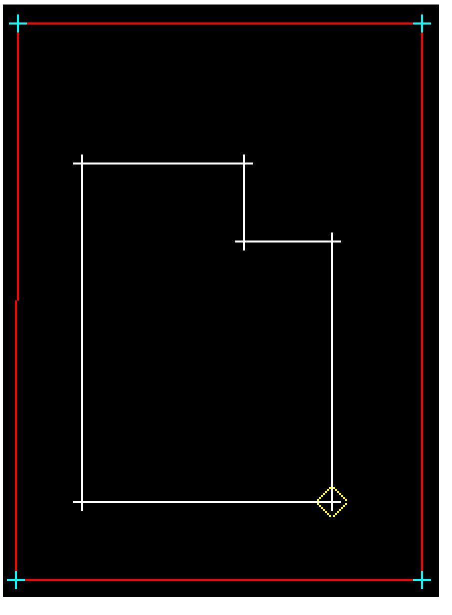
or by selection of appropriate icon from the toolbar.

This option creates a one point string that is on the line between two selected positions and a given distance from the first point. The z-value of the string is interpolated from the two selected positions.

On selecting **Between points 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

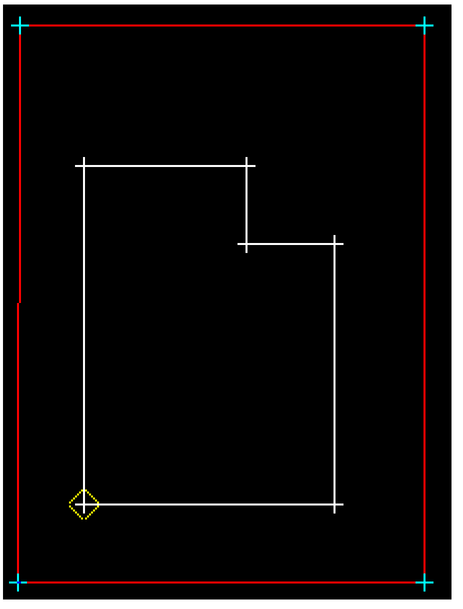
STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).



STEP 2:

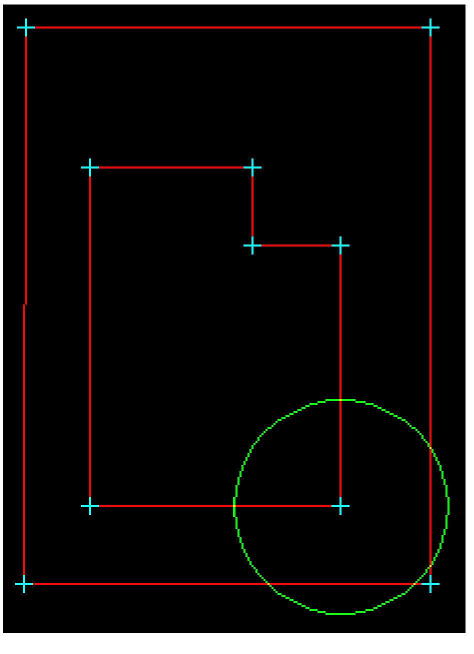
The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

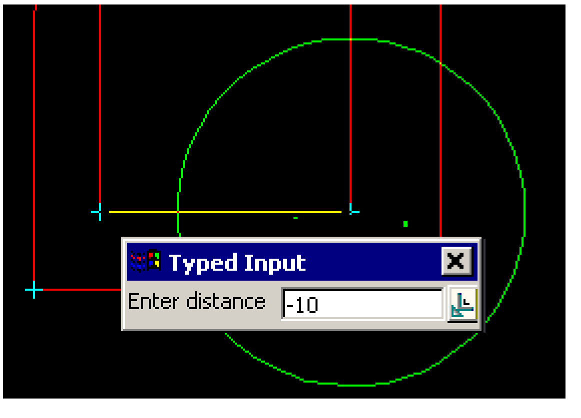


STEP 3:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

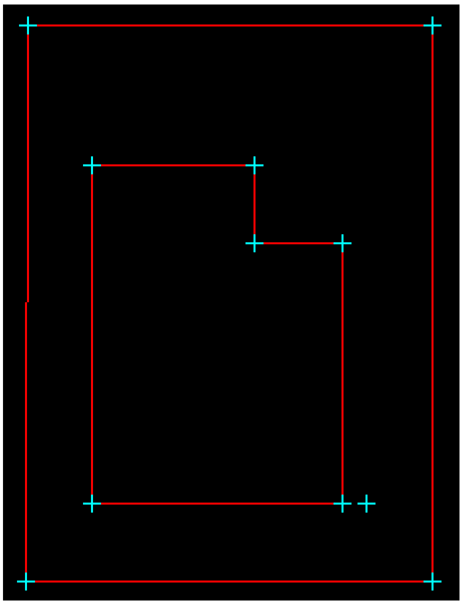
The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.





STEP 4:

A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.



15.9.17 Radiation

Position of option on menu: **CAD =>Point =>Radiation**

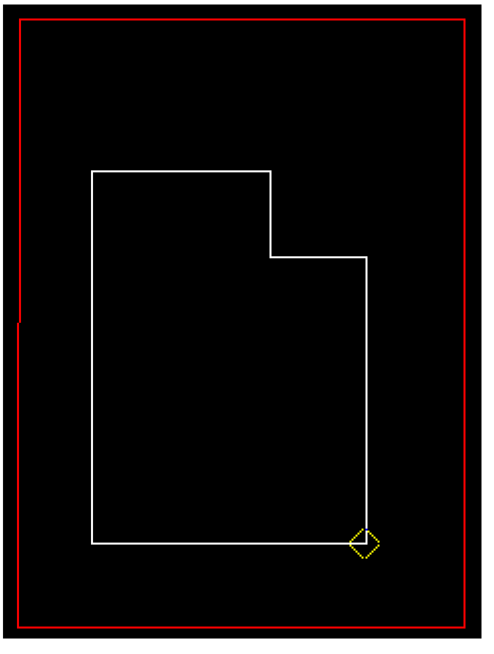
or by selection of appropriate icon from the toolbar. 

This option creates a series of one point strings that are located by given bearings and distances from a chosen start position.

On selecting **Radiation**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start position is selected and accepted.

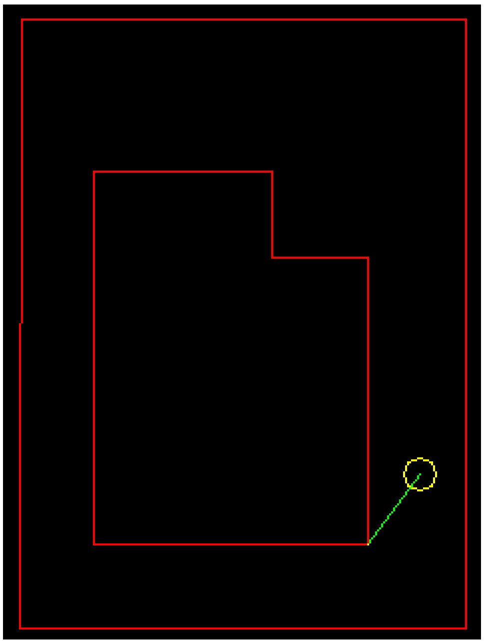


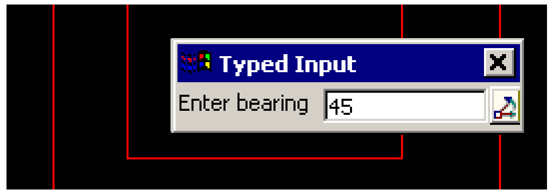
STEP 2:

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

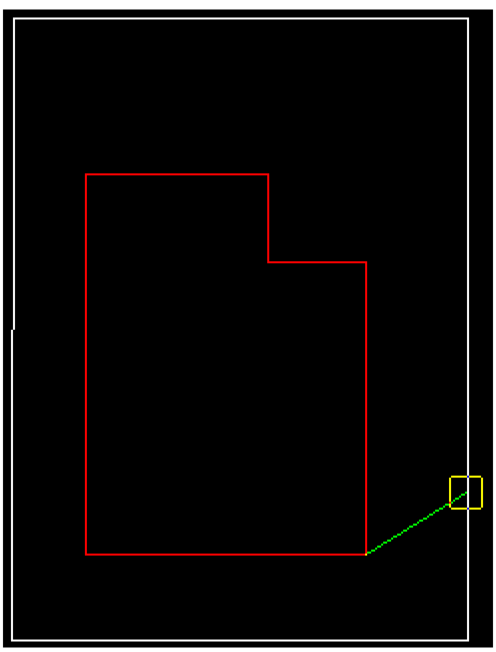
The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

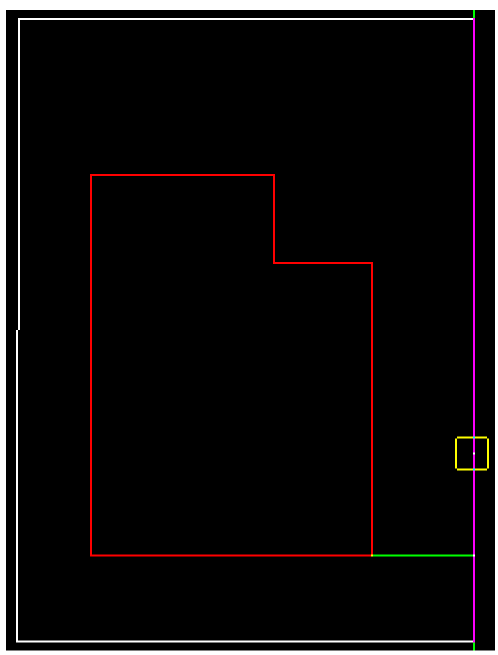
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**





This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

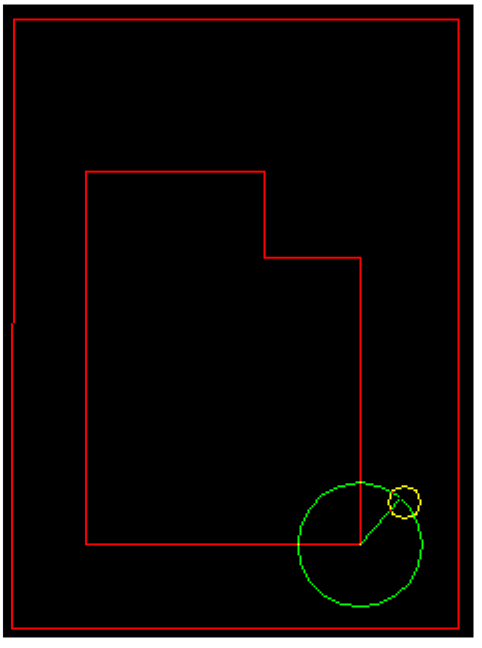


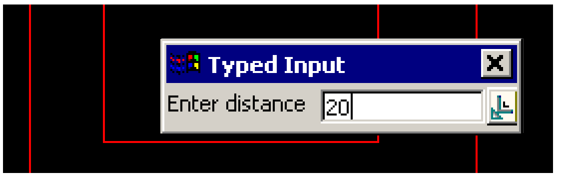


STEP 3:

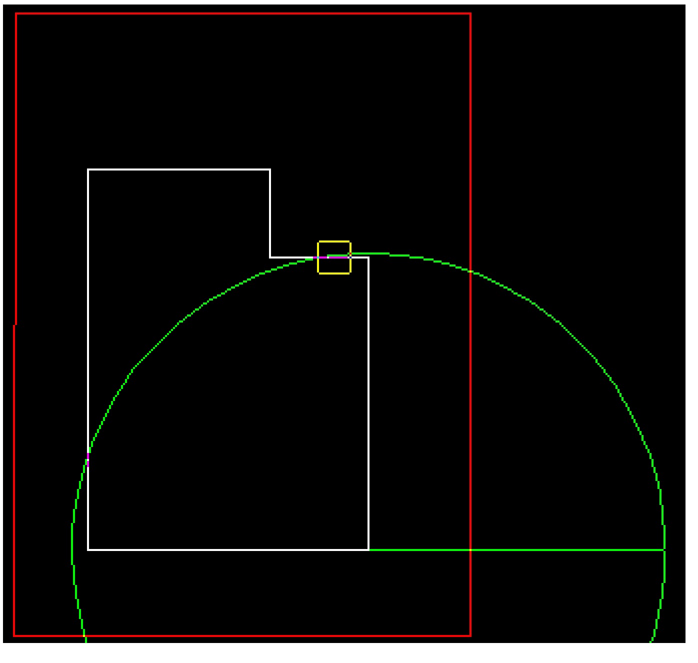
A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

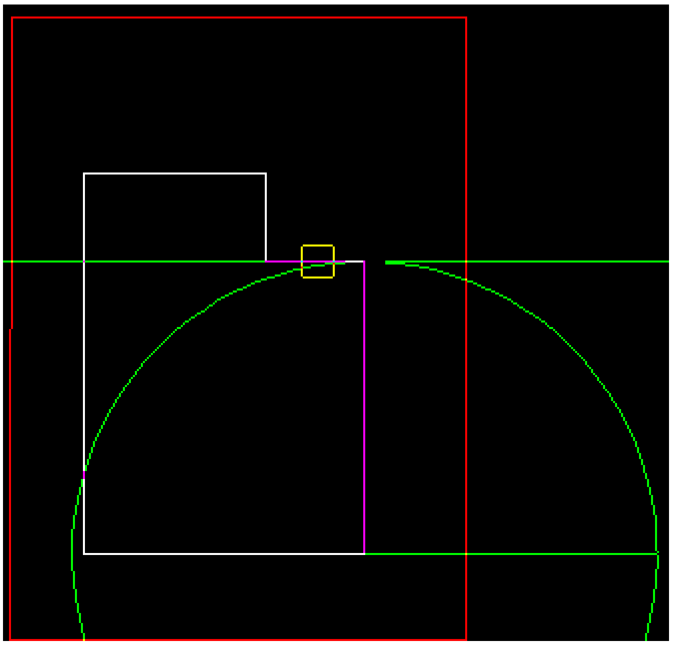




This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

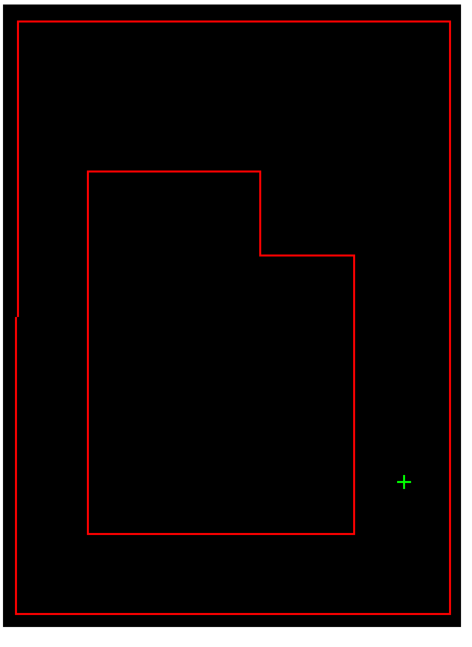


The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.



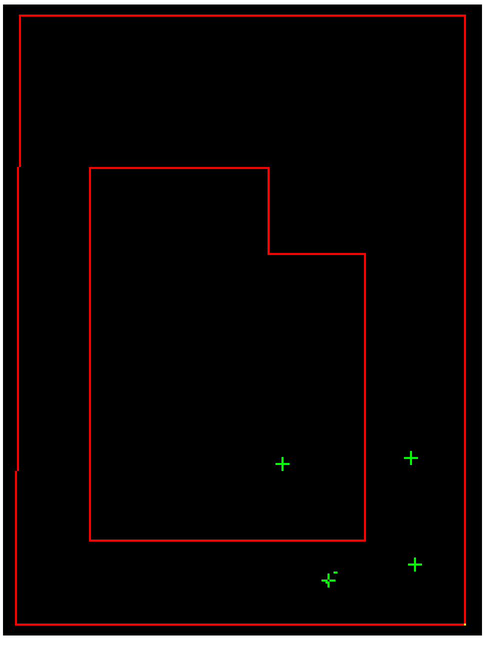
STEP 4:

A point string is created using the information supplied.



STEP 5

The next bearing and distance is prompted for as per step 3 and 4. Consequent points are created from the original start point selected.



15.9.18 Divide segment by number

Position of option on menu: **CAD =>Point =>Divide segment by number**

or by selection of appropriate icon from the toolbar.

This option creates one point strings which will break up a super string ***segment*** into equal pieces based on a user given number of intervals. The first and last points are not created since they are taken to be the end points of the selected segment. So for five intervals, four new one point strings are created. The option works for line or arc segments of a super string.

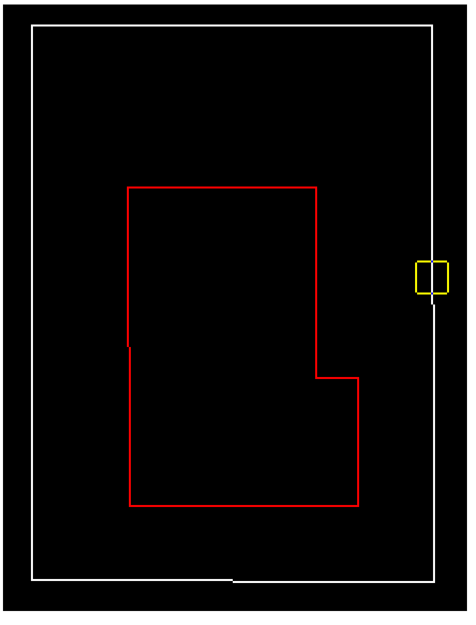
NOTES:

1. No vertices are inserted into the selected super string - the option **Strings =>Strings edits =>Segment strings** does that.
2. This option is for super strings only.

On selecting **Divide segment by number**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

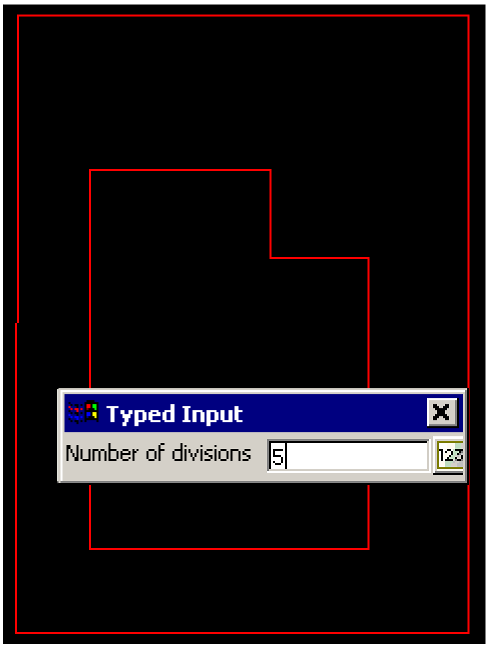
STEP 1:

A super string segment is selected and accepted.



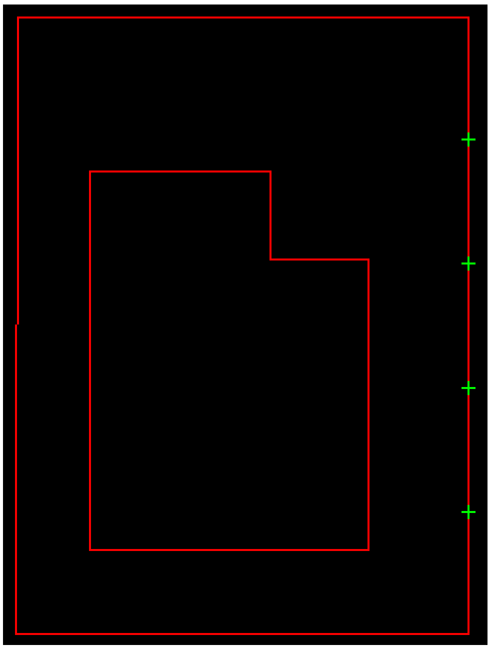
STEP 2:

The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.



STEP 3:

Given the above information, the new points are created.



15.9.19 Divide segment by chainage length

Position of option on menu: **CAD =>Point =>Divide segment by chainage length**

or by selection of appropriate icon from the toolbar.

This option creates one point strings which will break up a super string ***segment*** into pieces based on a user given chainage length. The process starts from the 1st point of the segment and continues until no more pieces can be created without going past the last point of the segment (the last piece may not be the correct length). This options works for line or arc segments of a super string.

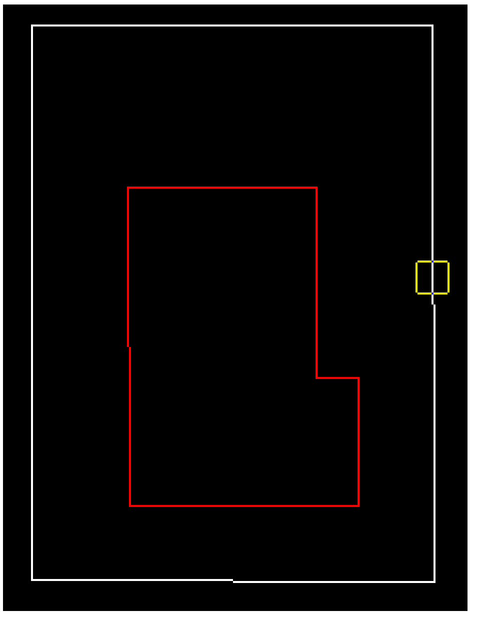
NOTES:

1. No vertices are inserted into the selected super string - the option **Strings =>Strings edits =>Segment strings** does that.
2. This option is for super strings only.

On selecting **Divide segment by chainage length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

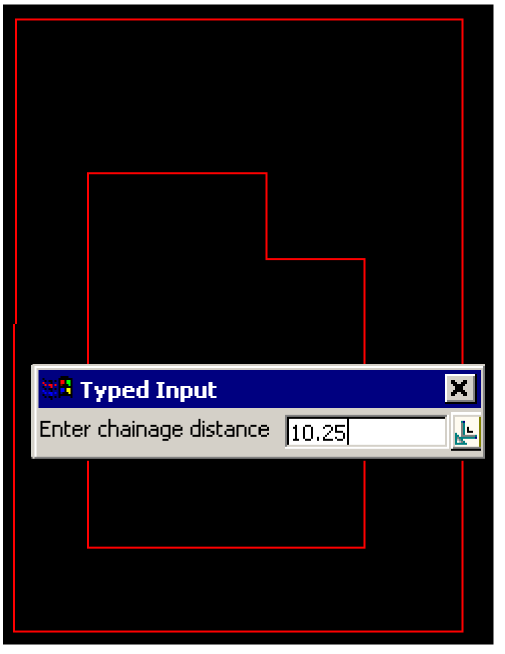
STEP 1:

A super string segment is selected and accepted.



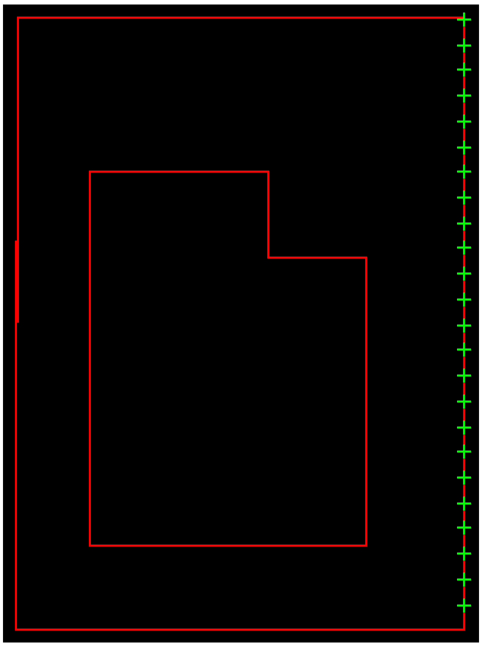
STEP 2:

The user is prompted for the chainage distance. The value is entered into the input box followed by the enter key.



STEP 3:

Given the above information, the new points are created.



15.9.20 Divide string by number

Position of option on menu: **CAD =>Point =>Divide string by number**

or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a super string into equal pieces based on a user given number of divisions. The first and last points are not created since they are taken to be the end points of the selected string. So for five intervals, four new one point strings are created.

NOTES:

1. No vertices are inserted into the selected super string - the option **Strings =>Strings edits =>Segment strings** does that.
2. This option is for super strings only.

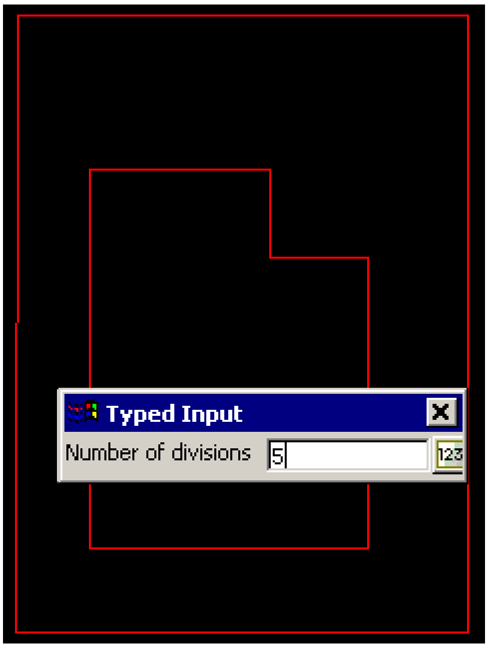
On selecting **Divide string by number**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A super string is selected and accepted.

STEP 2:

The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.



STEP 3:

Given the above information, the new points are created.

15.9.21 Divide string by chainage length

Position of option on menu: **CAD =>Point =>Divide string by chainage length**

or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a *super string* into pieces based on a user given chainage length. The process starts from the 1st vertex of the strings and continues until no more pieces can be created without going past the last vertex of the string (the last piece may not be the correct length).

NOTES:

1. No vertices are inserted into the selected super string - the option **Strings =>Strings edits =>Segment strings** does that.
2. This option is for super strings only.

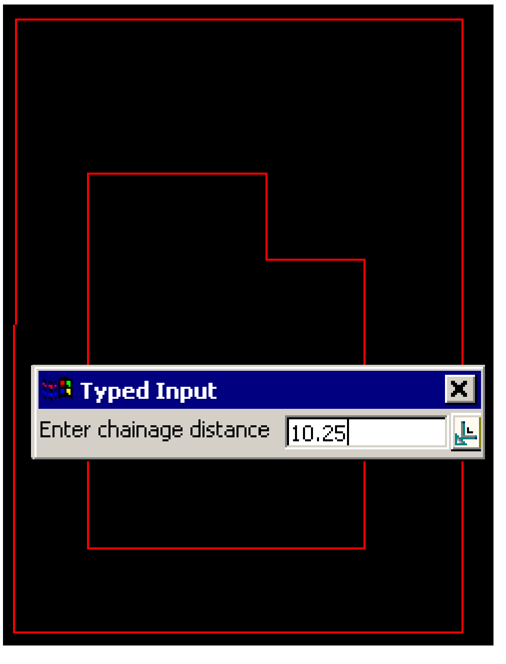
On selecting **Divide string by chainage length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A super string is selected and accepted.

STEP 2:

The user is prompted for the chainage distance. The value is entered into the input box followed by the <Enter> key.



STEP 3:

Given the above information, the new points are created.

15.9.22 String IPs

Position of option on menu: **CAD =>Point =>String IPs**

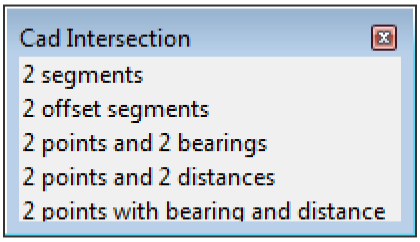
This option creates a separate point at each vertex of a selected string.

On selecting **String IPs** the user is prompted to select a string and a new point (a one vertex super string) is created for each vertex on the selected string. The model, colour, height, *etc.* for the new points are defined in the **Cad Control Bar**.

15.10 CAD Intersection

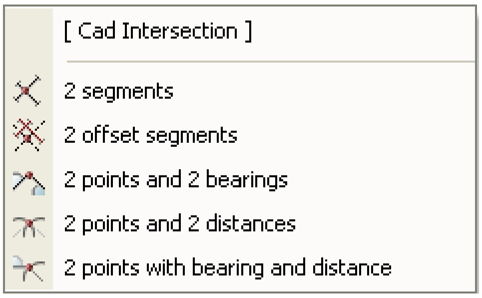
Position of option on menu: **CAD =>Intersection**

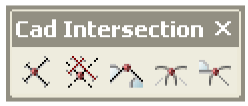
The **Intersection** walk-right menu is



Menu of Options to Create One Point Strings by Intersections

by intersecting two selected segments
by intersecting two offset selected segments
by given bearings from two selected positions
create a point with given distances from two selected positions
by selecting posn and bearing and another selected posn and dist





For the option 2 *segments*, go to 15.10.1 2 segments
2 offset segments 15.10.2 2 offset segments
2 points and 2 bearings 15.10.3 2 points and 2 bearings
2 points and 2 distances 15.10.4 2 points and 2 distances
2 points with bearing and distance 15.10.5 2 points with bearing and distance

15.10.1 2 segments

Position of option on menu: **CAD =>Intersection=> 2 segments**

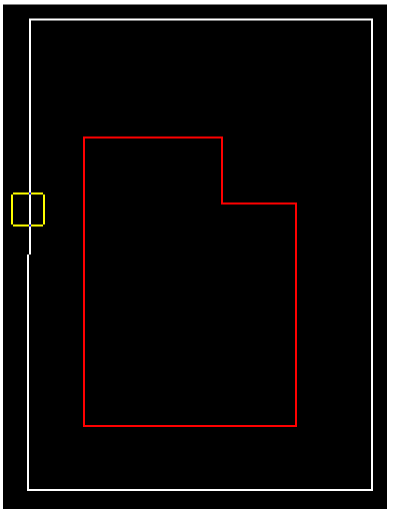
or by selection of appropriate icon from the toolbar.

This option creates a point at the intersection of the projections of two line or arc segments.

On selecting **2 segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

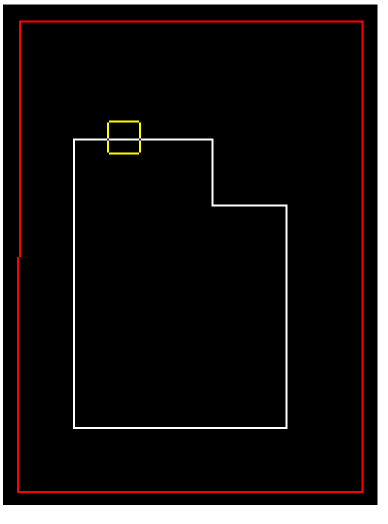
STEP 1:

The 1st segment is selected and accepted.



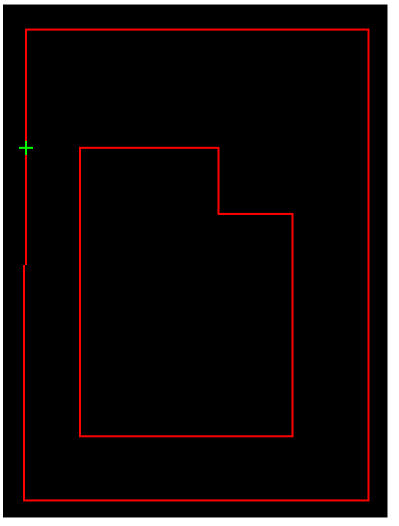
STEP 2:

The 2nd segment is selected and accepted.



STEP 3:

A point is created at the intersection of the two segments (if a solution exists). Note that the 2nd segment in this case has been projected to enable a solution to be calculated.



15.10.2 2 offset segments

Position of option on menu: CAD =>Intersection=> 2 offset segments

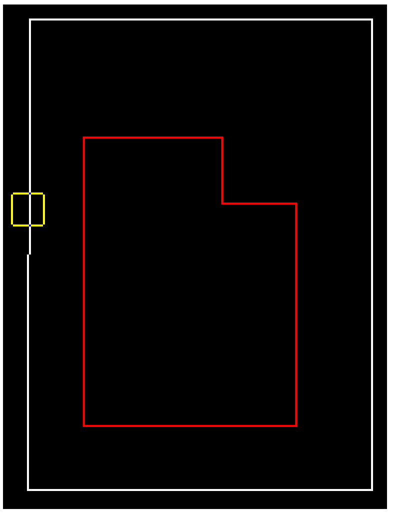
or by selection of appropriate icon from the toolbar.

This option creates a point at the intersection of the offsets of two selected segments.

On selecting **2 offset segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

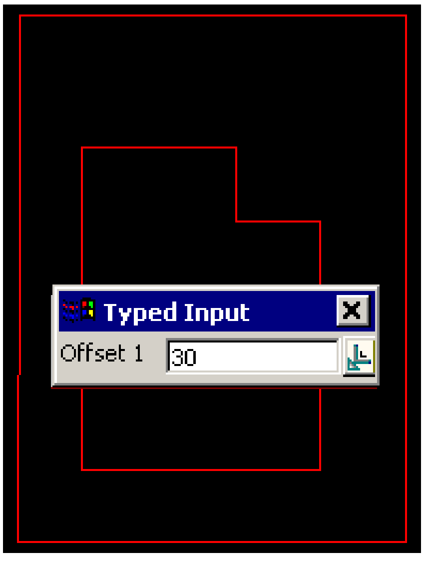
STEP 1:

The 1st segment is selected and accepted with direction. This sets the positive direction of the offset to the right of the direction of pick.



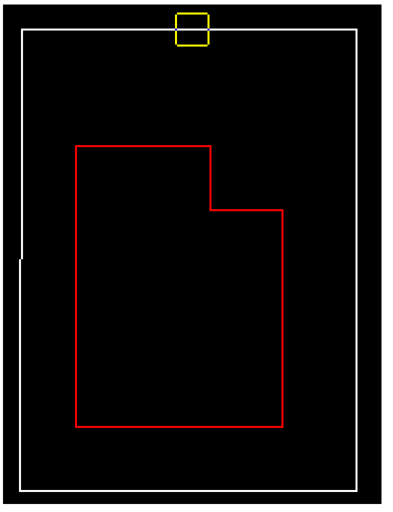
STEP 2:

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.



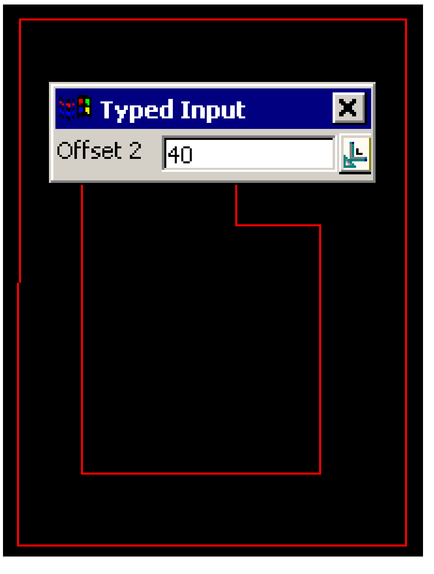
STEP 3:

The 2nd segment is selected with direction and accepted. This sets the positive direction of the offset to the right of the direction of pick.



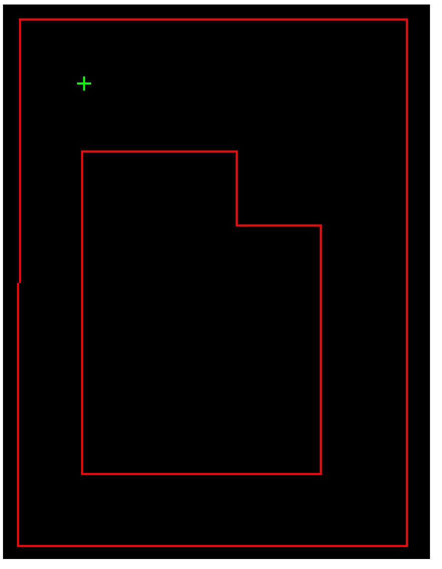
STEP 4:

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.



STEP 5:

A point is created at the intersection of the projected lines offset to the segments (if a solution exists).



15.10.3 2 points and 2 bearings

Position of option on menu: **CAD =>Intersection=>2 points and 2 bearings**

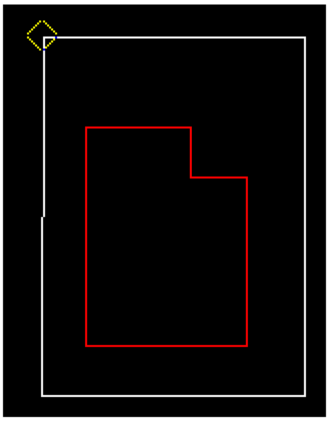
or by selection of appropriate icon from the toolbar.

This option creates a point by using two points and two bearings.

On selecting **2 points and 2 bearings**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected and accepted.

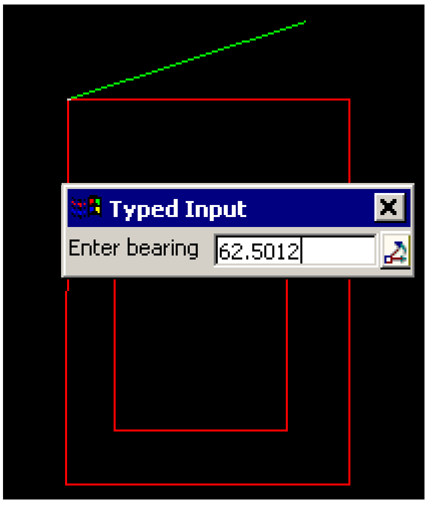


STEP 2:

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

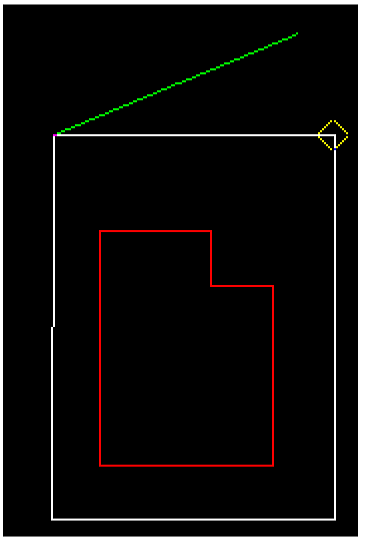
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

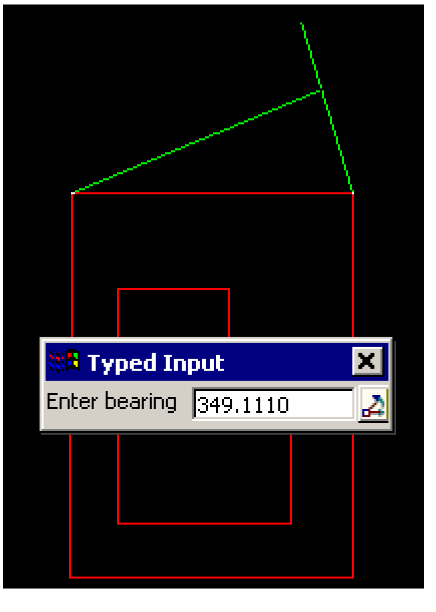
STEP 3:

The 2nd point to create the point from is selected and accepted.



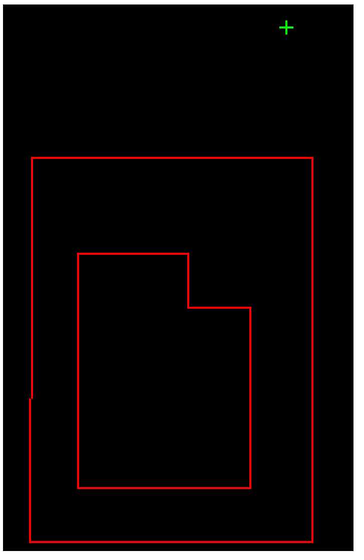
STEP 4:

A bearing from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.



STEP 5:

The point is created if there is a valid solution.



15.10.4 2 points and 2 distances

Position of option on menu: **CAD =>Intersection=>2 points and 2 distances**

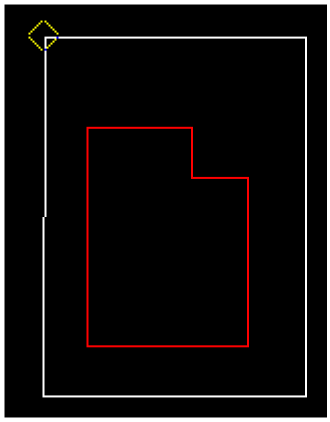
or by selection of appropriate icon from the toolbar.

This option creates a point using two points and two distances.

On selecting **2 points and 2 distances**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

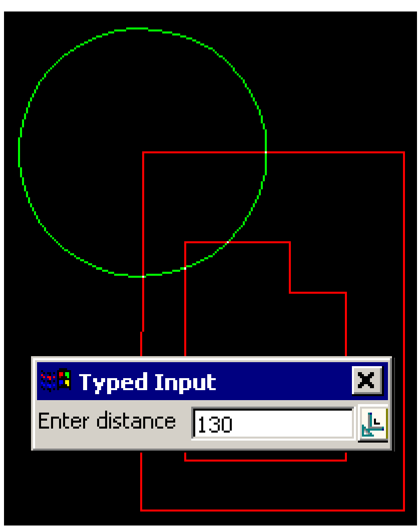
The 1st point is selected and accepted.



STEP 2:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

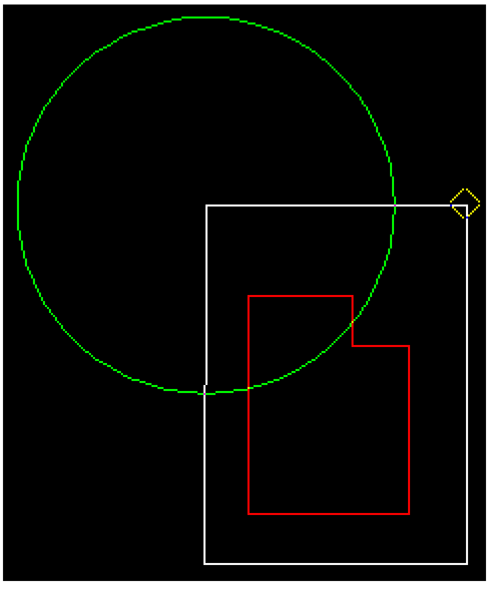
The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.



This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

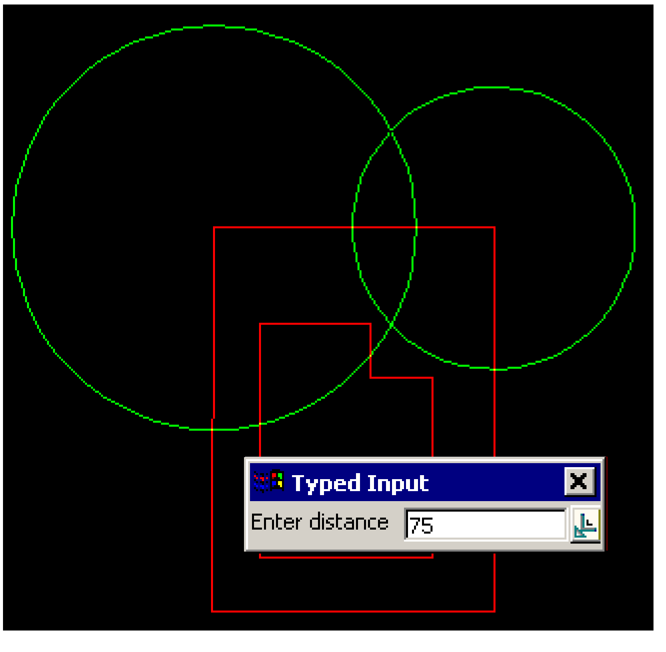
STEP 3:

The 2nd point to create the point from is selected.



STEP 4:

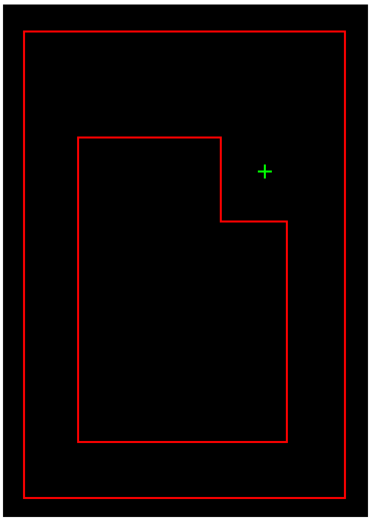
A distance from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.



STEP 5:

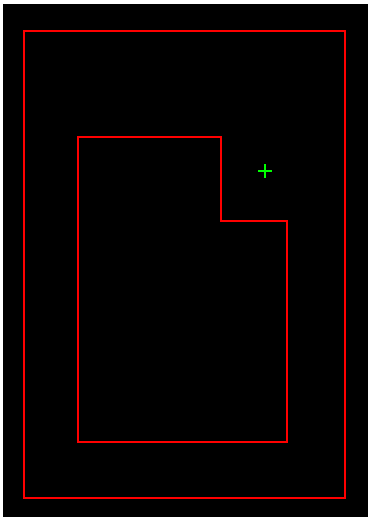
As there is two solutions, the user can select the correct one depending on the method of construction. This can be done by the direct entry of distances or by use of the mouse.

1. Distance entry. After the entry of the 1st distance, the 2nd point is selected. Following the selection of the 2nd point, the 2nd radius is shown (rubber banding). The user can select one of the two solutions by choosing with a **LB** mouse click over the approximate position of the required solution. The solution chosen is the closest solution to the selected point. The final radius can then be entered via the keyboard by simply starting typing which brings up the radius entry panel automatically. This panel can also be activated by pressing the space bar.
2. Use of the mouse. The 1st point is selected and the radius entered by using the mouse or by direct entry from the keyboard. The 2nd point is then selected and the 2nd radius is displayed (rubber banding). A solution can be chosen by selecting with a **LB** mouse click over the required solution. The final solution will be the closest one to the selection. **MB** to accept the intersection and create the point.



STEP 6:

The point is created if there is a valid solution.



15.10.5 2 points with bearing and distance

Position of option on menu: **CAD =>Intersection=>2 points with bearing and distance**

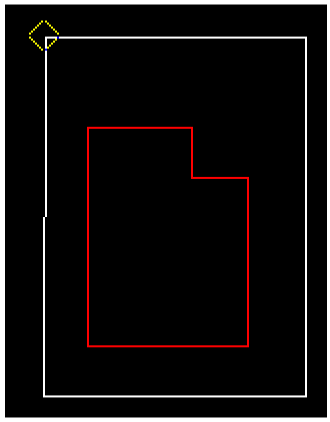
or by selection of appropriate icon from the toolbar. 

This option creates a point from a given point and a bearing, and a second point and a distance.

On selecting **2 points with bearing and distance**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected and accepted.

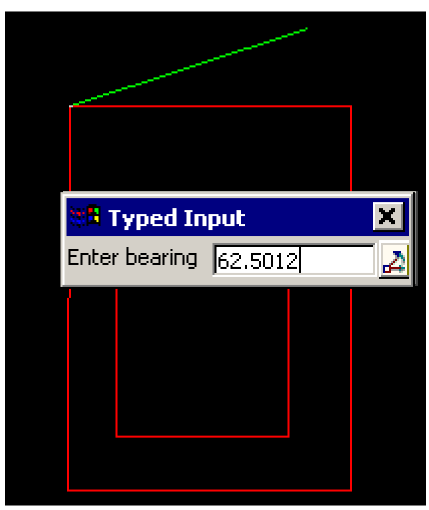


STEP 2:

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

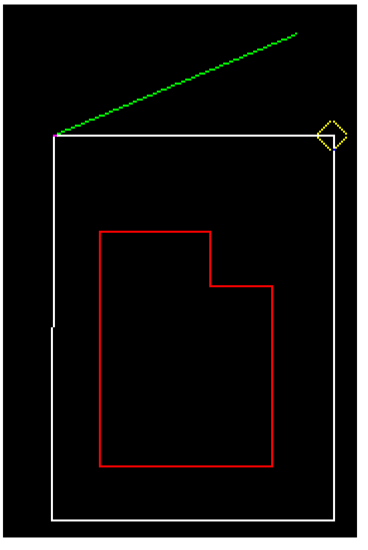
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

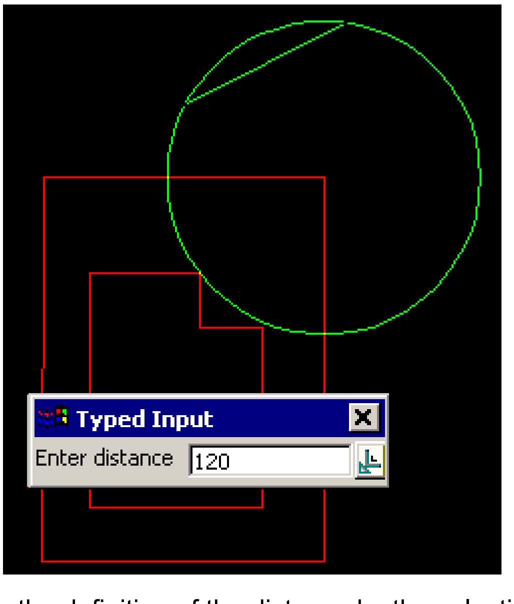
The 2nd point to create the point from is selected and accepted.



STEP 4:

A distance from the 2nd point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

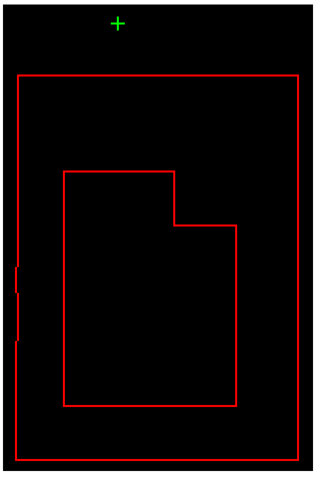


This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

A line is drawn between the two possible solutions.

STEP 5:

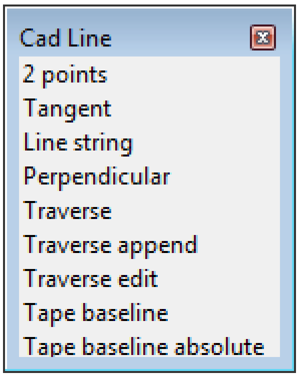
As there is two solutions, the user can select the correct one with the mouse.



15.11 CAD Line

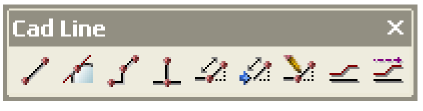
Position of option on menu: **CAD =>Line**

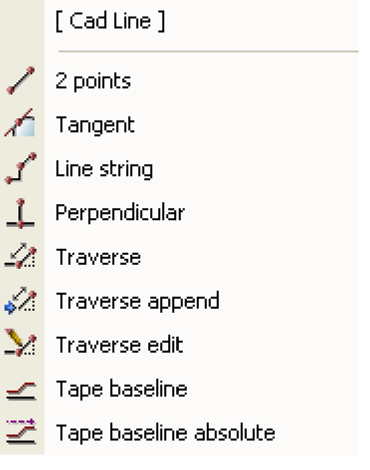
The **Line** walk-right menu is



Menu of Options to Create Strings

create a two vertex (point) super string
create tangent to two selected items (vertices and/or arcs)
create a many vertex super string
create a two points string perpendicular to a reference string
create many vertex super string by bearing distances from previous vertex
append to a super string using bearing distance entry
modify the bear/distance of a selected segment
create string with vertices a dist along and dist offset to a line
create string with vertices a dist along and dist offset absolute to a line





For the option *2 points*, go to 15.11.1 2 Points
Tangent 15.11.2 Tangent
Line string 15.11.3 Line string
Perpendicular 15.11.4 Perpendicular
Traverse 15.11.5 Traverse
Traverse append 15.11.6 Traverse append
Traverse edit 15.11.7 Traverse edit
Tape baseline 15.11.8 Tape baseline
Tape baseline absolute 15.11.9 Tape baseline absolute

15.11.1 2 Points

Position of option on menu: **CAD =>Line =>2 points**

or by selection of appropriate icon from the toolbar. 

This option creates two vertex super strings with a line between the two vertices.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height etc. are defined in the **Cad Control Bar**.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar**

The 2nd point is selected in the same way as the 1st point. The line is created after successful selection and acceptance of the 2nd point. The option remains current so that a number of lines can be created.

15.11.2 Tangent

Position of option on menu: **CAD =>Line =>Tangent**

or by selection of appropriate icon from the toolbar. 

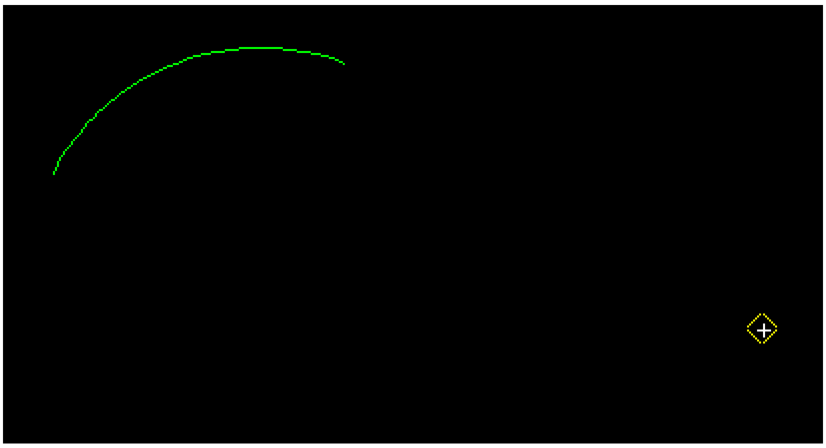
This option creates the tangential line between two elements.

NOTE: This option is for super strings only. When Selecting an arc or circle, the selection must be a line snap with direction. If a point is selected on the arc/circle the line will be draw between the selected points and not the tangent.

On selecting **Tangent**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

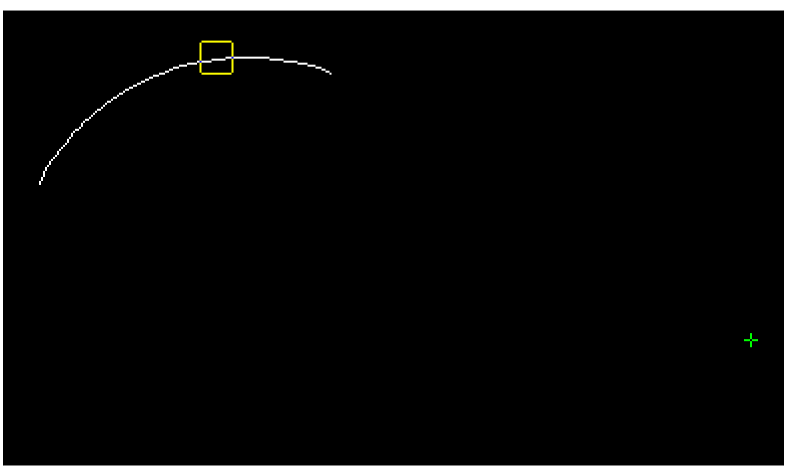
STEP 1:

A start position of the reference line is selected and accepted.



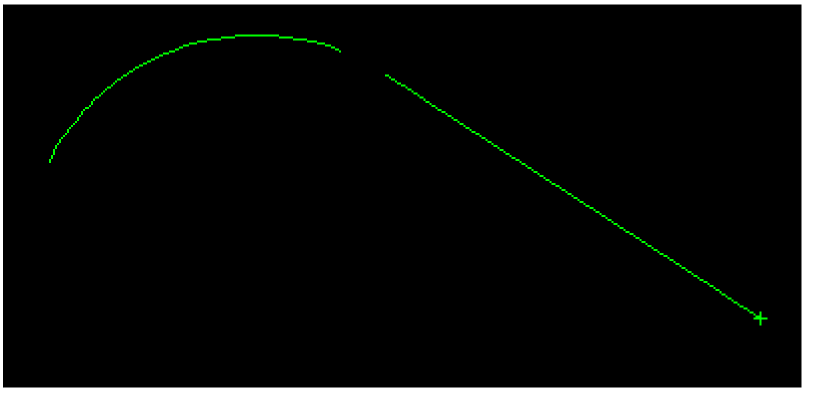
STEP 2:

The user selects and accepts the arc/circle segment with direction. The direction is required because there are two possible solutions. In this case, the direction was anti clockwise.



STEP 3:

After accepting the segment, a line is draw from the 1st selected point to the tangent point. Note that in this example, the arc is produced around so that a solution can be found.



15.11.3 Line string

Position of option on menu: **CAD =>Line =>Line string**

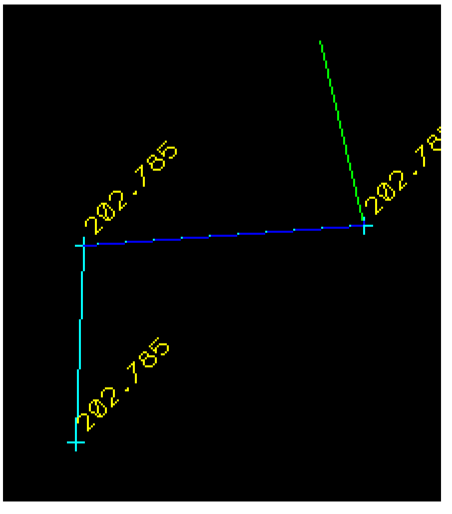
or by selection of appropriate icon from the toolbar. 

This option creates a string of many points.

On selecting **Line string**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The position of each vertex of the string is selected and accepted in order from the first to the last vertex.



15.11.4 Perpendicular

This option creates a string by selecting a reference string and a reference point the create a line from the reference point perpendicular to the reference string.

On selecting **Perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A reference string is selected and accepted.

STEP 2:

A line is drawn from the current mouse position perpendicular to the reference string

STEP 3:

After the final position is accepted, a line string is created which start from the selected position and perpendicular to the reference string.

15.11.5 Traverse

Position of option on menu: **CAD =>Line=>Traverse**

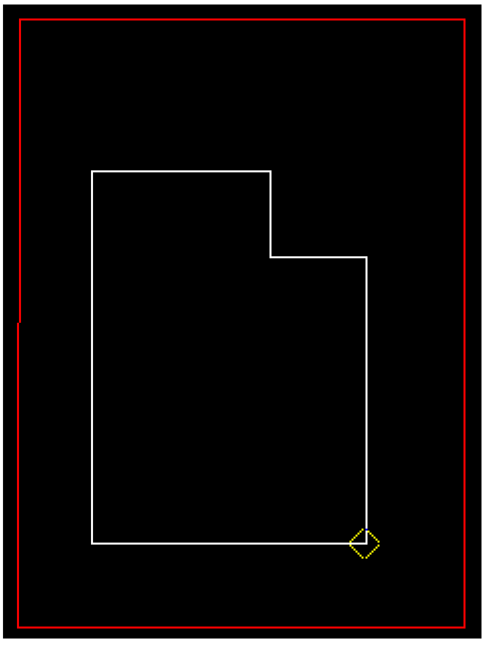
or by selection of appropriate icon from the toolbar.

This option creates a string by giving the bearing and distance of each vertex from the previous vertex. The position of the first vertex is the start of the string and then the bearing and distance is given to define the position of the next vertex. The created vertex then become the position to take the next bearing and distance from.

On selecting **Traverse**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start position is selected and accepted. This becomes the first vertex of the string.

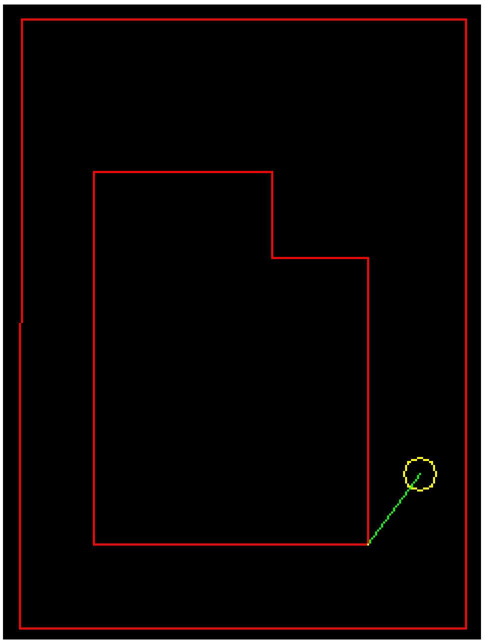


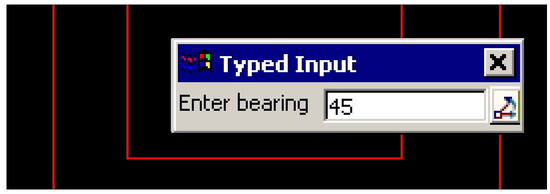
STEP 2:

A line is drawn from the vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

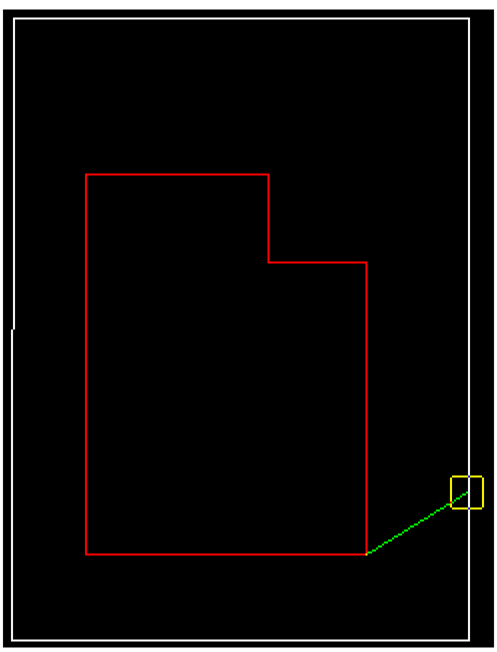
For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

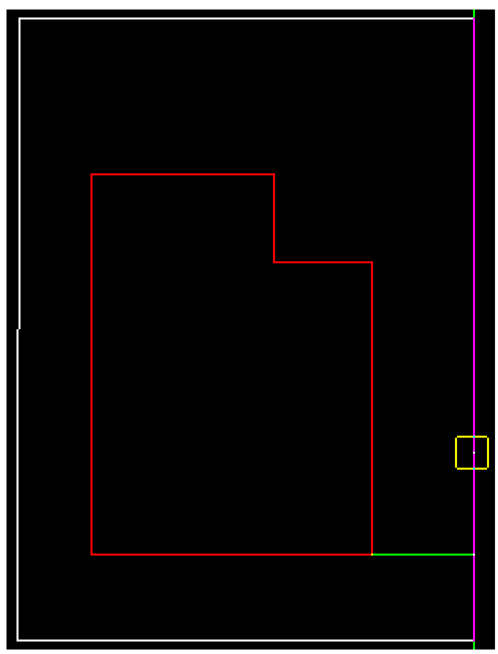
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**





This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

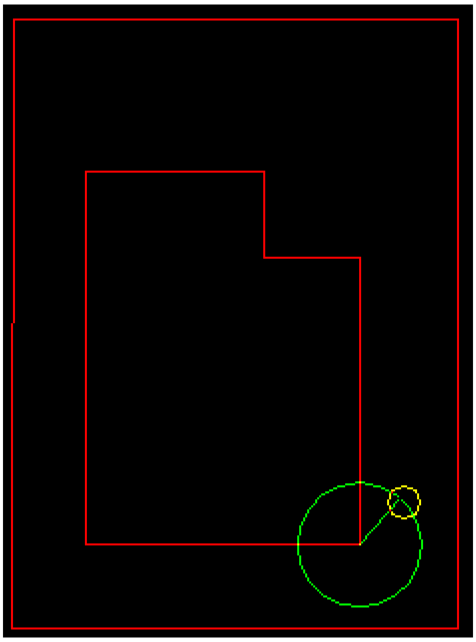


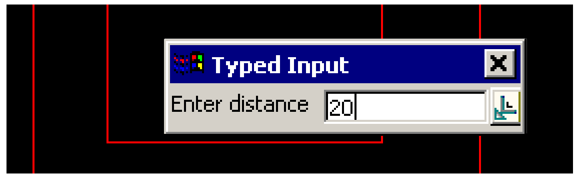


STEP 3:

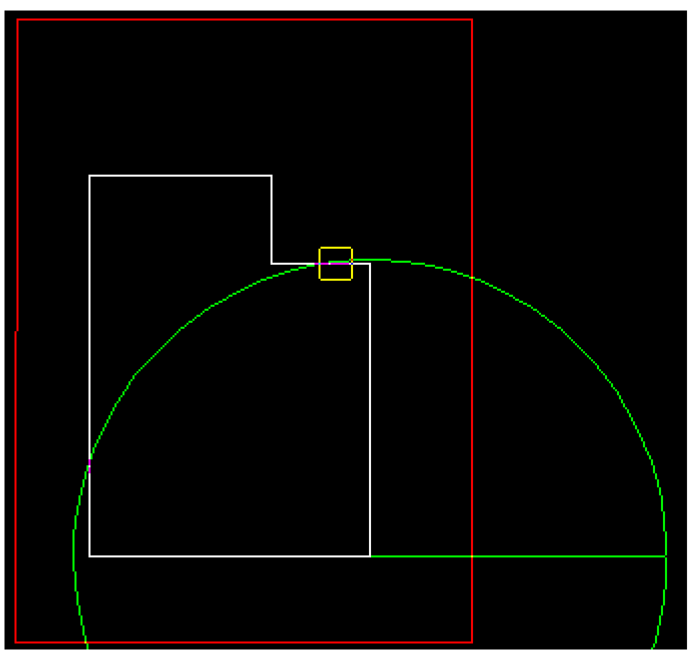
A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

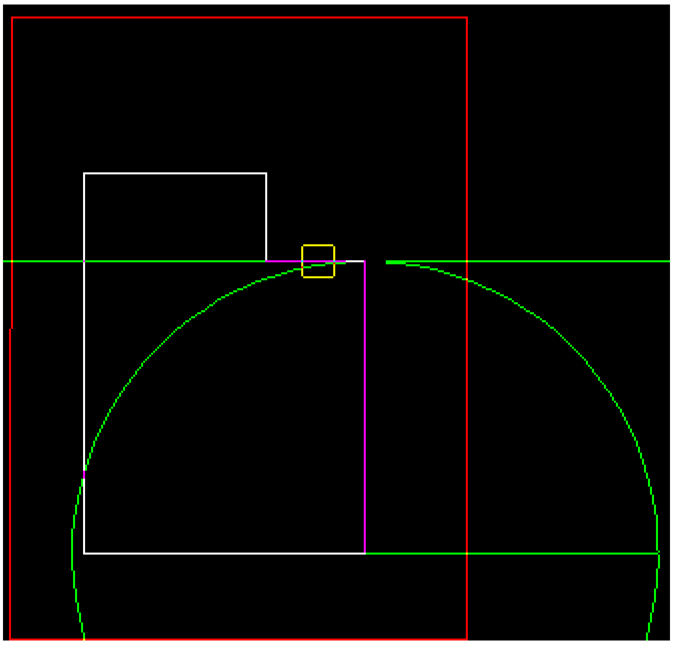




This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

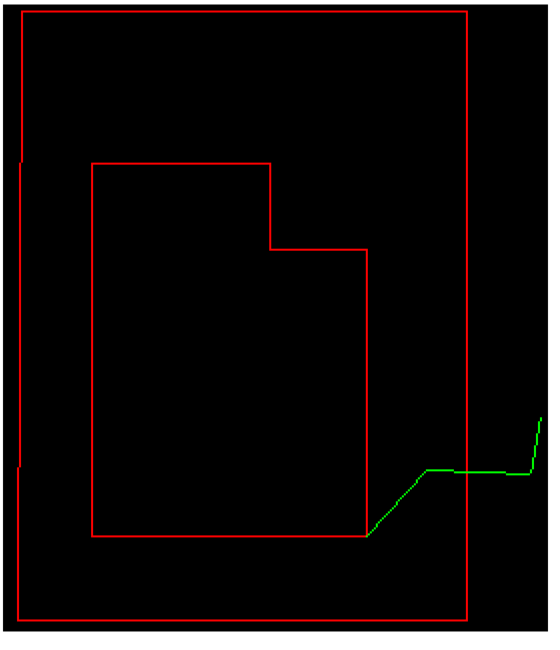


The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.



STEPS 4-5:

The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.



15.11.6 Traverse append

Position of option on menu: **CAD =>Line =>Traverse append**

or by selection of appropriate icon from the toolbar.

This option adds vertices to the ***end*** of a super string by giving the bearing and distance of each vertex from the previous vertex. When a string is selected, the end of the string becomes the position that the bearing distance is taken from. The created vertex then become the position to take the next bearing and distance from.

On selecting **Traverse append**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

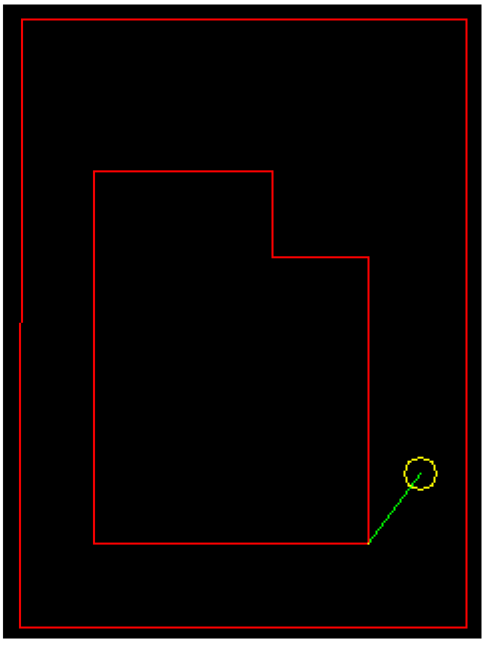
A string to append vertices to is selected and accepted. The end of this string becomes the position to define the first bearing distance from.

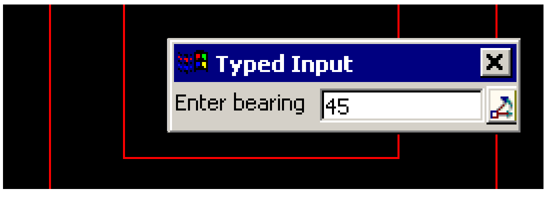
STEP 2:

A line is drawn from the last vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

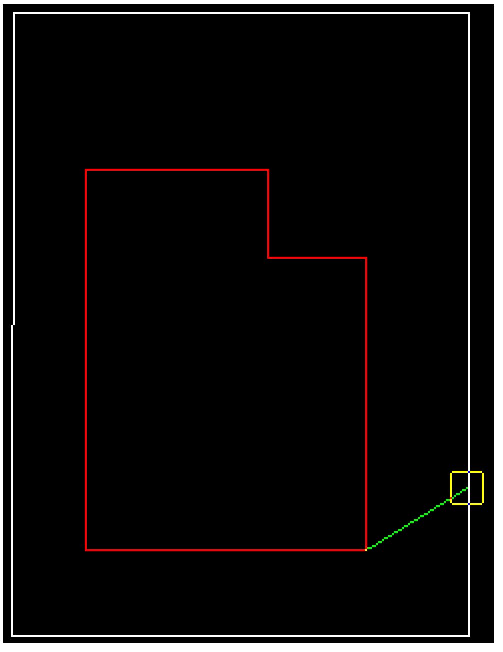
For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

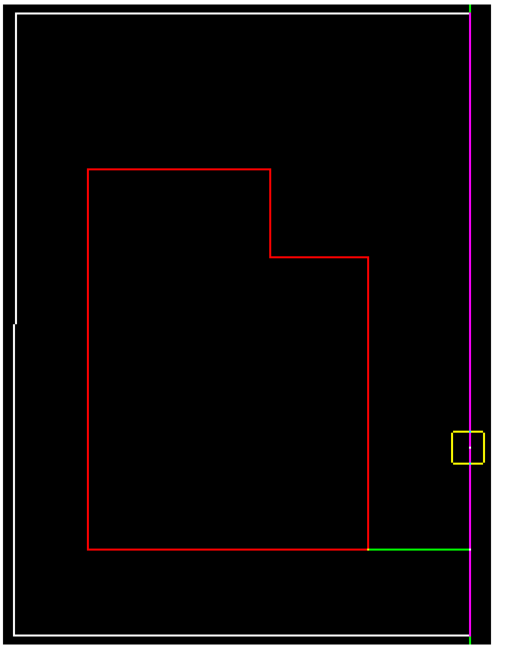
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**





This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

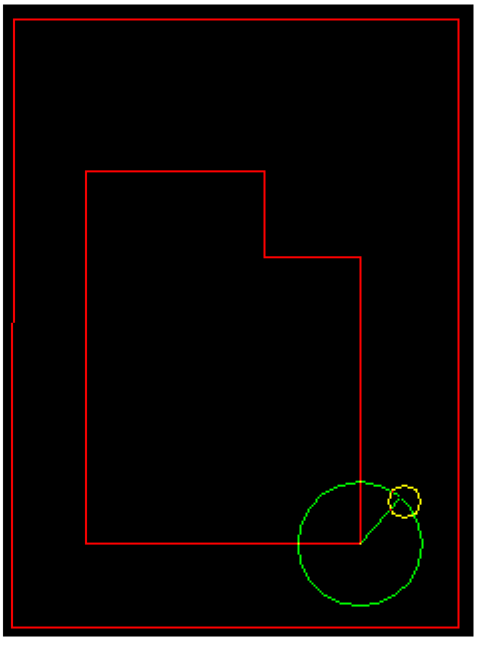


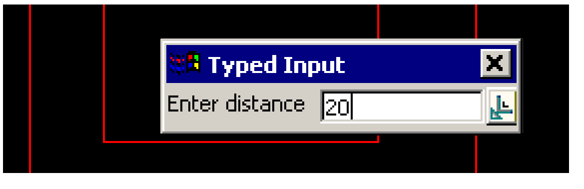


STEP 3:

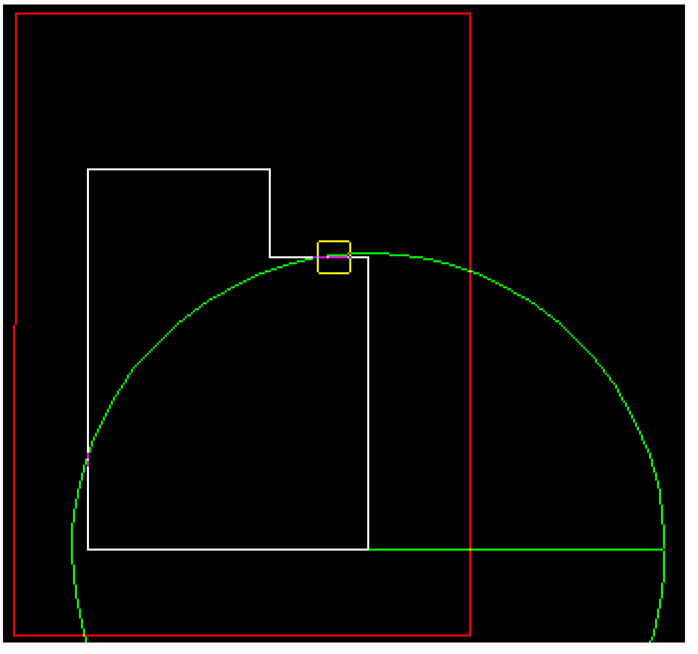
A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

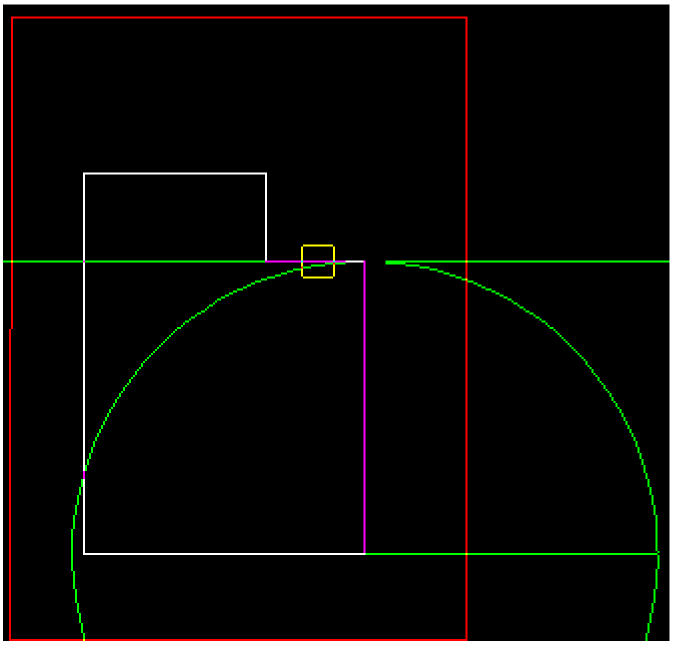




This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

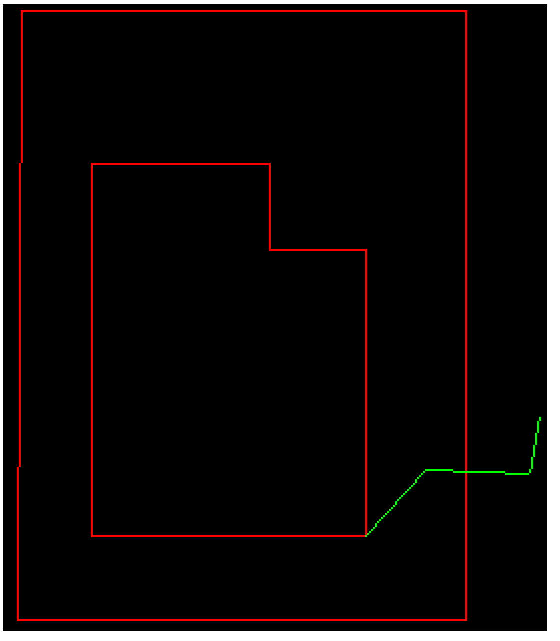


The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.



STEPS 4-5:

The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.



15.11.7 Traverse edit

Position of option on menu: **CAD =>Line =>Traverse edit**

or by selection of appropriate icon from the toolbar.

This option changes the bearing and length of a selected line segment of a super string.

On selecting **Traverse edit**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A line segment of a string is selected and accepted. This segment is the one to have its bearing distance redefined.

STEP 2:

A **Bearing** and then the **Distance** typed input boxes are presented with the current values for the line segment displayed. After new values are entered (or just <enter> if the original value is to be maintained) then the new bearing and distance values are applied to the start vertex of the segment to produce a new end vertex. The rest of the string keeps the same bearing/distances are in the original string.

Note: **The Page up and page down keys can be used when the input bearing box comes up to add or subtract intervals of 90 degrees.**

15.11.8 Tape baseline

Position of option on menu: **CAD =>Line =>Tape baseline**

or by selection of appropriate icon from the toolbar.

This option creates a line string by entering distances between points and the offset distance to a user defined reference line string.

On selecting **Tape baseline**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start position of the reference line is selected and accepted.

Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.

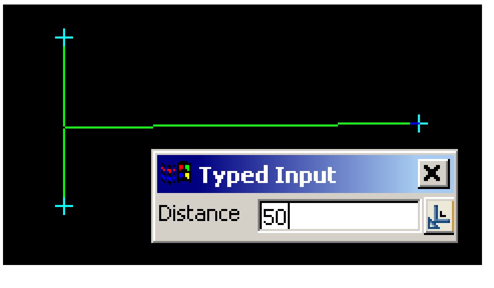
STEP 2:

The interception point for the reference line is selected and accepted.

STEP 3:

After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the first point, the distance entered is relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

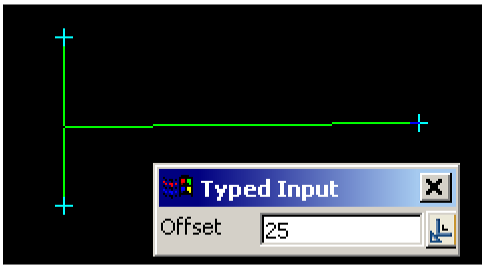
Note: The distance is always relative to the previously entered vertex (positive is from start point to intercept point along the reference line).



STEP 4:

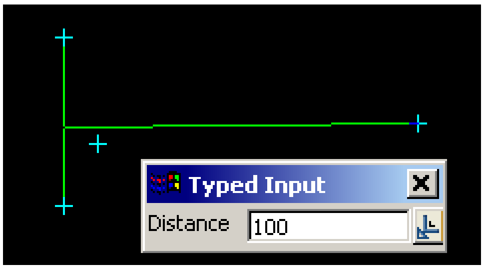
After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

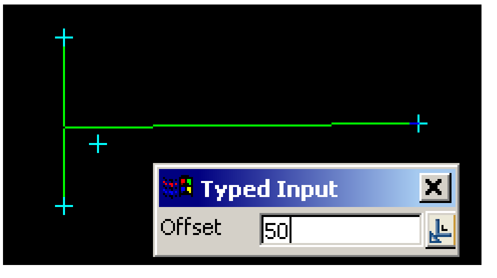
Note: The offset distance is always relative to the reference line (negative is to the left).



STEP 5:

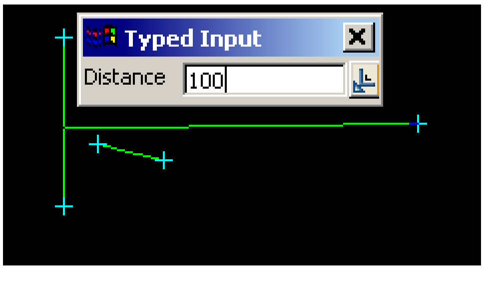
Steps 3 and **4** should be repeated until the required number of vertices have been created in the line string.

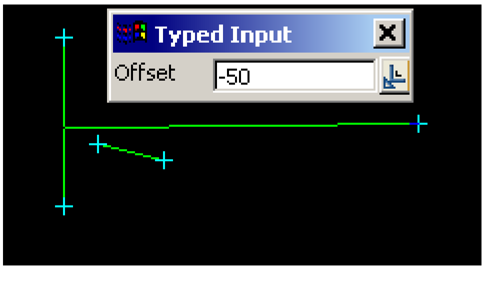


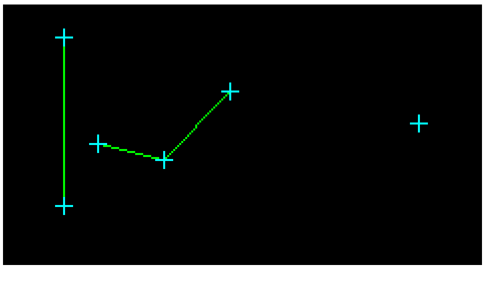


STEP 6:

The option can be terminated by click on the close button on the Input box, followed by the Esc key.







15.11.9 Tape baseline absolute

Position of option on menu: **CAD =>Line =>Tape baseline absolute**

or by selection of appropriate icon from the toolbar.

This option creates a line string by entering distances from the start point and the offset distance to a user defined reference line string.

On selecting **Tape baseline absolute**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start position of the reference line is selected and accepted.

Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.

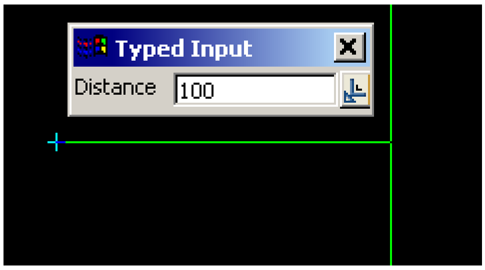
STEP 2:

The interception point for the reference line is selected and accepted.

STEP 3:

After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the absolute option, all distances entered are relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

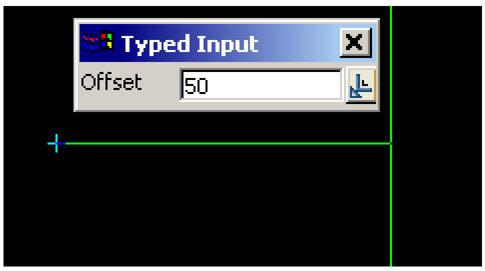
Note: For the absolute option, distances are always relative to the start point of the reference line (positive is from start point to intercept point along the reference line).



STEP 4:

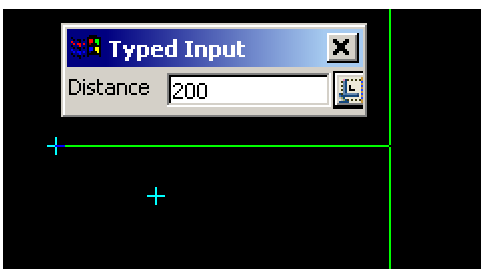
After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

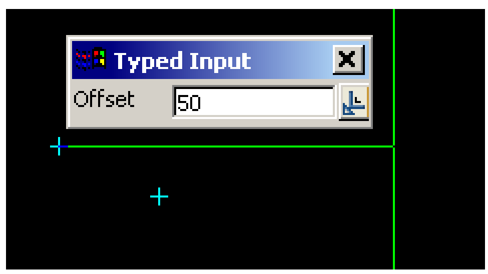
Note: The offset distance is always relative to the reference line (negative is to the left).



STEP 5:

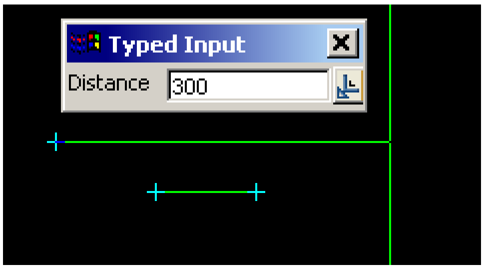
Steps 3 and 4 should be repeated until the required number of vertices have been created in the line string.





STEP 6:

The option can be terminated by click on the close button  on the Input box, followed by the Esc key.



Typed Input
Distance

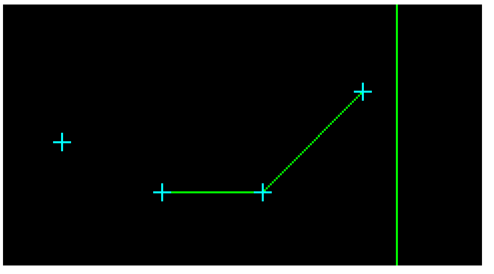
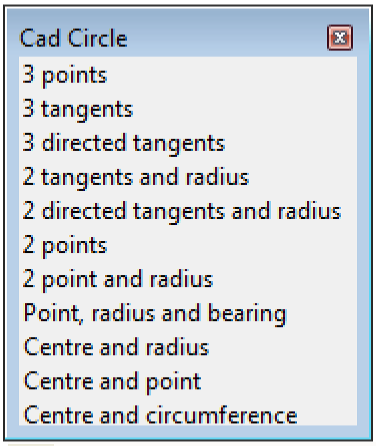
Typed Input
Offset
-50



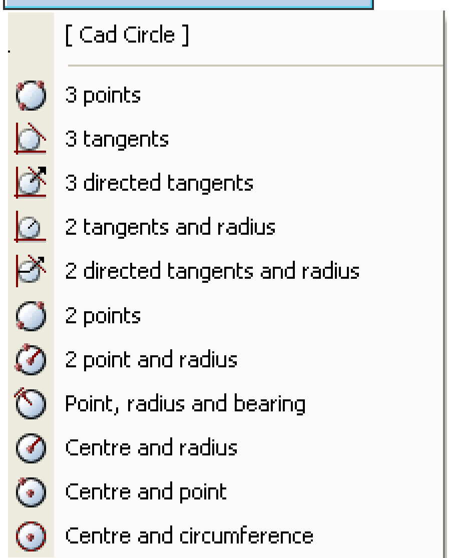
15.12 CAD Circle

Position of option on menu: **CAD =>Circle**

The **Circle** walk-right menu is



from 3 selected points
tangential to 3 tangents (including points)
tangential to 3 directed tangents (including points)
known radius and tangential to 2 tangents
known radius and tangential to 2 directed tangents
from 2 points on diameter
through 2 points and known radius
through point with known radius and a bearing at point
centre position and specified radius
centre position and point on circle



For the option *3 points*, go to 15.12.1 3 Points
3 tangents 15.12.2 3 tangents
3 directed tangents 15.12.3 3 directed tangents
2 tangents and radius 15.12.4 2 tangents and radius
2 directed tangents and radius. 15.12.5 2 directed tangents and radius
2 points 15.12.6 2 points
2 points and radius 15.12.7 2 point and radius
Point, radius and bearing 15.12.8 Point, radius and bearing
Centre and radius 15.12.9 Centre and radius
Centre and point 15.12.10 Centre and point
Centre and circumference 15.12.11 Centre and circumference

15.12.1 3 Points

Position of option on menu: CAD =>Circle =>3 points

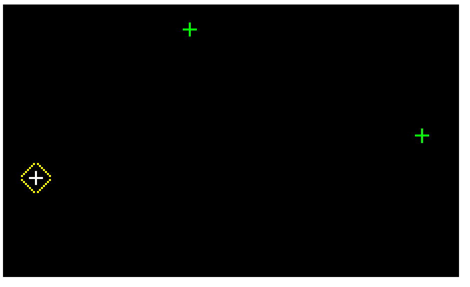
or by selection of appropriate icon from the toolbar.

This option creates the circle through three selected points.

On selecting **3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

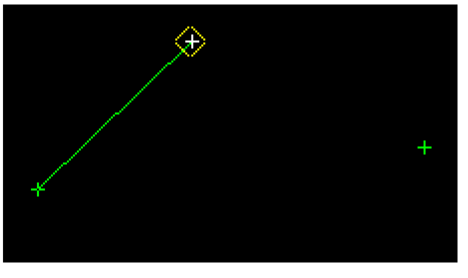
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



STEP 2:

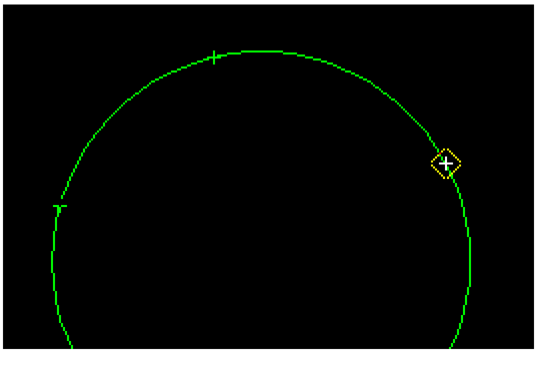
The 2nd point is selected and accepted.

After the 2nd point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.



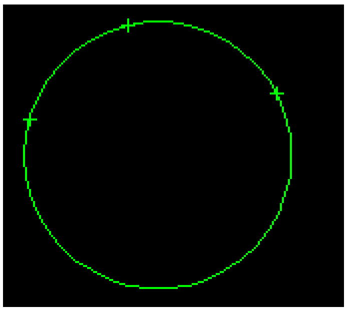
STEP 3:

The 3rd point is selected and accepted.



STEP 4:

A circle is constructed through the three selected points



15.12.2 3 tangents

Position of option on menu: **CAD =>Circle=>3 tangents**

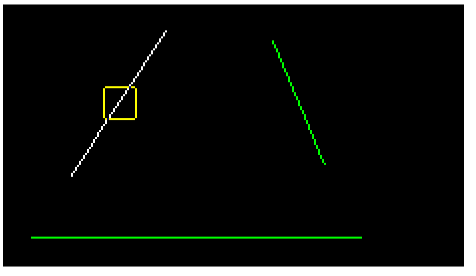
or by selection of appropriate icon from the toolbar. 

This option creates a circle that is tangential to three selected segments.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

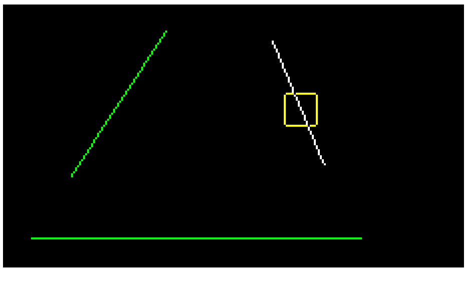
STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).



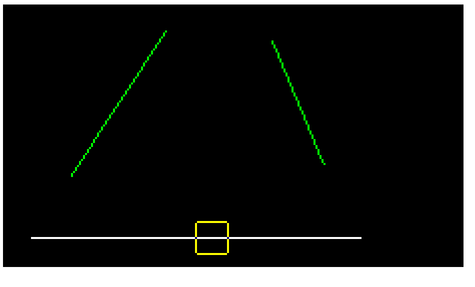
STEP 2:

The 2nd tangent is selected and accepted.



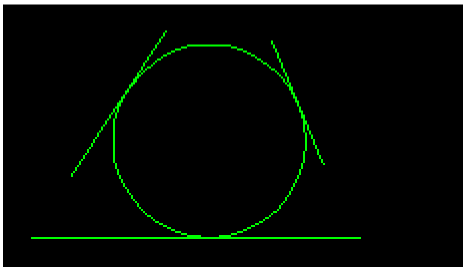
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

A circle is constructed that touches each of the three selected tangents.



15.12.3 3 directed tangents

Position of option on menu: **CAD =>Circle =>3 directed tangents**

or by selection of appropriate icon from the toolbar. 

This option creates a circle that is tangential to three selected segments. The segments are selected in order and with direction and the circle is to the right of the direction of the selected segments.

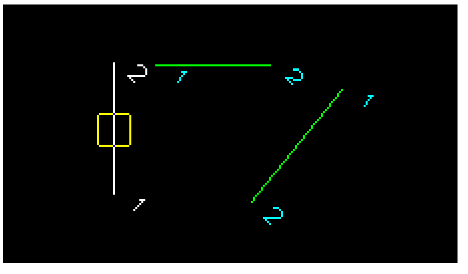
On selecting **3 directed tangents** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

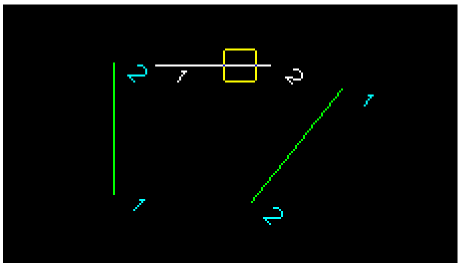
Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.



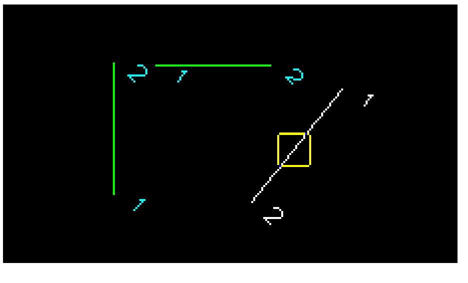
STEP 2:

The 2nd tangent is selected and accepted.



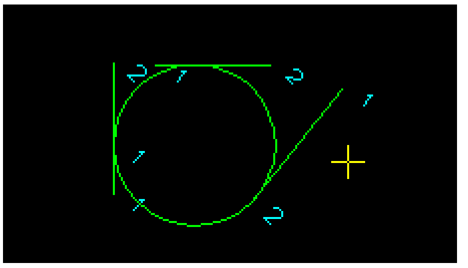
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

If a solution exists, a circle is constructed using the given information.



15.12.4 2 tangents and radius

Position of option on menu: **CAD =>Circles=>2 tangents and radius**

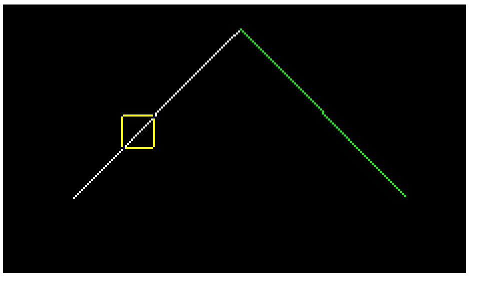
or by selection of appropriate icon from the toolbar.

This option creates a circle with a given radius that is tangential to two selecting segments.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

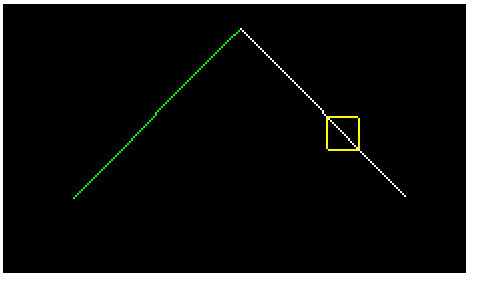
STEP 1:

Select the 1st tangent with the mouse (Left Button) and accept it (Middle Button).



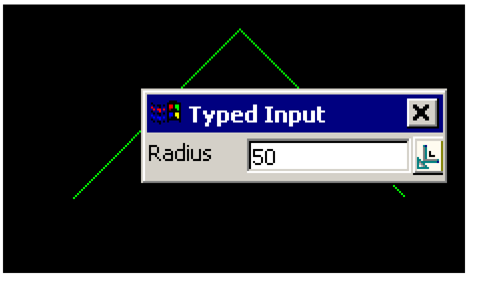
STEP 2:

Select the 2nd tangent and accept it.



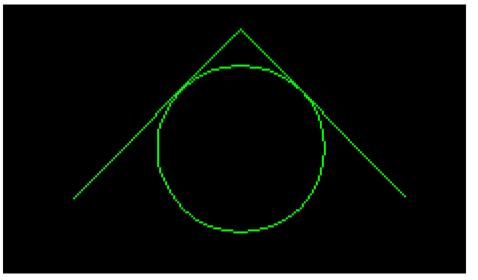
STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the radius by measuring existing elements.



STEP 4:

If a solution exists, a circle is fitted touching the two selected tangents using the given radius.



15.12.5 2 directed tangents and radius

Position of option on menu: CAD =>Circle=>2 directed tangents and radius

or by selection of appropriate icon from the toolbar.

This option creates a circle with a given radius that is tangential to two selected segments that are picked with direction.

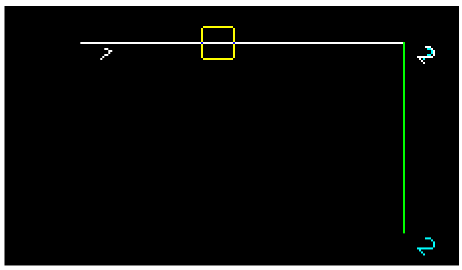
On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

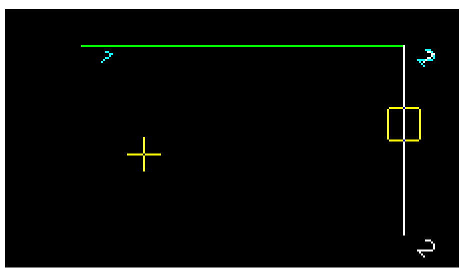
Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.



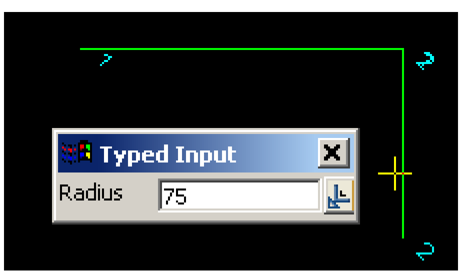
STEP 2:

The 2nd tangent is selected and accepted.



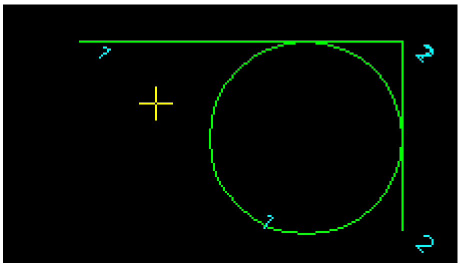
STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the Enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 4:

If a solution exists, a circle is constructed using the given information.



15.12.6 2 points

Position of option on menu: **CAD =>Circle =>2 points**

or by selection of appropriate icon from the toolbar.

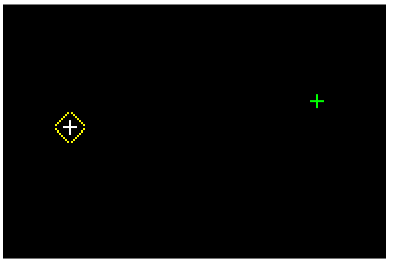
This option creates a circle by selecting two points that define the diameter of the circle.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

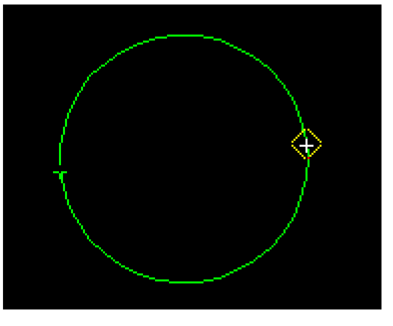
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor (cursor position taken as the other end of a diameter). This will continue until the 2nd point is selected and accepted.



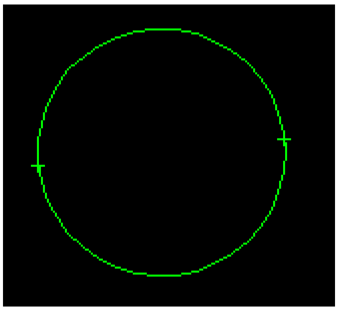
STEP 2:

The 2nd point is selected and accepted.



STEP 3:

The circle is constructed through the two selected points. The two points define the diameter.



15.12.7 2 point and radius

Position of option on menu: **CAD =>Circle =>2 point and radius**

or by selection of appropriate icon from the toolbar. 

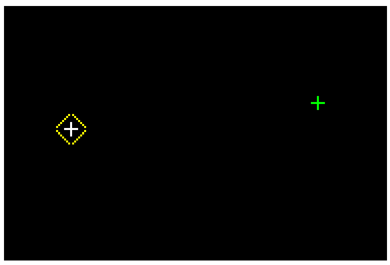
This option creates a circle of a given radius that goes through two selected points.

On selecting **2 point and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

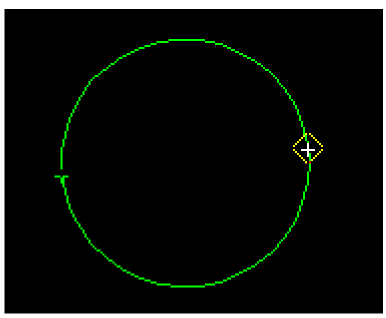
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.



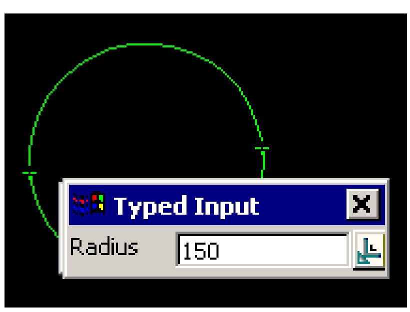
STEP 2:

The 2nd point is selected and accepted.



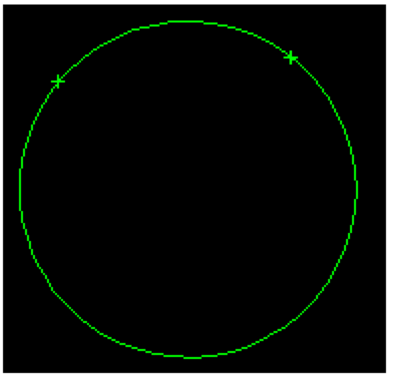
STEP 3:

After the 2nd point is accepted, the Radius Input box will appear. The radius value is entered into the input box followed by the enter key.



STEP 4:

If a solution exists, the circle is fitted through the two selected points using the given radius.



15.12.8 Point, radius and bearing

Position of option on menu: **CAD =>Circle=>Point, radius and bearing**

or by selection of appropriate icon from the toolbar.

This option creates a circle of a given radius, a selected point on the circle and the bearing of the tangent to the circle at that point.

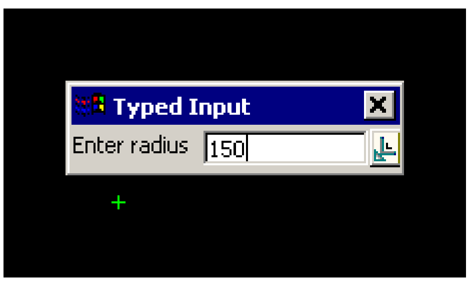
On selecting **Point, radius and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

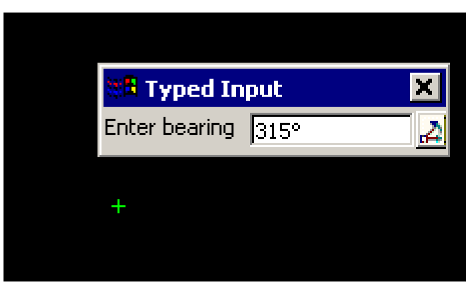
After the 1st point is accepted, the **Enter radius** input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

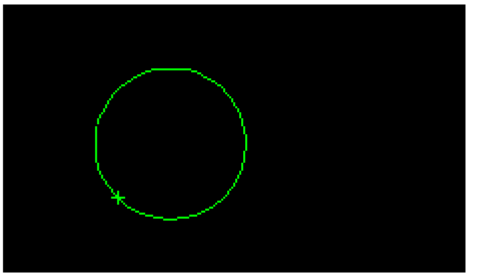
After the radius has been entered, the **Enter bearing** input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.**



STEP 4:

If a solution exists, a circle is fitted from the given bearing at the selected point using the selected radius.



15.12.9 Centre and radius

Position of option on menu: **CAD =>Circle =>Centre and radius**

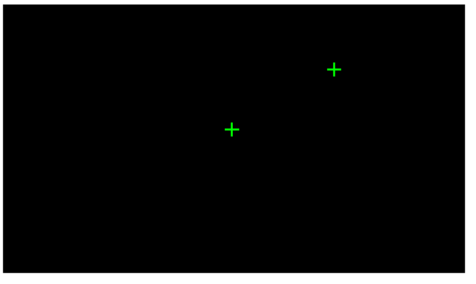
or by selection of appropriate icon from the toolbar. 

This option creates a circle of a given radius and a selected centre point

On selecting **Centre and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



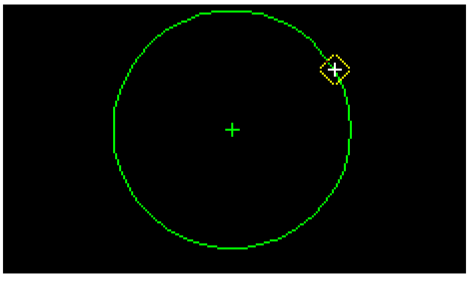
STEP 2:

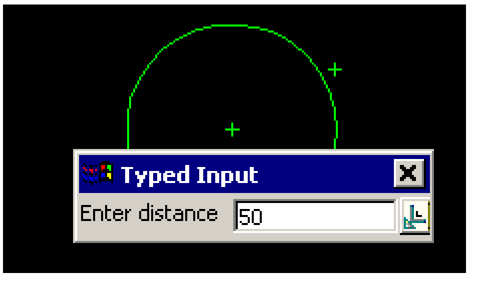
After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

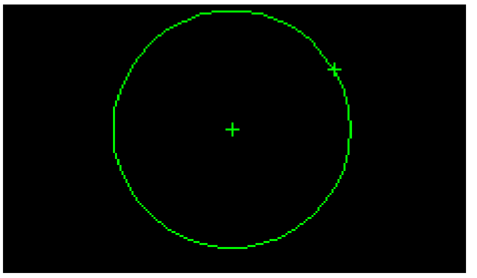
To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.





STEP 3:

The circle is constructed through the centre point using the specified radius.



15.12.10 Centre and point

Position of option on menu: **CAD =>Circle =>Centre and point**

or by selection of appropriate icon from the toolbar. 

This option creates a circle by selecting a centre point and then using the cursor to select a second point that in on the circle.

On selecting **Centre and point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

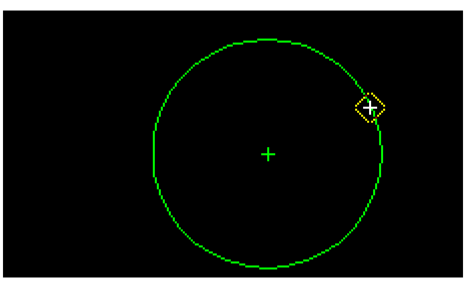
STEP 2:

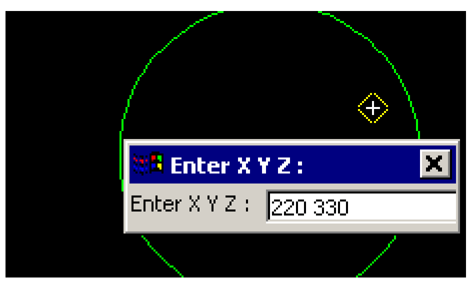
After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

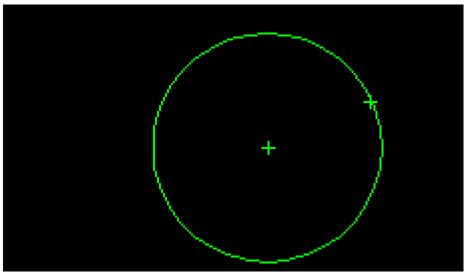
To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the point into the Input box and press the enter key.





STEP 3:

A circle is constructed using the two points defined by the user.



15.12.11 Centre and circumference

Position of option on menu: **CAD =>Circle=>Centre and circumference**

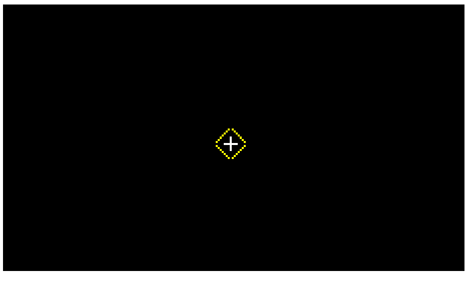
or by selection of appropriate icon from the toolbar.

This option creates a circle by selecting the centre point and giving a circumference value.

On selecting **Centre and circumference**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

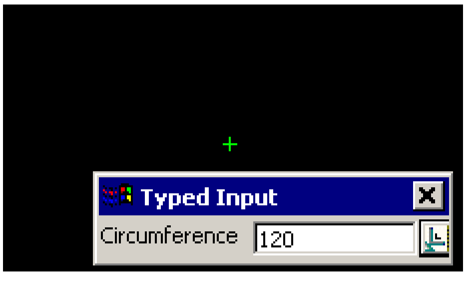
STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



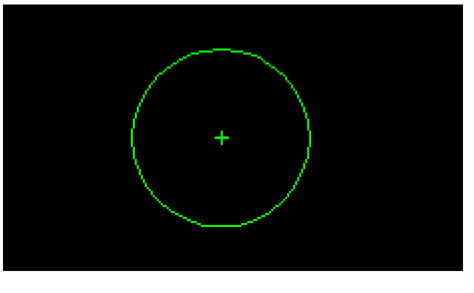
STEP 2:

After the centre point is accepted, the **Circumference** Input box will appear. Type the circumference length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

A circle is constructed using the centre point and the given circumference.

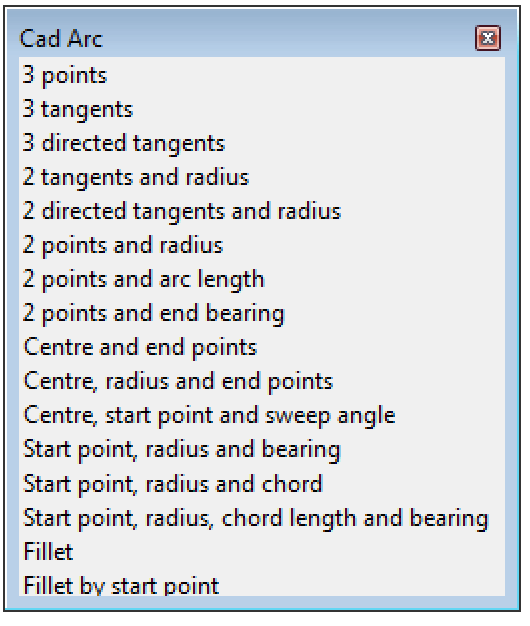


15.13 CAD Arc

Position of option on menu: **CAD =>Arc**

The arc options creates ***super string arcs***, not arc strings. The options **Strings =>Create =>Arc** create arc strings.

The **Arc** walk-right menu is



from 3 selected points
tangential to 3 tangents (including points)
tangential to 3 directed tangents (including points)
known radius and tangential to 2 tangents
known radius and tangential to 2 directed tangents
through 2 points and known radius
2 points and known arc length
2 points and known bearing at first point
centre and end points
centre, radius and end points
centre, start point and sweep angle
through point with known radius and a bearing at point
start point, radius and chord length
start point, radius and chord length and bearing
fillet between 2 segments and given radius
fillet between 2 segments with selected start point

For the option *3 points*, go to 15.13.1 3 points

3 tangents 15.13.2 3 tangents

3 directed tangents 15.13.3 3 directed tangents

2 tangents and radius 15.13.4 2 tangents and radius

2 directed tangents and radius 15.13.5 2 directed tangents and radius

2 points and radius 15.13.6 2 points and radius

2 points and arc length 15.13.7 2 points and arc length

2 points and end bearing 15.13.8 2 points and end bearing

Centre and end points 15.13.9 Centre and end points

Centre, radius and end points 15.13.10 Centre, radius and end points

Centre, start point and sweep angle 15.13.11 Centre, start point and sweep angle

Start point, radius, and bearing 15.13.12 Start point, radius and bearing

Start point, radius and chord 15.13.13 Start point, radius and chord

Start point, radius, chord length and bearing 15.13.14 Start point, radius, chord length and bearing

Fillet 15.13.15 Fillet

Fillet by start point 15.13.16 Fillet by start point

15.13.1 3 points

Position of option on menu: **CAD =>Arc =>3 points**

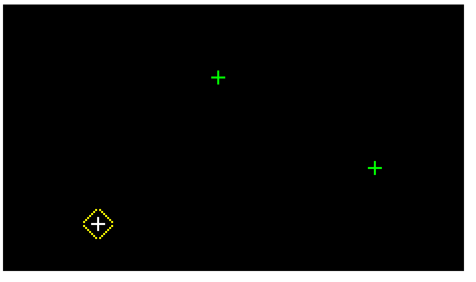
or by selection of appropriate icon from the toolbar. 

This option creates the arc through three selected points and the first and third points are the start and end of the arc.

On selecting **3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

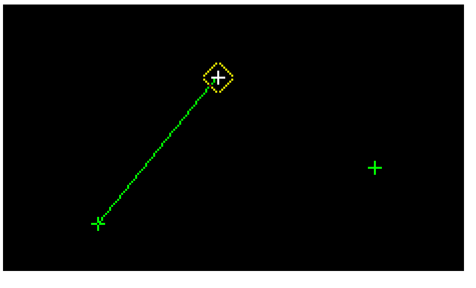
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



STEP 2:

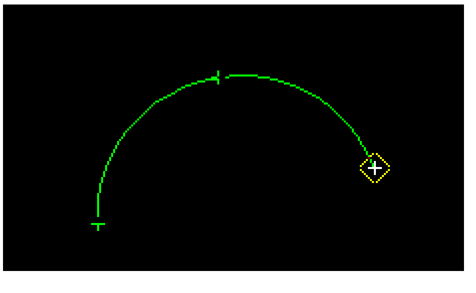
The 2nd point is selected and accepted.

After the 2nd point is accepted an arc will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.



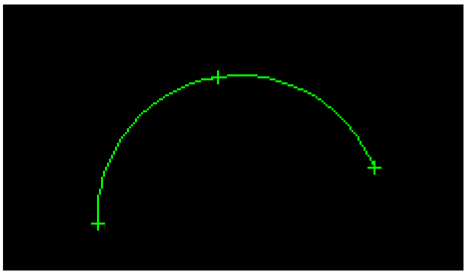
STEP 3:

The 3rd point is selected and accepted.



STEP 4:

An arc is constructed through the three selected points.



15.13.2 3 tangents

Position of option on menu: **CAD =>Arc =>3 tangents**

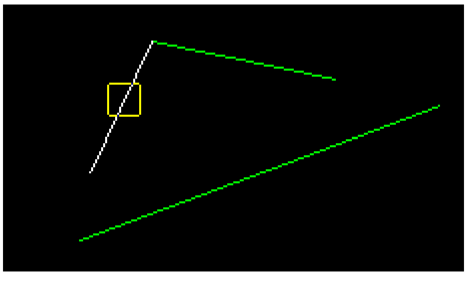
or by selection of appropriate icon from the toolbar. 

This option creates an arc that is tangential to three selected segments. The first and third segments are the start and end of the arc.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

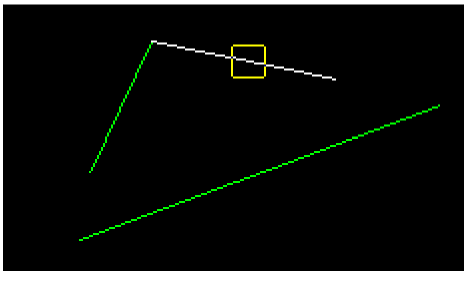
STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).



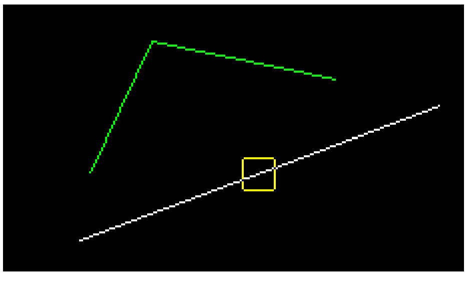
STEP 2:

The 2nd tangent is selected and accepted.



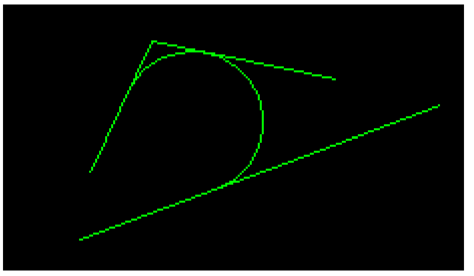
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

The arc is constructed touching the three selected tangents.



15.13.3 3 directed tangents

Position of option on menu: **CAD =>Arc =>3 directed tangents**

or by selection of appropriate icon from the toolbar. 

This option creates an arc that is tangential to three selected segments. The segments are selected in order and with direction and the arc is to the right of the direction of the selected segments. The first and third segments are the start and end of the arc.

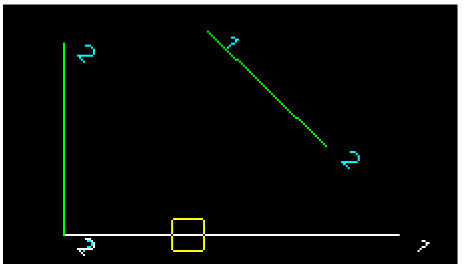
On selecting **3 directed tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

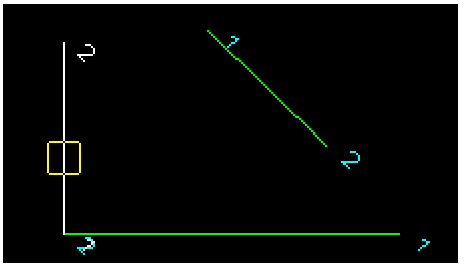
Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of the tangent. A user may reverse the direction of the tangent by selecting a tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.



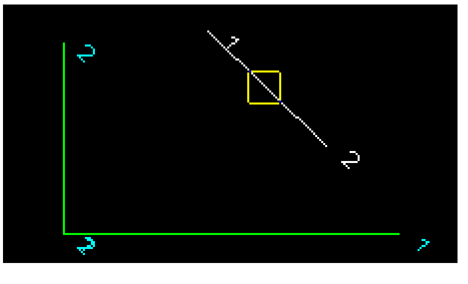
STEP 2:

The 2nd tangent is selected and accepted.



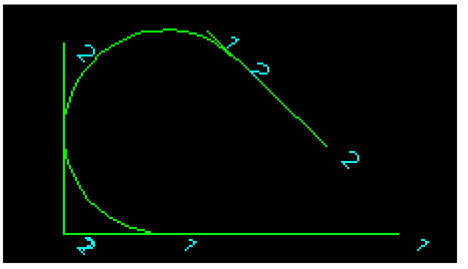
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

If a solution exists, an arc is constructed using the given information.



15.13.4 2 tangents and radius

Position of option on menu: **CAD =>Arc => 2 tangents and radius**

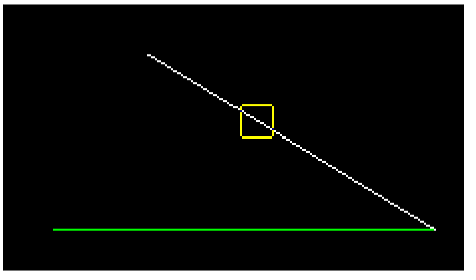
or by selection of appropriate icon from the toolbar.

This option creates an arc with a given radius that is tangential to two selecting segments. This is the same as a fillet.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

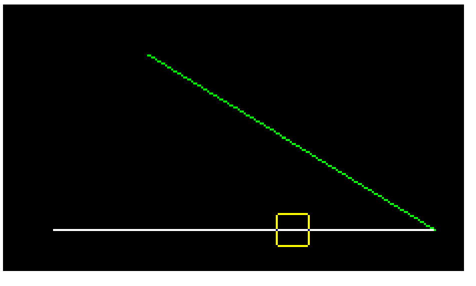
STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).



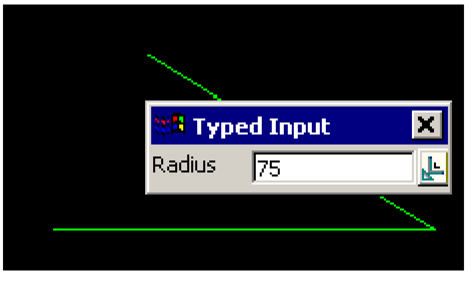
STEP 2:

The 2nd tangent is selected and accepted.



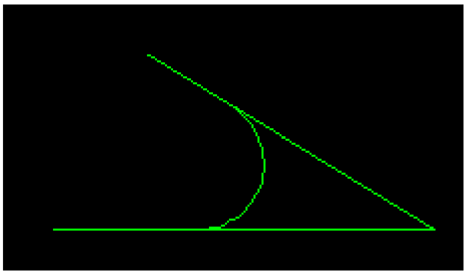
STEP 3:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 4:

If a solution exists, the arc is fitted through the two selected tangents using the given radius.



15.13.5 2 directed tangents and radius

Position of option on menu: **CAD =>Arc =>2 directed tangents and radius**

or by selection of appropriate icon from the toolbar.

This option creates an arc with a given radius that is tangential to two selected segments that are picked with direction.

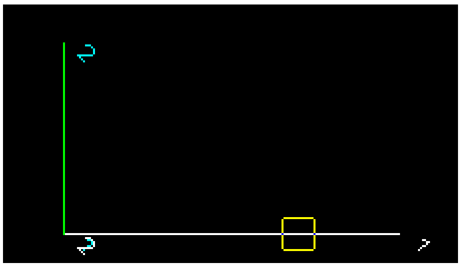
On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

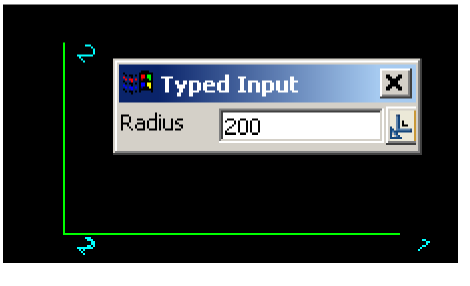


STEP 2:

The 2nd tangent is selected and accepted.

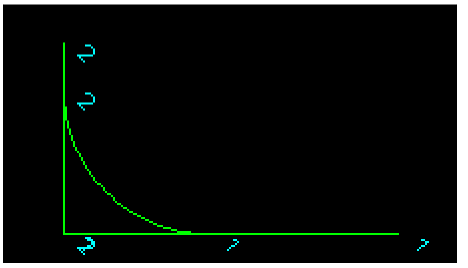
STEP 3:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 4:

If a solution exists, the arc is fitted through the two selected tangents using the given radius.



15.13.6 2 points and radius

Position of option on menu: **CAD =>Arc =>2 points and radius**

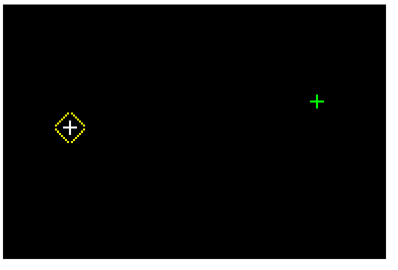
or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius that starts and ends on two selected points.

On selecting **2 points and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



STEP 2:

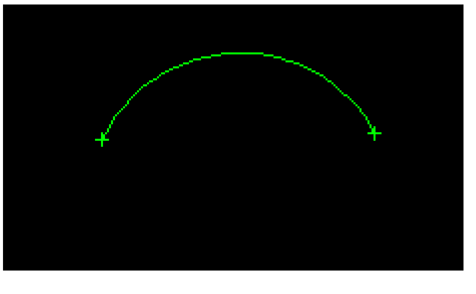
After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.



15.13.7 2 points and arc length

Position of option on menu: **CAD =>Arc =>2 points and arc length**

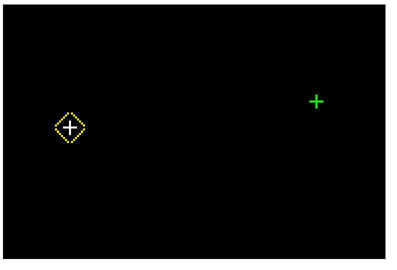
or by selection of appropriate icon from the toolbar 

This option creates an arc of a given arc length that starts and ends on two selected points.

On selecting **2 points and arc length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

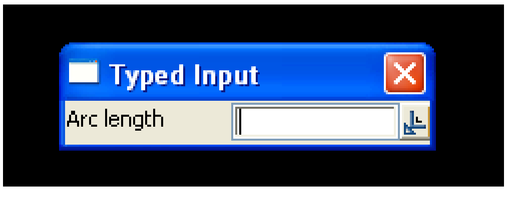
STEP 1:12d

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



STEP 2:

After the start point is accepted, the Arc length Input box will appear. Type the arc length value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc length by measuring existing elements.

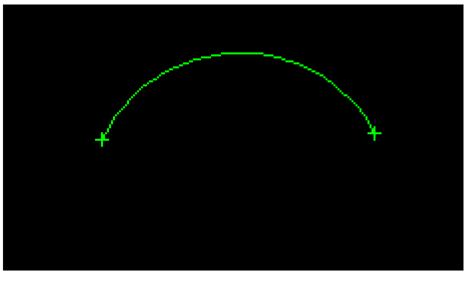


STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.



15.13.8 2 points and end bearing

Position of option on menu: **CAD =>Arc =>2 points and end bearing**

or by selection of appropriate icon from the toolbar.

This option creates an arc that starts and end on two selected points and has a given bearing of the tangent at the end point (the end bearing).

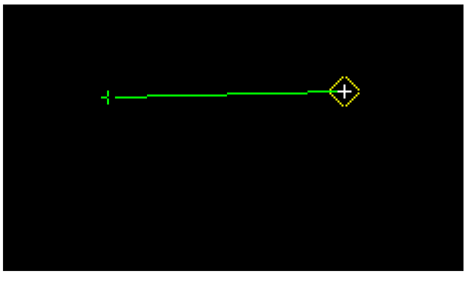
On selecting **2 points and end bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

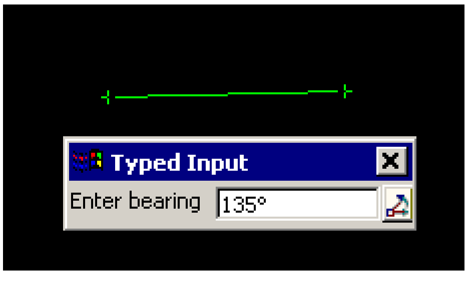
The 2nd point is selected and accepted.



STEP 3:

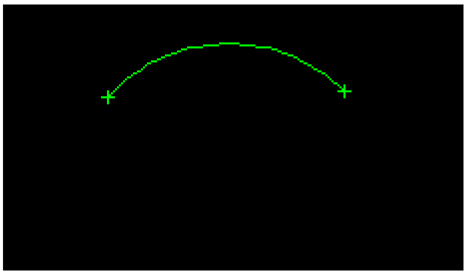
After the 2nd point is accepted, the Enter bearing input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.**



STEP 4:

If a solution exists, the arc is fitted through the two selected points with the end point of the given bearing.



15.13.9 Centre and end points

Position of option on menu: **CAD =>Arc =>Centre and end points**

or by selection of appropriate icon from the toolbar. 

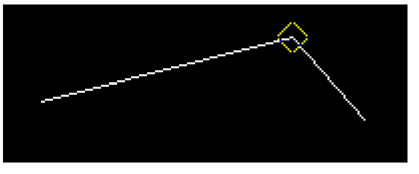
This option creates an arc by selecting in order, the centre point and the start and end points. The radius of the arc is the distance between the centre and the start point.

On selecting **Centre and end points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

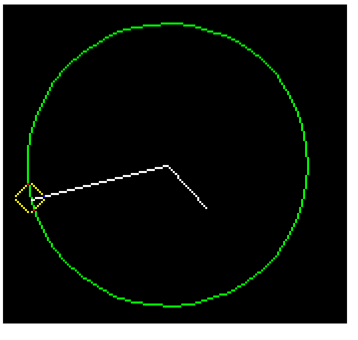
A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.



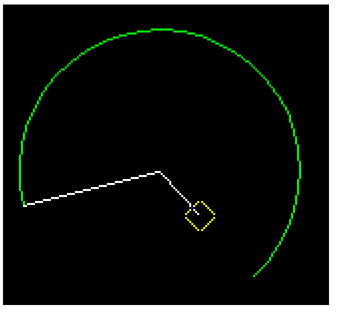
STEP 2:

Select and accept the start point. This point defines the radius and the start of the arc.



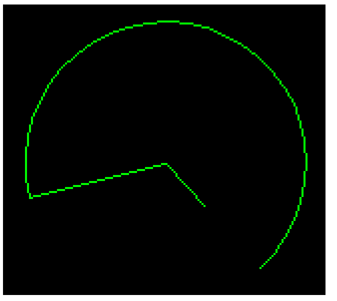
STEP 3:

The end point of the arc is specified.



STEP 4:

The arc is constructed using the given information.



15.13.10 Centre, radius and end points

Position of option on menu: **CAD =>Arc =>Centre, radius and end points**

or by selection of appropriate icon from the toolbar.

This option allows the creation of an arc given a centre point, radius, start and end points.

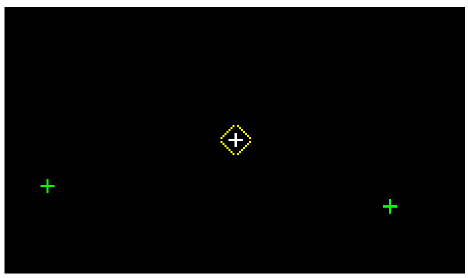
This option creates an arc of a given radius by selecting in the centre point and the start and end positions.

On selecting **Centre, radius and end points** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

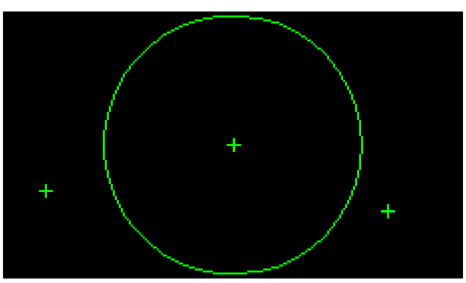
A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

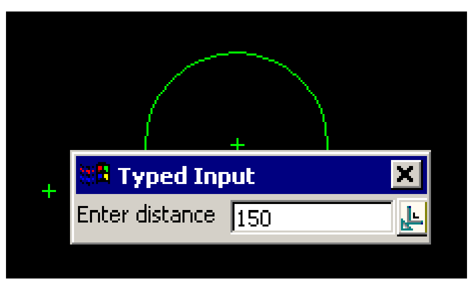
After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.



STEP 2:

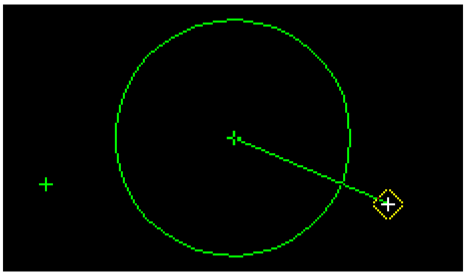
A radius value is selected with the mouse or entered in via the keyboard. To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the Enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.

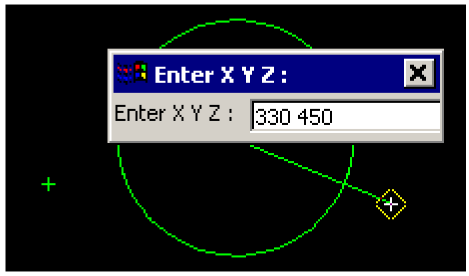




STEP 3:

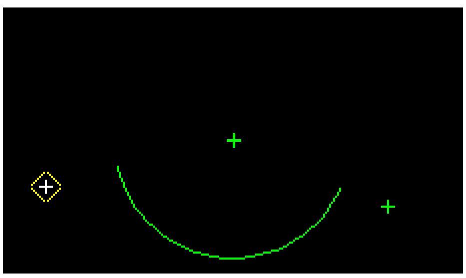
A start point defines the start of the sweep angle to define where to start the arc. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

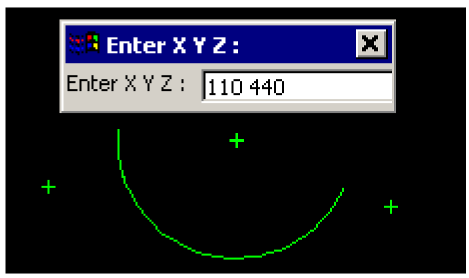




STEP 4:

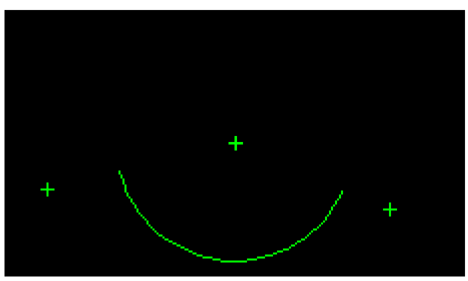
The end point of the arc is specified. The start and end points define the sweep angle to define the arc. The rubber banding of the arc will use the cursor position as the end position until a end point is selected and accepted. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The end point does not have to be on the arc itself. It is used to define the sweep angle.





STEP 5:

The arc is constructed using the given information.



15.13.11 Centre, start point and sweep angle

Position of option on menu: **CAD =>Arc =>Centre, start point and sweep angle**

or by selection of appropriate icon from the toolbar.

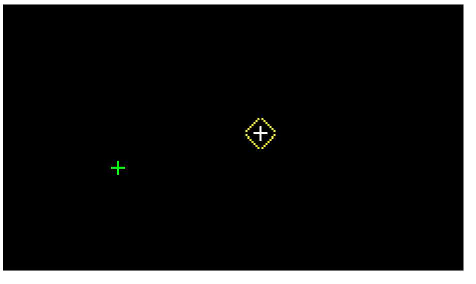
This option creates an arc by selecting a centre point and a start points and giving a sweep angle. The radius of the arc is the distance between the centre and start point.

On selecting **Centre, start point and sweep angle**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

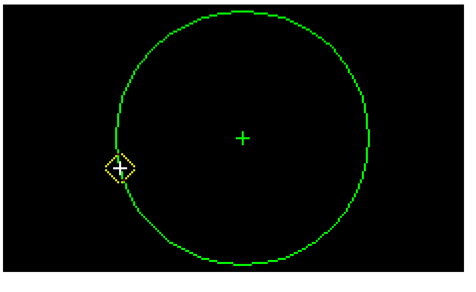
A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.



STEP 2:

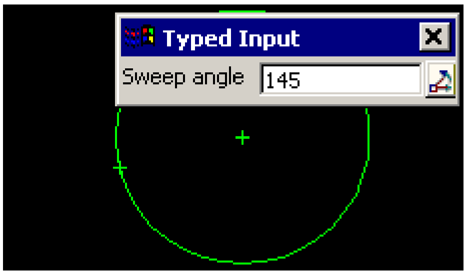
The 2nd point is selected with the mouse or entered in via the keyboard. This point defines the radius as well as the start point of the arc.To specify the 2nd point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



STEP 3:

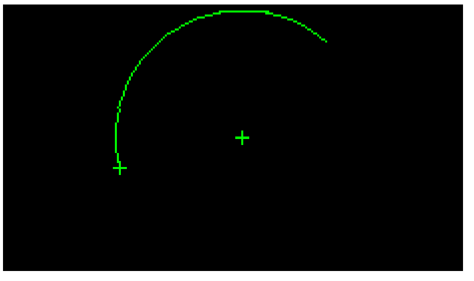
After the 2nd point is accepted, the **Sweep Angle** input box will appear. Type the sweep angle value into the input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



STEP 4:

The arc is created using the information supplied



15.13.12 Start point, radius and bearing

Position of option on menu: **CAD =>Arc =>Start point, radius and bearing**

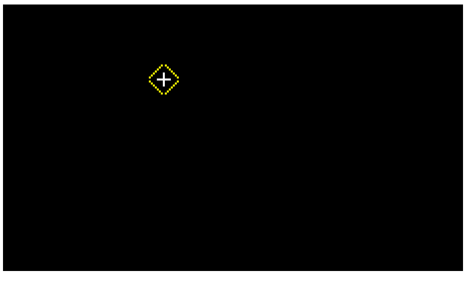
or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius, starting at a selected point and bearing of the tangent at the start point and going for a given arc length.

