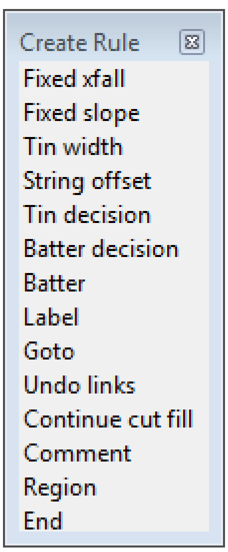
(i) end the processing of commands - **end**

The **Decisions Commands** are selected from the **Create Rule** menu that is displayed when clicking in a cell in the **Type** column of the **Decisions Template** panel.

The **Create Rule** menu is



fixed width and xfall
fixed width and slope
fixed width, up to a tin
go to an offset from a string
test depth below a tin
test if a batter cuts a tin
batter to a tin
create a label
goto a label
undo links
stop processing decisions, and continue with the cut/fill tables
add comment line
create a region row
terminate the decisions

For a description of each command, see

Fixed xfall	21.8.2 Template Decisions - Fixed Xfall
Fixed slope	21.8.3 Template Decisions - Fixed Slope
Tin width	21.8.4 Template Decisions - Tin Width
String offset	21.8.5 Template Decisions - String Offset
Tin decision	21.8.6 Template Decisions - Tin Decision
Batter decision	21.8.7 Template Decisions - Batter Decision
Batter	21.8.8 Template Decisions - Batter
Label	21.8.9 Template Decisions - Label
Goto	21.8.10 Template Decisions - Goto
Undo links	21.8.11 Template Decisions - Undo

Continue cut fill	21.8.12 Template Decisions - Continue Cut Fill
Comment	21.8.13 Template Decisions - Comment.
Region	21.8.14 Template Decisions - Region.
End	21.8.15 Template Decisions - End

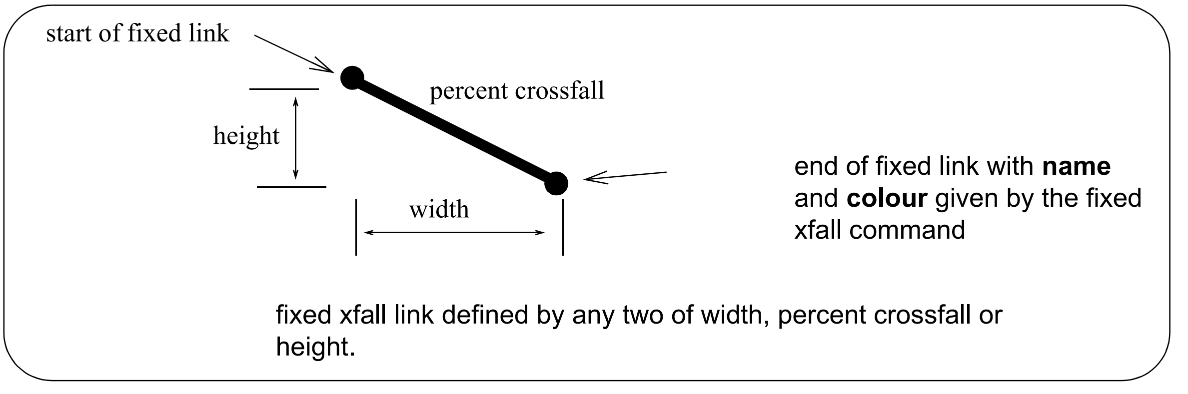
For examples of a using decisions, go to the section 21.8.17 Decisions Examples.

Please continue to the next section 21.8.2 Template Decisions - Fixed Xfall.

21.8.2 Template Decisions - Fixed Xfall

Selecting **Fixed xfall** brings up the **Fixed Xfall** panel which is used to constructed the command for a fixed link with the possibility of using cross fall (xfall). The fixed link is defined by specifying values for two of the three fields width, height and x-fall.

Note - if defining a slope rather than a xfall is required, use **Fixed Slope** (see 21.8.3 Template Decisions - Fixed Slope).



The format of the Fixed Xfall command in the panel is

Fixed Xfall Width *value* Height *value* XFall *value* Name *text* Colour *colour* // *comment*

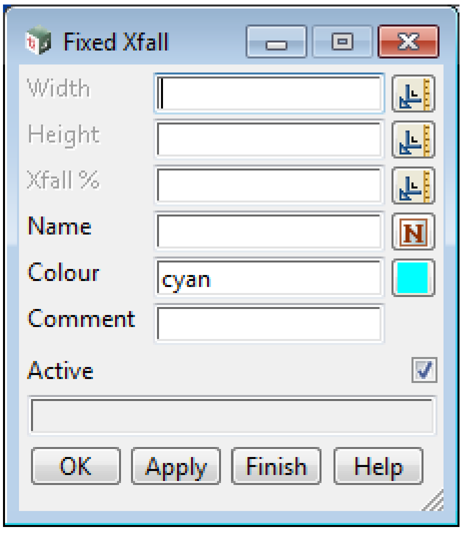
where only two of the three commands Width, Height and Xfall are used.

The format of the command typed into the template file is

Fixed_Xfall *width_value* *height_value* *xfall_value* *name* *colour* // **comment**

where one of *width_value*, *height_value* or *xfall_value* is the key word *unknown.*

The panel brought up when **Fixed xfall** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Width	input		

the width for the link.

Height input

the height for the link.

Xfall % input

the x-fall, in percent cross-fall, of the link. Positive is up and negative down.

Name input

the name to be used for the created point and string.

Colour input cyan available colours

the colour to be used for the created string

Comment, **Active, OK and Apply**

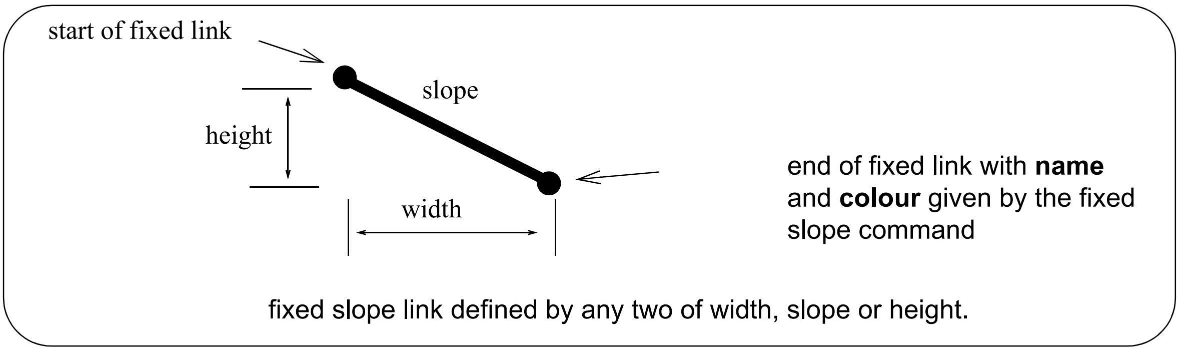
For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.3 Template Decisions - Fixed Slope or return to 21.8 Full Definition of Template Decisions.

21.8.3 Template Decisions - Fixed Slope

Selecting **Fixed slope** brings up the **Fixed Slope** panel which is used to constructed a fixed link. The fixed link is defined by specifying values for two of the three fields width, height and slope.

Note - if defining a cross fall (xfall) rather than a slope is required, use **Fixed Xfall** (see 21.8.2 Template Decisions - Fixed Xfall).



The format of the Fixed Slope command in the panel is

Fixed Slope Width *value* Height *value* Slope *value* Name *text* Colour *colour // comment*

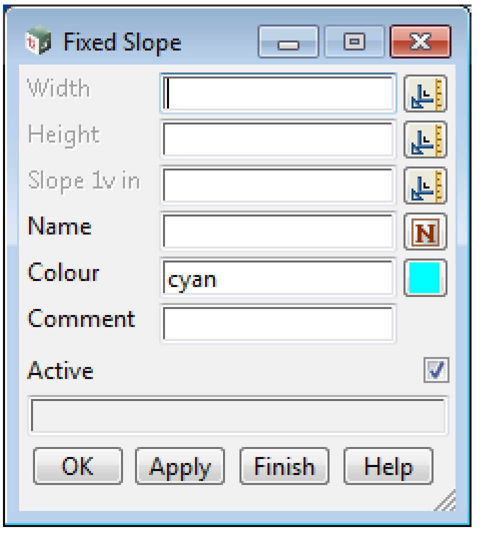
where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

Fixed_Slope *width_value height_value slope_value name colour // comment*

where one of *width_value*, *height_value* or *slope_value* is the key word *unknown*

The panel brought up when **Fixed slope** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Width	input		

the width for the link.

Height	input		

the height for the link.

Slope 1v in	input		

the slope, in 1v in, of the link. Positive is up and negative down.

Name	input		

the name to be used for the created point and string.

Colour	input	cyan	available colours

the colour to be used for the created string

Comment, **Active, OK and Apply**

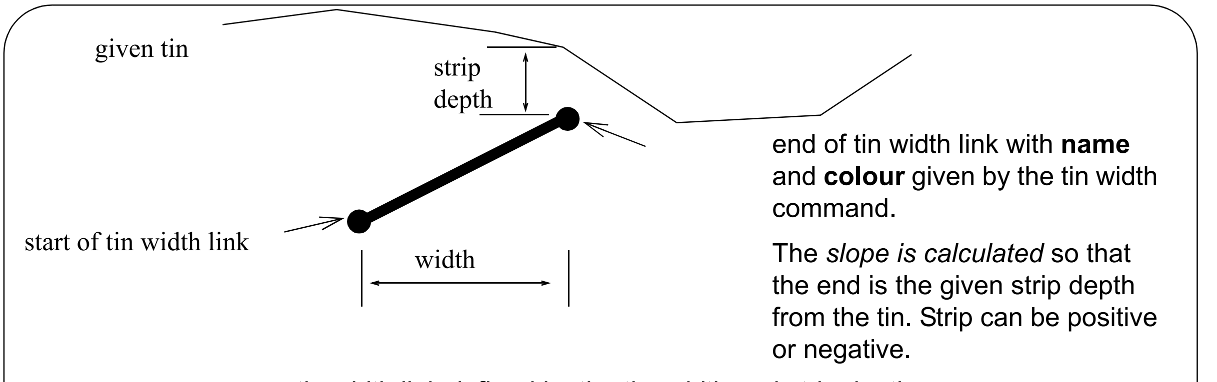
For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.4 Template Decisions - Tin Width or return to 21.8 Full Definition of Template Decisions.

21.8.4 Template Decisions - Tin Width

Selecting **Tin width** brings up the **Tin Width** panel which is used to construct a link which has a ***given width*** and stops at the depth **strip** below the tin. Control then passes to the next line of the table.

strip can be positive (end point is below the tin) or negative (end point is above the tin).



tin width link defined by the tin, width and strip depth.

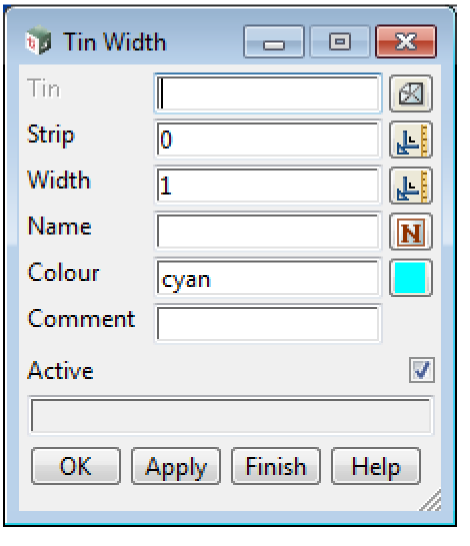
The format of the Tin Width command in the panel is

Tin Width *tin_name* Strip *value* Width *value* Name *text* Colour *colour* // *comment*

The format of the command typed into the template file is

Tin_Width *tin_name* *strip_value* *width_value* *name* *colour* // *comment*

The panel brought up when **Tin width** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	input		available tins
tin to batter to.			
Strip	input	0	

distance below the tin to stop at (strip depth). ***strip*** *can be positive (point is below the tin) or negative (point is above the tin).*

Width input 1

width of the link

Name input

the name to be used for the created point and string.

Colour input cyan available colours

the colour to be used for the created string

Comment, Active, OK and Apply

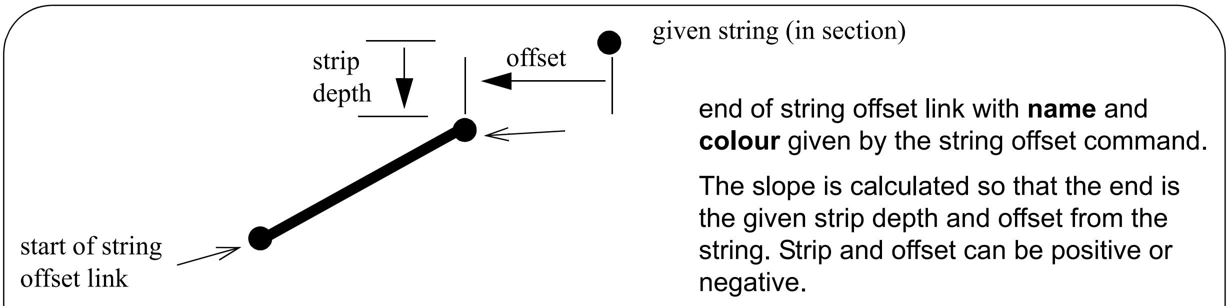
For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.5 Template Decisions - String Offset or return to 21.8 Full Definition of Template Decisions.

21.8.5 Template Decisions - String Offset

Selecting **String offset** brings up the **String Offset** panel which is used to construct a link which goes to a ***given offset from string*** and stops at the depth **strip *below the string***. Control then passes to the next line of the table.

offset and **strip** can be positive or negative.



string offset link defined by the string, offset and strip depth.

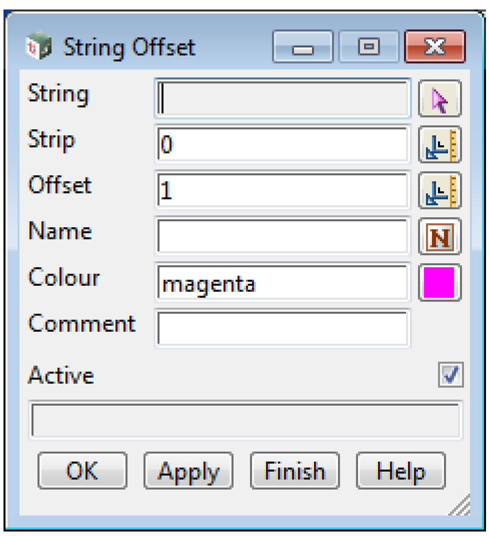
The format of the String Offset command in the panel is

> **String Offset** *string_name* Strip *value* Offset *value* Name *text* Colour *colour // comment*

The format of the command typed into the template file is

> **String_Offset** *string_name strip_value offset_value name colour // comment*

The panel brought up when **String offset** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
String	string select		
string to go to.			
Strip	input	0	

distance below the string to stop at.

Offset	input	1	

offset from the string to stop at.

Name	input		

the name to be used for the created point and string.

Colour	input	cyan	available colours

the colour to be used for the created string

Comment, **Active, OK and Apply**

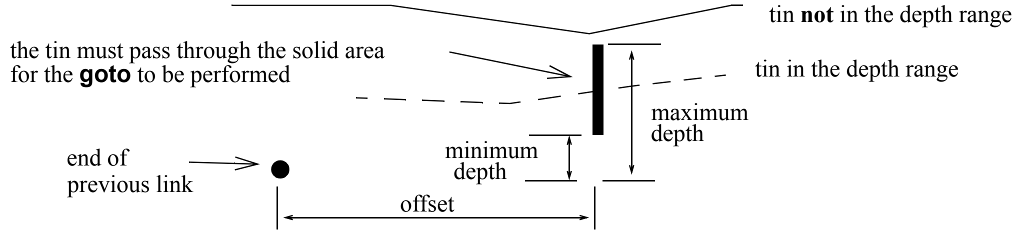
For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.6 Template Decisions - Tin Decision or return to 21.8 Full Definition of Template Decisions.

21.8.6 Template Decisions - Tin Decision

Selecting **Tin decision** brings up the **Tin Decision** panel which tests to see if the depth from the end of the previous link, offset by the amount given in the **offset** field, is between the two values given in the **minimum depth** and **maximum depth** fields. If the depth is between the values, then control is transferred to the line with the label given by the **goto** field. Otherwise, control passes to the next line of the table.

offset, **minimum** and **maximum** depth can be positive or negative.



tin decision given by offset and minimum and maximum depths.

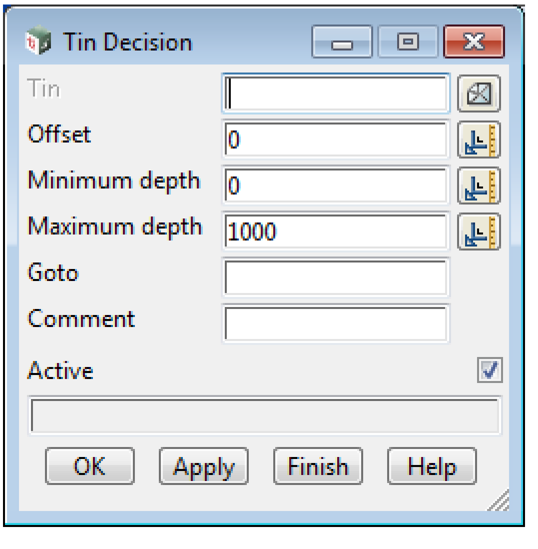
The format of the Tin Decision command in the panel is

Tin Decision *tin_name* Offset *value* Min *value* Max *value* Goto *label // comment*

The format of the command typed into the template file is

Tin_Decision *tin_name offset_value min_value max_value goto_label // comment*

The panel brought up when **Tin decision** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	tin box		available tins

the tin to calculate the depth to.

Field Description	Type	Default	Pop-Up
Offset	input	0	

the depth is calculate at an offset distance of **offset** *from the end of the previous link.*

Minimum depth input 0

if the depth is between the minimum and maximum depth, then control is passed to the line with the label given in the goto field, otherwise control passes onto the next line of the table.

Maximum depth input 1000

see previous field.

Goto input

label to go to if the depth is between the minimum and maximum depths.

Comment, **Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.7 Template Decisions - Batter Decision or return to 21.8 Full Definition of Template Decisions.

21.8.7 Template Decisions - Batter Decision

Selecting **Batter decision** brings up the **Batter Decision** panel which is used to test whether a given link comes within

(a) a **strip** depth of a tin

(b) an offset distance from a tin.

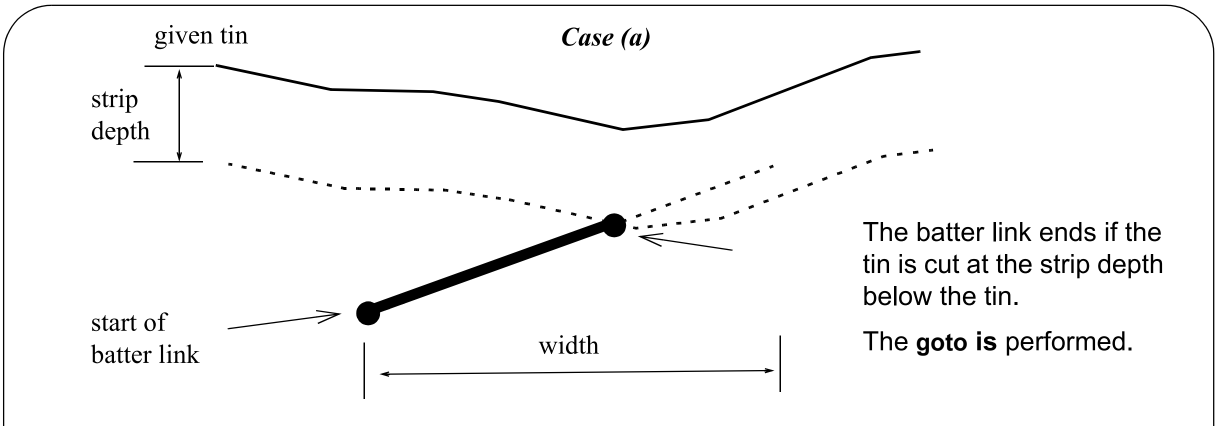
(c) a strip depth of a tin calculated at a given offset from the link.

If the test is satisfied, then control is transferred via a goto, otherwise control continues onto the next line in the table.

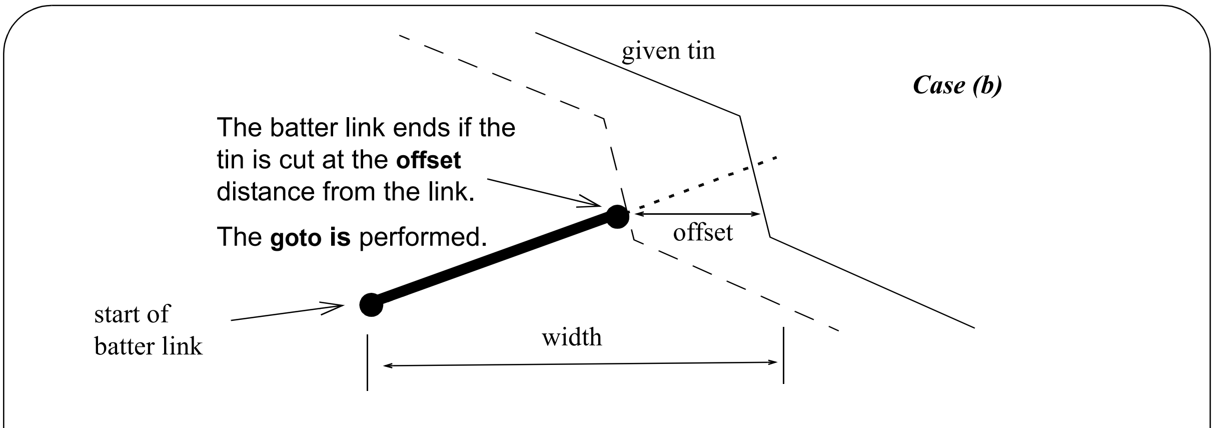
The **test link** is defined by specifying values for two of the three fields width, height and slope.

Notes

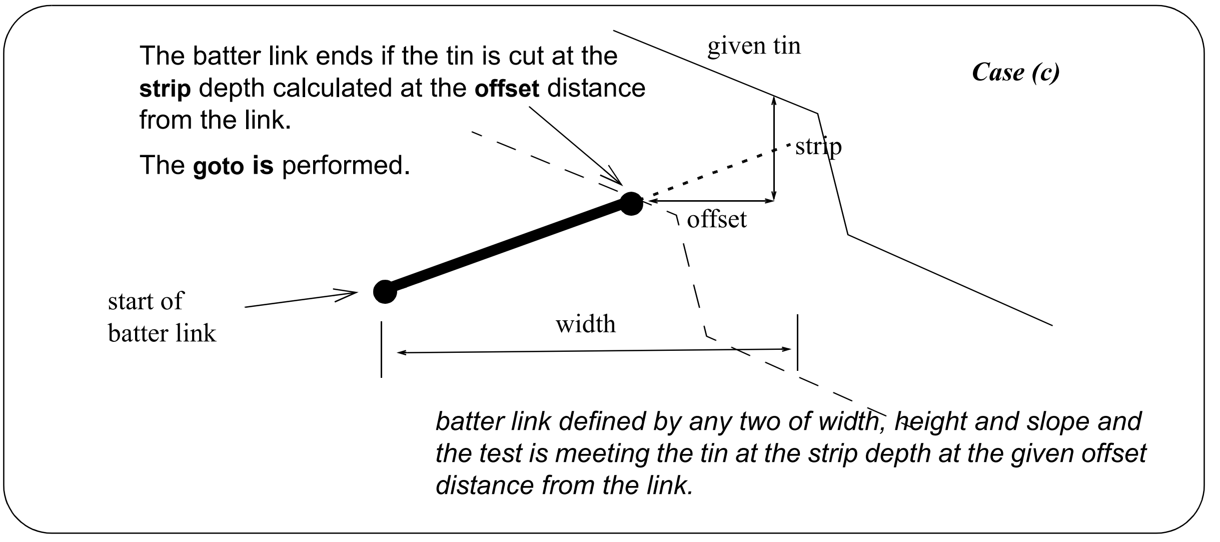
1. no link is created, just the test is performed
2. cases (a) and (b) are just special cases of (c)
3. the batter decision is mainly used to test if a batter will stop without performing the batter.

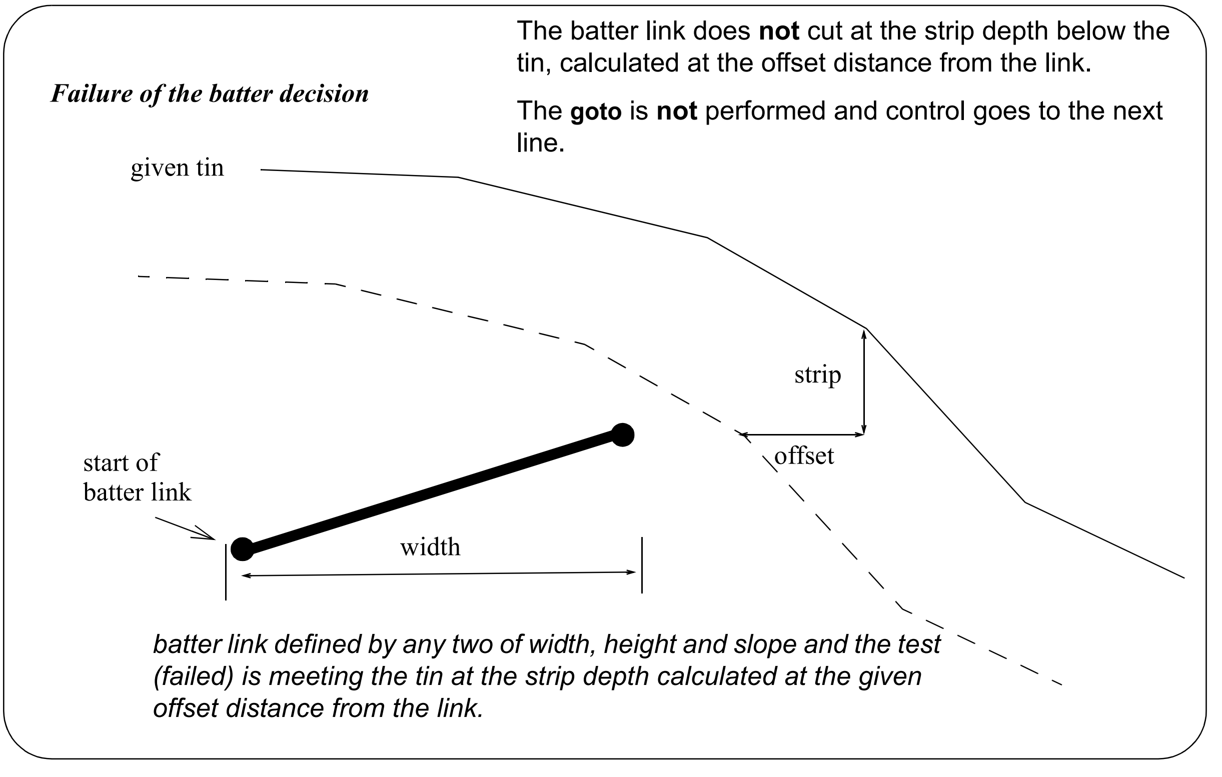


batter link defined by any two of width, height and slope and the test is meeting the tin at the strip depth.



batter link defined by any two of width, height and slope and the test is meeting the tin at the offset distance.





The format of the Batter Decision command in the panel is

Batter Decision *tin_name* Strip *value* Offset *value* Width *value* Height *value* Slope *value* Goto *label* // *comment*

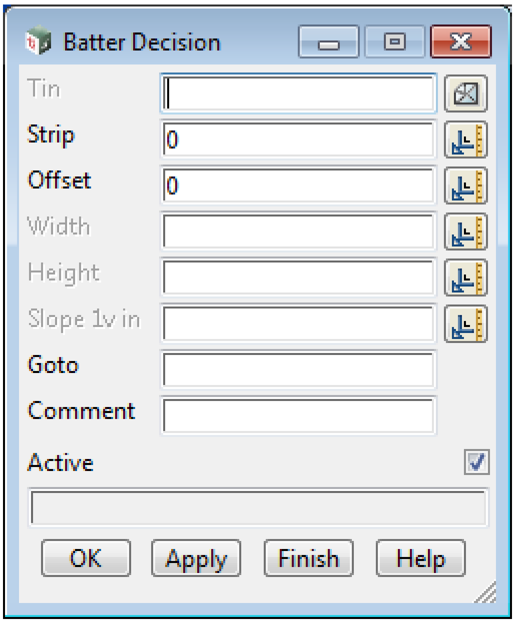
where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

Batter_Decision *tin_name strip_value offset_value width_value height_value slope _value* goto_*label* // *comment*

where one of *width_value*, *height_value* or *slope_value* is the key word *unknown*

The panel brought up when **Batter decision** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	tin box		available tins

tin to test the batter to.

Strip	input	0	

distance below the tin to stop at.

Offset	input	0	

offset distance from the link to check strip depth

Width input

the width for the link.

Height input

the height for the link.

Slope 1v in input

the slope, in 1v in, of the link. Positive is up and negative down.

Goto input

label to goto if the test link comes within the **strip** *depth of the tin at the given* **offset** *distance.*

Comment, **Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.8 Template Decisions - Batter or return to 21.8 Full Definition of Template Decisions.

21.8.8 Template Decisions - Batter

Selecting **Batter** brings up the **Batter** panel which is used to construct a link which stops if it comes within

(a) a **strip** depth of a tin

(b) an offset distance from a tin.

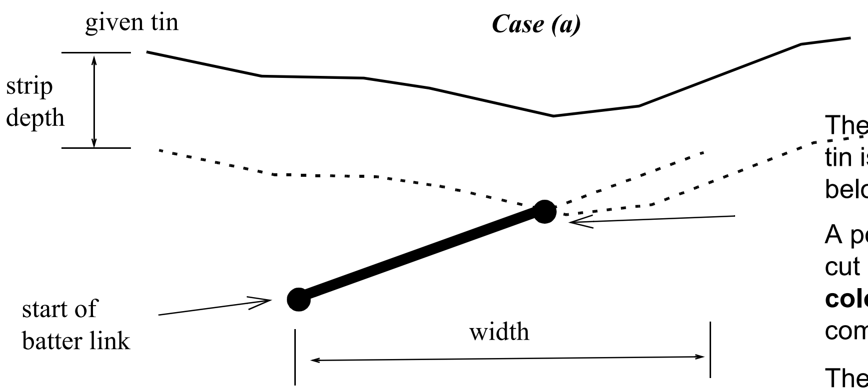
(c) a strip depth of a tin calculated at a given offset from the link.

If the link does stop, control is transferred via a goto, otherwise control continues onto the next line in the table.

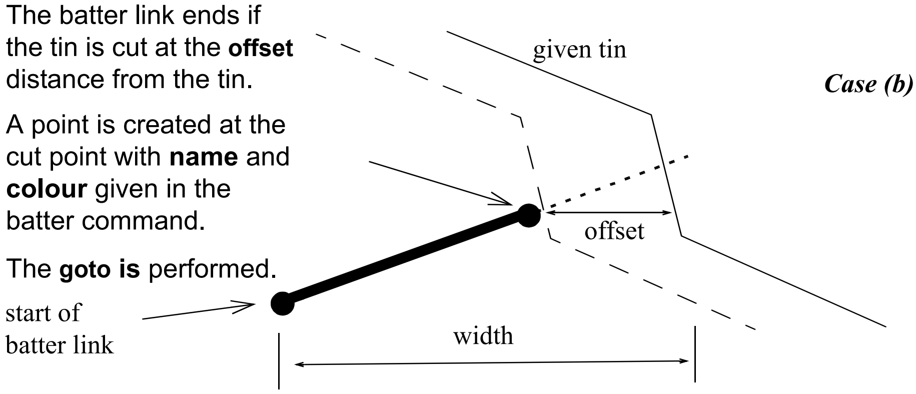
The **batter** link is defined by specifying values for two of the three fields width, height and slope.

Notes

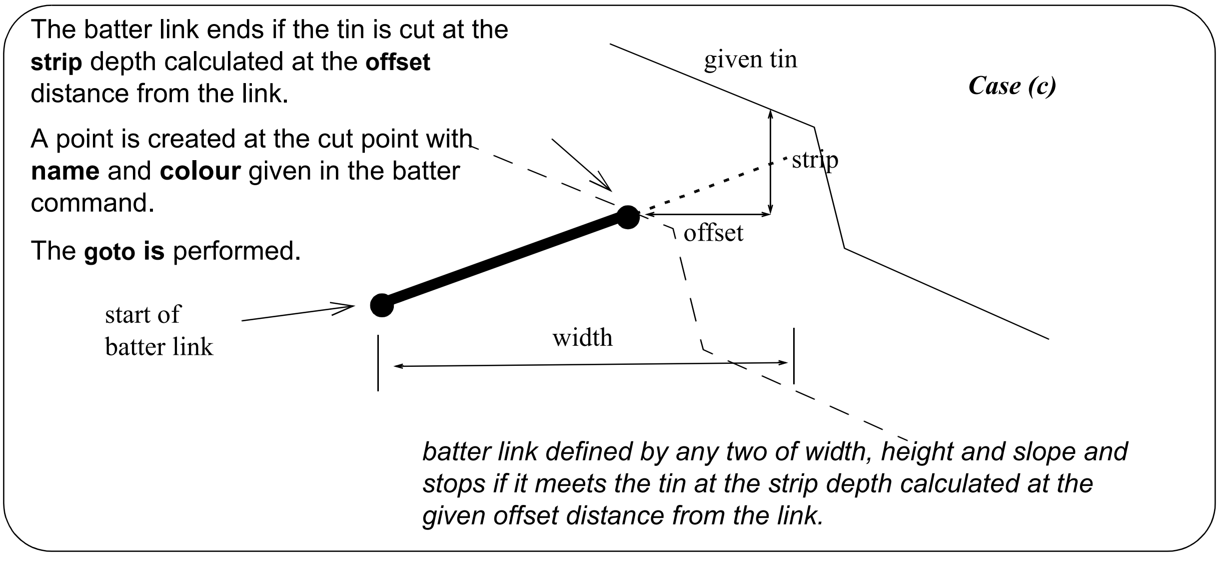
1. cases (a) and (b) are just special cases of (c)
2. strip and offset can be used to stop the link to allow for a fixed structure (such as a drain) to be inserted so that it ends up on the tin.

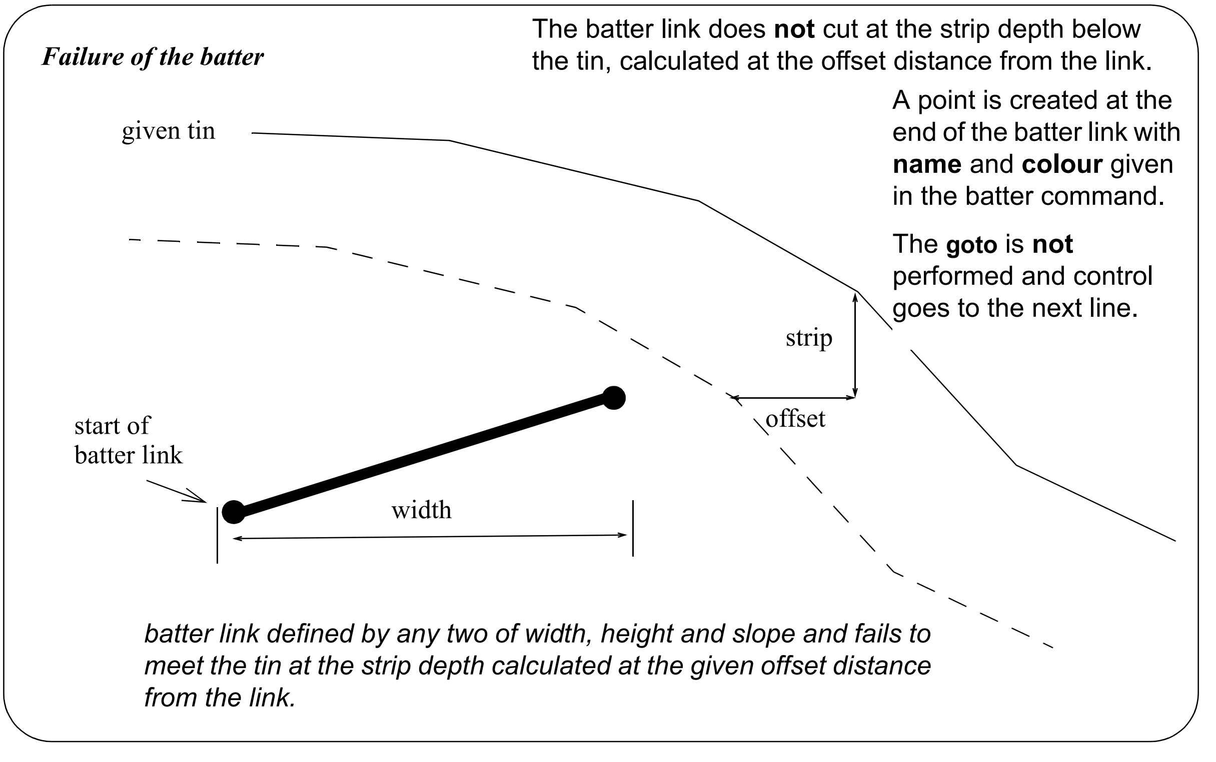


batter link defined by any two of width, height and slope and stops if it meets the tin at the strip depth.



batter link defined by any two of width, height and slope and stops if it meets the tin at the offset distance.





The format of the Batter command in the panel is

Batter *tin_name* Strip *value* Width *value* Height *value* Slope *value* Name *text* Colour *colour* Goto *label* // *comment*

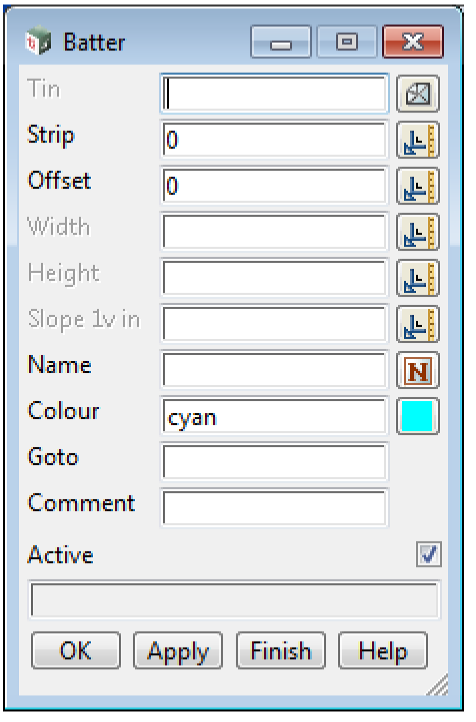
where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

Batter *tin_name strip_value width_value height_value slope_value* name colour goto_*label* // *comment*

where one of *width_value*, *height_value* or *slope_value* is the key word *unknown*

The panel brought up when **Batter** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin	tin box		available tins
tin to batter to.			
Strip	input	0	
distance below the tin to stop at.			
Offset	input	0	
offset distance from the link to check strip depth			
Width	input		
the width for the link.			
Height	input		
the height for the link.			
Slope 1v in	input		
the slope, in 1v in, of the link. Positive is up and negative down.			
Name	input		
the name to be used for the created point and string.			
Colour	colour box	cyan	available colours
the colour to be used for the created string			
Goto	input		
label to goto if the batter link comes within the depth **strip** *of the tin.*			

Comment, **Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.9 Template Decisions - Label or return to 21.8 Full Definition of Template Decisions.

21.8.9 Template Decisions - Label

Selecting **Label** brings up the **Label** panel which is used to define a label for the line for which control can be passed to via a goto.

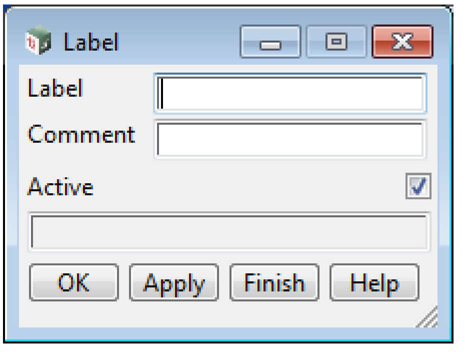
The format of the Label command in the panel is

Label *label_name* *// comment*

The format of the command typed into the template file is

Label *label_name* *// comment*

The panel brought up when **Label** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Label	input		

name of the label for the line in the table.

Comment, **Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.10 Template Decisions - Goto or return to 21.8 Full Definition of Template Decisions.

21.8.10 Template Decisions - Goto

Selecting **Goto** brings up the **Goto** panel which is used to transfer control to the line with the label given in the **goto** field of the panel.

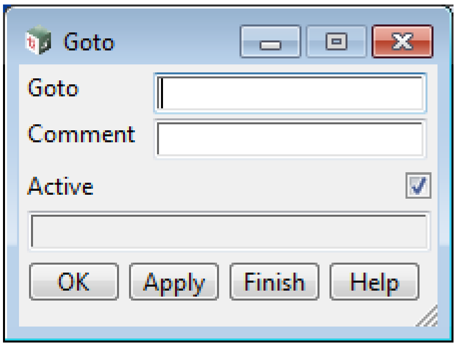
The format of the Goto command in the panel is

Goto *label_name* *// comment*

The format of the command typed into the template file is

Goto *label_name* *// comment*

The panel brought up when **Goto** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Goto	input		

name of the label to transfer control to.

Comment, **Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.11 Template Decisions - Undo or return to 21.8 Full Definition of Template Decisions.

21.8.11 Template Decisions - Undo

Selecting **undo** brings up the **Undo Decision** panel which is used to delete a given number of points (and hence links) from the template being constructed.

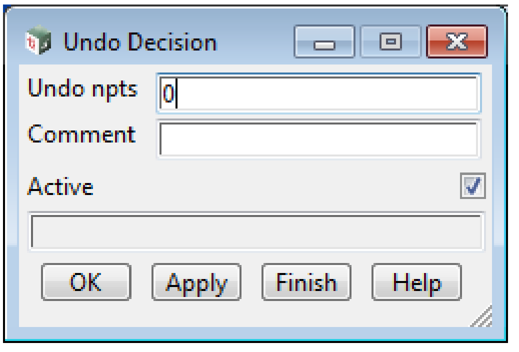
The format of the Label command in the panel is

Undo *number_of_points* *// comment*

The format of the command typed into the template file is

Undo *number_of_links* *// comment*

The panel brought up when **Undo** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Undo npts	input	0	

number of points to delete from the template, if the number is larger than the number of points in the template all points in the template are removed.

Comment, **Active, OK and Apply**

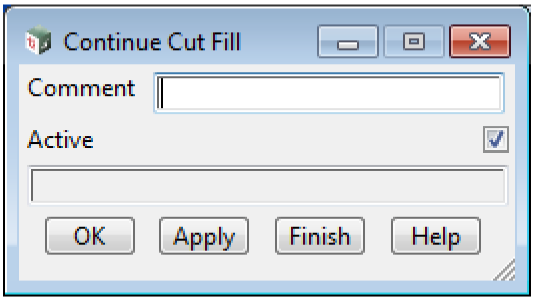
For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.12 Template Decisions - Continue Cut Fill or return to 21.8 Full Definition of Template Decisions.

21.8.12 Template Decisions - Continue Cut Fill

If the ***Continue Cut Fill*** statement is reached when processing the decision commands, the decision section is terminated, and the processing continues to the Cut and Fill tables.

The panel brought up when **Continue Cut Fill** is selected from the **Create Rule** menu is:



Comment, **Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

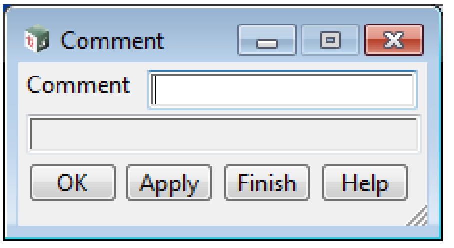
Clicking on ***OK*** or ***Apply*** inserts the ***Continue Cut Fill***, and any *Comment*, into the current line of the *Command* table.

Continue to the next section 21.8.13 Template Decisions - Comment or return to 21.8 Full Definition of Template Decisions.

21.8.13 Template Decisions - Comment

Selecting **Comment** brings up the **Comment** panel and inserts a comment into the line of the table. Comments are ignored by the decisions calculations.

The panel brought up when **Comment** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description Type Default Pop-Up

Comment, **Active, OK and Apply**

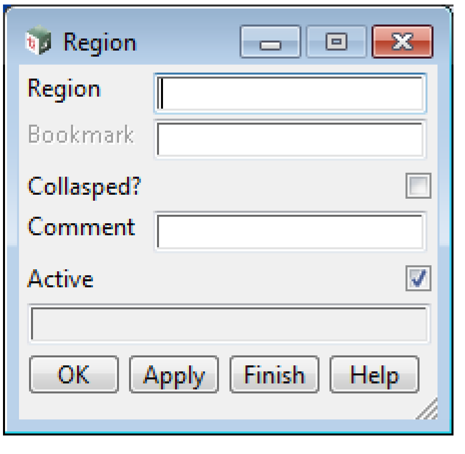
For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.14 Template Decisions - Region or return to 21.8 Full Definition of Template Decisions.

21.8.14 Template Decisions - Region

The **Region** option inserts a **Region command** into the row.

Selecting **Region** brings up the **Decisions Region** panel



There are **Regions**, **Previous Region** and **Next Region** icons at the right hand side of the **Hinge Modifiers** panel. For information on using these icons and information on **Regions** in a grid, see 4.19.6 Grids in Panels.

Continue to the next section 21.8.15 Template Decisions - End or return to 21.8 Full Definition of Template Decisions.

21.8.15 Template Decisions - End

Selecting **End** brings up the **End** panel and inserts an end command into the line of the table. When control reaches an **end** command, the decisions calculations are terminated.

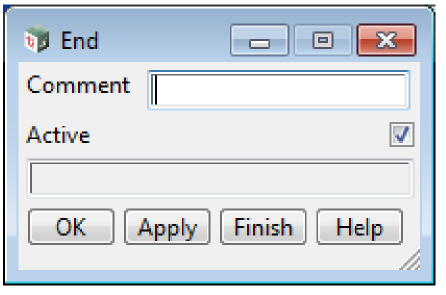
The format of the End command in the panel is

End *// comment*

The format of the command typed into the template file is

End *// comment*

The panel brought up when **End** is selected from the **Create Rule** menu is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up

Comment, **Active, OK and Apply**

For information on these panel fields, see 21.8.16 Common Fields in Template Decisions Panels.

Continue to the next section 21.8.16 Common Fields in Template Decisions Panels or return to 21.8 Full Definition of Template Decisions.

21.8.16 Common Fields in Template Decisions Panels

All the ***Template Decisions*** panels have the common panel fields **Comments** and **Active**, and buttons **OK** and **Apply**.

Comment input

*user comment - for information purposes only. In the file, the comment text will be preceded by **//.***

Active tick box tick

*if **ticked**, use this modifier.*
*If **not ticked**, don't use this modifier.*

OK button

OK *stores command and the values in the fields and removes the panel.*

Apply button

Apply *stores command and the values in the fields and leaves the panel on the screen.*

Continue to the next section 21.8.17 Decisions Examples or return to 21.8 Full Definition of Template Decisions.

21.8.17 Decisions Examples

One Tin Example

```
//From: 12D Solutions
//
//Basic Decisional Template for cut in 9m depth, 5m depth, and less
//Note the Tin Used is "SURVEY"
//
//
template "std" {
  fixed {
    link 5 unknown -3 cyan "eb"
  }
  decisional {
// if at offset 1m it is below "SURVEY" then goto drain
    Tin_Decision      "SURVEY" 1 0 1000 "drain"

    Fixed_Xfall       1 unknown -3 "edge1" cyan
    Batter            "SURVEY" 0 100 unknown -3 "fill" cyan "done"

// label drain
// create a table drain
    Label             "drain"
    Fixed_Slope       1 -0.5 unknown "invert" cyan
    Fixed_Slope       1 0.5 unknown "edge" cyan

// now at end of table drain, check depth of 5, 9
    Tin_Decision      "SURVEY" 0 0 5 "smallestcut"
    Tin_Decision      "SURVEY" 0 0 9 "smallcut"

// deeper than 9m, batter to within 9m of surface
    Batter            "SURVEY" 9 100 unknown 0.75 "cut1" cyan "bench"

// label smallcut -
    Label             "smallcut"
    Batter            "SURVEY" 5 100 unknown 0.75 "small" cyan "bench2"

// label smallestcut -
    Label             "smallestcut"
    Batter            "SURVEY" 0 100 unknown 2 "smallcut" cyan "done"

// label bench
    Label             "bench"
    Fixed_Slope       3 -0.3 unknown "bench1" cyan
    Batter            "SURVEY" 5 100 unknown 1.5 "cut2" cyan "bench2"

// label bench2 -
    Label             "bench2"
    Fixed_Slope       3 -0.3 unknown "bench2" cyan
    Batter            "SURVEY" 0 100 unknown 2 "cut3" cyan "done"

// label done -

    Label             "done"
    End
  }
```

```
  final {
    cut_slope na fill_slope na search_distance 100
  }
}
```

Three Tins Example

```
//From: 4D Solutions
//Date: 11/07/97
//
// Example with three surfaces - rock, shale, terrain
// Assume that rock is below shale is below terrain

template "std" {
  fixed {
    link 3 unknown -3 cyan "kerb"
    link 1 unknown -4 magenta "shoulder"
    link 2 unknown -5 purple "verge"
  }
  decisional {
// test if in rock
    Tin_Decision  "rock" 0 0 1000 "cut_rock"

// not in rock, test if in shale
    Tin_Decision  "shale" 0 0 1000 "cut_shale"

// not in rock or shale, test if below or above terrain
    Tin_Decision  "terrain" 0 0 1000 "cut_terrain"

// fill terrain - loop on creating some benches
    Label    "fill_terrain"

  }
}
```

Return to 21.8 Full Definition of Template Decisions.

21.9 Placing Parts for Super Alignments

Placing a super alignment consists of:

(a) defining the horizontal geometry which ultimately consisting of lines, arcs, transitions and tapers

(b) defining the vertical geometry which ultimately consisting of lines, parabolas and arcs.

A simple way to create horizontal and vertical geometry for the super alignment is by using horizontal intersection points (HIPs) with arcs and transitions (eg spirals), and vertical intersection points (VIPs) with parabolas or arcs for placing the vertical geometry.

However the super alignment also allows for more **complex construction methods** to define the lines, arcs and transitions (the horizontal elements) that within ***12d Model*** are be grouped together to make up the Parts of the horizontal geometry.

For example, a horizontal line can be defined to be a given parallel offset of a selected line segment from another string. Or an arc of a known radius going through a point of another string and having a a leading and a trailing transition.

Similarly **complex construction methods** are available to define the lines, parabolas and arcs (the vertical elements) that are grouped together within***12d Model*** to make up the vertical geometry.

So for a super alignment, the Horizontal Geometry is made up of **horizontal parts**, which may be as simple as a straight line between two points or an arc with a given centre and radius, or a horizontal intersection point with given leading and trailing transitions, or the **horizontal parts** can be very complicated where for example the points of a line are defined by the offset intersection of the two arcs from other strings.

Similarly for a super alignment, the Vertical Geometry is made up of **vertical parts**.

The definition of **parts** that are not fully defined are classified as being

(a) **fixed** if the part is fully defined

(b) **floating** if the part has one degree of freedom. That is, one unknown is still to be determined.

(c) **free** if the part has two degrees of freedom. That is, two unknowns are still to be determined.

When the **parts** definitions have some degree of freedom, the extra restriction that the horizontal parts must be linked **tangentially** is imposed to try and fully defined the horizontal geometry.

If, with tangentiality, ***12d Model*** can fully determine the horizontal geometry then the horizontal geometry is said to **solve**. For more information, see 21.9.1 Fixed, Floating and Free, and Solving.

Once it solves, the horizontal geometry consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called **parts**, and if the horizontal geometry solves, it also contains the resultant **horizontal segments**.

For example, if a ***Free Arc with Known Radius*** (an arc with known radius and leading and trailing transitions of known lengths) is placed between two known lines then the tangentiality condition means that the position of the ***Free Arc with Known Radius*** (arc and two transitions) is uniquely defined as a arc and leading and trailing transitions on the intersection point of the two lines. Or just a fillet between the two lines if the two transitions have zero length.

Similarly the Vertical Geometry is made up of **parts**, which are made up of simple or complicated combinations of straight lines, arcs or a parabolas. Again the extra restriction that the vertical parts must be linked tangentially is often necessary to fully defined the vertical geometry. The vertical geometry is then said to be **solved** and the solved vertical geometry simply consists of linked known segments of types lines, arcs and parabolas, and so can be drawn in a section view.

So the vertical geometry is made up of the constructive definitions called **parts**, and if the vertical geometry solves, it also contains the resultant **vertical segments**.

Important Note

The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the segments of the solved parts are displayed and any unsolved parts are displayed as red crosses.

For the documentation of the options on the **Edit SA** toolbar, see 14.4.11 Edit Super Alignment.

21.9.1 Fixed, Floating and Free, and Solving

The definition of fixed and floating part has to do with how many unknowns, or degrees of freedom, exist for a part.

Fixed parts, as the names suggests, are totally fixed in position, radius etc.

Floating parts have one unknown, or one degree of freedom. Solving for that one unknown will then totally determine the part.

Free parts have two unknowns, or two degree of freedom. Solving for both unknowns then totally determines the part.

The most common examples for the major parts used in the horizontal and vertical geometry are:

Horizontal Geometry

Fixed line - its position in space is totally defined

(a) line given by two points on the line

(b) line given by one point on the line and a bearing

Floating lines - one unknown

(a) line going through one known point. The bearing of the line is unknown

(b) line of a given bearing. A point that the line goes through is needed to fix it.

This unknown as the names suggests, are totally fixed in position, radius etc.

Free lines - a totally unconstrained line

Fixed arc - the arcs position in space and radius is totally defined

(a) arc given by centre and radius

(b) arc defined by three points on the arc

(c) arc defined by centre and two points on the arc

Floating arc - one unknown

(a) arc partially defined by one point on the arc and a radius.

(b) two points on an arc.

This unknown as the names suggests, are totally fixed in position, radius etc.

Free arc - two unknowns

(a) only the radius of the arc is known

(b) only one point on the arc is known

(c) only the arc length is known

Vertical Geometry

Fixed line - its position and shape in (chainage, height) is totally defined

(a) line given by two points on the line

(b) line given by one point on the line and a grade

Floating lines - one unknown

(a) line going through one known point. The grade of the line is unknown

(b) line of a given grade. A point that the line goes through is needed to fix it.

Free lines - a totally unconstrained line

Fixed parabola - the parabolas position in (chainage, height) space is totally defined

(a) parabola given by three points on the parabola

(b) parabola defined by its apex and effective signed radius

Floating parabola - one unknown

(a) one point on the parabola and K value are known

(b) two points on an parabola are known.

Free parabola - two unknowns

(a) only the K value of the arc is known

(b) only one point on the parabola is known

(c) only the length of the parabola is known

Fixed arc - the arcs position in (chainage, height) and radius is totally defined

(a) arc given by centre and radius

(b) arc defined by three points on the arc

(c) arc defined by centre and two points on the arc

Floating arc - one unknown

(a) arc partially defined by one point on the arc and a radius.

(b) two points on an arc.

This unknown as the names suggests, are totally fixed in position, radius etc.

Free arc - two unknowns

(a) only the radius of the arc is known

(b) only one point on the arc is known

(c) only the arc length is known

Solving

The horizontal and vertical geometry of a super alignment is made up of a series of Horizontal and Vertical Parts where the sequencing and types of the Parts, plus the condition that, if possible, each Part is **tangential** to the adjacent elements, allows ***12d Model*** to calculate and solve for all the unknowns in the Part definitions and totally define the super alignment.

The order and the whether adjacent parts are *Fixed*, *Floating* or *Free* is very important as only certain combinations will satisfy the tangentiality conditions and hence solve to give a super alignment.

If, with tangentiality, ***12d Model*** can fully determine the horizontal or vertical geometry then the horizontal or vertical geometry is said to **solve**.

Once it solves, the horizontal geometry consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called **parts**, and if the horizontal geometry solves, it also contains the resultant **horizontal segments**.

Similarly the vertical geometry is made up of the constructive definitions called **parts**, and if the vertical geometry solves, it also contains the resultant **vertical segments**.

The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the solved segments are displayed and any unsolved parts are displayed as red crosses.

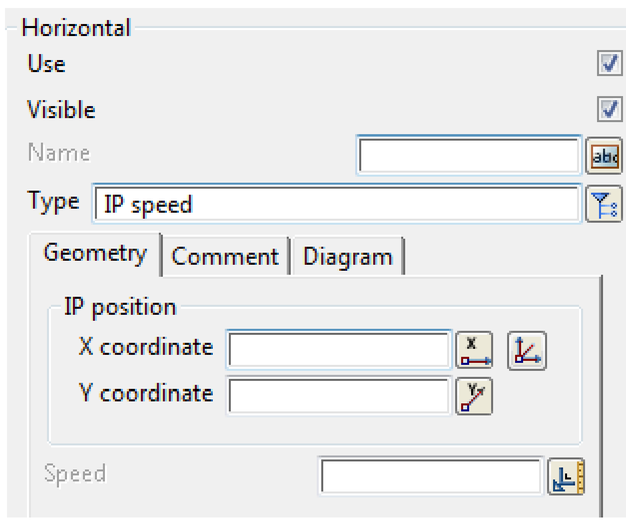
See HIP: Arc Length

21.9.4.1.1 HIP: Speed

A horizontal intersection point (HIP) is created and the sizes of the arc and transition curves for the HIP come from the Design Template of the super alignment.

Same As Button
Use the **Same As** button to select an existing HIP from the screen



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type choice box types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

X coordinate, Y coordinate

the (x,y) coordinates for the HIP can be typed in, or selected using the **X**, **Y** *or* **XY** *icons.*

Speed

if **Speed** *is not bank, then that is the speed used when looking up the Design Template for the HIP*

If **Speed** *is left bank, then the* **Design Speed** *for the super alignment in used when looking up the Design Template.*

Comment tab

the text type into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

Set button

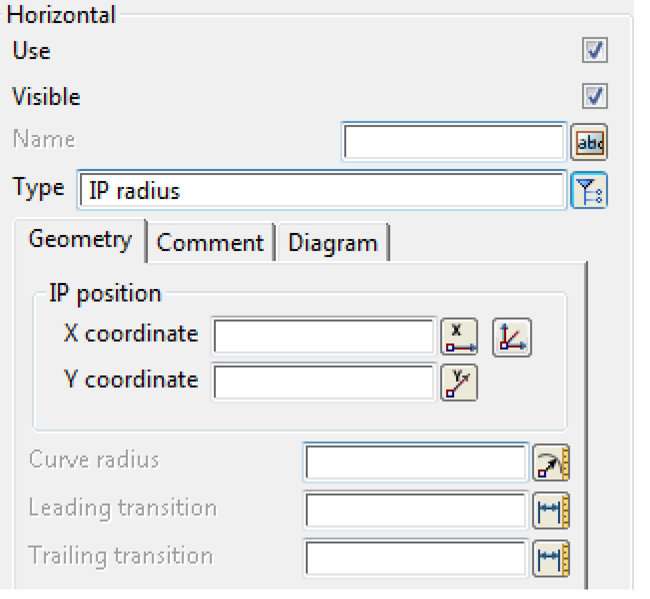
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

HIP: Radius:
A horizontal intersection point (HIP) is created and the sizes of the arc and transition curves for the HIP are given.

Same As Button
Use the **Same As** button to select an existing HIP from the screen



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.

If not ticked, the Part is not used in the horizontal geometry.

Field Description	Type	Defaults	Pop-Up
Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Field Description	Type	Defaults	Pop-Up
Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Field Description	Type	Defaults	Pop-Up
Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

X coordinate, Y coordinate

the (x, y) coordinates for the HIP can be typed in, or selected using the **X**, **Y** *or* **XY** *icons.*

Curve radius

if not blank, the radius used for the arc on the HIP.

If blank then no arc is used on the HIP.

Note: *if the* **Curve radius** *is blank then the* **Leading transition** *and* **Trailing transition** *must also be blank. That is, there is* ***no arc or transitions*** *on the HIP.*

Leading transition

if not blank, then it is the length of the leading transition on the HIP. This can only be non zero if the **Curve radius** *is also non zero*

If blank then there is no leading transition on the HIP.

Leading transition

if not blank, then it is the length of the trailing transition on the HIP. This can only be non zero if the **Curve radius** *is also non zero*

If blank then no trailing transition on the HIP.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

Set button

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

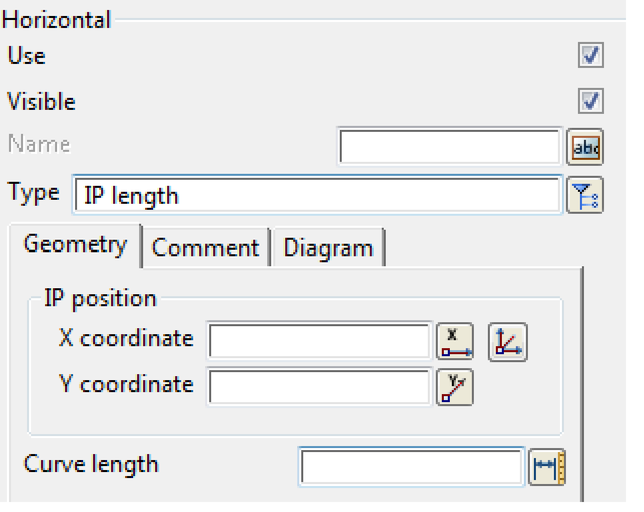
after clicking the **Same As** *button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

HIP: Arc Length

A horizontal intersection point (HIP) is created with an arc of a given arc length.

Same As Button

Use the **Same As** button to select an existing HIP from the screen



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible — tick box — ticked

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name — text box — blank

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type — choice box — Pop-Up: types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

X coordinate, Y coordinate

the (x,y) coordinates for the HIP can be typed in, or selected using the **X**, **Y** *or* **XY** *icons.*

Curve length

the length used for the arc on the HIP. This field can not be left blank.

If zero then no arc is used on the HIP.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

X coordinate, Y coordinate

the (x,y) coordinates for the floating line can be typed in, or selected using the **X**, **Y** *or* **XY** *icons.*

Transition length	measure box		available measures

if non zero, a transition curve of this length is at the end of the Floating Line that **Attach to** *specifies.*
If blank, no transition curve is used

Attach to	choice box		previous part, next part

the Part that the Floating Line is made tangential to. If there is a transition, it is at this end of the Floating line.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

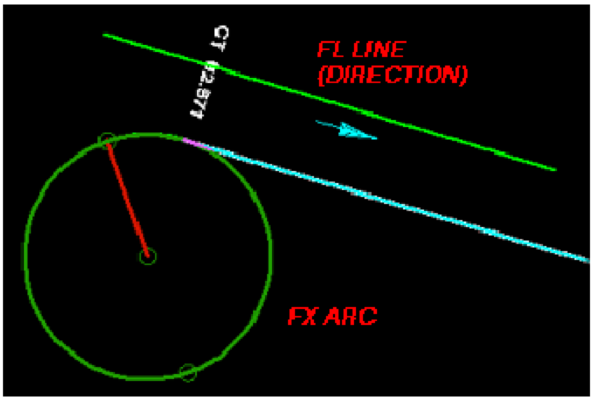
Set button

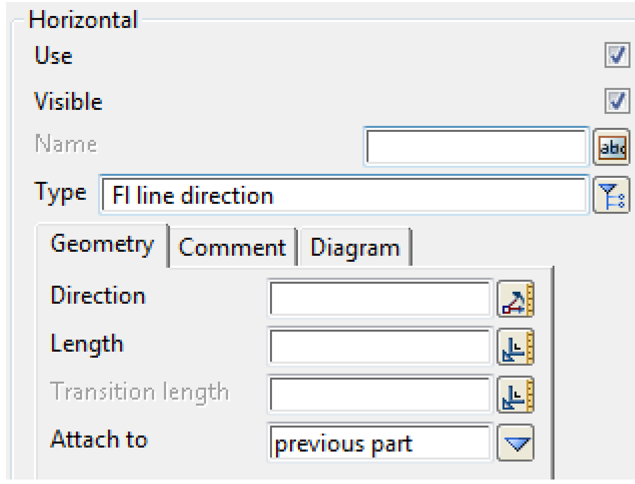
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an point is selected from the screen and its coordinates are piped into the appropriate fields in the panel.*

Floating Line: Known Direction
The *Floating Line* has a **known bearing** and a length.





Example:
Floating line with a direction becomes a tangent to an arc when attached to a previous fixed arc

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab
the geometrical information defining the Part

Direction	measure box		available measures

the direction of the line as a bearing can be typed in using 4.17.1 HP Notation *(dd.mmssss) or selected using the measure box.*

Length	measure box		available measures

length of the Floating Line

Transition length	measure box		available measures

if non zero, a transition curve of this length is at the end of the Floating Line that **Attach to** *specifies.*
If blank, no transition curve is used

Attach to choice box previous part, next part

the Part that the Floating Line is made tangential to. If there is a transition, it is at this end of the Floating line.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

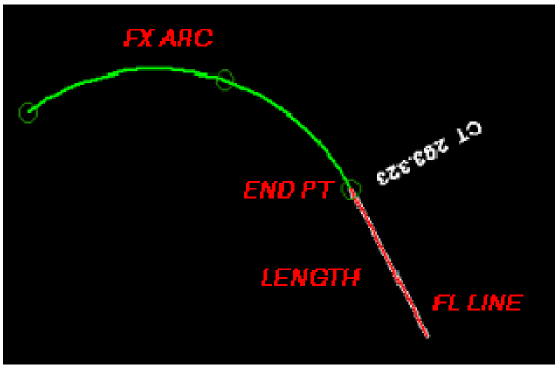
Set button

the **Set** *button must be clicked for the information for this Part to be used.*

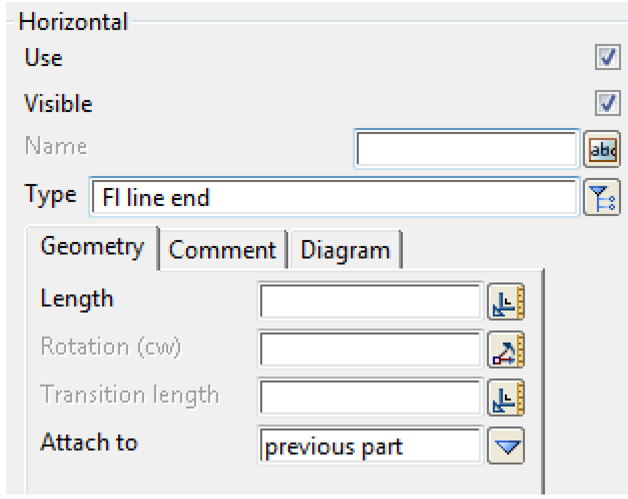
Same As button

after clicking the **Same As** *button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

Floating line: Known End and Nominal Length
The Floating Line has a **known nominal length** and is attached tangentially to the end of previous part or the beginning of the next part.



Example:
Extends from the end of a previous fixed arc for a given length



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Field Description	Type	Defaults	Pop-Up
Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Field Description	Type	Defaults	Pop-Up
Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Field Description	Type	Defaults	Pop-Up
Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Field Description	Type	Defaults	Pop-Up
Length	measure box		available measures

the nominal length of the Floating Line

Field Description	Type	Defaults	Pop-Up
Rotation (cw)	measure box		available measures

if non zero then the bearing of the line is decreased by Rotation degrees (and is no longer tangential). The transition, if it exists, is still tangential to the **Attach to** *part. See diagram at the end of this panel description.*

Field Description	Type	Defaults	Pop-Up
Transition length	measure box		available measures

if non zero, a transition curve of this length is at the end of the Part that **Attach to** *specifies. So if the Floating Line is* **Attach to** *the Previous Part, then the Previous Part comes first, then the transition and then the line. If the Floating Line is* **Attach to** *the Next Part, then the line comes first and then the transition, and the Next Part.*

If blank, no transition curve is used

Attach to	choice box	previous part, next part

the Part that the Floating Line is attached to, and made tangential to. If there is a transition, it is at this end of the Floating line.

Comment tab

the text typed into the text box is stored as a comment for the Part.

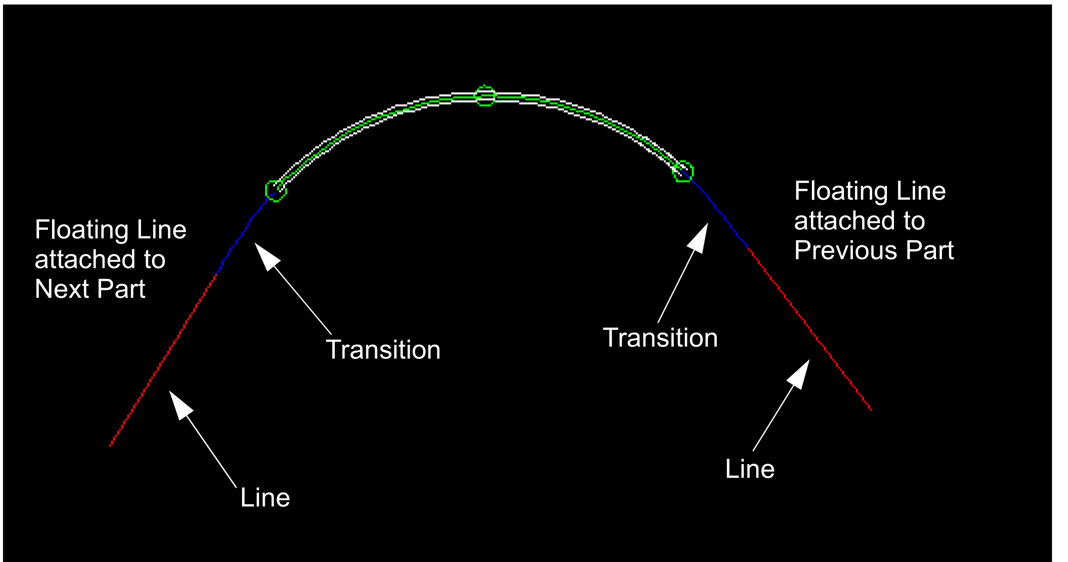
Note: *If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.*

Set	button

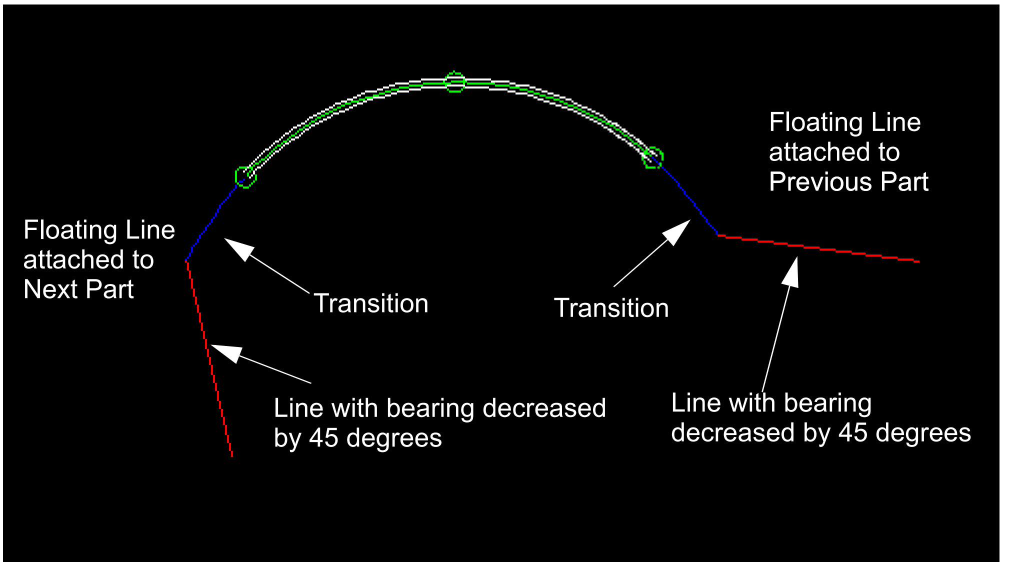
the **Set** *button must be clicked for the information for this Part to be used.*

Same As	button

not used for this Part



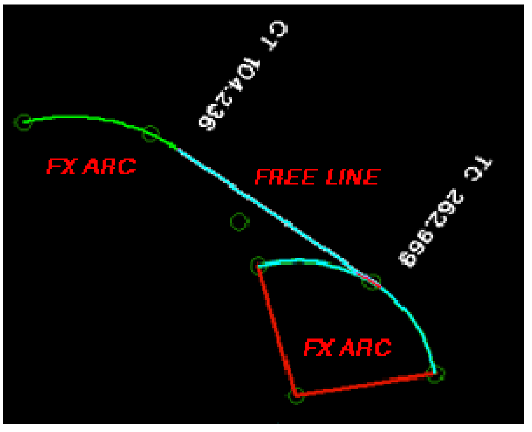
Two Examples of *Floating Lines* with Rotation = 0

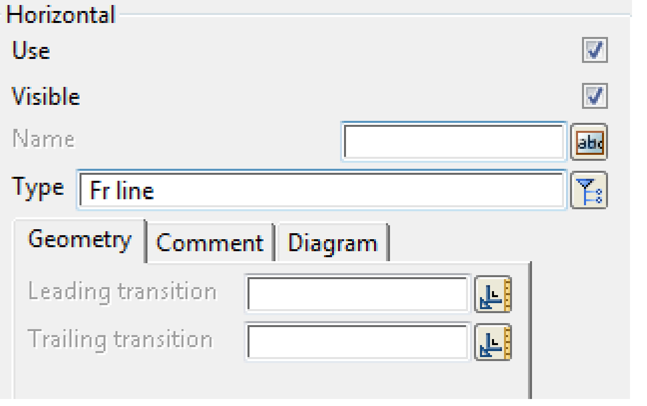


Two Examples of *Floating Lines* with Rotation = 45 degrees

Free Line: No Constraints

The **Free Line** is not constrained. It is determined by having to be tangential to the Parts at either end of the Line.





Example:
Free line is a tangent from a previous fixed arc to the following fixed arc.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Leading transition	measure box		available measures

if non zero, a transition curve of this length is at the beginning of the Free Line.
If blank or 0, no leading transition curve is used.

Trailing transition	measure box		available measures

if non zero, a transition curve of this length is at the end of the Free Line.
If blank or 0, no trailing transition curve is used.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* **#** *is placed after the type of the part in the Horizontal Parts list.*

Set button

the **Set** *button must be clicked for the information for this Part to be used.*

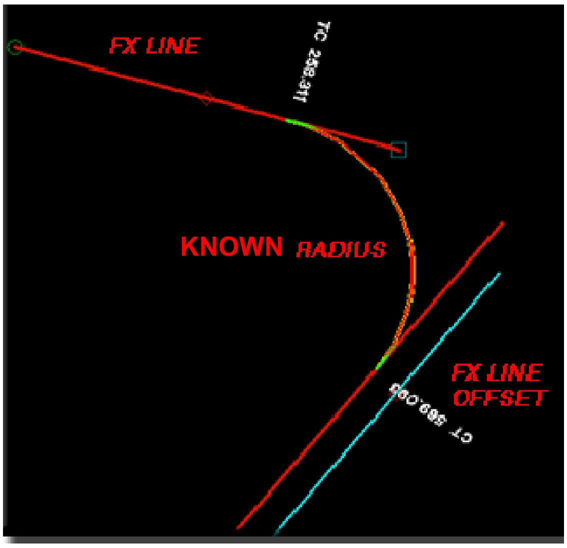
It may not always be possible for the *Free Arc* to actually solve.

For example in the case where the Free Arc is between two fixed lines and the two lines are on top of each other.



Example:
The Free Arc become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

X coordinate, Y coordinate

the (x,y) coordinates of a point on the arc can be typed in, or selected using the **X**, **Y** *or* **XY** *icons.*

Alternative solution	tick box	not ticked	

there can be two solutions. One solution is shown first.

If ticked, the other solution is shown.

Comment tab

the text typed into the text box is stored as a comment for the Part.

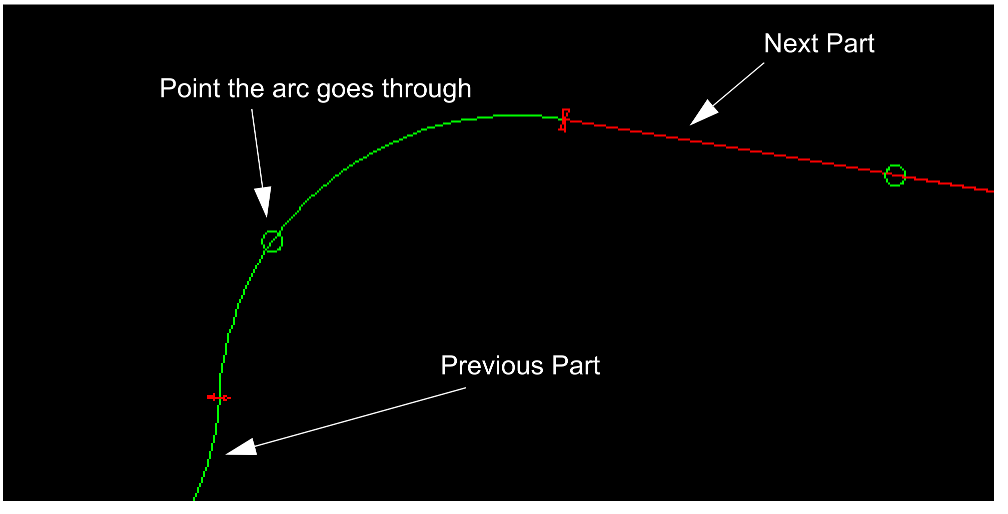
Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

Set button

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

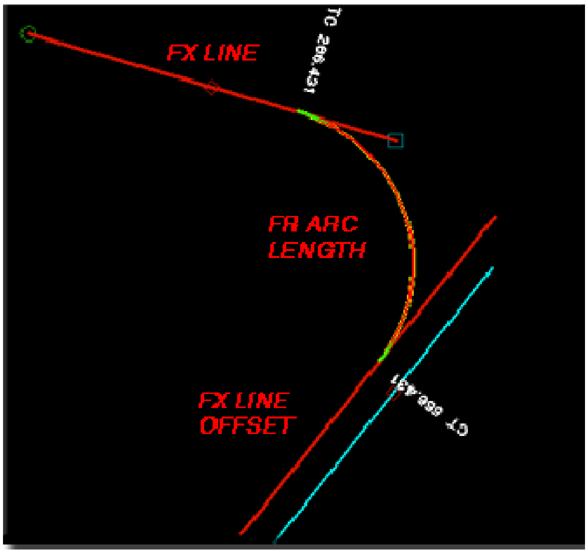
after clicking the **Same As** *button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.*

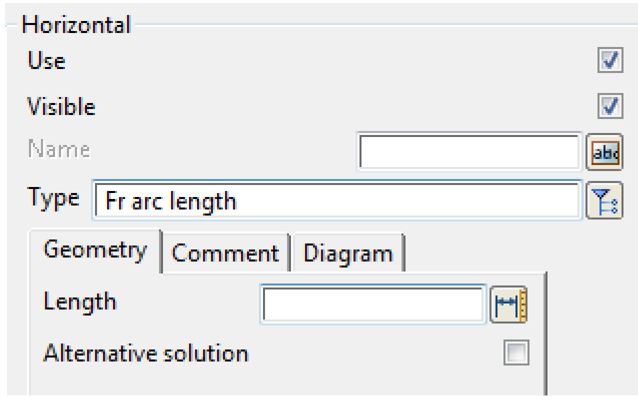


Free Arc: Arc has a Known Length
The *Free Arc* has a **known length**.

It may not always be possible for the *Free Arc* to actually solve.

For example in the case where the Free Arc is between two fixed lines and the two lines are on top of each other.





Example:
The Free Arc become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Length	length box		Measure Length

the length of the arc. This can be typed in or selected using the Measure Length pop-up.

Alternative solution tick box not ticked

there can be two solutions. One solution is shown first.

If ticked, the other solution is shown.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

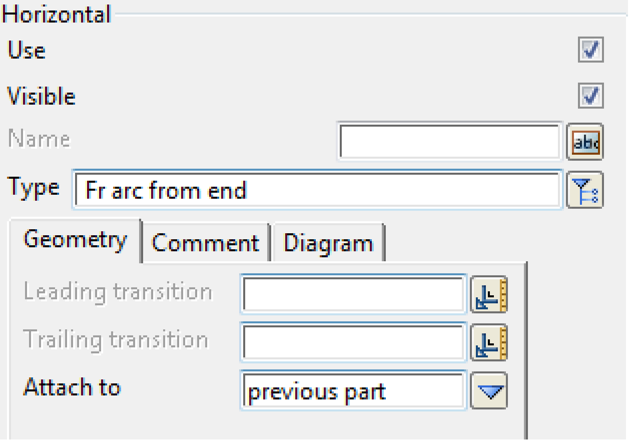
Set button

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.*

Free Arc: Arc has a Known End Point
The *Floating Arc* is attached to a **known end point** of a Previous or Next **Part**.



Example:
The Free Arc become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Leading transition	measure box		available measures

if non zero, a leading transition curve of this length is at the start of the Free Arc.
If blank or zero, no leading transition curve is used

Trailing transition	measure box		available measures

if non zero, a trailing transition curve of this length is at the end of the Free Arc.
If blank or zero, no trailing transition curve is used.

Attach to choice box previous part, next part

the Part that the Free Arc is attached to.

Comment tab

the text typed into the text box is stored as a comment for the Part.

***Note:** If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.*

Set button

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.*

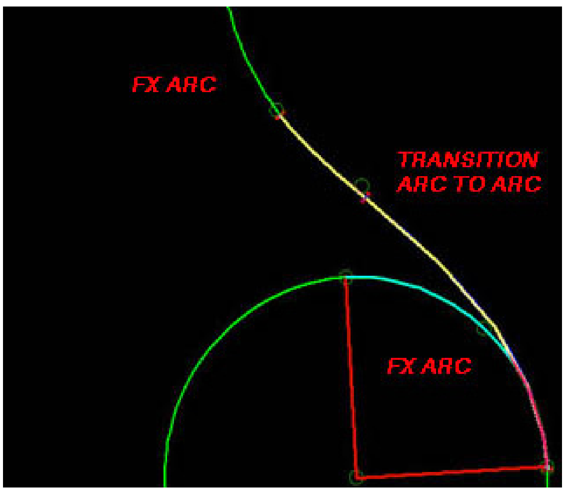
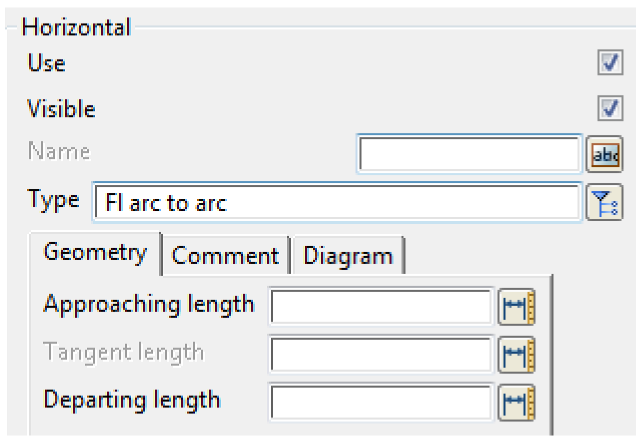
Floating Transition: From Arc to Arc

The *Floating Transition* consists of one or two **transition curves** going **between two arcs**.





Example:
The Floating Transition become fully defined when it is placed between two arcs

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Field Description	Type	Defaults	Pop-Up
Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name text box blank

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type choice box types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Approaching length measure box Measure Length

the length of the leading transition curve at the start of the Floating Transition.This must be non zero.
This will be tangential to the Previous Part.

Tangent length length box Measure Length

if non zero, a straight of this length is placed between the two transition curves.
This will be tangential to the Previous Part.

Departing length measure box Measure Length

the length of the trailing transition curve at the end of the Floating Transition.This must be non zero.
This will be tangential to the Next Part.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* **#** *is placed after the type of the part in the Horizontal Parts list.*

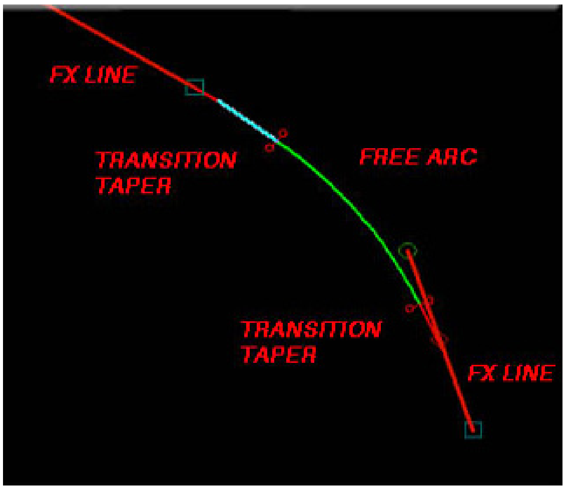
Set button

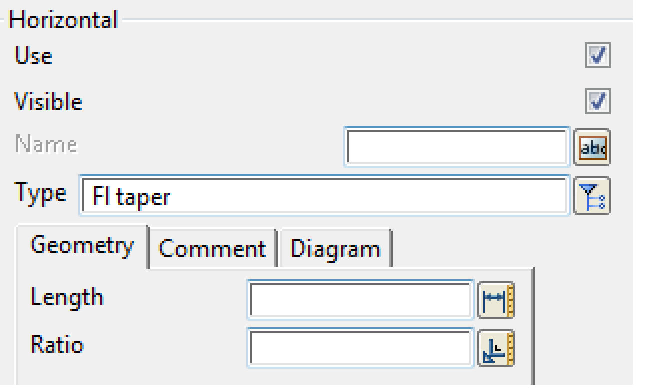
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

Floating Transition: Taper

The *Floating Transition* consists of.





Example:
The Floating Taper become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Length	length box		Point to point, String to point
Ratio	measure box		available measures

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

Set button

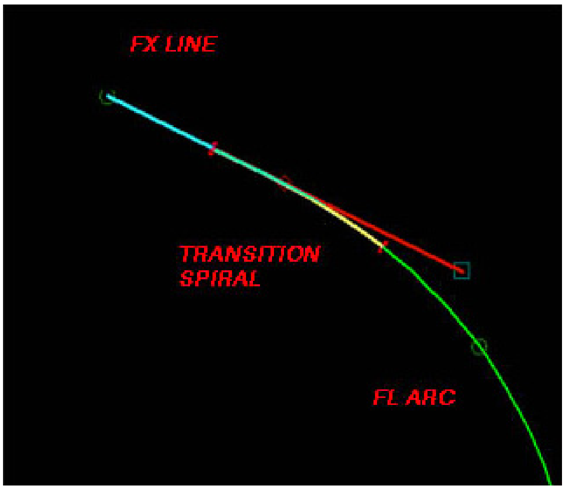
the **Set** *button must be clicked for the information for this Part to be used.*

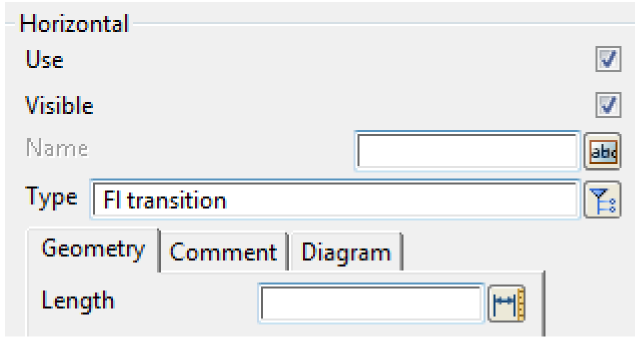
Same As button

after clicking the **Same As** *button, an existing HIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

Floating Transition: Known Length

The *Floating Transition* consists of a **transition curve** of **known length**.





Example:
The Floating Transition become fully defined when it is placed between a fixed line and a floating arc

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Field Description	Type	Defaults	Pop-Up
Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Field Description	Type	Defaults	Pop-Up
Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Field Description	Type	Defaults	Pop-Up
Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Field Description	Type	Defaults	Pop-Up
Length	length box		Measure Length

the length of the transition. This must be non zero.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

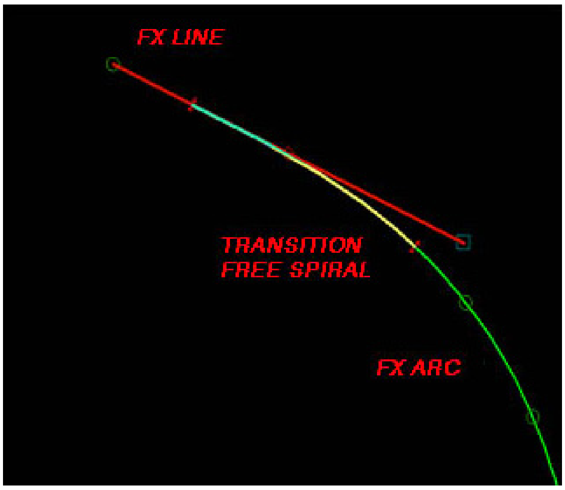
Field Description	Type	Defaults	Pop-Up
Set	button		

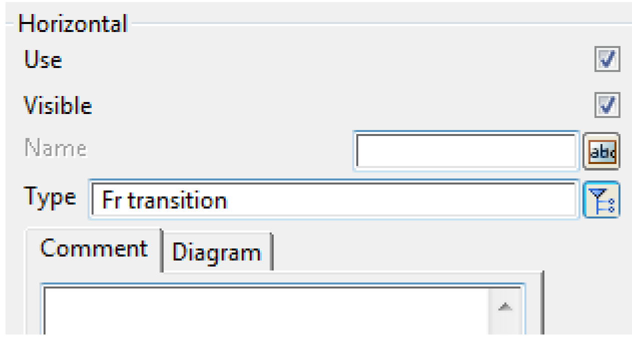
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

Free Transition: Unconstrained

The *Free Transition* is unconstrained.





Example:
The Free Transition become fully defined when it is placed between a fixed line and a fixed arc

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Comment tab

the text typed into the text box is stored as a comment for the Part.

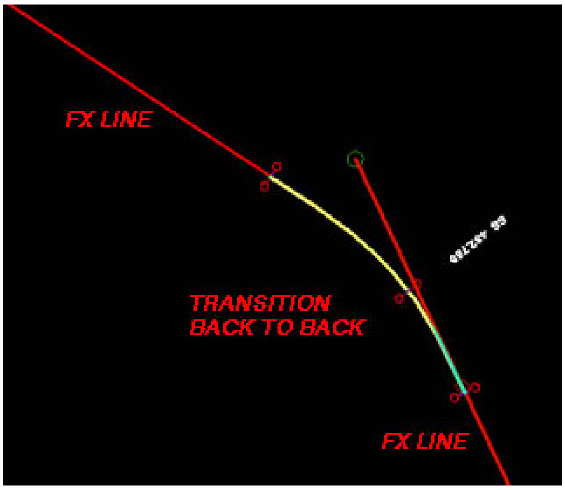
Note: *If a comment exists, a* **#** *is placed after the type of the part in the Horizontal Parts list.*

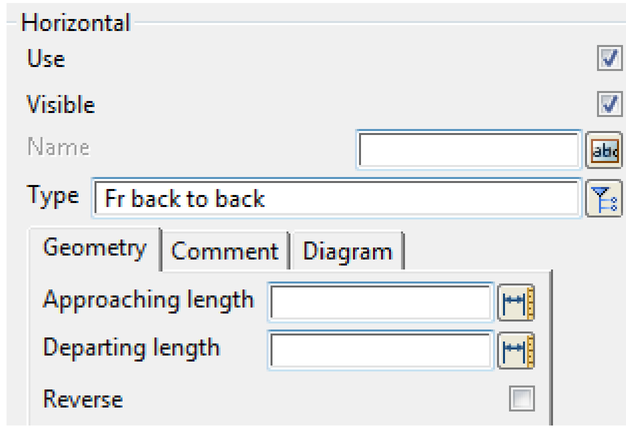
Set	button		

the **Set** *button must be clicked for the information for this Part to be used.*

Same As	button		

Free Transition: Back to Back Transitions of Known Lengths Between Lines
The *Free Transition* consists of a **two back to back transitions** of **known lengths between two lines.** The transitions can be the same hand or reversed.





Example:
The Free Transition become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Field Description	Type	Defaults	Pop-Up
Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Field Description	Type	Defaults	Pop-Up
Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Field Description	Type	Defaults	Pop-Up
Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab
the geometrical information defining the Part

Field Description	Type	Defaults	Pop-Up
Approaching length	measure box		Measure Length

the length of the leading transition curve at the start of the Floating Transition. This must be non zero. This will be tangential to the Previous Part.

Field Description	Type	Defaults	Pop-Up
Departing length	measure box		Measure Length

the length of the trailing transition curve at the end of the Floating Transition. This must be non zero. This will be tangential to the Next Part.

Reverse tick box not ticked

if ticked, transitions of opposite hands are used

Comment tab

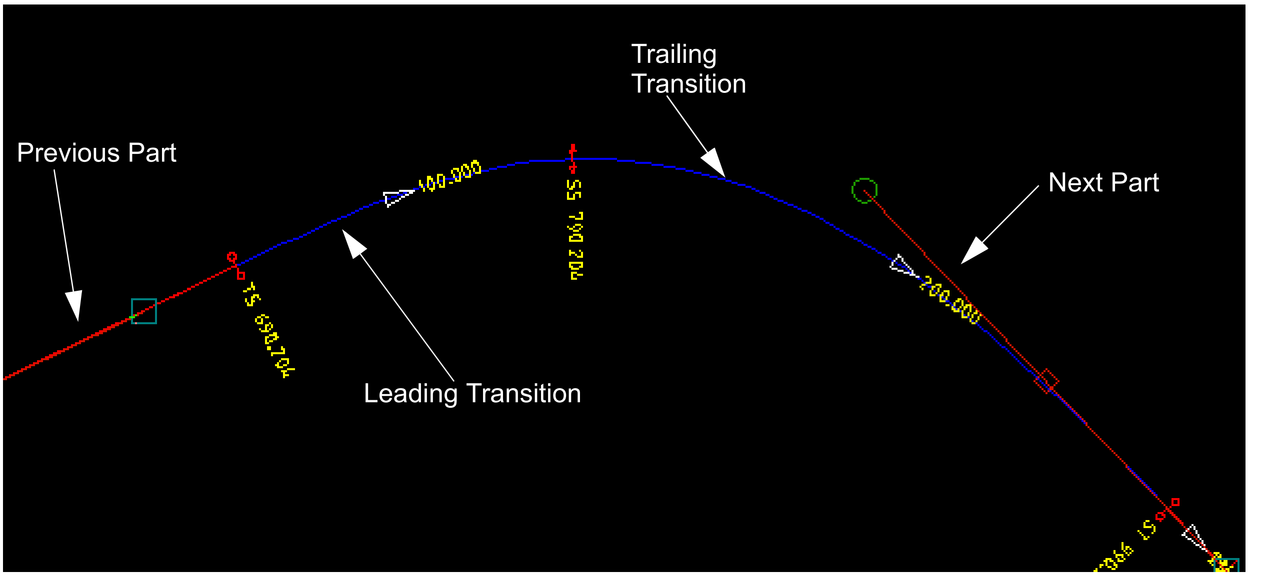
the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

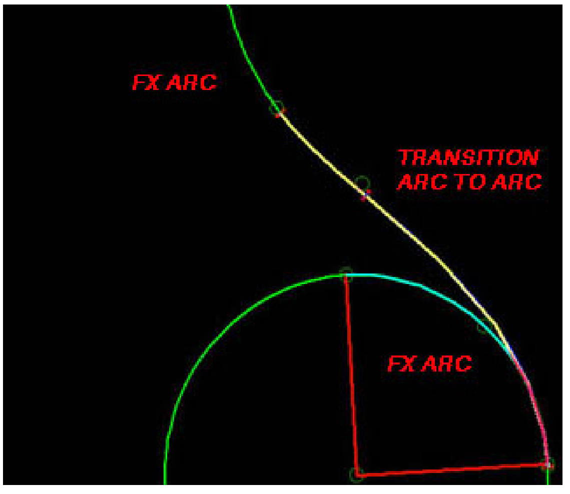
Set button

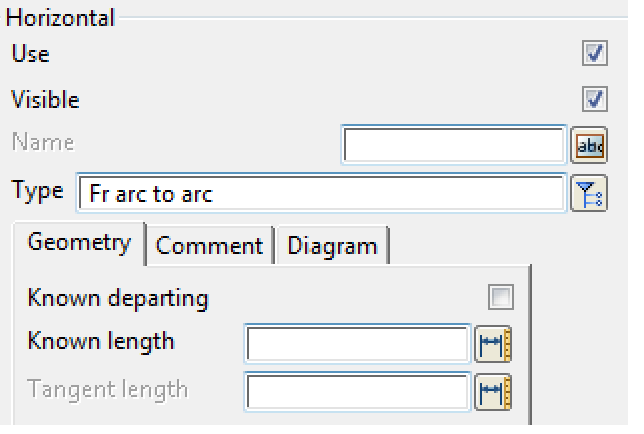
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button



Free Transition: Back to Back Transitions Between Two Arcs
The *Free Transition* consists of a **two back to back transitions** between two **arcs**. The **length** of **one transition** is needed. The transitions can be the same hand or reversed.





Example:
The Free Transition become fully defined when it is placed between two fixed arcs.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Known departing	tick box	not ticked	

if ticked,

If not ticked,

Known length	length box		Point to point, String to point

Tangent length length box Point to point, String to point

Comment tab

the text typed into the text box is stored as a comment for the Part.

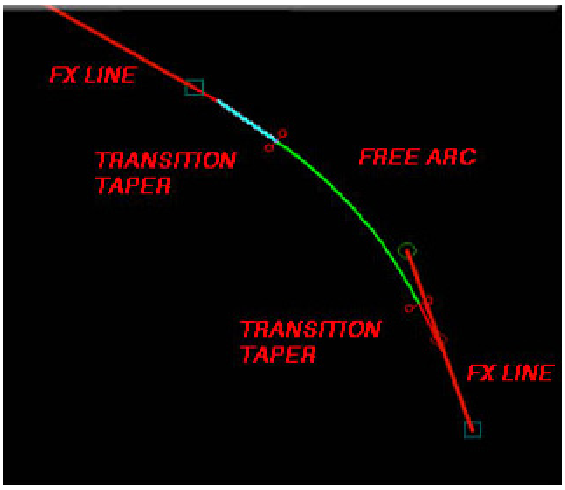
Note: *If a comment exists, a* # *is placed after the type of the part in the Horizontal Parts list.*

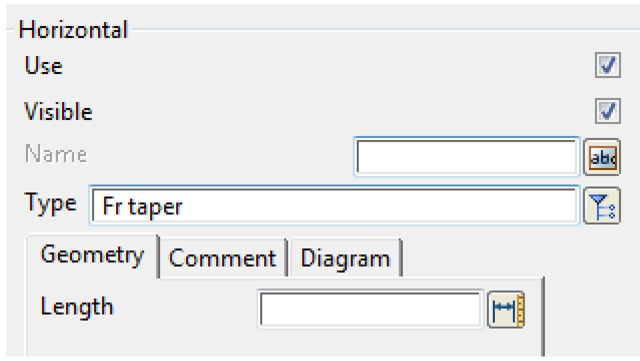
Set button

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

Free Taper: Taper of Known Length
The *Free Transition* consists of a **taper** of **known length**.





Example

The Free Transition Taper becomes fully defined when it is place

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the horizontal geometry.
If not ticked, the Part is not used in the horizontal geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the horizontal geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Type	choice box		types of horizontal parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

21.9.5 Definitions of Super Alignment Vertical Parts

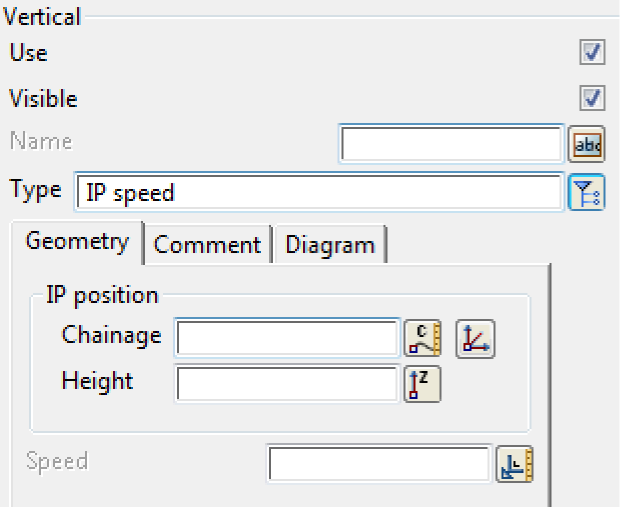
See 21.9.5.1 Vertical IPs
See 21.9.4.2 Horizontal Lines

21.9.5.1 Vertical IPs

See VIP: Speed
See VIP: K-value
See VIP: Radius
See VIP: Length:
See VIP: Asymmetric

VIP: Speed

A vertical intersection point (VIP) is created and the sizes of the parabolas for the VIP come from the Design Template of the super alignment.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.
If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type choice box types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Chainage, Height

the (chainage,height) coordinates for the VIP can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

Speed

if **Speed** *is not blank, then that is the speed used when looking up the Design Template for the VIP*

If **Speed** *is left blank, then the* **Design Speed** *for the super alignment in used when looking up the Design Template.*

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* **#** *is placed after the type of the part in the Vertical Parts list.*

Set button

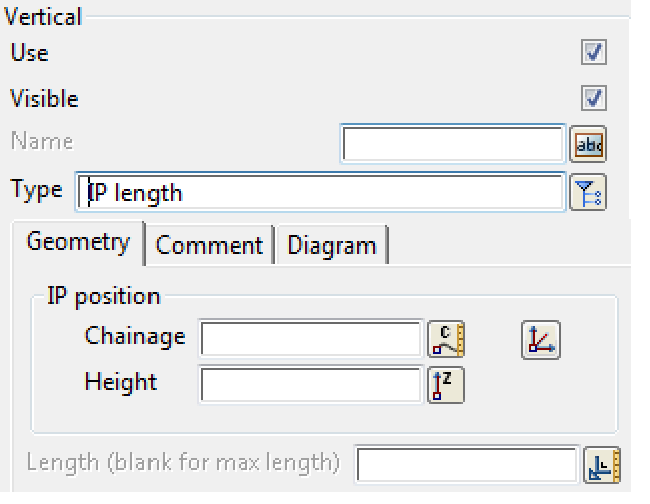
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: Length:

A vertical intersection point (VIP) is created and either length of the parabola on the VIP is given, or the maximum allowable parabola is used.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.
If not ticked, the Part is not used in the vertical geometry.

Field Description	Type	Defaults	Pop-Up
Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.
If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Field Description	Type	Defaults	Pop-Up
Name	text box	blank	

if not blank, then the Part is given this name.
If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Horizontal Parts list.*

Field Description	Type	Defaults	Pop-Up
Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Chainage, Height

the (chainage,height) coordinates for the VIP can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

Length (blank for max length)

the length used for the parabola on the VIP. This field can not be left blank.

If zero then a parabola of maximum length is used on the VIP.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* **#** *is placed after the type of the part in the Vertical Parts list.*

Set button

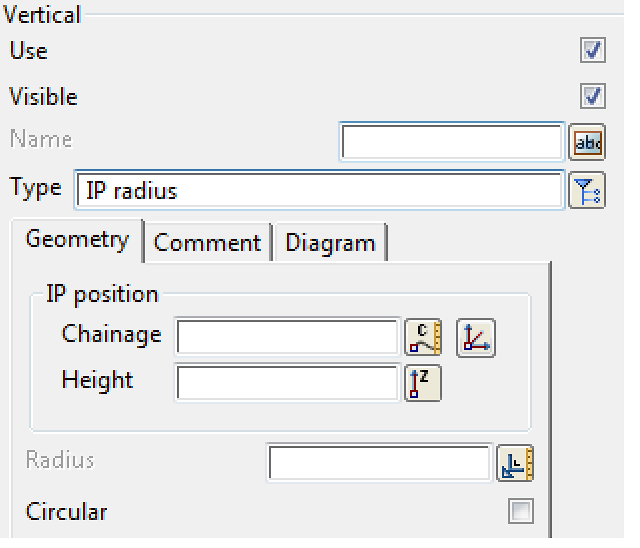
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: Radius

A vertical intersection point (VIP) is created and the effective radius for the parabola on the VIP is given.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Chainage, Height

the (chainage,height) coordinates for the VIP can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

Radius

if not blank or non zero, the radius entered is used for the parabola/arc on the VIP.

If blank or zero then no parabola/arc is used on the VIP.

Circular	tick box	not ticked	

if ticked, then the curve on the VIP is an arc

If not ticked, then the curve on the VIP is a parabola.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Vertical Parts list.*

Set button

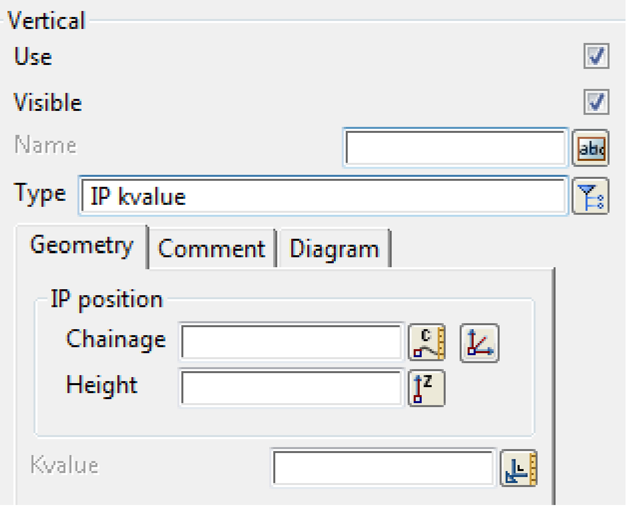
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: K-value

A vertical intersection point (VIP) is created and the K value for the parabola on the VIP is given.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Chainage, Height

the (chainage,height) coordinates for the VIP can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

K-value	measure box		available measures

the K value to use for the parabola on the VIP

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* **#** *is placed after the type of the part in the Vertical Parts list.*

Set button

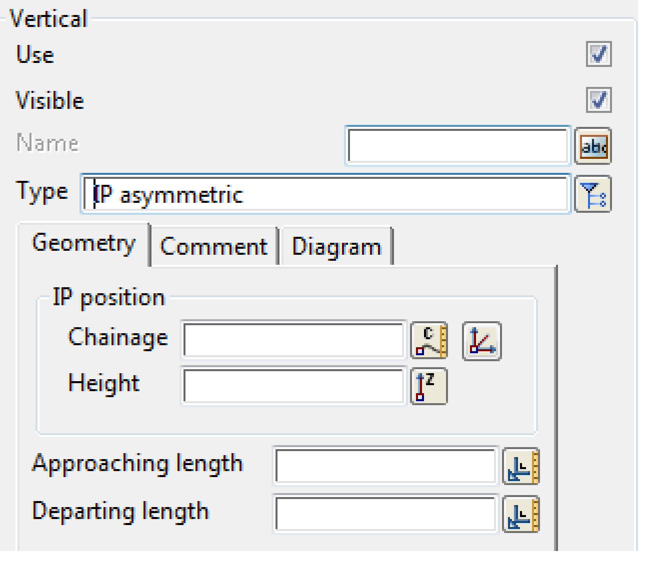
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

after clicking the **Same As** *button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: Asymmetric

A vertical intersection point (VIP) is created with an asymmetric parabola on the VIP. The two parabolic lengths are given for the asymmetric parabola.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Chainage, Height

the (chainage,height) coordinates for the VIP can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

Approaching length	measure box		available measures

the parabolic length of the first parabola of the asymmetric parabola. This parabola is tangential to the Previous Part.

Departing length	measure box		available measures

the parabolic length of the second parabola of the asymmetric parabola. This parabola is tangential to *the Next Part.*

Comment tab

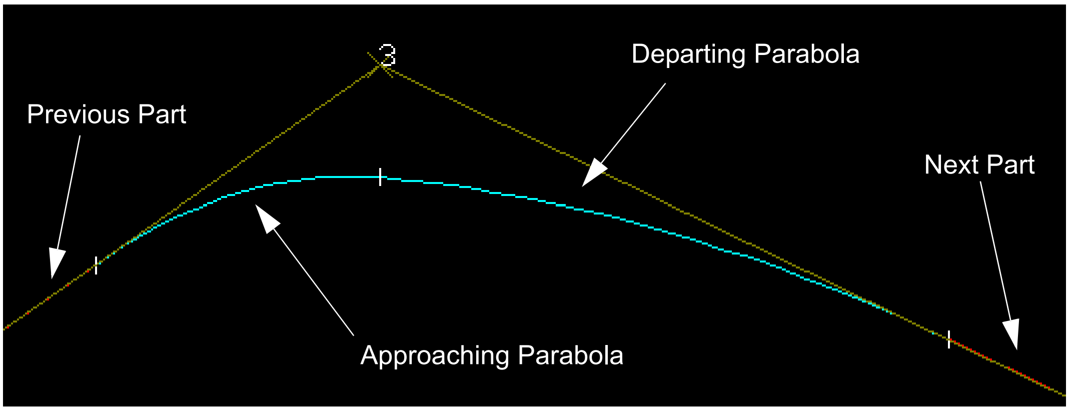
the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Vertical Parts list.*

Set button

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

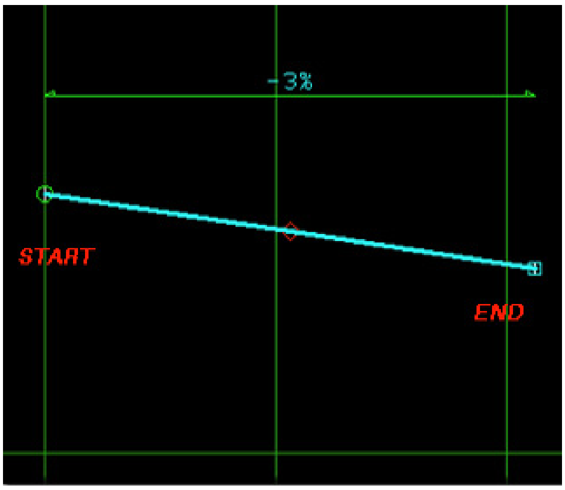


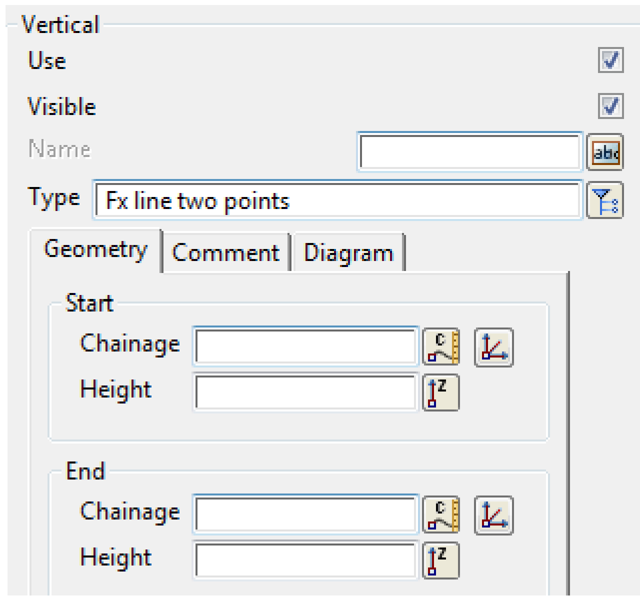
21.9.5.2 Vertical Lines

See Fixed Line: Two Points
See Fixed Line: Known Point and Grade
See Floating Line: Known Point
See Floating Line: Known Grade
See Floating Line: Known End and Nominal Length
See Free line - No Constraints

Fixed Line: Two Points

A *Fixed Line* is created by specifying two known points as the start and end points of the line.





The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Field Description	Type	Defaults	Pop-Up
Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Field Description	Type	Defaults	Pop-Up
Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Field Description	Type	Defaults	Pop-Up
Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Start Chainage, Height

the coordinates in (chainage,height) of the start of the line can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

End Chainage, Height

the coordinates in (chainage,height) of the end of the line can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Vertical Parts list.*

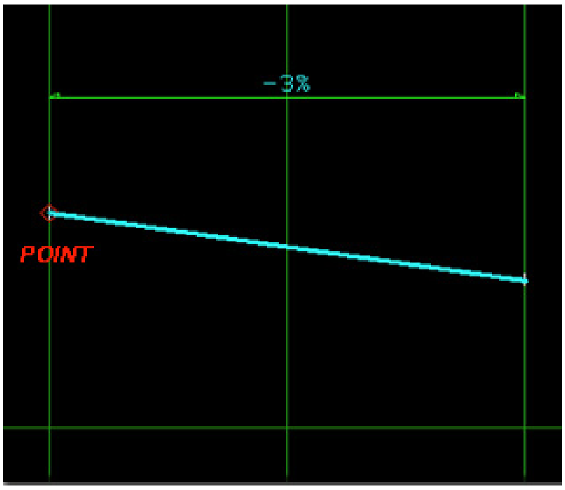
Set button

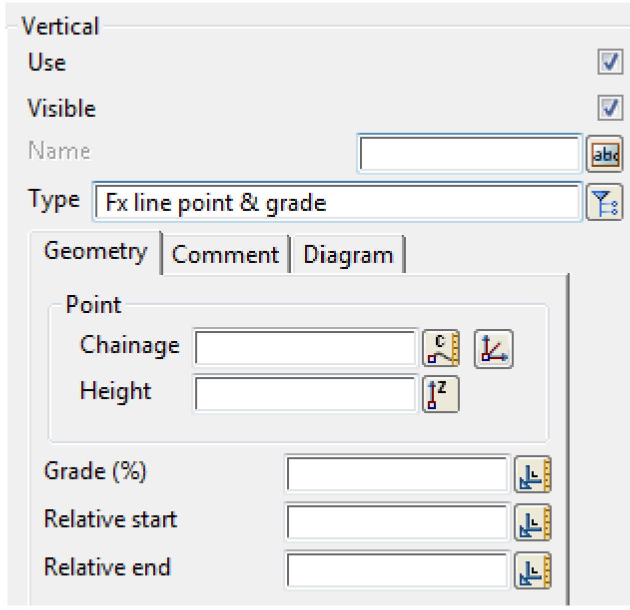
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

Fixed Line: Known Point and Grade

A *Fixed Line* is created by specifying a known point and a grade for the line.





The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Point Chainage, Height

the coordinates in (chainage,height) of the point that the line goes through can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

Grade (%)	measure box		available measures

the grade (in percent) of the line through the point

Relative start measure box available measures

the chainage distance, relative to the given point, to start the line at. A negative value is to the left of the point, and a positive value is to the right of the point.

Relative end measure box available measures

the chainage distance, relative to the given point, to end the line at. A negative value is to the left of the point, and a positive value is to the right of the point.

Comment tab

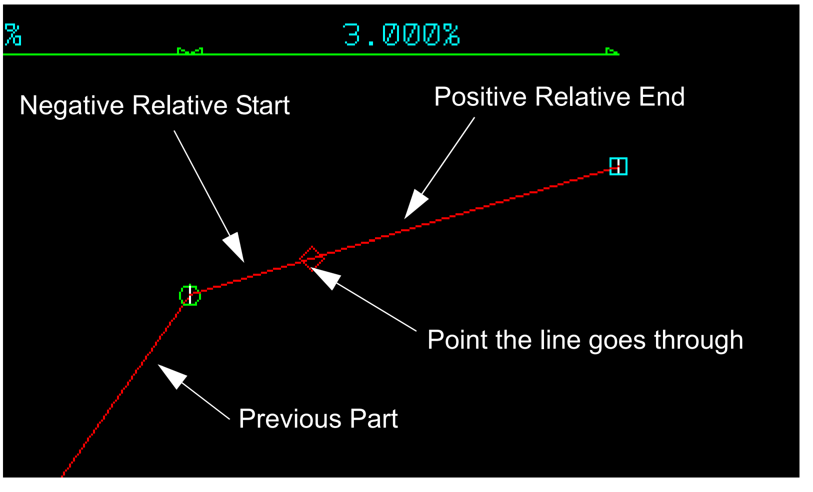
the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Vertical Parts list.*

Set button

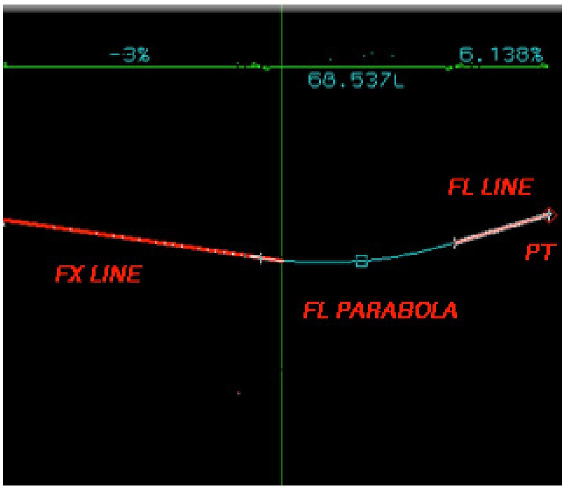
the **Set** *button must be clicked for the information for this Part to be used.*

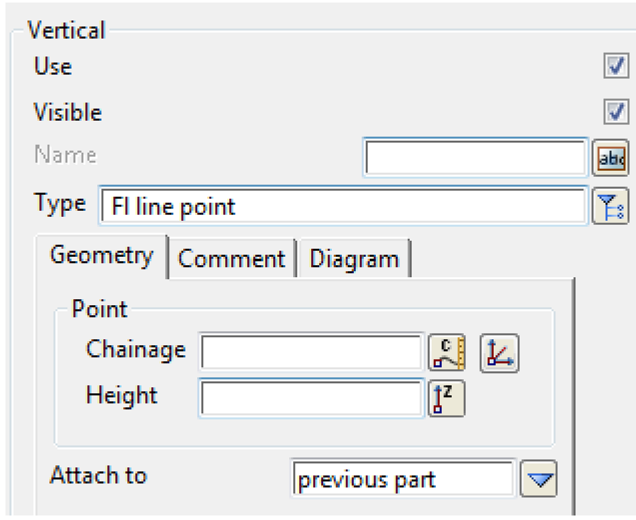
Same As button



Floating Line: Known Point

The *Floating Line* line passes through a **known point** but the grade is unknown.





Example

Floating Line attached to the previous parabola

The fields and buttons used in the panel have the following functions.

Field Description   Type   Defaults   Pop-Up

Use   tick box   ticked

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible   tick box   ticked

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name   text box   blank

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type   choice box   types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Chainage, Height

the (chainage,height) coordinates that the line passes through can be typed in, or selected using the **C**, **Z** *or* **CZ** *icons.*

Attach to   choice box   previous part   previous part, next part

the Part that the Floating Line is attached to and tried to make tangential to

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* # *is placed after the type of the part in the Vertical Parts list.*

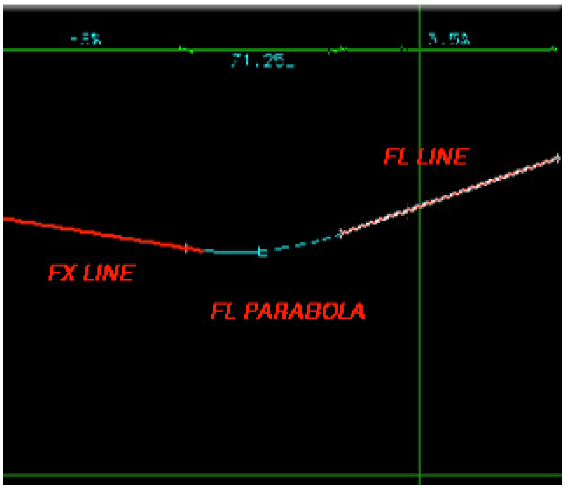
Set button

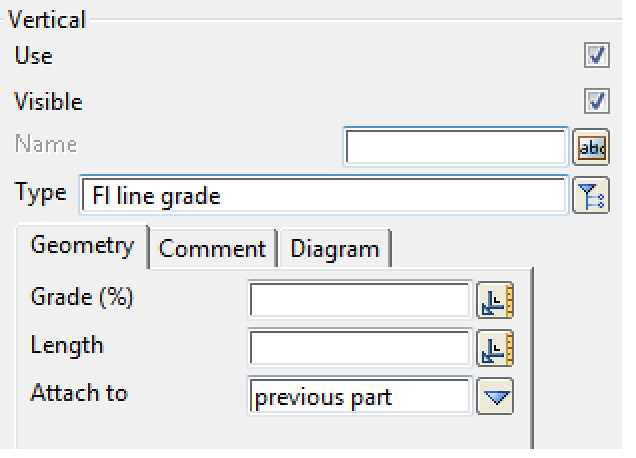
the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

Floating Line: Known Grade

The *Floating Line* line has a **known grade** but no point on the line is known.





Example

Floating Line attached to the previous parabola

The fields and buttons used in the panel have the following functions.

Field Description   Type   Defaults   Pop-Up

Use   tick box   ticked

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible   tick box   ticked

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name   text box   blank

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type   choice box   types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Grade (%)   measure box   available measures

the grade (in percent) of the line through the point

Length   measure box   available measures

nominal length of the line

Attach to   choice box   previous part   previous part, next part

the Part that the Floating Line is attached to and tried to make tangential to

Comment tab

the text typed into the text box is stored as a comment for the Part.

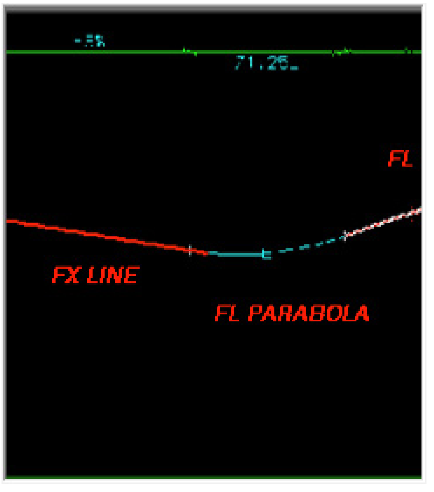
Note: *If a comment exists, a* # *is placed after the type of the part in the Vertical Parts list.*

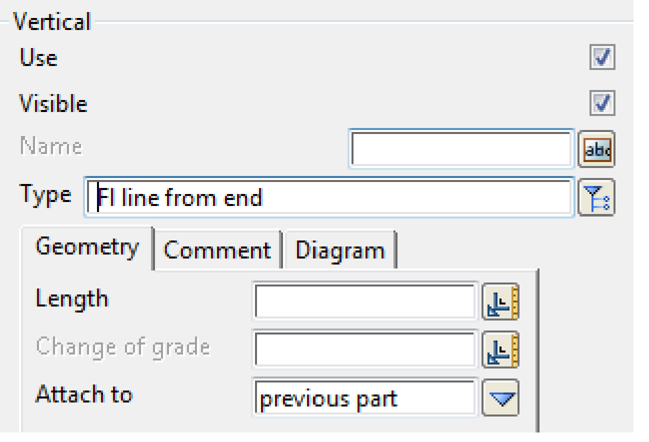
Set button

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

Floating Line: Known End and Nominal Length
The *Floating Line* has a **known nominal length** and is attached tangentially to the end of previous part or the beginning of the next part.





The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Length	measure box		available measures

the nominal length of the Floating Line. Must be non zero.

Change of grade	measure box		available measures

LJG??? if non zero then the grade of the line is increased by **Change of grade** *(units of percent grade). It is no longer tangential to the* **Attach to** *part.*

Attach to	choice box		previous part, next part

the Part that the Floating Line is attached to, and made tangential to. If there is a **Change of grade**, *then after the line is calculated to be tangential, the* **Change of grade** *is added to the grade of the line.*

Comment tab

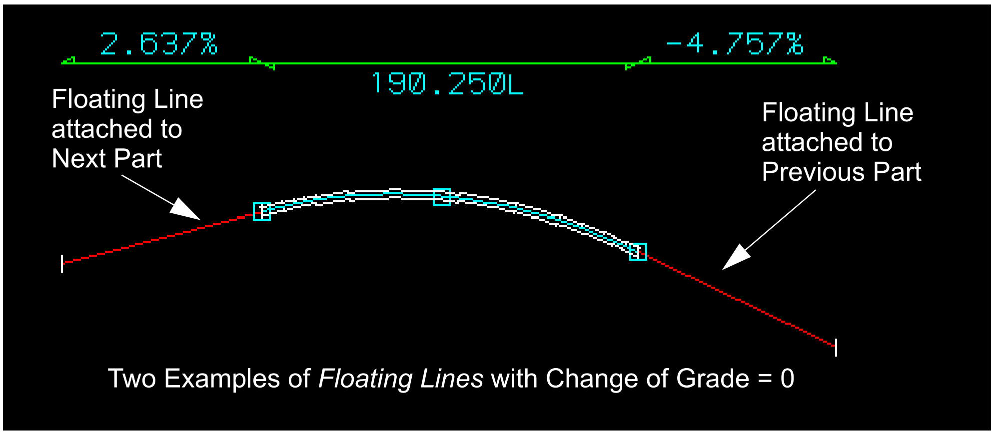
the text typed into the text box is stored as a comment for the Part.

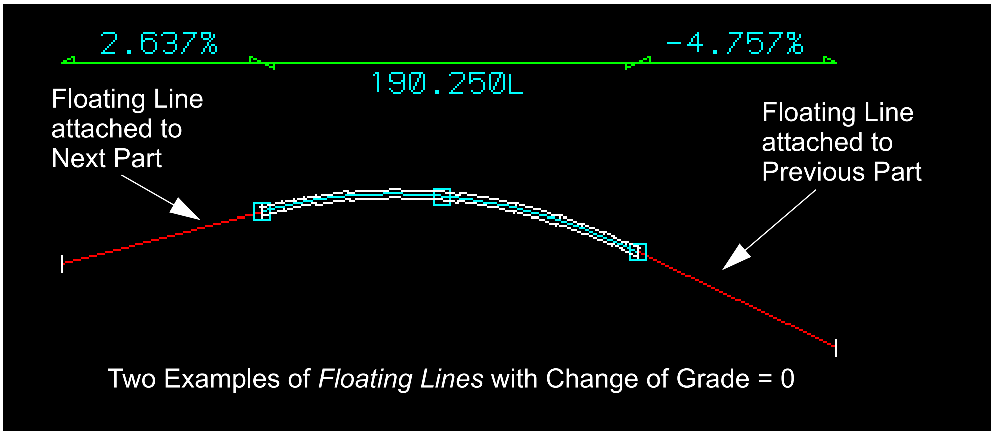
Note: *If a comment exists, a* # *is placed after the type of the part in the Vertical Parts list.*

Set button

the **Set** *button must be clicked for the information for this Part to be used.*

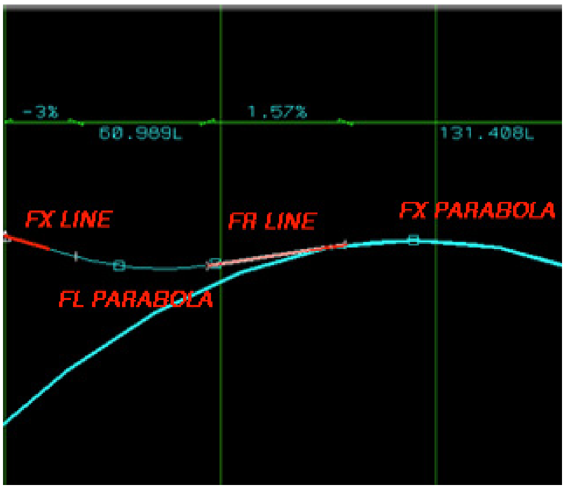
Same As button

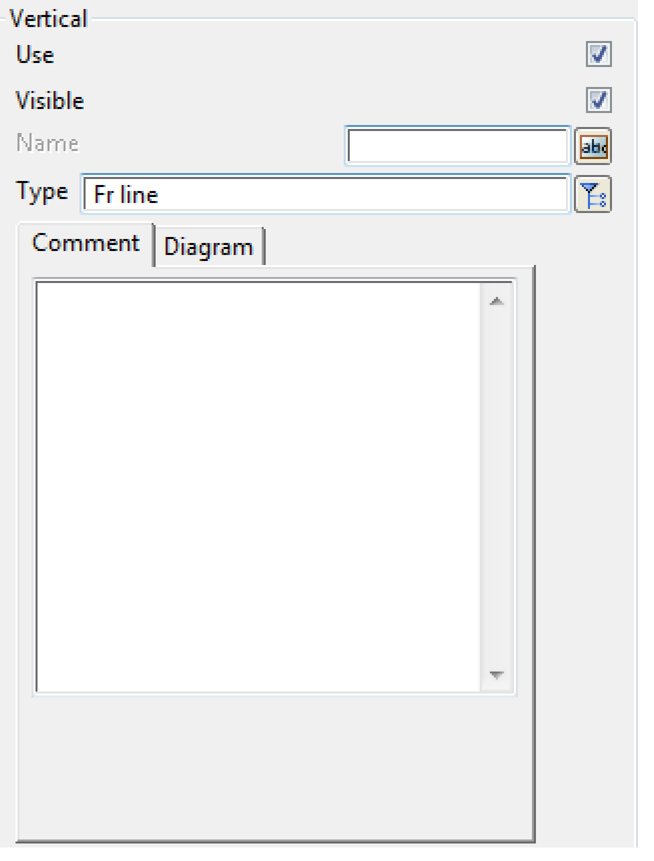




Free line - No Constraints

The *Free Line* is not constrained. It is determined by having to be tangential to the Parts at either end of the Line.





Example

Typical application is a Free Line tangent between two solved parts

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a* **#** *is placed after the type of the part in the Vertical Parts list.*

Set button

the **Set** *button must be clicked for the information for this Part to be used.*

the **Set** *button must be clicked for the information for this Part to be used.*

Same As button

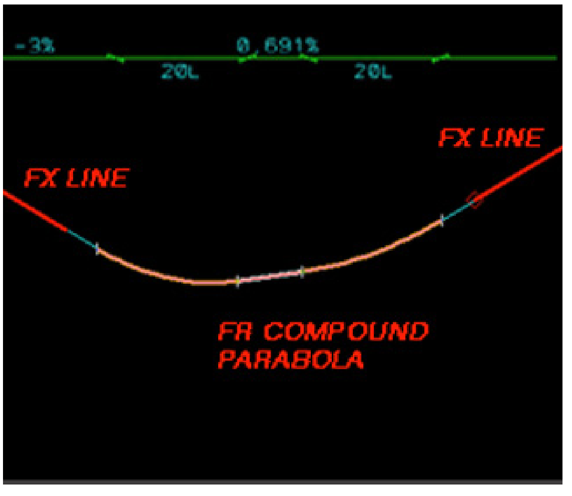
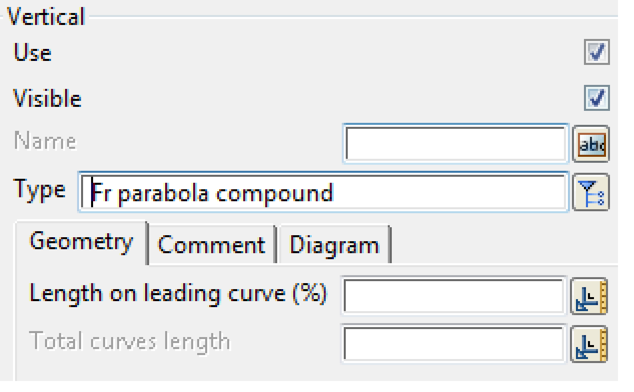
Free Compound Parabola: Two Parabolas with Optional Total Parabolic Length
This Free Parabola has two parabolas with a given total length and a ratio of the division between the two parabolas. There is an option total length of the two parabolas.

With a given Total Length, a straight between the two parabolas may need to be automatically inserted to get a solution.

Being tangential to the parts on either side fully determines the two parabolas and any necessary straight. The grades on the previous and next parts also determine if the parabolas are crest or sag parabolas.

It is not always possible for the Free Parabola to solve.





The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	

if ticked, then the Part is used in the vertical geometry.

If not ticked, the Part is not used in the vertical geometry.

Visible	tick box	ticked	

if ticked, then the Part is drawn in the vertical geometry.

If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have **Visible** *not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.*

Name	text box	blank	

if not blank, then the Part is given this name.

If blank then the Part has no name.

Note: *If the part has a name, then a* **!** *is placed after the type of the part in the Vertical Parts list.*

Type	choice box		types of vertical parts

the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab

the geometrical information defining the Part

Length on leading curve (%)	measure box		available measures

the percentage of the total parabolic length going to the first parabola. Must be non zero.

Total curves length measure box available measures

if blank, the two parabolic lengths are calculated in the given ratio to fit.

If no zero, this value and the **Length on leading curve (%)** *fully determines the lengths of the two parabolic curves but a straight between the two parabolas may need to be automatically inserted to get a solution.*

Comment tab

the text typed into the text box is stored as a comment for the Part.

21.9.5.6 Vertical Computators

Not yet documented.

21.10 Text Format of Files

Go to 21.10.1 Text Format of the MTF File

21.10.2 Text Format of the Boxing File

21.10.1 Text Format of the MTF File

In the text version of the mtf file, most of (a) to (h) begin with a key word, following by an equals sign (=) and then special commands enclosed in { }.

```
key_word   =  {
                 commands
              }
```

The key words for each case above are

(a) left_side, right_side

(b) specials

(c) hinge_modifier

(d) left_side_modifier, right_side_modifier

(e) stripping

(f) boxing_file, left_boxing, right_boxing, left_boxing_2, right_boxing_2 ... left_boxing_8, right_boxing_8

(g) auto_super_tables, left_auto_super, left_auto_width, right_auto_super, right_auto_width

(h) loops

(i) section_width

(j) string_modifiers

If any of the key words exist, then they must be in the following order in the **mtf** file:

left_side	=	{ ... }
right_side	=	{ ... }
specials	=	{ ... }
hinge_modifier	=	{ ... }
left_side_modifier	=	{ ... }
right_side_modifier	=	{ ... }
stripping	=	{ ... }
boxing_file	=	“something.bf”
left_boxing	=	{ ... }
right_boxing	=	{ ... }
section_width	=	*value*
string_modifiers	=	{ ... }
auto_super_tables	=	1 or 0
left_auto_super	=	{ ... }
left_auto_width	=	{ ... }
right_auto_super	=	{ ... }
right_auto_width	=	{ ... }
loop_removals	=	{ ... }

The format for *boxing_file* is simply

boxing_file = *"something.bf"*

where *something.bf* is the name of a file containing boxing definitions to use for the mtf.

The format for (g) is simply

section_width = *value* // default is 10000 where *value* is the distance to search from the hinge string for strings required in some options. If section_width is missing, then it takes the default value of 10000.

The key words, left_side and right_side which are for initially applying templates (for part (a)), have already been described under the **Design=>Apply=>Apply MTF** option but will be summarised in the next section 21.2.1 MTF Hinge Modifiers.

The documentation for the **text file syntax** of the MTF file now follows.

See 21.10.1.1 MTF Templates File Format

21.10.1.2 MTF Specials File Format

21.10.1.3 MTF Hinge Modifier File Format

21.10.1.4 MTF MTF Modifiers File Format

21.10.1.12 MTF Stripping File Format

21.10.1.13 MTF Boxing File Format

21.10.1.14 MTF Width File Format

21.10.1.15 MTF String Modifiers File Format

21.10.1.16 Substitutions in the Modifiers and Templates File

21.10.1.1 MTF Templates File Format

The templates on the left and right hand sides of the centre line (or Hinge string if one is selected) are specified separately in the *Modifiers and Templates File*. Apart from a key word denoting whether the following part of the definition is for the left side or the right side, the set out for the left-side is identical to the right-side. Hence, only the left-side will be described in detail.

The left-side definition begins with the key words

left_side =

A list of chainages (in ascending order, one per line) with corresponding template names then follows. This list of chainages and templates is enclosed in curly braces **{ }**.

Note if the template name includes spaces, then the name must be enclosed in quotes **".** For example, "left 1".

The chainage-template lists are assembled as follows

(a) To represent a template starting at a given chainage, the chainage value followed by the template name is given. The chainage and name are separated by one or more spaces. For example, the template **std** starting at chainage 150 is represented by

150 std

The template is assumed to apply until the chainage given on the next line of the left-side definition.

If the template is to go to the end of the centre-line, add a line with a chainage greater than or equal to the end chainage. For example,

150 std

99999

(b) if no template exists from a chainage, simply include the chainage with no template name following it. For example, if there is no template from chainage 250, this is represented by

250

The non-existence of a template is assumed to apply until the chainage given on the next line of the left-side definition

(c) the case of a linear change from one template to another template over a specified chainage range is represented by giving the start chainage of the linear change, followed on the same line by the start template, a comma, and the end template. For example, if the template is to vary linearly between the template **std** and the template **left**, beginning at the chainage 350, then the line in the file would be

350 std, left

The linear change takes place over the interval beginning at the chainage given on the defining line and ending at the chainage given on the next line of the left-side. Distances and percent cross-falls are interpolated linearly and slopes are interpolated on the radian value of the slope angles.

Combining these rules, the following lines in a template file

```
left_side = {
          100       std
          200       std , "left 1"
          250       "left 1"
          300
          350       std
          99999
}
```

describes the situation

1. the left-hand side of the centre-line has no template from the beginning of the centre-line until chainage 100.
2. at chainage 100, the template **std** begins and continues until chainage 200.

3. there is a linear change from the template **std** to the template **left 1** between chainage 200 and chainage 250.
4. the template **left 1** goes from chainage 250 to chainage 300.
5. there is a gap between chainage 300 and chainage 350.
6. the template **std** goes from chainage 350 to chainage 99999, or if the end chainage is smaller than 99999, to the end of the centre-line.

The right-side template definition begins with the key word right_side. The rest of the definition follows the same rules at the left hand side of the centre-line. For example,

```
right_side = {
         100       std
         200       std , right
         250       right
         300       right , std
         350       std
         400
}
```

The left and right sides can vary independently.

Restrictions on the Template File Definitions

1. If one template stops at the same chainage that another template begins, then the two templates must have the same number of fixed and variable links. The templates will be varied linearly from the stopping template to the starting template over one section separation distance.
2. If there is a linear variation between two templates, the two templates must have the same number of fixed and variable links.
3. If two templates do not have the same number of links, they must be separated by a gap, that is, by a region with no template.

Summarising:

The templates on the left and right hand sides of the centre line are specified separately in the Modifiers and Templates File.

The left-side (right-side) definition begins with the key words

left_side =   right_side =

with a list of chainages (in ascending order, one per line) with template names. This list of chainages and templates is enclosed in curly braces **{ }**.

The chainage-template lists are assembled as follows

(a) To represent a template starting at a given chainage, the chainage value followed by the template name is given. The chainage and name are separated by one or more spaces. For example, the template **std** starting at chainage 150 is represented by

150   std

The template is assumed to apply until the chainage given on the next line of the left-side definition.

If the template is to go to the end of the centre-line, add a line with a chainage greater than or equal to the end chainage. For example,

150   std

99999

(b) if no template exists from a chainage, simply include the chainage with no template name following it. For example, if there is no template from chainage 250, this is represented by

250

The non-existence of a template is assumed to apply until the chainage given on the next line of the left-side definition

(c) the case of a linear change from one template to another template over a specified chainage range is represented by giving the start chainage of the linear change, followed on the same line by the start template, a comma, and the end template. For example, if the template is to vary linearly between the template **std** and the template **left**, beginning at the chainage 350, then the line in the file would be

350 std, left

The linear change takes place over the interval beginning at the chainage given on the defining line and ending at the chainage given on the next line of the left-side. Distances and percent cross-falls are interpolated linearly and slopes are interpolated on the radian value of the slope angles.

A Left and Right Side File Example

```
left_side = {
         100      std
         200      std , "left 1"
         250      "left 1"
         300
         350      std
         99999
}
right_side = {
         100      std
         200      std , right
         250      right
         300      right , std
         350      std
         400
}
```

The left_side describes the situation:

1. the left-hand side of the centre-line has no template from the beginning of the centre-line until chainage 100.
2. at chainage 100, the template **std** begins and continues until chainage 200.
3. there is a linear change from the template **std** to the template **left 1** between chainage 200 and chainage 250.
4. the template **left 1** goes from chainage 250 to chainage 300.
5. there is a gap between chainage 300 and chainage 350.
6. the template **std** goes from chainage 350 to chainage 99999, or if the end chainage is smaller than 99999, to the end of the centre-line.

Go to the next section 21.10.1.2 MTF Specials File Format or back to 21.10.1 Text Format of the MTF File

21.10.1.2 MTF Specials File Format

In the Modifiers and Templates File, the **specials** definition begins with the key word

specials =

This is followed by a list of

(a) chainages, in any order, one per line

and/or

(b) the names of files (enclosed in quotes **“**) which include lists of chainages (The default ending for a special chainage file is *.spc)

The list of chainages and/or file names is enclosed in curly braces {}.

A Specials Example

```
specials = {
        125.3
        1925.4
        “fred”        // file of chainages to read in
        3007
        “joe”
}
```

Go to the next section 21.10.1.3 MTF Hinge Modifier File Format or back to 21.10.1 Text Format of the MTF File

21.10.1.3 MTF Hinge Modifier File Format

In the Modifiers and Templates File, the **hinge modifier** definition begins with the key word

hinge_modifier =

followed by one or more of the hinge modifier commands **offset**, **height**, **coord** and **nohinge** enclosing curly braces {}.

```
hinge_modifier = {
                      hinge modifier commands
                 }
```

The definition of the hinge modifier commands will now be given.

Offset

The **Offset** modifier will move the hinge point a given offset distance (perpendicular to the reference string) from its current plan position. A positive offset is to the right of the hinge string and a negative offset to the left.

The format of the modifier to vary the **offset** is

offset st_ch end_ch st_offset end_offset absrel type extra_start extra_end

where

st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
st_offset	offset to be used at the start modifier chainage, st_ch
end_offset	offset to be used at the end modifier chainage, end_ch.
absrel	relative (default) or absolute
type	linear (default) or cubic
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

If **absrel** is **relative** (the default) then

the st_offset is added to the current position of the hinge point at chainage st_ch.
the end_offset is added to the current position of the hinge point at chainage end_ch.

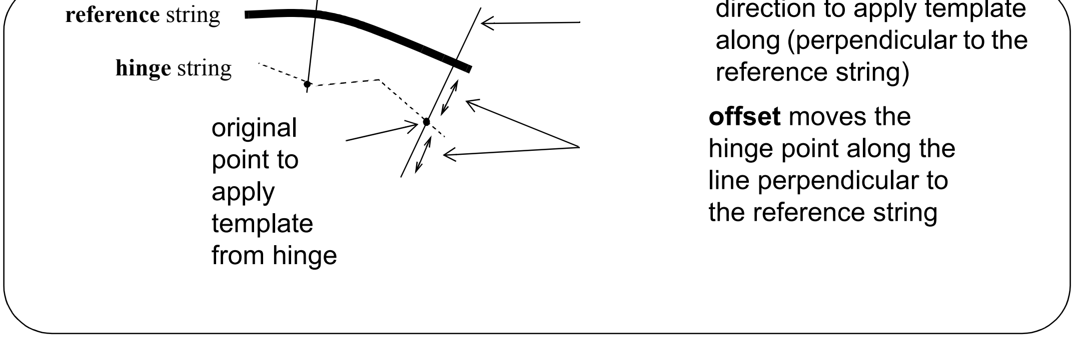
If **absrel** is **absolute**, then

the offset of the hinge point is taken with respect to the original position of the hinge string at chainage st_ch.
the offset of the hinge point is taken with respect to the original position of the hinge string at chainage end_ch.

If **type** is **linear** (the default), then the offset is varied linearly (with respect to the reference chainage) between the offsets at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the offset is varied as a reverse cubic (with respect to the reference chainage) between the offsets at chainage st_ch and chainage end_ch.

.



Offset to String

The offset for the hinge point can also be varied by **going out to another *12d Model* string**.

offset st_ch end_ch full_string_name extra_start extra_end

where

st_ch start chainage for the modifier
end_ch end chainage for the modifier

full_string_name name of a ***12d Model*** string to take the hinge point out to. The format of the string name is "model_name->string_name".

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

Height

The **height** modifier varies the height of the hinge point between the given chainages.

height st_ch end_ch st_height end_height absrel type extra_start extra_end

where

st_ch start chainage for the modifier
end_ch end chainage for the modifier

st_height height to be used at the start modifier chainage, st_ch
end_height height to be used at the end modifier chainage, end_ch.

absrel relative (default) or absolute
type linear (default) or cubic

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

If **absrel** is **relative** (the default) then

the st_height is added to the current height of the hinge point at chainage st_ch.
the end_height is added to the current height of the hinge point at chainage end_ch.

If **absrel** is **absolute**, then

the height of the hinge point is set to st_height above the original hinge string at chainage st_ch.
the height of the hinge point is set to end_height above the original hinge string at chainage end_ch.

If **type** is **linear** (the default), then the height is varied linearly (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the height is varied as a reverse cubic (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

Height to String

The height of the hinge point can also be specified by **taking the height from another** 12d Model **string**.

height st_ch end_ch full_string_name extra_start extra_end

where

st_ch start chainage for the modifier
end_ch end chainage for the modifier

full_string_name name of a ***12d Model*** string to take the hinge point height from. The format of the string name is "model_name->string_name".

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

Coord to String

The **coord** modifier is used to replace the x, y and z position of the hinge point by the x, y and z position of **another *12d Model* string** between given chainages. Hence **coord** replaces the hinge string by another string between the given chainages.

coord st_ch end_ch full_string_name extra_start extra_end

where

st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
full_string_name	name of the ***12d Model*** string used to replace the hinge string between the chainages st_ch and end_ch. The format of the string name is “model_name->string_name”.
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

Nohinge

The **nohinge** modifier is used to **stop** the hinge string (and hence the apply) between given chainages. This will leave a gap in the strings created by the apply between the given chainages.

nohinge st_ch end_ch extra_start extra_end

where

st_ch	start chainage to stop the apply
end_ch	end chainage for stopping the apply
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

Please continue to the next section A Hinge Modifier Example.

A Hinge Modifier Example

```
hinge_modifier  =  {
        offset    0   250   0    3             // linearly offset the hinge by 0 to 3
                                               // over the chainage range 0 to 250.
        height    125   300   2    2           // add 2 to the hinge height
                                               // over the chainage range 125 to 300.
        coord     300   400   “mod->new_string”   // use the position of the string
                                                  // new_string over the chainage
                                                  // range 300 to 400.
        nohinge    400   500   2    2          // stop the apply between the chainages
                                               // over the chainage range 400 to 500.
        }
```

Go to the next section 21.10.1.4 MTF MTF Modifiers File Format or back to 21.10.1 Text Format of the MTF File

21.10.1.4 MTF MTF Modifiers File Format

In the Modifiers and Templates File, the **template modifier** definition begins with the key word

left_side_modifier =

and/or

right_side_modifier =

followed by one or more of the template modifier commands enclosing curly braces **{ })**

(a) fixed link modifiers - commands working on fixed links

insert

remove

width, **height**, **xfall, xfall_crc, copy_width, copy_height, copy_xfall, tin_height, tin_xfall**

(b) stop and start decisions commands

decision

(c) variable cut and fill link modifiers - commands working on cut/fill links

insert_cut, **insert_fill**

remove_cut, **remove_fill**

cut_width, **cut_height**, **cut_slope, copy_cut_width, copy_cut_height, copy_cut_slope, tin_cut_height, tin_cut_slope**

fill_width, **fill_height**, **fill_slope, copy_fill_width, copy_fill_height, copy_fill_slope, tin_fill_height, tin_fill_slope**

(d) final cut/fill link modifiers

final_width, **final_cut_slope**, **final_no_cut_slope**

final_fill_slope, **final_no_fill_slope**

(e) snippets - inserting groups of modifier commands

snippet

That is,

```
left_side_modifier  =  {
                          template modifier commands
                       }
```

and/or

```
right_side_modifier  =  {
                          template modifier commands
                        }
```

The definition of the template modifier commands and their file format will now be given.

For **Start mode and End mode**, go to the section 21.10.1.5 Start and End Chainages in the Modifier File Format.

For **Fixed Link** modifiers, go to the section 21.10.1.6 MTF Fixed Link Modifiers File Format.

For **Decision Link** modifiers, go to the section 21.10.1.7 Decision File Format.

For **Cut and Fill Link** modifiers, go to the section 21.10.1.8 Cut and Fill Variable Link Modifiers File Format.

For **Final Link** modifiers, go to the section 21.10.1.9 Final Link Modifiers File Format.

For **Snippets**, go to the section 21.10.1.10 Snippets File Format.

Please continue to the next section 21.10.1.5 Start and End Chainages in the Modifier File Format.

21.10.1.5 Start and End Chainages in the Modifier File Format

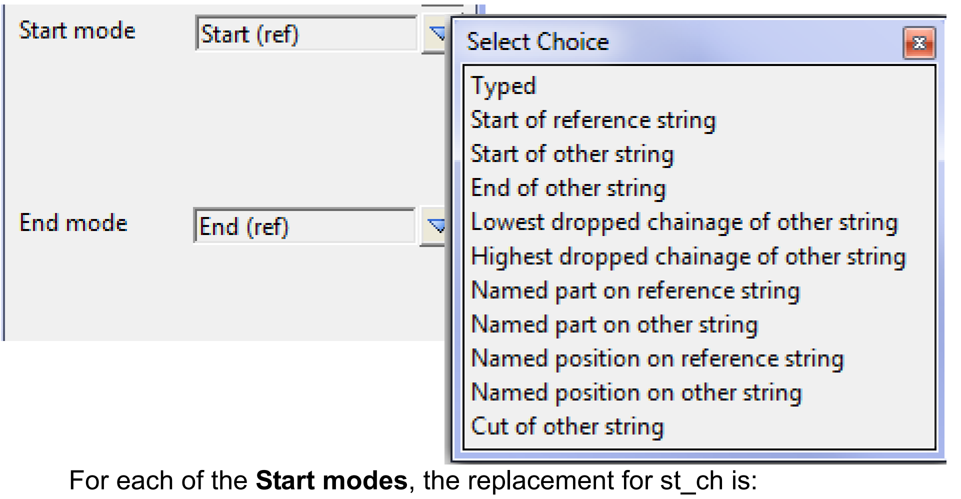
Modifiers work between two chainages and in each modifier command, the position of the start and end chainages for the commands are denoted by:

st_ch start chainage for the modifier

end_ch end chainage for the modifier

However there are a number of ways for defining the start and end chainages in the modifier command (called Start mode and End mode on the modifier panels.

Start Mode - st_ch



For each of the **Start modes**, the replacement for st_ch is:

(a) Typed

the actual typed in chainage value

(b) Start of reference string

$null

(c) Start of other string

chainage_start "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the start chainage from. The double quotes (") are needed.

(d) End of other string

chainage_final "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the end chainage from. The double quotes (") are needed.

(e) Lowest dropped chainage of other string

chainage_low "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the lowest dropped chainage from. The double quotes (") are needed.

(f) Highest dropped chainage of other string

chainage_high "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the highest dropped chainage from. The double quotes (") are needed.

(g) Named part of reference other string

named_part "part_specifier" start_extension_value

where part_specifier is the full specification of the part of the reference string to use. The start_extension_value is added to the chainage. The double quotes (") are needed.

(h) Named part of other string

named_part "model_of_string->string_name" "part_specifier" start_extension_value

where model_of_string and string_name are the model and name of the string to take the name part from, and part_specifier is the full specification of the part from that string. The start_extension_value is added to the chainage. The double quotes (") are needed.

(i) Named position of reference

named_position "pos_name" start_extension_value

where pos_name is the name of the named position of the reference string to use. The start_extension_value is added to the chainage. The double quotes (") are needed.

(j) Named position on other string

named_position "model_of_string->string_name" "pos_name" start_extension_value

where model_of_string and string_name are the model and name of the string to take the name position from, and pos_name is the name of the named position from that string. The start_extension_value is added to the chainage. The double quotes (") are needed.

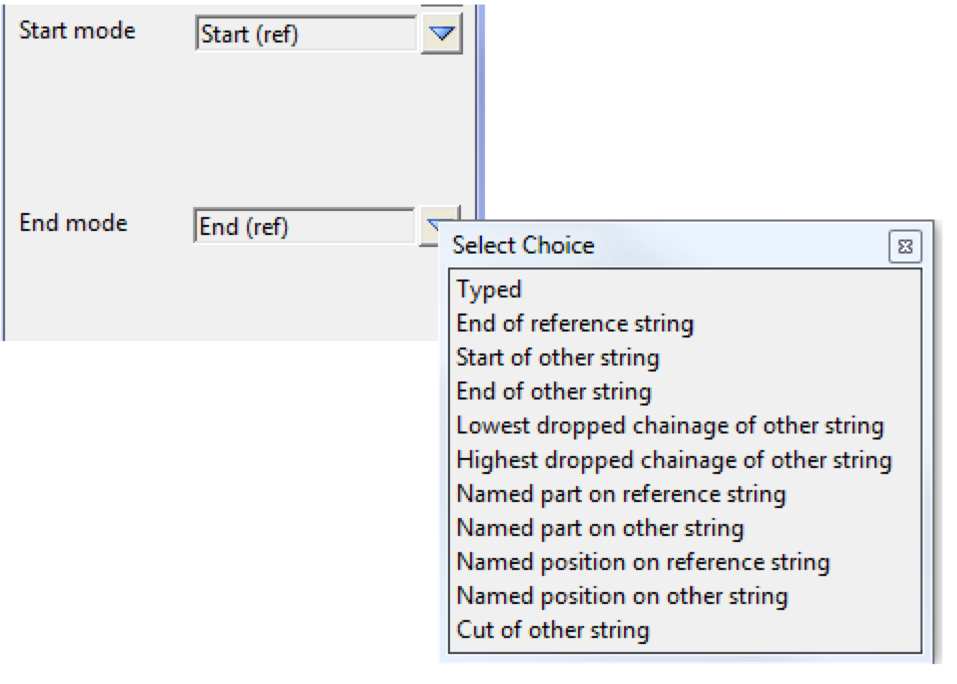
(k) Cut of other string

cut_other "model_of_string->string_name" "name" start_extension_value

where model_of_string and string_name are the model and name of the selected string. A chainage is calculated from the cut of the string with the reference string. The start_extension_value is added to the chainage. The double quotes (") are needed.

Note: If there are no cuts, or if there is more than one cut, then the command is not processed.

End Mode - end_ch



For each of the **End modes**, the replacement for end_ch is:

(a) Typed

the actual typed in chainage value

(b) End of reference string

$null

(c) Start of other string

chainage_start "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the start chainage from. The double quotes (") are needed.

(d) End of other string

chainage_final "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the end chainage from. The double quotes (") are needed.

(e) Lowest dropped chainage of other string

chainage_low "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the lowest dropped chainage from. The double quotes (") are needed.

(f) Highest dropped chainage of other string

chainage_high "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the highest dropped chainage from. The double quotes (") are needed.

(g) Named part of reference other string

named_part "part_specifier" start_extension_value

where part_specifier is the full specification of the part of the reference string to use. The start_extension_value is added to the chainage. The double quotes (") are needed.

(h) Named part of other string

named_part "model_of_string->string_name" "part_specifier" end_extension_value

where model_of_string and string_name are the model and name of the string to take the name part from, and part_specifier is the full specification of the part from that string. The end_extension_value is added to the chainage. The double quotes (") are needed.

(i) Named position of reference

named_position "pos_name" end_extension_value

where pos_name is the name of the named position of the reference string to use. The end_extension_value is added to the chainage. The double quotes (") are needed.

(j) Named position on other string

named_position "model_of_string->string_name" "pos_name" end_extension_value

where model_of_string and string_name are the model and name of the string to take the name position from, and pos_name is the name of the named position from that string. The end_extension_value is added to the chainage. The double quotes (") are needed.

(k) Cut of other string

cut_other "model_of_string->string_name" "name" start_extension_value

where model_of_string and string_name are the model and name of the selected string. A chainage is calculated from the cut of the string with the reference string. The end_extension_value is added to the chainage. The double quotes (") are needed.

Note: is there is no cuts or more than one cut then the command is not processed.

Please continue to the next section 21.10.1.6 MTF Fixed Link Modifiers File Format.

21.10.1.6 MTF Fixed Link Modifiers File Format

Fixed - Link Insert

Fixed links can be created by one of three **insert** commands by specifying either width and height, width and xfall, or height and xfall.

insert link_name colour width height **unknown** st_ch end_ch *optional // use width, height*

insert link_name colour width **unknown** xfall st_ch end_ch *optional // use width, xfall*

insert link_name colour **unknown** height xfall st_ch end_ch *optional // use height, xfall*

where **unknown** takes the place of the one of width, height or xfall not being used, and

link_name	name of the link being created
colour	colour of the link being created
width, height, xfall	width, height or xfall of the created link
st_ch	start chainage for creating the link
end_ch	end chainage for creating the link

and *optional* can be none, one or more of the following

name	if non-blank, insert before the link name in the template if blank, then append after the last link of the fixed template table
interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the Apply MTF is used
interval_value	only exists if *interval* exists
extra_start	optional - adds in an extra x-section 0.1 *mm* before start chainage
extra_end	optional - adds in an extra x-section 0.1 *mm* before end chainage
inactive	if *inactive* is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Link Remove

Fixed links can be deleted by the **remove** command:

remove link_list st_ch end_ch *optional*

where

link_list	one or more names of links to be removed, in the form name1 name2 ... namei
st_ch	start chainage for removing the link
end_ch	end chainage for removing the link

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the Apply MTF is used
interval_value	only exists if *interval* exists
extra_start	optional - adds in an extra x-section 0.1 *mm* before start chainage
extra_end	optional - adds in an extra x-section 0.1 *mm* before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Width

The **width** modifier is used to modify the width of fixed links originally defined by width.

The format of the modifier to vary the **width** of the fixed links given by link_list is

width link_list st_ch end_ch st_wid end_wid absrel type optional

where

link_list one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

st_wid width to be used at the start modifier chainage, st_ch
end_wid width to be used at the end modifier chainage, end_ch.

absrel relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_wid is added to the current width of links in link_list at chainage st_ch.
the end_wid is added to the current width of links in link_list at chainage end_ch.

If **absrel** is **absolute**, then

the width of links in link_list are set to st_wid at chainage st_ch.
the width of links in link_list are set to end_wid at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the width of links in link_list are varied linearly (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the width of links in link_list is varied as a reverse cubic (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used

interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text the text is a comment

The width for a link can also be varied by **going out to another *12d Model* string** or by taking the **width between two *12d Model* strings**.

width link_list st_ch end_ch full_string_name side optional
width link_list st_ch end_ch str_name_1 side_1 str_name_2 side_2 optional

where

link_list one or more names of fixed links given in the template definition;

	with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
full_string_name	name of a ***12d Model*** string to take links in link_list out to. The format of the string name is "model_name->string_name".
side	side to search for string: -1 for left, 0 for left and right, 1 for right
str_name_1	name of the first ***12d Model*** string. The format of the string name is "model_name->string_name".
side_1	side to search for string_1: -1 for left, 0 for left and right, 1 for right
str_name_2 name	name of the second ***12d Model*** string. The format of the string is "model_name->string_name".
side_2	side to search for string_2: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the Apply MTF is used
interval_value	only exists if *interval* exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if *inactive* is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The **width** of links in link_list are taken to be the distance between **str_name_1** and **str_name_2**.

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed- Width from Link

The **width from link** modifier is used to modify the width of fixed links originally defined by width to be the same as another link. That is, the width of the link is a copy of the width of another link.

The format of the modifier to vary the **width from link** of the fixed links given by link_list is

copy_width link_list st_ch end_ch from_link zone optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
from_link	name of link to take the width from
zone	section of the template that the from_link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the Apply MTF is used

interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Height

The **height** modifier is used to modify the height of fixed links originally defined by height.

The format of the modifier to vary the **height** of the fixed links in the **link_list** is almost identical to varying the width and is:

height link_list st_ch end_ch st_ht end_ht absrel type optional

where

link_list one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

st_ht height to be used at the start modifier chainage, st_ch
end_ht height to be used at the end modifier chainage, end_ch.

absrel relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_ht is added to the current height of links in link_list at chainage st_ch.
the end_ht is added to the current height of links in link_list at chainage end_ch.

If **absrel** is **absolute**, then

the height of links in link_list are set to st_ht at chainage st_ch.
the height of links in link_list are set to end_ht at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the height of links in link_list are varied linearly (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the height of links in link_list is varied as a reverse cubic (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

The height for a link can also be varied by **taking the height from a *12d Model* string** or by taking the **height between two *12d Model* strings**.

height link_list st_ch end_ch full_string_name side optional
height link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

where

link_list — one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch — start chainage for the modifier
end_ch — end chainage for the modifier

full_string_name — name of a ***12d Model*** string to take links in link_list out to. The format of the string name is “model_name->string_name”.

side — side to search for string: -1 for left, 0 for left and right, 1 for right

str_name_1 — name of the first ***12d Model*** string. The format of the string name is “model_name->string_name”.

side2 — side to search for string: -1 for left, 0 for left and right, 1 for right

str_name_2 name — name of the second ***12d Model*** string. The format of the string is “model_name->string_name”.

side2 — side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval — if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value — only exists if *interval* exists

extra_start — optional - adds in an extra x-section 0.1mm before start chainage
extra_end — optional - adds in an extra x-section 0.1mm before end chainage

inactive — if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text — the text is a comment

The **height** of links in link_list are taken to be the height between **str_name_1** and **str_name_2**.

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Height from Link

The **height from link** modifier is used to modify the height of fixed links originally defined by height to be the same height as another link. That is, the height of the link is a copy of the height of another link.

The format of the modifier to vary the **height from link** of the fixed links given by link_list is

copy_height link_list st_ch end_ch from_link zone optional

where

link_list — one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch — start chainage for the modifier
end_ch — end chainage for the modifier

from_link — name of link to take the height from
zone — section of the template that the from_ link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval — if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value — only exists if *interval* exists

extra_start — optional - adds in an extra x-section 0.1mm before start chainage
extra_end — optional - adds in an extra x-section 0.1mm before end chainage

inactive — if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text — the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Cross Fall

The **xfall** modifier is used to modify the cross fall of fixed links originally defined by xfall.

The format of the modifier to vary the cross-fall of the fixed links in the **link_list** is almost identical to varying the width and is:.

xfall link_list st_ch end_ch st_xfall end_xfall absrel type optional

where

link_list — one or more names of fixed links given in the template definition; with format
name1 name2 ... namei

st_ch — start chainage for the modifier
end_ch — end chainage for the modifier

st_xfall — xfall to be used at the start modifier chainage, st_ch
end_xfall — xfall to be used at the end modifier chainage, end_ch.

absrel — relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_xfall is added to the current xfall of links in link_list at chainage st_ch.
the end_xfall is added to the current xfall of links in link_list at chainage end_ch.

If **absrel** is **absolute**, then

the xfall of links in link_list are set to st_xfall at chainage st_ch.
the xfall of links in link_list are set to end_xfall at chainage end_ch.

type — linear (default) or cubic

If **type** is **linear** (the default), then the xfall of links in link_list are varied linearly (with respect to the reference chainage) between the xfall at chainage st_ch and chainage end_ch.

cubic, then the xfall of links in link_list are varied as a reverse cubic (with respect to the reference chainage) between the xfall at chainage st_ch and chainage end_ch.

rotate, then the angle of the xfall of the links in link_list is varied linearly (with respect to the reference chainage) between the angle of the xfall at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval — if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value — only exists if *interval* exists

extra_start — optional - adds in an extra x-section 0.1mm before start chainage
extra_end — optional - adds in an extra x-section 0.1mm before end chainage

inactive — if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text the text is a comment

The **xfall** of a link can be defined by using the xfall from the **beginning of the link** (i.e. the end of the previous link or the hinge string if it is the first link) **to another *12d Model***, or by taking the **xfall between two *12d Model* strings**.

xfall link_list st_ch end_ch full_string_name side optional
xfall link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

where

link_list one or more names of fixed links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier
full_string_name name of a ***12d Model*** string to use to calculate xfall. The format of the string name is “model_name->string_name”.
side side to search for string: -1 for left, 0 for left and right, 1 for right
str_name_1 name of the first ***12d Model*** string. The format of the string name is “model_name->string_name”.
side1 side to search for string_1:
-1 for left, 0 for left and right, 1 for right

str_name_2 name of the second ***12d Model*** string.

side2 side to search for string_2:
-1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists
extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

The **xfall** of links in link_list are taken to be the xfall between **str_name_1** and **str_name_2**.

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Cross Fall Circular Reverse Curve

The **xfall_crc** modifier is used to modify the cross fall of fixed links originally defined by **xfall** using the circular reverse curve formula.

The format of the modifier to vary the cross-fall of the fixed links (using circular reverse curves) in the **link_list** is:

xfall_crc link_list st_ch end_ch st_xfall end_xfall st_len end_len optional

where

link_list one or more names of fixed links given in the template definition; with format
name1 name2 ... namei

st_ch   start chainage for the modifier
end_ch   end chainage for the modifier

st_xfall   xfall to be used at the start modifier chainage, st_ch
end_xfall xfall to be used at the end modifier chainage, end_ch.

st_len   length of the start circular arc to be used at the start modifier chainage, st_ch.
end_len   length of the end circular arc to finish at the end modifier chainage, st_ch.

and *optional* can be none, one or more of

interval   if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value   only exists if *interval* exists

extra_start   optional - adds in an extra x-section 0.1mm before start chainage
extra_end   optional - adds in an extra x-section 0.1mm before end chainage

inactive   if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text   the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Xfall from Link

The **xfall from link** modifier is used to modify the xfall of fixed links originally defined by xfall to be the same xfall as another link. That is, the xfall of the link is a copy of the xfall of another link.

The format of the modifier to vary the **xfall from link** of the fixed links given by link_list is

copy_xfall   link_list   st_ch   end_ch   from_link   zone   optional

where

link_list   one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch   start chainage for the modifier
end_ch   end chainage for the modifier

from_link   name of the link to take the xfall from
zone   section of the template that the from_link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval   if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value   only exists if *interval* exists

extra_start   optional - adds in an extra x-section 0.1mm before start chainage
extra_end   optional - adds in an extra x-section 0.1mm before end chainage

inactive   if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text   the text is a comment

Important Note

The link to copy cross fall from can be defined in terms of cross fall or slope.

If the link to copy is defined by slope, then the cross fall is calculated to match the slope.

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Tin Height

The **tin height** modifier is used to modify the height of the link so that the link will sit on the tin at the given width.

The tin height can only be used for a fixed link defined by width and height.

The format of the modifier to vary the **tin height** of the fixed links in the **link_list** is:

tin_height   link_list   st_ch   end_ch   tin_name   optional

where

link_list   one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch   start chainage for the modifier
end_ch   end chainage for the modifier

tin_name   name of the tin to be used in defining the height.

and *optional* can be none, one or more of

interval   if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value   only exists if *interval* exists

extra_start   optional - adds in an extra x-section 0.1mm before start chainage
extra_end   optional - adds in an extra x-section 0.1mm before end chainage

inactive   if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text   the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Fixed - Tin Xfall

The **tin xfall** modifier is used to modify the xfall of the link so that the link will sit on the tin at the given width.

The tin xfall can only be used for a fixed link defined by width and xfall.

The format of the modifier to vary the **tin xfall** of the fixed links in the **link_list** is:

tin_xfall   link_list   st_ch   end_ch   tin_name

where

link_list   one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch   start chainage for the modifier
end_ch   end chainage for the modifier

tin_name   name of the tin to be used in defining the xfall.

and *optional* can be none, one or more of

interval   if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value   only exists if *interval* exists

extra_start   optional - adds in an extra x-section 0.1mm before start chainage
extra_end   optional - adds in an extra x-section 0.1mm before end chainage

inactive   if *inactive* is there then the command is not processed.

	If inactive is not there then the command is processed
// text	the text is a comment

Please continue to the next section 21.10.1.7 Decision File Format.

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

21.10.1.7 Decision File Format

Each template is made up of the sections fixed, decisions, cut, fill and final cut/fill. If a template has a decisions section then by default it is used instead of the cut, fill and final cut/fill sections.

Hence by default, either the
decisions section

or
the cut, fill and final cut/fill sections

from the template being used over the chainage range.

Using the **decision** modifier, it is possible to override the default and for a given chainage range
use the cut, fill and final cut/fill sections **instead** of the decisions section

or
use the decisions section **from another** template instead of the current templates sections.

The format of the decision modifier is

decision template_name st_ch end_ch *optional*

decision " " st_ch end_ch *optional*

where

template_name name of template to take the decision section from.

If the template name is given as **" "**, then the decision section for the template being used in the chainage range is ignored, and the cut, fill and final cut/fill tables for the template are used instead. Hence this overrides the default of using the decisions section in preference to the cut, fill and final cut/fill sections of the template.

st_ch start chainage for applying/removing the decision
end_ch end chainage for applying/removing the decision

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Note

The full description of the **Decisions** section of a template is given in 21.8 Full Definition of Template Decisions.

Please continue to the next section 21.10.1.8 Cut and Fill Variable Link Modifiers File Format.

21.10.1.8 Cut and Fill Variable Link Modifiers File Format

Cut and Fill Link Insert

Cut and fill links can be created by one of three **insert** commands by specifying either width and height, width and slope, or height and slope.

insert_cut link_name colour width height **unknown** st_ch end_ch *optional // width, ht*
insert_fill link_name colour width height **unknown** st_ch end_ch *optional // width, ht*

insert_cut link_name colour width **unknown** slope st_ch end_ch *optional // width, slope*
insert_fill link_name colour width **unknown** slope st_ch end_ch *optional // width, slope*

insert_cut link_name colour **unknown** height slope st_ch end_ch *optional // ht, slope*
insert_fill link_name colour **unknown** height slope st_ch end_ch *optional // ht, slope*

where **unknown** takes the place of the one of width, height or slope not being used, and

link_name	name of the link being created
colour	colour of the link being created
width, height, slope	width, height or slope of the created link
st_ch	start chainage for creating the link
end_ch	end chainage for creating the link

and *optional* can be none, one or more of the following

name	if non-blank, insert before the link name in the template if blank, then append after the last link of the fixed template table
interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the Apply MTF is used
interval_value	only exists if *interval* exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if *inactive* is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Link Remove

Cut and fill links can be deleted by the **remove** commands:

remove_cut link_list st_ch end_ch *optional*

remove_fill link_list st_ch end_ch *optional*

where

link_list	one or more names of links to be removed, in the form name1 name2 ... namei
st_ch	start chainage for removing the link
end_ch	end chainage for removing the link

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command

	if interval is missing, then the interval for the Apply MTF is used
interval_value	only exists if *interval* exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if *inactive* is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Width

The **cut_width** modifier is used to modify the width of variable cut links originally defined by width. Similarly the **fill_width** modifier is used to modify the width of variable fill links originally defined by width.

The format of the modifier to vary the width of the variable cut/fill links in **link_list** is

cut_width link_list st_ch end_ch st_wid end_wid absrel type optional
fill_width link_list st_ch end_ch st_wid end_wid absrel type optional

where

link_list	one or more names of cut/fill links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
st_wid	width to be used at the start modifier chainage, st_ch
end_wid	width to be used at the end modifier chainage, end_ch.
absrel	relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_wid is added to the current width of links in link_list at chainage st_ch.
the end_wid is added to the current width of links in link_list at chainage end_ch.

If **absrel** is **absolute**, then

the width of links in link_list are set to st_wid at chainage st_ch.
the width of links in link_list are set to end_wid at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the width of links in link_list are varied linearly (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the width of links in link_list are varied as a reverse cubic (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the Apply MTF is used
interval_value	only exists if *interval* exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if *inactive* is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The **width** for a variable link can also be varied by **going out to another *12d Model* string**.

cut_width link_list st_ch end_ch full_string_name side optional
fill_width link_list st_ch end_ch full_string_name side optional

where

link_list one or more names of cut/fill links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

full_string_name name of a ***12d Model*** string to take links in link_list out to. The format of the string name is “model_name->string_name”.

side side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

The **width** for a link can also be varied by using the **width between two *12d Model* strings str_name_1** and **str_name_2**.

cut_width link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

fill_width link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Width from Link

The cut and fill **width from link** modifiers are used to modify the width of cut and fill links originally defined by width, to be the same as another link. That is, the width of the link is a copy of the width of another link.

The format of the modifier to vary the cut and fill **width from link** of the fixed links given by link_list is

copy_cut_width link_list st_ch end_ch from_link zone optional
copy_fill_width link_list st_ch end_ch from_link zone optional

where

link_list one or more names of fixed links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

from_link name of the link to take the width from
zone section of the template that the from_link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval — if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value — only exists if *interval* exists

extra_start — optional - adds in an extra x-section 0.1mm before start chainage
extra_end — optional - adds in an extra x-section 0.1mm before end chainage

inactive — if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text — the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Height

The **cut_height** modifier is used to modify the height of variable cut links originally defined by height. Similarly the **fill_height** modifier is used to modify the height of variable fill links originally defined by height.

The format of the modifier to vary the height of the variable cut/fill links in **link_list** is

cut_height link_list st_ch end_ch st_ht end_ht absrel type optional
fill_height link_list st_ch end_ch st_ht end_ht absrel type optional

where

link_list — one or more names of cut/fill links given in the template definition; with format
name1 name2 ... namei

st_ch — start chainage for the modifier
end_ch — end chainage for the modifier

st_ht — height to be used at the start modifier chainage, st_ch
end_ht — height to be used at the end modifier chainage, end_ch.

absrel — relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_ht is added to the current height of links in link_list at chainage st_ch.
the end_ht is added to the current height of links in link_list at chainage end_ch.

If **absrel** is **absolute**, then

the height of links in link_list are set to st_ht at chainage st_ch.
the height of links in link_list are set to end_ht at chainage end_ch.

type — linear (default) or cubic

If **type** is **linear** (the default), then the height of links in link_list are varied linearly (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the height of links in link_list are varied as a reverse cubic (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval — if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value — only exists if *interval* exists

extra_start — optional - adds in an extra x-section 0.1mm before start chainage extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text the text is a comment

The **height** for a variable link can also be varied by **taking the height from a *12d Model* string**.

cut_height link_list st_ch end_ch full_string_name side optional
fill_height link_list st_ch end_ch full_string_name side optional

where

link_list one or more names of cut/fill links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

full_string_name name of a ***12d Model*** string to take links in link_list out to. The format of the string name is “model_name->string_name”.

side side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used

interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text the text is a comment

The **height** for a link can also be varied by using the **height between two *12d Model* strings str_name_1** and **str_name_2**.

cut_height link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional
fill_height link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Height from Link

The cut and fill **height from link** modifiers are used to modify the height of cut and fill links originally defined by height, to be the same as another link. That is, the height of the link is a copy of the height of another link.

The format of the modifier to vary the cut and fill **height from link** of the fixed links given by link_list is

copy_cut_height link_list st_ch end_ch from_link zone optional
copy_fill_height link_list st_ch end_ch from_link zone optional

where

link_list one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

from_link name of the link to take the height from
zone section of the template that the from_link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Slope

The **cut_slope** modifier is used to modify the slope of variable cut links originally defined by slope. Similarly the **fill_slope** modifier is used to modify the slope of variable fill links originally defined by slope.

The format of the modifier to vary the cut/fill slope of the variable links in **link_list** is

cut_slope link_list st_ch end_ch st_slope end_slope absrel type optional
fill_slope link_list st_ch end_ch st_slope end_slope absrel type optional

where

link_list one or more names of cut/fill links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

st_slope slope to be used at the start modifier chainage, st_ch
end_slope slope to be used at the end modifier chainage, end_ch.

absrelrelative (default) or absolute
If **absrel** is **relative** (the default) then

the st_slope is added to the current slope of links in link_list at chainage st_ch.
the end_slope is added to the current slope of links in link_list at chainage end_ch.

If **absrel** is **absolute**, then

the slope of links in link_list is set to st_slope at chainage st_ch.
the slope of links in link_list is set to end_slope at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the slope of links in link_list is varied linearly (with respect to the reference chainage) between the slope at chainage st_ch and chainage end_ch.

cubic, then the angle of the slope of links in link_list are varied as a reverse cubic (with respect to the reference chainage) between the angle of the slope at chainage st_ch and chainage end_ch.

rotate, then the angle of the slope of the links in link_list are varied linearly (with respect to the reference chainage) between the angle of the slope at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval — if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used

interval_value — only exists if *interval* exists

extra_start — optional - adds in an extra x-section 0.1mm before start chainage

extra_end — optional - adds in an extra x-section 0.1mm before end chainage

inactive — if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text — the text is a comment

The **slope** of a link can also be defined by using the slope from the **beginning of the link** (i.e. the end of the previous link or the hinge string if its the first link) to a given ***12d Model*** string.

cut_slope link_list st_ch end_ch full_string_name side optional
fill_slope link_list st_ch end_ch full_string_name side optional

where

link_list — one or more names of cut/fill links given in the template definition; with format
name1 name2 ... namei

st_ch — start chainage for the modifier

end_ch — end chainage for the modifier

full_string_name — name of a ***12d Model*** string to use to calculate slope. The format of the string name is “model_name->string_name”.

side — side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval — if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used

interval_value — only exists if *interval* exists

extra_start — optional - adds in an extra x-section 0.1mm before start chainage

extra_end — optional - adds in an extra x-section 0.1mm before end chainage

inactive — if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text — the text is a comment

The **slope** of a link can also be defined by using the slope **between two *12d Model* strings str_name_1** and **str_name_2**.

cut_slope link_list st_ch end_ch str_name_1 side1 str_name_2 optional
fill_slope link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Slope from Link

The cut and fill **slope from link** modifiers are used to modify the slope of cut and fill links originally defined by slope, to be the same **slope** or **xfall** as another link. That is, the slope of the link is a copy of the slope of another link.

The format of the modifier to vary the cut and fill **slope from link** of the fixed links given by link_list is

copy_cut_slope link_list st_ch end_ch from_link zone optional
copy_fill_slope link_list st_ch end_ch from_link zone optional

where

link_list one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

from_link name of the link to take the slope or xfall from
zone section of the template that the from_link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

Important Note

The link to copy slope from can be defined in terms of slope or **cross fall**.

If the link to copy is defined by cross fall, then the slope is calculated to match the cross fall.

Hence this command can be used with cut and fill slopes to match to rotation of cross fall of fixed links for super-elevation.

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Tin Height

The **cut and fill tin height** modifiers are used to modify the height of the link so that the link will sit on the tin at the given width.

The tin height can only be used for a cut or fill link defined by width and height.

The format of the modifiers to vary the **cut** and **fill tin height** of the links in the **link_list** are:

tin_cut_height link_list st_ch end_ch tin_name optional
tin_fill_height link_list st_ch end_ch tin_name optional

where

link_list one or more names of cut/fill links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

tin_name name of the tin to be used in defining the height.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used

interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Cut and Fill Tin Slope

The **cut and fill tin slope** modifier is used to modify the slope of the link so that the link will sit on the tin at the given width.

The cut and fill tin slope can only be used for a cut/fill link defined by width and slope.

The format of the modifiers to vary the **cut** and **fill tin slope** of the links in the **link_list** are:

tin_cut_slope link_list st_ch end_ch tin_name optional
tin_fill_slope link_list st_ch end_ch tin_name optional

where

link_list one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

tin_name name of the tin to be used in defining the slope.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Please continue to the next section 21.10.1.9 Final Link Modifiers File Format.

21.10.1.9 Final Link Modifiers File Format

Final Width

The format of the modifier to **vary the width** of the final cut and fill link link_name is

final_width link_name st_ch end_ch st_wid end_wid absrel type optional

where

link_name name of final link given in the template definition

st_ch start chainage for the modifier
end_ch end chainage for the modifier

st_wid width to be used at the start modifier chainage, st_ch
end_wid width to be used at the end modifier chainage, end_ch.

absrel relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_wid is added to the current width of link_name at chainage st_ch.
the end_wid is added to the current width of link_name at chainage end_ch.

If **absrel** is **absolute**, then

the width of link_name is set to st_wid at chainage st_ch.
the width of link_name is set to end_wid at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the width of link_name is varied linearly (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the width of link_name is varied as a reverse cubic (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Final Cut and Fill Slope

The format of the modifier to vary the cut/fill slope of the final link **link_name** is

final_cut_slope link_name st_ch end_ch st_slope end_slope absrel type optional
final_fill_slope link_name st_ch end_ch st_slope end_slope absrel type optional

where

link_name name of final link given in the template definition

st_ch start chainage for the modifier
end_ch end chainage for the modifier

st_slope slope to be used at the start modifier chainage, st_ch
end_slope slope to be used at the end modifier chainage, end_ch.

absrel relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_slope is added to the current slope of link_name at chainage st_ch.

the end_slope is added to the current slope of link_name at chainage end_ch.

If **absrel** is **absolute**, then

the slope of link_name is set to st_slope at chainage st_ch.

the slope of link_name is set to end_slope at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the slope of link_name is varied linearly (with respect to the reference chainage) between the slope at chainage st_ch and chainage end_ch.

cubic, then the angle of the slope of link_name is varied as a reverse cubic (with respect to the reference chainage) between the angle of the slope at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Stopping Final Cut and Fill Slope

The final link can be stopped altogether in either cut or fill.

The format of the modifier to stop the cut/fill slope of the final link link_name is

final_no_cut_slope link_name st_ch end_ch optional
final_no_fill_slope link_name st__ch end_ch optional

where

link_name name of final link given in the template definition

st_ch start chainage for the final link to stop
end_ch end chainage for the final link to stop

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command
if interval is missing, then the interval for the Apply MTF is used
interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed
// text the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

Please continue to the next section 21.10.1.10 Snippets File Format.

21.10.1.10 Snippets File Format

Snippets are a method of inserting groups of modifiers at once. Snippets can have parameters but the values of the parameters are saved in the actual MTF.

snippet snippet_file st_ch end_ch param_name_1 param_value_1**...**
param_name_n param_value_n *optional*

where **unknown** takes the place of the one of width, height or xfall not being used, and

snippet_file	file containing the snippet definition
st_ch	start chainage for creating the link
end_ch	end chainage for creating the link
param_name_n	name of the nth parameter - must be in quotes (")
param_value_n	value for the nth parameter - must be in quotes

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the Apply MTF is used
interval_value	only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive	if *inactive* is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See 21.10.1.5 Start and End Chainages in the Modifier File Format for the format for st_ch and end_ch.

For more information on the inserting and use of snippets, see 21.5 Defining and Using Snippets.

Please continue to the next section 21.10.1.11 A Template Modifier File Example.

21.10.1.11 A Template Modifier File Example

```

}
right_side_modifier = {
}
```

Go to the next section 21.10.1.12 MTF Stripping File Format or back to 21.10.1 Text Format of the MTF File

21.10.1.12 MTF Stripping File Format

The stripping depth is given in the Modifiers and Templates File (*.mtf) and is similar to the format for applying templates except there is no separate left and right side.

The stripping definition begins with the key words

stripping =

A list of chainages (in ascending order, one per line) with corresponding stripping depth then follows. The list of chainages and stripping depths is enclosed in curly braces {}.

The chainage-stripping lists are assembled as follows

(a) to represent a stripping depth starting at a given chainage, the chainage value followed by the stripping depth is given. The chainage and stripping depth are separated by one or more spaces. For example, the stripping depth **0.03** starting at chainage 150 is represented by

```
150        0.03
```

The stripping depth is assumed to apply until the chainage given on the next line of the stripping definition.

If the stripping depth is to go to the end of the reference string, add a line with a chainage greater than or equal to the end chainage. For example

```
150        0.03
9999       0.0
```

Warning - unlike applying templates, a stripping depth **must exist** after a chainage, however the stripping depth can be zero.

(b) linearly varying stripping depth between chainages is represented by giving the **start chainage** for the variation followed on the same line by the **start depth** and the **end depth** separated by a comma.

The linear change takes place over the interval beginning at this chainage and ending at the chainage given on the next line of the stripping definition.

For example, to linearly vary the stripping depth from 0.02 to 0.03 between the chainages 350 and 500, use

```
350        0.02 , 0.03
500        0.03
```

A Stripping Example

An example of a stripping command is

```
stripping = {
          -999      0.03
          30        0.0
          70        0.03,0.05
          110.5     0.05
          999       0.05
      }
```

Go to the next section 21.10.1.13 MTF Boxing File Format or back to 21.10.1 Text Format of the MTF File

21.10.1.13 MTF Boxing File Format

Apart from a key word specifying whether the following part of the definition is for the left or the right, the set out for the left boxing is identical to the right boxing. Hence only the left boxing will be described in detail.

The left boxing definition begins with the key words

left_boxing =

A list of chainages (in ascending order, one per line) with corresponding boxing names then follows. The list of chainages and boxing is enclosed in curly braces **{ }**.

The chainage-boxing lists are assembled as follows

(a) to represent a boxing starting at a given chainage, the chainage value followed by the boxing name is given. The chainage and boxing name are separated by one or more spaces. For example, the boxing **left** starting at chainage 150 is represented by

```
150        left
```

The boxing is assumed to apply until the chainage given on the next line of the left_boxing definition.

(b) if no boxing exists from a chainage, simply include the chainage with no boxing name following it. For example, if there is no boxing from chainage 250, this is represented by

```
250
```

The non-existence of boxing is assumed until the chainage given on the next line of the left_side definition.

If the boxing is to go to the end of the reference string, add a line with a chainage greater than or equal to the end chainage. For example

```
150        left
9999
```

When using the **Apply MTF** option, the name of the boxing definitions file is given by a **boxing_file** command **in the Modifiers and Templates File**.

```
boxing_file  =          boxing_definitions_file
```

When using the **boxing many** option, if a file name is given in the **boxing file** panel field, it is used for the boxing definitions file, otherwise the boxing_file command in the Modifiers and Templates File is used.

Note - if the boxing name includes spaces, then the name must be enclosed in quotes **“**. For example, “left 1".

An Applying Boxing Example

```
boxing_file  = “boxing_for_client.bf”
left_boxing  = {
                    -999        left
                    30
                    70          “left narrow”
                    110.5       left
                    999
             }
right_boxing  = {
                    -999        right
                    30
                    70          “right narrow”
                    110.5       right
```

999
}

Warning - no interpolation or modifiers exist for boxing.

Go to the next section 21.10.1.14 MTF Width File Format or back to 21.10.1 Text Format of the MTF File

21.10.1.14 MTF Width File Format

The format for **section width** in the mtf file is simply

section_width = *value* // default is 10000

where *value* is the distance to search from the hinge string for strings required in some options. If section_width is missing, then it takes the default value of 10000.

For example

section_width = 100.0

Go to the next section 21.10.1.15 MTF String Modifiers File Format or back to 21.10.1 Text Format of the MTF File

21.10.1.15 MTF String Modifiers File Format

In the Modifiers and Templates File, the **string modifiers** definition begins with the key word

string_modifiers =

followed by one or more occurrences of the string modifier command **height** enclosed by curly braces **{ })**

The definition of the string modifier commands will now be given.

Height

The *height* the **Height** string modifier calculates for the amend point is given by:

(a) if the absolute flag is not set, the height of the hinge point, otherwize zero.

plus

(b) the interpolated height for the user given heights at the start and end chainages

plus

(c) the interpolated height for the user given cross falls at the start and end chainage.

That is, if the absolute flag is not set:

new height = hinge height + (interpolated height) + (interpolated xfall) x (offset distance)

If the absolute flag is set:

new height = (interpolated height) + (interpolated xfall) x (offset distance)

The format of the **Height** string modifier is

height amend_str ref_str hinge_str st_ch end_ch ch_int st_xfall end_xfall st_ht end_ht absolute

where

amend_str	name of a ***12d Model*** string to take the hinge point out to. The format of the string name is "model_name->string_name".
ref_str	name of reference string. The format of the string name is "model_name->string_name".
hinge_str	name of hinge string. The format of the string name is "model_name->string_name".
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
ch_int	interval between chainage points - can be the word *null*
st_xfall	xfall to be used at the start modifier chainage, st_ch
end_xfall	xfall to be used at the end modifier chainage, end_ch.
st_ht	height to be used at the start modifier chainage, st_ch
end_ht	height to be used at the end modifier chainage, end_ch.
absolute	*optional* - if it exists, include the height of the hinge string

Height and Two Strings

The *height* the **Height 2x** string modifier calculates for the amend point is given by:

(a) the height of the hinge point

plus

(b) the offset distance multiplied by the cross fall between two user selected strings.

new height = hinge height + (xfall between string 1 and string 2) x (offset distance)

The format of the **Height 2x** string modifier is

height amend_str ref_str hinge_str st_ch end_ch ch_int xfall_str1 xfall_str2

where

amend_str name of a ***12d Model*** string to take the hinge point out to. The format of the string name is "model_name->string_name".

ref_str name of reference string. The format of the string name is "model_name->string_name".

hinge_str name of hinge string. The format of the string name is "model_name->string_name".

st_ch start chainage for the modifier

end_ch end chainage for the modifier

ch_int interval between chainage points - can be the word *null*

xfall_str_1 name of first string to calculate cross fall between. The format of the string name is "model_name->string_name".

xfall_str_2 name of second string to calculate cross fall between. The format of the string name is "model_name->string_name".

Go to the next section 21.10.1.16 Substitutions in the Modifiers and Templates File or back to 21.10.1 Text Format of the MTF File

21.10.1.16 Substitutions in the Modifiers and Templates File

The **many template variables** are special variables standing for information about the reference string used in the Apply MTF operation.

The many template variables are only evaluated when the many template file is used in an **Apply MTF** operation and provide a mechanism to generalize the many template file.

The many template file also recognizes the CCCP preprocessor rules including #include, #define, #if etc.

Many Template Variables

The list of the many template variables is:

$tangent_curve_n	chainage of the tangent curve point for the nth HIP
$tangent_spiral_n	tangent spiral
$curve_spiral_n	curve spiral
$spiral_curve_n	spiral curve
$curve_spiral_n	curve spiral
$spiral_tangent_n	spiral tangent
$curve_tangent_n	curve tangent
$start_spiral_n	length of the start spiral on the nth HIP point
$end_spiral_n	length of the end spiral
$radius_n	absolute radius of the curve
$signed_radius_n	signed radius of the curve
$vertical_tangent_curve_n	chainage of the tangent curve point for the nth VIP
$vertical_curve_tangent_n	chainage of the curve tangent point for the nth VIP
$vertical_sag_n	chainage of the sag point for the nth HIP
$vertical_crest_n	crest
$vertical_crest_sag_n	crest or sag

For example,

$tangent_spiral_3   get the chainage for the tangent spiral on HIP 3.

The variables can be used in expressions with the arithmetic operations +, -, * and / as long as the expression is surrounded by round brackets (   ).

For example, in the width command:

```
width   E   ($tangent_spiral_2 - 50)   ($tangent_spiral_2 + 50)   3   5   absolute
```

the expression ($tangent_spiral_2 - 50) will yield the chainage of fifty metres before the tangent spiral point of the second HIP point.

The variables can also be used in **#define**'s and **#include**'s according to the following CCCP rules.

(a) **#define**   *NAME*   *Expansion of NAME*

if the #define is longer than one line, the backslash character **** is added to the end of each line that has another line of the #define following to indicate that the #define continues to the next line.

(b) **#define** can be used to define a block of things with more than one argument

For example,

#define SUPER(name,ip,xf1,xf2) \
\
xfall name START_TAPER(ip) xf1 xf2 absolute \
xfall name FIXED_TAPER(ip) xf2 xf2 absolute \
xfall name END_TAPER(ip) xf2 xf1 absolute

means that SUPER("EB",3,-3.0,3.0) will be expanded to the three lines:

xfall "EB" START_TAPER(3) -3.0 3.0 absolute
xfall "EB" FIXED_TAPER(3) 3.0 3.0 absolute
xfall "EB" END_TAPER(3) 3.0 -3.0 absolute

Note that **** is used to indicate that the #define continues to the next line.

(c) (if (*express*) {*expression1* } else {*expression 2*})

is an expression *express,* which evaluates to
if *express* is true, then the value of the expression is *expression1* otherwize *expression 2*.

(d) **word##p**

is equivalent to **wordp**

(e) **#include *file_name***

A number of #defines can be placed in a file and included in the mtf by using the #include.

As an example combining the above rules, the meaning of

LEADING_TAPER_START(2)

given by the following $define:

#define LEADING_TAPER_START(ip) (if($radius_##ip < 75) {$tangent_spiral_##ip - 50)\
else { $tangent_spiral_##ip - 75 })

is

if the radius of the second HIP is less than 75, then set LEADING_TAPER_START(2) to the chainage of the tangent spiral point of the second HIP point, less fifty metres, **otherwize** LEADING_TAPER_START(2) is set to the chainage of the tangent spiral point of the second HIP point, less seventy five metres

A more complicated example now follows which shows how #defines can be used to easily apply super-elevation according to rules involving leading and trailing spirals.

```
// ---------------------------------------------------
#define LEADING_TAPER_START(ip)    ( if($radius_##ip < 75)\
 { $tangent_spiral_##ip - 50 } else { $tangent_spiral_##ip - 75 })
```

// Note: LEADING_TAPER_START evaluates to a chainage.

```
#define LEADING_TAPER_END(ip)    ( if($radius_##ip < 75)\
 { $tangent_spiral_##ip + 10 } else { $tangent_spiral_##ip + 25 })
```

// Note: LEADING_TAPER_END evaluates to a chainage.

```
#define TRAILING_TAPER_START(ip) ( if($radius_##ip < 75)\
 { $spiral_tangent_##ip - 10 } else { $spiral_tangent_##ip - 25 })
```

// Note: TRAILING_TAPER_START evaluates to a chainage.

```
#define TRAILING_TAPER_END(ip)   ( if($radius_##ip < 75)\
 { $spiral_tangent_##ip + 50 } else { $spiral_tangent_##ip + 75 })
```

// Note: TRAILING_TAPER_END evaluates to a chainage.

```
#define START_TAPER(ip) LEADING_TAPER_START(ip)\
          LEADING_TAPER_END(ip)
```

// Note: START_TAPER evaluates to two chainages: chainge1 chainage2.

```
#define FIXED_TAPER(ip) LEADING_TAPER_END(ip)\
          TRAILING_TAPER_START(ip)
```

// Note: FIXED_TAPER evaluates to two chainages: chainge1 chainage2.

```
#define END_TAPER(ip)   TRAILING_TAPER_START(ip)\
          TRAILING_TAPER_END(ip)
```

// Note: TRAILING_TAPER evaluates to two chainages: chainge1 chainage2.

```
#define SUPER(name,ip,x1,x2) \
\
  xfall name START_TAPER(ip) x1 x2 absolute \
  xfall name FIXED_TAPER(ip) x2 x2 absolute \
  xfall name END_TAPER(ip)   x2 x1 absolute
```

With the above #defines, SUPER evaluates to three lines of xfall MTF Modifiers which rotates cross-fall, keeps it constant and then counter-rotates the cross-fall about leading and trailing spirals for an HIP point.

For example,

SUPER(EB,2,-3,3)

would give expand to the following three lines of xfall commands for link **EB** which will rotate xfall from -3 to 3, hold it at 3 and then rotate it back form 3 to -3, all about the leading and trailing spirals for horizontal intersection point number two:

xfall EB begin_chainage_for_start_taper end_chainage_for_start_taper -3 3 absolute

xfall EB begin_chainage_for_fixed_taper end_chainage_for_fixed_taper_ch 3 3 absolute

xfall EB begin_chainage_for_end_taper end_chainage_for_end_taper 3 -3 absolute

The above definitions of SUPER could be placed in a file, say

f:\12d\12dmodel\library\super_mtf.def

and then simply included into a mtf file using the a #include:

#include f:\12d\12dmodel\library\super_mtf.def

Examples of Substitutions in the Modifiers and Templates File

The following example shows how #defines can be used to easily apply super-elevation according to rules involving leading and trailing spirals.

The definition of SUPER is given in the file, f:\12d\12dmodel\library\super_mtf.def, which is simply included in the mtf file using a #include.

```
// ----------------------------------------------------------------
// include the file containing the definition of SUPER
// ----------------------------------------------------------------

#include "f:\12d\12dmodel\library\super_mtf.def"
```

```
// ------------------------------------------------------------------
// apply templates left and right and then modifier them
// -------------------------------------------------------------------

left_side = {
   -999999 std
    999999
}

right_side = {
  -999999 std
   999999
}

specials = {
}

hinge_modifier = {
}

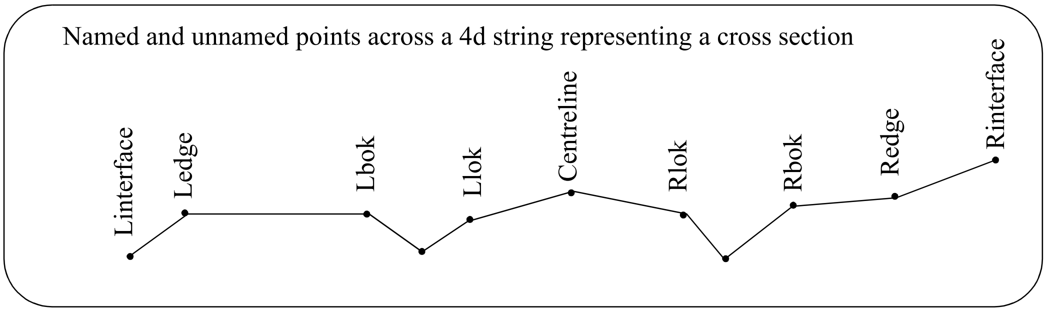
21.10.2 Text Format of the Boxing File

The interactive editor for creating the *Boxing Definitions* in the *Boxing* file has been given in the previous sections 21.7.2 Edit Boxing File.

This section will describe the text layout of the text boxing file.

Boxing is defined by a series of commands going from **left to right** across the points of a cross section. (Cross sections are generated as 4d strings by options such as **apply** and **cuts**).



The definitions of boxing cross sections are set up in a file ending in **.bf** (called the boxing file) and any number of boxing definitions can be placed in the boxing file as long as each boxing definition is given a unique name.

In the boxing file, a *Boxing Definition* with name **boxing_name** is set out as

```
boxing      boxing_name   {
                                boxing commands
                          }
```

The boxing commands apply from the offset specified at the beginning of that command (**start offset** for the command) to the start offset of the **next** command in the file (like chainages and templates in the Apply MTF file).Hence the **end offset** for a command is the start offset of the following command in the file.

For example, in the sequence

```
offset1,     command1
offset2,     command2
```

command1 goes from offset1 (the start offset for command1) to offset2 (the end offset for command1).

The **offsets** can be **fixed** values or can be specified **relative** to a point name on the 4d string representing the x-section. One restriction is that all the points mentioned in a boxing definition, must be present in each x-section the boxing definition is applied to.

The notation used to specify an actual offset, or offset relative to a point name is

```
        offset_value
or      “point_name”
or      “point_name”   +/-   offset_value
```

and means in the first case

take the specified **offset** value (offset_value can be positive or negative).

and for the other two relative cases

take the **offset at** the string or 4d point called **point_name** and add **offset_value** to it (offset_value can be positive of negative).

Hence the offset can be specified as either a value or given **relative to point_name** (**relative offset**). For convenience, the offset will be denoted by **rel_off**.

The major advantage of defining boxing in terms of point names is that whenever the points are modified using MTF Modifiers, the boxing across the section is also automatically modified.

Since the offset part of a command can consist of text plus or minus a number, commas are used to separate each field of the command.

A boxing definition may be used in either a left_boxing or right_boxing mtf command (see the section, creating boxing), however unlike the case for templates, the boxing definition is applied to the point names going from left to right regardless of whether the boxing definition is used on the left or the right.

In practice, the definitions for left and right boxing are usually different because of the necessity of having unique point names across the entire cross section.

Vertical Walls

If a boxing definition creates two different height values at the one offset (i.e. a wall), then extra offset points are automatically inserted into the boxing x-section (at 0.1 mm from the previous point) so that no points are on top of each other.

So in effect a vertical wall is created but since no points are created that are directly above each other, the data can be triangulated.

The commands in the boxing definition are:

see 21.10.2.1 Text Format - Boxing Copy
see 21.10.2.2 Text Format - Boxing Copy with Height Adjustment
see 21.10.2.4 Text Format - Boxing Line
see 21.10.2.5 Text Format - Boxing Xfall
see 21.10.2.6 Text Format - Boxing Xfall1
see 21.10.2.9 Text Format - Boxing End
see 21.10.2.10 Text Format - Boxing Right_Xfall
see 21.10.2.11 Text Format - Boxing Right_slope
see 21.10.2.12 Text Format - Boxing Right_copy
see 21.10.2.13 Text Format - Boxing Left_Xfall
see 21.10.2.14 Text Format - Boxing Left_slope
see 21.10.2.15 Text Format - Boxing Left_copy
see 21.10.2.16 Text Format - Boxing Definitions Example

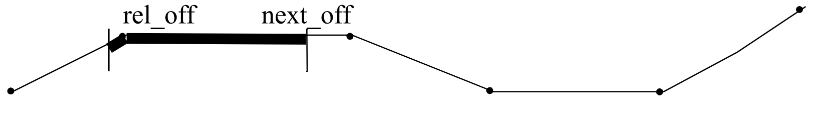
21.10.2.1 Text Format - Boxing Copy

rel_off, **copy**

This copies the links (or parts of links) from the start offset **rel_off** to the offset on the next line, keeping the present crossfall and height of each link

.

rel_off, **copy**
next_off, ...



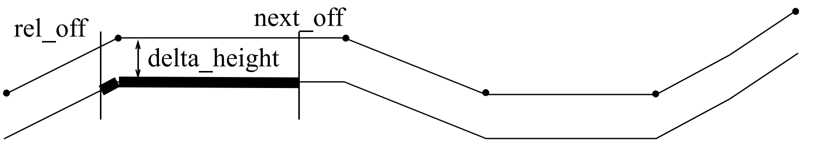
For the boxing panel that creates this boxing command, see 21.7.2.2.1 Boxing Copy.

21.10.2.2 Text Format - Boxing Copy with Height Adjustment

rel_off, **copy**, delta_height

This copies the links (or parts of links) from the start offset **rel_off** to the offset on the next line, keeping the present slope of each link but adjusting the height of each link by **delta_height**.

rel_off, **copy**, delta_height
next_off, ...



For the boxing panel that creates this boxing command, see 21.7.2.2.1 Boxing Copy.

21.10.2.3 Text Format - Boxing Vertex

For the boxing panel that creates this boxing command, see 21.7.2.2.2 Boxing Vertex.

21.10.2.4 Text Format - Boxing Line

Line Through Two Given Points

rel_off, **line**, rel_off_1, delta_height_1, rel_off_2, delta_height_2

This creates a link from the start offset **rel_off** to the offset on the next line, with a

(a) slope given by two points

(b) start height given by projecting to the start offset, the line through the two points.

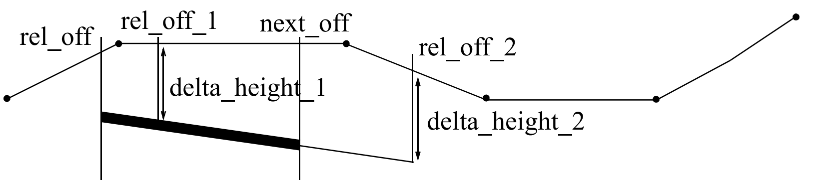
The first point defining the line has an offset **rel_off_1** and a height given by the height of the design x-section at offset **rel_off_1** adjusted by **delta_height_1**.

The second point defining the line has an offset **rel_off_2** and a height given by the height of the design x-section at offset **rel_off_2** adjusted by **delta_height_2**.

The typed format of the **line** commands created by this panel is (all on one line):

point_name + point_offset,**line**, point_1_name + point_1_offset,delta_height_1,
point_2_name + point_2_offset,delta_height_2

rel_off, **line**, rel_off_1, delta_height_1, rel_off_2, delta_height_2
next_off, ...



For the boxing panel that creates this boxing command, see 21.7.2.2.6 Boxing Line - line through two points.

21.10.2.5 Text Format - Boxing Xfall

Line Through a Given Point with a Given Crossfall

rel_off, **xfall**, rel_off_1, delta_height_1, xfall_value

This creates a link from the start offset to the offset on the next line, with a

(a) user given xfall

(b) start height given by projecting to the start offset, the line with a given xfall and going through a given point.

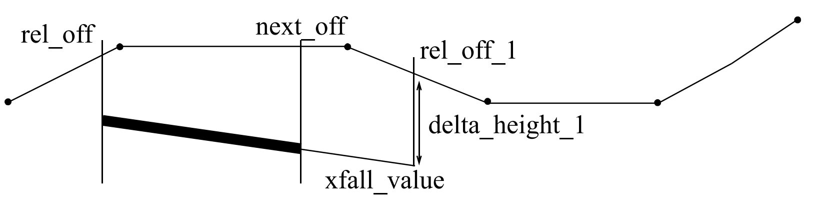
The point defining the line has an offset **rel_off_1** and a height given by the height of the design x-section at offset **rel_off_1** adjusted by **delta_height_1**.

The typed formats of the **xfall** commands created by this panel is:

point_name + point_offset, **xfall,** control_name + control_offset, control_height, xfall

The crossfall of the line is given by **xfall_value**

rel_off, **xfall**, rel_off_1, delta_height_1, xfall_value
next_off, ...



For the boxing panel that creates this boxing command, see 21.7.2.2.4 Boxing Xfall - line through a point with a given crossfall.

21.10.2.6 Text Format - Boxing Xfall1

Line Through a Given Point with Crossfall Taken from a Point

rel_off, **xfall1**, rel_off_1, delta_height_1, rel_off_2, delta_xfall

This creates a link from the start offset **rel_off** to the offset on the next line, with a

(a) xfall which is the xfall at a given offset plus an addition given xfall

and

(b) start height given by projecting to the start offset, the line with the given xfall and going through a given point.

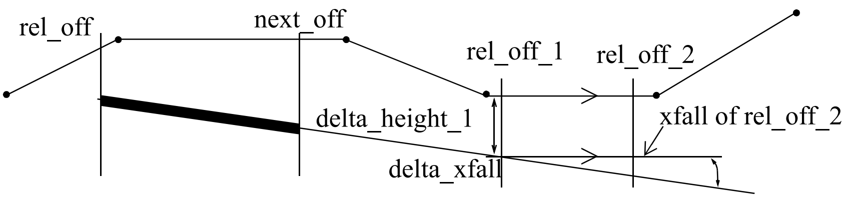
The point defining the line has offset **rel_off_1** and a height given by the height of the design x-section at offset **rel_off_1** adjusted by **delta_height_1**

The typed formats of the **xfall1** commands created by this panel is:

point_name + point_offset, **xfall1,** control_name + control_offset, control_height,
xfall_name + xfall_offset, xfall_delta

The xfall of the line is **delta_xfall** added to the xfall on the design x-section at the offset **rel_off_2**

rel_off, **xfall1**, rel_off_1, delta_height_1, rel_off_2, delta_xfall
next_off, ...



For the boxing panel that creates this boxing command, see 21.7.2.2.5 Boxing Xfall 1 - line through a point with a crossfall taken from a point.

21.10.2.7 Text Format - Boxing Intersect

For the boxing panel that creates this boxing command, see 21.7.2.2.7 Boxing Intersect - Intersection of Two Lines.

21.10.2.8 Text Format - Boxing Xfall Point

For the boxing panel that creates this boxing command, see 21.7.2.2.9 Boxing Xfall Point.

21.10.2.9 Text Format - Boxing End

rel_off, **end**

The typed format of the **line** commands created by this panel is:

point_name + point_offset,   **end**

This command in used to give an end offset for any of the above commands when no command follows to use for the end offset. That is, the offset **rel_off** is used as the **end offset** for the **previous command**.

end doesn't begin another command and none of the above commands can follow an **end** command.

All of the above boxing commands are known as **standard** commands. Hence the **end** command is the **last** standard command.

For the boxing panel that creates this boxing command, see 21.7.2.2.16 Boxing End.

21.10.2.10 Text Format - Boxing Right_Xfall

Batter off Right End of Boxing with Crossfall Taken from a Point

The **right_xfall** command has two versions - providing a fixed cross fall or using the crossfall from part of the design x-section.

right_xfall   rel_off,   delta_xfall

right_xfall   xfall_value

The typed formats of the **right_xfall** commands created by this panel is:

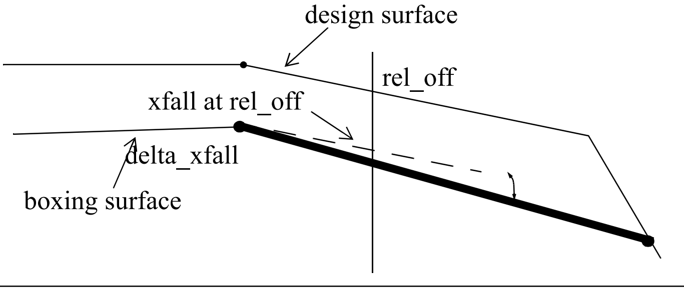
right_xfall,   xfall_name + xfall_offset, xfall_delta
For the first case, the **right_xfall** command batters off the right end of the boxing using the xfall from the design section at a given offset *rel_off* plus an additional given xfall *delta_xfall*, until the design section is intersected. The intersection point is used as the next point in the boxing.

Hence the xfall of the batter is **delta_xfall** added to the xfall on the design x-section at the offset **rel_off**

For the second case, the **right_xfall** command batters off to the right end of the boxing at the given xfall **xfall_value** until the design section is intersected. The intersection point is used as the next point in the boxing.

In the right_xfall command, the xfall is percent cross-fall and a positive xfall is up and negative down.

right_xfall1   rel_off,   del
ta_xfall



For the boxing panel that creates this boxing command, see 21.7.2.2.18 Boxing Right Side Interface Xfall from Point.

21.10.2.11 Text Format - Boxing Right_slope

Batter Off the Right End of Boxing with a Given Slope

right_slope slope_value

The **right_slope** commands batter off to the right end of the boxing at the given slope **slope_value** until the design section is intersected. The intersection point is used as the next point in the boxing. In this command, a positive slope is up and negative down.

For the boxing panel that creates this boxing command, see 21.7.2.2.18 Boxing Right Side Interface Xfall from Point.

21.10.2.12 Text Format - Boxing Right_copy

Copy from the Last Boxing Point to the end of Design Section

right_copy value

If value is non-zero, the right_copy command copies from the last boxing point to the last point on the design section. Hence the right_copy command is used to continue the boxing section from the intersection point with the design section to the end of the design section (a full width boxing section).

Note
The **right_xfall** command **takes precedence over** the **right_slope** command. That is, if both commands exist then only the right_xfall command is used.

For the boxing panel that creates this boxing command, see 21.7.2.2.18 Boxing Right Side Interface Xfall from Point.

21.10.2.13 Text Format - Boxing Left_Xfall

Batter off Left End of Boxing with Crossfall Taken from a Point

left_xfall rel_off, delta_xfall

left_xfall xfall_value

The typed formats of the **left_xfall** commands created by this panel is:

left_xfall, xfall_name + xfall_offset, xfall_delta

The left_xfall is identical to the right_xfall command except that it is applied at the beginning of the boxing definition and batters off to the left rather than to the right.

In the left_xfall command, the xfall is percent cross-fall and a positive xfall is up and negative down.

For the boxing panel that creates this boxing command, see 21.7.2.2.17 Boxing Left Side Interface Xfall from Point.

21.10.2.14 Text Format - Boxing Left_slope

Batter Off the Left End of Boxing with a Given Slope

left_slope slope_value

The left_slope is identical to the right_slope command except that it is applied at the beginning of the boxing definition and batters off to the left rather than to the right. In this command, a positive slope is up and negative down.

The left_slope and left_copy are identical to the right_slope and right_copy except that they are applied at the beginning of the boxing definition and batter off and copy to the left rather than to the right. In this command, a positive slope is up and negative down.

The left_copy command must come before the left_slope command but they both come after all of the standard commands.

Note

The **left_xfall** command **takes precedence over** the **left_slope** command. That is, if both commands exist then only the left_xfall command is used.

For the boxing panel that creates this boxing command, see 21.7.2.2.17 Boxing Left Side Interface Xfall from Point.

21.10.2.15 Text Format - Boxing Left_copy

Copy from the Start of Design Section to the First Boxing Point

left_copy value

The left_copy is identical to the right_copy except that it is applied at the beginning of the boxing definition and copies to the left rather than to the right.

If *value* is non-zero, the **left_copy** command copies from the last boxing point to the last point on the design section. Hence the left_copy command is used to continue the boxing section from the first boxing point to the start of the design section (a full width boxing section).

Note

The left_xfall, left_slope, left_copy, right_xfall, right_slope and right_copy commands should come after all of the standard commands.

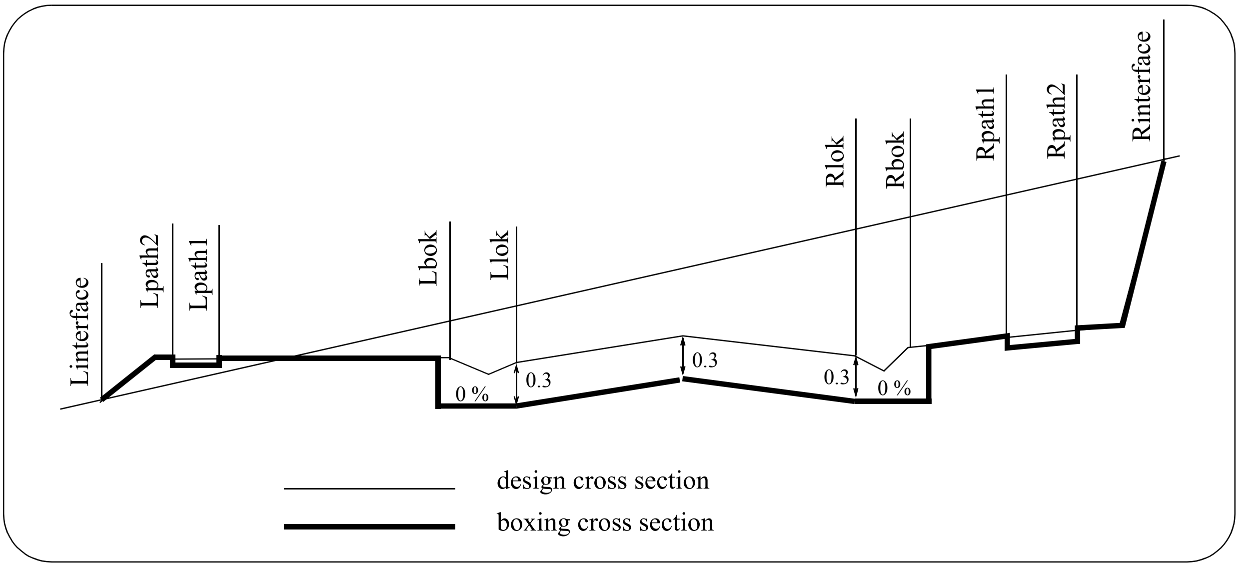
When a boxing definition is applied on the left side, any right_xfall, right_slope or right_copy is ignored. Similarly, when a boxing definition is applied on the right side, any left_xfall, left_slope or left_copy is ignored.

Hence a boxing definition can have a left_xfall, left_slope, left_copy and a right_xfall, right_slope, right_copy but which set is used depends on whether the boxing definition is used on the left or the right.

When the **boxing** panel is used to create the boxing, only one boxing definition is needed and all of the right_xfall, right_slope, right_copy, left_xfall, left_slope and left_copy commands are used.

For the boxing panel that creates this boxing command, see 21.7.2.2.17 Boxing Left Side Interface Xfall from Point.

21.10.2.16 Text Format - Boxing Definitions Example



```
boxing "1" {

    "Linterface",        copy                                       // line 1
    "Lpath2",            copy,     -0.075                           // line 2
    "Lpath1",            copy                                       // line 3
    "Lbok" - 0.15,       xfall,    "Llok",     -0.3,      0         // line 4
    "Llok",              copy,     -0.3                             // line 5
    "Rlok",              xfall,    "Rlok",     -0.3,      0         // line 6
    "Rbok" + 0.15,       copy                                       // line 7
    "Rpath1",            copy      -0.095                           // line 8
    "Rpath2",            copy                                       // line 9
    "Rinterface",        end                                        // line 10
}
```

Description

Line 1	copy from "Linterface" to "Lpath2"
Line 2	copy and drop by 0.075 from "Lpath 2" to "Lpath 1"
Line 3	copy from "Lpath1" to 0.15 before "Lbok"
Line 4	go from 0.15 before "Lbok" to "Llok" at depth 0.3 below "Llok", with cross fall 0
Line 5	copy and drop by 0.3 from "Llok" to "Rlok"
Line 6	go from "Rlok" to 0.15 past "Rbok" at depth 0.3 below "Rlok", with cross fall 0
Line 7	copy from 0.15 past "Rbok" to "Rpath1"
Line 8	copy and drop by 0.095 from "Rpath1" to "Rpath2"
Line 9	copy from "Rpath2" to "Rinterface"

```
boxing "left narrow"  {                  // boxing defined from just before lkerb to m001
            "lkerb"   - 0.7  ,        copy
            "m001"   - 1.0,           copy   ,     -0.6
            "m001",                   end
  }
```

```
boxing "left" {      // boxing defined from the left start of the section to m001 (the centreline say)
        "lkerb",     copy,     -0.6
        "m001",      end
        left_slope   5.0
        left_copy    1
  }
boxing "right" {          // boxing defined from m001 to the far right of the section
        "m001",      copy,     0.6
        "rkerb",     end
        right_slope  5.0
        right_copy 1
  }
boxing "full" {      // a full width boxing - defines the entire boxing going from left to right
        "lkerb",     copy,     -0.6
        "rkerb",     end
        left_slope   5.0
        left_copy    1
        right_slope -5.0
        right_copy 1
  }
```

For more information on how Boxing works in ***12d Model***, please go to the section 21.4 Smart Chainages.

21.11 Superseded MTF Commands

These MTF Modifier options were superseded by the commands in ***12d Model 11*** that did not care how the links were originally defined.

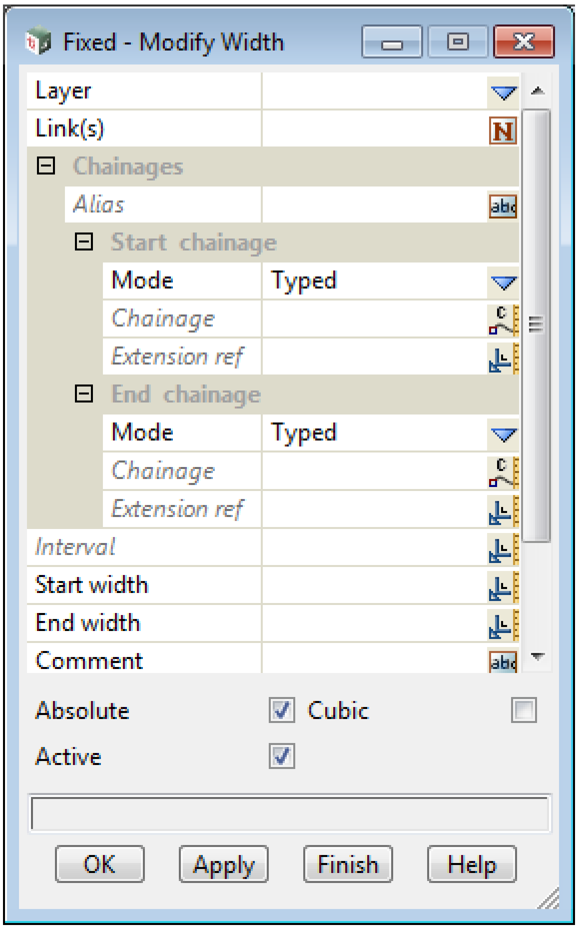
21.11.0.1 Fixed Link - Modify Width or Height - Superseded

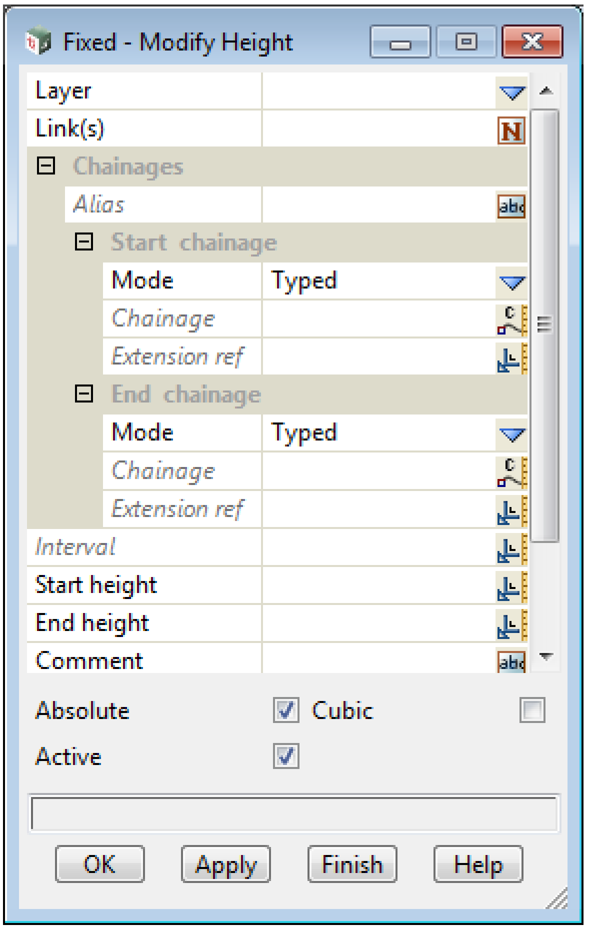
This option has been superseded in V11 by the Fixed Link modifier, **Modify Link**. See 21.2.2.2.4 Fixed - Modify Link.

The **Width** modifier is used to ***modify the width*** of fixed links originally defined by width (*width and height* or *width and xfall*).

The **Height** modifier is used to ***modify the height*** of fixed links originally defined by height (*height and width* or *height and xfall*).

Selecting **width and height** brings up the **Fixed - Modify Width** and **Fixed - Modify Height** panels respectively.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link.

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End width/height input measures menu

start/end width/height for modifying the template link.

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute tick box tick

*if **ticked**, the width/height is set to the values given in the* **start** *and* **end value** *fields.*
*if **not ticked**, the values given in the* **start** *and* **end value** *fields are added to the existing widths/heights.*

Cubic tick box

*if **ticked**, the width/height is varied as a reverse cubic between the start and end chainages.*
*if **not ticked**, the width/height is varied linearly between the start and end chainages.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **MTF** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply MTF** for the MTF is done.*

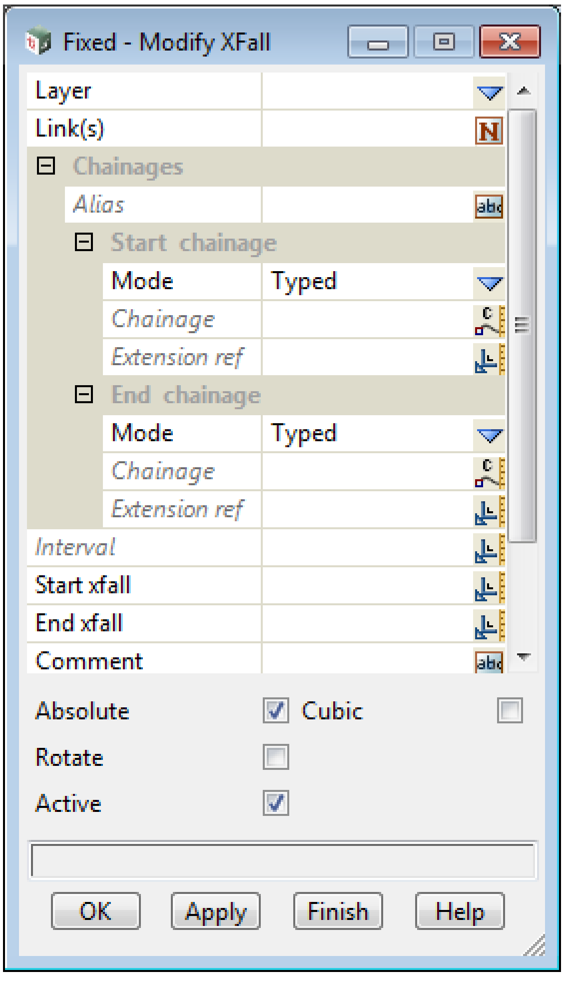
Continue to the next section 21.11.0.2 Fixed Link - Modify Xfall - Superseded or go to the replacement options 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.11.0.2 Fixed Link - Modify Xfall - Superseded

This option has been superseded in V11 by the Fixed Link modifier, **Modify Link**. See 21.2.2.2.4 Fixed - Modify Link.

The **Xfall** modifier is used to ***modify the cross fall*** of fixed links originally defined by cross fall (*xfall and width* or *xfall and height*).

Selecting **Xfall** brings up the **Fixed - Modify Xfall** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link.

Interval	input		

if ***non blank****, the interval to use to create cross sections and strings over the given chainage range. If* ***blank****, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End xfall	input		measures menu

start/end crossfall for modifying the template link.

Extra start/end	tick box		

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute tick box tick

*if **ticked**, the xfall is set to the values given in the* **start** *and* **end xfall** *fields.*
*if **not ticked**, the values given in the* **start** *and* **end xfall** *fields are added to the existing xfall.*

Cubic and Rotate tick boxes:

*Only none or one of **Cubic** and **Rotate** can be set to **tick.***
*The **default** is none - that is, **neither is ticked** and in the default case, the crossfall is varied **linearly with respect to crossfall** between the start and end chainages.*

Cubic tick box

*if **ticked**, the crossfall is varied as a reverse cubic between the start and end chainages.*

Rotate tick box

*if **ticked**, the xfall is varied linearly **with respect to** the **angle,** between the start and end chainages.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

Apply *stores the values and leaves the panel on the screen.*

*If the **MTF** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply MTF** for the MTF is done.*

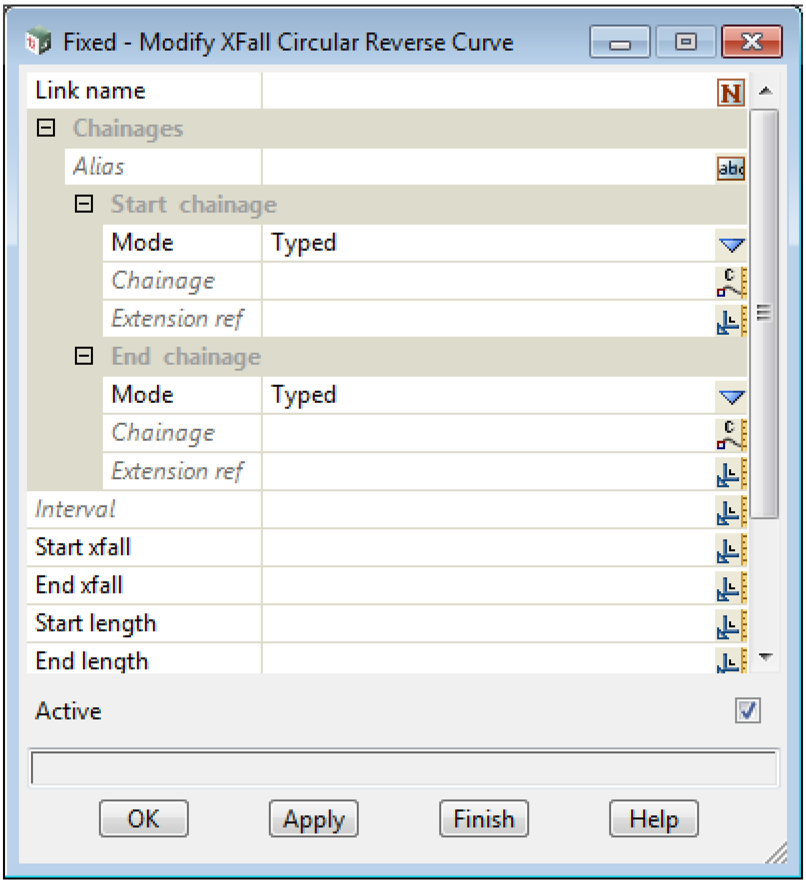
Continue to the next section 21.11.0.3 Fixed Link - Modify Xfall by CRC Formula - Superseded or go to the replacement options 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.11.0.3 Fixed Link - Modify Xfall by CRC Formula - Superseded

This option has been superseded in V11 by the Fixed Link modifier, **Modify Link**. See 21.2.2.2.4 Fixed - Modify Link.

The **Xfall CRC** modifier is used to modify the cross fall of fixed links originally defined by **xfall** and uses the **circular reverse curve** formula to modify the cross fall.

Selecting **Xfall CRC** brings up the **Fixed - Modify Xfall Circular Reverse Curve** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link.

Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

Start/End xfall	input		measures menu

start/end crossfall for modifying the template link.

Start/End length	input		measures menu

start/end length for circular arcs.

Extra start/end	tick box		

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

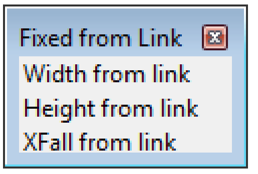
Apply *stores the values and leaves the panel on the screen.*

*If the **MTF** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply MTF** for the MTF is done.*

Continue to the next section 21.11.0.4 Fixed Link - From Link - Superseded or go to the replacement options 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.11.0.4 Fixed Link - From Link - Superseded

The **fixed from Link** walk-right brings up the **fixed from Link** menu with options to take the width, xfall or height from another link.



For *Width/Height/Xfall from link*, go to the next section [Fixed Link - Take Width, Height or Xfall from another Link](#)

Fixed Link - Take Width, Height or Xfall from another Link

Width from Link

The **Width from link** modifier is used to ***modify the width*** of fixed links originally defined by width (*width and height* or *width and xfall*) to be the same width as another link. That is, the width of the link is a **copy** of the **width** of another link.

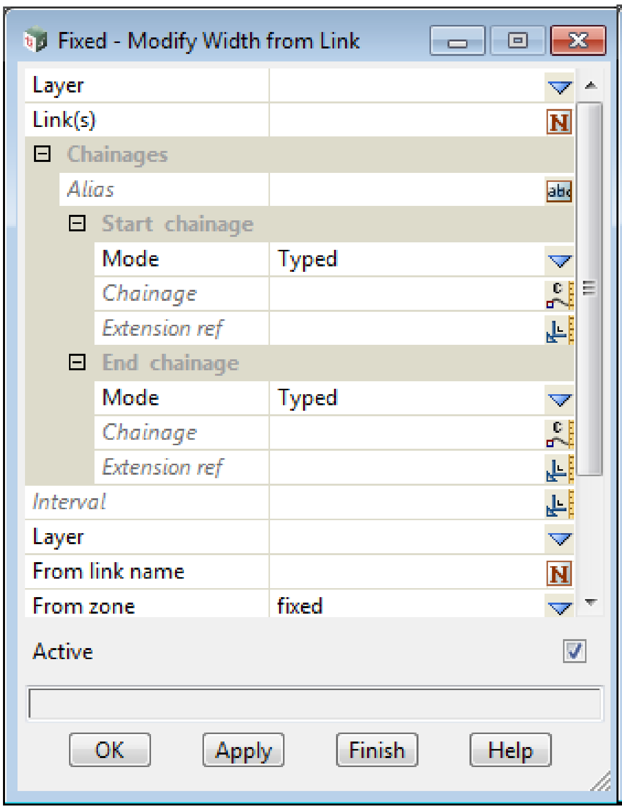
Height from Link

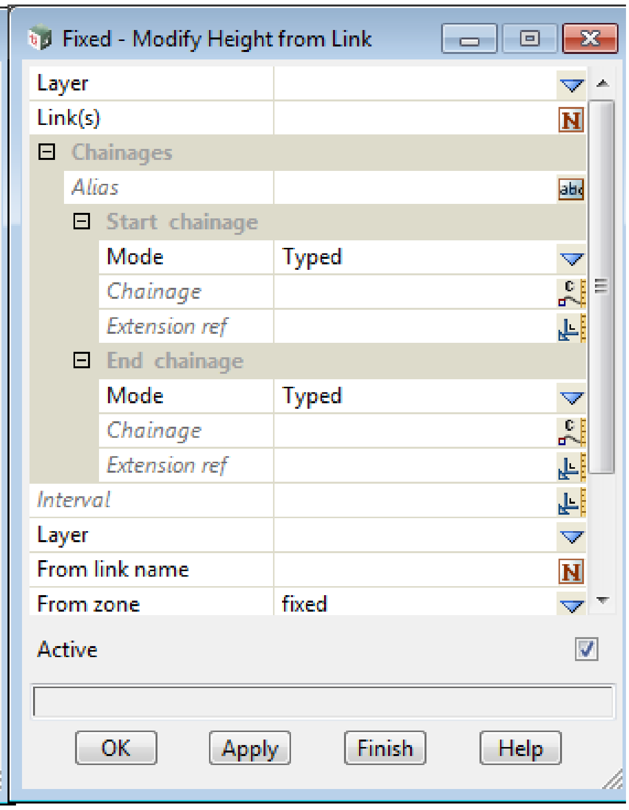
The **Height from link** modifier is used to ***modify the height*** of fixed links originally defined by height (*height and xfall* or *height and width*) to be the same height as another link. That is, the height of the link is a **copy** of the **height** of another link.

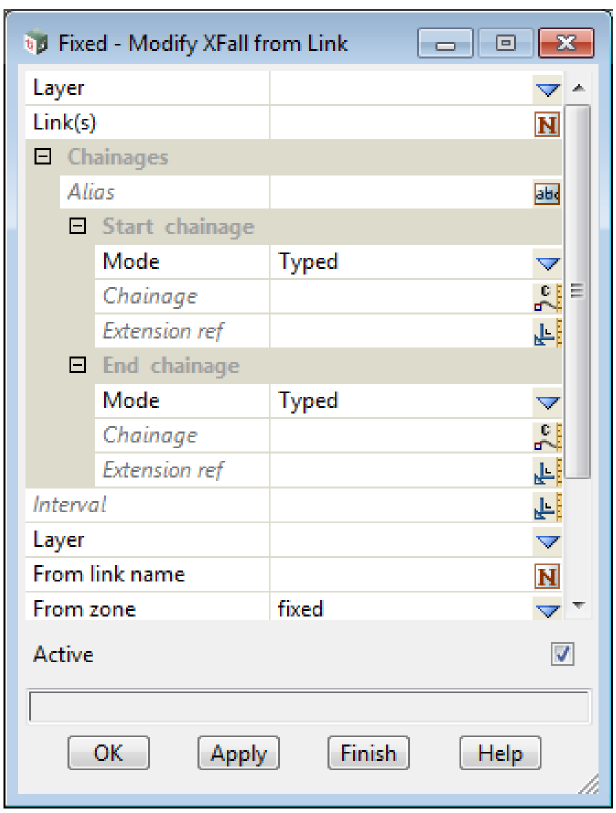
Xfall from Link

The **Xfall from link** modifier is used to ***modify the cross fall*** of fixed links originally defined by xfall *(xfall and height* or *xfall and width*) to be the same xfall as another link. That is, the cross fall of the link is a **copy** of the **cross fall** of another link. The link to copy cross fall from can be defined in terms of cross fall or slope. If the link to copy is defined by slope, then the cross fall is calculated to match the slope.

Selecting the **Width from link, Height from link or Xfall from link** option brings up the **Fixed - Modify Width from Link**, **Fixed- Modify Height from Link** and **Fixed- Modify Xfall from Link** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link.

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

From link name	input		select name menu

template link to take width/height/xfall from.

From zone	input	fixed	fixed, cut, fill

zone that the template link to take width/height/xfall from, comes from.

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active	tick box	tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

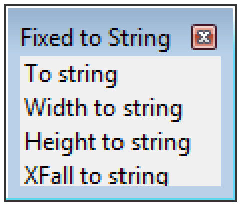
Apply *stores the values and leaves the panel on the screen.*

*If the **MTF** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply MTF** for the MTF is done.*

Continue to the next section 21.11.0.5 Fixed Link - to String - Superseded or go to the replacement options 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.11.0.5 Fixed Link - to String - Superseded

The **fixed from string** walk-right brings up the **fixed from string** menu with options to take the width, xfall or height by going to another string.

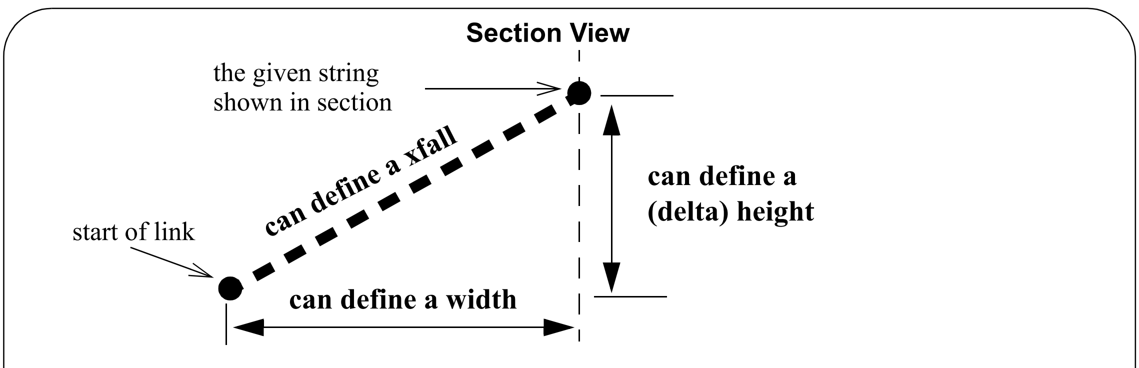


For *To string, go to* — Fixed Link - Modify To String

Width/Height/Xfall to string — Fixed Link - Calculate Width, Height or Xfall to a String

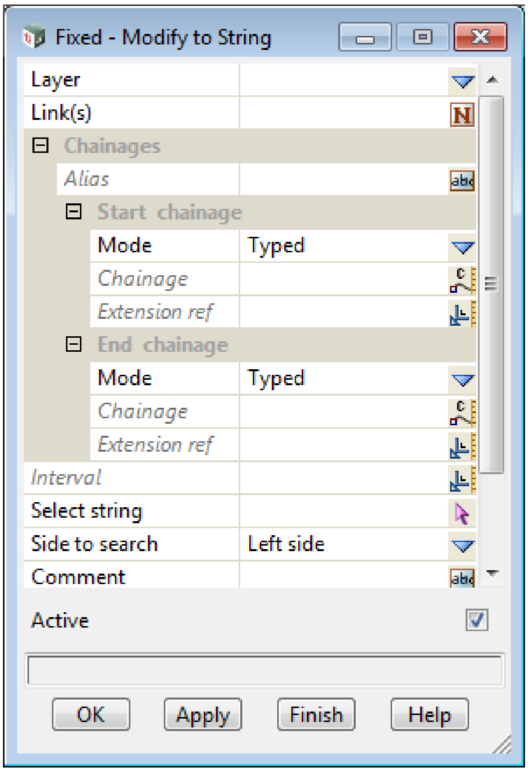
Fixed Link - Modify To String

For any fixed link, **To string** calculates the required width, height and/or xfall of the link needed to get from the start point of the link **to the selected string**.



the start and end points can be used to define a width, xfall or (delta) height

Selecting **To string** bring up the **Fixed - Modify to String** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

names of the links to modify.

If there is more then one link name then the names must be separated by spaces. If the link name includes a space, then the name must be enclosed in the quotes " (eg "EB 1").

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link.

*When the **Start mode** is **Start (ref),** or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.*

*When the **End mode** is **End (ref),** or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

Interval	input		

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String	string-select		

select string to use for defining width/height/crossfall for the link.

Side to search	input	left side	left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/crossfall.

Extra start/end	tick box		

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment	input		

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

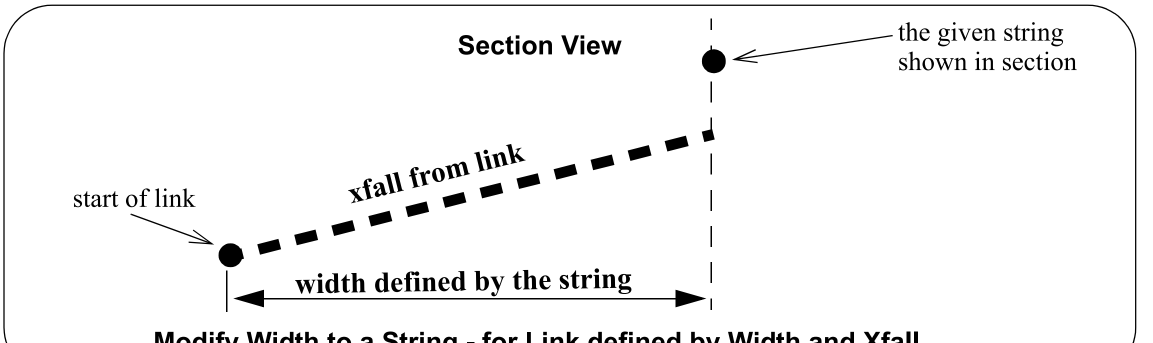
Apply *stores the values and leaves the panel on the screen.*

*If the **MTF** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply MTF** for the MTF is done.*

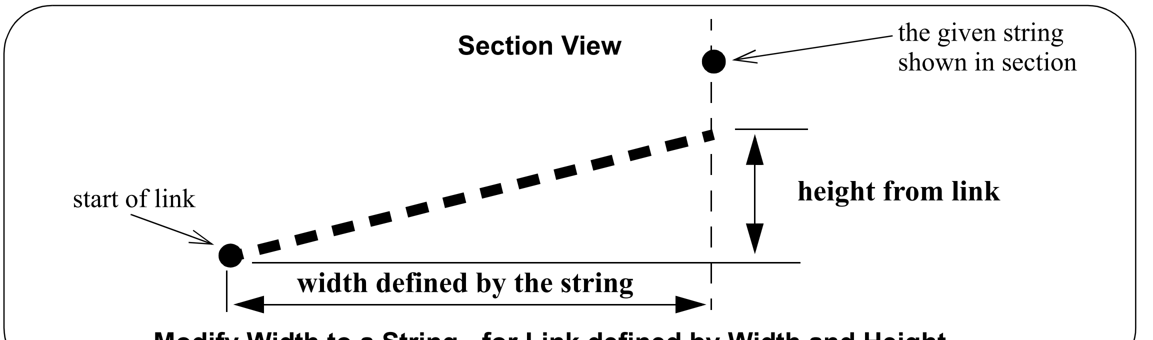
Fixed Link - Calculate Width, Height or Xfall to a String

Width to String:

For a fixed link defined by *width* and *height* or *width* and *xfall*, **Width to string** calculates the **width** of the link as the width from the start point of the link, to the **to the selected string**. The *xfall* or *height* is taken from the link. The option will give an error for a link defined by *height* and *xfall*.



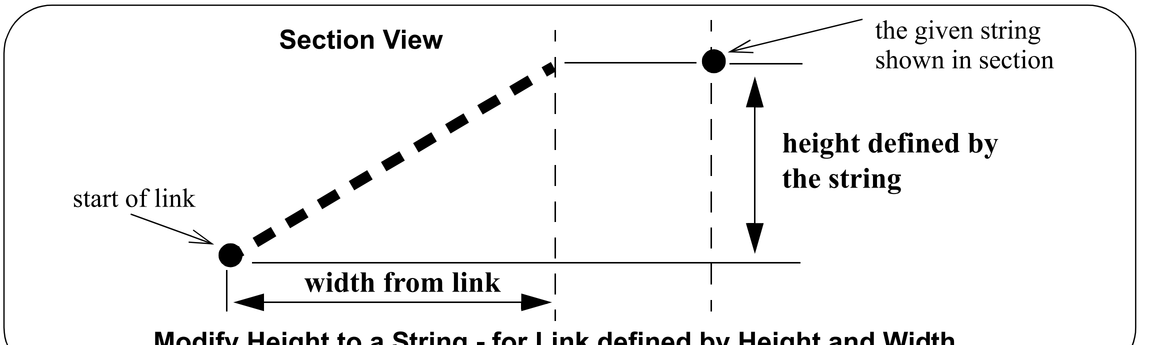
Modify Width to a String - for Link defined by Width and Xfall



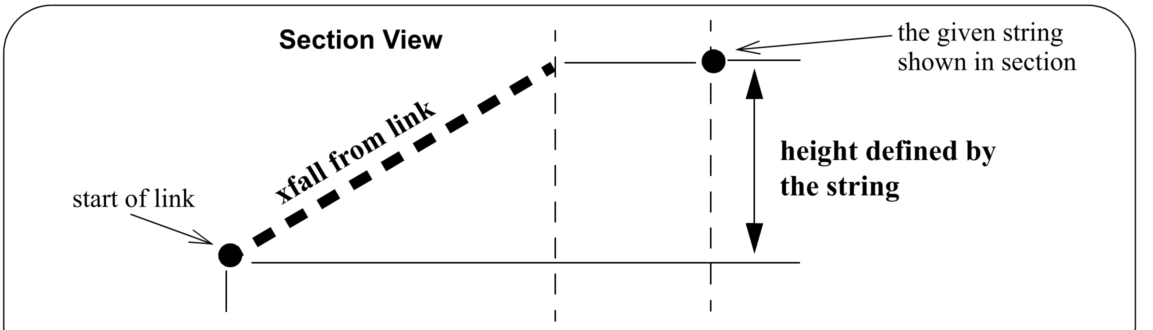
Modify Width to a String - for Link defined by Width and Height

Height to String:

For a fixed link defined by *height* and *width* or *height* and *xfall*, **Height to string** calculates the **height** of the link as the difference in the height at the start point of the link, and the height **at the selected string**. The *xfall* or *width* is taken from the link. The option will give an error for a link defined by *width* and *xfall*.



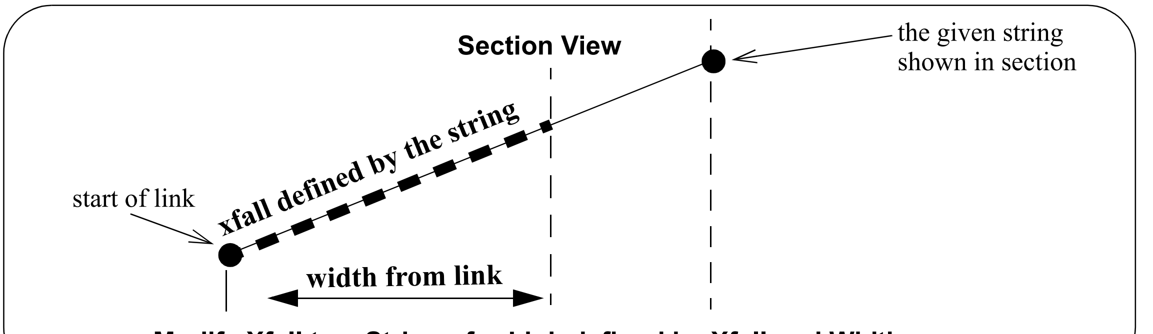
Modify Height to a String - for Link defined by Height and Width



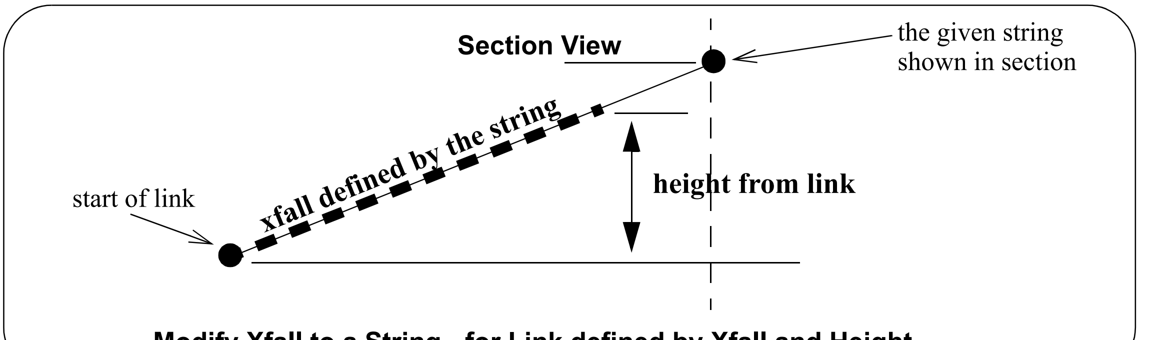
Modify Height to a String - for Link defined by Height and Xfall

Xfall to String:

For a fixed link defined by *xfall and width* or *xfall* and *height*, **Xfall to string** calculates the **xfall** of the link as the *xfall* from the start point of the link to the **selected string**. The *width* or *height* is taken from the link. The option will give an error for a link defined by *width* and *height*.



Modify Xfall to a String - for Link defined by Xfall and Width



Modify Xfall to a String - for Link defined by Xfall and Height

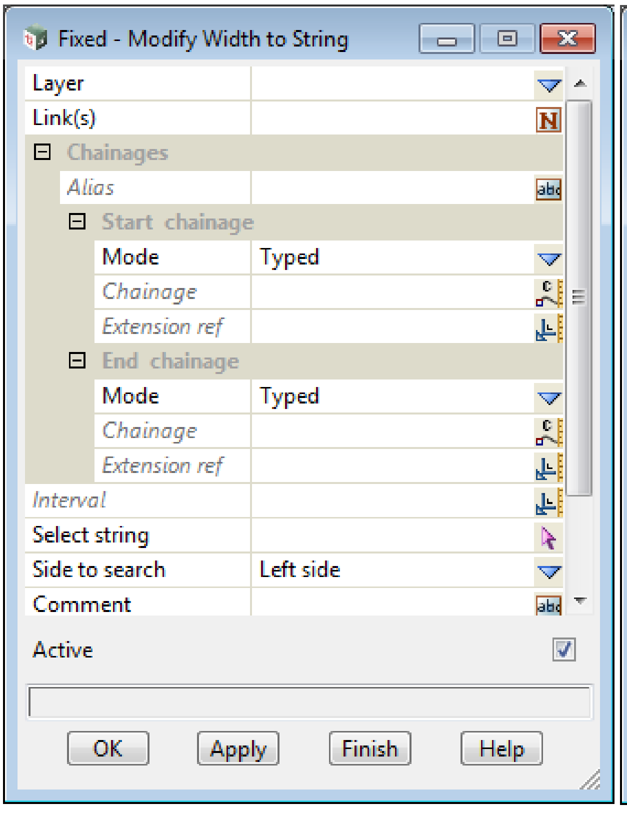
Note:

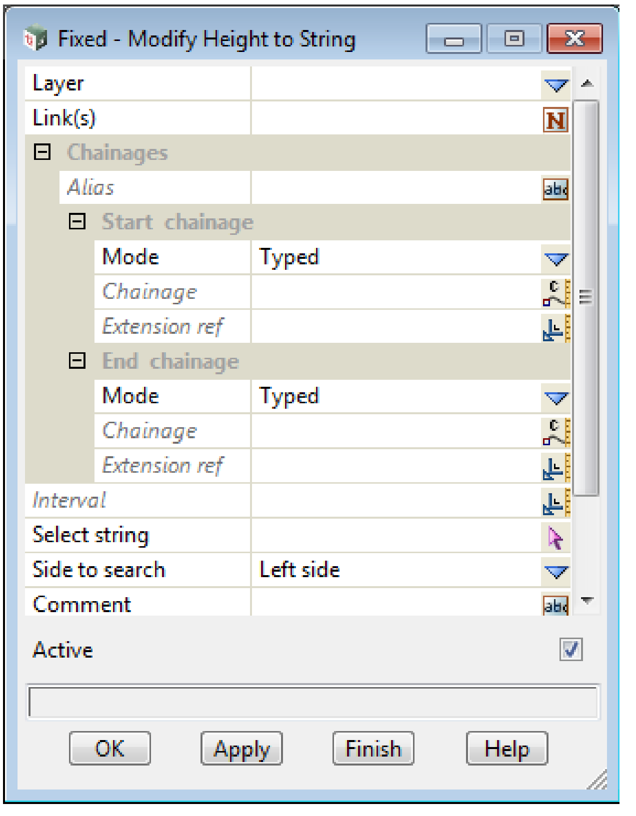
Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example for a modifier defined by *width and xfall*, using *width to string* and a *xfall to string* with the same string will place the end of the link on that string.

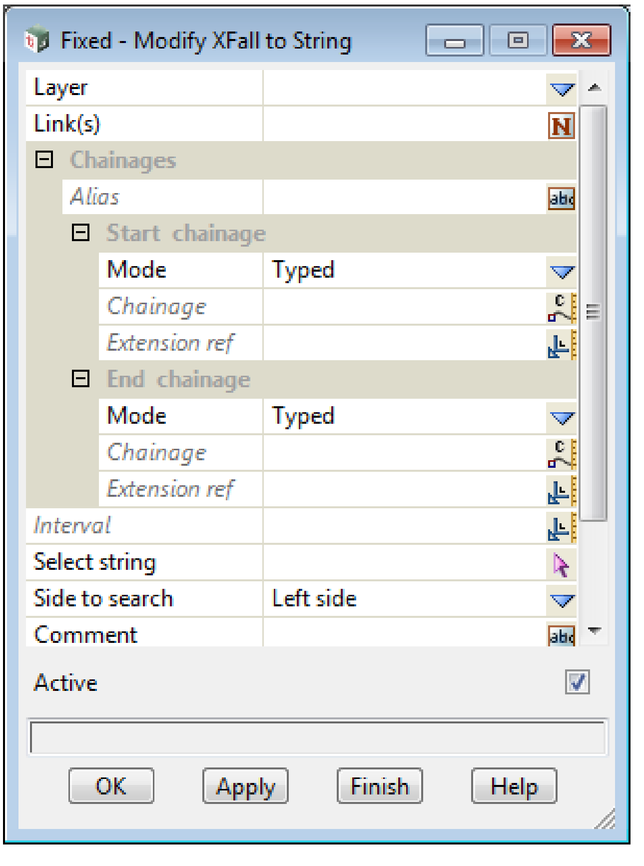
But the To string option will do the same thing in one command. See Fixed Link - Modify To String.

Selecting the **width to string, height to string or xfall to string** option brings up the **Fixed - Modify Width**

to String, **Fixed - Modify Height to String** and **Fixed - Modify Xfall to String** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)	

defines the start/end chainages for modifying the link.

*When the **Start mode** is **Start (ref),** or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.*

*When the **End mode** is **End (ref),** or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the* **Section separation** *value from the* **Apply MTF** *panel is used.*

String string-select

select string to use for defining width/height/crossfall for the link.

Side to search input left side left side, right side, both sides

side of the hinge string to start searching to find the string to define width/height/crossfall.

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK *stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

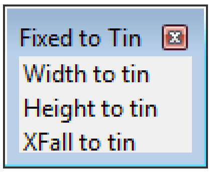
Apply *stores the values and leaves the panel on the screen.*

*If the **MTF** is being used in an **Apply MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply MTF** for the MTF is done.*

Continue to the next section 21.11.0.6 Fixed Link - to Tin - Superseded or go to the replacement options 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.11.0.6 Fixed Link - to Tin - Superseded

The **fixed to tin** walk-right brings up the **fixed to Tin** menu with options to calculate the width, xfall or height to get to a given tin.

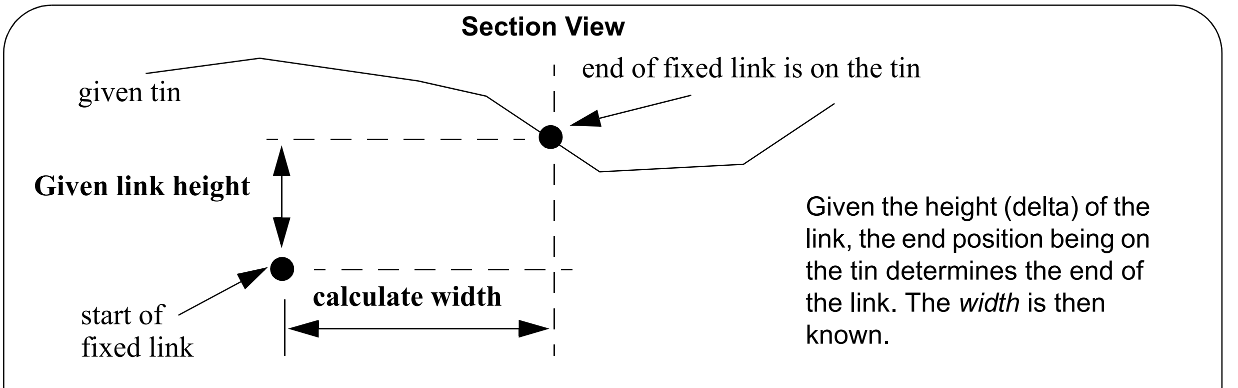


For *Width/Height/Xfall to tin*, go to the next section Fixed Link - Modify Width, Height or Xfall to Sit on User Tin

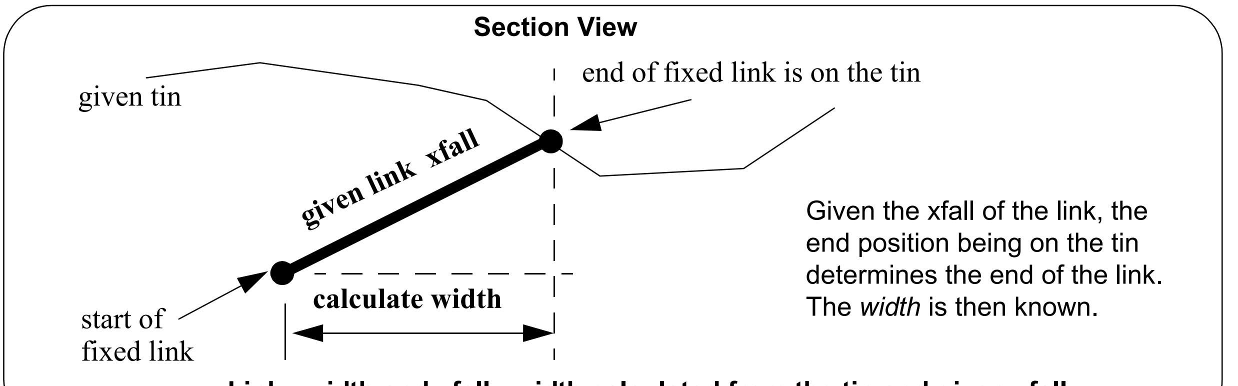
Fixed Link - Modify Width, Height or Xfall to Sit on User Tin

Width to Tin

For a fixed link defined by *width* and *height* or *width* and *xfall*, **Width to tin** calculates the **width** of the link as the width required so that the link will sit on the user given tin at the ***height/xfall given in the link***. The option gives an error for a link defined by *height* and *xfall*.



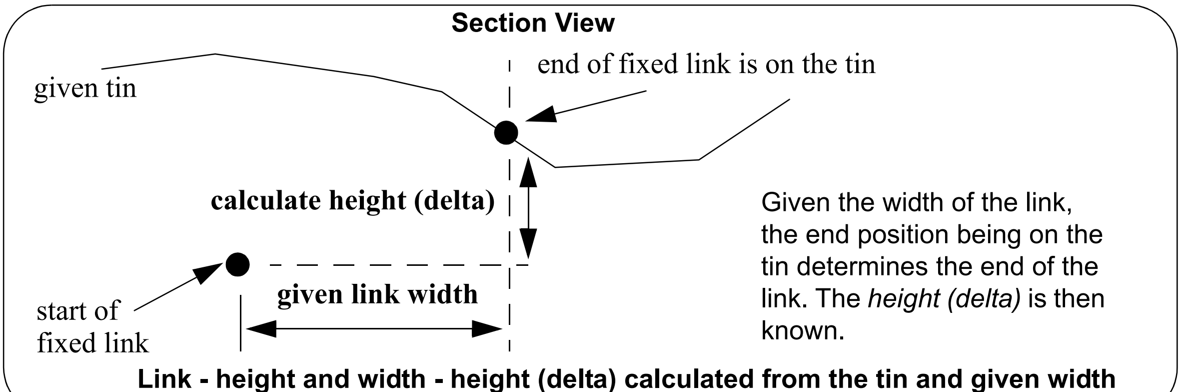
Link - width and height - width calculated from the tin and given height (delta)



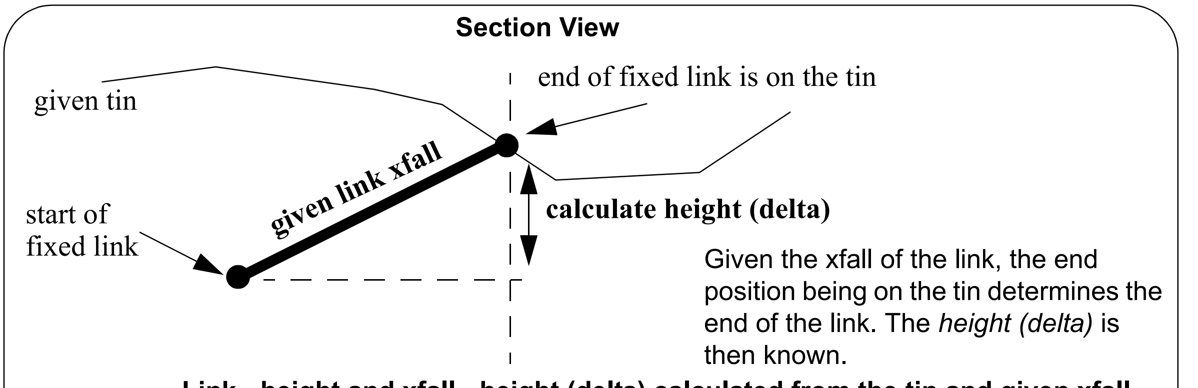
Link - width and xfall - width calculated from the tin and given xfall

Height to Tin

For a fixed link defined by *height* and *width* or *height* and *xfall*, the **Height to tin** calculates the ***height*** of the link as the difference in the height of the start point of the link, and the height that is required so that the link will sit on the user tin at the ***width/xfall given in the link.*** The option gives an error for a link defined by *width* and *xfall*.



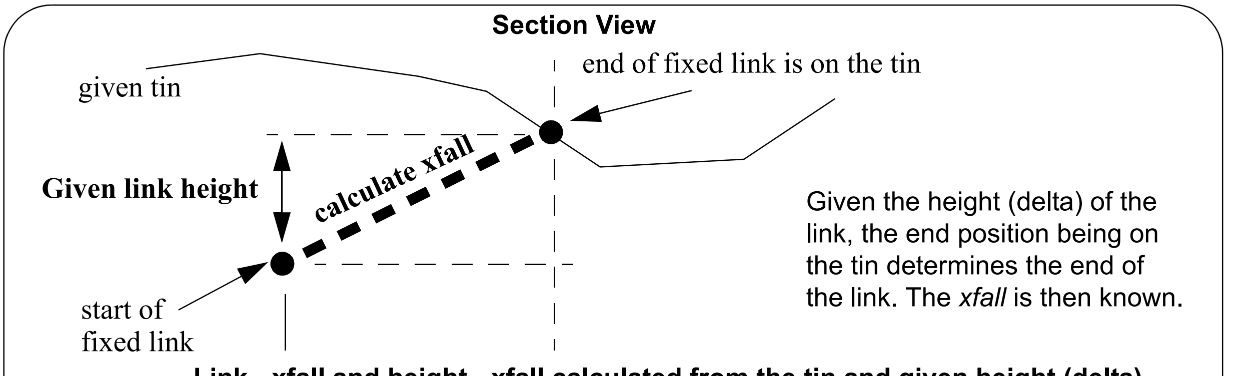
Link - height and width - height (delta) calculated from the tin and given width



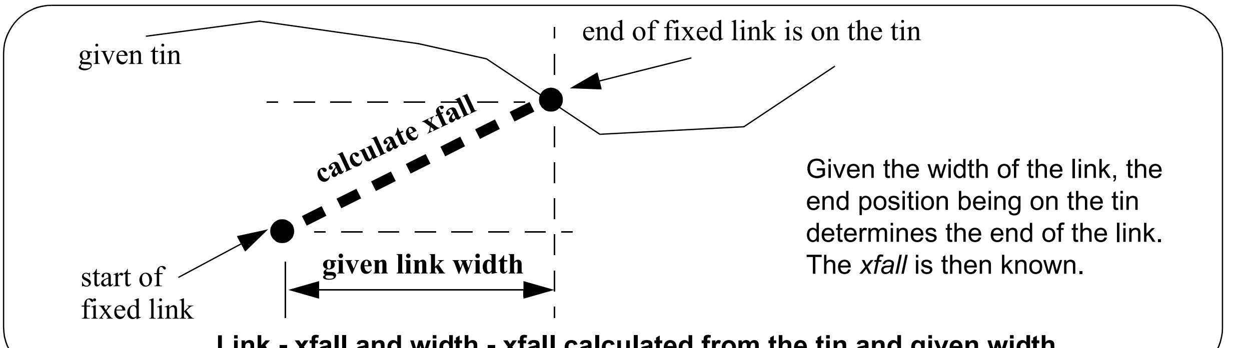
Link - height and xfall - height (delta) calculated from the tin and given xfall

Xfall to Tin

For a fixed link defined by *xfall and width* or *xfall* and *height*, **Xfall to tin** calculates the **xfall** of the link as the *xfall* required so that the link will sit on the user tin at the ***width/height given in the link***. The option gives an error for a link defined by *width* and *height*.



Link - xfall and height - xfall calculated from the tin and given height (delta)



Link - xfall and width - xfall calculated from the tin and given width

Selecting **Width to tin**, **Height to tin, or Xfall to tin** brings up the **Fixed - Modify Width to Tin**, **Fixed - Modify Height to Tin** and **Fixed - Modify Xfall to Tin** panels respectively.

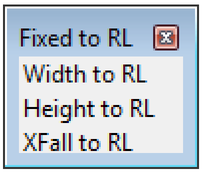
Continue to the next section 21.11.0.7 Fixed Link - to RL - Superseded or go to the replacement options 21.2.2.2 Fixed Link Modifiers or 21.2.2 Left and Right MTF Modifiers.

21.11.0.7 Fixed Link - to RL - Superseded

The **fixed to RL** walk-right brings up the **fixed to RL** menu with options to calculate the width, xfall or height to get to a given RL.



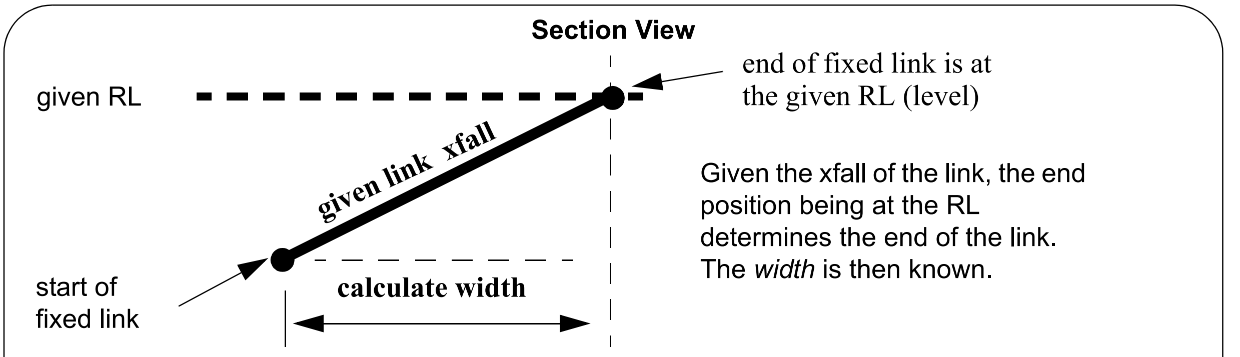
For *Width/Height/Xfall to tin*, go to the next section Fixed Link - Modify Width, Height or Xfall to Get to an RL

Fixed Link - Modify Width, Height or Xfall to Get to an RL

Width to RL

The **Modify Width to RL**, only applies to links defined by *Width and Xfall* NOT Width and Height or Xfall and Height.

For a fixed link defined by *width* and *xfall*, **Modify Width to RL** calculates the **width** required for the link to end at the given RL using the ***xfall given in the link***.



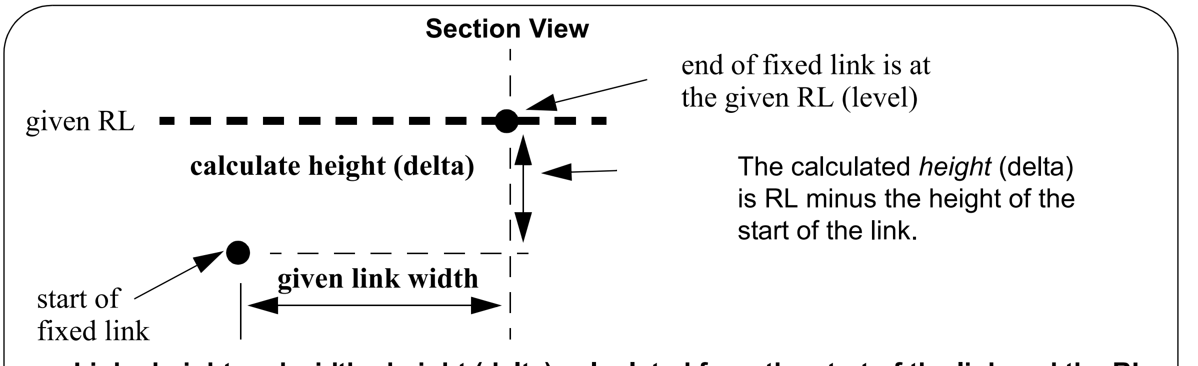
Link - width and xfall - width calculated to get to the RL at the given width

The **Modify Width to RL** gives an error for a link defined by *width and height* or *xfall and height.*

Height to RL

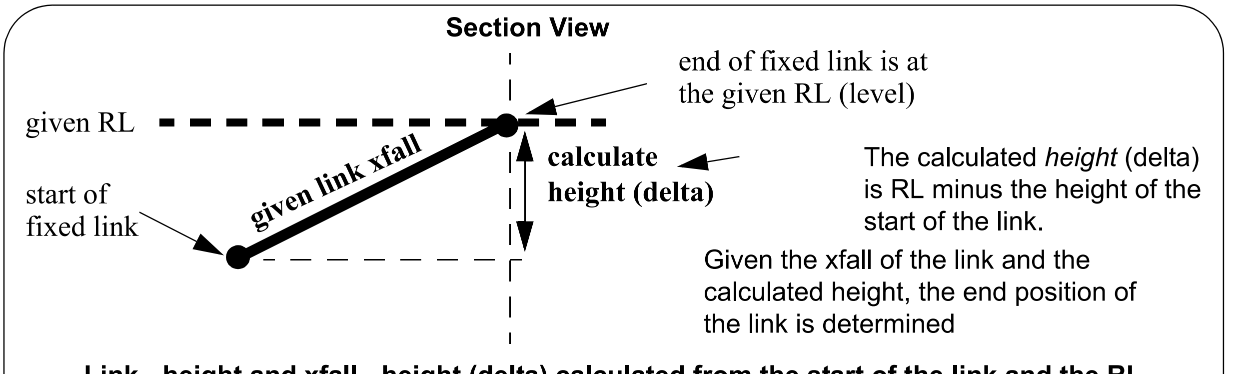
The **Modify Height to RL**, only applies to links defined by *Width and Height and Height NOT Width and Xfall.*

For a fixed link defined by *height and width*, the **Modify Height to RL** calculates the ***height*** required for the link as the difference in height of the start point of the link and the given **RL.**



Link - height and width - height (delta) calculated from the start of the link and the RL

For a fixed link defined by *height and xfall*, the **Modify Height to RL** calculates the ***height*** required for the link to end at the given RL using the ***xfall given in the link***. That is, the difference in the height of the start point of the link, and the height that is required so that the link will sit on the RL at the ***given xfall.***



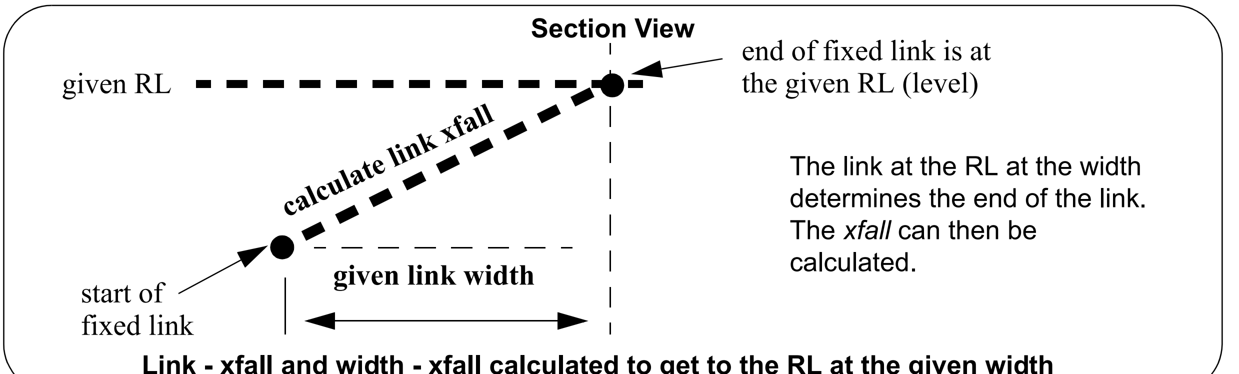
Link - height and xfall - height (delta) calculated from the start of the link and the RL

The **Modify Height to RL** gives an error for a link defined by *width and xfall.*

Xfall to RL

The **Modify Xfall to Get an RL**, only applies to links defined by *Xfall and Width*, NOT Xfall and Height or *Width and Height.*

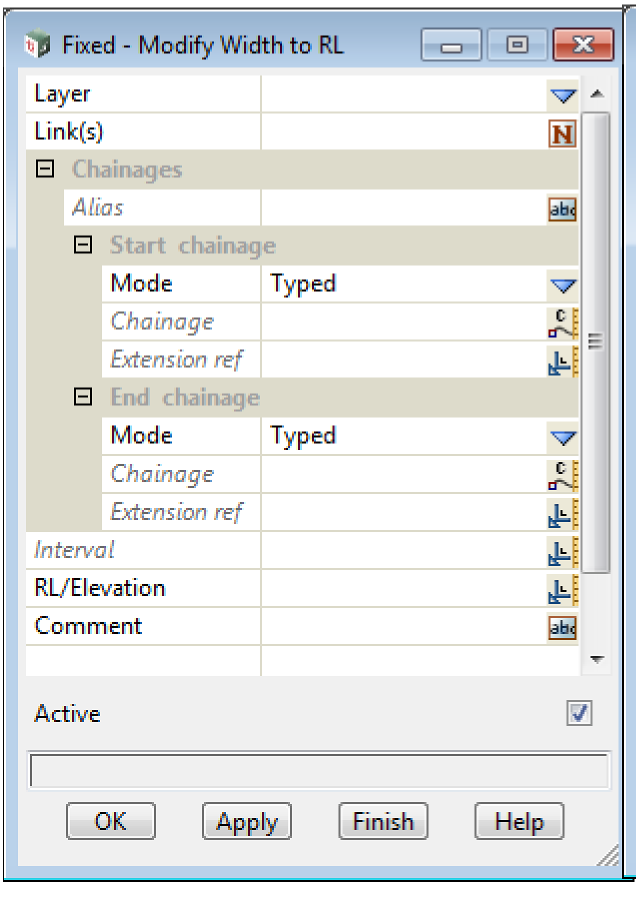
For a fixed link defined by *xfall and width*, **Modify Xfall to RL** calculates the **xfall** of the link required for the link to end at the given RL using the ***width given in the link***.

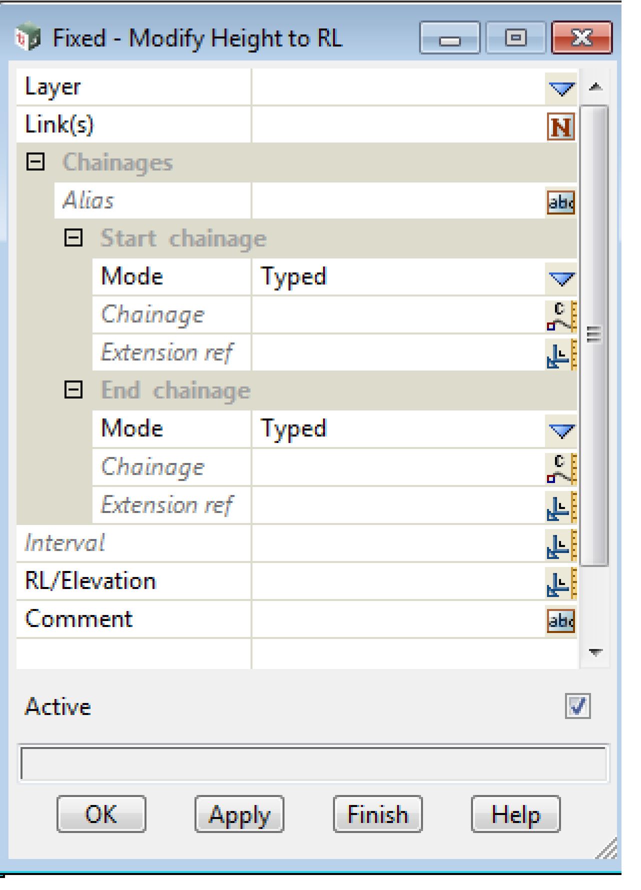


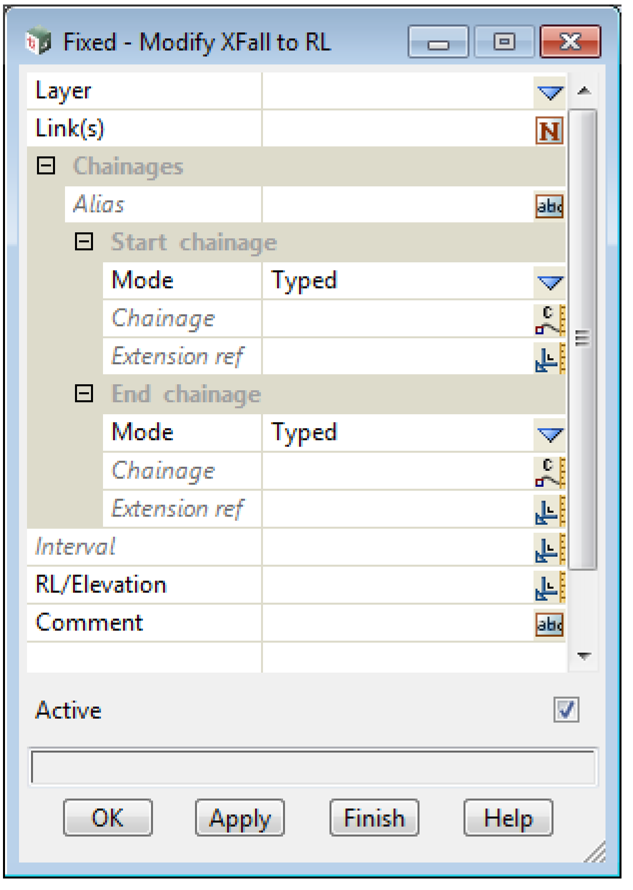
Link - xfall and width - xfall calculated to get to the RL at the given width

The **Modify Xfall to RL** gives an error for a link defined by *xfall and height*, or *width and height*.

Selecting **Width to RL**, **Height to RL, or Xfall to RL** brings up the **Fixed - Modify Width to RL**, **Fixed - Modify Height to RL** and **Fixed - Modify Xfall to RL** panels respectively.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

22 Drainage and Sewer

Position of menu: **Design =>Drainage-Sewer**

The **Drainage-Sewer** option is used to place drainage and sewer networks within a subdivision, along highways and culverts for cross drainage. Pumps may also be included in the network. The network is placed in three dimensions including manholes (maintenance holes), and for sewer work, lot controls and house connections can be defined. A 12d drainage string is used for all of these options.

If used in conjunction with the services on a section view, interference with neighbouring pipe strings can be taken into consideration when placing the network.

Note that the drainage string and plots capabilities are only available with the drainage and sewer options, and the sewer extensions (property control, house controls and Melbourne Water plots) are only available with the sewer option.

The **drainage string** is based on a **polyline** string so that **arcs** can exist between manholes (maintenance holes). The manholes may be placed anywhere along the polyline but generally manholes are located at the polyline indices.

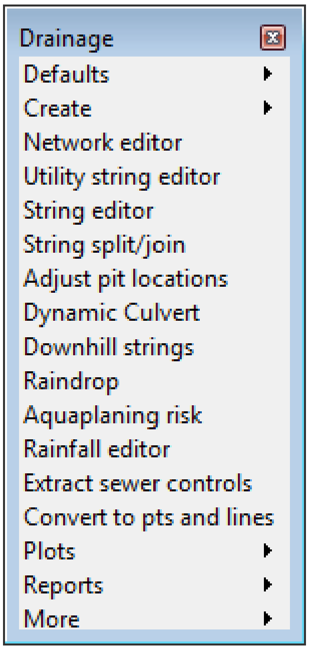
The use of the drainage string for drainage is only a subset of its use for sewer so the steps for the sewer will be given since they cover drainage as well.

The sewer process consists of a number of steps (the drainage process does not use steps 2 and 3):

1. creating the drainage or sewer network
2. vertical alignment, pipe cover and utility clash checking using the Drainage Network Editor,
3. checking that residential blocks are controlled by the sewer network
4. creating the house connections for the sewer
5. network design using custom routines, spread sheets or advanced network analysis packages via the Drainage Network Editor
6. producing Drainage Plots (plan and long section) and Reports (material quantity reports, excavation volumes and manhole construction reports)

These steps are described in the rest of this chapter.

The **Drainage** walk-right menu is laid out to reflect the standard sequence of placing drainage and wastewater pipes, *i.e.* creating, editing and plotting.



For a description of the drainage string in ***12d Model***, please go to the section Drainage Strings

For a definition of a drainage network and a junction in ***12d Model***, please go to the section Networks and Junctions.

For a description of the drainage defaults in ***12d Model***, please go to the section Drainage Definitions - Manholes and Pipes

More, please continue to the section More Drainage

22.1 Drainage Strings

A **drainage string** consists of a series of manholes (maintenance holes) at user selected (x,y,z) positions. The manholes can be joined by either straight or curved pipes.

Manholes may be any type of drainage structure and are represented by circles or rectangles. Drainage inlets, pump wet wells, gross pollutant traps, soak away pit, open channel changes in direction are all examples of manholes. The manholes have cover, grate and sump levels as well as wall and bottom thicknesses.

Pipes are the conduits connecting the manholes. Round pipes, box culverts, trapazoidal channels, pump rising mains, basin links, weirs and orifices are all examples of pipes.

Like all ***12d Model*** strings, the drainage string has an implied direction, starting at the first manhole and going in the direction towards the next manhole in the drainage string. This order is normally determined by the creation order (or string order) of the manholes.

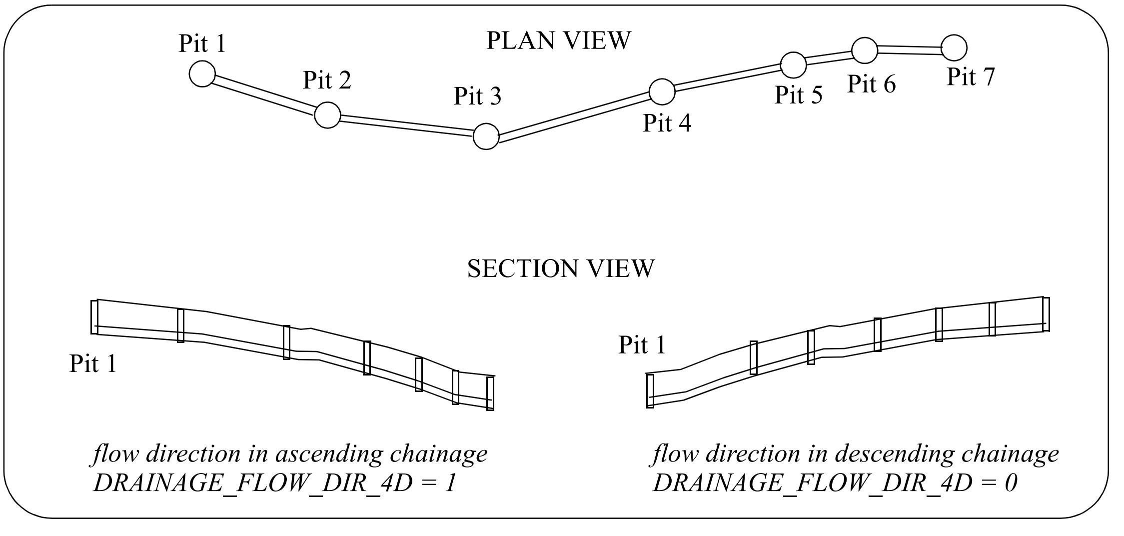
The chainage of the drainage string starts at the **first** manhole and then increases along the direction of the drainage string.

In ***12d Model***, drainage strings have a property indicating

(a) the most upstream manhole is entered as the first point of the string and hence the water flows in the direction of ascending string chainage. The flow direction is said to be in ascending chainage.

or

(b) the most downstream manhole is entered as the first point of the string and hence the water flows in the direction of descending chainage. The flow direction is said to be in descending chainage)



When a drainage string with flow direction in ascending order is profiled in a section view, the left hand side of a manhole is normally upstream and the right hand side of a manhole downstream.

It is recommended that drainage strings are entered with the flow direction in ascending chainage so that the minimum grade and cover can be satisfied as the drainage string is being placed.

That is, if the drainage string flow is in ascending chainage direction, then as manholes are appended, minimum *cover* and minimum *grade* can be automatically maintained. In all cases the invert levels can be recalculated using the Drainage Network Editor.

22.1.1 Pipes

A pipe is automatically created when a second or additional manhole is added to a drainage string. The properties of the pipe follow:

22.1.1.1 Type

22.1.1.2 Size (diameter, width, top width and natural channel shapes (dynamic only).

22.1.1.3 Inverts Levels

22.1.1.4 Wall Thickness

22.1.1.5 Minimum cover limit

22.1.1.6 Length

The pipe length by default is set to manhole centre to manhole centre. This length is displayed in the DNE and on the section view (Toggle->Grades) when the drainage string is profiled.

The pipe length maybe be also be calculated from the inside edge of the drainage manhole by using pit connections points enabled in the Drainage Network Editor on the Global Tab.

22.1.1.7 Grade

The pipe grade is calculated from the length and invert properties discussed above. This grade is displayed on the section view (Toggle->Grades) when the drainage string is profiled. It is shown as % or 1 in via

Section View Menu View => Settings =>Grade annot

Please continue to the next section Networks and Junctions.

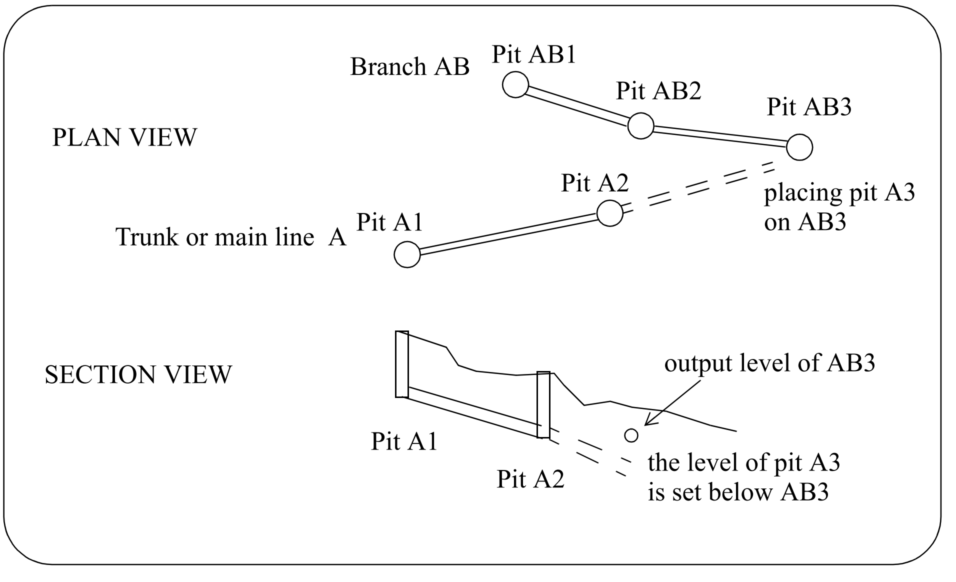
22.2 Networks and Junctions

In ***12d Model***, a **drainage network** consists of one or more drainage strings in the *same* model. Consequently, all the drainage strings in the same model are considered to be part of the same drainage network. It is suggested that **all** drainage strings in a network be entered with the same flow direction.

If two drainage strings from the same model have a manhole at exactly the same (x,y) location, then 12d Model assumes that the co-incident manholes **are** the same manhole and that the situation represents a **junction**. Most junction manholes are at the ends of the drainage strings. A junction may have a maximum of one manhole that is not at the end of the drainage string.

When water flows into a drainage string (from a branch drainage string) it is referred to as a trunk line. A trunk line may be a branch for another downstream trunk line.

Also for a network, if all the drainage strings are entered with the flow direction in ascending chainage, not only can minimum cover and minimum grade be maintained as manholes are appended, but if the branches are laid down before the trunk, then as you connect each branch to the trunk, the invert level for the trunk will be set to below the invert level of the branch line (less the default drop for the manholes). In all cases the invert levels for the entire network be recalculated using the Drainage Network Editor.



Please continue to the next section Drainage Definitions - Manholes and Pipes.

22.3 Drainage Definitions - Manholes and Pipes

A file of pipe and manhole (maintenance hole) definitions is used to create pipe and manhole (maintenance hole) types to allow tailoring for a particular project. The manhole or pipe type is one method to set many of the objects properties such as inlet capacity, thickness and roughness along with the objects user defined attributes.

When 12d Model starts up, it checks to see if an environment variable called DRAINAGE_4D exists and if it does, then the file it points to is used to provide the available types of manholes (maintenance holes) and pits.

If the environment variable is not set, then 12d Model searches for a file called **drainage.4d** in the standard 12d Model search sequence for set up files.

The drainage definitions file format is an text format and consists of one or more pipe and manhole definitions. Each definition in the file begins with the key word **Pipe** or **Manhole**, followed by the pipe or manhole type and then curly braces **{ }**. The order that the definitions appear in the file determines the order they appear in the drop down lists inside 12d Model.

IMPORTANT: the file is only read when 12d Model starts up. When the file is changed while, 12d Model is running, you must restart 12d Model for the changes to become active. If any syntax errors have been made editing the file, the line number will be displayed in the output window. The error generally slightly above this line. The most common errors are missing curly braces **{ }** and forgetting quotes around entries containing spaces

A minimal example of a drainage definitions file is:

```
// ---------------------------------------------------------------
// drainage.4d                          1/6/96
// Used to define the types of Pipes and Manholes
// ---------------------------------------------------------------
 Pipe  "PVC"  {
 }

 Pipe  "VC"  {
 }
 Pipe  "PVC Extra Heavy"  {
 }
 Pipe  "Plastic" {
 }

 Manhole  "CONC COVER"  {
 }
 Manhole "Gatic"  {
 }
 Manhole  "Rubber"  {
 }
```

Notes

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes **"**.
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored
4. Duplicate definitions are not allowed.

Please continue to the next section Drainage Definitions - Manhole Types.

22.3.1 Drainage Definitions - Manhole Types

Manhole types may be used to set the following manhole properties via the DNE.

- manhole diameter, length/width and thickness
- manhole description, notes, group, ku/kw method, ku/kw values, rational engine design freeboard,
- manhole level modes for cover level, grate level, survey setout level and sump levels,
- survey setout xy modes and road chainage modes
- user defined manhole attributes

Each definition (manhole block) in the file begins with the key word **Manhole**, followed by the manhole type and then curly braces **{ }**. The order that the definitions appear in the file determines the order they appear in the drop down lists inside 12d Model.

The minimum requirement for a pit type definition is

Manhole "type name" {

}

The type name must be unique and the braces {} cannot be () or [].

Optional manhole commands may be placed inside the braces. These commands include may include Manhole Editor Commands, Manhole Drainage Network Editor Commands and Manhole Calculation Commands.

22.3.1.1 Manhole Editor Commands

These optional commands change the properties of the manhole objects. Changes to these commands will used in creating new drainage strings and the Drainage Network Editor will prompt you to update the object if these settings are different to the strings current settings. A list of these commands follows

mhdiam x.x	set the manhole as circular (internal diameter in base units)

mhsize x.x y.y	set the manhole as rectangular (over rides mhdiam) length and width in base units

```
mhthickness    {
   diam_thickness   x.xxx a.aaa b.bbb c.ccc d.ddd
}
```

x.xxx	nominal diameter choices will appear in the DNE->Pipe->Diameter drop down
a.aaa	optional front thickness (base units) 0.000 if omitted
b.bbb	optional back thickness (base units) front thickness if omitted
c.ccc	optional left thickness in direction of chainage (base units) front thickness if omitted
d.ddd	optional right thickness in direction of chainage (base units) front thickness if omitted

22.3.1.2 Manhole Level Modes

There are several modes that may be used to calculate x,y,and z values for the manholes. A decription of each fllows.

FS tin	the manhole centre x,y location is used to obtain the level from the drainage finished surface tin

NS tin	the manhole centre x,y location is used to obtain the level from the drainage natural surface tin

Setout string	the manhole centre x,y location is dropped perpendicular onto the setout string. The x,y or z value is then obtained from this string. If this string is missing then the pit x,y location or finiahed surface tin level is used instead.

Centre string the manhole centre x,y location is dropped perpendicular onto the road centre string and the chainage value is obtained. If this string is missing an problem message will be created in the output window.

Sz + Setout stringthe manhole centre x,y location is dropped perpendicular onto the setout string. The Sz value for the manhole is then added to the z value obtained from this string. If this string is missing the Sz value is added to the finiahed surface tin level at the pit centre x,y location.

Manual the x,y,z or chainage value is manually entered by the user.

Cover RL the z level is set the the Cover RL level (after it has been recalculated.

Max Obvert The maximum obvert level from off the conduits connected to this manhole is used.

Floating sump the manhole sump level is set to the lowest invert of all the conduits connected to this manhole + the sump offset

22.3.1.3 Manhole Drainage Network Editor Commands

These optional commands store user defined data on the manholes or change the calculation modes available in the Drainage Network Editor. The set pit details button in the editor will recalculate these for all manholes in the network. A list of these commands follows

mhdesc "description" creates a pit text attribute "pit type description" and is used in the drainage pit schedule report.

mhnotes "note" creates a pit text attribute "pit type remarks" and is used in the drainage pit schedule report.

mhgroup "group" routines that select manholes will select from a manhole belonging to the same group

attribute_integer "attribute name1" x x is an integer value (no decimal, stored exactly by computers

attribute_real "attribute name2" x.xxx x is a real value (used to store numbers with decimals or very large or very small numbers

attribute_text "attribute name3" "text" text is a series of words or numbers not intended for calculations

Note: If a non-special attribute name is set for some, but not all manhole types, that attribute will be deleted on all manholes with types where the attribute is not defined.

The following special attribute commands create/modify an attribute as described above but these attributes also control calculations performed by the set pit details button on the Drainage Network Editor. The DNE fields will be locked when these attributes are defined for the selected pit type. If these attribute are not defined for the selected pit type the DNE field will not be locked and remain unchanged.

attribute_integer "cover rl mode" x DNE field ->Pit=>Main=>Cover RL mode

Mode	**x**
FS tin	0
Setout string	1
Manual	2
NS tin	3
Max Obvert	4
Sz + setout string	8

attribute_integer "grate rl mode" x DNE field ->Pit=>Main=>Grate RL mode

Mode	x
FS tin	0
Setout string	1
Manual	2
NS tin	3
Max Obvert	4
Cover RL	7
Sz + setout string	8

attribute_real "sump offset" x.xx DNE field ->Pit=>Main=>Sump offset
if sump RL mode is floating then this is the offset (negative down) from the lowest pipe invert <base units>

attribute_integer "ku method" DNE field is Pit=>Main=>Ku method

Mode	x	Description
Direct	0	user enters the ku value stored as pit real attribute "ku"
Ku,Kw - Missouri/Hare Charts		
	1	ku calculated during analysis
Ku,Kw>0 - Missouri/Hare Charts		
	2	ku calculated during analysis (ku < 0.0 changed to 0.0)
Ku - Culvert Inlet - Generic (101 or 201)		
	3	Culvert analysis using inlet control and backwater control (entrance and exit losses automatically set)
Remaining	xxx	Culvert analysis - use numbers from DNE drop down list

attribute_real "ku" x.xx DNE field is Pit=>Main=>Ku
x.xx is used to calculate pit upstream hgl when ku method is Direct

attribute_real "kw" x.xx DNE field is Pit=>Main=>Kw
x.xx is used to calculate pit hgl when ku method is Direct

attribute_integer "setout xy mode" x DNE field is Pit=>Setout=>Setout xy mode

Mode	x
FS tin	0
Setout string	1
Manual	2

attribute_integer "setout z mode" x DNE field is Pit=>Setout=>Setout z mode

Mode	x
FS tin	0
Setout string	1
Manual	2
NS tin	3
Max Obvert	4
Cover RL	7
Sz + setout string	8

attribute_integer "road chainage mode" DNE field is Pit=>Setout=>Chainage mode

Mode	x
No Road	0
Centre string	1
Manual	2

attribute_real "setout adjustment" DNE field is Pit=>Setout=>Sxy

attribute_real "setout adjustment z" DNE field is Pit=>Setout=>Sz

attribute_real "design freeboard" DNE field is Pipe=>Design=>Freeboard limit
at US pit

The following example of a channel ip point is given below. The setout modes are set, the cover and grate level modes are set and the ku (losses) are set. Finally, the inlet capacity is set to an on-grade pit with200% inlet capacity so that even in a major storm with a choke factor of 0.5 it will still have 100% inlet capacity.