On selecting the **Start point, radius and bearing** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

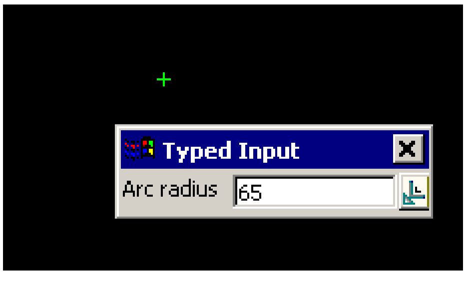
STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



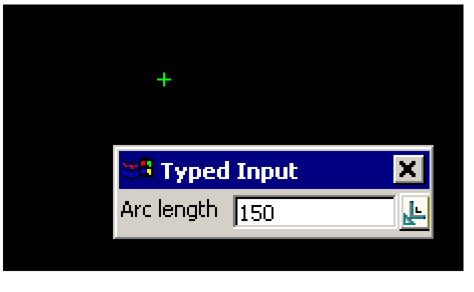
STEP 2:

After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

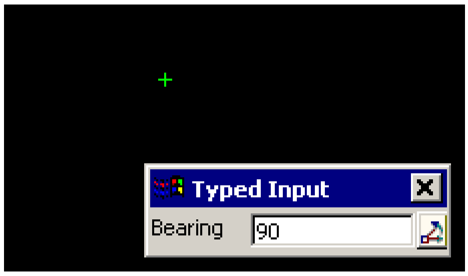
After the radius has been entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.



STEP 4:

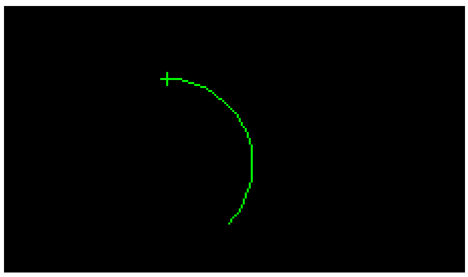
After the arc length is accepted, the Bearing Input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.**



STEP5:

The arc is created with the given information.



15.13.13 Start point, radius and chord

Position of option on menu: **CAD =>Arc =>Start point, radius and chord**

or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius, starting from a selected point and with a given chord bearing at the start point and a given arc length.

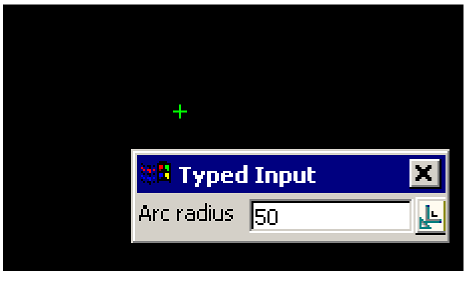
On selecting **Start point, radius and chord**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

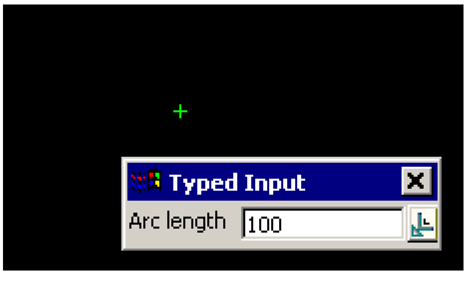
STEP 2:

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

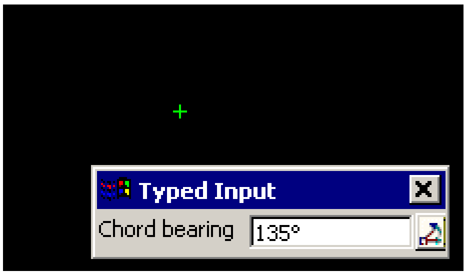
After the arc radius is entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.



STEP 4:

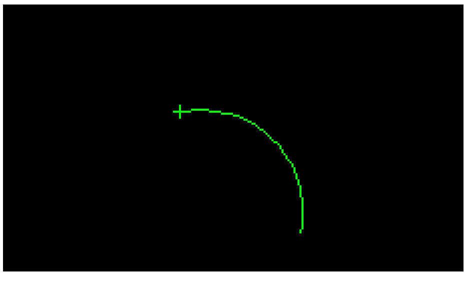
After the arc length is entered, the **Chord Bearing** Input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Chord Bearing Input box comes up to add or subtract intervals of 90 degrees.**



STEP 5:

An arc is created with the given information.



15.13.14 Start point, radius, chord length and bearing

Position of option on menu: **CAD =>Arc =>Start point, radius, chord length and bearing**

or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius, starting from a selected point, with a given bearing of the tangent at the start point and a given chord length from the start point.

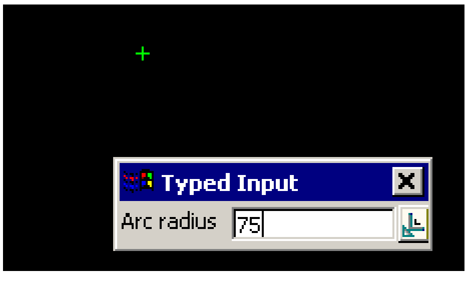
On selecting **Start point, radius, chord length and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

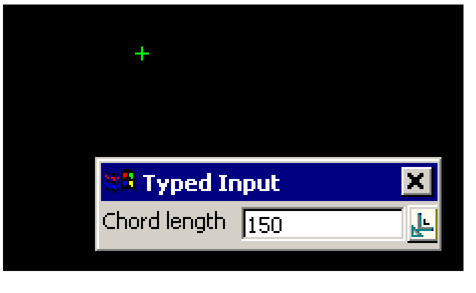
STEP 2:

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

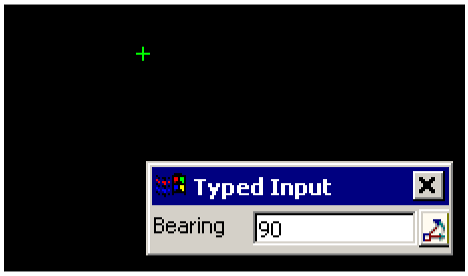
After the radius has been entered, the **Chord Length** Input box will appear. Type the chord length into the Input box and press the enter key. The browse button on the Input box can be used to define the chord length by measuring existing elements.



STEP 4:

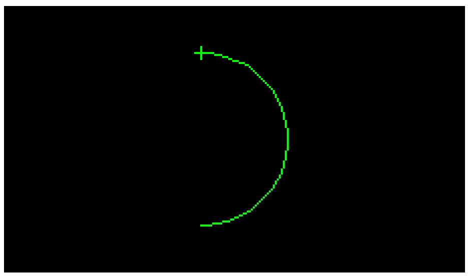
After the chord length has been entered, the **Bearing** Input box will appear. Type the bearing of the start tangent into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.**



STEP 5:

The arc is created with the given information.



15.13.15 Fillet

Position of option on menu: **CAD =>Arc =>Fillet**

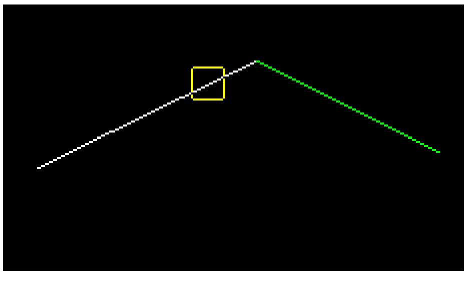
or by selection of appropriate icon from the toolbar.

This option creates an arc given a fillet radius

On selecting **Fillet**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

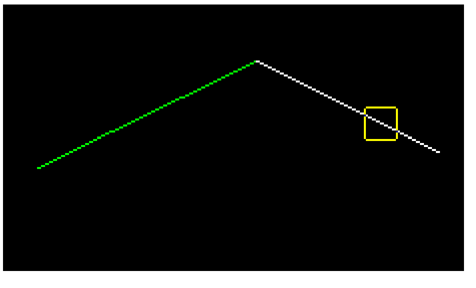
STEP 1:

The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown, the direction was in a north-east direction.



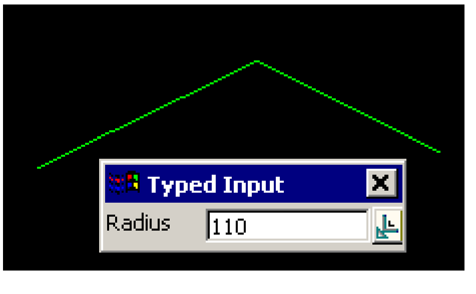
STEP 2:

The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a south-east direction



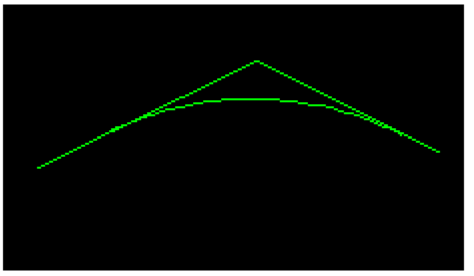
STEP 3:

After the 2nd segment is accepted, the Arc Radius Input box will appear. Type the radius of the fillet in the Input box (positive radius for curves curving to the right) and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 4:

The fillet arc is placed between the selected segments.



15.13.16 Fillet by start point

Position of option on menu: **CAD =>Arc =>Fillet by start point**

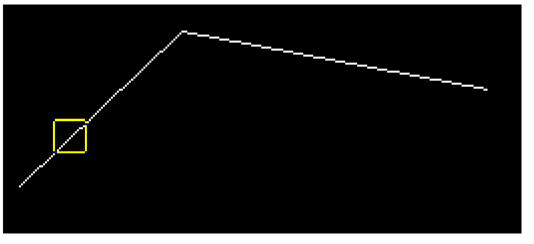
or by selection of appropriate icon from the toolbar. 

This option creates an arc that is a fillet between two selected sections and with a selected fillet start point (which will be a tangent point of the created arc).

On selecting **Fillet by start point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

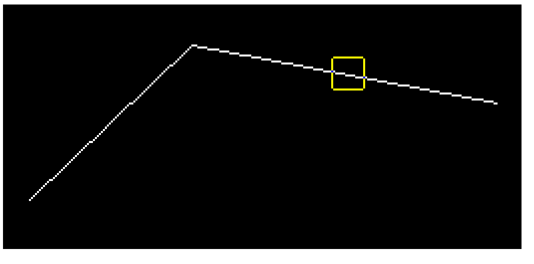
STEP 1:

The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a north-east direction.



STEP 2:

The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a south-east direction

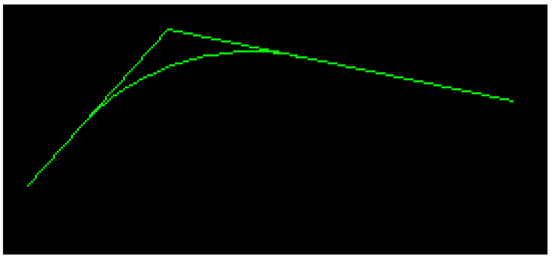


STEP 3:

The tangent start point of the fillet is selected and accepted.

STEP 4:

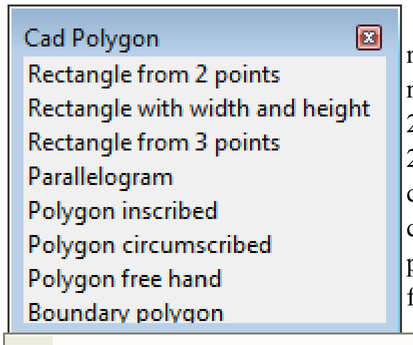
The fillet arc is placed between the selected segments.



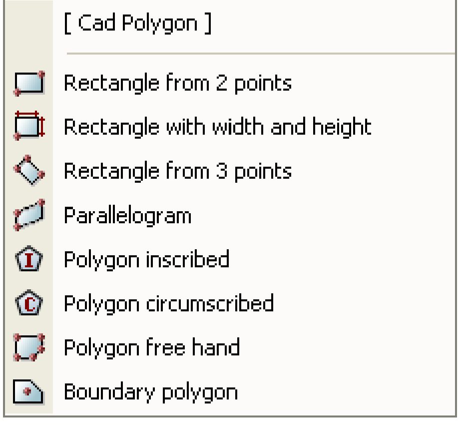
15.14 CAD Polygon

Position of option on menu: **CAD =>Polygon**

The **Cad polygon** walk-right menu is



rectangle (fillet/chamfer) parallel to axes by picking 2 diagonal corners
rectangle parallel to axes by picking BL point, width and height
2 points defining base, 3rd point defining height
2 points defining base, 3rd point defining corner
centre point, number of sides and point on circumference
centre point, number of sides and point on circumference
pick in polygon vertices (in order)
find polygon from lines and arcs, surrounding selected point



For the option *Rectangle from 2 points*, go to 15.14.1 Rectangle from 2 points
Rectangle with width and height 15.14.2 Rectangle with width and height
Rectangle from 3 points 15.14.3 Rectangle from 3 points
Parallelogram 15.14.4 Parallelogram
Polygon inscribed 15.14.5 Polygon inscribed (in a circle)
Polygon circumscribed 15.14.6 Polygon Circumscribed About a Circle
Polygon free hand 15.14.7 Free Hand Polygon
Boundary polygon 15.14.8 Create Boundary Polygon

15.14.1 Rectangle from 2 points

Position of option on menu: **CAD =>Polygon =>Rectangle from 2 Points**

or by selection of appropriate icon from the toolbar.

This option creates a rectangle parallel to the x and y axis by selecting two diagonal corners of the rectangle.

On selecting **Rectangle from 2 Points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

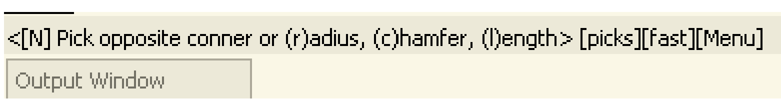
STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a rectangle will be displayed 'rubber banding' to form a rectangle with the first point and the cursor position being diagonal corners. This will continue until the 2nd point is selected and accepted.

STEP 2:

The following message is displayed in the screen message box:



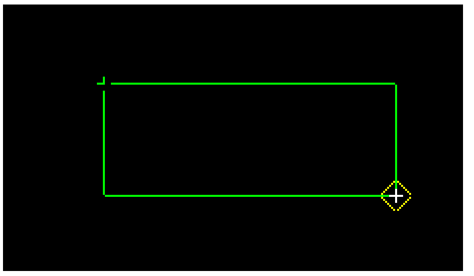
If filleted corners are required, type **r** and enter the *corner radius*.

If chamfered corners are required, type **c** and enter the *chamfer length*.

If a fillet or chamfer has been selected, type **n** to turn it off.

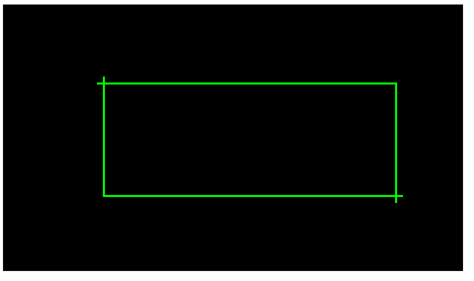
STEP 3:

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



STEP 4:

The rectangle is created with the given information.



15.14.2 Rectangle with width and height

Position of option on menu: **CAD =>Polygon =>Rectangle with width and height**

or by selection of appropriate icon from the toolbar.

This option creates a rectangle parallel to the x and y axis by selecting a start point and giving the width and height of the rectangle.

On selecting **Rectangle with width and height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

This point defines the bottom left point of the rectangle.

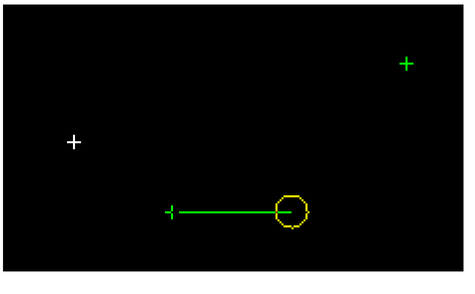
After the start point is accepted, the width will be displayed ‘rubber banding’ to right of the start point (positive distance). The width is equal to the distance from the start point to the position of the cursor. This will continue until the width is selected and accepted.

STEP 2:

The width is selected with the mouse or entered in via the keyboard. To specify the width with the mouse, a point must be selected and accepted. To enter the width with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

A negative distance (to the left of the 1st point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button to select a distance, then place a minus "-" sign in front of the distance value.

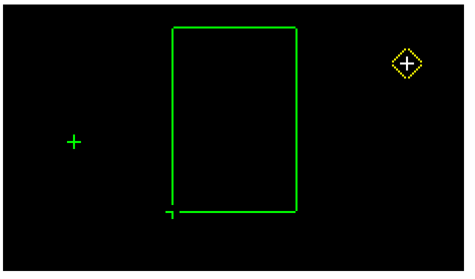
After the width is accepted, the width of the rectangle is confirmed and the height will be displayed ‘rubber banding’ upwards on the screen. The height is equal to the distance from the found width point to the position of the cursor. The rectangle will be created once the height is selected and accepted.



STEP 3:

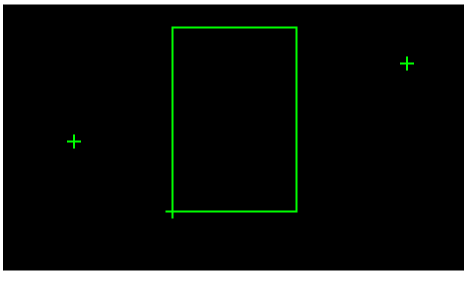
The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the height with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

A negative distance (below of the 2nd point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button to select a distance, then place a minus "-" sign in front of the distance value.



STEP 4:

The rectangle is created with the given information.



15.14.3 Rectangle from 3 points

Position of option on menu: **CAD =>Polygon =>Rectangle from 3 points**

or by selection of appropriate icon from the toolbar.

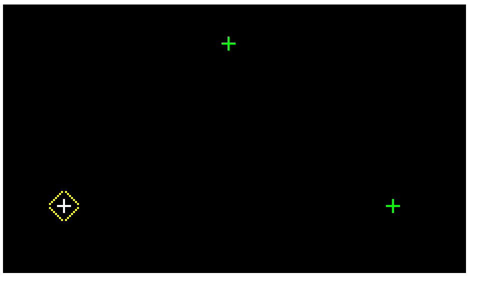
This option creates a rectangle by selecting three points. The first and second point define the base of the rectangle, which can be at any angle, and the third point is on the opposite side of the rectangle. The rectangle can be filleted or chamfered.

On selecting **Rectangle from 3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

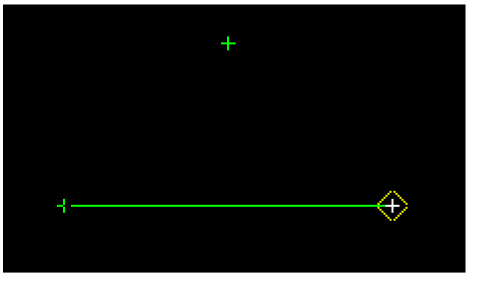
After the 1st point is accepted, the base of the rectangle will be displayed ‘rubber banding’ on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.



STEP 2:

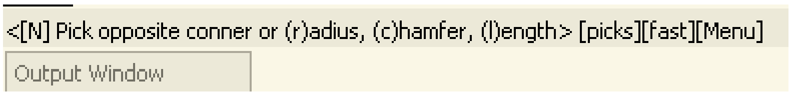
The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the rectangle is confirmed and the height will be displayed ‘rubber banding’ on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The rectangle will be created once the height is selected and accepted.



STEP 3:

The following message is displayed in the screen message box:



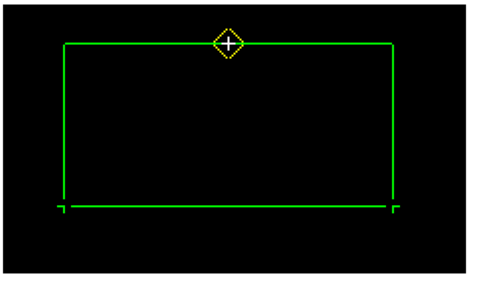
If filleted corners are required, type **r** and enter the *corner radius*.

If chamfered corners are required, type **c** and enter the *chamfer length*.

If a fillet or chamfer has been selected, type **n** to turn it off.

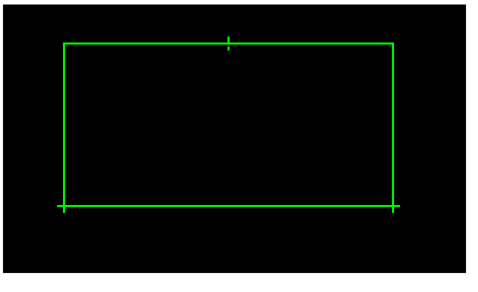
STEP 4:

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.



STEP 5:

The rectangle is created with the given information.



15.14.4 Parallelogram

Position of option on menu: **CAD =>Polygon =>Parallelogram**

or by selection of appropriate icon from the toolbar.

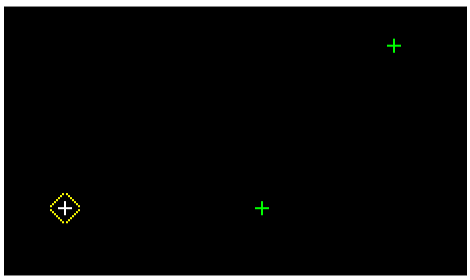
This option creates a parallelogram by selecting three points. The first and second point define the base of the parallelogram, which can be at any angle, and the third point is the end point of the opposite side of the parallelogram.

On selecting **Parallelogram**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

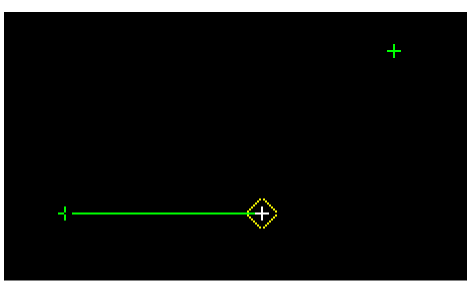
After the 1st point is accepted, the base of the rectangle will be displayed 'rubber banding' on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.



STEP 2:

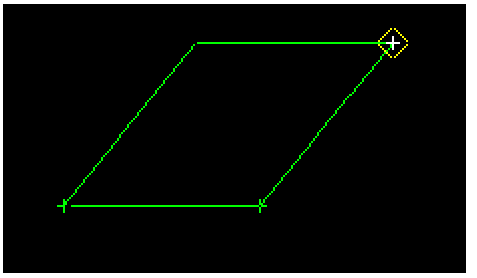
The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the parallelogram is confirmed and the height will be displayed 'rubber banding' on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The parallelogram will be created once the height is selected and accepted.



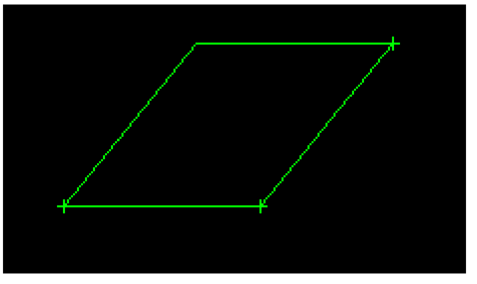
STEP 3:

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button on the Input box can be used to define the distance by measuring existing elements.



STEP 4:

The parallelogram is created with the given information.



15.14.5 Polygon inscribed (in a circle)

Position of option on menu: **CAD =>Polygon =>polygon inscribed**

or by selection of appropriate icon from the toolbar. 

This option creates a polygon with a user defined number of sides on the inside of a a circle.

The polygon is constructed inside a circle, thus each corner of the polygon touches the circumference of the circle defined by the user. Conversely using the **Polygon circumscribed** option, the midpoint of each side of the polygon touches the circumference of the circle creating a polygon outside the circle.

On selecting **polygon inscribed**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

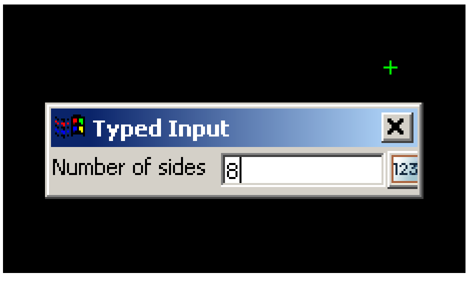
STEP 1:

The centre point is selected with the mouse or entered in via the keyboard. To specify the centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired number of sides for the polygon into the Input box and press the enter key.

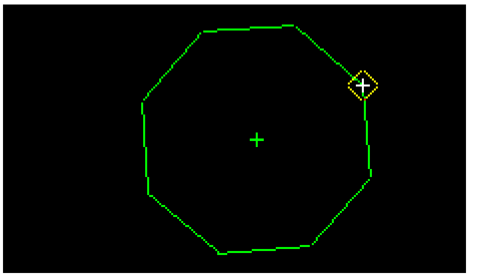
After the number of sides have been selected, the polygon will be displayed 'rubber banding' on the screen. The polygon will be created once the radius is selected and accepted.



STEP 3:

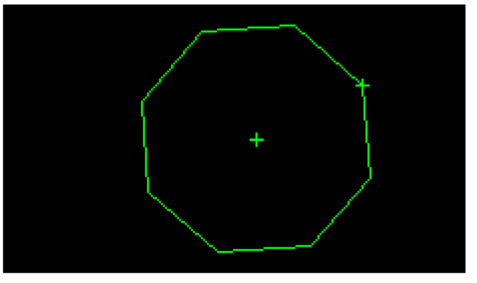
Before a polygon can be created inside the circle, its radius must be defined by the user. To specify the radius with the mouse, a point must be selected and accepted. To enter the point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

Note: One of the polygon's corners will be located on the point selected to defined the circle's radius



STEP 4:

A polygon is created inside a circle with a radius defined by the user.



15.14.6 Polygon Circumscribed About a Circle

Position of option on menu: **CAD =>Polygon =>Polygon circumscribed**

or by selection of appropriate icon from the toolbar.

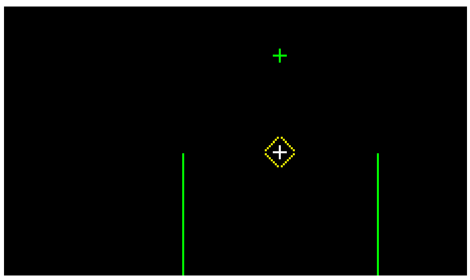
This option creates a polygon with a user defined number of sides on the outside a circle.

The polygon is constructed outside a circle, thus the midpoint of each side of the polygon touches the circumference of the circle defined by the user. Conversely using the **Polygon inscribed** option, each corner of the polygon touches the circumference of the circle creating a polygon inside the circle.

On selecting **Polygon circumscribed**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

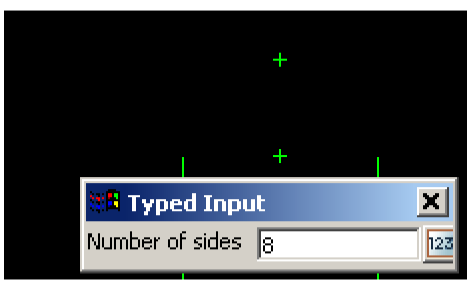
The centre point is selected with the mouse or entered in via the keyboard. To specify the centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.



STEP 2:

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired number of sides for the polygon into the Input box and press the enter key.

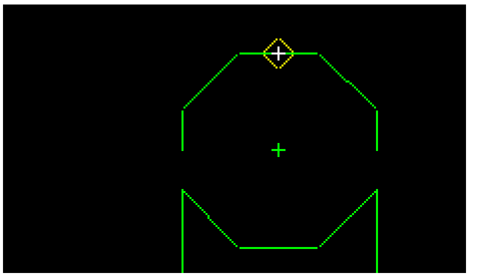
After the number of sides have been selected, the polygon will be displayed 'rubber banding' on the screen. The polygon will be created once the radius is selected and accepted.



STEP 3:

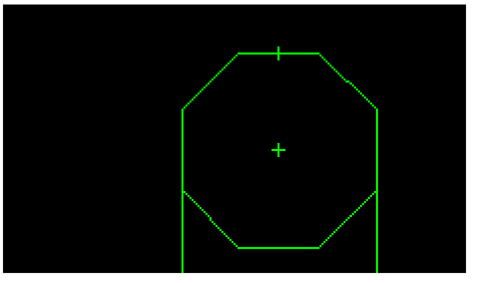
Before a polygon can be created outside the circle, its radius must be defined by the user. To specify the radius with the mouse, a point must be selected and accepted. To enter the point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

Note: One midpoint of the polygon's side will be located on the point selected to defined the circle's radius



STEP 4:

A polygon is created outside the circle with a radius defined by the user.



15.14.7 Free Hand Polygon

Position of option on menu: **CAD =>Polygon =>Polygon free hand**

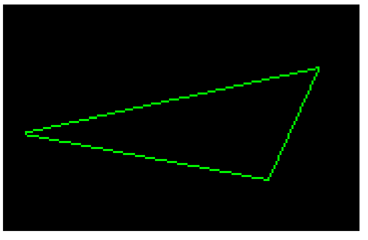
or by selection of appropriate icon from the toolbar. 

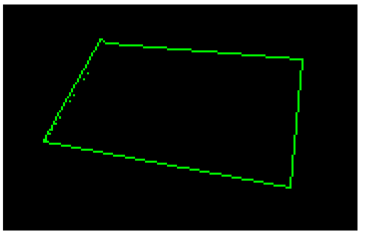
This option creates a closed polygon from selected vertices.

On selecting **Polygon free hand**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Pick and accept the position to form the vertices of the polygon. As each vertex is accepted, the polygon is automatically closed.





STEP 2:

The polygon is finished by pressing the <Esc> key.

15.14.8 Create Boundary Polygon

Position of option on menu: **CAD =>Polygon =>Boundary polygon**

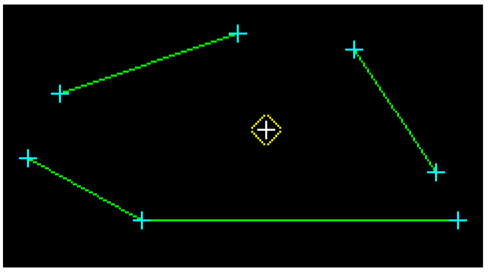
or by selection of appropriate icon from the toolbar.

This option tries to form a boundary from a selected set of segments.

On selecting **Boundary polygon**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

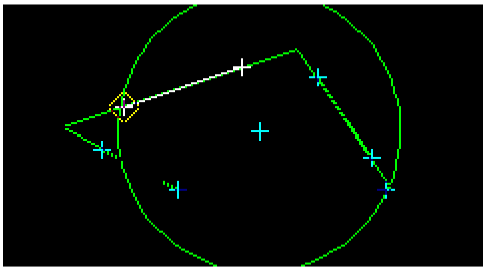
STEP 1:

Pick a position inside the lines, arcs and strings to form a bounding polygon from.



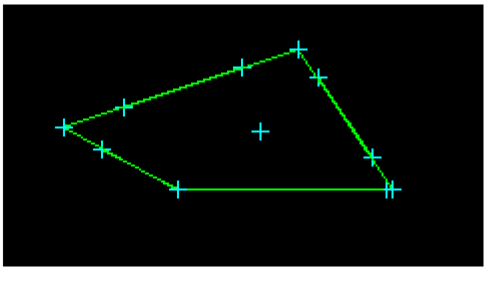
STEP 2:

A circle is then drawn centred on the selected position with circumference going through the position of the cursor. Drag the cursor out until it encloses all the data to be used to create the closest bounding polygon around the centre.



STEP 3:

On accepting the circle position, an attempt is made to create the inner polygon using all the strings inside the circle.



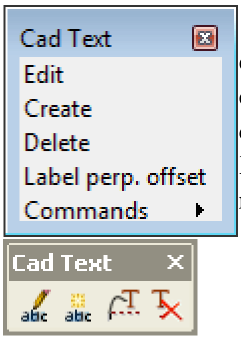
15.15 CAD Text

Position of option on menu: **CAD =>Text**

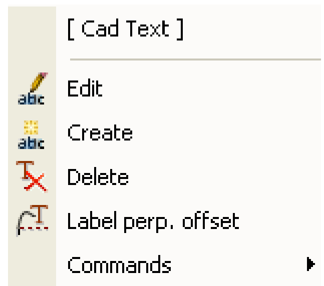
Position of option on menu: **Various toolbars**

Text can occur as a text string, on vertices and segments of a super string or on vertices of a 4d string. But the display position of text is not as straight forward as simply placing a point. For more information about text, go to the section 4.6 Text Definitions.

The **Text** walk-right menu is



edit text string using typed commands and grips
create text string using typed commands and grips
delete text
label perpendicular offset distance
menu of individual Text options



For the option *Edit*, go to	15.15.2 Edit Text
Create	15.15.1 Create Text
Delete	15.15.20 Text Delete
Label perp. offset	15.15.18 Label Perpendicular Offset
Commands	15.15.3 CAD Text Commands

15.15.1 Create Text

Position of option on menu: **CAD =>Text =>Create**

or by selection of appropriate icon from the toolbar.

For information about text and its definitions, go to the section 4.6 Text Definitions.

12d Model has two CAD text options ***Create*** and ***Edit***. However both of these run the same option which starts up in different modes - ***Create*** is in the mode to create text as straight text, or text on a super string vertex or on a super string segment and ***Edit*** which edits existing text.

Once either CAD text option is started it is possible to change between the ***Create*** and ***Edit*** modes at any time.

The ***Create*** option creates text strings, text at super string vertices and text on super string segments, and then displays a list key commands in the screen message area, and grips on screen, to quickly allow editing of the text, text size, colour, rotation, style, angle, raise, justification point etc.

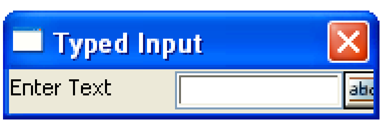
After selecting the option, the ***Pick position*** message is displayed in the screen message area.

To go from **Create** to **Edit** mode, type **e** - go to To Go from Create to Edit Mode - Typing e
To create a text string, type **c** - go to Creating a Text String - Typing c
To create vertex text, type **v** - go to Creating Text at a Super String Vertex- Typing v
To create segment text, type **s** - go to Creating Text at a Super String Segment- Typing s

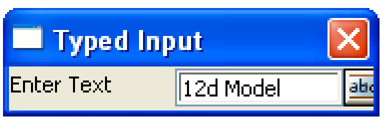
Creating a Text String - Typing c

After typing **c**, the ***Pick position*** message is again displayed in the screen message area and the position of the text is then selected with the cursor.

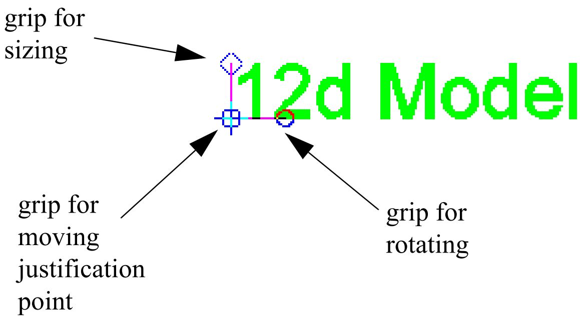
When the position is accepted an **Enter text** typed input box is then displayed on the screen.



The text is typed into the box and the <enter> key pressed.

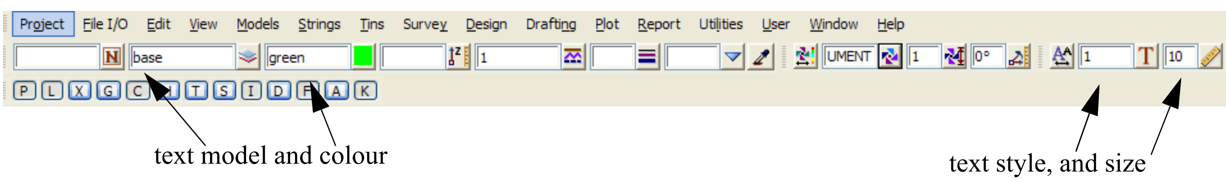


The text vertex and text justification point is placed at that position and the direction of the text is parallel to the x-axis. The angle and raise are both zero and the text justification is (left x, bottom y).

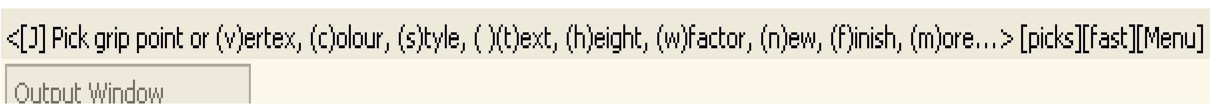


When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.14 Text Grips.

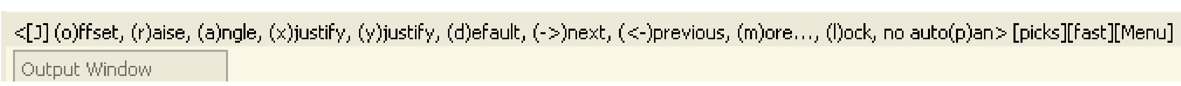
For the new text, the style and height are taken from the ***Text controlbar*** and the model and colour from the ***CAD controlbar*** (see 15.1 Controlbars,15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar).



After the text is created, a list of typed options is then displayed in the screen message area.



and if **m** is typed, the rest of the options are shown

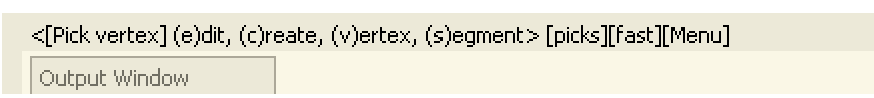


These option are the same as when editing existing text, and will be described in detail in the section 15.15.2 Edit Text.

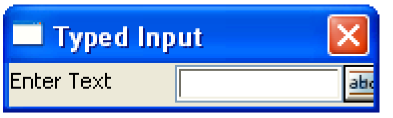
c is the default if nothing is typed.

Creating Text at a Super String Vertex- Typing v

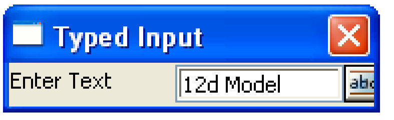
After typing **v**, the ***Pick vertex*** message is displayed in the screen message area and the vertex of the super string to place the text at is then selected with the cursor.



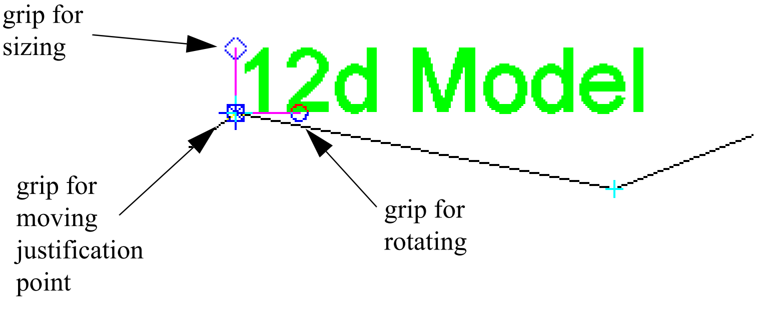
When the vertex is accepted an **Enter text** typed input box is then displayed on the screen.



The text is typed into the box and the <enter> key pressed.

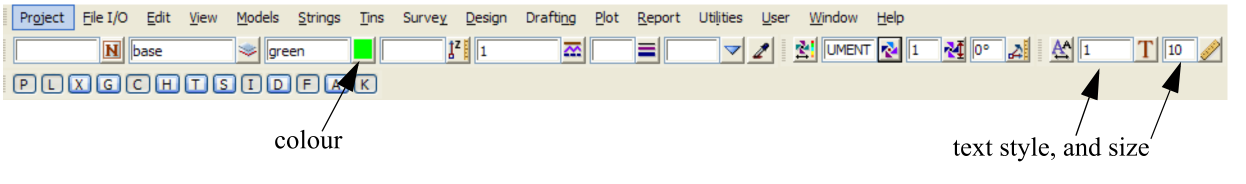


The text justification point is placed at the selected string vertex and the direction of the text is parallel to the x-axis. The angle and raise are both zero and the text justification is (left x, bottom y).

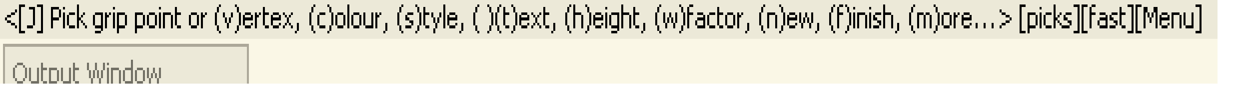


When the text is displayed, grips for quick editing of size, rotation, moving of the justification point and string vertex are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.14 Text Grips.

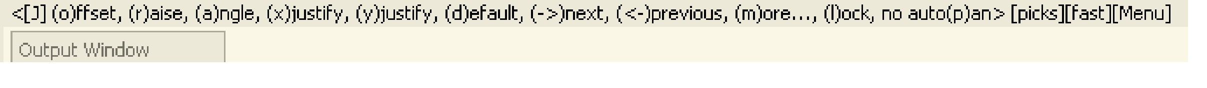
For the new text, the style and height are taken from the ***Text controlbar*** and colour from the ***CAD controlbar*** (see 15.1 Controlbars,15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar). The created text will be part of the super string so no model is required.



After the vertex text is created, a list of typed options is then displayed in the screen message area.



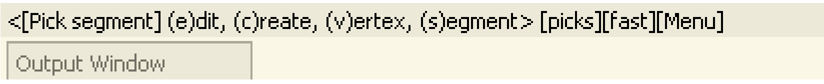
and if **m** is typed, the rest of the options are shown



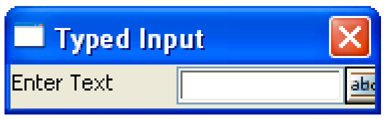
These option are the same as when editing existing text, and will be described in detail in the section 15.15.2 Edit Text.

Creating Text at a Super String Segment- Typing s

After typing **s**, the ***Pick segment*** message is displayed in the screen message area and the segment of the super string to place the text on is then selected with the cursor.

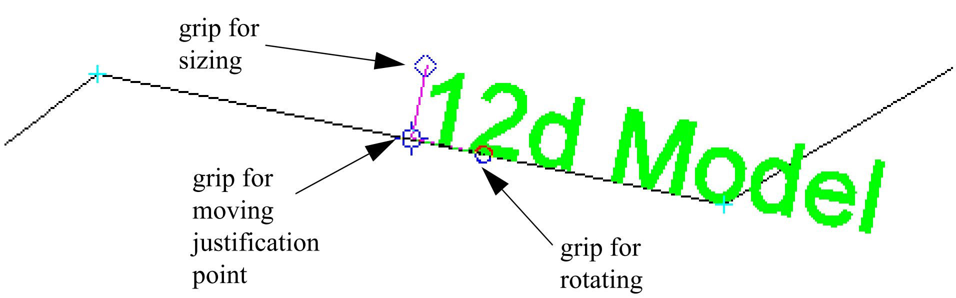


When the segment is accepted an **Enter text** typed input box is then displayed on the screen.



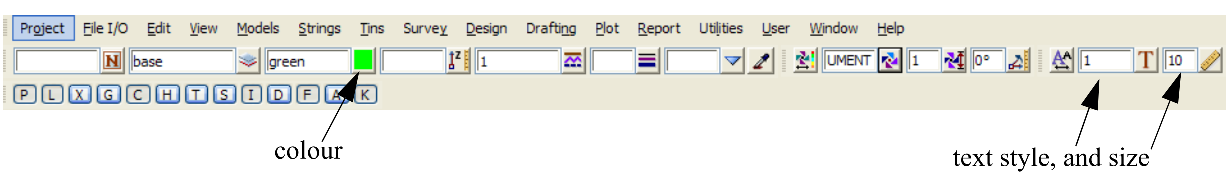
The text is typed into the box and the <enter> key pressed.

The text justification point is placed at the centre of the segment and the direction of the text is parallel to the segment. The angle and raise are both zero and the text justification is (left x, bottom y).

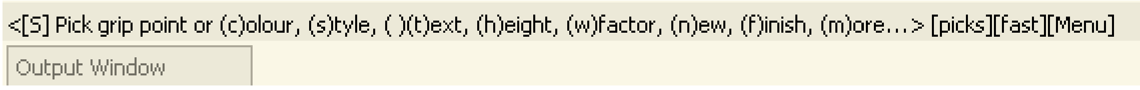


When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.14 Text Grips.

For the new text, the style and height are taken from the ***Text controlbar*** and colour from the ***CAD controlbar*** (see 15.1 Controlbars,15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar). The created text will be part of the super string so no model is required.



After the segment text is created, a list of typed options is then displayed in the screen message area.

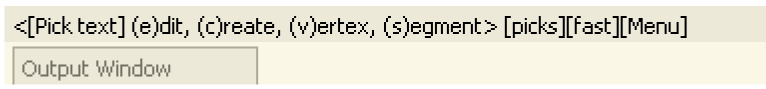


and if **m** is typed, the rest of the options are shown

These option are the same as when editing existing text, and will be described in detail in the section 15.15.2 Edit Text.

To Go from Create to Edit Mode - Typing e

After typing **e**, the ***Pick text*** message is displayed in the screen message area.



This is the same as when selecting the Edit option from the CAD Text toolbar and will be described in detail in the section 15.15.2 Edit Text.

15.15.2 Edit Text

Position of option on menu: **CAD =>Text =>Edit**

or by selection of appropriate icon from the toolbar. 

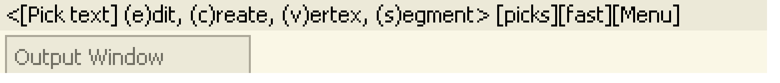
For information about text and its definitions, go to the section 4.6 Text Definitions.

12d Model has two CAD text options ***Create*** and ***Edit***. However both of these run the same option which starts up in different modes - ***Create*** is in the mode to create text as straight text, or text on a super string vertex or on a super string segment and ***Edit*** which edits existing text.

Once either CAD text option is started it is possible to change between the Create and Edit modes at any time.

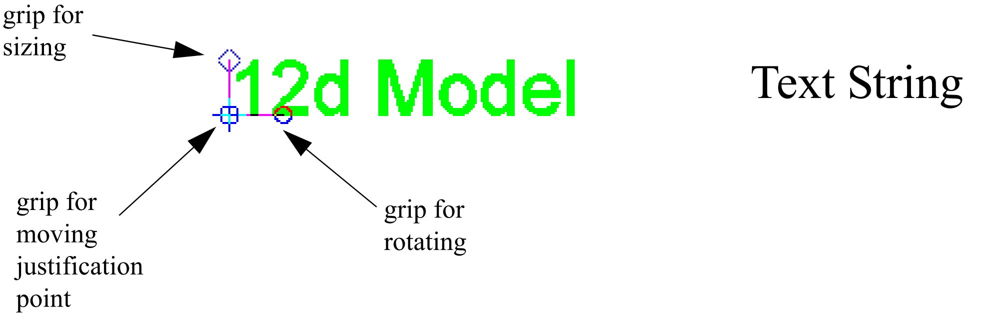
The ***Edit*** option edits text as either text strings, text at super string vertices or text on super string segments.

After typing **e**, the ***Pick text*** message is displayed in the screen message area

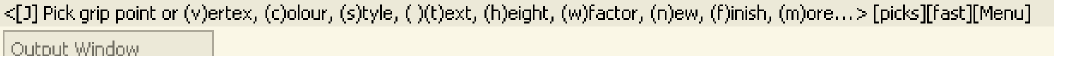


and text either as a text string, or text on a super string vertex or segment, is then selected by the mouse for editing.

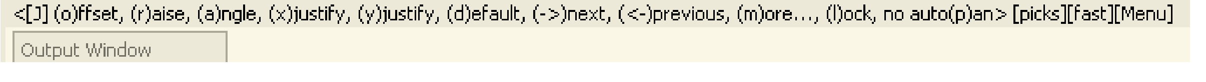
The selected text with the text edit grips is shown on screen, and a list of available typed commands in the screen message area to quickly allow editing of the text, text size, colour, rotation, style, angle, raise, justification point, vertex, etc.



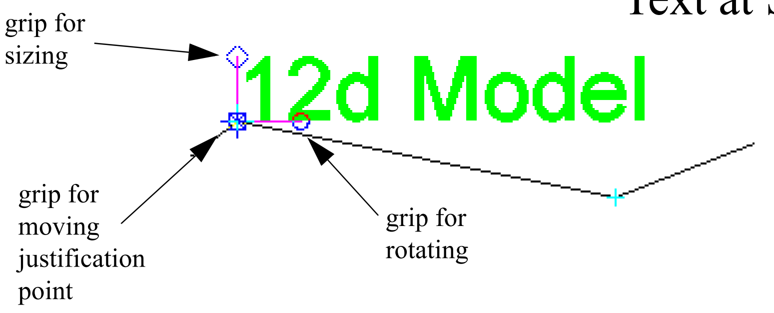
Options displayed after selecting text



and by typing **m**



Text at Super String Vertex



Options displayed after selecting text

<[J] Pick grip point or (v)ertex, (c)olour, (s)tyle, ( )(t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]

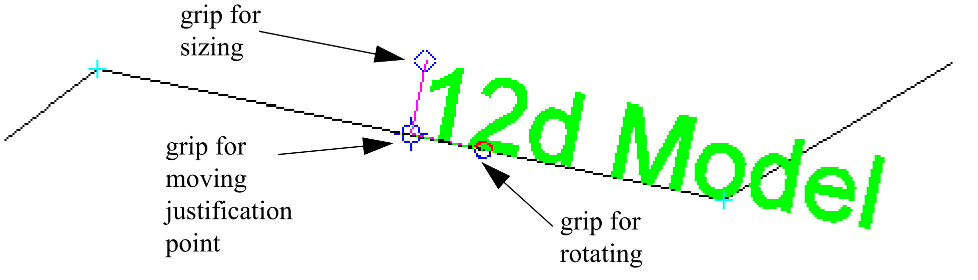
Output Window

and by typing **m**

<[J] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]

Output Window

Text on Super String Segment



Options displayed after selecting text

<[S] Pick grip point or (c)olour, (s)tyle, ( )(t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]

Output Window

and by typing **m**

<[S] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., no auto(p)an, <-previous, ->next> [picks][fast]

Output Window

To change the text colour, type **c** - go to Change Text Colour - Typing c

To change the text style, type **s** - go to Change Text Style - Typing s

To change the actual text, type **t** or press **space bar** - go to Change Text - Pressing space bar or Typing t

To change the text height, type **h** - go to Change Text Height - Typing h

To change the text width factor, type **w** - go to Change Text Width Factor - Typing w

To create/edit a new text, type **n** - go to Create/Edit New Text - Typing n

To end the create/edit option, type **f** - go to Finish the Create/Edit - Typing f

To show the other line of options, type **m** - go to Show Other Line of Options - Typing m

To change the text offset, type **o** - go to Change Text Offset - Typing o

To change the text raise, type **r** - go to Change Text Raise - Typing r

To change the text angle, type **a** - go to Change Text Angle - Typing a

To change the text x justification, type **x** - go to Change Text X Justification - Typing x

To change the text y justification, type **y** - go to Change Text Y Justification - Typing y

To reset some text values to their defaults, type **d** - go to Reset Text Parameters to Defaults - Typing d

To change focus to the next text, press **->** - go to Change Focus to the Next Text in String - Pressing right arrow key (->)

To change focus to the previous text, press **<-** - go to Change Focus to the Previous Text in String - Pressing left arrow key (<-)

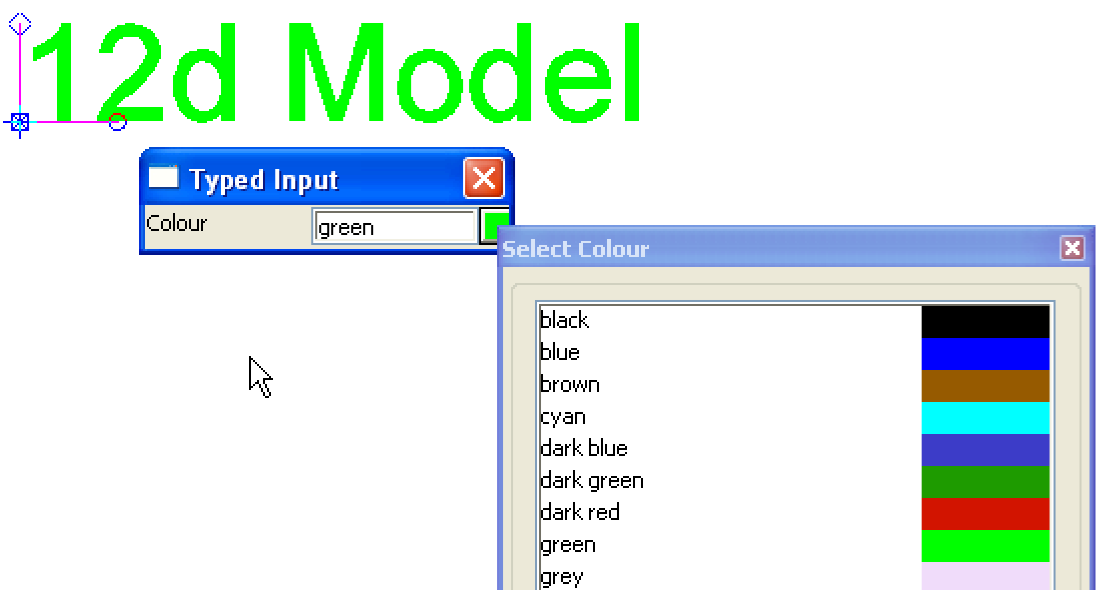
To show the other line of options, type **m** - go to Show Other Line of Options - Typing m

To toggle vertex lock on and off, type **l** - go to Toggle Lock - Typing l

To toggle autopan on and off, type **p** - go to Toggle Autopan - Typing p

Change Text Colour - Typing c

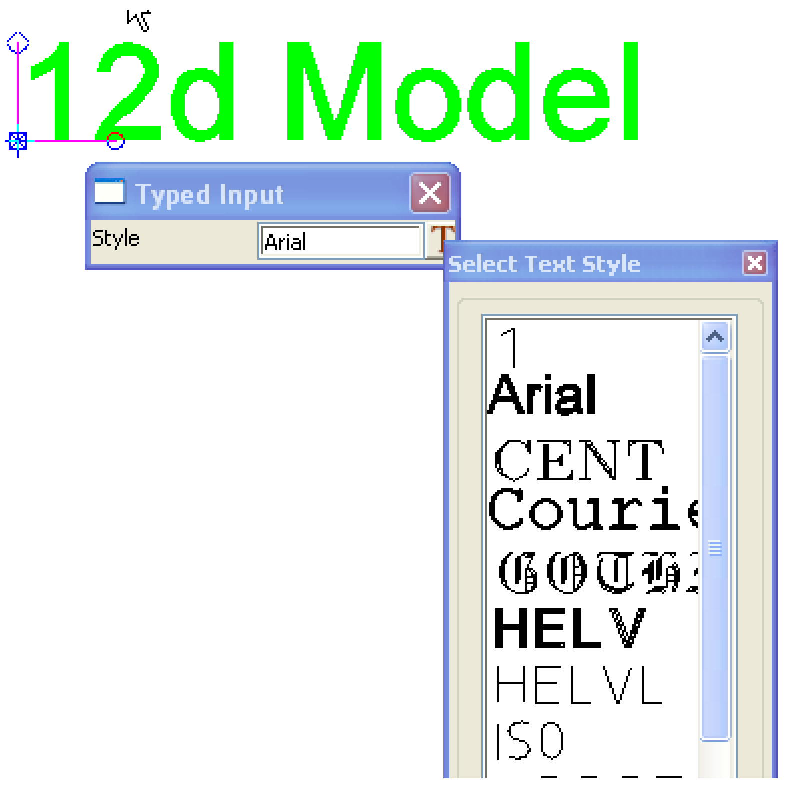
After typing **c**, a Colour **Typed input** box appears with the current text colour displayed.



The new colour for the text is typed into the Colour input box followed by the <enter> key, or by selecting a colour from the **Select Colour** box which is brought up by clicking B1 on the colour button.

Change Text Style - Typing s

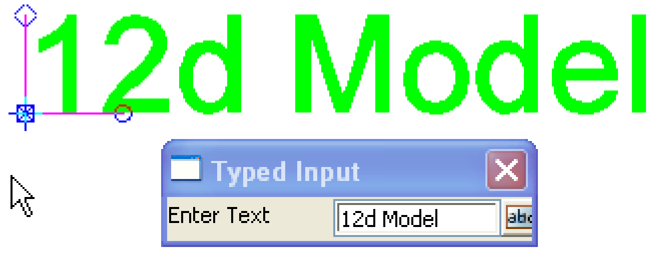
After typing **s**, a Style **Typed input** box appears with the current text style displayed.



The new style for the text is typed into the Style input box followed by the <enter> key, or by selecting a style from the **Select Text Style** box which is brought up by clicking B1 on the style button.

Change Text - Pressing space bar or Typing t

After typing **t** or pressing the space bar, an Enter Text **Typed input** box appears with the current text in it.



The new text is typed into the Enter Text input box followed by the <enter> key.

Change Text Height - Typing h

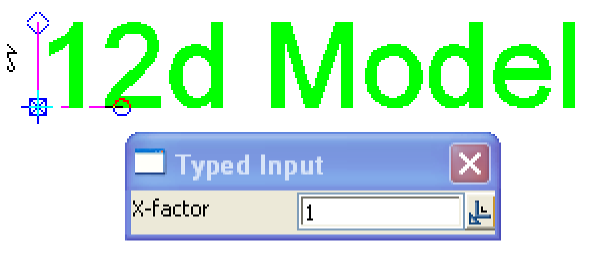
After typing **h**, a Size **Typed input** box appears with the current text height in it.

The new height is typed into the Size input box followed by the <enter> key.

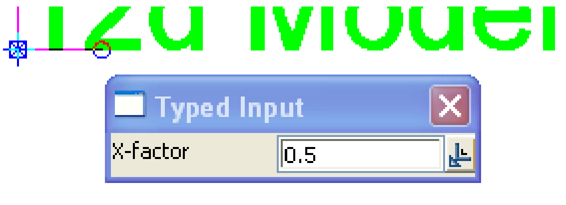
Note - Many arithmetic expressions are supported in the **Size** typed input box (*e.g.* 10+27). See the section 4.19.1 Expressions in Panel Fields.

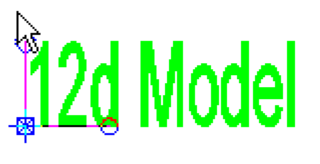
Change Text Width Factor - Typing w

After typing **w**, a X-Factor **Typed input** box appears with the current width (x-factor) in it.



The new width (x-factor) is typed into the X-factor input box followed by the <enter> key.



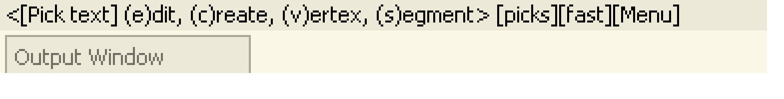


width (x-factor) = 0.5

Note - Many arithmetic expressions are supported in the **X-factor** typed input box (e.g. 0.5*2.2). See the section 4.19.1 Expressions in Panel Fields.

Create/Edit New Text - Typing n

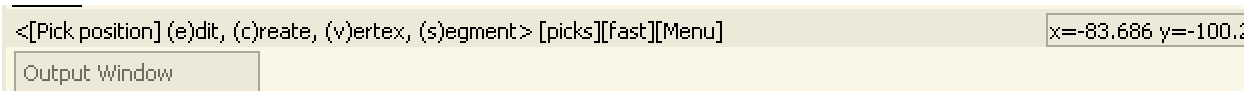
If the option was in ***Edit*** mode and **n** is typed, a new **Edit** is started (**e** mode). The ***Pick text*** message is displayed in the screen message area and another text is selected to edit.



Or a ***new*** text can be created by typing **c**, **v** or **s**. See the section 15.15.1 Create Text for more information on **c**, **v** and **s**.

If the option was in ***Create*** mode and **n** is typed, a new **Create** is started in the **c** mode. The

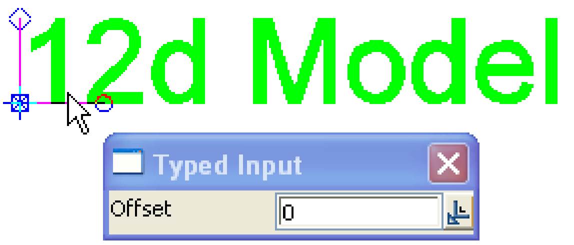
Pick position message is displayed in the screen message area and a new text is created.

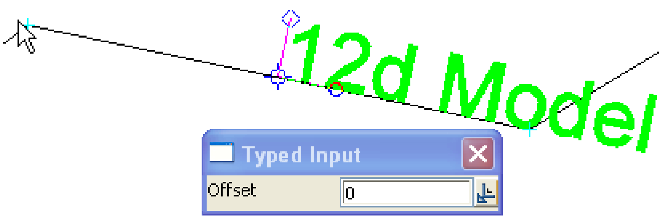


Or a ***new*** segment or vertex text can be created by typing **v** or **s** or the Edit mode can be entered by typing **e**. See the section 15.15.1 Create Text for more information on **c**, **v** and **s**.

Change Text Offset - Typing o

After typing **o**, an Offset **Typed input** box appears with the current text offset in it.



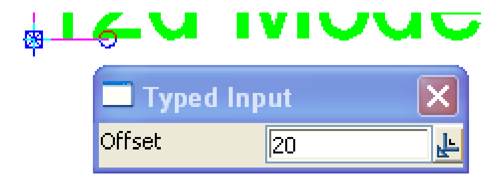


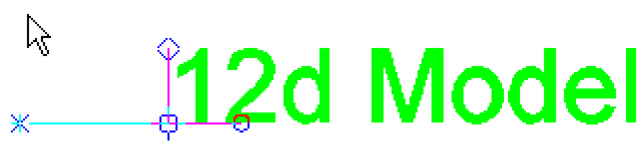
Vertex text - offset = 0

Segment text - offset = 0

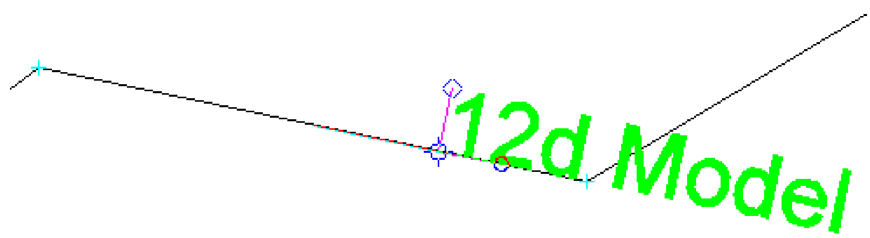
The new offset is typed into the Offset input box followed by the <enter> key.

The text justification point will be offset by the new amount





Vertex text - offset = 20



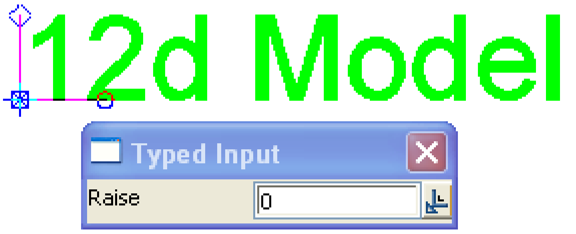
Segment text - offset = 20

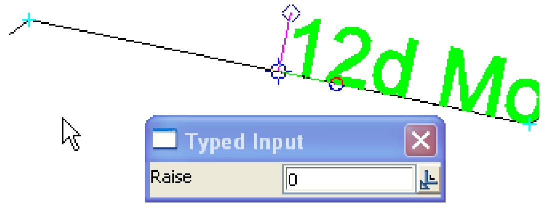
For information about text and the definition of **offset**, go to the section 4.6 Text Definitions.

Note - Many arithmetic expressions are supported in the **Offset** typed input box (*e.g.* 10+27). See the section 4.19.1 Expressions in Panel Fields.

Change Text Raise - Typing r

After typing **r**, a Raise **Typed input** box appears with the current text raise in it.

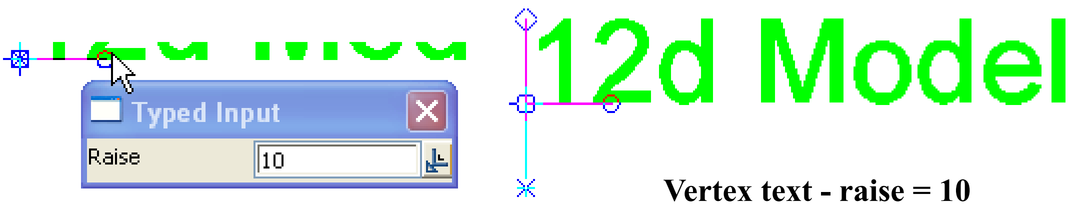




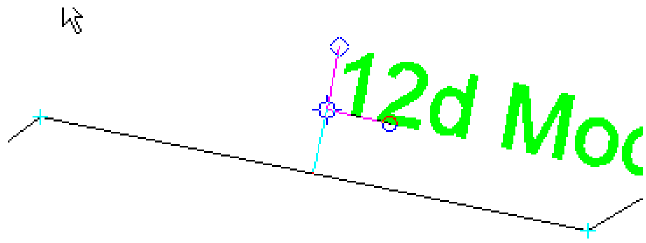
Vertex text - raise = 0 **Segment text - raise = 0**

The new raise is typed into the Raise input box followed by the <enter> key.

The text justification point will be raised by the new amount



Vertex text - raise = 10



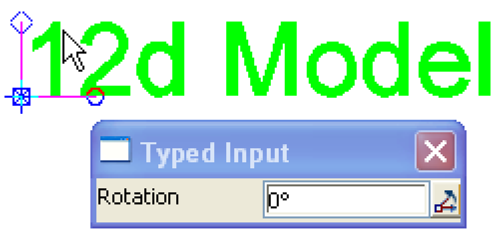
Segment text - raise = 10

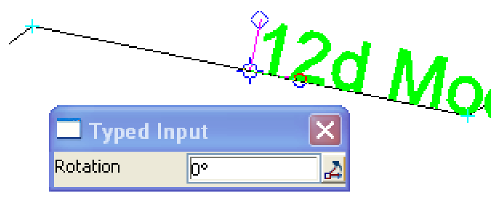
For information about text and the definition of **raise**, go to the section 4.6 Text Definitions.

Note - Many arithmetic expressions are supported in the **Raise** typed input box (*e.g.* 10+27). See the section 4.19.1 Expressions in Panel Fields.

Change Text Angle - Typing a

After typing **a**, a Rotation **Typed input** box appears with the current text angle in it.



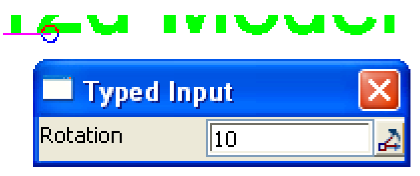


Vertex text - angle = 0 **Segment text - angle = 0**

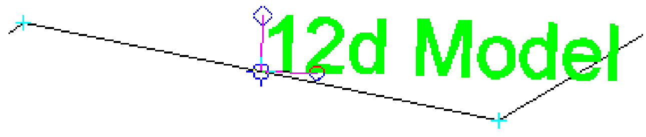
The new angle is typed into the Rotation input box followed by the <enter> key.

The direction of the text point will be rotated by the new amount.

For information about text and the definition of **angle**, go to the section 4.6 Text Definitions.



Vertex text - angle = 10

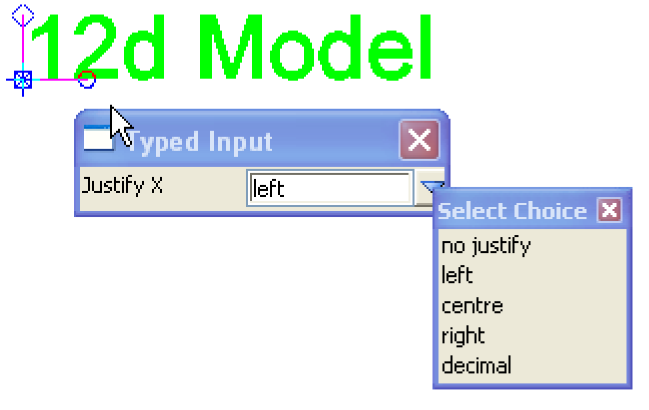


Segment text - angle = 10

Note - Some arithmetic expressions are supported in the **Rotation** typed input box (*e.g.* 10+90). See the section 4.19.1.2 Expressions in Bearing, Angle Panel Fields for what is allowed in angle/ bearing panel fields.

Change Text X Justification - Typing x

After typing **x**, a Justify X **Typed input** box appears with the current text x justification in it.

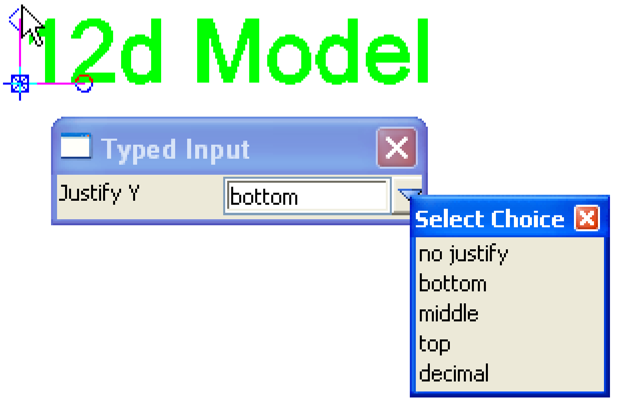


The new x justification for the text is typed into the Justify X input box followed by the <enter> key, or by selecting a justification from the **Select Choice** box which is brought up by clicking B1 on the choice button.

For information about text and the definition of **justification**, go to the section 4.6 Text Definitions.

Change Text Y Justification - Typing y

After typing **y**, a Justify Y **Typed input** box appears with the current text y justifcation in it.



The new y justification for the text is typed into the Justify Y input box followed by the <enter> key, or by selecting a justification from the **Select Choice** box which is brought up by clicking B1 on the choice button.

For information about text and the definition of **justification**, go to the section 4.6 Text Definitions.

Reset Text Parameters to Defaults - Typing d

After typing **d**, some of the text parameters are set back to their default values.

That is for a:

Text String, Vertex Text and Segment Text:

Text style is set to the Text style in the Cad Text Controlbar

Colour is reset to the colour in the Cad Controlbar

Size is set to the size in the Cad Text Controlbar

Angle is set to 0r

Offset is set to 0

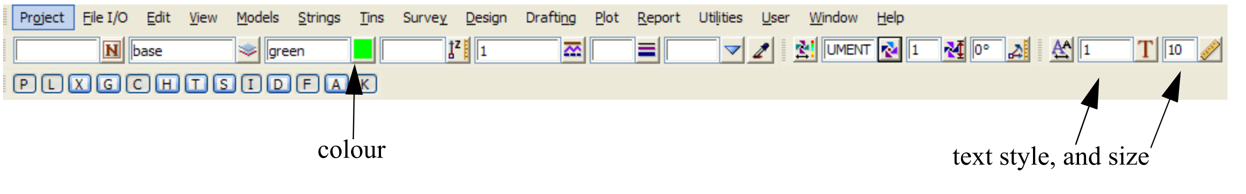
Raise is set to 0

X Factor is set to 1

X Justification is set to left

Y Justification is set to bottom

Model stays the same



For information about text definitions, go to the section 4.6 Text Definitions.

Change Focus to the Next Text in String - Pressing right arrow key (->)

For vertex text on a super string, pressing **->,** moves the focus of the edit commands to the vertex text on the next vertex of the super string. If the text is on the last vertex, pressing **->** does nothing.

For segment text on a super string, pressing **->**, moves the focus of the edit commands to the segment text on the next segment of the super string. If the text is on the last segment, pressing **->** does nothing.

For information about text definitions, go to the section 4.6 Text Definitions.

Change Focus to the Previous Text in String - Pressing left arrow key (<-)

When editing vertex text on a super string, pressing **<-,** moves the focus of the edit commands to the vertex text on the **previous** vertex of the super string. If the text is on the first vertex, pressing **<-** does nothing. If Autopan is on, the selected vertex text is made the centre of the active plan view.

When editing segment text on a super string, pressing **<-,** moves the focus of the edit commands to the segment text on the **previous** segment of the super string. If the text is on the first segment, pressing **<- d**oes nothing. If Autopan is on, the selected segment text is made the centre of the active plan view.

For information about text definitions, go to the section 4.6 Text Definitions.

Toggle Lock - Typing l

Typing **l** toggles locking the vertex on and off.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads (l) lock (l)ock, , this means that vertex lock is off (unlocked) and typing **l** locks it.

When the screen message area reads un(l) lock un(l)ock, , this means that the vertex is locked and typing **l** unlocks it.

For information about the vertex text grip, go to the section 4.14 Text Grips.

For information about text definitions, go to the section 4.6 Text Definitions.

Toggle Autopan - Typing p

Typing **p** toggles autopan on and off.

When editing vertex text on a super string and **Autopan** is **on**, pressing **->** or **<-**, moves the focus of the edit commands to the vertex text on the next/previous vertex of the super string, and the selected vertex text is made the centre of the active plan view.

When editing segment text on a super string and **Autopan** is **on**, pressing **->** or **<-**, moves the focus of the edit commands to the vertex text on the next/previous segment of the super string, and the selected segment text is made the centre of the active plan view.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads auto(p)an 

, this means that autopan is off and typing **p** turns autopan on.

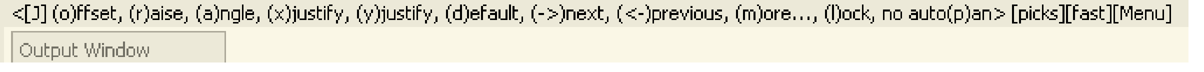
When the screen message area reads no auto(p)an 

, this means that autopan is on and typing **p** turns it off.

For information about text definitions, go to the section 4.6 Text Definitions.

Show Other Line of Options - Typing m

There are too many *Edit* options to fit onto one line of the screen message and two lines of options are required. Typing **m** toggles between the two lines of options.



Finish the Create/Edit - Typing f

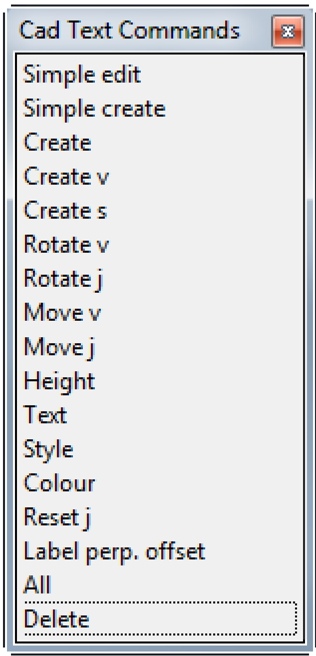
Typing **f** exits the create/edit text option.

15.15.3 CAD Text Commands

The *Cad Text Commands* do just one text modification at a time but once one selected text has been modified, another text can then be selected to have the same type of modification.

So the CAD Text Commands perform the same modification on progressively selected texts whereas the CAD Text Create and CAD Text Edit options perform any of the modifications on the one selected text.

The **Cad text commands** walk-right menu is



Menu of Individual Options to Create and Manipulate Text

earlier version of CAD Text Edit - edit text using grips
earlier version of CAD Text Create - create text string and edit using grips
create text string at a selected position
create text at a user selected super string vertex
create text at a user selected super string segment
rotate text about its vertex
rotate text about its justification points (which may be offset from the vertex
move text by its vertex
move text by its justification point (the vertex does not move)
change the height of text
change the characters of the text
change the style of text
change the colour of text
reset the text justification point so that it is on top of the vertex posn
label perpendicular offset distance
menu to make most of the above changes to one selected text
delete text

For the option *Simple edit*, go to	15.15.4 Simple Text Edit
Simple create	15.15.5 Simple Text Create
Create	15.15.6 Text Create
Create v	15.15.7 Create Text on Vertex of Super String
Centre s	15.15.8 Text Create on Segment of Super Strings
Rotate v	15.15.9 Rotate Text around Vertex
Rotate j	15.15.10 Rotate Text about the Justification Point
Move v	15.15.12 Move the Text Vertex Point
Move j	15.15.11 Move the Text Justification Point
Height	15.15.13 Height of Text
Text	15.15.14 Change Text
Style	15.15.15 Style of Text
Colour	15.15.16 Text Colour
Reset j	15.15.17 Reset Text Justification Point
Label perp. offset	15.15.18 Label Perpendicular Offset
All	15.15.19 All Text Edits
Delete	15.15.20 Text Delete

15.15.4 Simple Text Edit

Position of option on menu: CAD =>Text =>Commands =>Simple edit

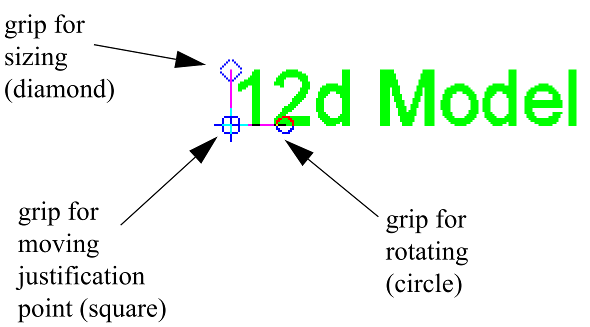
or by selection of appropriate icon from the toolbar. 

This option edits text strings, and text on super string vertices or segments, using grips to quickly define the mode of editing (sizing, rotating or moving the justification point).

On selecting **Simple edit**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

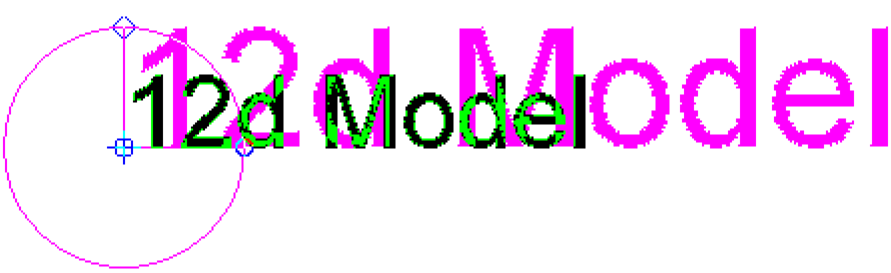
When the text to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.



Size Grip (diamond):

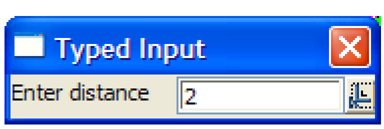
If the **Size grip** is selected, the text size is dynamically adjusted by moving the cursor. The size of the text is displayed as part of the *Enter height* prompt in the message area.

The text size is set when a position is accepted.



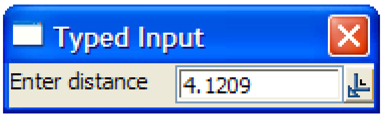
An ***exact*** text size can be entered by hitting the <space bar> or by starting to type a size. This brings up the **Enter distance** typed input box. The size is typed in and the <enter> key pressed

.



To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically sized, the ***current*** size of the text can be displayed by pressing the **d** key which brings up the **Enter distance** typed input box with the current text size in it.



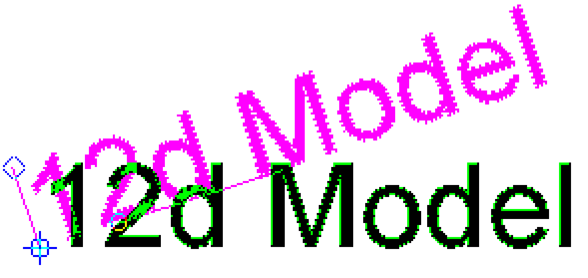
The size can be modified and the value used by pressing the <enter> key.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box.

Rotate Grip (circle):

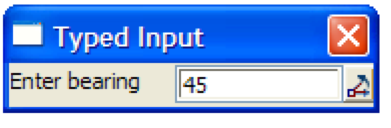
If the **Rotate grip** is selected, the text bearing is dynamically adjusted by moving the cursor. The bearing of the text is displayed as part of the *Enter bearing* prompt in the message area.

The text bearing is set when a position is accepted.



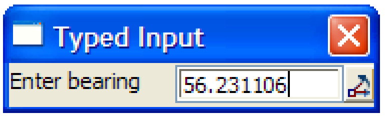
An ***exact*** bearing can be entered by hitting the <space bar> or by starting to type a bearing. This brings up the **Enter bearing** typed input box. The *bearing* is typed in and the <enter> key pressed

.



To return to dynamic rotating without entering a bearing, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically rotated, the ***current*** bearing of the text can be displayed by pressing the **d** key which brings up the **Enter bearing** typed input box with the *current* text bearing in it.



The *bearing* can be modified and the value used by pressing the <enter> key.

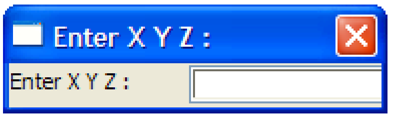
To return to dynamic rotation without entering a bearing, simply select the **X** on the top of the input box.

Justification Grip (square):

If the **Justification grip** is selected, the text justification point is dynamically adjusted by moving the cursor. The (x,y) position of the text is displayed in the message area.

The text justification point is set when a position is accepted.

An ***exact*** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.



To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

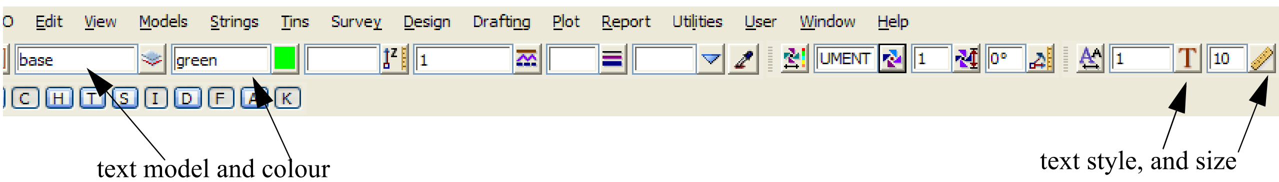
15.15.5 Simple Text Create

Position of option on menu: **CAD =>Text =>Simple create**

or by selection of appropriate icon from the toolbar. 

This option creates text strings and then displays grips to quickly allow editing of text size, rotation and justification point.

The text style and height are taken from the **Text controlbar** and the model and colour from the **CAD controlbar** (see 15.1 Controlbars,15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar).



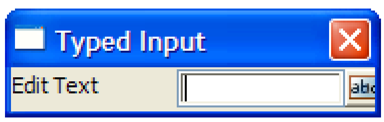
The text will be placed with the vertex and justification point at the selected position.

After defining one piece of text, the option restarts so that another of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

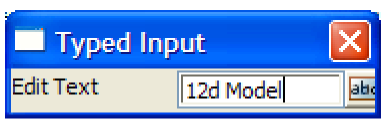
On selecting **Simple create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

An insertion point for the text is selected and accepted and an **Enter text** typed input box is then displayed on the screen.

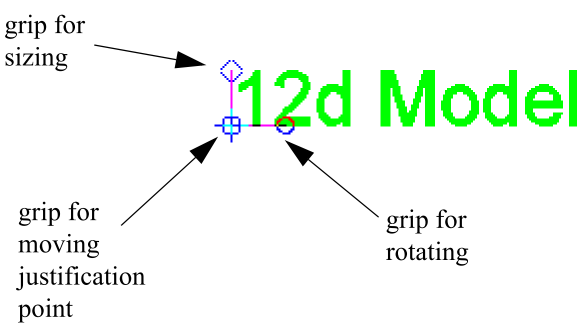


The text is typed into the box and the <enter> key pressed.



The text will be placed with the vertex and justification point at the selected position and using values such as colour, model, text height and text style given in the **CAD controlbar** and **Text controlbar** (See 15.1 Controlbars)

When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 15.15.5 Simple Text Create.



15.15.6 Text Create

Position of option on menu: **CAD =>Text =>Create**

or by selection of appropriate icon from the toolbar.

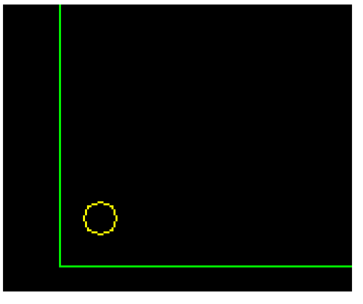
This option creates text strings at a selected insertion point (a cursor snap is valid).

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting **Create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

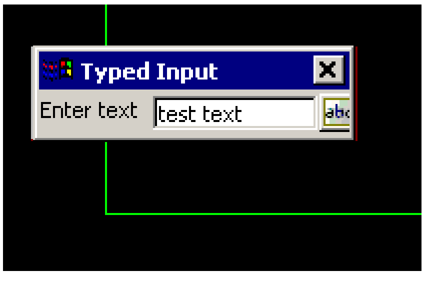
STEP 1:

An insertion point is selected and accepted. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel



STEP 2:

The actual text is entered into the text input box followed by the enter key.



STEP 3:

The text is created using the specified settings.

15.15.7 Create Text on Vertex of Super String

Position of option on menu: **CAD =>Text =>Create v**

or by selection of appropriate icon from the toolbar.

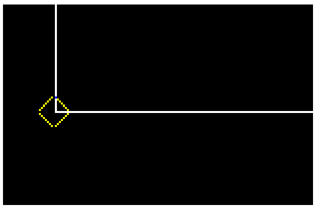
This option creates text at a vertex of a super string. One piece of text is allowed per super string vertex, so if this option is used on existing vertex text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting **Create v**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

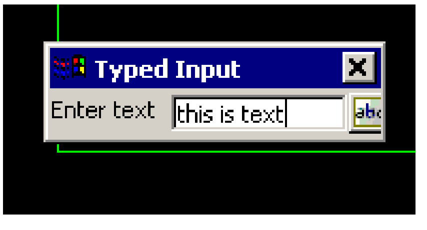
STEP 1:

An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel



STEP 2:

The actual text is entered into the text input box followed by the Enter key.



STEP 3:

The text is created using the specified settings.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

15.15.8 Text Create on Segment of Super Strings

Position of option on menu: **CAD =>Text =>Create s**

or by selection of appropriate icon from the toolbar.

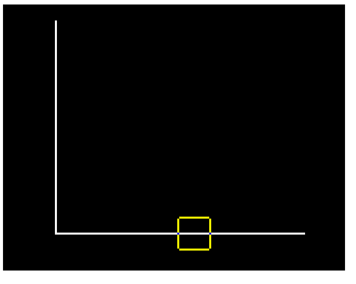
This option creates text at the mid point of a selected super string segment. One piece of text is allowed per super string segment, so if this option is used on existing segment text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

On selecting **Create s**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

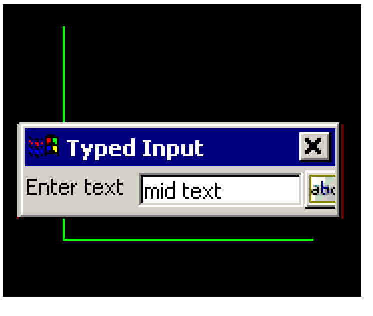
STEP 1:

A super string segment is selected and accepted. The line snap is forced on so that a segment can be selected. The text will be placed relative to the insertion point which is the midpoint of the segment given other parameters such as justification, as defined in the textstyle data panel



STEP 2:

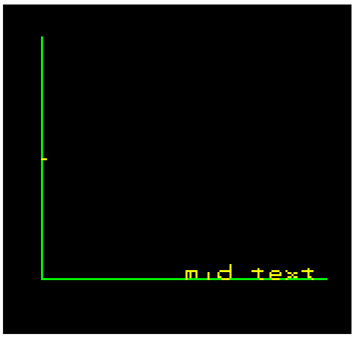
The actual text is entered into the text input box followed by the Enter key.



STEP 3:

The text is created using the specified settings.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



mid text

15.15.9 Rotate Text around Vertex

Position of option on menu: **CAD =>Text =>Rotate v**

or by selection of appropriate icon from the toolbar.

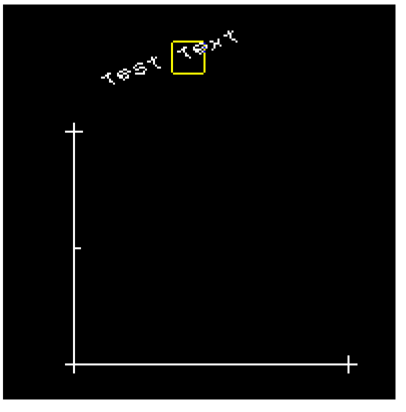
This option rotates text about its vertex. This applies to text strings, super string segment or vertex text and 4d string vertex text. For super string segment text, the vertex is taken to be the mid point of the segment.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.

On selecting **Rotate v**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A text string to be rotated is selected and accepted.



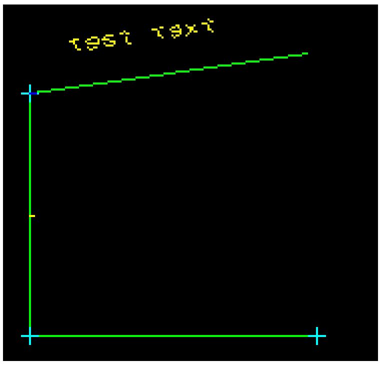
STEP 2:

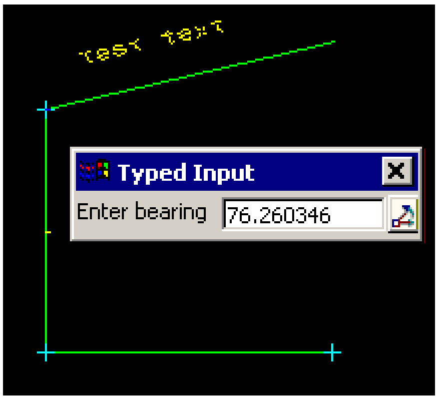
The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an input box followed by the enter key. To bring up the input box start typing or press the space bar. The value is entered into the input box followed by the enter key.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the angle continued.

Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



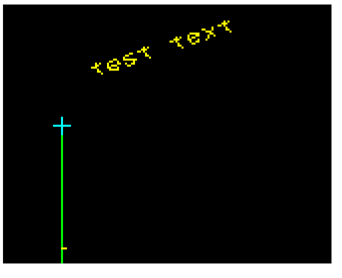


This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The text is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



15.15.10 Rotate Text about the Justification Point

Position of option on menu: **CAD =>Text =>Rotate j**

or by selection of appropriate icon from the toolbar. 

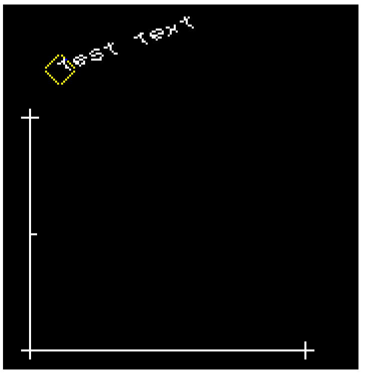
This option rotates text about its justification point. Note that the vertex point and the justification point do not coincide when either the raise or offset for the text is not zero.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

On selecting **Rotate j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The text to be rotated is selected and accepted.

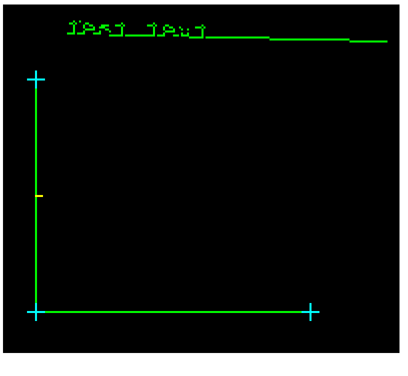


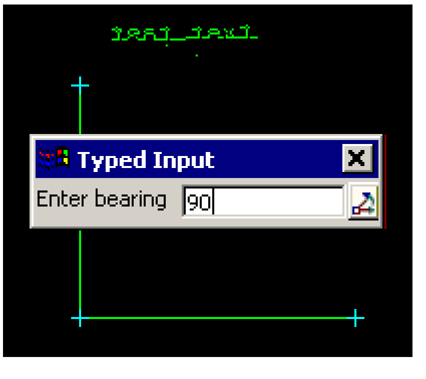
STEP 2:

The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: **The Page up and page down keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.**



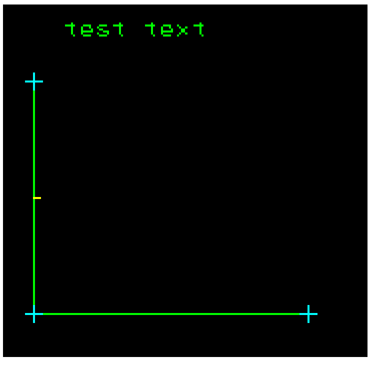


This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The text is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



15.15.11 Move the Text Justification Point

Position of option on menu: **CAD =>Text =>Move j**

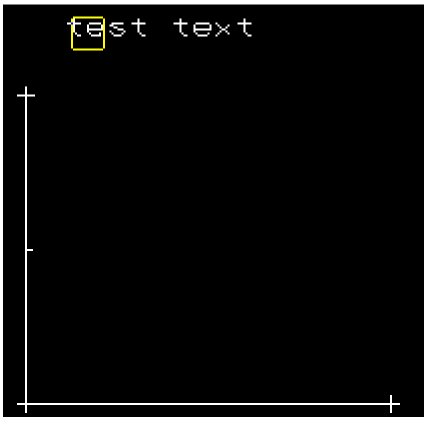
or by selection of appropriate icon from the toolbar.

This option moves the text justification point, and hence the text with it.

On selecting **Move j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

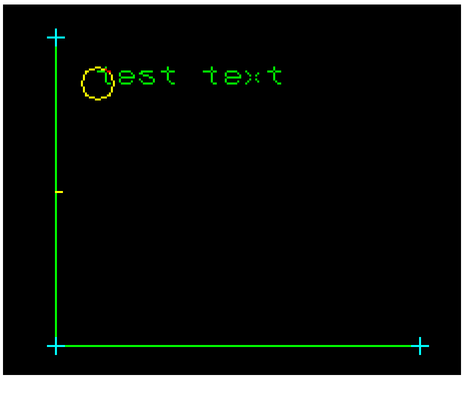
STEP 1:

The text to be moved is selected and accepted.



STEP 2:

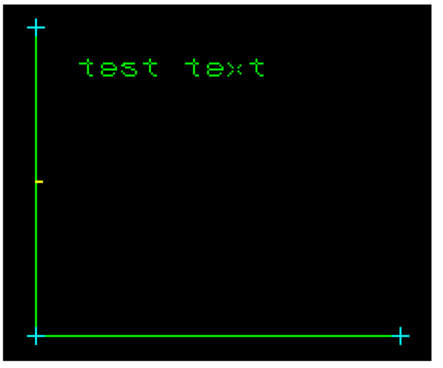
The new position for the text is selected and accepted.



STEP 3:

The text is moved to the new position.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



test text

15.15.12 Move the Text Vertex Point

Position of option on menu: **CAD =>Text =>Move v**

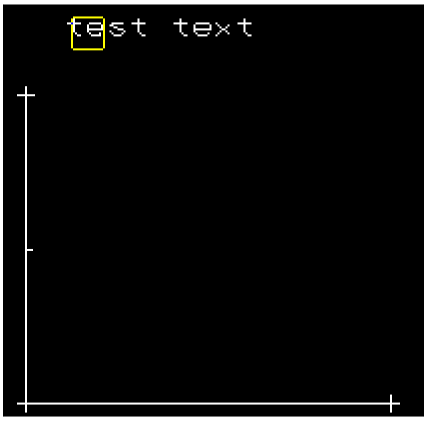
or by selection of appropriate icon from the toolbar. 

This option moves the vertex that vertex text is attached to, and hence moves the text with it. The option works for text strings, vertex text for super strings and 4d string but will ***not*** work for segment text where there is no actual vertex at the mid segment position where the segment text is initially placed.

On selecting **Move v**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

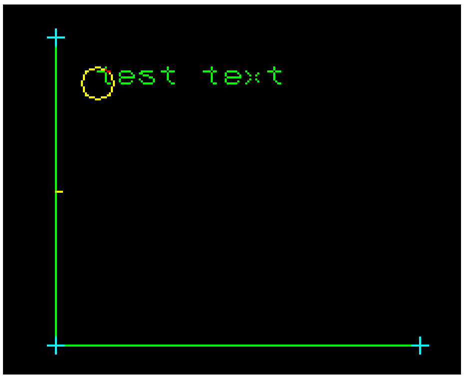
STEP 1:

The vertex text to be moved is selected and accepted.



STEP 2:

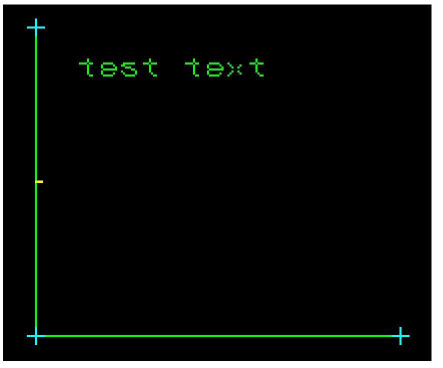
The new position for the vertex and the text is selected and accepted.



STEP 3:

The vertex and the vertex text is moved to the new position.

Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.



test text

15.15.13 Height of Text

Position of option on menu: **CAD =>Text =>Height**

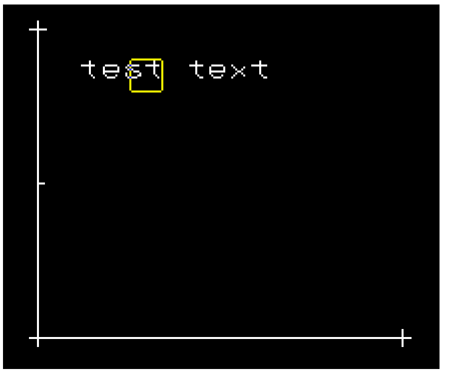
or by selection of appropriate icon from the toolbar. 

This option changes the height of text.

On selecting **Height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

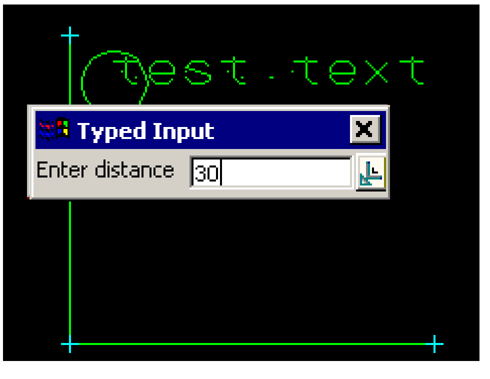
The text of which the height is to be changed is selected and accepted.



STEP 2:

A height for the text is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

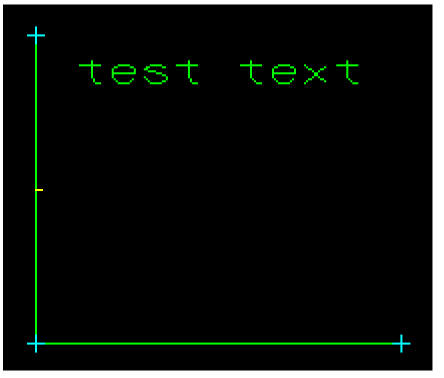


This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

The text height is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



15.15.14 Change Text

Position of option on menu: CAD =>Text =>Text

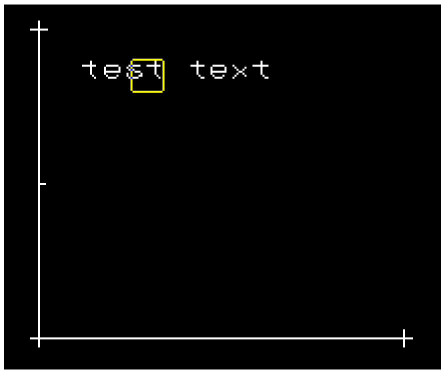
or by selection of appropriate icon from the toolbar.

This option edits the characters of selected text.

On selecting **Text**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

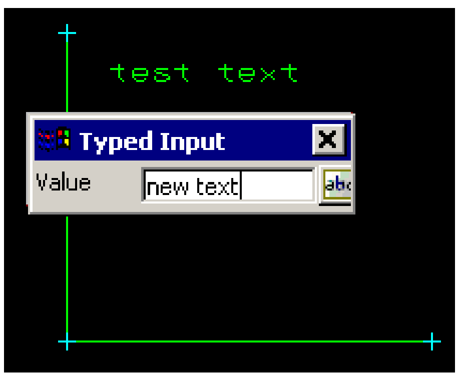
STEP 1:

The text to be changed is selected and accepted.



STEP 2:

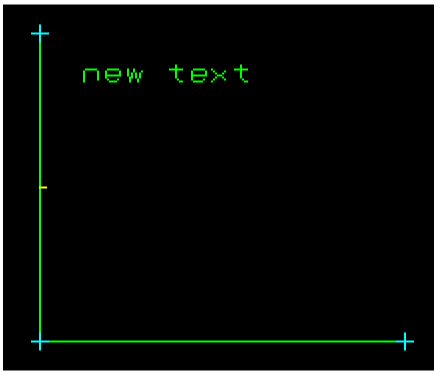
The new text is entered into the text input box followed by the Enter key.



STEP 3:

The text is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



new text

15.15.15 Style of Text

Position of option on menu: CAD =>Text =>Style

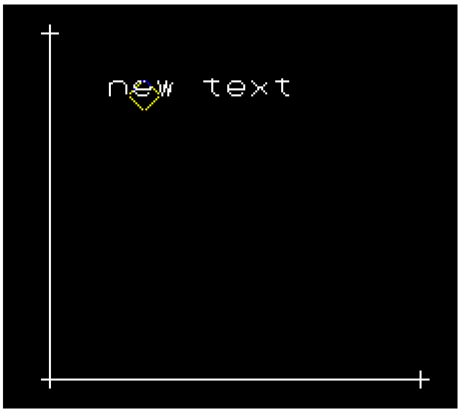
or by selection of appropriate icon from the toolbar.

This option changes the textstyle of selected text.

On selecting **Style**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

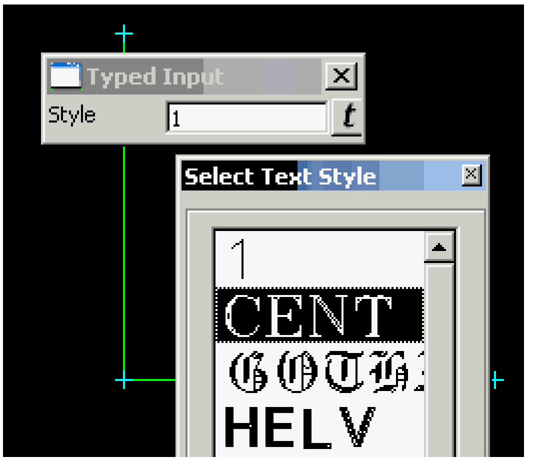
STEP 1:

The text to be changed is selected and accepted.



STEP 2:

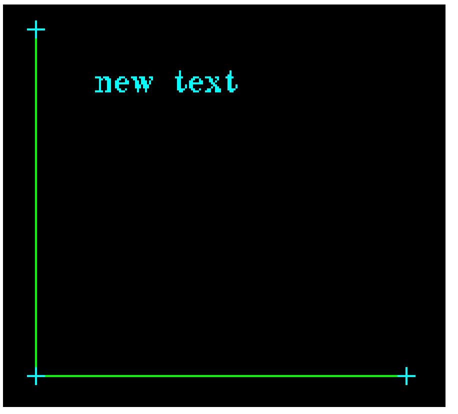
The new textstyle is selected from the style pop-up list.



STEP 3:

The textstyle is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



new text

15.15.16 Text Colour

Position of option on menu: **CAD =>Text =>Colour**

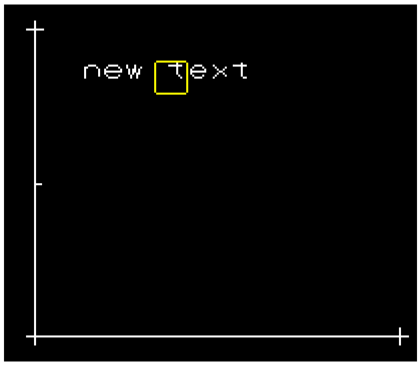
or by selection of appropriate icon from the toolbar.

This option changes the colour of selected text.

On selecting **Colour**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

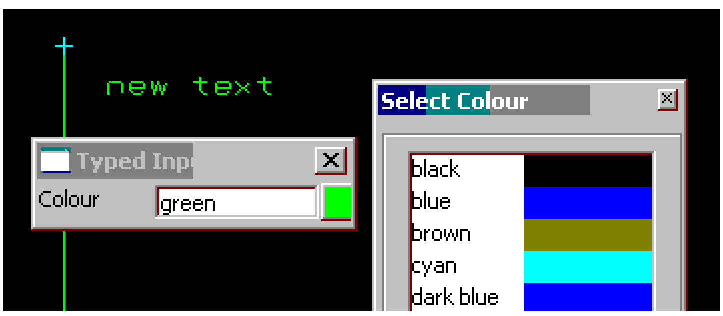
STEP 1:

The text to be changed is selected and accepted.



STEP 2:

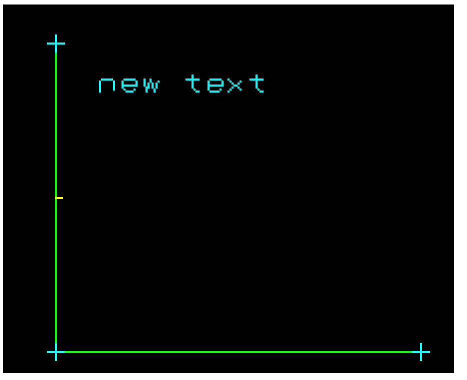
The new colour for the text is entered into the text input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.



STEP 3:

The text colour is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



new text

15.15.17 Reset Text Justification Point

Position of option on menu: **CAD =>Text =>Reset j**

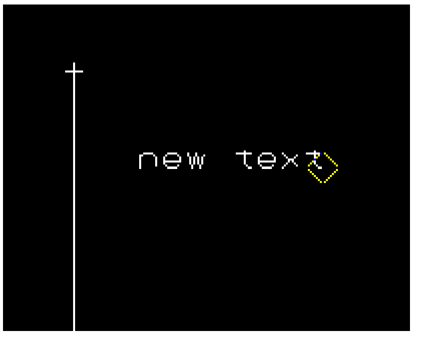
or by selection of appropriate icon from the toolbar. 

This option resets the text justification point back to being the same as the vertex for vertex text, and to the segment mid point for segment text. That is, the offset and raise for the selected text are both set to zero.

On selecting **Reset j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

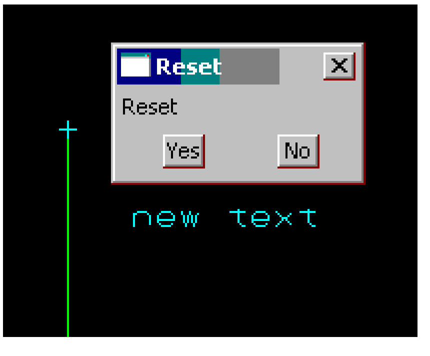
STEP 1:

The text to be changed is selected and accepted.



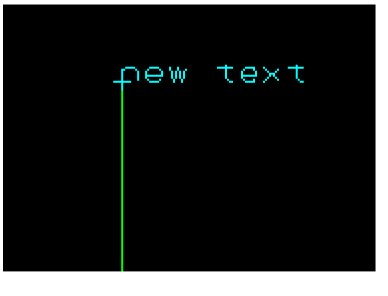
STEP 2:

A warning message is shown giving the user the option of resetting the justification point or not.



STEP 3:

The text is reset if accepted.



15.15.18 Label Perpendicular Offset

Position of option on menu: **CAD =>Text =>Label perp. Offset**

or by selection of appropriate icon from the toolbar. 

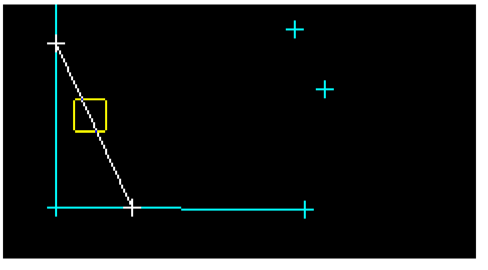
This option creates a perpendicular line from a selected segment to a selected position, and creates text with the value of the perpendicular distance between the segment and the selected position, on the line.

On selecting **Label perp. Offset**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

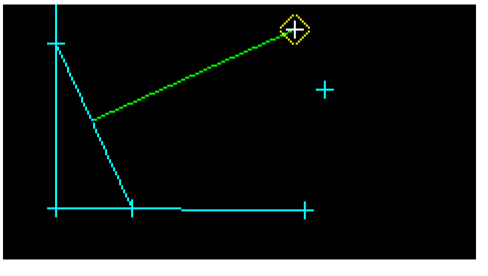
A string is selected and accepted.

After the string is accepted a perpendicular line will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a 2nd point is selected and accepted.



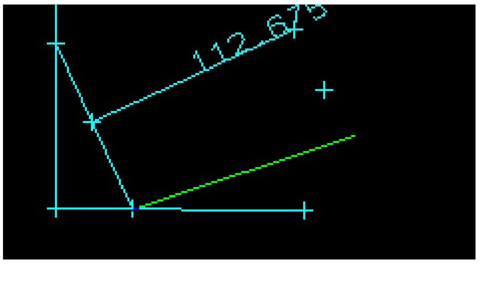
STEP 2:

Select a 2nd point and accept it.



STEP 3:

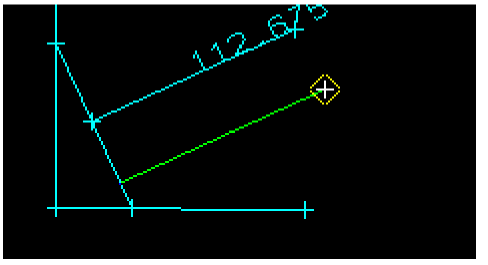
A perpendicular line is constructed between the accepted string and point. The length value of this line will be displayed in text. This text can be modified or changed using the other CAD Text options.



STEP 4:

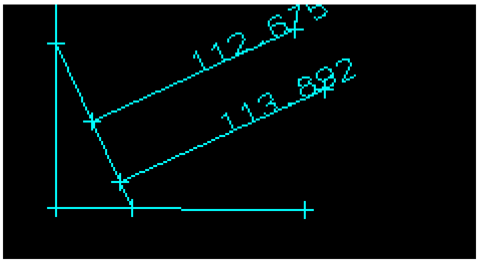
After the labelled perpendicular line is constructed, another perpendicular *rubber banding* line will be displayed. This will continue until the option is terminated (via the Esc key).

To create another labelled perpendicular line, select another point and accept it.



STEP 5:

Another labelled perpendicular line is constructed. Another perpendicular *rubber banding* line will be displayed. This will continue until the option is terminated (via the Esc key).



15.15.19 All Text Edits

Position of option on menu: **CAD =>Text =>All**

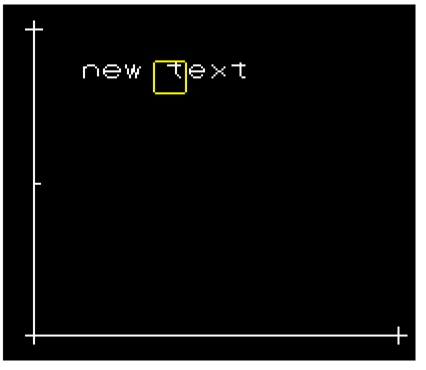
or by selection of appropriate icon from the toolbar. 

This option positions text using a menu made up of most of text edits already described.

On selecting **All**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

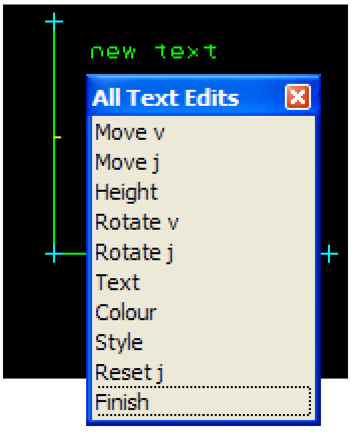
STEP 1:

The text to be changed is selected and accepted.



STEP 2:

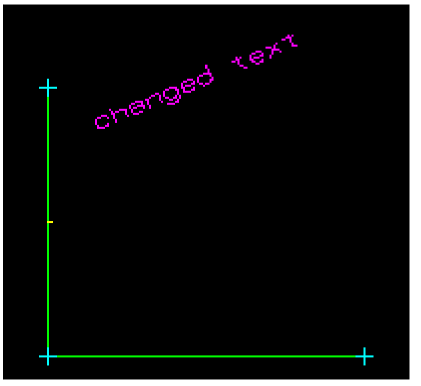
After the selection and acceptance of a piece of text, the positioning menu is shown. This also allows various other text editing functions such as colour, height and text.



STEP 3:

The user can select the appropriate option from the menu and make the changes. The menu remains active allowing a number of operations to be made is succession.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



changed text

15.15.20 Text Delete

Position of option on menu: CAD =>Text =>Delete

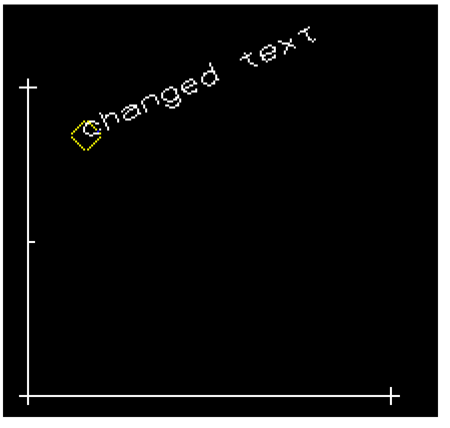
or by selection of appropriate icon from the toolbar.

This option deletes selected text.

On selecting **Delete**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

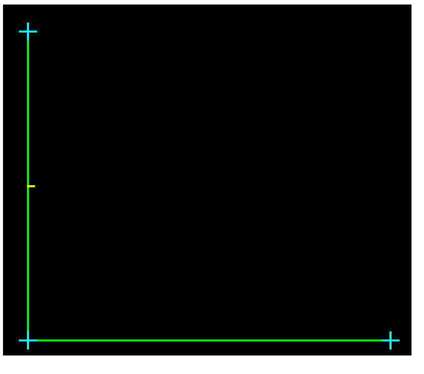
The text to be deleted is selected and accepted.



STEP 2:

The selected text is deleted.

Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.



15.16 CAD Symbol

Position of option on menu: **CAD =>Symbol**

Position of option on menu: **Various toolbars**

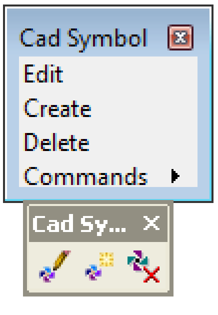
12d Model symbols are world styles at a vertex of a super string. The symbol is attached to a vertex (these are displayed when ***Vertices*** are toggle on in a plan view) and has a justification point, a rotation, a delta x and a delta y. The vertex and justification point only coincide if the delta x and delta y values are both zero.

In some symbol options, the symbol *type*, *size* and *angle* are defined by the **Symbol Controlbar** and *model* and *colour* from the **CAD Controlbar** (for more information, go to the section 15.1.2 Symbol Controlbar).

The *symbols* are defined in the ***symbols.4d*** file.

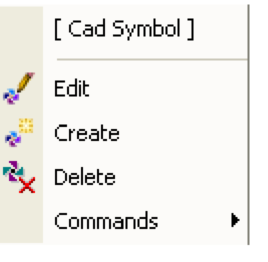
For more information on the control bars, go to the sections 15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar**.**

The **Cad Symbol** walk-right menu is



Menu of Options to Create and Manipulate Symbols

edit symbols using grips
create symbols and edit using grips
delete a symbol



For the option *Edit*, go to	15.16.2 Edit Symbol
Create	15.16.1 Create Symbol
Delete	15.16.3 Symbol Delete
Commands	15.16.3.1 Cad Symbol Commands

15.16.1 Create Symbol

Position of option on menu: **CAD =>Symbol =>Create**

or by selection of appropriate icon from the toolbar. 

For information about Symbol and its definitions, go to the section 4.7 Symbol Definitions.

12d Model has two CAD symbol options **Create** and **Edit**. However both of these run the same option which starts up in different modes - **Create** is in the mode to create symbols on a super string vertex and **Edit** which edits existing symbols.

Once either CAD symbol option is started it is possible to change between the Create and Edit modes at any time.

The ***Create*** option creates a new super string with a symbol on the vertex, or create a symbol on an existing super string vertex which does not already have a symbol, and then displays a list key commands in the screen message area, and grips on screen, to quickly allow editing of the symbol type, size, colour, rotation, angle, x and y offset etc.

After selecting the option, the ***Pick position*** message is displayed in the screen message area.

<[Pick position] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]

To go from Create to Edit mode, type **e** - go to To Go from Create to Edit Mode - Typing e

To create a symbol and a new super string, type **c** - go to Creating a Symbol - Typing c

To create vertex symbol, type **v** - go to Creating Text at a Super String Vertex- Typing v

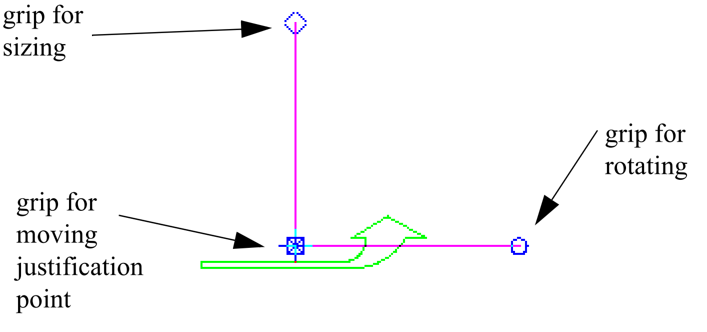
Creating a Symbol - Typing c

After typing **c**, the ***Pick position*** message is again displayed in the screen message area and the position of the symbol is then selected with the cursor.

<[Pick position] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]

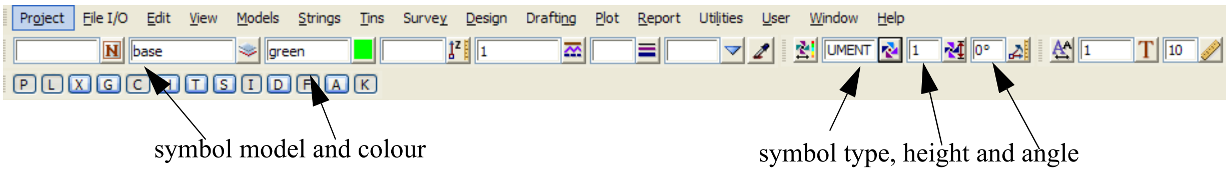
When the position is accepted a new one vertex super string is created with the symbol on it.

The super string vertex and symbol justification point is placed at that position. The x and y offset both zero.



When the symbol is displayed, grips for quick editing of height, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.15 Symbol Grips.

For the new symbol, the symbol name, height and angle are taken from the ***Symbol controlbar*** and the model and colour from the ***CAD controlbar*** (see 15.1 Controlbars,15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar).



After the symbol is created, a list of typed options is then displayed in the screen message area.

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

and if **m** is typed, the rest of the options are shown

```
<[J] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]
```

These option are the same as when editing existing symbols, and will be described in detail in the section 15.16.2 Edit Symbol.

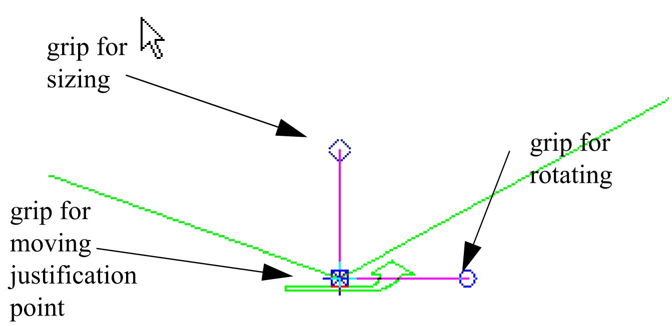
c is the default if nothing is typed.

Creating a Symbol at a Super String Vertex- Typing v

After typing **v**, the ***Pick grip point*** message is displayed in the screen message area and the vertex of the super string to place the symbol on is then selected with the cursor.