```
Manhole "CHNL auto" {

  mhdesc  "channel hip-vip"
  attribute_text "lplot description1"  "OPEN CHANNEL"

  mhsize  0.0
  mhdiam  0.0
  attribute_integer "setout xy mode"        0 // centre of the channel
  attribute_integer "setout z mode"         6 // sump invert is the bottom of the channel
  attribute_integer "cover rl mode"         4 // max obvert - top of the channel
  attribute_integer "grate rl mode"         4 // max obvert - top of the channel
  attribute_integer "ku method"             0    // direct
  attribute_real    "ku"                    0.0  // zero unless interested in bend losses

  cap_config G

  cap_percent 200 // if a choke factor of 0.5 is applied then it will still have 100% inlet capacity
}

//  attribute_real    "design freeboard"      Pipe=>Design=>Freeboard limit at US pit
```

22.3.1.4 Manhole Drainage Analysis Inlet Capacity Commands

Manhole inlet configuration and bypass pit entries determine if these inlet capacity commands are used. Both may be set in the Drainage Network Editor.

22.3.1.4.1 cap_config

The inlet configuration may be set via the following command

cap_config x

Mode	x
Manhole	m
Ongrade	g
Sag	s

Inlet Configuration = manhole - no water will enter the pit through the grate. Commands not used.

Inlet configuration = on grade or sag

Bypass pit not set - 100% of the approach flow will enter the pit. Commands not used.
Bypass pit is entered. The following commands define the stormwater inlet capacity characteristics.

22.3.1.4.2 Inlet Capacity Equation

The inlet capacity equation is built up with optional components (**single polynomial** + **curve polynomial** + **curve coordinates**). Generally, only one of the components is used for each manhole type but they may all be used if desired.

inlet capacity = inlet efficiency * inlet multiplier *
[**single polynomial** + curve multiplier (**curve polynomial** + **curve coordinates**)]

An inlet efficiency (choke factor) is specified in the Drainage Network Editor. An inlet efficiency (choke factor) of 0 would stop all water from entering the inlet.

The inlet multiplier is specified with a cap_multi parameter.

Multipliers

cap_multi x.x inside a cap_curve_grade block or cap_curve_sag block, the curve inlet capacity is multiplied by this value
outside a cap_curve_grade or cap_curve_sag, the total inlet capacity is multiplied by this value

Single Polynomial

The inlet capacity for an inlet may be specified by a single polynomial equation based on the approach flow. This is the most simplistic method and generally used for percentage capture or fixed capture rates.

inlet capacity = cap_fixed
+ cap_percent*0.01*Qa
+ cap_coeff*Qa^cap_power

Example
This example creates an inlet with a fixed inlet capacity of 0.010 (cms or cfs).

```
Manhole "fixed inlet capacity" {
        cap_fixed 0.010
}
```

Default values

cap_multi = 1.0

cap_fixed = 0.0

cap_percent = 0.0

cap_coeff = 0.0

cap_power = 1.0

Curve Polynomial

For on-grade inlets, the polynomial parameters may change with road grade and cross fall threshold values. The formula is the same for cap_fixed, cap_percent, cap_coef and cap_power. Note that each curve may have its own curve multiplier specified with a cap_multi parameter (discussed below). Some hydraulic model tests have their on grade inlet results converted to polynomial equations.

Example
This example creates an inlet where the inlet capacity polynomials have been determined for 2 road grades (1% and 3%). Note that the road_grade 0.0 command is used for the 1% road grade. Since this is the flattest road grade curve we have calculated we will start using it at a road grade of 0%.

Note that the second curve "NJ G3" will be used when the road grade reaches 2.5. The threshold value where 12d should change to the next curve is generally slight less than the road grade from the source.

```
Manhole "On grade pit type NJ" {
        cap_config G

        cap_curve_grade   "NJ 1G" {
                road_grade  0
                cap_coeff  0.215
                cap_power  0.67
        }

        cap_curve_grade   "NJ 3G" {
                road_grade  2.5
                cap_coeff  0.24
                cap_power  0.673
        }
}
```

Curve Coordinates (On grade and SAG)

For on-grade and sag inlets, the inlet capacity may be determined by entering coordinates along the inlet capacity curve. These coordinates are usually obtained from hydraulic model studies or analytical methods such as HEC-22.

For on grade inlets, the coordinates are Qapproach and Qin, and the curves may change with road grade and cross fall threshold values. The inlet capacity curves are never extrapolated.

Example

```
Manhole "Ongrade coordinates" {
        cap_config G
        cap_curve_grade "0.5G" {
                road_grade  0
                coord 0.000 0.000
                coord 0.060 0.060
                coord 0.140 0.112
                coord 0.260 0.174
                coord 0.430 0.244
                coord 0.500 0.270
        }
        cap_curve_grade "1G" {
                road_grade  0.75
                coord 0.000 0.000
                coord 0.060 0.060
                coord 0.140 0.108
                coord 0.260 0.164
                coord 0.430 0.227
                coord 0.500 0.248
        }
}
```

For sag inlets, the coordinates are Depth (base units) and Qin, and there is only one curve. Each curve has a curve muliplier specified with a cap_multi parameter (discussed below).

Example

```
Manhole "SAG coordinates" {
        cap_config S
        cap_curve_sag "SAG" {
                coord 0.000 0.040
                coord 0.045 0.101
                coord 0.070 0.151
                coord 0.095 0.245
                coord 0.120 0.302
                coord 0.170 0.347
                coord 0.220 0.371
                coord 0.270 0.391
        }
}
```

22.3.1.4.3 Polynomial Inlet Capacity Commands

The following commands are used to set the parameters in the following polynomial equation

```
inlet capacity =    cap_fixed
                    + cap_percent*0.01*Qa
                    + cap_coeff*Qa^cap_power
```

cap_fixed	x.x	cms or cfs
cap_percent	x.x	percentage (0 to 100)
cap_coeff	x.x	multiplier
cap_power	x.x	exponent

22.3.1.4.4 Inlet Curve Block Commands

Inlet curve blocks may be specified for both on-grade or sag inlets. Inside the curve block you may include the Polynomial Inlet Capacity Commands and Coordinate Inlet Capacity Commands.

```
cap_curve_grade "unique name for the pit type" {
        road_grade x.xx
        road_xfall x.xx
}
```

Inside the cap_curve_grade block the road grade and road crossfal threshold values (percent) may be set. The road grade and crossfall are calculated by the Drainage Network Editor. When the 12d analysis engine selects the inlet curve, all curves with the same road_xfall are grouped together and then within the crossfall group the road_grade curves is selected.The inlet curve with the maximum grade threshold that is less than or equal to the road grade is selected.

Rules for 'cap_curve_grade' entries:

- Only applicable to on-grade pits.
- All cap_curve_grade names must be unique within a Manhole block
- If both 'road_grade' and 'road_xfall' entries are omitted, only one cap_curve_grade entry is allowed within a pit.
- The cap_curve_grade 'coord' entries (if used) must be in order of increasing Qa.

```
cap_curve_sag "unique name for the pit type" {
}
```

Rules for 'cap_curve_sag' entries:
Only applicable to sag pits.
Only one cap_curve_sag entry is allowed within a pit, and it must have a valid name.

22.3.1.4.5 Coordinate Inlet Capacity Commands

The coord command must be used inside the cap_curve_grade or cap_curve_sag grouping

coord x.xx y.yy

x.xx must be in increasing order.

For cap_curve_grade group, the coord command has the parameters Qapproach and Qin

For cap_curve_sag group, the coord command has the parameters Depth and Qin

Please continue to the next section Drainage Definitions - Pipe Types.

22.3.2 Drainage Definitions - Pipe Types

Pipe types may be used to set the following pipe properties via the DNE.

- pipe nominal/actual diameters and thickness
- roughness method and value
- rational method design mode and design percent depth
- minimum pipe height for the rational design engine
- user defined pipe attributes

Each definition (pipe block) in the file begins with the key word **Pipe**, followed by the pipe type and then curly braces **{ }**. The order that the definitions appear in the file determines the order they appear in the drop down lists inside 12d Model.

The minimum requirement for a pipe type definition is

```
Pipe "name" {
}
```

The name must be unique and the braces {} cannot be () or [].

Example:

```
Pipe "CHNL GRASS PROPOSED" {  //Open Channel created below the tin. cover set in cover file to 0.0
  roughness_n 0.040
  attribute_integer "design size mode"     3  // open channel mode
}
```

22.3.2.1 Pipe Drainage Network Editor Commands

22.3.2.1.1 Pipe Thickness

```
pipethickness     {
                     diam_thickness   x.xxx y.yyy a.aaa b.bbb c.ccc d.ddd
                  }
```

x.xxx nominal diameter choices will appear in the DNE->Pipe->Diameter drop down
y.yyy internal diameter (base units) will be entered into the DNE->Pipe->Diameter field
a.aaa optional top thickness (base units) 0.000 if omitted
b.bbb optional bottom thickness (base units) top thickness if omitted
c.ccc optional left thickness in direction of chainage (base units) top thickness if omitted
d.ddd optional right thickness in direction of chainage (base units) top thickness if omitted

22.3.2.1.2 Pipe Attributes

attribute_integer "attribute name1" x x is an integer value (no decimal, stored exactly by computers

attribute_real "attribute name2" x.xxx x is a real value (used to store numbers with decimals or very large or very small numbers

attribute_text "attribute name3" "text" text is a series of words or numbers not intended for calculations

The following special attribute commands create/modify an attribute as described above but these attributes also control calculations performed by the set pit details button on the Drainage Network Editor. The DNE fields will be locked when these attributes are defined for the selected pipe type. If these attribute are not defined for the selected pipe type the DNE field will not be locked and remain unchanged.

roughness_n x.xx> DNE field ->Pipe=>Main=>Roughness
DNE field ->Pipe=>Main=>Roughness type (set to Manning)

roughness_k x.xx DNE field ->Pipe=>Main=>Roughness
Colebrook k roughness value in millimetres
DNE field ->Pipe=>Main=>Roughness type (set to Colebrook)

attribute_real x.xx DNE field ->Pipe=>Design=>Min pipe height
min height in base units

attribute_integer "design size mode" x DNE field ->Pipe=>Design=>Design mode

Mode	**x**
Pressurised Pipe: Freeboard design	0
Part-full Pipe: Freeboard design	1
Part-full Pipe: Flow depth design	2
Open Channel: Freeboard design	3

attribute_real "design percent depth" x.xx DNE field
Pipe=>Design=>Flow-depth at pipe entrance

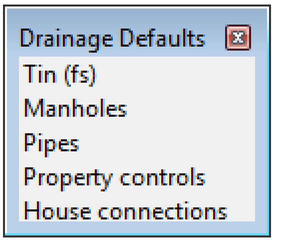
Please continue to the next section Defaults.

22.4 Defaults

Position of menu: **Design =>Drainage-Sewer =>Defaults**

The **defaults** menu sets default tin, manhole (maintenance hole) information, drainage pipe information, property control (sewer module only) and house connection (sewer module only) defaults which are all used when defining drainage networks.

The **Defaults** walk-right menu is

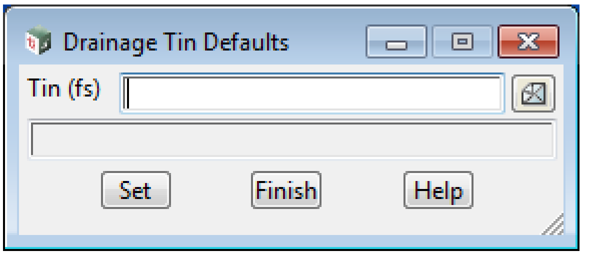


For the option *Tins (fs)*, please continue to the section Tin (fs).
Manholes, please continue to the section Manholes (Maintenance Holes).
Pipes, please continue to the section Pipes.
Property controls, please continue to the section Property Controls.
House connections, please continue to the chapter House Connections.

22.4.1 Tin (fs)

Position of option on menu: **Design =>Drainage-Sewer =>Defaults =>Tin (fs)**

On selecting the **Tin (fs)** option, the **Drainage Tin Defaults** panel is displayed.



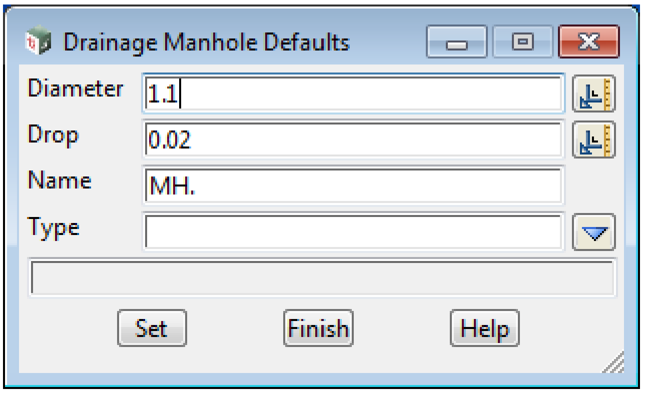
This panel is for setting the default finished surface tin in the **Create Drainage Strings** panel which is used for creating a new drainage string.

For the drainage string, the finished surface tin is used as the surface that manholes automatically sit on when z float is set on, and for defining cover when placing controls and connections.

22.4.2 Manholes (Maintenance Holes)

Position of option on menu: **Design =>Drainage-Sewer =>Defaults =>Manholes**

On selecting the **Manholes** option, the **Drainage Manhole Defaults** panel is displayed.



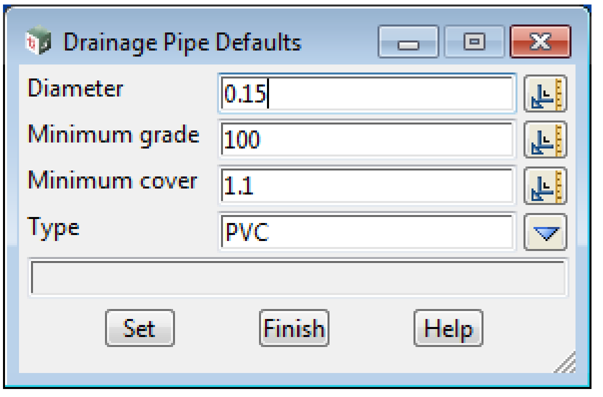
These defaults are used when creating a manhole in a drainage string. The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Diameter	input	1.1	
default diameter of a drainage manhole			
Drop	input	0.02	
drop (metres) through the manhole			
Name	input	MH.	
default name for the manhole Note that if a manhole name is EOL or eol, then the diameter of the manhole is forced to be zero.			
Type	input	CONC COVER	CONC COVER, GATIC
the default cover or lid type of the manholes			
Set	button		
set the drainage manhole defaults to the values in the above fields.			

22.4.3 Pipes

Position of option on menu: **Design =>Drainage-Sewer =>Defaults =>Pipes**

On selecting the **Pipes** option, the **Drainage Pipes Defaults** panel is displayed.



This panel is for setting the default drainage pipe diameter, grade, cover and type. These defaults are used when creating a pipe in a drainage string.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Diameter	input	0.1	
default diameter of the pipe.			
Minimum grade	input	1.0	
the minimum grade (measured as 1: value) used when laying down the pipe.			
Minimum cover	input	1.0	
the minimum cover, measured in world units from the surface to the top of the pipe (obvert); used when laying down the pipe.			
Type	input	PVC	PVC, VC, PVC X/HEAVY
the default type of the pipe			
Set	button		
set the drainage pipe defaults to the values in the above fields.			

IMPORTANT NOTE.

If the drainage string is laid down in the direction of flow (and hence the flow direction is in ascending chainage), then the minimum grade and minimum cover along the pipe are maintained as the drainage string is created. Otherwise the minimum grade and cover cannot be maintained.

Cover for the pipe segment can also be calculated and/or set afterwards by the **pipe=>cover** option in the drainage string editor.

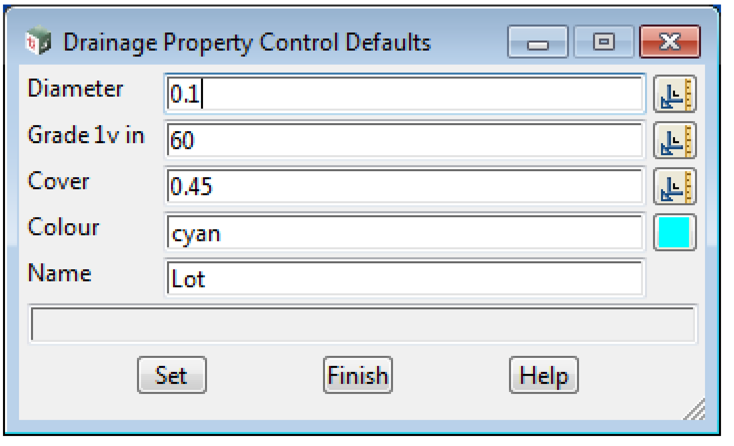
Minimum cover and minimum grade for the pipe segment to the end of the line can be set afterwards by the **pipe=>default grading** option in the drainage string editor.

22.4.4 Property Controls

Position of option on menu: **Design =>Drainage-Sewer =>Defaults =>Property Controls**

On selecting the **Property controls** option, the **Drainage Property Control Defaults** panel is displayed.

On a section view, the *Profile =>One substring* and *Profile =>Many substrings* options will profile the property control. Note that the centre (axis) of the property control is drawn on the section view, not the invert (bottom) or the obvert (top).



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Diameter	input	0.1	

default diameter of the property control.

Grade 1v in	input	60	

grade (units are "1v in" given value) to use for the property control

Cover	input	1.0	

*cover measured from the surface to the **top** of the property control (world units) to be maintained from the end of the property control in the house block to the drainage string.*

Colour	input	cyan	available colours

colour to use to draw the property control

Name	input	Lot	

name for the property control - usually the lot number

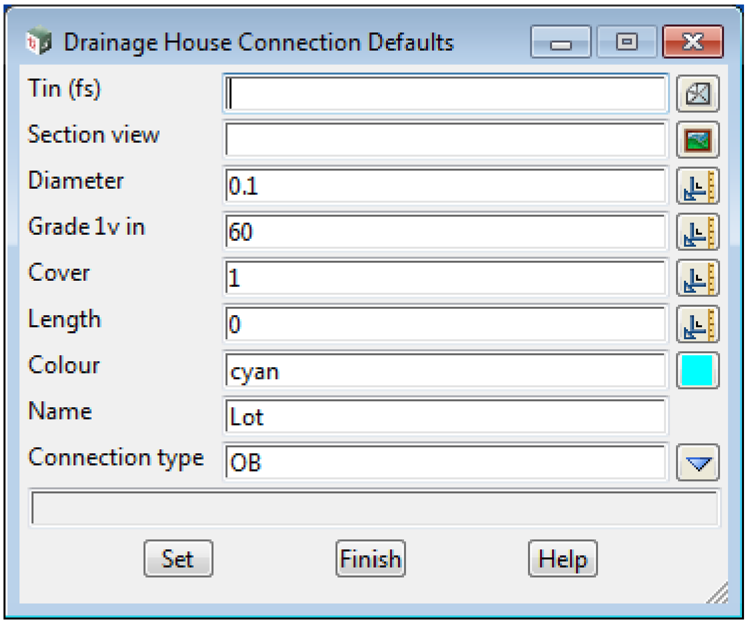
Set	button		

set the property control defaults to the values in the above fields.

22.4.5 House Connections

Position of option on menu: **Design =>Drainage-Sewer =>Defaults =>House connections**

On selecting the **House connections** option, the **Drainage House Connection Defaults** panel is displayed.



This panel is for setting the default information used for connections from the drainage pipe to the house blocks.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin (fs)	input	drainage tin	available tins

name of the tin to automatically add to the section view used for drawing the profile along the house connection.

Section view	input		

the section view used to profile along the house connections as they are placed in plan view.

Diameter	input	0.1	

default diameter of the house connection.

Grade 1v in	input	60	

grade (units are "1v in") to use for the house connection

Cover	input	1.0	

cover (world units) to use for the house connection

Length	input	2.0	

length (metres) to use for some types of house connections

Colour	input	cyan	available colours

default colour used for the house connection

Name	input	Lot	

name for the house connection - usually the lot number

Connection type	input	A special	A, A special, B, C, OB,

Special Jump Up

the default type of house connection, Please continue to the section House Connection Types *for a description of each connection type*

Set button

set the house connection defaults to the values in the above fields.

House Connection Types

All house connection calculations do not take into account any thickness of pipe, joint sizes or actual entry points into the sewer. Hence they are ***approximate only*** and should only ever be used as a guide. Any quantities calculations should allow for a suitable margin of error.

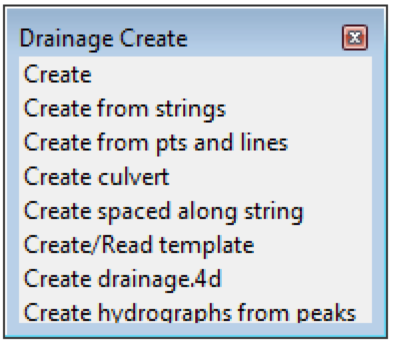
Please continue to the next section Create.

22.5 Create

Position of menu: **Design =>Drainage-Sewer =>Create**

The **Create** walk-right menu is



For *Create*, please see Create Drainage String.

Create from strings, please see Create from Strings.

Create from pts and lines, please see Create from Points and Lines.

Create culvert, please see Create Culvert Change.

Create spaced along string, please see Create Drainage Spaced Along String.

Create/Read template, please see Create/Read Drainage Template.

Create drainage.4d, please see Create drainage.4d.

Create hydrographs from peaks, please see Create Hydrographs from Peaks.

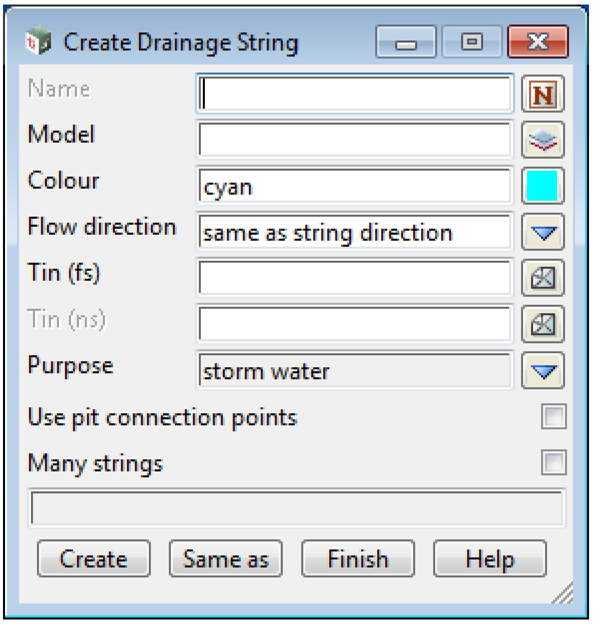
22.5.1 Create Drainage String

Position of option on menu: **Design =>Drainage-Sewer =>Create =>Create**

This section of documentation is a work in progress and will be updated in subsequent releases.

The **Create** option is used to produce **new** drainage strings and networks. If a drainage string already exists, the **Editor** option is used to modify it.

On selecting the **Create** option, the **Create Drainage String** panel is displayed.



To create a new drainage string, the name, colour, model and style of the new string are entered into the appropriate fields, plus the finished surface triangulation that the manholes are normally flush with, the natural surface triangulation, and the **Create** button selected.

The new fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		
Model	model box		
Colour	colour box		
Flow direction	input	ascending chainage	ascending chainage descending chainage
if ascending chainage, then the flow direction is in ascending chainage (recommended) *if descending chainage, then the flow direction is in descending chainage.*			
Tin (fs)	input	drainage=>defaults=>tin	available tins
the finished surface tin. If manholes are "floating", the top of the manhole is automatically place on the tin surface ("floated" on the surface).			
Tin (ns)	input		available tins
the natural surface tin used in longsection plots.			
Purpose	choice box		
Use pit connection points	tick box		

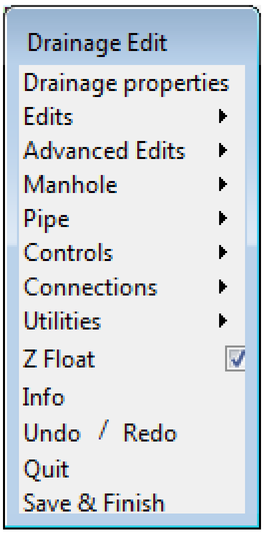
Many strings tick box

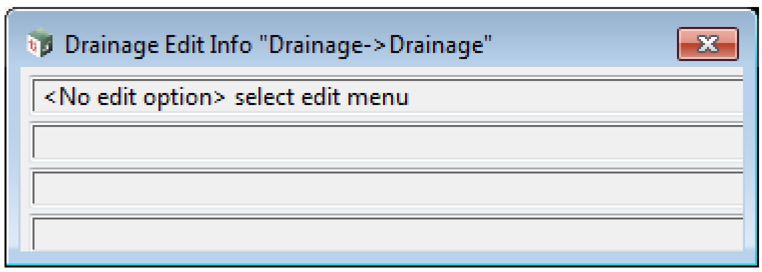
Create button

The **Create Drainage String** panel is then removed and the **Drainage Edit** menu and **Drainage Edit Info** panel fired up.

As for a 3d string, to create a new drainage string with some of the **same** name, colour, model and style as an existing string (not necessarily a drainage), the **Same as** button is chosen and the appropriate string selected.

The **Drainage Edit** menu contains all the available options for editing a drainage string and its associated block controls and house connections. The **Drainage Edit Info** panel contains information areas. The **Drainage Edit** menu and **Drainage Edit Info** panel are





To create a new drainage string, the user selects the **Append** option from the **Edits** walk right menu on the **Drainage Edit** menu.

Since the **Drainage Edit** menu and **Drainage Edit Info** panel are the same as those used when editing a drainage string, the options will be discussed under the drainage **Edit** option.

For documentation on editing Drainage string, please continue to the next section String Editor.

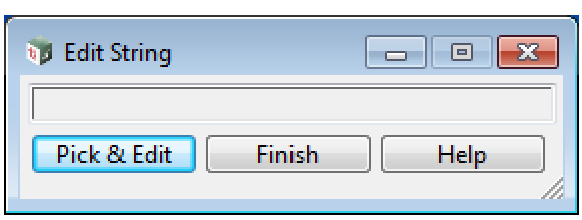
For drainage utilities and import/export see More Drainage

22.6 String Editor

Position of option on menu: **Design =>Drainage-Sewer =>String editor**

This is the same option as **Editor** from the **Strings** walk-right menu on the 12d Model menu.

The string editor is used to modify any 12d Model strings. After selecting the **Editor** option, the **Edit String** panel is placed on the screen to record any error messages.



The option is already in the **pick** mode (the **pick & edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited.

From the picked string's type, the editor is able to determine the edits that apply to the string and list them in the string's **edit** menu.

If a drainage string is selected, the **Drainage Edit** menu and **Drainage Edit** panel (as shown in the previous section) are placed on the screen.

The individual edit operations for a drainage string will now be discussed in detail.

Please continue to the next section Drainage Edit.

22.6.1 Create from Strings

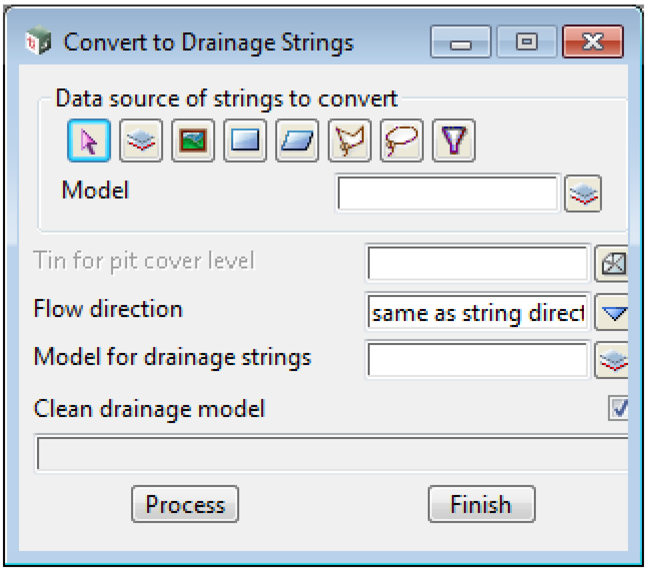
Position of option on menu: **Design =>Drainage-Sewer=>Create=>Create from strings**

12d will convert the super strings into 12d drainage strings. The default pipe, pit and tin data will be used to set the levels for the network. Do not use the other string convert commands found on the menu system.

See Also

Drainage overview

On selecting the **Create from strings** option, the **Convert to Drainage Strings** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source	source box	model	

data source for strings to be converted

Model for drainage strings model box

The new drainage strings will be added to this model. If it does not exist it will be created.

Tin for pit cover level tin box

The new drainage manhole cover level will be set to the tin level at the manhole centre (optional)

Flow direction choice box same as string direction

same as string direction *if the strings have been drawn in the direction of water flow*
opposite to string direction *if the strings are drawn opposite to the direction of flow.*

Clean drainage model tick box

When selected, all strings in the model will be deleted before creating the new strings.

Process button

Coverts the strings to the drainage strings.

Finish button

Removes the panel from the screen.

Important notes:

The imported strings must all be drawn in the same direction. Either all in the direction the water flows or all opposite the direction of flow..

Pits are created at all vertices on the strings.

Trunk lines must have a vertex where the branch lines join.

String names can be used to control the order in when the drainage lines are numbered. These names will be transferred to the 12d drainage strings. Later, the string names can be changed in the Drainage Network Editor.

Pits can always be renamed in 12d after the import is complete.

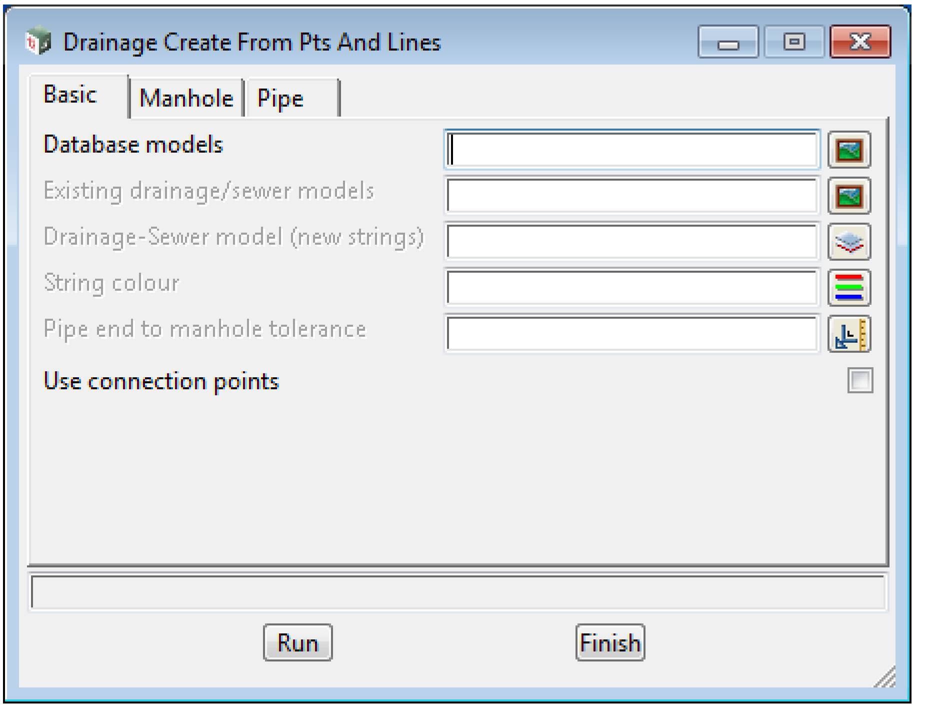
The drainage lines must have string names to use the Set Pit Names feature on the network editor.

22.6.2 Create from Points and Lines

Position of option on menu: **Design =>Drainage-Sewer=>Create=>Create from pts and lines**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **Create from pts and lines** option, the **Drainage Create from Ptd and Lines** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Basic Tab			
Database models	view box

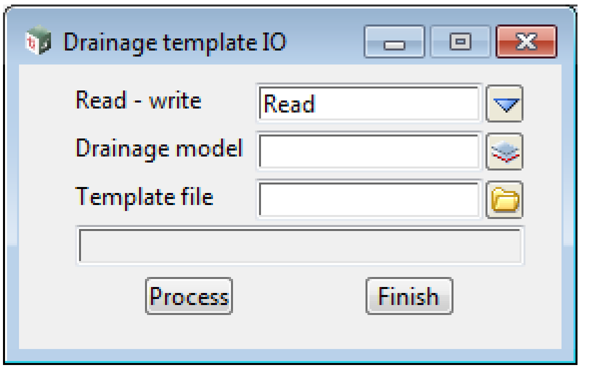
Pick	button

22.6.5 Create/Read Drainage Template

Position of option on menu: **Design =>Drainage-Sewer=>Create=>Create/Read template**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **Create/Read template** option, the **Drainage Template I/O** panel is displayed.



The fields and buttons used in this panel have the following functions:

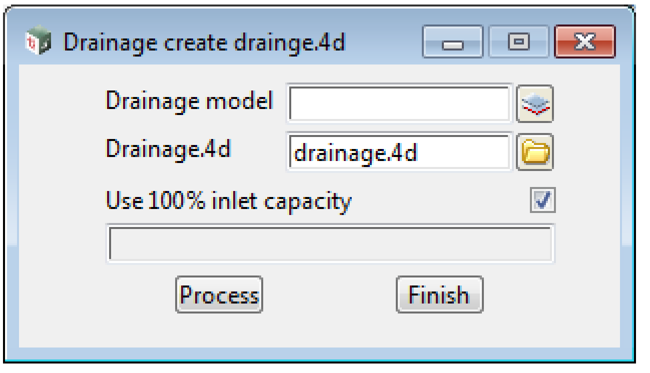
Field Description	Type	Defaults	Pop-Up
Read-write	choice box		
Drainage model	model box		
Template file	file box		
Process	button		

22.6.6 Create drainage.4d

Position of option on menu: **Design =>Drainage-Sewer=>Create=>Create drainage.4d**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **Create drainage.4d** option, the **Drainage Create Drainage.4d** panel is displayed.



The fields and buttons used in this panel have the following functions:

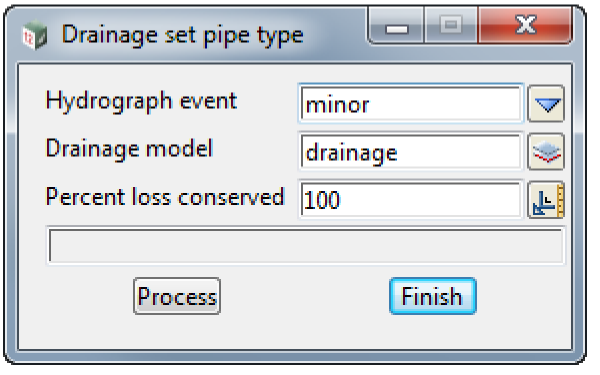
Field Description	Type	Defaults	Pop-Up
Drainage model	model box		
Drainage.4d	file box		
Use 100% inlet capacity	tick box		
Process	button		

22.6.7 Create Hydrographs from Peaks

Position of option on menu: **Design =>Drainage-Sewer=>Create=>Create hydrographs from peaks**

This section of documentation is a work in progress and will be updated in subsequent releases.

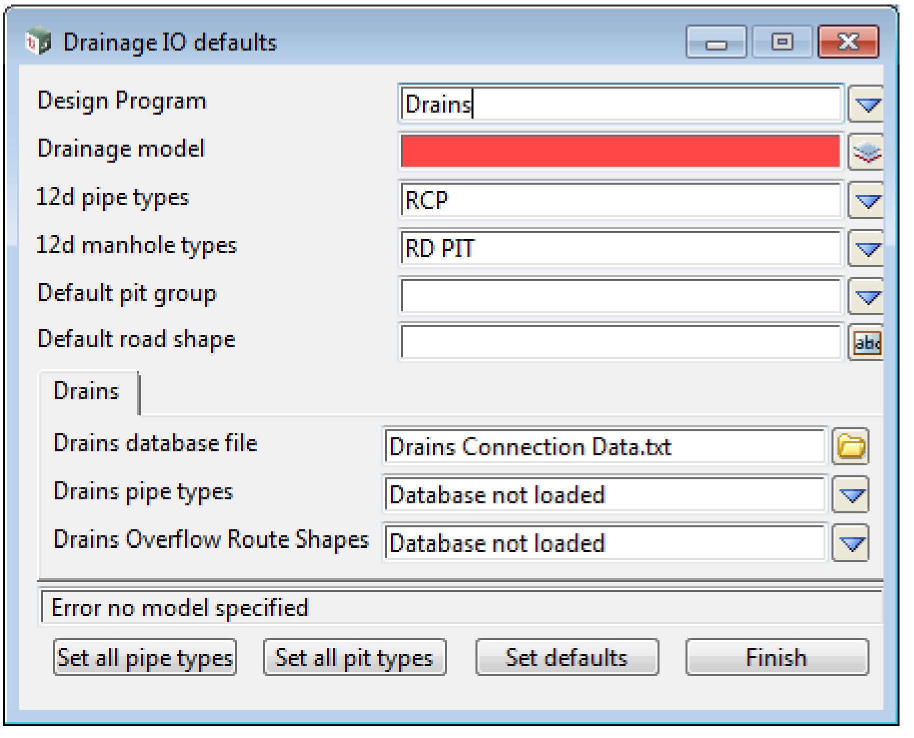
On selecting the **Create hydrographs from peaks** option, the **Drainage Set Pipe Type** panel is displayed.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Hydrograph event	choice box		
Drainage model	model box		
Percent loss conserved	measure box		
Process	button		

22.6.8 Drainage IO Defaults



22.7 Drainage Network Editor

Position of option on menu: Design =>Drainage-Sewer =>Network editor

The drainage network editor enables the user to edit all of the drainage strings in a model (a network). The global and default settings may be stored and loaded via . There are five main tabs and plus function buttons on the bottom of the panel.

Using the Drainage Network Editor

Recommended order to use the tabs and Buttons.

(This is not required but it will lead you through the process in an systematic method.)

Tab	Function Buttons
1. Global tab	3. Set Pit Names
2. Defaults tab	4. Set Catchments
5. Pipe tab	8. Set Pit Details
6. Pit tab	9. Regrade Network
7. Catchment	Storm Analysis
	Plot
	Import/Export

22.7.1 Global Tab

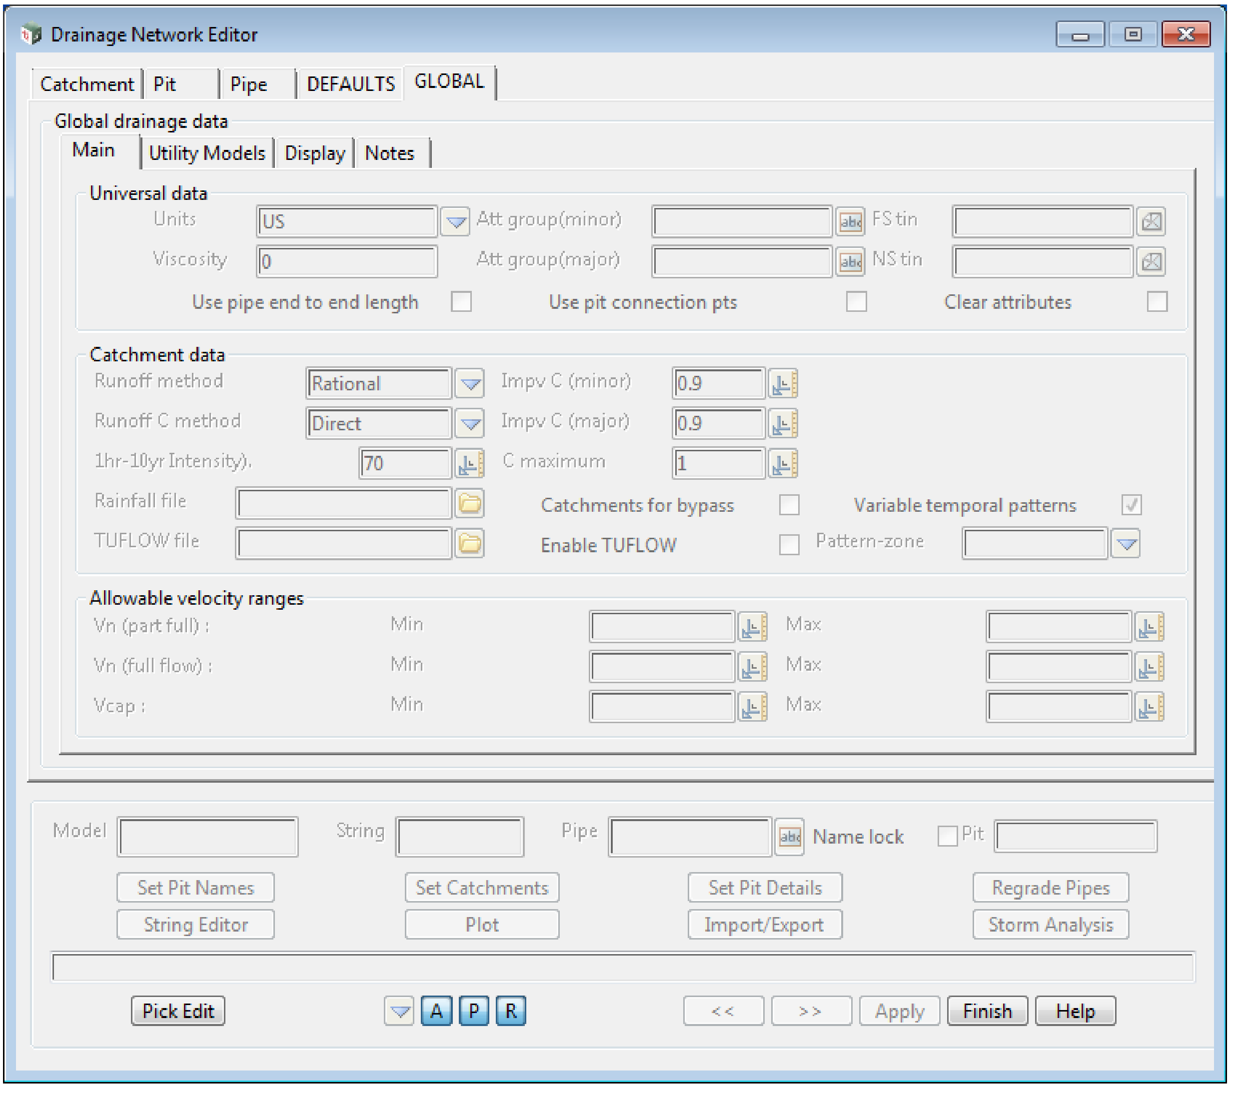
Design values for the hydrology and hydraulics calculations are set either globally (one value for the entire network) or via Defaults for the manholes or pipes. Defaults values may be overridden by explicit settings found on the catchment, pits or pipes tab. Explicit manhole/pipe settings need only be specified if the default value is not desired.ragg

There are 4 sub tabs. See Main tab, Utility Models tab, Notes tab **and** Display tab

22.7.1.1 Main tab

Universal data Group

Units - Metric or US. Catchment areas in ha/acres and rainfall-infiltration-storage in mm/in
Viscosity - Used with Colebrook-White energy loss calculations
TUFLOW file - with the dynamic drainage analysis and TUFLOW modules this specifies the TUFLOW tcf file to be used for the 2d storm analysis.
Att group (minor) - results from the storm analysis (minor event) may be contained within this pit/pipe attribute group
Att group (major) - results from the storm analysis (major event) may be contained within this pit/pipe attribute group
Use pit connection pts - when not selected, pipes connect at the centre of the manhole. When selected the pipes connect at the pit connection points. See Pit Connection Points for more details.
Finished surface tin - used for determining pipe cover and surface levels for the manholes.
Natural surface tin - specified so that it can be included on the drainage longsection plots
Clear attributes - when selected all pit/pipe attributes will be deleted before the Apply/AutoApply saves the data currently in the panel.



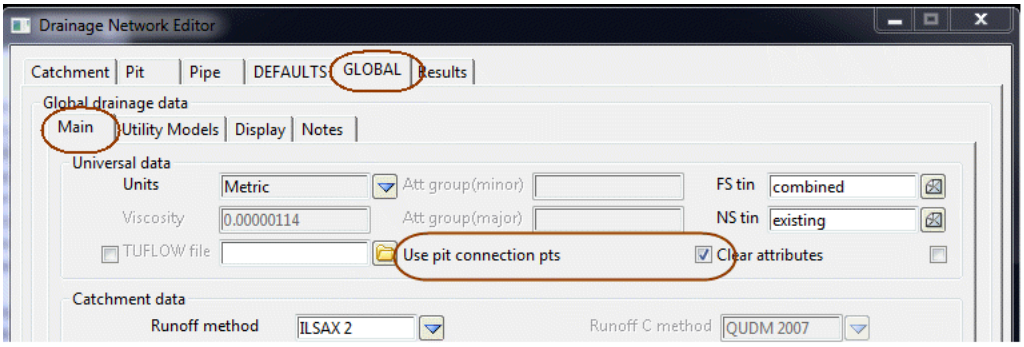
Catchment data Group

see Coefficients of Runoff

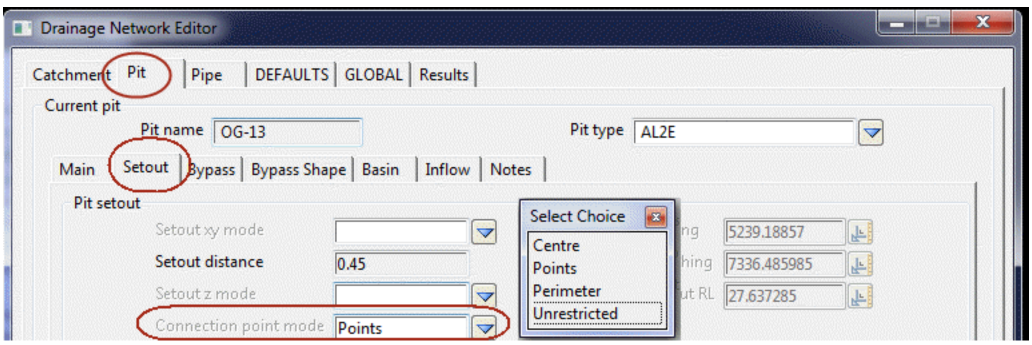
For **Global pipe data** see Pipe Friction Method.

22.7.2 Pit Connection Points

Pit Connection points allow the pipes connected to the pit to join at locations other than the inside perimeter of the pit wall. This feature is off by default and may be enabled on the **DNE->Global->Main** tab.



All pits have their connection point initially set to **Points**. This setting is found on the **DNE->Pits->Setout** tab.



Pit Connection Point Modes

Pit connection points may be moved via **Strings->Points Edit->Move** (except for **Centre** mode described below). The other modes constrain the movement of the connection points. If a pipe is manually moved to a new connection point, it will be locked to the connection point and will not move if the pit or neighbouring pit is moved (see exceptions below).

Centre (rectangle and circular) - This mode is the same as having the **Use connection points** turned off**.**The connection points will be located on the inside perimeter of the pit wall with the centre line of the pipe intersecting the centre of the pit. In this mode the connection points may not be adjusted.

Points (rectangle) - A connection point is created at the mid point of each internal side of the pit. This may be changed for a **Pit type** by using the **con_points** command in the drainage.4d file. In this mode the pipe ends will snap to the connection points. It is possible to place more than one pipe on the same connection point (the elevation of the pipes is not checked for clashes).

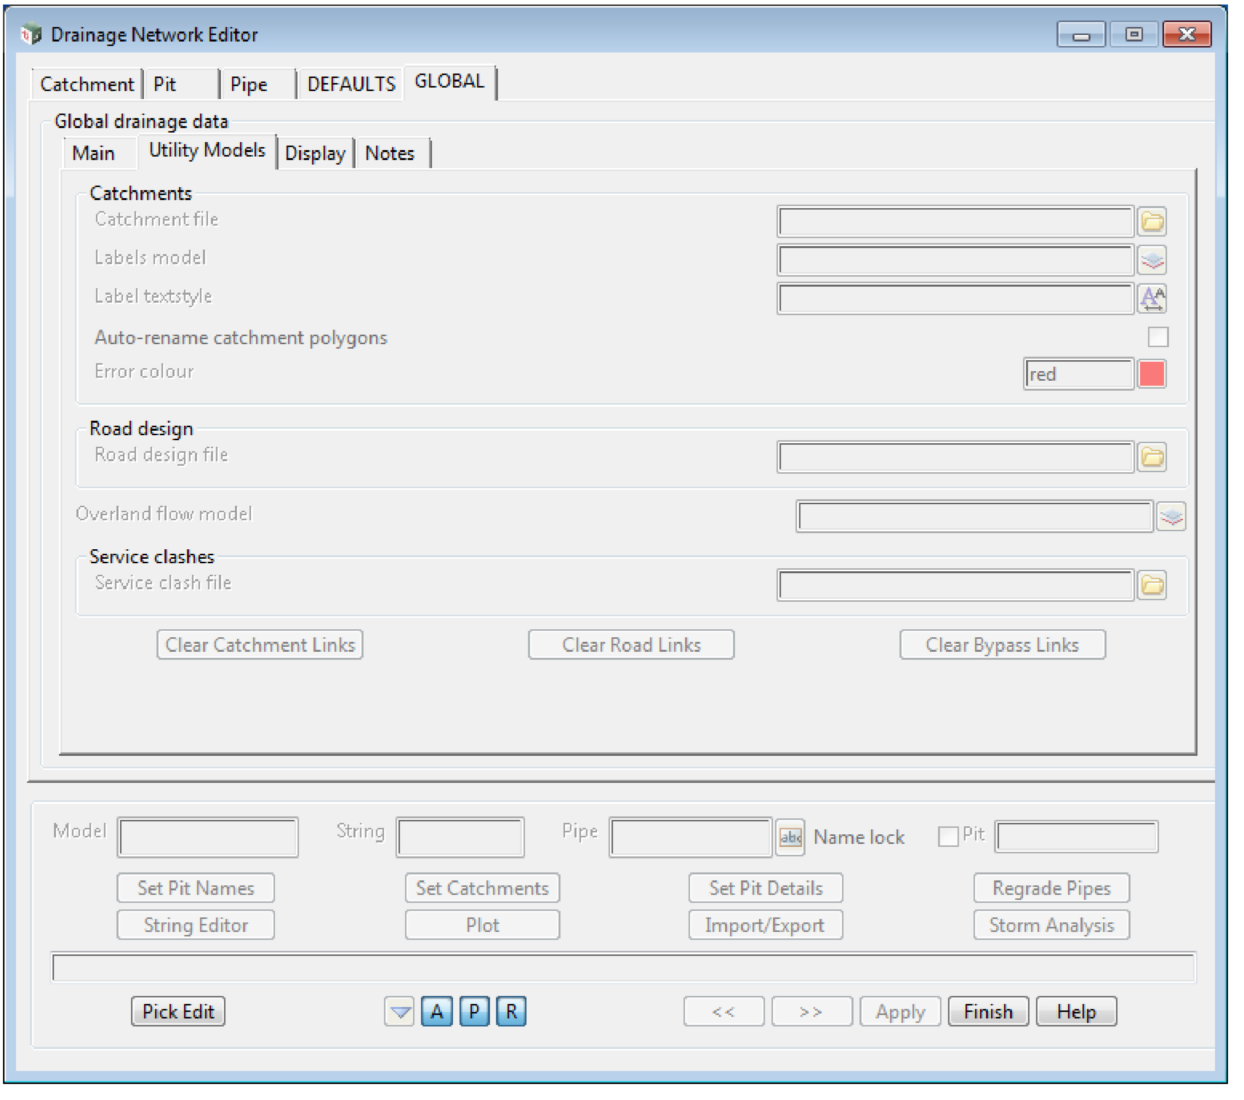
Points (circular) - The connection point may be moved anywhere around the pit internal wall as there are no connection points on the circular pits. Again, it is possible to place more than one pipe on the same connection location (the elevation of the pipes is not checked for clashes).
If the manhole centre is moved the connection point locks are removed.

Perimeter (rectangular and circular) - Same as **Points** (circular) above.

Unrestricted (rectangular and circular) - There are no constraints on the location of the pit connection points.This mode is intended for irregular shapes such as GPT structures and stormwater basins.

22.7.2.1 Utility Models tab

The utility models tab is used to specify the following data:



Catchment polygons, the catchment slope strings, catchment labelling data

Bypass flow strings

Road setout strings., road centre line strings and crossfall/grade offsets

Service/utility models and the allowable clearances

Additional details

Catchments Areas

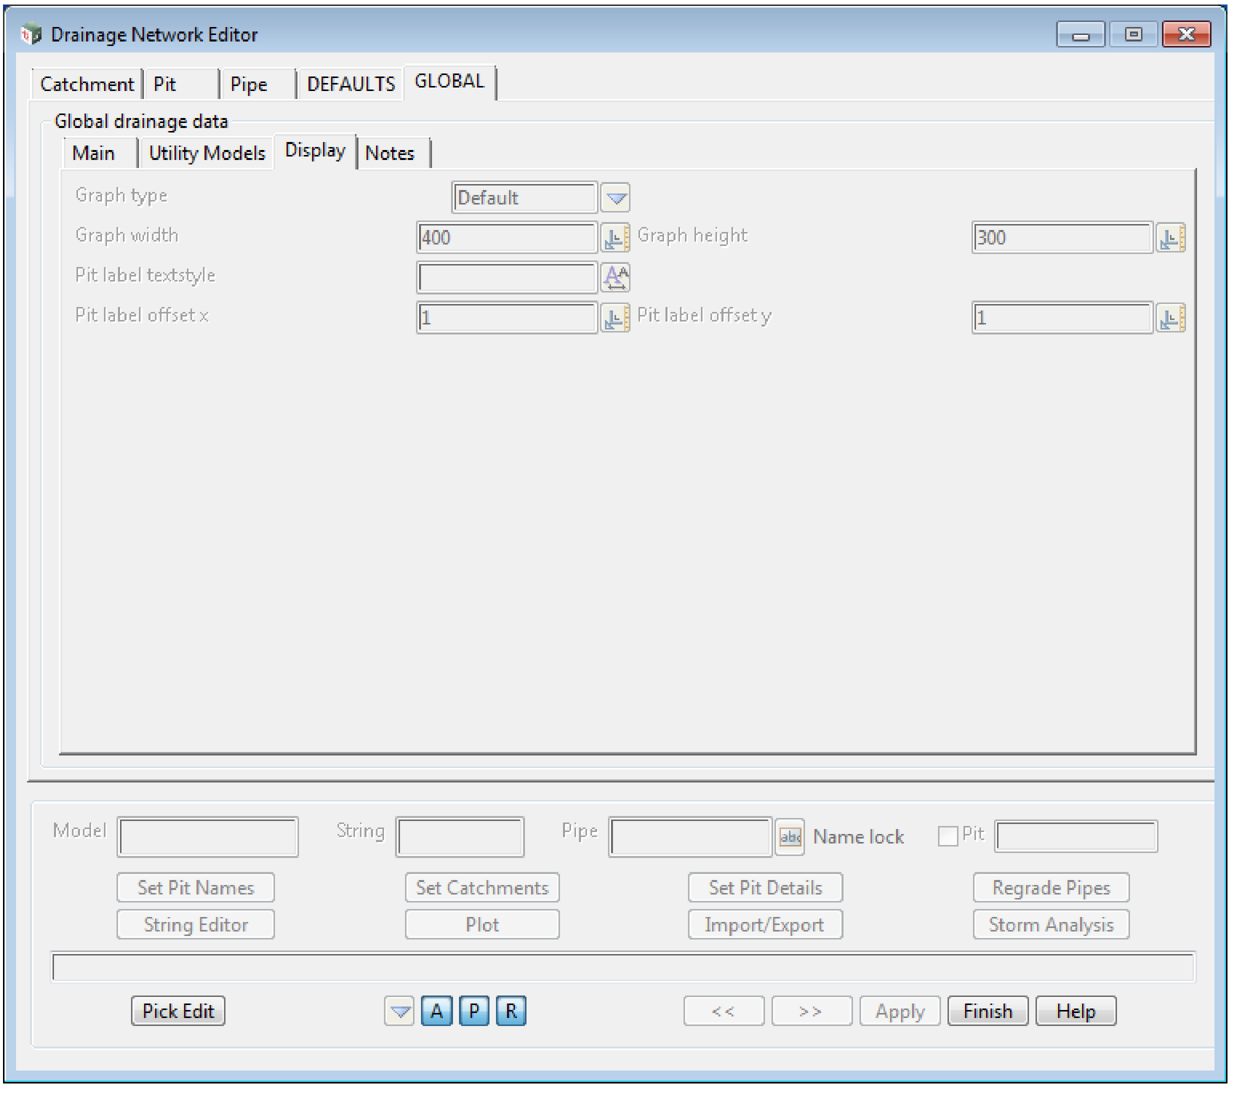
Bypass flow

Manhole setout via setout strings

Service and Utility Clashes

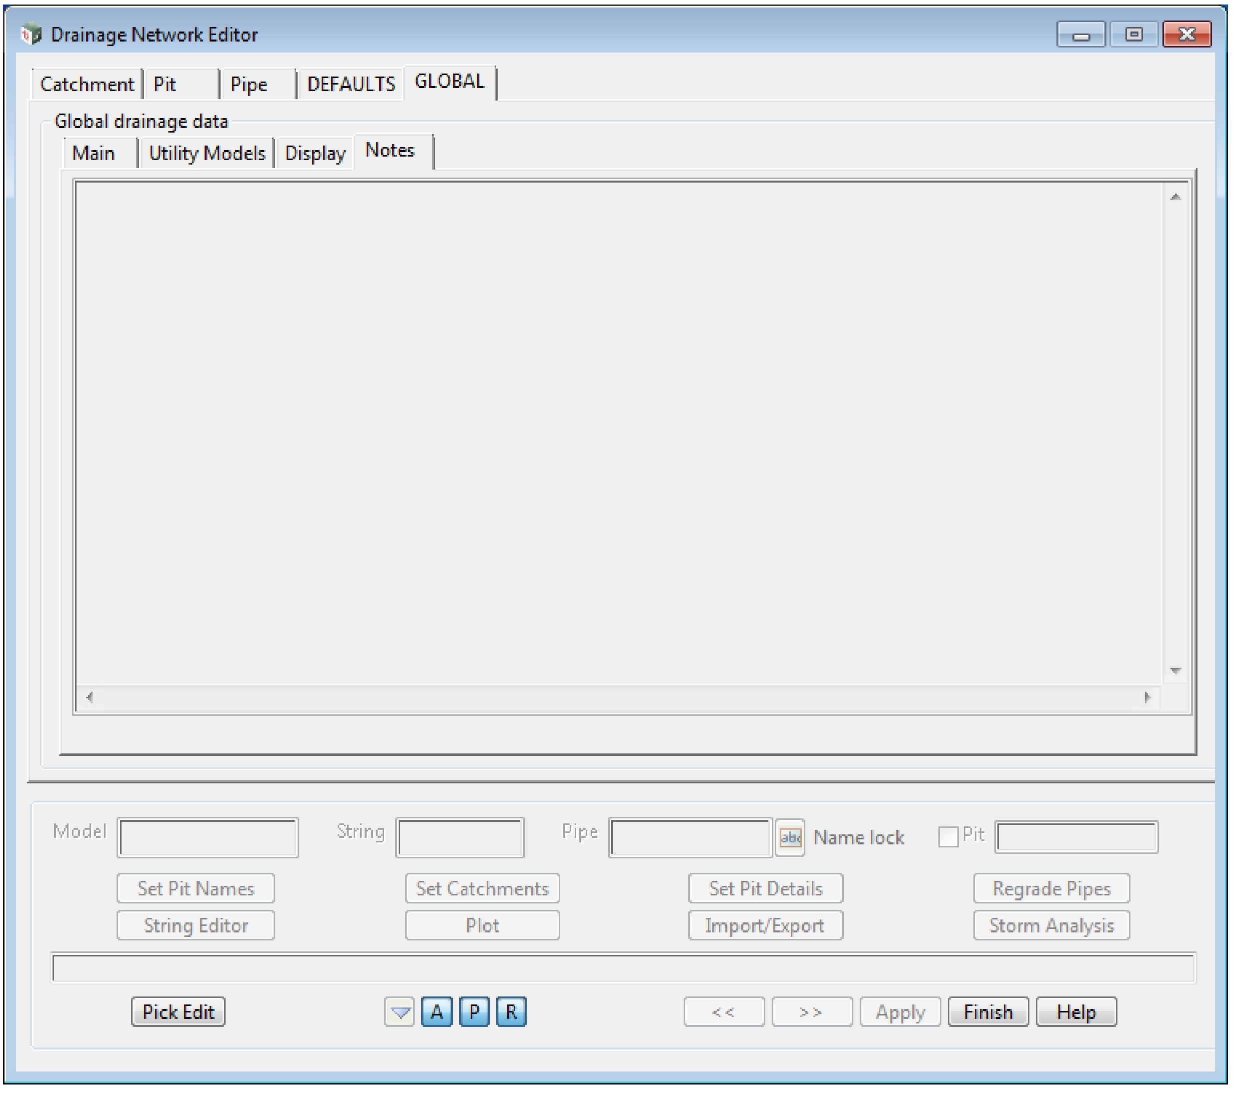
22.7.2.2 Display tab

The display tab is used to specify the following data:



22.7.2.3 Notes tab

The notes tab is used to specify the following data:



Drainage Network Editor

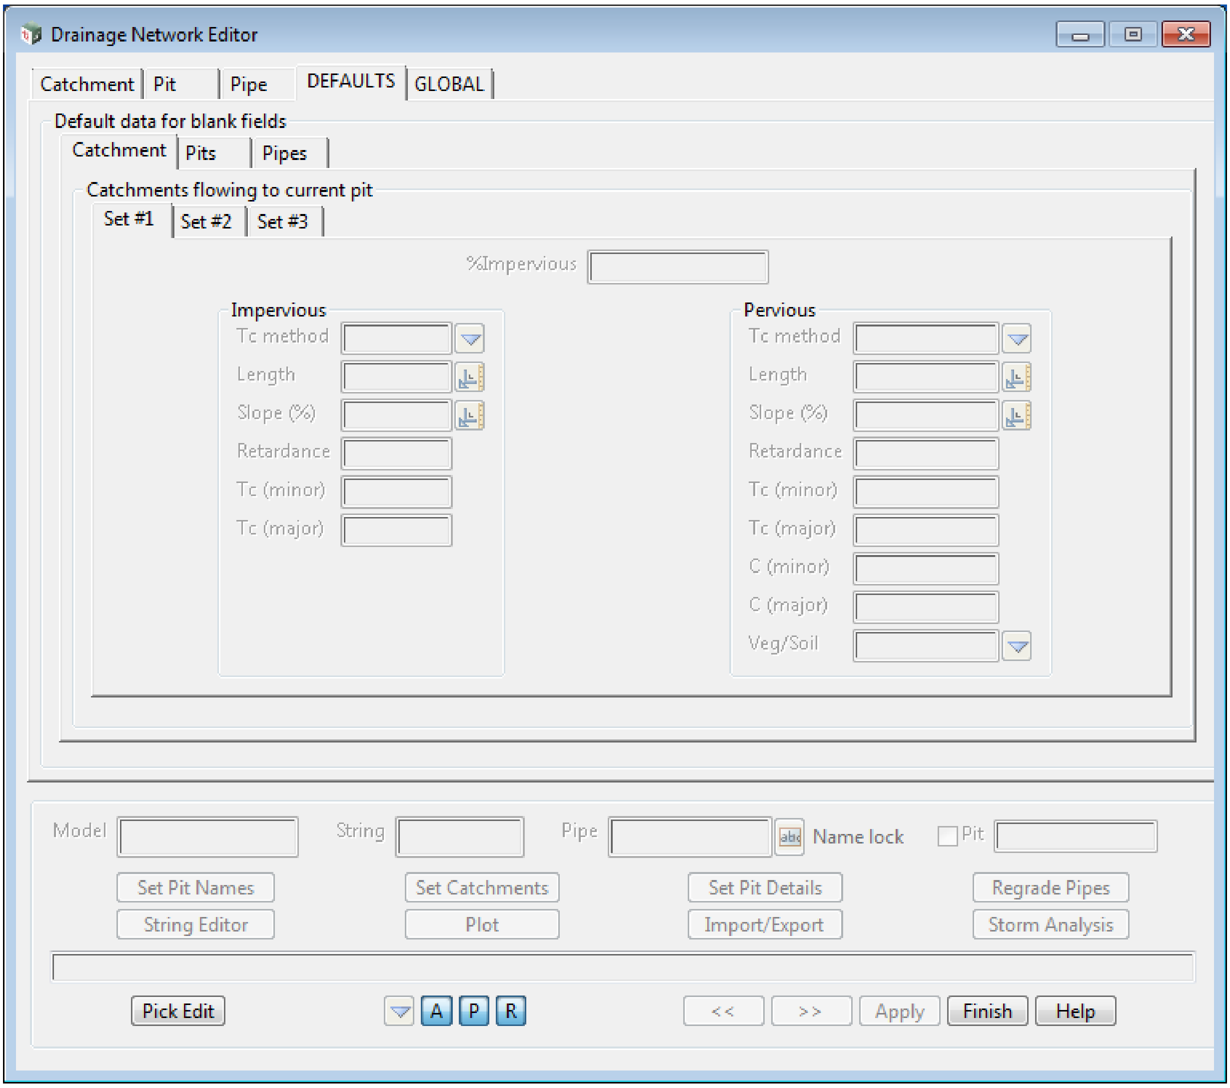
22.7.3 Defaults tab

The values on the defaults tabs are used unless the values are explicitly set on the **Main** Catchment, Pit and Pipe tabs.

22.7.3.1 Catchment subtab

The Catchment subtab is used to specify the following data:



Catchment Areas

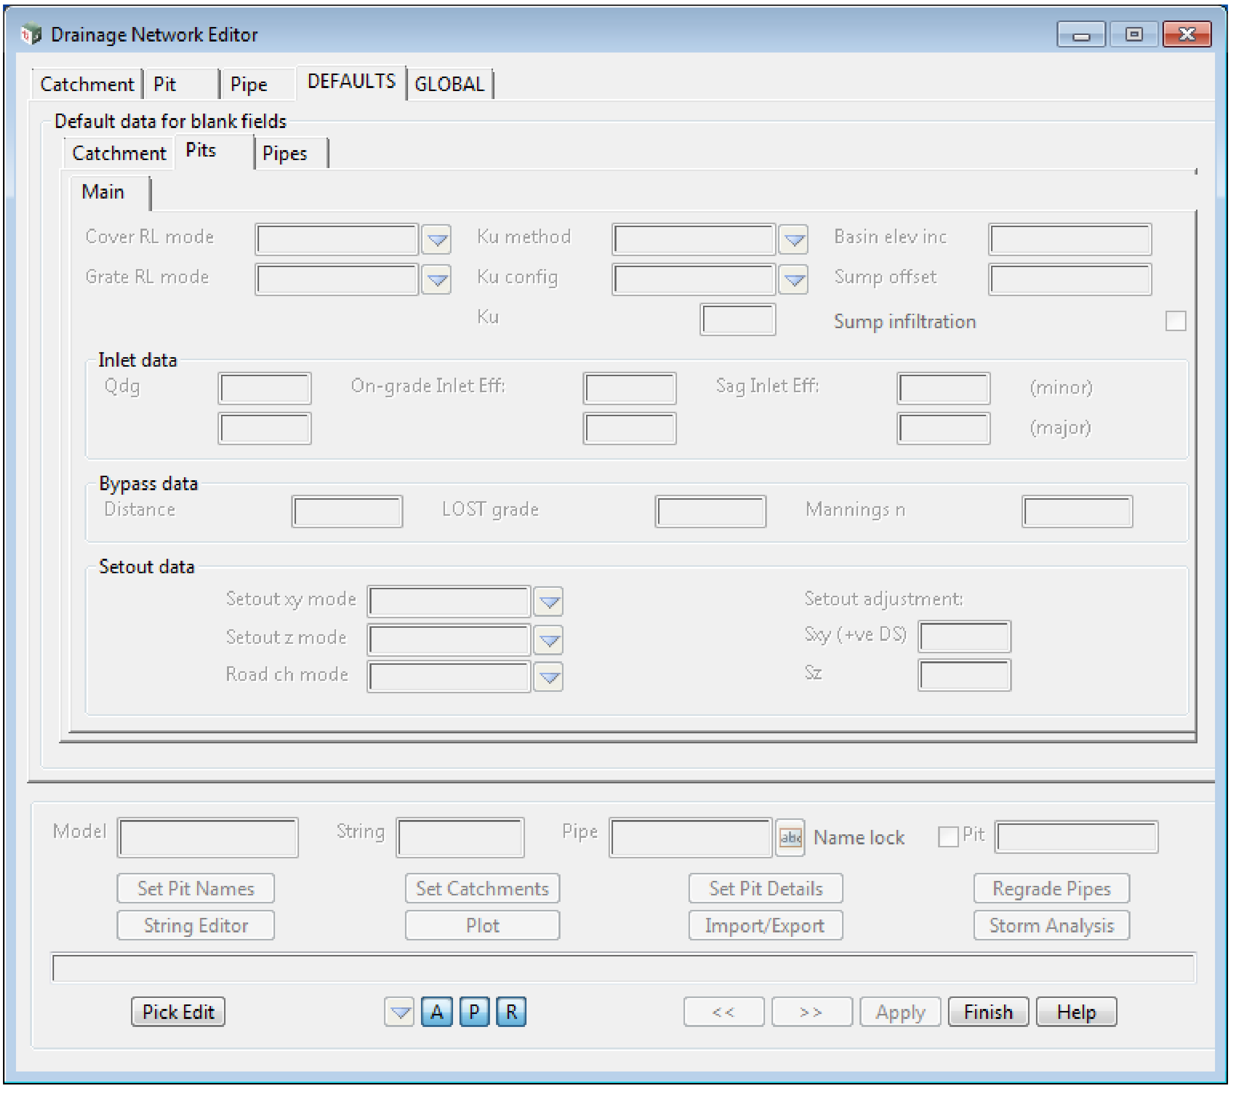
Percent Impervious

Times of Concentration Methods

Coefficients of Runoff

22.7.3.2 Pits subtab

The Pits subtab is used to specify the following data:



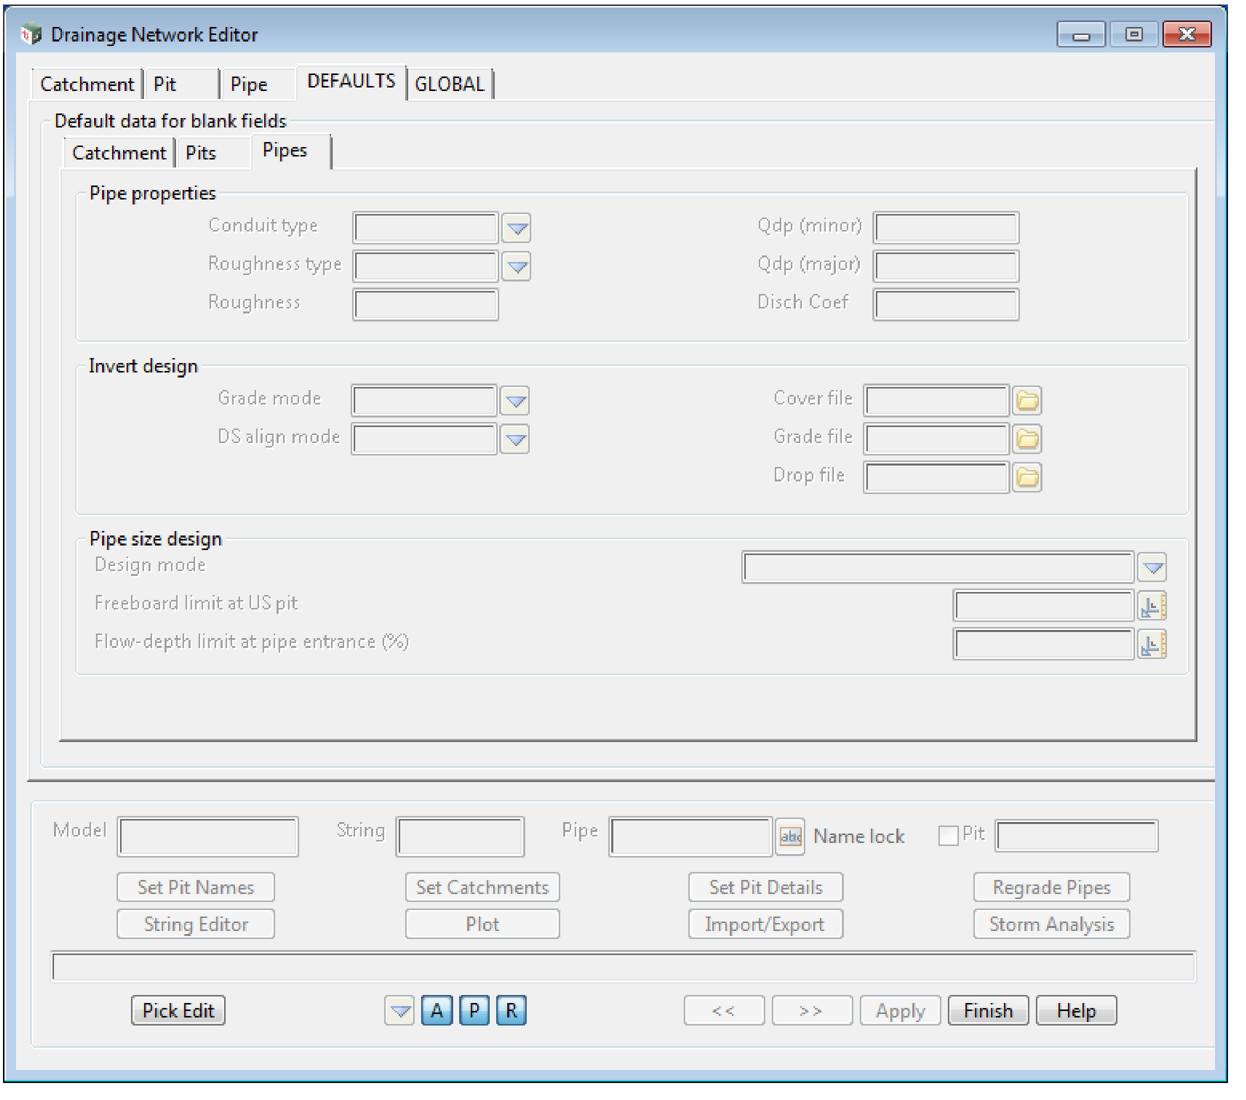
Manhole Setout Settings

Pit Losses Ku, and Direct Flow

Setout to Grate Offset

22.7.3.3 Pipes subtab

The Pipes subtab is used to specify the following data:



Pipe Friction Method

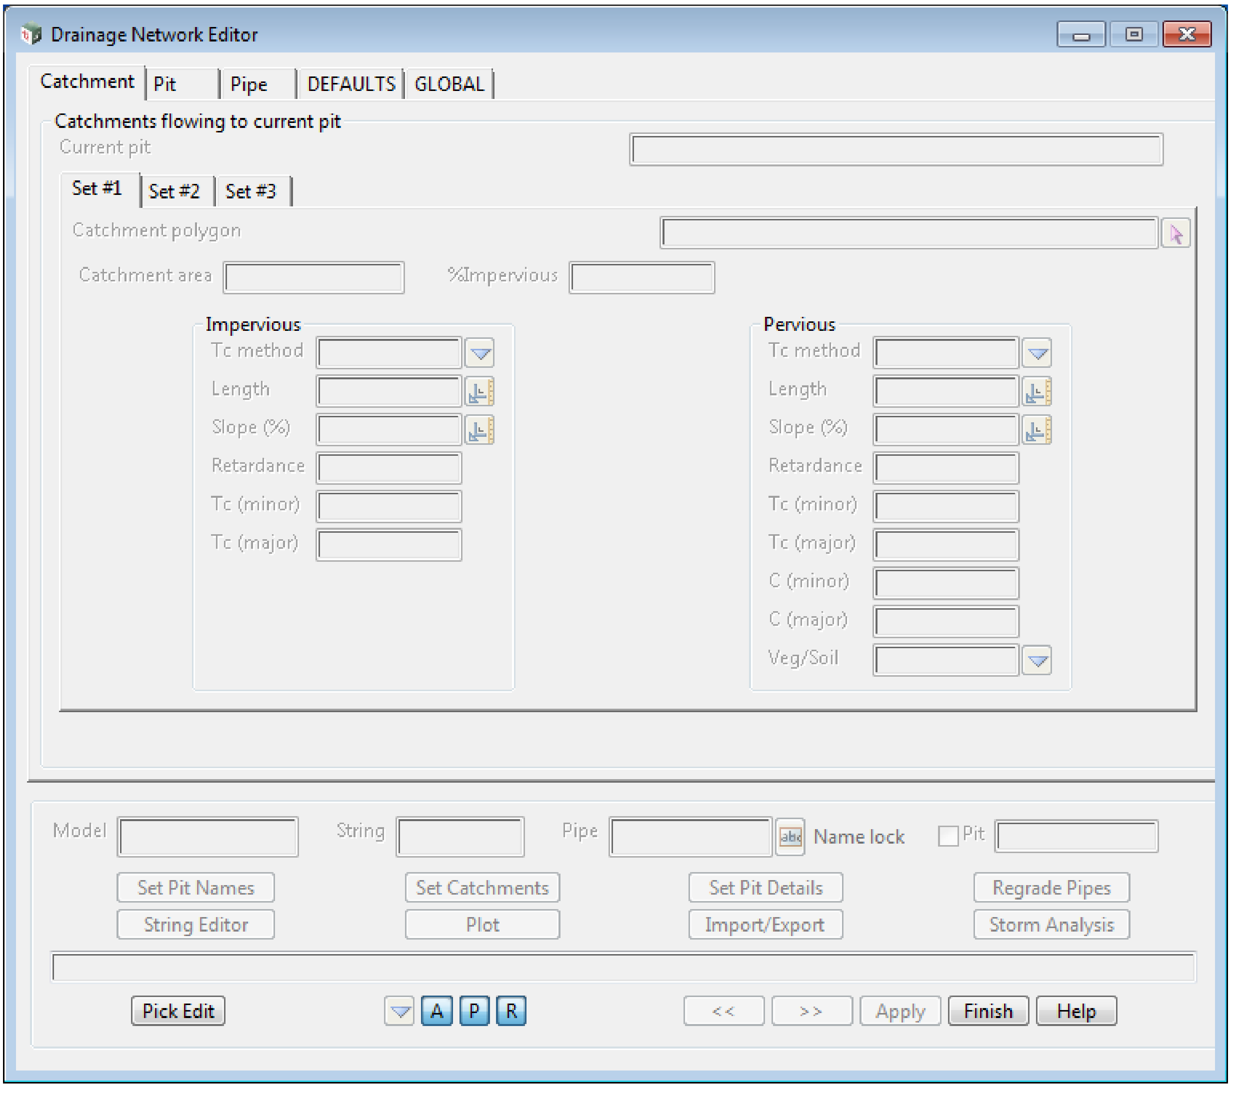
Pipe Friction Values and Freeboard Limit

Pit Losses Ku, and Direct Flow

Pipe Design Parameters

22.7.4 Catchment tab

The Catchment tab is used to specify the following data:



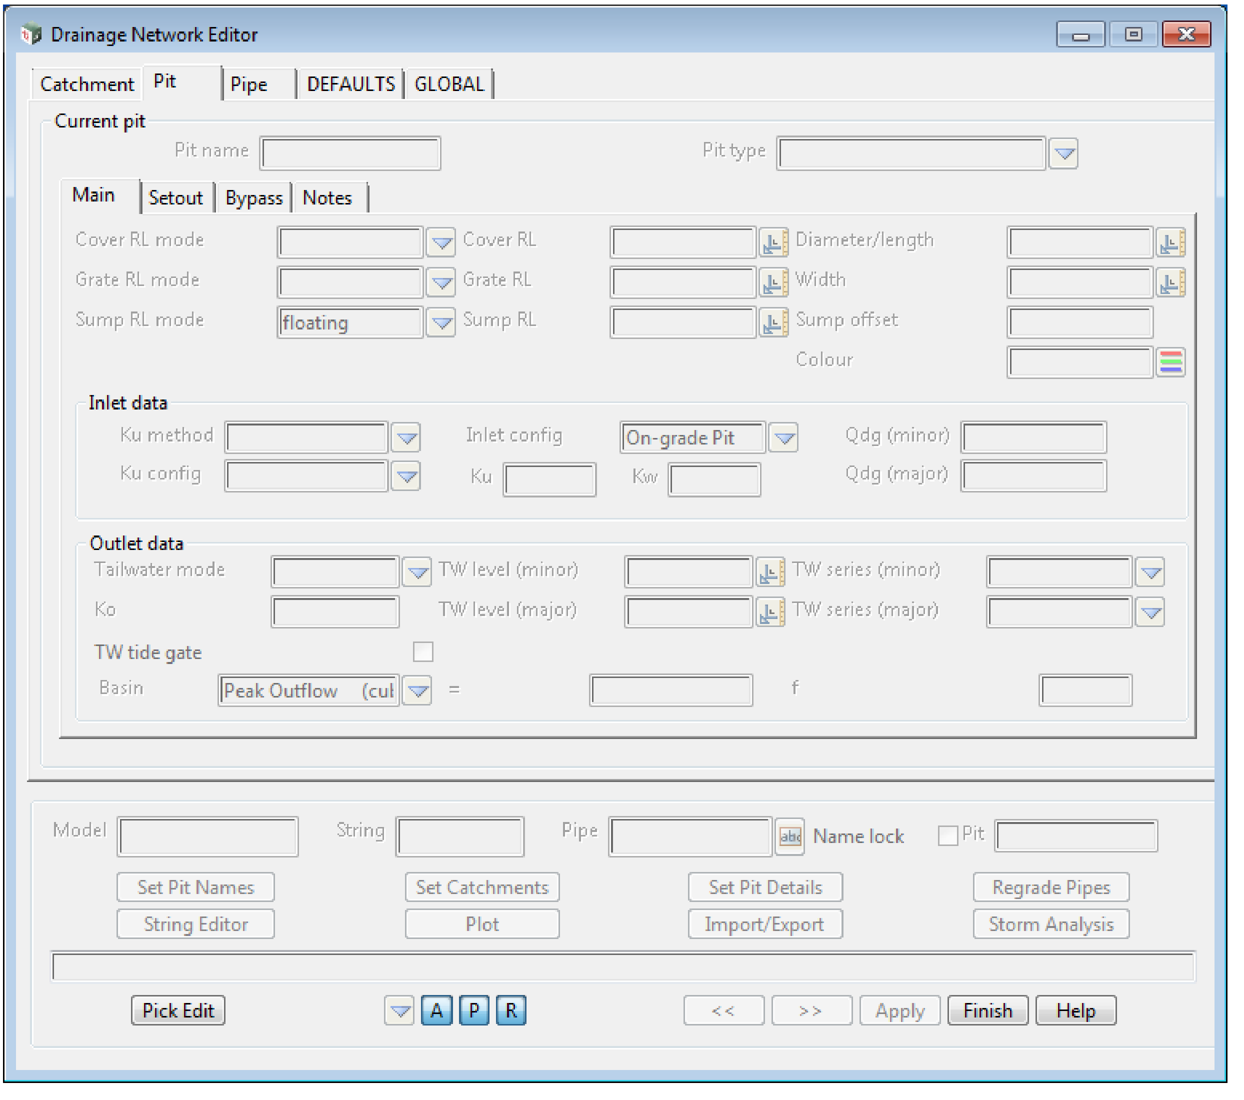
The pit tab has the explicit settings for the values entered on the Defaults catchment tab. When these fields are blank the default value is used. Three catchment sets are available. Typically the user will use one set for different types of catchment areas. For example: Set 1-Road area, Set 2-Lots, Set 3-Parks.

All 3 sets use the same default values except the percent impervious which has a separate default for each set.

Catchment Areas

22.7.5 Pit tab

The Pit tab is used to specify the following data:



The pit tab has the explicit settings for the values entered on the Defaults pit tab. When these fields are blank the default value is used.

Manhole Setout Settings

Pit Losses Ku, and Direct Flow

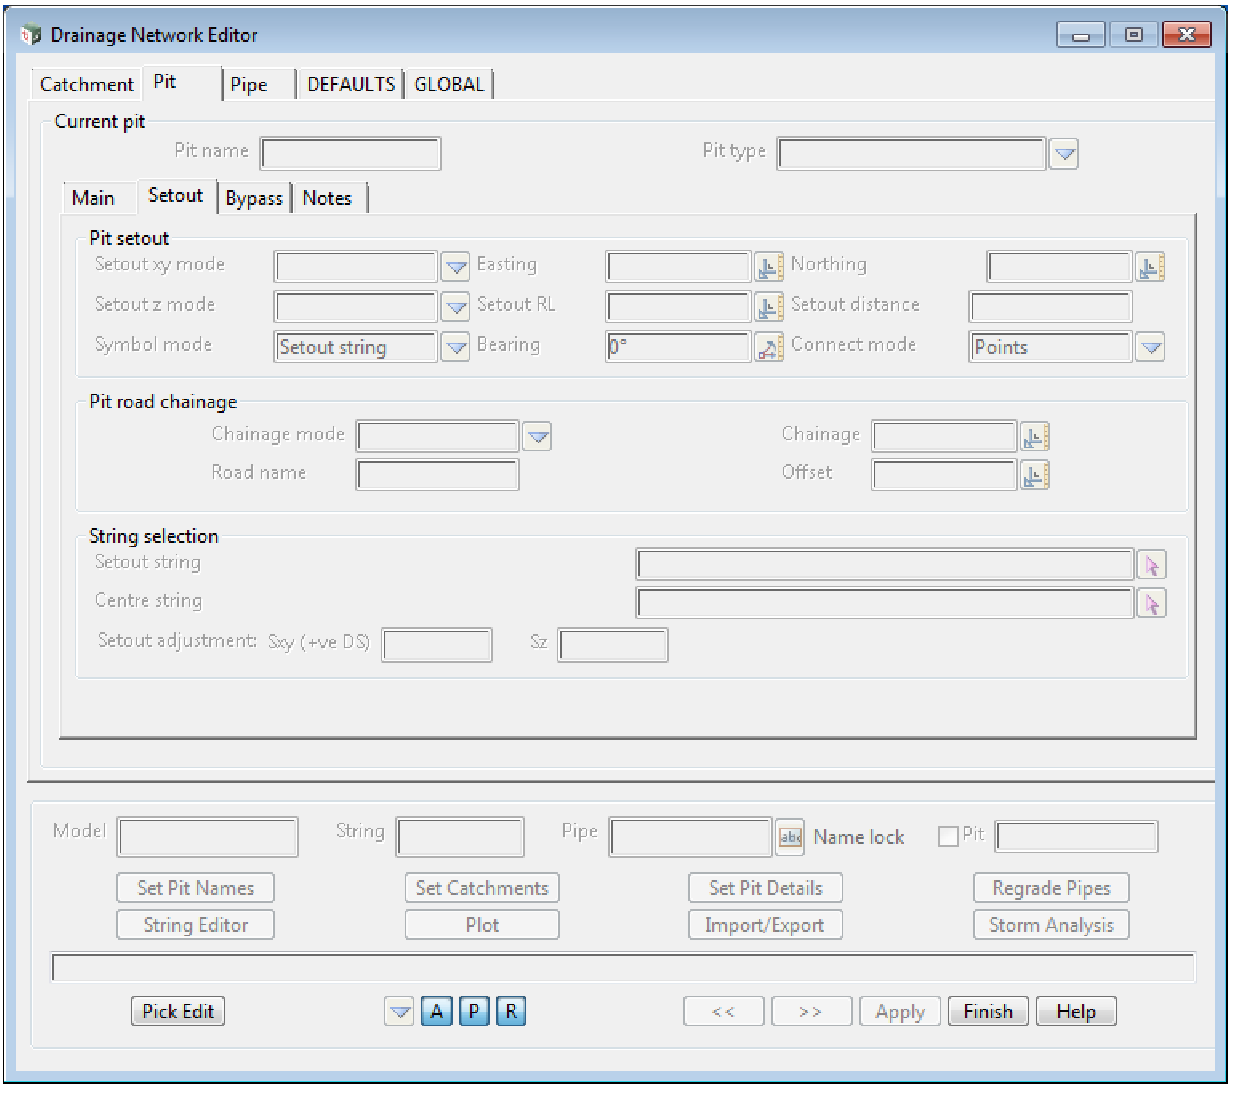
Setout to Grate Offset

Outlet and Tailwater Conditions

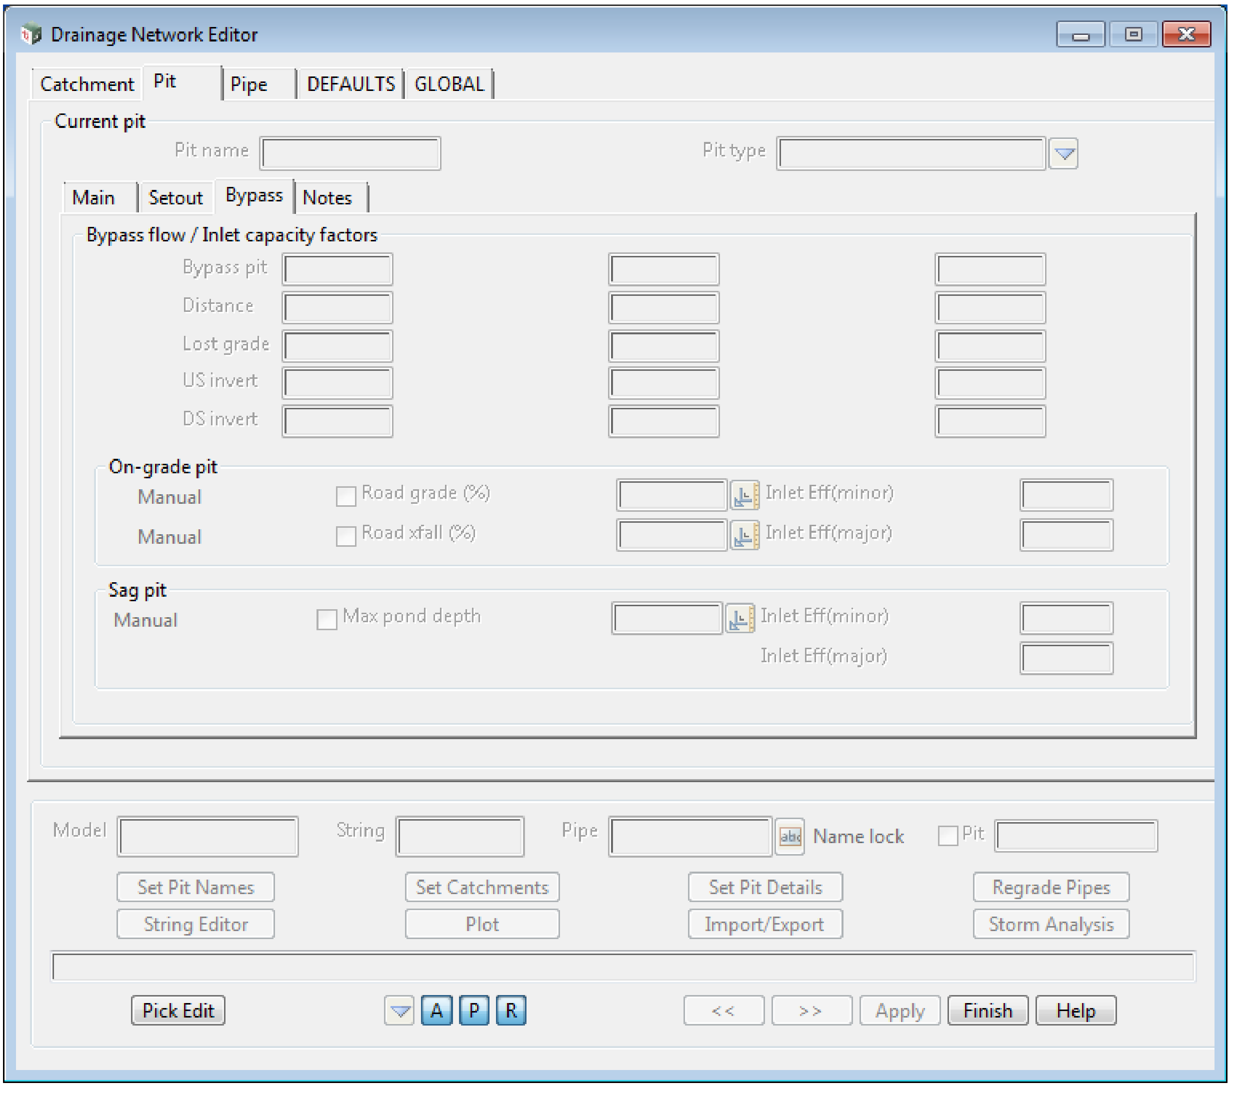
Pipe Design Parameters

Bypass Flow Settings

22.7.5.1 Setout subtab



22.7.5.2 Bypass subtab

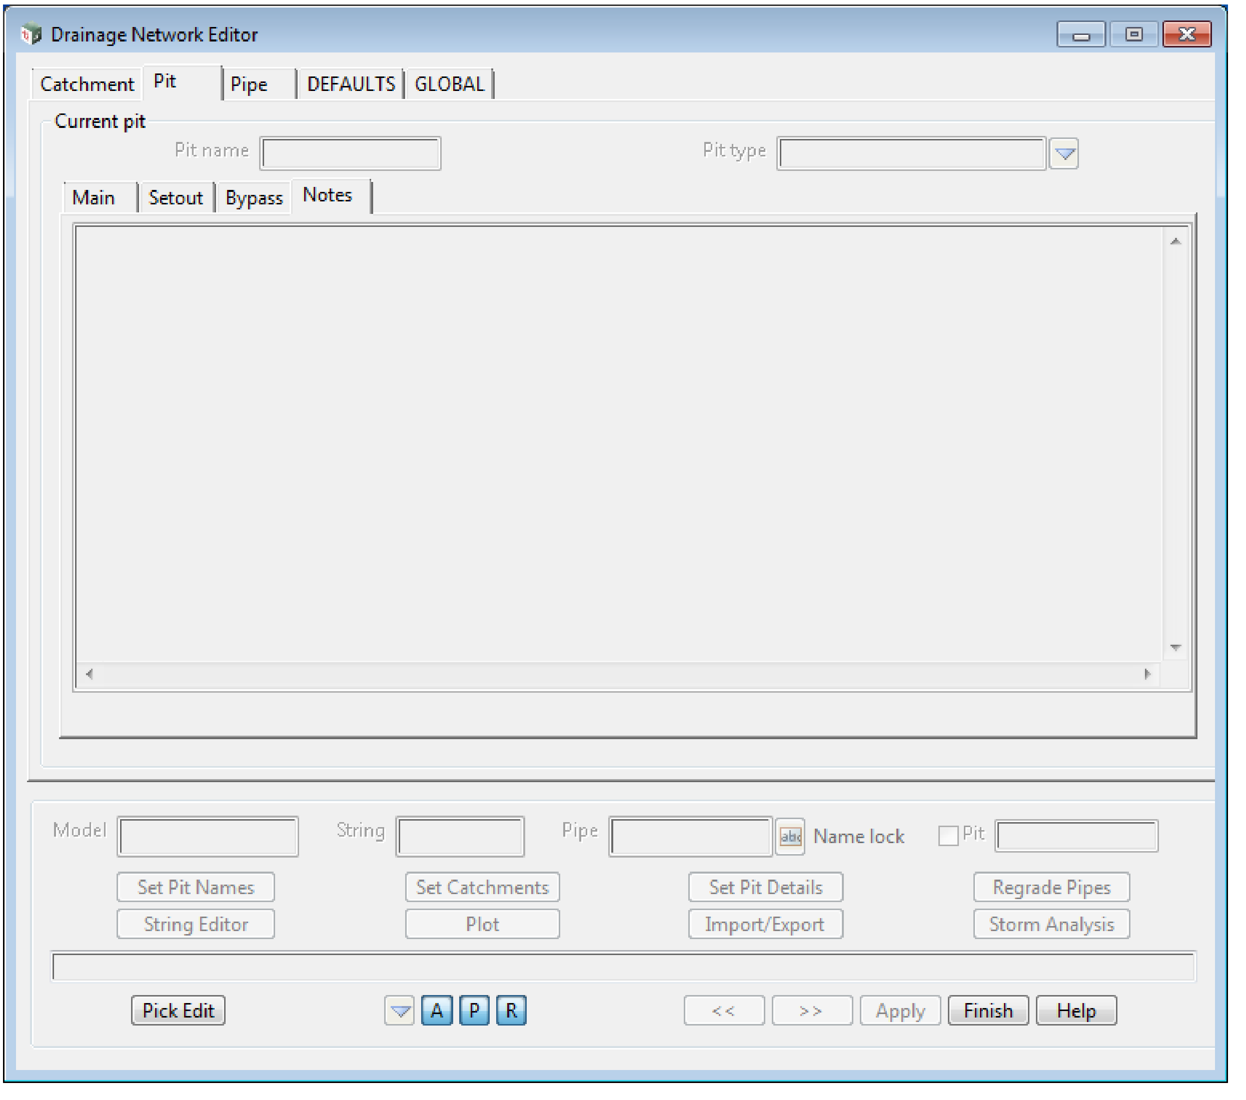


22.7.5.3 Bypass Shape subtab

22.7.5.4 Basin subtab

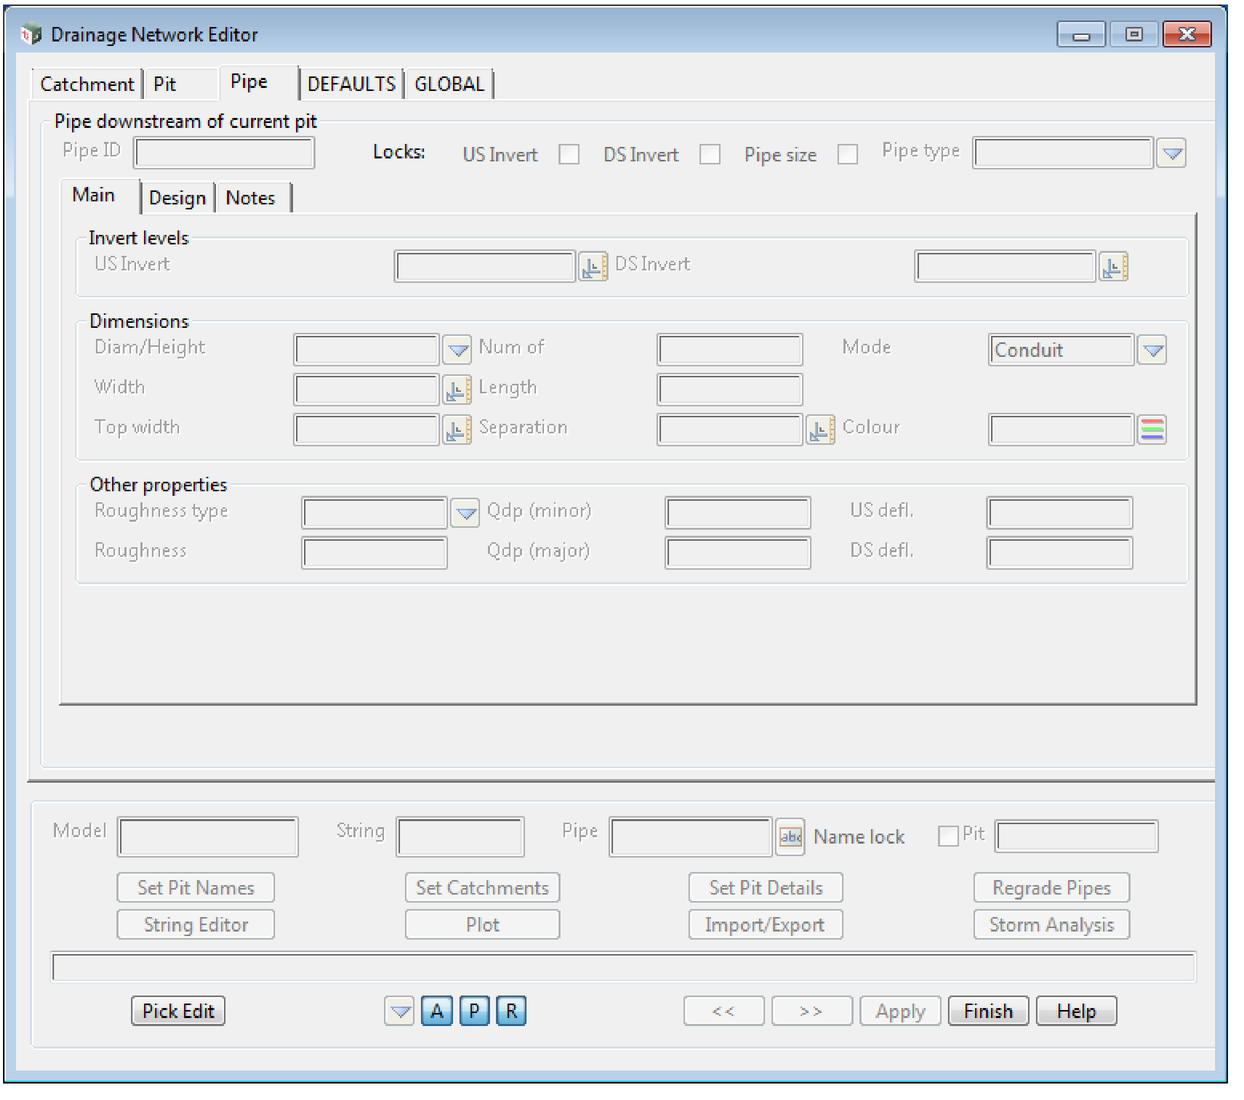
22.7.5.5 Inflow subtab

22.7.5.6 Notes subtab



22.7.6 Pipe tab

The Pipe tab is used to specify the following data:

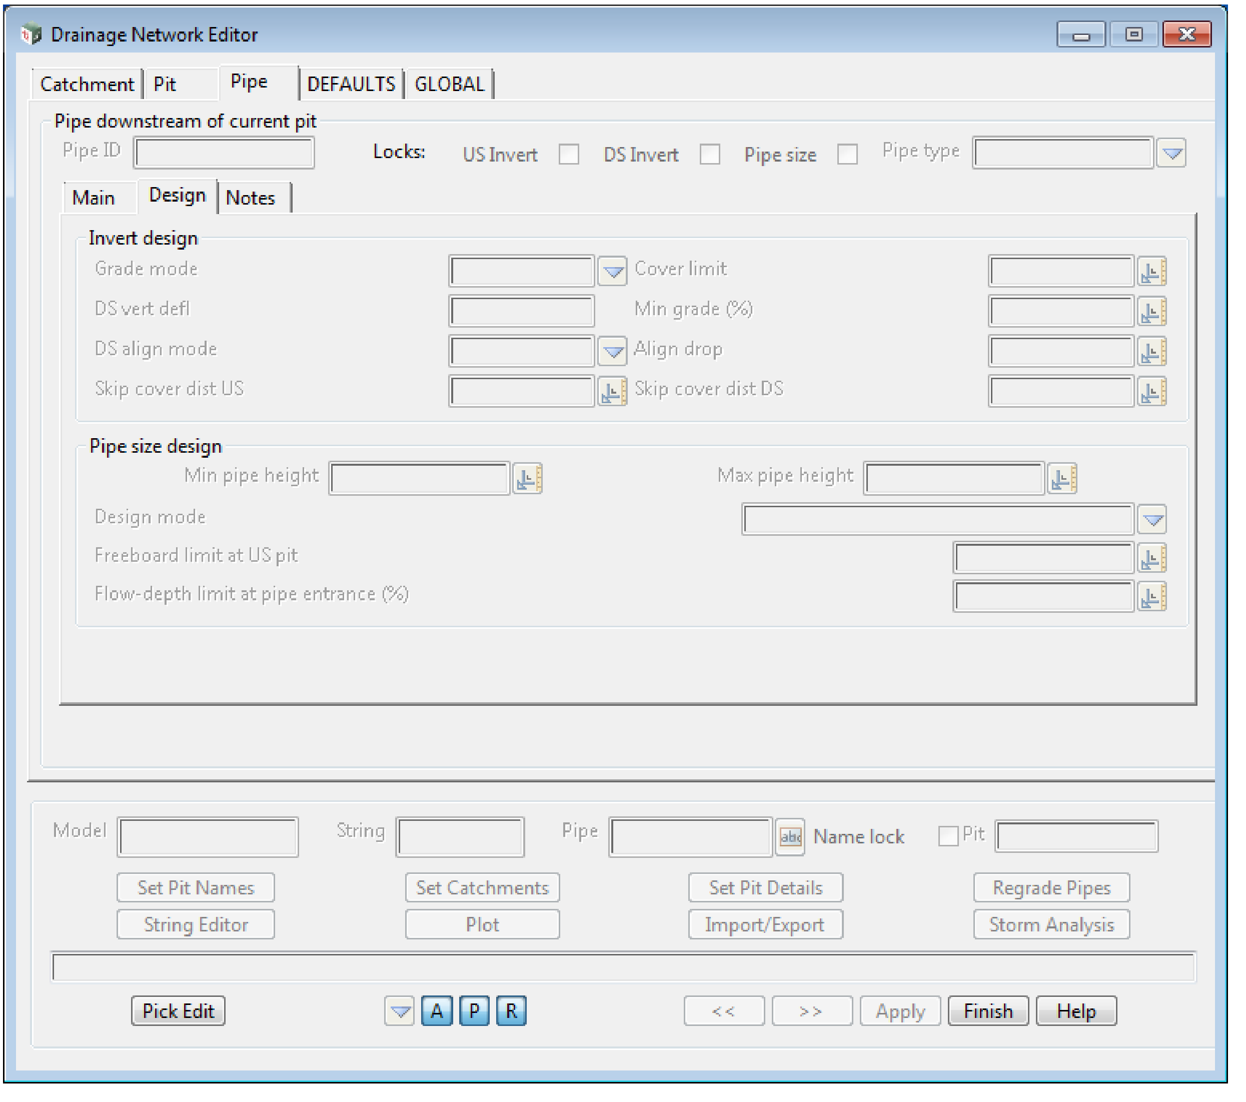


The pipe tab has the explicit settings for the values entered on the Defaults pipe tab. When these fields are blank the default value is used. It has 2 sub tabs.

Pipe:Main subtab

Pipe sizes, Max pipe height and Multiple Pipes and Box Culverts

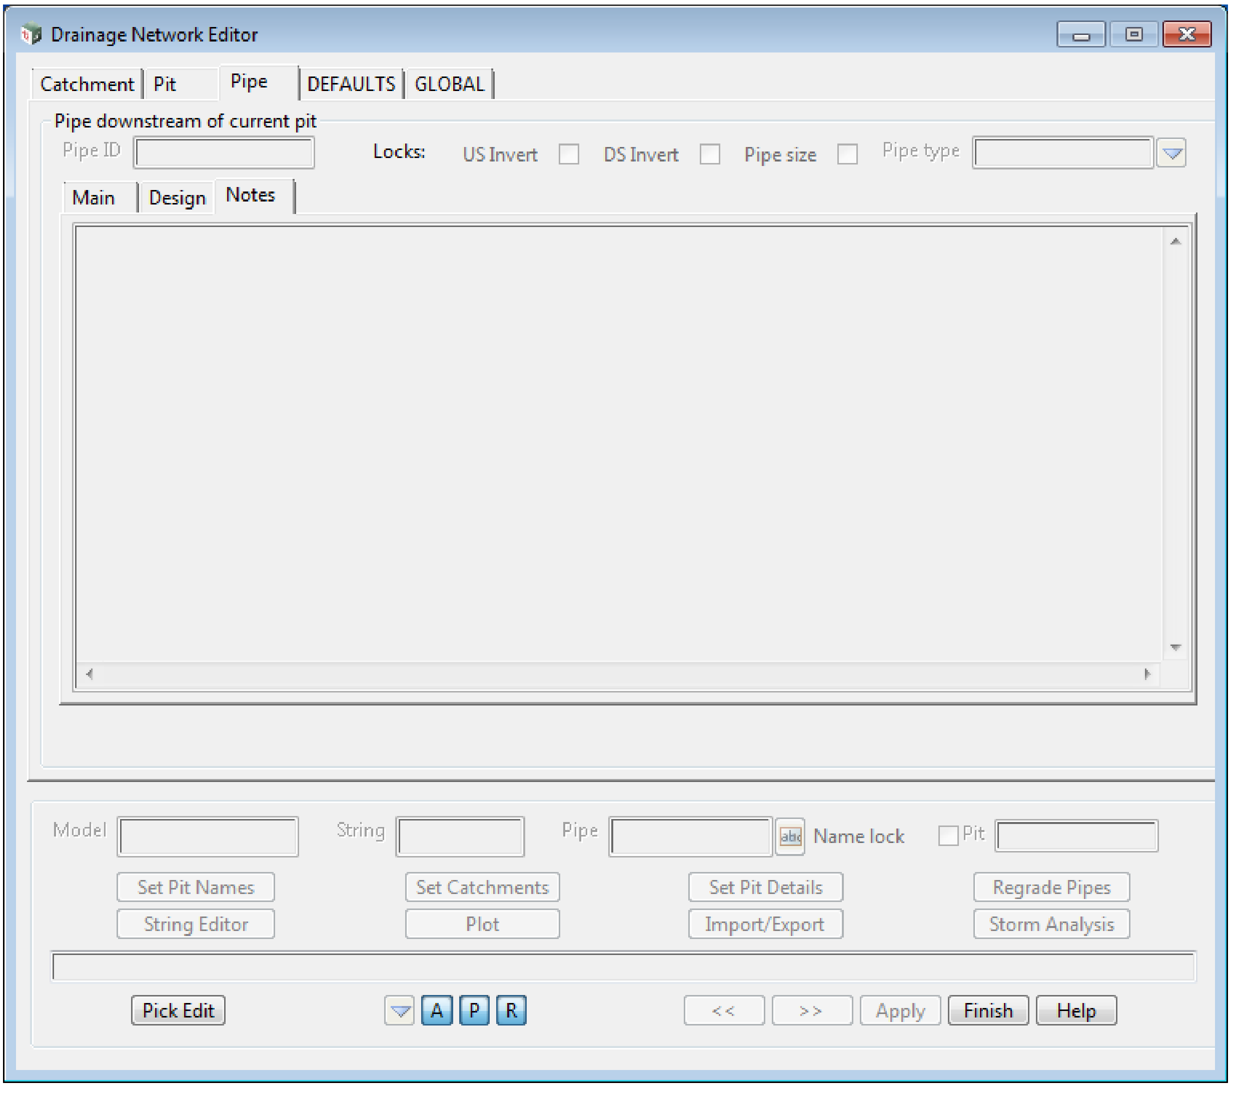
22.7.6.1 Design subtab



Pipe Friction Values and Freeboard Limit
Pipe Friction Method
Pipe Friction Values and Freeboard Limit
Pipe Design Parameters

22.7.6.2 Channels subtab

22.7.6.3 Notes subtab



22.7.6.4 Set Catchments

This selection links the catchment strings to the manholes and recalculates the areas. For SAG pits the catchments strings from all 3 sets are draped onto the design surface to locate the lowest overflow point. This level is used for the ponding depth. Information messages are written to the output window during this process.

See Set Catchments

22.7.6.5 Regrade Pipes

This option resets the pipe invert levels using the pipe design parameters. Information, warning and problem messages will be displayed in the output window. These messages will include pipe cover warnings, service crossing data and invert alignment messages. The user may place too many restraints using the regrade options results in no feasible solutions to the grading. These messages will also be shown.

22.7.6.6 Set Pit Details

This option resets the following manhole values: cover level. If activated the following are also set: road design string, setout x,y and z, road centre line chainage and offset, the manhole symbol rotation, the road grade and crossfall, the bypass pit,

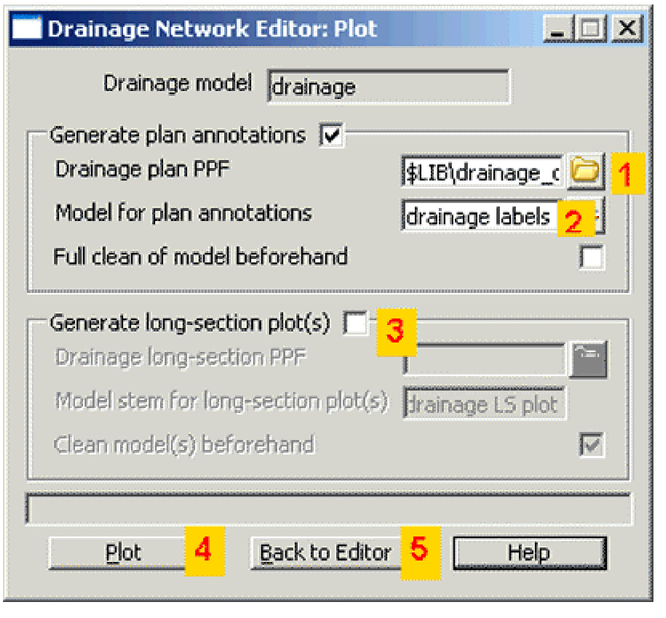
22.7.6.7 Set Pit Names

Tin for pit cover level   tin box

The new drainage manhole cover level will be set to the tin level at the manhole centre (optional)

22.7.6.8 Plot

This plotting option will create a drainage plan and/or long section using the ppf files entered. The ppf editors can be launched from this panel by selecting the More Information folder icon beside the ppf field.



See Using Drainage Network Plot Button

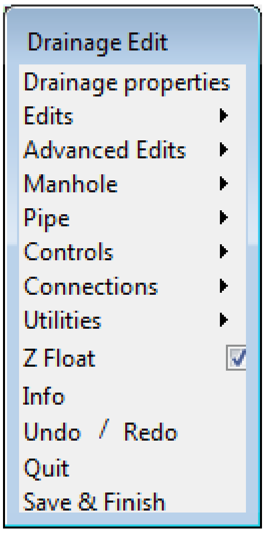
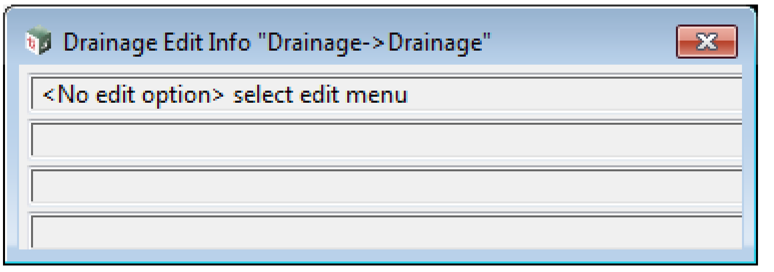
22.7.10 Drainage Edit

On picking a drainage string when in the string **Editor** option, or by selecting **Create** in the **Create Drainage String** panel, the **Drainage Edit** menu and panel are placed on the screen.





The edit is **cancelled** by selecting the **Quit**. No changes to the string are recorded and the **Drainage Edit** option terminates.

The edit is **finished** and the changes recorded when the **Finish** is chosen. The **Drainage Edit** option then terminates.

When either button is selected, a **Yes-No-Cancel** panel is displayed and the user must confirm the selection.

The **Drainage Edit Info** panel is principally used to display information and messages during the creation and editing of the drainage string. It is toggled on and off by **Info** on the **Drainage Edit** menu.

The main message area indicates the purpose of the mouse buttons at each step.

Message area 1 displays the current Drainage Edit option and message area 4 indicate the next step in the edit option.
Message areas 2 and 3 are used to display information about the string as the cursor is moved near the drainage string and the drainage manholes.

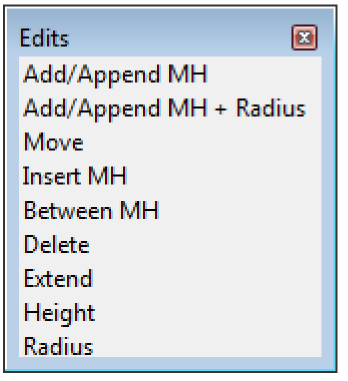
Each of the options in the **Drainage Edit** menu will now be described.

For the option *Drainage properties*, please continue to the section .
Edits, please continue to the section Edits.
Advanced Edits, please continue to the section Advanced Edits.
Manhole, please continue to the section Manhole (Maintenance Hole).
Pipe, please continue to the section Pipe.
Controls, please continue to the section House Connections.
Connections, please continue to the chapter House Connections.
Utilities, please continue to the chapter Utilities.
Z float, please continue to the chapter Z Float.

22.7.10.1 Edits

The options in the **Edits** menu are used for placing the initial manholes of a new drainage string, editing a new drainage string once the initial manholes are placed or editing an existing drainage string.

The **Edits** walk-right menu is



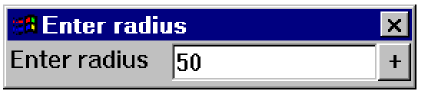
22.7.10.1.1 Append, Append+Radius

The **Append**, **Append+Radius** operations for a drainage string are similar to the **Append** options for a polyline string except that manholes are also automatically placed at each added point.

Note - a manhole can be removed from the point afterwards using the **Manhole=>Remove** option. The point will still be there but without a manhole on it.

If the **Append + Radius** option selected, then before each point is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like



The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next drainage string point and the arc will be drawn correctly as the cursor is moved to the next point.

A **radius** value of **0** is taken to mean no arc.

If **z Float** is set to tick, then the top of the manhole is automatically placed on the terrain given in the tin field for the drainage string.

If height snap is toggled on in the **Snaps** menu, the height will be displayed an a new height entered but the new height will only be used if **z Float** is turned off for the manhole.

Each manhole in the string is connected by a drainage pipe. The diameter, type and cover at each end of the **drainage pipe** are taken from the **Drainage Pipe Defaults** panel.

The **Append** options are terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.1.2 Move

If used in a plan view, the **Move** option is used to move the (x,y) position of a manhole.

If used in a section view, the **Move** option can be used to change the height of the top of any manhole or the height of either end of the drainage pipe connecting adjacent manholes in the drainage string.

After the **Move** option is chosen, the user selects either a manhole in a plan view or the top of a manhole or a pipe end in a section view.

If a manhole is selected from a plan view, then the plan position of the selected manhole will move with the cursor. The new position for the top of the manhole can be chosen by either cursor selection or typed input in exactly the same way as for moving a point on a 3d string.

If the top of a manhole or the end of a pipe connecting adjacent manholes is chosen in a section view, then only the height of the selected point can be modified. That is, if a point is selected in a section view, then it is constrained to move in the z-direction only.

The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.1.3 Insert

The **Insert** option is designed to place a new manhole between two adjacent manholes (note that the inserted manhole does not have to be on the line joining the two adjacent manholes).

To insert a new manhole, the two adjacent manholes are chosen by selecting the line connecting the two manholes. Once the **line** is selected, the new manhole is assumed to be at the current cursor position. As the cursor is moved, the drainage string is redrawn reflecting the changing position of the inserted manhole.

The **Insert** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.1.4 Between

The **Between** option is similar to the **Insert** option except that the inserted manhole **does** have to be on the line joining the two adjacent manholes. To accomplish this, the cursor position is projected onto the manhole-manhole line to give the new manhole position.

Note - once the manhole is placed, it is no longer constrained to be on the one straight or arc joining adjacent manholes. If this is required, then the manhole is placed using the **Manhole=>Add** option.

The **Between** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.1.5 Delete

The **Delete** option is used to delete manholes/and or points from the drainage string.

The manhole/point to be deleted is selected with the cursor and when the selection is accepted (MB), it is **deleted**.

Once a manhole/point has been deleted, the delete option is still current and can be repeated without re-selecting the **Delete** option.

The string, minus the deleted manhole/point, is redrawn after each deletion.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.1.6 Extend

The **Extend** option is used to move a manhole/point along the line joining the manhole/point to one of its adjacent manhole/point.

That is, the bearing of the manhole/point-manhole/point line is kept constant and the manhole/point moved along that line either **towards** or **away** from its neighbouring manhole/point.

Extending, like moving a manhole/point, is a two step process.

Step (a) - selecting the manhole/point-manhole/point line and the manhole/point to be moved along that line
Step (b) - selecting the final position for the manhole

Both steps are identical to extending an point in a polyline string.

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **Extend** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Note - Extend can be used on the end manholes of the drainage string

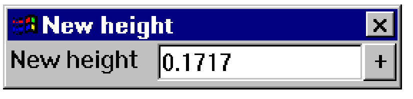
22.7.10.1.7 Height

The **Height** option is used to modify the height (z value) of the top of any manhole, or the height of the ends of the pipes connecting adjacent manholes in the drainage string.

The top of the manhole can be selected in either a plan or a section view. The pipe ends can only be selected in a section view.

After the **Height** option is chosen, the user must select the manhole top or pipe end that is going to have its height modified.

Once the manhole or pipe end has been selected, an New height typed-input box is displayed on the screen with the items current height (z value) in it.

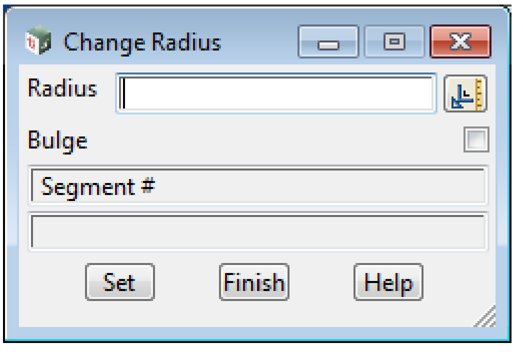


The required height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the manhole or pipe and the string redrawn with the new height at that point. The typed-input box then disappears.

The **Height** option is terminated by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.1.8 Radius

Selecting **Radius** brings up the **Change Radius** panel which is used to modify the radius of any arc/line joining adjacent manhole points.



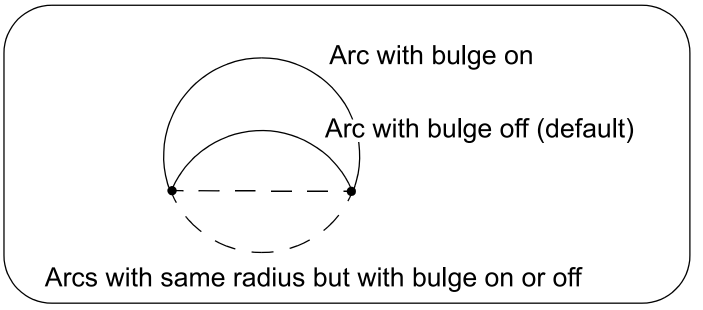
After selecting the **Radius** option, the user selects the arc/straight to be modified and the current arc radius and bulge setting will be displayed in the **Change Radius** panel.

New values can then be entered and the arc modified by selecting the **Set** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

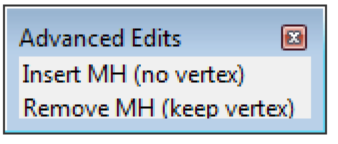
If bulge is turned on, the larger arc is used. The default is bulge turned off.



22.7.10.2 Advanced Edits

The options in the **Advanced Edits** menu are used for placing the adding manholes at locations other than a vertex and removing these manholes.

The **Advanced Edits** walk-right menu is



22.7.10.2.1 Insert MH (no vertex)

The **Insert MH (no vertex)** operation for a drainage adds a manhole on the existing string. When either of the 2 adjacent manholes with a vertex are moved, this manhole will move as well.

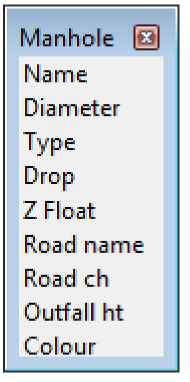
22.7.10.2.2 Remove MH (no vertex)

The **Remove MH (no vertex)** operation for a drainage removes a manhole on the existing string. If the manhole is on a vertex the vertex remains in the horizontal geometry but does not affect the vertical geometry.

22.7.10.3 Manhole (Maintenance Hole)

The options in the **Manhole** menu are used to modify information about individual manholes in the drainage string.

The **Manhole** walk-right menu is



22.7.10.3.1 Add

The **add** option is similar to the **Edits=>Between** option in that a new manhole is created that must be on the line or arc between two adjacent manholes.

However, once the manhole is placed, it is **always constrained** to be on the one straight or arc joining its adjacent manholes.

To **add** a new manhole, the two adjacent manholes are chosen by selecting the line connecting the two manholes. Once the **line** is selected, the new manhole is assumed to be at the current cursor position. As the cursor is moved, the drainage string is redrawn reflecting the changing position of the inserted manhole.

The **add** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.3.2 Remove

The **Remove** option is used to remove manholes from the drainage string but unlike the **Edits=>Delete** option, the underlying point on the drainage string remains. Hence only the manhole is deleted, but not the polyline point underneath.

The manhole to be removed is selected with the cursor and when the selection is accepted (MB), it is **removed**.

Once a manhole has been removed, the **Remove** option is still current and can be repeated without re-selecting the **Remove** option.

The string, minus the deleted manhole/point, is redrawn after each removal.

The **Remove** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.3.3 Name

The **Name** option is used to change a manhole's label.

After selecting the option, the mouse is used to pick the manhole to have a name change.

Once a manhole has been selected, an Enter text typed-input box is displayed on the screen containing the selected manhole's name.

The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

NOTE - if the name of the manhole is *EOL* or *eol* then the diameter of the manhole is forced to zero.

22.7.10.3.4 Diameter

The **Diameter** option is used to change a manhole's diameter.

After selecting the option, the mouse is used to pick the manhole to have its diameter modified.

Once a manhole has been selected, an **Enter value** typed-input box is placed on the screen displaying the selected manhole's current diameter.

The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.3.5 Type

The **Type** option is used to change the type of the cover (lid) placed on a manhole.

After selecting the option, the mouse is used to pick the manhole to have its cover type modified.

Once a manhole has been selected, a **Manhole type** typed-input box is displayed on the screen containing the selected manhole's cover type.

The list of common covers for the manhole can be obtained by clicking the **[+]** in the **Manhole type** input box and getting a menu of valid cover types.

The new cover type is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Type** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.3.6 Drop

The **Drop** option is used to change the vertical distance between the bottom of the pipes on either side of a manhole, *i.e.*, the difference in the invert levels of the pipe.

Since the drop in simply the difference in vertical distance between two pipes on either side of a manhole, the actual value of the drop can be changed by moving either of the pipes up or down the manhole.

After selecting the option, the end of the pipe to be moved is selected with the mouse.

Once the pipe end been selected, an enter value typed-input box is displayed containing the drop across the manhole that the pipe end connects into.

The new drop type is entered into the typed-input box, terminated with <enter>.

If the end of the pipe was on the upstream side of the manhole (normally the right hand side of a manhole in a section view), the end of the pipe will be moved upward until the drop across the manhole equals the entered value.

If the end of the pipe was on the downstream side of the manhole (normally the left hand side of a manhole in a section view), the end of the pipe will be moved down until the drop across the manhole equals the entered value.

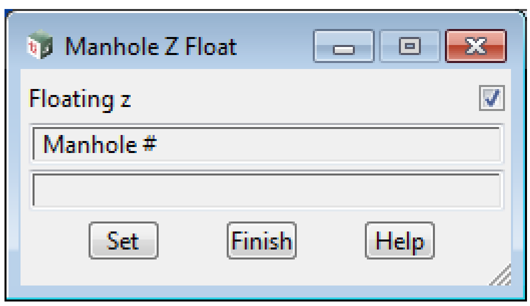
The typed-input box then disappears.

The **Drop** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.3.7 Z Float

A **floating manhole** takes the z-value for the top of the manhole from the tin selected for the drainage string. Hence as a floating manhole moves around in a plan view, the top of manhole will automatically change to suit the new z-value of the drainage string tin.

Selecting **Z float** brings up the **Manhole Z Float** panel which is used to change a manhole from floating to non-floating and vice-versa.



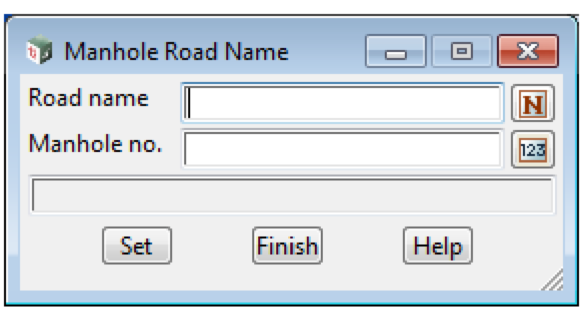
After selecting the **Z Float** option, the user selects the manhole to be modified and the current **floating z status** is displayed in the **Manhole Z Float** panel.

The tick box can then be changed and the manhole modified by then selecting the **Set** button.

22.7.10.3.8 Road Name

A **road name** can be set for a manhole of the line.

Selecting **Road name** brings up the **Manhole Road Name** panel which is used to give and change a road name for a manhole.



The option is running as soon as the panel is on the screen and the user is asked to selected a manhole.

<Select manhole> [picks][][Menu]

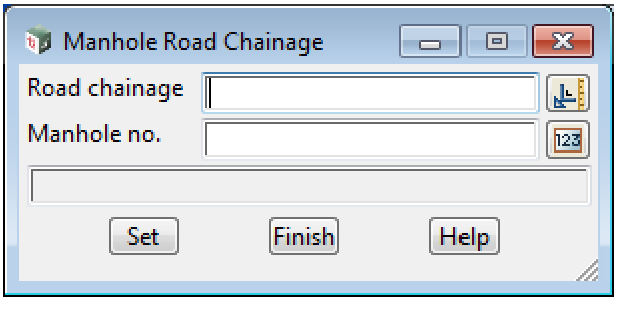
When the manhole is selected, any existing road name and the manhole number is placed in the road name and vertex no. fields respectively of the **Manhole Road Name** panel.

A new **road name** is then typed into the road name panel field and the **Set** button selected to record the road name with the manhole.

22.7.10.3.9 Road Chainage

A **road chainage** can be set for a manhole of the line.

Selecting **Road ch** brings up the **Manhole Road Chainage** panel which is used to give and change a road chainage for a manhole.



The option is running as soon as the panel is on the screen and the user is asked to selected a manhole.

<Select manhole> [picks][][Menu]

When the manhole is selected, any existing road chainage and the manhole number is placed in the road chainage and vertex no. fields respectively of the **Manhole Road Chainage** panel.

A new **road chainage** is then typed into the road chainage panel field and the **Set** button selected to record the road chainage with the manhole.

22.7.10.3.10 Outfall Height

When a drainage string is created, the furthest downstream is often an outfall and the height of the outfall known.

When the furthest downstream manhole is considered to be an outfall, the **Outfall ht** option is used to set and change the outfall height. Once set, the outfall height is taken to be the height at the *bottom* of the furthest downstream manhole.

If this option is not used, the outfall height is left undefined.

After selecting the option, an enter value typed-input box is displayed on the screen containing the existing outfall height or **null** if no outfall height has been set.

The new outfall height is entered into the typed-input box, terminated with <enter>.

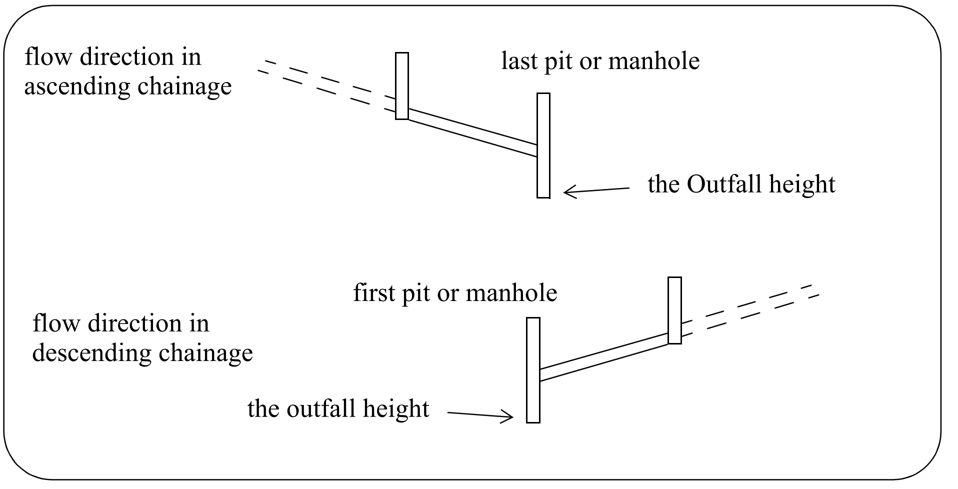
The height of the bottom of the furthest downstream manhole in the drainage string is then set to the given height and the typed-input box removed.

The **Outfall ht** option automatically terminates after use.

Note:

For a drainage string with flow direction in ascending chainage, the furthest downstream manhole is the *last* manhole.

For a drainage string with flow direction in descending chainage, the furthest downstream manhole is the *first* manhole.

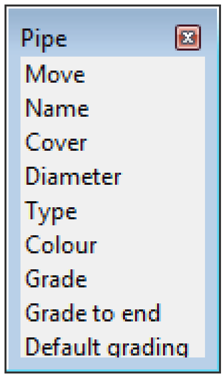


flow direction in
ascending chainage
last pit or manhole
the Outfall height
first pit or manhole
flow direction in
descending chainage
the outfall height

22.7.10.4 Pipe

The options in the **Pipe** menu are used to modify information about the pipes joining adjacent manholes in the drainage string.

The **Pipe** walk-right menu is



22.7.10.4.1 Move

The **Move** option is used to move a pipe connecting two manholes whilst keeping the grade of the pipe constant.

After selecting the option, the mouse is used to pick the pipe to be moved.

Once a pipe has been selected, the pipe will be moved up or down so that the cursor remains on the pipe (or on the extension of the pipe if the cursor is on the other side of the manholes at either end of the pipe). The grade of the pipe is kept constant.

The manholes at either end of the pipe will also be extended if necessary so that the pipe still connects into the adjacent manholes.

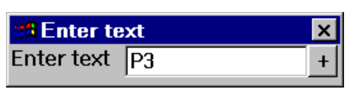
The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.4.2 Name

The **Name** option is used to change a pipe's label.

After selecting the option, the mouse is used to pick the pipe to have a name change.

Once a pipe has been selected, an Enter text typed-input box is displayed on the screen containing the selected pipe's name.



The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

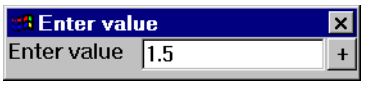
The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.4.3 Cover

The **Cover** option is used to place the selected pipe so that minimum cover is maintained along the top of the pipe (obvert) with respect to the finished surface tin (tin (fs)).

After selecting the option, the pipe to set the cover for is selected with the mouse.

Once a pipe has been selected, an Enter value typed-input box is displayed on the screen containing the existing cover.



The new cover is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the pipe is adjusted so that the specified cover is maintained for the full length of the pipe at the pipes existing grade.

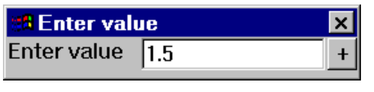
The **Cover** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.4.4 Diameter

The **Diameter** option is used to change a drainage pipe's diameter.

After selecting the option, the mouse is used to pick the pipe to be modified.

Once a drainage pipe has been selected, an Enter value typed-input box is placed on the screen displaying the selected pipe's current diameter.



The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears

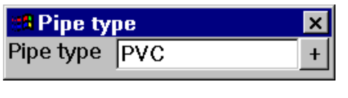
The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.4.5 Type

The **Type** option is used to change the type of material that the pipe is made of.

After selecting the option, the mouse is used to pick the pipe to have its material type modified.

Once a pipe has been selected, a Pipe type typed-input box is placed on the screen displaying the selected pipes material type.



The list of common materials for the pipe can be obtained by clicking B3 in the type input box and getting a menu of valid material types.

The new material type is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Type** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.4.6 Grade

The **Grade** option is used to specify an exact grade for a drainage pipe. The value for the grade is entered using typed input and is in the units "1v in".

In this option, the new grade is given to a pipe by keeping one end fixed and raising or lowering the other end by the amount required to give the pipe the new grade.

After the **Grade** option is selected, the pipe whose grade is to be modified is selected **at the end that is going to be moved**.

Once the pipe end has been selected, an enter value typed-input box is displayed on the screen containing the current grade of the pipe. The new grade is entered into the typed-input box, terminated with <enter>.

The selected end of the drainage pipe is then moved up or down so that the pipe has the new grade.

If necessary, the manhole at the moved end of the pipe will be lengthened so that the pipe still connects into the adjacent manholes.

The **Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.4.7 Grade to End

The **Grade to end** option is used to specify a ***fixed*** grade for all the drainage pipes from a selected pipe to the **low chainage** end (beginning) of the line. That is, it grades from *right* to *left* on a long section of the drainage string.

The value for the grade is entered using typed input and is in the units "1v in".

This option was originally written for pipes with flow direction in descending chainage direction which is the reason why it works from the selected pipe back towards the beginning of the line.

Hence **Grade to end** should only be run on pipes with flow in descending chainage direction. If the flow is in ascending chainage direction, use the reverse string option (**string=>strings edit=>reverse**) before using this option, and then reverse the string again after the option is run. Note that the **Default grading** option looks at maintaining minimum *grade* and minimum *cover* for flow in either ascending or descending chainage direction and supersedes **Grade to end**.

In this option, the new grade is given to a pipe by keeping the high chainage end of the selected pipe fixed and raising or lowering the low chainage end by the amount required to give the pipe the new grade. The minimum cover is over ridden during this process. If necessary, the bottom of the manhole will be lowered so that the pipe still connects into its adjacent manholes.

The next lower chainage pipe is then dropped through the default drop and given the new grade. The drop is measured from the lowest pipe invert of all pipes in the network entering the manhole.

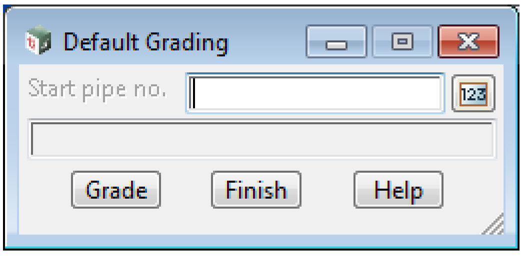
This process is repeated until the low chainage end (beginning) of the line is reached.

After the **Grade to end** option is selected, the first pipe whose grade is to be modified is selected.

Once the pipe end has been selected, an enter value typed-input box is displayed on the screen containing the current grade of the selected pipe. The new grade is entered into the typed-input box, terminated with <enter>. The option then does the grading.

The **Grade to end** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.4.8 Default Grading



The **Default grading** option starts at the given pipe and then works to the end of the line when the flow direction is in ascending chainage, or the beginning of the line when the flow direction is in descending chainage. The **Default grading** option maintains minimum grade and minimum cover.

Default grading is not designed to optimise the placement of the pipes but provides one solution preserving minimum grade and cover.

22.7.10.5 Property Controls

Property, block or lot **controls** are trial connections from a sewer line (drainage string) to a user specified plan point.

The property controls are used as checks that selected house blocks can be serviced by the sewer line. That is, they are used to test if the house block is under the control of the sewer line.

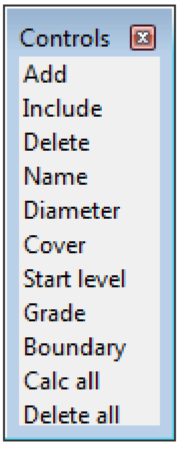
For the trial connection, once the cover (measured from the finished surface to the top of the property connection line) that the property connection must maintain and the grade are specified, the position and depth that the trial property connection must have at the sewer line can be calculated, and where the height of the *centre line* of the property control when it reaches the sewer line is displayed in any section view containing a profile of the sewer line.

If the calculated depth of the trial property connection at the sewer line (drainage string) is below the sewer pipe, then no such connection would be feasible and the house block would not be totally controlled by the sewer line.

On a section view, the *Profile =>One substring* and *Profile =>Many substrings* options will profile the property control. Note that the *centre line* (axis) of the property control is drawn on the section view, not the invert (bottom) or the obvert (top).

NOTE - property controls are only accessible by the ***Sewer module.***

The options in the **Controls** menu are used to place and modify the trial connections. The **Controls** walk-right menu is



22.7.10.5.1 Add

The **Add** option is used to create a new trial control line going from a selected drainage pipe to a user specified plan position (the free end of the connection).

After selecting the option, the mouse is used to pick the plan position of the connection point on the drainage pipe, and then the points defining the path to the plan position of the free end of the trial connection.

After the free end has been selected, the property name typed-input box is displayed on the screen so that a label for the control can be entered (this usually consists of the lot number).

When the property name box is placed on the screen, it will already have some text in it. This text comes from the name field in the **Drainage Property Control Defaults** panel.

A z-value equal to the drainage tin value minus the default control cover depth is automatically given to the free end of the control. The default control grade is then used to define z-values along the trial path (ensuring that the default control cover depth is always observed) to give a z-value back at the drainage pipe (the connection height of the control).

A cross at the calculated connection height is displayed whenever the drainage string is profiled on a section view.

The colour for the new control is taken from the **Drainage Property Control Defaults** panel.

The **Add** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.2 Include

The **Include** option is used to make a control out of an existing polyline string.

The polyline string must start at the connection point on the drainage string and end at the free end (use *Strings=>Strings Edit=>Reverse* if the string's direction is incorrect).

After selecting the option, the mouse is used to pick the polyline string and its plan position is copied and used to define a new control.

A z-value equal to the default drainage tin at that point, minus the default control cover depth is automatically given to the free end of the new control. The default control grade is then used to define z-values along the trial path (ensuring that the default control cover depth is always observed) to give a z-value back at the drainage pipe.

The **Include** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.3 Delete

The **Delete** option is used to delete a control.

After selecting the option, the mouse is used to pick the block control to be deleted.

Once a block control has been selected, it will deleted and removed from the screen.

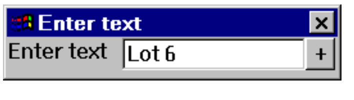
The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.4 Name

The **Name** option is used to change the **Property name** of a control.

After selecting the option, the mouse is used to pick the control that will have a name change.

Once a control has been selected, an enter text typed- input box is displayed on the screen containing the selected control's name.



The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

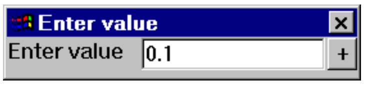
The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.5 Diameter

The **Diameter** option is used to change the diameter of a control.

After selecting the option, the mouse is used to pick the control that will have its diameter modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the selected control's current diameter.



The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

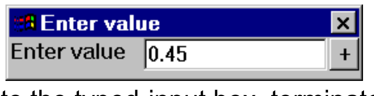
The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.6 Cover

The **Cover** option is used to change the distance that the control is below the tin (fs) for the drainage string.

After selecting the option, the cursor is used to pick the control whose cover will be modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the selected block control's current cover.



The new cover is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new cover calculated.

The **Cover** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.7 Grade

The **Grade** option is used to change the grade of a control (units "1v in").

After selecting the option, the mouse is used to pick the control whose grade will be modified.

Once a control has been selected, an enter value typed- input box is placed on the screen displaying the selected control's grade.

The new grade is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new grade calculated.

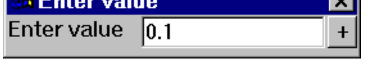
The **Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.8 Boundary

The **Boundary** option is used to specify a boundary trap depth which is used as a final drop at the drainage pipe end of the control.

After selecting the option, the mouse is used to pick the control whose boundary depth will be modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the selected boundary depth.



The new boundary trap depth is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new boundary trap depth is calculated.

The **Boundary** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

22.7.10.5.9 Calc all

The **Calc all** option is used to re-calculate the connection heights for all controls of the drainage line.

The calculation uses the plan layout of the control, the control's cover, grade and boundary trap depth and the default tin for the drainage line.

The **Calc bc's** option automatically terminates after use.

22.7.10.5.10 Delete All

The **Delete all** option is used to remove all the controls defined for the drainage line being edited.

The **Delete all** option automatically terminates after use.

22.7.10.6 House Connections

The **Connections** option is used to create the connections from the sewer line (drainage string) to the house blocks in a subdivision.

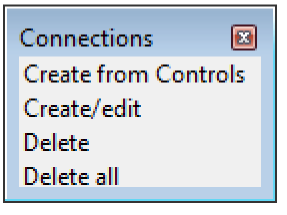
When placing a house connection, the user indicates the two corners of the frontage of the block to allow the cross-fall of the block to be calculated and allow the frontage to be used in positioning the house connection.

When placing house connections, a section view is used to automatically display the connection to facilitate checking the type of connection used and any obstructions that may need to be avoided.

NOTES

1. House connections are only accessible by the ***Sewer module.***
2. All house connection calculations do not take into account any thickness of pipe, joint sizes or actual entry points into the sewer. Hence they are ***approximate only*** and should only ever be used as a guide. Any quantities calculations should allow for a suitable margin of error.

The **Connections** walk-right menu is



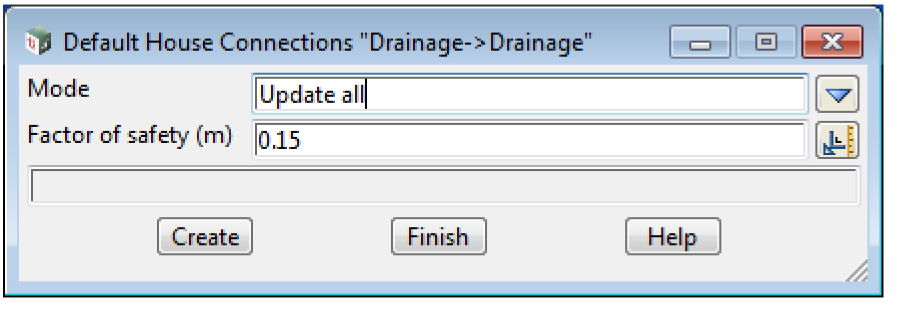
The process for creating a house connection will now be described in detail.

22.7.10.6.1 Create from Controls

The **Create from Controls** option is used to create a new house connection from existing controls.

or modify an existing house connection.

After selecting the **Create from Controls** option, the **Default House Connections** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	update all	remove existing first, update new, update all

if ***remove existing first****, all the existing connections are deleted before new ones are created from the controls.*
if ***update new****, connections are only created from controls with names different from any existing connection.*
if ***update all****, connections are created from all controls.*

Factor of safety input 0.15

the connection height for the control is adjust by this depth from the control connection depth.

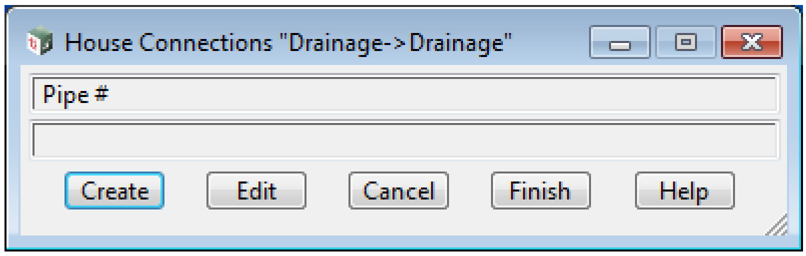
Create button

after selecting **Create***, the connections are created from the selected controls.*

22.7.10.6.2 Create/Edit

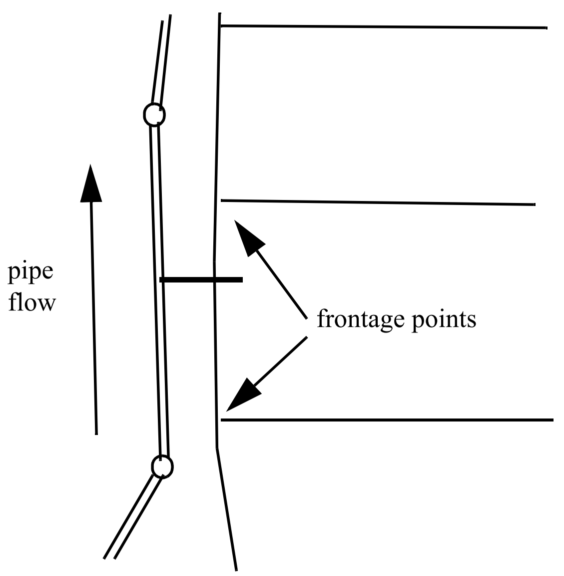
The **Create/edit** option is used to create a new house connection or modify an existing house connection.

After selecting the **Create/edit** option, the **House Connections** panel is displayed.



The process for creating a house connection will now be described in detail.

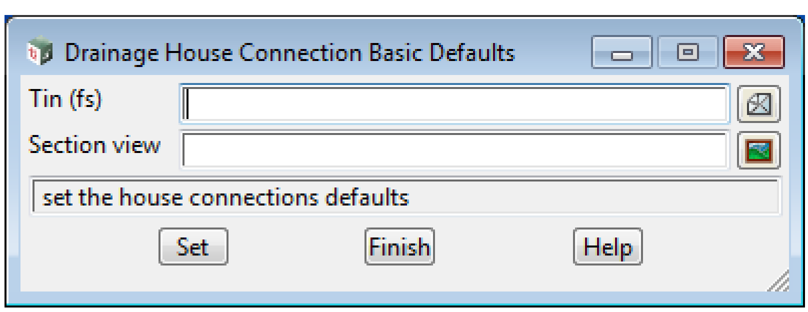
Creating A House Connection



Step 1 Select *Create*

To create a new house connection, the **Create** button is selected from the **House Connections** menu.

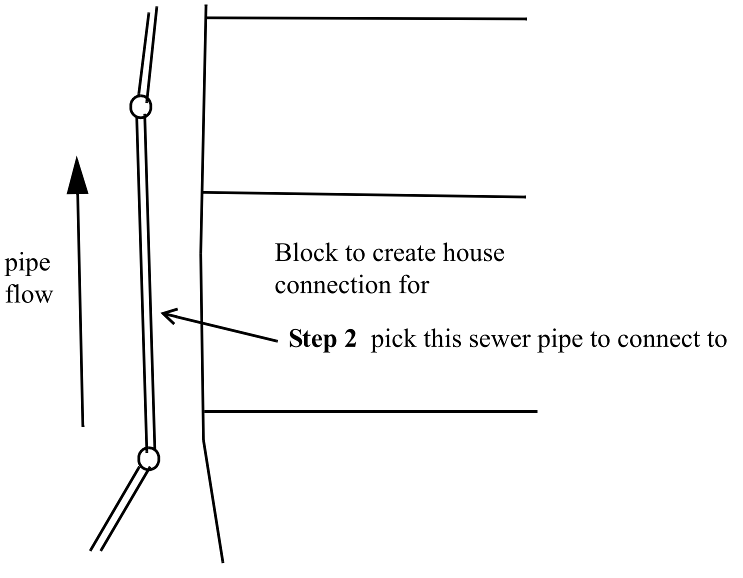
If either the default **drainage tin** or **section view** have not be defined, the **Drainage House Connection Basic Defaults** panel will be placed on the screen after the **Create** button is selected.



The missing values need to be filled in and the **Set** selected. This information is needed so that the house connections can be drawn up in a section view as soon as they are created.

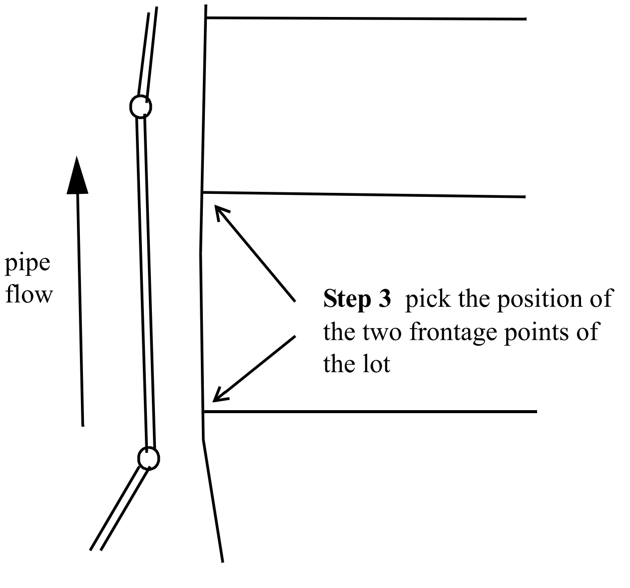
Step 2 Selecting the Sewer (drainage) Pipe to Connect to

The user is then asked to select the sewer pipe to connect into.



Step 3 Selecting the House Lot Frontage

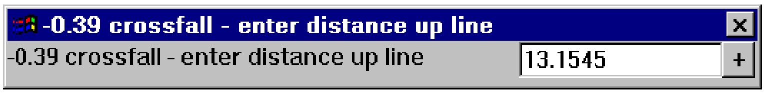
Next the user indicates the two frontage points for the house block.



Step 4 Positioning the House Connection on the Sewer Pipe

From the two frontage points and the default drainage tin, the program calculates the crossfall for the block frontage.

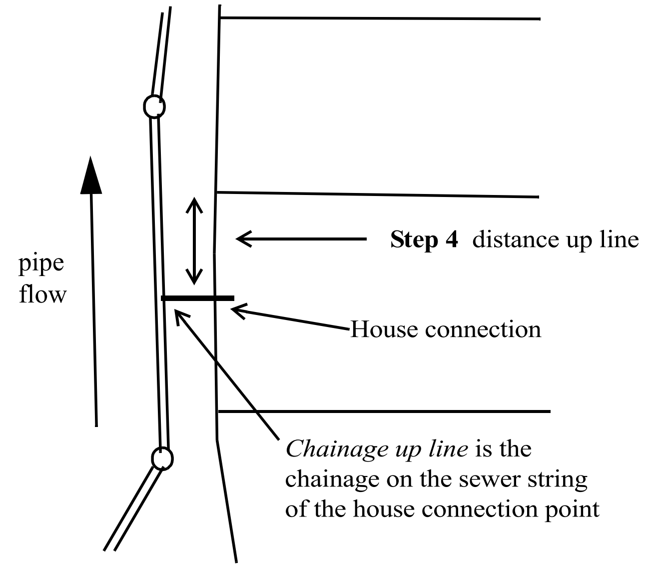
The crossfall is displayed in the name of the enter distance up line typed-input box which is now placed on the screen. The distance up line is the distance along the frontage that the house connection will be placed.



Depending on the crossfall, a default value for the distance up line is displayed. If the ground crossfall is greater than 1% the lot mid point is the suggested connection location. For crossfalls less than 1%, the connection is located 3m off the ***lowest*** lot boundary.

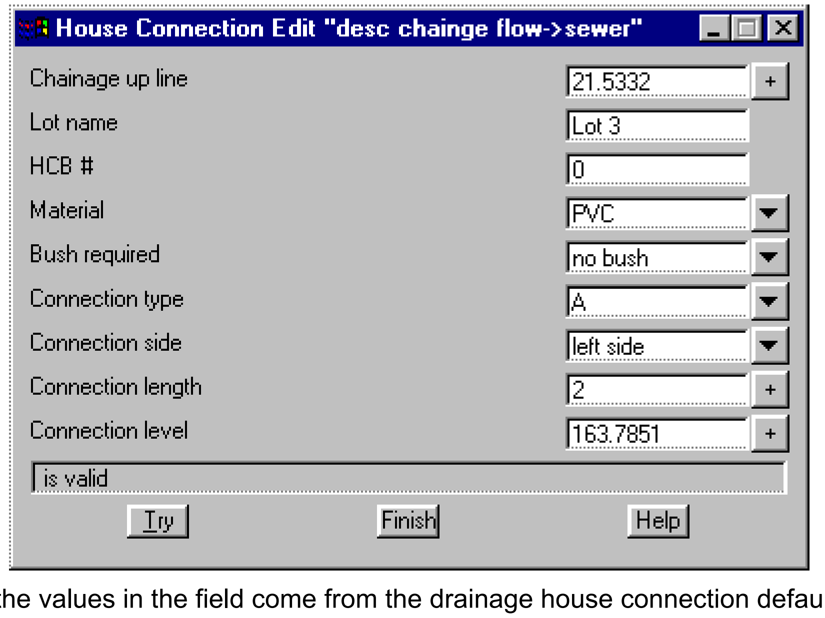
A pop-up also exists for placing the connection point at the distance 2.0, 3.0, 5.0 along the frontage, the mid point of the frontage, and the distances 2.0, 3.0 and 5.0 from the other end of the frontage.

The distance up line value is entered into the typed-input box, terminated with <enter>. The typed-input box is then removed from the screen.



Step 5 Defining the House Connection Type

Next the **House Connection Edit** panel is placed on the screen.



Most of the values in the field come from the drainage house connection defaults.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage up line	input/output	chainage of connection	

the chainage on the sewer string where the house connection is attached to the sewer line.

Lot name	input	from drainage defaults	

name of the house block

HCB #	input		

a user supplied house connection branch (HCB) number

Material	input	from drainage defaults	PVC, PVC X/HEAVY, VC

the material used for the house connection.

Bush required	input	no bush	no bush, PVC to VC

the type of bush used

Connection type	input	from drainage defaults	A, A Special, B, C, OB, Special jump up

the type of connection used. Go to the section House Connection Types *for a description of each connection type*

Connection side	input	right side	right side, left side

the side of the line to make the connection

Connection length	input	from drainage defaults	

length of pipe for the house connection

Connection level	input	calculated	

height of the house connection. When this is first displayed, it is calculated using the invert level of the sewer pipe where the house connection is attached, the house connection type and connection length (if required by the house connection type), the default house connection grade, the default house connection cover and the surface level at the end of the house connection.

Try	button		

using the parameters in the panel fields, create the house connection. Also calculate a section along the house connection and draw it in the drainage default section view.

Finish	button		

end the option, remove the panel.

Step 5 Continued

After entering the appropriate values in the **House Connection Edit** panel and then selecting the **Try** button, the house connection will created.

To help check the house connection parameters, a section along the house connection will automatically be calculated and displayed in the section view given in the drainage defaults panel. Any tins or models on the section view will be included in the section.

Step 6 Modifying the Connection

If any of the fields in the **House Connection Edit** panel are changed, selecting the **Try** button will modify the house connection and redraw the section in the default drainage section view.

Editing A House Connection

To edit an existing house connection, the **Edit** button is selected from the **House Connections** menu and then the appropriate house connection selected.

The **House Connection Edit** panel will then be placed on the screen with the details of the selected house connection.

If any of the fields in the **House Connection Edit** panel are changed, the **Try** is used button to modify the house connection and redraw the section in the default drainage section view.

22.7.10.6.3 Delete

The **Delete** option is used to delete a connection.

After selecting the option, the mouse is used to pick the house connection to be deleted.

Once a house connection has been selected and accepted, it is deleted and removed from the screen.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, by selecting a new option from the **Drainage Edit** menu.

22.7.10.6.4 Delete all

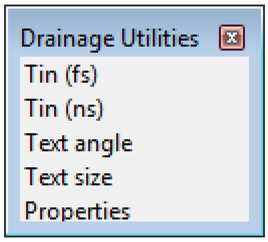
The **Delete all** option is used to delete all connections.

After selecting the option, all the connections are deleted and the option terminates.

22.7.10.7 Utilities

The options in the **Utilities** menu are used to modify default drainage tin, the name, colour, style and start chainage of the drainage string, and the size, angle, and offsets used when displaying the text for the names of all the manholes.

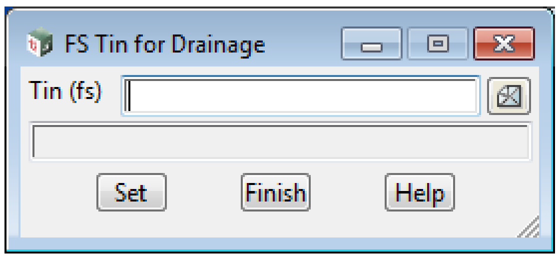
The **Drainage Utilities** walk-right menu is



22.7.10.7.1 Tin (fs)

The **Tin (fs)** option changes the default finished surface tin (tin (fs)) for the drainage string.

After selecting the option, the **FS Tin for Drainage** panel is displayed.

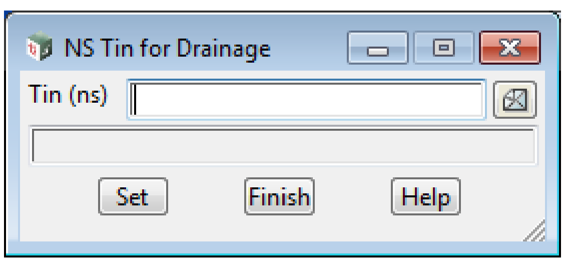


The existing default tin is displayed in the tin panel field. If a new tin is required, simply enter the new tin name into the tin (fs) field and select the **Set** button.

22.7.10.7.2 Tin (ns)

The **Tin (ns)** option changes the default natural surface tin (tin (ns)) for the drainage string.

After selecting the option, the **NS Tin for Drainage** panel is displayed.



The existing default tin is displayed in the tin (ns) panel field. If a new tin is required, simply enter the new tin name into the tin field and select the **Set** button.

22.7.10.7.3 Angle

The **Angle** option changes the angle of the text for manhole labels.

After selecting the option, an enter angle typed-input box is displayed on the screen containing the current text angle.

The new angle is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Angle** option then terminates.

22.7.10.7.4 Size

The **Size** option is used to change the size of the text for manhole labels.

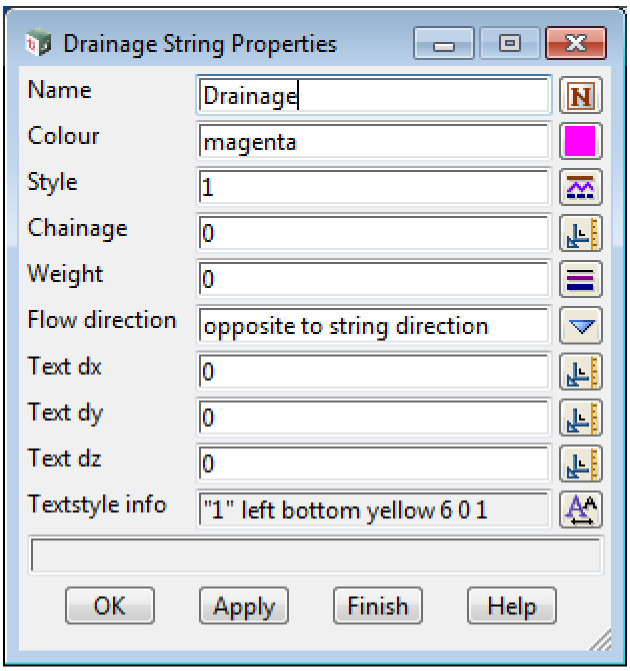
After selecting the option, an enter value typed-input box is displayed on the screen containing the current text size.

The new size is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Size** option then terminates.

22.7.10.7.5 Properties

The **Properties** option brings up the **Drainage String Properties** panel for the current drainage string.



Any of the data in the panel fields can be modified and then set for the drainage string by selecting the **OK** or **Apply** button.

22.7.10.8 Z Float

The status of **Z Float** is used each time a new manhole is created.

If **Z Float** is set to tick, then the top of the manhole is set to z float which means that automatically sits on the default drainage tin.

If **Z Float** is not set to tick, then the top of the manhole is given a set z value when it is created.

The z float status of the manhole can be changed after it has been created by using the **Drainage Edit=>Manhole=>Z Float** option.

22.7.11 Utility String Editor

Position of option on menu: **Design =>Drainage-Sewer =>Utility String Editor**

This editor is used to edit properties of the strings used by the DNE. Properties always change at an existing vertex.

Cross Section Strings (Manning's n) - set the left and right bank n values. the centre n value is assigned by the DNE.

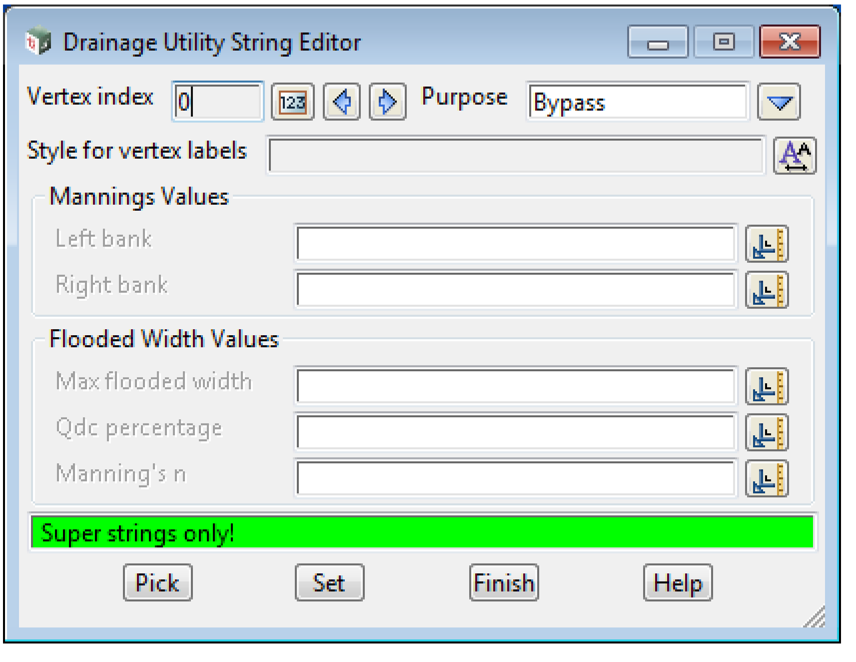
Flooded Width Values on Bypass Flow Strings - the default setting of the bypass flow strings when used to calculate flooded widths in the Drainage Analysis.Changes are in effect until the end of the string or it has been re specified at vertex at a higher chainage.

Vertex labels are created whenever properties are set (Texstyle is required).

Usage

First the string is selected at the vertex where the values are to be assigned. Next select the purpose of the string (cross section or bypass) to unlock the appropriate fields. A textstyle favourite is required as the vertex is labelled with the assigned values. Enter the values into the fields and then select Set to set the values as vertex attributes and create the label as a vertex annotation.

On selecting the **Utility String Editor** option, the **Drainage Utility String Editor** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	vertex	selected vertex	

Once the string is selected use this to move between vertices

Style for Vertex Labels textstyle favourite textstyles

A label is created on the vertex using this textstyle favourite

Left bank Input

mannings n value, to delete clear and select set

Right bank Input

mannings n value, to delete clear and select set

Max Flooded with Input

This changes the threshold were warning bars are created during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Qdc percentage Input

This changes the percentage of the Qdirect+Qcatchment that is used to interpolate the discharges during flooded width calculations. It is generally set on the first vertex past upstream pit and remains in effect till the next change or the end of the bypass flow string. The flow changes from the bypass flow at the upstream pit to this value/100(Qdirect+Qcatchment).*

Manning's n Input

This changes the Manning's n value used for during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Pick button

Use this button to select the string. Select near the vertex you want assign the values to.

Set button

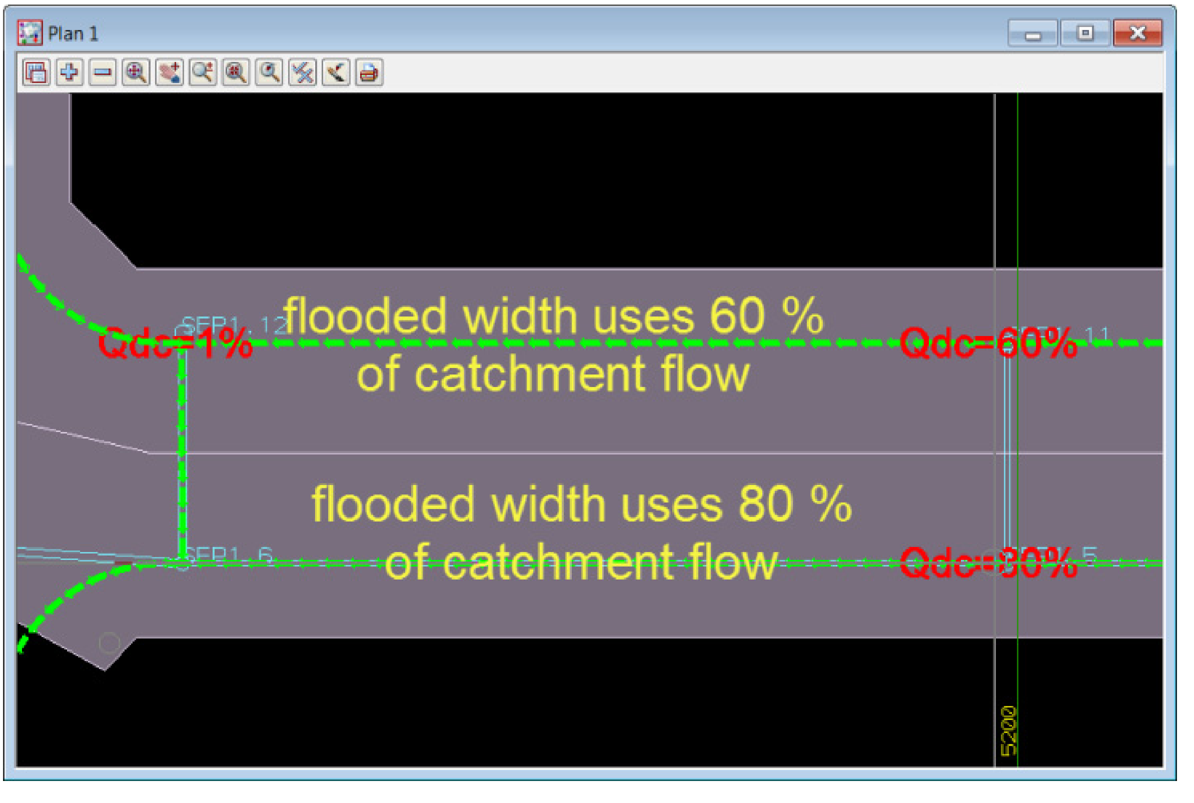
Creates the attributes and the label on the vertex.

Finish button

Removes the panel from the screen.

Help button

Launches the 12d help

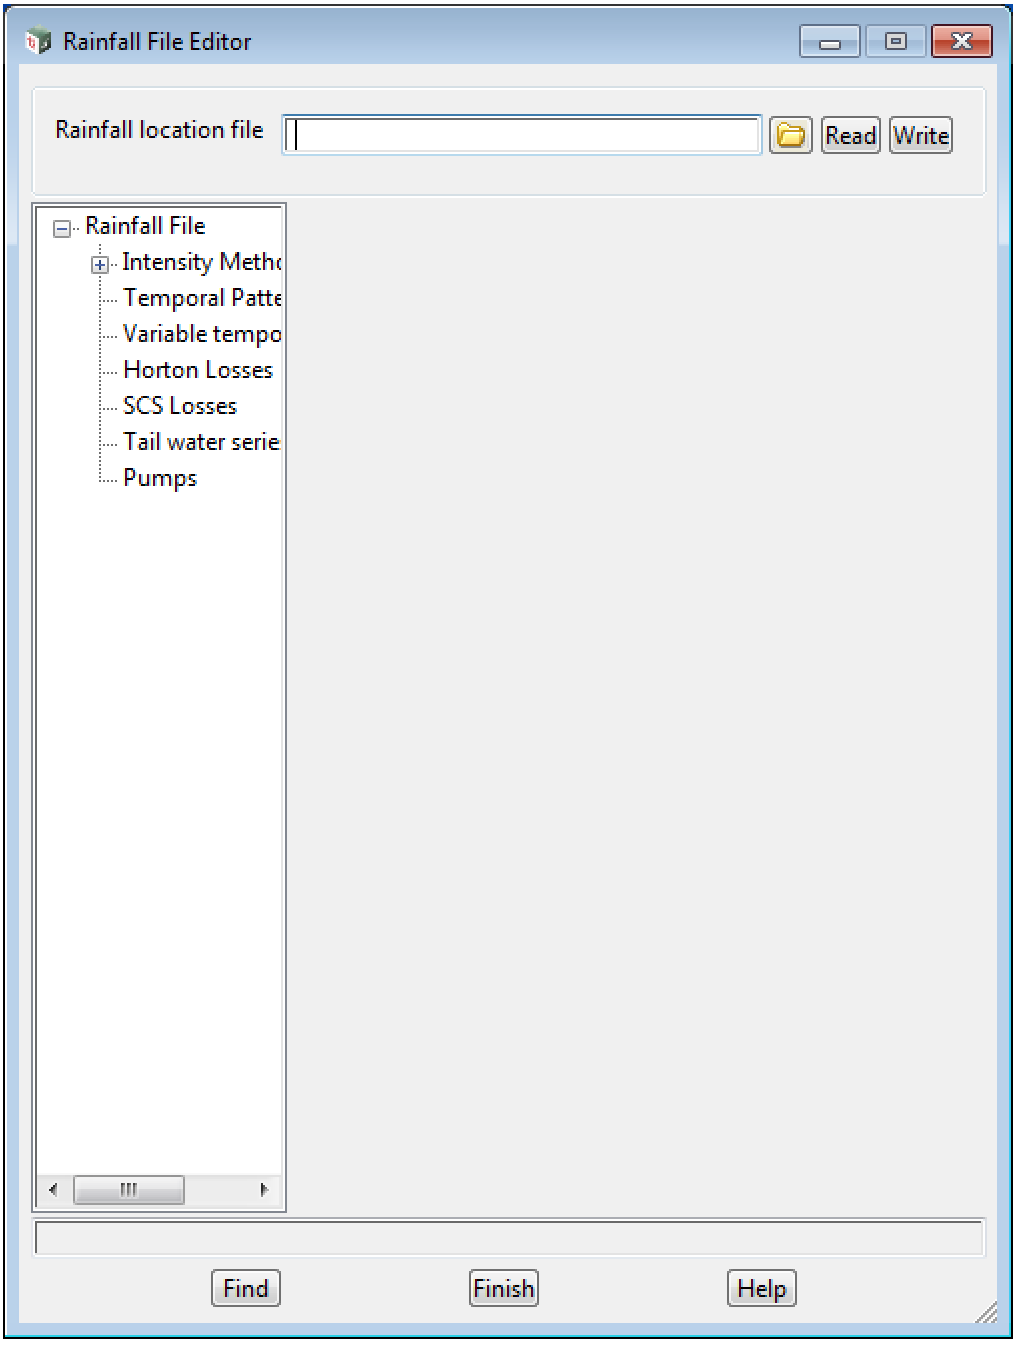


In the example above, The Qdc is set to 80% at the eastern end of the catchment. The Qdc is set to 2% for the water overtopping the road. The 18% of the area is not considered large enough to do the flooded width calculation for. If desired, another bypass flow string approaching from the east could be drawn but the final bypass string to the west (direction during bypass should remain).

22.7.12 Rainfall File ppf Editor

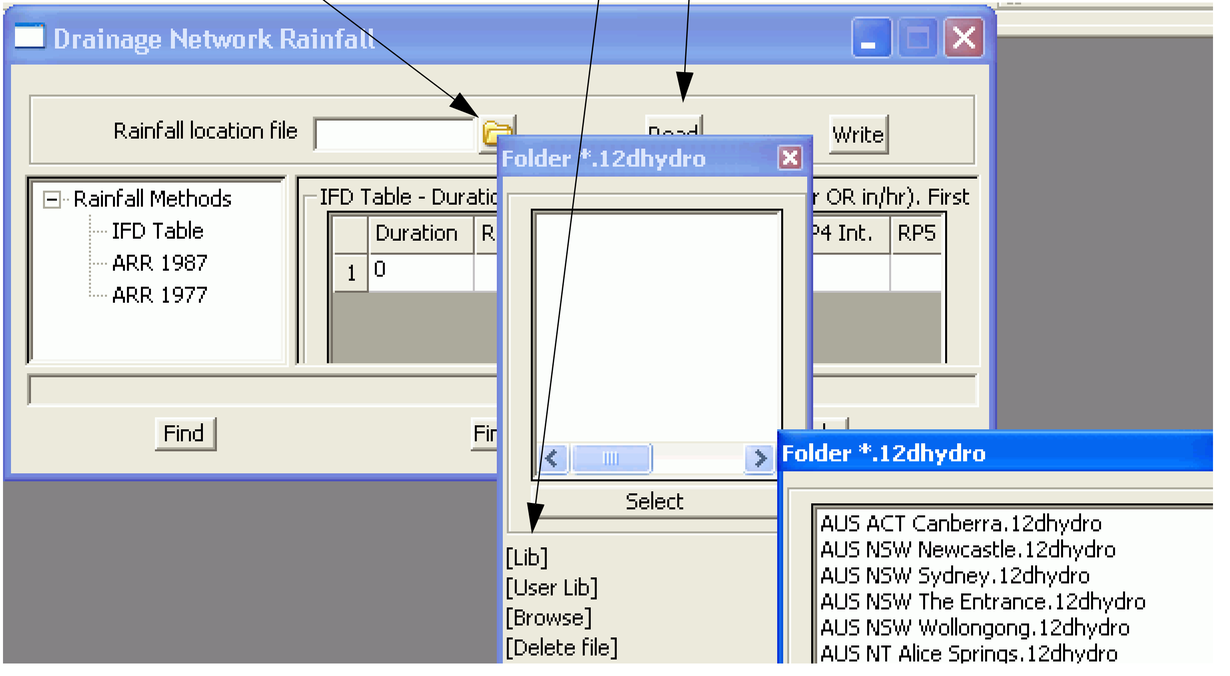
Position of option on menu: **Design =>Drainage-Sewer =>Rainfall editor**

On selecting the **Rainfall editor** option, the **Rainfall File Editor** panel is displayed.



Data is entered using one (or more if desired) input methods and then saved by entering a **Meteorology file** name and selecting **Write.** The standard 12d system file search paths are used (project folder, user library folder and then library folder).

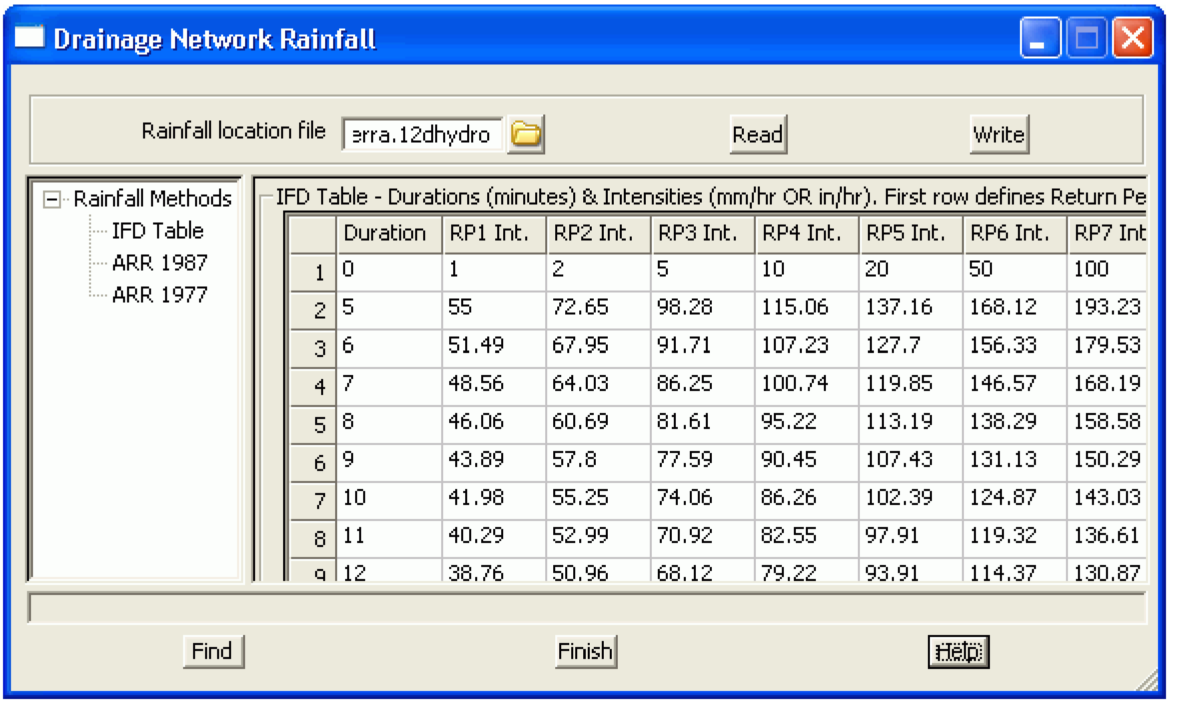
Select the folder icon and then walk right on the **Lib** item to display a list of sample files.
Select a file the select **Read. YOU MUST SELECT THE READ BUTTON!**



22.7.12.0.1 IFD Tables

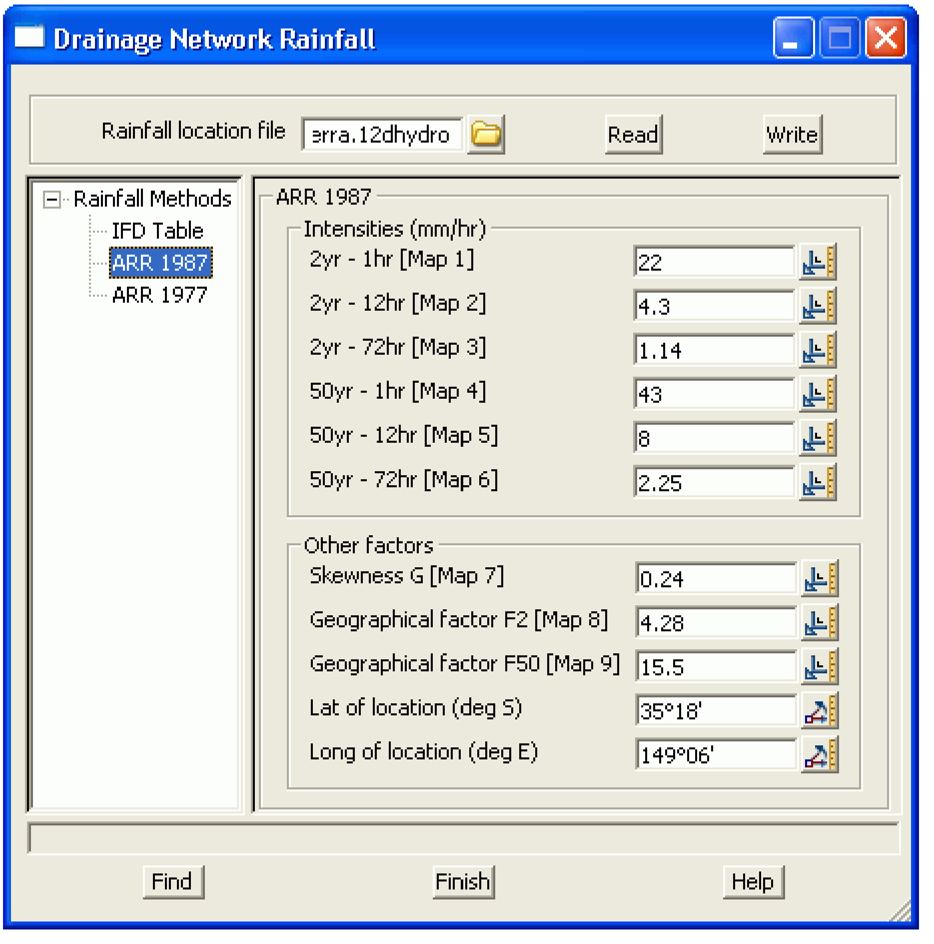
IFD tables are often available from meteorological services. The table input format follows. The first row is used to define up to 9 return periods and the following rows list the rainfall intensities for the duration entered in the first column.

Hint: to increase the size of the grid control select another method, ARR 1987 for example, and then select IFD table again.



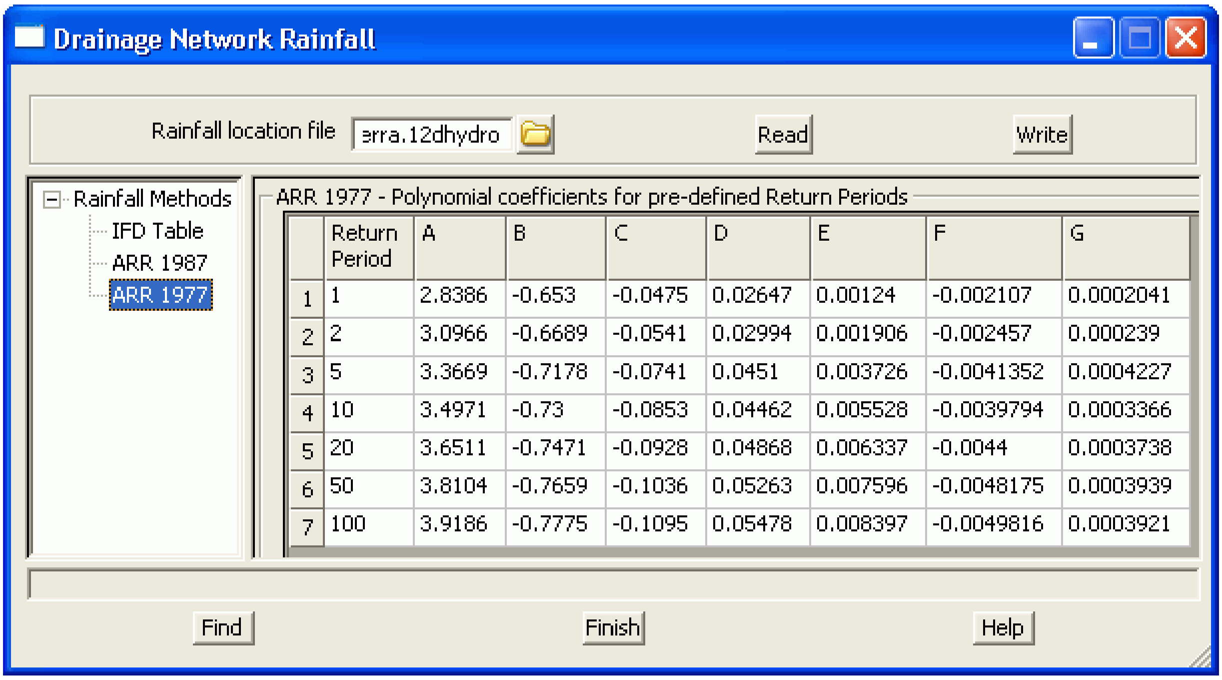
22.7.12.0.2 Australian Rainfall and Runoff 1987 Method

The rainfall intensities and other factors from Volume 2 of ARR 1987 are entered in this table.

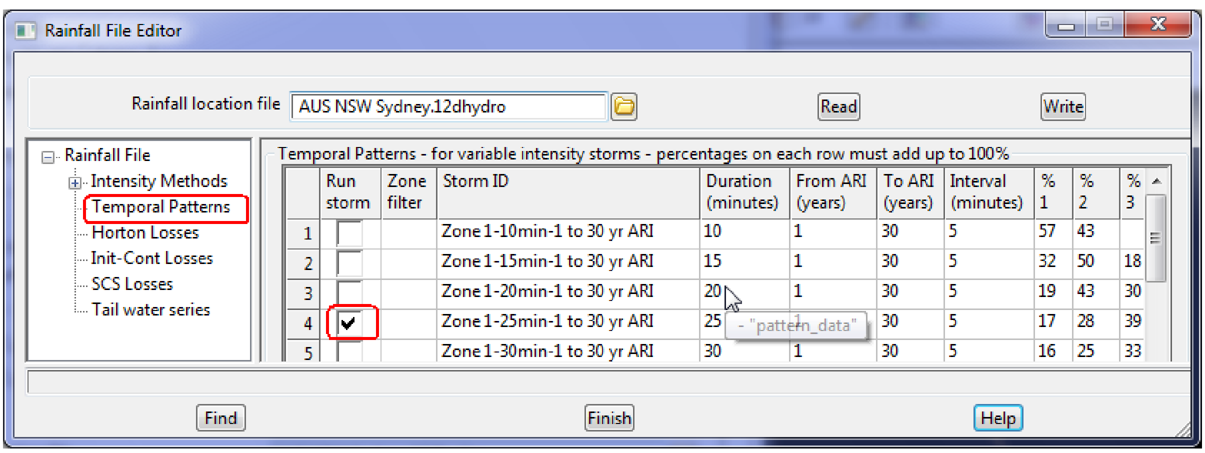


22.7.12.0.3 Australian Rainfall and Runoff 1977 Method

The seven coefficients for each return period from ARR 1977 are entered in this table.



22.7.12.1 Rainfall Temporal Patterns



Temporal patterns are referred to as storms in dynamic drainage. Several example hydro files are included in the 12d library. These examples have the temporal patterns for the minor and major storms in the 8 zones of Australia.

Temporal patterns are not required for the SCS NZ method as the standard 24 hour temporal pattern from TP108 is built into the 12d analysis engine.

The **Run storm**, **Zone filter, From ARI** and **To ARI** columns are used determine which storms are analysed (run). The **Run storm** column must be checked for that temporal pattern to be analsyed. Many storms may be selected.

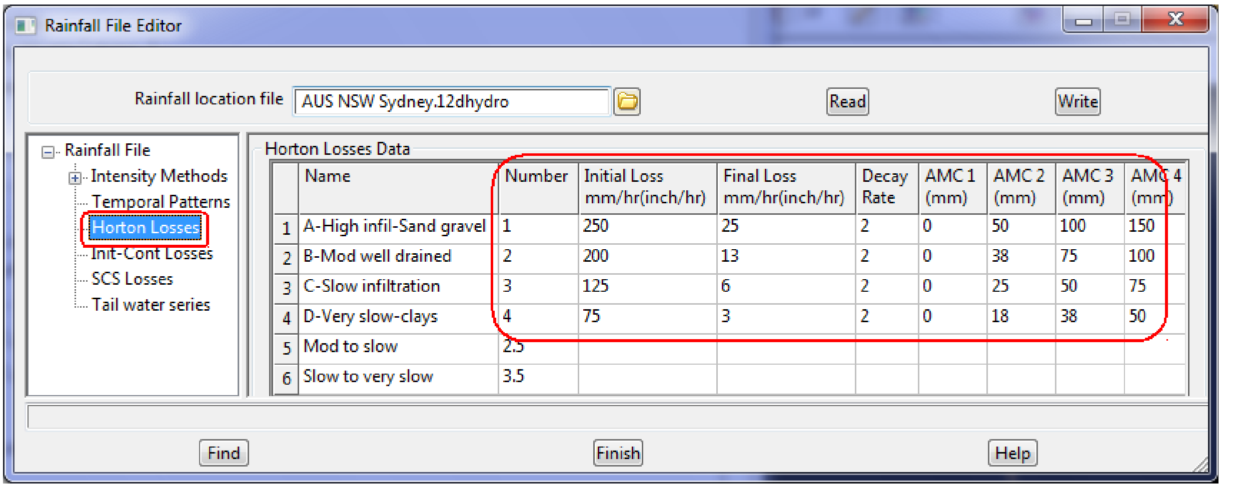
The **Zone filter** is optional. Entering a value here will allow the selected storms to be further filterd. A **Zone filter** field (accepts wild card characters) is found on the DNE Global tab that is used to determine which of the selected storms (paragraph above) are analysed.

The **ARI** field on the Run panel is used with the **From ARI** and **To ARI** columns. The value on the run panel must be within the From-To range for the storm to be analysed.

The **Duration** column determines the total length of the storm. This value divided by the **Interval** must be a whole number and this number determines the number of **%** values to be entered to the right of the **Interval column.** The total of the percentage must equal 100.

22.7.12.2 Horton Losses

The pervious portion of the catchments used in the **ILSAX 2** analysis will have a loss type defined describing the soil type. The loss type is defined in the DNE Default->catchment and catchment tabs.



These soil types use the classifications of Terstriep and Stall (1974), based on the system developed by the U.S. Department of Agriculture. The default values entered from the library represent the soil types of

1. Type A - low runoff potential, high infiltration rates (consists of sand and gravel
2. Type B - moderate infiltration rates and moderately well-drained
3. Type C - slow infiltration rates (may have layers that impede downward movement of water)
4. Type D - high runoff potential, very slow infiltration rates (consists of clays with a permanent high water table and a high swelling potential)

Numbers are assigned to each soil type to allow interpolation between the defined soil types. When interpolated values are used they must be included in the list (2.5 and 3.5 for example). Interpolated values do not need loss data entered. If loss data is entered for the interpolated names then this data will be used rather than an interpolation occurring. If any loss data is entered then all of the values must be entered.

Four preset AMC points are defined in the rainfall file to mark AMC conditions ranging from dry (AMC1) to saturated (AMC4). The required data for each line is the **Initial loss rate, Final loss rate, decay rate** and 4 antecedent moisture conditions **(AMCs).** The AMC values are entered in depth of rainfall (mm) they represent the total rainfall prior to the start of the temporal pattern.

The AMC point numbers are set once for all catchments on the DNE Global tab. Value between 1 and 4 (decimal value are permitted) are entered for the minor and major events.

22.7.12.3 SCS NZ Losses (Initial Abstraction and Curve Numbers)

The SCS NZ method uses Initial abstraction (Ia) and the curve number (CN) to determine the losses for the catchments. Names are given to the SCS curve numbers in the rainfall file. These names and Ia (entered as storage values) and selected in the DNE catchment data.

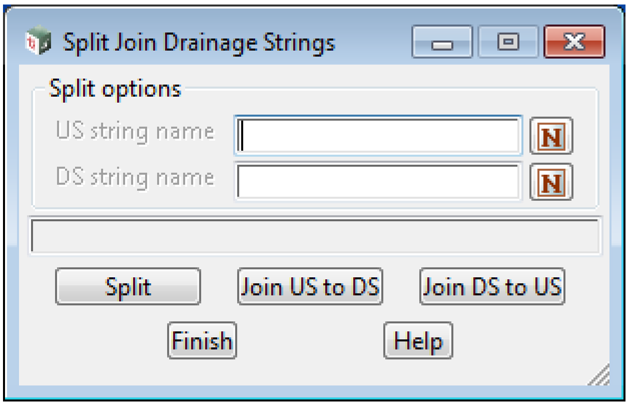
A curve number of 0 results in zero runoff while a CN=100 results in 100% runoff. TP 108 recommends the selection of the curve number by identifying 1) the soil type and 2) the land use. A CN=98 an Ia=0 are recommended for impervious areas.

22.7.13 String split/join

Position of option on menu: **Design =>Drainage-Sewer =>String split/join**

This option must be used on drainage strings instead of the standard split or join commands.

On selecting the **String split/join** option, the **String split/join** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
US string name	input		

The upstream section of the split string is assigned this name.

DS string name	input		

The downstream section of the split string is assigned this name.

Split	button		

The split may only occur at a manhole. The upstream and downstream sections are renamed if names are provided above.

Join US to DS	button		

The upstream segment must be selected first and then the downstream. The properties from the upstream string are used for the new string created. If there is a gap in between the joined strings, a pipe will be inserted with the default pipe properties. The attributes of the upstream pit on the downstream string will be discarded.

Join DS to US	button		

The downstream segment must be selected first and then the upstream. The properties from the downstream string are used for the new string created. If there is a gap in between the joined strings, a pipe will be inserted with the default pipe properties. The attributes of the downstream pit on the upstream string will be discarded.

Finish	button		

remove the panel from the screen

Help	button		

display the help for this panel

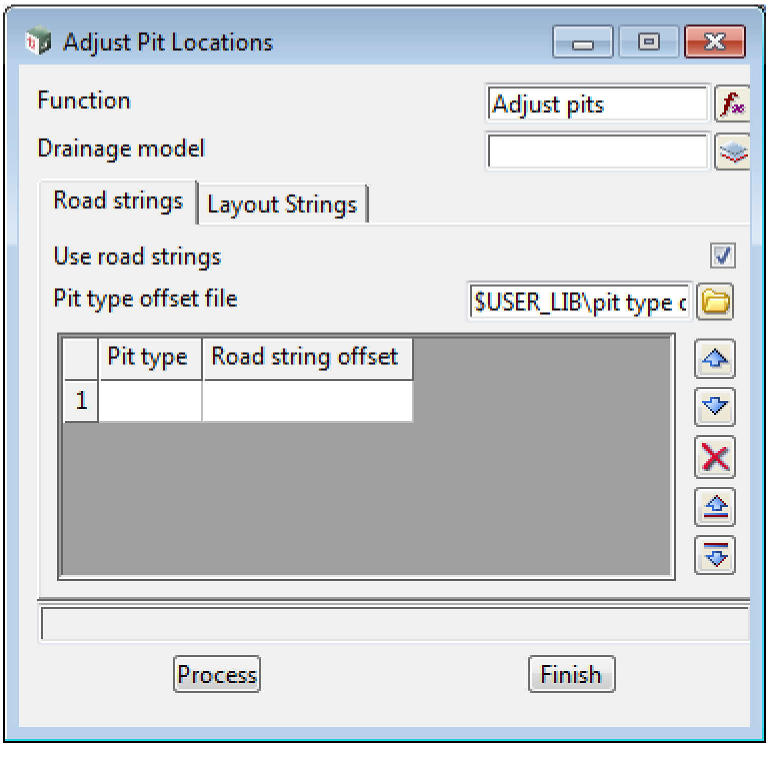
22.7.14 Adjust Pit Locations

Position of option on menu: **Design =>Drainage-Sewer =>Adjust Pit Locations**

Key Points

1. Pits are moved perpendicular to the road string.
2. The string to be moved to must be closer than the **search distance** or it will not be moved.

On selecting the **Adjust pit locations** option, the **Adjust Pit Locations** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Function function

This function will re adjust the drainage pits

Drainage model model

The drainage model to have the pits moved.

Use road strings tick

*When selected, a DNE road string is checked for each pit. When found, the pit will be moved perpendicular to this string at the **Road string offset** distance. If the road string is not found, the layout string will be searched for using the **Max layout search distance**. If not selected the only the layout strings with an offset of zero will be used.*

Pit type offset file file

*The grid data below is stored in this file when the **Process button** is selected.*

Pit type input

*Only used when **Use road strings** is selected. Each pit scans for its pit type in the **Pit type** column. When found, the pit is placed at the **Road string offset** distance from the road string.*

Road string offset input

*Only used when **Use road strings** is selected. The pit is placed at the **Road string offset** distance from the road string. Positive is away from the road centreline and negative is towards the centreline. When no **Road string offset** is set via the **pit type**, the offset value is zero.*

Data Source of Pit Layout Stringssourcemodel

*Used when **Use road strings** is NOT selected or when no road string is found. As road strings are often in several models, so the filter option is usually the best. Select a view with the road string models and then use the string info tab and name field (* wild card can be used) to select the strings to move to.*

Max Layout Search Distancereal 1.0

Only used for layout strings. Road strings do not have a search distance. If the closest string in the pit layout strings is farther than this distance the pit will not be moved.

Run button

This moves the pits horizontally. Undo is available

Finish button

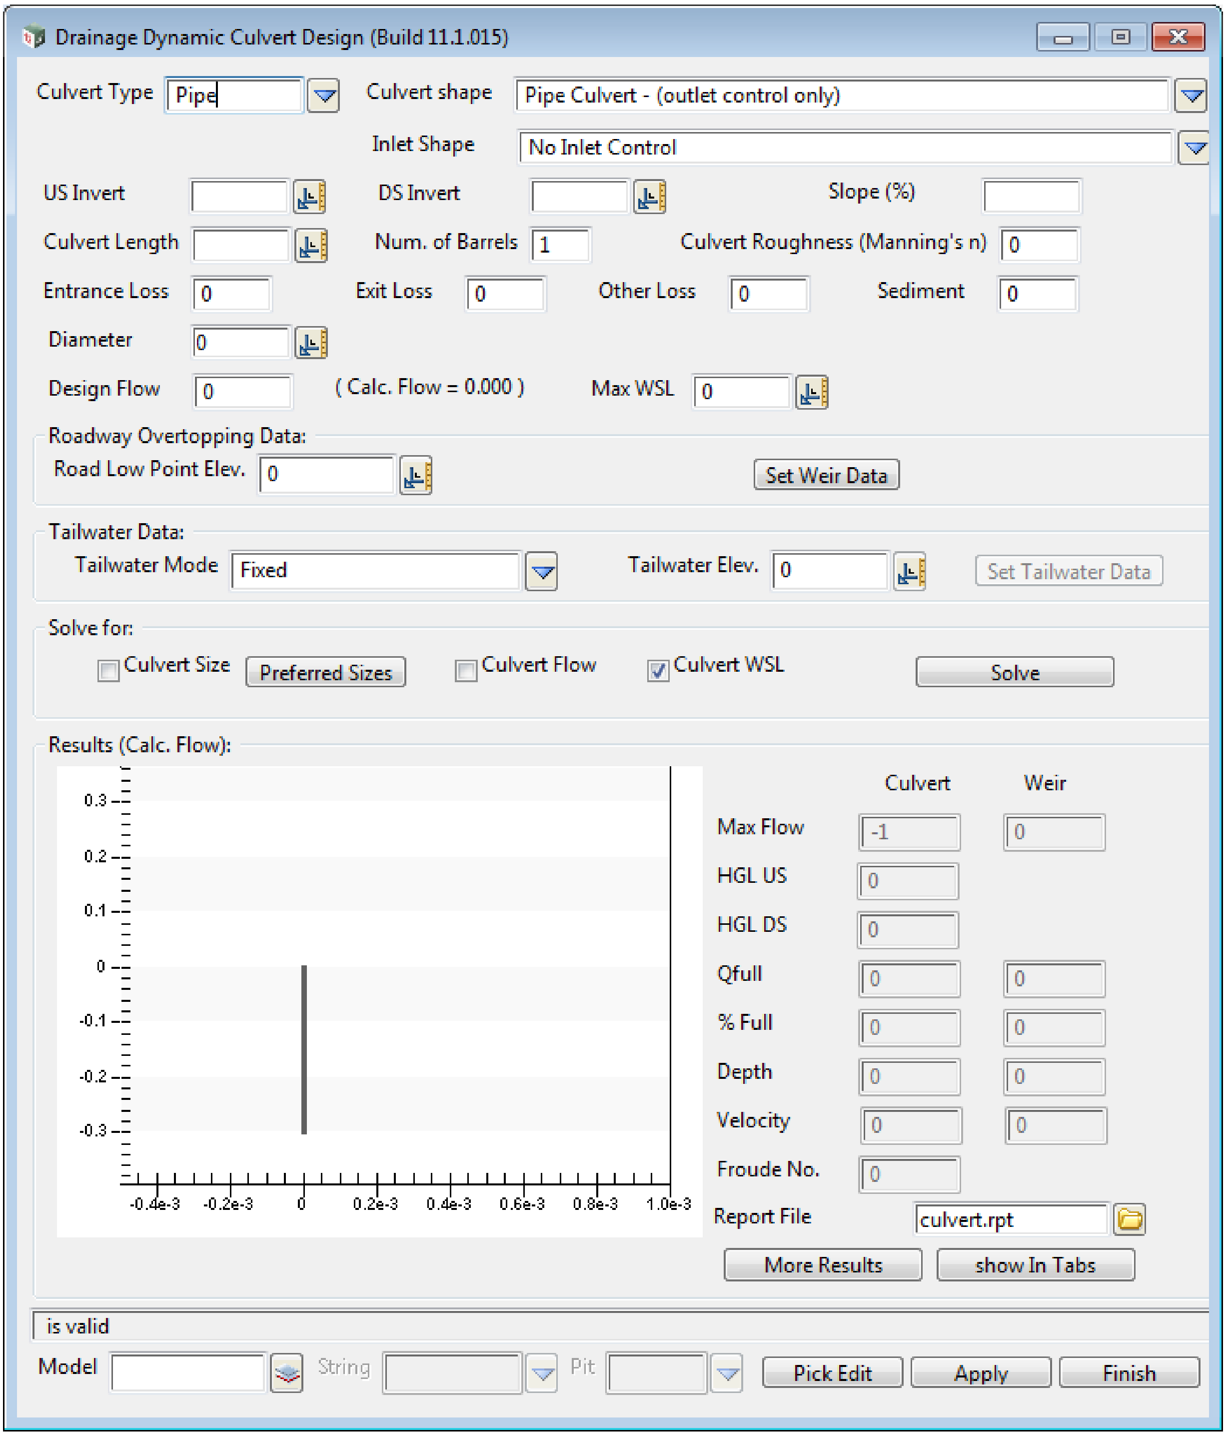
Removes the panel from the screen.

22.7.15 Dynamic Culvert Design

Position of option on menu: **Design =>Drainage-Sewer =>Dynamic Culvert**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **Dynamic Culvert** option, the **Drainage Dynamic Culvert Design** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Culvert type	choice box	Pipe	

Culvert shape	choice box	Pipe Culvert - (outlet control only)
Inlet Shape	choice box	No Inlet Control
US Invert	measure box	
DS Invert	measure box

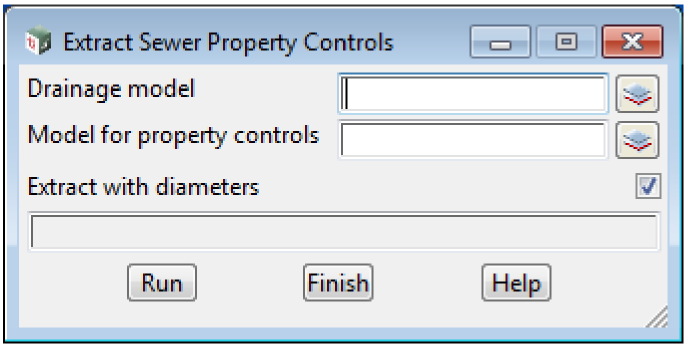
22.7.16 Extract Sewer Property Controls

Position of option on menu: **Design =>Drainage-Sewer =>Extract Sewer Property Controls**

The sewer property control strings are a sub string of the drainage string and therefore may only be profiled using a right mouse click of the profile button. To include these control strings on plots or export to other packages they need to be converted to super strings.

On selecting the **Extract Sewer Property Controls** option, the **Extract Sewer Property Controls** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	mode box		

All drainage strings in this model will have their property controls strings duplicated as super strings.

Model for property controls	model box		

The super strings for the property controls are placed in this model.

Extract with diameters	tick box	on	

The super strings will have the constant pipe dimension set to the control diameter.

Run	button		

Create the super strings representing the property controls.

Finish	button		

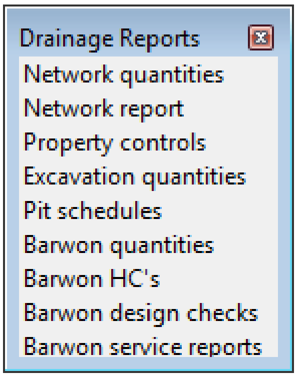
Remove the panel from the screen.

22.8 Reports

Position of menu: **Design =>Drainage-Sewer=>Reports**

Reports menu contains an option to report on the property controls for the drainage strings and an option produce network quantities.

The **Reports** walk-right menu is



For the option *Network quantities*, please continue to the section Drainage Network Quantities.
Network report, please continue to the section Network Report.
Property control, please continue to the section Property Controls.
Excavation quantaties, please continue to the section Excavation Quantities.
Pit schedules, please continue to the section Pit Schedules.
Barwon quantities, please continue to the section Barwon Quantities.
Barwon HC's, please continue to the section Barwon House Connections.
Barwon design checks, please continue to the section Barwon Design Checks.
Barwon services reports, please continue to the section Barwon Services Report

22.8.1 Drainage Network Quantities

Position of option on menu: **Design => Drainage => Reports=> Network Quantities**

The **Network quantities** report contains information about the manholes and pipes that make up the selected drainage strings. Configuration files allow the user to specify the depth ranges and sizes of pipes to report on.

This option creates quantity tables for manholes, pipes and house connections.

The manholes/pipes/house connections are summarised by user defined depths and types.

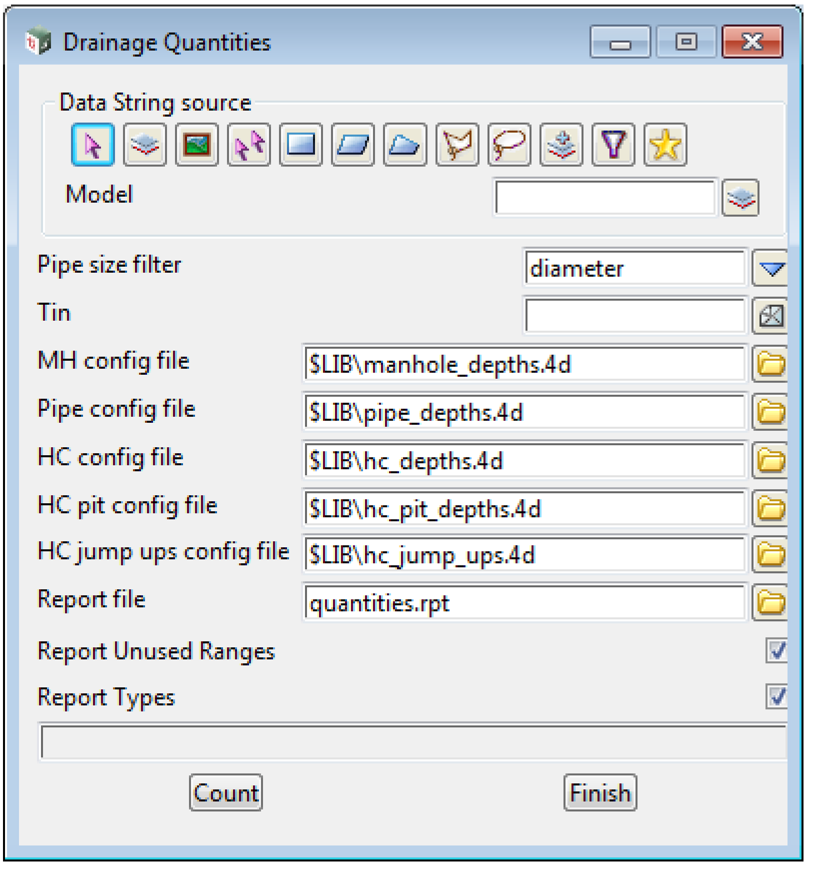
See Also

Drainage overview

Key points

1. Items are counted/totalled by depth and optionally type.
2. The routine will not "double count" items even if the ranges overlap.
3. Types are case sensitive, types with spaces in the name must be enclosed in quotes and the wild card * may be used.
4. Use vertically offset tins and "banded" depth ranges to get quantities under roads, foot paths, *etc.* This is discussed later in detail.
5. Erase count file fields if the items are not to be counted.

On selecting the **Network quantities** option, the **Drainage quantities** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Data String Source Choice

usually the entire model is selected but view is also available for combining models

Pipe size filter Choice diameter or pipe size attribute

The second item in a count line is used to filter by ***diameter*** *(in meters/ft) or the* ***pipe size attribute****. The* ***diameter*** *can only be used when no box culverts or trapezoidal channels are used. The* ***pipe size attribute*** *is the label generally used in the plan plots. This is the pipe size in mm/inches (375), for box culverts width x height (750x375) and for trapezoidal channels TopwidthBottomwidthxHeight (T5000B1000x500).*

Tin tin box

This tin will be used for the pipe and pit depths.

MH config file file box

This file specifies the types and depth ranges for the pits. Details of this file are contained below.

Pipe config file file box

This file specifies the types and depth ranges for the pipes. Details of this file are contained below.

HC config file file box

This file specifies the types and depth ranges for the house connections. Details of this file are contained below.

HC pit config file file box

This file specifies the types and depth ranges for the HC pits. Details of this file are contained below.

HC jump ups file file box

This file specifies the types and depth ranges for the house connections jump ups. Details of this file are contained below.

Report file file box

a sample report file is given below.

Report unused ranges tick box

*the depth ranges for the pit/pipe/house connections are defined in the *.4d files. Selecting this option will cause the depth ranges in the file to be printed even if there are no pit/pipe/house connections in these depth ranges (zero quantity values will be shown).*

Report types tick box

*Selecting this option will cause the pit/pipe/house connection types used in the model types to be listed (even if quantities are not requested in the *.4d files). Since this is a complete of the type used in the model, the list informs the user what types have not been included in the quantity calculation.*

Count button

executes the option.

Finish button

removes the dialogue from the screen

The *.4d files listed above are contained in the 12d **library** directory. Each line is the file performs a count (count lines). No items are counted twice. Therefore, if an item is counted its type and then a count line is found the wild card is used for the type, the type already counted will not be included in the count.

The format for a count line is three or four values (space delimited) per line. Size is optional.

```
<type (from drainage.4d)>  <size> <starting depth>   <ending depth>
```

Notes:

All **types** with spaces in the name must be enclosed in quotes The wild card * may be used.

The **size** is optional and if omitted the all sizes will be counted in this group (do not use the * for a wild card).

The **starting depth** and **ending depth** are required for all count lines.

Quantities Under Roads and Footpaths

By creating super tins with vertically offset sections, quantities under roads, footpaths, *etc.* can be determined. for example.

Offset your road design tin up by 1000m (**Tins->Utility->Translate/Copy)** and then use the depth range 1000-1999 for pipes under roads.

Create a tin from the footpaths only, null by angle length with a small length to remove the road and then offset it vertically by 2000m. the depth range 2000-2999 is not the quantities under the footpath.

Sample count lines

```
// sum concrete cover manholes is various ranges

"CONC COVER" 0.0 1.6
"CONC COVER" 1.5 3.0
"CONC COVER" 3.0 999.9  // this is expected to be zero
"CONC COVER" -999.0 0.0 // trap errors

// any that are not Concrete cover will be counted here

* 0.0 1.6
* 1.6 3.0
* 3.0 999.9
```

```
Manhole Quantities
====================================

CONC COVER          0.00    1.60    13      16.506
CONC COVER          1.60    3.00     1       1.510
CONC COVER          3.00   999.9     0       0.000
CONC COVER        -999.0     0.0     0       0.000

*                     0.00  1.60     0       0.000
*                     1.60  3.00     0       0.000
*                     3.00 999.9     0       0.000

  total length = 18.016

  Types Used
  ----------

  CONC COVER

  Diameters Used
  ----------

  1.100
```

Since the **Report unused ranges** tick box was selected, these lines were printed even though there were no pits in the data ranges.

This data results from selecting the **Report types** tick box.

Sample count lines for pipes follow.

```
// sum class 2 pipes by diameter and for various ranges

// count 375

2 0.375 0.0 2.0
2 0.375 2.0 5.0
2 0.375 5.0 999.

// count 450

2 0.450 0.0 2.0
2 0.450 2.0 5.0
2 0.450 5.0 999.

// count 525

2 0.525 0.0 2.0
2 0.525 2.0 5.0
2 0.525 5.0 999.

// count pipe sizes that were missed

2 * 0.0 2.0
2 * 2.0 5.0
2 * 5.0 999.

// count all other missed pipes

* 0.0 999.
```

22.8.2 Network Report

After selecting the **Network report** option, the **Report on Selected Items** panel is displayed.

This is the same as the option **Reports** =>**Co-ord/ Brd-dst** on the main menu.

For the given model, it prints out the string information for each string in the model.

If a sewer network model is given, each sewer string in the network model is reported on.

For further information, go to Coordinates or Bearing-Distance Report.

22.8.3 Excavation Quantities

Position of option on menu: **Design =>Drainage-Sewer =>Reports=>Excavation quantities**

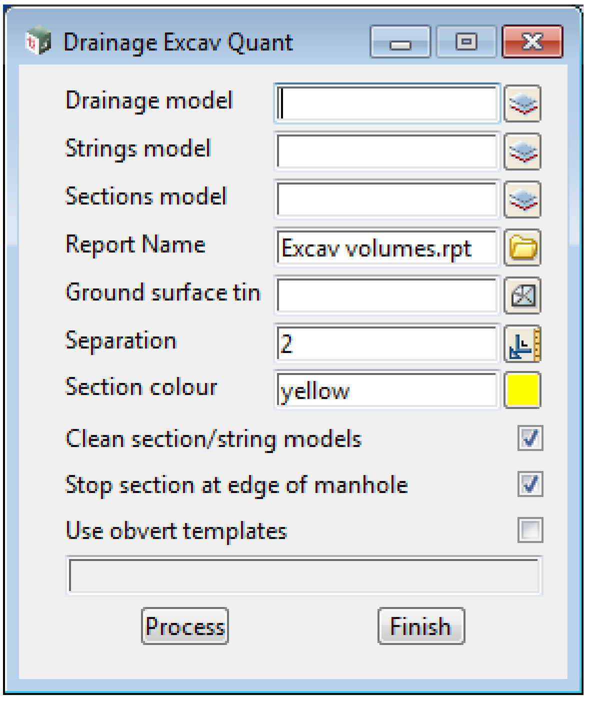
This routine uses 12d templates to calculate the excavation volume for all of the drainage strings in a model. An option to create section for a tin on top of the pipe is also available so that the drainage long sections can include hatching between the obvert of the pipe and the design tin under roads.
Templates with names set to the pipe diameters (times 1000) are used for the calculations, thus trench shapes can be customised and over excavation for bedding materials can be included. Net area calculations to exclude pipe area are not supported.

Key points

1. One template for each pipe size (mm)
2. If obvert templates are used, add the prefix "obvert " to the pipe size
3. Carefully consider the tin selected.

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. A sample template library is included in the 12d library in the file **pipe_template.tpl**.
The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file.

If a tin is created from these strings then volumes by depth can be determined using
Design=>Volumes=>Exact=>Tin to tin
On selecting the **Excavation quantities** option, the **Drainage Excavation Quantities** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	input box		

Model to contain all of the pit and pipe network to be worked on.

Field Description	Type	Defaults	Pop-Up
Strings model	model box		

Strings generated from the templates will be stored in this model

Sections model model box

Sections generated from the templates will be stored in this model

Report name input box

cut and fill volumes will ne sent to this report

Ground Surface Tin tin box

tins from which the volumes will be calculated

Separation real box

distance between the sections

Sections colour colour box

Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)

Clean section/strings modeltick box

Delete the strings in these models before processing.

Stop section at edge of pit tick box

*Template are run from pit centre to centre if this is not selected. The templates stop at the edge of the pit if selected. This is often selected with the following option **Use obvert templates.***

Use obvert templates tick box

*Templates must be named with the prefix "obvert". i.e. **obvert 300.** The template is still run along the invert of the pipe but the user now has a section "set" of templates that can be used to create a tin on top of the pipe as well as below.*

An example report file follows.

```
 ----------------------------- BEGIN APPLY TEMPLATE REPORT ------------------------------

  apply template to string report -

    string         E
    tin            design
    separation         10.000
    left template  375
    right template 375
    cut volumes and areas are negative
    fill volumes and areas are positive

  chainage-  ------sectional   information------   ------intermediate   information----      ---------accumulative
information-------

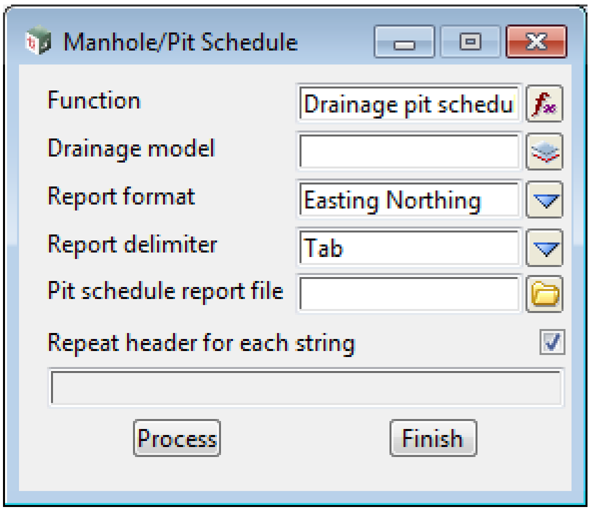
Selecting design string or tin?
Drainage overview

Usage

Position of option on menu: **Design => Drainage => Reports => Pit schedule**

This routine prints the calculations from the last time Set Pit Details was selected in the Drainage Network Editor.

On selecting the **Pit schedule** option, the **Manhole/Pit Schedule** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model name	input box	drainage network	
model containing the drainage strings			
Pit schedule file name	input box	pit report	
file to be created			
Report Format	choice box	Road chainge.,Easting...	
file format			
Data delimiter	choice box	Tab, Space	
tab delimiters are best for spreadsheets and space for some text editors			
Repeat header for each line	tick box	selected	
when selected, the column headings will be printed each drainage line			
Process	button		
Create the pit report			
Finish	button		
remove the panel from the screen			

Notes:

The columns of data may be separated by spaces or a tab. (tab is used for spreadsheet transfers). The internal width and length data are retrieved from the **drainage.4d** file for the pit type specified. If you want a longer description for the pit then the type used inside 12d this can also be entered in the drainage.4d file. The remarks for each pit are entered as user defined pit attribute named **remarks** and may be set using the attribute editor (on the drainage menu) or via a spreadsheet.

A/5	5217.194	7322.036	93.736	d0027.450
A/6	5183.458	7322.036	60.000	d0027.450
A/7	5152.699	7322.036	29.241	d0027.450

Notes

The Set pit details must be run at least once to before printing the report. If the pits are moved or the designed strings changed then this option must re rerun.

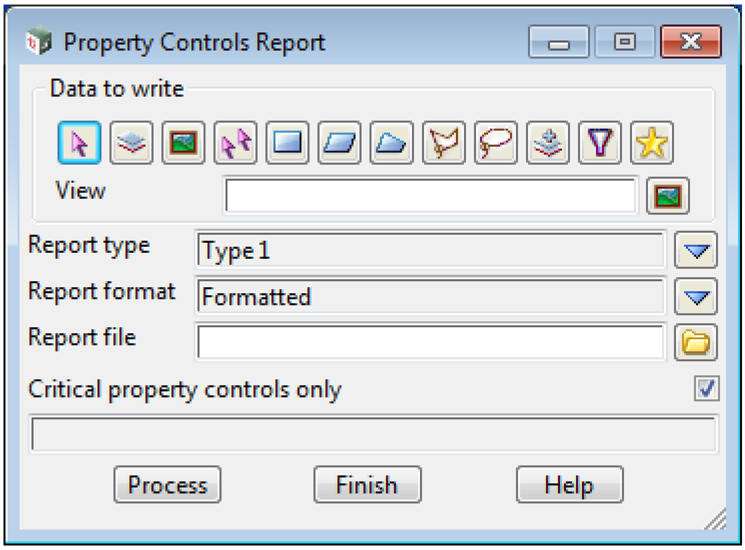
The easting northing data obtained for the **road design string** option is obtained by dropping the pit centre perpendicular onto the selected road design string. This data is stored as pit attributes **setout x** and **setout y**. It is calculated when the **Set Pit Detail** is selected in the Drainage Network Editor.

22.8.5 Property Controls

Position of menu: **Design =>Drainage-Sewer=>Reports=>Property Controls**

The property controls report contains information about all the property controls for the selected drainage strings, and if required, denote the critical property control for a lot.

On selecting **Property controls,** the **Property Controls Report** panel is displayed.



The fields and buttons used in this panel have the following functions.

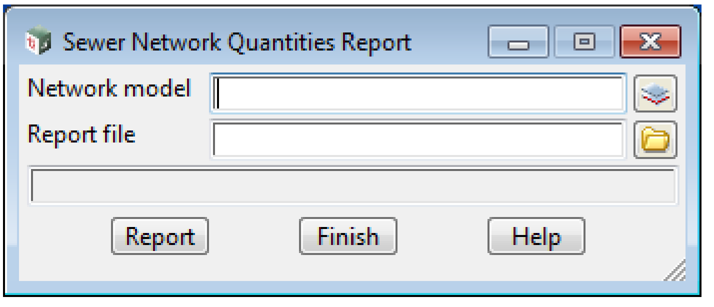
Field Description	Type	Defaults	Pop-Up
Data source type			
data source type.			
Data source			
data source for the drainage strings to process.			
Format	choice box	ascii	ascii, Excel spread sheet
format for the property control report.			
Report file	file box		
name of the file for the report.			
Critical property controls only	tick box	tick	
if tick, only the critical property controls are reported.			
Process	button		
run the option.			

22.8.6 Barwon Quantities

The report generated from this option includes

- the lengths of each pipe type for each line and the total length for each pipe type for all pipes in the network.
- the quantity of concrete used for the manholes in the network.
- the number and type of house connections in the network, including caps, bends and bushes.

After selecting the **Barwon quantities** option, the **Sewer Network Quantities Report** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model			available models

model containing the sewer strings.

Report file	file box		

name of the file for the report.

Report	button		

run the option.

22.8.7 Barwon House Connections

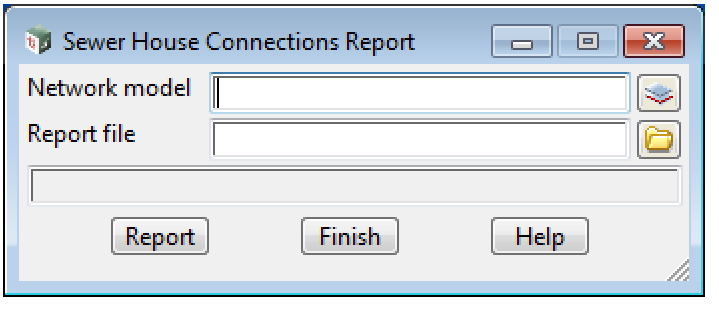
Position of menu: **Design =>Drainage-Sewer=>Reports=>House connections**

The house connections report contains information about all the house connections for the selected drainage (sewer) strings.

The house connection report includes for each house connection (branch) the

- name of the sewer line
- downstream manhole for the house connection
- lot name
- house connection number and type
- chainage of the house connection
- the invert level at the end of the house connection (IL branch)
- the invert level of the house connection at the sewer pipe (IL sewer)
- the drop over the house connection (branch depth)

On selecting **House connections,** the **Sewer House Connections Report** panel is displayed.



The fields and buttons used in this panel have the following functions.

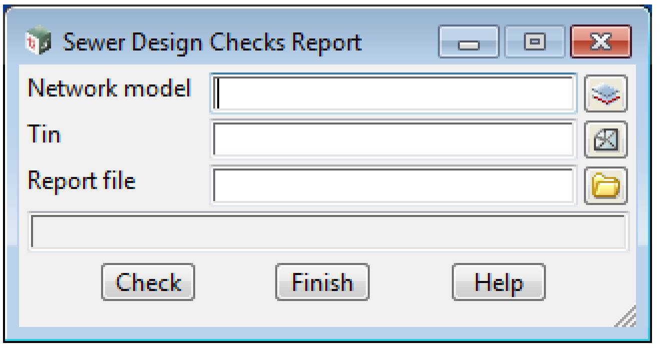
Field Description	Type	Defaults	Pop-Up
Network model			available models
model containing the sewer strings.			
Report file	file box		
name of the file for the report.			
Report	button		
run the option.			

22.8.8 Barwon Design Checks

The report generated from this option includes the design checks

- network validations (checks that there are strings, no closed loops)
- manholes don't have negative drops
- other sewer lines connecting in don't have negative drops
- sewers flows downhill with a minimum grade
- manholes are not too close together (*i.e.* on top of each other)
- a minimum cover for each sewer line
- block controls are above the pipe invert level

After selecting the **Design checks** option, the **Sewer Design Checks Report** panel is displayed



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model			available models

model containing the sewer strings.

Tin			available tins

tin used for checking minimum cover against.

Report file	file box		

name of the file for the report.

Report	button		

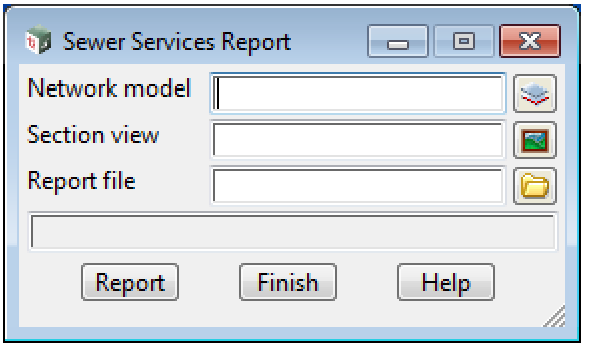
run the option.

22.8.9 Barwon Services Report

For each sewer string in the network, this option generates a report which includes the

- section through any tins on the section view
- name and model of any services in the corridor defined by the section view
- co-ordinates and chainages of the parts of the service in the corridor, and the chainage and offset for each of the point of the parts projected onto the sewer centre-line.
- clearance at the point where any service goes under or over the sewer string.

After selecting the **Services report** option, the **Sewer Services Report** panel is displayed



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model			available models

model containing the sewer strings.

Section view			available section views

section view defining the corridor and service models.

Report file	file box		

name of the file for the report.

Report	button		

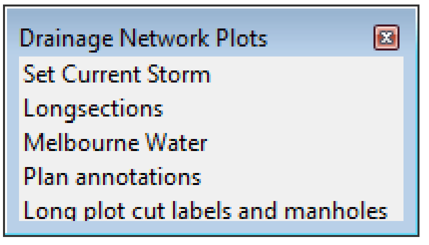
run the option.

22.9 Drainage Plots

Position of menu: **Design =>Drainage-Sewer=>Plots**

Currently the **Plots** menu contains an option to produce a long section including any HGL values, flows and user defined attributes read in from other sources, and a second option to output the network to Melbourne Water’s sewer format.

The **Plots** walk-right menu is



The options **Longsections** and **Melbourne Water** will now be described in more detail.

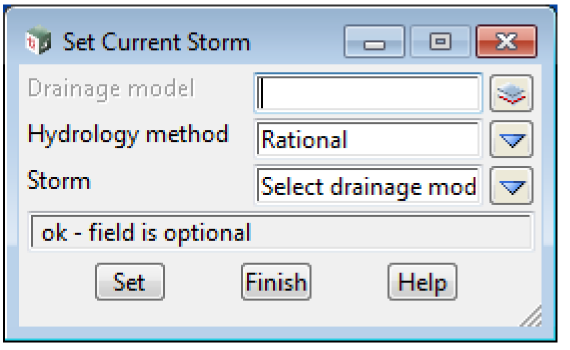
For the option *Set Current Storm*, please continue to the section Set Current Storm.
Long sections, please continue to the section Drainage Longsections.
Melbourne Water, please continue to the section Melbourne Water.
Plan annotations, please continue to the section Plot Annotations.
Long plot cut labels and manholes, please continue to the section Long Plot Cut Labels and Manholes.

22.9.1 Set Current Storm

Position of menu: **Design =>Drainage-Sewer=>Plots=>Set Current Storm**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Set Current Storm** brings up the **Set Current Storm** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	model box		available models
Hydrology method	choice box		
Storm	choice box		
Set	button		

22.9.2 Drainage Longsections

Position of menu: **Design =>Drainage-Sewer=>Plots=>Longsections**

The **Longsections** option is used to generate the longsection plots for all lines in a drainage network.

Given the plot sheet size and the horizontal and vertical scales, the longsections for the drainage lines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

Hence the drainage lines are plotted one after another on one or more plotter sheets.

The drainage lines are plotted in string name alphabetical order.

The drainage longsection plot includes

- the manholes, drainage pipe and any house connections
- the height of the finished surface at the manhole
- manhole names and cover types
- distances between manholes
- the invert depth of the pipe on either side of a manhole
- the grades and types of the pipes
- any services in the corridor - including their name, invert level and distance from the nearest down-stream manhole
- if the information exists, the velocity, flow, HGL values and diagram

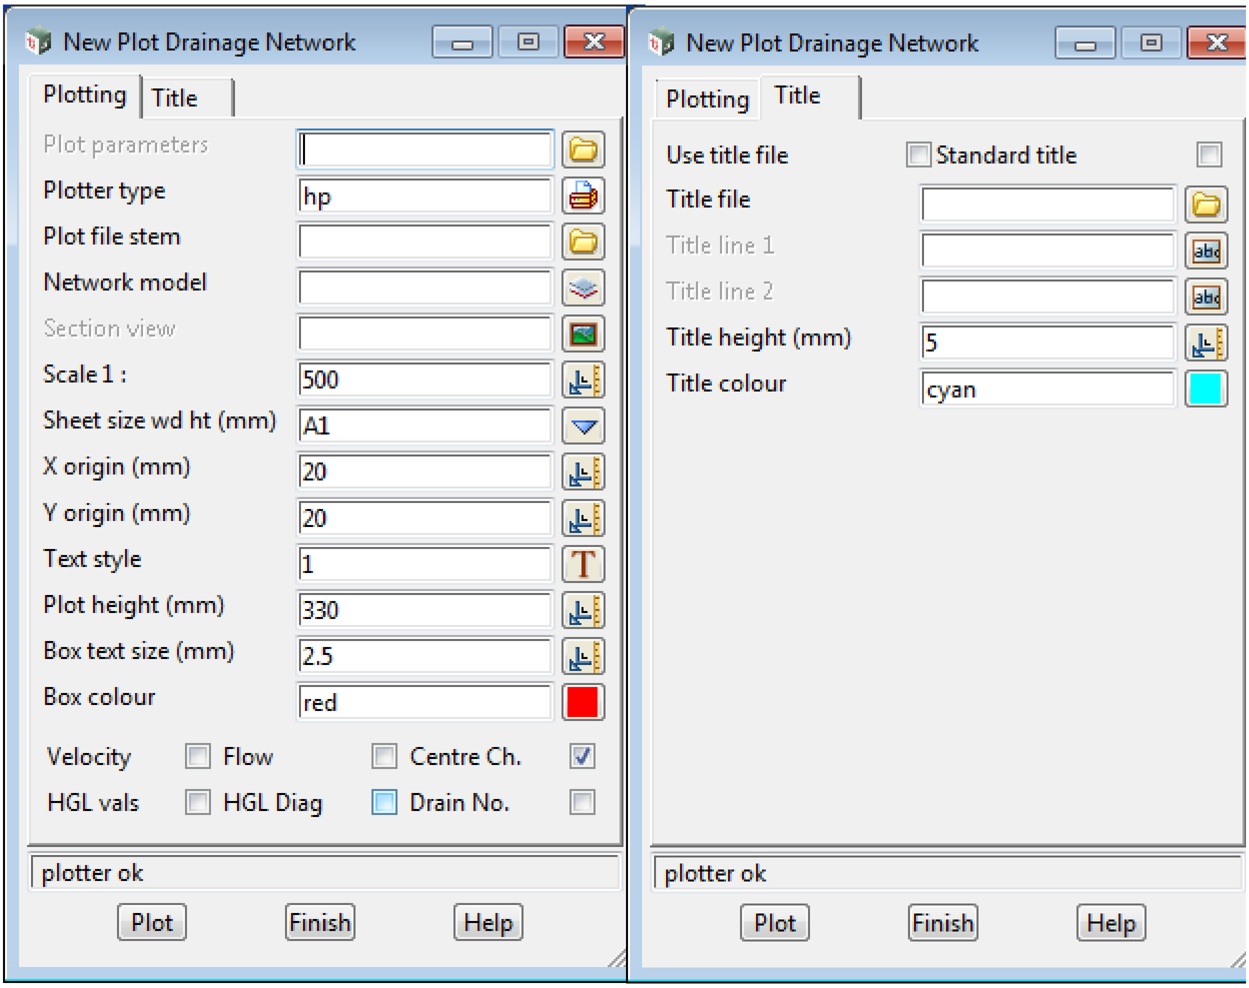
After selecting the **Longsections** option, the **New Plot Drainage Network** panel is displayed.

The drainage long section plot is tailored by using the plot parameter file (.ppf file) given in the plot parameters field. A default .ppf file is set by pointing to it with the environment variable

DRAINAGE_PPF_4D	path name of default .ppf file

In the path name to the default .ppf file, $LIB is used to stand for the library folder set by LIB_4D. For example, "$LIB/drainage.ppf" is the file drainage.ppf in the library area.

The **title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **Title** button is selected, the **drainage plot title** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	input		*.ppf

file of plot parameters used for extra control of the long section plot.

Plotter type	input	hp	model, windows, hp, dxf, postscript, *etc.*

format for the plot output.

Network model input

the model containing all the drainage lines for the network.

Section view input

the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section, etc.

Plot file stem input

since more than one plot page may be produced, the plot file names are constructed from the stem plus a plot page sequence number, followed by the appropriate plotter type ending.

Scale 1: input

horizontal scale for plotting the drainage long section. The vertical exaggeration is taken from the section view given in the section view *field.*

Sheet size wd ht (mm) input available sheet sizes

the width and height values (separated by space) or the name of a user defined sheet size.

X origin (mm) input

the x position on the plot sheet for the bottom left hand corner of the longsection plots. Same as left_margin in the plot parameter file.

Y origin (mm) input

the y position on the plot sheet for the bottom left hand corner of the longsection plots. Same as bottom_margin in the plot parameter file.

Text style input 1 available text styles

the default text style to use in the longsection plot.

Plot ht (mm) input

the maximum allowable height for a longsection plot for a drainage line. Datum breaks are applied to any part of the longsection that will not fit into the plot ht

Box text size (mm) input 3

size (in millimetres) to plot the chainages, heights etc. in the boxes in the plots of the drainage longsections

Box colour input cyan available colours

colour used for the text and the boxes.

Velocity tick box tick

*if **tick**, the velocity values for the pipes are drawn on the longsection plot.*

Flow tick box tick

*if **tick**, the flow values for the pipes are drawn on the longsection plot.*

Centre CH. tick box tick

*if **tick**, the road centre line chainages are drawn on the longsection plot.*

HGL vals tick box tick

*if **tick**, the HGL values for the pipes are drawn on the longsection plot.*

HGL diag tick box tick

*if **tick**, lines joining the HGL values for the pipes are drawn on the longsection plot.*

Drain No. tick box tick

*if **tick**, the drainage line names are drawn on the longsection plot.*

Plot button

plot the drainage longsections for the drainage lines in the model given in the network model *field.*

The fields and buttons in the *title* tab are

Use title file tick box

*if **tick,** a user defined title block file is used.*

Standard Title tick box tick

*if **tick**, the standard 12d Model border and two lines of title are placed on the bottom of the plot*

Title file input *.tf

*if **non-blank** and* use title file *is set to **tick**, then the file given in this field is used to generate a user defined title block for the plot.*

Title line 1/2 input

first/second line of title information

Title height (mm) input 5

height (in millimetres) to draw the characters in the two lines of title information.

Title colour input cyan available colours

colour used for the border and the title information.

Please continue to the next section Drainage Longsection Plot Parameter File.

22.9.2.1 Drainage Longsection Plot Parameter File

The **Longsections plot** option is used to make special long section plots for a **network** of drainage strings.

Some of the look of the drainage long section plot can be controlled from the **plot drainage network** panel itself, however a wider selection of control parameters is available by using a drainage long plot, plot parameter file.

The drainage long section plot parameters are placed in a file with ending **.ppf**.

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash *//* is considered to be a comment.

The set of all parameters for the drainage long section plot is enclosed within a set of curly brackets **{ }** with the header

drainage_long_plot "plot set name"

before the curly brackets.

That is,

```
drainage_long_plot "plot set name" {
        plot parameters
        one per line
}
```

If there is more than one *drainage_long_plot* parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as *section_x_plot* in the same file. The other sets will be ignored when doing a drainage long section plot.

The plot parameters are documented in following groups:

For the *Plot Sheet layout*, please continue to the section Plot Sheet Layout.

Labelling the drainage string name, please continue to the section Labelling the Drainage String Name on the Plot.

Boxes area, please continue to the section Boxes Area.

Chainages and uprights, please continue to the section Chainages and Uprights.

Staggering, please continue to the section Staggering of Chainages and Uprights.

Below datum area, please continue to the section Below Datum Area.

Arrows area, please continue to the section Arrow Areas.

Grade arrows parameters, please continue to the section Parameters for the Arrows for Grades of the Pipes.

Pipe diameter arrows parameters, please continue to the section Parameters for the Arrows for Diameters of the Pipes.

Pipe velocity arrows parameters, please continue to the section Parameters for the Arrows for Velocity in the Pipes.

Pipe flow arrows parameters, please continue to the section Parameters for the Arrows for Flow in the Pipes.

Drainage line name arrows parameters, please continue to the section Parameters for the Arrows giving the Drainage Line Name.

User defined pipe arrows parameters, please continue to the section Parameters for the Arrows for User Defined Pipe Attributes.

Graph area parameters, please continue to the section Graph Area.

Top area parameters, please continue to the section Top Area.

Bubbles area parameters, please continue to the section Manhole name, Manhole Types and Surrounding Bubbles.

Change of direction parameters, please continue to the section Change of Direction Through Pits and Junctions.

Symbols at manhole parameters, please continue to the section Symbols at Manholes.

House connection parameters, please continue to the section Labelling House Connections

Symbols at Property controls parameters, please continue to the section Symbols at Property Controls.

Property controls parameters, please continue to the section Labelling Property Controls.

Hatching cut and fill parameters, please continue to the section Hatching Cut and Fill Areas.

Labelling cuts parameters, please continue to the section Labelling Cuts of Drainage Through Strings in a Model.

Title block parameters, please continue to the section Title Block Information.

Panel modifying parameters, please continue to the section Parameters that Modify Fields In the Plot Drainage Network Panel.

22.9.2.1.1 Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

sheet_size	*text*	// sheet name, or
	"*mm* *mm*"	// sheet size: width height

The sheet size name and width and heights can be specified by the user in a file named sheets.4d which is in the normal set up areas, or is pointed to by the environment variable

SHEET_SIZES_4D	*file*	// file of plotter sheets sizes

The plotting area is restricted to within the plot sheet by giving the margins

left_margin	*mm*
right_margin	*mm*
top_margin	*mm*
bottom_margin	*mm*

The drainage long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

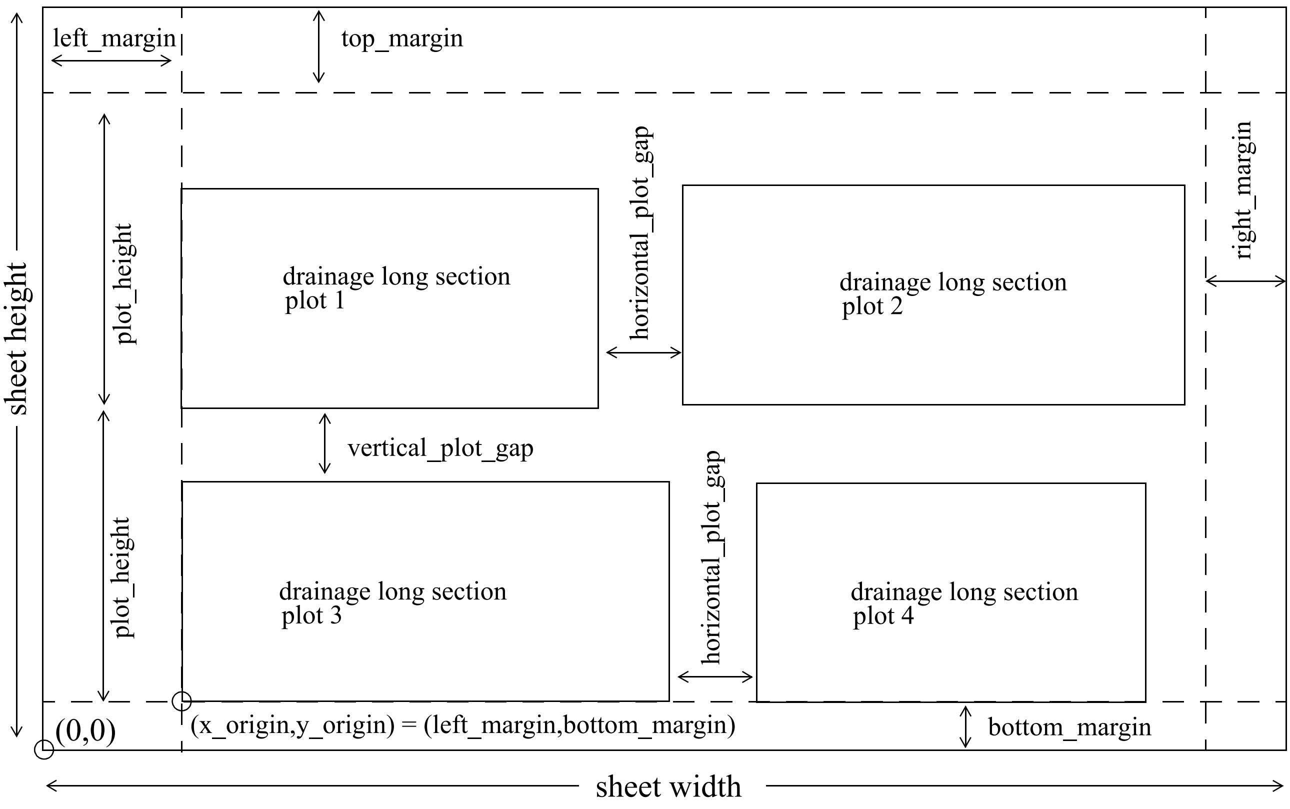
When a sheet is full, a follow on sheet is created.

As soon as one drainage string is completed, the next drainage string in the network model is plotted beginning on the same row as the previous drainage string and with a horizontal gap of size *horizontal_plot_gap* between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, *x_origin* and *y_origin* which are the same as *left_margin* and *bottom_margin* respectively.

If there are two or more rows of plots, the position of the first plot in each row is given by adding multiples of the *plot_height* to the *y_origin* (*bottom_margin*).

network_model	*text*	// model of drainage strings
x_origin	*mm*	// Position of the left hand bottom,
		// same as *left_margin*.
y_origin	*mm*	// corner of first plot in the bottom row,
		// same as *bottom_margin*.
only_one_line	*0*	// more than one row on a sheet
	1	// only one row of plot on a sheet
plot_height	*mm*	// total height of a plot row.
		// It includes the vertical_plot_gap.
horizontal_plot_gap	*mm*	// gap between plots on same row
vertical_plot_gap	*mm*	// gap between rows of plots,
		// also the size of the top area



The drainage long plot itself consists of eleven areas. From the bottom up, they are

drainage string name, boxes, below datum, arrow 1, bottom stagger, arrow 2, graph, arrow 3, top stagger, arrow 4, top.

The **drainage string name area** is where the name of the drainage string can be plotted.

The **boxes area** is where the chainages and various values for the drainage strings are labelled.

The **below datum area** is a region between the boxes area and the datum line.

The **arrow 1 area** is for drawing arrows where the arrows go between the staggered uprights and below the graph area. The datum line is at the bottom of the arrow 1 area.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **arrow 2 area** is for drawing arrows below the graph but where the arrows go between non-staggered uprights.

The **graph area** is the area where the actual plots of the strings are drawn.

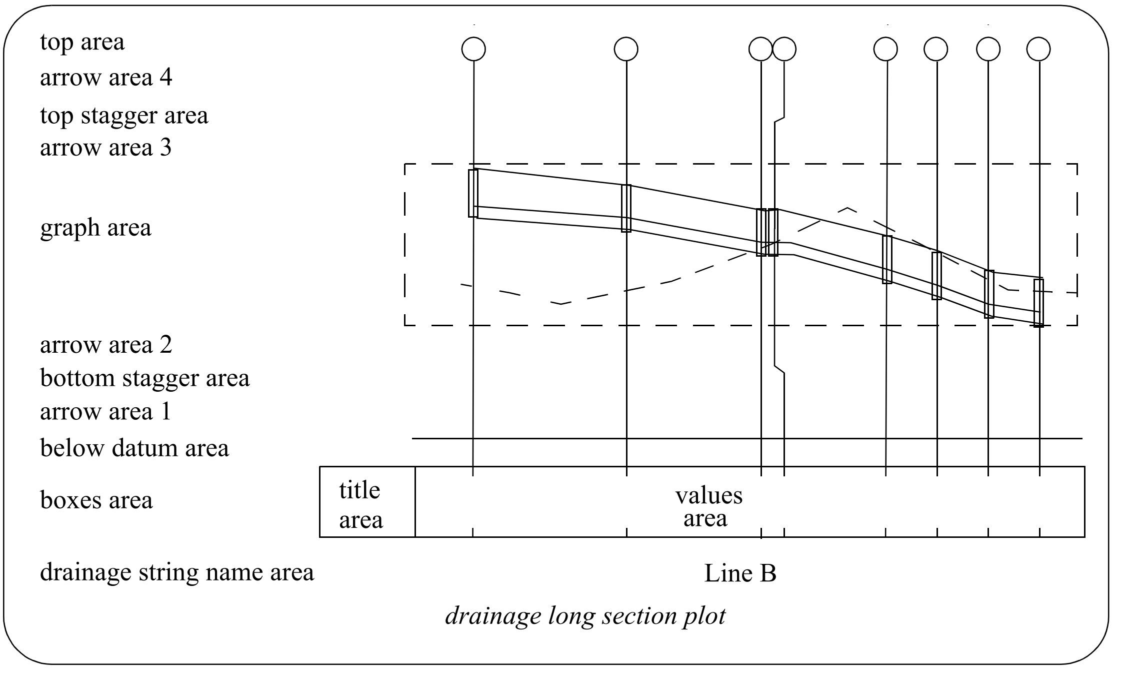
The **arrow 3 area** is for drawing arrows above the graph area and where the arrows go between non-staggered uprights.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is for drawing arrows where the arrows go between the staggered uprights and above the graph area.

The **top area** is an annotation area above the arrow 4 area and is used for bubbles, manhole names (pit names), junctions, deflection angles, *etc.*

The areas and the information in them will now be described in more detail.



22.9.2.1.2 Labelling the Drainage String Name on the Plot

The plot can be labelled with the name of the drainage string under the boxes area.

The name is made up of concatenation the text strings:

plot_name_pre_text drainage-string-name plot_name_post_text

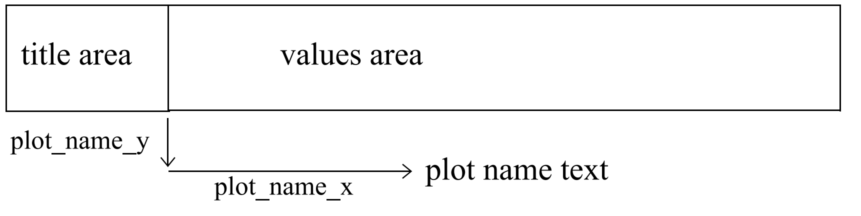
The plot name is positioned under the boxes.

plot_name_mode	***0***	// don't use the drainage string name
	1	// use the drainage string name in the // label
plot_name_pre_text	*text*	
plot_name_post_text	*text*	
plot_name_textstyle	*textstyle*	
plot_name_text_size	*mm*	
plot_name_text_colour	*colour*	
plot_name_x	*mm*	
plot_name_y	*mm*	

The *plot_name_x* is measured from the beginning of the height boxes.

The default for *plot_name_x* is centred on the values area.

The *plot_name_y* is measured from the bottom of the box area with positive being **down**.



labelling drainage string name on drainage long section plots

Example of Labelling Drainage String Name

plot_name_pre_text	“Drainage Long Section Plot for String”
plot_name_mode	1
plot_name_post_text	“”
plot_name_text_size	15
plot_name_text_colour	red
plot_name_textstyle	ISO
plot_name_y	30

22.9.2.1.3 Boxes Area

Many of the drainage string values (invert levels and depth, hgl values, natural and finished surface, *etc.*) can be labelled in the boxes area at the bottom of the drainage long section plot.

Each type of information is plotter in a row made up of a title, and the actual values given at the chainage of each pit in the drainage string.

Each row of information is surrounded by lines to form a box, and the stacked boxes form the boxes area at the bottom of the drainage plot.

The **title** for the information, is drawn in the **title area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

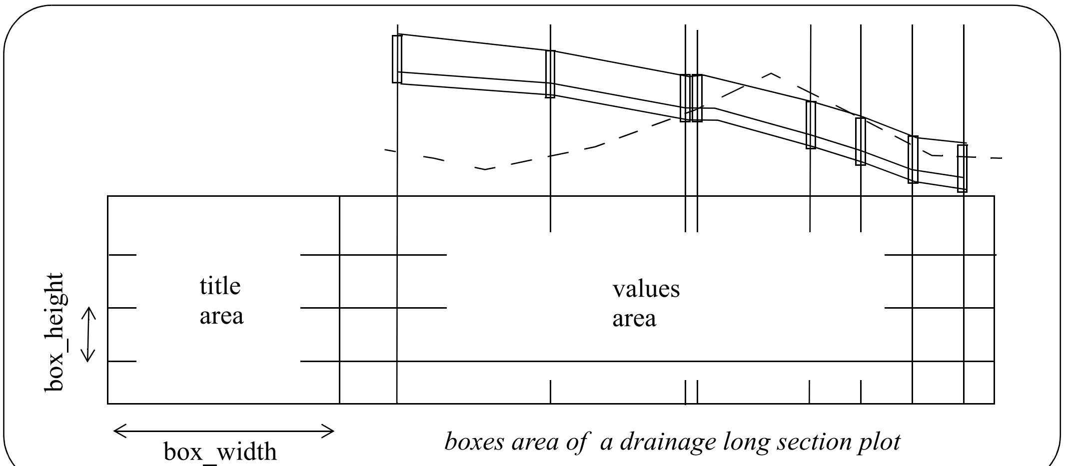
Consequently the boxes area is made up of rows of text consisting of:

title followed by the **values** along the drainage string.

The **titles area** for the left plot in the bottom row starts at the co-ordinate (*x_origin*,*y_origin*) and each row is begun by adding the distance *plot_height* to the *y_origin* (see previous section).

The width of the **title area** is given by the **box_width** parameter and the height of each box is given by **box_height**.

box_width	*mm*	// width of the label boxes.
box_height	*mm*	// height of each box



boxes area of a drainage long section plot

The colour of the box line work is given by:

box_colour	*colour*	// colour of the lines in the boxes

A default text size and colour can be specified for the title text and the values, or sizes, colours and text styles can be given for each individual box (given later in this section).

title_box_text_size	*mm*	// size of title text in boxes
title_box_text_colour	*colour*	// colour of title text in boxes
box_text_size	*mm*	// size of value text in boxes
box_text_colour	*colour*	// colour of values in boxes

The values text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_left_justify*).

The values text can be on the left, right or centred on the uprights and is given by the parameter *box_text_side*.

The width of the values area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing (see next section).

box_text_left_justify	*0*	// top justify text in values area
	1	// bottom justify text in values area
box_text_side	*0*	// left (default)
	1	// right
	2	// centre

The default order of the boxes from the bottom up is

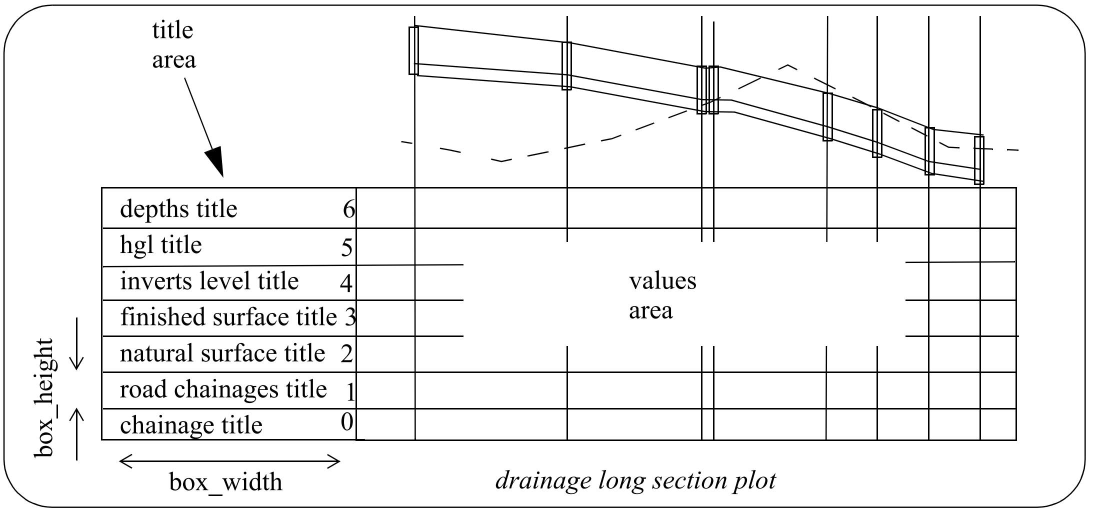
0. drainage string chainages
1. road centre line chainages - user choice
2. natural surface heights - user choice
3. finished surface heights - user choice
4. before pit and after pit invert levels
5. before pit and after pit hgl values - user choice
6. before pit and after pit depth to inverts - user choice

There are parameters to change the order for 1-6.
*Drainage string chainage*s is fixed at the bottom (box 0) but what is in the boxes above box 0 is can be set by the box_n parameters:

box_n	*number_from_list*	// the n'th box above the drainage string
		// chainages will contain given item number
		// form the list.

For example, to have *finished surface heights* in the first box the drainage string chainages, use:

box_1 3 // the (1) will be replaced by (3)



chainage_box_size	*mm*	// box height for chainage box
centre_chainage_box_size	*mm*	// box height for centre chainage box
surface_box_size	*mm*)	// box height for surface box
f_surface_box_size	*mm*	// box height for finished surface box
invert_height_box_size	*mm*	// box height for invert height box
hgl_box_size	*mm*	// box height for hgl box
invert_depth_box_size	*mm*	// box height for invert depth box

The default for each box size is *box_height*

The boxes (1), (2), (3) and (5) can be suppressed by the parameters

draw_centre_chainage	*0/1*	// 0 = don't have centre line chainages

```
                                          //      box
draw_ns_text            0/1               // 0 = don't draw ns values from
                                          //     ns tin for drainage string
draw_fs_text            0/1               // 0 = don't draw fs values from
                                          //      fs tin or top of manhole
                                          //      for drainage string
draw_fs_mode            0                 // 0 = fs_text is from fs tin
                        1                 // 1 = fs_text is top of manhole
draw_hgl_value          0/1               // 0 = don't have hgl value boxes
```

The definition of depth to invert and whether box (6) is suppressed or not, are given by the parameter *depth_mode:*

```
depth_mode              0                 //don't draw depth to invert values
                        1                 // draw depth to invert values to fs tin
                                          // for drainage string
                        2                 // draw depth to invert values to top of
                                          // manhole for drainage string
                        3                 // draw depth to invert values to ns tin
                                          // for drainage string
```

The default for the number of decimal places used in the values in the boxes is:

```
number_of_decimals      integer           // default number of decimal places
```

The text, size, colour and textstyle for the title text and values text for each box can be set by

(0) drainage string chainages

```
plot_title_chainage_name      text        // first line of title for chainages box
plot_title_chainage_name_2    text        // second line of title for chainages box
chainage_title_colour         colour      // colour of text
chainage_title_text_size      mm          // size of title in chainage box
chainage_title_textstyle      textstyle   // textstyle for title in chainage box
chainage_text_colour          colour      // colour of chainage values
chainage_text_size            mm          // size of values
chainage_textstyle            textstyle   // textstyle of values
chainage_decimals             integer     // number of decimal places in chainage
```

(1) road centreline chainages

```
plot_title_centre_chainage_name     text       // title for road centre
                                               // line chainages box
plot_title_centre_chainage_name_2   text       // second line of title for road
                                               // centre line chainages box
chainage_title_colour_cl            colour     // colour of text
chainage_title_text_size_cl         mm         // size of title in cl box
chainage_title_textstyle_cl         textstyle  // textstyle for title
chainage_text_colour_cl             colour     // colour of cl values
chainage_text_size_cl               mm         // size of values
chainage_textstyle_cl               textstyle  // textstyle of values
chainage_cl_decimals                integer    // number of decimal places in chainage cl
```

(2) natural surface values

```
plot_title_surface_name       text        // title for the drainage ns values box
plot_title_surface_name_2     text        // second line of title for drainage ns values
ns_title_colour               colour      // colour of text
ns_title_text_size            mm          // size of title in ns box
ns_title_textstyle            textstyle   // textstyle for title
ns_text_colour                colour      // colour of ns values
ns_text_size                  mm          // size of values
```

ns_textstyle	*textstyle*	// textstyle of values
ns_decimals	*integer*	// number of decimal places in ns

(3) finished surface values

plot_title_finished_name	*text*	// title for the drainage fs values box
plot_title_finished_name_2	*text*	// second line of title for drainage fs values
fs_title_colour	*colour*	// colour of text
fs_title_text_size	*mm*	// size of title in fs box
fs_title_textstyle	*textstyle*	// textstyle for title
fs_text_colour	*colour*	// colour of ns values
fs_text_size	*mm*	// size of values
fs_textstyle	*textstyle*	// textstyle of values
fs_decimals	*integer*	// number of decimal place in fs

(4) invert levels

plot_title_invert_name	*text*	// title for the invert levels box
plot_title_invert_name_2	*text*	// second line of title for the invert levels box
il_title_colour	*colour*	// colour of text
il_title_text_size	*mm*	// size of title in il box
il_title_textstyle	*textstyle*	// textstyle for title
il_text_colour	*colour*	// colour of il values
il_text_size	*mm*	// size of values
il_textstyle	*textstyle*	// textstyle of values
il_decimals	*integer*	// number of decimal places in il

(5) hgl values

plot_title_hgl_name	*text*	// title for hgl values box
plot_title_hgl_name_2	*text*	// second line of title for hgl values box
hgl_title_colour	*colour*	// colour of text
hgl_title_text_size	*mm*	// size of title in hgl box
hgl_title_textstyle	*textstyle*	// textstyle for title
hgl_text_colour	*colour*	// colour of hgl values
hgl_text_size	*mm*	// size of values
hgl_textstyle	*textstyle*	// textstyle of values
hgl_decimals	*integer*	// number of decimal places in hgl

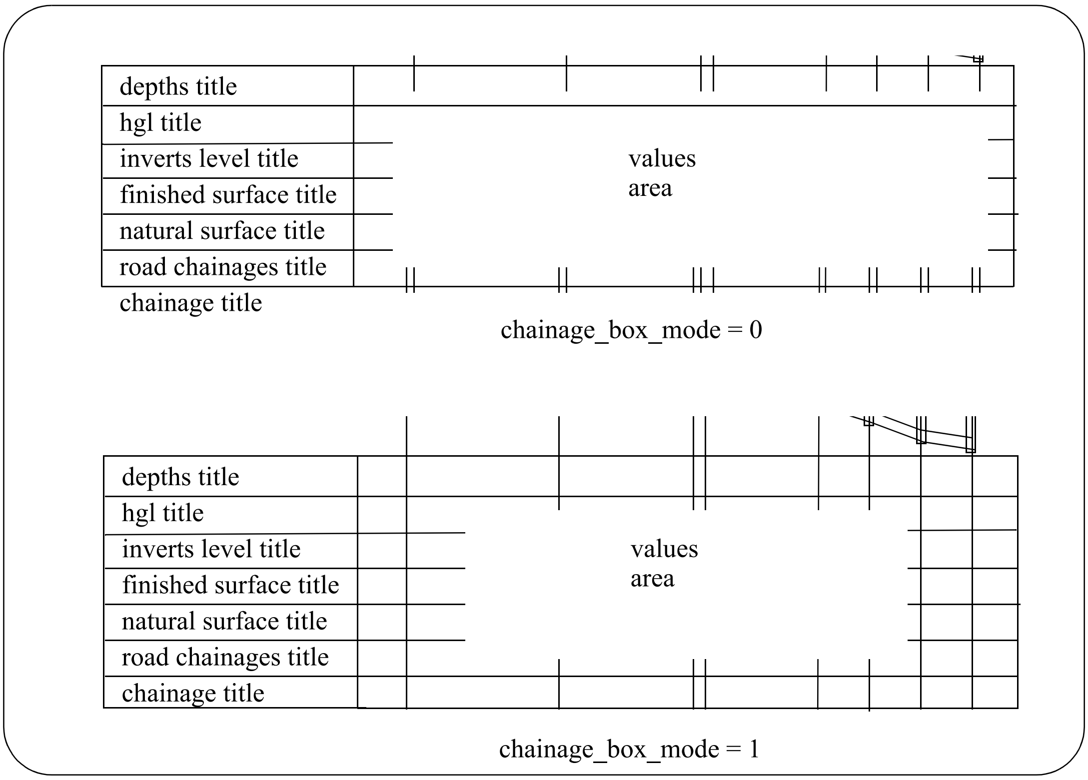
(6) depths

plot_title_depth_name	*text*	// title for depth of inverts box
plot_title_depth_name_2	*text*	// second line of title for depth of inverts box
depth_title_colour	*colour*	// colour of text
depth_title_text_size	*mm*	// size of title in depth box
depth_title_textstyle	*textstyle*	// textstyle for title
depth_text_colour	*colour*	// colour of depth values
depth_text_size	*mm*	// size of values
depth_textstyle	*textstyle*	// textstyle of values
depth_decimals	*integer*	// number of decimal places in depth

Drawing the Boxes

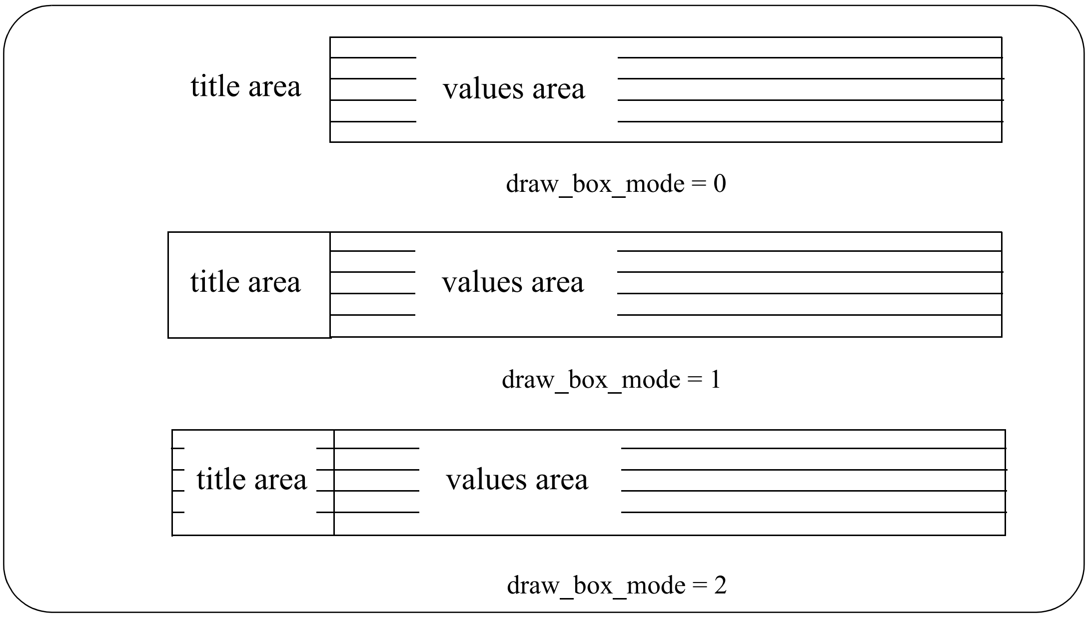
The bottom line from the boxes can be drawn or not drawn:

chainage_box_mode	*0*	// don't draw the bottom line
	1	// draw all the box line work - **default**



A box can be drawn/not drawn around the title area of the boxes area.

draw_box_mode	*0*	// don't draw the title area box
	1	// draw the title area box, no lines - **default**
	2	// draw title box area with lines



22.9.2.1.4 Chainages and Uprights

The chainage box contains drainage string chainages for

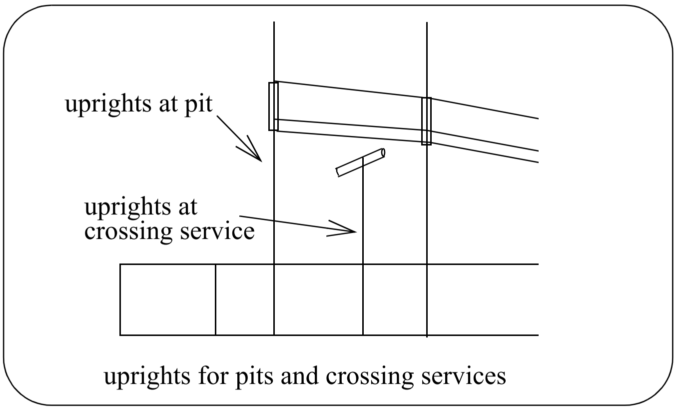
(a) the chainages of each pit in the drainage string

(b) the chainages on the drainage string where any strings in models on the section view are **cut** by the drainage string (crossing services)

For a **pit**, the invert levels, depths, finished and natural surface levels, and hgl of pipes at a pit can all labelled at the chainage of the pit.

For a **crossing service**, the level of the crossing service and the chainage on the drainage string where the crossing occurs are labelled.

Note - crossing services can also be labelled using cuts of drainage line through strings. However, this does not create a chainage in the chainage box.

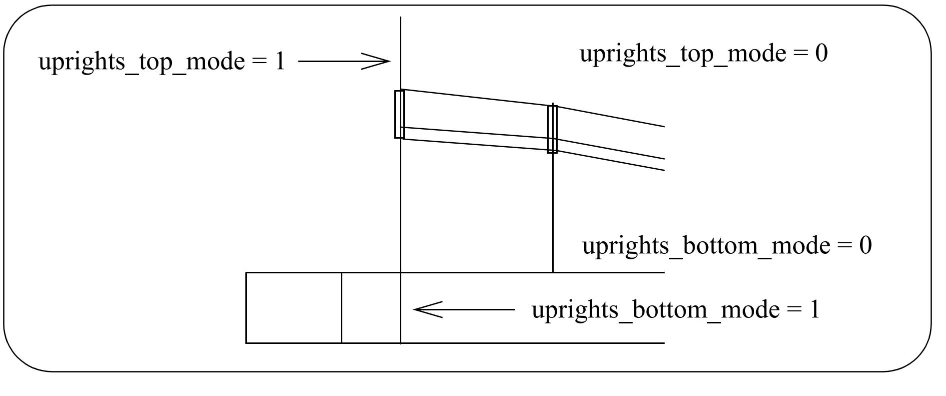


Uprights, or leader lines, can be drawn from the chainage values at the bottom of the boxes to the pit in the graph area, and from the top of the pit to the top area.

Using the parameters *uprights_top_mode* and *uprights_bottom_mode*, it is possible to suppress the drawing from the top of the pit to the top area, and also from the top of the boxes to the bottom of the boxes.

uprights_top_mode	*0*	// stop at top of pit
	1	// go to top area (default)
uprights_bottom_mode	*0*	// stop at top of boxes
	1	// go to bottom of boxes (default)

Also uprights can be drawn from the chainage values bottom of the boxes to the crossing service in the graph area.



The chainage values at the uprights for the pits can be running chainage along the drainage string, pipe length chainages (*i.e.* the chainage starts at zero for each pipe) or both.

chainage_mode	*0*	//pipe length chainage
	1	// running chainage
	2	// both pipe length and running

If the *chainage_mode* includes "pipe length chainage" (modes 0 and 2), the pipe length can either be labelled with a 0.0 chainage at the start pit for the pipe and the pipe length at the end pit, or just have the length centred between the two pits.

centre_pipe_length	***0***	// default - 0 at start pit, length at end pit
	1	// centre pipe length

The chainage values for the crossing services can be running chainage along the drainage string, chainage length from the previous pit (*i.e.* the chainage starts at zero at the previous pit) or both.

service_chainage_mode	*0*	//pipe length chainage
	1	// running chainage
	2	// both pipe length and running

The colour of the uprights for the pits and crossing services are given by:

manhole_line_colour	*colour*	// colour of uprights to the pits
service_line_colour	*colour*	// colour of upright to the crossing // services

The crossing services are labelled with the drainage string chainage of the crossing point, the invert level of the service at the crossing and the name of the service which is made up of:

service diameter   name of service   invert level at the service at the crossing.

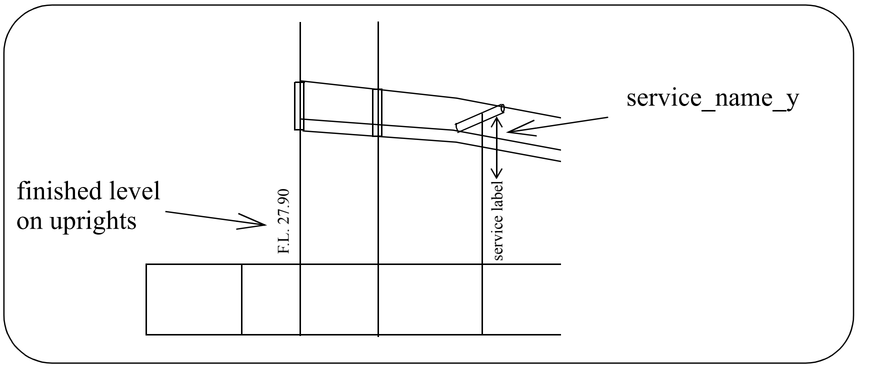
The service label is drawn the distance service_name_y below the crossing point:

service_name_y	*mm*	// def 1, distance of label below crossing point

The colours, text styles and sizes of the service information is specified by:

service_ch_text_colour	*colour*	// colour of services ch text
service_ch_text_size	*mm*	// size of services ch text
service_ch_textstyle	*mm*	// textstyle of services ch text
service_il_text_colour	*colour*	// colour of services il text
service_il_text_size	*mm*	// size of services il text
service_il_textstyle	*mm*	// textstyle of services il text
service_name_text_colour	*colour*	// colour of services name
service_name_text_size	*mm*	// size of services name
service_name_textstyle	*mm*	// textstyle of services name
service_name_decimals	*integer*	// number of decimal is il in name

A **finished surface** value or **top of manhole** value can also be written vertically along the uprights.



Whether the value is finished surface level or top of manhole level, the values position, size, colour, *etc.* is controlled by the parameters:

draw_fs_vertical	*0*	// don't draw fs vertical values
	1	// always draw values
	2	// only draw values when different -see // draw_fs_vertical_mode

draw_fs_vertical_mode	*0*	// the fs value is the value from the **fs tin**
		// for the drainage string.
		// When draw_fs_vertical is 1,
		// always draw the fs value.
		// When draw_fs_vertical is 2,
		// only draw fs value when it is
		// different from the top of manhole value

	1	// the fs value is the **top of manhole**
		// for the drainage string.
		// When draw_fs_vertical is 1,
		// always draw the fs value.
		// When draw_fs_vertical is 2,
		// only draw fs value when it is
		// different from the value of the fs tin.

		draw_fs_vertical_mode	
		0	**1**
draw_fs_vertical	**0**	nothing	nothing
	1	fs tin	top of manhole
	2	fs tin when different from top of manhole	top of manhole when different from fs tin

fs_vertical_pre_text	*text*	// text before the vertical fs value
fs_vertical_post_text	*text*	// text after the vertical fs value
fs_vertical_decimals	*integer*	// number of decimals in vertical fs
fs_vertical_colour	*colour*	// colour of the vertical fs text
fs_vertical_size	*mm*	// size of the vertical fs text
fs_vertical_textstyle	*textstyle*	// textstyle of the vertical fs
fs_vertical_x	*mm*	// x adjustment to position of text
fs_vertical_y	*mm*	// y adjustment to position of text

22.9.2.1.5 Staggering of Chainages and Uprights

If the text values are placed at the real chainage positions at the bottom of the plot, text over writing can easily occur if the chainages are very close together.

To prevent such over writing, the text can be **staggered**.

That is, if the text is going to over write a previous text value, the next text value is actually moved along until there is no over writing.

Since the text is no longer at the correct chainage position, the uprights to the pits and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the drainage plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

And there is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

```
stagger_height_1        mm      // distance from the top of arrow_area_1
                                // to the start of the staggers
stagger_height_2        mm      // distance over which stagger occurs
stagger_gap_bottom      mm      // distance from end of staggers to the
                                // bottom of arrow_area_2
```

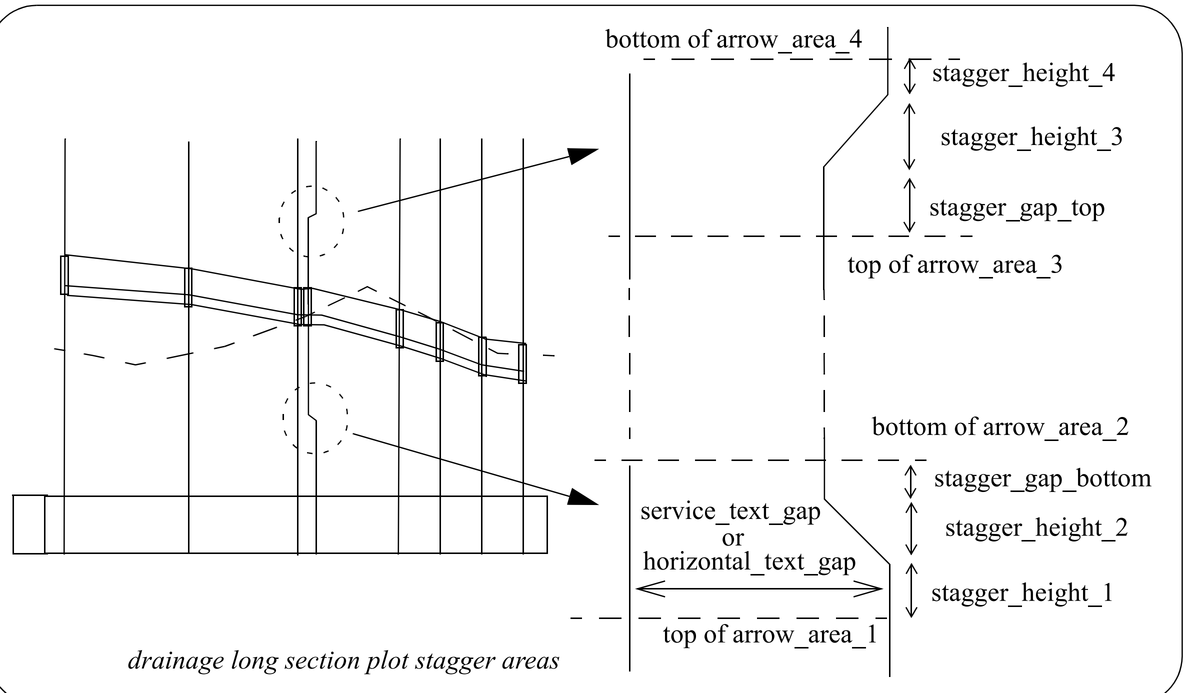
The stagger area above the graph area is defined

```
stagger_gap_top         mm      // distance from the top of arrow_area_3
                                // to the start of the staggers
stagger_height_3        mm      // distance over which stagger occurs
stagger_height_4        mm      // distance from end of staggers to the
                                // bottom of arrow_area_4
```

The distance to be left for text to avoid over writing is:

```
horizontal_text_gap     mm      // minimum distance to leave for text
                                // after pit values
service_text_gap        mm      // minimum distance to leave for text
                                // after service values
```

When staggering occurs, it is possible for the values area to be longer than the graph area.



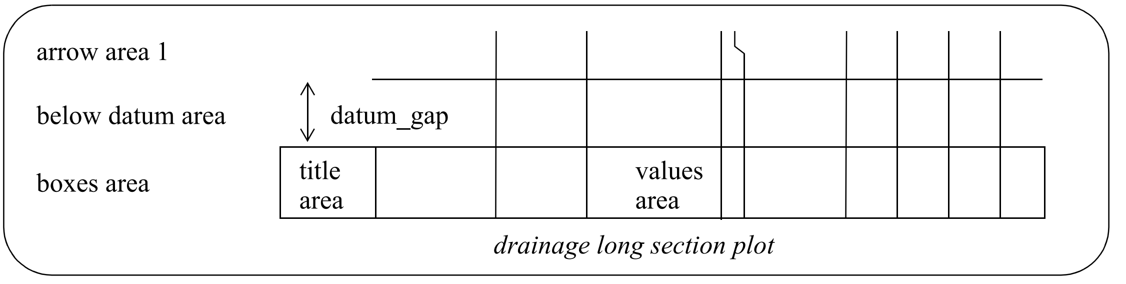
drainage long section plot stagger areas

22.9.2.1.6 Below Datum Area

The **below datum area** is the region between the boxes area and the arrow_1 area. The datum line is drawn at the top of the below datum area.

The size of the below datum area is

datum_gap	*mm*	// height of the below datum area



The datum value is placed above the datum line, preceded by a datum name on the left hand side of the title area.

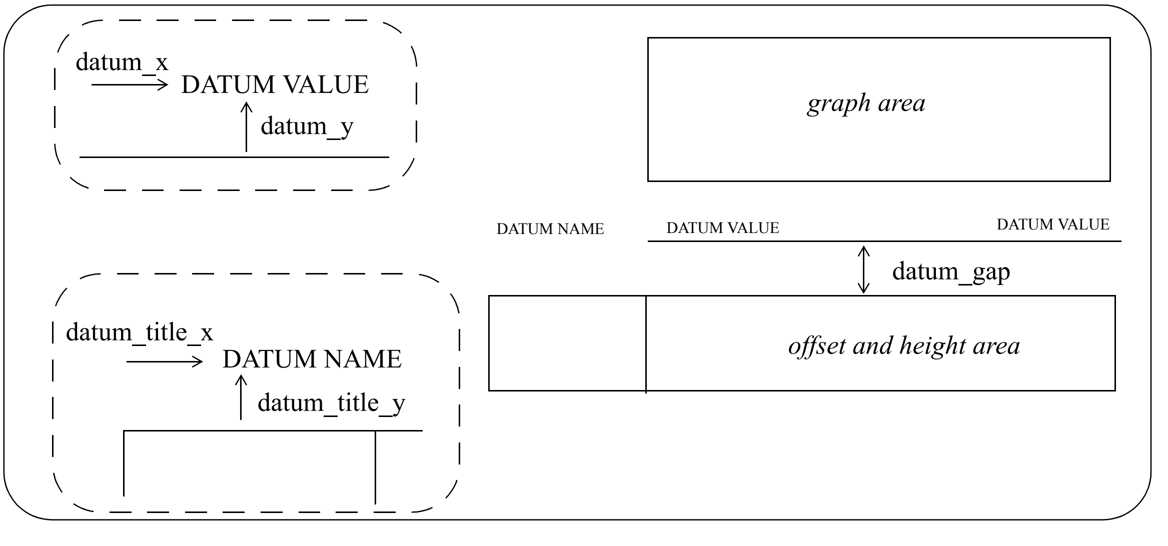
Since the datum value is automatically calculated to try and fit the plot vertically into the graph area, the datum value can change along the plot. When a datum change occurs, the new datum value is written on the datum line at the relevant chainage position.

The datum name, text size, colour and position are controlled by:

datum_name	*text*	// datum title
datum_title_x	*mm*	// distance to write name from lhs
datum_title_y	*mm*	// distance above datum line
datum_title_textstyle	*textstyle*	// textstyle of name
datum_title_text_size	*mm*	// text size
datum_title_colour	*colour*	// text colour

The datum value, number of decimal places, text size, colour and position are controlled by:

datum_decimals	*integer*	// number of decimal places in datum value // >0 drop trailing zeros after decimal point // < 0 keep trailing zeros
datum_x	*mm*	// x dist. to write value from manhole
datum_y	*mm*	// y dist. to write value above datum line
datum_text_size	*mm*	// size of datum value
datum_textstyle	*textstyle*	// textstyle for datum
datum_text_colour	*colour*	// colour of the datum text and line



22.9.2.1.7 Arrow Areas

Apart from information labelled in the boxes and top areas, the drainage long section plot can place arrows between pits for other information such as

(a) pipe grade or slope
(b) pipe diameter
(c) velocity
(d) flow
(e) drainage line name
(f) user defined pipe attributes

A specific arrow area is defined for each set of arrows.

The **arrow areas** are designed for drawing and labelling arrows between pits.

All the values refer to pipes connecting adjacent pits and the relevant pipe is indicated by drawing an arrow between the uprights from the chainage text to the pits.

Because staggering of the chainage text can occur, the position of the uprights to draw the arrows between can vary depending on whether the arrow is above or below a stagger area.

Hence, there are four arrow areas:

arrow area 1 which is below the graph and the bottom stagger area. The arrows go between the *staggered* chainage positions of the pits.

The datum line is at the bottom of arrow 1 area.

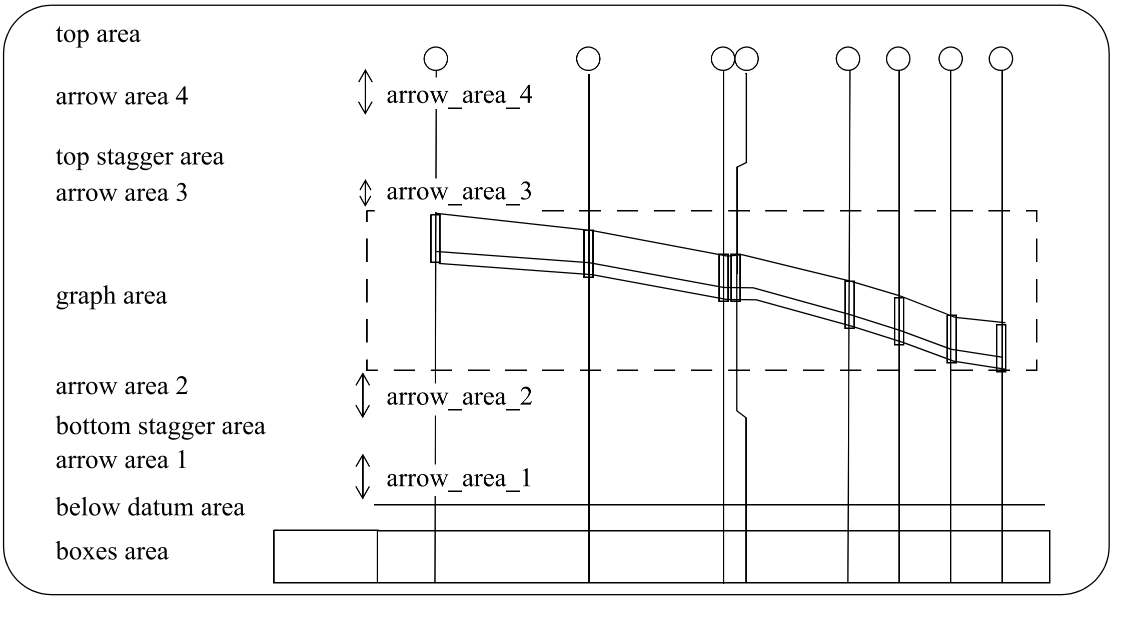
arrow area 2 which below the graph but above the bottom stagger area. Hence the arrows go between the non-*staggered* chainage positions of the pits.

arrow area 3 which is above the graph but below the top stagger area. The arrows go between the non-*staggered* chainage positions of the pits.

arrow area 4 is above the graph and the top stagger area. The arrows go between the *staggered* chainage positions of the pits.

The heights of the four areas (which can be zero) are defined by:

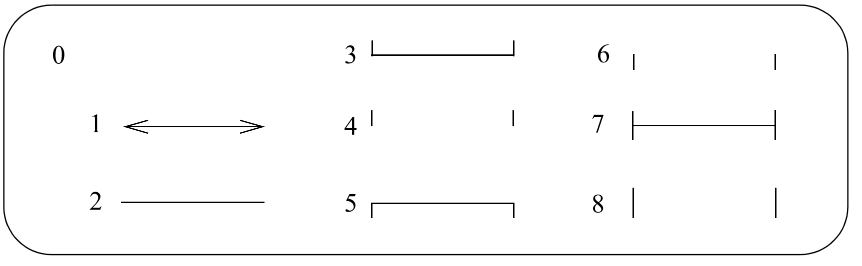
arrow_area_1	*mm*	// height of arrow_1 area
arrow_area_2	*mm*	// height of arrow_2 area
arrow_area_3	*mm*	// height of arrow_3 area
arrow_area_4	*mm*	// height of arrow_4 area



The parameters for controlling the arrows between manholes and associated text for the values of pipe slope, pipe diameter, flow, velocity, drainage line name and user defined pipe attributes are now given.

Each set of parameters has an arrow_mode with the following values:

..._arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line



22.9.2.1.8 Parameters for the Arrows for Grades of the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_grade	*0*	// don't draw pipe grade
	1	// draw pipe grade
pipe_grade_arrow_area	*m*	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_grade_y	*mm*	// distance that the arrow is above the // bottom of the arrow area.

For the arrow, the value of the grade can be specified as either **1 in** or **percent** grade:

percentage_grade	*0*	// the value is a "1 in" grade
	1	// the value is a percent grade

Parameters for the title text on the left hand side of the plot:

pipe_grade_title	*text*	//title on the left hand side of the arrow
pipe_grade_title_textstyle	*textstyle*	// textstyle of the title
pipe_grade_title_text_size	*mm*	// size of the title
pipe_grade_title_text_colour	*colour*	// colour of the title
pipe_grade_title_offset	*mm*	//distance to raise or lower the text // from the arrow position
pipe_grade_title_x	*mm*	// distance from the left hand side of the // plot

Parameters for the arrow type:

pipe_grade_arrow_mode	*0*	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_grade_arrow_colour	*colour*	// colour of the arrow
pipe_grade_arrow_size	*mm*	// height of the arrow
pipe_grade_arrow_gap	*0*	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_grade_arrow_pre_text	*text*	// text before the arrows text
pipe_grade_arrow_post_text	*text*	// text after the arrows text

pipe_grade_arrow_decimals	*integer*	// The number of decimal places used
		// when writing out the pipe grade
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and **no**
		// trailing zeros are removed after the
		//decimal point.

pipe_grade_arrow_textstyle	*textstyle*	// textstyle of arrow text
pipe_grade_arrow_text_size	*mm*	// size of the text
pipe_grade_arrow_text_colour	*colour*	// colour of the text
pipe_grade_arrow_text_offset	*mm*	// distance to raise or lower the text // from the arrow position

22.9.2.1.9 Parameters for the Arrows for Diameters of the Pipes

The diameter of the drainage pipes can be plotted between each pit.

Inside 12d Model, the pipe diameter is given a world units (usually metres), but on the diameter arrow, the diameter is multiplied by 1000 and written out as an integer value. This is normally millimetres.

For diameters entered in feet and the plot diameter to be in inches, the following parameter should be set

pipe_diameter_scale_factor 12. // default is 1000.

Parameters specifying the arrow area used and the position of the pipe diameter arrows.

draw_pipe_diameter	*0*	// don't draw pipe diameter
	1	// draw pipe diameter
pipe_diameter_arrow_area	*m*	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_diameter_y	*mm*	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_diameter_title	*text*	// title on the left hand side of the arrow
pipe_diameter_title_textstyle	*textstyle*	// textstyle of the title
pipe_diameter_title_text_size	*mm*	// size of the title
pipe_diameter_title_text_colour	*colour*	// colour of the title
pipe_diameter_title_offset	*mm*	// distance to raise or lower the text // from the arrow position
pipe_diameter_title_x	*mm*	// distance from the left hand side of the // plot

Parameters for the arrow type:

pipe_diameter_arrow_mode	*0*	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_diameter_arrow_colour	*colour*	// colour of the arrow
pipe_diameter_arrow_size	*mm*	// height of the arrow
pipe_diameter_arrow_gap	*0*	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_diameter_arrow_pre_text	*text*	// text before the arrows text
pipe_diameter_arrow_post_text	*text*	// text after the arrows text

On the arrow, the pipe type can be also plotted after the pipe_diameter_arrow_post_text:

pipe_type_mode	*0*	// don't include the pipe type
	1	// include the pipe type after the // post_text
pipe_diameter_arrow_textstyle	*textstyle*	// textstyle of arrow text
pipe_diameter_arrow_text_size	*mm*	// size of the text
pipe_diameter_arrow_text_colour	*colour*	// colour of the text
pipe_diameter_arrow_text_offset	*mm*	// distance to raise or lower the text // from the arrow position

22.9.2.1.10 Parameters for the Arrows for Velocity in the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_velocity	*0*	// don't draw pipe velocity
	1	// draw pipe velocity
pipe_velocity_arrow_area	*m*	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_velocity_y	*mm*	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_velocity_title	*text*	//title on the left hand side of the arrow
pipe_velocity_title_textstyle	*textstyle*	// textstyle of the title
pipe_velocity_title_text_size	*mm*	// size of the title
pipe_velocity_title_text_colour	*colour*	// colour of the title
pipe_velocity_title_offset	*mm*	//distance to raise or lower the text // from the arrow position
pipe_velocity_title_x	*mm*	// distance from the left hand side of // the plot

Parameters for the arrow type:

pipe_velocity_arrow_mode	*0*	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_velocity_arrow_colour	*colour*	// colour of the arrow
pipe_velocity_arrow_size	*mm*	// height of the arrow
pipe_velocity_arrow_gap	*0*	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_velocity_arrow_pre_text	*text*	// text before the arrows text
pipe_velocity_arrow_post_text	*text*	// text after the arrows text

pipe_velocity_arrow_decimals	*integer*	// The number of decimal places used
		// when writing out the pipe velocity
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and **no**
		// trailing zeros are removed after the
		// decimal point.

pipe_velocity_arrow_textstyle	*textstyle*	// textstyle of arrow text
pipe_velocity_arrow_text_size	*mm*	// size of the text
pipe_velocity_arrow_text_colour	*colour*	// colour of the text
pipe_velocity_arrow_text_offset	*mm*	// distance to raise or lower the text // from the arrow position

22.9.2.1.11 Parameters for the Arrows for Flow in the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_flow	*0*	// don't draw pipe flow
	1	// draw pipe flow
pipe_flow_arrow_area	*m*	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_flow_y	*mm*	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_flow_title	*text*	// title on the left hand side of the arrow
pipe_flow_title_textstyle	*textstyle*	// textstyle of the title
pipe_flow_title_text_size	*mm*	// size of the title
pipe_flow_title_text_colour	*colour*	// colour of the title
pipe_flow_title_offset	*mm*	// distance to raise or lower the text // from the arrow position
pipe_flow_title_x	*mm*	// distance from the left hand side of // the plot

Parameters for the arrow type:

pipe_flow_arrow_mode	*0*	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_flow_arrow_colour	*colour*	// colour of the arrow
pipe_flow_arrow_size	*mm*	// height of the arrow
pipe_flow_arrow_gap	*0*	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_flow_arrow_pre_text	*text*	// text before the arrows text
pipe_flow_arrow_post_text	*text*	// text after the arrows text

pipe_flow_arrow_decimals	*integer*	// The number of decimal places used
		// when writing out the pipe flow
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and **no**
		// trailing zeros are removed after the
		// decimal point.

pipe_flow_arrow_textstyle	*textstyle*	// textstyle of arrow text
pipe_flow_arrow_text_size	*mm*	// size of the text
pipe_flow_arrow_text_colour	*colour*	// colour of the text
pipe_flow_arrow_text_offset	*mm*	//distance to raise or lower the text // from the arrow position

22.9.2.1.12 Parameters for the Arrows giving the Drainage Line Name

Parameters specifying the arrow area used and the position of the arrows.

draw_drainage_line	*0*	// don't draw drainage line arrow
	1	// draw drainage line arrow
drainage_line_arrow_area	*m*	// the arrow area for the arrows // m = 1,2,3 or 4
drainage_line_y	*mm*	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

drainage_line_title	*text*	// title on the left hand side of the arrow
drainage_line_title_textstyle	*textstyle*	// textstyle of the title
drainage_line_title_text_size	*mm*	// size of the title
drainage_line_title_text_colour	*colour*	// colour of the title
drainage_line_title_offset	*mm*	// distance to raise or lower the text // from the arrow position
drainage_line_title_x	*mm*	// distance from the left hand side of // the plot

Parameters for the arrow type:

drainage_line_arrow_mode	*0*	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
drainage_line_arrow_colour	*colour*	// colour of the arrow
drainage_line_arrow_size	*mm*	// height of the arrow
drainage_line_arrow_gap	*0*	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

drainage_line_arrow_pre_text	*text*	// text before the arrows text
drainage_line_arrow_post_text	*text*	// text after the arrows text
drainage_line_arrow_textstyle	*textstyle*	// textstyle of arrow text
drainage_line_arrow_text_size	*mm*	// size of the text
drainage_line_arrow_text_colour	*colour*	// colour of the text
drainage_line_arrow_text_offset	*mm*	// distance to raise or lower the text // from the arrow position

22.9.2.1.13 Parameters for the Arrows for User Defined Pipe Attributes

There can be up to twenty sets of parameters which are used to define arrows for *user defined attributes* on the pipes.

Each *user defined attribute* is referred to by a given *user name* and it is this *user name* that is specified by a parameter and links the set of parameters to the information in the drainage string.

Note: *user defined attributes* on drainage pipes are usually set by special macros.

The parameters for the n'th set (n=1,2, 20) are:

Parameters specifying the pipe attribute used for this set of arrows and the arrow area used.

draw_pipe_attr_n	*0*	// don't draw nth set of arrows
	1	// draw the nth set of arrows
pipe_attr_n_name	*text*	// the name of the attribute to be labelled // on the n'th set of arrows
pipe_attr_n_arrow_area	*m*	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_attr_n_y	*mm*	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_attr_n_title	*text*	//title on the left hand side of the arrow
pipe_attr_n_title_textstyle	*textstyle*	// textstyle of the nth attribute's title
pipe_attr_n_title_text_size	*mm*	// size of the nth attribute's title
pipe_attr_n_title_text_colour	*colour*	// colour of the nth attribute's title
pipe_attr_n_title_offset	*mm*	//distance to raise or lower the text // from the nth arrow position
pipe_attr_n_title_x	*mm*	// distance from the left hand side of the // plot

Parameters for the arrow type:

pipe_attr_n_arrow_mode	*0*	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_attr_n_arrow_colour	*colour*	// colour of the nth arrow
pipe_attr_n_arrow_size	*mm*	// height of the nth arrow
pipe_attr_n_arrow_gap	*0*	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_attr_n_arrow_pre_text	*text*	// text before the arrows text
pipe_attr_n_arrow_post_text	*text*	// text after the arrows text

pipe_attr_n_arrow_decimals	*integer*	// Only if the attribute is a real number.
		// The number of decimal places used
		// when writing out the value of the
		// attribute.
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and **no**
		// trailing zeros are removed after the
		// decimal point.

```
pipe_attr_n_arrow_textstyle     textstyle    // textstyle of arrow text
pipe_attr_n_arrow_text_size     mm           // size of the text
pipe_attr_n_arrow_text_colour   colour       // colour of the text
pipe_attr_n_arrow_text_offset   mm           // distance to raise or lower the text
                                             // form the nth attribute's arrow position
```

22.9.2.1.14 Graph Area

The **graph area** is the area where the actual plots of the drainage strings are drawn.

The length of the graph area is determined by the length of the drainage string to be plotted, the horizontal scale (given by scale) of the plot and the sheet width.

scale *value* // 1:value - horizontal scale
// The vertical scale is determined by the
// horizontal scale and the vertical
// exaggeration for the section view.

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

view_name *text*

The tins to be sectioned through by the drainage strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is **calculated** by subtracting the height of the other nine boxes from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate pit and the plot continued on another row.

Datum breaks at pits are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the drainage long section plot are:

(a) drainage string — the strings from the network model

(b) tins — sections of the drainage string through any tins on the section view.

(c) hgl — hydraulic grade line values from the drainage string

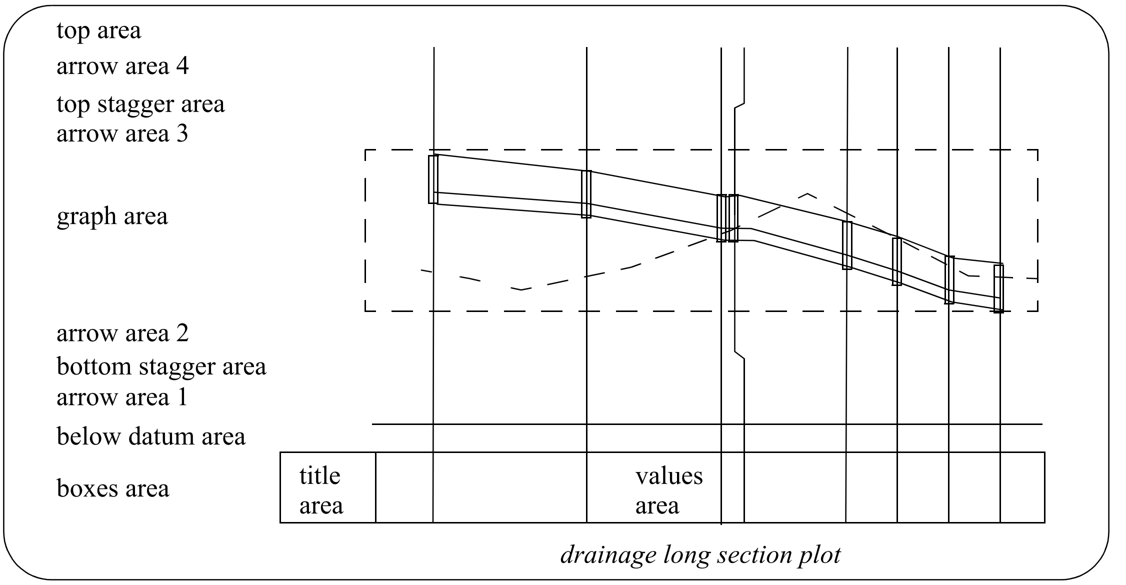
(d) services — parts of strings from any models on the section view that cut the corridor for the section view.

Whether to draw the hydraulic grade line is controlled by:

draw_hgl_diag *0/1* // 1 = draw hydraulic grade line

The **colour** of the strings in the plot is the actual string colour for case (a) and (d), the colour of the tin used for the section in case (b) and user specified colour for (c).

hgl_colour *colour*



drainage long section plot

22.9.2.1.15 Top Area

The **top area** is an annotation area above the arrow_4_area at the top of the plot.

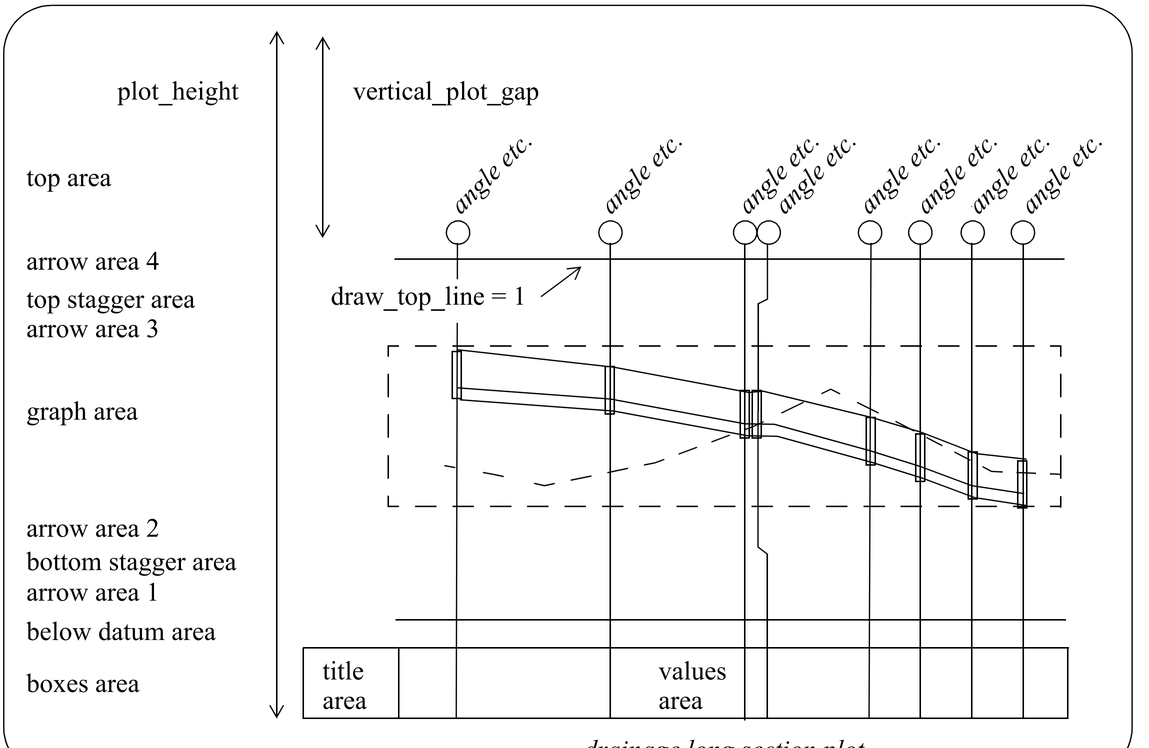
It can be used for pit names, pit types, line names, junctions and deflection angles through pits.

The height of the top area is given by

vertical_plot_gap	*mm*	// size of the top area. If it is not large // enough, the text will over write the // plot in the row above.

A line can be drawn at the bottom of the top area:

draw_top_line	*0/1*	// 1= draw line at bottom of top area // (*i.e.* top of arrow_4_area)



drainage long section plot

22.9.2.1.16 Manhole name, Manhole Types and Surrounding Bubbles

The drainage string name, the manhole name (pit number) and manhole type (pit type) can be drawn on the drainage long section plot, with or without a bubble around it.

The bubble text is made up of

line_name / pit_name   pit_type

where the bits actually used are controlled by

draw_line_name	*0/1*	// 1 = include line name. The "/" is only // included if the line_name is drawn.
draw_pit_name	*0/1*	// 1 = include pit_name
draw_pit_type	*0/1*	// 1 = include pit type

The size, colour and text style of the bubble text is given by:

bubble_text_size	*mm*	// size of text in bubble def angled_text_size
bubble_text_colour	*colour*	// colour of text def angled_text_colour
bubble_textstyle	*textstyle*	// textstyle for text def angled_text_textstyle
bubble_text_x	*mm*	// horizontal distance from the default // position (at the pit or in top area)
bubble_text_y	*mm*	// vertical distance from the default // position (at the pit or in top area)
bubble_pre_text	*text*	// default ""
bubble_post_text	*text*	// default ""
bubble_text_angle	*value*	// default 0
bubble_text_justify	*value*	// the default is centre justified

A bubble is drawn of radius **bubble_radius** is drawn around the bubble text.

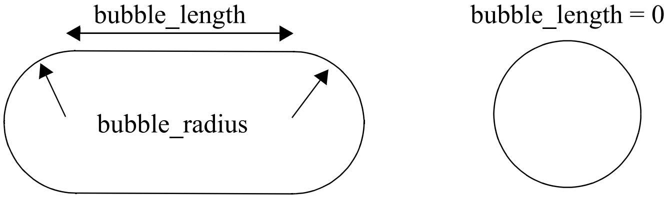
If **bubble_radius** is zero, then no bubble is drawn.

If the *bubble_radius* is zero, the bubble text is still drawn but without the enclosing bubble.

bubble_radius	*mm*	// if non-zero a bubble of this radius is // drawn around the text
bubble_colour	*colour*	// colour of bubbles

The "bubble" can be drawn as two semi-circles and two straight lines

bubble_length	*mm*	// length of the straight line in between // the semi-circles



The bubble text (and bubble) can be positioned at the bottom of the **top area**, or can be placed a fixed distance above the top of the corresponding manhole.

If the bubble text is drawn at the bottom of the top area, the upright is automatically drawn up to the bubble text.

If the bubble text is drawn above the pit, it is positioned by the *distance_above_pit* parameter **plus** the top stagger distances, *stagger_gap_top*, *stagger_height_3* and *stagger_height_4*.

This is necessary because the bubble text may need to be staggered.

draw_text_at_pit	*0*	// draw bubble and/or text in the top

		// area.
	1	// draw it above the pit

distance_above_pit	*mm*	// distance to add to the top stagger area
		// heights to draw the bubble above the
		// pit.

uprights_top_mode	*0/1*	// 1 = draw line from pit to bubble. Used to be // *draw_line_to_text*

22.9.2.1.17 Change of Direction Through Pits and Junctions

If there is a change of direction of the pipes of the plotted drainage string going through the pit, the deflection angle (in degrees, minutes and seconds) is drawn above the bubble text.

The deflection angle text is made up:

angled_pre_text   deflection angle   angled_post_text

Also any junctions at a pit in the plotted drainage string can be labelled with the name of the drainage strings coming into the pit, and the angle of the pipes at the junction.

Hence the junction text is made up of **two** lines:

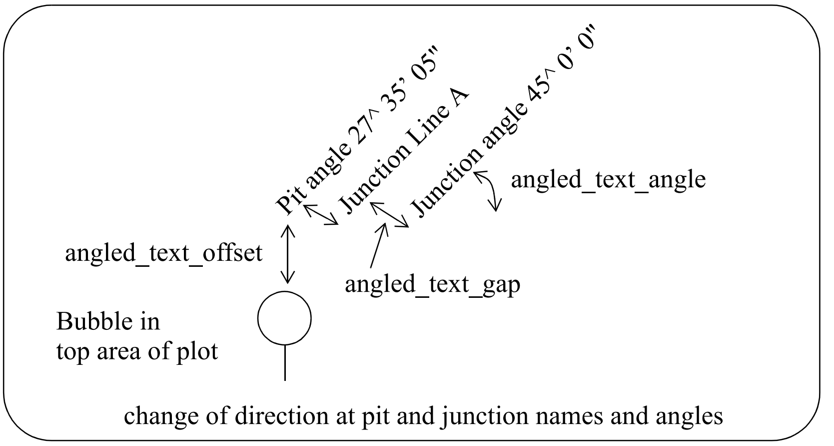
junction_pre_text   line_name   junction_post_text
junction_angle_pre_text   junction angle   junction_angle_post_text

If bubbles are drawn, the deflection angle and junction name and angle are drawn at the distance ***angled_text_offset*** above the bubble and with the distance ***angled_text_gap*** between the lines of information.

If bubbles are not drawn, the bubble text and the deflection angle and junction name and angle is placed the distance ***angled_text_offset*** above bottom of the top area. Each line of text is separated by the distance ***angled_text_gap***.

The deflection angle and junction name and angle are drawn at an angle of ***angled_text_angle***.

angled_text_offset	*mm*	// distance of text above bubble text // or above bottom of top area
angled_text_gap	*mm*	// distance between text to the right // of bubble text.
angled_text_angle	*value*	// angle of text



change of direction at pit and junction names and angles

The pre and post text, colour, size and text style for the deflection angle of the drainage string pipes going through the pit are controlled by:

angled_pre_text	*text*	// default " "
angled_post_text	*text*	// default " "
angled_text_colour	*colour*	// colour of deflection angle text
angled_text_size	*mm*	// size of deflection angle text
angled_textstyle	*textstyle*	// textstyle of deflection angle text

The junction drainage string name can be included/not included in the first line of junction information:

junction_name_mode	*0*	// don't include the junction string name
	1	// default - use junction string name

The pre and post text, colour, size and text style for the junction name and the angle that the junction makes at the pit are controlled by:

junction_pre_text	*text*	// default "JUNCTION "
junction_post_text	*text*	// default " "
junction_text_colour	*colour*	// colour of junction name text
junction_text_size	*mm*	// size of junction name text
junction_textstyle	*textstyle*	// textstyle for junction name text
junction_angle_pre_text	*text*	// default " "
junction_angle_post_text	*text*	// default " "
junction_angle_text_colour	*colour*	// colour of junction angle text
junction_angle_text_size	*mm*	// size of junction angle text
junction_angle_textstyle	*textstyle*	// textstyle for junction angle text

22.9.2.1.18 Symbols at Manholes

Manholes can be labelled with symbols which depend on the manhole type. There can be up to twenty (20) sets of manhole symbols.

manhole_symbol_n_type	*mh_type*	// manhole type to have symbols
manhole_symbol_n_mode	*0*	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

0 + 1 ˈ 2 | 3 □ 4 △ 5 ○

predefined symbols for manhole_symbol_n_*modes*

manhole_symbol_n_position	***1***	// at top of manhole - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
manhole_symbol_n_size	*mm*	// size
manhole_symbol_n_x	*mm*	// x adjustment to position - default 0
manhole_symbol_n_y	*mm*	// y adjustment to position - default is 0
manhole_symbol_n_style	*text*	// the name of the linestyle (symbol)
manhole_symbol_n_angle	*value*	// default value is 0
manhole_symbol_n_colour	*colour*	//

For example:

manhole_symbol_1_type	"CONC COVER"	// manhole type to use
manhole_symbol_1_position	1	// on top of manhole
manhole_symbol_1_mode	6	// use 12d symbol
manhole_symbol_1__style	"shrub"	// name of 12d symbol
manhole_symbol_1_size	1	
manhole_symbol_1_x	0	
manhole_symbol_1_y	0	

22.9.2.1.19 Labelling House Connections

NOTE - house connections are only accessible by the ***Sewer module.***

The house connections can be drawn from the pipe to the house connection level, with a line across the top (a T). The full width the T can be specified by the user.

draw_house_connections	yes/no
house_connection_width	value

The lot name for the house connection and the connection type can be labelled above the house connection. The house connection label is made up as:

connection_pre_text lot_name *connection_mid_text* connection_type *connection_post_text*

where lot_name and connection_type are stored with the house connection on the drainage string.

The parameters controlling the drawing of the house connection label are

house_connection_mode	*0*	// don't label the house connection
	1	// label the house connection with name
		// and type(default)
	2	// label the house connection with name only
connection_pre_text	*text*	// default " "
connection_mid_text	*text*	// default " "
connection_post_text	*text*	// default " "
connection_text_colour	*colour*	// colour of connection label
connection_text_size	*mm*	// size of connection label
connection_textstyle	*textstyle*	// textstyle connection label
connection_text_x	*mm*	// x adjustment to position of text - def 0
connection_text_y	*mm*	// y adjustment to position of text - def 0
connection_text_justify	*text*	// default is Bottom_left
connection_text_angle	*value*	// default vertical 90
connection_text_position	*1*	// above point height value
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin

Label connection type:

(this is used when the house_connection_mode is turned off, only the connection type is labelled)

house_connection_type_mode	*0*	// default, don't label connection type
	1	// label connection type
connection_type_text_x	*mm*	// x adjustment to position of text - def 0
connection_type_text_y	*mm*	// y adjustment to position of text - def 0
connection_type_pre_text	*text*	// text before type - def " "
connection_type_post_text	*text*	// text after type - def " "
connection_type_text_size	*mm*	// def box_text_size
connection_type_text_colour	*colour*	// def box_text_colour
connection_type_textstyle	*text*	//
connection_type_text_justify	*text*	//
connection_type_text_angle	*value*	// def vertical 90
connection_type_text_position	*1*	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin

Label the distance from the down stream pit to the house connection

house_connection_ds_pit_mode	*0*	// default, don't label chainage
	1	// label from down stream
	2	// label from up stream
	3	// label from left
	4	// label from right
connection_ds_pit_text_x	*mm*	// x adjustment to position of text
connection_ds_pit_text_y	*mm*	// y adjustment to position of text
connection_ds_pit_pre_text	*text*	// ("") text before type
connection_ds_pit_post_text	*text*	// ("") text after type
connection_ds_pit_text_size	*mm*	// def box_text_size
connection_ds_pit_text_colour	*colour*	//def (box_text_colour
connection_ds_pit_textstyle	*text*	//

connection_ds_pit_text_justify	*text*	// default Bottom_Left
connection_ds_pit_text_angle	*value*	// default is vertical (90)
connection_ds_pit_text_position	***1***	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
connection_ds_pit_decimals	*value*	// def number_of_decimals

Label the connection depth from the finished surface

house_connection_depth_mode	*1*	//default, label house connection depth
	0	// don't label house connection depth
connection_depth_text_x	*mm*	// x adjustment to position of text - def 0
connection_depth_text_y	*mm*	// y adjustment to position of text - def 0
connection_depth_pre_text	*text*	// text before type - def " "
connection_depth_post_text	*text*	// text after type - def " "
connection_depth_text_size	*mm*	// default box_text_size
connection_depth_text_colour	*colour*	// default box_text_colour
connection_depth_textstyle	*text*	//
connection_depth_text_justify	*text*	// default Bottom_left
connection_depth_text_angle	*value*	// default is vertical (90)
connection_depth_text_position	***1***	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
connection_depth_decimals	*value*	// default number_of_decimals

Label the finished surface:

house_connection_fs_mode	*1*	//default, label house connection finished // surface
	0	// don't label house con finished surface
connection_fs_text_x	*mm*	// x adjustment to position of text - def 0
connection_fs_text_y	*mm*	// y adjustment to position of text - def 0
connection_fs_pre_text	*text*	// text before type -def " "
connection_fs_post_text	*text*	// text after type - def " "
connection_fs_text_size	*mm*	// default box_text_size
connection_fs_text_colour	*colour*	// default box_text_colour
connection_fs_textstyle	*text*	//
connection_fs_text_justify	*text*	// default Bottom_left
connection_fs_text_angle	*value*	// default (vertical 90)
connection_fs_text_position	*1*	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin

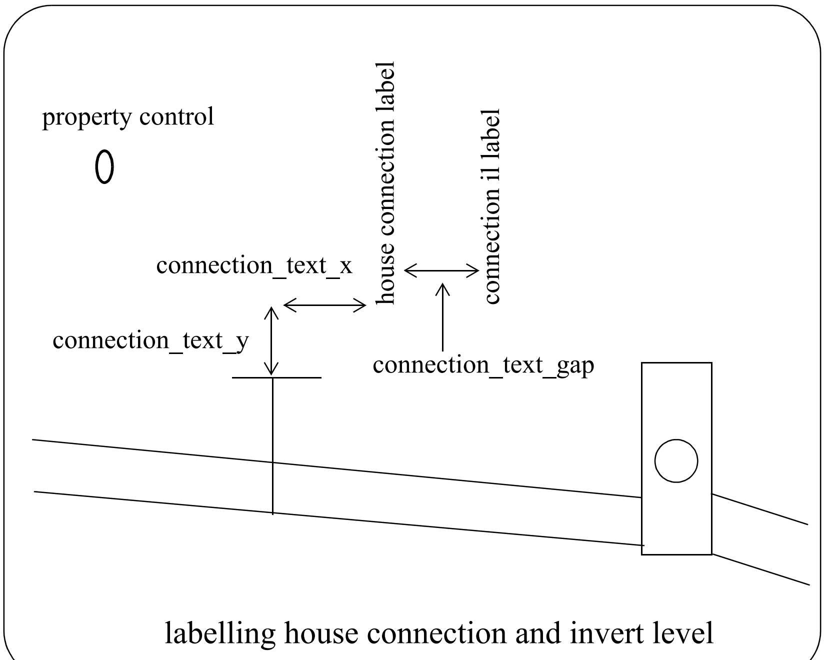
connection_fs_decimals	*integer*	// default number_of_decimals
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and **no**
		// trailing zeros are removed after the
		// decimal point.

The invert level of the house connection can also be plotted. The house connection invert level label is made up as:

connection_il_pre_text connection_invert_level *connection_il_post_text*

The parameters controlling the drawing of the house connection invert level label are:

house_connection_il_mode	*1*	// default, label the house connection il
	0	// don't label the house connection il
connection_il_text_position	***1***	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
connection_il_text_x	*mm*	// x adjustment to position of text - def 0
connection_il_text_y	*mm*	// y adjustment to position of text - def 0
connection_text_gap	*mm*	// distance from connection label and il label
connection_il_decimals	*integer*	// def -3, number of decimal places in il value
		// >0 drop trailing zeros after decimal point
		// < 0 keep trailing zeros
connection_il_pre_text	*text*	// default " ", text before type
connection_il_post_text	*text*	// default " ", text after type
connection_il_text_colour	*colour*	// colour of connection il -def box_text_colour
connection_il_text_size	*mm*	// size of connection il - def box_text_size
connection_il_textstyle	*textstyle*	// textstyle connection il
connection_il_text_justify	*text*	//
connection_il_text_angle	*value*	// (vertical 90)



labelling house connection and invert level

22.9.2.1.20 Symbols at Property Controls

NOTE - property controls and house connections are only accessible by the ***Sewer module.***

The position of the property controls can be drawn as circles (which will display as an oval depending on the vertical exaggeration) with the diameter of the property control.

draw_property_controls yes/no

The position of the property control can also be indicated by placing a symbol at the property control.

The position of the property control at the drainage string can be labelled with symbols. There can be up to twenty (20) sets of property control symbols.

property_control_symbol_n_mode	*0*	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

predefined symbols for property_control_symbol_n_modes 0

property_control_symbol_n_position	***0***	// at bottom (invert) of property control
	1	// at top (obvert) of property control
	2	// at centre (axis) of property control
property_control_symbol_n_size	*mm*	// size
property_controle_symbol_n_x	*mm*	// x adjustment to position - default 0
property_control_symbol_n_y	*mm*	// y adjustment to position - default is 0
property_control_symbol_n_style	*text*	// the name of the 12d symbol
property_control_symbol_n_angle	*value*	// default value is 0
property_control_symbol_n_colour	*colour*	//colour of the symbol

For example:

property_control_symbol_1_position	0	// at bottom of prop control
property_control_symbol_1_mode	6	// use 12d symbol
property_control_symbol_1__style	"shrub"	// name of 12d symbol
property_control_symbol_1_size	1	
property_control_symbol_1_x	0	
property_control_symbol_1_y	0	

22.9.2.1.21 Labelling Property Controls

NOTE - property controls and house connections are only accessible by the ***Sewer module.***

The property control can be labelled with its name where the property control is at the drainage string. The property control name label is made up as:

property_control_pre_text property_control_name *property_control_pre_post_text*

where property_control_name is the stored with the property control on the drainage string.

The parameters controlling the labelling the property control are

property_control_mode	*0*	// don't label the property control with name
	1	// label the property control with name
property_control_pre_text	*text*	// default " "
property_control_post_text	*text*	// default " "
property_control_text_colour	*colour*	// colour of label
property_control_text_size	*mm*	// size of label
property_control_textstyle	*textstyle*	// textstyle label
property_control_text_x	*mm*	// x adjustment to position of text - def 0
property_control_text_y	*mm*	// y adjustment to position of text - def 0
property_control_text_justify	*text*	// default is Bottom_left

property_control_text_angle	*value*	// default vertical 90
property_control_text_position	*1*	// above pc centre height value
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin

Label the distance from the down stream pit to the property control

property_control_ds_pit_mode	*0*	// default, don't label chainage
	1	// label from down stream
	2	// label from up stream
	3	// label from left
	4	// label from right
property_control_ds_pit_text_x	*mm*	// x adjustment to position of text
property_control_ds_pit_text_y	*mm*	// y adjustment to position of text
property_control_ds_pit_pre_text	*text*	// ("") text before type
property_control_ds_pit_post_text	*text*	// ("") text after type
property_control_ds_pit_text_size	*mm*	// def box_text_size
property_control_ds_pit_text_colour	*colour*	//def (box_text_colour
property_control_ds_pit_textstyle	*text*	//
property_control_ds_pit_text_justify	*text*	// default Bottom_Left
property_control_ds_pit_text_angle	*value*	// default is vertical (90)
property_control_ds_pit_text_position	***1***	// above pc centre height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
property_control_ds_pit_decimals	*value*	// def number_of_decimals

Label the depth from the finished surface to the invert level of the property control:

property_control_depth_mode	*1*	//default, label property control depth
	0	// don't label pc depth
property_control_depth_text_x	*mm*	// x adjustment to position of text - def 0
property_control_depth_text_y	*mm*	// y adjustment to position of text - def 0
property_control_depth_pre_text	*text*	// text before type - def " "
property_control_depth_post_text	*text*	// text after type - def " "
property_control_depth_text_size	*mm*	// default box_text_size
property_control_depth_text_colour	*colour*	// default box_text_colour
property_control_textstyle	*text*	//
property_control_depth_text_justify	*text*	// default Bottom_left
property_control_depth_text_angle	*value*	// default is vertical (90)
property_control_depth_text_position	***1***	// above pc centre height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
property_control_depth_decimals	*value*	// default number_of_decimals

Label the finished surface:

property_control_fs_mode	*1*	//default, label pc finished surface
	0	// don't label pc finished surface
property_control_fs_text_x	*mm*	// x adjustment to position of text - def 0
property_control_fs_text_y	*mm*	// y adjustment to position of text - def 0
property_control_fs_pre_text	*text*	// text before type -def " "
property_control_fs_post_text	*text*	// text after type - def " "
property_control_fs_text_size	*mm*	// default box_text_size
property_control_fs_text_colour	*colour*	// default box_text_colour

```
property_control_fs_textstyle        text        //
property_control_fs_text_justify     text        // default Bottom_left
property_control_fs_text_angle       value       // default (vertical 90)
property_control_fs_text_position    1           // above pc centre height value - default
                                     3           // above top of boxes
                                     4           // above highest point
                                     100         // to primary string
                                     101         // to first found tin
property_control_fs_decimals         integer     // default number_of_decimals
                                                 // If > 0, all trailing zeros after the
                                                 // decimal place are removed.
                                                 // If < 0, the absolute value is taken as
                                                 // the number of decimal places and no
                                                 // trailing zeros are removed after the
                                                 // decimal point.
```

The invert level of the property control at the drainage string can also be plotted. The property control invert level label is made up as:

property_control_il_pre_text property_control_invert_level *property_control_il_post_text*

The parameters controlling the drawing of the property control invert level label are:

```
property_control_il_mode             1           // default, label the pc il
                                     0           // don't label the pc il
property_control_il_text_position    1           // above pc centre height value - default
                                     3           // above top of boxes
                                     4           // above highest point
                                     100         // to primary string
                                     101         // to first found tin
property_control_il_text_x           mm          // x adjustment to position of text - def 0
property_control_il_text_y           mm          // y adjustment to position of text - def 0
property_control_text_gap            mm          // distance from pc name label and il label
property_control_il_decimals         integer     // def -3, number of decimal places in il value
                                                 // >0 drop trailing zeros after decimal point
                                                 // < 0 keep trailing zeros
property_control_il_pre_text         text        // default " ", text before type
property_control_il_post_text        text        // default " ", text after type
property_control_il_text_colour      colour      // colour of pc il -def box_text_colour
property_control_il_text_size        mm          // size of pc il - def box_text_size
property_control_il_textstyle        textstyle   // textstyle pc il
property_control_il_text_justify     text        //
property_control_il_text_angle       value       // (vertical 90)
```

22.9.2.1.22 Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

```
hatch_original_tin_n        tin_name     // tin_name for original surface
hatch_new_tin_n             tin_name     // tin_name for final surface

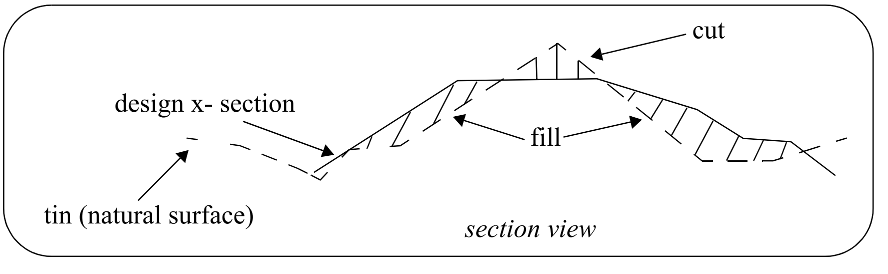
hatch_cut_separation_n      mm           // distance between cut hatch lines
                            0            // don't do cut hatching
hatch_cut_angle_n           degrees      // angle in degrees of cut hatching
hatch_cut_colour_n          colour       // colour of the cut hatching
hatch_cut_linestyle_n       linestyle    // linestyle for cut hatching
hatch_cut_draw_sides_n      1/0          // 1 = draw sides of cut regions
hatch_cut_draw_original_n   1/0          // 1 = draw original tin in cut regions
hatch_cut_draw_new_n        1/0          // 1 = draw new tin in cut regions

hatch_fill_separation_n     mm           // distance between fill hatch line
                            0            // don't do fill hatching
hatch_fill_angle_n          degrees      // angle in degrees of fill hatching
hatch_fill_colour_n         colour       // colour of the fill hatching
hatch_fill_linestyle_n      linestyle    // linestyle for fill hatching
hatch_fill_draw_sides_n     1/0          // 1 = draw sides of fill regions
hatch_fill_draw_original_n  1/0          // 1 = draw original tin in fill regions
hatch_fill_draw_new_n       1/0          // 1 = draw new tin in fill regions
```

Notes

(a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.

(b) cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.



22.9.2.1.23 Labelling Cuts of Drainage Through Strings in a Model

The cuts that the drainage string makes though any strings in user given models can be automatically labelled on the long section plots.

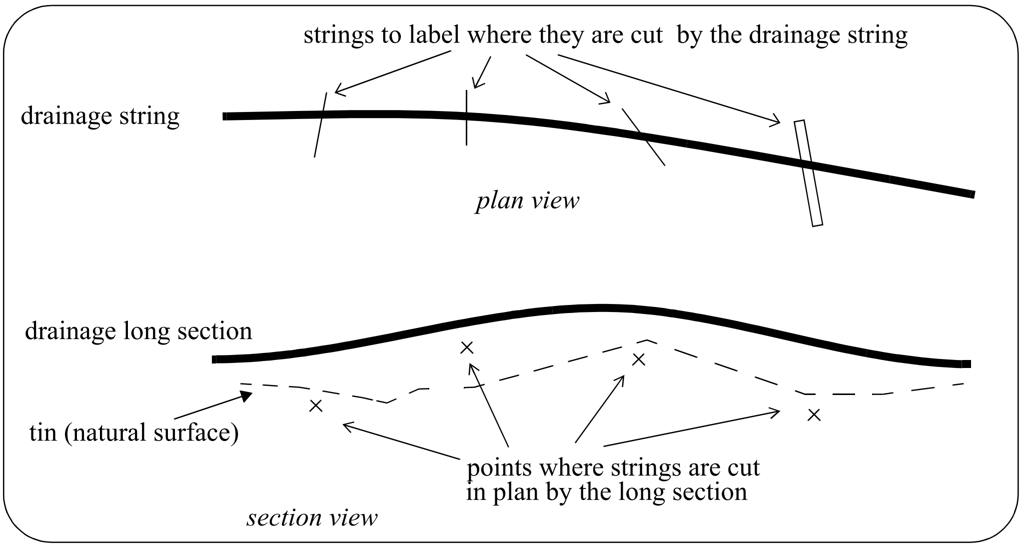
The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

(a) top of the boxes on the long section
(b) height value of the cut string
(c) height of the primary string
(d) height of a tin.

The actual position of the label is defined relative to the above point.



Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

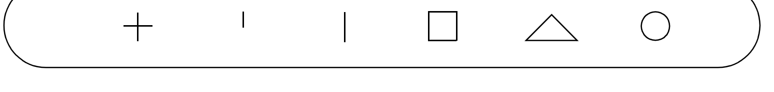
Text justification refers to the actual position and is given by

"top-left"	"top-centre"	"top-right"
"middle-left"	"middle-centre"	"middle-right"
"bottom-left"	"bottom-centre"	"bottom-right"

A choice of six special symbols and/or or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are



Up to twenty five (25) separate models of strings can be cut and labelled.

22.9.2.1.24 Parameters for Labelling Where the Drainage Line Cuts Strings in a Model

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

The parameters for selecting and labelling the n'th set (where n can be from 1 to 25) of cuts of the design string with the strings in the model are given by:

cuts_n_model	*model_name*	// model of strings to be cut

The selection of the strings from the model *model_name* whose cut points are to be labelled is all the strings whose name satisfies the name mask *cuts_n_mask*:

cuts_n_mask	*name_mask*	// strings to check for cuts
		// and if a cut occurs,
		// parameters show how to
		// label the cut

where *name_mask* is a text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mast can include wild cards and wild characters.

For example

	cuts_1_mask	"ke*"
or	cuts_1_mask	"?bank*"

or, if both masks are required,

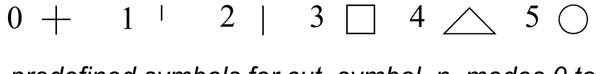
cuts_1_mask	"ke* ?bank*"

If *cuts_n_mask* is missing, then all strings in the model are used. This is equivalent to *name_mask* being "*".

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the drainage strings, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the n'th set.

The parameters for drawing a **symbol** at the cut points are

cuts_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol



predefined symbols for cut_symbol_n_modes 0 to 5

If *cuts_symbol_n_mode* is 6, then the 12d symbol is given by

cuts_symbol_n_style	*plotsymbol*	// 12d symbol to draw at cut

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

(a) the parameter *plot_symbols* in the ppf file

plot_symbols *filename*

or if plot_symbols is not defined, then

(b) in the file pointed to by the environment variable PLOT_SYMBOLS_4D

PLOT_SYMBOLS_4D *filename* *// default plotsym.4d*

or if PLOT_SYMBOLS_4D is not defined, then

(c) in the file *plotsym.4d*

which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

(d) either pointed to by the environment variable SYMBOLS_4D

SYMBOLS_4D filename // default symbols.4d

or if the environment variable SYMBOLS_4D does not exist, in the file, *symbols.4d*

The position of the symbol or plot symbol is given by:

cuts_symbol_n_position	1	// above point height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*

The symbol can be adjusted by the parameters:

cuts_symbol_n_x	*mm*	// offset adjustment to position
cuts_symbol_n_y	*mm*	// height adjustment to position
cuts_symbol_n_angle	*degrees*	// rotation about point
cuts_symbol_n_colour	*colour*	// colour of symbol

and for all values of *cuts_symbol_n_mode* **other** than 6:

cuts_symbol_n_size	*mm*	// size of symbol, 0 don't draw

The value of the **chainage** of the cut string can be labelled using the parameters

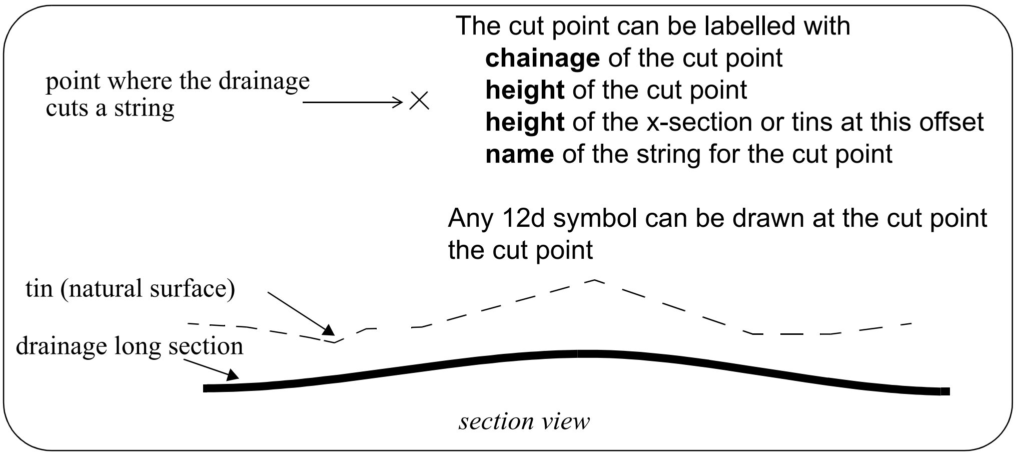
cuts_chainage_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*
cuts_chainage_n_x	*mm*	// chainage adjustment to position
cuts_chainage_n_y	*mm*	// height adjustment to position
cuts_chainage_n_angle	*degrees*	// rotation about point
cuts_chainage_n_size	*mm*	// size of text, 0 don't label
cuts_chainage_n_colour	*colour*	// colour of text
cuts_chainage_n_textstyle	*text*	// textstyle of text chainage
cuts_chainage_n_pre_text	*text*	// text before the chainage value
cuts_chainage_n_post_text	*text*	// text after the chainage value
cuts_chainage_n_justification	*justification*	// justification of the text
cuts_chainage_n_no_decimals	*integer*	// number of decimals in chainage

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	*1*	// use height of cut point itself
	3	// use real world height of position
		// above boxes
	100	// height of primary string
	101-500	// use height of to tin1 or tin2, *etc.*
cuts_height_n_position	*1*	// at points position
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*
cuts_height_n_x	*mm*	// chainage adjustment to position
cuts_height_n_y	*mm*	// height adjustment to position
cuts_height_n_angle	*degrees*	// rotation about point
cuts_height_n_size	*mm*	// size of text, 0 don't label
cuts_height_n_colour	*colour*	// colour of text
cuts_height_n_textstyle	*text*	// textstyle of text height
cuts_height_n_pre_text	*text*	// text before the height value
cuts_height_n_post_text	*text*	// text after the height value
cuts_height_n_justification	*justification*	// justification of the text
cuts_height_n_no_decimals	*integer*	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	*1*	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*
cuts_label_n_mode	*0*	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	*mm*	// chainage adjustment to position
cuts_label_n_y	*mm*	// height adjustment to position
cuts_label_n_angle	*degrees*	// rotation about point
cuts_label_n_size	*mm*	// size of text, 0 don't label
cuts_label_n_colour	*colour*	// colour of text
cuts_label_n_textstyle	*text*	// textstyle of text label
cuts_label_n_pre_text	*text*	// text before the string name
cuts_label_n_post_text	*text*	// text after the string name
cuts_label_n_justification	*justification*	// justification of the text



The cut point can be labelled with
chainage of the cut point
height of the cut point
height of the x-section or tins at this offset
name of the string for the cut point
point where the drainage cuts a string
Any 12d symbol can be drawn at the cut point the cut point
tin (natural surface)
drainage long section
section view

22.9.2.1.25 Title Block Information

The plot can have a standard ***12d Model*** title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard ***12d Model*** title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

plot_border	*yes/no*	*// yes plots a standard title block* *// default yes*
title_1	*text*	
title_2	*text*	
title_text_size	*value*	
title_colour	*colour*	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

use_title_file	*yes/no*	*// yes draws the title block given in title_file* // default no
title_file	*filename*	
plot_border	*no*	*// turn off standard title block*

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters user_text_n (n = 1,2,... 1000)

user_text_n	*text*

The special plot parameters are:

time_format	*text*	// format for $time
user_text_n	*text*	// where n = 1,2,... 1000 // passed down to $user_text_n
title_1	*text*	// passed down to $title_1
title_2	*text*	// passed down to $title_2
start_page_number	*integer*	// used as the starting value for // $page_number. If missing, // $page_number starts at 1.

start_drawing_number	*integer*	// added to $drawing_number in title
		// block file. If missing,
		// $drawing_number starts at 1.

drawing_number_prefix	*text*	// passed down to // $drawing_number_prefix
drawing_number_postfix	text	// passed down to // $drawing_number_postfix

22.9.2.1.26 Parameters that Modify Fields In the Plot Drainage Network Panel

A number of parameters match those in the **plot drainage network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **plot drainage network** panel are:

network_model	*text*
scale	*value*
plotter_type	*text*
plot_stem	*text*
view_name	*text*
sheet_size	*text* or "*width* *height*"
plot_height	*mm*
x_origin	*mm*
y_origin	*mm*
global_textstyle	*textstyle*
box_text_size	*mm*
box_colour	*colour*
plot_border	*yes/no*
title_1	*text*
title_2	*text*
title_text_size	*value*
title_text_colour	*colour*
use_title_file	*yes/no*
title_file	*filename*

22.9.3 Melbourne Water

Position of menu: **Design =>Drainage-Sewer=>Plots=>Melbourne Water**

The **Melbourne Water** option is used to generate the longsection plots for all lines in a drainage network to the Melbourne Water sewer standards.

Given the plot sheet size and the horizontal and vertical scales, the longsections for the drainage lines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

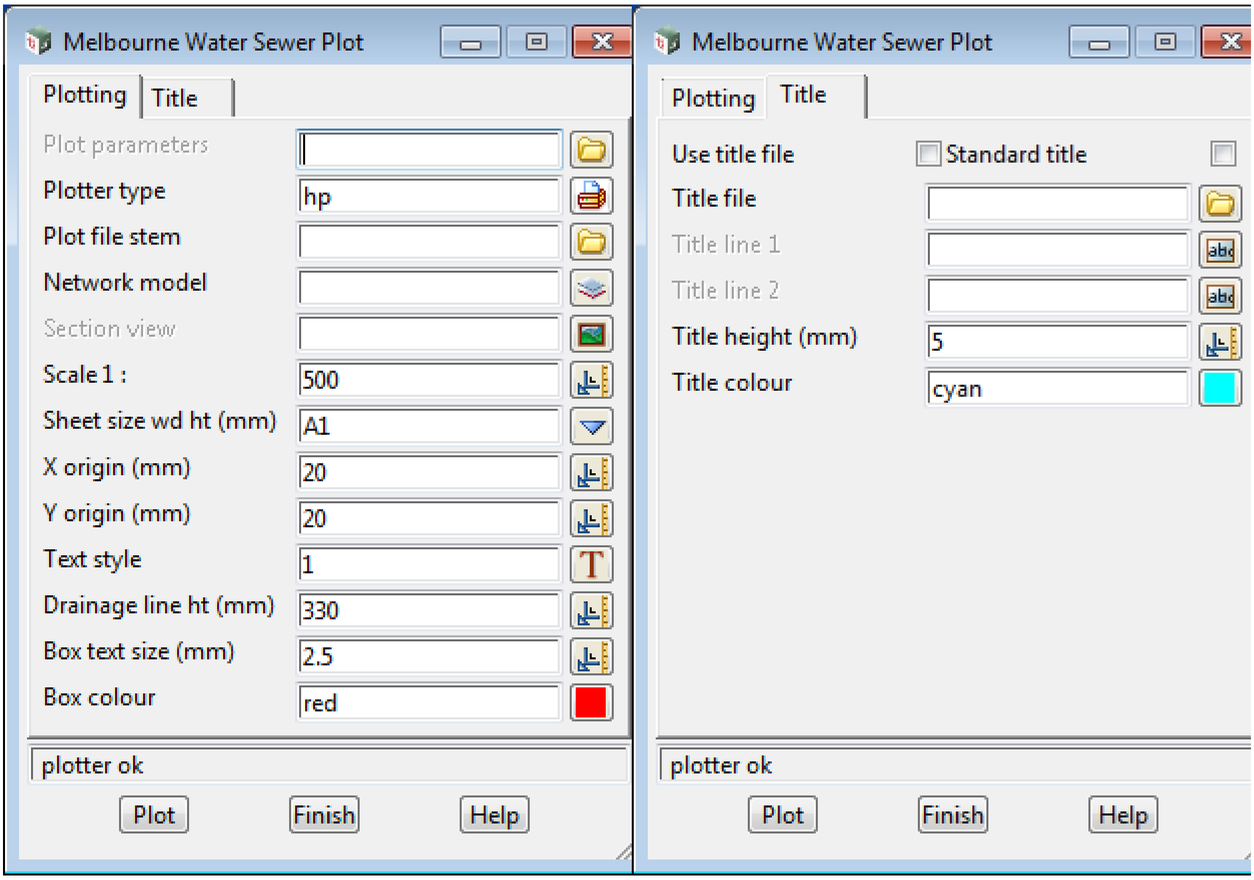
Hence the drainage lines are plotted one after another on one or more plotter sheets.

The drainage lines are plotted in string name alphabetical order.

The drainage longsection plot includes

- the manholes, drainage pipe and any house connections
- the height of the natural surface at the manhole
- manhole names and cover types
- distances between manholes
- the invert depth of the pipe on either side of a manhole
- the grades and types of the pipes
- any services in the corridor - including their name, invert level and distance from the nearest downstream manhole

After selecting the **Melbourne Water** option, the **Melb plot drainage network** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	input		*.ppf

file of plot parameters used for extra control of the long section plot.

Plotter type	input	hp	hp, dxf, postscript, *etc.*

format for the plot output.

Network model input

the model containing all the drainage lines for the network.

Section view input

the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section, etc.

Plot file stem input

since more than one plot page may be produced, the plot file names are constructed from the stem plus a plot page sequence number, followed by the appropriate plotter type ending.

Scale 1: input

horizontal scale for plotting the drainage long section. The vertical exaggeration is taken from the section view given in the section view *field.*

Sheet size wd ht (mm) input available sheet sizes

the width and height values (separated by space) or the name of a user defined sheet size.

X origin (mm) input

the x position on the plot sheet for the bottom left hand corner of the longsection plots.

Y origin (mm) input

the y position on the plot sheet for the bottom left hand corner of the longsection plots.

Drainage line ht (mm) input boxes boxes, centreline

the maximum allowable height for a longsection plot for a drainage line. Datum breaks are applied to any part of the longsection that will not fit into the drainage line ht.

Box text size (mm) input 3

size (in millimetres) to plot the chainages, heights, etc. in the boxes in the plots of the drainage longsections

Box colour input cyan available colours

colour used for the text and the boxes.

Plot button

plot the drainage longsections for the drainage lines in the model given in the network model *field.*

The fields and buttons in *title* tab are:

Use title file tick box

*if **tick,** a user defined title block file is used.*

Standard Title tick box tick

*if **tick**, the standard 12d Model border and two lines of title are placed on the bottom of the plot*

Title file input *.tf

*if **non-blank** and* use title file *is set to **tick**, then the file given in this field is used to generate a user defined title block for the plot.*

Title line 1/2 input

first/second line of title information

Title height (mm) input 5

height (in millimetres) to draw the characters in the two lines of title information.

Title colour input cyan available colours

colour used for the border and the title information.

Please continue to the next section Melbourne Water Plot Parameter File.

22.9.3.1 Melbourne Water Plot Parameter File

The **Melbourne Water plot** option is used to make special long section plots for a **network** of new drainage strings to Melbourne Water sewer standards.

Some of the look of the long section plot can be controlled from the **Melb plot drainage network** panel itself, however a wider selection of control parameters is available by using a Melbourne Water long plot, plot parameter file.

Because the Melbourne Water format is so fixed, most of the parameter have sensible default values and can be left out. However, for completeness, all the parameters are given.

The Melbourne Water Sewer (MWS) long section plot parameters are placed in a file with ending **.ppf**.

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash **//** is considered to be a comment.

The set of all parameters for the Melbourne Water sewer long section plot is enclosed within a set of curly brackets **{ }** with the header

melb_water_sewer_long_plot "plot set name"

before the curly brackets.

That is,

melb_water_sewer_long_plot "plot set name" **{**

plot parameters
one per line

}

If there is more than one melb_water_sewer_long_plot parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as section_x_plot in the same file. The other sets will be ignored when doing a Melbourne Water long section plot.

The plot parameters are documented in following groups:

For the *Plot Sheet layout*, please continue to the section Plot Sheet Layout.

Chainages, staggering and uprights, please continue to the section Chainages, Staggering and Uprights.

Boxes area, please continue to the section Boxes Area.

Datum area, please continue to the section Datum Value.

Arrows area, please continue to the section Arrow Areas.

Graph area parameters, please continue to the section Graph Area.

Top area parameters, please continue to the section Top Area.

Manhole parameters, please continue to the section Manholes.

Junctions parameters, please continue to the section Junctions.

Services parameters, please continue to the section Services.

Property controls and house connection parameters, please continue to the section Property Controls and House Connections.

Symbols at manhole parameters, please continue to the section Symbols at Manholes.

Hatching cut and fill parameters, please continue to the section Hatching Cut and Fill Areas.

Labelling cuts parameters, please continue to the section Labelling Cuts of Drainage Through Strings in a Model.

Title block parameters, please continue to the section Title Block Information.

Panel modifying parameters, please continue to the section Parameters that Modify Fields In the Melbourne Water Network Panel.

22.9.3.1.1 Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

sheet_size	*text*	// sheet name, or
	"*mm* *mm*"	// sheet size: width height

The sheet size name and width and heights can be specified by the user in a file named sheets.4d which is in the normal set up areas, or is pointed to by the environment variable

SHEET_SIZES_4D	*file*	// file of plotter sheets sizes

The Melbourne Water long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

When a sheet is full, a follow on sheet is created.

As soon as one drainage string is completed, the next drainage string in the network model is plotted beginning on the same row as the previous drainage string and with a horizontal gap of size horizontal_plot_gap between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, x_origin and y_origin.

If there are two or more rows of plots, the position of the first plot in each row is given by adding multiples of the plot_height to the y_origin.

network_model	text	// model of sewer strings
x_origin	mm	// Position of the left hand bottom
y_origin	mm	// corner of first plot in the bottom row.
only_one_line	0	// more than one row on a sheet
	1	// only one row of plot on a sheet
plot_height	mm	// total height of a plot row.
		// It includes the vertical_plot_gap.
horizontal_plot_gap	mm	// gap between plots on same row
vertical_plot_gap	mm	// gap between rows of plots

A textstyle can be specified which is used for all the text in the plot.

global_textstyle	textstyle	//used for all plot text

The Melbourne Water long plot itself consists of nine areas. From the bottom up, they are

boxes, arrow 1, bottom stagger, arrow 2, graph, arrow 3, top stagger, arrow 4, top.

The **boxes area** is where the chainages and various values for the drainage strings are labelled.

The **arrow 1 area** is for drawing arrows where the arrows go between the staggered uprights and below the graph area. The datum line is at the bottom of the arrow 1 area.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **arrow 2 area** is for drawing arrows below the graph but where the arrows go between non-staggered uprights.

The **graph area** is the area where the actual plots of the strings are drawn.

The **arrow 3 area** is for drawing arrows above the graph area and where the arrows go between non-staggered uprights.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is for drawing arrows where the arrows go between the staggered uprights and above the graph area.

The **top area** is an annotation area above the arrow 4 area and is used for manhole names, junctions, deflection angles, *etc.*

Although the arrow areas exist, the Melbourne Water plot does not have any arrows in them.

22.9.3.1.2 Chainages, Staggering and Uprights

All of the labelling of the Melbourne Water sewer plot is done at the chainages of the manholes on the drainage line. For example, the invert levels, depths and natural surface of pipes at a manhole are all labelled at the chainage of the manhole.

The labels for these values are done at an angle of zero degrees rather than ninety degrees for the sewer plots.

Uprights, or leader lines, are drawn from the values at the bottom of the plot to the manhole in the graph area.

If the text values are placed at the real chainage positions at the bottom of the plot, text over writing can easily occur if the chainages are very close together.

To prevent such over writing, the text can be **staggered**. That is, if the text is going to over write a previous text value, the next text value is actually moved along until there is no over writing.

Since the text is no longer at the correct chainage position, the uprights to the manholes and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the Melbourne Water plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

And there is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

stagger_height_1	*mm*	// distance from the top of arrow_area_1 // to the start of the staggers
stagger_height_2	*mm*	// distance over which stagger occurs
stagger_gap_bottom	*mm*	// distance from end of staggers to the // bottom of arrow_area_2

The stagger area above the graph area is defined

stagger_gap_top	*mm*	// distance from the top of arrow_area_3 // to the start of the staggers
stagger_height_3	*mm*	// distance over which stagger occurs
stagger_height_4	*mm*	// distance from end of staggers to the // bottom of arrow_area_4

The distance to be left for text to avoid over writing is:

horizontal_text_gap	*mm*	// minimum distance to leave for text // after manhole values
services_text_gap	*mm*	// minimum distance to leave for text // after service values

When staggering occurs, it is possible for the values area to be longer than the graph area.

The **colour** of the uprights that are drawn from the text to the manholes is given by:

manhole_line_colour	*colou*r	// colour of uprights to the manholes

22.9.3.1.3 Boxes Area

The drainage string values invert level, depth to invert and surface level can be labelled in the Melbourne Water plot with one line of title, and the actual values given at the chainage of each manhole in the drainage string.

The title or **label** for the strings, is drawn in the **labels area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

labels followed by the **values** along the string.

Thus the boxes area is built up as a series of individual boxes and the **boxes** area is made up of two areas side by side - the **labels** area and the **values** area.

The order of the boxes from the bottom up is

(a) chainage values
(b) upstream and downstream depth to inverts
(c) upstream and downstream invert levels
(d) natural surface heights

The label text size and colour are specified by

```
plot_title_text_size      mm        // size of label text in boxes
plot_title_text_colour    colour    // colour of label text in boxes
```

The width of the label box is given by the **box_width** parameter and the height of each box is given by **box_height**.

```
box_width     mm    // width of the label boxes.
box_height    mm    // height of each box
```

The label text for each box can be set by

```
plot_title_chainage_name    text    // label for chainages box
plot_title_surface_name     text    // label for the sewer ns values
plot_title_invert_name      text    // label for the invert levels
plot_title_depth_name       text    // label for depth of inverts
```

For the Melbourne Water plots, there are also additional parameters for special Melbourne Water labels. They are

```
plot_title_item_name       text    // label for item line
plot_title_d_and_g_name    text    // label for diameter and grade
plot_title_detail_name     text    // label for detail line at top of plot
```

The pipe type can also be included with the diameter and grade values

```
label_pipe_type    yes/no
```

The **labels area** for the left plot in the bottom row starts at the co-ordinate (x_origin,y_origin) and each row is begun by adding the distance plot_height to the y_origin.

```
x_origin    mm    // x coord of bottom lh corner of bot row
y_origin    mm    // y coord of bottom lh corner of bot row
```

The **values area** starts at the end of the label area.

As for the label boxes, the height of each individual box area is given by the box_height parameter.

The width of the heights area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

```
box_text_size      mm        // size of value text
box_text_colour    colour    // colour of values in boxes
```

The colour of the box line work is given by:

```
box_colour    colour    // colour of the lines in the boxes
```

The total height of the boxes area is simply given by number of boxes drawn multiplied by the height of one box).

The total width of the boxes area is the width of the labels area plus the width of the values area which depends on the amount of staggering that occurs.

22.9.3.1.4 Datum Value

The datum value is placed above the top of the natural surface heights box.

Since the datum value is automatically calculated to try and fit the plot vertically into the graph area, the datum value can change along the plot. When a datum change occurs, the new datum value is written on the datum line at the relevant chainage position.

The datum name, text size and colour are controlled by:

```
datum_name              text        // text to write before the datum value
datum_text_size         mm          // size of datum text and value
datum_colour            colour      // colour of the datum text and line
datum_value_pre_text    text        // text before the datum value
datum_value_post_text   text        // text after the datum value
                                    // (default " m")
datum_value_decimals    integer     // number of decimal places in the
                                    // datum value.
                                    // If > 0, trailing zeros are removed.
                                    // If < 0, the absolute value is taken as
                                    //   the number of decimal places and no
                                    //   trailing zeros are removed.
```

22.9.3.1.5 Arrow Areas

The **arrow areas** were designed for drawing arrows between manholes and labelling them with values such as pipe slope, pipe diameter, flow, velocity and drainage line name.

These are not required for the Melbourne Water sewer plot.

However, values can still be given to defined the sizes of the arrow areas.

There are four arrow areas:

arrow_1_area which is below the graph and the bottom stagger area. The arrows go between the staggered positions of the manhole chainages.

The datum line is at the bottom of the arrow 1 area.

arrow_2_area which below the graph but above the bottom stagger area. Hence the arrows go between the non-staggered chainage positions of the manholes.

arrow_3_area which is above the graph but below the top stagger area. The arrows go between the non-staggered chainage positions of the manholes.

arrow_4_area is above the graph and the top stagger area. The arrows go between the staggered chainage positions of the manholes.

The heights of the four areas (which can be zero) are defined by:

```
arrow_area_1    mm    // height of arrow_1 area
arrow_area_2    mm    // height of arrow_2 area
arrow_area_3    mm    // height of arrow_3 area
arrow_area_4    mm    // height of arrow_4 area
```

22.9.3.1.6 Graph Area

The **graph area** is the area where the actual plots of the drainage strings are drawn.

The length of the graph area is determined by the length of the drainage string to be plotted, the horizontal scale (given by scale) of the plot and the sheet width.

scale	*value*	// 1:value - horizontal scale
		// The vertical scale is determined by the
		// horizontal scale and the vertical
		// exaggeration for the section view.

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

view_name	*text*

The tins to be sectioned through by the sewer strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is **calculated** by subtracting the height of the other nine boxes from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate manhole and the plot continued on another row.

Datum breaks at manholes are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the sewer long section plot are:

(a)	drainage string	the strings from the network model
(b)	tins	sections of the drainage string through any tins on the section view.
(c)	services	parts of strings from any models on the section view that cut the corridor for the section view.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), and the colour of the tin used for the section in case (b).

22.9.3.1.7 Top Area

The **top area** is an annotation area above the arrow_4_area at the top of the plot.

It can be used for manhole names, manhole types, pegs, junctions and deflection angles through manholes.

The height of the top area is given by

vertical_plot_gap	*mm*	// size of the top area. If it is not large
		// enough the text will over write the
		// plot in the row above.

22.9.3.1.8 Manholes

The manhole name, manhole type, special manhole symbol and the change of direction of the pipes going through the manhole can all be displayed at the top of the plot.

The manhole name and type are drawn first, followed by the angle of any change of direction of the pipes going through the manhole (the angle is in degrees, minutes and seconds) and finally any junction information.

The text is drawn at the distance **angled_text_y_offset** above the top of the plot, **angled_text_x_offset** to the right of the manhole position and each piece of information is spaced horizontally by the distance **angled_text_gap** to the right of the manhole name if the **angled_text_angle** is zero, or the distance **angled_text_gap** below the previous text if **angled_text_angle** is non-zero.

The size of the manhole names and type is given by **angle_text_size** and the size of the change of direction angle is given by **manhole_angle_text_size**.

The colour of the manhole names, type and change of direction angle is given by **angle_text_colour**.

label_manhole_type	*yes/no*	// include manhole type
angled_text_size	*mm*	// size of manhole name text
manhole_angle_text_size	*mm*	// size of text for change of // angle through manhole
angled_text_x_offset	*mm*	// distance of text above top of the plot
angled_text_y_offset	*mm*	// distance of text to the right of manhole
angled_text_gap	*mm*	// distance of text to the right of previous // text
angled_text_angle	*value*	// angle of text
angled_text_colour	*colour*	// colour of text

The symbol at the manhole is controlled by the manhole name.

manhole_symbol_n_size	*mm*	
manhole_symbol_n_colour	*colour*	
manhole_symbol_n_y	*mm*	// distance above top line

manhole_symbol_n_repeats	*integer*	// draw the symbol this
		// many times with a
		// decreasing size)

manhole_line_colour	*colour*	// colour of line through // manhole

22.9.3.1.9 Junctions

Any junctions at the manhole are also labelled with the name of the lines coming into the manhole.

The junction text is made up of two lines:

JUNCTION LINE   line_name

angle of the junction

The junction text is at the same height as the manhole and angle text and at a distance **angled_text_gap** to the right of the manhole and angle text, or a previous junction label. The size of the text is given by

junction_angle_text_size	*mm*

When a junction does occur, the incoming pipe is drawn at the correct position on the manhole of the main line.

22.9.3.1.10 Services

Any services in the corridor are drawn on the plot and if the service actually cuts the drainage string, then a line is drawn to the cut point and the line labelled with the service name. The name is drawn below the cut point and is right justified.

service_text_size	*m*m	// size of the text for the service name
service_text_x_offset	*m*m	// adjustment to the drawing position
service_text_y_offset	*mm*	// for the service name
service_text_colour	*colour*	// colour of the service name
service_line_colour	*colour*	// colour of the line to the cut point

22.9.3.1.11 Property Controls and House Connections

The position of the property controls can be drawn on the plot and can have a user specified diameter.

draw_property_controls	*yes/n*o
property_control_diameter	*value*

The house connections can be drawn from the pipe to the house connection level, with a line across the top (a T). The full width the T can be specified by the user.

draw_house_connections	*yes/no*
house_connection_width	*value*

22.9.3.1.12 Symbols at Manholes

Manholes can be labelled with symbols which depend on the manhole type. There can be up to twenty (20) sets of manhole symbols.

manhole_symbol_n_type	*mh_type*	// manhole type to have symbols
manhole_symbol_n_mode	*0*	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

predefined symbols for manhole_*symbol_n_modes*

manhole_symbol_n_position	***1***	// at top of manhole - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
manhole_symbol_n_size	*mm*	// size
manhole_symbol_n_x	*mm*	// x adjustment to position - default 0
manhole_symbol_n_y	*mm*	// y adjustment to position - default is 0
manhole_symbol_n_style	*text*	// the name of the 12d symbol
manhole_symbol_n_angle	*value*	// default value is 0
manhole_symbol_n_colour	*colour*	//

For example:

manhole_symbol_1_type	"CONC COVER"	// manhole type to use
manhole_symbol_1_position	1	// on top of manhole
manhole_symbol_1_mode	6	// use 12d symbol
manhole_symbol_1__style	"shrub"	// name of 12d symbol
manhole_symbol_1_size	1	
manhole_symbol_1_x	0	
manhole_symbol_1_y	0	

22.9.3.1.13 Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

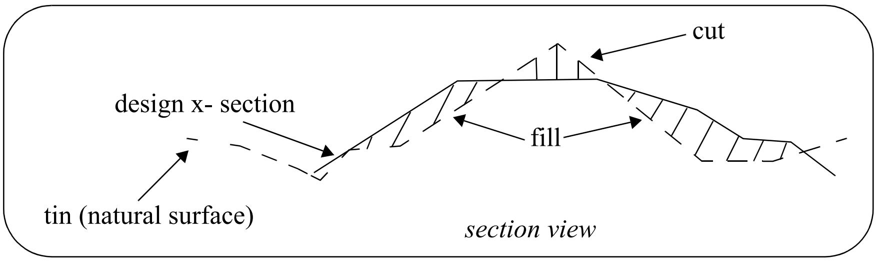
The parameters for labelling cuts and/or fill regions between tins are given by:

hatch_original_tin_n	*tin_name*	// tin_name for original surface
hatch_new_tin_n	*tin_name*	// tin_name for final surface
hatch_cut_separation_n	*mm*	// distance between cut hatch lines
	0	// don't do cut hatching
hatch_cut_angle_n	*degrees*	// angle in degrees of cut hatching
hatch_cut_colour_n	*colour*	// colour of the cut hatching
hatch_cut_linestyle_n	*linestyle*	// linestyle for cut hatching
hatch_cut_draw_sides_n	1/0	// 1 = draw sides of cut regions
hatch_cut_draw_original_n	1/0	// 1 = draw original tin in cut regions
hatch_cut_draw_new_n	1/0	// 1 = draw new tin in cut regions
hatch_fill_separation_n	*mm*	// distance between fill hatch line
	0	// don't do fill hatching
hatch_fill_angle_n	*degrees*	// angle in degrees of fill hatching
hatch_fill_colour_n	*colour*	// colour of the fill hatching
hatch_fill_linestyle_n	*linestyle*	// linestyle for fill hatching
hatch_fill_draw_sides_n	1/0	// 1 = draw sides of fill regions
hatch_fill_draw_original_n	1/0	// 1 = draw original tin in fill regions
hatch_fill_draw_new_n	1/0	// 1 = draw new tin in fill regions

Notes

(a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.

(b) cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.



22.9.3.1.14 Labelling Cuts of Drainage Through Strings in a Model

The cuts that the drainage string makes though any strings in user given models can be automatically labelled on the long section plots.

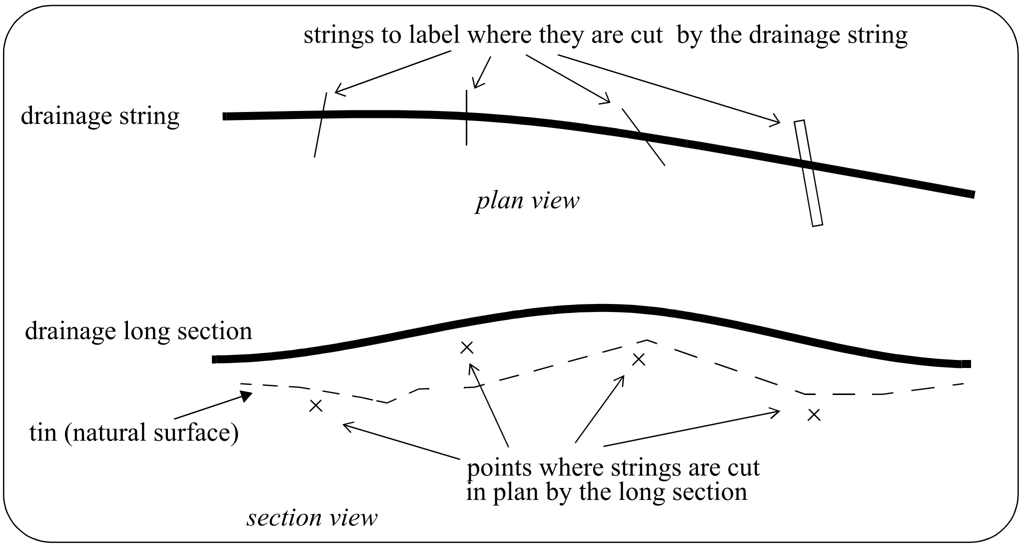
The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

(a) top of the boxes on the long section
(b) height value of the cut string
(c) height of the primary string
(d) height of a tin.

The actual position of the label is defined relative to the above point.



Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

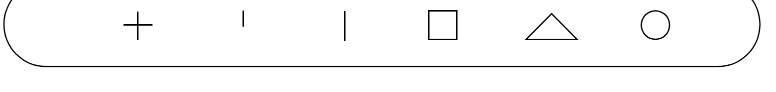
Text justification refers to the actual position and is given by

"top-left"	"top-centre"	"top-right"
"middle-left"	"middle-centre"	"middle-right"
"bottom-left"	"bottom-centre"	"bottom-right"

A choice of six special symbols and/or or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are



Up to twenty five (25) separate models of strings can be cut and labelled.

22.9.3.1.15 Parameters for Labelling Where the Drainage Line Cuts Strings in a Model

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

The parameters for selecting and labelling the n'th set (where n can be from 1 to 25) of cuts of the design string with the strings in the model are given by:

cuts_n_model	*model_name*	// model of strings to be cut

The selection of the strings from the model *model_name* whose cut points are to be labelled is all the strings whose name satisfies the name mask *cuts_n_mask*:

cuts_n_mask	*name_mask*	// strings to check for cuts
		// and if a cut occurs,
		// parameters show how to
		// label the cut

where *name_mask* is a text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mast can include wild cards and wild characters.

For example

	cuts_1_mask	"ke*"
or	cuts_1_mask	"?bank*"

or, if both masks are required,

cuts_1_mask	"ke* ?bank*"

If *cuts_n_mask* is missing, then all strings in the model are used. This is equivalent to *name_mask* being "*".

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the drainage strings, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the n'th set.

The parameters for drawing a **symbol** at the cut points are

cuts_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

predefined symbols for cut_symbol_n_modes 0 to 5

If *cuts_symbol_n_mode* is 6, then the 12d symbol is given by

cuts_symbol_n_style	*plotsymbol*	// 12d symbol to draw at cut

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

(a) the parameter *plot_symbols* in the ppf file

plot_symbols *filename*

or if plot_symbols is not defined, then

(b) in the file pointed to by the environment variable PLOT_SYMBOLS_4D

PLOT_SYMBOLS_4D *filename* *// default plotsym.4d*

or if PLOT_SYMBOLS_4D is not defined, then

(c) in the file *plotsym.4d*

which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

(d) either pointed to by the environment variable SYMBOLS_4D

SYMBOLS_4D filename // default symbols.4d

or if the environment variable SYMBOLS_4D does not exist, in the file, *symbols.4d*

The position of the symbol is given by:

cuts_symbol_n_position	1	// above point height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*

The symbol can be adjusted by the parameters:

cuts_symbol_n_x	*mm*	// offset adjustment to position
cuts_symbol_n_y	*mm*	// height adjustment to position
cuts_symbol_n_angle	*degrees*	// rotation about point
cuts_symbol_n_colour	*colour*	// colour of symbol

and for all values of *cuts_symbol_n_mode* **other** than 6:

cuts_symbol_n_size	*mm*	// size of symbol, 0 don't draw

The value of the **chainage** of the cut string can be labelled using the parameters

cuts_chainage_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*

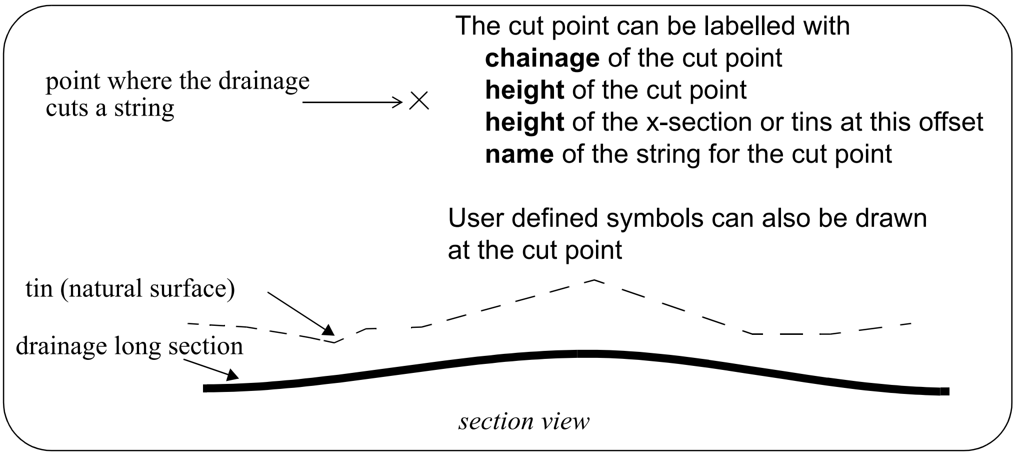
cuts_chainage_n_x	*mm*	// chainage adjustment to position
cuts_chainage_n_y	*mm*	// height adjustment to position
cuts_chainage_n_angle	*degrees*	// rotation about point
cuts_chainage_n_size	*mm*	// size of text, 0 don't label
cuts_chainage_n_colour	*colour*	// colour of text
cuts_chainage_n_textstyle	*text*	// textstyle of text chainage
cuts_chainage_n_pre_text	*text*	// text before the chainage value
cuts_chainage_n_post_text	*text*	// text after the chainage value
cuts_chainage_n_justification	*justification*	// justification of the text
cuts_chainage_n_no_decimals	*integer*	// number of decimals in chainage

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	*1*	// use height of cut point itself
	3	// use real world height of position // above boxes
	100	// height of primary string
	101-500	// use height of to tin1 or tin2, *etc.*
cuts_height_n_position	*1*	// at points position
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*
cuts_height_n_x	*mm*	// chainage adjustment to position
cuts_height_n_y	*mm*	// height adjustment to position
cuts_height_n_angle	*degrees*	// rotation about point
cuts_height_n_size	*mm*	// size of text, 0 don't label
cuts_height_n_colour	*colour*	// colour of text
cuts_height_n_textstyle	*text*	// textstyle of text height
cuts_height_n_pre_text	*text*	// text before the height value
cuts_height_n_post_text	*text*	// text after the height value
cuts_height_n_justification	*justification*	// justification of the text
cuts_height_n_no_decimals	*integer*	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2, *etc.*
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	*mm*	// chainage adjustment to position
cuts_label_n_y	*mm*	// height adjustment to position
cuts_label_n_angle	*degrees*	// rotation about point
cuts_label_n_size	*mm*	// size of text, 0 don't label
cuts_label_n_colour	*colour*	// colour of text
cuts_label_n_textstyle	*text*	// textstyle of text label
cuts_label_n_pre_text	*text*	// text before the string name
cuts_label_n_post_text	*text*	// text after the string name
cuts_label_n_justification	*justification*	// justification of the text



The cut point can be labelled with
chainage of the cut point
height of the cut point
height of the x-section or tins at this offset
name of the string for the cut point
point where the drainage cuts a string
User defined symbols can also be drawn at the cut point
tin (natural surface)
drainage long section
section view

22.9.3.1.16 Title Block Information

The plot can have a standard ***12d Model*** title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard ***12d Model*** title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

plot_border	*yes/no*	*// yes plots a standard title block* *// default yes*
title_1	*text*	
title_2	*text*	
title_text_size	*value*	
title_colour	*colour*	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

use_title_file	*yes/no*	*// yes draws the title block given in title_file* // default no
title_file	*filename*	
plot_border	*no*	*// turn off standard title block*

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters user_text_n (n = 1,2,... 1000)

user_text_n		*text*

The special plot parameters are:

time_format	*text*	// format for $time
user_text_n	*text*	// where n = 1,2,... 1000 // passed down to $user_text_n
title_1	*text*	// passed down to $title_1
title_2	*text*	// passed down to $title_2
start_page_number	*integer*	// used as the starting value for // $page_number. If missing, // $page_number starts at 1.

start_drawing_number	*integer*	// added to $drawing_number in title
		// block file. If missing,
		// $drawing_number starts at 1.

drawing_number_prefix	*text*	// passed down to // $drawing_number_prefix
drawing_number_postfix	text	// passed down to // $drawing_number_postfix

22.9.3.1.17 Parameters that Modify Fields In the Melbourne Water Network Panel

A number of parameters match those in the **New Melb Plot Drainage Network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **Melb plot drainage network** panel are:

network_model	*text*
scale	*value*
plotter_type	*text*
plot_stem	*text*
view_name	*text*
sheet_size	*text* or "width height"
plot_height	*mm*
x_origin	*mm*
y_origin	*mm*
global_textstyle	*textstyle*
box_text_size	*mm*
box_colour	*colour*
plot_border	*yes/no*
title_1	*text*
title_2	*text*
title_text_size	*value*
title_text_colour	*colour*
use_title_file	*yes/no*
title_file	*filename*

22.9.4 Plot Annotations

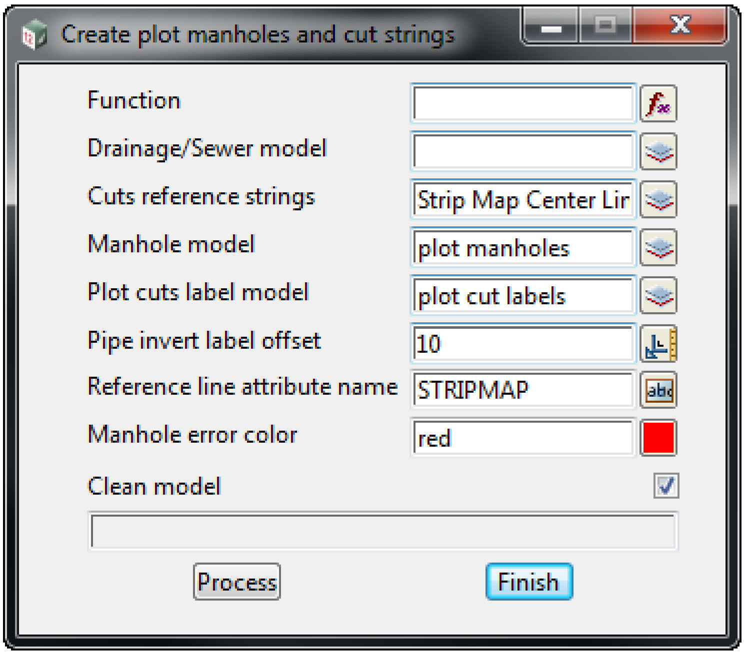
See Drainage Long Plot PPF Editor.

22.9.5 Long Plot Cut Labels and Manholes

Position of menu: **Design =>Drainage-Sewer=>Plots=>Long plot cut labels and manholes**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Long plot cut labels and manholes** brings up the **Create plot manholes and cut strings** panel.



The fields and buttons used in this panel have the following functions.

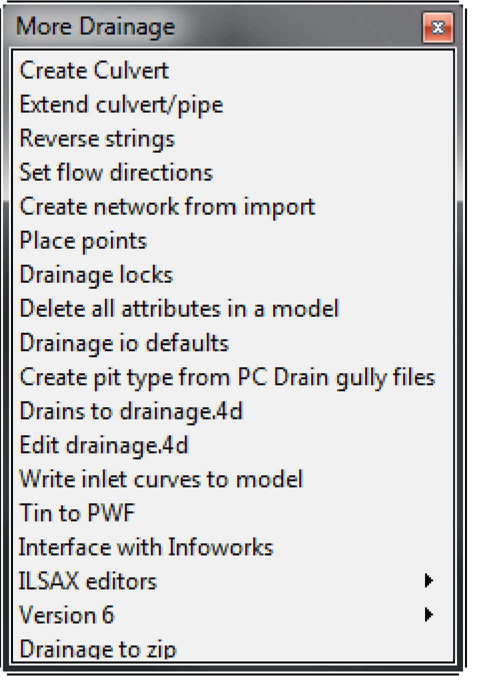
Field Description	Type	Defaults	Pop-Up
Function	function box		
Drainage/Sewer model	model box		
Cuts reference strings	model box		
Manhole model	model box		
Plot cuts label model	model box		
Pipe invert label offset	measure box		
Reference line attribute name	name box		
Manhole error colour	colour box		
Clean model	tick box		
Process	button		

22.10 More Drainage

Position of menu: **Design =>Drainage-Sewer=>More**

The More Drainage menu items contain the drainage import export routines and tools that enhance the basic drainage functions on the Drainage Sewer menu.

The **More Drainage** walk-right menu is:



Frequently Asked Questions (FAQ)

Drainage Overview

The following are the basic steps from creating a urban drainage network to producing your plan/ drainage longsection drawings and pit layout table. The optional catchment area models and bypass flow model will be discussed afterwards.

Set drainage defaults

Draw the drainage strings

Set zero chainage to downstream end of the pipe string (Reverse drainage strings) (optional)

Automatically assign pit names

Define catchment areas (optional)

Define Pit/manhole Inlet Capacities via Overland flow strings (optional)

Hydraulic/hydrology calcs via spreadsheets, Drains, RAT2000, PCdrain, XP SWMM or ILSAX

Drainage longsection plots

Pit layout/construction schedules

Manhole and Pipe Table of Quantities (summarise by type, depth and size)

Drainage line excavation volume calculations

Roadway flooded width calculations

Drainage Export and Import to Design Software

Copy/Paste from spreadsheets

Running Drains

Running PCdrain (Windows)

Running Micro Drainage - Win DES

Running XPSWMM

Running RAT2000

22.10.0.1 Training Course Notes

Stormwater Part 1, Stormwater Part 2 and Dynamic Stormwater Design training course notes (Adobe PDF format for printing) and sample 12d data sets are available on the Installation DVD and the 12d User Forum. The training course moves through a worked example in detail. The course notes are also included below for your reference.

Stormwater Part 1

Stormwater Part 2

Dynamic Stormwater Design

22.10.1 Drainage FAQ

What is **pipe capacity**?

Pipe capacity is full pipe flow with no pressurisation. The capacity figure should be used to help designers know if the friction loss in the pipe is greater or less than the pipe slope.

Case 1: Flow less than capacity....friction slope is less than pipe slope. except for maybe for pit losses, surcharging is not a problem

Case 2: Flow greater than capacity....friction slope is MORE than pipe slope. You can do this for a short length of pipe but watch out for surcharging because you cannot keep it up for too long without flooding occurring!

Why do the **obvert/invert levels not change** when I import data via the "pit/pipe interface"?

On the interface panel there is an **Options** button that displays a panel with the **"hold obverts on import"** option. The default is off but if it is selected the pipe obverts will not change even if import data has new levels. Note that the invert levels will change is the pipe diameters change.

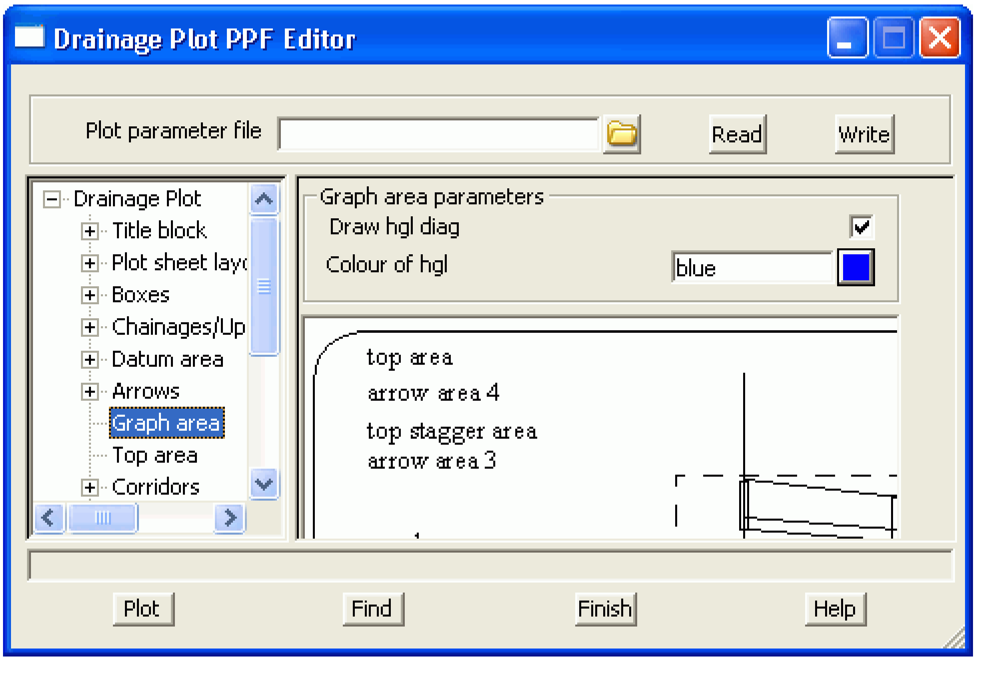
Can I **manually enter catchment areas** in the drainage design programs?

Yes. The catchment strings are optional in 12d. If no catchment string has been linked to a manholes and there has been no manhole "area" attribute a default area of 0.0001 will be sent. When results are imported back into 12d the total areas from the design package will be saved in the manhole "area" attribute.

How do I include/exclude the **hydraulic grade line** on drainage longsections..

First, there must be HGL results. These may come from the 12d rational drainage design, imported from another design package (including spreadsheets) or manually entered as manhole/pipe attributes. If HGL results exists then they may be viewed in the section view of the drainage line.

Second, the HGL results may be added to the drainage longsection drawings by editing the plot parameter file (ppf) as shown below.



22.10.2 Creating Drainage Strings

Drainage strings may be created in 12d in a number of ways.

1. Import 2d strings from other drawing packages and convert them to drainage string inside 12d.
2. draw the string in 12d using a design tin to the manhole cover levels and pipe inverts.
3. Enter the details in a spreadsheet format and paste the spreadsheet into 12d.

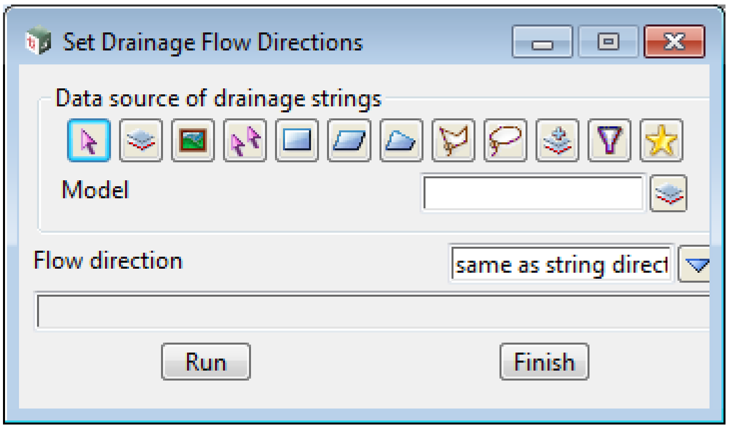
Regardless of the method, take the time to set your defaults before you start. You can always change the data later.

22.10.3 Set Drainage Flow Direction

Position of option on menu: **Design =>Drainage-Sewer =>More=>Set flow directions**

The routine changes the strings drainage flow direction to either **same as string direction** or **opposite to string direction.** This setting affects the pipe grading, network connectivity and hydraulic calculations.

On selecting the **Set flow directions** option, the **Set Drainage Flow Directions** panel is displayed.



The fields and buttons used in this panel have the following functions.

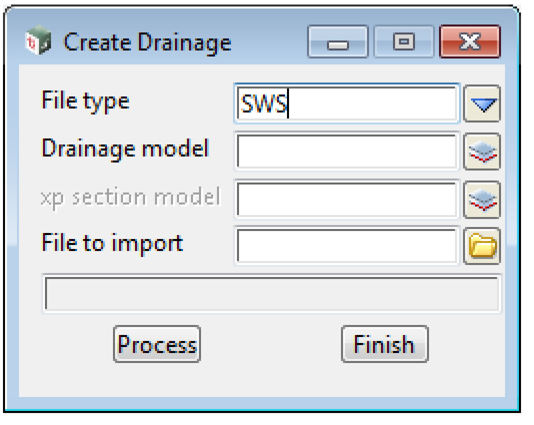
Field Description	Type	Defaults	Pop-Up
Source of drainage strings	source box		
Select the desired drainage strings			
Flow direction	choice box	same as string direction	same as string direction, opposite to string direction
all drainage strings will have this flow direction set			
Run	button		
set flow directions			
Finish	button		
remove the panel from the screen			

22.10.4 Create Network from Import

Position of option on menu: **Design =>Drainage-Sewer =>More=>Create network from import**

This routine creates drainage strings from existing MicroDrainage WinDes (sws and fws) and xpsoftware xpswmm (xpx) files.

On selecting the **Create network from import** option, the **Create Network from Import** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File type	choice box	SWS	SWS,xpswmm

SWS (or FWS) for WinDes files, xpstorm files are the xpsoftware xpx files

Drainage model	model box		

the drainage strings created will be stored in this model.

File to import	file box		

select sws, fws or xpx file types

Process	button		

create import file and create strings

Finish	button		

remove the panel from the screen

22.10.5 Place Points

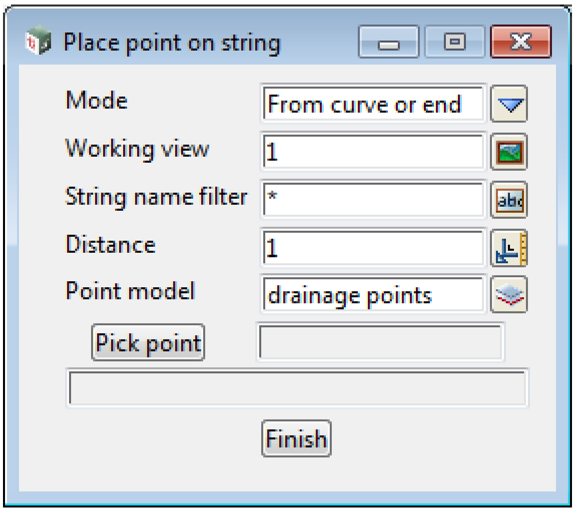
Position of option on menu: **Design =>Drainage-Sewer =>More=>Place points**

This routine creates points along a string so that drainage pits can be placed at a fixed offset from an intersection. As this is a very common task it combines several standard 12d options into one step.

The user selects a point near where the pit it to be located. The routine finds the closest string on the **working view** that matches the **String name filter** and creates a temporary point on the string.

The **Mode** determines a reference point located on the string and a marker of length, **distance**, is created from the reference point towards the temporary point.

On selecting the **Place points** option, the **Place point on string** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	choice box	From curve or end	From curve or end, From end, Nearest point

if **From curve or end**, the reference point is closest (by chainage) end of curve or end of string
if **From end**, the reference point is the closest (by chainage) end of the string is located
if ***Nearest point***, the reference point is *the closest vertex to the temporary point is located*

Working view	view box	1	

*strings on this view will be searched using the **string name filter**. The **point model** will also be added to this view.*

String name filter	input	*	

*the closest string on the **working view** matching this filter will be selected*

Distance	input	1	

the chainage distance from the reference point to the end of the marker (note that the marker is drawn as a straight line but the distance uses the chainage value).

Point Model	model box	drainage points	

*the marker points are placed in this model using the **FLOW LINE** linestyle*

Pick point	button		

select a point near where the point marker is to be created. Only the x,y value is used from the selected point

Finish button

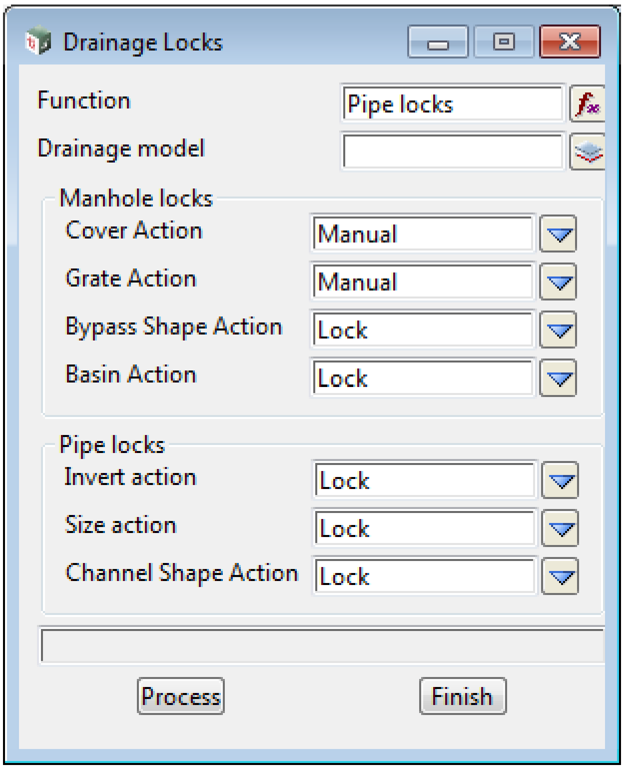
remove the panel from the screen

22.10.6 Drainage Pit and Pipe Locks

Position of option on menu: **Design =>Drainage-Sewer =>More=>Pipe locks**

The routine locks/unlocks (sets to manual) the pit and pipe levels in a drainage network model. A function is created so that the locks can easily be applied or removed. This is often used for existing networks or by designers wishing to set all levels manually.

On selecting the **Pipe locks** option, the **Pit and pipe locks** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box	Pipe locks	

A function can be created to lock and unlock the drainage string properties (via attributes)

Invert action	choice box	Lock	Lock,Unlock,None,Default

Sets the pipe invert lock flags for the DNE
if Lock, the flag is enabled
if Unlock, the flags are cleared
if None, the flags are left unchanged
if Default, the flags are cleared (same as unlock)

Size action	choice box	Lock	Lock,Unlock,None,Default

Sets the pipe diameter, width and top width lock flags for the DNE
if Lock, the flag is enabled
if Unlock, the flags are cleared
if None, the flags are left unchanged
if Default, the flags are cleared (same as unlock)

Cover action	choice box	Manual	Manual,None,Default

Sets the mode for the cover levels (manual is the equivalent of locked)

if Manual, the mode is set to manual,
if None, the mode if left unchanged,
if Default, the field is cleared and the default setting becomes active

Grate action choice box Manual Manual,None,Default

Sets the mode for the grate levels (manual is the equivalent of locked)
if Manual, the mode is set to manual,
if None, the mode if left unchanged,
if Default, the field is cleared and the default setting becomes active

Drainage model model box

existing strings in this model are processed

Process button

Applies and removes the locks as indicated

Finish button

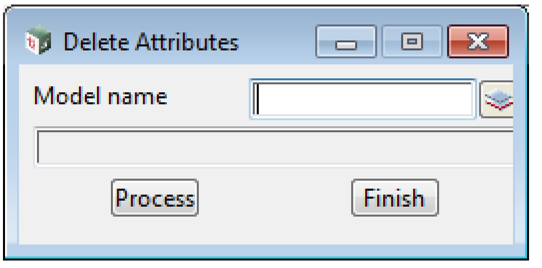
remove the panel from the screen

22.10.7 Delete All Attributes in a Model

Position of option on menu: **Design =>Drainage-Sewer =>More=> Delete All Attributes in a Model**

This routine deletes all of the model, string, pit and pipe attributes in the selected model.

On selecting the **Delete All Attributes in a Model** option, the **Delete Attributes** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model name	model box		

existing model

Process	button		

model, string, pit and pipe attributes will be deleted

Finish	button		

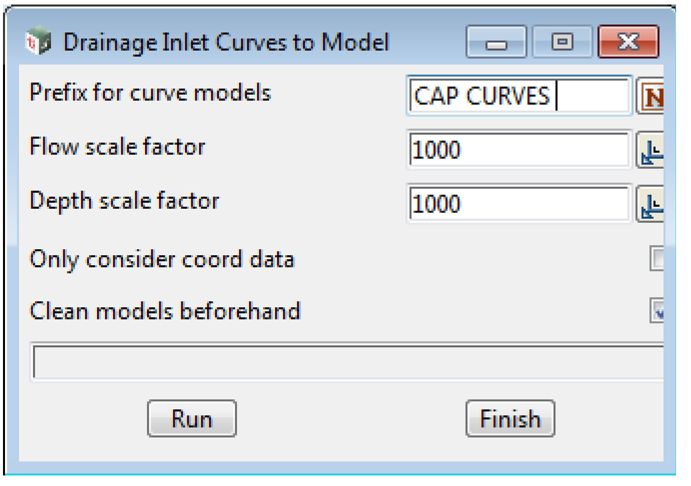
remove the panel from the screen

22.10.8 Write Inlet Curves to Model

Position of option on menu: **Design =>Drainage-Sewer =>More=>Write inlet curves to model**

This routines reads the inlet capacity curves from the drainage.4d file and creates plot strings. This tool is an efficient way to review the inlet capacity data in the file.

On selecting the **Write inlet curves to model**, the **Drainage Inlet Curves to Model** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prefix for curves models	model box	CAP CURVES	

All inlet curves for a manhole type will be placed in a model named with this prefix and the manhole type.

Flow scale factor	input	1000	

Inlet and bypass flow values will be multiplied by this value before creating the strings.

Depth scale factor	input	1000	

Depth values for sag curves will be multiplied by this value before creating the strings.

Only consider coord data	tick box	off	

Inlet capacity curves may be expressed as formulas, curve coordinate or both. Selecting this box stops curves with only formulas from being plotted as strings.

Clean models before hand	tick box	on	

The curve models are cleaned before the new strings are created

Run	button		

Models and strings are created from the drainage.4d file

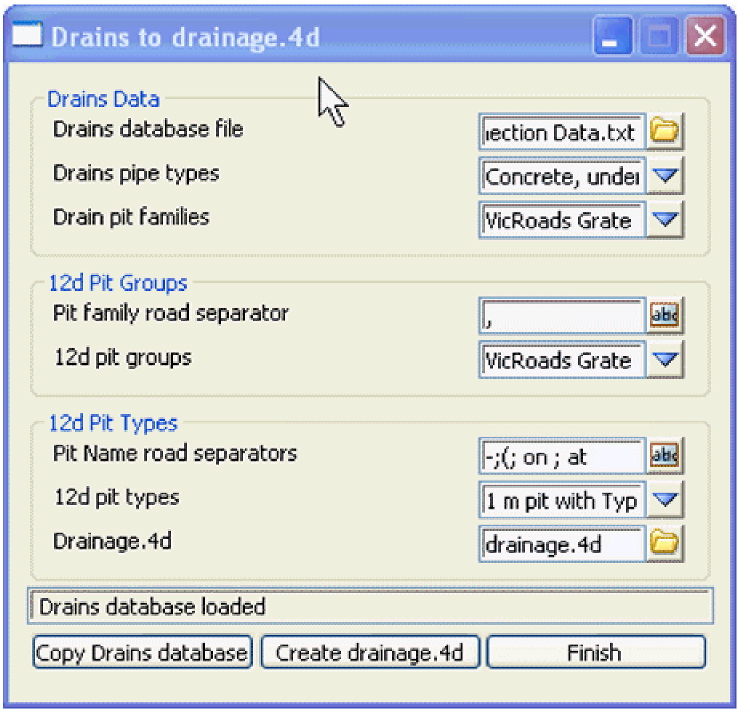
Finish	button		

remove the panel from the screen

22.10.9 Creating a drainage.4d file from the Drains database dump

Position of option on menu: **Design =>Drainage-Sewer =>More=>Drains to drainage.4d**

On selecting the **Drains to drainage.4d** option, the **Drains to drainage.4d** panel is displayed.



Key Points

When you are finished, open the drainage.4d file and check the road grade and crossfall values for the ongrade curves!

1. If Drains is used to selected the pit sizes
   then the 12d pit type must be the prefix of the Drains pit size (**Pit Name road separators** are used).

   If 12d is used to select the pit sizes to export to Drains, the Drains **Pit Size** and 12d **Pit types** have to match, exactly! The pit databases supplied by Drains often have road grade and/or crossfall attached to the end of the pit size. If pit sizes are to be sent from 12d, **this must be removed**! Find **Prepare the Drains Pit Database** for more details.
2. Select **Copy Drains database (12d will search the usual locations for the Drains data-base).**
3. Review the **Drains pipe types** and **Drains pit families** lists to ensure you have the correct database.
4. 12d pit groups are not used in Version 8.
5. **Pit Name road separators** can only be used if **Drains** is selecting the pit types. If 12d pit types are to be exported to Drains, this field should be left blank. If you change these entries you must press the enter key to update the **12d pit types** list below.
6. Check the **12d pit types** and if they are acceptable select **Create drainage.4d.**

The Details

YOU MUST RESTART 12D FOR THE NEW DRAINAGE.4D FILE TO BECOME ACTIVE!

Field Description Type Defaults Pop-Up

Drains database file file box Drains Connection Data.txt

You must update this file from Drains before each use of this panel. Inside Drains select Project=>Overflow Route database. Then select OK and then YES. This will cause Drains to export the database to the file "Drains Connection Data.txt".

Selecting ***Copy Drains database*** *will cause the panel to search for the database dump in the folders* ***C:\Program Files\Drains\Program*** *and* ***C:\Program Files\Drains\Demo\Program****. If the Drains program is installed in another folder then you must browse for the file. The file will be read and the panel updated with eother selection.*

Drainage.4d file box drainage.4d

The drainage.4d will be created in the 12d working folder unless otherwise specified. It will only be used for 12d projects in this folder.

Pit families choice box Drains pit families

These are the Drains pit families that will be exported to the drainage.4d file. These will become the names ongrade inlet capacity curves for all the pit sizes that belong to the family. The pit family name will be searched for words like ***grade****,* ***slope*** *etc to try to determine the values for road grade and crossfall for the 12d capacity curves.*

Pipe type choice box Drains pipe types

These are the Drains pipe types that will be exported to the drainage.4d file.

Pit group separatorinput box

Pit groups are not used in Version 8. These characters will be used to remove the road grade crossfall data from the ***Pit families*** *above. The data before this character will become the* ***12d pit groups.*** *Press* ***Enter*** *or select* ***Read Drains database*** *to create a new list of* ***12d pit groups.***

12d pit groups choice box 12d pit groups

These are created from the Pit family list above by deleting all text after the ***Pit group separator****.*

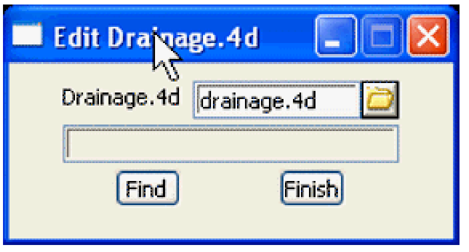
Create drainage.4dbutton

Create a drainage.4d file.

22.10.10 Editing a drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Edit drainage.4d

On selecting the Edit drainage.4d option, the Edit drainage.4d panel is displayed.



Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

22.10.11 Drainage IO Defaults

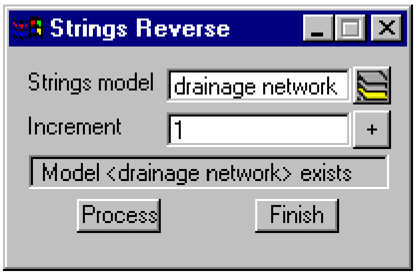
22.10.11.1 Set zero chainage to downstream end of line (Reversing the strings)

Position of options on menu: **Design =>Drainage-Sewer=>More=>Reverse all strings**

For drainage direction of flow see Reversing the strings

If desired, the reverse function may be used to move the zero chainage to the downstream end of the line. This should be done after entering all of the drainage strings and before naming the pits. From the main menu select

Design=>Drainage-sewer=>More=>Reverse all strings



This will also change the drainage flow direction attribute from **ascending chainage** to **descending chainage.**

Leave the **Increment** as 1.

22.10.12.1 Spreadsheet clipboard

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

Drainage strings will be created if they do not exist in the model but pits cannot be added to existing strings.

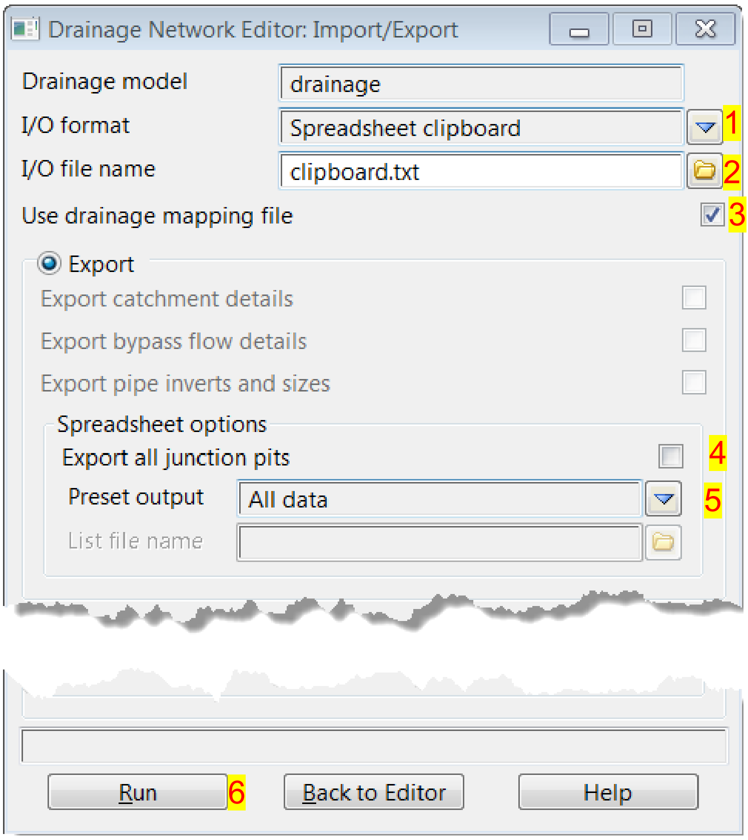
12d to spreadsheet transfers

Spreadsheet to 12d update and create

Spreadsheet options

22.10.12.2 12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.

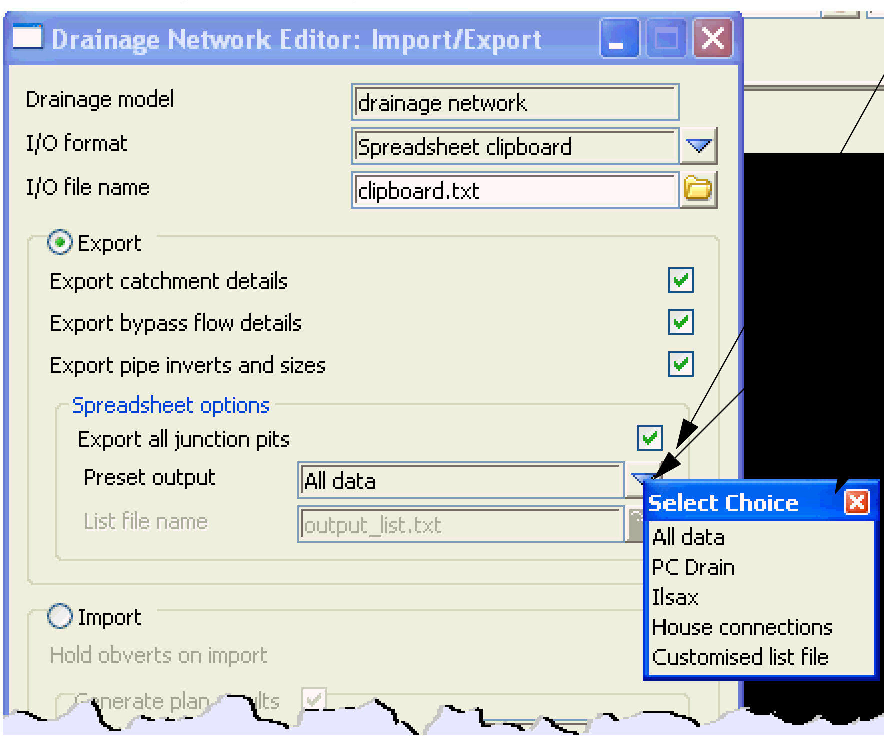


1. Select Spreadsheet clipboard
2. leave as **clipboard.txt** to send the data to the windows clipboard as well as this file.
3. Mapping files are the most current 12d technology. Leave this selected.

   These options are not used for spreadsheet export.
4. Usually leave this off! Select to export the junction pit at the end of all drainage lines (very rarely needed).
5. You may also select to limit the output if desired. If you like using spreadsheets for data entry, the PCdrain data and ILSAX data formats are useful for adding data for the first time for either program.
6. Select Run to place the data on the clipboard.

22.10.12.2.1 Options

The **Spreadsheet Options** section allows the user to define the amount of data exported.



Export all junction pits when selected will repeat the data for the junction pit at the end of each branch line.

Preset Output this choice box offers the following choices:

All Data: All of the 12d drainage string data and the user defined attributes will be exported to the clipboard in a tab delimited format. The 12d data names and the user defined attribute names will appear at the top of the spreadsheets columns.

ILSAX: For the ILSAX program, the spreadsheet column headings will change depending on the pipe and catchment indicators (P2 card) and the inlet type (P3 card). Therefore, use the ILSAX pipe editor macro to set up one pit/catchment for the type of data you wish to enter. Now when you export the pipe network data the column headings will include the names of the relevant parameters.

User defined below: The **Customised list file name** is used to define the drainage values, their order and format you desire.

The **customised list file** is a text file where each line contains a drainage variable or a spreadsheet IO command (blank lines are ignored unless preceded by the header command). The spreadsheet IO commands are all lower case and listed below:

header	to define a line of text to be exported
blank	to leave a blank column in the output
pit data	the following attributes are for the pit.
downstream pit data	the following attributes are for the downstream pit.
upstream pit data	the following attributes are for the upstream pit(s).
pipe data	the following attributes are for the pit's outlet pipe
downstream pipe data	the following attributes are for the downstream pipe(s)
upstream pipe data	the following attributes are for the upstream pipe(s)
variable name	a 12d drainage variable names
factor	the following variable is multiplied by this factor
decimals	the following variable will export with these decimal places

The simplest way to create your own customised tab delimited file is to set the **Preset Output** field to **All data** and leave the **customised list file name** field blank. Selecting **Set**, **Finish** and then **Copy** from the main dialogue. The data will be placed on the clipboard and a **customised list file**, named **output_list.txt** will be created containing the names of all of the drainage variables in the 12d model. Use a text editor to add/or delete the variable names, change their order and/or add spreadsheet IO commands. **Save the file with a new name!** The **output_list.txt** file is overwitten on every export.

A listing of a customised list file follows. Note the words in the header file have a “tab” between them so that they will be spaces across the spreadsheet columns.

```
header
Pipe Details
    header
    Name Length   U/S IL   D/S IL   Slope(%)   Class   Dia I.D.   Rough   Pipe Is   No. Pipes

    pit data
    *pit name

    pipe data
    *length
    low ch invert
    high ch invert

    factor
    100
    *grade

    pipe type

    factor
    1000
    diameter
```

After creating your customised list file, select **Options** again and change the **Preset Output** field to **User Defined below** and enter the new **customised list file** name that you saved above. Select **Set** then **Finish** and finally **Copy** to put the formatted data onto the clipboard.

The data can be pasted into a spreadsheet program for checking or additional formatting.

CUSTOM FORMATED DATA MIGHT NOT BE PASTED BACK INTO 12d!

The data must be in the “12d drainage spreadsheet” format to be read into 12d.

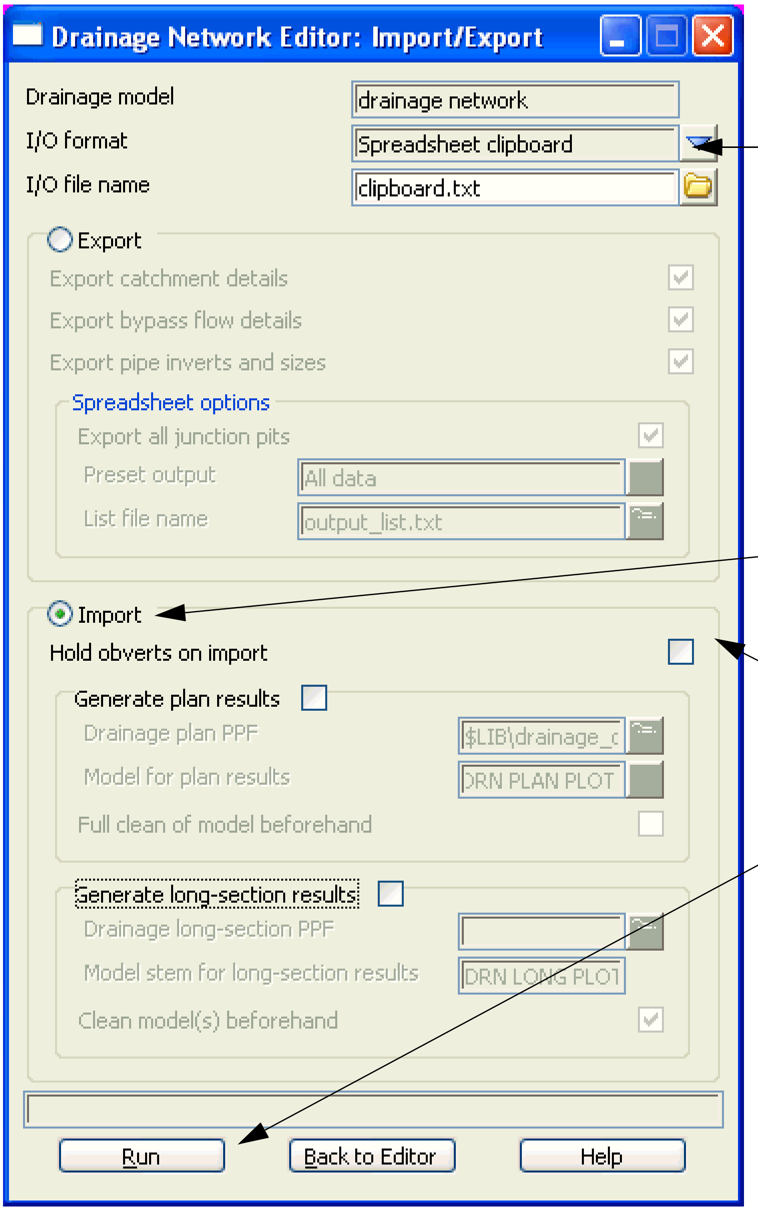
Caution with pit names in the form 1-1 or 1/1. Some spreadsheets will interpret these values as dates. If you use these formats for your pit names you will have to paste command them in once, format the columns that contain the pits names as text data and then paste the information in again.

One final word on using the copy/paste commands in the Microsoft Excel program. The Paste Special command using the “Skip Blanks” option will allow you to copy a large block of 12d data (with blanks in it) on top your data so that your data is preserved where it coincides with the blanks. To use this option paste the data into a blank spreadsheet and then select copy again. The Paste special option with “Skip Blanks” will now be available.

22.10.12.2.2 Spreadsheet to 12d Update and Create

This item is accessed from the **Import/Export** button on the **Drainage Network Editor**.

The following panel will appear.



Select the **Spreadsheet clipboard** format**.**

Select **Import**

This is ignored on spreadsheet imports.

Select **Run** to update the drainage model.

Tab delimited, “12d drainage spreadsheet” format or “from to” format data must be on the clipboard in order to update a 12d drainage model or create a new model. These format are described below.

22.10.12.2.3 Updating an Existing Model

The data usually is generated by 12d using the **Export** option, pasted into a spreadsheet and then copied back to the clipboard so that 12d can be updated.

When 12d exports the drainage model to a spreadsheet it includes a column for the unique string identifier and a unique pit identifier (unique to the drainage model not the 12d project). The names of the strings and pits may be changed via the spreadsheet if these columns are present at import time.

If the pit id column is not present, 12d will search the drainage model for a matching pit name. When the pit is a junction between drainage lines, only the trunk line will be the data updated.

22.10.12.2.4 Creating a New Model

It is possible to create a new string or an entire drainage network using this format. However, pits cannot be added to an existing string. The entire drainage string must be created at once. Two formats are available, the “from-to pit” format and the “12d drainage spreadsheet” format.

At present the network editor must select a drainage string to become active. Therefore, if you are not adding strings to a network, you will have to great a drainage network with one “dummy” pit. Select this one “dummy” pit to activate the editor. After importing the data and the new drainage lines are created the “dummy” pit may be deleted.

12d drainage spreadsheet Format

The top left cell in the clipboard data must be the text “12d” to specify this format. The minimum amount of data required to create a new string is the string name, pit name, x and y coordinates. You can add as much additional data as you have available. This would include pipe diameters inverts etc. The pits must be listed from upstream to downstream order. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An example file exists called **new_network.txt** is supplied in the library. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Set the **I/O Action** to **Import** and select **Run**. The new drainage lines will exist in the model currently being edited.

From-to Pit Format

The top left cell in the clipboard data must be the text “from to” to specify this format. The minimum amount of data required to create a new string is the upstream pit name "*pit name), the downstream pit name (*ds pit name) and the x(x location) and y(y location) coordinates of the upstream pit. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An optional column for the pit cover elev (cover elev) may be specified. Once the network has been created additional pipe and pit data may be added using the “12d drainage spreadsheet” format described above.

An example file exists called **new_from_to_network.txt** is supplied in the library. It is shown below. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Enter a new model name in the **Drainage model** field and select paste. The new drainage model will now exist.

from to	pit	pit	pit	pit
*pit name	*ds pit name	x location	y location	cover elev
text	text	real	real	real
E/1	A/3	5309.458	7336.935993	29.2173
D/1	A/4	5277.189	7336.935989	28.5071

B/2	B/3	5264.638564	7393.947083	30.7948
B/3	B/4	5249.738564	7384.207593	30.4187
B/4	B/5	5249.738564	7351.201545	29.1444
B/5	A/5	5233.426685	7336.935984	27.544

22.10.12.3 “12d drainage spreadsheet” Format

Each column of data is used for a 12d drainage variable or a user defined attribute. Each row represents a pit and the downstream pipe (controlled by the direction of flow variable) within the drainage network. A sample is shown below.

12d	pit	pit	pit	pit	pit	pit
*string Name	*pit name	pit type	pit low ch invert	pit high ch invert	pit id	string id
text	text	text	real	real	integer	integer
E	E/1	SA2	28.108	28.108	1	67389
E	A/3	SA2	27.7559	27.7559	2	67389
D	D/1	SA2	27.3961	27.3961	3	68100
D	A/4	SA2	26.8018	26.8018	4	68100
C	C/1	SA2	30.67	30.67	5	72072
C	B/3	SA2	29.563	29.563	6	72072
A	A/1	SA2	29.1026	29.1026	7	82469
A	A/2	SA2	28.7811	28.7311	8	82469
A	A/3	SA2	27.7652	27.7059	9	82469
A	A/4	SA2	26.8127	26.7518	10	82469
A	A/5	SA2	26.0867	26.0244	11	82469

B	A/5	SA2	26.0744	26.0744	19	192066

Duplicate Definitions

Strings Variables such as “direction” are may be defined for numerous pits on the same string. Searching in a top down direction through the file, the last definition found for the string will be set.

Invert levels may be set via pipe data or pit data or combined. It is recommended that the user only use one method and not combine them. Both are exported so delete the ones you are not going to use. The variables are processed from left to right, so if duplicate definitions of an invert level or found the right most data will be set.

The format definition

1. Row1, column 1 must contain either “12d”, or “from to”. Therefore, the first column must be a 12d drainage variable (cannot be a user defined attribute).
2. Row 1. The text <pit> at the top of the column indicates the column contains a user defined pit attribute and similarly <pipe> indicates a user defined pipe attribute.
3. Row 2. This row contains the names of the 12d drainage variable names and the pit/pipe attributes. All names are case sensitive so be careful where you use capital letters. A list of 12d drainage variables is found below.

   Names beginning with an asterix (*) will not be processed (except pit/string names when unique identifiers are present in the data). 12d drainage variables names beginning with an asterix indicate that this data was calculated at export time and cannot be read back into 12d (for example, pipe length, pipe grade and deflection angle).

   Prefixing an user defined attribute name with “DELETE ” (no quotes, note the space after the DELETE) will cause the attribute to be deleted from all pits/pipes within the model.

4.Row 3. The text in this row define the type of attribute to be stored within 12d. The only valid choices are;

integer
real
text

If you want to change an attribute type you must delete the attribute and create it again. If you simply change the attribute type in the third row then that attribute will not be updated.

5.Blank lines may be inserted as desired.

6.You are not required to fill in all of the cells in the spreadsheets. Blank cells are ignored (you must use a space to remove all data from text attributes (the space will not be stored).

7.Pipe names are included in the data so that they can be changed but they are **not** used to identify the pipe. Pipe data will always be assigned to the pipe following the pit in the direction of **ascending** chainage. If flow directions is ascending then the pipe data will be for the downstream pipe. If the flow direction is descending then the pipe data will apply to the upstream pipe.

22.10.12.4 12d Drainage Variable Names

Manhole Variables	Pipe Variables	String Variables
*string Name	pipe name	direction
*pit name	pipe type	[illegible]
pit type	low ch invert	[illegible]
pit diameter	high ch invert	string id
pit low ch invert	diameter	
pit high ch invert	*length	
pit road chainage	*grade	
pit road name	low hgl	
*pit angle	high hgl	
*pit drop	pit hgl	
*pit depth	flow	
*pit chainage	velocity	
x location		
y location		
cover elev		
*fs elev		
*ns elev		
pit id		

22.10.13 Quick Check Lists for Drainage Design Software

The drainage design software packages each have their specific requirements regarding the manhole types, names and then method they use to model pit inlet capacities. The following section details the specific requirement for each package.

See Drains Version 2+ Requirements and Notes

See PCdrain Requirements

See Running RATHGL/RAT2000 and XP-SWMM

See Micro Drainage - WinDes Requirements

22.10.13.1 Drains Version 2+ Requirements and Notes

See also Drainage overview

Basic Check List

1. All manholes must have a unique name (Manhole names cannot begin with "O ")
2. The pipe type used in 12d must exist in the Drains pipe database

Overland flow with Inlet Capacity Check List

1. Make sure you are using Drains Version 2-5 clipboard data. Inside Drains select **Project=>Pit database**. The pit family selection should be available. (CAP1 etc. is Version 1).
2. All Overflow route shapes, pit families and pit types used in 12d must exist in the Drains pit database
3. Overland flow lines must be within 1.0 metres/feet of the manhole

22.10.14 Running Drains - Version 2+

Key Points

The Drains database (each project has its own) and the12d database (drainage.4d) must be synchronised (**More**).

12d Version 8 needs you to create a new drainage.4d file to include the new inlet capacity curves (pit groups are no longer used).

For pits with a bypass pit and road grade defined (non ILLUDAS), 12d selects pit families for Drains in the following way

The users selects the pit type (Drains pit size) in 12d and 12d selects the ongrade or sag curve from the drainage.4d file (see inlet capacity calculations). The names of these curves are the Drains pit families. If there are no curves for the pit type in the drainage.4d file then the Drains pit type is exported as ILLUDAS with no family or size data.

If the 12d pit type is **Headwall** then the pit will be exported as a headwall.

Catchment lengths, slopes and roughness values are NOT exported in the Drains Rational format. The default values for these parameters are NOT exported in the Drains ILSAX format but the explicit settings from the catchment panel are exported. If used, Drains requires length, slope and roughness for both impervious (paved) and pervious (grass). Supplementary values must entered in Drains.

Data is copied from 12d to the Windows clipboard and then pasted into Drains. 12d can not delete any objects in Drains, it can only add and update.

When updating 12d from Drains, always copy the DATA to 12d before the results. 12d will update the network but will not add or delete pits.

If a new pit is added in Drains, the user willhave the option to create it in 12d. If it is created only the pit will be added and not the pipes.

Why Do I get ILLUDAS pits?

The bypass pit is blank. There must bypass pit for the water to go to. Bypass flow strings must pass within 1 pit diameter (beware pits with zero manhole diameters) and you can enter them manually.

The pit type selected has no capacity curves in the drainage.4d file. The curve names become the pit family for the export to Drains. No pit family means ILLUDAS.

If you are intentionally using a drainage.4d file with NO inlet capacity curves, the pit families you set in Drains will be remembered by 12d when you import back into 12d. The inlet capacity curves will not be required for your next export to Drains.

Drains Interface Overview

The Drains program performs the rational or ILSAX hydrology calculations as well as hydraulic grade line calculations that determine pipe sizes and pipe invert levels.

The data sent to Drains includes

pit names and types, easting and northing data with surface levels

finished surface profile along the centre line of the pipes

Headwalls and their levels

optional - bypass inlets, road grades/crossfalls and **SAG Inlet Calculations** (ponding volumes and depths). Pit family selection using road grade and crossfall data.

optional - composite catchment area create from three12d areas per inlet (must alter the mapping file)

catchment characteristics, k values and overland travel times

pipe sizes, type and invert levels

Data is copied from 12d to the Windows clipboard and then pasted into Drains **(Edit=>Paste data from spreadsheet)**. 12d can not delete any objects in Drains, it can only add and update.

The Drains menu selection **Run=>Design** is used to design the network. Once the drainage network has been designed in Drains the updated design data (**Edit=>Copy data to spreadsheet)** and/or the hydraulic results (**Edit=>Copy results to spreadsheet)** are sent back to 12d via the clipboard.

Always copy the DATA to 12d before the results as the results are deleted inside 12d with every update of the data!

Catchment Data

Drains has one catchment per inlet and therefore only 12d's catchment set one is used in the interface. The 12d catchment is split a pervious (grass) area and an impervious (paved) area using the percent impervious fraction. The rational and ilsax spreadsheet export formats (selected in the import/export panel) are different.

The Rational format of the Drains interface does not export Drains "more detailed data". The ilsax format does support the "more detailed data" format but the user must define the length, slope and roughness in the catchment panel. No 12d DNE default data will be exported. As 12d does not have a supplementary area this data will have to be entered into Drains. Gutter lengths and slopes are calculated from the upstream section of the longest overland flow path entering the inlet.

Supplementary data entered in Drains will be remembered in 12d for the next export. The grassed percentage for the next export is calculated as the (100 - % impervious - % supplementary).

Synchronising the Drains database and the drainage.4d file.

The 12d pipe types are always used to interface with Drains. Ongrade or SAG pits will be created for export to Drains if the 12d pit has a bypass pit, road grade and a pit type with inlet capacity curves. If all three are not present it will be exported as an ILLUDAS pit.

Every Drains file begins with a default database and Drains uses that database for the life of the project. This database must by synchronised with the **drainage.4d** file in 12d to ensure the Drains pit families, pit sizes, pipe types and overflow route types match. Therefore it is highly recommended that copy of the drainage.4d file be kept in the 12d working folder.

The Drains and 12d data must match as follows.

Drains database	**drainage.4d**
Pipe type	Pipe type entries
Only if bypass flow is required	
Drains database	**drainage.4d**
Pit size	Pit type
Pit famly	ongrade or sag curve names
Overland route database	default in mapping file

Note: If Drains is to be used to select the pit size then an exact match in pit types is not required. For this case the 12d pit type need only be the prefix of the Drains pit size.

The following 6 steps will help ensure 12d is synchronised with Drains. More details are given in the sections below.

1)Prepare the Drains Pit Database

IF 12d is to select the Drains **Pit Size**, then the Drains **Pit Size** and 12d **Pit types** have to match, exactly! If Drains is used to determine the pit size then you may skip this step.

The pit databases supplied by Drains often have road grade and/or crossfall attached to the end of the pit size. **THIS EXTRA DATA MUST BE REMOVED**!

For example, in Drains database you may find the following

Pit family	Pit size
NSW RTA SA Inlet, 3% crossfall, 1% grade	SA1 (Type 2) - 1% longitudinal grade
and	
NSW RTA SA Inlet, 3% crossfall, 3% grade	SA1 (Type 2) - 3% longitudinal grade

The pit size for both is the same, **SA1,** but 12d can not tell this because of all the extra data at the end. In Drains, simply remove the extra information so that they are both **SA1**. If the network already exists in Drains, then Drains will automatically change the names of the sizes you have already selected. No time lost here.

Once you have changed the Drains pit size names, you are ready to use the **Drains to drainage.4d** routine to create a drainage.4d file that is synchronised with Drains.

2)Export the Drains database from your Drains file

Inside Drains Open your drains file or begin with a blank file. Select **Project=>Overflow Route database**. Then select **OK** and then **YES**. This will cause Drains to export the database to the file "Drains Connection Data.txt" and store it in the folder with the Drains program.

3)Create a drainage.4d file from the Drains file

From the 12d menu select **Design->Drainage-Sewer->More->Drains to drainage.4d**.

Select **Copy Drains database** to copy the file to the 12d working folder.

select **Create drainage.4d.** The Drains database dump file is copied to the 12d working folder and a drainage.4d file is created in the 12d working folder.

More details below.

4)Edit the drainage.4d file

From the 12d menu select **Design->Drainage-Sewer->More->Edit drainage.4d**. Select **Find** then edit from the file **more info** button. Set the road grade and crossfalls for the 12d pit groups.**More details below.**

5)Restart 12d

From the 12d menu select **Project->Restart**.

6)Set the Overflow shape, Update Pit and Pipe types (Optional)

If the network has already been created using pit and pipe types that no longer exist in the drainage.4d file, they will have to be updated before the export to Drains can occur. You may update them using the drainage network editor (one at a time) or you may set **all** of the pit and pipes types to **one value** using this routine.Later you may change them individually using the **Drainage network editor**

This routine will also set a default overflow route shape for export (values can be modified in the Drains program if desired).

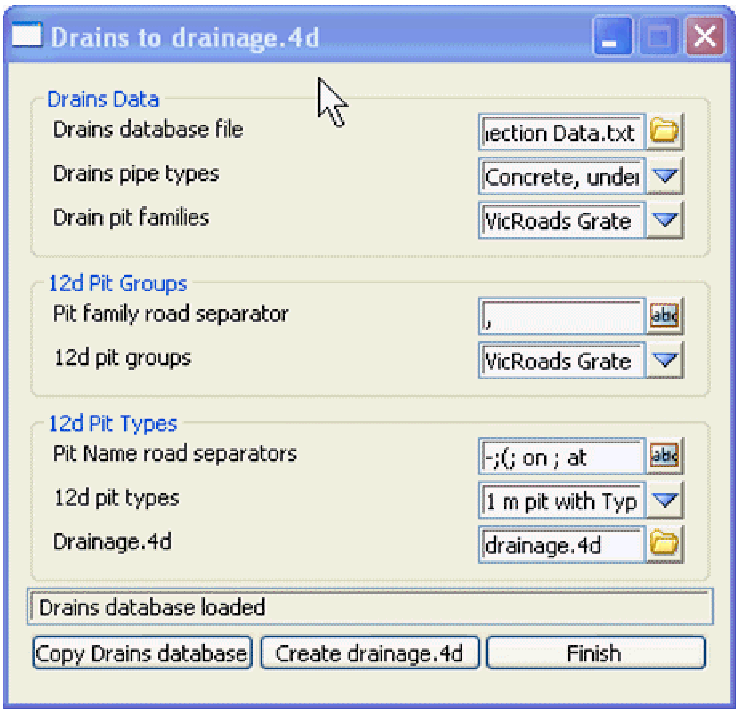
From the 12d menu select **Design->Drainage-Sewer->More->Drainage io defaults.**

More details below.

Drains to drainage.4d file

Position of option on menu: **Design =>Drainage-Sewer =>More=>Drains to drainage.4d**

On selecting the **Drains to drainage.4d** option, the **Drains to drainage.4d** panel is displayed.



Key Points

When you are finished, open the drainage.4d file and check the road grade and crossfall values for the ongrade curves!

If Drains is used to selected the pit sizes
then the 12d pit type must be the prefix of the Drains pit size (**Pit Name road separators** are used).

If 12d is used to select the pit sizes to export to Drains, the Drains **Pit Size** and 12d **Pit types** have to match, exactly! The pit databases supplied by Drains often have road grade and/or crossfall attached to the end of the pit size. If pit sizes are to be sent from 12d, **this must be removed**! Find **Prepare the Drains Pit Database** for more details.

Select **Copy Drains database (12d will search the usual locations for the Drains database).**

Review the **Drains pipe types** and **Drains pit families** lists to ensure you have the correct database.

12d pit groups are not used in Version 8.

Pit Name road separators can only be used if **Drains** is selecting the pit types. If 12d pit types are to be exported to Drains, this field should be left blank. If you change these entries you must press the enter key to update the **12d pit types** list below.

Check the **12d pit types** and if they are acceptable select **Create drainage.4d.**

The Details

YOU MUST RESTART 12D FOR THE NEW DRAINAGE.4D FILE TO BECOME ACTIVE!

Field Description	Type	Defaults	Pop-Up
Drains database file	file box	Drains Connection Data.txt	

You must update this file from Drains before each use of this panel. Inside Drains select Project=>Overflow Route database. Then select OK and then YES. This will cause Drains to export the database to the file “Drains Connection Data.txt”.

Selecting **Copy Drains database** will cause the panel to search for the database dump in the folders **C:\Program Files\Drains\Program** and **C:\Program Files\Drains\Demo\Program**. If the Drains program is installed in another folder then you must browse for the file. The file will be read and the panel updated with eother selection.

Drainage.4d file box drainage.4d

The drainage.4d will be created in the 12d working folder unless otherwise specified. It will only be used for 12d projects in this folder.

Pit families choice box Drains pit families

These are the Drains pit families that will be exported to the drainage.4d file. These will become the names ongrade inlet capacity curves for all the pit sizes that belong to the family. The pit family name will be searched for words like **grade**, **slope** etc to try to determine the values for road grade and crossfall for the 12d capacity curves.

Pipe type choice box Drains pipe types

These are the Drains pipe types that will be exported to the drainage.4d file.

Pit group separatorinput box

Pit groups are not used in Version 8. These characters will be used to remove the road grade crossfall data from the **Pit families** above. The data before this character will become the **12d pit groups.** Press **Enter** or select **Read Drains database** to create a new list of **12d pit groups.**

12d pit groups choice box 12d pit groups

These are created from the Pit family list above by deleting all text after the **Pit group separator**.

Create drainage.4dbutton

Create a drainage.4d file.

Editing the Drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Edit drainage.4d

On selecting the Edit drainage.4d option, the Edit drainage.4d panel is displayed.

Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

The drainage.4d file contains Manhole and Pipe commands. 12d also uses the Manhole commands to specify a pit group by using the prefix “group”. Details follow.

Headwalls

The pit type “Headwall” (case sensitive for Drains) is reserved for the inlet headwall for a conduit. Drains does not use this for an outlet headwall.

If the inlet type is On Grade or there is no bypass pit, the grate level is exported as the Drains surface level. If the Inlet type is marked as a SAG pit then the surface level will be calculated from the low point on the catchment string (catchment set #1). Also see **SAG Inlet Calculations**.

Pit Families

Version 2+ of the Drains clipboard interface uses a **pit family** to describe the kerb shape and optionally, the name include the road crossfall and/or grade attached as a suffix.

An example pit group is the drainage.4d file is shown below.12d uses the road grade and/or the road crossfall to select which pit family should be sent to Drains. In this example the road crossfall would not be used in selecting the pit family.

It is up to the user to decide the grade when the next pit family should be used. In this case the threshold value for the gutter grade is set midway between the published values of the inlet curves. For example at a gutter grade of 2% 12d starts sending the ***NSW RTA Pits - 3% slope*** pit family.

The pit families listed on the right must match exactly with those in the Drains pit database.

Pit Types and Pit Sizes

Each Drains **pit family** has several **pit sizes**. The Drains **pit sizes** link to the12d pit types and therefore all Drains **pit sizes** should exist in the 12d drainage.4d file.

The **pit size** will be read back from Drains into 12d as the **pit type** so that it can be placed on the drainage long sections and pit schedules. If no matching pit type is found in 12d then a character will be dropped off the end of the Drains pit size and 12d will be searched for the new shorter pit type. This will be repeated till a match is found (or there are no more characters in the Drains pit size).

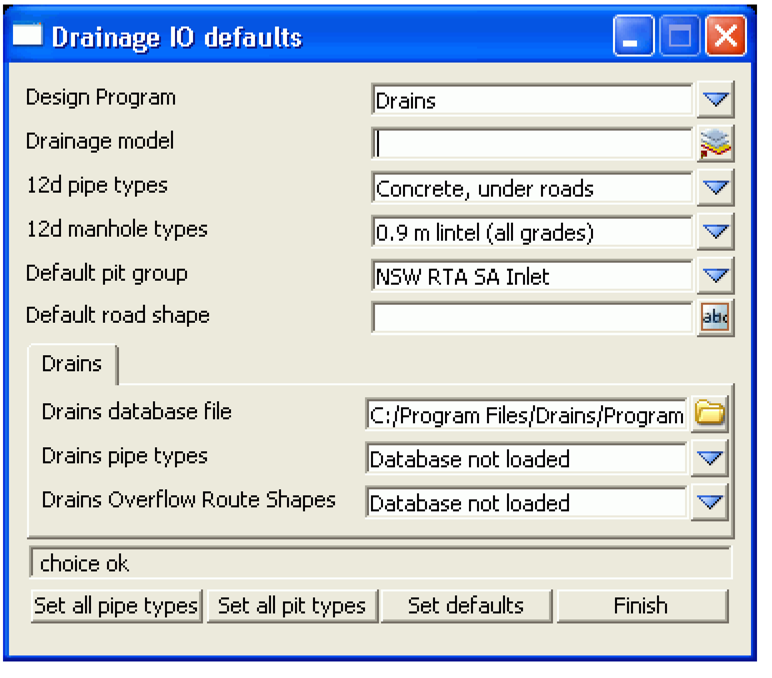
Pipe Types

The pipe type selected in 12d must exist in the pipe database inside Drains. Simple “2” for class 2 or “RCP “do not exist in Drains.

Setting the Overflow Route, the Pit and Pipe types

Position of option on menu: Design =>Drainage-Sewer =>More=>Drainage IO Defaults

On selecting the Drainage IO Defaults option, the Drainage IO Defaults panel is displayed.



The routine changes ALL of your pit and pipe types in a model to a single value. If you have changed your drainage.4d file after creating you drainage network, the pit and pipe types you originally selected may no longer be valid (i.e. in the drainage.4d file).

Field DescriptionType Defaults Pop-Up

Design Programchoice Drains Drains, PCdrain

The drainage model to be updated.

Drainage modelfile

The drainage model to be updated.

12d pipe types choice values from drainage.4d

Set all pipe types will set all pipes in the model to this value

12d pit types choice values from drainage.4d

Set all pit types will set all pits in the model to this value

Default pit groupschoice values from drainage.4d

pit definitions in the drainage.4d file that have **group** as a prefix are included.

Default road shapechoice values from drainage.4d

type the desired name or if using Drains select the desired shape from the **Drains Overflow route shapes**.

Drains Tab

Drains database filefile

pressing enter in this field will start a search for the Drains database dump. The search path is the specified folder, C:\Program Files\Drains\Program then C:\Program Files\Drains\Demo\Program. If the file is found the choice fields below are populated. **It is highly recommended that this file be in the 12d working folder.**

Drains pipe typeschoice l values from Drains file

the pipe types are retrieved from the last Drains database dump. Changing this value will update the **12 pipe types** above.

Drains Overflow Route Shapeschoice values from Drains file

the overflow route shapes are retrieved from the last Drains database dump. Changing this value will update the **Default road shape** above.

Set all pipe typesbutton

all pipe types in model are set to this value

Set all pit types button

all pit types in model are set to this value

Set defaults button

the defaults for the **Drains Overflow Route Shapes** and **12d pit group** are set

Finish button

removes the panel

Drains Version 2+ Requirements

Pit Names

The 12d pit names cannot be more than 9 characters long. 12d uses 2 additional characters to the pit name at export time create names for the pipes, overflow routes and catchments. For example pit “A-1” will have a bypass route “F A-1”, a catchment “C A-1” and a downstream pipe “P A-1”.

Bypass Flow (Overland Flow Routes)

There are 3 requirements for Drains bypass flow (bypass pit, pit inlet capacity curve and road grade/crossfall).

Select a **pit type** that has ongrade or sag inlet capacity curves defined in the drainage.4d file. The Drains and 12d databases must be in sync.

Bypass strings in the **Bypass route model** specified (Network editor->Global->Utility Models->Bypass flow model. For more details see **Bypass Flow.**

Road grade and crossfall calculated (Network editor->Global->Utility Models->Road design file)

The overland flow strings are not allowed to pass through the outlet pit on the network.

SAG Inlet Calculations

SAG inlets are inlets where the water ponds at the surface rather than flowing past. If a SAG inlet has a catchment string the overflow depth and volume are calculated. The catchment string from Set #1 is draped onto the design tin and the lowest point in found on the draped string (stored as a 12d pit attribute ***overflow level***. The storage volume inside the string up to this point is measured and stored as a 12d pit attribute ***overflow volume from level***. and are subtracted from the to determine

The Max Ponding Depth = **overflow level**- **grate level**

If the **manual flag** is selected for the "sag pit pond depth", 12d will NOT calculate the value but will use the value entered by the user. 12d will check if a volume has been calculated before or imported from Drains. If the volume exists then it is exported. If it does not exist, this ponding depth will be used calculate the ponding level (depth + grate level). The ponding level will be used to calculate a ponding volume from the design tin and the catchment boundary.

If you want to manually delete this volume and force 12d to recalc to volume using the user defined level, delete the pit attribute, "overflow volume from level". To delete the attribute use Strings->Properties->Attributes, select the pit, go to the pit tab, right mouse select the row with this attribute and select delete).

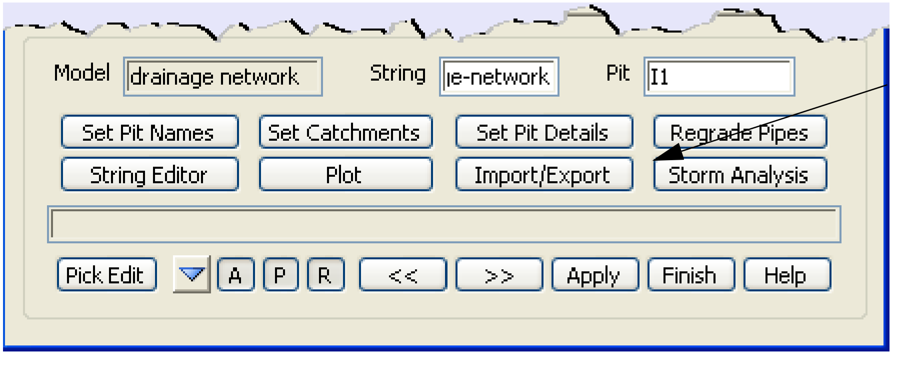
Results

Drains exports the maximum data from all of the rainfall events analysed. Therefore, ensure you analyse only the rainfall events desired before coping the results to the clipboard. To verify the data that is being sent to 12d, copy the data into a spreadsheet so you can view it there first. The pit sizes selected in Drains will be stored in 12d as the pit type. Therefore the pit sizes in Drains should exist as pit types in the drainage.4d file. If pit families are changed in Drains the pit group in 12d will be updated by search for the pit family in the drainage.4d file.

12d to Drains

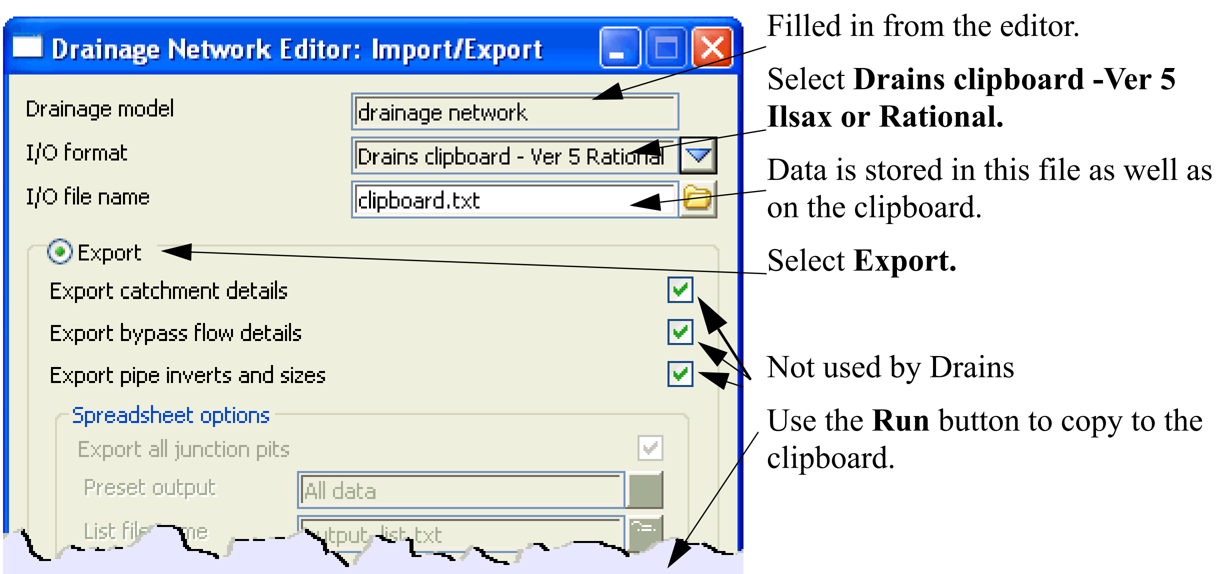
Setup your drainage network models and ensure they have been assigned pit names.

Copy the data to the clipboard



From the Drainage network editor select the **Import/Export** button.

The following interfaces dialogues will appear.



From within the Drains program select **Edit =>Paste data from spreadsheet**. If you paste the data into a Drains project that has a hydrological model and rainfall data already defined the project will be ready to run.

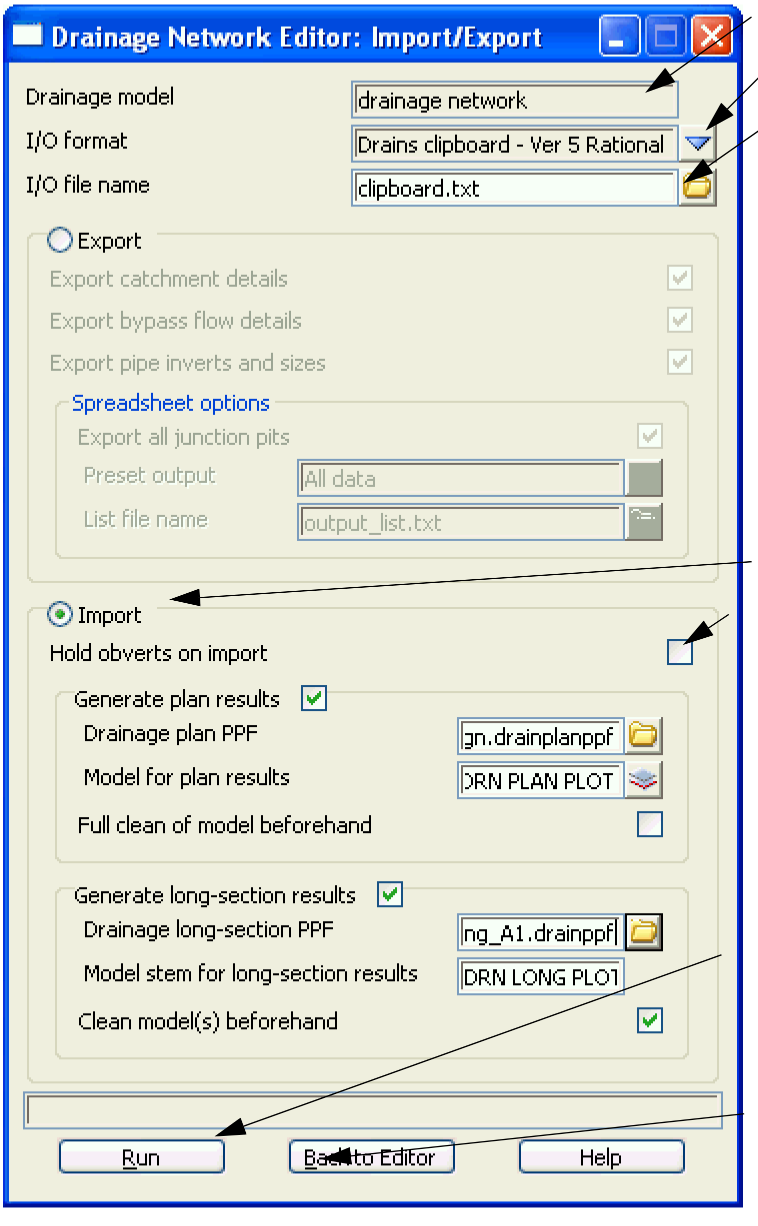
Use the Drains Run=>Standard design to design your pipe sizes and invert levels. The Run=>Advanced Design will select the size of the pits as well.

Drains to 12d Update

The following steps are required to update the 12d model with the Drains hydraulic results and changes to the pipe sizes and inverts.

To update the pipes and invert levels in 12d, select **Edit->Copy Data to Spreadsheet** from the Drains menu.

From within the 12d Drainage network editor select **Import/Export**.



Filled in by the editor.

Select Drains clipboard - Version 5

Leave as clipboaard.txt

Select **Import**

This will ignore the invert levels read from Drains and the current pipe obverts will remain fixed.

Plan and long section drawings may be created at the import time so that you can see the results on the drawings.

Select **Run** to update the drainage model. To see the changes in the section views you will have to select **Regen** on the section view toolbar.

To return to the network editor select **Edit**

IMPORTANT: THE DATA MUST BE PASTED BEFORE THE RESULTS!

12d erases the hydraulic and hydrology data when the physical data is updated. Therefore, always paste the data before the results.

Drains Mapping File

The rational format and the ilsax format have separate mapping files.

The Drains spreadsheet format consists of sections starting with a header, then the data area and ending with a blank line. The mapping file defines the format of the section headers and the format of the data within the sections

	A	B	C	D	E	F	G	H	I
1	PIT / NODE DETAILS			Version 9					
2	Name	Type	Family	Size	Ponding	Pressure	Surface	Max Pond	Base
3					Volume	Change	Elev (m)	Depth (m)	Inflow
4					(cu.m)	Coeff. Ku			(cu.m/s
5	A2	Node	Sutherlan	0.85 m lint	1	1	26.451	0	
6	A3	OnGrade	Sutherlan	0.85 m lint	1	1.2	27.194	0	
7	A4	OnGrade	Sutherlan	0.85 m lint	1	1.2	27.92	0	
8	A5	OnGrade	Sutherlan	0.85 m lint	1	1.2	28.872	0	
9	D1	Sag	NSW RTA	SA1	1	2	28.492	0.068	
10									
11	DETENTION BASIN DETAILS								
12	Name	Elev	Surf. Area	Init Vol. (c	Outlet Typ	K	Dia(mm)	Centre RL	Pit Famil
13									
14	SUB-CATCHMENT DETAILS								
15	Name	Pit or	Total	Paved	Grass	Supp	Paved	Grass	Supp
16		Node	Area	Area	Area	Area	Time	Time	Time
17			(ha)	%	%	%	(min)	(min)	(min)
18	C A2	A2	0.039	80	20	0	5	10	0
19	C A3	A3	0.0408	80	20	0	5	10	
20	C A4	A4	0.0705	80	20	0	5	10	

The headers in the mapping file define the exact text to be exported in the Drains section headers. During an import the first 4 columns of the Drains header are compared to the headers in the mapping file to determine which section is being read. The data format line is then used to decode the the data.

22.10.15 PCdrain Requirements

See also Drainage overview

Basic Check List

1. All manholes must have a unique name
2. Only one outlet allowed in the drainage model
3. First export should have **“Export default catchment/pit/overland parameters”** selected
4. Pit types in used in 12d must exist in the PCdrain Inlet gully file selected.

Overland flow with Inlet Capacity Check List

1. A gutter profile named “4d” must exist in PCdrain before the interchange file is read. This gutter profile may be created in PCdrain from the menu selection **Data=>Gutter profiles** then **New.**
2. Overland flow lines must be within 1.0 metres/feet of the manhole

Data is exchanged to and from PCdrain via the interchange (*.int) file. Gutter profiles and inlet type must be specified in PCdrain before the interchange file is read into PCdrain.

The data sent to PCdrain includes

- pit names and types, easting and northing data with surface levels
- pipe deflection angles at pits
- finished surface profile along the centre line of the pipes
- optional - crossing services - level, size and location along the pipes
- optional - bypass inlets, road grades and SAG inlet ponding depths
- optional - up to 2 catchment areas per inlet
- optional - default catchment characteristics, k values and overland travel times
- optional - pipe sizes and invert levels

22.10.15.1 PCdrain Requirements

Pit names

The pit name from 12d is assigned to both the structure and catchment name in PCdrain. These names cannot exceed 7 characters.

Pit type

The 12d pit type is transferred to the structure type in PCdrain. These names must match those specified in the PCdrain Inlet charts selected (**Data=>Inlet charts**). Select the desired inlet charts BEFORE importing the interchange file.

12d pit types with an “S” in the name are treated by 12d and PCdrain as a SAG inlet pit. 12d will strip off all characters after the “S” before adding the ponding depth. If a catchment string in set #1 is available for the SAG pit then the ponding depth will be calculated.The12d pit type will remain unchanged. A typical example would be a pit type “1TC” with the sag tick box on would become “1TC0.100” if a ponding depth of 0.1 was calculated.

Bypass Flow

When a catchment string is specified for the pit, the maximum depth before bypass flow commences is calculated. The lowest point on the catchment string is determined by draping it onto the drainage strings tin. The maximum depth before bypass is calculated pit setout level less the setout to grate offset less the lowest point on the catchment string.

PCdrain differentiates between pits (no surface inflow) and gully pits via the 12d pit type. The bypass flow strings can only be drawn within 1 pit diameter of the gully pits. Keep the bypass flow strings away from the PCdrain pits.

Catchments

Again, since PCdrain differentiates between inlets and manholes (using the 12d pit type), ensure that catchments are only drawn for gully inlet and NOT manholes.

12d to PCdrain Pit Data

Pervious	Slope	Grade of overland flow

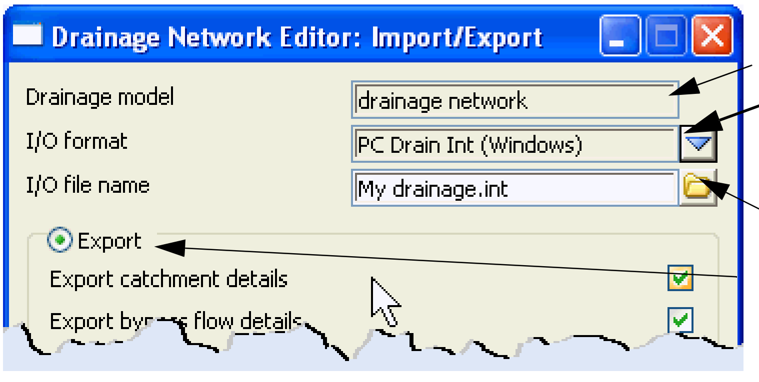
Perviouus Impervious	12d	PCdrain
Impervious	Length	Length of gutter
Impervious	Slope	Grade of Gutter

22.10.15.2 12d to PCdrain

1. Export the data to PCdrain selected via the Network editor

   Design=>Drainage-Sewer=>Drainage Network Editor

After selecting the drainage network, select the **Import/Export** button and the following dialogue will appear.



The drainage model will be completed by the editor.

Select **PCdrain Int (Windows)** from the drop down list.

Enter the name of the int file to be created.

Select **Export**.

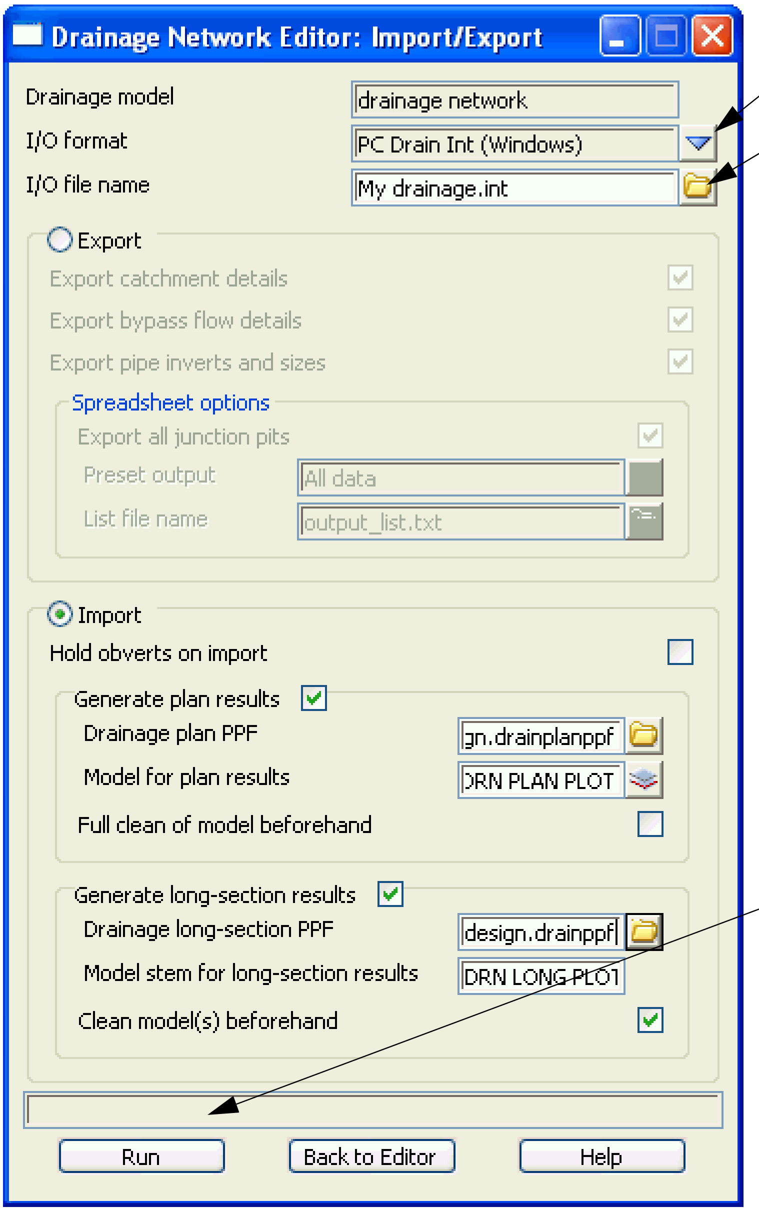
Select the **Run** button and the interface file will be created.

2. Launch the PCdrain for Windows program. If you have a project set up with the design parameters, rainfall data, inlet charts and gutter profiles then open it now and skip to step 8. Otherwise continue with step 5.
3. The Design Parameters can be set as desired with the menu selection **Data=>Design Parameters**.
4. Select the rainfall data using the **Data=>Rainfall** menu selection.
5. Select the inlet charts using the **Data=>Inlet Charts** menu selection. The pit types specified in 12d must be included in these settings. **More - PCdrain to 12d pit converter**
6. At least one gutter profile in PCdrain needs to be defined. These are set through the menu selection **Data=>Gutter Profiles**. The default gutter section name (**Road ID)** from 12d is **4d** and therefore it is recommended you create a profile with this name and your own description. If you have changed the profile names in 12d (through the spreadsheet interface or the Attribute editor) these new profile names will have to exist in PCdrain.
7. Save this file now so that you can retrieve it later if required. It can be used as a starting template for new jobs.
8. **File=>Import** from the menu. Select the file exported in step 1. The information from 12d may be viewed by selecting **Data=>Network** and then selecting the desired tabs.
9. The HGL level and the pipe elevation at the outlet should be set using the menu selection **Data=>Outlet.**
10. If you have not exported pipe data then the pipe size must be determined. Use the menu selection **Process=>Select Pipe Sizes.**

22.10.15.3 PCdrain to 12d

Export the results to 12d using the **File=>Export** menu selection. Note the name of the interchange file you are creating as you will need to enter it inside 12d.

Return to 12d and select **Import/Export** from the network editor and the following dialogue will appear,



Select **PCdrain Int (Windows)** from the drop down list.

Select the output file name you created in PCdrain.

Select **Run** and the file will be read into 12d and the drainage network will be updated. To see the changes in a section view, select **Regen.**

A listing of the data imported is stored on the 12d output window.

Inlets that have been specified as SAG inlets will have the ponding depth removed from the end of the PCdrain structure type before the data is stored as the12d pit type.

22.10.15.4 RAT2000 Requirements

See also Drainage overview

Basic Check List

1. All manholes must have a unique name (they become nodes in RAT2000)
2. Only one outlet allowed in the drainage model
3. First export should have **“Export default catchment/pit/overland parameters”** selected
4. First export should have **“Export pipe diameters and Inverts”** selected
5. Outlet conditions must be set in RAT2000.

6. Start-up data may be specified in the file **drainage startup.xpx** (the standard 12d system file path will be searched).

Overland flow with Inlet Capacity Check List

1. Overland flow lines must be within 1.0 metres/feet of the manhole
2. If inlet capacity curves are to be used then the curve name must match the 12d pit type with the road grade/crossfall data added.

23.0 Running RAT2000

Data is exchanged to and from RAT2000 via the interchange (*.xpx) file. The data exported from the 12d drainage model is appended to the xpx startup data specified in the file **drainage startup.xpx** (the standard 12d system file path will be searched). This file may be edited using a text editor or you may create your own default file by exporting your RAT2000 global data this file.

RAT2000 Requirements

Manhole names

All manholes will become nodes in RAT2000 and therefore they must have a unique name inside 12d.

Manhole Types

The manhole types are used to determine the pit inlet capacities if overland flow routes are selected. Fixed inlet capacities values may be set in the drainage.4d file while inlet capacites curves must be included in the drainage_startup.xpx file. The range of available curves for 12d to choose from are set in the drainage.4d file and the curves are determined using the pit type, road grade and road crossfall.

Pipe Types

Pipe types are not transfered to RAT2000.

Overland Flow

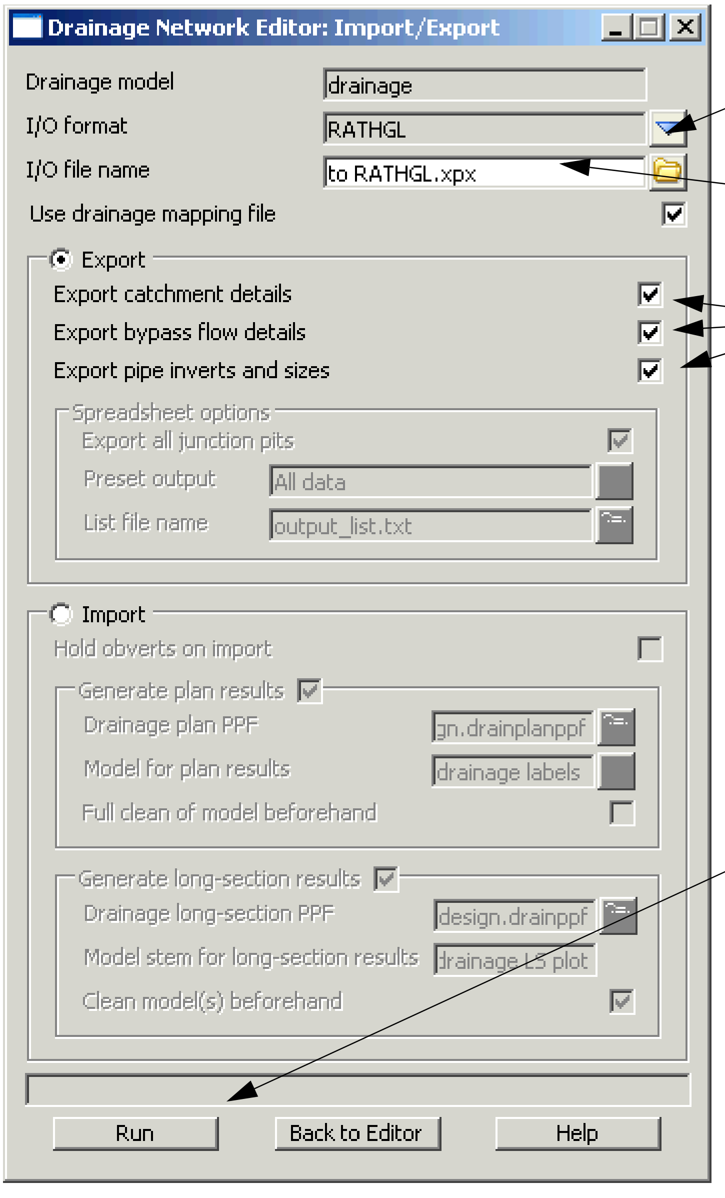
When an overland flow model is selected the pit inlet capacities and bypass routes are calculated.

23.1 12d to RAT2000

1. Export the data to RAT2000 by selecting

Design=>Drainage-Sewer=>More=>Pit/Pipe Design Interface

The following dialogue will appear.



Select RAT2000 from the drop down list.

Enter the name of the xpx file to be created.

Optional.

Not supported in RAT2000.

See notes below on **Updating an existing RAT2000 file**

Select the **Run** button and several checks will be made on the drainage network at this time. The interface file will be created.

23.2 Updating an existing RAT2000 file

Adding new Nodes and Pipes

If new manholes and pipes have been added to 12d then these new entities will now be included in the xpx file and imported into the RAT2000 project. 12d identifies the nodes in XP by the node names. Therefore if nodes names are changed in either program then they must be manually changed in both programs.

If a manhole is to be inserted in an existing link then the existing link must be deleted in RAT2000 so that the new links and manholes may be created in the void.

WARNING! If the tick box **Export catchment/pit/overland flow default data** is selected for the update then any changes to these defaults in RAT2000 will be lost. Two options are available to the user.

Option 1 - Preferred method if updating pipe lengths, invert levels for your design.

De select the tick box and export the data. The new node and links created in RAT2000 will not have all the defaults set but the existing nodes and links will not have revisions to defaults over-written.

Option 2 - Preferred method if you have created numerous new links and nodes.

Leave the tick box selected but export the RAT2000 to a temporary xpx fle first. This will save the existing setting. After RAT2000 is launched and loaded with the new data, import your temporary xpx file you just created to restore the original data.

Deleting Nodes and Pipes

If a node or link is to be deleted then delete the entity from both 12d and RAT2000.

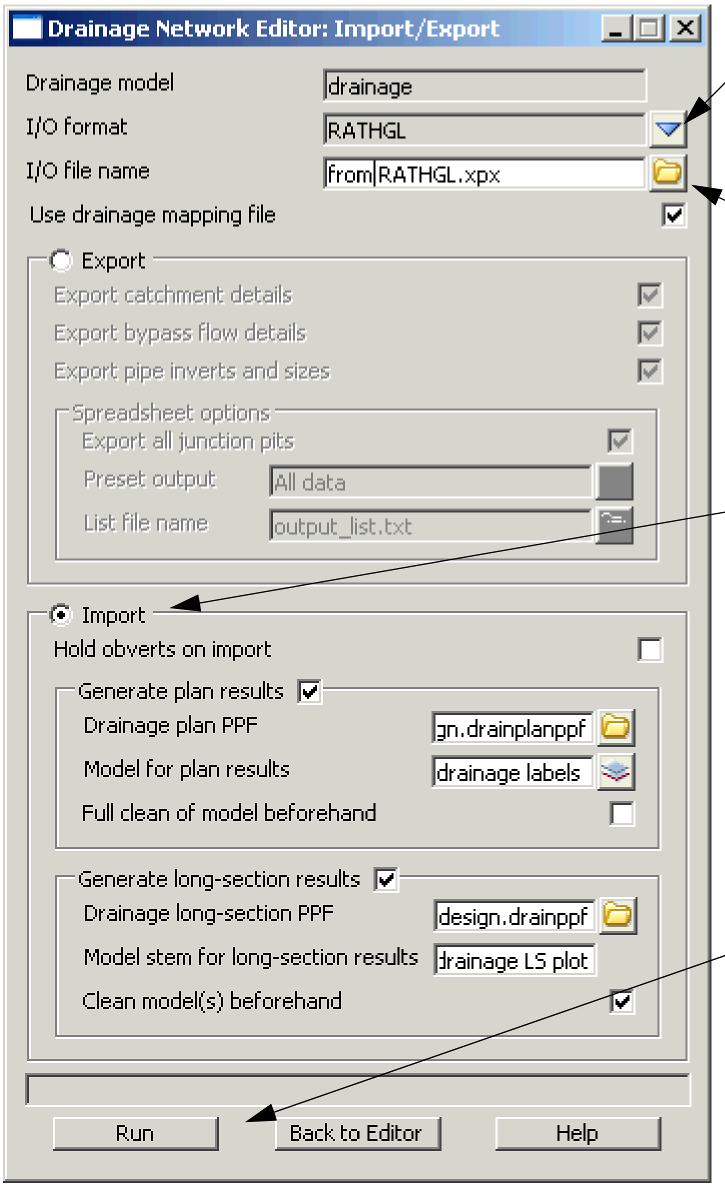
23.3 RAT2000 Results to update 12d

If RAT2000 is lauched automatically using option 1 above then as soon as RAT2000 is exited an interface file is automatically created (using the same name as the import xpx file). This file will now be read back into 12d to update the pipe network and import hydraulic results for drainage longsection plots.

Return to 12d and select

Design=>Drainage-Sewer=>More=>Pit/Pipe Design Interface

The following dialogue will appear,



Select **RAT2000**from the drop down list.

Select the output file name you created in RAT2000.

The remaining fields are not used for the import process.

Select **Import**

Select **Run** and the file will be read into 12d and the drainage network will be updated. To see the changes in a section view, select **Regen.**

23.3.0.1 XP SWMM Program Requirements

See also Drainage overview

Basic Check List

1. All manholes must have a unique name (they become nodes in XP SWMM)
2. Only one outlet allowed in the drainage model
3. First export should have **“Export default catchment/pit/overland parameters”** selected
4. First export should have **“Export pipe diameters and Inverts”** selected
5. Outlet conditions must be set in XP SWMM.
6. Start-up data (run times and hydrology data) may be specified in the file **master_drainage.xp** (the standard 12d system file path will be searched).

23.3.1 Running RATHGL/RAT2000 and XP-SWMM

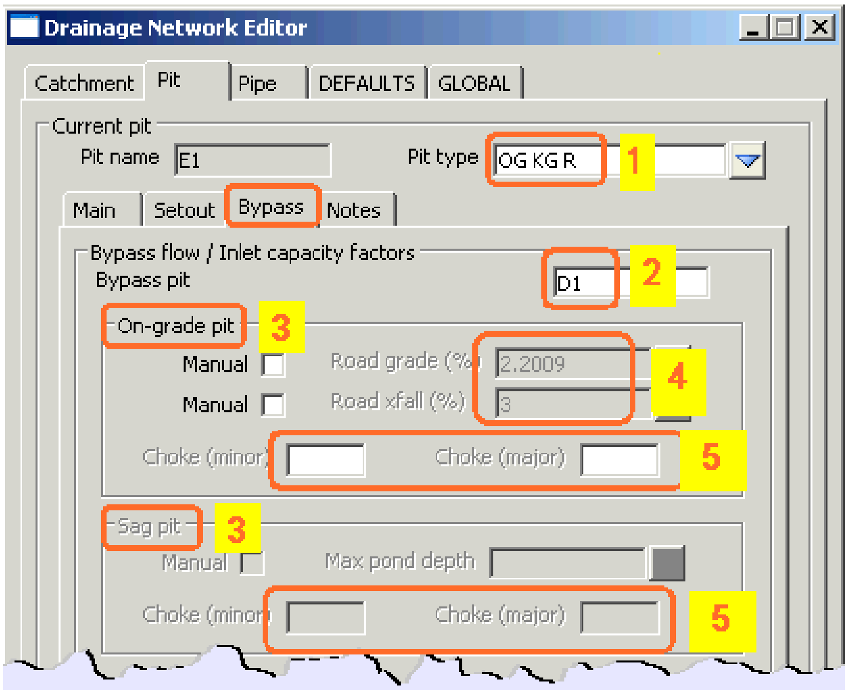
The drainage design with all three of the XP software programs follows the same methodology. The process is substantially automated with the XP-SWMM program so that the XPX file is automatically read by XP-SWMM and automatically created when leaving XP-SWMM.

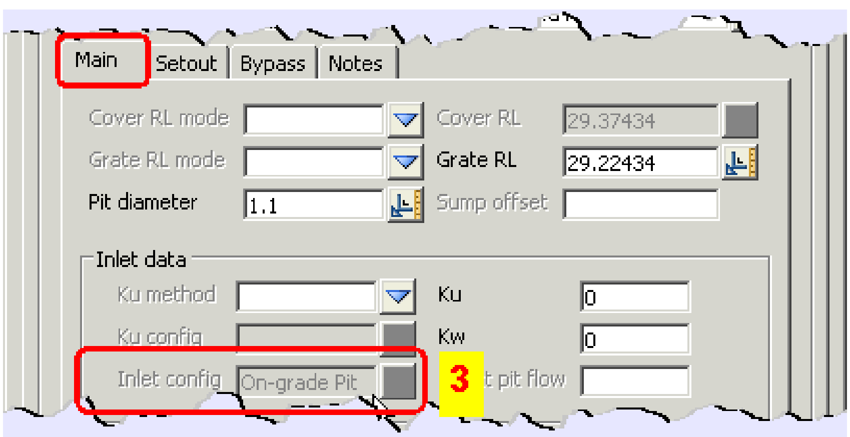
Drainage design with XP programs includes the following steps.

1. 12d creates an XPX file that is read by the XP programs.
2. The XP program is then run in the design mode to determine the pipe sizes and invert levels.
3. If bypass and overland flows are to be modelled then the inlet capacities need to be defined and then run the XP program in the Full Analysis Model.
4. The XP program creates an XPX file for 12d to import.

23.4 xpstorm and xpswmm bypass requirements

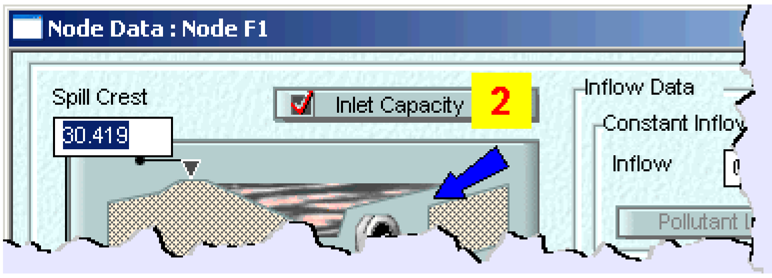
12d will select the inlet capacity curves for the xp programs when the following bypass settings are complete

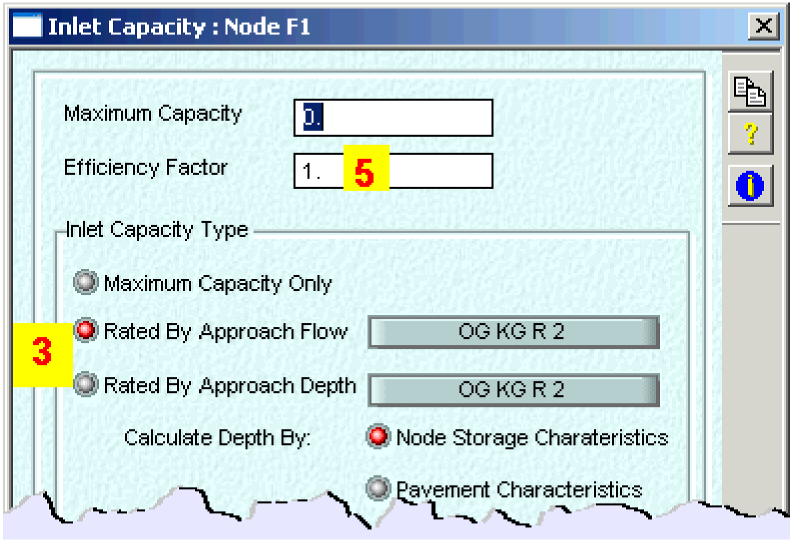




1. The 12d pit type determines the inlet capacity values or curves to be selected from.
2. The bypass pit must be defined for the pit. If the bypass pit follows the pipe network a xp-multi link with a natural channel is created. Otherwise a xp single link is created. The default xp natural shape is “Road Section”
3. The Ongrade/SAG pit on the Main tab determines whether depth or approach curves are exported to (details below).
4. If ongrade is selected then the 12d inlet capacity curves may be selected by road grade, crossfall, both or neither. (details below).
5. The 12d choke factors will be exported as the xp inlet effeciency factor (1 - 12d choke)

The numbers below relate the same numbers in the 12d panels above.





1.

2. Inlet capacity is turned on when 12d has a bypass inlet.

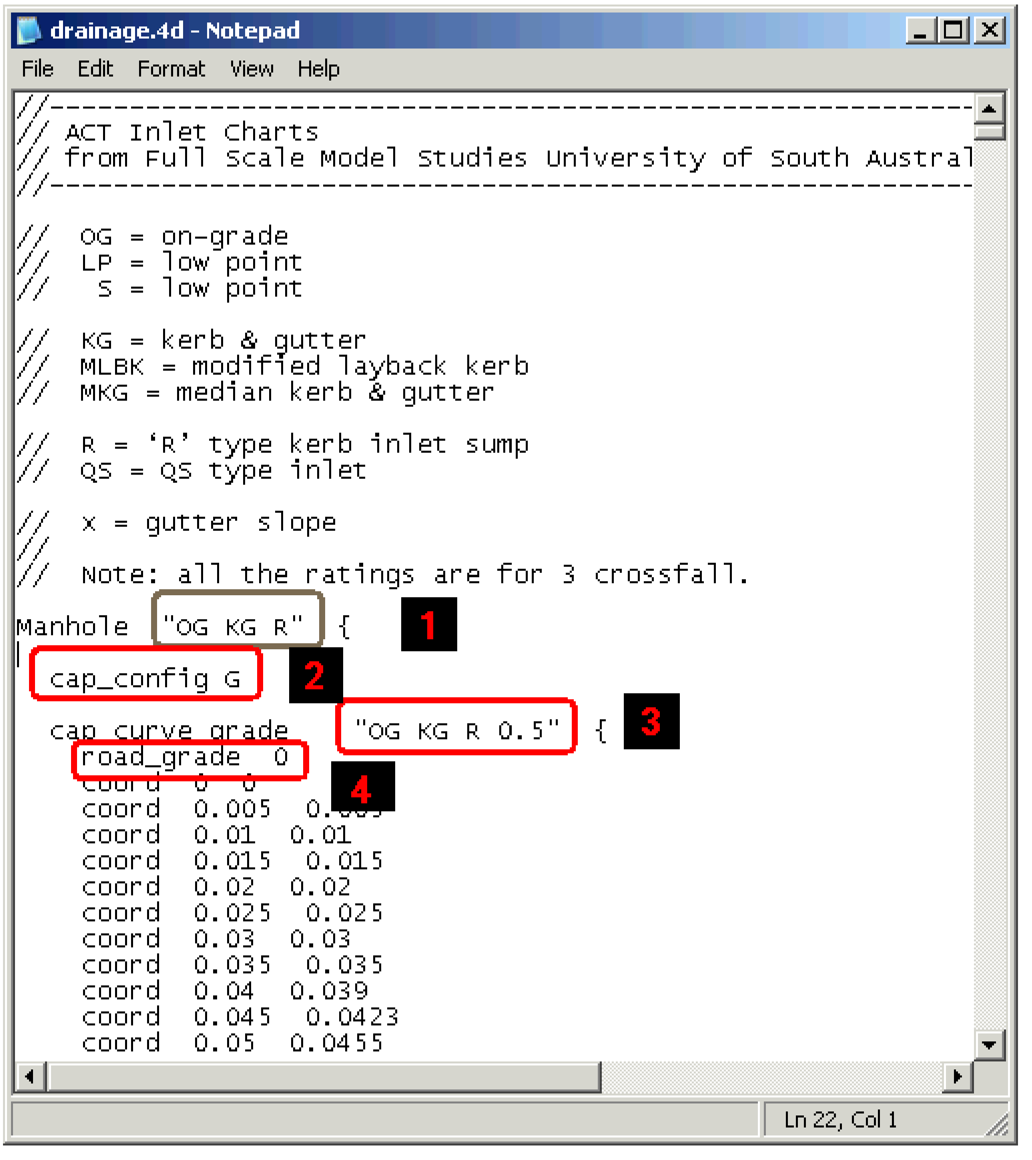
3. 12d **Ongrade** inlets export as **Rated by Approach Flow** and 12d **SAG** inlets export a **Rated By Approach Depth** with depth calculated by **Node Storage Characteristics.**

4.

5. The minor/major selection is the 12d export panel determines the effienciecy factors that are exported/ Efficiency factor = 1.0 - 12d choke.

12d Inlet Capacity Curve names

Below is an extract from the drainage.4d file for Canberra rating curves.



1. The manhole is the inlet type selected above.
2. cap_config G forces the inlet to be used as qa 12d ongrade inlet. An S would be SAG and an M a manhole.
3. The curve name indicated here is exported as the xp inlet capacity curve.
4. The curve name will be exported starting at road grade of 0. Since one curve has a road grade value all curves must have a road grade value and the user must have a road grade calculated on the 12d bypass tab.

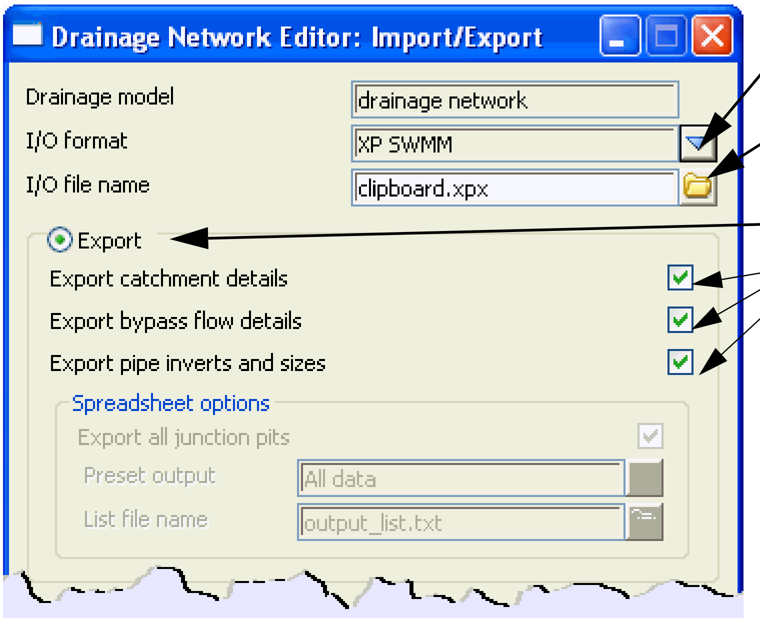
23.5 12d to the XP Programs

The x,y pit layouts and the cover/surface levels are obtained from your drainage network while the catchment and overland flow data comes from the models specified in the drainage interface dialogue.

The steps required to transfer the data to the XP programs are as follows.

1. Setup your drainage network models.
2. To create the XPX file for XP programs start the Drainage Network Editor and select **Import/ Export**

The following interfaces dialogues will appear.



Select **XPSWMM or RAT HGL** from the drop down list.

Enter the name of the xpx file to be created.

Select **Export**

Not used at this time.

Finally, Select the **Run** button to create the file.

If exporting to RAT-HGL the following dialogue will appear.

If you are using old versions of RAT-HGL (1996 or earlier) select use **Local** otherwise select **4D units** (eastings and northings).

Select process.

3. The XP SWMM program will automatically startup and load the XPX file.

   From within RAT-HGL, either select **File =>New** and follow the input prompt or load a file that contains all of the pit inlet rating curves, hydrological and design data without a pipe network. Many users have such RAT-HGL files setup so as to streamline the design process.

   The xpx file for RAT2000 will have the file startup.xpx added to it so that you may include all the startup global data that you require. The
   Fixed inlet capacities and rating curve names indicating road grade and crossfall may be set in the **drainage.4d** file. The format for these names is pit name-crossfall-road grade (ex SA2-3-4). These curves must exist in this file.
4. To read in the pipe file created above, select **Special =>Import Data** and select the xpx data file. Warnings will be given stating that several fields are inactive. This is expected as more data is sent to RAT-HGL than is needed at this time. Select the **Close Square** on the Help title area and the pipe network and catchments should now appear on the screen.
5. If you want RAT-HGL to redesign you network, change the analysis mode to Design mode by

selecting **Special=>Job Control** and **S**elect Design mode. Do not do this if you want to analyse the network you layed out in 12d (used for existing systems).

6. Select the rainfall events to design/analyse and the **LB** (twice) on **OK** to return to the layout. Now select the outlet and enter the starting tailwater levels.
7. Now you can run RAT-HGL (**Special =>Solve**).

23.6 XP Programs to 12d

Once you have your design finished, the following steps are required to update your 12d model. Your design may contain several return periods in the analysis (Rp1 to Rp7) but 12d reads only the results from Rp1. The following table is taken from the RATHGL output file (*.out extension) and the results indicated are read back into 12d via the xpx file.

```
HGL  PIPE  NETWORK  ANALYSIS  SUMMARY    RETURN PERIOD   5 YEARS
       PROJECT:12d DRAINAGE LAYOUT

 --------------------------------------------------------
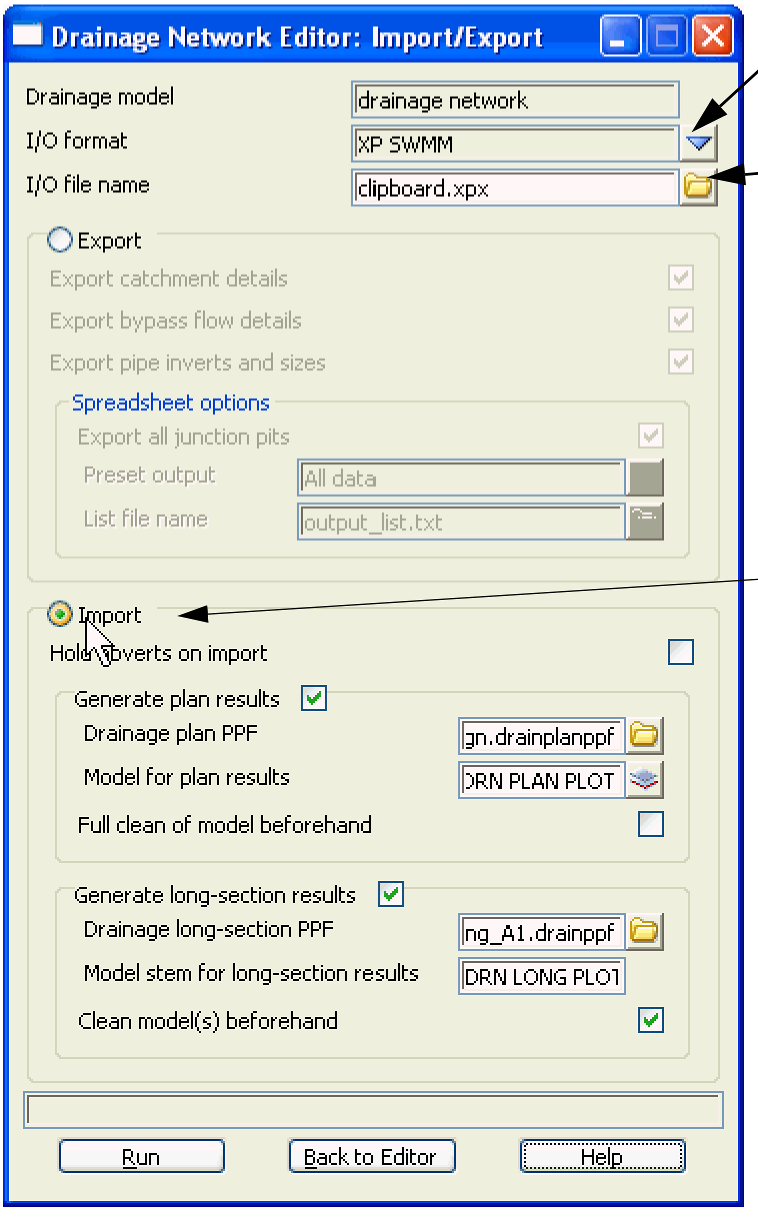
```

In addition to the results, the following input data is read back into the 12d model so that it may be exported back to RATHGL in the future (if required). 100% of your RATHGL data is not included in the XPX formats and the contents of the XPX file will depend upon your design mode. Therefore, use caution if you read an XPX file into an existing RATHGL model and check your data once inside RATHGL.

1. From within RAT-HGL, produce an XPX file for 12d to read by selecting **Special=>Export Data** and following the default prompts**.**
2. From within 12d, select the **Import/Export** button on the Drainage Network Editor.The fol-

lowing panel will appear.



Select to select **RATHGL** or **XP-SWMM**.

Select the file name specified in step 1

Select **Import.**

Select **Run** to update the drainage model and import hydraulic/ hydrological results.

23.6.1 Running Micro Drainage - WinDes

See also Drainage overview

Basic Check List

1. All manholes must have a unique name (they become nodes)
2. Only one outlet allowed in the drainage model
3. First export should have **"Export default catchment/pit/overland parameters"** selected
4. First export should have **"Export pipe diameters and Inverts"** selected
5. Outlet conditions must be set in Win DES.

23.7 Micro Drainage - WinDes Requirements

Pit - Pipe names

The pipe names are used in the WinDes interface NOT the pit names. Therefore the pipes are often named separately to follow the WinDES required naming convention.

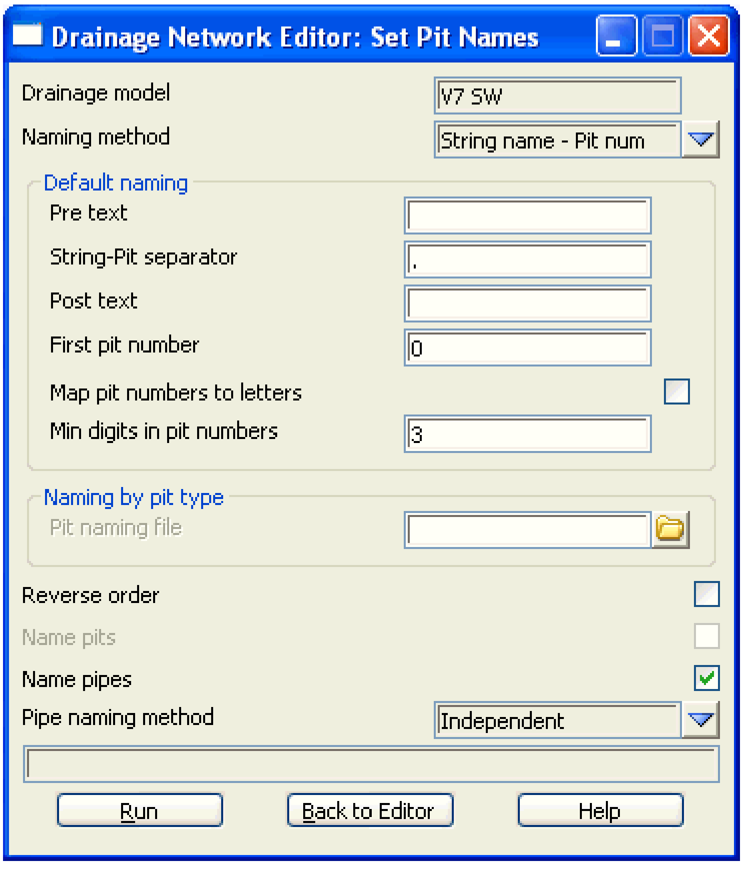
12d string names

The trunk line drainage string must be named "1" and then moving from upstream to down stream the branch line strings increase 2,3,4 etc. If the branch lines have sub branches then they are named in a similar upstream to downstream sequence. The sub branch string are named before moving downstream on the trunk line. If this string numbering system is not followed 12d will renumber the strings and request the user to run the drainage misc utilities to rename the pipes and pits.

12d pipe names

The trunk line pipe segments start at the upstream end at 1.000 and increase downstream (1.001, 1.002 etc). The assign pit names will automatically name the pits for you if you have followed the string naming convention discussed above. "Number of digits" must be set to 3 to ensure the leading zeros are used.

The panel below shows the naming convention.



12d pit names

The pit names may be set to any desired naming convention. Using the same names as the pipes makes the pit/pipe identification easier for the user but it is not required. As of April 2007 the maximum length is 8 characters but Windes is planning to remove this restriction.

The *.sws or *.fws files may be open directly inside WinDes.

23.8 Global /default variable mapping

The default 12d drainage mapping file maps the following Windes data

Windes	12d attribute name	pit, pipe or model	default value
Return period		model	
Time of entry		model	
UK region		model	
min grade		model	
min cover		model	
Outfall manhole name		pit	
Roughness method		model	
pipe file		model	blank. standard.pip
manhole file		model	blank. standard.mhs

23.9 Additional Notes

Pipe Resizing

Pipes are automatically resized when opened in Windes and the sizes used are from the specified *.pip file (standard.pip by default)

When locked pipe sizes are sent to Windes the pipe sizes can be increased but not made smaller.

Pit Resizing

Pit diameters are automatically updated by Windes depending on the size of the attached pipes. This resizing is determined by the Windes file, standard.mhs.

23.10 Open channel drainage design.

Win Des can (hydraulically) model any shape of conduit. The conduits are given numbers between 1 and 100. 12d selects these conduits by setting the **pipe type** to **WINDES** (case sensitive) and pipe diameter to the WinDes conduit number divided by 1000. (examples 0.032 indicates WinDes conduit 32).

12d can create the conduit shape by applying a template to the drainage string. The user must create a template with the same name as the WinDes shape number (32 for example). The templates are created from the main menu

Design->Template->Create Edit

For more information about template design please refer to the 12d training manual.

Once the template has been created it is applied to the drainage string to create the cross sections and strings to represent the conduit shape.

From the main menu **Design=>Drainage-Sewer=>User=>Drainage Volume Calculations**

For more information see **Drainage line excavation volume calculations**.

23.10.1 Drainage Excavation Quantities

Position of option on menu: Design => Drainage => Reports => Excavation Quantities

See Also

Drainage overview

This routine uses 12d templates to calculate the excavation volume for all of the drainage strings in a model. An option to create section for a tin on top of the pipe is also available so that the drainage long sections can include hatching between the obvert of the pipe and the design tin under roads.

Templates with names set to the pipe diameters (times 1000) are used for the calculations, thus trench shapes can be customised and over excavation for bedding materials can be included. Net area calculations to exclude pipe area are not supported.

Key points

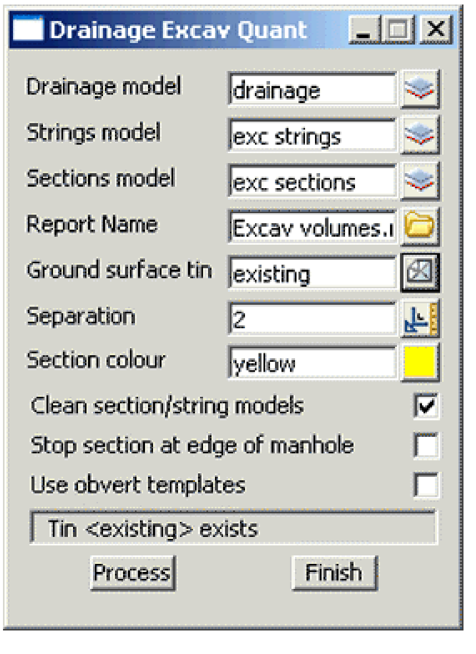
1. One template for each pipe size (mm)
2. If obvert templates are used, add the prefix “obvert “ to the pipe size
3. Carefully consider the tin selected.

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. A sample template library is included in the 12d library in the file **pipe_template.tpl**.

The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file.

If a tin is created from these strings then volumes by depth can be determined using **Design=>Volumes=>Exact=>Tin to tin**

On selecting the **Excavation quantities** option, the **Drainage Excavation Quantities** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Drainage model input box

Model to contain all of the pit and pipe network to be worked on.

Strings model model box

Strings generated from the templates will be stored in this model

Sections model model box

Sections generated from the templates will be stored in this model

Report name input box

cut and fill volumes will ne sent to this report

Ground Surface Tin tin box

tins from which the volumes will be calculated

Separation real box

distance between the sections

Sections colour colour box

Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)

Clean section/strings model tick box

Delete the strings in these models before processing.

Stop section at edge of pit tick box

Template are run from pit centre to centre if this is not selected. The templates stop at the edge of the pit if selected. This is often selected with the following option ***Use obvert templates.***

Use obvert templates tick box

Templates must be named with the prefix "obvert". i.e. ***obvert 300.*** *The template is still run along the invert of the pipe but the user now has a section "set" of templates that can be used to create a tin on top of the pipe as well as below.*

An example report file follows.

```
---------------------------- BEGIN APPLY TEMPLATE REPORT ------------------------------

 apply template to string report -

   string         E

ie excess of cut over fill         32.924

---------------------------- END APPLY TEMPLATE REPORT -----------------------------
```

23.10.2 Attribute Editor

Position of option on menu: Design => Drainage => More => Top Ten attributes editor

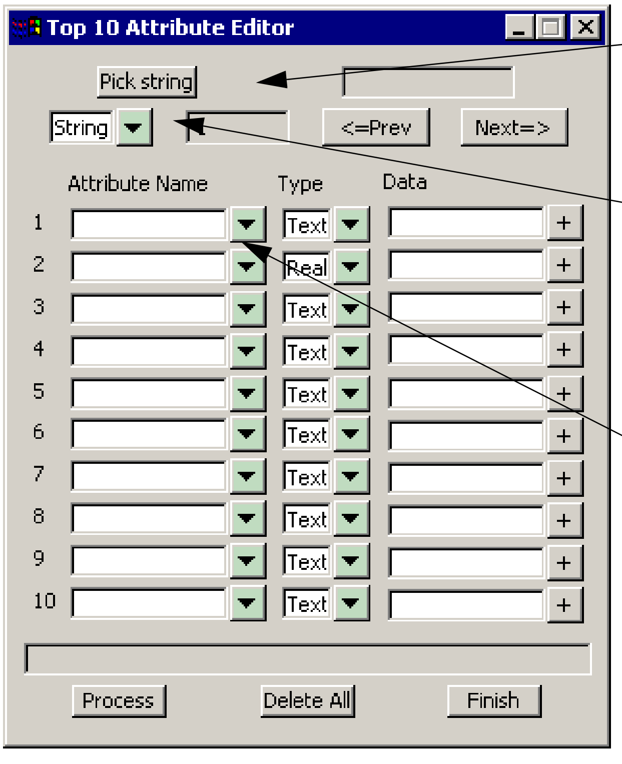
Most of the detailed catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d or edited inside 12d using this panel.

See Also

Drainage overview

Usage

From the menu select **Design => Drainage => More => Top ten attribute editor**



First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **Pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
pick string	button		

used to pick the initial string in a model

string-pit-pipe	choice box		**string,pit,pipe**

select the type of attribute to be displayed. Pit and pipe attributes are only available for drainage strings.

attribute name	input box		

3 top 10 attributes lists are maintained (pit, pipe and string). The attributes that you can select from are all of the attributes that exist on all of the strings in the model. If the attribute does not exist for the *string/pit/pipe that you are displaying the **data** field will display **Not found.***

type choice box **Text, Real, Integer**

for existing attributes this will display Text, Real or Integer.
When defining a new attribute select the type of data to be stored in the attribute

data input box

the data stored in the attribute is displayed/edited/created in this field.

<= prev button

move to next string in the model
pit on the string
pipe on the string

next => button

move to next string in the model
pit on the string
pipe on the string

process button

updates the attributes displayed in the dialogue.

Notes:

First LB select Pick to select the string that contains the user attributes. All catchment data is stored with the pits in drainage strings. The strings will be highlighted in white when they are selected.

To access the pit attributes **LB** this field then select **Pit**. A circle will be drawn around the pit selected.

LB the **Attribute Name** field and then select from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in. They may not be defined for the string you are editing. If the string does not have that attribute defined **not found** will be displayed in the **Data** field.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The following message will be displayed whenever you are creating a new attribute.

23.10.3 Delete All Attributes in a Model

Position of option on menu: Design => Drainage => More => Delete all attributes in a model

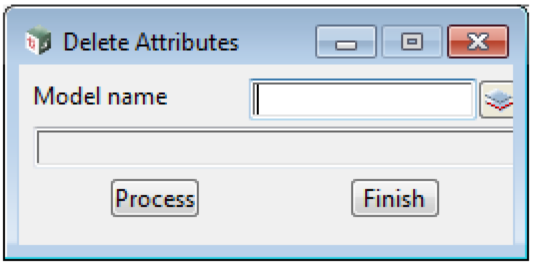
See Also

Drainage overview

This option deletes all model, string, pit and pipe attributes in the model specified. This option allows the user to "start from scratch" while maintaining the drainage, catchment and bypass flow strings.

Usage

From the menu select **Design => Drainage => More => delete all attributes in a model**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model name	input box		

the model specified will have all of its attributes and all of the strings attributes deleted

Field Description	Type	Defaults	Pop-Up
Process	button		

Deletes all of the attributes

Notes: THERE IS NO UNDO!

23.10.4 Flooded Width Flow Analysis and HEC-RAS

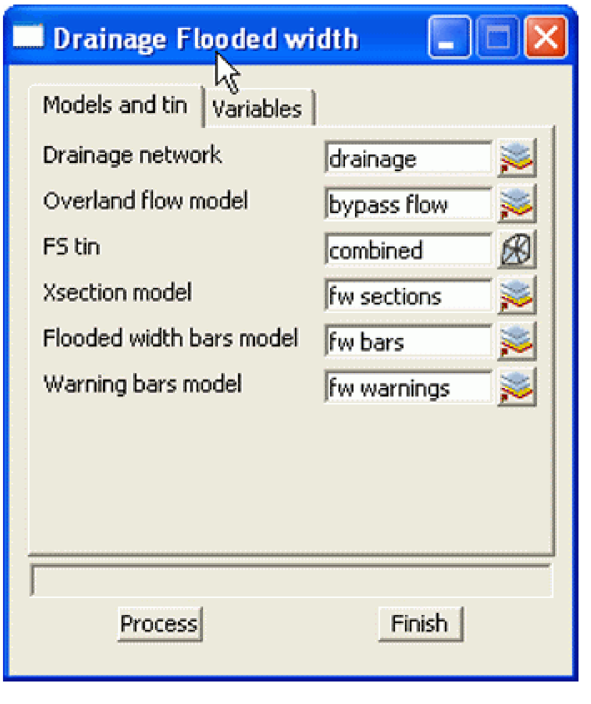
Position of option on menu: **Design =>Drainage-Sewer =>Calc flooded widths**

The Calculate Flooded width procedure creates cross sections along the **bypass flow** paths and then calculates the flooded width at each section using Manning's normal depth calculations. A HEC-RAS project (same name as the bypass flow string) is also created for each line. The flooded width is indicated on each section as a blue line if it is less than a user defined width and a red line if the flooded width exceeds the limit. Details of the calculations such as the velocity, depth, wetted perimeter and slope can be exported to a spreadsheet for further analyse (velocity times depth calculations for example). The discharges imports from the urban stormwater design packages are shown in the following table.

Design Program	Discharge Event
PCdrain	Minor ARI
Drains	Maximum flow event analysed
ILSAX	Maximum flow event analysed
RAT HGL	First return period analysed

The user defines the length of these sections and the interval at which they are to be spaced. 12d calculates the normal flow depth interpolating the pit approach and bypass flows from the hydrology models (ILSAX, Drains, PC Drains or RAT HGL). The cross sections are taken perpendicular to the flow line and the slope is for the normal depth calculations is determined using the distance along the flow line and the change in elevation between the two lowest points in the primary flow channel. The flow line need not intersect the low points on the section but the flow line does mark the primary flow channel. If the depth of the flow exceeds the banks of the primary channel, then all adjacent flow channels will be considered as active flow area.

On selecting the **Calc flooded widths**, the **Drainage flooded width** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Models and tin

Drainage network model box drainage

Existing drainage strings must have approach and bypass flow pit attributes. See doco below

Overland flow model model box bypass

Cross sections are cut perpendicular to these existing strings

FS tin tin box design

This tin is used to cut the cross sections and to determine the slope for normal depth calcs

Xsection model model box fwsections

Model is cleaned before processing. Calculated values such as velocity and slope are stored with these strings.

Flooded width bars model model box fw bars

Model is cleaned before processing. Blue or yellowstrings with levels indicate normal depth flooded widths.

Warning bars model model box fw warnings

Model is cleaned before processing. Strings created when vel x depth exceeds limit.

Variables

Max flooded width input 2

the limit where the blue flooded width bars turn red

Manning's n input 0.014

The n value to be used in the normal depth calculations.

Flow correction factor input 0.8

The is the factor described in ARR 1987 for calculating depths of flow in gutter channels.

Distance between sections input 5

The interval at which cross sections and therefore flooded width will be calculated along the flow path.

Section Length input 5

The length of each cross section. The cross section will be centred on the overland flow path.

Trim sections at levee tick box off

Trims the cross section at the crest on either side of the flow channel. A levee point is the crest in the cross section found as you move away from the flow line location.

Levee tolerance input 0.1

The amount the cross section needs to drop as you move away from the centre line in order to identify a levee.

VxD warning limit input 0.6

The velocity times depth limit that when exceeded will cause a flooded width bar to be generated in the warning bars model.

VxD warning colour colour box orange

Colour of the velocity x depth bars

Process button

Clean output models, calculate flooded width and create HEC-RAS projects named from the string names.

Finish button

remove the panel from the screen

23.11 Limitations where overland flow lines join

Where overland flow lines converge at an inlet, 12d does not know the flow split between the 2 approaching paths. Therefore, 12d uses the total flow from all lines as the flow at the inlet for each line. This may overestimate the flooded width along the flow lines at these points.

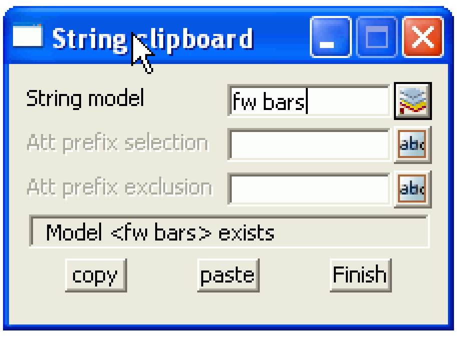
23.12 Limitations at SAG pits

The flow width are not shown adjacent the sag inlets. The depth of flow due to ponding and the approach flow coming from several directions may overestimated flooded width in these areas. Therefore not flood depths are calculated approaching SAG inlets.

Summary Tables

The hydraulic calculations and warning messages are stored as string attributes on the flooded width bars. If these attributes are exported to a spreadsheet via the clipboard a summary table my be created. To copy these attributes to the clipboard select

File IO->User->String attributes-properties to/from clipboard



The **string model** may be either the flooded width bars or the warning bars. Both models of strings contain attributes on the strings.

The prefix selection and prefix exclusion are filters for reducing the number attributes that are exported to the clipboard.

23.13 Cross Sections, Discharges and Warnings

The analyse flooded width will proceed along each flow path and identify every pit on the line. Cross sections will be constructed in the model with the length and interval entered in the input dialogue. These cross sections may be plotted using the main menu selection **Plot=>X plot=>X plot**. The **Sort Sections** must **not** be selected for these sections to be plotted.

Discharges will be determined for each cross section by linearly interpolating the discharge using distance between the pits. The bypass discharge (pit attribute - calculated bypass flow) will be taken from the upstream pit and the approach discharge (pit attribute - calculated approach flow) from the downstream pit.

The slope is calculated by subtracting the lowest points nearest to the centre line and dividing the cross section separation. The levee tolerance is NOT used for locating this point thus any rise in section moving away from the centre line marks the end of the low point search in that direction.

12d will give warning messages in the output window when it encounters the following conditions and these messages will be stored as string attributes on the flooded width strings. Descriptions of these messages follow.

Inverts do not go downhill

12d locates the lowest point (adjacent to the flow line without moving over a local crest) on each cross section to calculate the slope between the cross sections. This message indicates that the downstream minimum elevation is higher than the upstream minimum elevation.

Sometimes flow lines will go uphill. If you have specified an overflow from a SAG location then the flow line will go uphill until it crosses the overflow crest.

If the flow line is not supposed to be going uphill at this section, check to see where the flow line intersects the cross section located upstream of the one identified in the warning message. If it is in a local sag point that is not the lowest point on the section, move the flow line.

The program will use a slope of 0.5% to calculate a width at this location. This results in very wide flooded width sections to draw the user’s attention to the problem area.

Vertical Walls Assumed at the Ends of the Cross Sections

If the depth of flow exceeds the ground surface elevation at the ends of the cross section a warning message the warning message shown above is shown. The cross sections causing the warning follows.

The vertical wall is placed at cross section chainage –20. Note that the flow line is always at chainage 0

23.13.1 Convert Drainage String to Polyline

Position of option on menu: Design => Drainage => More=> Convert drainage string to polyline

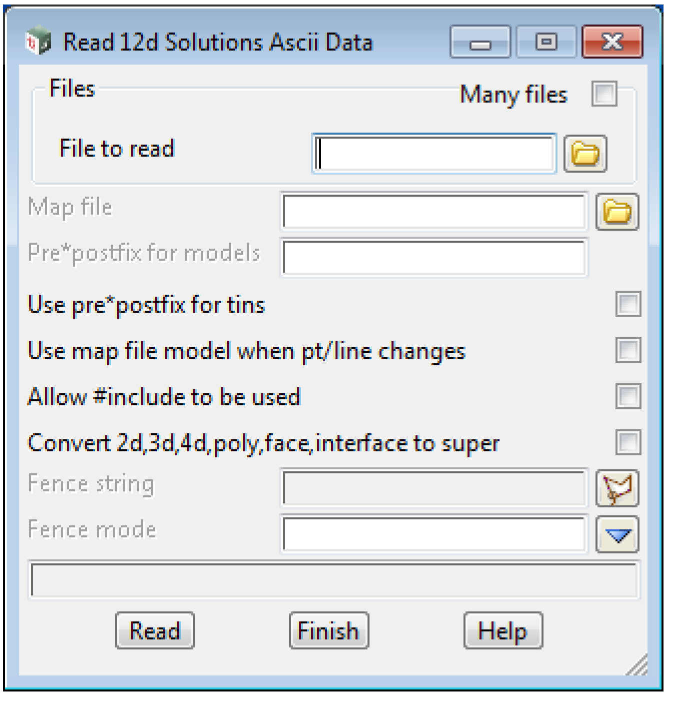
See Also

Drainage overview

All drainage strings in the specified model are exported to a 12da file. When this 12da file is imported back into ***12d Model*** the strings will be converted to polylines. Import the strings using

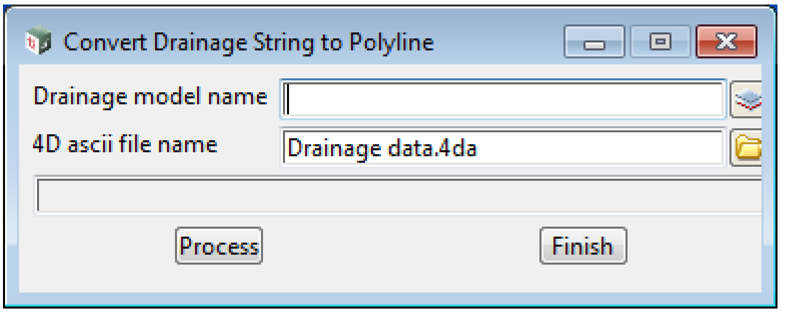
File_io=>Data Input=>12da/4da data

Specify a prefix for the model when it is read back in. Otherwise the strings will be placed in the same model as the originals.



Usage

From the menu select **Design => Drainage => More=> Version 6=> Convert drainage string to polyline**



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

drainage model name input box

Drainage model containing the drainage strings

12da file name input box drainage data.4da

A temporary file that will hold the converted string data.

process button

Exports the drainage strings and converts the file to polylines.

23.13.2 Drainage.4d file

A sample pit entry in the drainage.4d file is as follows:
Enhancements have been made if exporting to the Drains program. See Pit Families and Pit Groups
The drainage.4d file controls many of the settings for the pit and pipes types inside 12d. This section details the format of the drainage.4d file. Changes to this file take effect only after 12dmodel has been restarted. If there are any errors in the drainage.4d file they will be listed in the output window at startup (just after the shp file listing). The error in the drainage.4d file is generally located just above the line indicated in the output window.

All text to the right of the // is ignored by 12d (comments). There are pit and pipe type definitions. Because of historic reasons the pit types are defined using a **Manhole** command.

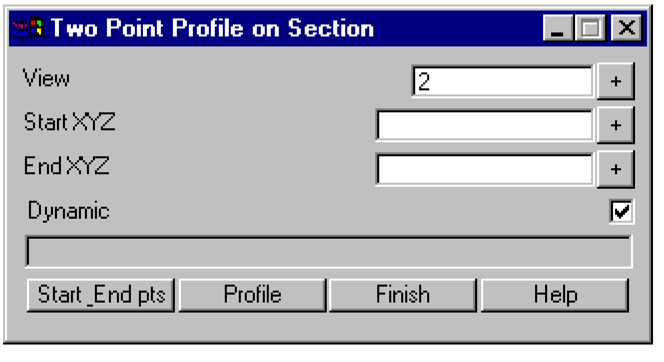
Many of the settings in the drainage network editor (DNE) can be controlled by the pit types and the pipe types defined in the drainage.4d file. The **special manhole attributes** defined below control these fields.

The original **drainage.4d** file is found in the “program files\12d\12dmodel\10.00\set_ups” directory. **Do NOT** change this file. Copy it into your user folder “\12d\10.00\User” and edit it there. Files in the user directory are used by preference and they are never over written by a 12d update.

Two Point Dynamic Profiles

If at any time you want to obtain a temporary section view, 12d has a dynamic profiling capability (2 point profile). First, add your tin design model to the section view.

Next RB on the section view title area and then LB select 2 points. The following panel will appear.



Select **Start_End pts** to begin and then pick/accept a point on a Plan View Now as you move your cursor the section view will be dynamically updated (the dynamic box should be checked on and a surface tin model added to the section view). When you obtain the cross section you want LB select then accept (MB) the second point.

LB select Finish when done.

23.13.3 ILSAX Editors

Position of menu: Design => Drainage => More => ILSAX Editors

The **ILSAX editors** walk-right menu is

See ILSAX Pipe/Catchment Editor

See ILSAX Rainfall File Editor

23.13.3.1 ILSAX Pipe/Catchment Editor

Position of option on menu: Design => Drainage => More=> ILSAX editor=>ILSAX pipe editor

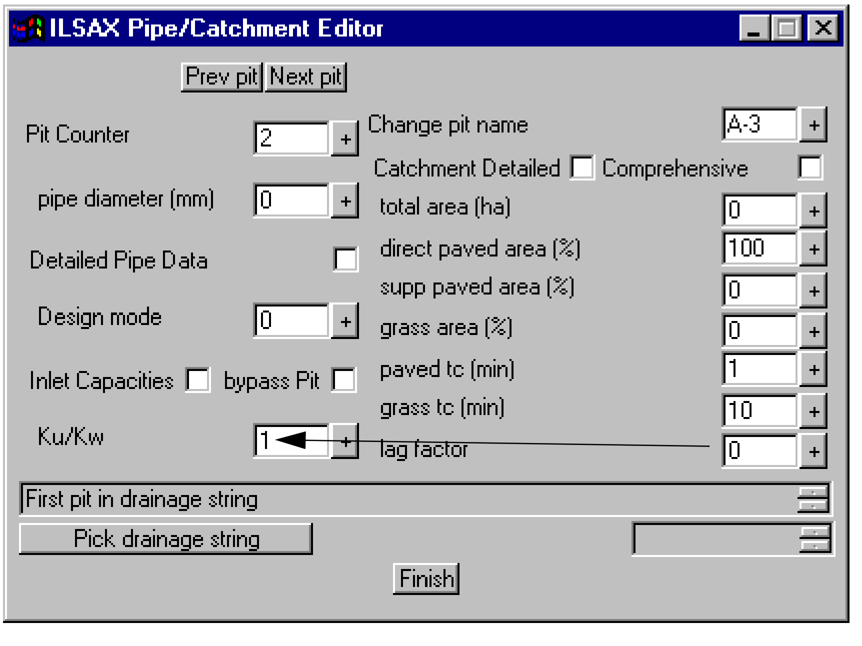
See Also

ILSAX Rainfall File Editor
Drainage overview

The ILSAX pipe data editor allows the user to edit pipe and catchment parameters. Most commonly used functions are supported but some of the less used functions are not included at this time. The same names have been used as those in the ILSAX drainage manual for easy reference.
Unlike the rainfall editor, all of the data in the pipe data editor is stored with the drainage string as user attributes. These user attributes can be changed using the editor (recommended for the novice user) or they may be output to a spreadsheet, changed and then read back into 12d.
CAUTION: If the drainage string is deleted then all of the attributes are deleted at the same time.

Usage

The ILSAX pipe data editor is accessed by selecting **Design=>Drainage-Sewer=>More=>ILSAX Editors=>ILSAX Pipe file editor**. The following dialogue will appear.
.



The panel to the left is only and example of what the editor panel may look like. This dialogue will change in size and complexity depending on the check boxes selected. The left side of the dialogue is reserved for pipe and pit data while the right side contains catchment data. The first step is to select the drainage string to be edited. Click on **Pick drainage string** and then select the drainage string from one of the views.

There are two ways to move between pits. The **Prev pit** and **Next pit** will move the user between the pits with the current pit name been shown in the **Change pit name** field. Do **<u>not</u>** use the **Change pit name** field to move between pits. It will not work! This field is used to manually change the pit name. Entering the **pit number** and pressing **Enter** is the second method for selecting pits. This is a good way to move between pits on long drainage lines (from pit 20 to pit 1 for example).

The **pipe diameter** will change the diameter of the pipe leaving the pit in the direction of increasing chainage. Note that the invert level of the pipe will remain fixed as the obvert level changes.

The most common **Design mode** is 1 for design. This ignores the present pipe size and resizes the pipe as required.

When the **Inlet capacity** and **Bypass pit** tick boxes are checked, additional fields are added to the dialogue. These will be discussed in the section 5.0 above

The **Catchment Detailed** and **Comprehensive** tic boxes also add additional fields to the dialogue. Again, the ILSAX drainage manual contains detailed descriptions of these parameters.

23.13.3.2 ILSAX Rainfall File Editor

Position of option on menu: Design => Drainage => More => ILSAX Editor=>ILSAX rainfall file editor

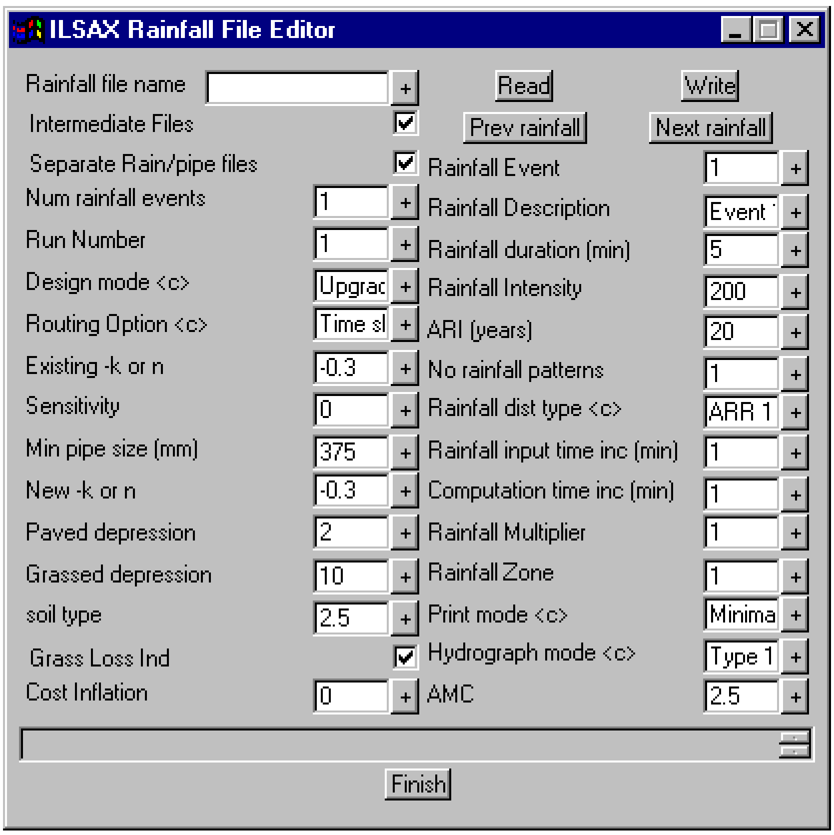
The ILSAX rainfall file editor assists in the creation and editing of the ILSAX rainfall files. It is truly a file editor and no data is stored inside the ***12d Model***. Most common features of the ILSAX rainfall file are included but some have been omitted as they have been rarely used. The files can be created using the editor and then manually edited using a word processor if required.

See Also

ILSAX pipe editor
Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage => More=> ILSAX editors => Ilsax rainfall file editor**



The **Rainfall file name** must be specified before the **Read** or **Write** buttons will operate. If you want to create a file, fill in the **Rainfall file name** field and then **LB** select **Write** to save the data.

Intermediate Files and **Separate Rain/pipe files** must be ticked to have ILSAX run within 12d.

The minimum value for **Num Rainfall Events** is 1.

The remaining data in the left column is the data for the ILSAX R3 and R4 cards and the data in the right column is the data for the ILSAX R2,R6, R6B and R8 cards. Please refer to the ILSAX manual for a description of these values. The fields are not in the same order as the ILSAX files but instead the fields at the top of the column are those changed most frequently between rainfall events.

The **Prev Rainfall** and **Next Rainfall** buttons select the rainfall events up to the number specified in **Num rainfall events**. If you wish to add or decrease the number of events analysed change the **Num rainfall events** value.

CAUTION: the **Finish** button does not perform a save so make sure you click **Write** before **Finish.**

The fields and buttons used in this panel are described in the ILSAX users manual.

23.13.4 PCdrain to 12d pit converter

Position of option on menu: Design => Drainage Sewer => More=>Create Pit type from PC Drain gully files

This option is used to read a PCdrain gully file and create the same pit type in the 12d drainage.4d file. The sag pits in the gully file have an "S" added as a suffix as they are imported.

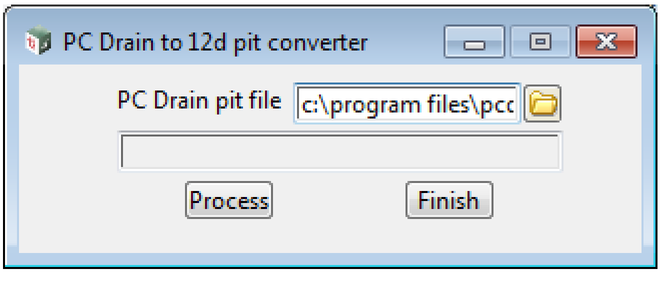
Important: 12d must be restarted to see the new pit types.

See Also

Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage Sewer => More=>Create Pit type from PC Drain gully files**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
PCdrain pit file	file box		

the PCdrain gully file to be imported into 12d

Process	button		

import the data file

Finish	button		

removes the dialogue from the screen

23.13.5 Calc pit overflow areas

Position of option on menu: Design => Drainage Sewer => More=>Calc pit overflow areas

This option is used to graphically display the overflow storage volume at a sag pit. The following pit attributes must exist for the flood extents to be calculated.

overflow volume	value greater than zero required.
sag pit	must be equal to 1.
catchment model id	set by labelling catchments
catchment string id	set by labelling catchments

The maximum storage volume is read from the drainage pit attribute "overflow volume". This may be entered manually using the **Attribute Editor** or it will be created when data is read from the drainage design programs Drains or XP SWMM design programs.

This routine locates the lowest point on the catchment string by draping the string on the tin specified and adds the overflow limit specified to this value. This becomes the **overflow limit.**

The volume at this level is calculated and the compared to the **overflow volume** read from the user defined attribute.If the overflow volume is less than the volume in the catchment then the routine iterates to find the flood level for the overflow volume.

If the overflow volume is greater than the volume in the catchment, the results depend on the **Use overflow limit** tick box.

If the box is selected, the **overflow limit** (calculated above) is reported at the flood level in the catchment.

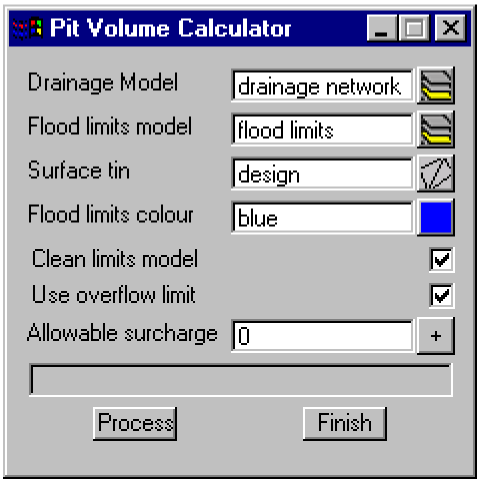
If the tick box is not selected the routine iterates to find the flood level where the storage equals the **overflow volume** read. This option allows the user to see the maximum flood level should the catchment low point become blocked.

See Also

Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage Sewer => More=>Calc pit overflow areas**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	model box		

all pits in this model that have a non zero "overflow volume" and "sag pit" set to 1 will be processed

Flood limits model model box

flood limits strings will be created in this model

Surface Tin tin box

ground surface tin used to calculate the volumes and flood limits

Flood limits colour colour box

flood limits strings will be created using this colour

Clean limits model tick box

*if selected all strings in the **Flood limits model** will be deleted before the calculations commence.*

Use overflow limit tick box

*if the elevation calculated from the storage volume is higher than the lowest point on the catchment string then the **allowable surcharge** value below will be added to the lowest point on the catchment string and this elevation will be used to determine the flooding limits*

Allowable surcharge real box

*this value is used only if **Use overflow limit** is ticked. Its purpose is described in the field above.*

Process button

executes the option.

Finish button

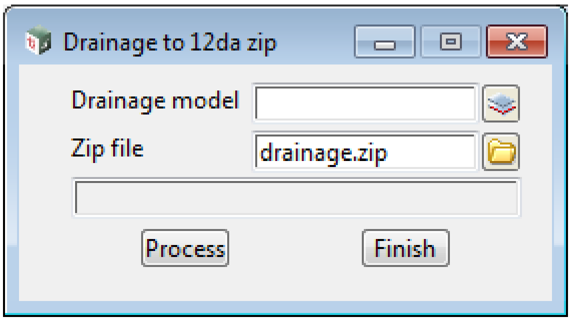
removes the dialogue from the screen

23.13.6 Drainage to Zip

Position of option on menu: **Design =>Drainage-Sewer => More=> Drainage to zip**

This zip routine is intended for support purposes only. It will save your project! This function zips up project views and only the models and files delated to the drainage model.

On selecting the **Drainage to zip** option, the **Drainage to Zip** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	model box		

This model and the related models through the drainage network editor will be zipped into one file.

Zip file	file box	drainage.zip	

This zip file is intended to be sent to support personnel.

Process	button		

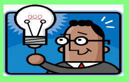
Saves the project and creates the zip file

Finish	button		

remove the panel from the screen

1.12d Model Drainage Modules and Work Flow

12d Model has a suite of drainage modules for stormwater design. This course covers the items listed below on this page except 24,25 and 28.



If viewing the pdf version of this manual, bookmarks on the left are hyperlinks as well as the green text. **Use Alt+left arrow** to return to where you were reading.

1.1 Drainage Module

Part A - Locate Structures and Connect the Pipe Network

1. Obtain/create Survey data and design surfaces (TINs) for pipe and manhole levels,
2. Identify overland flow paths and drainage inlet structure locations,
3. Set drainage default for the pits and pipes (most common settings, they may be changed later).
4. Read a drainage model template file containing you default and global settings.
5. Create the drainage strings in 12d or convert strings from CAD.
6. Assign pit names using the DNE. This allows easy reference to the structures.
7. Change pit and pipe types where they are different from the default values
8. Link the drainage model to the road design models for an integrated design.
9. Check and adjust horizontal alignment of the pipes and pits.
10. Set the vertical alignment using the DNE (set pit details and regrade pipes).
11. Check for service clashes and adjust vertical as required.

Part B - Hydrology and Hydraulic Data Preparation

12. Set catchment areas, % impervious, C and tc values for hydrology,
13. Set grate levels, Ku methods (pit and culverts), pipe roughness etc for hydraulic design
14. Draw/create bypass flow paths if bypass/inlet capacity calcs are required.
15. user defined export and update interfaces with Drains, PCdrain, Micro drainage-WinDes, RAT2000 and XP SWMM/STORM.

Part C - Design Documentation

16. Print pit schedules and plan/long section drawings for construction,
17. Import and Export the network to spreadsheets,
18. Calculate network quantities (by depth ranges) for costing and system checks,
19. Calculate earthwork excavation volumes,
20. Repeat as required for design changes,
21. And of course peer review at various points of design,
22. Electronic models for survey setout.

1.2 Drainage Analysis Module

Part D - Rational Hydrology, Surface Flow Calculations and Pipe Hydraulics

23. Calculate rational hydrology peak discharges,
24. Normal depth surface flow hydraulics using channel sections cut from the ground surface. Results are shown in plan, section and 3d views (and reports) with warnings given for exceeding max widths, channel capacity and velocity x depth hazard conditions,
25. inlet capacities at sag and on grade locations determine bypass and pipe flows,

26. Hgl calculations use pipe and manhole losses (Ku/Kw) . Pipe are sized using either freeboard or flow depth methods. This includes full culvert design with backwater and inlet control calculations.
27. Review results in plan drawings, long sections and printed reports,
28. Analysis of the major flood event and checks for surface flow and hazard conditions.

1.3 Dynamic Drainage Module - Unsteady flow analysis

This module uses ILSAX and SCS hydrology together with the solution of the unsteady flow equations to analyse the network. Inlet capacity charts are used to analyse surface and subsurface hgl lines. Natural channel shapes and elevation-area curves for basin are created directly from the ground surface. User defined reports are created via the spreadsheet interface.

1.4 TUFLOW and Roadflow Modules

These modules use the TUFLOW engine (1D/2D hydrodynamic computational engine) for simulating free-surface water flow for urban waterways, rivers, floodplains, estuaries and coastlines. Using tools including 12d grid tins and the 12d TUFLOW control file editor the 12d, TUFLOW input data is created, edited and viewed all within 12d. This module may be combined with the dynamic drainage module for a coupled 1D/2D analysis to include pipes and culverts.

2.12d Model Stormwater Courses

In these documents, the generic term **pit** refers to manholes, inlets and catch basins. When the term **manhole** is used on the 12d menu system it refers to any type of pit.

2.1 Stormwater Design Part 1

These notes are for this course designed to cover creating drainage networks, rational method design and reporting.

- create a super tin for pipe cover and pit cover levels,
- set Defaults and layout a drainage network from CAD and in 12d,
- use the 12d Drainage Network Editor to assign names to the pit/pipes, avoid service clashes, grade pipes, align obverts, minimise depth and many other design tools,
- designate catchment areas and produce catchment plans,
- run the 12d storm rational hydrology and hydraulics engine,
- transfer data to and from electronic spreadsheets to enable the user to easily review the data and add user defined data to the 12d pipe network. This data may include such data as pipe bedding types and trench width,
- create a drainage template containing customised default design parameters,
- create pit setout schedules to export to spreadsheets or word processors for final formatting,
- produce long section drainage profiles including HGL data, flows, invert levels and service crossings,
- create plan drawings with pipe sizes, flows, pit symbols, linestyles for pipe sizes, design parameters for pit and pipes and user defined data,
- locate pits/manholes at exact chainage and offset locations.

2.2 Stormwater Design - Part2

This course continues on with surface flow analysis, inlet capacity and bypass flow and customising the 12d drainage setup file (pit and pipe type database).

- customising the drainage.4d file Drainage Definitions - Manholes and Pipes,
- 12d storm analysis with inlet capacity calculations and bypass flow,
- flooded width analysis and flooding at SAG pits,
- drainage trench excavation volume calculations,
- pipe and pit quantity calculations/reports,
- open channel calculations,
- adjusting pit locations for changes in horiz road geometry
- analysing the major flood events,
- creating drainage symbols with grates and upstream side inlets,
- detailed drainage plan labelling and long sections with hatching under roads.

2.3 Stormwater Basin Design Hydraulics and Hydrology

- The course discusses unsteady flow hydraulics and their use in the design of storage basins and tanks.

3.Using the Course Notes

Areas marked in yellow (grey for black and white prints) are the exact steps required to complete the tasks. The numbers in the panels are the order to preform the tasks and they are always written to the right of the button, drop down or data field.

The additional text explains in more detail the tasks you are preforming.

4.Customising12d Model Drainage

12d Drainage has a series of files that customise your drainage components and design process. These includes

- drainage.4d (required) — manhole types and properties
pipe types and properties
- drainage model template — contains global and default settings for the drainage network. Including references to the following files.
- cover files — specify pipe cover for each pipe type
- grade file — specify pipe/channel slope by height
- drop file — specify drop across manholes by deflection angle
- catchment file — specify polygons for 3 land use types
- road design file — link manholes to strings to determine x,y z coordinates
- services file — specify clearance tolerances for models of service crossing.

The drainage.4d file has been configured for the training version. However, when you start working on your projects you may want customise the drainage module. More - Customising the drainage module

The drainage.4d file is the required drainage setup file that contains:

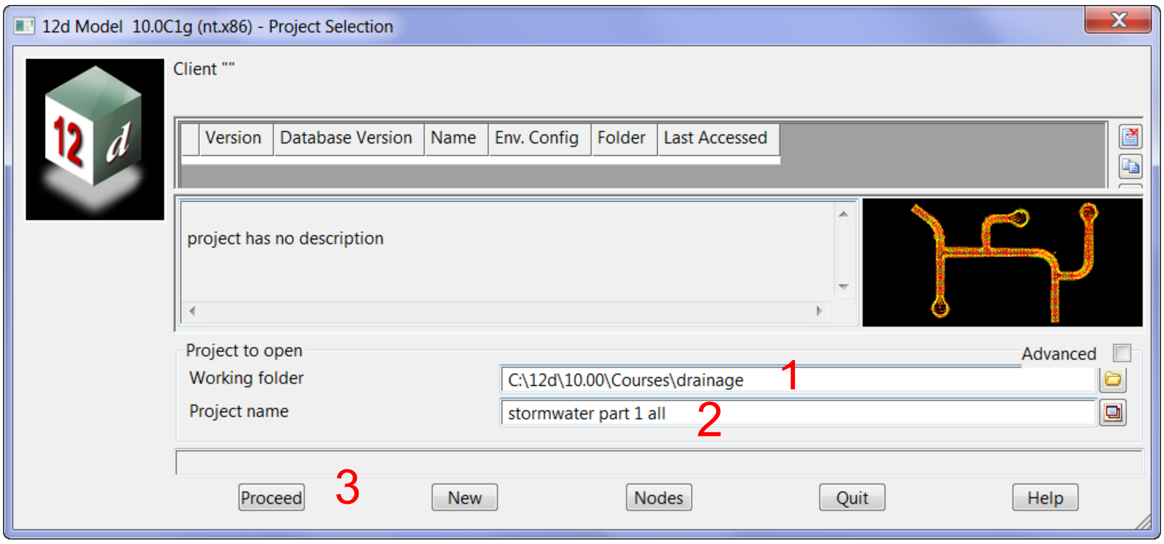
- manhole and inlets with wall thickness and inlet capacity curves for ongrade and sag conditions
- pipe types (RCP, Class 2 etc.) with nominal pipe diameters and wall thicknesses,
- user defined attributes lists to be assigned to the network via pit and pipe types.
- manhole and pipe type parameters are used to control settings in the DNE. This allows the user to set numerous properties by selecting only the pit or pipe type. More.

5.Survey data and design surfaces (TINs)

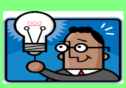
We will start a 12d project from the beginning by first creating the project and then reading in the survey and design data. The data can then be triangulated so that we have a final surface to measure pipe cover from and set structure cover levels to.

Start up the 12d model by selecting the 12d icon from your desktop.

The project selection panel will appear. The bottom corner of the panel is shown below



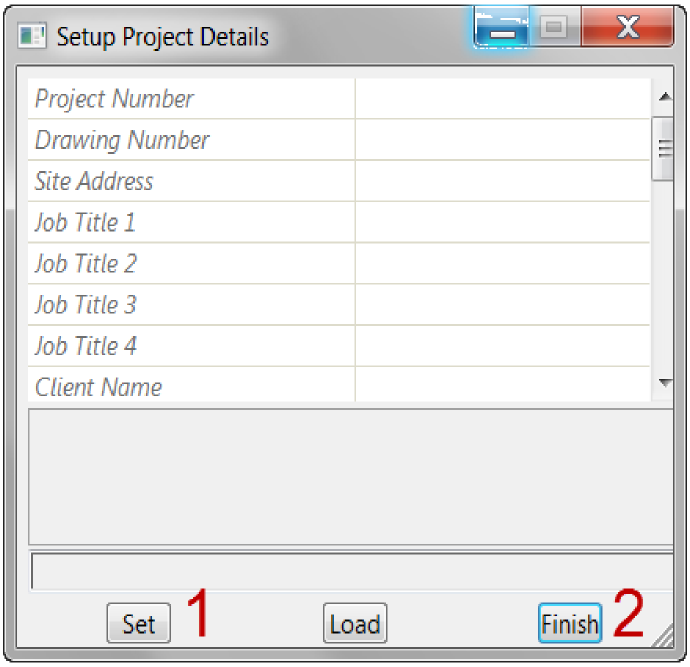
1) **LB** to browse to the **working folder** indicated.
2) Type a project name for your work **Stormwater Part 1 all** for example.
3) Select **Proceed.**



Alternate Step 2. If you do not want to create the tin or roadway then select the existing project Stormwater Part1 found in the courses\drainage folder. Skip to the section Drainage Overland Flow Investigation or go straight to Read in a drainage model template

12d will first look in your working folder for any input data files and output files will be created here unless you specify another folder. 12d stores it's data in a folder **not** a single file. Therefore, a folder named **Stormwater Part 1 all** will be created when you select **Proceed**.

12d model will load and you will see the following panel.



Enter data as desired. This data is both for reference and can be included on your drawings.

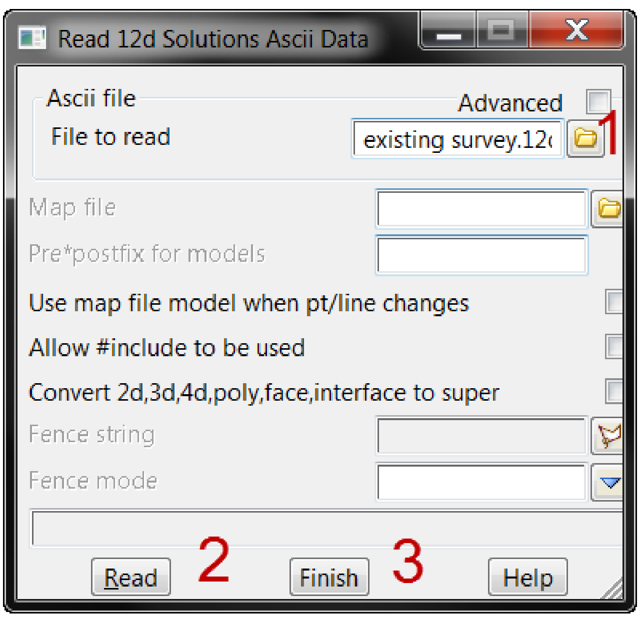
Later these details can be changed via

Project=>Management=Details Editor

5.1 Importing the Raw Survey Data

You have created a new project into which we will import the survey data. From the main menu select.

File I/O->Data Input->12da/4da data

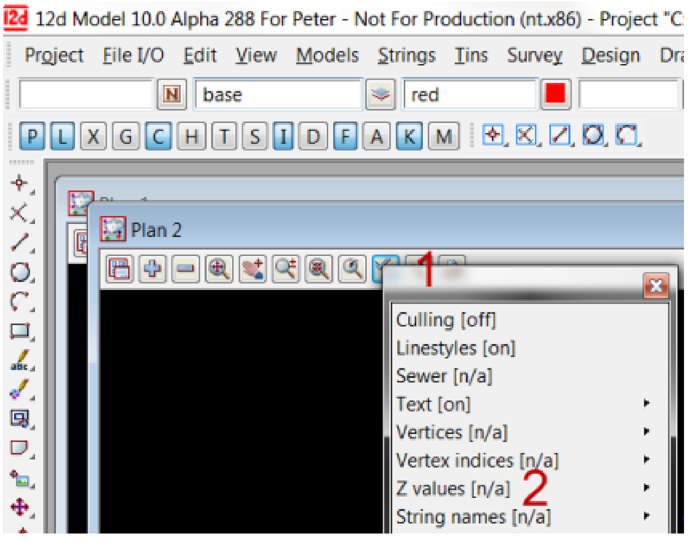


1) LB the folder icon to display the file list. Select the file **existing survey.**

2) LB Read to read the data

3) **LB Finish** to remove the panel

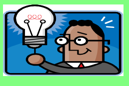
The data will appear on a new plan view.



Now we will display the z values for the survey data.

1) LB the toggle button

2) LB **Z values**

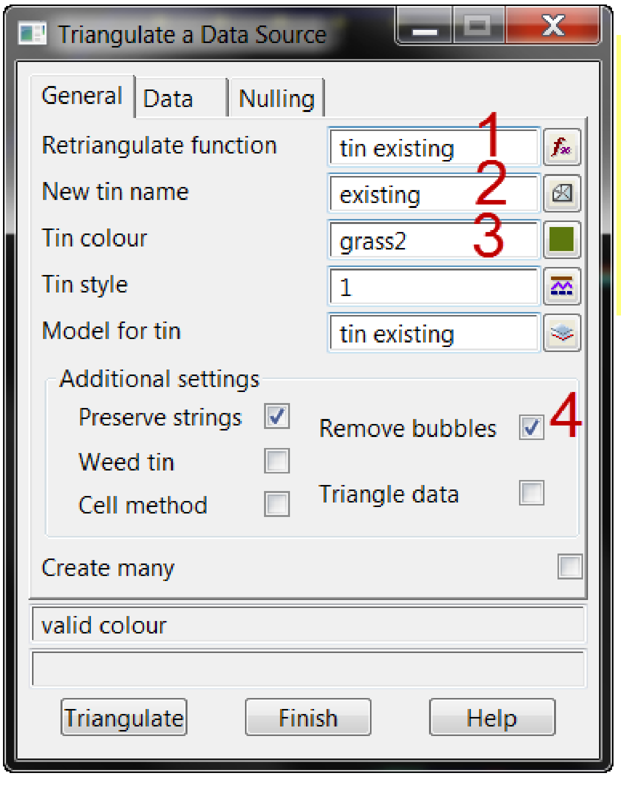


Use your mouse wheel to zoom in and read the z values.
Press Ctrl and Middle mouse drag to pan

5.2 Creating the existing Ground Surface

From the main menu select

Tins=>Create=> Triangulate data



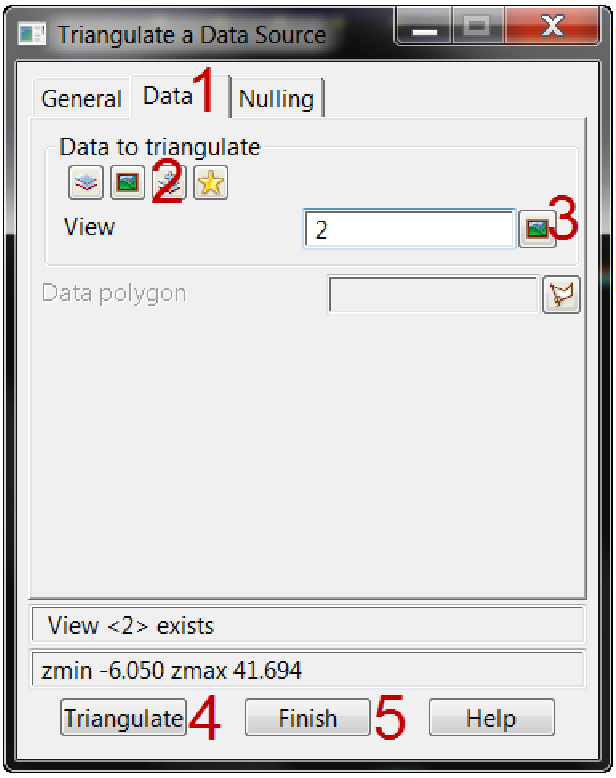
1) Type a name for the function to make it easy to recalculate later in new data arrives.
2) Type a new tin name then press **Enter**
3) Type grass2 instead of green. This will look better in the visualisation.
4) LB **Remove Bubbles** so that breaklines will attempt not to form triangles back onto themselves (if the breakline is a contour, this removes contour bubbles).

Preserve strings will make one side of a triangle follow the string thereby preserving the levels along the string.

Weed tin removes all duplicate points from the tin database.

The **Cell method** is a good speed enhancement for data that is in a grid type pattern.

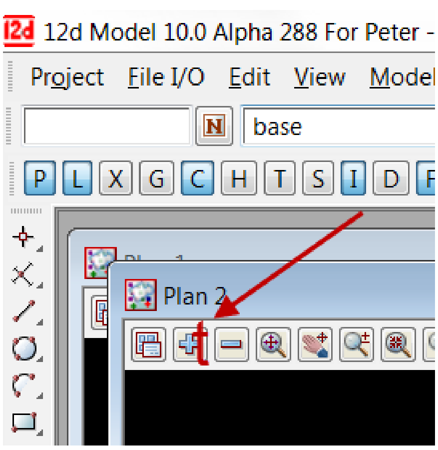
Triangle data is used for string that form triangles (tins imported from other programs).



1) LB the **Data** tab
2) LFinishB the **View** icon
3) Select view **2**
4) LB **Triangulate** to create the new tin.
5) **LB**

The tin will be stored in the model **tin existing**. A tin, like all 12d strings, must be stored in a model. 12d prefixes all its tins with **tin** for data management.

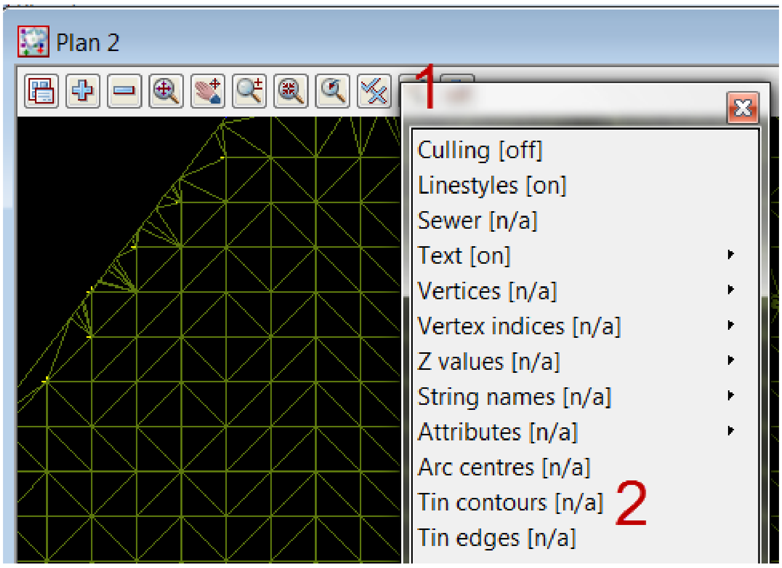
5.3 Viewing the Ground Surface Tin



1) Move your pointer over the "+" sign on the plan view 2 title toolbar
2) press the **t** key (all of the models beginning with lower case t will appear)

3) Double click on **tin existing**
4) **LB** Finish

The tin will be shown with the tin edges turned on. This is the default when you have all tin display modes turned off.



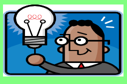
Display Contours

1) LB the toggle button
2) LB **Tin contours**.

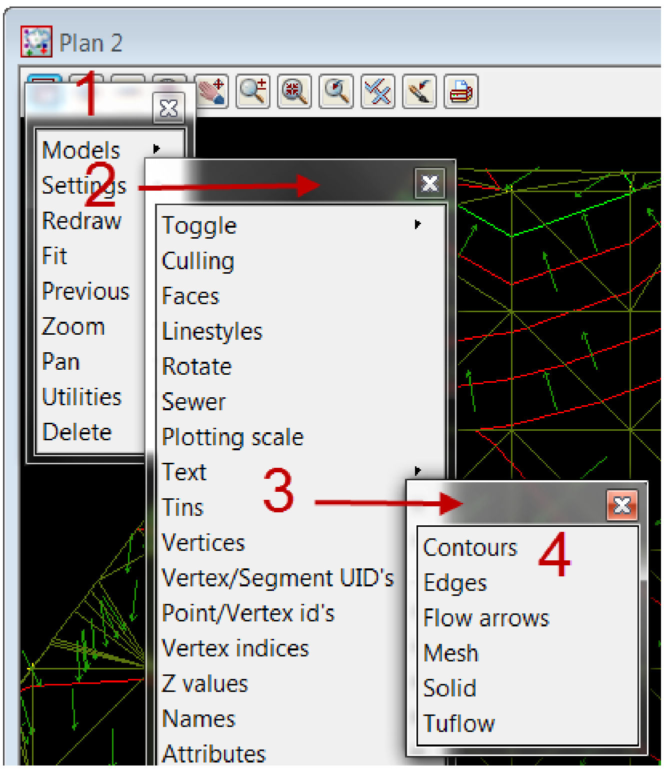
The contours are displayed with their default colours and increment (1 unit).

Display Flow

1. LB the toggle button
2. LB **Tin flow**.
   Flow arrows are now visible at the centre of every triangle.



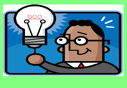
To plot flow arrows, create them in a model using
Tins->Tin analysis->Flow arrows



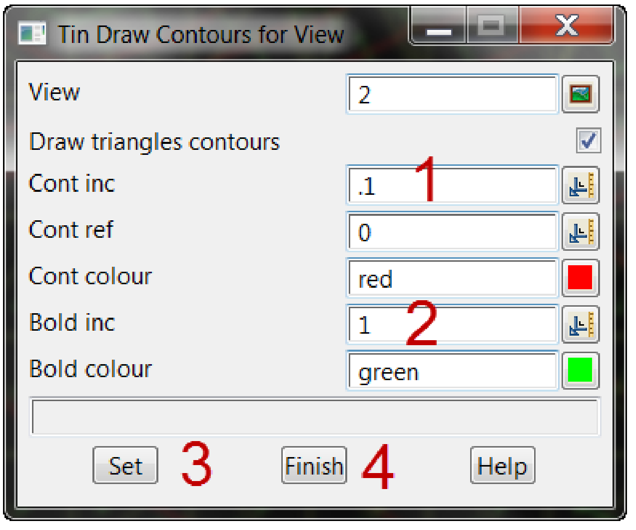
Change Contour Intervals and Colours

1) LB the View menu button
2) Walk right (do not **LB** select) on settings.
3) Walk right on **Tins.**
4) LB **Contours**

4) LB **Contours**



ShortCut! Press F11 to display the Menu shown in step 4

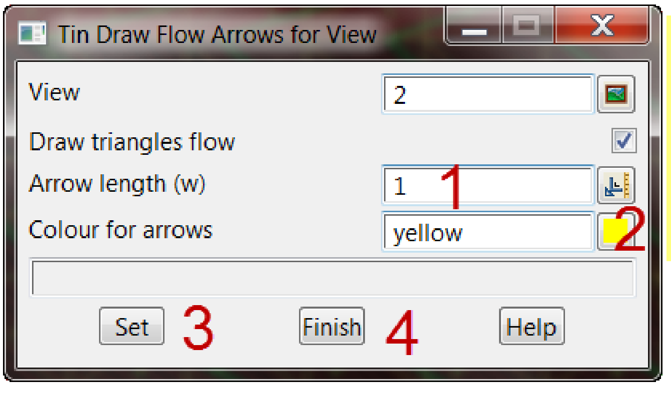


1) Type a new **Cont inc**
2) Type a new **Bold inc**.
3) LB **Set** to see the new contours**.**
4) LB **Finish** when done.

Change the Flow Arrow Length and Colour

Select the **Menu** button on the **plan view tool bar** and then walk right on.

Settings=>Tins=>Flow Arrows and the following dialog will appear. Remember to walk right!

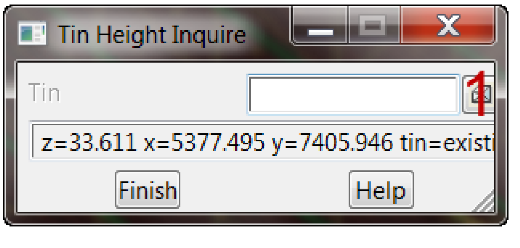


1) Type a new **Arrow length**
2) LB the colour icon to select a new **Colour for arrows.**
3) LB **Set** to see the new flow arrows**.**
4) LB **Finish** when done.

5.4 Inquiring about Heights on the Surface

The elevation anywhere on the tin can be obtained by simply moving the pointer over the desired spot. To obtain the tin elevations select,

Tins=>Inquire=>Height



If you do not select a tin, the last tin added to the view will have its height displayed. You will see the data in the panel change as you move the pointer around the screen. You may explicitly select a tin if another tin is desired.

Move the panel to the bottom right corner of the screen and leave it there.

5.5 Viewing the Surface Tin in a 3d Perspective

To create a 3d perspective view select

View=>New=>Perspective Open GL

1) Add the model **tin existing** to the view.

2) **Toggle** the **contours** on.

3) **Toggle** the **shading** on (note that the contours are no longer seen).

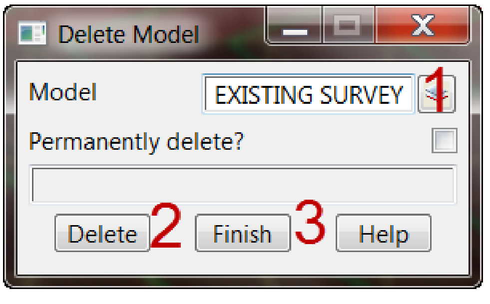
4) Use the Orbit control (planet on the toolbar) and zoom wheel to move around the view.

5.6 Reducing the number of points for the 12d Practice Version

We can delete the survey data to save space for those using the practice version of 12d. If you have a full version of 12d this is not required. From the main menu select.

Models=>Delete=>Delete a Model

and the following dialog will appear.



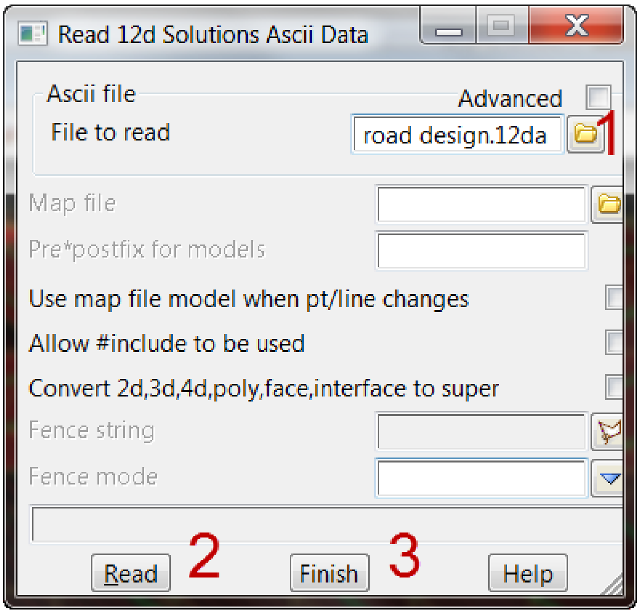
1) LB the model icon and select **EXISTING SURVEY**
2) LB **Delete** and then confirm each panel
3) LB **Finish**

The model is now in the 12d trash can (see bottom right corner of the 12d screen).

5.7 Importing the Road Design Centre lines

Repeat the process of importing 12da data.

File I/O->Data Input->12da/4da data

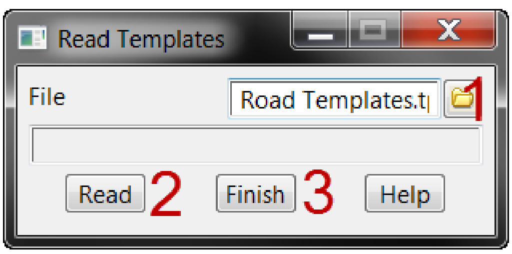


1) LB folder icon and select **road design**
For 12d practise users select **road design practice size use 10m spacing.12da**
2) LB **Read** (the data will not appear on the view yet).
3) LB **Finish**

5.8 Using Create Roads

We are going to create the roadways from the road centre lines (vertical grading has already been done). First we will need the road templates that we will read from a templates file.

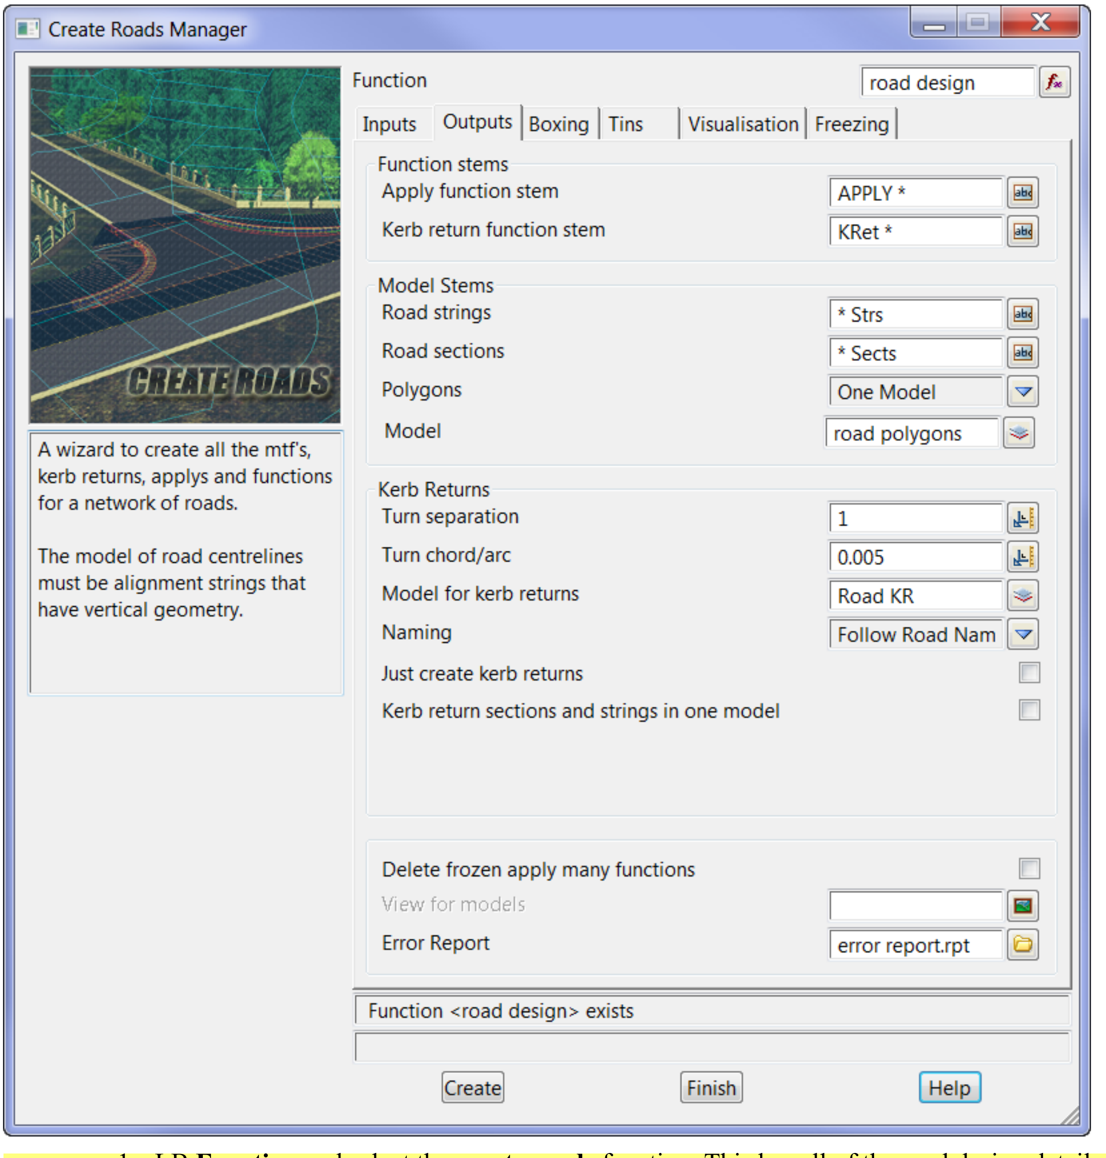
File IO=>Templates input



1) LB folder icon and select **lib** and select **Road templates**
2) LB **Read**
3) LB **Finish**

Now we are ready to create the road strings and design tin.

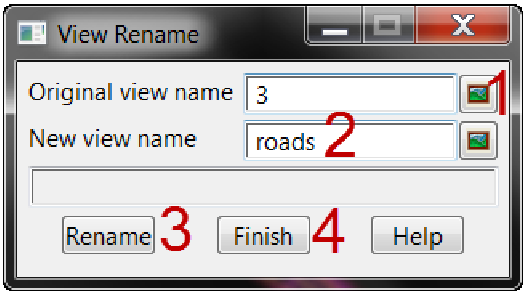
Design=>Roads=>Create=>Create Roads - Manager



1. LB **Function** and select the **create roads** function. This has all of the road design details included in it.
2. LB the **Create** button
3. LB the **Finish** button.
4. Add **tin design** onto the plan view.

To view the road strings, add on all of the **road *** models to view **3**. To view the tin add on the **tin design** model.You can also add the **tin design** model onto the perspective view. **Important:** On the OpenGL perspective view, 12d will show the tin data with the greatest z values (when viewed from the top side).

Rename view 3 to roads to help organise your work.

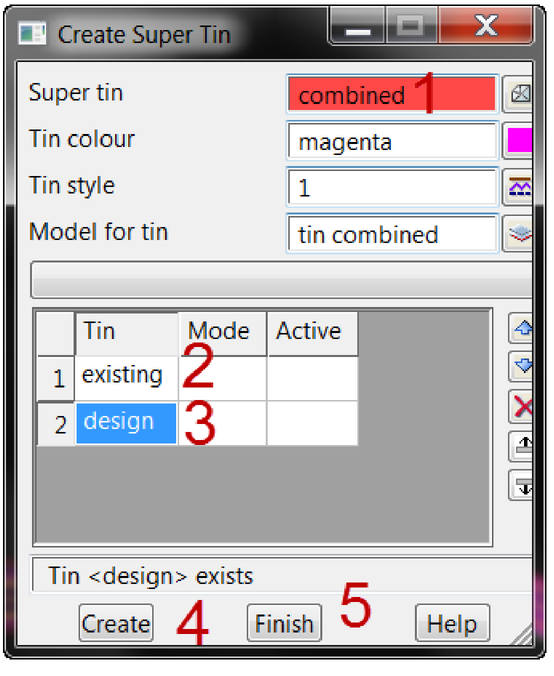


1. LB the **View** icon to select view **3**
2. Type the new name **roads**
3. LB the **Rename** button
4. LB the **Finish** button.

5.9 Creating a Super Tin from the Survey and Design Data.

The drainage fs tin may be used to set pipe inverts, pit levels, sag catchment overflow points and catchment slopes for tc strings. Therefore, the tin often needs to include several tins combined into one tin. To create a tin that is the combination of the survey data and the road design data you will need to create a 12d super tin. From the main menu

Tins=>Create=>supertin



1. Type a **New tin name** of **combined.** Press **Enter!**
2. RB in the cell and select the **existing** tin.
3. RB in the cell and select the **design** tin.
4. LB the **Create** button.
5. LB the **Finish** button.
6. Add **tin combined** onto the plan view.

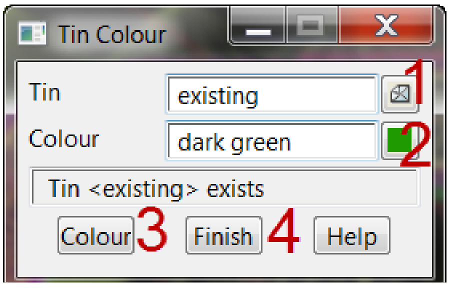
Notes about super tins:

- tin colour is only used in section views,
- the super tin is the 2 tins "glued" together,
- the super tin is Opaque so it will "cover up" other models already on the view. Use the Menu button on the View toolstrip and select **Models->models to back** and select the super tin.

- **The order of the tins is very important.** Tin 1 is the first to be drawn then tin 2 is drawn. i.e. wherever tin 2 exists it will be used. If there is no tin 2 at a location then tin 1 will be used.

5.10 Changing the Colour of a Tin

To emphasise the super tin is just the tins "glued" together, we will change the colour of the **existing** tin and see how the super tin changes colour as well.



Tins=>Colour=>Colour of tin

1. LB tin icon and select the **existing** tin
2. LB colour icon and select **dark green**
3. LB **Colour**
4. LB **Finish**

Toggle the **Tin solid** on and note the colours of the super tin.

6.Drainage Overland Flow Investigation

Where a drainage designer chooses to start their design is depends a great deal on the project and the designer. Identifying overland flow routes, with the crest and sag points, is essential because it is on these routes that the inlets are to be placed. Inlet structures are then placed at the critical locations (sag points, flattening of grades, intersections, upstream of pedestrian crossings etc.). and then the spacing of additional inlets is determined by the size of the catchments. Finally, the pipe drainage system can be created linking the drainage structures.

Following is a list of 12d tools to identify surface flow routes:

Change the Flow Arrow Length and Colour

Downhill Strings

Locating Crests and Sag Points

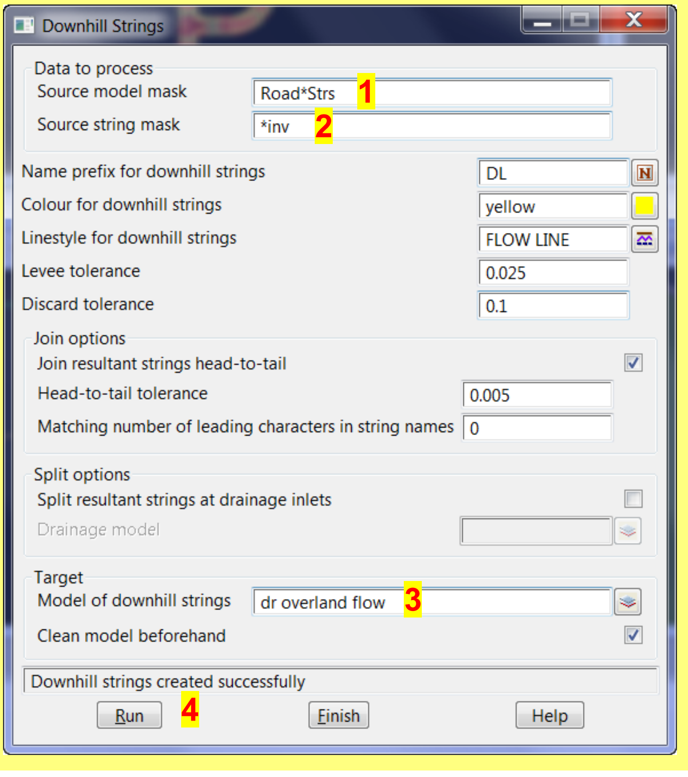
Rain drop

6.1 Downhill Strings

Roads are generally designed with a flow path in the cross section shape. In this example the roadway has a dual crossfall with kerb and gutters. We will use the downhill strings option to locate all the inverts strings, change their line style to a flow arrow, split them at their crest and sag points and ensure the chainage increases in the downhill direction.

From the main menu select

Design->Drainage-Sewer->Downhill strings

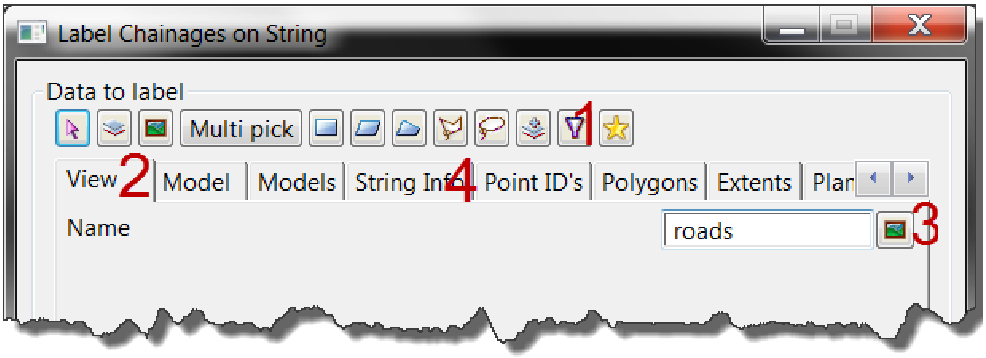


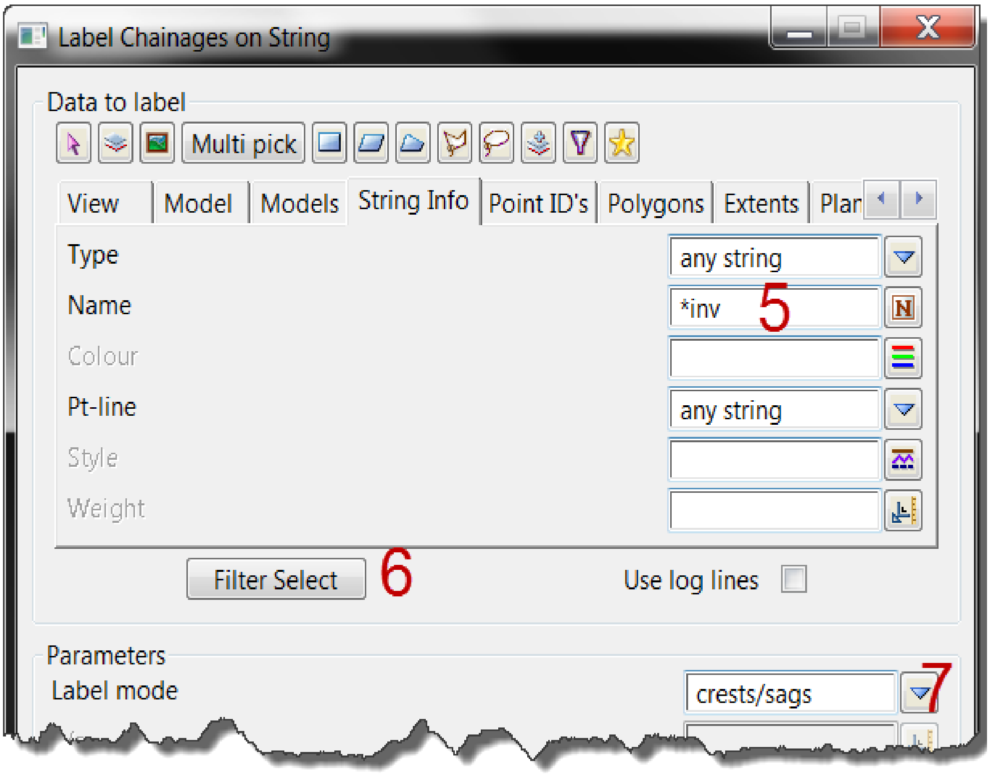
1. type **Road*Strs** (it is case sensitive). These are the models that contain all of the road strings. **Road 1 Strs** for example.
2. type ***inv**. The road string models have a **linv** and **rinv** string for the invert of the kerb and gutters.
3. type **dr overland flow** to create a model for the new strings
4. Select **Run**
5. add the model **dr overland flow** onto the **roads** view.

6.2 Locating Crests and Sag Points

This step will place tick marks at the crest and sag points of your kerb strings and label them with the levels.

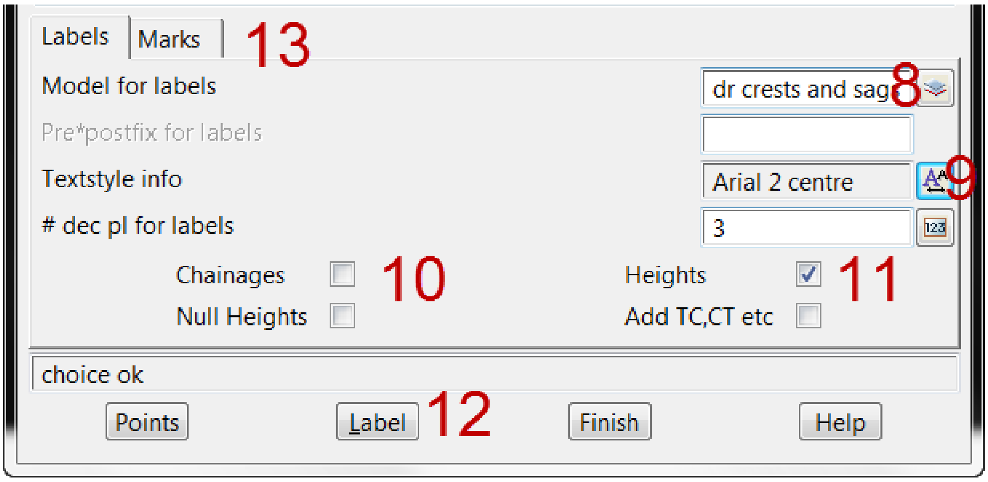
Strings =>Label => Chainages



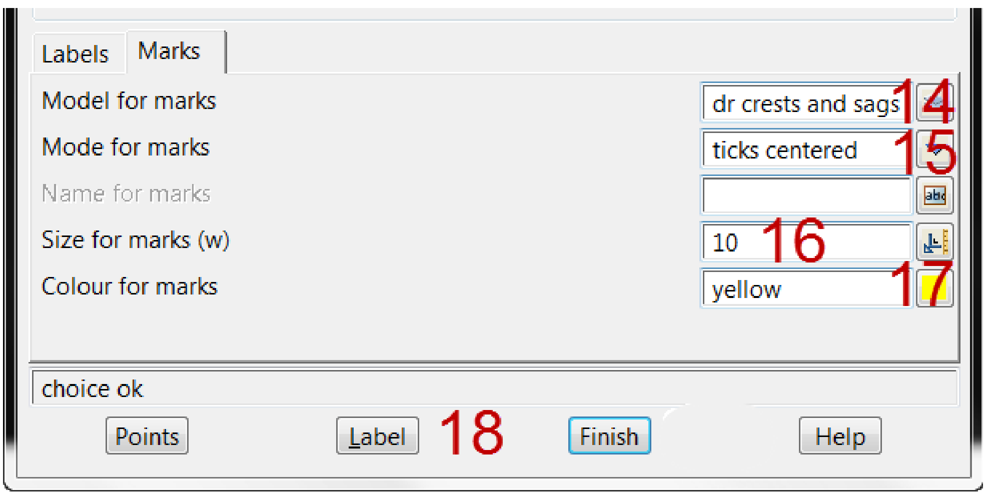


Add all of the models beginning with Road onto plan view 1.

1. Select the filter button
2. Select the **View** tab
3. Select the **Roads** view
4. Select the **String Info** tab
5. Type ***inv** to so that the linv and rinv strings will be selected.
6. Select **Filter Select** to select the inv strings to be labelled.
7. Select **crests/ sags** from drop down list**.**

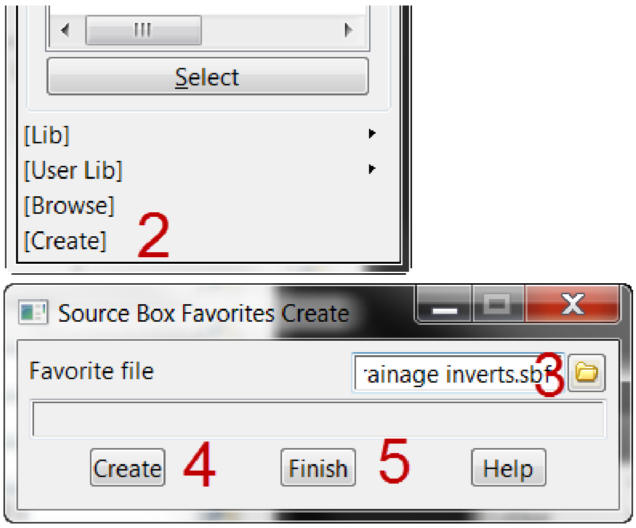


8. Enter a model to contain the text labels. A ,1 after the model name, requests that the model be added to view 1. This saves you adding the model to the view later to see the labels.
9. Select icon to define the text style.
10. Untick **Chainages**
11. Tick **Heights**
12. Select **Label**
13. Select **Marks** tab



14. Select the model used above for the tick marks.
15. **LB** to select **ticks centred** from the drop down list**.**
16. 10m marks stand out well on the screen.
17. Set colour to **yellow**
18. Select **Label** to create the labels.

6.3 Creating a Filter Favourite



1. Before closing the panels, create a filter favourite that can be used later. Select the Star button
2. Select **[Create]**
3. Type **drainage inverts**
4. Select **Create**
5. Select **Finish**. The favourite is now created for later use.

Select **Finish** to remove the panel.

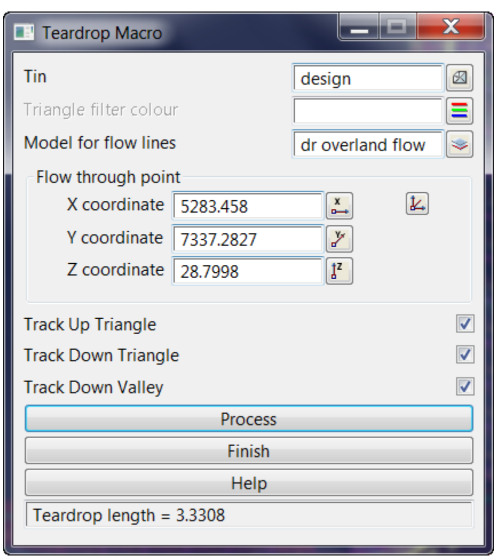
Now add the model **dr crests and sags** onto the **roads** view.

6.4 Rain drop

The raindrop routine will create a line from a selected point and follow either up or down the tin.

From the main menu select

Design->Drainage-Sewer->Rain drop



Try selecting several points on the tin to see the flow lines that are created.

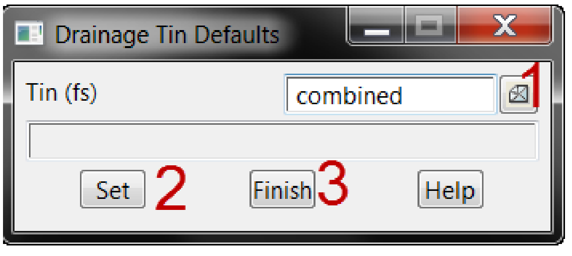
7.Setting Drainage Defaults (Initial Settings)

Before creating drainage strings in12d we should set default values for the pit and pipes. These defaults are only used as initial settings for new manholes and pipes. This ensures that most of the pit and pipes will have the desired type, size etc and then we only need to modify the pit and pipes that are different to the default values.The defaults for the drainage network are accessed through three panels; pipe defaults, manhole defaults and Tin defaults.

7.1 Tin Default

The 12d drainage module is designed so that no levels need to be manually entered into the drainage system (although they can be and locked if desired). The primary source for these levels is a design tin but levels from design strings and polygons can be used as well.

Design =>Drainage-Sewer =>Defaults=>Tin



The default TIN is used to set the initial manhole cover level and the pipe invert levels (via pipe cover or depth settings discussed later). Super tins may be used if you want to place manholes on both the existing and the design ground surface (see Creating a Super Tin from the Survey and Design Data.).

1. LB the tin icon and select the **combined** tin.
2. LB the **Set button**
3. LB the **Finish** button.

If you place a pit outside the tin boundary:

1. then no elevation will be set for the top of the pit, (it can be set later manually or by linking it to a road design string).
2. Pipe invert levels cannot be set using the default cover. Pipe invert levels must be set manually as 12d cannot automatically determine cover levels without a TIN.
3. Finally, if you are exporting to an external drainage design program that accepts surface levels along the string, then an error message will be displayed at export time. The message will say that the surface level string is shorter than the pipe length.

7.2 Manhole (Pit) Defaults

Design =>Drainage-Sewer =>Defaults=>Manholes

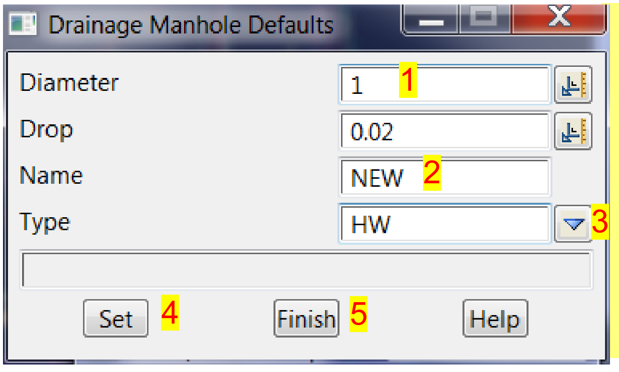
Notes on pit Diameters

The pit diameter/size is specified in metres/feet **not** mm/inches. The size of the pit is generally set in the drainage.4d file as either circular (mhdiam) or rectangular (mhsize). If both commands are specified then the mhsize command takes precedence. Plan drawings may use a symbol via the drainage plot annotations.

The **Diameter** is used for:

1. for visual service clash identification in long section drawings,

2. to clip the pipe lines drawn in the plan annotations so that symbols can be inserted in the space created,
3. maximum distance the bypass flow strings can be drawn from an inlet centre.



1. Type the desired diameter. If the manhole type below has a diameter/height defined, this setting is ignored.
2. Type the **Name** as **NEW** to remind you to assign a name latter.
3. LB the **Type** drop down and select the most common manhole type.
4. LB the **Set** button.
5. LB the **Finish** button.

The minimum **drop** will be used to set the invert level of the outlet pipe relative to the invert level of the inlet pipes. The drop should always be entered as a positive value. The DNE has many more options for aligning the pipe inverts at the pits. The drop may vary with the pipe deflection angle via the DNE**->Defaults->Pipe->Drop file**.

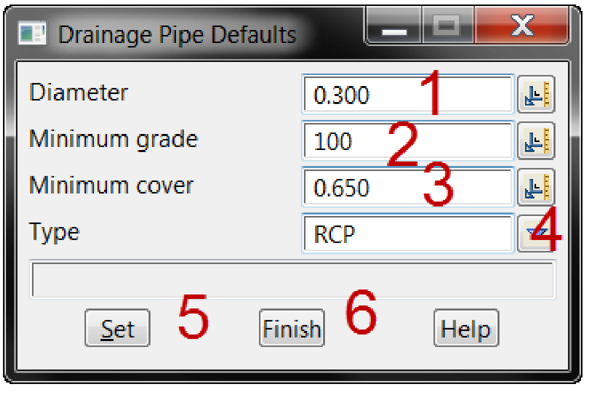
Setting the default name to **New** is a good reminder that you have not confirmed the pit type. Use the Set Pit Names function on the DNE to assign the pit names.

The **pit type** list is obtained from the drainage.4d file. Set this to the most common pit type and then later change the ones that are different using the DNE.

You **must** click the **Set** button to set the default values. Finish alone will **not** set the defaults.

7.3 Pipe Defaults

The pipe **diameter** is set in metres or feet **not** mm or inches. Set this to a common pipe diameter for your project then alter other pipes or change to box culverts in the DNE.



1. Type the common pipe diameter.
2. Type the minimum grade (1 in xxx). This value can changed by pipe height via the **DNE->Defaults->Pipe->Grade file**
3. Type the minimum cover. This value can be changed by pipe type via the **DNE->Defaults->Pipe->Cover file**
4. LB the **Type** drop down and select the most common pipe type.
5. LB the **Set** button.
6. LB the **Finish** button.

Pipe Thickness for Pipe Cover

When 12d set the pipe inverts it checks the **minimum cover** from the top of the pipe to the finished ground surface at the ends f the pipe. Pipe thickness is changed by pipe type as defined in the drainage.4d file.

Cover = surface level - thickness - diameter(height) - invert

If the grade of the pipe is less than the **minimum** grade, the grade of the pipe is increased. The DNE has a pipe grade file where the minimum grade may be changed via the pipe diameter.

Finally, 12d checks if there is anywhere along the pipe length that has less than the **minimum cover**. If there is such a low point in the design surface, the pipe is shifted vertically downwards to achieve the cover required. The DNE has a pipe cover file that will change the pipe cover via the pipe type. If the pipe type is not found in this file then this minimum cover will be used. Circular pipes have the cover checked along the centre line and box culverts along the centre line and edges.

When using the 12d editors to change the pipe diameters the invert levels will remain fixed and the obverts will change. The inverts may be reset using Regrade Network on the network editor.

The list of available pipe types is set in the drainage.4d file.

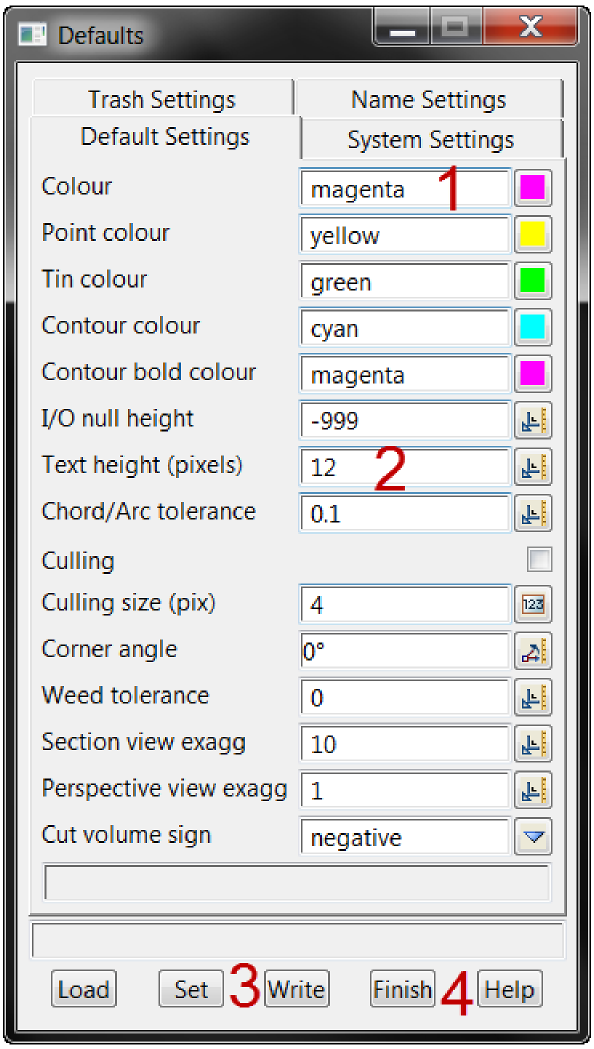
7.4 String Colour and pit Label Text Size/location (string defaults)

12d can automatically label the pits at a fixed offset from the pit using view text OR you can use the network editor Plot to create text labels that can be moved/rotated etc.

For view text, the default line colour and text size are set by selecting

Project=>Management =>Defaults

The following panel will appear.



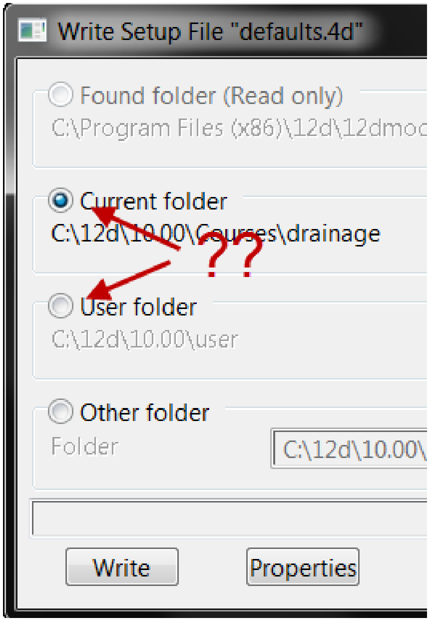
1. LB **colour** icon to set the default colour of the drainage string and manhole labels.
2. Type the height of the text in pixels
3. LB the **Set** button. This will set the defaults for this project only.
4. LB the **Finish** button.

The manhole label textstyle and offset may be changed via the DNE->Global->display tab

Optionally, you may LB the **Write** button to set the defaults for other projects. The following panel will appear. Selecting **Current folder** will save ALL these defaults for projects in this working folder only. The defaults set in the **user** or **setups** directories will not be used if you select this option.

Selecting **User folder** will save your defaults so that all other 12d projects will use these defaults. This is the most common option (unless your network administrator has not given you write access to this folder (check **Properties** in windows explorer).

Select **Write** then **Finish**



8.Creating Drainage Strings

We are now going to create a culvert to cross road 3.

Key Points

1. Before creating the drainage strings, read in a drainage model template (Design->Drainage-Sewer->Create->Create/Read template) so that all of DNE settings will set. There is a sample one in the 12d library (drainage_template_QLD.12da). If you forget, do it later but **READ A TEMPLATE FILE.** We will create one at the end of this course.
2. You will be placing centre of the culvert headwall. The headwall centre is the selection point for the pit. Pipes can be connected this pit Use setout strings for construction setout points!
3. Drawing all drainage lines in the same direction may help you keep your drainage work organised. Either draw all string uphill to downhill **(**flow **same as string direction) OR** downhill to uphill (flow **opposite to string direction**). You can mix the flow directions if desired.
4. The Drainage Network Editor **Regrade Pipes** is the key to setting pipe invert levels! Use this after modifying the drainage plan layout as it will update all initial grading described below.

   However, 12d will perform an initial grading as you draw the string. If you choose **opposite to string direction** then will need to select Pipe=>Default Grading then Grade to achieve this initial estimate. If you create branch lines before the trunk lines the initial grading will ensure the trunk line inverts remain below the branch line. Regardless, the DNE regrade pipes will sort the grading for all strings in the model.