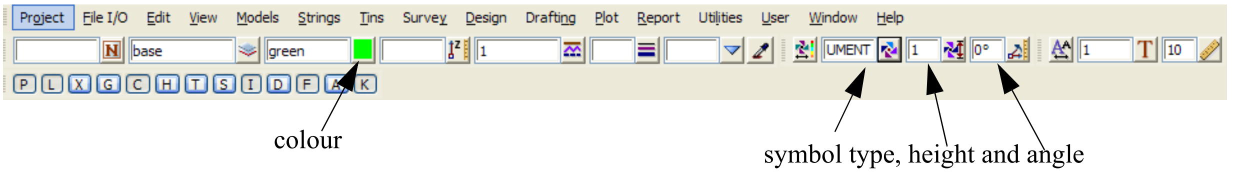
```
<[V] Pick grip point or (j)ustification, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

The symbol and symbol justification point are placed at that vertex. The x and y offset both zero.



When the symbol is displayed, grips for quick editing of size, rotation, moving of the justification point and string vertex are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 4.15 Symbol Grips.

For the new symbol, the symbol name, height and angle are taken from the ***Symbol controlbar*** and colour from the ***CAD controlbar*** (see 15.1 Controlbars,15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar). The created symbol will be part of the super string so no model is required.



After the vertex symbol is created, a list of typed options is then displayed in the screen message area.

<[V] Pick grip point or (j)ustification, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]

and if **m** is typed, the rest of the options are shown

<[V] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an, <-previous, ->next> [picks][fast][Menu]

These option are the same as when editing existing symbols, and will be described in detail in the section 15.16.2 Edit Symbol.

To Go from Create to Edit Mode - Typing e

After typing **e**, the ***Pick Symbol*** message is displayed in the screen message area.

<[Pick symbol] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]

This is the same as when selecting the Edit option from the CAD Symbol toolbar and will be described in detail in the section 15.16.2 Edit Symbol.

15.16.2 Edit Symbol

Position of option on menu: **CAD =>Symbol =>Edit**

or by selection of appropriate icon from the toolbar. 

For information about Symbol and its definitions, go to the section 4.7 Symbol Definitions.

12d Model has two CAD symbol options **Create** and **Edit**. However both of these run the same option which starts up in different modes - **Create** is in the mode to create a new symbol, or a symbol on a super string vertex and **Edit** which edits existing symbols.

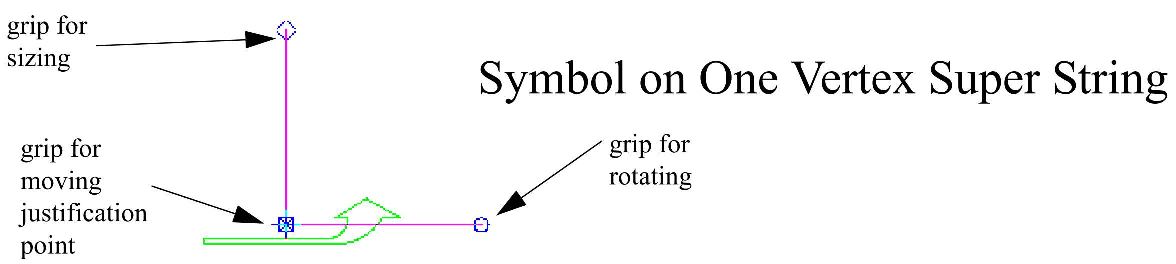
Once either CAD symbol option is started it is possible to change between the Create and Edit modes at any time.

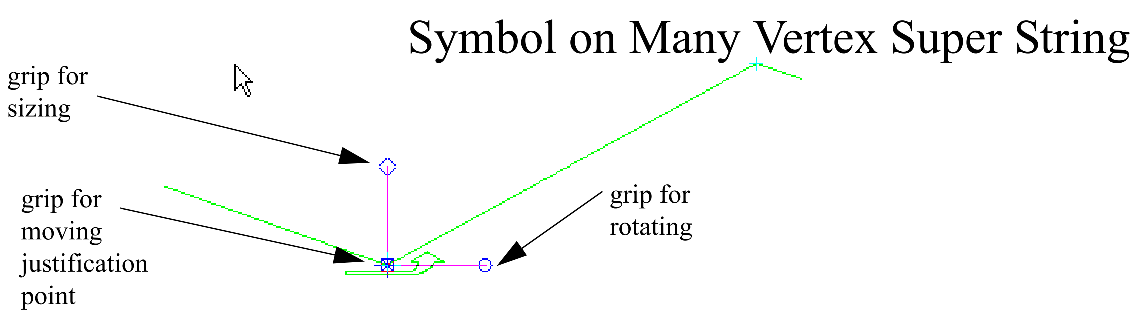
After typing **e**, the ***Pick symbol*** message is displayed in the screen message area

<[Pick symbol] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]

and a symbol s then selected by the mouse for editing.

The selected symbol with the symbol edit grips is shown on screen, and a list of available typed commands in the screen message area to quickly allow editing of the symbol name, symbol size, colour, rotation, angle, x and y offset, justification point, vertex, etc.





Options displayed after selecting symbol

<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]

and by typing **m**

<[J] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]

To change the symbol colour, type **C** - go to Change Symbol Colour - Typing c

To change the symbol name, type **s** - go to Change Symbol Name - Typing s

To change the symbol height, type **h** - go to Change Symbol Height - Typing h

To create/edit a new symbol, type **n** - go to Create/Edit a New Symbol - Typing n

To end the create/edit option, type **f** - go to Finish the Create/Edit - Typing f

To show the other line of options, type **m** - go to Show Other Line of Options - Typing m

To change the x offset, type **x** - go to Change Offset x - Typing x

To change the y offset, type **y** - go to Change Offset y - Typing y

To change the symbol angle, type **a** - go to Change Symbol rotation - Typing a

To reset some symbol values to their defaults, type **d** - go to Reset Symbol Parameters to Defaults - Typing d

To show the other line of options, type **m** - go to Show Other Line of Options - Typing m

To toggle vertex lock on and off, type **l** - go to Toggle Lock - Typing l

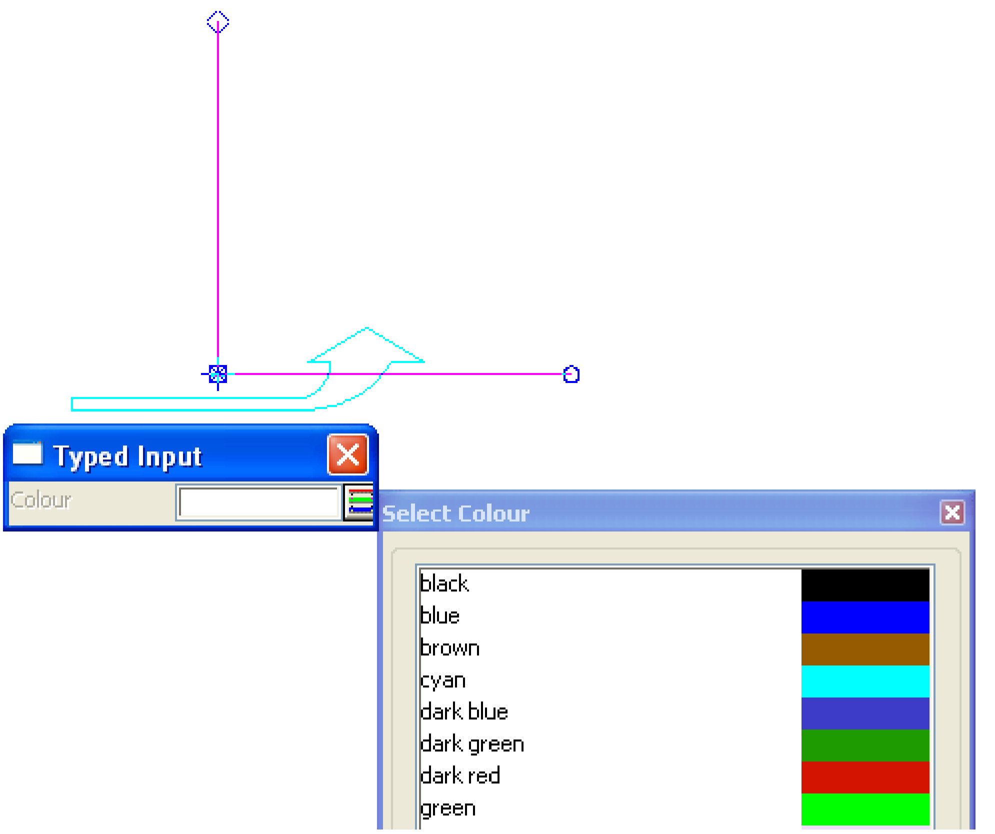
To toggle autopan on and off, type **p** - go to Toggle Autopan - Typing p

To change focus to the next symbol press **->** - go to Change Focus to the Next Vertex in String - Pressing right arrow key (->)

To change focus to the previous symbol, press **<-** - go to Change Focus to the Previous Vertex in String - Pressing left arrow key (<-)

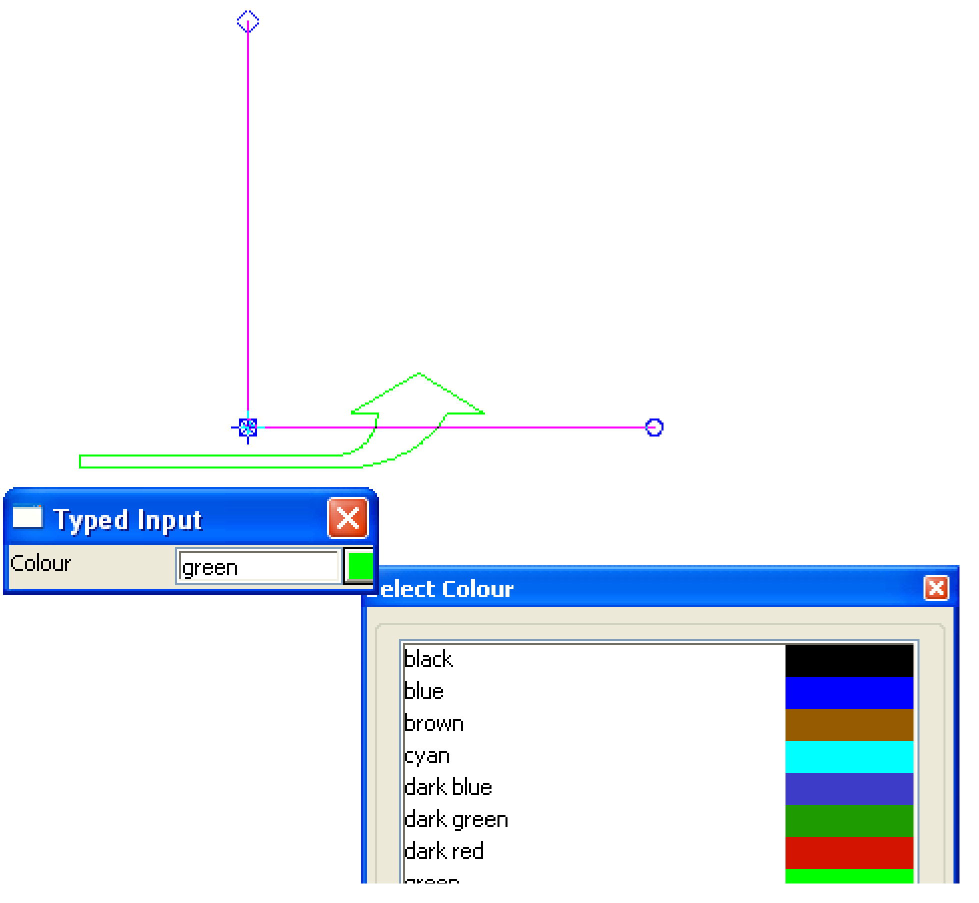
Change Symbol Colour - Typing c

After typing **c**, a Colour **Typed input** box appears on the screen.



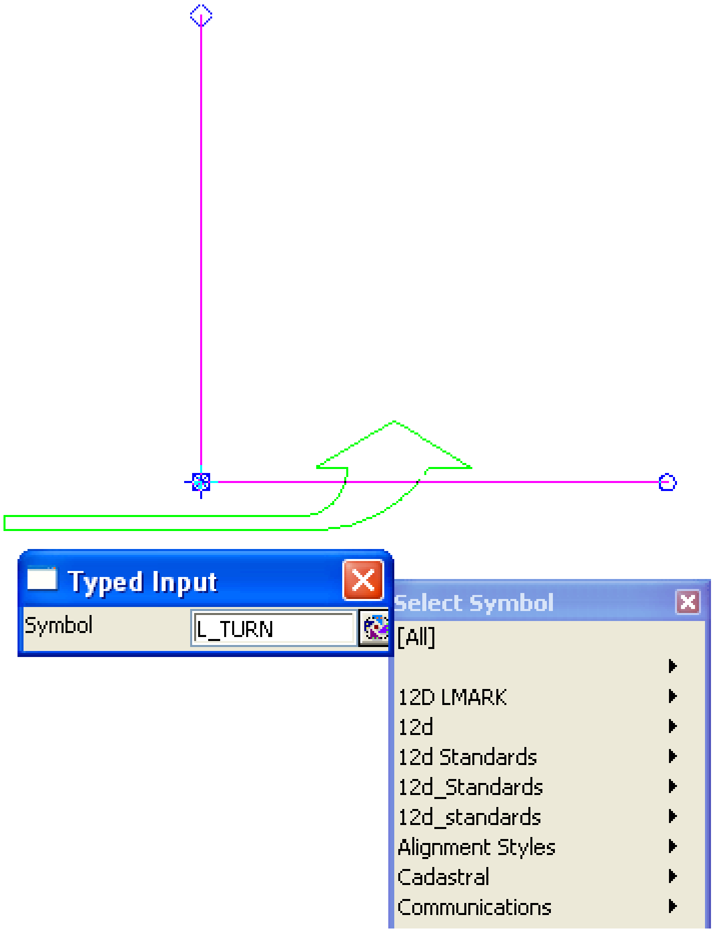
The new colour for the symbol is typed into the Typed input box followed by the <enter> key, or by selecting a colour from the **Select Colour** box which is brought up by clicking on the colour button.

If the symbol has an existing colour, other then the default colour, typing **c** will display the Typed Input box with the current colour displayed.



Change Symbol Name - Typing s

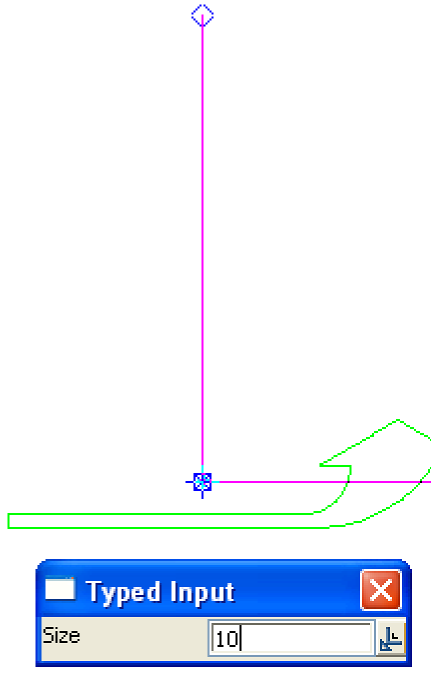
After typing **s**, a Symbol **Typed input** box appears with the current symbol style displayed.



The new style for the symbol is typed into the Style input box followed by the <Enter> key, or by selecting a style from the **Select Symbol** box which is brought up by clicking on the style button.

Change Symbol Height - Typing h

After typing **h**, a Size **Typed input** box appears with the current symbol height in it.



The new height is typed into the Size **Typed Input** box followed by the <Enter> key.

Note - Many arithmetic expressions are supported in the **Size** typed input box (*e.g.* 10+27). See the section 4.19.1 Expressions in Panel Fields.

Create/Edit a New Symbol - Typing n

If the option was in ***Edit*** mode and **n** is typed, a new **Edit** is started (**e** mode). The ***Pick symbol*** message is displayed in the screen message area and another symbol is selected to edit.

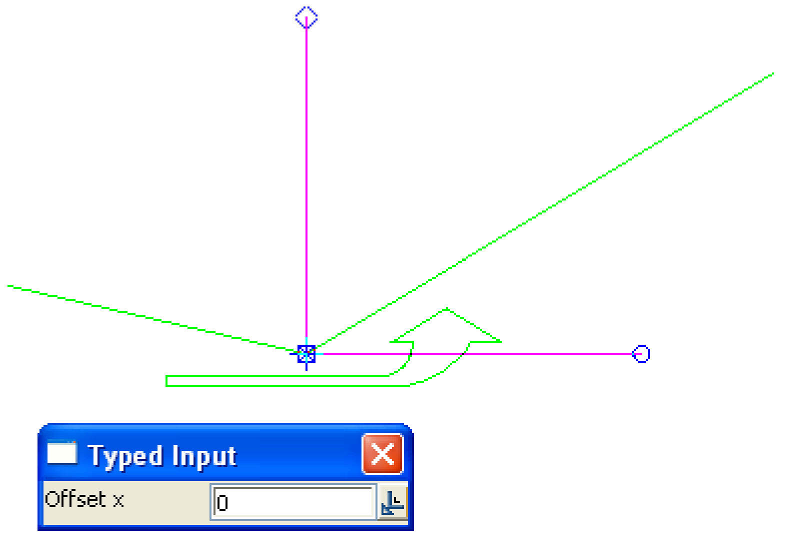
Or a ***new*** symbol can be created by typing **c** or **v**. See the section 15.16.1 Create Symbol for more information on **c** and **v**.

If the option was in ***Create*** mode and **n** is typed, a new **Create** is started in the **c** mode. The ***Pick position*** message is displayed in the screen message area and a new symbol is created.

Or a ***new*** vertex symbol can be created by typing **v,** or the **Edit** mode can be entered by typing **e**. See the section 15.16.1 Create Symbol for more information on **c** and **v**.

Change Offset x - Typing x

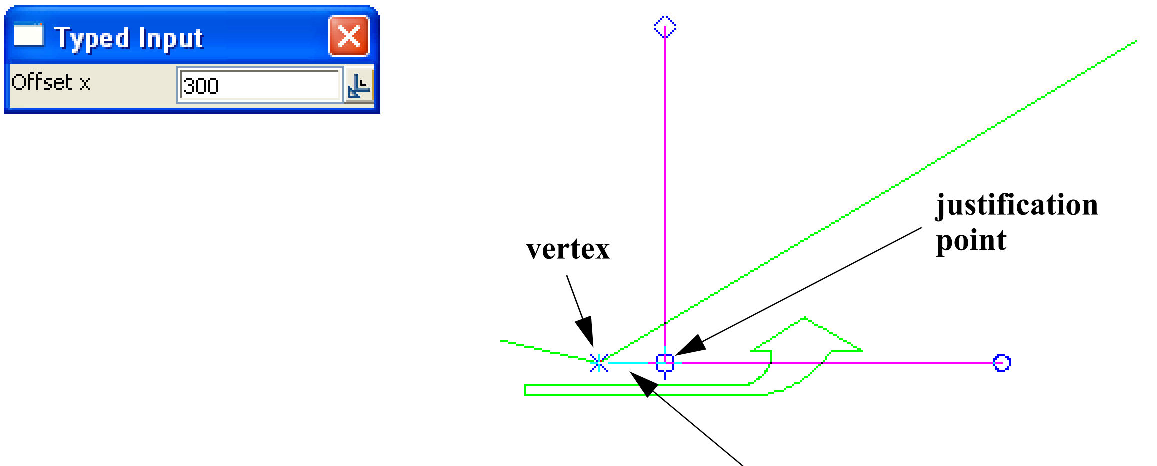
After typing **x**, an Offset x **Typed input** box appears with the current symbol x offset in it.



Symbol - offset x = 0

The new offset x is typed into the Offset x input box followed by the <Enter> key.

The symbol justification point will be offset x by the new amount



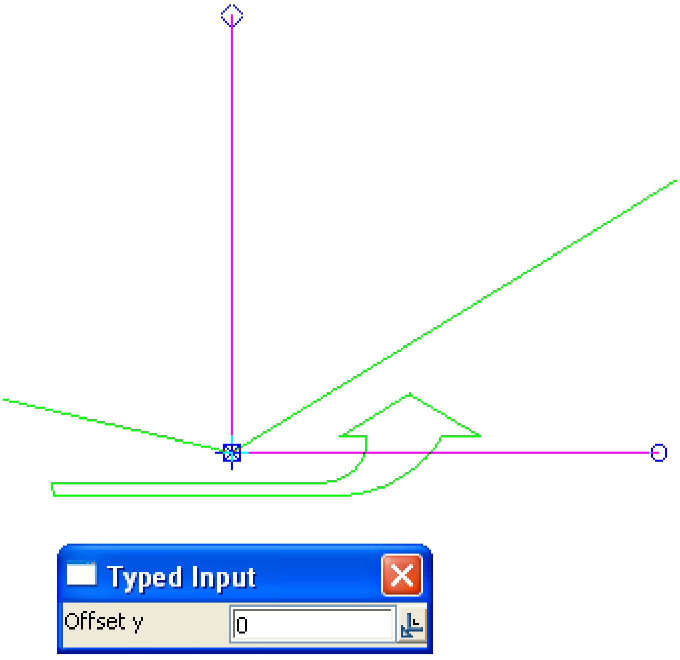
Symbol - offset x = 300

For information about Symbol and the definition of **offset**, go to the section 4.7 Symbol Definitions.

Note - Many arithmetic expressions are supported in the **Offset** typed input box (*e.g.* 10+27). See the section 4.19.1 Expressions in Panel Fields.

Change Offset y - Typing y

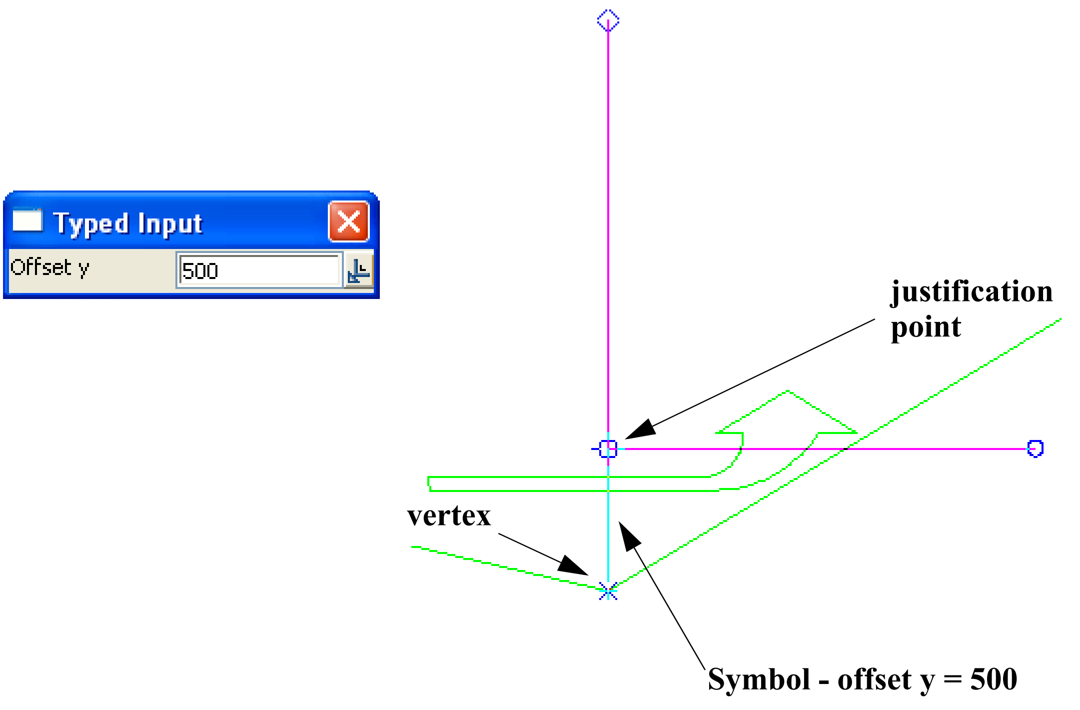
After typing **o**, an Offset y **Typed input** box appears with the current symbol offset in it.



Symbol - offset y = 0

The new offset is typed into the Offset y **Typed Input** box followed by the <Enter> key.

The symbol justification point will be offset y by the new amount

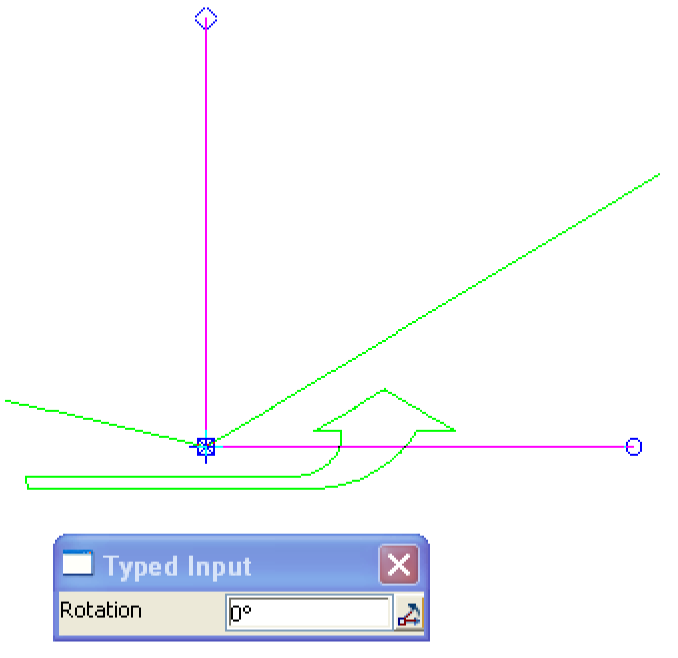


For information about symbol and the definition of **offset**, go to the section 4.7 Symbol Definitions.

Note - Many arithmetic expressions are supported in the **Offset** typed input box (*e.g.* 10+27). See the section 4.19.1 Expressions in Panel Fields.

Change Symbol rotation - Typing a

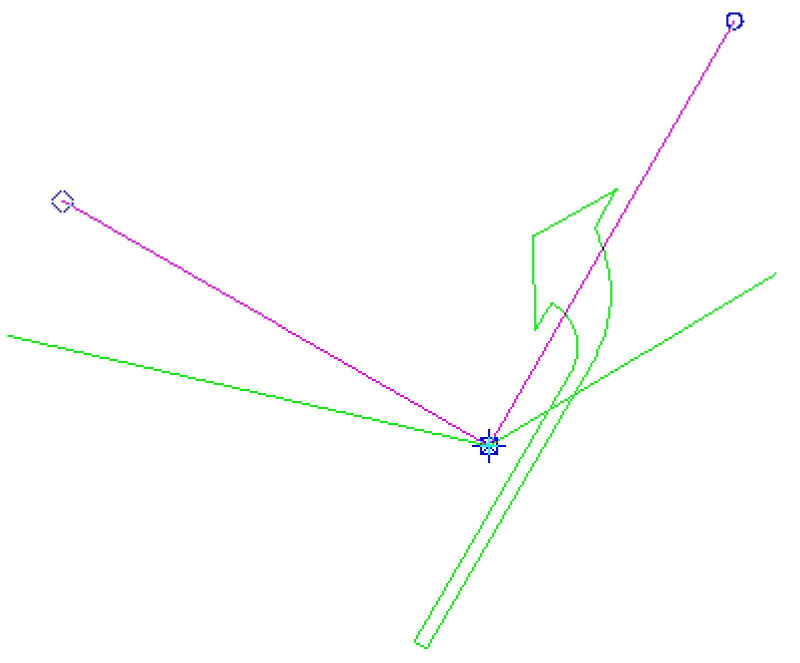
After typing **a**, a Rotation **Typed input** box appears with the current symbol angle in it.



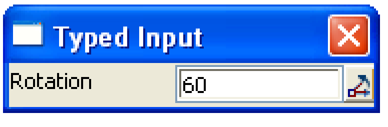
Symbol - angle rotation = 0

The new angle is typed into the Rotation **Typed input** box followed by the <Enter> key.

The direction of the symbol point will be rotated by the new amount.



Symbol - angle rotation= 60



For information about symbol and the definition of **angle rotation**, go to the section 4.7 Symbol Definitions.

Note - Some arithmetic expressions are supported in the **Rotation** typed input box (*e.g.* 10+90). See the section 4.19.1.2 Expressions in Bearing, Angle Panel Fields for what is allowed in angle/ bearing panel fields.

Reset Symbol Parameters to Defaults - Typing d

After typing **d**, some of the symbol parameters are set back to their default values.

That is:

Symbol type is set to the symbol in the Cad Symbol Controlbar

Height is set to the height in the Cad Symbol Controlbar

Angle is set to the angle in the Cad Symbol Controlbar

Model is left as it is

Colour is rest to the string colour.

symbol name, height and angle

The default symbol *type*, *height* and *angle* are defined by the **Symbol Controlbar** and *model* and *colour* from the **CAD Controlbar** (for more information, go to the section 15.1.2 Symbol Control-bar).

For information about Symbol definitions, go to the section 4.7 Symbol Definitions.

Change Focus to the Next Vertex in String - Pressing right arrow key (->)

For vertex symbol on a super string, pressing **->**, moves the focus of the edit commands to the vertex symbol on the next vertex of the super string. If the symbol is on the last vertex, pressing **->** does nothing.

For information about symbol definitions, go to the section 4.7 Symbol Definitions.

Change Focus to the Previous Vertex in String - Pressing left arrow key (<-)

When editing vertex symbol on a super string, pressing **<-,** moves the focus of the edit commands to the vertex symbol on the **previous** vertex of the super string. If the symbol is on the first vertex, pressing **<-** does nothing. If Autopan is on, the selected vertex symbol is made the centre of the active plan view.

For information about symbol definitions, go to the section 4.7 Symbol Definitions.

Toggle Lock - Typing l

Typing **l** toggles locking the vertex on and off.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads (l) lock (l)ock, , this means that vertex lock is off (unlocked) and typing **l** locks it.

When the screen message area reads un(l) lock un(l)ock, , this means that the vertex is locked and typing **l** unlocks it.

For information about the vertex symbol grip, go to the section 4.15 Symbol Grips.

For information about symbol definitions, go to the section 4.7 Symbol Definitions.

Toggle Autopan - Typing p

Typing **p** toggles autopan on and off.

When editing vertex symbol on a super string and **Autopan** is **on**, pressing **->** or **<-**, moves the focus of the edit commands to the vertex symbol on the next/previous vertex of the super string, and the selected vertex symbol is made the centre of the active plan view.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads auto(p)an auto(p)an, , this means that autopan is off and typing **p** turns autopan on.

When the screen message area reads no auto(p)an no auto(p)an, , this means that autopan is on and typing **p** turns it off.

For information about symbol definitions, go to the section 4.7 Symbol Definitions.

Show Other Line of Options - Typing m

There are too many *Edit* options to fit onto one line of the screen message and two lines of options are required. Typing **m** toggles between the two lines of options.

<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]

<[J] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]

Finish the Create/Edit - Typing f

Typing **f** exits the create/edit symbol option.

15.16.3 Symbol Delete

Position of option on menu: **CAD =>Symbol =>Delete**

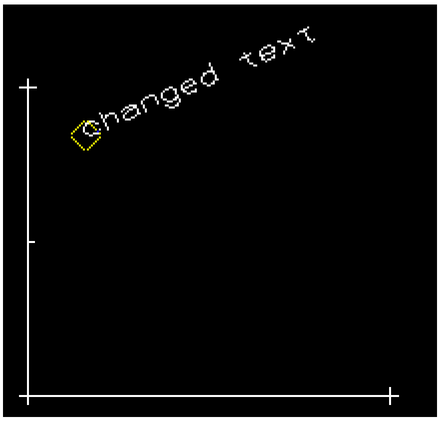
or by selection of appropriate icon from the toolbar. 

This option deletes symbols.

On selecting **Delete**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

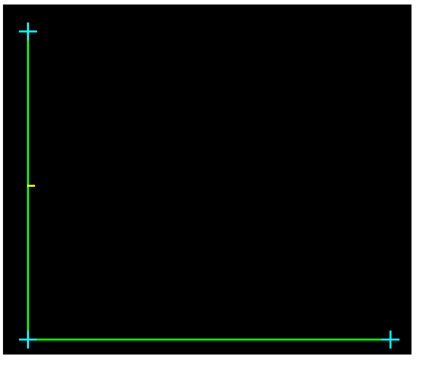
The Symbol to be deleted is selected and accepted.



STEP 2:

The selected Symbol is deleted.

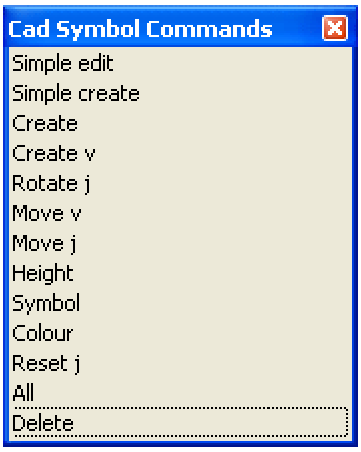
Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.



15.16.3.1 Cad Symbol Commands

Position of option on menu: **CAD =>Symbol =>Commands**

The **Cad Symbol Commands** walk-right menu is



Menu of Options to Create and Manipulate Symbols

edit symbols using grips
create symbols and edit using grips
create a symbol at a selected position - a one point string is created
create a symbol at a user selected super string vertex
rotate symbol about its justification pt (which may be offset from the vertex)
move symbol by its vertex
move symbol by its justification point (the vertex does not move)
change the height of a symbol
change the symbol
change the colour of a symbol
reset the symbol justification point so that it is on top of the vertex posn

For the option *Simple edit*, go to	15.16.4 Simple Symbol Edit
Simple create	15.16.5 Simple Symbol Create
Create	15.16.6 Create Symbol
Create v	15.16.7 Create Symbol at the Vertex of a Super String
Rotate j	15.16.8 Rotate Symbol about the Justification Point
Move v	15.16.10 Move the Symbol Vertex Point
Move j	15.16.9 Move the Symbol Justification Point
Height	15.16.11 Height of Symbol
Symbol	15.16.12 Change Symbol
Colour	15.16.13 Symbol Colour
Reset j	15.16.14 Reset the Symbol Justification Point
All	15.16.15 All Symbol Edits
Delete	15.16.3 Symbol Delete

15.16.4 Simple Symbol Edit

Position of option on menu: **CAD =>Symbol =>Commands=>Simple edit**

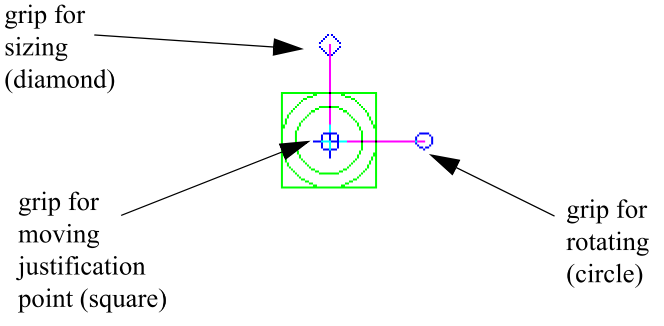
or by selection of appropriate icon from the toolbar. 

This option edits symbols using grips to quickly define the mode of editing (sizing, rotating or moving the justification point).

On selecting **Simple edit**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

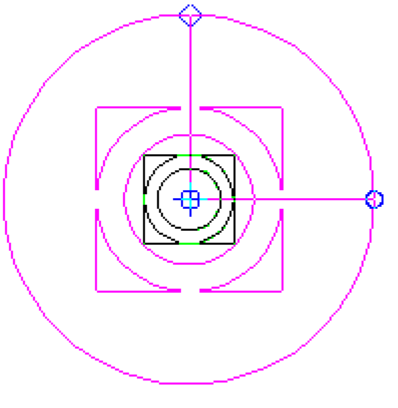
When the symbol to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.



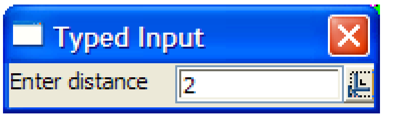
Size Grip (diamond):

If the **Size grip** is selected, the symbol size is dynamically adjusted by moving the cursor. The size of the symbol is displayed as part of the *Enter height* prompt in the message area.

The symbol size is set when a position is accepted.

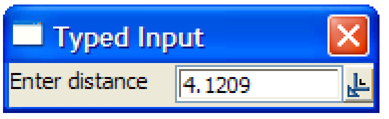


An ***exact*** symbol size can be entered by hitting the <space bar> or by starting to type a size. This brings up the **Enter distance** typed input box. The size is typed in and the <enter> key pressed.



To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the symbol is being dynamically sized, the ***current*** size of the symbol can be displayed by pressing the **d** key which brings up the **Enter distance** typed input box with the current dynamic symbol size in it.



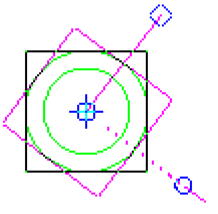
The size can be modified and the value used by pressing the <Enter> key.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box.

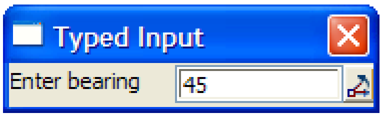
Rotate Grip (circle):

If the **Rotate grip** is selected, the symbol bearing is dynamically adjusted by moving the cursor. The bearing of the symbol is displayed as part of the *Enter bearing* prompt in the message area.

The symbol bearing is set when a position is accepted.

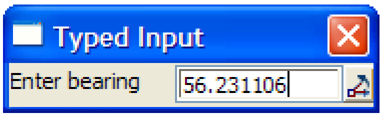


An ***exact*** bearing can be entered by hitting the <space bar> or by starting to type a bearing. This brings up the **Enter bearing** typed input box. The *bearing* is typed in and the <Enter> key pressed.



To return to dynamic rotating without entering a bearing, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the symbol is being dynamically rotated, the ***current*** bearing of the symbol can be displayed by pressing the **d** key which brings up the **Enter bearing** typed input box with the *current* symbol bearing in it.



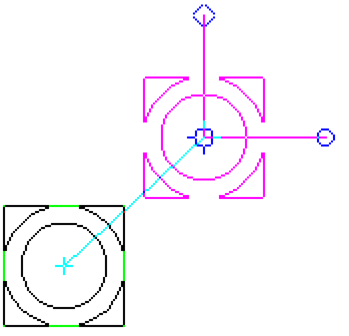
The *bearing* can be modified and the value used by pressing the <Enter> key.

To return to dynamic rotation without entering a bearing, simply select the **X** on the top of the input box.

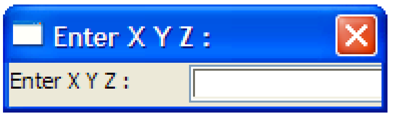
Justification Grip (square):

If the **Justification grip** is selected, the symbol justification point is dynamically adjusted by moving the cursor. The (x,y) position of the symbol is displayed in the message area.

The symbol justification point is set when a position is accepted.



An ***exact*** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <Enter> key pressed.



To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

15.16.5 Simple Symbol Create

Position of option on menu: **CAD =>Symbol =>Commands=>Simple create**

or by selection of appropriate icon from the toolbar. 

This option creates symbols and then displays grips to allow quick editing of symbol size, rotation and justification point.

The symbol and symbol height and symbol angle are taken from the **Symbol controlbar** (See 15.1 Controlbars) and the model and colour (if the symbol does not have an inbuilt colour) from the **CAD controlbar** (see 15.1 Controlbars,15.1.2 Symbol Controlbar and 15.1.1 CAD Controlbar).

The symbol will be placed with the vertex and justification point at the selected position.

After defining one symbol, the option restarts so that another symbol can be defined. Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.

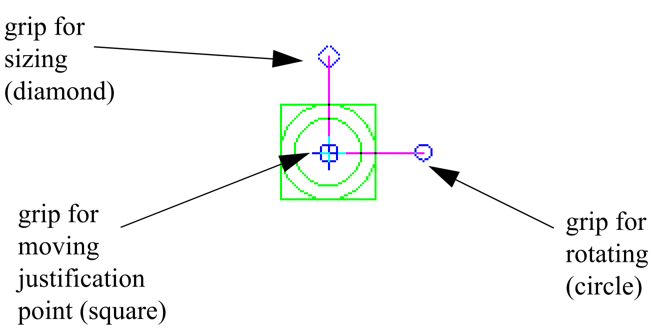
On selecting **Simple create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

An insertion point for the symbol is selected and accepted, the symbol is displayed on the screen.

***Warning* -** if no symbol appears, then there is probably no symbol selected in the **Symbol controlbar**.

When the symbol is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section 15.16.4 Simple Symbol Edit.



15.16.6 Create Symbol

Position of option on menu: **CAD =>Symbol =>Commands=>Create**

or by selection of appropriate icon from the toolbar.

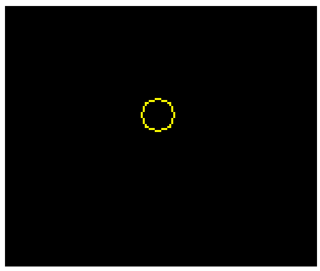
This option creates a symbol (as a one vertex super string) at a selected point (a cursor snap is valid).

After defining a symbol, the option restarts so that another symbol can be defined. Picking **Cancel** from the **Pick Ops** menu, hitting <esc> or selecting another option terminates the option.

On selecting **Create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

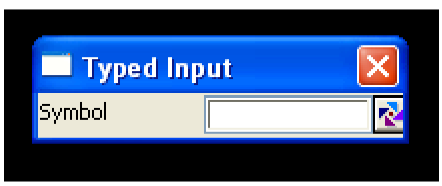
STEP 1:

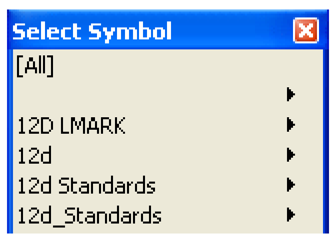
An insertion point is selected and accepted. A one vertex super string is created and the symbol placed at that vertex. The symbol is placed relative to the insertion point given in the symbol definition (See symbols.4d file).



STEP 2:

The symbol style (name) is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu



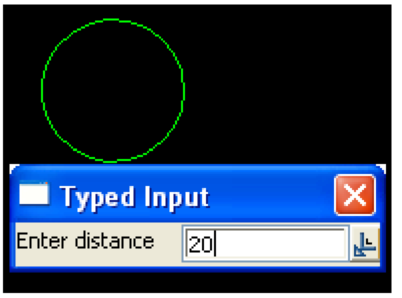


STEP 3:

A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

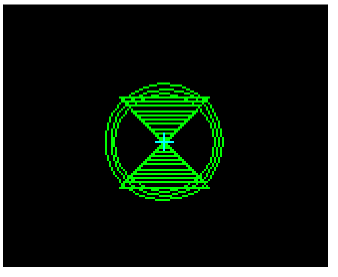
The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.



STEP 4:

The symbol is created together with a point super string at the selected point.



15.16.7 Create Symbol at the Vertex of a Super String

Position of option on menu: **CAD =>Symbol =>Commands=>Create v**

or by selection of appropriate icon from the toolbar.

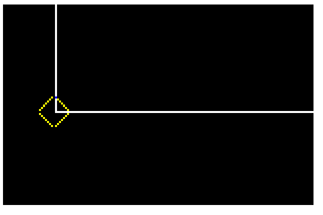
This option creates a symbol at a vertex of a super string. One symbol is allowed per super string vertex, so if this option is used on existing vertex symbol, the existing value is displayed in the symbol input box.

After defining a symbol, the option restarts so that another symbol can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting **Create v**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

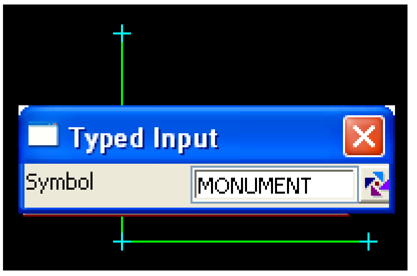
STEP 1:

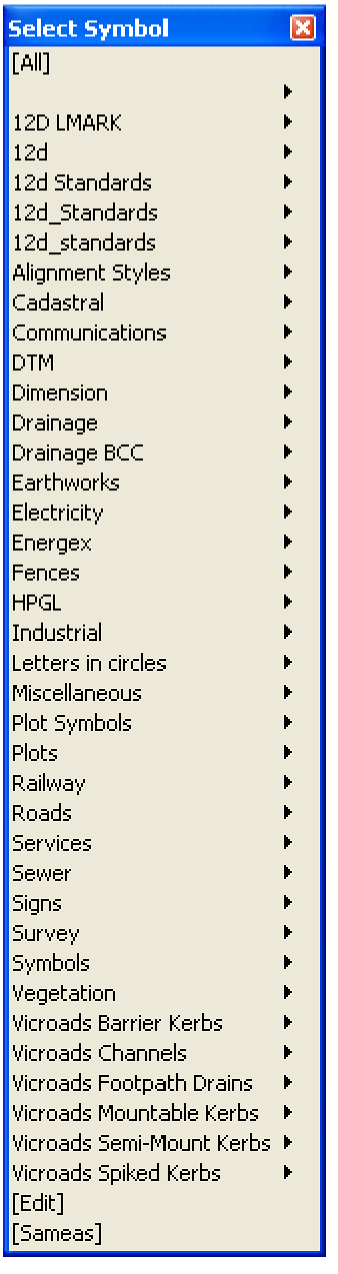
An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The Symbol will be placed relative to the insertion point given other parameters such as justification, as defined in the symbol definition.



STEP 2:

The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu



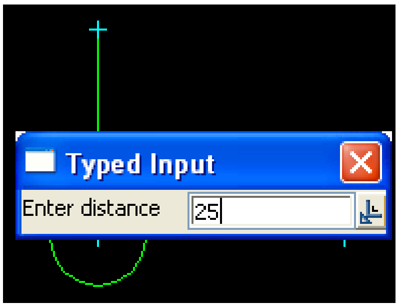


STEP 3:

A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

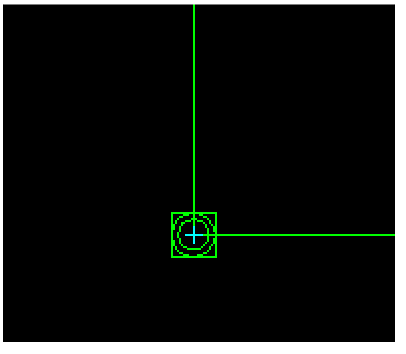
The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.



STEP 4:

The symbol is created at the vertex of the super string.



15.16.8 Rotate Symbol about the Justification Point

Position of option on menu: **CAD =>Symbol =>Commands=>Rotate j**

or by selection of appropriate icon from the toolbar.

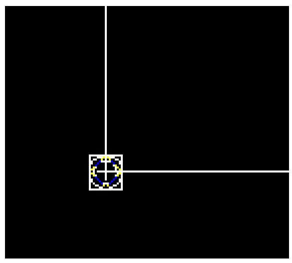
This option rotates a symbol about its justification point. The vertex point and the justification point often do not coincide. This occurs when non zero value is specified for either the x or y offset.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing symbol by that amount, rather it will reposition the symbol at that bearing.

On selecting **Rotate j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The Symbol to be rotated is selected and accepted.

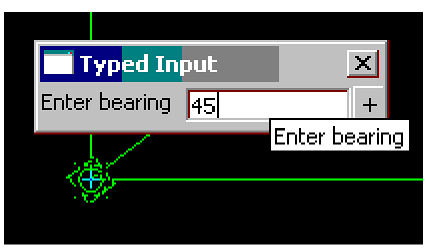


STEP 2:

The rotation bearing (the final bearing of the symbol) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: **The Page up and page down keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.**

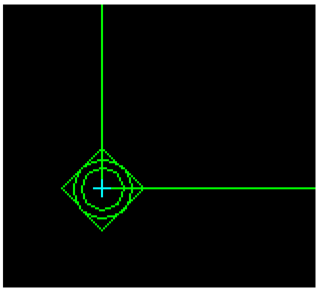


This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The Symbol is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.



15.16.9 Move the Symbol Justification Point

Position of option on menu: **CAD =>Symbol =>Commands=>Move j**

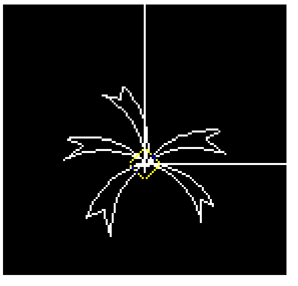
or by selection of appropriate icon from the toolbar. 

This option moves a symbol by moving its justification point.

On selecting **Move j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

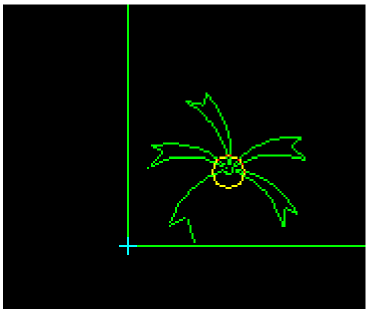
STEP 1:

The Symbol to be moved is selected and accepted.



STEP 2:

The new position for the Symbol is selected and accepted.



STEP 3:

The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

15.16.10 Move the Symbol Vertex Point

Position of option on menu: **CAD =>Symbol =>Commands=>Move v**

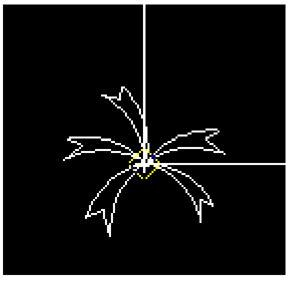
or by selection of appropriate icon from the toolbar. 

This option moves a symbol by moving the vertex that the symbol is attached to. Hence the symbol and the justification point for the symbol will move.

On selecting **Move V**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

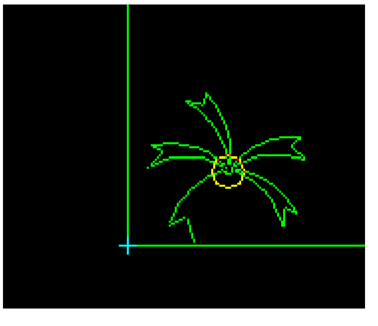
STEP 1:

The Symbol to be moved is selected and accepted.



STEP 2:

The new position for the vertex of the Symbol is selected and accepted.



STEP 3:

The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

15.16.11 Height of Symbol

Position of option on menu: **CAD =>Symbol =>Commands=>Height**

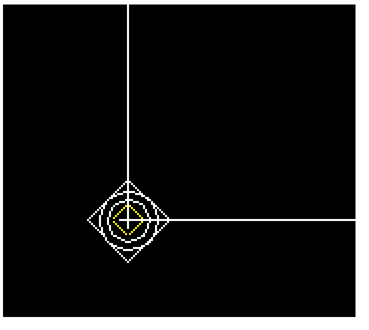
or by selection of appropriate icon from the toolbar. 

This option changes the height of a symbol.

On selecting **Height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

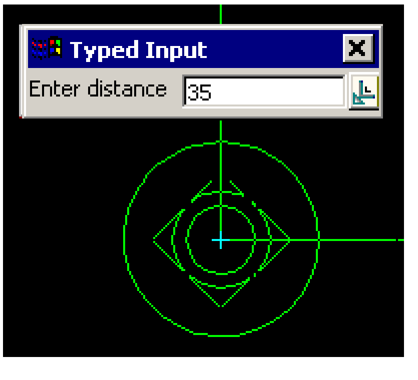
The Symbol of which the height is to be changed is selected and accepted.



STEP 2:

A height for the Symbol is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

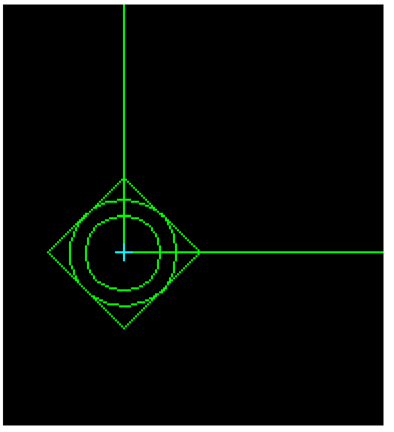


This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

The Symbol height is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.



15.16.12 Change Symbol

Position of option on menu: CAD =>Symbol =>Commands=>Symbol

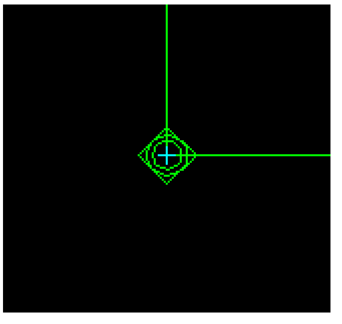
or by selection of appropriate icon from the toolbar. 

This option changes the actual symbol defined at a super string vertex.

On selecting **Symbol**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

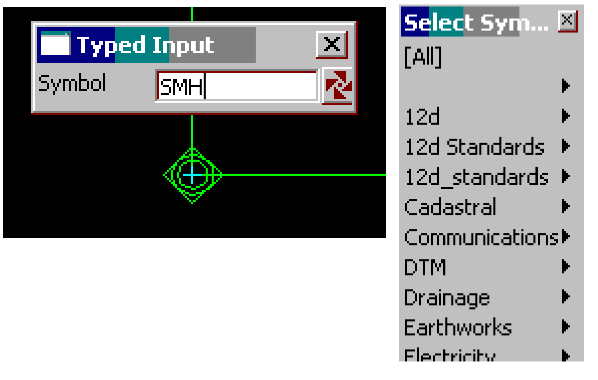
STEP 1:

The Symbol to be changed is selected and accepted.



STEP 2:

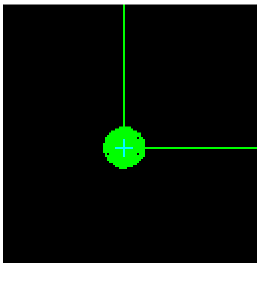
The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu



STEP 3:

The Symbol is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.



15.16.13 Symbol Colour

Position of option on menu: **CAD =>Symbol =>Commands=>Colour**

or by selection of appropriate icon from the toolbar.

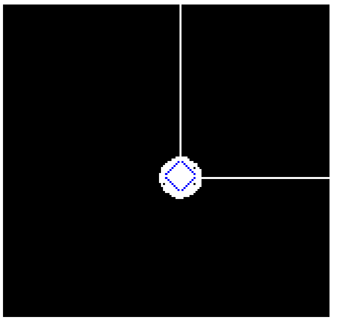
This option changes the default colour of a symbol.

Important Note: if the symbol has inbuilt colours, changing the default colour will not change the symbols displayed colours. For this case, the definition of the symbol itself will need to be changed.

On selecting **Colour**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

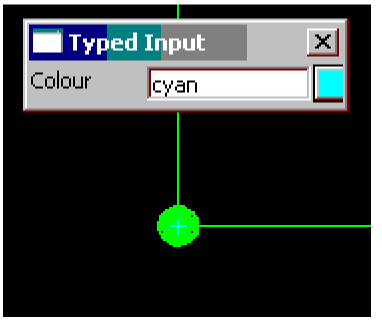
STEP 1:

The symbol to have the default colour changed is selected and accepted.



STEP 2:

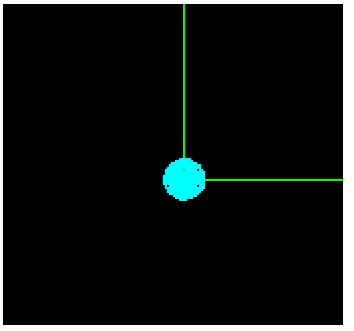
The new colour for the Symbol is entered into the Symbol input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.



STEP 3:

The Symbol colour is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.



15.16.14 Reset the Symbol Justification Point

Position of option on menu: **CAD =>Symbol =>Commands=>Reset j**

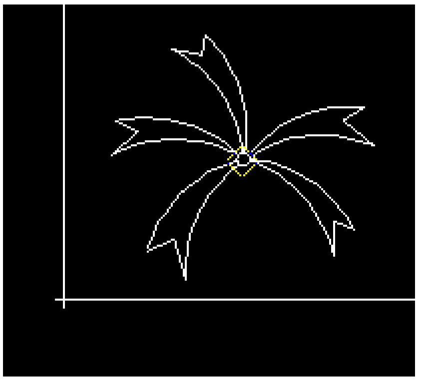
or by selection of appropriate icon from the toolbar.

This option resets justification point of a selected symbol. That is, the x and y offsets for the justification point are set to zero.

On selecting **Reset j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

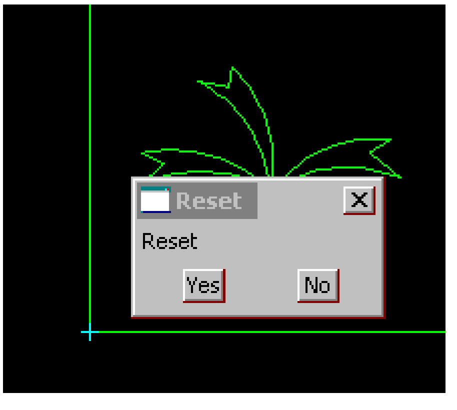
STEP 1:

The Symbol to be changed is selected and accepted.



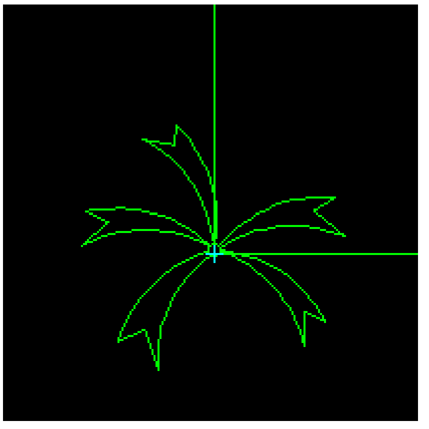
STEP 2:

A warning message is shown giving the user the option of resetting the justification point or not.



STEP 3:

The symbol is reset if accepted.



15.16.15 All Symbol Edits

Position of option on menu: **CAD =>Symbol =>Commands=>All**

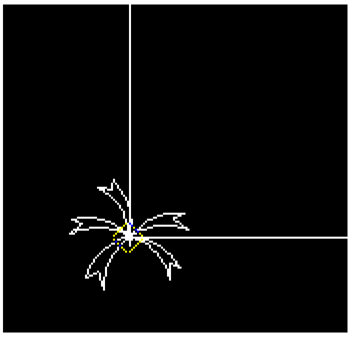
or by selection of appropriate icon from the toolbar. 

This option allows a number of symbol editing options to be done in succession using a menu made up of many of the options defined above.

On selecting **All**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

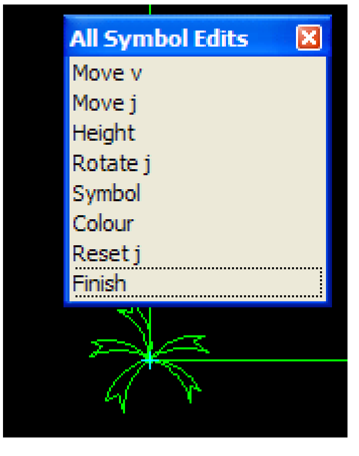
STEP 1:

The Symbol to be changed is selected and accepted.



STEP 2:

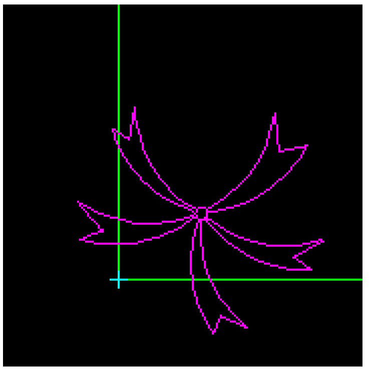
After the selection and acceptance of a symbol, the positioning menu is shown. This also allows various other symbol editing functions such as colour, height and rotate.



STEP 3:

The user can select the appropriate option from the menu and make the changes. The menu remains active allowing a number of operations to be made is succession.

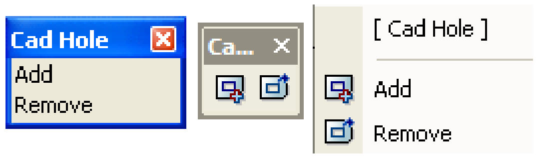
Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.



15.17 CAD Hole

Position of option on menu: **CAD =>Hole**

The C**ad Hole** walk-right menu is



For the option *Add*, go to [15.17.1 Add Holes](#)
Remove [15.17.2 Remove Holes](#)

15.17.1 Add Holes

Position of option on menu: **CAD =>Hole =>Add**

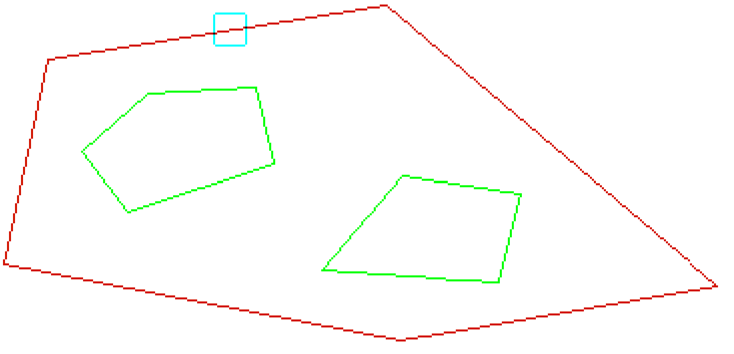
or by selection of appropriate icon from the toolbar.

This option adds holes to a polygon.

On selecting **Add holes**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

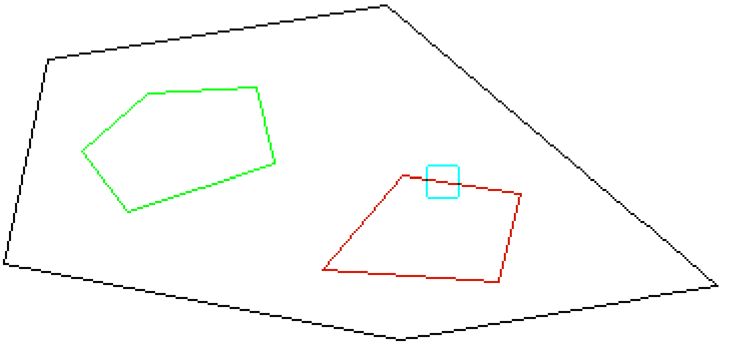
First select the parent string. That is the polygon that is to have holes added to it.



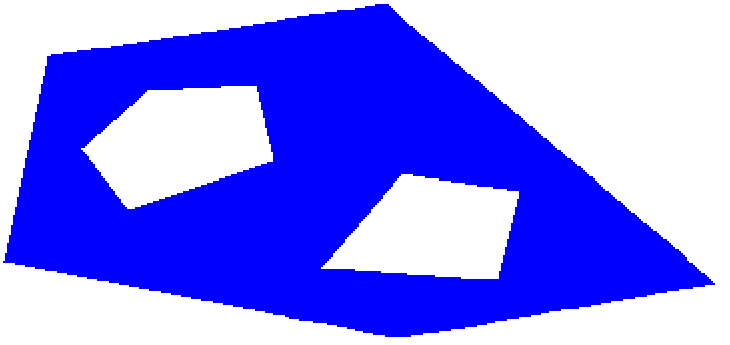
STEP 2:

Then select the polygons that are to be the holes in the parent polygon (the child strings).

The selection of holes is terminated by pressing the <esc> key.



It is easier to see the result by colour filling the parent polygon.



15.17.2 Remove Holes

Position of option on menu: CAD =>Hole =>Remove

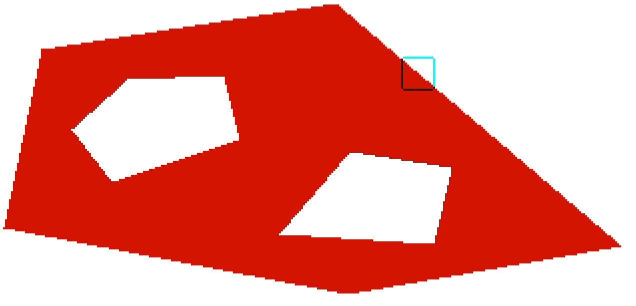
or by selection of appropriate icon from the toolbar.

This option removes all holes from a polygon with holes.

On selecting **Remove holes**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

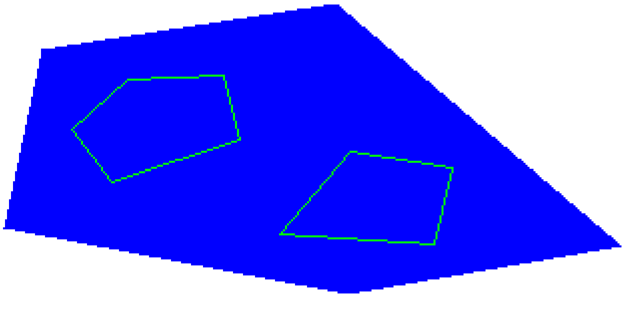
STEP 1:

Select the parent string. That is the polygon that contains holes.



STEP 2:

On selecting and accepting the string, all holes are removed from the string. Super strings are created for each of the hole boundaries.



15.18 CAD Fill

Position of option on menu: **CAD =>Fill**

The **Fill** walk-right menu is

For the option *Solid*, go to 15.18.1 Solid Fill
Solid many 15.18.2 Solid Fill Many Strings

15.18.1 Solid Fill

Position of option on menu: **CAD =>Fill =>Solid**

or by selection of appropriate icon from the toolbar.

This option fills a super string with a user defined colour and blend.

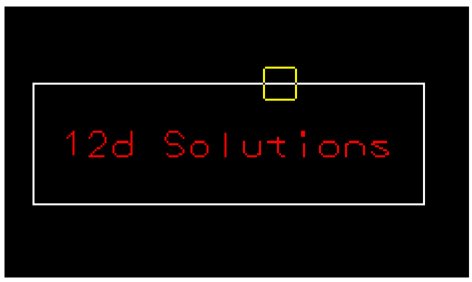
On selecting **Solid Fill**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept a string.

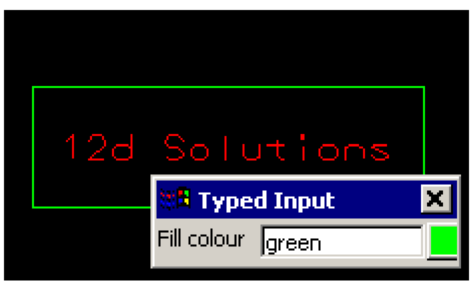
If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn't closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

Note: If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.



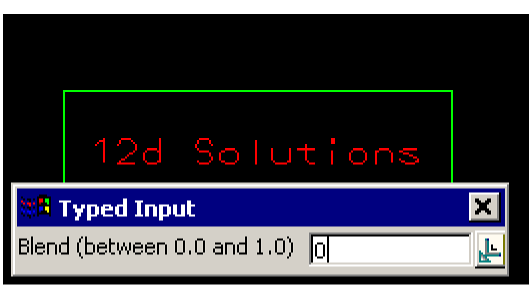
STEP 2:

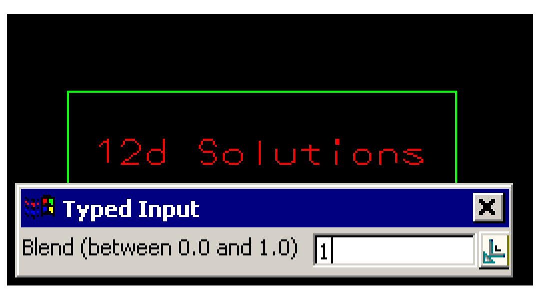
After the string is accepted, the **Fill Colour** Input box will appear. Type the name of the required colour into the Input box and press the enter key. The browse button on the Input box can be used to define the blend by measuring existing elements.



STEP 3:

After the colour is accepted, the Blend Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1(totally transparent) must be selected.





STEP 4:

The selected super string is then filled.

Blend 0

Blend 1

15.18.2 Solid Fill Many Strings

Position of option on menu: **CAD =>Fill =>Solid many**

or by selection of appropriate icon from the toolbar.

This option fills many selected super strings with the same user defined colour and blend.

On selecting **Solid fill many**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

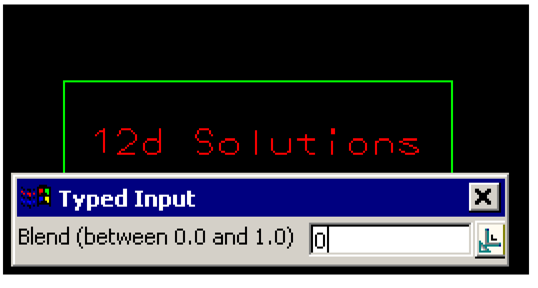
STEP 1:

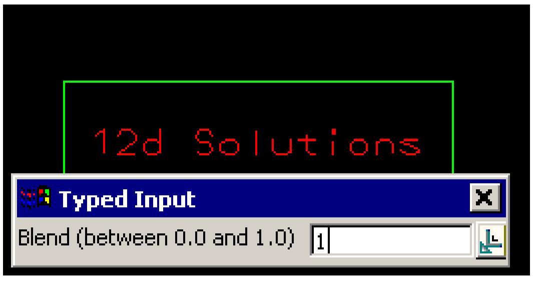
After selecting the option, the **Fill Colour** Input box is displayed.

Type the name of the required colour into the Input box and press the enter key. The browse button on the Input box can be used to define the blend by measuring existing elements.

STEP 2:

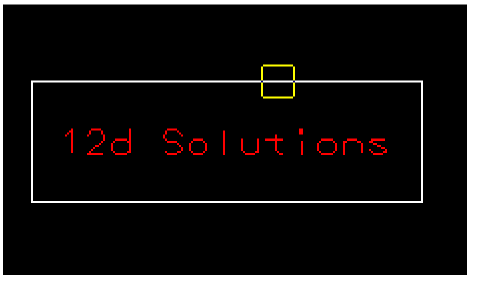
After the colour is accepted, the **Blend** Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1(totally transparent) must be selected.





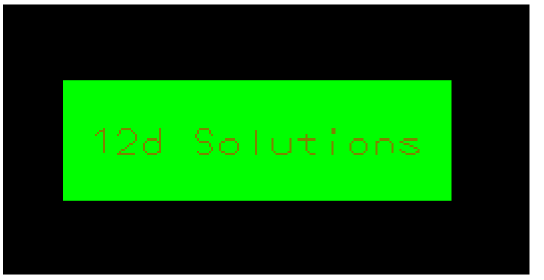
STEP 3:

Select and accept a string and the string is coloured filled.



The selected super string is then filled.

Blend 0



Blend 1

Then select and accept the next string to fill and the same colour and blend is used to colour fill the next string

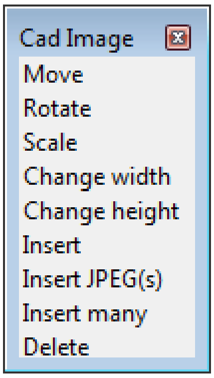
If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn't closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

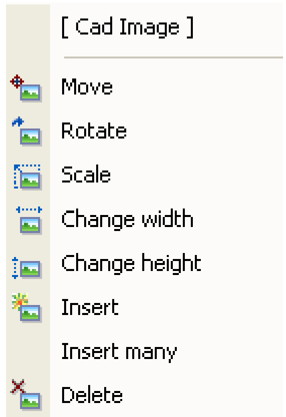
Note: If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.

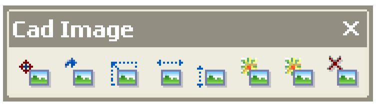
15.19 CAD Image

Position of option on menu: **CAD =>Image**

The **Cad Image** walk-right menu is







For the option *Move*, go to 15.19.1 Move Image
Rotate 15.19.2 Rotate Image
Scale 15.19.3 Scale Image
Change width 15.19.4 Change Width
Change height 15.19.5 Change Height
Insert 15.19.6 Insert Image
Insert JPEG(s) 15.19.7 Insert JPEG(s)
Insert many 15.19.8 Insert Many
Delete 15.19.9 Delete Image

15.19.1 Move Image

Position of option on menu: **CAD =>Image =>Move**

or by selection of appropriate icon from the toolbar.

This option moves an inserted image by modifying the x and y offset for the image. The vertex that the image is attached to does not move.

On selecting **Move Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

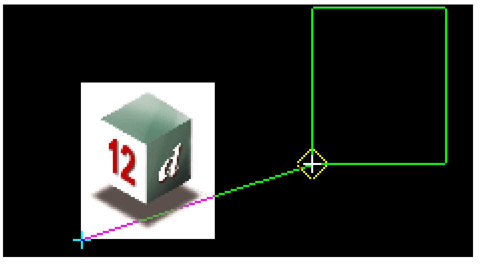
STEP 1:

Select the vertex that the image is attached to.

Note: The position of the image is defined **relative to the vertex.** To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After a vertex of an image is accepted, an outline of the image is displayed and moves with the position of the cursor. This will continue until the new position is selected and accepted.



Select the new position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image is then displayed at its new position.

Note: The ***CAD Move Image*** option only moves **the image offset relative to the vertex.** Use the option ***CAD Move*** to **move the vertex** (and the corresponding image moves with it).

15.19.2 Rotate Image

Position of option on menu: **CAD =>Image =>Rotate**

or by selection of appropriate icon from the toolbar.

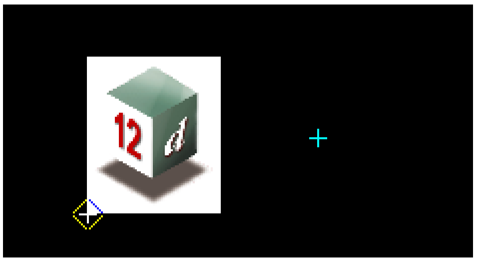
This option rotates an image around its justification point.

On selecting **Rotate Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

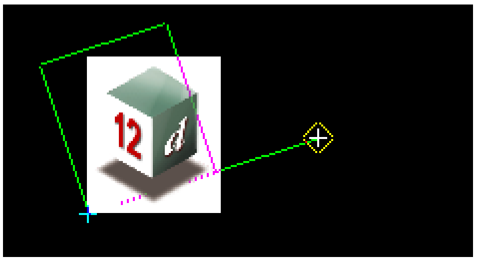
Select the vertex that the image is attached to.

Note: The position of the image is defined **relative to the vertex.** To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.



STEP 2:

After the vertex of an image is accepted, an outline of the image is displayed. The outline is rotated dynamically as the position of the cursor changes. This will continue until a final position is selected and accepted.

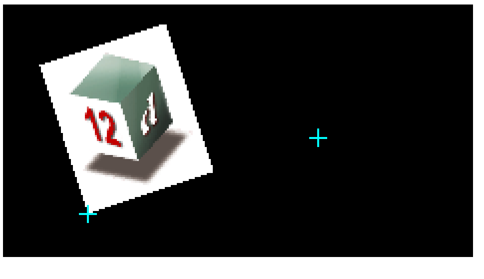


Select the new rotated position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The rotated image is then displayed.



15.19.3 Scale Image

Position of option on menu: **CAD =>Image =>Scale**

or by selection of appropriate icon from the toolbar.

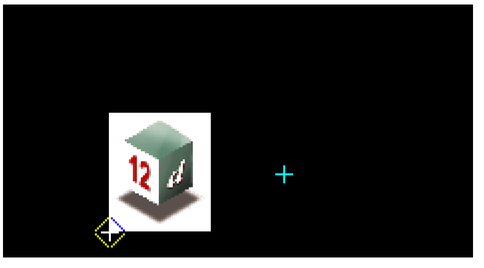
This option changes the size of an image.

On selecting **Scale Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

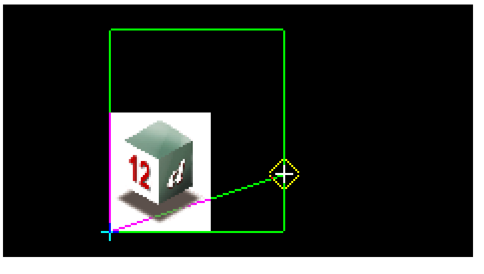
Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex.** To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.



STEP 2:

After the vertex of an image is accepted, an outline of the image is displayed. The size of the outline is determined by the position of the cursor. Both the height and the width of the image increase/decrease in the same ratio so that the image is not distorted.

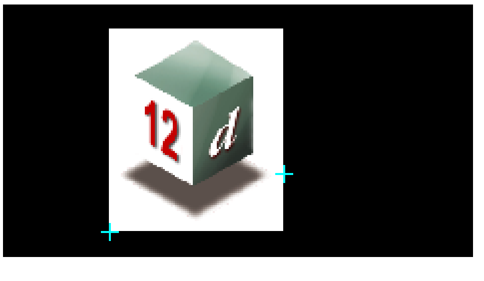


Select the new size as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The scaled image is then displayed.



15.19.4 Change Width

Position of option on menu: **CAD =>Image => Change width**

or by selection of appropriate icon from the toolbar. 

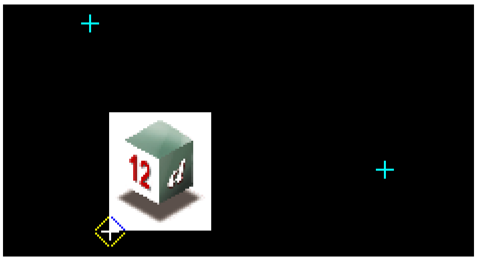
This option is user to increase or decrease the width of an image. The height of the image is not changed so the images will be stretched.

On selecting **Width Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

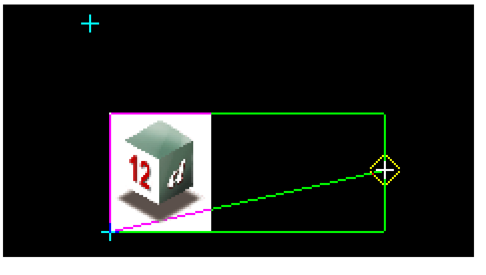
Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex.** To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.



STEP 2:

After the vertex of an image is accepted, the outline of the image is displayed. The width of the outline is determined by the position of the cursor. Whilst the height remains constant, the width of the outline increases and decreases dynamically as the position of the cursor changes.



Select the new width as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image with the new width is then displayed.

15.19.5 Change Height

Position of option on menu: **CAD =>Image => Change height**

or by selection of appropriate icon from the toolbar.

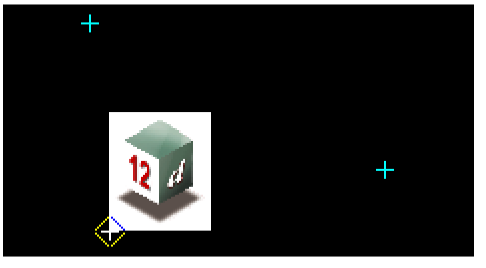
This option allows the user to increase or decrease the height of an image. The width of the image is not changed so the images will be stretched.

On selecting **Height Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

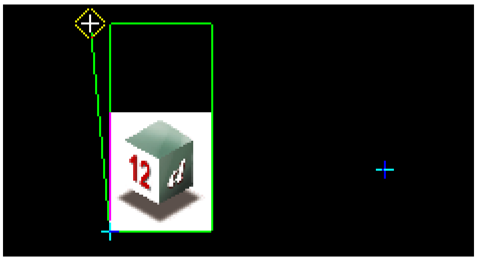
Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex.** To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.



STEP 2:

After the vertex of an image is accepted, the outline of the image is displayed. The height of the outline is determined by the position of the cursor. Whilst the width remains constant, the height of the outline increases and decreases dynamically as the position of the cursor changes.



Select the new height as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image with the new height is then displayed.

15.19.6 Insert Image

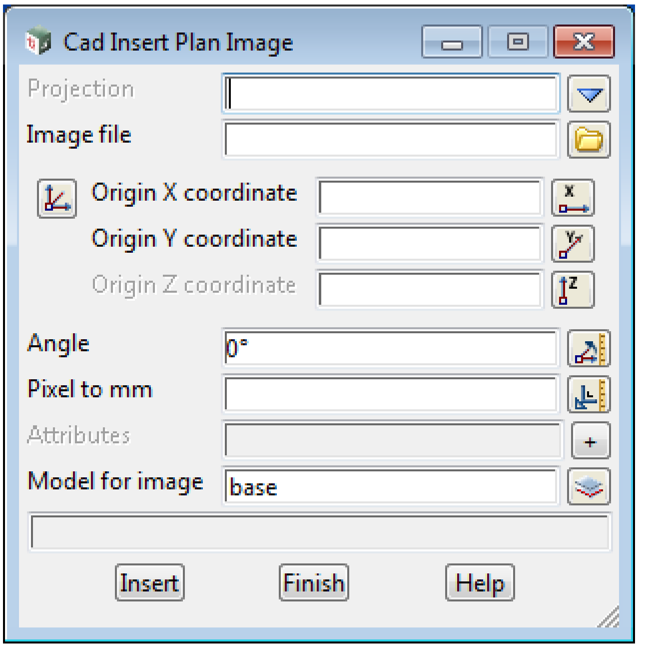
Position of option on menu: **CAD =>Image =>Insert**

or by selection of appropriate icon from the toolbar.

This option takes a user selected image file and creates a super string vertex with the image inserted at that vertex.

If the file type is JPEG and it includes the EXIF and GPS information, the information is loaded into attributes for the image.

On selecting **Insert**, the **Cad Insert Plan Image** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	input box		BMP, DIB, ECW, GIF, JPEG JPEG 2000, PNG, TGA TIFF, 12D

select the type of image file to insert. If the file type is JPEG and it includes the EXIF and GPS information, the information is loaded into attributes for the image and they can be examined by clicking '+' next to the Attributes *field.*

Image file input box

Select the image filename to be inserted into the project.

X/Y co-ordinate XY Pick button

select the x/y co-ordinate for origin (bottom left corner) of the image.

Origin X coordinate input box

enter the x coordinate for the bottom left of the image.

Origin Y coordinate input box

enter the y coordinate for the bottom left of the image.

Pixel to mm input box

the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the Pixel to mm *(mm being millimetres) value to give width and height size in world unit* *(metres) which is needed when inserting the image.*

Attributes

when JPEG is selected for the Format *and the JPEG file includes the EXIF and GPS information, the information is loaded into attributes for the image. The attributes can be looked at by clicking on the '+'.*

Model for image input box

select the model for the image to be inserted into.

Insert button

*when all the fields have been entered, the **Insert** button creates an image from the selected file.*

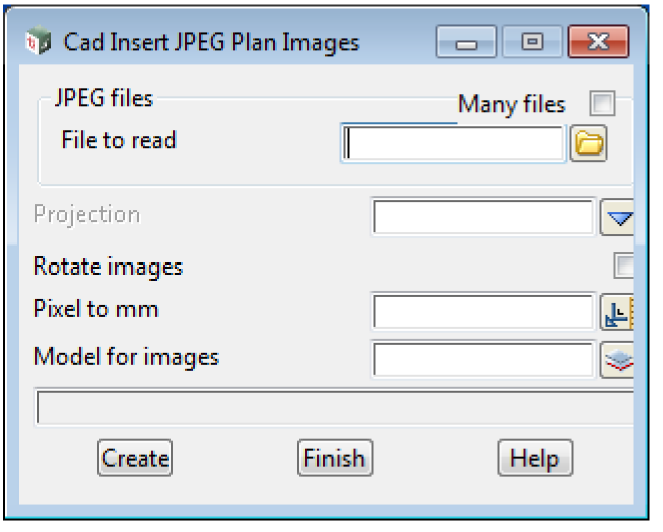
15.19.7 Insert JPEG(s)

Cad_Insert_JPEG_Plan_Images**Position of option on menu:** **CAD =>Image =>Insert JPEG(s)**

This option is for reading in JPEG files which must include EXIF and GPS information. This information is then used to position the image.

If a Projection is selected by the user, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no Projection is given, then the co-ordinates are left as lat/long.

On selecting **Insert JPEG(s)**, the **Cad Insert JPEG Plan Images** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Advanced tick box not ticked

clicking Advanced *brings up a grid to allow the user to enter many JPEG files.*

File to read file box available *.jpg files

the JPEG files to read in and create images from. The JPEG file must include EXIF and GPS information, which is used to position the image. If Projection *is not blank, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If* Projection *is blank, then the co-ordinates are left as lat/long.*

Projection choice box

if a Project Projection is set, then it is placed in the Projection *field. This can be changed to any other projection. The projection is used to convert the lat/long of the GPS values to the XYZ co-ordinates.*

If no projection is set, then the co-ordinates are left as lat/long.

Rotate images tick box not ticked

*if **ticked**, the rotate value from the EXIF will be used to rotate the image.*

Pixel to mm input box

the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the Pixel to mm *(mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.*

Model for images input box

the model for the image to be inserted into.

Create button

*when all the fields have been entered, the **Create** button creates images from the selected files.*

15.19.8 Insert Many

Position of option on menu: CAD =>Image =>Insert Many

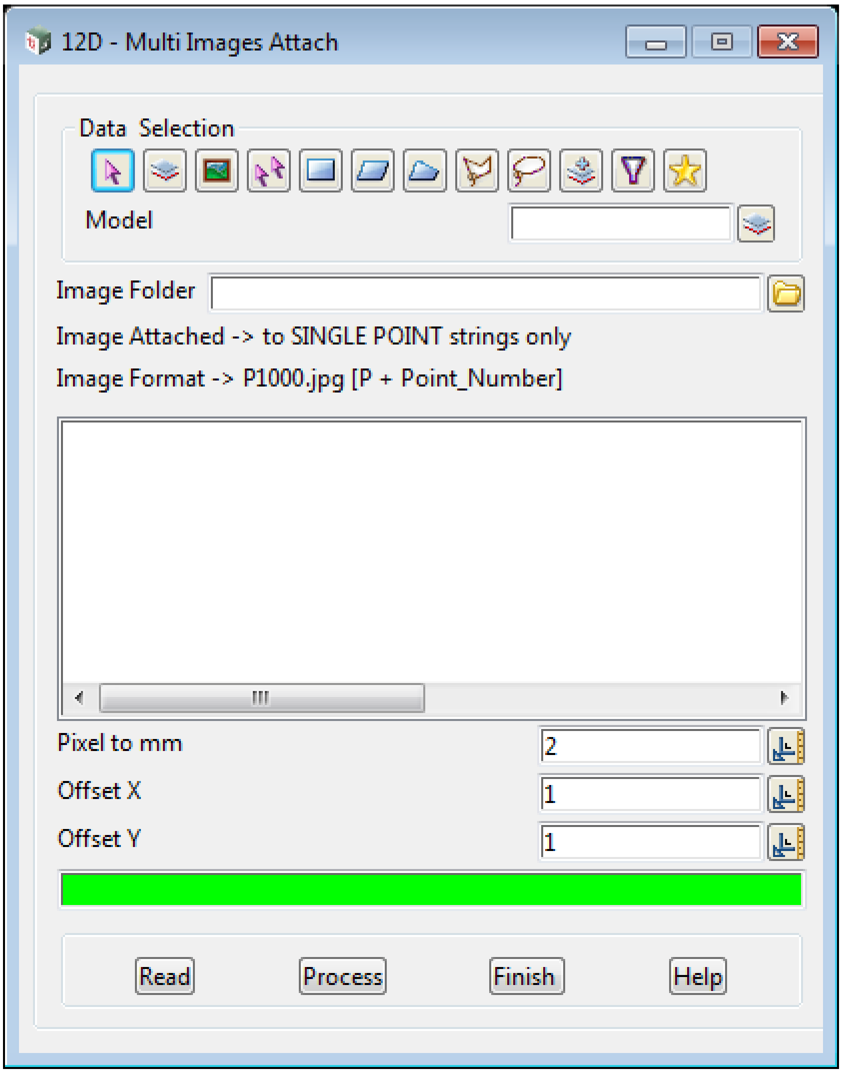
or by selecting the icon from the Cad Images **toolbar.** 

This option allows the attachment of an image to a selection of super point strings.

As shown on the panel, the images are to be stored in a directory folder and must be in the following format.

Image Format: P1000.jpg [P + point number]

Note: Attachment to Single Point super strings only



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Image Folder	directory		select folder

browse for a folder containing the images (folder only)

Pixel to mm	measure box	At Point, Point to Point, String from Point, String to Point

scale factor for image (check pixel size first)

Offset X	measure box	At Point, Point to Point, String from Point, String to Point

image offset in the x direction from point

Offset Y	measure box	At Point, Point to Point, String from Point, String to Point

image offset in the y direction from point

Read button

searches the image folder for the jpg images and displays them in the list box above

Process button

attaches the image to appropriate point

15.19.9 Delete Image

Position of option on menu: **CAD =>Image =>Delete**

or by selection of appropriate icon from the toolbar.

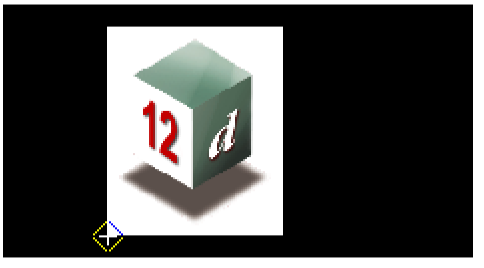
This option deletes an image.

On selecting **Delete Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select the **vertex** that the image is attached to.

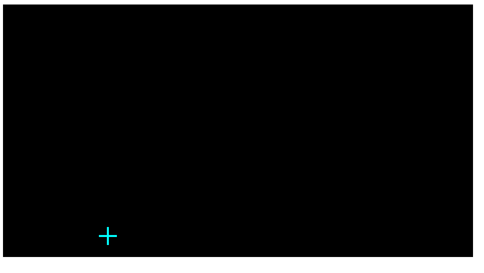
Note: The position of the image is defined **relative to the vertex.** To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.



STEP 2:

When the selected image is accepted, it is then deleted.

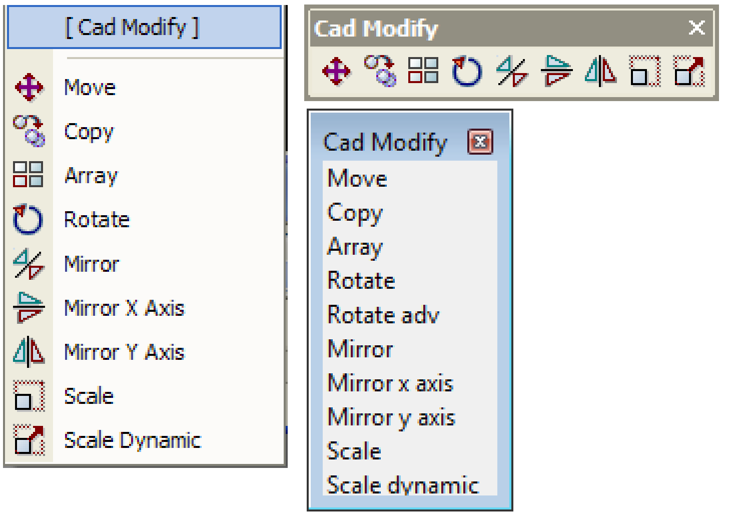
Note that the **vertex** that the image was attached to is not deleted.



15.20 CAD Modify

Position of option on menu: **CAD =>Modify**

The **Modify** walk-right menu is



For the option *Move*, go to	15.20.1 CAD Move
Copy	15.20.2 CAD Copy
Array	15.20.3 CAD Array
Rotate	15.20.4 CAD Rotate
Rotate adv	
Mirror	15.20.5 CAD Mirror
Mirror x axis	15.20.6 CAD Mirror X Axis
Mirror y axis	15.20.7 CAD Mirror Y Axis
Scale	15.20.8 CAD Scale
Scale dynamic	15.20.9 CAD Scale Dynamic

15.20.1 CAD Move

Position of option on menu: **CAD =>Modify =>Move**

or by selection of appropriate icon from the toolbar. 

This option moves a selected string.

On selecting **Move**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

For **CAD Multipick Move**, go straight to Step 2.

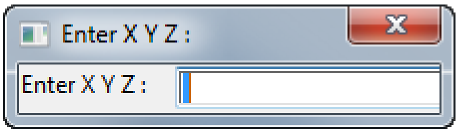
STEP 1:

A super string or circle is picked.

STEP 2:

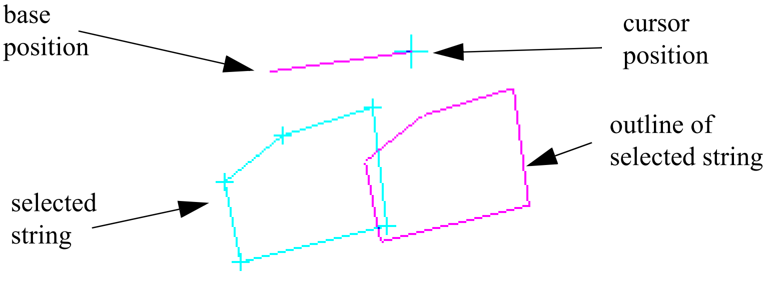
A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

NOTE: If the <Spacebar> or any other key is pressed, an Enter X Y Z typed input box is displayed on the screen.



X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the Enter X Y Z box from the screen. If values are not going to be typed in, clicking **X** on the top right-hand corner of the Enter X Y Z box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

Note: The base position is not required to lie on the string itself.



STEP 3:

A final cursor position is selected which defines a distance and direction from the base position to the final position.

STEP 4:

On accepting the final position, the selected super string is moved by the determined distance and direction.

15.20.2 CAD Copy

Position of option on menu: **CAD =>Modify =>Copy**

or by selection of appropriate icon from the toolbar. 

This option copies a super string.

On selecting **Copy**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

For **CAD Multipick Copy**, go straight to Step 2.

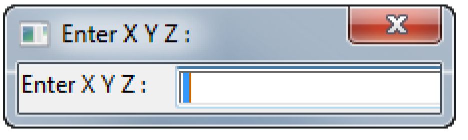
STEP 1:

Select a super string.

STEP 2:

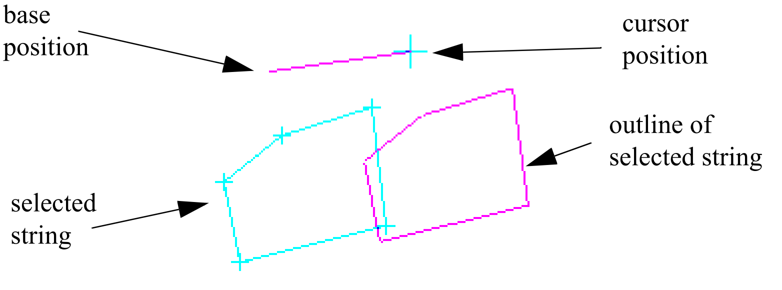
A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

NOTE: If the <Spacebar> or any other key is pressed, an Enter X Y Z typed input box is displayed on the screen.



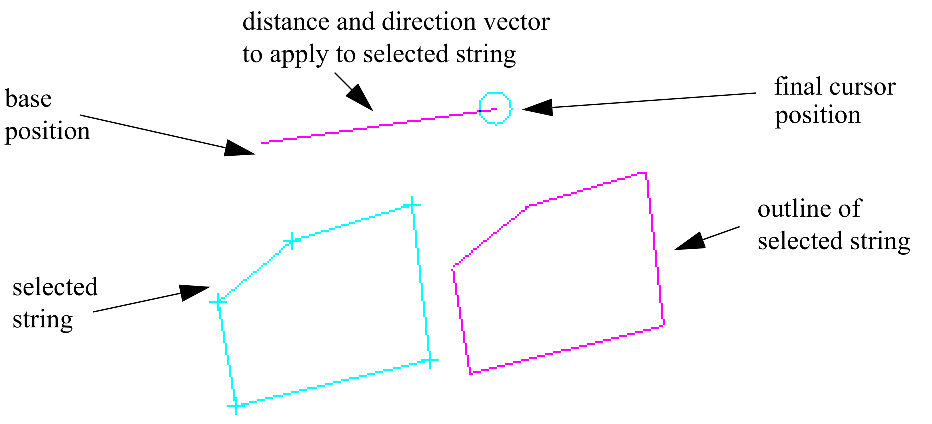
X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the Enter X Y Z box from the screen. If values are not going to be typed in, clicking on **X** on the top right-hand corner of the Enter X Y Z box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

Note: The base position is not required to lie on the string itself.



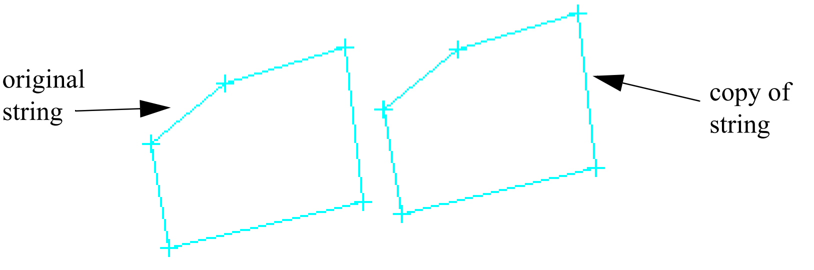
STEP 3:

A final cursor position is selected which defines a distance and direction from the base position to the final position.



STEP 4:

On accepting the final position, a copy of the selected super string is moved by the determined distance and direction.



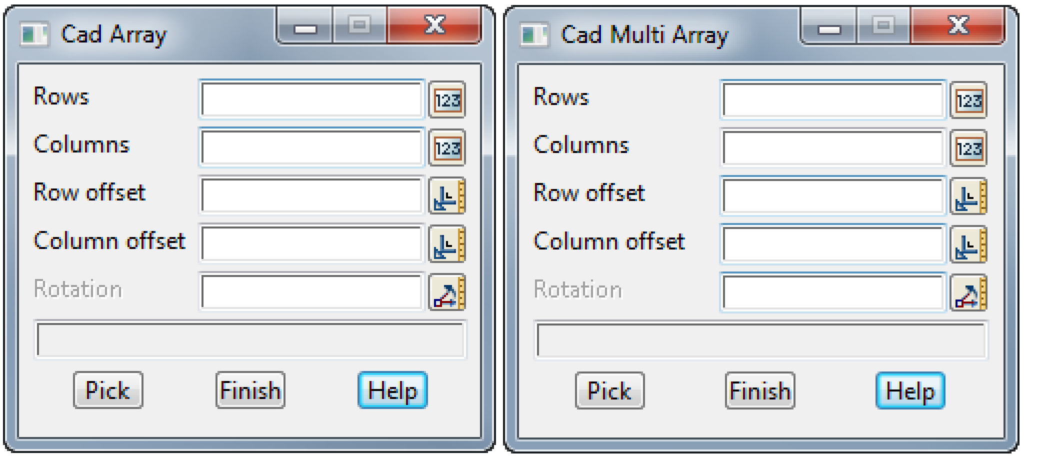
15.20.3 CAD Array

Position of option on menu: **CAD =>Modify =>Array**

or by selection of appropriate icon from the toolbar.

This option copies a super string a number of times. The Multipick Array option works in the same way once the *Multipick set* is selected.

On selecting **Array**, either the **Cad Array** panel (for CAD Array) or the **CAD Multi Array** panel (for CAD Multipick Array) is displayed.

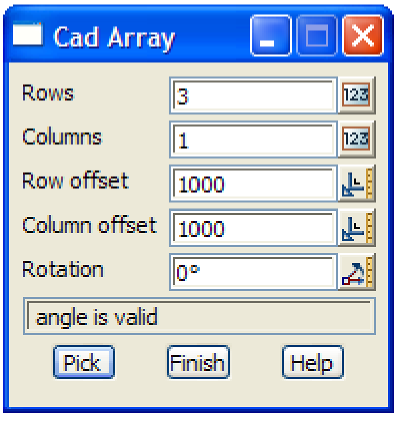


The fields and buttons used in the panel have the following functions.

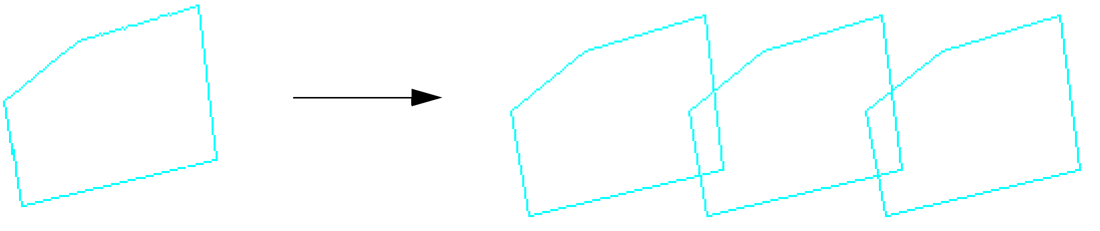
Field Description	Type	Defaults	Pop-Up
Rows	Input box		
number of rows			
Columns	Input box		
number of columns			
Row offset	Input box		
distance between the rows			
Column offset	Input box		
distance between the columns			
Rotation	angle box		
the angle to use for the rows and columns of copies			
Pick	button		
pick the super string to copy and when it is accepted the super string is copied			

STEPS:

Fill in the fields in the **Cad Array** panel, click **Pick** and select the super string to copy.



Cad Array
Rows 3
Columns 1
Row offset 1000
Column offset 1000
Rotation 0°
angle is valid
Pick
Finish
Help



15.20.4 CAD Rotate

Position of option on menu: **CAD =>Modify =>Rotate**

or by selection of appropriate icon from the toolbar. 

This option rotates a super string.

On selecting **Rotate**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

For **CAD Multipick Rotate**, go straight to Step 2.

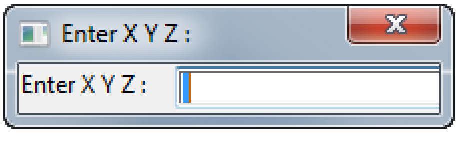
STEP 1:

Select the super string to rotate.

STEP 2:

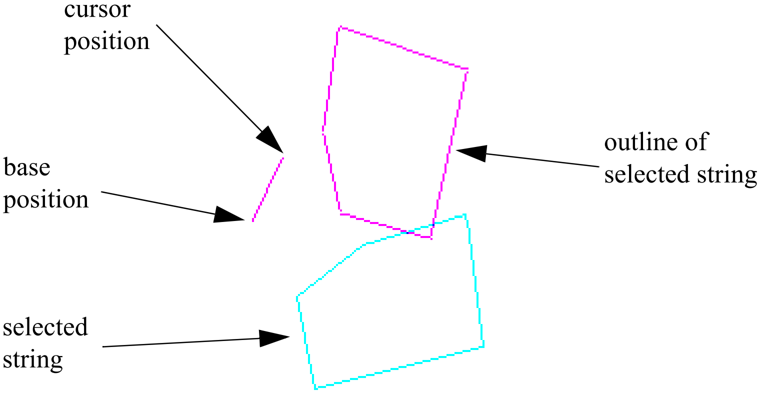
A base position is picked and then an outline of the selected string is drawn and rotated around the base position with the cursor, plus a line will be drawn from the base position to the current cursor position.

NOTE: If the <Spacebar> or any other key is pressed, an Enter X Y Z typed input box is displayed on the screen.



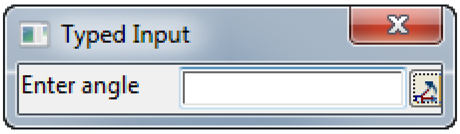
X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the Enter X Y Z box from the screen. If values are not going to be typed in, clicking on **X** on the top right-hand corner of the Enter X Y Z box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

Note: The base position is not required to lie on the string itself.



When the line has an angle of 0 degrees (bearing of 90 degrees), the outline will be on top of the selected string (*i.e.* there is no rotation). As the line rotates around the base position, the outline rotates around the base position. This rotation will continue until the final point is selected and accepted.

NOTE: If the <Spacebar> or any other key is pressed, an ***Enter Angle*** Typed Input box is displayed on the screen.

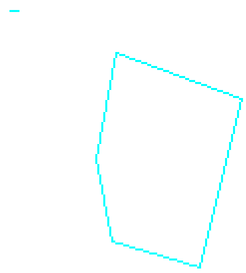


An angle (measured counter-clockwise from the positive X-axis and in 4.17.1 HP Notation) can be typed in and <Enter> will accept the value and remove the Typed Input box from the screen. If a value is not going to be typed in, clicking on **X** on the top right-hand corner of the Typed Input box removes the box from the screen and the option returns to selecting the rotation by moving the cursor.

STEP 3:

A final cursor position is selected which defines the rotation about the base position.

On accepting the final position, or after an angle has been entered, the selected string is rotated around the base position through the defined angle.



15.20.5 CAD Mirror

Position of option on menu: **CAD =>Modify =>Mirror**

or by selection of appropriate icon from the toolbar. 

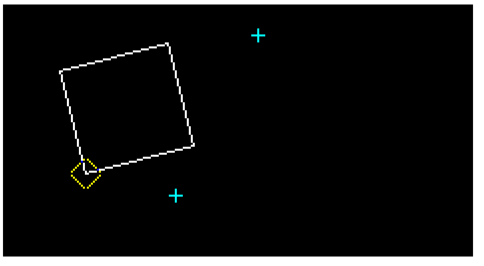
This option creates a mirrored image of a selected string.

On selecting **Mirror**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

For **CAD Multipick Mirror**, go straight to Step 2.

STEP 1:

Select a super string to mirror.

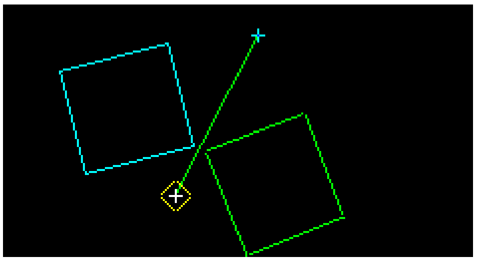


STEP 2:

Select the 1st point of the mirror axis.

The 1st point is selected with the mouse or entered via the keyboard. To enter a point with the keyboard, simply start typing or press the space bar to bring up the X Y Z Input box. Type the coordinates into the XYZ Input box and press the <Enter> key.

After the 1st point is accepted a line will be drawn from the 1st point to the position of the cursor. This line forms the mirroring axis. The outline of the reflected image will be dynamically displayed according to the changing cursor position.



STEP 3:

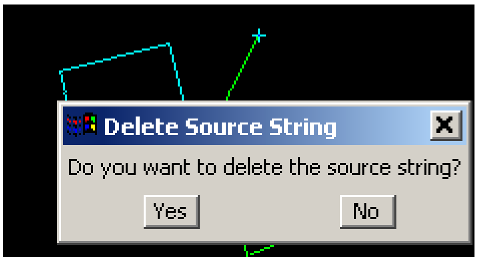
Select and accept the 2nd point of the mirror axis.

STEP 4:

For **CAD Mirror**, after the base point is accepted, the **Delete Source String** box will appear.

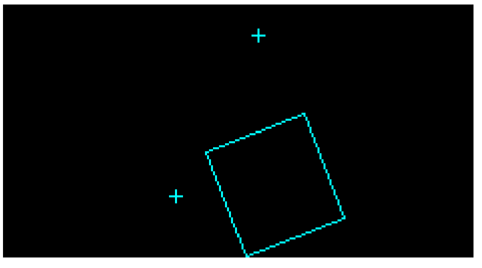
Select **Yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **No** if you want the original super string to remain when the new mirrored string is constructed.

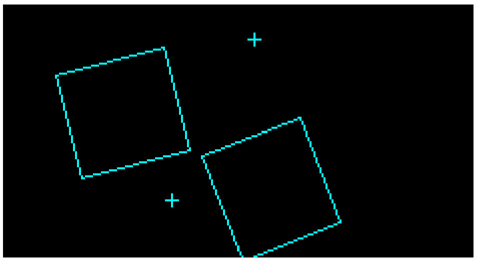


STEP 5:

The selected super string will be mirrored using the information given.



Delete the source string



Don't delete the source string

For **CAD Multipick Mirror**, the original strings are always deleted.

15.20.6 CAD Mirror X Axis

Position of option on menu: **CAD =>Modify =>Mirror X axis**

or by selection of appropriate icon from the toolbar.

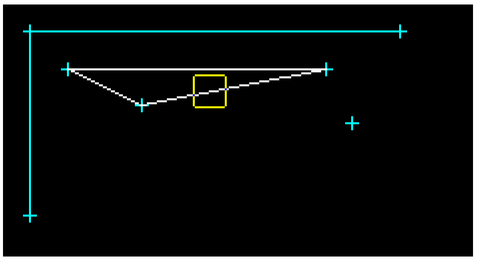
This option mirrors a string through the X axis.

On selecting **Mirror X Axis,** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

For **CAD Multipick Mirror X axis**, go straight to Step 2.

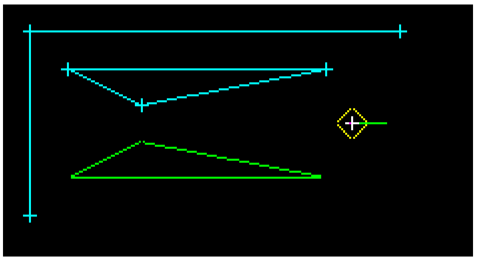
STEP 1: Picking a string

Select a super string to mirror though the X axis.



STEP 2:

After the string is accepted the position of the cursor on the Y axis determines the position of the mirror (which runs parallel to the X axis). As the cursor moves along the Y axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.



Select the final Y-position of the mirror X-axis.

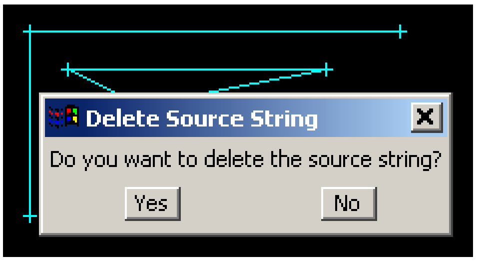
The final position is selected with the mouse or entered via the keyboard. To enter a base point with the keyboard, simply start typing or press the <Spacebar> to bring up the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

STEP 3:

For **CAD Mirror X axis**, after the final position is accepted, a **Delete Source String** box will appear.

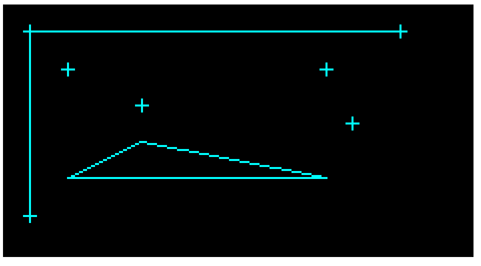
Select **Yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **No** if you want the original super string to remain when the new mirrored string is constructed.

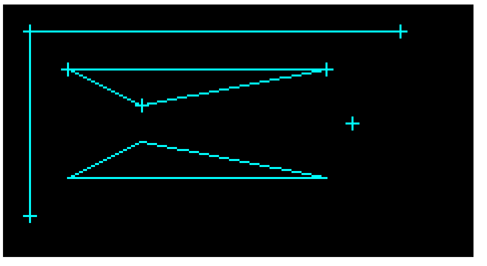


STEP 4:

The selected super string will be mirrored using the information given.



Delete the source string



Don't delete the source string

For **CAD Multipick Mirror X axis**, the original strings are always deleted.

15.20.7 CAD Mirror Y Axis

Position of option on menu: **CAD =>Modify =>Mirror Y Axis**

or by selection of appropriate icon from the toolbar.

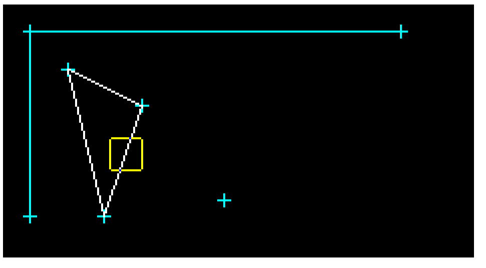
This option mirrors a string through the Y axis.

On selecting **Mirror Y Axis,** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

For **CAD Multipick Mirror Y Axis**, go straight to Step 2.

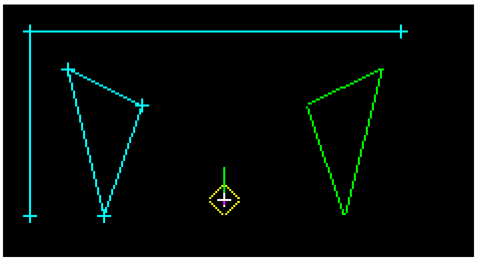
STEP 1:

Select a super string to mirror though the Y axis.



STEP 2:

After the string is accepted the position of the cursor on the X axis determines the position of the mirror (which runs parallel to the Y axis). As the cursor moves along the X axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.



Select the final X-position of the mirror Y-axis.

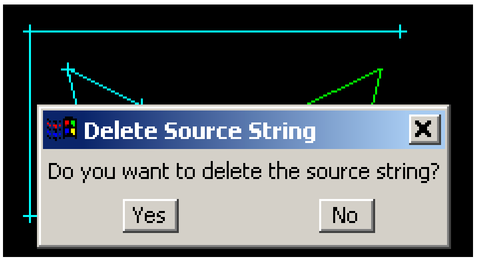
The final position is selected with the mouse or entered via the keyboard. To enter a base point with the keyboard, simply start typing or press the <Spacebar> to bring up the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

STEP 3:

After the final position is accepted, a **Delete Source String** box will appear.

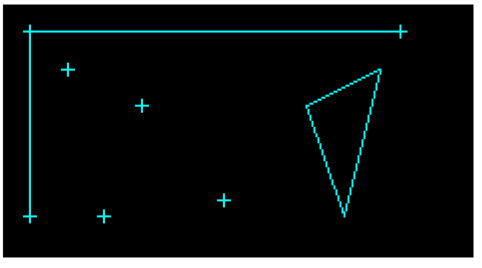
Select **Yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **No** if you want the original super string to remain when the new mirrored string is constructed.

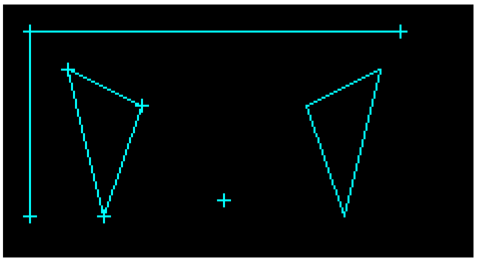


STEP 4:

The selected super string will be mirrored using the information given.



Delete the source string



Don't delete the source string

15.20.8 CAD Scale

Position of option on menu: **CAD =>Modify =>Scale**

or by selection of appropriate icon from the toolbar.

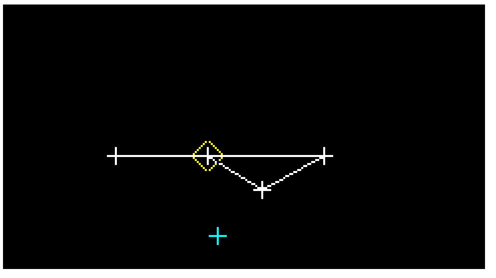
This option increases or decreases the size of a string by a given scale about a user selected origin. Go to 15.8.9 Scale About an Origin for the definition of scaling.

On selecting **Scale**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

For **CAD Multipick Scale**, go straight to Step 2.

STEP 1:

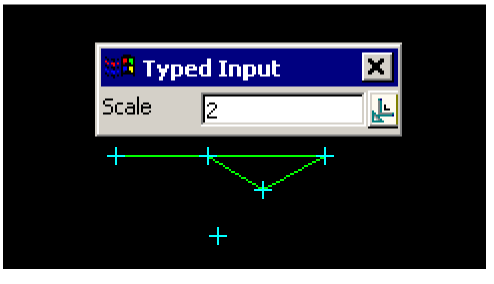
Select a super string to scale.

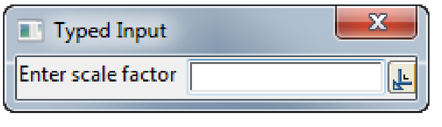


STEP 2:

After a string is accepted, the **Scale** Typed Input box will appear. Type the desired scale factor into the input box and press the <Enter> key. The browse button on the Input box can be used to define the scale by measuring existing elements.

Note: the Scale/Scale Factor can be positive or negative.





STEP 3:

After a scale value has been entered the user is required to select the position of the origin.

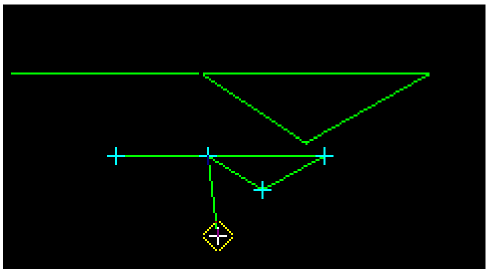
An origin position can be selected with the mouse or entered via the keyboard.

To enter an origin position with the keyboard, simply start typing or press the space bar to bring up the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

If the position of the origin is given by the cursor, the position of the scaled highlighted string moves dynamically as the position of the origin changes as the cursor moves. The final selected origin position establishes the location of the scaled string relative to the original selected string.

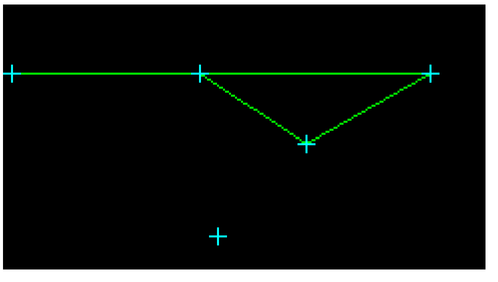
The dimensions of the highlighted string are defined by the Scale value.

For example, if you selected a scale of **2**, the distance between the cursor and a point on the highlighted string would be double the distance between the cursor and the corresponding point on the original super string.



STEP 4:

After the final position has been accepted, the original string will be removed and the newly scaled highlighted string constructed.



15.20.9 CAD Scale Dynamic

Position of option on menu: **CAD =>Modify =>Scale Dynamic**

or by selection of appropriate icon from the toolbar.

This option dynamically increases or decreases the size of a string.

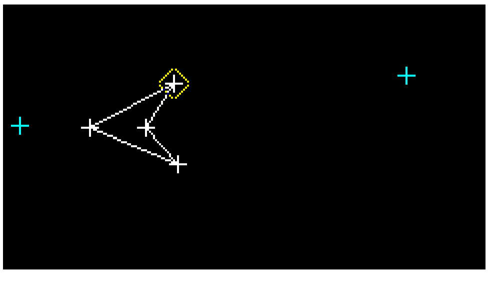
This option dynamically increases or decreases the size of a string about a user selected origin by selecting a point to define the scale factor. Go to 15.8.9 Scale About an Origin for the definition of scaling.

On selecting **Scale Dynamic**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

For **CAD Multipick Scale Dynamic**, go straight to Step 2.

STEP 1:

Select a super string to scale.

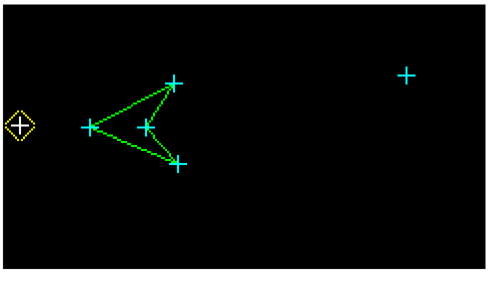


STEP 2:

An Origin point is required to be defined. An Origin point can be selected with the mouse or entered in via the keyboard.

To enter an Origin point with the keyboard, simply start typing or press the space bar to bring up the Enter X Y Z box. Type the coordinates into the Enter X Y Z box and press the <Enter> key.

To enter the origin by the cursor, simply select and accept the required origin position.



STEP 3:

For **CAD Scale Dynamic**:

After an Origin point has been accepted, the cursor then defines the Projection point.

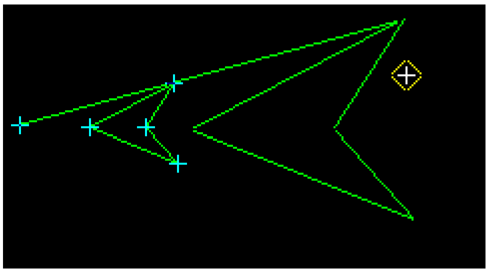
Note: the Projection Point is the cursor position dropped perpendicularly onto the line from the origin through the original point selected on the string.

The scale factor is taken to be the ratio of the distance from the projection point to the origin and the distance from the original point selected on the string to the origin.

That is,

Scale factor = (the distance from the projection point to the origin) divided by (the distance from the original point selected on the string to the origin)

The highlighted string is projected from the Origin point to the Projection point (which is being defined by the cursor).



For **CAD Multipick Scale Dynamic**:

After an Origin point has been accepted, a Start Scale Position is selected.

After that the cursor then dynamically defines the End Scale position.

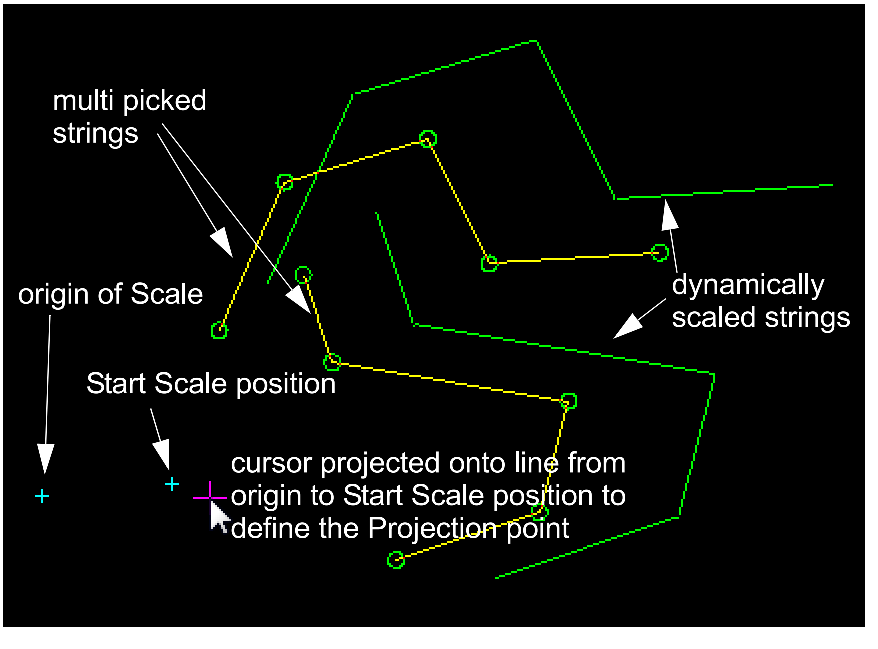
For Multipick, the Projection Point is the End Scale position dropped perpendicularly onto the line from the origin through the Start Scale position.

The scale factor is taken to be the ratio of the distance from the Projection Point to the origin and the distance from the Start Scale position to the origin.

That is,

Scale factor = (the distance from the Projection Point to the origin) divided by (the distance from the Start Scale position to the origin)

The highlighted strings are projected from the Origin point using the scale factor dynamically defined by the cursor (and hence the Projection point).



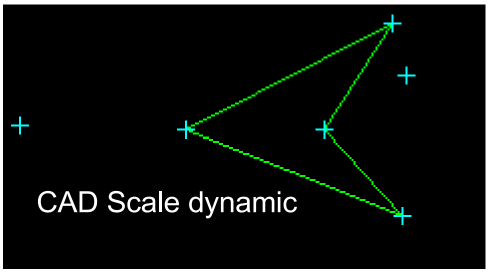
Hence for both the CAD Scale Dynamic and the CAD Multipick Scale Dynamic, the size and position of the highlighted string will move dynamically as the position of the Projection point moves with the cursor.

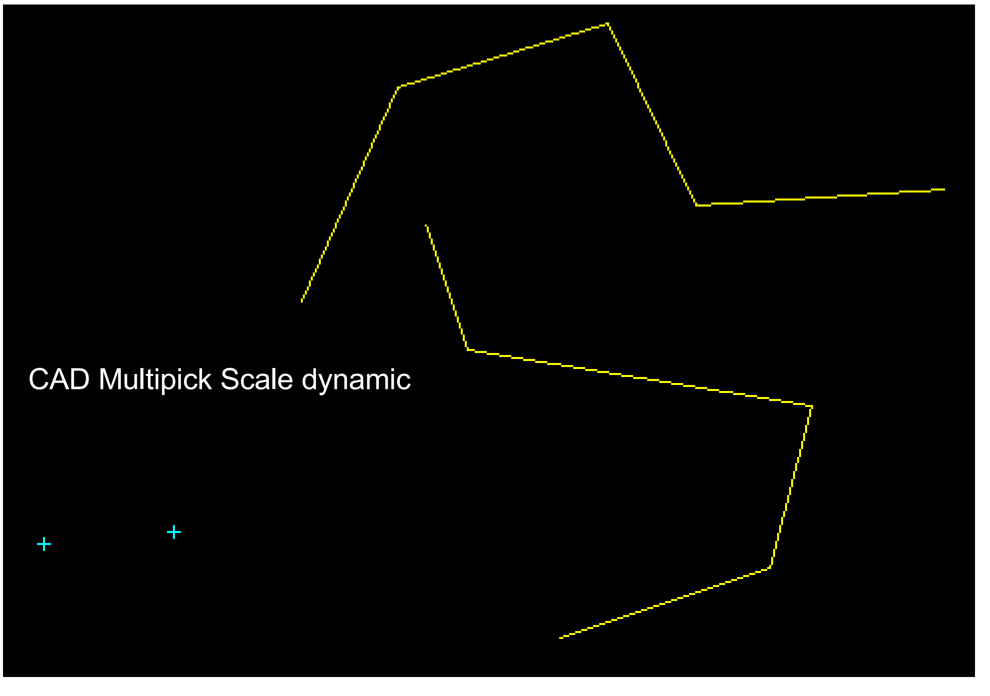
The highlighted string will increase in size if the cursor moves the Projection point further from the Origin than the original string point/Start Scale position, or decrease in size if the cursor moves the Projection point closer to the Origin than the original string point/Start Scale position.

This will continue until a Projection point is accepted.

STEP 4:

After the Projection point has been accepted, the new scaled strings are created and the original strings deleted.



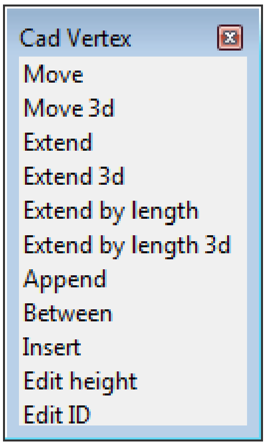


15.21 CAD Vertex

Position of option on menu: CAD =>Vertex

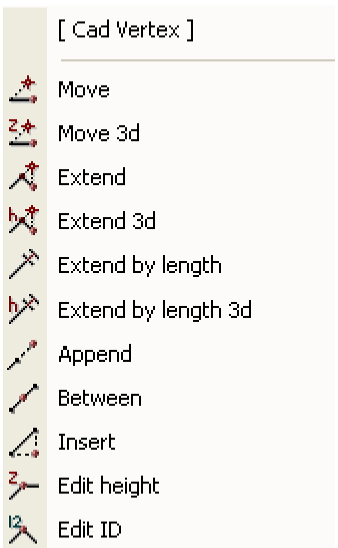
This section of documentation is a work in progress and will be updated in subsequent releases.

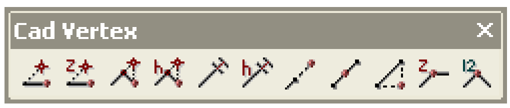
The **Cad Vertex** walk-right menu is



Menu of Options to Move Vertices

move a vertex
move a vertex and modify its height
move a vertex along its segment - keep the same height
move a vertex along its segment - interpolate/extrapolate the height
move a vertex by a given chainage distance along a segment - keep height
move a vertex a given chainage dist along a segment - extrapolate height
append a vertex to an existing string
create a vertex on the segment joining two adjacent vertices of a string
insert a vertex between two adjacent vertices of a string
edit the height of a vertex
edit the point (vertex) ID





These options allow the editing of vertices on super strings.

For the option *Move*, go to 15.21.1 Move a Vertex while Keeping its Height
Move 3d 15.21.2 Move a Vertex and Modify its Height
Extend 15.21.3 Extend a Vertex while Keeping its Height
Extend 3d 15.21.4 Extend Segment and Extrapolating Heights
Extend by length 15.21.5 Extend Segment by Length and Keeping Height
Extend by length 3d 15.21.6 Extend Segment by Length and Extrapolating Heights
Append 15.21.7 Append a Vertex
Between 15.21.8 New Vertex on a Segment (Between Two Vertices)

Insert	15.21.9 Insert a Vertex
Edit height	15.21.10 Change Height of a Vertex
Edit ID	15.21.11 Edit ID

15.21.1 Move a Vertex while Keeping its Height

Position of option on menu: **CAD =>Vertex =>Move**

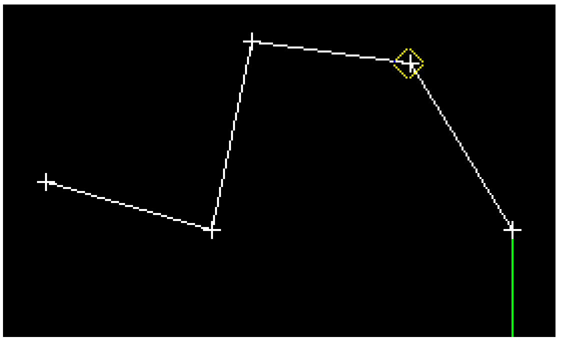
or by selection of appropriate icon from the toolbar. 

This option moves the vertex of a super string. The height of the vertex is not modified.

On selecting **Move**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

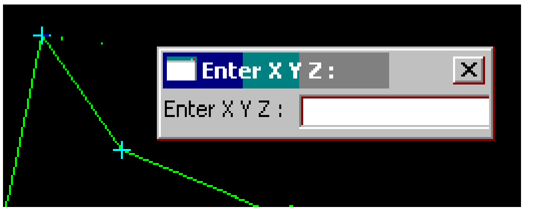
STEP 1:

A vertex on a super string is selected and accepted.



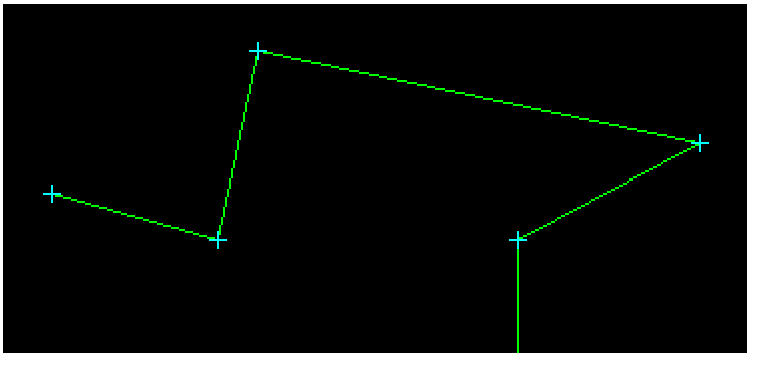
STEP 2:

The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.



STEP 3:

The selected vertex is moved to the new position.



15.21.2 Move a Vertex and Modify its Height

Position of option on menu: **CAD =>Vertex =>Move 3d**

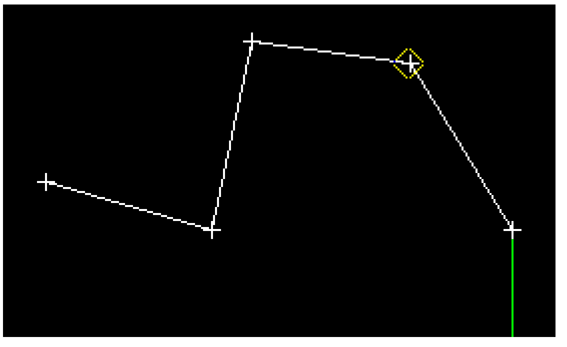
or by selection of appropriate icon from the toolbar.

This option moves the vertex of a super string and the height of the vertex is taken from the height of the final selected position.

On selecting **Move 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

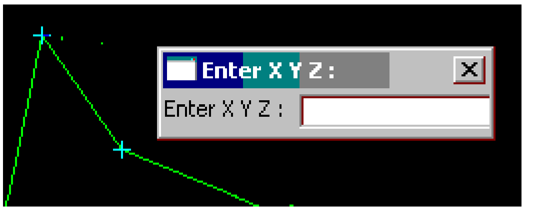
STEP 1:

A vertex on a super string is selected and accepted.



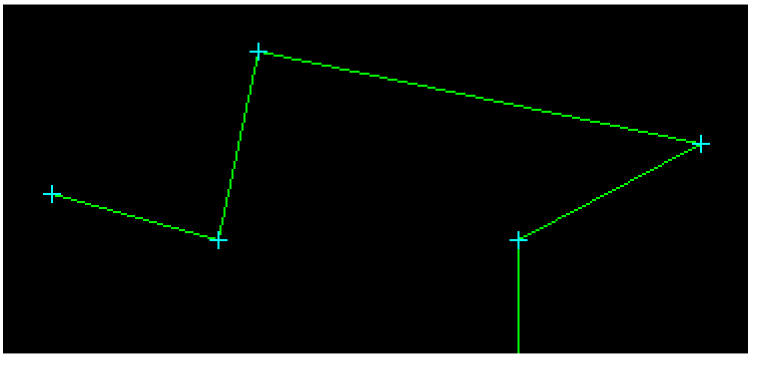
STEP 2:

The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.



STEP 3:

The selected vertex is moved to the new position and takes on the height of the string it is snapped to, or the Z value entered into the **Enter XYZ** box.



15.21.3 Extend a Vertex while Keeping its Height

Position of option on menu: **CAD =>Vertex =>Extend**

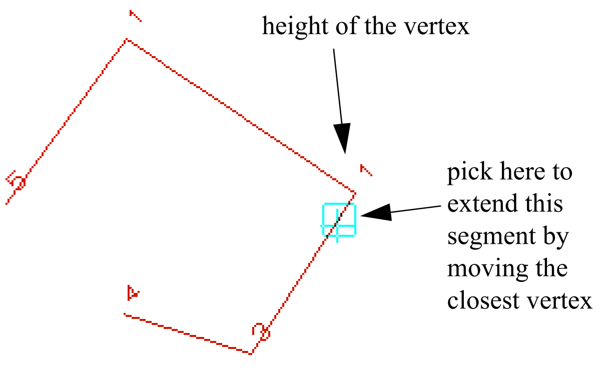
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is not modified.

On selecting **Extend**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

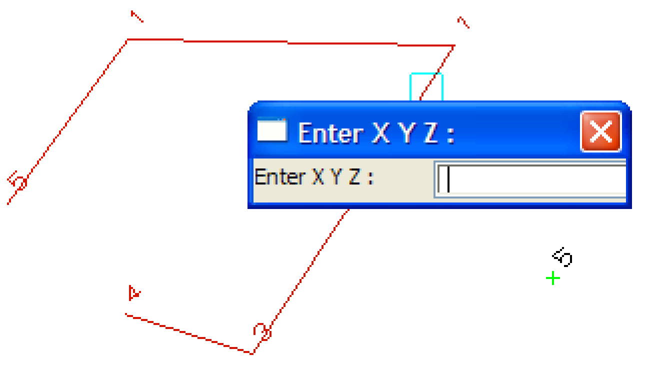
STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.



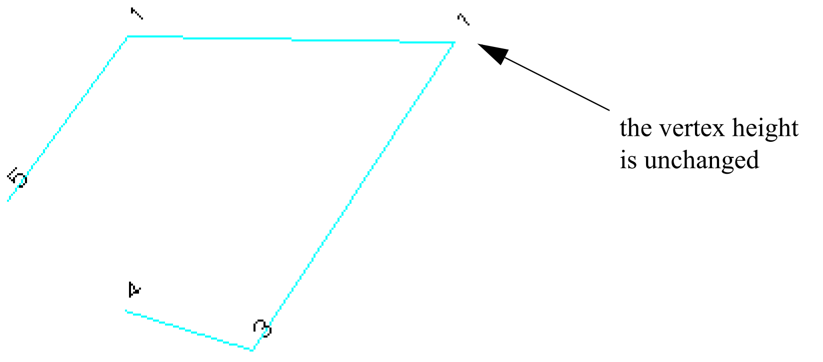
STEP 2:

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.



STEP 3:

The selected vertex is moved to the new position. The height of the vertex is not changed.



the vertex height
is unchanged

15.21.4 Extend Segment and Extrapolating Heights

Position of option on menu: CAD =>Vertex =>Extend 3d

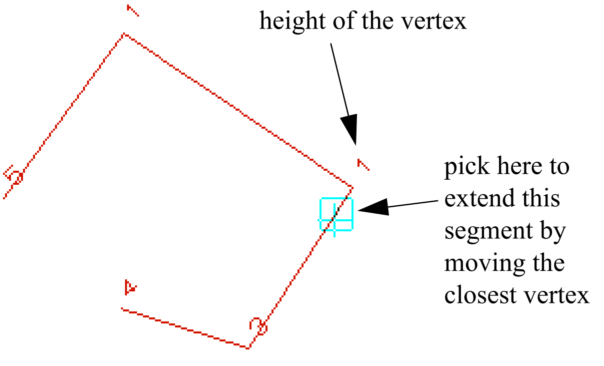
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is extrapolated.

On selecting **Extend 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

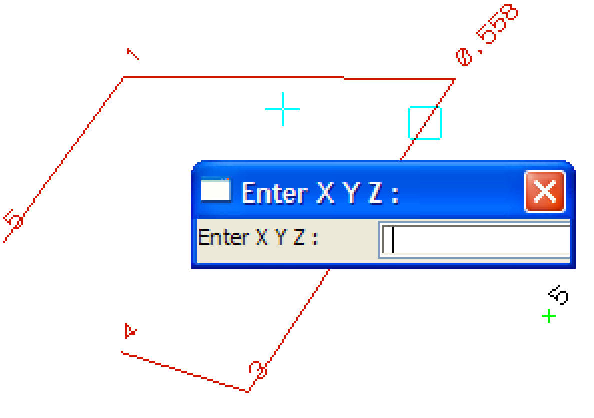
Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.



STEP 2:

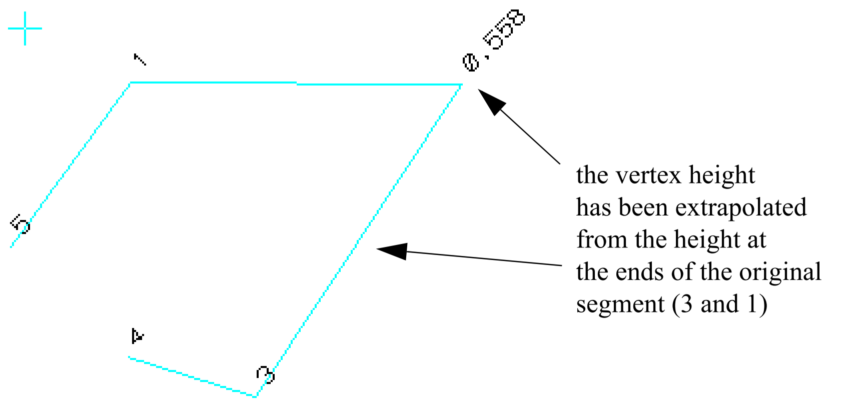
As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

The point selected is moved to the cursor position in a rubber banding fashion. The final position of the point is selected and accepted. Alternatively, the user can enter the final coordinate value of the moved point by the Enter XYZ box. This box can be brought into view by simply typing a value or by pressing the space bar.



STEP 3:

The selected vertex is moved to the new position. The height of the vertex has been extrapolated from the heights at either end of the original segment.



15.21.5 Extend Segment by Length and Keeping Height

Position of option on menu: **CAD =>Vertex =>Extend by length**

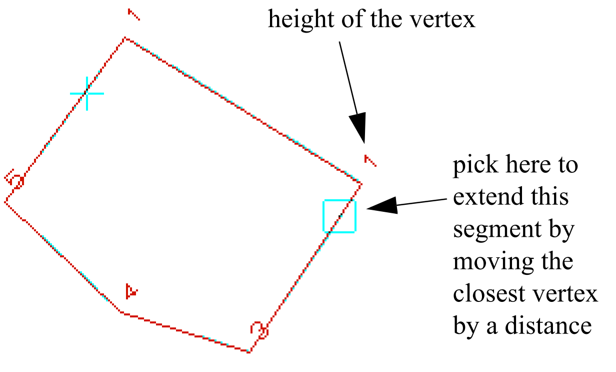
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is not modified.

On selecting **Extend by length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

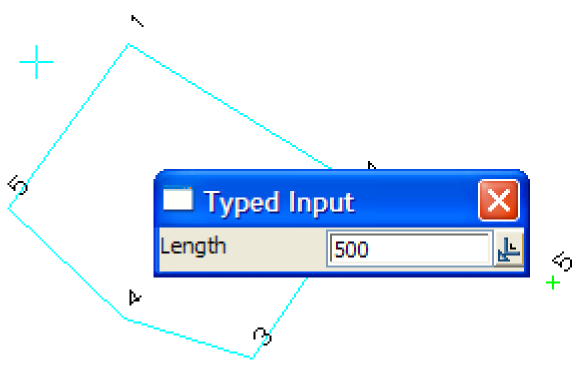
STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.



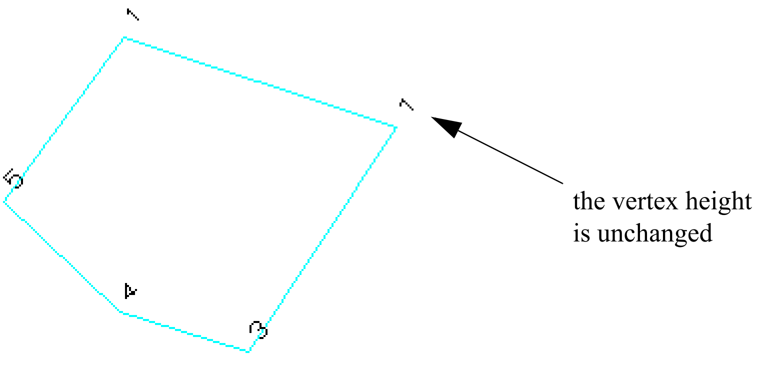
STEP 2:

The user enters the distance to extend the segment. This value is positive in the direction that the string was created.



STEP 3:

The point selected is moved to the new position and the string topology maintained.



the vertex height
is unchanged

15.21.6 Extend Segment by Length and Extrapolating Heights

Position of option on menu: **CAD =>Vertex =>Extend by length 3d**

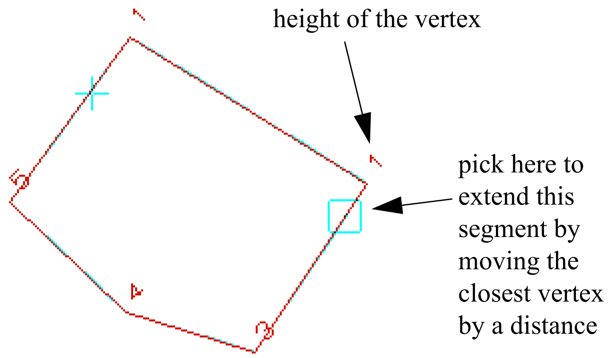
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is extrapolated modified.

On selecting **Extend by length 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

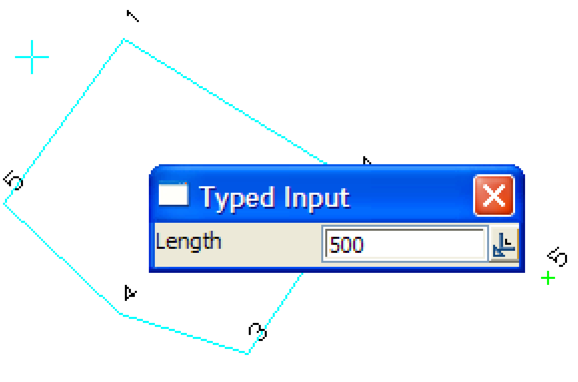
STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.



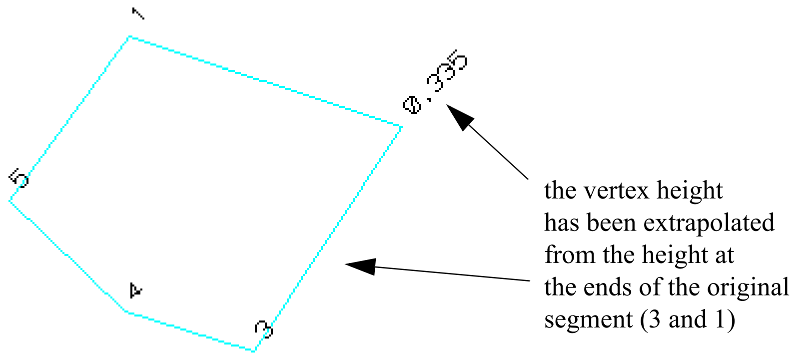
STEP 2:

The user enters the length value for which the point is to be extended by. This value is positive in the direction that the string was created.



STEP 3:

The point selected is moved to the new position and the height adjusted according to the grade of the extended segment.



1
0.335
5
4
3
the vertical height
has been extrapolated
from the height at
the ends of the original
segment (3 and 1)

15.21.7 Append a Vertex

Position of option on menu: **CAD =>Vertex =>Append**

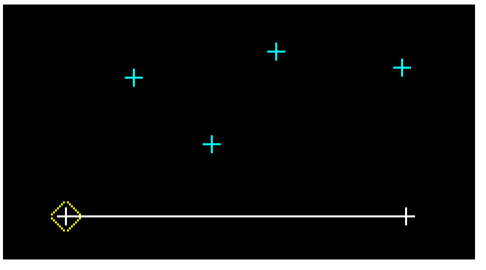
or by selection of appropriate icon from the toolbar. 

This option adds vertices to an existing super string.

On selecting **Append**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

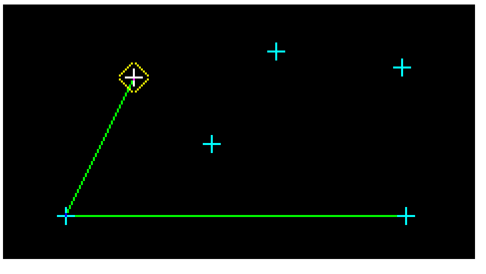
STEP 1:

Select a string by picking near the end of the string that vertices are to be added to (added to the beginning of the string - prepend, or added to the end of the string - append).



STEP 2:

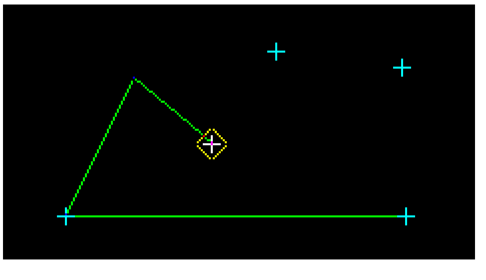
After the string is accepted, a line is drawn from the end of the string to the current cursor position.



Select the position for the new vertex.

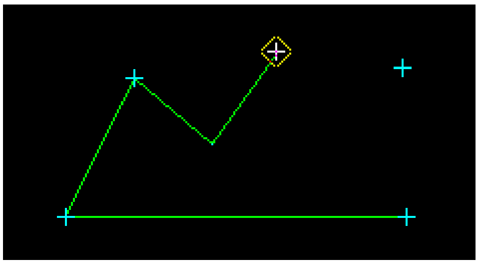
STEP 3:

After the new vertex is accepted, a line is drawn from that vertex to the current cursor position. That is, the process of adding points is repeated.

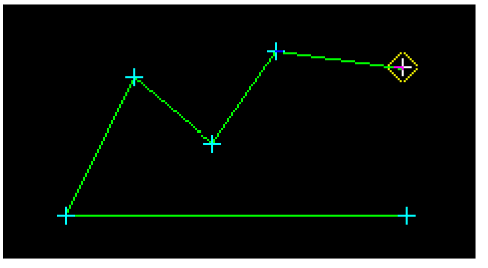


STEP 4:

This step should be repeated until the required number of vertices has been added.



STEP 5:



STEP 6:

After the required number of vertices have been added, the option is terminated for this string by pressing the <Esc> key.

15.21.8 New Vertex on a Segment (Between Two Vertices)

Position of option on menu: **CAD =>Vertex =>Between**

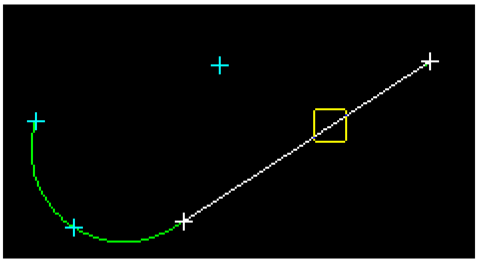
or by selection of appropriate icon from the toolbar.

This option adds a vertex to a string but it is constrained to be on an existing segment of the string. The height of the vertex is interpolated from the heights at the end of the segment.

On selecting **Between**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

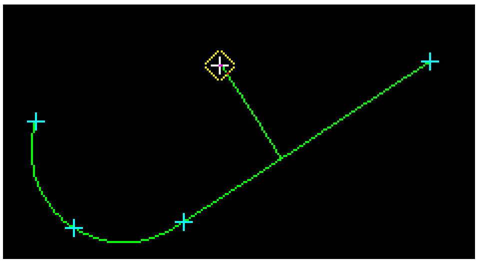
STEP 1:

Select the string on the segment of the string that is to have a vertex added to it. The new vertex will be constrained to be on the segment.



STEP 2:

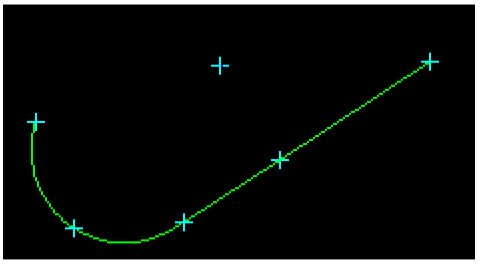
After the segment is accepted, a perpendicular line is drawn from the selected segment of the string to the position of the cursor.



STEP 3:

A position is selected with the mouse or typed in via the keyboard and the new vertex is created by **dropping** the position **perpendicularly** onto the segment.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the XYZ Input box and press the enter key.



15.21.9 Insert a Vertex

Position of option on menu: **CAD =>Vertex =>Insert**

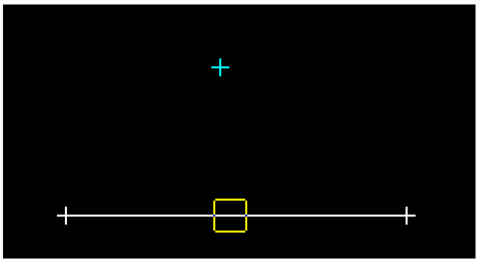
or by selection of appropriate icon from the toolbar.

This option inserts a vertex into to a string between two adjacent vertices but it is constrained to be on the existing segment joining the vertices. The height of the vertex is taken from the final selected position.

On selecting **Insert**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

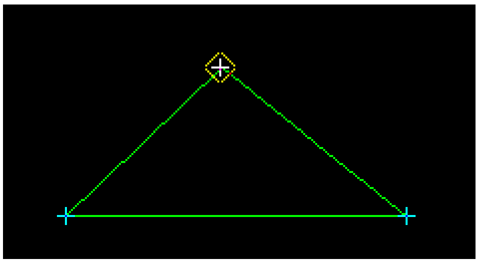
STEP 1:

Select the string on the segment of the string that is to have a vertex added to it. The new vertex is ***not*** constrained to be on the segment.



STEP 2:

After a string is accepted, two lines will be drawn from the cursor position to either end of the selected segment.

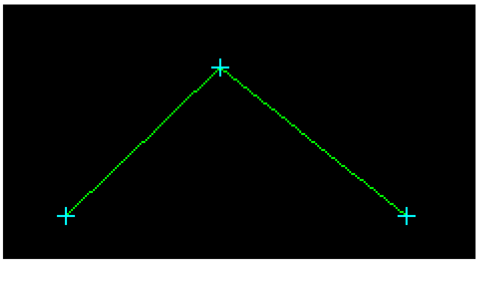


STEP 3:

A final position is selected with the mouse or typed in via the keyboard and the new vertex is created at the final position.

Once the new vertex is created the original segment is no longer drawn.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the XYZ Input box and press the enter key.



15.21.10 Change Height of a Vertex

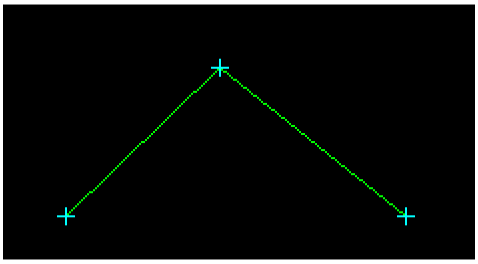
Position of option on menu: **CAD =>Vertex =>Edit height**

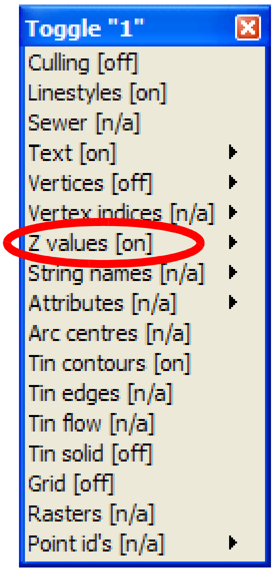
or by selection of appropriate icon from the toolbar.

This option changes the height (z value) of a vertex.

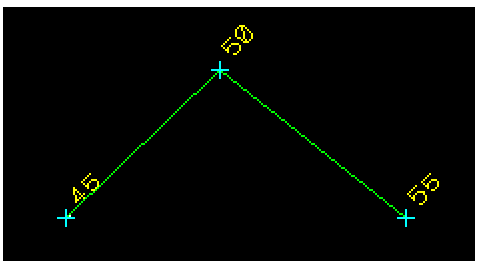
On selecting **Edit height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:





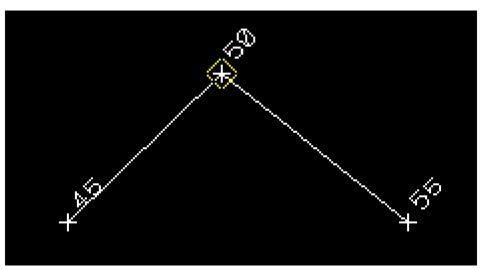
To see the effects of this option, use the **Toggle** menu to toggle on **Z values**. The height of each vertex (z value) is then displayed on the plan view so any modification to the height will be visible.



STEP 2:

Select a vertex with either the mouse or via the keyboard.

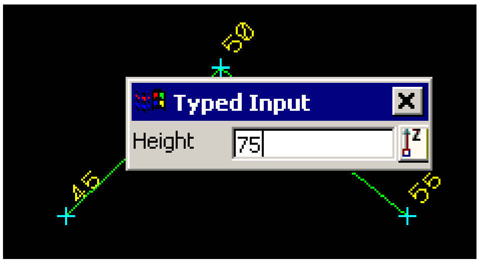
Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the **Enter XYZ** Input box and press the <Enter> key.



STEP 3:

After a point is accepted, the **Height** input box will appear with the current height displayed in it.

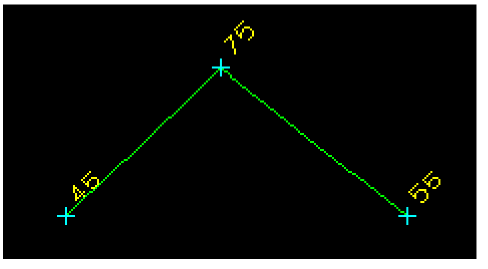
Type the new height (z value) of the vertex into the **Height** input box and press the <Enter> key. The browse button on the Input box can also be used to define the point's height.



STEP 4:

The height (z value) of selected point will have changed to the new value.

If z values have been turned on, the new value will be displayed in the view.



15.21.11 Edit ID

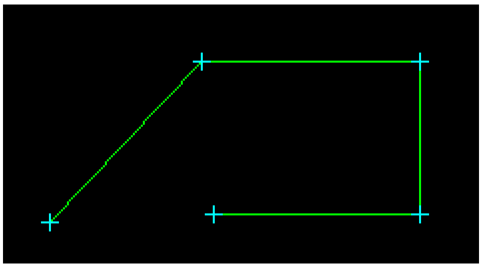
Position of option on menu: **CAD =>Vertex =>Edit ID**

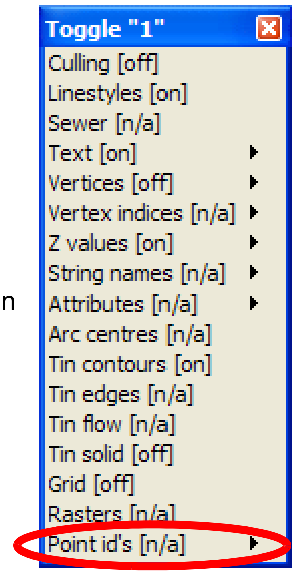
or by selection of appropriate icon from the toolbar. 

This option changes the point id of the vertex of a super string.

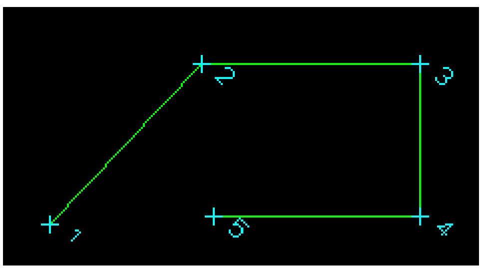
On selecting **Edit ID**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:





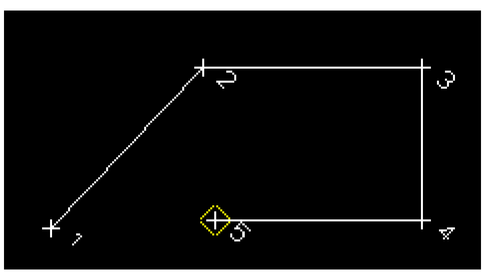
To see the effects of this option, use the **Toggle** menu to toggle on **Point id's**. The Point id of each vertex is then displayed on the plan view so any modification to the point id will be visible.



STEP 2:

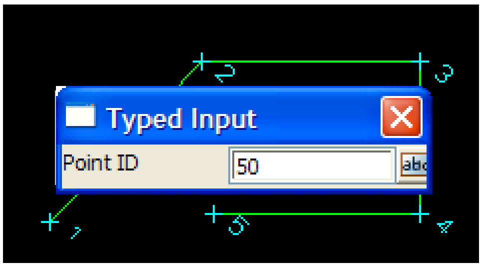
Select a vertex with either the mouse or via the keyboard.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the **Enter XYZ** Input box and press the Enter key.



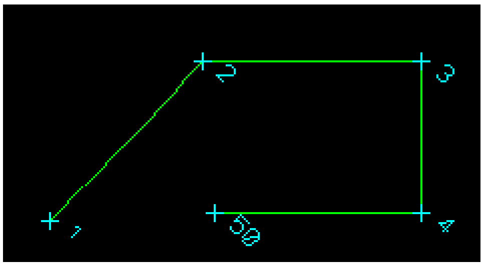
STEP 3:

After the vertex is accepted, the **Point ID** input box will appear. Type the point id into the input box and press the Enter key.



STEP 4:

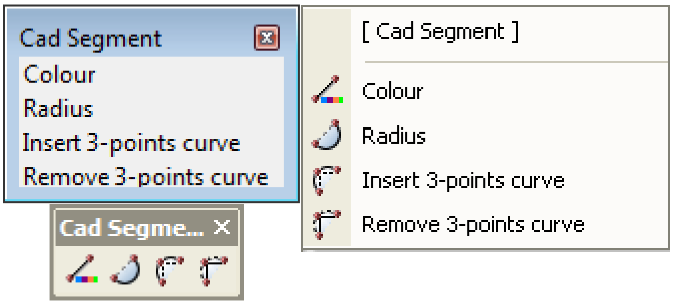
The point id of selected vertex is changed to the new value. If Point id's have been turned on, the new value will be displayed in the view.



15.22 CAD Segment

Position of option on menu: **CAD =>Segment**

The **Cad Segment** walk-right menu is



For the option *Colour*, go to 15.22.1 Colour
Radius 15.22.2 Radius
Insert 3-points curve 15.22.3 Insert 3-points curve
Remove 3-points curve 15.22.4 Remove 3-points curve

15.22.1 Colour

Position of option on menu: **CAD =>Cad Segment =>Colour**

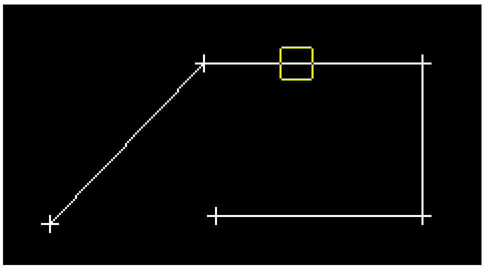
or by selection of appropriate icon from the toolbar. 

This option changes the colour of a selected segment.

On selecting **Segment colour**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

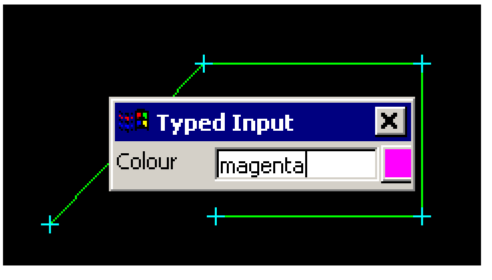
STEP 1:

Select the segment of the super string that is to have a colour change.



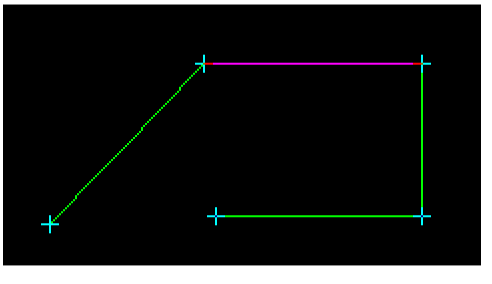
STEP 2:

After the segment is accepted, the **Colour** Input box will appear. Type the desired colour into the Input box and press the enter key. Alternatively you can select a colour from a list by clicking the browse button  on the Input box.



STEP 3:

The colour of the selected segment is drawn in the new colour.



15.22.2 Radius

Position of option on menu: **CAD =>Cad Segment =>Radius**

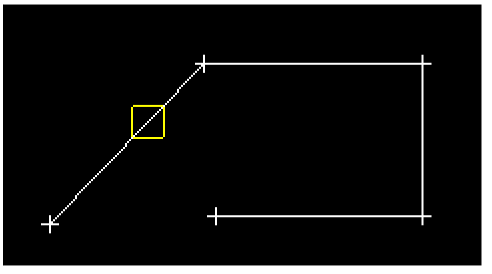
or by selection of appropriate icon from the toolbar. 

This option changes the radius of a segment.

On selecting **Segment radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

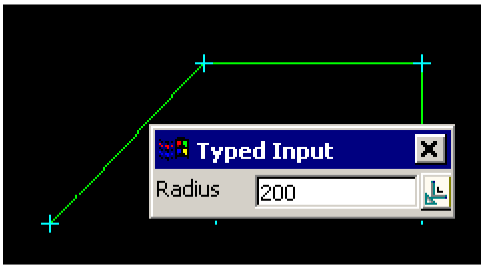
STEP 1:

Select the segment of the super string that is to have a change of radius.



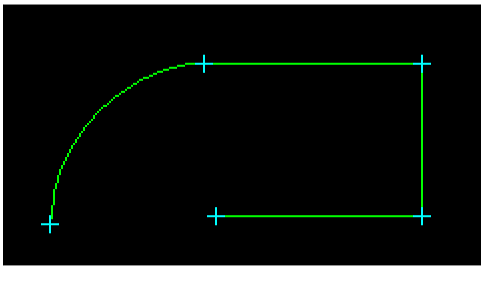
STEP 2:

After the segment is accepted, the **Radius** box will appear. Type the desired radius into the Input box and press the enter key. The browse button  on the Input box can be used to define the radius by measuring existing elements.



STEP 3:

The selected segment is then drawn with the new radius.



15.22.3 Insert 3-points curve

Position of option on menu: **CAD =>Cad Segment =>Insert 3-points curve**

or by selection of appropriate icon from the toolbar.

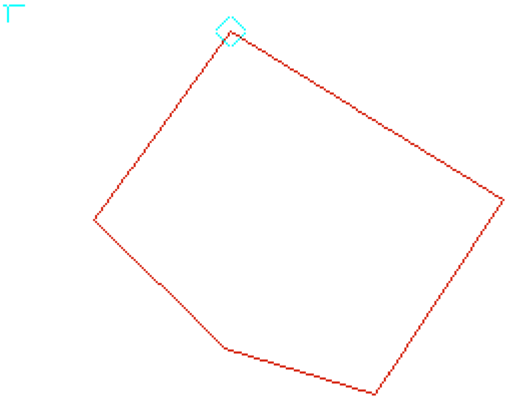
This option allows the creation of a 3 point curve using 2 existing segments.

On selecting **Insert 3pt curve**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

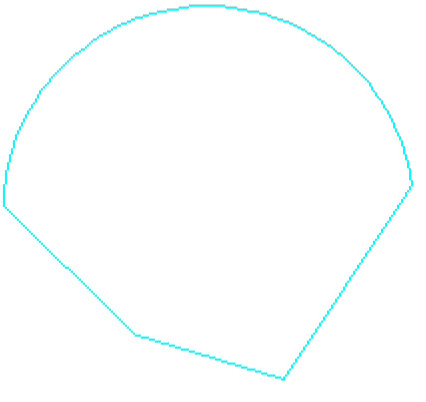
Select a vertex of a super string a vertex with a segment on either side, or segment of a super string.

If a **vertex** is selected, that vertex will be the middle vertex of the constructed 3 point curve. If a **segment** is selected, the closest vertex will become the **middle** vertex of the 3 point curve.



STEP 2:

After the vertex or segment is selected and accepted, an arc is through the three vertices is calculated and its radius used for the tow segments on either side of the vertex.



15.22.4 Remove 3-points curve

Position of option on menu: CAD =>Cad Segment =>Remove 3-points curve

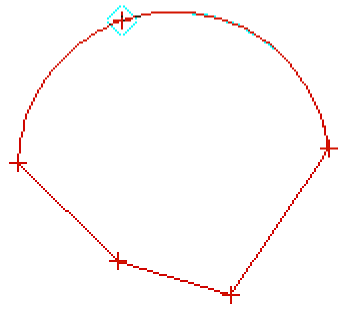
or by selection of appropriate icon from the toolbar. 

This option removes the arcs from either side of a selected vertex. If a segment is selected, the closest vertex is used and the arcs removed from either side of the vertex,

On selecting **Remove 3pt curve**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

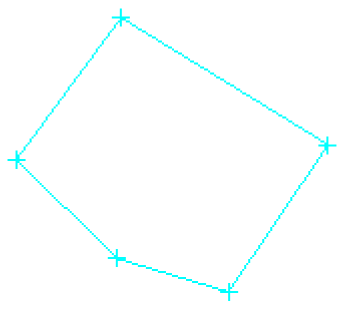
STEP 1:

Select a vertex of a super string with arcs on one or two sides of the vertex.



STEP 2:

After the vertex is selected and accepted, arc on either side will removed (the radius is set to zero). Two line segments are then drawn.

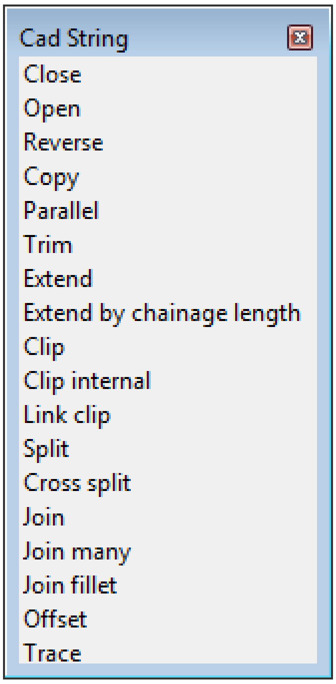


15.23 CAD Edit Strings

Position of option on menu: **CAD =>String**

These options are currently under development.

The **Cad String** walk-right menu is



Menu of Options to Edit Strings

close a string
open a string
reverse the direction of a string
copy a string
parallel a string
trim a string back to a selected string
extend a string until it cuts a selected string
extend a string by a typed chainage length
clip a string and keep the outer strings
clip a string and keep the internal string
deletes the selected link from the string (making two strings)
split a string
splits two strings where they first intersect each other
join two strings
join many strings
fillet and join
string parallel and more
trace over parts of strings to form a new string

For the option *Close*, go to 15.23.1 Close String
Open 15.23.2 Open String
Reverse 15.23.3 Reverse a String
Copy 15.23.4 Copy a String
Parallel 15.23.5 Parallel a String
Trim 15.23.6 Trim a String
Extend 15.23.7 Extend a String
Extend by chainage length 15.23.8 Extend String by Chainage Length
Clip 15.23.9 Clip String
Clip internal 15.23.10 Delete an Internal Section of a String
Link clip 15.23.11 Delete a Segment
Split 15.23.12 Split String
Cross split 15.23.13 Split Crossing Strings
Join 15.23.14 Join String
Join many 15.23.15 Join String Many
Join fillet 15.23.16 Join Fillet
Offset 15.23.17 Offset
Trace 15.23.18 Trace

15.23.1 Close String

Position of option on menu: **CAD =>String=>Close**

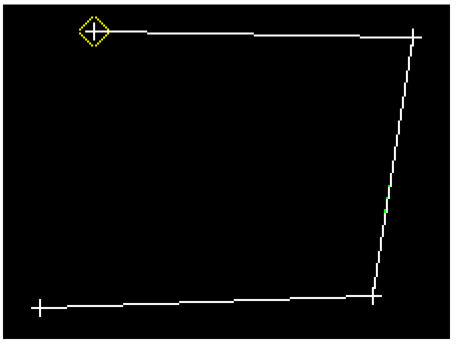
or by selection of appropriate icon from the toolbar. 

This option closes an open string.

On selecting **Close**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

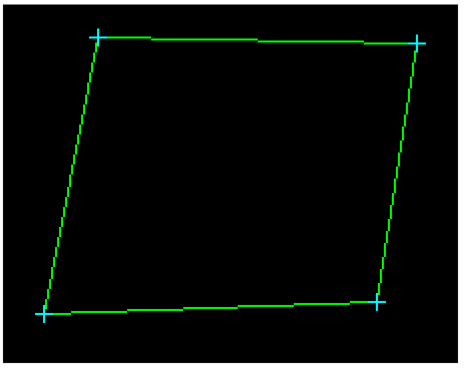
An open string is selected and accepted.



STEP 2:

The string is closed

After closing of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.



15.23.2 Open String

Position of option on menu: **CAD =>String=>Open**

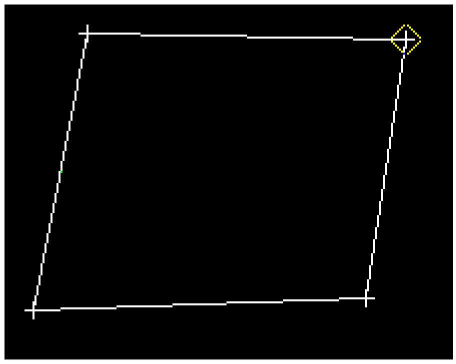
or by selection of appropriate icon from the toolbar. 

This option opens a closed string.

On selecting **Open**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A closed string is selected and accepted.

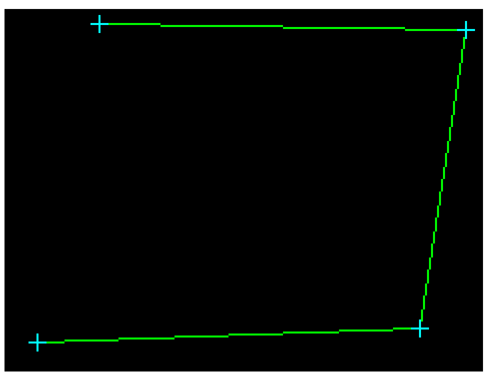


STEP 2:

The string is opened by deleting the last segment of the closed string.

Note - this may not be where the string was selected.

After opening of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.



15.23.3 Reverse a String

Position of option on menu: **CAD =>String=>Reverse**

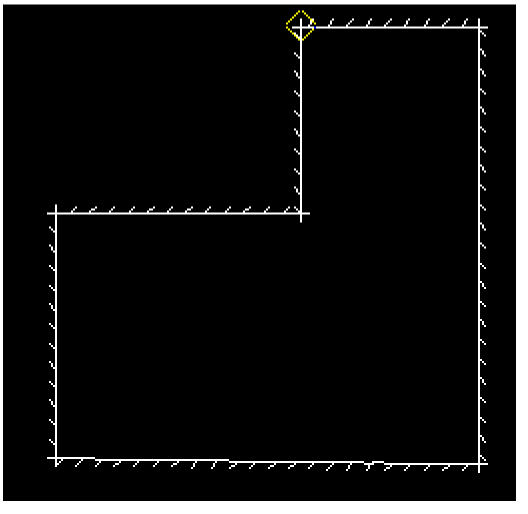
or by selection of appropriate icon from the toolbar. 

This option reverses the direction of a string

On selecting **Reverse**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

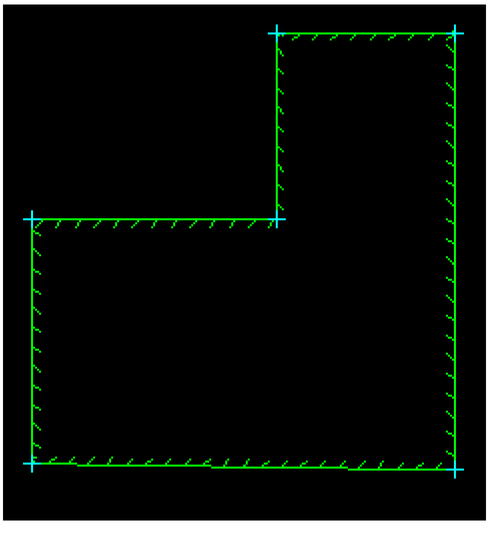
STEP 1:

A string is selected and accepted.



STEP 2:

The string is reversed.



After reversing of a string, the option restarts so that another string can be selected. Picking **Cancel** from the **Pick Ops** menu, hitting <esc> or selecting another option terminates the option.

15.23.4 Copy a String

Position of option on menu: **CAD =>String=>Copy**

or by selection of appropriate icon from the toolbar. 

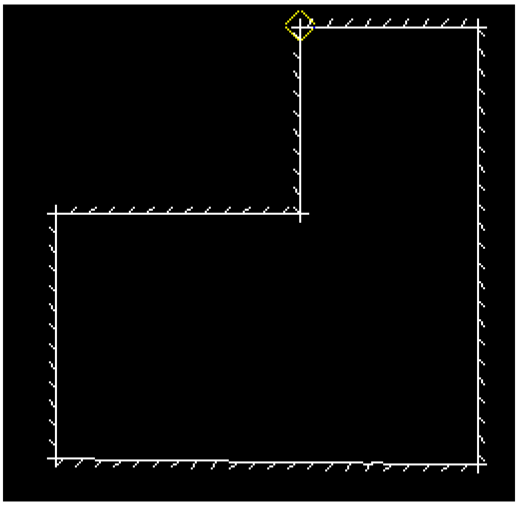
This option copies a string. The copied strings takes its attributes from the **Cad Control Bar.**

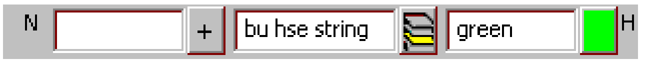
Copy is particularly helpful in backing up strings.

On selecting **Copy**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A string is selected and accepted. The copied string will take on the values in the control bar at the time of accepting.





STEP 2:

A copy of the original string will be saved into the model **bu hse string**.

15.23.5 Parallel a String

Position of option on menu: **CAD =>String=>Parallel**

or by selection of appropriate icon from the toolbar.

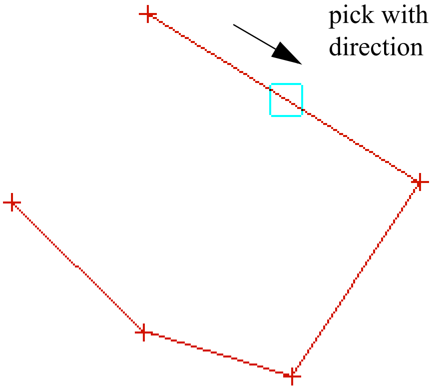
This option parallel a string by a given to a selected string.

Note that if there are arcs in the string, the string can not be paralleled by a distance that would collapse the arcs.

On selecting **Parallel**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The string to parallel is picked with direction. The direction determines what it means to parallel to the right or left of the string.

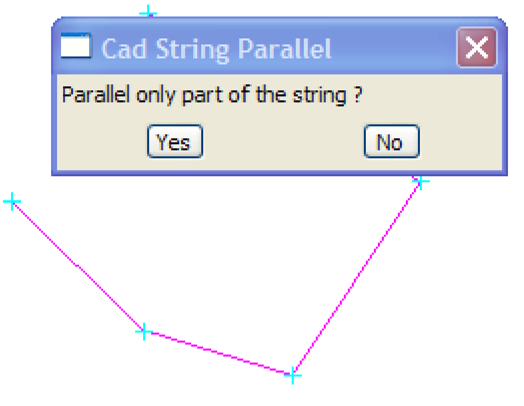


STEP 2:

The parallel option can be applied to **all** of the selected string or only **part** of the string.

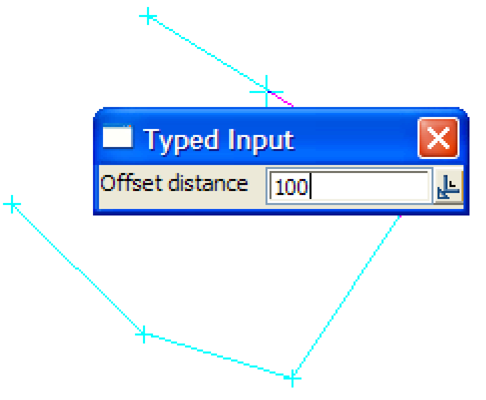
After the string is selected, a panel is displayed asking if only part of the string is to be paralleled.

If only part of the string is to be paralleled (i.e. **yes** selected) the user picks the start and end positions of where the string is to be paralleled. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values. If the whole string is to be paralleled the user should select **no**.



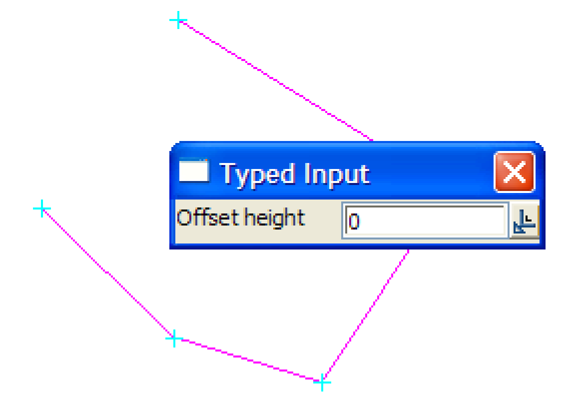
STEP 3:

The user is prompted for the parallel distance. Positive distance is to the right of the selected string. Negative to the left.



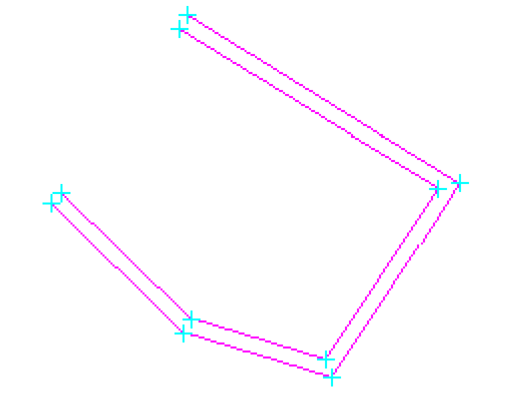
STEP 4:

The user is prompted for the offset height. This height value will be added to the selected string values to produce the heights for the paralleled string.



STEP 5:

The paralleled string is then generated using the supplied information.



15.23.6 Trim a String

Position of option on menu: **CAD =>String=>Trim**

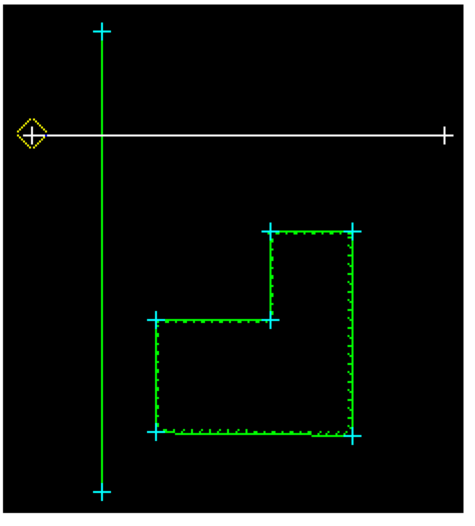
or by selection of appropriate icon from the toolbar. 

This option trims a string to another nominated cutting string.

On selecting **Trim**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

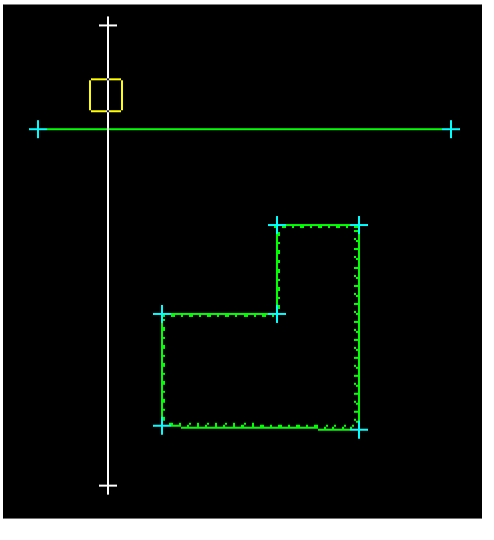
STEP 1:

The cutting string which will be used to define the trim extent is selected and accepted.



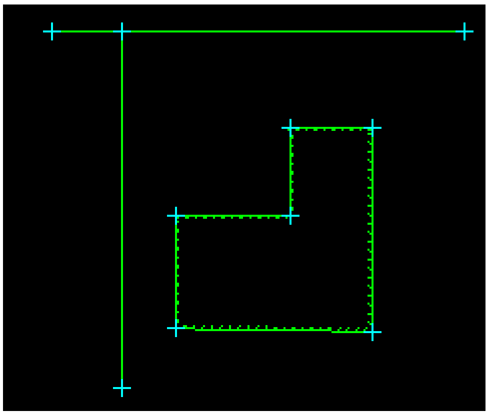
STEP 2:

The string to trim is selected. The position of the pick relative to the cutting string will dictate which part of the string will be trimmed. In this case, the selection is above the cutting string and so the trim will be of the top part of the string.



STEP 3:

The string is trimmed.



15.23.7 Extend a String

Position of option on menu: **CAD =>String=>Extend**

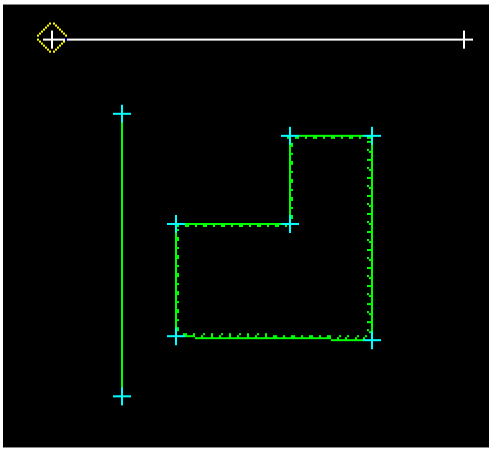
or by selection of appropriate icon from the toolbar.

This option extends a string to a another nominated string.

On selecting **Extend**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

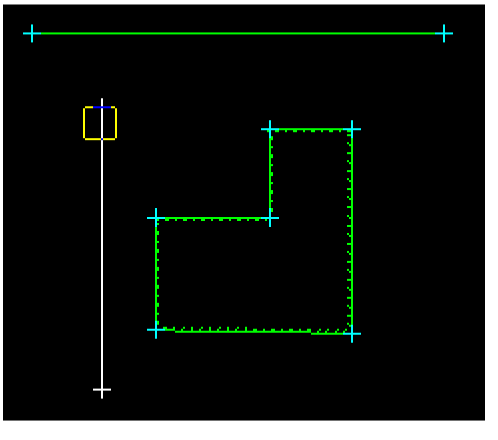
STEP 1:

The string to extend to is selected and accepted.



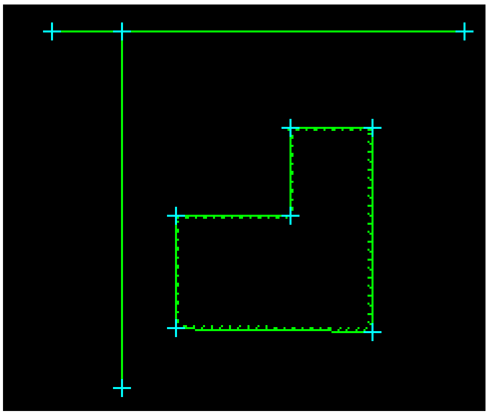
STEP 2:

The string to extend **to** selected and accepted



STEP 3:

The string is extended.



15.23.8 Extend String by Chainage Length

Position of option on menu: **CAD =>String=>Extend by chainage length**

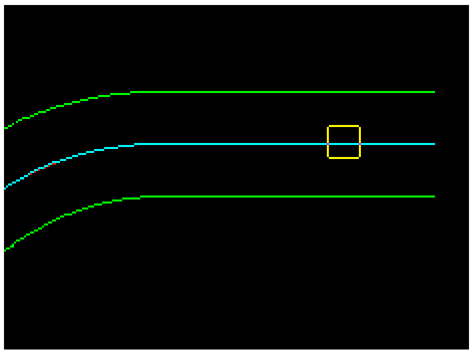
or by selection of appropriate icon from the toolbar.

This option extends a string by a given chainage value.

On selecting **Extend by chainage length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

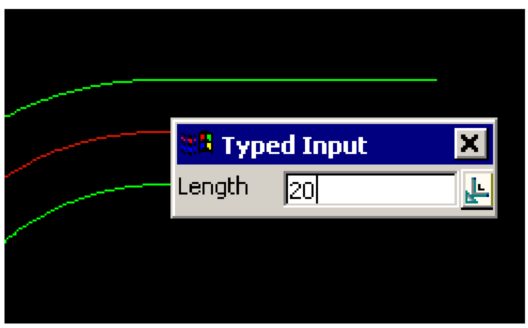
STEP 1:

The string to extend is selected and accepted.



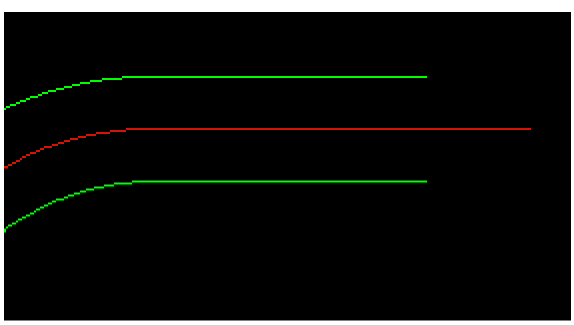
STEP 2:

The chainage length to extend the string is entered into the **Length** input Box. Positive is in the direction of the string. Negative in the opposite direction of the string.



STEP 3:

The string is extended by the given chainage amount.



15.23.9 Clip String

Position of option on menu: **CAD =>String=>Clip**

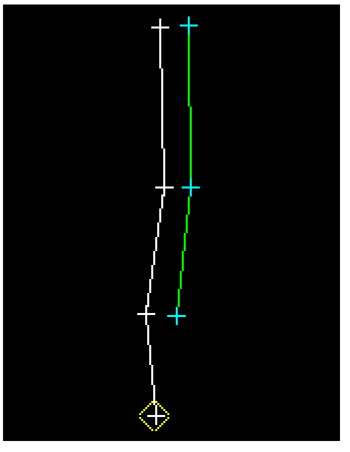
or by selection of appropriate icon from the toolbar.

This option deletes part of a string.

On selecting **Clip**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

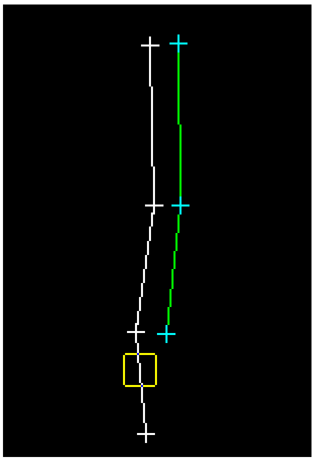
The string to be clipped is selected and accepted.

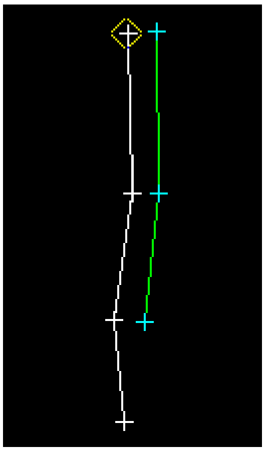


STEP 2:

The first and second positions defining what part of the string is to **remain** are selected and accepted.

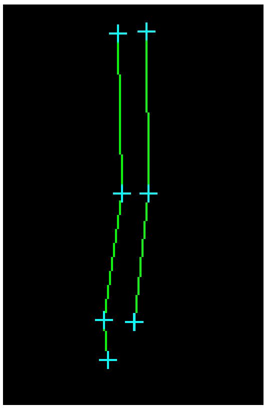
The positions do not have to be at vertices but can be anywhere on segments





STEP 3:

The string is clipped.



15.23.10 Delete an Internal Section of a String

Position of option on menu: **CAD =>String=>Clip internal**

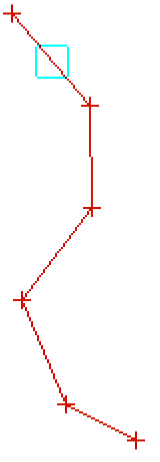
or by selection of appropriate icon from the toolbar. 

This option deletes an internal part of a string and leaves the two end sections.

On selecting **Clip internal**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The string to be clipped is selected and accepted.

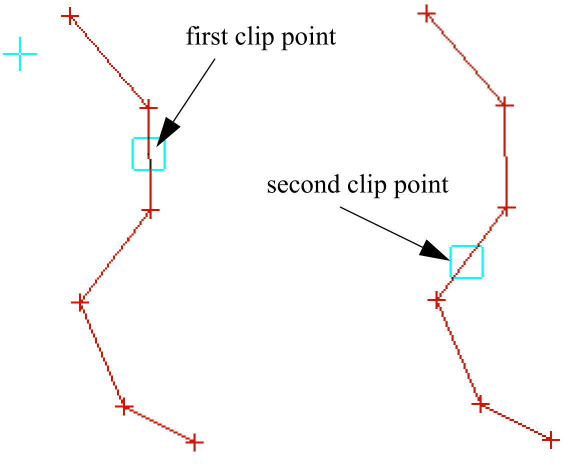


STEP 2:

The first and second position defining what part of the string is to **remain** is selected and accepted. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values.

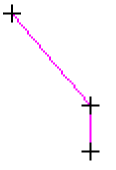
The first and second positions defining what part of the string is to be **deleted** are selected and accepted.

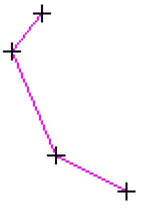
The positions do not have to be at vertices but can be anywhere on the segments



STEP 3:

The part of the string between the two selected clip points is deleted leaving two strings.





15.23.11 Delete a Segment

Position of option on menu: **CAD =>String=>Link clip**

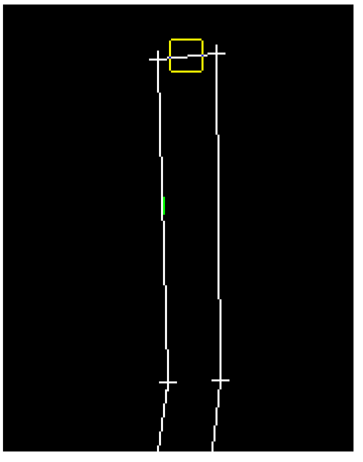
or by selection of appropriate icon from the toolbar.

This option deletes a segment from a string.

On selecting **Link clip**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

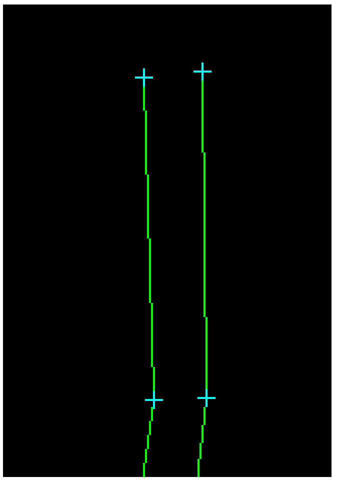
The **segment** to be deleted is selected and accepted.



STEP 2:

The selected segment is deleted.

Note - unless the selected string was a closed string, two strings are produced.



15.23.12 Split String

Position of option on menu: **CAD =>String=>Split**

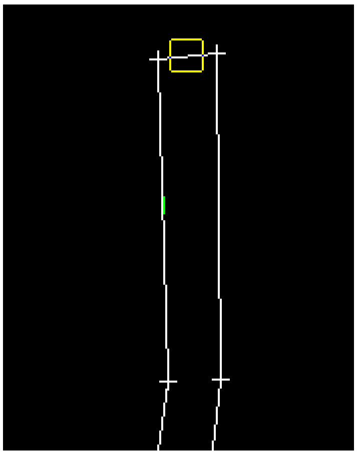
or by selection of appropriate icon from the toolbar.

This option splits one string into two strings at a given split position.

On selecting **Split**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

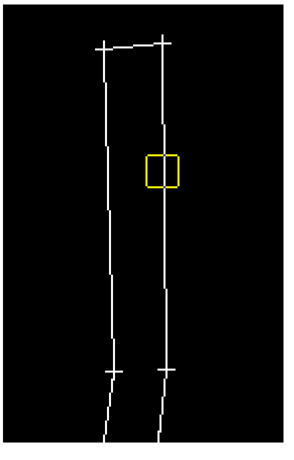
STEP 1:

The string to be split is selected and accepted.



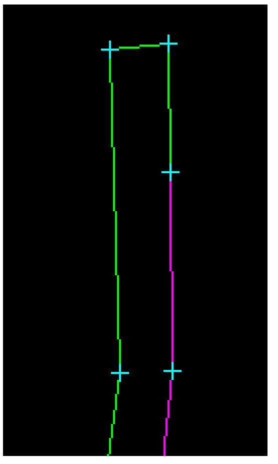
STEP 2:

The split position is selected and accepted.



STEP 3:

The split is made at the position selected. If no vertex exists at that position, a vertex is created.



15.23.13 Split Crossing Strings

Position of option on menu: CAD =>String=> Cross split

or by selection of appropriate icon from the toolbar.

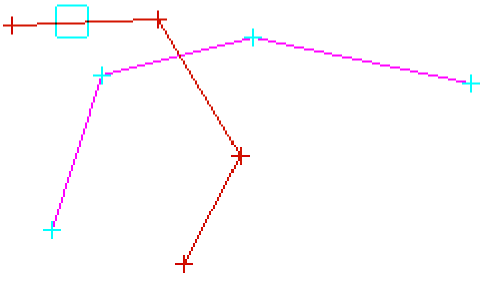
This option splits two crossing strings at the position of their crossing.

If there are multiple intersections between the two strings, then it splits the strings at the intersection that is the shortest distance to a pick position.

On selecting **Cross split**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

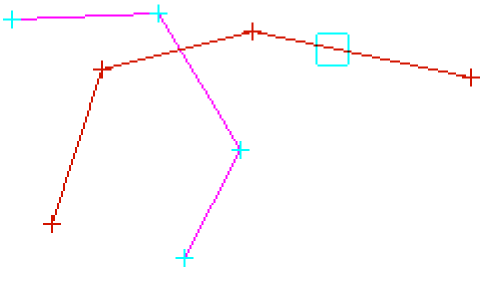
STEP 1:

Pick the first string.



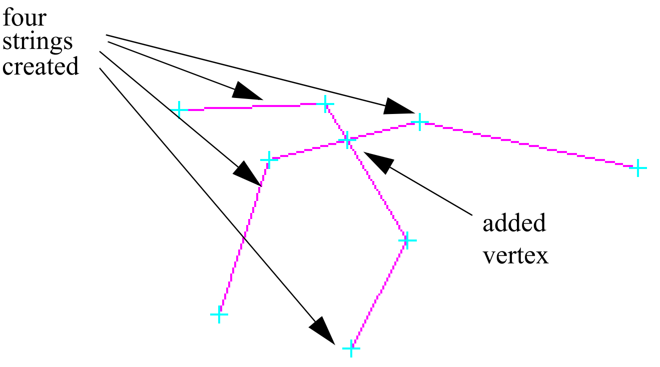
STEP 2:

Pick the second string.



STEP 3:

The two strings are then split where the strings crossed (at the intersection that is the shortest distance to a pick position). This will create four strings.



four
strings
created
added
vertex

15.23.14 Join String

Position of option on menu: **CAD =>String=>Join**

or by selection of appropriate icon from the toolbar. 

This option joins two super strings together at their end points.

There are four possible ways of joining the strings and the required case is determined by picking the strings with direction.

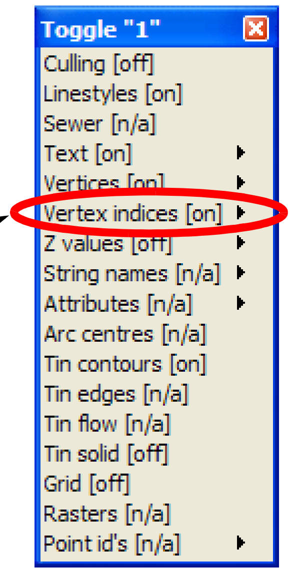
On selecting the **Join** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

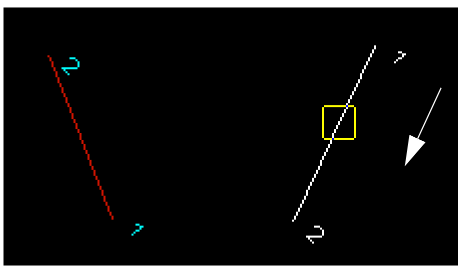
STEP 1:

Select and accept a super string *with direction*.

For notes on picking strings with direction, see Picking with Direction.

Note: *Vertex indices* can be displayed by toggling the option on the Toggle Menu.



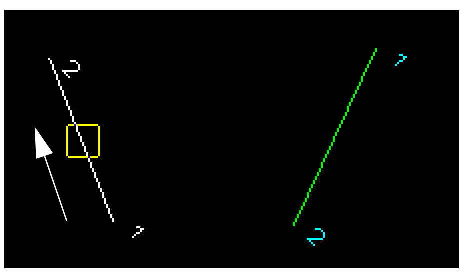


pick with direction

STEP 2:

Select and accept another super string *with direction*.

pick with direction



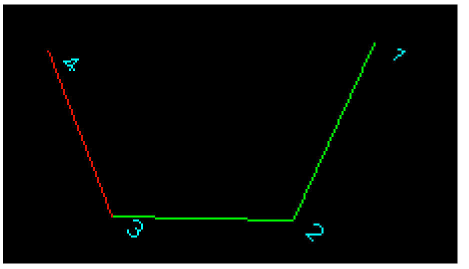
STEP 3:

The head of the first string (as determined by the picking direction) is then joined to the tail of the second string (as determined by the picking direction).

After the strings are joined, the vertex indices will change since the order of the vertices in the string is now different.

The colour of the constructed line is adopted from first selected super string. The colour of the second string will remain unchanged.

Note: The constructed line and selected strings are stored in the model of the first selected string.



4
1
3
2

15.23.15 Join String Many

Position of option on menu: **CAD =>String=>Join many**

or by selection of appropriate icon from the toolbar. 

This option joins many strings together. Picking with direction is used to specify which ends of the strings are joined.

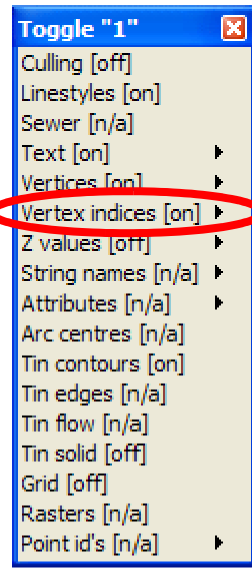
On selecting the **Join many** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

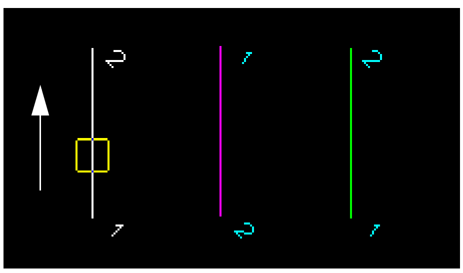
Pick a super string *with direction*.

For notes on picking strings with direction, see Picking with Direction.

Note: The ***Vertex indices*** can be displayed by toggling the option on the Toggle Menu.



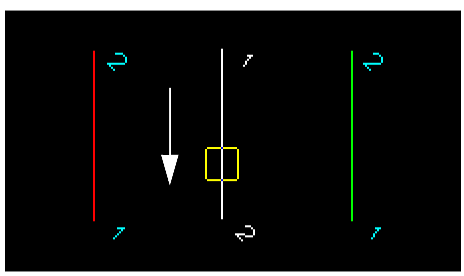
pick with direction



STEP 2:

Select and accept another super string, again picking *with direction*.

pick with direction

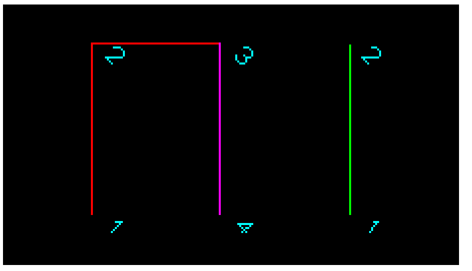


STEP 3:

The **head** of the first string is then joined to the **tail** of the second string. What is the head or tail of the strings is determined by the *picking direction*.

After the strings are joined, the vertex indices to reflect the new order of the vertices in the string. The colour of the constructed segment will be the same as that of the first selected super string. The colour of the second string will remain unchanged.

Note: The constructed segment and selected strings are stored in the model which contains the 1st selected string.

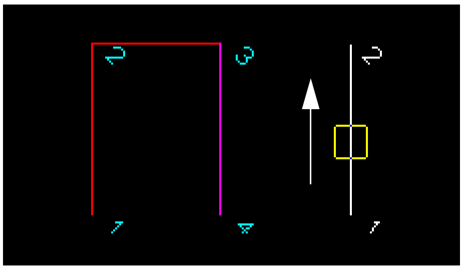


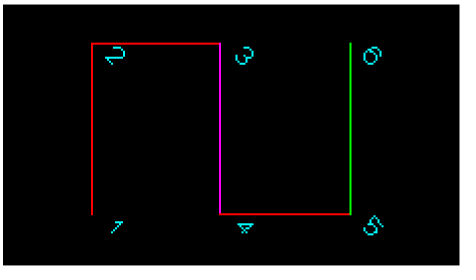
STEP 4:

The *Join Many* option joins extra strings to the already selected (and joined) strings. The user may continue selecting additional strings to join together by select and accept additional super strings by picking with direction.

This option can be terminated by the user with the **Esc** key.

Note: Each further construction line adopts the same colour as the 1st selected string. Both the constructed line and selected strings are stored in the model which contains the first selected string.





15.23.16 Join Fillet

Position of option on menu: **CAD =>String=>Join fillet**

or by selection of appropriate icon from the toolbar. 

This option fillets, trims and joins strings.

There are eight possible ways of filleting the strings and the required case is determined by picking the strings with direction and by the sign of the radius.

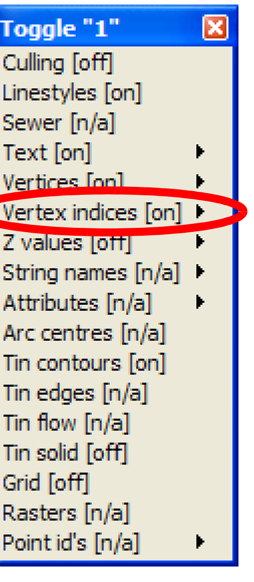
On selecting the **Join strings** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

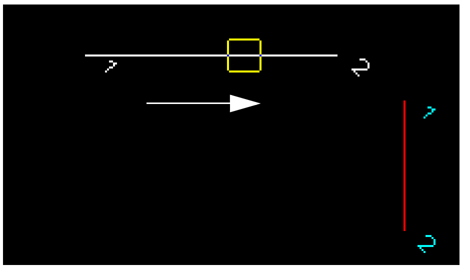
Pick a super string *with direction*.

For notes on picking strings with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.



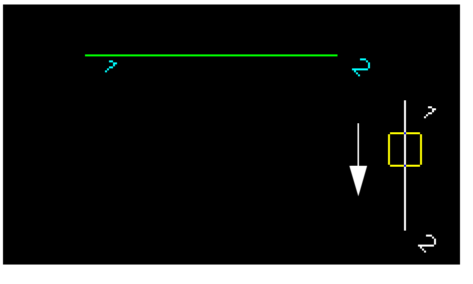
pick with direction



STEP 2:

Select and accept another super string, again picking *with direction*.

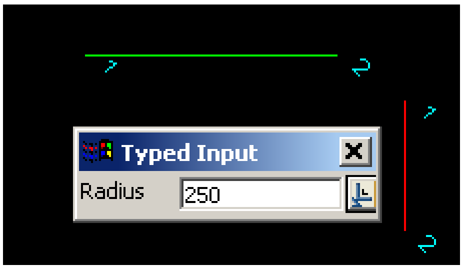
pick with direction



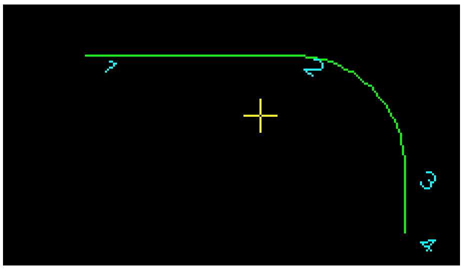
STEP 3:

After the second super string is accepted, the **Radius** input box will appear. Type the *fillet radius* into the input box and press the Enter key. The browse button  on the input box can be used to define the fillet radius by measurement of existing elements.

Note: A **positive** fillet radius value will curve to the right, where as a **negative** fillet radius will curve to the left.



A fillet arc with the radius is constructed and joined to the two strings and the ends of the two strings are automatically trimmed back to the arc.



The vertex indices will change to accommodate the new vertices in the string. The colour of the constructed line and 2nd selected string adopts the colour of the 1st selected super string.

Note: The constructed arc and selected strings are stored in the model of the first selected string.

15.23.17 Offset

Position of option on menu: **CAD =>String =>Offset**

or by selection of appropriate icon from the toolbar. 

This option allows the user to create "parallel" strings, *i.e.* creating a string that is offset by a given distance from a selected string.

There are five possible ways of offsetting the strings as well as options for offsetting full strings or partial strings.

The string to offset is selected by picking with direction, and the offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

On selecting the **Offset** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

e.g.

<[N][J] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

The letters in the square brackets indicate which offset modes are currently selected.

For example, [N][J] at the front indicates that (n)ormal and (j)oin are the selected options.

For the option *N for (n)ormal*, go to	Typing N for (n)ormal
P for (p)artial	Typing P for (p)artial
J for (j)oin	Typing J for (j)oin
I for (i)ntersect	Typing I for (i)ntersect
F for (f)illet	Typing F for (f)illet
D for (d)ual	Typing D for (d)ual
C for (c)lip	Typing C for (c)lip

Typing N for (n)ormal

Typing **N** or **n** for (n)ormal causes the **whole string to be offset**.

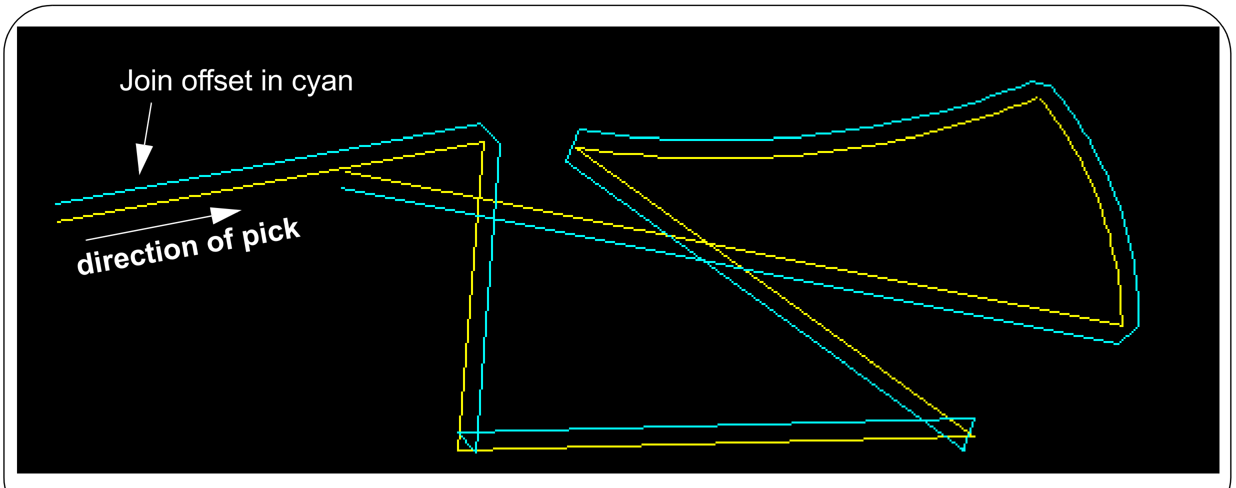
Note - the other choice is Partial when only part of a string is offset.

When **N** is typed, the first character in the square brackets changes to [N].

Continue to the next mode Typing P for (p)artial or to the beginning of the Offset documentation 15.23.17 Offset.

Typing J for (j)oin

For **Join**, each segment of the selected string is offset by the given distance and the end points of adjacent offset segments are joined together.

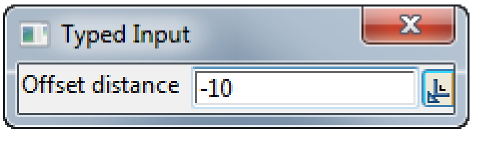


Offset Join with Offset Distance of -10

So when **J** or **j** is typed, the second character in the square brackets changes to [J] and the string to offset is then selected by picking with direction.

<[N][J] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.



NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

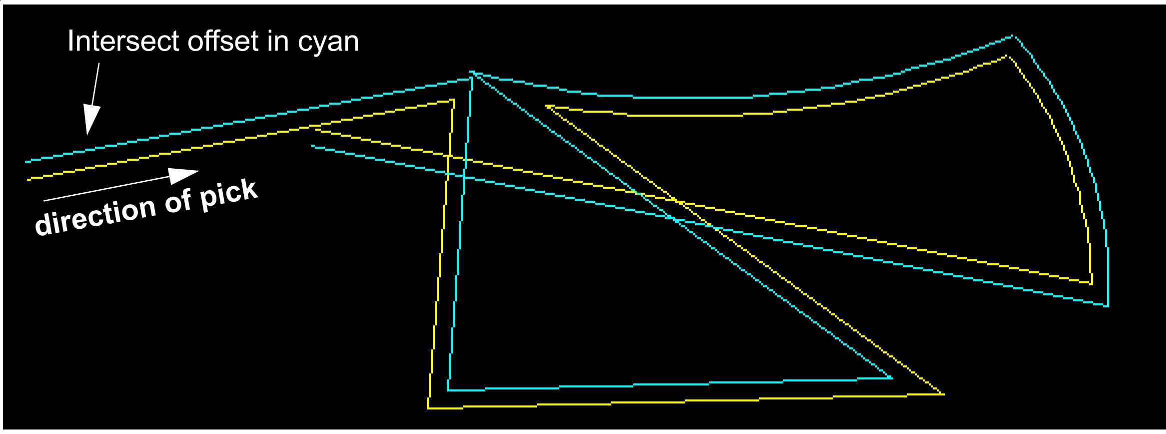
After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode [Typing I for (i)ntersect] or to the beginning of the Offset documentation [15.23.17 Offset].

Typing I for (i)ntersect

For **Intersect**, each segment of the selected string is offset by the given distance and the ends of adjacent offset segments are extended or contracted so that they intersect.

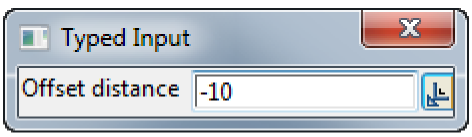


Offset Intersect with Offset Distance of -10

So when **I** or **i** is typed, the second character in the square brackets changes to **[I]** and the string to offset is then selected by picking with direction.

<[N][I] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.



NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

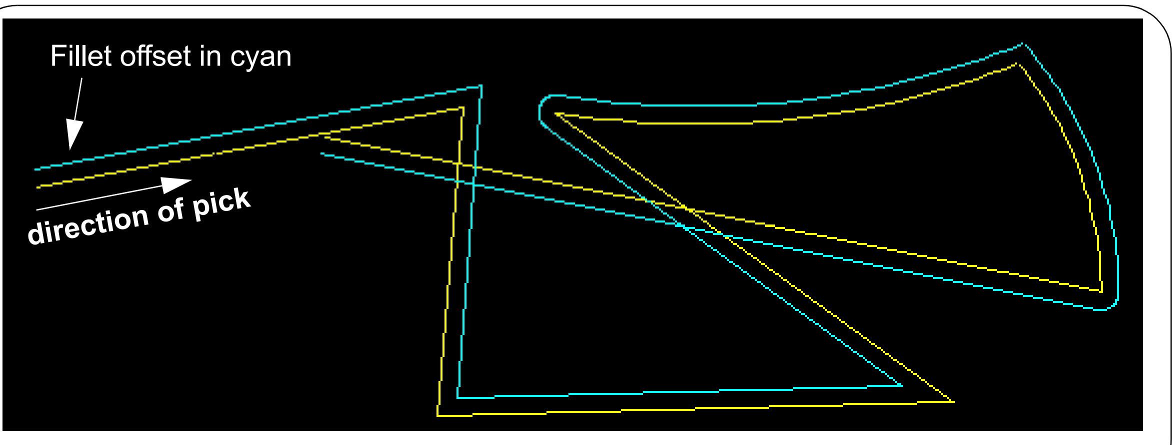
After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode Typing F for (f)illet or to the beginning of the Offset documentation 15.23.17 Offset.

Typing F for (f)illet

For **Fillet**, each segment of the selected string is offset by the given distance and the ends of adjacent offset segments are extended or contracted so they intersect. If the change of direction between adjacent segments is greater than 180 degrees, an arc is used instead of an intersect of the two segments.

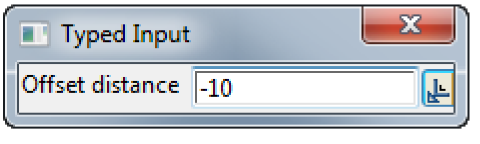


Offset Fillet with Offset Distance of -10

So when **F** or **f** is typed, the second character in the square brackets changes to [F] and the string to offset is then selected by picking with direction.

<[N][F] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.



NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

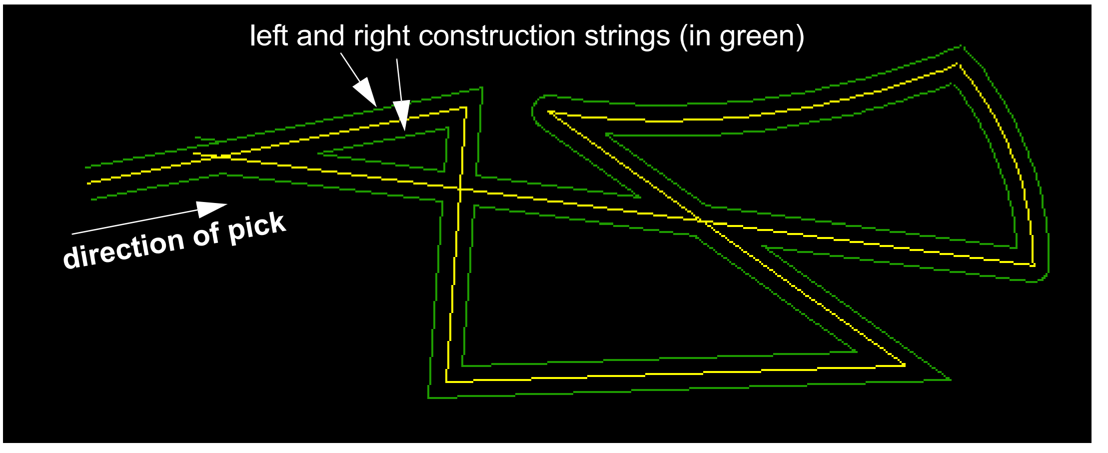
After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode [Typing D for (d)ual] or to the beginning of the Offset documentation [15.23.17 Offset].

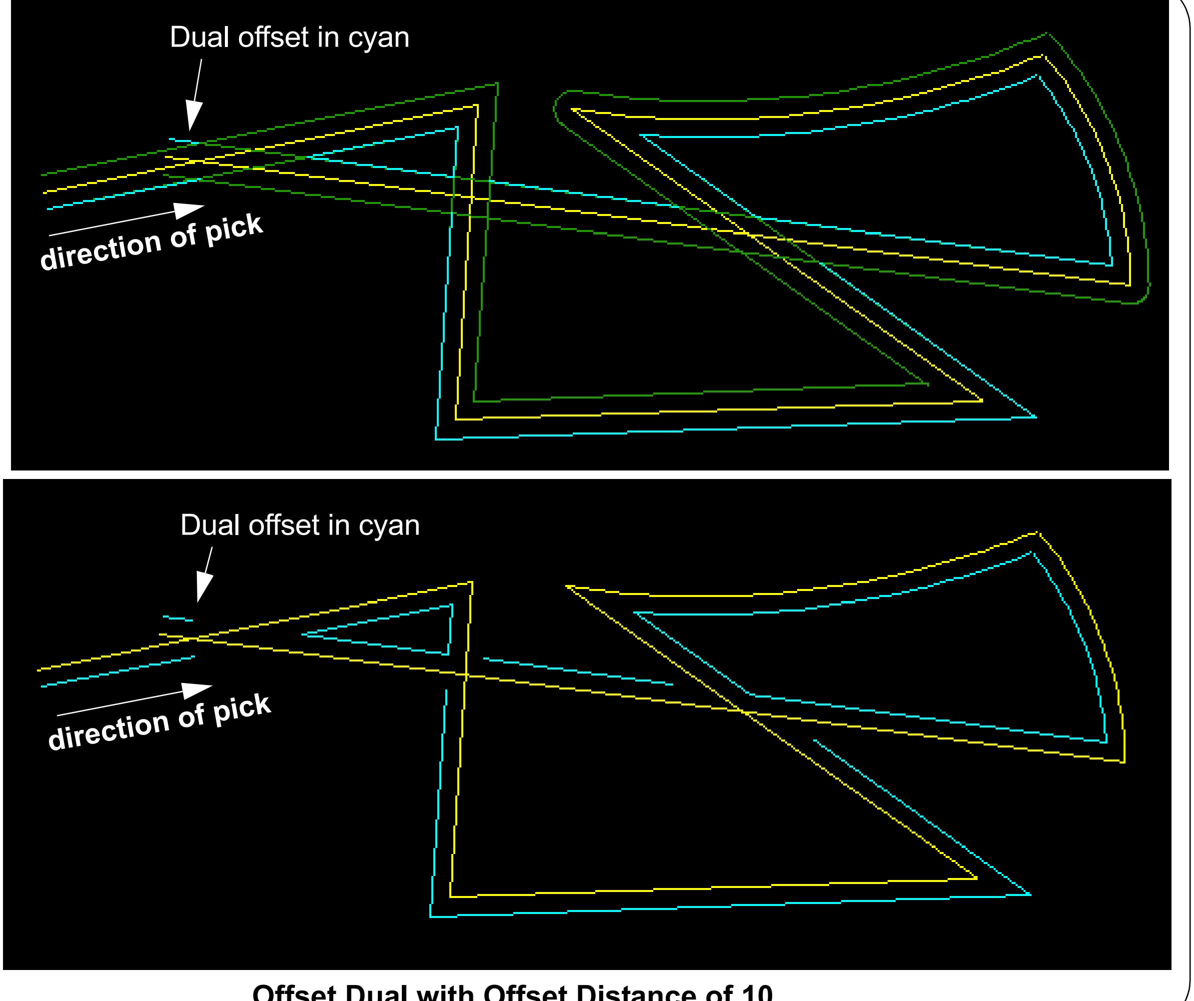
Typing D for (d)ual

For **Dual**, *construction* strings are created by offset fillets to both the left and right with the given offset distance.



Construction Strings for Offset Dual with Offset Distance of 10

Then the **Offset Dual** is created for the given offset distance but the created string **does not cut** either of the two left and right offset construction strings.



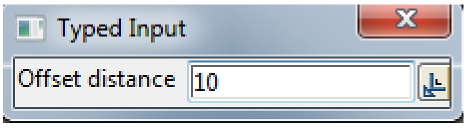
Offset Dual with Offset Distance of 10

More than one string may be created by the **Dual** option.

So when **D** or **d** is typed, the second character in the square brackets changes to [D] and the string to offset is then selected by picking with direction.

<[N][D] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.



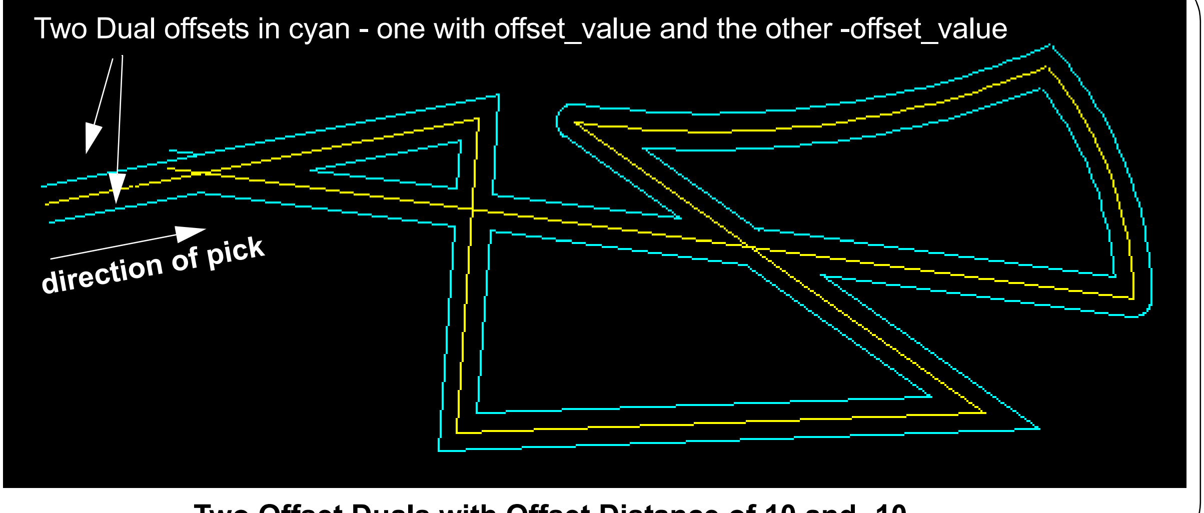
NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

NOTE: Running the Dual offset command twice, one with an offset and then again with the negative of the offset (-offset)

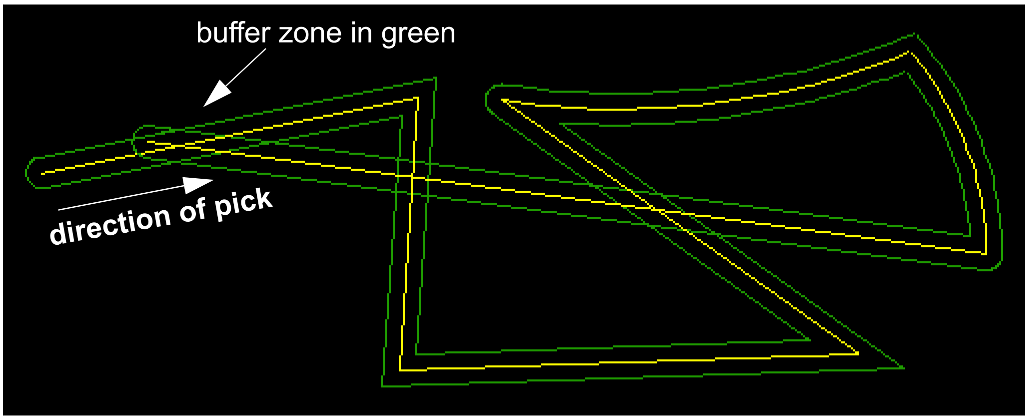


Two Offset Duals with Offset Distance of 10 and -10

Continue to the next mode [Typing C for (c)lip] or to the beginning of the Offset documentation [15.23.17 Offset].

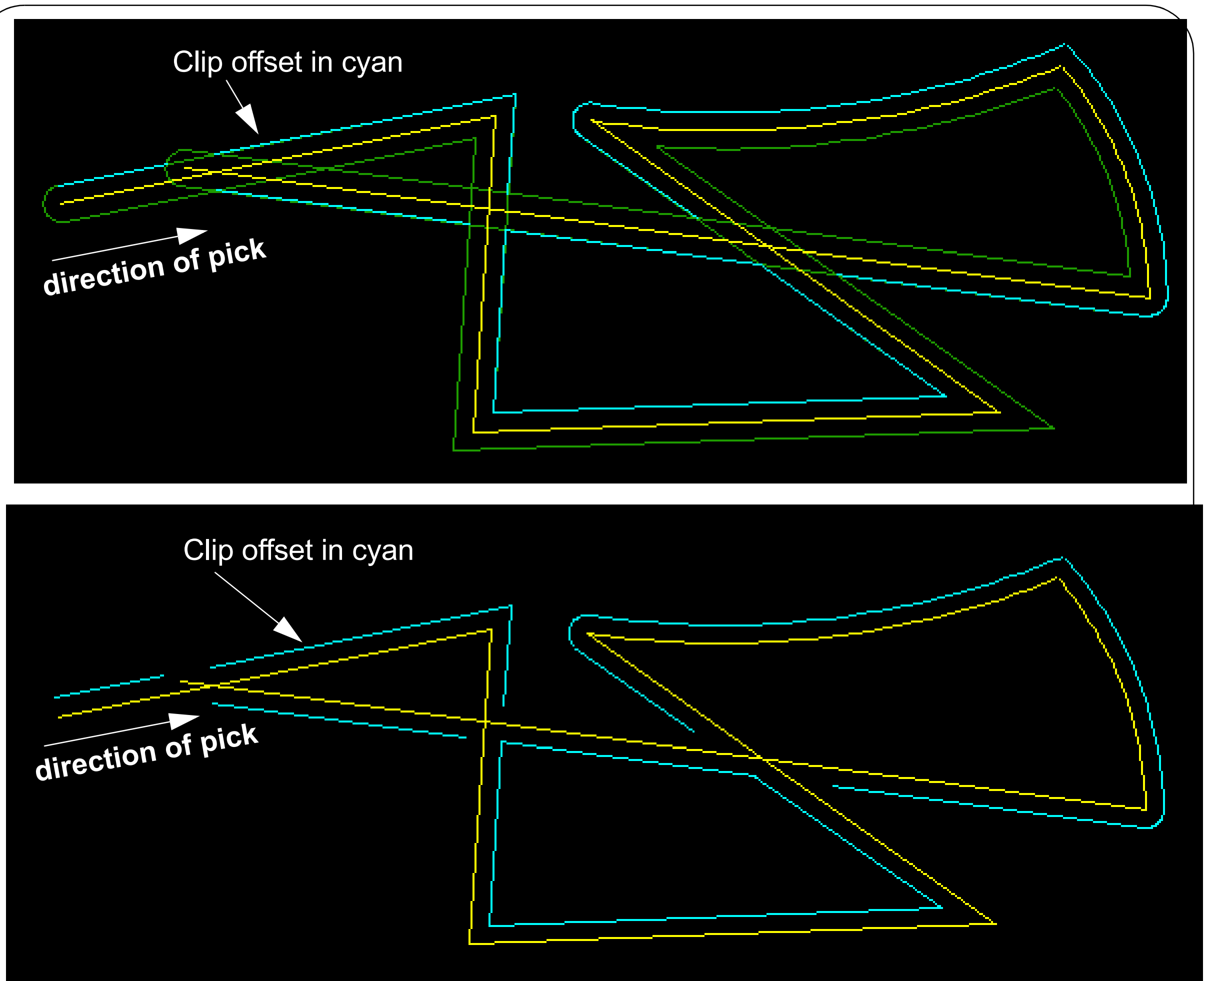
Typing C for (c)lip

For **Clip**, *construction* strings are created as for the Dual option by offsetting the selected string to both the left and right by the given offset distance as an offset fillet and a buffer zone defined by the construction strings and end caps with radius equal to the offset distance at each end of the selected string.



Buffer Zone for Offset Clip with Offset Distance of -10

Then the **Offset Clip** is created for the given offset distance, but it **does not cut** the buffer zone for the selected string.



Offset Clip with Offset Distance of -10

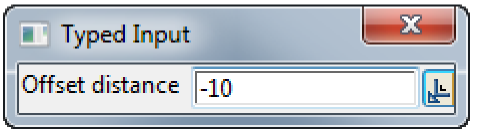
More than one string may be created by the **Clip** option.

So a Clip is like the Dual option except everything is removed from the buffer zone.

So when **C** or **c** is typed, the second character in the square brackets changes to [C] and the string to offset is then selected by picking with direction.

<[N][C] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.



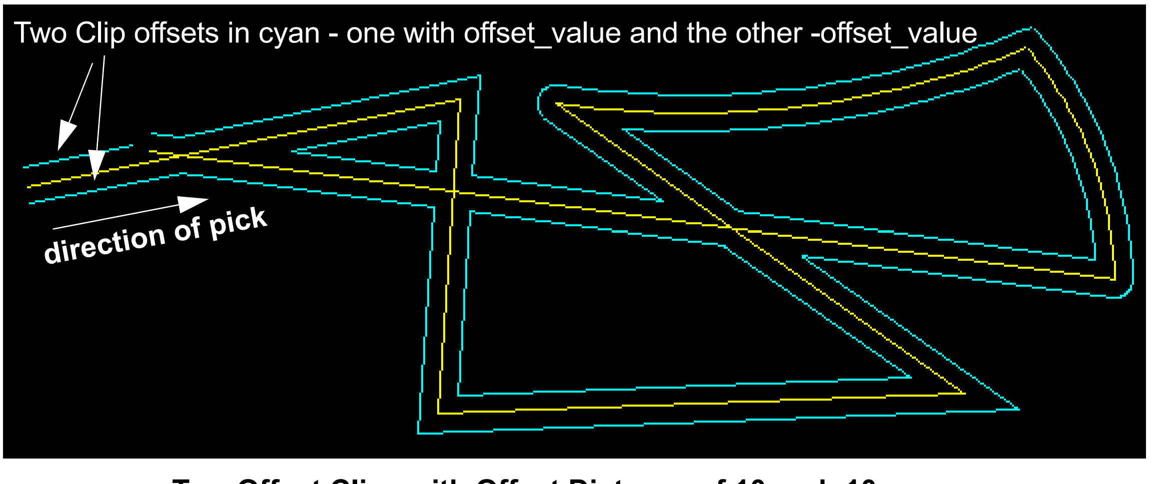
NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

NOTE: Running the Clip offset command twice, one with an offset and then again with the negative of the offset (-offset)



Two Offset Clips with Offset Distance of 10 and -10

Continue to the first mode Typing N for (n)ormal or to the beginning of the Offset documentation 15.23.17 Offset.

Typing P for (p)artial

Selecting **P** for (p)artial allows for a **part** of the string to be offset.

When **P** or **p** is typed, the first character in the square brackets changes to [P].

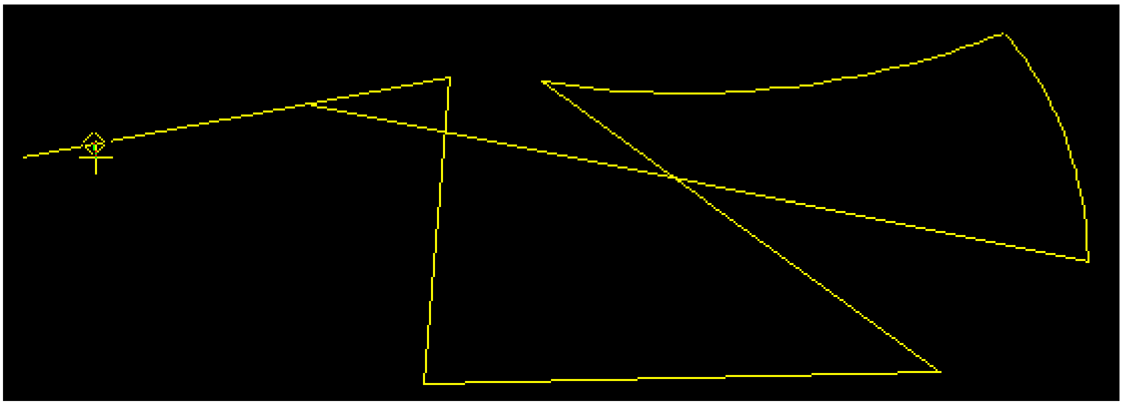
e.g.

<[P][I] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After **P** is typed, the two positions on the string are selected to indicate the subsection of the string that is to be offset.

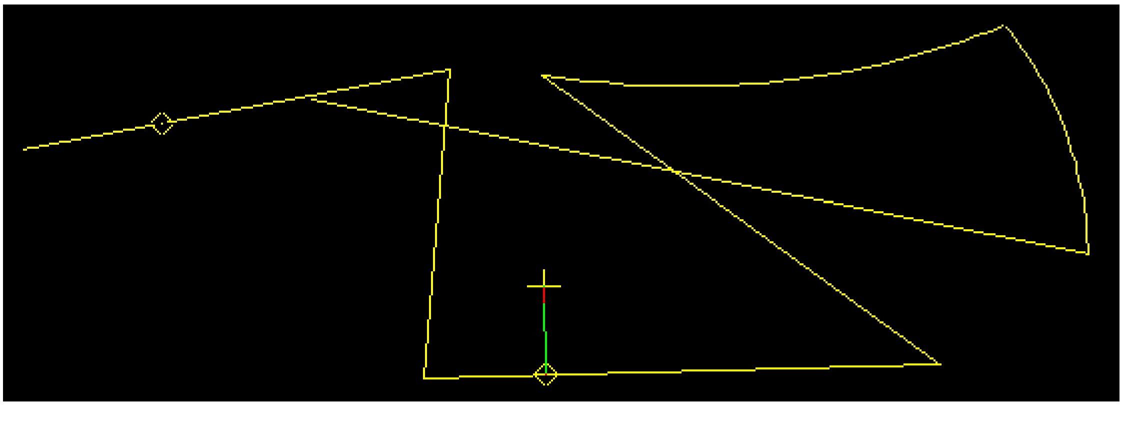
STEP 1:

Pick your first position. This does not have to be on the string to offset because it will be dropped perpendicular onto the string to give the first point of the partial offset.



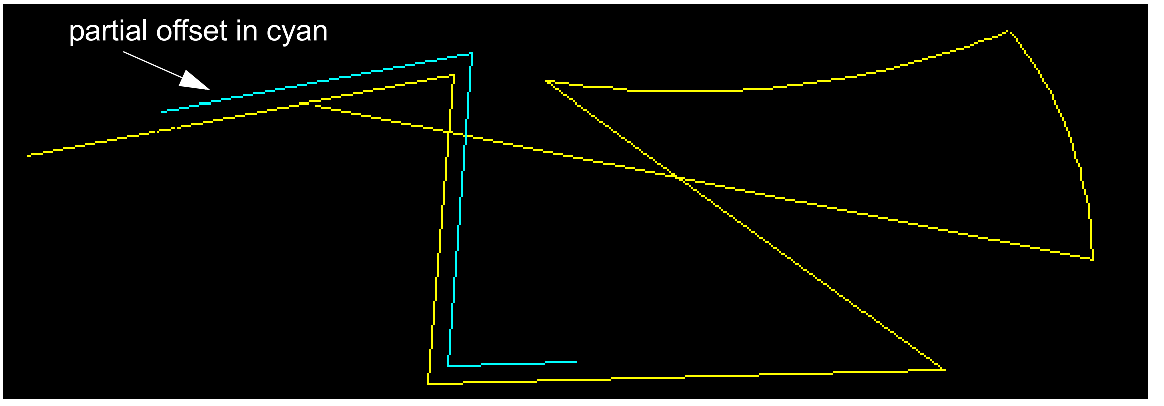
STEP 2:

Pick your second position. This does not have to be on the string to offset because it will be dropped perpendicular onto the string to give the second point of the partial offset.



STEP 3:

After accepting the second position, the part of the string between the two dropped positions is offset.



After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode Typing J for (j)oin or to the beginning of the Offset documentation 15.23.17 Offset.

15.23.18 Trace

Position of option on menu: **CAD =>String =>Trace**

or by selection of appropriate icon from the toolbar. 

This option allows the user to create a new string by

(a) creating points as in a normal string

and/or