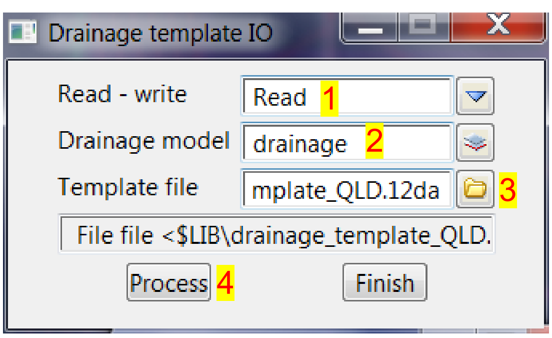
8.1 Read in a drainage model template

A drainage model template contains your favourite global and default settings for the DNE. These settings are stored as model attributes and the template may be read before or after the drainage strings have been created. Caution: existing default and global setting may be overridden.

You can create you own templates as well. After you have completed a drainage job and all of your global and default settings are set, create a template to save in your user library.

From the main menu select

Design =>Drainage-Sewer =>Create->Create/Read template



1. Leave as **Read**.
2. Type **drainage** to create a new model for the drainage strings
3. LB the folder icon, then lib to locate drainage_template_QLD.12da
4. LB **Process** to create tthe model and import the default and global settings.

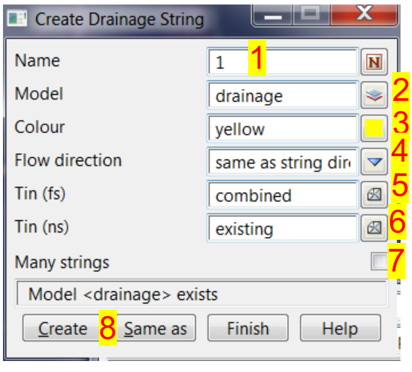
8.2 Creating the Drainage Strings in 12d

12d has a routine that creates a culvert very quickly. **Design->Drainage-Sewer->Create->Culvert**. It will also add a channel to the outlet as well! Try this, then the general method discussed below. The culvert is placed in a model **culvert** and the levels are all set to the manual mode.

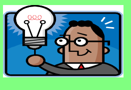
A drainage string is created by selecting

Design =>Drainage-Sewer =>Create->Create

The initial manhole and pipe types will those set in Setting Drainage Defaults (Initial Settings).



1. Type a string name (used for pit naming later).
2. Type a new model name for the network
3. LB the **Colour** icon and select colour (optional).
4. Leave unless drawing in uphill direction.
5. From the default, leave as is.
6. Existing tin can be used for long section dwg levels
7. Select if creating more than 1 string.
8. LB the **Create** button, the menu below will appear.

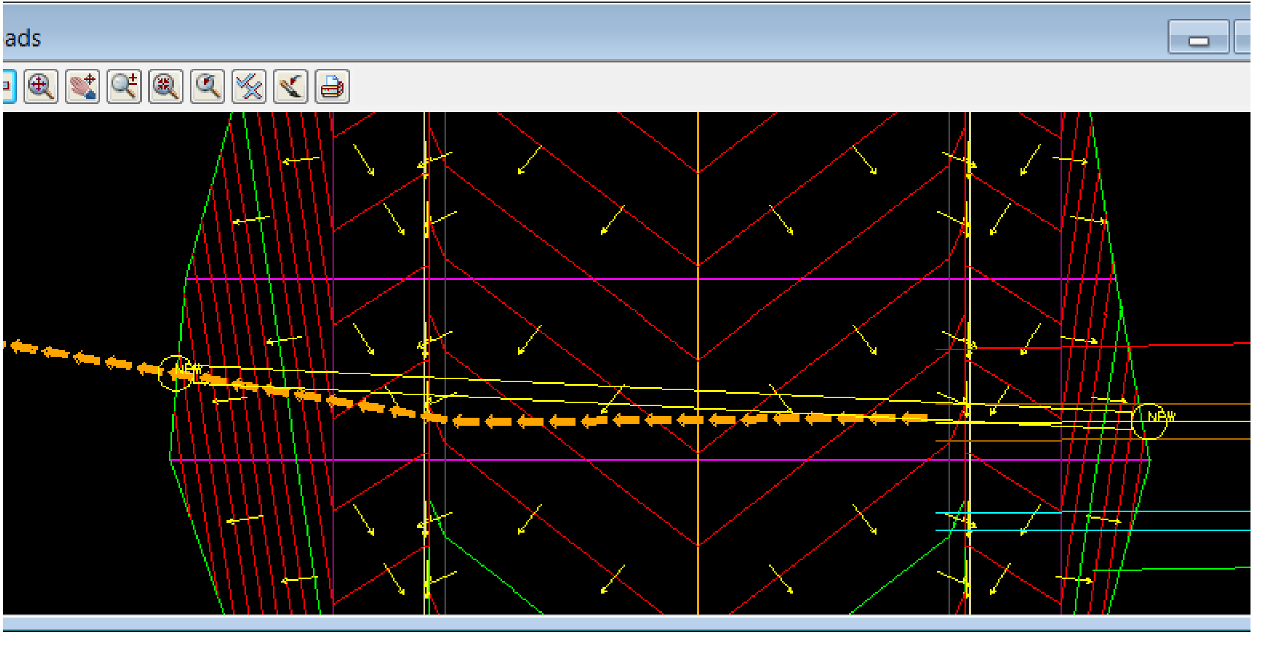


If you have already created a drainage string, click the **Same as** button and select the drainage string to obtain the panel values from that string. After selecting the string, change the string **Name.**

We are going to initially place our head walls on edge of the batters and then fine tune the location later.

To create your first manhole select

1. **Edits =>Add/Append MH**. A +MH will appear with your pointer. Refer to the plan below for the headwall locations.
2. LB and accept for the upstream (east) and downstream (west) headwalls.
3. LB the **Finish** button after the last headwall is placed.



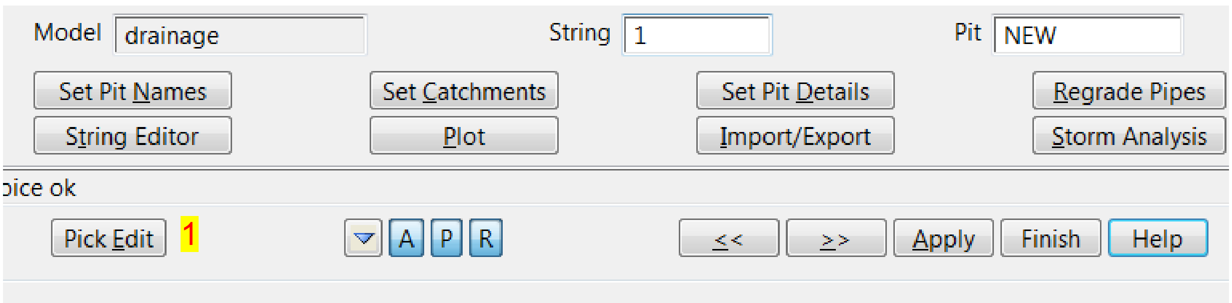
8.3 Change Pit and Pipe Types and Sizes

We will use the DNE to change the structures to inlet and outlet headwalls and the pipe to a box culvert.

The drainage network editor is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Network Editor

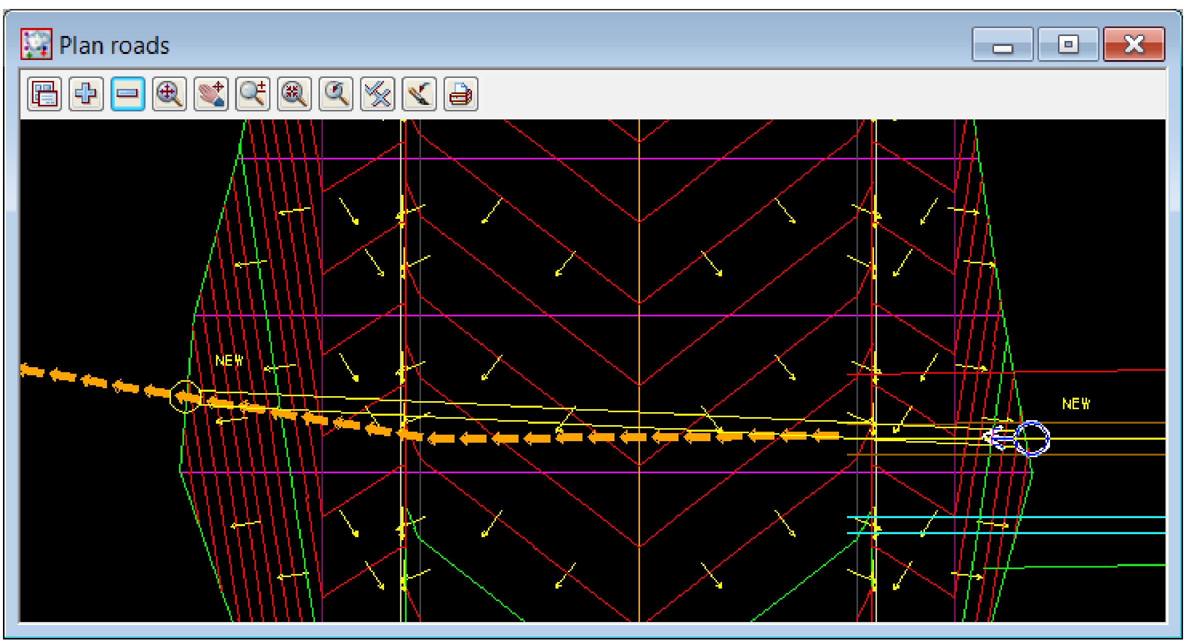
The bottom section of the network editor panel is shown below. You can change tabs but no data can be entered in the panel until a drainage pit or pipe has been selected and accepted.

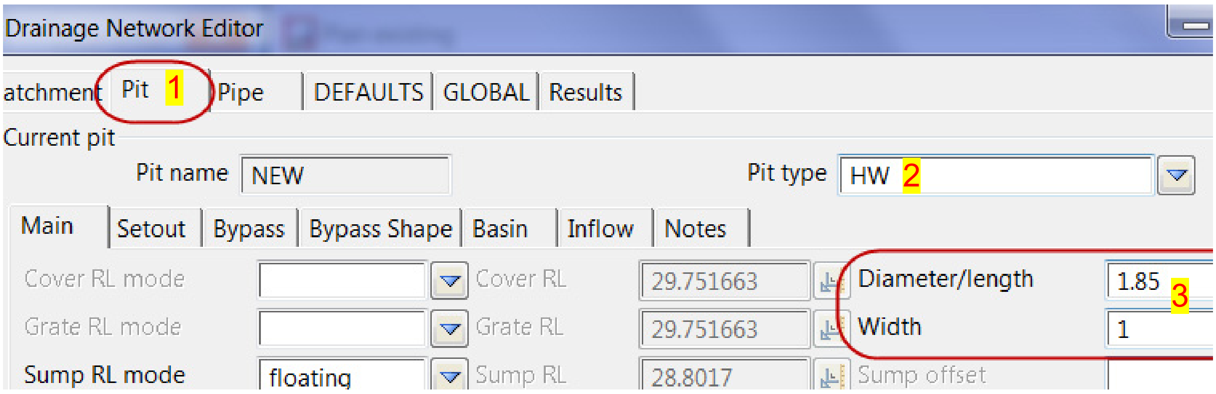


1. Pick and accept the drainage string near the western headwall and the network will be loaded into the panel (only drainage strings may be picked).

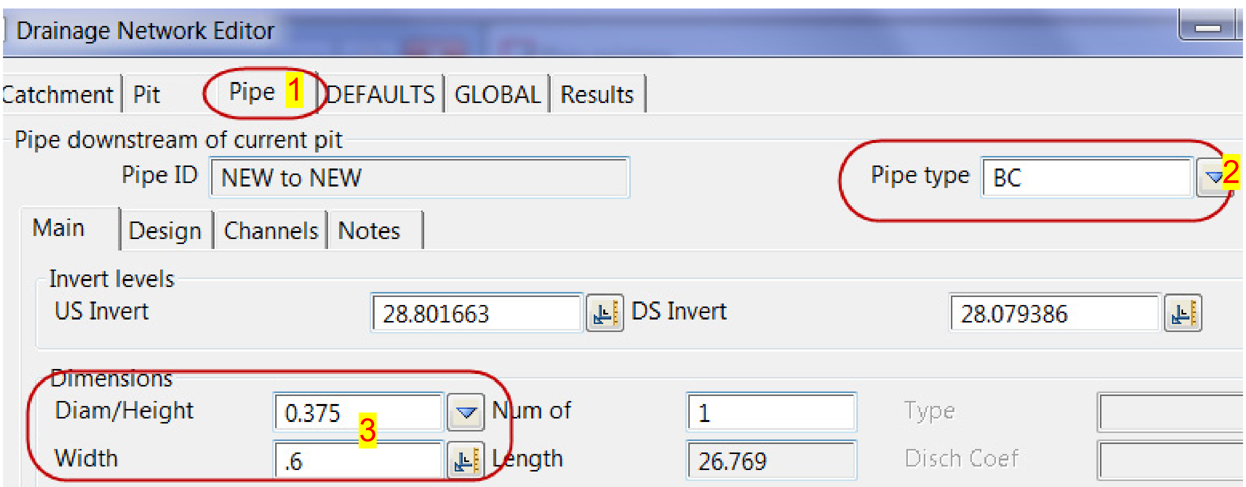
The action buttons on the drainage editor now become active.

The pit closest to the point selected is highlighted with a circle and an arrow shows the direction of flow and the pipe being edited (see image below). When the outlet is selected there is no arrow. If the arrow is in the wrong direction or the outlet is at the upstream end of the string see Flow in the Wrong Direction to correct this.

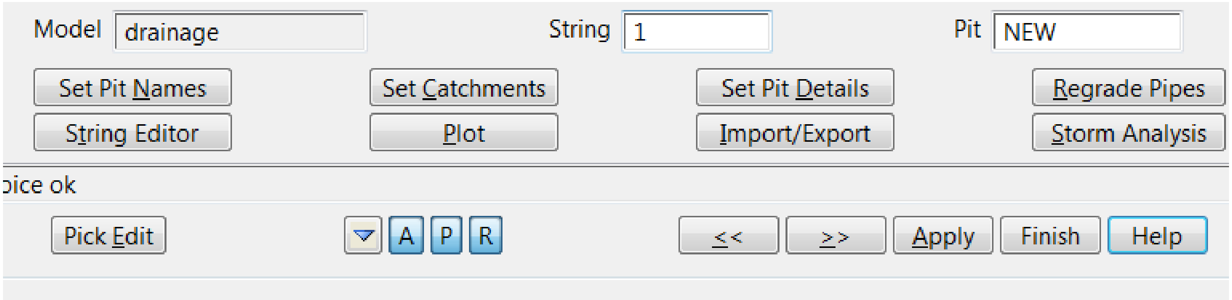




1. Select the **Pit** Tab
2. Note the **Pit type** is already **HW** as we set this as the default. The type may be used to set pit properties. See Drainage Definitions - Manhole Types in 12d help. If you did not set this as your default (Manhole (Pit) Defaults) then change it now.
3. Diameter/length is in the direction of the road once it is linked otherwise it is east-west. Width is 90 degrees to this, If width is blank the pit is circular.
4. Select **Apply** to see the changes.

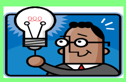


1. Select the **Pipe** Tab
2. Change the **Pipe type** to **BC** (for box culvert). This may be used to set some of the pipe properties. See Drainage Definitions - Pipe Types in 12d help.
3. Change **Diam/height** to 0.375 and width to 0.600. If width is blank the pipe is circular.



1. Now move to the outlet using the **Pick Edit,** **<<** or **>>** buttons. << and >> are left and right in section view and NOT east west.
2. Enter the pit length and width for the outlet headwall.

A popup will appear indicating that the pipe thickness will be changed because the pipe type has a different thickness setting in the drainage.4d. Select **Stop asking for this session** and then click **Update**.



Note: **A P R**. The **A (auto apply)** is active by default. Changes are saved and displayed when you press any button on the DNE except **Finish** or the red **X** in the top right corner. If you turn **auto apply** off, it will be back on the next time you start the DNE.

8.4 Flow in the Wrong Direction

The direction of flow is used by 12d to determine which end of the string is the outlet and therefore the direction of decreasing invert elevations when regrading the string.

The direction of flow will be indicated with the arrow on the pit when using the DNE. No arrow will appear if the outlet is selected. If you find the arrow is pointing in the wrong direction there are 2 methods to access the flow directions.

Method 1: Use the DNE to select the string with the flow in the wrong direction and then select the **String Editor** button. From the menu select **Utility->Properties.** Change the **Flow direction** value to the other value. Select **OK** then **Save & Finish**. Now use the **Pick** button to select the drainage network again.

Method 2: Use the **Strings->Properties->String** option from the main menu. Select the string and then change the **Flow direction** value to the other value.

9.Drainage Strings Levels

The DNE quickly sets the levels for your drainage network. All the levels can be calculated by the DNE or locked with user specified values.

9.1 Pit Levels

Pits have 4 levels:

1. the cover level is used in plotting and pit depth calculations. This is also the maximum obvert level drawn for all connecting pipes.
2. the grate level is used for the freeboard measurements, the surcharge to bypass level and the reference level for pond flooding depths.
3. the setout level is used for survey setout to construct the pit.
4. the sump level (bottom of the pit) is used in plotting and for depth calculations. If set to floating mode, it is calculated from the lowest pipe invert connected to the pit plus the sump offset.

The grate level is the most important level in 12d hydraulics and will be discussed more in those sections.

9.2 Pipe Levels

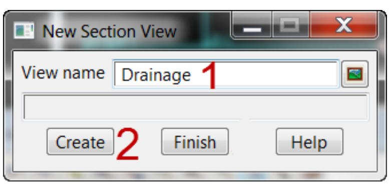
Pipes have the upstream and downstream invert levels that can set by the minimum grade and cover criteria (see Vertical Alignment - Pipes). The invert drop across a pit can also be fixed or change with the deflection angle. At this time we are only concerned with the pipe cover and grade.

9.3 Section View of a Drainage String

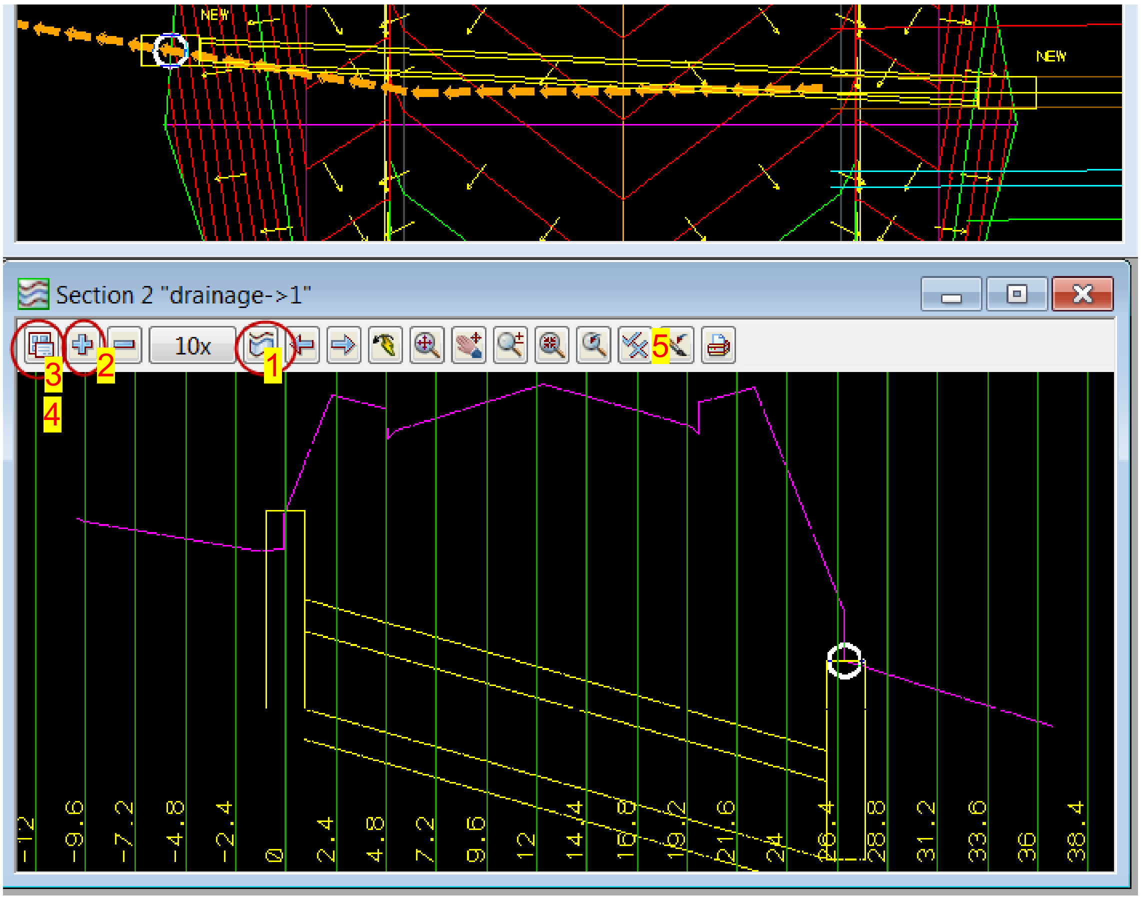
Create a section view to profile the drainage string.

From the main menu select

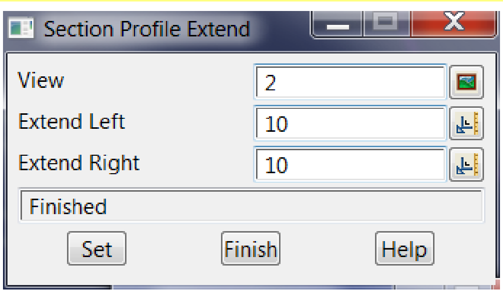
View->Create->Section view

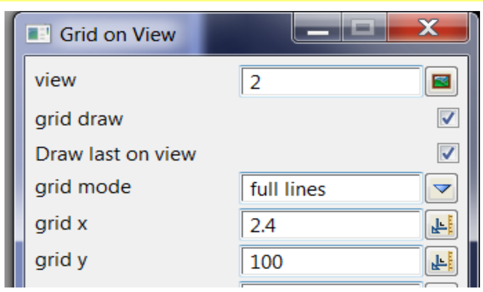


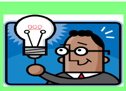
1. Type **Drainage**
2. Select the **Create** button



1. LB the **profile** button then pick and accept the drainage string.
2. LB the + button and add the **tin combined** to the view.
3. LB the view menu button and select **Settings->Extend** to view 10m past the ends of the culvert.
4. LB the view menu button and select **Settings->Grid** to set the horizontal grid to 2.4m (a standard culvert length)
5. Toggles **Grades** on to see the pipe length and grade



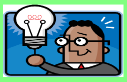




LB the view menu button and select **Settings->Grade annot** to set **Draw grades as 1 in**.

9.4 Set Pit Details

Selecting **Set Pit Details** will set the pit levels and setout coordinates for all of the pits in the network using either the default settings for the model or the explicit settings for the pit (if used). Other attributes are set as well but they will be discussed later. A prompt box appears asking you to confirm. Select **Yes**.



To toggle off/on the confirm request, RB **Set Pit Details**. The same works for **Regrade pipes** and **Set Catchments**

9.5 Regrade Pipes

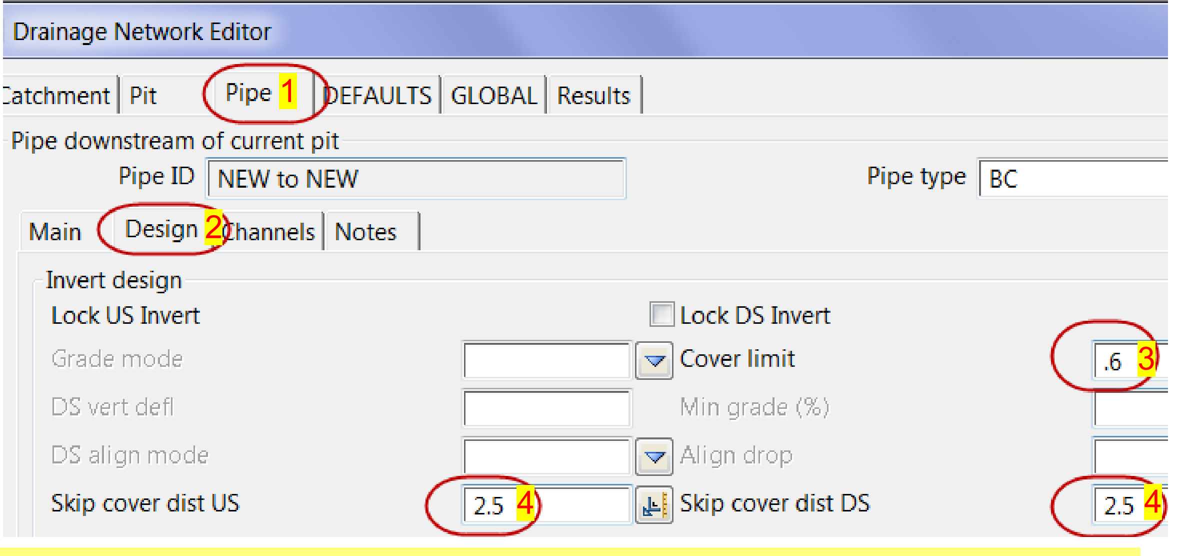
Selecting the **Regrade Pipes** button sets the pipe inverts for all of the pipe in the network using either the default settings for the model or the explicit settings for the pipe (if used). A prompt box appears asking you to confirm. Select **Yes**. To toggle off/on the confirm request RB **Regrade Pipes**.

Minimum grade and cover are checked and trunk lines are lowered to accept incoming branch lines. Grade is calculated using either the pit centre to centre distance or the end of pipe to end of pipe distance (DNE->Global **Use end to end pipe length).** Default pipe cover and grade are set on the DNE **Defaults-Pipe** tab and if not found there the **Drainage->Defaults-Pipe** settings are used.

Invert alignment is based on the pipe cover, the pipe minimum grade and the drop across the pit (see Pipe Grade Modes). The tin specified in the **Global-Main Finished Surface Tin** box is used for these calculations. Since every pipe that enters the pit may have a different drop mode, the drop mode is set on the downstream end of the pipe, NOT the pit.

If the inverts are locked on the **Pipe** tab then some the design criteria may not be able to be achieved. Messages in the output window will indicate these problems.

Now we will regrade the culvert checking the cover only under the roadway. First select the upstream (east) headwall.



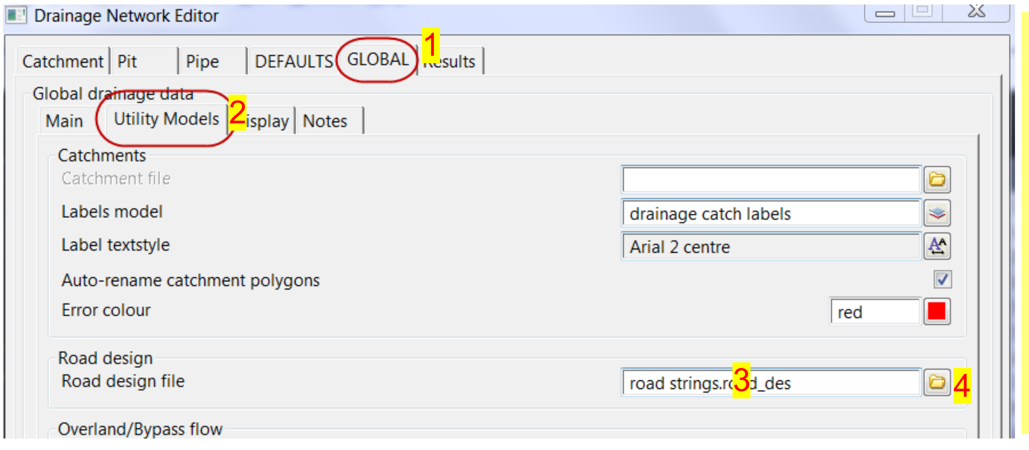
1. Select the **Pipe** tab
2. Select the **Design** tab
3. Type **0.6** to over ride the default cover we set earlier (this is the minimum distance measured from the top of the pipe).
4. Type **2.5** for the Skip cover distances (US and DS). These distances are measured from the ends of the pipe. This will stop 12d from checking the cover in these areas.
5. Select **Regrade Pipe** to reset the inverts.

For circular pipes, the cover is checked along the centre line of the pipe. For box culverts the cover is also measured along the sides. The wall thickness is set via the pipe type and diameter from the drainage.4d file.

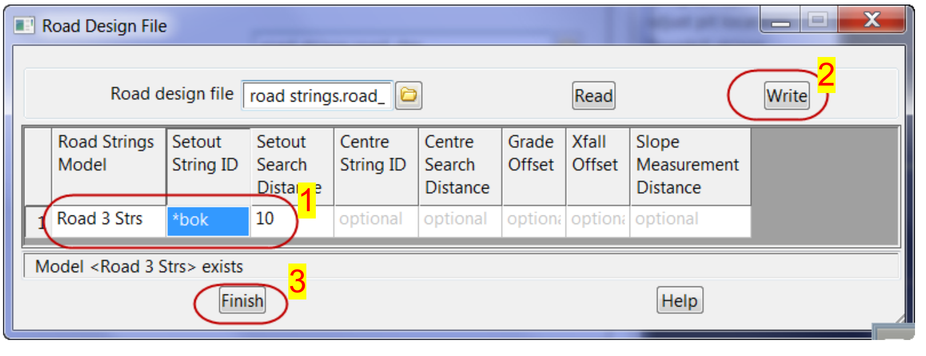
Note: The obvert of the pipe will never be drawn above the grate levels. If the cover or grate level is below the pipe invert you will get an X pipe. **Set pit details** will recalculate the pit levels and Regrade pipe to set the inverts..

9.6 Setout Strings to Align the Headwalls with the Roadway

Now link the headwalls to the roadway so they are perpendicular to the batter slope.

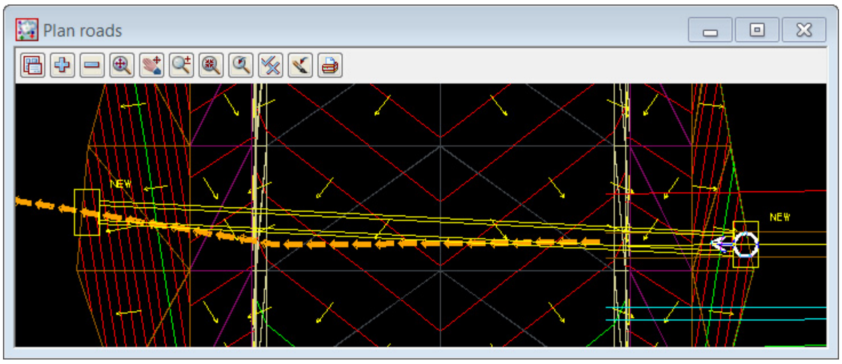


1. Select **Global**
2. Select **Utility Models**
3. Type **road strings**
4. Select the **folder** icon then **Open**

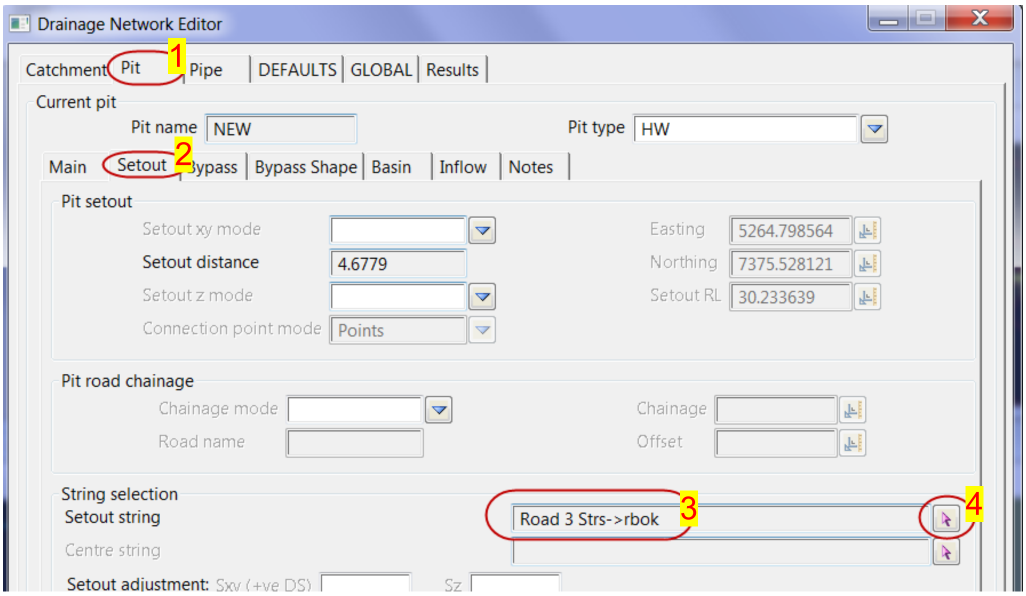


1. RB in the **Road Strings Model** cell and select **Road 3 Strs** model
   type ***bok** so that the headwall will be linked to the closest lbok or rbok string.
   type **10** as the max distance to search for a string
2. LB **Write** to save the file
3. Select **Finish**
4. Select **Set Pit Details** to create the links to the road strings.

The culvert headwalls now align with the roadway instead of east-west.



Now confirm the manhole link to the road strings (setout strings).



1. LB **Pit**
2. LB **Setout**
3. Note: selected string
4. Note: manual pick/clear button

DNE string links exist until you manually clear them or you delete the string.

OR you clear the link by RB on the manual pick and select **Clear,**

OR you clear all road string links via **Global->Utility Models->Clear Road Links.**

We have a good link so do not do this at this time.

9.7 Adjust Pipe Length

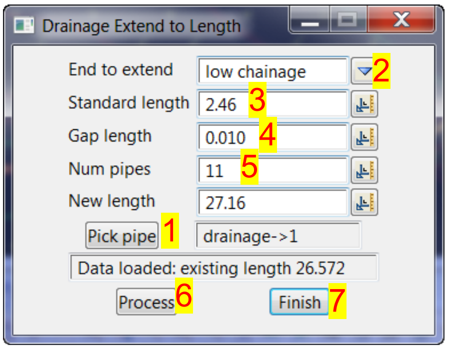
Now adjust the culvert length to an even number of pipe lengths.

Only one editor at a time can access the strings. The DNE locks all of the strings in the model. Close the DNE now, before we start the next editor.

From the main menu select

Design->Drainage-Sewer->More->Extend pipe/culvert

As the culvert appears to be too long we will shorten it to 10 standard lengths (half on both ends).



1. Pick and accept the culvert
2. Change **End to extend** to **high chainage**
3. Change **Standard length** to 2.46
4. Change **Gap length** to 0.010
5. Change **Num pipes** to 11 and press enter. the new length is displayed
6. Select **Process**
7. Select **Finish**

After selecting process, the section view will need updating. Also the pit cover levels are set to the pipe invert level. The next time you press **Set pit details** in the DNE they will be reset using the selected method.

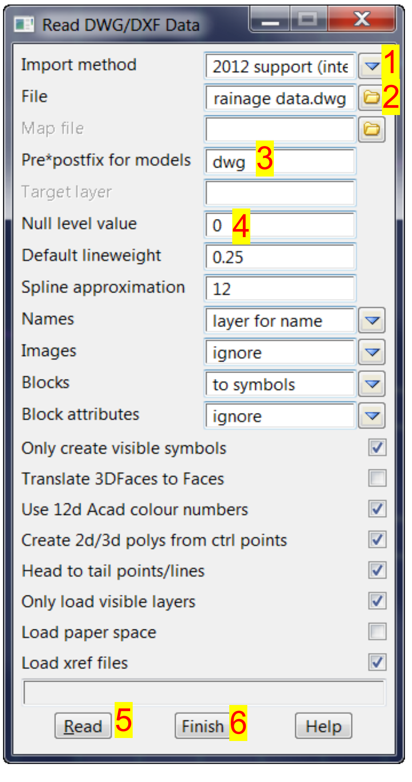
10.Importing Drainage Layouts from AutoCAD

We are now going to import a pipe layout that was drawn in CAD along with the overland flow routes and catchment areas (These could have been created in 12d as well). When these were drawn the following rules were followed:

1.Strings are drawn where the pipes are NOT to setout x,y locations,
2.Polylines are used in AutoCAD,
3.lines drawn from upstream to downstream (direction of flow),
4.a vertex was placed at every pit location.

To import the AutoCAD drawing, from the main menu select

File IO->Data Input=>DWG/DXF/DXB



1. Select 2012 support
2. LB the folder icon and select the **drainage data.dwg** file
3. Type a **prefix** for the models. It will help organise the layers from AutoCAD as every layer goes into a separate model in 12d. Specifying a prefix causes all of the layer names to be prefixed with this text and therefore kept together in the model list. The prefix used is dwg<space>.
4. Enter the null value **0** (no level in CAD value)
5. LB **Read** button. If you select the **Read** button more than once the data will be imported again and you will get duplicate, triplicate...etc data.
6. LB **Finish**

The models that have been created are,

dwg Catchs Future
dwg Catch Lots
dwg Catch Reserve
dwg Catch Roads
dwg network

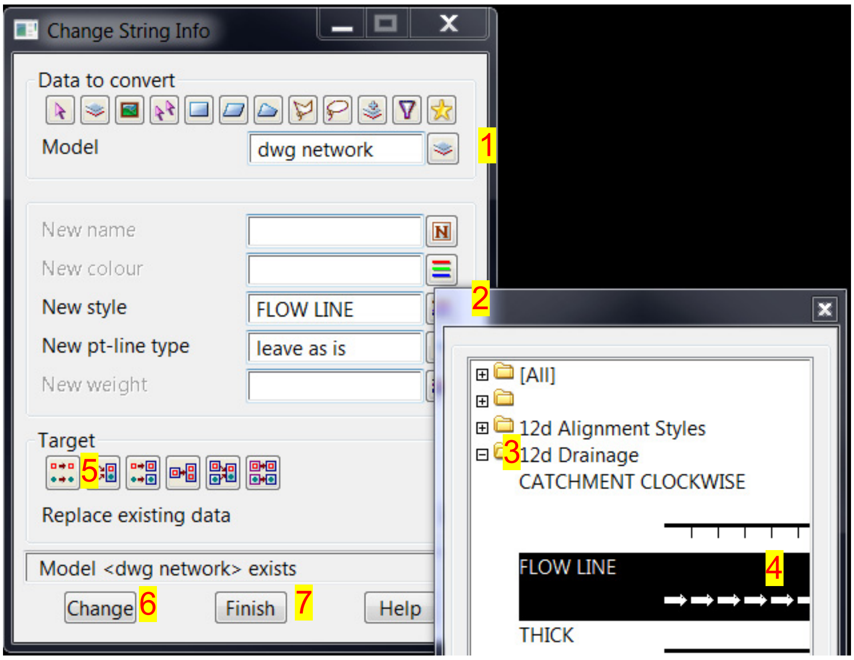
dwg network is a drainage layout that we will use to locate the pits in our drainage design.

10.1 Checking the String Direction of CAD Network Strings

A quick way to check the direction of the strings imported from CAD is to change the linestyle to a style that indicates the direction.

From the main menu select,

Utilities->A-G->Change



1. Select the dwg network model that contains the drainage network.
2. Select the **New Style** icon
3. Select + on the **Drainage 12d** group
4. Select **FLOW LINE** from the style list
5. Select the **Replace** option from the **Target** buttons
6. Select **Change**
7. Select Finish

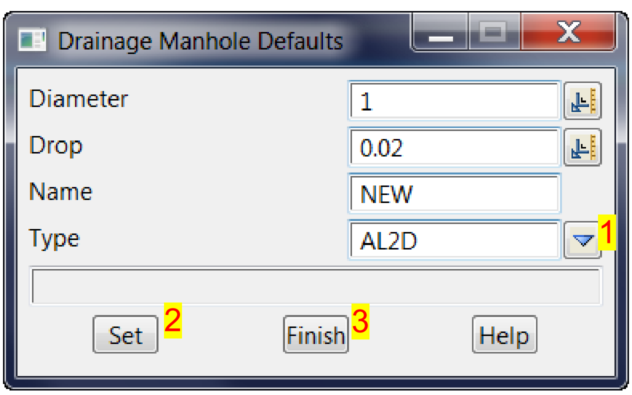
10.2 Create the drainage strings from the CAD strings

Before creating the drainage strings, Read in a drainage model template so that all of DNE settings will be set. If you forget, do it later but **READ A TEMPLATE FILE.** If the drainage strings are going to be added to a model that already has the global and default settings set, these strings will use those model settings.

12d will convert the import strings into 12d drainage strings. The default pipe, pit and tin data will be used to set the levels for the network. Do not use the other string convert commands found on the menu system.

Most of the pits will be grated roadway side entry pits (AL2D). Set this pit type as the default.

Design =>Drainage-Sewer =>Defaults=>Manholes

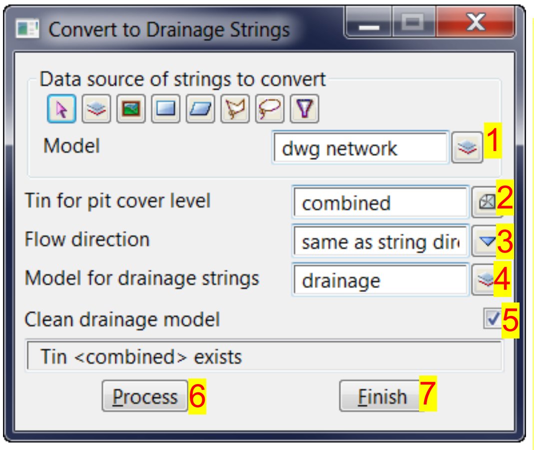


1. LB the **Type** drop down and select **AL2D**.
2. LB the **Set** button.
3. LB the **Finish** button.

Next from the menu select

Design=>Drainage-Sewer=>Create=>Create from strings

The following panel will appear.



1. Select the existing **dwg network** model
2. Select the **combined** tin. The cover level for the manholes will be obtained at the manhole centres from this tin.
3. Leave as **same as string direction**. The strings were drawn in the same direct as the flow in th CAD program.
4. Select the existing **drainage** model. If this model was not created from the read drainage model template function then you could type the name now and the model would be created.
5. **Clean drainage model** when selected will delete all strings in the model before the new drainage strings are created.
6. **Process** create the drainage strings
7. **Finish** closes the panel

The imported strings must all be drawn in the same direction. Either all in the direction the water flows or all opposite the direction of flow.

Pits are created at all vertices on the strings.

Trunk lines must have a vertex where the branch lines join.

Delete the new plan that was created and observe the new drainage strings created (road view).

11.Horizontal Alignment and Drainage String Edits

11.1 Road design strings (centre line) for Adjust Pit Locations

During the design process, roadways are often moved slightly, requiring the pit location to be adjusted. Linking the inlets to the road design strings enables 12d to quickly adjust these locations and create a report of the pit requiring adjustment.

The Adjust Pit Locations routine will move the centre of the pit perpendicularly to a **layout string** or offset from a **road setout** string.

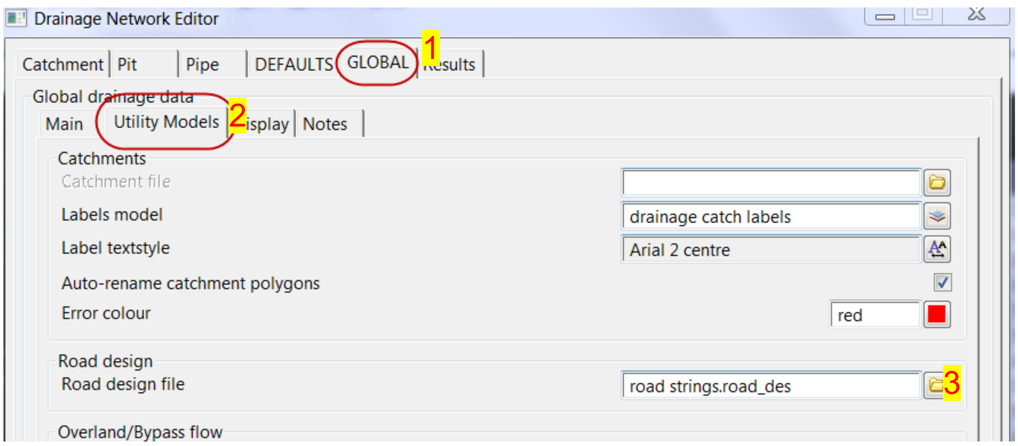
Layout strings do not need to be set up in advance but they do not allow for an offset.

Road design strings need to be setup in the DNE but the allow an offset from the setout string that can vary with the pit type. Often large pits will be offset more into the footpath or roadway.

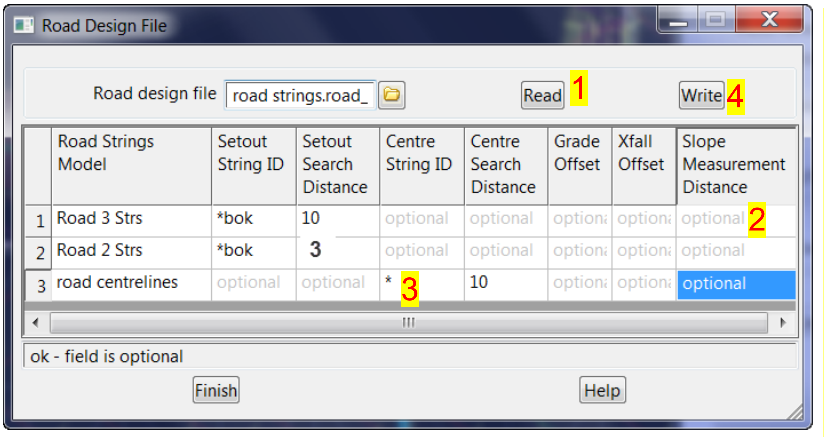
Road and layout strings can be used at the same time. If no road string is found, a layout string will be searched for.

In this example were are going to use the road setout strings not layout strings. We have already linked the culvert headwalls to the road design strings on Road 3. We will now do the same for the roadway inlets so they will align with the roadway and we can offset the centre of the pit a fixed distance from the setout string. This will require a link to the road centre line as well. A positive offset is away from the centre line and negative towards the centre line.

Start the DNE and select the network.

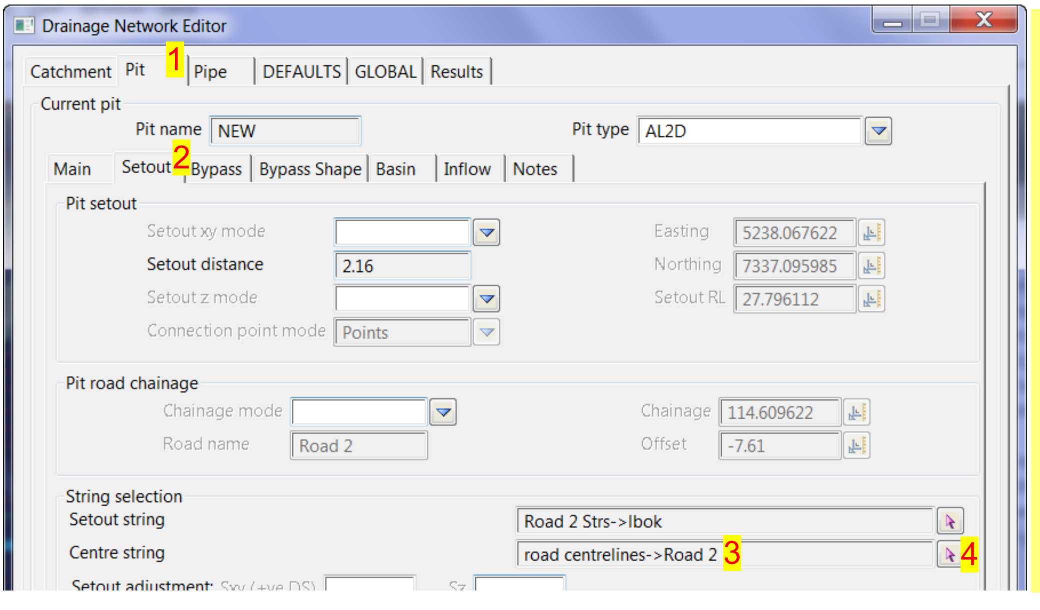


1. Select **Global**
2. Select **Utility Models**
3. Select the **folder** icon then **Open**



1. RB in the **Road Strings Model** cell and select **Road 2 Strs** model
   type ***bok** so that the inlets will be linked to the closest lbok or rbok string.
   type **3** as the max distance to search for a string
2. press enter until row 3 is added
3. type * for **Centre String ID**. This wild card will allow a string with any name (blank will not work).
   type **10** as the max distance to search for a string
4. LB **Write**, then **Replace** to save the file
5. Select **Finish** then **Set Pit Details** to create the links to the road strings.
6. Regrade pipe to set the inverts.

To confirm that the inlets were linked to setout (*bok) and centre line strings,



1. LB **Pit**
2. LB **Setout**
3. Note: selected string
4. Note: manual pick/clear button

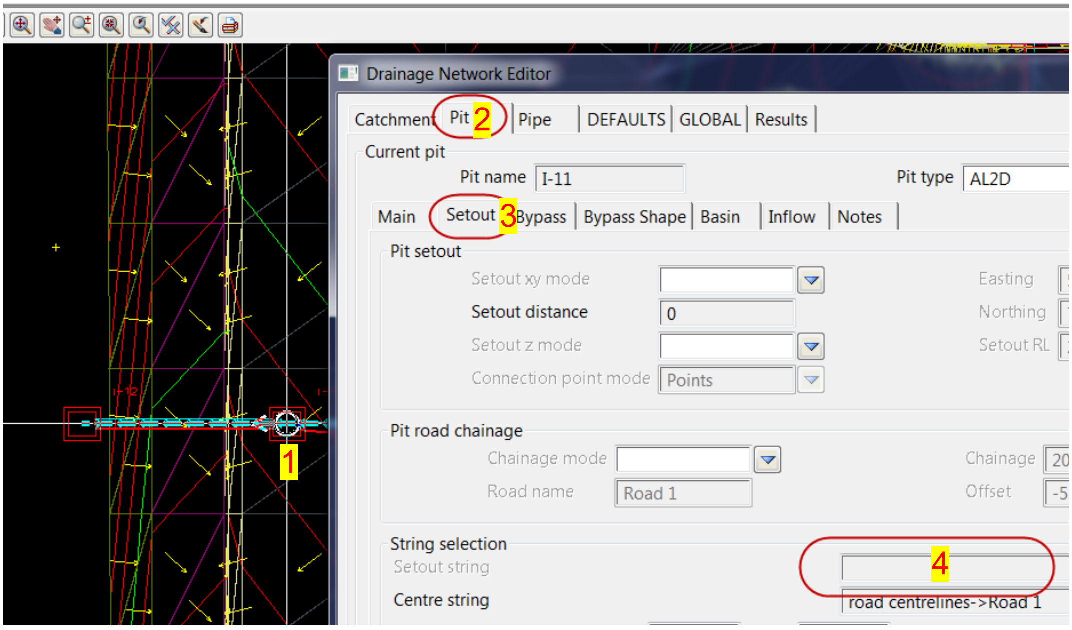
11.2 Log Lines with the Drainage Network Editor

Double clicking on a log line in the Output window will take the DNE directly to the pit the message refers to!

Selecting **Set Pit Details** and messages are created in the **Output Window** for information and error checking. If the line of text begins with a exclamation mark it is a log line.

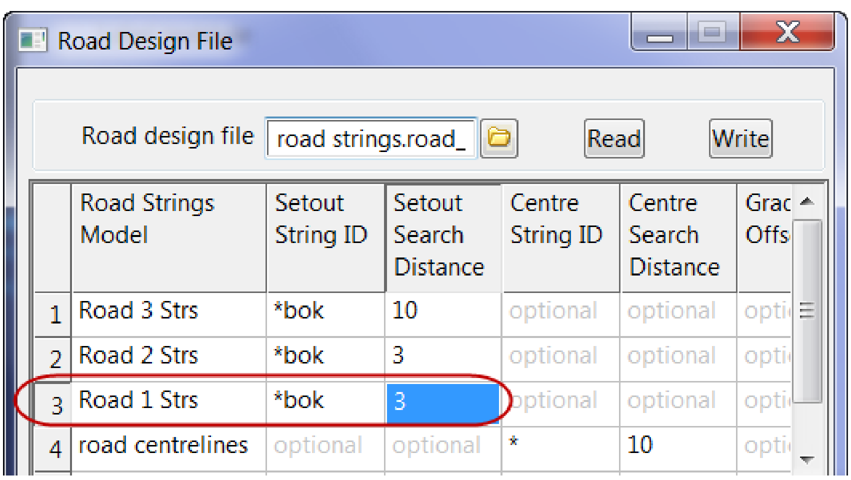
```
!INFO: Pit "NEW" Setout distance is:      0.450
!PROBLEM: Pit "NEW" Setout string not found
         ... needed for pit grate rl
         ... needed for pit z setout
         ... needed for pit xy setout
         ... needed for pit symbol angle
```

1. Double click on the word **PROBLEM**.



1. Note: the DNE (if open) moves to inlet NEW.
2. Select the **Pit** tab
3. Select the **Setout** tab.
4. Note that the **Setout string** field is blank

No road setout string has been found because we have not included the model **Road 1 Strs** in the **Road strings file** found on the **Global->Utility Models** tab of the DNE. The *bok strings in the **Road 2 Strs** and **Road 3 Strs** were more than the search distance away.



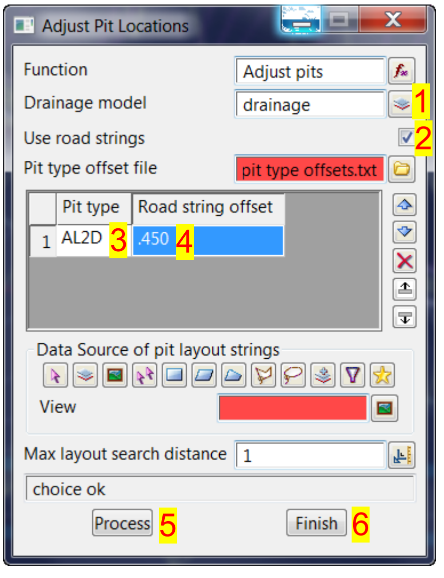
1. Add the new row and complete with the data as you have done before.
2. After **Writing** the file select **Set Pit details.**
3. Confirm that I-11 now has a setout string.

11.3 Adjust Pit Locations

Now we can offset the inlets from the bok setout strings.

Close the DNE and then from the main menu select,

Design->Drainage-Sewer->Adjust pit locations



1. Select the model **drainage**.
2. ensure **Use road strings** is selected.
3. RB and select **AL2D** pit type
4. type **0.450** for the offset away from the road centre line
5. Layout strings and layout search distance are not being used at this time.
6. Select **Process** and redraw the plan view to see the new pit locations.
7. Select **Finish**

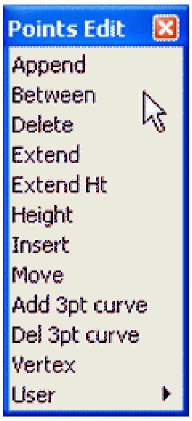
The message box indicates that 13 of the 18 pits were adjusted. Check the output window for a list of the pits that were adjusted. If no road string is found then the layout string is searched for. Since we did not use layout strings we get the warning messages for 3 of the pits. Note: You will not have pit names assigned yet (Set Pit names (and pipes)) so your names will be just NEW.

```
WARNING: Adjust Pit Locations - pit "I-07" found no perpendicular layout string within
the specified search distance.
INFO: Adjust Pit Locations - pit "I-04" adjusted by 2.610 units.
WARNING: Adjust Pit Locations - pit "I-08" found no perpendicular layout string within
the specified search distance.
INFO: Adjust Pit Locations - pit "I-05" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-06" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-07" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-08" adjusted by 2.610 units.
WARNING: Adjust Pit Locations - pit "I-10" found no perpendicular layout string within
the specified search distance.
INFO: Adjust Pit Locations - pit "I-09" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-10" adjusted by 2.610 units.
WARNING: Adjust Pit Locations - pit "I-11" found no perpendicular layout string within
the specified search distance.
WARNING: Adjust Pit Locations - pit "I-12" found no perpendicular layout string within
the specified search distance.
```

11.4 Manual Horizontal Alignment - Moving, Adding and Deleting Pits

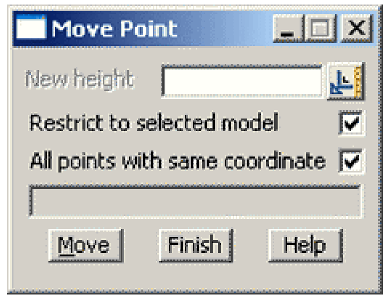
The most common functions for adjusting the horizontal alignment of manholes and pipes are found on the

Strings->Points Edit menu.



The **Append, Between, Delete, Insert and Move** commands are the most common.

The **Move** command has extra options for moving junction pits. Selecting **All points with the same coordinate** will move all points on the view that are at the same x,y coordinate. The point selected will move first and the others will follow **after** the new location has been accepted. **Restrict to selected model** will stop data from other models at the same location from being moved.



The second option

Strings->Edit

gives you all the same commands and more but requires you to select a string first and the edit commands will be restricted to the selected string.

12.Completing the Intersection Drainage Design

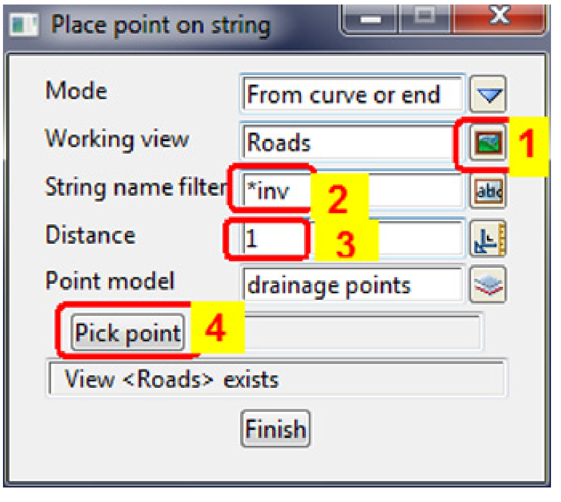
When placing inlets around an intersection, it is often required to place the centre of the inlet a specified distance from the curve so that the grate and/or the side inlet will be located on the straight section of kerb. If there is a pedestrian crossing, the inlet should be placed at a specified distance upstream to be clear of the crossing.

12.1 Placing Marker Points around the Intersection

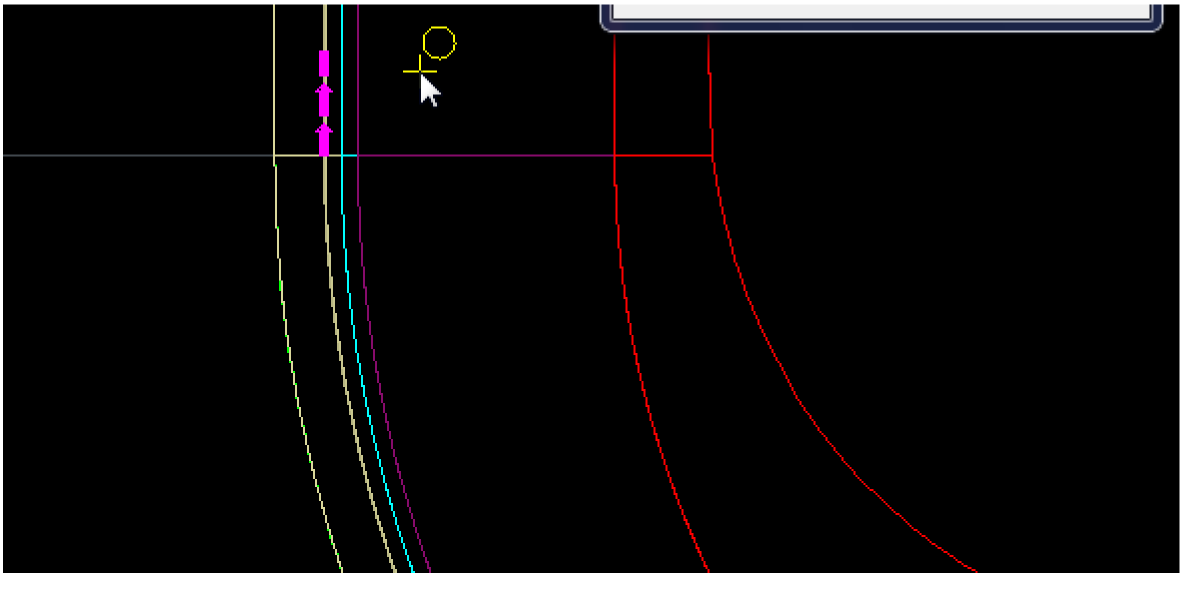
The place points routine is a fast way to place inlet location markers at a specified location from the curved section of the kerb.

From the main menu select

Design->Drainage-Sewer->More->Place points

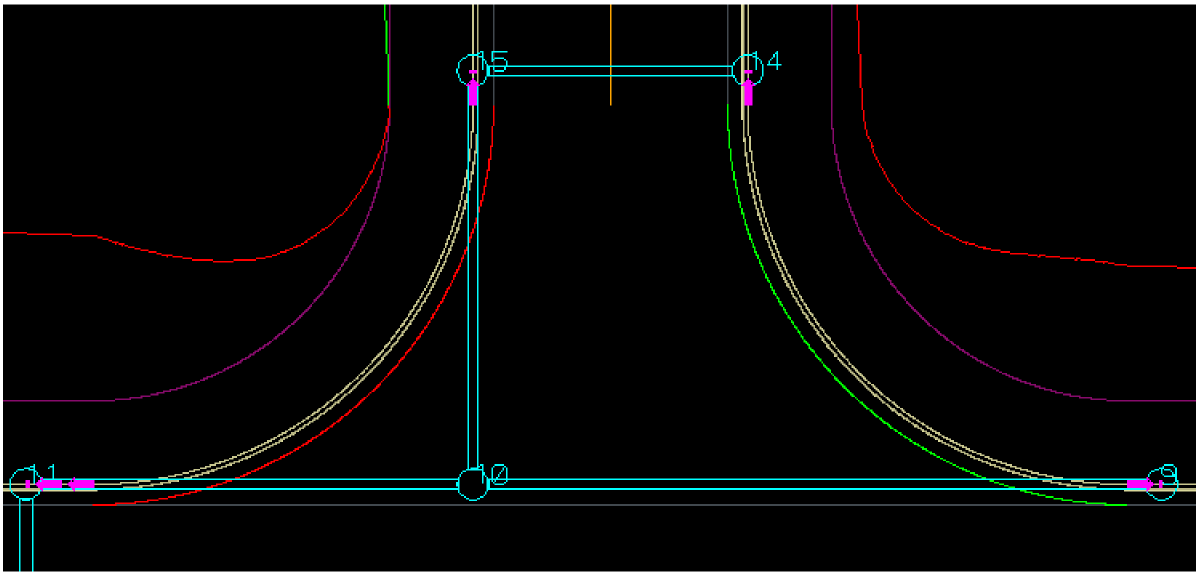


1. Select the **Roads** view as it contains the inv strings where we want the pipes.
2. Type ***inv** so the linv and rinv strings can be selected.
3. Type the distance from the end of the string or the start of curve where the pit is to be placed.
4. Select **Pick point** and then snap near where the pit is to be placed. The routine will find the closest *inv string and then search for the closest end or curve. It will then measure from the point towards your initial snap to create the marker (see magenta arrows below).
5. repeat for the remaining 3 ends of the kerb returns.



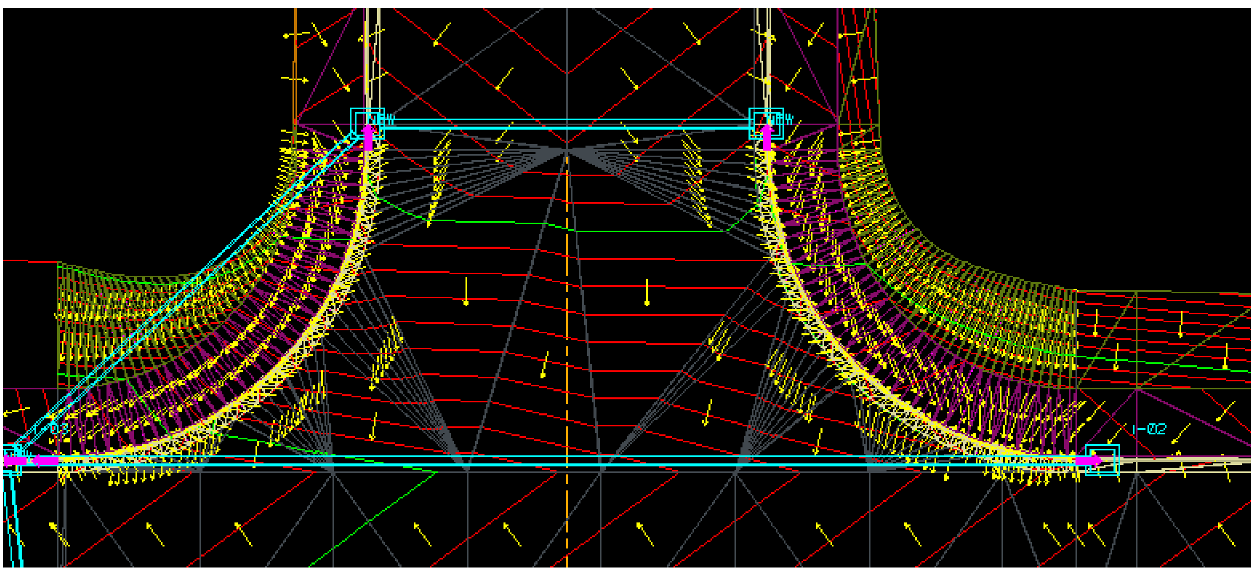
12.2 Option 1 (Connection at Manhole in the Road)

The option below has been selected for you to complete so that it has 2 inlets and a manhole. Use the tools you have learnt thus far to create the drainage string and assign the pit names. Special care is required when creating a junction pit (10) shown below. There must be a pit on the trunk line where the branch line connects and there branch line must point snap onto the centre of the trunk line pit (see Junction Pits).



12.3 Option 2(Connection pipe under the footpath)

Some road authorities prefer not to have a manhole in the intersection. Move the connection pit to the inlet to the west and delete the manhole.



A check list is on the following page once you have completed the layout.

12.4 Intersection Check List

1. Did you place the pipes in the correct location so that the correct cover could be measured?
2. When placing the manhole did you use the RB and **Perpendicular** to place the manhole?
3. Did you use **Strings->Points Edit->Insert** to add a pit to the trunk line at the junction location?
4. Did you assign a unique string number to the new string so that the set pit names routine would run?
5. Did you select **Set Pit Details** in the DNE to ensure the cover, grate and setout data was correctly calculated?
6. Did you check the output window for problem messages? Did you fix them?

7. Did you recalc the function **Adjust pits** so that the inlets are 0.450 behind the bok string.

Below are 2 other methods for placing pits that you may find useful.

12.5 Offsets from strings

As an alternative to the place points above you can use the snaps CAD to place the pits “on the fly”. Once the points move has been started use the **RB** and select
Snaps Cad=>Points=>Locate Offset. Follow the prompts given in the message area (bottom left corner of the screen). You will need experience with the 12d “directional pick” to use this capability.

12.6 Placing pits at specific Easting Northing Locations

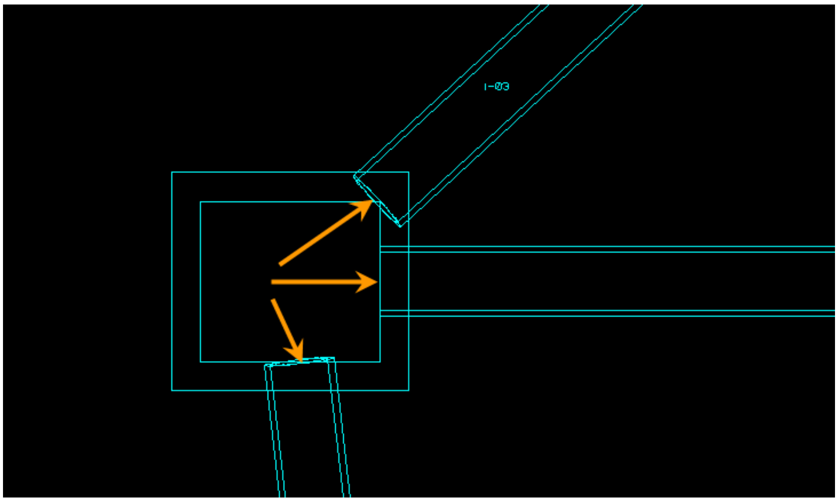
For locating pits at specific x, y coordinates, simply start typing the x coordinate instead of clicking onto a location. An input panel will appear for you to enter the x and y coordinate separated by a space.

13.Manholes - A Closer Look

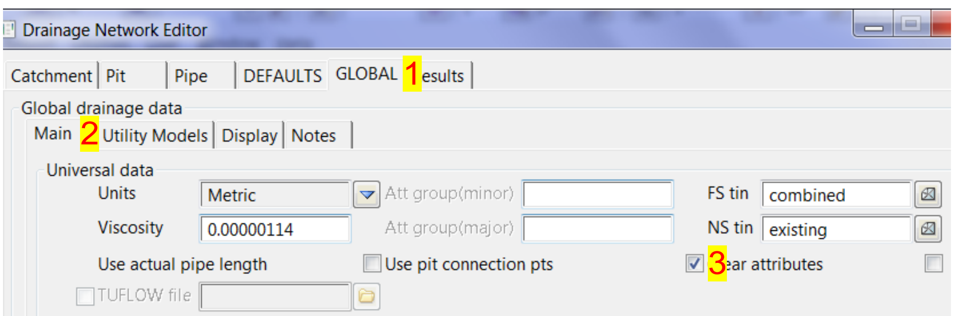
A manhole is made up of 3 points; the centre of the manhole and the pit-pipe connection points. The pipe exists as the connection between two manholes. The pipe may have a horizontal radius but not vertical.

13.1 Pit-Pipe Connection Points

The default mode has the pipes align between the centres of the manholes. The pit-pipe connection points are at the intersection of the manhole interior wall and the centre of the pipe (see below).

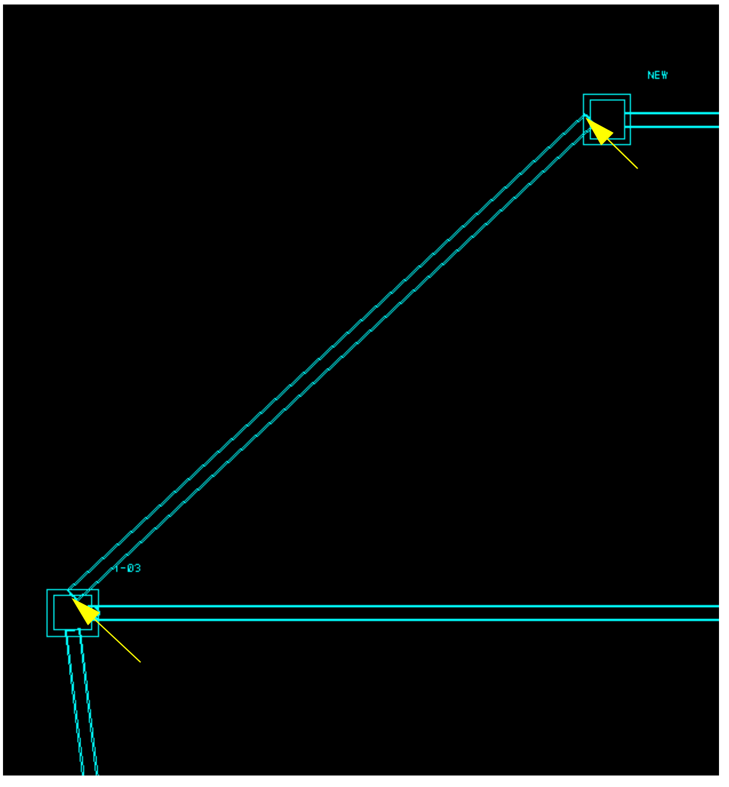


These connection points may be moved by enabling **Use pit connection points** on the **DNE->Global->Main** tab. All pits have their connection point initially set to **Points**. This setting is found on the **DNE->Pits->Setout** tab.



1. Select the **Global** tab.
2. Select the **Main** tab
3. tick the **Use pit connection pts** tick box
4. Select **Apply**

Pit connection points may be moved via **Strings->Points Edit->Move** (except for **Centre** mode described below). If a pipe is manually moved to a new connection point, it will be locked to the connection point and will not move if the pit or neighbouring pit is moved.



1. Close the DNE to unlock the drainage strings.
2. Use **Strings->Points Edit->Move to** move the junction pit you added to complete the intersection westward to the inlet.
3. Use **Strings->Points Edit->Move** to move the ends of the pipes as shown. Note that the pipes snap to the centre of the edges.

13.1.1 Pit Connection Point Modes

Centre (rectangle and circular) - This mode is the same as having the **Use connection points** turned off**.** The connection points will be located on the inside perimeter of the pit wall with the centre line of the pipe intersecting the centre of the pit. In this mode, the connection points may not be adjusted.

Points (rectangle) - A connection point is created at the mid point of each internal side of the pit. This may be changed for a **Pit type** by using the **con_points** command in the drainage.4d file. In this mode, the pipe ends will snap to the connection points. It is possible to place more than one pipe on the same connection point (the elevation of the pipes is not checked for clashes).

Points (circular) - The connection point may be moved anywhere around the pit internal wall as there are no connection points on the circular pits. Again, it is possible to place more than one pipe on the same connection location (the elevation of the pipes are not checked for clashes). If the manhole centre is moved the connection point locks are removed.

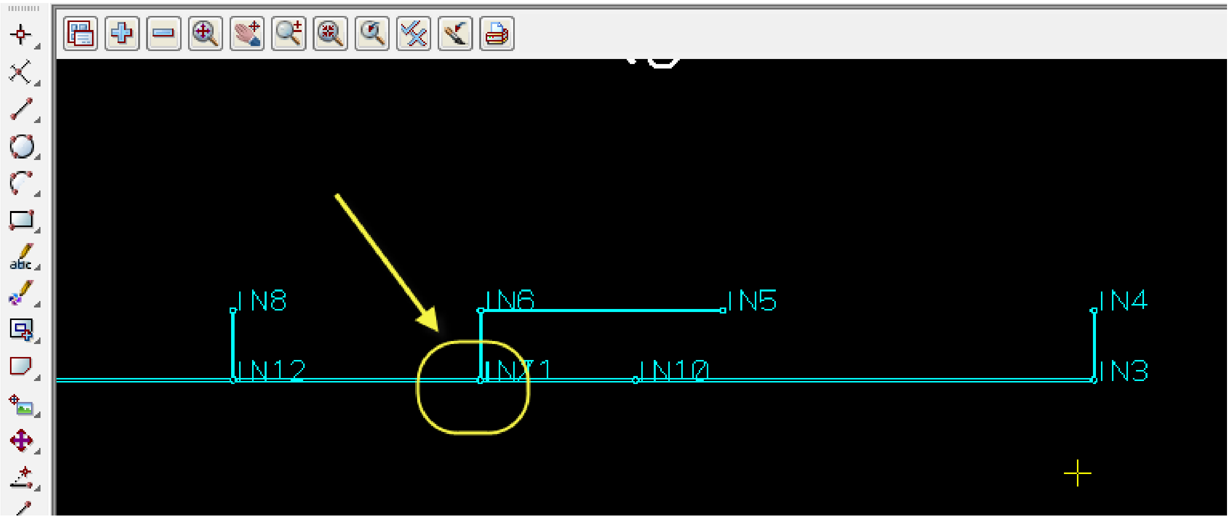
Perimeter (rectangular and circular) - Same as **Points** (circular) above.

Unrestricted (rectangular and circular) - There are no constraints on the location of the pit connection points.This mode is intended for irregular shapes such as GPT structures and stormwater basins.

13.2 Junction Pits

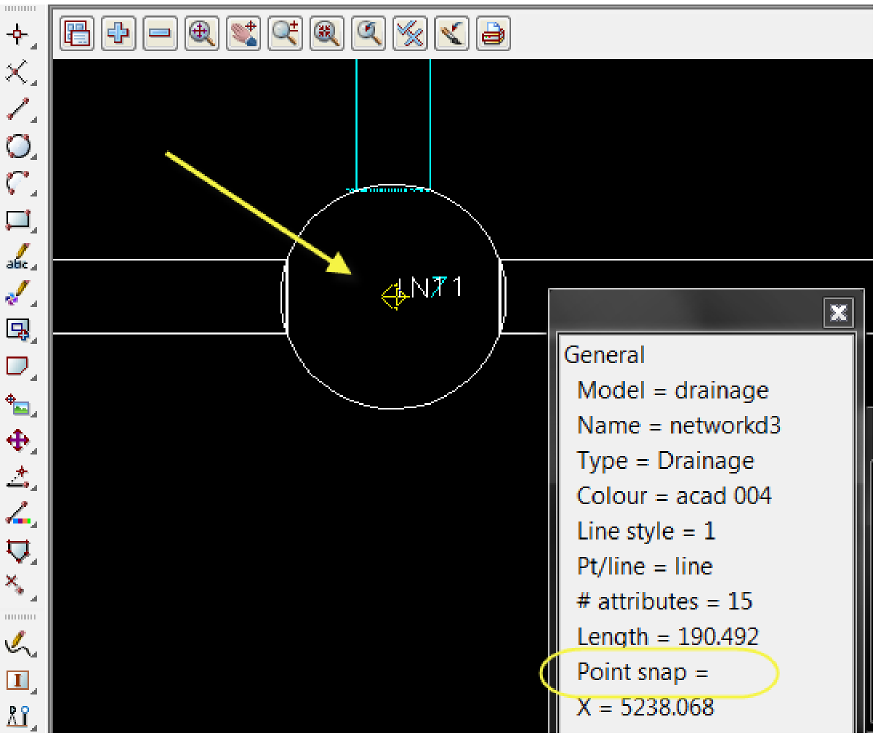
Key Points

1. The branch line must **Point Snap** onto the centre of a pit on the trunk line.
2. Both strings must be in the same model.
3. The downstream end of the string (depends on flow direction) must join onto the trunk line.



When creating a junction, pit turn the point snap on and the line snap off (the F3 and F4 keys are convenient for this). Zoom into the pit so that you can snap the being moved onto the centre of the stationary pit.

Recall a pit contains three points; one at each pit pipe connection points and one at the pit centre. You want to snap onto at the pit centre for a junction pit. In the figure below, the blue line is being placed to join the white line. Note that the diamond indicates that there is a point snap as well as the information panel.



If you cannot see your branch lines joining in the section view. check the following:

1. The centre of the pits did not align, **Use Strings=>Points Edit=>Move** to move the branch string pit the “downstream end” of the branch line must be the junction pit.

2. The branch string and the trunk string have not been created in the same drainage model. From the main menu select **Strings->Inquire (F2)** and select the strings to check their models. If this is the problem, use **Strings=>Edit=>Change** and specify the correct drainage model (enter the model BEFORE picking the string) or **Strings=>Edit=>Duplicate** to duplicate one of the strings into the correct model.

13.3 Drainage Section Views (downhill left to right OR right to left)

The long section views and the profile plots are running downhill from left to right. If you want them downhill from right to left use the **reverse** function.

To reverse only one string, from the main menu select

Strings =>Strings Edit =>Reverse

and pick the drainage strings to reverse. This will also change the drainage flow direction attribute from **same as string direction** to **opposite to string direction.**

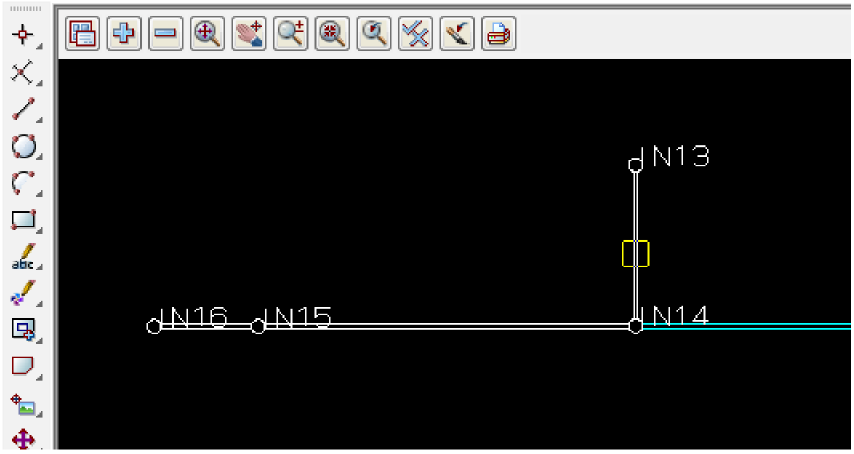
To reverse all of the strings in a model select the Reverse all strings option,

Design =>Drainage-Sewer =>More=>Reverse all strings

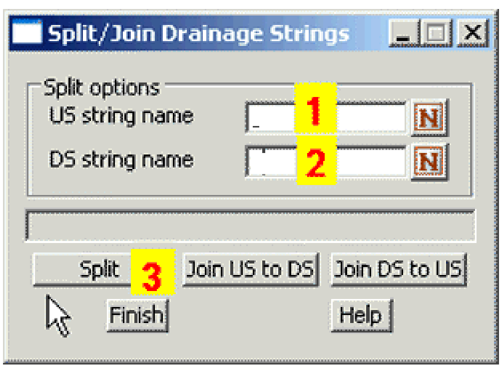
13.4 Drainage Split and Join

In this example, we are going to **split** the string shown in white below at IN14 (your pit are still NEW) so that we can **join** the west end (IN14 to IN16) to the trunk line on the southern side of the road (cyan). This will allow us to produce a long section that will extend the full length of the road 2 to the headwall outlet.

Use the **String split/join** from the Drainage menu not the one on the **Strings->Strings edit.**



Split Option

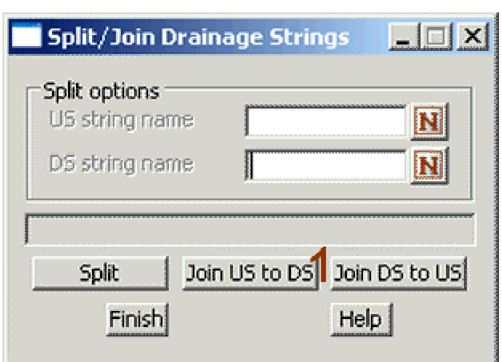


The split must be done at a pit.

1. A new name for the upstream string (optional). Leave it blank
2. A new name for the downstream string (optional) Leave it blank.
3. LB the **Split** button and then select the pit where the split is to occur. (IN14).

Join Option

This routine will add a new pipe between the 2 strings if required. When **Join US to DS** is selected, the properties and attributes of the upstream string and pit at the join will transfer to the new joined string.m string. **Join DS to US** will cause the properties and attributes to come from the ds string. Upstream and downstream is determined by the flow direction



1. Select the **Join US to DS** button.
2. Pick and accept the cyan drainage string, then the IN14 to IN16 string (follow the messages in the 12d message area).

14.Drainage Network Editor (DNE)

We have had a brief introduction to the DNE when we worked with the culvert. We will now look at many more of the DNE capabilities.

Read in a drainage model template! There is no need to set all of your global and default settings each time you start a new job. If we had not already read in a template we wold do it now. Templates are a way to store all of your Network Editor - Global, Default Settings and Explicit Settings

The drainage network editor is used to automatically or manually change the properties of your drainage network. These abilities include:

Vertical Alignment - Manholes

Set Pit names (and pipes)

Service and Utility Clashes

Hydrology

Catchment Areas

Catchment Areas and Percent Impervious

Coefficients of Runoff

Times of Concentration

Tc Path Strings

Bypass flow routes

Hydraulics

Cover RL, Grate RL, Setout RL and Sump RL modes,

Culvert Hydraulics and Tailwater

Pit Losses Ku, and Direct Flow

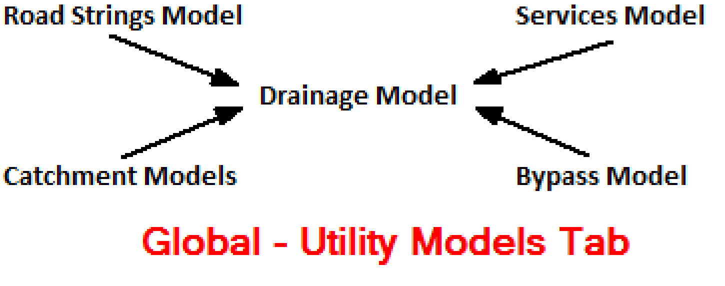
Pipe Friction Method, Roughness Values and Direct pipe flow

Design mode, Freeboard Limit and Flow-depth limit

Pipe Size Design

Pipe Design Parameters - Sizes, Invert alignment, Min Cover, Max Height

The DNE also links your drainage model to your 12d design models.

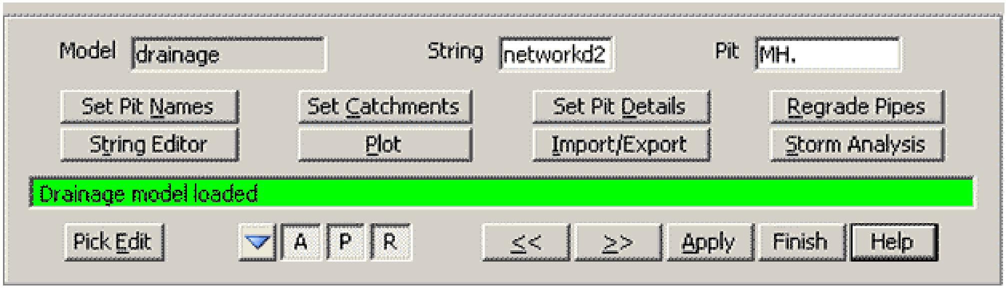


The drainage network editor is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Network Editor

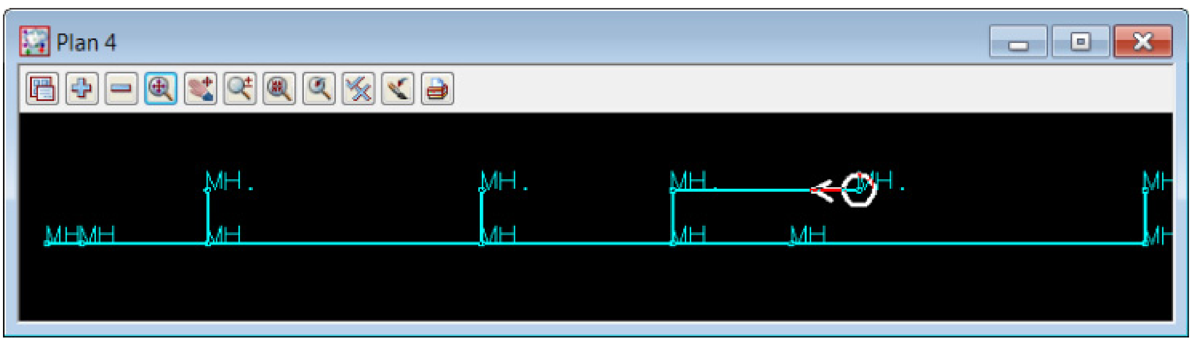
There is no need to fill in all the fields. On the **Catchment**, **pit** and **pipe** tabs, blank fields will use default values from the **Defaults** tab. Check the tool tip for the default value being used.

The bottom section of the network editor panel is shown below. You can change tabs but no data can be entered in the panel until a drainage pit or pipe has been selected.



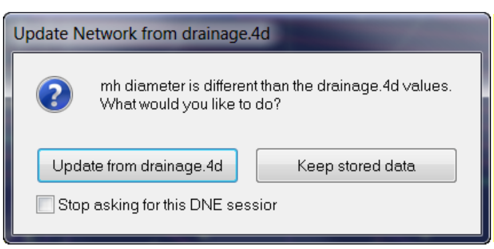
1. Pick and accept a drainage string and the network will be loaded into the panel (only drainage strings may be picked).

The pit closest to the point selected is highlighted with a circle and an arrow shows the direction of flow and the pipe being edited (see image below). When the outlet is selected there is no arrow. The option buttons on the drainage editor now become active.



14.1 Update from drainage.4d

We have set our default diameter as 1m and default manhole as AL2D. In the drainage.4d file the AL2D manhole is defined having a diameter/length of 0.93m and a width of 0.85m. When you select one of the manholes the DNE finds the difference and asks you if you want to update the manhole diameter.



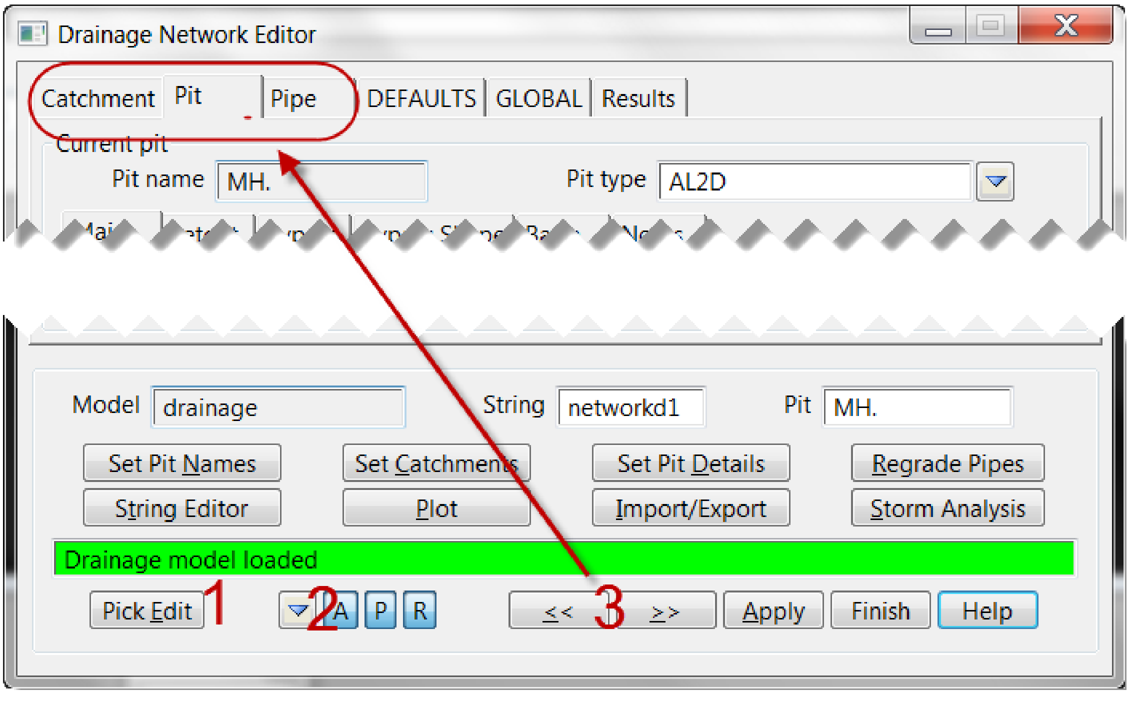
1. Select **Update from drainage.4d.** The manhole diameter will now be changed to 0.93 for this manhole.
2. If you select **Stop asking for this DNE session** first, you will not be prompted before the DNE updates the manhole data.
3. Selecting **Set Pit details** will update all manhole diameters in the network.

A surveyor who received a 12da file of the drainage network without the drainage.4d file would select **Keep stored data**.

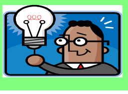
14.2 Moving through the Drainage Network

There are 3 ways to change pits in the network editor. The Next-Previous (chainage NOT flow direction or east west) buttons will work if you are on the **Defaults**, **Global** or **Results** tabs. If the editor finds an error on a pit, it will take you to the error and you must correct the error before moving to the next pit.

Try all 3. The **GoTo List** will be interesting as we have not assigned pit names yet.



1. Pick Edit Button - Pick and pit or pipe in section or plan view
2. GoTo List - Select the pit from a list of pit name
3. Next and Previous (chainage) buttons - loop through all of the pits in the network



The most important button on the DNE is the **Set Pit Details** button. This button calculates the all of the manhole levels and data required for the drainage calculations.

14.3 Auto-Apply, Auto-Pan, Auto-Profile and Auto-Redraw

To tell if these buttons are on or off you need to know your computer display settings. For Windows 7, the default is Blue for on.

With **Auto-Apply** (A) enabled, data is saved when any of the 15 lower buttons are pressed **except Finish** and **Help**.

Auto-Pan is always active and any plan view showing the active drainage network selected will always auto pan if the selected pit is not in the view.

With the Auto-Profile (**P**) enabled, the same will happen for the section view.

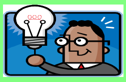
With **Auto-Redraw (R)** enabled, the editor will regenerate the section view when changes are made in the vertical. This saves selecting **Regen** on the section views.

14.4 Set Pit names (and pipes)

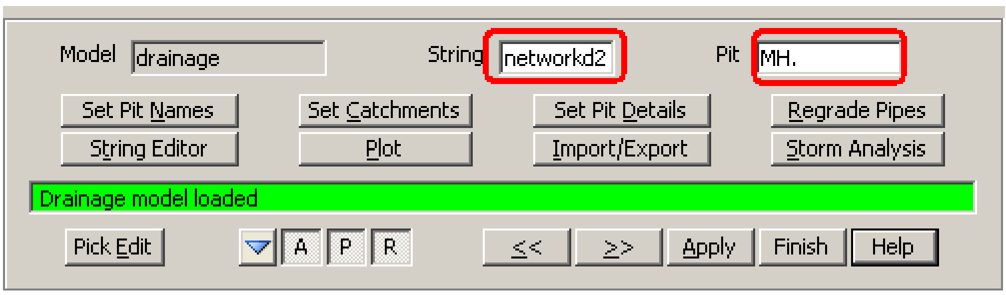
Pit names are used to identify and label the pits for access. The DNE Goto drop down and outlout window loglines (warning/problem messages) become much more meaningful. meaningful. **Storm analysis** requires that unique pit names be set.

Use the DNE to manually change single pit names (in the **Pit** field) or quickly change all the names using the **Set Pit Names,** button.

The **Set Pit Names** button requires unique string names. To view string names on the plan view, go to the Plan View tool bar and select **Toggle=>Names**. If they do not appear see Displaying View Text.

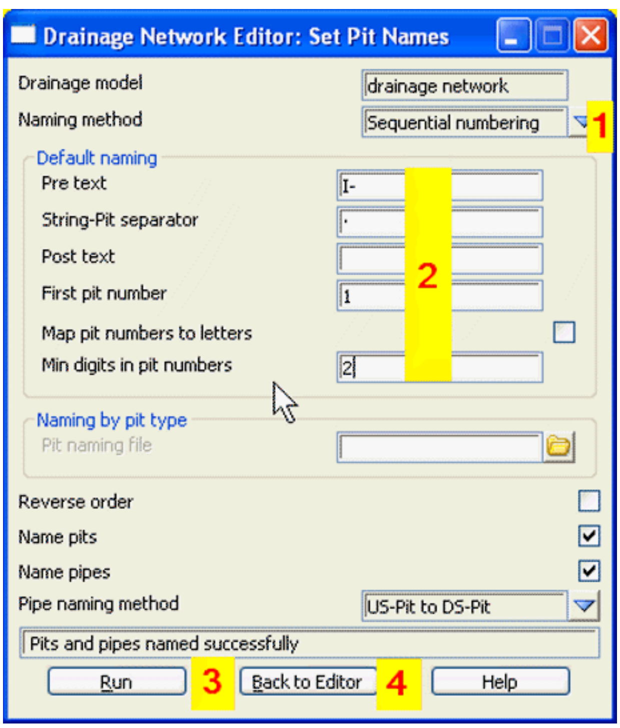


Models->String Info table is a fast was to view all the string names in the model. Double clicking on the lines will launch an editor to change the string names. The DNE also sorts the strings based on these namesand this controls the plotting order.



The string names may be changed in the **String** field when the **Catchment, Pit** or **Pipe** tabs are selected at the top of the DNE. The string names must be unique.

1. Select **Set Pit Names** and the following panel will appear.

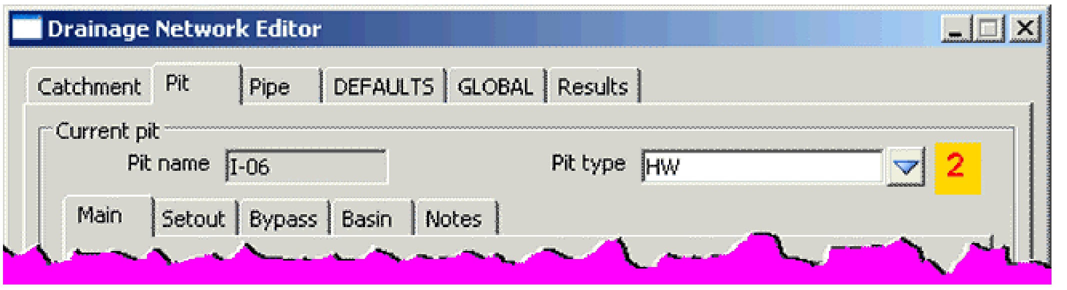


1. Select **Sequential Numbering** to number the manholes starting at First Pit Number.
2. Change the **Default naming** parameters**.**
   Map pit numbers to letters causes the first pit to be A instead of 1.
   Min digits in pit numbers set to 2 causes 1 to be 01.
3. **Run** will update the quick text pit names on the plan view.
   Try other settings!
   You may find you want to change some of the string names back in the network editor.
4. **Back to the Editor** return to the main editor panel.

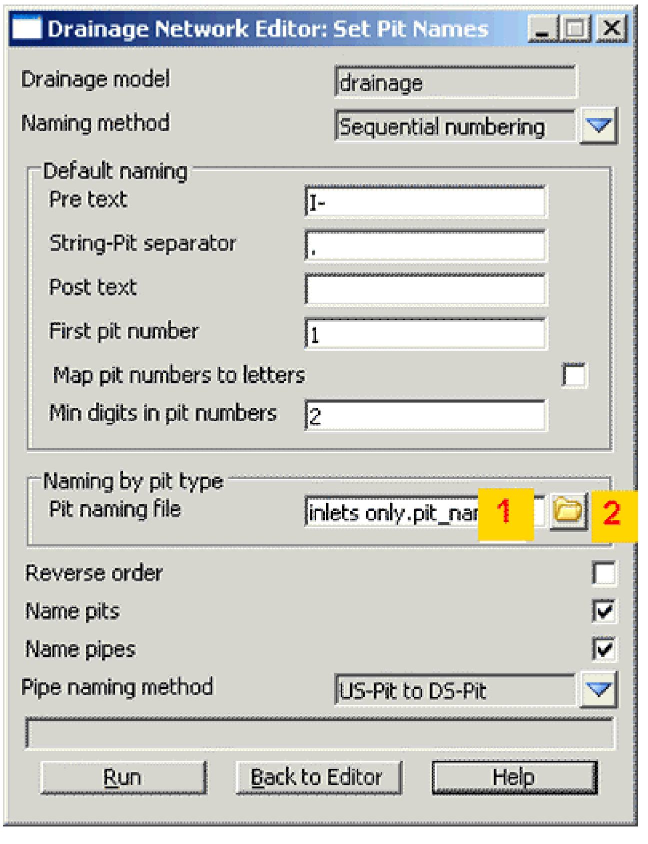
   Reverse order starting numbering at the high chainage end of the string instead of the low chainage.

14.5 Set Pit Names using Pit Type

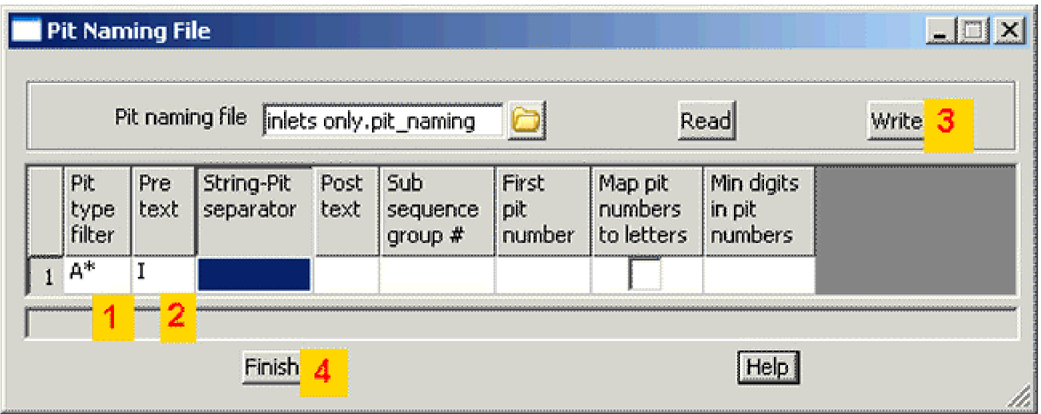
We can customise the pit name prefix, suffix, numbering sequence etc for each pit type. Currently all of the pits have the default pit type. We will now change the outlet pit type to HW and then rename the pits.



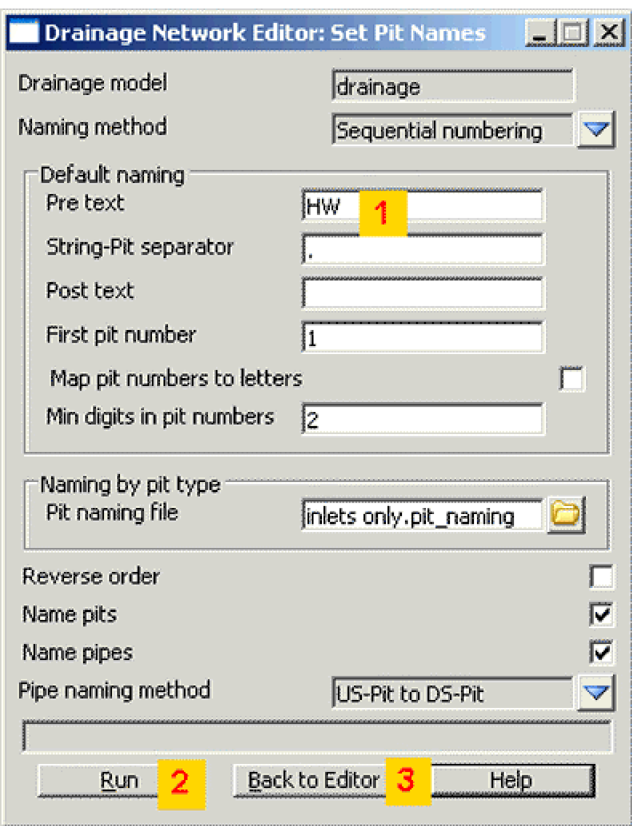
1. Move to the outlet using any of the 3 methods.
2. Change the **Pit type** to HW
3. LB Select **Pit Names**



1. Type the file name for the pit naming scheme. An example may be found in the library if desired.
2. LB the folder icon and select **Open.**



1. RB to select the **Pit type** or type text with wild card characters as shown
2. Type the **Pre text**
3. LB **Write** to save the settings to the file.
4. LB **Finish** to return to the panel.

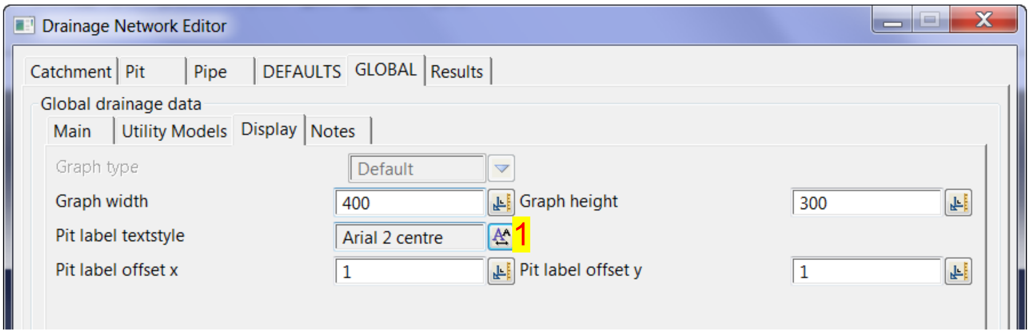


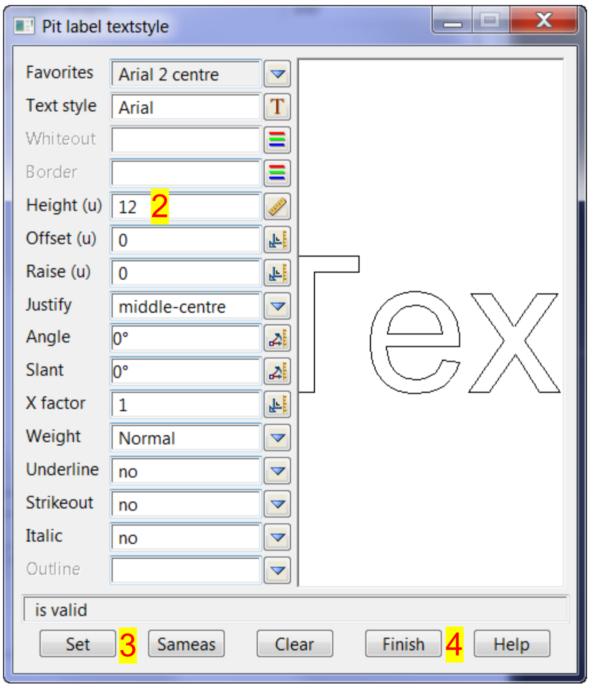
1. Type **Pre text** for those not included in the pit naming file.
2. LB **Run** to name the pits
3. LB **Back to Editor** to return to the main panel.

Note that the headwall still get the sequential numbering continued from the last numbering method. To start at a new number the **Sub sequence group number** would have to be included in the file.

14.6 Change Pit Name Textstyle and Offset

The textstyle and offset for the pit name is set on the **Global->Display** tab of the DNE. It is always shown as pixel text size and cannot be changed to world.



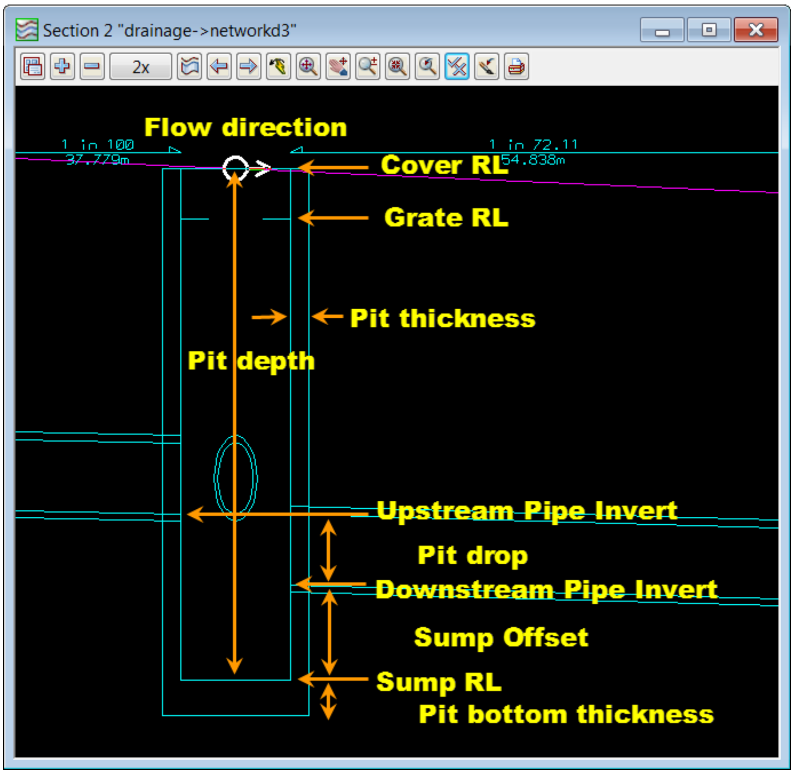


1. Select the **Pit label textsyle** icon and then the **Arial 2 centre** favourite.
2. Type the new **Height (u)** as **12** pixels.
3. Select **Set**.
4. Select **Finish**.
5. Select **Apply** from the bottom of the DNE to see the new textstyles.

15.Vertical Alignment - Manholes

The diagram below shows the properties of a manhole. The RL levels may be set manually or calculated via the their associated mode and the **Set Pit Details** button. The **Grate RL** is used by 12d hydraulics when determining the freeboard level, bypass flows, inlet capacity values at sag inlets and depth of flooding at sag inlets.

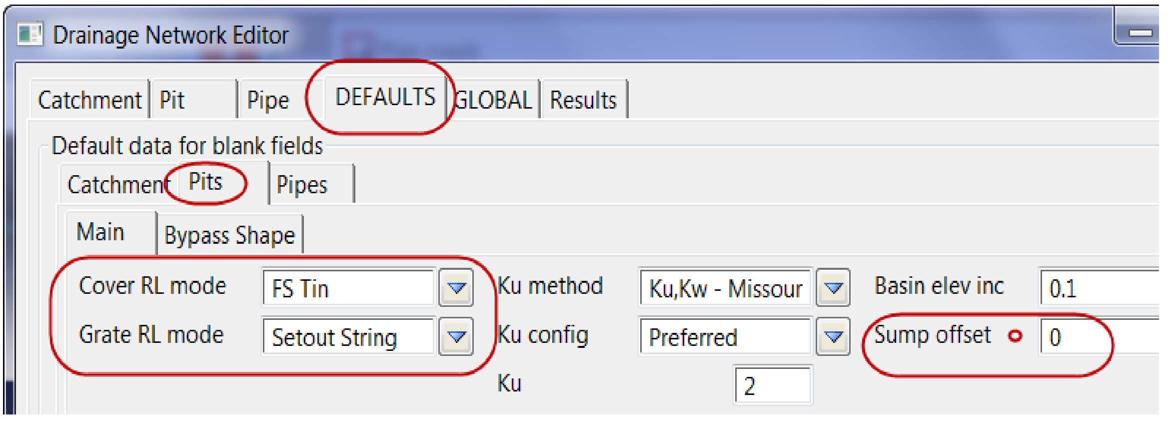
The **Setout RL** is the level used by surveyors to setout the pit.



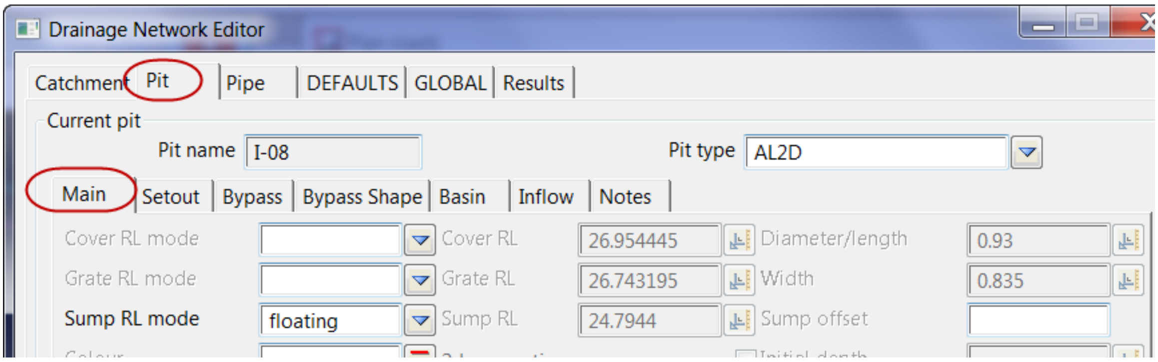
Flow direction	string property
Cover RL	DNE->Pit->Main
Grate RL	DNE->Pit->Main
Setout RL	DNE->Pit->Setout (not shown)
Pit thickness	drainage.4d via type
Pit depth	calculated value
Upstream pipe invert	DNE->pipe->design
Pit drop	Defaults(manhole) or DNE->Default->Pipes Drop file
Downstream pipe invert	DNE->pipe->design
Sump offset	DNE->Pit->Main
Sump RL	DNE->Pit->Main
Pit bottom thickness	drainge.4d via type

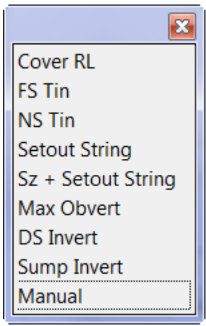
15.1 Cover RL, Grate RL, Setout RL and Sump RL modes

The default values for the RL modes are set on the **DNE->Defaults->Pits** tab.



These may be explicitly for an individual pit on the **DNE->Pit->Main** and Setout tabs





RL Modes

Cover RL Only available for Grade and Setout RL modes. z value will be the same as the cover RL.

FS Tin z value from the pit centre x,y location on the DNE->Global->Main->FS tin.

NS Tin z value from the pit centre x,y location on the DNE->Global->Main->NS tin.

Setout String z value from the string found by dropping the pit centre x,y location perpendicularly onto the setout string (DNE->Pit->Setout->Setout string) and then moving the distance DNE->Pit->Setout->Setout adjustment Sxy.

Sz+Setout String zvalue as for the **Setout String** plus the value DNE->Pit->Setout->Setout adjustment Sz.

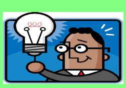
Max Obvert z value of the maximum pipe obvert of all the connecting pipes.

DS Invert z value

Sump Invert Only available for Setout RL. z value from DNE->Global->Main->Sump RL

Manual z value is entered in the RL field to the right of the mode (field becomes active when this is selected).

floating Only available for Sump RL mode. z value is of the minimum pipe invert of all connecting pipes plus the value DNE->Pit->Main->Sump offset

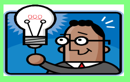


RL modes for the entire model may be set via
Design->Drainage-Sewer->More->Pipe Locks

This routine has lock modes for pipes as well.

16. Vertical Alignment - Pipes

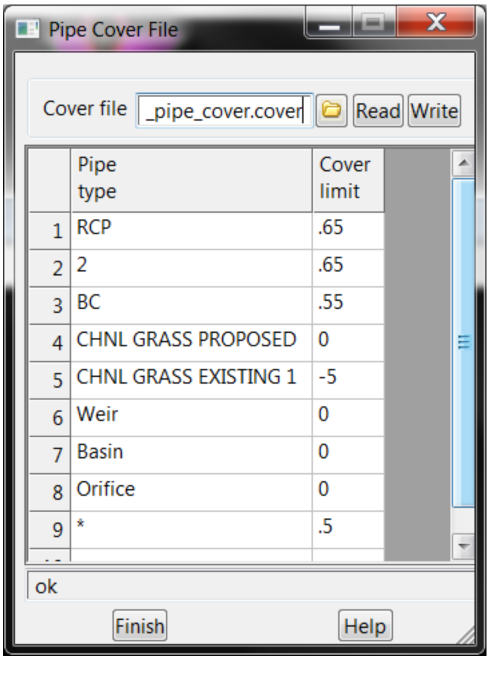
The pipe invert levels may be set manually or calculated using the DNE->Regrade Pipes button.



Pipe invert mode may be set to locked for the entire model via **Design->Drainage-Sewer->More->Pipe Locks**

There are many controls to guide 12d in the setting of the pipe inverts and the user may over constrain the network so that no solution is possible. If the minimum cover, grade or drop criteria cannot meet the criteria you have set, a problem message will be in the output window.

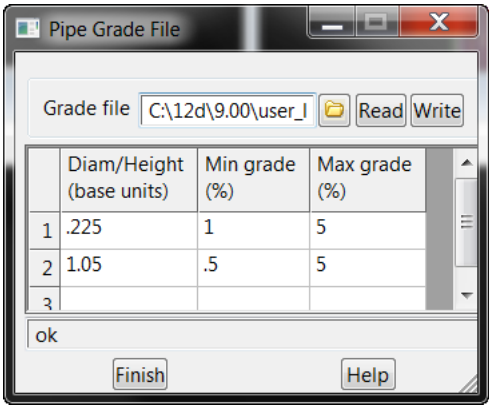
16.1 Minimum Cover



The minimum cover can be set via the pipe type and the pipe cover file (optional). If the pipe type is not found in the pipe cover file then the Defaults-Pipes-Cover for the project is used.

16.2 Minimum Grade

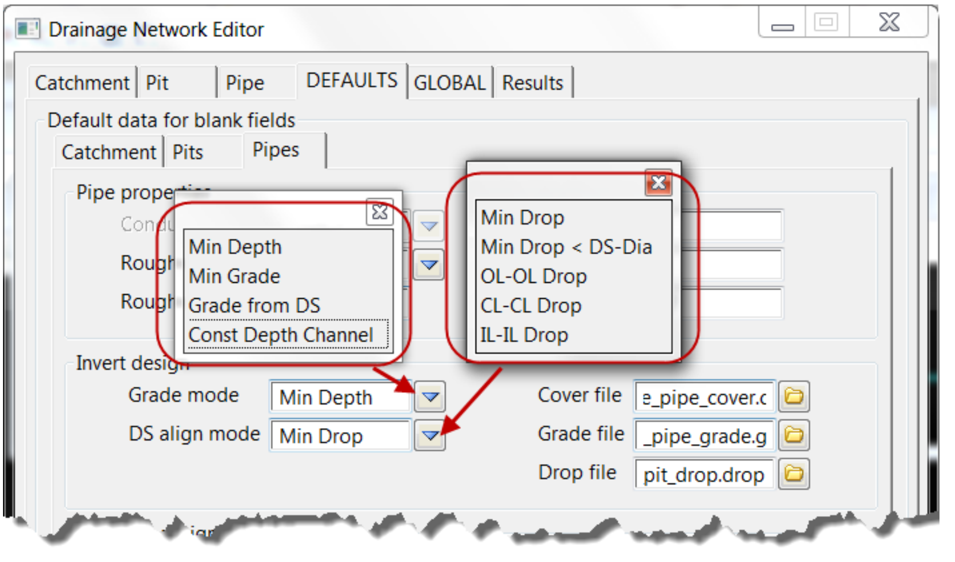
Pipe grade has been traditionally measured based on the horizontal distance from pit centre to pit centre. However, this causes issues with surveyors when they use electronic models to set out the drainage pipes. All drainage pipes lengths can now be calculated from the horizontal distance between inside pit edges (or pit connection point for the unrestricted pit connection mode). The alternate pipe length results in a different pipe grade to be calculated in 12d. This option is set one the **DNE->Global->Main Use Actual Pipe Lengths**.



The minimum grade can be set via the pipe diameter and the pipe grade file (optional). The diameter is the maximum diameter that this grade will be used for. If the diameter exceed the greatest diameter in the grid, the last grade will be used.

If the pipe grade file is not used then the grade from the Defaults-Pipes-Min grade for the project is used.

16.3 Pipe Grade Modes



Minimum Depth The cover sets the inverts at each end of the pipe and then the downstream invert is lowered if the minimum grade is not achieved.

Minimum grade The pipe is set to the min grade and then lowered to meet the cover requirements.

Grade from DS Warning! Minimum cover may not be maintained in this mode. Each pipe has its downstream (ds) invert level set via its **DS pipe alignment** mode. If the downstream pit is the outlet then the cover is used to set the invert level. The upstream invert is set using the minimum grade.

Const Depth Channel Warning! Minimum cover, minimum grade and pit alignments are not used in this mode. The obvert of the pipe is set to the finished tin level at the pit centre.

16.4 Downstream Alignment Modes

The amount of the drop is determined first from the **Drop file** and then if required from the manhole default settings for the project. How the drop value is applied is set via the **DS align mode**.

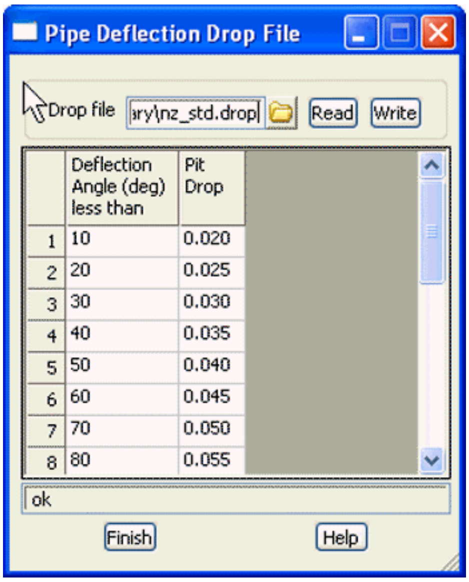
Inverts are moved down, if required, according to the setting in **DS align mode.**

Min drop ensures that the inverts drop a minimum of the drop but may be more.

Min drop<DS-Dia ensures that the inverts drop a minimum of the drop but may not be more than the downstream pipe diameter. This restricts the max drop so that the water jet will not completely impact the opposite wall of the pit.

OL-OL Drop uses the drop value for the obverts. If the downstream pipe is a smaller, then the drop will be applied to the inverts so that water will not be trapped in the pit. If the downstream pipe is larger then the obverts will be aligned as long as the min drop is maintained on the inverts.

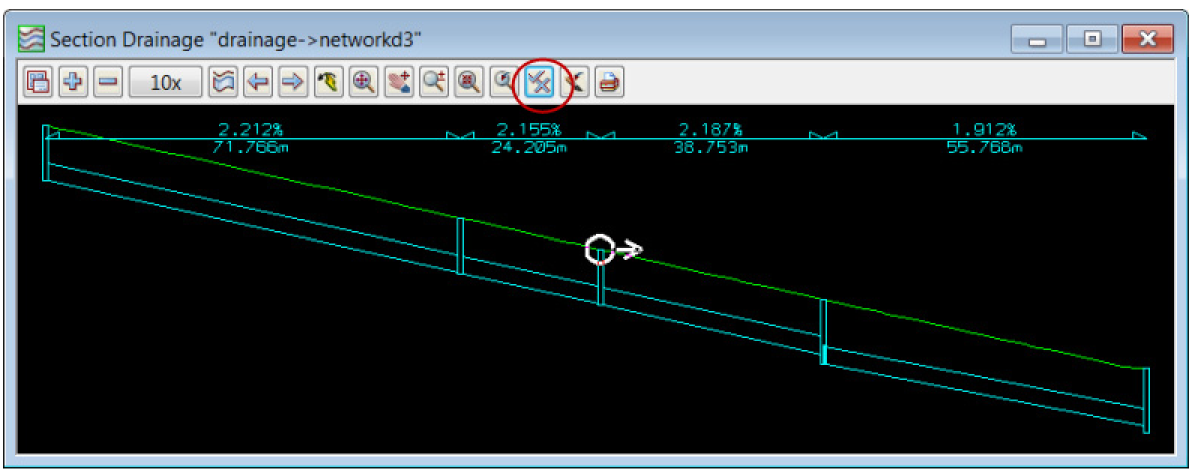
IL-IL Drop uses the drop value for the inverts.



The **Drop file** contains the drops that change with the pipe deflection angle. A sample file is included in the library.

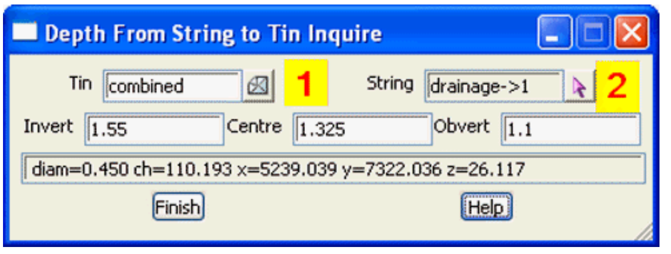
If only one drop value is to be used set the deflection angle to 180 degrees.

After setting the pit and pipe levels, add the model **tin combined** to the **Drainage** section view. The trunk profile will be similar to the following. Select the toggle button, to toggle on the grades (and pipe lengths).



To inquire about the cover on a pipe use the following option.

Tins->Inquire->Depth from string



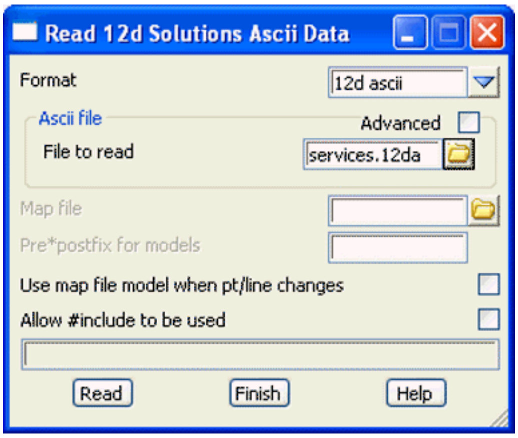
1. LB to select the tin
2. LB to select the string.
3. Move the pointer in plan or section to monitor the data.

The DNE calculates cover from the top of the pipe NOT the obvert so cover may appear incorrect. Also for box culverts, cover is measured at the edges as well as the centre of the pipe. Finally for multiple pipes, each pipe is checked for cover.

17.Service and Utility Clashes

We will import some services from a 12da file. From the main menu select,

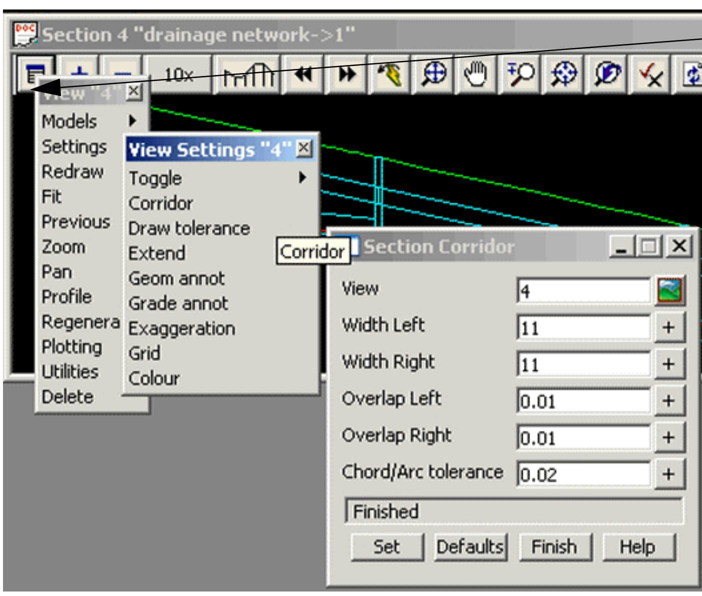
File I/O->Data Input->12da/4da data



1. LB the **Folder icon**
2. Select the service file
3. LB the **Read** button.
4. LB the **Finish** button.
5. Add the model **services** onto the plan and section views.

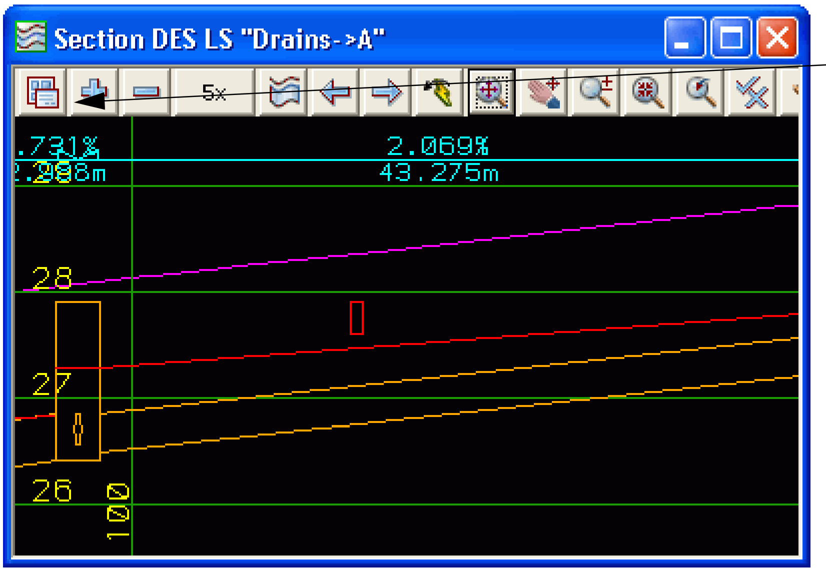
12d service clash routines notify the user of crossing services but not parallel services that are close to each other. The clearance values are vertical distances at the centre line of the drainage and service strings. The minimum clearance may be less than the vertical clearance if the drainage or services are on very steep slopes.

To view parallel services, add the services model onto a section view, profile a drainage string and then set the corridor value for the section view.

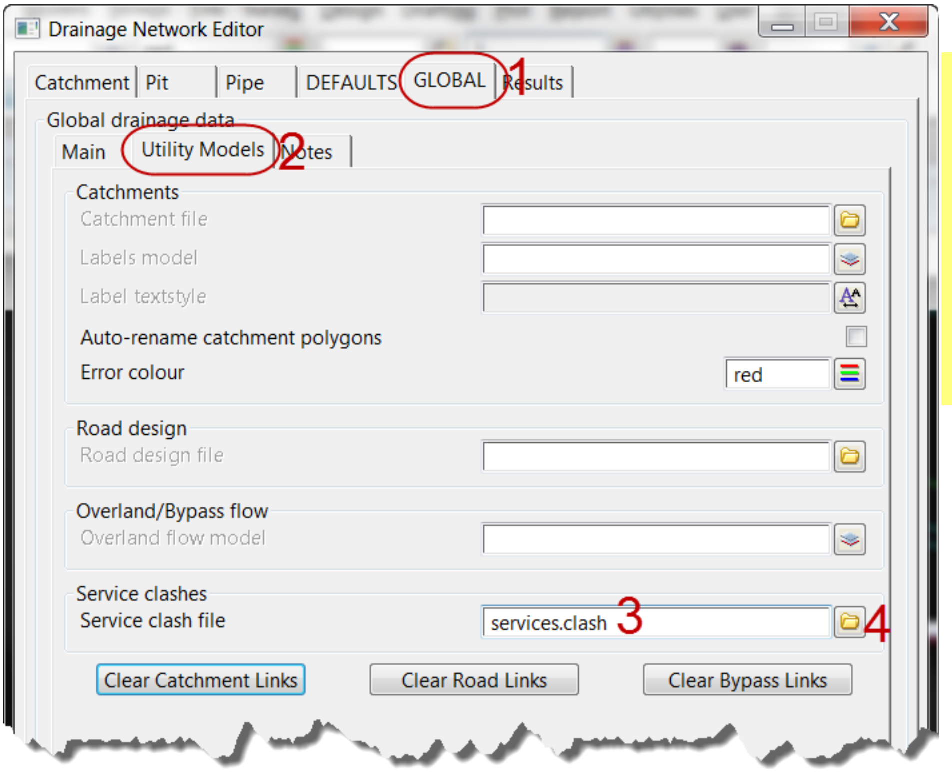


Settings->Corridor and then set the **Width left** and **Width Right** to the desired clearance. If the service can be seen then it is within the tolerance. 11 is used in this example only so that you can see the service on the other side of the road.

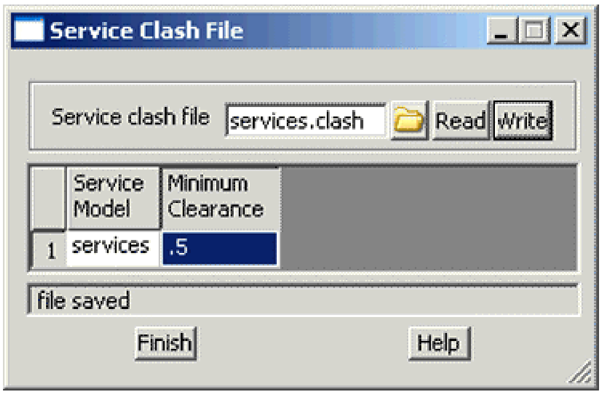
Use the **Next** and **Prev** button to switch drainage strings.



To obtain a report of all strings inside or crossing the drainage string profiled, select the **View menu** button then **Utilities->Report**

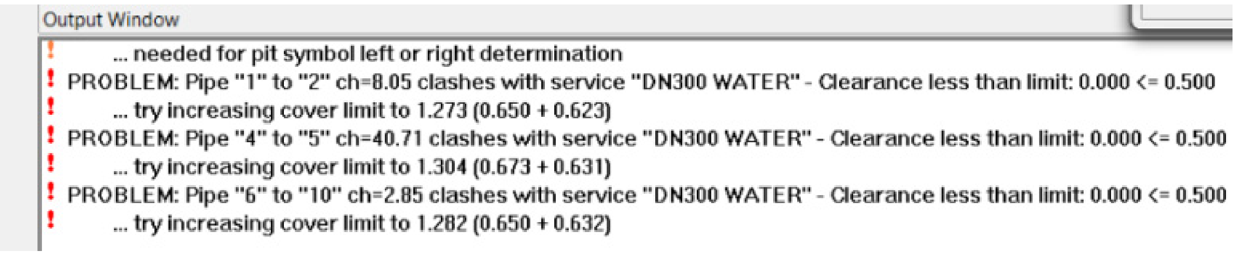


1. Select the **Global tab**
2. Select **Utilities Model** tab
3. Type **services** to create a new services file.
4. Select **Open** from the icon list.

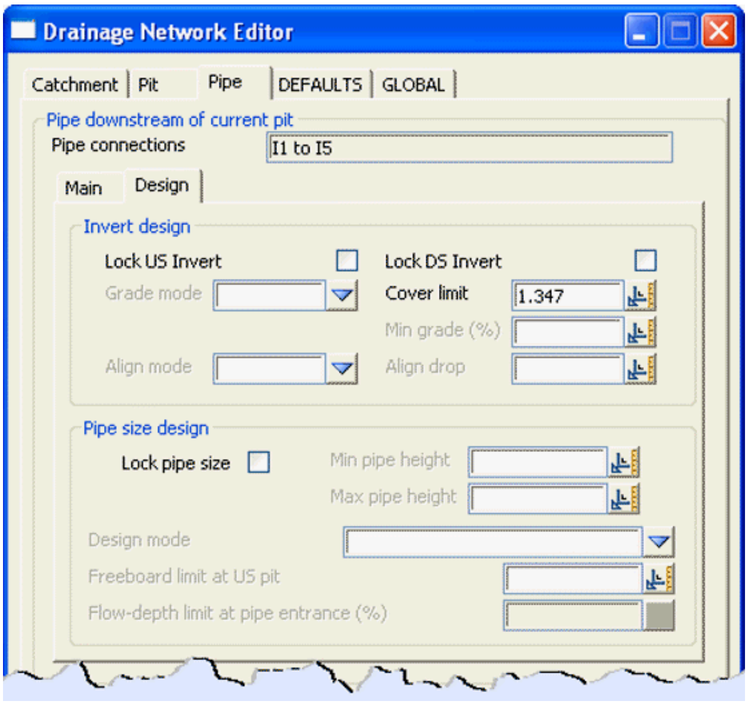


In the **Service model** column **RB** to select the model. Enter **Minimum Clearance** for the services in this model. Include an extra amount for the thickness of the drainage pipe. If the service model contains other drainage/sewer strings you must add the thickness of these pipes as well.

If different clearances are required for different services then place the services in different models. Warnings will be issued when you **Regrade Pipes, Set Pit details, Import** or **Storm Analysis**. Cover levels or fixed inverts can be used to avoid the services.



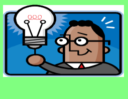
To quickly move to the section view of the string, Double click on the message in the output window (note the red! mark). The DNE will move to the pipe and with auto profile button enables the section view will update to this string.



The most common method to avoid the clash is to increase the **Pipe cover limit** for this pipe segment so that the pipe is pushed down.

If the clash problem is above the pipe then the **Max pipe height** may be used and multiple pipes are selected.

This method is preferred over locking the inverts as this leaves more flexibility for aligning the inverts.



Often changing the **Grade mode** to **Min grade** on a branch line will raise the downstream invert. This may allow the entire trunk line to rise and thus reduce excavation costs. This is especially true if the service clash is near the upstream end of the pipe.

Once the invert levels have been reset by selecting **Regrade pipes,** the output window will indicate the final clearance.

After a pipe design run in **Storm Analysis**, details of the service clash data will again be listed in the output window.

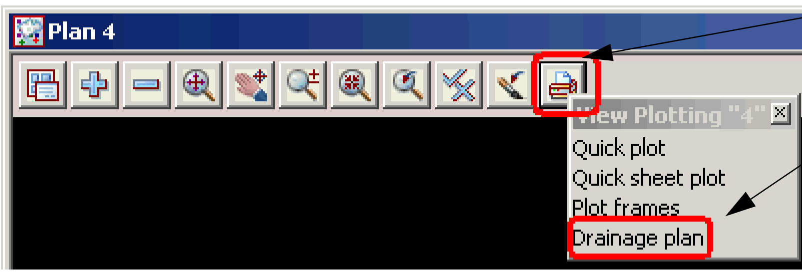
18.Drainage Plan Plots

The drainage plan plots create detailed drawings with symbols for the pits, linestyles for the pipes and string names ready to export to the desired layers in CAD. Pipes levels are 3d and setout points ready for downloading to survey total stations are prepared.

18.1 Labelling the Pits and Pipes

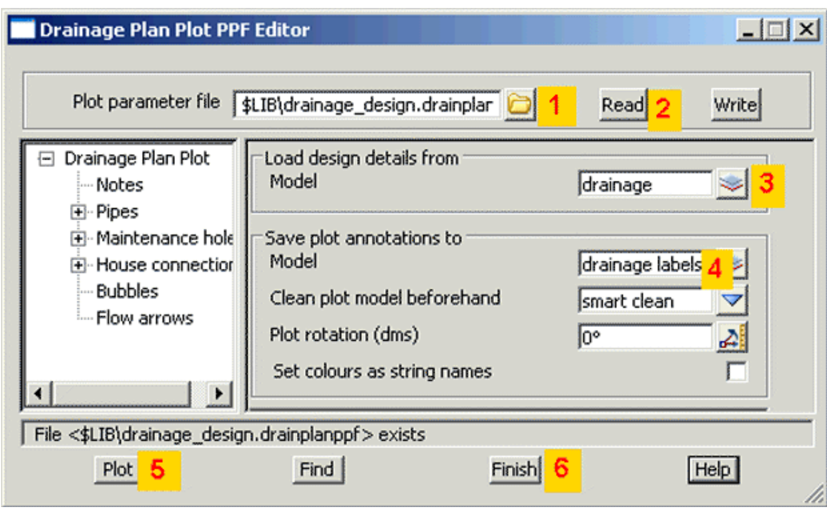
Plan plots are used to label the pits and the pipes. Drainage Plan Annotations may be accessed from one of three locations. The third is the most common.

Location 1: From the plan toolbar



Select the **plot** button and then **Drainage plan**

Note (The following panel has been reduced in size).

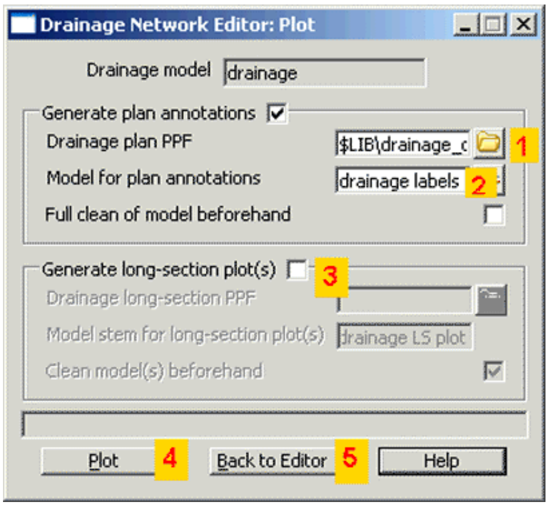


1. Select a ppf file from the library
2. LB **Read**
3. Select your drainage model
4. Type a model name for the new labels.
5. Select **Plot**
6. Select **Finish**

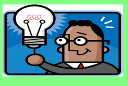
Now add the drainage labels model onto the plan view.

Location 2: The **Plot Button** on the **Drainage Network Editor**

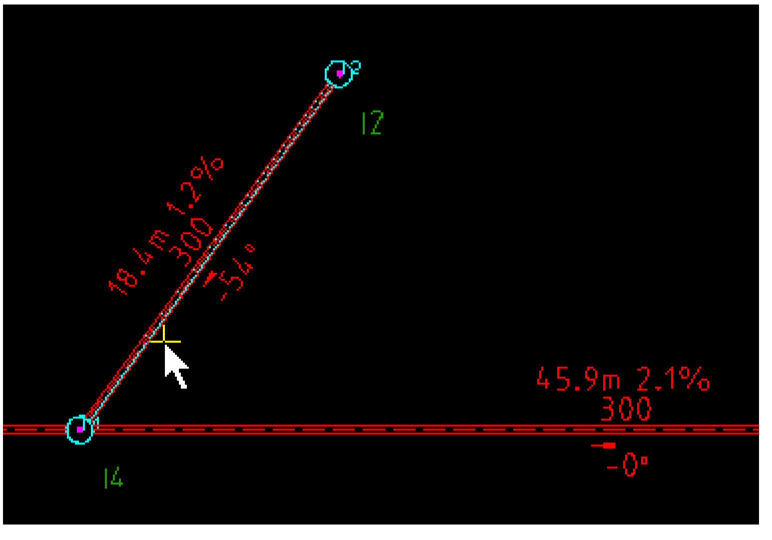
The following panel will be displayed. This option can plot both the long section and plan at the same time. Select a ppf file from the library (drainage_design).



1. Enter a model for the plan annotations.
2. Select **Full clean model beforehand** if you have not manually moved any of your manhole labels.
3. Turn off the long section plot for now.
4. Select **Plot.**
5. Select **Back to Editor**
6. Now add the **Model for plan annotations** onto the plan view.
7. Note: if you rename the manholes you will need to replot these labels!



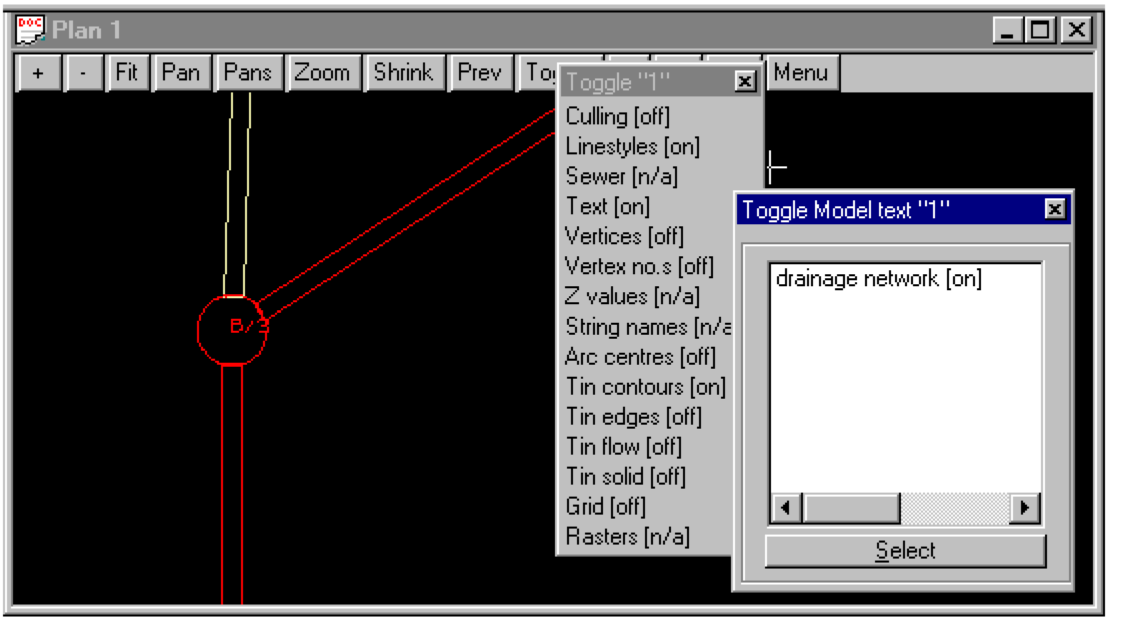
Note that **Full clean of model beforehand** was not selected. The drainage plan plot does a smart clean where it deletes and reprints text that has not been manually moved and updates text that has been moved.



The text properties can all be customised using the plot parameter file but this will be discussed later in the plotting section. These labels are **not** automatically updated when you change the names or pipe diameters. You must rerun the plot routine to update the labels.

18.1.1 Turn off View Text Pit Labels

To turn off the automatic view text pit labels for this view select Toggle=>Text and then walk right to select the drainage model. Do not click on **Text**, rather walk right. If you click **Text** you will toggle on/off all of your text on the view, not just the drainage model.



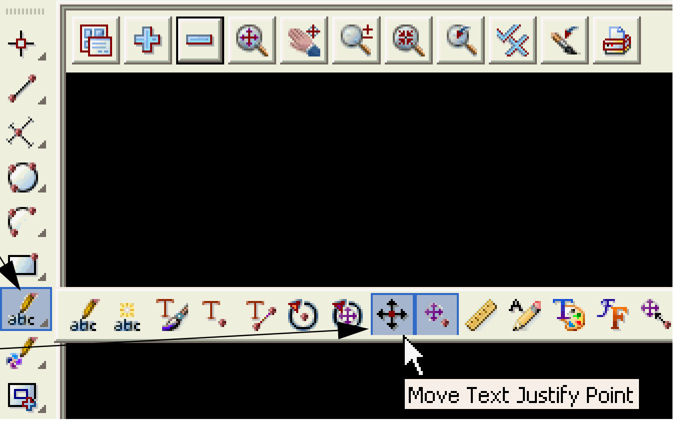
18.1.2 Moving Text

The labels created may be manually moved using the **CAD toolbar** but if the model is relabelled the text will return to its original location! Text moved via the **Drafting->Multi string translate** will remain in the moved position when **Smart Clean** is selected in the Plan Annotation panel.

Before selecting text turn on your **teXt snap.**

To move a single line a text use the **CAD** toolbar. Select the **Move text justify** button. To use this toolbar you must **DRAG** the **Create text** button to the right

and then release when the pointer is on the **Move Text Justify Point.**



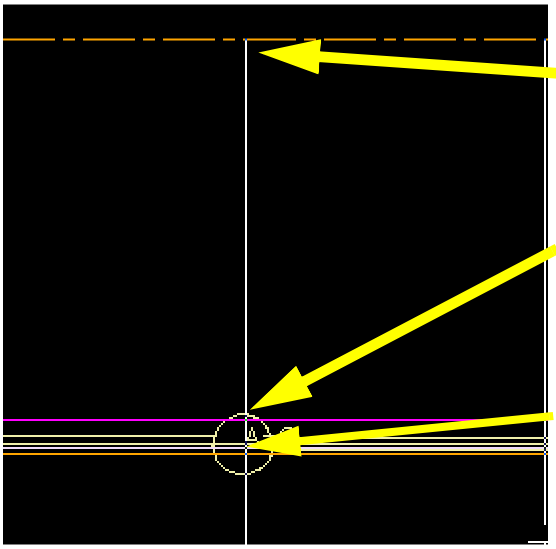
To move a pre-defined **Group** of text select

Drafting->Multi string translate

Select **Group** and then pick and accept one of the text items in the group. Move it to its new location and accept.

19.Construction Setout

Pits are setout on the construction site using a variety of techniques. The DNE creates a construction setout point (x,y,z) that can either be located at the pit centre or the pit centre can be dropped perpendicularly onto a design string for the xy location. The z value for the setout point has a number of modes as described below. Road centre line chainage may also be calculated



Road Centre Line

Road Chainage and offset

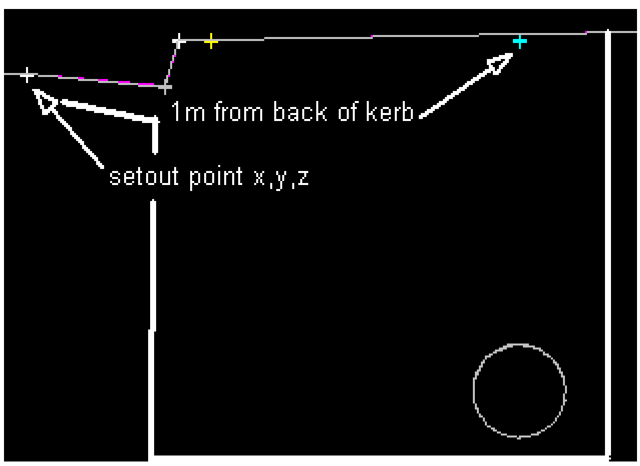
Setout String

x y from setout string

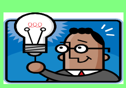
Pit Centre

x y at pit centre

In the diagram below the setout point is lip of kerb. The setout x,y location level z will be obtained from the setout string and the pipe will be shown at its proper position so that the pipe cover is calculated correctly.



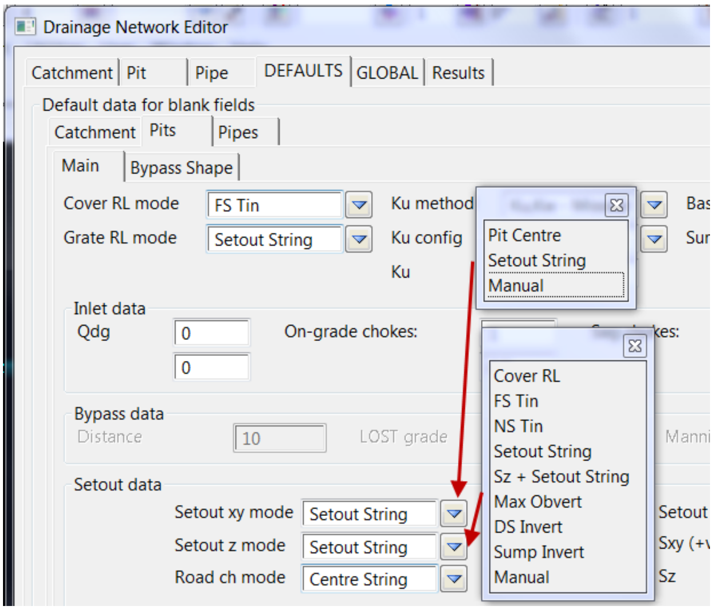
Pipes are setout using the pit connection points and the invert levels.



Design->Drainage-Sewer->Convert to Pts and Lines will create 12d super strings with the pipe attributes on them.

Setout reports can be created and the drainage plan plot generates strings for the surveyor to download to the instruments.

19.1 Pit Setout (xy)



Setout xy mode - Pit centre is the centre point of the manhole (the intersection of the joining pipes). Often the setout point for a manhole or catch basin is not the centre of the manhole but rather a point on the kerb or back on the foot path. The **setout string** option will drop the centre point of the manhole onto the closest string in the **Road design** model list specified on the **Global->Utility models** tab.

Setout z mode options are listed in the panel. This levels are used in the pit schedules.

There are currently 9 modes for determining the pit setout levels.

Cover RL - this ensures the level is the same as the Cover RL (not available for Cover level).

FS tin -The level is obtained from the finished surface tin at the pit centre.

NS tin -The level is obtained from the existing surface tin at the pit centre.

Setout String - The pit centre is dropped perpendicular onto the setout string and the level is obtained from the elevation on the string.

Sz + Setout String an offset is added to the level from Setout string described above.

Max Obvert- all connecting pipes, usually open channels, are checked for the highest obvert.

DS Invert - the invert of the outlet pipe (there is only one).

Sump Invert - the lowest pipe invert plus the **Sump offset.**

Manual - The user must manually type in the cover levels (rarely used as a default).

Explicit settings for the setout strings and the auto calculated values are found on the **Pit-Setout** tab. If the **manual** mode is selected the Easting and Northing locations may be picked in plan view or typed into the input boxes.

19.2 Pit Setout (z) Level

The setout level defines the level to be printed in the pit setout tables and in the drainage longsection plots. The **FS Tin** selection obtains the level from the FS tin, specified on the **Global-Main** tab, at the centre point of the pit.The **Setout String** location obtains the z level from the setout string as described in the section above. Explicit settings and the auto calculated value are found on the **Pit-Setout** tab.

19.3 Road Centre Line Chainage

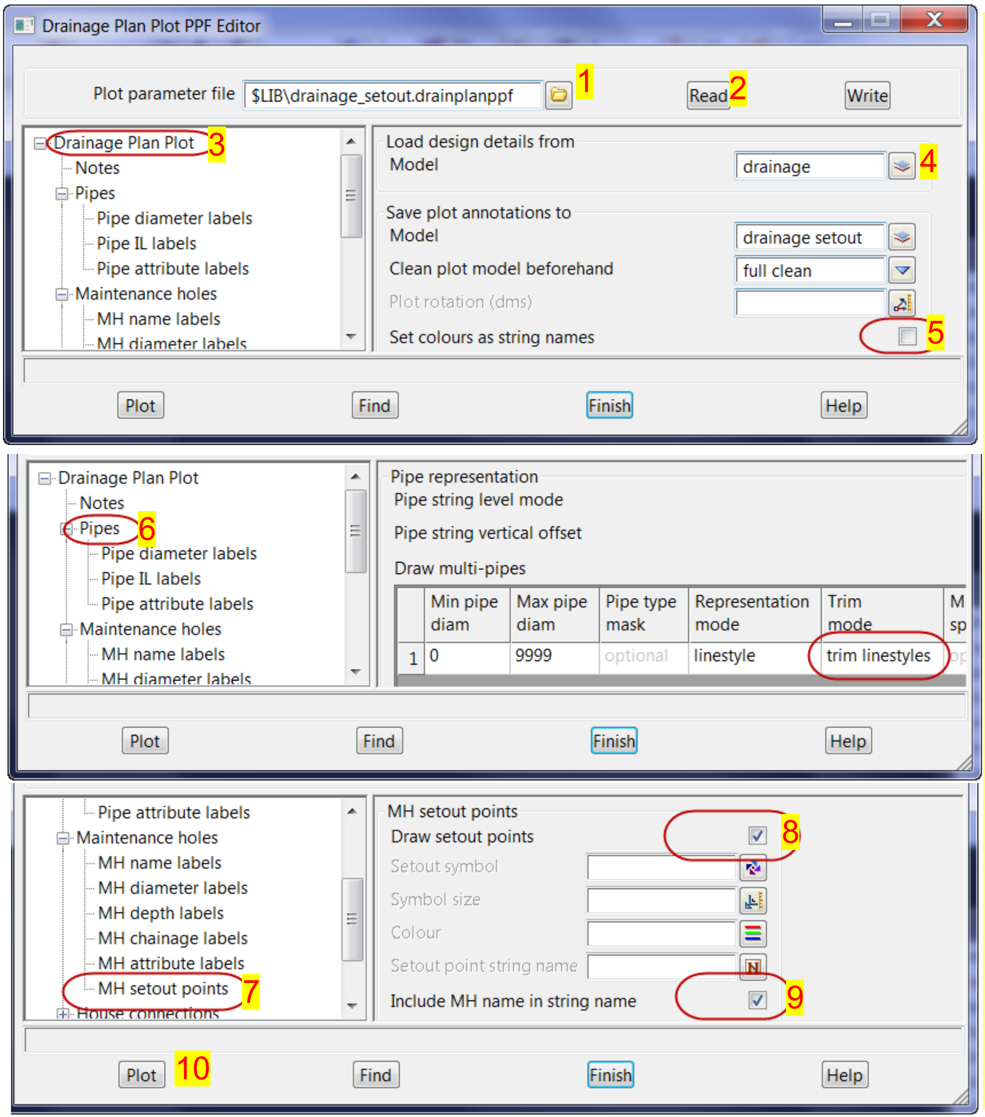
If **Road chainage mode** is set to **Centre string**, then the **Centre String ID** in the **Road design file** (shown above) is used to select the road string to measure the chainage and offset from. The values and explicit settings for the road chainage and offset are found on the **Pit->Setout** ta

19.4 Pipe Setout

Pipe setout is along the centre line of pipes.

19.5 Plan Plots for Surveyors

Use the drainage plan plot routine to create survey setout point for each pit and strings for each pipe with the invert levels. If **drainage_setout** is not in your library, start with **drainage_inverts**.



1. Select **drainage_setout** ppf from the library
2. LB **Read**
3. LB **Drainage Plan Plot** branch
4. Select the existing **drainage** model
5. ensure NOT selected
6. Select **Pipes** branch and note **Trim mode**
7. Select **Maintenance holes->MH setout points** branch
8. Note:**Draw setout points** is selected.
9. String names are sent to the survey instruments so select this.
10. Select Plot
11. Add **drainage setout** model onto a plan view

19.6 Construction Manhole/Pit Schedules

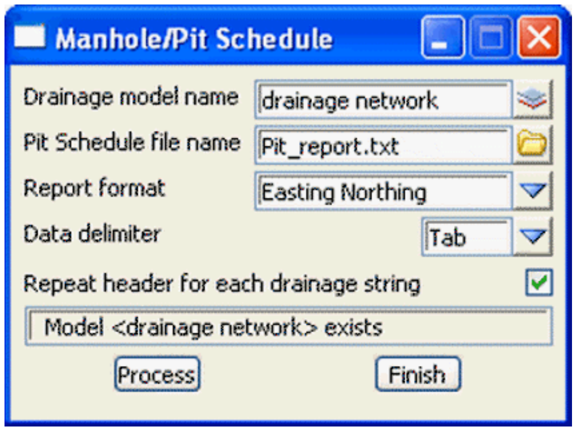
Manhole/pit schedules or construction tables are generated in tab or space delimited formats.

This routine does not recalculate the setout locations. Similar to plotting, it prints the results of the last time the calculation were done (DNE->Set Pit Details).

Position of option on menu: **Design => Drainage => Reports => Pit schedule**

This routine prints the calculations from the last time Set Pit Details was selected in the Drainage Network Editor.

On selecting the **Pit schedule** option, the **Manhole/Pit Schedule** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model name	input box	drainage network	
model containing the drainage strings			
Pit schedule file name	input box	pit report	
file to be created			
Report Format	choice box	Road chainge.,Easting...	
file format			
Data delimiter	choice box	Tab, Space	
tab delimiters are best for spreadsheets and space for some text editors			
Repeat header for each line	tick box	selected	
when selected, the column headings will be printed each drainage line			
Process	button		
Create the pit report			
Finish	button		
remove the panel from the screen			

Notes:

The columns of data may be separated by spaces or a tab. (tab is used for spreadsheet transfers). The internal width and length data are retrieved from the **drainage.4d** file for the pit type specified. If you want a longer description for the pit then the type used inside 12d this can also be entered in the drainage.4d file. The remarks for each pit are entered as user defined pit attribute named **remarks** and may be set using the attribute editor (on the drainage menu) or via a spreadsheet.

Easting Northing Sample

```
.PIT SCHEDULE
  Pit                                  INTERNAL          INLET         OUTLET                    PIT

```

Notes

The Set pit details must be run at least once to before printing the report. If the pits are moved or the designed strings changed then this option must re rerun.

The easting northing data obtained for the **road design string** option is obtained by dropping the pit centre perpendicular onto the selected road design string. This data is stored as pit attributes **setout x** and **setout y**. It is calculated when the **Set Pit Details** is selected in the Drainage Network editor.

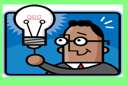
20.DNE and Rational Hydrology

The rational methods uses the formula Q = CIA/360
where

A = catchment area (hectares)
C = runoff coefficient
I = rainfall intensity (mm/hr)
360 conversion factor to m^3/s for area (ha) and rainfall (mm/hr)

The rainfall intensity requires the input/calculation of the time of concentration (tc) for the catchment and then a return period to be used in the IFD table (see 12d Rational Method Hydrology - Drainage Rainfall Editor).

The total area entered/measured may be split into impervious and pervious and analysed separately.



If you use a single composite C value for your catchments, enter a %impervious of zero and ignore the impervious settings.

Many authorities increase the C values for major storms. If you do not then enter the same C for minor and major. Similarly Tc values are sometimes reduced for major storms so you have the option to enter a minor and major C value. An example is provided below.

Total Area = **0.1**		%imp=**80**	Cminor	Cmajor	Tc minor	Tc major
Impervious	Area*%imp		**0.9**	**0.92**	**5** min	**5** min
Pervious	Area-Imp area		**0.3**	**0.31**	**10** min	**10** min

20.1 Network Editor - Global, Default Settings and Explicit Settings

This section will discuss the **Global**, **Defaults** and explicit setting for the hydrology parameters. Design values for the hydrology and hydraulics calculations are set

s either globally (one value for the entire network)

s or via defaults.

Defaults values may be overridden by explicit settings found on the top level **catchment, pits** or **pipes** tabs. Explicit over ride catchment settings need only be specified if the default value is not desired. Only fill them in if you want to use a value different than the default. The tool tip will indicate the default values.

Default values must be entered for **all** of the fields for Set 1. Set 2 and Set 3 blank default values will use the defaults you have used in Set 1.

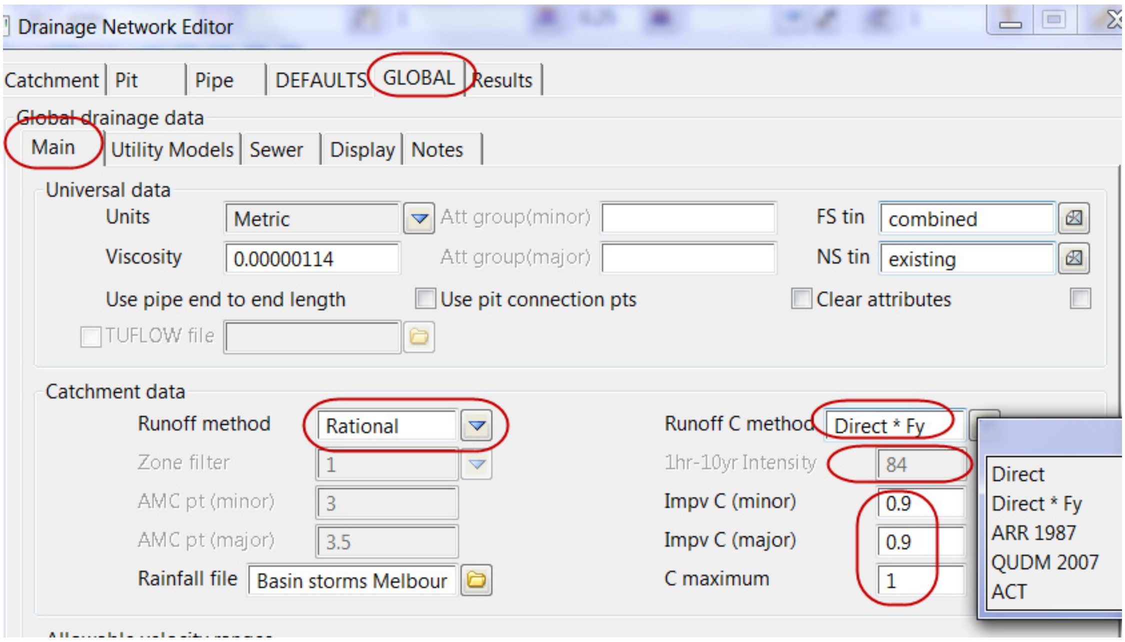
20.1.1 Catchment Areas and Percent Impervious

There is no default catchment area to apply to all catchments. You may type in the catchment area or create a string where 12d will measure the plan area (Drawing Catchment Strings in 12d).

The percent impervious will split the catchment area into the pervious and impervious sub catchments. Separate C and tc values are used for the pervious and impervious areas. The default percent impervious for the various sets are entered on the **Defaults->Catchment Defaults** tab and the explicit settings are on the **Catchment** tab. The percent impervious is used also used to determine the composite C value if using the **ARR 1987** method for calculating runoff coefficients.

20.1.2 Coefficients of Runoff

Global Settings



Runoff C methods include **Direct, Direct * Fy, ARR 1987, QUDM 2007** and **ACT.**

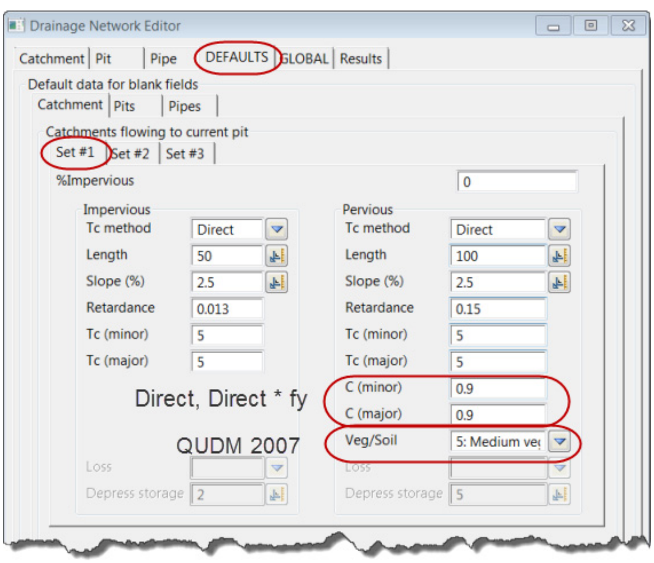
Direct: There is a global impervious C value for minor and major storms. This can only be set once. The C values for the pervious areas may be changed for every catchment in your model.

Direct * Fy: For urban areas in Australia the flood frequency factors (fy) are constant for urban hydrology. You are required to enter the f10 values, the same value for minor and major. For rural areas the direct method is required.

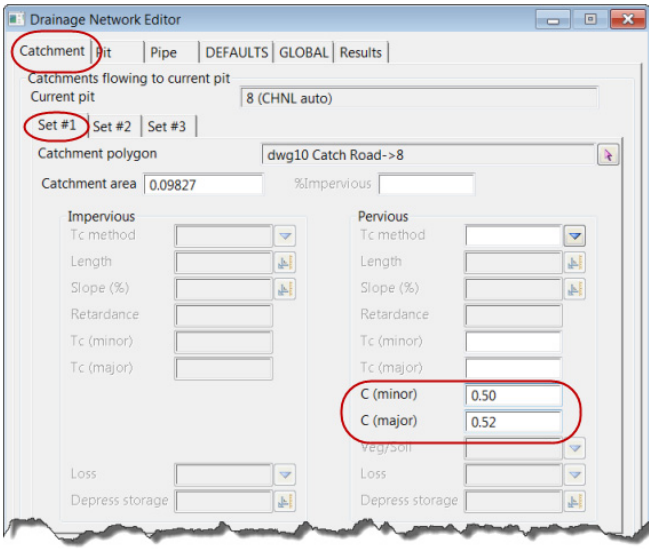
ARR 1987: The composite C value is calculated using the **1hr-10yr intensity,** the percent impervious, ARR frequency factors and the return period specified when hydrology runs are made. **You must enter the 1hr-10yr intensity value. No C values are entered if this method is used!**

QUDM 2007: Similar to the ARR 1987 method (except when the %impervious for the catchment = 0.0). The **Veg/Soil** type must be entered for the catchment via the default catchment tab.

Default Settings

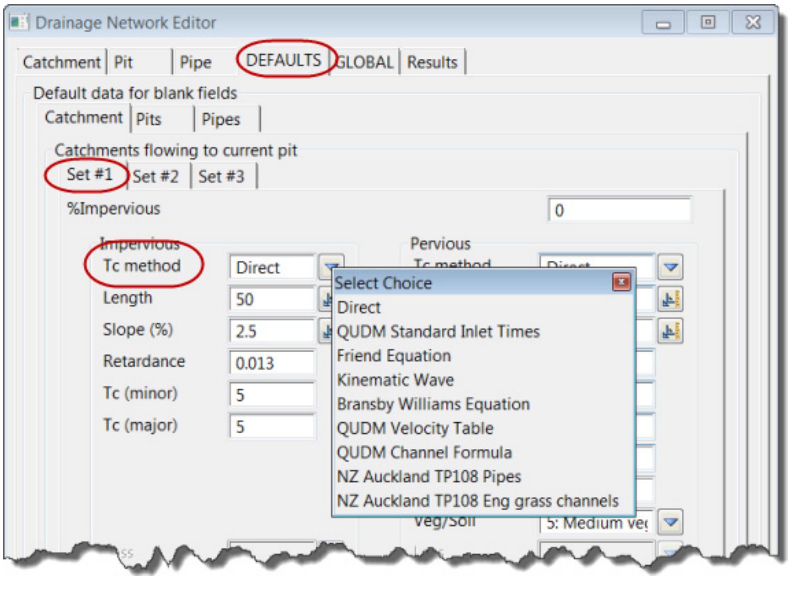


Explicit Settings



20.1.3 Times of Concentration

There are several methods for entering times of concentration for the catchment areas (see list below). Since each catchment may use a different tc method, all of the tc parameter fields on the defaults tab are active and required. They must be filled in even if you do not plan on using that value.



1. **Direct method** requires minor and major tc values.
2. **Friend**, **Kinematic Wave, Bransby Williams** and **QDUM** methods require the retardance, length and slope of the catchments to be entered. Default values must be entered but the optional explicit settings for slope and length can be entered on the catchment tabs or a catchment characteristic strings may be drawn (see Catchment Tc path strings). The length of this string is used for the length parameter and the design tin is used with the string to calculate the slope using the equal area method.
3. Data for the remaining methods is entered in a similar fashion.

20.2 Catchment Areas

Key Points

1. You do not have to draw catchment strings. You can enter the catchment areas manually (ha or acres).

2. When drawing catchment polygons, start near the inlet for auto linking.
3. 3 catchment sets are available and all catchment polygons must be in these models.
4. Specify catchment models via Network Editor->Global->Utility Models **Catchment file**.
5. Network Editor **Set Catchment** button links the polygons and calculates the areas
6. Once a string has been linked to a inlet, it will remain linked until it is deleted or the link has been cleared (**Clear Catchment Links** on the Globals->Utility Models tab).
7. Manual linking available via DNE->Catchments->Set x->Pick button (RB for a manual clear).
8. Manholes (set via cap_config in drainage.4d or **Inlet config** on the **Pit->Main** tab cannot have linked catchments.
9. Use the CAD polygon tool for drawing catchments OR close the string for sag pits
10. You can disable the auto selection of a string via Right mouse on the pick button then select **Clear**.

The catchment strings may be drawn in a CAD package and then imported into 12d or drawn inside 12d. The strings may be easily drawn in 12d with the tin contours and/or flow arrows displayed in the plan view.

When a catchment string is created to define the area for an inlet then all other data entry types will be ignored and the area from the string will be used.

There are 3 sets of catchments and it is up to the user to decide how they are to be used. Each set has its own percent impervious. The most common is to use the sets as land use types (roads, lots and park land for example). Another frequently used option is to use set 1 for all the impervious areas and set 2 the pervious and set 3 for special areas. The 3 catchment sets are drawn in three different models.

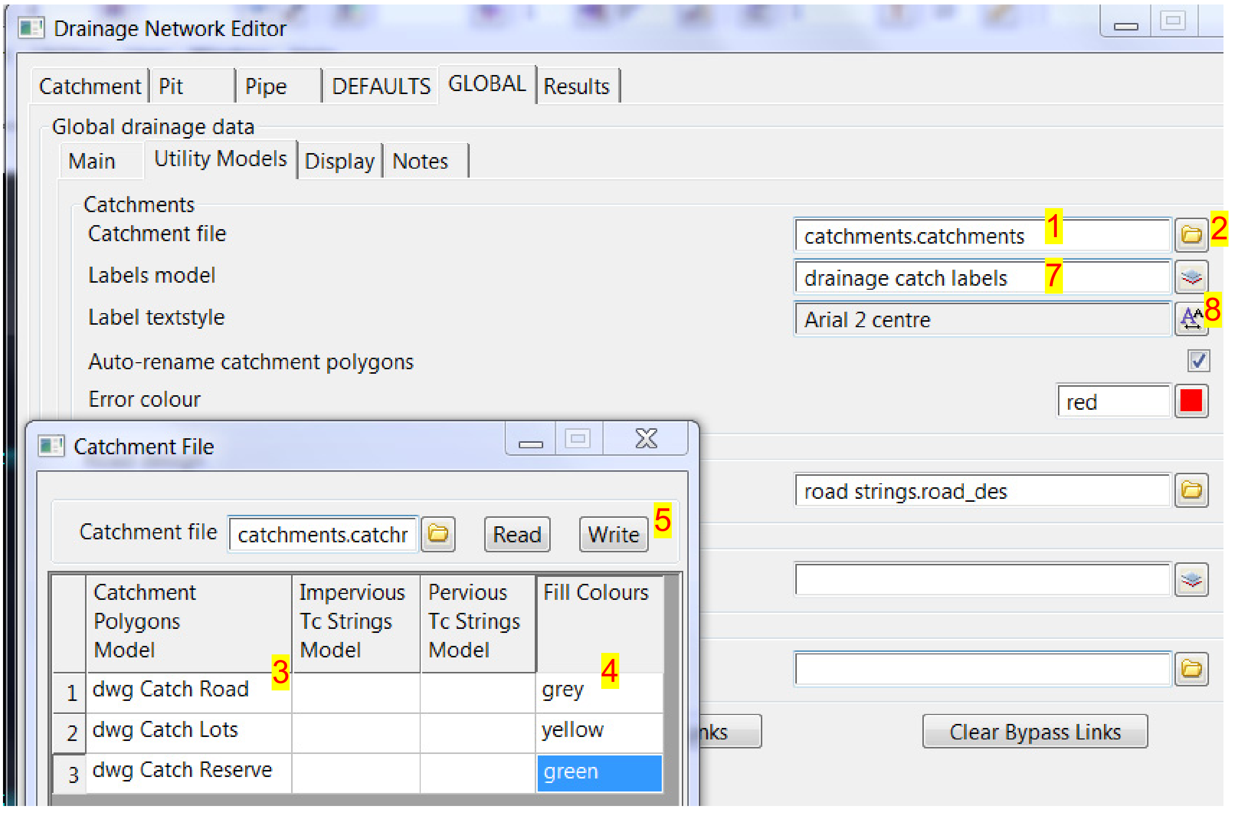
If exporting to external drainage design programs, the package may not accept all three sets so check the interface notes before defining the catchments.

Set Catchments - Auto Linking

In each set/model, 12d will automatically link the catchment string to the inlet that is closest to vertex 1 on your catchment string. This is the preferred method. If this is not possible, then an inlet may be manually linked to a catchment string using the Catchment manual link. More on catchment links may be found in Catchment string links,

Also see Checking the Automatic Catchment Linking

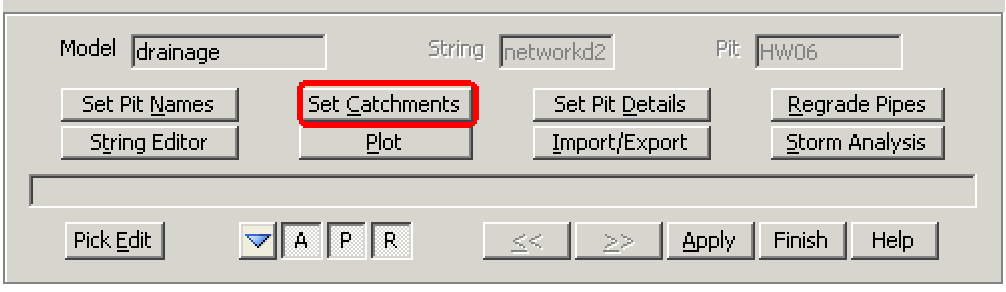
Start the **Drainage network editor** and move to the **Global** Tab and then the **Utility Models** sub tab.



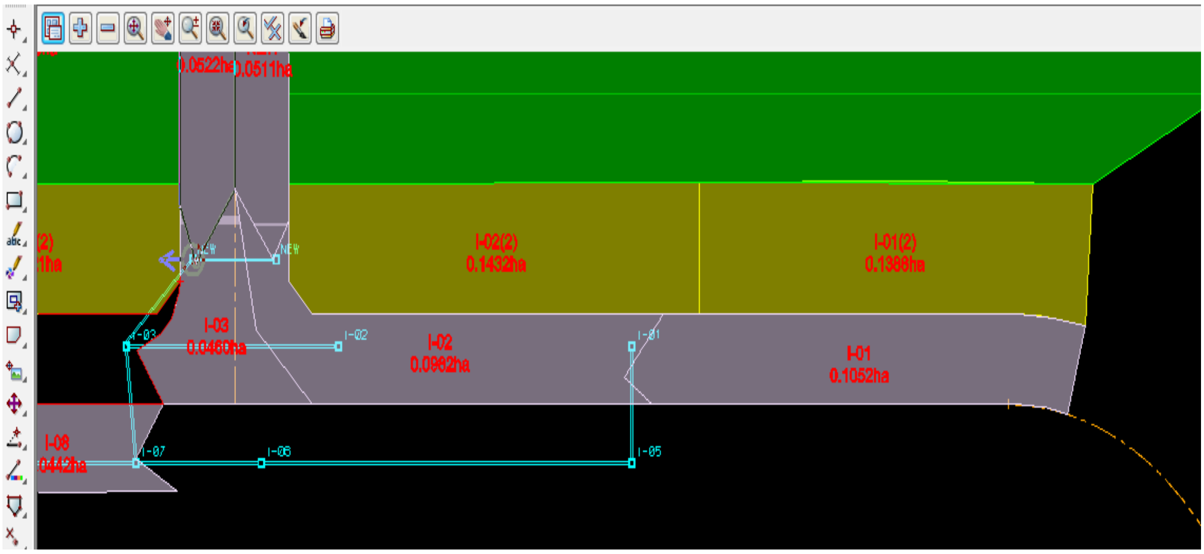
1. Type a filename for the catchment file
2. LB **More info** button and then select **Open**
3. RB to select the catchment model for set 1 (used in the **CAD control bar** above). Every inlet can have up to 3 catchments, row 1 is catchment set 1, row 2 for catchment set 2 and row 3 for catchment set 3. Often the sets are used as catchment types. for example
   Set 1 - Roads, Set 2 Lots and Set 3 Parks
4. .Optional - RB to select a fill colour for the catchments
5. LB **Write** to save the file
6. LB **Finish**
7. Type a new model name for the catchment labels (optional)
8. LB **More info** button to select textstyle (required if **Labels model** is used)

The **Auto-rename catchment polygons** will set the name of the catchment string to the pit name that it is linked to. If it is not linked to any inlet it will be named **"not used".** The model can be checked for **not used** strings by selecting **Models->String Info Table.** The catchment will also be filled with the **Error colour** if a catchment string is not linked.

Label Catchments



Finally select **Set catchments**. This will link the catchments to the inlets and label the catchments. Now add the mod **labels** onto the plan view.



Adding the edges to the fills

To view the edges go to the View Menu button and select **Settings->Faces**

1. LB **Draw Edges**
2. LB **Set**
3. LB **Finish**

There are some cases where linking the closest inlet to vertex 1 is not feasible. In these cases you may manually link the inlet to a catchment.

20.3 Drawing Catchment Strings in 12d

There are 2 catchments on the south east side of the road that have not be drawn. Use the CAD polygon tool to draw the catchments

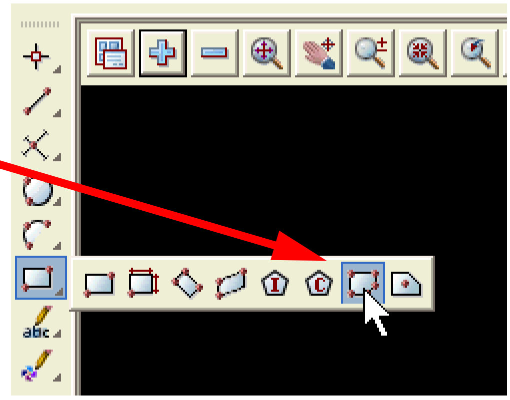
Before creating the catchment string set the **CAD control bar** data.

Type the name of a model for the catchment strings

Now to create the catchment string use the **Create line string** button on the CAD toolbar.

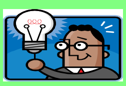
DRAG the **Create line** button and release at the **Create Line String** button.

The first point should always be placed near the inlet. 12d will assume that the catchment will drain to the inlet closest to this first point.



Draw the catchment strings with the accuracy you feel appropriate. Catchment strings for sag pit or drawn along a crest lines so take extra care near the crest low points where the water may overflow and bypass. Continue selecting and accepting the points on the catchment string and the press **ESC** to finish creating this string. You are now ready to create the next catchment string.

Sag inlet catchments: **DO NOT START AT THE INLET, just start nearer to this inlet than any other!** If you start at the inlet then move out to the crest of the catchment, the catchment overflow level cannot be determined from the catchment string.



CAD tips

Use the CAD toolbar eye dropper to load the properties from an existing catchment polygon.

Try CAD trace instead of CAD polygon to trace around edges of existing catchment areas. It is at the end of the CAD string fly out. Follow the directions in the 12d message area (bottom left of window).

Trace begins as normal string draw,
select **t** to start the trace, pick the start point on a string then
pick the end point of the trace, (if the trace is going the wrong way select **f** or **b**).

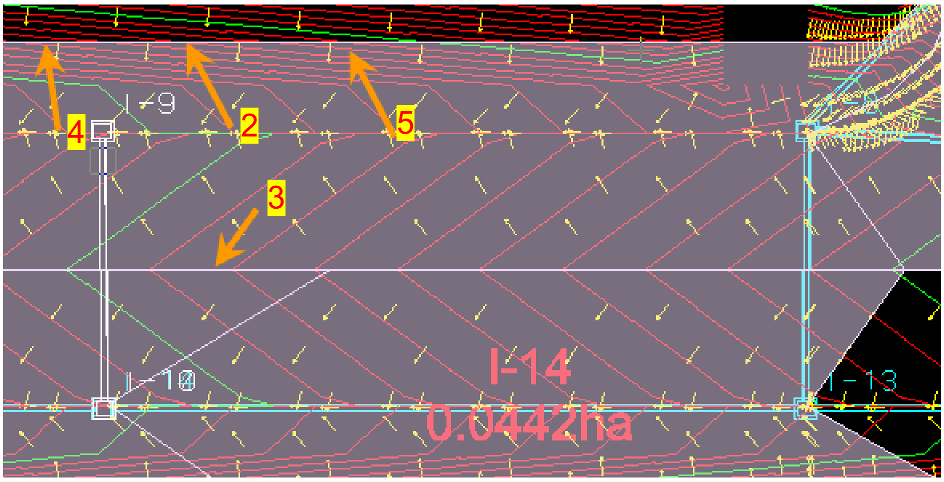
Now you can select another string to trace or
select **p** to return to pick mode.
select **c** to close and finish
and you are off creating another catchment string.

Once the catchments are drawn they become linked to the drainage network in the **Drainage network editor.** We will label the catchment with the inlet name and area at the same time.

20.4 Splitting Catchment Strings to Insert an Inlet

The catchment for the northwest sag pit needs to be split into 2 catchments for the inlet labelled I-9.

We will use mostly CAD tools except for Strings->Strings edit->Split. The trick is to roll the mouse roller ball once whenever you need to redraw the screen.

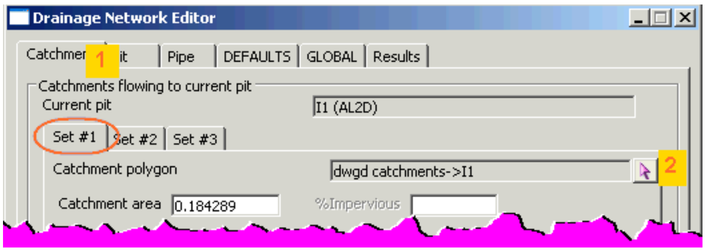


1. Cad String->Close to close the string. (roller ball!)
2. Strings->Strings Edit->Split, select string at split point (string area will go solid white - accept) roller ball!
3. repeat for south side
4. CAD vertex->Append select the string away from the split point, roller ball and draw the new catchment boundary. Single ESC to finish this string.
5. CAD vertex->Append select the string away from the split point, roller ball and trace the new catchment boundary. Double ESC to finish this string and end appending

Catchment manual link

The manual links are used when the first point on the catchment string is closest to the wrong inlet. Note that the following restrictions still apply.

1. The string selected for catchment 1 must be in the model for set 1. To check if you have selected a valid string select the **Set Catchments** button.
2. If the catchment string has already been linked to another inlet (automatic or manual) then the new link will be created and the old link erased.
3. If you change the catchment model for one of the sets on the **Network Editor->Global->Utility Models->catchments** than all of the manual links in that set will be erased.



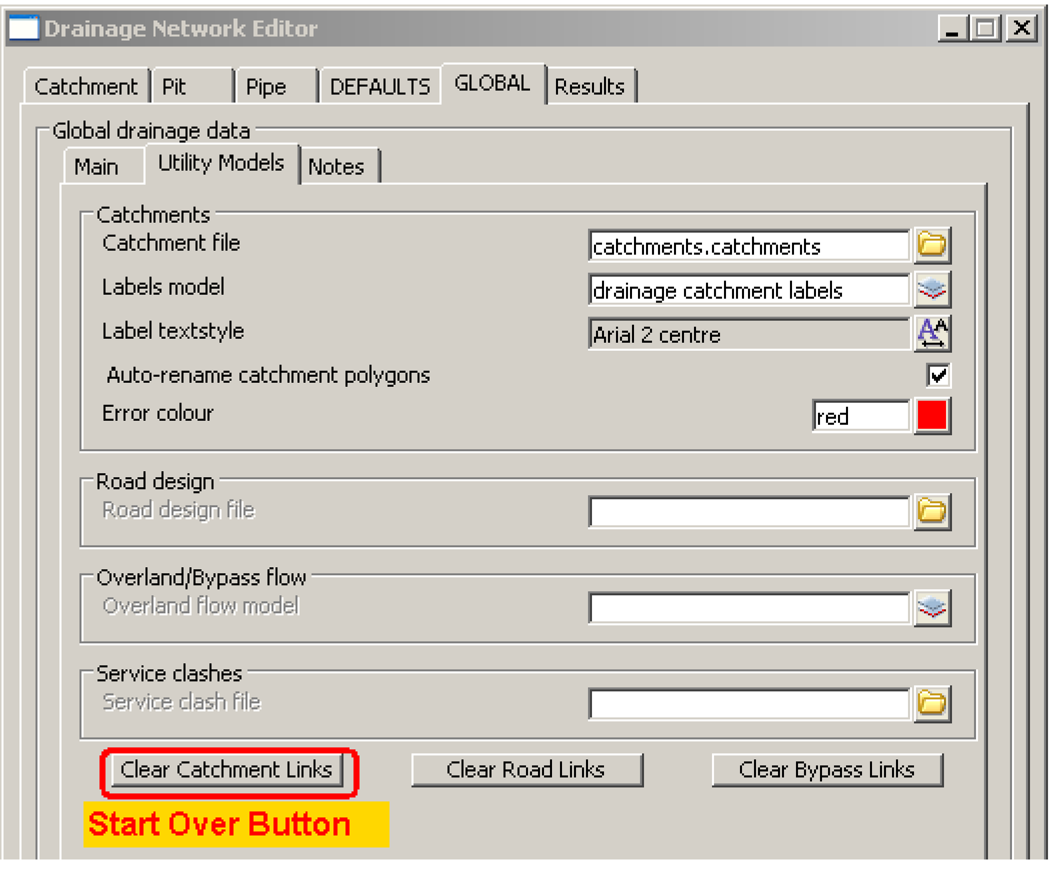
1. Change to the **Catchment** tab.Move to the desired inlet. I-9 in the plan above. The inlet will be circled in the plan view and its name shown in the **Current Pit** field.
2. LB Set 1 then LB the **Catchment polygon** button and pick the desired catchment string. **NOTE!** If you decide to enter a value and NOT use the selected string **RB** on the button and select **Clear.**
   If the **Auto apply** tick box is not selected then you will have to select the **Apply** button for the manual link to become active.
3. LB **Set Catchments** button. A prompt box appears asking you to confirm. Select **Yes**. To toggle off/on the confirm request RB **Set Catchments**. The measured catchment area will be shown in the **Catchment area** field using the units specified in the **Global-Utility models-Units** field.
4. Repeat these steps for the sag pit to the west.

Verifying the Automatic Catchment Linking

The automatic inlet-catchment linking is easily checked by after selecting the **Set Catchments** button on the network editor by any or all of the following:

1. Specifying a **Catchment labels model** with **Labels textstyle** on the **Global->Utility models** tab and . The catchment is indicated when the inlet is selected using the network editor. Since there may be three catchments per inlet the catchment data last viewed in the editor is the catchment that is highlighted.
2. Selecting the **Auto-rename catchment polygons** on the **Global->Utility Models** tab will set the name of the catchment string to the pit name that it is linked to. If it is not linked to any inlet, it will be named **"not used".** The model can be checked for **not used** strings by selecting **Models->String Info Table.**
3. The unlinked catchment strings will be filled with the **Error colour** on the **Global->Utility models** tab.

Reseting All Catchment links to Start Over



There may be occasions where you will want to clear all of the catchment links and begin with a fresh start. Select **Clear Catchment Links** on Network Editor->Global->Utility Models.

20.5 Tc Path Strings

These strings are used to calculate the time of concentration for the impervious and pervious areas. For each catchment set, they are drawn in two models; one for the impervious paths and one for pervious paths. The models are specified using the **Catchment file** field on the network editor (Global->Utility model tab). The 3 rows in the **catchment file** correspond to the 3 catchments available for each inlet. Therefore it is possible to have a maximum of 6 Tc paths models!

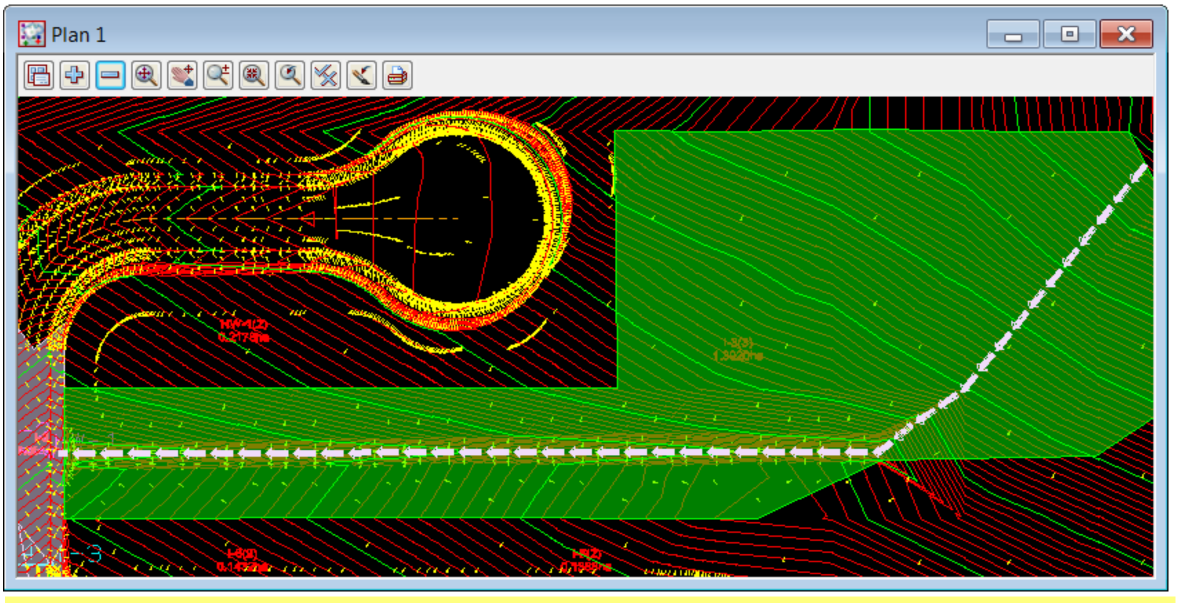
Key Points

1. Each Catchment set may have 2 Tc paths models. Pervious and impervious paths are kept in separate models.
2. End the Tc path string near the inlet that it is to be linked to.
3. Enter the paths models via **Catchment file** field on the (Global->Utility model tab)
4. You must select a Tc method (explicit or implicit) via the **Defaults->Catchments tab** or the **Catchments Tabs**. Just specifying the models is NOT enough!
5. Select **Set Catchments** to perform the calculations of length and slope.

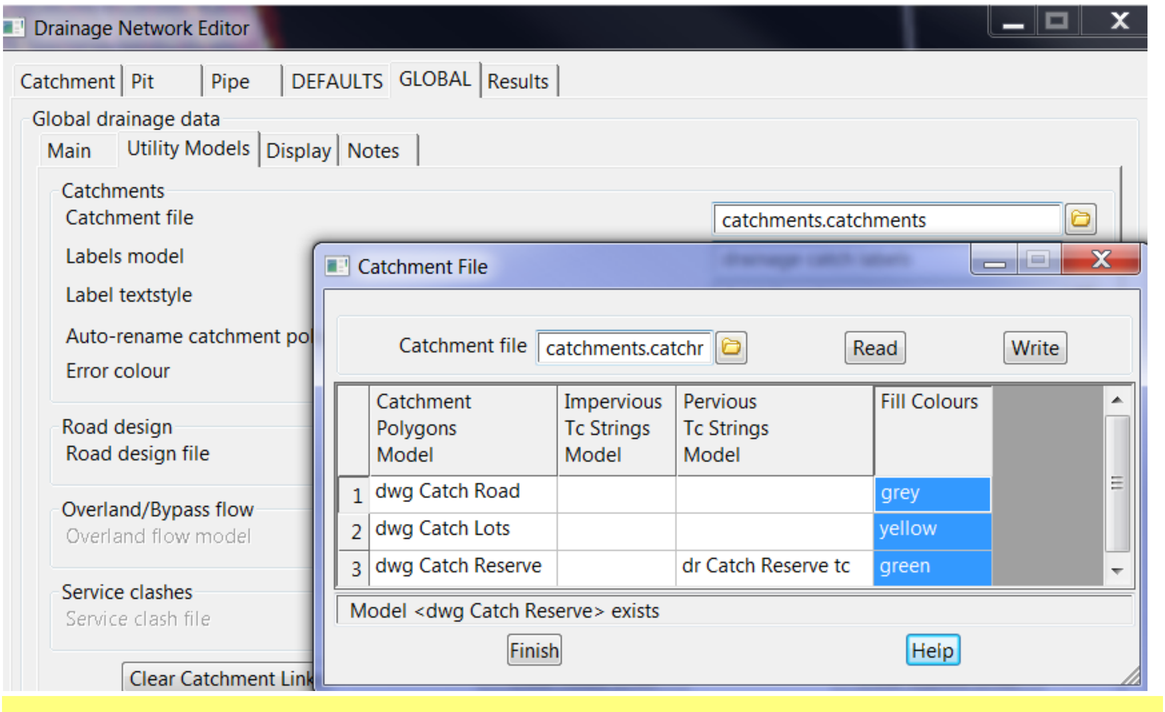
The tc strings can be drawn in the same way as the catchment strings but make sure that you change the model name first! The tc string model is then entered in either the impervious or pervious paths model columns (You could have up to 6 tc string models!).

20.5.1 Catchment slope (equal area)

The length of this string is used for the length parameter and the design tin is used with the string to calculate the slope using the equal area method. These strings are drawn from upstream to downstream, finishing nearest to the inlet they are to be linked to.

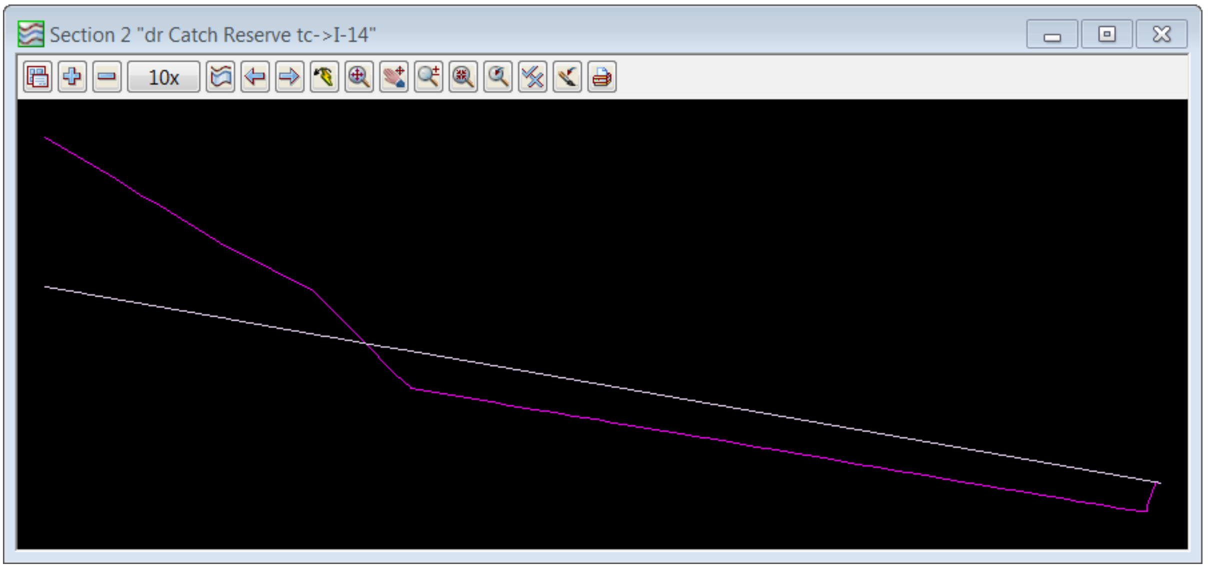


1. Change the Cad toolbar model to dr Catch Reserve tc and the line type to FLOW LINE
2. Use Cad line->Cad line to draw the flow path from the culvert inlet up to the top of the catchment.
3. Use Cad string->Reverse to that the string is in the same direction as the flow.



1. Change the Cad toolbar model to **dr Catch Reserve tc** and the line type to **FLOW LINE**
2. Use Cad line->Cad line to draw the flow path from the culvert inlet up to the top of the catchment.

The equal area slope is calculated when **Set Catchments** is selected. The slope string be profiled, with tin combined added to the view, to see the slope and the equal areas (see below) above and belong the tin.



21.Network Editor - Hydraulics

This section will discuss the hydraulic **Global**, **Defaults** and explicit settings for the hydraulic parameters. The explicit settings for the parameters described on the **defaults** tab will also be found on the **Pit** or **Pipe** tabs.

21.1 Grate Levels

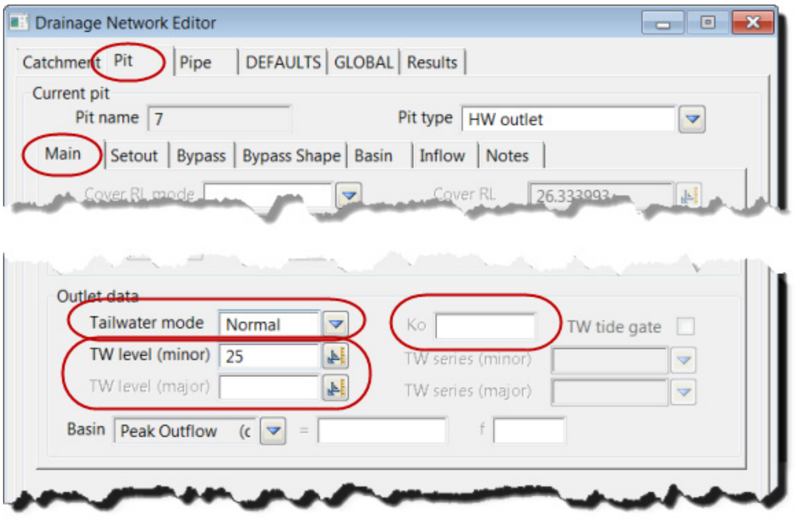
Important! Get the Grate level correct! The freeboard is measured from this level and if you do bypass calcs the water will bypass if the hgl reaches this level. If the grate level is at or below the obvert of the pipe then the pit cannot surcharge and the pipe cannot flow full (it is an open channel). The grate level should not exceed the cover level except for pressurised, bolt down manholes and culvert headwalls.

Special Structures

- **Bolt down manholes** will have the grate level above the cover level. The height above the cover will determine the hydraulic head required to "pop" the cover off and begin surcharging.
- **Headwalls** cover levels are often the top of the headwall structure and and the grate level is set to the highest point of the channel before bypass begins.

21.2 Outlet and Tailwater Conditions

The most downstream pit on each network requires tailwater conditions. Often the invert level on the downstream end of the last pipe also needs to have the invert level locked to either discharge into a waterway or join into an existing drainage system. When the most downstream pit is selected the following fields will become active on the DNE **Pit-Main** tab**.** If these field are not active and you think you are at the outlet see Flow in the Wrong Direction.

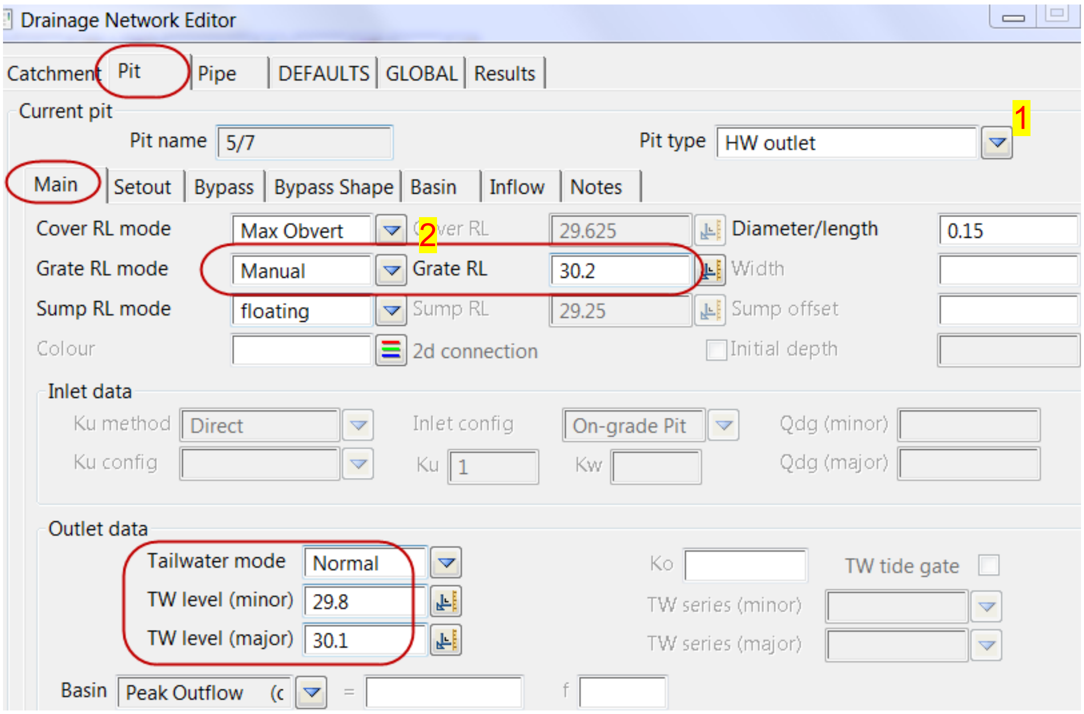


Minimum will use the least of the **Critical** or **Normal** depths. If a fixed level is available for the minor and/or major storms, these value may be entered here.

The **Ko** is the loss coefficient for the exit losses into the downstream system. A value of 1 is typical for discharging into a pond or creek, or a Ku value for the pipe configuration in the pit the network is joining.

21.3 Culvert Hydraulics and Tailwater

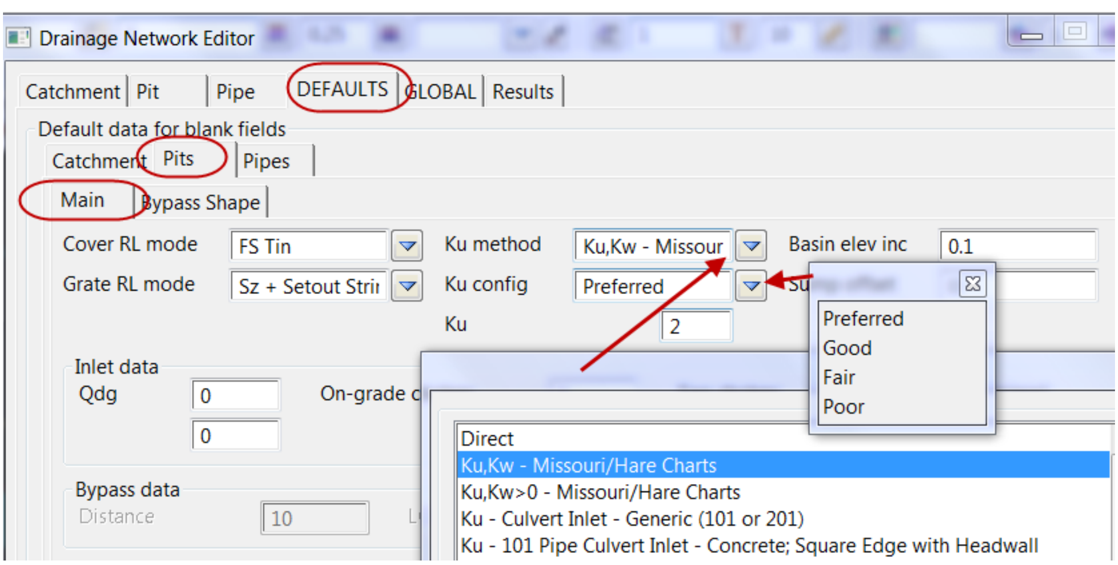
To set the tailwater conditions for the culvert we created at the beginning of the course, select the outlet



1. Select **HW outlet.**
2. Select **Max Obvert** so the top of the headwall is at the obvert
3. Select **Manual** so that the grate level can be set above the max twl+ko losses.
4. Type **30.2** as the road overtopping level
5. Type **0.150** for the HW thickness.
6. Set the tailwater mode to normal and enter the expected twl.
7. Type the minor and major tailwater levels. These

In part 2 of the course we add an open channel to calculate a realistic tailwater for the culvert.

21.4 Pit Losses Ku, and Direct Flow



The **Qdg** (direct flow) (cms/cfs) is water flowing into the manhole. It is added to the approach flow and is subject to pit inlet capacity. This field will be disabled on the pit tab if the inlet type is set to a manhole.

The **Pit loss Ku** is used to model the energy losses through the pits and inlet control on culvert inlets. Three Ku methods are available, **Direct** (user entered), **Ku,Kw via charts** (may be negative), or **Ku,Kw >0 via charts** where all negative values are changed to zero. The remaining methods specify various headwall types for culverts. These will use inlet control curves and backwater energy loss coefficients.

Ku config has 4 options: **Preferred, Good, Fair** and **Poor**. The settings have no effect for 100% grate flow, straight through and 90° bends. For pipes with bends they determine the charts to use. The following are guidelines in selecting the Ku config.

Preferred	water impacts the opposite wall where it exits
Good	water impacts the side wall where it exits
Fair	water impacts the side wall and exits on the end
Poor	water impacts the opposite wall of the pit and exits on the side wall.

21.5 Introduction to 12d Ku/Kw Calculations

The following description is a very general overview of the Ku calculations in 12d. For a detailed description please see the 12d forum site http://forums.12dmodel.com/.

When 12d uses the Ku and Kw Charts, the values of upstream pipe angle, (Qgrate/Qoutlet), (Upstream diameter/outlet diameter) and (pit depth/outlet diameter) are calculated and used in the Ku/Kw charts. Three cases exist which determine which chart is used.

Case 1 - Pits with 100% Grate Flow

The angle between the ground approach flow and the exit pipe is measured. Charts, compiled from Sangster et al (1958) are used; G1 is used for angles less than 15 degrees (rare) and G2 for angles > 15 degrees. 12d's names G1 and G2 can be referenced to other publications in the table below.

Case 2 - Pits with More than 50% Through Flow

12d has 10 charts (T1-T10) compiled from the Hare (1981) and cross referenced to the QUDM and ACTDS Charts. In general T10 charts have greater losses than T1 charts.

Ku Config	0°	22.5°	45°	67.5°	90°
Preferred	T1	T2	T4	T8	T10
Good	T1	T2	T5	T8	T10
Fair	T1	T3	T6	T9	T10
Poor	T1	T3	T7	T9	T10

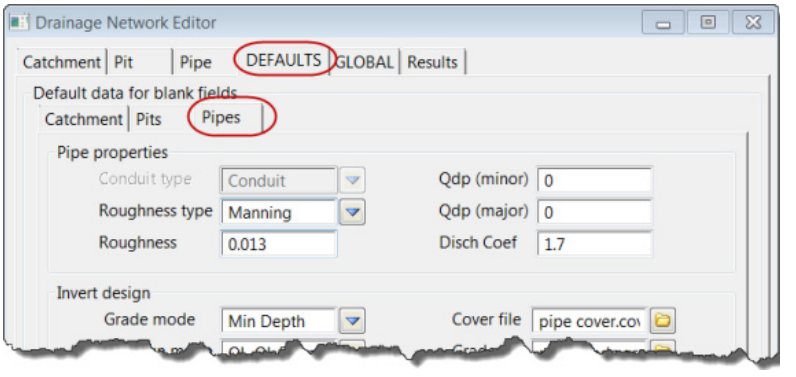
12d Chart Cross References

12d Pit Config	G1	G2	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10
QUDM Ku Chart #	32	32	33	34	35	37	37	38	40	42	44	46
QUDM Kw Chart #	32	32	33	34	36	37	37	39	41	43	45	47
ACTDS Ku Chart #	1	1	2	13	14	10	9	16	18	20	22	7
ACTDS Kw Chart #	1	1	2	13	15	10	9	17	19	21	23	8
ACTDS Pit Type #	1	2	3	11	12	8	7	13	14	15	16	6

Case 3 - Pits with between 0 and 50% Through Flow

With the flow condition between grate flow and through flow, a K value interpolation is performed based on the percentage through flow.

21.6 Pipe Friction Method, Roughness Values and Direct pipe flow

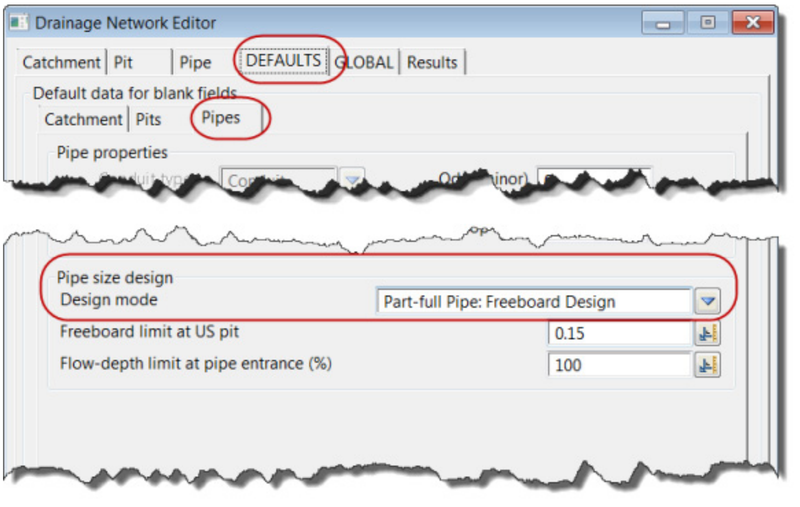


The **default** roughness and pipe roughness method are set here (**Colebrook (mm)** or **Manning**).

Qdp (direct pipe flow is flow) at the upstream end of the pipe that is included in the pipe flow calculations but is not included in the upstream pit losses nor restricted by the pits inlet capacity.

The ranges for pipe peak velocities are used for checking purposes only. If the velocities are outside this range, warning messages will be given in the output window.

21.7 Design mode, Freeboard Limit and Flow-depth limit



The **Design mode** has 4 options.

Pressurised Pipe: Freeboard Design does not use partial depths in the pipes and pipe sizes selected by checking the pit freeboard.

Part-full Pipe: Freeboard Design is similar to option 1 except gradual varied flow and hydraulic jumps are calculated in the pipes. Critical depth is the minimum depth at the upstream end of the pipe.

Part-full Pipe: Flow-depth Design is the similar to option 2 except the pipe sizes are selected by checking the normal depth in the pipe against the **Flow-depth limit**. Freeboard is also checked in this mode and if required the pipe will increase in size.

Open Channel: Freeboard Design is similar to option 2 except depths at the upstream end of the pipe may be less than critical depth for steep pipes (supercritical flow at the entrance).

The **Freeboard limit** is used for all **Design modes**. The freeboard is measured down from the grate level (**Cover RL** plus **Grate offset**).

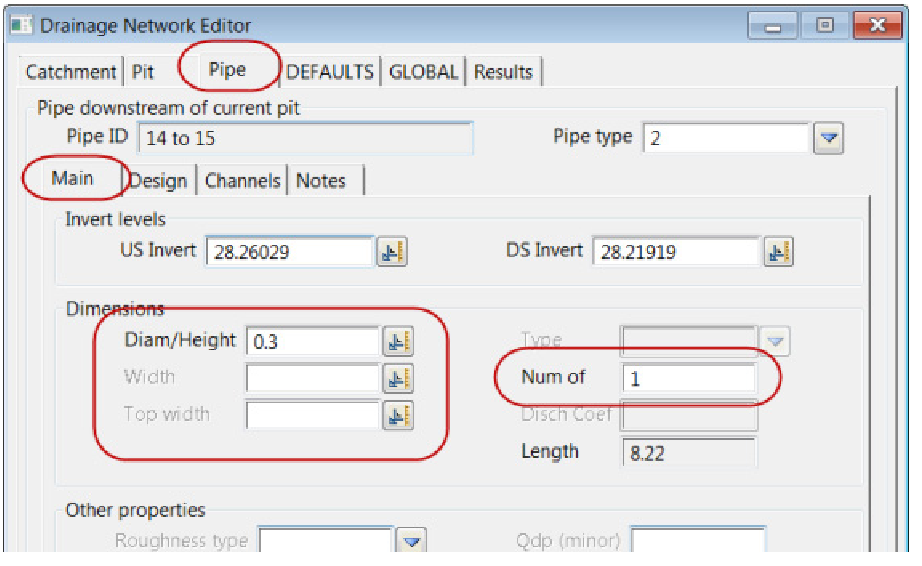
The **Flow-depth limit at pipe entrance (%)** is used in **Design mode** 3. If the flow depth in the pipe is greater than this value the pipe size is increased.

21.8 Pipe Design Parameters - Sizes, Invert alignment, Min Cover, Max Height

The invert levels during design are controlled by the pipe sizes, max pipe height, min pipe cover and invert alignment mode.

21.9 Pipe sizes, Max pipe height and Multiple Pipes and Box Culverts

The 12d design engine will select pipe sizes from the file specified on the **Drainage Network Design** panel, **Preferred pipes file** field list. See selecting pipe sizes. However, the maximum pipe height allowed before multiple pipes are used and the selection of box culverts is set on the **pipe->main** and **pipe >design** tabs respectively.



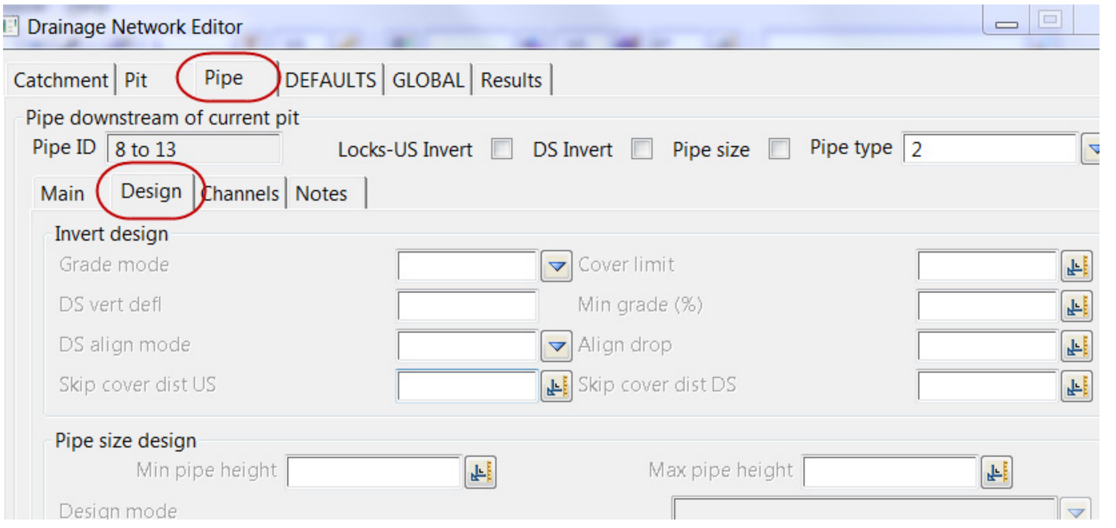
Num of specifies the number of identical pipes. The pipe flow is divided by this value when calculating losses.

To specify a box section in your network, select the pipe and enter a **width** for the pipe.

A **Top width** is used for trapezoidal channels. Note that if the hgl exceeds the top of the channel it will have friction on the soffit just as a box culvert.

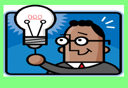
For box culverts, the design engine increases the widths and maintains the height through the available sizes. Once the maximum height has been reached, the next culvert height and minimum width is checked.

21.10 Pipe Size Design



On the **Pipe** tab the **Lock Pipe size** prevents the 12d design engine from resizing the pipe.

Min pipe height can be set for each pipe segment (there is no default for this value).



Specifying a minimum pipe size may speed up 12d design. The starting value for pipe sizing will not be less than this value. That includes all downstream pipes as well. So if you know that the pipe needs to be this size or bigger, enter it here.

Max pipe height can be set for each pipe segment (there is no default for this value). If the 12d design engine requires a larger pipe, then multiple pipes will be selected.

21.11 Calculate Bypass flow routes

This option is required for pit inlet capacity calculations and is covered in the Stormwater Part 2 training.

As an introduction, the bypass strings determine the downstream bypass inlet for each inlet. Inlet capacity is determined from commands in the drainage.4d file. Road grade and crossfall measurements require the inlet to be linked to a setout string and pond depth measurements require a link to catchment string.

22.Drainage Design in 12d Drainage Design

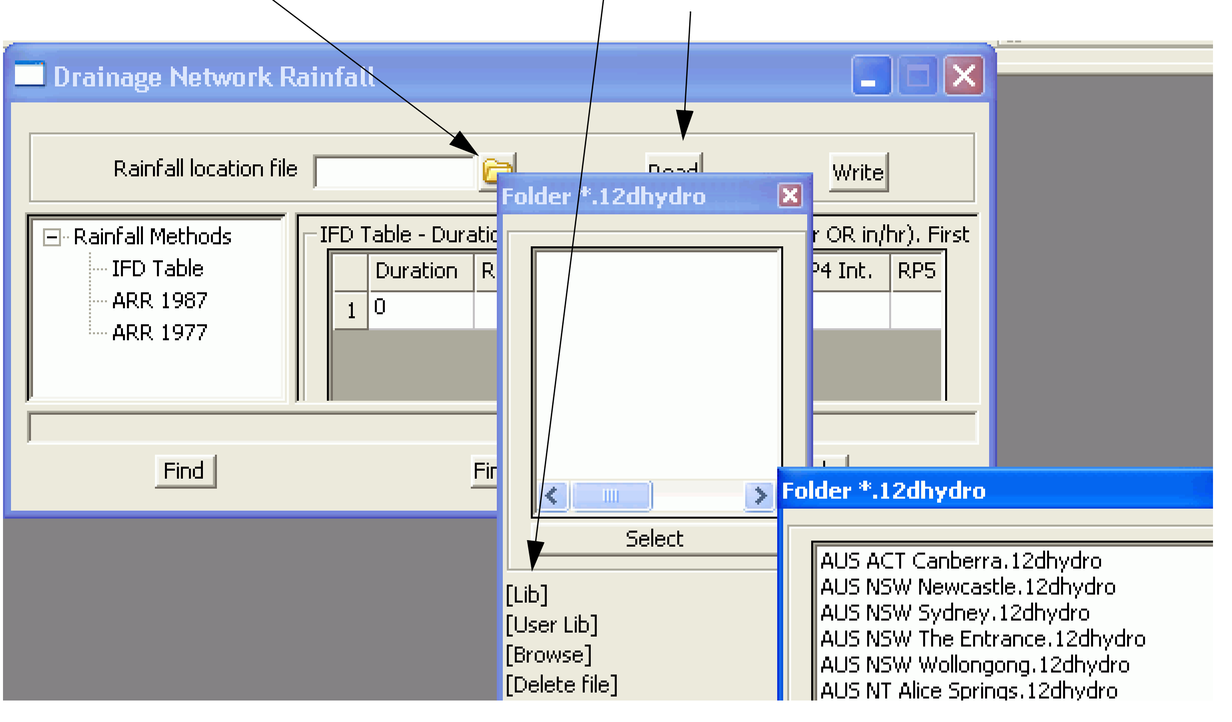
12d has a sophisticated rational method hydrology and hydraulic grade line pipe design engine. In addition it has the capability to export this data to several other popular drainage packages. Regardless of the design method selected, the drainage network in 12d is updated from the design so that drainage plans, long sections and pit schedules can be quickly produced.

22.1 12d Rational Method Hydrology - Drainage Rainfall Editor

The **Drainage Rainfall Editor** is used to input rainfall IFD data using several methods. The data is stored in hydro files (each file is for a specific location) that can be shared between 12d projects. The data is edited using an editor similar to those used for the plot parameter files (ppf). Seven methods for entering/ calculating the rainfall intensities are shown in the panel below. From the main menu select,

Design->Drainage-Sewer->Rainfall EditorData is entered using one (or more if desired) input methods and then saved by entering a **Meteorology file** name and selecting **Write.** The standard 12d system file search paths are used (project folder, user library folder and then library folder).

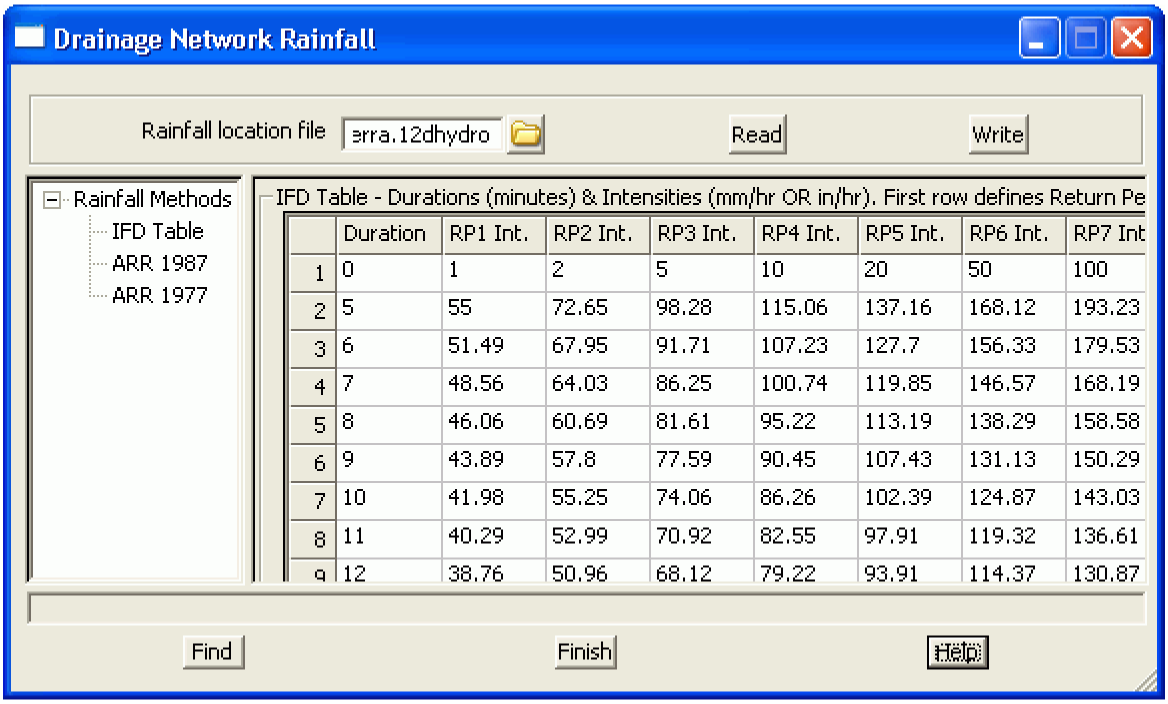
Select the folder icon and then walk right on the **Lib** item to display a list of sample files. Select a file the select **Read. YOU MUST SELECT THE READ BUTTON!**



22.1.1 IFD Tables

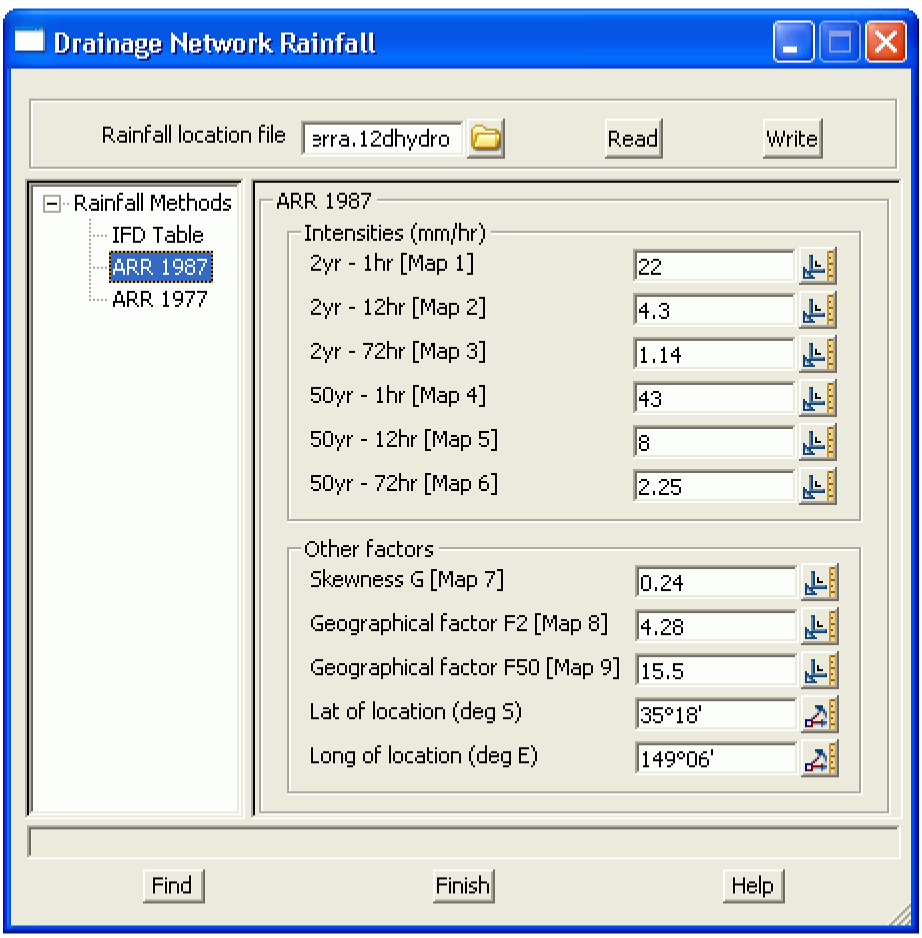
IFD tables are often available from meteorological services. The table input format follows. The first row is used to define up to 9 return periods and the following rows list the rainfall intensities for the duration entered in the first column.

Hint: to increase the size of the grid control select another method, ARR 1987 for example, and then select IFD table again.



22.1.2 Australian Rainfall and Runoff 1987 Method

The rainfall intensities and other factors from Volume 2 of ARR 1987 are entered in this table.



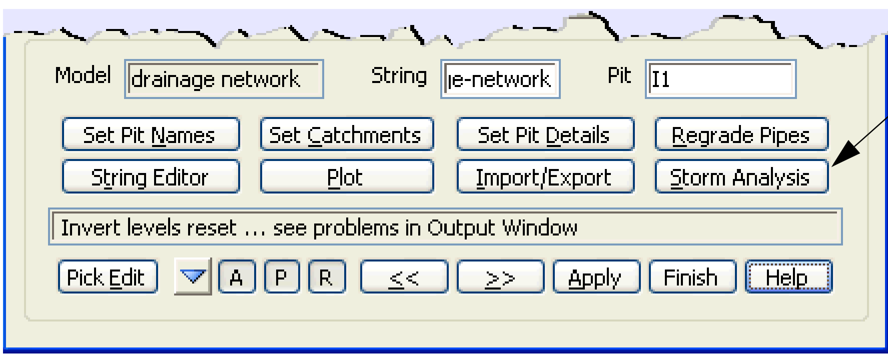
22.1.3 Australian Rainfall and Runoff 1977 Method

The seven coefficients for each return period from ARR 1977 are entered in this table.

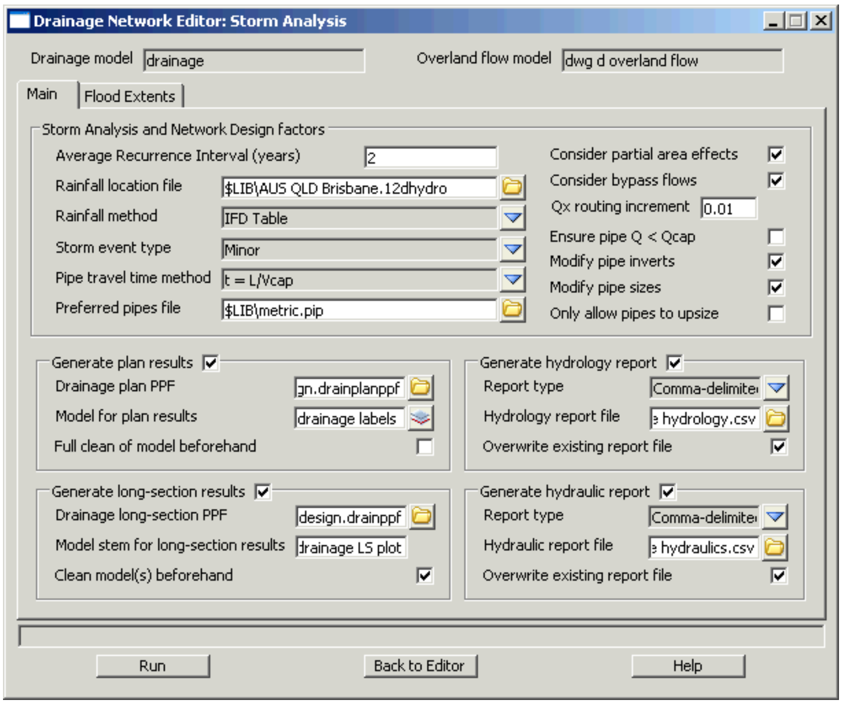
	Return Period	A	B	C	D	E	F	G
1	1	2.8386	-0.653	-0.0475	0.02647	0.00124	-0.002107	0.0002041
2	2	3.0966	-0.6689	-0.0541	0.02994	0.001906	-0.002457	0.000239
3	5	3.3669	-0.7178	-0.0741	0.0451	0.003726	-0.0041352	0.0004227
4	10	3.4971	-0.73	-0.0853	0.04462	0.005528	-0.0039794	0.0003366
5	20	3.6511	-0.7471	-0.0928	0.04868	0.006337	-0.0044	0.0003738
6	50	3.8104	-0.7659	-0.1036	0.05263	0.007596	-0.0048175	0.0003939
7	100	3.9186	-0.7775	-0.1095	0.05478	0.008397	-0.0049816	0.0003921

22.2 Drainage Network Design

The **Storm Analysis** button on the **Network Editor** executes the 12d drainage design, plots the drainage long section and plan annotation and prepares the hydrology and hydraulic design tables.



From the **Drainage Network Editor** select **Storm Analysis.** The following design panel will appear.



Storm Analysis Factors

The valid **ARI** will depend of the method selected but you cannot extrapolate beyond your data. Select the folder icon on the **Rainfall location file** and then walk right on the **Lib** line to select one of the rainfall files in the 12d library. If the file has only one type of rainfall definition then the **Rainfall method** field will be completed. Otherwise select the **Rainfall method** desired.

Storm event type determines which set of design values (**minor or major)** will be used for this run. **Pipe travel time method** should be set to the authorities requirements.

Enable the 12d rational method engine partial area calculations by selecting the **Partial area effects** box.

Network Design Factors

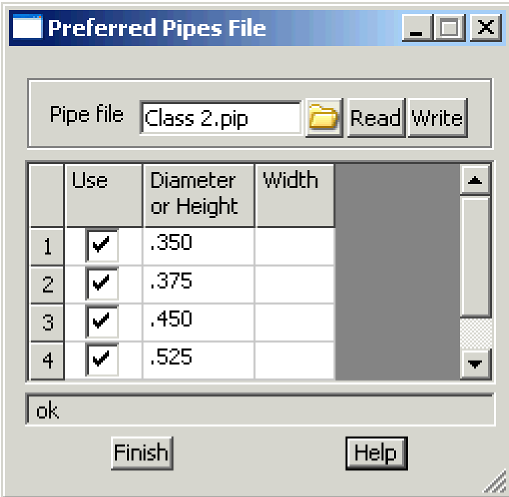
Modify Pipe Sizes

These values control the values to be designed in the run. **Consider bypass flows** causes the engine to use the bypass flow routes and inlet capacity data from the drainage.4d file.

Ensure Pipe Q < Qcap will increase the pipe size if this criteria is violated.

Modify pipe inverts will allow the design engine to shift the inverts if required (usually pipe size changes).

If **Modify pipe sizes** is selected then a files containing the available pipe sizes must be supplied. The pipe sizes in this file are in the **Units** specified in the drainage network editor. To create a new file, enter the file name and then select the folder icon followed by the **Edit** line. The following panel will appear.



The diameters/heights are required and the width is optional to specify a box culvert.

YOU MUST SELECT THE WRITE BUTTON!

The **Upsize only** selection will stop pipes in the system from being reduced in the design. Regardless of this selection, the 12d design engine will not allow a smaller pipe to be selected in the downstream direction.

22.3 Pipe Sizes too Large?

Your hydraulic settings can change you pipe sizes. Check

Grate levels, freeboard, pipe design criteria and read the notes below!

A few comments on why you may have large pipes in your design.

If one pipe is sized large then 12d will not allow a smaller pipe downstream. So when pipes seem large, check the most upstream large pipe. HGL restraints will require you to look downstream of the large pipe.

Check List

1. High roughness values, accidentally setting roughness to Manning with a 0.6 roughness value (Colebrook)!
2. Grate levels not set correctly. Freeboard is measured from these levels.
3. Pipe min pipe cover set very close to freeboard.
4. Selecting **Ensure Q<Qcap** in the storm analysis dialogue. This is required by some authorities but can cause larger pipes in flat areas.
5. NOT selecting **Modify pipe sizes** in the storm analysis dialogue. 12d will not change the pipe size.
6. Selecting **Only allow pipes to upsize** in the storm analysis dialogue. 12d will not check if a smaller pipe will do.

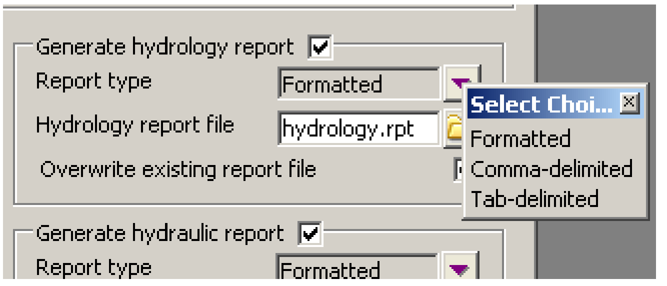
Generate Results in Plan

This selection automatically runs the drainage plot annotation function. A **Drainage plan ppf** must be entered and samples are supplied in the 12d library. A **Model for plan results** is required if this option is selected. The **Full clean model before hand** tick box forces the model to be cleaned before the labels are created. When not selected a “Smart clean” is performed.

Generate Results in Long Section

This selection automatically runs the drainage long section plotter. A **Drainage long section ppf** is required and examples are found in the 12d library. A **Model stem for long section results** is required if this option is selected. In almost all cases the **Clean model before hand** tick box should be selected.

Generate hydrology report

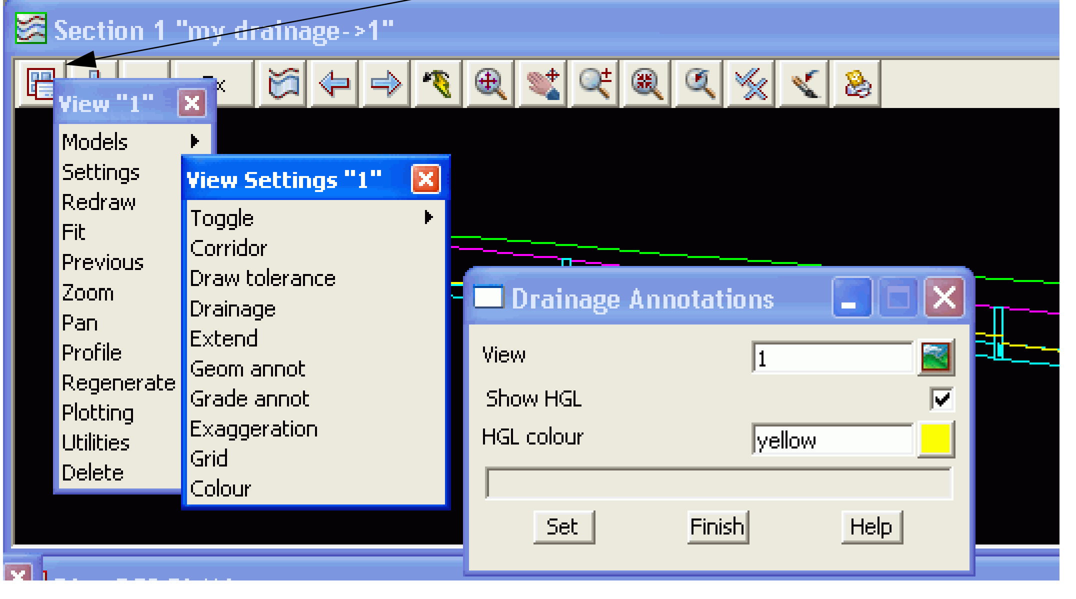


The **hydrology report** may be formatted for inserting into a 12d model/ text editor (formatted) or spreadsheet (comma or tab delimited). In almost all cases **Overwrite existing report file** will be selected.

22.4 The Run Button and HGL data on the Section View

When the **Run** button is selected the discharges are calculated, the HGL check is performed and the pipes sizes and inverts are designed (if selected). The plan and long section drawings will also be updated with the new data (if selected).

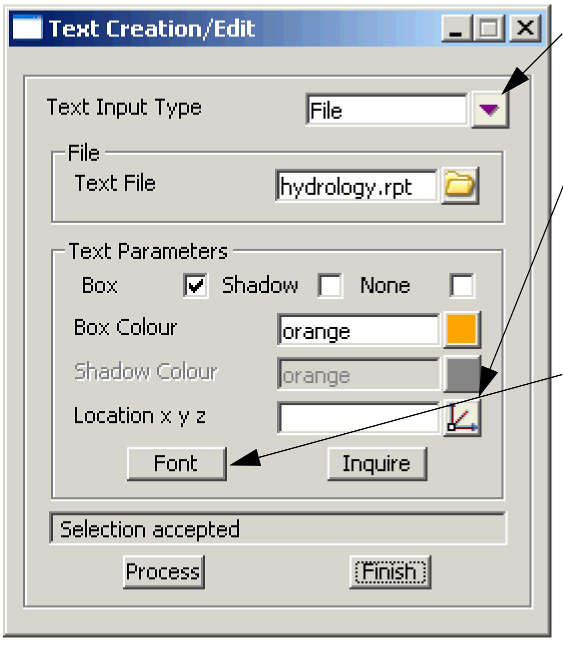
The HGL values will also be available on the 12d section views when profiling the drainage strings. The colour of the HGL line may be changed via the view's menu button then **Settings->Drainage**.



22.5 Importing Text into a 12d model

Formatted text may be inserted into a 12d model by selecting

Drafting->Text and Tables->Create edit paragraph text



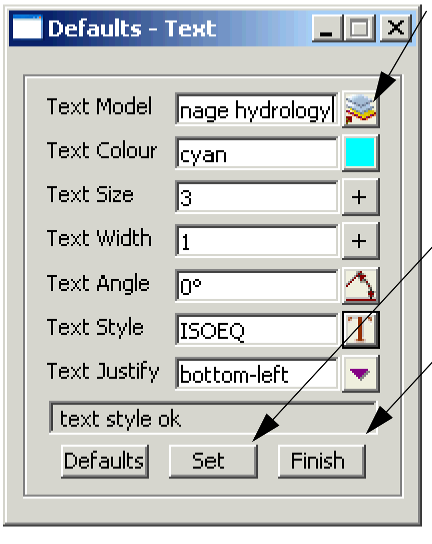
Change to **File.**

Select the folder icon and then pick the formatted text file. It will be displayed then select **Set**.

Next select the location in plan for the text.

The font selected must be a fixed space font or the data will not align properly.

Select the **Font** to display the following panel.



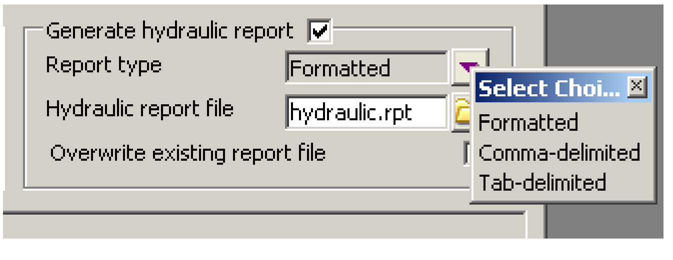
Enter a **Text Model** for the report.

The **Text Style** must be a fixed space font.

Select **Set** then **Finish.**

Now add the **Text Model** onto the

Generate hydraulic report



The **hydraulic report** may be formatted for inserting into a 12d model/text editor (formatted) or spreadsheet (comma or tab delimited). In almost all cases **Overwrite existing report file** will be selected.

If you want both the hydrology and hydraulic report in the same file, enter the same file name in both file fields but turn of the **Overwrite existing report file** for the hydraulic report.

22.5.1 Design Results

Results from the design runs are shown in several forms:

1. Hydrology and hydraulic reports
2. Drainage plan annotations
3. Drainage long sections
4. Hydraulic Grade line on the Section view
5. Output window data - Service/utility clashes

Samples of the hydrology and hydraulics report are shown below.

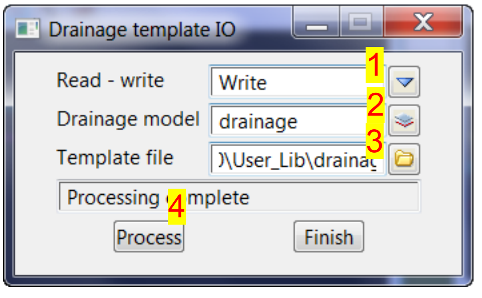
23.Create a Drainage Model Template (Saving Defaults and Globals)

A drainage model template contains your favourite global and default settings for the DNE. These settings are stored as model attributes and the template may be read before or after the drainage strings have been created. Caution: existing default and global setting may be overridden.

You can create you own templates as well. Now that you have completed a drainage job and all of your global and default settings are set, create a template to save in your user library.

From the main menu select

Design =>Drainage-Sewer =>Create->Create/Read template



1. Change to **Write**.
2. Select **drainage** for you existing network
3. LB the folder icon, then user_lib, type a name for the template the select **Open**
4. LB **Process** to create the drainage model template for your next project.

24.Drainage Data Input and Output to Spreadsheets

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

Drainage strings will be created if they do not exist in the model but pits cannot be added to existing strings.

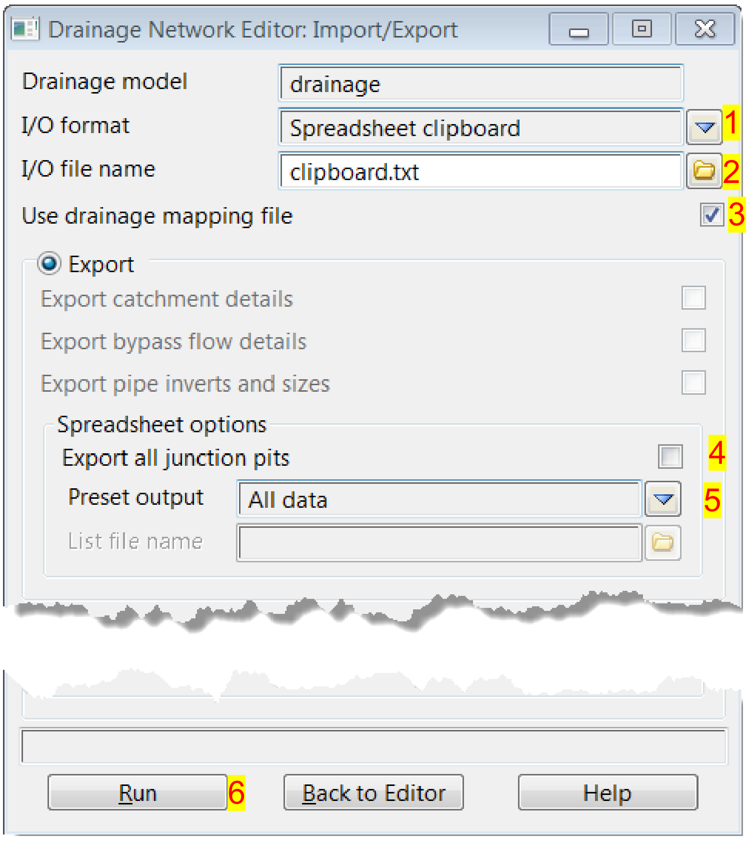
12d to spreadsheet transfers

Spreadsheet to 12d update and create

Spreadsheet options

24.1 12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.



1. Select Spreadsheet clipboard
2. leave as **clipboard.txt** to send the data to the windows clipboard as well as this file.
3. Mapping files are the most current 12d technology. Leave this selected.

   These options are not used for spreadsheet export.
4. Usually leave this off! Select to export the junction pit at the end of all drainage lines (very rarely needed).
5. You may also select to limit the output if desired. If you like using spreadsheets for data entry, the PCdrain data and ILSAX data formats are useful for adding data for the first time for either program.
6. Select Run to place the data on the clipboard.

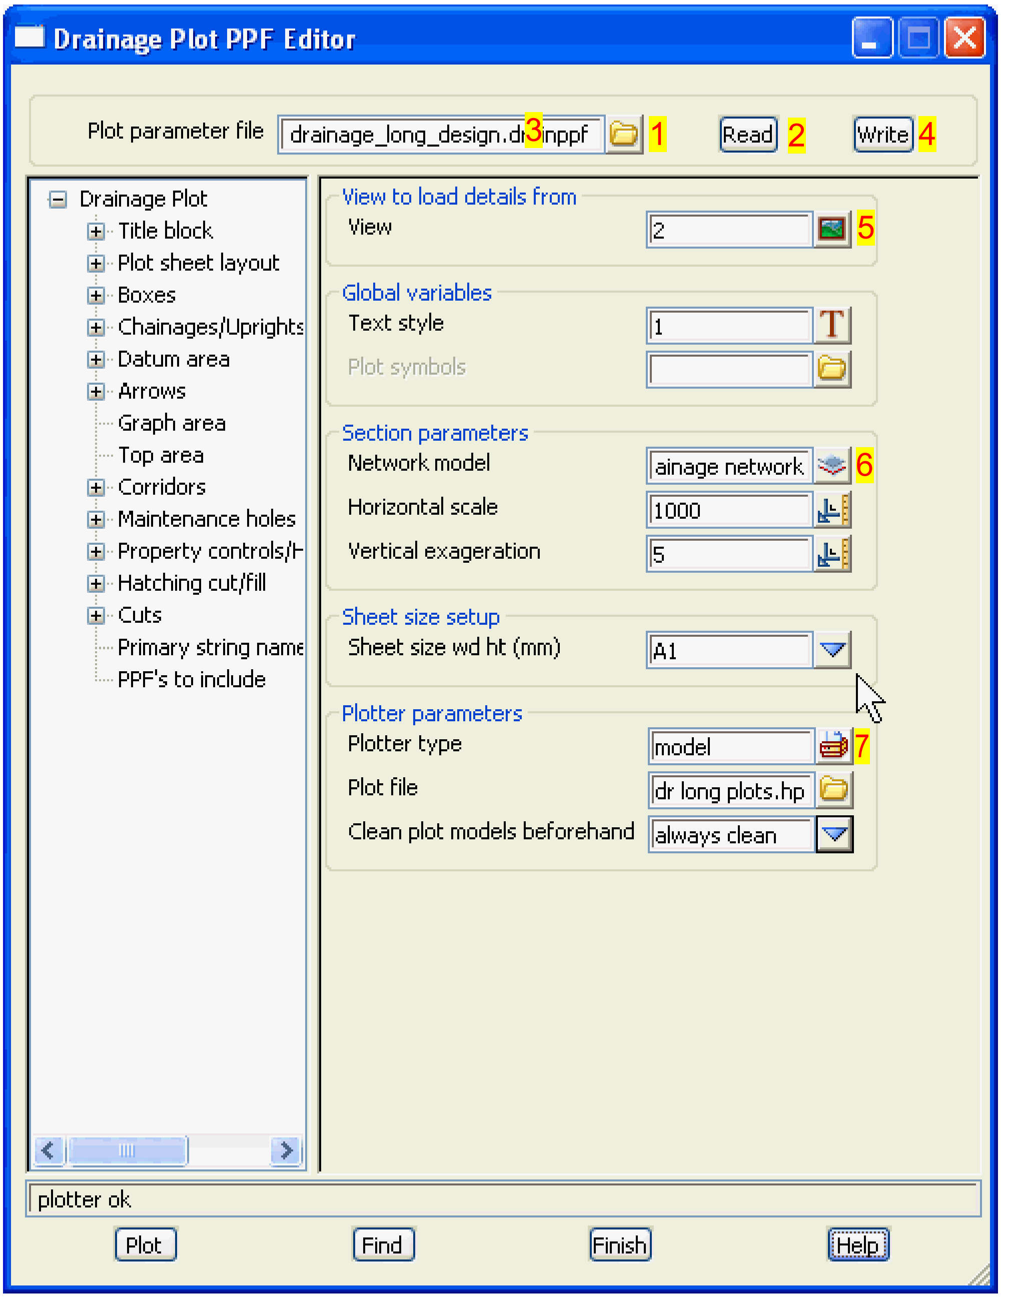
25.Long Section Plotting

Detailed description of the 12d drainage long section plotting may be found in the 12d Reference manual. The long section plots are customised using the drainage plot parameter files (drainppf). Title blocks, user defined text may be added and then plotted directly or to various file formats (dwg, dgn etc.). From the main menu

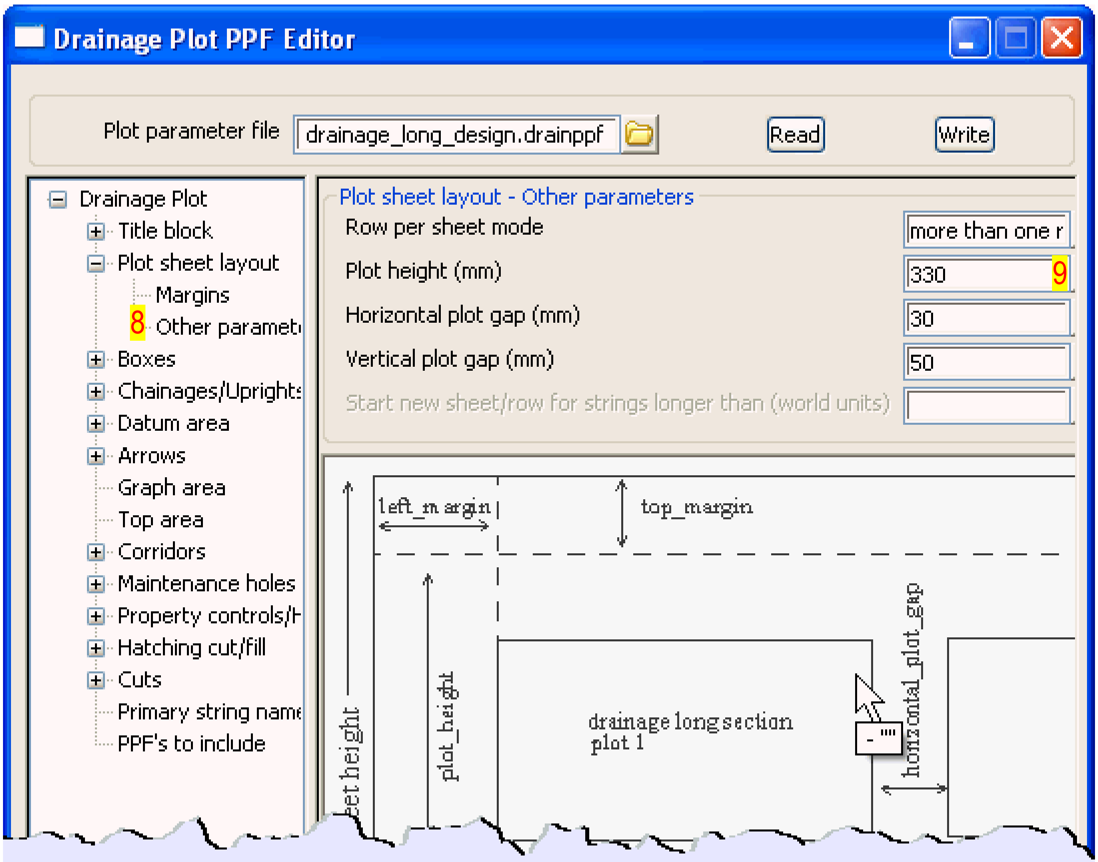
Design=>Drainage-Sewer=>Plots=>Longsections

See Also

Set Pit Details to set road chainage and name data

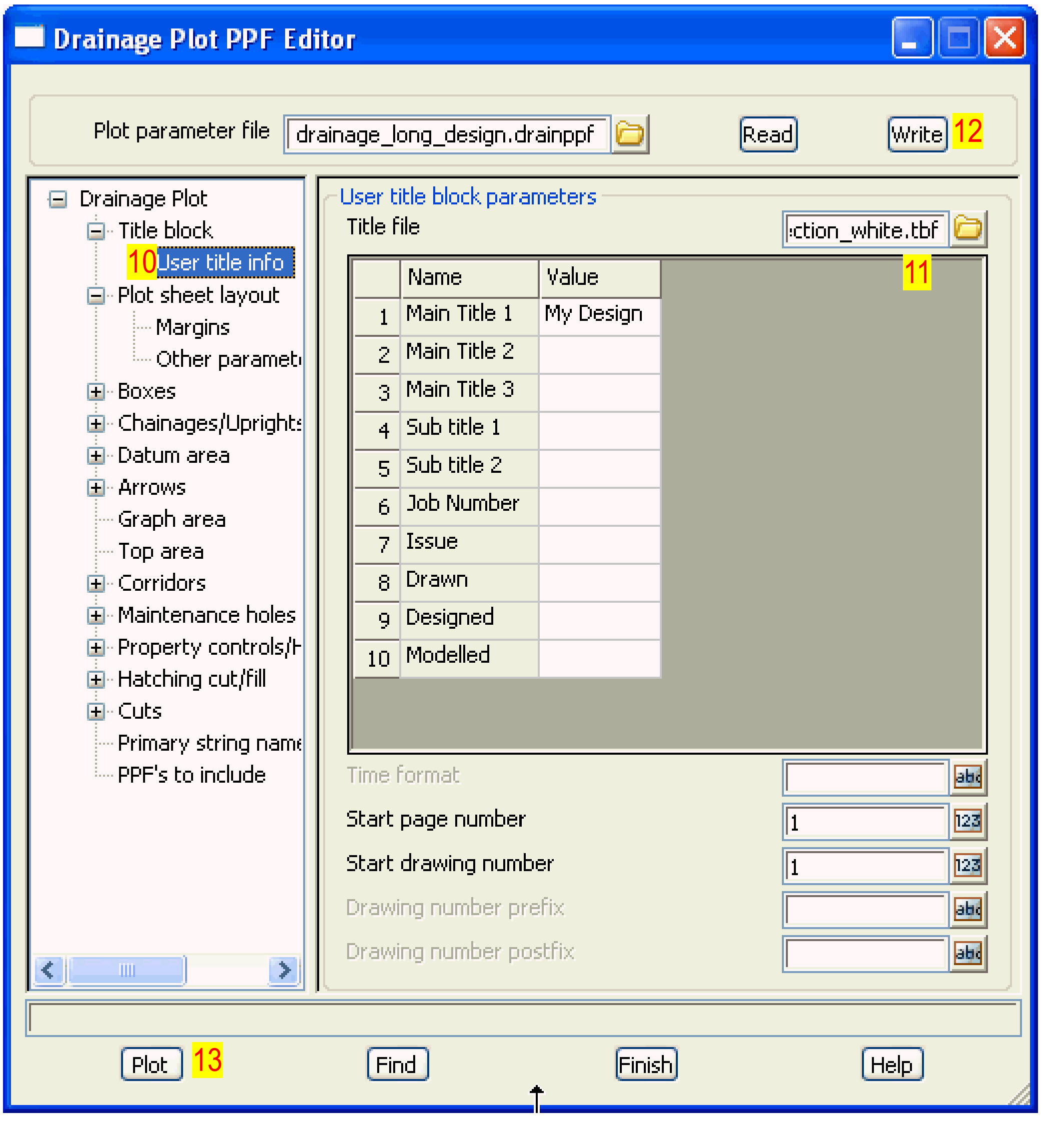


1. To access the drainppf files supplied select the icon and then walk right on **Lib** to select this drainppf file.
2. Select **Read**
3. Enter a new name for this drawing
4. select **Write**. This will save the setting we are about to make should you want to replot this long section.
5. This section view determines the additional models (such as services) to show plot. These are referred to as corridor models. The vertical exaggeration is also obtained from this view.
6. The **network model** field will be completed with the model of the string being profiled. If this is not your drainage network model then select it now.
7. When **Plotter Type** is set to model then **plot file stem** is the model name prefix for plots that will be created. The first sheet of plots will be in model **plot1**, the second in **plot2** etc.



8. Select + on the **Plot sheet layout branch** and then select **Other parameters.**
9. The **plot height** determines how much room is left vertically for the actual plot. This specifies the total height of the plot. 12d then constructs the box area and arrow area on the bottom and then arrow area on the top. The amount left over is used for the long section itself.

   To stop datum breaks from occurring increase this height, increase your plot scale or decrease your vertical exaggeration. If there is too much white space in the graph area then reduce this value.



10. The **+Drainage plot+title block+User title info** allow you to enter the text for the title block.

11. The list displayed is retrieve from the **title file** selected above. Enter the data for the plot

12. Select **Write** to save the changed to the local drainppf file you entered earlier.

13. Select **Plot** and the plots will be send to the **plot file stem** entered. These models may be added (one at a time) to a plan view to inspect them before plotting to paper or exporting to other drawing packages.

26.More Information

This section provides detailed description of items introduced previously in the training notes.

26.1 Linking to Strings in General

Many pit properties may be calculated from strings linked to the pit. The following rules apply to all strings linked via the DNE.

1. The selection of strings is limited to the models specified on the DNE->Utility Model tab.
2. When no link exists for the pit, the closest string matching the selection criteria will be chosen. If a link exists, then no new string will be searched for. Even if the search criteria changes or a closer string is created. The link must be deleted before new links are searched for.
3. The link will not be broken unless
   another string is manually selected
   the link is manually Cleared with the RB on the manual string select
   the string is deleted (manually or when a recalc is done on template applies),
   the model links are reset on the DNE->Utility Model tab,
   the model is removed from the DNE->Utility Model tab.
4. Once link is broken the calculated values will be kept unchanged, with the exception of bypass pits.

26.2 Catchment string links

Each catchment set has its own model of catchment strings and the sets are linked independently.

If the area (in ha) is present in the area field, no new string link be searched for.

Vertex number 1 on the catchment string determines which pit the string will link to. If vertex 1 of several catchment strings are closest to the same pit. Only the closest string will link and the remaining will not be used for any other pit.

After the catchment string link is created, the vertices are re arranged so that the vertex closest to the pit becomes vertex.

26.3 Road string links

Road strings have a name and maximum search distance criteria and there is no limit to how many pits link to a single road string. The closest string matching the string name criteria (in the road string file) and within the search distance will be selected. Note that once the string link is established, changing the criteria will NOT break the link.

26.4 Bypass string links

Pits marked with an Inlet type of Manhole on the DNE->Pit->Main tab ignore the bypass strings. Bypass strings must pass within 1 manhole diameter to be linked..

27.Training Check List

Network plan	- convert from strings
	- insert, append, delete and move pits
Network Vertical	- Set Pit Details and Regrade pipes
	- Pipe alignment modes
Set Pit Names	
Catchments	- draw, label, link and check
	- tc strings
Hydrology	- Area, Tc, C values with defaults
Hydraulics	- setout to grate
	- method (pipe full or HGL)
	- available pipe sizes and box culverts
Services	- over and under drainage pipes
Road strings	- rotate symbols
	- x,y and/or z for setout
	- road grade and crossfall for inlet capacity
	- road chainage from centre line
12d design engine	understanding the reports
Setout pit schedules	- easting, northing and road centre line
Drawings	Long Section plotting
	Plan drawings
Kerb Strings	- select by name
	- crests and sags

THE END

1.0

1.0 Stormwater Design Part 2- Introduction

The **Stormwater Design Course Part 1** and this manual, the **Stormwater Design Part ,** describe the functions and processes of the 12d drainage module. In these documents, the generic term **pit** refers manholes inlets, catch basin and manholes.

The **Stormwater Design Course - Part 1 Notes** contain**:**

- create a super tin for pipe cover and pit cover levels,
- set Defaults and layout a drainage network from CAD and in 12d,
- use the 12d Drainage Network Editor to assign names to the pit/pipes, avoid service clashes, grade pipes, align obverts, minimise depth and many other design tools,
- designate catchment areas and produce catchment plans,
- run the 12d storm rational hydrology and hydraulics engine,
- transfer data to and from electronic spreadsheets to enable the user to easily review the data and add user defined data to the 12d pipe network. This data may include such data as pipe bedding types and trench width,
- create a drainage template containing customised default design parameters,
- create pit setout schedules to export to spreadsheets or word processors for final formatting,
- produce long section drainage profiles including HGL data, flows, invert levels and service crossings,
- create plan drawings with pipe sizes, flows, pit symbols, linestyles for pipe sizes, design parameters for pit and pipes and user defined data,
- locate pits/manholes at exact chainage and offset locations.

This manual, the **Stormwater Design Course - Part 2,** is intended to describe the additional features of 12d Model drainage and discuss the customisation of the package. This will include

- customising the drainage.4d file Drainage Definitions - Manholes and Pipes,
- 12d storm analysis with inlet capacity calculations and bypass flow,
- flooded width analysis and flooding at SAG pits,
- drainage trench excavation volume calculations,
- pipe and pit quantity calculations/reports,
- open channel calculations,
- adjusting pit locations for changes in horiz road geometry
- analysing the major flood events,
- creating drainage symbols with grates and upstream side inlets,
- detailed drainage plan labelling and long sections with hatching under roads.
-

2.0 Starting with a Basic Drainage Network

In this document, the generic term **pit** refers to manholes, inlets, catch basin and manholes. When the term **manhole** is used on the 12d menu system it refers to any type of pit. Pit types, dimensions and inlet capacities of the pits are set in the Drainage.4d setup file/database.

These course notes assume that you have completed the Stormwater Design Course and that you have experience creating 12d Model drainage networks with catchments areas. You may continue this project or begin with a completed drainage design found in the folder

\12d\10.00\Courses\Drainage_Analysis

The project name is Local Road Complete.

3.0 Setup Files and Their Locations

The drainage.4d setup/database file contains the pit and pipe types (RCP, Class 2 etc.). The drainage.4d setup/database file can also control many of the settings in the drainage network editor (DNE). Changing the pit/pipe type in the DNE will result in your favourite settings being applied thus minimising user input errors.

The pit types may optionally include:

- DNE field controls, including internal pit dimensions (diameter or length and width)
- pit wall thicknesses that vary with depth,
- pit connection points (locations where the pipes joint the pit),
- inlet capacities for sag and on grade inlet pits.
- detailed pit type descriptions to be inserted into your pit schedules
- user defined attributes.

The pipe types may optionally include:

- DNE field controls, including internal nominal and actual pipe sizes with wall thickness,
- user defined attributes.

For PCdrain and Drains users there are routines to read your gully pit/database files and create the Drainage.4d setup file/database.

The Drainage.4d setup file/database may be customised for any additional inlet capacity data you may have.**REVIEW THIS DATA CAREFULLY!**

4.0 Bypass Flow

Bypass flow strings are used to trigger the bypass calculations in the network editor and are used as a centre line for flooded width calculations.

The 12d storm analysis, and many of the design programs 12d exports to, allow for bypass flow. Bypass flow involves the calculation of pit inlet capacity for on-grade or sag inlets. These capacities are based on the pit type and may use either ponding depths (sag inlets) or on the road grade and/or crossfall upstream of the inlet (on grade inlets).

4.1 Key Points

1. Draw an bypass flow string in the direction of flow so that it passes within 1 pit diameter of an inlet. At sag locations the string should show the direction of flow during bypass conditions. When bypass flow strings join they must join within 1 pit diameter of an inlet (pits with **inlet config** set to **Manhole** are not considered inlets). If flooded with calculations are to calculated the string should located in the flow channel.
   Enter the model name in the **Bypass flow model** field on the **Global->Utility Models** tab.

   Note: if there is no bypass flow string within 1 pit diameter then 100% of the approach flow will enter into the pit.
2. Many bypass strings may join at an inlet but only one bypass string should leave each inlet.
3. Set the pit type. (**Pit Type** on the **Pit** tab). With a bypass string within 1 pit diameter of the pit centre, no water will enter the pit unless the pit type has inlet capacity data defined in the Drainage.4d setup file/database.
4. Set the **Inlet config** on the **Pit->Main** tab (Manhole, On-grade or Sag pit). This selection will be disabled if cap_config parameter sets the inlet type in the Drainage.4d setup file/database. Manholes have no inlet capacity and are not considered inlets, on-grade inlets capture the water as it passes the inlet while SAG inlets trap the water flowing in from all directions (until the pond depth overflows at the low point of the catchment string).
5. On grade pits may require road grade and/or crossfall data for inlet capacity. They may be entered manually or calculated using the road strings. A setout string link is required to measure road grade. If road crossfall measurement is needed then the centre string is also required. These strings are specified using the Road design file on the **Global->Utility Models** tab (see Stormwater Part 1 manual).
6. Sag inlets require a pond depth either manually entered or calculated by 12d. Pond depth calculations require a link to a catchment string to locate the overflow point and correct grate level (Grate rl mode).
7. Press the **Set Pit Details** button. Road grades, crossfalls, pond depths and bypass pits will now be found on the **Pit->Bypass** tab of the **Network Editor**. Measurement markers are created in the **construction drainage data** model.
8. Bypass pits may be cleared using **Clear Bypass Links** on the **Globals->Utility Models** tab
9. **Storm Analysis** must have **Consider Bypass Flows** selected on the **Main** tab.
10. **Calculate overland flood extents** is optional on the **Flood Extents** tab of **Storm Analysis**.

4.2 Creating Overland Flow Strings using Downhill Strings

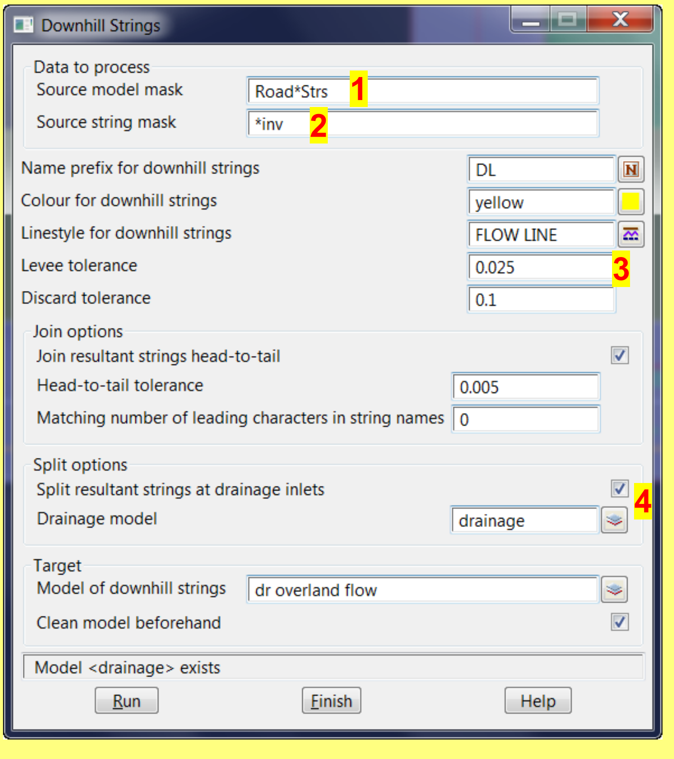
The bypass flow string must be within 1. pit diameter of the drainage pit in be considered on the bypass flow path. If the bypass flow string is to be used for flooded width calculations in the future, the string must also be drawn in the main flow area of the cross section. At sag locations the bypass flow strings indicate the direction the water flows when it overtops the overflow point. This string usually goes uphill to this overflow point.

The downhill string function quickly creates bypass flow strings from road design strings. The remaining tasks will be the bypass flow at intersections and areas off the roadways.

This routine copies strings to a single model using a string name mask to select the strings from a collection of models (using a model name mask). These strings will have their name, line style and colour changed. The line style is usually FLOW LINE so that you may see the direction of the string (downhill). The strings are split at crests (identified using a levee tolerance). They may also optionally be split at drainage string inlet location to allow easy modification using the drainage utility string editor.

From the main menu select

Design->Drainage-Sewer->Downhill strings



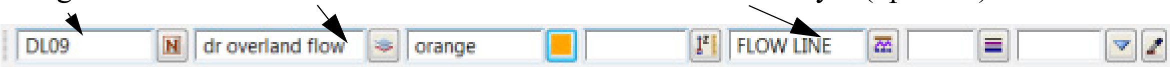
1. type **Road*Strs** (it is case sensitive). These are the models that contain all of the road strings. **Road 1 Strs** for example.
2. type ***inv**. The road string models have a **linv** and **rinv** string for the invert of the kerb and gutters.
3. If the crest height on one side is less than this amount it will not be split.
4. Tick the box and select the **drainage** model. This will help with the drainage utility editor later.
5. type **dr overland flow** to create a model for the new strings
6. Select **Run**
7. add the model **dr overland flow** onto the **roads** view.

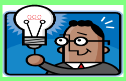
4.3 Creating Overland Flow Strings at Intersection and Sag Locations

Use the **CAD toolbar** to create the overland/bypass flow paths the flow crosses the road.

To use the **CAD toolbar** go to the **CAD data bar** and enter a string name and model name.

Select the line style (optional).

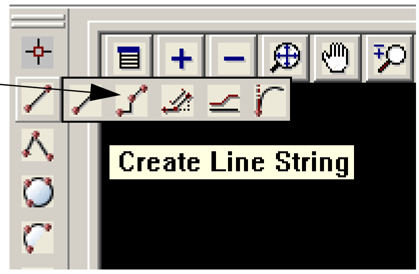


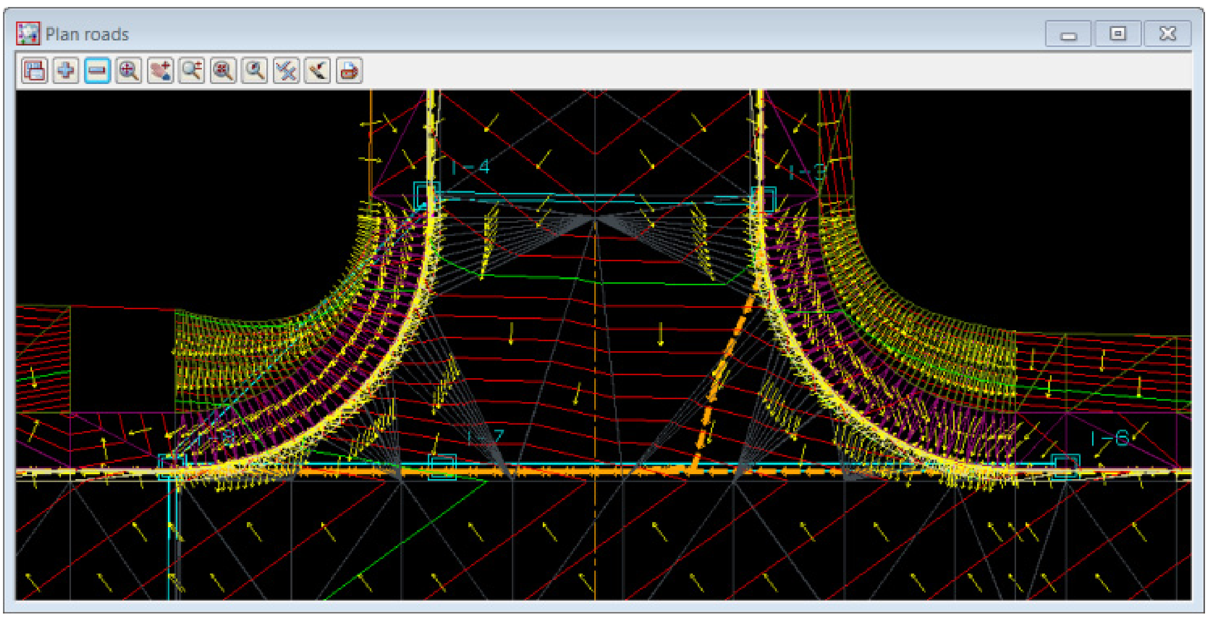


Use the CAD bar eye dropper on the right (same as) and select an existing overland/bypass string. The properties of the selected string will fill the CAD bar fields.

DRAG the **Create line** button and release at the **Create Line String** button.

When finished drawing the string press **ESC.**



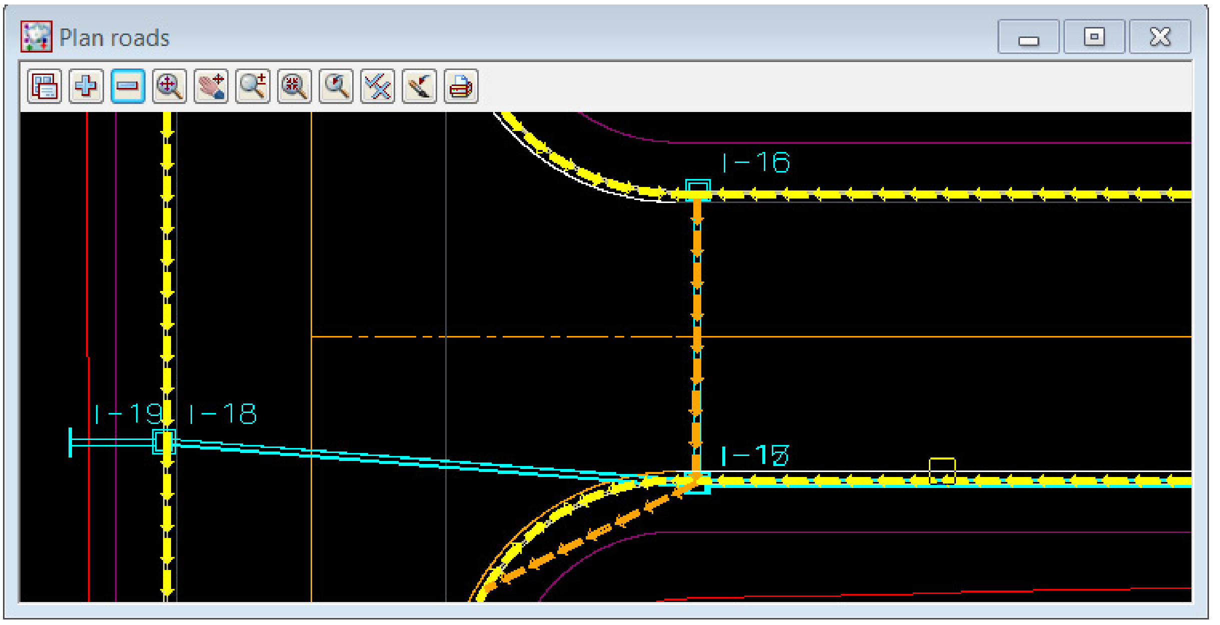


Starting at the upstream end. LB select an insertion point and MB or press return to accept the selection (the line style is shown after the point is accepted).

Do not stop drawing until you reach another sag or ongrade inlet (not a manhole). Overland flow lines often overlap as you see in the drawing above. If you stop short of the inlet, the bypass pit for the upstream inlet will be LOST.

Continue drawing until you reach the end of the flow path. Press **ESC** to finish drawing the string.

Frequently you will draw an overland flow path uphill and away from a sag inlet. It will usually go through the low point on the catchment crest and then downhill to the next inlet. No do this where road 2 intersects road 1 (see below).

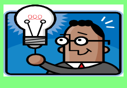


4.4 Creating Overland Flow Strings for Culverts

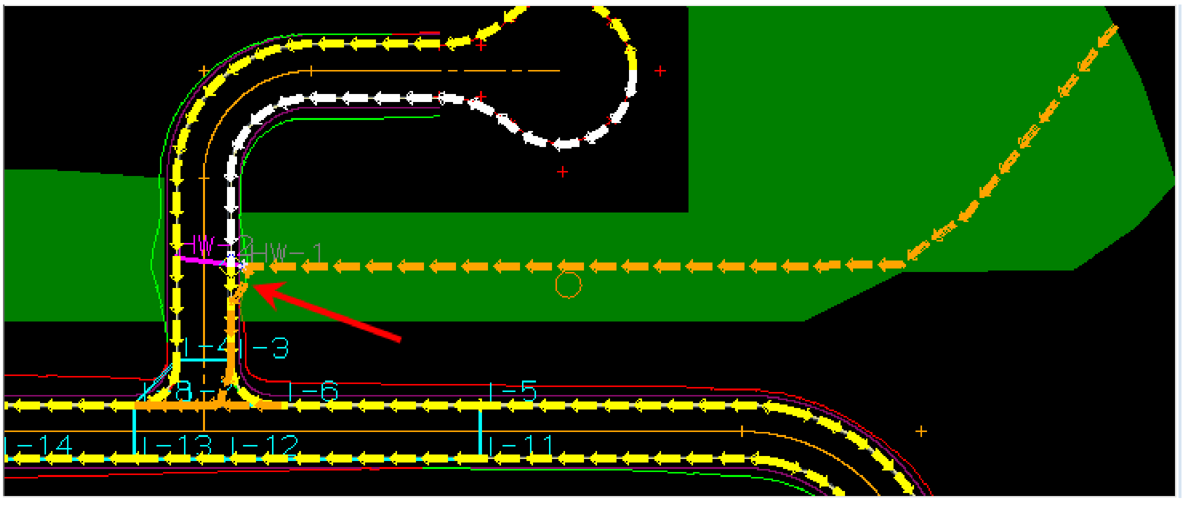
Culverts placed at sag location in the road will generally how the overflow across the crown of the the road and the upstream headwall grate level will be set the sag low point elevation of the road crown. For headwalls, there usually is not grate so this becomes the reference elevation for bypass.

The culvert in our example is not at a sag in the roadways so the water will overflow the southern side of the channel, cross the footpath, and flow down the roadway. We need to set the grate level to the bypass level along this path.

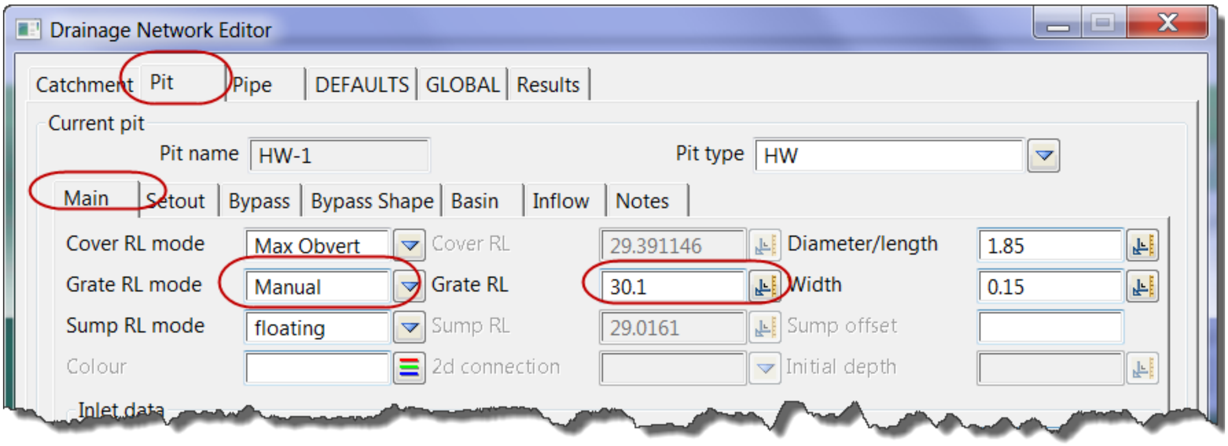
To draw the string, start at the top of the catchment so that the ***flooded width calculations*** in the approach channel will use the correct flows. Finish at I-3!



You could use the **CAD string->Copy** option to copy the tc string that was drawn in the model **dr Catch Reserve tc** and then **CAD vertex->Append** to add onto the downstream end of the new string and then **CAD vertex->Move** to adjust where need.



There is a low point where the south side of the channel joins the road (see red arrow). This overflow area will need to have erosion protection and detailed grading. Lets assume that the overflow area is regraded with a crest RL30.1. The grate level needs to be set to this value.



4.5 Set Inlet type to Sag or On grade

12d supports Manhole, on-grade and SAG configurations. The **inlet configuration** is set on the **Pit->Main**. This setting can be locked to the **Pit type** in the Drainage.4d setup file/database using the cap_config command. The remaining bypass data is found on the **Pit->Bypass** tab.

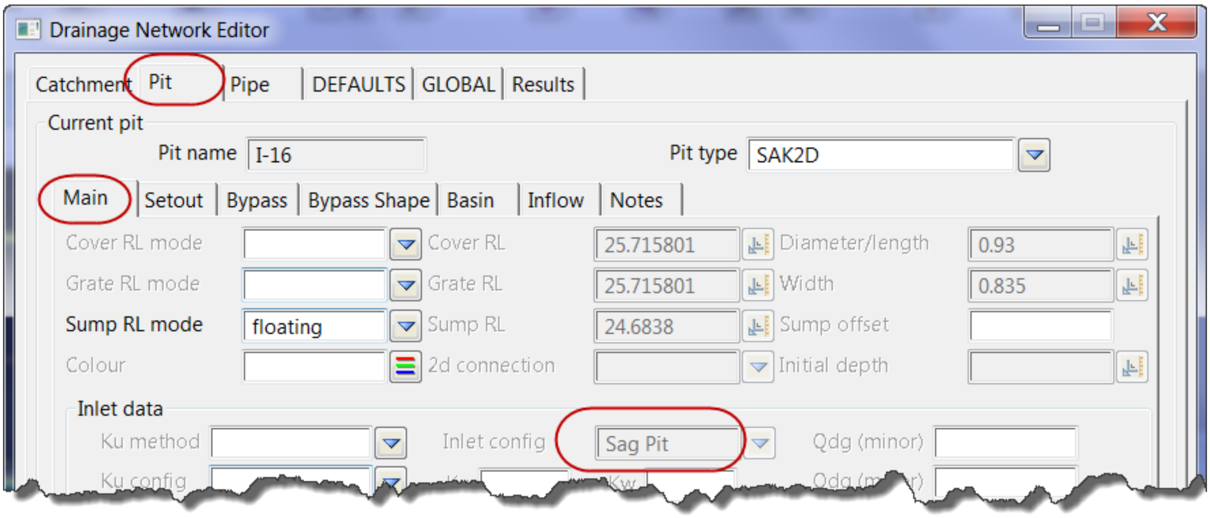
Pits **Inlet config** setting:

- **Manholes** will not receive bypass flow and cannot have catchments assigned to them.
- **On-grade** pits are pits where the water will flow past the pit if not captured (velocity and momentum are important for these inlets). Approach flow, road grade and road crossfall generally determine the inlet capacity equations/curves.
- **Sag pits** are located at sag locations where the water will pond around the pit if there is not enough inlet capacity (generally the water will stop at these locations and flow into the inlet). There is only one inlet capacity curve/equation per inlet and the ponding depth is used to determine the inlet capacity.

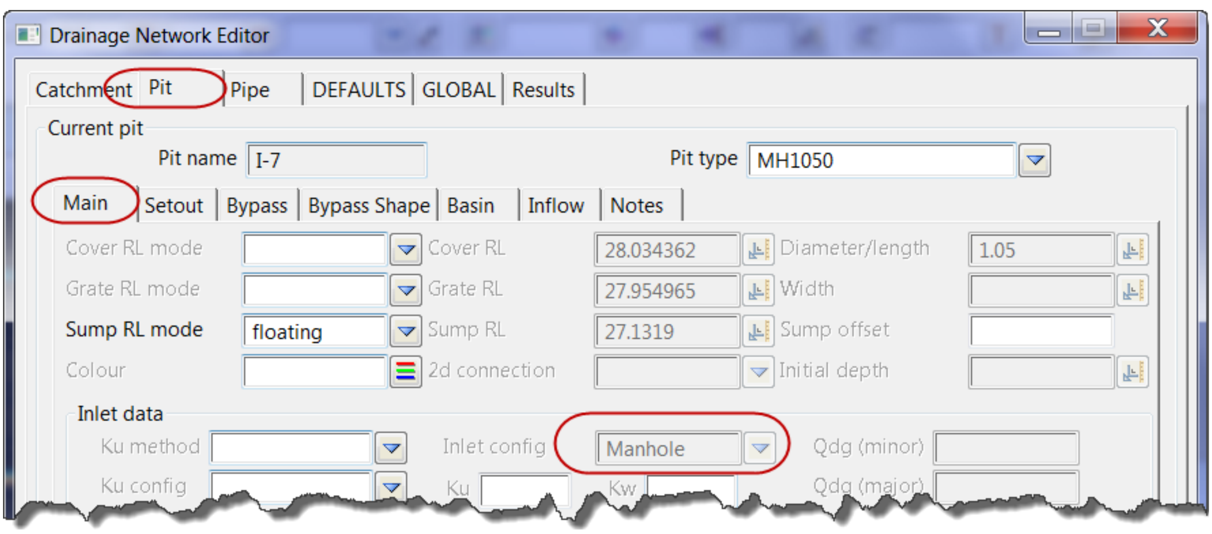
To view the inlet capacity curves used in this project, try Viewing Inlet Capacity Curves.

In this example the pit types have been set to an on grade grated, side entry inlet. We will now change the pit types for the manhole and the sag inlets.

Not all sag locations on a roadway behave hydraulically like a sag inlet. In general the flow should approach the inlet and not bypass over it. Sometimes the inlet acts as a sag inlet at low flows but like an on grade at design flows.



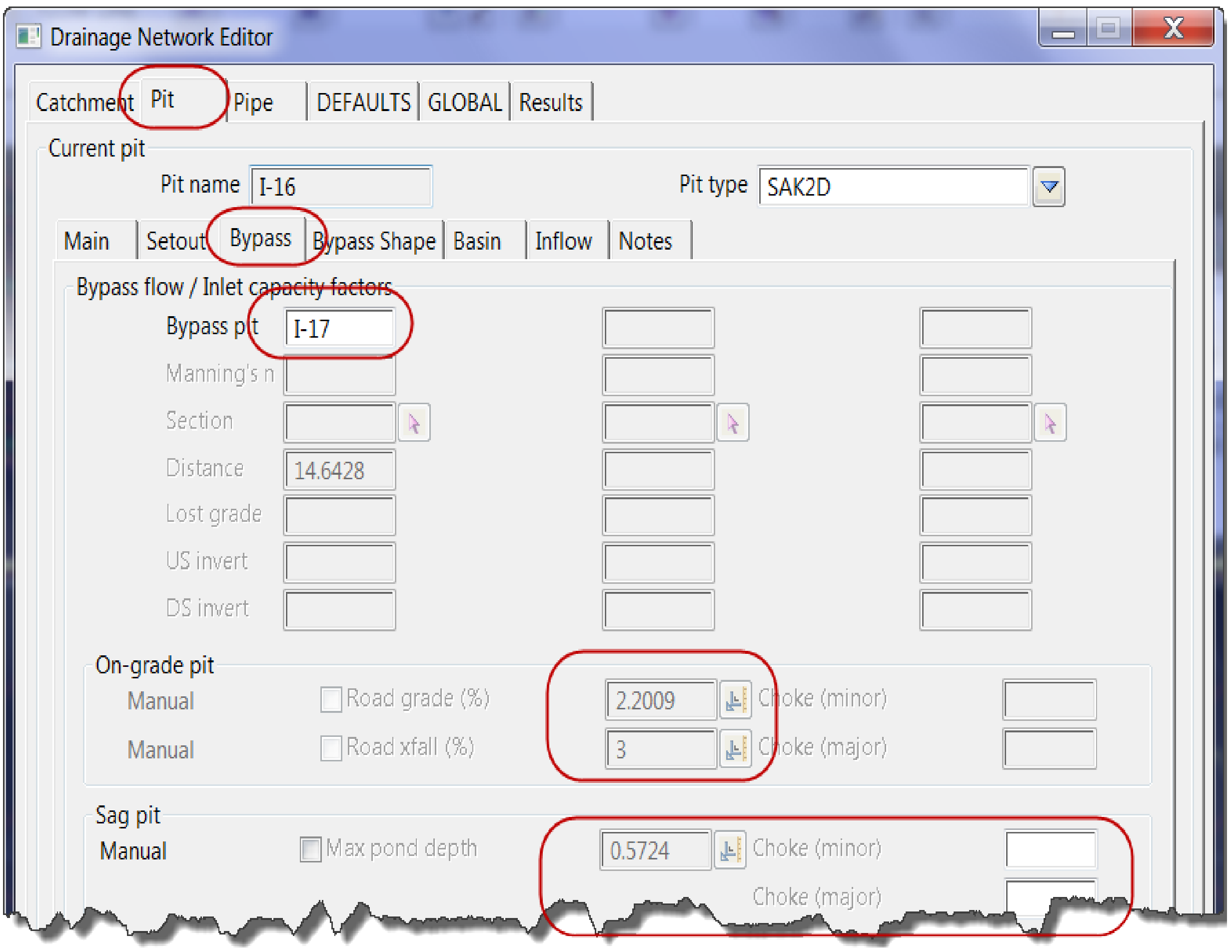
1. Movew to inlet marked I-16 above and select **SAK2D** for the pit type (you may be asked to confirm the changes from the drainge.4d file).
2. Note the **Inlet config** has been changed to **Sag pit** and it cannot be changed. This has been set in the drainage.4d file.



1. Select **MH1050** for the Wipit type (you may be asked to confirm the changes from the drainge.4d file).
2. Note the **Inlet config** has been changed to **Manhole**, the **Diameter/length** to 1.05 and the **Width** has been cleared. These changes are set in the drainage.4d file.

4.6 Set Pit Details - Calculate the Bypass Flow Data

Once the first Key Points of bypass flow are complete, you are ready to calculate the bypass flow data. Select **Set Pit Details** and then select a pit on a bypass flow string. The bypass data is found on the **Pit Main** and **Pit->Bypass** tabs.



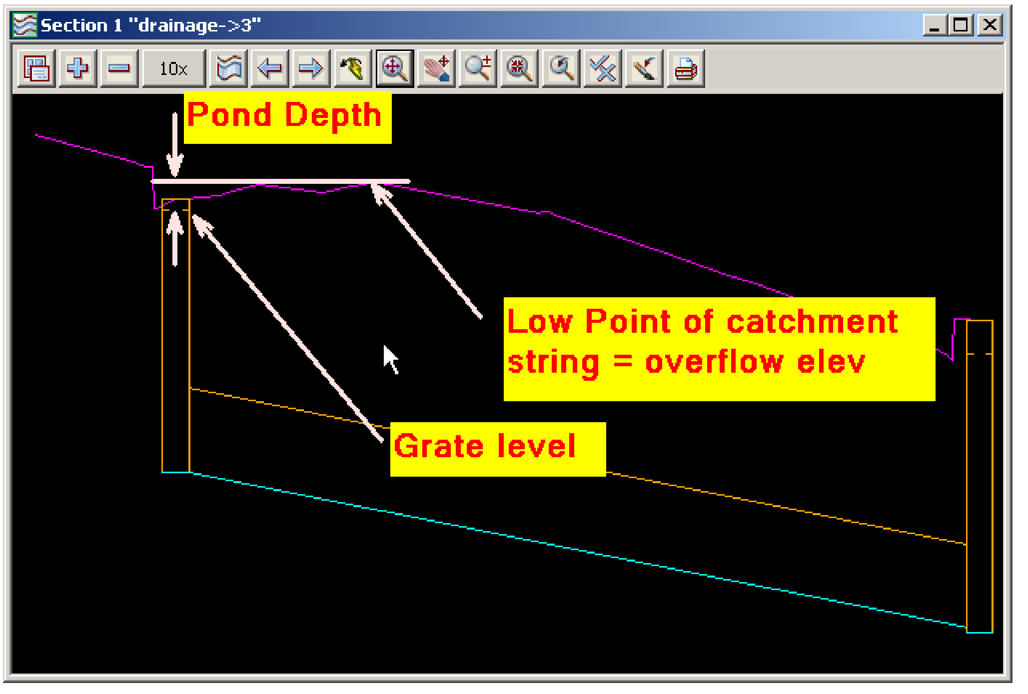
The downstream pit will now show in the **Bypass pit** field. If the bypass string does not go to another inlet (the network outlet is never an inlet) then the **Bypass pit** will be marked as **LOST**.

Always confirm bypass pits set to **LOST** are correct. An incorrect bypass to LOST would mean water is leaving your system when it should be included in the calculations.

If a setout string was found (see **Pit->Setout** tab), the **Road grade** will appear in grey. You may override this value by selecting the **Manual** tick box beside the value and entering your own value. If a road centre string was selected, the **Road xfall** field will also have a value.

If **Sag pit** was selected and a catchment string was selected, the **Max pond depth** will be displayed. The catchment strings from all 3 sets are draped onto the finish surface tin and the low point located. The **Max pond depth** is calculated as

Max pond depth = catchment string low point - Grate RL.



Negative Pond Depths

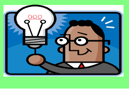
Negative pond depths are usually caused by one of two errors in input. The first may be that the grate level is too high. Often this happens when the Grate RL mode on the **Pit->Main** tab has not be set correctly or if **Sz + setout string** option is used the **Sz** value on the **Pit->Setout** tab has been entered correctly.

The second common error is that the catchment string has not been drawn around the crest of the catchment. The lowest section of the catchment string must be drawn carefully because it is the lowest point on the string that determines the overflow elevation. If in doubt, profile the catchment string with the design tin shown in the section view. Double check were the low point is.