(b) selecting parts of existing string to copy and make part of the new string (i.e. tracing over part of an existing string)

and/or

(c) closing the new string

On selecting the **Trace** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** screen message area at the bottom of the window.

e.g.

<[P] Pick point to append or (t)race, (c)lose> [picks][fast][Menu]

The letter in the square brackets indicate which trace mode is currently selected.

For example, [T] at the front indicates that (t)race mode is selected

For the option *P for (p)ick* go to Typing N for (n)ormal
T for (t)race Typing P for (p)artial
C for (c)lose Typing J for (j)oin

Typing P for (p)ick

Typing P or p for pick means that new vertices of the string will be created in the normal way for a string editor, and the created vertices are appended to the end of the new string being created.

When **P** or **p** is typed, the first character in the square bracket changes to [P].

e.g.

<[P] Pick point to append or (t)race, (c)lose> [picks][fast][Menu]

Points are then created for the new string by the normal pick and accept.

The option is terminated by pressing the <Esc> key.

Continue to the next mode Typing T for (t)race or to the beginning of the Trace documentation 15.23.18 Trace.

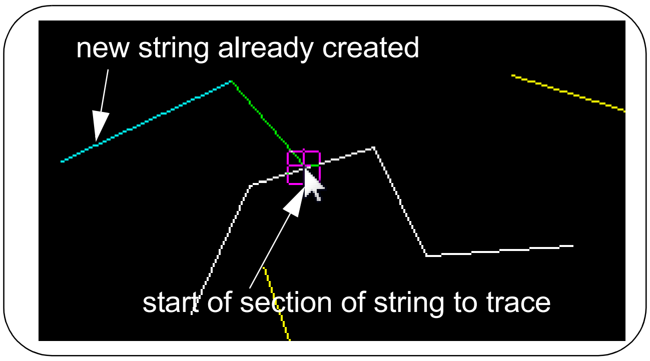
Typing T for (t)race

For **Trace**, an part of an existing string is selected to copy and make part of the new string. That is, part of an existing string is traced over to form part of the new string.

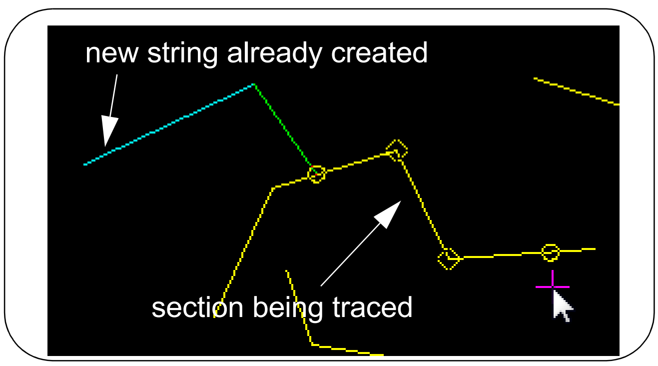
When **T** or **t** is typed, the second character in the square brackets changes to [T]

<[T] Select start point to trace or (p)ick, (c)lose> [picks][fast][Menu]

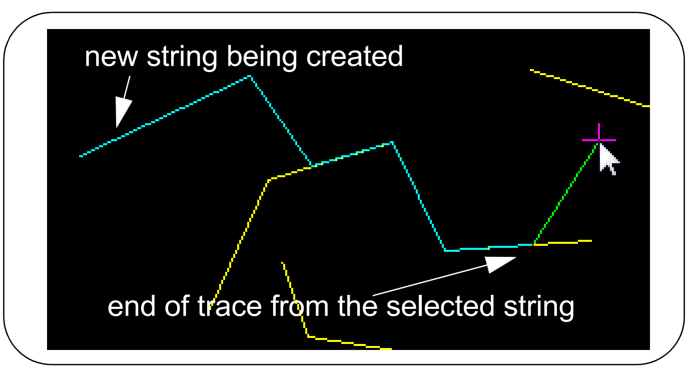
and the string to trace over is then selected by picking the string at the start position of the section of the string to trace over.



The cursor is then moved along the sting in the direction of the trace. Vertices on the traced section are displayed as diamonds and a non-vertex start on the string of the trace is shown as a circle.



The final position of the trace on the string is then selected and the traced portion is copied to the string being created.



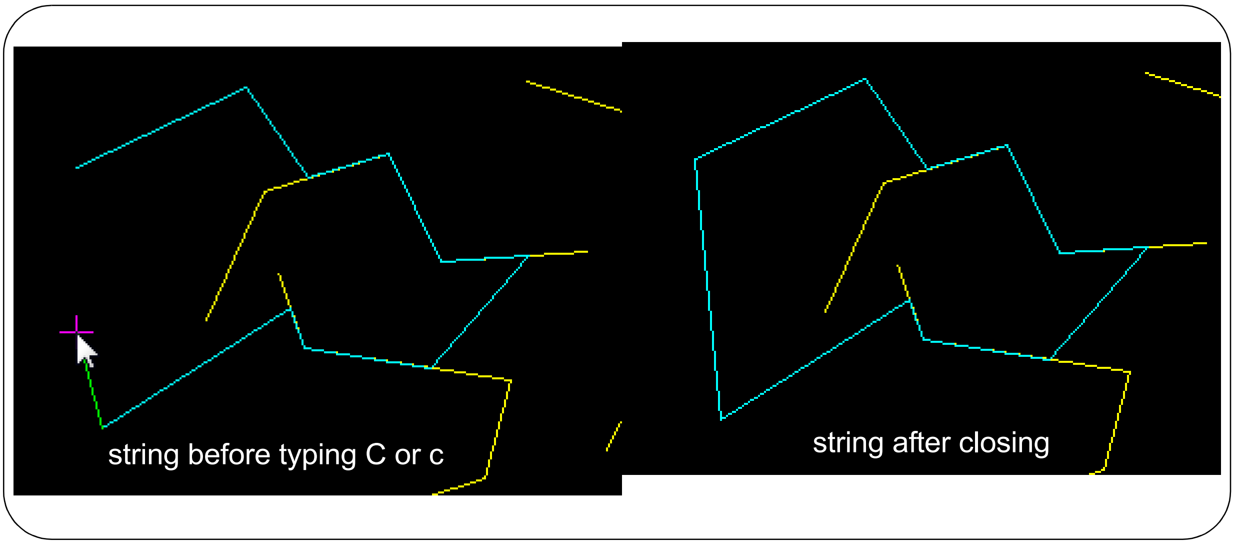
Another string can then be selected to trace over, or P or C typed to change modes.

The option is terminated by pressing the <Esc> key.

Continue to the next mode Typing C for (c)lose or to the beginning of the Trace documentation 15.23.18 Trace.

Typing C for (c)lose

Typing **C** or **c** will **Close** the string and ends the creation of the new string.

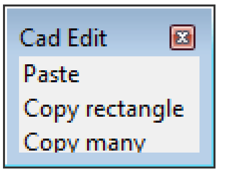


A new Trace option then begins.

The option is terminated by pressing the <Esc> key.

Go to the beginning of the Trace documentation 15.23.18 Trace.

15.24 CAD Edit



For the option *Paste*, please go to 15.24.1 Paste
Copy rectangle 15.24.2 12d Copy Rectangle
Copy many 15.24.3 12d Copy Many

15.24.1 Paste

Pastes the 12da data from the clipboard into the current view in 12d.

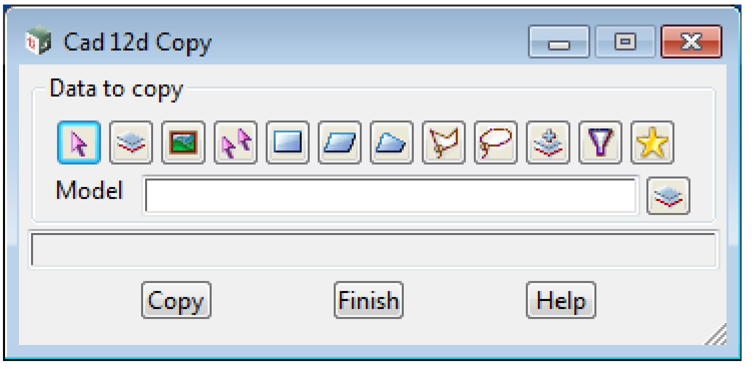
15.24.2 12d Copy Rectangle

In the chosen view select the first point and then drag the cursor to visualise your desired rectangle. When the second point is accepted, the data inside the rectangle is copied to the clipboard in 12da format, ready for pasting into an open 12d project. The data is copied into models of the same model names as the original data.

15.24.3 12d Copy Many

Data is copied to the clipboard by selecting data from the Data to Copy field and then selecting **Copy**.

On selecting the **Copy many** option, a **Cad 12d Copy** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Data to Copy

data selection type - for a full description go to 4.19.3 Data Source.

Model model box

select the data from the specified model.

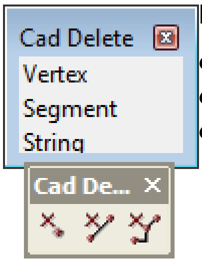
Copy button

Copies the selected data to the clipboard in 12da format.

15.25 CAD Delete

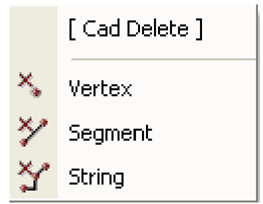
Position of option on menu: **CAD =>Delete**

The **Cad Delete** walk-right menu is



Menu of Options to Delete Vertices, Segments and Strings

delete a vertex
delete a segment
delete a string



For the option *Vertex*, go to 15.25.1 Delete Vertices
Segment 15.25.2 Delete Segments
String 15.25.3 Delete Strings

15.25.1 Delete Vertices

Position of option on menu: **CAD =>Delete =>Points**

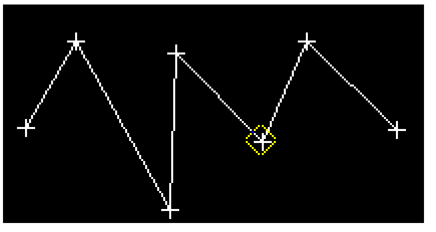
or by selection of appropriate icon from the toolbar. 

This option deletes vertices of super strings.

On selecting **Points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

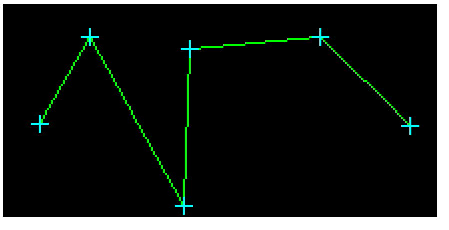
STEP 1:

The vertex to be deleted is selected and accepted (This must be a super string).



STEP 2:

The vertex point is deleted and the string redrawn.



15.25.2 Delete Segments

Position of option on menu: **CAD =>Delete =>Segments**

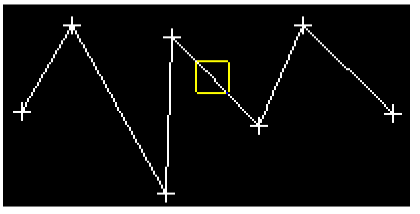
or by selection of appropriate icon from the toolbar. 

This option deletes segments of super strings.

On selecting **Segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

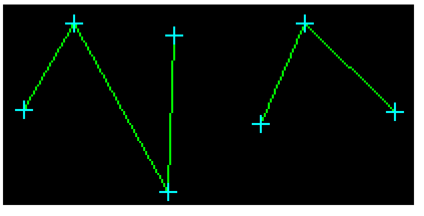
STEP 1:

The segment to be deleted is selected and accepted.



STEP 2:

The segment is deleted leaving two separate strings in this case.



15.25.3 Delete Strings

Position of option on menu: **CAD =>Delete =>Strings**

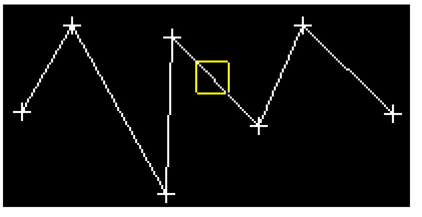
or by selection of appropriate icon from the toolbar. 

This option deletes selected strings. The string type does not specifically have to be a super string.

On selecting **Strings**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The string to be deleted is selected and accepted.



STEP 2:

The string is deleted.

15.25.4 Delete Selection of Strings

Position of option on menu: **CAD =>Delete =>Selection**

or by selection of appropriate icon from the toolbar. 

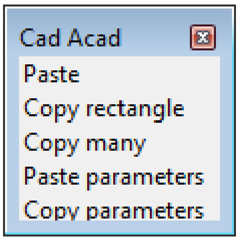
This option allows the deleting of selected objects specified in a source box. For help on this option see 28.9.14 Delete.

On selecting the **Delete** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

15.26 Cad Acad

Position of option on menu: **CAD =>Acad**

The Cad Acad walk-right menu is



For the option *Paste*, go to 15.26.1 Paste
Copy rectangle 15.26.2 Copy rectangle
Copy many 15.26.3 Copy many
Paste parameters 15.26.4 Paste parameters
Copy parameters 15.26.5 Copy parameters

15.26.1 Paste

Pastes the Dwg/Dxf data from the clipboard into the current view in 12d.

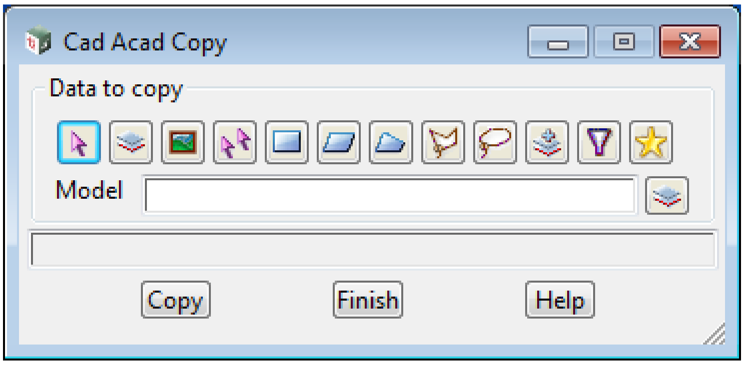
15.26.2 Copy rectangle

In the chosen view select the first point and then drag the cursor to visualise your desired rectangle. When the second point is accepted, the data inside the rectangle is copied to the clipboard for pasting.

15.26.3 Copy many

Data is copied to the clipboard by selecting data from the Data to Copy field and then selecting **Copy**.

Selecting the **Copy many** option, brings up the **Cad Acad Copy panel**.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Data to Copy

data selection type - for a full description go to 4.19.3 Data Source.

Model model box

select the data from the specified model.

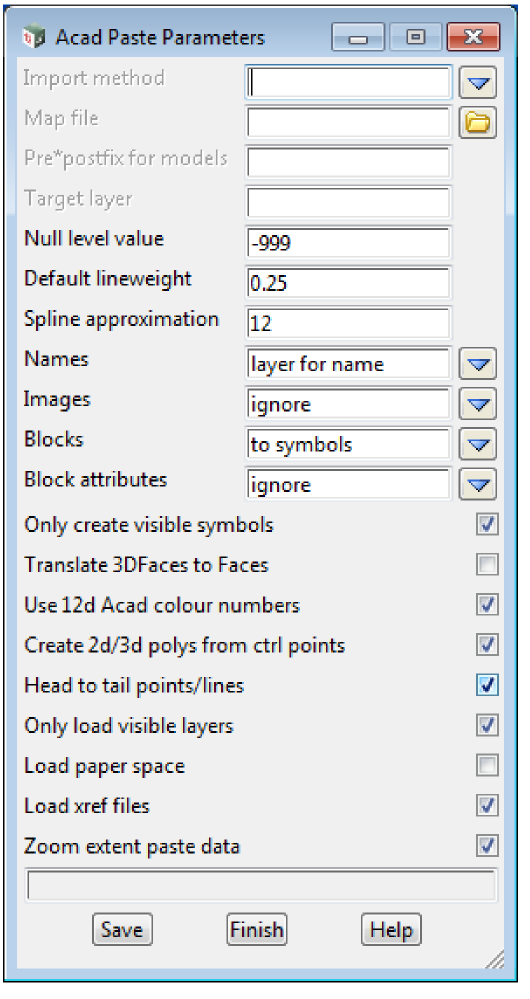
Copy button

Copies the selected data to the clipboard.

15.26.4 Paste parameters

The parameters for this panel are the same as parameters in the **Read DWG/DXF Data** panel.

Selecting **Paste parameters** brings up the **Acad Paste Parameters** panel:

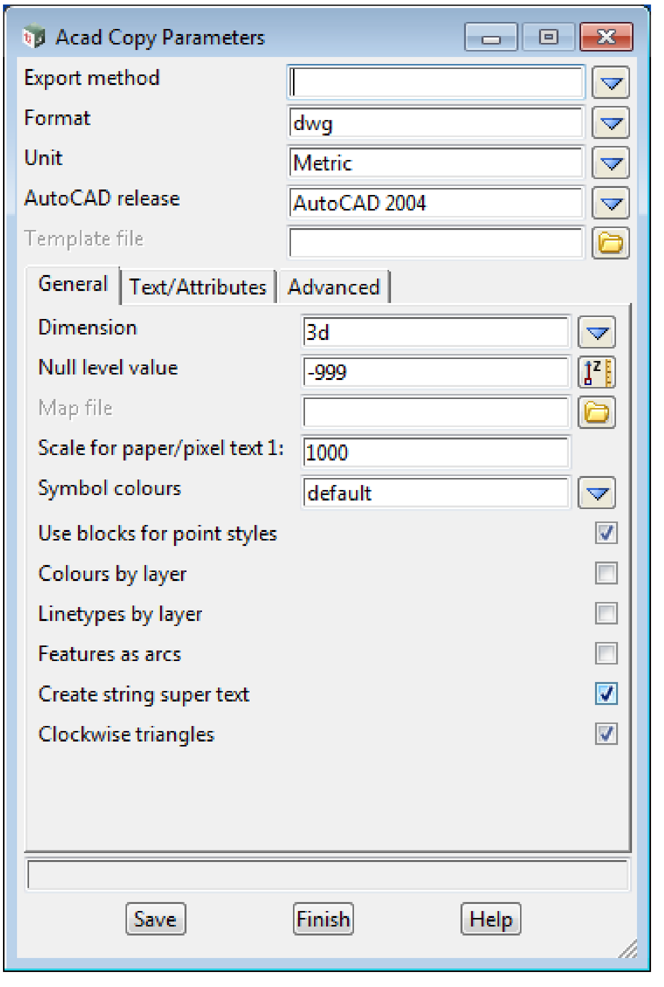


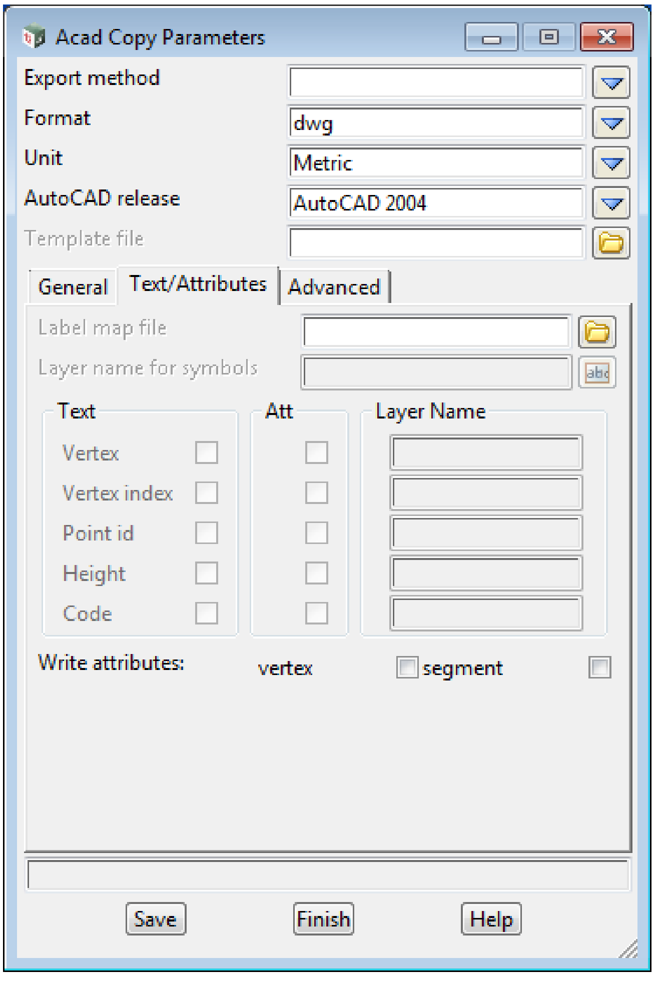
For more information please go to 8.1.10 DWG/DXF Input.

15.26.5 Copy parameters

The parameters for this panel are the same as parameters in the **Write DWG/DXF file for** panel.

Selecting **Copy parameters** brings up the **Acad Copy Parameters** panel:





Acad Copy Parameters

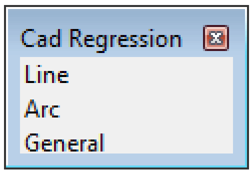
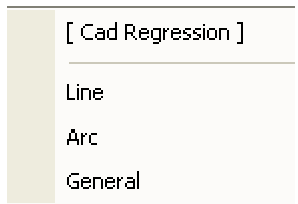
15.27 CAD Regression

Position of option on menu: **CAD =>Regression**

This section of documentation is a work in progress and will be updated in subsequent releases.

The **Cad Regression** walk-right menu is





For the option *Line*, go to 15.27.1 Line
Arc 15.27.2 Arc
General 15.27.3 General

15.27.1 Line

This section of documentation is a work in progress and will be updated in subsequent releases.

15.27.2 Arc

This section of documentation is a work in progress and will be updated in subsequent releases.

15.27.3 General

This section of documentation is a work in progress and will be updated in subsequent releases.

16 Tins

Position of menu: **Tins**

A **Tin** (triangulated irregular network) is an accurate method of representing 2.5D surfaces, especially those described by ground points or design strings. See 4.5.4 Tins.

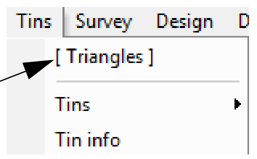
12d Model uses tins in most operations involving surfaces. For example, contouring, interfacing and volume calculations.

Unlike strings, tins can be in more than one model, or even no model at all. However, to be displayed in a view or used for profiling on a section view, tins need to be in at least one model. It is suggested that each tin be in its own model called “tin tin_name”. This makes it easy to know the model a tin is in, and also to see which models contain tins and obtain lists of all tins.

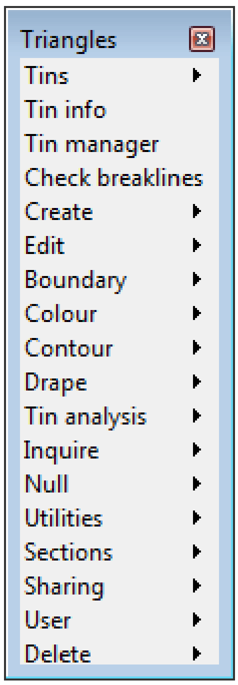
The **Triangles** walk-right menu is

on Main menu

create floating menu **Triangles**



on 12d Model menu and floating Triangles menu



list of tins
information on project tins
check crossing breaklines
triangulate a model or view, Super Tin
modify model list, *etc.* for tin
construct tin boundary
colour of tin, colour in polygon
contouring hts, depths, labelling
drape strings onto tin
slope, aspect, viewshed etc.
tin values at cursor position
remove unwanted triangles
various tin options
creating x-sections, mesh, long sec
tin sharing
Triangles User menus
delete tins from disk

Each of these options will now be discussed.

For the option *Tins*, go to 16.1 Tins
Tins info 16.2 Tin Info
Check breaklines 16.3 Check Breaklines, Duplicate Vertices, Identicals
Create 16.5 Create
Edit 16.6 Edit

Tin analysis 16.11 Tin Analysis
Inquire 16.12 Inquire
Null 16.13 Null

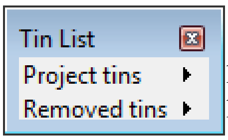
Utilities	16.14 Utilities
Sections	16.15 Sections
Sharing	16.16 Sharing
Delete	16.17 Delete

16.1 Tins

Position of menu: **Tins=>Tins**

The **Tins** walk-right menu provides options to list all the tins in the project (project tins) and all the tins in the project area but not in the project (removed tins).

The **Tin List** walk-right menu is



list of tins in project
list of removed tins in project area

For the option Project tins, go to 16.1.1 Project Tins
Removed tins 16.1.2 Removed Tins

16.1.1 Project Tins

Position of option on menu: **Tins =>Tins => Project Tins**

The **project tins** walk-right menu provides a list of all the tins in the project and there is a walk-right on each tin name showing what models the tin is in. If a tin name is selected from the list of tins, the **tin information** panel is fired up with the selected tin name already in the **tin** field.

16.1.2 Removed Tins

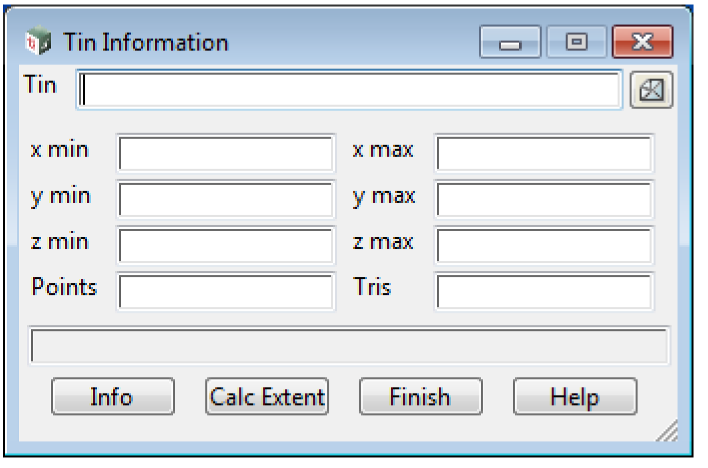
Position of option on menu: **Tins =>Tins => Removed Tins**

The **removed tins** walk-right menu provides a list of all the tins in the project area that have been removed from the project (using the **removed from project** option).

16.2 Tin Info

Position of option on menu: **Tins =>Tin info**

Selecting **Tin info** fires up the **Tin information** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	tin box		available tins

input the name of the tin to get information on

xmin, xmax	output
ymin, ymax	output
zmin, zmax	output

returns the tin x, y, z limits

Points output

returns the number of points in the tin

Tris output

returns the number of triangles in the tin

Info button

get the information for the tin given in the **tin** *field.*

Calc Extent button

recalculate the x, y, z bounding box for the tin given in the model field.

How to Use the Panel

The information for the tin given in the **tin** field is retrieved and placed in the appropriate panel fields when the tin name is piped into the **tin** field from the pop-ups, or an <enter> is entered after typing the tin name into the **tin** field, or on selecting the **info** button.

16.3 Check Breaklines, Duplicate Vertices, Identicals

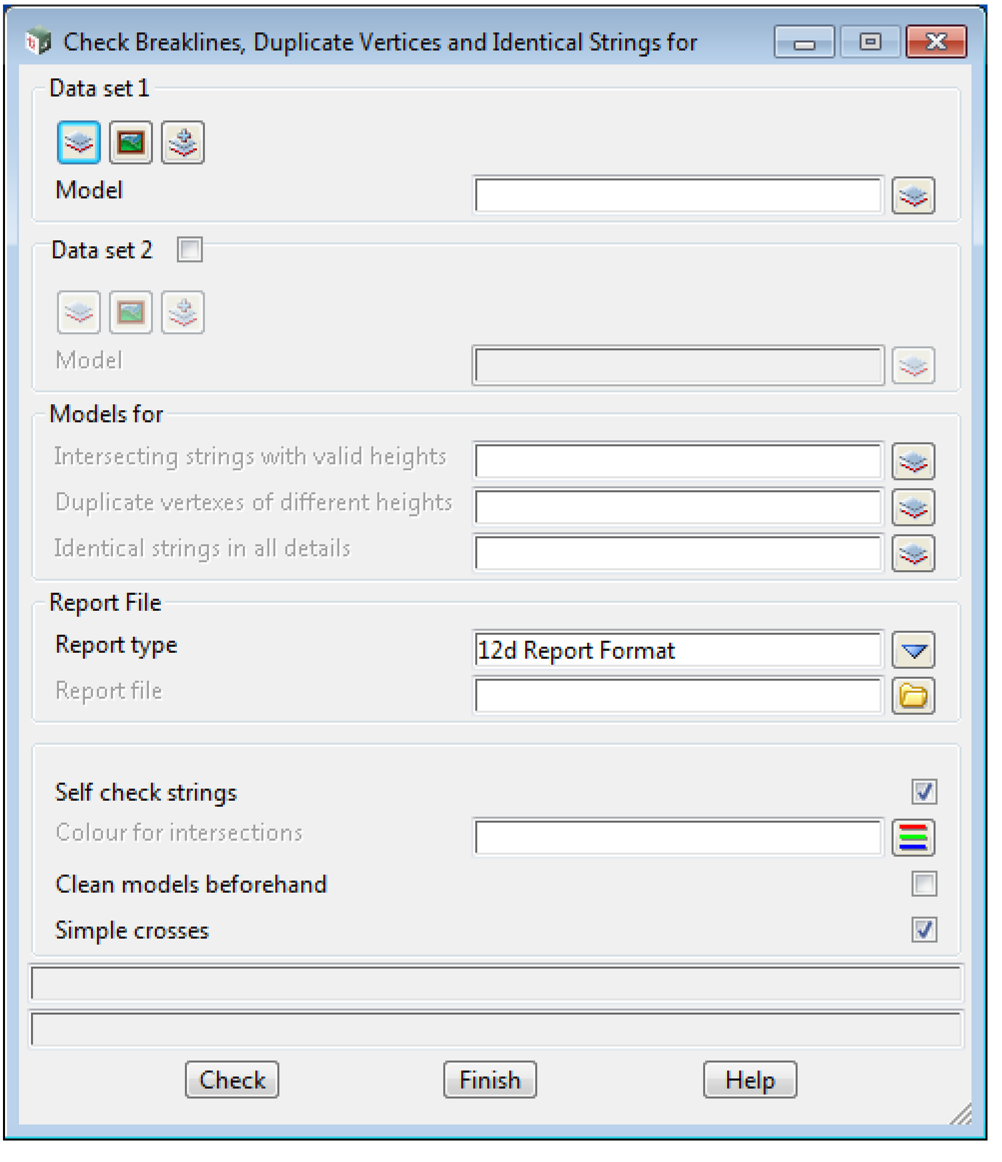
Position of option on menu: **Tins =>Check breaklines**
Utilities =>A-G =>Check/clash =>Check breaklines

The **Check breaklines** option is used to test whether any of the line segments from any line strings in a model or view intersect (cross) the line segments from any other string in the model/view. This includes self intersections of strings.

The option also checks for any points with the same x and y coordinates (same plan position) but different z-values, and for totally duplicated strings (identicals).

Intelligent log lines are written to the output window for showing any crossing breaklines, duplicate vertices, *etc.*

Selecting **Check breaklines** displays the **Check Breaklines, Duplicate Vertices and Identical Strings for** panel.



The fields and buttons in the panel have the following functions.

Field Description Type Defaults Pop-Up

Data set 1

*if **Data set 2** is ticked **off**, then all the selected strings in Data set 1 are checked against all the other selected strings from Data set 1.*

*If **Data set 2** is ticked **on**, then all the selected strings in Data set 1 are checked against all the selected strings in Data set 2, BUT the strings in Data set 1 are not checked against each other and the strings in Data set 2 are not checked against each other.*

Data set 1 source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data set 1 source input

data to be processed.

Data set 2

*if **Data set 2** is ticked **off**, then all the selected strings in Data set 1 are checked against all the other selected strings from Data set 1.*

*If **Data set 2** is ticked **on**, then all the selected strings in Data set 1 are checked against all the selected strings in Data set 2, BUT the strings in Data set 1 are not checked against each other and the strings in Data set 2 are not checked against each other.*

Data set 2 source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data set 2 source input

data to be processed.

Intersecting strings with valid heights model box available models

if non-blank, check for any crossing line segments and place either a copy of the crossing segments into the model given in this field or a diamond depending on the state of Simple crosses.

Duplicate vertices of different heights model box available models

*if non-blank, **copies** of any strings that are completely duplicated are placed in the model given in this field and circles are placed in this model at any duplicate points that aren't from an entire string.*

Identical strings in all details model box available models

*if non-blank, the duplicates of any strings are **moved** to model given in this field. That is, if any strings are identical in all ways, then the second and subsequent identical strings are moved to the this model. This is especially for the case when a second copy of some data has been supplied.*

Self check strings tick box tick

if ticked, a string is not check against itself for crossing breaklines etc.
If not ticked, a string is not checked against itself for crossing breaklines. This speeds up processing.

Colour for intersections colour box available colours

colour for the copies of the crossing segments.

Clean models beforehand tick box tick

*if **ticked**, the models for intersecting string, duplicate points, identicals are cleaned before the option is run.*

Report type choice box 12d Report Format, original xml

if 12d Report Format, the xml format is converted to the 12d Report Format for check breaklines

if original xml, report is in xml format

Report file file box

if non-blank, a report file of this name is created giving details of all the crossing breaklines and *duplicate plan points with different z-values.*

Simple crosses tick box tick

*if **ticked**, create diamonds at the position where strings cross, otherwise create a string in the shape of a cross with parts of the crossing strings.*

Check button

after selecting the **check** *button, all the strings in the model/view are tested for any crossing line segments or duplicate points. If requested, a report is generated.*
<esc> can be used to abort the checking option.

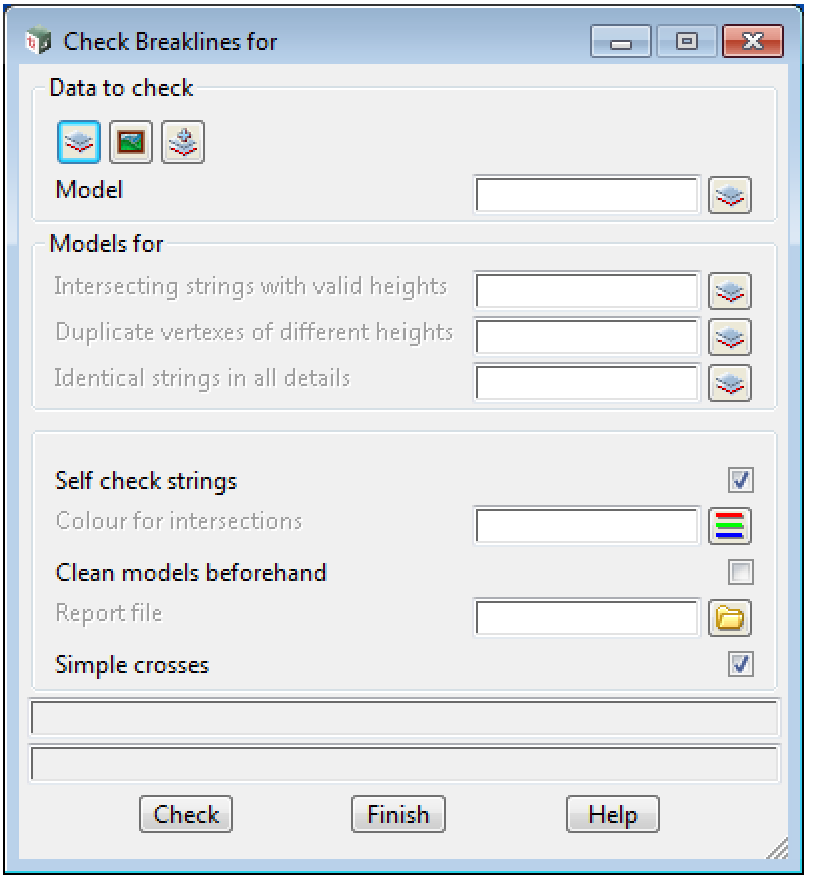
16.4 Check Breaklines - Old

Position of option on menu: **Utilities =>Old =>Check breaklines**

The **check breakline** option is used to test whether any of the line segments from any line strings in a model or view intersect (cross) the line segments from any other string in the model/view. This includes self intersections of strings.

The option also checks for any points with the same x and y co- ordinates (same plan position) but different z-values, and for totally duplicated strings.

On selecting **Check breaklines** option and then the appropriate **Data Source** in the panel, the **Check Breaklines for** panel is displayed.



The fields and buttons in the panel have the following functions.

Field Description   Type   Defaults   Pop-Up

Data source type   Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source   input

data to be processed.

Intersecting strings with valid heights   model box   available models

if non-blank, check for any crossing line segments and place either a copy of the crossing segments into the model given in this field or a diamond depending on the state of Simple crosses.

Duplicate vertices of different heights   model box   available models

*if non-blank, **copies** of any strings that are completely duplicated are placed in the model given in this field and circles are placed in this model at any duplicate points that aren't from an entire string.*

Identical strings in all details model box available models

*if non-blank, the duplicates of any strings are **moved** to model given in this field. That is, if any strings are identical in all ways, then the second and subsequent identical strings are moved to the this model. This is especially for the case when a second copy of some data has been supplied.*

Self check strings tick box tick

if ticked, a string is not check against itself for crossing breaklines etc.
If not ticked, a string is not checked against itself for crossing breaklines. This speeds up processing.

Colour for intersections colour box available colours

colour for the copies of the crossing segments.

Clean models beforehand tick box tick

*if **ticked**, the models for intersecting string, duplicate points, identicals are cleaned before the option is run.*

Report file file box

if non-blank, a report file of this name is created giving details of all the crossing breaklines and duplicate plan points with different z-values.

Simple crosses tick box tick

*if **ticked**, create diamonds at the position where strings cross, otherwise create a string in the shape of a cross with parts of the crossing strings.*

Check button

after selecting the **check** *button, all the strings in the model/view are tested for any crossing line segments or duplicate points. If requested, a report is generated.*

<esc> can be used to abort the checking option.

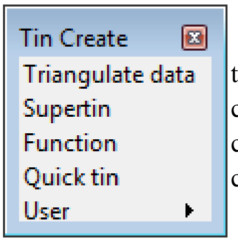
16.5 Create

Position of menu: **Tins =>Create**

The input data for a triangulation is either all the data in a selected model or all the data from all the models on a selected view or a list of models. The options for each method of selecting data are on the **Create** walk-right menu.

A Super Tin™ is a list of Tins and a Tin function creates a re-calc function name for an existing Tin. Each of these options are also on the **Create** walk-right menu.

The **Create** walk-right menu is



triangulate a model or view of data
create a supertin
create a triangulate function
create a quick tin of selected strings

For the option	*Triangulate data*, go to	16.5.1 Triangulate Data
	Supertin	16.5.2 Create Super Tin™
	Function	16.5.3 Function
	Quick tin	16.5.4 Quick Tin

16.5.1 Triangulate Data

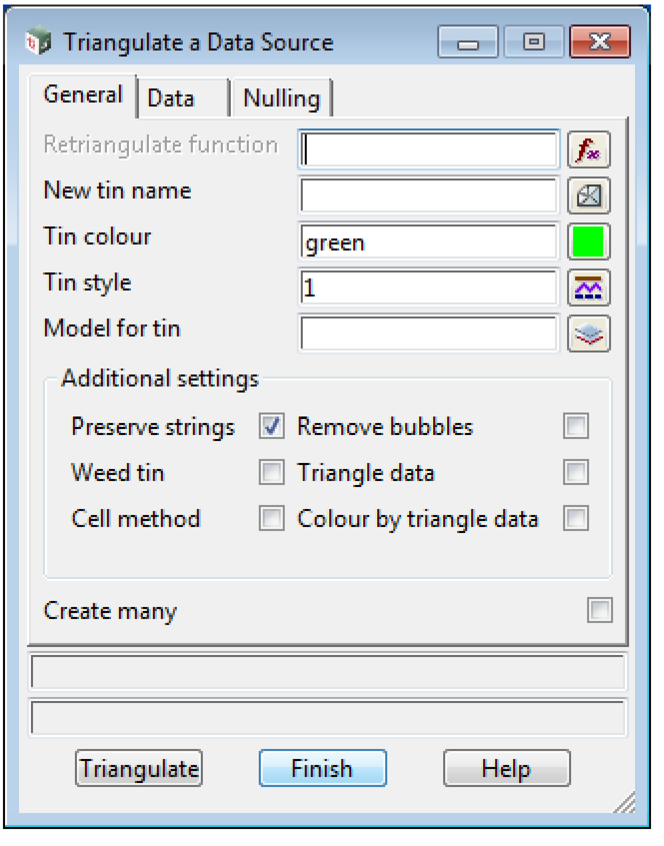
Position of option on menu: **Tins =>Create =>Triangulate data**

For simple jobs, the data to triangulate is all in the one model. However, it often occurs that the data one needs to triangulate is not in one model but is in the models displayed on a particular view.

The **Triangulate data source** option allows use to either select the data to triangulate from a single model, a list of models or to it uses the data points from all the models attached to a particular view, rather than the data from a particular model.

In each case, the models used in creating the triangulation are recorded so that the models can be easily retriangulated if any of the data changes.

Selecting **Triangulate data** displays the **Triangulate a Data Source** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

General tab

Retriangulate function function box box

if non blank, name of the tin function. The function can be recalced to recreate a new tin from the current data in the models used to construct the original tin. This is optional.

New tin name input

name of the tin created from the triangulation of the model/view.If <enter> is type after the name, the **model for tin** *field is filled out with the name* tin new_tin_nam***e***.

Tin colour input default tin colour available colours

colour to draw the triangles whenever they are displayed in a view. This is called the ***base tin colour****. It is possible to change the colour of individual triangles so they are different to base tin colour.*

Tin style input 1 available line styles

line style used for drawing sections through the tin on the section view.

Model for tin input available models

if non-blank, the created tin will be added to the model given in this field.
if blank, the name tin new_tin_name *will be placed in the field when the* **triangulate** *button is selected.*

Preserve strings tick box tick

*if **ticked**, all strings with breakline type **line** or segment type **tinable** will be preserved as sides of triangles. Otherwise, all line strings or segments of type tinable will be treated as point strings for the triangulation.*

Remove bubbles tick box

*if **ticked**, post-processing occurs to try and stop all the points of a triangle coming from the same string. This helps prevents triangles with all three points coming from the one contour string and hence forming a flat triangle.*

Weed tin tick box

*if **ticked**, all duplicate points all removed from the tin database. This helps to reduce the size of the tin files if there was a large amount of duplicate data. This flag is automatically set to tick for triangle data.*

Triangle data tick box

*if **ticked**, then it is assumed the original data was triangles and 12d will ensure that the triangles produced by the triangulation exactly match (including null regions) the original triangle data.* **Weed tin** *is automatically set to tick if* **face data** *is set to tick.*

Cell method tick box

*if **ticked**, try to create the triangles in cells - an alternate method of ordering the data which is often faster when the data comes in lines rather than randomly.*

Colour by triangle data tick box

*if **ticked** and* **Triangle data** *is ticked, the colour of each triangle in the created tin is made the same as the triangle from the triangle data.*

Create many tick box

*if **ticked**, once the tin has been triangulated, the panel will stay up so you can create another tin.*
*If **not ticked**, after the tin has been created, the panel is replaced by a Retriangulate Tin panel so if there are any mods to be made, no time is wasted in needed to select the panel.*

Data tab

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

For this option, only data types involving models can be used - model, view, model list and the models from a favourite.

Data source input

source of data is to be triangulated - only Model or View allowed for this option.

Data polygon string-select

if a string is selected as a data polygon, only string points that are inside the data polygon are used in the triangulation.
If no string is selected, then all the points in all the model/view are used in the triangulation.

Nulling tab

Apply nulling tick box

if ticked, null the resultant tin using Angle*,* Length*,* Combined angle and Combined length*.*

Angle angle box 5

if a triangle has an external side (that is not a breakline) with an angle on it less than **Angle***, then the triangle is nulled. The default value works most of the time.*

If blank then no triangles are nulled by this test.

Length real value 100

if a triangle has an external side (that is not a breakline) greater than **Length***, the triangle is nulled.*

If blank then no triangles are nulled by this test.

Combined angle angle box 60
Combined length real box 20

For the Combined case, a triangle is nulled if it:

has an external side (that is not a breakline) and the ***sum*** *of the two angles on it is* ***less*** *than* **Combined angle** *(the default value works most of the time)*

and

has an external side (that is not a breakline) whose length is ***greater*** *than* **Combined length***. A suggested value is one third to one half of Length.*

If either **Combined angle** *or* **Combined length** *is blank, then no triangles are nulled by this test.*

Null polygon string-select

if a string is selected as a null polygon, any triangle whose centroid is outside the null polygon is automatically nulled.

Button at bottom

Triangulate button

Triangulate the model/view given in the **model/view to triangulate** *field. The created tin will be stored with the name given in the* **new tin name** *field. The tin will be the colour given in the tin colour field. If the* **model/view for tin** *field is non-blank, the created tin will be added to the model given in that field - if the model does not exist, it will be created.*

Panel Messages

Progress messages - sent to the panel message area

no of points in model/view = *no. of points*
no. points pts *no. break lines* break lines
no. points pts *no. of secs* s *no.* pts/s *no.* dup
break lines finished. time taken = *secs*

Completion message - sent to the panel message area

average no of pts per sec = *no.*

<esc> can be used to abort the triangulation option.

16.5.2 Create Super Tin™

Position of option on menu: **Tins =>Create =>Supertin**

The **SuperTin**™ option is designed to create a super triangulation from other triangulations.

With Super Tins, existing triangulations can be combined to form the equivalent of a merged triangulation without having to completely re-build a merged model and retriangulating it.

This means there are less steps in creating a Super Tin merged triangulation so a lot less time is required and there is less opportunity for errors. Also, if any of the component triangulations of the Super Tin are modified, then the Super Tin is also instantly modified.

The Super Tin is defined by a list of triangulations in increasing number order. Wherever two triangulations overlap, the triangulation of higher number takes precedence and is used to defined z-values and sections.

Hence, for any (x,y) point, the z-value on the Super Tin is defined to be the z-value from the triangulation of the highest number which is under the (x,y) point.

A section through a Super Tin is made up of the sections through the tin of highest number at each point along the section and so may involve more than one tin.

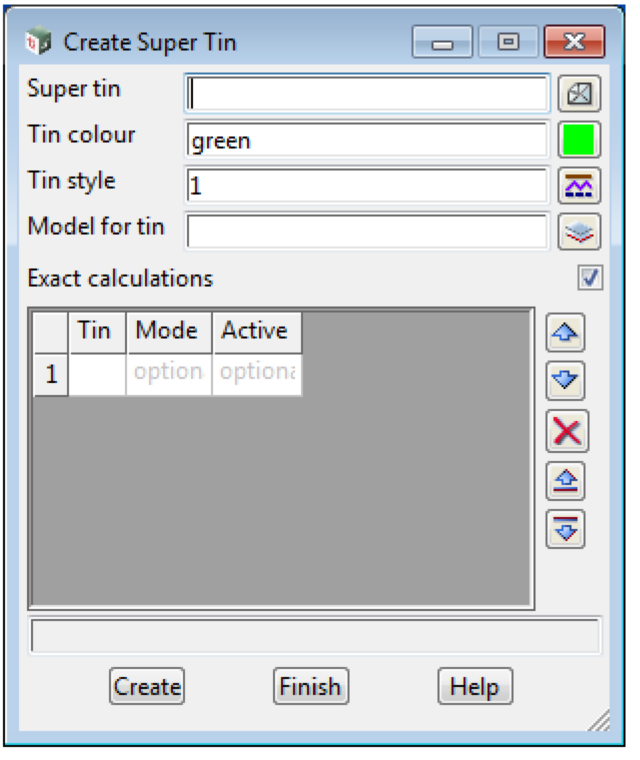
All Super Tins support Sections, Apply MTFs, Site Lines and volumes by end area calculations.

For a Super Tin, there is also an **Exact calculations flag** and if this is set to on, extra calculations are done when creating a Super Tin (and every time a tin included in a Super Tin is modified) so that the Super Tin can be used for Exact Volumes and Visualisation.

So Super Tins with the **Exact calculations** flag set support sections, Apply MTFs, site lines, and volumes by end area methods, as well as volumes by exact methods, and can also be used in visualisations.

Note - the reason that **Exact calculations** may be turned off is that for some tins, it may add significant processing time whenever a tin in the Super Tin is changed. So if that is slowing down your project and you don't need exact volumes or visualisations all the time, turn off **Exact calculations** for the Super Tin. **Exact calculations** can always be turned back on when you need them.

Selecting **Supertin** brings up the **Create Super Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super tin	super tin box		

name of the tin created from the triangulation of the model/view.If <enter> is type after the name, the **model for tin** *field is filled out with the name* tin new_tin_name*.*

Tin colour	colour box	default tin colour	available colours

the **tin colour** *is used as the section colour when sectioning through the Super Tin.When displayed on plan or section views, the each tin making up the Super Tin is drawn in its own colour.*

Tin style	linestyle box	1	available line styles

line style used for drawing sections through the Super Tin on the section view.

Model for tin	model box		available models

if non-blank, the created Super Tin will be added to the model given in this field.
if blank, the name tin new_tin_name *will be placed in the field when the* **Create** *button is selected.*

Exact calculations	tick box		

if ticked, when a Super Tin is created or a tin included in a Super Tin is modified, extra calculations are done for the Super Tin so that is can be used for Exact Volumes and in visualisations.

If ***not ticked****, no extra calculations are done for the Super Tin and it can only be used in options that use sections. For example, end area volumes and site lines.*

Tin Grid

Tin	table		available tins

name of the tin to be included in the Super Tin. The order is critical since the higher number tins take precedence over the lower number tins.

There can be up to 127 tins in a Super Tin.

Mode			replace, subtract

Replace

where ever this tin exists, use it instead of any tins of a lower number in the Tin column of the grid.

Subtract

where ever this tin exists, all parts of the tins of a lower number in the Tin column, are removed. So where ever the tin exists, it creates holes in all the tins of a lower number.

An example would be a tin that is the position of many gully pits. Using this tin in subtract *mode will punch holes in all the tins of a lower number in the Tin column. So in effect, it does a nulling that also nulls parts of triangles from the tins of a lower number.*

Active

if yes*, the tin is included in the Super Tin.*

If no, the tin is not included in the Super Tin. So the tin can be taken out of the Super Tin without having to remove it from the Tin list.

Create button

create a Super Tin from the tins in the **Tins to include** *table. The created Super Tin will be stored with the name given in the* **New tin name** *field.*

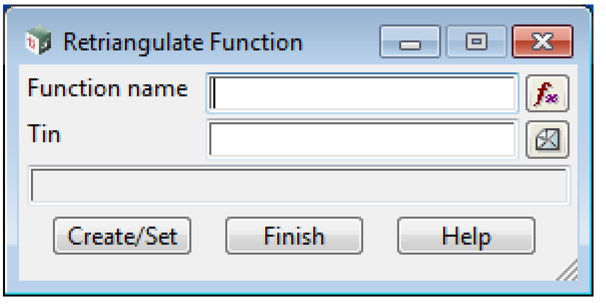
If there are no errors in creating the Super Tin, the panel then turns into a 16.6.2 Edit Super Tin *panel to allow any other edits to be made before finishing.*

16.5.3 Function

Position of option on menu: **Tins =>Create =>Function**

The **function** option is used to construct a function which when recalced, will run a retriangulate on the tin. Since a function name can be given when a tin is first created, this option is rarely needed.

Selecting **function** displays the **Retriangulate Function** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input		available functions

the name to give to the retriangulate function.

Tin	input		available tins

name of the tin to be retriangulated when the function is recalced.

Create/Set	button		

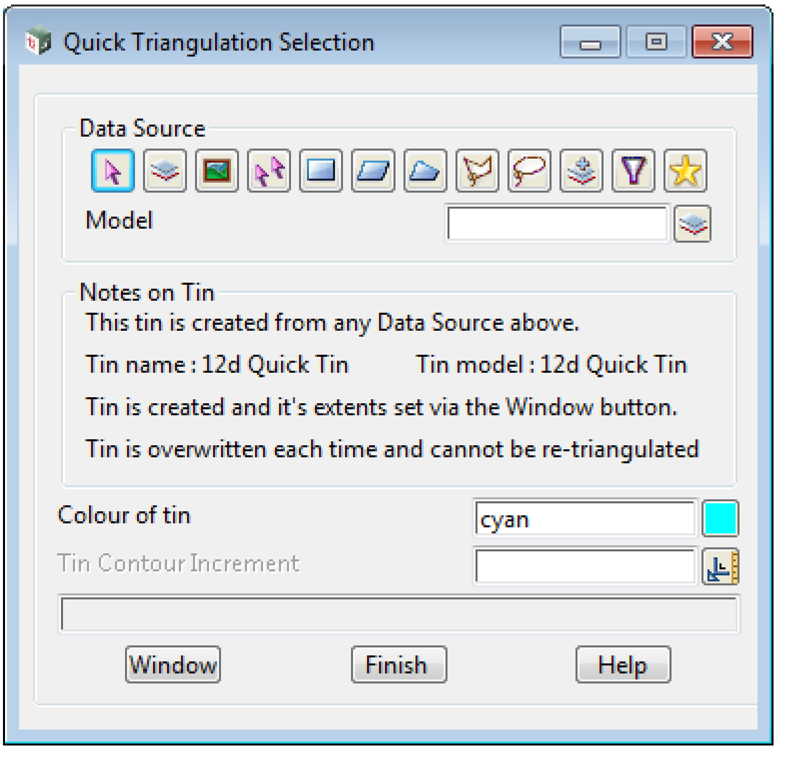
create or modify the retriangulate function.

16.5.4 Quick Tin

Position of option on menu: **Tins =>Create =>Quick tin**

The **Quick tin** option create a temporary tin from strings selected in a data source, and restricted to a user selected rectangular window. Contours of a user given increment can also be generated. Each time the option is run, is creates a tin called ***12d Quick Tin*** in the model ***12d Quick Tin*** so the tin is over written each time the option is run.

Selecting **Quick tin** displays the **Quick Triangulation Selection** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be triangulated - only Model or View allowed for this option.

Colour of tin	colour box		available colours

the colour or the tin, and any contours.

Tin contour increment	real value box		

in non blank, contours are created at the given increment and displayed on the view where the Window is created. Fast contours are turned on for the view so contours are displayed for the tin.

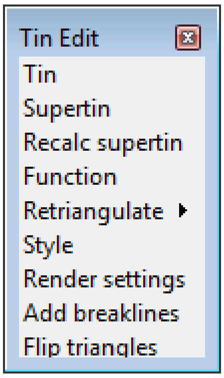
Window	button		

after clicking on Window, two corners to define a window are selected in a view. The tin for the selected data restricted to the Window is then created with the name 12d Quick Tin*, added to the model* 12d Quick Tin, *and then the model added to the view that the Window was defined. Tin contours is also turned of for the view.*

16.6 Edit

Position of menu: **Tins =>Edit**

Once a tin is created, it can be edited in a variety of ways. The **Edit** walk-right menu is



edit a tin definition and retriangulate
edit Super Tin definitions
recalculate a Super Tin
modify a retriangulate function
retriangulate an existing tin
set tin style
settings for rendering V6.1
add breakline
swap triangle edges

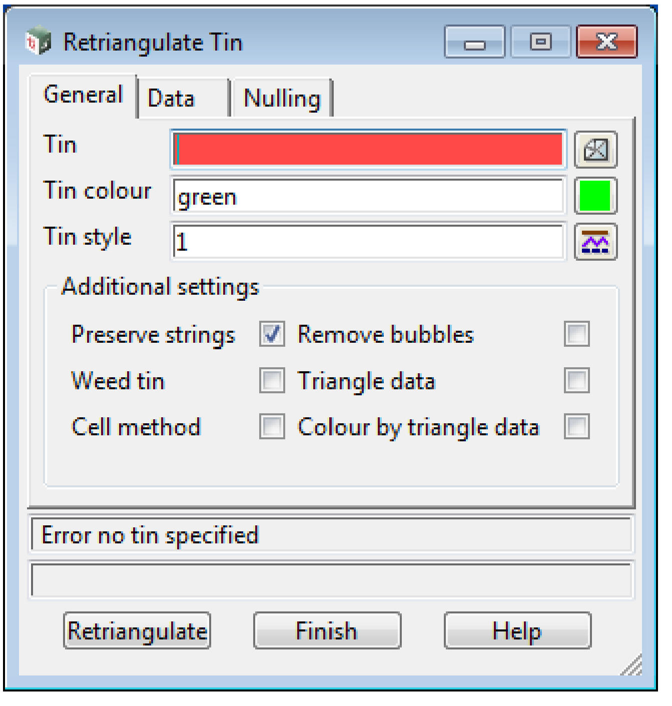
For the option *Tin*, go to	16.6.1 Edit a Tin
Supertin	16.6.2 Edit Super Tin
Recalc supertin	16.6.3 Recalc Super Tin
Function	16.6.4 Edit Tin Function
Retriangulate	16.6.5 Retriangulate
Style	16.6.6 Style
Render settings	16.6.7 Render Settings
Add breaklines	16.6.8 Add Breaklines
Flip triangles	16.6.9 Flip Triangles

16.6.1 Edit a Tin

Position of option on menu: **Tins =>Edit =>Tin**

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The **Edit** => **Tin** option can be used to modify the models and setting used to define the tin and then recreate the tin from the new models and settings.

Selecting **Edit** => **Tin** displays the **Retriangulate Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

General tab

Tin	tin box	original tin name	

name of the tin to be retriangulated. When the tin name is given, the list of models used for the tin and other settings, are displayed.

Tin colour	colour box	original colour	available colours

original colour of the tin - this can be modified. Note that this only modifies the base tin colour and any triangles that have had their colour modified, will keep the modified colour.

Tin style	line style box	original line style	available line styles

original line style of the tin - this can be modified.

Preserve strings	tick box	original setting	

*if **ticked**, all strings with breakline type **line** will be preserved as sides of triangles. Otherwise, all line strings will be treated as point strings for the triangulation.*

Remove bubbles	tick box	original setting	

*if **ticked**, post-processing occurs to try and stop all the points of a triangle coming from the same string.*

Weed tin	tick box	original setting	

*if **ticked**, all duplicate points all removed from the tin database.*

Triangle data tick box original setting

*if **ticked**, only triangles in the tin that are under the centroid of a string representing a triangle in the model/view are considered valid, all others are set to null. That is, any triangles not under the centroid of a string from the model/view will be set to null. This is extremely useful when the original string data represents triangles and it will ensure that the triangles produced by the triangulation will exactly match, including null regions, the original triangle data.* **Weed tin** *is automatically set to tick if* **face data** *is set to tick.*

Cell method tick box original setting

*if **ticked**, try to create the triangles in cells - an alternate method of ordering the data for use when the triangulation takes too long by the non-cell method.*

Data tab

Model List models in the tin

list of models used to create the original tins. The models and the order can be modified.

Data polygon string-select original data polygon

if a string is selected as a data polygon*, only string points that are inside the* data polygon *are used in the triangulation.*
If no string is selected, then all the points in all the models are used in the triangulation.

Nulling tab

Apply nulling tick box original setting

if ticked, null the resultant tin using Angle*,* Length*,* Combined angle and Combined length*.*

Angle angle box original setting

if a triangle has an external side (that is not a breakline) with an angle on it less than **Angle***, then the triangle is nulled. The default value works most of the time.*

If blank then no triangles are nulled by this test.

Length real value original setting

if a triangle has an external side (that is not a breakline) greater than **Length***, the triangle is nulled.*

If blank then no triangles are nulled by this test.

Combined angle angle box original setting
Combined length real box original setting

For the Combined case, a triangle is nulled if it:

*has an external side (that is not a breakline) and the **sum** of the two angles on it is **less** than* **Combined angle** *(the default value works most of the time)*
and

*has an external side (that is not a breakline) whose length is **greater** than* **Combined length***. A suggested value is one third to one half of Length.*

If either **Combined angle** *or* **Combined length** *is blank, then no triangles are nulled by this test.*

Null polygon string-select original null polygon

if a string is selected as a null polygon*, any triangle whose centroid is outside the* null polygon *is automatically nulled.*

Retriangulate button

The original tin is deleted and the data in the **models to include** *table used to create a new triangulation which is given the original tin name. The settings in this panel are used for the retriangulation.*

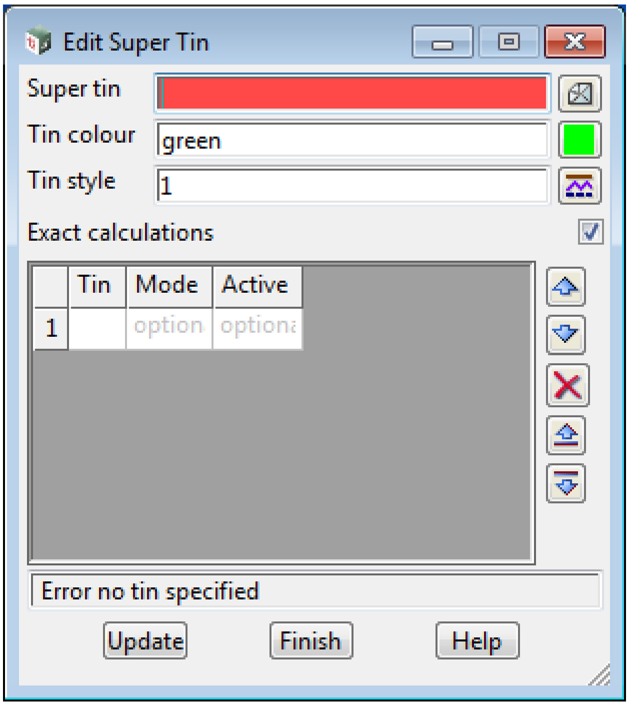
16.6.2 Edit Super Tin

Position of option on menu: **Tins =>Edit =>Supertin**

When a Super Tin is created, the tins and settings used to create the Super Tin are recorded.

The **Edit=>Supertin** option modifies the tins and setting used to define the Super Tin.

On selecting the **edit=>supertin** option, the **edit super tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super tin name	sup tin box	original super tin name	existing Super Tins

name of the Super Tin to be modified.

Tin colour	colour box	existing super tin colour	available colours

original colour for drawing sections through the Super Tin - this can be modified.

Tin style	line style box	existing Super Tin style	available line styles

original linestyle for drawing sections through the Super Tin - this can be modified.

Exact calculations	tick box		

if ticked, when a Super Tin is created or a tin included in a Super Tin is modified, extra calculations are done for the Super Tin so that is can be used for Exact Volumes and in visualisations.

*If **not ticked**, no extra calculations are done for the Super Tin and it can only be used in options that use sections. For example, end area volumes and site lines.*

Tin Grid

Tin	table		available tins

name of the tin to be included in the Super Tin. The order is critical since the higher number tins take precedence over the lower number tins.

There can be up to 127 tins in a Super Tin.

Mode replace, subtract

Replace

where ever this tin exists, use it instead of any tins of a lower number in the Tin column of the grid.

Subtract

where ever this tin exists, all parts of the tins of a lower number in the Tin column, are removed. So where ever the tin exists, it creates holes in all the tins of a lower number.

An example would be a tin that is the position of many gully pits. Using this tin in subtract *mode will punch holes in all the tins of a lower number in the Tin column. So in effect, it does a nulling that also nulls parts of triangles from the tins of a lower number.*

Active

if yes*, the tin is included in the Super Tin.*

If no, the tin is not included in the Super Tin. So the tin can be taken out of the Super Tin without having to remove it from the Tin list.

Update button

update the Super Tin definition with the information in the above panel fields.

16.6.3 Recalc Super Tin

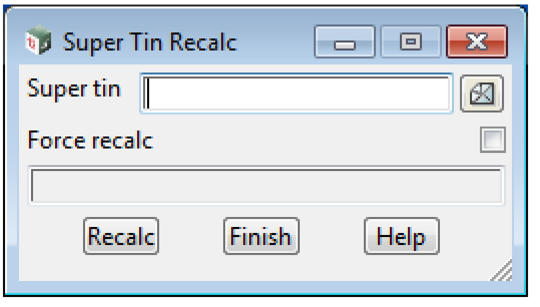
Position of option on menu: **Tins =>Edit =>Recalc supertin**

This option gets a super tin that has **Exact calculations** ticked on, to recalculate itself.

That is, the super tin updates all the interfaces with its component tins if there were any changes to the component tins.

The option can be used in a Chain.

Selecting **Edit=> Recalc supertin** displays the **Super Tin Recalc** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super tin	super tin box		existing Super Tins

name of the Super Tin to be recalculated.

Force recalc	tick box		

if ticked and **Exact calculations** *is ticked on for the super tin, a recalc of the super tin is done.*
If not ticked and **Exact calculations** *is ticked on for the super tin, a recalc of the super tin is only done if the super tin believes it is necessary.*

If **Exact calculations** *is not ticked on for the super tin, then no recalc occurs.*

Recalc	button		

recalculates the super tin.

16.6.4 Edit Tin Function

Position of option on menu: **Tins =>Edit =>Function**

The **edit=>function** option is used to edit a tin function.

On selecting the **function** option, the **retriangulate function** panel is displayed which is the same as for the option **Tins =>Create =>Function** (see 16.5.3 Function).

16.6.5 Retriangulate

Position of option on menu: **Tins =>Edit =>Retriangulate**

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The **retriangulate** option is used to recreate the tin from the same models and settings.

The **retriangulate** menu item operates two ways.

(a) The **retriangulate** walk-right brings up the **tins** menu which is a list of all the existing tins.

By choosing one of the tins from the **tins** menu, the tin is retriangulated.

(b) If **retriangulate** itself is activated (by clicking LB when **retriangulate** is highlighted), the **retriangulate tin** panel appears. The **retriangulate tin** panel can be used to modify the tin definition and retriangulate the tin.

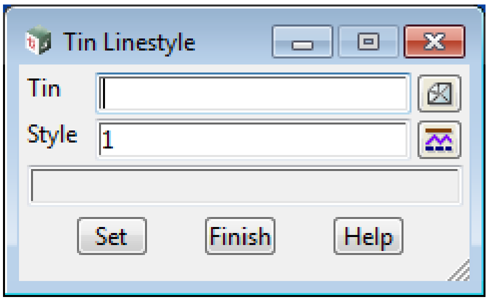
16.6.6 Style

Position of option on menu: **Tins =>Edit =>Style**

When a tin is created, it is given a linestyle (the tin linestyle) which is used for drawing the tin whenever it is profiled on a section view or plotted in long and cross section plots.

The **style** option is used to modify the tin linestyle.

On selecting the **style** option, the **tin linestyle** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to modify the linestyle of.

Style	linestyle box	1	available linestyles

linestyle for the tin.

Set	button		

set the tin linestyle to that given in the **style** *panel field.*

16.6.7 Render Settings

Position of option on menu: **Tins =>Edit =>Render settings**
Position of option on menu: **Tins =>Visualiation =>Tin render settings**

This option sets blending, texture mappings, raster draping, one/two sides, draping of polygons, text, billboards and images for triangles in a tin. It has already been documented as

Tins =>Visualiation =>Tin render settings

in the section 12.13.1 Tin Render Settings.

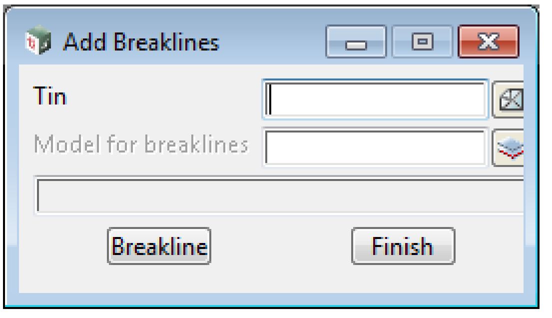
IMPORTANT NOTE: the ***Visualisation*** module is required for the *Tin Render Settings* to be used on a Perspective OpenGL view.

16.6.8 Add Breaklines

Position of option on menu: **Tins =>Edit =>Add breaklines**

This option allows extra breaklines joining existing vertices in the tin to be created. The new breaklines can be added to a model so that the results can be reproduced on a retriangulation.

Selecting **Add breakline** displays the **Add Breaklines** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to add a breakline to.

Field Description	Type	Defaults	Pop-Up
Model for breaklines	model box	1	available models

if non-blank, then as breaklines are created with this option, then the breakline is automatically added to this model so that the breakline modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).

Field Description	Type	Defaults	Pop-Up
Breakline	button		

add a breakline by clicking near the two vertices of the tin that are to be connected by a breakline (cursor snap will do). As each breakline is added, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.

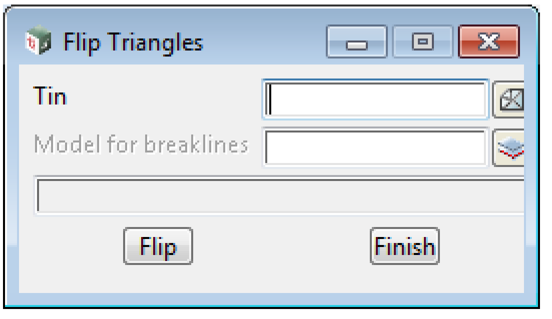
16.6.9 Flip Triangles

Position of option on menu: **Tins =>Edit =>Flip triangles**

This option works on a triangle side and if it is possible, it finds the two triangles with this common side, removes the common side and replaces it with a new common side which joins the non common triangle points in the original triangle. Note that this can't be done when the new side goes outside the two triangles.

A new breaklines can also be automatically added to a model so that the results can be reproduced on a retriangulation.

Selecting **Flip triangles** displays the **Flip Triangles** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to add a breakline to.

Model for breaklines	model box	1	available models

if non-blank, then as triangles are selected and flipped, then breaklines are automatically added to this model so that the flip modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).

Flip	button		

flip a triangle by clicking near the common edge (cursor snap will do). As each flip is done, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.

16.7 Boundary

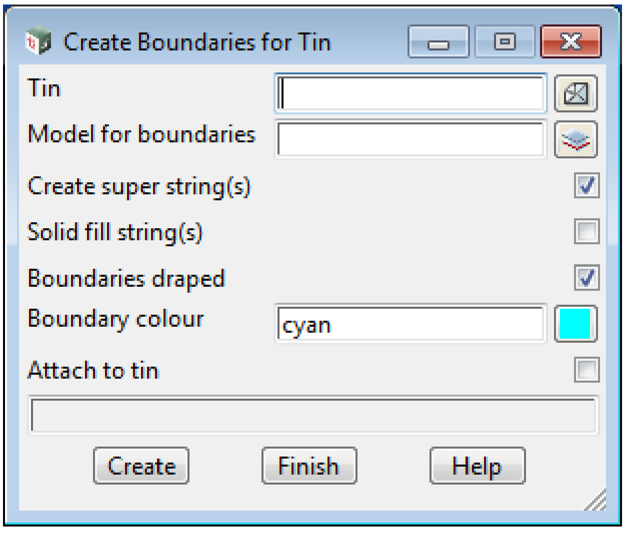
Position of option on menu: **Tins =>Boundary**

The **Boundary** option is used to construct the boundary strings for a tin, i.e. the strings going around the edges between the null and non-null triangles in the tin.

If the tin has holes (internal null regions), then there will be more than one boundary string created.

Often the boundary strings is used as a first step in creating a polygon to be used to null out further triangles not required in the tin.

Selecting **Boundary** displays the **Create Boundaries for Tin** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin (not a super tin) to calculate the boundary strings for.

Model for boundaries	model box		available models

the model to place the boundary strings in.

Create super string(s)	tick box	ticked	

*if **ticked**, the boundary strings are super strings.*

*If **not ticked**, the boundary strings are 3d strings.*

Solid fill string(s)	tick box	not ticked	

*if **ticked**, each of the boundaries is solid filled with the tin colour.*

Boundaries draped	tick box	ticked	

*if **ticked**, the points of the boundary have the z-values from the tin.*

*If **not ticked**, the z-value is set to 1.*

Boundary colour	input	cyan	available colours

the colour for the boundary strings.

Attach to tin	tick box	not ticked	

*if **ticked**, the boundaries are remembered with the tin and when you have the 250M version of*

12d Model and have Model Density turned on, if the density is such that the tin would only be drawn as a red rectangle, the boundaries are drawn instead of the red rectangle.

Create button

create the boundary polygons for the tin.

16.8 Colour

Position of menu: **Tins =>Colour**

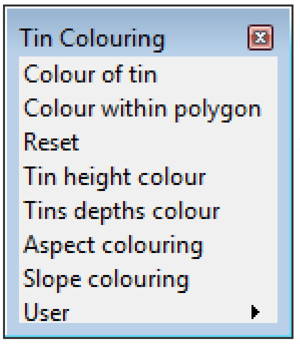
When a tin is created, all the triangles have the same colour (called the tin's **base** colour). This is the colour given by the user when creating the tin with the **Triangulate a Data Source** panel. The ***base*** colour can be changed at any time using the **colour of tin** option.

However, it often necessary to colour specific triangles in some other colour than the base colour. The option **Colour within polygon** is designed to do just that.

When the **Triangles** menu is torn off the main menu, the **Colour** menu item on it operates in two ways:

First, clicking on **Colour** without walking right brings up the **Colour of Tin** panel (see the next section). Secondly, the **Colour** walk-right brings up the **Tin Colouring** menu.

The **Tin Colouring** walk-right menu is



change base colour of tin
colour triangles within a polygon
reset all triangles to base colour
colour height ranges
colour depth ranges between two tins
colour aspect ranges
colour slope ranges

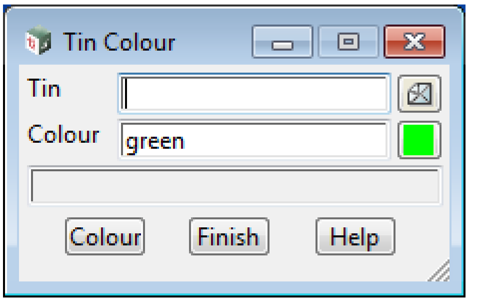
For the option *Colour of tin*, go to	16.8.1 Colour of Tin.
Colour within polygon	16.8.2 Colour Within Polygon
Reset	16.8.3 Reset
Tin height colour	16.8.4 Tin Height Colour
Tins depths colour	16.8.5 Tins Depths Colour.
Aspect colouring	16.8.6 Aspect Colouring.
Slope colouring,	16.8.7 Slope Colouring.

16.8.1 Colour of Tin

Position of option on menu: **Tins =>Colour =>Colour of tin**

A tin is given a base colour when it is originally constructed. The **colour of tin** option allows the user to change the base colour of the tin.

On selecting the **Colour of tin** option, the **Tin Colour** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to have its base colour modified. The tin must exist in 12d Model. When the tin name is entered, the existing colour of the tin is displayed in the **Colour** *panel field.*

Colour	colour box	default tin colour	available colours

the new base colour for the tin given.

Colour	button		

colour all the base triangles with the colour given in the **Colour** *field.*

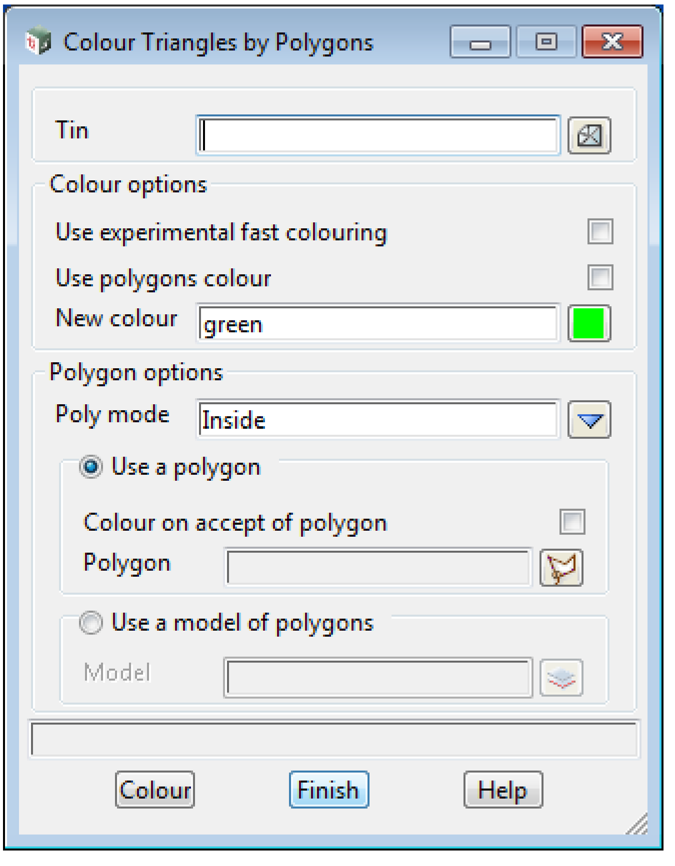
16.8.2 Colour Within Polygon

Position of option on menu: **Tins =>Colour =>colour within polygon**

Although a tin is given a base colour when constructed, it is useful to be able to change the colour of selected triangles. For example, in a design tin with a road and terrain, the road and the terrain could be displayed in different colours. This is particularly effective in shades.

The **colour within polygon** option allows the user to colour all the triangles whose centroids lie inside (or outside) a selected polygon, or for all the polygons in a given model, with either a user specified colour or the colour of each polygon. If a model of polygons is used, the polygons are processed in the order that they occur in the model. The option can be applied any number of times to a tin.

On selecting the **colour within polygon** option, the **colour triangles by polygons** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to have some of its triangles coloured. The tin must exist in 12d Model.

Use experimental fast colouring tick box

*if **ticked**, an experimental fast colouring algorithm is used.*

Use polygons colour tick box

*if **ticked**, the colour of the polygons is used as the colour for the triangles.*

New colour	input	default tin colour	available colours

if **Use polygons colour** *is **not** set to tick, this is the colour to set all the triangles within/out a polygon to.*

Poly mode choice inside inside, outside

*mode to select whether the triangles with centroids **inside** or **outside** the selected polygons are to be coloured.*

Use a polygon tick box

*if **ticked**, then individual polygons are selected and the tin coloured within them.*

Colour on accept of polygon tick box

*if **ticked**, then the colouring is done as soon as a polygon is accepted.*

Polygon polygon select string pop-up

this is used to
(a) select an individual string to use as a polygon for colouring
(b) dynamically define a rectangle to use as a polygon for colouring
(c) dynamically define a parallelogram to use as a polygon for colouring
(d) dynamically define a lasso to use as a polygon for colouring
(e) edit a string already selected with the polygon select
(f) get information on a string already selected with the polygon select
(g) delete a string already selected with the polygon select
(h) clear any selection already made by the polygon select
(i) toggle on/off the checks made the string selected by the polygon select

Use a model of polygons tick box

*if **ticked**, then all the polygons in the given model are used for colouring.*

Model model box available models

model of polygons which are used for selecting triangles to be coloured. Colour happens when the **Colour** *button is selected.*

Colour button

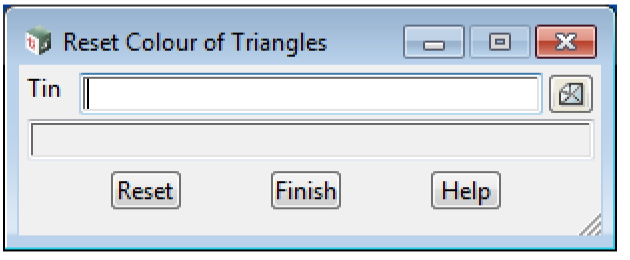
for a model of polygons, each string in the **Model of polygons** *is used to colour the triangles in the tin given in the* **tin** *field. If* **Colour on accept of polygon** *is off, colour within the selected string.*

16.8.3 Reset

Position of option on menu: **Tins =>Colour =>Reset**

The **reset** option is used to change all the non base-coloured triangles in a tin back to the base colour.

On selecting the **reset** option, the **reset colour of triangles** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to have any non base-coloured triangles reset to the base colour. The tin must exist in 12d Model.

Reset	button		

change any selectively coloured triangles back to the base colour.

16.8.4 Tin Height Colour

Position of option on menu: **Tins =>Colour =>Tin height colour**

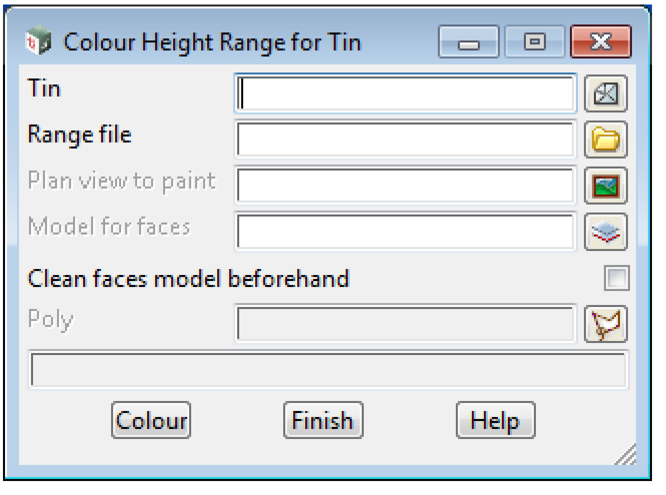
The **tin height colour** option is used to calculate height bands for the tin and colour a view and/or create faces for the height bands. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated heights and colours are given in a user supplied height range file. A plan view can be temporarily coloured on the height basis using the **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the height range file, see 8.9.6 Height Range File.

Selecting **Tin height colour** displays the **Colour Height Range for Tin** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to calculate the height ranges of the triangles and colour a view.

Range file	height range file box		*.hrf

the user supplied range file is used to give the colour ranges for heights of the tin. See 8.9.6 Height Range File.

Plan view to paint	view box		available views

if non-blank, the given plan view will be painted according to the range colours given in the range file.

Model for faces	model box		available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

Clean faces model beforehand tick box

if ticked, the model of faces is cleaned out before the option runs.

Poly polygon-select

if selected, this string is used as the bounding polygon for the height calculations.

Colour button

On selecting this button, the heights of the triangles of the tin within the selected bounding polygon are *calculated.*

<esc> can be used to terminate the option during height calculations.

16.8.5 Tins Depths Colour

Position of option on menu: **Tins =>Colour =>Tin depths colour**

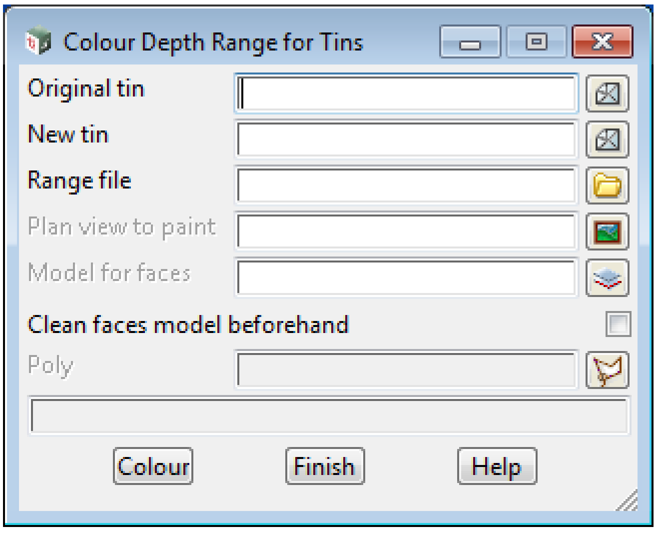
The **Tins depths colour** option calculates colour bands for the ***depths*** between two tins, and colours a view and/or create faces. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the common portions of the tins are used.

The calculated depths and colours are given in a user supplied depth range file. A plan view can be temporarily coloured on the depth basis using the **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the depth range file, see 8.9.4 Depth Range File.

On selecting the **Tins depths colour** option, the **Colour Depth Range for Tins** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin	tin box		available tins

name of the original/new tin to colour depths between. Cut is when the new tin is below the original tin.

Range file	depth range file box		*.drf

the user supplied depth range file is used to give the colour ranges for depths. See 8.9.4 Depth Range File.

Plan view to paint	input		available views

if non-blank, the given plan view will be painted according to the range colours given in the range file.

Model for faces	input		available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

Clean faces model beforehand tick box

if tick, the model of faces is cleaned out before the option runs.

Poly polygon-select

if selected, this string is used as the bounding polygon for the depth calculations.

Colour button

colour the depths between the tins within the selected bounding polygon.

<esc> can be used to terminate the option during depth calculations.

16.8.6 Aspect Colouring

Position of option on menu: **Tins =>Colour =>Aspect colouring**

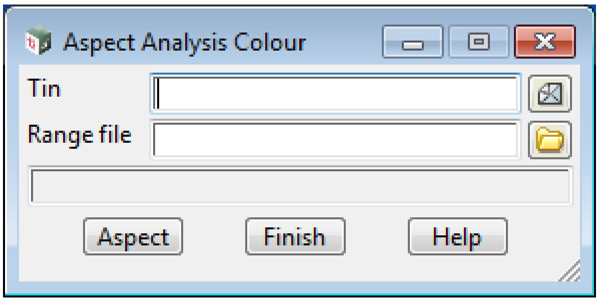
The **aspect colouring** option is used to colour the triangles according to the aspect (direction) of the triangles in the tin. An *aspect range file* is used to define the colour ranges.

Note that the actual colours of the triangles are changed - not a face model produced.

For more information on the aspect range file, see 8.9.5 Aspect Range File.

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the **Aspect colouring** option, the **Aspect Analysis Colour** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin for which the aspects of the triangles will be calculated and then the tin coloured.

Range file	aspect range file box		*.arf

the user supplied range file is used to give the colour ranges for aspects to use to colour the triangles. See 8.9.5 Aspect Range File.

Aspect	button		

On selecting this button, the aspects of the triangles of the tin are calculated and the triangle coloured according to the range file.

<esc> can be used to terminate the option during aspect calculations.

16.8.7 Slope Colouring

Position of option on menu: **Tins =>Colour =>Slope colouring**

The **Slope colouring** option is used to colour the triangles in the tin according to the slope of the triangles. A slope range file is used to define the colour ranges.

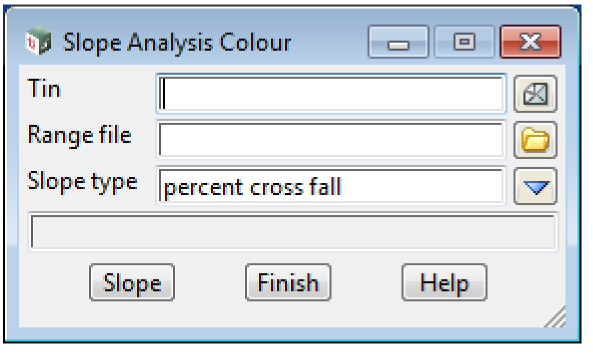
Note that the actual colours of the triangles are changed - not a face model produced.

For more information on the slope range file, see 4.24 Defaults.

The values can be percent cross fall, “1v in” slope or degrees (in 12d Model dms format).

The range_colour is used to colour all triangles in the tin satisfying the range.

On selecting the **Slope colouring** option, the **Slope Analysis Colour** panel is displayed.



The fields and buttons used in this panel have the following functions.

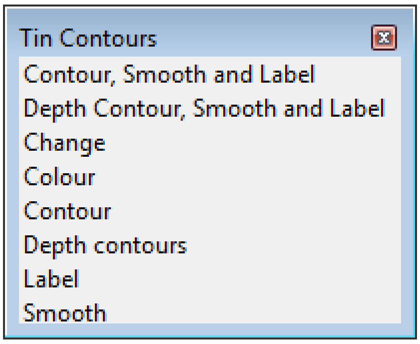
Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
name of the tin for which the slope of the triangles will be calculated and then the tin coloured.			
Range file	slope range file		*.srf
the user supplied range file is used to give the colour ranges for slopes to use to colour the triangles. See 4.24 Defaults.			
Slope type	input	percent cross fall	percent cross fall, degrees, 1v in
the units used for slope in the range file.			
Slope	button		
On selecting this button, the slopes of the triangles of the tin are calculated and coloured according to the slope range file.			

<esc> can be used to terminate the option during aspect calculations.

16.9 Contour

Position of menu: **Tins =>Contour**

The **Tin Contours** walk-right menu is



create, smooth and label contours
create depth contours and also label and smooth them
change colour/model
colour contours using a height range file
create contours
create depth contours
label contours
smooth contours

For the option *Contour, smooth and label*, go to	16.9.2 Contour, Smooth and Label
Depth Contour, Smooth and Label	16.9.3 Depth, Contour and Label Function
Change	16.9.4 Change Contours
Colour	16.9.5 Colour
Contour	16.9.6 Contour
Depth contours	16.9.7 Depth Contours
Label	16.9.8 Label Contours
Smooth	16.9.9 Smooth

For information on creating contours, go to the section 16.9.1 Creating, Smoothing and Labelling Contours.

16.9.1 Creating, Smoothing and Labelling Contours

Creating Contours

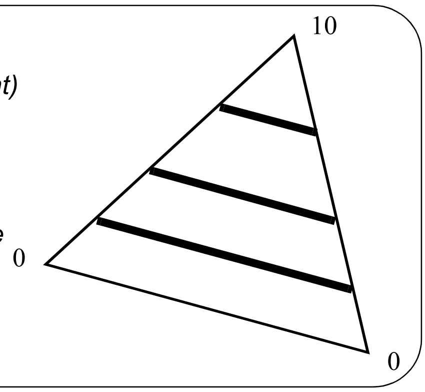
Contours (or level lines) for a surface are the strings of constant height. Contours are often produced on maps and labelled with the height of the contours.

A 12d Model tin represents a surface in three dimensions and there is an option in 12d Model for producing the contours for the tin.

For a triangle in three dimensions, a string of constant height is actually a straight line across the triangle and the contour lines of different heights for a triangle are parallel lines.

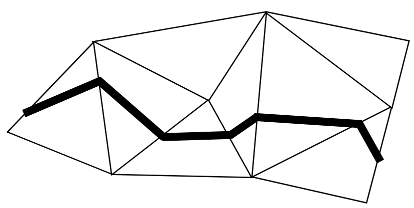
Contours (lines of equal height) on the triangle with heights 0, 0 and 10 at the triangle vertices.

The contours for a the triangle are parallel lines.



Because triangles in a tin have common sides, a contour of a given height for one triangle will connect to the contour of the same height in an adjacent triangle.

So the contour lines on adjacent triangles join up to form continuous contour strings, each segment of which is straight across a triangle.



Contour lines on adjacent triangles in a tin join up to form a continuous contour string.

The contours for a tin lie on the surface of the tin.

The options to create contours in 12d Model has five parameters to define which contours are calculated. They are the

minimum contour value
maximum contour value
contour increment
contour reference
bold increment

The elevation range over which the contours are to be produced is defined by the minimum and maximum contour values. If the minimum (maximum) value is not specified, the tin minimum (maximum) z-value is used.

The increment between successive contours is given by the contour increment.

For example, if contours are required every two metres from 100.0 metres to 200.0 metres, the parameters needed are

contour minimum = 100.0
contour maximum = 200.0
contour increment = 2.0

This would be sufficient information to produce the contours

100.0, 102.0, 104.0... 198.0, 200.0.

However, 12d Model also provides a parameter to allow the following contours to be produced

101.0, 103.0, 105.0 .... 197.0, 199.0

For this and similar cases, the ***contour reference*** value is used.

When a contour reference value is specified, all the contour increments are taken from the contour reference value.

In the first example, the contour reference value is the default value of 0.0. In the second example, the contour reference value is 1.0.

If **major (**or **bold** or **index**) contours are required, the major contour increment is given a non-zero value. Major contours will be drawn at the integer multiples of the major increment instead of the standard contours.

For information on **labelling contours**, go to the section Labelling Contours.

For information on **smoothing contours**, go to the section Smoothing Contours.

Smoothing Contours

If the triangles in a tin, or sections of a tin, are large then the contours for that section of the tin may appear angular. Consequently some people like to **smooth** the contours to take out the angularity.

Be careful of smoothing because smoothing of contours produces strings that no longer sit on the triangulation.

12d Model smooths contours by apply a smoothing algorithm to each of the contour strings that were produced from the triangulation.

Two smoothing algorithms are available

(a) Preserve string points - this method ensures that the smoothed contour goes through all the vertices from the original contour string.

(b) Don’t preserve string points - this method does not have to include the vertices from the original contours in the smoothed contour.

For information on **creating contours**, go to the section Creating Contours.

For information on **labelling contours**, go to the section Labelling Contours.

Labelling Contours

12d Model labels contours by placing text labels at user controlled distances along the contour string.

The position and frequency of the contour labels along a contour string is controlled by two parameters, the *start distance* and the *separation distance*.

The first contour label is placed at a chainage distance of *start distance* from the beginning on the contour and the labels are repeated at a chainage distance of *separation distance* from the previous contour label.

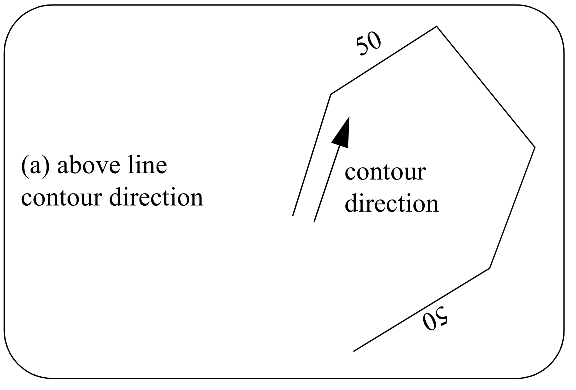
There is also a parameter to specify that contours are to be labelled at the start and the end regardless of the *start distance* and *separation distance*.

The number of decimal places used for the contour label is also user specified.

12d Model has seven methods for positioning the contour labels. They are the

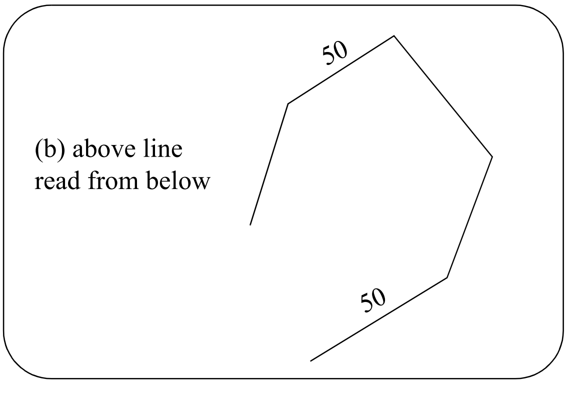
(a) above line contour direction

contour labels are created with the text parallel to the contours line and in the same direction as the contour string. The text is raised slightly above the contour string.



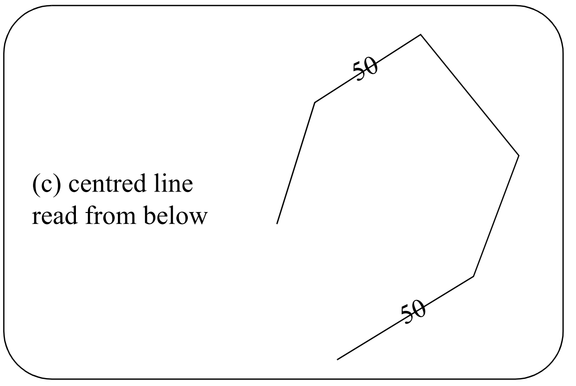
(b) above line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is raised slightly above the contour string.



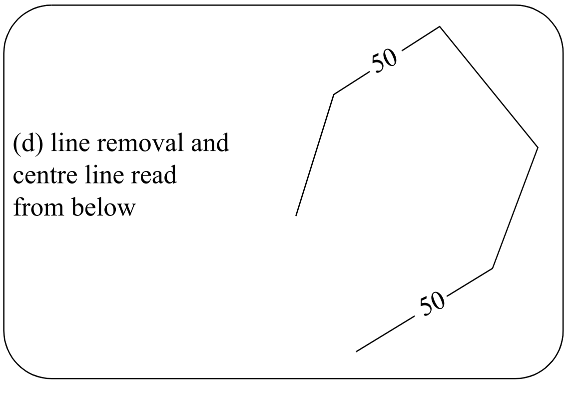
(c) centre line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is centred on the contour string so the contour string goes through the text.



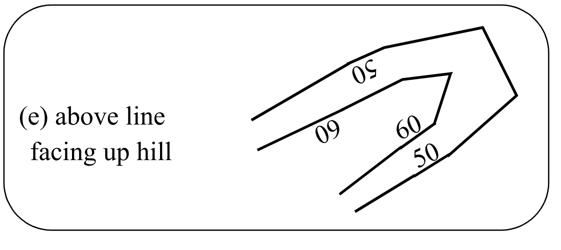
(d) line removal & centred line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and +90 degrees. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.



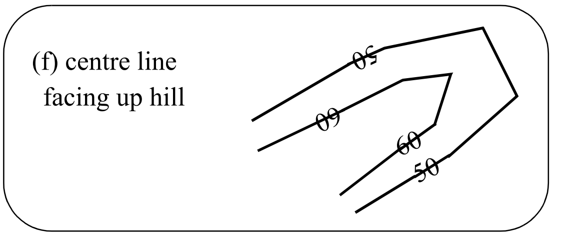
(e) above line facing up hill

contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that if faces uphill. The text is raised slightly above the contour string.



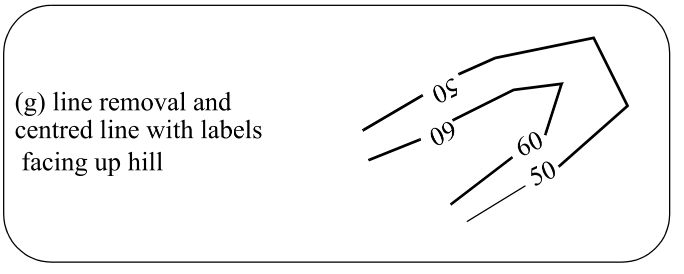
(f) centre line facing up hill

contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that if faces uphill. The text is centred on the contour string so the contour string goes through the text.



(g) line removal & centred line facing up hill

contour labels are created with the text parallel to the contour line. The text is orientated so that if faces uphill. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.



For information on **creating contours**, go to the section Creating Contours.

For information on **smoothing contours**, go to the section Smoothing Contours.

16.9.2 Contour, Smooth and Label

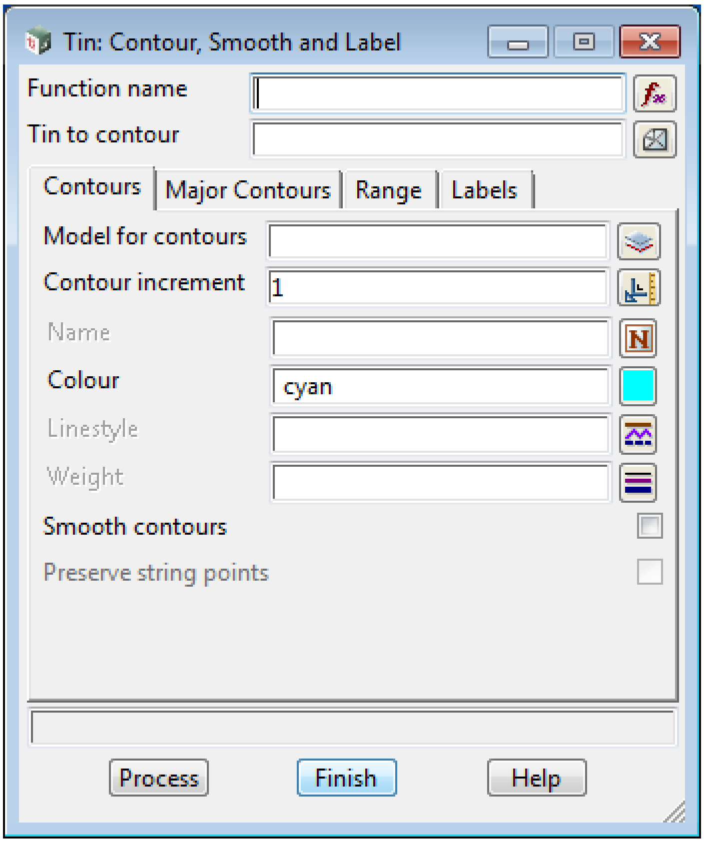
Position of option on menu: **Tins =>Contour =>Contour, smooth and label**

One method of visualizing tin data is with contours. In 12d Model, contour strings can be produced over any user defined elevation range and at any interval.

This option creates contours and can also smooth and label them. It is a function and so if a function is re-run it will remove any data from its last run.

For more information on contouring, smoothing and labelling in 12d Model, go to the section Creating Contours

Selecting **Contour, smooth and label** displays the **Contour, Smooth and Label** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		available contour fns

name of the contour, smooth and label function.

Tin to contour	input		available tins

name of the tin to be contoured.

Contours tab

Model for contours	model box		available models

name of the model to place the contours in.

Contour increment	input	1.0	

increment between contoured values.

Name input

if non-blank, name to give the contour strings.

Colour input cyan available colours

colour of the contours

Linestyle input 1 available linestyles

linestyles for the contour strings.

Weight input

if non-blank, weight to give the contour strings.

Smooth contours tick box

if ticked, the contours are smoothed.

Preserve string points tick box

if ticked, then the smoothed string goes through the original vertices of the non smoothed contour strings.
If not ticked, then the smoothed strings do not have to include the vertices from the non-smoothed contours.

Major Contours tab

Create major contours tick box

if ticked, then major contours can be given a different name, colour, style, weight and model.

Model for major contours model box available models

if non blank, the name of the model to place the major contours in. If blank, the same model is used as for the ordinary contours.

Major contour increment input 5.0

increment for the major contours.
If blank or zero, then no bold contours are drawn. If non-zero, it must be an integer multiple of the contour increment.

Name input

if non-blank, name to give the major contour strings. If blank, the same name is used as for the ordinary contours.

Colour input off yellow available colours

colour of the major contours. If blank, the same colour is used as for the ordinary contours.

Linestyle input 1 available linestyles

if non blank, linestyles for the major contour strings. If blank, the same linestyle is used as for the ordinary contours.

Weight input

if non-blank, weight to give the major contour strings. If blank, the same weight is used as for the ordinary contours.

Range tab

Contour minimum input

minimum value of the z range to be contoured. If blank, the tin's minimum z-value is used.

Contour maximum input

maximum value of the z range to be contoured. If blank, the tin's maximum z-value is used.

Contour reference input 0

reference value for the contour increments.

Colour by range tick box

if ticked, then the contours are coloured according to a height range file rather than bold colour. See 8.9.6 Height Range File.

Height range file height range file box *.hrf

the range file used to colour the contours.

Interpolate colours tick box

*if **ticked**, the colour of the contour will be interpolated between the colour for the range and the colour for the next range in the height range file.*
*If **not ticked**, all contours in the same range in the height range file will have the same colour*

Colour text labels tick box

if ticked, then any contour height text is also coloured the same colour as the contour.

Labels tab

Label contours tick box

if ticked, then the contours are labelled.

Label major contours only tick box

if ticked, then only the major contours are labelled.

Model for labels model box available models

if non blank, the name of the model to place the contour labels in. If blank, the same model is used as for the contours.

Contour method choice box above line contour direction
above line read from below
centred line read from below
line removal and centred line read from below
above line facing uphill
centred line facing uphill
line removal & centred facing uphill

For information on each of the methods of labelling contours, go to the section Labelling Contours.

Decimal places

number of decimal places used in the contour label.

Textstyle data 1 textstyle favourites

textstyle information to use for the contour labels.

Start dist (w) input 0

chainage distance to the first label on the string - world units

Separation (w) input 250

chainage interval between the labels - world units

Model of label lines model box available models

if non blank then instead of using the **start distance** *and* **separation** *parameters to define where the contour labels are placed, the* **Model of label lines** *is used. In this case, a label is created where ever s string in the* **Model of label lines** *cuts a contour.*

Label start and end tick box tick

if ticked, the start and end of the contours are labelled regardless of the values of start distance and separation.

Process button

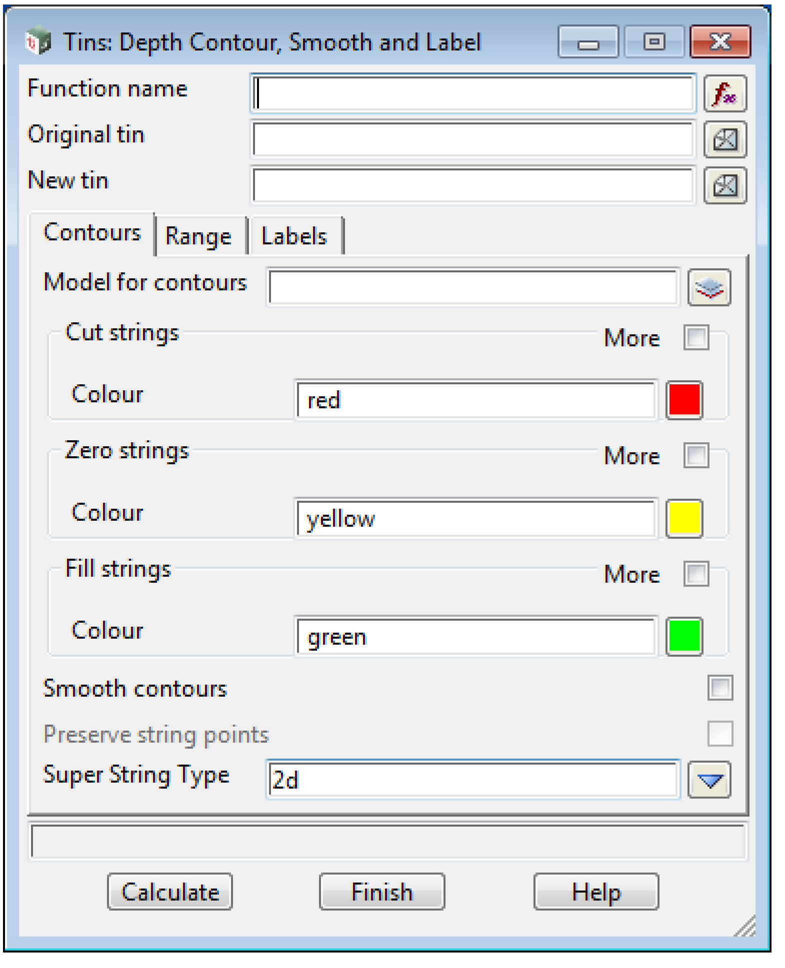
contour, smooth and label the tin given in the **tin** *field and place the contours in the model given in the model field.*

16.9.3 Depth, Contour and Label Function

This function allows the user to create depth contours and also label and smooth them.

Position of option on menu: Tins =>Contour =>Depth contour, smooth and label

Selecting **Depth contour, smooth and label** displays the **Tins: Depth Contour, Smooth and Label** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		available depth contour fns

name of the depth contour, smooth and label function.

Original/New tin	tin box		available tins

name of the original/new tin to contour between. Cut is when the new tin is below the original tin.

Contours tab

Cut/Zero/Fill strings sections

More	tick box	not ticked	

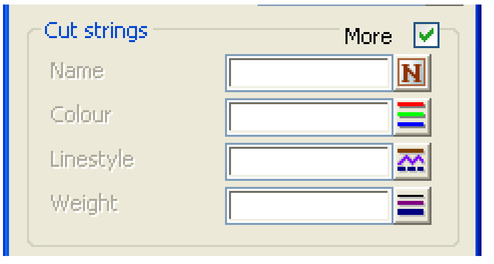
*if **not tick** then only the Colour panel field is displayed.*

*If **not ticked** then the extra fields **Name**, **Colour**, **Linestyle** are **Weight** are shown.*

Colour	colour box	cyan	available colours

*if **non-blank**, colour for the strings*

*If **More** is ticked then Name, Colour, Linestyle and Weight fields are displayed*



Name	name box		available names

*if **not blank**, name to give the cut/zero/fill strings.*

Colour	colour box	cyan	available colours

*if **not-blank**, colour for the cut/zero/fill strings*

Linestyle	linestyle box	1	available linestyles

*if **not blank**, linestyles for the cut/zero/fill strings.*

Weight weight box

*if **not blank**, weight to give the cut/zero/fill strings.*

Smooth contours tick box

*if **ticked**, the contours are smoothed.*

Preserve string points tick box

*if **ticked**, then the smoothed string goes through the original vertices of the non smoothed contour strings.*
*If **not ticked,** then the smoothed strings do not have to include the vertices from the non-smoothed contours.*

Super string type	choice box	2d	2d, 3d original, 3d new

*If **2d**, the created strings are 2d super strings with a z-value equal to the depth.*
*If **3d original**, the depth strings are draped over the original tin to form 3d super strings*
*If **3d new**, the depth strings are draped over the new tin to form 3d super strings.*

Range tab

Start level	real box	-10

the minimum depth to start the depth contours at.

End level	real box	10

the maximum depth to calculate the depth contours to.

Interval	real box	1

the interval between the depth contours.

Colour by range tick box

if ticked, then the contours are coloured according to a depth range file rather than cut and fill colours. See XX.

Depth range file	depth range file box		*.drf

the range file used to colour the depth contours.

Interpolate colours tick box

*if **ticked**, the colour of the contour will be interpolated between the colour for the range and the colour for the next range in the height range file.*
*If **not ticked**, all contours in the same range in the height range file will have the same colour*

Colour text labels tick box

if ticked, then any contour value text is also coloured the same colour as the contour.

Labels tab

Label contours tick box

if ticked, then the depth contours are labelled.

The text is given the z value of XX

Model for labels model box available models

if non blank, the name of the model to place the contour labels in. If blank, the same model is used as for the contours.

Label method choice box above line contour direction
above line read from below
centred line read from below
line removal and centred line read from below

For information on each of the methods of labelling contours, go to the section XX.

Decimal places

number of decimal places used in the contour label.

Textstyle data 1 textstyle favourites

textstyle information to use for the contour labels.

Start dist (w) real box 0

chainage distance to the first label on the string - world units

Separation (w) real box 250

chainage interval between the labels - world units

Model of label lines model box available models

if non blank then instead of using the **start distance** *and* **separation** *parameters to define where the contour labels are placed, the* **Model of label lines** *is used. In this case, a label is created where ever s string in the* **Model of label lines** *cuts a contour.*

Label start and end tick box tick

if ticked, the start and end of the contours are labelled regardless of the values of start distance and separation.

Button at bottom

Calculate button

generate, smooth and label the depth contours between the two tins

16.9.4 Change Contours

Position of option on menu: **Tins =>Contour =>Change**

The **Change** option is for changing the model and/or colour of contours with a given height interval.

The main purpose of the option is to separate contours to be used as index contours from other contours. For example, when contours are supplied by a third party and all the contours are in the same model with the same colour, **change contour colour** can move contours to be used as index contours to a different model and give them a different colour.

For this option the selection process for a Data source is extended.

After the data is selected as defined by the Data source, the two extra parameters, **interval** and **reference**, are used to further specify which contours are to be moved and/or coloured.

Only contour strings whose heights satisfy

height = reference + integer * interval

are selected.

For example, if the contours 5, 10, 15 etc. are required, the reference and interval would be

reference = 0

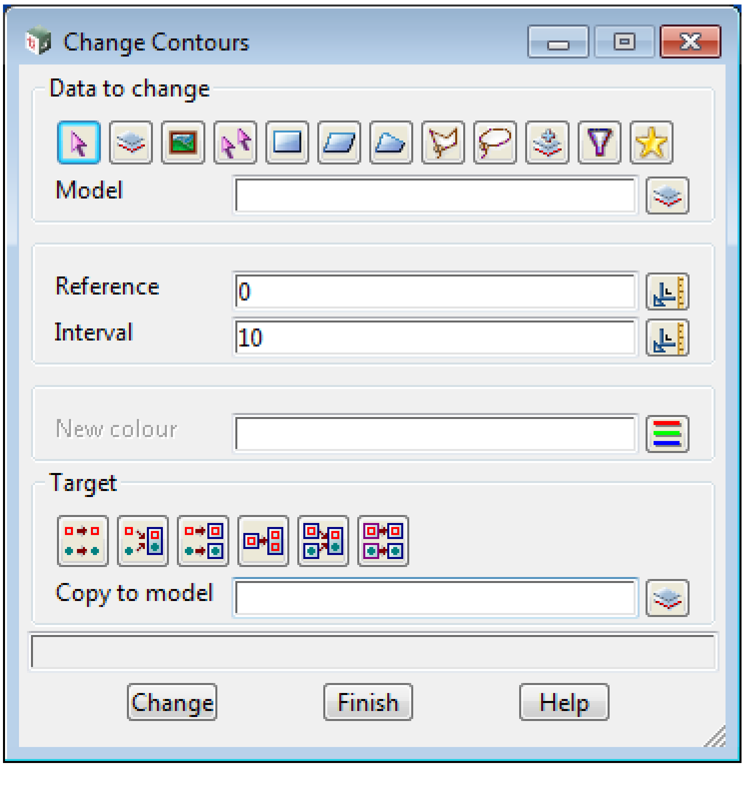
interval = 5

However, to modify the contours 6, 11, 16 etc., the required parameters are

reference = 1

interval = 5

Selecting **Change** displays the **Change Contours** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Reference	input	0	

the reference value to use to select contours.

Interval	input	10	

the interval to use to select contours.

New colour	input		available colours

if non-blank, then the colour of the selected strings will be changed to the colour given in the **New colour** *field.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info	input		

extra information required for the target.

Change	button		

process the selected strings

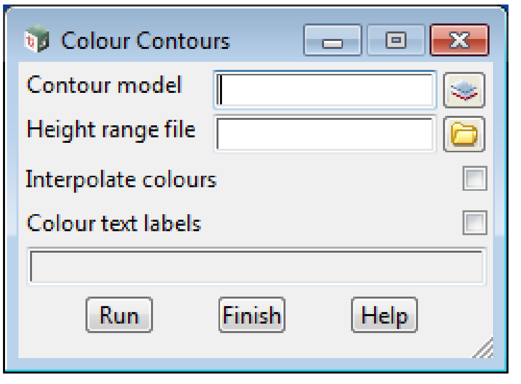
16.9.5 Colour

Position of option on menu: **Tins =>Contour =>Colour**

The **Colour** option is used to colour contours in a model according to a selected height range file.

For more information on the height range file, see 8.9.6 Height Range File.

On selecting **Colour**, the **Colour Contours** panel is displayed.



The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Contour model	model box		available models

model of contours to colour

Height range file	height range file box		.hrf files

height range file to specify the colour of the contour. See 8.9.6 Height Range File.

Interpolate colours	tick box		

*if **ticked**, the colour of the contour will be interpolated between the colour for the range and the colour for the next range in the height range file.*
*If **not ticked**, all contours in the same range in the height range file will have the same colour*

Colour text labels	tick box	tick	

*if **ticked**, any text labels in the model will also be coloured.*

Run	button		

colour the contours and text according to the height range file.

16.9.6 Contour

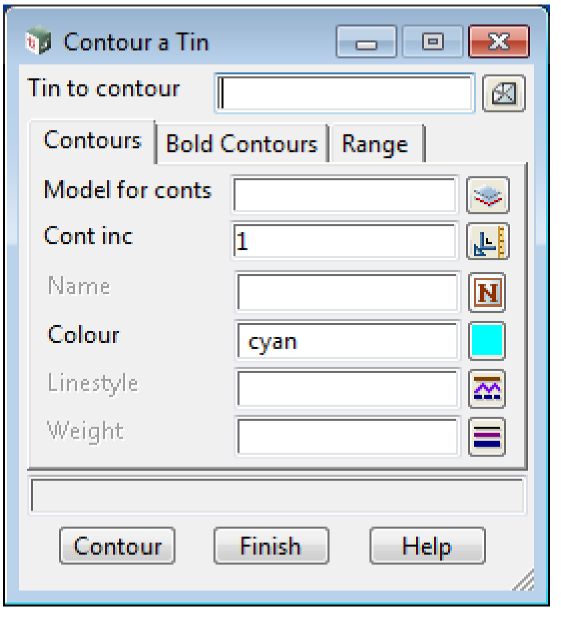
Position of option on menu: **Tins =>Contour =>Contours**

One method of visualizing tin data is with contours. In 12d Model, contour strings can be produced over any user defined elevation range and at any interval.

For more information on contouring in 12d Model, go to the section Creating Contours

The **contour** option can be applied to a tin any number of times. This may be necessary if the contour parameters vary over the total range to be contoured.

On selecting the **contour** option, the **contour a tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to contour	tin box		available tins

name of the tin to be contoured.

Contours tab

Field Description	Type	Defaults	Pop-Up
Model for conts	model box		available models

name of the model to place the contours in.

Cont inc	input	1.0	

increment between contoured values.

Name	input		

if non-blank, name to give the contour strings.

Colour	colour box	cyan	available colours

colour of the contours

Linestyle	linestyle box	1	available linestyles

linestyles for the contour strings.

Weight	weight box		

if non-blank, weight to give the contour strings.

Bold Contours tab

Model for bolds model box available models

name of the model to place the bold contours in. If blank, the same model is used as for the ordinary contours.

Bold inc input 5.0

increment for the bold contours.
If blank or zero, then no bold contours are drawn. If non-zero, it must be an integer multiple of the contour increment

Name input

if non-blank, name to give the bold contour strings.

Colour colour box cyan available colours

colour of the bold contours

Linestyle input 1 available linestyles

linestyles for the bold contour strings.

Weight input

if non-blank, weight to give the bold contour strings.

Range tab

Cont min input

minimum value of the z range to be contoured. If blank, the tin's minimum z-value is used.

Cont max input

maximum value of the z range to be contoured. If blank, the tin's maximum z-value is used.

Cont ref input 0.0

reference value for the contour increments.

Contour button

contour the tin given in the **tin** *field and place the contours in the model given in the model field. The contour range, contour increment and bold contour increment are used specify which contours are calculated.*

Panel Messages

Progress messages - sent to the panel message area

start contouring
contouring level *z-value*

Completion message - sent to the panel message area

finished contouring - *no.* contours

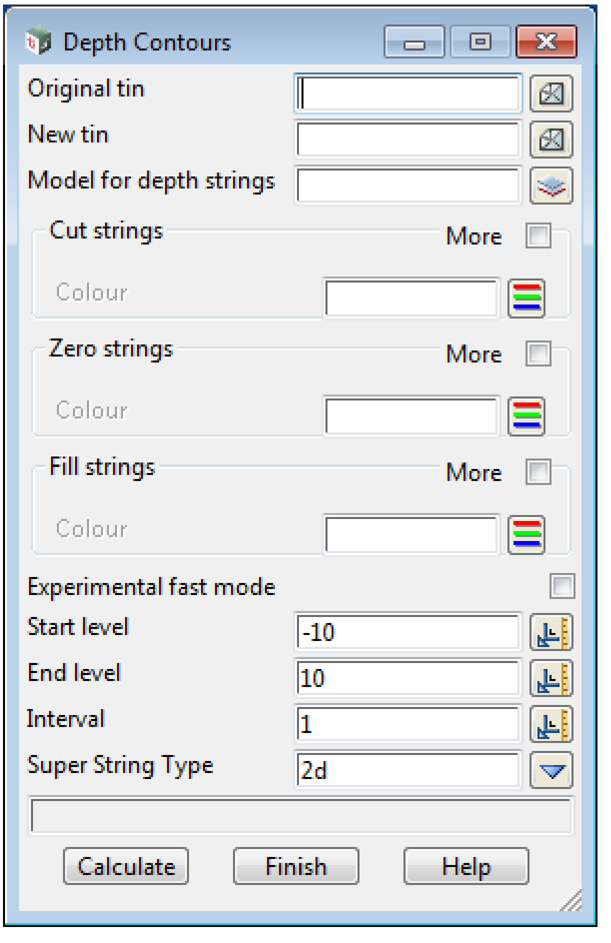
<esc> can be used to abort the calculation of contours.

16.9.7 Depth Contours

Position of option on menu: **Tins =>Contour =>Depth contours**

The **depth contours** option finds the contours lines for the difference between two tins. That is, it calculates the isopachs between the two tins.

Selecting **Depth contours** displays the **Depth Contours** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin	tin box		available tins

name of the original/new tin to contour between. Cut is when the new tin is below the original tin.

Model for depth strings	model box		available models

name of the model to contain the depth strings.

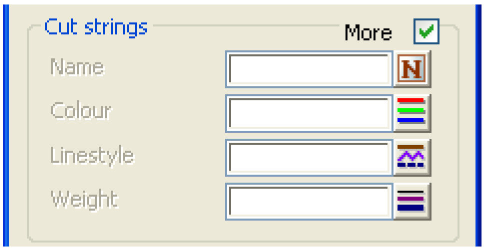
Cut/Zero/Fill strings section **More** tick box

if no tick then only the Colour panel field is displayed

Colour	colour box	cyan	available colours

if non-blank, colour for the strings

if tick then Name, Colour, Linestyle and Weight fields are displayed



Name input

if non-blank, name to give the strings.

Colour colour box cyan available colours

if non-blank, colour for the strings

Linestyle linestyle box 1 available linestyles

linestyles for the strings.

Weight weight box

if non-blank, weight to give the strings.

Start level input -10

the minimum depth to start the depth contours at.

End level input 10

the maximum depth to calculate the depth contours to.

Interval input 1

the interval between the depth contours.

Super string type choice box 2d 2d, 3d original, 3d new

*If **2d**, the created strings are 2d strings with a z-value equal to the depth.*
*If **3d original**, the depth strings are draped over the original tin to form 3d strings.*
*If **3d new**, the depth strings are draped over the new tin to form 3d strings.*

Calculate button

calculate the depth contours between two tins given in the panel fields. The resulting strings are added to the model given in the **Model for depth strings** *field.*

16.9.8 Label Contours

Position of option on menu: **Tins =>Contour =>Label**

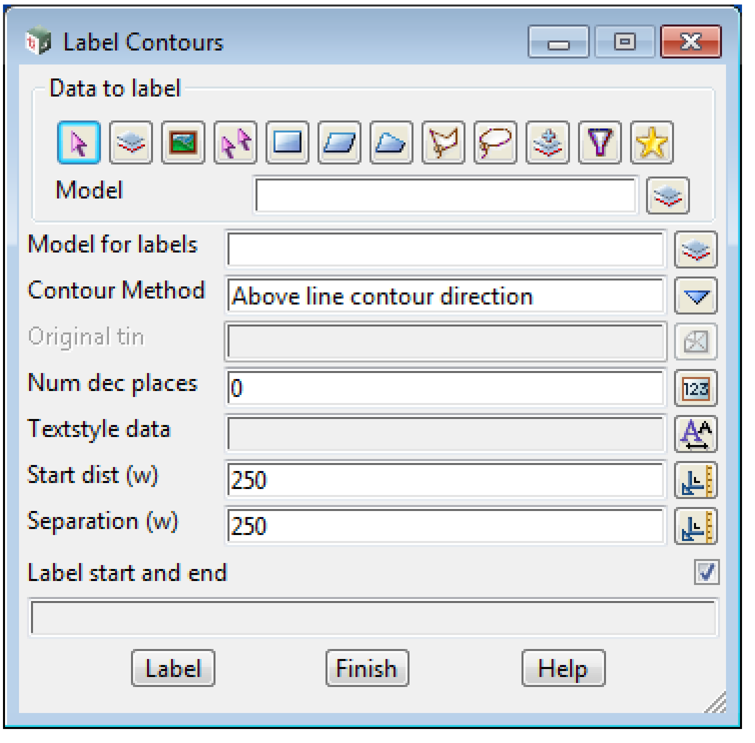
The **label contours** option can be used to label individual contour (2d) strings, or all the contour strings in a model.

The user has control over the label size, colour, number of decimal places, the distance between the labels and the distance to the first label on a string (start distance).

Note - this option cannot label fast contours. Contours strings must already exist or be generated using **Tins => Contour=> Contour, Smooth and Label** or **Tins => Contour=> Contour**

For more information on labelling contours, go to the section Labelling Contours.

On selecting the **label contours** option, the **label contours** panel is displayed.



When the **Label** button is selected, all the contour strings given by the data source field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the **label contours** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Field Description	Type	Defaults	Pop-Up
Data source	input		

source of data is to be triangulated - only Model or View allowed for this option.

Field Description	Type	Defaults	Pop-Up
Model for labels	model box		available models

name of the model to place the contour labels in.

Field Description	Type	Defaults	Pop-Up
Label method	choice box		above line contour direction above line read from below centred line read from below line removal and centred line read from below

above line facing uphill
centred line facing uphill
line removal & centred facing uphill

in all cases, contour labels are created and added to the model Model for contours.

For information on each of the methods of labelling contours, go to the section Labelling Contours.

Original tin	tin box		available tins

only needed for the "facing uphill" methods - name of the tin used to generate the contours. This is needed to calculate which direction is uphill.

Num dec places	input	1	0,1,2,3,4,5

number of decimal places used in the contour label.

Textstyle data	textstyle data box	1	textstyle favourites

textstyle information to use for the contour labels.

Start dist (w)	input	0

chainage distance to the first label on the string - world units

Separation (w)	input	250

chainage interval between the labels - world units

Pick button

if a number of individual contour strings need to be labelled, the pick button is used. After **pick** *is chosen, any strings selected are then labelled using the information in the panel fields. After labelling one string, another pick and label cycle automatically begins.*

The cycle is terminated by clicking RB to raise the **pick ops** *menu and selecting cancel from it.*

Label button

label all the contour strings selected by the "Data to label" data source.

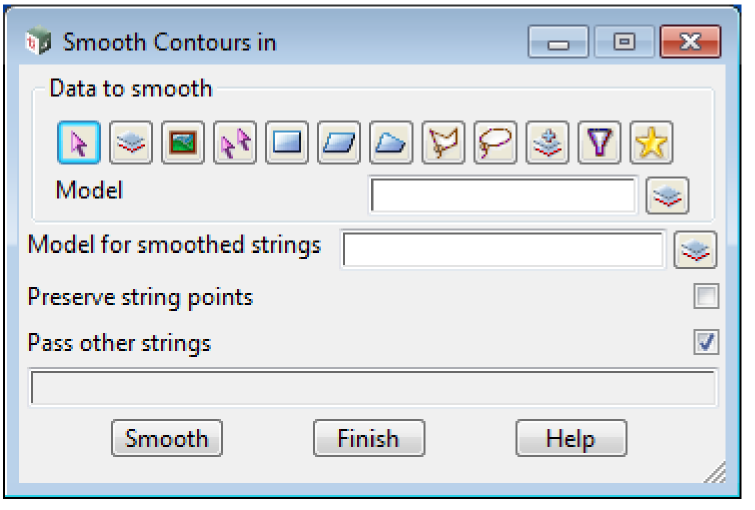
16.9.9 Smooth

Position of option on menu: **Tins =>Contour =>Smooth**

The **smooth** options are used to add extra points into a contour string (2d strings) to make a smoother string.

For more information on labelling contours, go to the section Smoothing Contours.

Selecting **Smooth** displays the **Smooth Contours in** panel.



The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

data source to be smoothed.

Model for smoothed strings	model box		available models

model for the smoothed strings to go to

Preserve string points	tick box		

*if **ticked**, the smoothed contour will still contain all the original points.*
*if **not ticked**, the smoothed contour may deviate from the original string points*

Pass other strings	tick box	tick	

*if **ticked**, any non-contour string is copied and added to the **smoothed strings** model.*

Smooth	button		

smooth the selected contour (2d) strings.

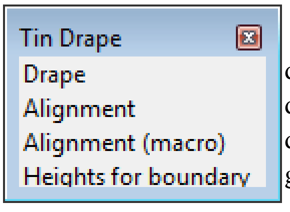
16.10 Drape

Position of menu: **Tins =>Drape**

The **drape** option sections along a string and creates a new 3d-string which sits over the original string in plan view (with line approximations for arcs and spirals) but with z-values taken from a triangulated surface (a tin).

The drape alignment option takes an alignment string and creates a new alignment string with the identical horizontal geometry and vertical intersection points with z-values taken from a tin.

The **tin drape** walk-right menu is



drape strings and produce 3d strings
drape an alignment string and produce an alignment string
drape alignment from V7V1f
give tin heights to a tin boundary

The options in the tin contours menu will now be discussed.

For the option *Drape*, go to 16.10.1 Drape
Alignment 16.10.2 Drape Alignment
Alignment (macro) 16.10.3 Drape Alignment (Macro)
Heights for boundary 16.10.4 Heights for Tin Boundary or Drape Using Closest Tin Node

16.10.1 Drape

Position of option on menu: **Tins =>Drape =>Drape**

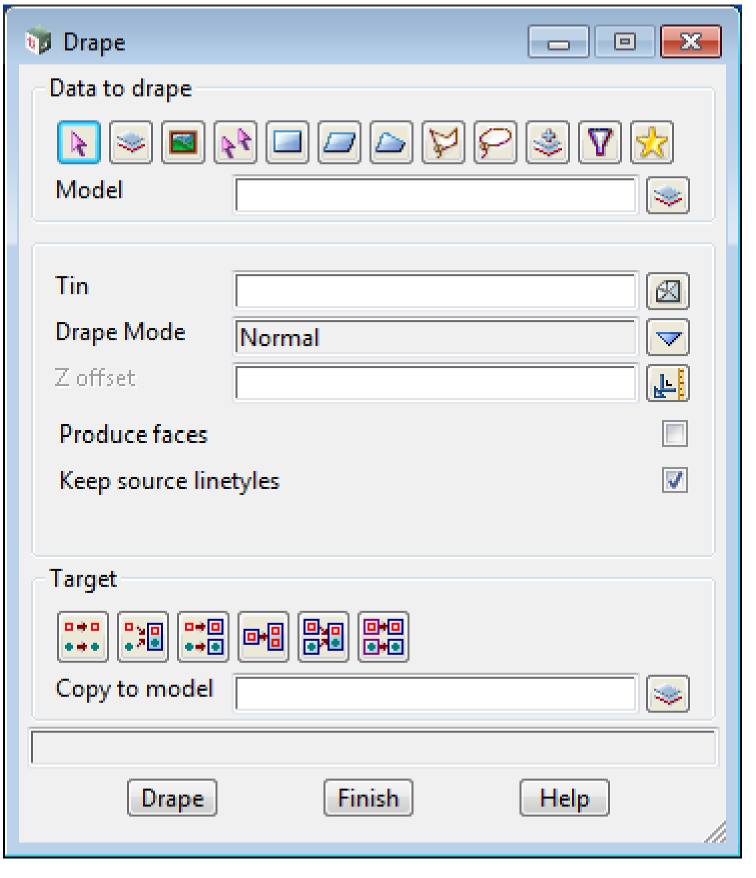
The **drape** operation is simply sectioning along a string.

Draping is a very useful method for attaching a z-value for strings defined in plan only. For example, cadastral information often has only (x,y) co-ordinates. The drape operation could be used to apply z-values to the cadastral information, for example, z-values from the natural surface tin. The draped cadastral information would then sit on the natural surface and could be used effectively in perspective views as well as plan views to delineate properties etc.

The draped strings can also have a z-offset applied so that the draped strings are a constant distance above or below the tin.

Instead of simply producing a section along a string, **drape** can also be used to produce a face for every segment of the string by draping the segment onto the tin and forming a face by perpendicularly connecting the end points of the segment and the draped segment. For example, if the strings represented the tops of buildings, the created faces would be the sides of the buildings down to the terrain.

On selecting **Drape**, the **Drape** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

data to drape.

Tin tin box available tins

name of the tin to drape the strings over.

Drape mode choice box Normal Normal, Vertices only

*if **Normal**, the section through the tin is created.*
*If **Vertices only**, only the z-value from the tin is calculated at the vertices of the strings.*

Z offset real value box

if non-blank, the z-value of all the draped strings is increased by this value.

Produce faces tick-box

*if **ticked**, drape each segment of the string to form faces.*
*If **not ticked**, simply drape the string onto the tin.*

Keep source linestyles tick box

*if **ticked**, the linestyles of the draped strings are the same as the original string that was draped.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

models where the draped strings are placed.

Drape button

drape the strings selected by the "data to drape" data source over the tin given in the tin field.

Note: if faces rather than sections are to be produced, tick on the **produce faces**.

<esc> can be used to abort the drape option.

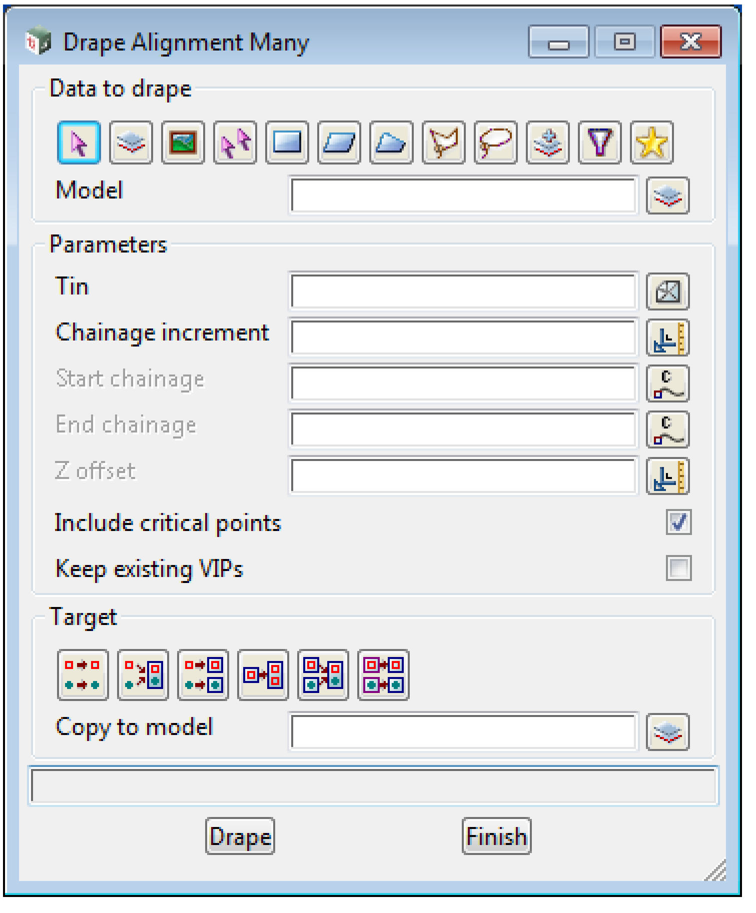
16.10.2 Drape Alignment

Position of option on menu: **Tins =>Drape =>Alignment**

The **Drape alignment** operation takes an alignment/super alignment string and creates a new alignment/super alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

The draped alignments can also have a z-offset applied so that the draped alignments are a constant distance above or below the tin.

On selecting **Alignment**, the **Drape Alignment Many** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data of alignment/super alignment strings to drape.

Tin tin box

triangulation to take z-values from.

Chainage increment input

the chainage interval to create VIP points for. Each created VIP point is given the z-value from the tin and the (x,y) position of the VIP.

Start/End chainage input

*if **non blank**, the chainage range to create VIP's over.*

*If **blank**, use the start/end chainage of the selected string.*

Z offset input

*if **non blank**, the value is added to the z-values from the tin.*

Include critical points tick box tick

if ticked, VIP's are created at the horizontal tangent points.

Keep existing VIPs tick box

if ticked, any existing VIP's outside the given chainage range are kept.

If not ticked, don't create any VIP points outside the chainage range.

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target

Target info input

extra information required for the target.

Drape button

create new alignment/super alignment strings with the same horizontal geometry as the selected strings and the z-value for VIP points taken from the given tin.

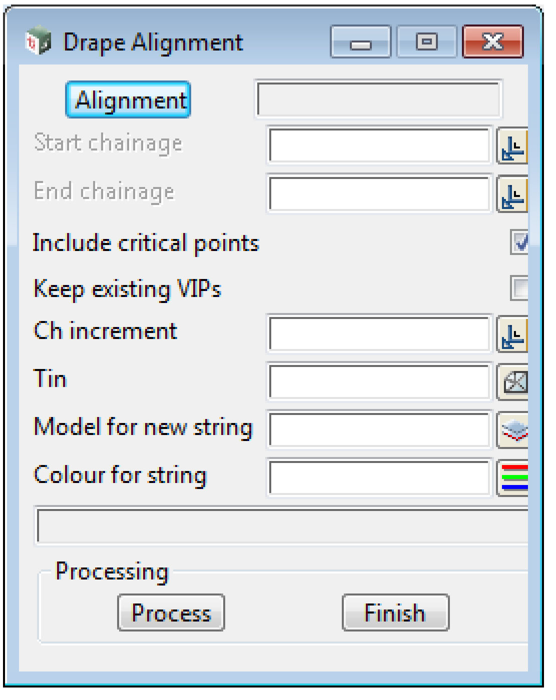
16.10.3 Drape Alignment (Macro)

Position of option on menu: **Tins =>Drape =>Alignment (macro)**

This is the **Drape =>Alignment** option from V7C1f. It has now been superseded.

The **Drape alignment (macro)** operation takes an alignment string and creates a new alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

On selecting **Alignment (macro)**, the **drape alignment** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Alignment string select

alignment string to drape.

Start/End chainage input

the chainage range to create VIP's over. if blank, use the start/end chainage of the selected string.

Include critical points tick box tick

if ticked, VIP's are created at the horizontal tangent points.

Keep existing VIPs tick box

if ticked, any existing VIP's outside the given chainage range are kept.

If not ticked, don't create any VIP points outside the chainage range.

Ch increment input

the chainage interval to create VIP points for. Each created VIP point is given the z-value from the tin and the (x,y) position of the VIP.

Tin tin box

triangulation to take z-values from.

Model for new string model box

model for the draped string.

Colour for string colour box

Colour for the draped string.

Process button

create a new alignment string with the same horizontal geometry as the selected string and the z-value for VIP points taken from the given tin.

16.10.4 Heights for Tin Boundary or Drape Using Closest Tin Node

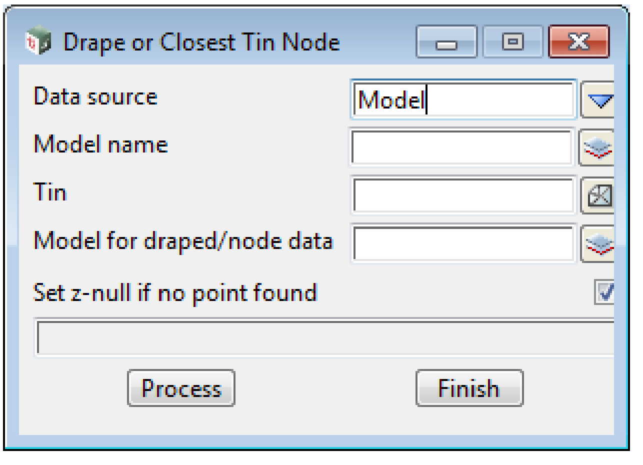
Position of option on menu: **Tins =>Drape =>Heights for boundary**

This option takes strings and for each vertex of each string, replaces the z-value by the z-value at the same (x,y) position from a given tin, or if there is no tin at the (x,y) position, takes the z-value from the closest non-null tin node to the (x,y) position.

The option is useful for taking a tin boundary with no z-values and creating z-values for each vertex from the tin.

Since V8 the option **Tins =>Boundary** option has a *Boundaries draped* flag which performs the same calculations as this option.

On selecting **Heights from boundary,** the **Update Z-values from Tin** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source	choice box	model	model, view, string

type of the data source

Model/View/String name

source of the data to drape vertices for.

Tin tin box

tin to drape the vertices onto.

Model for draped/node data model box

model for the draped strings.

Set z-null if no point found tick box tick

if ticked, the vertex z-value is set to null if no tin exists at the vertex.

If not ticked and the tin does not exist at the vertex, the z-value for the vertex is taken from the closest non-null tin node.

Process button

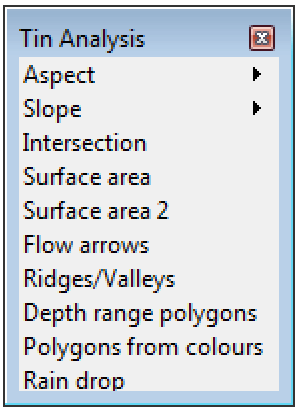
run the option.

16.11 Tin Analysis

Position of menu: **Tins =>Tin analysis**

The **Tin analysis** options are used to calculate the direction and slope of triangles, the intersection between tins, surface areas, flow arrows, ridge and valley lines and viewsheds.

The **Tin analysis** walk-right menu is



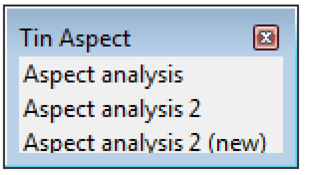
colour and report for ranges of aspects
colour and report for ranges of slopes
lines of intersection between two tins
report surface area within a polygon
report surface area for a model of polygons
create flow arrows for a tin.
create ridge and valley lines for a tin
create polygons for depth ranges
creates polygons around coloured regions of tin
creates flow lines from a selected point

For the options *Aspect*, go to	16.11.1 Aspect
Slope	16.11.2 Slope
Intersection	16.11.3 Intersection
Surface area	16.11.4 Surface Area
Surface area 2	16.11.5 Surface Area 2
Flow arrows	16.11.6 Flow Arrows
Ridge/Valleys	16.11.7 Ridge/Valleys
Depth range polygons	16.11.8 Depth Range Polygons
Polygons from colours	16.11.9 Polygons from Tin Colours
Rain drop	29.9.2 Raindrop/Teardrop

16.11.1 Aspect

Position of menu: **Tins =>Tin analysis =>Aspect**

The **Tin aspect** options calculate and report on the directions of the triangles. The **Tin aspect** walk-right menu is



The options in this menu will now be discussed.

For the option Aspect analysis, go to 16.11.1.1 Aspect Analysis
Aspect analysis 2 16.11.1.2 Aspect Analysis 2 and 2 (new)
Aspect analysis 2 (new) 16.11.1.2 Aspect Analysis 2 and 2 (new)

16.11.1.1 Aspect Analysis

Position of option on menu: **Tins =>Tin analysis =>Aspect => Aspect Analysis**

This panel is used to calculate the aspect or direction that the triangles of a tin face. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

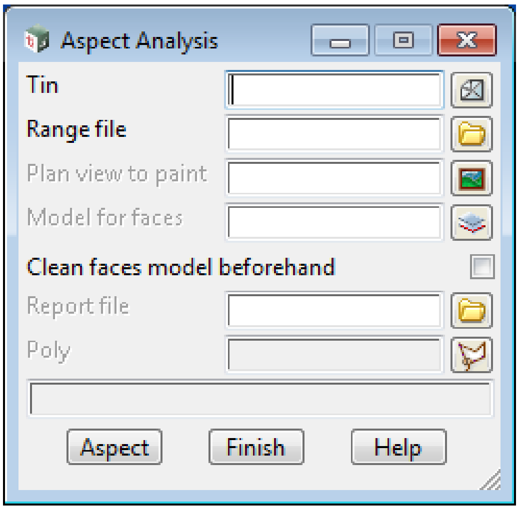
The calculated aspects can be produced and reported over user supplied bearing ranges. Similarly, a plan view can be temporarily coloured on an aspect basis using the same **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the aspect range file, see 8.9.5 Aspect Range File.

For each range in the file, the plan and slope areas of the triangles in the bearing range will be reported on, and the range_colour can be used to colour all areas on a plan view satisfying the range.

On selecting the **aspect analysis** option, the **Aspect Analysis** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Tin tin box available tins

name of the tin for which the aspects of the triangles will be calculated.

Range file aspect range file box *.arf

the user supplied range file is used to split up the aspect report and define the range colours used for painting a plan view. See 8.9.5 Aspect Range File.

Plan view to paint view box available views

if non-blank, the given plan view will be painted according to the range colours given in the range file.

Model for faces model box available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

The z-value for a face is the line number in the range file of the range that the face satisfies.

Clean faces model beforehand tick box

if ticked, the model of faces is cleaned out before the option runs.

Report file file box *.rpt

name of the file to contain the aspect report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly string-select

if selected, this string is used as the bounding polygon for the aspect calculations.

Aspect button

the aspects of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during aspect calculations.

16.11.1.1.1 Example of an Aspect Range File