4.7 Checking locations for measuring road grade, crossfall and max ponding depth

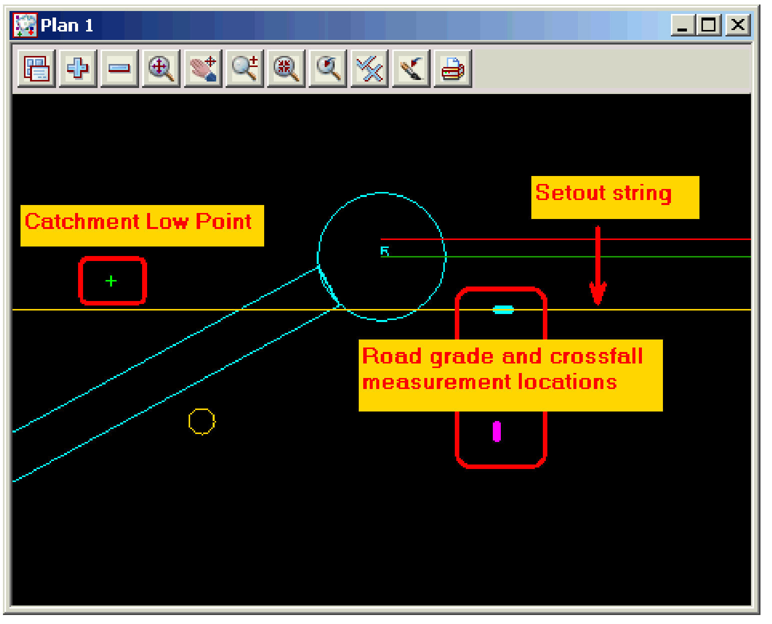
Strings indicating the location of inlet capacity parameters are generating in the **construction drainage data** model when **Set Pit Details** is selected.

The location of the low point, from all 3 catchment set polygons, is shown as a green vertex (plus sign).



Trouble finding the small green +? Select **Models->String info table** and select the sag marker line in the table. A large cross hair will show you the location in plan views.

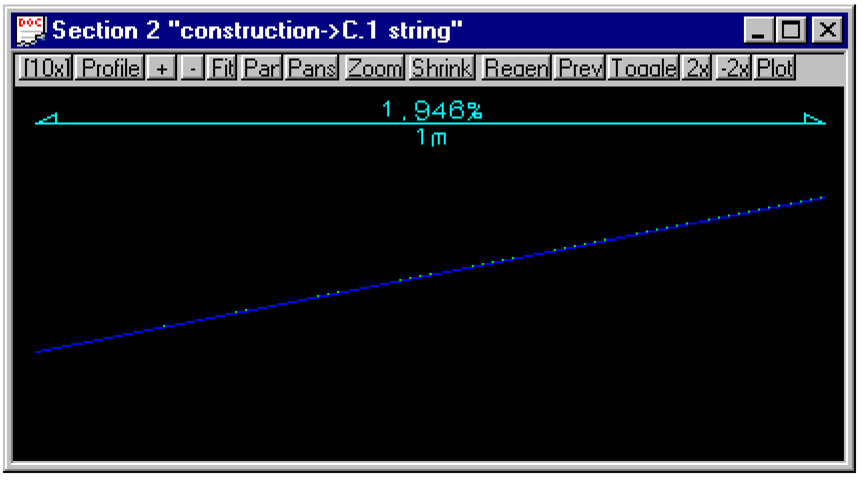
Verification strings in the same model confirm the locations where the road grade and crossfall have been measured. To check these strings add the **construction drainage data** model to the plan view. The following image shows a close up of the verification strings at a pit.



The green line indicates where road grade was measured and the magenta line indicates where the road cross fall was measured.

The default location of the road grade measurement is one pit diameter upstream of the setout point, along the setout string. The road crossfall is measure one pit diameter away from the setout point towards the road centreline. These are 3d super strings and therefore you may profile them in the section view. With the grades toggled on (check under **Toggle**) you can verify the slopes.

The location of the road grade and crossfall measurements can be changed in the **road design file**. The distance upstream to measure the road grade is controlled by the **Grade offset** column one the rows where the setout strings are defined. The road crossfall is controlled by the **Xfall offset** column on the rows where the road centre lines are defined. The distance the measurements are taken is controlled by the **Slope measurement distance**.



No flow into the pipe?

Pits with a bypass pit entered but no inlet capacity defined in the drainge.4d file will have a zero inlet capacity.

With Inlet config set to Manhole, the pit has no inlet capacity.

Important Notes

1. If no bypass flow string is supplied for a pit, the inlet capacity is set to 100%.
2. If you have a problem with the inlet capacity calculations, check the **Storm Analysis** hydrology report for details.

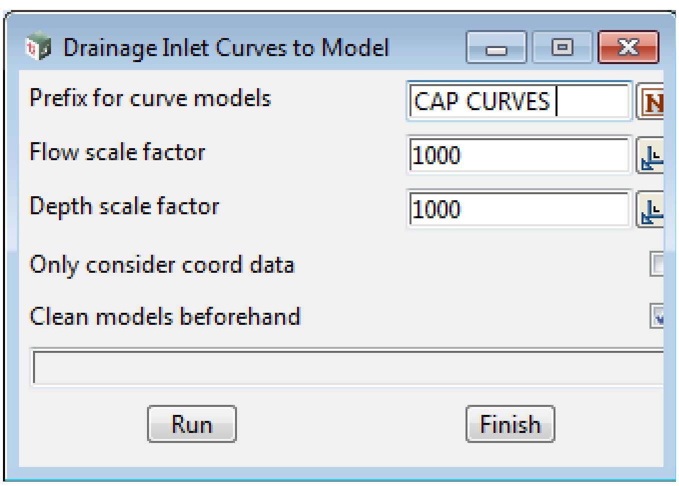
4.8 Viewing Inlet Capacity Curves

The inlet capacity information is stored in the drainage.4d file. We will now plot the inlet capacity curves in 12d. This will confirm what is in the drianage.4d but changing these plots will not change the inlet capacity calculations.

Put a **z** before **CAP CURVES** in the panel below. This will generally put these files at the end of your model list so they are not in the way when you are working.

From the main menu select

Design->Drainage-Sewer->More->Write inlet curves to model



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prefix for curves models	model box	CAP CURVES	

All inlet curves for a manhole type will be placed in a model named with this prefix and the manhole type.

Flow scale factor	input	1000	

Inlet and bypass flow values will be multiplied by this value before creating the strings.

Depth scale factor input 1000

Depth values for sag curves will be multiplied by this value before creating the strings.

Only consider coord data tick box off

Inlet capacity curves may be expressed as formulas, curve coordinate or both. Selecting this box stops curves with only formulas from being plotted as strings.

Clean models before hand tick box on

The curve models are cleaned before the new strings are created

Run button

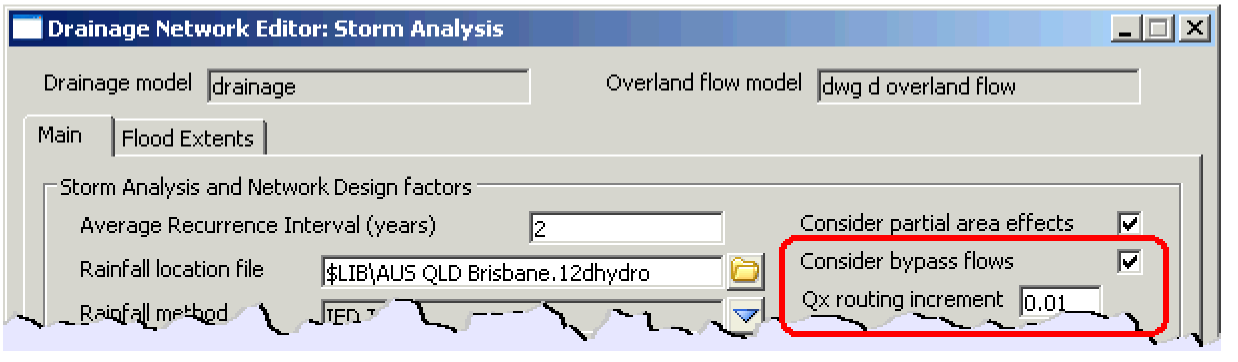
Models and strings are created from the drainage.4d file

Finish button

remove the panel from the screen

5.0 12d Storm Analysis Bypass and Flooded Width Calculations

Once the bypass pits are selected and the Drainage.4d setup file/database has been setup for bypass flow the storm analysis engine must have this feature enabled. Select **Consider bypass flow**.



Excess Flow

The **Qx** value controls how excess flow is handled in the bypass flow calculations. If the hgl at the pit reaches the grate level then no more water can enter the pit even if there is inlet capacity. The flow that will not enter the pit is considered excess flow. When a value greater than zero is entered here, the inlet will initially have its inlet capacity restricted by this value. Upstream inlets are done first as this may reduce the hgl in the downstream system. The system is automatically rerun adjusting the flows by this amount each time.

If the inlet capacity is reduced to zero and the hgl is still above the pit then water is removed from the pit and considered as Qs (surcharge flow). In the hydraulic reports this value is found as a negative **Inlet Flow Qi**.

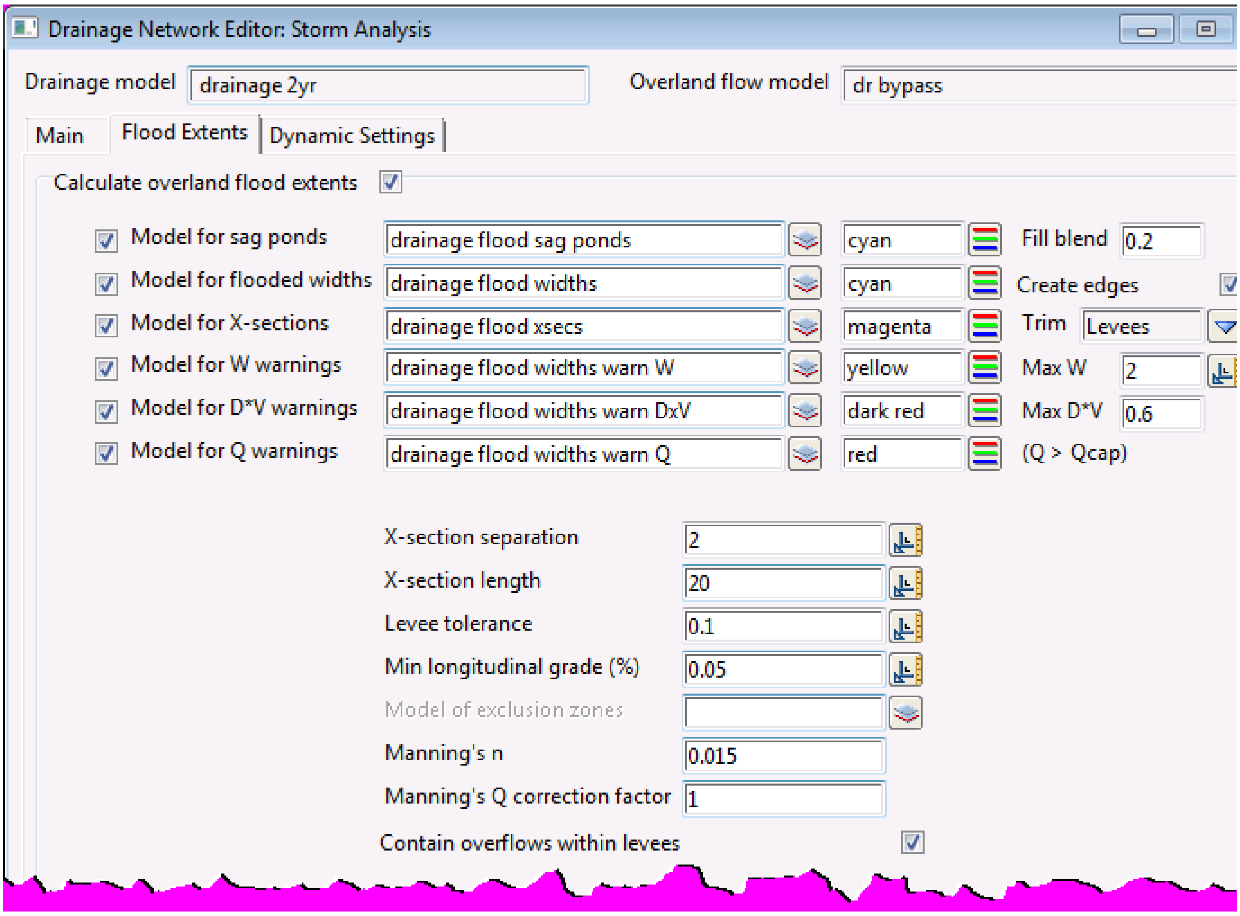
Overland Flow Calculations

The storm analysis engine will calculated flooded widths from normal depths along the flow path and ponding extents at SAG inlets. A bypass flow model (**Global-Utility Models** tab) is required for these calculations.

The **Utility String Editor** should be used where bypass flow strings combine at a pit. Without using this editor it is assumed that 100% of the catchment flow flows down each bypass flow string thereby overestimating the flooded widths.

The **Utility String Editor** could be used to change the Manning's along the string (approach channels to culvert for example) or the maximum flooded width warning limit (before a pedestrian crossing or a highway off-ramp).

The models and the default input data for these calculations are entered on the **Flood Extents** tab.

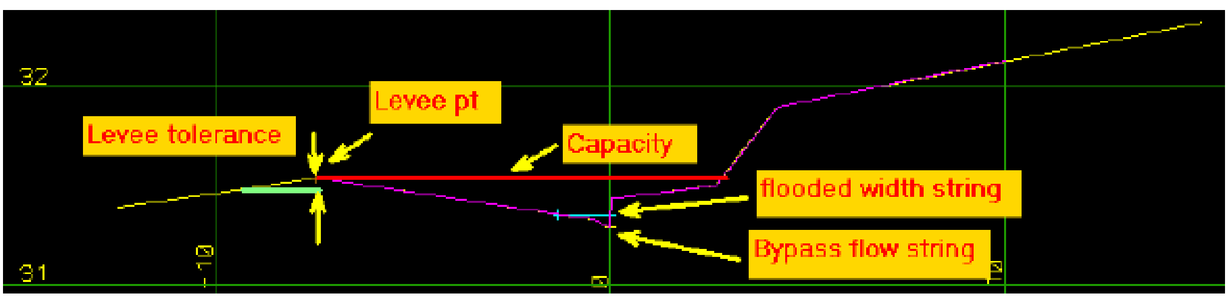


Select **Calculate overland flooded extents** to active the fields on the panel.

Model for sag ponds is used to hold strings that indicate the extent of flooding at the pits marked as SAG inlets. The total approach flow is used with the cap_curve_sag in the Drainage.4d setup file/database to determine the depth of flooding above the grate level. A closed contour at this flood elevation is then selected near the centre of the inlet. A super string is then created at this level with the colour and **fill blend** transparency selected (1.0 is solid).

Model for flooded width holds the strings indicating the normal depth - flooded width calculation results. These strings are created with a fixed elevation of the flood level. The strings will have string attributes with all of the calculations details.

Calculations



1. Cross sections are cut perpendicular to the overland flow string at the interval **X-section sepa-**

ration with a length of **X-section length**. No calculations are done for sect of the bypass flow string with in **Model of exclusion zones** polygon.

2. The x-section string is then trimmed using the **Trim** settings.The section above had a x-section length of 20 and was trimmed at the levee. The **levees** setting has the routine search for levee (high points) on either side of the low point near the bypass flow string. The levee points are found if sections drops more than the **Levee tolerance** value after the high point is found.
3. The flow for the section is calculated using the bypass flow string chainage to interpolate between the upstream bypass flow and the downstream approach flow. The percentage of catchment flow used in the calculation of the approach flow for this bypass string may be changed using the **Utility String Editor.**
4. The slope of the surface near the bypass flow line is measured for each section. If the slope is less than **Min longitudinal grade (%)** then this cross section is skipped in the calculations.
5. **Manning n** value is the default roughness used in the calculations. This value may be changed at any vertex along the bypass flow string using the **Utility String Editor**.
6. The flow's calculated at the indicated level are multiplied by the **Manning's Q correction factor**. A factor of 0.8 would cause the flooded widths to increase and the road capacity to decrease.
7. The maximum depth calculated will be at the point where water overflows the edges of the section (**Road capacity)** unless **Contain overflow within levees** is selected. This will cause frictionless vertical walls to be placed at the ends of the section so that higher water level may be calculated when the flow is greater that the road capacity.

Warning Models

Model for W warnings will contain copies of the flooded width strings with the colour selected if the flooded width is greater than the default **Max W** value.

Model for D*V warnings will contain copies of the flooded width strings with the colour selected if the depth * velocity is greater than the **Max D*V** value.

Model for Q warnings will contain copies of the flooded width strings with the colour selected if the flow is greater than the capacity of the section. The capacity is the flow where the water over tops one of the sides of the section.

6.0 Utility String Editor

Position of option on menu: **Design =>Drainage-Sewer =>Utility String Editor**

This editor is used to edit properties of the strings used by the DNE. Properties always change at an existing vertex.

Cross Section Strings (Manning's n) - set the left and right bank n values. the centre n value is assigned by the DNE.

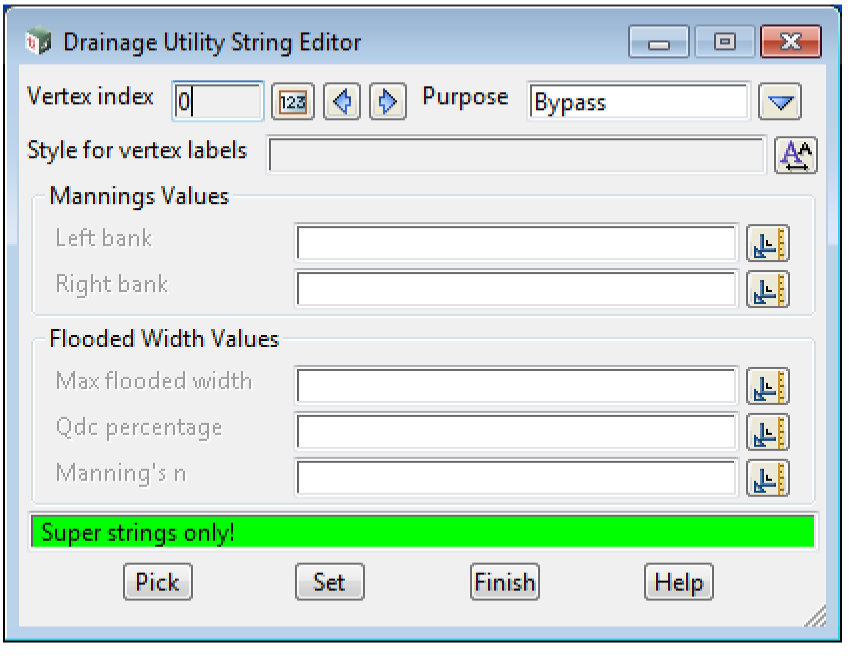
Flooded Width Values on Bypass Flow Strings - the default setting of the bypass flow strings when used to calculate flooded widths in the Drainage Analysis.Changes are in effect until the end of the string or it has been re specified at vertex at a higher chainage.

Vertex labels are created whenever properties are set (Texstyle is required).

Usage

First the string is selected at the vertex where the values are to be assigned. Next select the purpose of the string (cross section or bypass) to unlock the appropriate fields. A textstyle favourite is required as the vertex is labelled with the assigned values. Enter the values into the fields and then select Set to set the values as vertex attributes and create the label as a vertex annotation.

On selecting the **Utility String Editor** option, the **Drainage Utility String Editor** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	vertex	selected vertex	

Once the string is selected use this to move between vertices

Style for Vertex Labels textstyle favourite textstyles

A label is created on the vertex using this textstyle favourite

Left bank Input

mannings n value, to delete clear and select set

Right bank Input

mannings n value, to delete clear and select set

Max Flooded with Input

This changes the threshold were warning bars are created during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Qdc percentage Input

This changes the percentage of the Qdirect+Qcatchment that is used to interpolate the discharges during flooded width calculations. It is generally set on the first vertex past upstream pit and remains in effect till the next change or the end of the bypass flow string. The flow changes from the bypass flow at the upstream pit to this value/100(Qdirect+Qcatchment).*

Manning's n Input

This changes the Manning's n value used for during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Pick button

Use this button to select the string. Select near the vertex you want assign the values to.

Set button

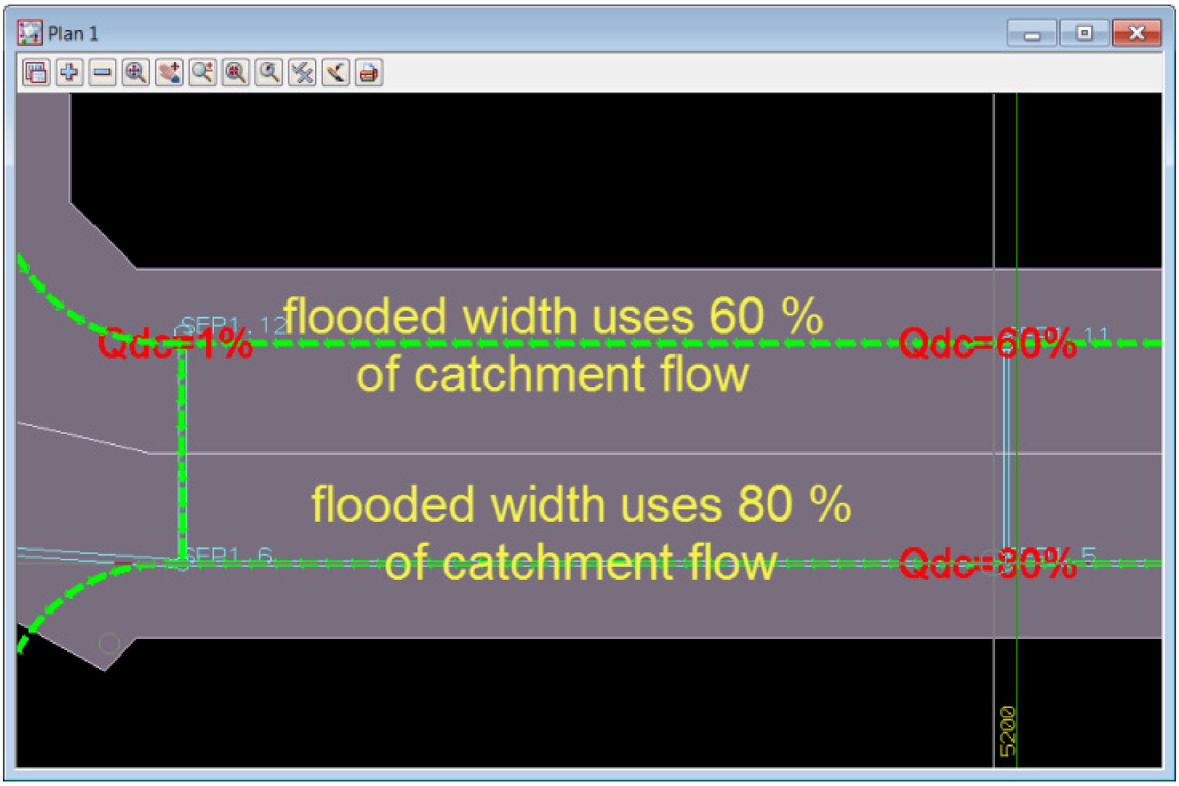
Creates the attributes and the label on the vertex.

Finish button

Removes the panel from the screen.

Help button

Launches the 12d help



In the example above, The Qdc is set to 80% at the eastern end of the catchment. The Qdc is set to 2% for the water overtopping the road. The 18% of the area is not considered large enough to do the flooded width calculation for. If desired, another bypass flow string approaching from the east could be drawn but the final bypass string to the west (direction during bypass should remain).

7.0 Drainage.4d setup file/database

The drainage.4d file controls many of the settings for the pit and pipes types inside 12d. This section details the format and features of the drainage.4d file. Changes to this file take effect only after 12dmodel has been restarted.

Press the **F1** button for 12d help. Select the **index** tab and type **drainage.4d** and select **drainage.4d** from the list. Full documentation of the drainage.4d file is found here.

7.1 Editing the drainage.4d file

When 12d Model starts up, it checks to see if an environment variable called DRAINAGE_4D exists and if it does, then the file it points to is used to provide the available types of manholes (maintenance holes) and pits. If the environment variable is not set, then 12d Model searches for a file called **drainage.4d** in the standard 12d Model search sequence for set up files.

12d model ships a **drainage.4d** file in the “program files\12d\12dmodel\10.00\set_ups” folder. **Do NOT** change this file. Copy it into your user folder “\12d\10.00\User” and edit it there. Files in the user folder are used by preference and they are never over written by a 12d update.

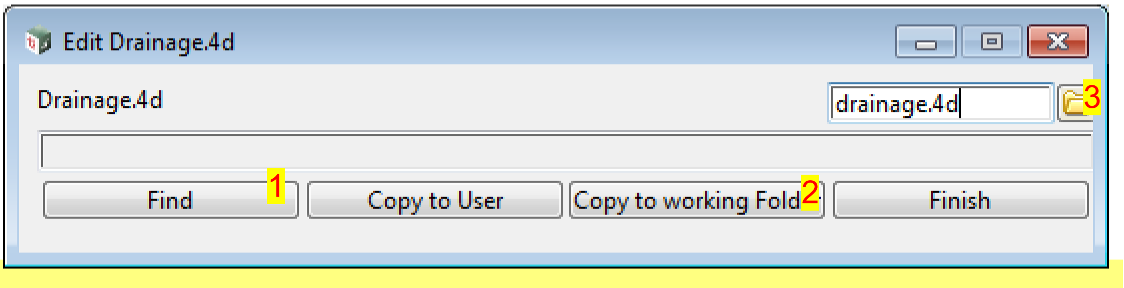
File Format

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes **"**.
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored

Duplicate definitions are not allowed. ie. you cannot have 2 manhole types with the same name.

From the main menu select

Design->Drainage-Sewer->More->Edit drainage.4d



1. Select the **Find** button to search the 12d path for the current drainage.4d file.
2. If the file is found in the setups folder, select **Copy to working folder** and then **Find** again.
3. Now that the file is found in the working folder, select the More info button (the folder) and then **Open** to edit the file.

You must restart 12d for these changes to become active. Select Project->Restart!

At startup, refer to the output window for any error messages. 12d will print the line number where it gave up. When looking in the long list of files, the drainage.4d file is loaded after the shp files. Sometimes one error will result in many other errors to follow so fix the first one, save your changes and restart again.

7.2 Creating and Modifying Manhole Types

We will now create a new manhole type for an enlarged grated inlet. For training purposes we will do it in steps restarting 12d model between each step.

1. Create a new manhole type
2. Add manhole commands to set the size and manhole thickness
3. Add manhole commands to create pit connection points where 2 pipes may be connected on the long side.
4. Add manhole commands to set the manhole level modes
5. Add a manhole command to create a user defined attribute.

7.2.1 Create a new manhole type

The order the manhole commands appear in the file is the order they appear in the type drop down list in the DNE.

1. Go to the bottom of the file and type the following.
   Manhole "AK2D enlarged" {
   }
2. Save the file
3. In 12d model close the Edit drainage.4d panel.
4. From the 12d model main menu select **Project=>Restart**
5. Check the output window for errors (just below the shp files.. there are easy to find as there are so many of them. Your should see the message
   File found <C:\12d\10.00\Courses\drainage\drainage.4d>
6. With the DNE, change inlet I-5 to the new manhole type **AK2D enlarged**. Note that you are free to change the diameter/length, width and many of the other DNE Pit field.s

Manhole must be capitalised.

Use “ (double quotes) not the single ‘ OR 2 single side by side ‘’.

Use {} NOT () or []

7.2.2 Add manhole commands to set the size and manhole thickness

The **mhsize** command sets the DNE length and width fields (rectangular manhole) and locks them from been changed.

mhdiam is used to set the diameter (circular manhole) and clear sthe width,

The **mhthickness** command block sets the mnahole wall thickness. The **diam_thickness** command has the manhole depth followed by the wall thickness. The line **diam_thickness** may be repeated if you want the pit wall thickness to change if the depth becomes greater than the specified value. Depth is measured from the cover level to the sump level.

The indenting is not required but makes the commands easier to read.

1. add a few blank lines between the braces in your new manhole definition and type the new commands shown in bold.
   ```
   Manhole "AK2D enlarged" {
       mhsize 1.86 0.835
       mhthickness {
           diam_thickness 0.000 0.150
       }
   }
   ```
2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.

7.2.3 Add manhole commands to create extra connection points

With connection points enables on the DNE->Global tab, a connection point is created at the mid points of the internal sides of the manhole. Additional connection points may be added with their offsets from the manhole centre.

1. add a few blank lines before the last brace in your new manhole definition and type the new commands shown in bold.
   ```
   Manhole "AK2D enlarged" {
       mhsize 1.86 0.835
       mhthickness {
           diam_thickness 0.000 0.150
       }

        con_points "AL2D" {
           con_point  0.930   0.000
           con_point  -.465   0.4175
           con_point   .465   0.4175
           con_point -0.930   0.000
           con_point  -.465  -0.4175
           con_point   .465  -0.4175
       }
   }
   ```
2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.
5. Use **Strings->Points Edit->Move** to move the end of the pipe that connects to I-5. You will see that it will snap to 2 points on the long side and 1 point on the short sides.

7.2.4 Add manhole commands to set the manhole level modes

We will now set the construction setout point and grate level to be obtained from the road setout string, the cover level to be 0.150 higher than the grate and a sump depth of 200mm.

1. add a few blank lines before the last brace in your new manhole definition and type the new commands shown in bold.

```
Manhole "AK2D enlarged" {
    mhsize 1.86 0.835
    mhthickness {
        diam_thickness 0.000 0.150
    }

     con_points "AL2D" {
        con_point   0.930    0.000
        con_point   -.465    0.4175
        con_point    .465    0.4175
        con_point  -0.930    0.000
        con_point   -.465   -0.4175
        con_point    .465   -0.4175
    }
attribute_integer "cover rl mode"        8
attribute_real    "setout adjustment z"   0.150
attribute_integer "grate rl mode"        1
attribute_real    "sump offset"          -0.200

attribute_integer "setout xy mode"       1
attribute_integer "setout z mode"        1

}
```

2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.
5. Use the DNE to select the i-5 inlet. You will be prompted to verify that you want the design parameters to change for each attribute you have added.

7.2.5 Add manhole commands to create a user defined attribute

We will now create a manhole text attribute called “reference dwg” that we can add our drainage plan plot.

1. add a few blank lines before the last brace in your new manhole definition and type the new commands shown in bold.

```
Manhole "AK2D enlarged" {
    mhsize 1.86 0.835
    mhthickness {
        diam_thickness 0.000 0.150
    }

     con_points "AL2D" {
        con_point   0.930    0.000
        con_point  -.465    0.4175
        con_point   .465    0.4175
        con_point  -0.930    0.000
        con_point  -.465   -0.4175
        con_point   .465   -0.4175
    }
attribute_integer "cover rl mode"        8
attribute_real    "setout adjustment z"    0.150
attribute_integer "grate rl mode"         1
attribute_real    "sump offset"          -0.200

attribute_integer "setout xy mode"        1
attribute_integer "setout z mode"         1

attribute_text "reference dwg" "Dwg 47.1 Rev A"

}
```

2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.
5. Use the **DNE** to select the pit. This will set the attribute for this manhole. The **Set Pit details** would do this for all manholes in the model.
6. Select **Apply** or more to another pit.
7. Use **Strings->Properties->Attributes** to select the manhole and on the pit table you will find the new attributes “reference dwg”.

7.3 Pit Inlet Capacities

The pit inlet capacity tables contained within the Drainage.4d setup file/database are used by the 12d drainage modules and exported to other design packages in different ways but with a common philosophy.

These tables may be plotted in 12d Model using Viewing Inlet Capacity Curves.

7.3.1 On grade pits

The grade and crossfall values for the tables are threshold values, i.e. the next set of capacity factors/curves will not be used until the measured crossfall and grade are equal to or exceed the threshold values for the curves. Curves with the same crossfall threshold are grouped together and the correct group is selected first. The road grade is then used to select the curve within the crossfall group.

Each inlet selects one road grade curve from the drainage.4d file. 12d Model does not interpolate between the curves.

Some simple sample pit definitions follow to demonstrate how the pit inlet capacities are calculated. The drainage.4d file supplied in the library has extensive curve data from model testing.

```
Manhole "SEP 25" {

  mhsize  1.200 0.900
  mhdesc  "SEP with 25 l/s"
  mhnotes ""
  mhgroup "SA"

  cap_multi   1.0
  cap_fixed   0.025

}

Manhole "SEP 50 percent" {

  mhsize  1.200 0.900
  mhdesc  "SEP with 50%"
  mhnotes ""
  mhgroup "SA"

  cap_multi   1.0
  cap_percent 50.

}

Manhole "SEP Grade x 10" {

  mhsize  1.200 0.900
  mhdesc  "SEP with 25 l/s"
  mhnotes ""
  mhgroup "SA"

  cap_curve_grade "curve 1" {
    road_grade 0.0
    cap_multi   1.0
    cap_fixed   0.010
  }

  cap_curve_grade "curve 2" {
    road_grade  2.0
    cap_multi   1.0
    cap_fixed   0.020
```

```
  }

  cap_curve_grade "curve 3" {
    road_grade  3.0
    cap_multi   1.0
    cap_fixed   0.030
  }

  cap_curve_sag "curve sag" {
    cap_multi   1.0
    coord 0.0  0.000
    coord 0.1  0.010
  }
}
```

7.3.2 Exporting Inlet Capacity to External Programs

Drains Version 1 and ILSAX

The cap1, cap2, cap3 and cap4 values are used to describe the inlet capacity of the pit as described in their user manuals.

Drains Version +

The 12d inlet curve names are exported to Drains as the pit family.

xpswmm, xpstorm and RAT-HGL

If cap2, cap3 and cap4 are all equal to zero then a fixed inlet capacity equal to cap1 will be exported to RAT-HGL. If the sum of these three values is greater than zero then a pit type will be created in the format of **pit_type-crossfall-roadgrade**. For example SA2-3-2 for a SA2 pit with a road crossfall of 3% and a road grade of 2%. A rating curve with this name will have to exist inside RAT-HGL. 12d has no way of transferring the rating curve itself into RAT-HGL.

PC Drain

Similar to RAT-HGL, PC Drain has it own rating curves defined internally. The road grade is sent as a separate piece of data to PC Drain so that the pit inlet capacity may be determined.

PC Drain places a suffix code in the pit type to specify that the pit is a SAG pit. For example an 9S.03 indicates that pit type 9 is a sag pit and the maximum depth before bypassing is 30mm. 12d model does this automatically when exporting.

7.3.3 Add manhole commands for inlet capacity

Manhole inlet configuration and bypass pit entries determine if these inlet capacity commands are used. Both may be set in the Drainage Network Editor.

cap_config

The inlet configuration may be set via the following command

cap_config x

Mode	**x**
Manhole	m
Ongrade	g
Sag	s

Inlet Capacity Equation

The inlet capacity equation is built up with 3 optional components (**single polynomial** + **curve polynomial** + **curve coordinates**). Generally, only one of the 3 components is used for each manhole type but they may all be used if desired.

inlet capacity = inlet efficiency * inlet multiplier *
[**single polynomial** + curve multiplier (**curve polynomial** + **curve coordinates**)]

An inlet efficiency (choke factor) is specified in the Drainage Network Editor. An inlet efficiency (choke factor) of 0 would stop all water from entering the inlet.

Curve Coordinates (On grade and SAG)

For on-grade and sag inlets, the inlet capacity may be determined by entering coordinates along the inlet capacity curve. These coordinates are usually obtained from hydraulic model studies or analytical methods such as HEC-22.

For on grade inlets, the coordinates are Qapproach and Qin, and the curves may change with road grade and cross fall threshold values. The inlet capacity curves are never extrapolated.

```
Example

Manhole "Ongrade Inlet A" {
        cap_config G
        cap_curve_grade "0.5G" {
                road_grade  0
                coord 0.000 0.000
                coord 0.060 0.060
                coord 0.140 0.112
                coord 0.260 0.174
                coord 0.430 0.244
                coord 0.500 0.270
        }
        cap_curve_grade "1G" {
                road_grade  0.75
                coord 0.000 0.000
                coord 0.060 0.060
                coord 0.140 0.108
                coord 0.260 0.164
                coord 0.430 0.227
                coord 0.500 0.248
        }
}
```

For sag inlets, the coordinates are Depth (base units) and Qin, and there is only one curve. Each curve has a curve multiplier specified with a cap_multi parameter (discussed below).

Example

```
Manhole "SAG Inlet A" {
        cap_config S
        cap_curve_sag "SAG" {
                coord 0.000 0.040
                coord 0.045 0.101
                coord 0.070 0.151
                coord 0.095 0.245
                coord 0.120 0.302
                coord 0.170 0.347
                coord 0.220 0.371
                coord 0.270 0.391
        }
}
```

Inlet Curve Block Commands

Inlet curve blocks may be specified for both on-grade or sag inlets. Inside the curve block you may include the Polynomial Inlet Capacity Commands and Coordinate Inlet Capacity Commands.

```
cap_curve_grade "unique name for the pit type" {
        road_grade x.xx
        road_xfall x.xx
}
```

Inside the cap_curve_grade block the road grade and road crossfal threshold values (percent) may be set. The road grade and crossfall are calculated by the Drainage Network Editor. When the 12d analysis engine selects the inlet curve, all curves with the same road_xfall are grouped together and then within the crossfall group the road_grade curves is selected.The inlet curve with the maximum grade threshold that is less than or equal to the road grade is selected.

Rules for 'cap_curve_grade' entries:

Only applicable to on-grade pits.
All cap_curve_grade names must be unique within a Manhole block
If both 'road_grade' and 'road_xfall' entries are omitted, only one cap_curve_grade entry is allowed within a pit.
The cap_curve_grade 'coord' entries (if used) must be in order of increasing Qa.

```
cap_curve_sag "unique name for the pit type" {

}
```

Rules for 'cap_curve_sag' entries:

Only applicable to sag pits.
Only one cap_curve_sag entry is allowed within a pit, and it must have a valid name.

Coordinate Inlet Capacity Commands

The coord command must be used inside the cap_curve_grade or cap_curve_sag grouping

coord x.xx y.yy

x.xx must be in increasing order.

For cap_curve_grade group, the coord command has the parameters Qapproach and Qin

For cap_curve_sag group, the coord command has the parameters Depth and Qin

Please continue to the next section Drainage Definitions - Pipe Types.

7.4 Drainage Definitions - Pipe Types

Pipe types may be used to set the following pipe properties via the DNE.

- pipe nominal/actual diameters and thickness
- roughness method and value
- rational method design mode and design percent depth
- minimum pipe height for the rational design engine
- user defined pipe attributes

Each definition (pipe block) in the file begins with the key word **Pipe**, followed by the pipe type and then curly braces **{ }**. The order that the definitions appear in the file determines the order they appear in the drop down lists inside 12d Model.

The minimum requirement for a pipe type definition is

Pipe “name” {

}

7.4.1 Pipe Thickness

```
pipethickness           {
            diam_thickness   x.xxx y.yyy a.aaa b.bbb c.ccc d.ddd
        }
```

x.xxx	nominal diameter choices will appear in the DNE->Pipe->Diameter drop down
y.yyy	internal diameter (base units) will be entered into the DNE->Pipe->Diameter field
a.aaa	optional top thickness (base units) 0.000 if omitted
b.bbb	optional bottom thickness (base units) top thickness if omitted
c.ccc	optional left thickness in direction of chainage (base units) top thickness if omitted
d.ddd	optional right thickness in direction of chainage (base units) top thickness if omitted

An example pipe definition follows.

```
Pipe "2" {

 // HUMES class 2 rubber ring joint pipe thicknesses
 pipethickness {
  // nominal_diam   internal_diam  top   [bottom] [left] [right]  (looking in the direction of chainage)
  diam_thickness  0.225    0.229     0.025
  diam_thickness  0.300    0.300     0.031
  diam_thickness  0.375    0.375     0.035
  diam_thickness  0.450    0.450     0.042
  diam_thickness  0.525    0.534     0.041
  diam_thickness  0.600    0.610     0.044
  diam_thickness  0.675    0.685     0.048
  diam_thickness  0.750    0.760     0.052
  diam_thickness  0.825    0.838     0.054
  diam_thickness  0.900    0.910     0.066
  diam_thickness  1.050    1.070     0.075
  diam_thickness  1.200    1.220     0.076
  diam_thickness  1.350    1.370     0.077
  diam_thickness  1.500    1.524     0.095
  diam_thickness  1.650    1.676     0.095
  diam_thickness  1.800    1.828     0.102
 }

}
```

7.4.2 Pipe Attributes

attribute_integer	"attribute name1" x	x is an integer value (no decimal, stored exactly by computers
attribute_real	"attribute name2" x.xxx	x is a real value (used to store numbers with decimals or very large or very small numbers
attribute_text	"attribute name3" "text"	text is a series of words or numbers not intended for calculations

The following special attribute commands create/modify an attribute as described above but these attributes also control calculations performed by the set pit details button on the Drainage Network Editor. The DNE fields will be locked when these attributes are defined for the selected pipe type. If these attribute are not defined for the selected pipe type the DNE field will not be locked and remain unchanged.

roughness_n	x.xx>	DNE field ->Pipe=>Main=>Roughness DNE field ->Pipe=>Main=>Roughness type (set to Manning)

roughness_k	x.xx	DNE field ->Pipe=>Main=>Roughness		
	Colebrook k roughness value in millimetres			
		DNE field ->Pipe=>Main=>Roughness type (set to Colebrook)		
attribute_real	x.xx	DNE field ->Pipe=>Design=>Min pipe height		
	min height in base units			
attribute_integer	"design size mode"		x	DNE field ->Pipe=>Design=>Design mode
	Mode			**x**
	Pressurised Pipe: Freeboard design			0
	Part-full Pipe: Freeboard design			1
	Part-full Pipe: Flow depth design			2
	Open Channel: Freeboard design			3

attribute_real	"design percent depth"	x.xx	DNE field Pipe=>Design=>Flow-depth at pipe entrance

An example of these setting follows:

```
Pipe "CHNL GRASS EXISTING 1" {  //Open Channel 1
  roughness_n 0.040
  attribute_integer "design size mode"     3  // open channel mode
}
```

8.0 Open Channel Flow

12d can model flow in open channels a trapezoidal sections. Suggestions for drainage network editor settings are listed below.

Generally, simple channels leading into a pipe network are often not modelled as open channels. The flooded width calculations can perform flooded width calcs (normal depth however) along the channel and the depth at the headwall is calculated using the headwall ku method.

If gradually varied depth/backwater calculations are desired then the channel will need to be modelled as a drainage string. Also if the pipes discharge into a channel then this channel will also need to be modelled as a drainage string.

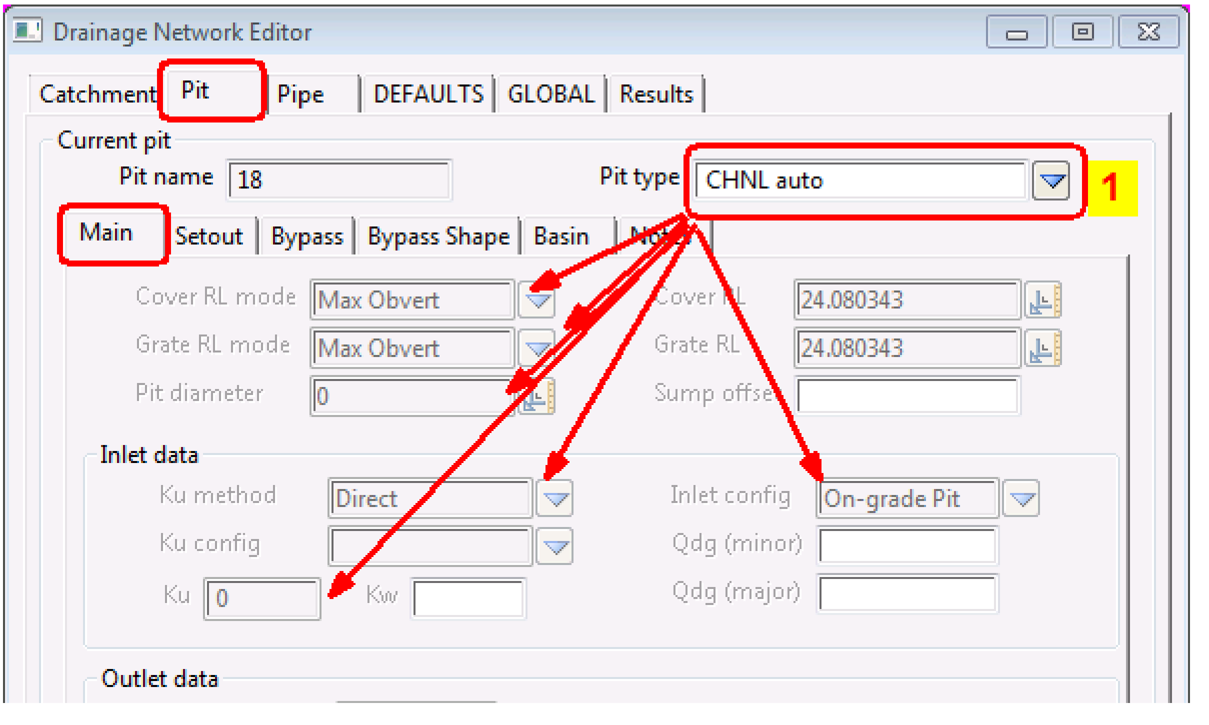
Key points

The pit grate level must always be at or above the top of the open channel conduit.

Changes in vertical grade and horizontal alignment require a pit in the drainage string. The pit diameter is usually set to zero.

Channels may exist in the tin or you may be proposing a channel to be cut into the tin. The grading and grate level modes will be different for each case. These channel type will be referred to as "Existing" or "Proposed"

Pit-Main Tab

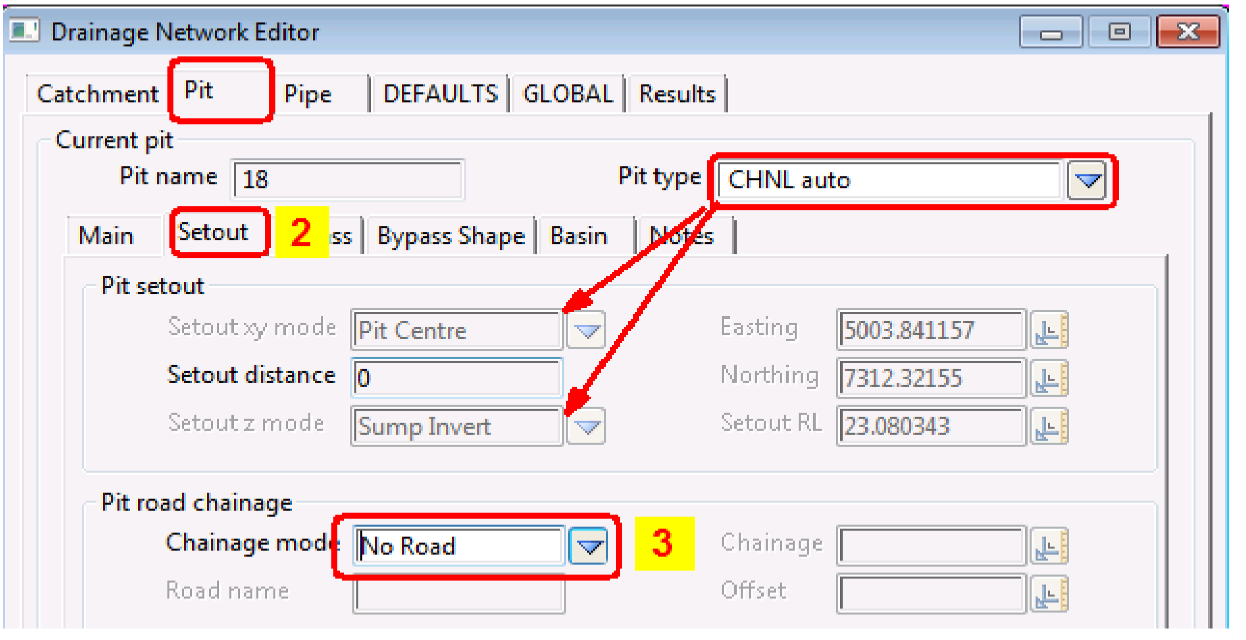


1. Selecting the **CHNL auto** pit typechanges many setting in the DNE.
   Cover RL mode is changed to **Max obvert**.
   Grate RL mode is changed to **Max obvert**.
   Pit diameter of diameter of zero. This will result in a single line on the drainage long sections instead of a pit.
   Ku method is set to **Direct** and a **Ku** of 0 for the channel change of grade points (pits).
   Inlet config - On-grade pit - it has a 200% inlet capacity. The 200% inlet capacity is in case a

choke factor is accidentally applied.

2. Select the Pit Setout tab

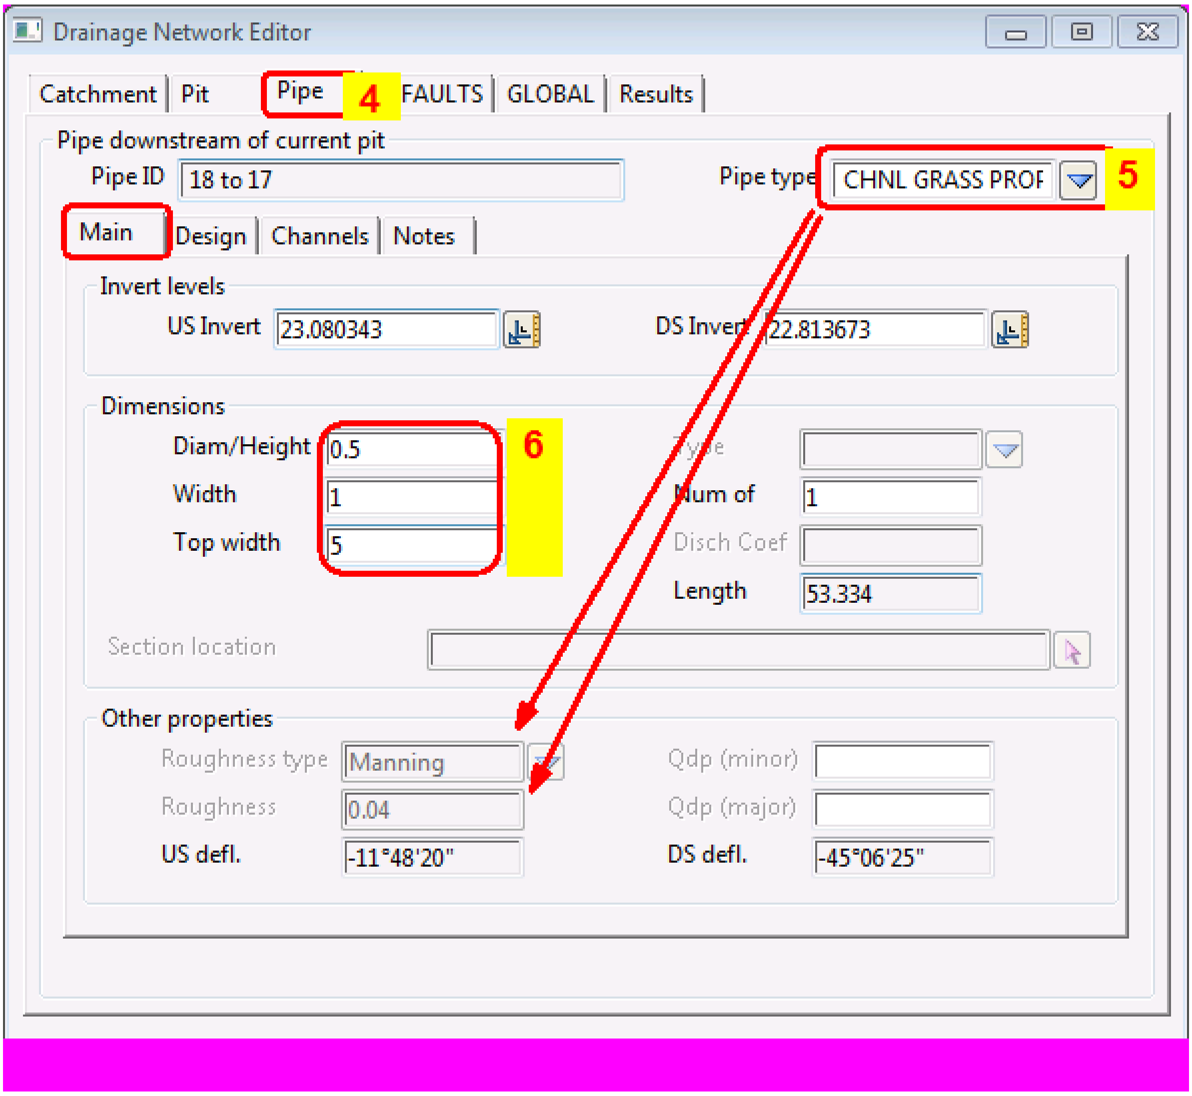
Pit-Setout Tab



Setout xy mode is set to **Pit centre**
Setout z mode is set to **Sump Invert** which is the lowest of the channel inverts if **Sump offset** = 0(Main tab).

3. The **Chainage mode** may be be changed to **No Road** if the channel centre line is not to be used for setout.If the default was **Centre string** this will stop the Problem message saying the centreline string is not found.

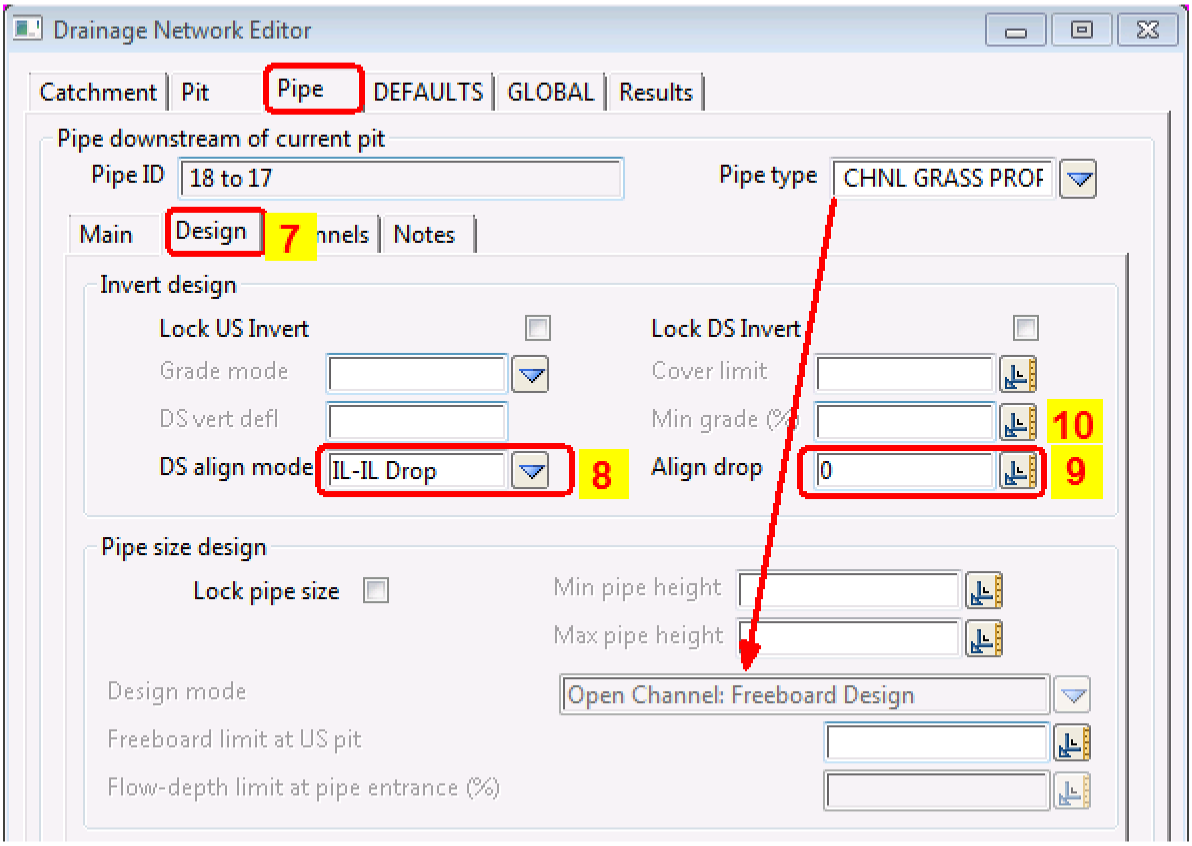
Pipe-Main Tab



4. Change to the **Pipe->Main** tab
5. Change the **Pipe type** to **CHNL GRASS PROPOSED**. This changes the following:
   the **Roughness type** to **Manning**
   the **roughness** for the open channel to 0.040
6. Set the **Height, Top width** and **Bottom width** of the channel.

Note: The pipe type can now be changed back to channel if you needed to alter any of the locked settings. Selecting the **CHNL GRASS PROPOSED** first set most of the setting correctly as a good starting point.

Pipe-Design Tab



7. Change to the **Pipe->Design** tab
8. Set the **Align mode** to “IL-IL drop”
9. Set the **Align drop** value to 0 (unless you are designing drop structures for your channel.
10. **Min Grade %** for open channels is usually much less than pipes.

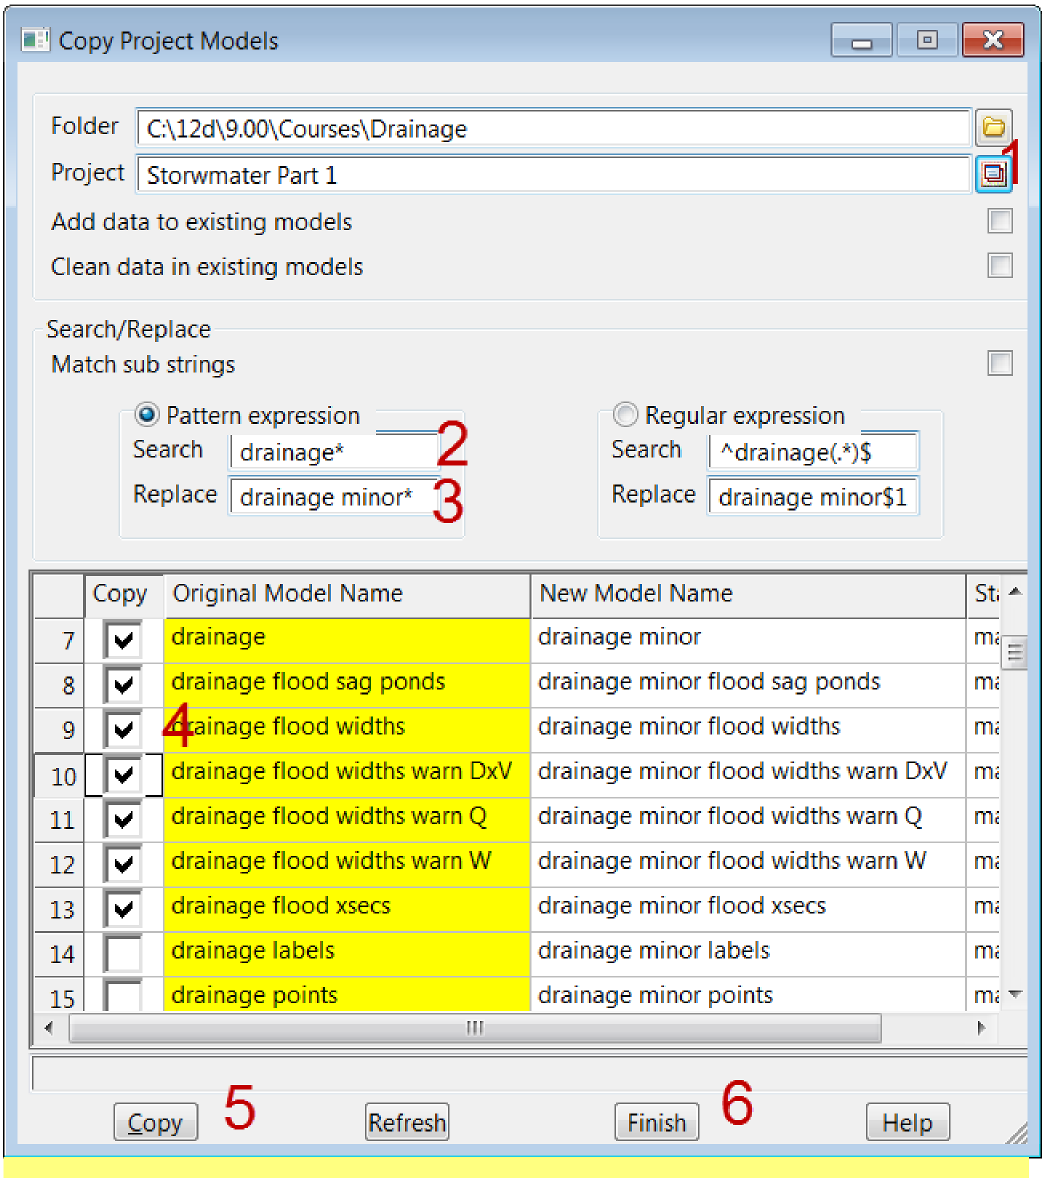
Note: The **Design mode** has been changed to “**Open Channel: Freeboard Design**”. This will allow supercritical flow to continue through the channel junctions. Often the Freeboard limit will be different for a channel than the pipe system.

9.0 Major Flood Events

To keep the results file from the minor event copy the drainage models using

Save your project. The following routine copies the models that are saved on disk!

Models->Utilities->Copy Project Models



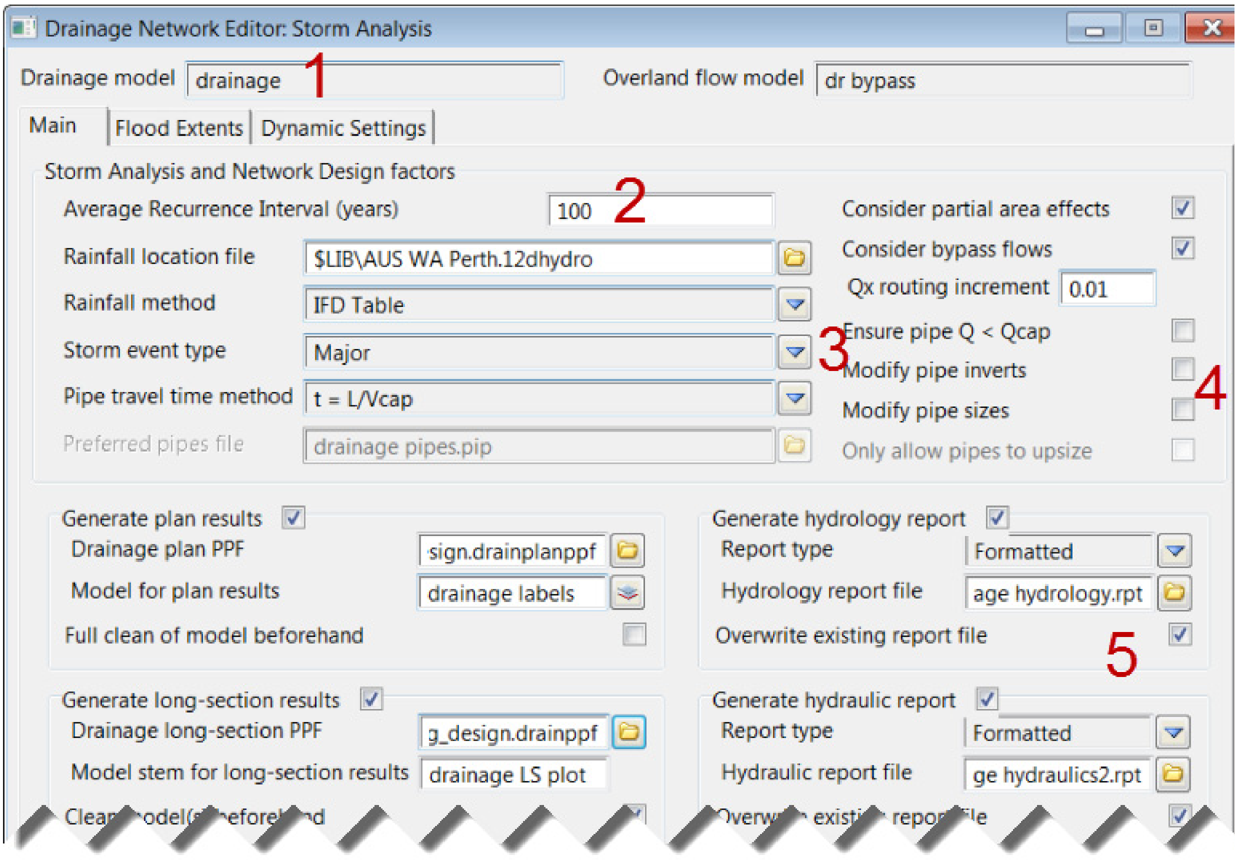
1. Select your current project
2. **Type** the name of your drainage model followed by the wildcard*
3. **Type** the new name for your minor results followed by the wildcard*
4. Tick the models that you want to copy
5. Select **Copy**
6. Select **Finish**

Now that the minor results are saftley stored away, edit the drainage model using the DNE.

For major flood events the user may desire to use an alternative set of values for

Catchment tc,
Catchment C,
Pit direct inflow (Qdi),
Pipe direct inflow (Qpi),
Pit choke factor for ongrade inlets,
Pit choke factor for SAG inlets,
Outlet tailwater levels.

These controls are found on the Storm Analysis Panel, **Main** tab.



1. Ensure you have selected the **drainage** model and then go to **Storm analysis**.
2. Type the new return period.
3. Select the **major** storm setting.
4. turn off the **Modify pipe inverts** and **Modify pipe sizes**.
5. Change the name of your report files by adding **100** after drainage.

You are now ready to analyse the major event and check the surface flooding condtions.

10.0 Excavation Quantities

Sample templates are included in the 12d library (pipe template.tpl). The templates from this template library may be added to your project using

Design=>Templates=>Utilities=>Input.

Usage

Access this report from the menu selection

Design => Drainage => Reports => Excavation Quantities

This routine uses 12d templates to calculate the excavation volume for all of the drainage strings in a model. An option to create section for a tin on top of the pipe is also available so that the drainage long sections can include hatching between the obvert of the pipe and the design tin under roads.

Templates with names set to the pipe diameters (times 1000) are used for the calculations, thus trench shapes can be customised and over excavation for bedding materials can be included. Net area calculations to exclude pipe area are not supported.

Key points

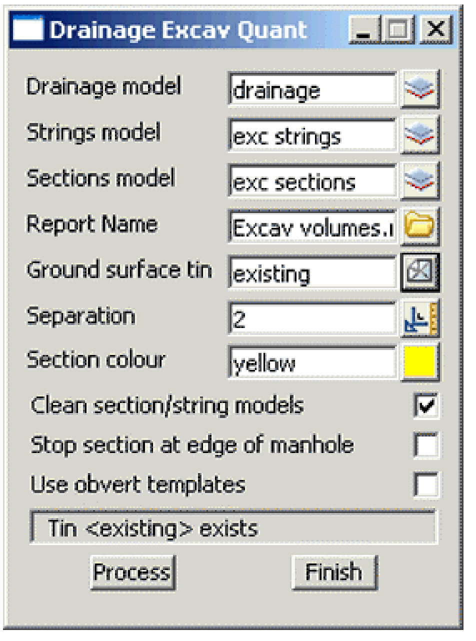
1. One template for each pipe size (mm)
2. If obvert templates are used, add the prefix “obvert “ to the pipe size
3. Carefully consider the tin selected.

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. A sample template library is included in the 12d library in the file **pipe_template.tpl**.

The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file.

If a tin is created from these strings then volumes by depth can be determined using **Design=>Volumes=>Exact=>Tin to tin**

On selecting the **Excavation quantities** option, the **Drainage Excavation Quantities** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Drainage model input box

Model to contain all of the pit and pipe network to be worked on.

Strings model model box

Strings generated from the templates will be stored in this model

Sections model model box

Sections generated from the templates will be stored in this model

Report name input box

cut and fill volumes will ne sent to this report

Ground Surface Tin tin box

tins from which the volumes will be calculated

Separation real box

distance between the sections

Sections colour colour box

Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)

Clean section/strings model tick box

Delete the strings in these models before processing.

Stop section at edge of pit tick box

*Template are run from pit centre to centre if this is not selected. The templates stop at the edge of the pit if selected. This is often selected with the following option **Use obvert templates.***

Use obvert templates tick box

*Templates must be named with the prefix "obvert". i.e. **obvert 300.** The template is still run along the invert of the pipe but the user now has a section "set" of templates that can be used to create a tin on top of the pipe as well as below.*

An example report file follows.

```
---------------------------- BEGIN APPLY TEMPLATE REPORT -----------------------------

 apply template to string report -

   string         E
   tin            design
   separation         10.000
   left template  375
   right template 375
   cut volumes and areas are negative
   fill volumes and areas are positive

chainage- ------sectional  information------  ------intermediate  information----    ---------accumulative  information-------

    0.000                -1.434       0.000                                                0.000         0.000         0.000
                                                             -0.771       0.000
    0.550                -1.367       0.000                                               -0.771         0.000        -0.771
                                                            -14.222       0.000
   10.000                -1.642       0.000                                              -14.992         0.000       -14.992
                                                            -15.293       0.000
   20.000                -1.416       0.000                                              -30.286         0.000       -30.286
                                                             -1.845       0.000
   21.313                -1.393       0.000                                              -32.130         0.000       -32.130
                                                             -0.794       0.000
   21.863                -1.493       0.000                                              -32.924         0.000       -32.924

total cut                        -32.924
total fill                         0.000
balance                          -32.924
ie excess of cut over fill        32.924

---------------------------- END APPLY TEMPLATE REPORT -----------------------------
```

11.0 Network Quantities Report

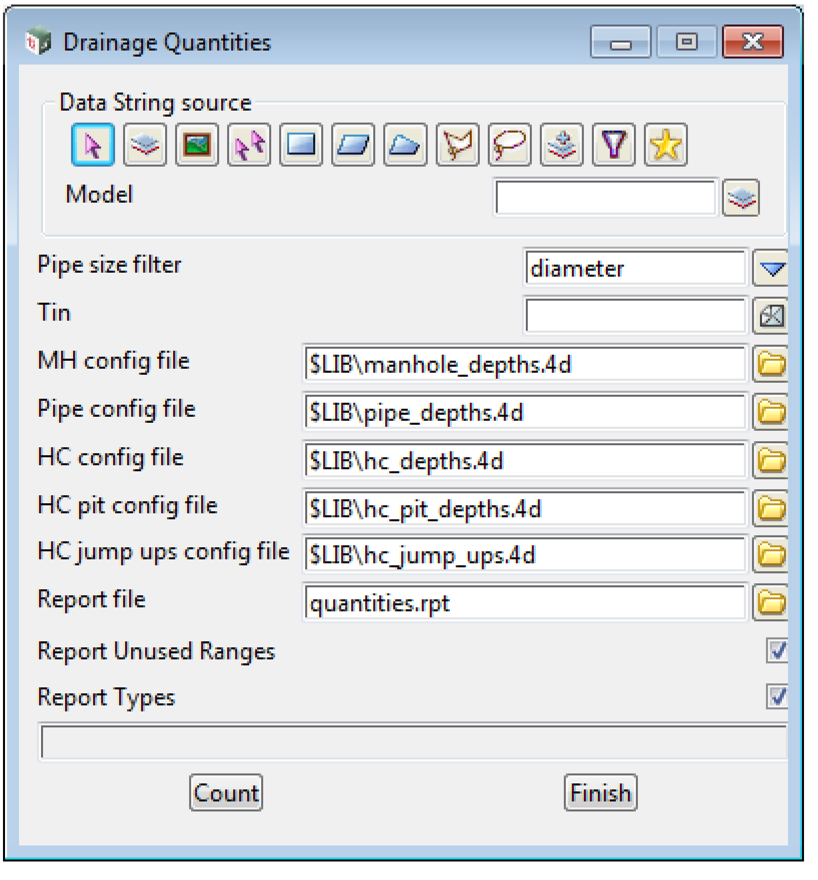
This panel is accessed from the menu selection

Design => Drainage Sewer => Reports=> Network Quantities

Key points

1. Items are counted/totalled by depth and optionally type.
2. The routine will not "double count" items even if the ranges overlap.
3. Types are case sensitive, types with spaces in the name must be enclosed in quotes and the wild card * may be used.
4. Use vertically offset tins and "banded" depth ranges to get quantities under roads, foot paths etc. This is discussed later in detail.
5. Erase count file fields if the items are not to be counted.

On selecting the **Network quantities** option, the **Drainage quantities** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data String Source	Choice		

usually the entire model is selected but view is also available for combining models

Pipe size filter	Choice		diameter or pipe size attribute

*The second item in a count line is used to filter by **diameter** (in meters/ft) or the **pipe size attribute**. The* *__diameter__ can only be used when no box culverts or trapezoidal channels are used. The __pipe size attribute__ is the label generally used in the plan plots. This is the pipe size in mm/inches (375), for box culverts width x height (750x375) and for trapezoidal channels TopwidthBottomwidthxHeight (T5000B1000x500).*

Tin tin box

This tin will be used for the pipe and pit depths.

MH config file file box

This file specifies the types and depth ranges for the pits. Details of this file are contained below.

Pipe config file file box

This file specifies the types and depth ranges for the pipes. Details of this file are contained below.

HC config file file box

This file specifies the types and depth ranges for the house connections. Details of this file are contained below.

HC pit config file file box

This file specifies the types and depth ranges for the HC pits. Details of this file are contained below.

HC jump ups file file box

This file specifies the types and depth ranges for the house connections jump ups. Details of this file are contained below.

Report file file box

a sample report file is given below.

Report unused ranges tick box

*the depth ranges for the pit/pipe/house connections are defined in the *.4d files. Selecting this option will cause the depth ranges in the file to be printed even if there are no pit/pipe/house connections in these depth ranges (zero quantity values will be shown).*

Report types tick box

*Selecting this option will cause the pit/pipe/house connection types used in the model types to be listed (even if quantities are not requested in the *.4d files). Since this is a complete of the type used in the model, the list informs the user what types have not been included in the quantity calculation.*

Count button

executes the option.

Finish button

removes the dialogue from the screen

The *.4d files listed above are contained in the 12d **library** directory. Each line is the file performs a count (count lines). No items are counted twice. Therefore, if an item is counted its type and then a count line is found the wild card is used for the type, the type already counted will not be included in the count.

The format for a count line is three or four values (space delimited) per line. Size is optional.

```
<type (from drainage.4d)>  <size> <starting depth>   <ending depth>
```

Notes:

All **types** with spaces in the name must be enclosed in quotes The wild card * may be used.

The **size** is optional and if omitted the all sizes will be counted in this group (do not use the * for a wild card).

The **starting depth** and **ending depth** are required for all count lines.

Quantities Under Roads and Footpaths

By creating super tins with vertically offset sections, quantities under roads, footpaths etc. can be determined. for example.

Offset your road design tin up by 1000m (**Tins->Utility->Translate/Copy)** and then use the depth range 1000-1999 for pipes under roads.

Create a tin from the footpaths only, null by angle length with a small length to remove the road and then offset it vertically by 2000m. the depth range 2000-2999 is not the quantities under the footpath.

Sample count lines

```
// sum concrete cover manholes is various ranges

"CONC COVER" 0.0 1.6
"CONC COVER" 1.5 3.0
"CONC COVER" 3.0 999.9  // this is expected to be zero
"CONC COVER" -999.0 0.0 // trap errors

// any that are not Concrete cover will be counted here

* 0.0 1.6
* 1.6 3.0
* 3.0 999.9
```

```
Manhole Quantities
====================================

CONC COVER           0.00     1.60     13       16.506
CONC COVER           1.60     3.00      1        1.510
CONC COVER           3.00    999.9      0        0.000
CONC COVER         -999.0      0.0      0        0.000

*                      0.00  1.60       0        0.000
*                      1.60  3.00       0        0.000
*                      3.00 999.9       0        0.000

  total length = 18.016

  Types Used
  ----------

  CONC COVER

  Diameters Used
  ----------

  1.100
```

Since the **Report unused ranges** tick box was selected, these lines were printed even though there were no pits in the data ranges.

This data results from selecting the **Report types** tick box.

Sample count lines for pipes follow.

```
// sum class 2 pipes by diameter and for various ranges

// count 375

2 0.375 0.0 2.0
2 0.375 2.0 5.0
2 0.375 5.0 999.

// count 450

2 0.450 0.0 2.0
2 0.450 2.0 5.0
2 0.450 5.0 999.

// count 525

2 0.525 0.0 2.0
2 0.525 2.0 5.0
2 0.525 5.0 999.

// count pipe sizes that were missed

2 * 0.0 2.0
2 * 2.0 5.0
2 * 5.0 999.

// count all other missed pipes

* 0.0 999.
```

12.0 Exporting to Drainage Design Software Packages

12d contains most of the data required for your drainage design packages. However, each packages has specific design variables that 12d does not have access too. The design process is intended to export your data from 12d to the design package, design the drainage system and then read the results back into 12d for your long sections.

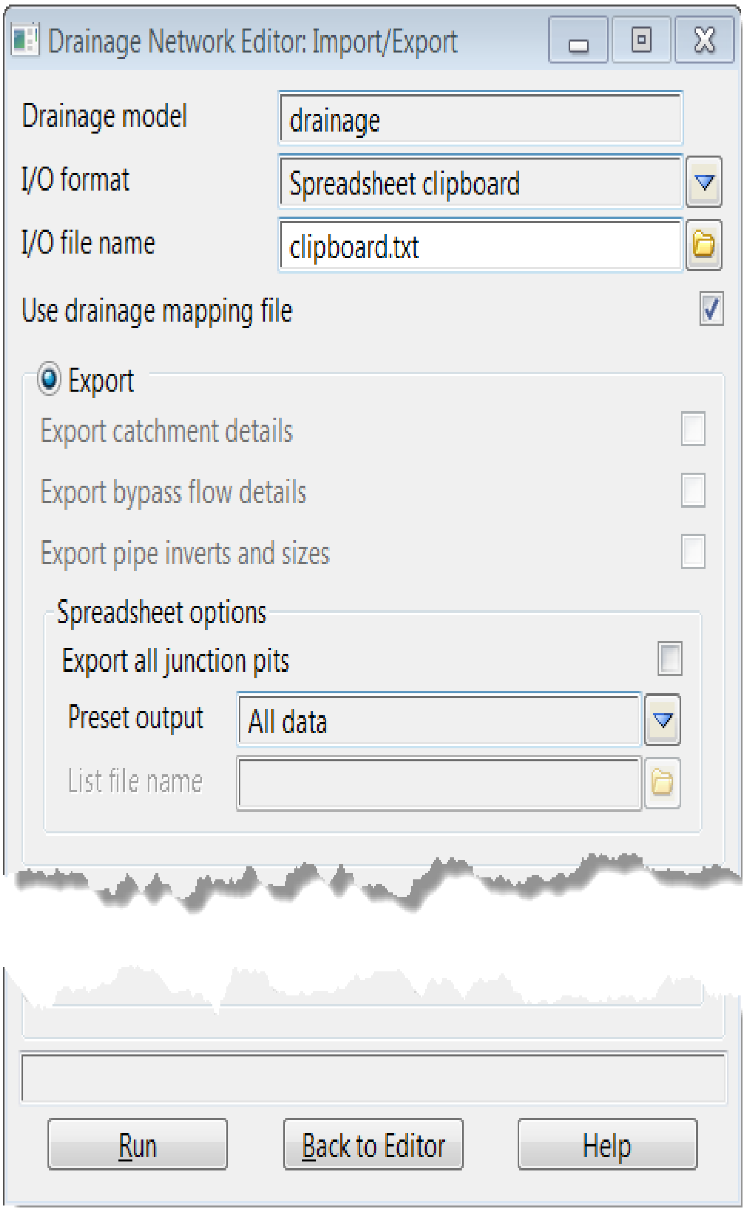
If pits/pipes are to be added/deleted from your network during the design process you are safest to add/delete the pit/pipe to 12d and to your design package separately.

Not recommended and as a poor alternative, you have the option of reading the results back into 12d, adding/deleting the pits/pipes and then exporting the data to a new drainage project in your drainage design software. **As 12d does not have access to all of the data in the design packages this method is not recommended!**

Some of the drainage design programs offer a third option that allows you to import data "on top of" an existing project thereby merging and over writing the existing data. Be sure to contact the drainage software supplier to obtain exact details of how the merging process is performed.

The interface is run by selecting **Import/Export** from the **Drainage** Network Editor

Design->Drainage-Sewer->Network Editor



The **Drainage model** is the model currently being edited.

The **I/O format** selects which external program the 12d is interfacing with. Some programs use the windows clipboard and others use files. If the clipboard is used the data will also be written to a file by 12d in case you need to take the data to another computer.

Export enables the export fields below and exports when **Run** is selected.

The **Export options** have slightly different effects depending on the **I/O format** (program) selected above. Therefore they will be discussed later with the various formats.

Export pipe diameters and inverts is generally select for existing systems only. If your design program will set invert levels and pipe sizes then turn this tick box off for new systems.Some design programs will require initial inverts and pipe sizes. In this case this box should be selected on the first export.

Export default catchment/pit parameters is generally selected for the first export. For subsequent exports turn this selection off and then only the catchment areas (if the model is supplied above) will be exported.

13.0 Drainage Data Input and Output to Spreadsheets

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

Drainage strings will be created if they do not exist in the model but pits cannot be added to existing strings.

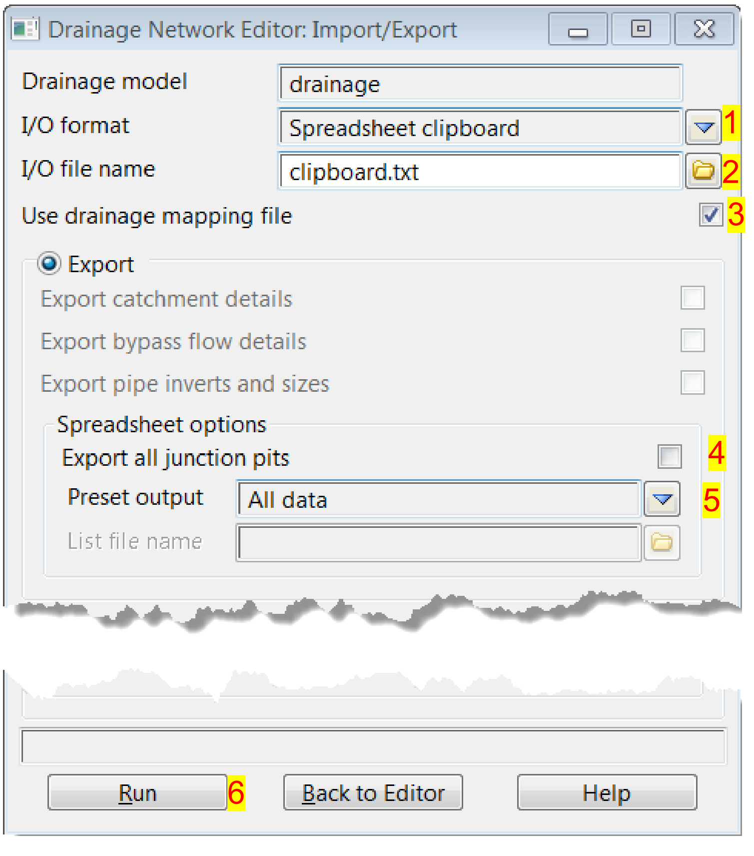
12d to spreadsheet transfers

Spreadsheet to 12d update and create

Spreadsheet options

13.1 12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.

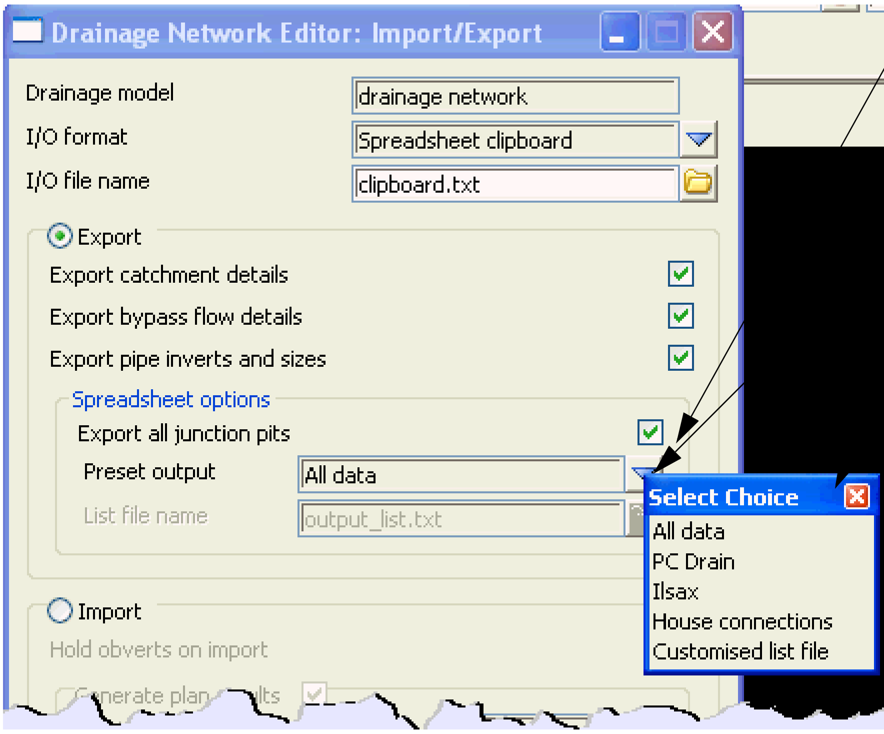


1. Select Spreadsheet clipboard
2. leave as **clipboard.txt** to send the data to the windows clipboard as well as this file.
3. Mapping files are the most current 12d technology. Leave this selected.

   These options are not used for spreadsheet export.
4. Usually leave this off! Select to export the junction pit at the end of all drainage lines (very rarely needed).
5. You may also select to limit the output if desired. If you like using spreadsheets for data entry, the PCdrain data and ILSAX data formats are useful for adding data for the first time for either program.
6. Select Run to place the data on the clipboard.

13.1.1 Options

The **Spreadsheet Options** section allows the user to define the amount of data exported.



Export all junction pits when selected will repeat the data for the junction pit at the end of each branch line.

Preset Output this choice box offers the following choices:

All Data: All of the 12d drainage string data and the user defined attributes will be exported to the clipboard in a tab delimited format. The 12d data names and the user defined attribute names will appear at the top of the spreadsheets columns.

ILSAX: For the ILSAX program, the spreadsheet column headings will change depending on the pipe and catchment indicators (P2 card) and the inlet type (P3 card). Therefore, use the ILSAX pipe editor macro to set up one pit/catchment for the type of data you wish to enter. Now when you export the pipe network data the column headings will include the names of the relevant parameters.

User defined below: The **Customised list file name** is used to define the drainage values, their order and format you desire.

The **customised list file** is a text file where each line contains a drainage variable or a spreadsheet IO command (blank lines are ignored unless preceded by the header command). The spreadsheet IO commands are all lower case and listed below:

header	to define a line of text to be exported
blank	to leave a blank column in the output
pit data	the following attributes are for the pit.
downstream pit data	the following attributes are for the downstream pit.
upstream pit data	the following attributes are for the upstream pit(s).
pipe data	the following attributes are for the pit's outlet pipe
downstream pipe data	the following attributes are for the downstream pipe(s)
upstream pipe data	the following attributes are for the upstream pipe(s)
variable name	a 12d drainage variable names
factor	the following variable is multiplied by this factor
decimals	the following variable will export with these decimal places

The simplest way to create your own customised tab delimited file is to set the **Preset Output** field to **All data** and leave the **customised list file name** field blank. Selecting **Set**, **Finish** and then **Copy** from the main dialogue. The data will be placed on the clipboard and a **customised list file**, named **output_list.txt** will be created containing the names of all of the drainage variables in the 12d model. Use a text editor to add/or delete the variable names, change their order and/or add spreadsheet IO commands. **Save the file with a new name!** The **output_list.txt** file is overwitten on every export.

A listing of a customised list file follows. Note the words in the header file have a "tab" between them so that they will be spaces across the spreadsheet columns.

```
header
Pipe Details
    header
    Name Length   U/S IL   D/S IL   Slope(%)   Class   Dia I.D.   Rough   Pipe Is   No. Pipes

    pit data
    *pit name

    pipe data
    *length
    low ch invert
    high ch invert

    factor
    100
    *grade

    pipe type

    factor
    1000
    diameter
```

After creating your customised list file, select **Options** again and change the **Preset Output** field to **User Defined below** and enter the new **customised list file** name that you saved above. Select **Set** then **Finish** and finally **Copy** to put the formatted data onto the clipboard.

The data can be pasted into a spreadsheet program for checking or additional formatting.

CUSTOM FORMATED DATA MIGHT NOT BE PASTED BACK INTO 12d!

The data must be in the "12d drainage spreadsheet" format to be read into 12d.

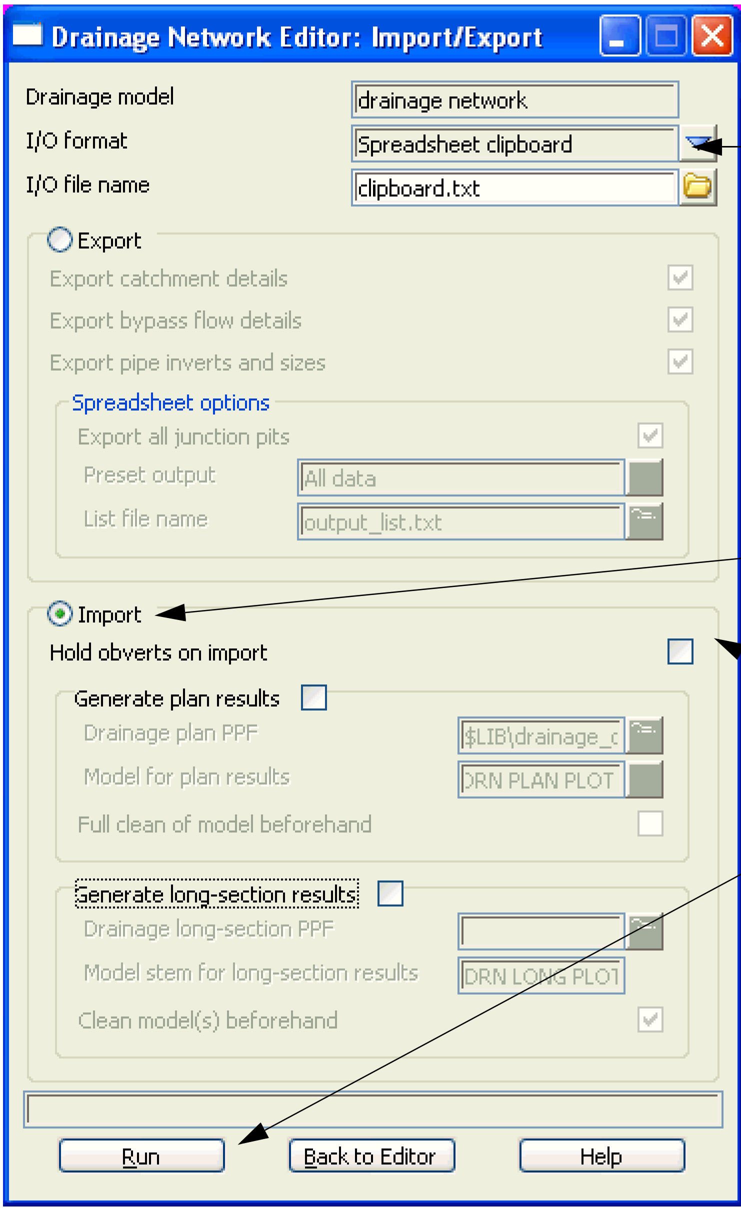
Caution with pit names in the form 1-1 or 1/1. Some spreadsheets will interpret these values as dates. If you use these formats for your pit names you will have to paste command them in once, format the columns that contain the pits names as text data and then paste the information in again.

One final word on using the copy/paste commands in the Microsoft Excel program. The Paste Special command using the "Skip Blanks" option will allow you to copy a large block of 12d data (with blanks in it) on top your data so that your data is preserved where it coincides with the blanks. To use this option paste the data into a blank spreadsheet and then select copy again. The Paste special option with "Skip Blanks" will now be available.

13.1.2 Spreadsheet to 12d transfers

This item is accessed from the **Import/Export** button on the **Drainage Network Editor**.

The following panel will appear.



Select the **Spreadsheet clipboard** format**.**

Select **Import**

This is ignored on spreadsheet imports.

Select **Run** to update the drainage model.

Tab delimited, “12d drainage spreadsheet” format or “from to” format data must be on the clip-board in order to update a 12d drainage model or create a new model. These format are described below.

13.1.3 Updating an Existing Model

The data usually is generated by 12d using the **Export** option, pasted into a spreadsheet and then copied back to the clipboard so that 12d can be updated.

When 12d exports the drainage model to a spreadsheet it includes a column for the unique string identifier and a unique pit identifier (unique to the drainage model not the 12d project). The names of the strings and pits may be changed via the spreadsheet if these columns are present at import time.

If the pit id column is not present, 12d will search the drainage model for a matching pit name. When the pit is a junction between drainage lines, only the trunk line will be the data updated.

13.1.4 Creating a New Model

It is possible to create a new string or an entire drainage network using this format. However, pits cannot be added to an existing string. The entire drainage string must be created at once. Two formats are available, the “from-to pit” format and the “12d drainage spreadsheet” format.

At present the network editor must select a drainage string to become active. Therefore, if you are not adding strings to a network, you will have to great a drainage network with one “dummy” pit. Select this one “dummy” pit to activate the editor. After importing the data and the new drainage lines are created the “dummy” pit may be deleted.

12d drainage spreadsheet Format

The top left cell in the clipboard data must be the text “12d” to specify this format. The minimum amount of data required to create a new string is the string name, pit name, x and y coordinates. You can add as much additional data as you have available. This would include pipe diameters inverts etc. The pits must be listed from upstream to downstream order. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An example file exists called **new_network.txt** is supplied in the library. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Set the **I/O Action** to **Import** and select **Run**. The new drainage lines will exist in the model currently being edited.

From-to Pit Format

The top left cell in the clipboard data must be the text “from to” to specify this format. The minimum amount of data required to create a new string is the upstream pit name "*pit name), the downstream pit name (*ds pit name) and the x(x location) and y(y location) coordinates of the upstream pit. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An optional column for the pit cover elev (cover elev) may be specified. Once the network has been created additional pipe and pit data may be added using the “12d drainage spreadsheet” format described above.

An example file exists called **new_from_to_network.txt** is supplied in the library. It is shown below. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Enter a new model name in the **Drainage model** field and select paste. The new drainage model will now exist.

from to	pit	pit	pit	pit
*pit name	*ds pit name	x location	y location	cover elev
text	text	real	real	real
E/1	A/3	5309.458	7336.935993	29.2173

B/5	A/5	5233.426685	7336.935984	27.544

13.2 "12d drainage spreadsheet" Format

Each column of data is used for a 12d drainage variable or a user defined attribute. Each row represents a pit and the downstream pipe (controlled by the direction of flow variable) within the drainage network. A sample is shown below.

12d	pit	pit	pit	pit	pit	pit
*string Name	*pit name	pit type	pit low ch invert	pit high ch invert	pit id	string id
text	text	text	real	real	integer	integer
E	E/1	SA2	28.108	28.108	1	67389
E	A/3	SA2	27.7559	27.7559	2	67389
D	D/1	SA2	27.3961	27.3961	3	68100
D	A/4	SA2	26.8018	26.8018	4	68100
C	C/1	SA2	30.67	30.67	5	72072
C	B/3	SA2	29.563	29.563	6	72072
A	A/1	SA2	29.1026	29.1026	7	82469

B	B/1	SA2	31.2759	31.2759	14	192066
B	B/2	SA2	29.351	29.301	15	192066
B	B/3	SA2	29.123	29.073	16	192066
B	B/4	SA2	28.0444	27.8951	17	192066
B	B/5	SA2	26.3447	26.2947	18	192066
B	A/5	SA2	26.0744	26.0744	19	192066

Duplicate Definitions

Strings Variables such as “direction” are may be defined for numerous pits on the same string. Searching in a top down direction through the file, the last definition found for the string will be set.

Invert levels may be set via pipe data or pit data or combined. It is recommended that the user only use one method and not combine them. Both are exported so delete the ones you are not going to use. The variables are processed from left to right, so if duplicate definitions of an invert level or found the right most data will be set.

The format definition

1. Row1, column 1 must contain either “12d”, or “from to”. Therefore, the first column must be a 12d drainage variable (cannot be a user defined attribute).
2. Row 1. The text <pit> at the top of the column indicates the column contains a user defined pit attribute and similarly <pipe> indicates a user defined pipe attribute.
3. Row 2. This row contains the names of the 12d drainage variable names and the pit/pipe attributes. All names are case sensitive so be careful where you use capital letters. A list of 12d drainage variables is found below.

   Names beginning with an asterix (*) will not be processed (except pit/string names when unique identifiers are present in the data). 12d drainage variables names beginning with an asterix indicate that this data was calculated at export time and cannot be read back into 12d (for example, pipe length, pipe grade and deflection angle).

   Prefixing an user defined attribute name with “DELETE ” (no quotes, note the space after the DELETE) will cause the attribute to be deleted from all pits/pipes within the model.
4. Row 3. The text in this row define the type of attribute to be stored within 12d. The only valid choices are;

   integer
   real
   text

   If you want to change an attribute type you must delete the attribute and create it again. If you simply change the attribute type in the third row then that attribute will not be updated.
5. Blank lines may be inserted as desired.
6. You are not required to fill in all of the cells in the spreadsheets. Blank cells are ignored (you must use a space to remove all data from text attributes (the space will not be stored).
7. Pipe names are included in the data so that they can be changed but they are **not** used to identify the pipe. Pipe data will always be assigned to the pipe following the pit in the direction of **ascending** chainage. If flow directions is ascending then the pipe data will be for the downstream pipe. If the flow direction is descending then the pipe data will apply to the upstream pipe.

13.3 12d Drainage Variable Names

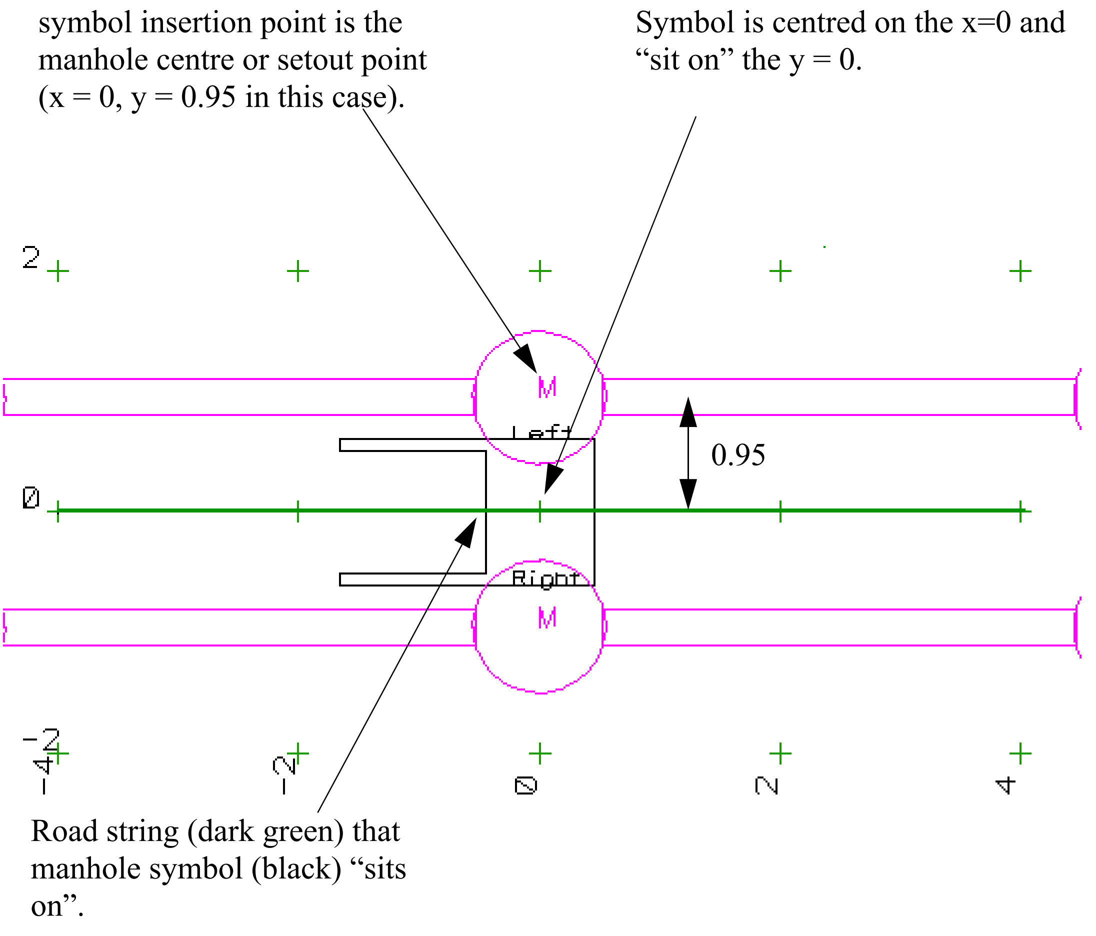
Manhole Variables	Pipe Variables	String Variables
*string Name	pipe name	direction
*pit name	pipe type	[illegible]
pit type	low ch invert	[illegible]
pit diameter	high ch invert	string id
pit low ch invert	diameter	
pit high ch invert	*length	
pit road chainage	*grade	
pit road name	low hgl	
*pit angle	high hgl	
*pit drop	pit hgl	
*pit depth	flow	
*pit chainage	velocity	
x location		
y location		
cover elev		
*fs elev		
*ns elev		
pit id		

14.0 Detailed Drainage Plan Drawing - Creating MH Symbols

There are many methods to create the drainage symbols and one is presented here. The pit symbol is drawn so that the symbol “sits on” the road string that it aligns with (the road string is the y reference). For drawing lintels and grates, assume the road is downhill to the right. See diagram below.

Two symbols are required, one for the left side of the road and one for the right side (referred to as the mirror symbol in the plan ppf). 12d checks the downhill direction of the road strings when using these symbols to determine which is the left and right side of the road.

Either draw your own symbol or import the symbols using **File IO->Data Input->4ds/12da data** and selecting the file **inlet symbols.12da**

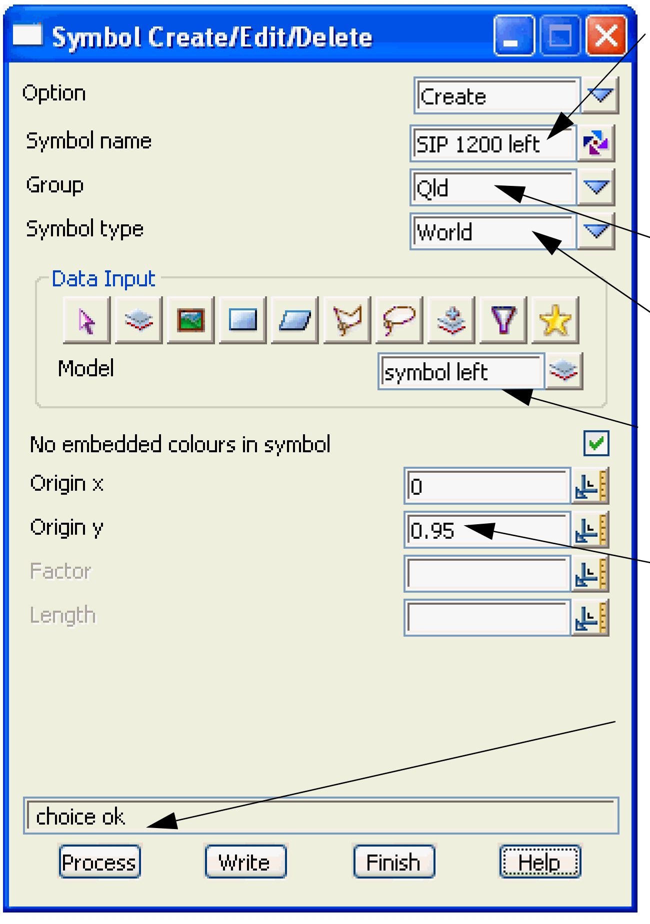


To create the symbol in 12d draw the left pit symbol in a model by itself. The pit should “sit on” the zero “y” grid line. A 900 wide by 600 long inlet with a 1.2m lintel is shown above.

From the main menu, select

Project->Tree

Expand **Project** then expand **Symbols** and finally select **Create Symbol**.



Enter the **Symbol Name**. Usually the name includes the size.

Select the **Group** the symbol is to appear in the symbol drop down menu and select **World** as the symbol type.

Select the **model** that contains the manhole drawing.

Enter the x,y location of the manhole centre in your drawing (0 is different then blank!).

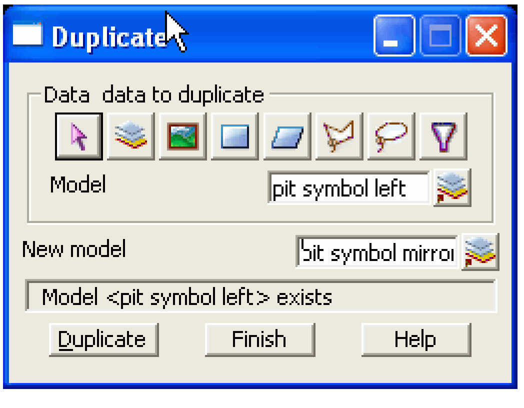
Process will create the symbol in the project.

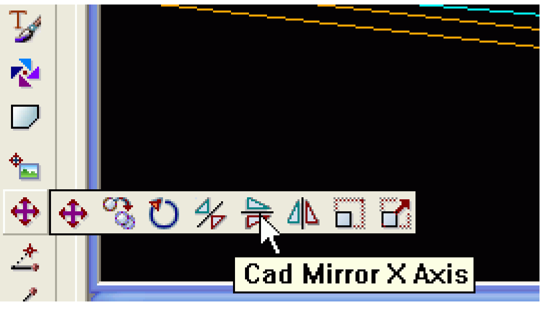
Change the **symbol name**, **origin y** and press **Process** for each offset required.

Write will add the new symbols to the symbols.4d file so that they will be available to other projects.

Leave this panel open as we will need it after we create the mirror image of the pit.

To create the mirror image of the symbol about the x axis use the CAD mirror about X axis command. 12d will require you do this one string at a time. Version 7 does not mirror into a new model so you will want to duplicate the pit symbol model first using **Utilities->A-G->Duplicate.**





Now repeat the process of creating the right side mirrored symbol. Note that the location of the pit centre is now **negative** and add the suffix **mirrored** to the symbol name.

Do not forget to select **Write** again to save the symbols to the symbols.4d file.

These symbols can now be used in the **Maintenance hole** tab of the Drainage Plan Plot ppf editor. If your version of 12d supports, **native-size symbol**, in the ppf editor then use this mode. If not, select scalable symbol and enter the size equal to the full width of the symbol (height if it is greater).

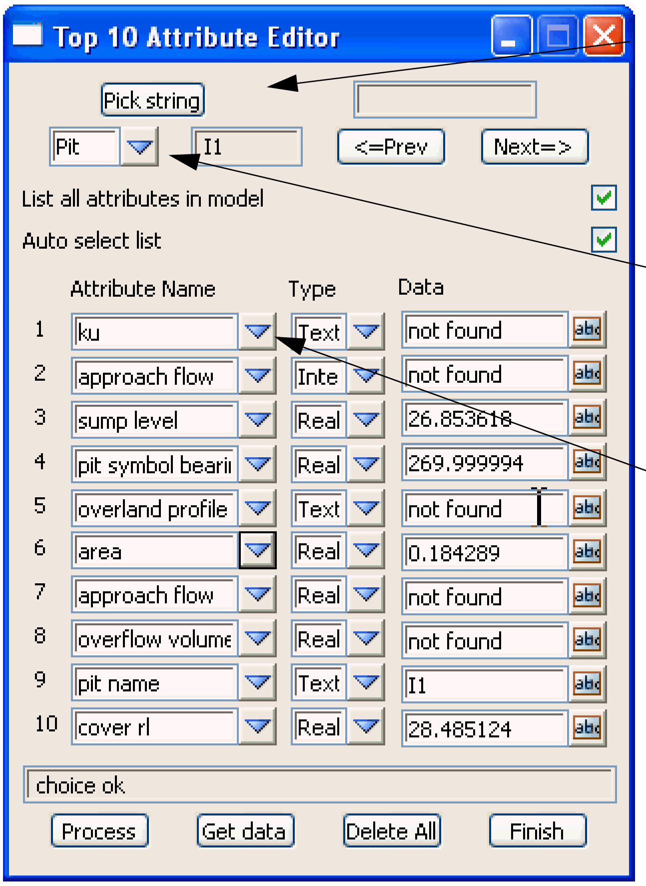
15.0 User Defined Attributes

These drainage attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d. To edit/add the user defined attributes within 12d select either

Strings=>Properties=>Attributes or

Strings=>User=>Attribute Editor. This second editor is described below.

.



First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

They may not be defined for the pit you are editing. **Not found** will be displayed in the **Data** field if the pit does not have that attribute defined.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The message on the right will be displayed whenever you are creating a new attribute.

15.1 Drainage Pit attributes2010

Pit attributes are created and/or updated when the user selects **Set Pit Details.**

pit length	real	0	mhsize (first value) from drainage.4d file
pit width	real	0	mhsize (second value) from drainage.4d file
pit group	text		mhgroup from drainage.4d file
cover rl	real	446.685248	
grate level	real	446.685248	
setout z	real	446.685248	
setout x	real	299643.648	
setout y	real	6563620.716

15.3

16.0 Detailed Drainage Plan Drawing

12d drainage has the capability to create detailed drainage plan drawings with the following features:

screate symbols at the inlets and the type of symbol is controlled by the inlet type (given when you create the inlet).

screate text labels for inlet types and user defined pit attributes

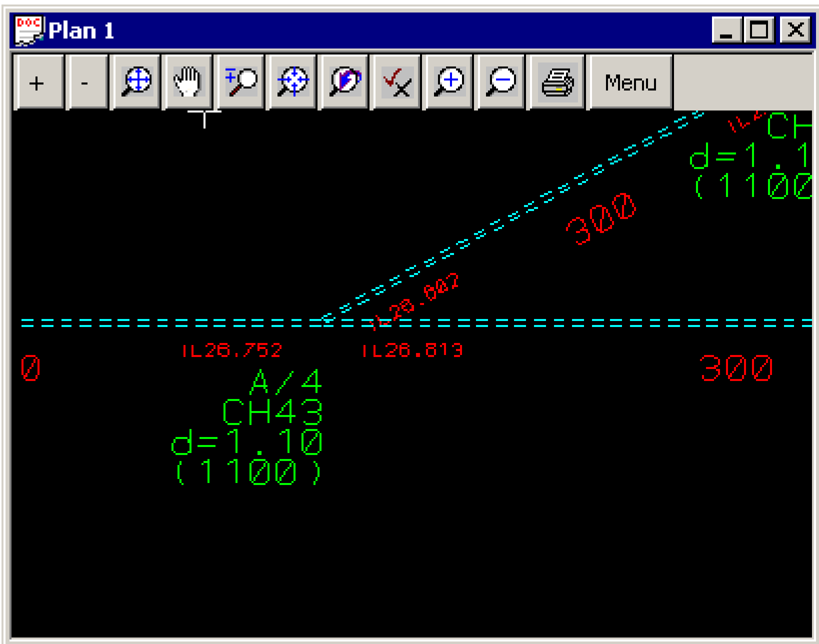
sdraw lines with line styles and colours to represent pipe sizes

screate text labels for pipe diameters, inverts and user defined pipe attributes

screate text labels for house connection types, invert levels and chainages

sindicate direction of flow on pipes.

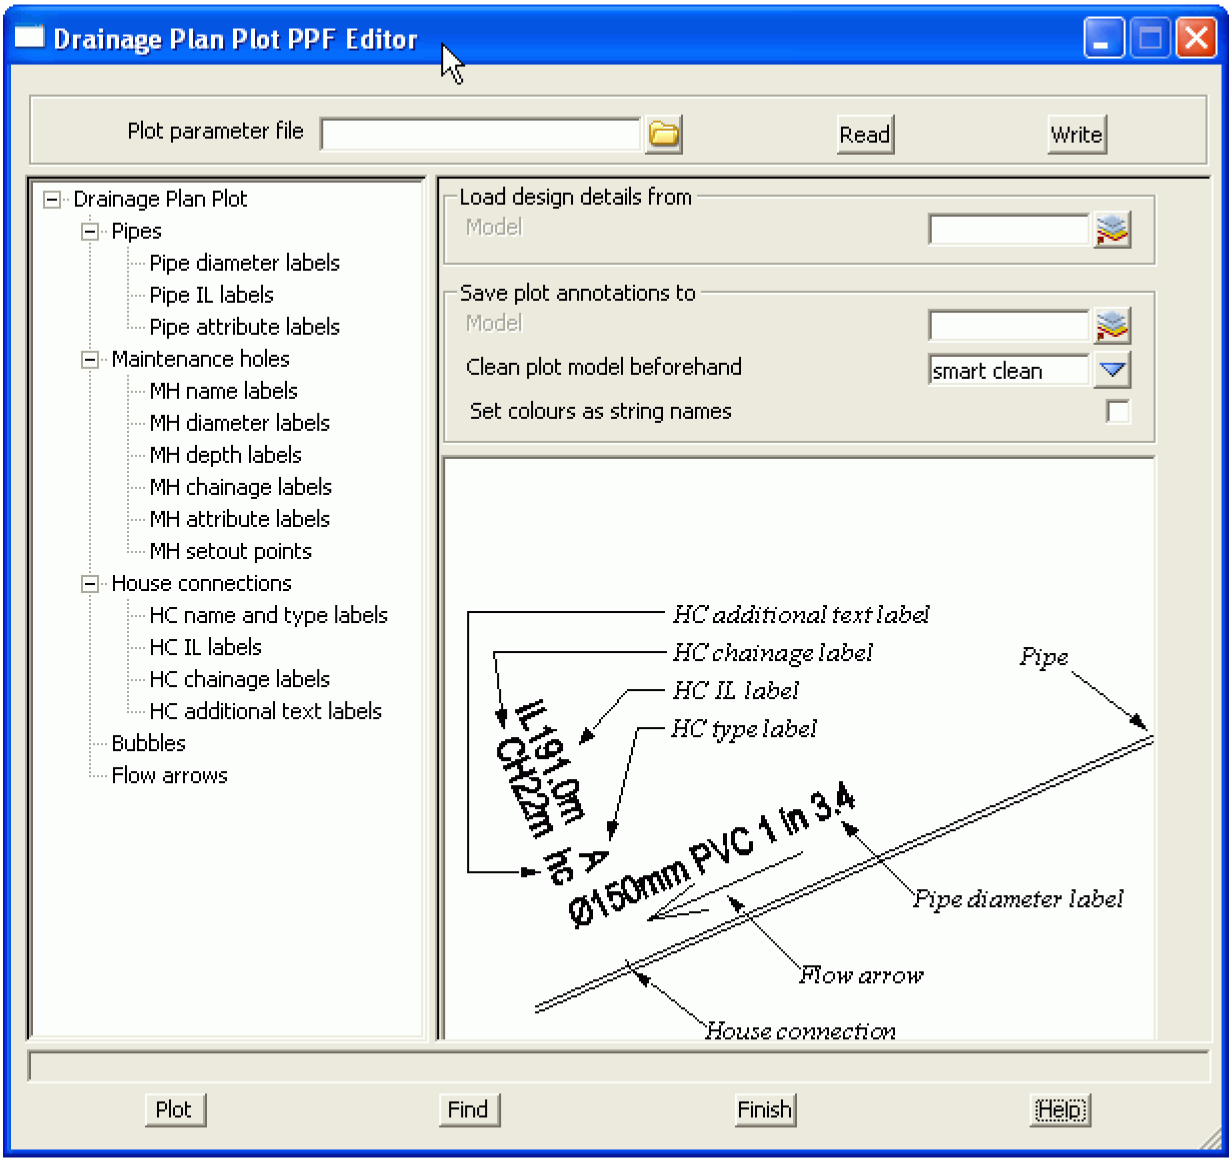
An example is shown below



Usage

This option is accessed from the menu selection

Design => Drainage-Sewer => Plots => Plan Annotations



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameter file	file box		

Optional - no dpf is required. The default settings will create a schematic drainage drawing. A custom dpf may be selected if desired.

Load design details from model box

data source for drainage strings to be labelled

Save plot annotations to modelmodel box

labels to be created are stored here, Undo will remove the labels created

Clean plot model before hand choice box *smart clean will update text that has been moved and clean the rest. Full clean will all text from the plan annotations model.*

Set colour as string name tick box

when selected the string colour will be used for the string name (to be used for DWG/DXF export using map files)

Plot button

Creates the labels in the model specified

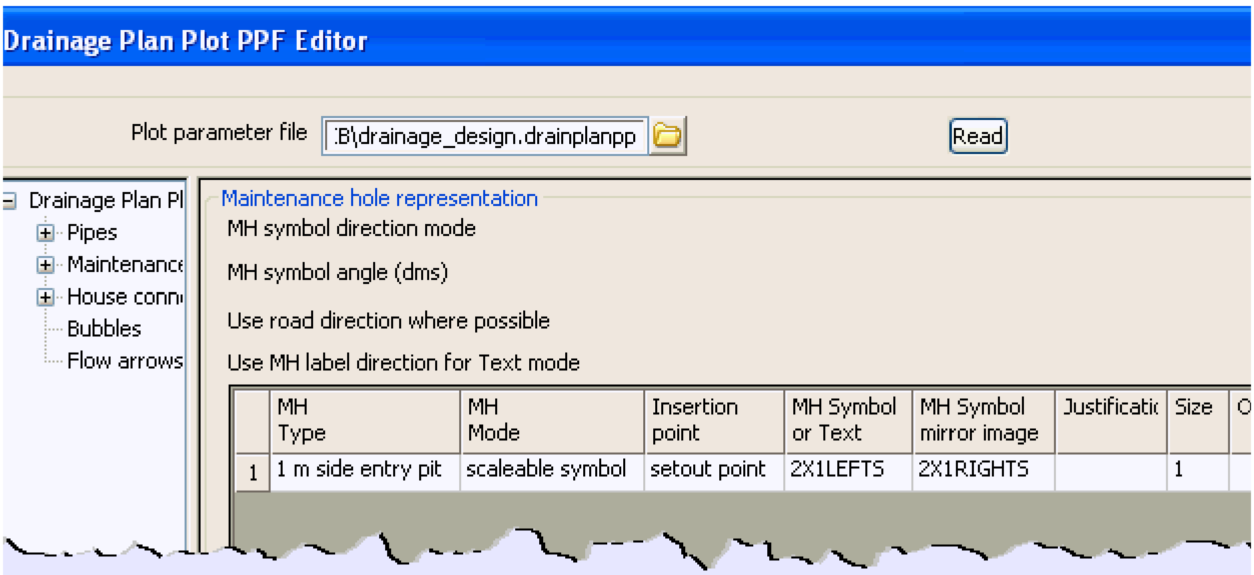
Find button

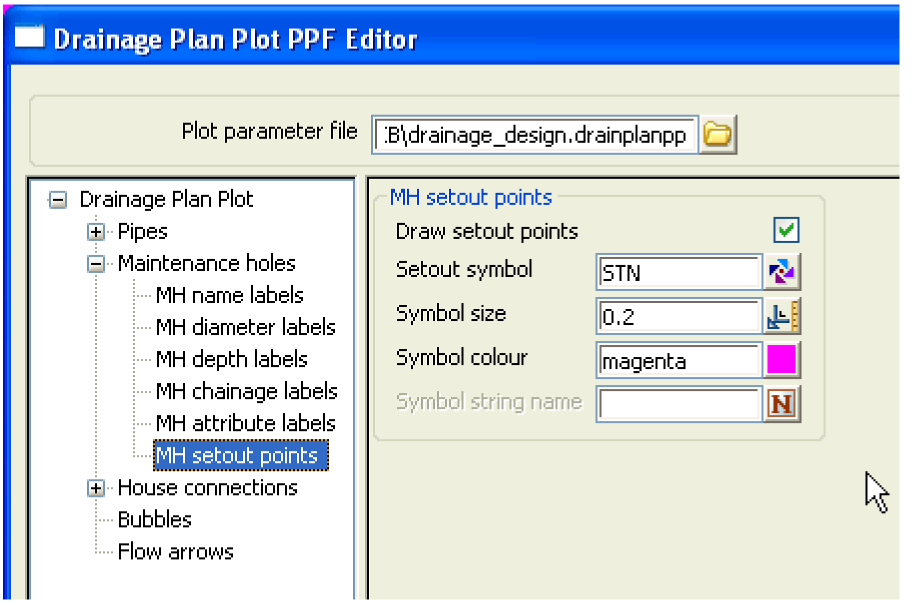
used to locate plot parameter input boxes using Version 5 plot parameter names

IMPORTANT! to turn off any data change the text height to zero.

Select **Maintenance holes** from the tree to set the symbols to be used for the various pit types.

Select the MH type as desired and use **scalable symbol** and **setout point**. For the symbols enter the names that you used when you created the symbols.





Plotting a symbol at the pit setout point is a good confirmation of the data printed in the setout reports. The settings to create this symbol are shown on the left.

17.0 Drainage Long Section Plotting - Hatching Under Roads

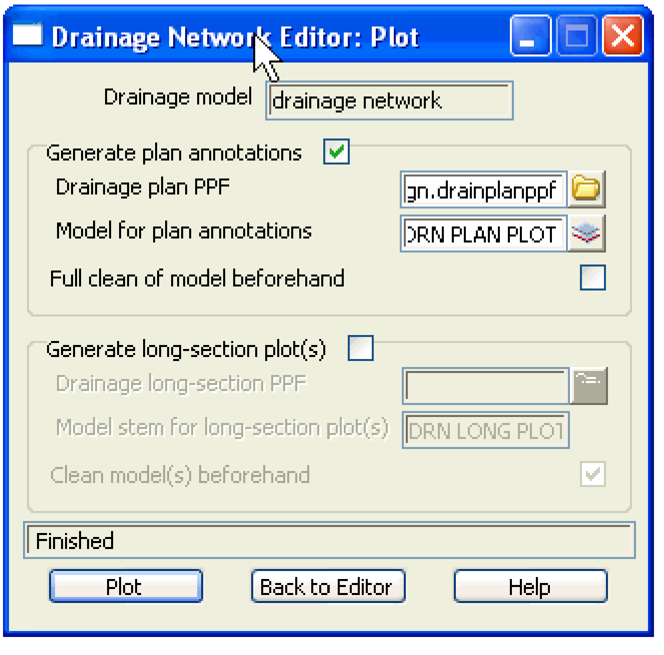
The drainage long section plotting has been discussed in the Intro Drainage Course. Here we will discuss the technique for hatching under roads and/or footpaths.

The following steps are required.

1. Run the Excavation volumes routine using the obvert templates to create sections and strings for a tin on top of the pipe (obvert tin). Select **Stop section at end of manhole** to prevent the pits from being hatched
2. Create the obvert tin from the strings and sections then and null by angle length with a small length value so that the tin is nulled near the pits.
3. Create a design tin that extends to the limit of the roads.
4. Use the hatching section of the drainage long section plot to select the hatching style.

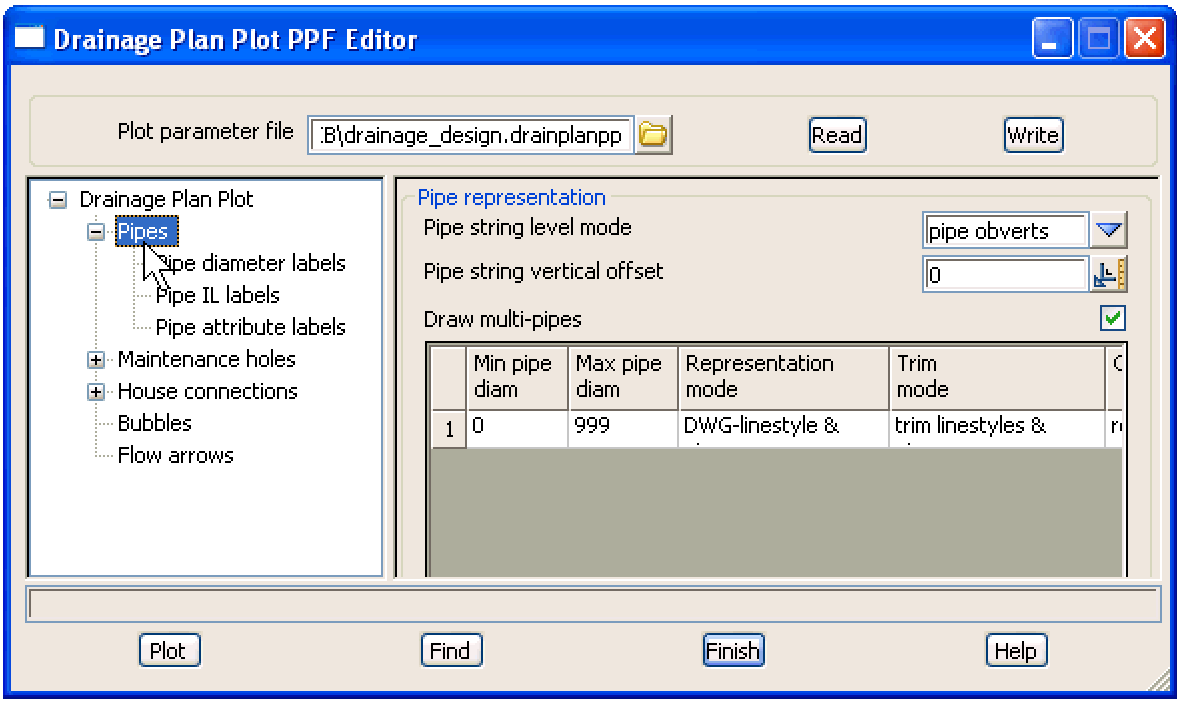
17.1 Creating the Obvert strings.

Run the Drainage Plan Plot by selecting Plot from the Drainage Network Editor.



Select the drainage_design ppf file from the library.

Select the folder icon then **Open** the ppf.

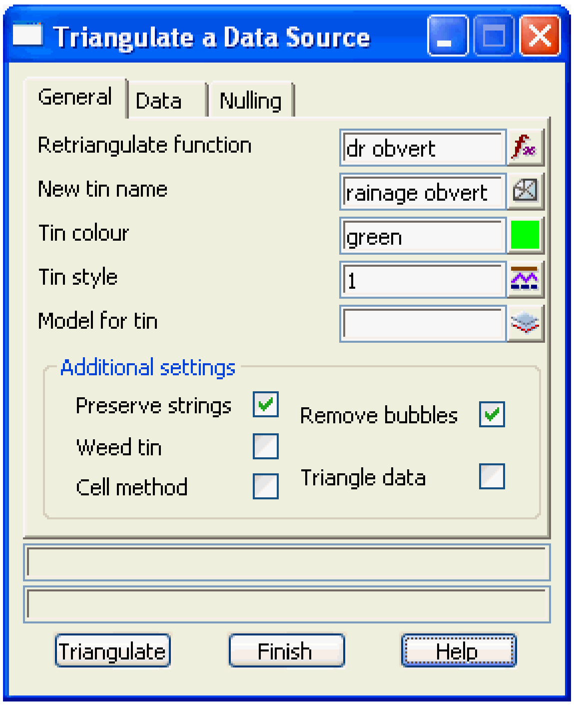


Confirm that the **Pipe string level mode** is set to **pipe obverts** and that all symbols with elevations are not used. This include:

- MH setout points,
- Flow arrows,
- pit symbols

Now plot the drawing and we will use the pipe strings at the obvert level to create a tin.

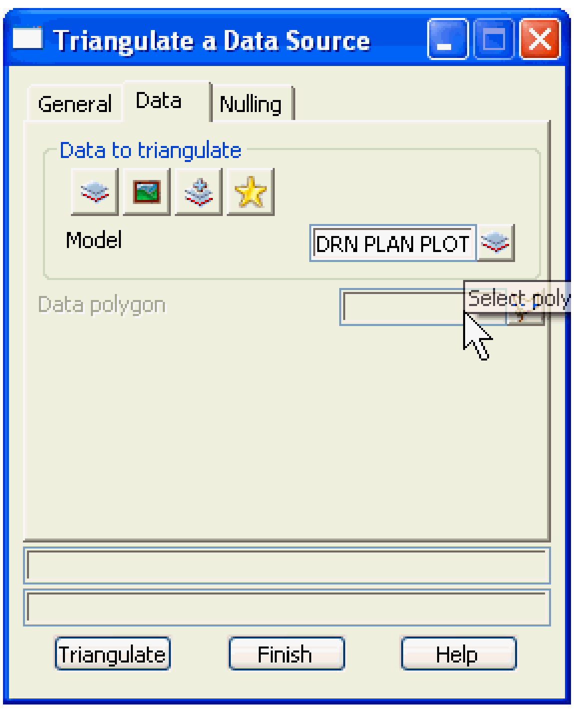
17.2 Create and Null the Obvert tin

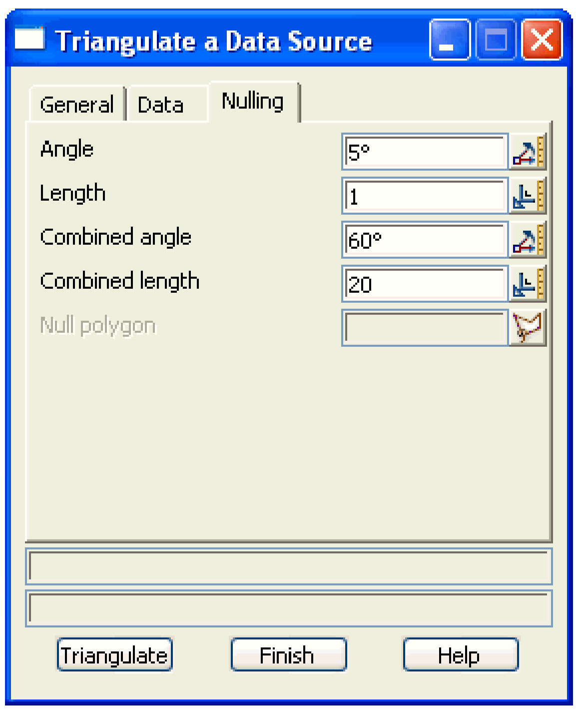


To create the obvert tin select.

Tins->Create->Triangulate Data

Enter a **New tin name** as desired.





Select the **Data** tab.

Select the plot model created above.

Select the Nulling tab

Enter a **Length** that is less than the pit diameter and greater than the largest pipe.

Select **Triangulate**

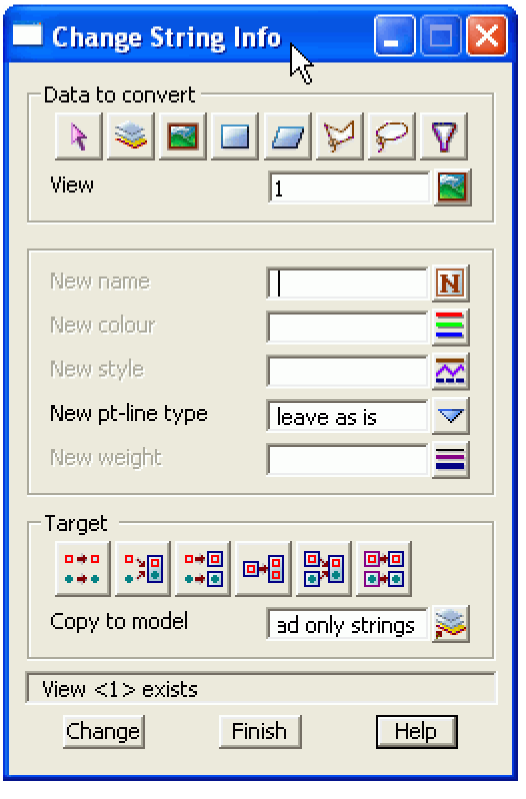
The tin will now only exist on top of the pipe and it is ready to use for hatching.

17.3 Create a Roads Only Tin

The design tin is already nulled to remove the long triangles. If the footpaths were to be excluded from the tin then they should be removed from the road design strings. You could run a template that did not include the footpath and has a **Final Maximum slope width** of zero or just copy the desired road strings to one model and remove unwanted strings. We will use the later techniques.

Add all of the road string and kerb return models onto one view and then select

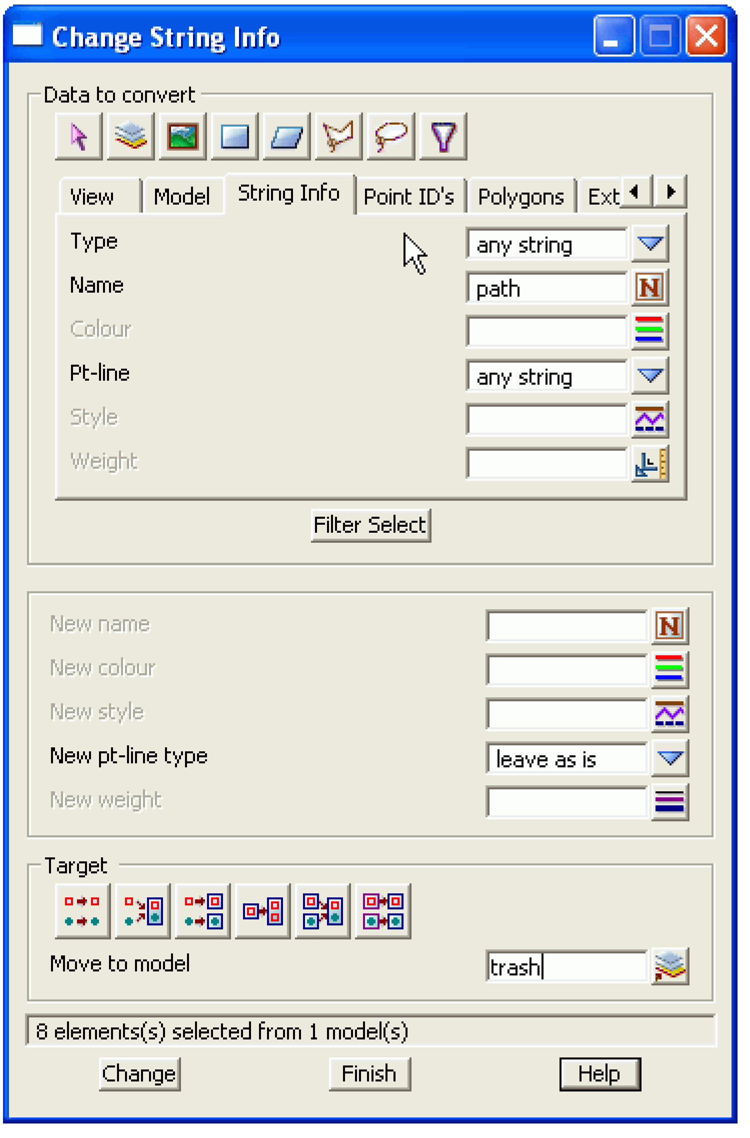
Utilities->A-G->Change



View select the view that contains all of the road strings

Copy to model type the name of a model for all of the road strings.

Select **Change** copy the strings.



Select the **Filter** icon at the end of the selection strip. Now select the **Model** tab and select the **Name** of the model that holds all of your road and kerb strings **road strings only** (tab not shown here).

Select the **String Info** tab and enter the name of the strings that you want to remove from the road only model. In this case it is **path.**

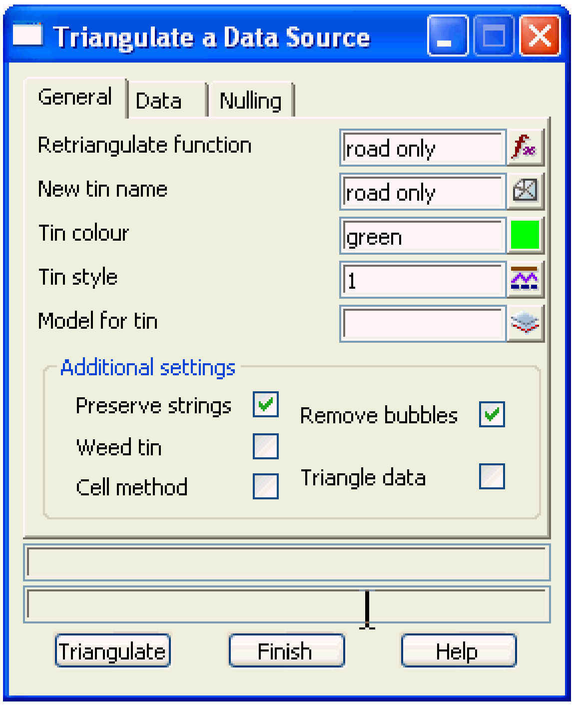
Select **Filter Select** to select these strings.

Select the second **Target** button **Move to model** and select the model **trash** and then select **Change**.

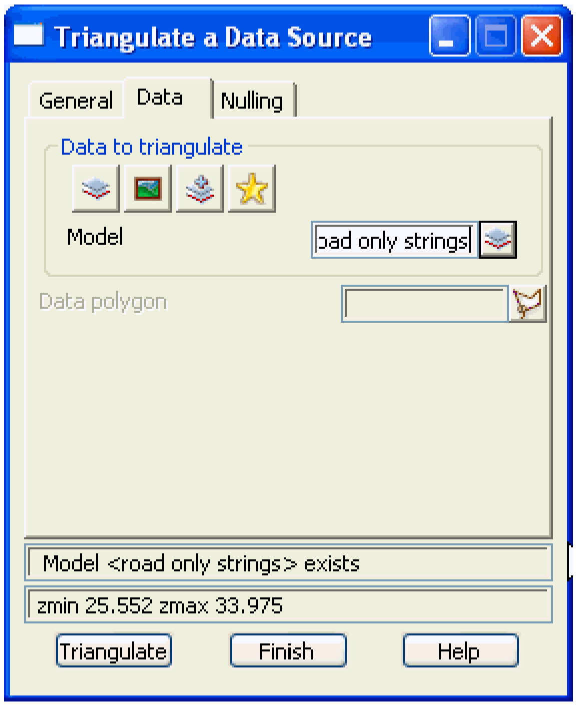
Repeat this for string names **int.**

We are now ready to triangulate the road only tin.

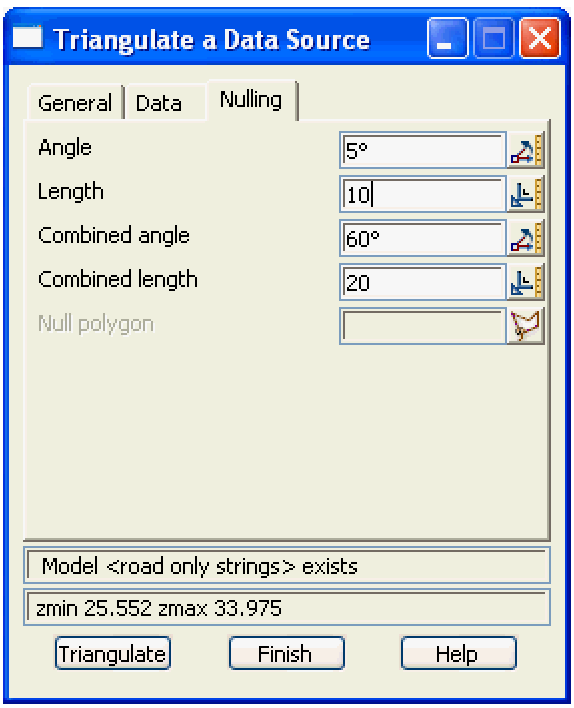
Now to create the tin select **Tins->Create->Triangulate data**



Enter a function name (optional) and **New tin name** and then select the **Data** tab.



Model - Select the model containing the road only strings.



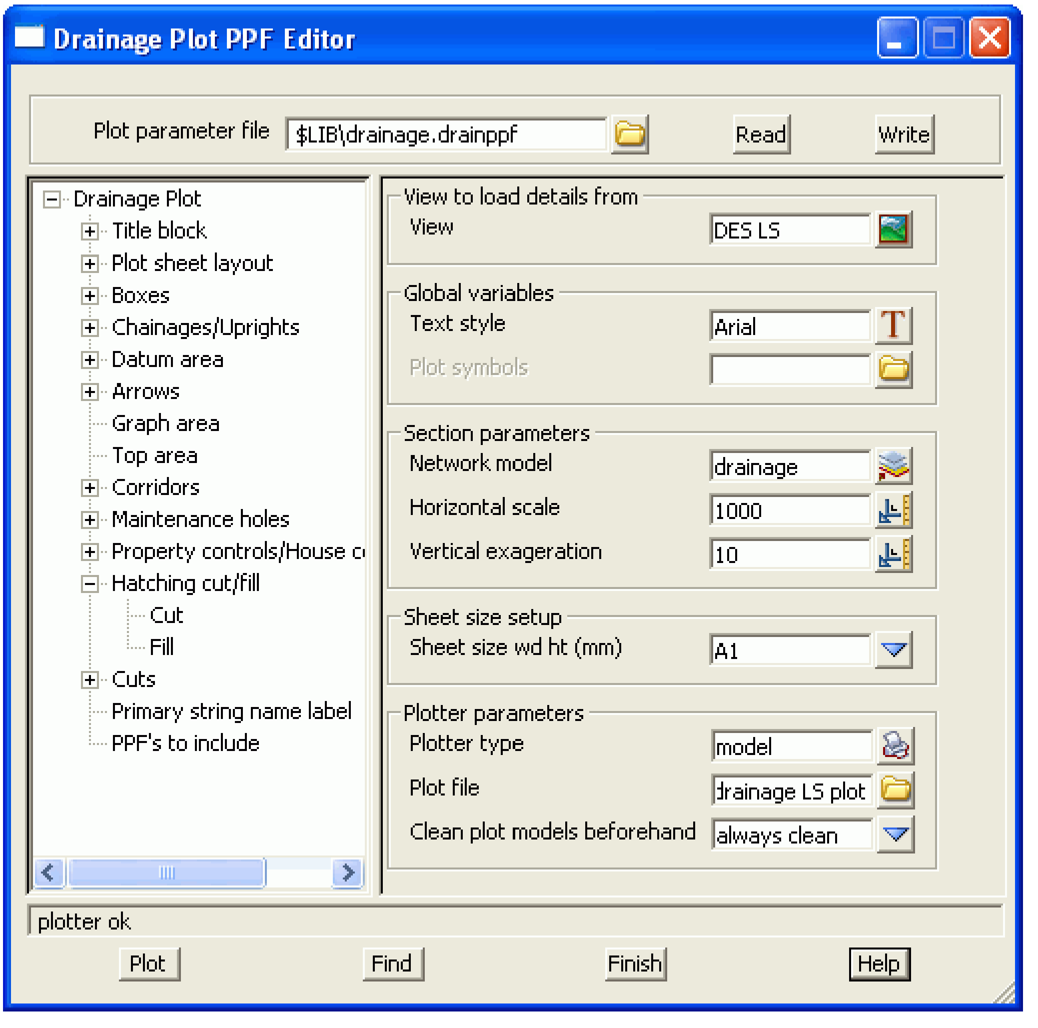
Length - Select a length just greater than the width of half the road so that the tin will not be nulled from the end of the roads.

Select **Triangulate.**.

17.4 Use the Hatching Feature in Drainage Longsections

We are now ready to create the drainage longsection plots. Set up a section view with the a string in the drainage model profiled, the vertical exaggeration set, the desired tins displayed and the service models added. From the main menu select,

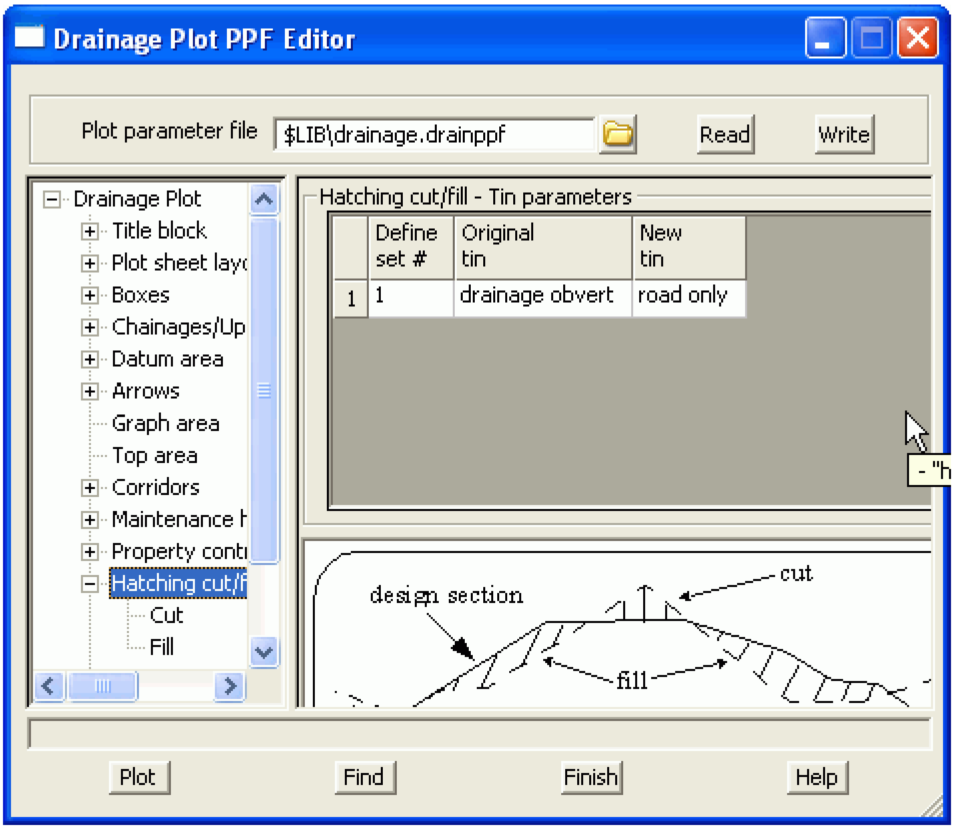
Design->Drainage-Sewer->Plots->Longsections



From the **Plot parameter file** field select a drainage longsection ppf from the library and then select **Read.**

In the **View to load details from** field select the section view you have setup for the drainage long section.

Now select **Hatching cut/fill**

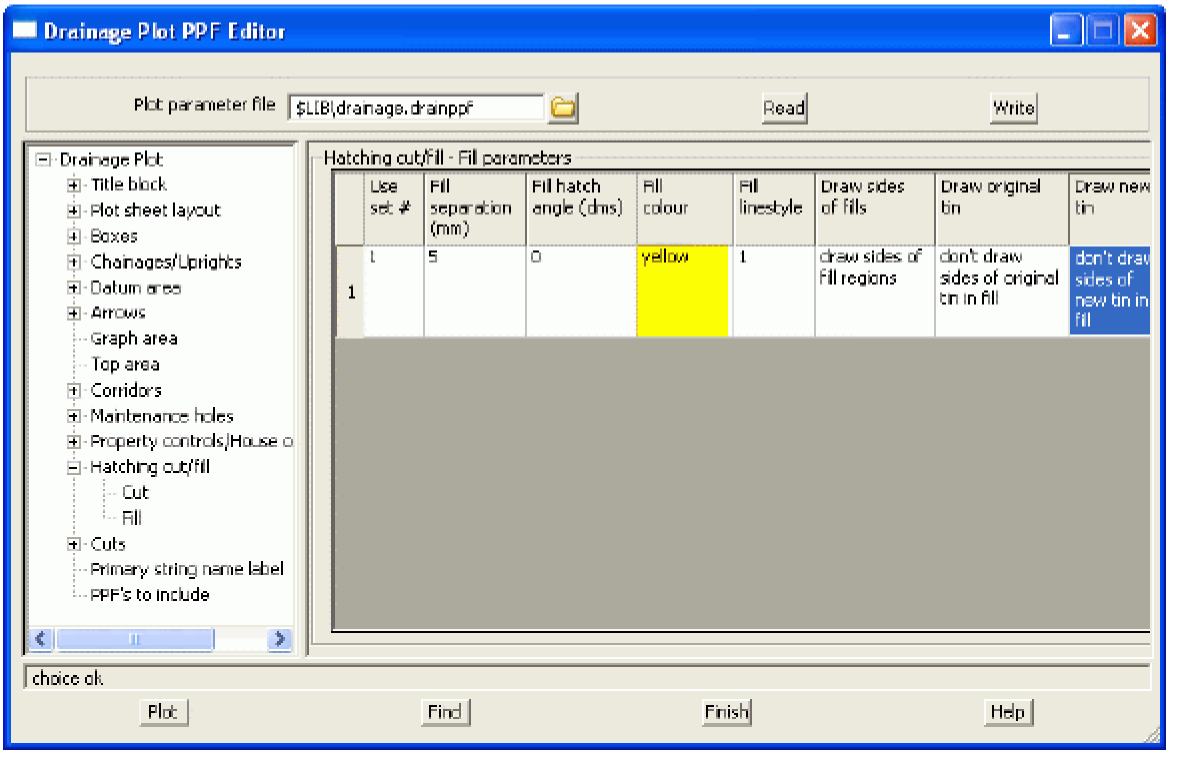


Define set is set to 1.

Original tin is set to the obvert tin.

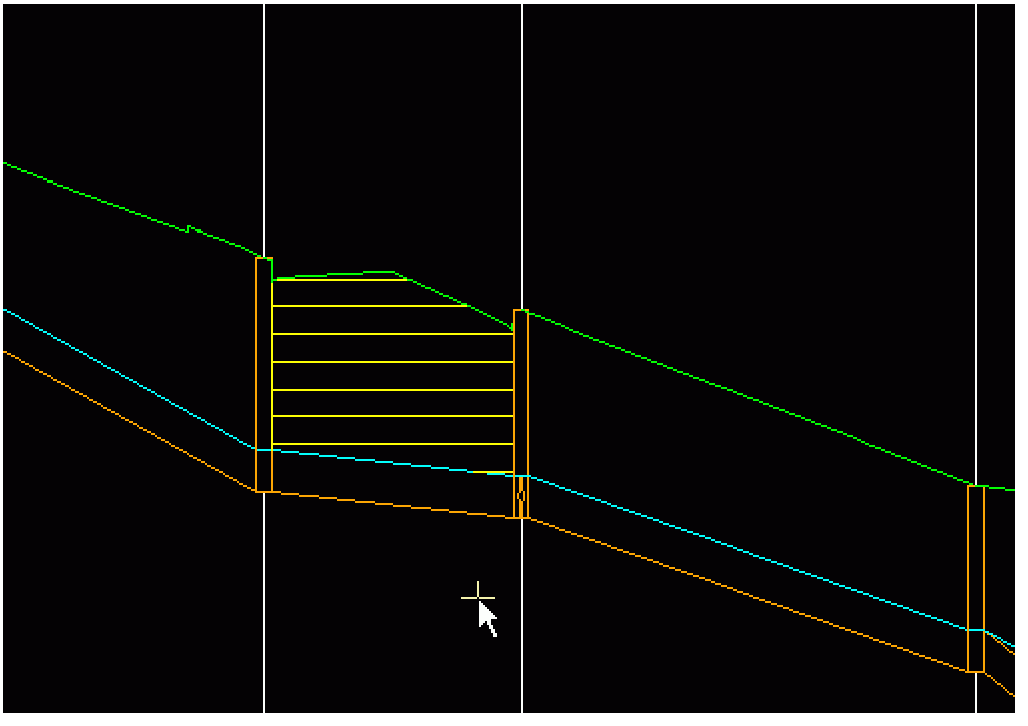
New tin is set to the road only tin.

Now select the + beside the **Hatching cut/fill** and then select **fill.**



Use set # is entered as 1. **Fill separation, hatch angle, colour and linestyle** selected as desired. **Draw sides of tin, Draw original tin** and **Draw new tin** are not required unless you want these extra line in the drawing.

Select **Plot** and add the plot model **drainage LS plot1** onto a PLAN view to preview the drawing.



The hatching is shown to the left at a 2mm spacing with the tins and sides not drawn.

18.0 Flooded Width Analysis and HEC RAS

There are 2 flooded width methods in the drainage module. The first can be used with any of the external drainage packages and the second is part of the 12d storm analysis. The first is found on the main menu

Design->Drainage-Sewer->Calc flooded widths

The name of the overland flow string becomes the name of the HECRAS project.

1.0

1.0 Dynamic Stormwater Design

This manual, the **Dynamic Stormwater Design,** describes how to use 12d model to calculate catchment hydrographs and perform unsteady flow hydraulic computations on drainage networks.

The rainfall runoff and loss methods supported include the time area unit hydrograph (ILSAX) with Horton infiltration (from runoff), and the New Zealand SCS hydrology method.

The starting point for this manual is a 12d drainage network already constructed with catchment areas assigned, inlet and manhole properties set and vertical grading applied. These tasks are described in detail in the **Stormwater Part 1 Design Course.**:The network will have open channels, bypass flow routes and pits with inlet capacity settings as described in **Stormwater Part 2Design Course**

This manual, **Dynamic Stormwater Design Course** contains**:**

- review and modifying the 12d hydro file with respect to IFD data, rainfall temporal patterns, infiltration loss methods (horton and SCS curve numbers),
- selecting the hydrological runoff method (Ilsax2 or NZ SCS) and the infiltration loss method,
- using cross section shapes cut from the tin for bypass flow paths and open channels
- running the analysis and reviewing the graphical output, plan and long section plots and the custom spreadsheet reports.
- create parallel pipes with different sizes and invert levels,
- adding and initial sizing of storage basin with fixed discharge,
- discuss graphical basin links,
- create outlet structures including, culverts, weir spillways, orifice controls, bubble up pits,
- underground storage tanks,
- bypass over road crown
-

2.0 Starting with a Basic Drainage Network

In this document, the generic terms **pit** or **manhole** refer to inlets, catch basins and manholes. The exception to this is when referring to inlet types in the Drainage Network Editor (DNE). The term **manhole** specifically refers to an inlet with zero inlet capacity. Pit types, dimensions and inlet capacities are set in the drainage.4d file.

These course notes assume that you have completed the Stormwater Design Course and that you have experience creating 12d model drainage networks with catchments areas. This course will begin with a completed drainage design found in the directory

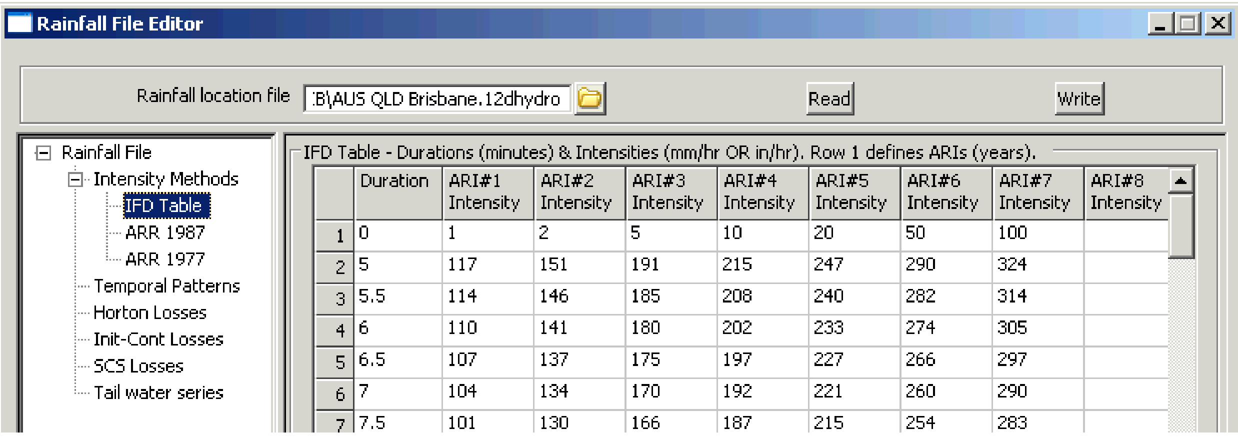
\12d\9.00\Courses\drainage\basins

The project name is basins.

3.0 Hydro-Rainfall File with Infiltration

Access the rainfall editor from the main menu

Design->Drainage-Sewer->Rainfall Editor



Key Points

1. Several rainfall files are shipped in the 12d library as examples.
2. One of the 3 Intensity method MUST be entered. Do not leave blank rows in the IFD Table.
3. All dynamic drainage runs require temporal patterns.
4. Dynamic drainage (ILSAX 2) requires Horton losses
5. Dynamic drainage (NZ SCS) requires SCS losses
6. Rainfall data is in mm/hr NOT mm (important for NZ)
7. Tailwater series are time versus elevation data for outlets.
8. Initial and continuing losses are not supported in release V9c1e

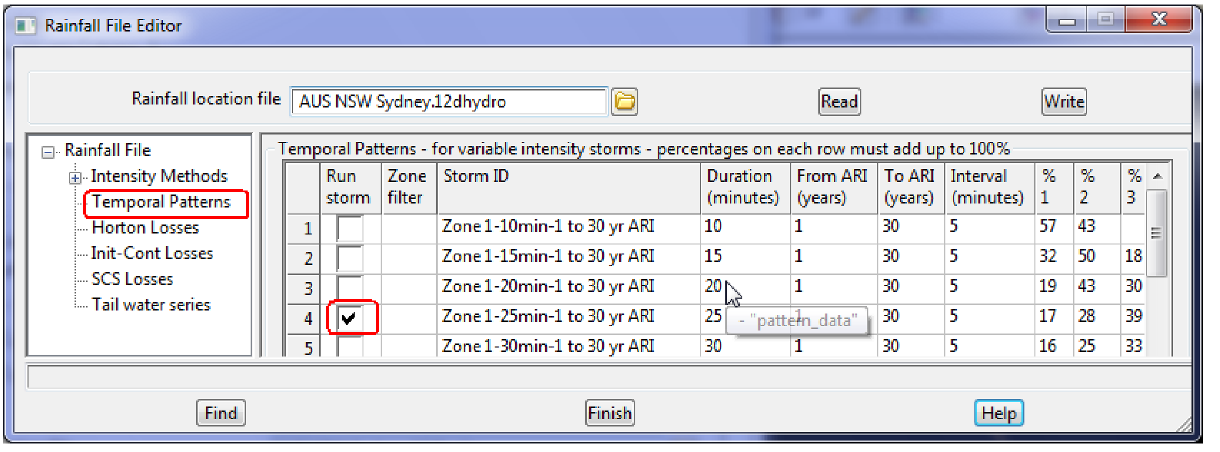
3.1 Intensity Frequency Duration (IFD) Data

The **IFD table** method is the most common (refer to figure above). The rainfall intensity is entered in mm/hr for metric data and in/hr for US units. The top row is the return period in years and the first column is the rainfall duration in minutes. The top left corner cell is always zero.

When using the TP 108 method for the Auckland region, the 24hr rainfall depth is extracted from the Appendix A and then converted to mm/hr before entering it into the IFD table. Thus only 2 lines may exist in the 12d grid.

Note that areal reduction factors must be accounted for by the user as they are not included in the 12d rational hydrology engine.

3.2 Rainfall Temporal Patterns



Temporal patterns are referred to as storms in dynamic drainage. Several example hydro files are included in the 12d library. These examples have the temporal patterns for the minor and major storms in the 8 zones of Australia.

Temporal patterns are not required for the SCS NZ method as the standard 24 hour temporal pattern from TP108 is built into the 12d analysis engine.

The **Run storm**, **Zone filter, From ARI** and **To ARI** columns are used determine which storms are analysed (run). The **Run storm** column must be checked for that temporal pattern to be analsyed. Many storms may be selected.

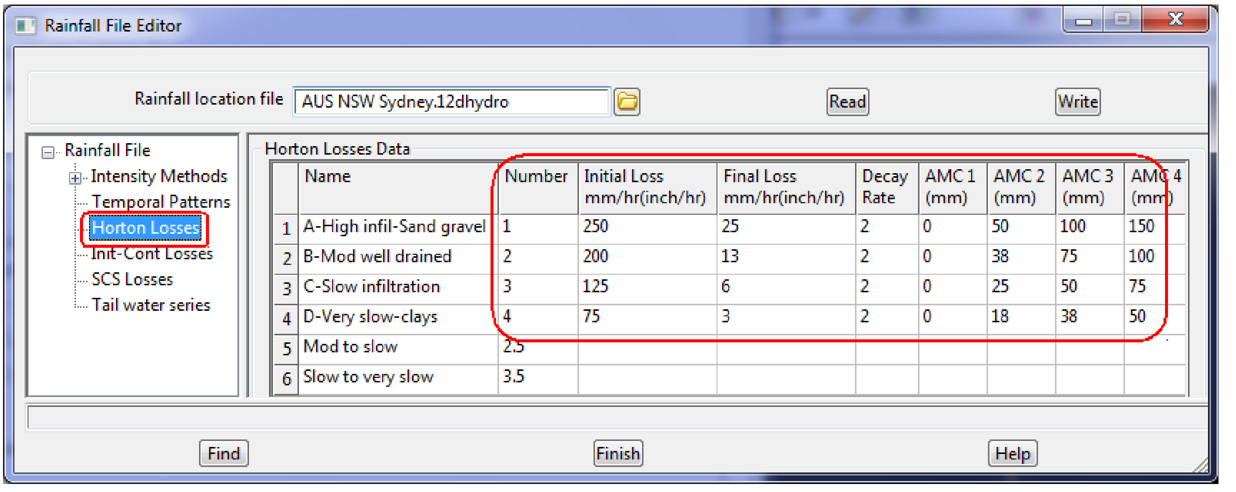
The **Zone filter** is optional. Entering a value here will allow the selected storms to be further filterd. A **Zone filter** field (accepts wild card characters) is found on the DNE Global tab that is used to determine which of the selected storms (paragraph above) are analysed.

The **ARI** field on the Run panel is used with the **From ARI** and **To ARI** columns. The value on the run panel must be within the From-To range for the storm to be analysed.

The **Duration** column determines the total length of the storm. This value divided by the **Interval** must be a whole number and this number determines the number of **%** values to be entered to the right of the **Interval column.** The total of the percentage must equal 100.

3.3 Horton Losses

The pervious portion of the catchments used in the **ILSAX 2** analysis will have a loss type defined describing the soil type. The loss type is defined in the DNE Default->catchment and catchment tabs.



These soil types use the classifications of Terstriep and Stall (1974), based on the system developed by the U.S. Department of Agriculture. The default values entered from the library represent the soil types of

1. Type A - low runoff potential, high infiltration rates (consists of sand and gravel
2. Type B - moderate infiltration rates and moderately well-drained
3. Type C - slow infiltration rates (may have layers that impede downward movement of water)
4. Type D - high runoff potential, very slow infiltration rates (consists of clays with a permanent high water table and a high swelling potential)

Numbers are assigned to each soil type to allow interpolation between the defined soil types. When interpolated values are used they must be included in the list (2.5 and 3.5 for example). Interpolated values do not need loss data entered. If loss data is entered for the interpolated names then this data will be used rather than an interpolation occurring. If any loss data is entered then all of the values must be entered.

Four preset AMC points are defined in the rainfall file to mark AMC conditions ranging from dry (AMC1) to saturated (AMC4). The required data for each line is the **Initial loss rate, Final loss rate, decay rate** and 4 antecedent moisture conditions **(AMCs).** The AMC values are entered in depth of rainfall (mm) they represent the total rainfall prior to the start of the temporal pattern.

The AMC point numbers are set once for all catchments on the DNE Global tab. Value between 1 and 4 (decimal value are permitted) are entered for the minor and major events.

3.4 SCS NZ Losses (Initial Abstraction and Curve Numbers)

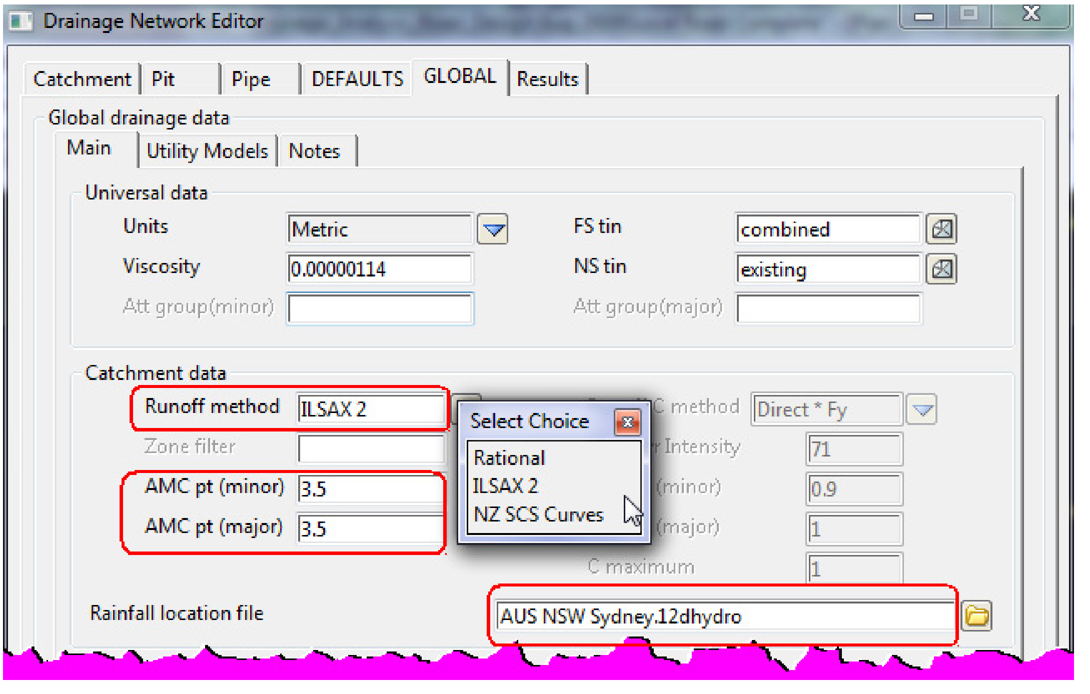
The SCS NZ method uses Initial abstraction (Ia) and the curve number (CN) to determine the losses for the catchments. Names are given to the SCS curve numbers in the rainfall file. These names and Ia (entered as storage values) and selected in the DNE catchment data.

A curve number of 0 results in zero runoff while a CN=100 results in 100% runoff. TP 108 recommends the selection of the curve number by identifying 1) the soil type and 2) the land use. A CN=98 an Ia=0 are recommended for impervious areas.

4.0 Rational to Dynamic ILSAX2 in the DNE

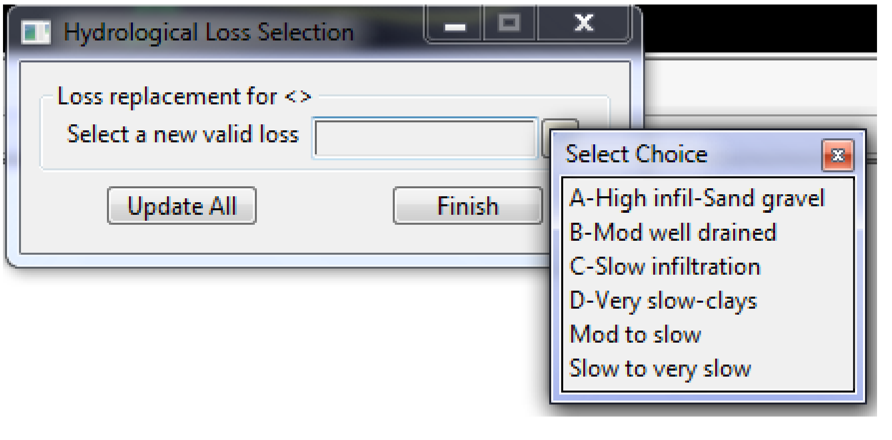
The user does not have to start with the rational hydrology method but since this method has a pipe sizing algorithm it is often run first. The following steps will prepare a drainage network for dynamic hydrology.

Changing to ILSAX 2 is done on the DNE Global->Main tab.



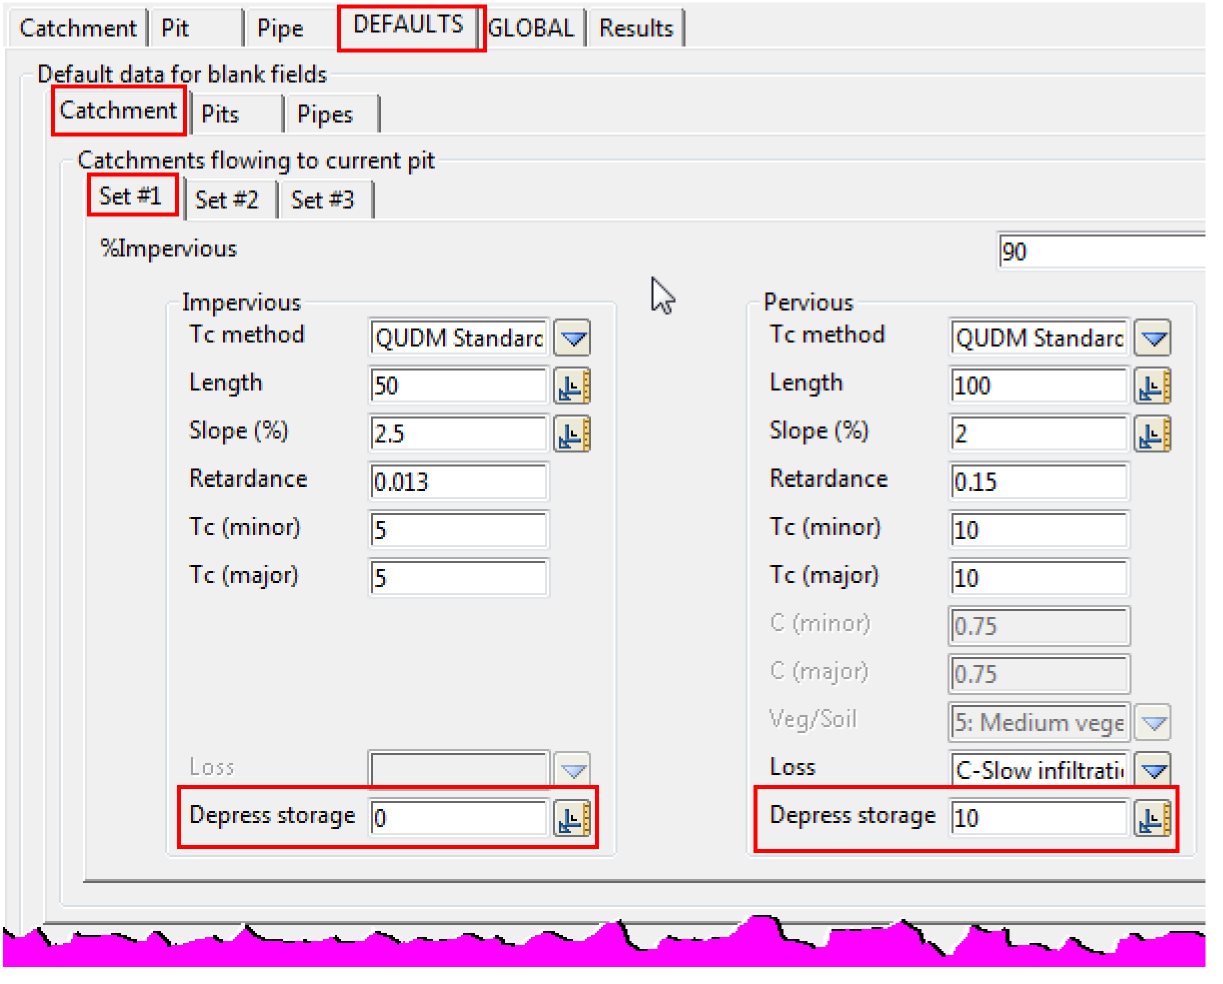
4.1 Infiltration Losses

If this is the first time in this project you have switched to ILSAX2 you will be prompted for the default infiltration loss. These loss types are retrieved from the rainfall location file (Horton losses) specified above. Select one of these and then select **Update All**. These losses are only applied to the previous percentage of the catchment.



4.2 Storage Losses

Both the impervious and pervious portions of the catchments have storage losses. This amount of rainfall depth (in mm) is removed from the start of the rainfall pattern. The default values are entered on the **Defaults Catchments** Tab.



5.0 Rainfall Runoff Calculations

12d currently supports 2 rainfall runoff methods.

See ILSAX 2
See SCS NZ

5.1 ILSAX 2

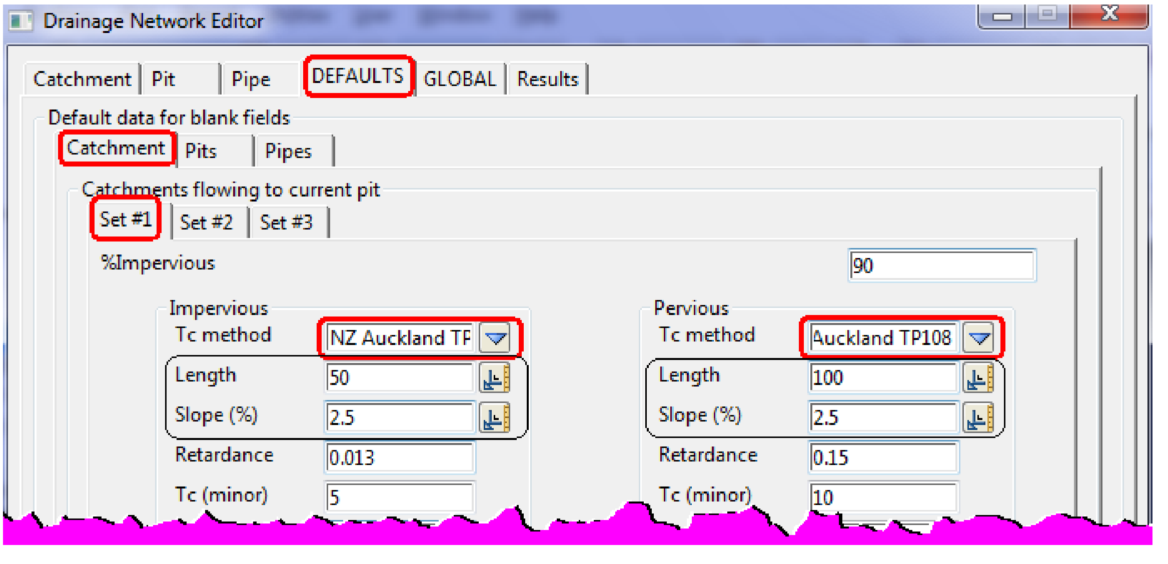
The ILSAX mode 2 uses a triangular shaped unit hydrograph with the time to peak equal to the recession time. The time to peak equals the tc value throughout the 12d DNE.

5.2 SCS NZ

The SCS NZ uses a unit hydrograph as described in TP 108 Table 4.1 (hydrograph number of 3/4). 12d calculates the time to peak value (tp) = 2/3 the time of concentration (tc).

The %impervious value is used to create a composte CN and a composite initial abstraction Ia

One of the optional tc methods uses the equation derived from a regression analysis of Auckland catchments (BCHF, 1999c). On the **Defaults->Catchments->Set 1** tab set the Impervious and Pervious Tc methods to **NZ Auckland TP108**. The default length and slope values will be used unless they are specified for each catchment.



6.0 Dynamic Hydraulics

As with the rational method hgl calculations it is essential that the pit grate levels are entered correctly. With no bypass specified, water is lost from the analysis when the hgl exceeds the grate level. When bypass is specified the water will not be lost until the level exceeds the highest bank of the bypass section shape (see below).

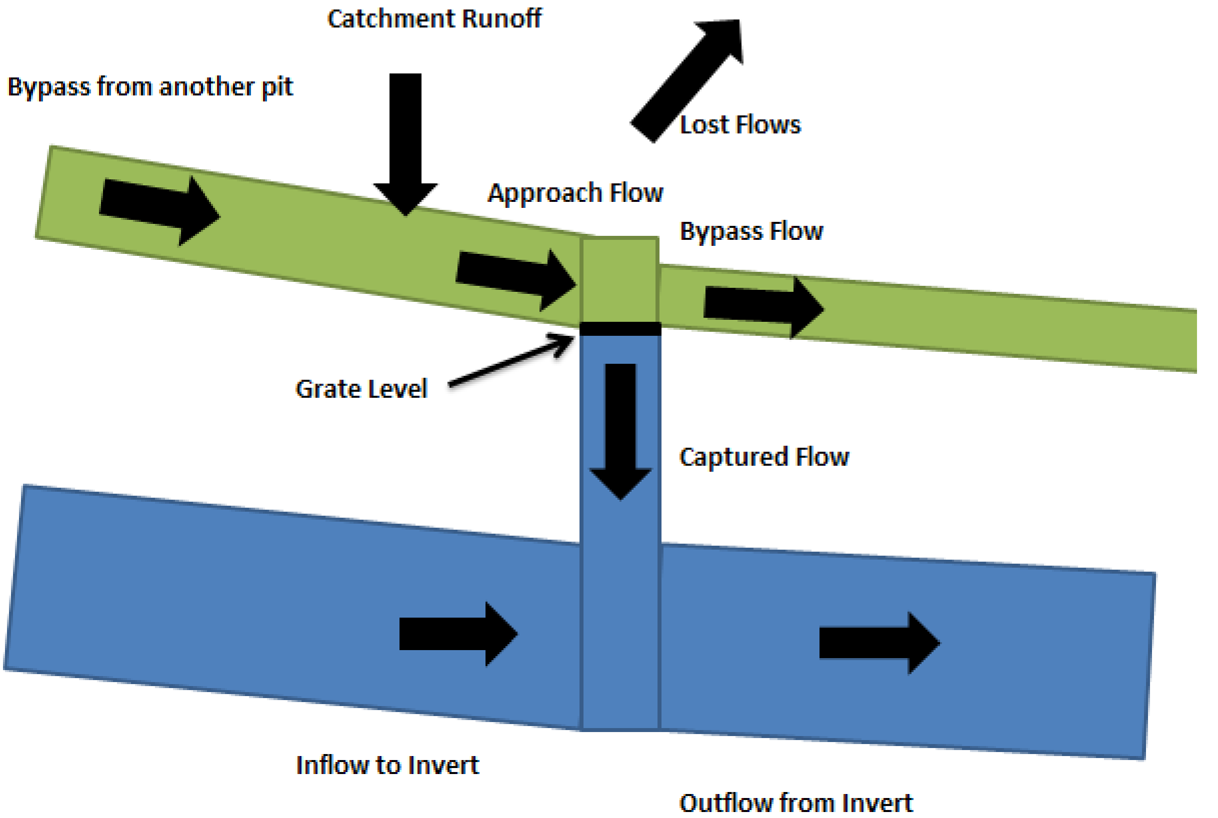
12d uses the St Venant unsteady flow and continuity equations to solve for the flows in the pipe network. With these equations it is the water level in the pits that determines how much flow travels through the conduits. The hgl is not calculated from the flows. Viewing the results from this perspective will help immensely.

6.1 Flows in and out of the Pits

The diagram below shows the possible flows through a pit. When bypass is used, there are 2 hgl levels; one level for all of the conduits with inverts at or above the grate level and another for conduits with inverts below the grate level.

The pit inlet capacity and choke factors determine the amount of approach flow that is captured. If the HGL of the subsurface reaches the grate level, the captured flow becomes zero and only the surface hgl is used to determine the flows in all conduits. When the hgl drops below the grate again, 2 hgl levels will again be used.

The continuity balance is monitored during analysis and the results of this check are stored as a model attribute “dynamic/xx/calculated hydraulic continuity error percent” where xx is the duration of the storm. A detailed output file is also created for each storm analysed. The file name begins with the name of the drainage model and ends with the storm duration (plus the extension rpt).



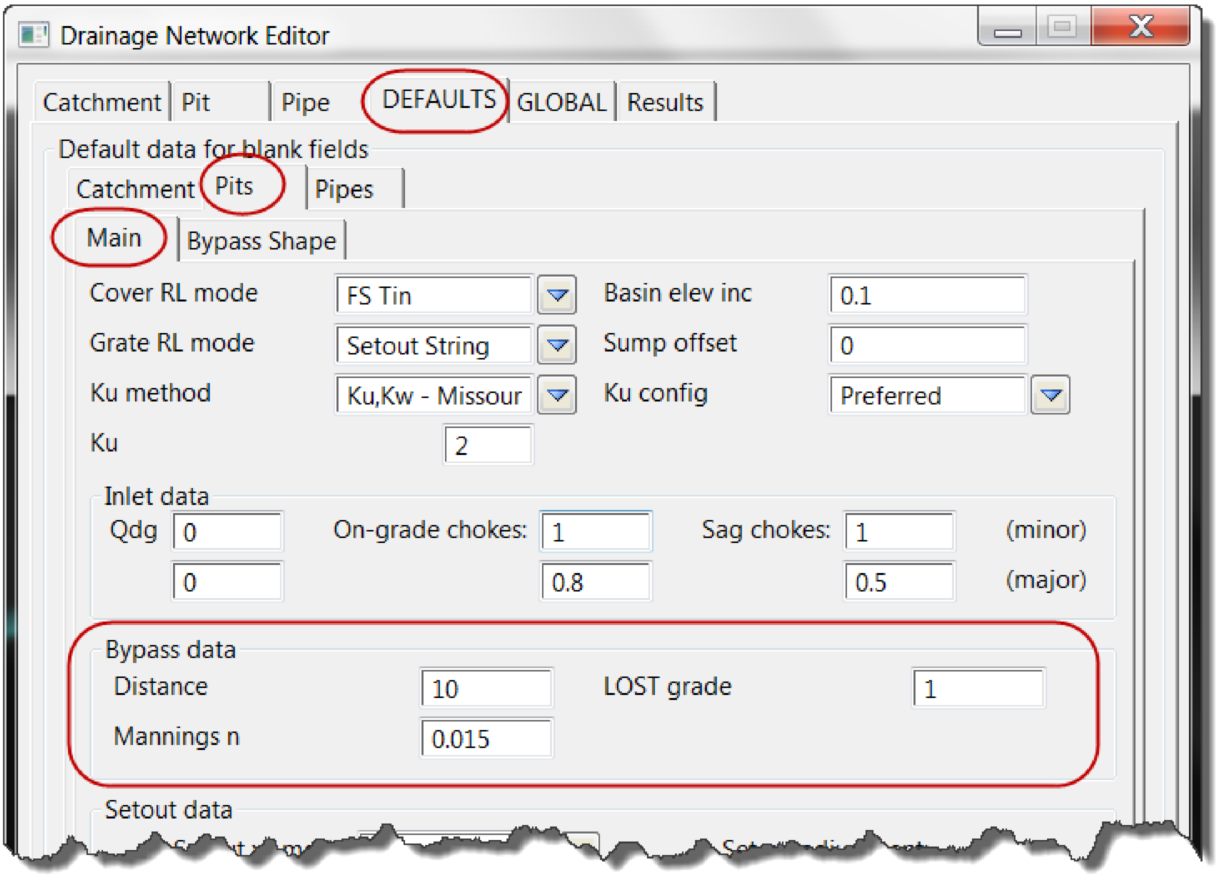
6.2 Default Bypass Section Shapes and Slopes

In the rational method, bypass flows (water that could not enter the inlet because of either inlet constrictions or hgl levels) were bypassed to the **Bypass pit**. With the dynamic analysis, a channel shape is required so that the hgl levels and the storage effects can be modelled. If all of the bypass routes have the same shape then you need only cut one default shape and it will be used for all routes. However you can enter a shape string for every bypass route if desired.

The bypass **distance** is determined from the length of the bypass flow string and the channel has a constant grade. If a changing grade or channel shape is required then the bypass should be to a drainage line modelled as a natural channel (see section further in the notes).

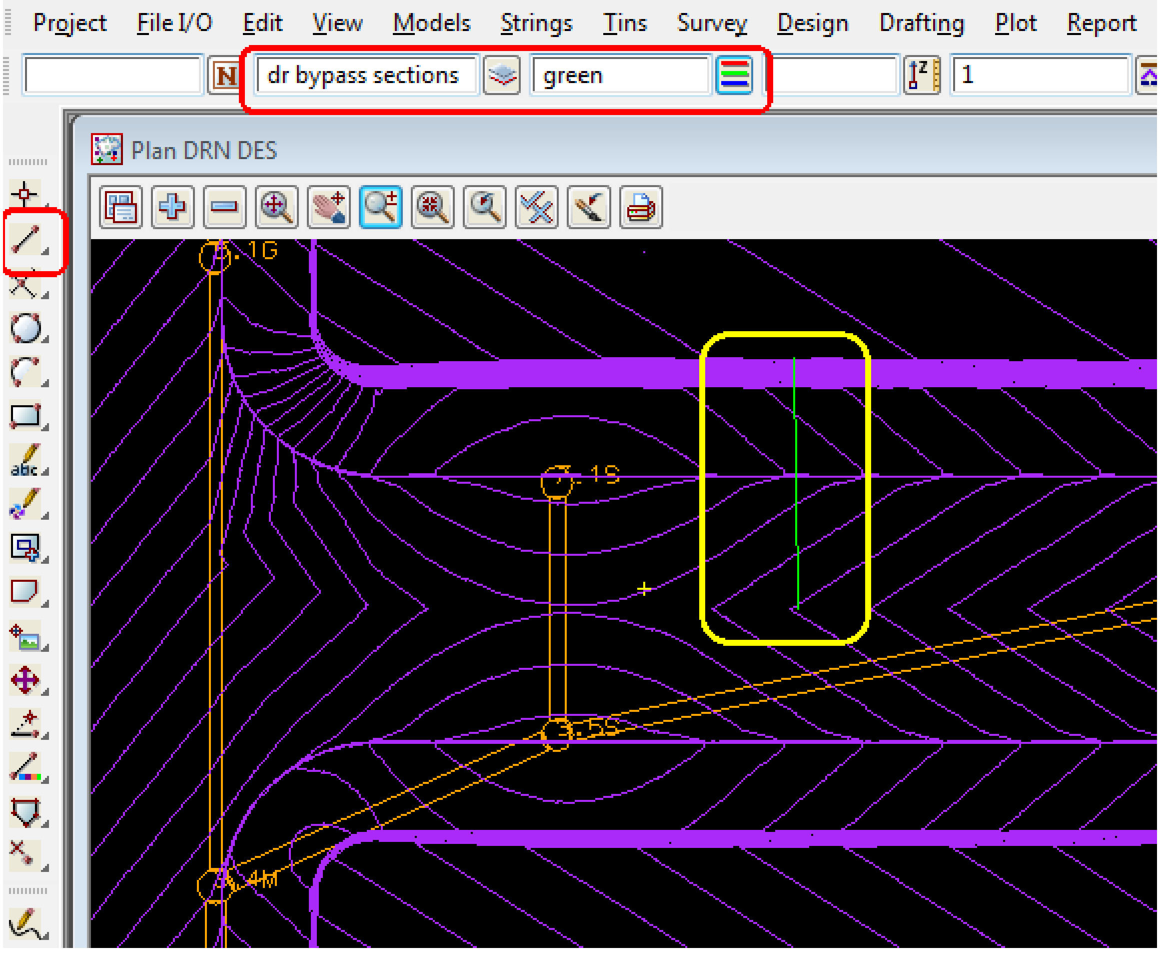
The invert elevations of the bypass channel are set by the grate elevation of the upstream and downstream pits. However, when the bypass is to the pit LOST then there is no downstream grate level so the slope of the bypass channel will be defined. The **Lost grade** value is specified here as 1%. 12d needs this to determine the water forces try to hold the water into the bypass channel.

The **Manning's n** value is the default for the entire section. If left and right bank n values are desired they are entered on the **Bypass Shape** tab.



6.3 Create and Editing Channel Shapes

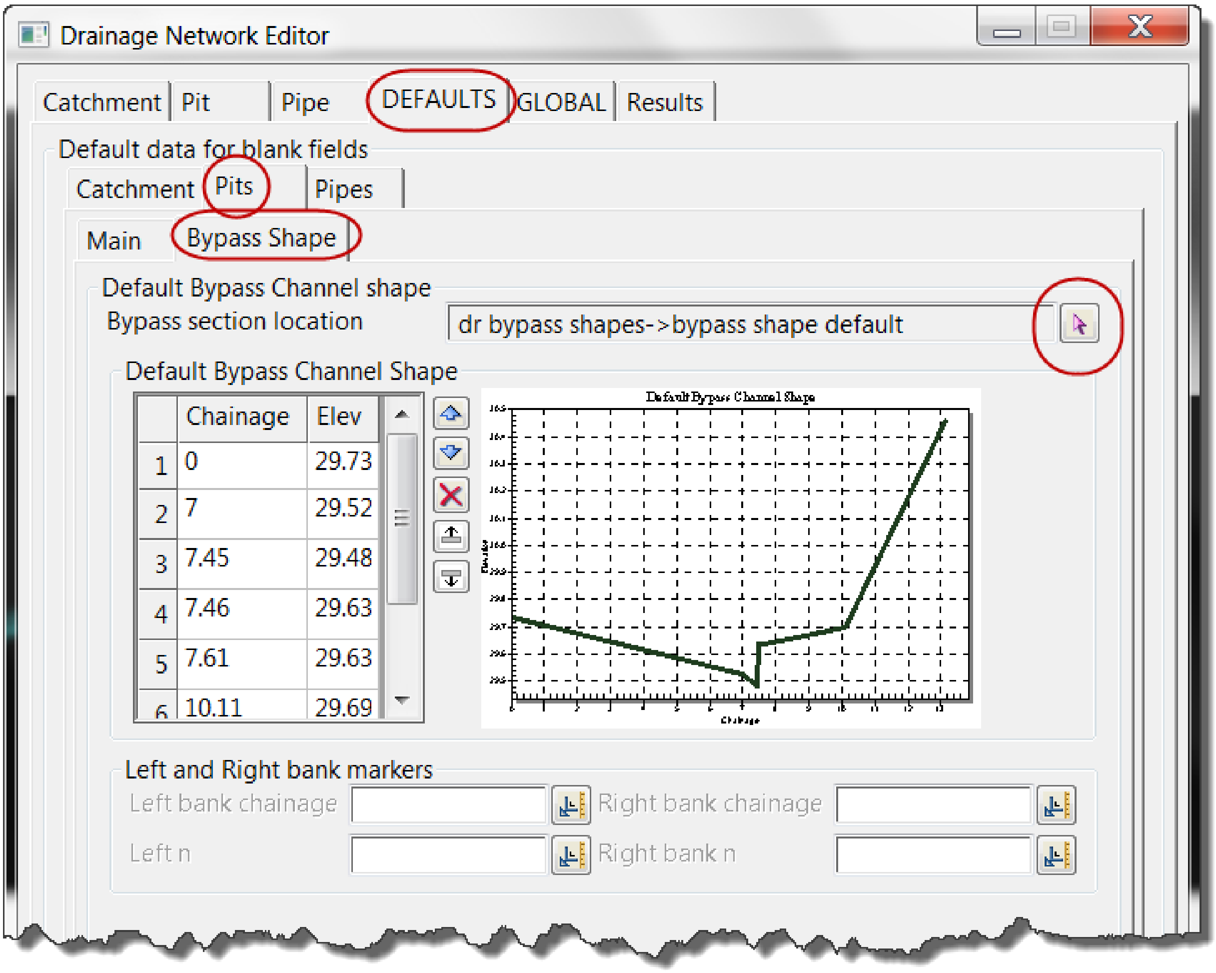
The channel shape may be entered manually or created by drawing a string perpendicular to the flow path and 12d will cut section from the finished surface tin. It is recommended that you keep you section shape strings in one model for data management purposes. The strings are drawn from left to right looking in the direction the bypass string (the direction of flow). To create this string enter the new **model name** in the **CAD Control Bar**. Entering a name for the string is optional. If only 2 points are to be used for the shape string then use the **Create Line** button from the **CAD** tool bar.



After drawing the string it needs to be selected via the **Bypass section location** pick button (see below). Once picked and accepted, select **Set Pit Details** to have the bypass shape cut from the finished surface tin specified on the Global tab. This shape may be seen on the **Bypass Shape** tab and the chainage elevation data displayed.

The elevations on this graph are not used. The data is relative to the lowest elevation on the section. This becomes level 0.0 for the shape and the channel inverts added to determine the final elevation.

Left and right bank n values may also be entered if desired. They **Left n** is used to the left of the **Left bank chainage** and the **Right n** is used to the right of the **Right bank chainage**. The centre chainage is entered on the **Default->Pits->Main** tab.

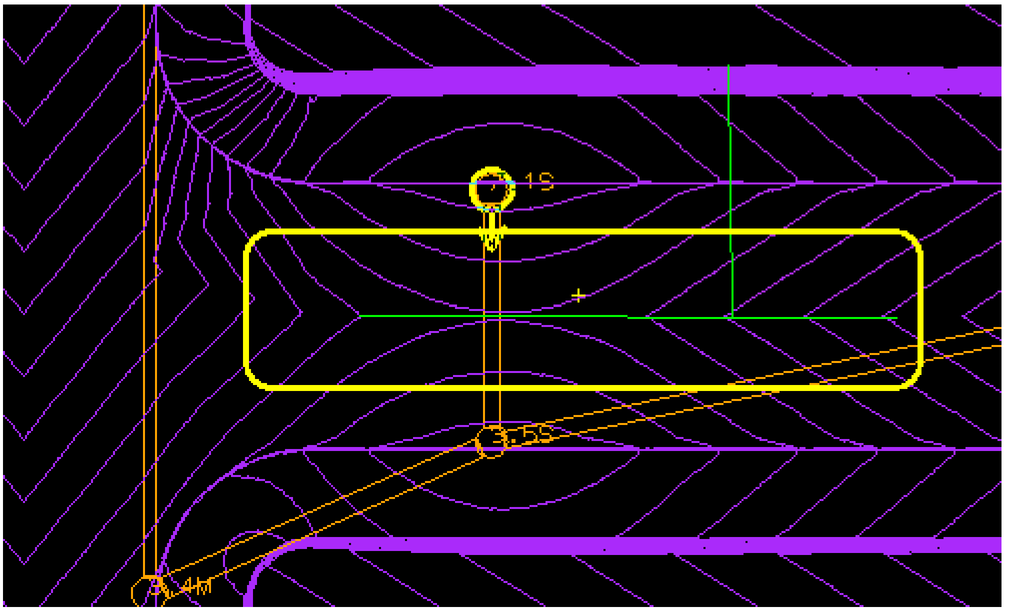


If you manually change any of the chainages and elevations they will be lost the next time you select **Set Pit Details**. To prevent this RB select the **Bypass section location** and select **Clear**. Now there is no string so the data cannot be recalculated.

6.4 Explicit Bypass Section Shapes and Slopes

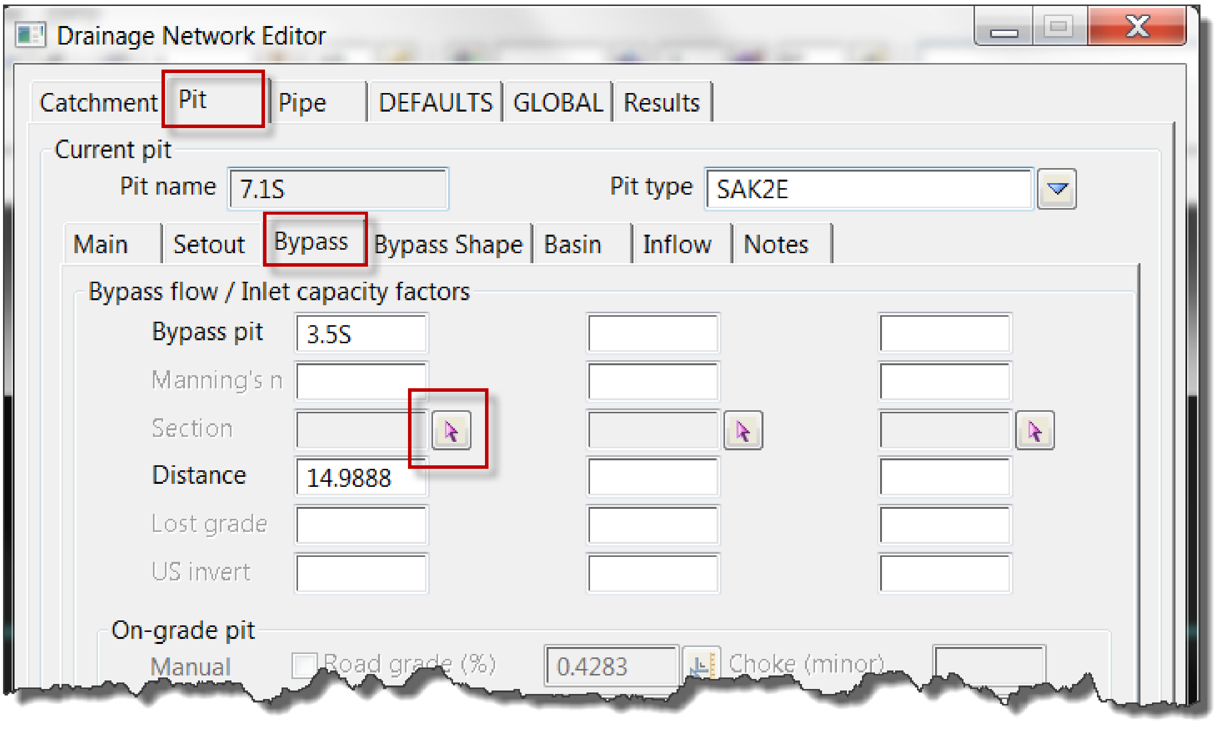
We will now explicitly define a bypass flow shape for bypass link. Water flow across the crown of the road should not use a kerb and gutter shape. Instead we need the shape and invert elevation for the road crown that the water will overtop.

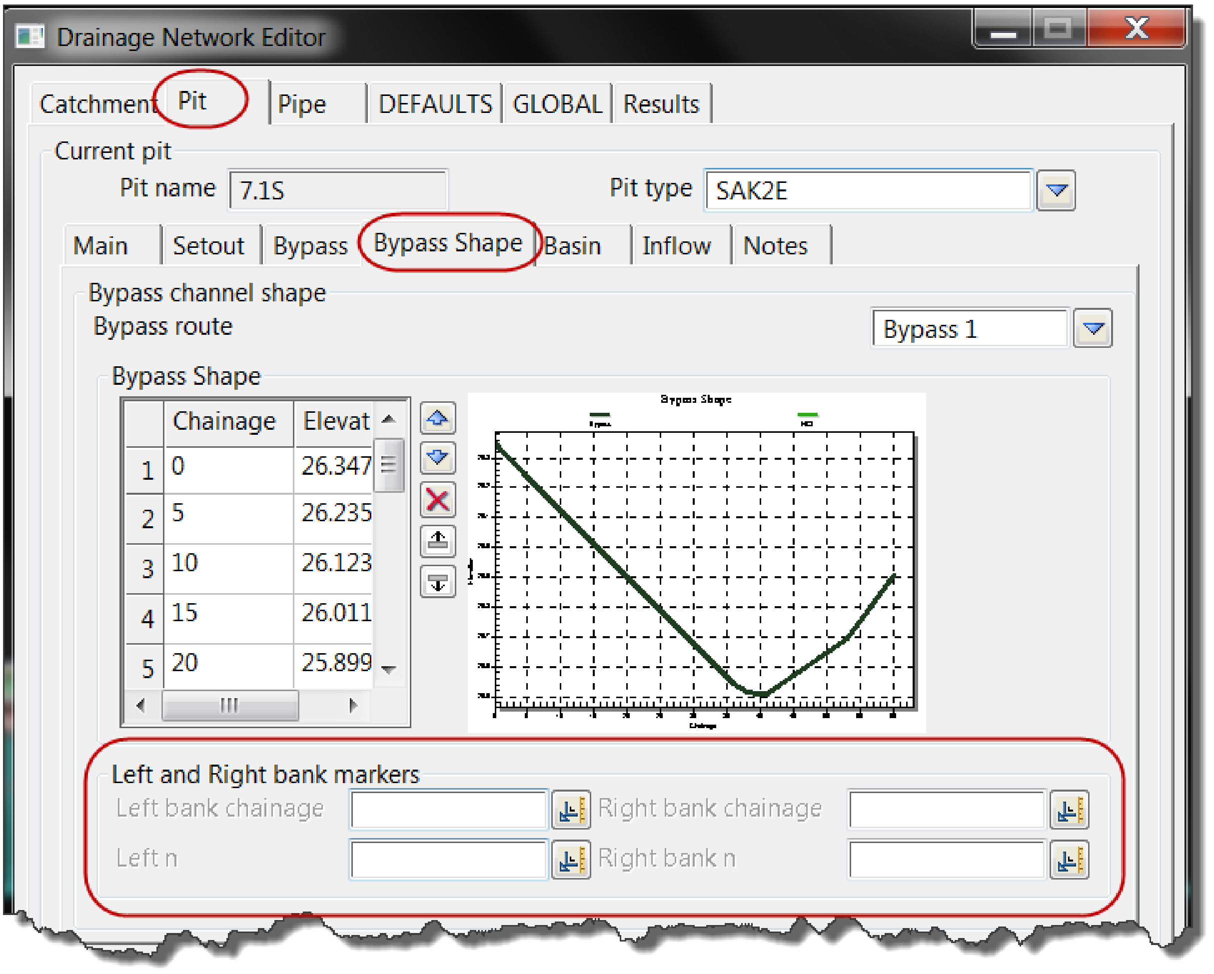
To create a shape string for the bypass across road 2, draw the string from east to west (left to right looking in the direction of flow).



Now select the bypass shape for crossing the crown of the road. Select the **Set Pit Details** button to have 12d calculate the bypass shape from the finished surface tin. Change to the Bypass Shape tab to see the shape. Note the **bypass pit** and **Distance** fields will already be completed from the bypass flow string calculations. Entering a manning's n value is optional.

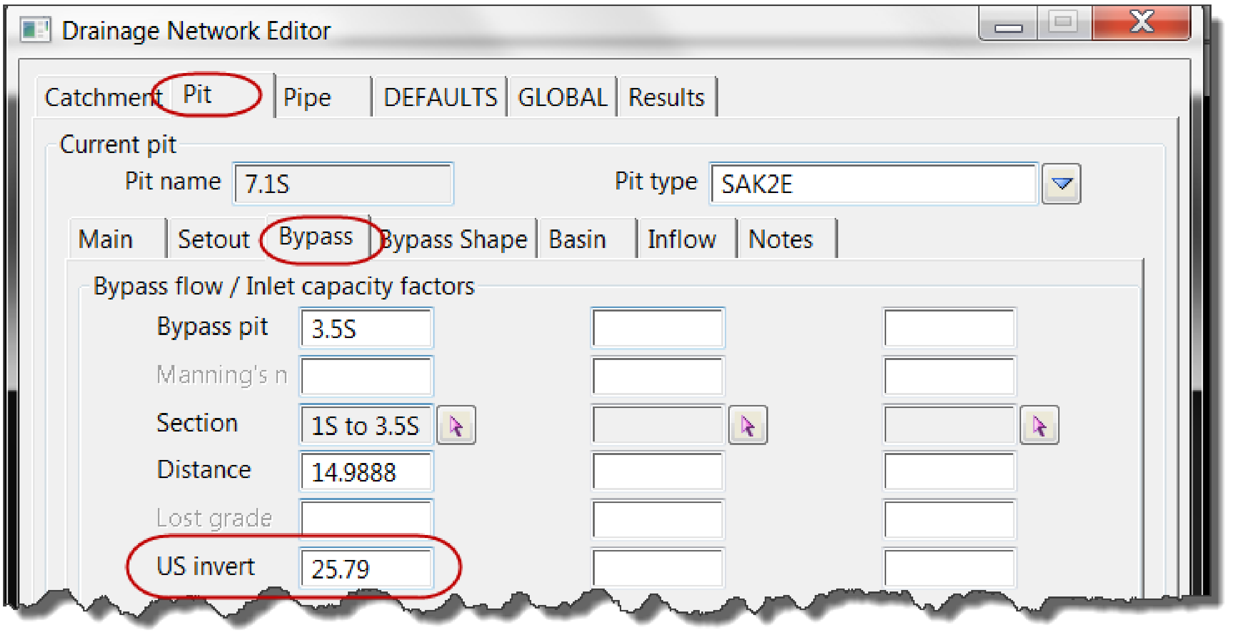
You will also note that there are 2 other bypass flow routes that can be used. To use these the bypass pit and distances will need to me manually set. The hgl above the grate determines the head that will drive the water down the various channels.





The enlarge the plot RB select inside the graph area and select **Maximise** from the menu. Note the lowest level on the section shape is approximately 25.5. This is the grate level of the pit. Press **Esc** or select the title area to close the graph. Left and right channel n values with their chainages may be entered in the fields below the graph. If these values are left blank the n value from the centre of the channel will be used, NOT the n values from the default bypass channel shape.

If this bypass shapes was to be used in the model now, the bypass channel would go from one grate level to the other without any reference to the crown of the road level. To model the flow path from the crown of the road to the pit 3.5S we will raise the upstream invert level to the road crest level (25.790).



Select the **Apply** button to store the changes and note that the lowest point of the bypass shape graph is now raise the 25.79.

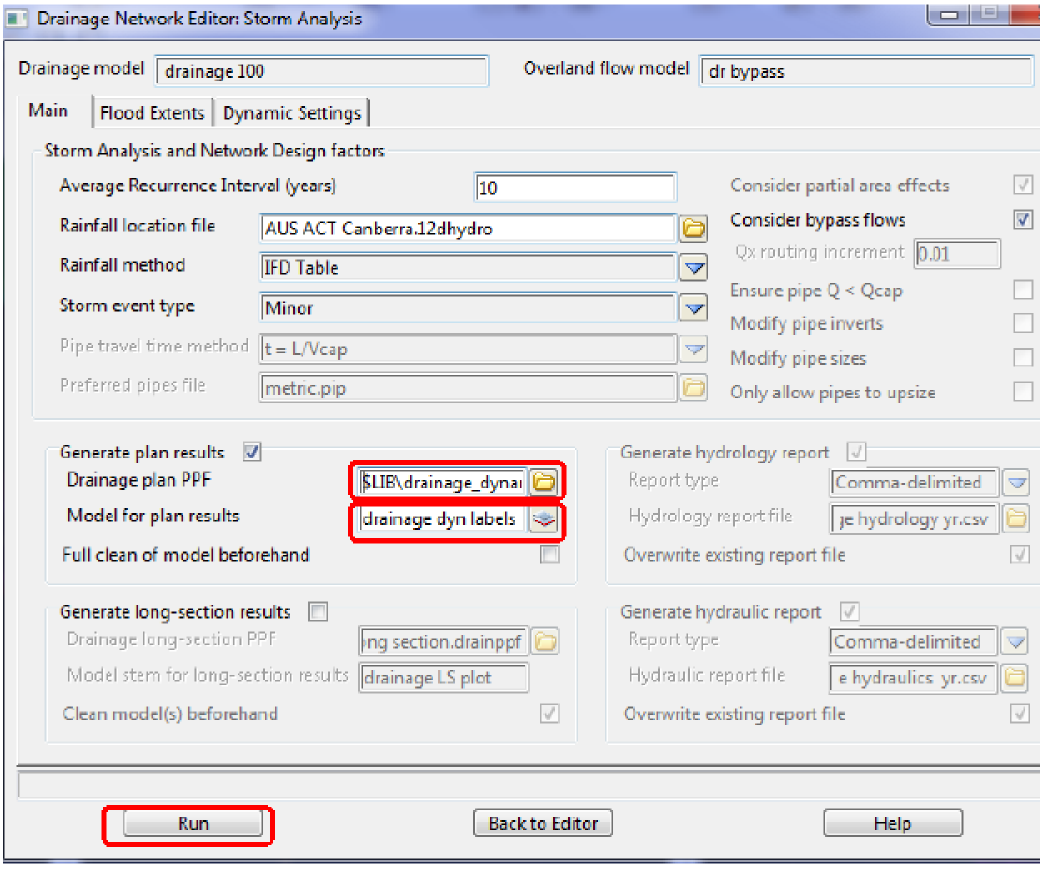
See Create and Editing Channel Shapes for details about manually entering data or changing the shape.

7.0 Running Dynamic Drainage

The dynamic engine analyses the network but does not design the components. Multiple storm patterns may be run simultaneously and the results from individual storms as well as the worst case from all currently analysed storms is saved. The results may be viewed graphically or in user defined reports. If your computer has a multiple core processor each storm will be processed by different processors and 12d will accumulate the results as the storms finish analysing.

7.1 Storm Analysis

Select the **Storm Analysis** button. To generate plan labels for the worst case dynamic results select the **drainage_dynamic_design** ppf file from the library. Also change the name of the **Model for plan results** so that you can keep the results from previous rational hydrology runs. Select the **Run** button.



A process window will be launched for each storm analysed and the status will be printed in the output window. **Always watch this window for messages**. Below are message from a sample run,

==> Checking Storm: 1

==> Storm: 1 OK

==> Updating Catchment Attributes

==> Updating Node Attributes

==> Updating Link Attributes

==> Updating Model Attributes

Elapsed Time: 6.67 secs

Run finished normally.

A run with errors would have a message like the following:

Dynamic Drainage Analysis (Build 5.1.026)

Dynamic Runoff Method: ILSAX 2

ari0.0

zone: 0

1 TP_Durations: 25.00

==> Solving Storm: 1

ERROR: Bypass section not defined for conduit: 7/A-SEP_to_6/A-SEP(S)

Model failed to solve.

7.2 Reviewing Results - Plan Labels

As with the rational method, the plan plots indicate the peak values. If multiple storms are run then this ppf file will print the max from all storms run.

So that the dynamic results are not mixed with the rational results, the worst case results are stored with the prefix **dynamic**. Results from individual storms have the prefix dynamic/xx where xx is the max time of the rainfall event.

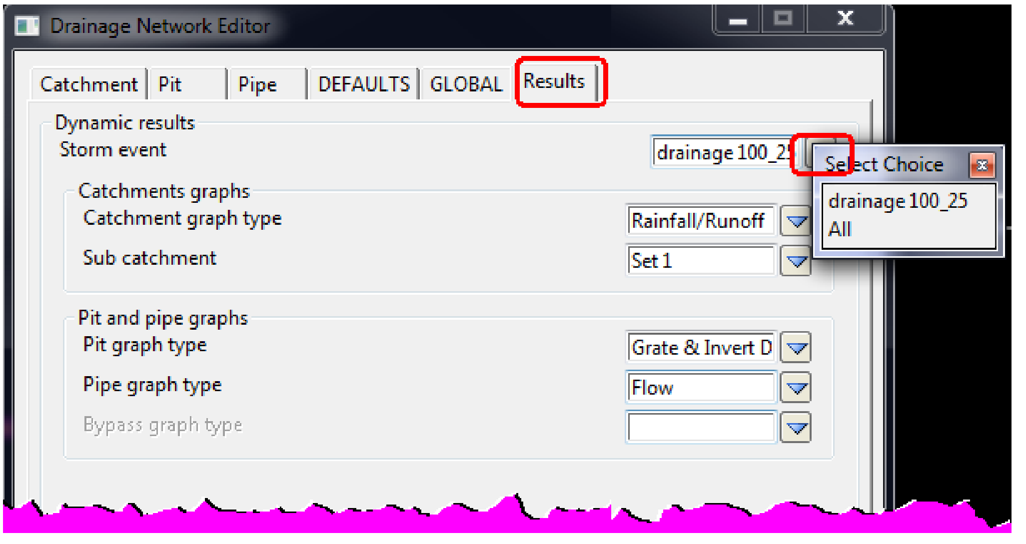
For example the pipe attribute for the maximum pipe flow

calculated pipe max flow	rational hydrology result
dynamic/calculated pipe max flow	worst case dynamic result
dynamic/calculated pipe max flow critical storm	storm where above results occurred
dynamic/25/calculated pipe max flow	25 min storm dynamic result
dynamic/calculated pipe max flow	worst case dynamic result

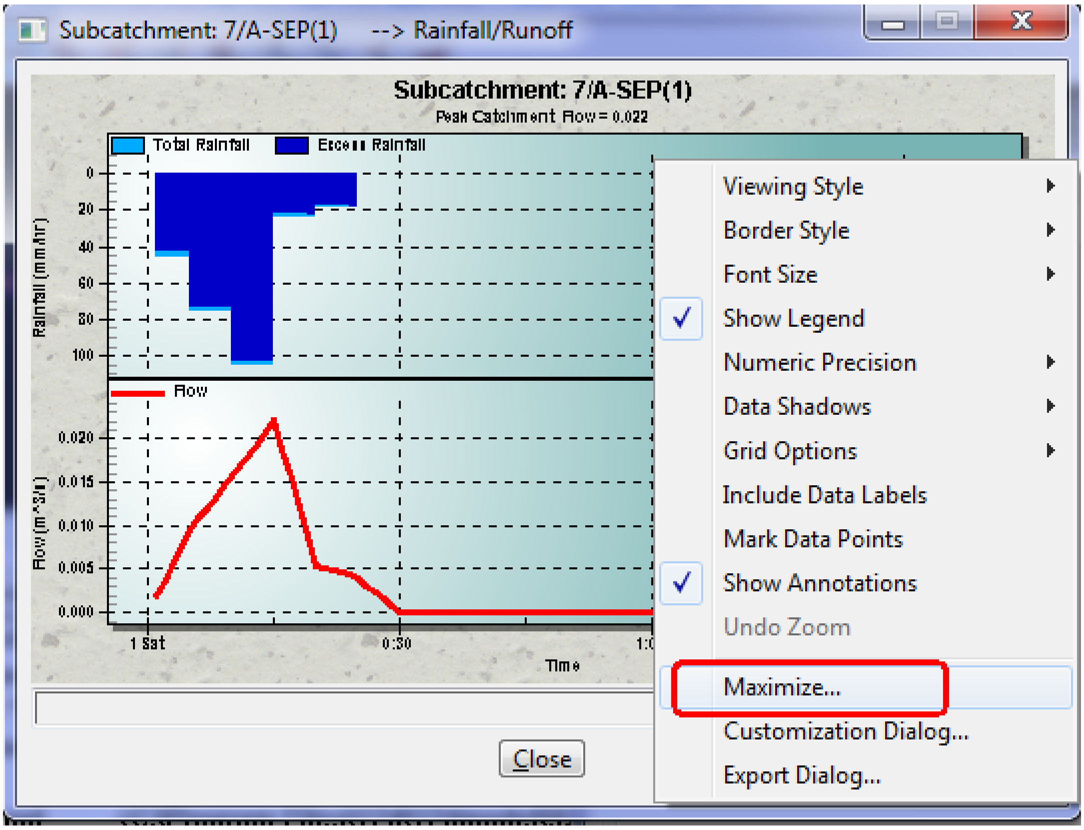
7.3 Reviewing Results - Graphs

Graphs indicating the results are created on the **Graphs** tab of the **DNE**. These graphs are a sampling of the time step results and usually does not include all time steps. Therefore, if the peak indicated in the attributes occurs between 2 plot points the peak may not be on the graph.

Select the **Storm event** to view. Nothing is displayed yet. When **All** is selected, the results from all the storms analysed in the last run are displayed. Graphs types that display more than one line will not be displayed when all is selected. There will be far too many lines on the plot to properly identify them.



Now select the data to view using the drop down boxes or by selecting the below and pressing enter. For example the **Rainfall/Runoff**.



The panel cannot be resized but it can be maximised via the right mouse menu. ESC returns to smaller view. The peak from the plot data (not the attribute) is indicated at the top of the graph.

You can zoom into the graph areas by dragging a rectangle inside the graph area. You must right mouse select and choose **Undo Zoom** to return to the full plot.

The available graphs are:

Catchment graph types (used in conjunction with **Sub catchment** selection)

Rainfall/runoff

The **Total rainfall** is the rainfall intensity calculated from the IFD data, the return period and the temporal patterns.

Excess rainfall (ILSAX 2) is the water that is left over after the rainfall losses infiltrate into the soil.

For the impervious area, excess rainfall = total rainfall - storage

For the pervious area, excess rainfall = total rainfall - storage - infiltration

Runoff starts when the excess rainfall depth exceeds the storage depth and the intensity is greater than the infiltration. Most frequently runoff starts from the impervious area first, (no infiltration, small storage and short tc) and then from the pervious area.

Runoff The runoff component of the **Rainfall/runoff** graph (good for all storms).

Rainfall The rainfall component of the **Rainfall/runoff** graph (good for all storms).

Losses These are the horton infiltration losses that are subtracted from the pervious component of the catchment (good for all storms).

Pit graph types

12d analysis has 2 systems for conveying flow. The **surface system** created with bypass flow strings (open channels with their inverts at the pit grate levels) and the **link system** created with the 12d drainage strings.

Grate & Invert Depths:
The top is the **Grate depth** showing the depth of flow in the surface channel measured from the grate level. The bottom is the **Invert depth** showing the depth in the link system above the pit invert.

Grate & Invert Elevations:
Shows both the bypass and link system water elevations. Good to see when the link elevation reaches the grate level to stop the inflow of water through the grate.

All Inflows & Outflows: (Inflows are + and outflows are - (S means surface)
Flows for each link and bypass are listed separately.
Local is the total **Catchment** flow from all 3 catchment sets plus direct flow,
In: Links and surfaces flows entering the pit.
Out: Links and surfaces flows leaving the pit.

Total Inflows and Outflows:
Local: the total **Catchment** flow from all 3 catchment sets plus direct flow,
Inflow to Invert: the sum of **In:** (links) + **Captured flow** This is the total inflow into the pit for the link system.
Outflow from Invert: the sum of **Out:** (links) This is the total outflow from the pit for the link system.
Approach Flow: the sum of the **Local** + **In:** (surface)
Captured Flow: determined from the **Approach Flow** (on grade pits) or **Grate Depth** (sag pits)
Bypass Flow: Approach flow - Captured Flow

Depth above Invert see invert depth above

Depth above Grate see grate depth above

Elevation - see Invert elevation above

Elevation Bypass Flow - see Grate elevation above

Basin volume - only available on pits with basin curve data.

Catchment Flow - Total of **Runoff** for Sets 1, 2 and 3.

Link Inflow and Captured Inflow: surface and link pit elevations, **Link Inflow** (see **Inflow to invert** above) and **Captured Inflow** (see **Captured Flow** above)

Link Outflow: see **Outflow from Invert** above

Approach Flow: see above

Bypass flow: see above

Inflow: see **Link Inflow** above

Overflow - the flow that is lost from the drainage system when the hgl exceeds the maximum level at the pit.
The maximum level at the pit is largest of
1) the cover level,

2) the grate level + depth of bypass channel
3) the maximum storage level in the basin storage data.

Ku - the link flow, upstream velocity, Ku and head loss of the primary outgoing link.

Pipe graph types (link system)

Dynamic Section: a section view of the entire string showing the hgl in the links and surface channels. The lower dashed line connect the grate levels and the upper shows the top of the surface channels. If the hgl goes above the top of the surface channel water will be lost from the system.

All Link Results 3 charts: The colour of the right axis label is the same as the graph line it represents.
HGL US, HGL DS (left axis)
Depth (right axis) depth at the mid point of the link
Capacity (left axis) the ratio of the current pipe flow / (pipe full, HGL at grade capacity)
Froude Number (right axis) - Froude number at the mid point of the link
Flow (left axis) flow in the link
Velocity (right axis) - velocity at the mid point of the link

Bypass graph types (bypass system)

same results graphs as for the **pipe graph types** above

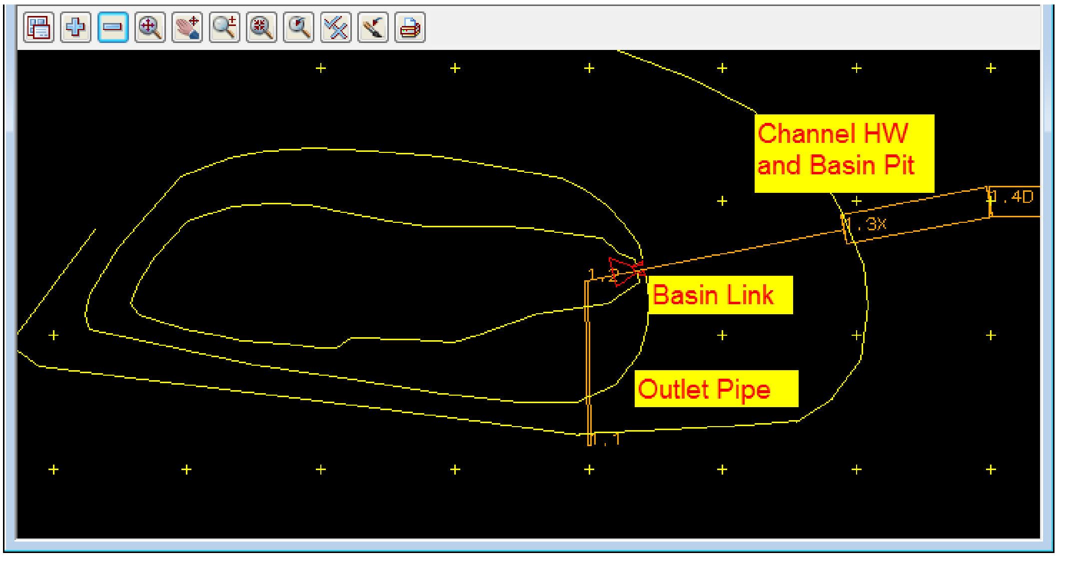
8.0 Adding Storage Basins

Storage basins are created by adding an elevation versus area curve at a pit. Without the area curve the default area of a pit is defined by the diameter or the length, width settings in the drainage.4d file.

The elevation area curve may be entered manually for initial estimates or measured from the finished surface tin (inside a string defining the extent of the basin).

The outlet structure is the link exiting the basin pit. This is often a weir, orifice or discharge limiting pipe.

An optional basin link may be used to separate the outflow structure from the basin pit. This allows the user to place the outlet structures in their correct position. The basin link is only a graphical link and often has its diameter set to zero to help indicate that it is not a hydraulic component of the system.

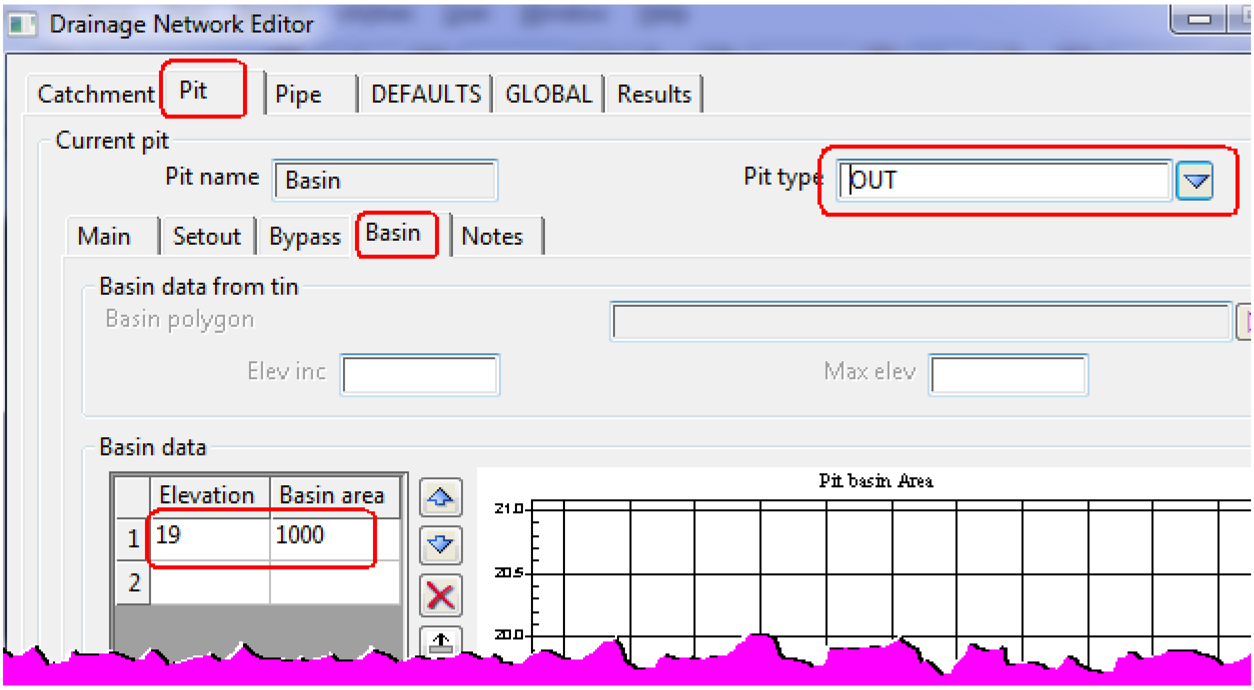


8.1 Selecting the Basin Location

The node modelling the basin is the outlet of the pipe or channel discharging into the basin. The pit becomes a basin when the user enters elevation versus area curve for the basin or selects a polygon around the top of the basin. With the polygon method, 12d will create the elevation versus area curve from the finished surface tin. We will use an existing string from the survey data but you may easily create your own polygon around the top of the basin.

For an initial sizing you only need to enter the basin invert elevation and area into the grid.

If the outlet pipe has an upstream invert level below the lowest basin curve entry, this lower section of the pit will use the default pit area.



8.2 The Outlet Structure and the Basin Link

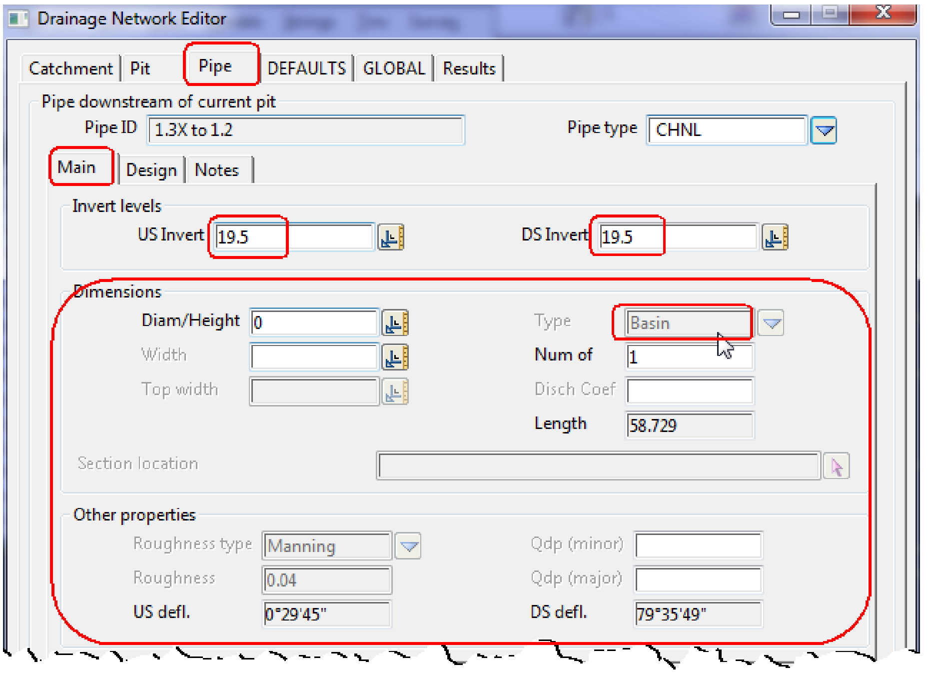
The basin outlet generally includes more than one structure. Typical arrangements include a low flow pipe that restricts the outflow from the basin and a high flow spillway used in larger events.

Every outlet structure is linked to the basin pit with a basin link. Often the outlet structure is a fair distance from the basin pit and we want the outlet structures drawn in their correct location. IF the diameter of the basin link is set to zero it joins the basin pit to the outlet structure but preforms no hydraulic function in the model.

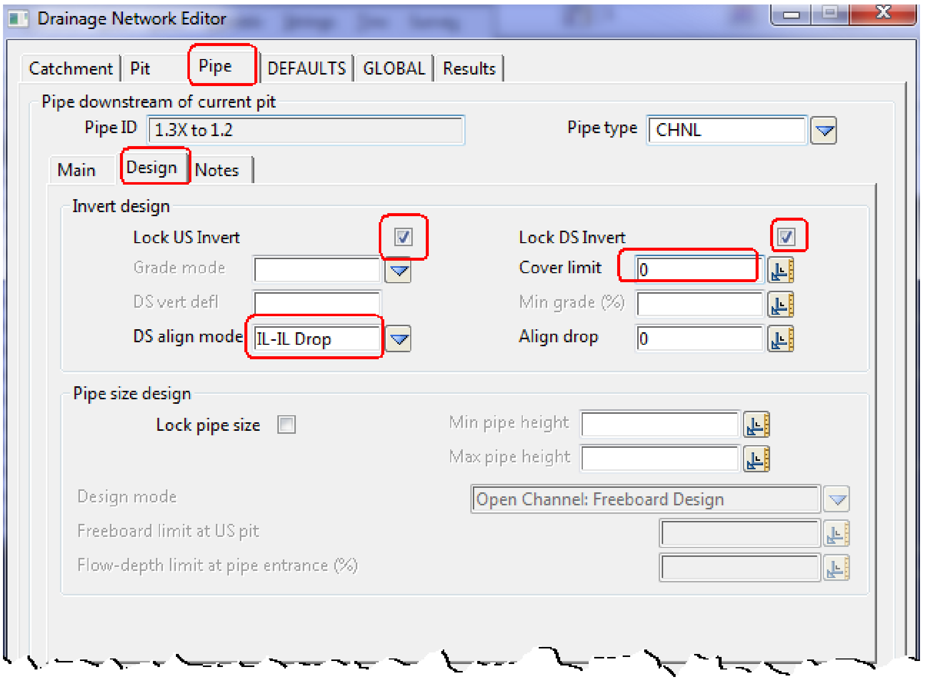
The minimum elevation in the elevation data becomes bottom of the basin and the outlet inverts cannot be below this level. If there is a drop pit for the outlet then ensure that the base of the drop pit is first elevation in the basin data. The area will be the area of the pit. The second entry will be the top of pit level with the same pit area.

8.3 Creating the Basin link

The pipe downstream of a basin pit is a basin link. When the diameter is set to zero, the data set on this link is for graphical presentation and has no hydraulic function.

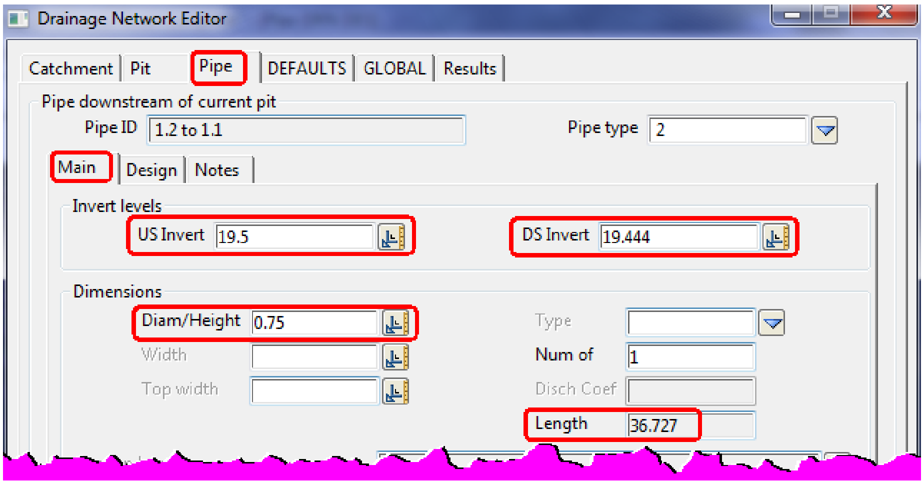


For clarity in the section view we will set the levels to the bottom elevation of the basin and set a zero pipe diameter to make the link as unobtrusive as possible.



Locking the link inverts will ensure the invert elevations are not changed with a regrade pipe selection. Remember this is a graphical link and the values do not affect the hydraulic calculations.

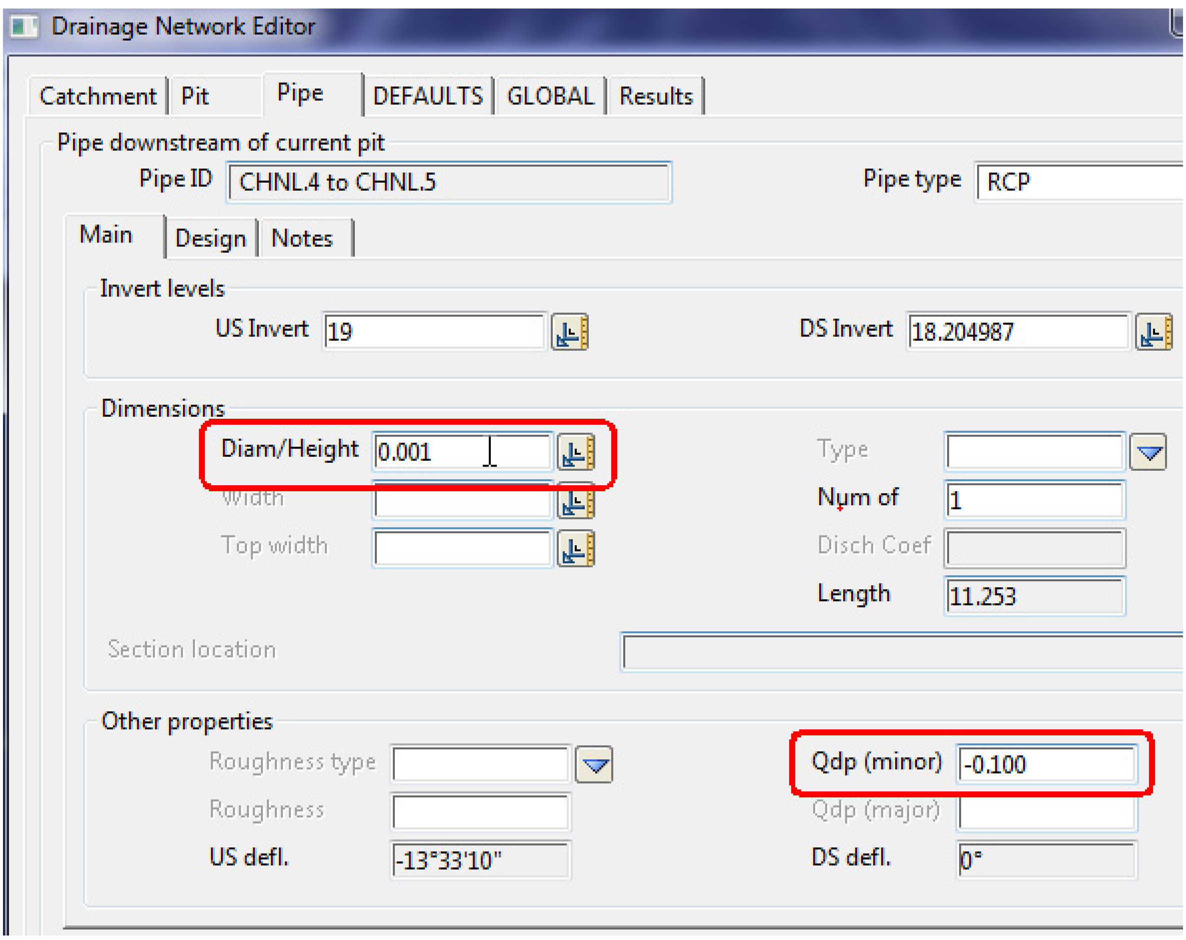
8.4 Data for the Outlet Control Pipe



The upstream invert is being set to the bottom of the basin and then we will lock this invert. We will leave the engine to set the DS invert level.

The length will depend of your drawing.

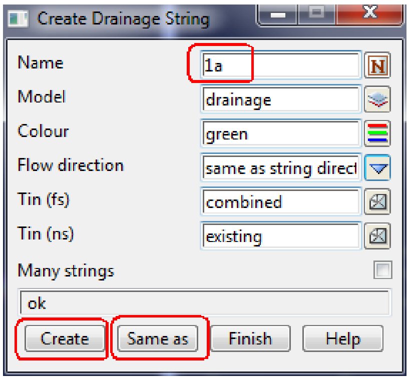
For initial sizing of the basin you can set the diameter of the pipe to 0.001m so that no flow goes through it. Now enter a negative pipe direct flow and this will become the constant outflow from the basin (usually set to your pre-development peak discharge). Once you size the basin, return here, remove the negative flow and select a pipe size to yield similar results.



8.5 Adding a Second Outlet Structure (Spillway Weir)

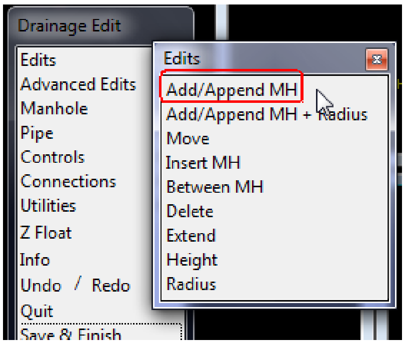
A second drainage string will be needed for the spillway. Again it will start with a basin link and then have a weir section. From the main menu select

Design->Drainage-Sewer->Create

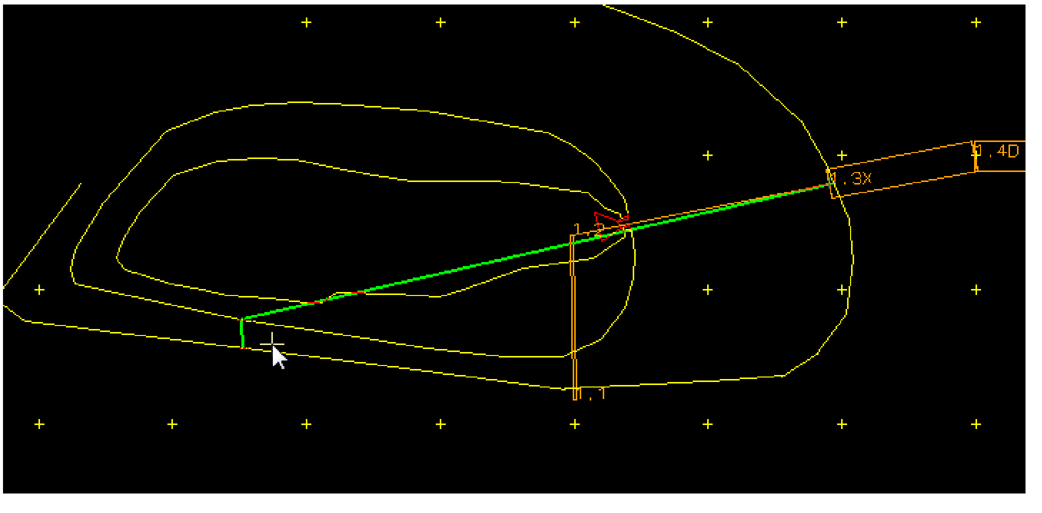


Select the Same as button and pick a drainage string in the model. This will fill in all of fields. Name must be unique so change this data. Finally select Create.

Then select Add/Append MH from the menu.

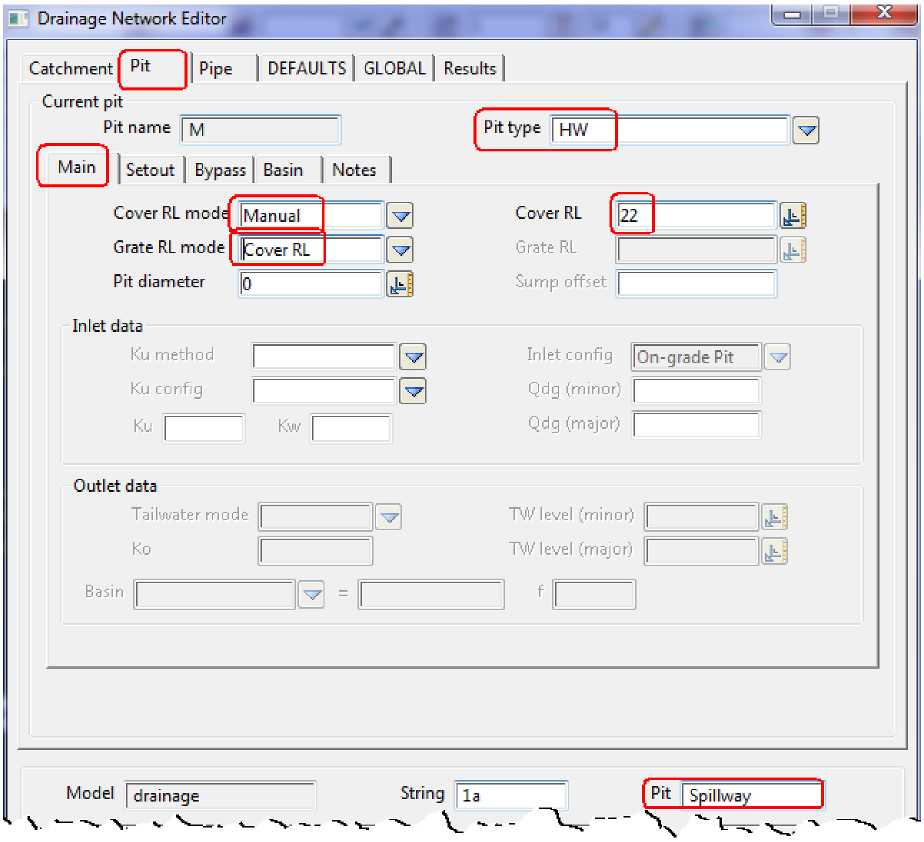


The plan view below shows the basin link and the spillway weir location. Draw the string in the



direction of flow and ensure you start with a point snap on end of the channel.

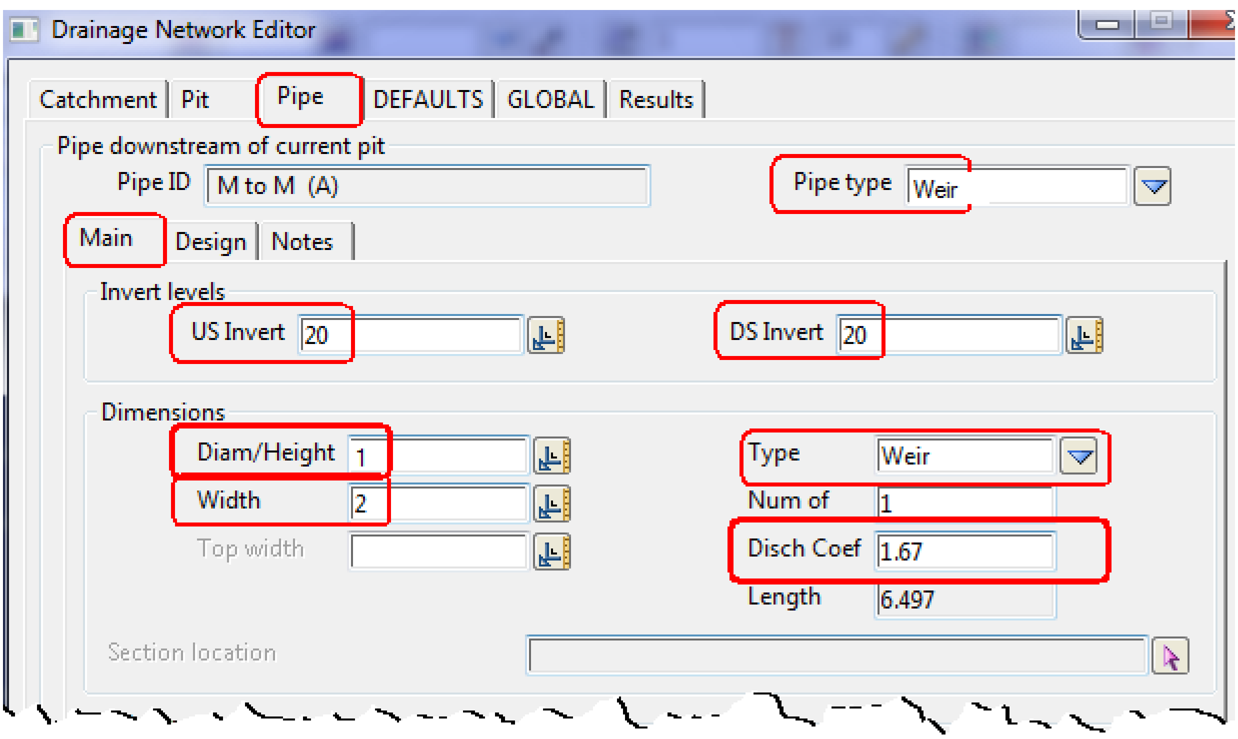
Once the string has been created the pit data at the upstream side of the weir need to be set.



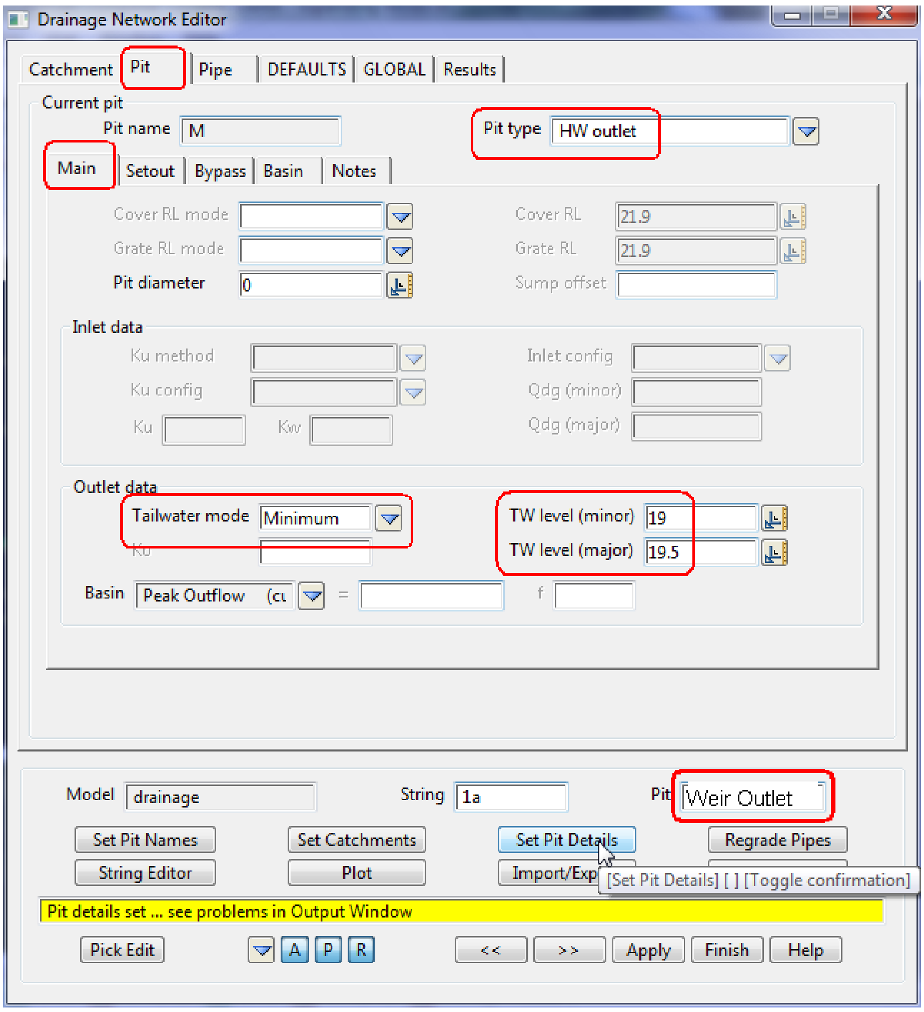
On the Pit->Main tab we are going to set the cover level at the highest expected water level in the basin. The grate level will have the same level as the cover level.

The **Pit type** does not affect the calculations for the weir.

We have also assigned a name to this pit.



On the pipe-main tab we will see the **US invert** level to weir crest level (20.0). The **DS Invert** is set the same but will have no affect on the calculations. The **Diam/Height** determines when the weir will start acting as an orifice. Generally used in underground storage tanks. In this case we will set is to a value higher than the expect flow depth (1.0 m). The **Width** is the dimension of the weir perpendicular to the flow. The Disch Coef is optional as the default will be used if it is blank.



The tailwater levels are now set to the expected levels for the minor and major events.

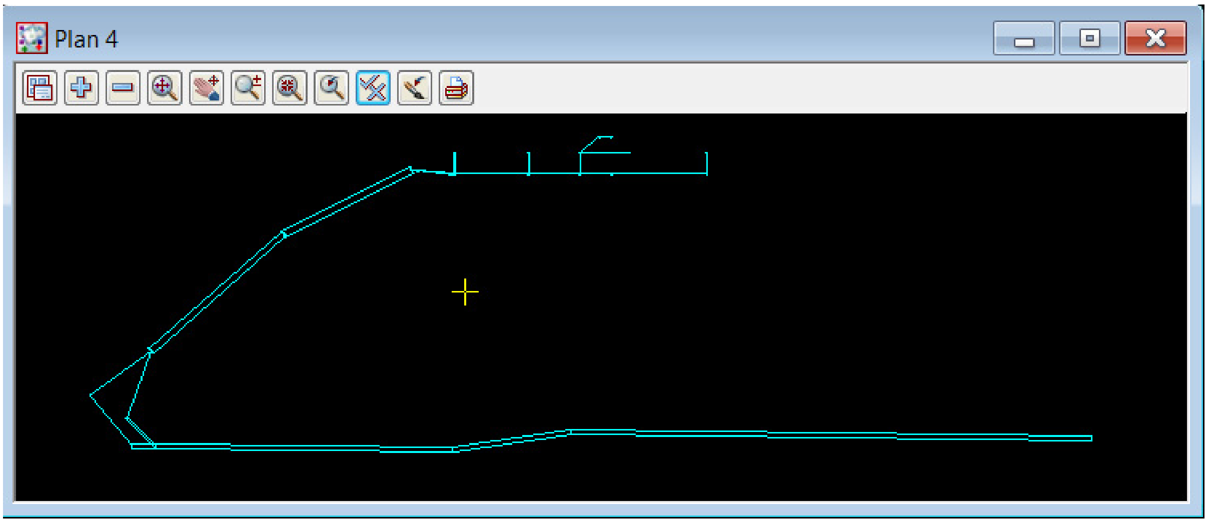
Enter a name for the outlet.

9.0 Natural Section Shapes

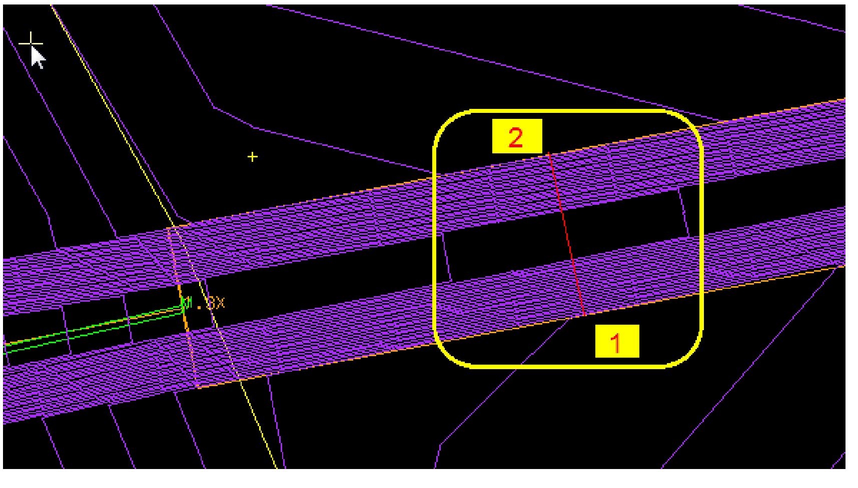
The channel shape may be cut from the design tin by drawing a string at the desired location. It is a standard convention to draw it from left to right looking in the direction of flow.

In this example we are going to connect the end of the culvert to a channel down to the spillway and then eastward to the end of the project. Set the Defaults, **Pit Type** to **chnl auto** and **Pipe Type** to **CHNL GRASS EXISTING 1** with a **height** of 4.0. This height will not affect the calculations but will show the approximate channel top in the section view. This will mean you no not have to change them later.

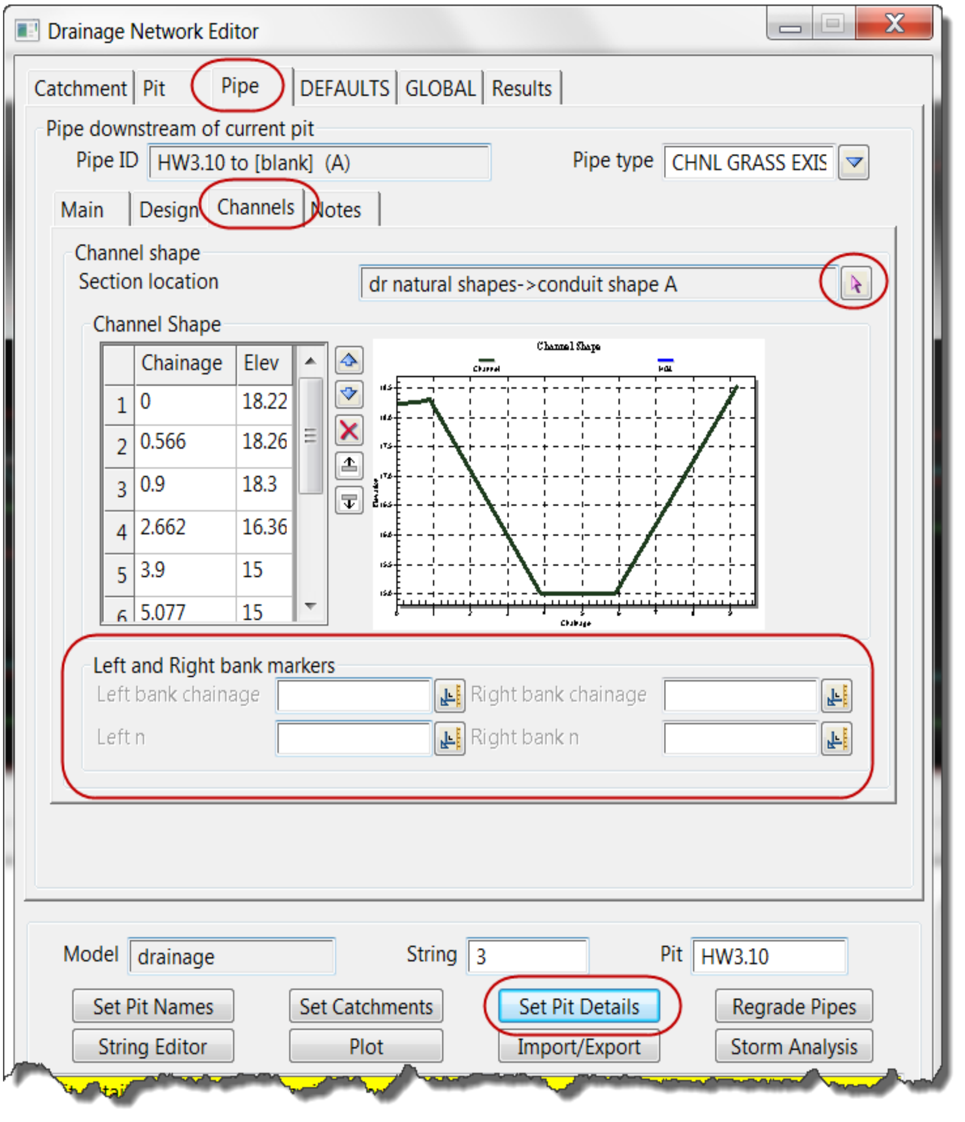
Use the **Points Edit->Append** to add the extra links as shown below. Ensure that the centre of the drainage string is in the lowest part of the channel. Finally, extent the spillway to the channel.



Enter the model name **dr natural shapes** into the CAD toolbar model field before drawing this string.



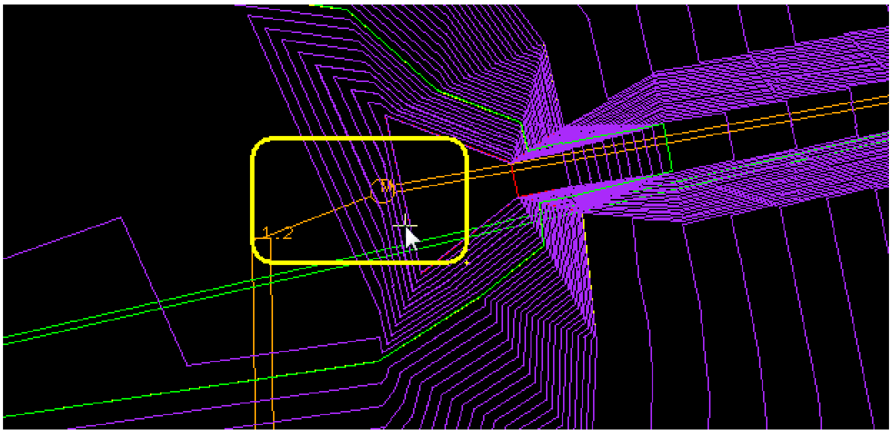
Once you have drawn the string you can select it from the **Pipe->Channels** tab. Selecting **Set Pit Details** will have the shape cut from the design tin and displayed in the grid and graph area. If you do not want the shape cut from the tin you can just enter the shape in the grid area. Once again the shape obtains its elevation by setting the lowest point onto the invert elevations.

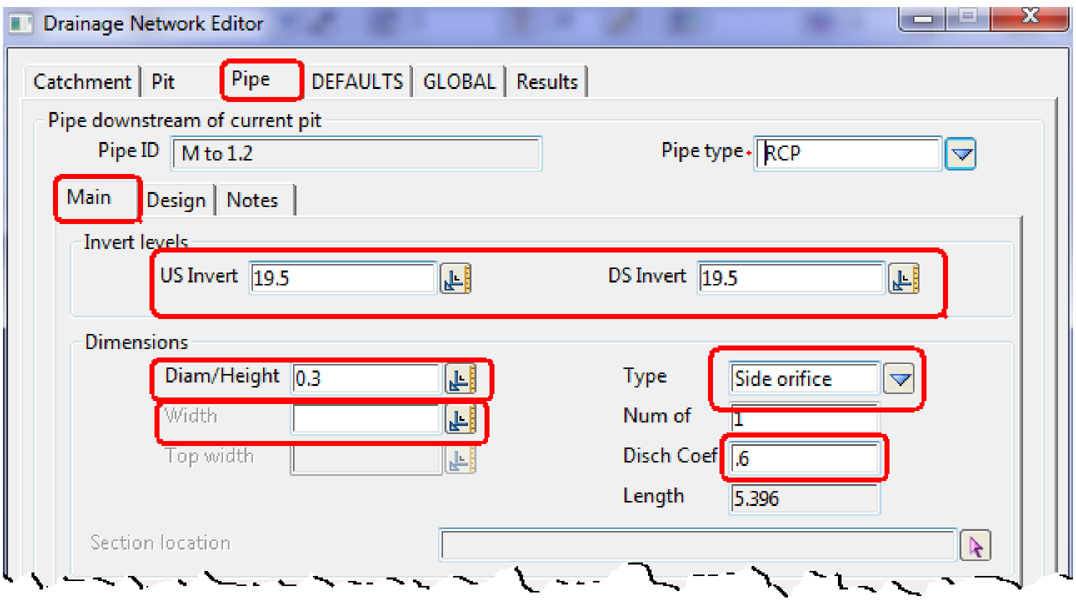


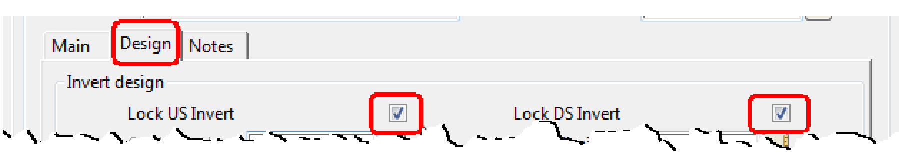
Left and **right bank chainages** and n values may be entered if desired. If blank the link's n value will be used. There is no default left and right bank n values.

10.0 Orifice Control on a Pipe

Use the Strings->Points Edit->Insert command to add a pit upstream of the outlet pipe. This new pipe will be set to an orifice to control the flow entering the pipe.







Lock the invert levels so that the orifice will not move in elevation,

11.0 Storage Tanks as Basin or Pipe

A storage tank may be modelled as a box culvert or as a basin but do not do both as this will double count the storage. To model the tank using basin areas Set conduit type to a Basin link and set the pipe diameter to a value that is meaningful for the long section appearance. Once it is marker as a basin link it will not affect the calculations.

11.0.1 Drainage Utility Program

Position of option on menu: Design => Drainage-Sewer =>More => Misc. utilities

The Drainage utility program contains functions to significantly reduce the time required to perform drainage tasks. These tasks include

Assign Pit names

To use the export routines, every pit in 12d must have a pit name. This selection automatically creates the pit names for the entire model or selected strings. Examples of pit names are 1,2,3... A1,A2,A3....Pit 3-A, Pit 3-B.

Reset pit cover levels

This selection sets the cover levels for the manholes to the design tin or design strings. The user will be prompted for each manhole to select a tin level, a string level (if a design string model is supplied) or keep a manually set level. The tin/string/manual selection will be stored and the levels reset now and whenever the pit/pipe interfaces exports the data (unless this last option has been manually turned off).

Regrade pipe levels

The selection applies the default grading rules (cover level) to reset the pipe invert levels for the entire network. Manhole cover levels are not changed during this function

Label Catchments and Label drainage network

This selection quickly creates labels for a drainage and catchment plan. The pits are labelled with their name, the pipes with their diameters and the catchments with their area and the pit they drain to. These labels must be updated using this selection whenever the catchment or network is changed. To turn off the automatically drawn pit names in the current view select **Menu=>Settings=>Text=>Toggle** and select the drainage model.

Analyse Flooded Width

This is the only hydraulic calculation that takes place in 12d. The normal depth along the bypass flow paths is calculated using discharges imported from hydrology/hydraulic packages including spreadsheets. This flooded width is drawn to scale at intervals along the bypass flow path and colour coded (blue if less than a specified limit and red if greater than the limit).

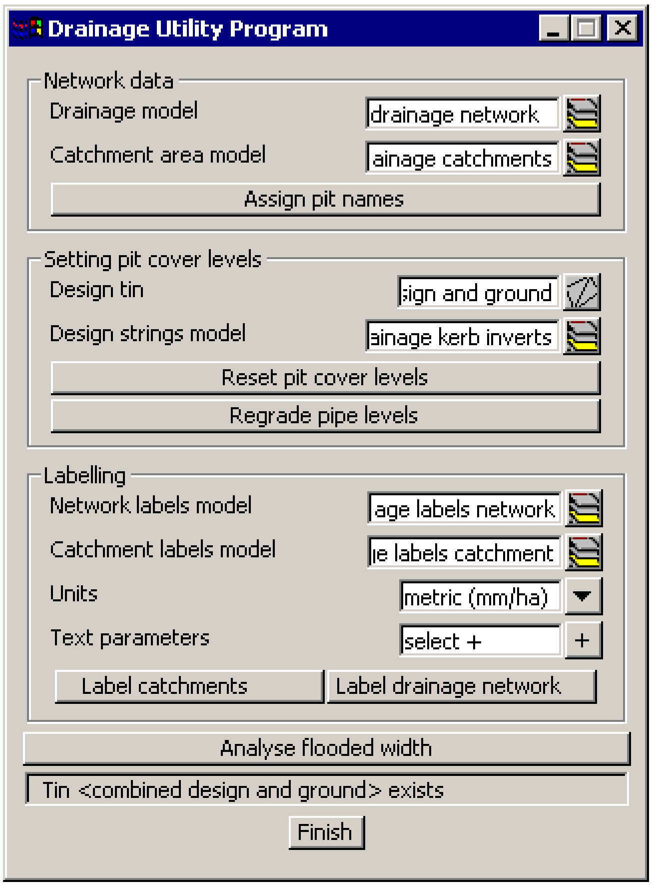
Drainage overview

Usage

This panel is accessed from the menu selection

Design => Drainage-Sewer => More => Misc. utilities



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

drainage model input box

Model to contain all of the pit and pipe network to be worked on.

catchment area model input box

Model to contain the catchments strings for the ***Drainage Model*** *above*

Assign pit names button

This button launches a dialogue for setting the names for the pit and pipes in the network model.

design tin tin box

This optional field allows the user to specify a new tin for the surface levels of the pits. If you are using road grade and cross fall for pit inlet capacity it is preferable leave this blank and to link the pits to a string using the ***design model*** *field below. If some or all of the pits are linked to strings in the design model below, they will still use the strings selected.* more about design strings

design model model box

This model contains the strings for the pit cover levels (the string directions are also used for road grade and cross fall). If this model is changed you will be prompted to select new strings to link the pits to. more about design strings

Reset pit cover levels button

*This button will reset the pit levels to the design strings in **design model** or to the tin specified in **design tin** above. The first time this is selected you will be prompted to choose whether to set the pit cover level to the design tin or the a string in the design model.* more about design strings

Regrade pipe levels button

The selection applies the default grading rules (cover level) to reset the pipe invert levels.

network labels model model box drainage labels network

*Model to contain the network labels for the **Drainage Model** above. This model is cleaned out each time **Label drainage network** is selected.*

catchment labels model model box drainage labels catchment

*Model to contain the catchment labels for the **Catchment Area Model** above. This model is cleaned out each time **Label catchments** is selected*

catchment units choice box ha, acres

Conversion factors of 10,000 will be used for ha and 43560 for acres.Not that not all design packages support both units.

text parameters input box

*Select the + to access the text parameters (colour, size, alignment etc.) for the text created with **Label Catchment** or **Label drainage network***

label catchments button

This selection creates labels indicating the catchment name and area in the units specified above.

***CAUTION:** If you change you catchment strings or rename you pits you must run this routine to update the labels.*

label drainage network button

This selection creates labels indicating the pipe size and pit name for the network model.

***CAUTION:** If you change you change the pipe sizes or rename you pits you must run this routine to update the labels.*

analyse flooded width button

This selection launches the dialogue for analysing the flood along bypass flow paths. The bypass flows must be imported from your design package/spreadsheet before running this selection.

11.0.1.1 Set Pit Names

The **Set pit name** selection names the pits and pipes for the drainage model (both pits and pipes can be named). Three numbering schemes are available:

drainage strings names are used as the prefix followed by the pit number (ex A-1)

drainage strings names are used as the suffix followed by the pit number (ex 1/A)

the pits are sequentially numbered. (ex 1,2,3....)

The names can have pre-text added to the beginning of the pit name and a separator between the string name and the pit number (/- etc.) if desired.

Design Program Notes:

PCdrain users: Since catchments contain only 3 characters do not use separators. Using the letters A-Z for strings and numbers 1-99 will give you 26 strings and up to 99 pits on each string. Using the numbered stem works very well in PC Drain.

Micro Drainage users: Pits and pipes are numbered separately in Micro drainage. The pipes must use the numbered sequence with the most upstream pipes numbered with the smallest numbers. Number of digits must be set to 3.

ILSAX users: You must use alphabetic characters for your string names and no more than 3 characters

Labelling a drainage network

Displaying the Auto Pit Names

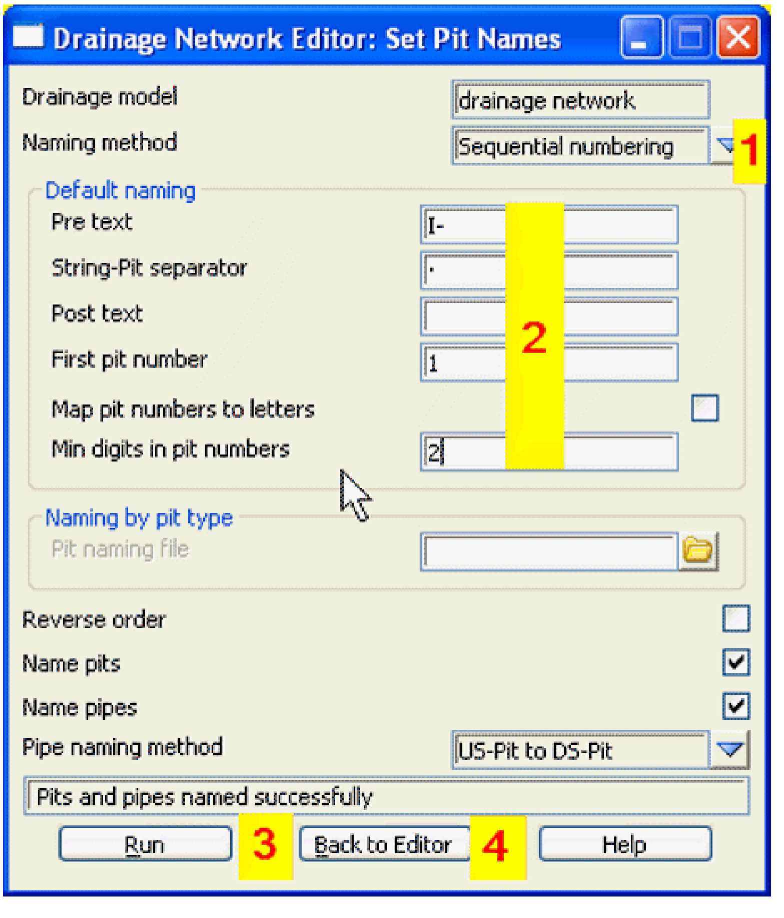
Drainage overview

Usage

The selection is found on the drainage **network editor** and is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Drainage Network=>Drainage=>Network editor

Select the **Set Pit Names button** and the following panel will appear.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model	Model box		**drainage model from main dialogue**
Naming Method	Choice box		

__Pit num - String name__ for string A pit 1 the name is 1A
__String name - Pit num__ for string A pit 1 the name is A1
__Sequential numbering__ the strings names are sorted alpha-numerically and the pits are numbered starting at __First pit number__

Pre text input box

this text will precede the pit name (ex Pit A01)

String/pit separator input box

the character that separates the string name from the pit number. For example if pit names A/01, A/02 etc. where desired a **"/"** *would be entered. You may omit the separator if none is desired.*

First Pit Number integer box

the starting pit number on the drainage lines. For drainage strings with the flow direction set as descending chainage the first pit is the junction pit.

Min digits in pit numbers integer box

a non zero value will pad the pit numbers with leading zeros. (ex if 2 is entered, pit 1 is not A/1 but rather A/01)

Reverse numbering order tick box

Unselected, pit __First pit number__ is at the low chainage end of the line. Selected, pit __First pit number__ is the second pit from the high chainage end of the line.

Number pits tick box

the pits are assigned names. This allows the pit and pipes to be names differently.

Number pipes tick box

the pipes are assigned names. This allows the pit and pipes to be names differently.

Run button

name the pits/pipes. The pit at the high chainage of the string is not labelled. The only time you will need to name this pit is when it is the outlet from the system.

Back to Editor button

return to the network editor.

Help button

display this page.

***Optional** this description will be sent to the design program*

export pipe diameters and invertstick box

Select this tick box to export the pipe diameters and inverts. see also Quick Check Lists for Drainage Design Software

export default catchment/pit parameterstick box tick

selected all default catchment parameters are exported
not selected only catchment area is exported if **catchment area model** *is specified above. see also* Quick Check Lists for Drainage Design Software

Options button

several calculations are preformed before all exports. Advanced users may turn some off for large models (100's of pits). The option to re-link your pits to new design strings is also included here. More options

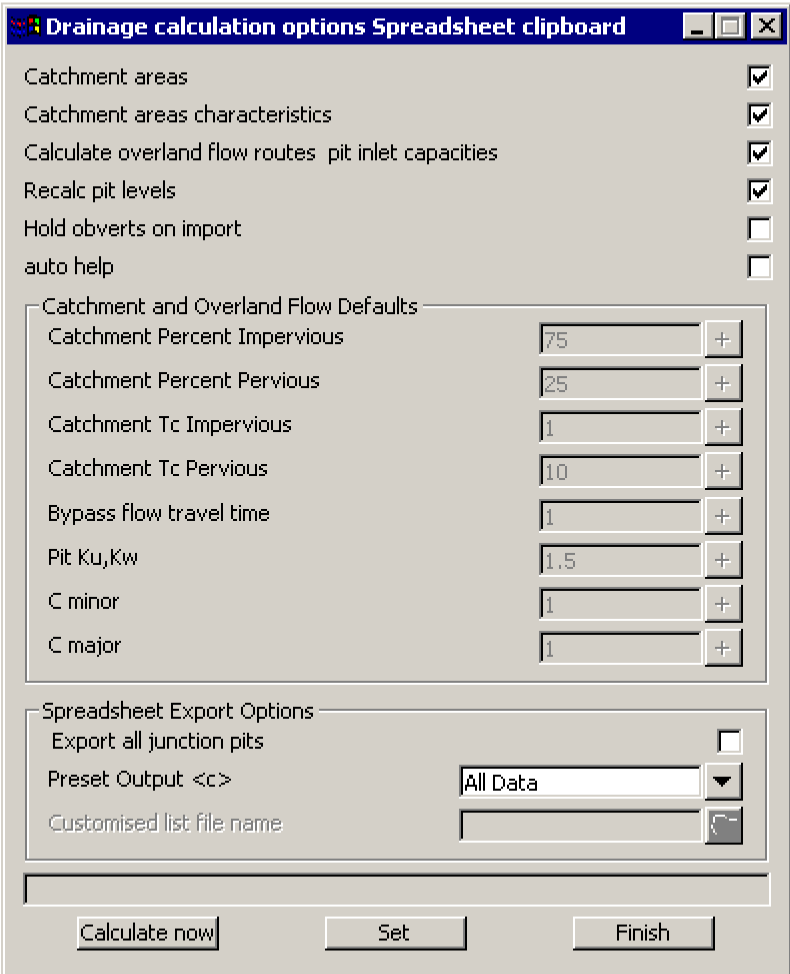
Write/Copy button

This will create/over write the file specified above in **file name**. *If* ***Copy*** *button is present the data will also be placed on the windows clipboard as Tab delimited text.*

Read/Paste button

Read *will read the file specified above in* **file name**. ***Paste*** *read the data from the windows clipboard. Both selections will update the drainage strings in the model specified above in* **drainage model**.*If the* ***Spreadsheet clipboard*** *import is selected and the strings are not present in the model they will be created.*

11.0.2.1 Options



Selecting the Options button brings up the dialogue to the left. Additional choices may be present at the bottom of the dialogue depending on the **Import/ Export Format** that you selected on the main dialogue.:

Catchment areas when selected the catchment areas are linked to the drainage pits and the areas recalculated. See also Designating Catchment Areas

Re-link pits to road strings-tin when selected a dialogue for each pit will be presented asking which design string or tin to link the pit to. See also Selecting design string or tin

Calculate bypass flow routes when selected will calculate the downstream bypass pit, road grade and crossfall and inlet capacities. See also Pit Inlet Capacity, road grade/ crossfall and Bypass routes

Calculate now will calculate the selected option immediately and return the user to the main dialogue.

Set will set the options but no calculations will be performed until a **Write** or **Copy** is selected from the main dialogue.

Finish removes the panel from the screen.

How to for Rivers

Rivers beta menu

21.1 River Interface Models

The River interface strings are split into different models depending on the strings function. Also the string names are used to define names of entities such as cross sections and reservoirs when they are exported. Following is a list of the river interface string types:

River strings

Source strings

Reservoir Strings

Spill Strings

21.1.1 River Strings

The river centre line and bank are defined by the strings in the **River strings** model.

The centre line string is used to

- measure the centre line distance between the sections,
- mark to zero chainage (or starting chainage) on the cross section, and
- if automatic source strings are created they will be perpendicular to this string
- **define culvert locations** and sizes (XP SWMM only)

The left and right bank strings are used to

- measure the bank distances between the sections and
- mark the cross section chainage where the conveyance (usually roughness) changes

The names of the strings must be **left bank, right bank** and **centre line *river name,reach name*** (centre may be spelled center).

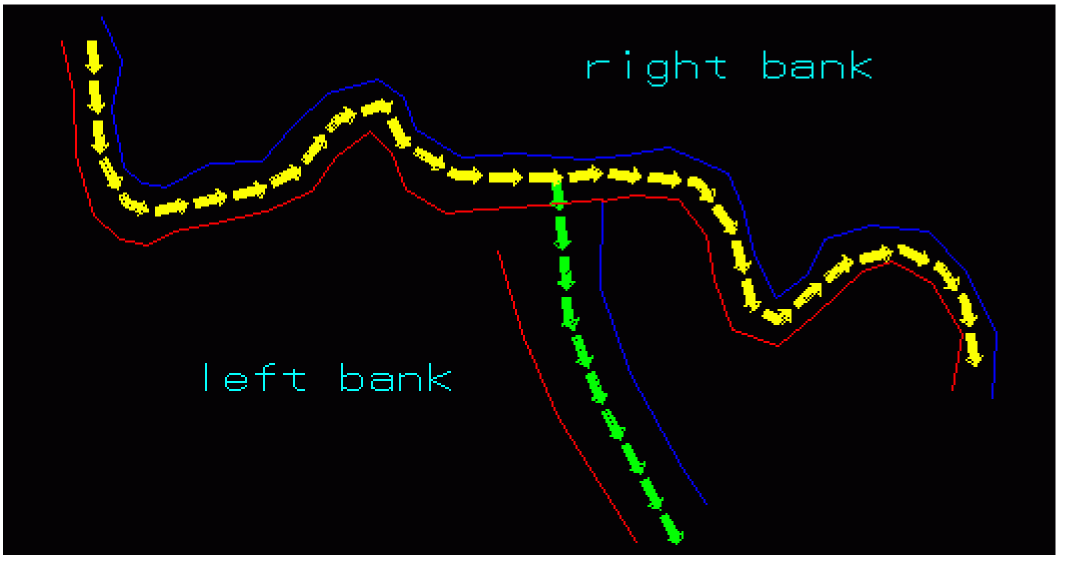
The left bank is on the left side of the river looking downstream and the right bank is on the right (looking down stream). These strings need not touch each other and may extend from one river reach to another.

HEC RAS and UNET

The centre line string must begin at the downstream end of the river. The modelling convention for these programs is to have the low chainage at the downstream end. You may use super, 2D,3D or alignment strings in this model. If you put other strings in this model you will receive warning messages saying that these strings will not be used.

Each reach of the river **MUST** have its own centre line string and they must "touch" each other to create a river confluence.

A sample of a river strings model for **HEC RAS** with one confluence is shown below. The line style for the centre line is not required. It is used only to show the direction of the centre line string.



Notes:

left bank strings are shown in red, right bank in blue and centre line strings in yellow and green. The line style for the centre line strings is *Drainage_4D->Flow line*. This is not required but shows the direction of the string. The string labels were created with Strings->Label->User-

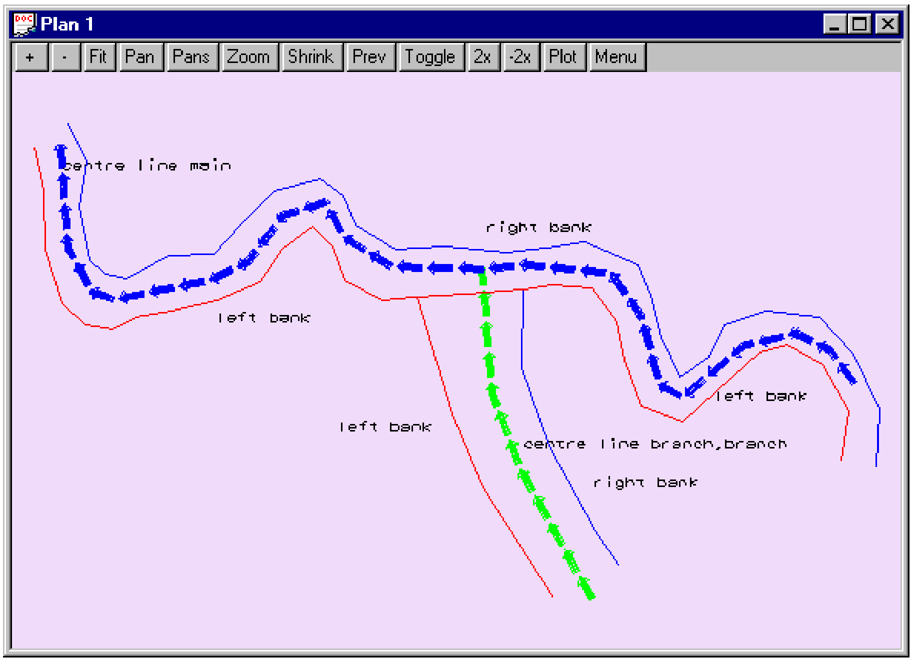
>Label strings with names.

Centre line string direction is very important!

HEC RAS, UNET, XP SWMM	start at the **DOWN**stream end of the river
ISIS and Mike 11	start at the **UP**stream end of the river

ISIS and MIKE11

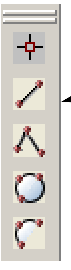
The centre line strings are drawn starting **upstream** for the ISIS and Mike 11 programs.



21.1.2 Source Strings

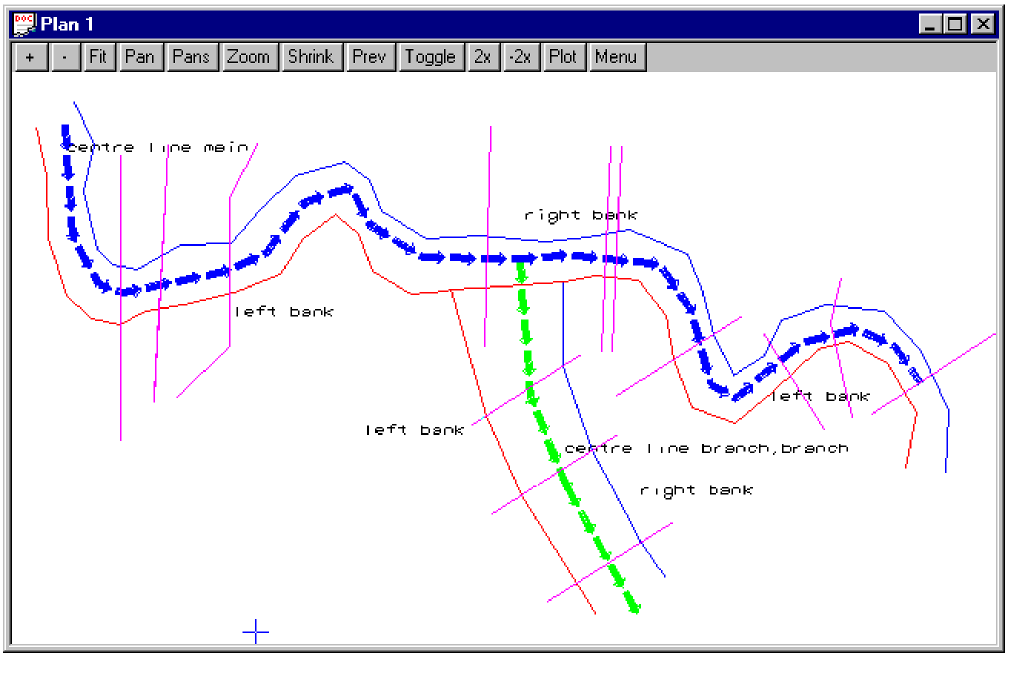
Cross sections are created at the location of the **source strings**. These source strings are initially created at a user defined spacing and section length using any one of the river interfaces writers. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.



A quick way to manually create 2 point string is via the CAD tool bar.

A sample of source strings (shown in magenta) is presented below. The source strings may run in any direction except for Mike11. In Mike11, the cross sections will be created in the same direction as the source strings. For all other interfaces the low chainage will be used for the left bank (section viewed looking downstream).



21.1.3 Reservoir Strings

The **reservoir strings** may define inline reservoirs or offline storage. The elevation of the first point on the string sets the maximum level to be used in the stage storage curve. 12d will determine the minimum level inside the reservoir string and then calculate the volumes at a 1m (2 foot for imperial units) increment. The default increment may be changed by creating a string attribute "stage increment" (see **stage increment**).

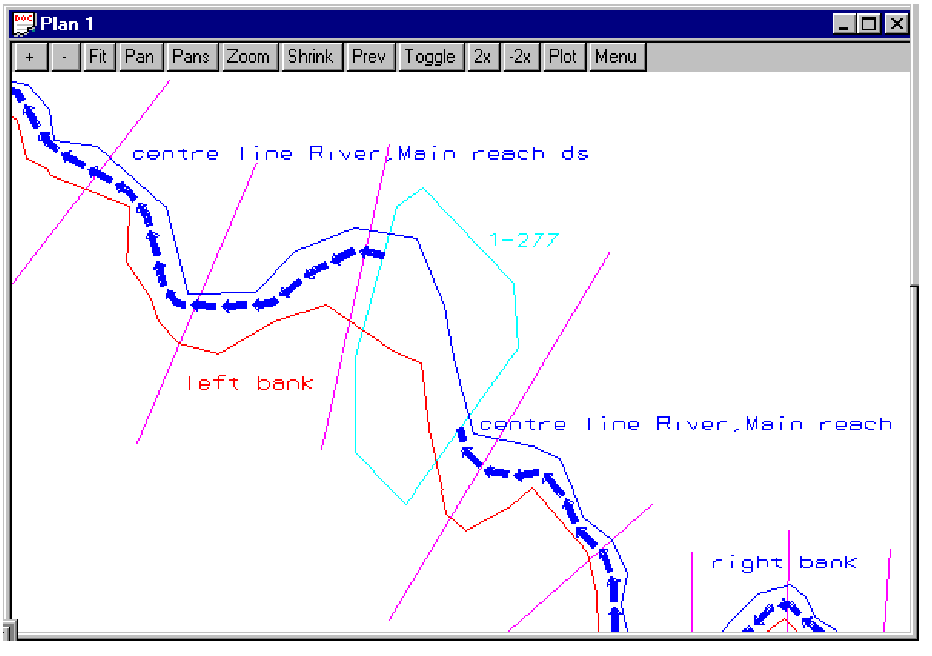
Inline reservoirs are "touched" by centre line strings both upstream and downstream. Offline storage areas are linked to the cross sections via **Spill strings.**

Other features of the reservoir strings are

Auto height

XP SWMM catchment parameters

A sample drawing showing an inline reservoir in cyan (1-277) follows. Note that the river centre line touches the reservoir string both upstream and downstream. The left and right bank strings may continue straight through the reservoir.



A sample drawing of an offline reservoir follows (the reservoir string is shown in green). Note that the spill string (black) starts at the source string (point 1), then follows the section line to be cut and exported (points 2 to 5) and ends by touching the off line reservoir string at point 6. The rivers strings do not touch the offline storage strings.

21.1.4 Spill strings

Spill strings are strings that link offline storage areas to a cross section (see drawing above). The string must begin by "touching" the source string and then proceed to the first point on the spill section. During the export the first point will NOT be exported as part of the spill section. After defining the end of the spill section the last point on the string must "touch" the reservoir string. Again this last point will NOT be exported as part of the spill section.

The default roughness for the spill section is the "left n" from the main export panel, the default slope is 0.5% and the default length is 100. See the manual setting table for **manual override settings**.

XPSWMM Only. 2 point culvert strings (6 max) may be draw across the spill string to create a multi conduit. The culvert strings should be drawn in the same direction as the spill string so that the upstream and downstream inverts follow in the same direction.

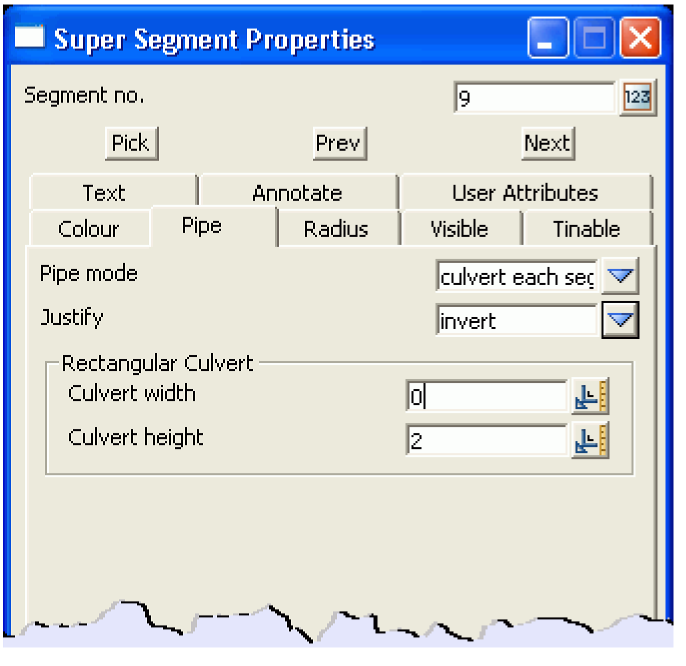
21.1.5 Define Culvert Locations

12d allows culverts to be included as a segment of a super string. The **XP SWMM** rivers interface allows culverts in 2 models. In the spill string model, multiple two point superstring mays cross a spill string to indicate a culvert through the embankment. In the river string model a segment of the river centre line may marked as a culvert. For parrallel culverts, segment attributes must be used.If a source string crosses the same segment than a mulit-link with both the culvert and the natural section will be exported.

Important note: Version 10.0 of xpswmm (at the time of writing) will only use inlet control curves on culverts with positive slopes.

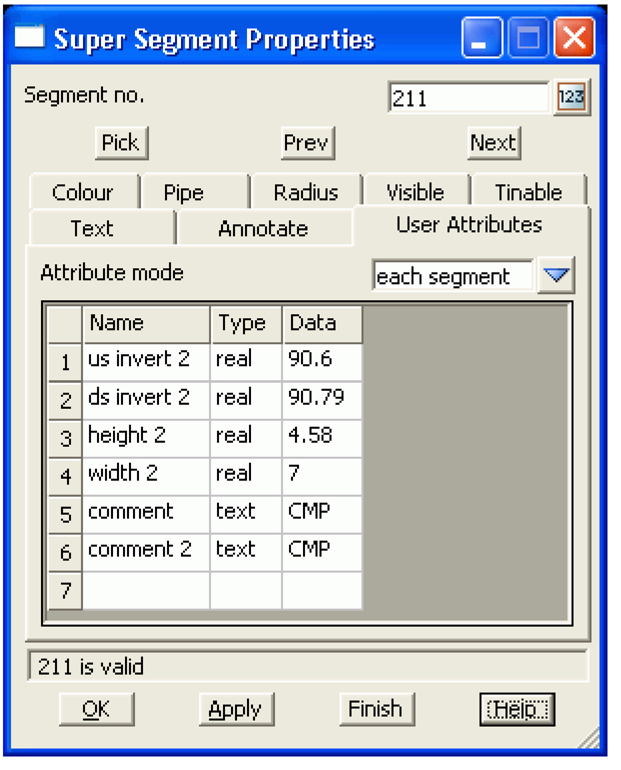
Adding a Culvert to a super string

1. **Super strings only!**
   Convert string to a super string (if required)
   Strings->Convert
2. **Mark the ends of the culvert.**
   Add a vertex at the upstream and downstream end of the culvert (Toggle vertices on if desired)
   String->Points Edit->Insert
3. **Mark the segemnt as a culvert or pipe**
   Use the super string segment editor to set the culvert data.
   Strings->Properties->Segments (all) and change Segment properties to use **culvert each segment** (box) or **pipe each segment** (round). Note that if there is one box culvert on the centre line then all must be box culverts. If you need pipes and box culverts combined, set the width to zero for pipes.
   Also set the Justify mode to indicate the type culvert levels you wish to specify.

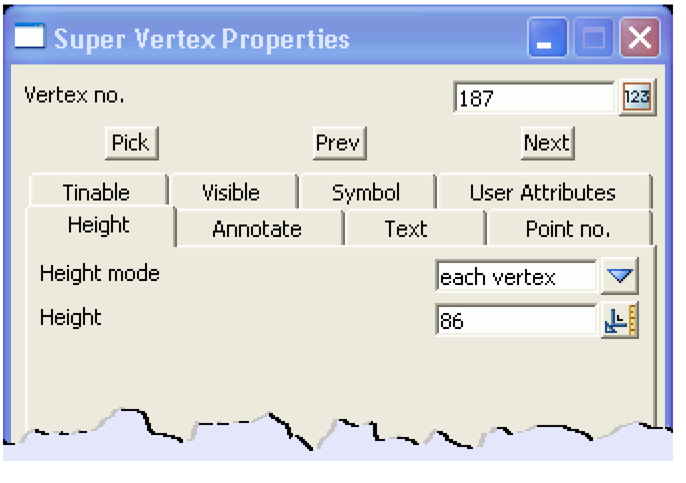


If there are two (max is 7) culverts at this location that have different inverts or sizes add the following user defined attributes to the segment. The comment attributes are printed by the Culvert Table routine and are used to label the culvert as well. If there are a number of identical culverts, the attributes "number of pipes" (integer) can be set to a value greater than 0. Additional attributes to customuse the culvert are listed at the end of this section. Default mannings n are 0.024 for pipes (corrigat metal) and 0.012 for box (concrete).

4. Conduit Factors are automatically set. Circular pipes are set to "Headwall (circular corrigated metal)" and box culverts are set to "45 deg Wingwall Flares (Rect, Conc)". Expansion and contraction energy loss coeficients have default values of 1.0 and 0.5 respectively but these may be changed using the attributes indicated below.



5. **Set the upstream and downstream levels**
   Select a vertex at the end of segment, ensure the **height mode** is **each vertex** and set the height. Use the **Next** or **Prev button** to move to the other end of the culvert and set its height as well.



Additional Culvert Segment Attributes (Spill and River strings)

Purpose	Attribute Name	Type	Typical Data Value
Culvert entrance loss	entrance loss	Real	0.5
Culvert exit loss	exit loss	Real	1.0
Mannings n	roughness	Real	0.014
Multiple identical culverts	number of pipes	Integer	2

Centre Line Culvert Segment Attributes (River strings)

The attribute name has the culvert number as a suffix. i.e. (height 2)

Purpose	Attribute Name	Type	Typical Data Value
Diameter/height	height n	Real	0.5
Box culvert width	width n	Real	1.0
Upstream invert	us invert n	Real	20.2
Downstream invert	ds invert n	Real	20.1
Culvert length	length n	Real	10.2

21.2 Culvert Table

Position of option on menu: Design=>Rivers=>XP SWMM interface=>Culvert table

This option is used to create a table of the culverts created along the centre line of the river and to label the invert levels and comment for the first culvert on each segment (some segments may include attributes for more than on culvert). A sample is shown below.

Culvert Listing										
chainage	Number	US Invei	DS Inver	Height	Width	Quantity	X location	Y locatior	Comment	Segment
Centre lin	center line 1									
88444	1	125.28	124.95	11	7	1	683236	1389459		705
87269	1	127.58	127.24	6		1	683059	1390605	72/cmp	695
85983	1	123.13	123.72	6		1	682871	1391834	inv-72/cm	682
84317	1	124.15	123.47	6		1	681757	1392779		666
84317	2	124.59	125.15	6	0	1	681757	1392779	6ft cmp	666
83854	1	123.07	123.28	5		1	681319	1392820	60 inch cc	659
83854	2	123.54	123.42	5		1	681319	1392820	60 inch cc	659

How to for Rivers

Frequently Asked Questions (Rivers)

Exporting to HEC-RAS

The HEC-RAS project is created from a surface tin (representing the river bed and overbanks) and a model containing strings identified by their names “left bank”, “right bank and the name prefix, “centre line”. Any additional strings in the specified model will be ignored (warning messages will be given when you run the macro that any additional strings are being ignored). The low chainage (often zero) of the centre line strings must be at the downstream end of the reaches.

Cross sections are created at the location of the **source strings**. These source strings are initially created using the HEC-RAS option at a user defined spacing and section length. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

Presenting HEC-RAS Results in 12d

After the HEC-RAS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the HEC-RAS results. These strings are then triangulated to create a water surface tin from which the water level boundaries are determined. These results can then be shown in plan, long section, cross section and in 3D perspectives.

More details

21.3.1 HEC-RAS Write Panel

Position of option on menu: Design=> Rivers=>HEC-RAS interface=>Create HEC-RAS project

The HEC-RAS interface creates the HEC-RAS project files ready to open and run. This includes the project, plan, flow and geometry files. Water levels are read back into 12d where they may be viewed in a three dimension perspective view to easily identify extents of flooding.

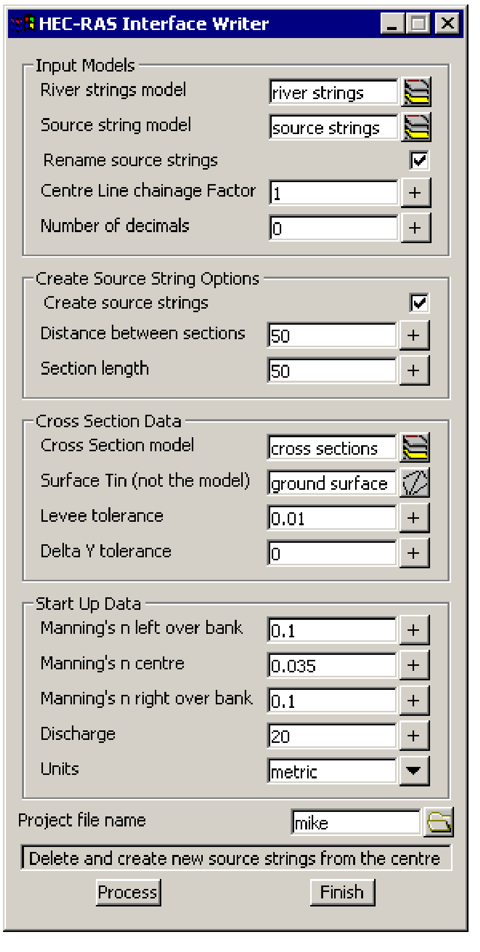
Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The HEC-RAS panel for creating the HEC-RAS project follows.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

INPUT MODELS

River strings model Model box

*Model containing the centre line, left bank and right bank strings. **The centre line strings must begin downstream and proceed upstream.** The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

Confluences are modelled by a using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

The distance from the start of the upstream strings to the first cross section is used to model the confluence length.

The left and right bank strings need not be separate strings (see figure below).

Source string model Model box

*New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.*

Rename Source Strings Tick box not selected

*If selected the source strings will be a name using the chainage along the river centre line. The **number of decimals** and the **Centre line chainage factor** (ft to miles or m to km) are specified below.*

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Number of decimals Real box

*When **Rename source strings** is selected, the source strings name will have the specified number of decimals.*

CREATE SOURCE STRNGS OPTIONS

Create Source Strings Tick box not selected

*When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).*

Distance between sections Real box

The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.

Section Length Real box

The length of the cross section with zero chainage at the mid point.

CROSS SECTION DATA

Cross section model Model box

The cross sections created and exported are stored in this model.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Levee Tolerance Real box

If the surface level drops more than this amount while moving away from the channel centre line then the crest is marked as a levee. A value of zero means that no levees are marked.

Delta Y tolerance Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. ***The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.***

STARTUP DATA

Manning's n Real box

Manning's n values for the left, right and centre channel sections.

Discharge Real box

This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside HEC-RAS or inside 12d. This can be changed at each section See manual settings

Units Choice box

This selection will set the default units for the project being created.

Project file name Input box

The HEC-RAS project name. Remember HEC-RAS (2.0 or earlier) is limited to 8 characters only. If the total path name is too long HEC-RAS will not analyse the project.

21.3.2 HEC-RAS Read Panel

Position of option on menu: Design=>Rivers=>HEC-RAS interface=>Read HEC-RAS reports

After the HEC-RAS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the HEC-RAS results. These strings are then triangulated to create a water surface tin.

HEC-RAS Interface overview

Create HEC-RAS files

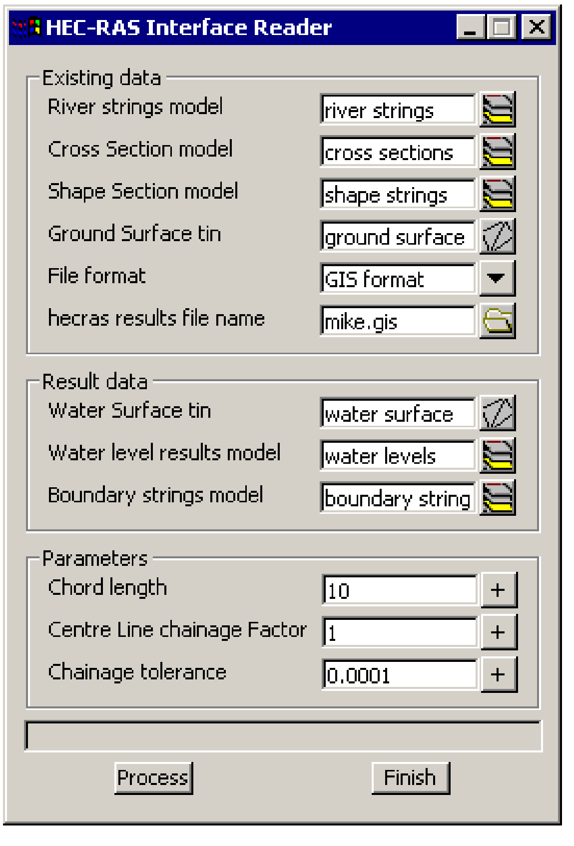
Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The HEC-RAS read panel follows.



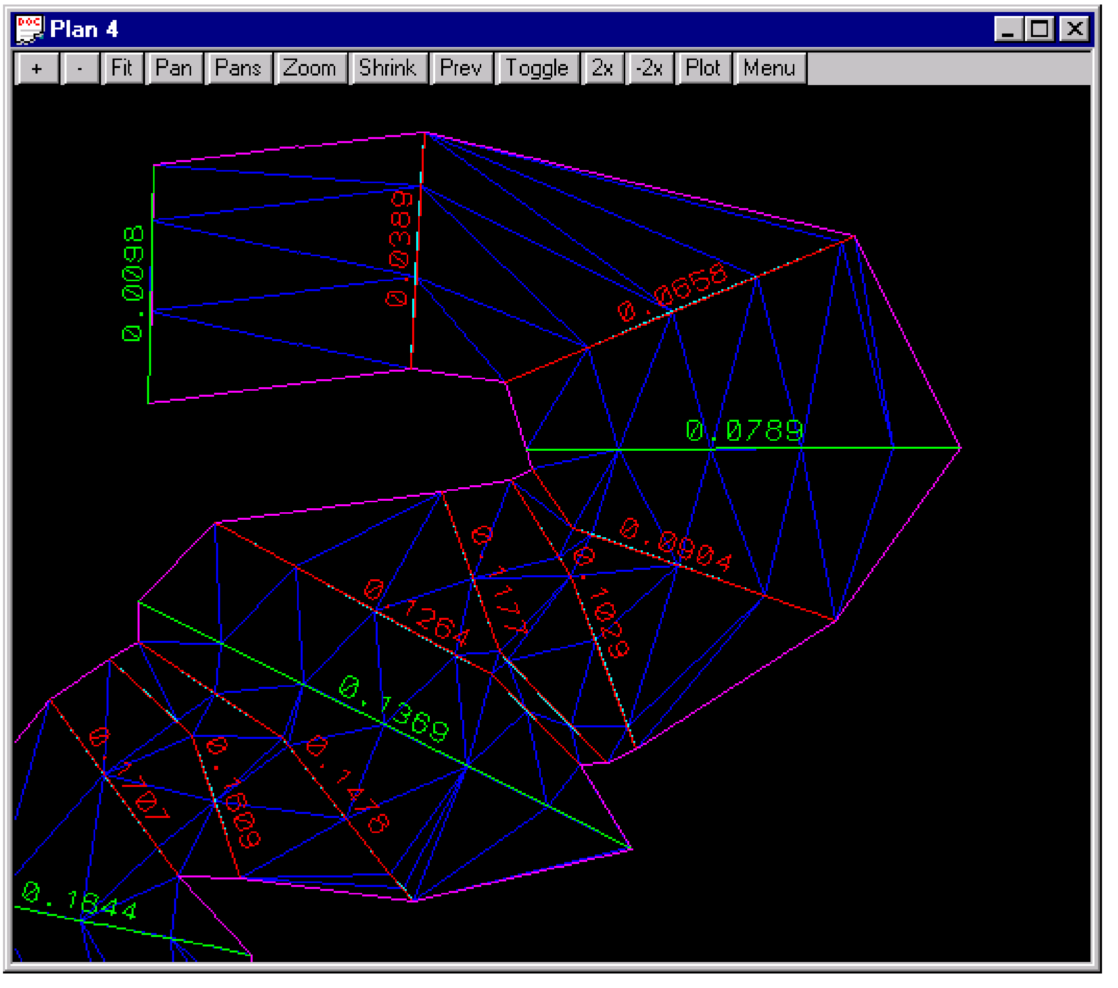
EXISTNG DATA

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. This must be specified but is only used when reading the *.rep file types (see **File format** below). The interface will search the string names in this model for the cross sections specified in the HEC-RAS report. A match is successful if the HEC-RAS* *cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*



Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Ground surface tin Tin box

*If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.*

File format Choice box

The GIS format should be used in most cases. The rep format is used for reading the HECRAS report files with the "Standard Table 1" selected in HECRAS.

HEC-RAS report file name File box

The HEC-RAS report file (GIS format) is created using the HEC-RAS menu selection

File=>Export GIS data

The HEC-RAS report file (REP format) created using the HEC-RAS menu selection

File=>Generate Report

The report must include the Standard Table 1.

RESULTS DATA

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

PARAMETERS

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Centre line chainage factor Model box

This data is only required if the ***Shape string model*** *is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.*

Chainage Tolerance Real box

This is the tolerance used when the cross section chainage from the HEC-RAS report is compared with the cross section string names. A value of 0.00001 is excellent if you have not altered the cross section names in 12d or HEC-RAS.

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the HEC-RAS report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor

(Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

21.3.3 Import cross sections (GIS file)

Position of option on menu: **Design=>Rivers=>HEC-RAS interface=>Import cross sections (gis file)**

This option is used to import HEC RAS cross sections, interpolated cross sections, source strings (Cut lines), river centre lines and storage area boundaries into 12d. Note that the imported data will be given the X,Y coordinates used in the HECRAS project.

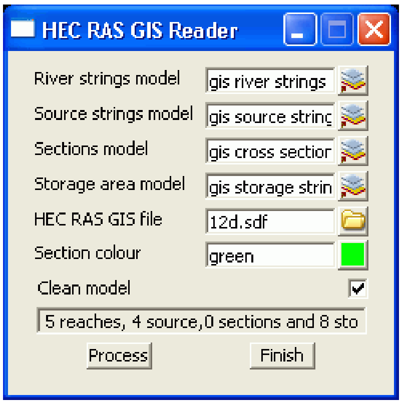
How to for Rivers

Frequently Asked Questions (Rivers)

Usage

This panel is accessed from the menu selection

Design => Rivers => HEC-RAS Interface=>Import cross sections (GIS file)



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
River strings model	model box		

the imported centre line strings will be stored in this model (REACH:CENTERLINE: data). If blank these string will not be imported.

Source string model model box

the imported source strings will be stored in this model (CROSS-SECTION:CUT LINE: data) If blank these string will not be imported.

Cross section model model box

the imported cross section strings will be stored in this model (CROSS-SECTION:SURFACE LINE: data). If blank these string will not be imported.

Storage area model model box

storage area boundaries will be stored in this model (strings not supported in 12d V7 interface). If blank these string will not be imported.

HEC RAS GIS File File box

the GIS file generated from HEC RAS (.RASexport.sdf)*

Section colour colour box

Cross sections will be created using this colour unless the section name contained illegal characters

Clean model tick box

if selected all strings in the Cross section model will be deleted before the cross sections are imported

Process button

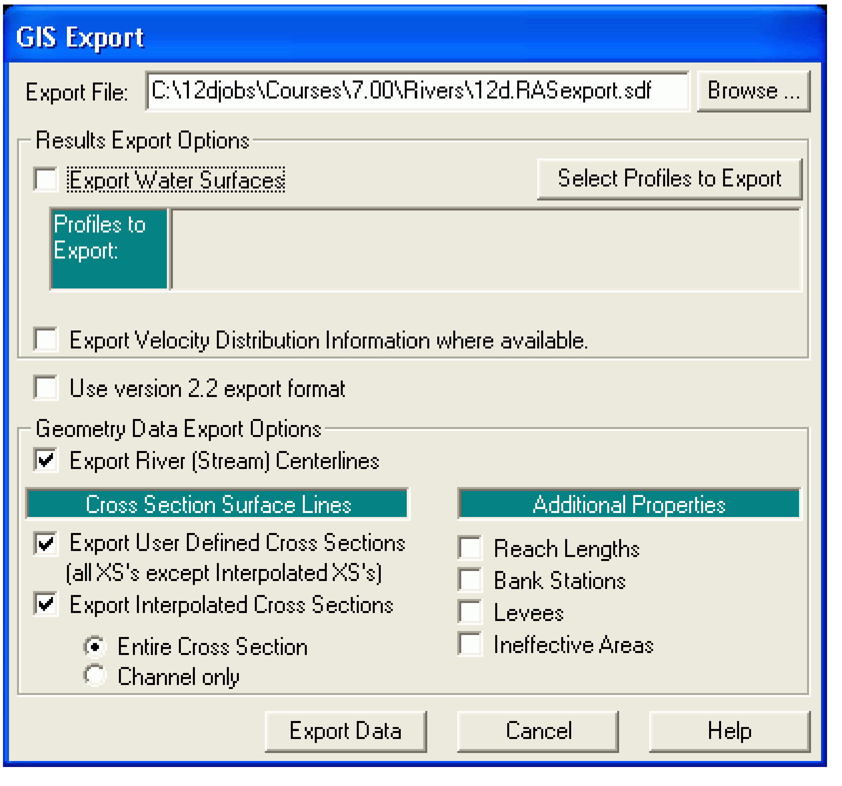
executes the option and the number of string imported will be reported in the message area.

Finish button

removes the dialogue from the screen

Notes:

The RASexport.sdf file is create from HEC RAS using File->Export GIS Data. From this panel the desired data to be exported may be selected. In this example all three Geometry tick boxes have been selected.



21.3.4 Read HEC-RAS interp sections

Position of option on menu: Design=>Rivers=>HEC-RAS interface=>Read HEC-RAS intep section

This option is used to import HEC RAS interpolated cross sections (names begin with *) based on their distance along the left and right bank strings.

The low chainage must be at the downstream end for both the "left bank" and "right bank" strings.

Hydrology Data

XP-SWMM Interface overview

Read XP-SWMM results

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

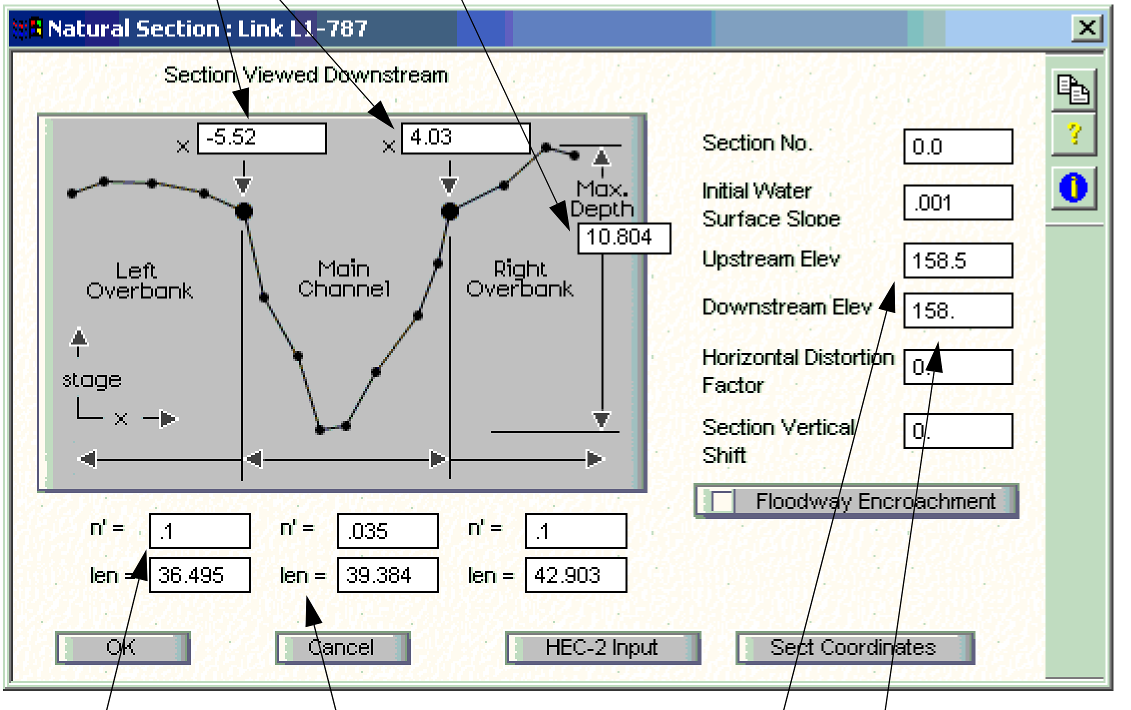
The source strings define the location where cross sections are cut from the ground surface TIN. A node is created in XP-SWMM at this location and the cross section shape is used to the next downstream node (no cross section is created at the most downstream source string).

The centre line and overbank channel lengths are measured in the downstream direction. XP SWMM link and node input panels are displayed below with the relationship to the ***12d Model*** described.

XP SWMM Link Data

cross section chainage at intersection of left and right bank strings

max elev - min elev at upstream cross section



n values from 12d panel

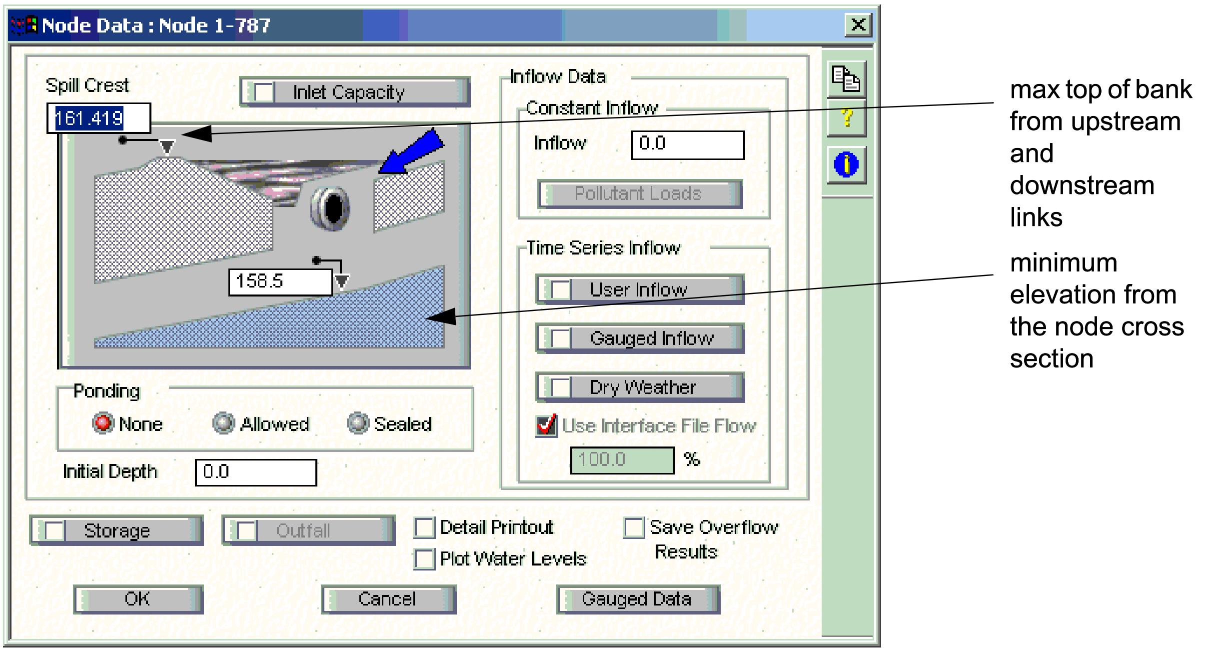
channel lengths measured along river strings

Minimum cross section elev from upstream node.

Minimum cross section elev from downstream node

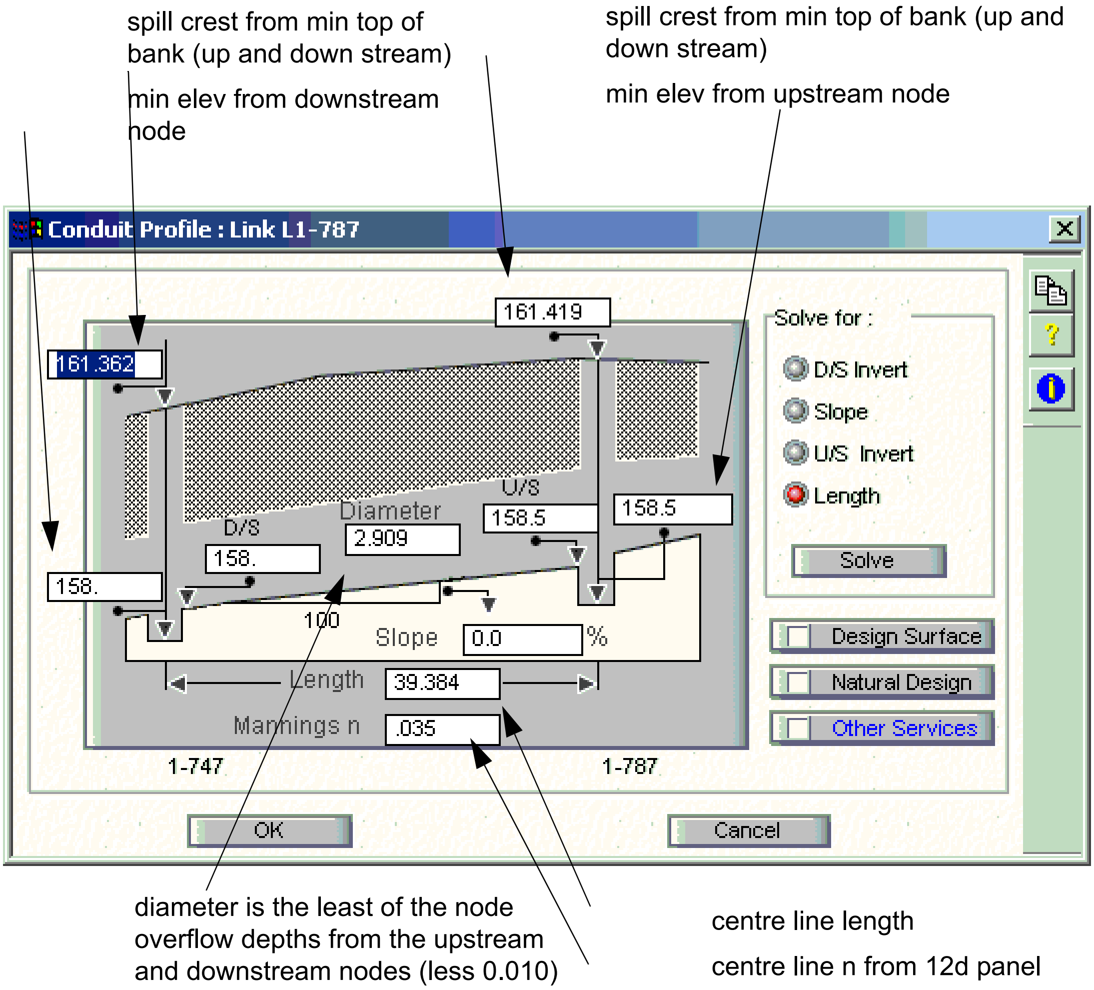
.

XP SWMM Node Data



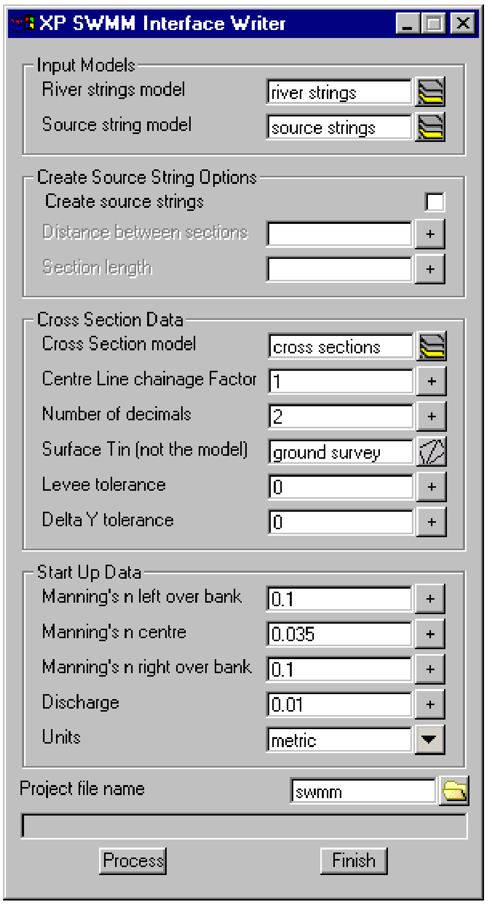
XP SWMM Conduit Data

The slope of the conduit/link is calculated by assuming that its invert matches vertically with the invert of the downstream link. The overflow levels at the nodes are calculated by determining the lowest of the bank levels for the upstream and downstream links. The least of the overflow depths at the nodes is then used as the link diameter.



Usage

The XP-SWMM panel for creating the XP-SWMM project follows.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
River strings model	Model box		

Model containing the centre line, left bank and right bank strings. ***The centre line strings must begin downstream and proceed upstream.*** *The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

The left and right bank strings need not be separate strings (see figure below).

Source string model Model box

New source strings will be created in this model or existing source strings are contained in the model. See ***Create source strings*** *tick box below.*

Create Source Strings Tick box not selected

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the ***Strings->Points Edit*** *menu you will find the selections* ***Move*** *(to move the end points),* ***Insert*** *(to insert additional points).*

Distance between sections Real box

The distance between the cross sections. At present no check is made for overlapping cross sections *around river bends.*

Section Length Real box

The length of the cross section with zero chainage at the mid point.

Cross section model Model box

The cross sections created and exported are stored in this model.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Number of decimals Integer box

*The cross section names are created with this many decimals. CAUTION XP SWMM only allows 10 characters for the names and each link name begins with "**Lx-**" That leaves 7 characters for the chainages.*

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Levee Tolerance Real box

Not implemented in XP-SWMM.

Manning's n Real box

Manning's n values for the left, right and centre channel sections.

Delta Y tolerance Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. ***The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.***

Discharge Real box

This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside XP-SWMM or inside 12d. This can be changed at each section See manual settings

Units Choice box

This selection will set the default units for the project being created.

Project file name Input box

*The XP-SWMM *.xp name to be created or updated. An xpx file will also be created using this name to transfer the data.*

After selecting the **Process** button the cross section strings will be created and exported to a xpx file (using the project file name as the stem. **Never included ".xpx" in the project file name**) The xpx file will be over written without any warning. This is only used as a temporary transfer file.

12d needs to know where XPSWMM program and the XP SWMM working directory are. The system file that contains these locations is called XPSWMM.4d. (See System file path for its location). The file contents are as follows:

Line 1the XP SWMM working directory
Line 2the full path to the XP SWMM program
Line 3the destination of the hydro.ini file when it is created

IMPORTANT: include the final "\" on lines 1 and 3.

The **XPSWMM.4d** file as supplied follows;

c:\xps\xp-swmm\work\
c:\xps\xp-swmm\xpswmp32.exe
c:\xps\xp-swmm\

Next 12d will check for an XP project in your XP SWMM work directory (project file name + ".xp"). If it does not exist the file **Master_rivers.xp** will be copied from the System file path to your XP SWMM working directory. If a wp file already exists in your working directory you will see the following options dialogue.

The default is to update the wp file. Nodes and links in the file with the same names as in the export will be updated. If they do not exist they will be added. The import will NOT delete any nodes or links inside XP SWMM. This option is often used to merge rivers data with urban drainage data.

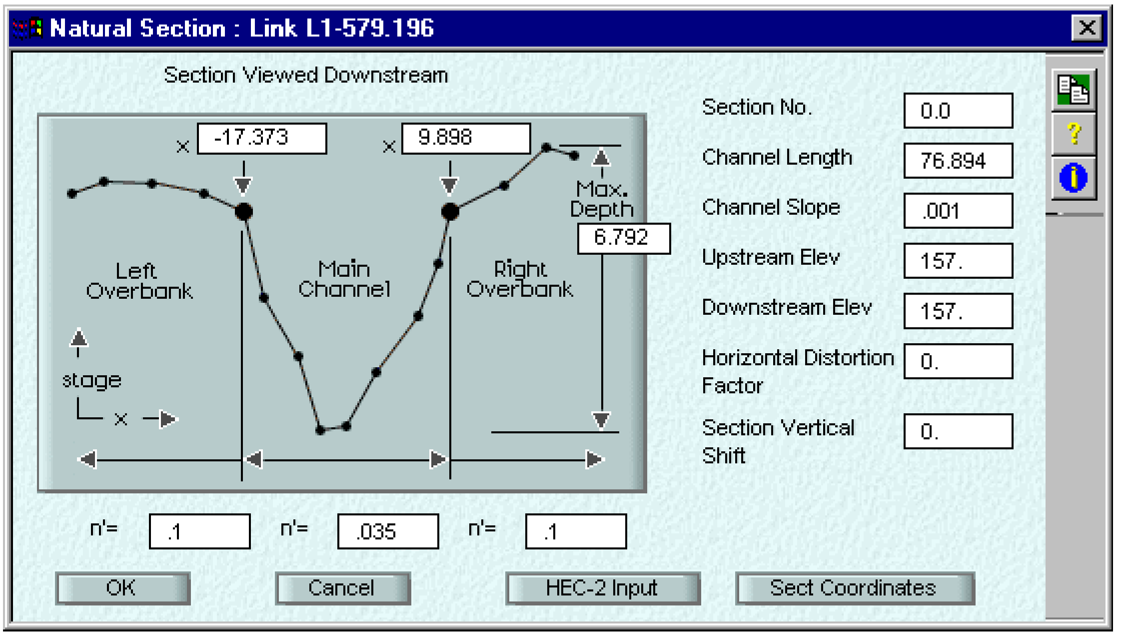
The over write option will copy the Master_river.xp file into the working directory and over write the existing file.

In either of the two cases the xpx file will be imported after XP SWMM has started. When you exit your XP SWMM session regardless of whether or not you save the XP file the XPX file will be exported over writing the original export file from 12d.

Your third option if not to run XP-SWMM at all and work with the XPX file as you see fit.

21.4.1.1 Export Details

The following diagram displays how the values from 12d are exported to XP-SWMM



At every source string location a node is created in XP-SWMM. The cross section geometry is then used for the downstream reach and is exported looking in the downstream direction.

The node name is set manually or calculated inside 12d by obtaining the centre line chainage at the intersection with section string. This value is divided by the **Centre line chainage factor** and rounded to the **Number of decimals** specified in the 12d export dialogue box. This value is then prefixed with the reach index followed by a dash. The downstream link name is set to the node name prefixed with "L". If you are planning to merge the river file with am XP SWMM drainage network then you will want to manually set the node names to the drainage pit names for the most upstream and most downstream source strings.

When selecting the **Number of decimals** in the 12d export dialogue, ensure that the total link name generated does not exceed the XP limit of 10 characters.

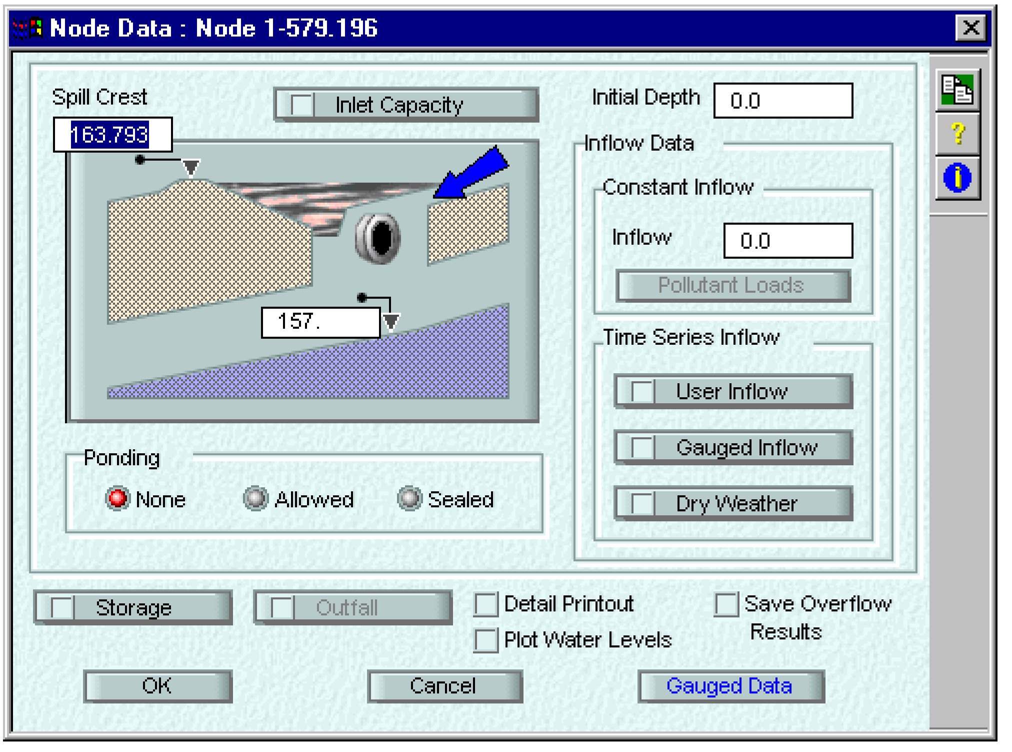
The section number variable is not exported to XP-SWMM.

Where the centre line cross the section in 12d is marked as zero chainage in XP-SWMM. The left overbank (-17.373) and the right overbank (9.898) are determined by the intersection of the left and right bank strings with the section. The n values are the values that are entered in the 12d export dialogue box. The maximum depth is calculated by subtracting the lowest elevation from the greatest elevation for both this cross section and the downstream cross section. The minimum of the two values is used.

The channel length is determined by subtracting the downstream section's centre line chainage from the current section centre line chainage. The **Centre line chainage factor** is **NOT** used in this calculation.

Upstream elevation is obtained by calculating the minimum elevation at the current section and the downstream elevation is the same value for the downstream cross section. The channel slope is calculated using these elevations and the channel length above.

The horizontal distortion factor and section vertical shift are set to zero. A section coordinate point in generated every time the source string crosses a 12d triangle edge, at the centre line and the left/right bank locations.



The spill crest level at the node is set to the maximum level on the cross section. Constant inflow is zero unless the node is the most upstream section on the reach are the flow value for the source string has been set manually see manual settings.

21.4.1.2 Hydrology Data

Hydrolgy data may be exported to the runoff layer of XP SWMM for both the reservoir strings and the source strings. There are 2 requirements to enable the hydrology.

21.4.1.2.1 Key Points

1. If you plan to use storage areas, you need to draw reservoir strings (all in one model) and each should have a name (to become the XP SWMM node name).
2. You must create a file named "hydrology.txt" and store it in the project working folder. This file will contain the default xpx variable names. These defaults may be over riden using the same xpx variable name as a string attribute on the source/reservoir string (see format below).
3. The reservoir or source string must have an integer string attribute named "xpx r rfcmnt" with a value greater than 0 (max of 5). Use the Strings->Properties->Attributes or Strings->User->Attribute Editor to create/change this attribute.
4. Total area for the reservoir strings is calculated at each export time.

21.4.1.2.2 Hydology.txt file format

The file is tab delimted and each line consists of three pieces of data: the XPSWMM variable name, the default value, and the type of data (integer, real or text).

You enter the xpx variable name

Any of these default values may be specified using a string attribute on the reservoir or source string. The attribute name must be of the same type as defined in the hdrology.txt file. If data for a second XP SWMM catchment is desired add a " 2" to the end of the attribute name. Up to 5 catchments are allowed in XP SWMM.

A sample hydrology.txt file follows:

```
// SCS hydrology screen

R_CN        85          real
R_TC        60          real
R_SHF       256         integer
R_SHAPE     0           integer

R_IADEPTH0.04           real
R_IAFRACT0.2            real
R_IA        1           integer
CNTLS       5           integer
R_FSCS      1           integer

// sub catchment screen

R_RAINSEL"SCS Type II FL Mod."text
R_INFILSEL              ""text
R_GWTAG     0           integer

// runoff node screen

R_WAREA     1.          real
R_WIMP      1.          real
R_WIDTH     1.          real
R_WSLOPE1.              real
```

21.4.1.2.3 Attribute name format for string attributes.

The attribute name is the XP variable name prefixed by "xpx " with the underscore character in the xpx variable replaced by a space. For example the xpx variable "R_RAINSEL" would be set using the attribute name "xpx R RAINSEL".

21.4.1.3 Exporting River Junctions

River junctions are defined by the intersection of the centre line strings in 12d. The cross section immediately downstream of the intersection becomes the junction node. It is used as the downstream cross section for all upstream branches. The channel length for the last link on the tributary is set to the distance the centre line string extends beyond the cross section. The distance downstream along the main branch is **NOT INCLUDED!**

21.4.2 XP-SWMM Read Panel

Position of option on menu: Design=>Rivers=>XP SWMM interface=>Read XP SWMM xpx results file

After the XP-SWMM analysis is complete and the XP-SWMM program is closed the water level data is written to an xpx file that 12d will read. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the XP-SWMM results. These strings are then triangulated to create a water surface tin.

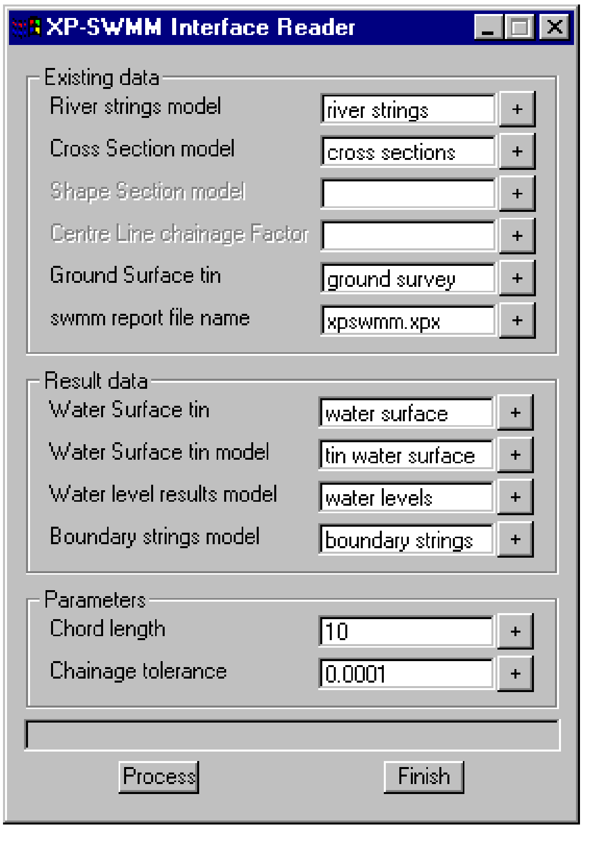
Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The XP-SWMM read panel follows.

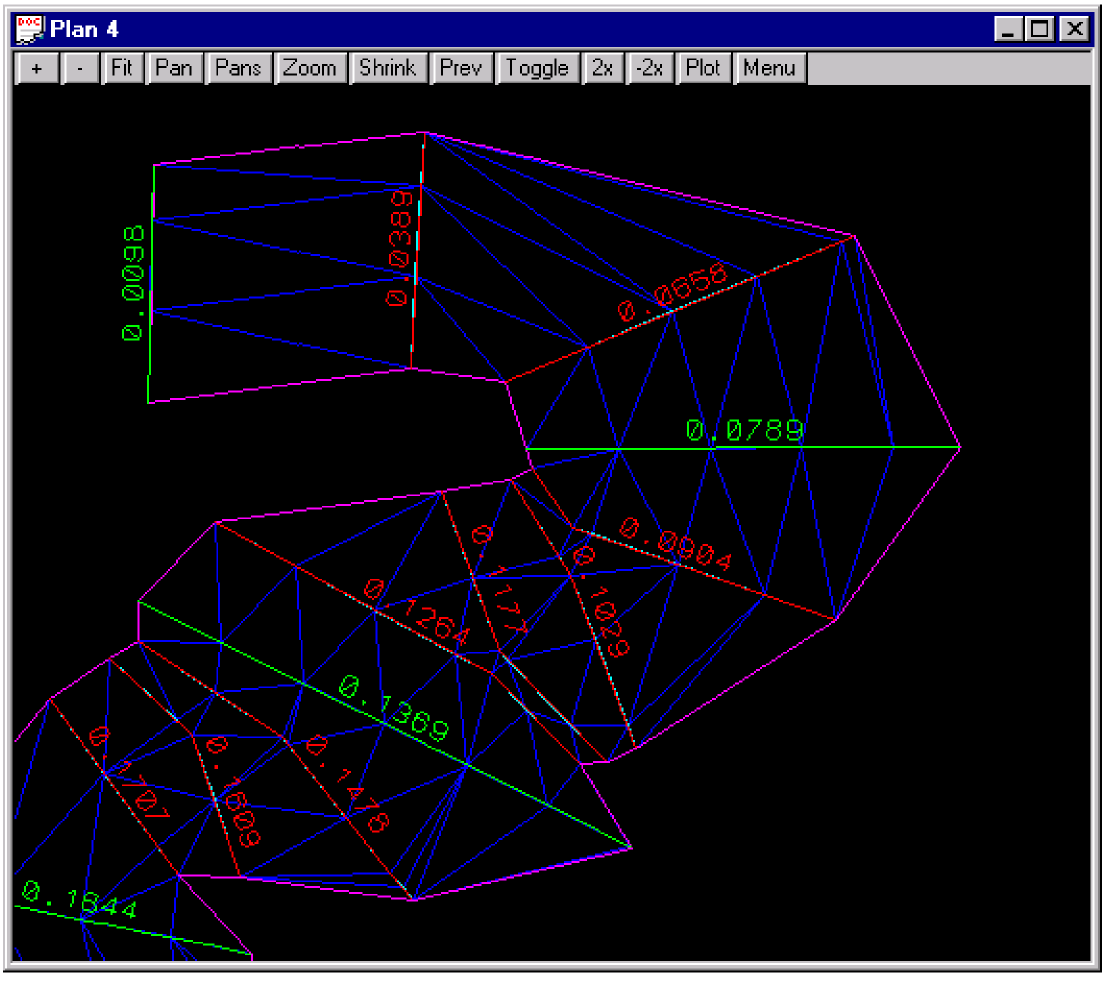


River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the XP-SWMM report. A match is successful if the XP-SWMM cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*



Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor Model box

This data is only required if the ***Shape string model*** *is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.*

Ground surface tin Tin box

If a ***boundary string model*** *is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the* ***boundary string model*** *field.*

XP-SWMM report file name File box

The XP-SWMM xpx file created automatically when closing XP-SWMM or via the XP-SWMM menu selection

File=>Export Data

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Chainage Tolerance Real box

This is the tolerance used when the cross section chainage from the XP-SWMM report is compared with the cross section string names. A value of 0.00001 is excellent if you have not altered the cross section names in 12d or XP-SWMM.

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the XP-SWMM report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor

(Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

21.5 MIKE11 Interface

Position of menu: **Design=>Rivers=>Mike11 interface**

The MIKE 11 interface creates the MIKE 11 project files including *.bnd11, *.hd11, *.nwk11, sim11 and the cross section data text file (to be imported into *.xns11). Water levels are read back into 12d where they may be viewed in a 3D perspective view, on cross sections and on river profiles. Plan drawings easily identify extents of flooding and all data can be plotted onto engineering drawings.

The Mike11 walk right panel is,

River and Source Strings

MIKE11 Interface Overview

MIKE 11 Write Panel

MIKE 11 Read Panel

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Exporting to MIKE 11

The MIKE 11 project is created from a surface tin (representing the river bed and overbanks) and a model containing river centre line strings (identified by the name prefix, “centre line”). The low chainage (often zero) of the centre line strings must be at the upstream end of the reaches.

Cross sections are created at the location of the **source strings**. These source strings are initially created using the MIKE 11 option at a user defined spacing and section length, imported from drawing packages or manually created in 12d. The user may alter these sections as desired. They may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The Create source strings tick box on the interface panel must NOT be selected to use the customised strings.

Presenting MIKE 11 Results in 12D

After the MIKE 11 analysis is complete the maximum water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the MIKE 11 results. These strings are then triangulated to create a water surface tin.

How the water level boundaries are determined

21.5.1 MIKE 11 Write Panel

Position of option on menu: Design=>Rivers=>Mike11 interface=>Create Mike11 files

The MIKE 11 interface creates the MIKE 11 project files including *.bnd11, *.hd11, *.nwk11, *.sim11 and the cross section data text file (to be imported into *.xns11). Water levels are read back into 12d where they may be viewed in a 3D perspective view to easily identify extents of flooding.

See also

River and Source Strings

MIKE 11 Read Panel

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

12d creates most of the files necessary to run MIKE11. The exception to these are the time series files (both water level and discharge data). The simulation file created assumes that these files will have the same name as the centre line strings used in 12d. For example, if you name your centre line string *centre line Major River* then your time series files will be named *Major River-H.DFS0* for the tail water conditions and *Major River-q.dfs0* for your discharges.

The *.bnd11, *.hd11, *.nwk11 and *.sim11 files are created by appending 12d data to default data found in the following files.

cross_sections.4d

hd11-end.4d

hd11-header.4d

nwk11-header.4d

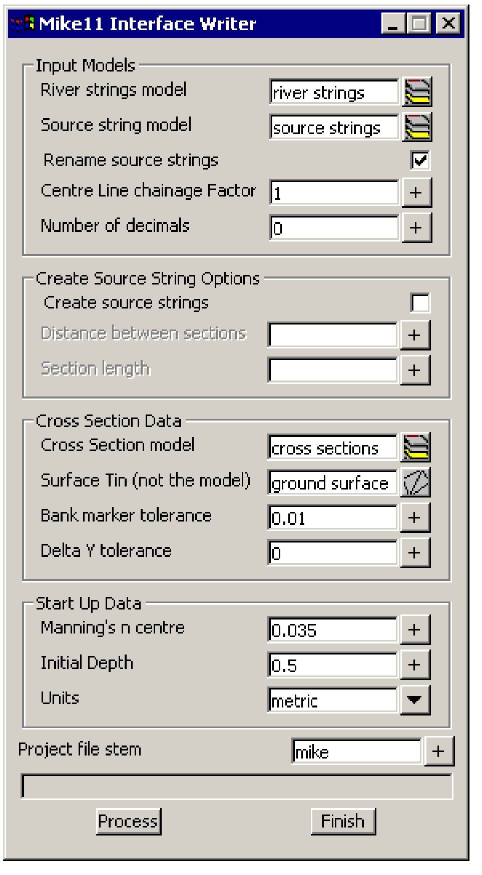
nwk11-options.4d

sim11-header.4d

sim11-period.4d

The user need not modify these files unless they would like to change the default values used when first creating the MIKE11 project. If you plan to modify these files, they are found in the 12d *setups* directory. Before modifying they should be copied to the 12d *user* directory (global defaults) or into the current project directory if they are project specific.

The MIKE 11 panel for creating the MIKE 11 project follows.



The fields and buttons used in this panel have the following functions:

Field Description   Type   Defaults   Pop-Up

River strings model   Model box

Model containing the river centre line strings. ***The centre line strings must begin upstream and proceed downstream.*** *The name of the river must follow the words "centre line " (note the ending space). The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

Confluences are modelled by a using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

Source string model   Model box

New source strings will be created in this model or existing source strings are contained in the model. See ***Create source strings*** *tick box below.*

Create Source Strings   Tick box   not selected

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the ***Strings->Points Edit*** *menu you will find the selections* ***Move*** *(to move the end points),* ***Insert*** *(to insert additional points).*

Distance between sections Real box

The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.

Section Length Real box

The length of the cross section with zero chainage at the mid point.

Cross section model Model box

The cross sections created and exported are stored in this model.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Bank Marker Tolerance Real box

If the surface level drops more than this amount while moving away from the channel centre line then the crest is used as a Bank Marker. A value of zero means that no bank marks are created.

Delta Y tolerance Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. ***The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.***

Manning's n Real box

Manning's n values for the channel sections.

Initial depth Real box

This depth is added to the minimum elevation on the cross section and is used as the starting water level for the cross section.

Units Choice box

This selection will set the default units for the project being created.

Project file name Input box

The MIKE11 project name. All of the MIKE11 files will begin with this name and the appropriate extensions added.

21.5.2 Running MIKE11

Three steps are required to run MIKE11 with the files 12d creates.

1. Create you time series files.
2. Inside MIKE11, create a new cross sections file and import the cross sections.
3. Open the simulation file, and load the network file to have the grid points calculated.

21.5.3 Creating Time Series Files

Your time series files must be named with the prefix of the river string name. For example if your centre line string in 12d was named *centre line Major* River your time series files need to named *Major River-H.DFS0* for the tail water conditions and *Major River-q.dfs0* for your discharges.

The standard time series dates are from 12:00 to 12:30 on 01 January 2000 with a one minute time step. If other periods are desired, you can either change the file *sim11-period.4d* in the 12d library before running the interface or change the dates inside MIKE11 after you read in the data. **DO NOT USE THE ORIGINAL FILES! Copy the file you are changing into the 12d user directory and modify it there. 12d will look for the file here first.**

21.5.4 Importing Cross Sections

From the MIKE11 main menu select **File->new** and then under Mike11 select **cross sections** from the dialogue box.

From the main menu select **File->Import->Import Raw data & Recompute**. Select the *.txt file with the **Project file stem** you specified in the 12d-Mike11 Write Panel. Now save this file with the same **Project file stem** (MIKE11 adds the .xns11 extension).

21.5.5 Calculating Grid Points

From the main menu select **File->Open** and select the *.sim11 file with the **Project file stem** you have specified in 12d. On the **Input** tab property sheet select **Edit** beside the **Network** file. Press **Ctrl+T** to take you into the table editing mode and then select the **Grid Points** tab property sheet. On the sheet select **Generate Grid Points** and then save the file.

You should now get the “Green lights” on the **Start** property sheet of the simulation file editor.

21.5.6 MIKE 11 Read Panel

Position of option on menu: Design=>Rivers=>Mike11 interface=>Read Mike11 results (max)
After the MIKE 11 analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the MIKE 11 results (maximum water level).

Water levels are interpolated to create water level strings at the shape string locations. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach. These strings are then triangulated to create a water surface tin.

The MIKE11 executable file, *res11read.exe* must be found in the directory *c:/mikezero/bin* so that 12d can read the Mike11 binary data files.

MIKE11 Interface Overview

Presenting Water Level Results

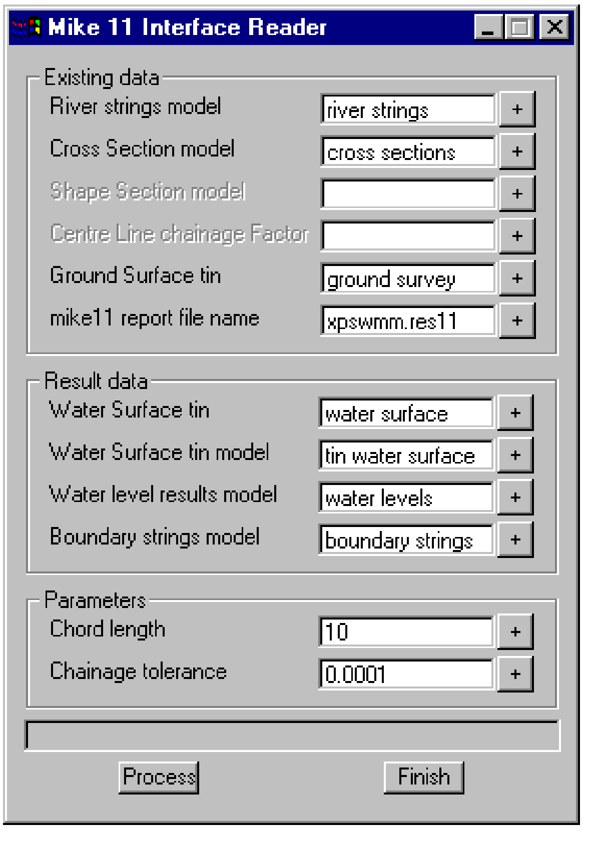
MIKE 11 Write Panel

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The MIKE 11 read panel follows.



The fields and buttons used in this panel have the following functions:

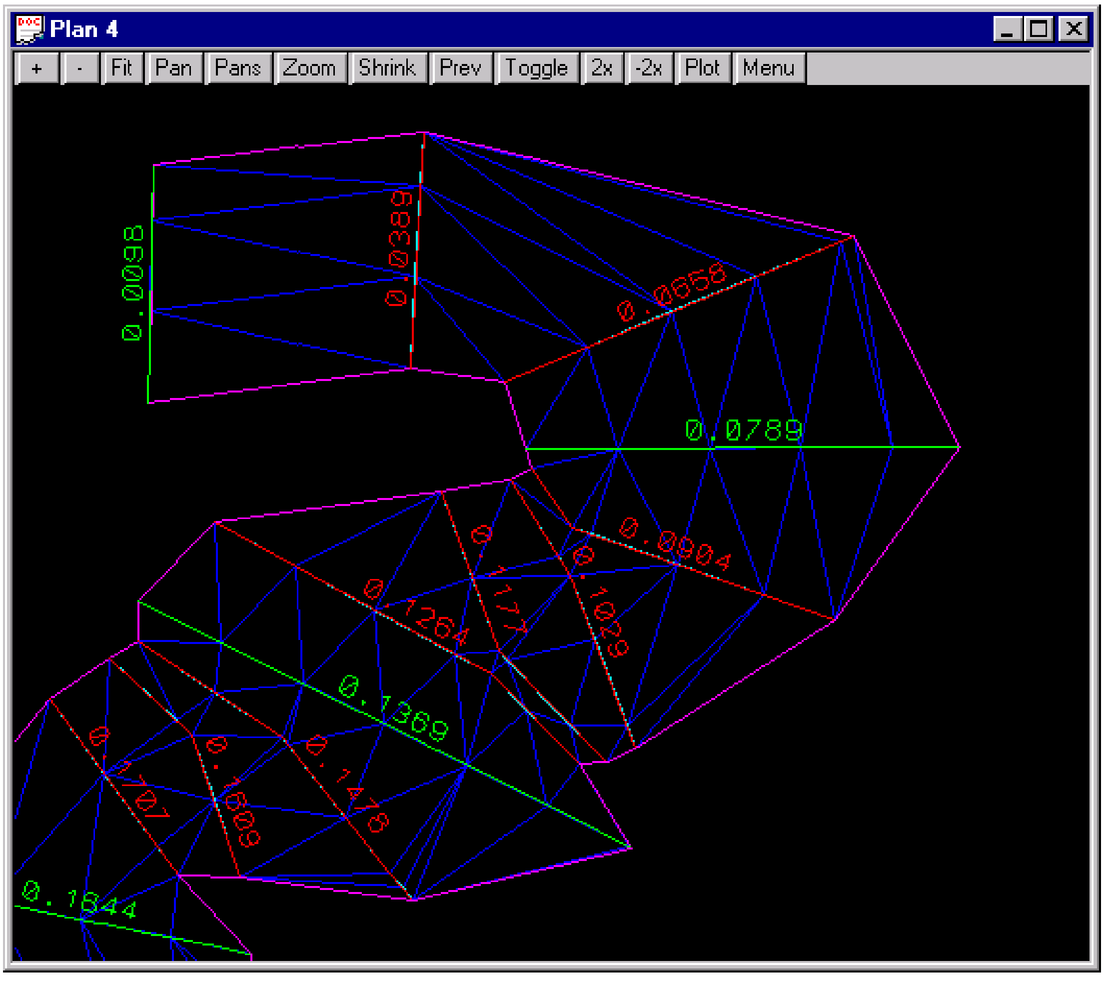
Field Description	Type	Defaults	Pop-Up

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the MIKE 11 report. A match is successful if the MIKE 11 cross section chainage and the string name are within the tolerance specified below in ***Chainage tolerance****.*



Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor Model box

This data is only required if the ***Shape string model*** *is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.*

Ground surface tin Tin box

If a ***boundary string model*** *is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the* ***boundary string model*** *field. Super tins cannot be used for this function. A composite tin is required for the tin-tin intersect.*

MIKE 11 report file name Input box

This is the binary data file that will converted to an ASCII text file and read by 12d. The maximum water levels at each cross section will be extracted from the file.

Water surface tin Tin box

The name of the water surface tin to be created.

Water surface tin model Model box

The model to contain the new water surface tin.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Chainage Tolerance Real box

This is the tolerance used when the cross section chainage from the MIKE 11 results file is compared with the cross section string names. If a ***Centre line chainage factor*** *of 1 is used a value of 0.1 is appropriate. If a* ***Centre line chainage factor*** *of 1000 or 5280 is used a* ***Chainage*** *tolerance of 0.00001 is more appropriate.*

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the MIKE 11 report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor (Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

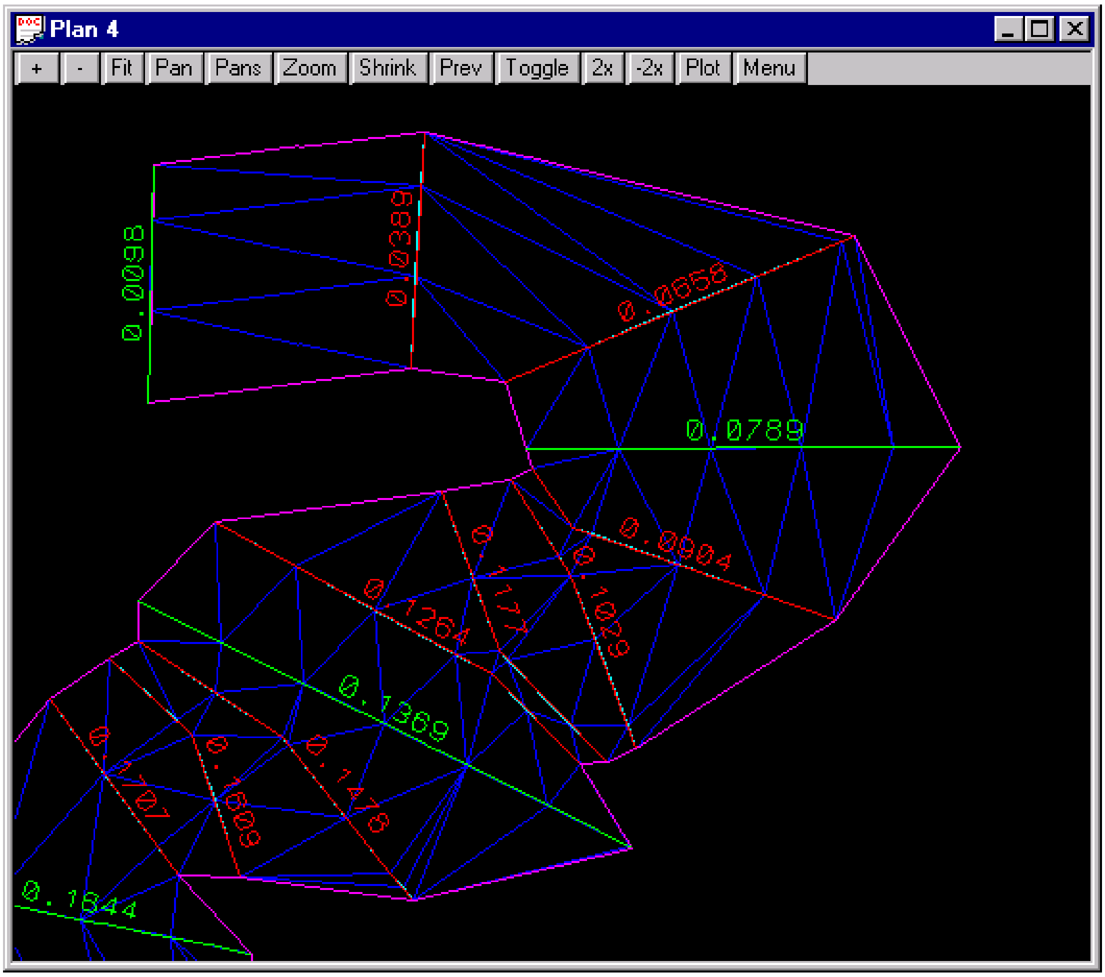
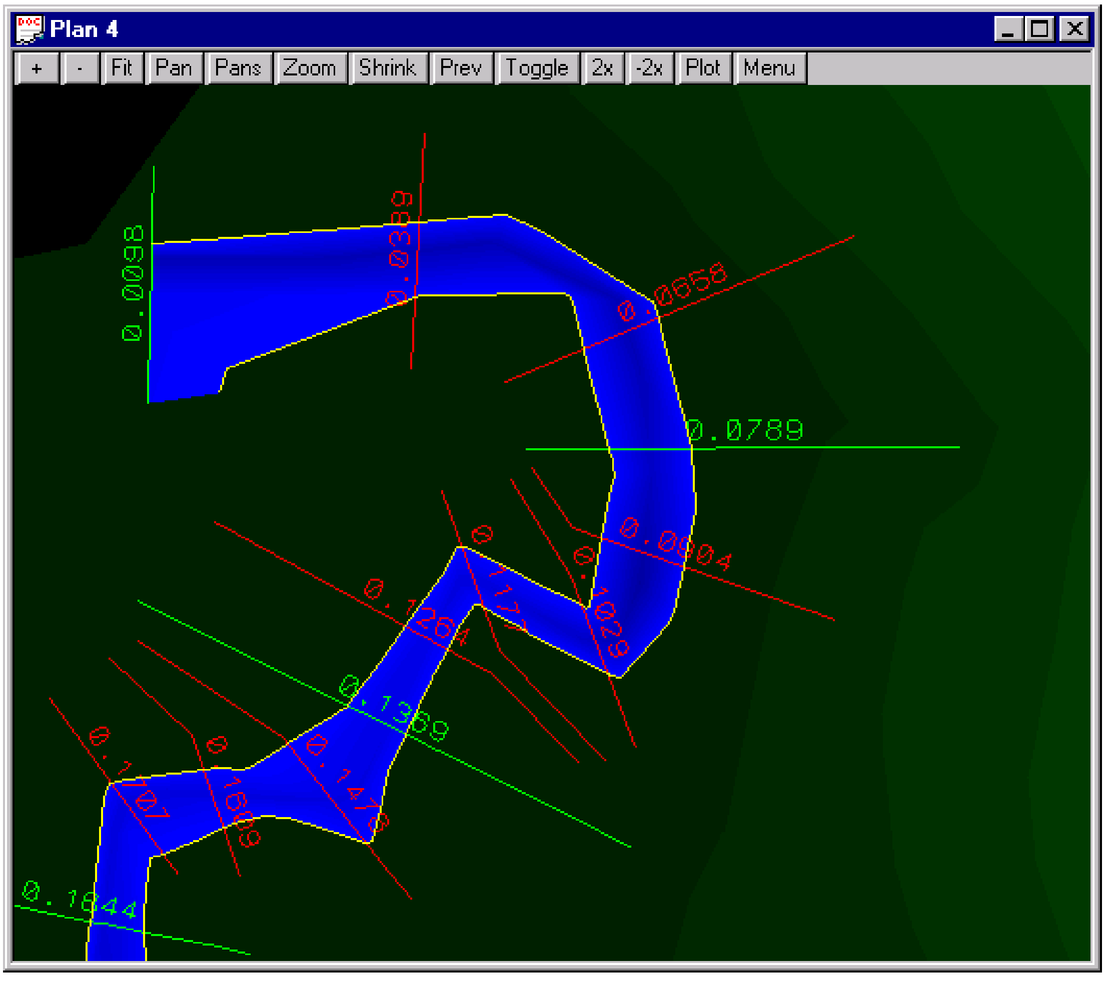
How to for Rivers

Frequently Asked Questions (Rivers)

21.6.1 How the water level boundaries are determined



For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above). Note that water levels are extended when the shape strings are in a junction area or past the end of a reach. can be created to create a water surface (shown in blue above) to follow the river.



The water surface is draped over the ground surface and the boundary strings (strings defining the edges of the water surface – shown in yellow above) are created. They may be used to trim the water surface or shade your ground surface tin for flood inundation mapping. Boundary strings also include islands! Shading the river bed blue, in a 3D perspective view, is an effective way to show the water level extents and still view the shape of the river bottom (it has the effect of very clean water that you can see through!).

21.6.2 Sample Presentations and Drawings

The water surface may be

s •contoured (elevation),

s • depth contours created,

s • water surface coloured by depth (shown above),

s • cross sections plotted

s • and longitudinal profiles drawn (shown below).

s •All of these results can be plotted complete with your customised drawing sheets.

s •Finally, you may walk down the water course in the perspective view (and record this to an Windows AVI file).

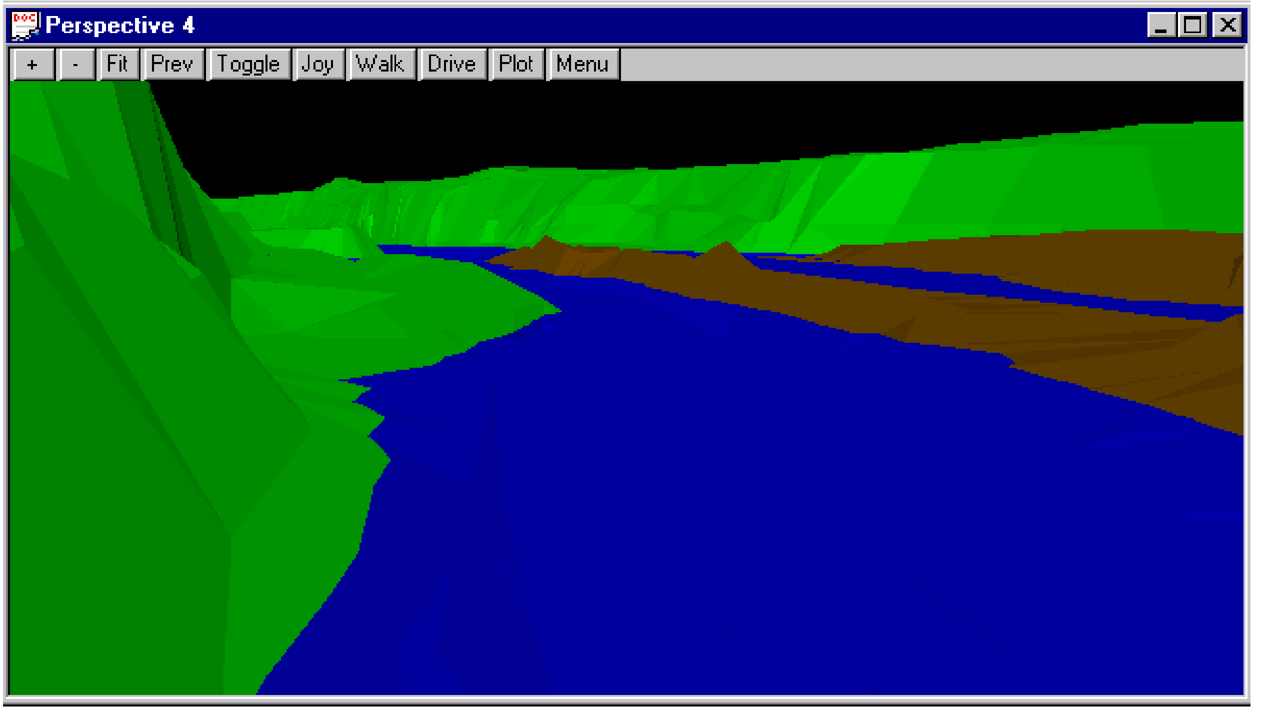
The tin created can be viewed in a perspective view and sections taken where desired. A sample perspective view follows.



Example of cross sections long sections and depth colouring see the HEC-RAS Interface topic.

21.6.3 Defining the Water Surface Boundaries

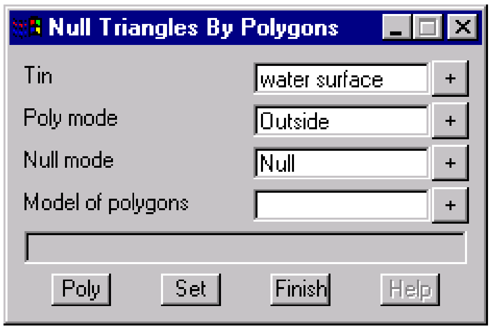
The water surface and its boundary is created by 12d. The first step is to trim the water surface back to the boundary strings. Since the water boundary does not generally form a closed polygon (the left and right river boundaries will need to be joined at one end of the river) use the **Strings=>Strings Edit=>Join** to connected strings.

If the water surface reached the edges of you cross sections then there will be numerous breaks in the boundary string. The best solution is to extend the cross sections and/or add additional shape strings. If it is not a major error in modelling then the break in the boundary can be joined using the **Strings=>Strings Edit=>Join.**

If boundary strings are created outside that water level boundaries they should not be used in this area. Boundary strings should only be used inside the area defined by your water level results.

21.6.4 Trimming the Water Surface Tin and Islands

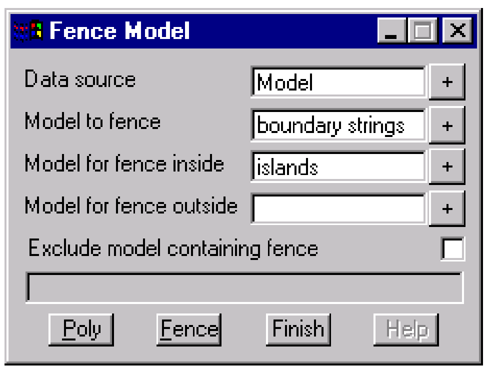
Use the **Triangle=>Null=>by polygons** selection to null triangles inside the polygon you have created above.



Select your water surface tin and change the **Poly mode** to **Outside**. Now select the **Poly** button and pick the boundary string. The triangles outside the polygon will now be nulled.

If you have some islands in the model then change the **Poly mode** to **Inside** and select the islands.

If you have numerous islands, say more than 10 it may be easier to copy all of the islands into one model using the fence command (Utilities->Fence->Fence).

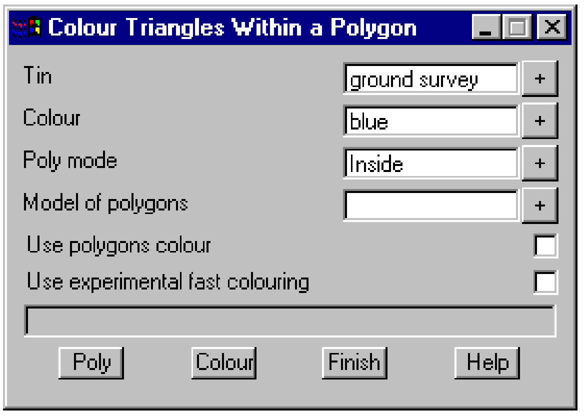


The **Model to fence** is the boundary strings model and the **Model for fence inside** is the new model to contain the islands. The **Exclude model containing fence** should not be ticked. Select **Poly** and then pick the boundary string. All of the islands inside the boundary string will not be copied to the islands model.

21.6.5 Colouring the Ground Surface with Flood Zones

The boundary strings can also be used to colour the ground surface. Colouring the river bed blue is an effective way to show the water level extents and still view the shape of the river bottom (the effect of very clean water that you can see through!).

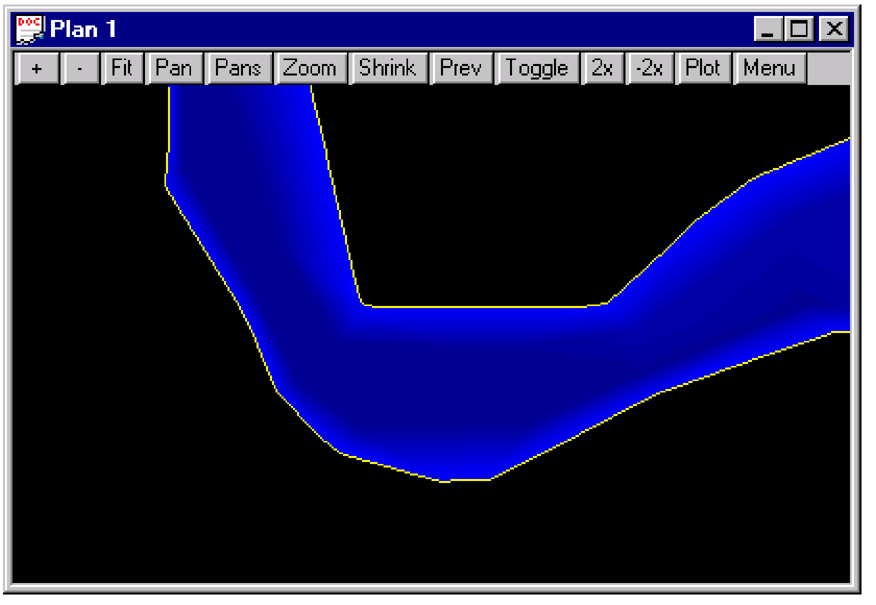
First, define the water surface boundaries (see above). Next re-triangulate the ground tin so that it includes the boundary string model (**Triangles=>Edit=>Tin**). Next select **Triangles=>Colour=>Colour within polygon**. The following panel will appear.



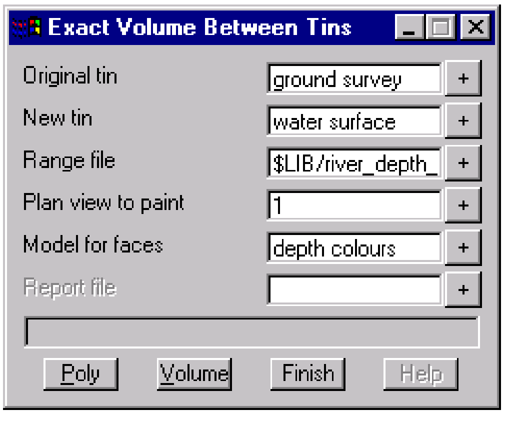
Select your ground tin and the desired colour. Next select the **Poly** button and pick the boundary string to be coloured inside. If islands exist change, change the colour (to a ground colour) and then select the island string.

21.6.6 Colour by Depth

The water surface can be coloured by depth. This function calculates the depth between the water surface and the ground surface and creates “faces” of different colours. The colours to be used are specified in a depth range file. This option requires the purchase of the Volumes Option



From the main menu select Options->Volumes->Exact->Tin to tin.

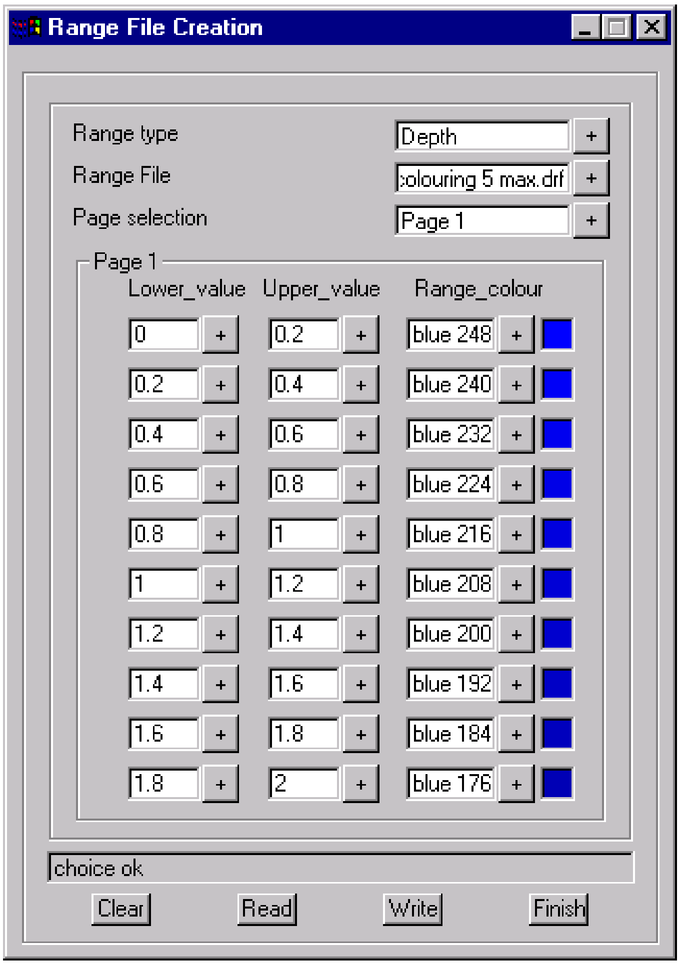


Original tin this is your ground survey tin

New tin this is your water surface tin

Range file two range files are supplied. One with a range from 0 to 5 and another from 0 to 50. The library contains a spreadsheet the can quickly create other range files or you may edit the using the built in range editor.

To use the built in range file editor select **+** beside you range file then **edit**.



You may change the range value and the colours as desired. Be sure to select **Write** to save the changes before selecting **Finish.**

See also Range File Creation

Plan View to paint you can paint a current view without saving the face data. This is a good option if you wish to take a quick look at the depth colours in one area.

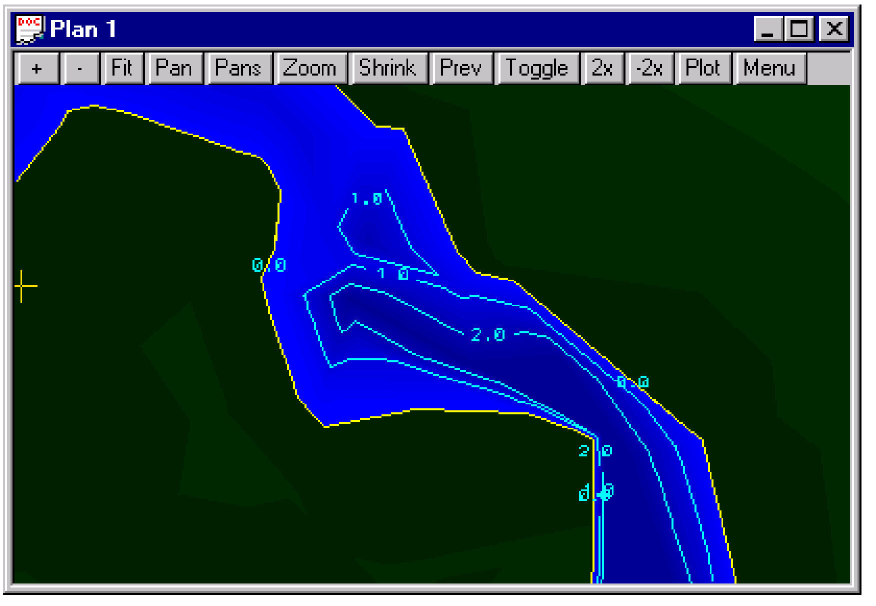
Model for faces the faces can be stored in a model. Note that faces consume a great deal of hard disk space. Therefore you may consider colouring one area at a time using the **Poly** option.

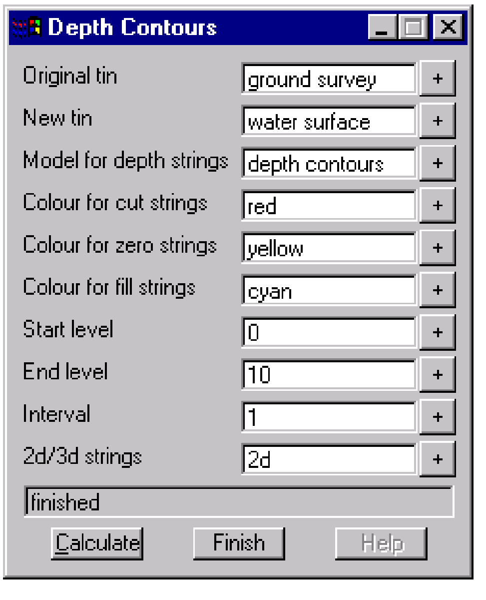
Poly If your water surface tin is very large than you may want to only colour a portion of the tin. You must create a polygon (Strings->Create->2d) and then pick this polygon. When your select **Volume** only the area inside the polygon will be coloured.

Volume select this button to colour the surface.

21.6.7 Depth Contours

Once you have the tin coloured by depth you might want to add depth contours. From the main menu select **Options->Tin->Analysis->Depth Contours**. This option requires the purchase of the tin Analysis module.





Original tin this is your ground survey tin

New tinthis is your water surface tin

Model for depth strings this is the model for your depth contours

Colour for cut strings this must be selected but we will not use this colour

Colour for zero strings the zero string will be the same as our boundary strings

Colour for fill strings this is the colour for the depth contours

Start level enter a zero for this value

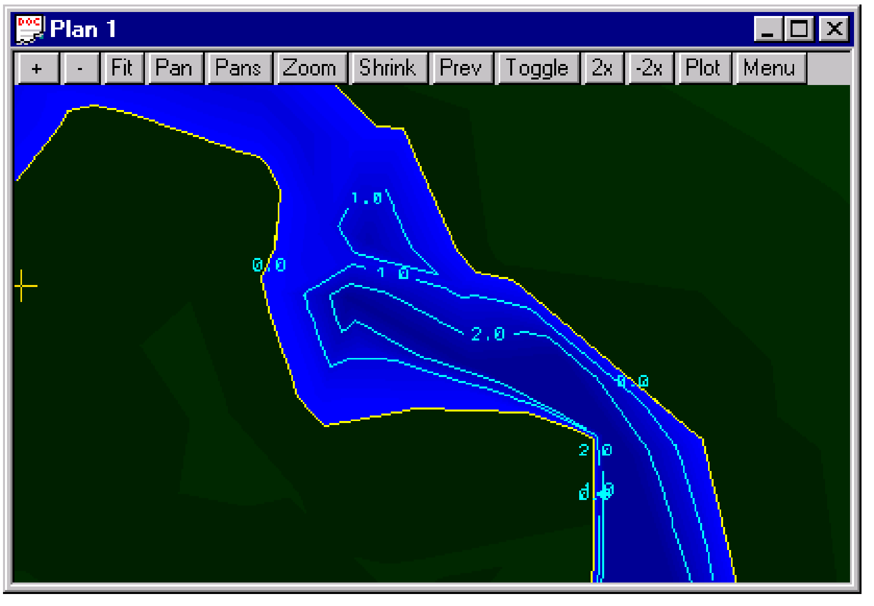
End level enter a level grater than the greatest depth

Interval enter the contour interval as desired

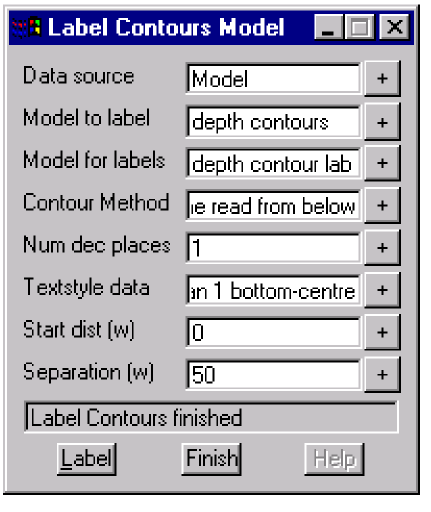
2d/3d strings 2d strings

Calculate this will create you contour strings

Adding Values to the Contours



Since there are numerous ways to label the contours it is performed as a separate step. From the main menu select **Strings->Label->Contours.**



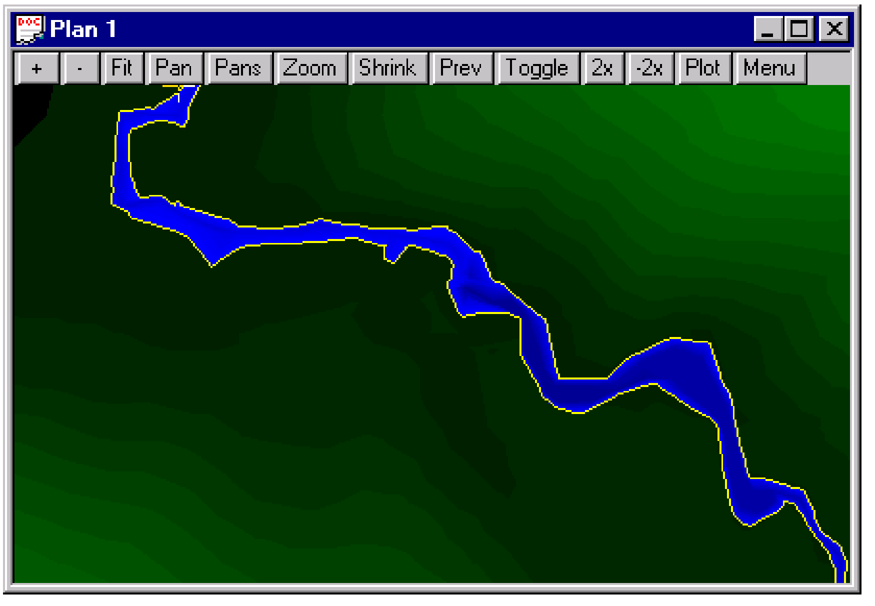
Contour method the example above uses *Line removal and Centred line read from below.* This copies the contour lines themselves and inserts a break in the line.

Start distance this is usually left as zero. It changes the start point for the first label on each contour.

Separation this determines the spacing of the contour labels.

21.6.8 Colour the ground surface by elevation

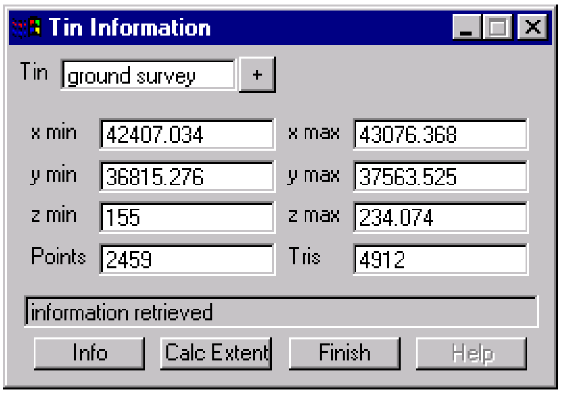
With the water surface coloured by depth, you may want to colour the ground surface by elevation.



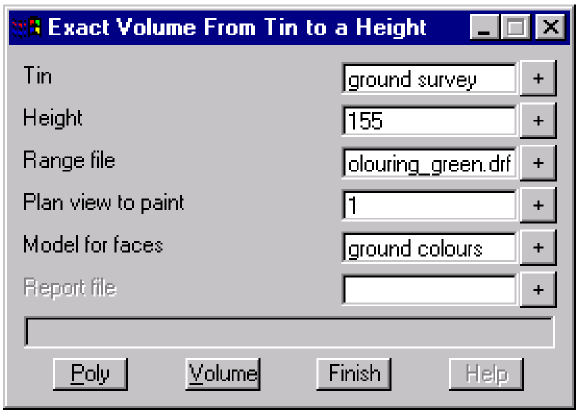
This colouring may be done from either From the main menu select **Options->Volumes->Exact->Tin to height** or **Triangles->Colour->Tin height colour.**

Options->Volumes->Exact->Tin to height

Options->Volumes->Exact->Tin to height requires the purchase of the Volumes module. First select **Triangles->Tin info** from the main menu and then select you ground surface tin. You will want to copy the minimum z level from this pane.



Now from the main menu select **Options->Volumes->Exact->Tin to height**



Select your ground surface to colour and enter the minimum elevation (from above) into the **Height** field. The **Range file** "*$LIB/ground_colouring_green.drf*" is found in the library.

Plan View to paint you can paint a current view without saving the face data. This is rarely used in this case

Model for faces the faces can be stored in a model. Note that faces consume a great deal of hard disk space. Therefore you may consider colouring one area at a time using the **Poly** option.

Poly If your ground surface tin is very large than you may want to only colour a portion of the tin. You must create a polygon (Strings->Create->2d) and then pick this polygon. When your select **Volume** only the area inside the polygon will be coloured.

Volume select this button to colour the surface.

21.7 UNET Interface

Position of menu: **Design=>Rivers=>UNET interface**

The UNET interface creates the *.cs file. Water levels are read back into 12d where they may be viewed in a 3D perspective view to easily identify extents of flooding.

Spill strings

Create ISIS files

Read ISIS results

Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Exporting to ISIS

The ISIS project is created from a surface tin (representing the river bed and overbanks) and a model containing river strings identified by their names "left bank", "right bank and the name prefix, "centre line". Any additional strings in the specified model will be ignored (warning messages will be given when you run the macro that any additional strings are being ignored). The low chainage (often zero) of the centre line strings must be at the upstream end of the reaches.

Cross sections are created at the location of the source strings. These source strings are initially created using the ISIS option at a user defined spacing and section length. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

Reservoir Strings are 2d strings that define the extents of the reservoir. The volume is calculated in increments of 1 or the value set in the attribute stage increment for this string. The volumes start from a level with zero volume to the level set for the 2d reservoir string.

The **reservoir strings** may define inline reservoirs or offside storage. Inline reservoirs are "touched" by centre line strings both upstream and downstream. Offline storage areas are linked to the cross sections via **spill strings.**

Spill strings are 2d strings that link offline storage areas to a cross section. The string must begin by "touching" the source string and then proceed to the first point on the spill section. During the export the first point will NOT be exported as part of the spill section. After defining the end of the spill section the last point on the string must "touch" the reservoir string. Again this last point will NOT be exported as part of the spill section.

Presenting ISIS Results in 12d

After the ISIS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the ISIS *.zzr file. These strings are then triangulated to create a water surface tin from which the water level boundaries are determined. These results can then be shown in plan, long section, cross section and in 3D perspectives.

More details

21.8.1 ISIS Write Panel

Position of option on menu: **Design=>Rivers=>ISIS interface=>Create ISIS file**

The ISIS interface creates the ISIS project files ready to open and run. This includes the project, plan, flow and geometry files. Water levels are read back into 12d where they may be viewed in a three dimension perspective view to easily identify extents of flooding.

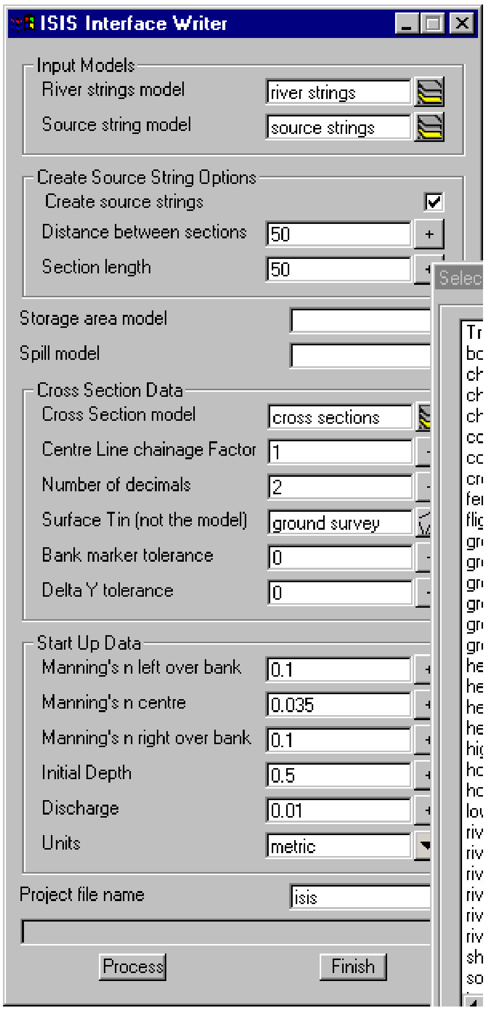
Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The ISIS panel for creating the ISIS project follows.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

River strings model Model box

*Model containing the centre line, left bank and right bank strings. **The centre line strings must begin downstream and proceed upstream.** The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

Confluences are modelled by a using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

The distance from the start of the upstream strings to the first cross section is used to model the confluence length.

The left and right bank strings need not be separate strings (see figure below).

Source string model Model box

*New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.*

Create Source Strings Tick box not selected

*When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).*

Distance between sections Real box

The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.

Section Length Real box

The length of the cross section with zero chainage at the mid point.

Storage strings Real box

These 2d strings define the extents of the storage area. For more details see Reservoir strings.

Spill strings Real box

These 2d strings define the location to cut the spill section and start end points define the cross section and reservoir, respectively. For more details see Spill strings

Cross section model Model box

The cross sections created and exported are stored in this model.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Number of decimals Integer box

*The cross section names are created with this many decimals. CAUTION XP SWMM only allows 10 characters for the names and each link name begins with "**Lx-**" That leaves 7 characters for the chainages.*

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Bank Marker Real box

Not currently implemented in ISIS

Delta Y tolerance Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. ***The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.***

Manning's n Real box

Manning's n values for the left, right and centre channel sections.

Initial depth Real box

Not currently implemented in ISIS.

Discharge Real box

This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside ISIS or inside 12d. This can be changed at each section See manual settings

Units Choice box

This selection will set the default units for the project being created.

Project file name Input box

The ISIS project name. The extension ".dat" will automatically be added for you.

21.8.2 ISIS Read Panel

Position of option on menu: **Design=>Rivers=>ISIS interface=>Read ISIS results**

After the ISIS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the ISIS results. These strings are then triangulated to create a water surface tin.

ISIS Interface overview

Create ISIS files

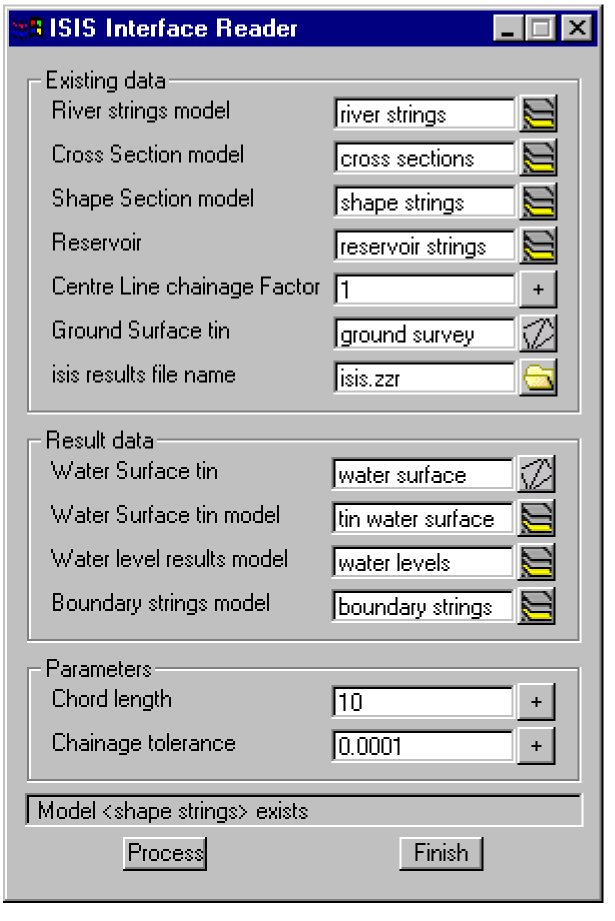
Presenting Water Level Results

How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The ISIS read panel follows.



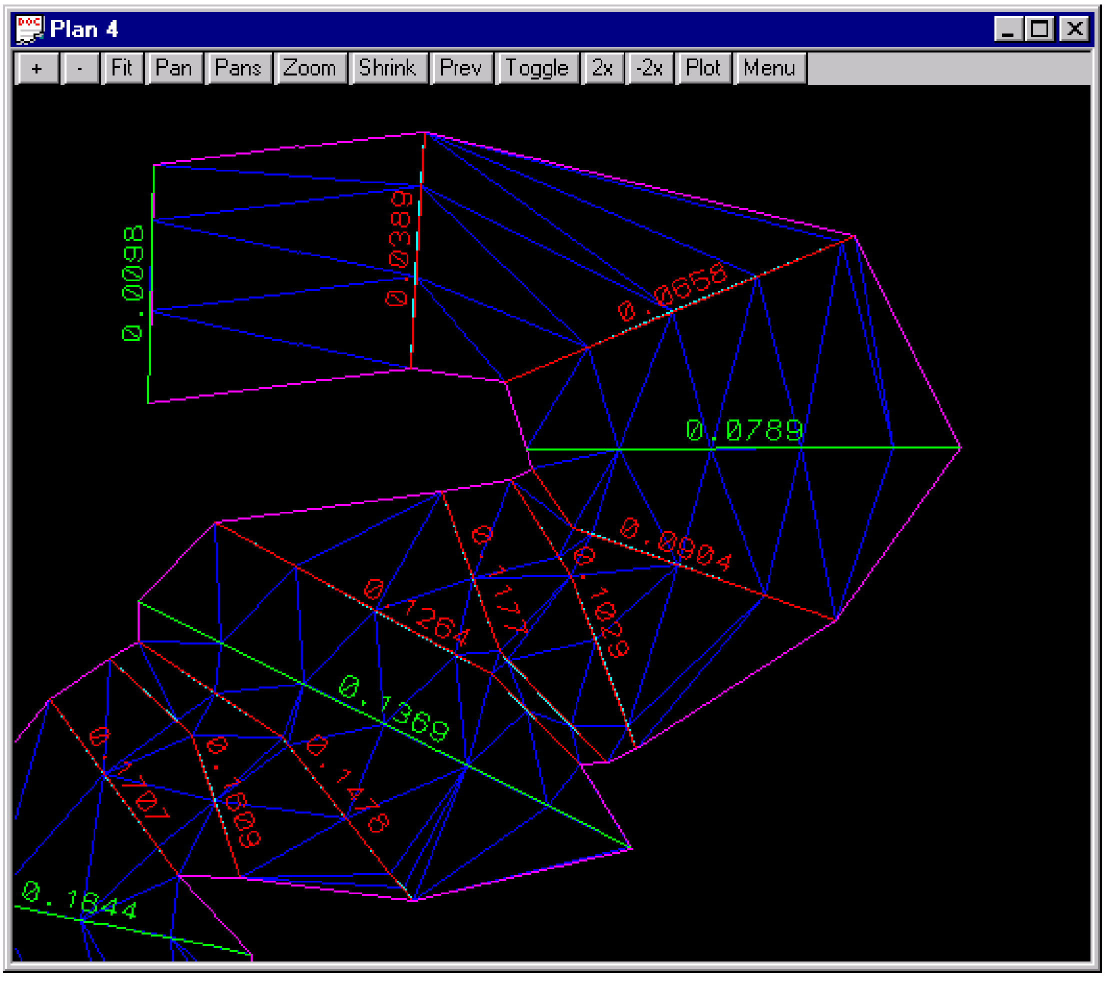
River strings model Model box

The same river strings model specified in the write panel. The river strings are used to sort the cross section and the shape strings. The left and right bank strings are used to check the direction of the strings.

Cross Section model Model box

The same cross section model specified in the write panel. The interface will match the ISIS label and *the string name (without the "SECT "). If the ISIS labels were created by 12d then an exact match should result.*

However, if the ISIS file was not created by 12d, the file can still be mapped by manually creating cross section strings (2d or 3d strings). See Mapping non 12d and historical water level data.



Shape string model Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Reservoir Model box

Reservoir strings are assigned elevations from the ISIS zzr file. This model is the same as the ***storage area stings*** *specified in the write panel.*

Centre line chainage factor Model box

This data is only required if the Cross sections have been manually created and have no names yet. See Mapping non 12d and historical water level data.

ISIS results file name File box

The ISIS zzr file is automatically generated by ISIS.

Ground surface tin Tin box

*If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.*

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Chainage Tolerance Real box

This tolerance is not used for the standard 12d cross section names. However, if the cross section names have been created manually and they can be converted to a real number then this is the tolerance used to match the cross section label from the ISIS report to the cross section string names. A value of 1.0 to 10. is common. See Mapping non 12d and historical water level data *for more details.*

A sample of the *.zzr file that is read by 12d follows.

A sample of the zzr file that is read follows.

Maxima and minima of all variables from

time 0.000 hours to time 30.000 hours

21.9 How to for Rivers

This section lists specific tasks for the rivers interface. Worked examples are contained in the courses directory of 12jobs and training manuals are found in the documentation directory on the ***12d Model*** distribution CD.

21.9.1 Manual Override settings

Many of the automatic settings can be overridden using string attributes via the String Attribute Editor. To use the editor

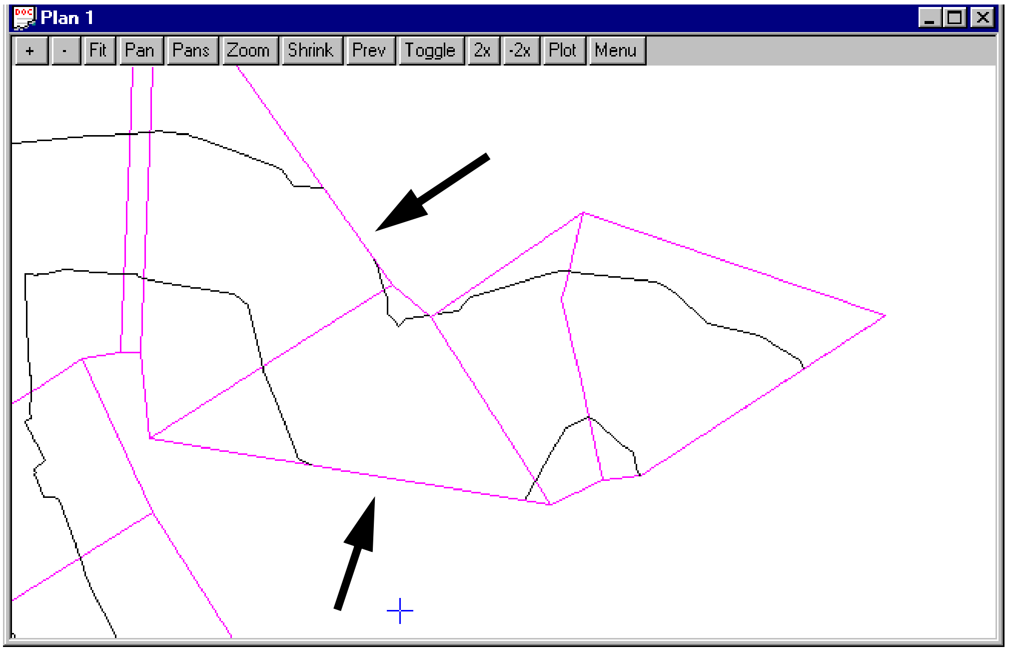
1. Select the river or source string to add/edit the attribute for
2. In the **Attribute Name** column use the selection list to find the attribute to change. If it is not listed then type the attribute name into on of the boxes.
3. Change the attribute **Type** to Integer/Real/Text as required
4. Type the attribute value into the **Data** field (erase the **not found** if required).
5. Select **Process, Next, Previous** or **Pick string.** Selecting **Finish** will NOT save the attribute.

You will be prompted that you will create a new attribute if you have typed in a new attribute for that string

Purpose	String Type	Attribute Name	Type	Typical Data Value
Node/cross section name	source strings	node name	Text	A1
Set a local inflow for this section	source string	flow	Real	10.2
Storage curve increment	storage area strings	stage increment	Real	1.0
Water level string tolerance when comparing numeric string names to data file names	cross sections before importing	tolerance	Real	0.01
Custom n values	source strings	left n, right n, centre n	Real	0.03
Culvert n value	centre line and culverts in spill	roughness	Real	.013
Culvert entrance loss	centre line and culverts in spill	entrance loss	Real	0.5
Culvert exit loss	centre line and culverts in spill	exit loss	Real	1.0
Culvert length	centre line and culverts in spill	length	Real	8.0
Multiple identical culverts	centre line and culverts in spill	number of pipes	Integer	2
Chanel length of a spill string	spill strings	length	Real	30
Channel roughness	spill strings	roughness	Real	0.02
Channel slope %	spill strings	slope	Real	0.5

21.9.2 Boundary Strings are broken. How do I stop this?

The boundary strings will be broken into sections when the boundary string goes outside the area defined by the cross sections. See below



In these two cases the water level has not exceeded the extents of the cross sections but the boundary strings (black) has gone outside the limits of the water level strings (magenta). **Shape strings** are used to expand the area of the water levels between the sections. The water level assigned to the shape string is a linear interpolation between the upstream and downstream cross section water levels. The interpolation is prorated using the distance along the centre line of the river.

Important! water levels are extended when the shape strings are in a junction area or past the end of a reach.

Shape strings are 2d strings. The direction is not important except for Mike11 models. For Mike11 they must be in the same direction as the cross section strings (usually left bank to right bank). The following drawing shows the boundary string when 2 shape strings have been added (green).

21.10 Mapping non 12d and historical water level data

12d can map water levels from river engineering models that were not created by 12d. If the water level results are in the standard HECRAS GIS, HECRAS report, ISIS zzr, UNET, XP SWMM xpx or Mike11 binary file then the standard 12d readers can be used. If the data is historical or not in any of the standard format the **River Mapper** feature can be used.

21.10.1 River Mapper

Position of option on menu: **Design=>Rivers=>River Mapper**

River cross section water level data in an text file may be mapped and displayed using the 12d River Mapper interface. 2d strings are created by the user with the plan shape of the cross sections. 12d assigns water levels from a text file to these strings. These strings are then triangulated to create a water surface tin.

See also

Presenting Water Level Results

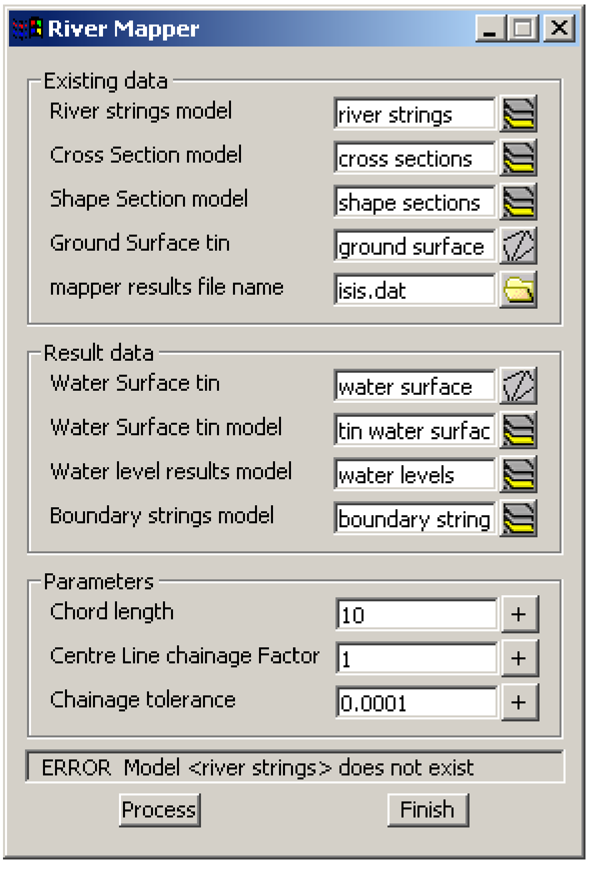
How to for Rivers

Frequently Asked Questions (Rivers)

Usage

The steps are as follows:

1. Create the river strings (centre line, left bank and right bank).
2. Create 2d source strings. Use your name for the cross section as the string name. 12d will match the water levels in the file to this string using the name as the key. If you do not assign a name the interface will assign names to strings according to the chainage along the centre-line and the value of .**Centre line chainage factor.**
3. From the **Design->Rivers** menu select **River Mapper**.
4. Fill in the fields in the dialogue for the rivers strings (step 1 above) and the cross sections (step 2 above).



River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the HEC-RAS report. A match is successful if the HEC-RAS cross section chainage and the string name are within the tolerance specified below in ***Chainage tolerance****.*

Shape string model Model box

For meandering rivers, the cross sections may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings can be created (automatically or manually) to create a water surface to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor Model box

If you assigned the source/cross section string a name in Step 2 this field is not used. Otherwise, the centre line chainage and the Centre line chainage factor are used to name your source string/cross sections in 12d. The cross sections will be named in the same units as the 12d data if a Centre line chainage factor of 1 is specified. If your existing data uses cross section names in your data file are in kilometres and your 12d data in meters, you will want to use a Centre line chainage factor of 1000. If your existing data cross section names are in miles and your 12d data is in feet then a Centre line chainage factor of 5280 would be used.

Mapper results file name File box

The report is a tab (or space) delimited text file (usually created by a text editor or spreadsheet). The format is

cross section name <tab> water level elevation

each section name with its water level must be on a separate line. For example.

Section A	*2.31*
Section B	*2.32*

If the names contain letters (abc..) then the section name must match the 12d string names exactly (case sensitive). If the names are real numbers than a tolerance for the matching (global and string specific) can be set (see parameters).

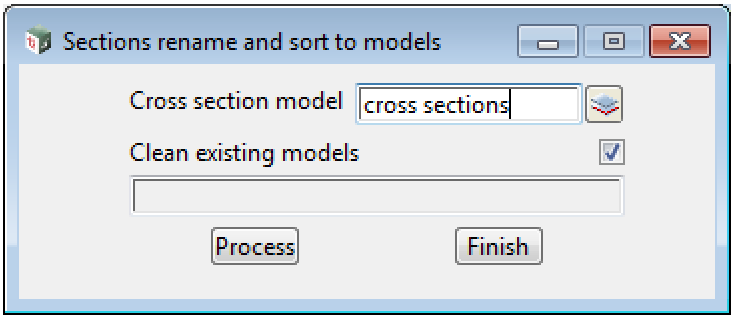
1.0 Rivers Rename and Move Cross Sections

Position of option on menu: **Design =>Rivers=>Xsections rename and move**

River cross section names begin with the river reach number followed by the cross section chainage. To plot these x sections they need to be renamed to the 12d chainage standard.

This routine gets the cross section model name moves the cross section to a model with the name as a prefix followed by the reach number. The reach number is removed from all of the cross section name.

On selecting the Xsections rename and move option, the panel is displayed.



These defaults are used when creating a manhole in a drainage string. The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Cross section model	model box		

this model holds the cross sections created by one of the river interface routines. The name of this model will used as the prefix for the new models to hold the renamed cross sections.

Clean existing models	tick box		

when selected the models that the cross sections are to be moved to will be cleaned before the supplied cross sections are moved into them.

Process	button		

moves and renames the cross sections

Finish	button		

Remove the panel

1.1 12d System Path

When looking for system files 12d first checks your local project directory (the directory that hold the *.project folder), and then the system folders. Unless you have changed these folders in your env.4d file the path is first "program files\12d\12dmodel\5.00\user" and then "program files\12d\12dmodel\5.00\set_ups". In summary:

1. local project directory (the directory that hold the *.project folder
2. program files\12d\12dmodel\5.00\user
3. program files\12d\12dmodel\5.00\set_ups

Never modify the files in set_ups. Copy them to the user directory and make your changes there. Here they are safe from being changed during future 12d updates. The only time you will want files in the local project directory is when you have some project specific data. Master_drainage.xp and Master_rivers.xp are good examples of such cases.

More on System files
Attribute Editor

1.1.1 FAQ Rivers

22 Pipeline

Position of menu: Design =>Pipeline

The **Pipeline** option is used to place large diameter pipelines.

The pipeline is very similar to an alignment string in that it is defined by separate horizontal and vertical geometries.

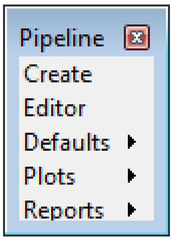
The major differences between a pipeline and an alignment is that a pipeline has a diameter and normally uses circular curves in the vertical geometry rather than the parabolic curves used for alignments.

The pipeline is entered by placing the invert (bottom) of the pipe. Hence in a plan view, the horizontal geometry places the centre of the pipeline. The vertical geometry of the pipeline is for the invert (bottom) of the pipeline.

Note

A **pipeline** string is not the same as a **pipe** string. A **pipe** string is only a 3d string with a diameter.

The **Pipeline** walk-right menu is



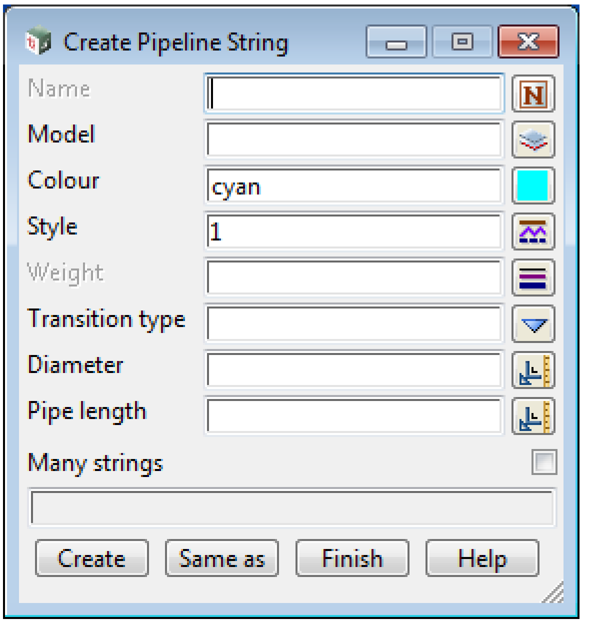
For the option *Create*,go to	22.1 Create
Editor	22.2 Editor
Defaults	22.4 Defaults
Plots	22.5 Plots
Reports	22.6 Reports

22.1 Create

Position of option on menu: Design =>Pipeline =>Create

The **Create** option is used to produce **new** pipelines. If a pipeline string already exists, the **Edit** option is used to modify it.

On selecting the **Create** option, the **Create Pipeline String** panel is displayed.



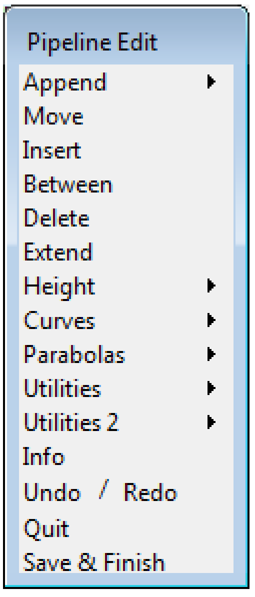
To create a new pipeline string, the pipeline's name, model, colour, style, spiral type and pipe diameter, plus the standard length of pipes used to make up the pipeline are entered into the appropriate fields and the **Create** button selected.

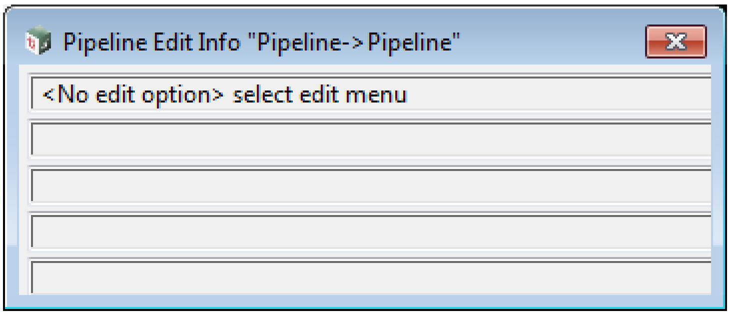
As for a 3d string, to create a new pipeline string with some of the **same** name, colour, model, style etc. **as** an existing string (not necessarily a pipeline), the **same as** button is chosen and the appropriate string selected.

The **Create Pipeline String** panel is then removed and the **Pipeline Edit** menu and **Pipeline Edit Info** panel fired up.

The **Pipeline Edit** menu contains all the options for creating/editing a pipeline string. The **Pipeline Edit Info** panel contains information areas.

The **Pipeline Edit** menu and **Pipeline Edit Info** panel are





As for an alignment string, to create a new pipeline string the user selects the **Append=>HIP's** option from the **Pipeline Edit** menu and start placing points in a plan view.

Since the **Pipeline Edit** menu and **Pipeline Edit Info** panel are the same as those used when editing a pipeline string, the options will be discussed in the following sections under the pipeline **Edit** option.

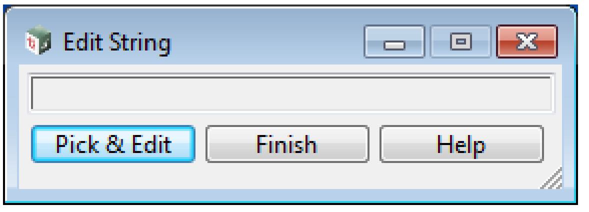
For information on pipeline editing, please continue to the section 22.3 Pipeline Editor.

22.2 Editor

Position of option on menu: Design =>Pipeline =>Editor

This is the same option as **Editor** from the **Strings** walk-right menu on the ***12d Model*** menu.

The string editor is used to modify any ***12d Model*** strings. After selecting the **Editor** option, the **Edit String** panel is placed on the screen to record any error messages.



The option is already in the **Pick** mode (the **Pick & Edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited.

From the picked string's type, the editor is able to determine the edits that apply to the string and list them in the string's **Edit** menu.

If a pipeline string is selected, the **Pipeline Edit** menu and **Pipeline Edit Info** panel (as shown in the previous section) are placed on the screen.

The individual edit operations for a pipeline string will now be discussed in detail.

Please continue to the next section 22.3 Pipeline Editor.

22.3 Pipeline Editor

Position of option on menu: Design =>Pipeline =>Editor

A pipeline string is defined by specifying both the horizontal and vertical geometry of the invert (bottom of the pipeline) as separate operations.

The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points) and circular curves applied to the intersection points.

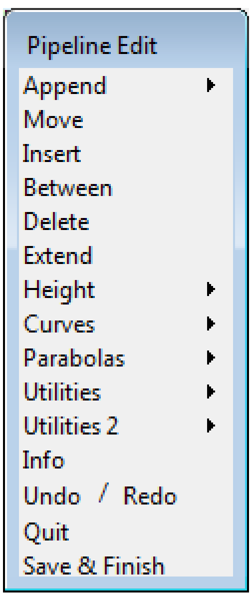
Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points (called vertical intersection points) and circular curves applied to the vertical intersection points.

The horizontal geometry is usually defined in a plan view and the vertical geometry in a section view. Hence the pipeline string editor can edit information for the string on both plan and section views.

Note: the string can only be edited on a section view if the string is also profiled on the section view.

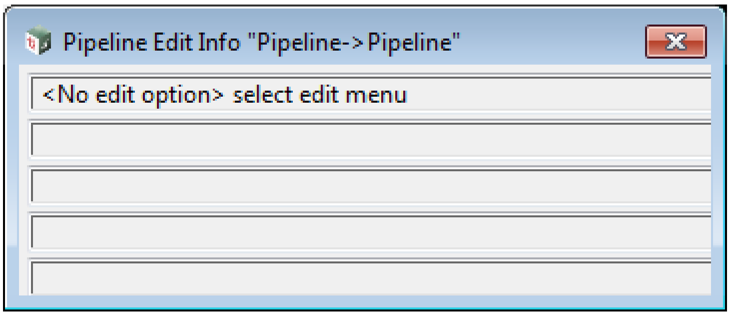
On selecting a pipeline string the **Pipeline Edit** menu and **Pipeline Edit Info** panel are placed on the screen.

The **Pipeline Edit** menu is



append or prepend an IP
move an IP or TP
insert an IP
insert on IP-IP line
delete an IP
extend an IP
modify the strings z-value
circular curves, spirals
VG only, radius or length
interval, start chainage, validate, clear etc.
set diameter and pipe length
toggle edit info panel
undo and redo
quit the edit session
finish the create

and the **Pipeline edit info** panel is



To edit the selected pipeline string, simply select the required edit option from the list of all possible edits in the **pipeline edit** menu.

The edit is **cancelled** by selecting the **cancel** option. The edited string is restored to its pre-edit state and the option terminated.

The edit is **finished** and the new string placed in the given model when the **finish** option is chosen. The edit option then terminates.

When either **quit** or **finish** is selected, a **yes-no-cancel** panel is displayed and the user must confirm the selection.

The **pipeline edit info** panel is used to display information and messages during editing of the pipeline string.

The main message area indicates the purpose of the mouse buttons at each step.

Message area 1 displays the current pipeline edit option and message area 5 indicate the next step in the edit option.

Message areas 2 and 3 are used to display information about the string as the cursor is moved near the string and the string points. For example, for the closest IP, the (x,y,z) position and radius of the IP is displayed in area 2, and in area 3 the bearing-in, bearing-out and deflection angle for the adjacent IPs.

Message area 4 displays the cover above the pipeline and the vertical, horizontal and combined joint deflection.

Most of the options are identical to the edit options for an alignment string and will not be discussed in detail again. The options that are only applicable to a pipeline string will be fully described.

22.3.1 Append

22.3.1.1 HIPs

In a plan view, the **append=>HIPs** option is used to create the first horizontal point in a new pipeline string, to append a new horizontal intersect point to the end of the string or to prepend a new horizontal intersection point to the beginning of the string. The horizontal geometry is for the centre of the pipe in plan.

22.3.1.2 VIPs

In a section view, the **append=>VIPs** option can be used to create and edit the vertical geometry of the picked string if the string is a primary string on any section view. This can be achieved by using either the **VG edit** or the **profile** option from the section view **View ops** menu. The vertical geometry is for the invert (bottom) of the pipe.

The **append** option is the same as **append** for an alignment string and will not be described further.

22.3.2 Move

The **move** option can be used for moving individual horizontal and vertical intersection and tangent points.

The option acts on the horizontal geometry if the point to move is selected in a plan view, or the vertical geometry if the point to move is selected in a section view.

The **move** option is the same as **move** for an alignment string and will not be described again.

22.3.3 Insert

The **insert** option is designed to place a new intersection point in a string between two adjacent horizontal or vertical intersection points (note that the inserted point does not have to be on the line joining the two intersection points).

The **insert** option is the same as **insert** for an alignment string and will not be described again.

22.3.4 Between

The **between** option is similar to the **insert** option except the inserted point **does** have to be on the line joining the two intersection points. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP point position.

The **between** option is the same as **between** for an alignment string and will not be described again.

22.3.5 Delete

The **delete** option is used to delete horizontal or vertical intersection points from the string.

The **delete** option is the same as **delete** for an alignment string and will not be described again.

22.3.6 Extend

The extend option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

The **extend** option is the same as **extend** for an alignment string and will not be described again.

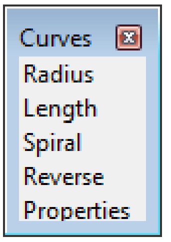
22.3.7 Height

The height option is used to modify the height of a vertical intersection point in the string.

The **height** option is the same as **height** for an alignment string and will not be described again.

22.3.8 Curves

The **curves** option allows the user to add circular curves of a given radius to a either horizontal or vertical intersection points.

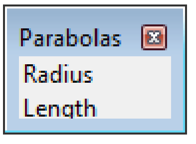


The **curve** option is the same as **curve** for an alignment string and will not be described again.

22.3.9 Parabolas

The **parabolas** option is for adding parabolic curves to the **vertical geometry**.

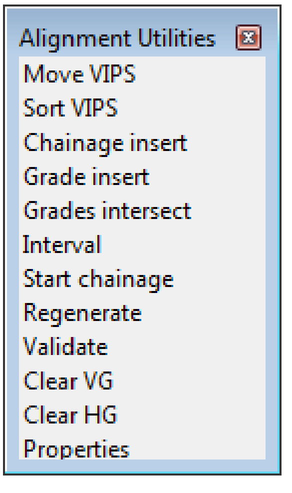
For pipelines, circular curves are normally used on vertical curves.



The **parabolas** option is the same as **parabolas** for an alignment string and will not be described again.

22.3.10 Utilities

The **Alignment Utilities** walk-right menu contains a number of useful miscellaneous options for the pipeline string. The menu is

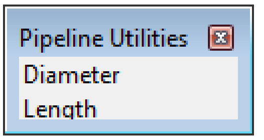


Each of these options is the same as for an alignment string and will not be discussed again.

22.3.11 Utilities 2

The **utilities 2** walk-right menu contains options to modify the diameter of the pipeline and to set the standard length of the pipes used to construct the pipeline.

The **utilities 2** walk-right brings up the **Pipeline Utilities** menu:



22.3.12 Diameter

The **Diameter** option is used to change the diameter of the pipeline string.

After selecting the option, an enter value typed-input box is displayed on the screen containing the pipeline's current diameter.

The new diameter is entered into the typed-input box, terminated with <return>.

The typed-input box then disappears and the option terminates.

22.3.13 Length

The **Length** option is used to change the length of the standard pipe used to construct the pipeline string.

The length of the pipes used in constructing the pipeline string is used for calculating joint deflections along the pipeline.

After selecting the option, an enter value typed-input box is displayed the pipeline's current standard pipe length.

The new length is entered into the typed-input box, terminated with <return>.

The typed-input box then disappears and the option terminates.

22.3.14 Info

The **pipeline edit info** panel is toggled **on/off** by the **info** option in the **pipeline edit** menu.

22.3.15 Quit and Finish

Even after points are created for the new string, the create process can be **aborted** by selecting the **quit** option from the **pipeline edit** menu. The option then terminates and **no** string is created.

The create process is completed and the new string created and placed in the given model when the **finish** option is chosen from the **pipeline edit** menu.

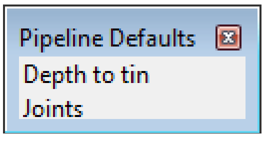
When either the **finish** or **quit** option is selected, a **yes-no-cancel** panel is displayed and the user must confirm the selection.

22.4 Defaults

Position of menu: Design =>Pipeline =>Defaults

The **defaults** menu sets default depth to tin and joint deflection angle.

The **default** walk-right menu is

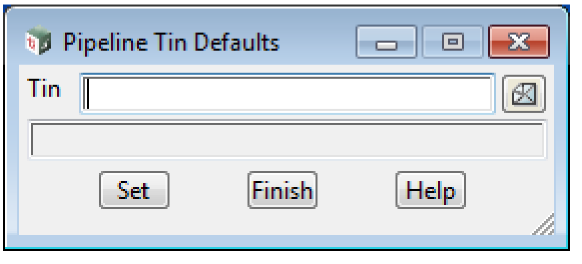


For the option Depth to tin, go to 22.4.1 Depth to Tin
Joints 22.4.2 Joints

22.4.1 Depth to Tin

Position of option on menu: Design =>Pipeline =>Defaults =>Depth to tin

On selecting the **tin** option, the **pipeline tin defaults** panel is displayed.

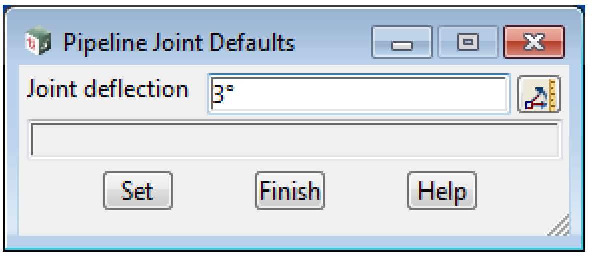


This panel is for setting the default terrain tin which is used to calculated the cover above the pipeline.

22.4.2 Joints

Position of option on menu: Design =>Pipeline =>Defaults =>Joints

On selecting the **joints** option, the **pipeline joint defaults** panel is displayed.



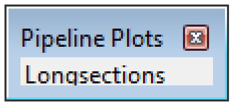
This panel is for setting the maximum joint deflection for the individual pipes that make up the pipeline.

22.5 Plots

Position of menu: Design =>Pipeline =>Plots

Currently the **plots** menu contains only one option and it is used for producing longsection plots of major pipelines.

The **plots** walk-right brings up the **pipeline plots** menu:



This option will now be described in more detail.

Please continue to the next section 22.5.1 Longsections.

22.5.1 Longsections

Position of option on menu: Design =>Pipeline =>Plots

Position of option on menu: Plot =>Pipeline Plot PPF Editor

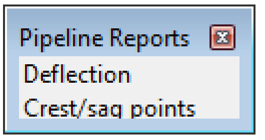
For more information please go to the section 26.7 Pipeline Plot PPF Editor

Continue to the next section 22.6 Reports.

22.6 Reports

Position of menu: Design =>Pipeline =>Reports

The **Reports** walk-right menu contains reports for joint deflections along the pipeline and crest and sag points.



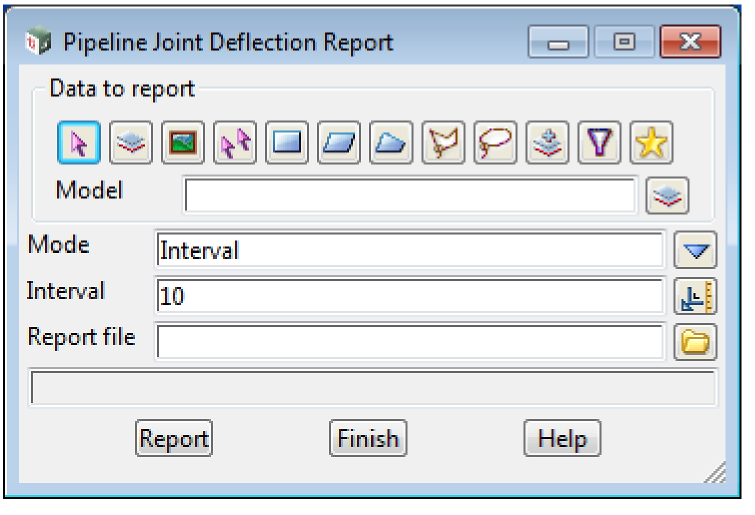
Fo the option Deflection, go to 22.6.1 Deflection
Crest/ sag points 22.6.2 Crest/Sag Points

22.6.1 Deflection

Position of option on menu: Design =>Pipeline =>Reports=>Deflection

The deflection report gives the horizontal, vertical and combined joint deflections along the pipeline.

After selecting the **Deflection** option, the **Pipeline Joint Deflection Report** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Report file	input		

name of the file for the report

Field Description	Type	Defaults	Pop-Up
Mode	input	interval	interval, critical, summary

if interval - reports the joint deflection at the interval given plus any horizontal or vertical intersection points without curves on them

If critical - only reports points where the deflection is greater than the value given in the **pipeline joint defaults** *panel.*

If summary - gives the maximum joint deflections

Field Description	Type	Defaults	Pop-Up
Interval	input	10	

the chainage distance between points along the pipeline where joint deflections are to be reported

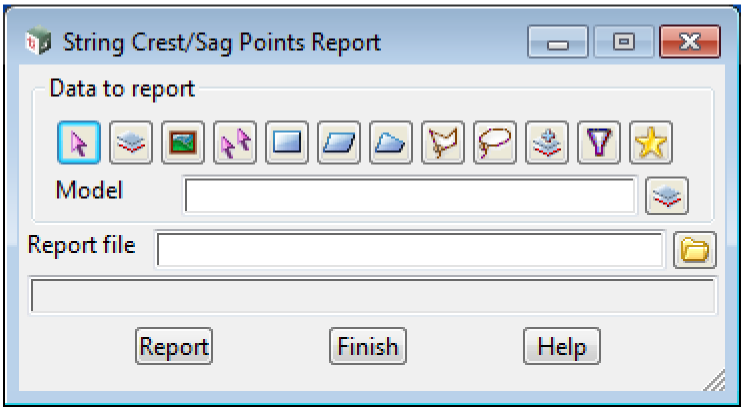
Pick & Report button

pick the pipeline string to report on.

22.6.2 Crest/Sag Points

Position of option on menu: Design =>Pipeline =>Reports=>Crest/Sag Points

After selecting the **Crest/sag points** option, the **String Crest/Sag Points Report** panel is displayed.



This is the same option as the **Reports=>Strings=>Crest/sag points**.

For more information please go to 22.6.2 Crest/Sag Points.

For each selected string, the string's crest/sag points are written to the report file given in the report file field of the panel.

23 Volumes

Position of menu: **Design =>Volumes**

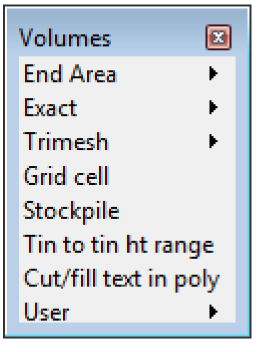
For tins, ***12d Model*** provides two distinct methodologies for calculating volumes: End Area and Exact. See 23.1 Definition of Cut and Fill and 23.2 End Area and Exact Volumes

For both the end area and exact cases, the volumes are broken up into cut and fill volumes.

By using an apporximation method, volumes can be calculated between two tins for a given height range.

Exact volumes can also be calculated for closed trimeshes.

The **Volumes** walk-right menu is



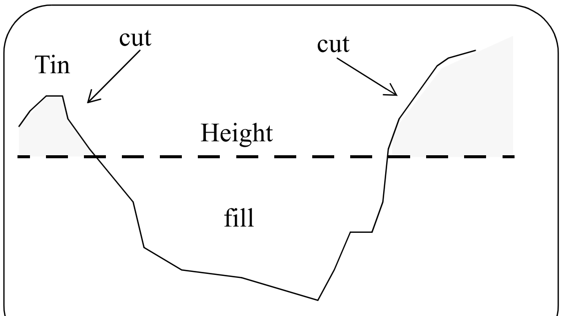
For the options see:

End area	23.3 End Area
Exact	23.4 Exact
Trimesh	23.5 Trimesh
Grid cell	23.6 Grid Cell
Stockpile	23.7 Stockpile
Tin to tin ht range	23.8 Tin to Tin by Height Range
Cut/fill text in poly	23.9 Create Cut/Fill Text Within Polygon

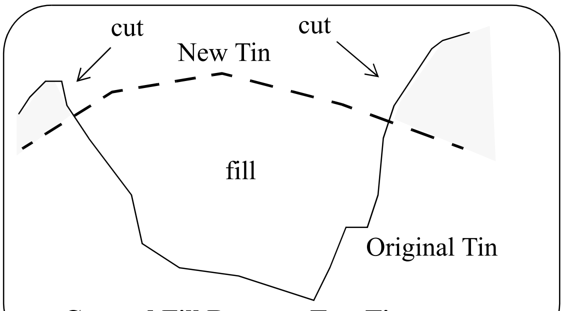
23.1 Definition of Cut and Fill

Cut is defined to be where ever the new surface or given height is **below** the original surface. That is, you have to **cut** to get from the original surface to the new surface. The sign of cut quantities is set via the **Cut volume sign** field from the **Default settings** tab of the Defaults panel (**Utilities=>Defaults**) and the default for *cut volume sign* is positive.

Fill is defined to be where ever the new surface or given height is **above** the original surface. That is, you have to **fill** to get from the original surface to the new surface. The sign of fill quantities is the opposite to the value for cut and cut is set via the **Cut volumes sign** field from the **Default settings** tab of the Defaults panel (**Utilities=>Defaults**). The default for fill is *negative*.



Cut and Fill Between a Tin and a Height



Cut and Fill Between Two Tins

Go to the next section 23.2 End Area and Exact Volumes or return to 23 Volumes.

23.2 End Area and Exact Volumes

In the **End Area** methods using tins, the sections are *automatically* created through the tins. From the sections, cut and fill areas for the sections and the cut and fill volumes between the sections are calculated. End Area is an approximation method. For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes

For **Exact** volumes, the volume between a tin and a plane or between two tin is determined by working out the exact geometrical shapes between the tins and summing their volumes. Unlike the end area methods which are approximations, the Exact method calculates the exact volume. For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

The only method that is not an approximation is **Exact** Volumes.

But even these volumes should always be double checked by using an End Area with parallel sections. And a couple of different angles of the sections should be used to make doubly sure that the End Area method is good.

The next best after **Exact** are the **End Area** method with **parallel sections**.

The worst approximations are **End Area** methods where **the sections are NOT parallel**. For example when calculating volumes using the sections along an alignment with curves.

With the End Area approximation methods, how good the approximation also depends on what the data is like. If the calculation is along an alignment then how good the approximation is will also vary depending on how tight the curves on the alignment are, the distribution of cut and fill with respect to the alignment, whether the alignment is in the middle of the sections etc.

However with all the End Area section methods, you should always look at the generated sections through the tins to make sure they have all worked correctly.

Exact volumes are more accurate than End Area volumes. However, for most End Area calculations with parallel sections and a small distance between sections, the results are the same to any reasonable degree of accuracy.

The reason for having both methods available in 12d Model is

(a) to provide an independent check on the volumes produced

(b) each method produces a different breakup of the volumes.

In the End Area method, cut and fill volumes are produced on a section by section basis. This is needed for applications such as mass-haul calculations.

For the Exact method, cut and fill volumes are easily calculated between different **depth** values. This is useful for applications such as depth (isopach) analysis.

For both the end area and the exact method, 12d Model provides options to calculate the volume

(a) between a surface (tin) and a fixed height (z-value)

and

(b) the volume between two surfaces (tins) - an original surface (tin) and a new surface (tin).

NOTE: For the ***end area volumes***, sections are automatically generated and used for the calculations. You do ***not*** need to generate the sections separately.

For checking purposes, each of the End Area volumes options can keep the generated sections so that they can be checked.

For more information on the End Area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

For information on the End Area options, please go to the section 23.3 End Area.

For more information on the Exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes.

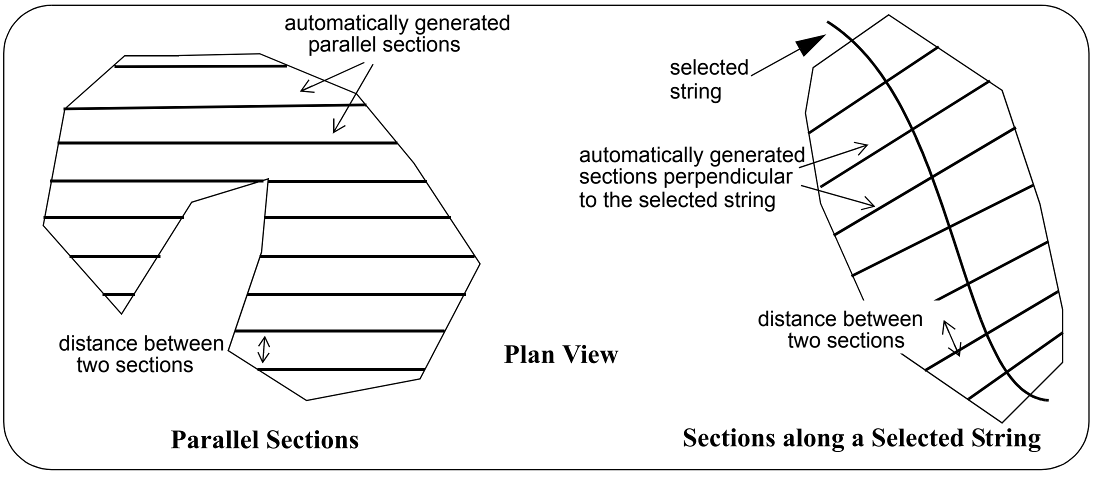
For information on the Exact volume options, please go to the section 23.4 Exact.

23.2.1 Theory of End Area Volumes

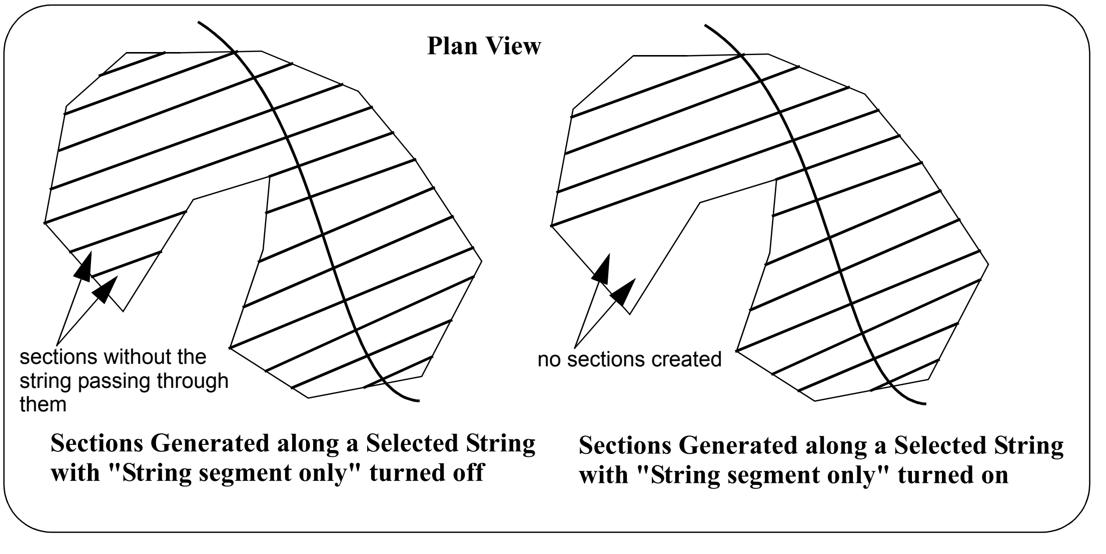
In the **end area** method of calculating volumes, sections are automatically generated through the tins. For each section, cut and fill areas are calculated and then cut and fill volumes are calculated from the cut and fill areas. For the definition of cut and fill, please go to the section 23.1 Definition of Cut and Fill.

For the end area method, 12d Model provides options to calculate the volume between a surface (tin) and a fixed height (z-value) and the volume between two surfaces (tins).

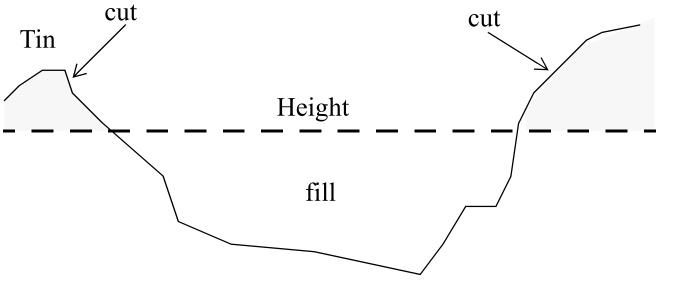
In the **end area** methods of calculating volumes, sections can be generated through a tin or tins at either a *given angle* or at right angles to a ***selected*** string.



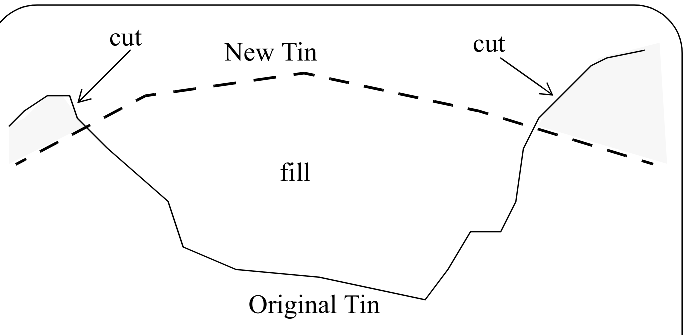
When using the ***sections along a string*** options, it is possible for a generated section to be broken into more than one part and a parameter exists to only use those sections that contain the selected string.



For each generated section, the *cut* and *fill* areas are calculated and then the volumes between the two sections using either the ***average end*** (see 23.2.1.1 Average End Area Formula) or the ***two section prismoidal*** methods (see 23.2.1.2 Two Section Prismoidal Formula).



Section view - Cut and Fill Areas Between a Tin and a Height



Section view - Cut and Fill Areas Between Two Tins

NOTE: For the ***end area volumes***, sections are automatically generated and used for the calculations. You do ***not*** need to generate the sections separately.

See

23.2.1.1 Average End Area Formula

23.2.1.2 Two Section Prismoidal Formula

23.2.1.1 Average End Area Formula

Using the *Average End Area* method the *volume* between two *consecutive* sections is calculated by the formula

Volume of cut between the two sections = D x (C1 + C2) / 2

where

D = distance between the two sections
C1 = area of cut for the first section
C2 = area of cut for the second section

The **Total cut volume** is the sum of the cut volumes between each pair of sections.

Similarly

Volume of fill between the two sections = D x (F1 + F2) / 2

where

D = distance between the two sections
F1 = area of fill for the first section
F2 = area of fill for the second section

The **Total fill volume** is the sum of the fill volumes between each pair of sections.

Go to the next section 23.2.1.2 Two Section Prismoidal Formula or return to 23.2.1 Theory of End Area Volumes.

23.2.1.2 Two Section Prismoidal Formula

The *two section prismoidal* method, as its name suggests, is a modification of the standard prismoidal method but it uses only two sections rather than the three sections required by the standard prismoidal method.

Using the *Two Section Prismoidal* method the *volume* between two *consecutive* sections is calculated by the formula

Volume of cut between the two sections = D x (C1 + C2 + Sqrt(C1 x C2)) / 3

where

D = distance between the two sections
C1 = area of cut for the first section
C2 = area of cut for the second section

The **Total cut volume** is the sum of the cut volumes between each pair of sections.

Similarly

Volume of fill between the two sections = D x (F1 + F2 + Sqrt(F1 + F2)) / 3

where

D = distance between the two sections
F1 = area of fill for the first section
F2 = area of fill for the second section

The **Total fill volume** is the sum of the fill volumes between each pair of sections.

For the definition of cut and fill, please go to the section 23.1 Definition of Cut and Fill.

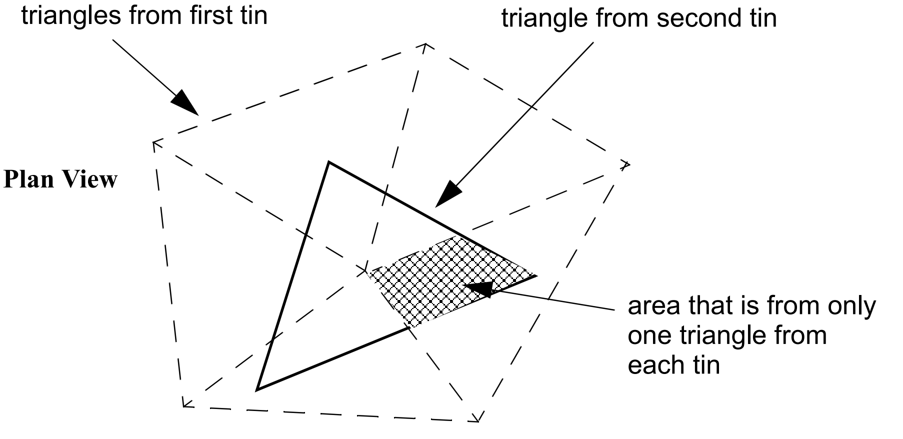
For information on the end area options, please go to the section 23.3 End Area.

For information on the theory for exact volumes, please continue to the section 23.2.2 Theory of Exact Volumes.

23.2.2 Theory of Exact Volumes

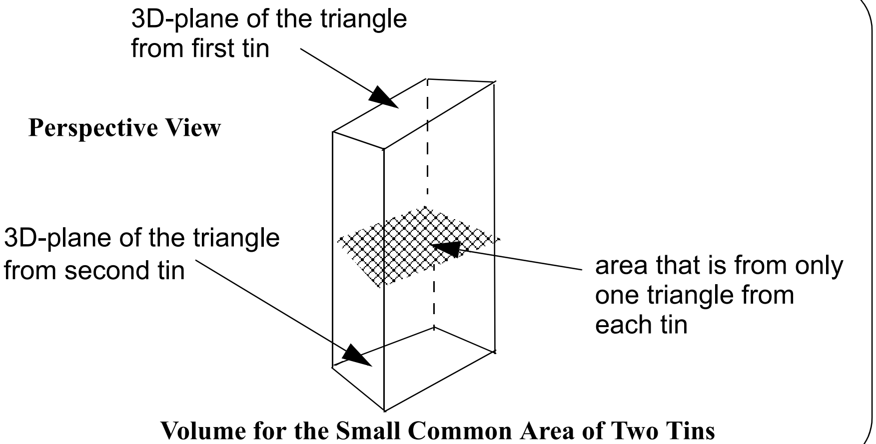
This method calculates the exact volume between two triangulated surfaces (tins), or between one triangulated surface and a plane of constant height.

The volumes are calculated by mathematically subdividing the triangles from both tins into areas that contain only one triangle from each tin.



Subdividing the Triangles for the Exact Method of Calculating Volumes

In three dimensions, these areas represent well defined polygons with the plane of the triangle from one tin as its top and the plane of the triangle from the other tin as its bottom.



Volume for the Small Common Area of Two Tins

For each small area, the cut and fill volume between the two tins can be calculated exactly.

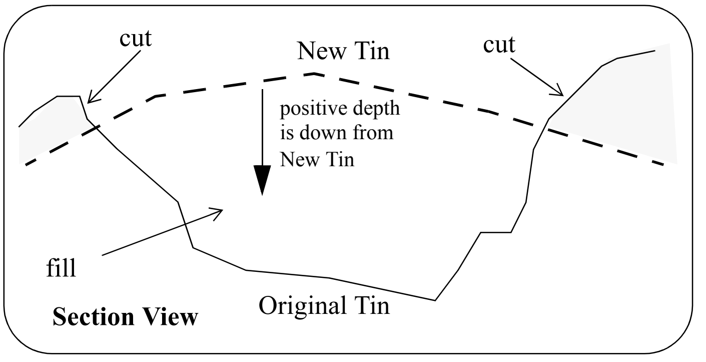
The total *cut* and *fill* volume between the two tin is simply the sum of the cut and fill volumes for each small area.

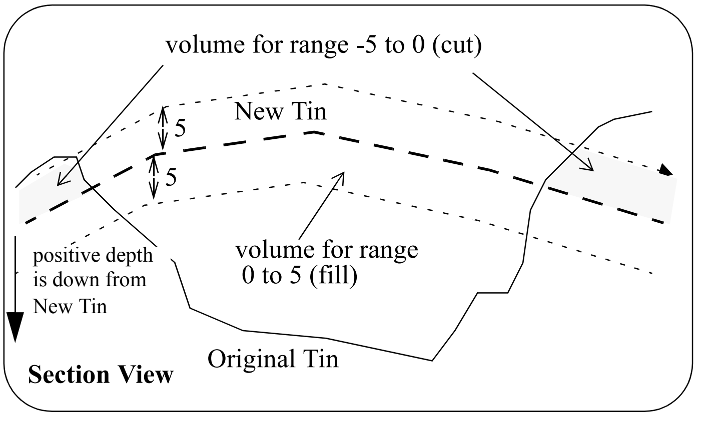
For the definition of cut and fill, please go to the section 23.1 Definition of Cut and Fill.

For information on the exact volume options, please go to the section 23.4 Exact.

The calculated volumes by the exact method can be produced and reported on over *user supplied depth ranges*. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the ***volume totals*** are **only** calculated for the ***depths in the range file***. If the depth ranges ***does not cover*** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will ***not*** be the same as the volumes between the two tins.





For information on the theory for end area volumes, please go to the section 23.2.1 Theory of End Area Volumes.

23.3 End Area

Position of menu: **Design =>Volumes =>End area**

These volumes are calculated using the end area method. For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

The options **tin to height** and **tin to tin** use parallel sections defined at a user supplied angle and separation distance, to calculate the end areas.

The options **string tin to height** and **string tin to tin** use sections defined at right angles to a user selected string, for their end area volume calculations. The distance between sections is supplied by the user.

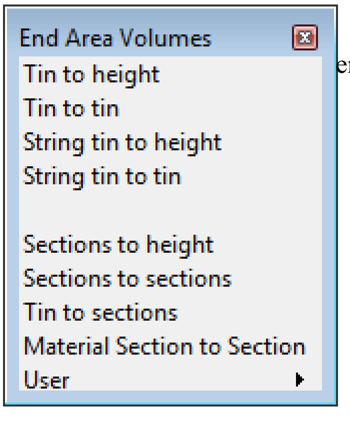
The options **sections to height** and **sections to sections** use sections already created to calculate volumes using end areas.

In all the volume options, the sections are restricted to a user defined polygon.

12d Model reports on the cut, fill and balance for each of the sections used in the calculations and also the total cut, fill and balance.

In the report, the sign for cut (negative or positive) is given by the cut volume sign from the **Defaults** panel (fill will have the opposite sign).

The **End area** walk-right menu is



end area volumes between surface and height
between surfaces
along string between surface and height
along string between surfaces

between a model of sections and height
between two models of sections
between a model of sections and a tin
for one or more material layer(s)

Each option in this menu will now be described.

For the options see

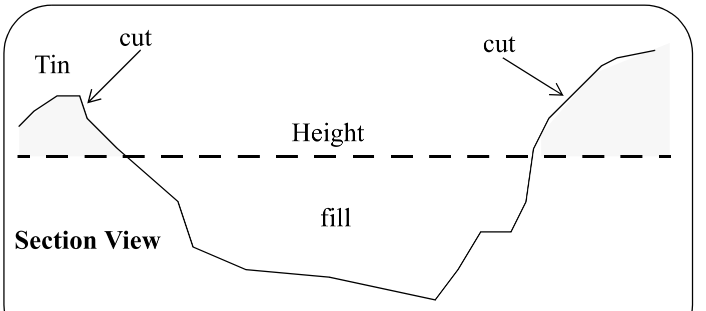
23.3.1 End Area - Tin to Height
23.3.2 End Area - Tin to Tin
23.3.3 End Area - String Tin to Height
23.3.4 End Area - String Tin to Tin
23.3.5 End Area - Sections to Height
23.3.6 End Area - Sections to Sections
23.3.7 End Area - Tin to Sections
23.3.8 End Area - Material Section to Section

For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

23.3.1 End Area - Tin to Height

Position of option on menu: **Design =>Volumes =>End Area =>Tin to height**

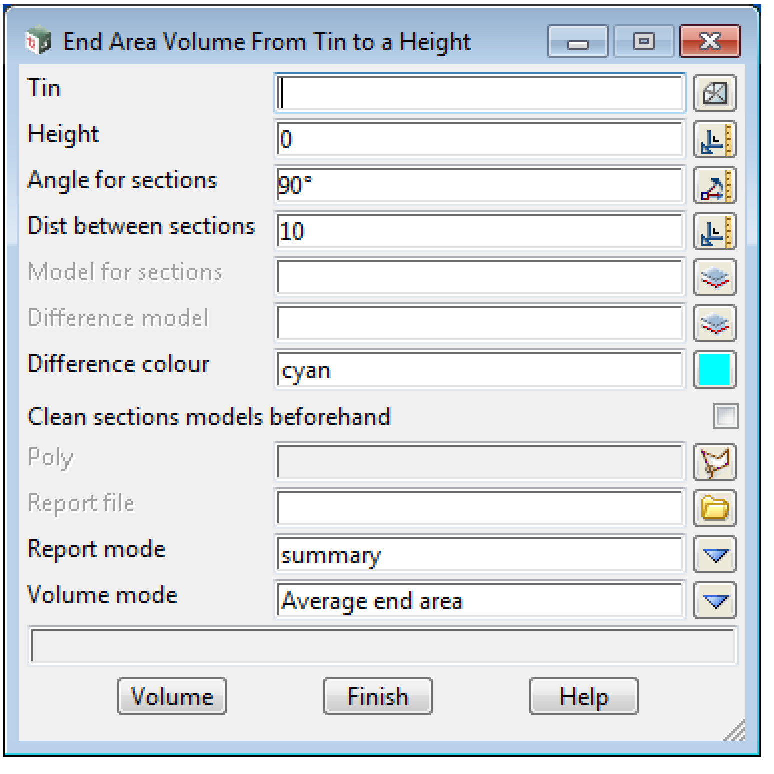
The **Tin to height** option is used to find volumes between an existing surface and a user supplied height. The volumes can only be calculated within a user supplied polygon.



Cut and Fill Areas Between and a Tin and a Height

For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

On selecting the **Tin to height** option, the **End Area Volume From Tin to a Height** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin for which the volume between it and a height (z value) will be calculated.

Field Description	Type	Defaults	Pop-Up
Height	input		

the volume is calculated between the tin and the value in this field.

Angle for sections input 90.0 0,45,90

angle (in degrees) of the lines to section along.

Dist between sections input 10.0 1,10,100

distance between the lines to section along

Model for sections input available models

if non-blank, the sections though the tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the tin.
If blank, the sections are not kept.

Difference model input available models

if non-blank, the sections which are the difference between the tin sections and the height are retained and placed in the model given in this field.
If blank, the sections are not kept.

Difference colour input available colours

colour for the difference sections strings

Clean sections models beforehand tick box

if tick, the model of sections and difference sections are cleaned out before the option runs.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Report mode input summary summary, full

*if **full**, the cut and fill details for every section are included.*
*If **summary**, just the cut and fill totals are given.*

Volume mode choice box Average end area average end area,

prismoidal - 2 sections

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to 23.2.1.1 Average End Area Formula

Volume button

The volume between the tin and the height (z-value) within the selected bounding polygon is calculated by the end area method. The sections through the polygon will be calculated along straight lines at the angle given by the angle *field and at a separation given by the* dist *field. The sections are made against the tin given in* tin *field.*

How to Use the Panel and Panel Messages

(a) Select the bounding string by choosing **Poly** and picking the required string.

(b) Volume processing begins on selecting the **Volume** button.

Progress messages - sent to the panel message area

calculating volumes

Completion message - sent to the panel message area

c *cut volume* f *fill volume* bal *total (balance) volume*

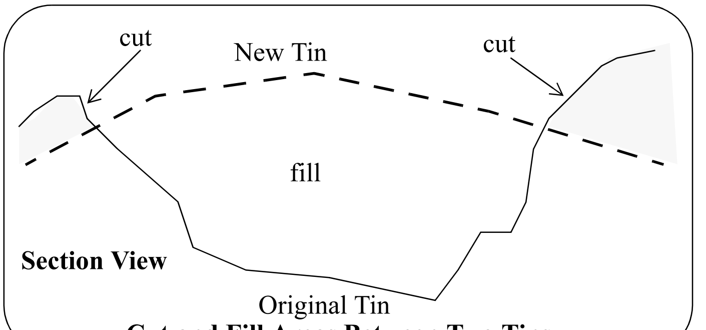
<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.3.1 End Area - Tin to Height or return to 23.3 End Area.

23.3.2 End Area - Tin to Tin

Position of option on menu: **Design =>Volumes =>End Area =>Tin to tin**

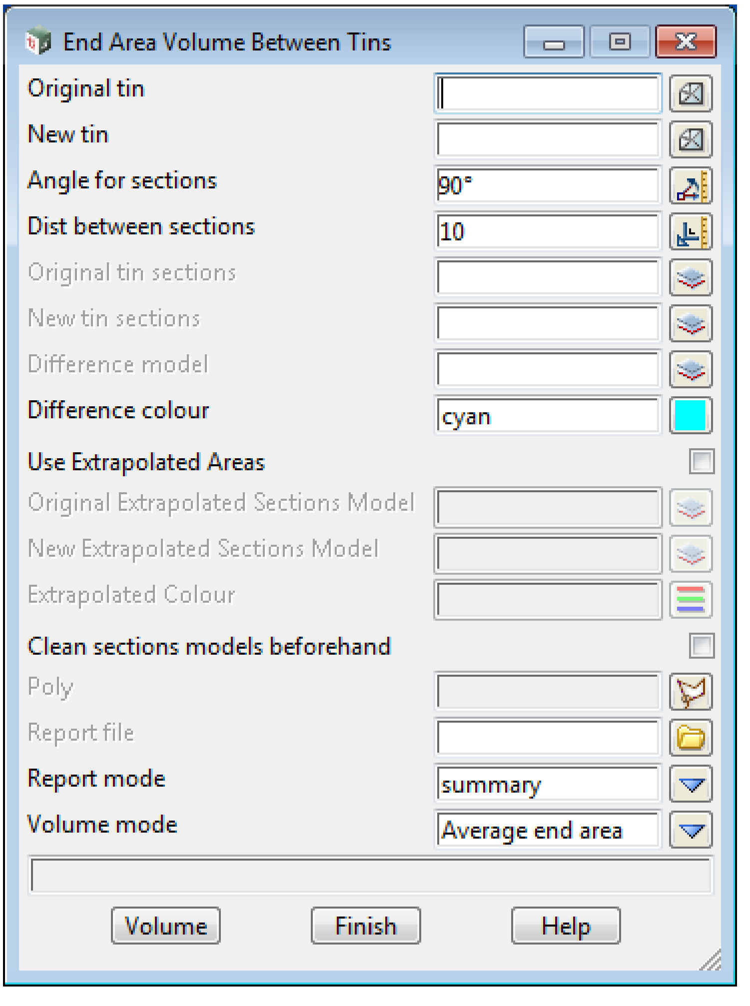
The **Tin to tin** option is used to find volumes between an existing and a new surface. The volumes can only be calculated within a user supplied polygon.



Cut and Fill Areas Between Two Tins

For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

On selecting the **Tin to tin** option, the **End Area Volume Between Tins** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Original tin	input		available tins

name of the original tin for determining volumes.

New tin	input		available tins

name of the new tin for determining volumes.

Angle for sections	input	90.0	0,45,90

angle (in degrees) of the lines to section along.

Dist between sections	input	10.0	1,10,100

distance between the lines to section along

Original tin sections	input		available models

*if **not blank**, the sections though the original tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour at the original tin.
If blank, the sections are not kept.*

New tin sections	input		available models

*if **not blank**, the sections though the new tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the new tin.
If blank, the sections are not kept.*

Difference model	input		available models

*if **not blank**, sections which are the depth from the original tin to the new tin are created and placed in the model given in this field. That is, the value on the difference section is:*

z- diff = z-value of original section - z-value of new tin.

Hence triangulating the difference sections and contouring them will give you the depths isopachs between the two tins.

If blank, the sections are not kept.

Difference colour	input		available colours

colour for the difference sections strings

Use extrapolated areas	tick box	not tick	

*if **not tick**, areas (and hence volumes) are only calculated where **both** sections exist. Hence the sections are limited to where both occur.*

*If **tick**, when the sections are not the same length, the end points of the above and below sections are connected thereby extrapolating the smaller section. This method is not recommended since data does not exist.*

Original extrapolated sections model	model box	available models

*if non-blank, the extrapolated sections created from the Original sections are placed in this model.
If blank, the extrapolated sections for the original sections are not kept.*

The volume between the new and the original tins within the selected polygon string is calculated by the end area method. The sections through the polygon selected by **poly** *will be calculated along straight lines at the angle given by the* angle *field and at a separation given by the* dist *field. The sections are made against the tins given by the original and the new tin fields.*

How to Use the Panel and Panel Messages

(a) Select the bounding polygon string by choosing **Poly** and picking the required string.

(b) Volume processing begins on selecting the **volume** button.

Progress messages - sent to the panel message area

calculating volumes

Completion message - sent to the panel message area

c *cut volume* f *fill volume* bal *total (balance) volume*

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.3.3 End Area - String Tin to Height or return to 23.3 End Area.

23.3.3 End Area - String Tin to Height

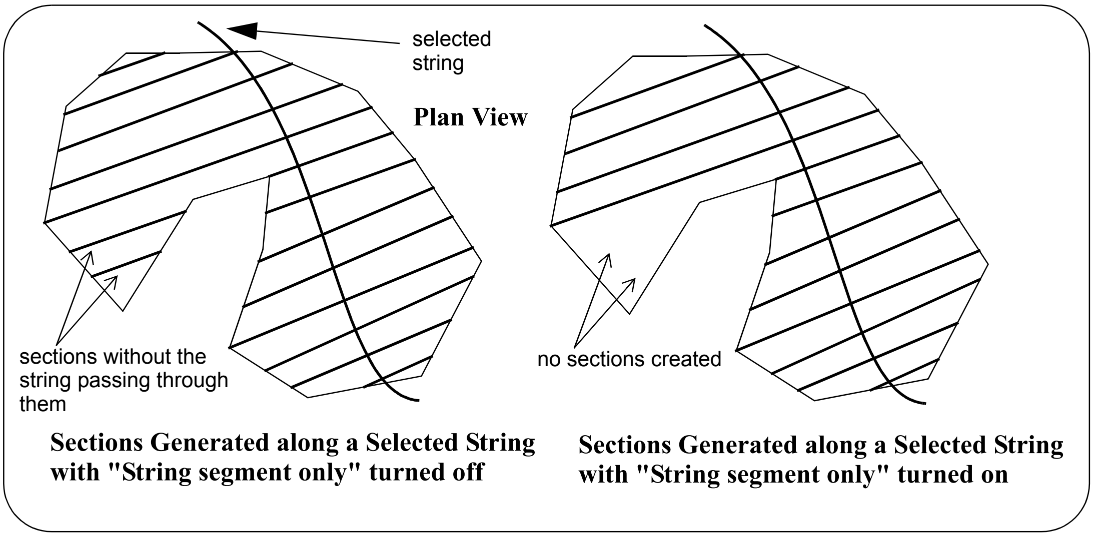
Position of option on menu: **Design =>Volumes =>End Area =>String tin to height**

The volume options already described calculate the volumes by forming parallel sections through the tin and then using the end area method between adjacent sections.

In many situations, the sections to be used are defined to be at right angles to a user selected string. This method is commonly used in road calculations.

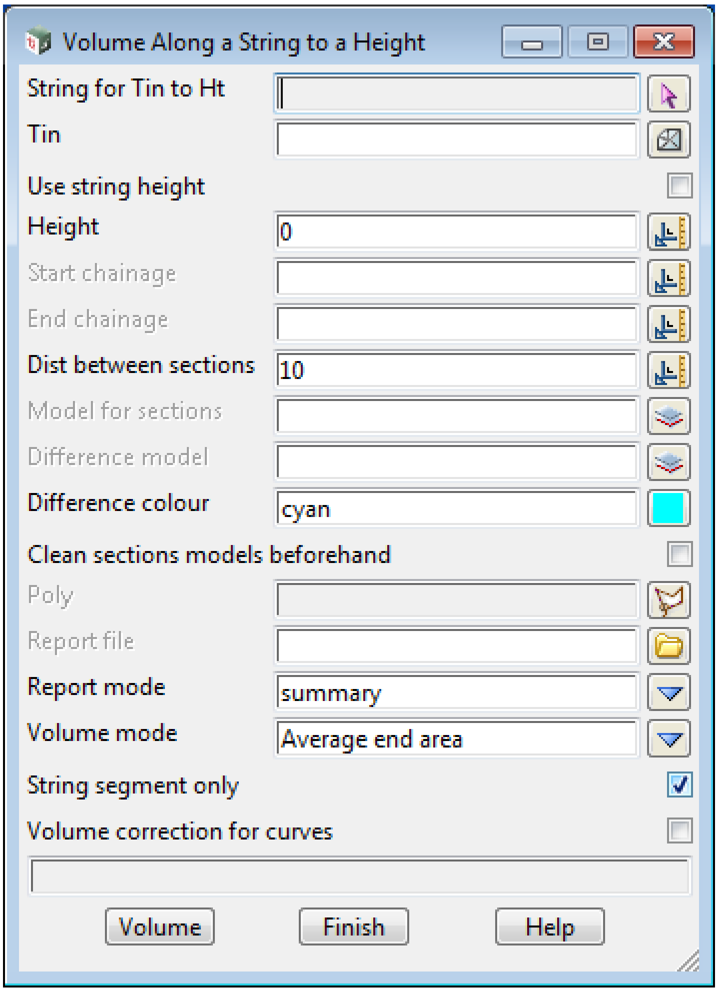
The options **String tin to height** and **String tin to tin** both use sections defined at right angles to a user selected string for the end area volume calculations. For both options, the volumes can only be calculated within a user supplied polygon.

It optionally uses the whole section within the polygon or only the part of the section that contains the string.



For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

On selecting the **String tin to height** option, the **Volume Along a String to a Height** panel is displayed.



The fields and buttons in this panel are used as follows.

Field Description	Type	Defaults	Pop-Up
String for Tin to Ht	string select		

a string is selected to be used to define the sections used in the end area calculations. The sections are taken at right angles to this string.

Tin	input		available tins

name of the tin for which the volume between it and a height (z-value) will be calculated.

Use string height	tick box		

*if **tick**, the height used for the area calculations is taken at each section from the user selected string.*
*If **not tick**, the height given in the* height *panel field is used in the area calculations.*

Height	input	0	

if Use string height *is set to **no tick**, the volume is calculated between the tin and the value in this field.*

Start chainage	input		

if non blank, the chainage of the first section to use for volume calculations.
If blank, start with the section with the lowest chainage.

End chainage	input		

if non blank, the chainage of the last section to use for volume calculations.
If blank, end with the section with the highest chainage.

Dist between sections input 10 1,10,100

distance between the sections taken at right angles down the user selected string.

Model for sections input available models

if non-blank, the sections though the tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the tin.
If blank, the sections are not kept.

Difference model input available models

if non-blank, the sections which are the difference between the tin sections and the height are retained and placed in the model given in this field.
If blank, the sections are not kept.

Difference colour input available colours

colour for the difference sections strings

Clean sections models beforehand tick box

if tick, the model of sections and difference sections are cleaned out before the option runs.

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Report mode input summary summary, full

*if **full**, the cut and fill details for every section are included.*
*If **summary**, just the cut and fill totals are given.*

Volume mode choice box Average end area average end area,

prismoidal - 2 sections

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to 23.2.1.1 Average End Area Formula

String segment only tick box tick

*if **tick**, only the part of the section within the polygon that contains the selected string is used.*
*If **not tick**, the whole section within the polygon is used (see* 23.2.1 Theory of End Area Volumes*).*

Volume correction for curves tick box

if tick, volume corrections are made when going around curves.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Volume button

The volume between the tin and the height (z-value) within the selected polygon is calculated by the end area method. The sections through the tin are calculated at right angles to the selected string at a separation given by the dist *field. The section strings are placed in the model given in the* model *field.*

How to Use the Panel and Panel Messages

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.3.4 End Area - String Tin to Tin or return to 23.3 End Area.

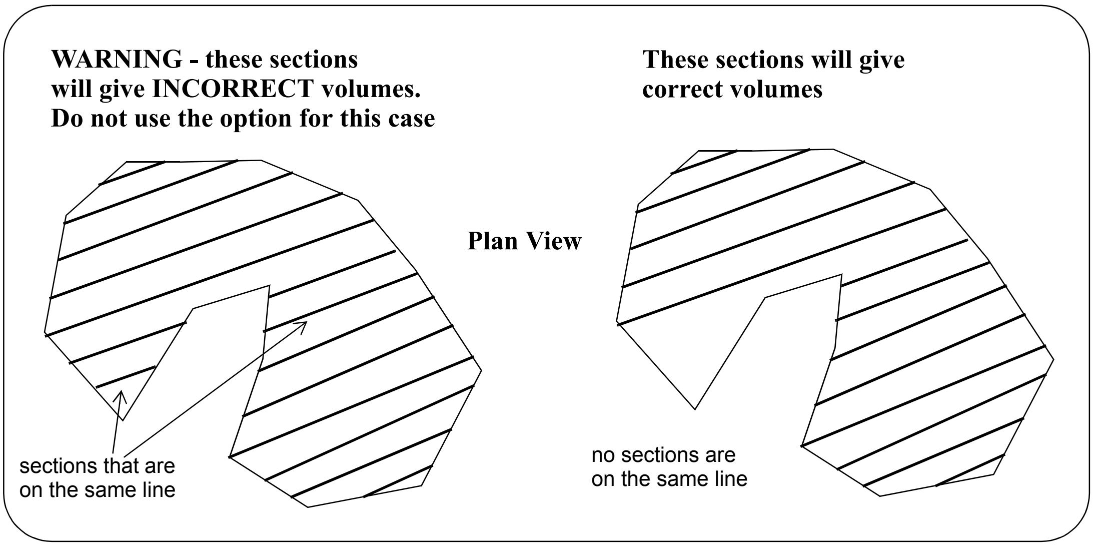
23.3.5 End Area - Sections to Height

Position of option on menu: **Design =>Volumes =>End Area =>Sections to height**

The **Sections to height** option is used to find volumes between sections that already exist (in a given model) and a user supplied height. The volumes can be restricted to be within a user supplied polygon.

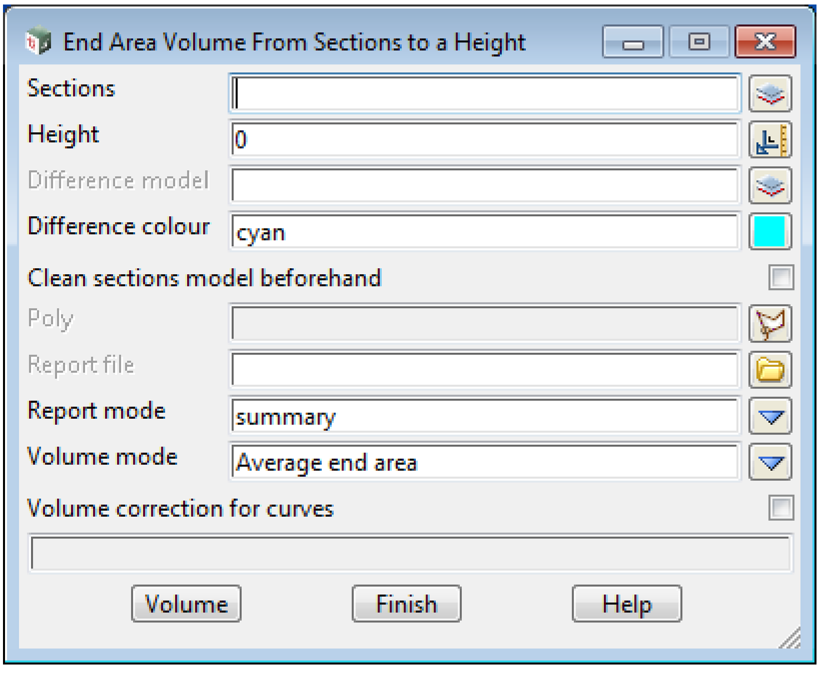
Normally the ***Sections to Height*** method is not used since if the tin exists, the option
Design =>Volumes =>End Area =>Tin to height
automatically generates sections through the tin at the required interval.

WARNING: The ***Sections to Height*** method can ***not*** be used when there are cases of two sections being on the same line.



For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

On selecting the **Sections to height** option, the **End Area Volume from Tin to a Height** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Sections input available models

name of the model containing the sections for which the volume between them and a height (z value) will be calculated.

Height input

the volume is calculated between the sections and the value in this field.

Difference model input available models

if non-blank, the sections which are the difference between the given sections and the height are retained and placed in the model given in this field.
If blank, the sections are not kept.

Difference colour input available colours

colour for the difference sections strings

Clean sections models beforehand tick box

if ticked, the model of sections and difference sections are cleaned out before the option runs.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Report mode input summary summary, full

*if **full**, the cut and fill details for every section are included.*
*In **summary**, just the totals are given.*

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to 23.2.1.1 Average End Area Formula

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

Volume button

the volume between the model of sections and the height (z-value) within the selected bounding polygon is calculated by the end area method.

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.3.6 End Area - Sections to Sections or return to 23.3 End Area.

23.3.6 End Area - Sections to Sections

Position of option on menu: **Design =>Volumes =>End Area =>Sections to sections**

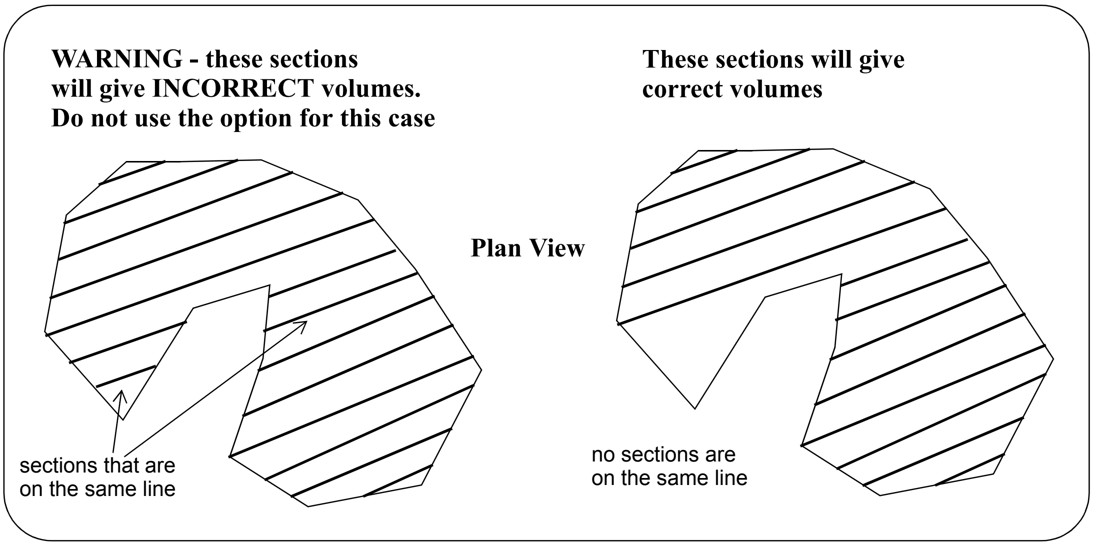
The **Sections to sections** option is used to find volumes between two models of sections. The volumes can be restricted to be within a user supplied polygon. Note that there needs to be matching sections in the two models of section.

Normally the ***Section to Sections*** method is not used since if the tin exists, the option

Design =>Volumes =>End Area =>Tin to tin

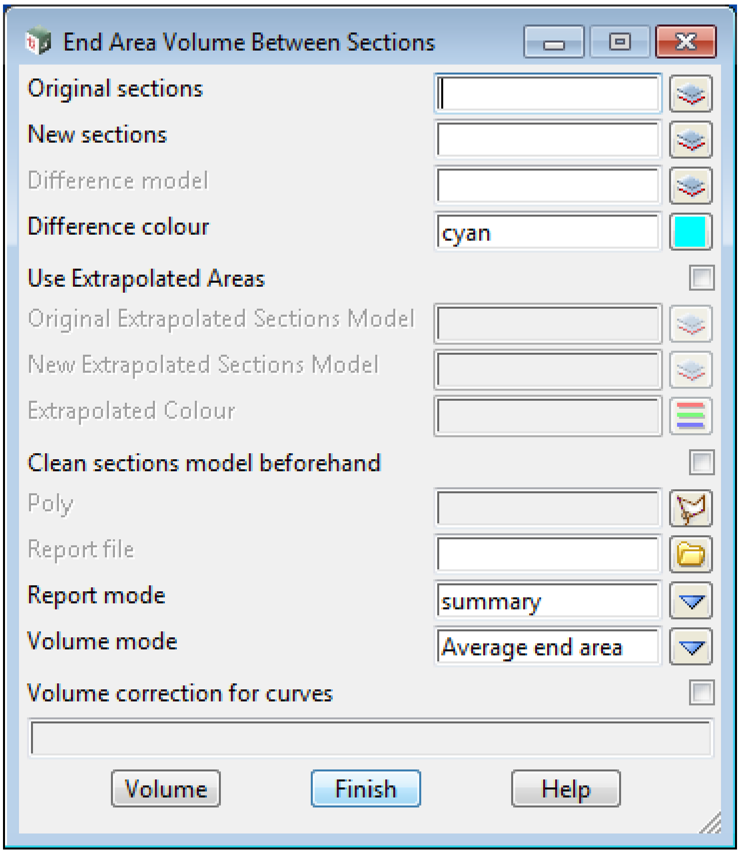
automatically generates sections through the two tins at the required interval.

WARNING: ***The Section to Sections*** method can ***not*** be used when there are cases of two sections being on the same line.



For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

On selecting the **Sections to sections** option, the **End Area Volume Between Sections** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original sections	input		available models

name of the original model of sections for determining volumes.

New sections	input		available models

name of the new model of sections for determining volumes.

Difference model	input		available models

if non-blank, the sections which are the difference of the original and the new sections are retained and placed in the model given in this field. If blank, the sections are not kept.

Difference colour	input		available colours

colour for the difference sections strings

Use extrapolated areas	tick box	not tick	

*if **not tick**, areas (and hence volumes) are only calculated where **both** sections exist. Hence the sections are limited to where both occur.*

*If **tick**, when the sections are not the same length, the end points of the above and below sections are connected thereby extrapolating the smaller section. This method is not recommended since data does not exist.*

Original extrapolated sections model	model box	available models

if non-blank, the extrapolated sections created from the Original sections are placed in this model. If blank, the extrapolated sections for the original sections are not kept.

New extrapolated sections model	model box	available models

if non-blank, the extrapolated sections created from the New sections are placed in this model. If blank, the extrapolated sections for the new sections are not kept.

Extrapolated colour colour box available colours

colour for the extrapolated sections

Clean sections models beforehand tick box

if ticked, the model of sections and difference sections are cleaned out before the option runs.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Report file input

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no file name is given, the report is not produced.

Report mode input summary summary, full

*if **full**, the cut and fill details for every section are included.*
*If **summary**, just the cut and fill totals are given.*

Volume mode choice box Average end area average end area,

prismoidal - 2 sections

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to 23.2.1.1 Average End Area Formula

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

Volume button

The volume between the original model of sections and the new model of sections within the selected bounding polygon is calculated by the end area method.

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.3.7 End Area - Tin to Sections or return to 23.3 End Area.

23.3.7 End Area - Tin to Sections

Position of option on menu: **Design =>Volumes =>End Area =>Tin to sections**

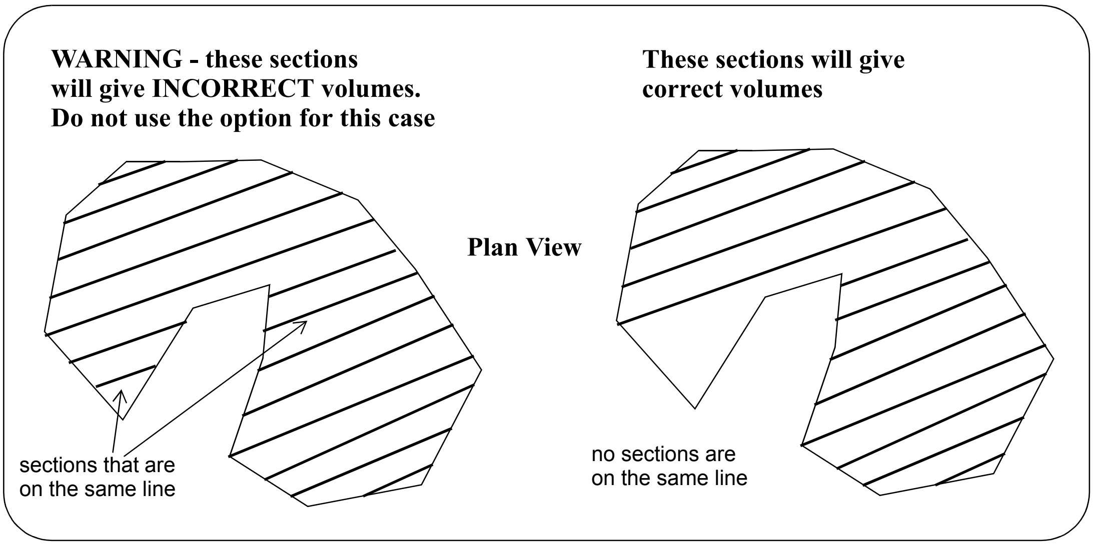
The **Tin to sections** option is used to find volumes between a tin and a model of sections. The volumes can be restricted to be within a user supplied polygon.

Normally the ***Tin to Sections*** method is not used since if the tin for the sections exists, the option

Design =>Volumes =>End Area =>Tin to tin

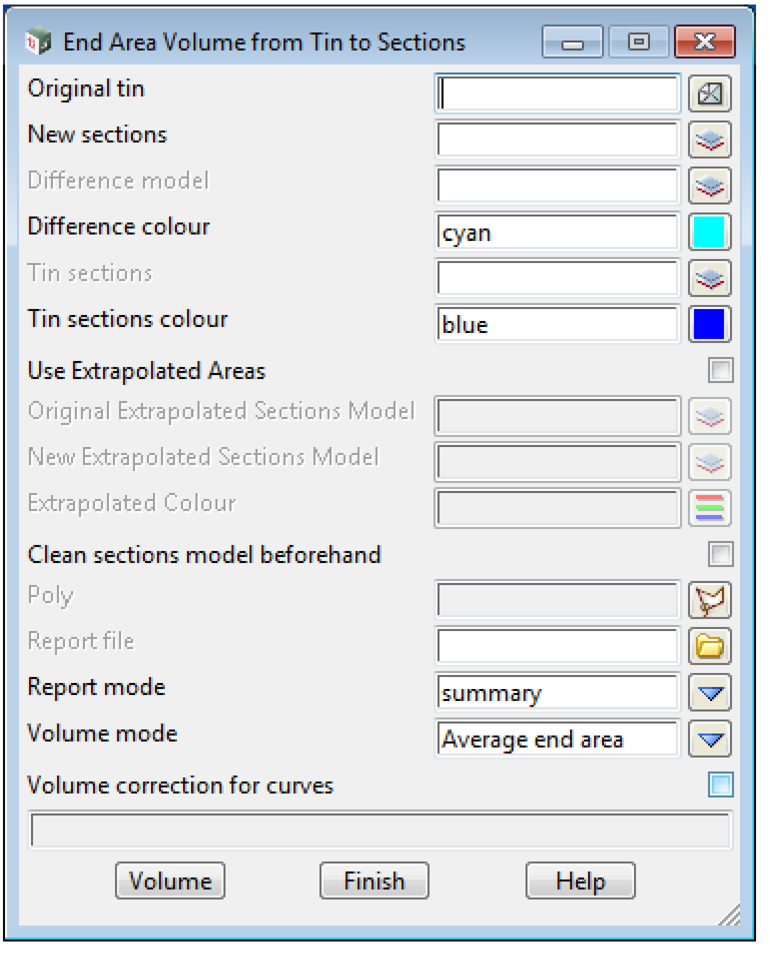
automatically generates sections through the two tins at the required interval.

WARNING: ***The Tin to Sections*** method can ***not*** be used when there are cases of two sections being on the same line.



For more information on the end area volume calculations, go to the section 23.2.1 Theory of End Area Volumes.

Selecting **Tin to sections** brings up the **End Area Volume from Tin to Sections** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original Tin	tin box		available tins

name of the original tin to use for determining volumes.

New sections	model box		available models

name of the new model of sections for determining volumes.

Difference model	model box		available models

if non-blank, the sections which are the difference of the original and the new sections are retained and placed in the model given in this field. If blank, the sections are not kept.

Difference colour	colour box		available colours

colour for the difference sections strings

Tin sections	model box		available models

if non-blank, the sections cut through the Original tin are placed in this model.
If blank, the sections through the Original tin are not kept.

Tin sections colour	colour box		available colours

colour for the sections cut through the Original tin

Use extrapolated areas	tick box	not ticked	

*if **not ticked**, areas (and hence volumes) are only calculated where **both** sections exist. Hence the* *sections are limited to where both occur.*

*If **ticked**, when the sections are not the same length, the end points of the above and below sections are connected thereby extrapolating the smaller section. This method is not recommended since data does not exist.*

Original extrapolated sections model model box available models

if non-blank, the extrapolated sections created from the Original sections are placed in this model. If blank, the extrapolated sections for the original sections are not kept.

*if **full**, the cut and fill details for every section are included.*
*If **summary**, just the cut and fill totals are given.*

Volume mode choice box Average end area average end area,

prismoidal - 2 sections

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to 23.2.1.1 Average End Area Formula

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

Volume button

The volume between the original model of sections and the new model of sections within the selected bounding polygon is calculated by the end area method.

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.3.8 End Area - Material Section to Section or return to 23.3 End Area.

23.3.8 End Area - Material Section to Section

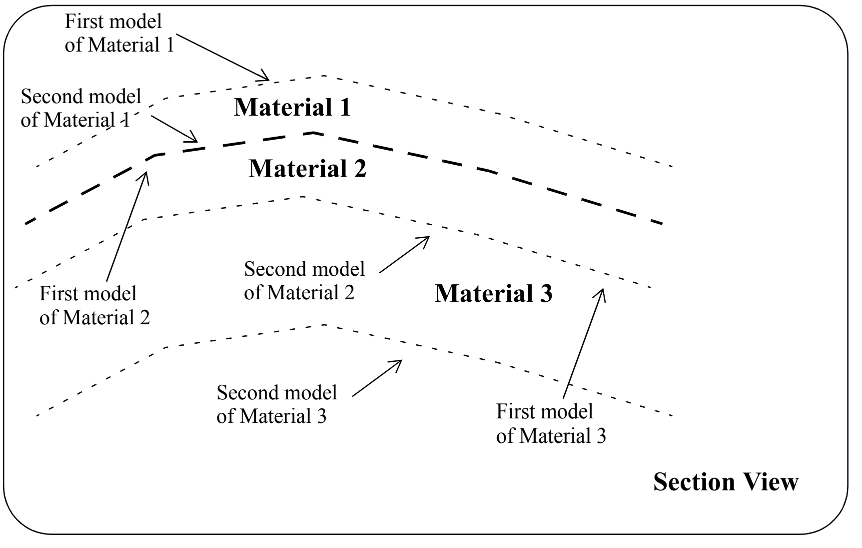
Position of option on menu: **Design =>Volumes =>End Area =>Material section to section**

The **Material section to section** option calculates the volumes for one or more material layers where a material layer is given by two models of sections representing the top (First model) and the bottom (Second model) of the material layer.

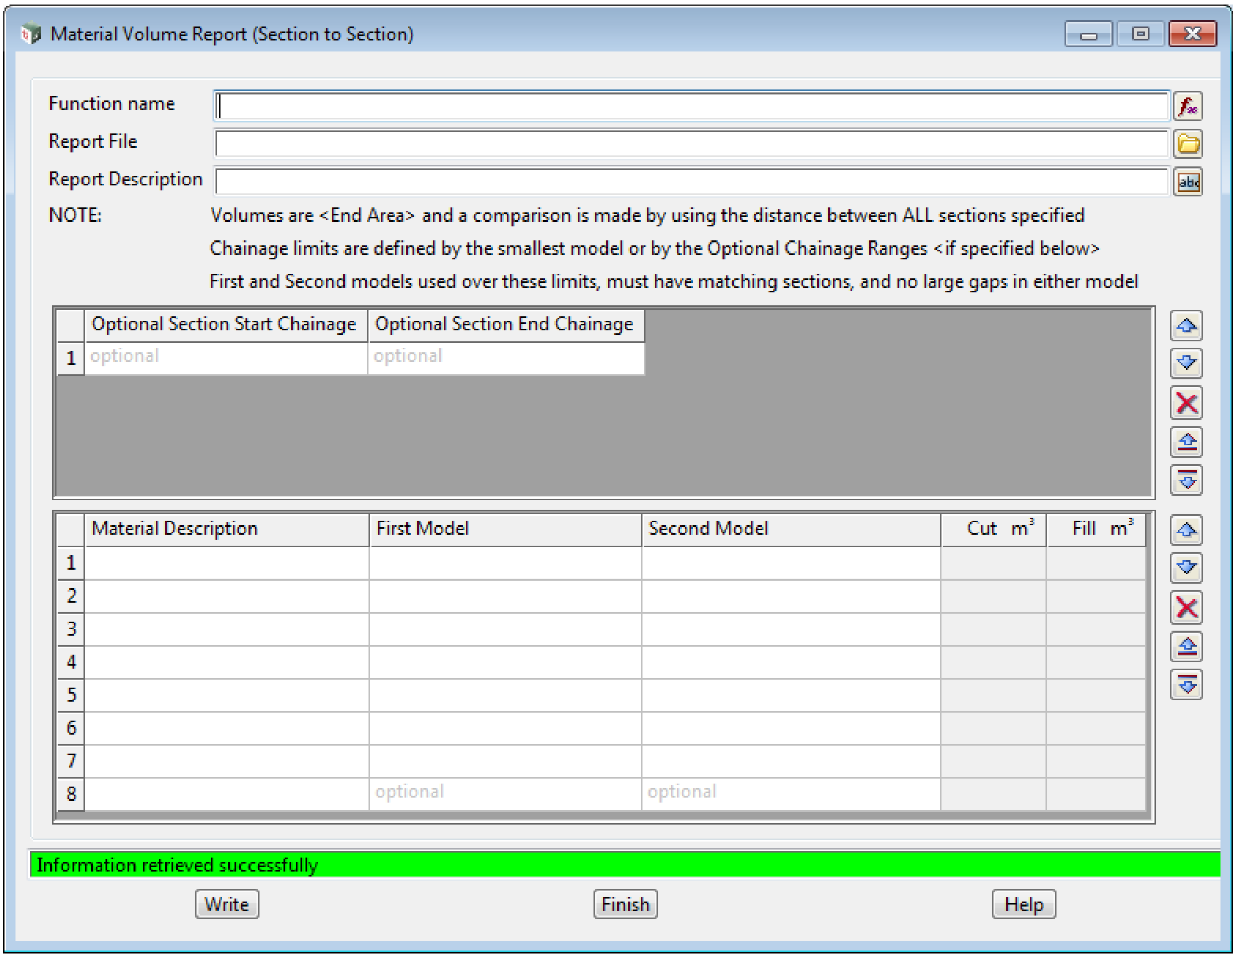
The cut and fill volumes for each material layer is written to a table on the panel, and optionally to a report.

This option uses models of sections already created by other options such as *Apply MTF* or **Tins =>Sections =>X sections**

The cut and fill volumes are calculated using the ***End Area*** method (see 23.2.1 Theory of End Area Volumes).



Selecting **Material section to section** brings up the **Material Volume Report (Section to Section)** panel



Volumes are End Area and a comparison is made by using the distance between ALL the sections specified.

The chainage limits for the volume calculations are defined by the smallest chainages on the sections in the ***First*** and ***Second Models,*** or by the ***Optional Section Start Chainage*** and ***Optional Section End Chainage*** ranges given in the panel.

The ***First*** and ***Second Models*** used over these limits, must have matching sections, and no large gaps in either model.

If the chainage limit in the smaller model falls within the limits of the chainages in the larger model and no optional chainages are used, then the chainage limit of the smaller model is used.

In this case no interpolation is done up to the start or after the end of the smaller model chainage limits, in relation to the larger model.

However, if there is a large chainage gap in the smaller model then some interpolation will be done between the first and last section in this area, in relation to the larger model.

The latter is not desirable and the optional chainage ranges should be used to take into account the chainage gap in the smaller model

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function Name	function box		

if non-blank entry used as the name of a function that can be used in chains etc

Report File	file box		available *.csv files

if non-blank entry used as the report file in a csv format

Report Description input

if non-blank entry used a descriptive heading in the report

Optional Chainages Grid

Section Start Chainage real

if non-blank entry used as the start chainage in the report

Section End Chainage real

if non-blank entry used as the end chainage in the report

Report Options Grid

Material Description input

if non-blank entry used as a description for a material, such as "Asphalt Surface" in the report

First Model model

if non-blank entry this section model is used in the volume calculations

Second Model model

if non-blank entry this section model is used in the volume calculations

Cut m^3

field for display of results only, after the "Write" button is used.

If more than one <Optional Chainage Grids> are used, then the values displayed represents the accumulative cut for that material

Fill m^3

field for display of results only, after the "Write" button is used.

If more than one <Optional Chainage Grids> are used, then the values displayed represents the accumulative fill for that material

Write button

the end area volumes is run for each of the Optional Chainage ranges or for the extents of the smaller model, if no optional chainages are specified

The volumes are calculated for each material using a chain from the Library. This can be verified in the output window.

Starting chain: Vol Sect to Sect.chain

Return to 23.3 End Area.

23.4 Exact

Position of menu: **Design =>Volumes =>Exact**

These volumes are calculated by dividing the tins up into small prisms whose volumes can be calculated exactly. For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

In the exact volume options, the volumes calculations can be restricted to a user defined polygon or if no polygon is provided, the volumes will be only be calculated for the regions where both the triangulations exist.

With the exact method, volumes can easily be calculated for depth bands from

(a) the given height to the tin for "tin to height" volumes

or

(b) the new tin to the original tin for "tin to tin" volumes.

Hence for the calculations, a range file can be supplied giving depth pairs and 12d Model will report the cut, fill and balance for each of the depth pairs and also the total of the cut, fill and balance for all the pairs.

In the report, the sign for cut (negative or positive) is given by the cut volume sign from the **default settings** panel (fill will have the opposite sign).

The range file consists of a list of depth ranges and colours, one set per line, in the format

lower_depth   upper_depth   depth_colour

This line represents all depths satisfying

lower_depth <= depth < upper_depth.

For ***each range*** in the file, the total cut and fill volumes for the depth range will be reported on, and the depth_colour can be used to colour all areas on a plan view satisfying the range.

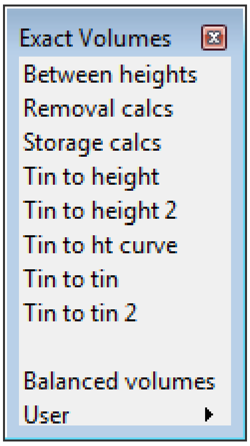
IMPORTANT NOTE - when are depth file is used, the ***volume totals*** are **only** calculated for the ***depths in the range file***. If the depth ranges ***does not cover*** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will ***not*** be the same as the volumes between the two tins or the volumes from a tin to a height.

Example of a Depth Range File

// depth range file
// format: lower_depth upper_depth colour_for_depth_range
// depth is measured positive down and negative up.

-20 -10 red // colour red where the depth is greater or equal to -20 and less than -10
-10 0 magenta // colour magenta where the depth is greater or equal to -10 and less than 0
0 10 green // colour green where the depth is greater or equal to 0 and less than 10
10 20 "dark green" // colour dark green where depth is >=10 and less than 20

The **Exact** walk-right menu is



volumes between two heights
cut/slope vol calcs for height range
fill/slope vol calcs for height range
volumes between surface and a height
" " "

volumes between surfaces
" " "

The options in this menu will now be described.

For the option see

23.4.1 Exact - Between Heights
23.4.2 Exact - Removal Calcs
23.4.3 Exact - Storage Calcs
23.4.4 Exact - Tin to Height
23.4.5 Exact - Tin to Height 2
23.4.6 Exact - Tin to Height Curve
23.4.7 Exact - Tin to Tin
23.4.8 Exact - Tin to Tin 2
23.4.9 Exact - Balanced Volumes

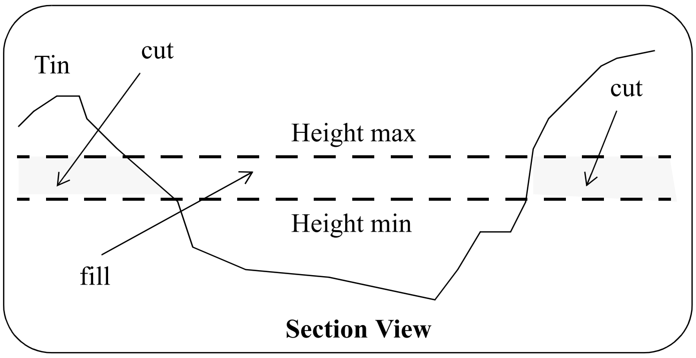
For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

23.4.1 Exact - Between Heights

Position of option on menu: **Design =>Volumes =>Exact =>Between heights**

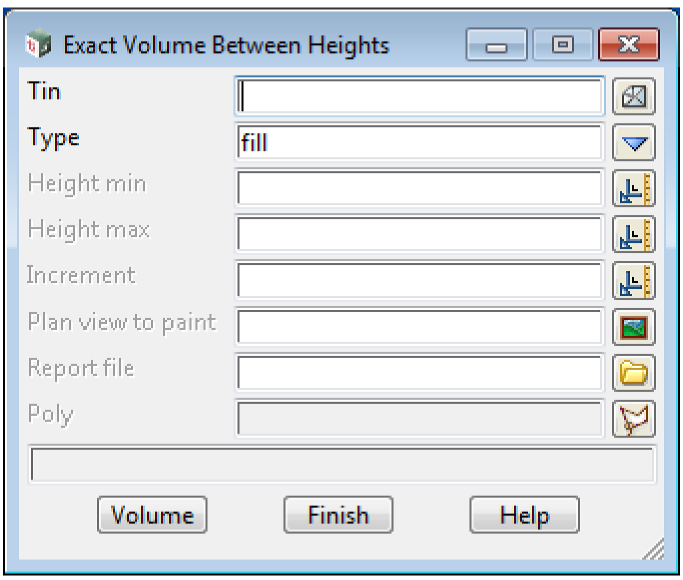
This panel is used to calculate the volume between two heights on a given tin.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.



For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Between heights** option, the **Exact Volume Between Heights** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin for which the volume between two heights will be calculated.

Field Description	Type	Defaults	Pop-Up
Type	input	fill	cut, fill

*if **fill**, the fill volume between the two heights is calculated.*
*If **cut**, the cut volume between the two heights is calculated.*

Height min/max input

volume is calculated between the height min *and the* height max *values.*

Increment input

the volumes between the height min *and* height max *are reported on and is broken up into intervals given by the* increment *value.*

Plan view to paint	input	available views

*if non-blank, the region used for calculations will be painted in the given plan view. The colour will be green if type is **fill**, or red if type is **cut**.*

Report file	input	*.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly	poly string-select	

if selected, this string is used as the bounding polygon for the volume calculations.

Volume	button	

The volume between the height min *and* height max *for the tin within the selected bounding polygon is calculated by the exact method.*

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.4.2 Exact - Removal Calcs or return to 23.4 Exact.

23.4.2 Exact - Removal Calcs

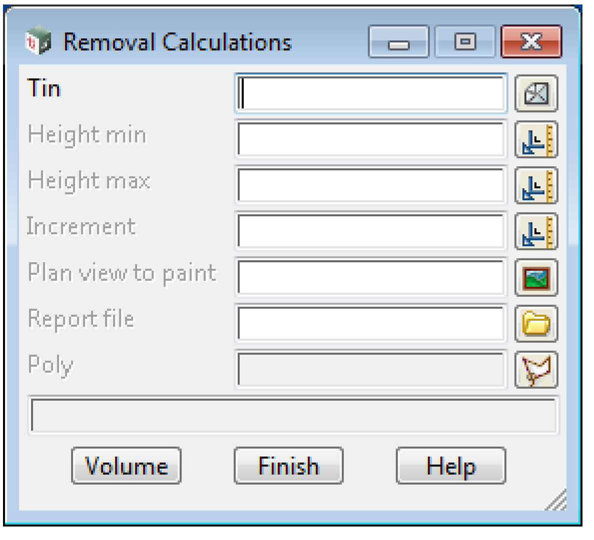
Position of option on menu: **Design =>Volumes =>Exact =>Removal calcs**

For a user specified range of heights, this option will calculate the cut volume from each height to a given tin, plus the plan and slope areas for the region of the tin exposed by cutting to the height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Removal calcs** option, the **Removal Calculations** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins
name of the tin used in the volume calculations.			
Height min/max	input		
if non-blank, the minimum/maximum value of the height range to calculate volumes to. if blank, the tin's minimum/maximum z-value is used.			
Increment	input		
increment between the heights to calculate the volumes to.			
Plan view to paint	input		available views
if non-blank, the region used for calculations will be painted red in the given plan view.			
Report file	input		*.rpt
name of the file to contain the volume report. If the file already exists, the report will be appended to the file. if no name is given, no report is produced.			
Poly	poly string-select		
if selected, this string is used as the bounding polygon for the volume calculations.			
Volume	button		

calculate the cut volumes from the tin to the height for the required heights in the height min *and* height max *range.*

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.4.3 Exact - Storage Calcs or return to 23.4 Exact.

23.4.3 Exact - Storage Calcs

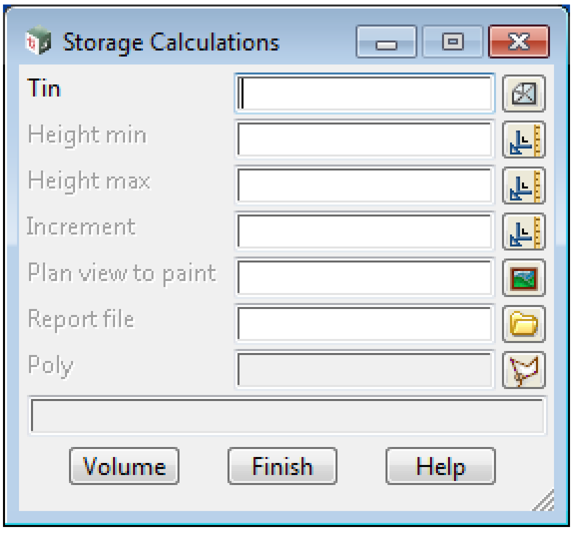
Position of option on menu: **Design =>Volumes =>Exact =>Storage calcs**

For a user specified range of heights, this option will calculate the fill volume from each height to a given tin, plus the plan and slope areas for the region of the tin covered by filling to the height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Storage calcs** option, the **Storage Calculations** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin used in the volume calculations.

Height min/max	input		

if non-blank, the minimum/maximum value of the height range to calculate volumes to.
if blank, the tin's minimum/maximum z-value is used.

Increment	input	1	

increment between the heights to calculate the volumes to.

Plan view to paint	view box		available views

if non-blank, the region used for calculations will be painted green in the given plan view.

Report file	file box		*.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly	poly string-select		

if selected, this string is used as the bounding polygon for the volume calculations.

Volume	button		

calculate the fill volumes from the tin to the height for the required heights in the height min *and* height max *range.*

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.4.4 Exact - Tin to Height or return to 23.4 Exact.

23.4.4 Exact - Tin to Height

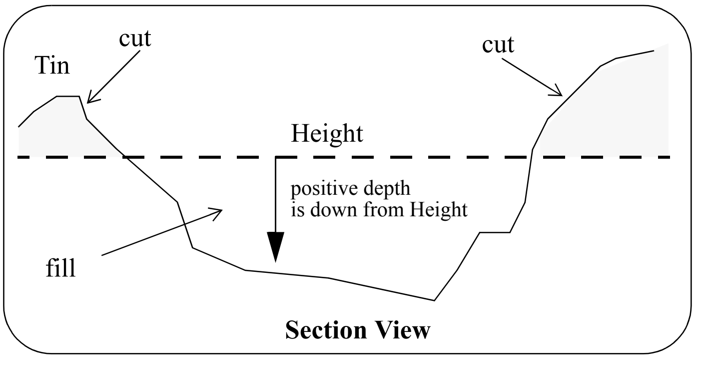
Position of option on menu: **Design =>Volumes =>Exact =>Tin to height**

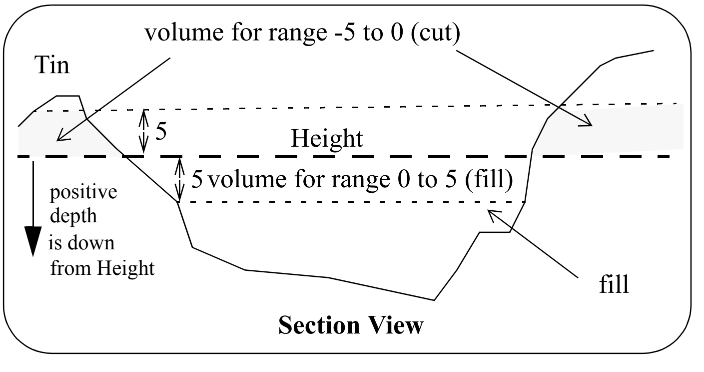
This panel is used to calculate the volume between a tin and a given height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

The calculated volumes can be produced and reported over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

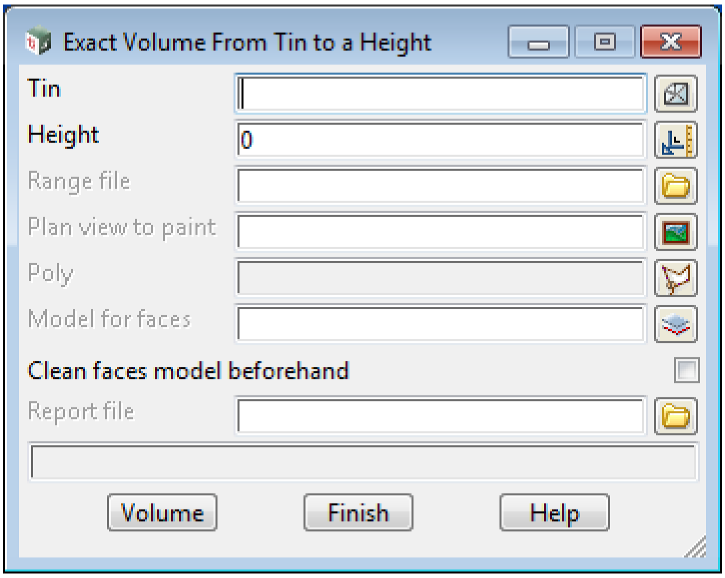
IMPORTANT NOTE - the ***volume totals*** are **only** calculated for the ***depths in the range file***. If the depth ranges ***does not cover*** the entire depth difference between the tin and the height then the totals which are the sum of the different depth ranges will ***not*** be the same as the volume between the tin and the height.





For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Tin to height** option, the **Exact Volume From Tin to a Height** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		available tins

name of the tin for which the volume between it and a height (z value) will be calculated.

Height	input		

the volume is calculated between the tin and the value in this field.

Range file	input		*.drf

if non-blank, the user supplied depth range file is used to split up the volumes report and define the depth colours used for painting a view.

Plan view to paint	input		available views

if non-blank, the given plan view will be painted according to the depth colours given in the range file.

Poly	poly string-select		

if selected, this string is used as the bounding polygon for the volume calculations.

Model for faces	input		available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

Clean faces models beforehand	tick box		

if ticked, the model of faces is cleaned out before the option runs.

Report file	input		*.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Volume	button		

The volume between the tin and the height (z-value) for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the tin and the height is calculated.

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.4.5 Exact - Tin to Height 2 or return to 23.4 Exact.

23.4.5 Exact - Tin to Height 2

Position of option on menu: **Design =>Volumes =>Exact =>Tin to height 2**

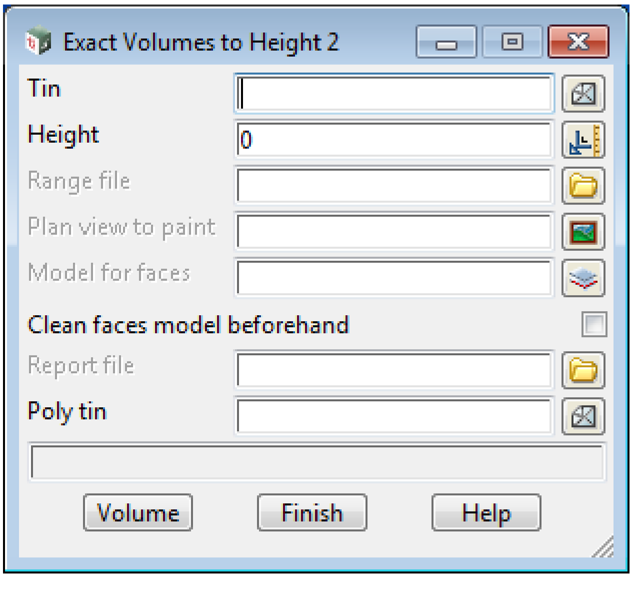
This panel is used to calculate the volume between a tin and a given height but the calculations are restricted to only the regions defined by another tin rather than to a polygon.

The calculated volumes can be produced and reported over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the ***volume totals*** are **only** calculated for the ***depths in the range file***. If the depth ranges ***does not cover*** the entire depth difference between the tin and the height then the totals which are the sum of the different depth ranges will ***not*** be the same as the volume between the tin and the height.

For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Tin to height 2** option, the **Exact Volumes to Height 2** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin for which the volume between it and a height (z value) will be calculated.

Height	input		

the volume is calculated between the tin and the value in this field.

Range file	input		*.drf

if non-blank, the user supplied depth range file is used to split up the volumes report and define the depth colours used for painting a view.

Plan view to paint	view box		available views

if non-blank, the given plan view will be painted according to the depth colours given in the range file.

Model for faces	model box		available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

Clean faces models beforehand tick box

if ticked, the model of faces is cleaned out before the option runs.

Report file file box *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly tin tin box available tins

name of the tin to define the regions that the volume calculations are restricted to.

Volume button

The volume between the tin and the height (z-value) for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the tin and the height is calculated.

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.4.6 Exact - Tin to Height Curve or return to 23.4 Exact.

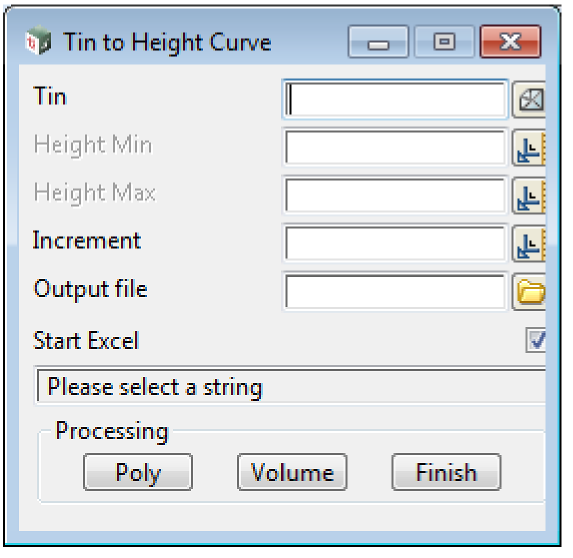
23.4.6 Exact - Tin to Height Curve

Position of option on menu: **Design =>Volumes =>Exact =>Tin to ht curve**

This panel is used to calculate the volume between a tin between heights and writes out a report on the volumes.

For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Tin to ht curve** option, the **Tin to Height Curve** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin for which the volume between it and a height (z value) will be calculated.

Height min input

the start height for calculation volumes.

Height max input

the end height for calculation volumes.

increment input

the height increment.

Output file file box

the file for the volumes report.

Start Excel tick box tick

if ticked, start Excel up with the report loaded into it.

Poly select

select the polygon which is used in plan only to restrict the area for calculating volumes over.

Volume button

calculate the volume between heights differing by the given increment, and write out a report.

Continue to the next section 23.4.7 Exact - Tin to Tin or return to 23.4 Exact.

23.4.7 Exact - Tin to Tin

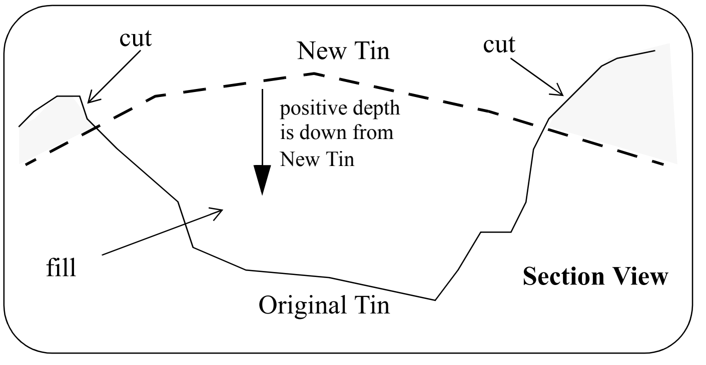
Position of option on menu: **Design =>Volumes =>Exact =>Tin to tin**

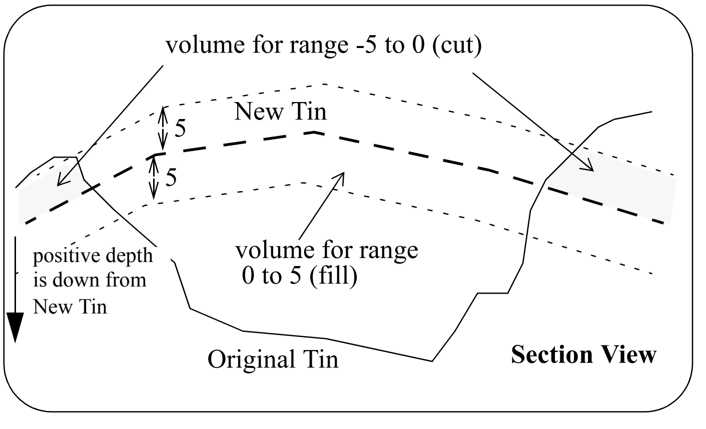
This panel is used to calculate the volume between two tins using the exact method.

The calculations can be restricted to within a polygon, or if no polygon is selected, the overlapping sections of the two tins is used.

The calculated volumes can be produced and reported on over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

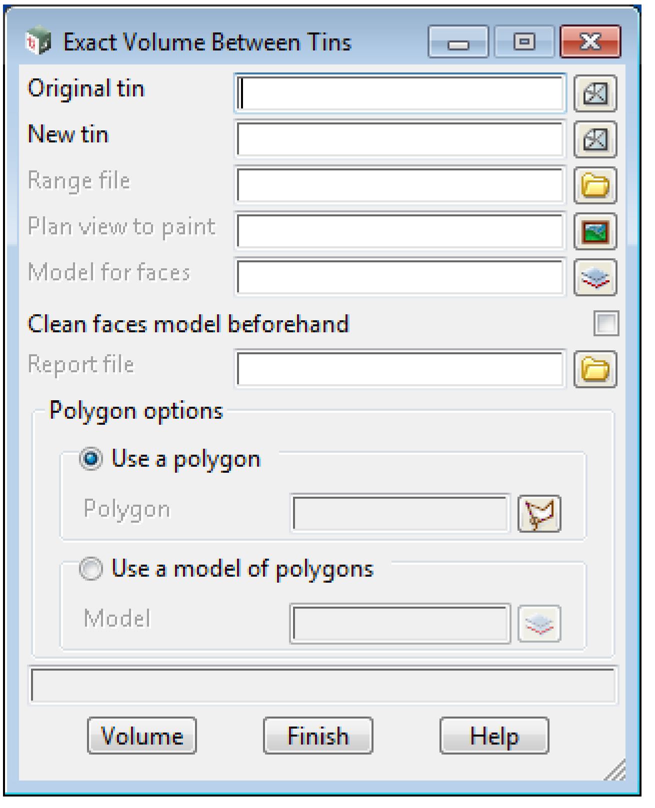
IMPORTANT NOTE - the ***volume totals*** are **only** calculated for the ***depths in the range file***. If the depth ranges ***does not cover*** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will ***not*** be the same as the volumes between the two tins.





For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Tin to tin** option, the **Exact Volume Between Tins** panel is displayed.



Cut is defined to be where ever the new tin is **below** the original tin. Fill is defined to be where ever the new tin is **above** the original tin.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New Tin	tin box		available tins

name of the original/new tin for determining volumes.

Range file	input		*.drf

if non-blank, the user supplied range file is used to split up the volumes report and define the depth colours used for painting a view.

Plan view to paint	input		available views

if non-blank, the given plan view will be painted according to the depth colours given in the range file.

Model for faces	input		available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

Clean faces model beforehand	tick box		

if ticked, the model of faces is cleaned out before the option runs.

Report file	input		*.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Polygon options

Use a polygon	radio button		
Polygon	poly string select		

if Use a polygon *is selected, then the selected string is used as the bounding polygon for the volume calculations.*

Use a model of polygons radio button

Model model box available models

if Use a model of polygons *is selected, then this model is used and each string in the model is used as a bounding polygon and the volume calculated.*

Volume button

The volume between the two tins for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the two tins is calculated.

<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.4.8 Exact - Tin to Tin 2 or return to 23.4 Exact.

23.4.8 Exact - Tin to Tin 2

Position of option on menu: **Design =>Volumes =>Exact =>Tin to tin 2**

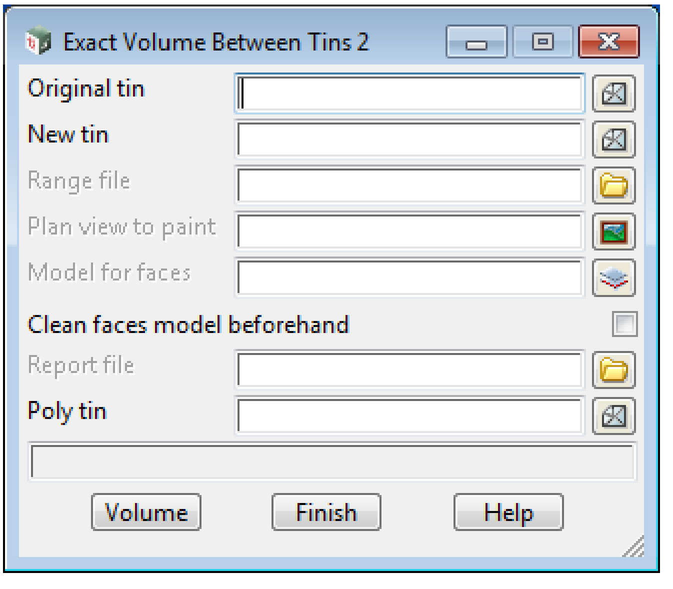
This panel is used to calculate the volume between two tins using the exact method but the calculations are restricted to only the regions defined by another tin rather than to a polygon.

The calculated volumes can be produced and reported on over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the ***volume totals*** are **only** calculated for the ***depths in the range file***. If the depth ranges ***does not cover*** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will ***not*** be the same as the volumes between the two tins.

For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Tin to tin** option, the **Exact Volume Between Tins 2** panel is displayed.



Cut is defined to be where ever the new tin is **below** the original tin. Fill is defined to be where ever the new tin is **above** the original tin.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Original/New Tin tin box available tins

name of the original/new tin for determining volumes.

Range file input *.drf

if non-blank, the user supplied range file is used to split up the volumes report and define the depth colours used for painting a view.

Plan view to paint input available views

if non-blank, the given plan view will be painted according to the depth colours given in the range file.

Model for faces input available models

if non-blank, faces will be created with colours according to the range colours given in the range file.

Clean faces model beforehand tick box *if ticked, the model of faces is cleaned out before the option runs.*

Report file	file box	*.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly tin	tin box	available tins

name of the tin to define the regions that the volume calculations are restricted to.

Volume	button	

The volume between the two tins for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the two tins is calculated.

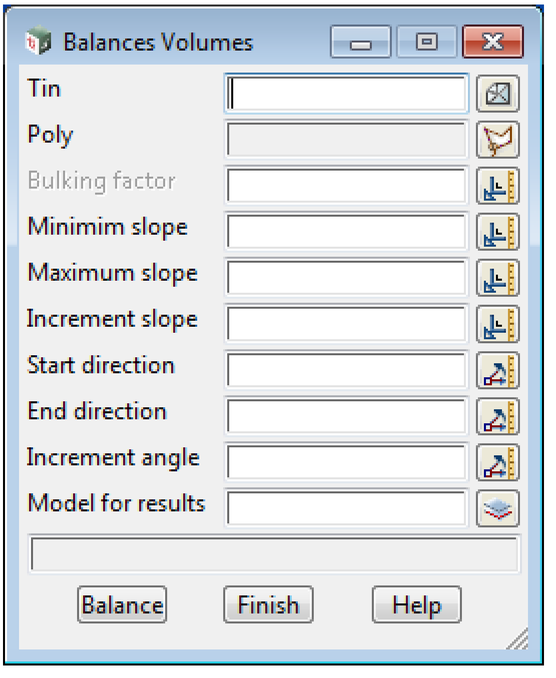
<Esc> can be used to terminate the option during volume calculations.

Continue to the next section 23.4.9 Exact - Balanced Volumes or return to 23.4 Exact.

23.4.9 Exact - Balanced Volumes

Position of option on menu: **Design =>Volumes =>Exact =>Balanced volumes**

On selecting the **Balanced volumes** option, the **Balances Volumes** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Balance	button		

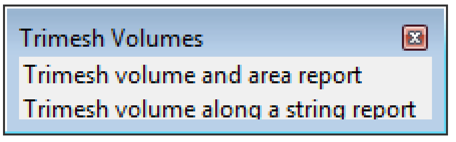
Return to 23.4 Exact.

23.5 Trimesh

Position of menu: **Design =>Volumes =>Trimesh**

These volumes are calculated for trimeshes.

The **Trimesh** walk-right menu is



volumes of trimeshes

volumes of trimeshes for chainge interval along a string

For the options see:

[23.5.1 Trimesh Volume and Area Report]

[23.5.2 Trimesh Volume Along a String]

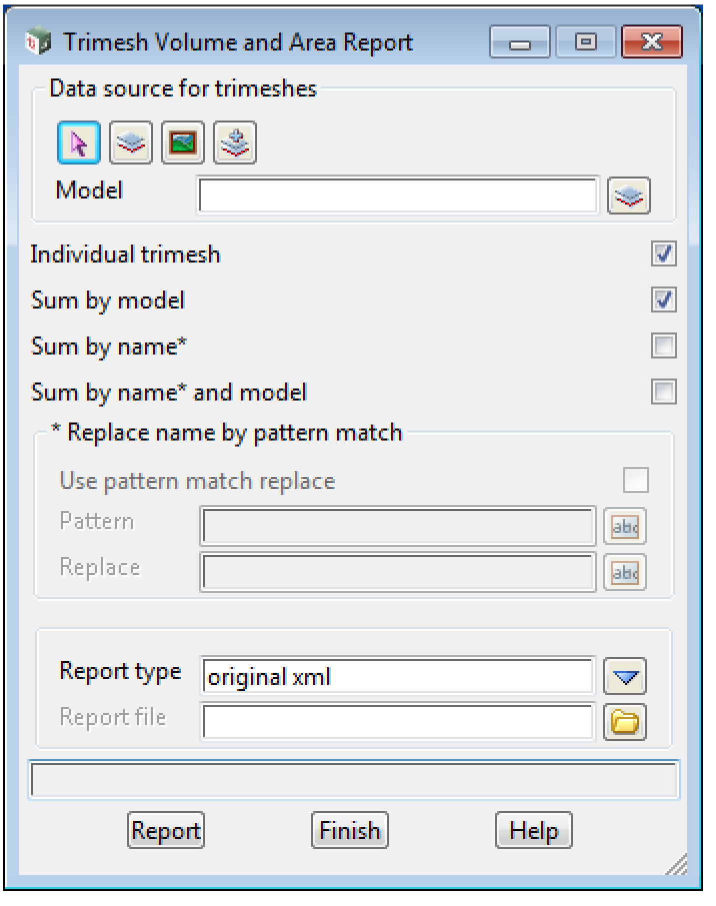
Or Return to [23 Volumes].

23.5.1 Trimesh Volume and Area Report

Position of option on menu: **Design =>Volumes =>Trimesh =>Trimesh volume report**

This option calculate the volume of closed trimeshes, and user selected combinations of closed trimeshes.

On selecting **Trimesh volume report**, the **Trimesh Volume Report** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

Data to search - for a full description go to 4.19.3 Data Source.

Data source	input		

source of trimeshes to calculate the volumes for.

Individual trimesh tick box

if ***ticked****, the volume for each individual trimesh will be written to the XML file.*

Sum by name tick box

if ***ticked****, the sum of the volumes for trimeshes with the same name will be written to the XML file.*

Sum by model tick box

if ***ticked****, the sum of the volumes for trimeshes in the same model will be written to the XML file.*

Sum by name and model tick box

if ***ticked****, the sum of the volumes for trimeshes in the same model will be written to the XML file.*

Report type choice box original xml, <Customize>

output format for the report.

For information on setting up custom reports from the generated XML file using xslts, see 4.30 Setting Up XML Reports.

Report file file box

an XML file will be created and a report of this name, and of the type given by **Report type** *will be generated from the XML file. If the file already exists, a panel with* **Replace** *and* **Cancel** *buttons will be displayed.*

Report button

the volumes of the various combinations of trimeshes are calculated and written to the XML file.

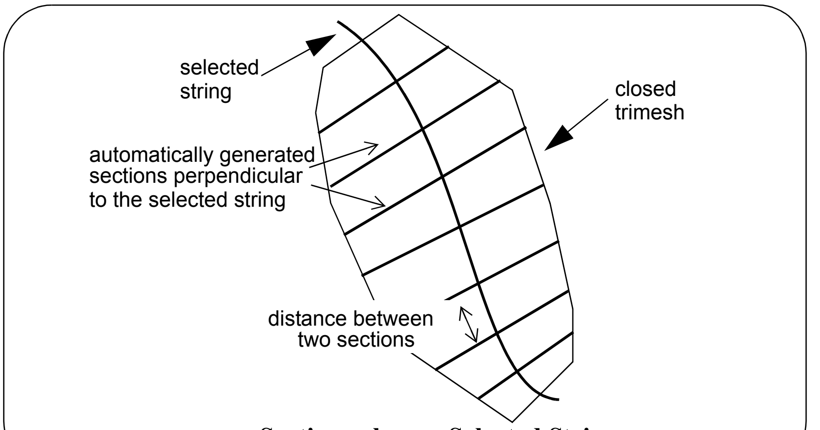
Continue to the next section 23.5.2 Trimesh Volume Along a String or return to 23.5 Trimesh.

23.5.2 Trimesh Volume Along a String

Position of option on menu: **Design =>Volumes =>Trimesh =>Trimesh volumes along a string**

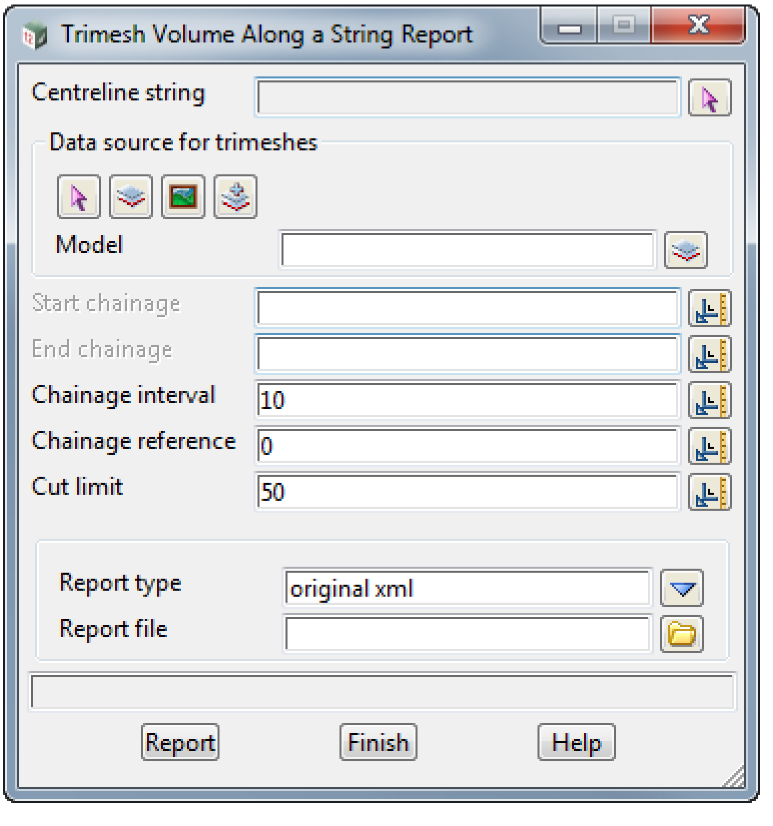
This option calculates the volume of closed trimeshes between chainages on a selected string.

Warning: The volumes can only be calculated for trimeshes that in plan, the section line only cuts the trimesh twice. So in plan, the trimesh can't be a U or an S shape.



Sections along a Selected String

Selecting **Trimesh volumes along a string report** displays the **Trimesh Volumes Along a String Report** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Centreline string	string select		

the string for defining the sections to be used in the volume calculations. The sections are taken at right angles to this string.

Data source type Model

Data to search for trimeshes - for a full description go to 4.19.3 Data Source.

Data source input

source of trimeshes to calculate the volumes along a string for.

Start chainage input

*if **not blank**, the chainage of the first section to use for volume calculations.*
*If **blank**, start at the beginnng of the selected string.*

End chainage input

*if **not blank**, the chainage of the last section to use for volume calculations.*
*If **blank**, end at the end of the selected string.*

Chainage interval real box 10

the chainage distance between the lines to section along.

Cut limit real box 50

the plan distance that the section goes out from the selected string.

Report type choice box original xml, <Customize>

output format for the report.

For information on setting up custom reports from the generated XML file using xslts, see 4.30 Setting Up XML Reports.

Report file file box

an XML file will be created and a report of this name, and of the type given by **Report type** *will be generated from the XML file. If the file already exists, a panel with* **Replace** *and* **Cancel** *buttons will be displayed.*

Report button

the volume of each trimesh is calculated between each pair of sections and written to the XML file.

Continue to the next section 23.6 Grid Cell or return to 23.5 Trimesh.

23.6 Grid Cell

Position of option on menu: **Design =>Volumes =>Grid cell**

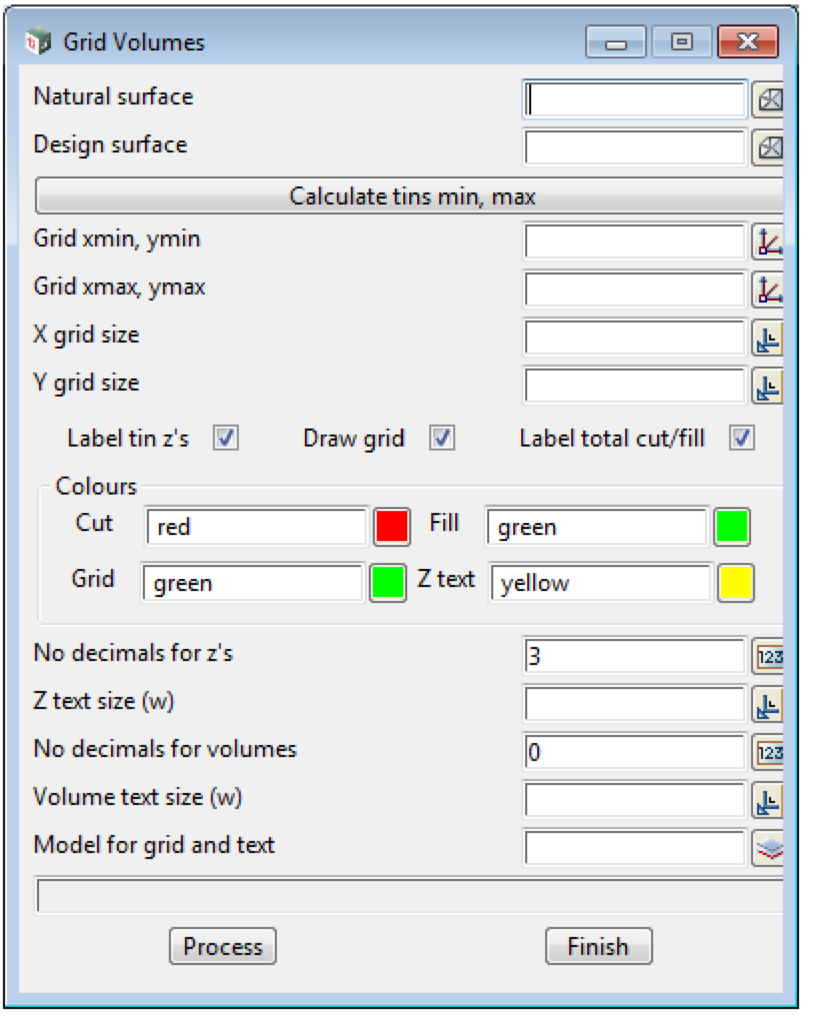
This panel is used to calculate the cut and fill volume between two tins using the exact method and then creating text for each rectangular cells of user defined sides covering the tins.

The rectangular cells (grid) can be drawn and the text of the cut and fill values for each grid cell and z-values at the cell corners. The total cut and fill can also be created at the bottom of the grid.

Cut is defined to be where ever the *design* tin is **below** the *natural surface* tin. ***Fill*** is defined to be where ever the *design* tin is **above** the *natural surface* tin.

For more information on the exact volume calculations, go to the section 23.2.2 Theory of Exact Volumes

On selecting the **Grid cell** option, the **Grid Volumes** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Natural surface/Design surface	tin box		available tins

name of the original/new tin for determining volumes.

Calculate tins min, max button

when selected, the minimum and maximum x and y values to define the grid cells are calculated and written to the grid x and y minimum and maximum panel fields.

Grid xmin xmax input

the minimum and maximum x values to define the grid cells.The two values are separated by one or more spaces.

Grid ymin ymax input

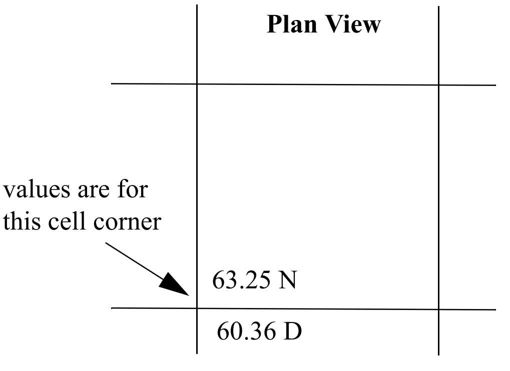
the minimum and maximum y values to define the grid cells.The two values are separated by one or more spaces.

X/Y grid size input

the X/Y size of the grid cell.

Label tin z's tick box ticked

*if ticked, create text values for the z-values from the tins for each of the grid cell corners. The natural surface z value is followed by a **N** and is placed above and to the right of the corner point. The design surface z value is followed by a **D** and is placed below and to the right of the corner point.*



Draw grid tick box ticked

if ticked, the grid is drawn.

Label total cut/fill tick box ticked

if ticked, label the total cut, fill and balance at the left hand bottom corner of the grid.

Cut/Fill/Grid/Z text colours colour box

colours to use for the cut, fill and z-values and the grid lines.

Num decimals for z's input 3

number of decimal places in the z values.

Z text size (w) input

size in world units for the text of the z values.

Num decimals for volumes input 0

number of decimal places in the cut and fill volumes.

Volume text size (w) input

size in world units for the text of the volumes.

Model for grid and text model box available models

model to place all the text and grid lines in.

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Process button

calculate the grid volumes and grid lines.

Undo button

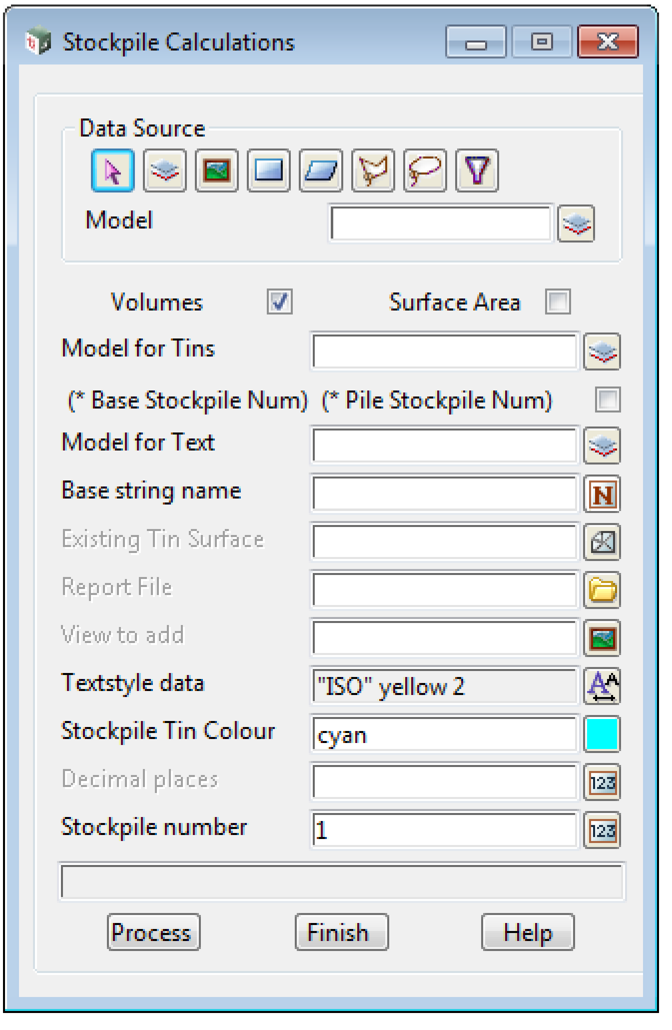
undo the last set of text and grid lines created whilst the panel was up.

Continue to the next section 23.7 Stockpile or return to 23 Volumes.

23.7 Stockpile

Position of option on menu: **Design =>Volumes =>Stockpile**

On selecting the **Stockpile** option, the **Stockpile Calculations** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source

data source for strings to create the stockpile.

Volumes tick box ticked

if ticked, calculate and report the volumes of the stockpiles.

Surface area tick box

if ticked, calculate and report the surface area of the stockpiles

Model for tins model box available models *name of the model to place the stockpile tins in.*

Model for text	model box		available models

name of the model to place the text in.

Base string name	name box	bsp	available names

Name of the string to use as the base of the stockpile.

Report file	file box		*.rpt

name of the file to contain the volume report.

View to add	view box		available views

view to add the model of text to.

Textstyle data	textstyle data box		text favourites

text setup - for a full description go to 4.6.12 Textstyle Data and Textstyle Info.

Decimal places number box

number of decimal places for the volumes in the report.

Stockpile number number box

number of stockpile to use in the report.

Process button

calculate the volume and/or surface area of the stockpile.

Continue to the next section 23.8 Tin to Tin by Height Range or return to 23 Volumes.

23.8 Tin to Tin by Height Range

Position of option on menu: **Design =>Volumes =>Tin to tin ht range**

This option is used to calculate the cut and fill volume between two tins breaking the *cut* and *fill* volumes up by height ranges.

An approximate method is used which uses the z-value of the tin at a point as the representative of the height for a cell of user specified size "delta x" by "delta y" centred on the point. By making delta x and delta y small, the volumes become more accurate but the computation time increases.

Please note that the volume totals are **only** for the heights in the range file. If the height ranges don't cover the entire height difference, then the totals will not be the volumes between the two tins.

Cut is defined to be where ever the new tin is **below** the original tin. **Fill** is defined to be where ever the new tin is **above** the original tin.

In the volumes report, the sign for cut (negative or positive) is given by the cut volume sign from the **default settings** panel (fill will have the opposite sign).

The *height range file* consists of a list of height ranges and colours, one set per line, in the format

lower_height upper_height height_colour

This line represents all heights satisfying

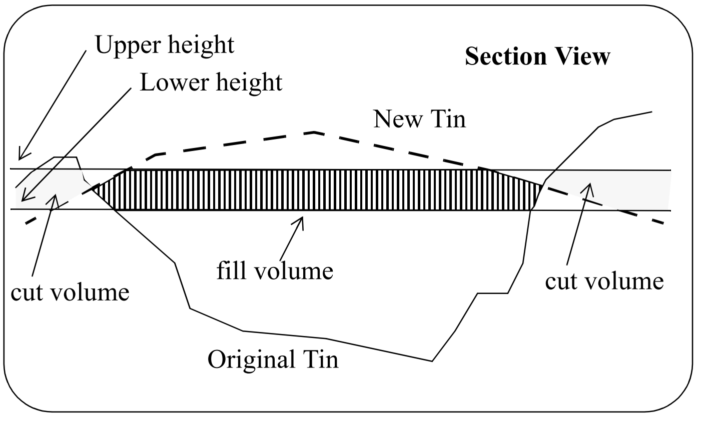
lower_height <= height < upper_height.

For each range in the file, the total cut and fill volumes for the height range will be reported on. The colour is ignored in this option.

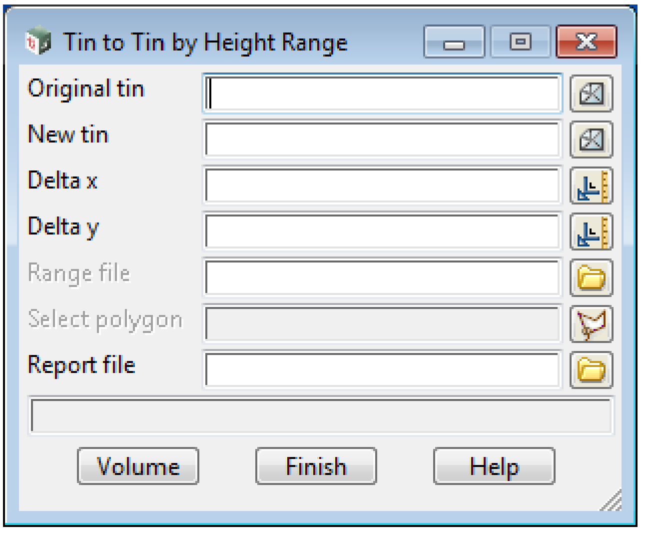
Example of a Height Range File

```
//   height range file
// format:   lower_height      upper_height      colour_for_height_range

110    120    green      // colour green where the height is greater or equal to 110 and less than 120
120    220    "dark green"        // colour dark green where height is >= 120 and less than 220
```



On selecting the **tin to tin ht range** option, the **tin to tin by height range** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin	tin box		available tins

name of the original/new tin for determining volumes.

Delta x/Delta y	input	1	

x/y size of the cell to consider to be of the height.

Select polygon	string select		

optional. If selected, the volumes are restricted to being inside this polygon.

Range file	input		*.drf

*if non-blank, the user supplied height range file is used to split up the volumes report. Note that the volume totals are **only** for the heights in the range file.*

Report file	report file		*.rpt

*if non-blank, the name of the file to contain the volume report. Note that the volume totals are **only** for the heights in the range file*

Volume	button		

calculate the volumes.

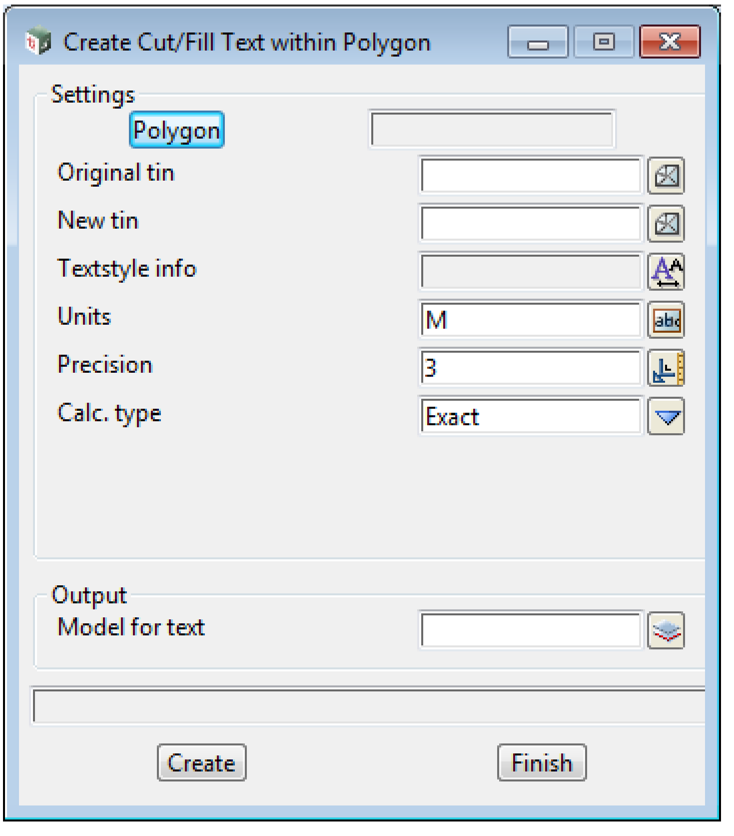
Continue to the next section 23.9 Create Cut/Fill Text Within Polygon or return to 23 Volumes.

23.9 Create Cut/Fill Text Within Polygon

Position of option on menu: **Design =>Volumes =>Cut/fill text in poly**

This option is used to calculate the cut and fill volume between two tins within a polygon and writing the cut and fill values to a model. The Exact or End Area method can be used for the volume calculations.

Selecting **Cut/fill text in poly** brings up the **Create Cut/Fill Text within Polygon** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Polygon	poly string select		
the volumes are restricted to being inside this polygon.			
Original/New tin	tin box		available tins
name of the original/new tin for determining volumes.			
Textstyle info	textstyle info box		
textstyle info to use for the cut and fill text			
Units	input		
text to place after the cut/fill values			
Precision	input	3	
number of decimal places to use for the cut/fill values			
Calc. type	choice box	Exact	Exact, End Area
use either Exact or End Area for the volume calculations			

Angle input

angle for sections when End Area is used

Separation input

distance between sections when End Area is used

Model for text model box available models

model to place to cut and fill text in.

Create button

calculate the volumes and text.

Return to 23 Volumes.

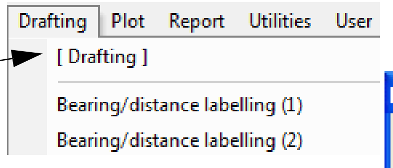
24 Drafting

The **Drafting** menu contains options to create data for plots.

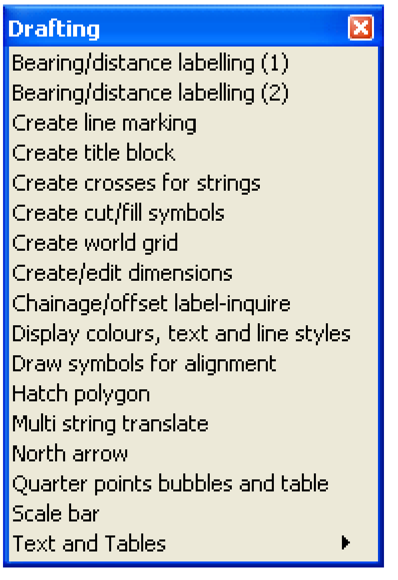
The **Drafting** menu is

on Main menu

create floating **Drafting** menu



on 12d Model menu and floating Drafting menu

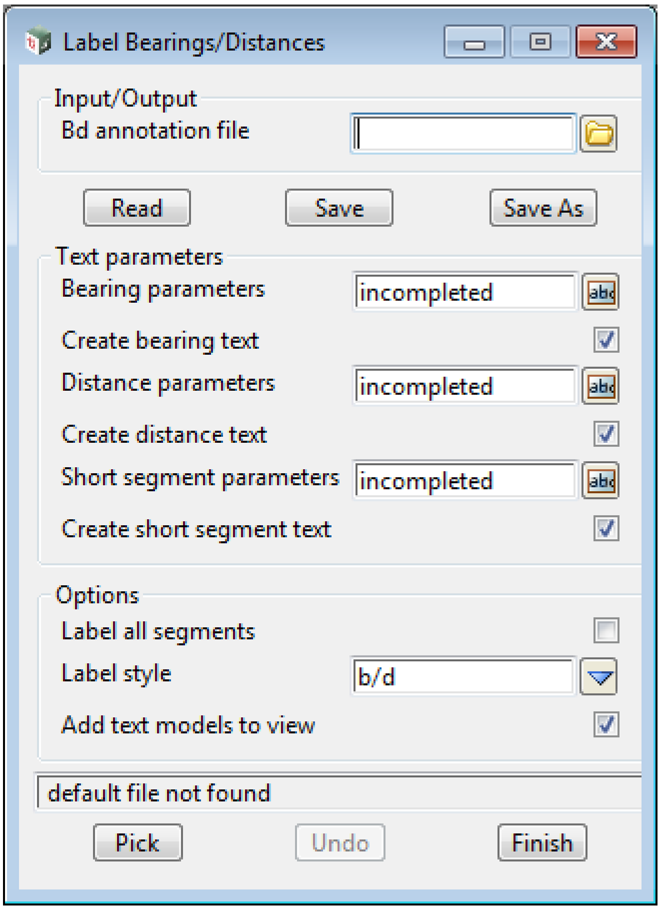


For *Bearing/distance labelling* go to	24.1 Bearing/Distance Labelling
Create line marking	12.13.35.5 Line Marking
Create title block	25.7.1 Create/Edit Title Block File
Create crosses for strings	24.4 Create Crosses at String Points
Create cut/fill symbols	24.5 Create Cut/Fill Symbols
Create world grid	24.6 Create World Grid
Create/edit dimensions	24.7 Create/Edit Dimensions
Chainage/offset label inquire	24.8 Chainage/Offset Label Inquire.
Display colours, text, linestyles	24.9 Display Colours, Textstyles and Linestyles.
Draw symbols for alignment	24.10 Draw Symbols for Alignment String
Hatch polygon	24.11 Polygon Hatching
Multi string translate	24.16 Text and Tables
North arrow	24.13 North Point Insertion
Quarter points bubbles and table	17.18.3 Setout Lip Line
Scale bar	24.15 Scalebar
Text and tables	24.16 Text and Tables

24.1 Bearing/Distance Labelling

Position of option on menu: **Drafting =>Bearing/distance labelling**

This option is used to label a selected line or arc segment with bearing, distance information and arc length information. If the line or arc length is below a given value, the label information is added to a short segment table.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
bd annotation file	file box		*.bdf files

file containing values for the text parameters.

Read	button		

read the file given in the "bd annotation file" field.

Save	button		

save the current text parameter settings to the file given in the "bd annotation file" field.

Save as	button		

save the current text parameter settings in a file.

Bearing parameters	input box	none/complete incomplete	bearing parameters

if none, don't label bearings.

If complete, all the bearing parameters have been set.

If incomplete, not all the bearing parameters have been set so the labels can't be created.

Create bearing text	tick box	tick	

if tick, bearings are labelled.

Distance parameters	input box	none/complete incomplete	bearing parameters

if none, don't label distances.

If complete, all the distance parameters have been set.

If incomplete, not all the distance parameters have been set so the labels can't be created.

Create distance text	tick box	tick	

if tick, distances are labelled.

Label all segments	tick box		

if tick, all segments of the selected element are labelled.

If not-tic, only the selected segment is labelled.

label style	input box	b/d, d/b, /bd /db, bd, db	b/d

defines how to label the bearing and distances. For example, d/b means distance above the line and bearing below the line. Bearing or distance is only labelled if the appropriate flags are set.

Add text models to view	tick box	tick	

if tick, all models containing text are added to the view containing the selected segment.

Minimum length	input box	0	

if non-zero, then if the length of the segment is less than this value, then it is given a short segment number and added to the short segment table.

Next short segment no.	input box	1	

the next number to use for short segments.

Pick	button		

select the segment to be labelled.

Undo	button		

undo the last set of created labels.

24.2 Line Marking

Position of option on menu: **Drafting =>Create line marking**

This option creates a title block file from a model of data. It has already been documented as

View => Visualisation => Line marking

in the section 12.13.35.5 Line Marking.

24.3 Create Titleblock

Position of option on menu: **Drafting =>Create title block**

This option creates a title block file from a model of data. It has already been documented as

Plot => Create title block file

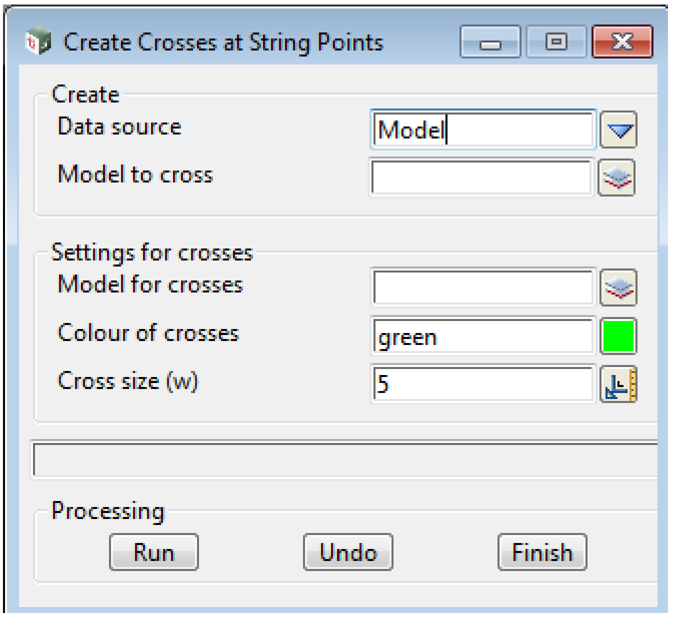
in the section 25.7.1 Create/Edit Title Block File.

24.4 Create Crosses at String Points

Position of option on menu: **Drafting =>Create crosses for strings**

This panel is used to create crosses at the points of strings. The cross is made up of two 2d strings with the intersection of the two strings being the (x,y) position of the point in the string.

The option is mainly used to created crosses to send to packages that don't support a cross at a point.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source	data source	Model	String, Model, View

type of data source.

Model/View/String	data source		

data source to create crosses for.

Model for crosses	model box		available models

model for the created crosses

Colour for crosses	colour box		available colours

colour for the crosses

Cross size (w)	input box		5

size of the cross in world units.

Run	button		

run the option

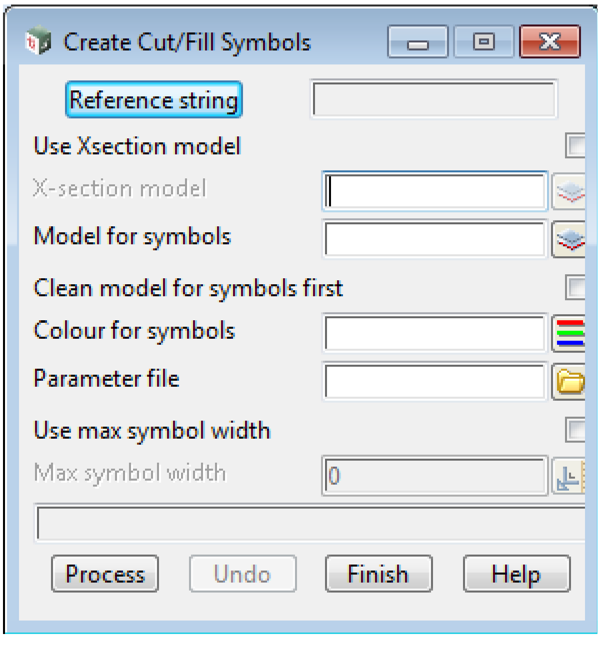
Undo	button		

undo the last set of crosses created whilst the panel has been up.

24.5 Create Cut/Fill Symbols

Position of option on menu: **Drafting =>Create cut/fill symbols**

This option is used to create cut and fill symbols (tadpoles) between strings or the names of the points across x-sections. The choice of symbols and the points they go between is controlled by a parameter file.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Reference string	string select		

string used to define chainage and perpendicular

Use X-section model	tick box	not ticked	

if ticked, the points on the cross-sections in the model are used as the names to create symbols between.

X-section model	model box		available models

model of cross sections used if "Use X-section model" is ticked.

Model for symbols	input		available models

model for the created cut-fill symbols

Clean model for symbols first	tick box	not ticked	

if ticked, the Model for symbols *will be cleaned before the new symbols are created and added.*

Colour for symbols	input		available colours

colour for the created cut-fill symbols

Parameter file	input		

file specifying what symbols are drawn between what strings (or points on x-sections).

Use max symbol width	tick box		

if tick, the symbols are only stretched to the maximum size given in the "Max symbol width" field.

Max symbol width	input		

maximum distance in world units to stretch the symbol.

Process button

Run the option.

Undo button

undo the last set of cut-fill symbols created by running the panel.The "Undo" function is lost once the option is finished.

Notes:

```
// Sample file for plotting symbols to denote cut/fill slopes
// All lines starting with // are comments. Blank lines are ignored
//
// The file layout is:

// ch_start ch_end ch_inc side str1   str2 symbol1 %1 symbol2   %2
//
// eg 110 150 10 L "trial1->c1" "trial->c2" tadpole 100 tadpole 50
//
// ch_start defines the start chainage
// ch_end defines the end chainage
// ch_inc defines the chainage increment
// side is one of L, R or LR (left, right, both)
// str1 is the name of the string (or point on x-section) to start tadpole
// str2 is the name of the string (or point on x-section) to end tadpole

// If strings are used, the string model name must be contained in the
// string definition i.e. in the format "model->string_name"
//
// The symbols drawn between the strings (or points) alternate between
// symbol1 and symbol2 and the symbols are drawn as the
// given percentages %1 and %2 respective of the distance
//  between the strings (points).

// The symbol can be one of "
// tadpole      - predefined tadpole shape
// line        - predefined batter tick
// "model=xxxxx" - where model "xxxxx" contains 3d strings
//             defining the symbol shape. This is as per
//             user-defined batter symbols in 4D.
//             NB. only 3d strings are supported in the macro

// Example

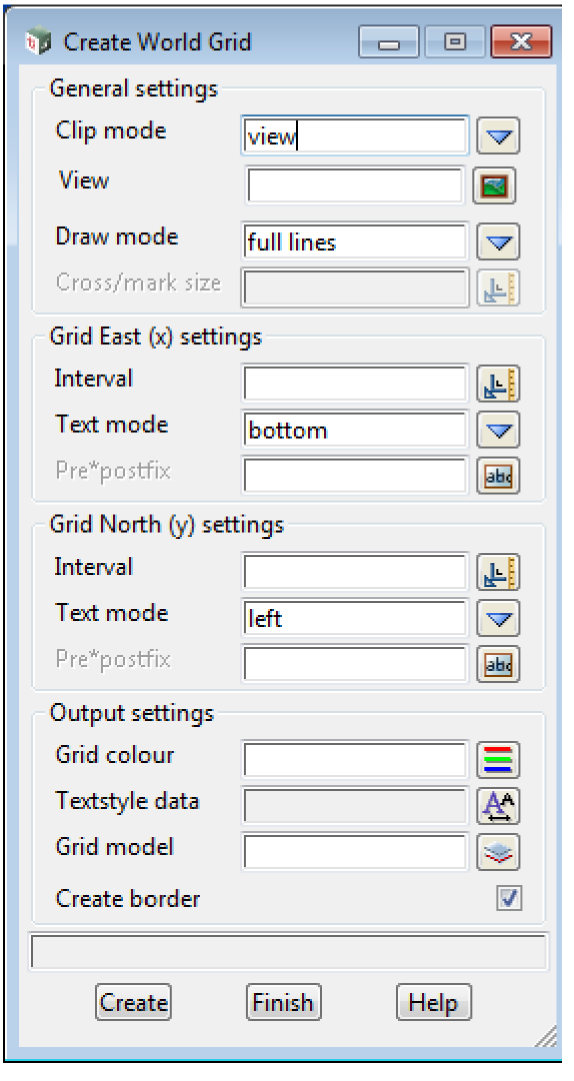
0 700 10 LR "road str->c2" "road str->c3" tadpole 100 tadpole 50
0 700 10 LR "road str->c4" "road str->c5" line 90 line 50
0 700 10 LR "road str->f2" "road str->f3" "model=symbol" 100 tadpole 50
0 700 10 LR "road str->f4" "road str->f5" line 90 line 50
```

24.6 Create World Grid

Position of option on menu: **Drafting =>Create world grid**

This option is used to create a grid, identical to the one drawn on a plan view, but in world units. This can then be output to CAD systems that do not allow grids to be easily created.

Selecting the **Create world grid** option, brings up the **Create World Grid** panel:



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Clip mode	choice box		rectangle, view

*if **rectangle**, icons appear for drawing a rectangle, a rotated rectangle or selecting a plot frame.*

*selecting the **rectangle** and **rotated rectangle** icons require the user to draw the rectangle to define the area to produce the grid for.*

*selecting the **plot frame** icon requires the user to select a plot frame and the view area from the plot frame defines the area to produce the grid for.*

*If **view**, a View Box appears and a view is selected to define the area to produce the grid for.*

Draw mode	choice box	full lines	full lines, crosses, marks

the type of the grid being drawn - full lines, crosses or marks.
*If **full lines**, then solid lines are drawn at the grid x and y spacing.*
*If **crosses**, then crosses of size **cross/mark size** are drawn at the intersection of the grid x and y spacing.*
*If **marks**, then solid lines size **cross/mark size** are drawn at the beginning/end of the grid at the x and y spacing.*

Cross/mark size	input

size in world units of the grid crosses/marks.

Grid East (x)

Interval	input

the distance between the East (x) grid lines. If this value is zero, the x grid lines will not be drawn.

Text mode	input	bottom	off, top, bottom, top and bottom

the x (East) grid lines can be labelled with their x value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the x-grid lines.

*if **off**, no text is created for the x-grid lines.*

*If **bottom**, text is created only at the bottom of the x-grid lines.*

*If **top**, text is created only at the top of the x-grid lines.*

*If **top & bottom**, text is created at the top and bottom of the x-grid lines.*

Pre*postfix	input

*if **non blank**, pre*post text to use for the labels on the x-grid lines.*
*prefix/postfix (pre*post) to be applied to the value of x (East). If pretext only, just give the text. If post text is required, precede it by a *. For example E*m will place E before the x value and m after the number.*

Grid North (y)

Interval	input

the distance between the North (y) grid lines. If this value is zero, the y grid lines will not be drawn.

Text mode	input	bottom	off, top, bottom, top and bottom

the y (North) grid lines can be labelled with their y value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the y-grid lines.

*if **off**, no text is created for the y-grid lines.*

*If **left**, text is created only at the left of the y-grid lines.*

*If **right**, text is created only at the right of the y-grid lines.*

*If **left & right**, text is created at the left and right of the y-grid lines.*

Pre*postfix	input

*if **non blank**, pre*post text to use for the labels on the y-grid lines.*
*prefix/postfix (pre*post) to be applied to the value of y (North). If pretext only, just give the text. If post text is required, precede it by a *.*

Output settings

Grid colour	colour box	available colours

colour for the grid lines.

Textstyle data	textstyle box	

textstyle data (height, angle etc) for the text for the grid labels.

Grid model	model box	available models

model for the grid lines and text.

Create border	tick box	tick

if tick, a rectangle around the area to create the grid for, is created.

Create	button	

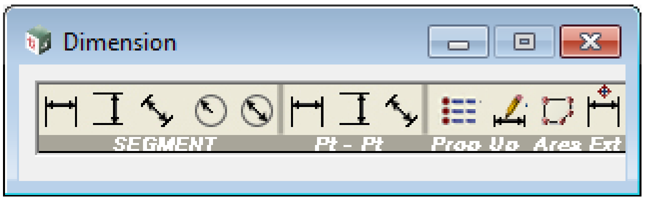
create the grid according to the values given in the panel.

24.7 Create/Edit Dimensions

Position of option on menu: **Drafting =>Create/edit dimensions**

This option is used to create and edit dimensions.

This option is currently under development.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

read in an existing range file.

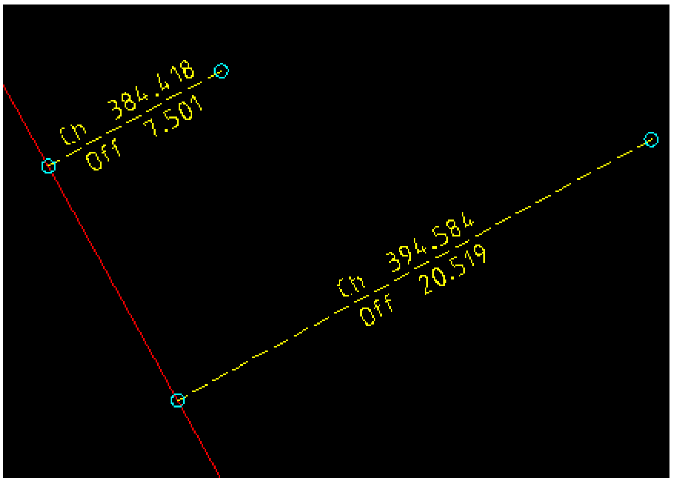
Write button

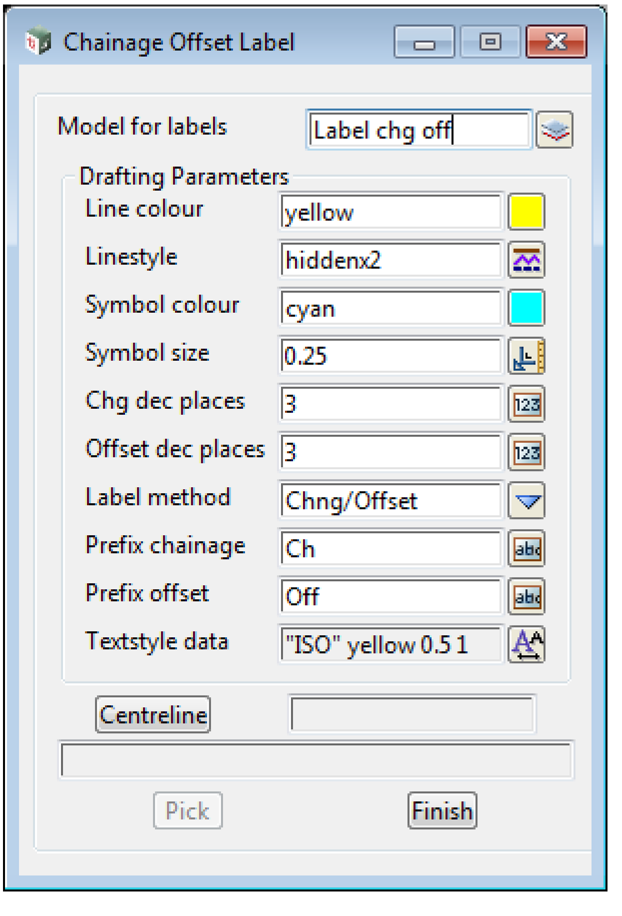
write out the data in the pages to the given range file.

24.8 Chainage/Offset Label Inquire

Position of option on menu: **Drafting =>Chainage/offset label inquire**

This option is used to calculate and label the perpendicular distance from a selected point to a selected centreline, and the chainage of the point dropped perpendicularly onto the centreline.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Model for labels model box Label chg off available models

if non-blank, create text for the calculated offset and chainage values and place it in this model.

Line colour yellow available colours

colour of the line drawn.

Linestyle linestyle box hidden2 available linestyles

text style for the text.

Symbol colour cyan available colours

colour of the symbol drawn at the point.

text style for the text.

Symbol size 0.5

size (in world units) of the symbol drawn at the point.

Label method choice box Chng/Offset Chng/Offset, Offset/Chng

method of labelling the line from a selected point to the dropped point.

Prefix chainage Ch

prefix for the chainage value.

Prefix offset Off

prefix for the offset value.

Textstyle data textstyle data box available text data

textstyle, size, colour etc. for the text.

Centreline string select

select the string to use for the calculation of chainage and offset.

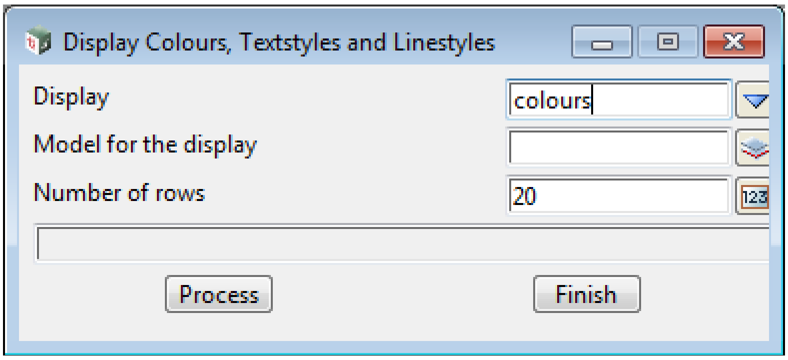
Pick button

pick a position and the offset from the position to the position dropped perpendicularly onto the selected Centreline *is calculated, plus the chainage on the Centreline of the dropped point. The values are reported in the panel's message area and if* Model for labels *is non-blank, text of the values is created and place in the model.*

24.9 Display Colours, Textstyles and Linestyles

Position of option on menu: **Drafting =>Display colours, text and line styles**

This option creates a model to display either all the colours, linestyles or textstyles defined for a project.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Display	choice	colours	colours, textstyles, linestyles

type of data to display.

Model for the display	model box		available modes

model to create the display in.

Number of rows	input	20	

the display is created by first doing a column of the given "Number of rows" and then moves on to another column until all the data is drawn.

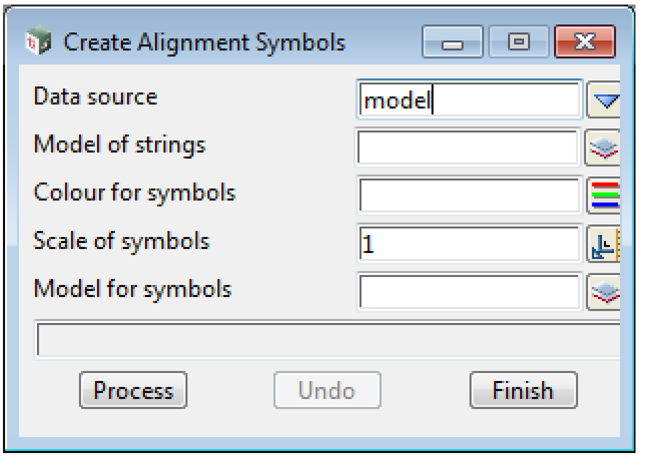
Process	button		

run the option.

24.10 Draw Symbols for Alignment String

Position of option on menu: **Drafting =>Draw symbols for alignment**

This panel is used to create symbols (butterflies and dumbbells) at the spiral-tangent, spiral-curve and curve tangent points.



The fields and buttons used in this panel have the following functions:

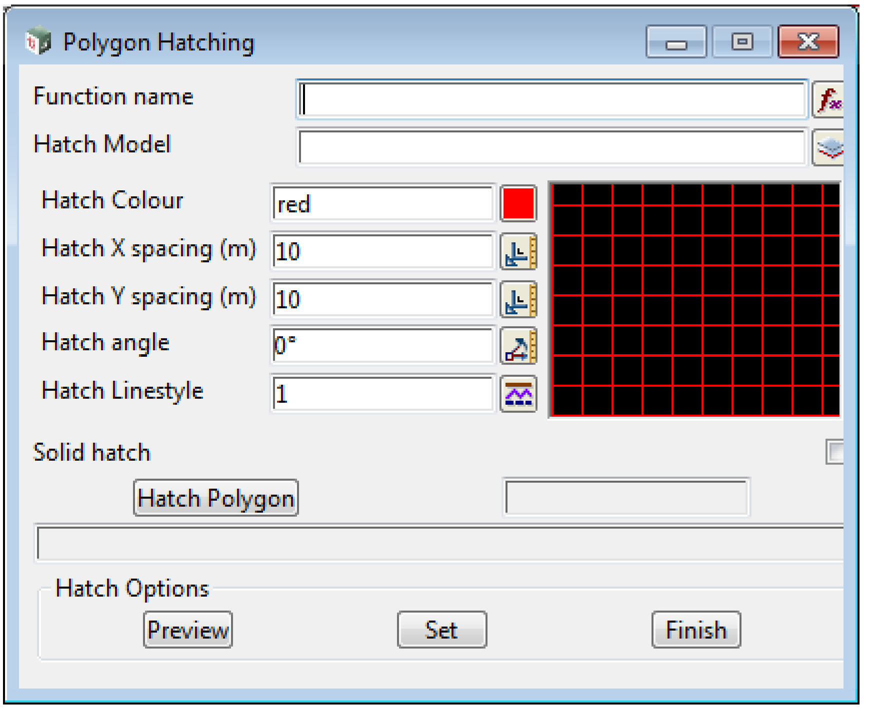
Field Description	Type	Defaults	Pop-Up
Data source	input box		
type of data to create symbols for.			
Model/View/String	input box		
data source to create symbols for.			
Colour of symbols	input box		
colour to use for the created symbols.			
Scale of symbols	input box	1	
scale of the created symbols.			
Model for symbols	input box		
model to put the created symbols into.			
Process	button		
run the option.			
Undo	button		
undo the last set of symbols created whilst the panel has been up.			

24.11 Polygon Hatching

Position of option on menu: **Drafting =>Hatch polygon**

This option is used to create hatching within a user selected string. A function is created so that the hatching can be recalced if the string is modified.

Selecting **Hatch polygon** brings up the Polygon Hatching panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input box		
name of the hatching function.model			
Hatch model	input box		
model to place the hatching in.			
Hatch colour	colour box	red	
colour for the hatch lines			
Hatch x/y spacing (m)	input box	10	
distance in world units between the x/y hatching lines.			
Hatch angle	input box	0	
angle of the hatch lines.			
Hatch linestyle	input box	1	
linestyle for the hatch lines.			
Solid hatch	tick box		
if ticked, a solid fill of the given hatch colour is used.			
Hatch polygon	string select		

select the string to hatch.

Preview button

draw the hatching to see if it is correct - the hatching function has not been defined.

Set button

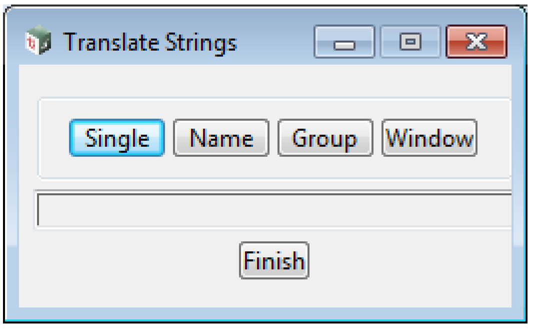
define the hatching function with the values given in the panel fields.

24.12 Translate Strings

Position of option on menu: **Drafting =>Multi string translate**

This panel is used to translate strings selected by name group of a window.

Selecting **Multi string translate** brings up the **Translate Strings** panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Single	button		

select a single string to translate.

Name	button		

select a string and all strings with the same name on the view will be translated.

Group	button		

select a string and all strings with the same group on the view will be translated.

Window	button		

click and release to define the first point of the window and then move the cursor and click and release to define the second point of the window. A position is then selected and as the cursor is moved, all strings in the view that are totally inside the window are translated and placed at the next selected position.

Undo	button		

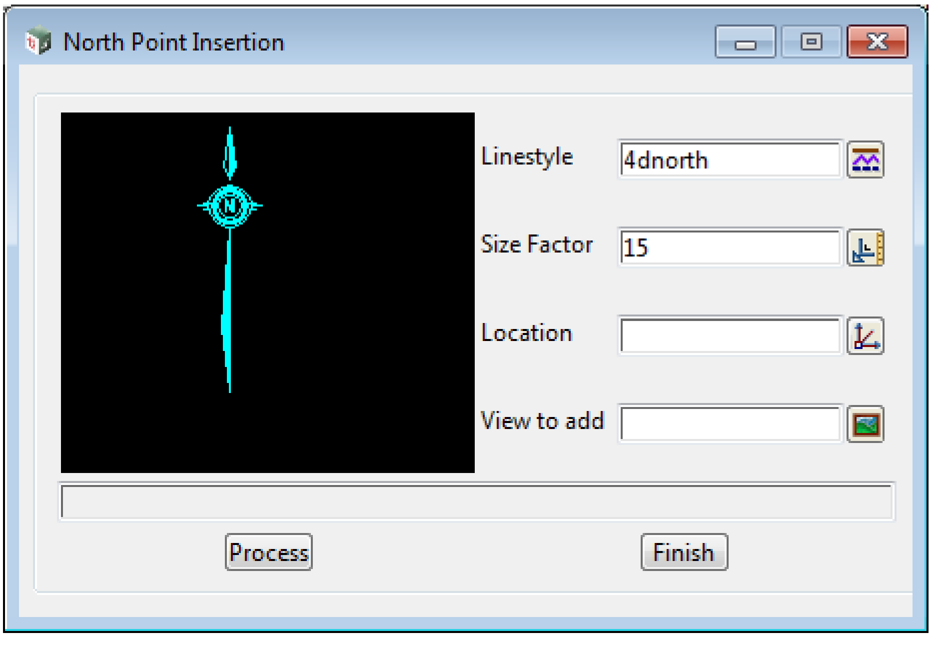
undo the last set of strings translated whilst the panel has been up.

24.13 North Point Insertion

Position of option on menu: **Drafting =>North arrow**

This option creates a point with a textstyle of the north point arrow.

Selecting **North arrow** brings up the North Point Insertion panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Linestyle	input box	4dnorth	

Linestyle for the north point arrow - leave as 4dnorth.

Size factor	input box	15	

factor the north arrow by this value.

Location	input box		

either type in an x y position or click on "+" and use Pick xyz to locate the north arrow.

View to add	input box		

view to add the arrow to.

Process	button		

*create the north point arrow in the model **North Point**.*

24.14 Quarter Points

Position of option on menu: **Drafting =>Quarter points bubbles and table**

This option is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

This option has already been documented as

Survey=>Setout=>Setout lip line

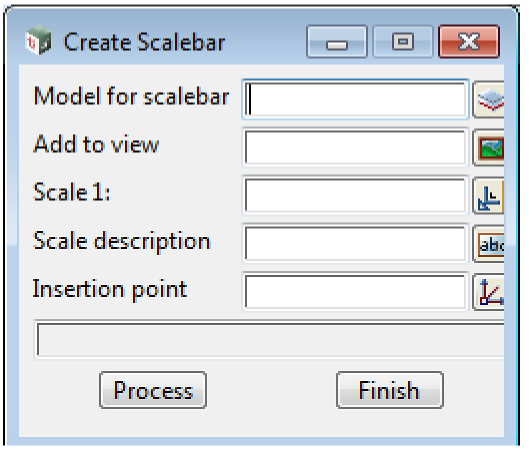
in the section 17.18.3 Setout Lip Line.

24.15 Scalebar

Position of option on menu: **Drafting =>Scale bar**

This option is used to create a scale bar.

Selecting **Scale bar** brings up the Create Scalebar panel.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model for scalebar	model box		available models

model to place the scalebar in.

Add to view	input box		available views

if non-blank, the model is added to this view.

Scale 1: input box

scale to create the scale bar at.

Scale description input box

description to write under the scale bar.

Insertion point	pick ops		pick ops

position to place the left hand bottom corner of the scale bar at.

Process button

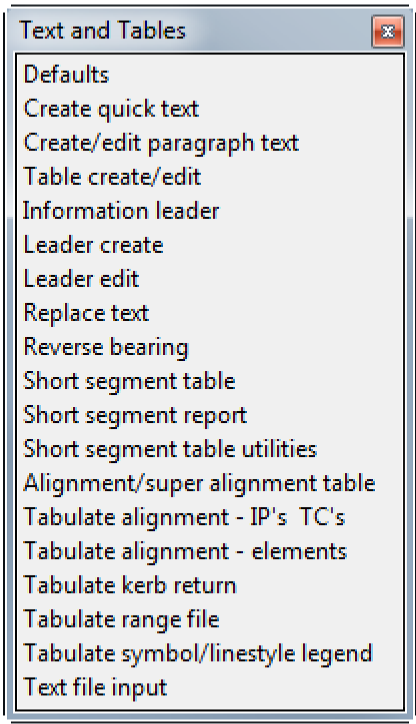
run the option.

24.16 Text and Tables

Position of menu: **Drafting =>Text and Tables**

The **Text and Tables** menu contains options to create text data and tables for plots.

The **Text and Tables** menu is

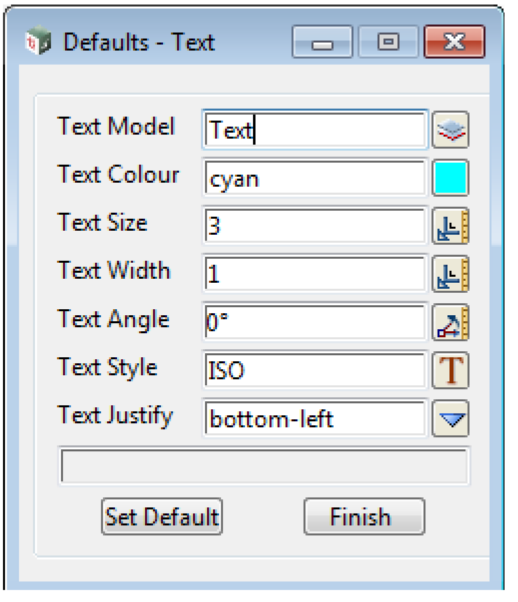


For the option *Defaults*, go to 24.16.1 Defaults - Text
Create quick text 24.16.2 Quick Text Input
Create/edit paragraph text 24.16.3 Text Creation/Edit
Table create/edit 24.16.4 Table Create/Edit
Information Leader 24.16.5 Leader Create (Information)
Leader create 24.16.6 Leader Text Creation
Leader edit 24.16.7 Leader Edit
Replace text 24.16.8 Replace Text
Reverse bearing 24.16.10 Reverse Bearing
Short segment table 24.16.11 Short Segments Table
Short segment report 24.16.12 Short Segment Report
Short segment table utilities 24.16.13 Short Segments Table Utilities
Alignment/super alignment table 24.16.14 Alignment & Super Alignment Table
Tabulate alignment - IP's, TC's 24.16.15 Tabulate Alignment - IP's and CT's
Tabulate alignment - elements 24.16.16 Tabulate Alignment - Elements
Tabulate kerb return 24.16.17 Tabulate Kerb Return
Tabulate range file 24.16.18 Tabulate Range File
Tabulate symbols/linestyle legend 24.16.19 Symbol / Linestyle Legend - Tabulation
Text file input same option as 24.16.3 Text Creation/Edit

24.16.1 Defaults - Text

Position of option on menu: **Drafting =>Text and Tables =>Defaults**

This option is used to project text defaults that are used with the "Fonts" button on many of the text options.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Text model	model box	Text	available models

default model to place the text in.

Text colour	colour box	cyan	available colours

default colour for text.

Text size	input box	3	

default size for text.

Text width	input box	1	

default x-factor text.

Text angle	input box	0	

default angle for text.

Text style	input box	iso	

default text style.

Text justify	input box	bottom-left	

default text justification.

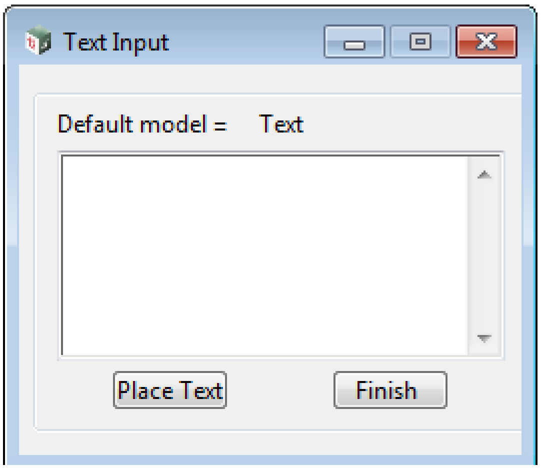
Set defaults	button		

set the project defaults.

24.16.2 Quick Text Input

Position of option on menu: **Drafting =>Text and Tables =>Create quick text**

The quick text option creates lines of text using the text defaults. The text can be edited and modified using the create/edit paragraph text.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Text box	button		

type the text to be created into the text box.

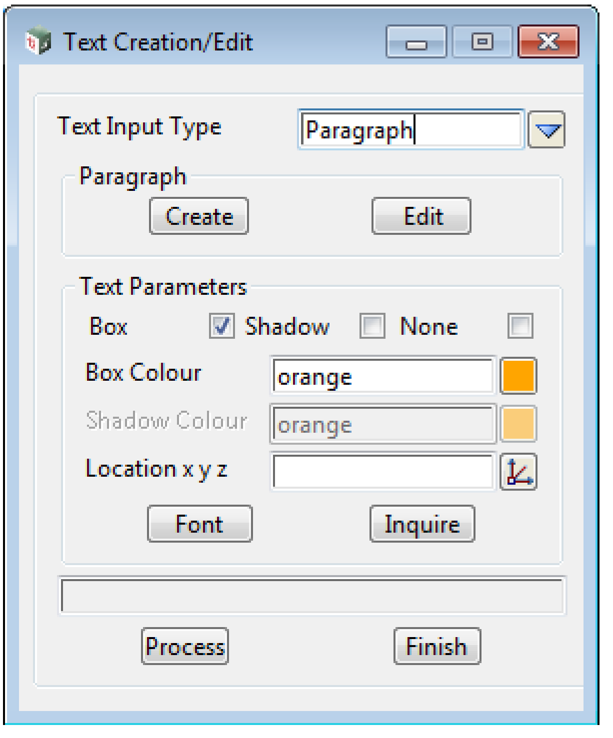
Place text	button		

pick a position to become the justification point for the first line of text.

24.16.3 Text Creation/Edit

Position of option on menu: **Drafting =>Text and Tables =>Create/edit paragraph text**

The option creates and edits a paragraph of text created with this option or the quick text option.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Text input type	choice box	paragraph	paragraph, file

method of creating text - type in a paragraph or read from a file

if *Paragraph* selected

Create	button		

select create to bring up the text box to type text into.

Edit	button		

select edit to pick and edit existing text.

if *File* selected

Text file	file box		

name of the file to read in.

Text parameters

Box/Shadow/None	radio button	box	

if box is ticked, draw a box around the text.

if shadow is ticked, draw shadowed box around the text.

if none is ticked, don't draw a box around the text.

Box colour	colour box	orange	

Colour of the box around the text

Shadow colour colour box orange

Colour of the shadow around the box around the text

Location x y z x,y,z box pick ops menu

pick the position for the text.

Font button

bring up the values for the text - e.g. model, colour, size etc.

Inquire button

Process button

create the text and place it at the given location.

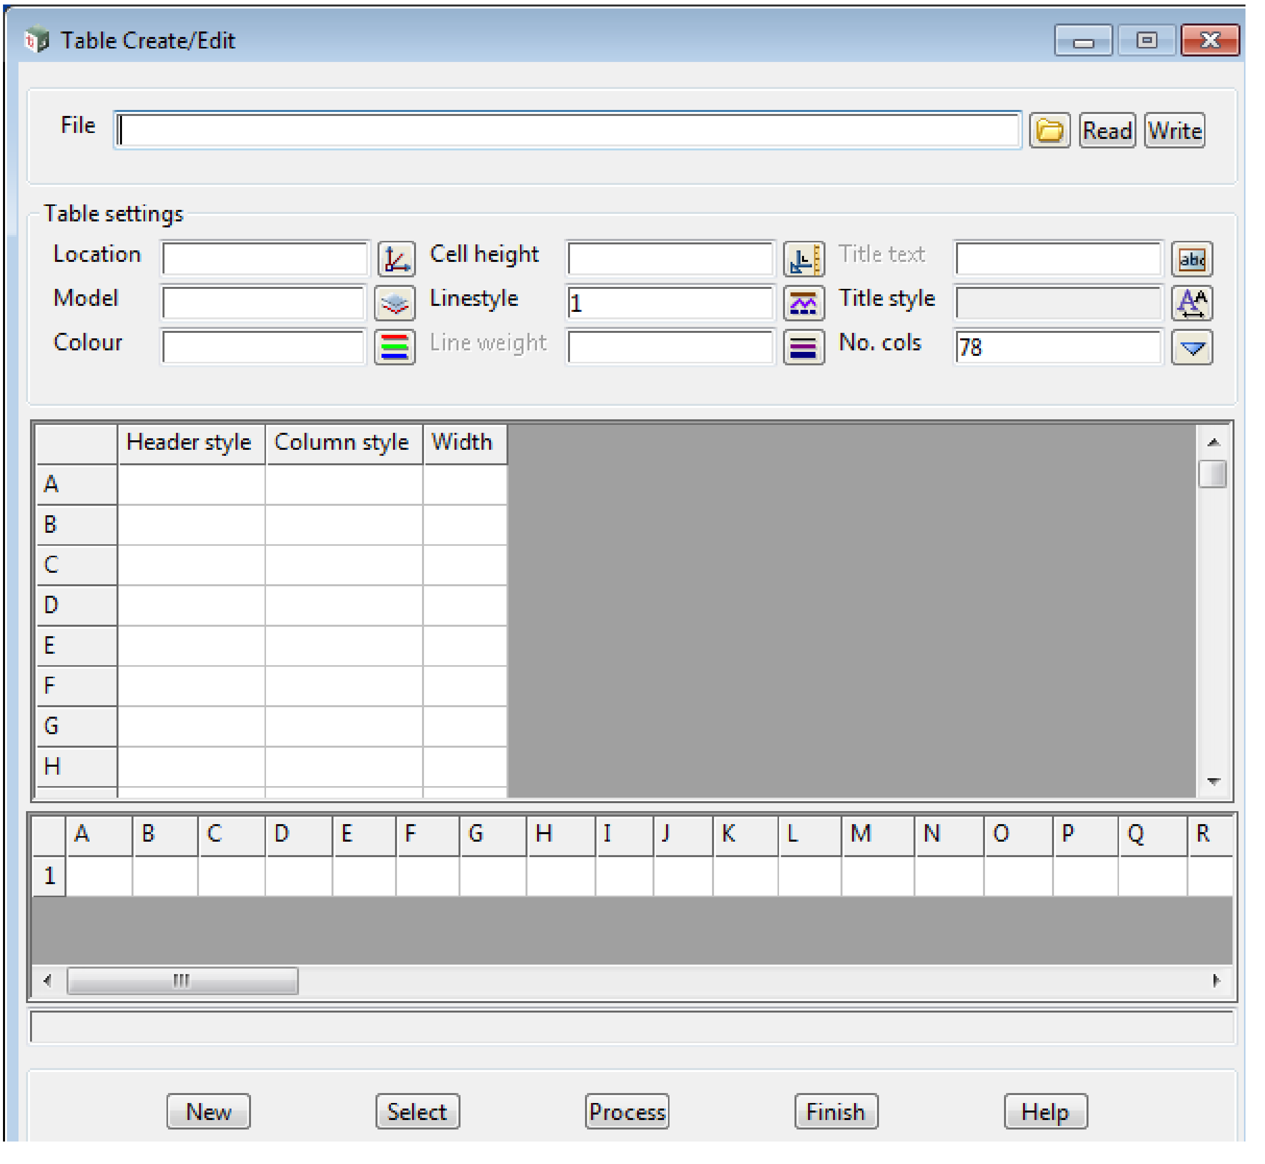
24.16.4 Table Create/Edit

Position of option on menu: **Drafting =>Text and Tables =>Table Create/edit**

This option is currently under development

This option reads in a csv file and loads the data into a grid on the panel. The data can be edited in the grid and then a table produced in a model.

An existing table in a model can also be selected and the data read into the grid on the panel. The data can then be edited and the table updated.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

File file

file to read in and display in the grid on the panel.

Read button

read the specified file in and display it in the grid on the panel.