```
//   aspect range file
// format:   lower_bearing     upper_bearing     colour_for_range

0   45   red   // colour red the triangles with bearing greater than 0 and less than or equal to 45
45  90   green   // colour green the triangles with bearing > 45, and <= 90

90  123.30  "dark green"  // colour dark green triangles with bearing > 90 and <=l to 123 deg 30'
```

16.11.1.2 Aspect Analysis 2 and 2 (new)

Position of option on menu: **Tins =>Tin analysis =>Aspect => Aspect Analysis 2**

Position of option on menu: **Tins =>Tin analysis =>Aspect => Aspect Analysis 2 (new)**

As with the **aspect analysis** option, the **aspect analysis 2** option is used to calculate the aspect or direction that the triangles in the tin face.

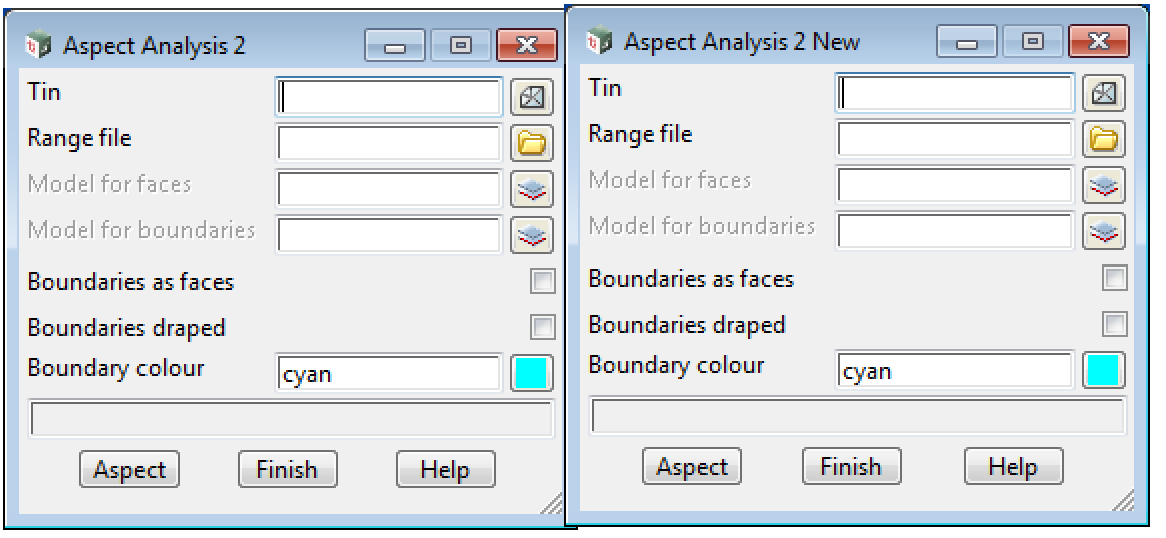
However, this option can also create the strings that bound the triangles in the same aspect range. The **aspect analysis 2 (new)** option is the same as aspect analysis 2 except the boundary polygons have slightly different names.

One restriction for this option is that the calculations can not be restricted to be within a polygon and the entire tin is used.

For more information on the aspect range file, see 8.9.5 Aspect Range File.

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the **Aspect analysis 2** option, the **Aspect Analysis 2** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin for which the aspects of the triangles will be calculated.

Range file	aspect range file box		*.arf

the user supplied range file is used to split the triangles into groups of common aspects so that boundary strings can be created and the range colours used for faces and the boundary strings. See 8.9.5 Aspect Range File.

Model for faces	model box		available models

if non-blank, a faces will be created (with the colour given in the range file) for each triangle.

The z-value for a face is the line number in the range file of the range that the face satisfies.

Model for boundaries	model box		available models

if non-blank, for each range of aspects in the range file, boundary strings will be created for regions of common aspect. The boundary strings are given the name "aspect boundaries" plus the number of the entry in the range file. Many of the boundaries will exist twice since they are the upper boundary for one range and the lower boundary for the next range but will have a different colour and name. For **aspect analysis 2 (new)**, *the boundary name also has the addition of "face" and a number to more clearly differentiate the boundaries of the same range.*

Boundaries as faces	tick box		

if ticked, output the regions of common aspect as faces.

Boundaries draped	tick box		

if ticked, the z-values for the boundary are taken from the tin.

If not ticked, the z-value for a boundary is the line number in the range file of the range that the boundary satisfies.

Boundary colour	colour box	cyan	available colours

not used - was the colour for the aspect boundaries.

Aspect	button		

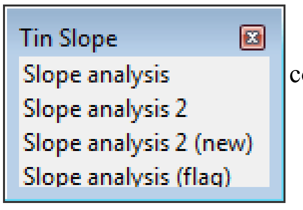
On selecting this button, the aspects of the triangles of the tin are calculated and the appropriate boundaries and faces created.

<esc> can be used to terminate the option during aspect calculations.

16.11.2 Slope

Position of menu: **Tins =>Tin analysis =>Slope**

The **tin slope** options calculate and report on the slopes of the triangles. The **tin slope** walk-right menu is



colour and report for ranges of slopes

The options in this menu will now be discussed.

For the option Slope analysis, go to	16.11.2.1 Slope Analysis
Slope analysis 2	16.11.2.2 Slope Analysis 2 and 2 (new)
Slope analysis 2 (new)	16.11.2.2 Slope Analysis 2 and 2 (new)
Slope analysis (flag)	16.11.2.3 Slope Analysis - Flag Slopes

16.11.2.1 Slope Analysis

Position of option on menu: **Tins =>Tin analysis =>Slope =>Slope analysis**

This panel is used to calculate the slopes of triangles in the tin. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated slopes can be produced and reported over user supplied slope ranges. Similarly, a plan view can be temporarily coloured on a slope basis using the same **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the slope range file, see 4.24 Defaults.

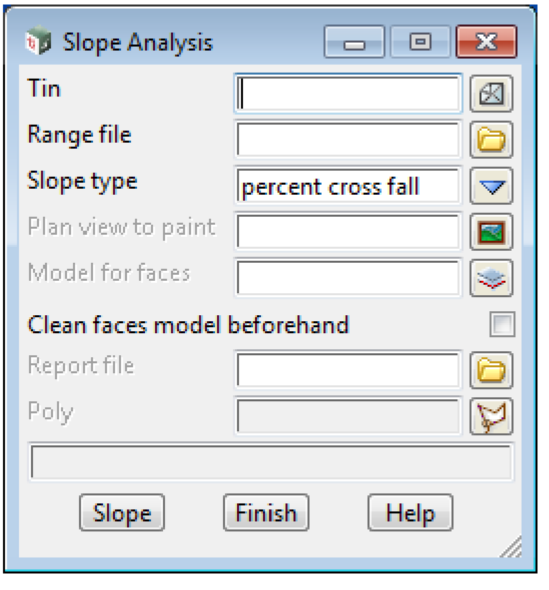
The slopes in the file can be percent cross fall, “1v in” slope or degrees (in 12d Model dms format) but they must all be of the same type in the file.

Note - if ***1v in*** is used, the range is converted to:

smaller_slope_as_percent_cross_fall < slope <= larger_slope_as_percent_crossfall

For each range in the file, the plan and slope areas of the triangles in the range will be reported on, and the range_colour used to colour all areas on a plan view satisfying the range.

On selecting the **Slope analysis** option, the **Slope Analysis** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin for which the slopes of the triangles will be calculated.

Field Description	Type	Defaults	Pop-Up
Range file	slope range file		*.srf

the user supplied range file is used to split up the slope report and define the range colours used for painting a view. See 4.24 Defaults.

Field Description	Type	Defaults	Pop-Up
Slope type	choice box		percent cross fall, degrees, 1v in

the units used for slope in the range file.

Field Description	Type	Defaults	Pop-Up
Plan view to paint	view box		available views

if non-blank, the given plan view will be painted according to the range colours given in the range file.

Clean faces model beforehand tick box

if ticked, the model of faces is cleaned out before the option runs.

Model for faces model box available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

The z-value for a face is the line number in the range file of the range that the face satisfies.

Report file file box *.rpt

name of the file to contain the slope report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly string-select

if selected, this string is used as the bounding polygon for the slope calculations.

Slope button

On selecting this button, the slopes of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during slope calculations.

16.11.2.1.1 Example of a Slope Range File

```
//   slope range file in percent cross fall
// format:    lower_slope     upper_slope     colour_for_range

0    5      red      // colour red the triangles with slope greater than 0% and less than
                     // or equal to 5% x-fall
5   10     green    // colour green the triangles with slope > 5%,  and <= 10% x-fall
10   300  "dark green"   // colour dark green triangles with slope greater than 10%
                         // and less than or equal to 300% x-fall
```

// slope range file in ***1v in*** slopes