Write button

write the data in the grid on the panel to the specified file.

Table settings

create the text and place it at the given location.

24.16.5 Leader Create (Information)

Position of option on menu: **Drafting =>Text and Tables =>Information leader**

This option creates a leader that can extract and list certain information about the string selected.

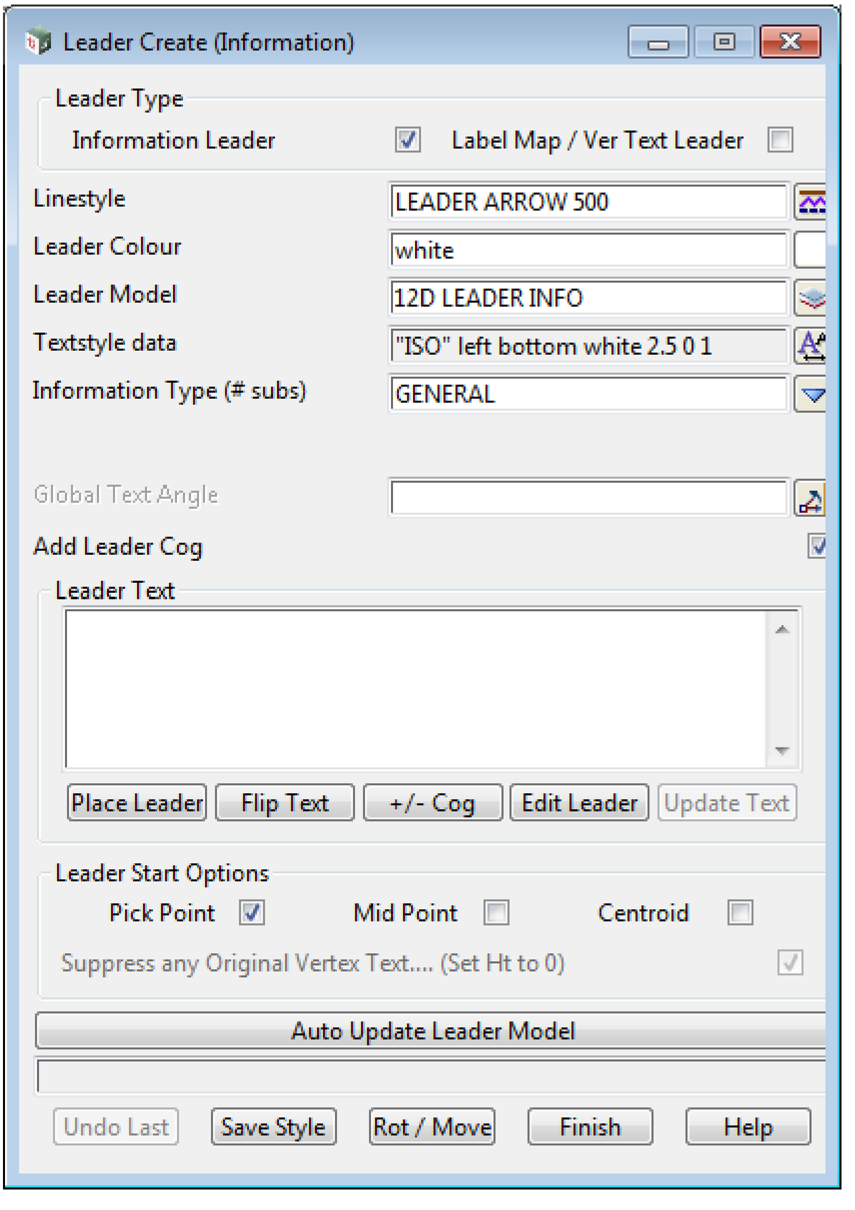
Information such as AREA, STRING LENGTH, SEGMENT LENGTH and GRADE can be displayed.

A choice list is available and can be partially user defined.

General notes can also be placed that do not extract information from any string selected.

Leaders can be moved along the string they relate to, and subsequent information values updated.

Selecting the **Information leader** option brings up the Leader Create (Information) panel:



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

Leader Type

Information Leader tick box ticked

If ticked, information or general notes can be created.

Label Map / Ver Text Leader tick box not ticked

If ticked, any vertex text or text created via the Label Map File can be converted into a leader, allowing the text to be moved but still have the leader at the original location.

Linestyle linestyle box LEADER ARROW 500 available linestyles

If non-blank, entry used as leader arrow scale.

Leader Colour colour box white available colours

If non-blank, entry used as leader colour.

Leader Model model box 12D LEADER INFO available models

If non-blank, entry used as leader model.

Textstyle data input "ISO" white 2.5 available Textdata

If non-blank, entry used as text properties.

Information Type (# subs) choice box GENERAL available choices

If non-blank, entry used as type of information leader. The list is generated from a defaults file in the library.

Global Text Angle real GENERAL

If non-blank, entry used as angle for text during placement of leader.

Add Leader Cog tick box ticked

If ticked, leader cog will be added.

Leader Text

From the choice above, default text is placed in the Leader Text box on the panel.

Any calculated information value, such as AREA, LENGTH will be substituted for the # that may appear in the Leader Text.

Place Leader button

Select a position along a string that suits the type of information selected from the choice box (segment for SEGMENT LENGTH, a vertex for XYZ COORDS, etc.).

General notes (i.e. notes without the # in the Leader Text) may be placed using the cursor position as well.

Placement of the leader is controlled by the ***Leader Start Options****.*

Flip Text button

Select an information leader already placed. Upon accepting the string, the text will be flipped to the opposite side of the leader.

+/- Cog button

Select an information leader already placed. Upon accepting the string, the cog will be added or removed.

Edit Leader button

Select an information leader already placed to edit the text. The text will be displayed in the edit box.

Update Text button

If selected, the text will be updated on the selected leader.

Leader Start Options

Pick Point tick box

If ticked, the start of the leader will be at the selection point.

Mid Point tick box

If ticked, the start of the leader will be at the mid point of the string selected or segment selected, depending on the Information Type.

Centroid tick box

If ticked, the start of the leader will be at the centroid of the string selected.

Suppress any Original Vertex Text (Set Ht to 0) tick box

*Available only for the leader option **Label Map / Ver Text Leader**, where the vertex text on the original string selected can be invisible by setting its height to zero.*

Auto Update Leader Model button

If selected and the string the leader is linked to has changed, and/or the leader is moved to another position on the string, information in the leader relating to the string will be updated.

Undo Last button

If selected, will undo the last leader placed.

Save Style button

Writes out a default file to the .project folder using the current Information type displayed (e.g. STRING_LENGTH) as part of the file name.

STRING_LENGTH_LEADER_TEXTSTYLE.def

Example data written to file:

Text_Style "ISO"

Text_Colour 7

Text_Whiteout_Colour 0

Text_Border_Colour 0

Text_Size 2.500

Text_Units paper

Text_Angle 0.0000

This file can be copied to a user_lib area for use in other projects.

Rot / Move button

This option is two-fold depending on where you select the leader.

If the leader is selected at the arrow or first vertex, then the Move command is activated.

*If moving the leader from, say, one radius segment to another radius segment, then the leader only needs to be placed close to the segment, as the **Auto Update Leader Model** will lock it onto the segment and in this case update the radius value.*

If the leader is selected anywhere else, then the Rotate command is activated.

The leader rotates about the arrow insertion point.

Example of Library Defaults file:

Info_Leader_Create_Panel.def

```
Leader_Style              "LEADER ARROW 500"
Leader_Colour              7
Leader_Model              "12D LEADER INFO"
Text_Style                ISO
Text_Colour               7
Text_Whiteout_Colour      -1
Text_Border_Colour        -1
Text_Units                "Paper"

Seg_Att_1  <example only>

Area syntax special:

AREA             "Area #"                             "2"

Drop down       Display Text which can be set as "Area *ha" to define
hectares        Decimal places

TIN_DEPTH             "Depth #"                       "2"

Drop down        Display Text which can be set as "Depth *mm" to
define millimetres    Decimal places

Attributes syntax special:

USER_STRING_ATTRIBUTE       "#"
USER_VERTEX_ATTRIBUTE   "#"
USER_SEGMENT_ATTRIBUTE  "#"

Drop down        Display Text of "#" that will be substituted with
attr value

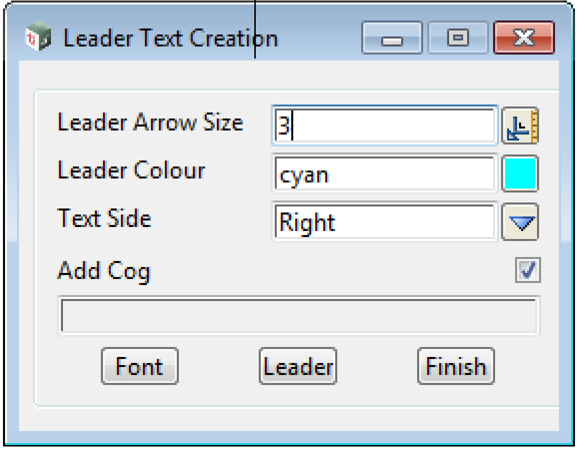
Note: An attribute with the name "Leader" can be set on any string,
for any of the above attributes.

It will appear automatically in the choice box along with any others
set here
```

24.16.6 Leader Text Creation

Position of option on menu: **Drafting =>Text and Tables =>Leader create**

This option is used to create leader lines and text.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Leader arrow size	input box	3	

length (in world units) of the head of the arrow of the leader line.

Leader colour	colour box	cyan	

colour of the leader line or arrow

Text side	choice box	Right	Right, Left

side of the leader line to create the text.

Add cog	tick box	tick	

if tick, add a cog to the leader line.

Font	button		

brings up panel for defining information about the text (size, model colour etc.).

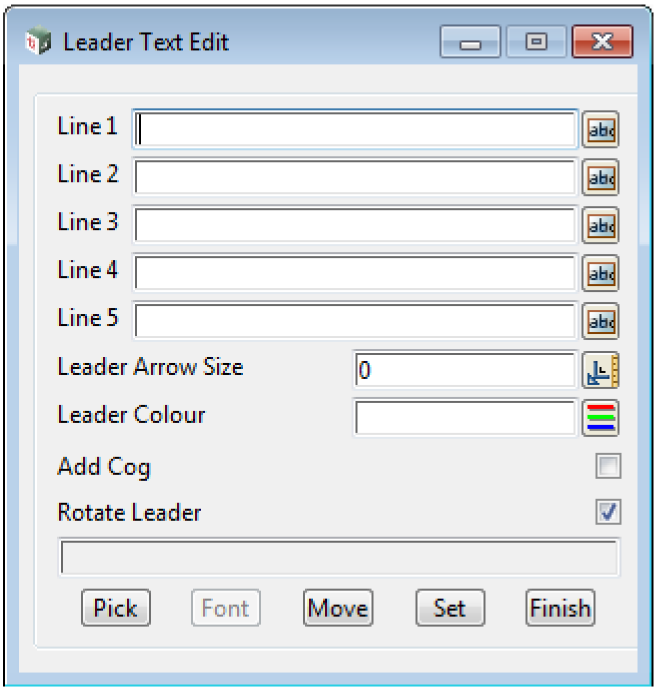
Leader	button		

create the leader by firs picking the point for the arrow end and then the point for the opposite end.where the text goes. Once the second point is place, the "Leader Text Input" panel is displayed for entering five lines of text.

24.16.7 Leader Edit

Position of option on menu: **Drafting =>Text and Tables =>Leader edit**

This option is used to edit leader lines and text.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Line 1-5 input box

lines of text from the selected leader.

Leader arrow size input/output box

length (in world units) of the head of the arrow of the leader line.

Leader colour colour box cyan

colour of the leader line or arrow

Text side choice box Right Right, Left

side of the leader line to create the text.

Add cog tick box tick

if tick, add a cog to the leader line.

Rotate leader tick box tick

if tick, the leader arrow remains fixed when the leader is moved.

If not tick, the whole leader line and text is moved.

Pick button

select the leader to be modified.

Font button

brings up panel for defining information about the text (size, model colour etc.).

Move button

move the select leader and its associated text. If "rotate leader" is ticked, then the leader arrow head is left fixed.

Set button

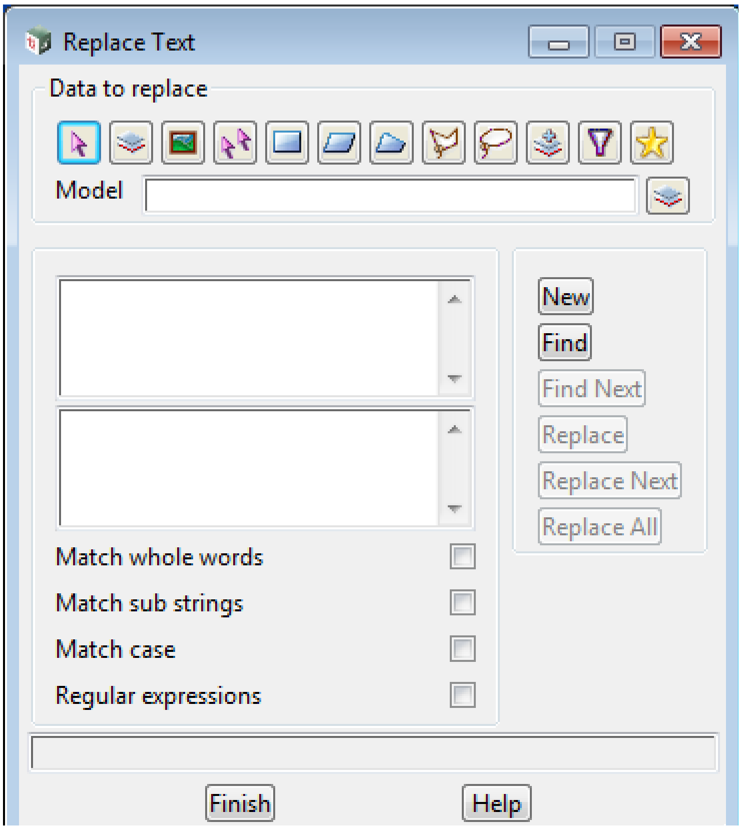
redefine the leader line and text with the current values in the panel fields.

24.16.8 Replace Text

Position of option on menu: **Drafting =>Text and Tables =>Replace text**

Position of option on menu: **Utilities =>H-Z =>Find/replace text**

This option is used to find and replace text in text strings, 4d string, super strings for vertex and segment text.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Data source type Model

source of data to be processed - for a full description go to 4.19.3 Data Source.

Data source

data source for text to search and change.

Find what input box

text to search for.

Replace with input box

text to replace the searched text with

Match whole words tick box

if not tick, text is selected if the "find text" is only part of the text.

If tick, only find the text when the text is exactly the same as the "find text", not just a part of the text.

Match case tick box

if not tick, case is ignored when trying to find a match.

If tick then case is not ignored when trying to find a match.

Regular expressions tick box

if tick then the Find what *text can contain regular expressions.*

If not tick, the Find what *text is not considered to contain regular expressions.*

New button

after selecting new the parameters for the find and replace can be changed.

Find button

find the search text. The text is highlighted and centred in the view.

Find Next button

find the next occurrence of the search text.

Replace button

replace the text.

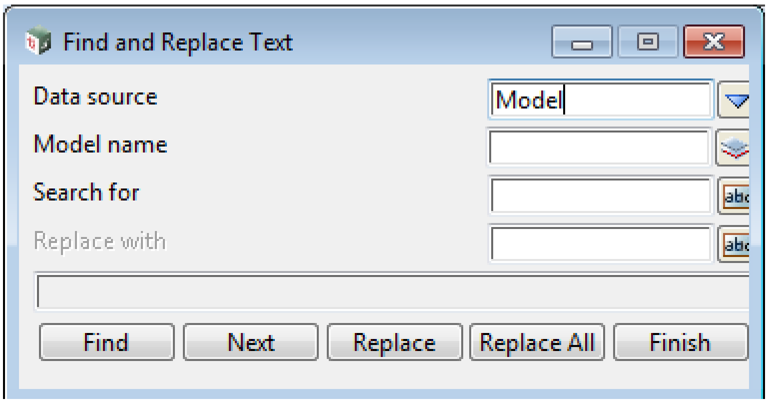
Replace all button

replace all occurrences of the text.

24.16.9 Find and Replace Text

Position of option on menu: **Drafting =>Text and Tables =>Replace text**

This option is used to find and replace text.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type	input box		string, model, view

data source type.

Data source — input box

source of data to change text.

Search for — input box

text to search for.

Replace with — input box

if non-blank, text to replace the searched text with

Find — button

find the search text

Next — button

find the next occurrence of the search text.

Replace — button

replace the text.

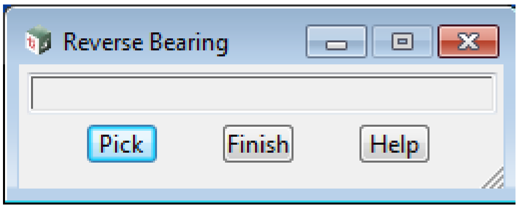
Replace all — button

replace all occurrences of the text.

24.16.10 Reverse Bearing

Position of option on menu: **Drafting =>Text and Tables =>Reverse bearing**

This section of documentation is a work in progress and will be updated in subsequent releases.

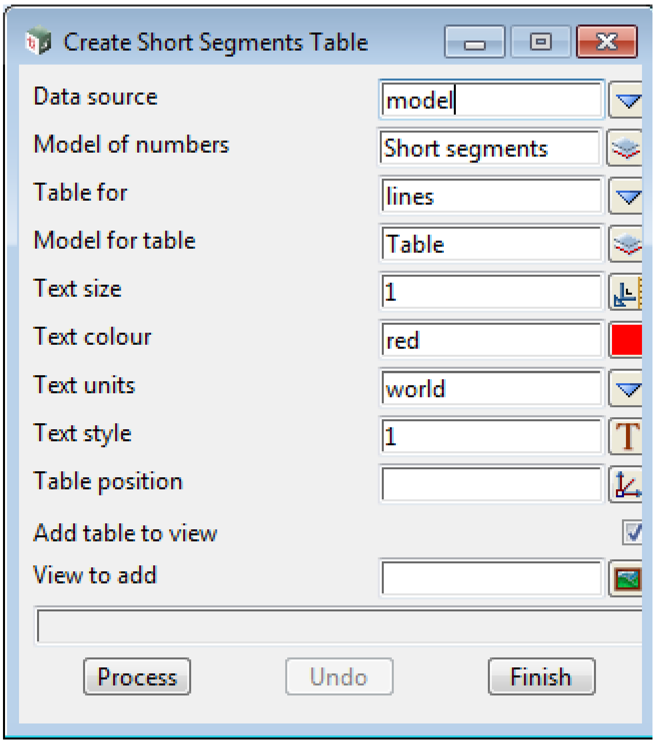


24.16.11 Short Segments Table

Position of option on menu: **Drafting =>Text and Tables =>Short segment table**

This panel is used to create a short segment table.

This option is still under development.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source	input box	model	model, string, view

type of data to process

Model/string/View of numbers

data to process and build a short segment table for.

Table for	choice box	lines	lines, arcs, lines and arcs

type of short elements to tabulate.

Model for table	model box	Table	

model to place the short segment table in.

Text size	input box	1	

text size.

Text colour	colour box	red	

text colour

Text units	choice box	world	world, pixels

units for the text size - default is world units.

Text style	input box	1	

textstyle for the created text.

Table position input box

location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.

Add table to view tick box tick

if tick, add the model containing the table to the view.

View to add input box

view to add the table to.

Process button

create and place the short segment table

Undo button

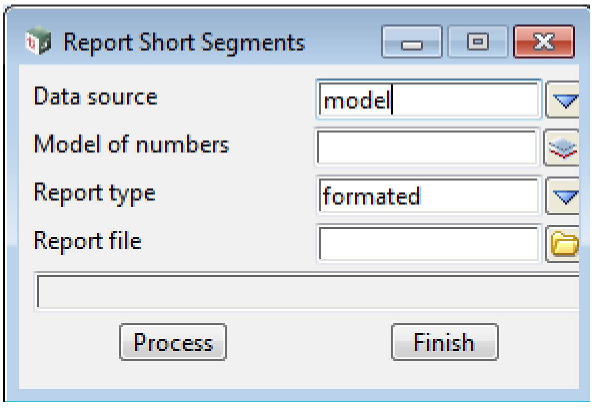
undo the last short segment table created whilst the panel has been up.

24.16.12 Short Segment Report

Position of option on menu: **Drafting =>Text and Tables =>Short segment report**

This panel is used create a report on the short segments.

This option is still under development



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source	input box	model	model, string, view

type of data to process

Model/string/View of numbers

data to process and report on the short segments.

Report file report box

name of the report file.

Process button

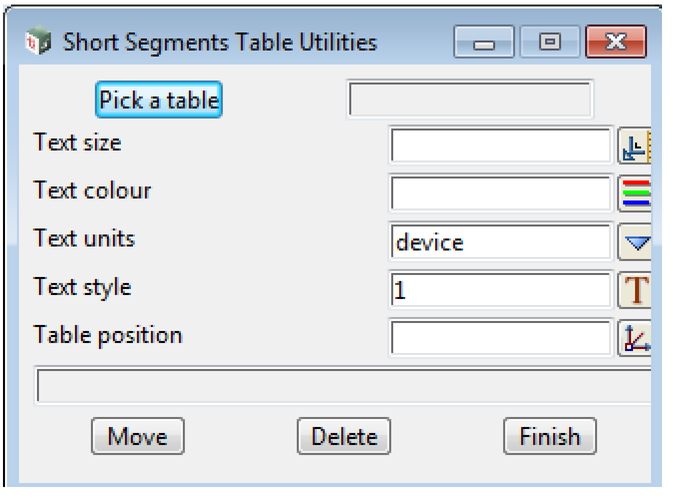
create the short segment report

24.16.13 Short Segments Table Utilities

Position of option on menu: **Drafting =>Text and Tables =>Short segment table utilities**

This panel is used modify an existing short segments table.

This option is still under development.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Pick a table	string select		

select the short segments table to modify.

Text size	input box	1	

text size.

Text colour	colour box	red	

text colour

Text units	choice box	world	world, pixels

units for the text size - default is world units.

Text style	input box	1	

textstyle for the created text.

Table position	input box		

location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.

Move	button		

move the selected table to the new location.

Delete	button		

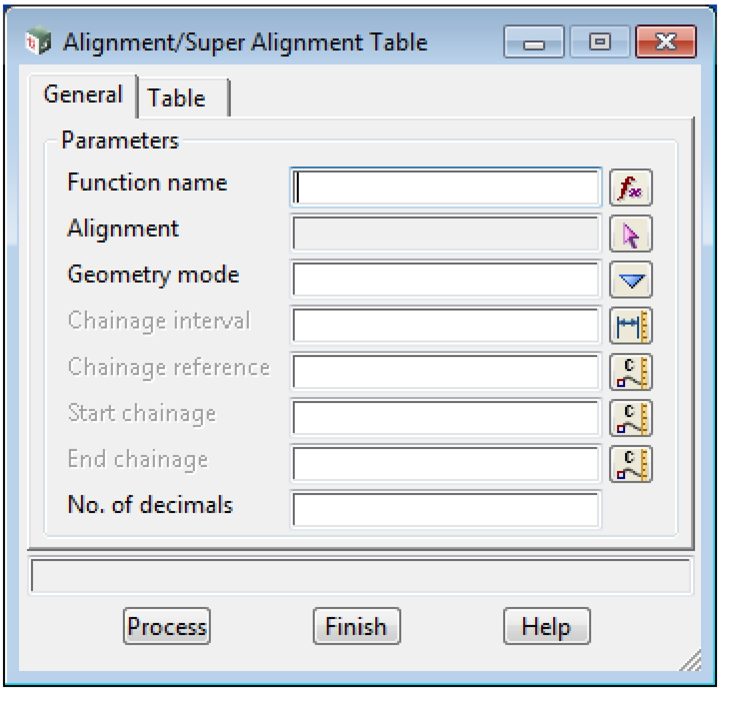
delete the selected table.

24.16.14 Alignment & Super Alignment Table

Position of option on menu: **Drafting =>Text and Tables =>Alignment/Super alignment table**

This option is used to create a report and/or a table in a model for an alignment and super alignment string in an IP or element format.

This option is under development.

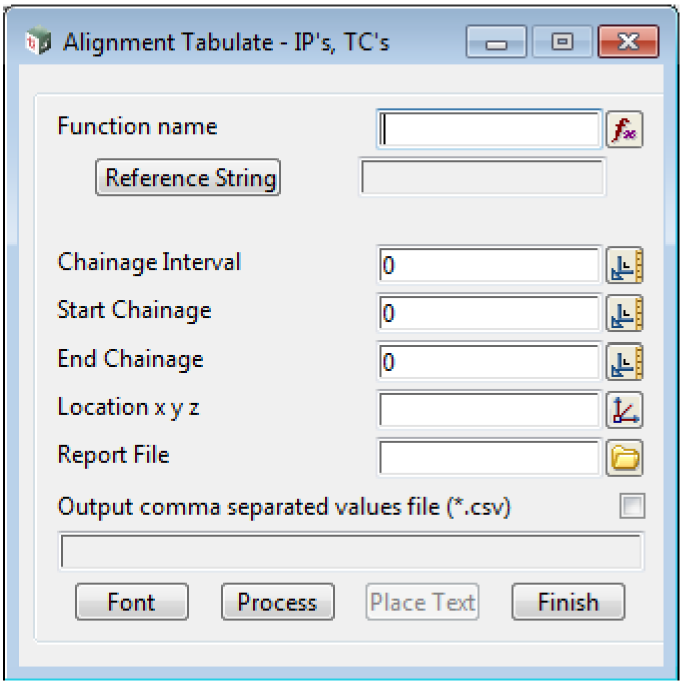


24.16.15 Tabulate Alignment - IP's and CT's

Position of option on menu: **Drafting =>Text and Tables =>Tabulate alignment - IP's TC's**

This option is used to create a report and/or a table in a model of an alignment string in an IP and tangent point format.

The table is created by a function so that if the alignment string changes, the table can be easily recalced.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Function name input box

name of the function

Reference string string select

select the string to create the table and/or report for.

Chainage interval input box 0

if zero, only information on the tangent and intersection points is given.

If non-zero, the chainage interval to use to report the information about the reference string. The horizontal tangent and intersection points are included.

Start/End chainage input box 0

start/end chainage to use. If 0, the start/end chainage is used.

Location x y z input box

location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.

Report file file box

if non blank, name of the report file.

If blank, don't create the report.

Font button

brings up panel for defining information about the text (size, model colour etc.).

Process button

process the reference string and create the report. The table is not yet created.

Place text button

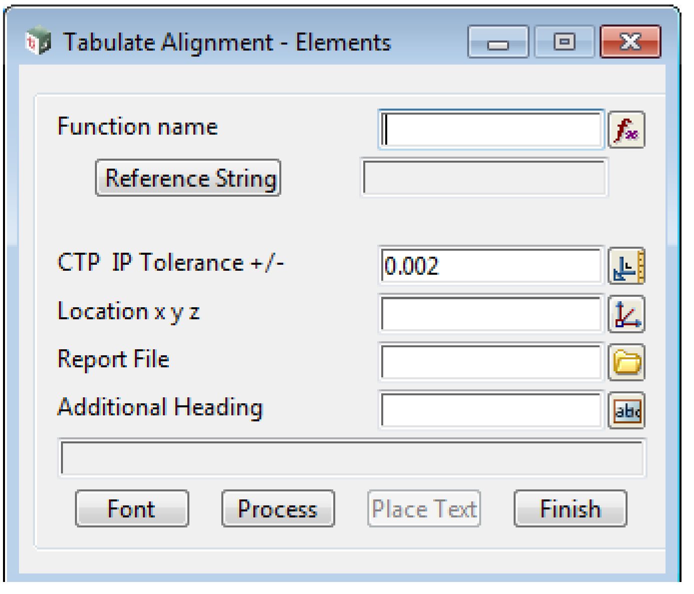
create the table and place it at the given location.

24.16.16 Tabulate Alignment - Elements

Position of option on menu: **Drafting =>Text and Tables =>Tabulate alignment - elements**

This option is used to create a report and/or a table in a model of an alignment string in an horizontal element format.

The table is created by a function so that if the alignment string changes, the table can be easily recalced.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input box		

name of the function

Reference string	string select		

select the string to create the table and/or report for.

CTP IP tolerance +/-	input box	0.002	

xxxx.

Location x y z	input box		

location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.

Report file	file box		

if non blank, name of the report file.

If blank, don't create the report.

Additional heading	input box		

additional information for the heading above the table.

Font	button		

brings up panel for defining information about the text (size, model colour etc.).

Process	button		

process the reference string and create the report. The table is not yet created.

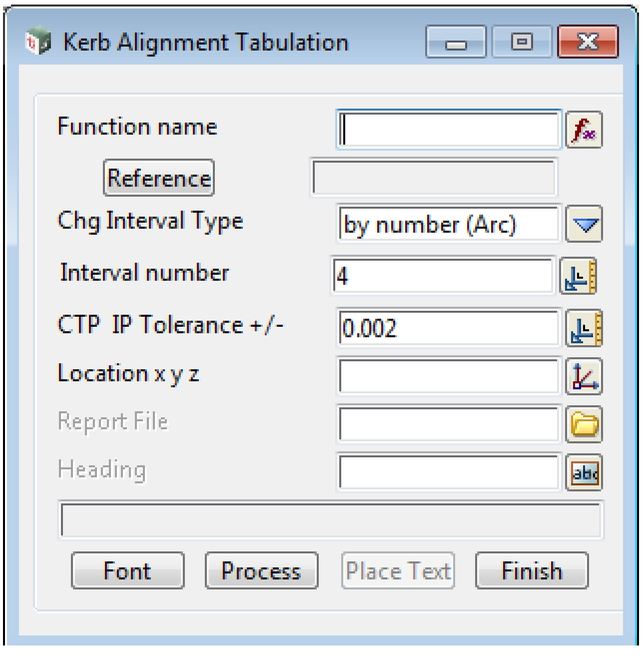
Place text button

create the table and place it at the given location.

24.16.17 Tabulate Kerb Return

Position of option on menu: **Drafting =>Text and Tables =>Tabulate kerb return**

This option creates a table for a kerb return.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input box		
name of the function			
Reference	string select		
select the string to create the kerb return table and/or report for.			
Chg interval type	choice box	by number (Arc)	by number (Arc) by distance (Arc) by special chg file by number (Chord)
Interval number	input box	4	
number of points to divide the alignment into.			
CTP IP tolerance +/-	input box	0.002	
xxxx.			
Interval number	input box	4	
xxxx.			
Location x y z	input box		
location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.			
Report file	file box		
if non blank, name of the report file. *If blank, don't create the report.*			
Heading	input box		

heading above the table.

Font button

brings up panel for defining information about the text (size, model colour etc.).

Process button

process the reference string and create the report. The table is not yet created.

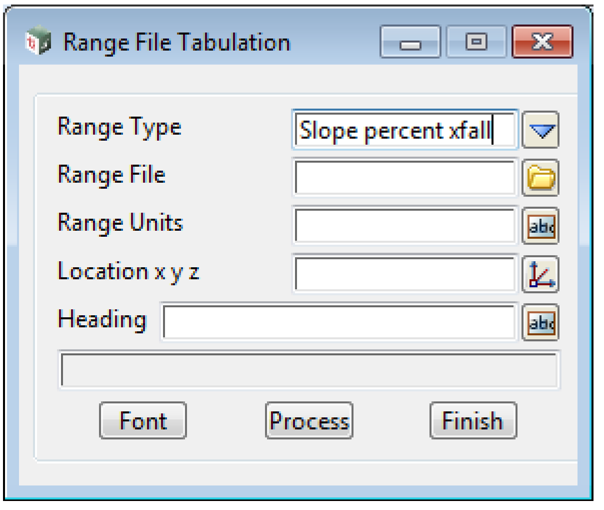
Place text button

create the table and place it at the given location.

24.16.18 Tabulate Range File

Position of option on menu: **Drafting =>Text and Tables =>Tabulate range file**

This option creates a table for a range file.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Range type	choice box	slope percent xfall	slope percent xfall slope 1 v in, slope degrees depth, aspect, height

type of range file to be created.

Range file file box

name of the range file.

Range units input box

text to place beside each line of upper and lower values.

Heading input box

heading to place at the top of the table.

Location x y z input box

location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.

Font button

brings up panel for defining information about the text (size, model colour etc.).

Process button

create and place the range table.

24.16.19 Symbol / Linestyle Legend - Tabulation

Position of option on menu: **Drafting =>Text and Tables =>Tabulate symbol/linestyle legend**

This option can create a legend showing features and their associated linestyle, colour, symbol *etc.*

There are 3 distinct parts to the macro. Once a data selection is chosen, the data can be analysed by either using a map file or the data features themselves.

Map File Extraction:

If specified, the 12d Map File is read and data sorted by string name (*Name* column).

If the **Extract Data** button is clicked, the **Map File Extraction** grid is populated.

The *Description* column is used in the legend and is controlled by the *Mode* selected, either *Model Name* or *Comment.*

Data only Extraction:

If no map file is specified, then the data is sorted in relation to *Name*, *Linestyle, Colour* and *Weight*.

If the **Extract Data** button is clicked, the **Data Only Extraction** grid is populated.

The *Description* column is used in the legend and is controlled by the *Mode* selected: *Model Name, String Name, Linestyle, Symbol, Ver attr + Name, Name +Ver Attr.*

Once a mode is selected, clicking the Update button will update the *Description* field.

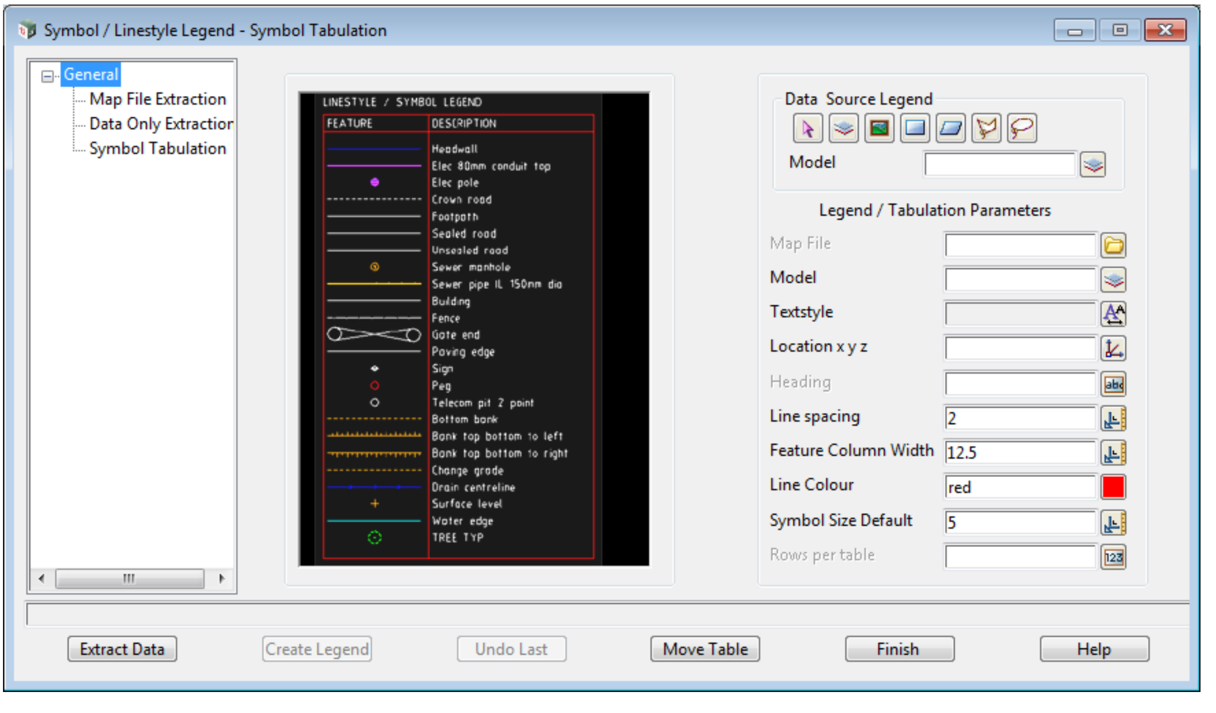
Symbol Tabulation:

This tabulation is for symbols, *e.g.* survey station points.

The table is in the format of Name, Easting, Northing & Level.

The title of the Name column can be changed.

The data to be tabulated is given by the Tabulation by choice box. It can be either tabulating the *Point ID* or the *Vertex Text.*



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Legend / Tabulation Parameters			
Data Source Legend	selection		model, view, string
selection data to extract legend information			
Map File	input		
if non-blank, then the map file is used with the data selection to sort and populate the < Map File Extraction > grid			
Model	input		
model name for legend tabulation			
Textstyle	input		
text parameters for all text			
Location x y z	xyz box		
insertion point for top left corner of legend			
Heading	input		
if non-blank, heading placed at top of legend			
Line spacing	real	2	
spacing for adjustment of lines of text			
Feature Column Width	real	12.5	
width for display of sample line and symbol in legend			
Line Colour	input	red	available colours
the colour of separation lines in the tabulation			
Symbol Size Default	real	5	
default size for symbols in table			
Rows per table	integer		
if blank, the legend table will be created vertically *if non-blank, more than one legend may be created, arrayed in either horizontal or vertical* *the format is: +ve number for Horizontal array -ve number for Vertical array*			
Extract Data	button		
Sorts the source data and populates either the Map File Extraction grid or Data only Extraction grid			
Create Legend	button		
Creates the tabulation using all parameters set in the general tab			
Undo Last	button		T
his undo is only available while the panel is still open and only works on the last table created. *Once the panel is finished all tables can be accessed via the normal 12d undo.*			
Move Table	button		
Any Legend Tabulation can be moved for clarity (Esc or rmb to cancel)			
Symbol Tabulation			
Data Source Tabulation	selection		

selection data to extract tabulation information

Model model box

model name for symbol tabulation

Textstyle textstyle box

text parameters for all text

Location x y z XYZ box

insertion point for top left corner of tabulation

Heading input

if non-blank, heading placed at top of tabulation

Line colour colour box red available colours

the colour of separation lines in the tabulation

Line spacing real 2

spacing for adjustment of lines and text

Station name input STN

maximum 8 characters

Tabulation by choice box Point ID Point ID / Vertex Text

value used to define symbol e.g. Survey Station may use point ID < 901 >

Process button

processes the data

Create Tab button

creates the symbol tabulation using the above parameters.

24.16.20 Text File Input

Position of option on menu: **Drafting =>Text and Tables =>Text file input**

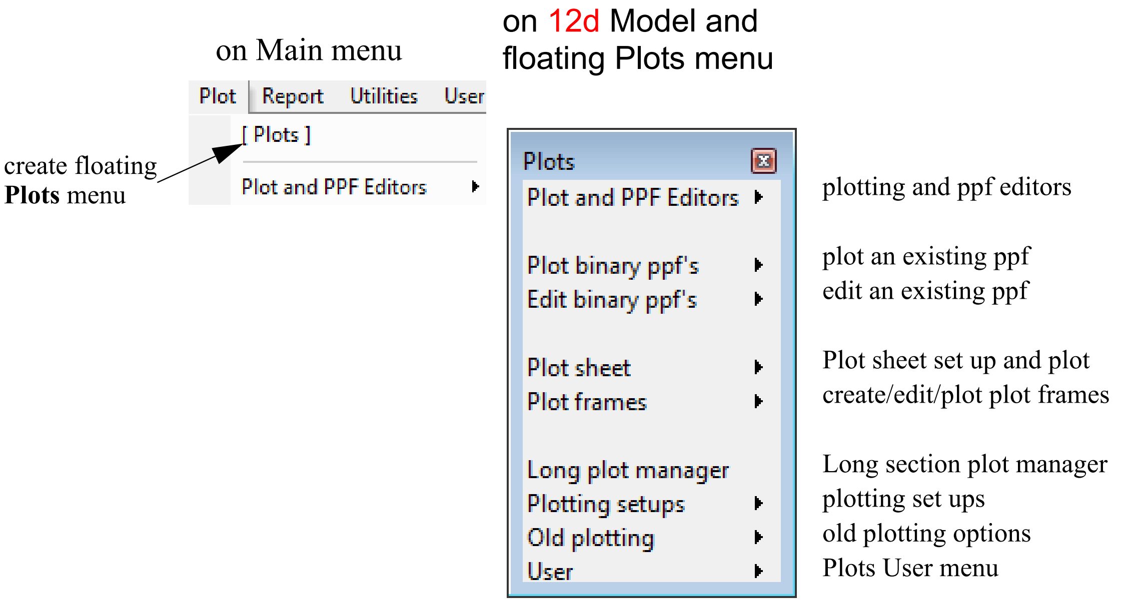
This option has already been documented as 24.16.3 Text Creation/Edit

Drafting =>Text and Tables =>Create/edit paragraph text

25 Plots

Position of menu: **It is on the main menu as Plot**

The **Plots** walk-right menu is



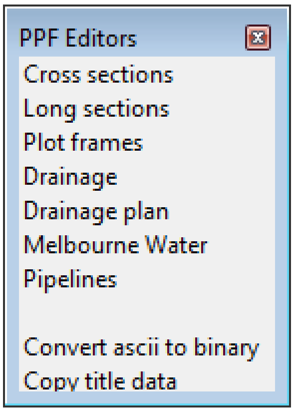
The options 25.2 Plot Binary PPFs and 25.3 Edit Binary PPFs are both walk-right menus which list all the binary PPFs in the project and the when the PPF is double-clicked, it is Plotted/Edited.

For the options see:

25.1 Plot and PPF Editors

Position of menu: **Plot =>Plot and PPF editors**

The **Plot and PPF editors** walk-right menu is



cross section PPF editor
long section PPF editor
creating/editing plot frames
drainage long section PPF editor
drainage plan plot PPF editor
Melbourne Water sewer long section PPF editor
pipeline long section PPF editor

convert old PPF files to new PPF files
copy title data

For the options see:

26.3 Section X Plot PPF Editor
26.4 Long Plot PPF Editor
26.9 Plot Frame and PPF Editor
26.5 Drainage Long Plot PPF Editor
26.8 Drainage Plan Plot PPF Editor
26.6 Melbourne Water Plot PPF Editor
26.7 Pipeline Plot PPF Editor
26.10 Convert Ascii PPF to Binary
26.11 Copy Title Data

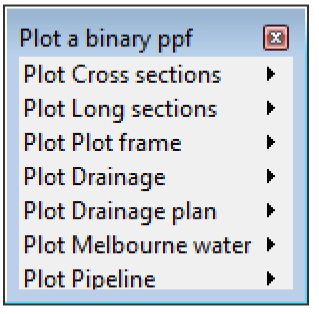
25.2 Plot Binary PPFs

The binary PPFs can have enough information in them to totally generate the plot from the ppf.

The options in this section will run the selected (binary) ppfs and generate the plot as defined by all the plot parameters in the ppf file.

The plot the ppf, just walk right on the appropriate plot type and a walk-right menu will appear with the existing binary ppfs included in the project, and a **[Lib]** and **[User Lib]** to display the ppfs in these two library areas.

When a file is selected from the list, it is then used to generate a plot.



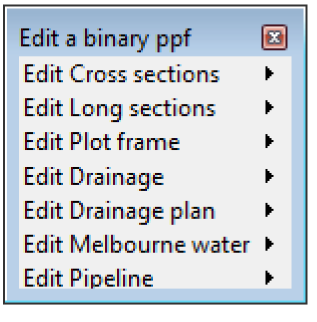
Go to the next section 25.3 Edit Binary PPFs or return to 25 Plots.

25.3 Edit Binary PPFs

The options in this section will bring up the selected (binary) ppfs into the appropriate PPF Editor.

The edit the ppf, just walk right on the appropriate plot type and a walk-right menu will appear with the existing binary ppfs included in the project, and a **[Lib]** and **[User Lib]** to display the ppfs in these two library areas.

When a file is selected from the list, it is then opened in the appropriate PPF Editor.



Go to the next section 25.4 Plot Sheet or return to 25 Plots.

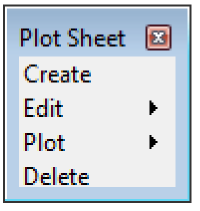
25.4 Plot Sheet

Position of menu: **Plot =>Plot sheet**

The ***Plot sheet*** option is for defining the layout of plotting areas on a sheet of paper and to produce a pdf file of what is on the sheet of paper.

That is ***Plot Sheet*** is for setting up plot compositions. For V11 it is only for setting up areas from plan views.

The **Plot Sheet** menu is:



See

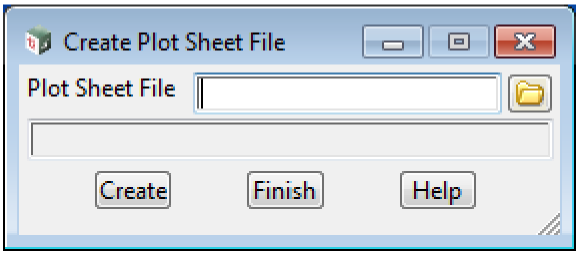
25.4.1 Plot Sheet Create
25.4.2 Plot Sheet Edit
25.4.3 Plot Sheet Plot
25.4.4 Plot Sheet Delete

25.4.1 Plot Sheet Create

Position on menu: **Plot =>Plot sheet =>Create**

Plot sheet create is for creating a new plot sheet file.

Selecting **Create** brings up the **Create Plot Sheet File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot sheet file	file box		*.12dpsf files

name for the file to create.
This file name must not already exist in the working folder.

Create	button		

when pressed, a new plot sheet file is created with the name given in the **Plot sheet file** *field and then the* **Plot Sheet Create/Editor** *panel is started with that file as the Plot Sheet File being edited. See* 25.4.2.1 Plot Sheet Create/Edit.

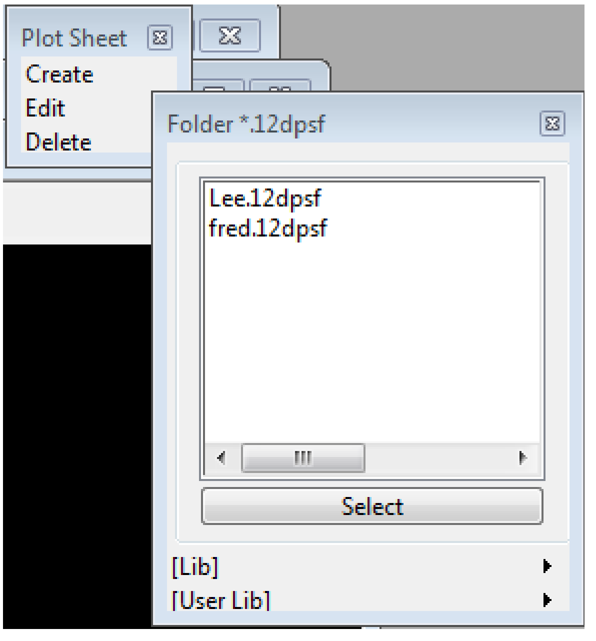
Go to the next section 25.4.2 Plot Sheet Edit or return to 25.4 Plot Sheet.

25.4.2 Plot Sheet Edit

Position on menu: **Plot =>Plot sheet =>Edit**

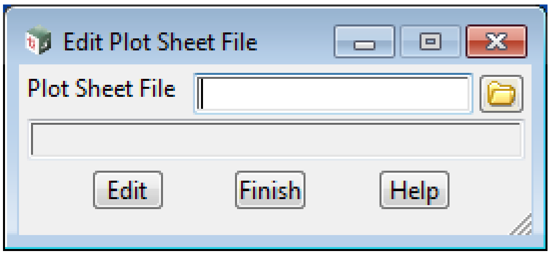
The **Edit** option works in two ways - you can click on **Edit** itself or walk right on **Edit** and see a list of all the plot sheet files in the working folder.

The **Edit** walk right lists all the plot sheet files is the working folder.



Selecting a plot sheet file from the list, or from another area, brings up the **Plot Sheet Create/ Editor** panel already loaded with the selected plot sheet file. *See* 25.4.2.1 Plot Sheet Create/ Edit.

By clicking on **Edit** itself, the **Edit Plot Sheet File** panel is brought up.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot sheet file	file box		*.12dpsf files

name for the plot sheet file to edit.
This file name must exist in the working folder.

Edit	button		

when pressed, the existing plot sheet file with the name given in the **Plot sheet file** *field is edited and the* **Plot Sheet Create/Editor** *panel is started with that file as the Plot Sheet File being edited. See* 25.4.2.1 Plot Sheet Create/Edit.

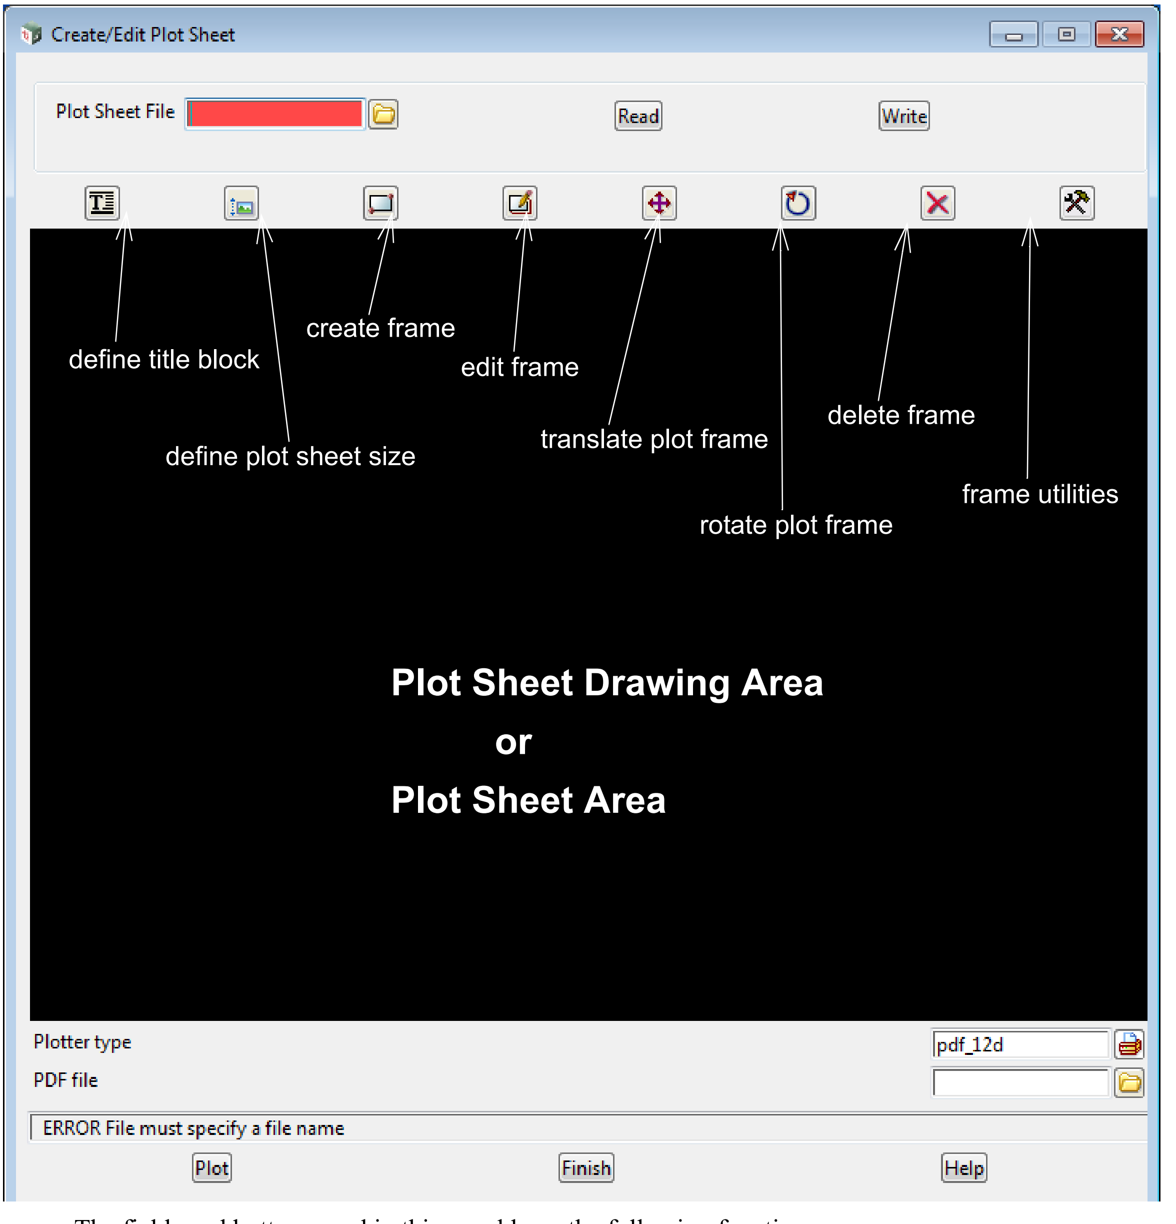
Go to the next section 25.4.2.1 Plot Sheet Create/Edit or return to 25.4 Plot Sheet.

25.4.2.1 Plot Sheet Create/Edit

The **Plot Sheet Create/Edit** panel is for creating/editing the layout of plotting areas on a sheet of paper, and then to produce a pdf file of what is on the sheet of paper.

If the **Plot Sheet Create** option was used, then the **Plot Sheet Edit** panel is brought up with the new file loaded but there is nothing defined for the Plot Sheet.

If the **Plot Sheet Edit** option was used, then the **Plot Sheet Edit** panel is brought up with the existing file loaded so there will already be some information defined on the Plot Sheet.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot sheet file	file box		*.12dpsf files

name for the file to save/read in the information for a plot sheet layout.

Read button

read in the plot sheet file given in the **Plot sheet file** *field and load the information into the panel. For any Frames in the file, a Plot Frame is created, and a model and the Plot Frame added to the* *model. If a view has been recorded for that model when the plot sheet file was written, and that view currently exists, then the model is added to that view.*

Write button

write out the current information defined in the panel to a plot sheet file with the name given in the **Plot sheet file** *field.*

Plot Sheet Area

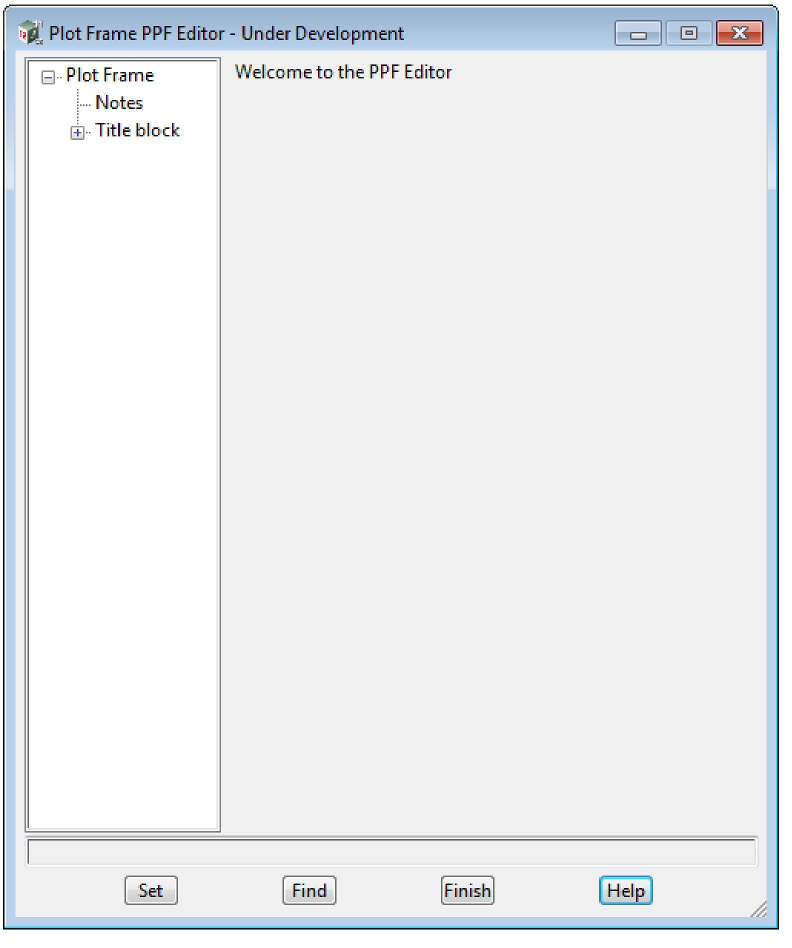
*the black area represents the sheet of paper being plotted (the **Plot Sheet**) with (0,0) in the bottom left hand corner of the plot sheet.*

*The areas where plotting will occur on the Plot Sheet are defined by **Frames** and each created Frame is displayed in the black area. A Frame contains all the information for producing the plot inside the area of the Frame.*

*For example, a Frame may be a **Plan Frame** and defines an area of a Plan View to plot. The Frame then needs has a Scale to give the Frame a world size, a rotation and a World Coordinate to fully define a region to plot. Using these values, a Plot Frame is then created and linked to the Frame. The Plot Frame is added to a Plan View to define which data is to be plotted inside the Frame.*

Title block button

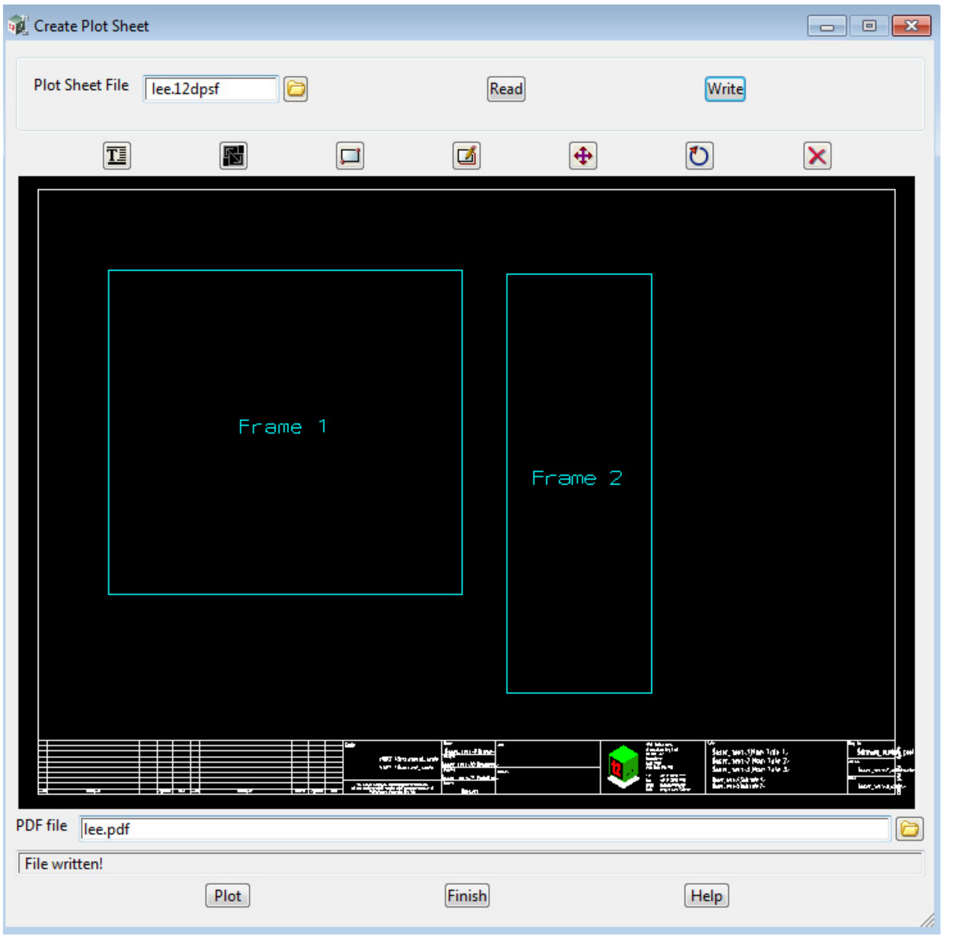
brings up the Title Block section of a Plot Frame.



After the title block information has been filled in, the **Set** *button must be pressed and then* **Finish** *to remove the panel.*

If the title block file (tbf file) includes the Sheet size, then that size is automatically used to set the sheet size for the **Sheet Size** *button.*

If a user title block has been selected, the text and line work in the title block will be drawn in the Plot Sheet Area so that you see where to add Frames to the Plot Sheet without overwriting the title block. No *substitution is made for the $ text variables in the title block file.*



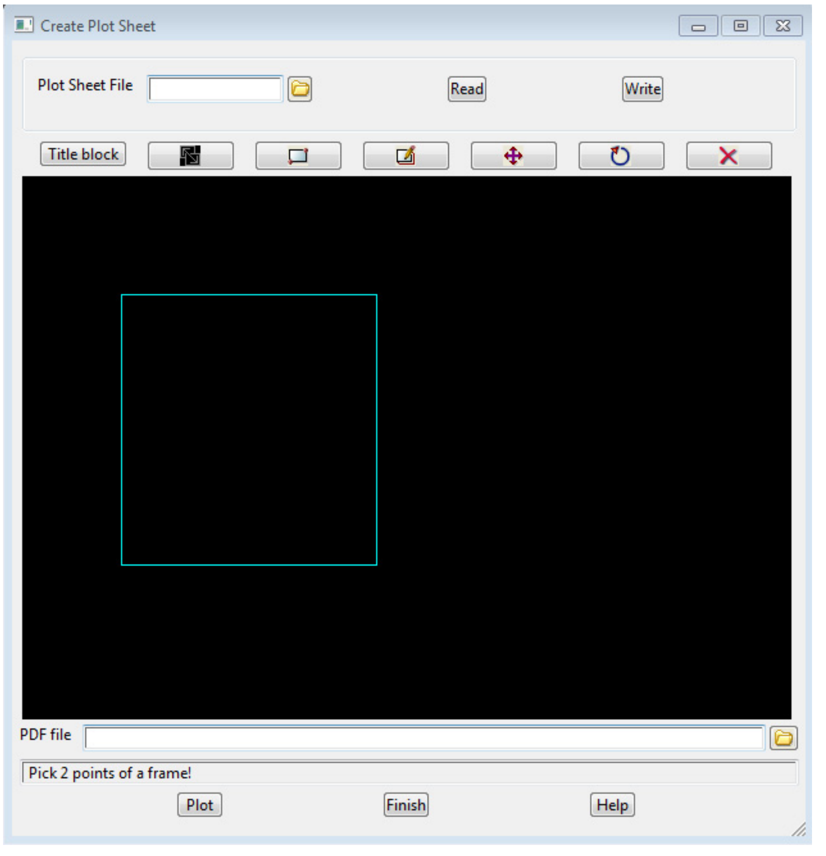
Sheet size button

brings up a **Sheet size** *box for entering the size of the size of the Plot Sheet.*
Once a size has been typed in, or selected from the pop up, the Plot Sheet Area is drawn with an aspect ratio to match the selected paper size.

If there is a Sheet size in the selected user title block file, the Sheet size is automatically set to that size and the **Sheet Size** *button does not need to be used.*

Create frame button

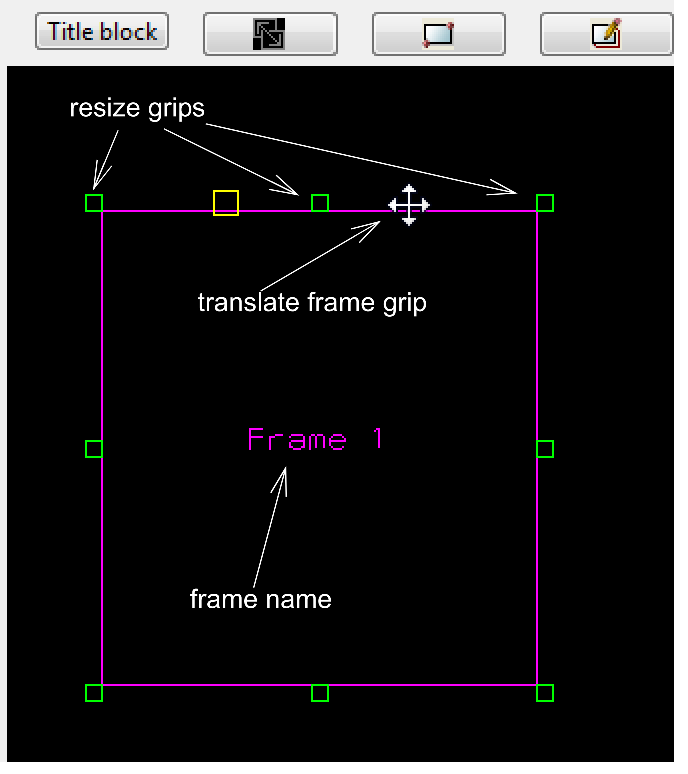
this button is used to define a Frame in the plot sheet area.
After clicking the button, two points are selected in the plot sheet area to define the area on the plot sheet that the Frame will plot to.



Currently all created Frames are Plan Frames so after the Frame is created, the **Create Frame for Plan Plot** *panel is displayed. See* 25.4.2.1.1 Create Frame for Plan Plot.

Edit frame button

this button is used to edit an existing Frame in the plot sheet area.
After clicking the button, a Frame is selected by clicking LB ***anywhere inside*** *the Frame in the Plot Sheet Area.*
When the Frame has been tentatively picked with the LB but ***not*** *yet* ***accepted***, ***Resize*** *grips are displayed on the four corners and on the four sides of the Frame. These grips are used to resize the Frame, and hence the associated plotting area.*
Plus when the cursor is over the edge of a Frame, a ***Translate*** *grip is displayed. The* ***Translate*** *grip is used to move the Frame around in the Plot Sheet Area.*



*How the **Resize** grips extend the plotting area depends on* **Make centre of frame the origin**.

> *If* **Make centre of frame the origin** *is **ticked** then no matter which resize grip is used, the resulting plotting area is still **centred** on the* **World Coordinate**.
>
> *If* **Make centre of frame the origin** *is **not ticked** then the plotting area is extended in the direction indicated by the Resize grip and the* **World Coordinate** *may be changed.*

If you haven't accepted the Frame after the Resizing and Translating, then you can pick another Frame to resize or translate by simply clicking LB inside the new Frame.

When a Frame is accepted after a tentatively pick, then the **Create Frame for Plan Plot** *panel is displayed so that the Frame properties can be modified. See* 25.4.2.1.1 Create Frame for Plan Plot.

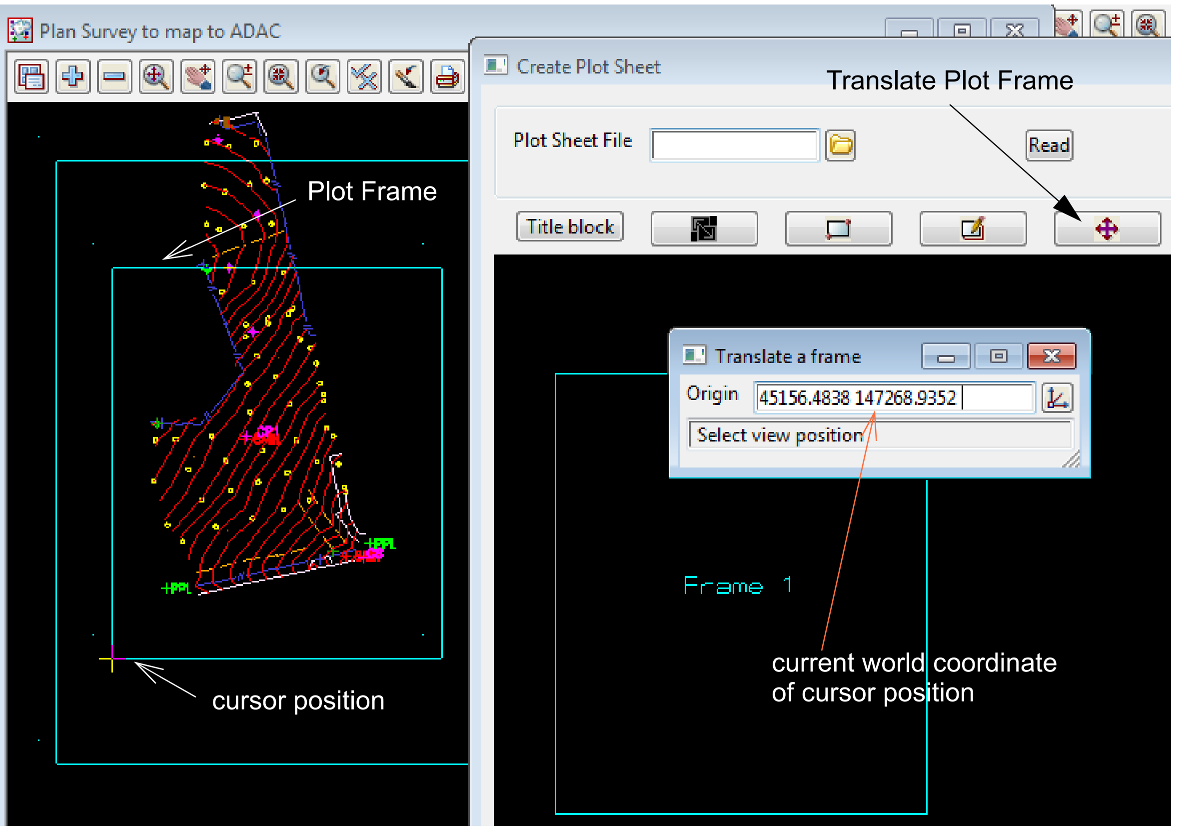
After the **Create Frame for Plan Plot** *panel has been finished, the* **Edit** *is still active and another Frame can be selected to edit.*

Translate Plot Frame button

this button is used to change the value of the **World Coordinate** *of a Frame by dynamically translating the **Plot Frame** that corresponds to the Frame.*

*After clicking the button, a Frame is selected by clicking LB **anywhere inside** the Frame in the Plot Sheet Area and then **accepting** the pick.*

When the Frame is accepted, a **Translate a Frame** *panel is displayed showing the value of the* **World coordinate** *for the Frame. Then when you move the cursor onto a Plan View which has the **Plot Frame** associated with the selected Frame on it, the* **World Coordinate** *of the Plot Frame and Frame are changed to the current cursor position. This continues until a new* **World Coordinate** *is selected on the Plan View.*



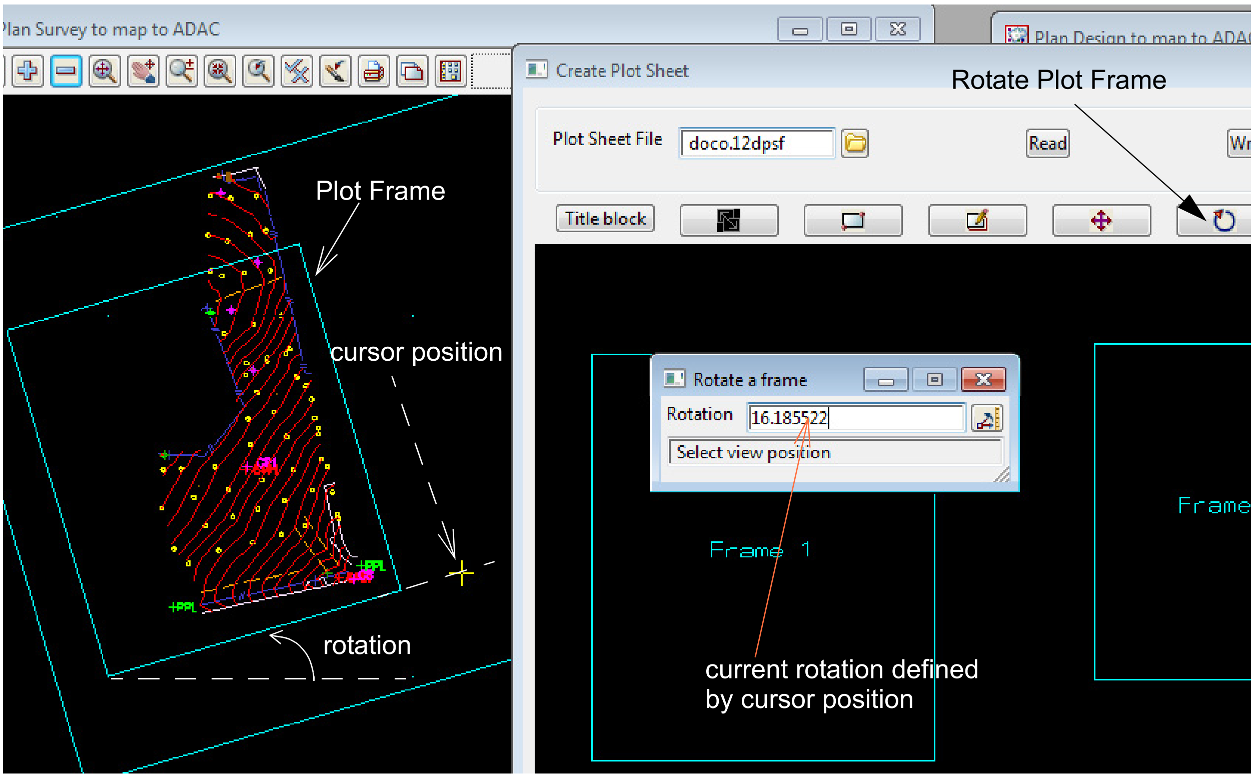
Once the Frame is translated then you can pick another Frame to translate.

Rotate Plot Frame button

this button is used to change the value of the **Rotation** *of a Frame by dynamically rotating the **Plot Frame** that corresponds to the Frame.*

*After clicking the button, a Frame is selected by clicking LB **anywhere inside** the Frame in the Plot Sheet Area and then **accepting** the pick.*

When the Frame is accepted, a **Rotate a Frame** *panel is displayed showing the value of the* **Rotation** *for the Frame. Then when you move the cursor onto a Plan View which has the **Plot Frame** associated with the selected Frame on it, the* **Rotation** *of the Plot Frame and Frame are changed to the rotation defined by the current cursor position. This continues until a cursor position is accepted and that defines the new* **Rotation** *for the Plot Frame and Frame.*



Once the Frame is rotated then you can pick another Frame to rotate.

Delete Frame button

this button is used to delete a Frame in the ***Plot Sheet.*** *The associated Plot Frame and model containing the Plot Frame are also deleted.*

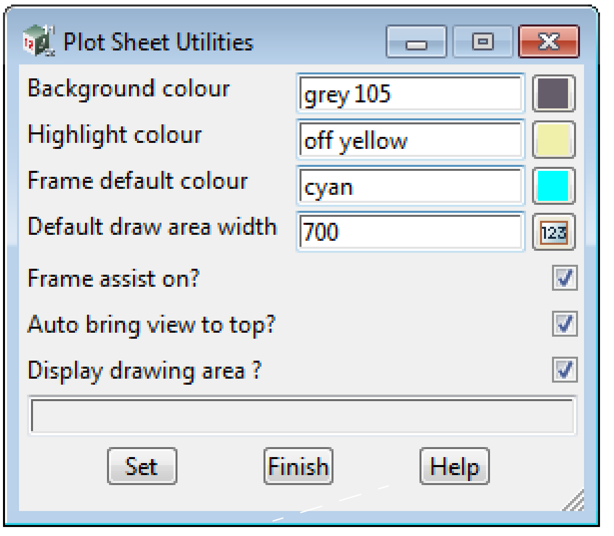
After clicking the button, a Frame is selected by clicking LB ***anywhere inside*** *the Frame in the Plot Sheet Area and then accepting the pick.*

When the Frame is accepted, the Frame is deleted, and its associated Plot Frame and the model containing the Plot Frame are also deleted.

Once a Frame is deleted, another Frame can then be selected to delete.

Utilities button

this button brings up the **Plot Sheet Utilities** *panel to change the settings for the Plot Sheet.*



Background colour colour box grey 105 available colours

the colour for the background of the Plot Sheet drawing area. "Grey 105" is a good colour to use because both blank and white strings are visible when drawn on "Grey 105".

Highlight colour colour box white available colours

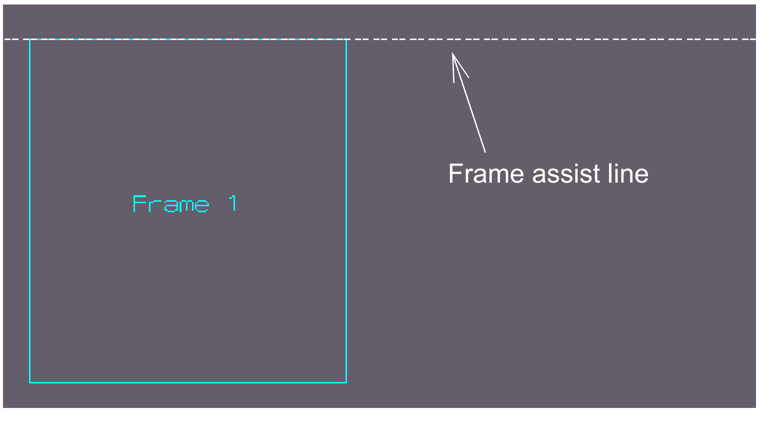
the colour to highlight the Frames in the Plot Sheet Drawing Area when they are selected.

Frame default colour colour box cyan available colours

the colour to draw the Frames borders in the Plot Sheet drawing area.

Frame assist on tick box ticked

*if **ticked**, when a new Frame is being created or an existing Frame moved in the Plot Sheet Area, when the cursor it is near the side of another Frame then guide lines are drawn in the Plot Sheet Area to help in placing the new Frame to be on the same horizontal or vertical line as the sides of existing frames.*



Auto bring view to top? tick box ticked

*if **ticked**, when the buttons Edit Frame or Delete Frame, or Plot Frame Move or Plot Frame Rotate, are selected and a Frame then selected, the View that the corresponding Plot Frame is on is brought to the top so that the View is not obscured by other Views.*

Display drawing area tick box ticked

*if **ticked** and the title block file has a drawing area defined, the n it is shown in the Plot Sheet Area.*

The drawing area of the title block when the buttons Edit Frame or Delete Frame, or Plot Frame

Fields and Buttons Under the Plot Sheet Area

PDF file	file box	*.pdf files

name of the file to write the pdf plot out to.

Plot	button

generate a pdf plot with the name given in the **PDF file** *field.*

Finish	button

when the **Finish** *button is selected, all the Plot Frames and the models containing the plot frames, that have been created by* ***Plot Sheet*** *are deleted.*

Go to the next section 25.4.2.1.1 Create Frame for Plan Plot or return to 25.4 Plot Sheet.

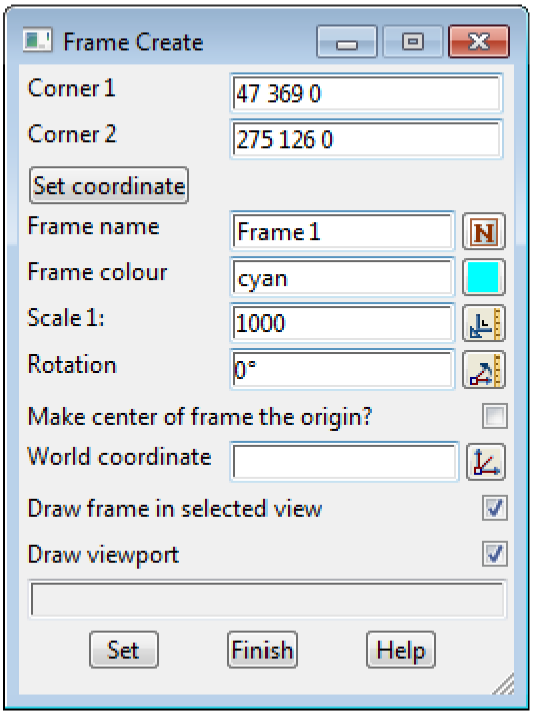
25.4.2.1.1 Create Frame for Plan Plot

The **Frame Create** panel defines the information required to create a plan plot in the Frame.

The size of the Frame in ***millimetres*** is known from the Plot Sheet and so with a ***Scale***, the Frame then defines a rectangle in world units (metres).

A ***World Coordinate*** for one point in the Frame and a ***Rotation*** then fully defines a world rectangle.

A ***Plot Frame*** of a given name can then be created and added to a view to represent the information to be plotted in the Frame.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Frame name	text box		

the name for the frame. It must be unique amongst all the Frames for the Plot Sheet.
A name is automatically generated but it can be changed as long as it is still unique for the Plot Sheet.

*A **Plot Frame** will be created with the name of the plot sheet file (without the .12dpsf) followed by a space and the* **Frame name**.

*A **model** will also be created with the name **"PF "** followed by the Plot Frame Name. The Plot Frame will be added to this model.*

Frame colour	colour box		available colours

the colour for the frame, and also for the Plot Frame that is created.

Scale 1:	measure box		available measures

scale for the plan plot.

Rotation	measure box	0 degrees	available measures

angle of rotation for the plot frame. The angle is in degrees and is measured in a counter clockwise direction from the positive x axis.

Make centre of frame the origin?	tick box		not ticked

*if **ticked**, the* **World coordinate** *is taken to be the world coordinate for the **centre** of the Frame.*

*If **not ticked**, the* **World coordinate** *is taken to be the world coordinate for the **bottom left hand corner** of the Frame.*

World coordinate input **xyz ops** menu

x_origin y_origin z_origin

this is a point in world units to be used as either the centre, or the bottom left hand corner, of the Frame. The values can either be typed in as three values separated by spaces, or selected by clicking LB on the **xyz ops** *icon and then picking a point in a plan view.*

When the **World coordinate** *is selected from a plan view, then after the* **Set** *button is clicked, the plot frame is created, added to the created model, and the model added to the view that the* **world coordinate** *was selected from.*

Draw viewport tick box ticked

*if **ticked**, when a plot is generated, a box is drawn around the Frame.*

Set button

when **Set** *is pressed, a Plot Frame of the name plot sheet file (without the .12dpsf) followed by a space and the* **Frame name** *is created. A model, with the name "PF " followed by the Plot Frame name, is then created and the Plot Frame is added to this model.*

The model containing the Plot Frame is then added to the plan view that the **World coordinate** *was selected from.*

Go to the next section 25.4.3 Plot Sheet Plot or return to 25.4 Plot Sheet.

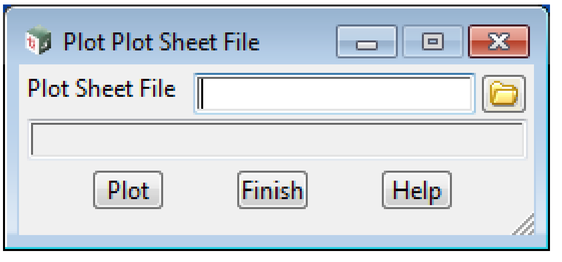
25.4.3 Plot Sheet Plot

Current position on menu: **Plot =>Plot sheet =>Plot**

Plot sheet plot is for plotting a plot sheet file that is on disk without.having to bring up the plot sheet file in the **Plot Sheet Editor**.

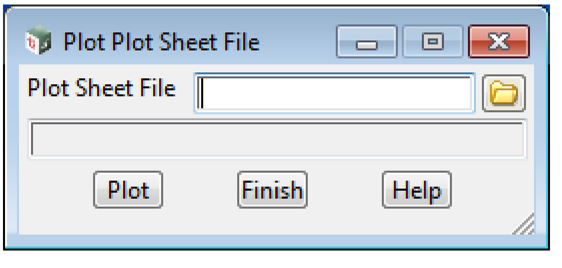
The **Plot** walk right operates in three ways.

1. The **Plot** walk-right displays a list of all the plot sheet files (*.12dpsf files) and by double clicking on a plot sheet file in the list, the plot sheet file will be run and the associated plots produced.
2. If the walk right ***Plot =>Plot sheet =>Plot*** is being displayed from the **Main Menu** on the top of ***12d Model***, then clicking on the name **Plot** on the **top of the walk right** will bring up the **Plot Plot Sheet File** panel.



Selecting the name of the plot sheet file in the field **Plot sheet file** and then pressing **Plot** will generate the plot.

3. If the walk right is being displayed from a pinned menu, then clicking on **Plot** on the **Plot Sheet menu without walking right** will also bring up the **Plot Plot Sheet File** panel.



Again as in the previous case, selecting the name of the plot sheet file in the field **Plot sheet file** and then pressing **Plot** will generate the plot.

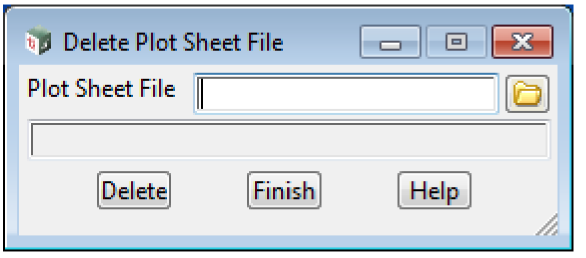
Go to the next section 25.4.3 Plot Sheet Plot or return to 25.4 Plot Sheet.

25.4.4 Plot Sheet Delete

Position on menu: **Plot =>Plot sheet =>Delete**

Plot sheet ***Delete*** is for deleting a plot sheet file from disk.

Selecting **Delete** brings up the **Delete Plot Sheet File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot sheet file	file box		*.12dpsf files

name for the file to be deleted.

Delete	button		

delete the file given in the **Plot sheet file** *field.*

Return to 25.4 Plot Sheet.

25.5 Plot Frames

Position of menu: **Plot =>Plot frames**

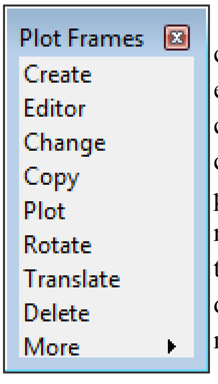
Although plan view plots can be generated in 12d Model by plotting the contents of the plan view with the **Plot** option, the plot will only have a simple title block.

To create plan plots of an arbitrary size, rotation and scale and with complex title blocks, 12d Model uses **plot frames**.

Basically a plot frame consists of a sheet size (in mm), margins within the sheet and a scale for the plot. This will define a plotting area in world coordinates (the plot frame).

The plot frame can be arbitrarily positioned and rotated on a plan view.

The **Plot frames** walk-right menu is



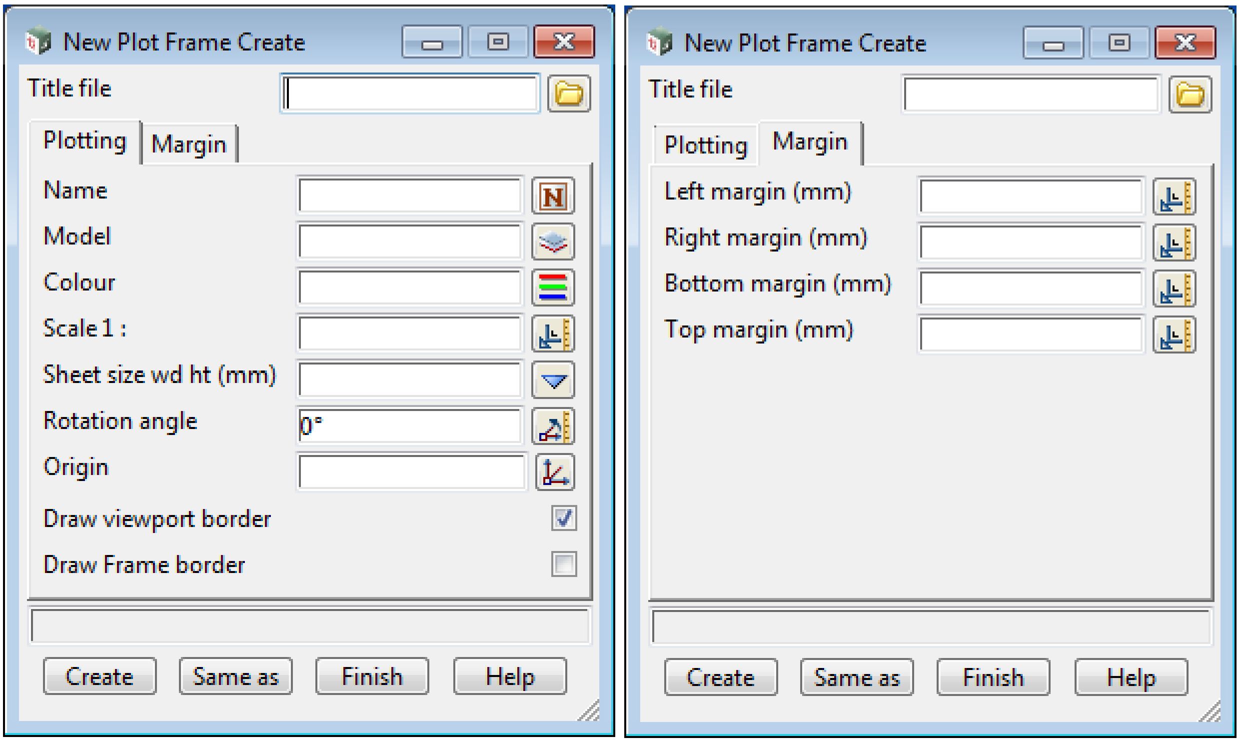
create a plot frame
edit an existing plot frame
change name, model and colour of a plot frame
copy a frame
plot one or many plot frames
rotate a plot frame
translate a plot frame
delete a plot frame
more plot frame options

For the option *Create*, go to	25.5.1 Plot Frame Create
Editor	25.5.2 Plot Frame Editor
Change	25.5.3 Plot Frame Change
Copy	25.5.3 Plot Frame Change
Plot	26.9 Plot Frame and PPF Editor
Rotate	25.5.6 Plot Frame Rotate
Translate	25.5.7 Plot Frame Translate
Delete	25.5.8 Plot Frame Delete
More	25.5.9 More Plot Frames

25.5.1 Plot Frame Create

Position of option on menu: **Plot =>Plot frames =>Create**

On selecting the **Create** option, the **New Plot Frame Create** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Title file	title file box		all title files

name for the title file to use when plotting the plot frame. The title block file can contain default information for the rest of the panel fields. See 26.2.6.5 Values Used for Defaults when Creating Plot Frames

Name	name box		available names

name for the plot frame.

Model	model box		available models

the model for the plot frame.

Colour	colour box		available colours

the colour for the plot frame.

Scale 1:	measure box		available measures

scale for the plot.

Sheet size wd ht (mm)	choice box		available sheet sizes

the width and height values (separated by spaces) or the name of a user defined sheet size.

Rotation angle	measure box	0 degrees	available measures

angle of rotation for the plot frame.

Origin	input		**xyz ops** menu

x_origin y_origin z_origin

origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the **origin** *panel view and getting up the* **xyz ops** *menu and selecting the* **pick xyz** *option.*

Draw viewport border tick box ticked

*if **ticked**, plot the box around the plotting area (viewport).*

Draw Frame border tick box not ticked

*if **ticked**, plot the box around the frame.*

Create button

create the plot frame and then put up the plot frame edit panel for the created plot frame.

Same as button

after picking the **Same as** *button, an existing plot frame is selected and its information is used to fill in the above panel fields.*

Margin tab

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

Once the frame is created, the **New Plot Frame Edit** panel for the created plot frame is automatically placed on the screen so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

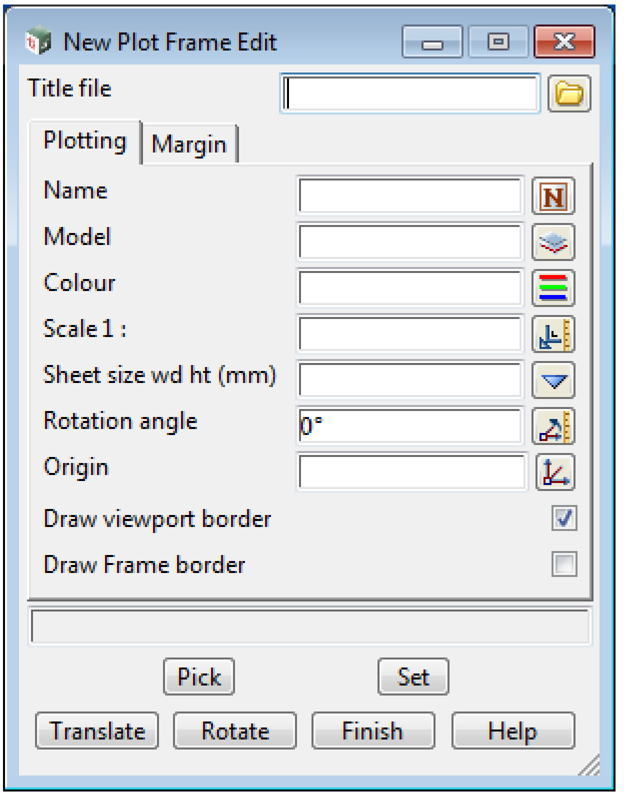
Go to the next section 25.5.2 Plot Frame Editor or return to 25.5 Plot Frames.

25.5.2 Plot Frame Editor

Position of option on menu: **Plot =>Plot frames =>Editor**

The plot frame editor is used to edit existing plot frames. It is automatically placed on the screen when a plot frame is created so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

On selecting the **Editor** option, the **New Plot Frame Edit** panel is displayed.



Most of the fields and buttons used in this panel are the same as the **New Plot Frame Create** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Title file	title file box		all title files

name for the title file to use when plotting the plot frame. The title block file can contain default information for the rest of the panel fields. See 26.2.6.5 Values Used for Defaults when Creating Plot Frames

Name	name box		available names

name for the plot frame.

Model	model box		available models

the model for the plot frame.

Colour	colour box		available colours

the colour for the plot frame.

Scale 1:	measure box		available measures

scale for the plot.

Sheet size wd ht (mm) choice box available sheet sizes

the width and height values (separated by spaces) or the name of a user defined sheet size.

Rotation angle measure box 0 degrees available measures

angle of rotation for the plot frame.

Origin input **xyz ops** menu

x_origin y_origin z_origin

origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the **origin** *panel view and getting up the* **xyz ops** *menu and selecting the* **pick xyz** *option.*

Draw viewport border tick box ticked

if ***ticked****, plot the box around the plotting area (viewport).*

Draw Frame border tick box not ticked

if ***ticked****, plot the box around the frame.*

Pick button

select the plot frame to be edited.

Set button

update the plot frame with the information in the above panel fields.

Translate button

after picking the **Translate** *button, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

Rotate button

after picking the **Rotate** *button, the plot frame is further rotated around the left hand corner of the sheet, by the angle made between the rotation point and the current cursor position.The plot frame will continue to rotate until a point is selected to fix the rotation angle.*

Margin tab

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

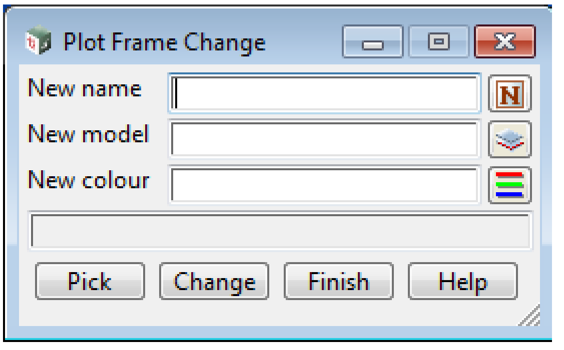
Go to the next section 25.5.3 Plot Frame Change or return to 25.5 Plot Frames.

25.5.3 Plot Frame Change

Position of option on menu: **Plot =>Plot frames =>Change**

The change option is used to modify a plot frame’s name, model or colour.

On selecting the **change** option, the **Plot Frame Change** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	name box		available names

if non-blank, then the name of the selected plot frame will be changed to the name given in the **new name** *field.*

New model	model box		available models

if non-blank, then the selected plot frame will be moved to the model given in the **new model** *field.*

New colour	colour box		available colours

if non-blank, then the colour of the selected plot frame will be changed to the colour given in the **new colour** *field.*

Pick	button		

select the plot frame to be changed.

Change	button		

update the plot frame with the information in the above panel fields.

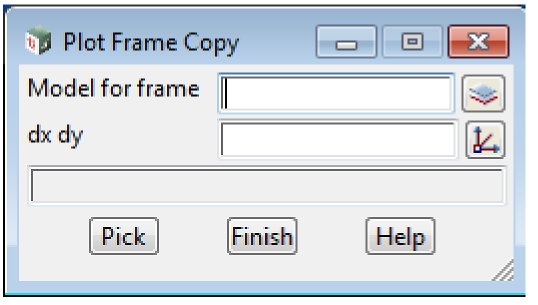
Go to the next section 25.5.4 Plot Frame Copy or return to 25.5 Plot Frames.

25.5.4 Plot Frame Copy

Position of option on menu: **Plot =>Plot frames =>Copy**

The **copy** option is used to make a copy of a plot frame.

On selecting the **Copy** option, the **Plot Frame Copy** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for frame	model box		available models

*if **blank**, then the model of the copied plot frame will be the same as that of the picked frame.*
*if **non-blank**, then the copied plot frame will be placed in the model given in the* **model for frame** *field.*

dx dy	input		**xyz ops** menu

dx_val   dy _val
translation in world units to apply to the copied plot frame - given as two values separated by spaces.

Pick	button		

select the plot frame to be copied - the copy will be made as soon as the selected plot frame is accepted.

Go to the next section 25.5.5 Plot Frame Plot or return to 25.5 Plot Frames.

25.5.5 Plot Frame Plot

Position of option on menu: **Plot =>Plot frames =>Plot**

The **Plot** option is an alternative way of bringing up the **Plot Frame PPF Editor** panel.

See 26.9 Plot Frame and PPF Editor.

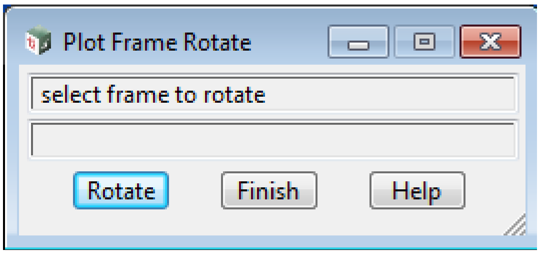
Go to the next section 25.5.6 Plot Frame Rotate or return to 25.5 Plot Frames.

25.5.6 Plot Frame Rotate

Position of option on menu: **Plot =>Plot frames =>Rotate**

The **Rotate** option is used to rotate a plot frame about a selected point.

On selecting the **Rotate** option, the **Plot Frame Rotate** panel is displayed.



The buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Rotate	button		

after picking the **Rotate** *button, the user is first asked to select a plot frame to rotate, and then to selected a point to rotate about. Once the rotation point has been selected, the plot frame is further rotated by the angle made between the rotation point and the current cursor position.The plot frame will continue to rotate until a point is selected to fix the rotation angle.*

The option then repeats.

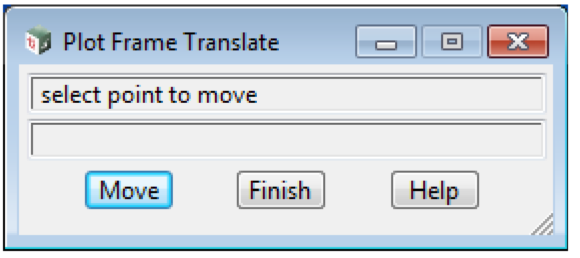
Go to the next section 25.5.7 Plot Frame Translate or return to 25.5 Plot Frames.

25.5.7 Plot Frame Translate

Position of option on menu: **Plot =>Plot frames =>Translate**

The **Translate** option is used to translate a plot frame.

On selecting the **Translate** option, the **Plot Frame Translate** panel is displayed.



The button used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Move	button		

after picking the **Move** *button, the user is first asked to select a plot frame to translate. Once the plot frame has been selected, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

The option then repeats.

Go to the next section 25.5.8 Plot Frame Delete or return to 25.5 Plot Frames.

25.5.8 Plot Frame Delete

Position of option on menu: **Plot =>Plot frames =>Delete**

The **Delete** option just gets up the standard **String Delete** panel which can be used to delete plot frames as well as strings. See 14.19 Delete

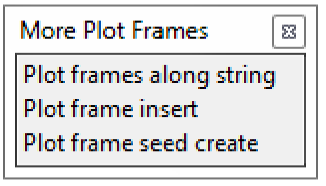
Go to the next section 25.5.9 More Plot Frames or return to 25.5 Plot Frames.

25.5.9 More Plot Frames

Position of menu: **Plot =>Plot frames =>More**

This menu contains options to create plot frame seeds, insert plot frame seeds into a view and create plot frames along a string.

The **More Plot Frames** walk-right menu is



insert a plot frame seed
create plot frames along a string
create a plot frame seed

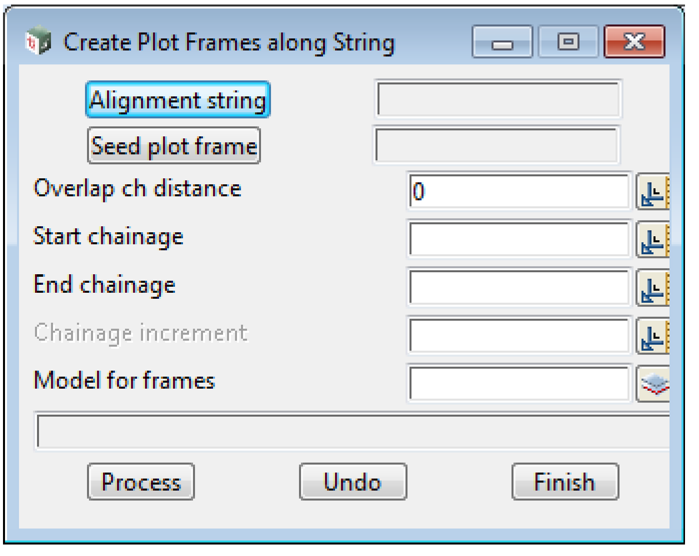
Each option in this menu will now be described.

For the option *Plot frames along string*, go to 25.5.9.1 Create Plot Frames along String
Plot frame insert 25.5.9.2 Insert Plot Frame
Plot frame seed create 25.5.9.3 Create Plot Frame Seed

25.5.9.1 Create Plot Frames along String

Position of option on menu: **Plot =>Plot frames =>More =>Plot frames along string**

On selecting the **plot frames along string** option, the **create plot frames along string** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Alignment string string select

string to create plot frame along.

Seed plot frame plot frame select

plot frame to create along the selected string.

Overlap chainage distance input 0

if non-zero, the next plot frame is started so that it includes this chainage distance of the selected string from previous plot frame.

Start/End chainage input 0

start/end chainage to restrict the amount of the selected string to place plot frames along.

Chainage increment input

if non-blank, the start of the next plot frame is placed this chainage distance along the string from the start of the previous plot frame. Used when you want to match the plot frames with the chainage interval on a long section plot.

If blank, the next plot frame is placed at the chainage point at the end of the previous plot frame (minus the **overlap chainage distance***).*

Model for frames model box available models

model to place the created plot frames in.

Process button

create the plots frames along the selected string.

Undo button

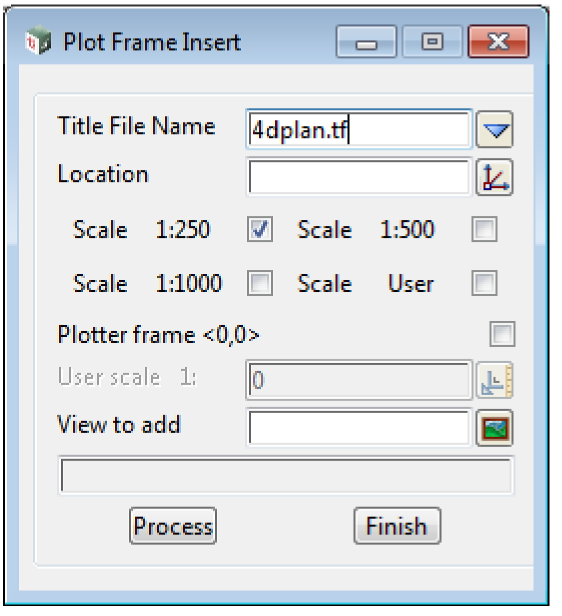
undo the last set of plot frames created whilst this panel is up.

Go to the next section 25.5.9.2 Insert Plot Frame or return to 25.5.9 More Plot Frames or 25.5 Plot Frames.

25.5.9.2 Insert Plot Frame

Position of option on menu: **Plot =>Plot frames =>More =>Plot frame insert**

On selecting the **Plot frame insert** option, the **Plot Frame Insert** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot frame to insert			plot frame seeds

plot frame from the seed library to insert.

Location	xyz box		xyz ops menu

the bottom left hand corner of the plot frame in inserted at this location.

Scale	radio buttons	1: 250	1: 250, 1: 500, 1:1000, User

scale to use for the inserted plot frame.

Plotter frame <0,0>	tick box	not ticked	

if ticked, the bottom left hand corner of the plot frame is placed at (0,0).

User scale 1:	measure box		

*if **User** is selected for **Scale**, then the required scale is entered here.*

View to add	view box		available views

if non-blank, add to plot frame to this view.

Process	button		

insert the selected seed plot frame at the given location at the given scale.

How To Use the Option

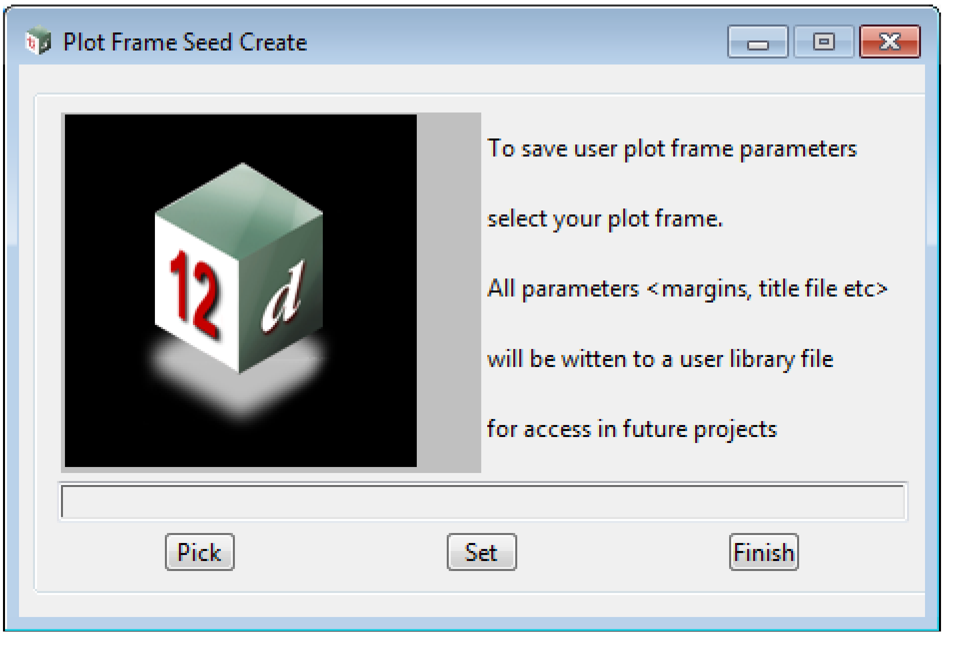
The selected plot frame is inserted at the given location with the given scale.

Go to the next section 25.5.9.3 Create Plot Frame Seed or return to 25.5.9 More Plot Frames or 25.5 Plot Frames.

25.5.9.3 Create Plot Frame Seed

Position of option on menu: **Plot =>Plot frames =>More =>Plot frame seed create**

On selecting the **Plot frame seed create** option, the **Plot Frame Seed Create** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	string select		

pick the plot frame to add to the plot frame seed library.

Set	button		

add the selected plot frame to the plot frame seed library.

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

The **Plot Frame Seed Create** panel adds selected plot frames to a library of plot frame seeds.

The seeds from the library can be inserted in a plan view using the **Insert plot frame seed** option.

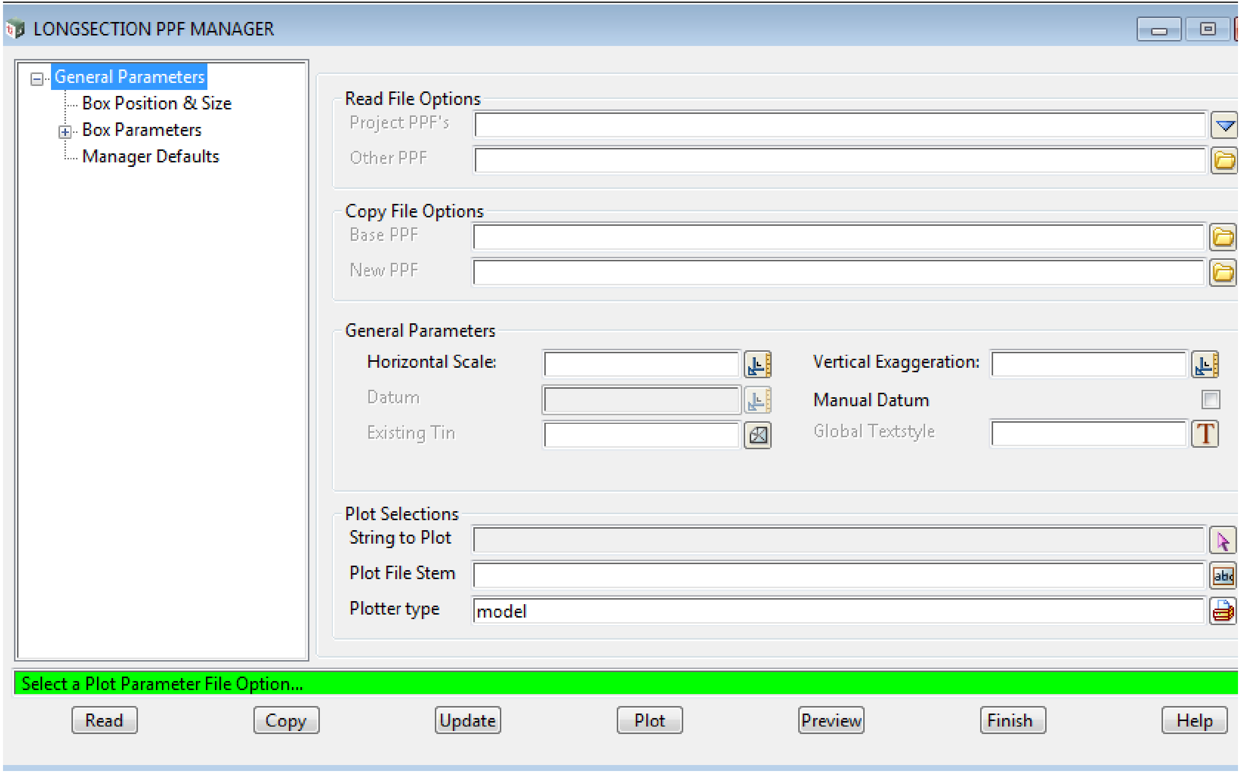
Return to 25.5.9 More Plot Frames or 25.5 Plot Frames.

25.6 Long Plot Manager

Position on menu: **Plot =>Long plot manager**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Long plot manager** brings up the **Longsection PPF Manager** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

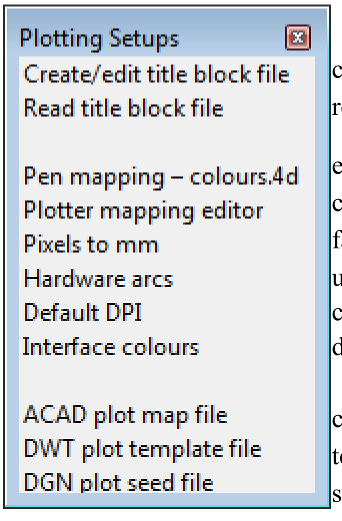
Go to the next section 25.7 Plotting Setups or return to 25 Plots.

25.7 Plotting Setups

Position of menu: **Plot =>Plotting setups**

The **Plotting setups** walk-right menu is



create/edit a title block file
read in a title block file

edit colours.4d for colours to pens
create/edit plotter mapping file
factor for pixel size to mm on plots
use/not use hardware arcs
change cut/fill colours
default DPI for raster plots

create/edit AutoCAD map file
template file for writing .dwt
seed file for writing .dgn

For the options, go to

25.7.1 Create/Edit Title Block File
25.7.2 Read Title Block

25.7.3 Pen Mapping
25.7.4 Plotter Mapping File Editor
25.7.5 Pixels to mm
25.7.6 Hardware Arcs
25.7.11 DGN Plot Seed File
25.7.8 Default DPI

25.7.9 ACAD Plot Map File
25.7.10 DWT Plot Template File
25.7.11 DGN Plot Seed File

25.7.1 Create/Edit Title Block File

Position of option on menu: **Plot =>Plotting setups =>Create/edit title block file**

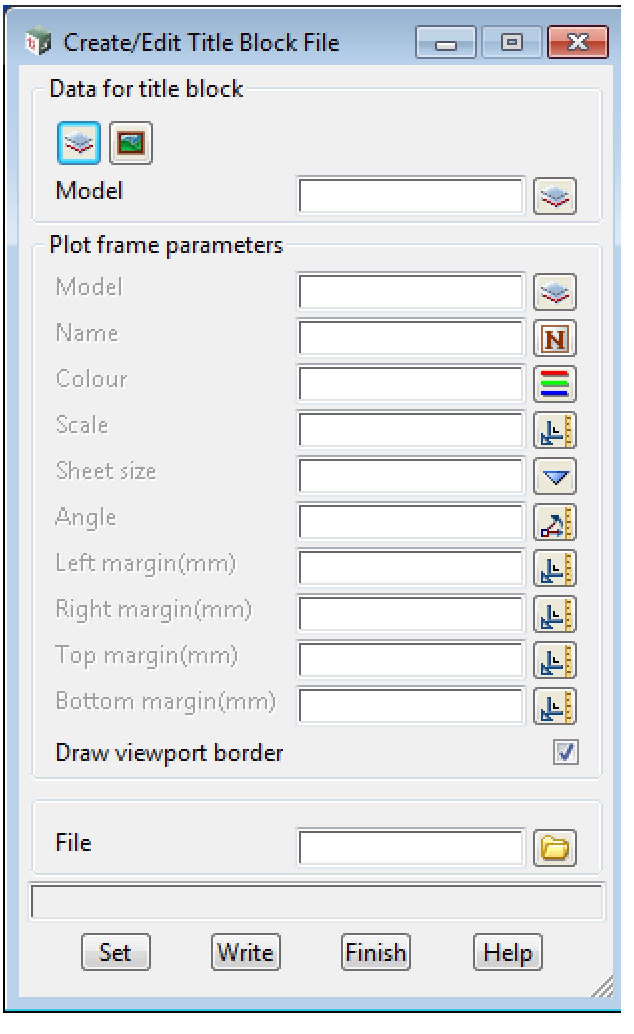
Position of option on menu: **Drafting => Create title block file**

This option is used to create a title block file from string data in a model or a view.

If it is a model, the model attributes can also contain information that is used for creating plot frames. For example, Sheet size, left/right margins, *etc.*).

The data in the model/view should be set up with (0,0) representing the left hand bottom of the plotting sheet and the units in model/view represent ***millimetres*** on the paper. So text should be defined with ***World*** units and a metre in world units is taken to be a millimetre in the title block itself. That is, a text size 5 world units will plot as 5 mm.

For more information and the format of the title block file, go to the section 26.2.6 Title Block



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data Model/View	model/view box		available models/views

the data in this model/view is written to the title block file to be used as the linework and text in a title block.
The **Set** *button is used to create model attributes for the information in the Plot frame parameters*

section, so if the **Set** *button is to be used, then only a* **Data Model** *can be used here.*

Plot frame parameters

*these parameters are written to an info block in the title block file and are only used when defining a plot frame using the option **Plot =>Plot frames =>Create**. The parameters can also be written as attributes in the* **Data Model** *using the* **Set** *button.*

Name

if not blank, the name to use for the plot frame.

Model model box available models

if not blank, model for the plot frame.

Colour colour box available colours

if not blank, colour for the plot frame.

Scale 1: input

if not blank, scale for the plot frame

Sheet size input available sheet sizes

if not blank, sheet size for the plot frame

Angle angle box

if not blank, angle of the plot frame - measured anticlockwise from the positive x-axis

Left margin, Right margin, Top margin, Bottom margin

margins for the plot frame

Draw viewport border tick box tick

if ticked, a border is drawn around the view port in the colour of the plot frame.

Title block file file box *.tbf files

name of the file to contain the title block information.

Set button

save the plot frame parameters as attributes in the Data model.

Write button

run the option – create the title block file.

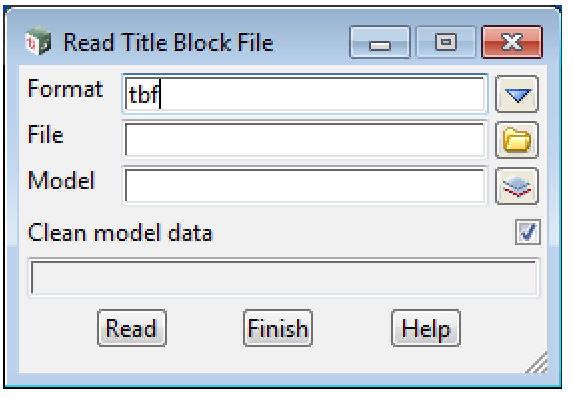
Go to the next section 25.7.2 Read Title Block or return to 25.7 Plotting Setups or 25 Plots.

25.7.2 Read Title Block

Position of option on menu: **Plot =>Plotting setups =>Read title block file**

The **Read title block file** option is for reading in a title block file and placing the lines, arcs and text defined in the title block file into a given model.

On selecting the **Read title block file** option, the **Read Title Block File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box		tbf, tf

specify if the format of the file is the V7 title block file (.tbf) or the older format (.tf).

File	file box		

name of title block file to read in.

Model	model box		available models

model to place the title block in when it is read. Any plot frame parameters in the info block of the title block file are set as attributes for this model. Hence these parameters can be written out again to a new title block file if the model in used as the Data Model when creating a title block file.

Clean model data	tick box	not ticked	

if ticked, the data in the model given in the **Model** *field will be cleaned prior to reading in the title block file.*

If not ticked, the data in the model given in the **Model** *field will not be cleaned prior to reading in the title block file. The data is appended to the existing model data.*

Read	button		

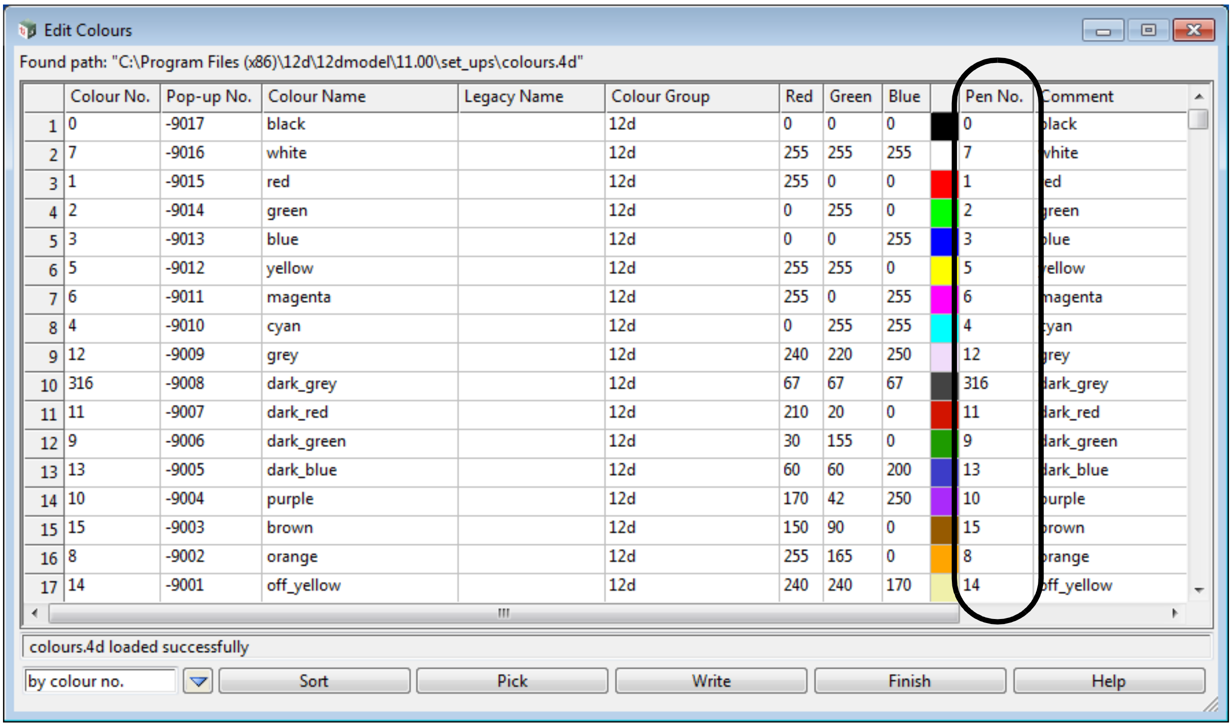
read in the title block file and place the information in the given model.

Go to the next section 25.7.3 Pen Mapping or return to 25.7 Plotting Setups or 25 Plots.

25.7.3 Pen Mapping

This option brings up the **Edit Colours** panel which has a column **Pen No.** that is used as the default pen number that a colour is mapped to.

The individual **colour-to-pen numbers** may be overridden by a **pen mapping file**.



Edit Colours

colours.4d loaded successfully

by colour no. Sort Pick Write Finish Help

For more information on this option, go to the section 4.22 Colours.

Go to the next section 25.7.4 Plotter Mapping File Editor or return to 25.7 Plotting Setups or 25 Plots.

25.7.4 Plotter Mapping File Editor

Position of option on menu: **Plot =>Plotting Setups =>Plotter mapping file editor**

The **Plotter Mapping Editor** is used to create a ***plotter mapping file*** (pmf file) which is used when making a plot from ***12d Model***. The *plotter mapping file* defines:

(a) the mapping from ***12d Model*** colours to the plotter pens

(b) the rgb (colours) and weights for the plotter pens

When defining Plotters Different *plotter mapping files* are used for different plotter configurations.

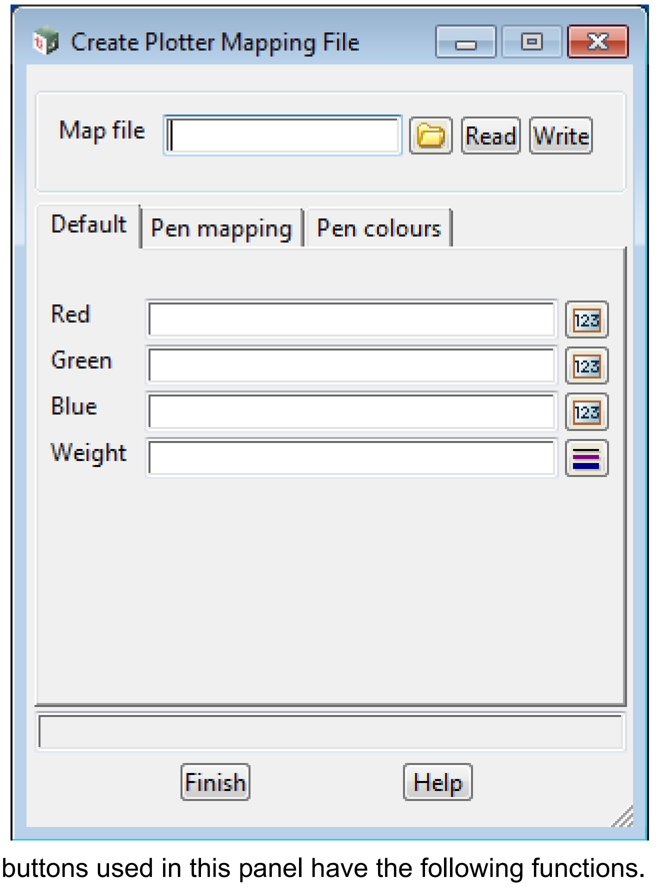
For example, different plotter mapping files would be used when plotting the same plot in ***12d Model*** to a mono-colour plotter or to a colour plotter.

For plotting to a mono-colour plotter, ***12d Model*** colours would be mapped to the one black pen but with possible different weights for different colours. So only one pen colour would be needed and its colour would be set to black (Red 0, Green 0 and Blue 0).

For plotting to a colour plotter, ***12d Model*** colours could be mapped to different colours and weights on the plotter.

The text definition of the plotter mapping file is given in the next section 25.7.5 Pixels to mm.

On selecting the **Plotter mapping editor** option, the **Create Plotter Mapping File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	file box		*.pmf file

the plotter mapping file to be created/edited.

Read button

read in the plotter mapping file given in **Map file**

Write button

write out to plotter mapping information in the panel to the file given in **Map file**.

Default tab

Red/Green/Blue input

the value between 0 and 255 of red/green/blue to be used for the default pen colour.

Weight input

the default pen weight.

12d Colour mapping tab

12d Colour colour box

the 12d colour to define the pen mapping for.

Use Pen Number integer box

the number of the pen on the plotter for the 12d colour to be mapped to.

Weight real number box

the weight to use for the plotter pen for the given 12d colour.

Define Pen Colours tab

Pen Number integer box

the number of the plotter pen to define the colour for.

Red/Green/Blue input

the value between 0 and 255 of red/green/blue to be used for the colour of the plotter pen.

Go to the next section 25.7.5 Pixels to mm or return to 25.7 Plotting Setups or 25 Plots.

25.7.5 Pixels to mm

Position of option on menu: **Plot =>Plotting setups =>Pixels to mm**

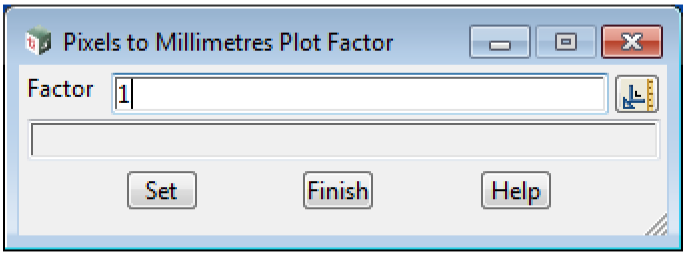
To plot an object, it must be possible to calculate the size in millimetres that the object will have in the plot.

However, in ***12d Model*** it is possible for text and linestyles to be defined in the screen unit pixels, and since the size of a pixel varies between screens, there is no direct millimetre equivalent for a pixel.

To allow text and linestyles with only a pixel size to be plotted, a factor to convert pixels to millimetres is used.

When plotting, all text and linestyles defined only in pixel units are **multiplied** by the pixels-to-millimetre factor to determine its size in the plot.

On selecting the **Pixel to mm** option, the **Pixels to Millimetres Plot Factor** panel is displayed.



To define a new factor, simply type the value into the **Factor** field and select **Set**.

The pixel-to-millimetres value is stored for the project.

For a new project, the initial value is loaded from the **Defaults** file and is defined in the file by

PIXELS TO MM PLOT FACTOR *value*

For information on the Defaults file, see 39.2.7.3 Defaults File (defaults.4d).

Go to the next section 25.7.6 Hardware Arcs or return to 25.7 Plotting Setups or 25 Plots.

25.7.6 Hardware Arcs

Position of option on menu: **Plot =>Plotting setups =>Hardware arcs**

When plotting arcs, the arc can either be broken into a series of straight lines within ***12d Model***, or plotted using the arc command (if it exists) for the relevant plotter.

The initial default for hardware arcs is set by the environment variable HARDWARE_ARCS_4D. but this can be overridden by the option **Plots =>Plotter setups =>Hardware arcs.**

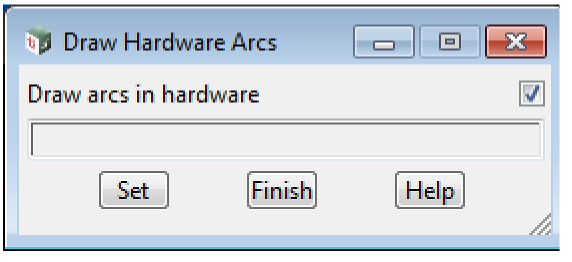
This option allows the user to choose whether

(a) the plotter arc command is used (hardware arcs)

or

(b) before plotting, the arc is broken into a series of lines.

On selecting the **hardware arcs** option, the **Draw Hardware Arcs** panel is displayed.



To use hardware arcs in plots, simply change the **Draw arcs in hardware** tick box to **tick** and select **Set**.

Go to the next section 25.7.7 Interface Colours or return to 25.7 Plotting Setups or 25 Plots.

25.7.7 Interface Colours

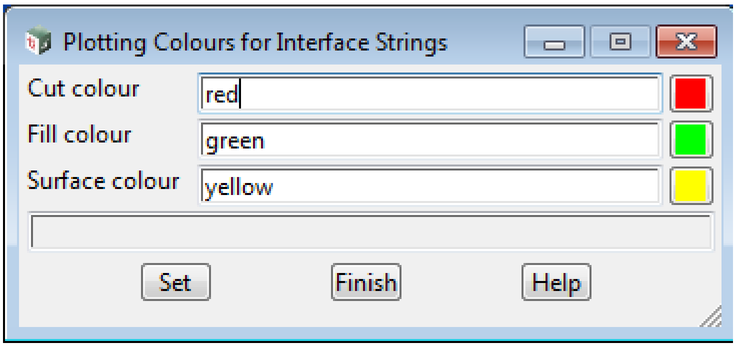
Position of option on menu: **Plot =>Plotting setups =>Interface colours**

When drawing interface strings in ***12d Model,*** cut areas are denoted in red, fill areas in green and sections on the surface in yellow (and yellow if the section became undefined).

However, when plotting it is convenient to map the interface colours to other colours.

This panel is used to define new colours for the interface colours, and the new colours are then mapped to pens using the pen mapping table or plotter mapping file.

On selecting the **interface colours** option, the **plotting colours for interface string** panel is displayed.



To define new colours, simply type the values into the appropriate panel fields and select **Set**.

Note - the new interface colours are not used for displaying interface strings in ***12d Model***, only for plotting.

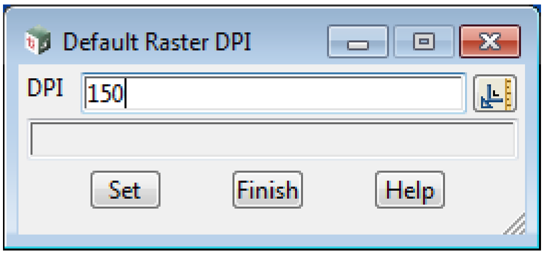
Go to the next section 25.7.8 Default DPI or return to 25.7 Plotting Setups or 25 Plots.

25.7.8 Default DPI

Position of option on menu: **Plot =>Plotting setups => Default DPI**

The *DPI* value give the default dots per inch that is used for plotting rasters.

On selecting **Default DPI**, the **Default Raster DPI** panel is displayed.



To define a new Default DPI, simply type the value into the **DPI** panel fields and select **Set**.

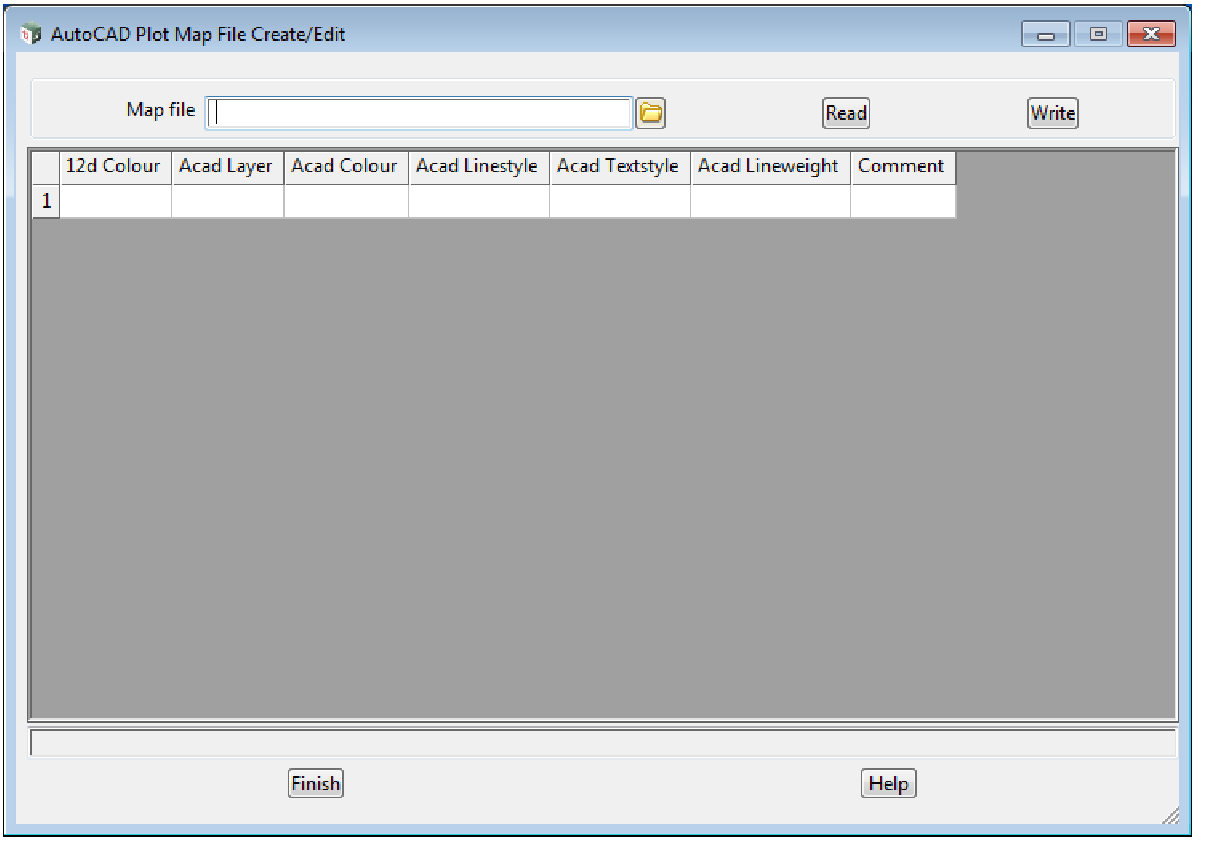
Go to the next section 25.7.9 ACAD Plot Map File or return to 25.7 Plotting Setups or 25 Plots.

25.7.9 ACAD Plot Map File

Position of option on menu: **Plot =>Plotting setups =>ACAD plot map file**

When plotting to AutoCAD, an Autocad map file can be used which uses the ***12d Model*** colour of an entity in the plot as a key to mapping the entity into AutoCAD.

On selecting the **ACAD plot map file** option, the **AutoCAD Map File Create/Edit** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	file box		*.amf files

name for the file to save/read in an AutoCAD mapping file.

Read button

read in the amf file given in the **Map file** *field and load the information into the panel.*

Write button

write out the current information defined in the panel to an amf file with the name given in the **Map file** *field.*

Grid

the information for each line of the amf file. The definition of the amf file is given in 43.2.1.2 Definition and Example of a .tbl File

12d Colour colour box

*the 12d colour to match against. This can include wild cards * and wild characters ?.*

Acad Layer text box

the name of the AutoCAD layer to map the data to.

Acad Colour text box

the AutoCAD colour. This can only be a number between 0 and 256 or BYLAYER.

This can be ***BYLAYER*** *which will be for AutoCAD BYLAYER.*

Use ***** *for the 12d Model colour.*

Acad linestyle text box

the AutoCAD line type.

This can be ***BYLAYER*** *which will be for AutoCAD BYLAYER.*

Use ***** *for the 12d Model linestyle.*

Acad Textstyle text box

Not currently used. The AutoCAD text style.

Use ***** *for the 12d Model text style.*

Comment text box

comment about this line of data.

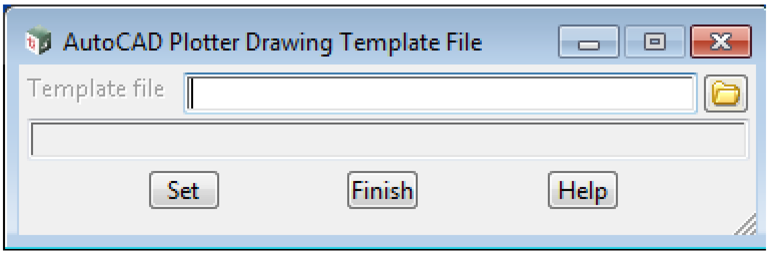
Go to the next section 25.7.10 DWT Plot Template File or return to 25.7 Plotting Setups or 25 Plots.

25.7.10 DWT Plot Template File

Position of option on menu: **Plot =>Plotting Setups =>DWG plot template file**

When creating plot files in AutoCAD format, an AutoCAD template file can be used.

On selecting the **DWT plot template file** option, the **AutoCAD Plotter Drawing Template File** panel is displayed.



To define an AutoCAD plot seed file to use for AutoCAD plotting, simply select either *DWG* or *DXF* for the **File format**, type the file name into the **plot seed file** panel field and select **set**.

25.7.11 DGN Plot Seed File

Position of option on menu: **Plot =>Plotting Setups =>DGN plot seed file**

When creating plot files in Microstation DGN format, a Microstation DGN seed file can be used.

A DGN seed file can be pointed to by the environment variable DGN_PLOT_SEED_FILE_4D

A folder containing the seed files can be pointed to with the environment variable MS_SEEDFILES_4D.

The Microstation seed file can also set by this option.

On selecting the **DGN plot seed file** option, the **DGN Plot Seed File** panel is displayed.

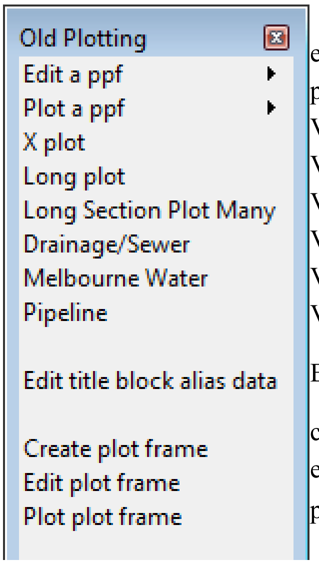
To define a Microstation IGDS plot seed file to use for Microstation plotting, simply type the file name into the **Plot seed file** panel field and select **Set**.

Return to 25.7 Plotting Setups or 25 Plots.

25.8 Old Plotting

Position of menu: **Plot =>Old plotting**

The **Old plotting** walk-right menu is



edit a V5 text PPF
plot a V5 text PPF

Drainage/sewer	22.9.2 Drainage Longsections
Melbourne Water	22.9.3 Melbourne Water.
Pipeline	22.5 Plots.
Edit title block alias data	25.8.9 Edit Title Block Alias Data
Create plot frame	25.8.10 Create Old Plot Frame
Edit plot frame	25.8.11 Editor Old Pot Frame
Plot plot frames	25.8.12 Plotting Old Plot Frames

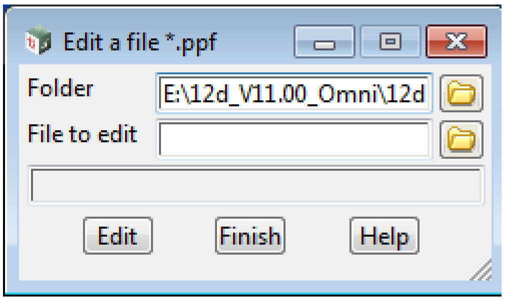
25.8.1 Edit a ppf

Position of option on menu: **Plot =>Old plotting =>Edit a ppf**

The **Edit a ppf** option is used to edit V5 text plot parameter files (*.ppf) with the editor pointed to by the EDITOR_4D environment variable.

The **Edit a ppf** walk-right menu provides a list all the plot parameter files (files ending in .ppf) in the current folder.

When a file is selected from the list, it is loaded into the editor pointer to by the environment variable EDITOR_4D.



25.8.2 Plot a ppf

Position of option on menu: **Plot =>Old plotting =>Plot a ppf**

The V5 text PPFs for long section, cross section and plot frames can have enough information in them to totally generate the plot from the ppf. The **plot a ppf** option is used to plot such a plot parameter file (*.ppf).

The **Plot a ppf** walk-right menu provides a list all the plot parameter files (files ending in .ppf) in the current folder.

When a file is selected from the list, it is then used to generate a plot.

Note - the plot parameter file is defined in 44 Text Plot Parameters.

25.8.3 X Plot

Position of option on menu: **Plot =>Old plotting =>X plot**

The **X plot** option is used to make the traditional pages of cross-section plots, that is, stacked x-sections, with offsets and elevations labelled for each cross section string, and elevations displayed for each of the tins on the section view.

For ***12d Model*** V5, each string to be plotted is assumed to be on a straight line in plan. Hence the cross section is taken as a straight line from the first point of the string to the last point of the string. The chainage of the first point of the string is used as the offset.

For ***12d Model*** V6 and above, sections do not have to be a straight line in plan. The chainage of the first point of the string is used as the offset.

The format of the x-section plot is partially controlled by fields in the **Section X Plot** panel but more extensive control is possible using a **plot parameter file** (*.ppf). The plot parameter file is fully documented in the 44.2 Cross Section Plot Parameter File section of the Appendix, 44 Text Plot Parameters.

The cross section plot is tailored by using the plot parameter file (.ppf file) given in the **plot parameters** field. A default .ppf file is set by pointing to it with the environment variable

X_SECTION_PPF_4D pathname of default .ppf file

In the pathname to the default .ppf file, $LIB is used to stand for the library folder set by LIB_4D. For example, "$LIB/cross.ppf" is the file cross.ppf in the library area.

Which x-sections are to be plotted is specified by giving the model containing the appropriate cross sections. Sections are also drawn through any triangulations and service items on the section view. Vertical exaggeration, services and corridor settings are taken from a plot parameter file or from the settings for the section view.

X-sections can be labelled with either the offset from the centreline and heights for each of the x-section points, or simply the position of the centre-line.

The required page size is given, plus the scale (the vertical exaggeration is taken from the view settings) and the sections are then plotted in columns on the plotter page. Once a page is full, a new plot page is automatically begun.

The stacked x-section plots in each column can be lined up by their centre-lines.

After selecting the **X plot** option, the **Cross Section Plot** panel is displayed.

The **Title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **title** button is selected, the **Cross Section Plot Title** panel is displayed.

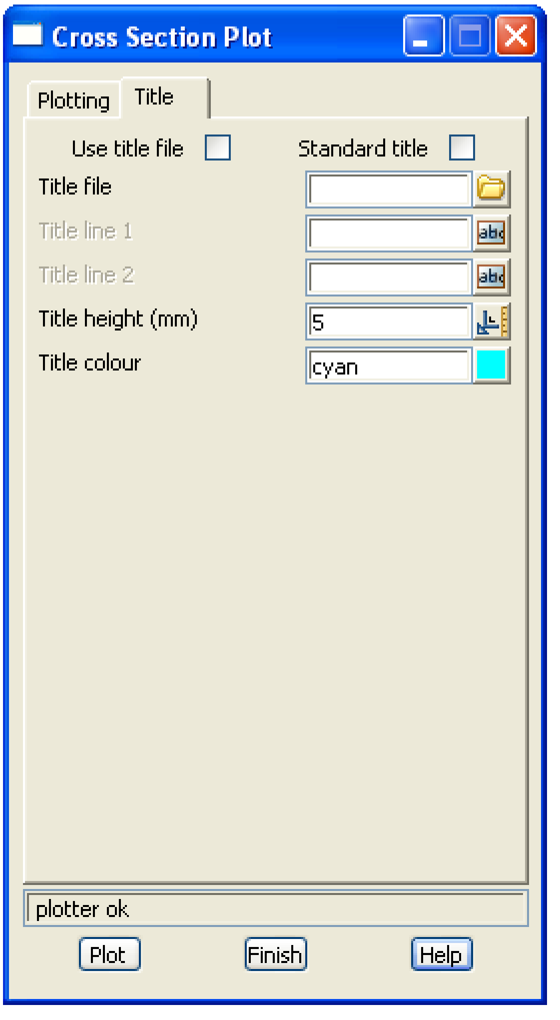
Help



The fields and buttons used in the first panel have the following functions.

Field Description Type Defaults Pop-Up

Plot parameters file box X_SECTION_PPF.4D available *.ppf files

file of plot parameters used for extra control of the x section plot. The default .ppf file is pointed to by the environment variable X_SECTION_PPF_4D.

For more information on the x section plot parameters, please go to the section 44.2 Cross Section Plot Parameter File *in the Appendix* 44 Text Plot Parameters

Plot parameters write file box available *.ppf files

file to write a copy of the plot parameters necessary to regenerate the plot.

Section view input/output current view available views

section view to use for plot definitions such as the tins to profile, the models of services, corridor width and vertical exaggeration.

Model of X-sections model box available models

the model containing all the x-sections to be plotted. The x-sections are plotted in the same order as they are in the model.

Each string to be plotted is assumed to be on a straight line in plan. Hence the cross section is taken as a straight line from the first point of the string to the last point of the string. The chainage of the first point of the string is used as the offset.

Plotter type	input	hp	hp, dxf, postscript etc.

file format for the plot output.

Plot file stem	input

since more that one plot page may be produced, the plot file stem plus a plot page sequence number followed by the ending for the plotter type is used as the plot file names.

Start/end chainage	input

the plots cover the chainage range for the cross sections given by the start and end chainage fields. If the **start/end chainage** *is blank, the star/end chainage of the x-section strings are used.*

Sheet size wd ht (mm)	choice box		available sheet sizes

must contain the width and height values (separated by space) or the name of a user defined sheet size.

Scale 1:	input

horizontal scale for plotting the x-sections.

Label type	choice box	boxes	boxes, centreline

if ***boxes****, the offset from the centreline and heights for each point in the x-section will be plotted in the traditional offset/height boxes.*
if ***centre line****, only the position of the centre-line and the height of the section at that point will be drawn.*

Text style (mm)	input	1

text style to be used in the x section plot boxes or centreline labelling.

Text ht (mm)	input	3

height (in millimetres) to plot the offset and heights in the boxes in the plots of the x-sections

Offset colour	colour box	red	available colours

colour used for the offset text and the boxes.

Primary string	tick box	ticked

if ***ticked****, the string from the* **model of x-sections** *(the primary string) is plotted.*

Sort sections	tick box	ticked

if ***ticked****, the strings from the* **model of x-sections** *are sorted by chainage along the design string.*

Absolute extensions	tick box	not ticked

If ***ticked****, the sections are only drawn from the centreline out to the left and right extension distances.*
if ***not ticked****, the left and right extension values are added to the section left and right widths, and the section is taken between the extended values*

Line up CL's	tick box	ticked

if ***ticked****, the centre-lines are lined up under each other for each plot in a column.*

LHS extension	input	0

distance to extend the x-section to the left.

RHS extension	input	0

distance to extend the x-section to the right.

Plot	button

write out the plots for the x-sections given in the **model of x-sections** *field.*

Title tab

panel for defining information in the title block.

The fields and buttons in *Title* tab are:

Use title file	tick box	not ticked	

*if **ticked,** a user defined title block file is used.*

Standard Title	tick box	ticked	

*if **ticked**, the standard 4D Solutions border and two lines of title are placed on the bottom of the plot*

Title file	file box		available *.tf files

*if **non-blank** and* **use title file** *is set to **tick**, then the file given in this field is used to generate a user defined title block for the plot.*

Title line 1/2	input		

first/second line of title information

Title height (mm)	input	5	

height (in millimetres) to draw the characters in the two lines of title information.

Title colour	input	cyan	available colours

colour used for the border and the title information.

25.8.4 Long Plot

Position of option on menu: **Plot =>Old plotting =>Long plot**

The **Long plot** option is used to make traditional long section plots with string chainages and elevations labelled for the primary string and elevations and depths displayed for each of the tins on the section view.

The format of the long section plot is partially controlled by fields in the section long plot panel but more extensive control is possible using a **plot parameter file** (*.ppf). The plot parameter file is fully documented in the 44.3 Long Section Plot Parameter File section.

After selecting the **Long plot**, the **Long Section Plot** panel is displayed.

The long section plot is tailored by using the plot parameter file (.ppf file) given in the **plot parameters** field. A default .ppf file is set by pointing to it with the environment variable

LONG_SECTION_PPF_4D pathname of default .ppf file

In the pathname to the default .ppf file, $LIB is used to stand for the library folder set by LIB_4D. For example, "$LIB/long.ppf" is the file long.ppf in the library area.

The **title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **title** button is selected, the **section long plot title** panel is displayed.

The **pagination** button on the bottom of this panel controls whether the long section plot is broken into pages, by a chainage length or millimetres of plot.

If the **pagination** button is selected, the **Section long plot pagination** panel is displayed.

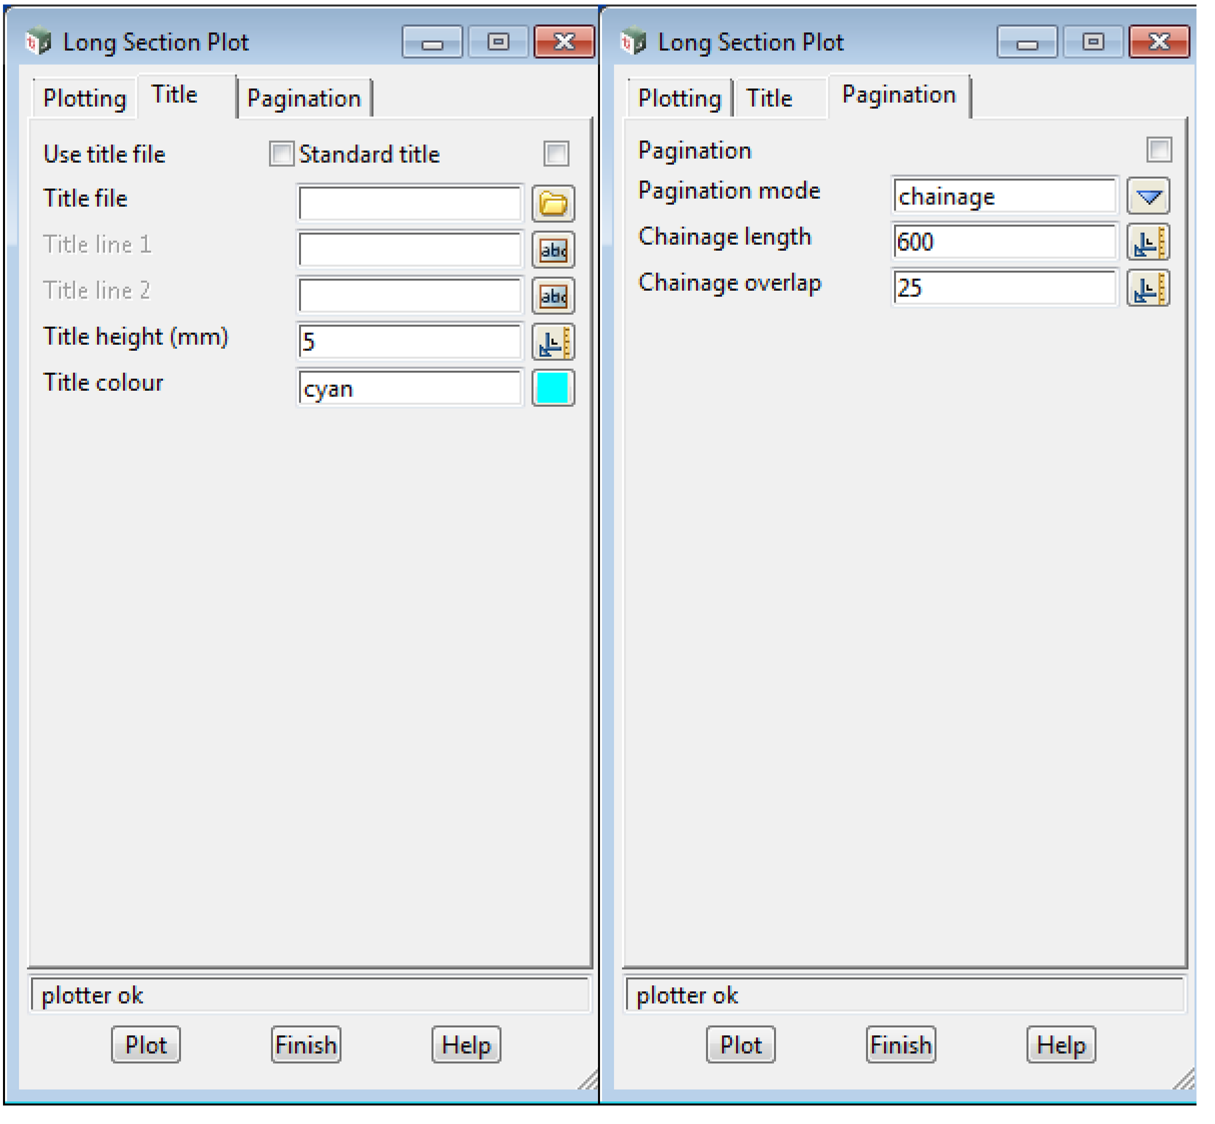
Help



The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	file box	LONG_SECTION_PPF_4D*.ppf	

file of plot parameters used for extra control of the long section plot. The default .ppf file is pointed to by the environment variable LONG_SECTION_PPF_4D.
For more information on the long section plot parameters, please go to the section 44.3 Long Section Plot Parameter File *in the Appendix* 44 Text Plot Parameters

Plot parameters write	file box		*.ppf

file to write a copy of the plot parameters necessary to regenerate the plot.

Section view	input/output	current view	available section views

section view to use for plot definitions such as the tins to profile, the models of services, corridor width and vertical exaggeration.

Plotter type	input	hp	hp, dxf, postscript etc.

file format for the plot information.

Plot file	file box		*.hp etc.

name of the file to write out the long section plot to.

Start/end chainage input

the plot covers the chainage range given by the start and end chainage fields. If the **start/end chainage** *is blank, the star/end chainage of the primary string is used.*

Chainage increment input 100

chainage increment to label the long plot with chainage and height values.

Sheet size wd ht (mm) input available sheet sizes

The width and height values (separated by space) or the name of a user defined sheet size.

Scale 1: input

horizontal scale for the plot. The vertical scale is taken from the ppf or the section view.

Plot primary string tick box ticked

if ***ticked****, the primary string is plotted along with any horizontal geometry displayed in the section view.*

Use HG VG for min, max tick box ticked

if ***ticked****, the chainage range available for plotting is from the minimum of the horizontal geometry (HG) and the vertical geometry (VG) to the maximum of the HG and VG. Useful for kerb returns.*
If ***not ticked****, the chainage range available for plotting is from the minimum of the horizontal geometry (HG) to the maximum of the HG.*

Label depths tick box ticked

if ***ticked****, label in boxes at the bottom of the plot, the distance between the primary string and the tins.*

Text style input 1

text style to be used in the long section plot boxes.

Box text ht (mm) input 3

height (in millimetres) to plot the chainage and elevations in the boxes in the long section plot.

Box colour colour box cyan available colours

colour used for the chainage text and the boxes.

Datum value input

if ***non-blank****, the value to be used as a datum. If* ***blank****, then a suitable datum value will be calculated.*

Offset model input available models

if ***non-blank****, then all the strings in the offset model will be projected onto the primary string and drawn and labelled on the long section plot.*

Title tab

brings up the section long plot title panel.

Use title file tick box not ticked

if ***ticked,*** *a use supplied title block file is used.*

Standard Title tick box ticked

if ***ticked****, the standard 4D Solutions border and two lines of title are placed on the bottom of the plot*

Title file file box available *.tf files

if ***non-blank*** *and* **use title file** *is set to* ***tick****, then the file given in this field is used to generate a user defined title block for the plot.*

Title line 1/2 input

first/second line of title information

Title height (mm) input 5

height (in millimetres) to draw the characters in the two lines of title information.

Title colour colour box cyan available colours

colour used for the border and the title information.

Pagination tab

brings up the section long plot pagination panel.

Pagination tick box ticked

*if **ticked,** the long section plot is broken into separate plots of length given in the* **length** *field, from the start chainage to the end chainage. If the* **overlap** *field is non-zero, then each page of the long section plot also includes the* **overlap** *value of the end of the previous page of plot.*

The units for **length** *and* **overlap** *can be either **chainage distance** or **millimetres on the plot page**.*

Hence apart from the first page and possibly the last page, the plot will have a total length given by the sum of the **length** *and the* **overlap** *panel fields.*

Pagination mode input chainage chainage, millimetres

the units for **length** *and* **overlap** *can be either **chainage distance** or **millimetres on the plot page**.*

If **pagination mode** *is set to **chainage**, the units are chainage distance.*
If **pagination mode** *is set to **millimetres**, the units are millimetres on the plot.*

Length measure box 600

if **pagination** *is set to **ticked**, the length of new plot to be included in the current plot.*

Overlap measure box 25

if **pagination** *is set to **ticked**, the length of the previous plot page to be included in the current plot.*

Plot button

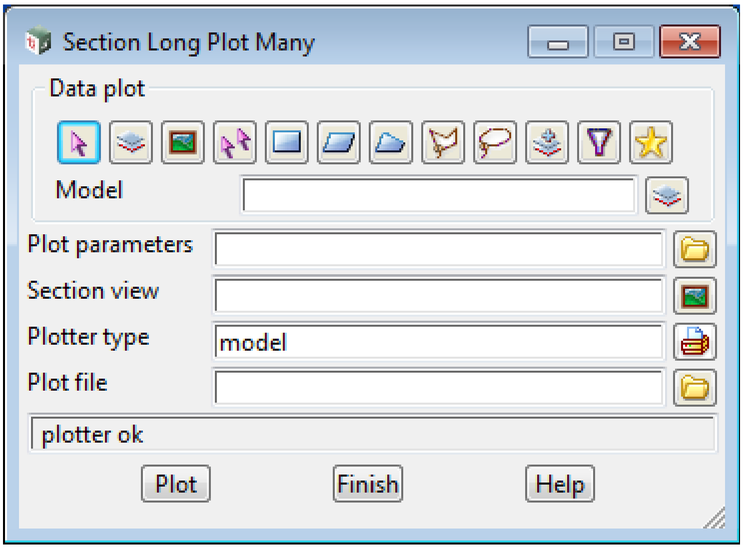
write out the plot for the long section plot between the chainages given in the start and end chainage fields. The format of the file is given by the **plotter type**

25.8.5 Plot Many Long Sections

Position of option on menu: **Plot =>Old plotting =>Long Section Plot Many**

The **Long Section Plot Many** option is used to plot individual long section plots for each string selected by the Data source.

On selecting the **Long Section Plot Many** option, the **Section Long Plot Many** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data to plot - Data source type

data source type.

Data source

when the **plot** *button is selected, long section plots are created for all the strings selected by the data source.*

Plot parameters file box *.ppf files

file of plot parameters to be used for the long section plots.

Section view view box available views

name of the section view for defining information for the long section plots. For example, tins to plot.

Plotter type input hp available plotters

type of plotter to plot to.

Plot file input

stem of the name to use for the long section plots.

Plot button

when the **Plot** *buttons is selected, individual long section plots will be created for all the strings selected in the data source field.*

25.8.6 Drainage/Sewer Plot

Position of option on menu: **Plot =>Old plotting =>Drainage/Sewer**

The **Drainage/Sewer** option is for creating drainage and/or sewer long-section plots.

The option has already been described under **Design=>Drainage-sewer =>Plots**.

See 22.9.2 Drainage Longsections.

25.8.7 Melbourne Water Sewer Plot

Position of option on menu: **Plot =>Old plotting =>Melbourne Water**

The **Melbourne Water** option is for creating sewer long-section plots to Melbourne Water specifications.

The option has already been described under **Design =>Drainage-sewer =>Plots**.

See 22.9.3 Melbourne Water.

25.8.8 Pipeline Plot

Position of option on menu: **Plot =>Old plotting =>Pipeline**

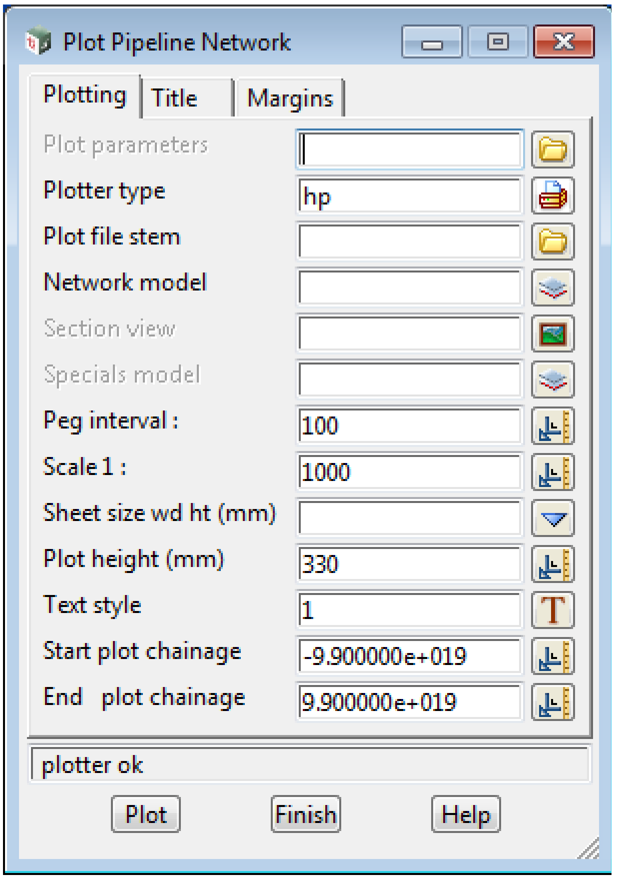
The **Pipeline** option is for creating pipeline long-section plots.

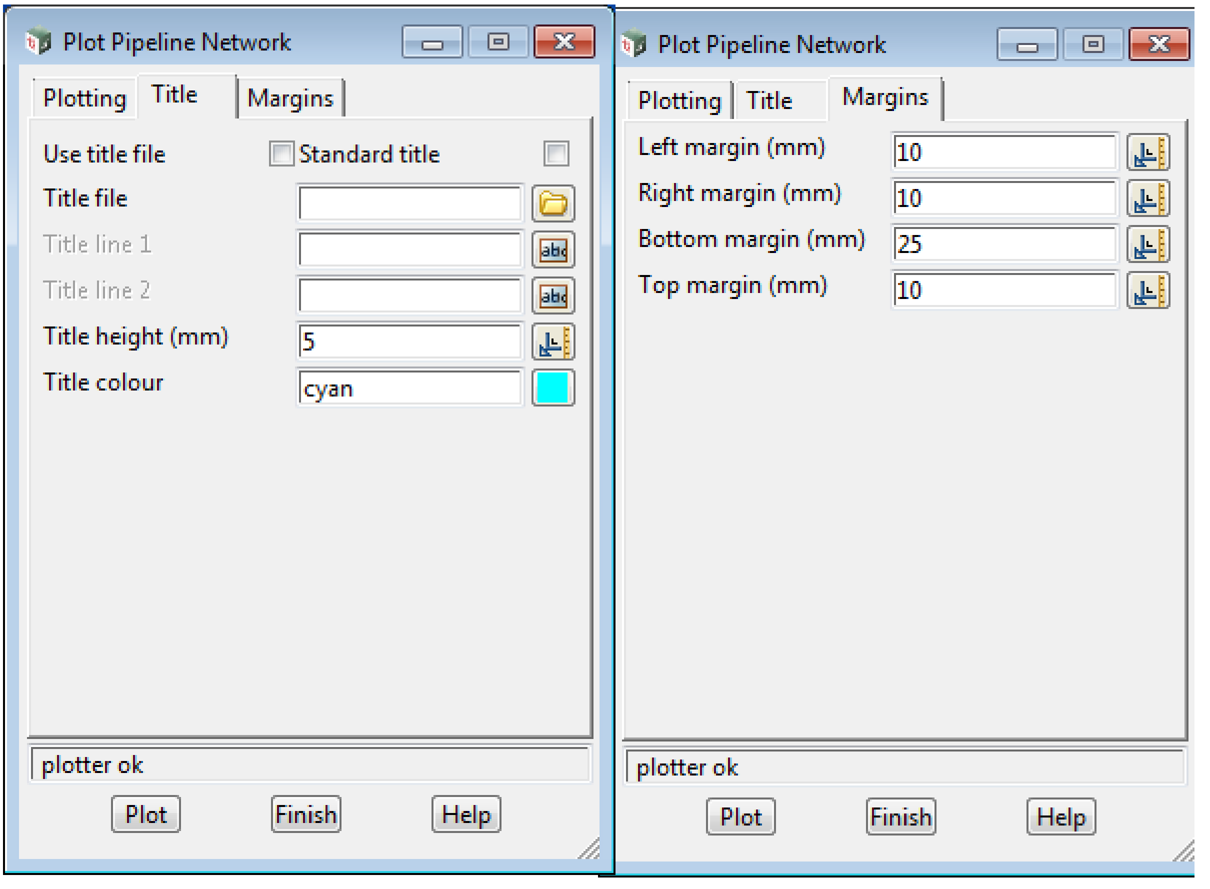
Given the plot sheet size and the horizontal and vertical scales, the longsections for the pipelines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

The pipeline plots include

- the horizontal and vertical joint deflection at any vertical intersection points which have no curves on them
- the natural surface height and chainage at any pegs or positions from the specials model, plus the invert level and depth to pipe at the position
- for any services which cuts the pipeline, the name, diameter, invert level, the distance along the pipeline of the cut point plus the invert level and depth of the invert for the pipeline and the cut point.

After selecting the **Pipeline** option, the **Plot Pipeline Network** panel is displayed.





The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	input		*.ppf

file of plot parameters used for extra control of the long section plot.

Plotter type	input	hp	hp, dxf, postscript etc.

format for the plot output.

Network model input

the model containing the pipelines to be plotted.

Section view input

the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section etc.

Plot file stem input

*since more that one plot page may be produced, the plot file stem plus a plot page sequence number followed by **.plt** is used as the plot file names.*

Specials model input

model of text strings which are used as extra labels for the plots.

Peg interval input 50

if the **specials model** *is blank, the pipelines are labelled with the text **peg** at the peg interval along the* *pipeline.*

Scale 1: input

horizontal scale for plotting the pipeline long sections. The vertical exaggeration is taken from the section view given in the **section view** *field.*

Sheet size wd ht (mm) input available sheet sizes

*if **non-blank**, the width and height values in millimetres (separated by space) or the name of a user defined sheet size.*
*If **blank**, the sheets size is calculated to fit the long section plot.*

Pipeline line ht (mm) input

the maximum allowable height for a longsection plot for a pipeline line. Datum breaks are applied to any part of the longsection that will not fit into the **pipeline line ht***.*

Start plot chainage input

If blank, the start chainage of the pipelines is used; if non blank, the plots start at this chainage for each pipeline.

End plot chainage input

If blank, the end chainage of the pipelines is used; if non blank, the plots finishes at this chainage for each pipeline.

Plot button

write out the pipeline longsection plots for the pipelines in the model given in the **network model** *field.*

The fields and buttons for *margin* tab:

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

The fields and buttons for the *title* tab:

Use title file tick box

*if **ticked,** a user defined title block file is used.*

Use Standard title tick box tick

*if **ticked**, the standard border and two lines of title are placed on the bottom of the plot*

Title file input *.tf

*if **non-blank** and* **use title file** *is set to **tick**, then the file given in this field is used to generate a user defined title block for the plot.*

Title line 1/2 input

first/second line of title information

Title height (mm) input 5

height (in millimetres) to draw the characters in the two lines of title information.

Title colour input cyan available colours

colour used for the border and the title information.

25.8.9 Edit Title Block Alias Data

Position of option on menu: **Plot =>Old Plotting =>Edit title block data**

NO LONGER USED IN V7

This panel is used to easily change to data in your drawing title blocks (set values for the user_text_n field in a title file).

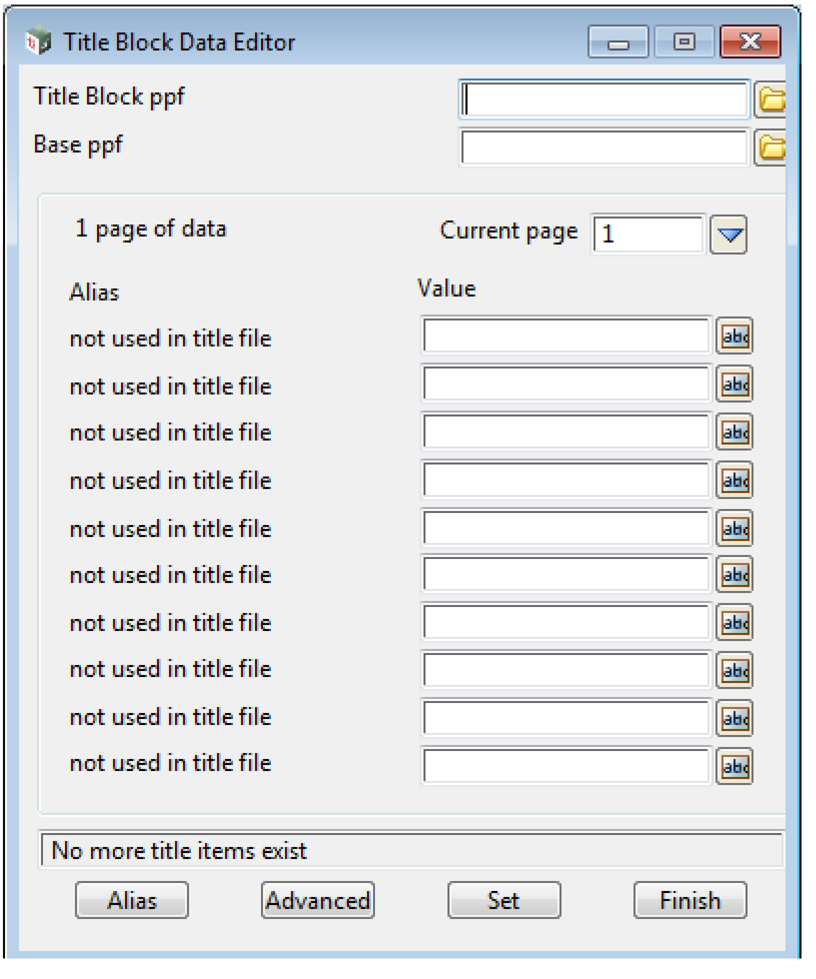
The ***Title block ppf*** is the ppf that is created by the panel. You may want to create a title block ppf for every drawing you create. This way you can easily re-plot a drawing with the same title block data. This is the ppf name that you will use in the future plot panels when you are ready to plot using the title block.

The ***Base ppf*** field is an existing ppf that includes all of your default plot parameters for creating your drawing. It must reference a title file.

12d marks the location of your title block data using the variables *user_text_1, user_text_2 etc*. Since it is difficult to remember what *user_text_1* represents in the title block, 12d allows you to use a meaningful name reference (Main title for example) instead of *user_text_1.* The Alias button allows you to set these alias names for the title file referenced in your base ppf.

The Advanced button is only used if the same text data is to be used in another Title Block ppf (share the data between drawing).

The Set button creates/updates the title block ppf and the title file values that you entered.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Title block ppf

this is the ppf that is created by the panel. This is the ppf name that you will use in the future plot panels when you are ready to plot using the title block. The Title Block ppf is usually stored locally (in the current folder).

Base ppf

this ppf must exist (often in library or your user library). It will contain all of your default plot parameters for creating your drawing. It must reference a title file (see notes below).When you press enter, the ppf file is read to find the name of the title file you reference. Once the title file is found, the alias names are read from the title alias file if available.

To convert an existing ppf file into a Base ppf file use a text editor to delete all references to *user_text_n* variables in the file.

Current page choice box available pages

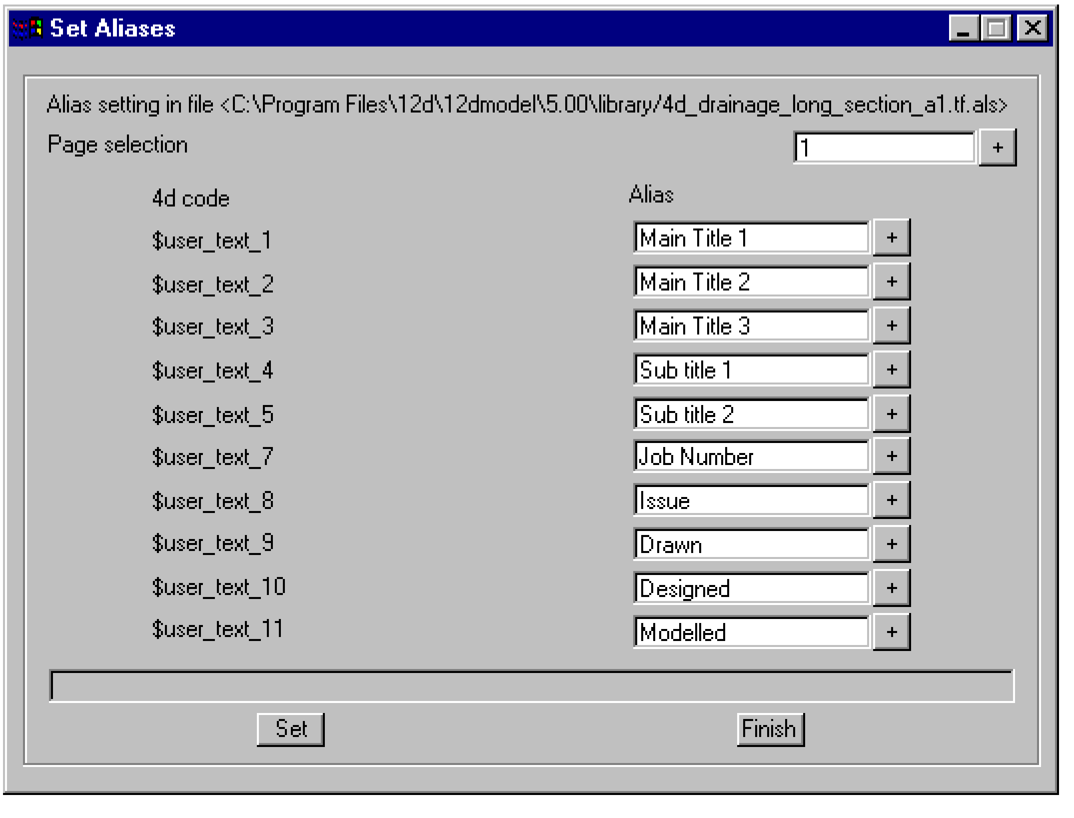
if more than one page of data (10 fields) are required additional pages will be listed here.

Value input box

the data to be shown into your drawing title block is entered here. The description to the left is either *$user_text_n* (Note that there may be gaps in the numbering sequence) or an alias that has been set up using the alias button below.

Alias button

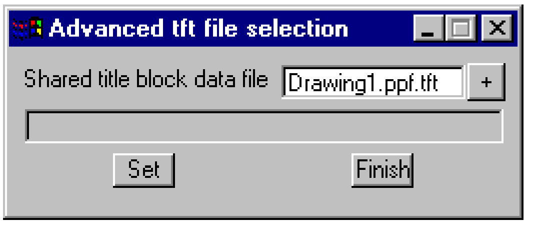
if the fields have the names *$user_text_1, $user_text_2 etc.* use the button to change the names to a more meaningful description. These new names will be stored in the same folder as the with the title file specified in your base ppf file (the extension ***als*** will be added). The following panel will be displayed.



Note that there may be gap in the *$user_text_n* sequence. Only the variable used in the title file will be listed.

Advanced button

this feature allows you to share text data between different *title block ppf* files. The actual text data in stored in a title file txt (*.tft) file. Selecting the button will bring up the following panel and allow you to change the *.tft file to be used. Generally you will select a *.tft file previously set up for another title block file.



Select the **Set** button to set your select. The text data will be read and the main panel updated when you select the **Finish** button.

Set button

creates/updates the Title block ppf file and *.tft file.

Notes:

Short-cuts:

***.als** and ***.tft** files can be copies, renamed and then edited using the Title Block Edit Panel or your own text editor.

Alias files (*.als) are kept in the same folder as the your title files. Once you have one alias file set up copy the alias file and rename the copy the same name as the title file but add the additional extension .als. For example:

title file 4d_drainage_long_section_a1.tf
alias file 4d_drainage_long_section_a1.tf.als

CAUTION: The *user_text_n* variables should represent the same data in both title files. For example *user_text_1* should be the main title in both files.

Title file text files (*.tft see advanced) files are kept in the same folder as the your Title block ppf. If you choose not to share a tft between Title block ppf files you can simply copy and rename them. Once you have saved one *.tft file, copy the file and rename the copy the same name as the title block file but add the additional extension .tft

Title Block ppf file drawing 1.ppf
title file text filedrawing 1.ppf.tft

Title Block ppf

The title block ppf file does not contain any data itself. Rather it references a *.tft file containing the text data and your base ppf file (file containing all of your default plot parameters). An example ppf file follows:

The Title Block ppf file is a ppf file with the Base ppf and user text values (in the tft file) referenced by #include statements.

```
#define ALIAS 1
section_long_plot "plot 2" {
// TITLE BLOCK PPF FILE
#include "Base_ljg.ppf"
#include "Title_block.ppf.tft"
}
```

Base ppf

The Base ppf can be anywhere including local, Library and User Library. It must contain a reference to a title file in the *use_title_file* parameter. The *user_title_file* parameter must be in the file and can't be in an #include file.

The following is an example title file reference.

use_title_file	yes
title_file	"your title file.tf "

Note: If you already have user_text variables defined in your Base ppf these values will not be used and a warning message will be issued at plot time. It is best to remove all user_text variables from your existing ppfs before attempting to use them with this new 4d facility.

The panel scans the title file reference and records all of the *user_text_n* entries that are used. **Only those used are displayed in the panel.** Next a file with the (is located. If found the alias values are used in the panel instead of *$user_text_1, $user_text_2 etc.*

If an alias file (same name as the title file PLUS the extension .als) has been previously created using the Alias button, the aliases for the user_text's are used on the left hand side of the panel. If an alias file has not been found, they can be created by simply selecting the Alias button.

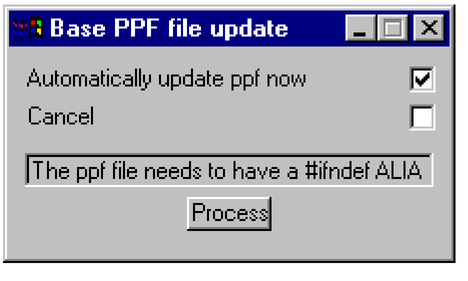
The Base ppf is also checked to see if a

#ifndef ALIAS

and

#endif

exist around the opening "xxxxxxxx {" and closing "}" braces. If not, a Base PPF file update panel is displayed.



Select *Automatically update ppf now* and select the Process button. The extra lines then are added to the Base ppf.

For example, the beginning and end of the updated file will look like:

BEGINNING

#ifndef ALIAS

section_long_plot "plot 2" {

#endif

END

#ifndef ALIAS

}

#endif

Clicking on the Alias button brings up the Set Aliases panel. Simply fill in the names to use instead of the words $user_texts_n in the Title Block - User Text Data Editor panel. Selecting Set writes out an aliases file which has the same names as the title file but with the appended ending .als.

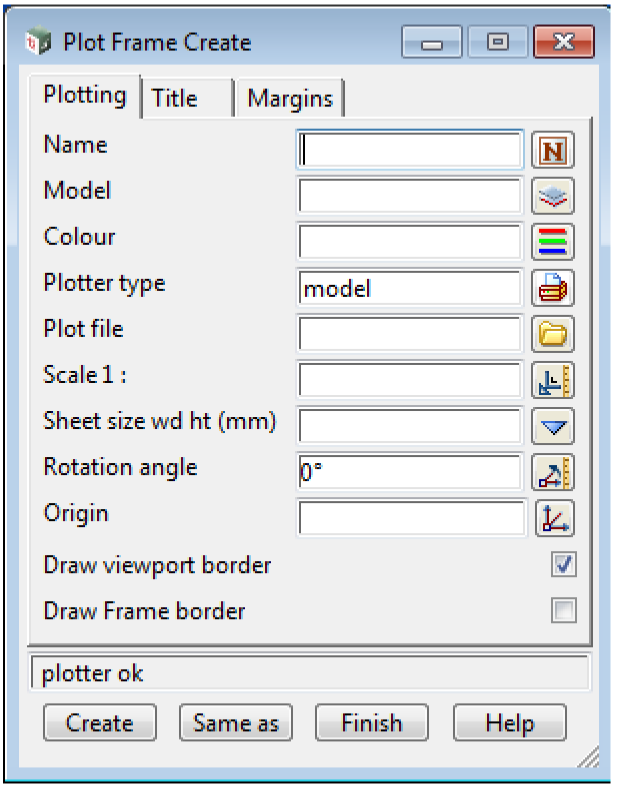
Set

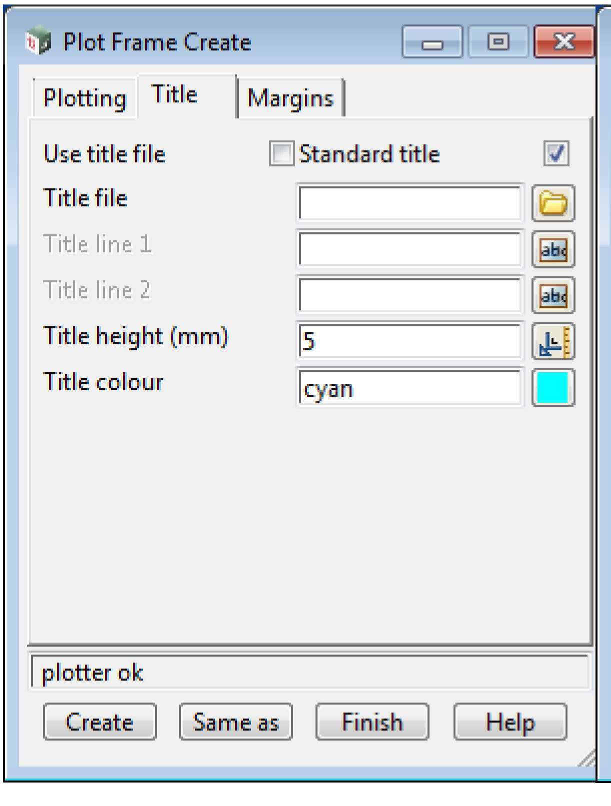
After selecting Set, the values for the user_texts are written to a file specified under **Advanced** (if used) or of the same name as the Title block ppf but with .tft appended.

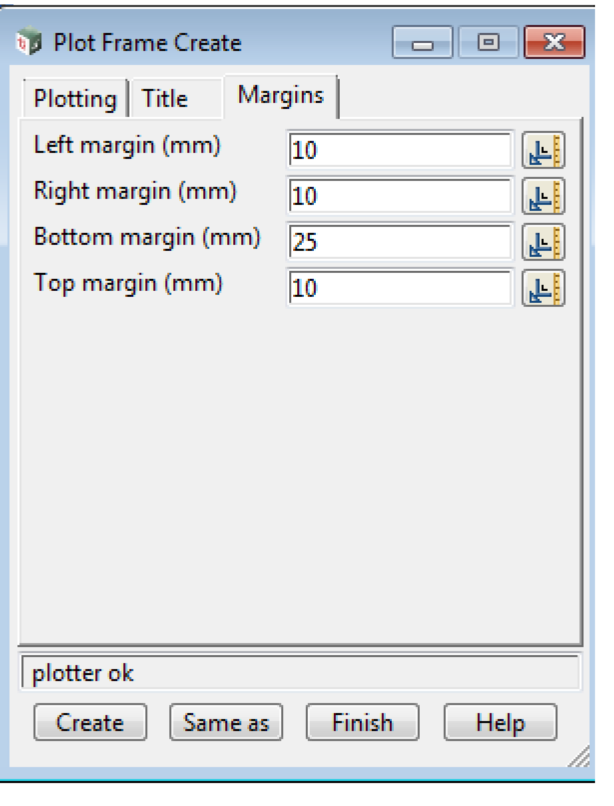
25.8.10 Create Old Plot Frame

Position of option on menu: **Plot =>Old plotting =>Create plot frame**

On selecting the **Create old** option, the **plot frame create** panel is displayed.







The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		

name for the plot frame.

Model	input		available model

the model for the plot frame.

Colour	input		available colours

the colour for the plot frame.

Plotter type	input	hp	hp, dxf, dwg, postscript etc.

format for the plot file.

Plot file	input		*.hp etc.

name of the file to write the plot of the plot frame to.

Scale 1:	input		

scale for the plot.

Sheet size wd ht (mm)	input		

the width and height values (separated by spaces) or the name of a user defined sheet size.

Rotation angle	input	0	

angle of rotation for the plot frame.

Origin	input		**xyz ops** menu

x_origin y_origin z_origin

origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the **origin** *panel view and getting up the* **xyz ops** *menu and selecting the* **pick xyz** *option.*

Draw viewport border	tick box	tick	

*if **ticked**, plot the box around the plotting area (viewport).*

Create	button		

create the plot frame and then put up the plot frame edit panel for the created plot frame.

Same as	button		

after picking the **same as** *button, an existing plot frame is selected and its information is used to fill in the above panel fields.*

Title tab

Use title file	tick box		

*if **ticked**, use the file given in the* **title file** *field to generate a title block.*

Standard Title	tick box	tick	

*if **ticked**, plot the standard 12d Model title block with the text, height and colour given in the following panel fields.*

Title line 1/2	input		

first/second line of title information in the 12d titleblock or for the user defined title block.

Title height (mm)	input	10	

*height (in **millimetres**) to draw the two lines of title information in the 12d titleblock.*

Title colour	input	cyan	available colours

colour used for the border and the title information in the 12d titleblock.

Title tab

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

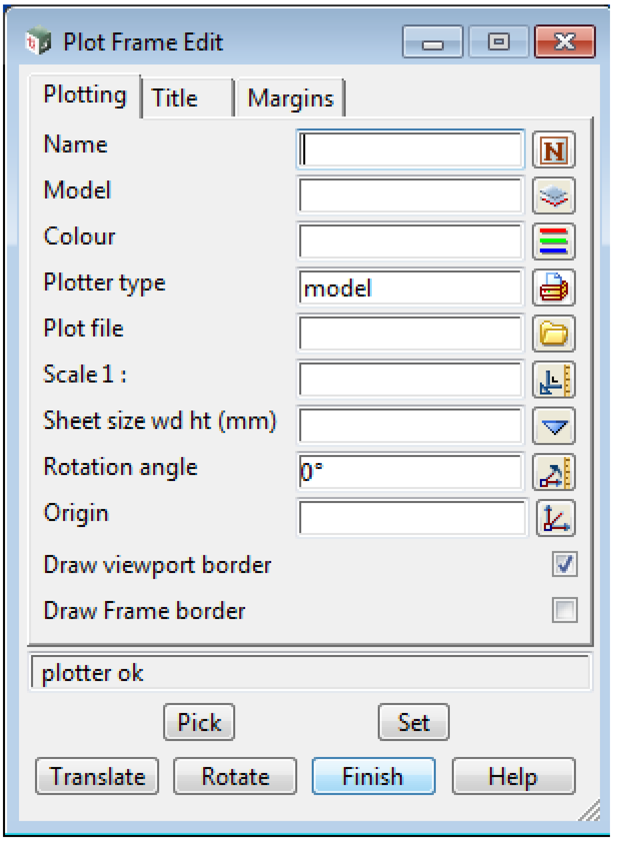
Once the frame is created, the **plot frame edit** panel for the created plot frame is automatically placed on the screen so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

25.8.11 Editor Old Pot Frame

Position of option on menu: **Plot =>Old plotting =>Editor plot frame**

The plot frame editor is used to edit existing plot frames. It is automatically placed on the screen when a plot frame is created so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

On selecting the **Editor old** option, the **plot frame edit** panel is displayed.



Most of the fields and buttons used in this panel are the same as the **plot frame create** panel - see the previous section 25.8.10 Create Old Plot Frame. The different ones are

Field Description	Type	Defaults	Pop-Up

Pick button

select the plot frame to be edited.

Set button

update the plot frame with the information in the above panel fields.

Translate button

after picking the **translate** *button, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

Rotate button

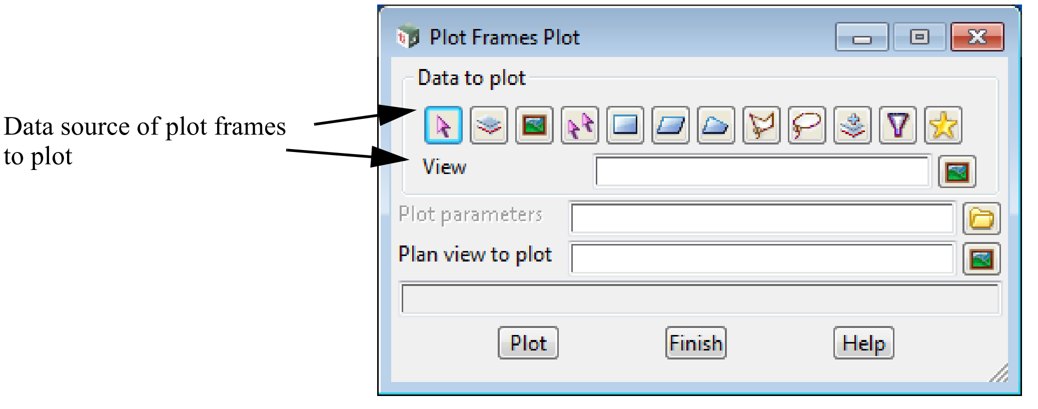
after picking the **rotate** *button, the plot frame is further rotated around the left hand corner of the sheet, by the angle made between the rotation point and the current cursor position.The plot frame will continue to rotate until a point is selected to fix the rotation angle.*

25.8.12 Plotting Old Plot Frames

Position of option on menu: **Plot =>Old plotting =>Plot plot frame**

The **plot old** option is used to make a plot of the data on a given plan view for all the selected plot frames (selected by the data source). Note that the plots are of a given plan view and the plot frames do not have to be on the plan view.

On selecting the **plot old** option, the **plot frames plot** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field DescriptionType Defaults Pop-Up

Data to plot - Data source type

data source type.

Data source

when the **plot** *button is selected, all the plot frames in the data source will be plotted.*

Plot parameters input *.ppf files

file of plot parameters to be used for the plot frames.

For more information on the plot frame plot parameters, please go to the section 44.1 Plot Frame Plot Parameter File *in the Appendix* 44 Text Plot Parameters

Plan view to plot input available views

the name of the view that is plotted when the plot frames are selected for plotting. Note that the plot frames ***do not*** *have to be on the view.*

Plot button

when the **plot** *buttons is selected, all the plot frames in the data source field will be plotted.*

25.8.13 Plotter Mapping Table

Position of option on menu: **Plot =>Plotting setups =>Plotter Mapping**

The **Plotter mapping file** can be used with pen plotters but is more specifically designed for electostatic and inject plotters and allows the user to

(a) map the full 10,240 12d Model colours to particular plotter pens and also specify a width (or weight) to be used forPCL5, HPGL2 and postscript plotters.

(b) specify the red, green and blue mix for pens on HPGL2 and colour postscript plotters

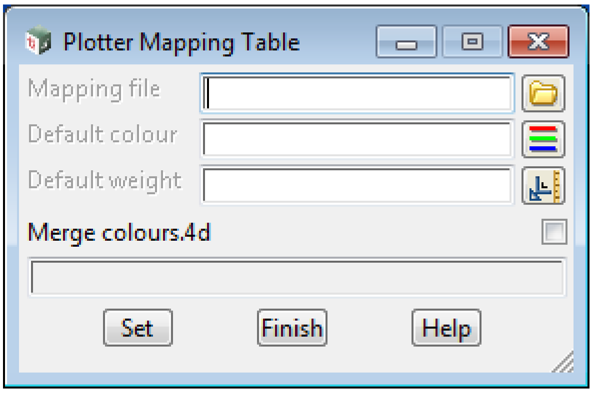
There are also two special formats of the plotter mapping file which are used for plotting to Autocad dxf/dwg and Intergraph dgn. The special mapping files use the 12d Model colour as a key to tables which control how the information is passed to DXF/DWG and DGN.

(c) .tbl file used with plotting to Intergraph dgn

(d) .amf used with plotting to Autocad dxf and dwg

The .tbl and .amf files are documented in the 43.3 Mapping 12d Colours to Pens and RGBs and 43.2.1.3 Definition and Example of a .amf File sections in the Appendix 43 Plotters and Plotting.

On selecting the **plotter mapping** option, the **Plotter Mapping Table** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Mapping file | *pmf box | | *.pmf file

the plotter mapping file to be used when plotting.

If no plotter mapping file is given, the pen mapping table in colours.4d is used.

Default colour | colour box | | available colours

*if **not blank**, the rgb of this colour is used as the rgb for the default pen colour.*

Default weight | input

*if **not blank**, the default pen weight.*

Merge colours.4d | tick box | ticked

*If **ticked**, the pen_mapping section is populated with the rgb columns from the colours.4d file are used to define the pen_colours for the colour_number row, and the pen mapping number is used to construct the pen_mapping table.*

Set | button

set the information in the panel

25.8.13.1 Initialization of the Plotter Mapping File

25.8.13.1.1 When using the Plotter Mapping Table panel:

When used with the **Plotter Mapping Table** panel, the *pen_mapping* and *pen_colours* sections are initialised before the plotter mapping file is used. This is to ensure that any colours and/or pens not mentioned in the file but used in a plot, do have valid definitions.

The initialisation sequence for the plotter mapping file used with the **Plotter Mapping Table** panel is:

Before the plotter mapping file is used:

(a) a default *pen_mapping* table is constructed for the colours in *colours.4d* by:

colour n goes to pen n with the **default weight** from the **Plotter Mapping Table** panel.

(b) a default *pen_colours* table for pens 0 to 10,240 is set up by:

pen n *default_red* *default_green* *default_blue*

where *default_red*, *default_green*, *default_blue* are the red, green and blue of the **default colour** from the **Plotter Mapping Table** panel.

If the **merge colours.4d** flag is set in the **Plotter Mapping Table** panel, the rgb columns from the *colours.4d* file are used to define the *pen_colours* and the *pen mapping number* is used to construct the pen_mapping table.

The **plotter mapping file** is then processed and over writes any of the above initial mapping values.

25.8.13.1.2 When Using a Plotter from Plotters.4d:

A *plotter mapping file* can be set for a user defined plotter in the file *plotters.4d*.

In this case, the **Plotter Mapping Table** panel is **not** used and hence the initialisation sequence is slightly different.

For a **user defined plotter**, the initialisation sequence for the plotter mapping file is:

Before the plotter mapping file is used

(a) a default *pen_mapping* table is constructed from the colours in the *colours.4d* file by:

colour n goes to pen n *default_weight*

where **default weight** is the *default_weight* if one is given in the specified plotter mapping file or zero if the default_weight does not exist.

(b) a default *pen_colours* table for pens 0 to 10,240 is set up by:

pen n *default_red* *default_green* *default_blue*

where *default_red*, *default_green*, *default_blue* are the red, green and blue of the *default_colour* if one is given in the specified plotter mapping file, or rgb 0 0 0 if the default_colour does not exist.

The **plotter mapping file** is then processed and over writes any of the above initial mapping values.

25.8.13.2 An Example of a Plotter Mapping File

An example of a plotter mapping file (.pmf) is:

```
default_colour        100     0     100
default_weight        0.1

pen_mapping {                       // pen mapping and weight table
```

```
//          colour      pen         weight

            0           1           0.15        // map colour 0 to pen 1 with weight 0.15
            1           2           0.25        // map colour 1 to pen 2 with weight 0.25
            3           1           0.5         // map colour 3 to pen 1 with weight 0.5
}
pen_colours {           // pen colours table

//pen       red         green       blue     values 0-255
   0        0           0           0           // pen 0 is black
   1        255         0           0           // pen 1 is red
   3        0           255         0           // pen 3 is green
}
```

25.8.14 Pen Mapping Old

Position of option on menu:

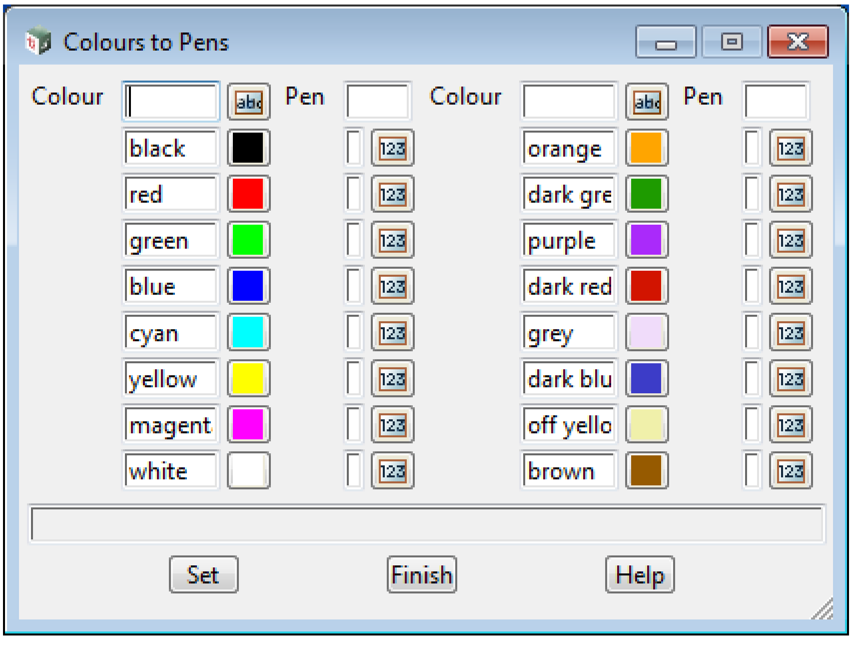
NO LONGER USED

Although 12d Model uses up to 10,240 different colours, most plotters have a smaller number of pens. Consequently for any plot, it is necessary to define what pen number corresponds to each 12d Model colour.

For all plotters types except Eagle, the **pen mapping** option can be used to define the correspondence between 12d Model colours and plotter pens for the first sixteen colours. The other colours are given in the colour_map.def file. For Eagle plots, the **eagleplt.pmf** file is used to map colours to pens.

The pen mapping option is only used if a plotter mapping is not being used (see next section).

On selecting the **pen mapping** option, the current pen mapping table is displayed in the **colours to pens** panel.



When starting a new project or entering an existing project, the default pen mapping table is defined by the **colours.4d** file.

Once inside the project, any pen number in the table can be modified by changing the appropriate **pen** field and then selecting the **set** button. The modified table is stored until 12d Model is quit or the user changes to another project.

The pen mappings for colours above sixteen are given in the **colours.4d** file but can not be displayed or modified by the **colour to pens** panel.

Whenever a plot is created using non-eagle plotter types, the colours are mapped to the pen numbers given in the **colours to pen** table before writing out the plot file.

For Eagle plots, the **eagleplt.pmf** file is used to map colours to pens.

Note - when 12d Model is started up again or the user changes to a new project, the table reverts to its default settings as given in the colours.4d file.

26 PPF Editors

26.1 General Information on PPF Editors

For the special plot types:

> Cross sections, General Long sections., Plot Frames, Drainage Long sections, Drainage plan, Melbourne Water long sections and Pipeline Long sections.

there are plot parameters for controlling what items are drawn on the plots, what colours are use, what the text is and its colour and sizes, what the title block, what information is in the title block including user supplied values that can vary with each plot, *etc*.

The plots themselves are considered to be drawn onto a sheet of paper with the origin (0,0) in the bottom left hand corner and with drawing units of millimetres.

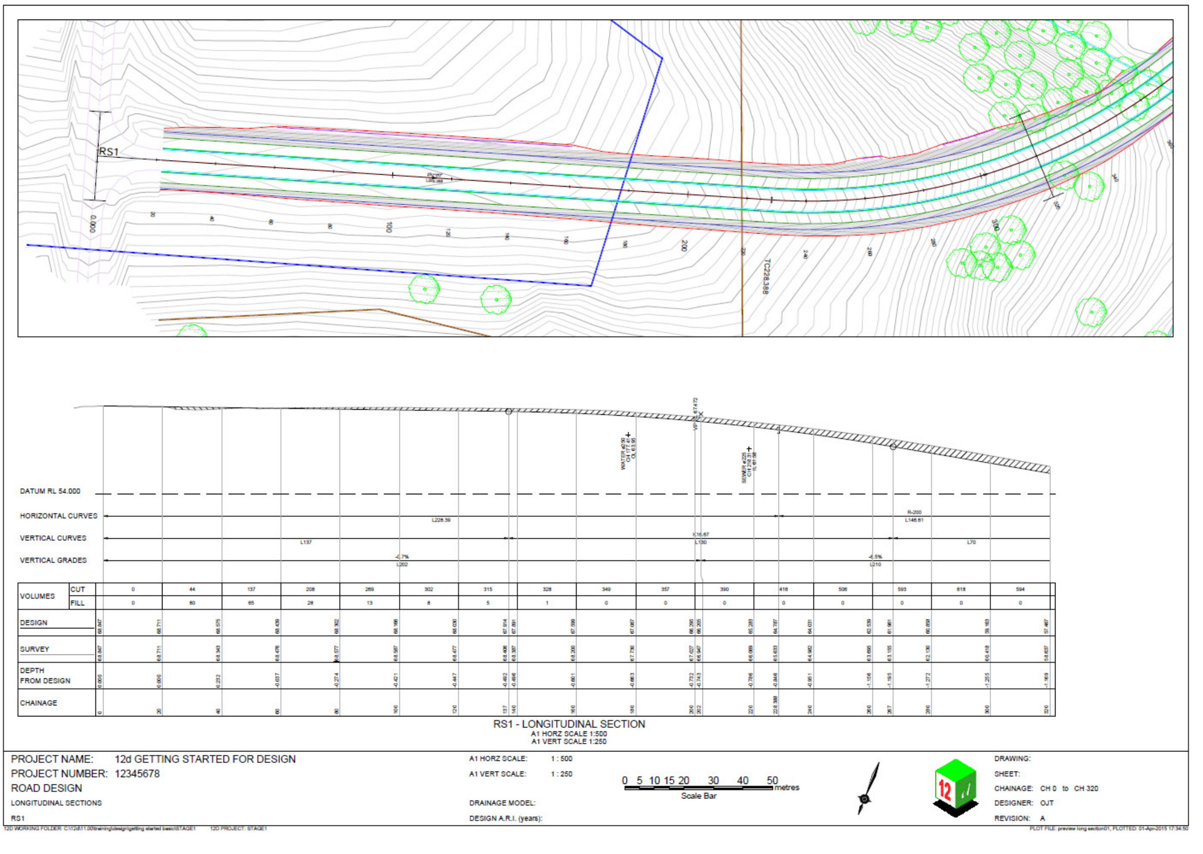
So when any of the plots is generated from ***12d Model***, the data is translated and scaled so that it fits onto the positive quadrant with (0,0) in the left hand corner. This means that title blocks and overlay models can be set up knowing exactly where they will sit in relation to a plot.

For each of the special plot types, there is a ***PPF Editor*** that allows the user to interactively change any of the plots parameters, specify the type of plotter to use (pdf, model, Windows *etc*) and actually produce the plot.

All this information can be saved away in a plot parameter file (ppf) for future reuse.

In fact the ppf has all the information required to generate the plot and can even be used to create a plot without any interaction from the user.

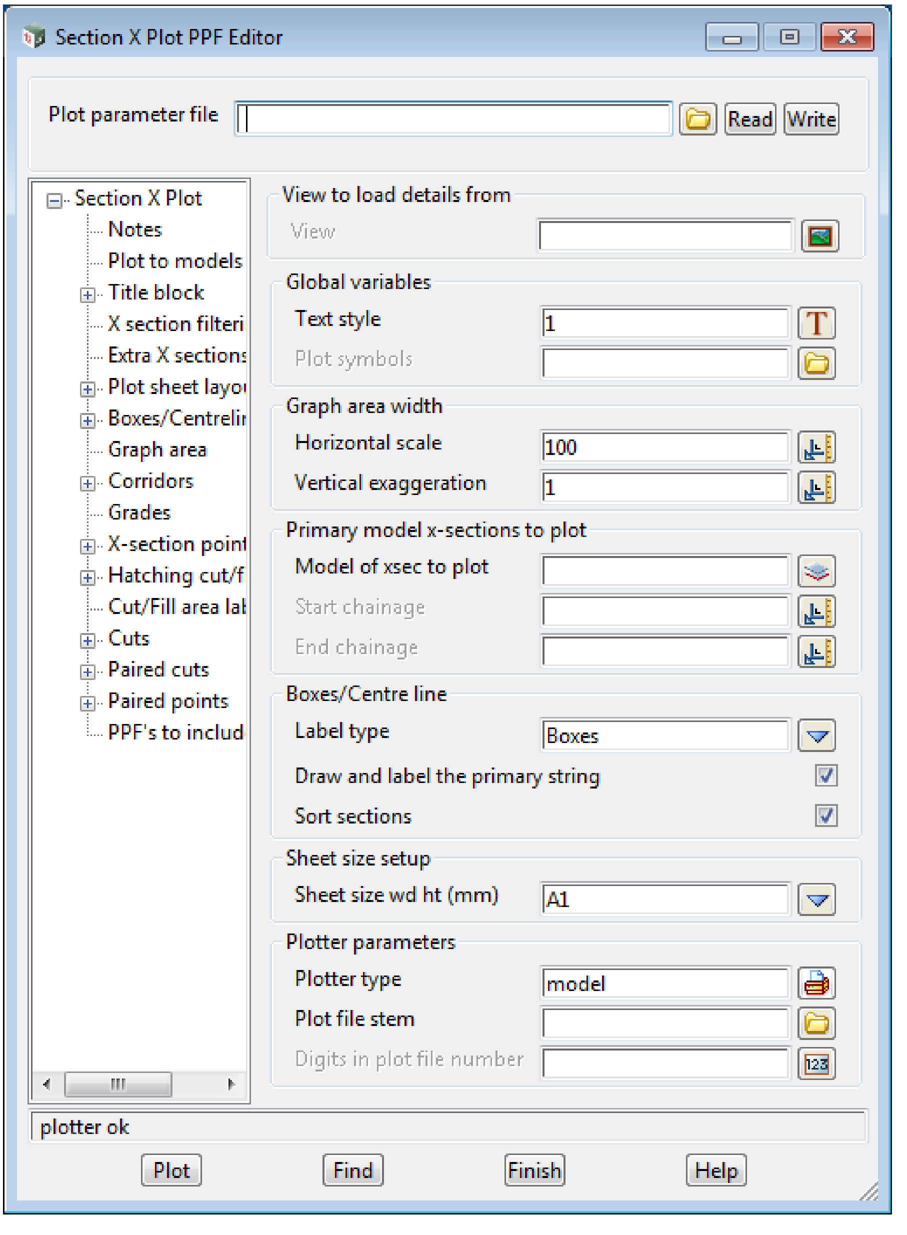
An example of a long section plot created in the ***Getting Started for Design*** manual is:



This plot, and the other three sheets of the set, are generated straight from ***12d Model*** with no manual drafting at all.

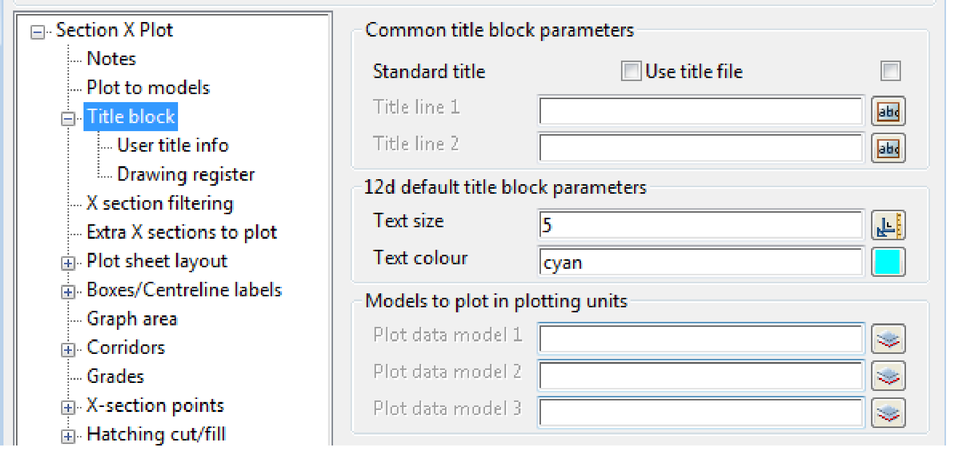
For each of the ***PPF Editors***, the parameters are displayed in a tree structure so they can be grouped together to make it easy to find any parameters to edit and modify.

For example, the **Section X Plot PPF Editor** looks like:



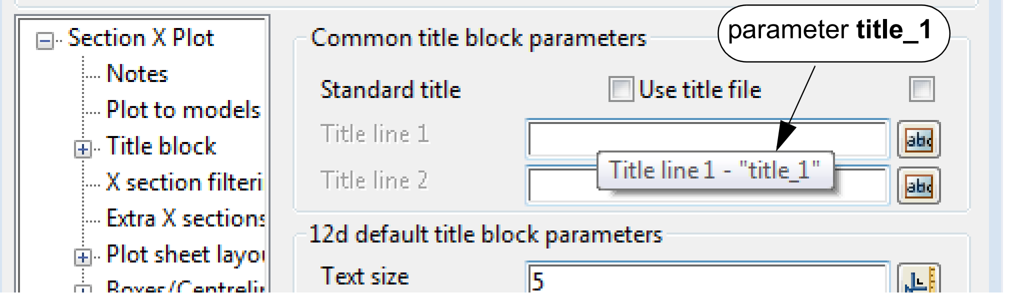
Clicking on a **+** will expand the node and on a **-** will collapse the node.

Clicking on a **node** will display information on the right hand side of the panel. This is where all the parameter values are entered.



Every plot parameter actually has a name but it is rare that will ever need to know it.

For most parameters you can see what the actual parameter name is by hovering over the parameter itself - a description and the name of the parameter is then displayed:



For the user, the parameter names usually only seen in diagrams explaining what the parameters control but when a plot is generated, the PPF Editor file is actually converted to a readable text file with the parameters and there values in it, and that text file that is used for generating the plot.

This all occurs in the background it is useful to know because the PPF Editor files are often referred to as **binary PPF**s and the text ones as **Ascii PPF**s and there is even a converter to go from the Ascii PPF to a Binary PPF.

However throughout this manual, PPF will refer to the Binary PPF's unless stated otherwise.

Note: Binary PPFs are normally stored *within* a project.

Many of the section of the ***PPF Editors*** are common and as much as possible, will be described in the one place.

For the items common to all the PPF Editors that are documented in the section 26.2 Nodes Common to the PPF Editors, see

26.2.1 Plot Parameter File
26.2.2 View to Load and Global Variables
26.2.3 Sheet Size and Plotter Parameters
26.2.4 Notes
26.2.5 Plot to models
26.2.6 Title Block
26.2.10 PPFs To Include
26.2.11 Buttons at the Bottom of the PPF Editors

For the individual PPF Editors, see

The first section of the documentation is 26.2 Nodes Common to the PPF Editors.

26.2 Nodes Common to the PPF Editors

For the items common to all the PPF Editors, see

26.2.1 Plot Parameter File
26.2.2 View to Load and Global Variables
26.2.3 Sheet Size and Plotter Parameters
26.2.4 Notes
26.2.5 Plot to models
26.2.6 Title Block
26.2.10 PPFs To Include
26.2.11 Buttons at the Bottom of the PPF Editors

26.2.1 Plot Parameter File

The Plot Parameter file is common to all the PPF Editors and reads and writes (binary) plot parameter files for all values on the PPF Editor.

Panel field **Type**

Plot parameter file file box

name for the binary plot parameter file to read in or write out.

If a name is selected the Read button still needs to be pressed to read the file in and load up the plot parameters in the PPF Editor.

Read button

read the given plot parameter file in and load up the plot parameters in the PPF Editor from any values in the file.

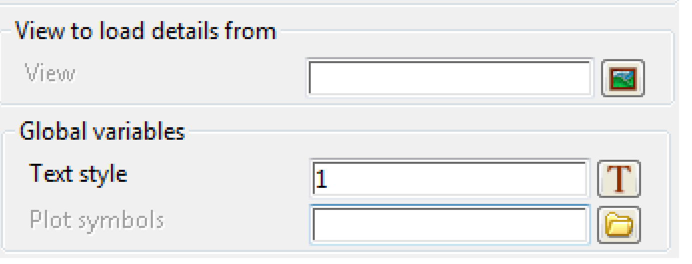
Write button

write out the plot parameters to the given plot parameter file.
A text ppf file is also written out.

Continue to the next section 26.2.2 View to Load and Global Variables or return to 26 PPF Editors.

26.2.2 View to Load and Global Variables

The following fields are common to the top node for most of the PPF Editors.



The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: View to load details from

View **section view box** **all section views**

on selection of an existing section view, the vertical exaggeration, model of x-sections to plot, corridor model and corridor settings from the section view are loaded into the PPF editor.

Section: Global variables

Text style global_textstyle text box

default textstyle to use if there is no parameter given for an optional text style parameter.

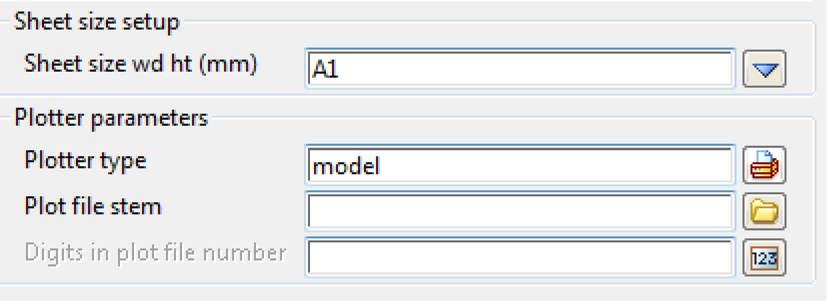
Plot symbols plot_symbols file box

if not blank, this file of plot symbols is used instead of the symbol file currently being used for the project.

Continue to the next section 26.2.3 Sheet Size and Plotter Parameters or return to 26 PPF Editors.

26.2.3 Sheet Size and Plotter Parameters

The following fields are common to the top node for most of the PPF Editors.



The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Sheet size setup

Sheet size wd ht (mm) sheet_size sheet size box

a valid sheet size is selected.

Section: Plotter parameters

Plotter type plotter_type plotter box

a valid plotting option is selected.

Plot file stem plot_stem plotter box

plot file name. The appropriate extension is added depending on the plotter type selected.

Digits in plot file number file_num_digits number box

*leaving **Digits in plot file number** blank or setting a value of 1 or less, will result in file names like we've always known them.*

*Setting **Digits in plot file number** to a value of 2 or more, ensures there will be at least that number of digits in the page numbers built into the plot file names, and if zero-padding is used where necessary to get that number of digits.*

*For example, if **Digits in plot file number** is 3 then plot number 7 will have the number 007.*

Continue to the next section 26.2.4 Notes or return to 26 PPF Editors.

26.2.4 Notes

Section: Document your PPF here ...

Region for typing ppf_notes

Type in any notes as documentation for this PPF file.

This information is not plotted.

Continue to the next section 26.2.5 Plot to models or return to 26 PPF Editors.

26.2.5 Plot to models

The ***Plot to models*** node controls whether models are cleaned before the plot is written to them, and whether the plots go to separate models for each page or all into one model.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Options for plotting to models

Clean plot models beforehand plot_model_clean choice box do not clean
prompt for clean
always clean

when plotting to a model, it defines whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s).

This parameter is only applicable if plotting to a model or models.

Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will ***not*** *be cleaned from the models, and the plot job will be cancelled.*

Section: Translate and merge models

Whenever a PPF is set to produce multiple sheets of plot models, the ***Translate and merge plot models*** *group of parameters, offer the ability to produce plot models arranged neatly in a row or column of sheets, optionally merged into the single plot model created for the first sheet.*

Note*: The* ***Origin X*** *and* ***Origin Y*** *parameters are useful when building up larger arrays of plot sheets -- perhaps entire drawing sets -- from multiple PPFs, where each PPF may be specified with a different origin.*

Mode plot_model_translate_mode choice box do not translate
row wise translation
column wise translation

The entire group of parameters is activated by setting the Mode to either "row-wise translation" or "column-wise translation". This determines whether the multiple sheets will appear as a row or a column of sheets. If unspecified, "do not translate or merge" is assumed, and the remaining parameters are ignored

Spacing (mm) plot_model_translate_spacing real box

determines how far to translate each sheet from the previous sheet. Practically, it should be at least as large as the sheet width or height. For an A1 sheet size, 1000 mm works well as a nice round number

Origin X (mm) plot_model_translate_origin_x real box

determines the x-coordinate of the bottom-left corner of the first sheet.

If let blank then 0 mm is assumed.

Origin Y (mm) plot_model_translate_origin_y real box

determines the y-coordinate of the bottom-left corner of the first sheet.

If let blank then 0 mm is assumed.

Merge plot_model_merge tick box

if ***ticked****, all sheets produced by the PPF, will be created in a single model and that model is the plot model created for the first sheet.*

Note: The **Origin X** and **Origin Y** parameters are useful when building up larger arrays of plot sheets -- perhaps entire drawing sets -- from multiple PPFs, where each PPF may be specified with a different origin.

Continue to the next section 26.2.6 Title Block or return to 26 PPF Editors.

26.2.6 Title Block

12d Model plots are considered to be drawn onto a sheet of paper with the origin (0,0) in the bottom left hand corner and with drawing units of millimetres. So when any plot is generated from ***12d Model***, the data is translated and scaled so that it fits onto the positive quadrant with (0,0) in the left hand corner.

This means that linework and text to make up title blocks and other data can be accurately positioned to overlay a ***12d Model*** plot.

For most plots, users can select to have a Standard ***12d*** title block, or use their own Title blocks that have been stored in ***title block files*** (tbf).

The format for the title block information is a subset of the ***12da*** format with the special header of ***title_block*** and the units inside the tbf are considered to be millimetres.

So inside the ***tbf*** file, the set of all title block drawing commands is enclosed within a set of curly brackets **{ }** with the special header

title_block

before the curly brackets.

That is,

```
title_block   {
              title block drawing commands in 12da syntax

}
```

The easiest way to create a ***tbf*** file is to create the title block information is to use ***12d Model*** and draw up the title block in a model, or a view of models, and then write the models out to a ***tbf*** file using the **Create/Edit Title Block File** panel (*Plot =>Plotting setups =>Create/edit title block file* or *Drafting => Create title block file. See* 25.7.1 Create/Edit Title Block File).

Because the units for plots are millimetres, the units for the title block drawing commands are taken to be millimetres**.**

So for the purpose of drawing up a title block in a ***12d Model*** model, the (0,0) for the ***model*** corresponds to the **origin** (0,0) of the plot, and the distances are taken to represent millimetres so you do everything in World units and multiply all the coordinates and distances as the millimetre value multiplied by 1000.

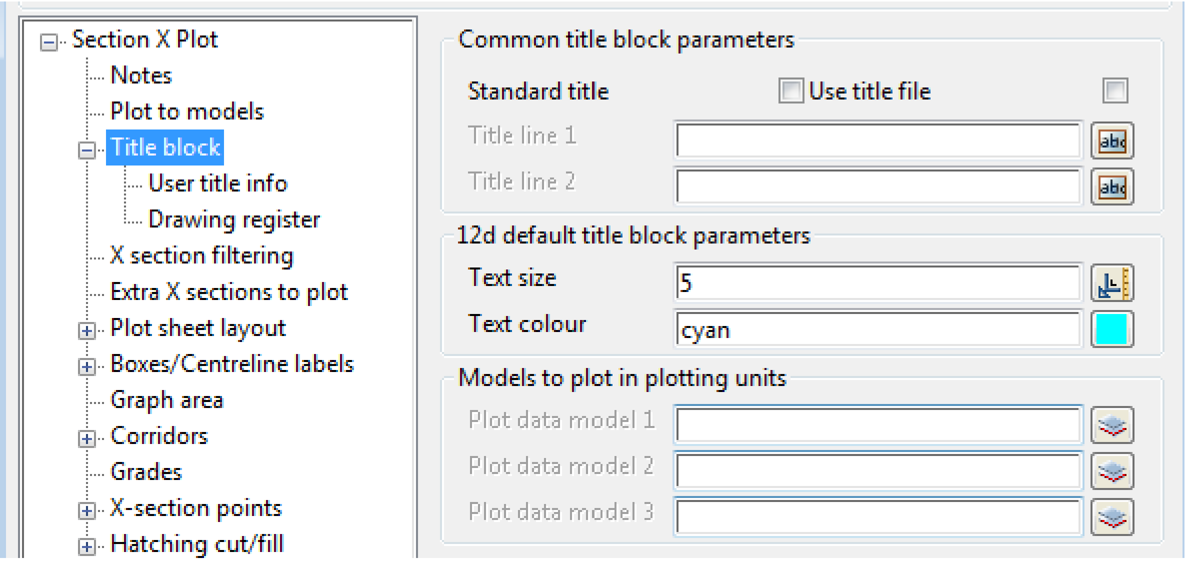
So if text is to be 5 mm high in the title block, then draw text in world units and of size 5. Do not use paper size. If a line is to be 200 mm long, then draw it as 200 World Units.

So for any lines and text drawn up in a model as part of a title block, think of the World units as representing millimetres rather than metres.

Continue to the next section 26.2.6.1 Title Block Section in PPF Editors or return to 26 PPF Editors.

26.2.6.1 Title Block Section in PPF Editors

Each of the **PPF Editors** has a **Title Block** section which is the same for each of them.



See:

26.2.6.1.1 Title Block Node
26.2.6.1.3 Title block - User title info
26.2.6.1.4 Title Block - Drawing Register

For general information about a title block, see 26.2.6 Title Block.

26.2.6.1.1 Title Block Node

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Common title block parameters

Standard title	plot_border	tick box	

if ticked, a standard 12d title block will be used.

Use title file	use_title_file	tick box	

if ticked, a user defined title file is used.

Title line 1	title_1	text box	

if **Standard title** *is ticked,* **Title line 1** *is the first line of title text. If* **Use title file** *is ticked,* **Title line 1** *is substituted for the title block variable* $title_1.

Title line 2	title_2	text box	

if **Standard title** *is ticked,* **Title line 2** *is the second line of title text. If* **Use title file** *is ticked,* **Title line 2** *is substituted for the title block variable* $title_2.

Section: 12d default title block parameters

Text size	title_text_size	measure box	

text size of title text.

Text colour	title_colour	colour box	available colours

colour of title text.

Section: Model to plot in plotter units

Plot data model 1, 2, 3	plot_model	model box	available models

if not blank, the models are plotted as part of the plot.

The Units for the **Plot data model** *are to be in World Units but each unit* ***is taken to represent a millimetre*** *when plotted. So a height of* ***5*** *represents 5mm on the plot. (0,0) in the* **Plot data model** *corresponds to (0,0) in the plot. Paper Units should not be used in Plot data models.*

For more information on plot data models, see 26.2.6.1.2 Plot Data Models.

Continue to:

26.2.6.1.3 Title block - User title info
26.2.6.1.4 Title Block - Drawing Register

Or return to 26.2.6 Title Block or 26 PPF Editors.

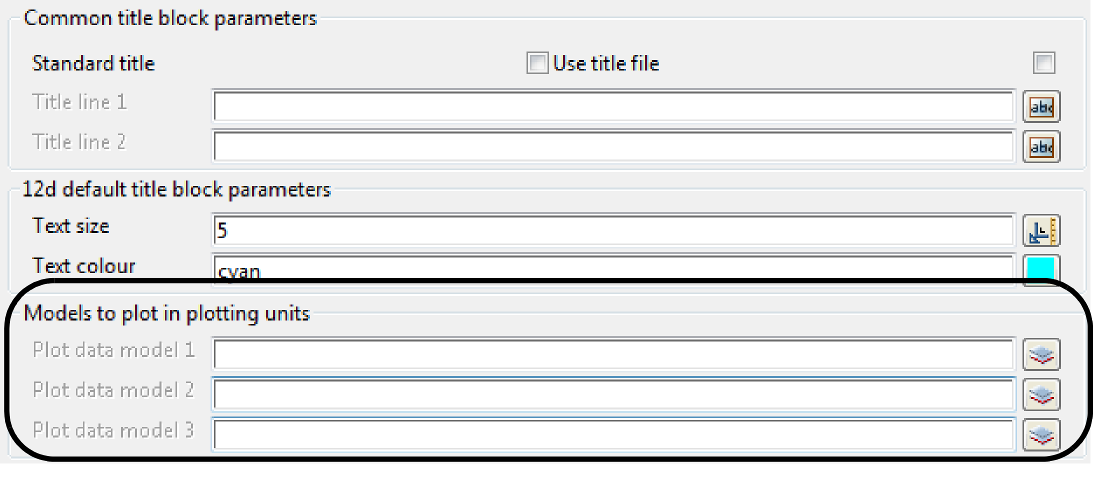
26.2.6.1.2 Plot Data Models

A sheet of paper on a plotter has (0,0) in the bottom left hand corner and the units of millimetres.

So when any plot (plan, plot frame, long section, cross section, drainage network longsection, Melbourne Water longsection or pipeline longsection) is generated from ***12d Model***, the data is effectively translated and scaled so that it fits onto a sheet of paper with (0,0) in the left hand corner, and the drawing units are millimetres.

If a title block is drawn, either using either the *Standard Title* or taking the title drawing information from a *User Defined Title File*, the title block is also drawn onto the sheet of paper with the drawing units of millimetres.

In each of the ***Title Block*** nodes in the plot ***PPF Editors***, models can be given in the ***Plot data model*** fields and these models are also drawn onto the plot sheet.



Because of the special nature of the plot sheet, the Origin (0,0) of a ***Plot data model*** is matched to the origin of the plot sheet, and the ***World Units*** in the ***Plot data model*** are taken to be ***millimetres*** on the plot sheet. This applies to strings, text, linestyles and symbols in World units. So a height of **5** world units represents 5mm on the plot. (0,0).

For text, linestyles and symbols defined in ***Paper units*** (millimetres), one Paper unit in a ***Plot data model*** still ends up as one millimetre on the plot.

There is also ***no clipping*** done when plotting the ***Plot data model.***

So like the Title Block, the ***Plot data models*** are simply an overlay that is plotted on top of the paper plan/long section/x section plot that has just been generated.

Special Notes

1. If the ***Plot data model*** is added to a *Plan View* (for creating, editing *etc*), then the ***Plotting scale*** for the *Plan view* needs to be ***1000*** so that any text, linestyles and symbols defined in *Paper Units* are drawn at the correct size to in relation to the other *World Units* data in the model, and hence as they would appear on a final plot.
2. When ***plotting to a model:***

(a) for all the data ***other than*** the ***Plot Data Models, 12d Model*** multiplies the millimetre size by 1000 and all text, linestyles and symbols are converted to World Units. So that lengths (distances) in the "model of the plot" represent millimetres on the plot page.

Hence if you plot the "model of the plot", you need to plot with a ***scale of 1:1000*** to get the correct size on the paper plot.

(b) for the ***Plot Data Models***, a copy of the ***Plot data model*** is simply added to the model containing the plot

Because the ***Plot data model*** is simply an overlay with no change of scale and is not clipped, then in the special case of ***plotting to a model***, a copy of the ***Plot data model*** is simply added to the model containing the plot. So World text, linestyles and symbols stay as World text, linestyles and symbols. And text, linestyles and symbols in Paper units stay as text, linestyles and symbols in Paper units.

3. When you ***plot to a model*** and then display the "model of the plot" on a *Plan View*, the ***Plotting scale*** for the *Plan View* needs to be **1000** so that text, linestyles and symbols that have come from the ***Plot data model*** and are defined in *Paper Units* display as they would appear in a final paper plot.
4. If you ***plot to a model***, and then add the model of the plot to a Plan View and plot the "model of the plot", ***all*** the linestyles and symbols will be exploded into lines and arcs.

When creating data in a ***Plot data model***, to save confusion it is easiest to create all the data, text, linestyles and symbols in World units, and to think of the World unit as being millimetres.

However many ***12d Model*** users have many of their linestyles and symbols defined in Paper units and then can be used in the ***Plot data model*** as long as the ***Special Notes*** are remembered.

Return to 26.2.6.1.1 Title Block Node.

26.2.6.1.3 Title block - User title info

The parameters shown below are subject to the appropriate title block variables existing in the title file. For more information on these variables see the section 26.2.6.2 Title Block Variables.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: User title block parameters

Title file title_file file box available title files

specifies the name of the title file to use. If a valid title file exists, the specified **Name** *values will be filled out in the grid using the title block variable* $user_text_n.

Name output

the alias for the nth user text specified in the title file.

Value user_text_n text box

the alias text to be substituted in for the user text specified.

Time format time_format text box

the time format relates to the $time *title block variable. For more information on the time formats see the section* 26.2.6.6 Specifying the Format for $time.

Start page number start_page_number integer box

used as the starting value for the title block variable $page_number.

If missing, $page_number *starts at 1.*

Start drawing number start_drawing_number integer box

used as the starting value for the title block variable $drawing_number. *If missing,* $drawing_number *starts at 1.*

Drawing number prefix drawing_number_prefix text box

the value entered is used for the title block variable $drawing_number_prefix.

Drawing number postfix drawing_number_postfix text box

the value entered is used for the title block variable $drawing_number_postfix.

Continue to 26.2.6.1.4 Title Block - Drawing Register or return to 26.2.6.1 Title Block Section in PPF Editors or 26 PPF Editors.

26.2.6.1.4 Title Block - Drawing Register

These parameters are for using a **Drawing Register** to be used to provide information for the title block. More detailed information is given below after defining the parameters on the node.

The columns for the fields documented in the sections are for.

Panel Field | **Parameter name** | **Type** | **Pop-Up**

Section: Drawing register parameters

Register type | drawing_register_type | choice box | Excel

the type of file that is being used for the drawing register.

Register file | drawing_register_file | file box

name of the register file.

Worksheet | drawing_register_excel_sheet | text box

*if **not blank** and the* **Register type** *is **Excel**, name of the register file, the name of the Worksheet of the spread sheet to use.*

Grid

name of the register file.

Name | text grid cell | text entry

name of the register file.

Value | text grid cell | text entry

name of the register file.

Many people use database tables, such as an Excel spreadsheet, to provide information for the title blocks of the plots. For example, for special drawing numbers and drawing revision. This database is often known as a ***Drawing Register***.

For example, in an Excel spreadsheet, the columns of the spreadsheet would have unique names to refer to the information in each column, and each row of the spreadsheet holds the information for a single, specific plot.

	A	B	C	D
1	PLOT FILE	DRG#	TITLE	REV
2	plot_xs_MC01_1	12345678-5-1	CROSS SECTIONS MC01	C
3	plot_xs_MC01_2	12345678-5-2	CROSS SECTIONS MC01	C
4	plot_xs_MC01_3	12345678-5-3	CROSS SECTIONS MC01	C
5	plot_xs_MC02_1	12345678-5-4	CROSS SECTIONS MC02	C
6	plot_xs_MC02_2	12345678-5-5	CROSS SECTIONS MC02	C
7	plot_ls_MC01_1	12345678-6-1	LONGITUDINAL SECTION MC01	C
8	plot_ls_MC01_2	12345678-6-2	LONGITUDINAL SECTION MC01	C
9	plot_ls_MC02_1	12345678-6-3	LONGITUDINAL SECTION MC02	C
10	plot_dr_ls_1	12345678-7-1	DRAINAGE LONGITUDINAL SECTIONS	C
11	plot_dr_ls_2	12345678-7-2	DRAINAGE LONGITUDINAL SECTIONS	C
12	plot_dr_ls_3	12345678-7-3	DRAINAGE LONGITUDINAL SECTIONS	C
13				
14				

information to use for the one plot

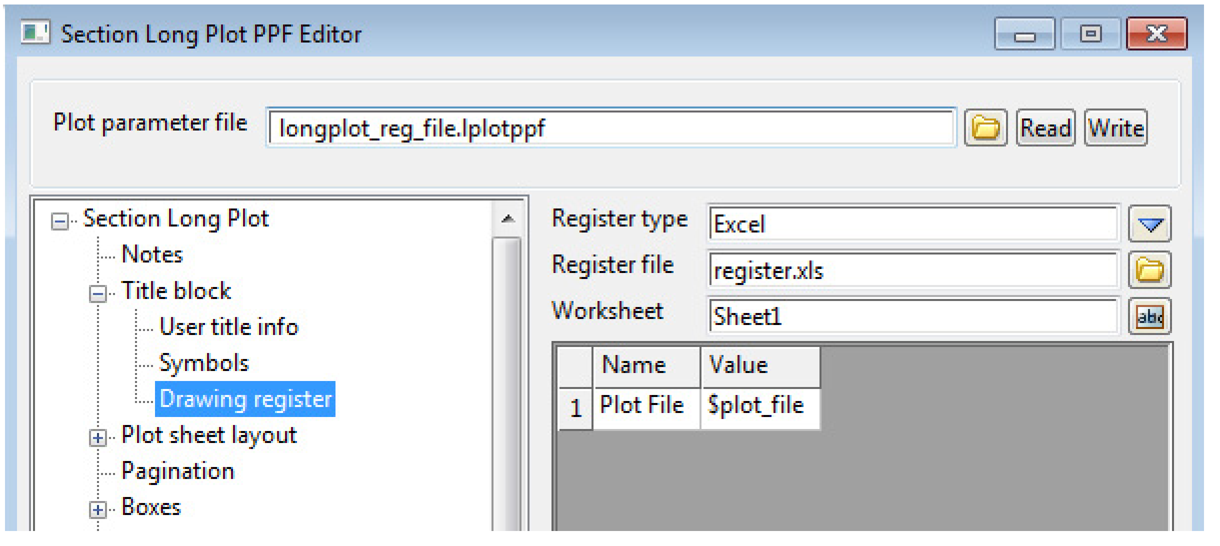
The **Drawing Register** node in the ***PPF Editor*** specifies the type and name of the database to be used to retrieve information from, and enough information to determine what row of the database table is to be used to supply information for the title block of a specific plot.

For example in the spreadsheet above, the *plot file name* will identify a particular plot, and the information in each of the columns from the rest of the row is the drawing number (**DRG#)**, Title (**TITLE**) and Revision (**REV**) for that plot.

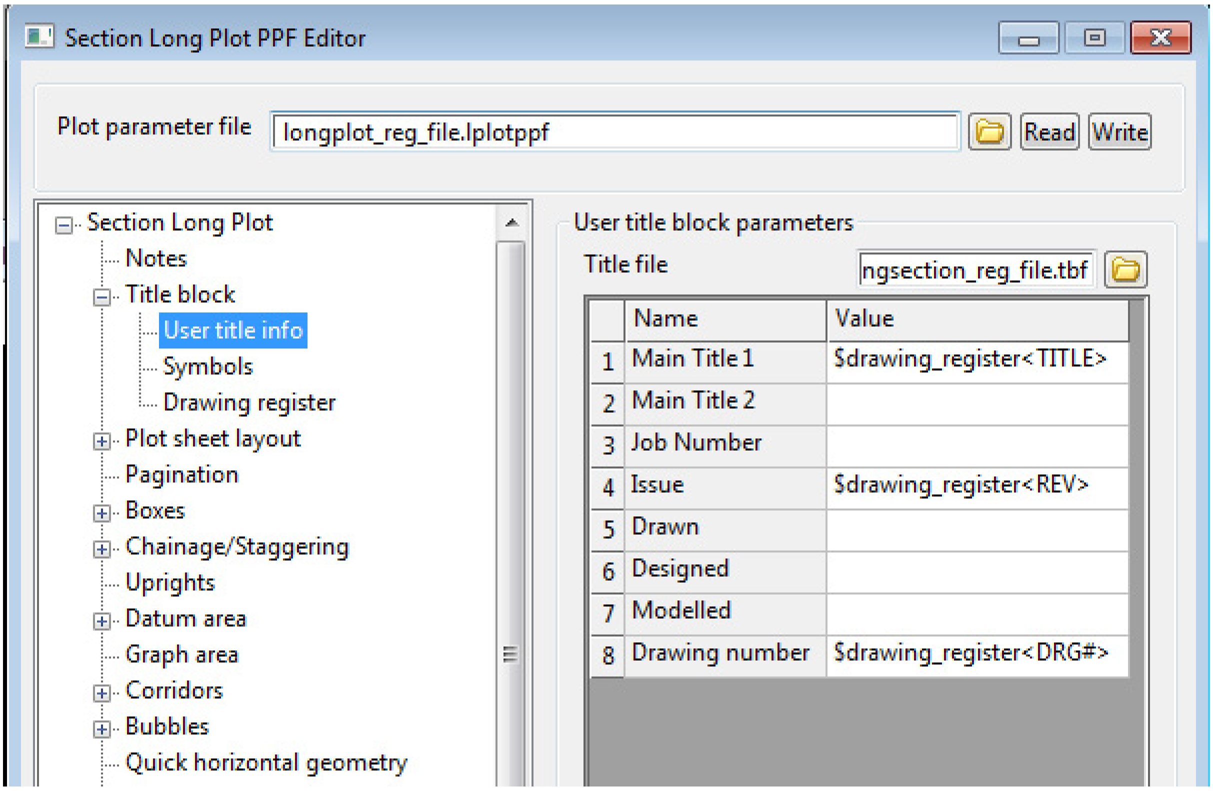
Once the ***Drawing Register*** node has been set up to identify a row of the spreadsheet, the title block variable to extract the information for column ***column_name*** from that row of the drawing register is

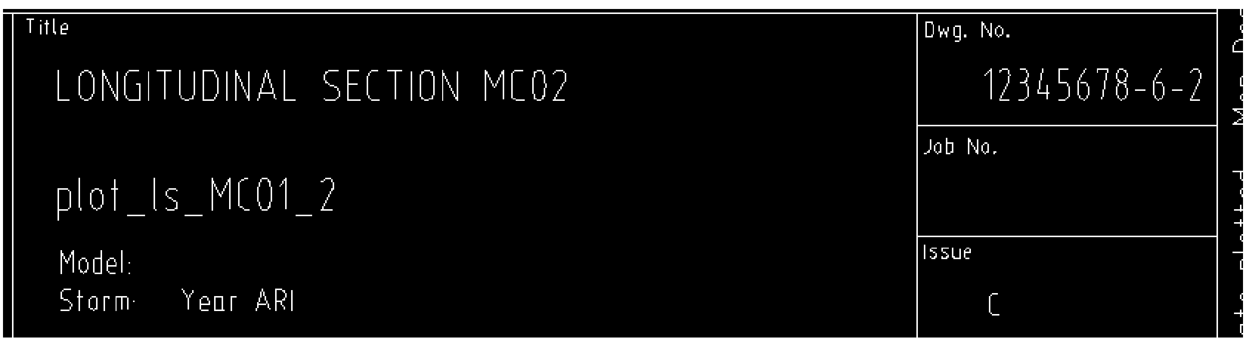
$drawing_register<column_name>

So the ***Drawing register*** node of a *Long Section Plot PPF* could be



and this could be used in a **User tile info** node as:





Continue to 26.2.6.2 Title Block Variables or return to 26.2.6.1 Title Block Section in PPF Editors or 26 PPF Editors.

26.2.6.2 Title Block Variables

For title blocks, the **text** drawing command has been extended so that they can use special information such as the project name, project details, current date and time, plotting scales *etc*. can be automatically inserted into the title block at plot time.

To achieve this, special **title block variables** have been defined and wherever these variables appear in a title block **text**, they are expanded to their defined value at the time of plotting.

Hence the title block variables are simply place markers which have text values substituted for them when the title block file is used in a plot.

The title block variables all begin with a **$** and are followed by either another title block variable or a single space. For example, in the 12da string definition, the line is

text “user text ***$variable*** more user text”

or

text “user text ***$variable_1*** more user text ***$variable_2*** more user text ”

For example

text "Project $project"

will write out the word "Project " followed by the name of the project.

Note - colour, style, xfactor, slant, offset *etc*. are all assigned as part of the ***12da*** string definition.

List of Title Block Variables

See:

Project Name
Project Details
Folder Details
Plot Details
Drawing Register Details
PPF Details
Model Details - for the Drainage Long-section Plot only

Project Name

$project // the current project

Project Details

Project details which are entered by the user for each project (and defined by the option **Project =>Details =>Details**) can be included in the title block and are specified as *title block variables* by beginning with ***$project_detail*** and then including the *project detail* ***name*** as part of the $project_detail.

$project_detail_*project_detail_name*

where project_detail_name is the name of the project detail as given in the **Projects Detail Editor** (and not the **Display name** which is shown in the **Setup Projects Details** or **Edit Project Details** panels)

For example

text "Client: $project_detail_Client"

will write out the word "Client: " followed by the text in the project detail with the name "Client".

Folder Details

The full path name of the working folder

$folder

Plot Details

The following title block variables take values which are passed down from the plot itself:

$plot_file	// the current plot file
$scale	// for plot frames, the current scale
$horizontal_scale	// for section plots, the current horizontal scale
$vertical_scale	// for section plots, the current vertical scale
$start_chainage	// for section plots, the start chainage for the plot // sheet
$end_chainage	// for section plots, the end chainage of the plot sheet

Drawing Register Details

$drawing_register<column_name>

When a ***Drawing Register*** node has been set up to identify a row of the spreadsheet, the title block variable **$drawing_register** is used to extract the information for column ***column_name*** from that row of the drawing register.

For information on setting up a ***Drawing Register*** node, see 26.2.6.1.4 Title Block - Drawing Register.

PPF Details

The following title block variables take values which are passed down from the **plot parameter file** for the plot

(plot parameter files are described in more detail in the rest of this manual):

$time

The current date and time. The format for the date and time is given by the plot parameter time_format. See the next section for the description of the format.

$title_1, $title_2

$title_1 takes the value from the panel field **title line 1** from the **section x plot title**, **section long plot title** or **plot frame title** panels, or from the parameter **title_ 1** in the plot parameter file.
If title_1 doesn't exist, then $title_1 is blank.

Similarly for $title_2.

$user_text_n where n=1,2,... 1000

$user_text_n takes the value of the parameter user_text_n in the plot parameter file. If user_n doesn't exist, then $user_text_n is blank.

Aliases can also be defined for the $user_text_n which are used in the PPF editors. See the next section 26.2.6.4 Aliases for $User Text on aliases.

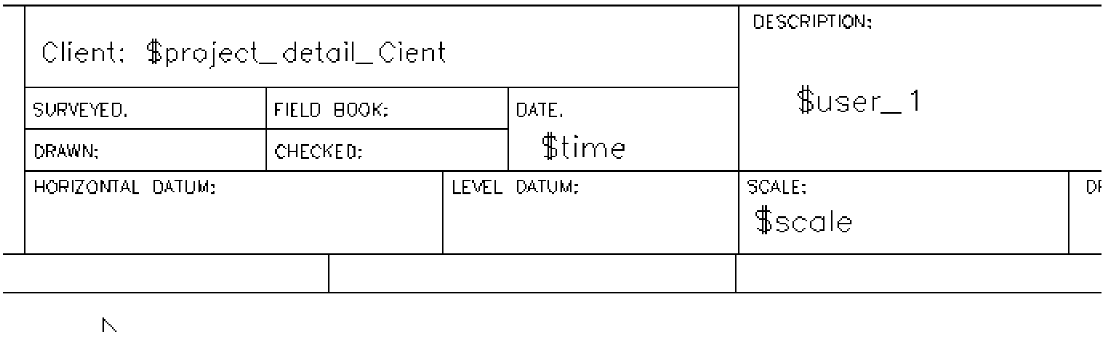
$page_number

$page_number has the starting value one, or the value given by the parameter **start_page_number** from the plot parameter file, and is incremented by one, for each plot produced by the plot option (for example, for each page of a long section plot, for each page of x-section plots or each plot generated from a model of plot frames).

$drawing_number_prefix, $drawing_number, $drawing_number_postfix

The values for $drawing_number_prefix and $drawing_number_postfix are passed down from the plot parameter file by the parameters **drawing_number_prefix** and **drawing_number_postfix** respectively.

$drawing_number has the starting value one, or the value given by the parameter **start_drawing_number** from the plot parameter file, and is incremented by one for each plot produced by the plot option (for example, for each page of a long section plot, for each page of x-section plots or each plot generated from a model of plot frames).



Example of Model with Title Block Variables

Notes

1. For plot frames, the horizontal_scale and vertical_scale are given the current scale, and $start_chainage and $end_chainage are ignored.
2. For section plots, $scale is ignored.

Model Details - for the *Drainage Long-section Plot* only

The following title block variables take values from the model containing the drainage network.

$model_name
The name of the drainage model

$model_event_type
Type of event of last storm analysed ("Minor" or "Major")

$model_return_period
ARI of last storm analysed.

Continue to 26.2.6.3 Ad Hoc Queries or return to 26.2.6 Title Block or 26 PPF Editors.

26.2.6.3 Ad Hoc Queries

It is possible to extract information from some external data sources to use in ***User Title Block*** variables, or directly in the title block file, to place in the title blocks of plots.

Data can be extracted from

(a) Excel spreadsheets

(b) XML files

(c) Databases supporting ODBC

The external data can be accesses in a completely user definable way, known as an **Ad Hoc Queries**.

For each different data source, there is a different method to specify how to identify the bit of information needed from the database.

See

26.2.6.3.1 EXCEL
26.2.6.3.2 XML
26.2.6.3.3 ODBC (Open Database Connectivity)

26.2.6.3.1 EXCEL

The Excel spreadsheet to extract information from **must** have the **first row as a header row** with the names of each column in it so row (n+1) is only the n'th row of actual information.

The format to retrieve the cell X(n+1) from the Sheet ***sheet_n*** is

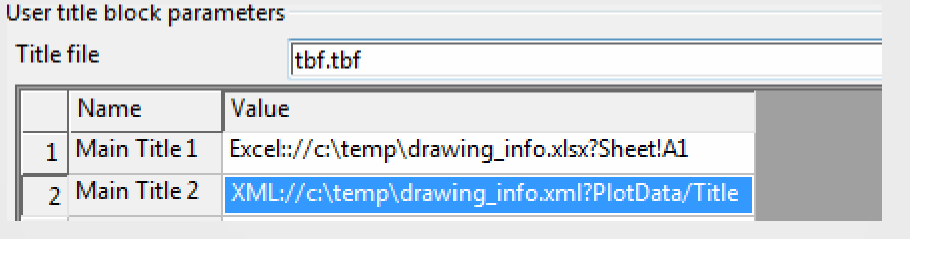
Excel://Full_Path_To_Excel_File?sheet_n?Xn

It is **Xn** is because the first row of the spreadsheet is the header row so Xn is referring to the n'th row of actual information but that is the (n+1) row in the spreadsheet.

For example,

Excel://c:\temp\drawing.info.xslx?Sheet1?A1

will open the Excel file ***c:\temp\drawing.info.xslx*** and get Cell **A2** from the sheet **Sheet 1**.



Return to 26.2.6.3 Ad Hoc Queries

26.2.6.3.2 XML

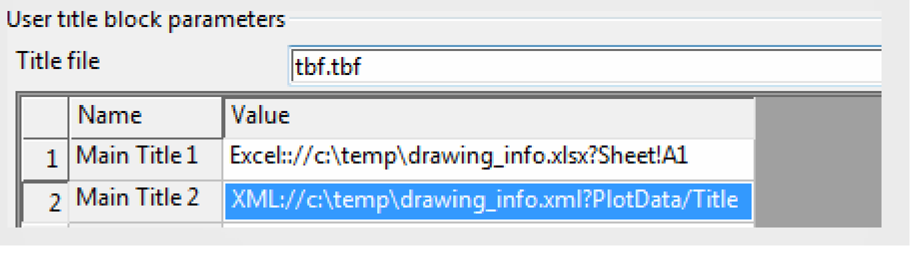
The format to retrieve the value of the element **sub_elt** inside the element **elt** is

XML://Full_Path_To_XML_File?elt/sub_elt

For example,

XML://c:\temp\drawing_info.xml?PlotData/Title

will open the XML file ***c:\temp\drawing_info.xml*** and extract the value of the Title element below the element PlotData.



So from the xml file

<PlotData>

<Title>My Title</Title>

<Client>12d</Client>

etc

</PlotData>

it will get the value "My Title"

Return to 26.2.6.3 Ad Hoc Queries

26.2.6.3.3 ODBC (Open Database Connectivity)

The format to retrieve information from a database is

ODBC://ConnectionString?Query

Unfortunately the format of the **ConnectionString** and the **Query** to pull data from a database is totally dependent on the database system.

But it would resemble something like

ODBC://DSN=MyDBDsn?SELECT Title FROM PlotData WHERE PlotType = ‘long’

ODBC is for advanced users only, and the user must be familiar with the requirements of the end database system.

Return to 26.2.6.3 Ad Hoc Queries

26.2.6.4 Aliases for $User Text

12d Model user defined title blocks can include up to 1,000 markers for placing *user defined text* ($user_text_n where n can be from 1 to 1000) which is only substituted for actual text at plotting time. Because of the difficulty of knowing exactly what *$user_text_n* stood for when the title block is being plotted, the concept of aliases has been introduced.

For example, instead of referring to $user_text_4, an alias can be defined to use the "Engineers name:" instead.

The definition of *$user_text_n* in a title block file has been ***extended*** so that it also includes any ***alias*** for the *$user_text_n.*

To define an alias for the $user_text_n in the title block file, simply replace the

"_n" by "<n, for the alias>"

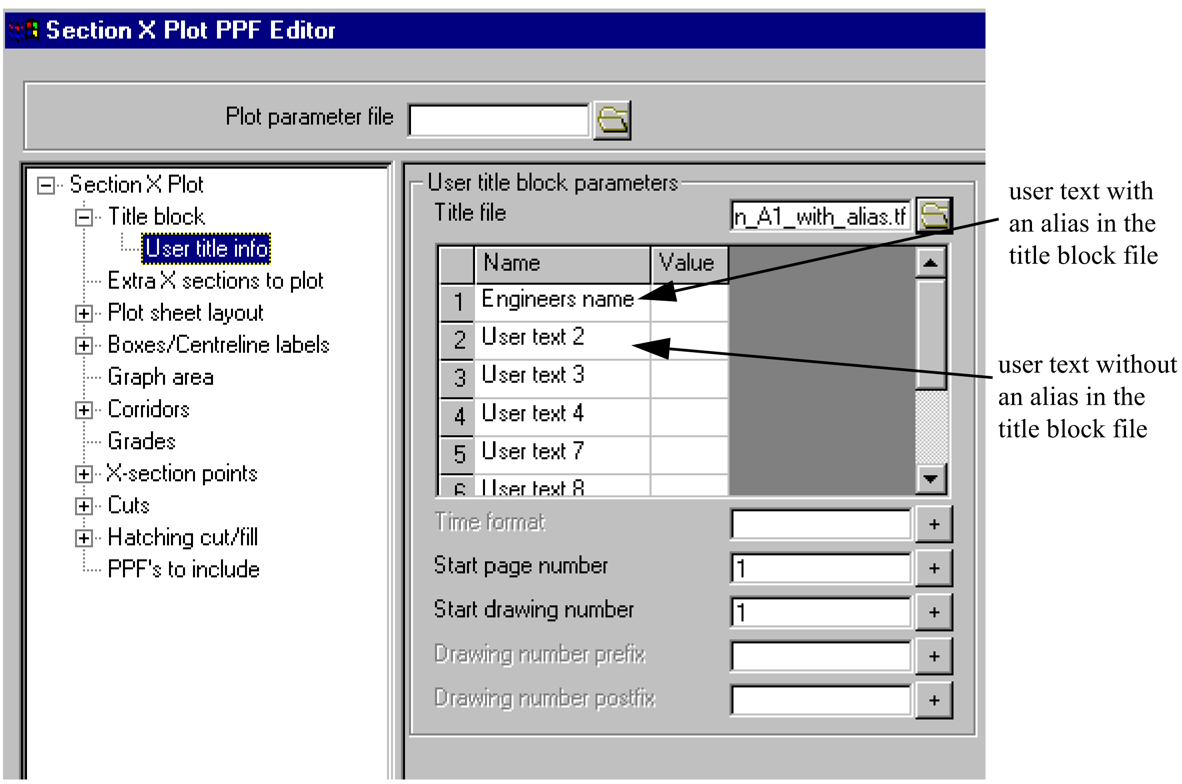
For example, if *$user_text_1* is to have the alias "Engineers name", the title block file would now contain:

text "$user_<1,Engineers name:>"

The title file and aliases work seamlessly with the interactive PPF editors and Plotters (which are described in their own sections). In the *Title block* section of the interactive PPF editors and Plotters, the user defined title block file is *scanned* for any *$user_text* in it and it is presented as a grid containing all the $user_user_text's in the title block with a column to fill in the values that the user wants to be plotted.

If the format *$user_text_n* is in the title block file, it is displayed as *"User text n" in the PPF editor*. If an *alias* exists, then the *alias* is displayed instead of "User text n".

For example, using the *$user_text<1,Engineers name>* in a title block file will give:



Continue to 26.2.6.5 Values Used for Defaults when Creating Plot Frames or return to 26.2.6 Title Block or 26 PPF Editors.

26.2.6.5 Values Used for Defaults when Creating Plot Frames

There are special parameters that are written in an **info block** at the top of title block file that are used as defaults for fields in the option **Plots=>Plot frames=>Create.**

They are

```
info {
   text  "plot_frame_name"              plot_frame_name
   text  "plot_frame_model"             plot_frame_model
   text  "plot_frame_sheet_size"        plot_frame_model
   text  " plot_frame_colour"           plot_frame_colour
   text  " plot_frame_scale"            real_number
   text  "plot_frame_angle"             real_number
   text  "plot_frame_left_margin"       real_number
   text  "plot_frame_right_margin"      real_number
   text  "plot_frame_top_margin"        real_number
   text  "plot_frame_bottom_margin"     real_number
   text  "plot_frame_viewport"          0 or 1
}
```

Continue to 26.2.6.6 Specifying the Format for $time or return to 26.2.6 Title Block or 26 PPF Editors.

26.2.6.6 Specifying the Format for $time

The format for $time is passed down by the plot parameter **time_format**.

time_format *format* // format for $time

The format consists of one or more codes and the formatting codes are preceded by a percent sign (%). Characters that do not begin with a % are copied unchanged.

%a	abbreviated weekday name
%A	full weekday name
%b	abbreviated month name
%B	full month name
%c	date and time representation for locale
%d	day of month as decimal number (01 - 31)
%H	hour in 24-hour format (00 - 23)
%I	hour in 12-hour format (01 - 12)
%j	day of year as decimal number (001 - 366)
%m	month as decimal number (01 - 12)
%M	minute as decimal number (00 - 59)
%p	current locale's A.M./P.M. indicator for 12-hour clock
%S	second as decimal number (00 - 59)
%U	week of year as decimal number, with Sunday as first day of week (00 - 51)
%w	weekday as decimal number (0 - 6; Sunday is 0)
%W	week of year as decimal number, with Monday as first day of week (00 - 51)
%x	date representation for current locale
%X	time representation for current locale
%y	year without century, as decimal number (00 - 99)
%Y	year with century, as decimal number
%z, %Z	time-zone name or abbreviation; no characters if time zone is unknown
%%	percent sign

The # flag may prefix any formatting code and the meaning of the format code is changed as follows

Format Code	Meaning
%#c	long date and time representation, appropriate for current locale. For example, "Tuesday, March 16, 1993,12:41:29"
%#x	long date, appropriate for current locale. For example, "Tuesday, March 16"
%#d, %#H, %#I, %#, %#m, %#M, %#S, %#U, %#W, %#y, %#Y	Remove leading zeros (if any).
%#a, %#A, %#b, %#B, %#p, %#X, %#z, %#Z, %#%	# flag is ignored

Examples

The format to give the date in the form dd/mm/yy (06/09/97) is "%d/%m/%y"

If you want to remove leading zeros from the day and month (6/9/97) "%#d/%#m/%y"

Continue to 26.2.6.7 Example of a Title Block File or return to 26.2.6 Title Block or 26 PPF Editors.