```
// format:    lower_slope     upper_slope     colour_for_range

  0    20      red      // colour red the triangles with slope greater than flat and
                        // less than or equal to 1:20
  20   10     green    // colour green the triangles with slope between 1:20 and equal to 1:10
  10   1     blue    // colour blue triangles with slope between 1:10 and equal to 1:1
```

16.11.2.2 Slope Analysis 2 and 2 (new)

Position of option on menu: **Tins =>Tin analysis =>Slope =>Slope analysis 2**

Position of option on menu: **Tins =>Tin analysis =>Slope =>Slope analysis 2 (new)**

As with the **Slope analysis** option, the **slope analysis 2** option is used to calculate the slope of triangles in the tin. However, this option can also create the strings that bound the triangles in the same slope range.

The **Slope analysis 2 (new)** option is the same as *Slope analysis 2* except the boundary polygons have slightly different names.

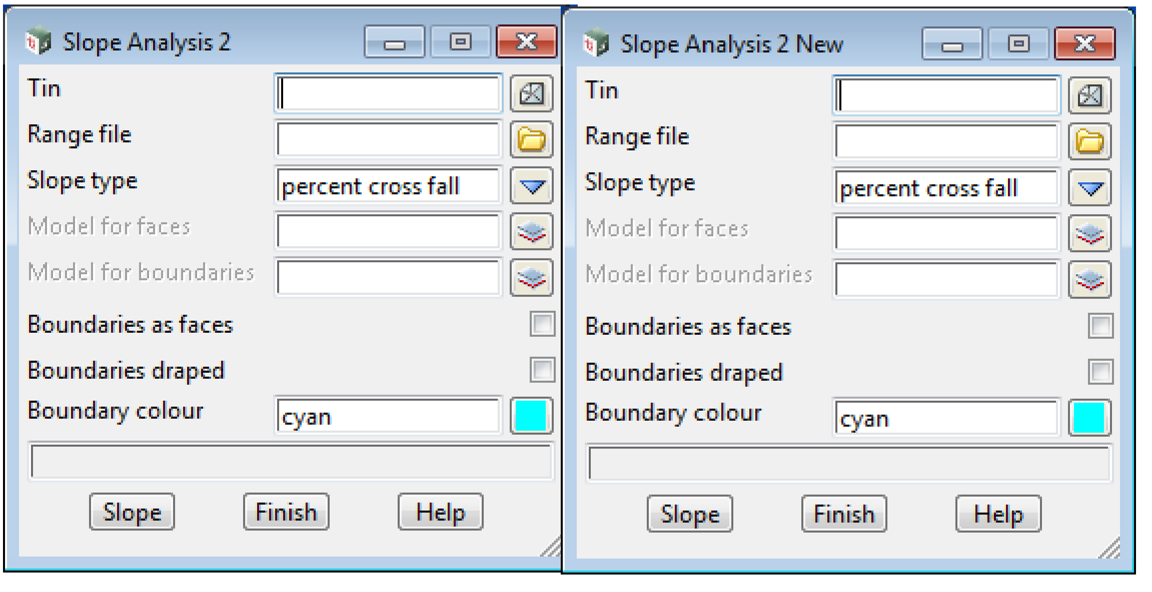
One restriction for this option is that the calculations can not be restricted to be within a polygon and the entire tin is used.

The range file for **Slope analysis 2** has the same format as for **Slope analysis.**

For more information on the slope range file, see 4.24 Defaults.

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the **Slope analysis 2** option, the **Slope Analysis 2 new** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin for which the slopes of the triangles will be calculated.

Range file	input		*.srf

the user supplied range file is used to split the triangles into groups of common slopes so that boundary strings can be created and the range colours used for faces. See 4.24 Defaults.

Slope type	input		percent cross fall, degrees, 1v in

the units used for slope in the range file.

Model for faces	input		available models

if non-blank, a faces will be created (with the colour given in the range file) for each triangle.

The z-value for a face is the line number in the range file of the range that the face satisfies.

Model for boundaries input available models

if non-blank, for each range of slopes in the range file, boundary strings will be created for regions of common slope. The boundary strings are given the name "slope boundaries" plus the number of the entry in the range file. Many of the boundaries will exist twice since they are the upper boundary for one range and the lower boundary for the next range but they will have a different colour and name. For **slope analysis 2 (new)***, the boundary name also has the addition of "face" and a number to more clearly differentiate the boundaries of the same range.*

Boundaries as faces tick box

if ticked, output the regions of common slope as faces.

Boundaries draped tick box

if ticked, the z-values for the boundary are taken from the tin.

If not ticked, the z-value for a boundary is the line number in the range file of the range that the boundary satisfies.

Boundary colour input cyan available colours

not used - was the colour for the slope boundaries.

Slope button

On selecting this button, the slopes of the triangles of the tin are calculated and the appropriate boundaries and faces created.

<esc> can be used to terminate the option during slope calculations.

16.11.2.3 Slope Analysis - Flag Slopes

Position of option on menu: **Tins =>Tin analysis =>Slope =>Slope analysis (flag)**

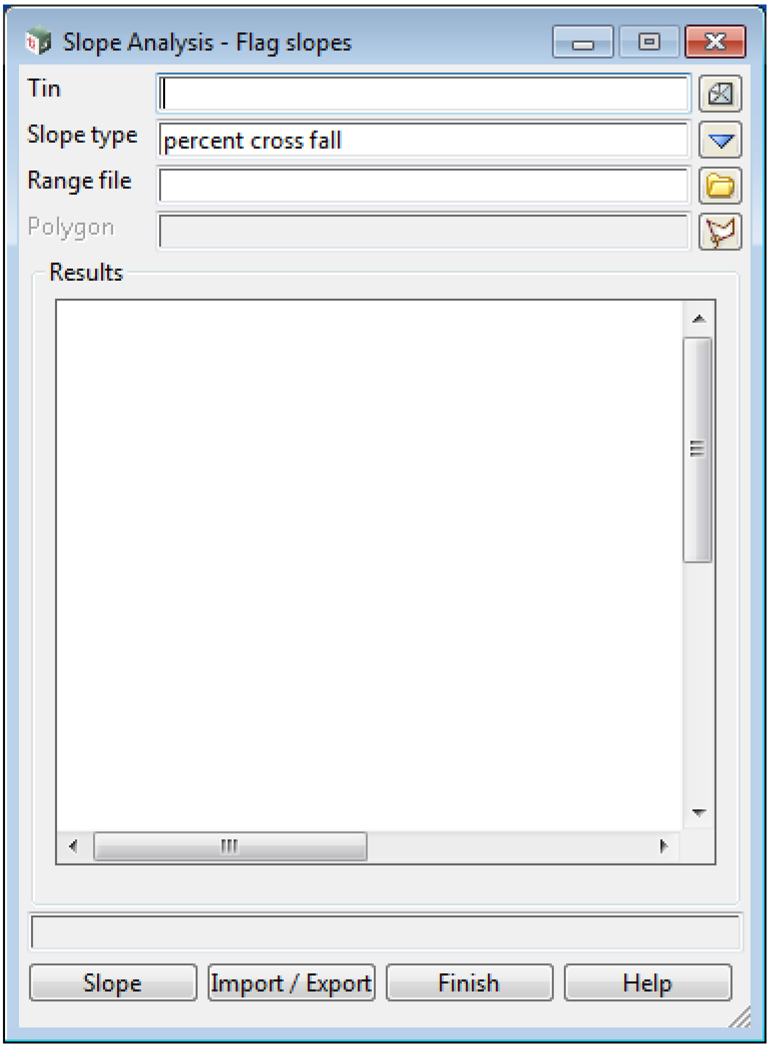
This panel analyses the slope of triangles in a tin and reports on triangles that fall within the supplied range file.

For more information on the slope range file, see 4.24 Defaults.

The results are listed in the results box.

Selecting a result line will pan the last selected view to display that triangle, as well as highlighting it on screen.

Selecting **Slope analysis (flag)** displays the **Slope Analysis - Flag Slopes** panel on the screen.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin			
the tin to analyse			
Slope type	choice box		percent cross file, 1v in, degrees minute seconds
the type of range file			

Polygon

an optional polygon to constraint the analysis within

Results

the list of results

Slope button

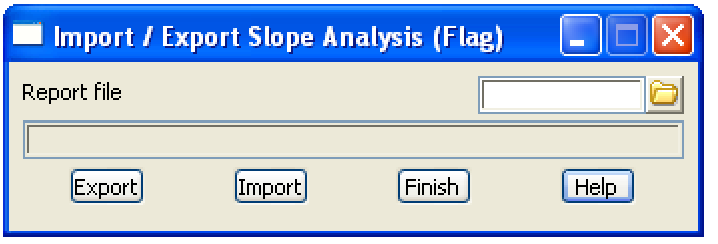
performs the analysis

Import/Export button

opens the 16.11.2.3.1 Import/Export Slope Analysis (Flag) *panel*

16.11.2.3.1 Import/Export Slope Analysis (Flag)

This panel imports and exports the results of a slope analysis.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Report file	file		

the file to read / write from

Export	button		

exports the results to the supplied file

Import	button		

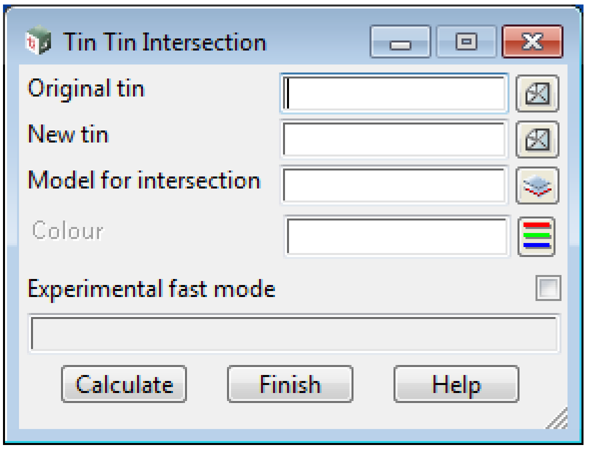
imports the results from the supplied file

16.11.3 Intersection

Position of option on menu: **Tins =>Tin analysis =>Intersection**

The **intersection** option finds the lines of intersection between two tins.

Selecting **intersection** displays the **Tin Tin Intersection** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original tin	tin box		available tins

name of one of the tins to be intersected.

New tin	tin box		available tins

name of the other tin to be intersected.

Model for intersection	model box		available models

name of the model to contain the intersection strings.

Colour for intersection	colour box	default colour	available colours

colour to make the intersection strings

Experimental fast mode	tick box		

if ticked, a faster method is used to calculate the intersection strings

Calculate	button		

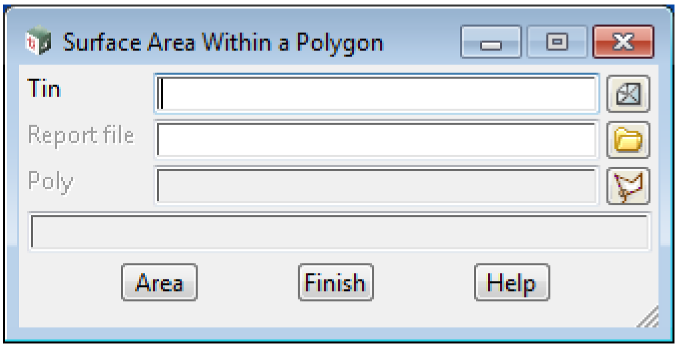
calculate the intersection between two tins given in the panel fields. The resulting intersection strings are added to the model given in the **model for intersection** *field.*

16.11.4 Surface Area

Position of option on menu: **Tins =>Tin analysis =>Surface area**

The **surface area** option is used to calculate the surface area of a tin within a user selected string.

Selecting **surface area** displays the **surface area within a polygon** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

the tin to calculate the surface area on.

Report file	file box		*.rpt files

if non-blank, the name of the file to write the surface area within the selected polygon to.

Poly	poly-select		

select the string to find the slope area within.

Area	button		

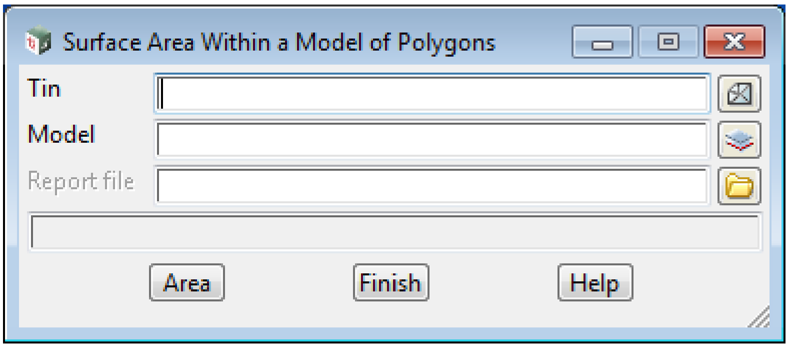
calculate the surface area of the tin within the selected polygon.

16.11.5 Surface Area 2

Position of option on menu: **Tins =>Tin analysis =>Surface area 2**

The **surface area 2** option is used to calculate the surface area of a tin within each polygon in a model.

Selecting **surface area 2** displays the **Surface Area Within a Model of Polygons** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

the tin to calculate the surface area on.

Model	model box		available models

the model of polygons for calculating surface area within.

Report file	file box		*.rpt files

if non-blank, the name of the file to write the surface area within each polygons in the model, plus the total of the surface area.

Area	button		

calculate the surface area of the tin within each polygons in the model, and sum the areas.

16.11.6 Flow Arrows

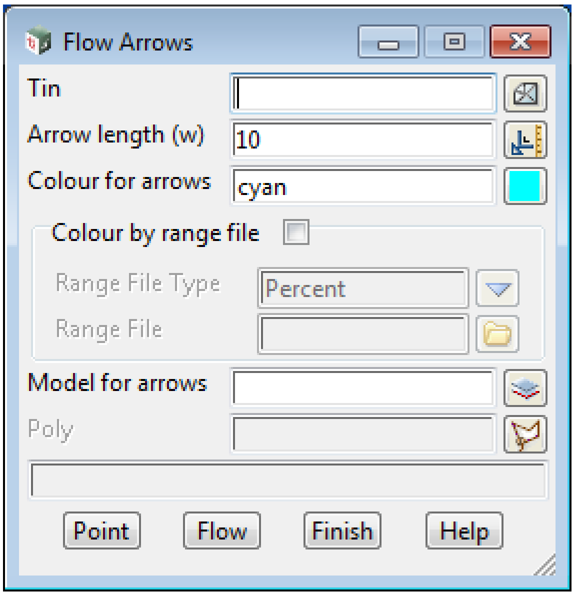
Position of option on menu: **Tins =>Tin analysis =>Flow arrows**

The flow arrows option draws arrows indicating the flow direction across triangles in a tin.

The flow arrows can be drawn for selected points, for all the triangles within a polygon, or if no polygon is selected, for all triangles in the tin.

The arrows are drawn at the centroid of the triangle and have a fixed user given length.

On selecting the **flow arrows** option, the **flow arrows** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to calculate flow arrows for.

Arrow length (w)	real value box		

length in world units to draw the flow arrows.

Colour for arrows	colour box	cyan	available colours

colour for the arrows.

Colour by range file	tick box		

if ticked, the flow arrows are coloured by the their slope using a slope range file. See 4.24 Defaults.

Range file type	choice box	Percent	Percent, 1v in

the units used for slopes in the range file
***Percent** - percent cross fall*
***1v in** - one vertical in ? horizontal*

Range file	slope range file box		.srf files
Model for arrows	model box		available models

model to put flow arrows in. Must be non-blank.

Poly	polygon select		

if a polygon is selected, then the spot heights will be restricted to within the polygon.

If no polygon is selected, the spot heights will be calculated over the entire tin.

Point button

after selecting **Point***, a flow arrow is drawn at each selected point. This continues until cancel is selected from the* **pick ups** *menu.*

Flow button

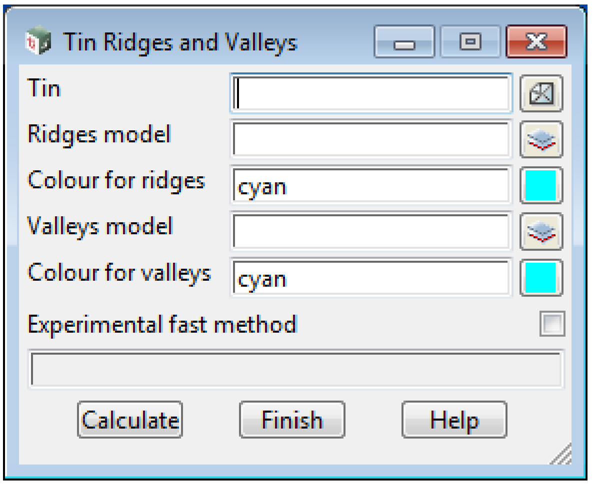
calculate the flow arrows for all the triangles in the tin, or if a polygon has been selected, for the triangles whose centroid is inside the polygon.

16.11.7 Ridge/Valleys

Position of option on menu: **Tins =>Tin analysis =>Ridges/Valleys**

In the **ridge/valleys** option, ridge and valley lines are calculated for the given tin.

On selecting the **ridge/valley** option, the **tin ridges and valleys** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to calculate ridge and valley lines for.

Ridges model	model box		available models

if non-blank, the name of the model to contain the ridge lines. If blank, the ridge lines are not created.

Colour for ridges	colour box	default colour	available colours

colour for the ridge lines

Valleys model	model box		available models

if non-blank, the name of the model to contain the valley lines. If blank, the valley lines are not created.

Colour for valleys	colour box	default colour	available colours

colour for the valley lines

Calculate	button		

ridge and valley lines will be calculated for the given tin and placed in the ridge and valley models.

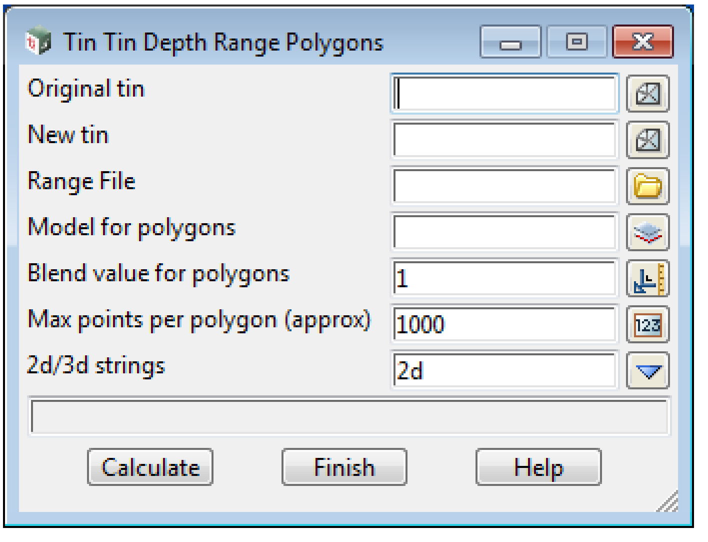
16.11.8 Depth Range Polygons

Position of option on menu: **Tins =>Tin analysis =>Depth range polygons**

In the **Depth range polygons** option, polygons are created around the regions given by a depth range file.

For more information on the depth range file, see 8.9.4 Depth Range File.

On selecting the **Depth range polygons** option, the **Tin Tin Depth Range Polygons** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New Tin	tin box		available tins

name of the original/new tin for determining depths between.

Range file	input		*.drf

the user supplied range file for splitting up the depths and colouring the polygons. See 8.9.4 Depth Range File.

Model for polygons	model box		available models

model to contain the polygons.

Blend value for polygons	real value	1	

The value of blending is between 0 and 1.

0 means the polygon is totally transparent (and hence invisible) and 1 means that the polygon is opaque (non-translucent) and can't be seen through at all.

If blank, then the value is taken as 1 and the polygon is opaque (non-translucent).

Max points per polygon (approx)	real value	1000	

when a polygon is created and the number of vertices in it is greater than this value, the polygon will be split into a number of polygons.

2d/3d strings	choice box	2d	2d, 3d original, 3d new

*If **2d**, the created strings are 2d strings with a z-value equal to the depth.*
*If **3d original**/new, the depth strings are draped over the original/new tin to form 3d strings.*

Calculate	button		

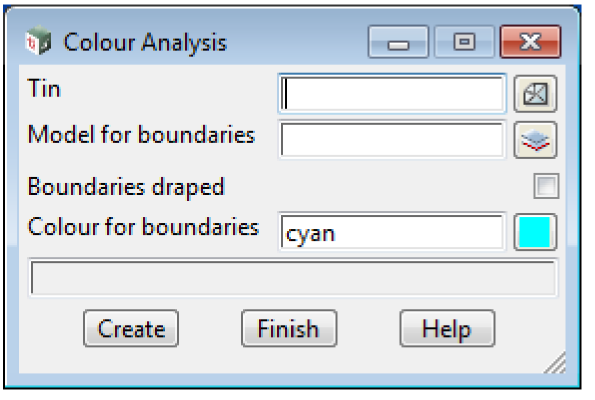
create the polygons surrounding regions of different heights between the tins.

16.11.9 Polygons from Tin Colours

Position of option on menu: **Tins =>Tin analysis =>Polygons from colours**

In the **Polygons from colours** option, polygons are created around the different coloured regions of the tin.

On selecting the **Polygons from colours** option, the **Colour Analysis** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to calculate polygons around the coloured regions.

Model for boundaries	model box		available models

model to contain the polygons.

Boundaries draped	tick box		

if ticked. the z-values for the vertices for the boundary strings come from the vertices of the coloured triangles.

If not ticked, the boundaries have constant z-values.

Colour for boundaries	colour box	default colour	available colours

colour for the polygons

Create	button		

create the polygons surrounding regions of different colours on the tin.

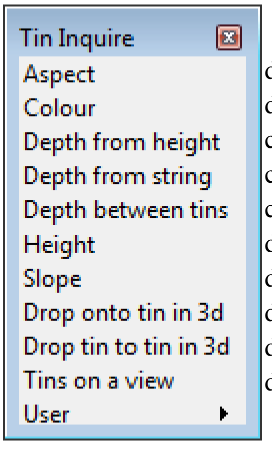
16.12 Inquire

Position of menu: **Tins =>Inquire**

The **inquire** options are used to display at the current cursor position the height (z-value) on a tin, the colour of the triangle, the depth from a fixed height to a tin, and the depth between two tins,.

Once the user specifies which tin or tins are to be analysed, then as the cursor moves around in any plan view, the triangles below the cursor are examined and the appropriate information displayed.

The **tin inquire** walk-right menu is



display aspect of triangles
display colour of tin
calculate depth from height to tin
calculate depth from string to a tin
calculate depth between tins
display height on tin
display slope of triangles
drop onto a tin in 3d
display perpendicular height between two tins
dynamically list all tins under the cursor

The options in the **Tin inquire** menu will now be discussed.

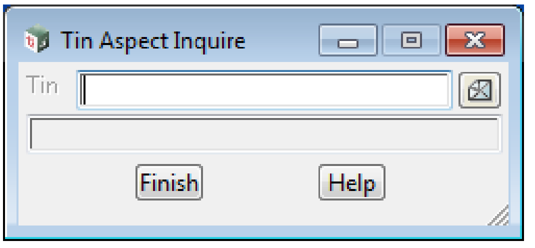
For the options *Aspect*, go to	16.12.1 Aspect Inquire.
Colour	16.12.2 Colour Inquire
Depth from height	16.12.3 Depth from Height
Depth from string	16.12.4 Depth from String
Depth between tins	16.12.5 Depth Between Tins
Height	16.12.6 Height Inquire
Slope	16.12.7 Slope Inquire
Drop onto tin 3d	16.12.8 Tin Drop Point 3d
Drop tin to tin in 3d	16.12.9 Tin Tin Drop Point 3d
Tins on a view	16.12.10 Tins on View Inquire

16.12.1 Aspect Inquire

Position of option on menu: **Tins =>Inquire =>Aspect**

The **aspect inquire** option calculates and displays the aspect (direction) of the triangles under the current plan view cursor position. The aspect is displayed in bearings in degrees, minutes and seconds.

Selecting **tin aspect inquire** displays the **tin aspect inquire** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

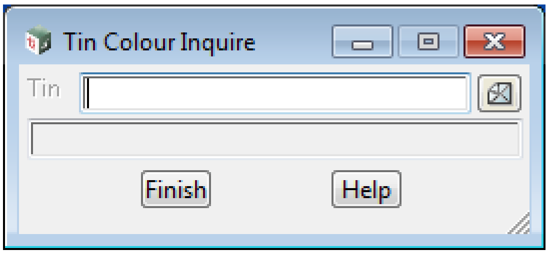
name of the tin for which the aspect of the triangle that the cursor is above will be displayed in the panel's message area.

16.12.2 Colour Inquire

Position of option on menu: **Tins =>Inquire =>Colour**

colour inquire displays the colour of the triangles under the current plan view cursor position.

Selecting **tin colour inquire** displays the **tin colour inquire** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

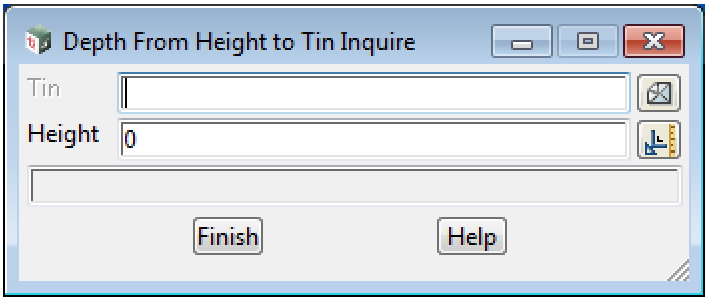
name of the tin for which the colour of the triangle at the current cursor position is displayed in the panel's message area.

16.12.3 Depth from Height

Position of option on menu: **Tins =>Inquire =>Depth from height**

The **depth from height** option calculates and displays the difference between the z-value of a tin and a given height for the current plan view cursor position.

Selecting **depth from height** displays **depth from height to tin inquire** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin used for calculating the distance from the tin to the given height at the cursor position.

Height	input	0	

the difference between the tin value and the value given in this field is displayed in the panel's message area.

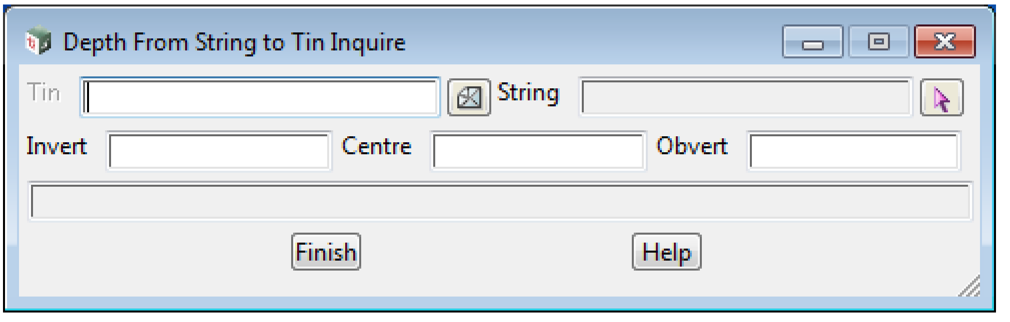
16.12.4 Depth from String

Position of option on menu: **Tins =>Inquire =>Depth from string**

The **depth from string** option calculates and displays the difference between the z-value of a tin and the height of a selected string at the current plan or section view cursor position projected back onto the selected string.

The obvert (top of the string) value is also known as the cover above a string to a tin.

Selecting **Depth from string** displays the **Depth From String to Tin Inquire** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin used for calculating the z-value at the cursor position.

String	string-select		

if a string is selected, the difference between the tin value and the height of the selected string (to the invert, centre and obvert of the string) at the current plan or section view cursor position, projected back onto the selected string, is displayed in the panel's message areas.

Invert/Centre/Obvert	output		

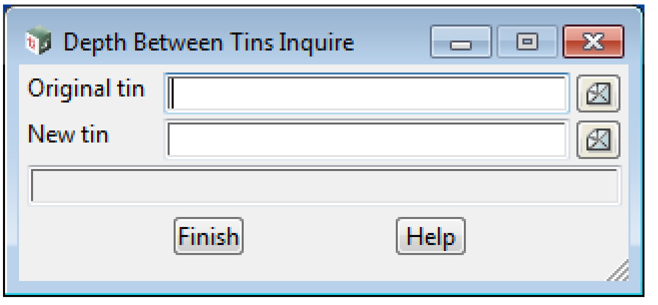
displays the distance between the tin and the invert (bottom), centre (axial) and obvert (top) of the selected string

16.12.5 Depth Between Tins

Position of option on menu: **Tins =>Inquire =>Depth between tins**

The **depth between tins** option calculates and displays the difference between the z-values of two given tins at the current plan view cursor position.

Selecting **depth between tins** displays the **depth between tins inquire** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/new tin	tin box		available tins

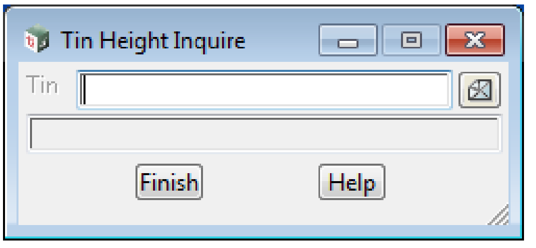
name of the two tins or which the z-value is to be calculated at the current plan view cursor position and the difference between the z-values (z_new - z_original) is displayed in the panel's message area.

16.12.6 Height Inquire

Position of option on menu: **Tins =>Inquire =>Height**

The **height inquire** option calculates and displays the height (z-value) of triangles from a tin at the current plan view cursor position.

Selecting **tin height inquire** displays the **tin height inquire** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

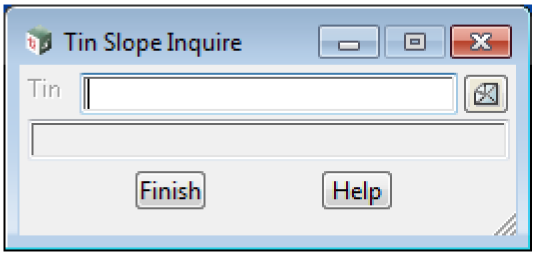
name of the tin for which the z-value at the current plan view cursor position is displayed in the panel's message area.

16.12.7 Slope Inquire

Position of option on menu: **Tins =>Inquire =>Slope**

The **slope inquire** option calculates and displays the slope of triangles from a tin at the current plan view cursor position. The slope is displayed as a percent cross fall, a "1v in "slope and as an angle in degrees, minutes and seconds.

Selecting **tin slope inquire** displays the **tin slope inquire** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

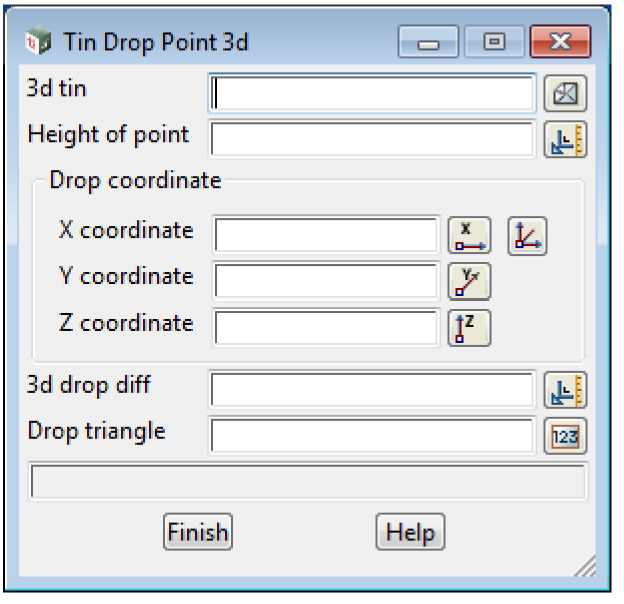
name of the tin for which the slope of the triangle that the cursor is above is displayed in the panel's message area.

16.12.8 Tin Drop Point 3d

Position of option on menu: **Tins =>Inquire =>Drop onto tin in 3d**

The **Drop onto tin in 3d** option takes a cursor position and a user defined height of the point and drops perpendicularly onto the closest triangle.

Selecting **Drop onto tin in 3d** displays the **Tin Drop Point 3d** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
3d tin	tin box		available tins

name of the tin to drop the point perpendicularly onto.This cannot be a Super Tin.

Height of point	real value		

the height to use at the (x,y) cursor position.

Drop coordinates

X, Y, Z coordinate of the point dropped perpendicularly to the tin from the (x,y) cursor position and height from **Height of point** *field*

3d drop diff	real		

the perpendicular distance to the tin.
positive if the point being dropped is above the tin
negative if the point being dropped is below the tin

Drop triangle	number box		

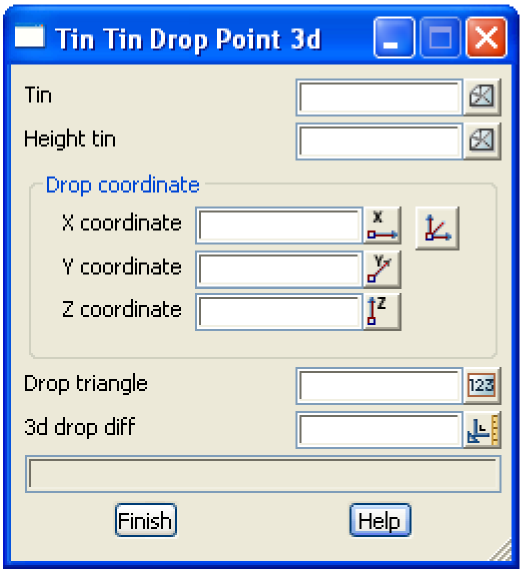
the number of the triangle the point was dropped to.

16.12.9 Tin Tin Drop Point 3d

Position of option on menu: **Tins =>Inquire =>Drop tin to tin in 3d**

The **Tin Tin Drop Point 3d** panel allows the 3d, (perpendicular) height difference between 2 tins to be displayed at any position. Once both tins are selected and a valid 3d drop can occur the difference is displayed and the triangle dropped to highlighted.

Selecting **Drop tin to tin in 3d** brings up the **Tin Tin Drop Point 3d** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

3d Tin

the tin to drop the point to perpendicularly in 3d, this tin cannot be a Super Tin.

Height tin

the tin to get a z value for the current position to use in the 3d drop, this tin can be a Super Tin.

Drop coordinate

*the x, y, z positions of the drop on the **3d Tin**.*

3d drop diff

*the 3d, (perpendicular) difference between the 2 tins, a positive value means the **3d Tin** is below the **Height tin** at the current position, a negative value the **3d Tin** is above the **Height tin**.*

Drop triangle

*the index of the triangle dropped to in the **3d Tin**.*

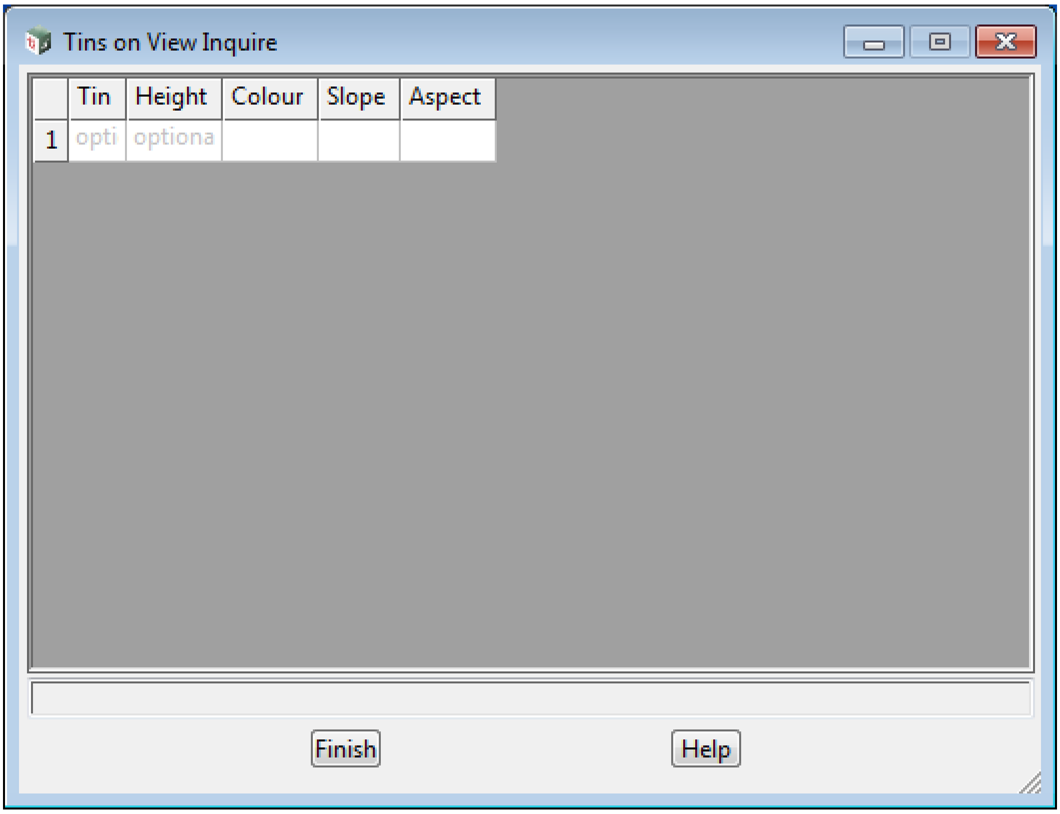
16.12.10 Tins on View Inquire

Position of option on menu: **Tins =>Inquire =>Tins on a view**

As the cursor is moved over any plan view, the **Tins on a view** option lists all the tins and super tins on that view, and at the (x,y) location of the cursor, dynamically displays the z-value of each tin or super tin at that (x,y) location, and the colour, slope and aspect of the triangle from the tins or super tins currently under the cursor.

For a super tin, it also displays the name of the tin being used from the super tin at that cursor location.

Selecting **Tins on a view** brings up the **Tins on View Inquire** panel.



The fields and buttons used in the this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	output		

when the cursor is over a plan view, the **Tin** *column list all the tins and super tins in the view.*

When the cursor is actually over a tin or super tin, on the row in the grid for that tin or super tin, the height of the tin or super tin at the cursor (x,y) location, and the colour, slope and aspect of the triangle under the cursor is displayed in the rest of the columns of the grid.

If it is a super tin and the cursor is over the super tine, then the name of the super tin is given and then a "/" and then the name of the tin from the super tin that is being used to give the height, colour, slope and aspect. For example, in the Tin column the name "combined/final" means that the tin the cursor is over is a super tin called "combined" and it is using the tin called "final" from the super tin "combined" at that location.

Height output

when in a plan view and the cursor is actually over the tin given in the Tin column, this is the height *from the tin/super tin at the cursor location.*

Colour/Slope/Aspect output

when in a plan view and the cursor is actually over the tin or super tin given in the Tin column, this is the colour/slope/aspect of the triangle from the tin or super tin at that cursor location.

16.13 Null

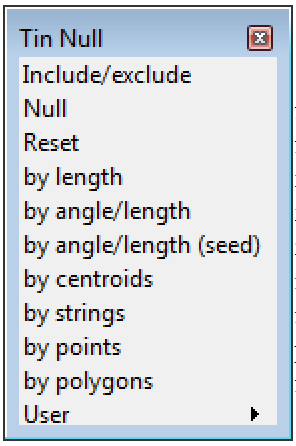
Position of menu: **Tins =>Null**

The triangulation process forms triangles throughout the convex polygon enclosing the data set. This means that triangles may cross regions where there is very little data and may produce strange results in the ill-defined regions.

In 12d Model, it is possible to make triangles invisible (called nulling triangles) so that they are not used in any options.

Note - nulled triangles are not deleted and can be made visible again at any time.

The **null** walk-right menu is



set a polygon to include/exclude all triangles inside the polygon
null triangles outside a polygon
reset all null triangles
null triangles by length of sides
null triangles by length of sides and angle
null by angle and length starting at a seed point
null/reset triangle under the centroid of strings
null triangles that are crossed by strings
pick triangles to null/reset
null/reset triangles inside/outside polygons

The three options in the tin colouring menu will now be discussed.

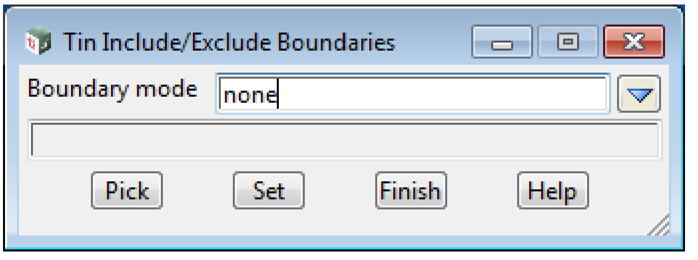
For the options *Include/exclude*, go to 16.13.1 Include/Exclude Boundaries.
Null 16.13.2 Null
Reset 16.13.3 Reset
by length 16.13.4 Null by Length
by angle/length 16.13.5 Null by Angle and Length
by angle/length (seed) 16.13.6 Null by Angle and Length (Seed)
by centroids 16.13.7 Null by Centroids
by string 16.13.8 Null by Strings
by points 16.13.9 Null by Points
by polygons 16.13.10 Null by polygons

16.13.1 Include/Exclude Boundaries

Position of option on menu: **Tins =>Null =>Include/excludes**

The **Include/exclude** option is used to tag a polygon that is part of the data set for a Tin so that all the triangles inside the polygon are either set to null or non-null.

On selecting the **Include/exclude** option, the **Tin Include/Exclude Boundaries** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boundary mode	choice box	none	none, include, exclude

mode to set the polygon to.

If ***exclude****, then any triangles inside the polygon are set to null.*

If ***include****, then any triangles inside the polygon are reset so that they aren't null.*

If ***none****, then the polygon is not used for automatically nulling/resetting triangles.*

Pick	button		

select the polygon to define a boundary mode for.

Set	button		

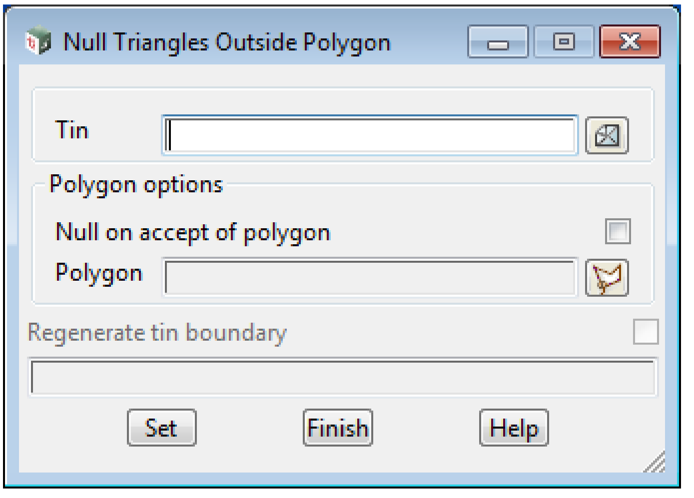
set the boundary mode for the selected polygon.

16.13.2 Null

Position of option on menu: **Tins =>Null =>Null**

The **null** option is used to null any triangle whose *centroid* is outside a user selected polygon.

Selecting **Null** displays the **Null Triangles Outside Polygon** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to null triangles in.

Null on accept of polygon tick box

if ticked, the triangles will be nulled as soon as the string is accepted.

If not ticked, the triangles will not be nulled until the **Set** *button is selected.*

Polygon polygon select

the string to be used as the polygon is selected after choosing this button. If **Null on accept of polygon** *is set, then the polygon is processed immediately.*

Set button

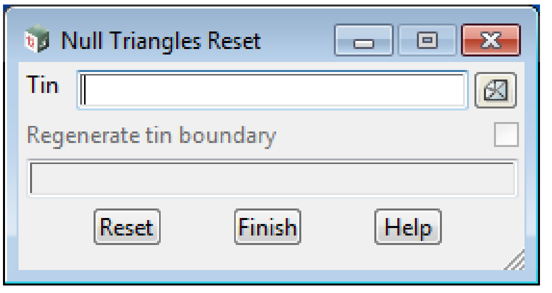
process the selected string/. Any triangle whose centroid is outside the selected boundary polygon is set to null.

16.13.3 Reset

Position of option on menu: **Tins =>Null =>Reset**

The **reset** option is used to change all the nulled triangles in a tin back to the visible triangles.

Selecting **reset** displays the **Null Triangles Reset** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to have any nulled triangles reset to being visible triangles.

Reset	button		

the **reset** *button resets* ***all*** *null triangles in the tin to the base colour.*

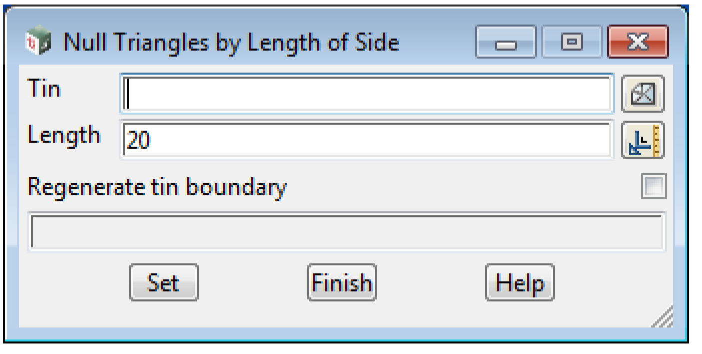
16.13.4 Null by Length

Position of option on menu: **Tins =>Null =>by length**

The **null by length** option is used to null any triangle with a side of length greater than a user specified length.

Warning - this option will null out *internal* triangles. The next option, Null by angle/length will only null triangles on the outer shell.

On selecting the **by length** option, the **null triangles by length of side** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to null triangles in.

Length	input		

length to check triangle sides against.

Set	button		

after selecting the **set** *button, the tin will be processed and any triangle with a side of length greater than the value given in the* **length** *panel field, will be nulled.*

16.13.5 Null by Angle and Length

Position of option on menu: **Tins =>Null =>by angle/length**

The **null by angle/length** option is a more powerful nulling option which tries to remove most of the external triangles that one expects should be removed. For example, for a T-intersection, all the long, thin outer triangles should be removed. The option has two sets of tests - one to remove long thin triangles and the other which uses a combined test to remove squat triangles.

Unlike the *null by length* option, *null by angle/length* only works on triangles which have an outer null triangle on one or two sides (it does not work on internal holes). These triangles are called *external triangles* and sides with an outer null triangle on them are called *external sides*.

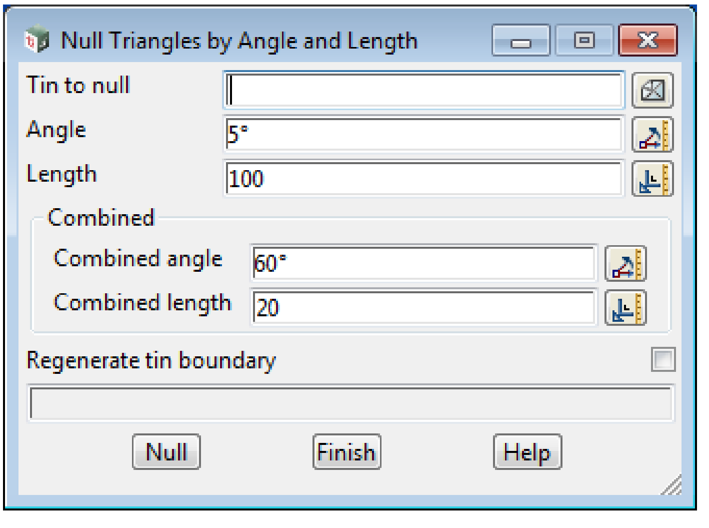
The *null by angle and length* option *does not* remove triangles whose external side is a breakline. Hence, as expected, breaklines will stop the nulling process.

Note that *null by angle and length* keeps processing the remaining non-nulled triangles until no more can be nulled or are stopped by breaklines. Hence the nulling works inwards as outer triangles are nulled revealing new external triangles to be tested. The nulling process is like peeling off layers of an onion.

Important note - the setting for this option are ***stored*** by the triangulation and the option is automatically re-run if the triangulation is re-run. To turn off the tests, just set the panel fields to blank.

Warning - this option should be the first nulling option used because all null triangles are first reset to valid triangles before this option is applied.

On selecting the null **by angle/length** option, the **Null Triangles by Angle and Length** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to null	tin box		available tins

name of the tin to have triangles nulled. If this option has been previously run on the tin, the previous panel values are written into the panel fields.

Angle	angle box	5	

if a triangle has an external side (that is not a breakline) with an angle on it less than **Angle**, *then the triangle is nulled. The default value works most of the time.*

If blank then no triangles are nulled by this test.

Length input 100

if a triangle has an external side (that is not a breakline) greater than **Length***, the triangle is nulled. If blank then no triangles are nulled by this test.*

Combined angle angle box 60
Combined length input 20

For the Combined case, a triangle is nulled if it:

has an external side (that is not a breakline) and the ***sum*** *of the two angles on it is* ***less*** *than* **Combined angle** *(the default value works most of the time)*
and

has an external side (that is not a breakline) whose length is ***greater*** *than* **Combined length***. A suggested value is one third to one half of Length.*

If either **Combined angle** *or* **Combined length** *is blank, then no triangles are nulled by this test.*

Null button

after selecting the **Null** *button, all nulled triangles are reset to be valid triangles and the tin then processed and triangles nulled.*

16.13.6 Null by Angle and Length (Seed)

Position of option on menu: **Tins =>Null =>by angle/length (seed)**

The **null by angle/length (seed)** option is similar to the powerful null by angle/length option (see 16.13.5 Null by Angle and Length) except it has the additional ***start point***.

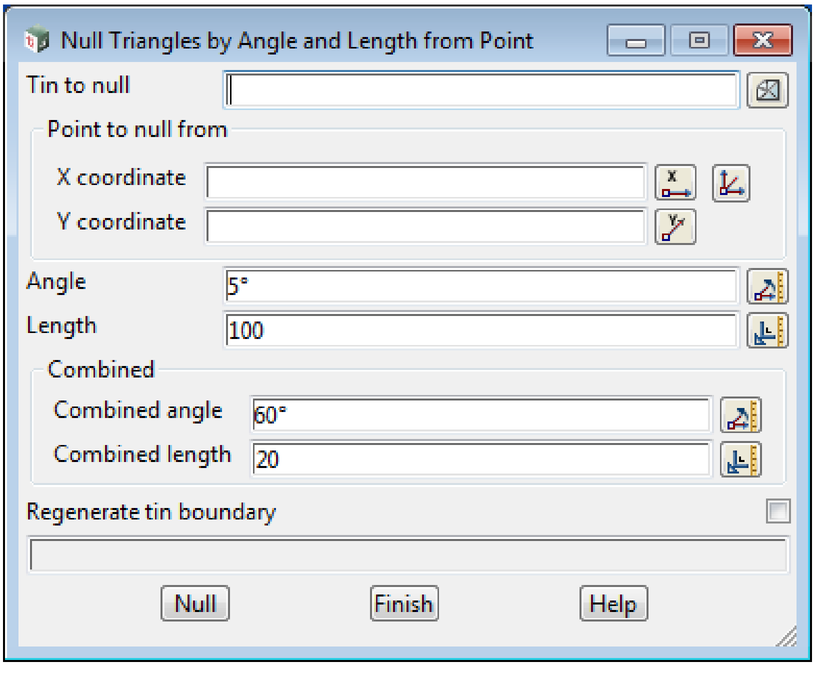
That is, a start triangle is selected by the cursor and the nulling starts from the triangle under the cursor.

The *null by angle/ length (seed)* option then starts nulling triangles from the start triangle using the angle/length parameters until stopped by breaklines.

Hence the nulling works ***outwards*** from the start triangle revealing new triangles to be tested until stopped by breaklines.

This option is particularly useful for nulling internal areas of a tin.

Selecting null **by angle/length (seed)** displays the **Null Triangles by Angle and Length from Point** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to null	tin box		available tins

name of the tin to have triangles nulled. If this option has been previously run on the tin, the previous panel values are written into the panel fields.

Point to null from

the X/Y co-ordinates of a position to start nulling from.

Angle	angle box	5	

if a triangle has an external side (that is not a breakline) with an angle on it less than **Angle***, then the triangle is nulled. The default value works most of the time.*

If blank then no triangles are nulled by this test.

Length	input	100	

if a triangle has an external side (that is not a breakline) greater than **Length***, the triangle is nulled.*

If blank then no triangles are nulled by this test.

Combined angle input 60
Combined length input 20

For the Combined case, a triangle is nulled if it:

*has an external side (that is not a breakline) and the **sum** of the two angles on it is **less** than* **Combined angle** *(the default value works most of the time)*
and

*has an external side (that is not a breakline) whose length is **greater** than* **Combined length**. *A suggested value is one third to one half of Length.*

If either **Combined angle** *or* **Combined length** *is blank, then no triangles are nulled by this test.*

Null button

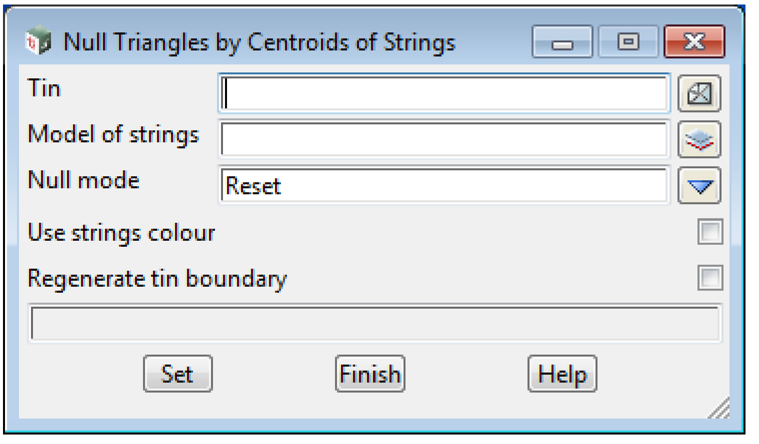
after selecting the **Null** *button, the triangle under the (X,Y) position is determined and null processing starts from that triangle.*

16.13.7 Null by Centroids

Position of option on menu: **Tins =>Null =>by centroids**

null by centroids is used to null/reset any triangle that lies under the centroid of a string.

On selecting the **by centroids** option, the **null triangles by centroids of strings** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to null/reset triangles in.

Model of strings	model box		available models

model of strings to be used to select triangles that are under a centroid of one of the model's strings.

Null mode	choice box	Reset	Reset, Null

*if **null**, any triangle under the centroid of a string from the* **model of strings***, will be nulled.*
reset**, any triangle under the centroid of a string from the* **model of strings, will be made visible again.*

Set	button		

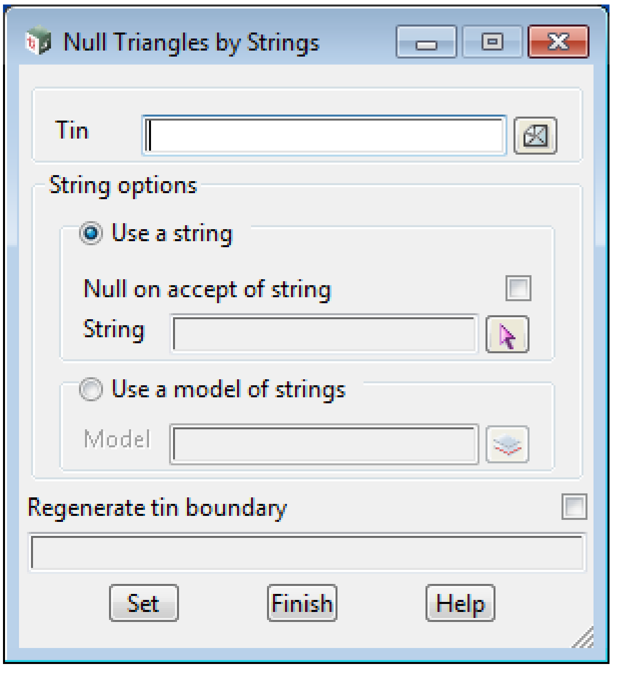
after selecting the **set** *button, the tin will be processed and any triangle under the centroid of a string will be set according to the* **null mode** *panel field.*

16.13.8 Null by Strings

Position of option on menu: **Tins =>Null =>by strings**

The **null by strings** option is used to null any triangle that is cut by a string.

On selecting the **by strings** option, the **null triangles by strings** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to null triangles in.

Use a string	radio button		

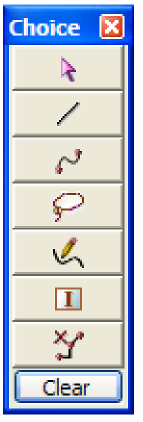
if set, strings will be selected and used to null any triangle that the string passes through.

Null on accept of string	tick box		

if ticked, the triangles will be nulled as soon as the string is accepted.

If not ticked, the triangles will not be nulled until the **Set** *button is selected.*

String	string select	existing string	string pop-up



if string, a strings will be selected and used to null any triangle that the string passes through.

If line, a temporary two point line is drawn and used to null any triangle that the line passes through

If polyline, a temporary polyline is drawn and used to null any triangle that the string passes through

If closed polyline, a temporary closed polyline is drawn and used to null any triangle that the string passes through

Use a model of strings radio button

if set, a model of strings is used and a triangle is nulled if it is cut by any one of the strings.

Model model box available models

model of strings to cut the triangles.

Set button

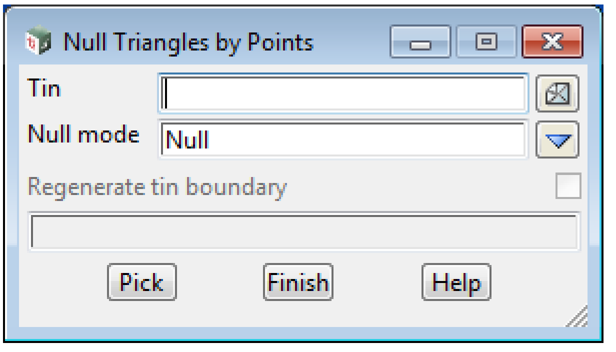
after selecting the **set** *button, the tin will be processed and any triangle that is cut by a string from the* **Model***, or a selected string for the* **User a string** *case, will be nulled.*

16.13.9 Null by Points

Position of option on menu: **Tins =>Null =>by points**

The **null by points** null or reset any triangle that the user clicks LB whilst over the triangle in a plan view.

On selecting the **by points** option, the **null triangles by points** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to null/reset triangles in.

Field Description	Type	Defaults	Pop-Up
Null mode	choice box	Null	Reset, Null

*if **null**, any triangles under a cursor pick will be nulled.*
* **reset**, any nulled triangles under a cursor pick will be turned back on.*

Field Description	Type	Defaults	Pop-Up
Pick	button		

any triangle under the cursor select will be processing according to the **null mode** *panel field.*

16.13.10 Null by polygons

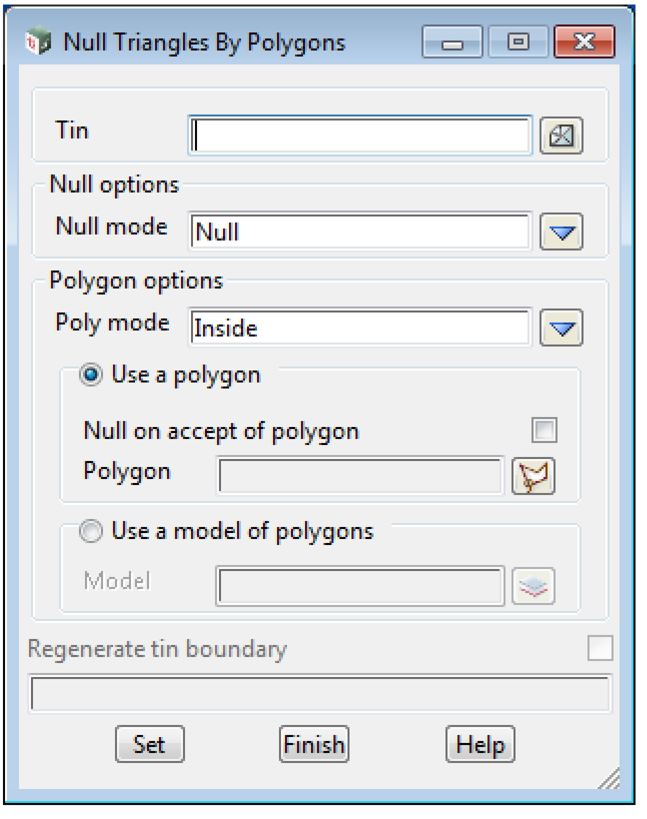
Position of option on menu: **Tins =>Null =>by polygons**

The **null by polygons** option is used to null/reset any triangles that are inside or outside a user selected polygon, or model of polygons.

If a string is selected to use and it is not closed, then a polygon is formed by joining the first and the last points of the string.

On selecting the **by polygons** option, the **null triangles by polygons** panel is displayed

.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to null/reset triangles in.

Null mode	choice box	Null	Reset, Null

*if **null**, any triangles selected will be nulled.*
__reset__, any nulled triangles selected will be turned back on.

Poly mode	choice box	inside	inside, outside

*mode to select whether the triangles with centroids **inside** or **outside** the selected polygons are to be nulled.*

Use a polygon	radio button		

if set, strings will be selected and used as the polygon to null/reset all triangles with centroids inside/ outside the polygon.

Null on accept of polygontick box

if ticked, the triangles will be nulled/reset as soon as the polygon (string) is accepted.

If not ticked, the triangles will not be nulled/reset until the **Set** *button is selected.*

Null on accept of string tick box

if ticked, the triangles will be nulled as soon as the string is accepted.

If not ticked, the triangles will not be nulled until the **Set** *button is selected.*

Polygon polygon select polygon pop-up

polygon to null or rest triangles when the centroid is inside/outside the polygon

Use a model of polygons radio button

if set, a model of strings will be used as the polygons to null/reset triangles whose centroids are inside/ outside one of the polygons.

Model model box available models

model of strings to provide the polygons for nulling/resetting triangles.

Set button

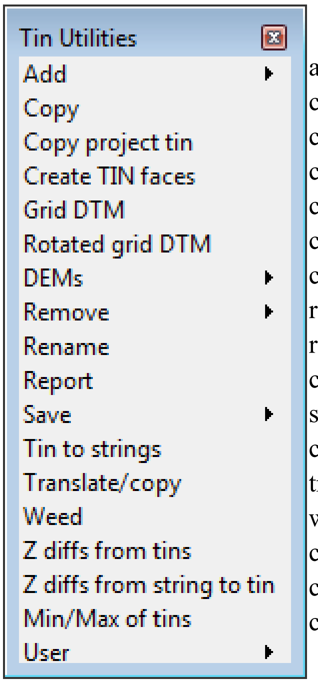
each string in the **model of polygons** *is used to null/reset the triangles in the tin given in the* **tin** *field according to the* **null mode** *and* **poly mode** *panel field.*

16.14 Utilities

Position of option on menu: **Tins =>Utilities =>Tin Utilities**

The **triangles=>utilities** menu contains miscellaneous options involving tins.

The **Utilities** walk-right menu is



add tins to project and models
create a copy of a tin
copy a tin from another project
create faces from a tin
create regular grid of points on a tin
create a rotated grid of points on a tin
create Digital Elevation Models
remove tins from project and models
rename a tin
create report of a tin
save tins to disk
create points and breaklines from a tin
translate/copy a tin
weed duplicate points from the tin database
create vertices with z-difference between two tins
create vertices with z-difference between string and a tin
calculate a grid of min and max values for the tin

Each option will now be described.

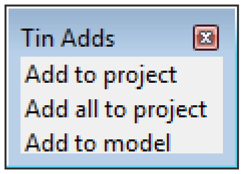
For the options *Add*, go to 16.14.1 Add
Copy 16.14.2 Copy
Copy project tin 16.14.3 Copy Project Tin
Create Tin faces 16.14.4 Create Tin Faces
Grid DTM 16.14.5 Grid DTM
Rotated grid DTM 16.14.6 Rotated Grid
DEMs 16.14.7 DEMs
Remove 16.14.8 Remove
Rename 16.14.9 Rename
Report 16.14.10 Report
Save 16.14.11 Save
Tin to strings 16.14.12 Tin to Strings
Translate/copy 16.14.13 Translate/Copy
Weed 16.14.14 Weed
Z diffs from tins 16.14.15 Z Differences from Tins
Z diffs from string to tin 16.14.16 Z Differences from String to Tin
Min/ Max of tins 16.14.17 Grid of Min / Max of Tins

16.14.1 Add

Position of menu: **Tins =>Utilities =>Add**

Tins can be added to the project and to models.

The **tin adds** walk-right menu is



The options in this menu will now be described.

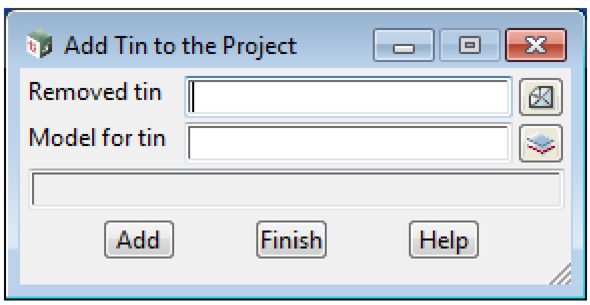
For the option Add to project, go to 16.14.1.1 Add to Project
Add all to project 16.14.1.2 Add All To Project
Add to model 16.14.1.3 Add to Model

16.14.1.1 Add to Project

Position of option on menu: **Tins =>Utilities =>Add =>Add to project**

The **add to project** option is used to add a removed tin back into the project.

On selecting the **add tin to project** option, the **add tin to the project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed tin	tin box		available tins

name of the tin to be added to the working project. The tin must exist on the disk in the project area and not already be in the project.

Model for tin	model box		available models

if non-blank, the loaded tin will be added to the model given in this field.

Add	button		

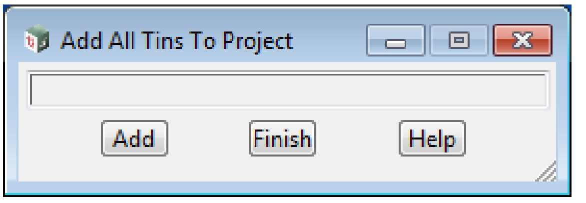
Add the tin given in the Tin field to the working project.
If the **model for tin** *field is non-blank, the tin will be added to the model given in that field - if the model does not exist, it will be created.*

16.14.1.2 Add All To Project

Position of option on menu: **Tins =>Utilities =>Add =>Add all to project**

The **add all tins** option is used to add all the removed tins back into the project.

On selecting the **add all to project** option, the **add all tins to project** panel is displayed.



The fields and buttons used in this panel have the following functions.

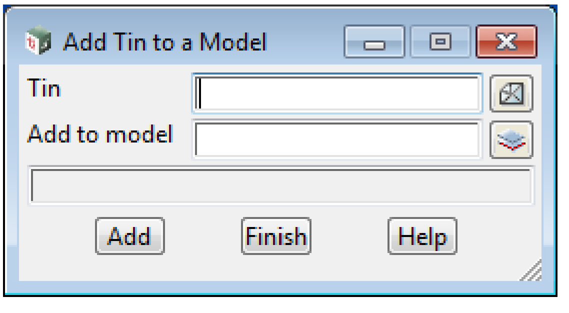
Field Description	Type	Defaults	Pop-Up
Add	button		

after selecting this button, all removed tins in the working project will be added to the project.

16.14.1.3 Add to Model

Position of option on menu: **Tins =>Utilities =>Add =>Add to model**

On selecting the **add to model** output option, the **add tin to a model** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to be added to a model.

Field Description	Type	Defaults	Pop-Up
Add to model	model box		available models

name of the model to which the tin given in the **tin** *field will be added.*

Field Description	Type	Defaults	Pop-Up
Add	button		

add the tin given in the **tin** *field to the model given by the* **add to model** *field.*

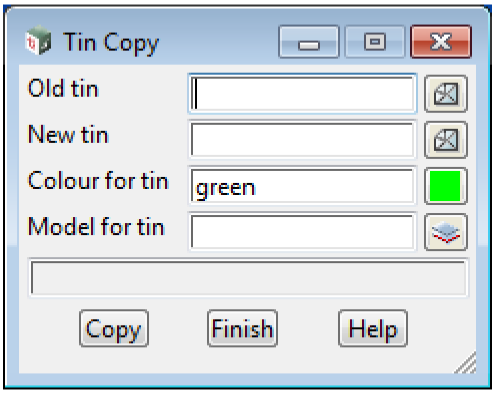
16.14.2 Copy

Position of option on menu: **Tins =>Utilities =>Copy**

A copy of an existing tin can be made using the **copy** option.

A Super Tin can also be copied and what is created is a new super tin with a new name but with exactly the same tins making it up as the original tin.

On selecting **copy**, the **tin copy** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old tin	tin box		available tins

name of the tin to be copied.

New tin	tin box		available tins

name of the copy of the tin - this can't be the same as any existing tin in the project.

Colour of tin	colour box		available colours

if non-blank, the colour of the new tin. If blank, use the old tin colour

Model for tin	model box		available models

if non-blank, the name of the model for the new tin. If blank, the tin is not put in any model.

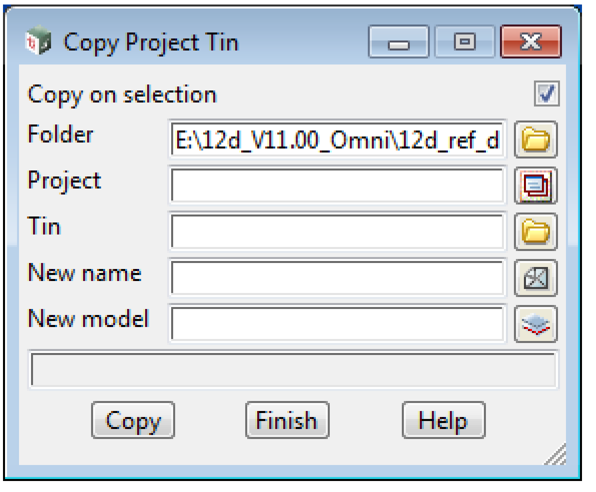
Copy	button		

after selecting this button, the tin given in the **old tin** *field will be copied and the copy given the name in the* **new tin** *field and placed in the model given in the* **model for tin** *field.*

16.14.3 Copy Project Tin

Position of option on menu: **Tins =>Utilities =>Copy project tin**

On selecting the **copy project tin** option, the **copy project tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Copy on selection	tick box		

if ticked, the project is copied as soon as it is selected. The same tin name and default model containing the tin is used.

Folder	folder box		working folder

name of the working folder containing the project from which the tin should be copied

Project	project box		current projects

*name of the project in the folder given in the **Folder** field, from which the tin should be copied.*

Tin	tin box		available tins

name of the tin to be copied.

New name	tin box		

if non-blank, the new name to be given to the copied tin which must be different to all the exiting tins names in the working project.
If blank, keep the name of the original tin (as long as it is different to the existing tins).

New model	model box		available models

if non-blank, the tin will be placed in this model.

Copy	button		

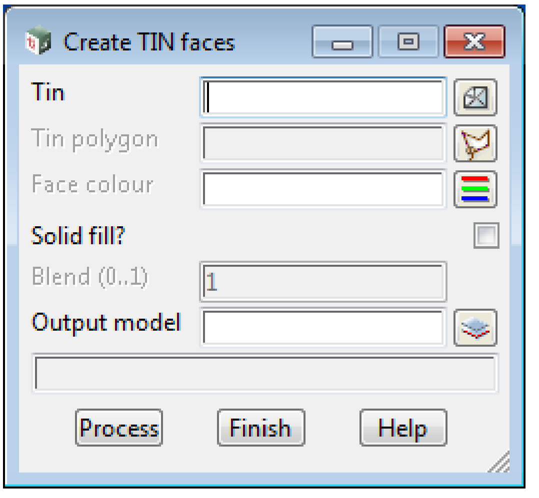
copy to this project, the tin given in the **Tin** *field from the project given in the* **Project** *field.*

16.14.4 Create Tin Faces

Position of option on menu: **Tins =>Utilities =>Create tin faces**

This options creates a separate face for each triangle in a tin.

Selecting **Create tin faces** displays the **Create Tin Faces** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to have faces created for each triangle.

Tin polygon	polygon select		

if selected, faces are created fro triangles whose centroid is inside the selected polygon.

Face colour	colour box		

if blank, the tin triangle colour is used for the face colour.
If not blank, this colour is used for all faces.

Solid fill ?	tick box		

if ticked, the faces are solid filled with a blend value

Blend (0 ... 1)	real value		

The value of blending is between 0 and 1.

0 means the face is totally transparent (and hence invisible) and 1 means that the face is opaque (non-translucent) and can't be seen through at all.

If blank, then the value is taken as 1 and the polygon is opaque (non-translucent).

Output model	model box		available models

model for the faces

Process	button		

create faces for selected triangles.

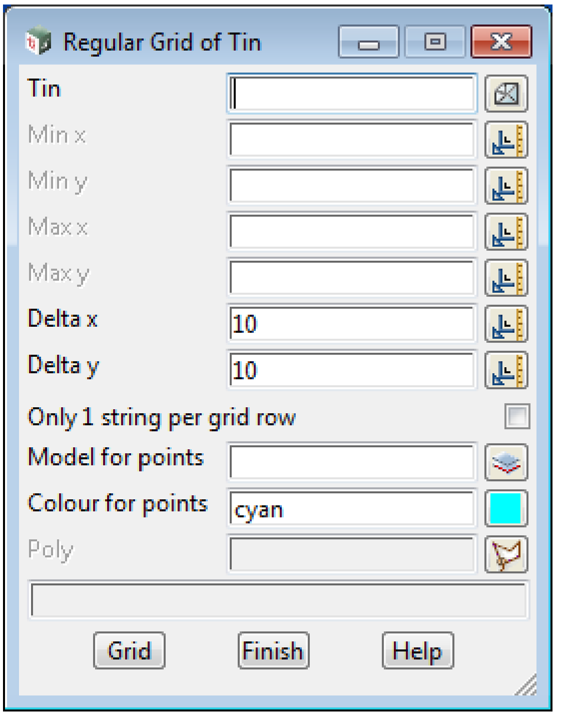
16.14.5 Grid DTM

Position of option on menu: **Tins =>Utilities =>Grid**

The grid option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Also see the 16.14.7 DEMs options for creating a file of a regular grid to different formats (Arc View, Quantm, Sokkia).

On selecting the **Grid** option, the **Regular Grid of Tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin on which the spot heights will be calculated.

Min x/y	input		

minimum x/y values to calculate spot heights for.

Max x/y	input		

maximum x/y values to calculate spot heights for.

Delta x/y	input		

difference between the x/y-values for the grid.

Only 1 string per grid row	tick box		

if ticked, all the grid points for a row are joined in a point string.
If not ticked, individual one vertex strings are created for each grid point.

Model for points	model box		available models

if blank, no point strings will be created.
If non-blank, points strings of the spots heights will be created and stored in this model.

Colour for points colour box default colour available colours

colour to make the point strings.

Poly poly-select

if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.

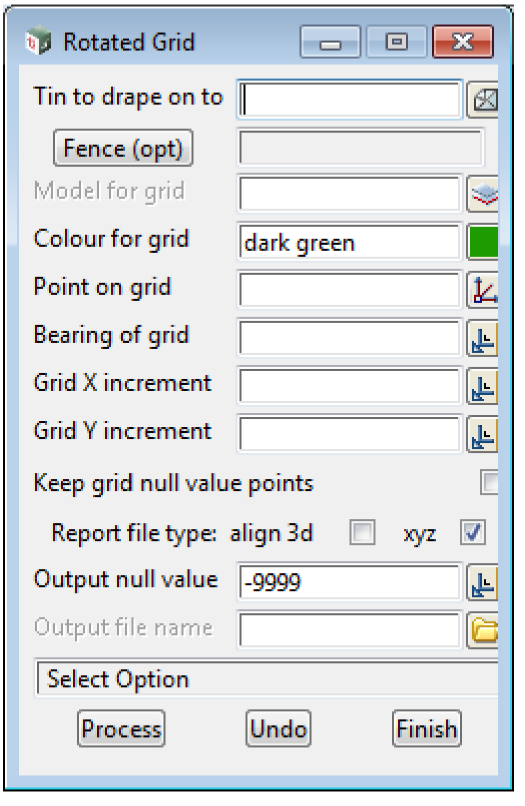
Grid button

calculate the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

16.14.6 Rotated Grid

Position of option on menu: **Tins =>Utilities =>Rotated Grid**

This panel is used to create a grid of points with z-values from a given tin. The grid can be rotated and a polygon can be used to restrict the created points. A report of grid points can also be calculated in either simple x y z (one point per line) form or if no polygon is used, in a format accepted by Quantm (formerly Align 3d).



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tin to drape on to	tin box		available tins

Tin to get the z-values from.

Fence (opt)	string select		

Optional – if selected, the grid is restricted to being inside the polygon.

Model for grid	model box		available models

Model for the created grid.

Colour for grid	colour box	dark green	available colours

Colour for the created grid

Point on grid	point select box		

The selected point is on the grid. The other grid points are integer multiples of the "Grid X increment" and "Grid Y increment" (with the bearing "Bearing of grid") from this point.

Bearing of grid	bearing box		

Bearing of the side of the grid.

Grid X increment input box

The grid is made up of points of integer multiple of "Delta X" in the X direction.

Grid Y increment input box

The grid is made up of points of integer multiple of "Delta Y" in the Y direction.

Keep grid null value points tick box

If ticked, the "Output null value" is written out for any null z-values.

Report file type radio button align 3d/xyz xyz

If xyz – the grid is written out as x y z with one point per line. The" Output null value" is used for any null z-values in the grid.

If align 3d – the grid is written out in a format suitable for align 3d (Quantm). The" Output null value" is used for any null z-values in the grid.

Output null value input box -9999

The z-value to write out if any grid z-value is null.

Output file name file box *.rpt files

Name of the output file for the grid data.

Process button

Run the option

Undo button

Undo the last grid created whilst the panel is up.

16.14.7 DEMs

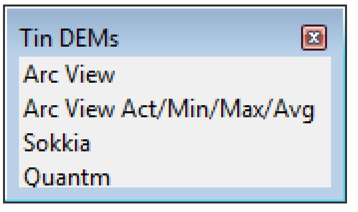
Position of menu: **Tins =>Utilities =>DEMs**

Position of menu: **File I/O =>Data output =>DEMs**

DEMS (Digital Elevation Models) can be created from a tin. DEMS are only regular arrays of z-values, rather than the random values and break lines supported by Tins.

Unfortunately there is not just one formats for DEMs.

The **DEMS** walk-right menu is



For the option *Arc View*, go to 16.14.7.1 Write Arc View DEM
Arc View Act/Min/Max/Avg 16.14.7.2 Write Arc View DEM (Actual, Min, Max, Av)
Sokkia 16.14.7.4 Sokkia
Quantm 16.14.7.3 Quantm

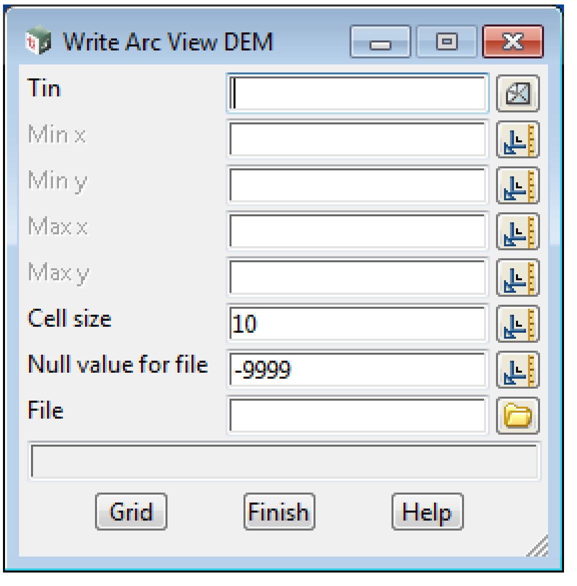
16.14.7.1 Write Arc View DEM

Position of option on menu: **Tins =>Utilities =>DEMs =>Arc View**

Position of menu: **File I/O =>Data output =>DEMs =>Arc View**

The **Arc View** option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values and writes out the data in the Arc View DEM format.

On selecting the **Arc View** option, the **Write Arc View DEM** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin on which the DEM heights will be calculated.

Min x/y	input		

minimum x/y values to calculate spot heights for.

Max x/y	input		

maximum x/y values to calculate spot heights for.

Cell size	input		

size of the delta x and delta y - cell is a square.

Null value for file	input	-9999	

value to use when writing null z-values out to the file.

File	file box		*.grd

the file name for the spot height values in Arc View DEM format.

Grid	button		

calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.

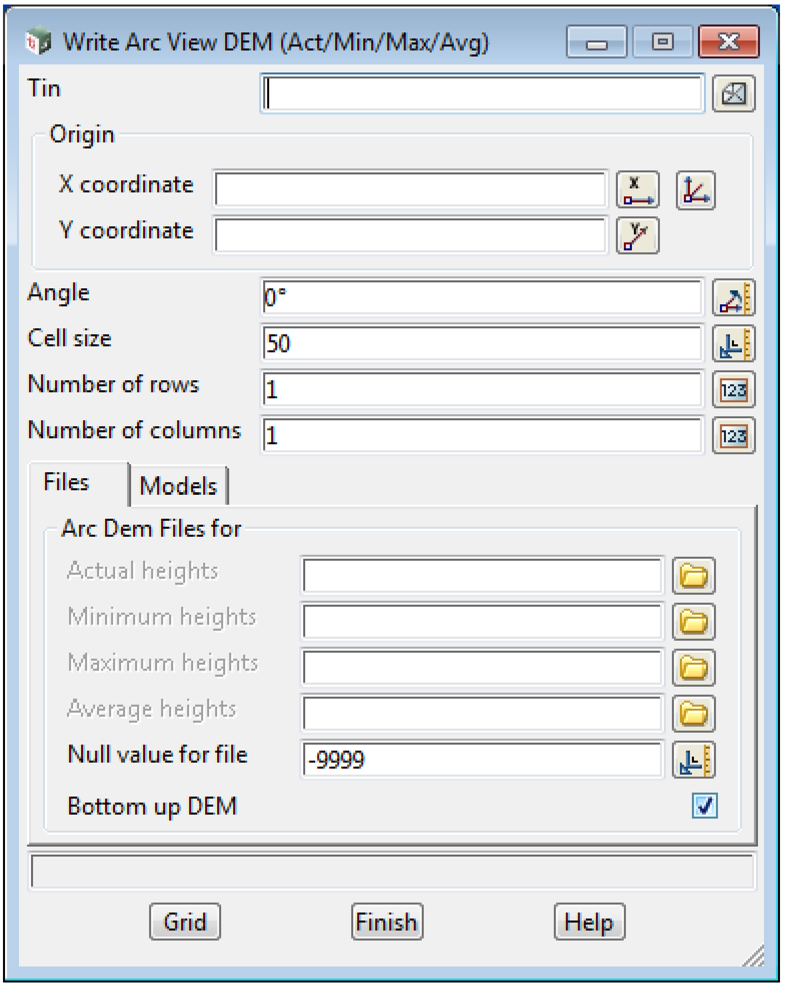
16.14.7.2 Write Arc View DEM (Actual, Min, Max, Av)

Position of option on menu: **Tins =>Utilities =>DEMs =>Arc View Act/Min/Max/Avg**

Position of menu: **File I/O =>Data output =>DEMs =>Arc View Act/Min/Max/Avg**

The **Arc View Act/Min/Max/Agg** option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values, and also the minimum, maximum and average values for the cell. The data is written out in the Arc View DEM format.

On selecting the **Arc View Act/Min/Max/Avg** option, the **Write Arc View DEM (Act/Min/Max/Avg)** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin on which the DEM heights will be calculated.

X/Y coordinate	input		

X/Y coordinates for the origin of the DEM

Angle	angle box		

angle of rotation of the DEM

Cell size	input		

size of the delta x and delta y - cell is a square.

Number of rows/columns input 1

number of rows/columns in the DEM

Files tab - Arc DEM files for

Actual heights file box

if non blank, write the z-values for the tin at the middle of each cell, out to a dem file

Minimum heights file box

if non blank, write the minimum z-values for the tin for the each cell, out to a dem file

Maximum heights file box

if non blank, write the maximum z-values for the tin for the each cell, out to a dem file

Average heights file box

if non blank, write the average z-values for the tin for the each cell, out to a dem file

Null value for file input -9999

value to use when writing null z-values out to the DEM files.

Bottom up DEM tick box

if ticked, the DEM files are written from the bottom row of the grid and work up.
If not ticked, the DEM files are written from to top row of the grid and work down

Models tab - Models for

Actual heights model box

if non blank, create points of z-values for the tin at the middle of each cell

Minimum heights model box

if non blank, create points of minimum z-values for the tin for the each cell

Maximum heights model box

if non blank, create points of maximum z-values for the tin for the each cell

Average heights model box

if non blank, create points of average z-values for the tin for the each cell

Colour for points colour box

colour for the point strings

Grid button

calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.

16.14.7.3 Quantm

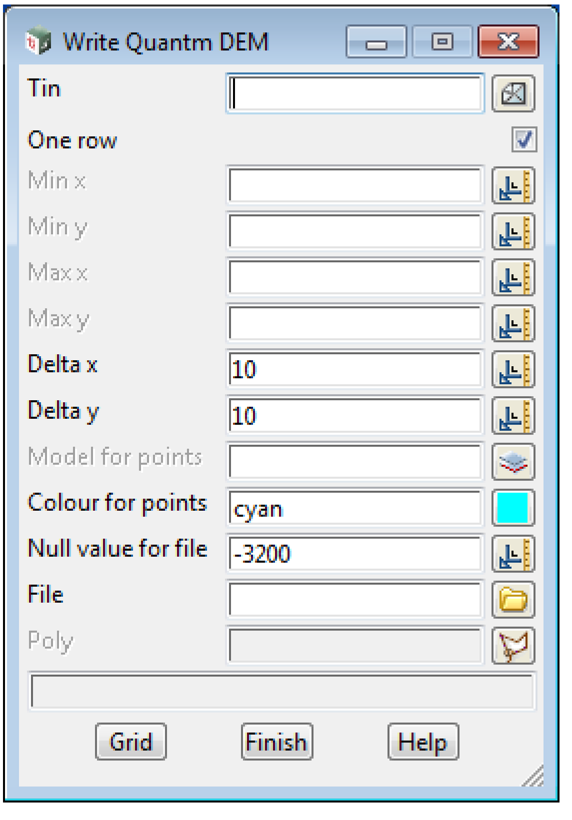
Position of option on menu: **Tins =>Utilities =>DEMs =>Quantm**

Position of menu: **File I/O =>Data output =>DEMs =>Quantm**

The **Quantm** option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Actual point strings and/or a file of heights at the points in Quantm (formerly Align 3D) format can be generated. For Quantm no polygon should be used and if there is no z-value (no tin) at a point, then a null z-value is written to the output file.

On selecting the **Quantm** option, the **Write Quantm DEM** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin on which the spot heights will be calculated.

One row tick box

*If **ticked**, null points are added in for any missing (x,y) so that there is only one row of data (one string) for each x-value.*

Min x/y input

minimum x/y values to calculate spot heights for.

Max x/y input

maximum x/y values to calculate spot heights for.

Delta x/y input

difference between the x/y-values.

Model for points	model box		available models

if blank, no point strings will be created.
If non-blank, points strings of the spots heights will be created and stored in this model.

Colour for points	colour box	default colour	available colours

colour to make the point strings.

Null value for file	input	-3200	

value to use when writing null z-values out to the file.

File	file box		*.grd

If non-blank, a file of the spot height values in Quantm format is created.

Poly	poly-select

if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.

Grid	button

calculate the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

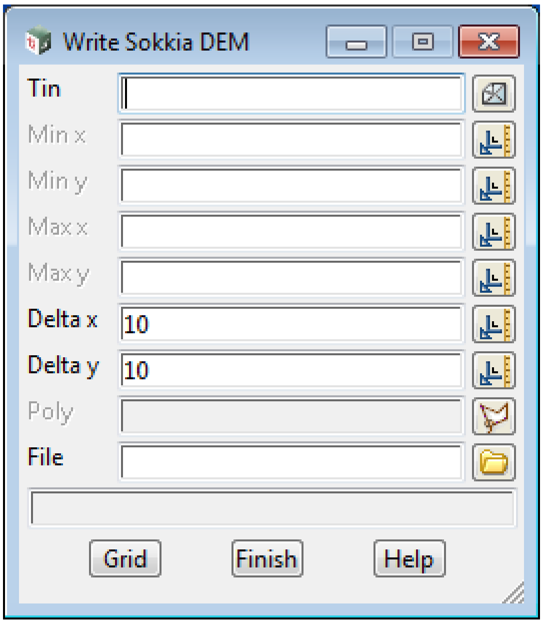
16.14.7.4 Sokkia

Position of option on menu: **Tins =>Utilities =>DEMs =>Sokkia**

Position of menu: **File I/O =>Data output =>DEMs =>Sokkia**

The **Sokkia** option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon. A file of heights at the points in Sokkia format is generated.

On selecting the **Sokkia** option, the **Write Sokkia DEM** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin on which the spot heights will be calculated.

Min x/y	input		

minimum x/y values to calculate spot heights for.

Max x/y	input		

maximum x/y values to calculate spot heights for.

Delta x/y	input		

difference between the x/y-values.

Poly	poly-select		

if a polygon is selected, then the spot heights will be restricted to within the polygon. If no polygon is selected, the spot heights will be calculated over the entire tin.

File	file box		*.grd

If non-blank, a file of the spot height values in Sokkia format is created.

Grid	button		

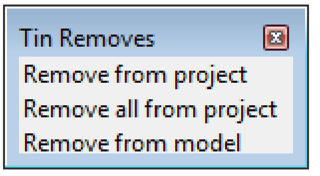
calculate and write a file of the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

16.14.8 Remove

Position of menu: **Tins =>Utilities =>Remove**

Tins can be removed from models and from the project. Remove tins are not deleted but simply taken off the tin list in the project. Removed tins are left in the project area and can be added in again using the **add** option.

The **tin removes** walk-right menu is



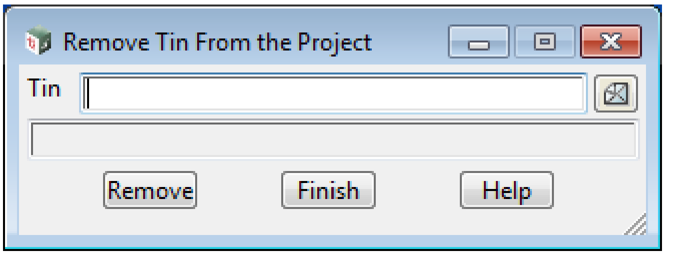
The options in the menu will now be described.

For the option Remove from project, go to	16.14.8.1 Remove From Project
Remove all from project	16.14.8.2 Remove All From Project
Remove from model	16.14.8.3 Remove From Model

16.14.8.1 Remove From Project

Position of option on menu: **Tins =>Utilities =>Remove =>Remove from project**

On selecting the **remove from project** option, the **remove tin from the project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to be removed from the working project.

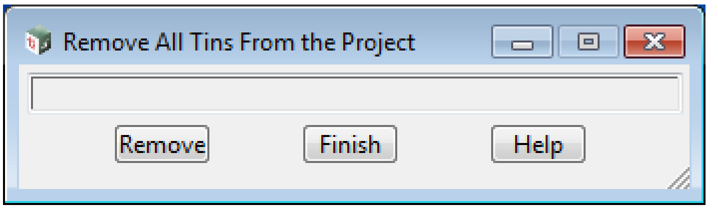
Remove	button		

remove the tin given in the **tin** *field from the project.*

16.14.8.2 Remove All From Project

Position of option on menu: **Tins =>Utilities =>Remove =>Remove all from project**

On selecting the **Remove all from project** option, the **remove all tins from project** panel is displayed.



The fields and buttons used in this panel have the following functions.

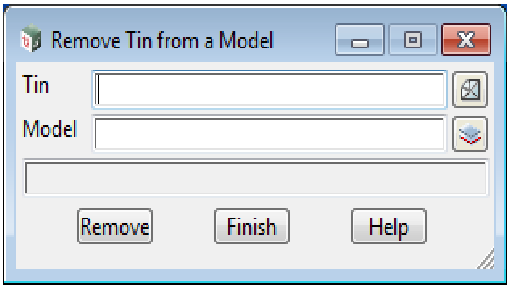
Field Description	Type	Defaults	Pop-Up
Remove	button		

remove all the tins from the working project. If no errors occur, the panel will be removed after the tins have been removed.

16.14.8.3 Remove From Model

Position of option on menu: **Tins =>Utilities =>Remove =>Remove from model**

On selecting the **remove from model** option, the **remove tin from a model** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to be removed from a model.

Model	model box		available models

name of the model from which the tin given in the **tin** *field will be removed.*

Remove	button		

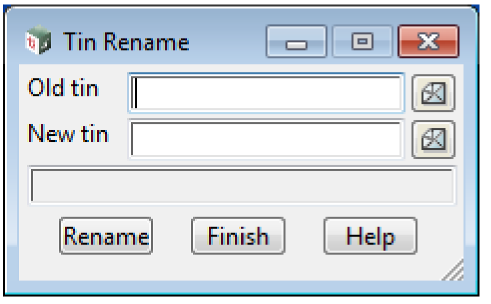
remove the tin given in the **tin** *field from the model given in the* **model** *field.*

16.14.9 Rename

Position of option on menu: **Tins =>Utilities =>Rename**

On selecting the **rename** option, the **tin rename** panel is displayed.

This panel can be used to change the names of existing tins



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old tin	tin box		available tins

name of the tin to be renamed.

New tin	tin box		

new name for the tin

Rename	button		

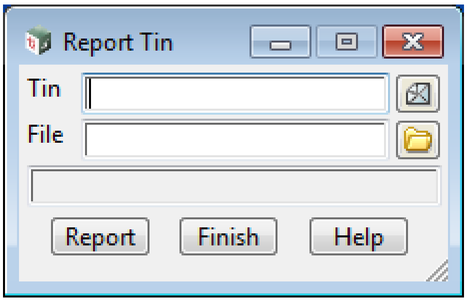
change the name of the tin in the **old tin** *field to the name given in the* **new tin** *field.*

16.14.10 Report

Position of option on menu: **Tins =>Utilities =>Report**

This panel produces a report on the tin including the models making up the tin and all the settings used when creating the tin.

On selecting the **Tin report** option, the **Report Tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

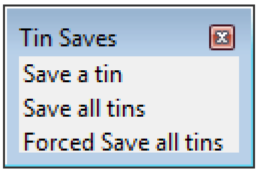
Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins or super tins
name of the tin to create report for.			
File	file box		*.rpt files
name of the report file			
Report	button		
create the tin report.			

16.14.11 Save

Position of menu: **Tins =>Utilities =>Save**

Tins are automatically saved on disk when they are first created but various operations can then be applied to tins which may not be immediately updated on disk.

The **tin saves** walk-right menu is

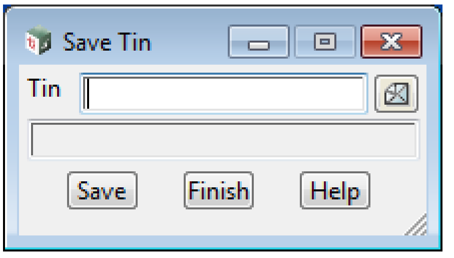


The options in the menu will now be described.

For the option Save a tin, go to	16.14.11.1 Save a Tin
Save all tins	16.14.11.2 Save/Forced Save All Tins
Forced Save all tins	16.14.11.2 Save/Forced Save All Tins

16.14.11.1 Save a Tin

On selecting the **save a tin** option, the **save tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to be saved to disk.

Save	button		

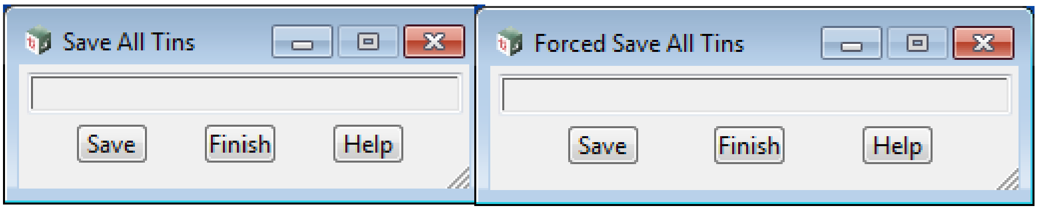
after selecting this button, the tin given in the **tin** *field will be saved to disk.*

16.14.11.2 Save/Forced Save All Tins

Position of option on menu: **Tins =>Utilities =>Save =>Save all tins**

Position of option on menu: **Tins =>Utilities =>Save =>Forced Save all tins**

On selecting the **save/force save all tins** option, the **save/forced save all tins** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

for save all tins: after selecting this button, all tins in the working project that have been modified since their last save, will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

for force save all tins: after selecting this button, all tins in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

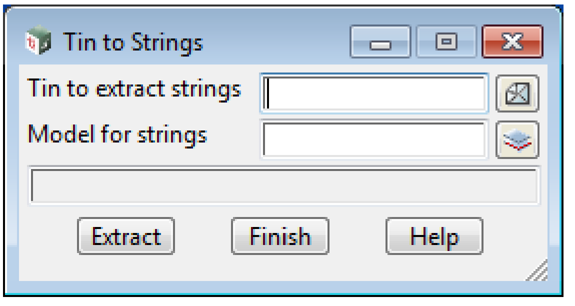
16.14.12 Tin to Strings

Position of option on menu: **Tins =>Utilities =>Tin to strings**

The points and breaklines of an existing tin can be extracted using the **Tin to strings** option.

Note that only the final points and breaklines used in creating the tin are extracted. Original string name, colours etc. are not obtainable.

Selecting **Tin to strings** displays the **Tin to Strings** panel:



The fields and buttons used in this panel have the following functions.

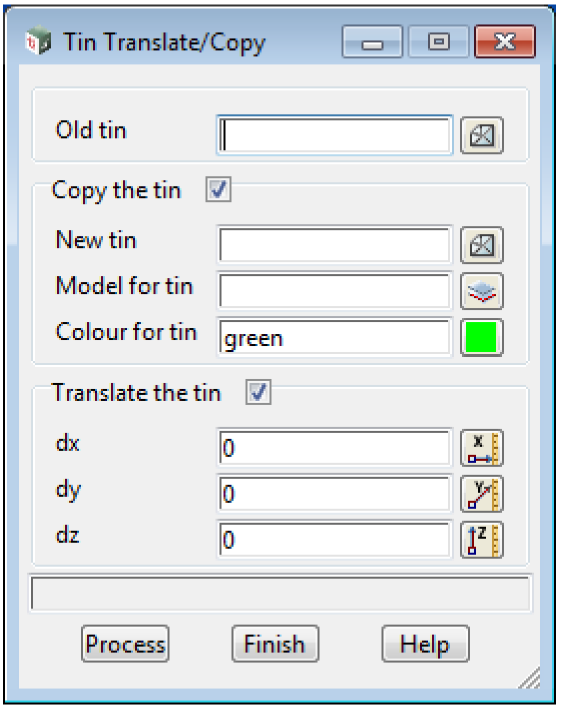
Field Description	Type	Defaults	Pop-Up
Tin to extract strings	tin box		available tins
name of the tin to extract points and breaklines from.			
Model for strings	input		available models
model to hold the extracted point and breakline strings.			
Extract	button		
extract the points and breaklines that make up a tin.			

16.14.13 Translate/Copy

Position of option on menu: **Tins =>Utilities =>Translate/copy**

An existing tin can be translated and/or copied using the **Translate/copy** option.

Selecting **Translate/copy**, displays the **Tin Translate/Copy** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old tin	tin box		available tins

name of the tin to be copied/translated.

Copy the tin	tick box	tick	

if ticked, the **New tin**, **Model for Tin** *and* **Colour for tin** *fields are activated and supply the information for the new tin.*

New tin	tin box		available tins

name of the copy of the tin - this can't be the same as any existing tin in the project.

Model for tin	model box		available models

if non-blank, the name of the model for the new tin. If blank, the tin is not put in any model.

Colour for tin	colour box		available colours

if non-blank, the colour of the new tin. If blank, use the old tin colour

Translate the tin	tick box	tick	

if ticked, the **dx**, **dy** *and* **dz** *fields are activated and supply the information for translating the tin*

dx/dy/dz	real box	0	

the delta amounts to translate the tine by.

Process	button		

translate/copy the tin.

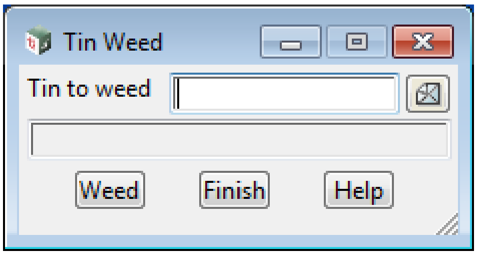
16.14.14 Weed

Position of option on menu: **Tins =>Utilities =>Weed**

When a tin is created, a copy of all the points and lines used in creating the tin is saved with the tin, including any duplicate points and lines.

The **weed** option will remove all the duplicate points and lines from the tin database.

On selecting the **Weed** option, the **tin weed** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to weed	tin box		available tins

name of the tin to weed.

Weed	button		

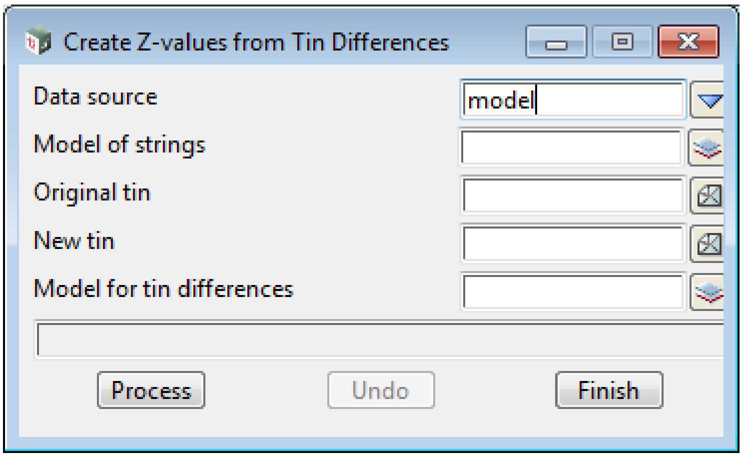
remove all duplicate points and lines from the tin database.

16.14.15 Z Differences from Tins

Position of option on menu: **Tins =>Utilities =>Z diffs from tins**

This option takes a data source and for each point in the data source, creates a new point whose z-value is the difference in z-values from two given tins at the plan position of the data source point.

On selecting the **Z diffs from Tins** option, the **Create Z-Values from Tin Differences** panel is displayed.



The fields and buttons used in this panel have the following functions:

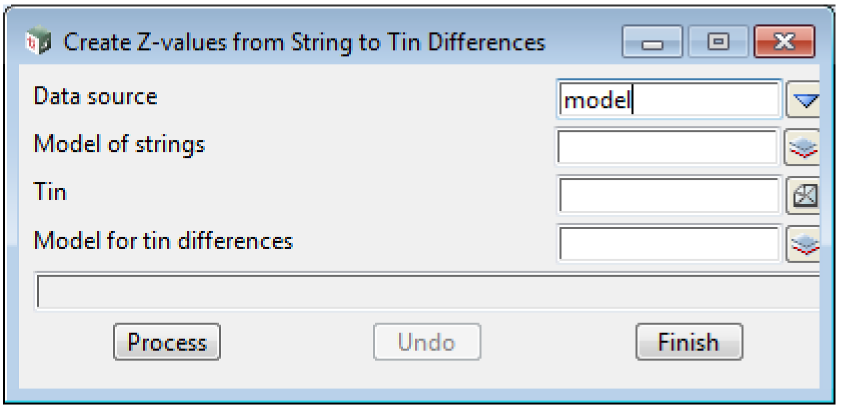
Field Description	Type	Defaults	Pop-Up
Data to settle			
Data source type	choice box	Model	model, string, view
data selection type			
Data source	input		
data to be processed.			
Original tin	tin box		available tins
name of the tin to get the z-value from.			
New tin	tin box		available tins
name of the tin to get the z-value from.			
Model for tin differences	model box		available models
model to place the strings containing the z values with the difference between the tins.			
Process	button		
for all strings in the data source, calculate the difference in the z-values from the two tins at the string vertices.			

16.14.16 Z Differences from String to Tin

Position of option on menu: **Tins =>Utilities =>Z diffs from string to tin**

This option takes a data source and for each string in the data source, creates a plan copy of the string and for each vertex in the new string, the z-value at a vertex is the difference in z-values from the original string vertex and the z-value of the tin at the (x,y) position of the vertex.

On selecting the **Z diffs from string to tin** option, the **Create Z-Values from String to Tin Differences** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type	choice box	Model	model, string, view

data selection type

Data source	input		

data to be processed.

Tin	tin box		available tins

name of the tin to get the z-value from.

Model for tin differences	model box		available models

model to place the strings containing the z values with the difference between the original string and the tin.

Process	button		

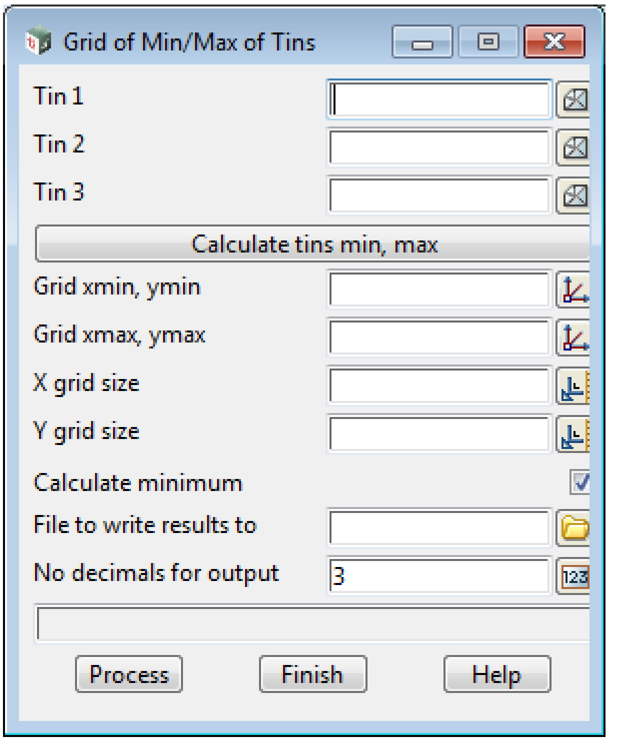
for all strings in the data source, calculate the difference in the z-values from the string to the tin.

16.14.17 Grid of Min / Max of Tins

Position of option on menu: **Tins =>Utilities => Min/ Max of Tins**

This option takes one to three tins and creates a regular grid of points where the z-value at each point is the minimum of the tins at that point.

Selecting **Min/ Max of Tins** brings up the **Grid of Min / Max of Tins** panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tin 1, Tin 2, Tin 3	tin box		available tins

if non blank, this tin is used to use in the calculation to find the minimum of the tins at each grid point.

Calculate tins min, max button

when pressed, the minimum and maximum x and y values for the union of the three tins is calculated and the values written to the Grid xmin, ymin, Grid xmax, ymax fields.

Grid xmin, ymin input

the minimum x value, then one or more spaces, and then the minimum y values, to be used for creating the grid.

Grid xmax, ymax input

the maximum x value, then one or more spaces, and then the maximum y values, to be used for creating the grid.

x grid size input

the x coordinates for the grid points are created starting at the Grid xmin and then incremented by "x grid size" for as long as the x value is less than or equal to Grid xmax

y grid size input

the y coordinates for the grid points are created starting at the Grid ymin and then incremented by "y *grid size" for as long as the y value is less than or equal to Grid ymax*

Calculate minimum tick box ticked

if ticked, then grid points are created with the z-value being the minimum of tins Tin1, Tin 2, Tin3.

If not ticked, then grid points are created with the z-value being the maximum of tins Tin1, Tin 2, Tin3.

File to write results to File

name of the file to write the grid points out to. The format of the file is x, y and z, separated by spaces and with one point per line. The "File to write results to" must be non-blank.

No decimals for output input 3

number of decimal places to use for the x, y and z values

Process button

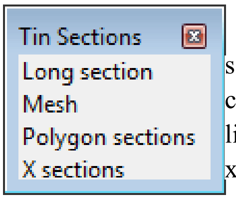
when this button is pressed, the grid of either the tin minimums or maximums is created and written to the file

16.15 Sections

Position of menu: **Tins =>Sections**

The **triangles=>sections** menu contains options involving sections through the tin.

The **sections** walk-right menu is



section along a string
create sets of sections through tin at right angles
limit sections to a polygon
x-sections along a string

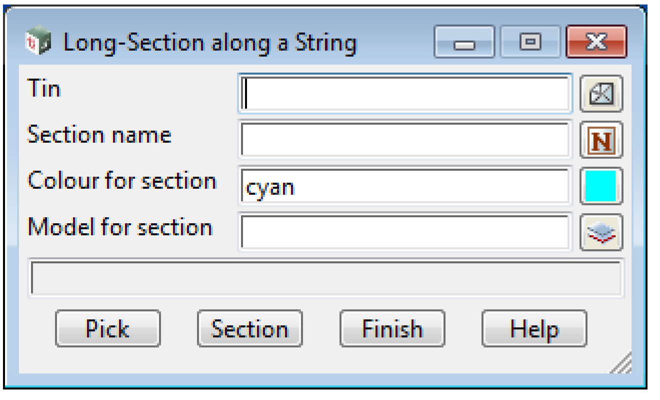
For the option *Long section*, go to 16.15.1 Long Sections.
Mesh, 16.15.2 Mesh
Polygon sections 16.15.3 Polygon Sections
X-sections 16.15.4 X-Sections

16.15.1 Long Sections

Position of option on menu: **Tins =>Sections =>Long Section**

The long section option calculates the section through a tin along a particular string. This option is rarely used because tins are automatically profiled through on the section view and in long section and x-section plots.

On selecting the **long section** option, the **long section along a string** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin that the string will be sectioned against.

Section name	input		

name to give the long section string

Colour for section	colour box	default colour	available colours

colour to make the long section string

Model for section	model box		available models

name of the model to contain the long section string.

Pick	string-select		

select he string to be sectioned along.

Section	button		

calculate the long section along the string selected by the **pick** *button, against the tin given in the tin field. The resulting section string is added to the model given in the* **Model for Section** *field.*

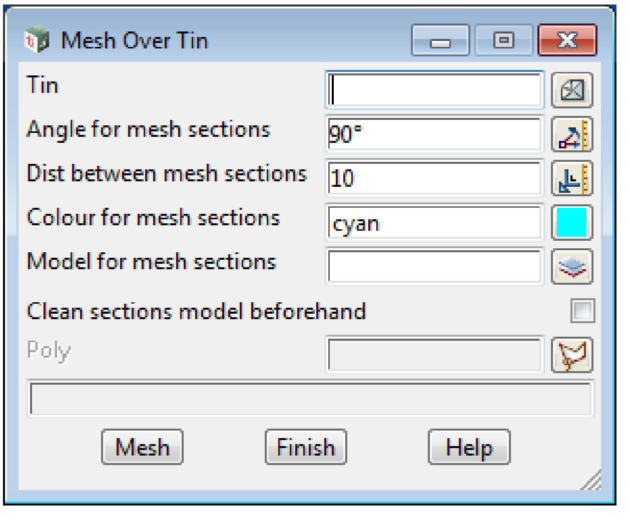
16.15.2 Mesh

Position of option on menu: **Tins =>Sections =>Mesh**

A 12d Model mesh is simply a series of lines cutting through the tin (sections) at a given angle and spacing, and at right angles to the given angle with the same spacing.

A mesh is an effective method of visualizing a triangulation when displayed in a perspective view and for hidden views.

On selecting the **mesh** option, the **mesh over tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin that the mesh sections will be calculated through.

Angle for mesh sections	angle box	90.0	0,45,90

angle (in degrees) of the lines to section along. The sections are also created at rights angles to this angle as well.

Dist between mesh sections	input	10.0	1,10,100

distance between the lines to section along

Colour for mesh sections	colour box	default colour	available colours

colour to make the calculated sections

Model for mesh sections	model box		available models

name of the model to contain the calculated sections.

Clean sections model beforehand tick box

if ticked, the model of sections is cleaned out before the option runs.

Poly polygon select

if a polygon is selected, then the sections are restricted to remaining within the polygon.

Mesh button

two sets of sections through the tin given in the **tin** *field are created within the selected polygon, or if no polygon is selected, the bounding polygon for the tin. One set of sections are calculated along straight lines at the angle given by the* **angle** *field and at a separation given by the* **dist** *field and the second set at right angles to the first set.*

<esc> can be used to abort the mesh option.

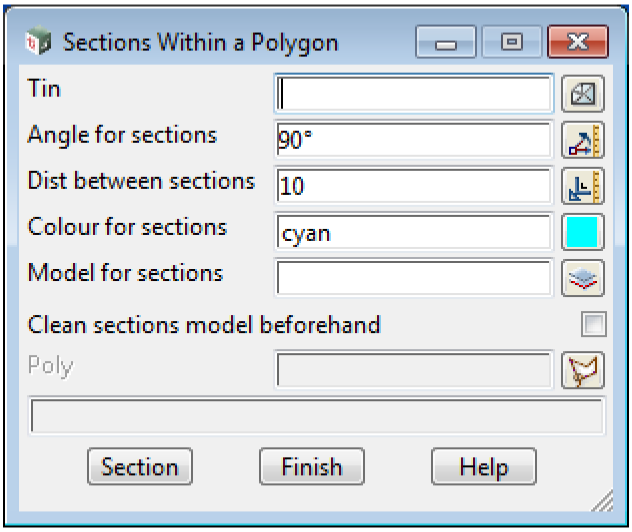
16.15.3 Polygon Sections

Position of option on menu: **Tins =>Sections =>Polygon sections**

In the **polygon sections** option, sections are calculated for a series of parallel lines covering the polygon, or if no polygon is given, the tin. The angle of the parallel lines and the distance between them are set by the user.

This option provides a quick method for producing a one directional set of sections covering a polygonal region on a tin.

On selecting the **polygon sections** option, the **sections within a polygon** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
name of the tin that the sections will be calculated through			
Angle for sections	angle box	90.0	0,45,90
angle (in degrees) of the lines to section along			
Dist between sections	input	10.0	1,10,100
distance between the lines to section along			
Colour for sections	colour box	default colour	available colours
colour to make the calculated sections			
Model for section	model box		available models
name of the model to contain the calculated sections.			
Clean sections model beforehand	tick box		
if ticked, the model of sections is cleaned out before the option runs.			
Poly	polygon-select		
*A polygon is selected from a view. If **no polygon** is selected, sections are created over the entire tin.*			
Section	button		

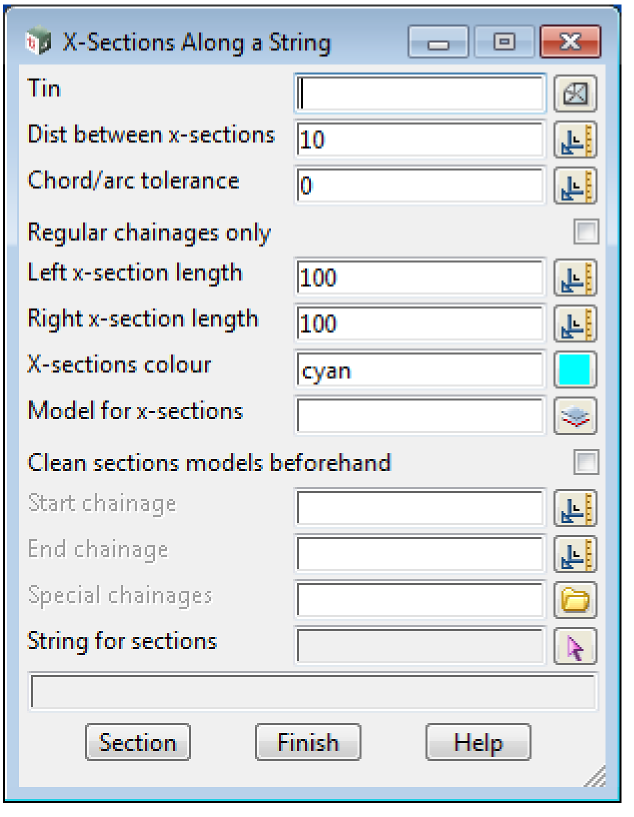
Sections within the polygon selected by **poly** *will be calculated along parallel straight lines at the angle given by the* **angle** *field and at a separation given by the* **dist** *field. The sections are made against the tin given by the Tin field. The sections colour is that given in the* **colour** *field and the section strings* *are placed in the model given in the* **model** *field.*

16.15.4 X-Sections

Position of option on menu: **Tins =>Sections =>X Sections**

The X-sections (cross sections) option calculates cross sections at a given interval along a string.

On selecting the **x-section** option, the **x-sections along a string** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin that the x-sections will be calculated through.

Dist between x-sections	input	10	

the distance between points on the selected string where the x-sections are calculated.

Regular chainages only	tick box		

if ***ticked****, sections are only calculated at points at the given chainage distance apart.*
If ***not ticked****, extra sections are created at horizontal tangent points and horizontal IPs.*

Left x-section length	input	100	

the plan distance for the left side of the x-section - that is, the distance that the x-section extends to the left of the selected string.

Right x-section length	input	100	

the plan distance for the right side of the x-section - that is, the distance that the x-section extends to the right of the selected string.

X-sections colour	colour box	default colour	available colours

colour to make the x- sections

Model for x-sections model box available models

name of the model to contain the x-sections.

Start/End chainage input

the string chainage to start/end the x-sections. If blank, the **start/end chainage** *is taken to be the chainage at the beginning/finish of the string.*

Special chainages file box *.spc files

if non blank, a file of special chainages to also create x-sections at

String for sections string-select

select the string to calculate the x-sections along.

Section button

calculate the x-sections along the string selected by the **pick** *button, against the tin given in the tin field. The resulting x-section strings are added to the model given in the* **model for x-sections** *field.*

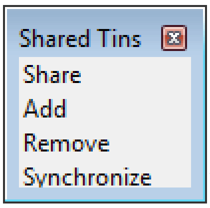
16.16 Sharing

Position of menu: **Tins =>Sharing**

Sharing allows tins from a project (the server project) to be added to other projects (client projects).

Before any tins can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The **Sharing** walk-right menu is



allow tins in this project to used by other projects
add a shared tin from another project
remove a tin shared from another project
updated tins shared from other projects

For the option *Share*, go to 16.16.1 Share Tins
Add 16.16.2 Add Shared Tins
Remove 16.16.3 Remove Shared Tins
Synchronize 16.16.4 Synchronize Shared Tins

16.16.1 Share Tins

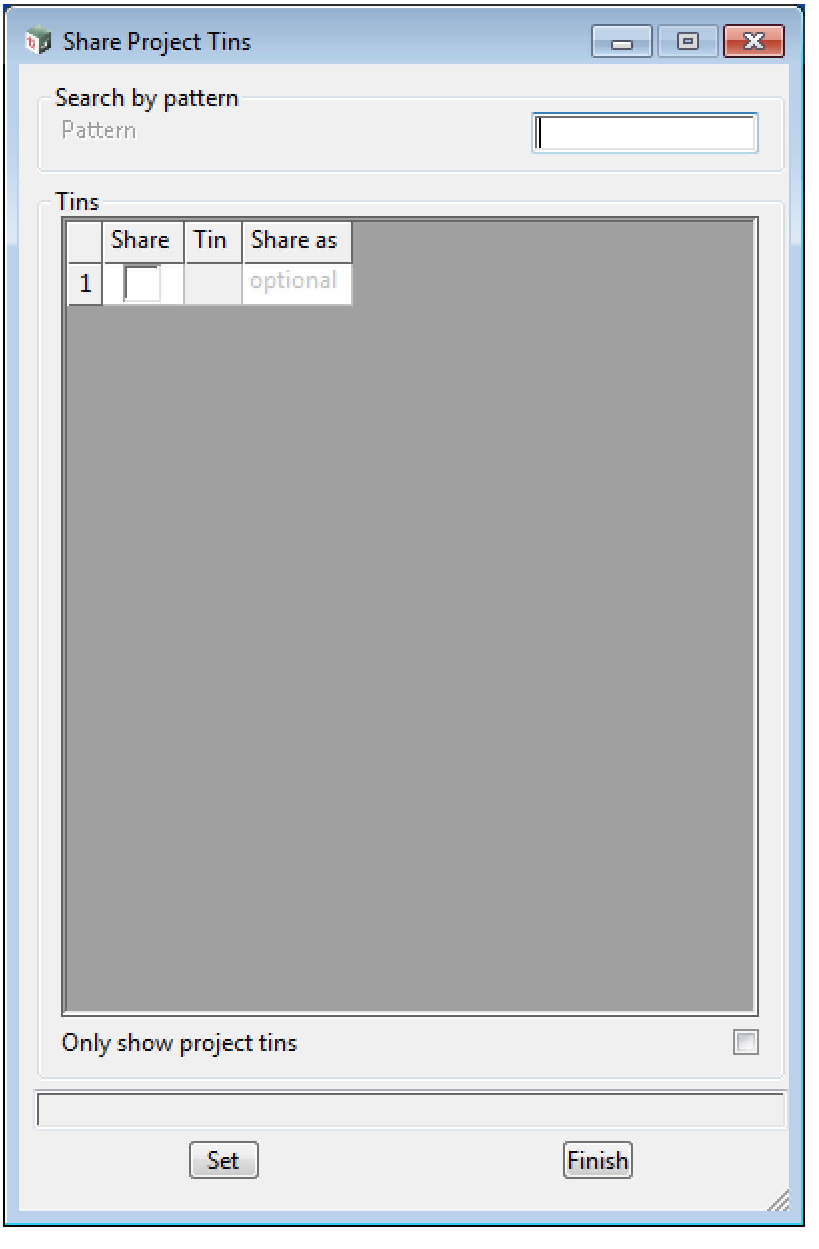
Position of option on menu: **Tins =>Sharing =>Share**

Before tins in a server project can be added to client projects, the tins must be made available for sharing in the server project by using the **Share** option.

All tins that have been made available for sharing are displayed in tin lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

This option also can reverse the process. That is, remove the availability of a tin for sharing. If this is done then clients who have shared this tin will be warned.when starting up their project and/or synchronizing occurs.

Selecting **Share** displays the **Share Project Tins** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Default Pop-Up

All the models in the project are listed in the **Share Project Tins** *panel and if a tin has been tagged for Sharing, a ticked will be displayed in the* ***Share*** *column of the grid.*

Pattern

if a pattern is typed then all the tins matching the pattern will have a tick placed in the ***Share*** *column. If * is typed then all tin are ticked for sharing.*

Share grid column

tick if the tin is to be made available for sharing when the **Set** *button is pressed.*

All tins that have been made available for sharing are displayed in tin lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

Clicking RB on ***Share*** *at the top of the column brings up a menu to* ***Toggle*** *the ticks,* ***Set*** *all the ticks on,* ***Clear*** *to turn all the ticks off.*

Tin grid column

this column lists all the tins in the project

Share as grid column

an optional name with which the tin will be shared out to clients. Leave it blank to share under the original name.

Only show project tins tick box

if ticked, only tins originating from the current project are shown.

Set button

clicking ***Set*** *marks all the tins with a tick in the* ***Tick*** *column as being available for sharing. Those tins without a tick will not be available for sharing.*

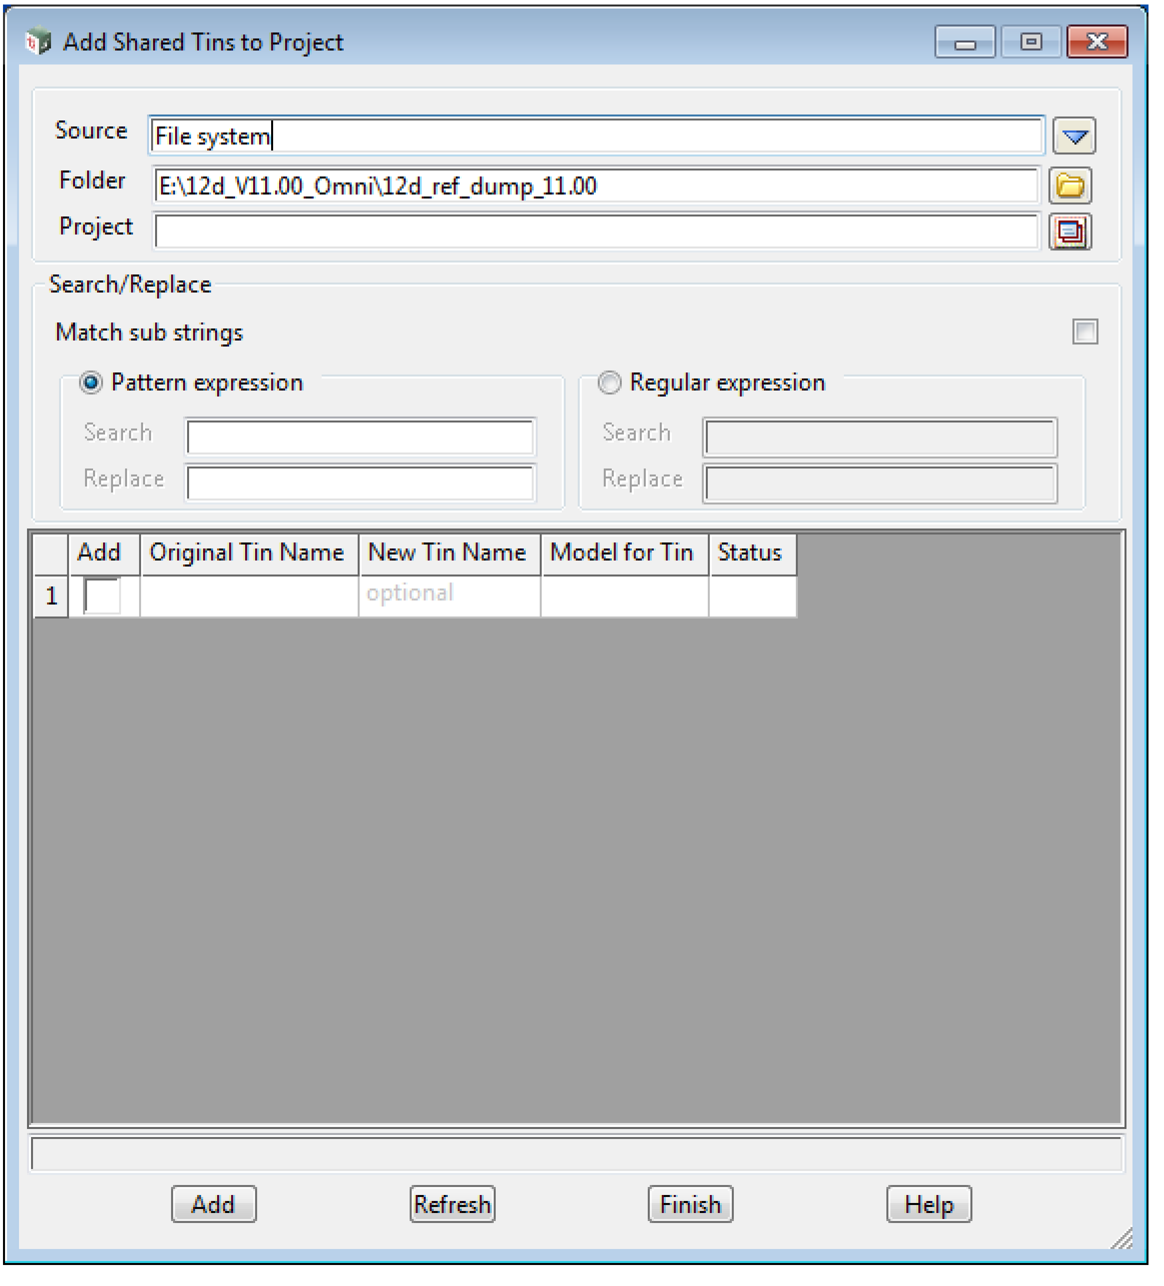
16.16.2 Add Shared Tins

Position of option on menu: **Tins =>Sharing =>Add**

The **Add** option is used to add shared tins from a server project, to this project (a client project).

All tins that have been added as shared tins are displayed in tin lists in a colour defined by an environment variable. The default colour is blue.

Selecting **Add** displays the **Add Shared Tins to Project** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box		select folder

*folder to look for **12d Model** projects. When a folder is selected, all the **12d Model** projects in the folder will be displayed in a **Projects** pop-up list.*

Project folder box select folder

name of the ***12d Model*** *project in the folder given in the* **Folder** *field, to search for tins marked for sharing. Once a project is selected, all the tins marked for sharing from that project will be listed in the* Original Tin Name *column.*

Search/Replace

section for renaming tins from the selected server project

Match sub strings tick box

if ***ticked****, the* **Search** *expression is used to match against part of each tin name.*

If ***not ticked****, the* **Search** *expression is used to match against the entire tin name.*

Pattern expression radio button