      }
    }
  }
```

Return to 26.2.6 Title Block or 26 PPF Editors.

26.2.7 Corridors

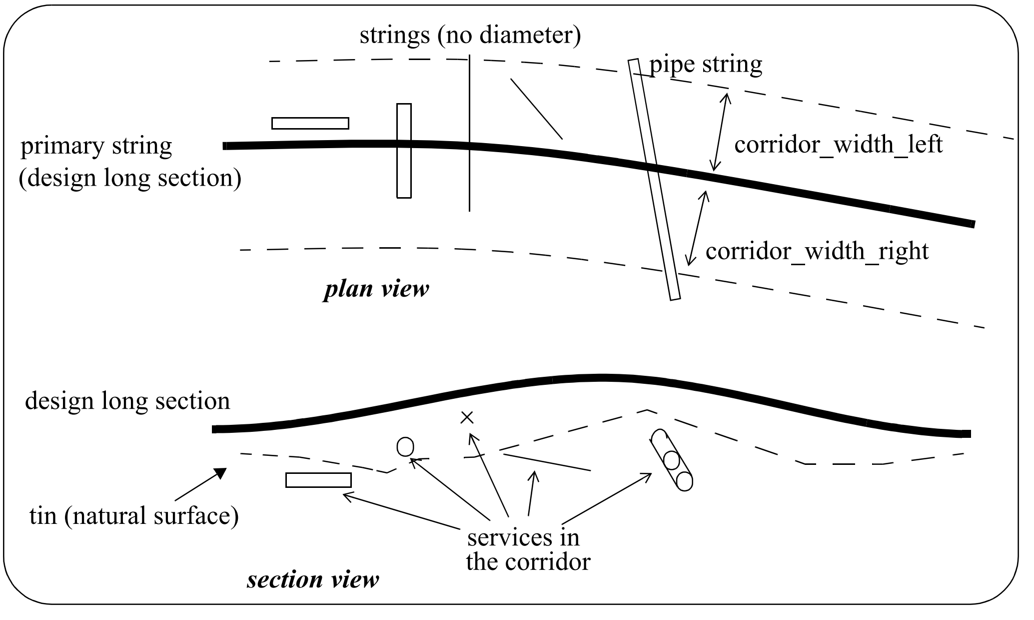
A corridor around the primary string is defined by giving a left and right corridor width.

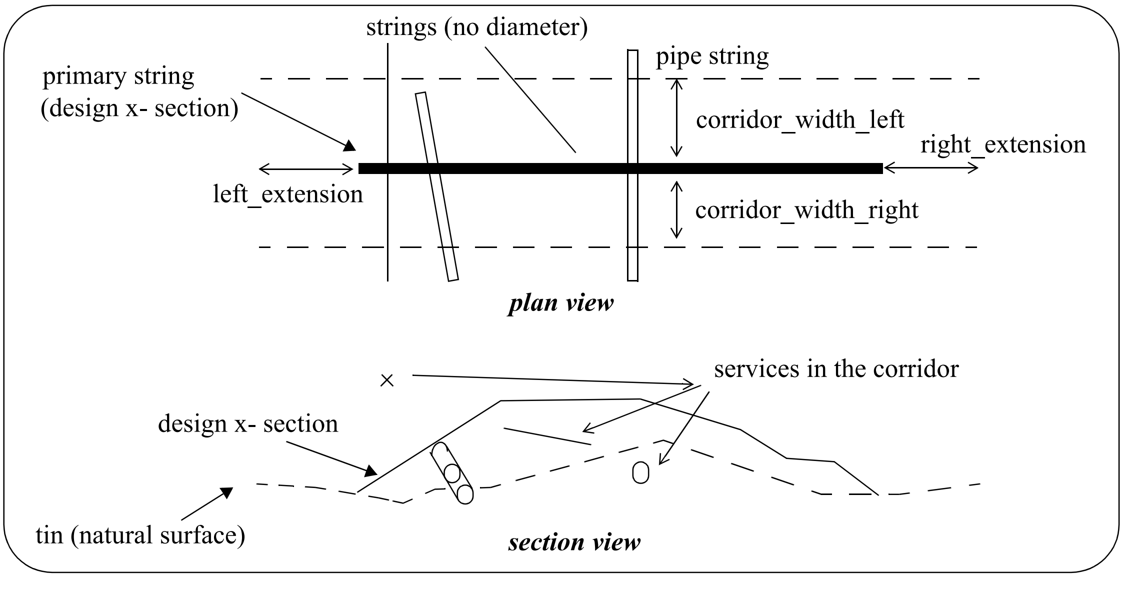
Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the long section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

For a **long section plot**, the primary string is the string being plotted.

For a **x section plot**, the primary string is the string currently being plotted in the x section sub plot.

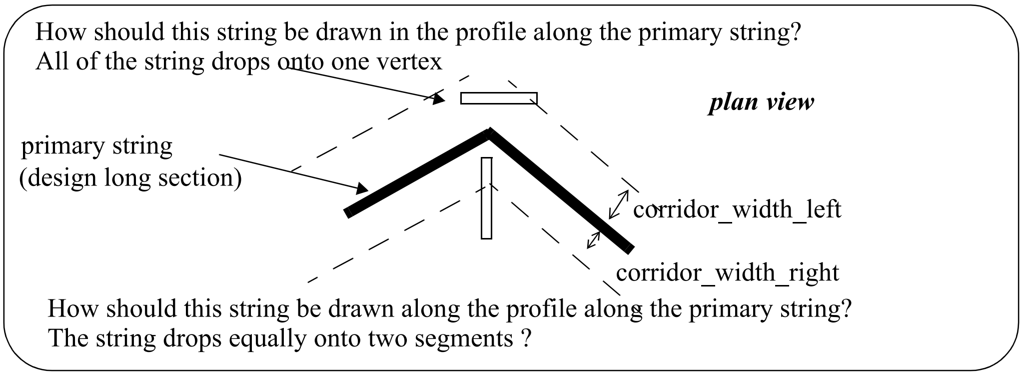




Warnings:

When the primary string is not a straight line in plan, then how the strings in the corridor project onto the primary string in the plot is not always well defined. Where every possible the ends of the string are dropped perpendicularly onto the primary string.

However if the primary string have sharp angles in it in plan, then dropping perpendicular may not be possible and dropping to the closed vertex is all that could be done. This means that many points on a string may drop onto the sam point on the primary string.



The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Corridor parameters

Left corridor width (world units) corridor_width_left real box
left corridor width

Right corridor width (world units) corridor_width_right real box
right corridor width

Left corridor overlap (world units) corridor_overlap_left real box
left corridor overlap

Right corridor overlap (world units) corridor_overlap_right real box
right corridor overlap

Chord-arc tolerance (world units) corridor_chord_arc real box
chord-arc tolerance used near any bends in the corridor.

Corridors - Model Selection

Section: Corridor - Model selection

Corridor model grid

the grid contains the models of tins and strings (service strings) to be in the corridor and hence draw onto the long section, There can be up to 100 models.

For the parameter corridor_model_n, n is the line number on the grid. that is, n = 1, 2, ... ,100.

Corridor model corridor_model_n model box

models containing tins and service strings to be drawn on the section. There can be up to 100 models.

For the parameter corridor_model_n, n is the row number of the cell in the grid.

Continue to the next section 26.2.8 Hatching Cut/Fill or return to 26 PPF Editors.

26.2.8 Hatching Cut/Fill

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins may be hatched.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Hatching cut/fill - Tin parameters

Define Set # integer box

set number to be used to define different original/new tin sets.

Original tin hatch_original_tin_n tin box

tin_name for original surface

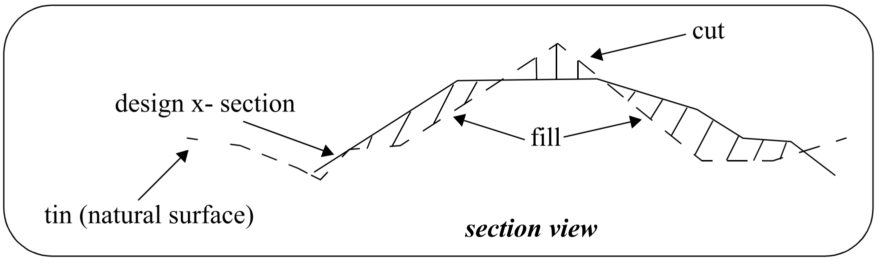
New tin hatch_new_tin_n tin box

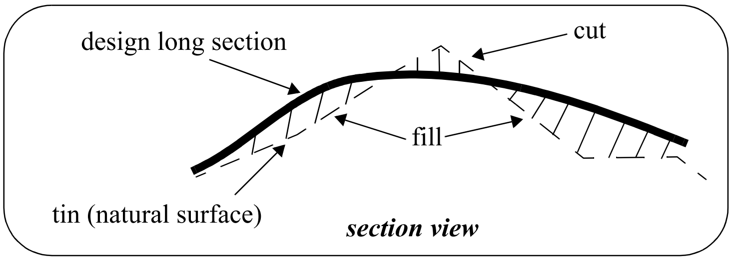
tin_name for final surface

Notes

(a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.

(b) cut hatching is turned off by setting *hatch_cut_separation_n* to 0.0.
fill hatching is turned off by setting *hatch_fill_separation_n* to 0.0.





See

26.2.8.1 Hatching Cut/Fill - Cut
26.2.8.2 Hatching Cut/Fill - Fill

Or return to 26 PPF Editors.

26.2.8.1 Hatching Cut/Fill - Cut

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Hatching cut/fill - Cut parameters

Use Set # **number box**

set number as specified in the **Define set#**.

Cut separation (mm) hatch_cut_separation_n real box

distance between cut hatch lines. If 0, no hatching.

Cut hatch angle (dms) hatch_cut_angle_n real box

angle of hatching.

Cut colour hatch_cut_colour_n colour box

colour of the hatching.

Cut linestyle hatch_cut_linestyle_n linestyle box

linestyle of the hatching.

draw mode for sides of original tin in fill.

Draw new tin hatch_fill_draw_new_n choice box

draw mode for sides of new tin in fill.

Continue to the next section 26.2.9 Cuts or return to 26 PPF Editors.

26.2.9 Cuts

The cuts that the primary string makes though strings in any user-specified model, can be automatically labelled on the x-section/long section plots.

The **height**, **offset/chainage name**, **attributes**, **diameter**, **x** and **y coordinates**, **3d length of CL until cut point** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

For a **x section plot,** the **offset position** for the labelling is the offset on the primary string where it cuts the string.

For a **long section plot**, the **chainage position** for the labelling is the chainage on the primary string where it cuts the string.

The height position for the labelling can be specified as the:

(a) top of the boxes

(b) above the maximum height of the strings on the plot,

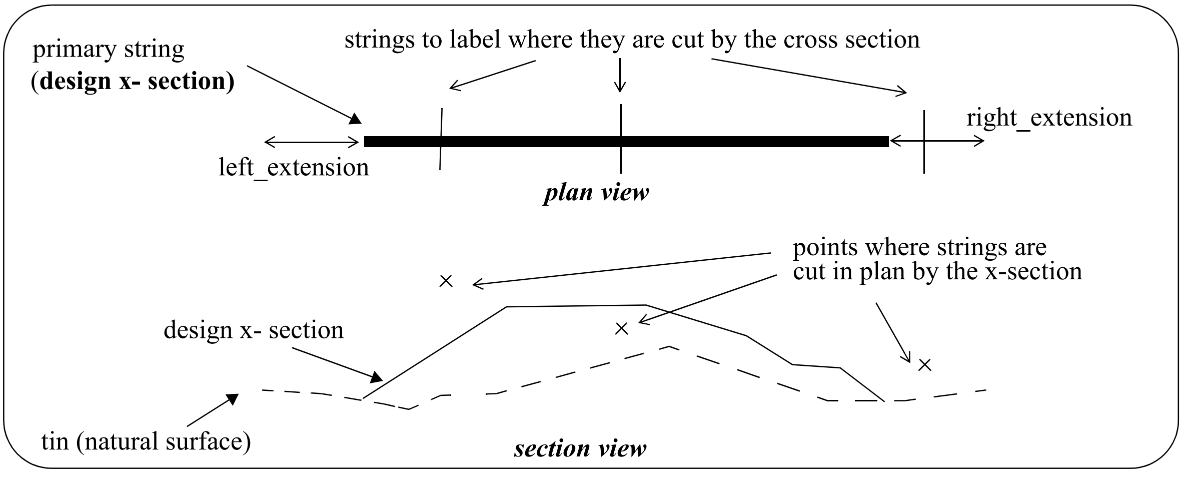
(c) height value of the cut string,

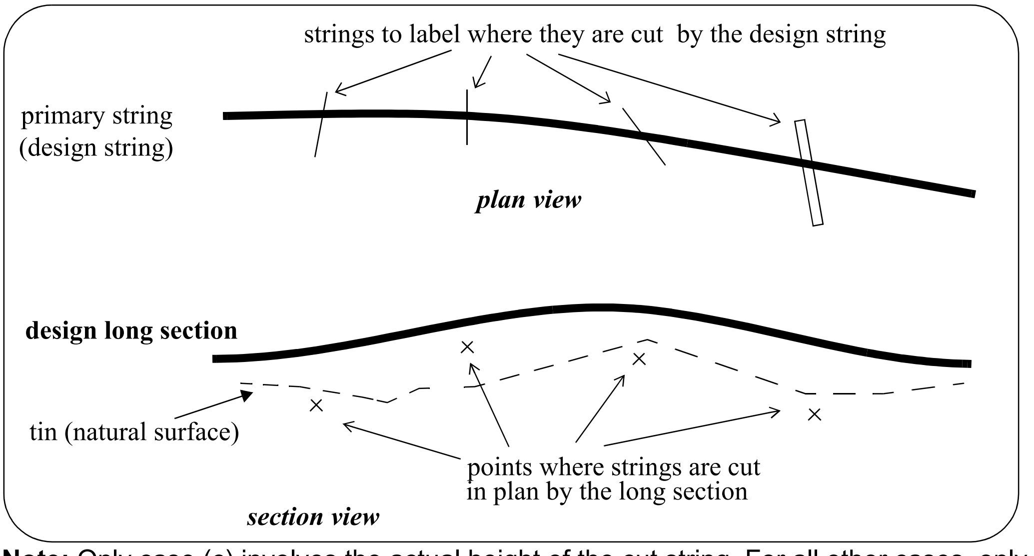
(d) diameter value of the cut string,

(e) height of the primary string,

(f) height of a tin.

The actual position of the label is defined relative to the above point.





Note: Only case (c) involves the actual height of the cut string. For all other cases, only the offset/chainage of the cut string is used. Hence, for all cases except (c), the string does need to have a sensible height to be used for cuts through strings. For example, a boundary string may have null heights but only the offset is required and the height of the tin at that offset can be used as the height (case (e)).

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose names match the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

See

26.2.9.1 Cuts - Model/Name mask parameters

Section: Cuts - Model/Name mask parameters

Define Set # *number box*

set number to be used to define different model/mask sets.

Model cuts_n_model model box

model from which cut masks are derived

Name mask cuts_n_mask text box

text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.
For example: "ke" or,*
"?bank" or, if both masks are required,*
"ke ?bank*"*
If cuts_n_mask is blank, then all strings in the model are used. This is equivalent to name mask being set to "".*

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the x-sections/longsection, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the nth set.

Double clicking on a choice in the list will take you to the relevant section of the tree and the relevant parameter on the right side of the panel.*

Return to 26 PPF Editors.

26.3 Section X Plot PPF Editor

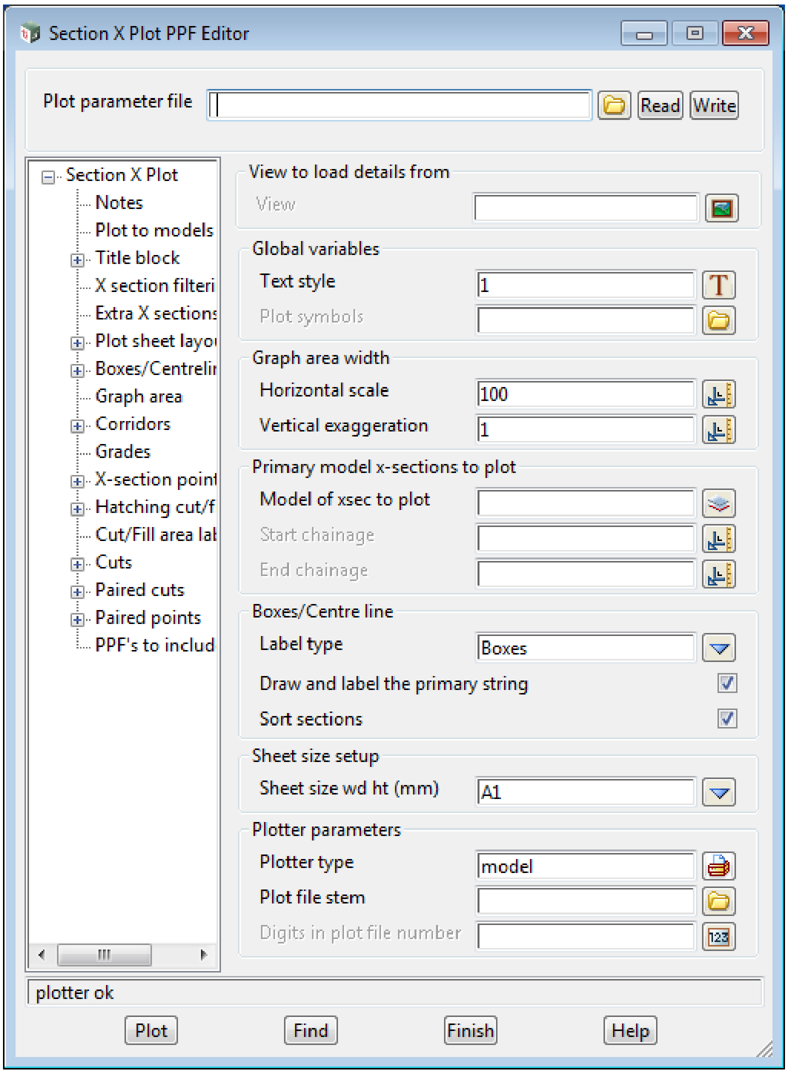
Position of option on menu: **Plot =>Plot and PPF Editors =>Cross sections**

The **Cross Sections PPF Editor** is for creating and/or editing a (binary) X-section PPF and for creating a cross section plot.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the text PPFs were).

On selecting the **Cross sections** option, the **Section X Plot PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding the appropriate node in the ***Section X Plot*** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the information to fill in is displayed on the right hand side of the panel.



For information on all the different nodes see:

26.3.1 General Information on Cross Section Plots
26.3.2 Section X Plot - Front Page
26.3.3 Notes - X-Section
26.3.5 Title Block - X Section
26.3.6 X Section Filtering

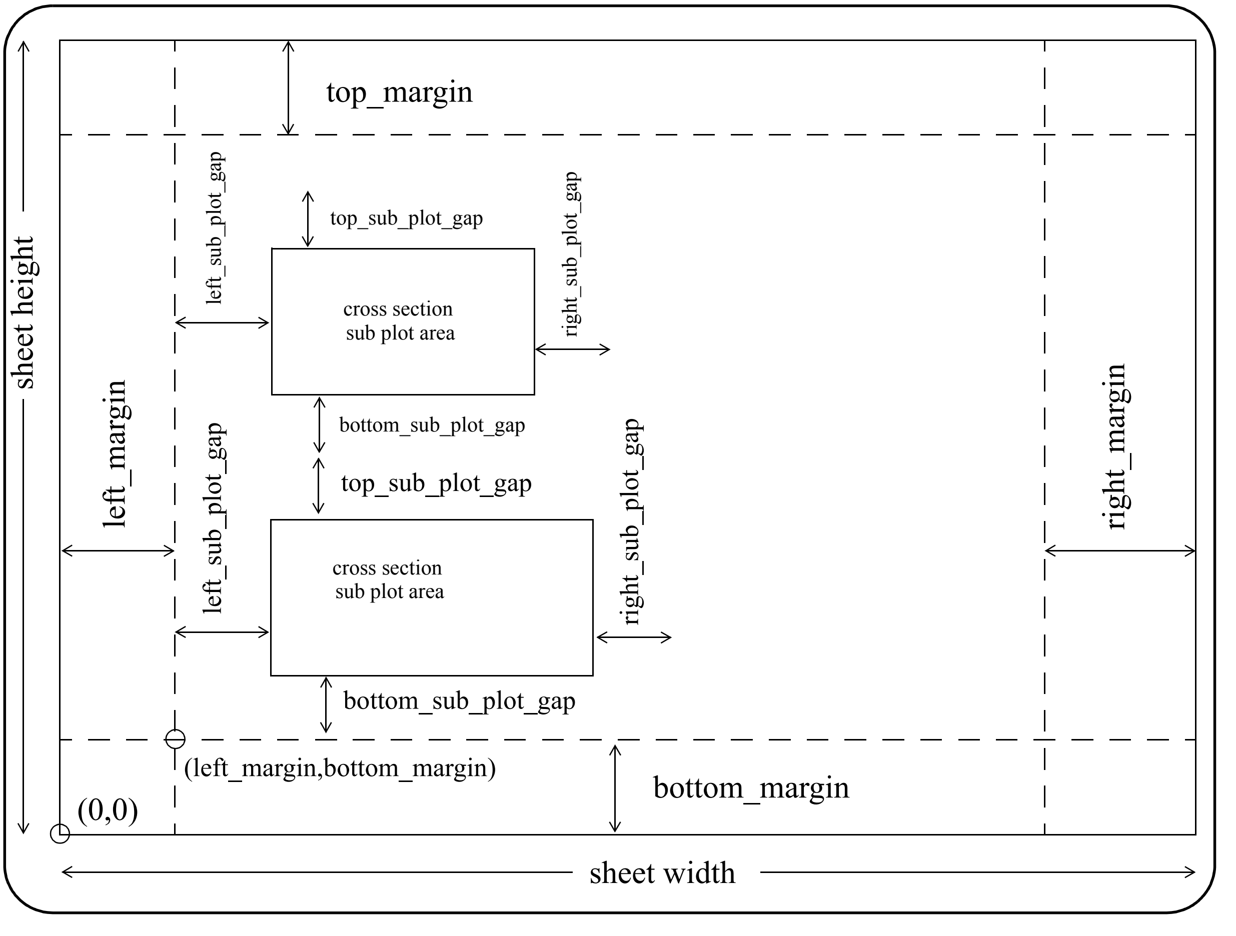
26.3.1 General Information on Cross Section Plots

X-sections are normally generated at chainages along a given centreline and this centreline chainage is stored as part of the name of each x-section string.

The start chainage of the x-section string is set so that zero chainage is where the Centre line cuts the x-section in plan. So the chainage along a x-section string is usually referred to as **offsets** from the centreline position rather than x-section chainages.

The x-sections along the centreline are stored in the one model (the primary model) which is then used to generate the cross section plot.

Each x-section from the primary model of x-sections generates its own **sub-plot** for which a x-section is the primary string. Hence the cross section plot consists of many individual plots drawn on one or more plot sheets.



The x-sections are plotted in the order they occur in the x-section model or can be sorted by the centreline chainage that is part of the x-section name.

The x-sections start being plotted at the bottom left hand corner of the cross section plotting area. The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

If required, all the sub-plots in a column can be automatically positioned up so that the zero offsets (the centrelines) of each x-section line up.

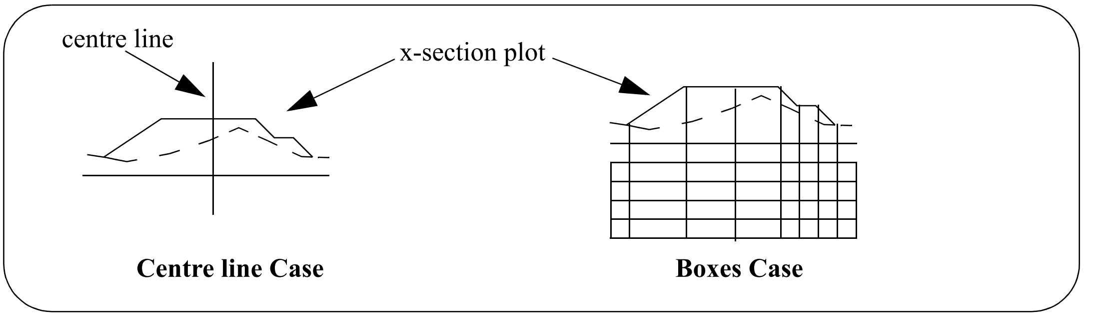
The x-section sub plots can be drawn and labelled with the two choices of:

(a) centreline case

where the x-section and tins are plotted and an upright at the zero offset, and labels for the offset and height values at the zero offset (normally the centre line position)

(b) **boxes case**

where the x-section is plotted and the heights of the x-section and the tins at all the x-section points are labelled in boxes under the plot of the x-section.

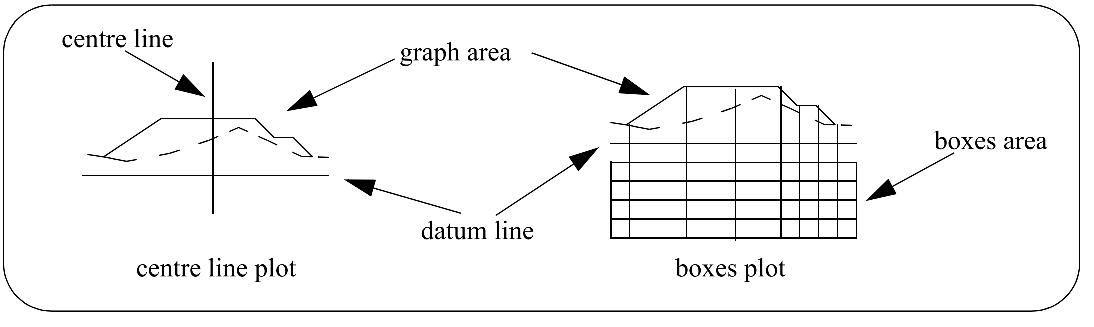


The x-section sub-plot itself consists of the three regions - graph, datum and boxes.

The **graph area** is the area where the actual plots of the strings are drawn. This exists for both the centreline and boxes case.

The **datum area** is the region between graph area and the datum line. This exists for both the centreline and boxes cases.

The **boxes area** is where the offset values and the heights for the strings drawn on the x-section plot are labelled. This only exists for the boxes case.



For both cases, the x-section sub-plot can be labelled with other information including

(a) grades across the x-section

(b) points across the x- section

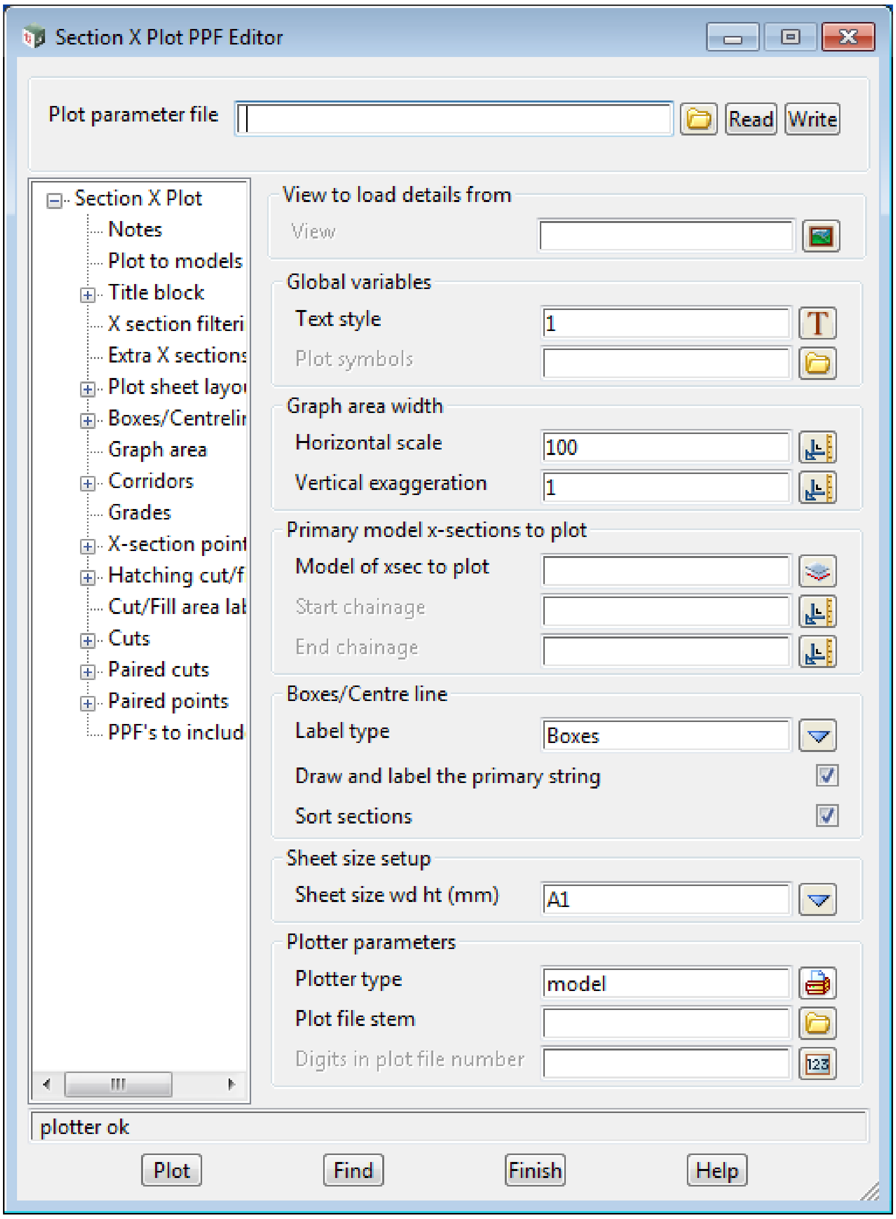
(c) cuts the x-section makes through strings

(d) cut and fill areas

All the required parameters for controlling the cross section plot are set up in the ***Section X Plot PPF Editor*** and will be described in detail in the following sections.

Please continue to the next section 26.3.2 Section X Plot - Front Page or return to 26.3 Section X Plot PPF Editor.

26.3.2 Section X Plot - Front Page



Section: Plot parameter file

*a **plot parameter file** can be used to load values into the fields of the PPF Editor, or as a file to write out all current values in a PPF Editor to.*

This section is documented for all the PPF Editors in 26.2.1 Plot Parameter File.

Section: Section: View to load details from AND Global variables

*a **section view** can be selected to load certain values into fields of the PPDF Editor. For example, Vertical exaggeration and Corridor models. And there are variables to use if some values aren't given.*

These sections are documented for all the PPF Editors in 26.2.2 View to Load and Global Variables.

Special chainage file filter_spc_file file box *.spc files

if non blank, a file of chainages to include sections at even if they are not a regular interval

Please continue to the next section 26.3.7 Extra X Sections To Plot.

26.3.7 Extra X Sections To Plot

The order and centreline chainages of the x-section subplots for the x-section plot are defined by the sections from the primary model of cross sections.

The sections through any specified triangulations and service models, and offsets for labelling are fully defined by these primary x-sections.

However it is also possible to plot extra x-sections on each of the sub-plots by supplying extra models of x-sections which are at the same plan positions as the primary x-section strings.

Only those x-sections from the extra models that are within a user specified tolerance of a primary x-section are plotted.

The extra models of x-sections and the plan tolerance for checking that the extra cross-sections are the same position as the primary x-sections are

The columns for the fields documented in the sections are for.

extra models of x-sections *to plot.*

Please continue to the next section 26.3.8 Plot Sheet Layout.

26.3.8 Plot Sheet Layout

X-sections are normally generated at chainages along a given centreline. This centreline chainage is stored with each x-section string.

The chainages of the actual x-sections are referred to as **offsets** from the centreline position rather than x-section chainages. The offsets of the x-section are set up so that the zero offset occurs where the x-section crossed the centreline string.

The x-sections along the centreline are stored in the one model (the primary model) which is then used to generate the cross section plot.

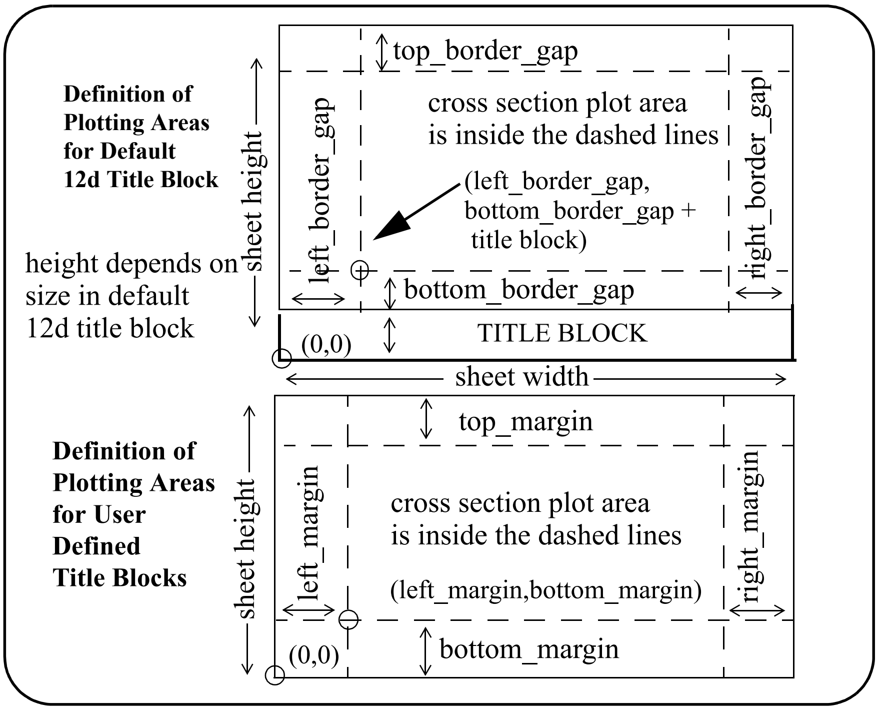
The x-sections are plotted in the order they occur in the x-section model and start being plotted at the bottom left hand corner of the sheet (left_margin,bottom_margin).

The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

Each x-section from the primary model of x-sections generates its own sub-plot for which the x-section is the primary string. Hence the cross section plot consists of many individual plots drawn on one or more plot sheets.

Each plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.



The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Plot width parameters

The width of the plot can be a fixed distance left or right of the centre line (zero offset) or for the full section plus an extra left and right distance:

Absolute extensions absolute_extensions tick box

if ticked, the section goes from the left_extension offset on the left to the right_extension offset on the *right. If unticked the section goes for the entire section length plus the left and right extension distances.*

Left extension left_extension input

The left_extension value in world units.

Right extension right_extension input

The right_extension value in world units

Section: Align section parameters

If required, all the sub-plots in a column can be automatically positioned so that the zero offsets (the centrelines) of each x-section line up.

Line up centrelines line_up_cl tick box

if ticked, each sub plot will be aligned on the plot using the centreline of each x section.

26.3.8.1 Plot Sheet Layout - Margins

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Margins for standard 12d title file - Border gaps

If the default 12d title block is used, then the size of the bottom of title block depends on the size. The following parameters are used in the default title block case and the bottom_border_gap is added to the calculated height of the bottom of the title block.

Left (mm) left_border_gap input

left border gap (in millimetres).

Right (mm) right_border_gap input

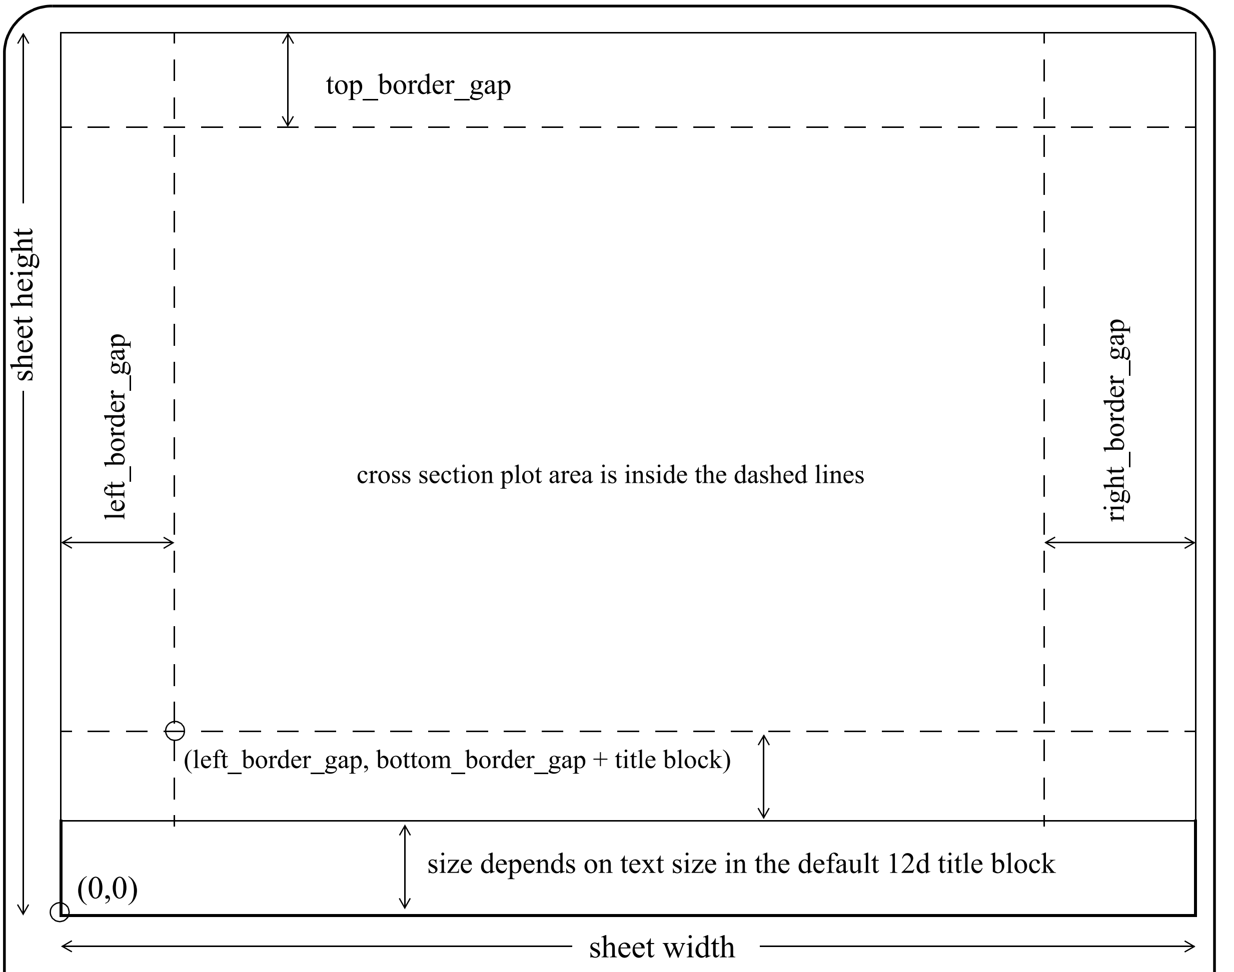
right border gap (in millimetres).

Top (mm) top_border_gap input

top border gap (in millimetres).

Bottom (mm) bottom_border_gapinput

bottom border gap (in millimetres).



Definition of Plotting Areas for Default 12d Title Block

Section: Margins for user title file

Left (mm)	left_margin	real box

left margin (in millimetres).

Right (mm)	right_margin	real box

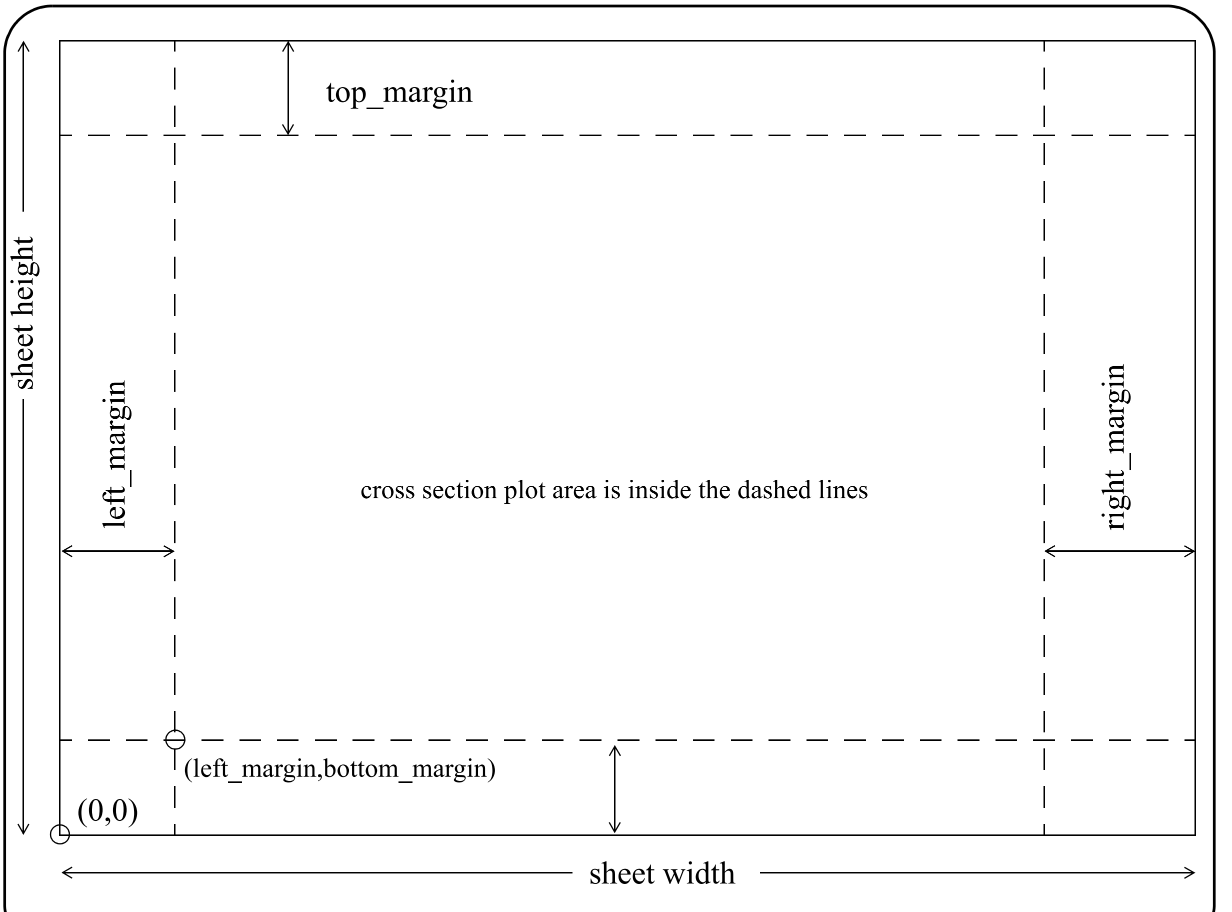
right margin (in millimetres).

Top (mm)	top_margin	real box

top margin (in millimetres).

Bottom (mm)	bottom_margin	real box

bottom margin (in millimetres).



Definition of Plotting Areas for User Defined Title Blocks

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margin and gap parameters can exist in the one plot parameter file.

The x-sections are plotted in the order they occur in the x-section model and start being plotted at the bottom left hand corner of the cross section plotting area.

The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

Continue to the next section 26.3.8.2 Plot Sheet Layout - Sub Plot Gaps or return to 26.3.8 Plot

Sheet Layout.

26.3.8.2 Plot Sheet Layout - Sub Plot Gaps

The gaps between the sub plots is restricted to those specified below.

Section: Sub plot gaps parameters

The fields and buttons used in this section have the following functions.

Panel Field | **Parameter name** | **Type** | **Pop-Up**

Left (mm) left_sub_plot_gap real box

left margin (in millimetres).

Right (mm) right_sub_plot_gap real box

right margin (in millimetres).

Top (mm) top_sub_plot_gap real box

top margin (in millimetres).

Bottom (mm) bottom_sub_plot_gap real box

bottom margin (in millimetres).

The x-section sub-plot itself consists of the three regions - boxes, datum and graph.

The **boxes area** is where the offset values and the heights for the strings drawn on the x-section plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

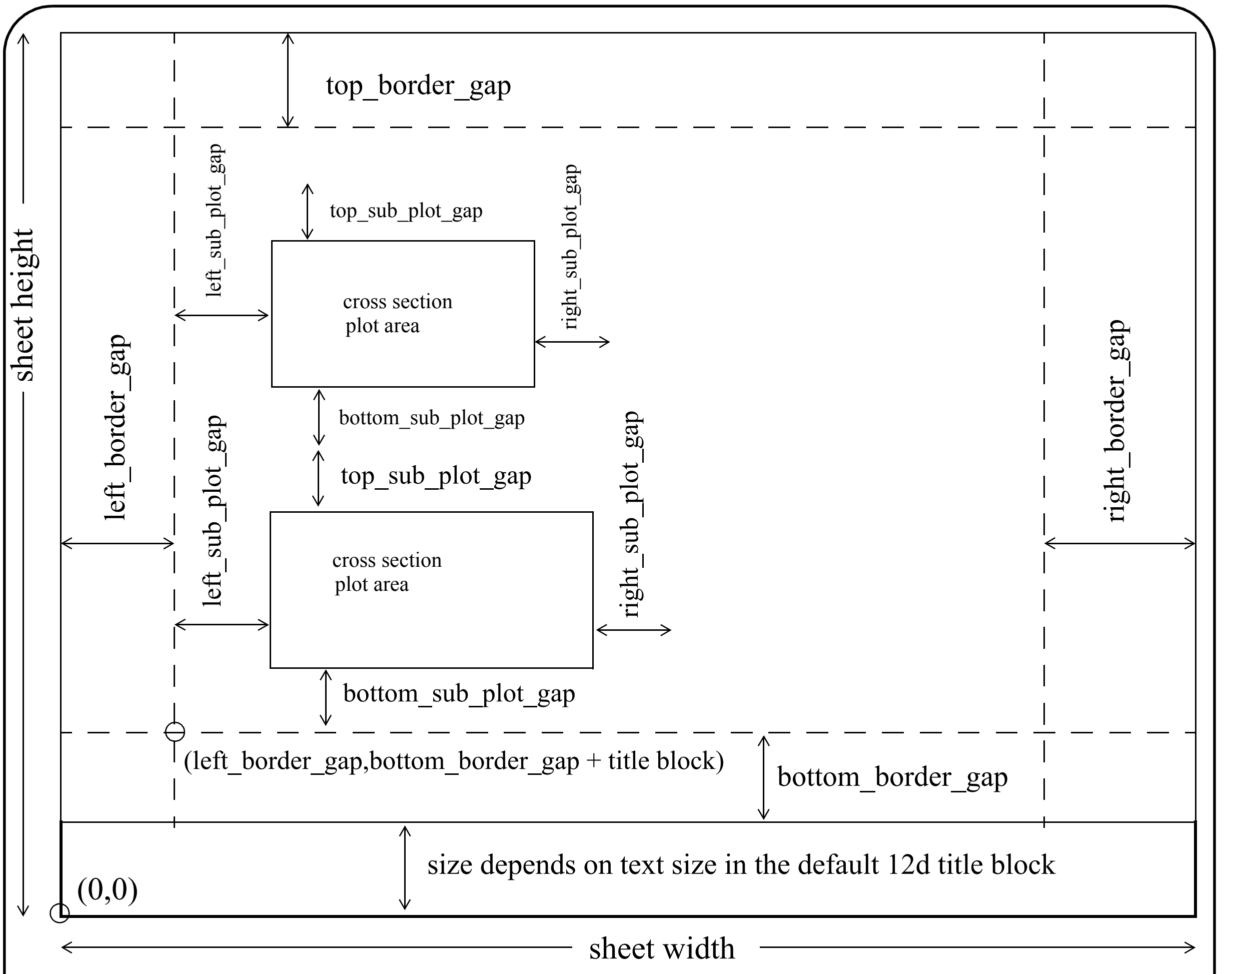
Apart from information labelled in the boxes area, the x-section sub-plot can label other information such as

(a) grades across the x-section

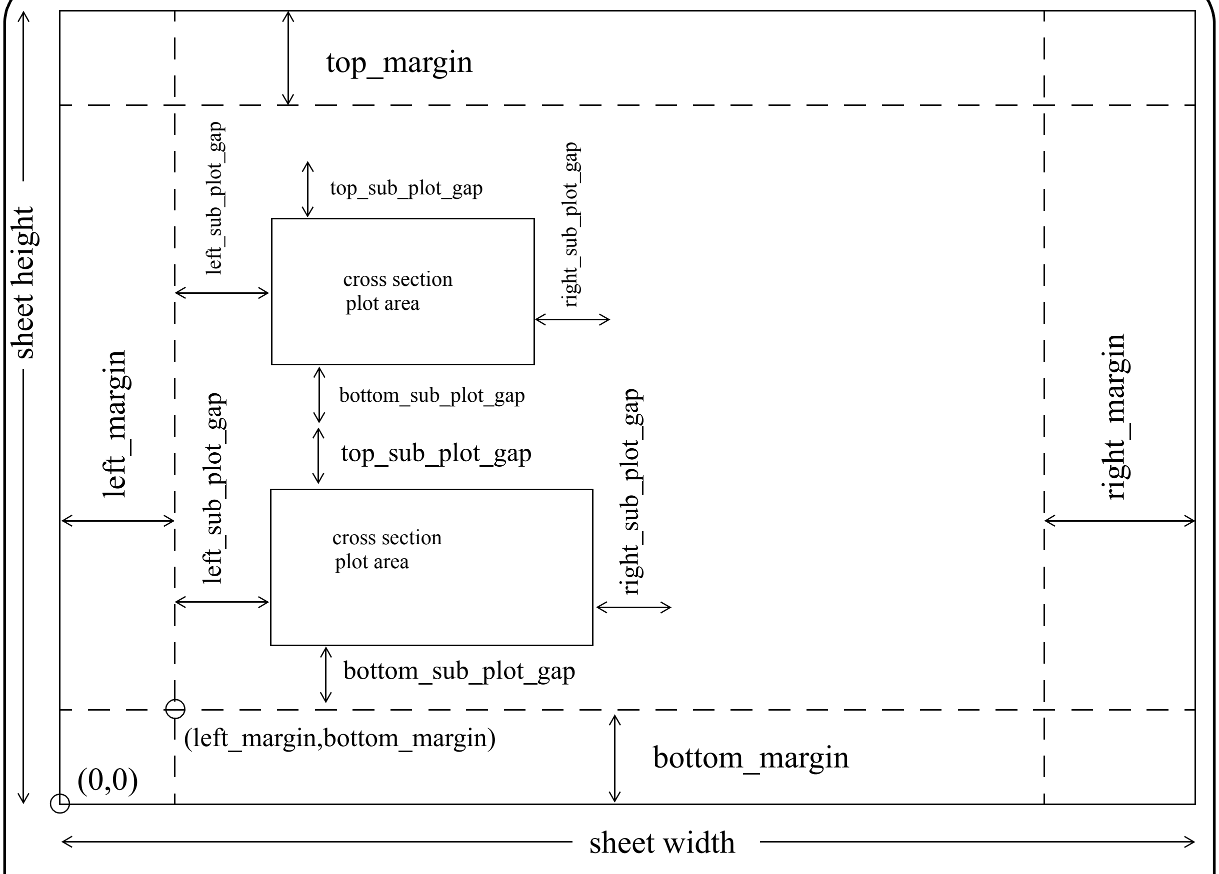
(b) points across the x- section

(c) cuts the x-section makes through strings

(d) cut and fill areas



Definition of Plotting Areas for Default 12d Title Block



Definition of Plotting Areas for User Defined Title Blocks

Please continue to the next section 26.3.9 Boxes/ Centreline Labels or return to 26.3.8 Plot Sheet Layout.

26.3.9 Boxes/ Centreline Labels

The x-section can be labelled with either

(a) an upright, and the offset and height value at the zero offset (normally the centre line position) - Centre line

(b) the heights of the x-section and the tins at all the x-section points. - Boxes

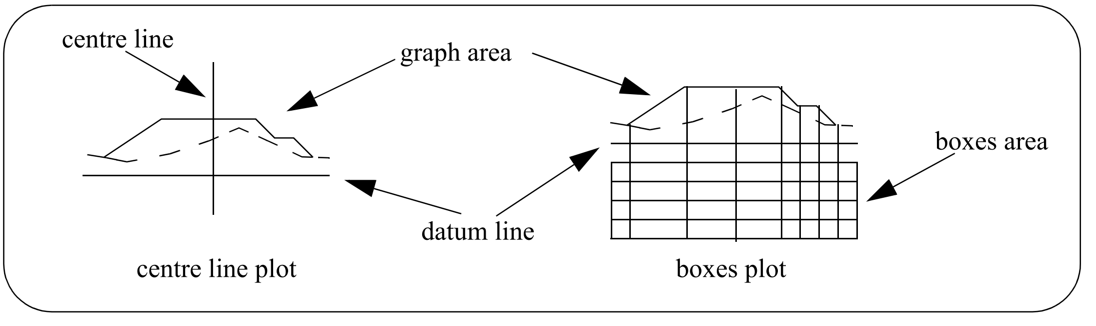
The choice is given by the parameter ***label_type*** defined in the section Section: Boxes/Centre line.

A datum line exists for both cases.

For the boxes case, a box area for the offset and heights is created below the datum line. The available parameters for tailoring the box area will be given after describing the datum line parameters.

For the centre line case, the centre line and offset and height of the centre line are shown.

In both cases, the actual cross section plot is drawn above the datum line in the graph area.



The parameters defined below, are common to both boxes and centreline label types.

See

26.3.9.1 Boxes/Centreline Labels - Common Parameters
26.3.9.2 Boxes/Centreline Labels - Boxes
26.3.9.3 Boxes/Centreline Labels - Centreline

Or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.1 Boxes/Centreline Labels - Common Parameters

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Common Datum Line label parameters

Datum roundoff datum_roundoff input

value to roundoff the datum value to e.g. 0.5, 0.2, 1.0 (default 1.0)

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

Decimal places for datum datum_decimals input

number of decimal places to display the datum value (default 1).

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Datum linestyle datum_linestyle linestyle box

datum line linestyle (default solid)

Datum name datum_name input

text to write before the datum value

Datum textstyle datum_textstyle text box

textstyle for datum information

Datum text size (mm) datum_text_size input

size of datum text and value (mm)

Datum colour datum_colour colour box

colour of the datum text

Datum line colour datum_line_colour colour box

colour of the datum line

26.3.9.1.1 Boxes/Centreline Labels - Common Parameters - Tins To Label

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Common parameters for tins to label

Define tin set #		input	

where n = 1 to.... The set enables the specification of a number of parameters for a number of specified tin names.

Tin name	tin_n_name	tin box	available tins

the name of the nth tin to be used for labelling.

If a tin of the name given by ***tin_n_name*** **does** not exist, then the plot is not produced and an error message is given.

Continue to the next section 26.3.9.1.2 Boxes/Centreline Labels - Common Parameters - Centreline Chainage or return to 26.3.9 Boxes/ Centreline Labels.

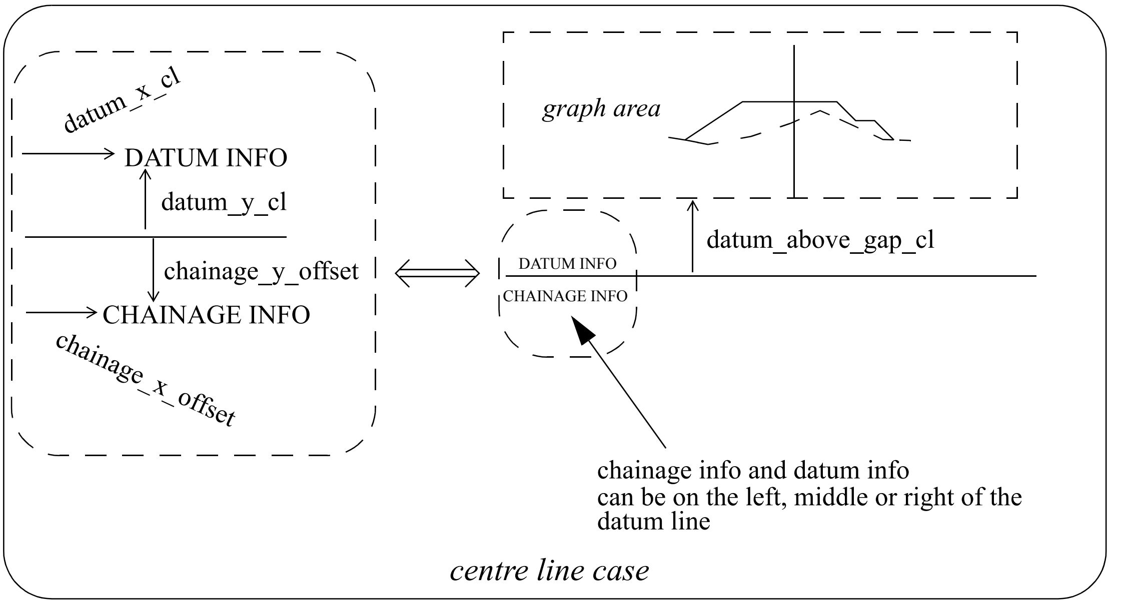
26.3.9.1.2 Boxes/Centreline Labels - Common Parameters - Centreline Chainage

Each x-section sub-plot can be labelled with the centreline chainage of the x-section string.

This CHAINAGE INFO label is made up of the text strings:

chainage_title followed by the *chainage-value*

and is drawn under the datum line.



The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Common centreline chainage label parameters

Label subplot with centreline chainage chainage_label tick box

if ticked, label sub-plot with centreline

Chainage title chainage_title input

text before the chainage value

Chainage Decimal places chainage_decimalsinput

number of decimals in the chainage value.

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Chainage colour chainage_colour colour box

colour of the text

Chainage text size (mm) chainage_size input

size of the text

Chainage textstyle chainage_textstyle text box

textstyle for the chainage label

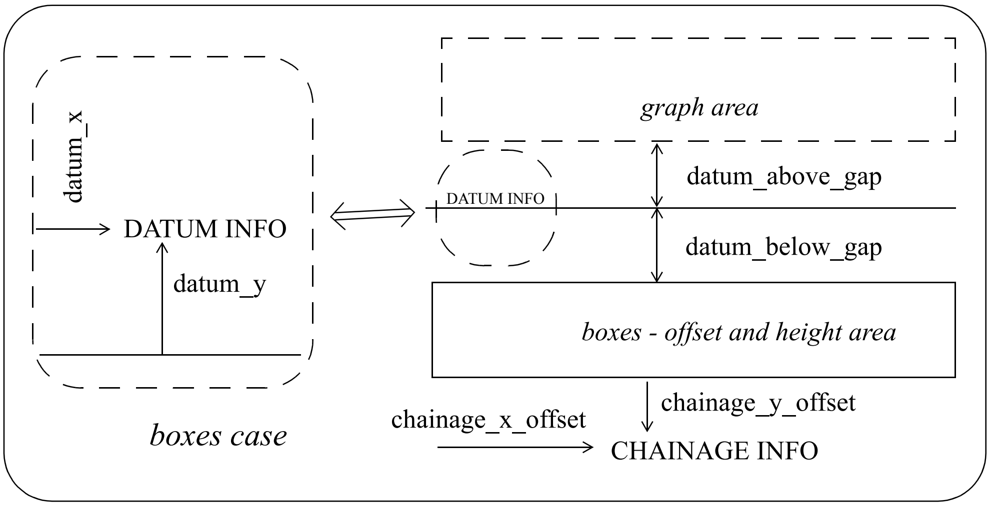
Chainage text x position (mm) chainage_x_offset input *x position of text (mm)*

Chainage text y position (mm) chainage_y_offset input

y position of text (mm)

The *chainage_x_offset* is measured from the beginning of the datum line.

The *chainage_y_offset* is measured from the bottom of the datum line with positive being **down**.



The values of the height and X and Y co-ordinates of the **primary string** (usually the design cross section) at the zero offset can be labelled. Note that zero offset is normally where the alignment string cuts the cross section.

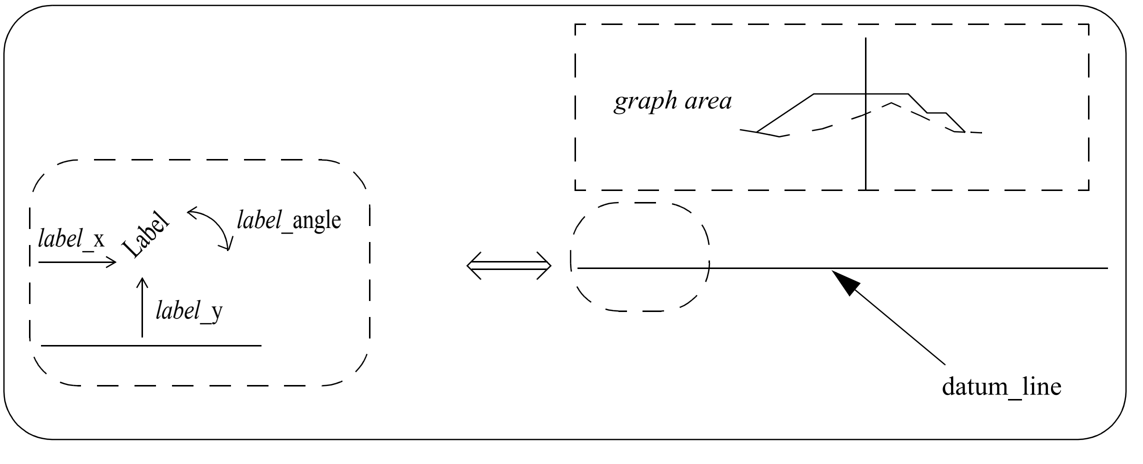
The heights of any tins (such as the natural surface) at the zero offset can also be labelled.

The labels are made up of:

pre_ text *value* post_text

where *value* is either a height or a co-ordinate.

The label is positioned at either the left, right or middle of the datum line, with an x and y adjustment and a rotation.



Chainage text justification chainage_text_justification_cl justification box

justification of the chainage text.

Continue to the next section 26.3.9.1.3 Boxes/Centreline Labels - Com Params - Centreline Equality Chainage or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.1.3 Boxes/Centreline Labels - Com Params - Centreline Equality Chainage

Continue to the next section 26.3.9.2 Boxes/Centreline Labels - Boxes or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.2 Boxes/Centreline Labels - Boxes

When **boxes** is selected for ***label_type***, the primary string (usually the design cross section) and each tin in the x-section sub-plot can be labelled with one or two lines of title, and the height at the offset position for each point in the primary string.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The offsets/heights are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **offset/height values** across the string/tin.

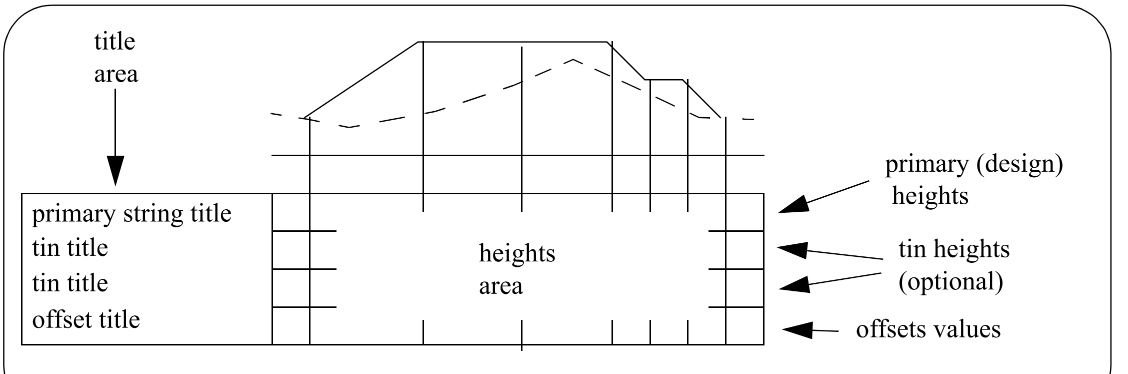
Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

(a) offset title and values

(b) tin title and heights - natural surface *etc*. (optional)

(c) primary string title and heights - design x-section (optional)



boxes cross section plot

The **title area** starts at the relative position (left_sub_plot_gap,bottom_sub_plot_gap).

The columns for the fields documented in the sections are for.

Or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.2.1 Boxes/Centreline Labels - Boxes - Datum Lines

For the boxes case, the **datum line** is positioned the distance ***datum_below_gap*** above the top of the boxes area and the graph area is then positioned the distance ***datum_above_gap*** above the datum line.

Hence the graph area is distance (datum_below_gap + datum_above_gap) above the top of the boxes area.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Boxes - datum line parameters

Graph area to datum line gap (mm) datum_above_gap input

dist from datum line to bottom of the

Datum line gap to top of boxes (mm) datum_below_gap input

dist from datum line to the top of the boxes

X adjustment (mm) datum_x input

distance to move the datum text along the datum line

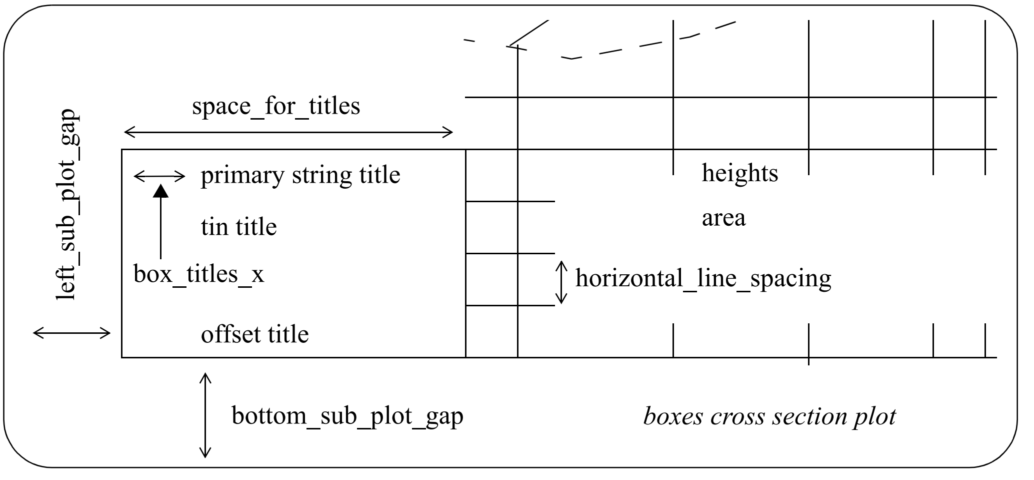
Y adjustment (mm) datum_y input

distance to raise the datum text above the datum line (used to be called datum_offset) The datum_x and datum_y can be positive, zero or negative.

Continue to the next section 26.3.9.2.2 Boxes/Centreline Labels - Boxes - Title Area or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.2.2 Boxes/Centreline Labels - Boxes - Title Area

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area.



The size of the title text is given by the ***title_box_text_size*** parameter.

The width of the title area is either given by the *space_for_titles* parameter, or if omitted, the required width is automatically calculated.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Boxes - Title area parameters

Size of titles (mm) title_box_text_sizeinput

size of offset, height label and values

Space for titles (mm) space_for_titles input

size of title area.

There can be two lines of title text and the title text, textstyle and colour can be set independently for the primary string and each tin.

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

X adjustment (mm) box_titles_x input

distance to move the title text from the left hand side of the boxes

The text in the title area is the same for each cross section plot on the sheet so it is possible to restrict the title area to be only on the first cross section on the sheet or the first column of cross sections.

Title area mode	label_first_only	choice box	on all sections
			on first x-sec of page only
			on x-sec's in first column

it is possible to restrict the title area to be only on the first cross section on the sheet or the first column of cross sections

Continue to the next section 26.3.9.2.3 Boxes/Centreline Labels - Boxes - Heights Area or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.2.3 Boxes/Centreline Labels - Boxes - Heights Area

The **heights area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_justification*).

The number of decimal places and the size of the heights text can also be specified.

The height of each individual box area is either given by the *horizontal_line_spacing* parameter, or if omitted, the required height is automatically calculated.

Section: Boxes - Height area parameters

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up
Number of decimals	**number_of_decimals**	**input**	

number of decimal places in the offset height boxes. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the offset, heights area.

Panel Field	Parameter name	Type	Pop-Up
Text size (mm)	**text_size**	**input**	

text size of the height values

Panel Field	Parameter name	Type	Pop-Up
Justification	**box_text_justification**	**choice box**	**bottom of individual boxes** top of individual boxes

justification of box text.

Horizontal line spacing (mm) **horizontal_line_spacinginput**

height of each individual box area of title area. Calculated if omitted

The total height of the boxes area is simply given by number of boxes drawn multiplied by the height of one box (they all have the same height).

The **width** of the heights area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the labels area plus the width of the heights area.

Continue to the next section 26.3.9.2.4 Boxes/Centreline Labels - Boxes - Outside Linework or return to 26.3.9 Boxes/ Centreline Labels.

Continue to the next section 26.3.9.2.5 Boxes/Centreline Labels - Boxes - Inside Linework or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.2.5 Boxes/Centreline Labels - Boxes - Inside Linework

The lines at the top of the individual boxes inside the title area and heights area (separation lines) are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n*.

The separation lines can be drawn just in the title area, just in the heights area or in both areas.

The parameter *box_line_draw_mode* can be set to control all the separation lines but there are additional parameters, *box_line_mode_n*, which override *box_line_draw_mode* for each of the individual boxes where n = 1, ... number of boxes -1.

The top of the top box is not controlled by box_line_mode_n but is controlled by the parameters *draw_box_side_2* and *draw_box_side_6.*

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Multiplier for positive depths **depth_positive_factor** **input**

if set, this value will be used to multiply positive depth values.

Multiplier for negative depths **depth_negative_factor** **input**

if set, this value will be used to multiply negative depth values.

The depth from the primary string to a tin, at a particular offset is defined as

depth = tin height value - height of the primary string

That is, the depth that the primary string is **below** the tin.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

if (depth >= 0) plotted_depth_value = depth * depth_positive_factor

if (depth < 0) plotted_depth_value = depth * depth_negative_factor

Hence the definition of depth can be modified by the parameters:

depth_positive_factor *value* // multiplier for positive depths

depth_negative_factor *value* // multiplier for negative depths

For example, if the opposite sign is required for depth, that is,

depth = height of the primary string - tin height value

simply set

depth_positive_factor -1

depth_negative_factor- 1

Continue to the next section 26.3.9.2.10 Boxes/CL Labels - Boxes - Upright Offset/Staggering Parameters or return to 26.3.9 Boxes/ Centreline Labels.

26.3.9.2.10 Boxes/CL Labels - Boxes - Upright Offset/Staggering Parameters

For each sub-plot, the offsets of the points across the x-section string (primary string) are used for positioning uprights (leader lines), and the offset and height labels for the uprights.

By default, there is an upright at each point across the primary string.

However, if the primary string is a 4d string, then the text at the points on the 4d string can be used as a key to **suppress** the labelling and upright at that point. See Section: Exclude uprights at nominated x-sec points

If the real offset position is used for the horizontal position of the offset/height text, text over writing can easily occur. To prevent over writing, the text is automatically **staggered**.

When staggering occurs, the real offset position is then indicated by the offset markers which are drawn at the top of the text boxes from the staggered text position back to the actual offset position of the upright.

The size and position of the staggers are given by:

The columns for the fields documented in the sections are for.

26.3.9.3.3 Boxes/CL Labels - Centreline - Labelling Offset/Height (Superseded)

In the centre line case, the value of the height of the **primary string** (usually the design cross section) at the zero offset can be labelled. This is normally where the alignment string cuts the cross section.

The label is made up of the texts:

primary_title offset_title offset_value height_text height_value

Note: These parameters have now been superseded. The parameters for labelling the height of the primary string at zero offset covers this case. To use the zero offset parameters instead, the *primary_height_pre_text* would include all text required for the Primary_title, offset_title, offset_value and height_ text (offset_value is always 0.0).

The columns for the fields documented in the sections are for.

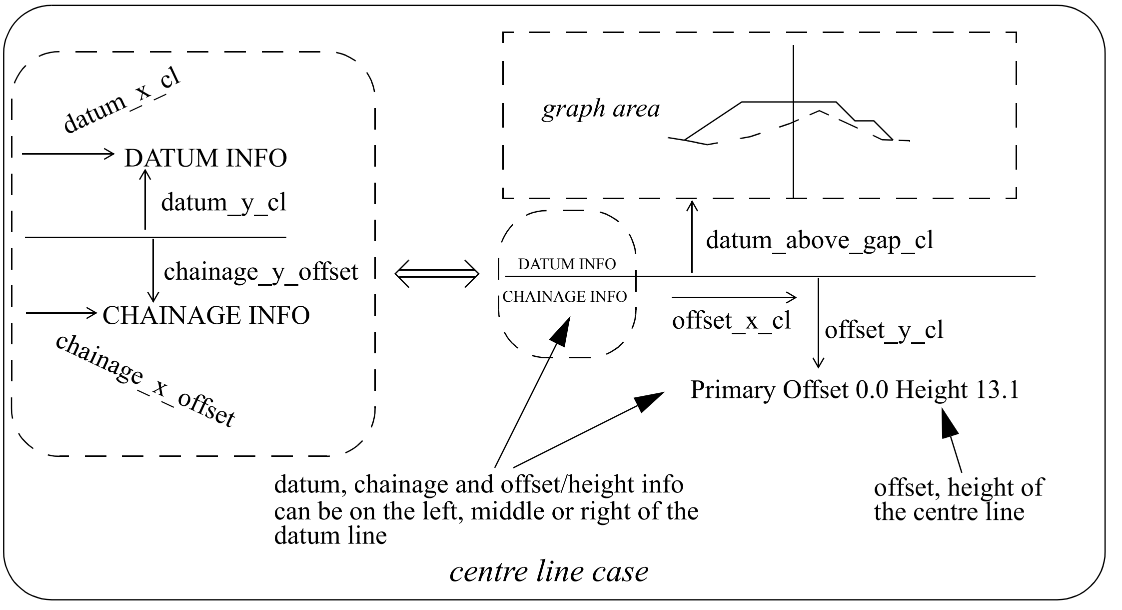
distance to move the text below the datum line.



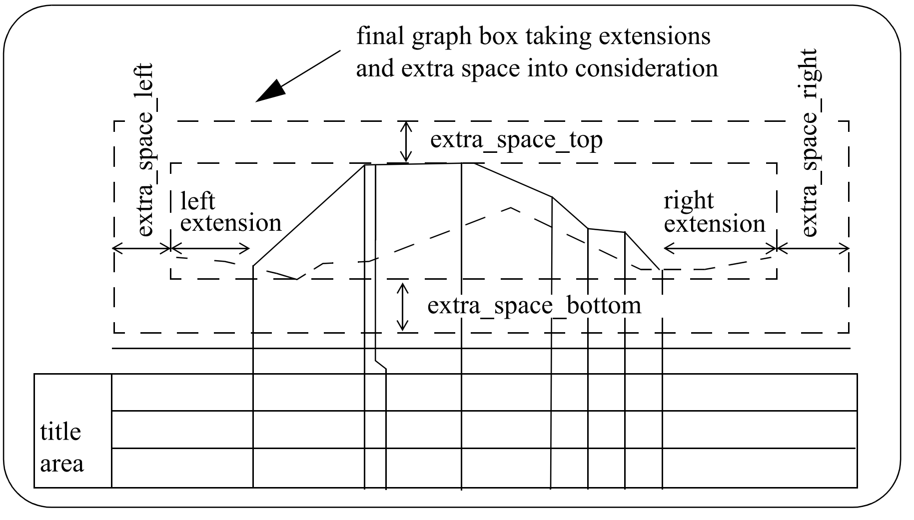
Continue to the next section 26.3.10 Graph Area or return to 26.3.9 Boxes/ Centreline Labels.

26.3.10 Graph Area

The **graph area** for each section sub-plot is the area where the actual plot of the x-section string is drawn.

The **width** of the graph area is determined by the width of the x-section string being plotted, the left and right extensions and horizontal scale (scale) given by the parameters.

The size of the graph area can be extended to allow for symbols by the following parameters:



The types of strings that are drawn in the graph area of a cross section plot are:

(a) primary string the x-section string from the x-section model that is being drawn. Called the primary string and is usually the design x-section.

(b) tins sections of the primary string through any tins in models in the corridor models.

(c) services parts of strings (from models in corridor models) that cut the defined corridor.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), and the colour of the tin used for the section in case (b).

Although all the strings are plotted, the plot parameter file can be used to select which ones are labelled with heights.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

distance to add to top of plot area

Extra space bottom (units)	extra_space_bottom	**input**

distance to subtract from bottom of plot area

Please continue to the next section 26.3.11 Corridors - X Section.

26.3.11 Corridors - X Section

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the cross-section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

This is documented for all the PPF Editors in 26.2.7 Corridors.

Please continue to the next section 26.3.12 Grades.

26.3.12 Grades

The plot of the x-section string is made up of straight lines joining the individual points of the x-section.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Grade parameters

Label grades grade_label **tick box**

if ticked, label grades.

Either the individual lines can be used as the segments to be labelled for grade, or adjacent lines of the same grade can be considered to be just one segment and labelled only once.

Hence the segments to be labelled for grade can be the individual lines of the x-section, or the segments defined by changes of grade.

Label change of grade segments

grade_change_only **tick box**

if ticked, label change of grade segments. If not, label individual lines.

It is also possible to ignore segments smaller that a given minimum width on the plot.

Minimum segment 3d length grade_minimum_width **input**

segments smaller than specified value (in mm) are not labelled

The grade labels are drawn parallel to the segment, centred about the segments end points, and a distance *grade_offset* above the segment. The size, colour and number of decimal places can all be set.

Minimum segment plan length grade_minimum_width_2d **input**

Minimum slope (m/m) grade_minimum_**slope** **input**

Maximum slope (m/m) grade_maximum_slope **input**

Decimal places for grades grade_decimals **input**

number of decimal places in grade.

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Size for grade text (mm) grade_size **input**

size of the grade label

Textstyle for grades **grade_textstyle** **text box**

textstyle of the grade label

Colour for grades grade_colour **colour box**

number of decimal places in grade

Grade offset (mm) grade_offset **input**

distance above the segment for label

Show grade sign grade_offset **tick box**

if ticked, the sign of the grade is labelled.

The grade can be labelled as percent cross-fall, 1 in slope, m/m or VicRoads x:1.

Also a threshold value can be set and any grades whose absolute value are below the threshold can be labelled in one way, and those above the threshold labelled a different way.

Hence, if the absolute value of the grade is less that or equal to the absolute value of *grade_threshold*, then ***grade_mode*** is used, otherwise ***grade_upper_mode*** is used.

Grade mode	grade_mode	**choice box**	**% grade** 1 in **m/m** **VicRoads x:1**

type of grade value

Grade threshold	grade_threshold	**input**

grade threshold for type of grade labelling

Grade threshold mode	grade_threshold_mode	**choice box**	**% grade** 1 in **m/m** **VicRoads x:1**

type of grade value

Grade upper mode	grade_upper_mode	**choice box**	**% grade** 1 in m/m VicRoads x:1

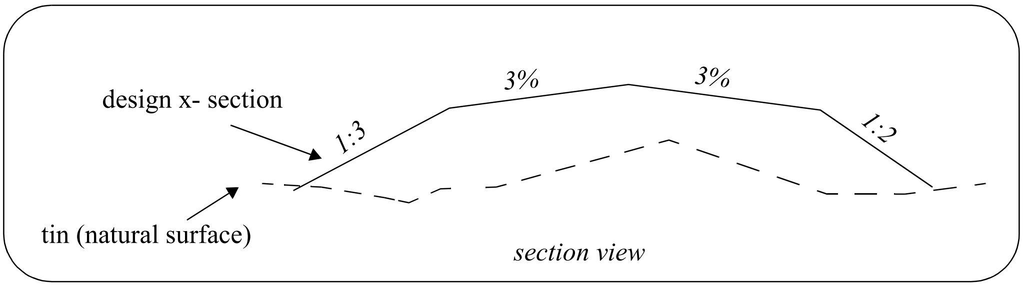
type of grade value

Decimal places for grades above threshold value

grade_upper_decimals **input**

number dec places in grades above threshold value

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.



Please continue to the next section 26.3.13 X-Section Points.

26.3.13 X-Section Points

The points across each x-section can be automatically labelled on the x-section plots.

The **offset, height** and **name** of the point can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The offset position for the labelling is the offset of the point.

The height position for the labelling can be specified as the

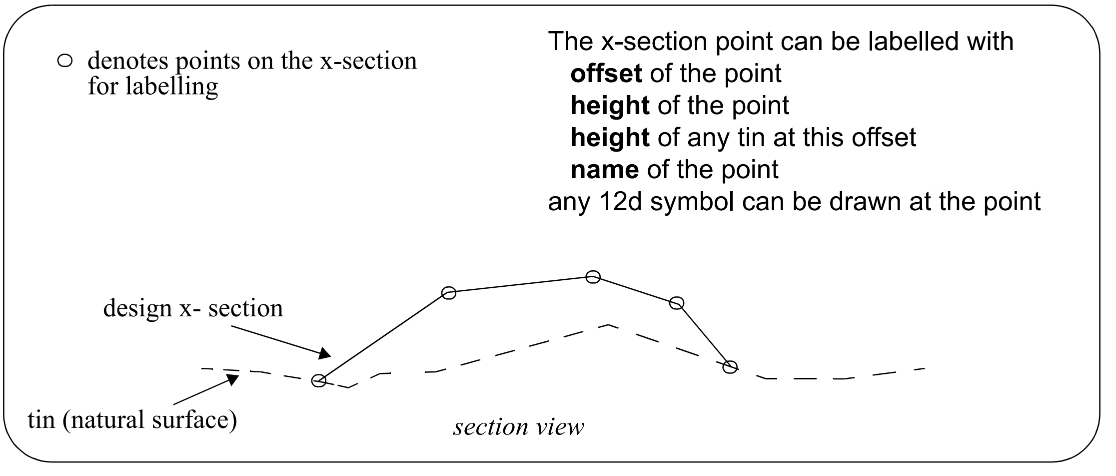
(a) top of the boxes for the x-section

(b) above the maximum height of the strings on the plot

(c) height of the point on the x-section string (primary string)

(d) height of a tin.

The actual position of the label is defined relative to the above point.



Note:

Only case (b) involves the actual height of the point on the cross section string. For all other cases, only the offset of the cut string is used.

Other heights, for example, the height of the tin at that offset can be used as the height (case (d)).

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: X-section point mask parameters

Define Set # **input**

set number to be used to define a number of points to include

Point mask **points_n_mask** **input**

The points of the x-section to be labelled for the nth set of parameters is restricted to all the points whose name satisfying the points_n_mask. For example

points_1_mask = "ke"*

or *points_1_mask = "?bank*"*

or, if both masks are required,

points_1_mask = "ke ?bank*"*

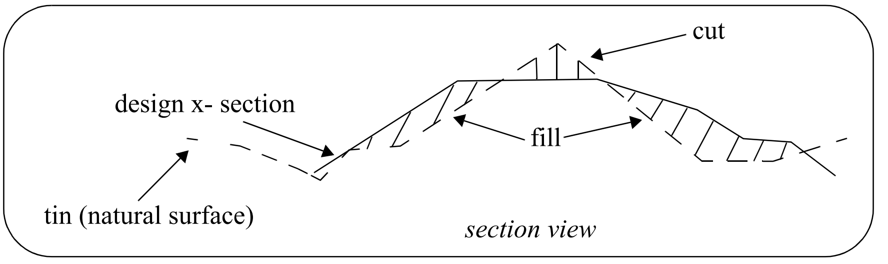
Please continue to the next section 26.3.14 Hatching Cut/Fill.

26.3.14 Hatching Cut/Fill

This option is used to hatch cut and/or fill areas between sets of tins.



The **Hatching Cut/Fill** section is common to the **PPF Editors** and is fully documented in 26.2.8 Hatching Cut/Fill.

Section: Hatching cut/fill - Tin parameters - *see* 26.2.8 Hatching Cut/Fill

Section: Hatching cut/fill - Cut parameters - *see* 26.2.8.1 Hatching Cut/Fill - Cut

Section: Hatching cut/fill - Fill parameters- *see* 26.2.8.2 Hatching Cut/Fill - Fill

Please continue to the next section 26.3.15 Cut/Fill Area Labels.

26.3.15 Cut/Fill Area Labels

If the cross section were produced by the Apply MTF or Apply Function, each section will have as following string attributes with values calculated at the time that the cross sections were created.

LHS Cut Area

LHS Fill Area

LHS Strip Area

RHS Cut Area

RHS Fill Area

RHS Strip Area

From these, the cut left, cut right and cut total, fill left, fill right and fill total, and balance left, balance right and balance total can be labelled on the plot.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Cut/Fill are labels

this section defines the pre and post text, textstyle, size and colour for displaying selected cut/fill areas.

The fields for each row form one set of controls for the placement of the given areas on the plot.

Cut/Fill areas Grid

Label cut/fill tick box

*if **ticked**, this row is used and the selected cut/fill value is labelled.*
*If **not ticked**, this row is ignored.*

Label mode choice box cut left, cut right, cut total
fill left, fill right, fill total
balance left, balance right, balance total

the type of area to be labelled for this row.

Text size (mm)

the text size for the area label.

Label position choice box middle
left
right

the area text is positioned with respect to the datum line.

*If the **Boxes/Centreline** **Label type** is **Boxes**, then the area text is position at the left hand side of the boxes at the Datum line and the* **Label position** *is ignored.*

*If the **Boxes/Centreline** **Label type** is **Centre line**, on the Datum line but positioned horizontally at the left hand side, right hand side, or middle of the Datum line depending on* **Label position**.

X off (mm) real box

the horizontal adjustment to the selected label position.

Y off (mm) real box

the vertical adjustment to the selected label position.

Angle (dms) angle box

the angle of the attribute label in degrees minutes and seconds in hp notation.

Pre text text box

text to go before the attribute label.

Post text text box

text to go after the attribute label.

Decimal places integer box

number of decimal places to use when it is a real attribute.

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Units factor real box

the area is multiplied by the **Units factor***.*

*If **blank** the value is 1.0*

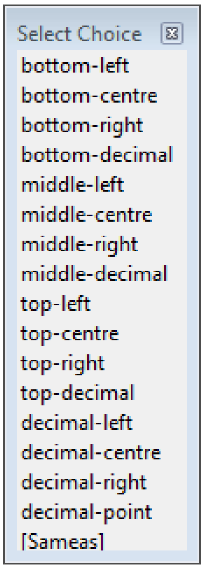
Colour colour box

the colour of the area label.

Textstyle textstyle box

the textstyle of the area label.

Justification justification box



the justification of the area label.

Please continue to the next section 26.3.16 Cuts.

26.3.16 Cuts

The cuts that each x-section string makes though strings in any user-specified model, can be automatically labelled on the x-section plots.

The **Cuts** section is common to the **PPF Editors** and is fully documented in 26.2.9 Cuts.

Section: Cuts - Model/Name mask parameters *- see* 26.2.9 Cuts.

Section: Cuts - Offset parameters *- see* 26.2.9.2 Cuts - Offsets - X Section Only

Section: Cuts - Height parameters *- see* 26.2.9.4 Cuts - Heights

Section: Cuts - Diameter parameters *- see* 26.2.9.5 Cuts - Diameters

Section: Cuts - Label parameters *- see* 26.2.9.6 Cuts - Labels

Section: Cuts - Symbol parameters *- see* 26.2.9.7 Cuts - Symbols

Continue to the next section 26.3.17 Paired Cuts - X Sections.

26.3.17 Paired Cuts - X Sections

Paired Cuts uses pairs of strings and where both strings cut each x-section, the cuts on the x-plot can be labelled with information such as

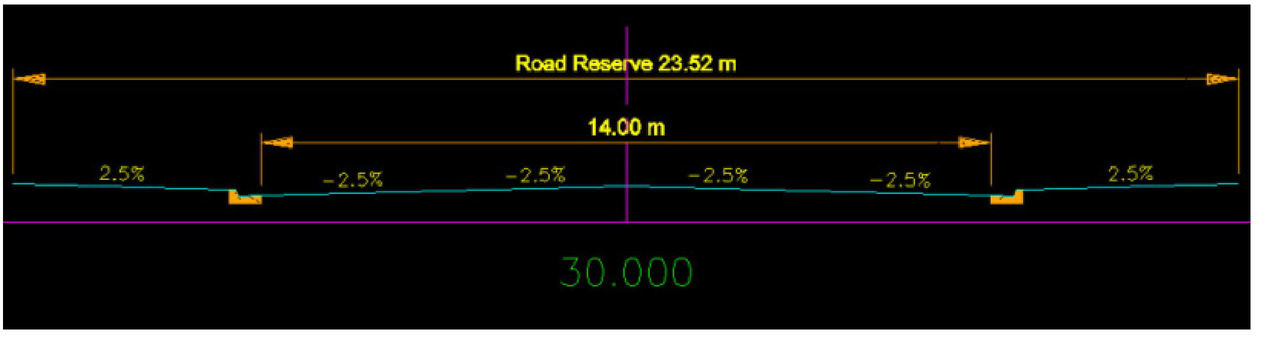
(a) the name of the first and second cut strings

(b) attributes from the first and second cut string

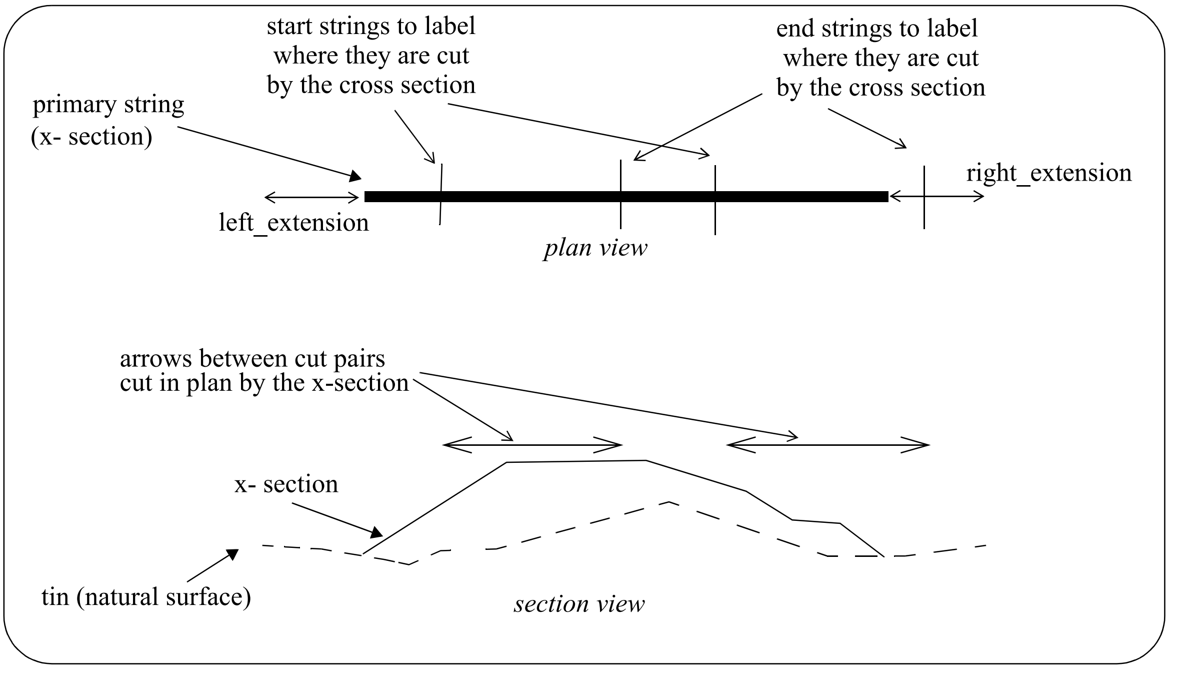
(c) offset distance between the two cuts of the pair

(d) 3d length between the two cuts of the pair

(e) the offsets on the x-section of the first and second cuts of the pair



Symbols can be drawn at the offsets of the first and second cuts (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts.



The method for specifying which strings are to be checked for paired cuts is by first specifying the **models** (using wild cards and characters) that contains the strings, and then a **start name mask** to select the all the strings that are to be the first strings in a cut pair, and an **end name mask** to select all the strings that are the second strings in a cut pair.

For a x-section, all the cuts of the selected **start** strings are found and the cuts ordered by the offset of the cut on the x-section. Then all the cuts of the selected **end** strings are found and the cuts ordered by the offset of the cut on the x-section.

The start cuts are then processed and each start cut is paired with the next end cut with a larger offset than the start cut. It is possible that there are end cuts before the first start cut (orphaned end cuts) and start cut with no following end cut (orphaned start cuts).

Up to twenty five different sets of models and name masks can be used so that different paired cut sets can be labelled in different ways.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type**

Section: Pairing - Model/Name mask parameters

Define Set # **input**

set number to be used to define different model/mask sets.

Model pairing_n_model **model box**

models (the name can include wild cards (*) and wild characters (?)) from which start and end cut masks are derived.

Start name mask pairing_n_start_mask **input**

text string containing the name masks to select the start strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes **"** *(eg* "bench 2"*).*
Each mask can include wild cards (*) and wild characters (?).
For example: *"ke*"* *or,*
"?bank"* *or, if both masks are required,*
"ke ?bank*"*

End name mask pairing_n_end_mask **input**

text string containing the name masks to select the end strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes **"** *(eg* "bench 2"*)*
Each mask can include wild cards and wild characters.
For example: *"ke*"* *or,*
"?bank"* *or, if both masks are required,*
"ke ?bank*"*

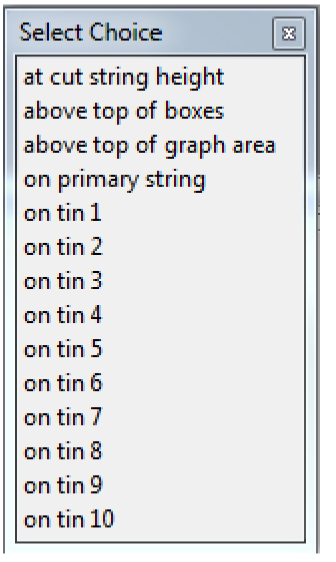
Note

If ***Start name mask*** *is blank and* ***End name mask*** *is not blank, then all strings in the models that are not used as end strings, are used as start string.*

If ***End name mask*** *is blank and* ***Start name mask*** *is not blank, then all strings in the models that are not used as start strings, are used as end string.*

This is currently not operational: If ***Start name mask*** *and* ***End name mask*** *are both blank, then all strings in the models are used. All the strings are cut by the x-section are ordered by offset, and successive pairs of cuts taken to be the cut pairs. There could be one remaining cut point (it has the largest offset) and if so, it is taken to be orphaned start point.*

Position **pairing_n_position** **choice box**



where to get the z-values to use for the two cut positions. This is used in conjunction with the choice in the **Adopted height** *field.*

If left blank, ***at cut string height*** *is used.*

Adopted height **pairing_n_height** **choice box** **lower position, higher position**

start position, end position

for the choice selected in the **Position** *field, there will be a z-value at the first cut and another z-value at the end cut. The* **Adopted height** *says which of the two z-value to use for placing symbols, lines between cuts, text from Attributes and the Offsets of the first cut and the second cut.*

If lower (higher) position, the smaller (greater) of the two z-values will be used.
If start (end), the z-value of the first (second) cut of the cut point pair will be used.

If left blank, ***lower position*** *is used.*

Include orphaned start ? pairing_n_orphan_start **choice box** **yes, no**

if ***Yes*** *and there are start cuts after the last end cut (and so can't be paired), then the last start cut (i.e. the one with the largest offset) is taken as an orphaned start and it is labelled as though there is a matching end at the end of the x-section.*
if ***No*** *and there are start cuts after the last end cut, then those start cut are ignored.*

If left blank, ***No*** *is used.*

Include orphaned ends ? pairing_n_orphan_end **choice box** **yes, no**

if ***Yes*** *and there are end cuts before the first start cut, then the first end cut (the one with the smallest offset) is taken as an orphaned end and it is labelled as though there is a matching start at the beginning of the x-section.*
if ***No*** *and there are end cuts before the first start cut, then those end cut are ignored.*

If left blank, ***No*** *is used.*

See

26.3.17.1 Paired Cuts - Lines and Symbols
26.3.17.2 Paired Cuts - Labels

26.3.17.4 Paired Cuts - End Offset

Or return to 26.3 Section X Plot PPF Editor.

26.3.17.1 Paired Cuts - Lines and Symbols

Symbols can be placed at the start and end cut offsets (at the z-value given by the **Position** and **Adopted height** columns when defining the Sets), and a line can also be drawn between the cuts at that z-value. Having both the line and a symbol forms an arrow between the cuts pair.

The columns for the fields documented in the sections are for.

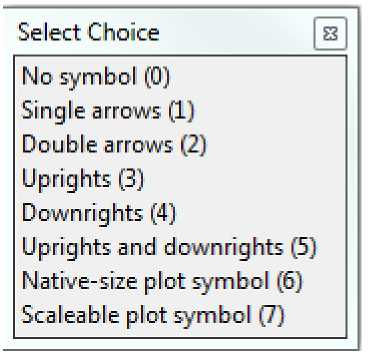
Panel Field **Parameter name** **Type**

Section: Pairing - Lines and symbol parameters

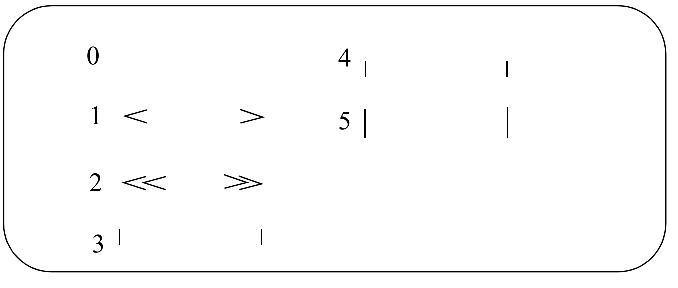
Use Set # **input**

set number as specified in the **Define set #**.

Symbol type **pairing_line_symbols_n_symbol** **choice box**



type of symbol at each end of the cut pair.



for cases 6 and 7, a plot symbol is to be used and is given in the Symbol field

The height used for the symbol at both ends of the cuts pair is given by the **Position** *and* **Adopted height** *column in the Set definition.*

Symbol **pairing_line_symbols_n_user_symbol** **plot symbols**

for Symbol type 6 and 7, the plot symbol to be used at each cut point.

For Symbol type 0 to 5, this field is not used.

The height used for the symbol at both ends is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Symbol colour **pairing_line_symbols_n_symbol_colour** **colour box**

colour of the symbol

Draw line **pairing_line_symbols_n_line** **choice box** **No line, Draw line**

if Draw line, draw a line between the start and end cuts for each cut pair.
If No line, no line is drawn between the start and end cuts for each cut pair.

The height used for the line at both ends is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Line colour **pairing_line_symbols_n_line_colour** **colour box**

colour of the line between the start and end cuts for each cut pair

Left symbol rotation **pairing_line_symbols_n_left_rotate** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the symbol at the start cut point for the cut point pair.*

If there is no value then the rotation is 0.

Right symbol rotation **pairing_line_symbols_n_right_rotate** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the symbol at the end cut point for the cut point pair.*

If there is no value then the rotation is 0.

X (mm) **pairing_line_symbols_n_x** **measure box**

horizontal adjustment to the position of the symbol.

Y (mm) **pairing_line_symbols_n_y** **measure box**

vertical adjustment to the position of the symbol.

Size **pairing_line_symbols_n_size** **measure box**

size of symbol. A value of 0 means no symbol.

Continue to the next section 26.3.17.2 Paired Cuts - Labels or return to 26.3.17 Paired Cuts - X Sections.

26.3.17.2 Paired Cuts - Labels

The columns for the fields documented in the sections are for.

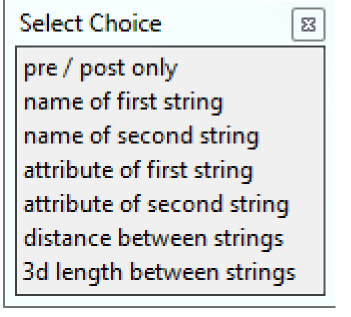
Panel Field **Parameter name** **Type**

Section: Pairing - Label parameters

Use Set # **input**

set number as specified in the **Define set #**.

Mode **pairing_label_n_mode** **choice box**



type of label to write between the start and end points of the cuts pair

The height used for the label is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Attribute name **pairing_label_n_attribute** **text box**

if **Mode** *is **attribute of first string** or **attribute of second string**, this is the name of the attribute to use as the label*

Offset **pairing_label_n_offset** **measure box**

the text is raised by this amount above the line between the cut pair

Colour **pairing_label_n_colour** **colour box**

colour of the text

Size (mm) **pairing_label_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_label_n_textstyle** **textstyle box**

the textstyle for the text

Pre-text **pairing_label_n_pre_text** **text box**

text to draw before the label. This can include spaces, including one or more spaces after the last non blank character of **Pre-text**.

Post-text **pairing_label_n_post_text** **text box**

text to draw after the label. This can include spaces, including one or more spaces before the first non blank character of **Post-text**.

Decimals **pairing_label_n_no_decimals** **number box**

if the label is a number, then **Decimals** *is the number of decimal places to write the number out to.*

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Leave gap for text pairing_label_n_?? **tick box**

if ticked then a gap in the line between the cuts pair is left large enough for the label and the pre-text and post-text.
If not ticked then no gap is left in the line between the cuts pair.

Rotate text to fit pairing_label_n_roate_text **tick box**

if ticked, then if the label and the pre-text and post-text will not fit between the start cut and end cut of the cut pair, the text is rotated through ninety degrees.

If not ticked, then the label text is drawn even though it will run over the ends of the cut pair.

Continue to the next section 26.3.17.3 Paired Cuts - Start Offset or return to 26.3.17 Paired Cuts - X Sections.

26.3.17.3 Paired Cuts - Start Offset

The Offset (on the x-section) of the first point of the cut pair can be labelled.

The text for the label consists of pre-text followed by Offset value followed by post-text.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type**

Section: Pairing - Start Offset parameters

Use Set # **input**

set number as specified in the **Define set #**.

The height used for the text is given by the **Position** *and* **Adopted height** *columns in the Set definition. This is then adjusted by the field* **Y (mm).**

X (mm) **pairing_start_offset_n_x** **measure box**

for placing the text: horizontal adjustment from the offset of the first cut.

Y (mm) **pairing_start_offset_n_y** **measure box**

for placing the text: the vertical adjustment to the height given by the **Position** *and* **Adopted height** *columns in the Set definition*

Angle (dms) **pairing_start_offset_n_angle** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the text*

Colour **pairing_start_offset_n_colour** **colour box**

colour of the text

Size (mm) **pairing_start_offset_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_start_offset_n_textstyle** **textstyle box**

the textstyle for the text

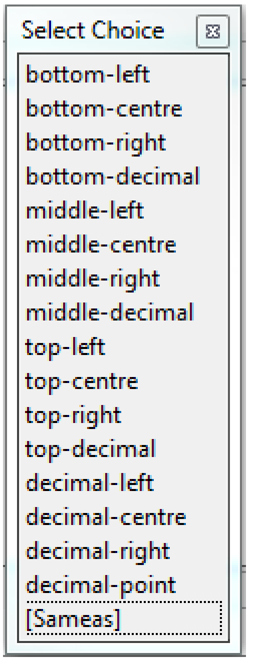
Pre-text **pairing_start_offset_n_pre_text** **text box**

text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of **Pre-text**.

Post-text **pairing_start_offset_n_post_text** **text box**

text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of **Post-text**.

Justification **pairing_start_offset_n_justification** **justification box**



justification of the text.

Decimals **pairing_start_offset_n_no_decimals** **number box**

the number of decimal places for the offset value

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Continue to the next section 26.3.17.4 Paired Cuts - End Offset or return to 26.3.17 Paired Cuts - X Sections.

26.3.17.4 Paired Cuts - End Offset

The Offset on the x-section of the second point of the cut pair can be labelled.

The label consists of pre-text then the Offset value followed by post-text.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type**

Section: Pairing - End Offset parameters

Use Set # **input**

set number as specified in the **Define set #**.

The height used for the text is given by the **Position** *and* **Adopted height** *columns in the Set definition. This is then adjusted by the field* **Y (mm).**

X (mm) **pairing_end_offset_n_x** **measure box**

for placing the text: horizontal adjustment from the offset of the second cut.

colour of the text

Size (mm) **pairing_end_offset_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_end_offset_n_textstyle** **textstyle box**

the textstyle for the text

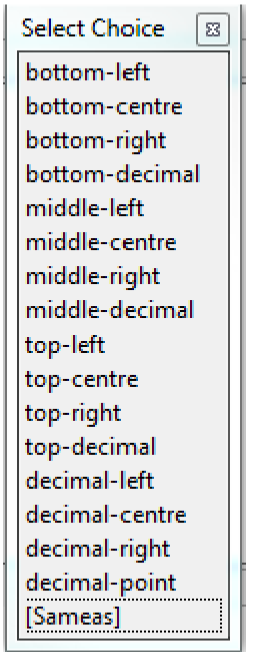
Pre-text **pairing_end_offset_n_pre_text** **text box**

text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of **Pre-text**.

Post-text **pairing_end_offset_n_post_text** **text box**

text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of **Post-text**.

Justification **pairing_start_offset_n_justification** **justification box**



justification of the text.

Decimals **pairing_start_offset_n_no_decimals** **number box**

the number of decimal places for the Offset value

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Please continue to the next section 26.3.18 Paired Points.

26.3.18 Paired Points

Most cross sections are created with the vertices having vertex names which correspond to the strings created by template links, or MTF modifiers, or the names of the cut strings when cross sections are created by cutting through strings.

The ***Paired Points*** option enables a user to link pairs of these vertex names from the cross section being plotted (to create a points pair), and the points from the pair can be labelled with information such as

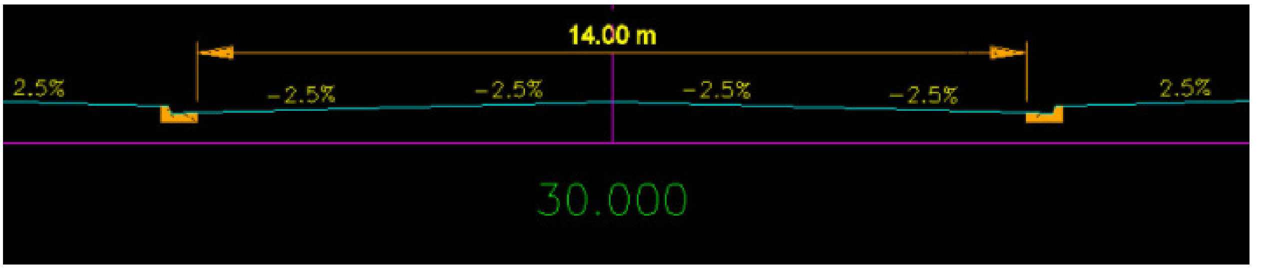
(a) the name of the first and second point of the pair

(b) vertex attributes of the cross section from the first and second points of the pair

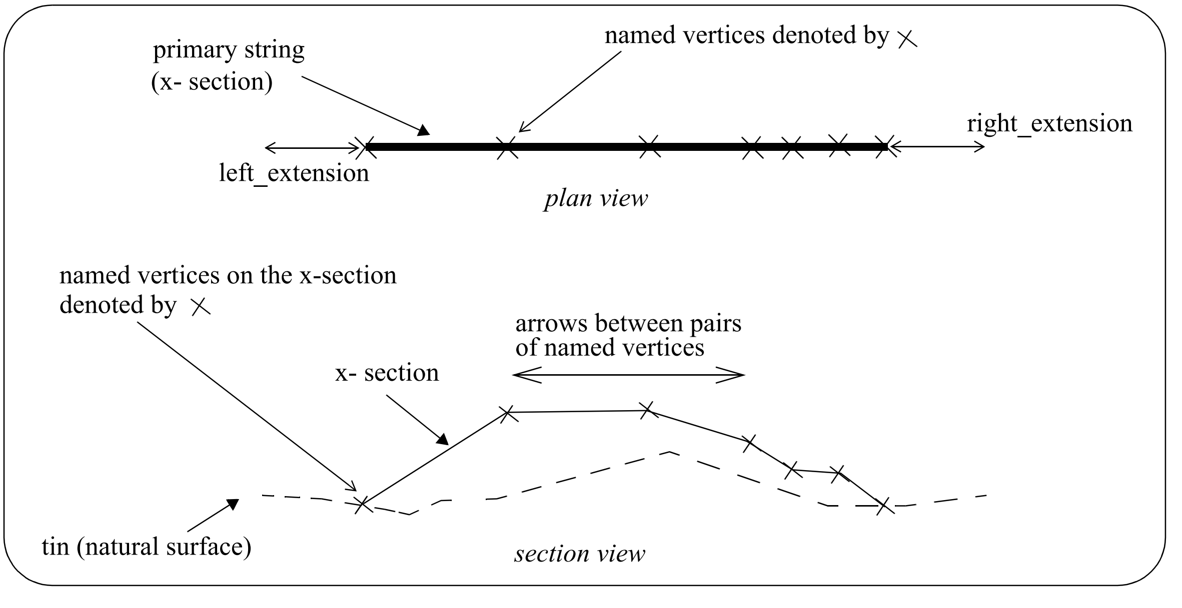
(c) distance between the two points in a pair

(d) 3d length between the two points in a pair

(e) the offsets on the x-section of the first and second points in a pair



Symbols can be drawn at the offsets of the first and second points of a pair (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts in a pair.



The method for specifying which named vertices are to be used for paired points is by a **start name mask** (using wild cards and characters) to select the all the vertices that are to be the first points in a pair, and an **end name mask** (using wild cards and characters) to select all the vertices that are the second points in a pair.

For a x-section, all the named vertices of the selected **start points** are found and the points ordered by the offset of the point on the x-section. Then all the named vertices of the selected

end points are found and the points ordered by the offset of the point on the x-section.

The start points are then processed and each start point is paired with the next end point with a larger offset than the start point. It is possible that there are end points before the first start point (orphaned end points) and start points with no following end point (orphaned start points).

Up to twenty five different sets of name masks can be used so that different paired point sets can be labelled in different ways.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type**

Section: Pairing - Model/Name mask parameters

Define Set # input

set number to be used to define different name mask sets.

Start name mask input

text string containing the name masks to select the start points, each separated by one or more spaces, to test the x-section vertex names against. If the name includes spaces then it must be enclosed in the quotes " *(eg* "bench 2"*).*
Each mask can include wild cards (*) and wild characters (?).
For example: "ke" or,*
"?bank" or, if both masks are required,*
"ke ?bank*"*

End name mask input

text string containing the name masks to select the end points, each separated by one or more spaces, to test the x-section vertex names against. If the name include spaces then it must be enclosed in the quotes " *(eg* "bench 2"*)*
Each mask can include wild cards and wild characters.
For example: "ke" or,*
"?bank" or, if both masks are required,*
"ke ?bank*"*

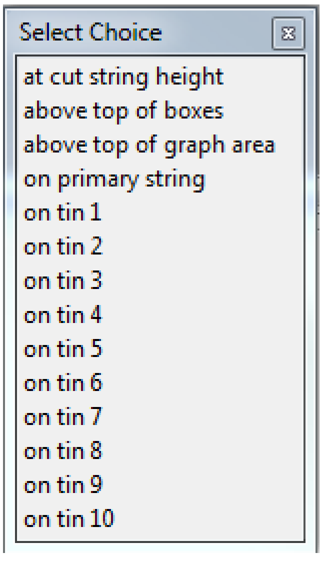
Note

*If **Start name mask** is blank and **End name mask** is not blank, then all vertices on the x-section that are not used as end points, are used as start points.*

*If **End name mask** is blank and **Start name mask** is not blank, then all vertices on the x-section that are not used as start points, are used as end points.*

*If **End name mask** and **Start name mask** are both blank, then all vertices on the x-section are used. Successive pairs of vertices taken to be the point pairs. There could be one remaining point (it has the largest offset) and if so, it is taken to be orphaned start point.*

Position **choice box**



where to get the z-values to use for the two paired points. This is used in conjunction with the choice in the **Adopted height** *field.*

If left blank, ***at point height*** *is used.*

Adopted height **pairing_n_height** **choice box** **lower position, higher position**

start position, end position

for the choice selected in the **Position** *field, there will be a z-value at the first point and another z-value at the second point of the pair. The* **Adopted height** *says which of the two z-value to use for placing symbols, lines between paired points, text from Attributes and the Offsets of the first point and the second point of a point pair.*

If lower (higher) position, the smaller (greater) of the two z-values will be used.
If start (end), the z-value of the first (second) cut of the cut point pair will be used.

If left blank, ***lower position*** *is used.*

Include orphaned start ? pairing_n_orphan_start **choice box** **yes, no**

if ***Yes*** *and there are start points after the last end point (and so can't be paired), then the last start point (i.e. the one with the largest offset) is taken as an orphaned start and it is labelled as though there is a matching end at the end of the x-section.*

if ***No*** *and there are start points after the last end point, then those start points are ignored.*

If left blank, ***No*** *is used.*

Include orphaned ends ? pairing_n_orphan_end **choice box** **yes, no**

if ***Yes*** *and there are end points before the first start point, then the first end point (the one with the smallest offset) is taken as an orphaned end and it is labelled as though there is a matching start at the beginning of the x-section.*
if ***No*** *and there are end points before the first start point, then those end points are ignored.*

If left blank, ***No*** *is used.*

26.3.18.4 Paired Points - End Offset

Or return to 26.3 Section X Plot PPF Editor.

26.3.18.1 Paired Points - Lines and Symbols

Symbols can be placed at the start and end point offsets (at the z-value given by the **Position** and **Adopted height** columns when defining the Sets), and a line can also be drawn between the paired points at that z-value. Having both the line and a symbol forms an arrow between the paired points.

The columns for the fields documented in the sections are for.

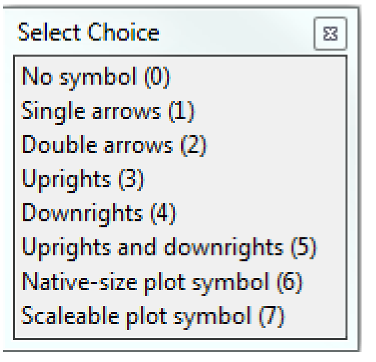
Panel Field **Parameter name** **Type**

Section: Pairing - Lines and symbol parameters

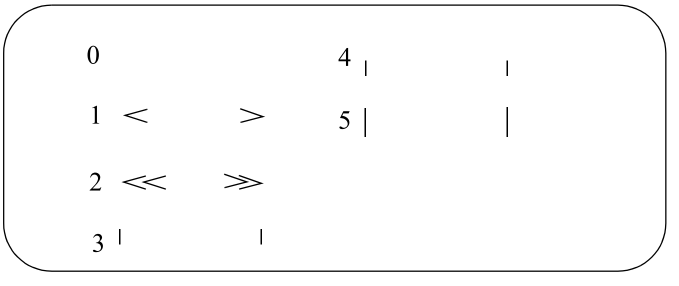
Use Set # **input**

set number as specified in the **Define set #***.*

Symbol type **pairing_line_symbols_n_symbol** **choice box**



type of symbol at each end of the points pair.



for cases 6 and 7, a plot symbol is to be used and is given in the Symbol field

The height used for the symbol at both ends is given by the **Position** *and* **Adopted height** *column in the Set definition.*

Symbol **pairing_line_symbols_n_user_symbol** **plot symbols**

for Symbol type 6 and 7, the plot symbol to be used at each paired point.

For Symbol type 0 to 5, this field is not used.

The height used for the symbol at both ends is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Symbol colour **pairing_line_symbols_n_symbol_colour** **colour box**

colour of the symbol

Draw line **pairing_line_symbols_n_line** **choice box** **No line, Draw line**

if Draw line, draw a line between the start and end points for each point pair.
If No line, no line is drawn between the start and end points for each point pair.

The height used for the line at both ends is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Line colour **pairing_line_symbols_n_line_colour** **colour box**

colour of the line between the start and end points for each point pair

Left symbol rotation pairing_line_symbols_n_left_rotate measure box

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the symbol at the start point of the point pair.*

If there is no value then the rotation is 0.

Right symbol rotation pairing_line_symbols_n_right_rotate measure box

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the symbol at the end point of the point pair.*

If there is no value then the rotation is 0.

X (mm) pairing_line_symbols_n_x measure box

horizontal adjustment to the position of the symbol.

Y (mm) pairing_line_symbols_n_y measure box

vertical adjustment to the position of the symbol.

Size pairing_line_symbols_n_size measure box

size of the symbol. A value of 0 means no symbol.

Continue to the next section 26.3.18.2 Paired Points - Labels or return to 26.3.18 Paired Points.

26.3.18.2 Paired Points - Labels

The columns for the fields documented in the sections are for.

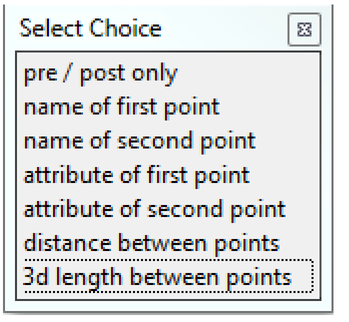
Panel Field **Parameter name** **Type**

Section: Pairing - Label parameters

Use Set # **input**

set number as specified in the **Define set #**.

Mode **pairing_label_n_mode** **choice box**



type of label to write between the start and end points of the points pair

The height used for the label is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Attribute name **pairing_label_n_attribute** **text box**

if **Mode** *is **attribute of first point** or **attribute of second point**, this is the name of the attribute to use as the label*

Offset **pairing_label_n_offset** **measure box**

the text is raised by this amount above the line between the point pair

Colour **pairing_label_n_colour** **colour box**

colour of the text

Size **pairing_label_n_size** **measure box**

size of the text. A value of 0 means no text.

Textstyle **pairing_label_n_textstyle** **textstyle box**

the textstyle for the text

Pre-text **pairing_label_n_pre_text** **text box**

text to draw before the label. This can include spaces, including one or more spaces after the last non blank character of the Pre-text.

Post-text **pairing_label_n_post_text** **text box**

text to draw after the label. This can include spaces, including one or more spaces before the first non blank character of the Post-text.

Decimals **pairing_label_n_no_decimals** **number box**

if the label is a number, then **Decimals** *is the number of decimal places to write the number out to.*

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Leave gap for text pairing_label_n_?? **tick box**

if ticked then a gap in the line between the points pair is left large enough for the label and the pre-text and post-text.

If not ticked then no gap is left in the line between the points pair.

Rotate text to fit pairing_label_n_roate_text **tick box**

if ticked, then if the label and the pre-text and post-text will not fit between the start point and end point of the point pair, the text is rotated through ninety degrees.

If not ticked, then the label text is drawn even though it will run over the ends of the point pair.

Continue to the next section 26.3.18.3 Paired Points - Start Offset or return to 26.3.18 Paired Points.

26.3.18.3 Paired Points - Start Offset

The offset (on the x-section) of the first point of the point pair can be labelled.

The text for the label consists of pre-text followed by Offset value followed by post-text.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type**

Section: Pairing - Start Offset parameters

Use Set # **input**

set number as specified in the **Define set #**.

The height used for the text is given by the **Position** *and* **Adopted height** *columns in the Set definition. This is then adjusted by the field* **Y (mm).**

X (mm) **pairing_start_offset_n_x** **measure box**

for placing the text: horizontal adjustment from the offset of the first cut.

Y (mm) **pairing_start_offset_n_y** **measure box**

for placing the text: the vertical adjustment to the height given by the **Position** *and* **Adopted height** *columns in the Set definition*

Angle (dms) **pairing_start_offset_n_angle** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the text*

Colour **pairing_start_offset_n_colour** **colour box**

colour of the text

Size (mm) **pairing_start_offset_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_start_offset_n_textstyle** **textstyle box**

the textstyle for the text

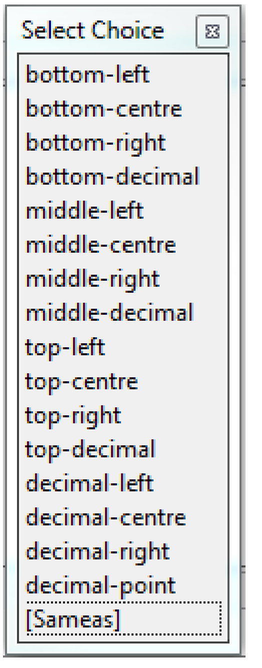
Pre-text **pairing_start_offset_n_pre_text** **text box**

text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of **Pre-text**.

Post-text **pairing_start_offset_n_post_text** **text box**

text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of the **Post-text**.

Justification **pairing_start_offset_n_justification** **justification box**



justification of the text.

Decimals **pairing_start_offset_n_no_decimals** **number box**

the number of decimal places for the Offset value

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Continue to the next section 26.3.18.4 Paired Points - End Offset or return to 26.3.18 Paired Points.

26.3.18.4 Paired Points - End Offset

The Offset (on the x-section) of the second point of the point pair can be labelled.

The label consists of pre-text then the Offset value followed by post-text.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type**

Section: Pairing - End Offset parameters

Use Set # **input**

set number as specified in the **Define set #**.

X (mm) **pairing_end_offset_n_x** **measure box**

for placing the text: horizontal adjustment from the Offset of the second point.

Y (mm) **pairing_end_offset_n_y** **measure box**

for placing the text: the vertical adjustment to the height given by the **Position** *and* **Adopted height** *columns in the Set definition*

Angle (dms) **pairing_end_offset_n_angle** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the text*

Colour **pairing_end_offset_n_colour** **colour box**

colour of the text

Size (mm) **pairing_end_offset_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_end_offset_n_textstyle** **textstyle box**

the textstyle for the text

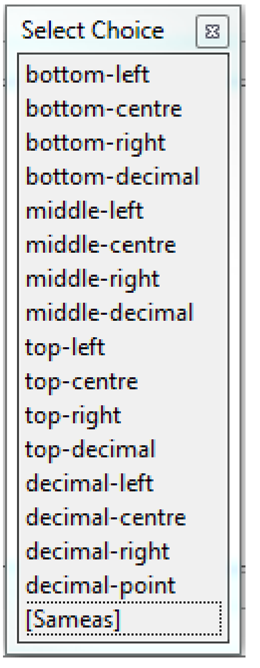
Pre-text **pairing_end_offset_n_pre_text** **text box**

text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of **Pre-text.**

Post-text **pairing_end_offset_n_post_text** **text box**

text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of **Post-text**.

Justification **pairing_start_offset_n_justification** **justification box**



justification of the text.

Decimals **pairing_start_offset_n_no_decimals** **number box**

the number of decimal places for the Offset value

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Please continue to the next section 26.3.19 PPFs To Include.

26.3.19 PPFs To Include

This is documented for all the PPF Editors in 26.2.10 PPFs To Include.

Please continue to the next section 26.3.20 Buttons at the Bottom of X-Plot Panel.

26.3.20 Buttons at the Bottom of X-Plot Panel

This is documented for all the PPF Editors in 26.2.11 Buttons at the Bottom of the PPF Editors.

Return to 26.3 Section X Plot PPF Editor.

26.4 Long Plot PPF Editor

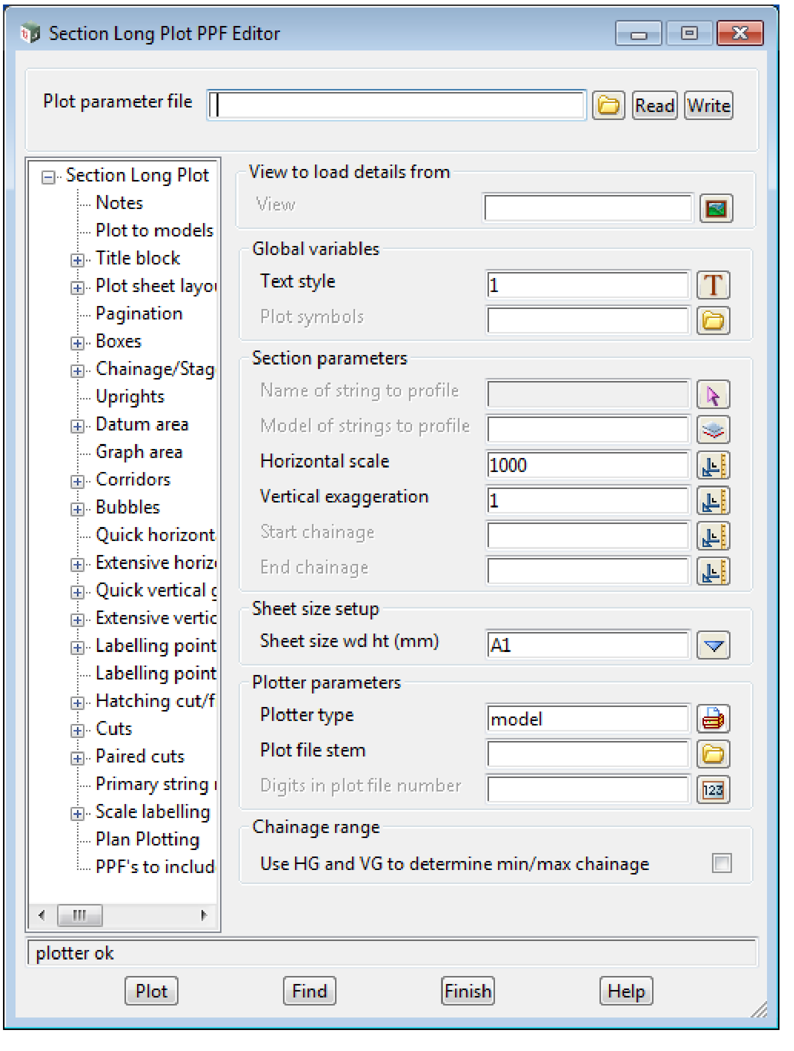
Position of option on menu: **Plot =>Plot and PPF Editors =>Long sections**

The **Long section PPF editor** is for creating and/or editing a (binary) long-section PPF and for creating a long section plot.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the text ppf's were).

On selecting the **Long sections** option, the **Section Long Plot PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the ***Section Long Plot*** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.



For information on all the different nodes see:

26.4.1 General Information on Long Section Plots

26.4.2 Section Long Plot - Front Page

26.4.3 Notes - Long Section

26.4.4 Plot to models - Long Section

26.4.5 Title Block - Long Section

26.4.1 General Information on Long Section Plots

A long section is normally generated along a given centreline and includes sections along the centre line through tins and services.

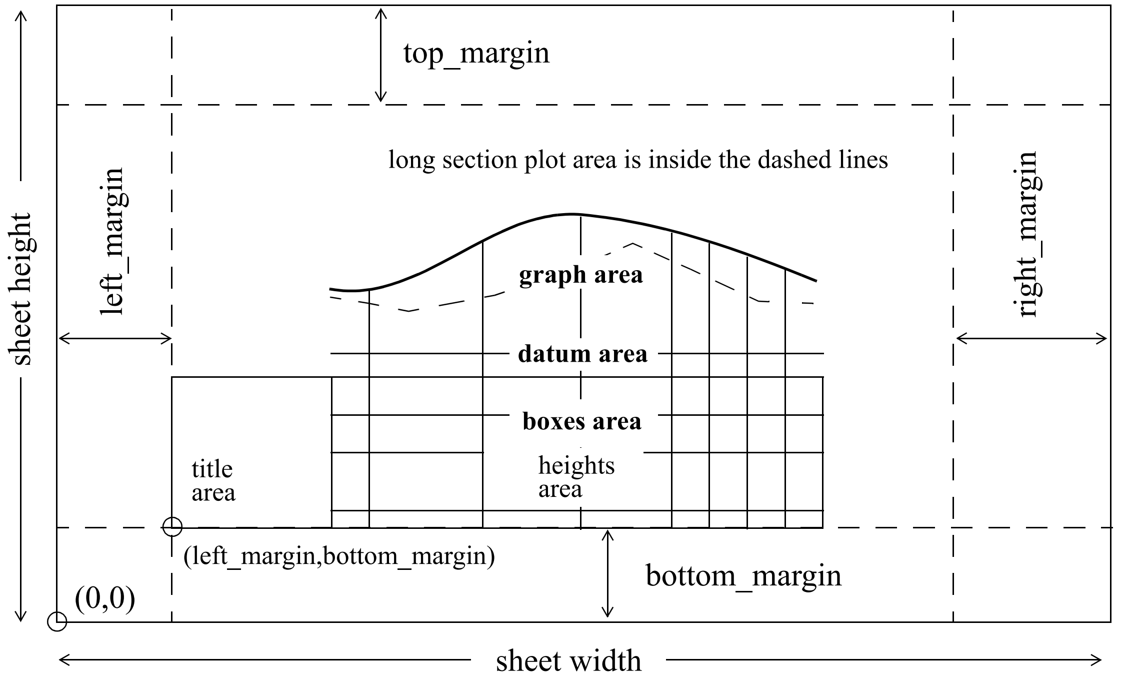
If the long section plot is too long to fit on one page, it can be broken into a number of pages (sheets) with a user defined overlap between the sheets.

The long plot on each page consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

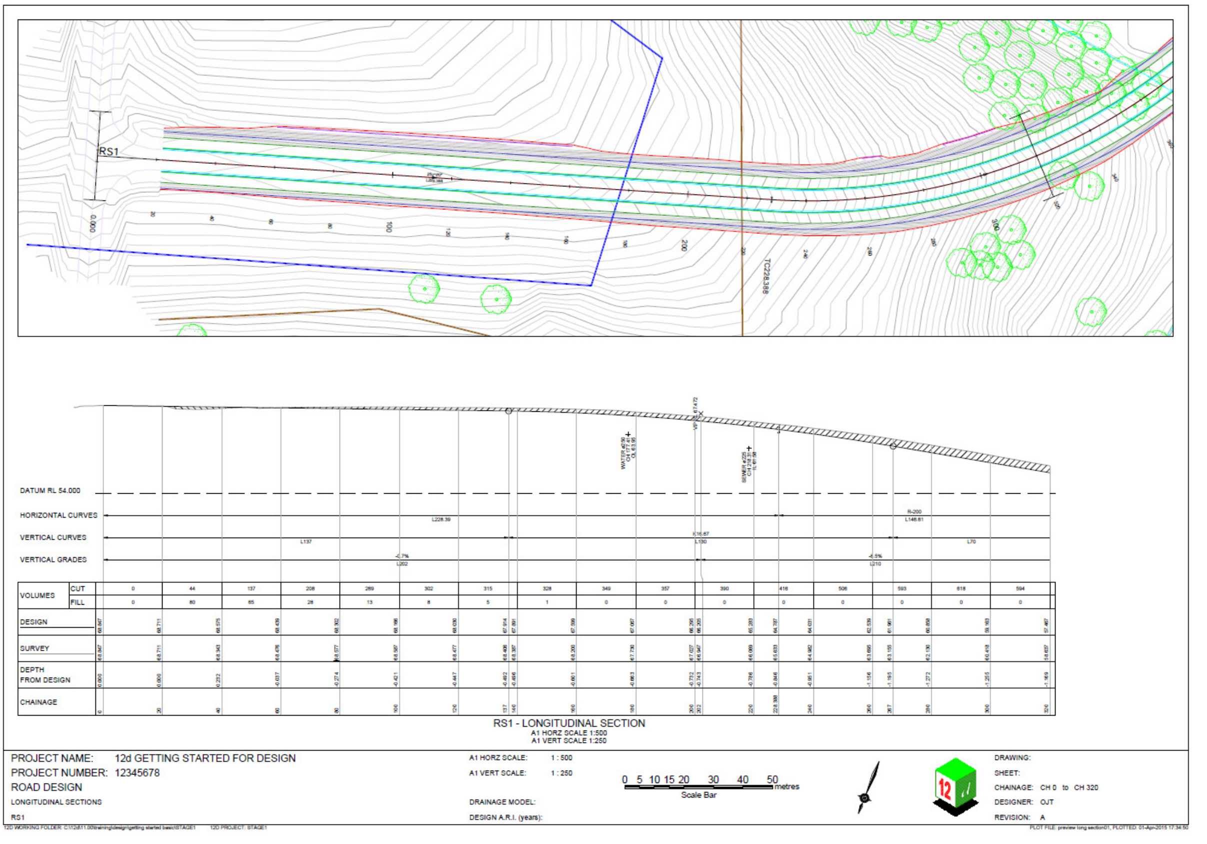
The **graph area** is the area where the actual plots of the strings are drawn.



Apart from information labelled in the boxes area, the long section plot can label other information such as

(a) horizontal geometry
(b) vertical geometry
(c) chainage, heights at special points
(d) symbols at special points
(e) bubbles at special chainages
(f) cuts the design string makes through strings
(g) cut and fill areas

A plot of the plan area that the long section traverses can also be automatically included on each page of the long section plot.



All the required parameters for controlling the long section plot are set up in the ***Long Plot PPF Editor*** and will be described in detail in the following sections.

Please continue to the next section 26.4.2 Section Long Plot - Front Page or return to 26.4 Long Plot PPF Editor.

26.4.2 Section Long Plot - Front Page

The long plot itself consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

Apart from information labelled in the boxes area, the long section plot can label other information including

(a) horizontal geometry

(b) vertical geometry

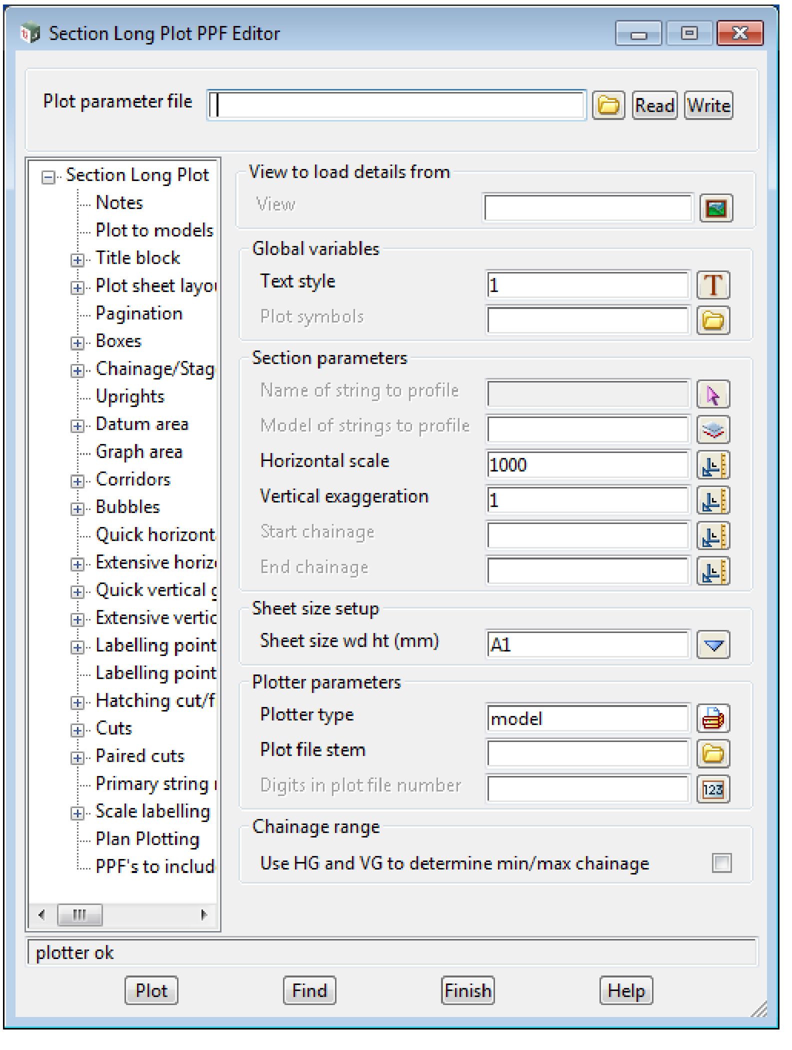
(c) chainage, heights at special points

(d) symbols at special points

(e) bubbles at special chainages

(f) cuts the design string makes through strings

(g) cut and fill areas



Section: Plot parameter file

*a **plot parameter file** can be used to load values into the fields of the PPF Editor, or as a file to write out all current values in a PPF Editor to.*

This section is documented for all the PPF Editors in 26.2.1 Plot Parameter File.

Section: Section: View to load details from AND Global variables

*a **section view** can be selected to load certain values into fields of the PPDF Editor. For example, Vertical exaggeration and Corridor models. And there are variables to use if some values aren't given.*

These sections are documented for all the PPF Editors in 26.2.2 View to Load and Global Variables.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Section parameters

Name of string to profile **string_to_plot** **string select box**

if selected, a long section plot is produced for this string.

Model of strings to profile **model_to_plot** **model box**

if not blank, a long section plot is produced for each string in the model.

Horizontal Scale **scale** **input**

horizontal scale to be used for the long section plots

Vertical exaggeration **vertical_exaggeration** **input**

vertical scale to be used for the long section plots

Start chainage **start_chainage** **input**

start chainage of the string to start the long section plots at

End chainage **end_chainage** **input**

end chainage of the string to end the long section plots at.

Section: Sheet size setup and Plotter parameters

these sections define the size of the "paper" to plot on, the type of plotter to use and the naming to use for the plot files.

These sections are documented for all the PPF Editors in 26.2.3 Sheet Size and Plotter Parameters.

Section: Chainage range

Use HG VG for min, max determines whether the horizontal geometry (HG) and the vertical geometry (VG) are both used to determine the minimum and maximum chainages for drawing. This allows the vertical geometry to be plotted when it is outside the horizontal geometry (e.g. kerb returns).

Use HG and VG to determine min/max chainage

use_hg_vg_for_min_max **tick box**

if ticked, the min/max chainage will be determined by the Horizontal and Vertical geometry.

Please continue to the next section 26.4.3 Notes - Long Section.

26.4.3 Notes - Long Section

This is documented for all the PPF Editors in 26.2.4 Notes.

Please continue to the next section 26.4.4 Plot to models - Long Section.

26.4.4 Plot to models - Long Section

This is documented for all the PPF Editors in 26.2.5 Plot to models.

Please continue to the next section 26.4.5 Title Block - Long Section.

26.4.5 Title Block - Long Section

This is documented for all the PPF Editors in 26.2.6.1 Title Block Section in PPF Editors.

For more general information about a title block, see 26.2.6 Title Block.

This is documented for all the PPF Editors in 26.2.6 Title Block.

Please continue to the next section 26.4.6 Plot Sheet Layout - Long Section.

26.4.6 Plot Sheet Layout - Long Section

Plot Sheet Layout - Margins

Section: Margins for standard 12d title file - Border gaps

If the default 12d title block is used, then the size of the bottom of title block depends on the text size. The following parameters are used in the default title block case and the bottom_border_gap is added to the calculated height of the bottom of the title block.

Left (mm) left_border_gap real box

left border gap (in millimetres).

Right (mm) right_border_gap real box

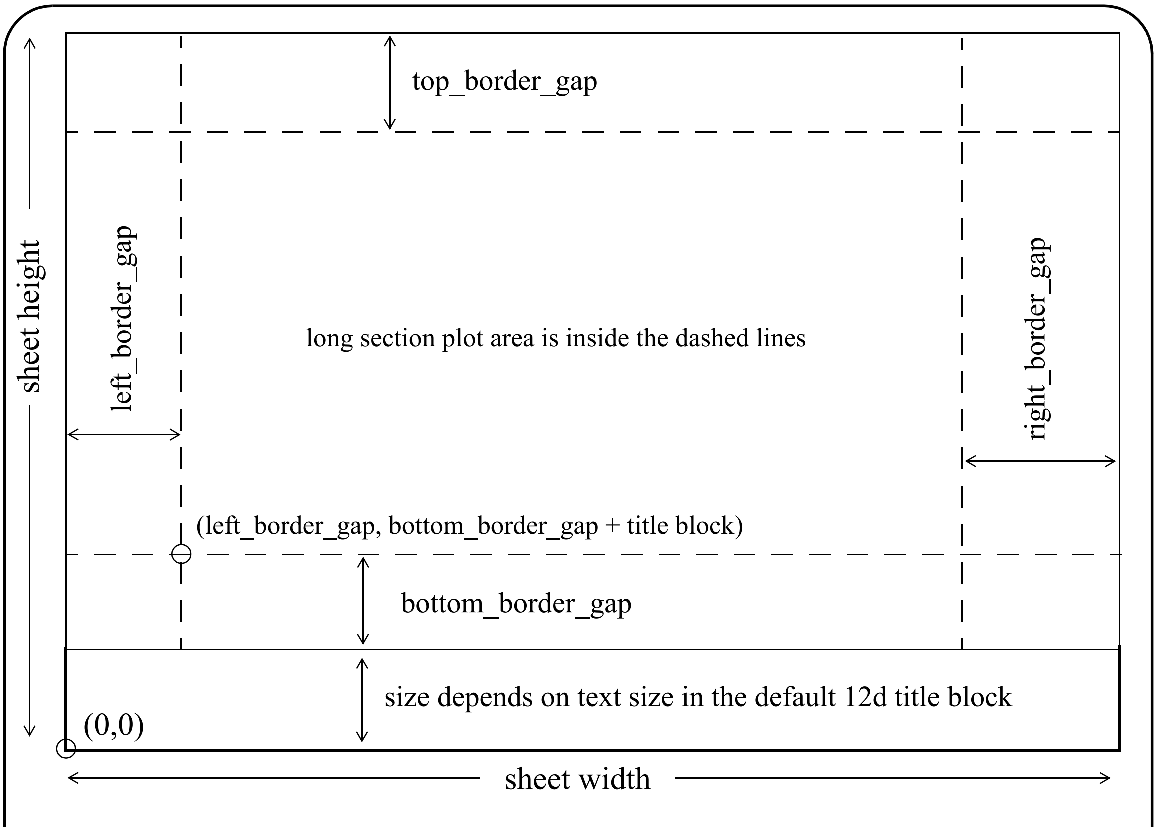
right border gap (in millimetres).

Top (mm) top_border_gap real box

top border gap (in millimetres).

Bottom (mm) bottom_border_gap real box

bottom border gap (in millimetres).



Definition of Plotting Areas for Default 12d Title Block

Section: Margins for user title file

Left (mm) left_margin input

left margin (in millimetres).

Right (mm) right_margin input

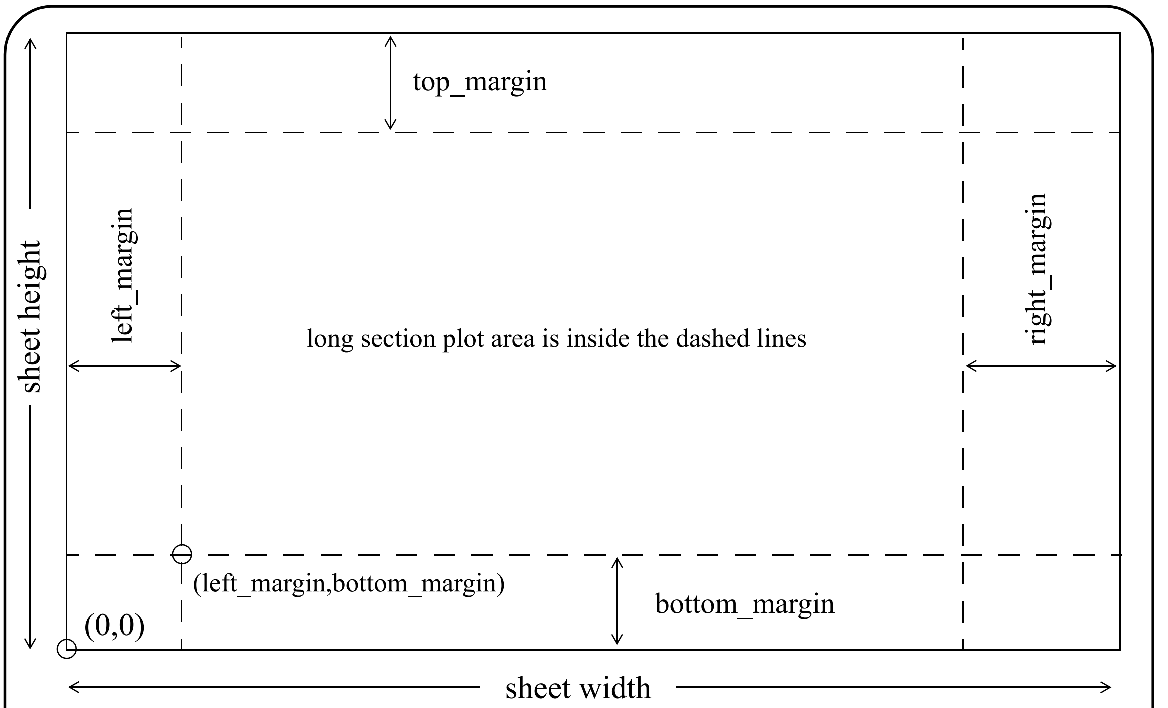
right margin (in millimetres).

Top (mm) top_margin input

top margin (in millimetres).

Bottom (mm) bottom_margin input

bottom margin (in millimetres).



Definition of Plotting Areas for User Defined Title Blocks

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margin and gap parameters can exist in the one plot parameter file.

The (left_margin,bottom_margin) defines the left hand corner position of the long plot on the plot sheet.

The *right_margin* and *top_margin* need not be set and if missing, will be calculated from the other plot parameters defining the plot layout.

If the sheet sizes are missing, they will also be automatically calculated.

Please continue to the next section 26.4.7 Pagination.

26.4.7 Pagination

If the long section plot is too long to fit on one page, it can be broken into a number of pages (sheets).

The parameter, *pagination_length*, controls the amount of new chainage length on each plot page. Each page of the long section plot can also included a set chainage amount from the end of the **previous** plot.

Hence apart from the first page and possibly the last page, the plot will have a chainage length given by the sum of the *pagination_length* and *pagination_overlap*.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Pagination parameters

Panel Field	Parameter name	Type	Pop-Up
Use pagination	**pagination**	**tick box**	
if ticked, then break the plot into pages.			
Pagination mode	pagination_mode	choice	chainage millimetres
length and overlap units.			
Chainage length	**pagination_length**	**input**	
new chainage range on each page.			
Chainage overlap	**pagination_overlap**	**input**	
overlap between pages.			

Note:
The *pagination_length* and *pagination_overlap* are given in chainage units **or** millimetres.The user must choose values which will fit on the selected sheet size or the end of each plot will be truncated by the sheet.

Please continue to the next section 26.4.8 Boxes.

26.4.8 Boxes

Each string in the long section plot can be labelled with one or two lines of title, and the chainages/heights/depths at the user specified chainages for the strings.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The **chainages/heights/depths** are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **chainage/height/depth** values along the string.

Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

(a) optional super-elevation diagram

(b) chainage values

(c) can be primary string heights - user choice

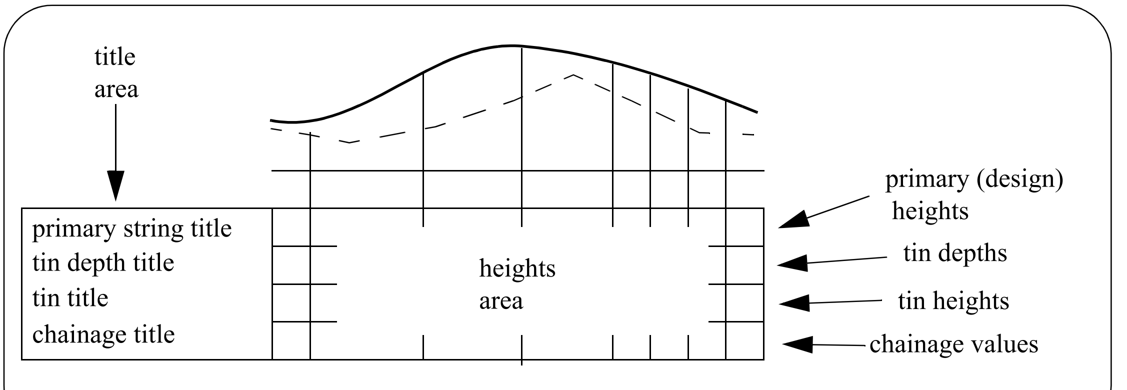
(d) tin heights and depths

(e) offset heights and depths

(f) optional volumes or earth works

(g) can be primary string heights - user choice

(h) zero or more blank boxes



boxes for long section plot

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Linework parameters

Panel Field	**Parameter name**	**Type**	**Pop-Up**
Draw box mode	**draw_box_mode**	**choice box**	**Do not draw any box lines** Draw box lines around height area only **Draw box lines around** title and height area only **Use parameters defined in** boxes - heights

mode for drawing the boxes for the long section plot.

Default box colour **box_colour** **colour box**

default box colour

Number of blank boxes **number_of_blank_boxesinput**

number of boxes to be left blank

The blank boxes are used to place other information in (such as horizontal or vertical geometry) or for other user supplied information.

Section: Primary string parameters

The primary string (the design string) is used to define

(a) the design long section

(b) the chainage positions for labelling heights and drawing uprights

(c) the section line used for sectioning through tins

(d) the section line for defining the corridor for services

Although the primary string is used to set up most of the information for the long section plot, it doesn't have to be drawn on the long section.

The drawing or not drawing of the primary string on each cross section plot is controlled by the parameter *primary_string*.

The **colour** of the primary string in the plot is the actual primary string colour.

Sometimes the primary string is only required to define chainages or the horizontal path for tin sections. In this case, the primary string would not be drawn on the long section plot.

If the primary string is drawn, it is automatically labelled.

Also the drawing of crosses at the vertical intersection points can be controlled from the ppf file.

Draw and label the primary string **primary_string** **tick box**

if ticked, the primary string will be drawn and labelled.

Draw crosses at VIPs **primary_draw_vips** **tick box**

if ticked, crosses will be draw at the vertical intersection points.

The position of the primary string label box can be either straight after the chainage box, or after the tin and offset boxes but before the blank boxes.

Placing the primary string label before the bank boxes or just after the chainage box in controlled by the parameter *primary_label_mode*.

Primary string location primary_label_mode choice box in last box before blank boxes

in first box above chainages

position of the primary string label.

Although the order of the boxes may appear to be fixed, in practice they can be in any order. This is possible because for each box, there is a parameter to set the height in millimetres from the bottom of all the boxes that the text in the box is drawn at (the *_y_pos* parameters).

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

Or return to 26.4 Long Plot PPF Editor.

26.4.8.1 Boxes - Title Area

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Boxes - Title area parameters

The **title area** starts at the co-ordinate (left_margin,bottom_margin).

The size of the title text is given by the ***title_box_text_size*** parameter.

The **width** of the title area is either given by the *space_for_titles* parameter, or if omitted, the required width is automatically calculated.

Size of titles (mm) **title_box_text_size** **input**

size of offset, height label and values

Space for titles (mm) **space_for_titles** **input**

size of title area.

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

X adjustment (mm) **box_titles_x** **input**

distance to move the title text from the left hand side of the boxes

The y position of the title text can be set separately for each type of title. The parameters are given later under each of the title types (*e.g.* chainages, primary string, tins, depths *etc.*).

After the title area there can be a user defined gap, followed by the heights area

Distance between title and values area (mm) box_gap input

distance between title and values area in mm.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box__justification*).

Continue to the next section 26.4.8.2 Boxes - Values Area or return to 26.4.8 Boxes.

26.4.8.2 Boxes - Values Area

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Boxes - Value area parameters

The **values area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_justification*).

The number of decimal places (*number_of_decimals*), and the size of the heights text (*box_text_size*) can be specified globally but there is a parameter for each box which overrides these defaults for each box of heights.

Justification box_text_justification choice box bottom of individual boxes
top of individual boxes

justification of height text.

Number of decimals **number_of_decimals** **input**

number of decimal places in the height boxes. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the heights area.

Text size (mm) **box_text_size** **input**

distance to move the title text from the left hand side of the boxes

Horizontal line spacing (mm)

horizontal_line_spacing input

height of the individual height boxes.

A global height for the individual boxes is either given by the *horizontal_line_spacing* parameter, or if omitted, a height to fit the largest height or depth value is calculated and used as the default box height.

However, the height of each box can be individually set by parameters *box_size_n* where the boxing numbering, n. starts from the bottom box. The value of *horizontal_line_spacing* is used for any of the *box_size_n* parameters not specified.

Label tin/offset string heights by default

label_heights tick box

Label tin/offset string depths by default

label_depths tick box

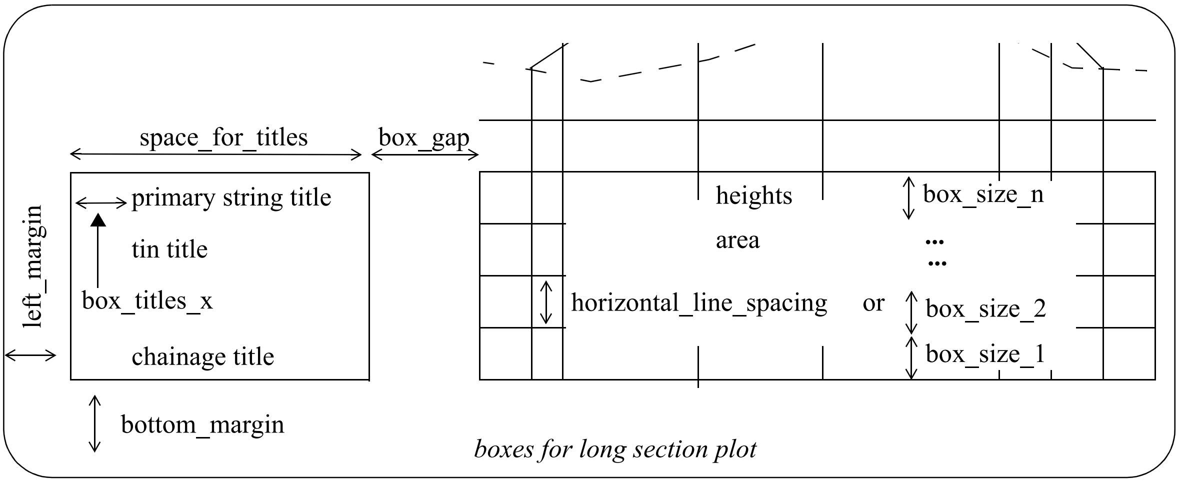
Box # **input**

specifying the nth value

Size (mm) **box_size_n** **input**

height of the nth box, numbered from bottom up.

The total height of the boxes area is simply given by the sum of the heights of each box.



The **width** of the **heights area** is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the **title area** plus box_gap, plus the width of the **heights area**.

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area so that the distances are independent of the number of boxes and box sizes.

Continue to the next section 26.4.8.3 Boxes - Outside Linework or return to 26.4.8 Boxes.

26.4.8.3 Boxes - Outside Linework

The drawing of the box line work, the box colour, the position of the primary string labels and the number of blank boxes are all set by parameters.

if set, the height in mm above the bottom of all the boxes that the tin depth text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Multiplier for positive depths **depth_positive_factorinput**

if set, this value will be used to multiply positive depth values.

Multiplier for negative depths **depth_negative_factorinput**

if set, this value will be used to multiply negative depth values.

The depth from the primary string to a tin, at a particular offset is defined as

depth = tin height value - height of the primary string

That is, the depth that the primary string is **below** the tin.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

if (depth >= 0) plotted_depth_value = depth * depth_positive_factor

if (depth < 0) plotted_depth_value = depth * depth_negative_factor

Hence the definition of depth can be modified by the parameters:

depth_positive_factor *value* // multiplier for positive depths

depth_negative_factor *value* // multiplier for negative depths

For example, if the opposite sign is required for depth, that is,

depth = height of the primary string - tin height value

simply set

depth_positive_factor -1

depth_negative_factor- 1

Continue to the next section 26.4.8.7.4 Boxes - Offset String Titles/Heights/Depths or return to 26.4.8 Boxes.

26.4.8.7.4 Boxes - Offset String Titles/Heights/Depths

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Offset string titles/heights/depths parameters

Each string in the offset model given can be automatically projected onto the primary string and drawn on the long section plot.

The offset model has been modified to allow strings to be projected onto the primary string to be specified by model and name, rather than just projecting all the strings in a given model. The string can also be labelled with either the string name, its model name or both.

The string is specified by

offset_n_mask *"model_name->string_name"*

For each n, a set of plot parameters determine if the string's heights and/or depths from the primary string are labelled in the boxes area.

If only the *string_name* is given, then the model given in the **Offset model** field of the **Section Long Plot** panel.

If there is **more than one string** with the given model and name, then it will be considered to be one string and at any primary string chainage, the closest of the strings will be the part used for projecting. For example, strings of the same name on either side of a road intersection will be considered to be the one string for projecting.

If any *offset_n_mask* is used, then the Offset option expects all the strings to be specified by an offset_n_mask. Then if no mask exists for any value of n, then that parameter set is ignored and no string projected.

If no offset masks are used (that is, no *offset_n_mask*'s are used), then the plot parameters determine whether each string in the offset model is drawn, and if the string's heights and depths from the primary string are labelled in the boxes area. The order that the strings are then plotted and labelled is the same as the order of the strings in the Offset model.

For the following sets of parameters, n takes the value 1 to 100 and specifies that the parameter set applies to the nth string given by *offset_n_mask* or, if no offset masks are given, the nth string in the *Offset model*.

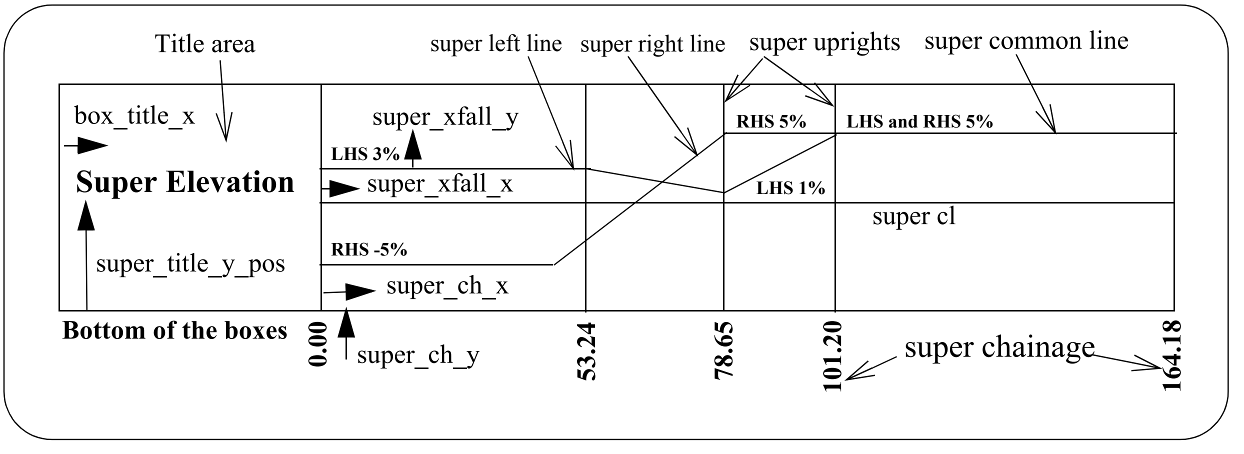
Continue to the next section 26.4.8.9 Boxes - Super Elevation Diagram or return to 26.4.8 Boxes.

26.4.8.9 Boxes - Super Elevation Diagram

The optional *super-elevation diagram* draws the values of the cross-fall (x-fall) between two strings using the primary string as the reference string. The cross-fall at a given chainage on the primary string is calculated by sectioning perpendicular to the reference string at that chainage and cutting the two strings. The cross-fall is defined as the cross-fall between the two cuts points on the strings.

The diagram has levels for the cross fall for a pair of strings on the left of the primary string, and a pair of strings on the right of the primary string. The diagram also has uprights in the super-elevation box with chainage values at the change of super values.

For the left hand side, the cross-fall is calculated at right angles to the primary string between the user given left hinge string and the left edge string.



The columns for the fields documented in the sections are for.

Continue to the next section 26.4.8.11 Boxes - X,Y or return to 26.4.8 Boxes.

26.4.8.11 Boxes - X,Y

The values of the X and Y coordinate for selected chainages can be labelled as separate boxes.

The chainages specified are limited to the base set of chainages already defined in the chainage selection and staggering section. i.e. an upright must exist for the X and Y value to be labelled. Not all of the uprights have to be labelled, just those specified in this section.

There are plot parameters to control all aspects of the X and Y labelling.

Chainages are used for positioning X and Y labels.

The chainages for the long section plot relate to the primary string and are controlled by a set of parameters.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: X, Y parameters

X, Y order xy_order choice box X before Y / Y before X

*order to place X and Y boxes. X before Y indicates that the X box will appear closest to the bottom of the boxes and the Y box will be on top of it. **Note**: The boxes are placed from bottom to top.*

Chord/arc chainage mode xy_chord_arc choice box Do not use chord/arc chainages / Use chord/arc chainages

mode to include chord/arc chainages.

Start chainage **xy_start_chainage** **input box**

start chainage of chainage range to be labelled.

End chainage **xy_end_chainage** **input box**

end chainage of chainage range to be labelled.

Chainage interval **xy_interval** **input**

the regular interval (0=no regulars).

Include tangents, spirals **xy_label_hcp** **tick box**

if ticked, include the tangents and spirals.

Include hip points **xy_label_hip** **tick box**

if ticked, include horizontal intersection points.

Include vip points **xy_label_vip** **tick box**

if ticked, include vertical intersection points.

Include tangent points **xy_label_vtp** **tick box**

if ticked, include tangent points.

Include crest points **xy_label_crest** **tick box**

if ticked, include crest points.

Include sag points **xy_label_sag** **tick box**

if ticked, include sag points.

Include change of vertical grade

xy_label_grade_change **tick box**

if ticked, include changes in vertical grade.

Include chord/arc tolerance chainages

xy_chord_arc **tick box**

Chainage weeding tolerance

xy_label_tolerance **input**

if >0 then use as a weeding tolerance, if <=0 don't weed.

Files of special chainages

xy_special_n_file **file box**

n = 1 to 20 - include chainages from the file (one chainage per line)

Merge in bubble chainages **chainage_merge_bubbles** **tick box**

if ticked, merge in bubble chainages.

Weeding tolerance after bubble merge **chainage_merge_tolerance** **input**

if > 0, weed after merge using specified weeding tolerance. If <= 0, don't weed after merge.

Files of special chainages **chainage_special_n_file** **file box**

n = 1 to 20 - include chainages from the file (one chainage per line)

Continue to the next section 26.4.9.1 Chainage/Staggering - Staggering or return to 26.4.9

Chainage/Staggering.

26.4.9.1 Chainage/Staggering - Staggering

If the real chainage position is used for the horizontal position of the chainage/height/depth text, text over writing can easily occur.

To prevent over writing, the text can be **staggered**.

If the ***stagger_mode*** parameter is set to 1, the text position is adjusted so that the text does not over write.

The real chainage position is then indicated by the chainage markers which are drawn at the top of the text boxes from the staggered text position back to the actual chainage position of the text.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Chainage/Staggering - Staggering parameters

Stagger mode	stagger_mode	choice box	no staggering, allow over writing Stagger text

stagger mode.

Distance from boxes to top of staggers (mm)

	stagger_gap_top	input	

distance from the top of boxes to top of staggers in mm.

Distance from boxes to bottom of staggers (mm)

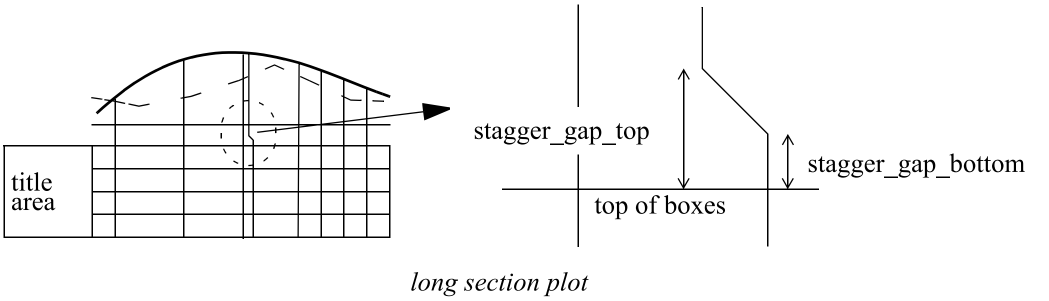
	stagger_gap_bottom	input	

distance from the top of boxes to bottom of staggers in mm.

Stagger gap factor	stagger_gap_factor	input	

*distance between staggers is box_text_size * stagger_gap_factor*

When staggering occurs, it is possible for the heights area to be longer than the graph area.



long section plot

Please continue to the next section 26.4.10 Uprights.

26.4.10 Uprights

Uprights, or leader lines, can be drawn from the top of the staggers to the strings drawn on the plot.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

26.4.11 Datum Area

The **datum area** is the region between the boxes area and the graph area.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Datum area - datum value mode

Use manual datum **manual_datum** **tick box**

if ticked the datum will be calculated internally, else use the datum_value parameter for the datum.

Datum value **datum_value** **input**

the value to be used for the datum.

Datum roundoff **datum_roundoff** **input**

the value to roundoff the datum value.

Decimal places for datum **datum_decimals** **input**

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Section: Datum area - other parameters

Datum name **datum_name** **input**

text to write before the datum value

Graph area to datum line gap (mm) datum_above_gap real box

distance from the bottom of the graph area to the datum line.

Datum line gap to top of boxes (mm) datum_below_gap real box

distance from datum line to top of boxes.

The **datum line** is positioned the distance ***datum_below_gap*** above the top of the boxes area and the graph area is positioned the distance ***datum_above_gap*** above the datum line.

Hence the graph area is distance (datum_below_gap + datum_above_gap) above the top of the boxes area.

The *datum_below_gap* and *datum_above_gap* can be zero or positive.

Datum linestyle datum_linestyle linestyle box

datum line linestyle (default solid)

Datum textstyle datum_textstyle text box

textstyle for datum information

Datum text size (mm) datum_text_size input

size of datum text and value (mm)

Datum colour datum_colour colour box

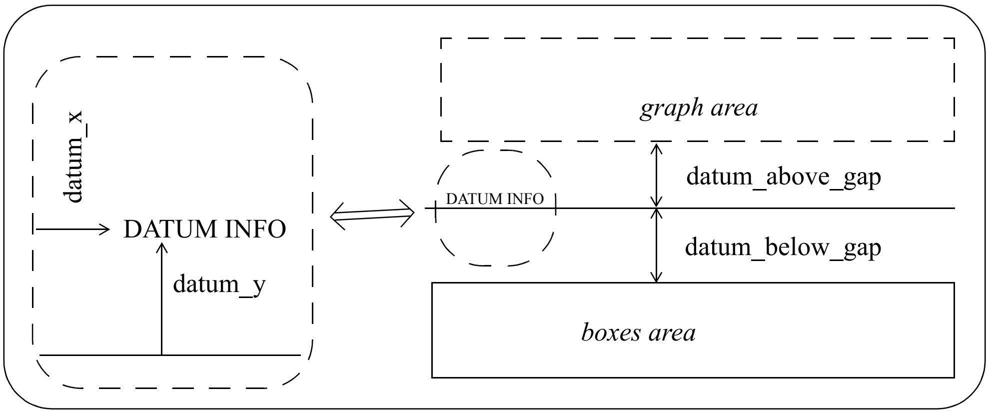
colour of the datum text and line.

X adjustment (mm) **datum_x** **input**

distance to move the datum text along the datum line

Y adjustment (mm) **datum_y** **input**

distance to raise the datum text above the datum line



Continue to the next section 26.4.11.1 Datum Area - Offset String Datum Labels or return to 26.4.11 Datum Area.

26.4.11.1 Datum Area - Offset String Datum Labels

Offset string

Datum name

Datum colour

X adjustment (mm)

Y adjustment (mm)

Please continue to the next section 26.4.12 Graph Area.

26.4.12 Graph Area

The graph area sits on top of the boxes and datum areas, so there may not be enough room left on the sheet for the full plot height. In this case, the plot will be truncated at the top of the allowed graph area.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Graph area parameters

Left/Right extensions (world units)

if not zero, the long section goes for this chainage distance from before the primary string starts to after the primary string ends. The primary string is extended by continuing at the instantaneous bearing at the ends of the primary string.

Extra space units **extra_space_units** **choice box** **world units**

millimetres

units for specifying extra space to be added to the plot area.

Extra space left (units) **extra_space_left** **input**

extra distance to add to the end of title area before the plot area starts.

Extra space right (units) **extra_space_right** **input**

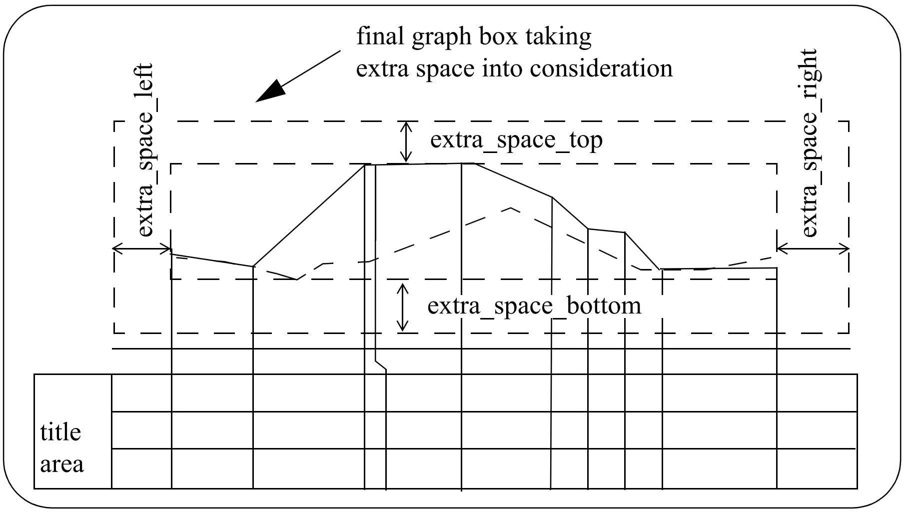
extra distance to add to the end of plot area for the end of the boxes to draw to.

Extra space top (units) **extra_space_top** **input**

extra distance to add to the top of plot area.

Extra space bottom (units) **extra_space_bottom** **input**

extra distance to add before the bottom of plot area starts.



Please continue to the next section 26.4.13 Corridors - Long Section.

26.4.13 Corridors - Long Section

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the cross-section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

This is documented for all the PPF Editors in 26.2.7 Corridors.

Please continue to the next section 26.4.14 Bubbles.

26.4.14 Bubbles

Circles with the string name and a unique number (**bubbles**) can be drawn on the long section plot. Bubbles are normally used for lip profiles.

The chainages used for the bubbles are given by a set of parameters similar to the chainage parameters. The resulting set of bubbles are sequentially numbered (starting with one) in chainage order.

Although many bubbles can be defined by the bubble parameters, a bubble is only drawn on the plot if there is a labelled chainage to draw it above.

Hence not all bubbles given by the bubble chainage parameters are drawn but for the ones that are drawn, the bubble number is taken from the full bubble set.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Bubble definition parameters

Bubble draw mode	chainage_bubbles	choice box	Do not draw bubbles Draw bubbles
draw bubble mode

Please continue to the next section 26.4.16 Extensive Horizontal Geometry.

26.4.16 Extensive Horizontal Geometry

The standard horizontal geometry arrows can be drawn at a given distance above the top of the boxes area.

For complicated horizontal geometry labelling, there are sets of horizontal geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the horizontal geometry of ***alignment*** strings other than the primary string. To plot such a string on the same plot, the chainage position of the horizontal geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the horizontal geometry (such as radius and spiral length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting horizontal geometry, the user can give up to twenty sets of these labels and they can be used to label spirals, curves and tangent information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

(a) a text label on the left hand side of the plot
(b) an arrow
(c) text on the arrows.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Extensive horizontal geometry parameters

Define set # **input**

where n = 1 to....20. The set enables the specification of a number of parameters for a number of specified extensive horizontal geometry.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Panel Field	Parameter name	Type	Pop-Up
Geometry to label	h_g_n_type	choice box	label spirals
			label horizontal curves
			label horizontal tangents

specifies what geometry is to be labelled for the nominated set. If h_g_n_type is missing, then the set is ignored.

Panel Field	Parameter name	Type	Pop-Up
Value to label	h_g_n_value_mode	choice box	nothing
			length
			radius (for curve labelling)
			or radius*length (for spiral)

specifies the value to label.

Y offset (mm) **h_g_n_label_y** **input**

distance of arrow line above top of the boxes.

If the set of parameters is to apply to the horizontal geometry of an alignment string *other* than the primary string, then the offset string can be specified.

Offset string **h_g_n_offset_string** **select box**

the name of the non-primary string. i.e.

h_g_n_offset_string *model->string_name*

or

h_g_n_offset_string *string_name*

and the model is the *defined by offset_model*. *offset_model has been* defined in the section 26.4.8.7.4 Boxes - Offset String Titles/Heights/Depths.

If the *h_g_n_offset_string* parameter does not exist, then the set of horizontal geometry parameters is applied to the primary string.

Please continue to the next section 26.4.18 Extensive Vertical Geometry.

26.4.18 Extensive Vertical Geometry

For complicated vertical geometry labelling of the *primary alignment* string, there are sets of vertical geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the vertical geometry of ***alignment*** strings other than the primary string. To plot such a string on the same plot, the chainage position of the vertical geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the vertical geometry (such as grade and curve length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting vertical geometry, the user can give up to twenty sets of these labels and they can be used to label grades or vertical curve information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

(a) a text label on the left hand side of the plot
(b) an arrow
(c) text on the arrows.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Extensive vertical geometry parameters

Define set # **input**

where n = 1 to....20. The set enables the specification of a number of parameters for a number of specified extensive horizontal geometry.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Geometry to label	v_g_n_type	choice box	label grades **label vg curve information**

specifies what geometry is to be labelled for the nominated set. If v_g_n_type *is missing, then the set is ignored.*

Value to label	v_g_n_value_mode	choice box	nothing %grade |or| parabola length, arc length *1 in grade |or| radius* *mm grade |or| K value* *ch length between curve points* *per chord(QR) |or| curve* constant (QR).

specifies the value to label. This will be dependant on the v_g_n_type chosen.

Vertical curve points to draw the arrows between (for grade labelling only)

Points to draw arrows between

	v_g_n_between_mode	**choice box**	**between chainages at the** vips between chainages at the vtps

specifies where to draw the arrows between (for grade labelling only).

Y offset (mm) **v_g_n_label_y** **input**

distance of arrow line above top of the boxes. This value can be negative

If the set of parameters is to apply to the vertical geometry of an alignment string *other* than the primary string, then the following parameter can define the other alignment string

Offset string **v_g_n_offset_string** **select box**

the name of the non-primary string. i.e.

v_g_n_offset_string *model->string_name*

or

v_g_n_offset_string *string_name*

and the model is the *defined by offset_model*. *offset_model has been* defined in the section 26.4.8.7.4 Boxes - Offset String Titles/Heights/Depths.

If the *v_g_n_offset_string* parameter does not exist, then the set of vertical geometry parameters is applied to the primary string.

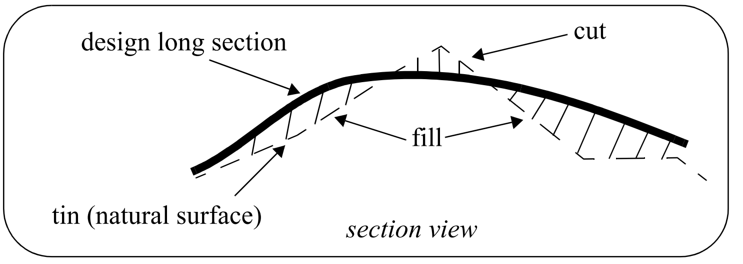
Please continue to the next section 26.4.21 Hatching Cut/Fill.

26.4.21 Hatching Cut/Fill

This option is used to hatch cut and/or fill areas between sets of tins.



The **Hatching Cut/Fill** section is common to the **PPF Editors** and is fully documented in 26.2.8 Hatching Cut/Fill.

Section: Hatching cut/fill - Tin parameters - *see* 26.2.8 Hatching Cut/Fill

Section: Hatching cut/fill - Cut parameters - *see* 26.2.8.1 Hatching Cut/Fill - Cut

Section: Hatching cut/fill - Fill parameters- *see* 26.2.8.2 Hatching Cut/Fill - Fill

Please continue to the next section 26.4.22 Cuts.

26.4.22 Cuts

The cuts that the longsection string makes though strings in any user-specified model, can be automatically labelled on the x-section plots.

The **Cuts** section is common to the **PPF Editors** and is fully documented in 26.2.9 Cuts.

Section: Cuts - Model/Name mask parameters - *see* 26.2.9 Cuts.

Section: Cuts - Chainage parameters - *see* 26.2.9.3 Cuts - Chainage - Long Sections Only

Section: Cuts - Height parameters - *see* 26.2.9.4 Cuts - Heights

Section: Cuts - Diameter parameters - *see* 26.2.9.5 Cuts - Diameters

Section: Cuts - Label parameters - *see* 26.2.9.6 Cuts - Labels

Section: Cuts - Symbol parameters - *see* 26.2.9.7 Cuts - Symbols

Continue to the next section 26.4.23 Paired Cuts - Long Section.

26.4.23 Paired Cuts - Long Section

Paired cuts uses pairs of strings and where both strings cut the primary string, the cuts on the long plot can be labelled with information such as

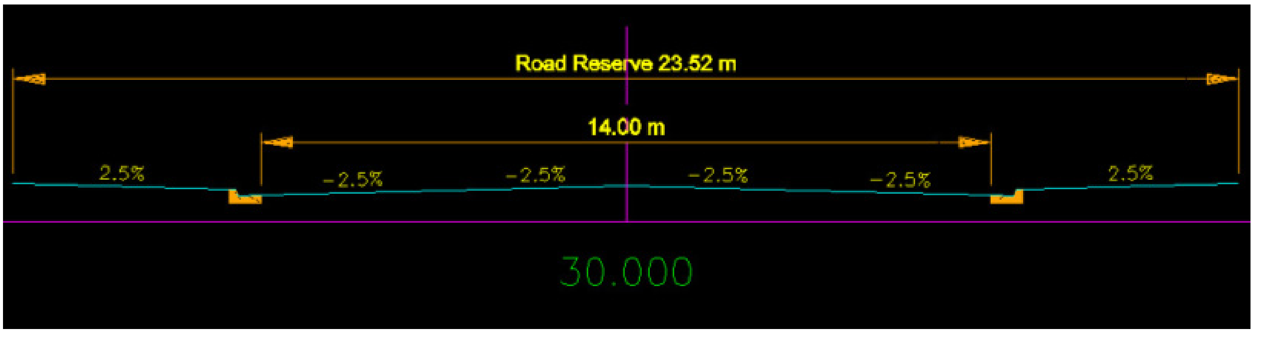
(a) the name of the first and second cut strings

(b) attributes from the first and second cut string

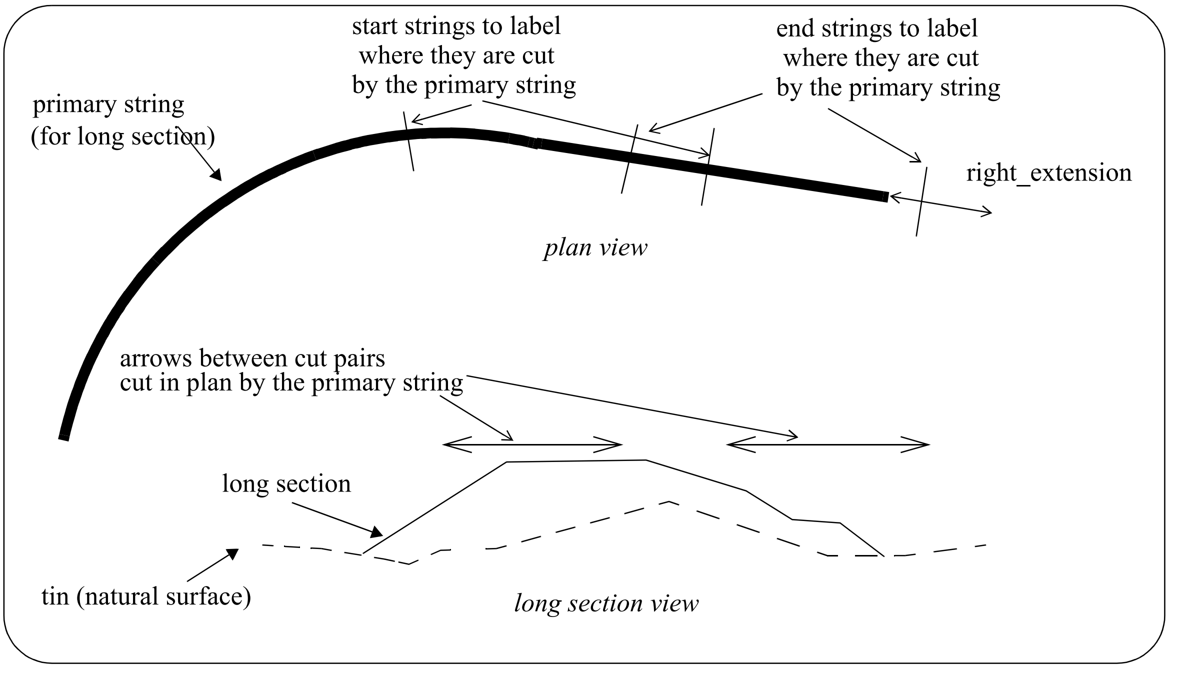
(c) plan distance between the two cuts of the pair

(d) 3d length between the two cuts of the pair

(e) the chainge on the long section of the first and second cuts of the pair



Symbols can be drawn at the chainages of the first and second cuts (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts.



The method for specifying which strings are to be checked for paired cuts is by first specifying the **models** (using wild cards and characters) that contains the strings, and then a **start name mask** to select the all the strings that are to be the first strings in a cut pair, and an **end name mask** to select all the strings that are the second strings in a cut pair.

For a long section, all the cuts of the selected **start** strings are found and the cuts ordered by the chainage of the cut with the primary string of the long section. Then all the cuts of the selected

end strings are found and the cuts ordered by the chainage of the cut with the primary string of the long section.

The start cuts are then processed and each start cut is paired with the next end cut with a larger chainage than the start cut. It is possible that there are end cuts before the first start cut (orphaned end cuts) and start cut with no following end cut (orphaned start cuts).

Up to twenty five different sets of models and name masks can be used so that different paired cut sets can be labelled in different ways.

See

26.4.23.1 Paired Cuts (Long Section) - Front Page
26.4.23.2 Paired Cuts (Long Section) - Lines and Symbols
26.4.23.3 Paired Cuts (Long Section) - Labels

26.4.23.5 Paired Cuts (Long Section) - End Chainage

Or return to 26.4 Long Plot PPF Editor.

26.4.23.1 Paired Cuts (Long Section) - Front Page

Section: Pairing - Model/Name mask parameters

Panel Field	Parameter name	Type
Define Set #		**input**

set number to be used to define different model/mask sets.

Model	pairing_n_model	**model box**

models (the name can include wild cards (*) and wild characters (?)) from which start and end cut masks are derived.

Start name mask	pairing_n_start_mask	**input**

text string containing the name masks to select the start strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes " *(eg* "bench 2"*).*
Each mask can include wild cards (*) and wild characters (?).

For example:	*"ke*"*	*or,*
	"?bank"*	*or, if both masks are required,*
	"ke ?bank*"*	

End name mask	pairing_n_end_mask	**input**

text string containing the name masks to select the end strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes " *(eg* "bench 2"*)*
Each mask can include wild cards and wild characters.

For example:	*"ke*"*	*or,*
	"?bank"*	*or, if both masks are required,*
	"ke ?bank*"*	

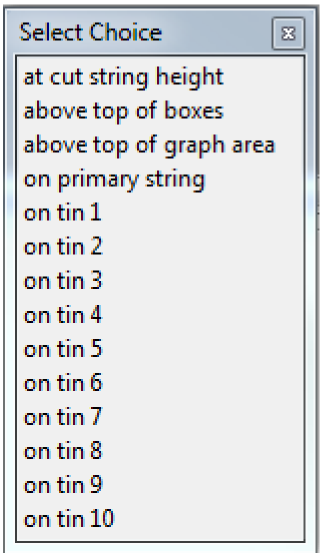
Note

*If **Start name mask** is blank and **End name mask** is not blank, then all strings in the models that are not used as end strings, are used as start string.*

*If **End name mask** is blank and **Start name mask** is not blank, then all strings in the models that are not used as start strings, are used as end string.*

*This is currently not operational: If **Start name mask** and **End name mask** are both blank, then all strings in the models are used. All the strings that cut the primary string of the long section are ordered by offset, and successive pairs of cuts taken to be the cut pairs. There could be one remaining cut point (it has the largest chainage) and if so, it is taken to be orphaned start point.*

Position **pairing_n_position** **choice box**



where to get the z-values to use for the two cut positions. This is used in conjunction with the choice in the **Adopted height** *field.*

If left blank, ***at cut string height*** *is used.*

Adopted height **pairing_n_height** **choice box** **lower position, higher position**

start position, end position

for the choice selected in the **Position** *field, there will be a z-value at the first cut and another z-value at the end cut. The* **Adopted height** *says which of the two z-value to use for placing symbols, lines between cuts, text from Attributes and the Offsets of the first cut and the second cut.*

If lower (higher) position, the smaller (greater) of the two z-values will be used.
If start (end), the z-value of the first (second) cut of the cut point pair will be used.

If left blank, ***lower position*** *is used.*

Include orphaned start ? pairing_n_orphan_start **choice box** **yes, no**

if ***Yes*** *and there are start cuts after the last end cut (and so can't be paired), then the last start cut (i.e. the one with the largest chainage) is taken as an orphaned start and it is labelled as though there is a matching end at the end of the long section.*
if ***No*** *and there are start cuts after the last end cut, then those start cut are ignored.*

If left blank, ***No*** *is used.*

Include orphaned ends ? pairing_n_orphan_end **choice box** **yes, no**

if ***Yes*** *and there are end cuts before the first start cut, then the first end cut (the one with the smallest chainage) is taken as an orphaned end and it is labelled as though there is a matching start at the beginning of the long section.*
if ***No*** *and there are end cuts before the first start cut, then those end cut are ignored.*

If left blank, ***No*** *is used.*

Continue to the next section 26.4.23.2 Paired Cuts (Long Section) - Lines and Symbols or return to 26.4.23 Paired Cuts - Long Section.

26.4.23.2 Paired Cuts (Long Section) - Lines and Symbols

Symbols can be placed at the start and end cut chainages (at the z-value given by the **Position** and **Adopted height** columns when defining the Sets), and a line can also be drawn between the cuts at that z-value. Having both the line and a symbol forms an arrow between the cuts pair.

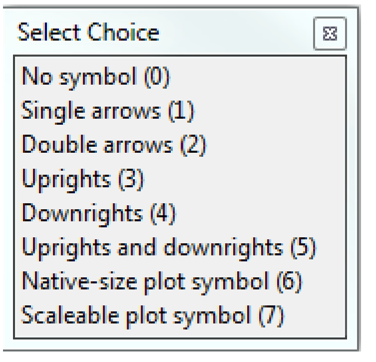
Section: Pairing - Lines and symbol parameters

Panel Field **Parameter name** **Type** **Pop-Up**

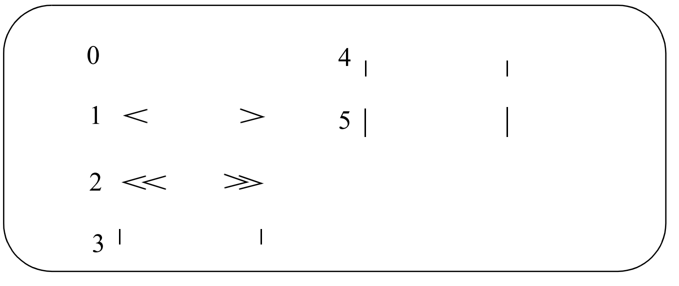
Use Set # **input**

set number as specified in the **Define set #**.

Symbol type **pairing_line_symbols_n_symbol** **choice box**



type of symbol at each end of the cut pair.



for cases 6 and 7, a plot symbol is to be used and is given in the Symbol field

The height used for the symbol at both ends of the cuts pair is given by the **Position** *and* **Adopted height** *column in the Set definition.*

Symbol **pairing_line_symbols_n_user_symbol** **plot symbols**

for Symbol type 6 and 7, the plot symbol to be used at each cut point.

For Symbol type 0 to 5, this field is not used.

The height used for the symbol at both ends is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Symbol colour **pairing_line_symbols_n_symbol_colour** **colour box**

colour of the symbol

Draw line **pairing_line_symbols_n_line** **choice box** **No line, Draw line**

if Draw line, draw a line between the start and end cuts for each cut pair.
If No line, no line is drawn between the start and end cuts for each cut pair.

The height used for the line at both ends is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Line colour **pairing_line_symbols_n_line_colour** **colour box**

colour of the line between the start and end cuts for each cut pair

Left symbol rotation **pairing_line_symbols_n_left_rotate** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the symbol at the start cut point for the cut point pair.*

If there is no value then the rotation is 0.

Right symbol rotation **pairing_line_symbols_n_right_rotate** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the symbol at the end cut point for the cut point pair.*

If there is no value then the rotation is 0.

X (mm) **pairing_line_symbols_n_x** **measure box**

horizontal adjustment to the position of the symbol.

Y (mm) **pairing_line_symbols_n_y** **measure box**

vertical adjustment to the position of the symbol.

Size **pairing_line_symbols_n_size** **measure box**

size of symbol. A value of 0 means no symbol.

Continue to the next section 26.4.23.3 Paired Cuts (Long Section) - Labels or return to 26.4.23 Paired Cuts - Long Section.

26.4.23.3 Paired Cuts (Long Section) - Labels

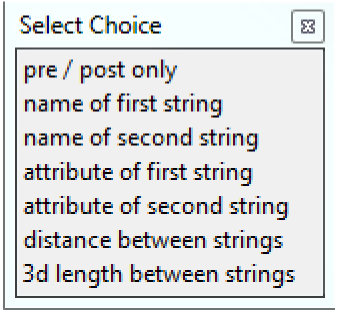
Section: Pairing - Label parameters

Panel Field **Parameter name** **Type** **Pop-Up**

Use Set # **input**

set number as specified in the **Define set #***.*

Mode **pairing_label_n_mode** **choice box**



type of label to write between the start and end points of the cuts pair

The height used for the label is given by the **Position** *and* **Adopted height** *columns in the Set definition.*

Attribute name **pairing_label_n_attribute** **text box**

if **Mode** *is* ***attribute of first string*** *or* ***attribute of second string****, this is the name of the attribute to use as the label*

Offset **pairing_label_n_offset** **measure box**

the text is raised by this amount above the line between the cut pair

Colour **pairing_label_n_colour** **colour box**

colour of the text

Size (mm) **pairing_label_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_label_n_textstyle** **textstyle box**

the textstyle for the text

Pre-text **pairing_label_n_pre_text** **text box**

text to draw before the label. This can include spaces, including one or more spaces after the last non blank character of **Pre-text***.*

Post-text **pairing_label_n_post_text** **text box**

text to draw after the label. This can include spaces, including one or more spaces before the first non blank character of **Post-text***.*

Decimals **pairing_label_n_no_decimals** **number box**

if the label is a number, then **Decimals** *is the number of decimal places to write the number out to.*

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Leave gap for text pairing_label_n_?? **tick box**

if ticked then a gap in the line between the cuts pair is left large enough for the label and the pre-text and post-text.

If not ticked then no gap is left in the line between the cuts pair.

Rotate text to fit pairing_label_n_roate_text **tick box**

if ticked, then if the label and the pre-text and post-text will not fit between the start cut and end cut of *the cut pair, the text is rotated through ninety degrees.*

If not ticked, then the label text is drawn even though it will run over the ends of the cut pair.

Continue to the next section 26.4.23.4 Paired Cuts (Long Section) - Start Chainage or return to 26.4.23 Paired Cuts - Long Section.

26.4.23.4 Paired Cuts (Long Section) - Start Chainage

The Chainge (on the long section) of the first point of the cut pair can be labelled.

The text for the label consists of pre-text followed by Chainage value followed by post-text.

Section: Pairing - Start Chainage parameters

Panel Field **Parameter name** **Type** **Pop-Up**

Use Set # **input**

set number as specified in the **Define set #**.

The height used for the text is given by the **Position** *and* **Adopted height** *columns in the Set definition. This is then adjusted by the field* **Y (mm).**

X (mm) **pairing_start_chainage_n_x** **measure box**

for placing the text: horizontal adjustment from the chainage of the first cut.

Y (mm) **pairing_start_chainage_n_y** **measure box**

for placing the text: the vertical adjustment to the height given by the **Position** *and* **Adopted height** *columns in the Set definition*

Angle (dms) **pairing_start_chainage_n_angle** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the text*

Colour **pairing_start_chainage_n_colour** **colour box**

colour of the text

Size (mm) **pairing_start_chainage_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_start_chainage_n_textstyle** **textstyle box**

the textstyle for the text

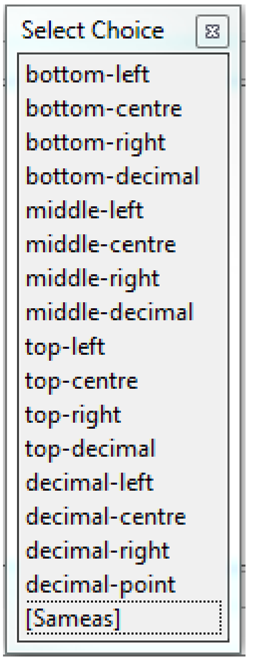
Pre-text **pairing_start_chainage_n_pre_text** **text box**

text before the Chainage value. This can include spaces, including one or more spaces after the last non blank character of **Pre-text**.

Post-text **pairing_start_chainage_n_post_text** **text box**

text after the Chainage value. This can include spaces, including one or more spaces before the first non blank character of **Post-text**.

Justification **pairing_start_chainage_n_justification** **justification box**



justification of the text.

Decimals **pairing_start_chainage_n_no_decimals** **number box**

the number of decimal places for the offset value

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Continue to the next section 26.4.23.5 Paired Cuts (Long Section) - End Chainage or return to 26.4.23 Paired Cuts - Long Section.

26.4.23.5 Paired Cuts (Long Section) - End Chainage

The Chainage on the long section of the second point of the cut pair can be labelled.

The label consists of pre-text then the Chainage value followed by post-text.

Section: Pairing - End Chainage parameters

Panel Field **Parameter name** **Type** **Pop-Up**

Use Set # **input**

set number as specified in the **Define set #**.

The height used for the text is given by the **Position** *and* **Adopted height** *columns in the Set definition. This is then adjusted by the field* **Y (mm).**

X (mm) **pairing_end_chainage_n_x** **measure box**

for placing the text: horizontal adjustment from the offset of the second cut.

Y (mm) **pairing_end_chainage_n_y** **measure box**

for placing the text: the vertical adjustment to the height given by the **Position** *and* **Adopted height** *columns in the Set definition*

Angle (dms) **pairing_end_chainage_n_angle** **measure box**

angle (measured counterclockwise from the positive x-axis with units of degrees in 4.17.1 HP Notation*) to rotate the text*

Colour **pairing_end_chainage_n_colour** **colour box**

colour of the text

Size (mm) **pairing_end_chainage_n_size** **measure box**

size of the text in millimetres. A value of 0 means no text.

Textstyle **pairing_end_offset_n_textstyle** **textstyle box**

the textstyle for the text

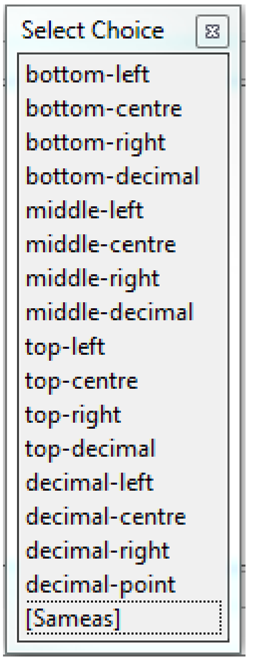
Pre-text **pairing_end_chainage_n_pre_text** **text box**

text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of **Pre-text**.

Post-text **pairing_end_chainage_n_post_text** **text box**

text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of **Post-text**.

Justification **pairing_start_chainage_n_justification** **justification box**



justification of the text.

Decimals **pairing_start_chainage_n_no_decimals** **number box**

the number of decimal places for the Offset value

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Please continue to the next section 26.4.24 Primary String Name Label.

26.4.24 Primary String Name Label

The plot can be labelled with a name under the boxes area.

The name is made up of a concatenation of the text string names.

Section: Primary string name label parameters

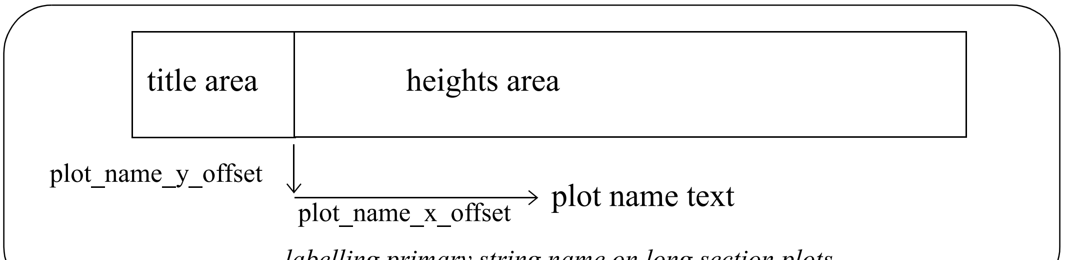
Panel Field	Parameter name	Type
Name mode	**plot_name_string_name**	**choice box**
determines what text is placed in the name labels.		
Pre-text	**plot_name_pre_text**	**input**
text before label.		
Post-text	**plot_name_post_text**	**input**
text after label.		
Textstyle	**plot_name_textstyle**	**text box**
textstyle of label.		
Size (mm)	**plot_name_size**	**input**
size of label.		
Colour	**plot_name_colour**	**colour box**
colour of label.		
X offset (mm)	**plot_name_x_offset**	**input**
horizontal adjustment to position of label.		
Y offset (mm)	**plot_name_y_offset**	**input**
vertical adjustment to position of label.		

The plot name is positioned under the boxes.

The *plot_name_x_offset* is measured from the beginning of the height boxes.

The default for *plot_name_x_offset* is centred on heights area.

The *plot_name_y_offset* is measured from the bottom of the box area with positive being down.



labelling primary string name on long section plots

Please continue to the next section 26.4.25 Scale Labelling.

26.4.25 Scale Labelling

The plot can be labelled with the horizontal and vertical scale under the boxes area.

The scale label is made up of a concatenation of the text strings:

scale_horizontal_pre_text horizontal scale value scale_horizontal_post_text

and

scale_vertical_pre_text vertical scale value scale_vertical_post_text

The horizontal scale value is the value given by the scale parameter.

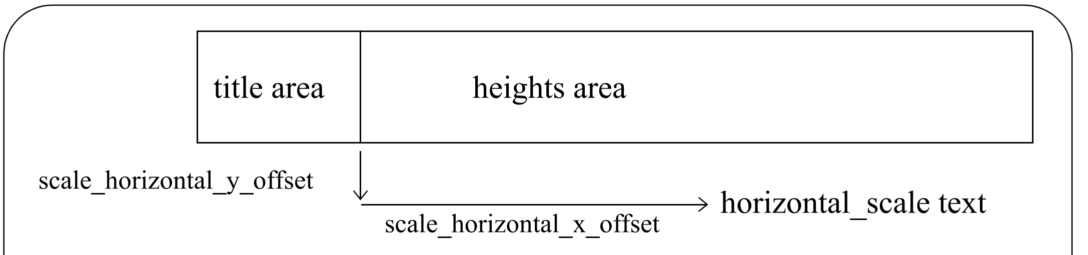
The scales are positioned under the boxes.

See

26.4.25.1 Scale Labelling - Horizontal
26.4.25.2 Scale Labelling - Vertical

Or return to 26.4 Long Plot PPF Editor.

26.4.25.1 Scale Labelling - Horizontal



labelling of scales on the long section plots

Section: Scale labelling - Horizontal parameters

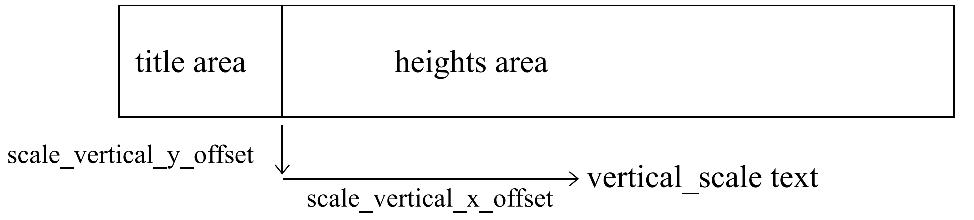
The fields and buttons used in this section have the following functions.

Panel Field	Parameter name	Type	Pop-Up
Pre-text	scale_horizontal_pre_text	text box	
text before scale label			
Post-text	scale_horizontal_post_text	text box	
text after scale label			
Textstyle	scale_horizontal_textstyle	textstyle box	
textstyle of scale label			
Size (mm)	scale_horizontal_size	real box	
size of scale label			
Colour	scale_horizontal_colour	colour box	
colour of scale label			
X offset (mm)	scale_horizontal_x_offset	real box	
horizontal adjustment to position the label. It is measured from the beginning of the heights area.			
Y offset (mm)	scale_horizontal_y_offset	real box	
vertical adjustment to position the scale label. It is measured down from the bottom of the boxes.			
Decimal places	scale_horizontal_decimals	integer box	
number of decimal places in the scale label.			

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Continue to the next section 26.4.25.2 Scale Labelling - Vertical or return to 26.4.25 Scale Labelling.

26.4.25.2 Scale Labelling - Vertical



labelling of scales on the long section plots

Section: Scale labelling - Vertical parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Pre-text	scale_vertical_pre_text	text box	

text before label

Post-text	scale_vertical_post_text	text box	

text after label

Textstyle	scale_vertical_textstyle	textstyle box	

textstyle of label

Size (mm)	scale_vertical_size	real box	

size of label

Colour	scale_vertical_colour	colour box	

colour of label

X offset (mm)	scale_vertical_x_offset	real box	

horizontal adjustment to the position of label. This is measured from the beginning of the heights area.

Y offset (mm)	scale_vertical_y_offset	real box	

vertical adjustment to the position of label. This is measure in a downward direction from the bottom of the boxes.

Decimal places	scale_vertical_decimals	number box	

number of decimal places in the label.

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Please continue to the next section 26.4.26 Plan Plotting.

26.4.26 Plan Plotting

Section: Plan parameters

The *Plan Plotting* section is for generating a combined long section and plan plot on the one plot sheet. The chainage interval for the long section plots (as set up in the ***Pagination*** section 26.4.7 Pagination) is used to define the chainage interval for the plan plot.

The total sheet size is given by the ***Sheet size*** parameter (see the section 26.4 Long Plot PPF Editor), and the position of the long section plot on the sheet is defined in the section 26.4.6 Plot Sheet Layout - Long Section. What is left to be defined is the area on the sheet for the plan plot.

Hence sheets of long sections and the associated plan plots are automatically generated.

The fields and buttons used in this section have the following functions.

Field Description | **Parameter name** | **Type** | **Pop-Up**

Use plan plotting | **plan_plotting** | **tick box**

*if **tick**, a plan plot to match the long section plot, is created on the same sheet.*
*If **not tick**, no plan plot is created - only the long section.*

Left margin (mm) | **plan_left_margin** | **input**

left margin of the area of the plan plot

Right margin (mm) | **plan_right_margin** | **input**

right margin of the area of the plan plot

Gap from left margin to start chainage (mm) | **plan_left_margin_gap** | **input**

Draw border around plan plot | **plan_draw_border** | **tick box**

*if **ticked**, a border is drawn around the plan plot area*

Border colour | **plan_border_colour** | **colour box**

colour of border

Symbol for start chainage | **plan_start_symbol** | **symbol box**

symbol to place in the plan area on the primary string at the start chainage of the long section plot

Symbol for end chainage | **plan_end_symbol** | **symbol box**

symbol to place in the plan area on the primary string at the end chainage of the long section plot

Symbol size (mm) | **plan_symbol_size** | **input**

size of the symbols

Symbol colour | **plan_symbol_colour** | **colour box**

colour of the symbols

View to plot | **plan_view_name** | **view box**

view containing the information to be plotted in the plan area

Please continue to the next section 26.4.27 PPFs To Include - Long Section.

26.4.27 PPFs To Include - Long Section

This is documented for all the PPF Editors in 26.2.10 PPFs To Include.

Please continue to the next section 26.4.28 Buttons at Bottom of Panel - Long Section.

26.4.28 Buttons at Bottom of Panel - Long Section

This is documented for all the PPF Editors in 26.2.2 View to Load and Global Variables.

Return to 26.4 Long Plot PPF Editor.

26.5 Drainage Long Plot PPF Editor

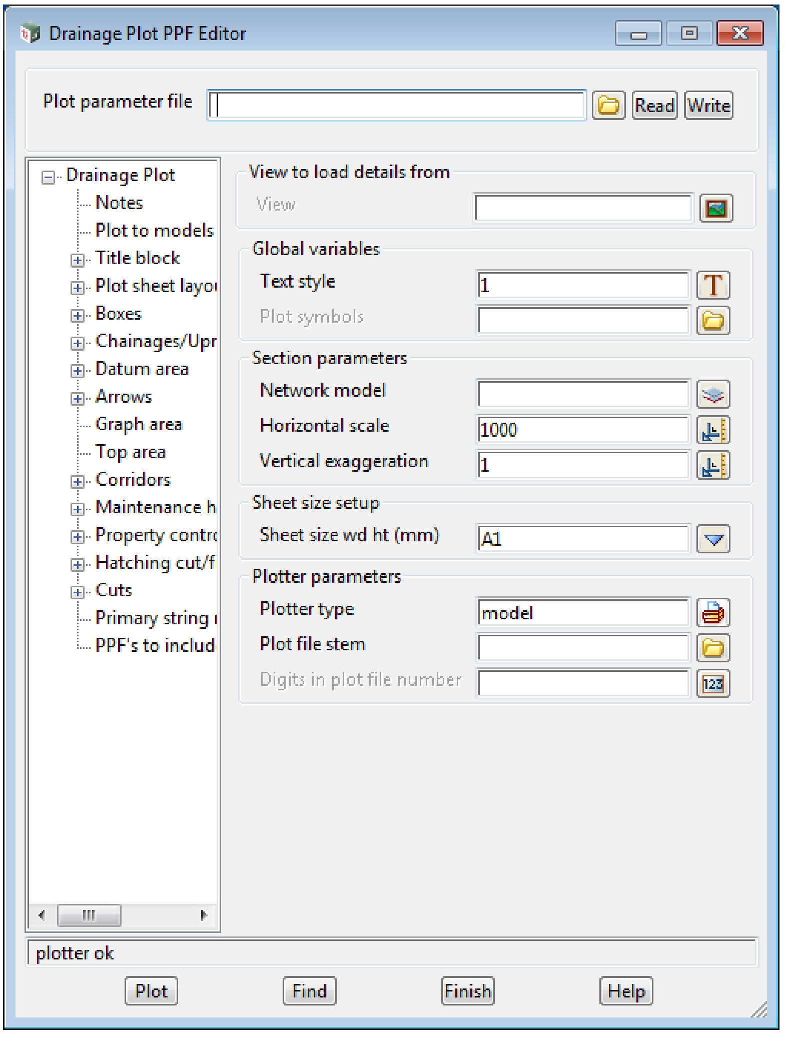
Position of option on menu: **Plot =>Plot and PPF Editors => Drainage long**

The **Drainage Plot PPF Editor** is for creating and/or editing a (binary) drainage and sewer long section ppf file and for creating a drainage and/or sewer long section plot.

Note: Binary and text PPFs are stored *within* the project (not in the folder containing the project).

On selecting the **Drainage long** option, the **Drainage Plot PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the ***Drainage Plot*** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.



For information on all the different nodes see:

[26.5.1 General Information on Drainage Long Section Plots]

[26.5.2 Drainage Plot - Front Page]

[26.5.3 Notes - Drainage Long Plot]

[26.5.6 Plot Sheet Layout]

[26.5.7 Boxes]

[26.5.8 Chainages/Uprights]

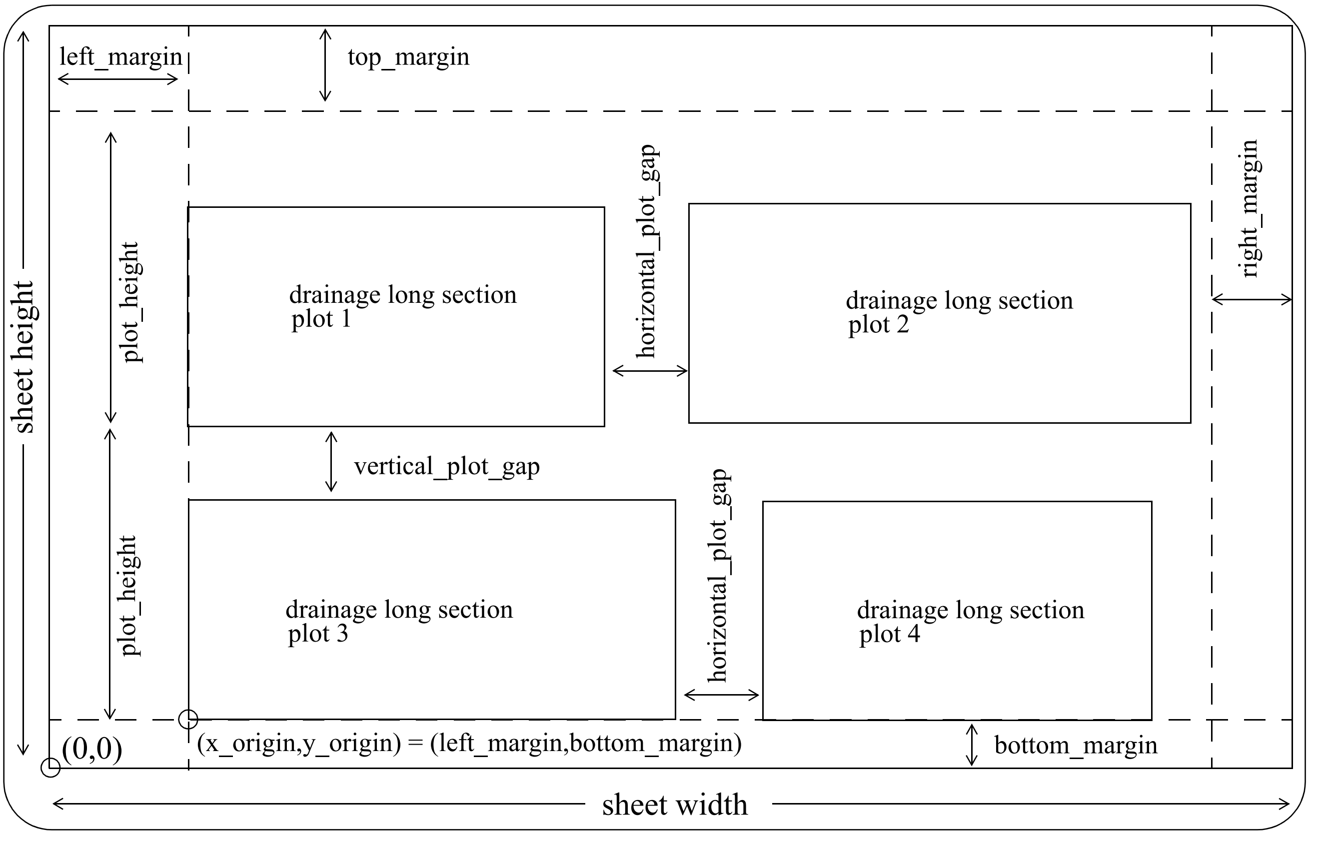
26.5.1 General Information on Drainage Long Section Plots

The Drainage Long Section Plot generates the longsection plots for all lines in a drainage network.

Given the plot sheet size and the horizontal and vertical scales, the long sections for the drainage lines are plotted in string name alphabetical order starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

Hence the drainage lines are plotted one after another on one or more plot sheets.

.



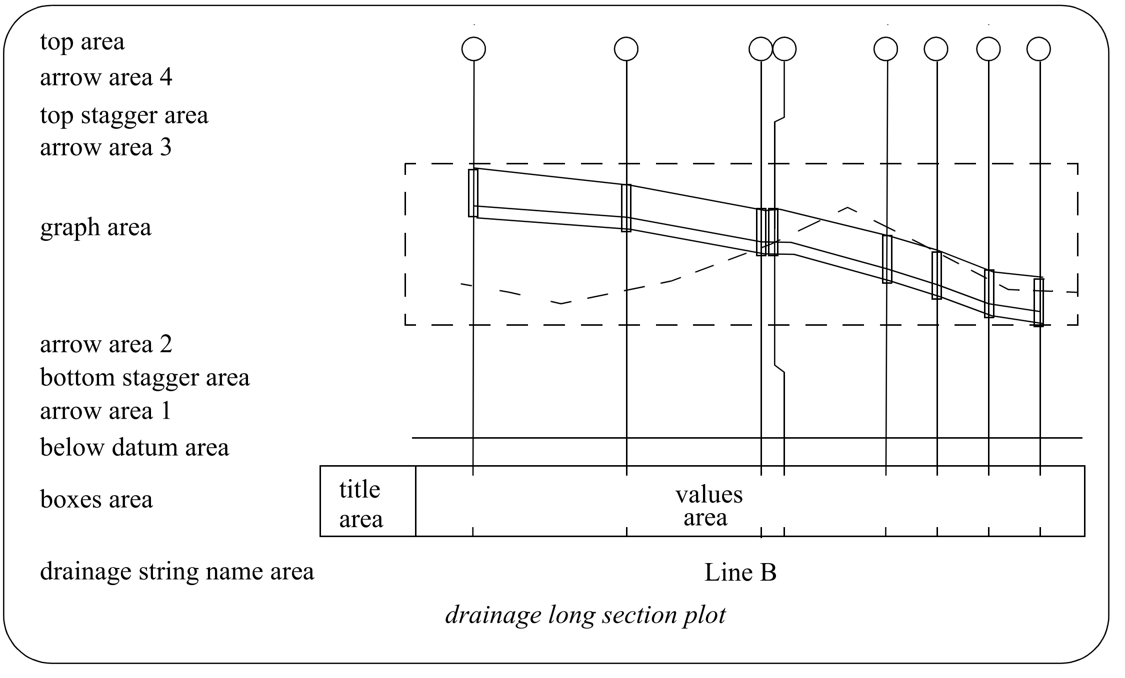
Each individual drainage long section plot consists of eleven areas.

From the bottom up, they are

1. The **drainage string name area** is where the name of the drainage string can be plotted.
2. The **boxes area** is where the chainages and various values for the drainage strings are labelled.
3. The **below datum area** is a region between the boxes area and the datum line.
4. The **arrow 1 area** is for drawing arrows where the arrows go between the staggered uprights and below the graph area. The datum line is at the bottom of the arrow 1 area.
5. The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.
6. The **arrow 2 area** is for drawing arrows below the graph but where the arrows go between non-staggered uprights.
7. The **graph area** is the area where the actual plots of the strings are drawn.
8. The **arrow 3 area** is for drawing arrows above the graph area and where the arrows go between non-staggered uprights.

9. The **top stagger area** is where the upright line staggers occur above the graph area.
10. The **arrow 4 area** is for drawing arrows where the arrows go between the staggered uprights and above the graph area.
11. The **top area** is an annotation area above the arrow 4 area and is used for bubbles, manhole names (pit names), junctions, deflection angles *etc*.

The areas and the information in them will now be described in more detail.



The drainage longsection plot includes

(a) the manholes, drainage pipe and any house connections
(b) the height of the finished surface at the manhole
(c) manhole names and cover types
(d) distances between manholes
(e) the invert depth of the pipe on either side of a manhole
(f) the grades and types of the pipes
(g) any services in the corridor - including their name, invert level and distance from the nearest downstream manhole
(h) if the information exists, the velocity, flow, HGL values and diagram

All the required parameters for controlling the drainage long section plot are set up in the ***Drainage Plot PPF Editor*** and will be described in detail in the following sections.

Please continue to the next section 26.5.2 Drainage Plot - Front Page or return to 26.5 Drainage Long Plot PPF Editor.

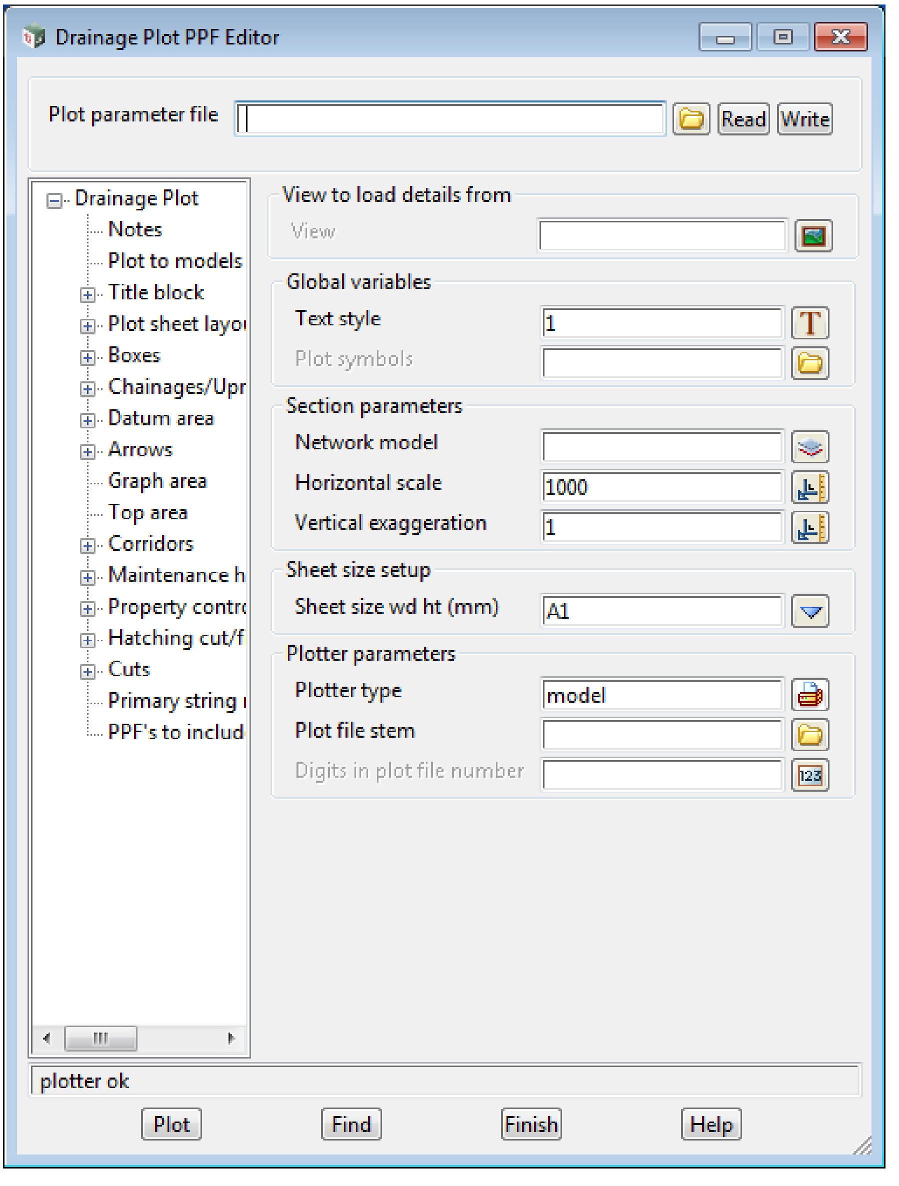
26.5.2 Drainage Plot - Front Page

The drainage long plot itself consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.



Section: Plot parameter file

*a **plot parameter file** can be used to load values into the fields of the PPF Editor, or as a file to write out all current values in a PPF Editor to.*

This section is documented for all the PPF Editors in 26.2.1 Plot Parameter File.

Section: Section: View to load details from AND Global variables

*a **section view** can be selected to load certain values into fields of the PPDF Editor. For example,* *Vertical exaggeration and Corridor models. And there are variables to use if some values aren't given.*

These sections are documented for all the PPF Editors in 26.2.2 View to Load and Global Variables.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Section parameters

Network model | **network_model** | **model box** | **available models**

model containing the drainage/sewer strings to draw in long section on the plot.

Horizontal Scale | **scale** | **input**

horizontal scale to be used for the long section plots

Vertical exaggeration | **vertical_exaggeration** | **input**

vertical scale to be used for the long section plots

Section: Sheet size setup and Plotter parameters

these sections define the size of the "paper" to plot on, the type of plotter to use and the naming to use for the plot files.

These sections are documented for all the PPF Editors in 26.2.3 Sheet Size and Plotter Parameters.

Please continue to the next section 26.5.3 Notes - Drainage Long Plot.

26.5.3 Notes - Drainage Long Plot

This is documented for all the PPF Editors in 26.2.4 Notes.

Please continue to the next section 26.5.4 Plot to Models - Drainage Long Plot.

26.5.4 Plot to Models - Drainage Long Plot

This is documented for all the PPF Editors in 26.2.5 Plot to models.

Please continue to the next section 26.5.5 Title Block - Drainage Long Plot.

26.5.5 Title Block - Drainage Long Plot

This is documented for all the PPF Editors in 26.2.6.1 Title Block Section in PPF Editors.
For more general information about a title block, see 26.2.6 Title Block.

Please continue to the next section 26.5.6 Plot Sheet Layout.

26.5.6 Plot Sheet Layout

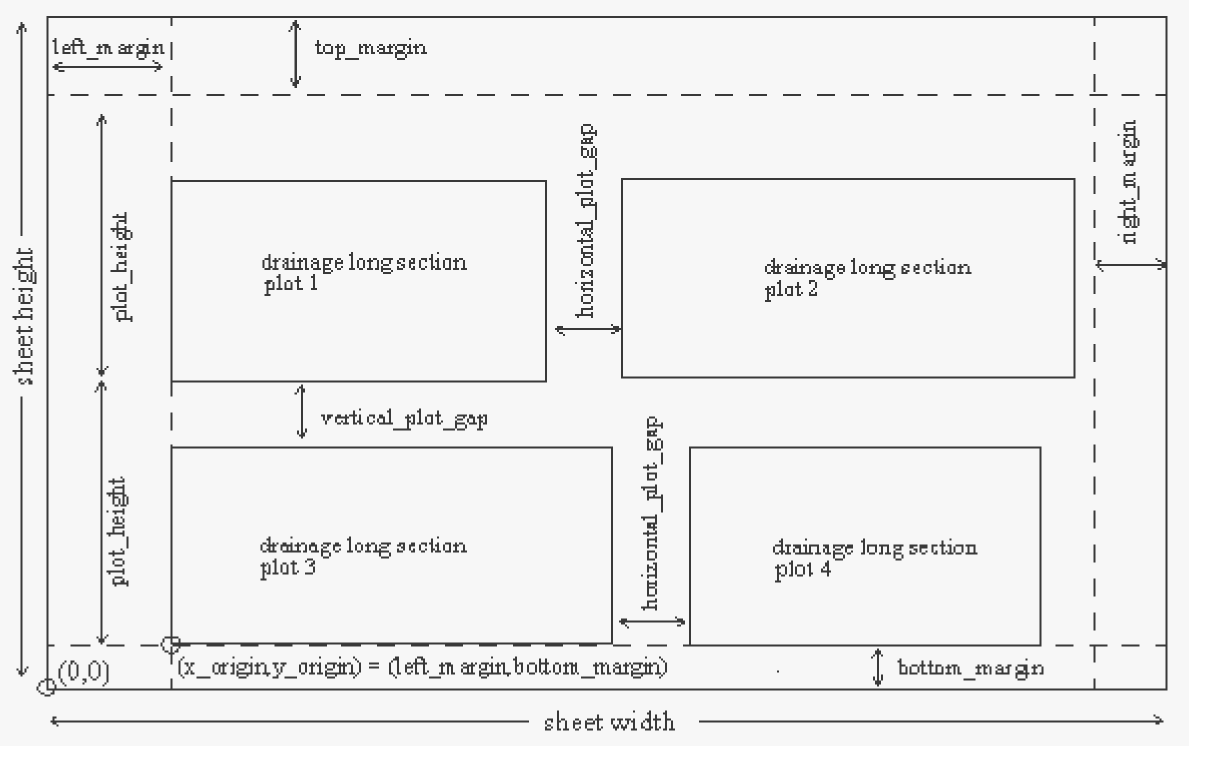
26.5.6.1 Plot Sheet Layout - Margins
26.5.6.2 Plot Sheet Layout - Other Parameters

Or return to 26.4 Long Plot PPF Editor.

26.5.6.1 Plot Sheet Layout - Margins



Section: Plot sheet layout - Margins

Panel field	Parameter name	Type
Left (mm)	**left_border_gap**	**input**

left border gap (in millimetres).

Right (mm)	**right_border_gap**	**input**

right border gap (in millimetres).

Top (mm)	**top_border_gap**	**input**

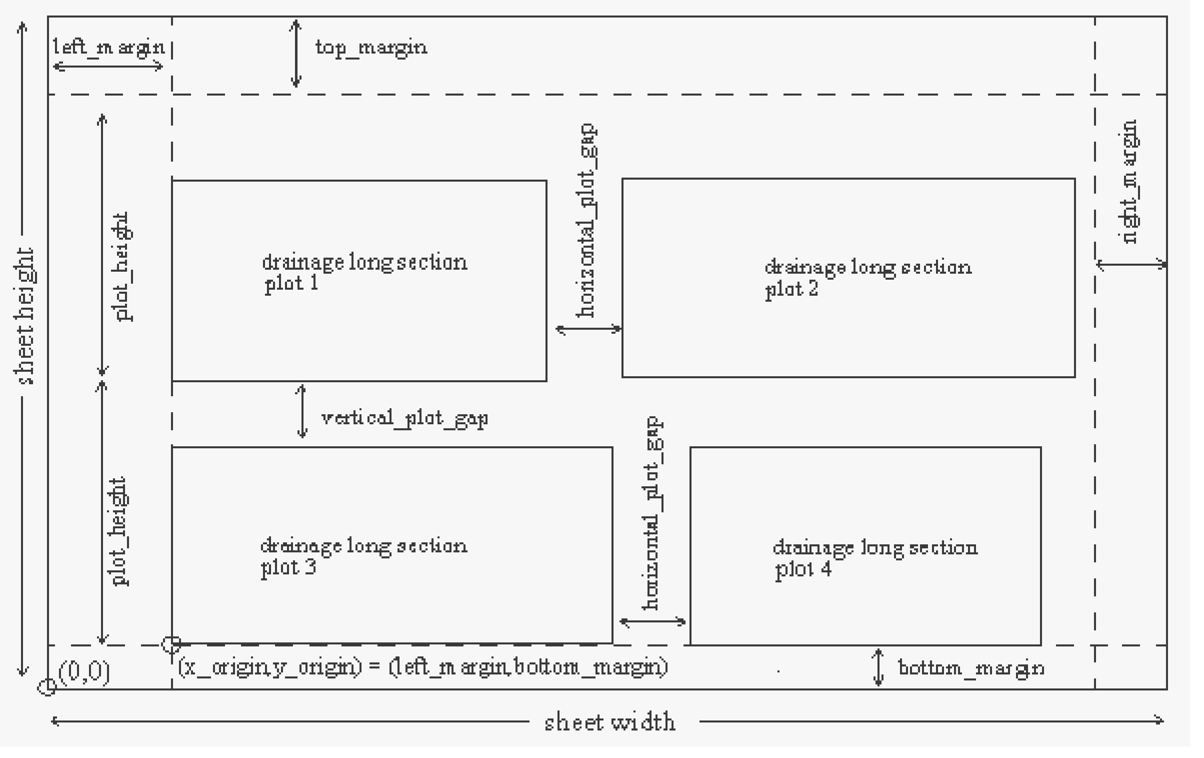
top border gap (in millimetres).

Bottom (mm)	**bottom_border_gap**	**input**

bottom border gap (in millimetres).

Continue to the next section 26.5.6.2 Plot Sheet Layout - Other Parameters or return to 26.5.6 Plot Sheet Layout.

26.5.6.2 Plot Sheet Layout - Other Parameters



Section: Plot sheet layout - Other parameters

Panel field	Parameter name	Type	Pop-Up
Row per sheet mode	**only_one_line**	**choice box**	**more than one row on sheet**
sheet			
			only one row on sheet

whether to allow multiple rows on a sheet.

Plot height (mm)	**plot_height**	**input**	

height of plot row (in millimetres).

Horizontal plot gap (mm)	**horizontal_plot_gap**	**input**	

gap between plot columns (in millimetres).

Vertical plot gap (mm)	**vertical_plot_gap**	**input**	

gap between plot rows (in millimetres).

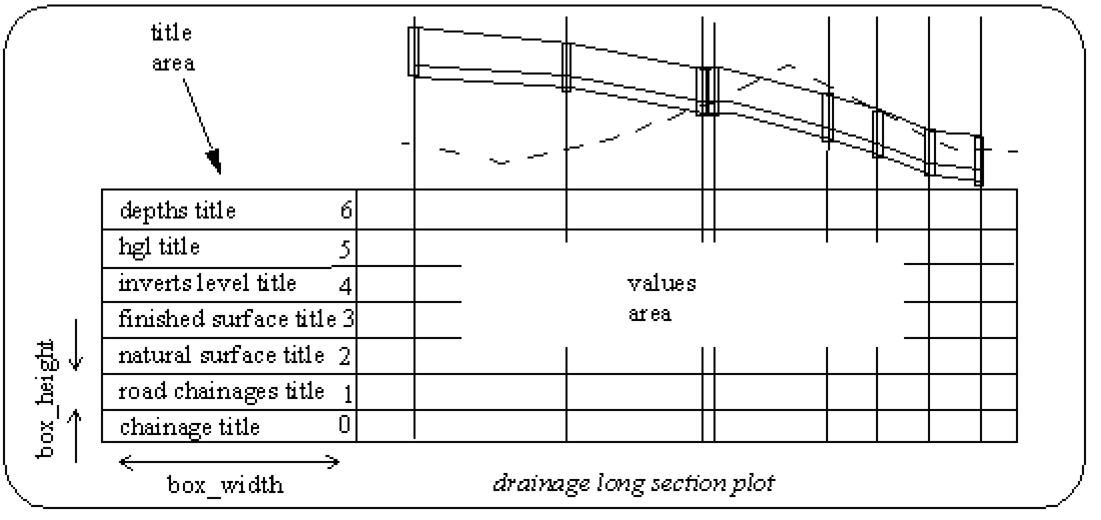
Start new sheet/row for strings longer than (world units) string_length_for_break input

Continue to the next section 26.5.7 Boxes or return to 26.5.6 Plot Sheet Layout.

26.5.7 Boxes

The Boxes Area on the drainage long section plot is used to label points on the drainage strings with the following information: chainages, road centre line chainages, natural surface heights, finished surface heights, before pit and after pit invert levels, before pit and after pit hgl values, and before pit and after pit depths to inverts.

The default order of the boxes is as shown in the diagram, below.



The *chainage box* is hardwired to always appear first (at the bottom) in the order of boxes. If, you wish to change the order of any of the other boxes, or wish to omit any of the other boxes, you can do so by specifying the following box order parameters.

Panel Field	Parameter name	Type	Pop-Up
Box #	**box_n_set**	**input**	

order (from 1 to 6) of the nth box type.

Panel Field	Parameter name	Type	Pop-Up
List #	**box_n**	**choice box**	**road centre line chainages** **natural surface heights** **finished surface heights** **invert levels** **hgl values** **depths to inverts**

box type for the nth set of box order parameters.

whether to draw the line work around the titles area, and if so, whether to draw lines separating each title as well.

Panel Field	Parameter name	Type	Pop-Up
Chainage box mode	chainage_box_mode	choice box	don’t draw the chainage box **draw the chainage box**

whether to draw the line work around the chainage box.

Please continue to the next section 26.5.8 Chainages/Uprights.

26.5.8 Chainages/Uprights

Uprights, or leader lines, can be drawn through the points on the drainage strings, anywhere from the top area to the bottom of the boxes area.

Section: Upright parameters

Panel Field	Parameter name	Type	Pop-Up
Top of uprights mode	uprights_top_mode	choice box	stop at top of pit **go to top area**

determines how high on the plot, the uprights are drawn.

Panel Field	Parameter name	Type	Pop-Up
Bottom of uprights mode	uprights_bottom_mode	choice box	stop at top of boxes **go to bottom of boxes**

determines how low on the plot, the uprights are drawn.

Leave gap in uprights through pit uprights_gap_mode tick box

Panel Field	Parameter name	Type	Pop-Up
Colour of uprights to pits	**manhole_line_colour**	**colour box**	**available colours**

colour of the uprights.

Section: Chainage parameters

Panel Field	Parameter name	Type	Pop-Up
Chainage values at uprights			
	chainage_mode	**choice box**	**pipe length chainage** **running chainage** **both pipe length and**

running

whether the chainage values represent the individual pipe lengths, the running chainages, or both.

Panel Field	Parameter name	Type	Pop-Up
Pipe length label position	centre_pipe_length	choice box	0 at start pit, length at end pit **centre of pipe length**

determines how pipe length chainages are displayed. ***Note****: if the* centre of pipe length *option is chosen, the pipe length chainage text is drawn horizontally, rather than vertically.*

See

26.5.8.1 Chainages/Uprights - Services
26.5.8.2 Chainages/Uprights - Finished Surface/Top of MH Values
26.5.8.3 Chainages/Uprights - Staggering

Or return to 26.4 Long Plot PPF Editor.

26.5.8.1 Chainages/Uprights - Services

Any services crossing the drainage strings (defined by specifying *corridor service models* in the *Corridors* section) can be automatically labelled with an upright, chainage and invert level labels (of the drainage string, placed within the appropriate boxes in the Boxes area), and a name label (that includes the crossing service string name, its diameter, and its invert level at the point of crossing).

Note: crossing services may also be labelled (independently) by utilising the parameters in the *Cuts* section.

Panel Field **Parameter name** **Type** **Pop-Up**

Service chainage values at uprights
service_chainage_mode **choice box** **pipe length chainage**
running chainage
both pipe length and running

whether the crossing service chainage values represent the chainages from the previous pits, the running chainages, or both.

Draw uprights to crossing services tick box

Colour of uprights to crossing services
service_line_colour **colour box** **available colours**

colour of the crossing service uprights.

Section: Service chainage text parameters

Panel Field **Parameter name** **Type** **Pop-Up**

Colour **service_ch_text_colour** **colour box** **available colours**

text colour of crossing service chainage box values (required only if different from default box_text_colour*).*

Text size (mm) **service_ch_text_size** **input**

text size of crossing service chainage box values (required only if different from default box_text_size*).*

Textstyle **service_ch_textstyle** **font box** **available fonts**

font of crossing service chainage box values (required only if different from default global_textstyle*).*

Decimal places **service_ch_decimals** **input**

decimal places for crossing service chainage box values (required only if different from default number_of_decimals*).*

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Section: Service invert level text parameters

Panel Field **Parameter name** **Type** **Pop-Up**

Colour **service_il_text_colour** **colour box** **available colours**

text colour of crossing service invert level box values (required only if different from default box_text_colour*).*

Text size (mm) **service_il_text_size** **input**

text size of crossing service invert level box values (required only if different from default box_text_size*).*

Textstyle **service_il_textstyle** **font box** **available fonts**

font of crossing service invert level box values (required only if different from default global_textstyle*).*

Decimal places **service_il_decimals** **input**

decimal places for crossing service invert level box values (required only if different from default number_of_decimals*).*

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Section: Service label text parameters

Panel Field	Parameter name	Type	Pop-Up
Show name	**service_name_show_name**	**tick box**	
Show size	**service_name_show_size**	**tick box**	
Show IL	**service_name_show_il**	**tick box**	
Show clearance	**service_name_show_clr**	**tick box**	
X adjustment (mm)	service_name_x	input	
Y adjustment (mm)	service_name_y	input	
Stagger	service_name_stagger	tick box	
Y position	service_name_y_mode	choice box	below crossing point
			above crossing point
			below top staggers
			above bottom staggers

Distance of label below crossing point (mm)
service_name_y **input**

distance (in millimetres) of crossing service name labels below crossing points.

Colour **service_name_text_colour**
colour box **available colours**

text colour of crossing service name labels (required only if different from default box_text_colour*).*

Text size (mm) **service_name_text_sizeinput**

text size of crossing service name labels (required only if different from default box_text_size*).*

Textstyle **service_name_textstyle** **font box** **available fonts**

font of crossing service name labels (required only if different from default global_textstyle*).*

Decimal places **service_name_decimalsinput**

decimal places for the crossing service invert levels that make up part of the crossing service name labels (required only if different from default number_of_decimals*).*

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Continue to the next section 26.5.8.2 Chainages/Uprights - Finished Surface/Top of MH Values or return to 26.5.8 Chainages/Uprights.

26.5.8.2 Chainages/Uprights - Finished Surface/Top of MH Values

In addition to the finished surface level labels within the Boxes area, more detailed vertical labels representing finished surface levels at the pits, can be added to accompany the pit uprights within the Graph area.

Panel Field	Parameter name	Type	Pop-Up
Finished surface draw mode			
	draw_fs_vertical	**choice box**	**do not draw fs values** **always draw fs values** **only draw if different**

whether to label the finished surface levels within the Graph area. Additional control is provided to only draw the labels if the finished surface level is different from the level at the top of the maintenance hole.

Panel Field	Parameter name	Type	Pop-Up
Finished surface value mode			
	draw_fs_vertical_mode	**choice box**	**value from fs tin** **value from top of mh**

whether the finished surface level label values come from the fs tin or the top of the maintenance holes.

Pre text fs_vertical_pre_text input

label text before the finished surface level.

Post text fs_vertical_post_text input

label text after the finished surface level.

Decimal places **fs_vertical_decimals** **input**

decimal places for finished surface level values (required only if different from default number_of_decimals*).*

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Colour **fs_vertical_colour** **colour box** **available colours**

text colour of finished surface level labels (required only if different from default box_text_colour*).*

Size (mm) **fs_vertical_size** **input**

text size of finished surface level labels (required only if different from default box_text_size*).*

Textstyle **fs_vertical_textstyle** **font box** **available fonts**

font of finished surface level labels (required only if different from default global_textstyle*).*

X adjustment (mm) fs_vertical_x input

horizontal adjustment to position of finished surface level labels.

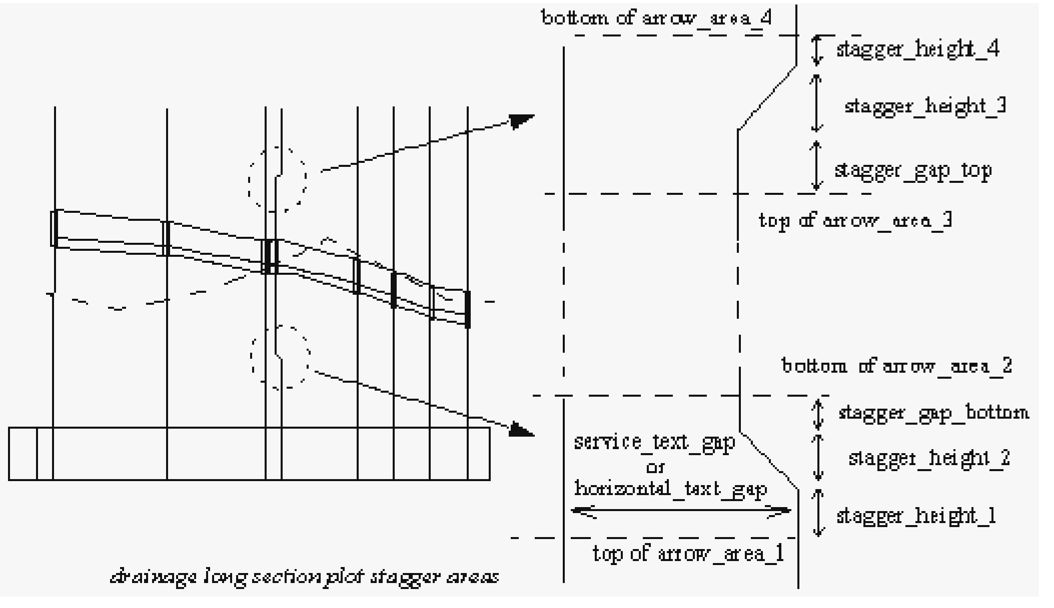
Y adjustment (mm) fs_vertical_y input

vertical adjustment to position of finished surface level labels.

Continue to the next section 26.5.8.3 Chainages/Uprights - Staggering or return to 26.5.8 Chainages/Uprights.

26.5.8.3 Chainages/Uprights - Staggering

Because the pit and service uprights are sometimes too close together to fit all the desired information in the Boxes and Arrows areas, the uprights can be staggered (widened) in such a way as to provide more space in these areas, below and above the Graph area, whilst still maintaining the correct upright spacing within the Graph area itself. Specifically, the staggering of the uprights occurs below the Graph area between Arrow areas 1 and 2, and above the Graph area between Arrow areas 3 and 4. As such, it is recommended that Arrow areas 2 and 3 be used only for information requiring minimal space.



Section: Stagger area below graph area parameters

Panel Field | **Parameter name** | **Type**

Top of arrow area 1 to start of the staggers (mm)
stagger_height_1 **input**

refer to stagger_height_1 *on above diagram.*

Distance over which stagger occurs (mm)
stagger_height_2 **input**

refer to stagger_height_2 *on above diagram.*

End of the staggers to bottom of arrow area 2 (mm)
stagger_gap_bottom **input**

refer to stagger_gap_bottom *on above diagram.*

Section: Stagger area above graph area parameters

Panel Field | **Parameter name** | **Type**

Top of arrow area 3 to start of the staggers (mm)
stagger_gap_top **input**

refer to stagger_gap_top *on above diagram.*

Distance over which stagger occurs (mm)
stagger_height_3 **input**

refer to stagger_height_3 *on above diagram.*

End of the staggers to bottom of arrow area 4 (mm)
stagger_height_4 **input**

refer to stagger_height_4 *on above diagram.*

Section: Stagger offset parameters

Panel Field	Parameter name	Type
Minimum distance between pit uprights (mm)	**horizontal_text_gap**	**input**

refer to horizontal_text_gap *on above diagram.*

Panel Field	Parameter name	Type
Minimum distance before first service upright (mm)	**service_text_gap_before**	**input**
Minimum distance after service uprights (mm)	**service_text_gap**	**input**

refer to service_text_gap *on above diagram.*

Please continue to the next section 26.5.9 Datum Area.

26.5.9 Datum Area

The Datum area is where each long section plot's datum value is drawn. The datum line for each long section plot is defined at the bottom of Arrow area 1.

Panel Field	Parameter name	Type
Below datum area gap (mm)	**datum_gap**	**input**

distance from the top of the Boxes area to the bottom of Arrow area 1.

Panel Field	Parameter name	Type
Extend datum line into title area	**datum_extend**	**tick box**

See

26.5.9.1 Datum Area - Name
26.5.9.2 Datum Area - Values

Or return to 26.4 Long Plot PPF Editor.

26.5.9.1 Datum Area - Name

The datum name (or title) is drawn at the datum line, above the Boxes title area.

Panel Field	Parameter name	Type	Pop-Up
Datum name	datum_name	input	

title for the datum area.

Panel Field	Parameter name	Type	Pop-Up
X offset (mm)	datum_title_x	input	

horizontal adjustment to position of datum name.

Panel Field	Parameter name	Type	Pop-Up
Y offset (mm)	datum_title_y	input	

vertical adjustment to position of datum name.

Panel Field	Parameter name	Type	Pop-Up
Textstyle	**datum_title_textstyle**	**font box**	**available fonts**

font of datum name (required only if different from default global_textstyle*).*

Panel Field	Parameter name	Type	Pop-Up
Text size (mm)	**datum_title_text_size**	**input**	

text size of datum name (required only if different from default box_text_size*).*

Panel Field	Parameter name	Type	Pop-Up
Colour	**datum_title_colour**	**colour box**	**available colours**

text colour of datum name (required only if different from default box_text_colour*).*

Continue to the next section 26.5.9.2 Datum Area - Values or return to 26.5.9 Datum Area.

26.5.9.2 Datum Area - Values

The datum values are drawn at the datum lines, above the Box values areas.

Panel Field | **Parameter name** | **Type** | **Pop-Up**

Decimal places datum_decimals input

number of decimal places for datum values.

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

X offset (mm) datum_x input

horizontal adjustment to position of datum values.

Y offset (mm) datum_y input

vertical adjustment to position of datum values.

Textstyle datum_textstyle font box available fonts

font of datum values (required only if different from default global_textstyle*).*

Text size (mm) datum_text_size input

text size of datum values (required only if different from default box_text_size*).*

Colour datum_text_colour colour box available colours

text colour of datum values (required only if different from default box_text_colour*).*

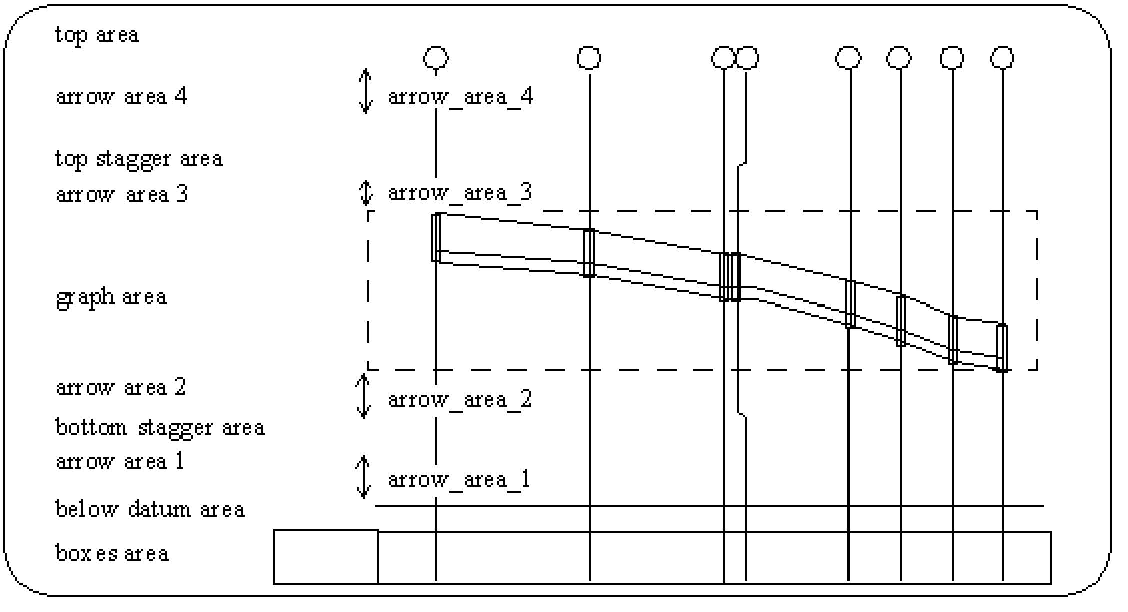
Please continue to the next section 26.5.10 Arrows.

26.5.10 Arrows

The Arrow areas on the drainage long section plot, are used to label segments (individual pipes) on the drainage strings with the following information: grades, diameters and types, flow velocities, flow volumes, drainage line names, and any user-defined pipe attribute values.

There are four separate Arrow areas on the plot, any of which can be used to label the above information. From plot bottom to top, the Arrow areas are:

Arrow area 1: staggered arrows below the Graph area,
Arrow area 2: unstaggered arrows below the Graph area,
Arrow area 3: unstaggered arrows above the Graph area,
Arrow area 4: staggered arrows above the Graph area.



Panel Field **Parameter name** **Type**

Height of arrow area 1 (mm)
arrow_area_1 **input**

refer to arrow_area_1 *on the above diagram.*

Height of arrow area 2 (mm)
arrow_area_2 **input**

refer to arrow_area_2 *on the above diagram.*

Height of arrow area 3 (mm)
arrow_area_3 **input**

refer to arrow_area_3 *on the above diagram.*

Height of arrow area 4 (mm)
arrow_area_4 **input**

refer to arrow_area_4 *on the above diagram.*

Or return to 26.5.10 Arrows.

26.5.10.1.1 Arrows - Grades - Title Text

Panel Field	Parameter name	Type	Pop-Up
Text	pipe_grade_title	input	

title for the pipe grade information.

Textstyle	**pipe_grade_title_textstyle**	**font box**	**available fonts**

font of pipe grade title.

Size (mm)	**pipe_grade_title_text_size**	**input**	

text size of pipe grade title.

Colour	**pipe_grade_title_text_colour**	**colour box**	**available colours**

text colour of pipe grade title.

Offset (mm)	pipe_grade_title_offset	input	

vertical adjustment to position of pipe grade title.

X offset (mm)	pipe_grade_title_x	input	

horizontal adjustment to position of pipe grade title.

Draw title bottom linework	pipe_grade_title_line	tick box	
Height of title left linework (mm)	pipe_grade_title_height	input	

Continue to the next section 26.5.10.1.2 Arrows - Grades - Arrow type or return to 26.5.10 Arrows.

26.5.10.1.2 Arrows - Grades - Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_grade_arrow_mode	choice box	available arrow types

arrow type (0 to 8) for the pipe grade information.

Colour	**pipe_grade_arrow_colour**	**colour box**	**available colours**

arrow colour for pipe grade information.

Size (mm)	**pipe_grade_arrow_size**	**input**	

arrow size for pipe grade information.

Arrow gap mode	pipe_grade_arrow_gap	choice box	no gap in arrow **leave gap in arrow for text**

whether to put text gaps in the arrows, for pipe grade information.

Continue to the next section 26.5.10.1.3 Arrows - Grades - Arrow Text or return to 26.5.10 Arrows.

26.5.10.1.3 Arrows - Grades - Arrow Text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_grade_arrow_pre_text	text box	

label text before the pipe grade values.

Post text	pipe_grade_arrow_post_text	**text box**	

label text after the pipe grade values.

Decimal places	pipe_grade_arrow_decimals	integer box	

decimal places for pipe grade values.

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Draw title bottom linework	pipe_flow_title_line	tick box	
Height of title left linework (mm)	pipe_flow_title_height	input	

Continue to the next section 26.5.10.4.2 Arrows - Flow - Arrow Type or return to 26.5.10 Arrows.

26.5.10.4.2 Arrows - Flow - Arrow Type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_flow_arrow_mode	choice box	available arrow types

arrow type (0 to 8) for the flow volume information.

Colour	**pipe_flow_arrow_colour**	**colour box**	**available colours**

arrow colour for flow volume information.

Size (mm)	**pipe_flow_arrow_size**	**input**	

arrow size for flow volume information.

Arrow gap mode	pipe_flow_arrow_gap	choice box	no gap in arrow **leave gap in arrow for text**

whether to put text gaps in the arrows, for flow volume information.

Continue to the next section 26.5.10.4.3 Arrows - Flow - Arrow Text or return to 26.5.10 Arrows.

26.5.10.4.3 Arrows - Flow - Arrow Text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_flow_arrow_pre_text	**input**	

label text before the flow volume values.

Post text	pipe_flow_arrow_post_text	**input**	

label text after the flow volume values.

Units factor	**pipe_flow_arrow_factor**	**input**	
Decimal places	**pipe_flow_arrow_decimals**	**input**	

decimal places for flow volume values.

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Colour	**pipe_flow_arrow_text_colour**	**colour box**	**available colours**

text colour for flow volume values.

Size (mm)	**pipe_flow_arrow_text_size**	**input**	

text size for flow volume values.

Textstyle	**pipe_flow_arrow_textstyle**	**font box**	**available fonts**

font of flow volume values.

Offset (mm)	pipe_flow_arrow_text_offset	**input**	

vertical adjustment to position of flow volume values.

Continue to the next section 26.5.10.5 Arrows - Drainage Line Name or return to 26.5.10 Arrows.

26.5.10.5 Arrows - Drainage Line Name

Panel Field	Parameter name	Type	Pop-Up
Draw drainage line	draw_drainage_line	check box	

whether to draw the drainage line names in one of the Arrow areas.

Panel Field	Parameter name	Type	Pop-Up
Arrow area for the arrow	drainage_line_arrow_area	**choice box**	**Area 1** **Area 2** **Area 3** **Area 4**

the desired Arrow area for the drainage line name information.

Panel Field	Parameter name	Type	Pop-Up
Y offset (mm)	drainage_line_y	input	

vertical offset of drainage line name information, measured upwards from the bottom of the selected Arrow area.

Panel Field	Parameter name	Type	Pop-Up
Pre text	drainage_line_arrow_pre_text	**input**	

label text before the drainage line names.

Post text	drainage_line_arrow_post_text	**input**	

label text after the drainage line names.

Colour	**drainage_line_arrow_text_colour**	**colour box**	**available colours**

text colour for drainage line names.

Size (mm)	**drainage_line_arrow_text_size**	**input**	

text size for drainage line names.

Textstyle	**drainage_line_arrow_textstyle**	**font box**	**available fonts**

font of drainage line names.

Offset (mm)	drainage_line_arrow_text_offset	**input**	

vertical adjustment to position of drainage line names.

Continue to the next section 26.5.10.6 Arrows - User Defined Pipe Attributes or return to 26.5.10 Arrows.

26.5.10.6 Arrows - User Defined Pipe Attributes

User defined pipe attribute data can be drawn in the Arrow areas.

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	

a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters.

Draw pipe attribute mode	draw_pipe_attr_n	choice box	don't draw pipe attribute **draw pipe attribute**

whether to draw the nth set of pipe attribute data in one of the Arrow areas.

Pipe attribute name	pipe_attr_n_name	input	

name of the nth pipe attribute.

Arrow area for the arrow	pipe_attr_n_arrow_area	choice box	Area 1 **Area 2** **Area 3** **Area 4**

the desired Arrow area for the nth set of pipe attribute data.

Y offset (mm)	pipe_attr_n_y	input	

vertical offset of the nth set of pipe attribute data, measured upwards from the bottom of the selected Arrow area.

See

26.5.10.6.1 Arrows - User Defined Pipe Attributes - Title Text

26.5.10.6.1 Arrows - User Defined Pipe Attributes - Title Text

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	

a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #'s from the grid in the parent node: ***User defined pipe attributes.***

Text	pipe_attr_n_title	input	

title for the nth set of pipe attribute data.

Textstyle	**pipe_attr_n_title_textstyle**	**font box**	**available fonts**

font of the title for the nth set of pipe attribute data.

Size (mm)	**pipe_attr_n_title_text_size**	**input**	

text size of the title for the nth set of pipe attribute data.

Colour	**pipe_attr_n_title_text_colour**	**colour box**	**available colours**

text colour of the title for the nth set of pipe attribute data.

Offset (mm)	pipe_attr_n_title_offset	input	

vertical adjustment to position of the title for the nth set of pipe attribute data.

X offset (mm)	pipe_attr_n_title_x	input	

horizontal adjustment to position of the title for the nth set of pipe attribute data.

Draw title bottom linework		tick box	
Height of title left linework (mm)		input	

Continue to the next section 26.5.10.6.2 Arrows - User Defined Pipe Attributes - Arrow Type or return to 26.5.10 Arrows.

26.5.10.6.2 Arrows - User Defined Pipe Attributes - Arrow Type

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	

a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #'s from the grid in the parent node: ***User defined pipe attributes****.*

Arrow type	pipe_attr_n_arrow_mode	choice box	available arrow types

arrow type (0 to 8) for the nth set of pipe attribute data.

Colour	**pipe_attr_n_arrow_colour**	**colour box**	**available colours**

arrow colour for the nth set of pipe attribute data.

Size (mm)	**pipe_attr_n_arrow_size**	**input**	

arrow size for the nth set of pipe attribute data.

Arrow gap mode	pipe_attr_n_arrow_gap	choice box	no gap in arrow **leave gap in arrow for text**

whether to put text gaps in the arrows, for the nth set of pipe attribute data.

Continue to the next section 26.5.10.6.3 Arrows - User Defined Pipe Attributes - Arrow Text or return to 26.5.10 Arrows.

26.5.10.6.3 Arrows - User Defined Pipe Attributes - Arrow Text

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	

a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #'s from the grid in the parent node: ***User defined pipe attributes****.*

Pre text pipe_attr_n_arrow_pre_text input

label text before the values of the nth set of pipe attribute data.

Post text pipe_attr_n_arrow_post_text input

label text after the values of the nth set of pipe attribute data.

Units factor

Decimal places pipe_attr_n_arrow_decimals input

decimal places the values of the nth set of pipe attribute data.

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Colour pipe_attr_n_arrow_text_colour colour box available colours

text colour for the values of the nth set of pipe attribute data.

Size (mm) pipe_attr_n_arrow_text_size input

text size for the values of the nth set of pipe attribute data.

Textstyle pipe_attr_n_arrow_textstyle textstyle box available textstyles

font for the values of the nth set of pipe attribute data.

Offset (mm) pipe_attr_n_arrow_text_offset input

vertical adjustment to position of values of the nth set of pipe attribute data.

Please continue to the next section 26.5.11 Drainage Graph Area.

26.5.11 Drainage Graph Area

The Graph area is where the diagram of the drainage line, in long-section, is drawn. In addition, if Hydraulic Grade Line (HGL) information is set, the HGL can also be drawn in the Graph area.

Panel Field	Parameter name	Type	Pop-Up
Left/Right extensions (world units)	profile_extension	input	
Drainage string colour	drainage_colour	colour box	available colours
Draw finished surface tin	draw_fs_tin	tick box	
Finished surface tin colour	fs_tin_colour	colour box	available colours
Draw natural surface tin	draw_ns_tin	tick box	
Natural surface tin colour	ns_tin_colour	colour box	available colours

Draw HGL draw_hgl_diag tick box

whether to draw the HGL in the Graph area.

HGL colour hgl_colour colour box available colours

colour of HGL.

HGL linestyle hgl_linestyle choice box

linestyle of HGL.

Please continue to the next section 26.5.12 Top Area.

26.5.12 Top Area

Panel Field	Parameter name	Type	Pop-Up
Line at the bottom of the top area mode			
	draw_top_line	choice box	don't draw line draw line

whether to draw a horizontal line at the bottom of the Top area.

Please continue to the next section 26.5.13 Corridors - Drainage Long.

26.5.13 Corridors - Drainage Long

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the cross-section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

This is documented for all the PPF Editors in 26.2.7 Corridors.

Please continue to the next section 26.5.14 Maintenance Holes.

26.5.14 Maintenance Holes

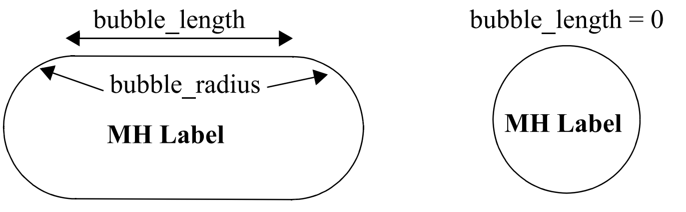
The **drainage string name**, the **maintenance hole** name (pit number) and **maintenance hole type** (pit type) can be drawn on the drainage long section plot as **MH label,** with or without a *bubble* around it.

The MH label text is made up of

pre_text line_name / pit_name   pit_type post_text

where each bit of the MH label is controlled by parameters.

The *bubble* may or may not exist



The **MH label** (and bubble) can be positioned at the bottom of the **top area**, or can be placed a fixed distance above the top of the corresponding manhole.

If the **bubble text** is drawn at the bottom of the top area, the upright is automatically drawn up to the **bubble text.**

If the **bubble text** is drawn above the pit, it is positioned by the *distance_above_pit* parameter **plus** the top stagger distances, *stagger_gap_top*, *stagger_height_3* and *stagger_height_4*.

This is necessary because the **bubble text** may need to be staggered.

The columns for the fields documented in the sections are for.

Panel Field	**Parameter name**	**Type**	**Pop-Up**

Section: Maintenance hole names/types/bubbles

Include line name mode	draw_line_name	choice box	don't include line name include line name

whether to include the drainage line name in the MH name label.

Include pit name mode	draw_pit_name	choice box	don't include pit name include pit name

whether to include the MH name in the MH name label.

Include pit type mode	draw_pit_type	choice box	don't include pit type include pit type

whether to include the MH type in the MH name label.

Size (mm)	bubble_text_size	real box	

text size of MH name label.

Colour	bubble_text_colour	colour box	available colours

text colour of MH name label.

Textstyle	bubble_textstyle	textstyle box	available textstyles

font of MH name label.

X adjustment (mm)	bubble_text_x	real box	

horizontal adjustment to position of MH name label.

Y adjustment (mm)	bubble_text_y	real box	

vertical adjustment to position of MH name label.

Pre text	bubble_pre_text	text box	

text to go before MH name label.

Post text	bubble_post_text	text box	

text to go after MH name label.

Text angle (dms)	bubble_text_angle	angle box	

text angle of MH name label.

Text justification	bubble_text_justify	justification box	

text justification of MH name label.

Bubble radius (mm)	bubble_radius	real box	

radius of bubble around MH name label. Zero (0) for no bubble.

Bubble colour	bubble_colour	colour box	available colours

colour of bubble around MH name label.

Bubble length (mm)	bubble_length	input	

length of bubble around MH name label. Zero (0) for circular bubble.

Bubble text position	draw_text_at_pit	choice box	draw bubble&text in top area draw bubble&text above pit

whether to position the MH name labels and bubbles in the Top area, or directly above the pits.

Distance to add to place bubble above the pit (mm) distance_above_pit real box

for draw_text_at_pit *set to* draw bubble & text above pit*, distance to add between top of pit and bottom of bubble.*

See

26.5.14.1 Maintenance Holes - Line/Junction Deflection Angles
26.5.14.2 Maintenance Holes - Symbols
26.5.14.3 Maintenance Holes - Attribute Labels

Or return to 26.5 Drainage Long Plot PPF Editor.

26.5.14.1 Maintenance Holes - Line/Junction Deflection Angles

If there is a change of direction of the pipes of the plotted drainage string going through the pit, the **deflection angle (pit angle)** is drawn above the MH label.

The **deflection angle text** is made up:

angled_pre_text   deflection angle   angled_post_text

Also **any junctions** at a pit in the plotted drainage string can be labelled with the name of the drainage strings coming into the pit, and the angle of the pipes at the junction.

Hence the **junction text** for each junction at the pit is made up of **two** lines:

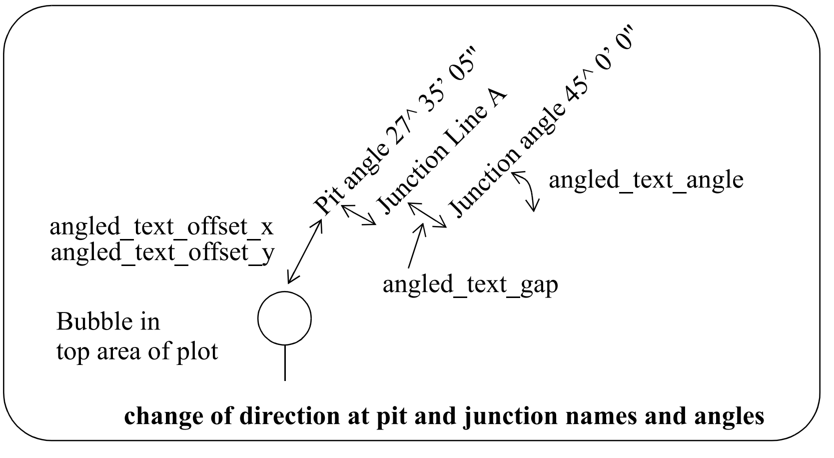
junction_pre_text   line_name   junction_post_text
junction_angle_pre_text   junction angle   junction_angle_post_text

Note that there may be more than one junction at the pit.

If bubbles are drawn around the MH label, the deflection angle and junction name and angle are drawn at the distance (***angled_text_x_offset, angled_text_y_offset)*** above the bubble and with the distance ***angled_text_gap*** between the lines of information.

If bubbles are not drawn, **MH label** and the deflection angle and junction names and angles are placed the distance (***angled_text_x_offset, angled_text_y_offset)*** above the bottom of the top area. Each line of text is separated by the distance ***angled_text_gap***.

The deflection angle and junction name and angle are drawn at an angle of ***angled_text_angle***.



The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Maintenance hole line/junction deflection angles

this section defines where the lines of text will be, and the angle of the text and distance between the lines of text.

Angled text x offset (mm) angled_text_x_offset real box

distance in mm that the text is offset in x from the centre of the top of the bubble.

Angled text y offset (mm) angled_text_offset real box

distance in mm that the text is offset in y from the centre of the top of the bubble.

Angled text horiz gap (mm) angled_text_gap real box

perpendicular distance in mm between the pit angle text and the junction texts.

Angled text angle (dms) angled_text_angle angle box

angle of the text in degrees minutes and seconds in hp notation.

Angled text justification angled_text_justification choice box left, right

justification of the pit angle text and the junction texts. It can only be "left" and "right".

Degrees mode angled_text_degrees_mode choice box DDDMMSS.s
DDDMM
DDD
Decimal degrees

*if **DDMMSS.s** the angle is given in degrees, minutes and seconds and tenths of a second*
*if **DDMMSS.s** the deflection angle is given in degrees, minutes and seconds and tenths of a second.*
*If **DDDMM** the deflection angle is given in degrees and minutes.*
*If **DDD** the deflection angle is given in degrees.*
*If **Decimal degrees** the deflection angle is given in decimal degrees with the number of decimal places given by* **Degrees decimals**.

Degrees decimals angled_text_degrees_decimals integer box

*if **Degrees mode** is Decimal degrees the it will be written out t this many decimal places.*

Section: Drainage line deflection angles

this section defines the pre and post text, textstyle, size and colour for the deflection angle (pit angle) text.

Pre text angled_pre_text text box

text to go before the pit deflection angle text.

Post text angled_post_text text box

text to go after the pit deflection angle text.

Colour angled_text_colour colour box available colours

colour of the pit deflection angle text.

Size (mm) angled_text_size real box

size in millimetres of the pit deflection angle text.

Textstyle angled_textstyle textstyle box available textstyles

textstyle of the pit deflection angle text.

label junction name and angle on separate lines
append angle to junction name
append name to junction angle

Pre text junction_angle_pre_text text box

text to go before the junction angle text.

Post text junction_angle_post_text text box

text to go after the junction angle text.

Colour junction_angle_text_colour colour box available colours

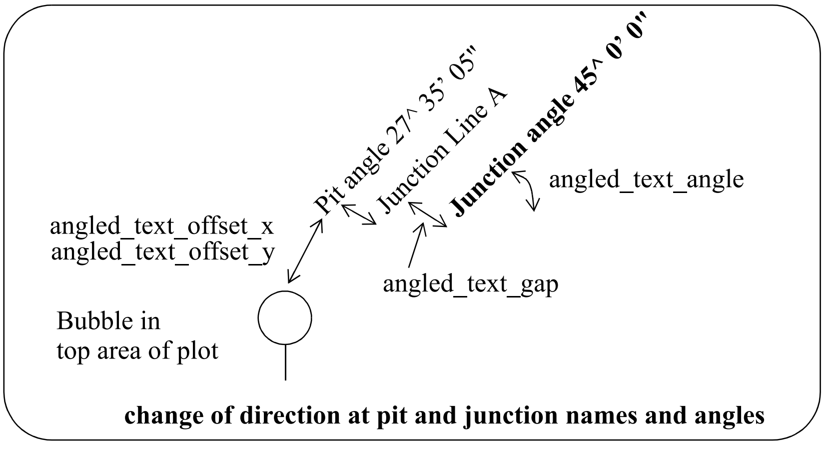
colour of the junction angle text.

Size (mm) junction_angle_text_size real box

size in millimetres of the junction angle text.

Textstyle junction_angle_textstyle textstyle box available textstyles

textstyle of the junction angle text.



Continue to the next section 26.5.14.2 Maintenance Holes - Symbols or return to 26.5.14 Maintenance Holes.

26.5.14.2 Maintenance Holes - Symbols

Symbols representing the different types of maintenance holes used, can be drawn on the plots.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Maintenance hole symbols

this section defines the pre and post text, textstyle, size and colour for the junction name text.

The fields for each row form one set of controls for the placement of MH symbols on the plot. Normally, the grid will contain one row for each MH type/symbol used.

Symbols Grid

All MH types tick box

*if **ticked**, then all MH types are labelled with the fields in this row.*
*If **not ticked**, then all maintenance holes with the given* **MH Type** *are labelled with the fields in this row.*

MH type manhole_symbol_n_type choice box available MH types

maintenance holes with this **MH type** *are labelled with the fields in this row.*

MH symbol mode manhole_symbol_n_mode choice box cross (0)
up from centre of box (1)
up&down from box centre(2)
square (3)
triangle, base at bottom (4)
circle (5)
use a 12d symbol (6)

for the MH type for this row, whether to use one of the hard-wired symbols (1-5), or a symbol from the 12d symbols list.(6)

predefined symbols for* manhole_symbol_n_modes *0 to 5

MH symbol position manhole_symbol_n_position
choice box at top of mh
above top of boxes
above highest point
to primary string
to first found tin

for the MH type for this row, the desired position of the symbol.

Stagger tick box

Size (mm) manhole_symbol_n_size real box
for the MH type for this row, the symbol size.

X (mm) manhole_symbol_n_x real box

for the MH type for this row, the horizontal adjustment to the selected MH symbol position.

Y (mm) manhole_symbol_n_y real box

for the MH type for this row, the vertical adjustment to the selected MH symbol position.

Symbol manhole_symbol_n_style symbol box available symbols

for the MH type for this row, and with Manhole symbol mode *set to* use a symbol*, the symbol to use from the 12d symbols list.*

Angle (dms) manhole_symbol_n_angle angle box

for the MH type for this row, the symbol angle in degrees minutes and seconds in hp notation.

Colour manhole_symbol_n_colour colour box available colours

for the MH type for this row, the symbol colour.

Continue to the next section 26.5.14.3 Maintenance Holes - Attribute Labels or return to 26.5.14 Maintenance Holes.

26.5.14.3 Maintenance Holes - Attribute Labels

The text for Maintenance Holes attributes can be drawn on the plots.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Maintenance hole attribute labels

this section defines the pre and post text, textstyle, size and colour for displaying the attributes as text.

The fields for each row form one set of controls for the placement of the given attribute on the plot.

Attributes Grid

Label MH attribute tick box

*if **ticked**, this row is used and the attribute is labelled.*
*If **not ticked**, this row is ignored.*

Attribute name

the full path name of the attribute to be labelled.

From primary string at junction pits (non-standard) tick box

*if **ticked**,.*

Text size (mm)

the text size for this attribute label.

Label position choice box at top of mh
at ds il of mh
at sump of mh
at first found tin
at top of boxes
at highest point

position to place attribute label

Stagger tick box

the text size for this attribute label.

X off (mm) real box

the horizontal adjustment to the selected label position.

Y off (mm) real box

the vertical adjustment to the selected label position.

Angle (dms) angle box

the angle of the attribute label in degrees minutes and seconds in hp notation.

Pre text text box

text to go before the attribute label.

Post text text box

text to go after the attribute label.

Decimal places integer box

number of decimal places to use when it is a real attribute.

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Units factor real box

for real and integer attributes, the value is multiplied by the **Units factor**.

Colour colour box

the colour of the attribute label.

Textstyle textstyle box

the textstyle of the attribute label.

Justification justification box

the justification of the attribute label.

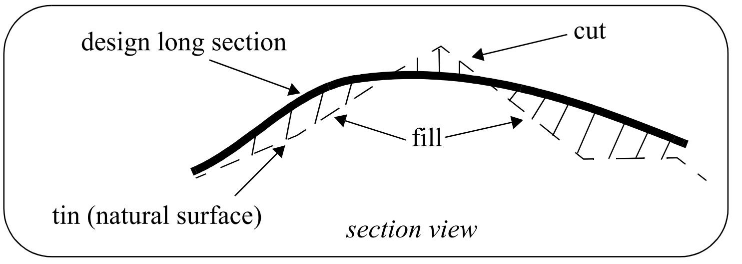
Please continue to the next section 26.5.16 Hatching Cut/Fill.

26.5.16 Hatching Cut/Fill

This option is used to hatch cut and/or fill areas between sets of tins.



The **Hatching Cut/Fill** section is common to the **PPF Editors** and is fully documented in 26.2.8 Hatching Cut/Fill.

Section: Hatching cut/fill - Tin parameters - *see* 26.2.8 Hatching Cut/Fill

Section: Hatching cut/fill - Cut parameters - *see* 26.2.8.1 Hatching Cut/Fill - Cut

Section: Hatching cut/fill - Fill parameters- *see* 26.2.8.2 Hatching Cut/Fill - Fill

Please continue to the next section 26.5.17 Cuts - Drainage/Sewer Long.

26.5.17 Cuts - Drainage/Sewer Long

The cuts that the primary string (drainage or sewer line) makes though strings in any user specified model can be automatically labelled on the drainage/sewer long section plots.

The **Cuts** section is common to the **PPF Editors** and is fully documented in 26.2.9 Cuts.

Section: Cuts - Model/Name mask parameters - *see* 26.2.9 Cuts.

Section: Cuts - Chainage parameters - *see* 26.2.9.3 Cuts - Chainage - Long Sections Only

Section: Cuts - Height parameters - *see* 26.2.9.4 Cuts - Heights

Section: Cuts - Diameter parameters - *see* 26.2.9.5 Cuts - Diameters

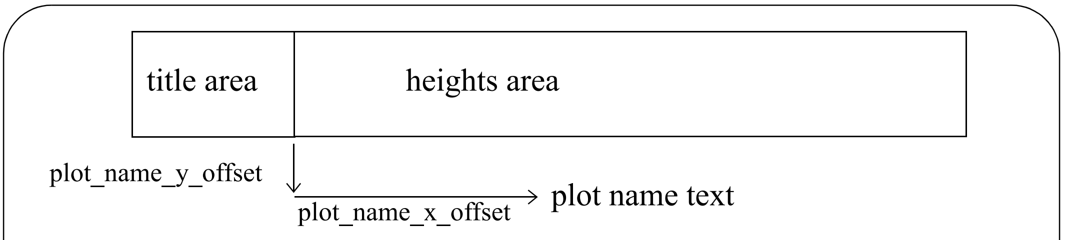
Section: Cuts - Label parameters - *see* 26.2.9.6 Cuts - Labels

Section: Cuts - Symbol parameters - *see* 26.2.9.7 Cuts - Symbols

Continue to the next section 26.5.18 Primary String Name Label.

26.5.18 Primary String Name Label

The plot can be labelled with a name under the boxes area.



labelling primary string name on long section plots

The name is made up of a concatenation of the text string names:

Panel Field	Parameter name	Type
Name mode	plot_name_string_name	choice box
determines what text is placed in the name labels.		
Pre-text	plot_name_pre_text	text box
text before label.		
Post-text	plot_name_post_text	text box
text after label.		
Textstyle	plot_name_textstyle	textstyle box
textstyle of label.		
Size (mm)	plot_name_size	real box
size of label.		
Colour	plot_name_colour	colour box
colour of label.		
X offset (mm)	plot_name_x_offset	real box
horizontal adjustment to position of label.		
Y offset (mm)	plot_name_y_offset	real box
vertical adjustment to position of label.		

The plot name is positioned under the boxes.

The *plot_name_x_offset* is measured from the beginning of the height boxes.

The default for *plot_name_x_offset* is centred on heights area.

The *plot_name_y_offset* is measured from the bottom of the box area with positive being down.

Please continue to the next section 26.5.19 PPFs to include - Drainage Long Section.

26.5.19 PPFs to include - Drainage Long Section

This is documented for all the PPF Editors in 26.2.10 PPFs To Include.

Please continue to the next section 26.5.20 Buttons at Bottom of Panel.

26.5.20 Buttons at Bottom of Panel

This is documented for all the PPF Editors in 26.2.2 View to Load and Global Variables.

Return to 26.5 Drainage Long Plot PPF Editor.

26.6 Melbourne Water Plot PPF Editor

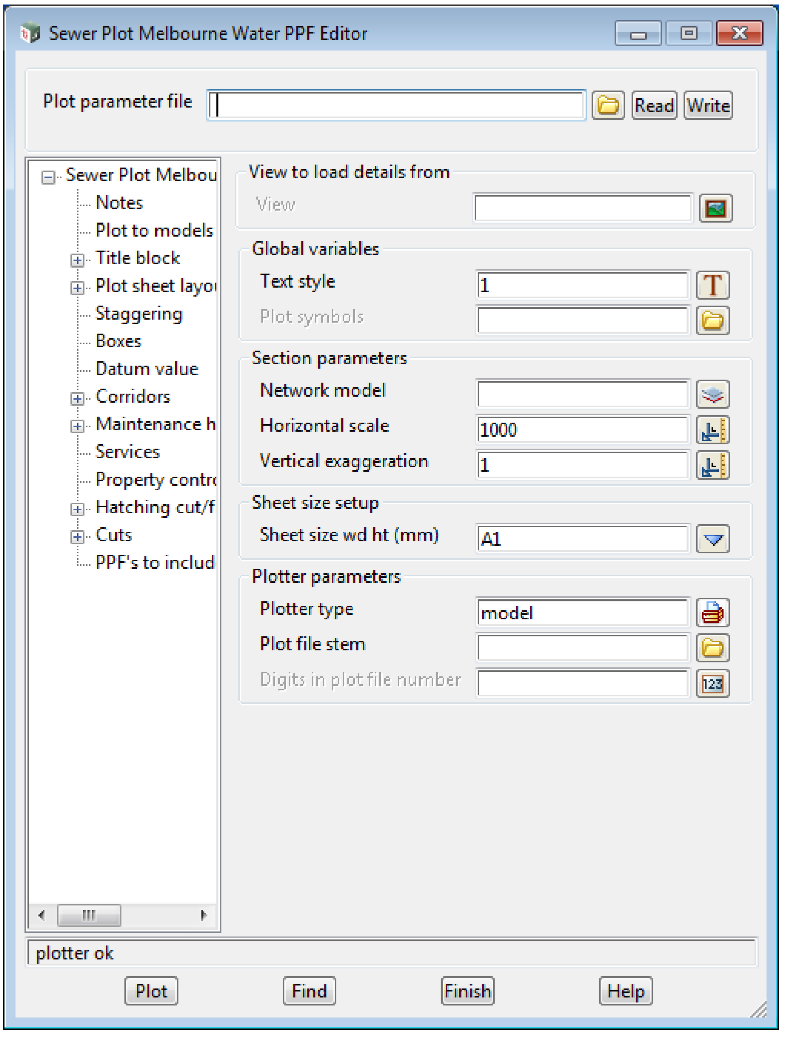
Position of option on menu: **Plot =>Plot and PPF Editors =>Melbourne Water**

The **Melbourne Water plot PPF editor** is for creating and/or editing a (binary) Melbourne Water sewer long section PPF and for creating a Melbourne Water sewer long section plot. An text version of the file is also produced.

Note: Binary and text PPFs are stored *within* the project (not in the folder containing the project).

On selecting the **Melbourne Water** option, the **Sewer Plot Melbourne Water PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the ***Sewer Plot Melbourne Water*** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.



For information on all the different nodes see:

[26.6.1 Melbourne Water Plot - Front Page](#)
[26.6.2 Notes - Melbourne Water](#)
[26.6.3 Plot to Models - Melbourne Water](#)
[26.6.4 Title Block - Melbourne Water](#)

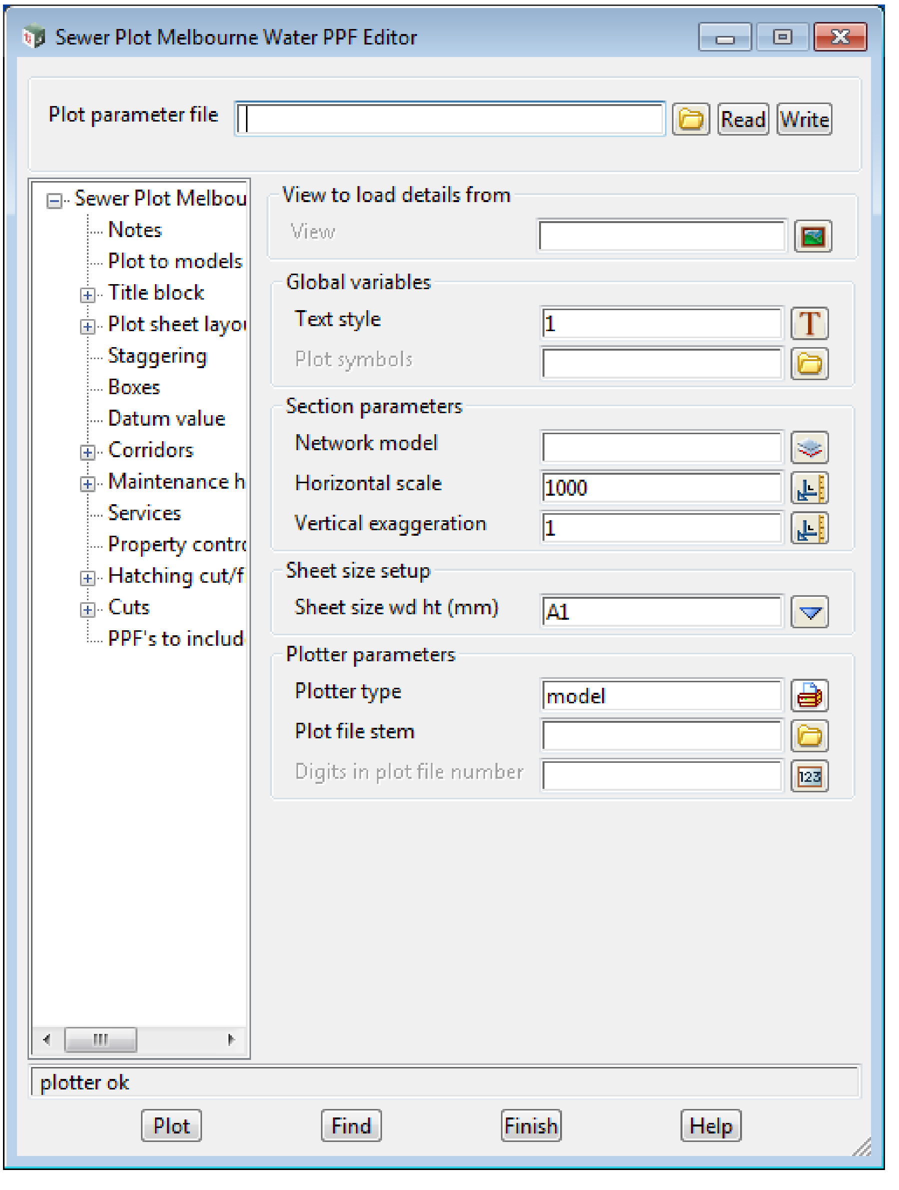
26.6.1 Melbourne Water Plot - Front Page

The Melbourne Water sewer long plot itself consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.



Section: Plot parameter file

a ***plot parameter file*** *can be used to load values into the fields of the PPF Editor, or as a file to write out all current values in a PPF Editor to.*

This section is documented for all the PPF Editors in 26.2.1 Plot Parameter File.

Section: Section: View to load details from AND Global variables

*a **section view** can be selected to load certain values into fields of the PPDF Editor. For example, Vertical exaggeration and Corridor models. And there are variables to use if some values aren't given.*

These sections are documented for all the PPF Editors in 26.2.2 View to Load and Global Variables.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Section parameters

Network model	network_model	model box	available models

model containing the sewer strings to draw in long section on the plot.

Horizontal Scale	scale	real box	

horizontal scale to be used for the long section plots

Vertical exaggeration	vertical_exaggeration	real box	

vertical scale to be used for the long section plots

Section: Sheet size setup and Plotter parameters

these sections define the size of the "paper" to plot on, the type of plotter to use and the naming to use for the plot files.

These sections are documented for all the PPF Editors in 26.2.3 Sheet Size and Plotter Parameters.

Section: Cuts - Symbol parameters - *see* 26.2.9.7 Cuts - Symbols

Continue to the next section 26.6.16 PPFs to include - Melbourne Water.

26.6.15 Paired Cuts - Melbourne Water

Paired cuts uses pairs of strings and where both strings cut the primary string, the cuts on the long plot can be labelled with information such as

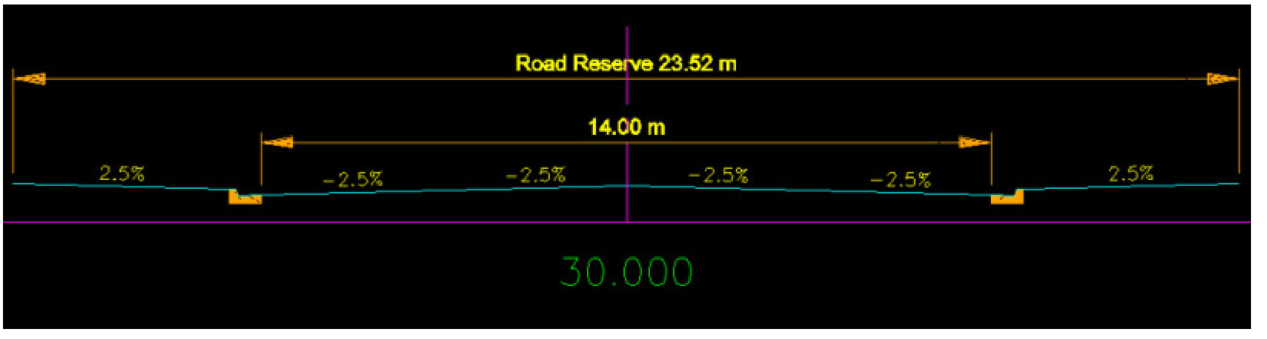
(a) the name of the first and second cut strings

(b) attributes from the first and second cut string

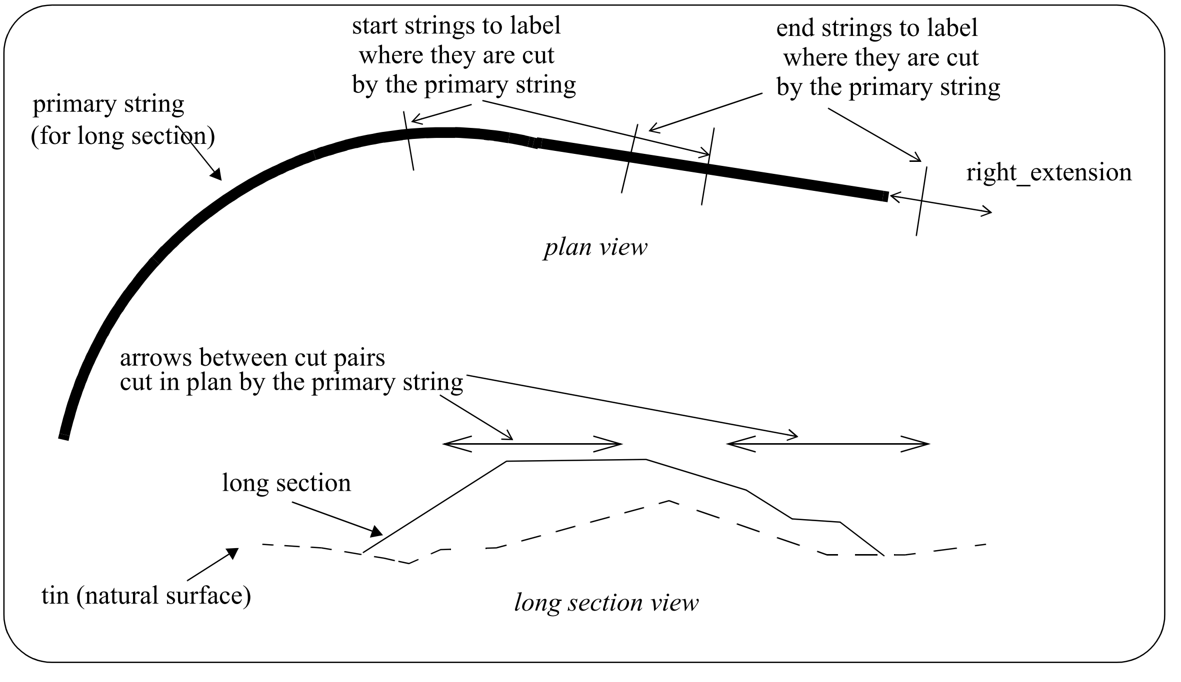
(c) plan distance between the two cuts of the pair

(d) 3d length between the two cuts of the pair

(e) the chainge on the long section of the first and second cuts of the pair



Symbols can be drawn at the chainages of the first and second cuts (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts.



The method for specifying which strings are to be checked for paired cuts is by first specifying the **models** (using wild cards and characters) that contains the strings, and then a **start name mask** to select the all the strings that are to be the first strings in a cut pair, and an **end name mask** to select all the strings that are the second strings in a cut pair.

For a long section, all the cuts of the selected **start** strings are found and the cuts ordered by the chainage of the cut with the primary string of the long section. Then all the cuts of the selected **end** strings are found and the cuts ordered by the chainage of the cut with the primary string of the long section.

The start cuts are then processed and each start cut is paired with the next end cut with a larger chainage than the start cut. It is possible that there are end cuts before the first start cut (orphaned end cuts) and start cut with no following end cut (orphaned start cuts).

Up to twenty five different sets of models and name masks can be used so that different paired cut sets can be labelled in different ways.

This is documented for all the PPF Editors in 26.2.11 Buttons at the Bottom of the PPF Editors.

Return to 26.6 Melbourne Water Plot PPF Editor.

26.7 Pipeline Plot PPF Editor

Position of option on menu: **Plot => Plot and PPF Editors => Pipelines**

Position of option on menu: **Design =>Pipeline =>Plots**

The **Pipeline Plot PPF Editor** is for creating and/or editing a (binary) pipeline long section ppf file and for creating a pipeline long section plot for all the pipeline strings in a given model.

The pipeline long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

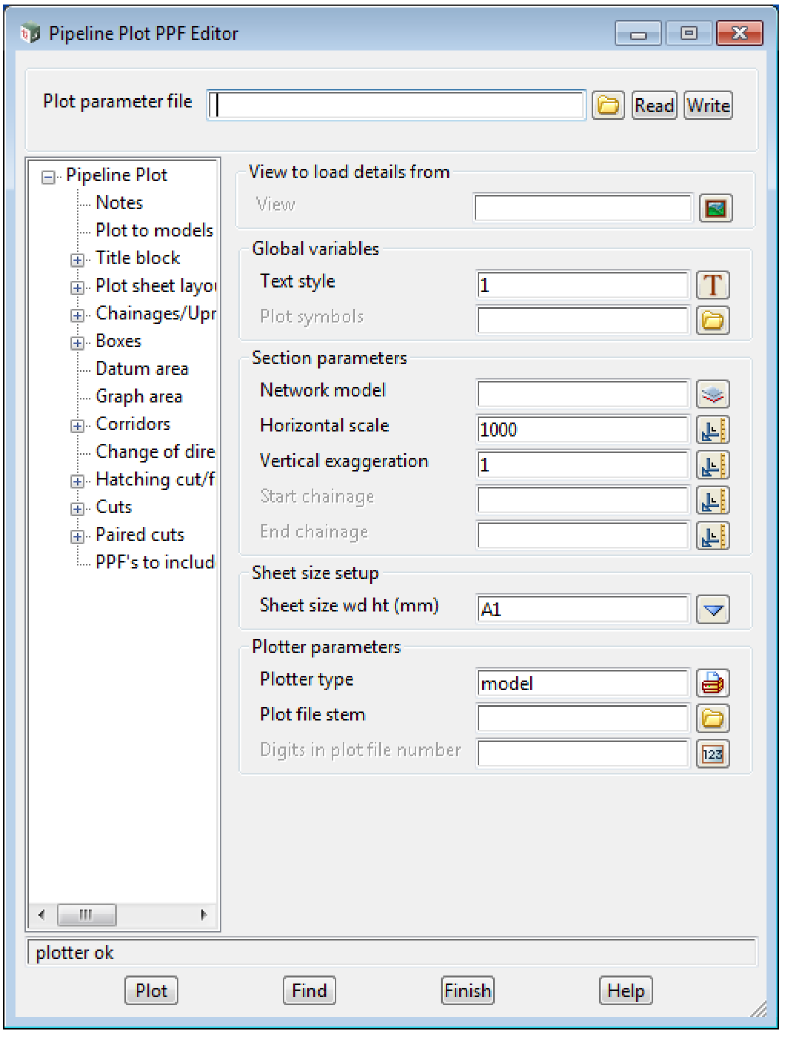
When a sheet is full, a follow on sheet is created.

As soon as one pipeline string is completed, the next pipeline string in the network model is plotted beginning on the same row as the previous pipeline string and with a horizontal gap of size horizontal_plot_gap between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the text PPFs were).

On selecting the **Pipelines** option, the **Pipeline Plot PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the ***Pipeline Plot*** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.



For information on all the different nodes see:

26.7.16 PPFs to include - Pipeline
26.7.17 Buttons at Bottom of Panel - Pipeline

26.7.1 General Information on Pipeline Long Section Plots

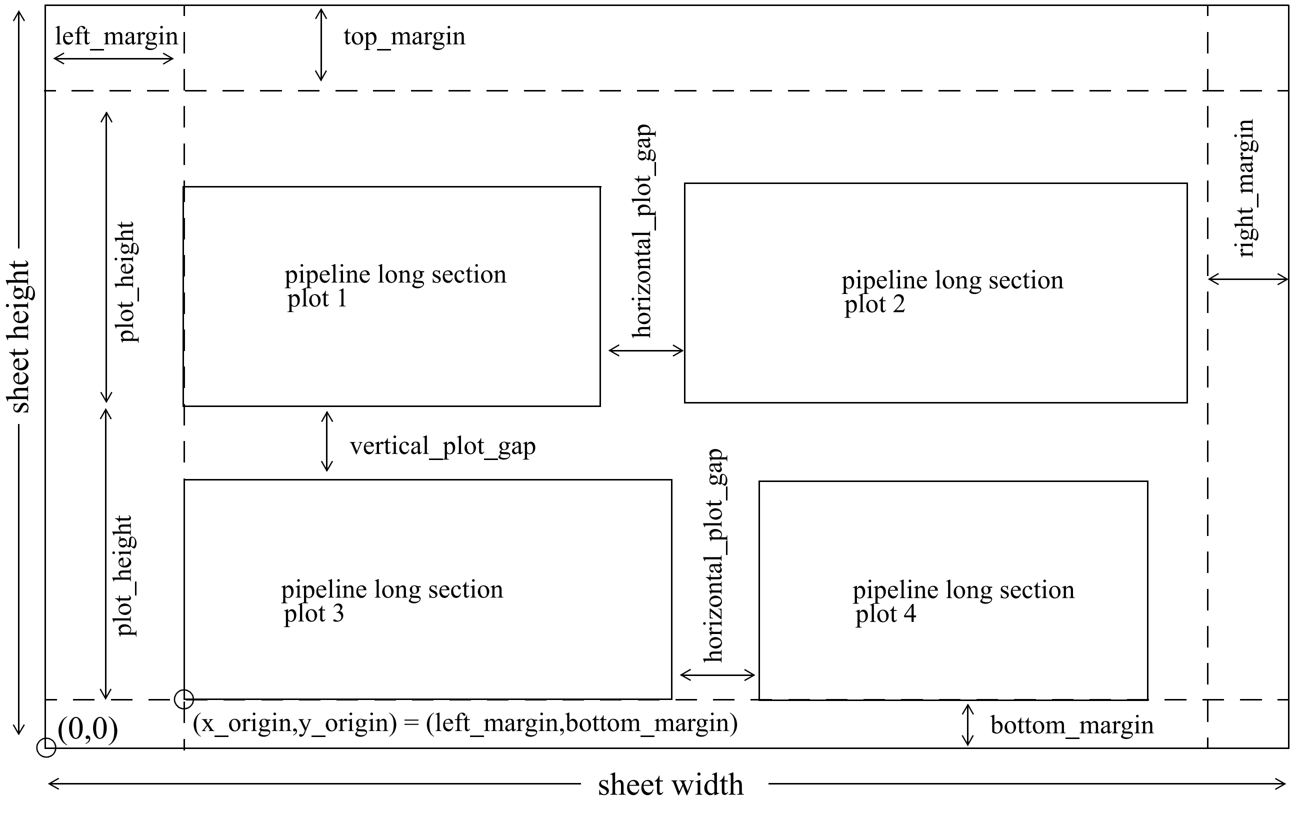
The pipeline plot makes special long section plots for a **network** of pipeline strings.

The pipeline long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

When a sheet is full, a follow on sheet is created.

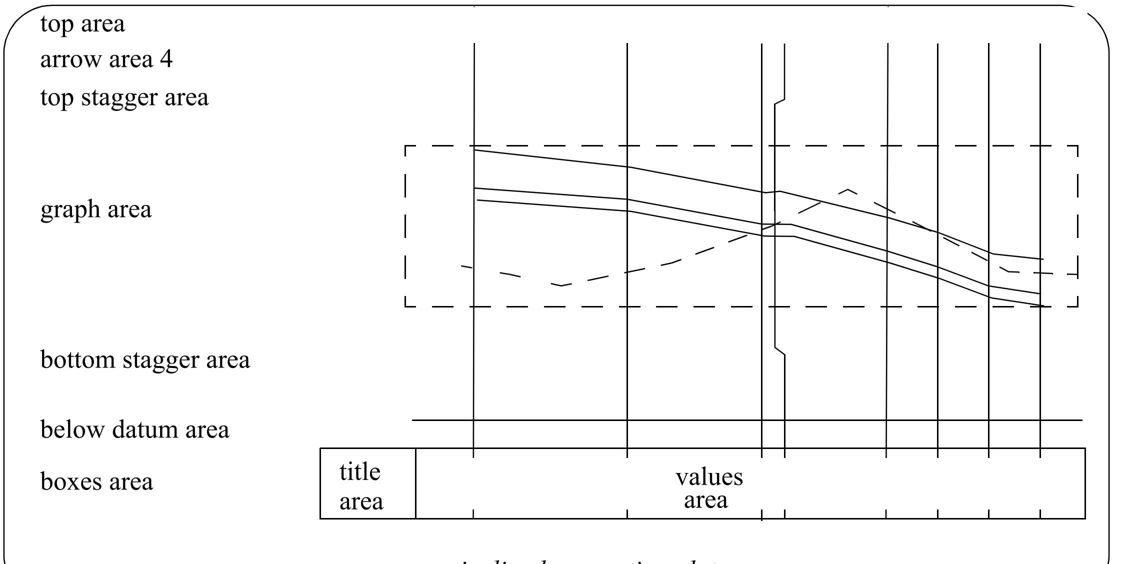
As soon as one pipeline string is completed, the next pipeline string in the network model is plotted beginning on the same row as the previous pipeline string and with a user given horizontal gap between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.



Each pipeline long plot consists of seven areas. From the bottom up, they are

1. The **boxes area** is where the chainages and various values for the pipeline strings are labelled.
2. The **below datum area** is a region between the boxes area and the datum line.
3. The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.
4. The **graph area** is the area where the actual plots of the strings are drawn.
5. The **top stagger area** is where the upright line staggers occur above the graph area.
6. The **arrow 4 area** is an extension of the uprights above the top stagger area to allow for the drawing of arrows where the arrows go between the staggered uprights above the graph area.
7. The **top area** is an annotation area above the arrow 4 area (the top of the plot) and is used for

pegs and deflection angles.



pipeline long section plot

Apart from information labelled in the boxes and top areas, the pipeline long section plot can place arrows between ips for other information such as

(a) pipe grade
(b) vertical geometry
(c) horizontal geometry

Also the chainages where services cross the pipeline line are automatically labelled.

For each pipeline plot, the labelling of pipe invert levels, depth to invert, pipe grade and natural surface level are done at the chainages:

(a) pegs given by a user given peg interval
(b) horizontal and vertical defection points
(c) points in the specials model
(d) crossing services

All the required parameters for controlling the pipeline long section plot are set up in the ***Pipeline Plot PPF Editor*** and will be described in detail in the following sections.

Please continue to the next section 26.4.2 Section Long Plot - Front Page or return to 26.4 Long Plot PPF Editor.

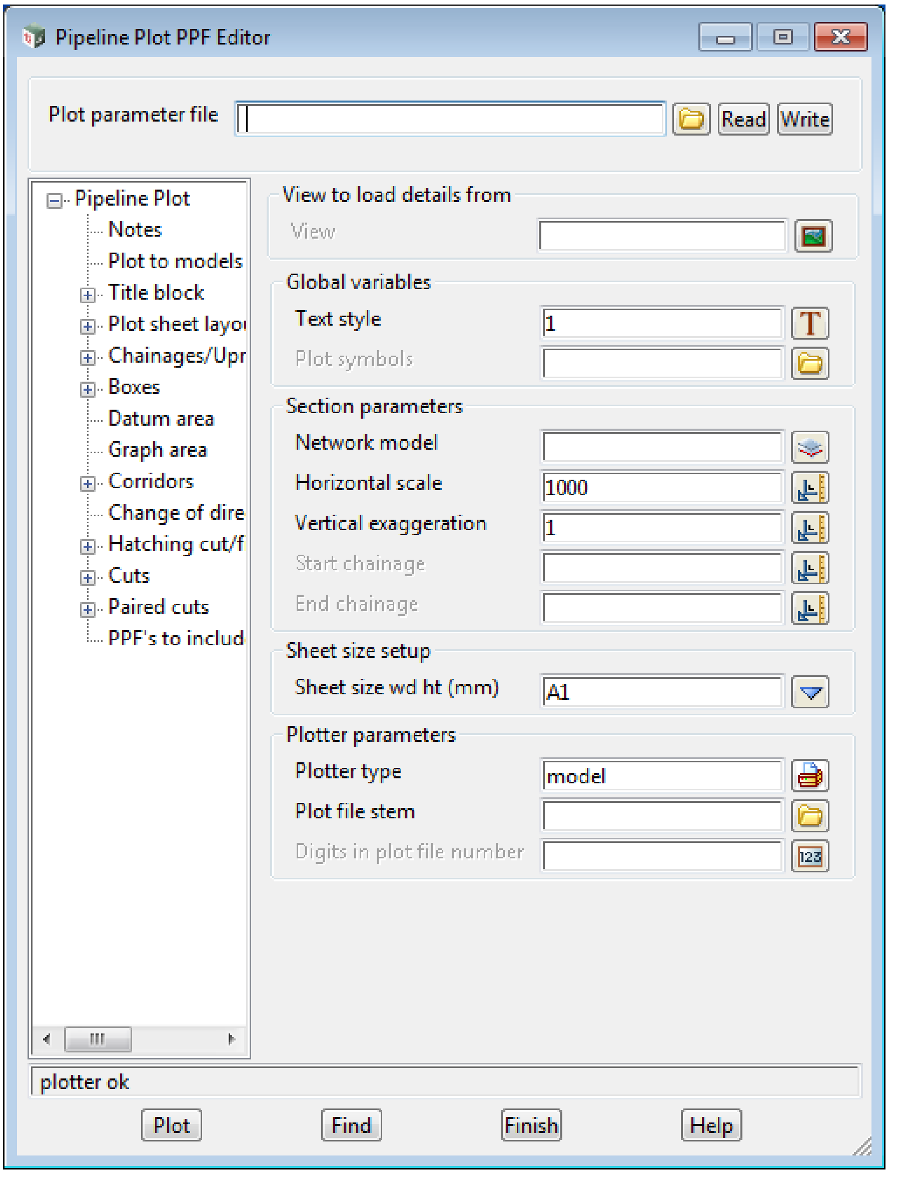
26.7.2 Pipeline Longsection Plot - Front Page

The pipeline long plot itself consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.



Section: Plot parameter file

*a **plot parameter file** can be used to load values into the fields of the PPF Editor, or as a file to write out all current values in a PPF Editor to.*

This section is documented for all the PPF Editors in 26.2.1 Plot Parameter File.

Section: Section: View to load details from AND Global variables

*a **section view** can be selected to load certain values into fields of the PPDF Editor. For example,* *Vertical exaggeration and Corridor models. And there are variables to use if some values aren't given.*

These sections are documented for all the PPF Editors in 26.2.2 View to Load and Global Variables.

*if **ticked**,*

Pipe Diameters Label grid

The fields in this section are grid column fields that may each have up to 20 rows (sets) defined.

All pipes with diameters that fall between the minimum diameter **Min pipe diam** *and the maximum diameter* **Max pipe diam** *for a row (set), will be represented according to the values of the other fields in this row. Note that the Pipe diameters are defined in the drainage design strings.*

Min pipe diam (m) pipe_dia_min_n input

minimum pipe diameter in metres for the nth row of pipe representations.

Max pipe diam (m) pipe_dia_max_n input

maximum pipe diameter in metres for the nth row of pipe representations.

All pipes with diameters that fall between the min and max diameters of this row, will be represented according to the values of the other fields in this row.

Pipe type mask text box

Representation mode pipe_dia_mode choice box none
linestyle
pipe
linestyle and pipe

determines whether to represent pipes as linestyles and/or solid pipes for the nth row of pipe representations.

Trim mode trim_edge_mode choice box don't trim strings
trim pipes
trim linestyles
trim pipes and linestyles

determines whether to trim pipe and/or linestyle strings around maintenance holes for the nth row of pipe representations.

Multi-pipe spacing real box

the distance to space the pipes when multiple pipes are drawn.

Colour pipe_dia_colour_n colour box available colours

colour to use for the nth row of pipe representations.

Linestyle	pipe_dia_linestyle_n	linestyle box	available linestyles

linestyle to use for the nth row of pipe representations.

Linestyle string name	pipe_dia_name_n	input	

string name of linestyles for the nth row of pipe representations.

Pipe string name	pipe_edge_name_n	input	

string name of pipes for the nth row of pipe representations.

Section: Pipe labels

Label Rise mode	rise_mode	choice box	rise from centre of pipe rise from edge of pipe

determines where all pipe label text rise values are measured from.

See

26.8.3.0.1 Pipes - Pipe Diameter Labels
26.8.3.0.2 Pipes - Pipe IL Labels
26.8.3.0.3 Pipes - Pipe Attribute Labels

Or return to 26.8 Drainage Plan Plot PPF Editor.

26.8.3.0.1 Pipes - Pipe Diameter Labels

The diameter of the pipes can be labelled in plan.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: Pipe diameter labels

Draw diameter labels	pipe_label_draw	tick box	

if ***ticked****, the pipe diameters are labelled.*

Label mode	pipe_label_mode	choice box	none pre dia post pre dia post grade pre dia post type grade

determines what text is to be placed for the pipe diameter labels. Pipe types and grades can be included, in addition to diameters. Pipe diameters, types and grades are all defined in the drainage design strings.

Note: *if a pipe attribute of real type named* **width** *exists and is greater than zero, the pipe is considered to be rectangular and is labelled* <width x height>*, where the height takes the value of the pipe diameter.*

Text size	pipe_label_size	real box	

text size of the pipe diameter labels. The labels will only be created if the size is greater than zero.

Text offset	pipe_label_offset	real box	

distance to move the pipe diameter labels along the pipe, from the mid position of the pipe segment. Positive values are to the right.

Text rise	pipe_label_rise	real box	

distance to move the pipe diameter labels away from the pipe centreline or edge (depending on setting of rise_mode*). A negative value will place the labels on the other side of the pipes.*

Text colour	pipe_label_colour	colour box	available colours

colour of the pipe diameter labels.

Text style	pipe_label_textstyle	textstyle box	available fonts

font of the pipe diameter labels.

Pre text	pipe_label_pre_text	text box	

text to be placed before the diameter in the pipe diameter labels.

Post text	pipe_label_post_text	text box	

text to be placed after the diameter in the pipe diameter labels.

Units factor	pipe_label_factor	real box	

multiplier of diameter values. A Units factor of 1000 will result in the diameters being labelled in mm.

Decimal places	pipe_label_decimals	integer box	

number of decimal places in labelled diameter values.

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name	pipe_label_name	name box	

string name of the pipe diameter labels.

Continue to the next section 26.8.3.0.2 Pipes - Pipe IL Labels section or return to 26.8.3 Pipes.

26.8.3.0.2 Pipes - Pipe IL Labels

The invert levels of both ends of the pipes can be labelled in plan.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Pipe IL labels

Draw IL labels pipe_text_draw_il tick box

*if **ticked**, the pipe invert levels are labelled.*

Text size pipe_text_size_il real box

text size of the pipe IL (Invert Level) labels. The labels will only be created if the size is greater than zero.

Text offset pipe_text_offset_il real box

distance to move the pipe IL labels along the pipe, from the ends of the pipe. Positive values are towards the mid position of the pipe segment.

Text rise pipe_text_rise_il real box

distance to move the pipe IL labels away from the pipe centreline or edge (depending on setting of rise_mode*). A negative value will place the labels on the other side of the pipes.*

Text colour pipe_text_colour_il colour box available colours

colour of the pipe IL labels.

Text style pipe_text_textstyle_il textstyle box available textstyles

textstyle of the pipe IL labels.

Pre text pipe_text_pre_text_il text box

text to be placed before the IL in the pipe IL labels.

Post text pipe_text_post_text_il text box

text to be placed after the IL in the pipe IL labels.

Units factor pipe_text_factor_il real box

multiplier of IL values. A Units factor of 3.281 will result in the ILs being labelled in feet.

Decimal places pipe_text_decimals_il integer box

number of decimal places in labelled IL values.

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name pipe_text_name_il name box

text string name of the pipe IL labels.

Continue to the next section 26.8.3.0.3 Pipes - Pipe Attribute Labels section or return to 26.8.3 Pipes.

26.8.3.0.3 Pipes - Pipe Attribute Labels

The values of any pipe attributes can be labelled in plan.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Pipe attribute labels

Pipe attribute label grid

each row of the grid defines how a pipe attribute is labelled. There may be up to 20 rows.

Label pipe attribute tick box

*if **ticked**, the pipe attribute for this row will be labelled.*

*If **not ticked**, the pipe attribute for this will **not** be labelled.*

Attribute name text box

full path name of the pipe attribute for this row that may be labelled.

Text size pipe_attribute_text_size_n real box

text size of the pipe attribute for this row.

Text offset real box

distance to move the pipe attribute labels for this row along the pipe, from the ends of the pipe. Positive values are towards the mid position of the pipe segment.

Text rise real box

distance to move the pipe attribute labels for this row away from the pipe edge. A negative value will place the labels on the other side of the pipes.

Text colour colour box available colours

colour of the pipe attribute labels for this row.

Text style textstyle box available textstyles

textstyle of the pipe attribute labels for this row.

Pre text text box

text to be placed before the pipe attribute labels for this row.

Post text text box

text to be placed after the pipe attribute labels for this row.

Units factor real box

if the pipe attribute for this row is real or integer, it is multiplied by the **Units factor** *for this row.*

Decimal places **I** integer box

if the pipe attribute for this row is real, this is the number of decimal places in the pipe attribute label for this row.

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name pipe_attribute_text_name_n name box

name of the text string of the pipe attribute label for this row.

Continue to the next section 26.8.4 Maintenance Holes or return to 26.8.3 Pipes or 26.8 Drainage Plan Plot PPF Editor

26.8.4 Maintenance Holes

The maintenance holes in a plan of a drainage network are often not drawn as they appear but with different symbols *etc* to represent different manhole types *etc*.

The manhole name, diameter, depth, chainage, attributes and setout points can all be labelled in plan.

The columns for the fields documented in the sections are for.

Panel Field | **Parameter name** | **Type** | **Pop-Up**

Section: Maintenance hole representation

MH symbol direction mode mh_symbol_dir_mode choice box
use symbol angle
left
right
average

determines what mode of direction is used to place the MH symbols.

MH symbol angle (dms) mh_symbol_angle angle

angle of MH symbol placement in degrees, minutes and seconds in hp notation. This is only used depending on the setting of mh_symbol_dir_mode.

Use road direction where possible tick box

Use MH label direction for Text mode tick box

Group symbols with text labels tick box

if ***ticked****,*

MH Grid

the rows in the grid contain information for placing symbols at maintenance holes. There can be up to 20 rows in the grid.

MH type mh_type_n MH cell available MH types

MH type that will be drawn by information in this row of the grid. All MHs of this type will be represented according to the values of the other fields in this row. MH types are defined in the drainage design strings.

MH mode mh_mode_n choice cell none
text
symbol
circle

determines whether a text string, a symbol, or a circle is to be used to represent the maintenance holes in this row.

Insertion point choice cell mh centre, setout point

where to place the representation of the maintenance hole.

MH Symbol or Text mh_symbol_n symbol cell available symbols

symbol or text string to use to represent the nth set of maintenance holes.

If mh_mode_n *is set to* **text***, a text string can be typed in.*
If mh_mode_n *is set to* **symbol***, the symbol name can be chosen from the pop-up list.*
If mh_mode_n *is set to* **circle***, then it is ignored.*

MH Symbol mirror image

.

Justification	mh_symbol_justify_n	choice cell	left bottom left middle left top centre bottom centre middle centre top right bottom right middle right top

justification mode of the MH text for this row of maintenance holes. It is relative to the centres of the MHs. This will only be relevant if mh_mode_n *is set to* **text**.

Size	mh_symbol_size_n	real cell	

size of the MH symbols or text strings for this row of maintenance holes. The symbols, circles or text strings will only be created if the size is greater than zero.

In the case of a circle, the size is determined to match the diameter of the MH.

Offset	mh_symbol_offset_n	real cell	

distance to move the MH symbols, circles or text strings to the left or right of the MH centres, for this row of maintenance holes. Positive values are to the right. The direction of movement is parallel to the angle of the MH symbols (see mh_symbol_dir_mode *and* mh_symbol_angle*).*

Rise	mh_symbol_rise_n	real cell	

distance to move the MH symbols, circles or text strings above or below of the MH centres, for this row of maintenance holes. Positive values are upwards. The direction of movement is perpendicular to the angle of the MH symbols (see mh_symbol_dir_mode *and* mh_symbol_angle*).*

Colour	mh_symbol_colour_n	colour box	available colours

colour of the MH symbols, circles or text strings, for this row of maintenance holes.

Text style	mh_symbol_textstyle_n	textstyle box	available fonts

font of the MH text for this row of maintenance holes. This will only be relevant if mh_mode_n *is set to **text**.*

MH Symbol string name	mh_symbol_name_n	text cell	

string name of the MH symbols, circles or text strings for this row of maintenance holes.

Section: Maintenance Hole Labels

MH label direction mode	mh_text_mode	choice box	use label angle use pipe angle

determines what angle is to be used to position the maintenance hole label text.

MH label angle	mh_text_angle	angle	

angle of MH label text in degrees, minutes and seconds using hp notation.

This is only used depending on the setting of mh_text_mode.

MH label justification	mh_text_justify	choice box	left bottom left middle left top centre bottom centre middle centre top right bottom right middle right top

justification mode of all MH label text strings, relative to the MH centres.

See

Or return to 26.8 Drainage Plan Plot PPF Editor.

26.8.4.1 Maintenance Holes - MH Name Labels

The maintenance holes names are defined in the drainage strings.

The columns for the fields documented in the sections are for.

Panel Field	Parameter name	Type	Pop-Up

Section: MH name labels

*this section defines how a **MH name** is labelled.*

Panel Field	Parameter name	Type	Pop-Up
Draw name labels		tick box	

*if **ticked** the name of the maintenance hole is labelled.*

*If **not ticked** the name of the maintenance hole is not labelled.*

Panel Field	Parameter name	Type	Pop-Up
Text size	mh_text_size	real box	

*if **>0**, the text size of the MH name labels.*
*If **zero**, the MH name will not be labelled.*

Panel Field	Parameter name	Type	Pop-Up
Text offset	mh_text_offset	real box	

distance to move the MH name labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle. *The justification of the text is specified by parameter* mh_text_justify.

Panel Field	Parameter name	Type	Pop-Up
Text rise	mh_text_rise	real box	

distance to move the MH name labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle. *The justification of the text is specified by parameter* mh_text_justify.

Panel Field	Parameter name	Type	Pop-Up
Text colour	mh_text_colour	colour	available colours

colour of the MH name labels.

Panel Field	Parameter name	Type	Pop-Up
Text style	mh_text_textstyle	textstyle	available textstyles

textstyle of the MH name labels.

Panel Field	Parameter name	Type	Pop-Up
Pre text	mh_text_pre	text box	

text to be placed before the MH name in the MH name labels.

Panel Field	Parameter name	Type	Pop-Up
Post text	mh_text_post	text box	

text to be placed after the MH name in the MH name labels.

Panel Field	Parameter name	Type	Pop-Up
Text string name	mh_text_name	text box	

text string name of the MH name labels.

Continue to the next section 26.8.4.2 Maintenance Holes - MH diameter Labels or return to 26.8.4 Maintenance Holes.

26.8.4.2 Maintenance Holes - MH diameter Labels

The diameter of each maintenance hole is defined in the drainage strings.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: MH diameter labels

*this section defines how a **MH diameter** is labelled.*

Draw diameter labels tick box

*if **ticked** the diameter of the maintenance holes are labelled.*

*If **not ticked** the diameter of the maintenance holes are not labelled.*

Sub Section: Only label if diameter is outside range:

Min mh_text_min_dia real box

Max mh_text_max_dia real box

range of MH diameters for which the MH diameter labels will not be created.
Both Min and Max are entered in metres.

Text size mh_text_size_dia real box

*if **>0**, the text size of the MH diameter labels.*
*If **zero**, the MH diameter will not be labelled.*

Text offset mh_text_offset_dia real box

distance to move the MH diameter labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle*. The justification of the text is specified by parameter* mh_text_justify.

Text rise mh_text_rise_dia real box

distance to move the MH diameter labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle*. The justification of the text is specified by parameter* mh_text_justify.

Text colour mh_text_colour_dia colour box available colours

colour of the MH diameter labels.

Text style mh_text_textstyle_dia textstyle box available fonts

font of the MH diameter labels.

Pre text mh_text_pre_dia text box

text to be placed before the diameter in the MH diameter labels.

Post text mh_text_post_dia text box

text to be placed after the diameter in the MH diameter labels.

Units factor **mh**_text_factor_dia real box

multiplier of diameter values. A Units factor of 1000 will result in the diameters being labelled in mm.

Decimal places mh_text_decimals_dia integer box

number of decimal places in labelled diameter values.

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name mh_text_name_dia text box

string name of the MH diameter labels.

Continue to the next section 26.8.4.3 Maintenance Holes - MH depth Labels or return to 26.8.4 Maintenance Holes.

26.8.4.3 Maintenance Holes - MH depth Labels

The depth of each maintenance hole is defined in the drainage strings.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: MH depth labels

*this section defines how a **MH depth** is labelled.*

Draw depth labels tick box

*if **ticked** the depth of the maintenance holes are labelled.*

*If **not ticked** the depth of the maintenance holes are not labelled.*

Text size mh_text_size_depth real box

*if **>0**, the text size of the MH depth labels.*
*If **zero**, the MH depths are not labelled.*

Text offset mh_text_offset_depth real box

distance to move the MH depth labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle. *The justification of the text is specified by parameter* mh_text_justify.

Text rise mh_text_rise_depth real box

distance to move the MH depth labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle. *The justification of the text is specified by parameter* mh_text_justify.

Text colour mh_text_colour_depth colour box available colours

colour of the MH depth labels.

Text style mh_text_textstyle_depth textstyle available fonts

font of the MH depth labels.

Pre text mh_text_pre_depth text box

text to be placed before the depth in the MH depth labels.

Post text mh_text_post_depth text box

text to be placed after the depth in the MH depth labels.

Units factor mh_text_factor_depth real box

multiplier of depth values. A Units factor of 3.281 will result in the depths being labelled in feet.

Decimal places mh_text_decimals_depth integer box

number of decimal places in labelled depth values.

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name mh_text_name_depth name box

string name of the MH depth labels.

Continue to the next section 26.8.4.4 Maintenance Holes - MH Chainage Labels or return to 26.8.4 Maintenance Holes.

26.8.4.4 Maintenance Holes - MH Chainage Labels

The chainage of each maintenance hole is defined in the drainage strings.

The columns for the fields documented in the sections are for.

Panel Field | **Parameter name** | **Type** | **Pop-Up**

Section: MH chainage labels

*this section defines how a **MH chainage** is labelled.*

Draw chainage labels | | tick box |

*if **>0**, the text size of the MH chainage labels.*
*If **zero**, the MH depths are not labelled.*

Chainage mode | mh_text_mode_ch | choice box | running chainage, previous chainage, next chainage

determines what the chainage is that is labelled at the MHs.

If **running chainage***, the chainage is given with reference to the start of the drainage design string.*

If **previous chainage***, the chainage is from the previous maintenance hole.*

If **next chainage***, the chainage is from the next maintenance hole.*

Text size | mh_text_size_ch | real box |

*if **>0**, the text size of the MH chainage labels.*
*If **zero**, the MH depths are not labelled.*

Text offset | mh_text_offset_ch | real box |

distance to move the MH chainage labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle*. The justification of the text is specified by parameter* mh_text_justify.

Text rise | mh_text_rise_ch | real box |

distance to move the MH chainage labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode *and* mh_text_angle*. The justification of the text is specified by parameter* mh_text_justify.

Text colour | mh_text_colour_ch | colour box | available colours

colour of the MH chainage labels.

Text style | mh_text_textstyle_ch | textstyle | available fonts

font of the MH chainage labels.

Pre text | mh_text_pre_ch | text box |

text to be placed before the chainage in the MH chainage labels.

Post text | mh_text_post_ch | text box |

text to be placed after the chainage in the MH chainage labels.

Units factor | mh_text_factor_ch | real box |

multiplier of chainage values. A Units factor of 3.281 will result in the chainages being labelled in feet.

Decimal places | mh_text_decimals_ch | integer box |

number of decimal places in labelled chainage values.

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name | mh_text_name_ch | name box |

string name of the MH chainage labels.

Continue to the next section 26.8.4.5 Maintenance Holes - MH Attribute Labels or return to 26.8.4 Maintenance Holes.

26.8.4.5 Maintenance Holes - MH Attribute Labels

The values of any maintenance hole attributes can be labelled in plan.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: MH attribute labels

MH attribute label grid

each row of the grid defines how a MH attribute is labelled. There may be up to 20 rows.

Label MH attribute tick box

*if **ticked**, the MH attribute for this row will be labelled.*

*If **not ticked**, the MH attribute for this row will **not** be labelled.*

Attribute name text box

full path name of the MH attribute for this row that may be labelled.

Text size real box

text size of the MH attribute for this row.

Text offset real box

distance to move the MH attribute labels for this row to the right of the centre of the MH.

Text rise real box

distance to move the MH attribute labels for this above the centre of the MH.

Text colour colour box available colours

colour of the MH attribute labels for this row.

Text style textstyle box available textstyles

textstyle of the MH attribute labels for this row.

Pre text text box

text to be placed before the MH attribute labels for this row.

Post text text box

text to be placed after the MH attribute labels for this row.

Units factor real box

if the MH attribute for this row is real or integer, it is multiplied by the **Units factor** *for this row.*

Decimal places integer box

if the MH attribute for the this row is real, this is the number of decimal places in the MH attribute label for this row.

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name name box

name of the text string of the MH attribute label for this row.

Continue to the next section 26.8.4.6 Maintenance Holes - MH Setout Points or return to 26.8.4 Maintenance Holes.

26.8.4.6 Maintenance Holes - MH Setout Points

Symbols can be placed at the setout points for each maintenance hole.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: MH setout points

Draw setout points tick box

*if **ticked**, symbols are drawn at the MH set out points.*
*If **not ticked**, symbols are **not** drawn at the MH set out points.*

Setout symbol symbol box available symbols

the symbol to draw at each setout point.

Symbol size real box

size of the symbol for the setout points.

Setout points string name name box

name of the string that has the symbol.

Include MH name in string name tick box

*if **ticked**, the MH name is included in the setout points string name.*
*If **not ticked**, the MH name is **not** included in the setout points string name.*

Continue to the next section 26.8.5 House Connections or return to 26.8 Drainage Plan Plot PPF Editor

26.8.5 House Connections

The maintenance holes in a plan of a drainage network are often not drawn as they appear but with different symbols *etc* to represent different manhole types *etc*.

The manhole name, diameter, depth, chainage, attributes and setout points can all be labelled in plan.

The columns for the fields documented in the sections are for.

Panel Field **Parameter name** **Type** **Pop-Up**

Section: Maintenance hole representation

Panel field **Parameter name** **Type** **Pop-Up**

Section: Maintenance hole representation

Draw house connections **hc_draw_mode** **tick box**

HC linestyle **hc_line_style** **linestyle** **available linestyles**

linestyle with which to represent the house connections to the pipes. The HCs will be represented as lines perpendicular to the pipe, from the pipe centreline, to the sides of the pipe that the HCs are on.

HC colour **hc_colour** **colour** **available colours**

colour of the house connection linestyles

HC string name hc_line_name input

string name of the HC lines.

The remaining fields in this section are grid column fields that may each have up to 6 sets (rows) defined.

Panel field **Parameter name** **Type** **Pop-Up**

HC Type **hc_types_n** **input**

*HC type of the nth set of house connections. All HCs of this type will be represented according to the values of the other fields in this set (row). HC types are defined in the drainage design strings. There are only 6 different HC types used in **12d Model**.*

HC Type label **hc_type_text_n** **input**

text label to be associated with the HC type of the nth set of house connections.

Label HC Name and Type **hc_type_tp_n** **tick box**

label the names and types of the HCs of the nth set of house connections. Depending on the HC type, it may not be desired to label the type.

Label HC IL **hc_type_il_n** **tick box**

label the ILs of the HCs of the nth set of house connections. Depending on the HC type, it may not make sense to label the IL.

Label HC Chainage **hc_type_ch_n** **tick box**

label the chainages of the HCs of the nth set of house connections. Depending on the HC type, it may not make sense to label the chainages.

Label HC Additional Text **hc_type_at_n** **tick box**

label the Additional text of the HCs of the nth set of house connections. Depending on the HC type, it may not be desired to label the Additional text.

See

26.8.5.1 House Connections - HC Name and Type Labels
26.8.5.2 House Connections - HC IL Labels
26.8.5.3 House Connections - HC Chainage Labels

26.8.5.4 House Connections - HC Additional Text Labels

Or return to 26.8 Drainage Plan Plot PPF Editor.

26.8.5.1 House Connections - HC Name and Type Labels

Panel field	Parameter name	Type	Pop-Up
Label mode	**hc_type_mode**	**choice box**	**available choices**
Text size	**hc_type_size**	**input**	

text size of the HC type labels. The labels will only be created if the size is greater than zero and the parameter hc_type_tp_n *is set to* **on** *for the nth set of house connections. The HC type labels are associated with the HC types are defined by the parameter set* hc_type_text_n.

Text offset	**hc_type_offset**	**input**	

distance to move the HC type labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise	**hc_type_rise**	**input**	

distance to move the HC type labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour	**hc_type_colour**	**colour**	**available colours**

colour of the HC type labels.

Text style	**hc_type_textstyle**	**textstyle**	**available fonts**

font of the HC type labels.

Text string name	hc_type_name	input	

string name of the HC type labels.

Continue to the next section 26.8.5.2 House Connections - HC IL Labels or return to 26.8.5 House Connections.

26.8.5.2 House Connections - HC IL Labels

Panel field	Parameter name	Type	Pop-Up
Text size	**hc_il_size**	**input**	

text size of the HC IL (Invert Level) labels. The labels will only be created if the size is greater than zero and the parameter hc_type_il_n *is set to* **on** *for the nth set of house connections.*

Text offset	**hc_il_offset**	**input**	

distance to move the HC IL labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise	**hc_il_rise**	**input**	

distance to move the HC IL labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour	**hc_il_colour**	**colour**	**available colours**

colour of the HC IL labels.

Text style	**hc_il_textstyle**	**textstyle**	**available fonts**

font of the HC IL labels.

Pre text	**hc_il_pre**	**input**	

text to be placed before the IL in the HC IL labels.

Post text	**hc_il_post**	**input**	

text to be placed after the IL in the HC IL labels.

Units factor	**hc_il_factor**	**input**	

multiplier of IL values. A Units factor of 3.281 will result in the ILs being labelled in feet.

Decimal places	**hc_il_decimals**	**input**	

number of decimal places in labelled IL values.

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name	hc_il_name	input	

string name of the HC IL labels.

Continue to the next section 26.8.5.3 House Connections - HC Chainage Labels or return to 26.8.5 House Connections.

26.8.5.3 House Connections - HC Chainage Labels

Panel field	Parameter name	Type	Pop-Up
Chainage mode	**hc_chain_mode**	**choice box**	**hc lot offset** **running chainage** **previous chainage** **next chainage**

determines what chainage values will be labelled at the HCs. The **running chainage** *option refers to the start of the drainage design string. The* **previous chainage** *and* **next chainage** *options refer to the previous and next MHs respectively. The* **hc lot offset** *option is a special one that looks for a user-defined attribute called* "<hc_name> hc lot offset" *in the house connections along the drainage design strings. If the attribute is found, its value is set as the HC chainage label. If the attribute is not found, the value of the HC chainage label is set to a default HC Lot Offset of 5.0.*

Text size — **hc_chain_size** — **input**

text size of the HC chainage labels. The labels will only be created if the size is greater than zero and the parameter hc_type_ch_n *is set to* **on** *for the nth set of house connections.*

Text offset — **hc_chain_offset** — **input**

distance to move the HC chainage labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise — **hc_chain_rise** — **input**

distance to move the HC chainage labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour — **hc_chain_colour** — **colour** — **available colours**

colour of the HC chainage labels.

Text style — **hc_chain_textstyle** — **textstyle** — **available fonts**

font of the HC chainage labels.

Pre text — **hc_chain_pre** — **input**

text to be placed before the chainage in the HC chainage labels.

Post text — **hc_chain_post** — **input**

text to be placed after the chainage in the HC chainage labels.

Units factor — **hc_chain_factor** — **input**

multiplier of chainage values. A Units factor of 3.281 will result in the chainages being labelled in feet.

Decimal places — **hc_chain_decimals** — **input**

number of decimal places in labelled chainage values.

If > 0, trailing zeros are ***removed*** *after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Text string name — hc_chain_name — input

string name of the HC chainage labels.

Continue to the next section 26.8.5.4 House Connections - HC Additional Text Labels or return to 26.8.5 House Connections.

26.8.5.4 House Connections - HC Additional Text Labels

Panel field	Parameter name	Type	Pop-Up

Additional text **hc_text** **input**

the additional text to place near the HCs.

Text size **hc_text_size** **input**

text size of the HC additional text labels. The labels will only be created if the size is greater than zero and the parameter hc_type_at_n *is set to* **on** *for the nth set of house connections.*

Text offset **hc_text_offset** **input**

distance to move the HC additional text labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise **hc_text_rise** **input**

distance to move the HC additional text labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour **hc_text_colour** **colour** **available colours**

colour of the HC additional text labels.

Text style **hc_text_textstyle** **textstyle** **available fonts**

font of the HC additional text labels.

Text string name hc_text_name input

string name of the HC additional text labels.

Continue to the next section 26.8.6 Bubbles or return to 26.8 Drainage Plan Plot PPF Editor

26.8.6 Bubbles

Panel field	Parameter name	Type	Pop-Up

Section: Bubbles

Panel field	Parameter name	Type	Pop-Up
Draw bubbles	**bubble_draw_mode**	**tick box**	

draw bubbles (circles) around the MH name labels.

Panel field	Parameter name	Type	Pop-Up
Bubble colour	**bubble_colour**	**colour box**	**available colours**

colour of the bubbles.

Panel field	Parameter name	Type	Pop-Up
Bubble factor	**bubble_factor**	**input**	

the initial radius of the bubble is calculated as half the text length of the MH name label. The bubble factor is used to multiply the initial radius to give the final bubble radius. Factors greater than 1 will increase the bubble size.

Panel field	Parameter name	Type	Pop-Up
Bubble string name	**bubble_name**	**input**	

string name of the bubbles.

Continue to the next section 26.8.7 Flow Arrows or return to 26.8 Drainage Plan Plot PPF Editor

26.8.7 Flow Arrows

Panel field	Parameter name	Type	Pop-Up

Section: Flow Arrows

Draw flow arrows **flow_arrow_mode** **tick box**

draw flow arrows near the pipe diameter labels, showing the direction of flow in the pipes.

Arrow colour **flow_arrow_colour** **colour box**

colour of the flow arrows.

Solid fill arrows **flow_arrow_fill** **tick box**

Arrow length **flow_arrow_length** **input**

length of the flow arrows. Setting the length to a negative number will place the arrow on the other side of the pipe (whilst still maintaining the correct arrow direction).

Arrow rise **flow_arrow_rise** **input**

Arrow string name **flow_arrow_name** **input**

string name of the flow arrows.

Continue to the next section 26.8.8 Buttons at Bottom of Panel or return to 26.8 Drainage Plan Plot PPF Editor

26.8.8 Buttons at Bottom of Panel

This is documented for all the PPF Editors in 26.2.11 Buttons at the Bottom of the PPF Editors.

Return to 26.8 Drainage Plan Plot PPF Editor

26.9 Plot Frame and PPF Editor

Position of option on menu: **Plot =>Plot and PPF Editors =>Plot frames**

The **Plot Frame PPF Editor** is for creating and/or editing a (binary) plot frame PPF file and for creating a cross section plot.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the text ppf's were).

On selecting the **Plot frames** option, the **Plot Frame PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the ***Plot Frame*** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.