if set on, then ***Pattern*** *expressions given in the* **Search** *and* **Replace** *fields are used to modify tin names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the tin names. For example " exist" will select all tins with a name ending with " exist"*

Replace input

replacement for the search pattern found in the tin name. For example, "exist " in the Replace *field, takes the matched part of the tin name and adds "exist " to the front of it.*

Hence the Search pattern " exist" and Replace pattern "exist *" finds all tin with names ending in " exist" and renames them with the name starting with "exist " (and the " exist" at the end of the name is dropped off).*

Regular expression radio button

if set on, then ***Regular*** *expressions given in the* **Search** *and* **Replace** *fields are used to modify tin names.*

Search input

regular expression to search for in the tin names.

Replace input

replacement for the search expression found in the tin name.

Tin Names Grid

The tins available for sharing in the selected project are shown in the Original Tin Name *column. Any renaming by the Search and Replace expressions are shown in the* New Tin Name *column. Note that if the tin already exists in the current project, then the cell for that model in* Original Tin Name *column will be displayed in yellow.*

Add tick boxes in grid column

if ticked, the tin will be added to the project when the ***Add*** *button is pressed.*
If not ticked, the tin will not be added to this project as a shared tin.

Clicking RB on ***Add*** *at the top of the column brings up a menu to* ***Clear*** *which turns all the ticks off.*

Note - a shared tin that has been previously added can only be removed by using the **Tins =>Sharing =>Remove** *option.*

Original Tin Name column

this column lists all the tins in the server project that are available for adding to this client project.

New Tin Name column

if ***non blank****, the name to use instead of the* Original Tin Name *when the tin is added t the project.*

*If **blank**, the* Original Tin Name *is used for the tin when it is added to the project.*

The New Tin Names *can be from applying the* **Search** *and* **Replace,** *or by just typing them in.*

Model for Tin grid column

*if **non blank**, the model name to use in the client project for this tin added to the project*

If blank, the model name is the same as that in the server project.

Status output column

displays if their has been a match *or* no match *for the search/replace for renaming tins*

Add button

add to this project (a client project) as a shared tin, the ticked tins given in the Original Tin Name *field from the project given in the* **Project** *field, and add them to the model in the* Model for Tin field*.*

Refresh button

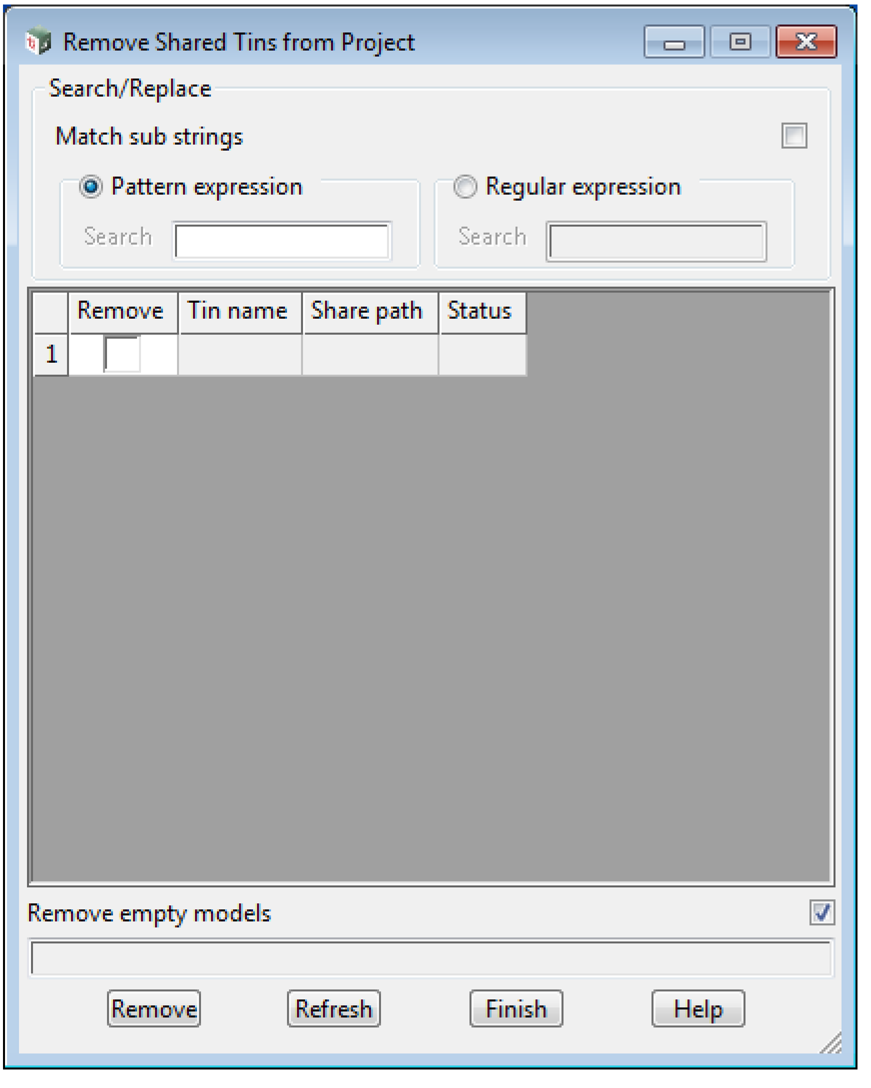
clicking Refresh *refreshes the list of all tins available for sharing in the selected* ***12d Model*** *project (server project).*

16.16.3 Remove Shared Tins

Position of option on menu: **Tins =>Sharing =>Remove**

The **Remove** option is used to remove shared tins from the.project. The shared tins would have been previously added to the project with the **Tins =>Sharing =>Add** option.

Selecting **Remove** displays the **Remove Shared Tins from Project** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Search/Replace

section for selecting by expressions, tins shared from other projects

Match sub strings tick box

*if **ticked**, the* **Search** *expression is used to match against part of each tin name.*

*If **not ticked**, the* **Search** *expression is used to match against the entire tin name.*

Pattern expression radio button

*if set on, then **Pattern** expressions given in the* **Search** *field are used to select tin names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the tin names. For example " exist" will select all tins with a name ending with " exist"*

Regular expression radio button

*if set on, then **Regular** expressions given in the* **Search** *field are used to select shared tin names.*

Search input

regular expression to search for in the shared tin names.

Tin Names Grid

list of all shared tins added to the project.

Remove tick boxes in grid column

*if ticked, the tin will be removed from this project as a shared tin when the **Remove** button is pressed.*

*Clicking RB on **Remove** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Tin Name grid column

this column lists all the tins in this project added as shared tins from other server projects

Share path

this column lists the path name to the server project and the original tin name in the server project

Status grid column

displays if their has been a match *or* no match *for the* Search *for selecting shared tins*

Remove button

*clicking **Remove** removes as shared tins form this project, all the tins with a tick.*

Refresh button

*clicking **Refresh** refreshes the list of all shared tins previously added to the project*

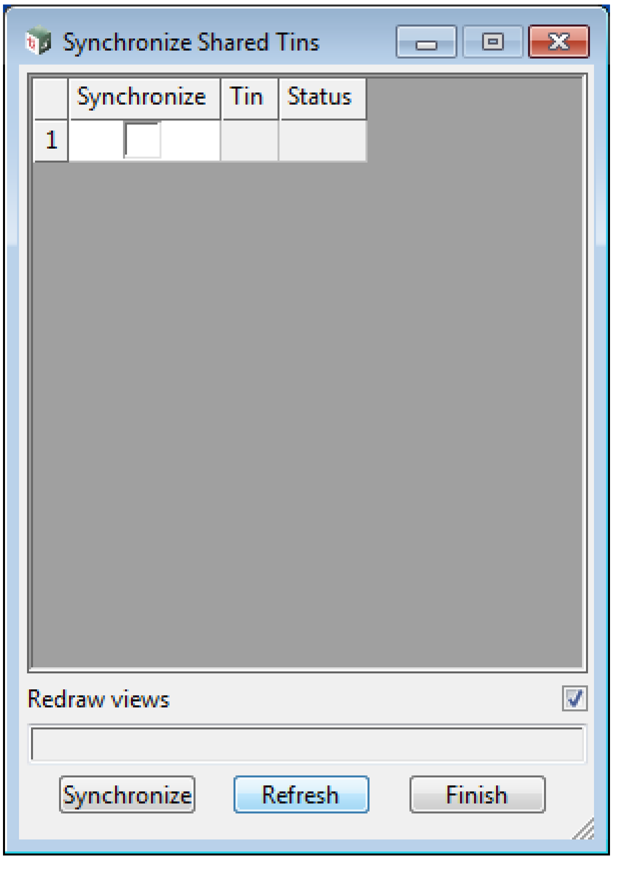
16.16.4 Synchronize Shared Tins

Position of option on menu: **Tins =>Sharing =>Synchronize**

The **Synchronize** option is used to updated any added shared tins. The shared tins would have been previously added to the project with the **Tins =>Sharing =>Add** option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section 7.6.13.4 Project Share Settings.

Selecting **Synchronize** displays the **Synchronize Shared Tins** panel.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Synchronize tick boxes in grid column

*if ticked and the tin has changed in the server project, then it will be re-copied from the server project when the **Synchronize** button is pressed.*

*Clicking RB on **Copy** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Tin grid column

this column lists all the tins in this project that have been added from other (server) projects

Synchronize button

*clicking **Synchronize** re-copies any tins with a tick from the server projects*

Status

*Status will either be **Ok** or **No Longer Shared** to reflect the status of the tin on that row.*

Redraw views tick box

Whether or not to redraw all the views any of the synchronized tins are on.

Refresh button

*clicking **Refresh** refreshes the list of all shared tins previously added to the project*

16.17 Delete

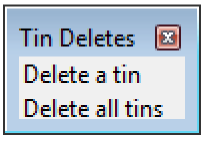
Position of menu: **Tins =>Delete**

The **delete** option is used to delete tins from the project and from the computer disk so that they no longer can be accessed or take up disk space.

To help protect against disasters, a **yes-no** pop-up menu is used to confirm that the user did intend deleting the tin. If deletion is confirmed, the selected tin is removed from the project (if its in the project) and deleted from the disk.

If a **12d** ***Model*** *trash bin* is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

The **tin Deletes** walk-right menu is



For the option *Delete a tin*, go to 16.17.1 Delete a Tin
Delete all tins 16.17.2 Delete All Tins

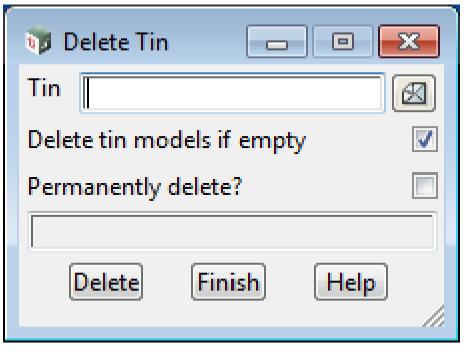
16.17.1 Delete a Tin

Position of option on menu: **Tins =>Delete =>Delete a tin**

The **delete a tin** option can be used to delete a tin in the project.

If a **12d** ***Model*** *trash bin* is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

On selecting the **delete a tin** option, the **delete tin** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		project tins

name of the tin to be deleted from the computer disk.

Delete tin models if empty tick box

if ticked then the models containing the tin are also deleted if they are empty after the tin is deleted.

Permanently delete tick box

if tick, the deleted tins will not go to the trash bin but will be permanently deleted from disk.

Delete button

after selecting this button, the tin given in the tin field will be deleted from the computer disk. A **yes-no** *pop-up is used to confirm that deletion is required.*

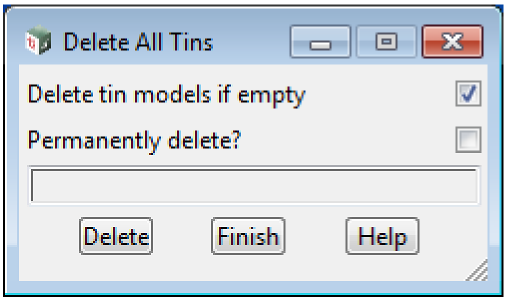
16.17.2 Delete All Tins

Position of option on menu: **Tins =>Delete =>Delete all tins**

The **delete all** option will delete all tins in the working project. It does not delete tins that are in the working project area but not yet added to the project.

If a **12d** ***Model*** *trash bin* is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see 7.6.15 Trash Bin).

On selecting the **delete all** option, the **delete all tins** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Delete tin models if empty tick box

if ticked then the models containing the tins are also deleted if they are empty after the tins are deleted.

Permanently delete tick box

if ticked, the deleted tins will not go to the trash bin but will be permanently deleted from disk.

Delete button

after selecting this button, a **yes-no** *pop-up is used to confirm that deletion is required. If it is, all tins in the working project will be deleted from disk. Unless an error occurs, the panel will be removed.*

17 Survey

Position of menu: **Survey**

The **Survey** walk-right menu is laid out to reflect the normal sequence of operations when handling field survey data.

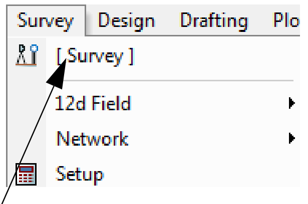
The description of the options on the **Survey** menu assumes that the reader is familiar with surveying, the 12d Model method of field coding for their particular data collector, data collector definitions and the 12d Model field file.

A description of the 12d Model field coding and data collector definitions is given in the Appendix 36 12d Survey Guide.

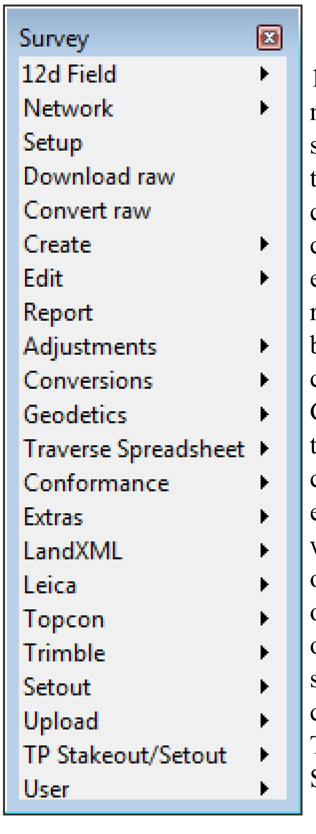
.

on Main menu

on 12d Model menu and floating Survey menu



create floating **Survey** menu



12d Field for Total stations and GNSS
networks incuding lsa, ePlan

17.2 Network
17.3 Setup
17.4 Download Raw
17.5 Convert Raw
17.6 Create Survey Function
17.7 Edit Survey Function
17.8 Report
17.9 Adjustments

17.1 12d Field

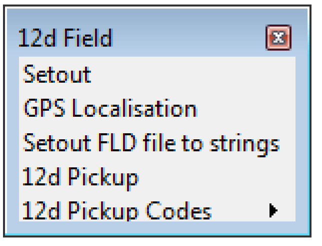
Position of menu: **Survey =>12d Field**

The **12d Field** module is for communicating directory with survey grade GPS units and Total Station theodolites through radio, blue tooth, Wi-Fi and cable. Survey data is displayed live on screen in conjunction with full road project design and existing surface data.

Because of its specialist nature, the documentation of the *12d Field* module is in a separate chapter and also in the ***12d Field Training*** manual.

The **12d Field** walk-right menu is:

.

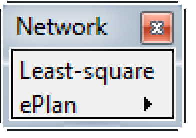


See 18 12d Field .- this is a separate chapter on ***12d Field***.

17.2 Network

Position of option on menu: **Survey =>Network**

Selecting **Network** brings up the **Network** menu



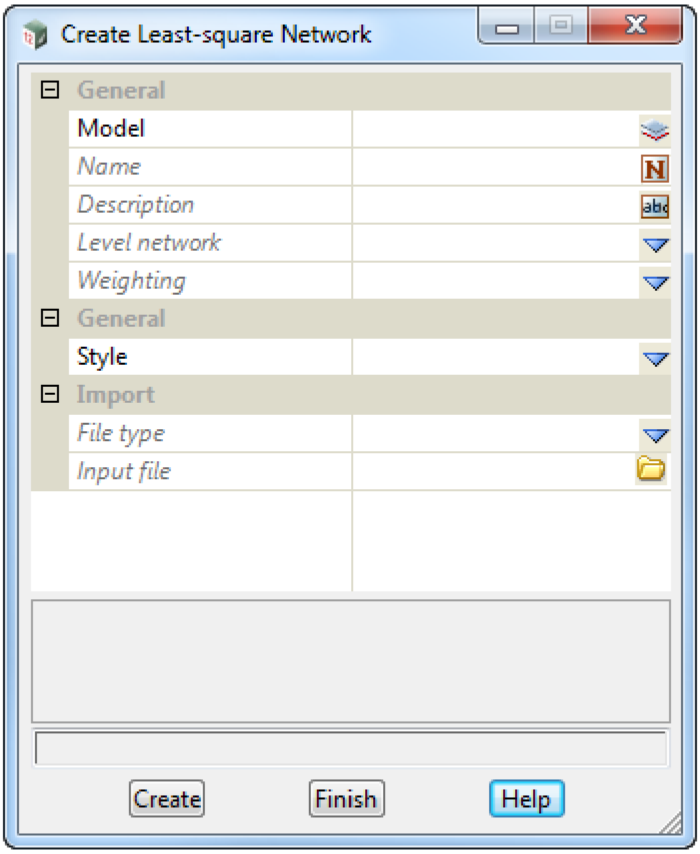
See

17.2.1 Creating a Least-Square Network
17.2.2 ePlan - this refers to a separate chapter on ***ePlan***.

17.2.1 Creating a Least-Square Network

Position of menu: **Survey =>Network =>Least-square**

Selecting **Least-square** brings up the **Create Least-square Network** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	model box		available models
the model			
Name	name box		
Description	input		
Level network	choice box		
Weighting	choice box		
Style	choice box		
File type	choice box		
Input file	file box		
Create	button		

17.2.2 ePlan

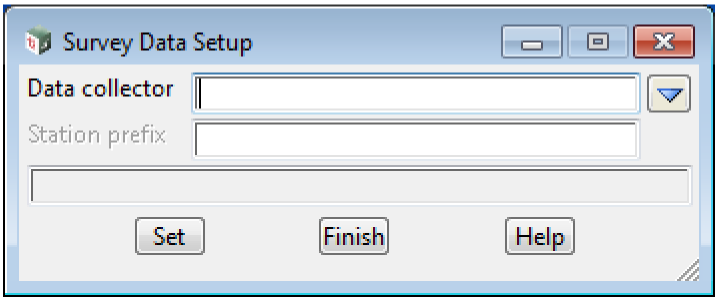
Position of menu: **Survey =>Network =>ePlan**

See 19 ePlan .- this is a separate chapter on **ePlan**.

17.3 Setup

Position of option on menu: **Survey =>Setup**

Selecting **Setup** brings up the **Survey data setup** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data collector	input		available data collectors

name of the data collector definition used to define how to read and interpret the raw survey data file. The list of available data collectors definitions is given in the file pointed to by the environment variable DATA_COLLECTORS_4D.

A data collector definition can be created/edited by
*(a) clicking on the choice button at the end of the **Data collector** panel field and selecting [Edit] at the bottom of the pop-up list of defined data collectors to bring up the Survey.4d Edit/Create panel.*

*(b) using **Project=>Browse=>Survey data collectors** the create/edit the Survey.4d file.*
Please see the 36.9 Data Collector Definitions *of Appendix* 36 12d Survey Guide *for more information on setting up a data collector definition.*

Station prefix	input		

*if **non-blank**, the prefix to be used for any text given for new instrument stations.*

Set	button		

store the selected data collector as being the currently selected one.

Note: Selecting *[Edit]* at the bottom of the pop-up list of data collectors will bring up the **Survey.4d Create/Edit** panel.

17.4 Download Raw

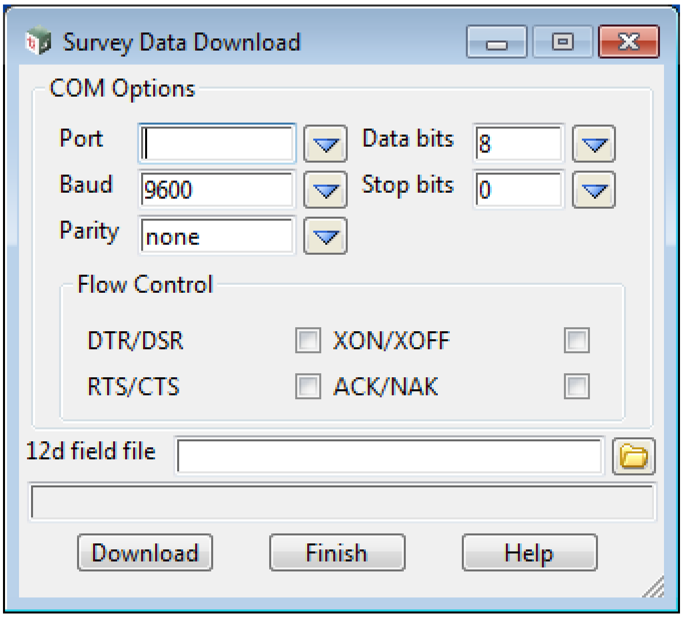
Position of option on menu: **Survey =>Download raw**

The **download raw** option will read data from the data collector connected to the computer's serial port, save it in a file (the raw data file) and once the download is completed, automatically convert the raw data file into a 12d field file using the currently defined data collector.

Hence the **download** option downloads data from the data recorder and creates a data collector raw file and an equivalent 12d field file.

For more detailed information on the survey reduction process in ***12d Model***, go to the Appendix 36 12d Survey Guide.

Selecting **Download raw** brings up the **Survey Data Download** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Port	input	from configuration file	

name of the computer serial port that the data collector is connected to. The default port is specified in the data collector configuration file.

Data bits	input	from configuration file	5,6,7,8

number of bits

Baud rate	input	from configuration file	

speed of the serial port

Stop bits	input	from configuration file	

number of stop bits

Parity	input	from configuration file	

parity

DTR/DSR	tick	from configuration file	

if ticked, use DTR/DSR flow control

RTS/CTS	tick	from configuration file	

*if **ticked**, use RTS/CTS flow control*

XON/XOFF	tick	from configuration file

*if **ticked**, use Xon/Xoff*

ACK/NAK	tick	from configuration file

*if **ticked**, use ACK/NAK*

12d Field file	input	*.fld files

name of the 12d field file that the raw file is to be converted to. The raw file is given the same name but with the extension specified in the configuration file, e.g., ".gre".

Download	button

On clicking the download button, the software will read a data stream from the serial port and store the raw data into a file. The extension of this file, will be specified in the configuration file. The name will be the same as the field file, with any ".fld" removed.

On completion of the download, the raw data file is automatically converted to a 12d field file of name given in the **field file** *field.*

17.5 Convert Raw

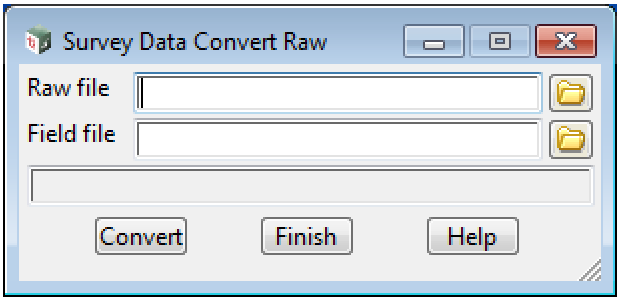
Position of option on menu: **Survey =>Convert raw**

The **convert raw** option is used to convert an existing raw data file of the type given by the data collector setup, into a 12d field file.

The raw data file may have been previously down loaded by 12d Model or obtained via another mechanism.

For more detailed information on the survey reduction process in ***12d Model***, go to the Appendix 36 12d Survey Guide .

Selecting **Convert raw** brings up the **Survey Data Convert Raw** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raw file	input		available raw files

name of the raw data file to be converted to a 12d field file. The popup will contain all files with the extension specified in the configuration file for raw data files, e.g. ".gre".

Field file	input		*.fld files

name of the 12d field file that the raw file is to be converted to. When the raw file name is given, the file of the same name but with the extension .fld is automatically piped into the **field file** *field.*

Convert	button		

convert the raw data given in the **raw file** *field into the 12d field file format and save it in the file given in the* **field file** *field.*

17.6 Create Survey Function

Position of menu: **Survey =>Create**

The **create** walk-right menu contains options to create a ***12d Model*** *Survey* function from either a 12d field file or from scratch using *Survey Reduction edit commands*.

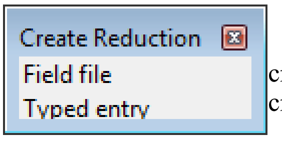
Basically, a **Survey** function keeps track of the field data, the information involved in the survey reduction and all the strings and models created by the *Survey* function. The field data for the *Survey* function can be edited and the reduction re-run and all the old reduced strings automatically deleted and replaced by the updated reduced strings.

For more detailed information on the survey reduction process in ***12d Model***, go to the Appendix 36 12d Survey Guide .

The field data can be read in from a *12d field file* using the **Field file** option, or the **Typed entry** option can be used to enter all the data by hand.

The **create** walk-right menu is:

.



create survey reduction function from a 12d field file - reduces data
create survey reduction function by typed entry into 12d field file.

For the option *Field file*, go to 17.6.1 Field File
Typed entry 17.6.2 Typed Entry

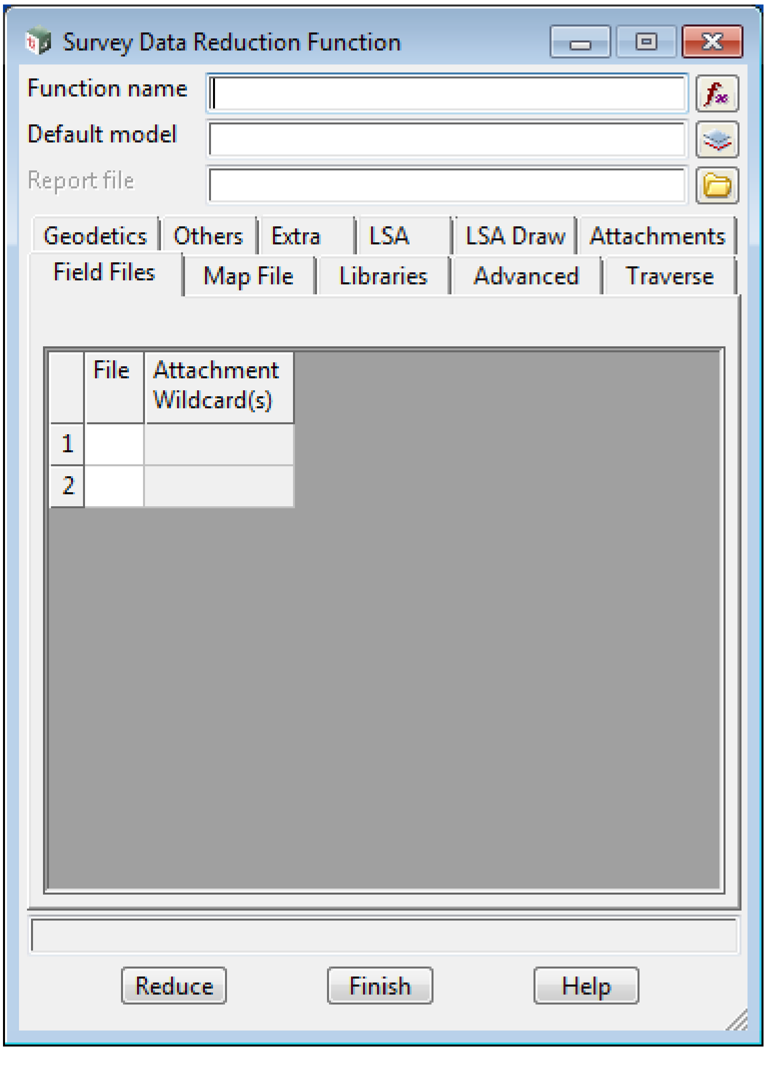
17.6.1 Field File

Position of option on menu: **Survey =>Create =>Field file**

The **field file** option creates a Survey *function* from a 12d field file.

For more detailed information on the survey reduction process in ***12d Model***, go to the Appendix 36 12d Survey Guide .

Selecting **field file** brings up the **survey data reduction function** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input		available Survey functions

name of the 12d Survey function. If the Survey function exists, then it is loaded into the panel. If the Survey function does not exist, then a new Survey function is created.

Default model	input		available models

if a feature code is not found in the map file, or no map file is selected, the strings and points of that feature code will be placed in the **default model***. The colour used will be the default line or point colour for* ***12d Model****. The* **default model** *field is compulsory. Check measurements will be always placed in the default model if a check model is not given (on the Advanced tab).*

Report file input *.rpt

if non-blank, a log of the reduction steps, including new instrument stations, new target heights, scale factors, backsights and check measurements is created. Any errors are also logged.

Button at Bottom

Reduce button

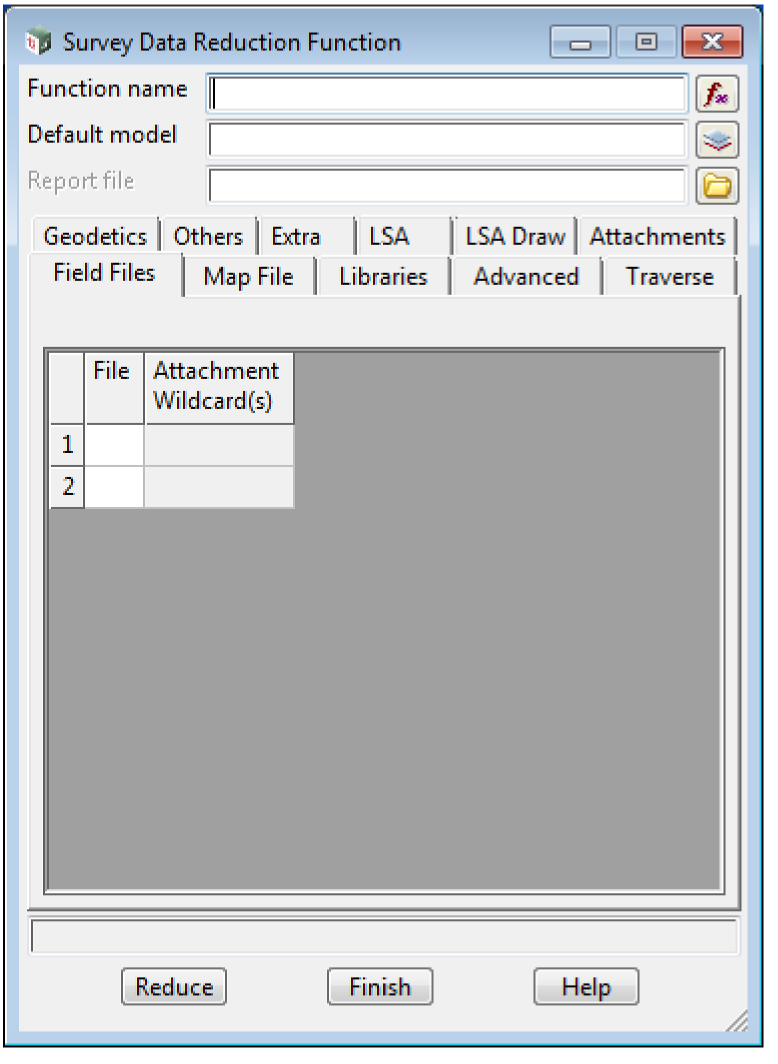
On clicking the reduce button, the software converts the field measurements in the selected 12d field file, using coordinates from the control model if necessary, and produces super strings. The super strings will be assigned names and models using the name library and map file.

For descriptions of each of the tabs on the panel, go to:

Field Files tab
Map File tab
Libraries tab
Advanced tab
Traverse tab
Geodetics tab
Others tab
Attachments tab

Field Files tab

list of field files to read in



The fields and buttons used in this panel have the following functions.

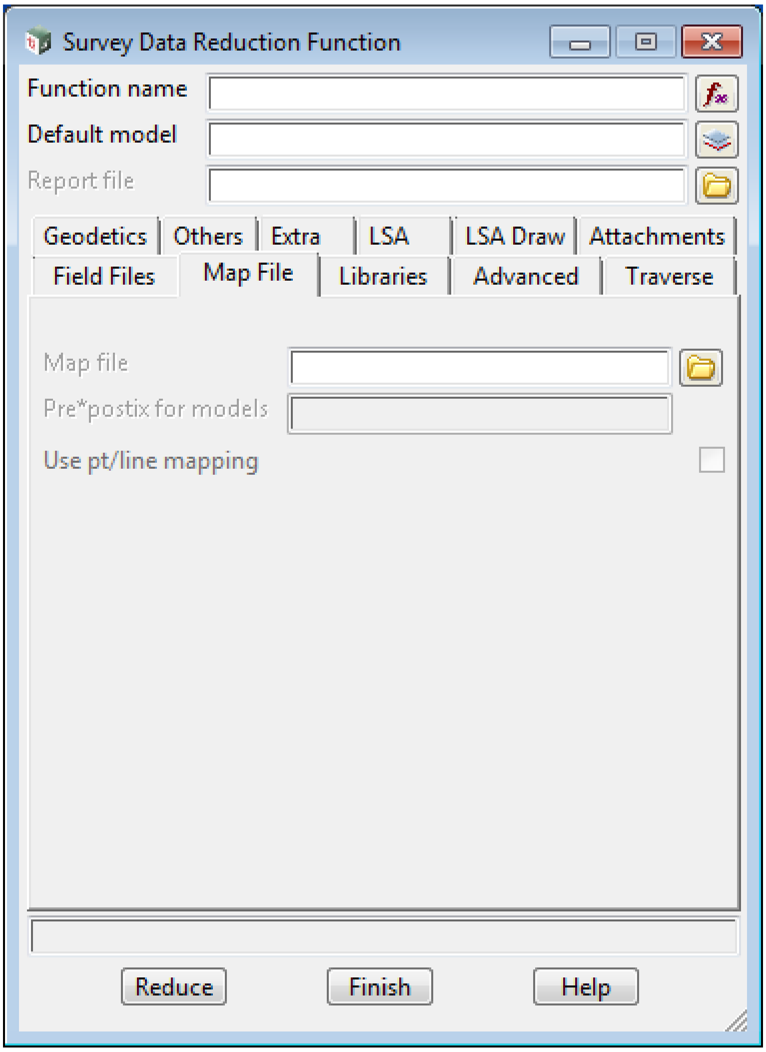
Field Description	Type	Defaults	Pop-Up
Field file	input		*.fld files

name of the 12d field file to be read into the function as its initial field data, and then reduced. The field data in the Survey function can be edited either by command or graphically.

Attachment wildcards	input		

not yet used

Map File tab



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.mf files

*if **non-blank**, the **map file** is used to map feature codes to string names, models, colours, line styles, etc. In general, strings will be created as line strings by assigning a non-zero string number in the field, and strings will be created as point strings by assigning a zero string number in the field. This behaviour may be overridden with field codes 92, 93 and 94.*

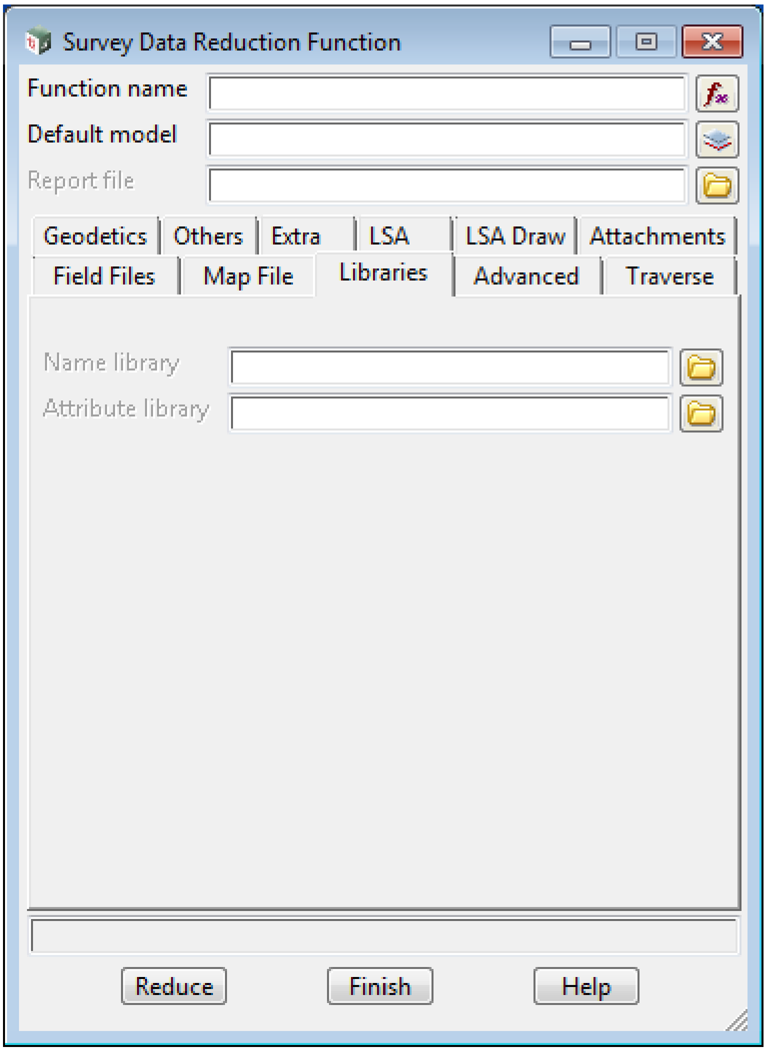
Field Description	Type	Defaults	Pop-Up
Pre*postfix for models	input		available models

*the **pre*postfix for models** text is applied to all model names in the map file.*

Field Description	Type	Defaults	Pop-Up
Use pt/line mapping	tick		

*if **ticked** and a **Map File** is used, the **column** in the map file that specifies the point/line type of the string is be used to set the point/line type of the string.*
*If **not ticked** and a **Map File** is used, the **column** is ignored (not used for setting point/line type of the string).*

Libraries tab



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name library	input		*.nl files

*if **non-blank**, the* **name library** *can be used to automatically create vertex text for the string if no vertex text is given in the field. A name library file contains two columns separated by one or more spaces. The text in the first column is matched against the feature code (wild cards * and ? can be used). The second column contains the vertex text to use if a match occurs.*

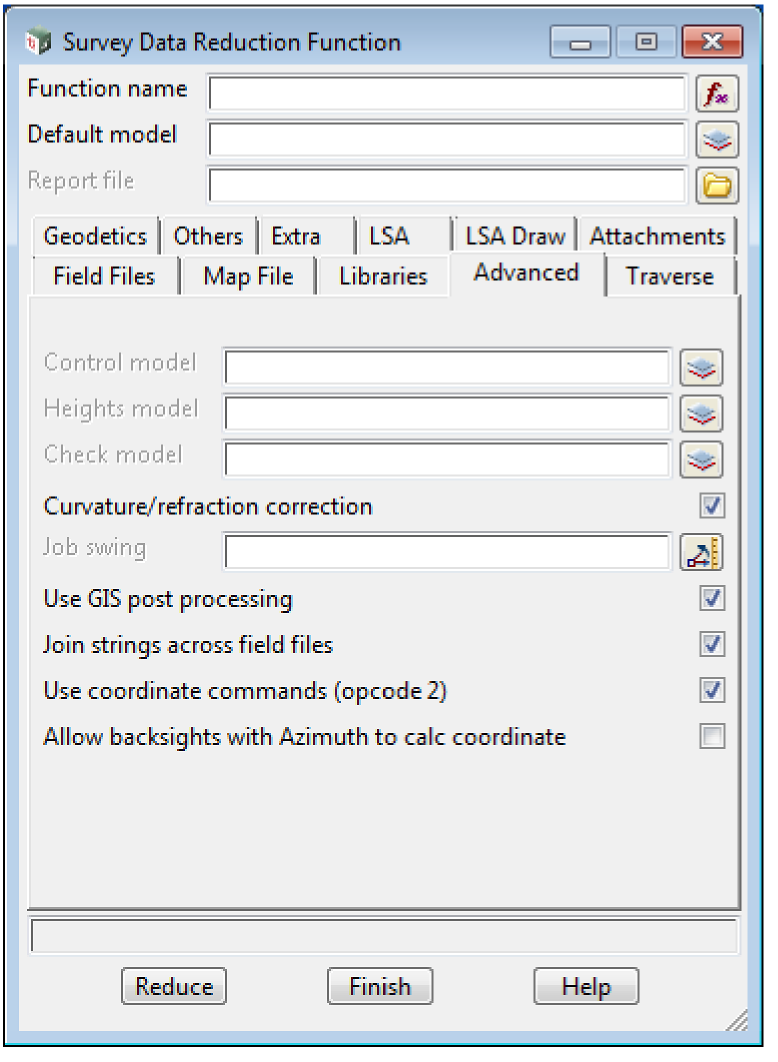
Note that if vertex text is given in the field then it is used instead of the text in the name library.

*Pre-super strings: if **non-blank**, the* **name library** *will be used to automatically create 4d strings and to assign text to 4d strings. Name library files will contain two columns. The first column in the name library will be matched against the feature code. Note that if a match is found, a 4d string is always created, as opposed to another string type. The second column will contain the text for the 4d string.*

Attribute library	input		*.al files

*if **non-blank**, the* **attribute library** *is used to give names to any unnamed attributes. The first word of each line in the file is the code to define the attribute for (can include wild cards) and the next n words are the names for each unnamed attributes in order. If the attribute library is mission, then the unnamed attributes will be given the names **unnamed attribute i** for 1=1, ...*

Advanced tab



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control model	input		available models

if not blank, name of the model containing instrument and backsight stations that can be referenced during the reduction. The name of the string is taken as the station name and if the string contains more than one point, the first point in the string is used for the co-ordinates of the station.

Heights model input available models

in not blank, name of the model containing points that are used for the heights of points during reduction. The points in the heights model have the point id of required point and a height which is used whenever that point id is found in the reduction. The (x,y) co-ordinates of the point are ignored.

Check model input available models

if non-blank, then all check shots will go to this model.
If blank then check shots go to the **default model**.

Curvature/refraction correction tick box tick

*if **ticked**, during the reduction, each EDM tacheometry measurement (field code 7) has a correction for earth curvature and refraction applied to the measurement.*

Job swing

if non-blank, then the job is swung through this value. The rotation is in a clockwise direction and the *value is in hp dms format.*

Use GIS post processing tick box tick

if ticked, run the given 12d macro to process attribute blocks

Join strings across field files tick box tick

*if **ticked**, points with the same code and string number will be included in the same string in any of the field files. The order that the points are placed in the string is the order of the field files in the **Field File** tab.*
*if **not ticked**, any strings will terminate at the end of a field file. Even if the string has the same name and string number is any following field file, a new string is started in the following field files.*

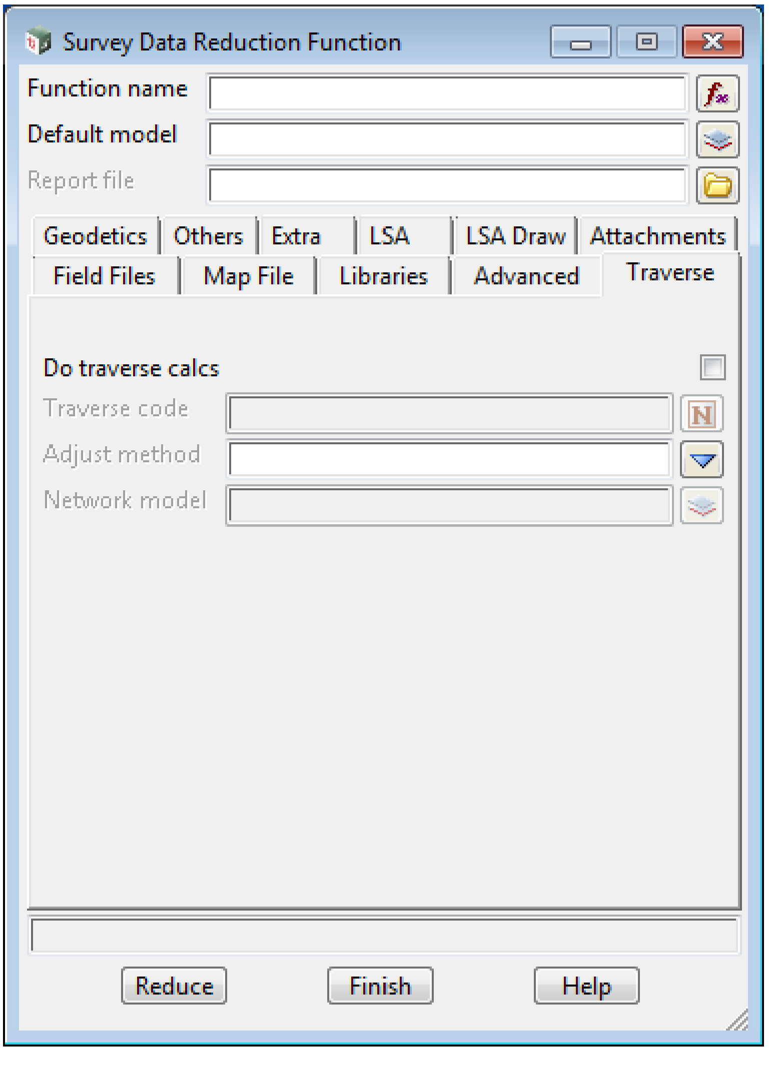
Use coordinate commands (opcode 2) tick box tick

if ticked,

Allow backsights with Azimuth to calc coordinate tick box

If ticked, for backsight commands that reference unknown backsight points, and the backsight has the horizontal angle, vertical angle, slope distance, and Azimuth defined, the backsight point will be created from that information.
This option was only included to allow reduction from legacy external formats, and should not be used as it is not good survey practise.

Traverse tab



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Do traverse calcs	tick box	not tick	

*if **ticked**, the traverse coded points are placed into a network model, and an adjustment done at the time of reduction.*

Traverse code	input		

if valid, this code will be used to identify traverse data. This will effectively be the same as stringing features in the field except the user has the option of isolating the model, adjusting the strings etc.

E.g. TL. The reduction function will look at the field file and extract any observations involving field codes with the TL code. Only backsights and measurements with the point name field populated will be processed.

Each traverse will have a separate string number. i.e. The main traverse with a feature code/string number of e.g. TL7 and a side traverse having a feature code/string number of e.g. TL3. Note the string numbers do not have to be in any particular order. The reduction will determine the order on which the separate traverses will be processed (by dependencies).

See 36.6 Traverse coding *in Appendix* 36 12d Survey Guide .

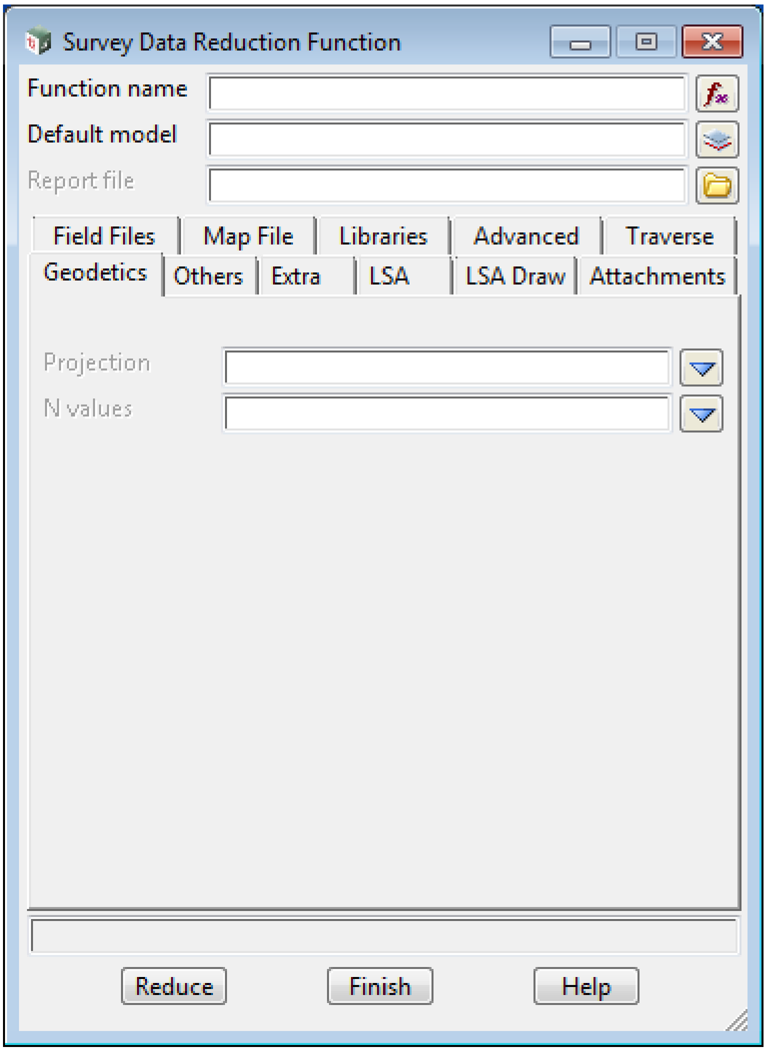
Adjustment method	choice		bowditch, compass, transit, least square, none

*method of adjustment. The adjustment will be made to the extracted traverse strings from known point to known point. **If a traverse string goes through a number of known points (known coordinates), the adjustment will made from known point to known point rather than the first known to the last known point.***

Network model	model box		

if non blank, any valid traverse strings are placed in this model

Geodetics tab



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection	projection box	current projection	available projections

the projection of the data to be reduced. If a valid projection is specified, the reduction will be done taking into account the projection scale factors. ***If this method is used it is paramount that the known coordinates(e.g station setups) are in terms of the projection coordinates and are not truncated (i.e. full coordinate values)****. These coordinates will allow the calculation of the relative longitude and latitude values which are used to compute coordinates from observations from the setup points. For more information about how to setup different projections see the section* 7.6.6 Projections .

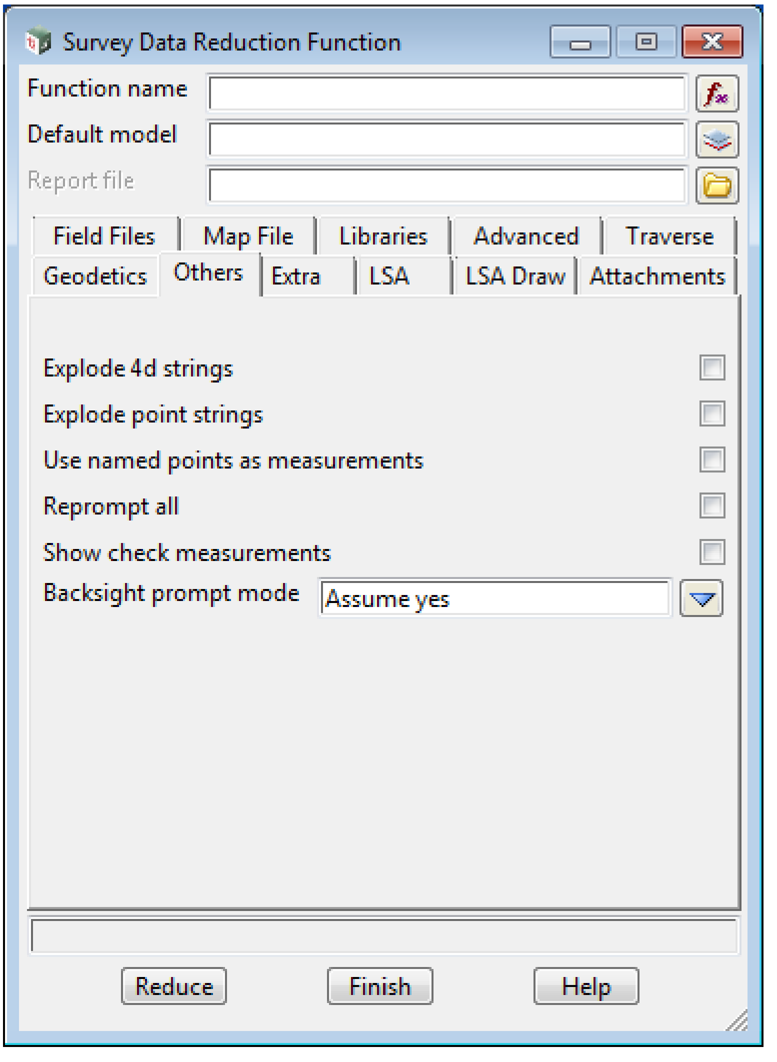
Field Description	Type	Defaults	Pop-Up
N values	choice box	currently set method	Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are defined in the project n value settings. For more information on the n value settings see the section 7.6.7 N values

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculations only. The original z value for the point will remain unchanged

For more information about geodetic terminology including projections and N values, see the Appendix 38 Geodetics Summary .

Others tab



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Explode 4d strings tick box

*if **ticked**, any 4d strings created during the reduction process will have only one vertex (point), i.e., no stringing of 4d strings will occur.*

Explode point strings tick box

*if **ticked**, point strings are created as one vertex (point) strings i.e., no stringing of any point strings will occur.*

Use named points as measurements tick box

*if **ticked**, named points are also created as measurements.*

Reprompt all

*if **ticked**, all check measurements are redisplayed on recalcs. Also if* **Backsight prompt mode** *is set to prompt, then backsights are redisplayed on recalcs.*
*if **not ticked**, check measurements are not redisplayed on a recalc and backsights depend on the backsight prompt mode.*

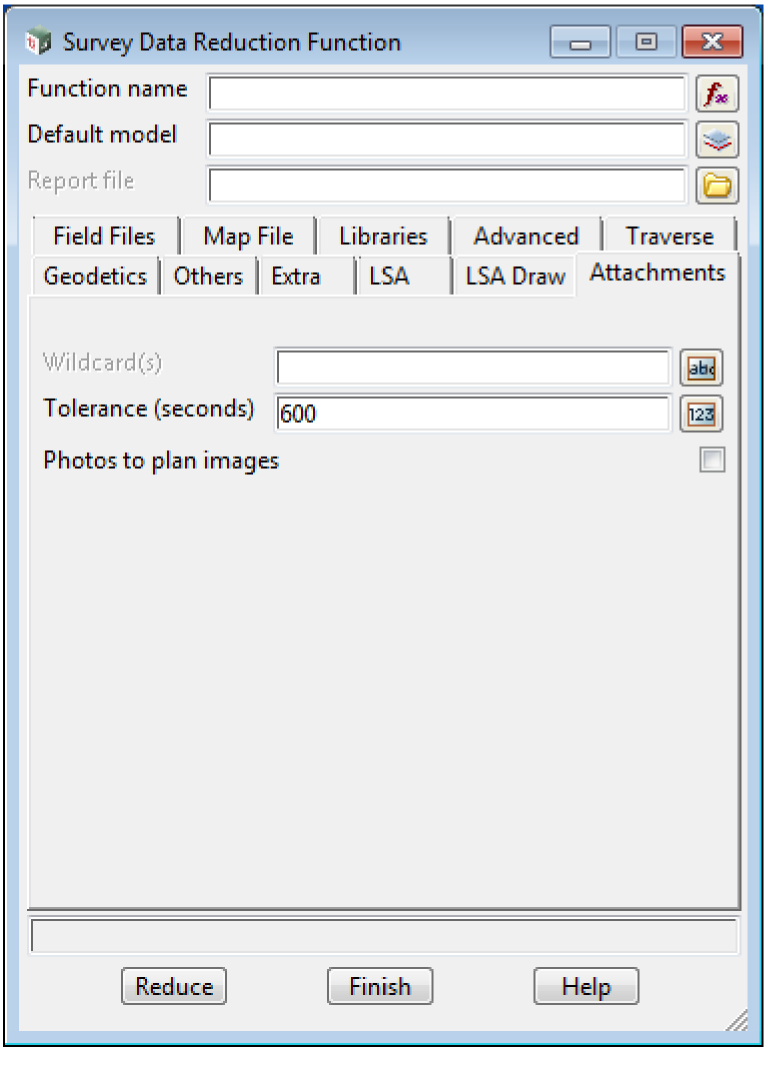
Show check measurements tick box

*if **ticked**, when a check measurement is processed a panel is displayed showing the calculated (x,y,z)* *for the check measurement.*

Backsight prompt mode choice box prompt, assume yes
assume no

*if **prompt**, then the backsight panel is brought up in a command has not been answered adequately previously or if something has changed that warrants a redisplay of the panel.*
*If **assume yes**, then **yes** is assumes for all the backsights and the panel is not brought up.*
*If **assume no**, then **no** is assumes for all the backsights and the panel is not brought up.*

Attachments tab



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Wildcard(s)

space delimited list of wildcards for attaching files to shots. For example, photo images taken in the field.

Tolerance (seconds) input 600

the shot must be taken first and then any files with time less than this number of seconds after the shot, but before any subsequent shots, are attached to the shot

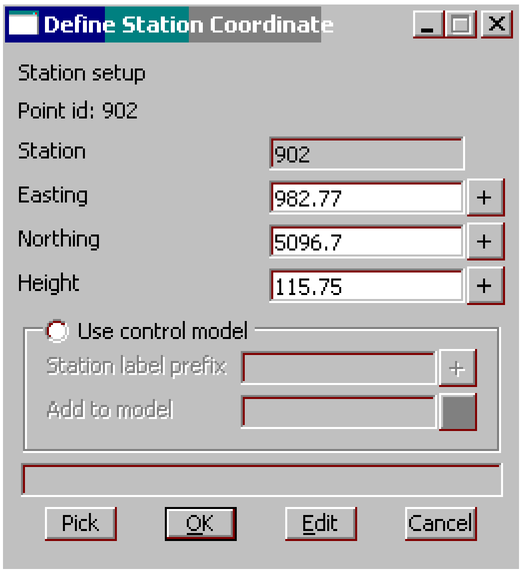
Photos to plan images tick box

*if **ticked**, 12d plan images are created for ay attached image in jpeg, tiff, bmp or png format*

During the reduction, the coordinates of a point may need to be supplied. This occurs when:

- an undefined point is named as the new instrument point (field code 3)
- backsight measurements are made to an undefined point (field code 4)
- check measurements are made to an undefined point (field code 6)

In this situation, a **define station coordinate** panel will pop up:



The coordinates may be typed in, or selected from existing strings. The station may also be added to a model to allow it to be used as a station later.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Station name	output		

the station name

Use control model radio button

if ticked, the point is added to the control model.
if not ticked, the point is created but is not placed in the control model.

Easting/Northing/Height input — Pop-Up: xyz ops menu

the easting (x)/northing (y)/height (z) co-ordinates for the station.

Station prefix input

if non-blank, the created station name will be prefixed by this value.

Add to model input — Defaults: control model — Pop-Up: available models

if not blank, a 4d string is created using the **Easting/Northing/Height** *values as co-ordinates, and the station name (with a possible prefix) as the text and name of the 4d string. The station can then be referred to later in the reduction.*

Pick button

pick a point whose co-ordinates are piped into the **Easting/Northing/Height** *fields.*

OK button

on selecting **ok***, the coordinates entered in the* **station xyz field** *are used as the station co-ordinates* *and if the* **add to model field** *is not blank, a 4d string created.*

Edit button

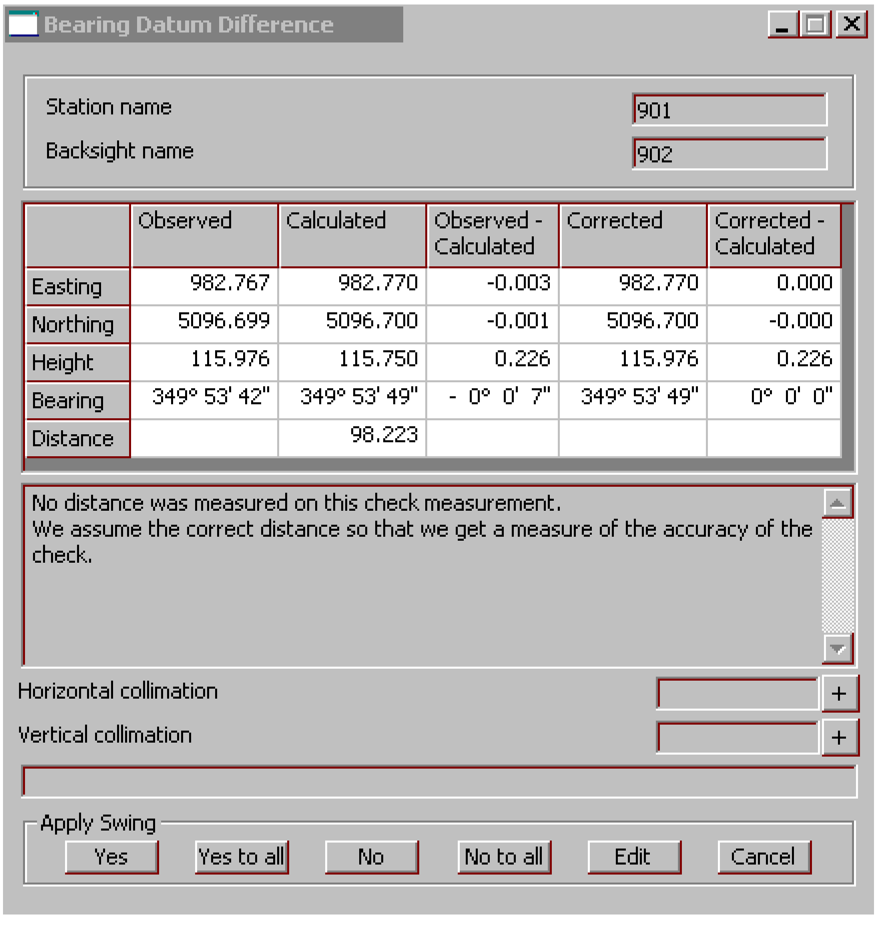
on selecting **Edit***, the next new instrument station entry is shown which allows the station number and associated fields to be edited.*

Cancel button

the cancel button will remove the panel and terminate the reduction.

If the **Backsight prompt mode** is set on, then at each backsight measurement, the **bearing datum difference** panel is displayed

:



If **yes** button is selected, the bearing datum difference is applied to this horizontal circle reading.

If **yes to all** button is selected, the bearing datum difference is applied to all subsequent horizontal circle readings.

The **cancel** button terminates the reduction.

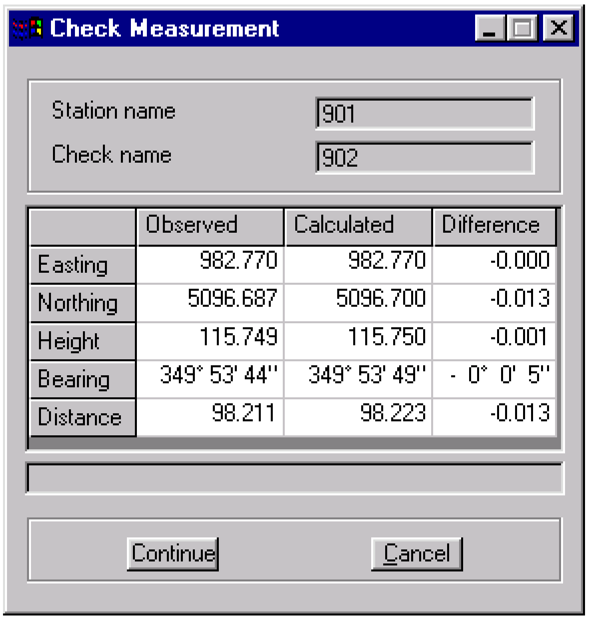
If **no** is selected, this horizontal circle reading is treated as actual bearing.

If **no to all** is selected, all the horizontal circle reading are treated as actual bearings.

This facility allows the horizontal circle to have any orientation during data capture.

At each check measurement, the **check measurement** panel is displayed giving information about the measurement, the point it was a check measurement for and the differences between the two.

:



If the **Continue** button is selected, the reduction continues.

The **Cancel** button terminates the reduction

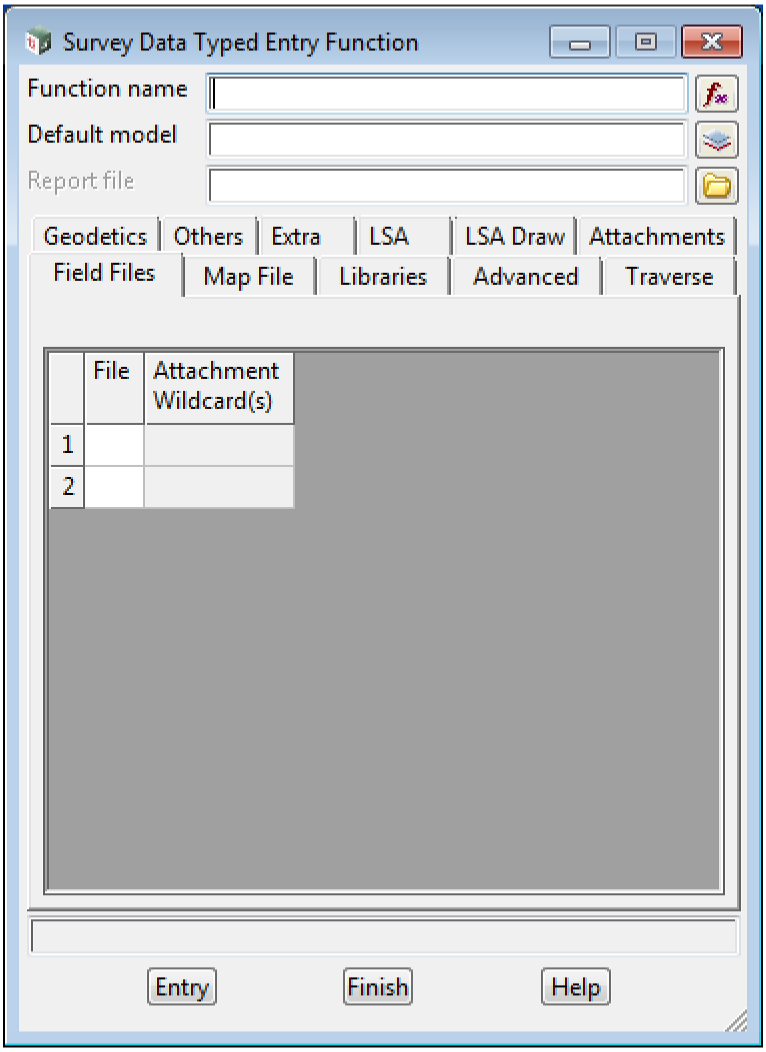
17.6.2 Typed Entry

Position of option on menu: **Survey =>Create =>Typed entry**

The **Typed entry** option creates a *Survey function* from scratch using the edit commands.

For more detailed information on the survey reduction process in ***12d Model***, go to the Appendix 36 12d Survey Guide .

Selecting **Typed entry** brings up the **survey Data Typed Entry Function** panel



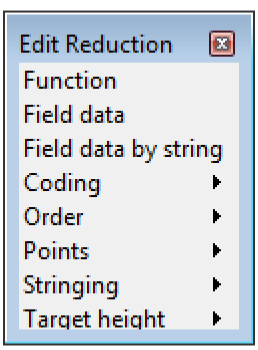
The fields and buttons are identical to those in the **Survey Data Reduction Function** panel in the previous section 17.6.1 Field File .

17.7 Edit Survey Function

Position of menu: **Survey =>Edit =>Edit Reduction**

The **Edit** walk-right menu is

.



edit 12d Survey function
edit field data for a 12d Survey function
edit 12d Survey function by selecting a string
point code correction
re-order points
graphically selected field edits for individual shots
graphically selected field edits for strings
insert and/or modify target heights

The **Edit reduction** walk-right menu contains options to create a ***12d Model*** *Survey function* from either a *12d field file* or from scratch using *Survey Reduction edit commands*.

Basically, a *Survey* function keeps track of all the information involved in the survey data reduction and all the strings and models created by the *Survey* function. The *Survey* function can be re-run and all the old information automatically deleted and replaced by the updated information.

Once the *Survey* function is created, it then reduces the data according to the information supplied and stored with the *Survey* function. As with other ***12d Model*** functions, the *Survey* function information can be modified and the function recalculated.

Many errors in a raw data file are only detected after the reduction has taken place These are then corrected and the function recalculated to re-reduce the data.

Some of the types of problems that regularly occur during electronic field surveys are:

- Instrument height incorrectly entered
- Target height incorrectly entered
- Change of target height not entered
- Backsight station incorrectly named
- Instrument station incorrectly named
- Feature code and string number errors

The *12d Survey* edits allow for all commands in the field data to be modified and new commands added. Selection for some edits can be done graphically (for example incorrect target height) and others through interactive editing of the Survey field data. In all cases, once the edit is completed, the effect is immediately calculated and displayed.

For more detailed information on the survey reduction process in ***12d Model***, go to the Appendix 36 12d Survey Guide.

Each option will now be described in detail.

For the option *Function*, please go to	17.7.1 Function
Field data	17.7.2 Field Data
Field data by string	17.7.3 Field Data by String
Coding	17.7.4 Coding
Order	17.7.7 Order
Points	17.7.8 SDR Point Edits
Stringing	17.7.9 SDR Strings Edit
Target height	17.7.10 Target Height

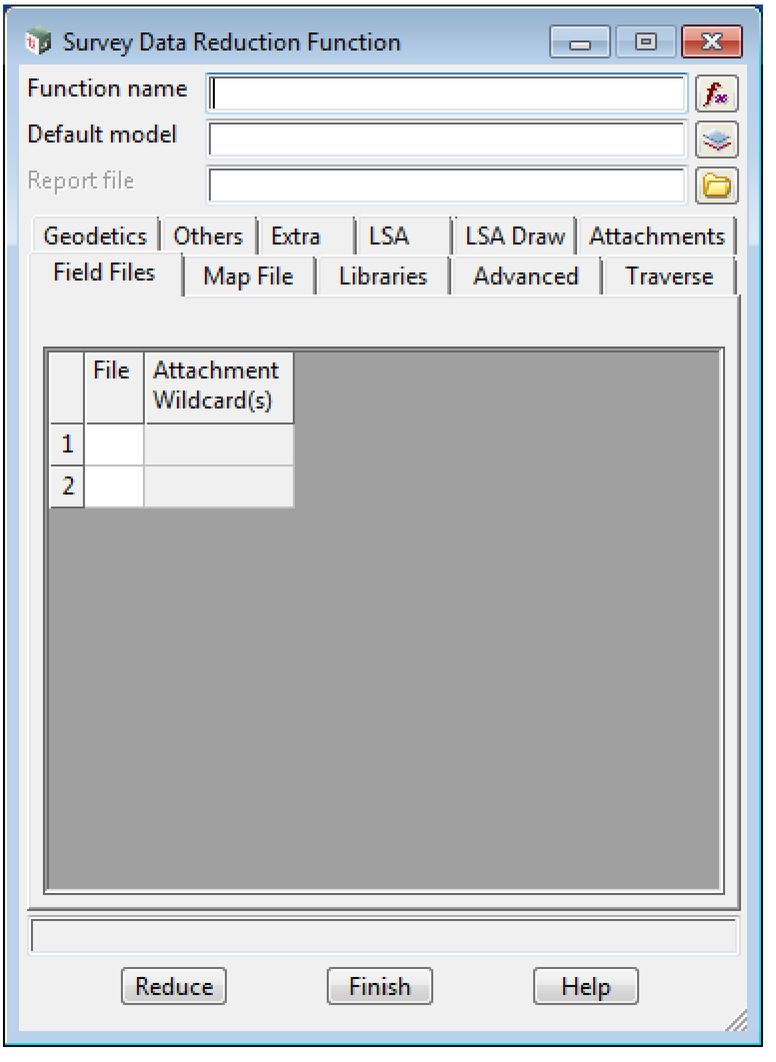
17.7.1 Function

Position of option on menu: Survey =>Edit =>Function

The **function** option is used to edit the set-up panel values for a *Survey* function.

Note - to edit the *field data* rather than the set-up panel, the **Field data** option is used.

Selecting **Function** brings up the **Survey Data Reduction Function** panel (which is the same panel used to create the function in the **Survey =>Create =>Field file** option).



A *Survey* function is selected for editing by choosing the survey function from the **Function name** pop-up list which loads up the panel information for that function.

The panel information is then modified and the new values stored and used by selecting the **Reduce** button. This recalcs the function which re-reduces the data using the new panel fields.

For more information on the fields in the panel, go to the section 17.7 Edit Survey Function .

For information on the *Survey Field Data Editor*, go to the section 17.7.5 Survey Field Data Editor
.

For more detailed information on the survey reduction process in ***12d Model***, go to the Appendix 36 12d Survey Guide .

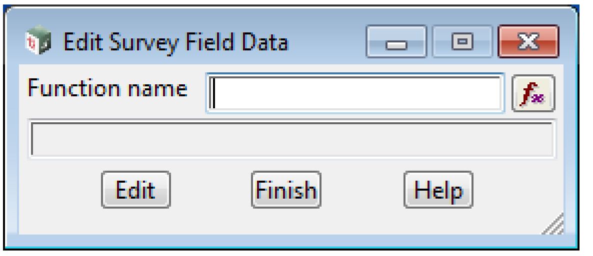
Please continue to the next section 17.7.2 Field Data .

17.7.2 Field Data

Position of option on menu: **Survey =>Edit =>Field data**

The **field data** option is used to edit the *field data* from a Survey function. As the changes are made, the field data is automatically reduced to reflect the changes.

Selecting **Field data** brings up the **Edit Survey Field Data** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		all survey functions

name of the Survey function to have the field data modified.

Edit	button		

clicking **edit** *will start the Survey Field Data Editor for the given Survey function. This will be documented in the section Survey Field Data Editor.*

For information on the *Survey Field Data Editor*, go to the section 17.7.5 Survey Field Data Editor
.

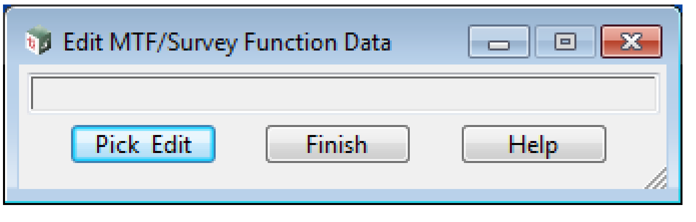
Please continue to the next section 17.7.3 Field Data by String .

17.7.3 Field Data by String

Position of option on menu: **Survey =>Edit =>Field data by string**

The **Field data by string** option is used to edit the *field data* by selecting a string created from a Survey function.

Selecting **Field data by string** brings up the **Edit MTF/Survey Function Data** panel:



After selecting the **Pick Edit** button, a string created by Survey function is selected and the Survey Field Data Editor is started for the given Survey function.

For information on the *Survey Field Data Editor*, go to the section 17.7.5 Survey Field Data Editor
.

Please continue to the next section 17.7.4 Coding .

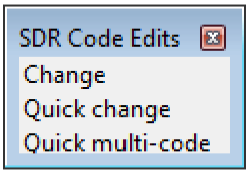
17.7.4 Coding

Position of menu: **Survey =>Edit =>Coding**

The **coding** options are used to modify the feature code and/or string number of selected points. The 12d field file is automatically updated.

The **coding** walk-right menu is

.



change for feature code, string number
change feature code, string number for many point

Each option will now be described in detail.

For the option *Change*, go to		17.7.4.1 Change
	Quick change	17.7.4.2 Quick Change
	Quick multi-code	17.7.4.3 Quick Multi Coding

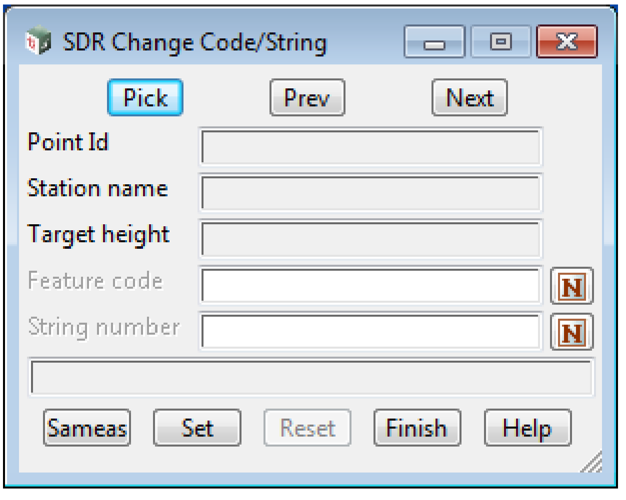
17.7.4.1 Change

Position of option on menu: **Survey =>Edit =>Coding =>Change**

Change is used to modify a points feature code and/or string number. When a point is selected, its point id, station name and target height are displayed as well as feature code and string number.

If either the feature code or string number is then modified in the panel, selecting the set button will give the selected point the new values for feature code and/or string number.

Selecting **Change** brings up the **SDR Change Code/String** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Pick button

select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.

Prev button

move to the previous point in the string.

Next button

move to the next point in the string.

Point id display only

point id of the selected point.

Station name display only

name of the station that the point was surveyed from.

Target height display only

height of the target when the point was surveyed.

Feature code input/output

when a point is selected, its feature code is displayed in this field. The value can then be changed by the user and if **set** *is selected, the point is given the new feature code.*

String number input/output

when a point is selected, its string number is displayed in this field. The value can then be changed by the user and if **set** *is selected, the point is given the new string.*

Same as button

after selecting **same as***, a point is selected and its feature code and string number are piped into the panel fields.*

Set button

selecting **set** *gives the selected point the values in the panel fields.*

Reset button

reset *undoes the changes.*

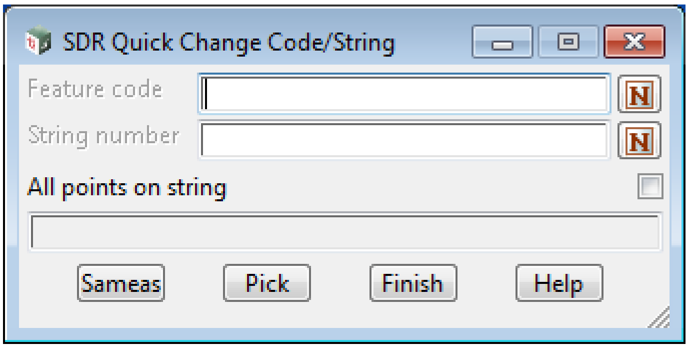
Please continue to the next section 17.7.4.2 Quick Change .

17.7.4.2 Quick Change

Position of option on menu: **Survey =>Edit =>Coding =>Quick change**

The **quick change** option is for more advanced users wishing to modify the same feature code and/or string number for many points.

The new feature code and/or string number is entered into the panel and whenever a point is selected and accepted, it is given the new feature code and/or string number. The picking of points continues until the picking is cancelled from the **pick ops** menu.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Feature code input/output

if not blank, when a point is accepted its feature code is changed to the value in this field.

String number input

if not blank, when a point is accepted its string number is changed to the value in this field.

Same as button

after selecting **same as***, a point is selected and its feature code and string number are piped into the panel fields.*

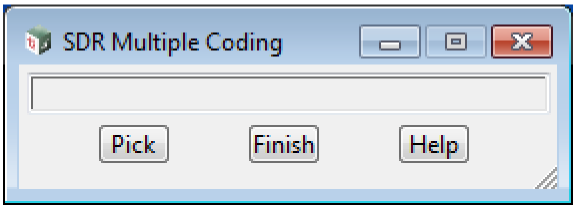
Pick button

selecting **pick** *starts the picking sequence and any accepted point will have its feature code and/or string number modified if the corresponding panel field is not blank. The pick is terminated by selecting* **cancel** *from the* **pick ops** *menu.*

Please continue to the next section 17.7.4.3 Quick Multi Coding .

17.7.4.3 Quick Multi Coding

Position of option on menu: Survey =>Edit =>Coding =>Quick multi-code



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Pick button

after selecting **Pick,** *pick the vertex that you want to multi-code, and then pick a string and the code and string number from the string will be added to the selected vertex as a multi-code.*

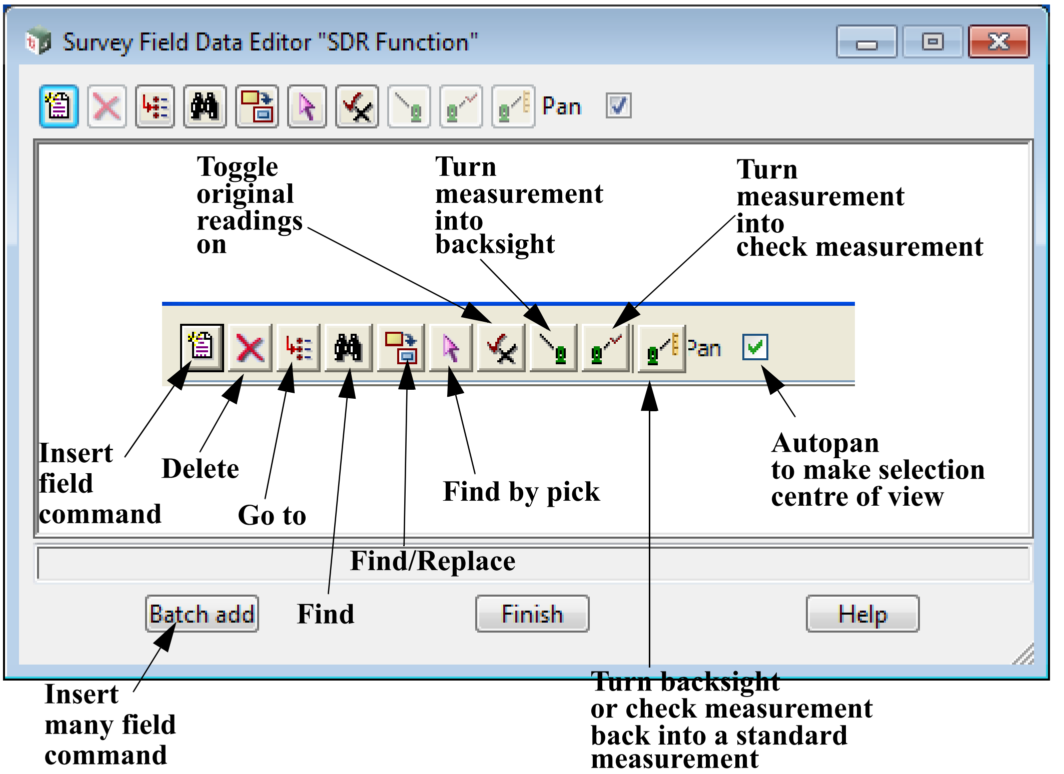
The sequence start again and continues until the pick is terminated by selecting **Cancel** *from the* **Pick ops** *menu.*

Please continue to the next section 17.7.5 Survey Field Data Editor .

17.7.5 Survey Field Data Editor

The **Survey Field Data Editor** is used to interactively edit the field data of a ***Survey*** function. All the commands in the field data can be modified or deleted, or new commands added. When changes are made, the field data is automatically re-reduced so the effects can be immediately checked.

If the Editor is opened using the **Survey=>Create=>Typed Entry** option the editor will appear blank.



For information on using things inside the panel, go to 17.7.5.1 Using the Survey Field Data Panel

For information on the field commands, go to 17.7.6 List of Field Data Commands and Panels

For information on the icons and buttons on the panel:

- *Insert*	*go to*	Insert and Batch Add button
- *Delete*		Delete
- *Go to*		Goto
- *Find*		Find
- *Find*/Replace		Find/Replace
- *Find by Pick*		Find by Pick
- *Toggle*		Toggle
- *Make backsight*		Make Measurement into a Backsight
- *Make check measurement*		Make Measurement into a Check Measurement
- *Change to measurement*		Make into a Measurement
Pan - *Autopan*		Autopan
- *Batch add*		Insert and Batch Add button

17.7.5.1 Using the Survey Field Data Panel

17.7.5.1.1 Colour Coding of the Field Data

Normally data has been loaded into the Survey function by a raw data file being downloaded from a data collector, converted to a 12d field file and then loaded into a Survey function.

When ***12d Model*** converts the raw file to a 12d field file, all the raw data can be included in the 12d field file as comments.

All **comments** lines are displayed in **green**.

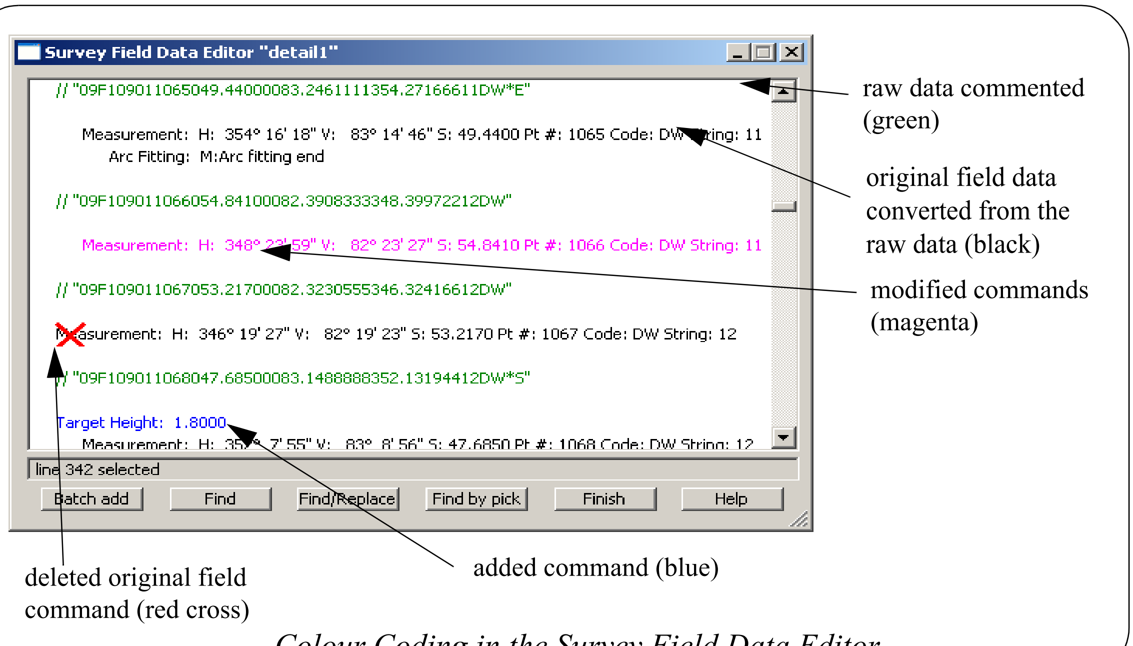
Each line (or lines if necessary) of raw data is converted into one or more equivalent 12d field file commands. These field file commands are placed straight after the commented line containing the raw data lines so it is easy to see what the raw data was converted to.

The **original** 12d **field commands** converted form the raw data are displayed in **black**.

If a field command has been **inserted**, it is coloured in **blue**. If a comment has been inserted, it will still be displayed in green but the word ***: added*** will be appended to the end of the comment.

If a field command has been **modified**, it is displayed in **magenta**.

If an **original** command has been **deleted**, the original command is left in the file but it has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply deleting the command again.

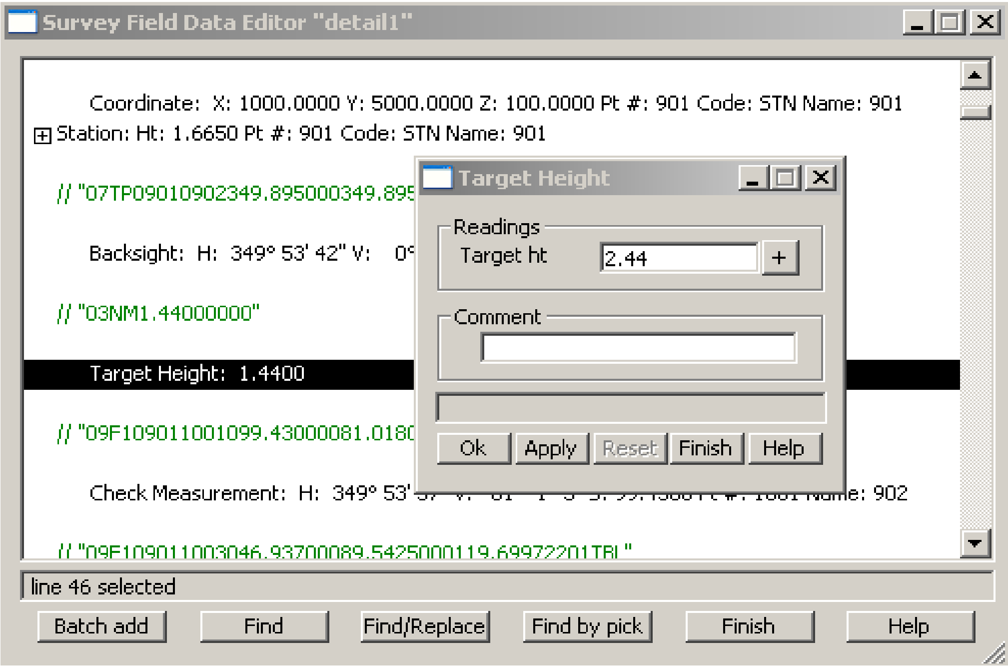


Colour Coding in the Survey Field Data Editor

17.7.5.1.2 Modifying the Field Data

To modify an existing command in the field data, double click on the line to be modified and the appropriate panel for the line of field data is displayed. The data in the panel can then be modified and stored by selecting either the **OK** or **Apply** buttons. The colour of the line of modified field data is then magenta.

For example, double clicking on **target height** command in the field file brings up the **Target Height** panel with the values loaded into the appropriate panel field. The data in the panel can be modified and saved by clicking **OK**.



17.7.5.1.3 Deleting Field Data

To delete a line from the field data, simply highlight the data by clicking in the line and then delete key on the keyboard or select the delete icon from the top of the panel. If the line was an original command, a red cross is placed

If an **original** command has been **deleted**, the original command is left in the file but it has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleting command and pressing the delete icon or delete key again.

If an **inserted** command has been **deleted**, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the delete key on the keyboard or select the delete icon from the top of the panel. Similarly to undelete multiple commands.

For information on the field commands, go to 17.7.6 List of Field Data Commands and Panels

For information on the icons and buttons on the Survey Field Data panel, go to 17.7.5.2 Icons and Buttons on the Survey Field Data Editing Panel

17.7.5.2 Icons and Buttons on the Survey Field Data Editing Panel

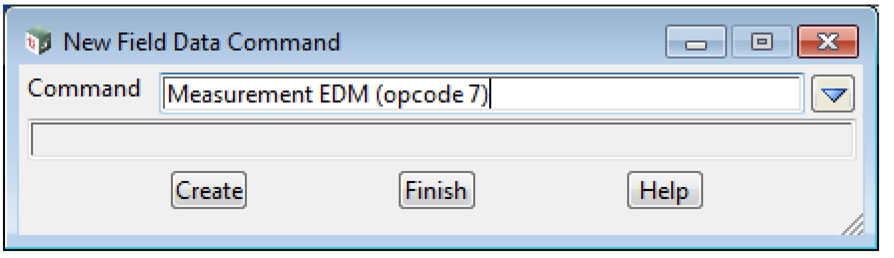
The use of the buttons at the bottom of the survey field data editing panel will now be described.

Insert and *Batch Add* button

To insert a new command into the field data, simply click on the line where the data is to be inserted and press the **Batch Add** button or select the **Insert** icon from the top of the panel.

The difference between the button and the icon, is that the button allows multiple entries whilst the icon allows one entry at a time.

Selecting either the icon or the **Batch Add** button, displays the **New Field Data Command** panel.



By clicking on the **Command** choice box selector, a full list of field commands is displayed and the required command is selected from the list.

Clicking **Create** then brings up the panel for the selected command type. The description of the field data commands panels is given in the section17.7.6 List of Field Data Commands and Panels

Alternatively, if the ***12d Field Data Op Code*** is known, this can be entered into the choice box instead of selecting from the list. For example, to enter a ***Measurement EDM*** field data command, the number ***7*** can be inserted in the choice box field.

When using **Batch Add,** once a command is selected, it will remain as a default for subsequent entries until another type is chosen. This allows a number of the same command to be quickly entered such as in the case of *Measurement EDM* by entering data into the appropriate fields and continuing to press <enter> through the default choices

For a more detailed explanation on each of the fields within the panels and the appropriate field ***12d Field File Op Codes*** see the section 36.10.4 Full Description of 12d Field File Op Codes .

For a summary of just the field file op codes, see the section 36.10.5 Summary of 12d Field File Op Codes

Delete

To delete a line from the field data, highlight the data by clicking in the line and then either use the ***Delete*** key on the keyboard or select the **Delete** icon from the top of the panel.

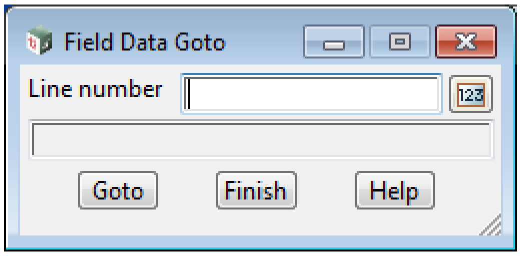
If an **original** command has been **deleted**, the original command is left in the file but has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleted command and pressing the **Delete** icon or ***Delete*** key again.

If an **inserted** command has been **deleted**, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the ***Delete*** key on the keyboard or the **Delete** icon from the top of the panel. Similarly to undelete multiple commands.

Goto

Selecting the **Goto** icon brings up the **Field Data Goto** panel.

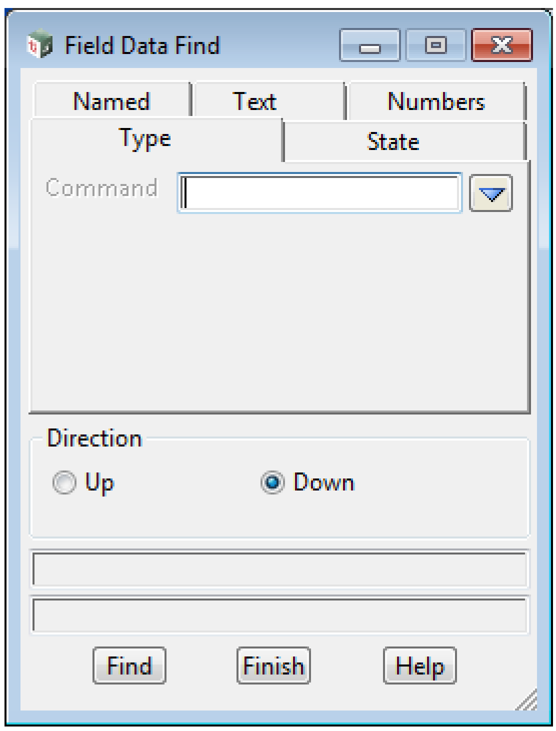


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Line number			
line number to go to			
Goto	button		
go to the given line number			

Find

Selecting **Find** brings up the **Field Data Find** panel.



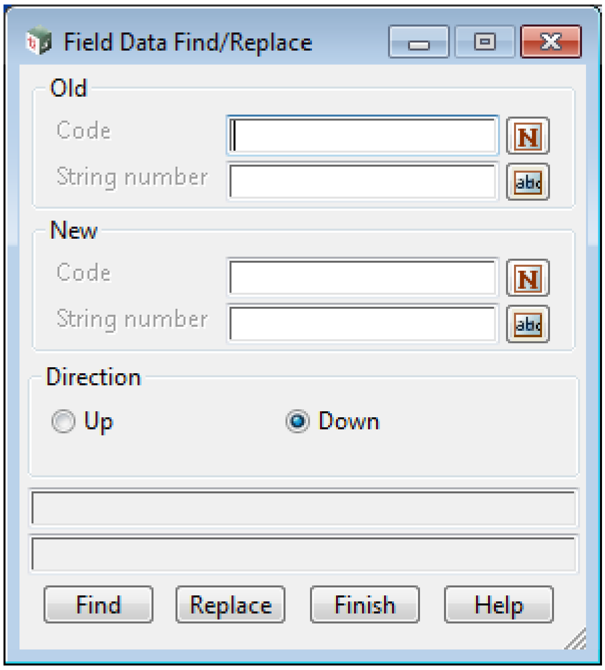
Each of the tabs sets the panel for the required data.

Named find given code, string number, point id etc.
Numbers find numbers between given minimum and maximum.
State find a field command in a given modification state (added, changed, deleted, field)
Text find text containing given text.
Type find a field command of a given type. For example "New String".

The up/down radio button define which direction to search in the field data.

Find/Replace

Selecting the **Find/replace** icon brings up the **Field Data Find/Replace** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

The user specifies the old and new ***Code*** and old and new ***String number*** fields, and the search and replace is done using those parameters.

The **Up/Down** radio button define which direction to search in the field data.

Find by Pick

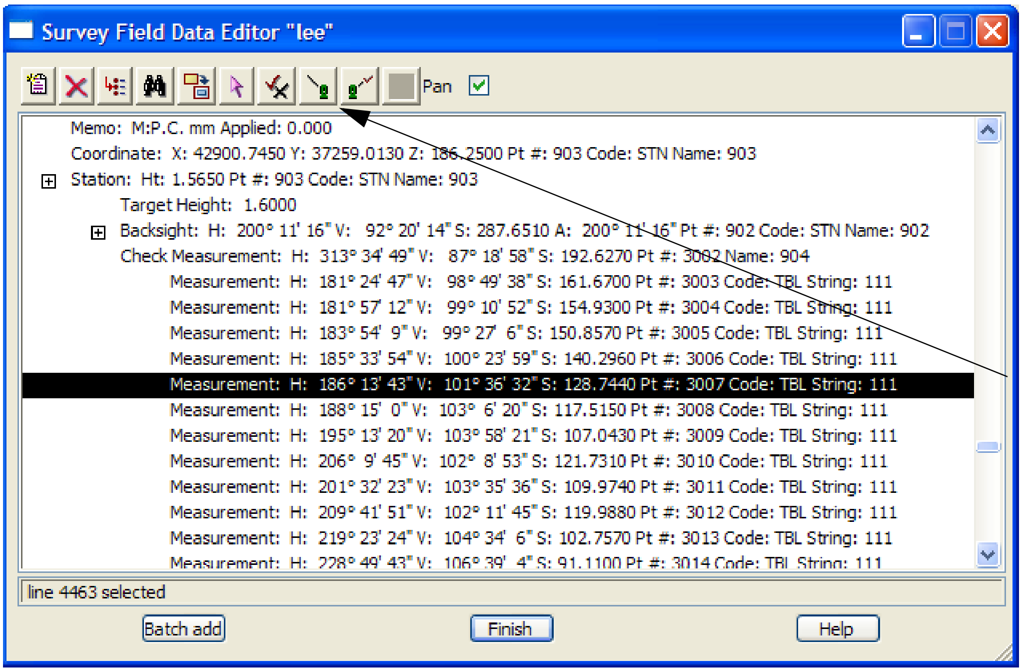
After selecting **Find by pick**, the user selects a point created by the Survey function and the field data editor will scroll to the line of the field data that created the point.

Toggle

The toggle button allows commented information to be shown/ not shown. Simply press the **Toggle** icon to move from one state to another.

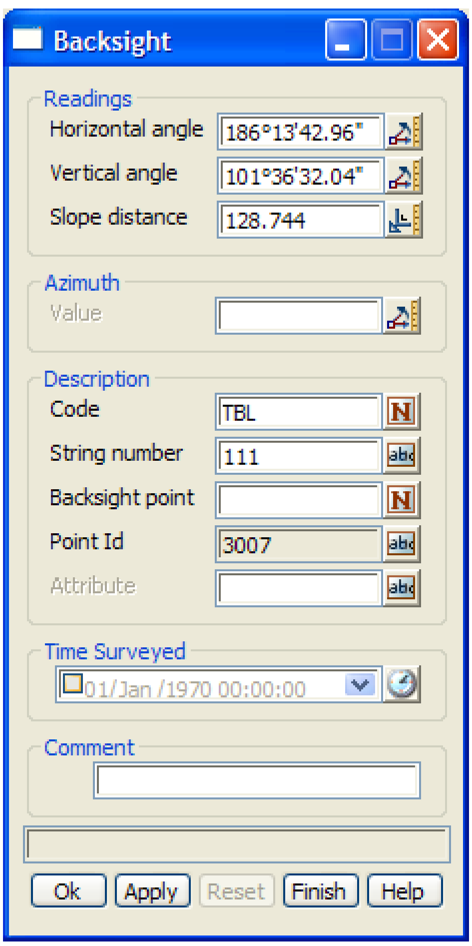
Make Measurement into a Backsight

The **Make Backsight** icon is visible when a ***measurement*** line has been selected (highlighted) in the field data.



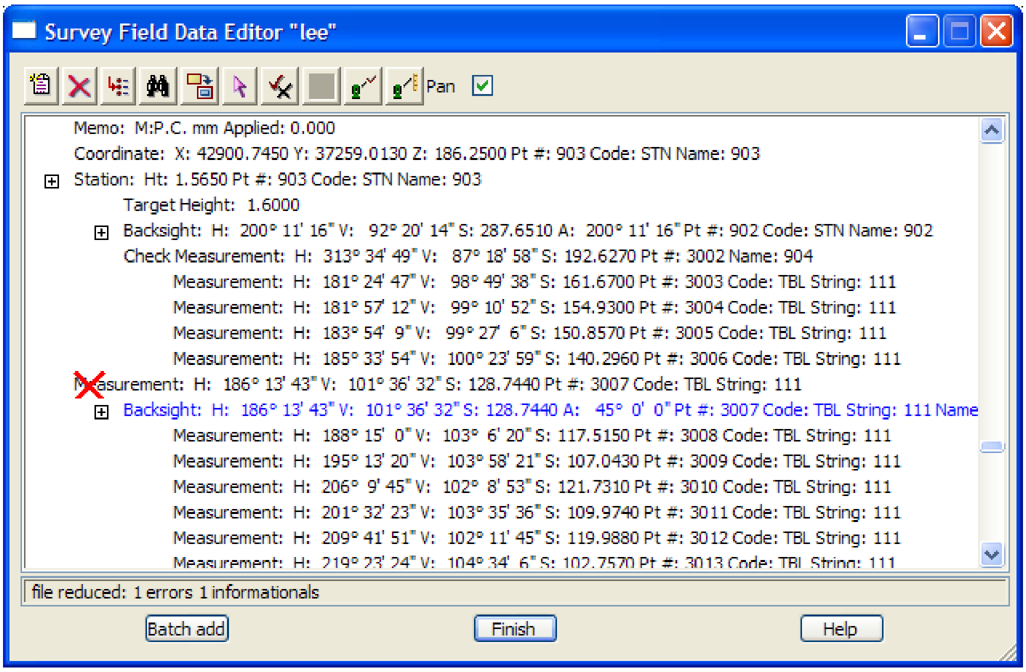
Highlighting a ***Measurement*** then displays the **Make Backsight** and **Make Check Measurement** icons

When the measurement line is highlighted, clicking on the **Make Backsight** icon brings up the **Backsight** panel with the highlighted measurement details filled in.



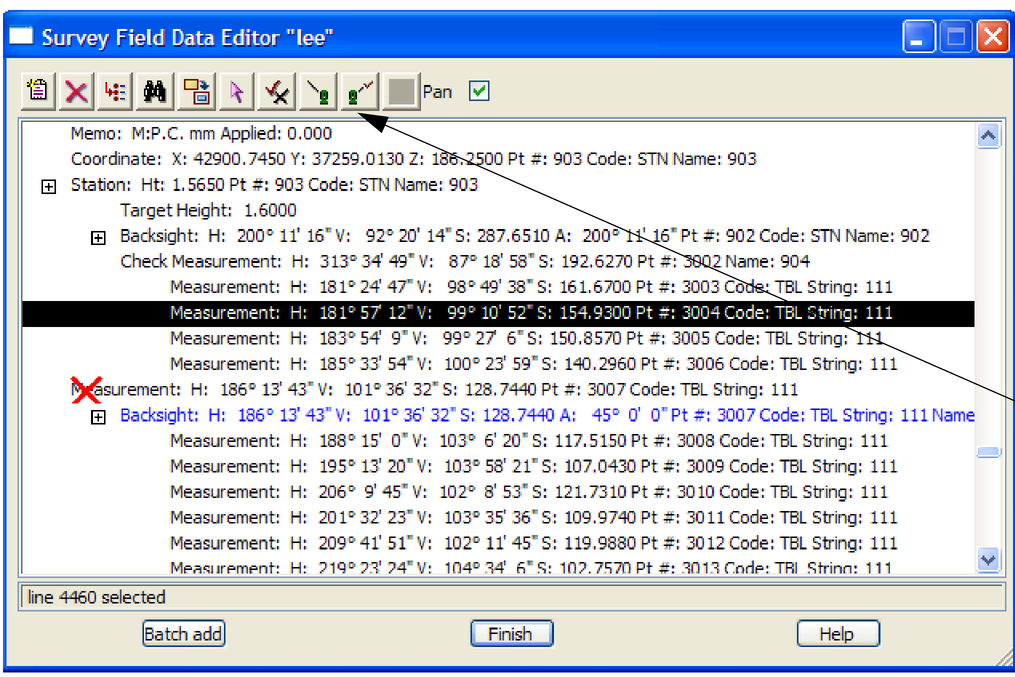
The ***Azimuth*** and ***Backsight point*** fields are filled in and the **OK** or **Apply** button selected.

The original measurement will then be shown as deleted and a new Backsight record created.



Make Measurement into a Check Measurement

The **Make Check Measurement** icon is only visible when a ***measurement*** or ***backsight*** line has been selected (highlighted) in the field data.

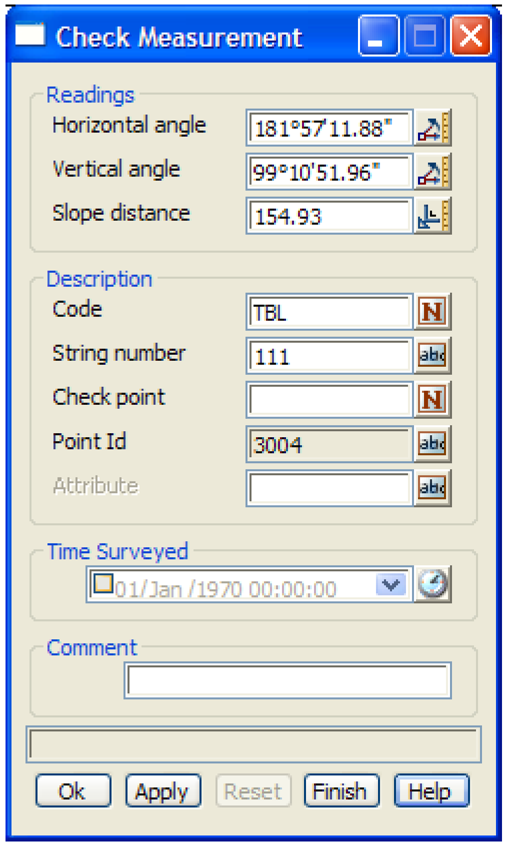


Highlighting a ***Measurement*** or ***Backsight*** then displays the **Make Check Sight**

and

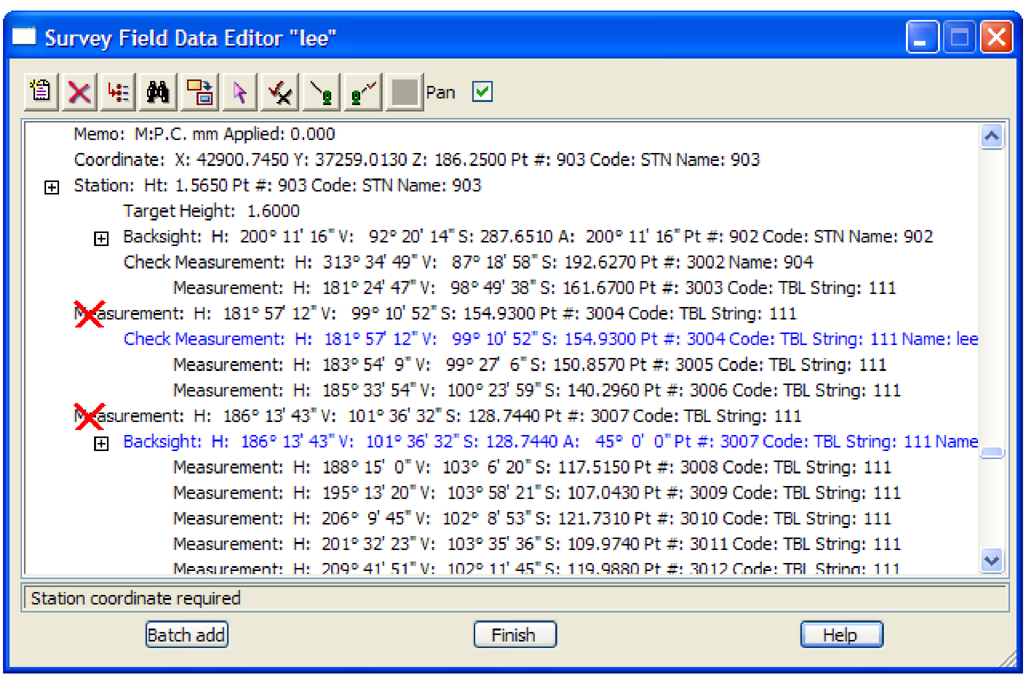
Make Check Measurement

When the measurement line is highlighted, clicking on the **Make Check Measurement** icon brings up the **Check Measurement** panel with the details from the highlighted measurement filled in.

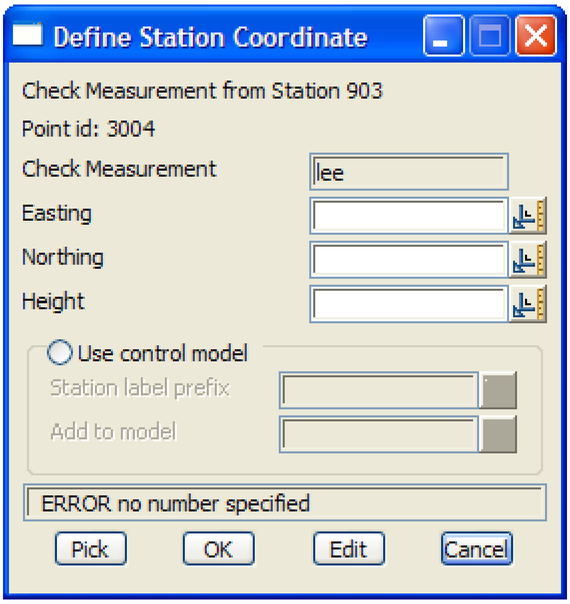


The ***Check point*** is then filled in and the **OK** or **Apply** button selected.

The original measurement will then be shown as deleted and a new ***Check measurement*** record created.

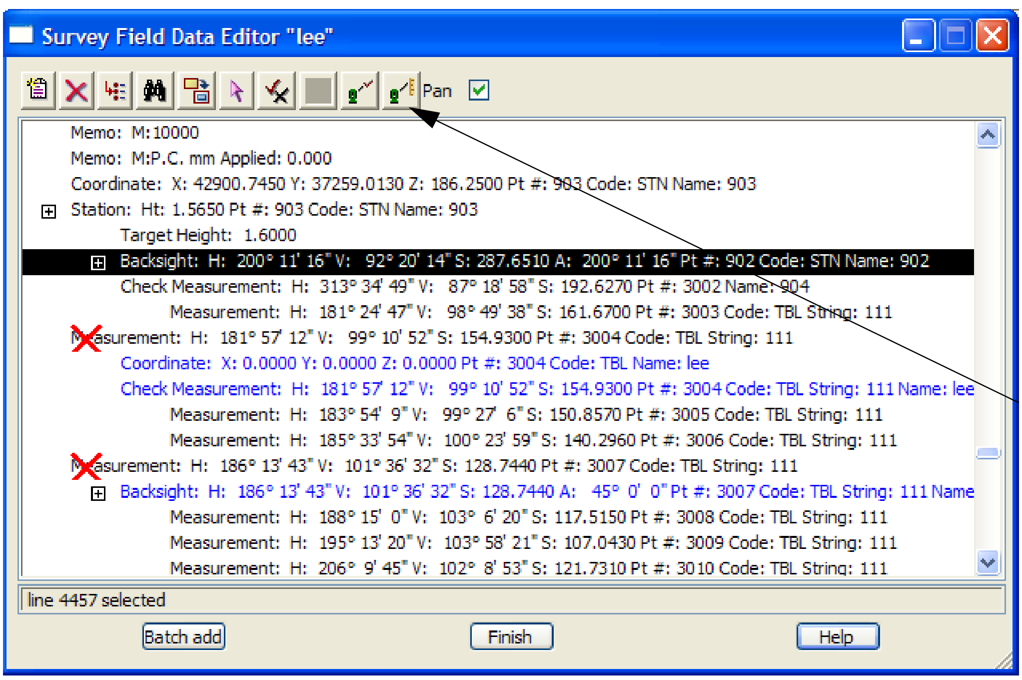


Note - if the ***Check point*** does not exist, a **Define Station Coordinate** panel is displayed for the user to enter the coordinates for the ***Check point***.



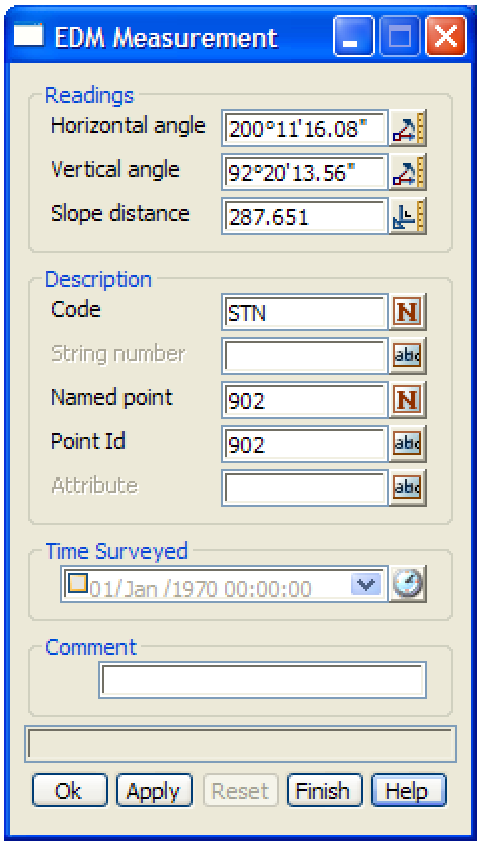
Make into a Measurement

The **Make into a Measurement** icon is visible when a ***backsight*** or ***check measurement*** line has been selected (highlighted) in the field data.



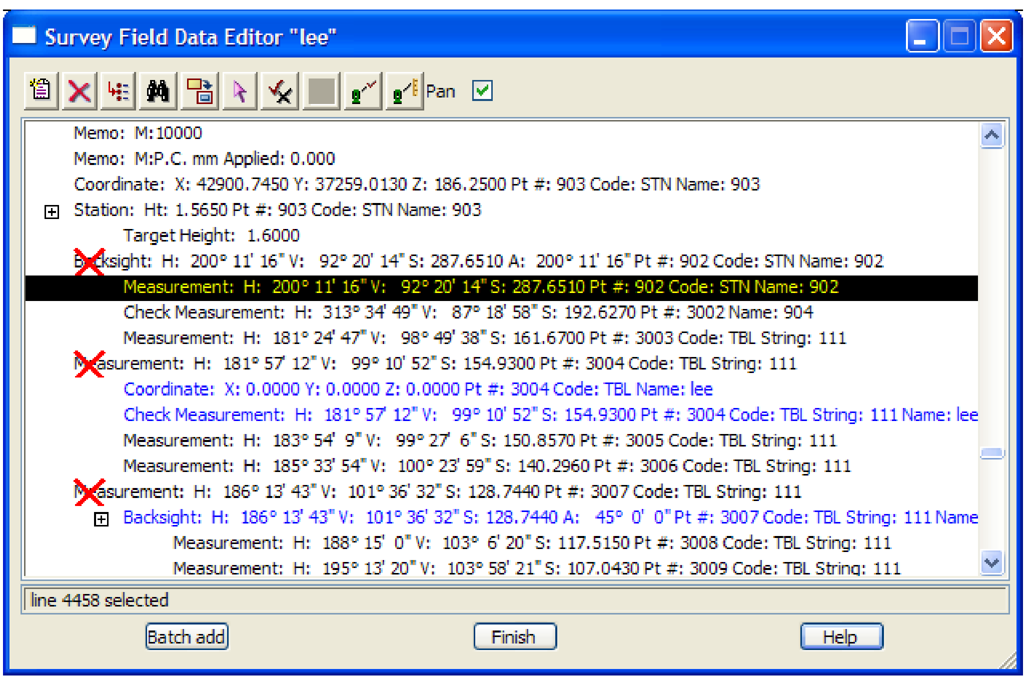
Highlighting a ***Backsight*** or ***Check Measurement*** then displays the **Make Measurement** icon

When the measurement line is highlighted, clicking on the **Make Measurement** icon brings up the **EDM Measurement** panel with the highlighted ***backsight*** or ***check measurement*** details filled in.



The ***String number*** field may need to be filled in and the **OK** or **Apply** button selected.

The original ***backsight*** or ***check measurement*** will then be shown as deleted and a new ***Measurement*** record created.



Autopan

Ticked on - when a line is selected (highlighted) in the survey data editor panel, if the point is not visible in a plan view that the model for the data is on, the view is modified so that the selected point is at the centre of the view (keeping the same scale for the view).

Please continue to the next section 17.7.6 List of Field Data Commands and Panels .

17.7.6 List of Field Data Commands and Panels

Panel buttons

The buttons that appear on the bottom of the panels used in this section have the following functions.

OK

Changes field data and closes the panel

Apply

Changes the field data but keeps the panel in view

Reset

If the record was an original field record (i.e. the command was not inserted manually) pressing the reset button will revert the record back to the original values.

Help and Finish

standard 12d buttons.

Existing point search

Some commands such as ***Backsight***, ***New instrument*** and ***Check*** allow the user to enter existing *point names* (i.e. backsight point, Setup point and Check point) or in the case of measurements from a data collector, both *point name* and *point ids*.

The difference between *point names* and *point ids* is that *point names* are usually specified by the user and should be a unique identifier for a point, whilst for that same physical point a number of measurements (and hence point ids) may be assigned (usually by the data collector). This may be particularly true of control station measurements where measurements are made to a given point name but each measurement is given a different point id by the data collector.

In most instances, a measurement to a point has a point id (from the data collector) and 12d automatically gives it the same point name as it is rare to measure a non-control point more than once (the point name can be over ridden by the user).

The names allow the reduction routine to search for the details of that point (eg coordinates) to allow for the reduction of further measurements. The order in which this searching takes place is as follows:

First search the Control model (if it exists):

1. A search is made of the control model for a string whose name is the same as the specified *point name*. If a string is found, the first point of the string is used for the (x,y,z) co-ordinates.
2. A search is made of the control model for a vertex of a string whose point id is the same as the specified *point name*. If a vertex is found its (x,y,z) co-ordinates are used.
3. If only a *point id* was specified, a search is made of the control model for a vertex of a string whose point id is the same as the specified *point id*. If a vertex is found its (x,y,z) co-ordinates are used.

Next search the already entered directly entered co-ordinates (DEC) in the field file:

4. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point name* is the same as the specified *point name*. If a

DEC is found, its (x,y,z) co-ordinates are used.

5. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point id* is the same as the specified *point name*. If a DEC is found, its (x,y,z) co-ordinates are used.
6. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point id* is the same as the specified *point id*. If a DEC is found, its (x,y,z) co-ordinates are used.

Next search the previous measurements in the field file:

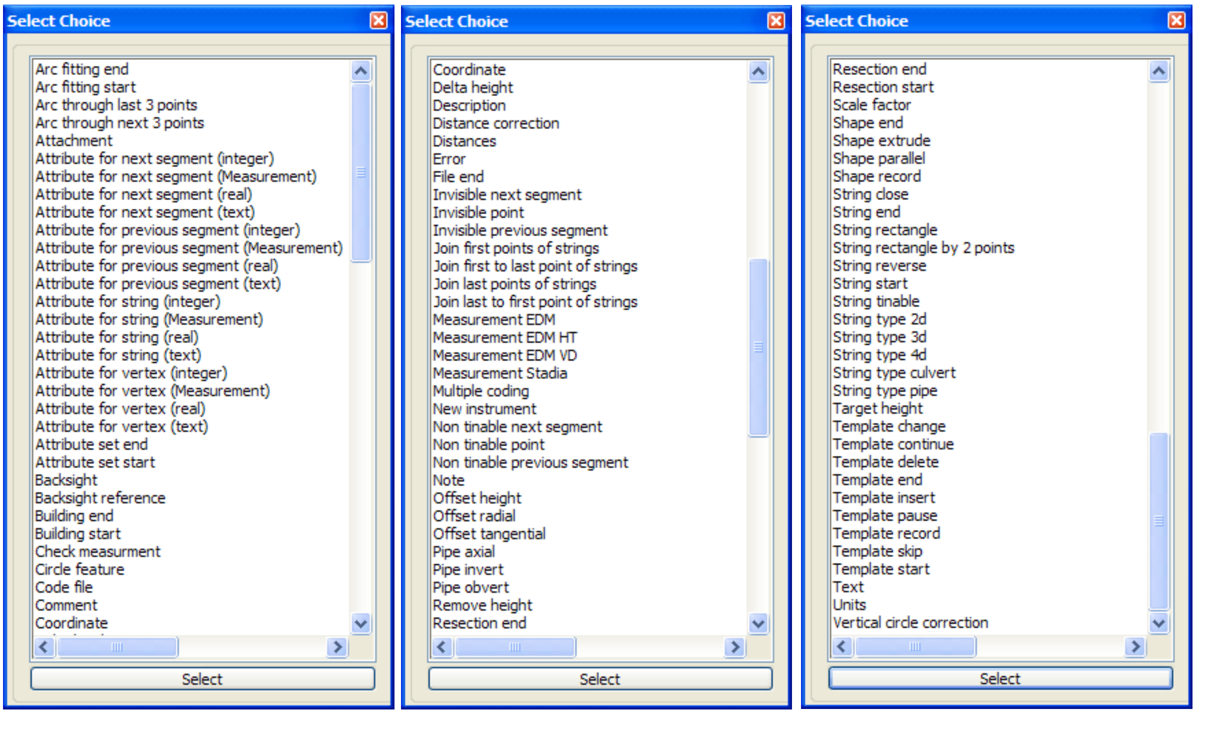
7. A search is made of previous measurements in the field file for a measurement whose *point name* is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.
8. A search is made of previous measurements in the field file for a measurement whose *point id* is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.
9. A search is made of previous measurements in the field file for a measurement whose *point id* is the same as the specified *point id*. If a measurement is found, its (x,y,z) co-ordinates are used.

Finally

10. If no match is found, the user will be prompted for the details of the previously undefined point. The user is asked to type in the (x,y,z) co-ordinates in the **Define Station coordinate** panel. If a model is specified in the **Add to model** field of the panel, then a new one point super string is created with the name *point name*, and as the vertex text for the point, the **Station label prefix** field value followed by *point name*

Field Data commands

The list of field commands in the pop-up from **Insert** or **Batch Add** are:



For a summary of the field file op codes see the section 36.10.5 Summary of 12d Field File Op Codes

For details on each option in the pop-up:

*Circle feature (*opcode 18)	Feature (opcode 18)
*Code file (*opcode 119)	Code file (opcode 119)
*Comment (*opcode -2)	Comment (opcode -2)
*Coordinate (*opcode 2)	Coordinate (opcode 2)
*Delta height (*opcode 28)	Height Or Depth (opcode 28)
*Description (*opcode 1)	Job Data (opcode 1)
Distance correction (opcode 127)	Distance correction (opcode 127)
*Distances (*opcode 49)	Distances (opcode 49)
*Error (*opcode -1)	Error (opcode -1)
*File end (*opcode 99)	End File (opcode 99)
*Invisible next segment (*opcode 108)	Invisible (opcodes 107, 108, 109)
*Invisible point (*opcode 109)	Invisible (opcodes 107, 108, 109)
*Invisible previous segment (*opcode 107)	Invisible (opcodes 107, 108, 109)
*Join first points of strings (*opcode 23)	Strings Join (opcodes 21 to 24)
*Join first to last point of strings (*opcode 22)	Strings Join (opcodes 21 to 24)
*Join last points of strings (*opcode 21)	Strings Join (opcodes 21 to 24)
*Join last to first point of strings (*opcode 24)	Strings Join (opcodes 21 to 24)
*Measure EDM (*opcode 7)	EDM Measurement (opcode 7)
*Measure EDM HT (*opcode 11)	EDM Measurement (HA,HD,HT) (opcode 11)
*Measure EDM VD (*opcode 12)	Edm measurement (HA,HD,Diff HT) (opcode 12)
*Measure Stadia (*opcode 10)	Stadia Measurement (opcode 10)
*Multiple coding (*opcode 16)	Multiple Coding (opcode 16)
*New instrument (*opcode 3)	New Instrument (opcode 3)
*Non tinable next segment (*opcode 38)	Tinable (opcodes 38, 39, 40)
*Non tinable point (*opcode 40)	Tinable (opcodes 38, 39, 40)
*Non tinable previous segment (*opcode 39)	Tinable (opcodes 38, 39, 40)
*Note (*opcode 29)	Note (opcode 29)
*Offset height (*opcode 44)	Offset Measurement (opcodes 42, 43, 44)
*Offset radial (*opcode 42)	Offset Measurement (opcodes 42, 43, 44)

*Offset tangential (*opcode 43)	Offset Measurement (opcodes 42, 43, 44)

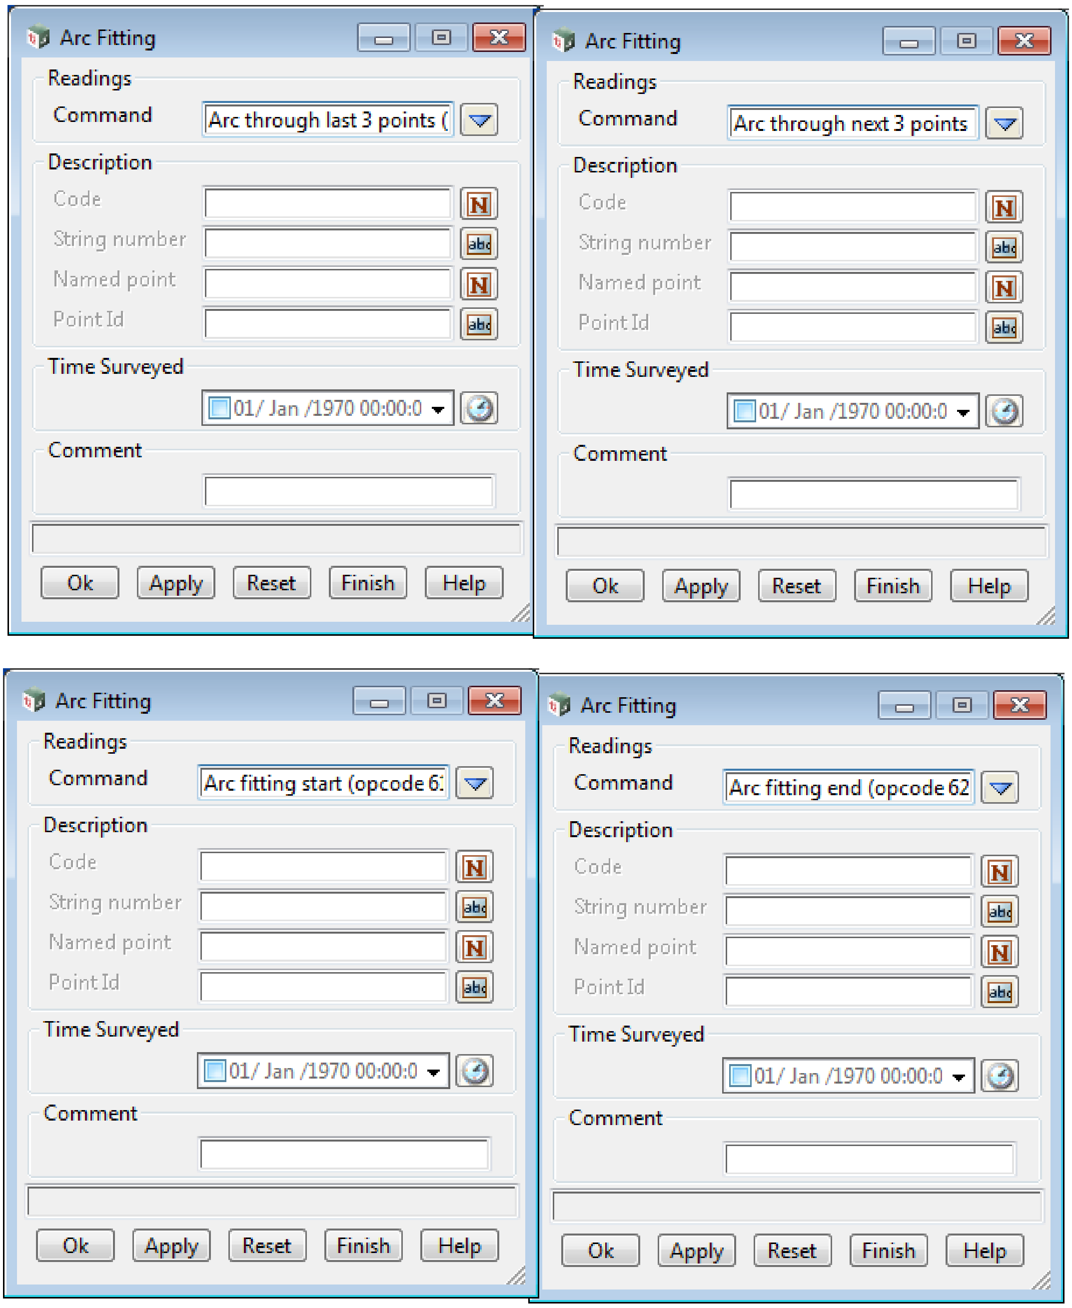
*Template start (*opcode 51)	Templating (opcodes 51 to 59)
*Text (*opcode 41)	Additional Text For Point (opcode 41)
*Vertical circle correction (*opcode 15)	Vertical Circle Correction (opcode 15)

Arc Fitting (opcodes 17, 60, 61, 62)

Fitting arcs through measurements.

See 36.3.9 Arcs Through Points in Appendix 36 12d Survey Guide .



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Arc through last 3 points (opcode 17) Arc through next 3 points (opcode 60) Arc fitting start (opcode 61) Arc fitting end (opcode 62)

for Arc through last 3 pts

Named point is not used.

If no *feature code, string number, named point or point id* is given, then the current measurement point and the two previous points with the same feature code and string number as the current measurement point, are joined by an arc. If there is less than three such points, no arc is fitted.

If the *feature code* and *string number* exist*,* the last three previous measurement points of the same *feature code* and *string number* are joined by an arc. If the current measurement point has that feature code and string number, then it is the third of the three points used. If there is less than three points, no arc is fitted.

If a *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id. That point and two measurement points previous to the predefined point of the same *feature code* and *string number*, are joined by an arc. If there is less than three points, no arc is fitted

for Arc through next 3 pts

Named point is not used.

If no feature *code, string number, named point or point id is* given, an arc is inserted through the current measurement point and the next two measured points with the same feature code and string number as the current measurement point. If there is less than three points, no arc is fitted.

If a feature *code, string number or point id* exists, then either the *feature code* and/or *string number* and/or the *point id* section of the *point description* can be used.

If the *feature code* or *string number* exist, a search is made for a previously defined measurement with the same feature code or string number. An arc is inserted through this previous measurement and the next two measured points following this previous measurement with the same feature code and string number. If the current point has that feature code and string number, then it is the first of the three points. If there is less than three points, no arc fitted.

If the *point id exists,* then the *feature code* and *string number* are taken from the previous measurement point **with** that point id, and an arc is inserted through that point and the next two measurement points with the same *feature code* and *string number.* If there is less than three points, no arc is fitted

for Start arc fitting

Named point is not used.

If no feature *code, string number, named point or point id* is given, arcs are inserted through the following sets of measurement points with the same feature code and string number as the current measurement point. The current measurement point is the first of the points.

The arcs are fitted as follows - the first arc is fitted through points one, two and three, the next arc through points three, four and five etc. If the current point has that feature code and string number, then it is the first of the points. If there is less than three points, then no arc is fitted.

If the *feature code* and *string number exist,* a search is made for a previously defined measurement with the same feature code or string number. An arc is inserted through the following measured points with the same feature code and string number as given. If the current point has that feature code and string number, then it is the first of the points.

If the *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id, and arcs are inserted through that point and the following measured points with the same *feature code* and *string number.*

for End arc fitting

Named point is not used.

If no feature *code, string number, named point or point id* is given, the fitting of arcs through the current string is stopped. The current measurement point is the last of the points used in the arc fitting.

If the *feature code* and *string number* exist, then the fitting of arcs through the points of the previous string with the same *feature code* and *string number* is stopped. If the current measurement point has that feature code and string number, then it is the last point used in the arc fitting.

If the *point id* from the *point description* exists, then the point with that point id is the last point used in the arc fitting.

If ***12d Model*** encounters an *End Arcs (62*) but no *Start Arcs through sets of three points* (61) command for the string, then a *Start Arcs through sets of three points* (61) is assumed to apply at the beginning of the string and hence arc fitting will be applied to the entire string.

Code

feature code. See the description of the panel field **Arc mode** *for usage*

String number

string number. See the description of the panel field **Arc mode** *for usage*

Named point

not used

Point id

point id. See the description of the panel field **Arc mode** *for usage*

Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Attribute for string (integer) (opcode 68) Attribute for string (real) (opcode 69) Attribute for string (text) (opcode 70) Attribute for vertex (integer) (opcode 71)) Attribute for vertex (real) (opcode 72)) Attribute for vertex (text) (opcode 73) Attribute for next segment (integer) (opcode 74) Attribute for next segment (real) (opcode 75)) Attribute for next segment (text) (opcode 76)) Attribute for previous segment (integer) (opcode 77)) Attribute for previous segment (real) (opcode 78) Attribute for previous segment (text) (opcode 79)

for String (integer)

Add an user defined integer attribute to the current string.

for String (real)

Add a real (floating point) user defined attribute to the current string.

for String (text)

Add a text user defined attribute to the current string.

for Vertex (integer)

Add an integer user defined attribute to the current measurement point.

for Vertex (real)

Add a real (floating point) user defined attribute to the current measurement point.

for Vertex (text)

Add a text user defined attribute to the current measurement point.

for Next segment (integer)

Add an integer user defined attribute to the next segment from the current measurement point.

for Next segment (real)

Add a real (floating point) user defined attribute to the next segment from the current measurement point.

for Next segment (text)

Add a text user defined attribute to the next segment from the current measurement point.

for Previous segment (integer)

Add an integer user defined attribute to the previous segment for the current measurement point.

for Previous segment (real)

Add a real (floating point) user defined attribute to the previous segment for the current measurement point.

for Previous segment (text)

Add a text user defined attribute to the previous segment for the current measurement point.

Name

The name of the attribute.

Value

The attribute data in the form specified by the mode.

Time surveyed

time when the command (op code) was created

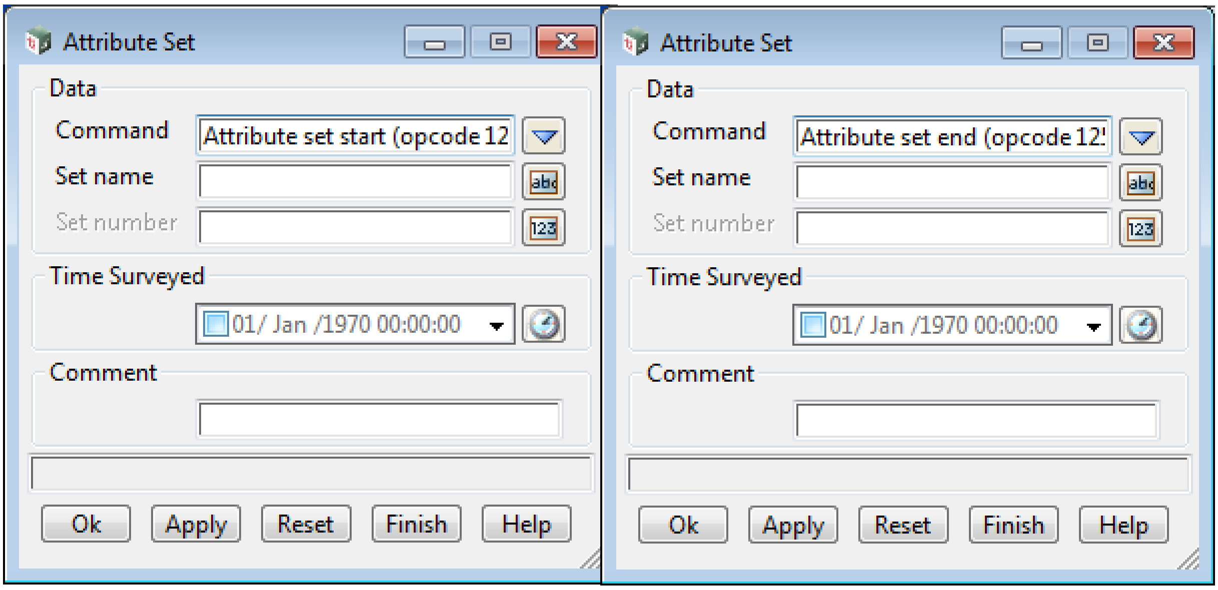
Attribute Set (opcode 124 and 125)

This section of documentation is a work in progress and will be updated in subsequent releases.



The fields and buttons used in this panel have the following functions.

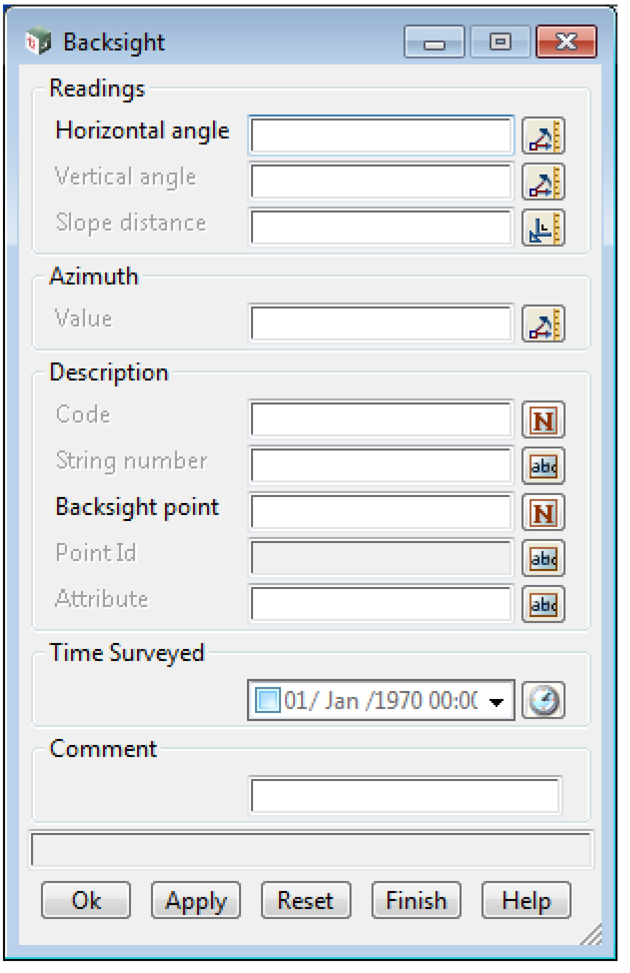
Field Description	Type	Defaults	Pop-Up
			Attribute set start (opcode 124) Attribute set end (opcode 125)

Backsight (opcode 4)

Denote the measurement as a backsight measurement.

Individual backsight measurements can be entered, or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement, the backsight command should be entered twice, with the appropriate values entered into the panel each time.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Horizontal angle

the horizontal angle to the backsight in dd.mmss format.

Vertical angle

the vertical angle to the backsight in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.

Slope distance

the slope distance to the measurement to the backsight. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.

Value

the azimuth to the backsight in dd.mmss format. This allows backsights to be specified by azimuth only. In the case of a differing azimuth and horizontal angle, a swing will be computed by the subtraction of the azimuth value and the horizontal angle.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Backsight point

point name.of the backsight point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the backsight point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search*. If a new backsight entry is inserted into the file, this field will be non-editable since only the backsight point is required.*

Attribute

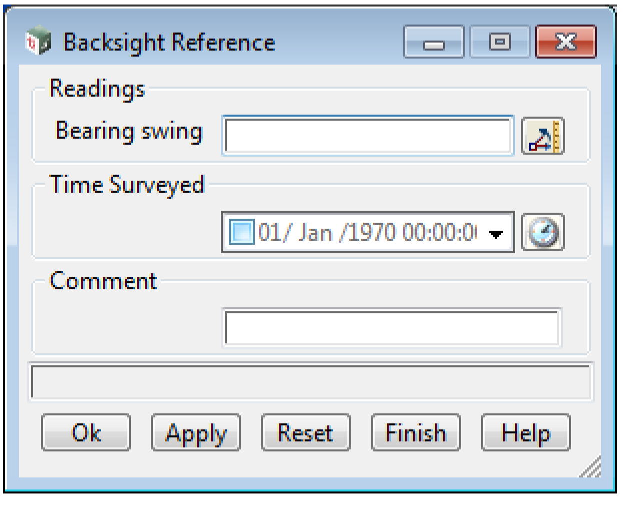
Backsight Reference (opcode 50)

Specify an angle (measured positive, clockwise from north) to swing the following measurements by.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Bearing swing

the angle (measured positive, clockwise from north) to swing following measurements. It is equivalent to the bearing datum difference. Note, this swing is only current for measurements following the command and for that particular station setup. It also negates any previous swings calculated from backsight measurements (bearing datum difference) for that station setup. Therefore, measurements after the command will use the new swing value. The direction of the swing is positive in the clockwise direction

Time surveyed

time when the command (op code) was created

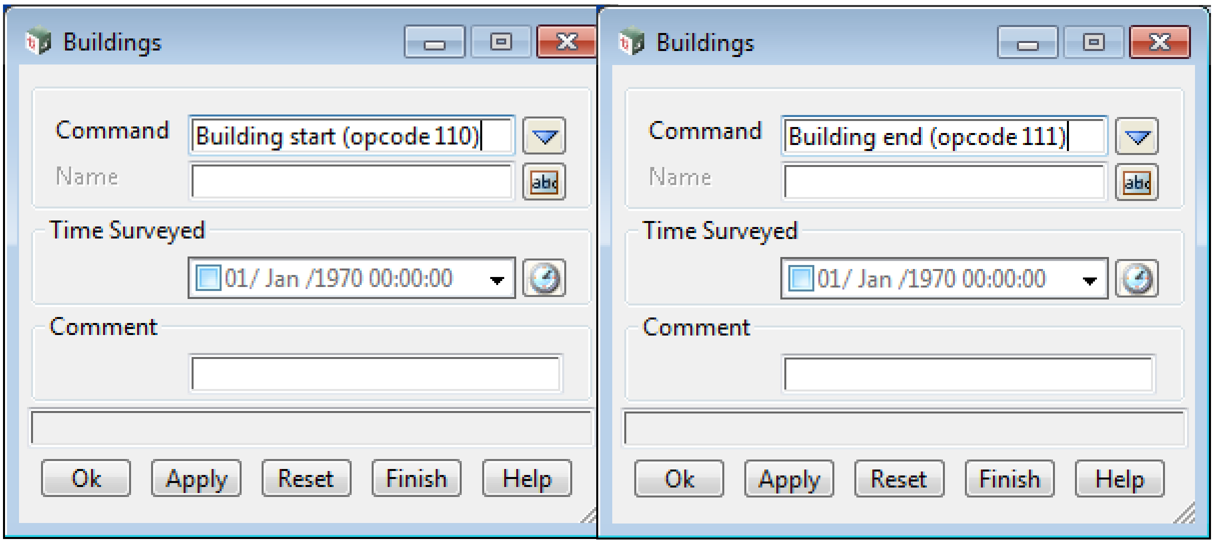
Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Buildings (opcodes 110, 111)

Create a building face.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command			Building end (opcode 111) Building start (opcode 110)

for Building end

If no *name exist*s, the current building face observation set is finished (including the current measurement point).

for Buildings start

Start recording a building face with the given name. If *name* is non-blank, then the default building face is defined by the *feature code* and *string number.*

The following measurements until a *Finish* code (111), are stored as the building face. There is no limit to the number of points in a building face.

Name

Name has the meaning as outlined above in Building end/start definition.

Time surveyed

time when the command (op code) was created

Comment

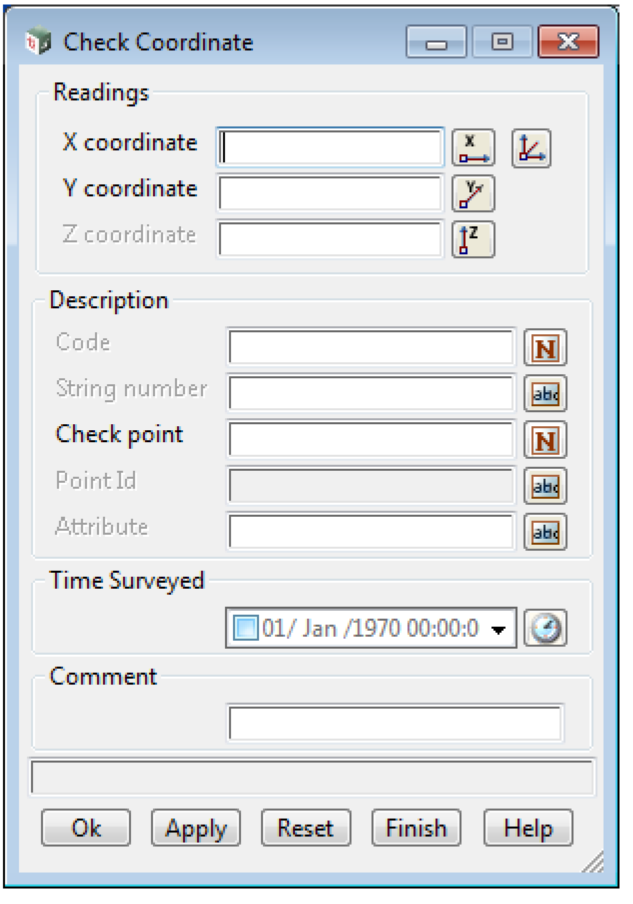
Check Coordinate (opcode 14)

This section of documentation is a work in progress and will be updated in subsequent releases

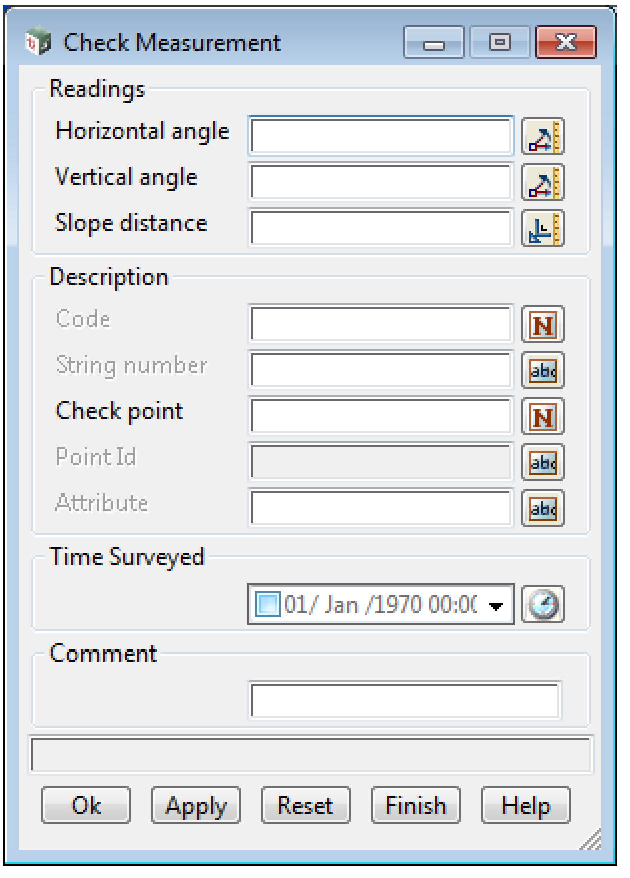


Check Measurement (opcode 6)

Denote the measurement as a check measurement.

Individual check measurements can be entered, or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement the check command should be entered twice, with the appropriate values entered into the panel each time.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Horizontal angle

the horizontal angle to the check point in dd.mmss format.

Vertical angle

the vertical angle to the check point in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.

Slope distance

the slope distance to the measurement to the check point. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Check point

point name.of the check point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the check point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point

search . *If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

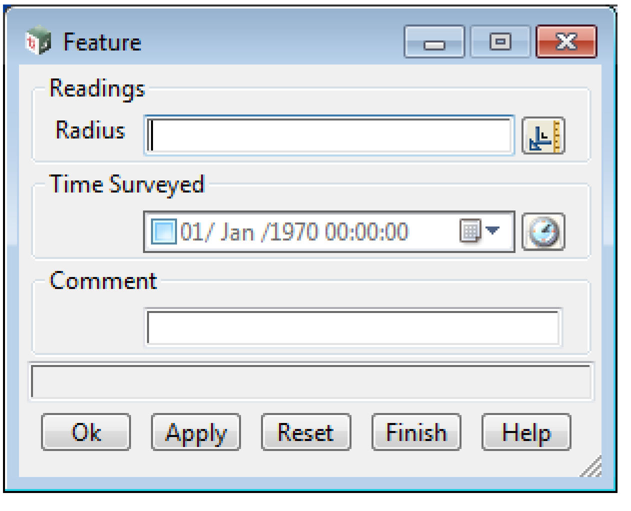
Feature (opcode 18)

Create a circle of a given radius around the current measurement point.

See 36.3.7 Feature *in Appendix* 36 12d Survey Guide .



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Radius

the radius of the circle to be drawn around the current measurement point.

Time surveyed

time when the command (op code) was created

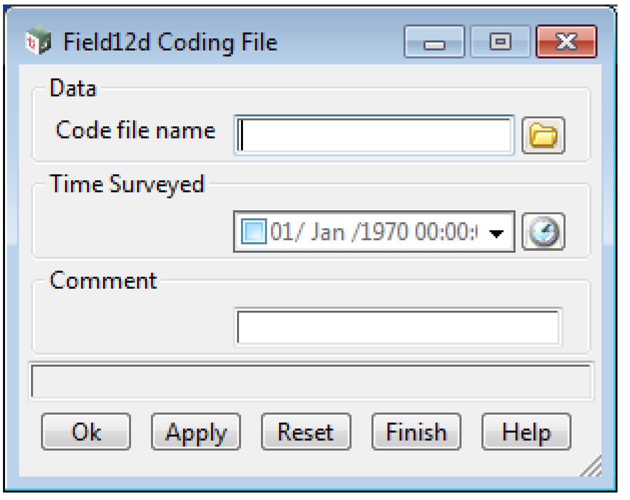
Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

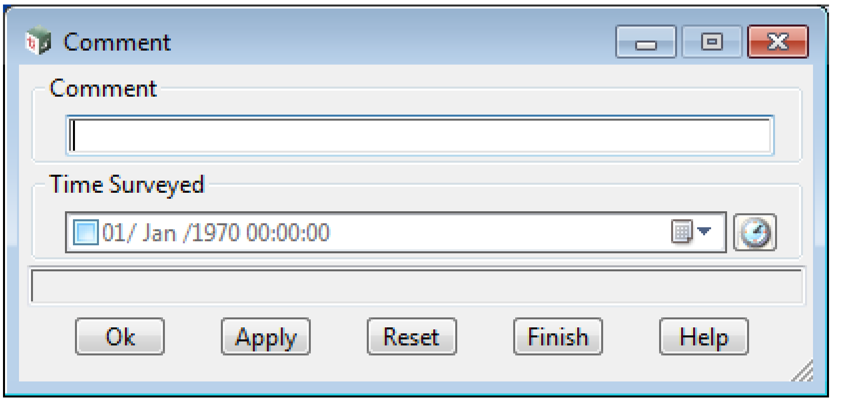
Code file (opcode 119)

This section of documentation is a work in progress and will be updated in subsequent releases.



Comment (opcode -2)

Insert a comment in the field file.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Comment

the comment to insert into the field file.

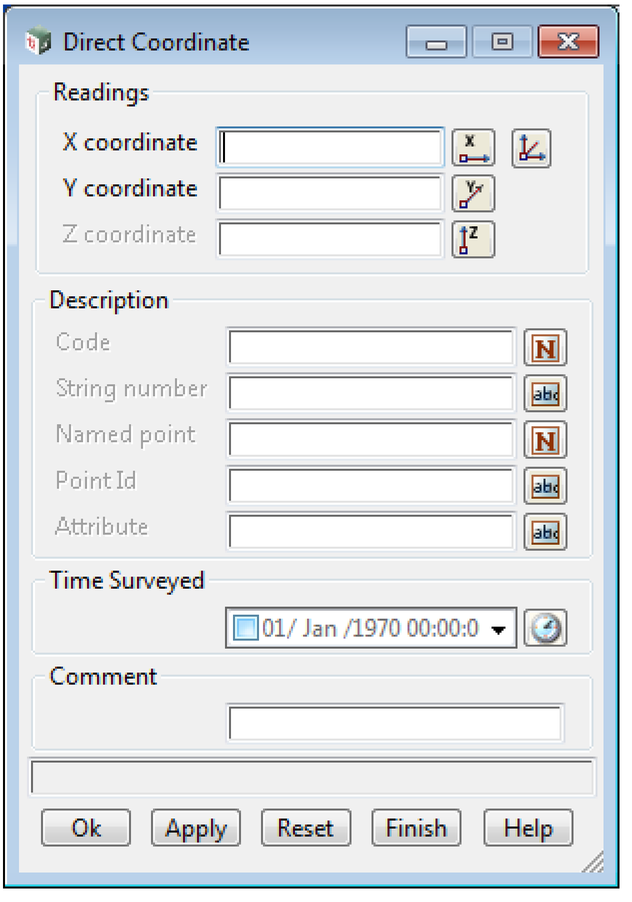
Time surveyed

time when the command (op code) was created

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Coordinate (opcode 2)

Create a point with specified coordinates.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
X coordinate	double box		

the x coordinate value of the nominated point.

Y coordinate double box

the y coordinate value of the nominated point.

Z coordinate double box

the z coordinate value of the nominated point.

Code

the feature code of the nominated point.

String number

the string number of the nominated point.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. *If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

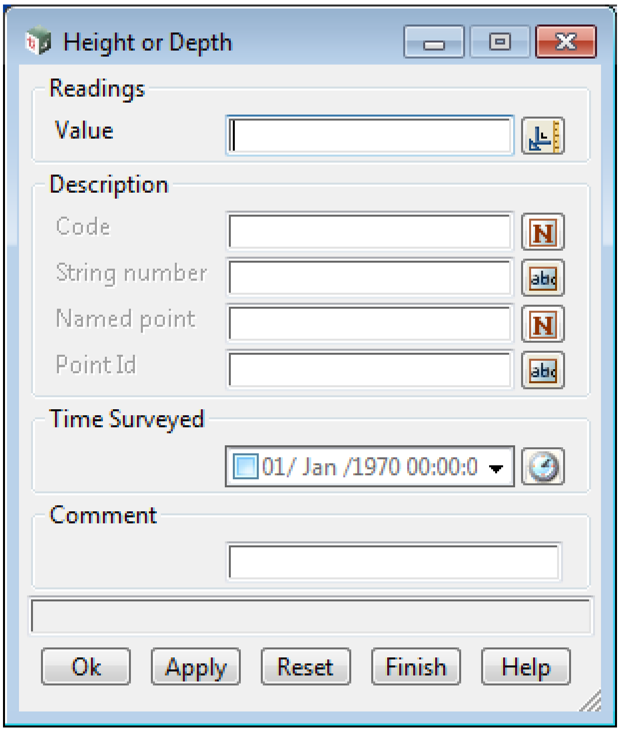
Height Or Depth (opcode 28)

Note - this option ***does not alter heights***. It just adds a text comment of the given value.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Value

value is converted to text and added to the string name as specified in the description fields.

Code, String number, Named point

Named point is not used.

If no feature *code, string number, named point or point id* is given, the value is added to all string names with the same code and string number as the current measurement. This applies to the entire field file.

If the *feature code* and *string number* exist, then the value is added to all string names with the same code and string number. This applies to the entire field file.

If the *point id* exists, then the value is added to all string names with the same code and string number as the point defined by the point id. This applies to the entire field file.

Time surveyed

time when the command (op code) was created

Comment

insert a comment within the field file.

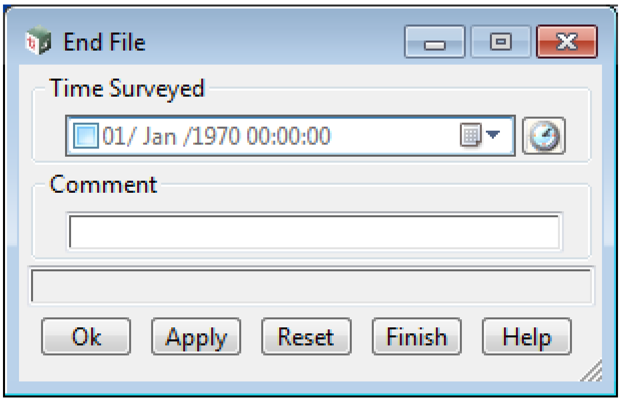
End File (opcode 99)

Command to stop the processing of the 12d field file at this line.

This is useful for debugging errors.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Time surveyed

time when the command (op code) was created

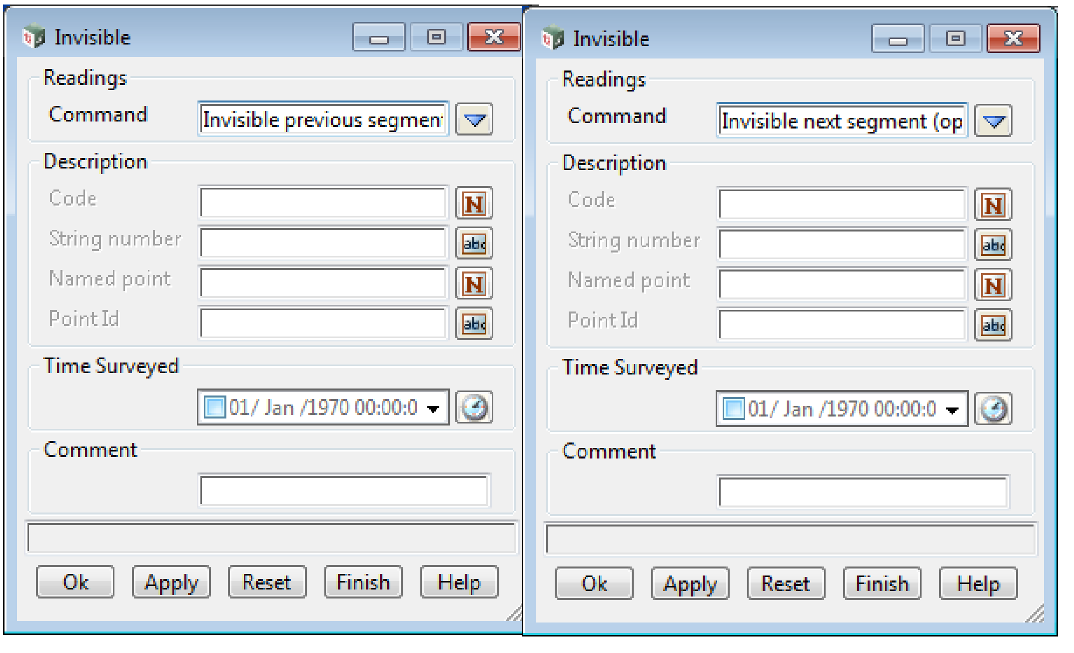
Comment

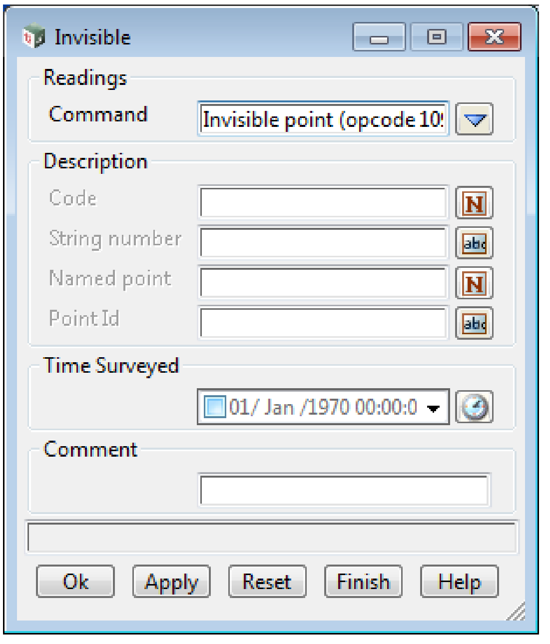
Stop processing the 12d field file at this line. Useful for debugging errors.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons .

Invisible (opcodes 107, 108, 109)

Make segments or vertices invisible.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Invisible previous segment (opcode 107) Invisible next segment (opcode 108) Invisible point (opcode 109)

for Make the previous segment invisible

If no *description* is given, the previous segment containing the current measurement point is set to invisible.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that point id as an end point, is set to invisible.

for Make the next segment invisible

If no *description* is given, the next segment containing the current measurement point as a starting point is set to invisible. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that point id as a start point, is set to invisible.

for Make a point invisible

If no *description* is given, the current measurement point is set to invisible. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the point with that point id is set to invisible.

Code

the feature code of the nominated point.

String number

the string number of the nominated point.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

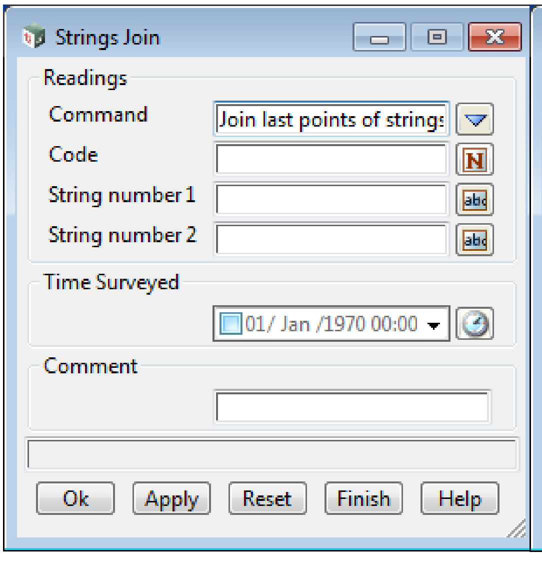
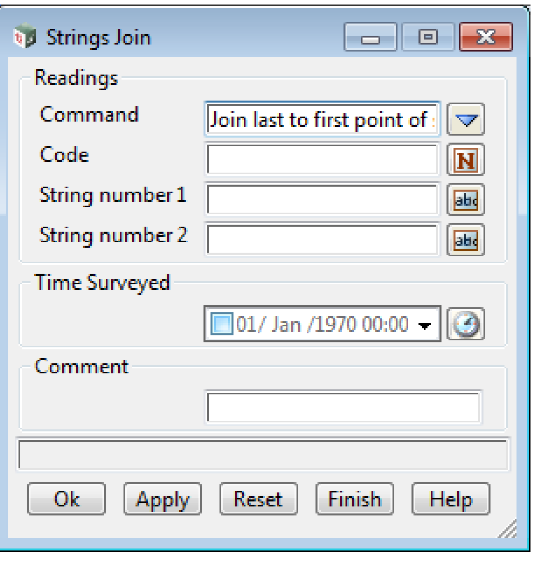
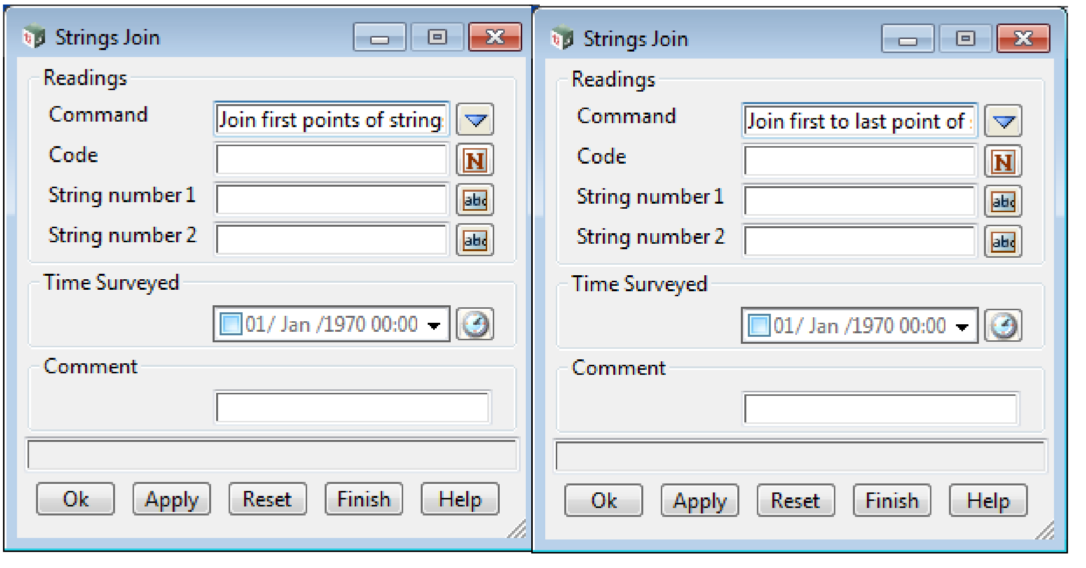
Strings Join (opcodes 21 to 24)

Join two strings together.

See 36.3.8 Joining Strings in Appendix 36 12d Survey Guide .







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Join last points of strings (opcode 21) Join first to last point of strings (opcode 22) Join first points of strings (opcode 23) Join last to first point of strings (opcode 24)

for Join last points of strings

In the final reduction, the last point of the string with the given *feature code* and *string_number_1* is joined to the last point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

for Join first to last point of strings

In the final reduction, the first point of the string with the given *feature code* and *string_number_1* is joined to the last point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

for Join first points of strings

In the final reduction, the first point of the string with the given *feature code* and *string number 1* is joined to the fist point of the string with given *feature code* and *string number 2*. The created string has the given *feature code* (no string number is needed since it is the final reduction when the string numbers are then dropped).

for Join last to first point of strings

In the final reduction, the last point of the string with the given *feature code* and *string_number_1* is joined to the first point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

Code

the feature code of the strings to be joined

String number 1

the string number of the first string

String number 2

the string number of the second string

Time surveyed

time when the command (op code) was created

Comment

insert a comment within the field file.

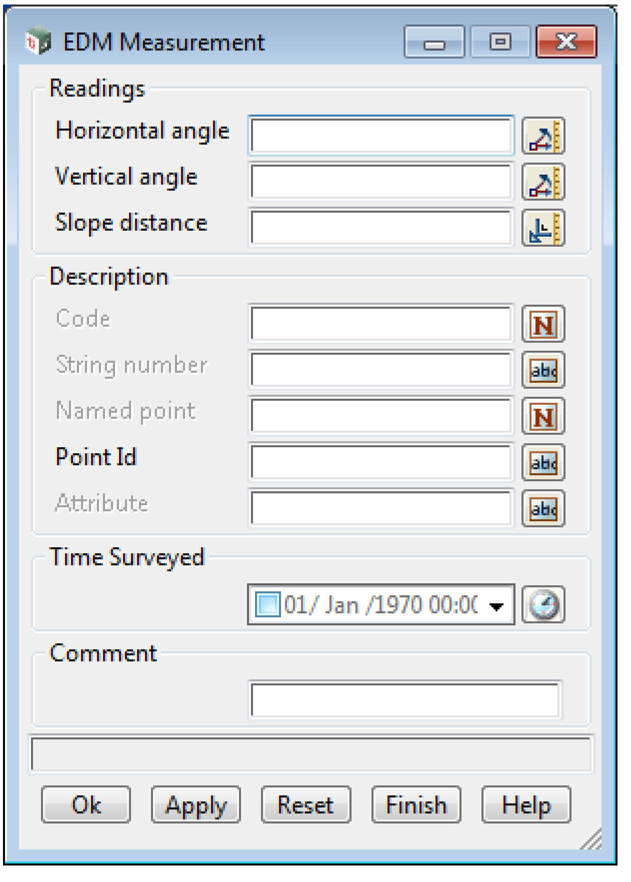
OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

EDM Measurement (opcode 7)

Store a measurement given by Horizontal angle, Vertical angle and Slope distance.

Individual measurements can be entered or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement the command should be entered twice, with the appropriate values entered into the panel each time.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Horizontal angle

the horizontal angle to the point in dd.mmss format.

Vertical angle

the vertical angle to the point in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.

Slope distance

the slope distance to the measurement to the point. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

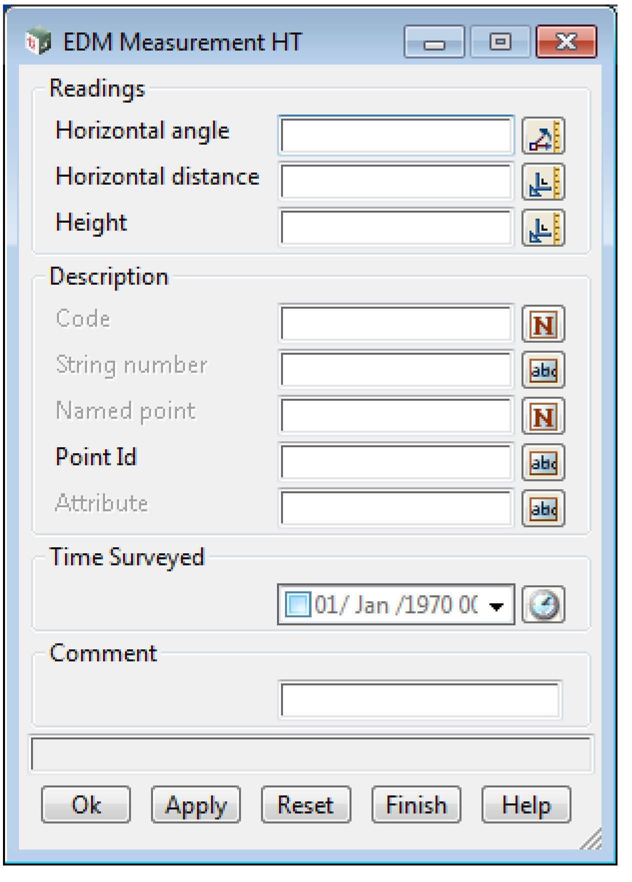
EDM Measurement (HA,HD,HT) (opcode 11)

Store a measurement given by Horizontal angle, Horizontal distance and Height.

Individual measurements can be entered or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement the command should be entered twice, with the appropriate values entered into the panel each time.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Horizontal angle

the horizontal angle to the point in dd.mmss format.

Horizontal distance

the reduced horizontal distance.

Height

the height of the observation point.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

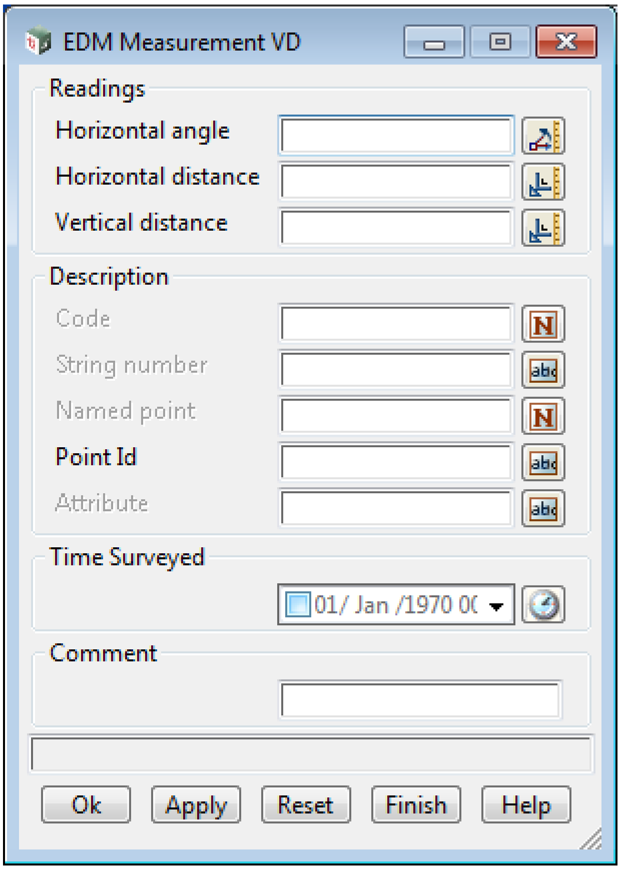
Edm measurement (HA,HD,Diff HT) (opcode 12)

Store a measurement given by Horizontal angle, Horizontal distance and Vertical distance.

Individual measurements can be entered or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement the command should be entered twice, with the appropriate values entered into the panel each time.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Horizontal angle

the horizontal angle to the point in dd.mmss format.

Horizontal distance

the reduced horizontal distance.

Vertical distance

the change in height as measured from the collimation height of the instrument to the target point (usually centre of target).

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed *description of how the reduction finds/uses the appropriate point see the section* [Existing point search](#)

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#)*. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

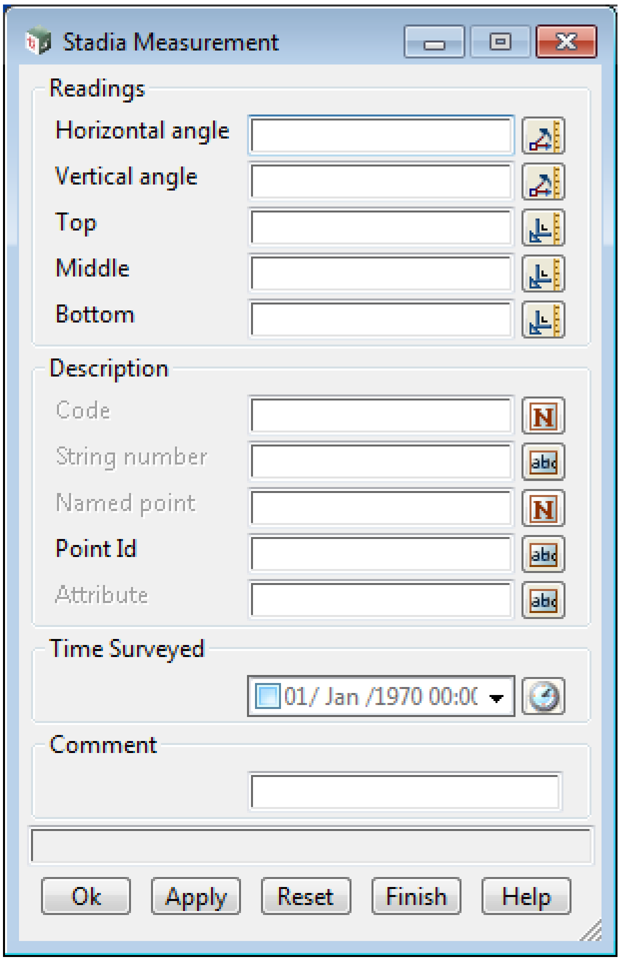
Stadia Measurement (opcode 10)

Store a measurement given by Horizontal angle, Horizontal distance and the Top, Middle and Bottom hair readings.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Horizontal angle

the horizontal angle to the point in dd.mmss format.

Vertical angle

the vertical angle to the point in dd.mmss format.

Top

the top hair reading.

Middle

the middle hair reading.

Bottom

the bottom hair reading.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. Multiple Coding (opcode 16)

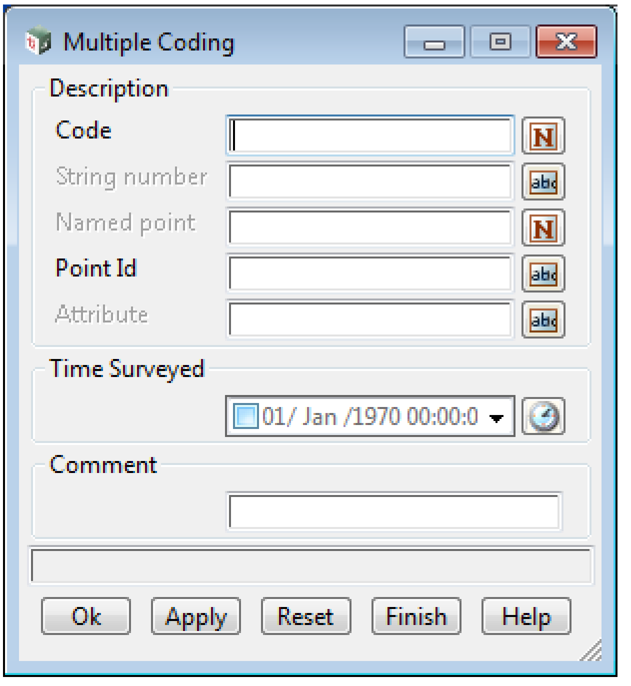
Record a new point at the same position as the current measurement point but with possibly a different feature code and string number.



A new point is created at the same position as the current measurement point but with the specified *feature code* and *string number*.

The *point id* and *text* are recorded as the point id and text for that vertex of the super string.

If a *point name* exists, then it is a ***named measurement*** and a 4d point string of name *point name* is created and mapped using the Map File. The 4d text is the station prefix followed by *point name*. The *point name* is added to the internal list of named points for searching for co-ordinates.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Code

the feature code of the new point.

String number

the string number of the new point.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

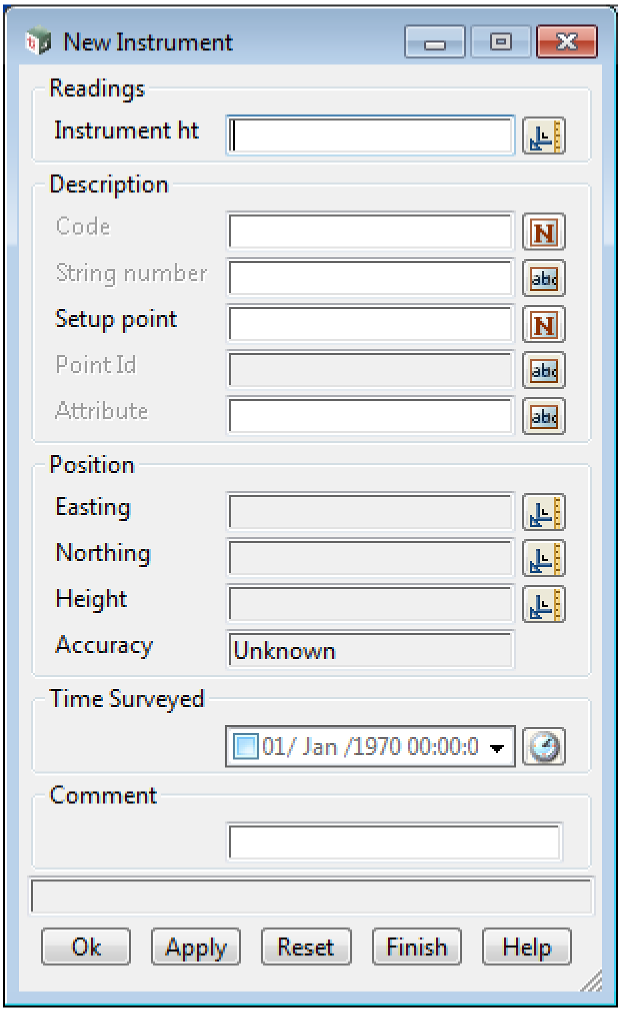
OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

New Instrument (opcode 3)

Define a new instrument setup.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Instrument ht

the height of the instrument setup.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

Easting

this field is non-editable and is populated if a valid coordinate exists for the nominated setup point.

Northing

this field is non-editable and is populated if a valid coordinate exists for the nominated setup point.

Height

this field is non-editable and is populated if a valid coordinate exists for the nominated setup point.

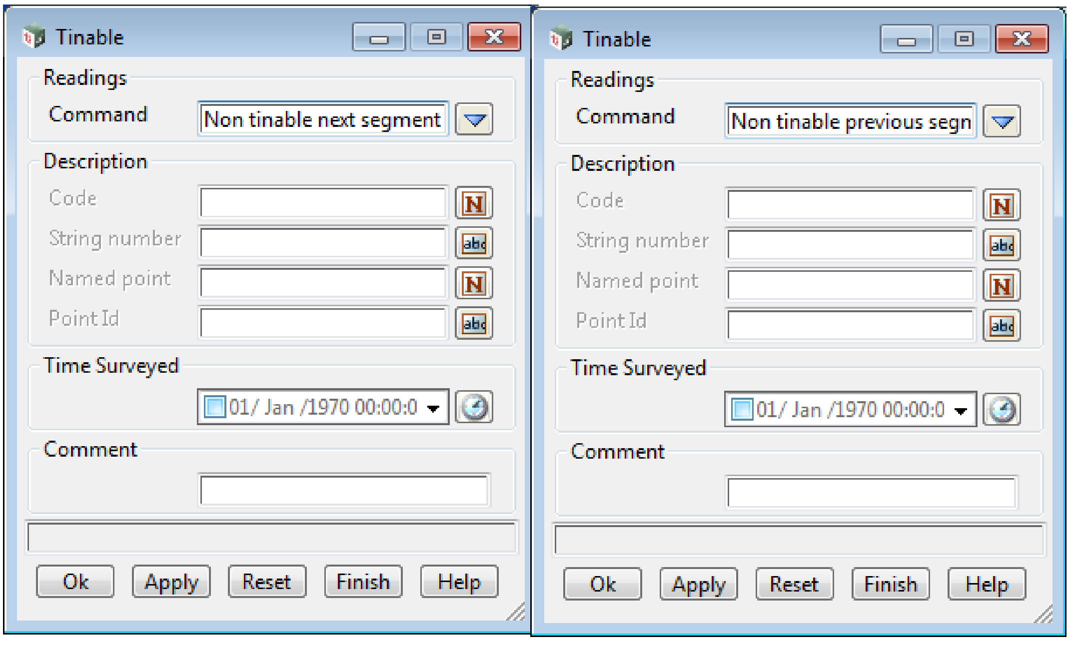
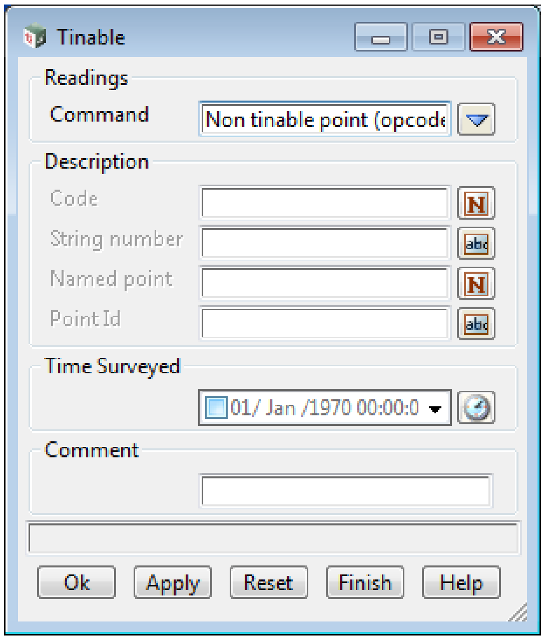
Tinable (opcodes 38, 39, 40)





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Non tinable previous segment (opcode 39) Non tinable next segment (opcode 38) Non tinable point (opcode 40)

for Make the previous segment non-tinable

If no *description* is given, the previous segment containing the current measurement point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as an end point, is set to non-tinable.

for Make the next segment non-tinable

If no *description* is given, the next segment containing the current measurement point as a starting point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as a start point, is set to non-tinable.

for Make a point not tinable

If no *description* is given, the current measurement point is set to not tinable. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is set to not tinable.

If the *point id* exists, then the point with that point id is set to not tinable.

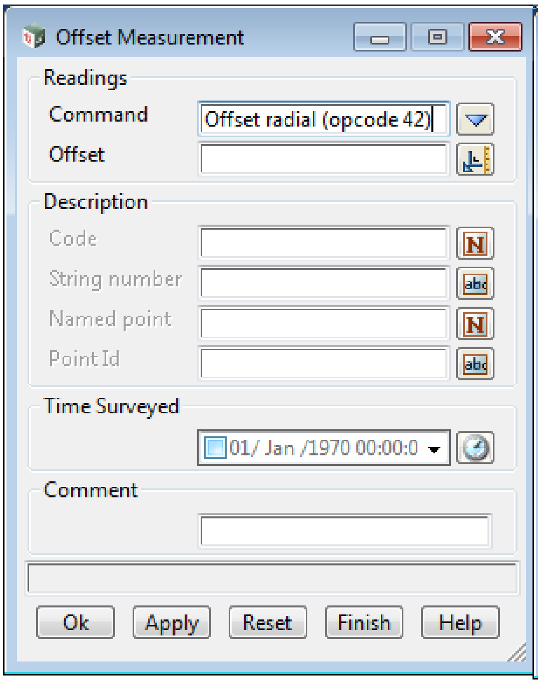
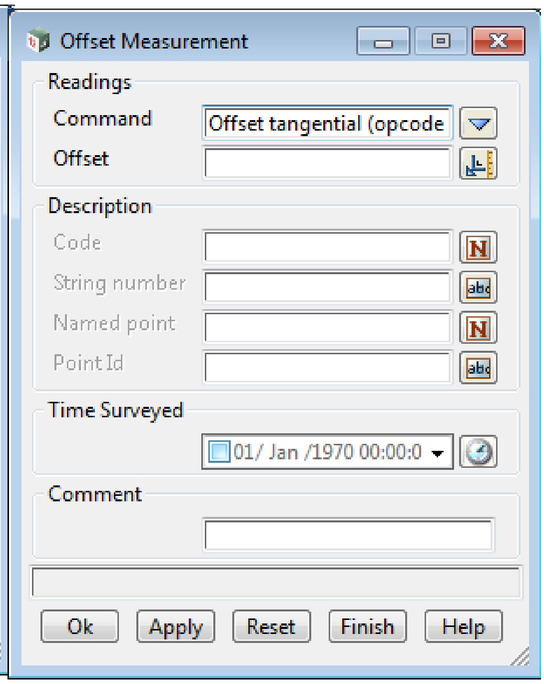
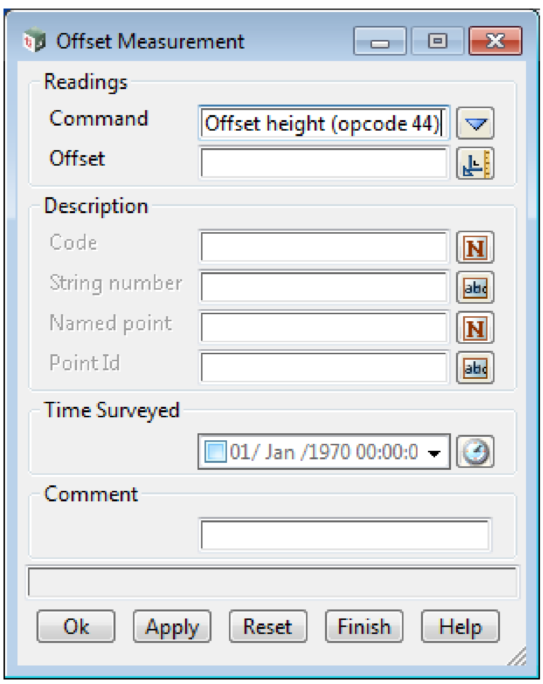
Offset Measurement (opcodes 42, 43, 44)

It is not always possible to measure a point directly but it may be possible to measure a point nearby and then measure an offset to adjust the measured point by and so produce the coordinates of the required point.

See 36.3.2 Offsets in Appendix 36 12d Survey Guide .







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command			Offset radial (opcode 42) Offset tangential (opcode 43)

for Radial

The *radial offset* is used to adjust the position of the specified point by a plan distance from the specified points original position, along the plan line joining the current station to the specified point. A positive offset is away from the station, negative is toward the station.

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

for Tangential

The *tangential offset* is used to adjust the position of the specified point by a plan distance from the specified points original position, at rights angles to the plan line joining the current station to the specified point. A negative offset is to the left (looking from the station), and positive is to the right (looking from the station).

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

for Height

If the height of the specified point is not null, then the *height offset* adjusts the height of the point. A positive offset adds to the height, a negative offset reduces the height.

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

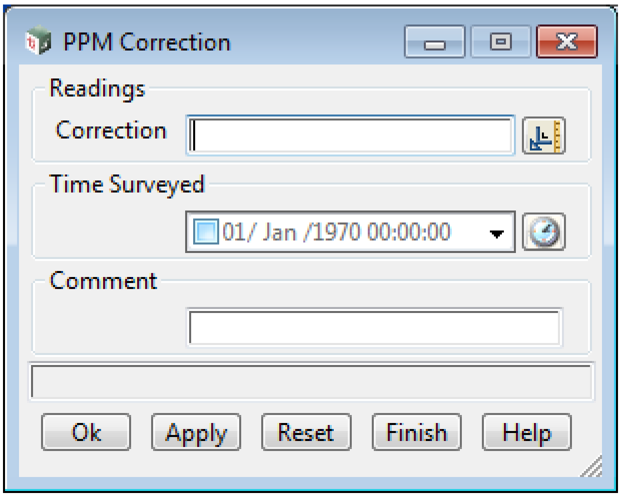
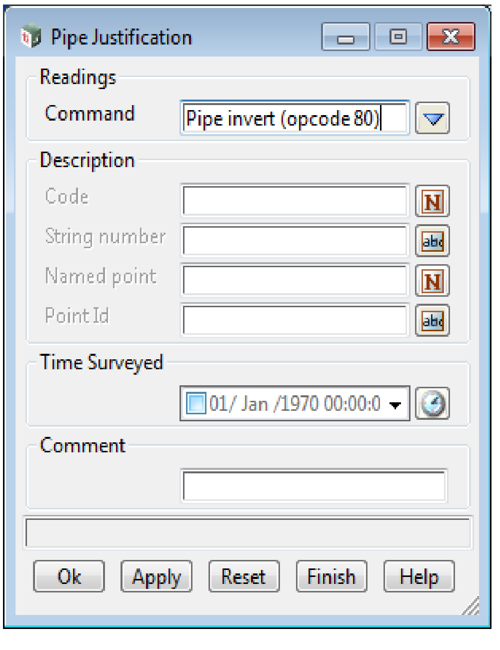
PPM Correction (opcode 131)

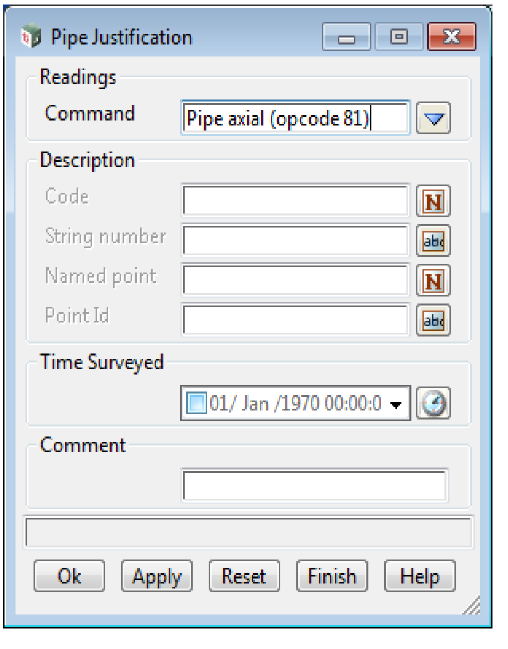
This section of documentation is a work in progress and will be updated in subsequent releases.

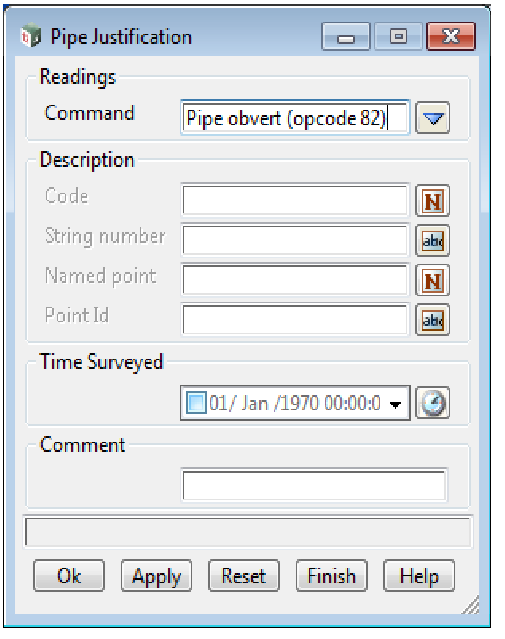


Pipe Justification (opcodes 80, 81, 82)

Specify what type of pipe justification point that the current measurement is.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command			Pipe invert (opcode 80) Pipe axial (opcode 81) Pipe obvert (opcode 82)

for Pipe invert (opcode 80)

If no *point description* is given, the current measurement point is on the invert (bottom) of a pipe. This is the default for measurements to points on pipe strings. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

for Pipe axial (opcode 81)

If no *point description* is given, the current measurement point is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

for Pipe obvert (opcode 82)

If no *point description* is given, the current measurement point is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. *If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

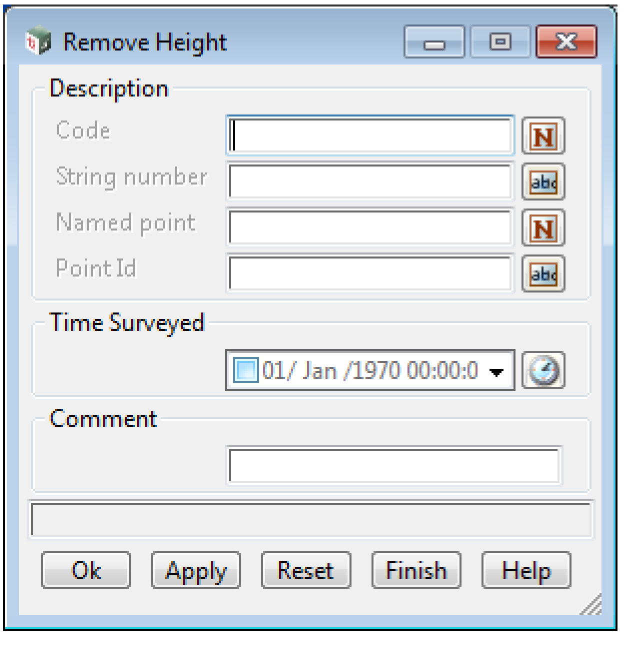
Remove Height (opcode 30)

Set the height of a measurement to null.



If no *point description* is given, the height of the current measurement point is set to null.

If the *feature code* and *string number* exist, then the height of the last point of the previous string with that *feature code* and *string number* is set to null.

If the *point id* exists, then the height of the point with that point id is set to null.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. Shaping (opcodes 83 to 86)

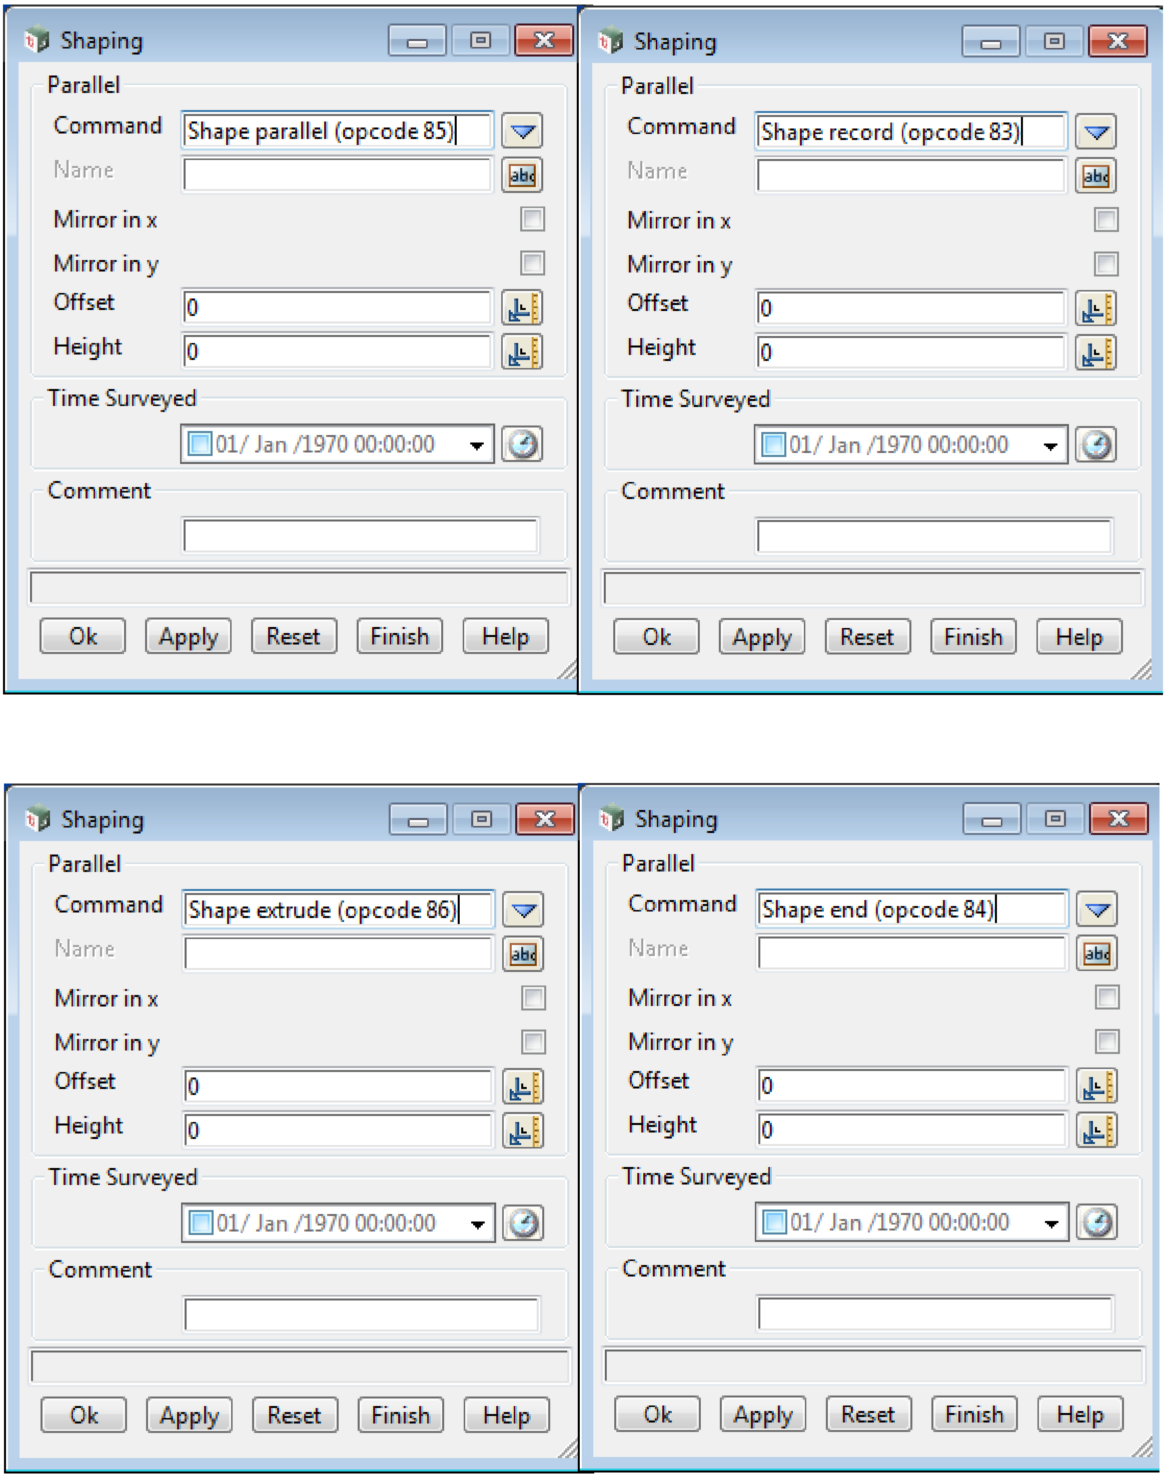
See 36.5 Shape field coding in Appendix 36 12d Survey Guide .



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Shape end (opcode 84) Shape record (opcode 83) Shape extrude (opcode 86) Shape parallel (opcode 85)

for Shape end

Stops using the current shape or stops recording a shape.

for Shape record

Start recording a shape with the shape name. If *Shape_name* is not blank, then the default field Shape is defined by the *feature_code* and *string_number* of the following measurements until a *shape end* co. There is no limit to the number of points in a shape.

for Shape extrude

extrude the current shape along the specified super string.

for Shape parallel

parallel the current shape along the specified super string. This creates a number of strings to represent each feature code of the shape record. In the case of shapes which contain curves, a number of strings will be created according to an arc/chord tolerance.

Name

the name of the shape.

Time surveyed

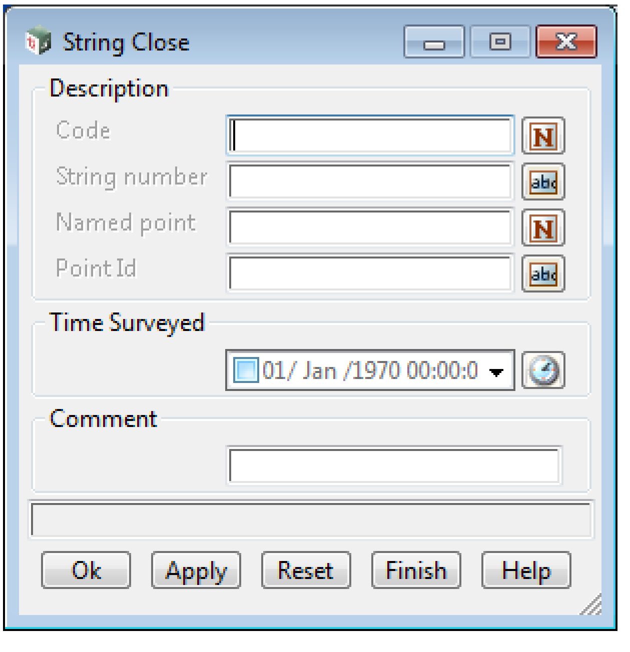
String Close (opcode 20)

Close a string.

See 36.3.4 Close String in Appendix 36 12d Survey Guide .



If no *point description* is given, the current string is closed.

If the *feature code* and *string number* from the *point description* exist, the last previous string with that *feature code* and *string number* is closed.

If the *point id* from the *point description* exists, then the string containing that point id will be closed.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. *If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

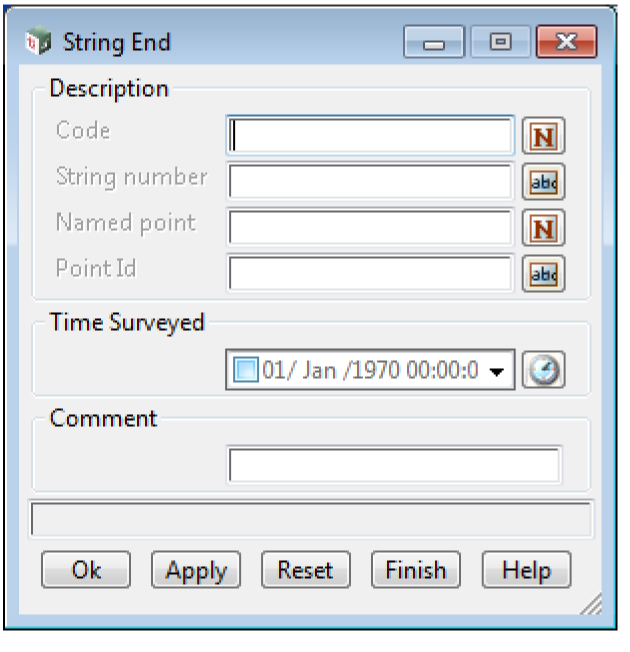
String End (opcode 48)

Stop a string.



If no *Description exist*s, the current string is terminated (including the current measurement point).

If *Code* (feature code) and *String number* exist, then the last point of the previous string with that feature code and string number becomes the last point of that string.

If *Point id* exists, then the previous string containing the point with that point id is terminated *after* the point id point

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. Rectangle (opcode 45)

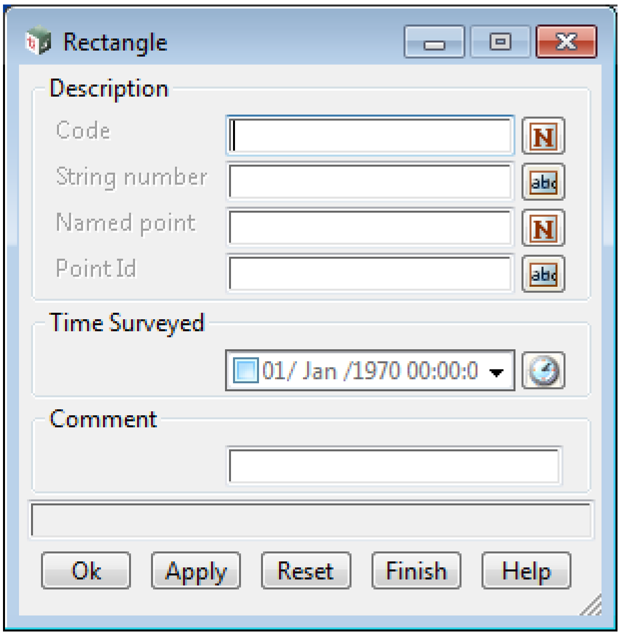
Create a parallelogram (squashed rectangle) from three points.

See 36.3.5 Rectangle in Appendix 36 12d Survey Guide .



If no *Description* is given, the current measurement point and the two previous points from the current string are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If the *feature code* and *string number* exist, the last three points with that *feature code* and *string number* are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If the *point id* exists, then the *feature code* and *string number* of the point with that point id are used and processed as above. Note that the point with the point id is not necessarily used.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

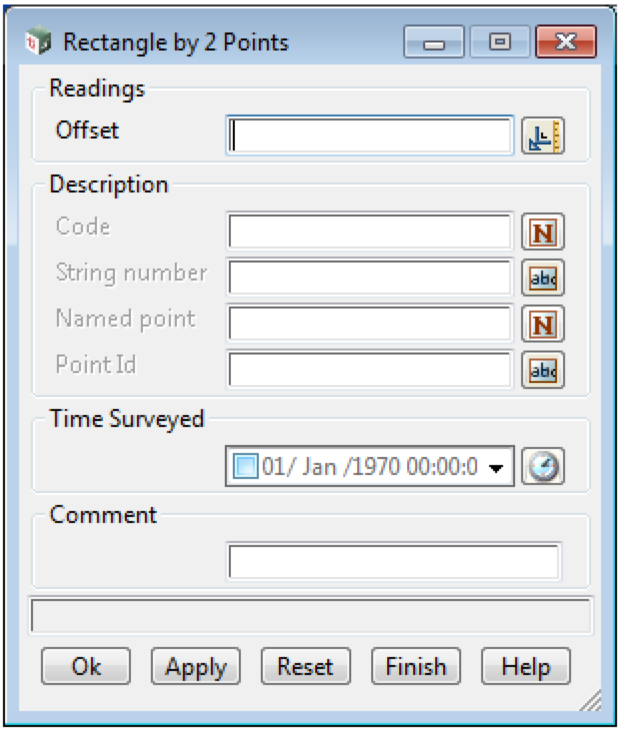
Rectangle By 2 Points (opcode 37)

Create a rectangle from two points and a given offset.

See 36.3.6 Rectangle by 2 Points in Appendix 36 12d Survey Guide .



The rectangle is defined by two points (reference side) and a offset.

If a positive offset value is given, two points will be created to the right of the reference side.

If a negative offset value is given, two points will be created to the left of the reference side.

If no *Description* is given, the two new points will be joined to the given points in a closed rectangular string, and will have the same feature code as the points given.

If the *feature code* and *string number* exist, then a search is made for the last occurrence of two points with the same *feature code* and *string number*. If found, then these points are used to define the reference side of the rectangle.

If the *point id* exists, then a search is made for the last occurrence of two points with the same *feature code* and *string number* as the point given by the point id. If found, then these points are used to define the reference side of the rectangle.

Two consecutive rectangles are unable to be defined side by side. In other words if the two points given are part of string of greater than two vertices, the command will only work for sets of two points that are exclusively defined. i.e. For a 5 point string, a rectangle can be defined by points 1 and 2, and 4 and 5.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

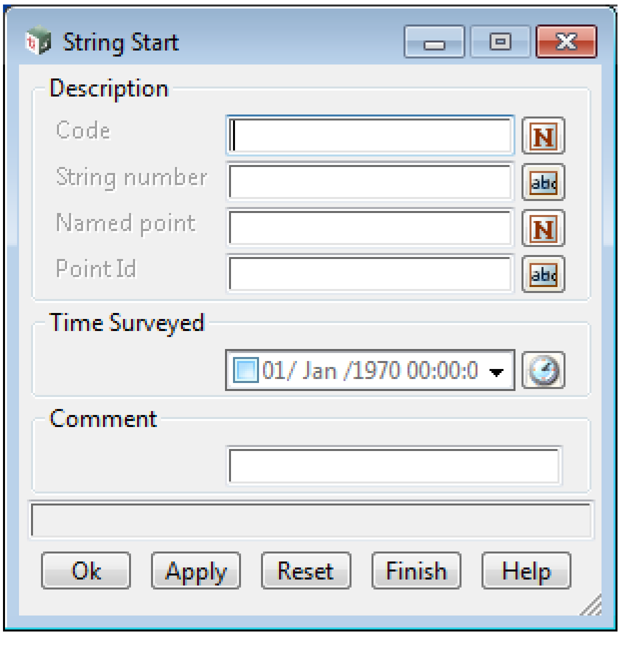
String Start (opcode 47)

Start a new string.

See 36.3.3 Start New String in Appendix 36 12d Survey Guide .



If no *Description* is given, the current string is terminated (without including the current measurement point) and the current measurement point becomes the first point of a new string with the same feature code and string number.

If the *feature code* and *string number* exist, then the last point of the previous string with that feature code and string number becomes the first point of a new string with the same *feature code* and *string number*.

If the *point id* exists, then the previous string containing the point with that point id is terminated *before* the point id point, and the point becomes the first point of a new string with the *same feature code* and *string number*.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

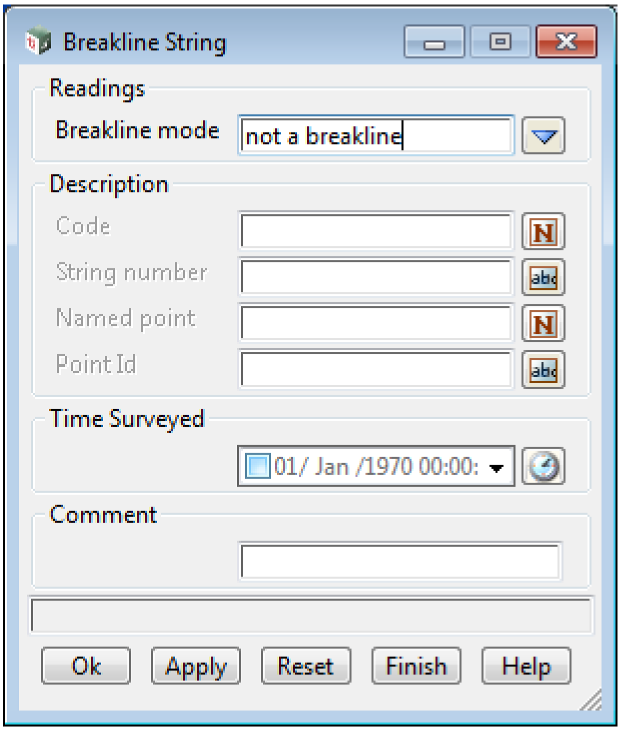
Breakline String (String tinable (opcode 46))

Make a string a breakline (*i.e.* all vertices and segments are tinable) or not a breakline.



The *point description* is used to select a string and the *mode* is used specify if the string is a breakline or not.

If no *point description* is given, the current string is selected.

If the *feature code* and *string number* exist, the last string with that *feature code* and *string number* is selected.

If the *point id* exists, then the string containing the point with that point id is selected.

If no *mode* is given, the selected string is set as a point string (that is, not a breakline).

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Breakline mode			not a breakline breakline

for Not a breakline

the selected string is set to a point string and hence is not a breakline (however the points are tinable).

for Breakline

the selected string is set to a line string (all vertices and segments are tinable) and is therefore a breakline.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

Time surveyed

time when the command (op code) was created

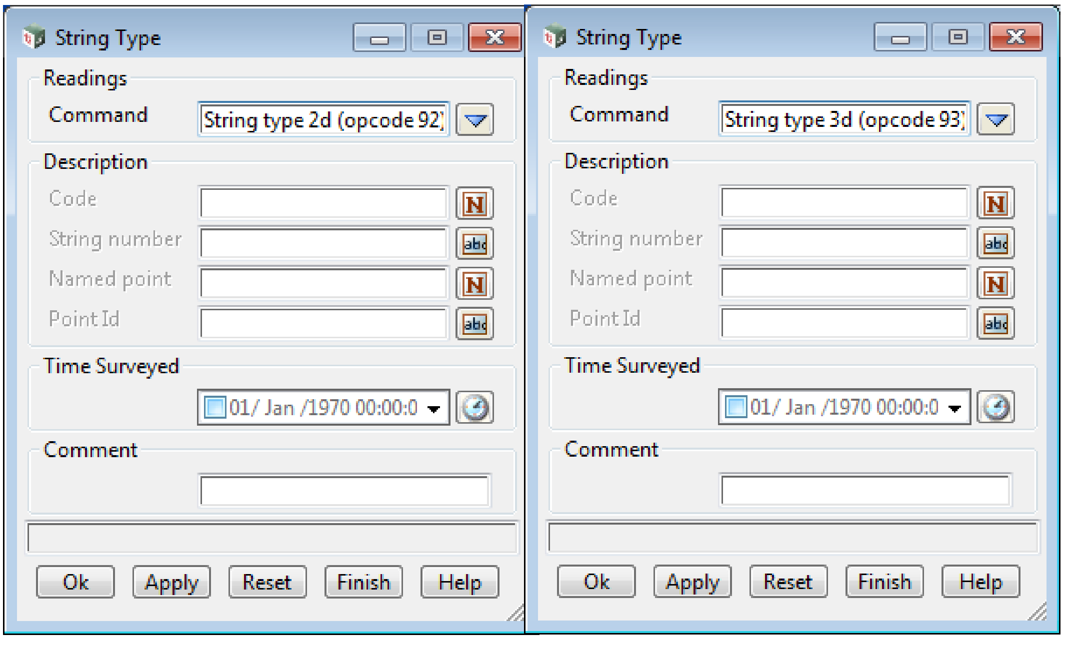
Comment

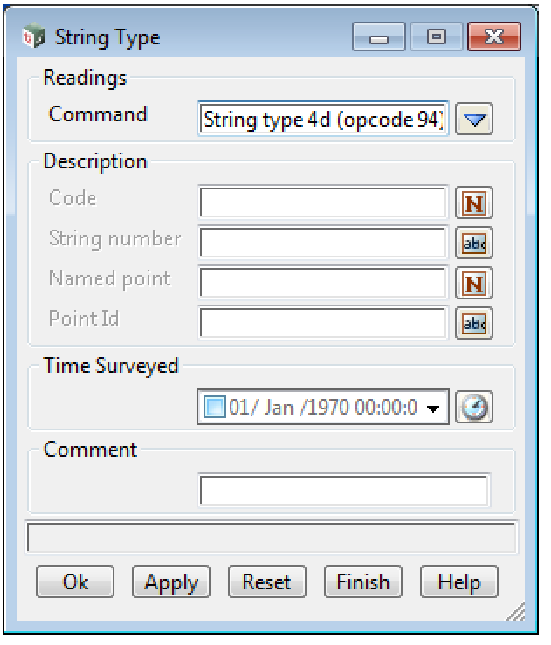
comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

String Type (opcodes 92, 93, 94)

Specify the string to be a 2d, 3d or 4d string.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box	String type 2d	String type 2d (opcode 92) String type 3d (opcode 93) String type 4d (opcode 94)

*if **2d** - the string has one height for the entire string*
*if **3d** - the string can have different heights at each vertex*
*if **4d** - the string can have different heights and text at each vertex*

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search. *If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

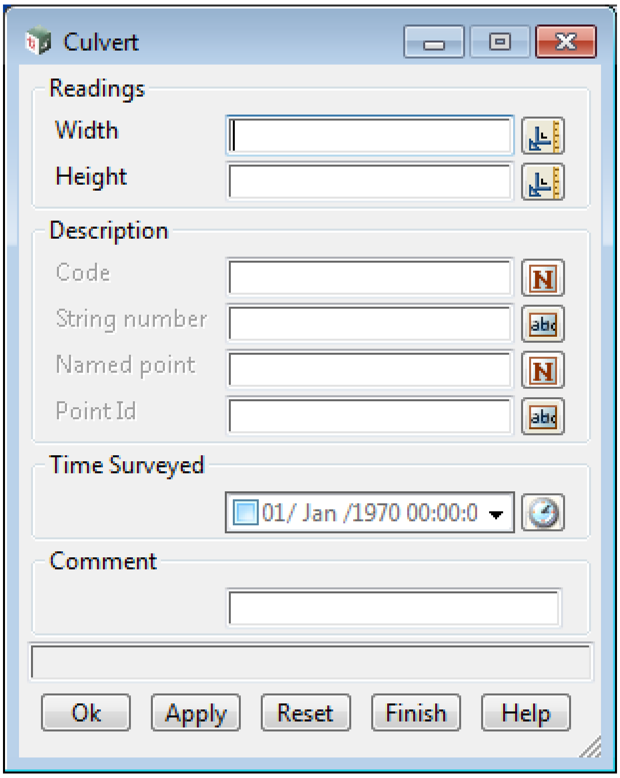
Culvert (opcode 96)

Specify the string to be a culvert and give the culvert width and height.



Culvert strings are always line strings and are stored with the justification of the majority of the string points. Individual culvert points are picked up either top (obvert), centre (axial) or bottom (invert) of the culvert using op codes 80, 81 and 82.

If no *point_description* is given, the current string is created as a culvert string with the given width and height.

If a *point_description* exists, then either the *feature code* and *string number* or the *point id* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* is created as a culvert with the given width and height.

If the *point id* exists, then the string containing that point id is created as a culvert string with the given width and height.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Width

the width of the culvert

Height

the height of the culvert

Code

the feature code of the measurement

String number

the string number of the measurement

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. Pipe Diameter (opcode 95)

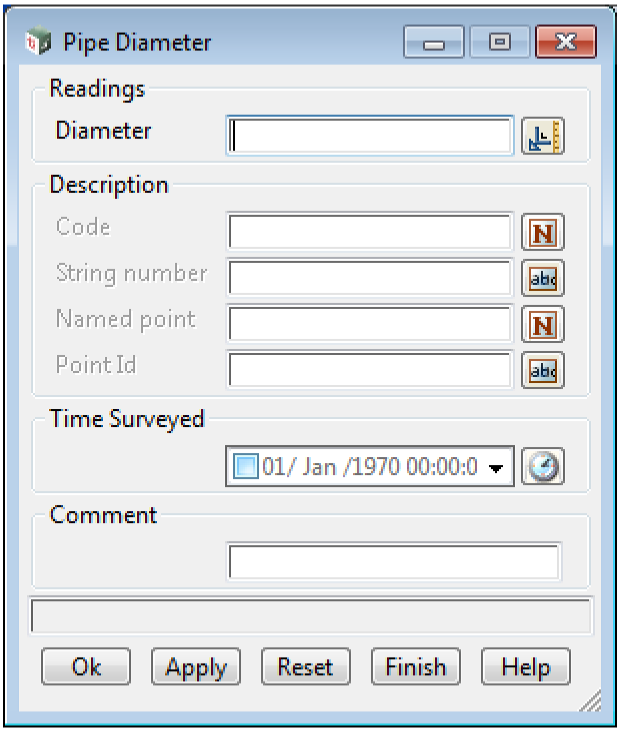
Specify the string to be a pipe and give the pipe diameter.



Pipe strings are always line strings and are stored with the justification of the majority of the string points. Individual pipe points are picked up either top (obvert), centre (axial) or bottom (invert) of the pipe using op codes 80, 81 and 82.

If no *point_description* is given, the current string is created as a pipe string with the given diameter.

If a *point_description* exists, then either the *feature code* and *string number* or the *point id* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* is created as a pipe with the given diameter.

If the *point id* exists, then the string containing that point id is created as a pipe string with the given diameter.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Diameter

the diameter of the pipe.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed *description of how the reduction finds/uses the appropriate point see the section* Existing point search

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section Existing point search *. If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.*

Templating (opcodes 51 to 59)

Record and use field templates when picking up string.

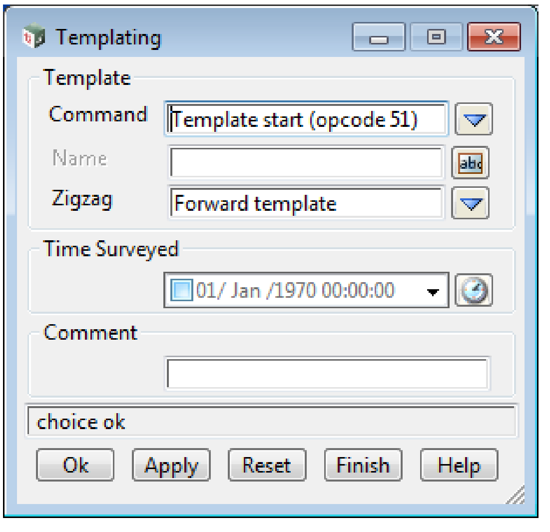
See 36.4 Field Templates in Appendix 36 12d Survey Guide .

For *Template start (opcode 51)*,go to Template start
Template end (opcode 52) Template end
Template pause (opcode 53) Template pause
Template continue (opcode 54) Template continue
Template record (opcode 55) Template record
Template skip (opcode 56) Template skip
Template insert (opcode 58) Template insert
Template delete (opcode 57) Template delete
Template change (opcode 59) Template change

Template start

Selecting *Template start (opcode 51)* brings up the **Templating** panel with the *Command* field set to **Template start**

Template start starts using the field template given in the field ***Name***.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command		Template start	Template start (opcode 51) Template end (opcode 52) Template pause (opcode 53) Template continue (opcode 54) Template record (opcode 55)
Name	Text box		

Name of the field template to use.
If *Name* is blank, the default field template is used.

Field Description	Type	Defaults	Pop-Up
Zigzag	choice box	Forward template	Forward template Reverse template Start on zig of zigzag Start of zag of zigzag

If *zigzag* is ***forward template***, then the field template is used as a *forward* template.*See* 36.4.1 Forward Direction *in Appendix* 36 12d Survey Guide

reverse template, then the field template is used as a *reverse* template.*See* 36.4.2 Reverse Direction *in Appendix* 36 12d Survey Guide

start on zig, then the field template is used as a zig_zag template and is used in the *forward* definition direction first (that is starts on a zig). *See* 36.4.3 Zig-Zag *in Appendix* 36 12d Survey Guide .

start on zag, then the template is used as a zig_zag template and is used in the *reverse* direction first (that is, starts on a zag).*See* 36.4.3 Zig-Zag *in Appendix* 36 12d Survey Guide .

If *zigzag* is ***blank***, or anything other than ***forward***, ***reverse***, or ***start on zag*** then the field template is used as a zig-zag template starting on a ***zig***.

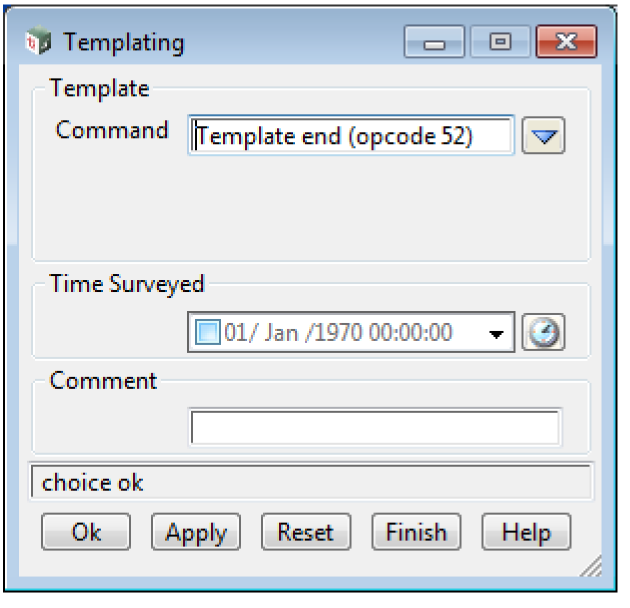
OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Template end

Selecting *Template end (opcode 52)* brings up the **Templating** panel with the *Command* field set to **Template end**

Template end stops using the current field template, or stops recording a field template.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command		Template end	Template start (opcode 51) Template end (opcode 52) Template pause (opcode 53) Template continue (opcode 54) Template record (opcode 55)

Time surveyed

time when the command (op code) was created

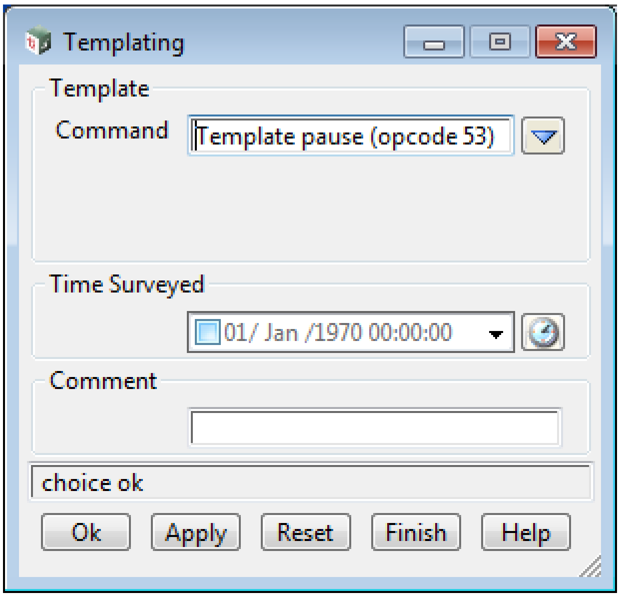
Template pause

Selecting *Template pause (opcode 53)* brings up the **Templating** panel with the *Command* field set to **Template pause**

Pause using the current field template or defining a field template, until a *continue field template (54*) or a finish field *template (52) code* is given.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command		Template pause	Template start (opcode 51) Template end (opcode 52) Template pause (opcode 53) Template continue (opcode 54) Template record (opcode 55)

Time surveyed

time when the command (op code) was created

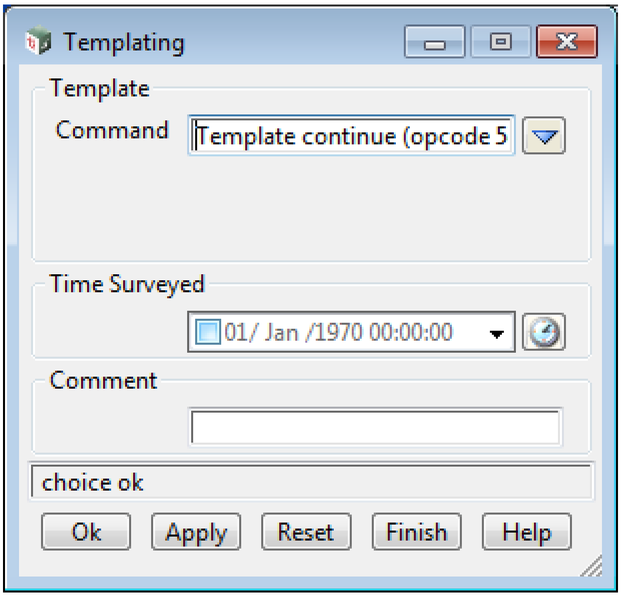
OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Template continue

Selecting *Template continue (opcode 54)* brings up the **Templating** panel with the *Command* field set to **Template continue**

Continue using or defining the current field template, which has been stopped by a *Template pause (opcode 53*). The *Continue* command only needs to be given once and applies to all following measurements until another *Pause* or *Finish* command is given.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command		Template continue	Template start (opcode 51) Template end (opcode 52) Template pause (opcode 53) Template continue (opcode 54) Template record (opcode 55)

Time surveyed

time when the command (op code) was created

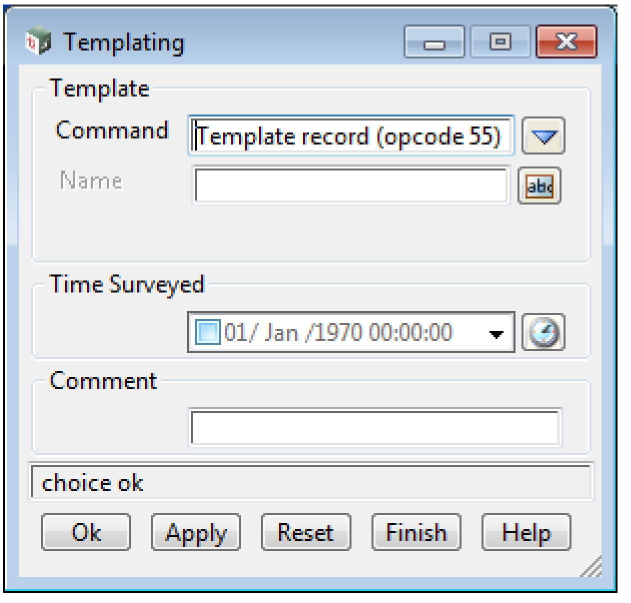
OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Template record

Selecting *Template record (opcode 55)* brings up the **Templating** panel with the Command field set to **Template record**

Template record stores the *feature code* and *string number* of the following measurements as a field template until a *Finish* code (52) is given.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command		Template record	Template start (opcode 51) Template end (opcode 52) Template pause (opcode 53) Template continue (opcode 54) Template record (opcode 55)

Name

name of the template being created

Start recording a field template with the name **Name**. *If* **Name** *is blank, then it is the default field template that is defined.*

The feature code and string number of the following measurements are stored as the field template until a Finish code (52) is given. There is no limit to the number of feature code and string number pairs that can be stored in a field template.

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

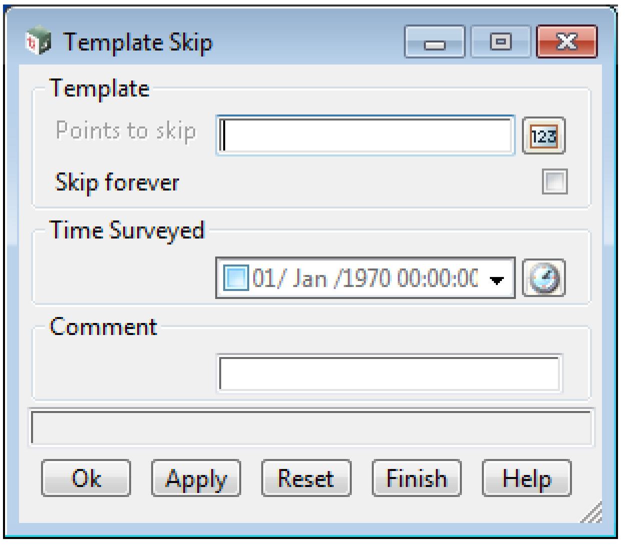
OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Template skip

Selecting *Template skip (opcode 56)* brings up the **Template Skip** panel.

This panel allows the user to skip picking up one or more points (feature code and string number pairs) from the field template currently being used. The next measurement takes the *feature code* and *string number* from the next point after the skipped points, from the field template definition.

See 36.4.4 Skipping Field Template Points in Appendix 36 12d Survey Guide



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Points to skip

the number of points (feature code and string number pairs) of the template to skip.
If **Points to skip** *is blank or zero, then only one point is skipped otherwise* **Points to skip** *points are skipped.*

Skip forever tick box

if ticked, the given number of feature code and string number pairs are not used from then on.
If not ticked, only skip for this one used of the template.

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

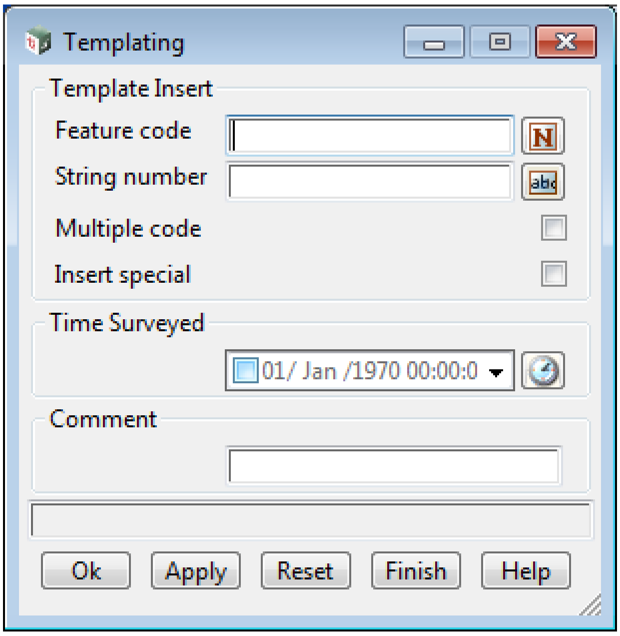
Template insert

Selecting *Template insert (opcode 58)* brings up the **Templating** panel.

This option allows the user to insert new point definitions into the template.

These may be **new points** or to **add a multiple code** to an **existing point** in the template.

See 36.4.5 Insert Template Points or Insert Multiple Codes in Appendix 36 12d Survey Guide



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Feature code

feature code to be inserted (as a new point or a multiple code) with the string number, into the template

String number

string number to be inserted (as a new point or a multiple code) with the feature code, into the template

Multiple code tick box

If ticked off (the default), a new point is inserted into the template with the Feature code and String number given in the panel.

If ticked on, no new point is inserted but the current template point will be made a multiple coded point with the Feature code and String number given in the panel. The multiple coding will be used each time the template point is used.

Insert special tick box

If ticked on, the point will be added to the current template being picked up (that is, to the end of the template).
If not ticked, the point will be added to the next template being picked up (that is, to the beginning of the template).

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

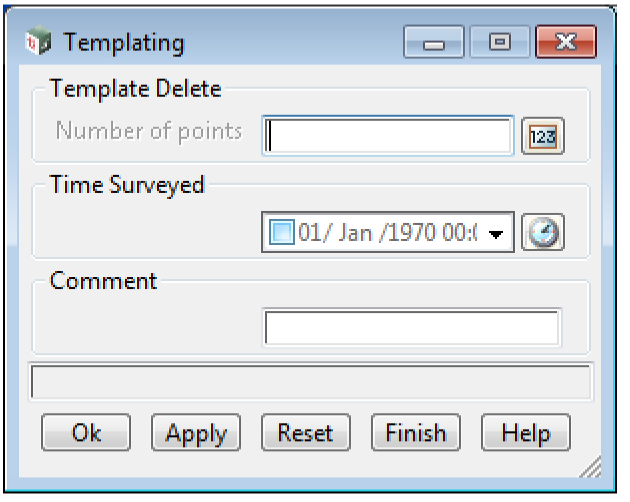
OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Template delete

Selecting *Template delete (opcode 57)* brings up the **Templating** panel.

Allows the user to delete one or more points on the template. Picking up will use the updated template definition.

See 36.4.6 Delete Template Points in Appendix 36 12d Survey Guide



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Number of points

number of points to delete from the template. Any further use of the template will used the updated template definition.

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section Panel buttons

Template change

Selecting *Template change (opcode 59)* brings up the **Templating** panel.

This option is still under development.

.

17.7.8 SDR Point Edits

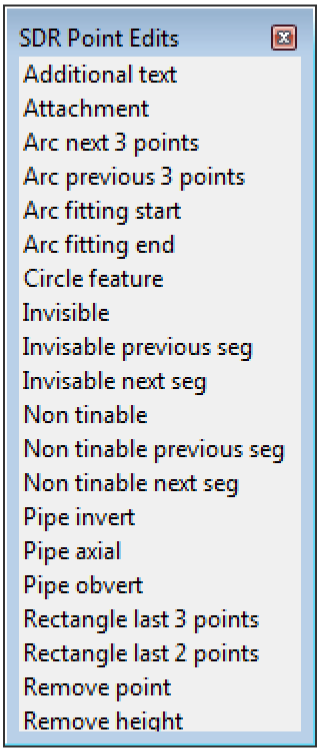
Position of menu: **Survey =>Edit =>Points**

The **Points** walk-right menu contains options that work on individual points (vertices).

Note - a point may be individual point (one vertex strings) or a vertex of a string.

The **Points** walk-right menu is:

.



add text to the vertex
attach an image to the vertex
put an arc through the next 3 points
put an arc through the preceding 3 points
start arc fitting
end arc fitting
make the vertex a feature
make the vertex invisible
make the last segment invisible
make the next segment invisible
make the vertex non tinable
make the last segment non tinable
make the next segment non tinable
the z-value is the invert of a pipe
the z-value is the centre of a pipe
the z-value is the overt of a pipe
make a rectangle of the last 3 points
make a rectangle of the last two points
delete a point
make the height null

For the option *Additional text*, go to 17.7.8.1 Additional Text

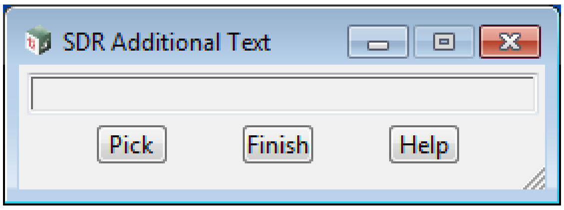
Non tinable last seg 17.7.8.12 Make the Previous Segment Non Tinable
Non tinable next seg 17.7.8.13 Make the Next Segment Non Tinable
Pipe invert 17.7.8.14 Make a Vertex an Invert Level of a Pipe
Pipe axial 17.7.8.15 Make a Vertex an Axial Level of a Pipe
Pipe obvert 17.7.8.16 Make a Vertex an Obvert Level of a Pipe
Rectangle last 3 points 17.7.8.17 Make a Parallelogram from the Last Three Points
Rectangle last 2 points 17.7.8.18 Make a Rectangle from the Last Two Points
Remove point 17.7.8.19 Delete a Vertex
Remove height 17.7.8.20 Set a Vertex Height to Null

17.7.8.1 Additional Text

Position of option on menu: **Survey =>Edit =>Points =>Additional text**

Additional text adds text to selected vertices. The user selects the vertex to add text to, and then types in the text.

Selecting **Additional text** brings up the **SDR Additional Text** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an **Additional text** typed input panel is displayed to type the text into. A **Text** code is then inserted into the 12d field file.*

The option continues until the **Finish** *button is selected.*

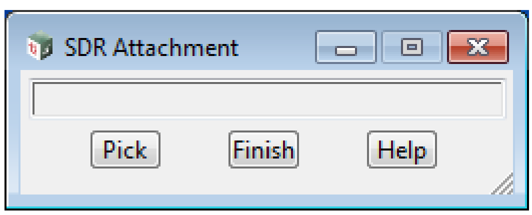
*If the **pick** is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.2 Attach a File

Position of option on menu: **Survey =>Edit =>Points =>Attachment**

Attachment adds files to selected vertices. The user selects the vertex to add an attachment to, and then enters the name of the file to attach.

Selecting **Attachment** brings up the **SDR Attachment** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an **Attachment file name** typed input panel is displayed to enter the file name into. An **Attachment** field code is then inserted into the 12d field file.*

The option continues until the **Finish** *button is selected.*

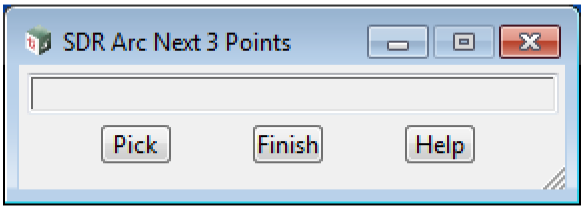
*If the **pick** is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.3 Arc Through Next Three Points

Position of option on menu: **Survey =>Edit =>Points =>Arc next 3 points**

Arc next 3 points adds an arc through the selected vertex and the next two vertices of the same string.

Selecting **Arc next 3 points** brings up the **SDR Arc Next 3 Points** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the next two vertices of the same string by inserting an **Arc through next 3 points** field code.*

The option then repeats and continues until the **Finish** *button is selected.*

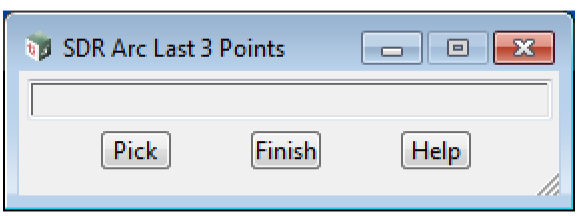
*If the **Pick** is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.4 Arc Through Last Three Points

Position of option on menu: **Survey =>Edit =>Points =>Arc last 3 points**

Arc last 3 points adds an arc through the selected vertex and the previous two vertices of the same string.

Selecting **Arc last 3 points** brings up the **SDR Arc Last 3 Points** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the previous two vertices of the same string by inserting an **Arc through last 3 points** field code.*

The option then repeats and continues until the **Finish** *button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the*

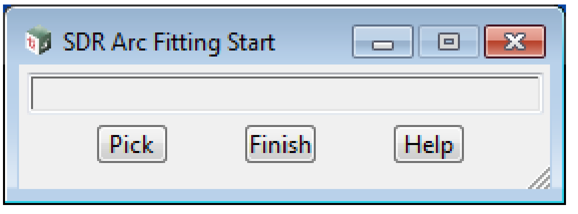
Pick *button can be used to restart the option.*

17.7.8.5 Start Arc Fitting

Position of option on menu: **Survey =>Edit =>Points =>Arc fitting start**

Arc fitting start starts arc fitting through from the selected vertex until the end of the string or an stop arc fitting field code is encountered for that string.

Selecting **Arc fitting start** brings up the **SDR Arc Fitting Start** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, arc fitting is started at the selected vertex by inserting an ***Arc fitting start*** *field code.*

The option then repeats and continues until the **Finish** *button is selected.*

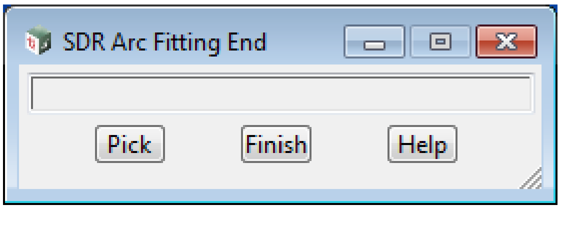
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.6 End Arc Fitting

Position of option on menu: **Survey =>Edit =>Points =>Arc fitting end**

Arc fitting end ends any arc fitting for that string at the selected vertex.

Selecting **Arc fitting end** brings up the **SDR Arc Fitting End** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, any arc fitting for the string is stopped at the selected vertex by inserting an ***Arc fitting end*** *field code.*

The option then repeats and continues until the **Finish** *button is selected.*

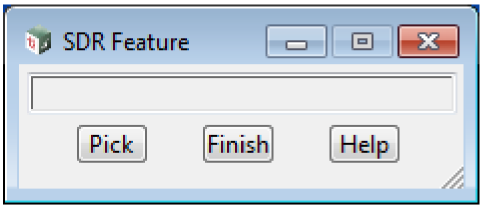
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.7 Create a Feature String

Position of option on menu: **Survey =>Edit =>Points =>Circle feature**

Circle feature creates a feature string of a given radius at the selected vertex.

Selecting **Circle feature** brings up the **SDR Feature** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, an ***Feature radius*** *typed input panel is displayed to type the radius into. A* ***Feature*** *code is then inserted into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

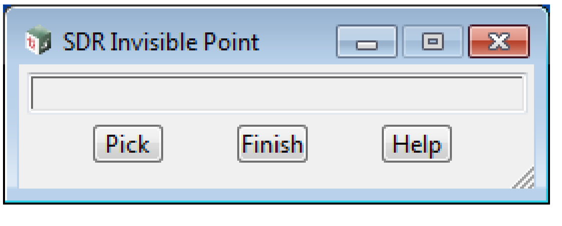
17.7.8.8 Make a Vertex Invisible

Position of option on menu: **Survey =>Edit =>Points =>Invisible**

Invisible turns the selected vertex invisible.

Even if the segments on either side of the invisible vertex ***are*** tagged as visible, the segments can not be drawn because the start/end point of the segment is invisible.

Selecting **Invisible** brings up the **SDR Invisible Point** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Pick button

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex is turned invisible by inserting an ***Invisible Point*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

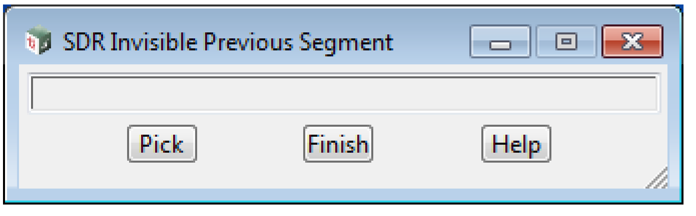
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.9 Make the Previous Segment Invisible

Position of option on menu: **Survey =>Edit =>Points =>Invisible previous segment**

Invisible previous segment turns the segment ending on the selected vertex invisible. The vertex itself is not invisible.

Selecting **Invisible previous segment** brings up the **SDR Invisible Previous Segment** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the segment ending on the vertex is turned invisible by inserting an ***Invisible Previous Segment*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

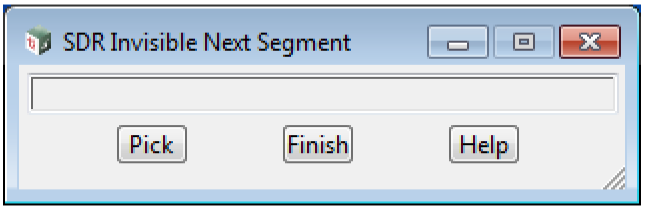
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.10 Make the Next Segment Invisible

Position of option on menu: **Survey =>Edit =>Points =>Invisible next segment**

Invisible next segment turns the segment starting on the selected vertex invisible. The vertex itself is not invisible.

Selecting **Invisible next segment** brings up the **SDR Invisible Next Segment** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the segment starting on the vertex is turned invisible by inserting an ***Invisible Next Segment*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

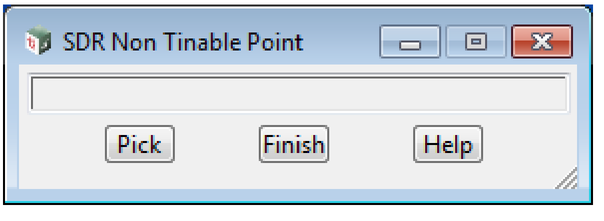
17.7.8.11 Make a Vertex Non Tinable

Position of option on menu: **Survey =>Edit =>Points =>Non tinable**

Non tinable sets the selected vertex to be non tinable (that is, the vertex is not included in any triangulation).

Even if the segments on either side of the non tinable vertex ***are*** tinable, the segments can not be included in any triangulation because the start/end point of the segment is non tinable.

Selecting **Non tinable** brings up the **SDR Non Tinable Point** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex is set to non tinable (that is, the vertex is not included in any triangulations) by inserting a ***Non tinable point*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

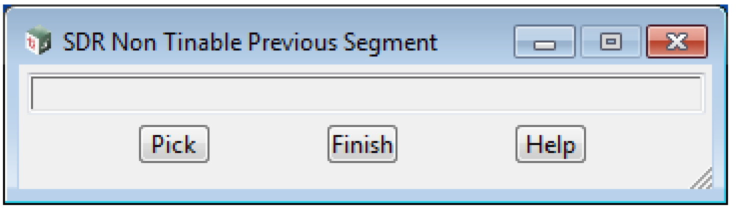
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.12 Make the Previous Segment Non Tinable

Position of option on menu: **Survey =>Edit =>Points =>Non tinable previous segment**

Non tinable previous segment sets the segment ending on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations) The vertex itself can be tinable.

Selecting **Non tinable previous segment** brings up the **SDR Non Tinable Previous Segment** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the segment ending on the vertex is set to non tinable by inserting a ***Non tinable previous segment*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

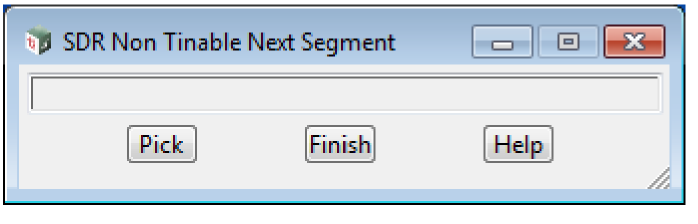
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.13 Make the Next Segment Non Tinable

Position of option on menu: **Survey =>Edit =>Points =>Non tinable next segment**

Non tinable next segment sets the segment starting on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations) The vertex itself can be tinable.

Selecting **Non tinable next segment** brings up the **SDR Non Tinable Next Segment** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the segment starting on the vertex is set to non tinable by inserting an ***Non tinable next segment*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

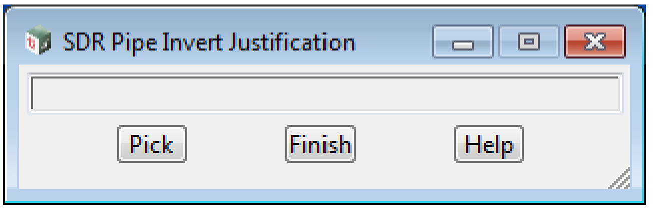
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.14 Make a Vertex an Invert Level of a Pipe

Position of option on menu: **Survey =>Edit =>Points =>Pipe invert**

Pipe invert sets the z-value of the selected vertex to be used as an invert level (pipe top) when the vertex is in a pipe string.

Selecting **Pipe invert** brings up the **SDR Pipe Invert Justification** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex is set to be an invert level (top of the pipe) for any pipe string it is in by inserting a ***Pipe invert*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

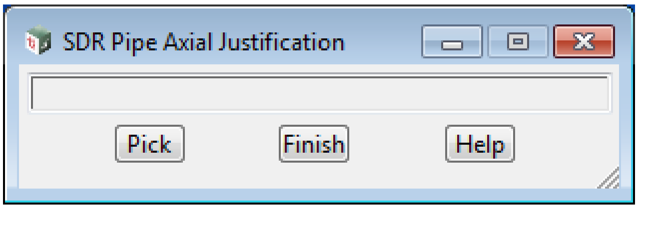
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.15 Make a Vertex an Axial Level of a Pipe

Position of option on menu: **Survey =>Edit =>Points =>Pipe axial**

Pipe axial sets the z-value of the selected vertex to be used as an axial level (pipe centre) when the vertex is in a pipe string.

Selecting **Pipe axial** brings up the **SDR Pipe Axial Justification** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex is set to be an axial level (centre of the pipe) for any pipe string it is in by inserting a ***Pipe axial*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

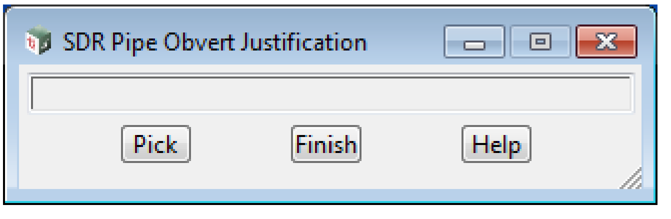
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.16 Make a Vertex an Obvert Level of a Pipe

Position of option on menu: **Survey =>Edit =>Points =>Pipe obvert**

Pipe obvert sets the z-value of the selected vertex to be used as an obvert level (bottom of pipe) when the vertex is in a pipe string.

Selecting **Pipe obvert** brings up the **SDR Pipe Obvert Justification** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex is set to be an obvert level (bottom of the pipe) for any pipe string it is in by inserting a ***Pipe obvert*** *code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

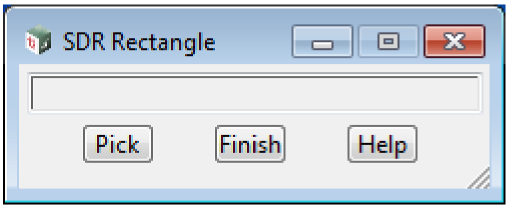
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.17 Make a Parallelogram from the Last Three Points

Position of option on menu: **Survey =>Edit =>Points =>Rectangle last 3 points**

Rectangle last 3 points creates a parallelogram (squashed rectangle) from the selected vertex and the previous two vertices in the same string.

Selecting **Rectangle last 3 points** brings up the **SDR Rectangle** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, a parallelogram (squashed rectangle) is created using the selected vertex and the previous two vertices of the same string (three vertices in total) and creating a four vertex to form the parallelogram of four vertices. The three vertices are removed from the original string and any following vertices are used in a new string.

*A **String rectangle** code is inserted into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

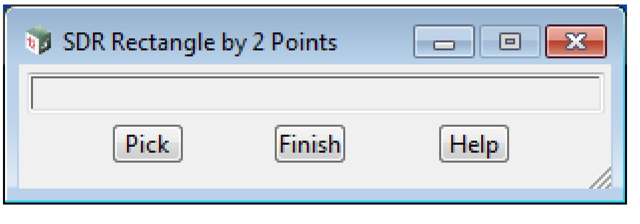
17.7.8.18 Make a Rectangle from the Last Two Points

Position of option on menu: **Survey =>Edit =>Points =>Rectangle last 2 points**

Rectangle last 2 points creates a rectangle from the selected vertex and the previous vertex in the same string, and a width supplied by the user.

The rectangle is formed by using the two vertices as the base of the rectangle and using the given width as the length of the other side of the rectangle. Two new vertices are created to from the rectangle.

Selecting **Rectangle last 2 points** brings up the **SDR Rectangle by 2 Points** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

*Each time a vertex is picked and accepted, a **Rectangle width** type input box is displayed and filled in.*

The rectangle is formed by using the two vertices as the base of the rectangle and using the given width as the length of the other side of the rectangle. Two new vertices are created to from the rectangle.

The two vertices are removed from the original string and any following vertices are used in a new string.

*A **String rectangle by 2 points** code is inserted into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

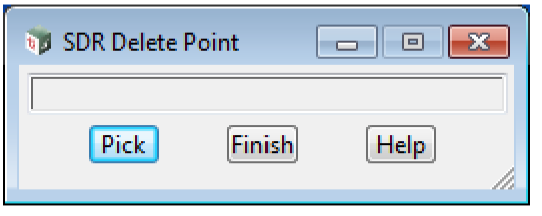
17.7.8.19 Delete a Vertex

Position of option on menu: **Survey =>Edit =>Points =>Remove point**

Remove point deleted the selected vertex.

The adjacent vertices in the string containing the deleted vertex will then be joined together.

Selecting **Remove point** brings up the **SDR Delete Point** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex deleted from the field file.

The option then repeats and continues until the **Finish** *button is selected.*

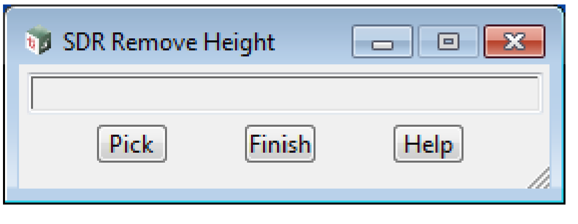
*If the **Pick** is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.8.20 Set a Vertex Height to Null

Position of option on menu: **Survey =>Edit =>Points =>Remove height**

Remove height sets the height of the selected vertex to null.

Selecting **Remove height** brings up the **SDR Remove Height** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the height of the selected vertex is set to null by inserting a **Remove height** code into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

If the **Pick** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

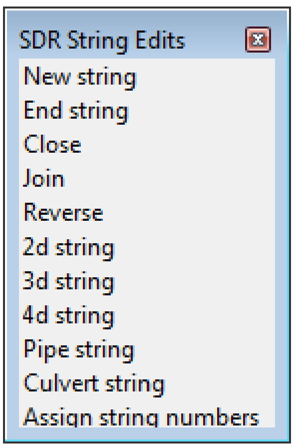
17.7.9 SDR Strings Edit

Position of menu: **Survey =>Edit =>Stringing**

The **Stringing** walk-right menu contains options that work on strings rather than individual points.

The **Stringing** walk-right menu is:

.



start a new string
end a string
close a string
join two strings
reverse a string
make a string 2d
make a string 3d
make a string 4d
make a string a pipe
make a string a culvert
assign string numbers

For the option *New string*, go to 17.7.9.1 New String
End string 17.7.9.2 End String
Close 17.7.9.3 Close String
Join 17.7.9.4 Join Two Strings of Same Feature Code
Reverse 17.7.9.5 Reverse String Direction
2d string 17.7.9.6 Make a 2d String
3d string 17.7.9.7 Make a 3d String
4d string 17.7.9.8 Make a 4d String
Pipe string 17.7.9.9 Make a Pipe String
Culvert string 17.7.9.10 Make a Culvert String
Assign string numbers 17.7.9.11 Assign String Numbers

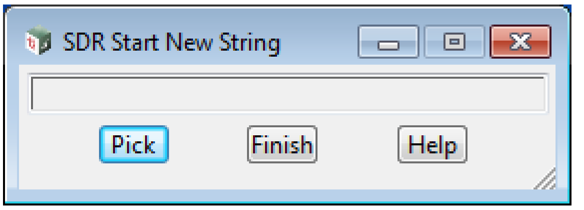
17.7.9.1 New String

Position of option on menu: **Survey =>Edit =>Stringing =>New string**

New string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With **new string**, the user selects the incorrect link and a ***new string*** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting **New string** brings up the **SDR Start New String** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and string links can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

Each time a string segment is picked and accepted, a ***string start*** *command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.*

The option then repeats and continues until the **Finish** *button is selected.*

If the **Pick** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

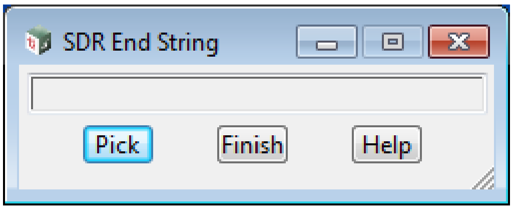
17.7.9.2 End String

Position of option on menu: **Survey =>Edit =>Stringing =>End string**

End string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With **end string**, the user selects the incorrect link and a ***end string*** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting **End string** brings up the **SDR End String** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and string links can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

Each time a string segment is picked and accepted, an ***string end*** *command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.*

The option then repeats and continues until the **Finish** *button is selected.*

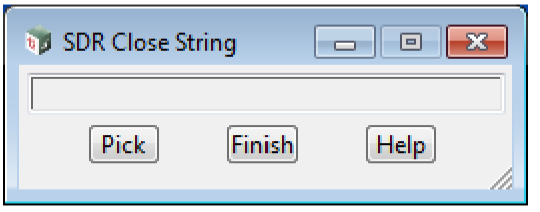
If the **Pick** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.9.3 Close String

Position of option on menu: **Survey =>Edit =>Stringing =>Close**

With **Close**, the user selects any part of the string to be closed and a ***close string*** command is inserted into the *12d field file*.

Selecting **Close** brings up the **SDR Close String** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and string can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

Each time a string is picked and accepted, a ***string close*** *command is inserted in the 12d field file which closes the selected string.*

The option then repeats and continues until the **Finish** *button is selected.*

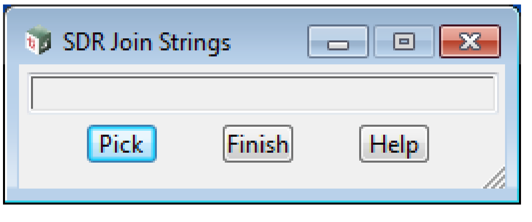
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.9.4 Join Two Strings of Same Feature Code

Position of option on menu: **Survey =>Edit =>Stringing =>Join**

With **Join**, the two strings of the same name (code) are selected with direction and the strings are joined by inserting the appropriate ***join string*** command in the *12d field file.*

Selecting **Join** brings up the **SDR Join Strings** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and string can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

*Each time two strings of the same name (code) are picked with direction, the appropriate join string field code (**Join first points of strings**, **Join first to last point of strings**, **Join last points of strings**, **Join last to first point of strings**) is inserted into the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

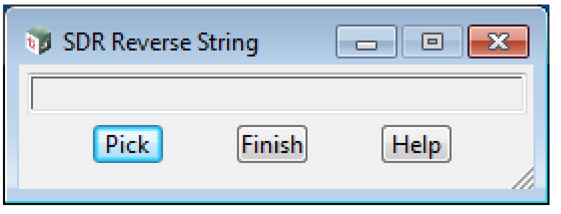
*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

17.7.9.5 Reverse String Direction

Position of option on menu: **Survey =>Edit =>Stringing =>Reverse**

With **Reverse**, the selected strings is reversed by inserting the ***String reverse*** command into the *12d field file.*

Selecting **Reverse** brings up the **SDR Reverse String** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is selected, a **String reverse** field code is inserted into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

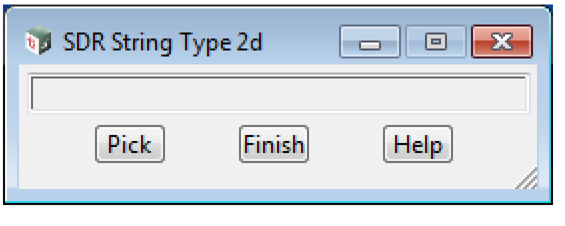
*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

17.7.9.6 Make a 2d String

Position of option on menu: **Survey =>Edit =>Stringing =>2d string**

With **2d string** the user selects any vertex of a string and a ***string type 2d*** command is then inserted into the *12d field file*.

Selecting **2d string** brings up the **SDR String Type 2d** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

Each time a string is picked and accepted, a ***String type 2d*** *command is inserted in the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

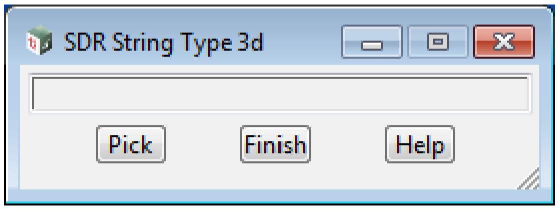
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.9.7 Make a 3d String

Position of option on menu: **Survey =>Edit =>Stringing =>3d string**

With **3d string** the user selects any vertex of a string and a ***string type 3d*** command is then inserted into the *12d field file*.

Selecting **3d string** brings up the **SDR String Type 3d** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and string can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

Each time a string is picked and accepted, a ***String type 3d*** *command is inserted in the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

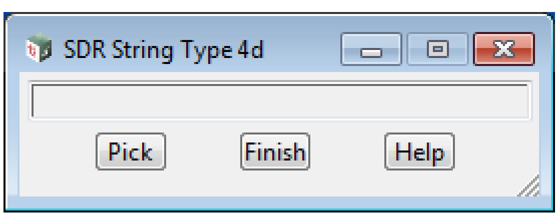
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.9.8 Make a 4d String

Position of option on menu: **Survey =>Edit =>Stringing =>4d string**

With **4d string** the user selects any vertex of a string and a ***string type 4d*** command is then inserted into the *12d field file*.

Selecting **4d string** brings up the **SDR String Type 4d** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Pick button

As soon as the option is selected, the **Pick** *is active and string can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

Each time a string is picked and accepted, a ***String type 4d*** *command is inserted in the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

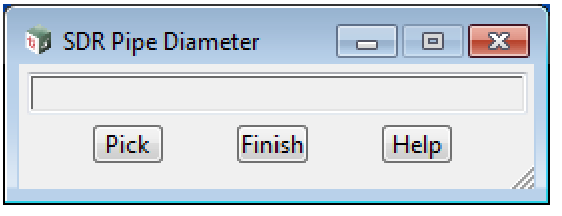
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.9.9 Make a Pipe String

Position of option on menu: **Survey =>Edit =>Stringing =>Pipe string**

With **Pipe string**, the user selects any vertex of a string, gives a pipe diameter and then a ***string type pipe*** command is inserted into the *12d field file*.

Selecting **Pipe string** brings up the **SDR Pipe Diameter** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** *is active and string can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

Each time a string is picked and accepted, a ***Pipe diameter*** *text input is displayed and after a value is typed in, a* ***String type pipe*** *command is inserted in the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

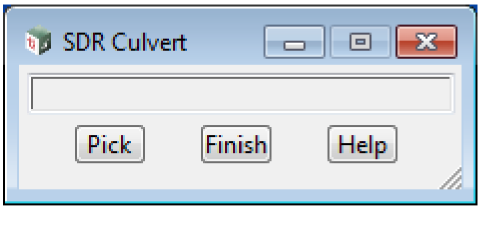
If the ***Pick*** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.9.10 Make a Culvert String

Position of option on menu: **Survey =>Edit =>Stringing =>Culvert string**

With **Culvert string**, the user selects any vertex of a string, gives a culvert width and height and then a ***string type culvert*** command is inserted into the *12d field file*.

Selecting **Culvert string** brings up the **SDR Culvert** panel:



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Pick | button

As soon as the option is selected, the **Pick** *is active and string can be selected. If the pick is cancelled for some reason, the* **Pick** *button can be used to restart the option.*

Each time a string is picked and accepted, ***Culvert width*** *and* ***Culvert height*** *text inputs are displayed and after values are typed in, a* ***String type culvert*** *command is inserted in the 12d field file.*

The option then repeats and continues until the **Finish** *button is selected.*

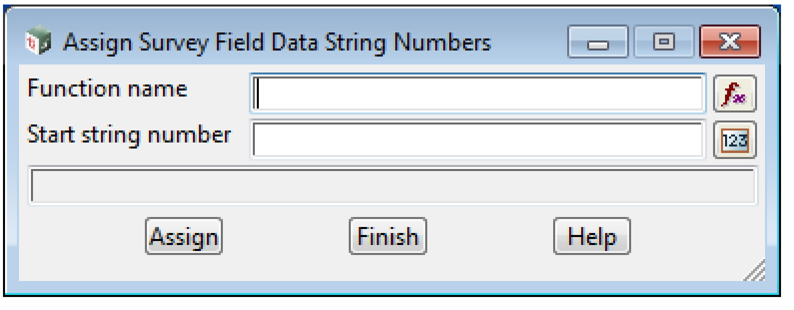
If the **Pick** *is cancelled by hitting the <Esc> key or selecting* **Cancel** *from the* **Pick Ops** *menu, the* **Pick** *button can be used to restart the option.*

17.7.9.11 Assign String Numbers

Position of option on menu: **Survey =>Edit =>Stringing =>Assign string numbers**

Assign string numbers xxx

Selecting **Assign string numbers** brings up the **Assign Survey Field Data String Numbers** panel:



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Function name | function box | | SDR functions

name of the SRD function to give string numbers to.

Start string number

string number to start numbering at.

Assign | button

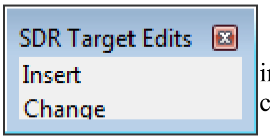
17.7.10 Target Height

Position of menu: **Survey =>Edit =>Target height**

The **Target height** option is used to correct target height errors. This includes giving an incorrect value for a target height or forgetting to change the target height.

The **Target height** walk-right menu is

.



insert an new target height
change existing target height

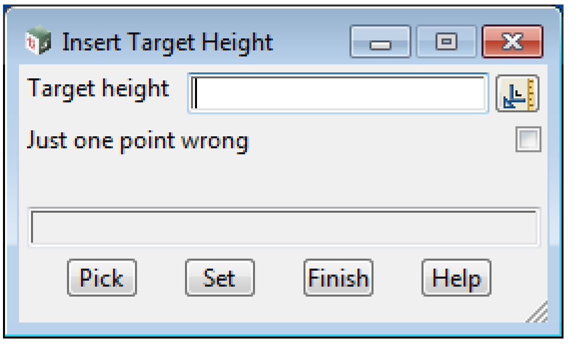
Each option will now be described in detail.

17.7.10.1 Insert Target Height

Position of option on menu: **Survey =>Edit =>Target height =>Insert**

The **insert** option inserts a new target height command into the 12d field file at a user selected point. The user can choose whether the new target height only applied for that one point or for all following points until a new target height is set.

Selecting **insert** brings up the **insert target height** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Target height	input/output		

when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if **set** *is selected, the target height is modified and all affected points updated.*

Just one point tick

if ticked, the new target height only applied for that one point and then reverts pack to the previous target height.
if not tick, the new target height applies for all following points until a new target height is set.

Pick button

pick the point to insert a new target height.

Set button

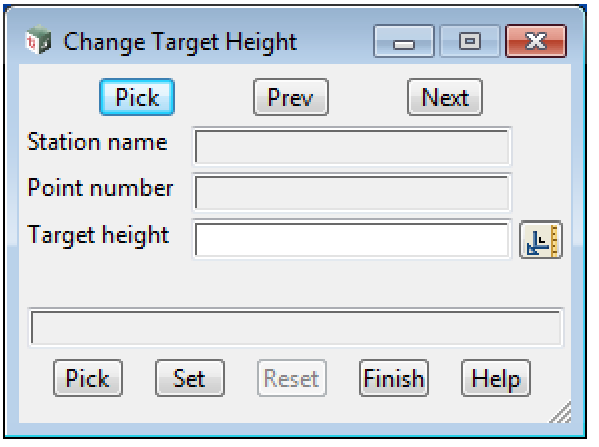
selecting **set** *inserts the new target height command into the 12d field file.*

17.7.10.2 Change Target Height

Position of option on menu: **Survey =>Edit =>Target height =>Change**

The **Change** option changes an existing target height to a new value.

Selecting **Change** brings up the **change target height** panel:



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Pick button

select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.

Prev button

move to the previous point in the string.

Next button

move to the next point in the string.

Station name display only

name of the station that the point was surveyed from.

Point ID display only

point ID of the selected point.

Target height input/output

when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if **set** *is selected, the target height is modified and all affected points updated.*

Pick button

pick the point to change the target height.

Set button

selecting **set** *changes the target height command in the 12d field file and updates affected points.*

Reset button

reset *undoes the changes.*

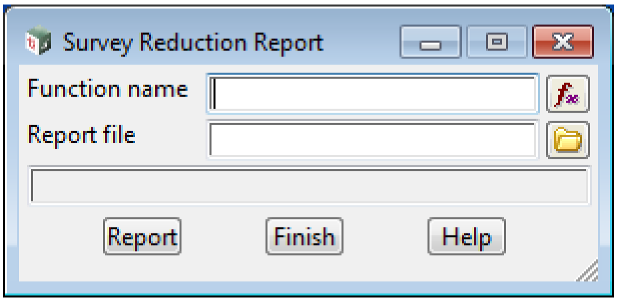
17.8 Report

Position of option on menu: **Survey =>Report**

Report produces a report on the field data from a *Survey* function.

Selecting **report** brings up the **survey reduction report** panel

The fields and buttons used in this panel have the following functions.



Field Description	Type	Defaults	Pop-Up
Function name	input		available Survey functions

name of the 12d Survey function to report on.

Report file	input		*.rpt

name of the file for the Survey function report.

Report	button		

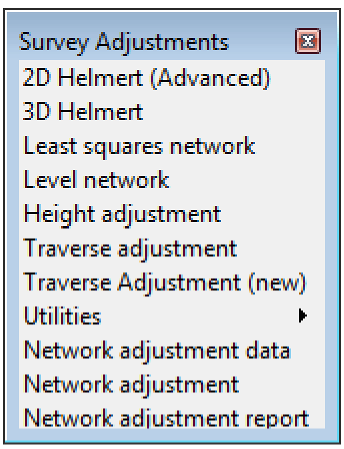
create the Survey report.

17.9 Adjustments

Position of menu: **Survey =>Adjustments**

The **Adjustments** walk-right menu is

.



2D Helmert with fixed scale
3D Helmert
least squares network adjustment
adjustment of level nets
adjust heights of data
traverse adjustment
traverse adjustment (new)
various utilities for massaging Leica files

For *2D Helmert (Advanced)*, go to 28.10.4.1 2D Helmert (Advanced)
3D Helmert 28.10.4.2 3D Helmert
Least squares network 17.9.3 Least Squares Network
Level network 17.9.4 Level Network
Height adjustment 17.9.5 Height Adjustment
Traverse Adjustment 17.9.6 Traverse Adjustment
Traverse Adjustment (new) 17.9.6 Traverse Adjustment
Utilities 17.9.7 Survey Adjustments Utilities

17.9.1 2D Helmert (Advanced)

Position of option on menu: **Survey =>Adjustments =>2D Helmert (Advanced)**

A ***2D Helmert*** transformation is a two dimensional linear transformation consisting of a scaling, rotation and a 2D- translation (shift) of data. Hence there are flour parameters to be specified.

The 2D Helmert (Advanced) option calculated and applied a Helmert transformation, and also allows the user to ***fix the scale*** for the transformation.

For information on the 2D Helmert transformation, please go to the section 28.9.1 Coordinate Transformations - Helmert and Affine

The *2D Helmert (Advanced)* panel is documented in the section 28.10.4.1 2D Helmert (Advanced)

17.9.2 3D Helmert

Position of option on menu: **Survey =>Adjustments =>3D Helmert**

A ***3D Helmert*** transformation is a three dimensional linear transformation consisting of a scaling, three rotations, and a 3D-translation (shift) of data. Hence there are 7 parameters to be specified.

For information on the 3D Helmert transformation, please go to the section 28.9.1 Coordinate Transformations - Helmert and Affine

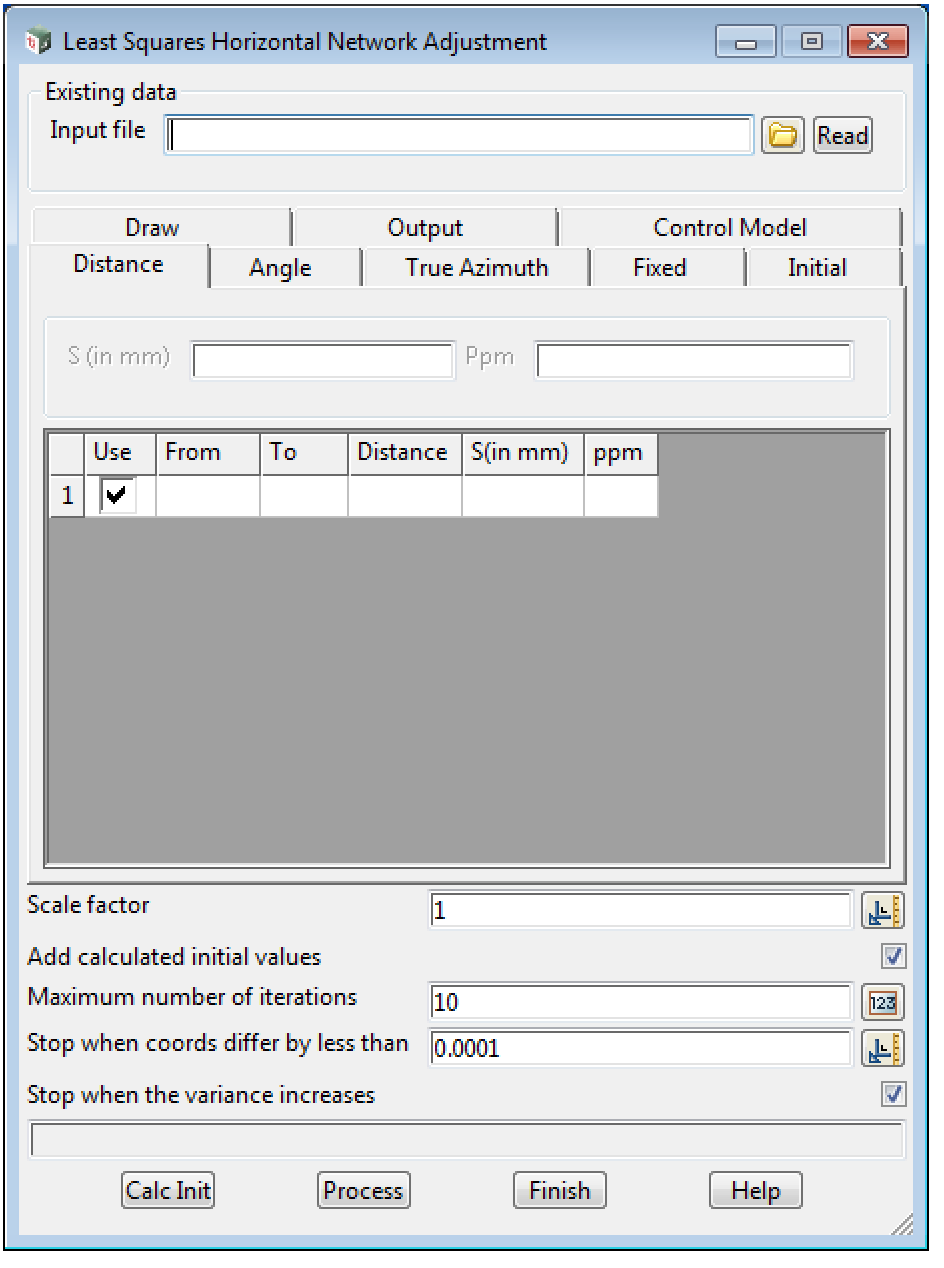
The *3D Helmert* panel is documented in the section 28.10.4.2 3D Helmert

17.9.3 Least Squares Network

Position of option on menu: **Survey =>Adjustments =>Least squares network**

The **Least square network** option performs a least square adjustment on a set of observations that can be manually entered into predefined grid box columns or by reading an existing input file. These observations can be of the form of distances, angles, azimuths or a combination of these.

Selecting**Least squares network** brings up the **Least Squares Horizontal Network Adjustment** panel



The fields and buttons used in this panel have the following functions.

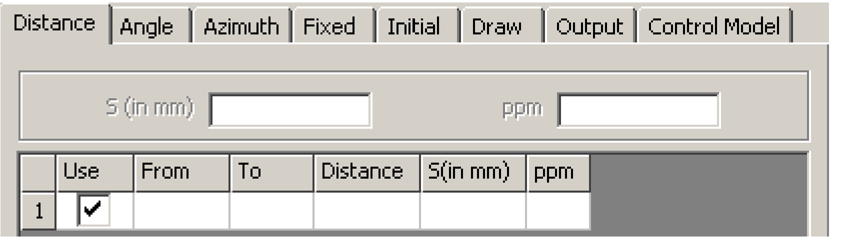
Field Description	Type	Defaults	Pop-Up
Input file	input box		*.in

a pre existing .in input file can be specified. For the format of the .in file, go to Format of the LSA .in File

Field Description	Type	Defaults	Pop-Up
Read	button		

on selection of the read button, if a valid .in input file has been specified, the relevant parameters will be read into the grid controls.

Distance tab



The fields and buttons used in this tab have the following functions.

Field Description	Type	Defaults	Pop-Up
S(in mm)	input box		

standard deviation of a single distance measurement in mm. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

ppm button

parts per million error. If entered the value will be used for all lines in the grid. This eliminates the need to put the ppm on each line.

the grid control values can be entered using valid inputs into the various fields:

Use - *if* ***ticked****, the row is used in the adjustment. If* ***not ticked*** *then the row is ignored*

From *point id which represents the point from which the distance was read*

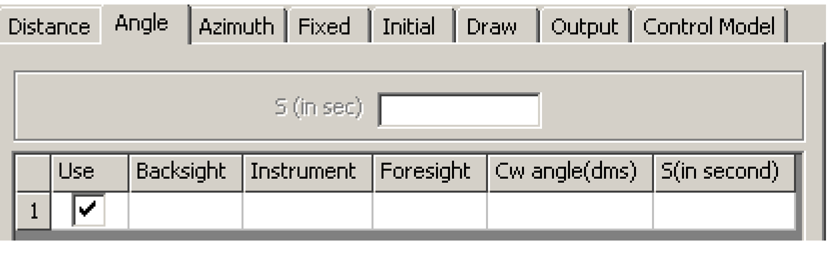
To *point id which represents the point to which the distance was read*

Distance *(horizontal) with all corrections having been made except for that of scale.*

S(in mm) *- if not blank, the standard deviation to use for this single distance measurement in millimetres. If blank, the default value in the panel field* **S(in mm)** *is used.*

ppm *- if not blank, the parts per million (ppm) error to use for this single distance measurement. If blank, the default value in the panel field* **Pmm** *is used.*

Angle tab



The fields and buttons used in this tab have the following functions.

Field Description	Type	Defaults	Pop-Up
S(in sec)	input box		

standard deviation for a single angle measurement in seconds of arc. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

the grid control values can be entered using valid inputs into the various fields. Angle input must be in the form of degrees minutes and seconds in 4.17.1 HP Notation *(e.g. 12.1055)*

Use - *if* ***tick****, the row is used in the adjustment. If* ***not ticked*** *then the row is ignored*

Backsight *- the backsight point id is entered.*

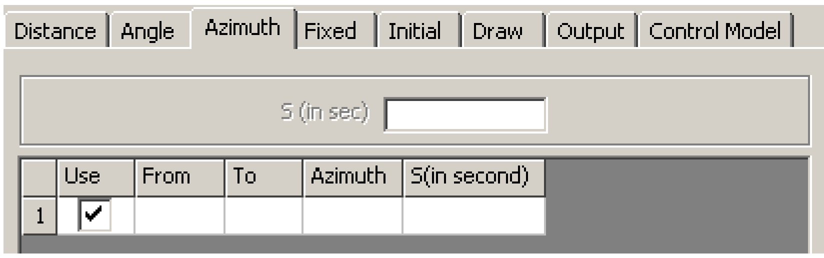
Instrument - *the point id of the instrument or observation station is entered.*

Foresight - *the point id of the foresight station is entered into the* ***Foresight*** *column.*

Angle (dms) -*. the angle defined by the clockwise measurement from the backsight to foresight station as observed from the instrument station.Valid ranges of 0 -360 degrees.*

S (in second) - *if non blank, the standard deviation of the angular measurement in seconds of arc to use for this single angle measurement. If blank, the default value in the panel field* **S (in sec)** *is used.*

Azimuth tab



The fields and buttons used in this tab have the following functions.

Field Description	Type	Defaults	Pop-Up
S(in sec)	input box		

standard deviation for a single azimuth measurement in seconds of arc. If entered the value will be used for all lines in the grid. This eliminates the need to put the standard deviation on each line.

the grid control values can be entered using valid inputs into the various fields.

Use - *if* ***ticked****, the row is used in the adjustment. If* ***not ticked*** *then the row is ignored*

From *- the instrument station point id should be entered.*

To *- the point id of the observed station is entered.*

Azimuth *- the true azimuth to the observed point is entered. Azimuth input should be in the form of degrees minutes and seconds (e.g. 12.1055) Valid ranges of 0 -360 degrees.*

S(in second) - *if non blank, the standard deviation of the azimuth in seconds of arc to use for this single angle measurement. If blank, the default value in the panel field* **S (in sec)** *is used.*

Fixed tab

the grid control values can be entered using valid inputs into the various fields.

Use - *if* ***ticked****, the row is used in the adjustment. If* ***not ticked*** *then the row is ignored*

Point name *- the point id of the fixed stations*

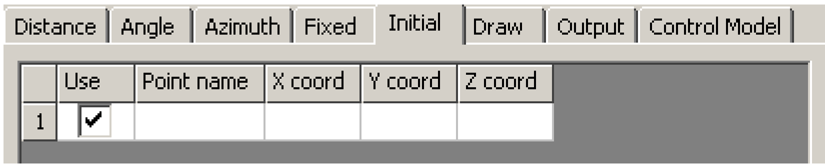
X coord *- the fixed x coordinate value is entered*

Y coord *- the fixed y coordinate value is entered*

Z coord *- the fixed z coordinate value is entered*

Initial tab

12d Model *will try and calculate initial position for each point from the entered measurement but for* *some points this is not possible and then the user must enter an initial position.*



the grid control values can be entered using valid inputs into the various fields.

***Use -** if **tick**, the row is used in the adjustment. If **not ticked** then the row is ignored*

***Point name** - the point id of a free or floating station should be entered.*

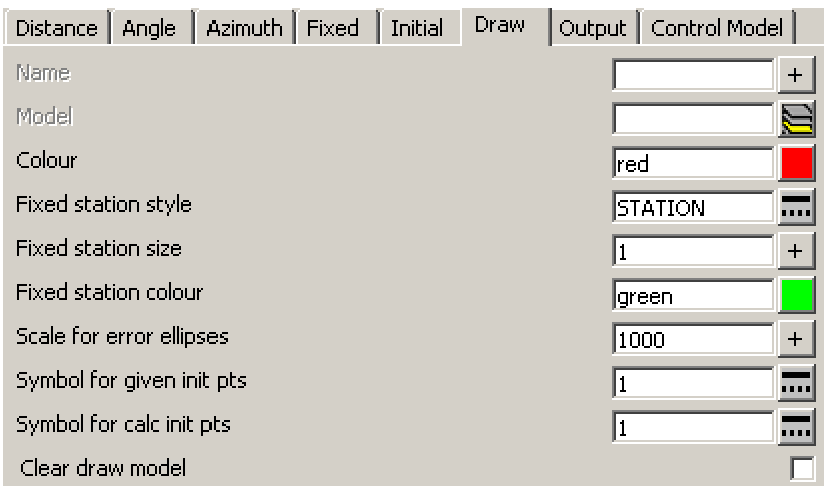
***X coord** - the initial x coordinate estimate is entered.*

***Y coord** - the initial y coordinate estimate is entered.*

***Z coord** - the initial z coordinate estimate is entered.*

NB. It is very important that the initial values are approximately equal to the true values. A solution will still be generated for rubbish values.

Draw tab



the following values can be entered to enable the production of a user defined plot of the adjustment.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file

if non-blank, the name of the new string

Model	model box		available models

if non-blank, the model of the new string (including error ellipse and station symbol if specified).

Colour	colour box	red	available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Fixed station style	input	Station	available line styles

line style of the station symbol. These will be placed at all of the fixed stations if specified.

Fixed station size	input	1	

size of symbol in world units.

Fixed station colour	colour box	green	available colours

if non-blank, the colour of the station symbols

Scale for error ellipses input 1000

this value will be applied to any error ellipses to enable an exaggerated view of the ellipse geometry

Symbol for given init points input 1 available line styles

line style of the given initial point symbols

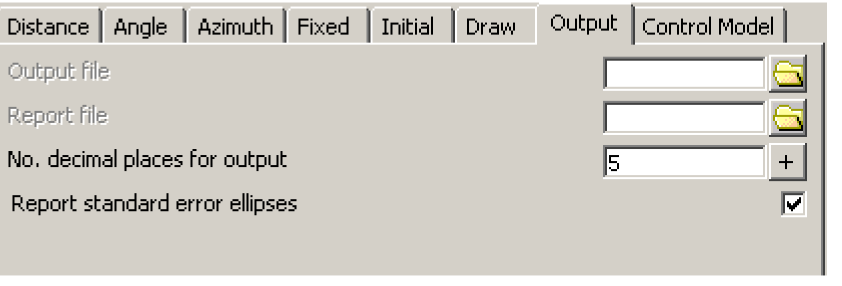
Symbol for calc init points input 1 available line styles

line style of the calculated initial point symbols

Clear draw model beforehand tick box

if ticked, the draw model will be cleaned before the new strings are created

Output tab



The fields in this panel define the output parameters.

Field Description Type Defaults Pop-Up

Output file input box *.in

if non blank, an output file is produced that can be read in the future.

Report file input box *.rpt

if non blank, a report file of this name is creating giving the calculation specific parameters and result.

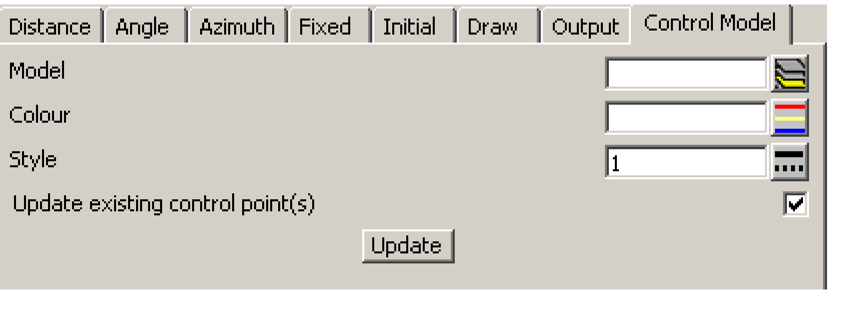
No. decimal places for output input box 5

the number of decimal place to use in the report

Report standard error ellipse tick box ticked

*if **ticked**, error ellipses for each new point are created*

Control Model tab



Model model box

a new model or an existing model containing some control points an be entered.

If a new model, the calculated points will placed into that control model.
*If an existing model, if there is a point in the model with the same point id as a point being calculated, then that rather than a new point being created, the coordinates of the existing point can be updated after the reduction is complete (depends on the **Update existing controls points** tick box).*

Colour model box

colour used for control station symbol

Style linestyle box

style for control stations.

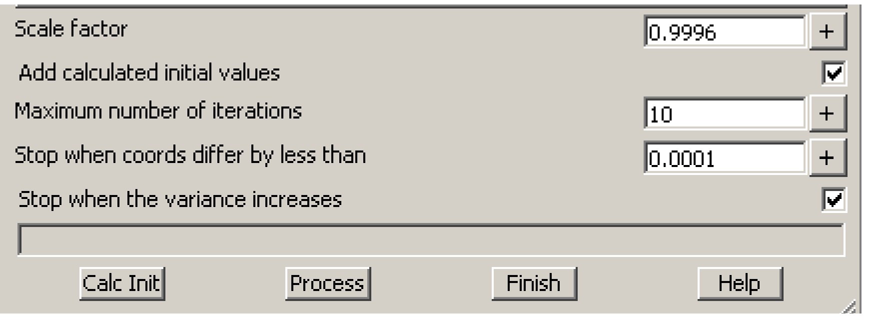
Update existing control points tick box ticked

if ticked, any existing coordinate positions from the adjustment will be updated in the given control model.

Update button

if pressed, the updating of changed level values in the given control model will be carried out.

The remaining fields refer to those located below the grid control



Scale factor input box project central meridian scale factor

a scale factor can be defined which will be applied to any entered distances. Final distances used in calculations are derived by multiplying the entered distance by the scale factor.

Add calculated initial values tick box tick

if this box is checked, then the initial values will be included in the report

Maximum number of iterations input box 10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations

Stop when coords differ... input box 0.0001

the calculation of the adjustment is stopped when the difference between successive calculations meet the defined tolerance

Stop when the variance increases tick box tick

*if **ticked**, the calculation of the adjustment is stopped when the variance between successive calculations increases*

Process button

run the adjustment

Format of the LSA .in File

The data in each line of the *.in* file is space delimited. That is, each piece of data on the line is separated by one or more spaces.

Line 1:

The layout of the data on the first line is as follows:

Position	Description	Variable	Type
1	Number of distance observations	N-Dist	Integer
2	Number of angle observations	N-Ang	Integer
3	Number of true azimuth observations	N-Azi	Integer
4	Number of control (fixed) stations	N-Fix	Integer
5	Number of stations (including control stations)	N-Stn	Integer
6	Distance standard deviation (positive if used)	D-Std	Double
7	Distance part per million (non-negative if used)	D-Ppm	Double
8	Angle standard deviation (positive if used)	A-Std	Double
9	Azimuth standard deviation (positive if used)	Z-Std	Double
10	Scale factor		Double

Note: D-Std, is in millimetres, A-Std and Z-Std are in seconds.

Example:

63 71 0 16 35 5.00000 5.00000 15.00000 5.00000 1.00000

Next ***N-Stn*** lines:

The next ***N-Fix*** lines are *control station* records, followed by (***N-Stn - N-Fix***) *station* records.

The layout of the line of a *station record* is as follows:

Position	Description	Type
1	Flag (1 if the station is used, otherwise 0)	Integer
2	Point number	Text
3	X-coord	Double
4	Y-coord	Double

Example:

1 9338 3889.23700 5341.54800

….

….

0 9712a 4007.45700 5168.68700

….

Next ***N-Dist*** lines

The next ***N-Dist*** lines are *distance observation* records.

The layout of the line of a *distance observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Start point number	Text
3	End point number	Text
4	Distance	Double
5	Standard deviation (in meter, negative if not used)	Double
6	Part per million*	Double

Note: * Part per million is different to D-Ppm by a factor of 1000. That is, if you want a ppm value of 5, the number in the file should be 0.005

Example:

1 9542 9702 100.20200 0.00300 0.00200

1 9542 9703 142.98200 -1.00000 -1.00000

0 9700 9506 72.10700 -1.00000 -1.00000

….

Next *N-Ang* lines

The next ***N-Ang*** lines are *angle observation* records.

The layout of the line of a *angle observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Backsight point number	Text
3	Instrument point number	Text
4	Foresight point number	Text
5	Degree	Integer
6	Minute	Integer
7	Second	Double
8	Standard deviation (in mm, negative if not used)	Double

Example:

1 19206 9506 9701 174 29 20.00000 -1000.00000

….

Next *N-Azi* lines

The next ***N-Azi*** lines are *true azimuth observation* records.

The layout of the line of a *true azimuth observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Backsight point number	Text
3	Instrument point number	Text
4	Foresight point number	Text
5	Degree	Integer
6	Minute	Integer
7	Second	Double
8	Standard deviation (in mm, negative if not used)	Double

Example:

1 19206 9506 174 29 20.00000 3.00000

….

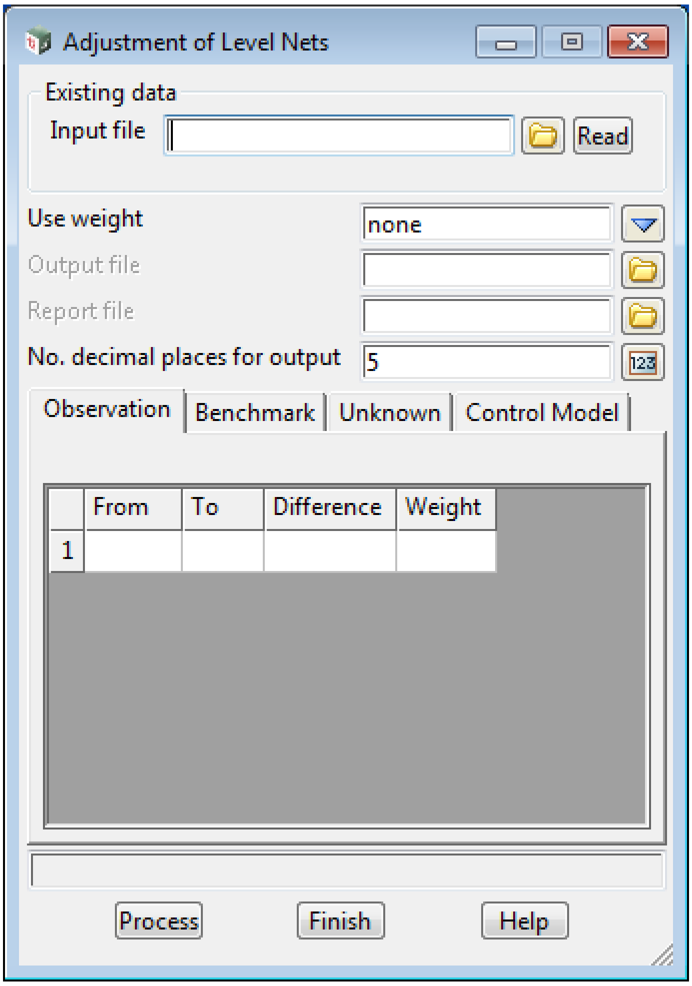
That is the end of data in the file.

17.9.4 Level Network

Position of option on menu: **Survey =>Adjustments =>Level network**

The **level network** option performs a least square adjustment on a set of level observations that can be manually entered into predefined grid box columns or by reading an existing input file.

Selecting **Level network** brings up the **Adjustment of Level Nets** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	input box		*.in

a pre existing input file can be specified.

Read	button		

on selection of the read button, if a valid input file has been specified, the relevant parameters will be read into the grid controls.

Use weight	choice box	none	none, distance, standard deviation

*a weighting per observation can be made according to the **none**, **distance**, and **standard deviation** choices*
***None -** no weighting will be applied.*

***Distance** - if the distance of the level network legs are to be used. The horizontal distance is entered into the weight field. eg 101.23*

***Standard deviation** - to define a standard deviation. e.g. 0.005*

***Note:** The method of defining the weight should be kept consistent. i.e. one of the 3 options.*

Output file	input box		*.in

an output file can be defined which will allow for the reading of the file in the future.

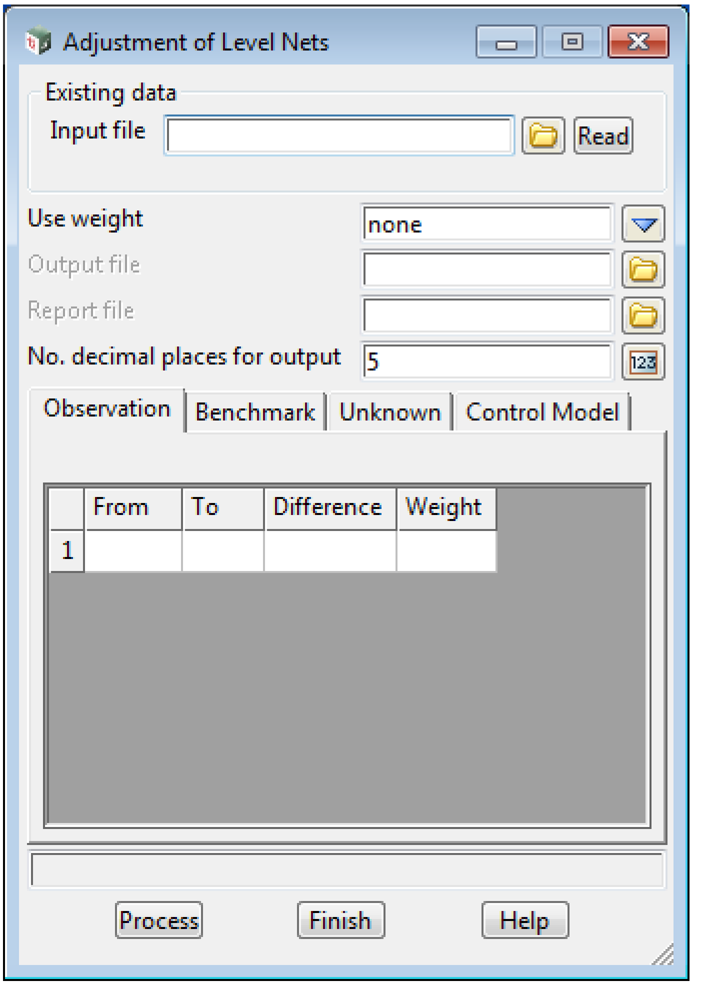
Report file			*.rpt files

a report using the nominated file name is created.

No. decimal places for out,,,input box 5

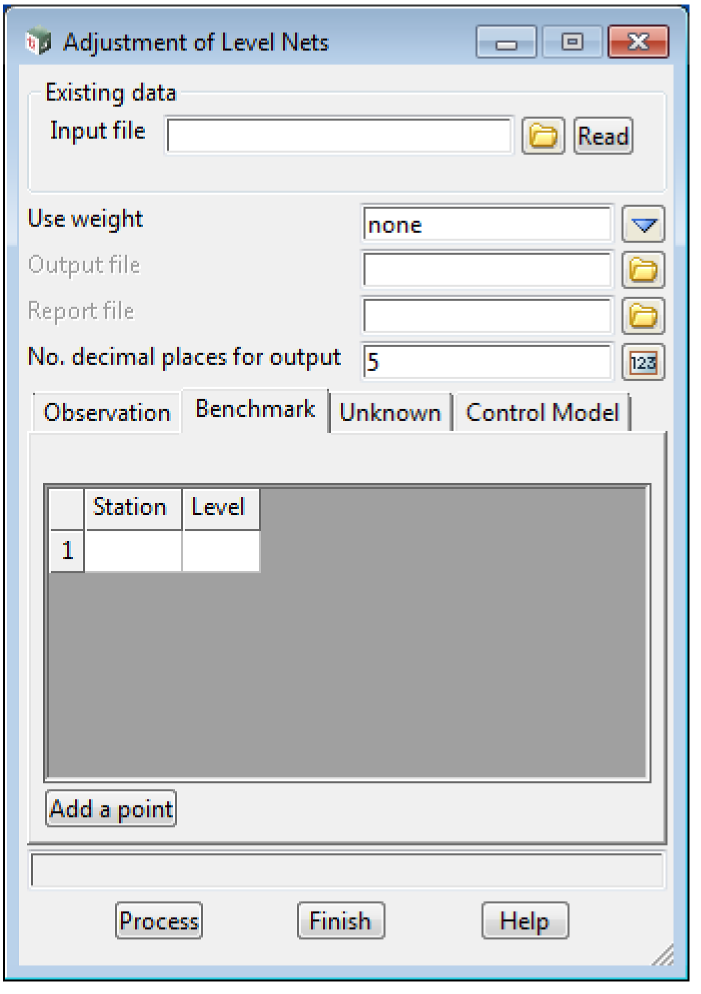
the number of decimal places for the new levels can be defined.

Observation tab



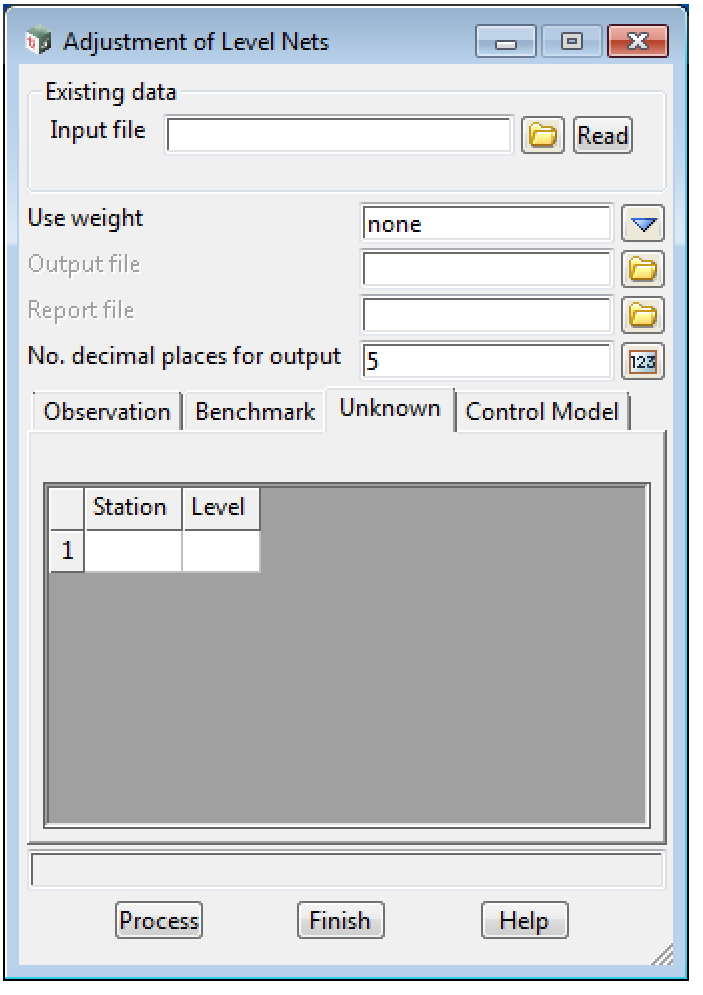
the grid control values can be entered using valid inputs into the various fields:
From *point id which represents the first point of the level difference*
To *point id which represents the second point to which the level difference refers*
Difference *the difference between the levels defined by the* ***From*** *point and the* ***To*** *point. i.e. the difference = (to point) level - (from point) level*

Benchmark tab



the grid control values can be entered using valid inputs into the various fields.
Station*. The point id of a fixed level station should be entered.*
Level*. The corresponding level value of the fixed station.*

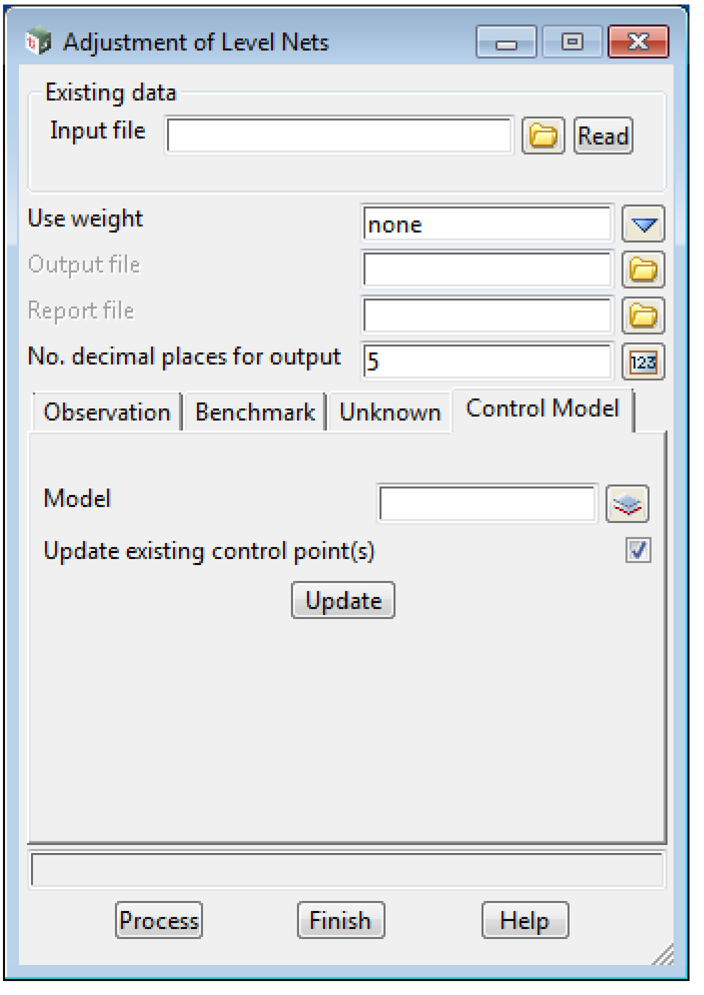
Unknown tab



the grid control values can be entered using valid inputs into the various fields.
Station*. The point id of any free or floating level stations should be entered.*
Level*. The corresponding approximate level value of free or floating level station.*

a report using the nominated file name is created.

Control Model tab



Model model box

an existing control model can be entered so that changes to level values can be updated.

Update existing control points tick box ticked

if ticked, any new level values from the adjustment will be updated in the given control model.

Update button

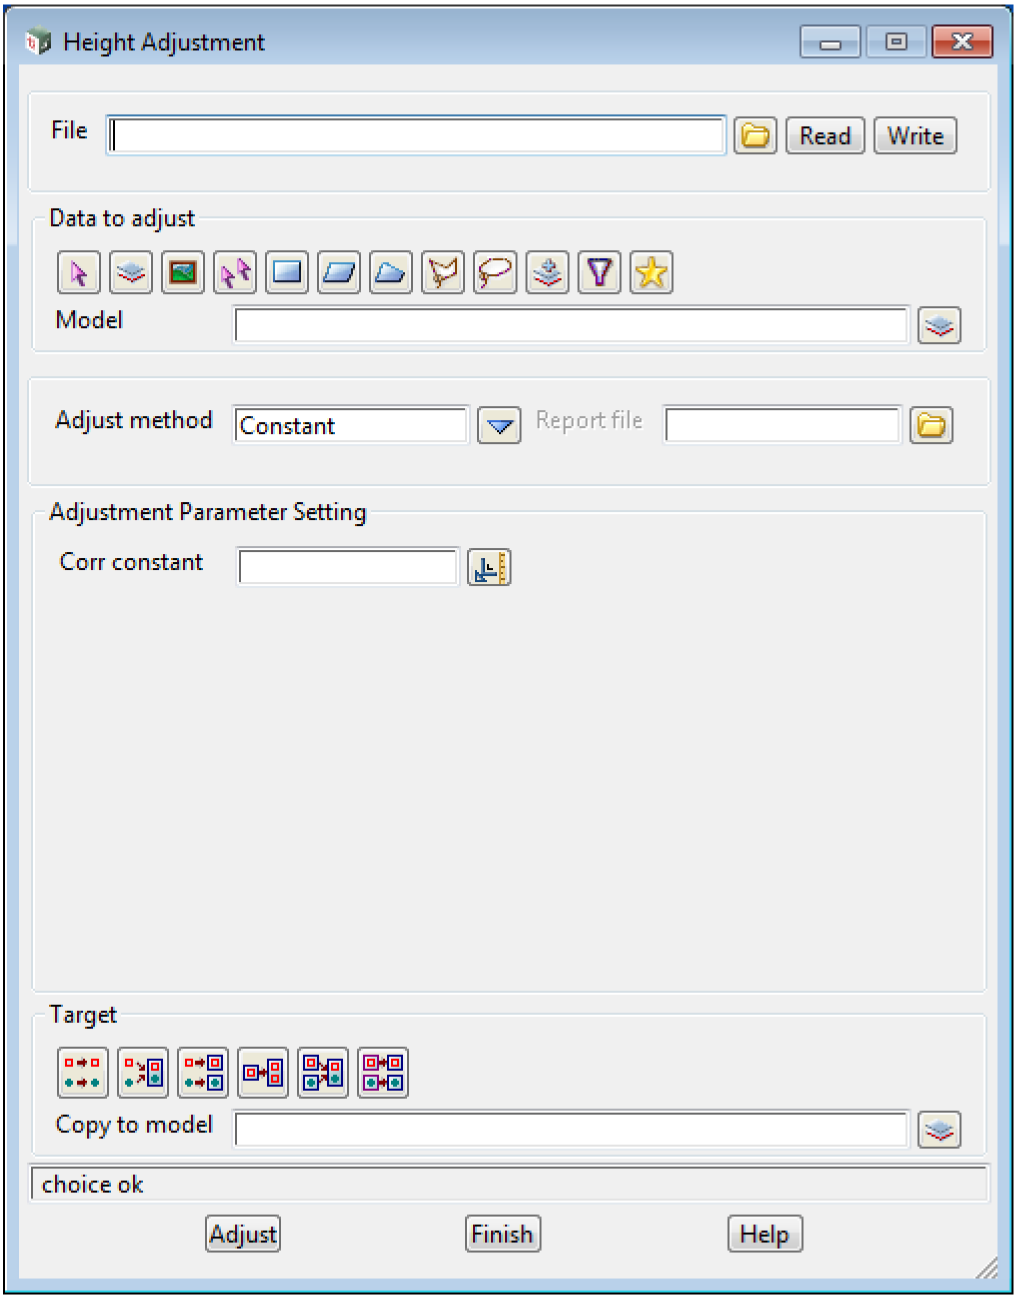
if pressed, the updating of changed level values in the given control model will be carried out.

17.9.5 Height Adjustment

Position of option on menu: **Survey =>Adjustments =>Height adjustment**

The **Height adjustment** option adjusts the selected data using either a constant z value, a plane defined by parameters, a plane defined by points (least square fit) or a tin of height differences.

Selecting **Height adjustment** brings up the **Height Adjustment** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	file box		*.haf files

a filename can be specified for reading or writing a file.

Read	button		

if a valid file exists, the file contents can be loaded into the panel.

Write	button		

if a valid name is specified, the user can write the input data to a file.

Data to adjust	input		

the source of the data to be adjusted is selected using the data source box. For more information on the data source box see 4.19.3 Data Source

Adjustment method choice box Constant Constant
Plane parameters
Plane by points
Difference tin

the adjustment method should be selected from the list. A description of each method is given below.

Report file *.rpt files

a report using the nominated file name is created.

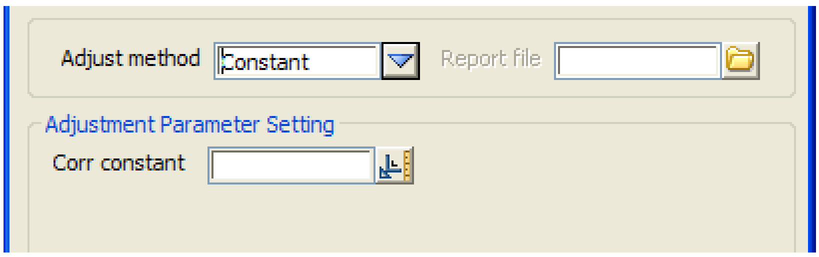
Target target

the target for the adjusted data should be specified. For more information on how to use a data target box see the section 4.19.4 Data Target

Transform button

perform the transformation.

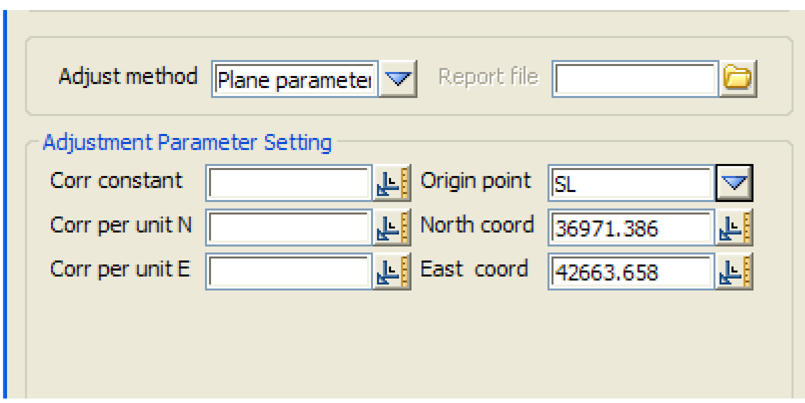
Constant adjustment method



Corr constant input box

the value to be added to the selected data.This method is the same as a translation in the z values only.

Plane parameters adjustment method



Corr constant input box

the value to be added to the selected data.

Corr per unit N input box

the z value correction per unit nothing.

Corr per unit E input box

the z value correction per unit easting.

Origin point string select [same as]

the name of the string of the origin pt.

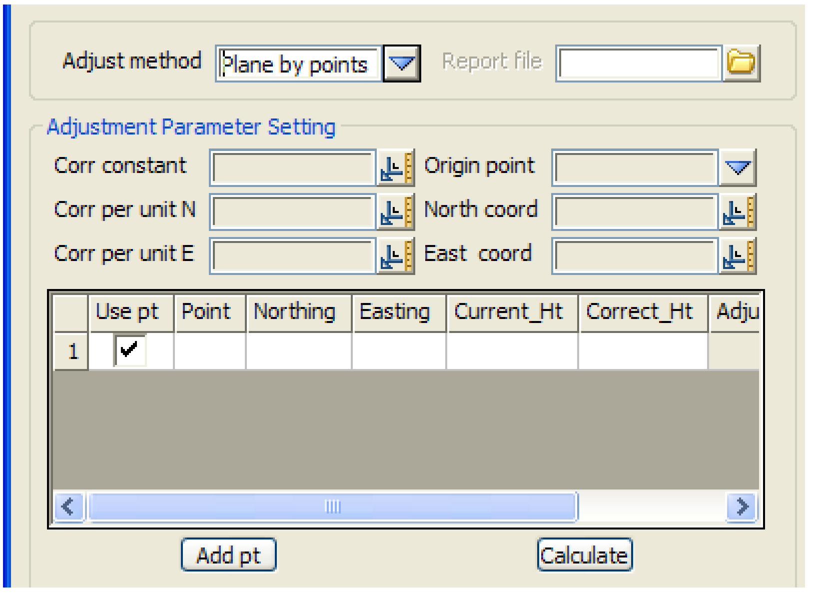
North coord input box

the northing value of the origin point.

East coord input box

the easting value of the origin point.

Plane by points adjustment method



the grid control values can be entered to build up the bench mark points from which the plane will be fitted to.

***Use pt**. the point (bench mark point) can be included in the derivation of the parameters by selecting the **Use pt** option. If the point is not to be included, then uncheck the box.*

***Point**. The point id of the bench mark*

***Northing**. The northing value of the bench mark*

***Easting**. The Easting value of the bench mark*

***Current_Ht**. The current level value of the bench mark*

***Correct_Ht**. The correct height in the adjusted level plane.*

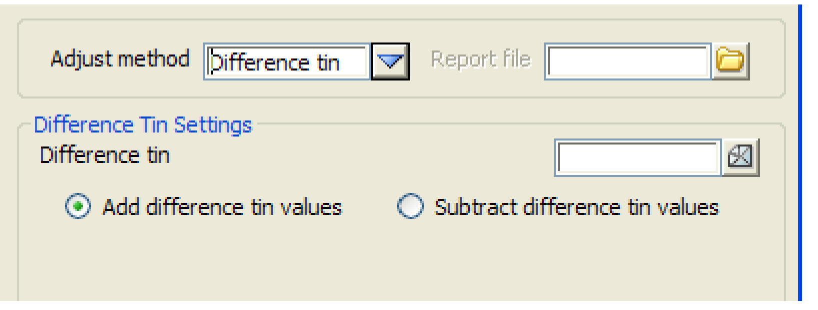
***Adjusted_Ht**. This field shows the adjusted height after the adjustment is performed.*

***Residual**. This field shows the difference between the correct height and the adjusted height. This value is shown after the adjustment is performed.*

The **Add pt** button used in this panel can be used to add points into the grid control from selecting points from a current view. After the button is selected, consequent selection and acceptance of points from the view will add the value into the grid. The **Correct_Ht** parameter will then have to be filled out by the user.

The **Calculate** button can be used to calculate the adjustment parameters and residuals so that they can be inspected before the adjustment is made.

Difference tin adjustment method



This option allows a difference tin to be specified as the adjustment reference. The selected points to be adjusted will be projected onto the difference tin to establish an interpolated adjustment value. This value is then applied to the data according to the add or subtract options. The fields used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Difference tin	tin box		available tins

the difference tin to be used to interpolate adjustment values.

Add difference tin values radio button

if the button **Add difference tin values** *is checked the interpolated value from the difference tin will be added to the existing levels of the adjusted points.*

Subtract difference tin values radio button

if the button ***Subtract difference tin values*** *is checked the interpolated value from the difference tin will be subtracted from the existing levels of the adjusted points.*

if *Constant, a given value is subtracted from each z-value*

Corr constant

the value to be subtracted from all z-values

Origin points

the value to be added to all z-values

if *Plan parameters, a 3d-plane is defined and the z-value of the plane subtracted from any points*

Corr constant

z-correction at the original point

Corr per unit N

z-correction per unit is the North (y) direction abut the origin point

Corr per unit E

z-correction per unit is the East (x) direction

Origin point 2d select box

pick box for selected a pint to use for North and East coordinates about the origin point

North coordinate

East coordinate

if *Constant, a given value is subtracted from each z-value*

Corr constant

the value to be subtracted from all z-values

Origin points

the value to be added to all z-values

if *Plan by points a 3d-plane is fitted using least squares adjustment to selecting points. The z-value of the plane is then subtracted from any points.*

Corr constant

z-correction at the original point

Corr per unit N

z-correction per unit is the North (y) direction abut the origin point

Corr per unit E

z-correction per unit is the East (x) direction

Origin point 2d select box

pick box for selected a pint to use for North and East coordinates about the origin point

North coordinate

East coordinate

if *Difference tin, the z-value from a triangulation is added/subtracted from any points*

Difference tin tin box available tins

tin of values to be added/subtracted from the z-values of points

Add difference tin values radio button

*if **on**, the values of the tin are **added** to the selected points*

Subtract difference tin values radio button

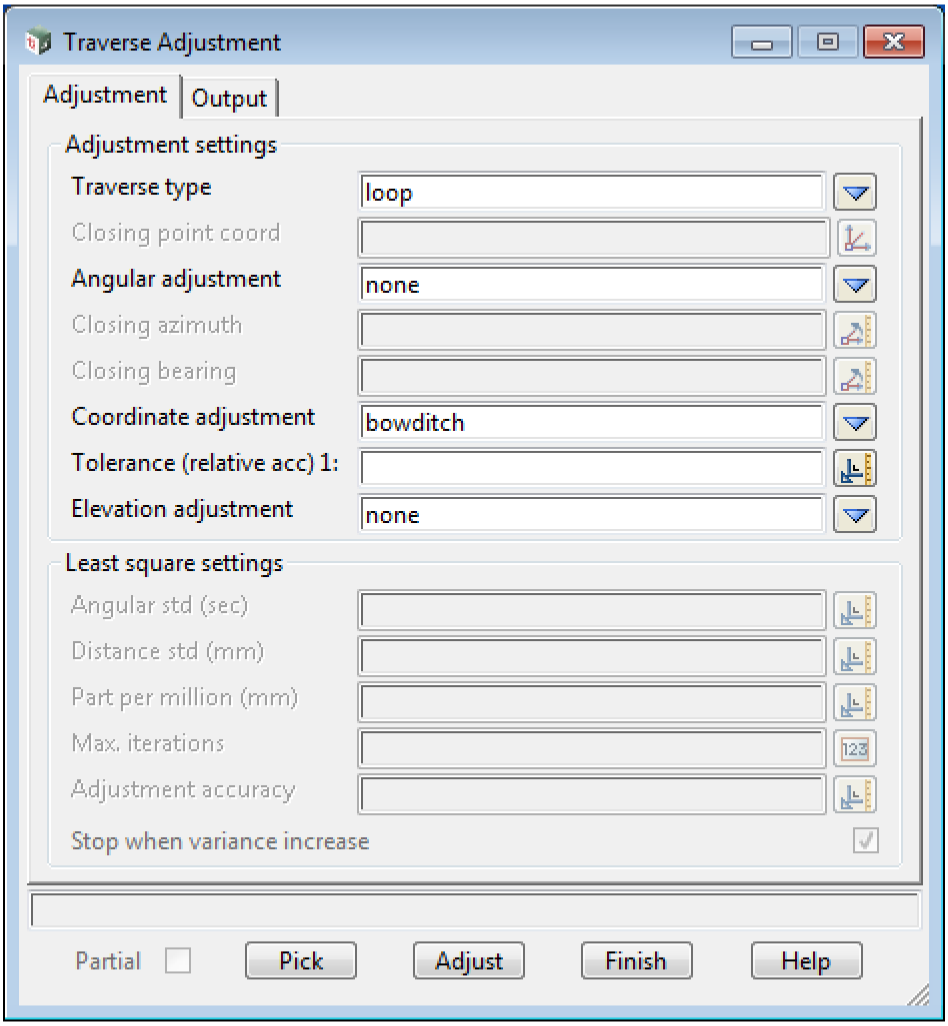
*if **on**, the values of the tin are **subtracted** to the selected points*

17.9.6 Traverse Adjustment

Position of option on menu: **Survey =>Adjustments =>Traverse adjustment**

The **Traverse adjustment** option performs a Bowditch, Transit, Compass or Least Square adjustment on a selected string. The adjustment can be for a closed string (loop) or an open string (non-loop).

Selecting **Traverse adjustment** brings up the **Traverse Adjustment** panel.



Traverse Adjustment
Adjustment
Output
Adjustment settings
Traverse type
loop
Closing point coord
Angular adjustment
